Renesas Starter Kit for RX231 Boot Loader
Application Note

RENESAS MCU RX Family / RX200 Series

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corporation without notice. Please review the latest information published by Renesas Electronics Corporation through various means, including the Renesas Electronics Corporation website (http://www.renesas.com).

#### Notice

- 1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
- 2. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
- 3. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
- 4. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics product.
- 5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anticrime systems; and safety equipment etc.

Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (nuclear reactor control systems, military equipment etc.). You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application for which it is not intended. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.

- 6. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
- 7. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or systems manufactured by you.
- 8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
- 9. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You should not use Renesas Electronics products or technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. When exporting the Renesas Electronics products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations.
- 10. It is the responsibility of the buyer or distributor of Renesas Electronics products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the contents and conditions set forth in this document, Renesas Electronics assumes no responsibility for any losses incurred by you or third parties as a result of unauthorized use of Renesas Electronics products.
- 11. This document may not be reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
- 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority owned subsidiaries.
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

#### **Disclaimer**

By using this Renesas Starter Kit (RSK), the user accepts the following terms:

The RSK is not guaranteed to be error free, and the entire risk as to the results and performance of the RSK is assumed by the User. The RSK is provided by Renesas on an "as is" basis without warranty of any kind whether express or implied, including but not limited to the implied warranties of satisfactory quality, fitness for a particular purpose, title and non-infringement of intellectual property rights with regard to the RSK. Renesas expressly disclaims all such warranties. Renesas or its affiliates shall in no event be liable for any loss of profit, loss of data, loss of contract, loss of business, damage to reputation or goodwill, any economic loss, any reprogramming or recall costs (whether the foregoing losses are direct or indirect) nor shall Renesas or its affiliates be liable for any other direct or indirect special, incidental or consequential damages arising out of or in relation to the use of this RSK, even if Renesas or its affiliates have been advised of the possibility of such damages.

#### **Precautions**

The following precautions should be observed when operating any RSK product:

This Renesas Starter Kit is only intended for use in a laboratory environment under ambient temperature and humidity conditions. A safe separation distance should be used between this and any sensitive equipment. Its use outside the laboratory, classroom, study area or similar such area invalidates conformity with the protection requirements of the Electromagnetic Compatibility Directive and could lead to prosecution.

The product generates, uses, and can radiate radio frequency energy and may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment causes harmful interference to radio or television reception, which can be determined by turning the equipment off or on, you are encouraged to try to correct the interference by one or more of the following measures;

- ensure attached cables do not lie across the equipment
- · reorient the receiving antenna
- · increase the distance between the equipment and the receiver
- · connect the equipment into an outlet on a circuit different from that which the receiver is connected
- power down the equipment when not in use
- consult the dealer or an experienced radio/TV technician for help NOTE: It is recommended that wherever possible shielded interface cables are used.

The product is potentially susceptible to certain EMC phenomena. To mitigate against them it is recommended that the following measures be undertaken;

- The user is advised that mobile phones should not be used within 10m of the product when in use.
- The user is advised to take ESD precautions when handling the equipment.

The Renesas Starter Kit does not represent an ideal reference design for an end product and does not fulfil the regulatory standards for an end product.

# How to Use This Manual

# 1. Purpose and Target Readers

This application note is designed to provide the user with an understanding of how the System\_Bootloader sample works, in order to provide a guide on how such systems may be developed on a RX231 based system. It is intended for users working with a RSKRX231 platform.

Further details regarding operating the RX231 microcontroller may be found in the Hardware Manual and within the sample code.

The following documents applying to the RSKRX231 may provide assistance. Refer to the device specific versions located on the installation of the RSK software or check the Renesas Electronics Web site for the latest versions.

Document Type	Description	Document Title	Document No.
User's Manual	Describes the technical details of the RSK hardware.	RSKRX231 User's Manual	R20UT3027EG
Tutorial	Provides a guide to setting up RSK environment, running sample code and debugging programs.	RSKRX231 Tutorial Manual	CS+: R20UT3028EG

RENESAS STARTER KIT

RSKRX231

R20AN0375EG0100 Rev. 1.00 Aug 24, 2015

# 1.Overview

# 1.1 Purpose

The RSK is an evaluation tool for Renesas microcontrollers. This application note describes the operation of the System Bootloader sample code on the RSK platform with a view to aiding development of similar applications.

#### 1.2 Features

The System Bootloader sample code demonstrates the ability to update application code via SCI while the system is running, using a standard S-Record or hex programmer file format. It incorporates system integrity checking facilities such as CRC Flash memory verification and a watchdog.

