

# Renesas Flexible Software Package (FSP) v3.7.0

User's Manual

Renesas RA Family

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

# Table of Contents

<b>Chapter 1 Introduction</b>	11
1.1 Overview	11
1.2 Using this Manual	11
1.3 Documentation Standard	11
1.4 Introduction to FSP	11
1.4.1 Purpose	12
1.4.2 Quality	12
1.4.3 Ease of Use	12
1.4.4 Scalability	12
1.4.5 Build Time Configurations	12
1.4.6 e2 studio IDE	12
<b>Chapter 2 Starting Development</b>	13
2.1 Starting Development Introduction	13
2.2 e2 studio User Guide	14
2.2.1 What is e2 studio?	14
2.2.2 e2 studio Prerequisites	16
2.2.2.1 Obtaining an RA MCU Kit	16
2.2.2.2 PC Requirements	16
2.2.2.3 Installing e2 studio, platform installer and the FSP package	16
2.2.2.4 Choosing a Toolchain	16
2.2.2.5 Licensing	17
2.2.3 What is a Project?	17
2.2.4 Creating a Project	19
2.2.4.1 Creating a New Project	19
2.2.4.2 Selecting a Board and Toolchain	20
2.2.4.3 Selecting Flat or Arm® TrustZone® Project	21
2.2.4.4 Selecting a Project Template	22
2.2.5 Configuring a Project	25
2.2.5.1 Summary Tab	25
2.2.5.2 Configuring the BSP	26
2.2.5.3 Configuring Clocks	27
2.2.5.4 Configuring Pins	28
2.2.5.5 Configuring Interrupts from the Stacks Tab	30
2.2.5.6 Viewing Event Links	33
2.2.6 Adding Threads and Drivers	33
2.2.6.1 Adding and Configuring HAL Drivers	34
2.2.6.2 Adding Drivers to a Thread and Configuring the Drivers	36
2.2.6.3 Configuring Threads	40
2.2.7 Reviewing and Adding Components	41
2.2.8 Writing the Application	42
2.2.8.1 Coding Features	42
2.2.8.2 HAL Modules in FSP: A Practical Description	48
2.2.8.3 RTOS-Independent Applications	49
2.2.8.4 RTOS Applications	50
2.2.8.5 Additional Resources for Application Development	52
2.2.9 Debugging the Project	53
2.2.10 Modifying Toolchain Settings	53
2.2.11 Creating RA project with ARM Compiler 6 in e2 studio	54
2.2.12 Importing an Existing Project into e2 studio	57
2.3 Tutorial: Your First RA MCU Project - Blinky	61
2.3.1 Tutorial Blinky	61

2.3.2 What Does Blinky Do? . . . . .	62
2.3.3 Prerequisites . . . . .	62
2.3.4 Create a New Project for Blinky . . . . .	62
2.3.4.1 Details about the Blinky Configuration . . . . .	65
2.3.4.2 Configuring the Blinky Clocks . . . . .	66
2.3.4.3 Configuring the Blinky Pins . . . . .	66
2.3.4.4 Configuring the Parameters for Blinky Components . . . . .	66
2.3.4.5 Where is main()? . . . . .	66
2.3.4.6 Blinky Example Code . . . . .	66
2.3.5 Build the Blinky Project . . . . .	66
2.3.6 Debug the Blinky Project . . . . .	67
2.3.6.1 Debug prerequisites . . . . .	67
2.3.6.2 Debug steps . . . . .	68
2.3.6.3 Details about the Debug Process . . . . .	69
2.3.7 Run the Blinky Project . . . . .	70
2.4 Tutorial: Using HAL Drivers - Programming the WDT . . . . .	70
2.4.1 Application WDT . . . . .	70
2.4.2 Creating a WDT Application Using the RA MCU FSP and e2 studio . . . . .	70
2.4.2.1 Using the FSP and e2 studio . . . . .	70
2.4.2.2 The WDT Application . . . . .	70
2.4.2.3 WDT Application flow . . . . .	71
2.4.3 Creating the Project with e2 studio . . . . .	71
2.4.4 Configuring the Project with e2 studio . . . . .	75
2.4.4.1 BSP Tab . . . . .	76
2.4.4.2 Clocks Tab . . . . .	76
2.4.4.3 Interrupts Tab . . . . .	77
2.4.4.4 Event Links Tab . . . . .	77
2.4.4.5 Pins Tab . . . . .	77
2.4.4.6 Stacks Tab . . . . .	77
2.4.4.7 Components Tab . . . . .	80
2.4.5 WDT Generated Project Files . . . . .	81
2.4.5.1 WDT hal_data.h . . . . .	83
2.4.5.2 WDT hal_data.c . . . . .	84
2.4.5.3 WDT main.c . . . . .	85
2.4.5.4 WDT hal_entry.c . . . . .	85
2.4.6 Building and Testing the Project . . . . .	88
2.5 Primer: ARM® TrustZone® Project Development . . . . .	89
2.5.1 Renesas Implementation of ARM® TrustZone® Technology . . . . .	90
2.5.1.1 Calling from Non-Secure to Secure . . . . .	91
2.5.1.2 Calling from Secure to Non-Secure . . . . .	91
2.5.2 Workflow . . . . .	91
2.5.2.1 Secure Project . . . . .	91
2.5.2.2 Non-Secure Project . . . . .	92
2.5.2.3 Flat Project . . . . .	92
2.5.3 RA Project Generator (PG) . . . . .	92
2.5.3.1 Secure Project Set Up . . . . .	94
2.5.3.2 RTOS Support in TZ Project . . . . .	94
2.5.3.3 Peripheral Security Attribution . . . . .	95
2.5.3.4 Non-Secure . . . . .	96
2.5.3.5 Flat Project Type . . . . .	96
2.5.3.6 Secure Connection to Non-Secure Project . . . . .	96
2.5.3.7 Debug Configurations . . . . .	97
2.5.4 Secure Projects . . . . .	97
2.5.4.1 Secure Clock . . . . .	98
2.5.4.2 Setting Drivers as NSC . . . . .	98

2.5.4.3 Guard Functions	99
2.5.5 Non-Secure projects	99
2.5.5.1 Clock Set Up	99
2.5.5.2 Selecting NSC Drivers	100
2.5.5.3 Locked Resources	100
2.5.5.4 Locked Channels	101
2.5.6 IDAU registers	101
2.5.6.1 SCI Boot Mode	103
2.5.6.2 DLM States	103
2.5.7 Debug	105
2.5.7.1 Non-Secure Debug	105
2.5.8 Debugger support	106
2.5.9 Third-Party IDEs	106
2.5.10 Renesas Flash Programmer (RFP)	107
2.5.11 Glossary	108
2.5.11.1 Configurator Icon Glossary	109
2.6 RA SC User Guide for MDK and IAR	109
2.6.1 What is RA SC?	109
2.6.2 Using RA Smart Configurator with Keil MDK	109
2.6.2.1 Prerequisites	109
2.6.2.2 Create new RA project	110
2.6.2.3 Modify existing RA project	111
2.6.2.4 Build and Debug RA project	111
2.6.2.5 Notes and Restrictions	112
2.6.3 Using RA Smart Configurator with IAR EWARM	113
2.6.3.1 Prerequisites	113
2.6.3.2 Create new RA project	113
2.6.3.3 Notes and Restrictions	114
<b>Chapter 3 FSP Architecture</b>	116
3.1 FSP Architecture Overview	116
3.1.1 C99 Use	116
3.1.2 Doxygen	116
3.1.3 Weak Symbols	116
3.1.4 Memory Allocation	116
3.1.5 FSP Terms	116
3.2 FSP Modules	118
3.2.1 Module Sources	119
3.2.2 Module Distribution	119
3.2.3 Module Versioning	119
3.3 FSP Stacks	119
3.4 FSP Interfaces	120
3.4.1 FSP Interface Enumerations	121
3.4.2 FSP Interface Callback Functions	121
3.4.3 FSP Interface Data Structures	123
3.4.3.1 FSP Interface Configuration Structure	123
3.4.3.2 FSP Interface API Structure	124
3.4.3.3 FSP Interface Instance Structure	126
3.5 FSP Instances	127
3.5.1 FSP Instance Control Structure	128
3.5.2 FSP Interface Extensions	128
3.5.2.1 FSP Extended Configuration Structure	128
3.5.3 FSP Instance API	129
3.6 FSP API Standards	129
3.6.1 FSP Function Names	129

3.6.2 Use of const in API parameters	129
3.6.3 FSP Version Information	129
3.7 FSP Build Time Configurations	130
3.8 FSP File Structure	130
3.9 FSP TrustZone Support	131
3.9.1 FSP TrustZone Projects	131
3.9.2 Non-Secure Callable Guard Functions	131
3.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules	131
3.9.4 Migrating TrustZone Project to newer FSP Version	131
3.9.5 Additional TrustZone Information	132
3.10 FSP Architecture in Practice	132
3.10.1 FSP Connecting Layers	132
3.10.2 Using FSP Modules in an Application	132
3.10.2.1 Create a Module Instance in the RA Configuration Editor	132
3.10.2.2 Use the Instance API in the Application	133
<b>Chapter 4 API Reference</b>	<b>134</b>
4.1 BSP	134
4.1.1 BSP I/O access	136
4.1.2 Common Error Codes	150
4.1.3 MCU Board Support Package	161
4.1.3.1 RA2A1	196
4.1.3.2 RA2E1	201
4.1.3.3 RA2E2	206
4.1.3.4 RA2L1	211
4.1.3.5 RA4E1	218
4.1.3.6 RA4M1	224
4.1.3.7 RA4M2	229
4.1.3.8 RA4M3	235
4.1.3.9 RA4W1	242
4.1.3.10 RA6E1	247
4.1.3.11 RA6M1	254
4.1.3.12 RA6M2	259
4.1.3.13 RA6M3	265
4.1.3.14 RA6M4	270
4.1.3.15 RA6M5	277
4.1.3.16 RA6T1	284
4.1.3.17 RA6T2	289
4.2 Modules	296
4.2.1 Analog	299
4.2.1.1 ADC (r_adc)	300
4.2.1.2 ADC Driver on r_adc_b	335
4.2.1.3 Comparator, High-Speed (r_acmphs)	369
4.2.1.4 Comparator, Low-Power (r_acmplp)	376
4.2.1.5 DAC (r_dac)	384
4.2.1.6 DAC8 (r_dac8)	390
4.2.1.7 Operational Amplifier (r_opamp)	396
4.2.1.8 SDADC Channel Configuration (r_sdadc)	414
4.2.2 Audio	436
4.2.2.1 ADPCM Decoder (rm_adpcm_decoder)	437
4.2.2.2 Audio Playback PWM (rm_audio_playback_pwm)	440
4.2.3 Bootloader	452
4.2.3.1 MCUboot Image Utilities	452
4.2.4 CapTouch	469
4.2.4.1 CTSU (r_ctsu)	469
4.2.4.2 Touch (rm_touch)	502