The RSK board contains all the circuitry required for microcontroller operation.

RSKRX231 2. Introduction

# 2.Introduction

This application note is designed to illustrate how the System Sample: System\_Bootloader provides the ability to update application code located in on-board Flash memory on the MCU whilst running, via a serial connection from a PC or equivalent device.

RSKRX231 3. System Bootloader

# 3.System Bootloader

## 3.1 Memory Map - Flash

In order to understand the operation of the Bootloader and Application system it is important to have an appreciation of the memory space in which they are operating. This is shown in Figure 3.1 Flash Memory Map.

At the top of the flash memory is the Bootloader code, including the Flash Self-Programming Library.

Following this is the space for the Application Code, this area will hold the code for the application programmed using the Bootloader. This includes an exception vector table for the Application.

The RX231 fixed reset and exception vectors are located between addresses 0xFFFFFF80 & 0xFFFFFFFF. The fixed reset vector always points to the Bootloader code to ensure that the system can verify the Application code space in the event of a reset.

Above this lies an area containing option bytes, endian select registers and security ids.

In the addresses immediately above is the user application area checksum bytes. This checksum is calculated and verified by the Bootloader to determine if the application area contains a valid application.

# 3.2 Memory Map - RAM

The RX231 fitted to the RSK has 64k bytes of RAM.

Because Application code and Bootloader code run entirely separately, there is no shared RAM between them and no restrictions placed on application RAM use.

RSKRX231 3. System Bootloader

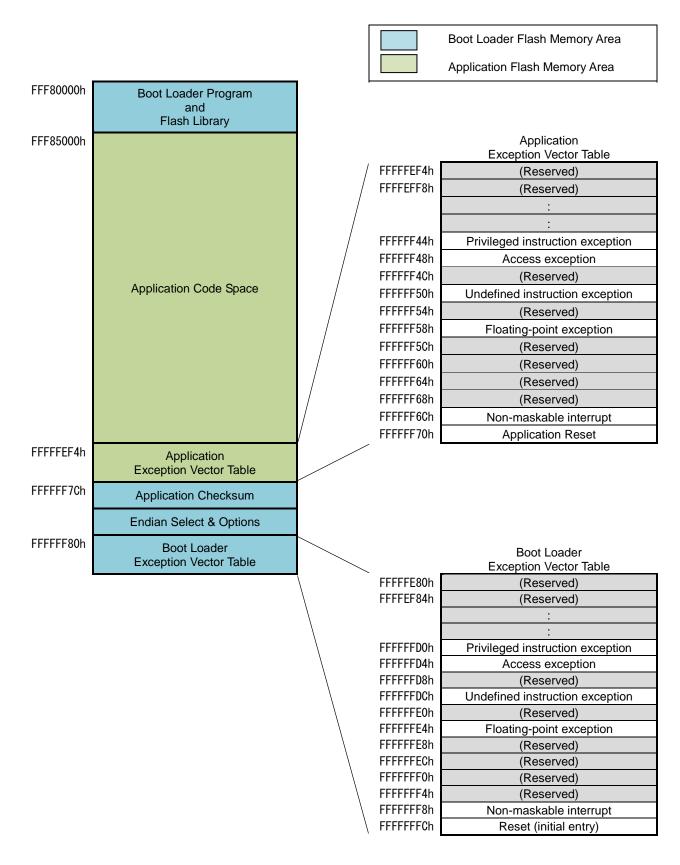

Figure 3.1 Flash Memory Map

RSKRX231 3. System Bootloader

## 3.3 Operation

Figure 3.2 Bootloader Flow Chart shows the workflow for the Bootloader

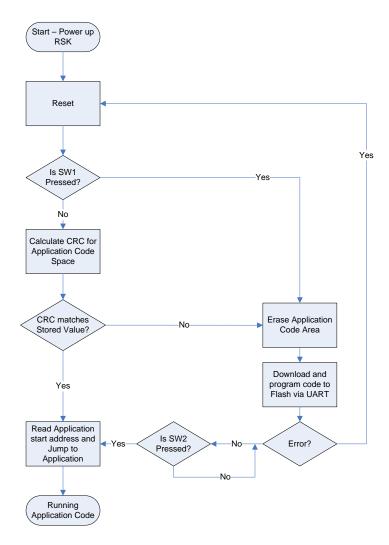

Figure 3.2 Bootloader Flow Chart

The MCU starts operation always by jumping to the location pointed to by the Bootloader fixed reset vector. This reset vector starts operation of the Bootloader (Not the Application). The Bootloader is responsible for deciding whether to run code located within the Application area, or to download new code via SCI and reprogram the flash area with this code.