4.2.5 Connectivity	521
4.2.5.1 Azure RTOS USBX Port (rm_usbx_port)	524
4.2.5.2 CAN (r_can)	593
4.2.5.3 CAN FD (r_canfd)	630
4.2.5.4 CEC (r_cec)	657
4.2.5.5 I2C Communication Device (rm_comms_i2c)	668
4.2.5.6 I2C Master (r_iic_b_master)	675
4.2.5.7 I2C Master (r_iic_master)	689
4.2.5.8 I2C Master (r_sci_b_i2c)	702
4.2.5.9 I2C Master (r_sci_i2c)	715
4.2.5.10 I2C Slave (r_iic_b_slave)	727
4.2.5.11 I2C Slave (r_iic_slave)	738
4.2.5.12 I2S (r_ssi)	749
4.2.5.13 I3C (r_i3c)	764
4.2.5.14 SPI (r_sci_b_spi)	804
4.2.5.15 SPI (r_sci_spi)	815
4.2.5.16 SPI (r_spi)	827
4.2.5.17 SPI (r_spi_b)	845
4.2.5.18 UART (r_sci_b_uart)	862
4.2.5.19 UART (r_sci_uart)	879
4.2.5.20 USB (r_usb_basic)	897
4.2.5.21 USB Composite (r_usb_composite)	927
4.2.5.22 USB HCD (r_usb_hcdc)	938
4.2.5.23 USB HID (r_usb_hhid)	946
4.2.5.24 USB HMSC (r_usb_hmsc)	956
4.2.5.25 USB Host Vendor class (r_usb_hvnd)	966
4.2.5.26 USB PCDC (r_usb_pcdc)	980
4.2.5.27 USB PHID (r_usb_phid)	987
4.2.5.28 USB PMSC (r_usb_pmsc)	1003
4.2.5.29 USB Peripheral Vendor class (r_usb_pvnd)	1009
4.2.6 DSP	1021
4.2.6.1 IIR Filter Accelerator (r_iirfa)	1022
4.2.7 Graphics	1030
4.2.7.1 Azure RTOS GUIX Port (rm_guix_port)	1031
4.2.7.2 D/AVE 2D Port Interface (r_drw)	1038
4.2.7.3 Graphics LCD (r_glcd)	1040
4.2.7.4 JPEG Codec (r_jpeg)	1084
4.2.7.5 Parallel Data Capture (r_pdc)	1111
4.2.7.6 SEGGER emWin RA Port (rm_emwin_port)	1118
4.2.7.7 Segment LCD (r_slcdc)	1126
4.2.8 Input	1134
4.2.8.1 External IRQ (r_icu)	1135
4.2.8.2 Key Matrix (r_kint)	1142
4.2.9 Monitoring	1146
4.2.9.1 CRC (r_crc)	1147
4.2.9.2 Clock Accuracy Circuit (r_cac)	1153
4.2.9.3 Data Operation Circuit (r_doc)	1160
4.2.9.4 Independent Watchdog (r_iwdt)	1165
4.2.9.5 Low Voltage Detection (r_lvd)	1175
4.2.9.6 Watchdog (r_wdt)	1183
4.2.10 Motor	1195
4.2.10.1 120-degree conduction control sensorless (rm_motor_120_control_sensorless)	1197
4.2.10.2 120-degree conduction control with Hall sensors (rm_motor_120_control_hall)	1214
4.2.10.3 ADC and PWM Modulation (rm_motor_driver)	1229
4.2.10.4 ADC and PWM modulation (rm_motor_120_driver)	1236

4.2.10.5 Motor 120 degree control (rm_motor_120_degree)	1250
4.2.10.6 Motor Angle (rm_motor_estimate)	1262
4.2.10.7 Motor Angle (rm_motor_sense_encoder)	1271
4.2.10.8 Motor Current Controller (rm_motor_current)	1281
4.2.10.9 Motor Encoder Vector Control (rm_motor_encoder)	1291
4.2.10.10 Motor Position Controller (rm_motor_position)	1303
4.2.10.11 Motor Sensorless Vector Control (rm_motor_sensorless)	1313
4.2.10.12 Motor Speed Controller (rm_motor_speed)	1325
4.2.11 Networking	1336
4.2.11.1 AWS Cellular Interface on RYZ (rm_cellular_ryz_aws)	1338
4.2.11.2 AWS HTTPS	1345
4.2.11.3 AWS PKCS11 PAL (rm_aws_pkcs11_pal)	1349
4.2.11.4 AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs)	1350
4.2.11.5 AWS Secure Sockets	1351
4.2.11.6 AWS Transport Interface on MbedTLS/PKCS11 (rm_aws_transport_interface_port)	1357
4.2.11.7 BLE Abstraction (rm_ble_abs)	1363
4.2.11.8 BLE Driver (r_ble_balance)	1398
4.2.11.9 BLE Driver (r_ble_compact)	1400
4.2.11.10 BLE Driver (r_ble_extended)	1403
4.2.11.11 Bluetooth Low Energy Mesh Network Modules	1405
4.2.11.12 Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)	1967
4.2.11.13 Ethernet (r_ether)	1972
4.2.11.14 Ethernet (r_ether_phy)	1992
4.2.11.15 FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)	1999
4.2.11.16 NetX Duo Ethernet Driver (rm_netxduo_ether)	2006
4.2.11.17 NetX Duo WiFi Driver (rm_netxduo_wifi)	2009
4.2.11.18 PTP (r_ptp)	2016
4.2.11.19 SPP BLE Abstraction (rm_ble_abs_spp)	2038
4.2.11.20 WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)	2047
4.2.12 Power	2062
4.2.12.1 Low Power Modes (r_lpm)	2062
4.2.13 RTOS	2071
4.2.13.1 Azure RTOS ThreadX Port (rm_threadx_port)	2071
4.2.13.2 FreeRTOS Port (rm_freertos_port)	2080
4.2.14 Security	2109
4.2.14.1 AWS Client Credentials	2110
4.2.14.2 AWS Device Provisioning	2113
4.2.14.3 Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto)	2117
4.2.14.4 Mbed Crypto HW Acceleration (rm_psa_crypto)	2155
4.2.14.5 SCE Protected Mode	2198
4.2.14.6 Secure Crypto Engine (r_sce_protected_cavp)	2357
4.2.14.7 TinyCrypt TRNG (rm_tinycrypt_port)	2361
4.2.15 Sensor	2372
4.2.15.1 FS2012 Flow Sensor (rm_fs2012)	2373
4.2.15.2 HS300X Temperature/Humidity Sensor (rm_hs300x)	2379
4.2.15.3 OB1203 Light/Proximity/PPG Sensor Middleware (rm_ob1203)	2391
4.2.15.4 ZMOD4XXX Gas Sensor (rm_zmod4xxx)	2432
4.2.16 Storage	2473
4.2.16.1 Block Media Custom Implementation (rm_block_media_user)	2475
4.2.16.2 Block Media SD/MMC (rm_block_media_sdmmc)	2476
4.2.16.3 Block Media SPI Flash (rm_block_media_spi)	2483
4.2.16.4 Block Media USB (rm_block_media_usb)	2493
4.2.16.5 FileX I/O (rm_filex_block_media)	2500
4.2.16.6 FileX I/O (rm_filex_levelx_nor)	2518
4.2.16.7 Flash (r_flash_hp)	2533