The Bootloader decides to update the Application if SW1 is pressed when the RSK starts or if a CRC check of the Application code space determines that the code is invalid.

The firmware update procedure consists of first erasing the Application code space, followed by reading in new code from a programmer file in S-Record or Intel Hex format received via a SCI connection from the RL78G1C USB to Serial converter, and programming the Application Flash block by block.

Once Application flash programming is complete, the Bootloader then calculates a CRC value for the Application space and programs it to a fixed location in Flash.

Once the Application update process is complete and SW2 pressed, or if the application checksum is validated at start-up, the Bootloader will jump to the start address of the Application by reading the Reset vector entry in the Application's exception vector table.

# 4. Vector Handling

The RX231 processor has two vector tables: Interrupt Vector table & Exception Vector table.

# 4.1 Interrupt Vector Table

As the name suggests this vector table can be located anywhere in the RX231 flash area and stores addresses for the majority of standard interrupt vectors.

The user application is responsible for setting the INTB register to the location of the application's interrupt table.

# 4.2 Exception Vector Table

This table contains a number of reserved vectors and vectors for:

Reset.

Non-maskable interrupt,

Floating-point exception,

Undefined instruction exception,

Access exception &

Privileged instruction exception.

The RX231 uses the fixed locations of 0xFFFFF80 through 0xFFFFFFF for this vector table. This is within the bootloader address space and is not modifiable by the user's application.

Exception Vector Table (EXTB) sets the 0xFFFFF80 after a reset.

The user application must have an exception vector table located at addresses 0xFFFFEF4 through 0xFFFFFF73. This table is in the same format as a standard exception vector table.

Exception Vector Table (EXTB) sets the 0xFFFFFEF4 after jumping to the user application.

If the exception has occurred by except for reset, exception handling by the user application is invoked.

# 4.3 Code Description

The System\_Bootloader project has been based on code generated by the Code Generator. Many configuration options can be quickly modified to suit the application using a GUI, for example, changing the baud rate of the SCI connection etc. Code Generator files prefixed by "r\_cg\_" are files controlled by the Code Generator and within such files it is important to make modifications only in areas between the comments such as shown.

```
/* Start user code for adding. Do not edit comment generated here */
/* End user code. Do not edit comment generated here */
```

Any code additions or modifications performed outside of these comments will be overwritten if the code regenerated by Code Generator.

For a more detailed guide to using Code Generator, refer to Code Generator Tutorial manual.

r\_cg\_main.c is the file of the project containing the main function. The function main.c provides a high level guide of the process, following Figure 3.2 Bootloader Flow Chart.

Function update\_from\_data\_source guides the update procedure of reading data from the SCI and programming the Flash with this data. It handles the incoming data byte by byte, determining the format of the file being sent (Intel Hex or S-Record) automatically, and assigning function pointers to handle the data reception appropriately. When complete lines of records from the file are received, it determines what to do with the information; whether it is code and needs to be programmed to Flash or otherwise.

The SCI code is in r\_cg\_sci.c. By default the SCI is set to use 38400 Baud, 8 Data Bits, No Parity, 1 Stop Bit. These parameters may be changed using Code Generator.

To control the flow of data from the host PC, XModem transfer protocol has been employed. This is a 128-byte packet based protocol and allows the System\_Bootloader to hold off further transfers from the PC while decoding and programming operations are in progress.

XModem packets are fed into a buffer, which is controlled in buffer.c. The buffer is circular, i.e. when the end of the buffer is reached it loops back to the start. The buffer handling code has been deliberately constructed so as to make it easy to replace the data reception functions with those from a different communications medium.

Programming or erasing Flash via the Flash Self-Programming library is achieved via the file code\_flash.c. This employs functions to write to the Flash independently of block size or location, encapsulating the FSL library functions. Furthermore repetitive calls to the Flash\_Write function will just append the data to a buffer held in RAM and only write the data to the Flash if new data is passed to it that lies outside of the Flash block, in order to reduce the number of Flash writes. Any remaining data held in the Flash Write buffer can be written to the Flash by calling the flash flush buffer function.