4.2.16.8 Flash (r_flash_lp)	2553
4.2.16.9 FreeRTOS+FAT Port for RA (rm_freertos_plus_fat)	2570
4.2.16.10 LevelX NOR Port (rm_levelx_nor_spi)	2583
4.2.16.11 LittleFS on Flash (rm_littlefs_flash)	2596
4.2.16.12 OSPI Flash (r_ospi)	2603
4.2.16.13 QSPI (r_qspi)	2629
4.2.16.14 SD/MMC (r_sdhi)	2647
4.2.16.15 Virtual EEPROM on Flash (rm_vee_flash)	2663
4.2.17 System	2677
4.2.17.1 Clock Generation Circuit (r_cgc)	2678
4.2.17.2 Event Link Controller (r_elc)	2698
4.2.17.3 I/O Port (r_ioport)	2706
4.2.18 Timers	2729
4.2.18.1 Port Output Enable for GPT (r_poeg)	2730
4.2.18.2 Realtime Clock (r_rtc)	2737
4.2.18.3 Three-Phase PWM (r_gpt_three_phase)	2751
4.2.18.4 Timer, General PWM (r_gpt)	2759
4.2.18.5 Timer, Low-Power (r_agt)	2806
4.2.19 Transfer	2831
4.2.19.1 Transfer (r_dmac)	2832
4.2.19.2 Transfer (r_dtc)	2845
4.2.20 TrustZone	2857
4.2.20.1 ARM TrustZone Context RA Port (rm_tz_context)	2858
4.3 Interfaces	2859
4.3.1 ADC Interface	2867
4.3.2 ADPCM Decoder Interface	2885
4.3.3 AUDIO PLAYBACK Interface	2889
4.3.4 BLE ABS Interface	2893
4.3.5 BLE Interface	2929
4.3.5.1 GAP	2935
4.3.5.2 GATT_COMMON	3102
4.3.5.3 GATT_SERVER	3103
4.3.5.4 GATT_CLIENT	3139
4.3.5.5 L2CAP	3190
4.3.5.6 VS	3207
4.3.6 BLE Mesh Access Interface	3237
4.3.6.1 Application Callback	3304
4.3.7 BLE Mesh Bearer Interface	3306
4.3.8 BLE Mesh Bearer Platform Interface	3323
4.3.9 BLE Mesh Health Server Interface	3330
4.3.10 BLE Mesh Interface	3335
4.3.11 BLE Mesh Lower Trans Interface	3348
4.3.12 BLE Mesh Model Client Interface	3355
4.3.13 BLE Mesh Model Configuration Client Interface	3363
4.3.14 BLE Mesh Model Server Interface	3367
4.3.15 BLE Mesh Network Interface	3376
4.3.16 BLE Mesh Provision Interface	3393
4.3.17 BLE Mesh Scene Server Interface	3419
4.3.18 BLE Mesh Upper Trans Interface	3423
4.3.19 Block Media Interface	3442
4.3.20 CAC Interface	3451
4.3.21 CAN Interface	3461
4.3.22 CEC Interface	3471
4.3.23 CGC Interface	3480

4.3.24 CRC Interface	3494
4.3.25 CTSU Interface	3501
4.3.26 Communicatons Middleware Interface	3515
4.3.27 Comparator Interface	3520
4.3.28 DAC Interface	3528
4.3.29 DOC Interface	3533
4.3.30 Display Interface	3540
4.3.31 ELC Interface	3557
4.3.32 Ethernet Interface	3561
4.3.33 Ethernet PHY Interface	3571
4.3.34 External IRQ Interface	3576
4.3.35 FSXXXX Middleware Interface	3583

# Chapter 1 Introduction

## 1.1 Overview

This manual describes how to use the Renesas Flexible Software Package (FSP) for writing applications for the RA microcontroller series.

## 1.2 Using this Manual

This manual provides a wide variety of information, so it can be helpful to know where to start. Here is a short description of each main section and how they can be used.

**Starting Development** - Provides a step by step guide on how to use e2 studio and FSP to develop a project for RA MCUs. This is a good place to start to get up to speed quickly and efficiently.

**FSP Architecture** - Provides useful background material on key FSP concepts such as Modules, Stacks, and API standards. Reference this section to extend or refresh your knowledge of FSP concepts.

**API Reference** - Provides detailed information on each module and interface including features, API functions, configuration settings, usage notes, function prototypes and code examples. Board Support Package (BSP) related API functions are also included.

*Note*

*Much of the information in the API Reference section is available from within the e2 studio tool via the [Developer Assistance](#) feature. The information here can be referenced for additional details on API features.*

## 1.3 Documentation Standard

Each **Modules** section user guide outlines the following:

- **Features:** A bullet list of high level features provided by the module.
- **Configuration:** A description of module specific configurations available in the RA Configuration editor.
- **Usage Notes:** Module specific documentation and limitations.
- **Examples:** Example code provided to help the user get started.
- **API Reference:** Usage notes for each API in the module, including the function prototype and hyperlinks to the interface documentation for parameter definitions.

Each **Interfaces** section user guide outlines the following:

- **Detailed Description:** A short description and summary of the interface functionality.
- **Data Structures:** A list and definition of each data structure used by the interface including the structure of the pointers that define the API and are shared by all modules that implement the interface.
- **Typedefs:** A list and description of the typedefs used by the interface.
- **Enumerations:** A list and description of the enumerations used by the interface.

## 1.4 Introduction to FSP

### 1.4.1 Purpose

The Renesas Flexible Software Package (FSP) is an optimized software package designed to provide easy to use, scalable, high quality software for embedded system design. The primary goal is to provide lightweight, efficient drivers that meet common use cases in embedded systems.

### 1.4.2 Quality

FSP code quality is enforced by peer reviews, automated requirements-based testing, and automated static analysis.

### 1.4.3 Ease of Use

FSP provides uniform and intuitive APIs that are well documented. Each module is supported with detailed user documentation including example code.

### 1.4.4 Scalability

FSP modules can be used on any MCU in the RA family, provided the MCU has any peripherals required by the module.

### 1.4.5 Build Time Configurations

FSP modules also have build time configurations that can be used to optimize the size of the module for the feature set required by the application.

### 1.4.6 e2 studio IDE

FSP provides a host of efficiency enhancing tools for developing projects targeting the Renesas RA series of MCU devices. The e2 studio IDE provides a familiar development cockpit from which the key steps of project creation, module selection and configuration, code development, code generation, and debugging are all managed.

# Chapter 2 Starting Development

## 2.1 Starting Development Introduction

The wealth of resources available to learn about and use e2 studio and FSP can be overwhelming on first inspection, so this section provides a Starting Development Guide with a list of the most important initial steps. Following these highly recommended first 11 steps will bring you up to speed on the development environment in record time. Even experienced developers can benefit from the use of this guide, to learn the terminology that might be unfamiliar or different from previous environments.

1. Read the section [What is e2 studio?](#), up to but not including [e2 studio Prerequisites](#). This will provide a description of the various windows and views to use e2 studio to create a project, add modules and threads, configure module properties, add code, and debug a project. It also describes how to use key coding 'accelerators' like Developer Assist (to drag and drop parameter populated API function calls right into your code), a context aware Autocomplete (to easily find and select from suggested enumerations, functions, types, and many other coding elements), and many other similar productivity enhancers.
2. Read the [FSP Architecture](#), [FSP Modules](#) and [FSP Stacks](#) sections. These provide the basic background on how FSP modules and stacks are used to construct your application. Understanding their definitions and the theory behind how they combine will make it easier to develop with FSP.
3. Read a few [Modules](#) sections to see how to use API function calls, structures, enumerations, types and callbacks. These module guides provide the information you will use to implement your project code.
4. After you have a Kit and you have downloaded and installed e2 studio and FSP, you can build and debug a simple project to test your installation, tool flow, and the kit. (If you do not have a Kit or have not yet installed the development software, use the links included in the [e2 studio Prerequisites](#) for more information.) The simple [Tutorial: Your First RA MCU Project - Blinky](#) will Blink an LED on and off. Follow the instructions for importing and running this project in section [Create a New Project for Blinky](#). It will use some of the key steps for managing projects within e2 studio and is a good way to learn the basics.
5. Once you have successfully run Blinky you have a good starting point for using FSP for more complex projects. The Using HAL Drivers Tutorial, available at [Tutorial: Using HAL Drivers - Programming the WDT](#), shows how to create a project from scratch, using FSP API functions. Do this next.
6. Several Hands-on Quick FSP Labs are available that cover key development topics with short 15-minute Do it Yourself (DIY) activities targeting the EK-RA6M3. Topics covered include code development accelerators like Developer Assistance, Autocomplete, Help, Visual Expressions and using Example Projects. The complete list of available Quick FSP Labs can be found here: <https://en-support.renesas.com/knowledgeBase/category/31087/subcategory/31090>. Doing a couple of these labs provides further details on using FSP, and is also good practice. Running these labs is highly recommended.
7. The balance of the [FSP Architecture](#) sections (that is, those not called out in step 2 above) contain additional reference material that may be helpful in the future. Scan them so you know what they contain, in case you need them.
8. The balance of the e2 studio User Guide, starting with the [What is a Project?](#) section up to, but not including, [Writing the Application](#) section, provides a detailed description of each of

the key steps, windows, and entries used to create, manage, configure, build and debug a project. Much of this may be familiar after running through the tutorials and Quick Labs. However, it is important to have a good grasp of what each of the configuration tabs are used for as that is where the bulk of the project preparation work takes place prior to writing code. Skim over this section as it may help with any questions in the future.

9. Read the [Writing the Application](#) section to get a short introduction to the steps used when creating application code with FSP. It covers both RTOS-independent and RTOS-dependent applications. It also includes a short description for several of the code accelerators you should be familiar with by now. Using additional Quick FSP Labs is a good way to become familiar with the application development process and links to them are included in the appropriate places in this section. You can find the complete list of available Quick FSP Labs here: <https://en-support.renesas.com/knowledgeBase/19308277>.
10. Scan the [Debugging the Project](#) section to see the steps required to download and start a debug session.
11. Explore the additional material available on the following web pages and bookmark the resources that look most valuable to you:
  - a. RA Landing Page: <https://www.renesas.com/ra>
  - b. FSP Landing Page: <https://www.renesas.com/fsp>
  - c. Example Projects on GitHub: <https://github.com/renesas/ra-fsp-examples>

## 2.2 e2 studio User Guide

### 2.2.1 What is e2 studio?

Renesas e2 studio is a development tool encompassing code development, build, and debug. e2 studio is based on the open-source Eclipse IDE and the associated C/C++ Development Tooling (CDT).

When developing for RA MCUs, e2 studio hosts the Renesas Flexible Software Package (FSP). FSP provides a wide range of time saving tools to simplify the selection, configuration, and management of modules and threads, to easily implement complex applications. The time saving tools available in e2 studio and FSP include the following:

- A Graphical User Interface (GUI) (see [Adding Threads and Drivers](#)) with numerous wizards for configuring and auto-generating code
- A context sensitive Autocomplete (see [Tutorial: Using HAL Drivers - Programming the WDT](#)) feature that provides intelligent options for completing a programming element
- A [Developer Assistance](#) tool for selection of and drag and drop placement of API functions directly in application code
- A [Welcome Window](#) with links to example projects, application notes and a variety of other self-help support resources
- An [Information Icon](#) from each module is provided in the graphic configuration viewer that links to specific design resources, including code 'cheat sheets' that provide useful starting points for common application implementations.

Figure 1: e2 studio Splash Screen

e2 studio organizes project work based on Perspectives, Views, Windows, Panes, and Pages (sometimes called Tabs). A window is a section of the e2 studio GUI that presents information on a key topic. Windows often use tabs to select sub-topics. For example, an editor window might have a tab available for each open file, so it is easy to switch back and forth between them. A window Pane is a section of a window. Within a window, multiple Panes can be opened and viewed simultaneously, as opposed to a tabbed window, where only individual content is displayed. A memory-display Window, for example, might have multiple Panes that allow the data to be displayed in different formats, simultaneously. A Perspective is a collection of Views and Windows typical for a specific stage of development. The default perspectives are a C/C++ Perspective, an FSP Configuration Perspective and a Debug Perspective. These provide specific Views, Windows, Tabs, and Panes tailored for the common tasks needed during the specific development stage.