Decoding of S-Record formatted files is handled in srec.c. Further information on the S-Record file format can be obtained at the following link: <a href="http://en.wikipedia.org/wiki/SREC">http://en.wikipedia.org/wiki/SREC</a> (file format)

Decoding of Intel hex formatted files is handled in hex.c. Further information on the hex file format can be obtained at the following link: http://en.wikipedia.org/wiki/Intel\_HEX

The Bootloader activates the watchdog timer, as a system integrity function. This is achieved in the r\_cg\_wdt.c file. The function R\_WDT\_Restart in the Bootloader code resets the watchdog to prevent timeout and reset.

## 4.3.1 XModem transfer implementation

Details of the XModem protocol may be found at the following link: <a href="http://en.wikipedia.org/wiki/XMODEM">http://en.wikipedia.org/wiki/XMODEM</a>.

The Bootloader implements the standard XModem protocol and not any variant such as XModem-1K or XModem-CRC.

In line with the standard protocol implementation, NAKs are sent by the RSK every 10 seconds before the first packet is received. As such there may be up to ten seconds delay between initialising the transfer on the terminal and the first packet being sent.

A <CAN> flag is sent to the terminal if the Bootloader detects a problem during the XModem transfer. This will cancel the transfer from the PC and allow the error message to be displayed to the user. <CAN> aborts are not supported by all PC terminal programs.

## 4.3.2 Flash API and FIT

The Renesas Flash API is used to perform the flash erase and programming. To reduce Bootloader code footprint, full Renesas Board Support Package (r\_bsp) has not been used. The reduced size approach detailed in the 'Using the Simple Flash API for RX without the r\_bsp\_ Module Application Note' has been employed.

## 4.4 Bootloader Section Link Addresses

To implement the memory map detailed in section 3.1 Memory Map, the following settings are used for the Bootloader linker sections.

Address	Section Name	Comment
0x00001000	SU	Bootloader work RAM start
	SI	
	B_1	
	R_1	
	B_2	
	R_2	
	В	
	R	
	RPFRAM	
0xFFF80000	PResetPRG	Start of Bootloader code
	C_1	
	C_2	
	С	
	C\$*	
	D*	
	W*	
	L	
	PIntPRG	Bootloader Interrupt Vector Table
	Р	
	PFRAM	
0xFFFFFF80	EXCEPTVECT	Bootloader Exception Vector Table
0xFFFFFFC	RESETVECT	Reset

# 4.5 Considerations for Bootloader Application Code

#### 4.5.1 Section Link Addresses

The Bootloader application code and vector tables must be linked within the section shown in Figure 3.1 Flash Memory Map, summarised below.

Address	Section Name	Comment
0x00004400	SU	Application work RAM start
	SI	
	B_1	
	R_1	
	B_2	
	R_2	
	В	
	R	
0xFFF85000	PResetPRG	Start of Application code
	C_1	
	C_2	
	С	
	C\$*	
	D*	
	W*	
	L	
	PIntPRG	Application Interrupt Vector Table
	Р	
0xFFFFFEF4	EXCEPTVECT	Application Exception Vector Table
0xFFFFFF73	RESETVECT	Application Reset

During download the image will be rejected if the Bootloader Application has code placed outside of the Application area shown in Figure 3.1 Flash Memory Map. If this occurs, analysis of the Bootloader Application linker map output file should indicate what has been set incorrectly.

Please note that Code Generator in e<sup>2</sup> studio adjusts Linker Section addresses each time code generated. If using Code Generator in e<sup>2</sup> studio the user needs to manually change the sections to the addresses required.

#### 4.5.2 Fixed Register Configuration

The RX231 has a number of registers that store non-volatile configuration information in the code flash. These include:

- a) Endian Select Register (MDE),
- b) Option Function Select (OFS0 & OFS1) &
- c) ID Code.

These registers are configured by, and located within, the Bootloader area of flash.

Code Generator creates the file 'r\_cg\_vecttbl.c' which has configuration for these registers as standard. However, these registers are not used in Bootloader Application.

### 4.5.3 Microcontroller Defaults

Before the user application is launched the Bootloader runs, this sets up various peripherals including the CGC, SCI and WDT. The Bootloader Application should be such that it is can accommodate peripherals not being in their default power-on state.

RSKRX231 5. Additional Information

# 5. Additional Information

## **Technical Support**

For information about the RX231 group microcontroller refer to the RX231 Group Hardware Manual.

For information about the RX assembly language, refer to the RX Series Software Manual.

#### **Technical Contact Details**

#### Please refer to the contact details listed in section 9 of the "Quick Start Guide"

General information on Renesas microcontrollers can be found on the Renesas website at: <a href="http://www.renesas.com/">http://www.renesas.com/</a>