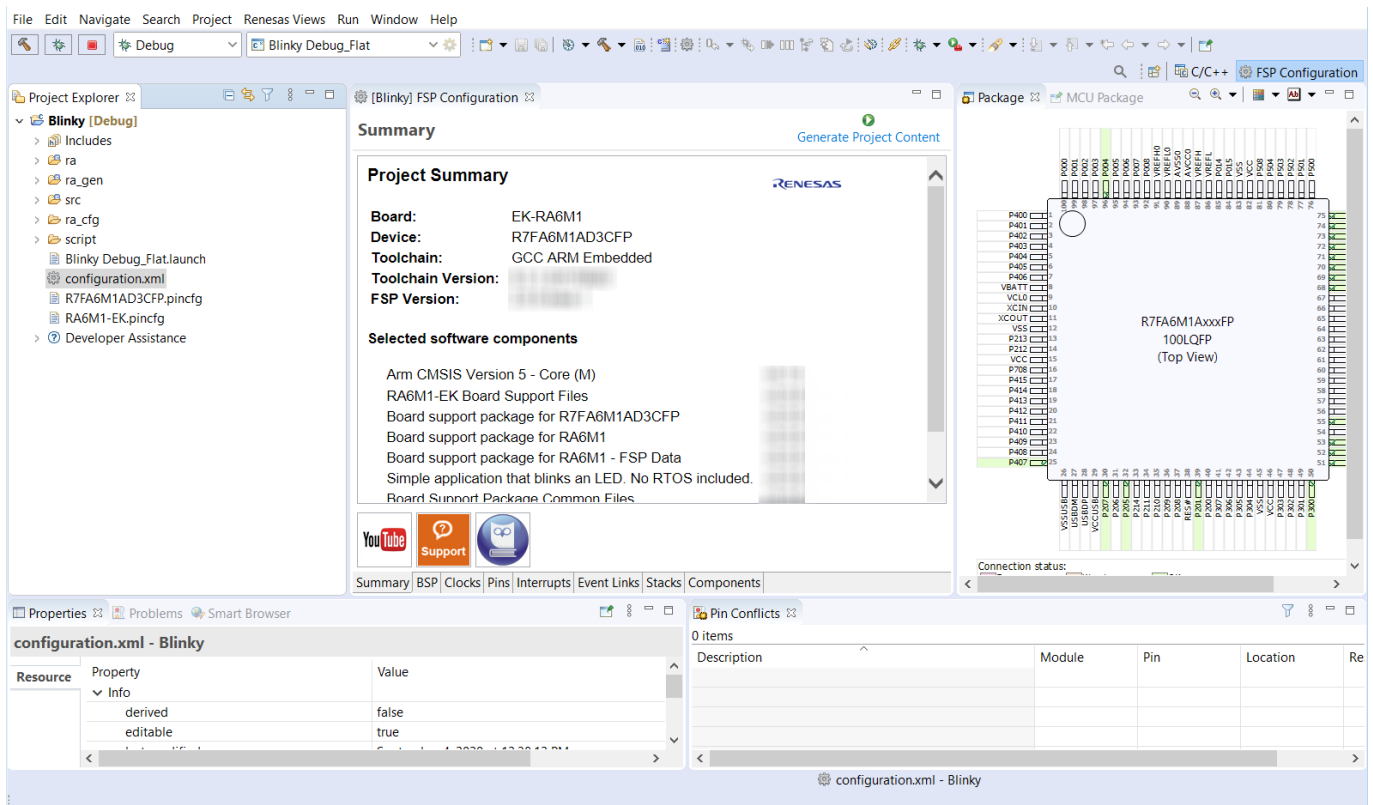

Figure 2: Default Perspective

In addition to managing project development, selecting modules, configuring them and simplifying code development, e2 studio also hosts the engine for automatically generating code based on module selections and configurations. The engine continually checks for dependencies and automatically adds any needed lower level modules to the module stack. It also identifies any lower level modules that require configuration (for example, an interrupt that needs to have a priority assigned). It also provides a guide for selecting between multiple choices or options to make it easy to complete a fully functional module stack.

The Generate Project Content function takes the selected and configured modules and automatically generates the complete and correct configuration code. The code is added to the folders visible in the **Project Explorer** window in e2 studio. The configuration.xml file in the project folder holds all the generated configuration settings. This file can be opened in the GUI-based RA Configuration editor to make further edits and changes. Once a project has been generated, you can go back and reconfigure any of the modules and settings if required using this editor.

Figure 3: Project Explorer Window showing generated folders and configuration.xml file

## 2.2.2 e2 studio Prerequisites

### 2.2.2.1 Obtaining an RA MCU Kit

To develop applications with FSP, start with one of the Renesas RA MCU Evaluation Kits. The Renesas RA MCU Evaluation Kits are designed to seamlessly integrate with the e2 studio.

Ordering information, Quick Start Guides, User Manuals, and other related documents for all RA MCU Evaluation Kits are available at <https://www.renesas.com/ra>.

### 2.2.2.2 PC Requirements

The following are the minimum PC requirements to use e2 studio:

- Windows 10 with Intel i5 or i7, or AMD A10-7850K or FX
- Memory: 8-GB DDR3 or DDR4 DRAM (16-GB DDR4/2400-MHz RAM is preferred)
- Minimum 250-GB hard disk

### 2.2.2.3 Installing e2 studio, platform installer and the FSP package

Detailed installation instructions for the e2 studio and the FSP are available on the Renesas website <https://www.renesas.com/fsp>. Review the release notes for e2 studio to ensure that the e2 studio version supports the selected FSP version. The starting version of the installer includes all features of the RA MCUs.

### 2.2.2.4 Choosing a Toolchain

e2 studio can work with several toolchains and toolchain versions such as the GNU Arm compiler and Arm AC6. A version of the GNU Arm compiler is included in the e2 studio installer and has been verified to run with the FSP version.

### 2.2.2.5 Licensing

FSP licensing includes full source code, limited to Renesas hardware only.

## 2.2.3 What is a Project?

In e2 studio, all FSP applications are organized in RA MCU projects. Setting up an RA MCU project involves:

1. Creating a Project
2. Configuring a Project

These steps are described in detail in the next two sections. When you have existing projects already, after you launch e2 studio and select a workspace, all projects previously saved in the selected workspace are loaded and displayed in the **Project Explorer** window. Each project has an associated configuration file named `configuration.xml`, which is located in the project's root directory.

Figure 4: e2 studio Project Configuration file

Double-click on the `configuration.xml` file to open the RA MCU Project Editor. To edit the project configuration, make sure that the **FSP Configuration** perspective is selected in the upper right hand corner of the e2 studio window. Once selected, you can use the editor to view or modify the configuration settings associated with this project.

Figure 5: e2 studio FSP Configuration Perspective

#### Note

*Whenever the RA project configuration (that is, the `configuration.xml` file) is saved, a verbose RA Project Report file (`ra_cfg.txt`) with all the project settings is generated. The format allows differences to be easily viewed using a text comparison tool. The generated file is located in the project root directory.*

Figure 6: RA Project Report

The RA Project Editor has a number of tabs. The configuration steps and options for individual tabs are discussed in the following sections.

*Note*

*The tabs available in the RA Project Editor depend on the e2 studio version and the layout may vary slightly, however the functionality should be easy to follow..*

Figure 7: RA Project Editor tabs

- Click on the YouTube icon to visit the Renesas FSP playlist on YouTube
- Click on the Support icon to visit RA support pages at Renesas.com
- Click on the user manual (owl) icon to open the RA software package User's Manual

## 2.2.4 Creating a Project

During project creation, you specify the type of project, give it a project name and location, and configure the project settings for version, target board, whether an RTOS is included, the toolchain version, and the beginning template. This section includes easy-to-follow step-by-step instructions for all of the project creation tasks. Once you have created the project, you can move to configuring the project hardware (clocks, pins, interrupts) and the parameters of all the modules that are part of your application.

### 2.2.4.1 Creating a New Project

For RA MCU applications, generate a new project using the following steps:

1. Click on **File > New > RA C/C++ Project > Renesas RA**.

Figure 8: New RA MCU Project

Then click on the type of template for the type of project you are creating.

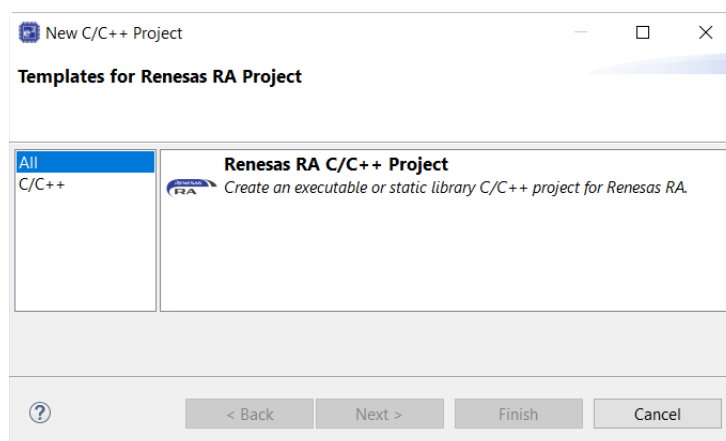

Figure 9: New Project Templates

2. Select a project name and location.

Figure 10: RA MCU Project Generator (Screen 1)

3. Click **Next**.

#### 2.2.4.2 Selecting a Board and Toolchain

In the **Project Configuration** window select the hardware and software environment:

1. Select the **FSP version**.
2. Select the **Board** for your application. You can select an existing RA MCU Evaluation Kit or select **Custom User Board** for any of the RA MCU devices with your own BSP definition.
3. Select the **Device**. The **Device** is automatically populated based on the **Board** selection. Only change the **Device** when using the **Custom User Board (Any Device)** board selection.
4. To add threads, select **RTOS**, or **No RTOS** if an RTOS is not being used.
5. The **Toolchain** selection defaults to **GCC Arm Embedded**.
6. Select the **Toolchain version**. This should default to the installed toolchain version.
7. Select the **Debugger**. The J-Link Arm Debugger is preselected.

8. Click **Next**.

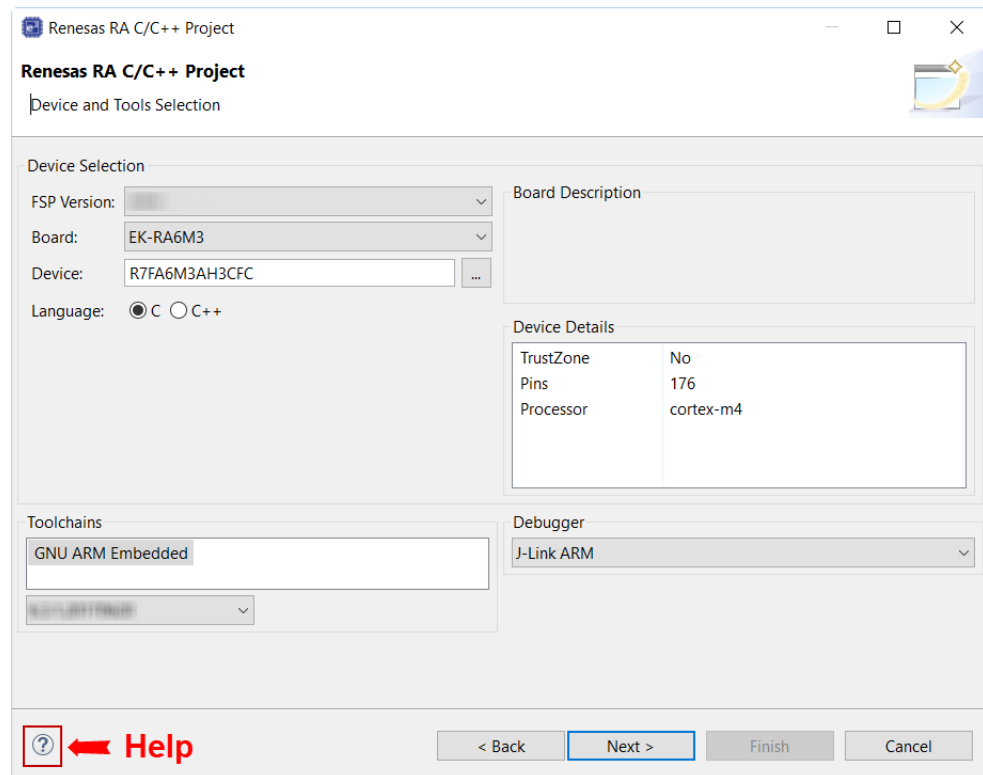

Figure 11: RA MCU Project Generator (Screen 2)

*Note*

Click on the **Help** icon (?) for user guides, RA contents, and other documents.

### 2.2.4.3 Selecting Flat or Arm® TrustZone® Project

If you selected a device or tool based on an Arm® Cortex®-M33, you next select whether to use Arm® TrustZone® in your project. For normal, non-TrustZone projects, select "Flat".

Figure 12: Flat, Secure, or Non-Secure Project

For more information on Arm® TrustZone®, see [Primer: ARM® TrustZone® Project Development](#).

#### 2.2.4.4 Selecting a Project Template

In the next window, select the build artifact and RTOS.

Figure 13: RA MCU Project Generator (Screen 3)

In the next window, select a project template from the list of available templates. By default, this screen shows the templates that are included in your current RA MCU pack. Once you have selected the appropriate template, click **Finish**.

*Note*

*If you want to develop your own application, select the basic template for your board, **Bare Metal - Minimal**.*

Figure 14: RA MCU Project Generator (Screen 4)

When the project is created, e2 studio displays a summary of the current project configuration in the RA MCU Project Editor.

Figure 15: RA MCU Project Editor and available editor tabs

On the bottom of the RA MCU Project Editor view, you can find the tabs for configuring multiple aspects of your project:

- With the **Summary** tab, you can see all they key characteristics of the project: board, device, toolchain, and more.
- With the **BSP** tab, you can change board specific parameters from the initial project selection.
- With the **Clocks** tab, you can configure the MCU clock settings for your project.
- With the **Pins** tab, you can configure the electrical characteristics and functions of each port pin.
- With the **Interrupts** tab, you can add new user events/interrupts.
- With the **Event Links** tab, you can configure events used by the Event Link Controller.
- With the **Stacks** tab, you can add and configure FSP modules. For each module selected in this tab, the **Properties** window provides access to the configuration parameters, interrupt priorities, and pin selections.
- The **Components** tab provides an overview of the selected modules. Although you can also add drivers for specific FSP releases and application sample code here, this tab is normally only used for reference.

The functions and use of each of these tabs is explained in detail in the next section.

## 2.2.5 Configuring a Project

Each of the configurable elements in an FSP project can be edited using the appropriate tab in the RA Configuration editor window. Importantly, the initial configuration of the MCU after reset and before any user code is executed is set by the configuration settings in the **BSP**, **Clocks** and **Pins** tabs. When you select a project template during project creation, e2 studio configures default values that are appropriate for the associated board. You can change those default values as needed. The following sections detail the process of configuring each of the project elements for each of the associated tabs.

### 2.2.5.1 Summary Tab

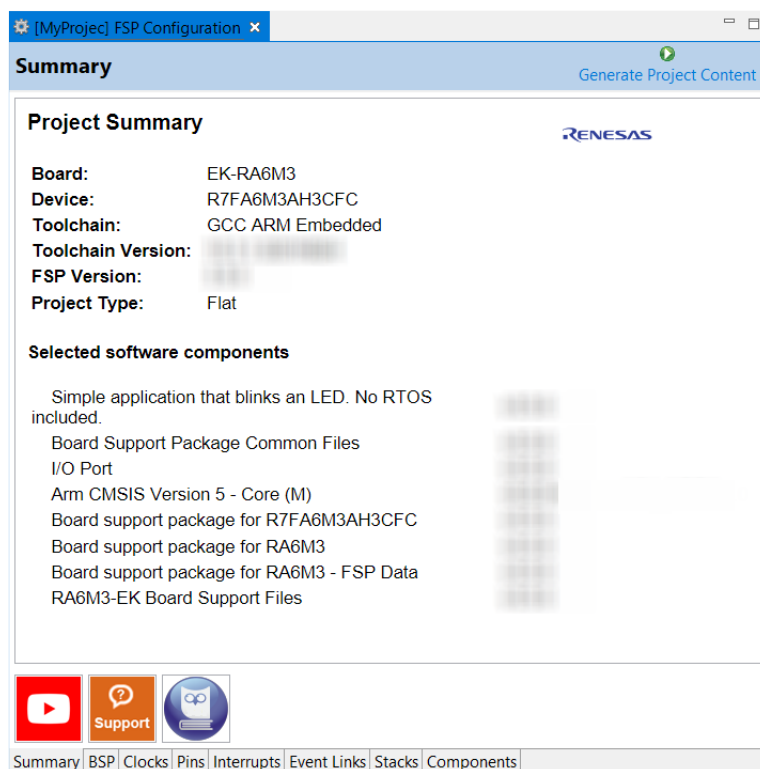

Figure 16: Configuration Summary tab

The **Summary** tab, seen in the above figure, identifies all the key elements and components of a project. It shows the target board, the device, toolchain and FSP version. Additionally, it provides a list of all the selected software components and modules used by the project. This is a more convenient summary view when compared to the **Components** tab.

The summary tab also includes handy icons with links to the Renesas YouTube channel, the Renesas support page and to the RA FSP User Manual that was downloaded during the installation process.

### 2.2.5.2 Configuring the BSP

The **BSP** tab shows the currently selected board (if any) and device. The Properties view is located in the lower left of the Project Configurations view as shown below.

*Note*

*If the Properties view is not visible, click **Window > Show View > Properties** in the top menu bar.*

Figure 17: Configuration BSP tab

The **Properties** view shows the configurable options available for the BSP. These can be changed as required. The BSP is the FSP layer above the MCU hardware. e2 studio checks the entry fields to flag invalid entries. For example, only valid numeric values can be entered for the stack size.

When you click the **Generate Project Content** button, the BSP configuration contents are written to `ra_cfg/fsp_cfg/bsp/bsp_cfg.h`

This file is created if it does not already exist.

#### Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

### 2.2.5.3 Configuring Clocks

The **Clocks** tab presents a graphical view of the MCU's clock tree, allowing the various clock dividers and sources to be modified. If a clock setting is invalid, the offending clock value is highlighted in red. It is still possible to generate code with this setting, but correct operation cannot be guaranteed. In the figure below, the USB clock UCLK has been changed so the resulting clock frequency is 60 MHz instead of the required 48 MHz. This parameter is colored red.

Figure 18: Configuration Clocks tab

When you click the **Generate Project Content** button, the clock configuration contents are written to: `ra_gen/bsp_clock_cfg.h`

This file will be created if it does not already exist.

#### Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

#### 2.2.5.4 Configuring Pins

The **Pins** tab provides flexible configuration of the MCU's pins. As many pins are able to provide multiple functions, they can be configured on a peripheral basis. For example, selecting a serial channel via the SCI peripheral offers multiple options for the location of the receive and transmit pins for that module and channel. Once a pin is configured, it is shown as green in the **Package** view.

#### Note

*If the **Package** view window is not open in e2 studio, select **Window > Show View > Pin Configurator > Package** from the top menu bar to open it.*

The **Pins** tab simplifies the configuration of large packages with highly multiplexed pins by highlighting errors and presenting the options for each pin or for each peripheral. If you selected a project template for a specific board such as the EK-RA6M3, some peripherals connected on the board are preselected.

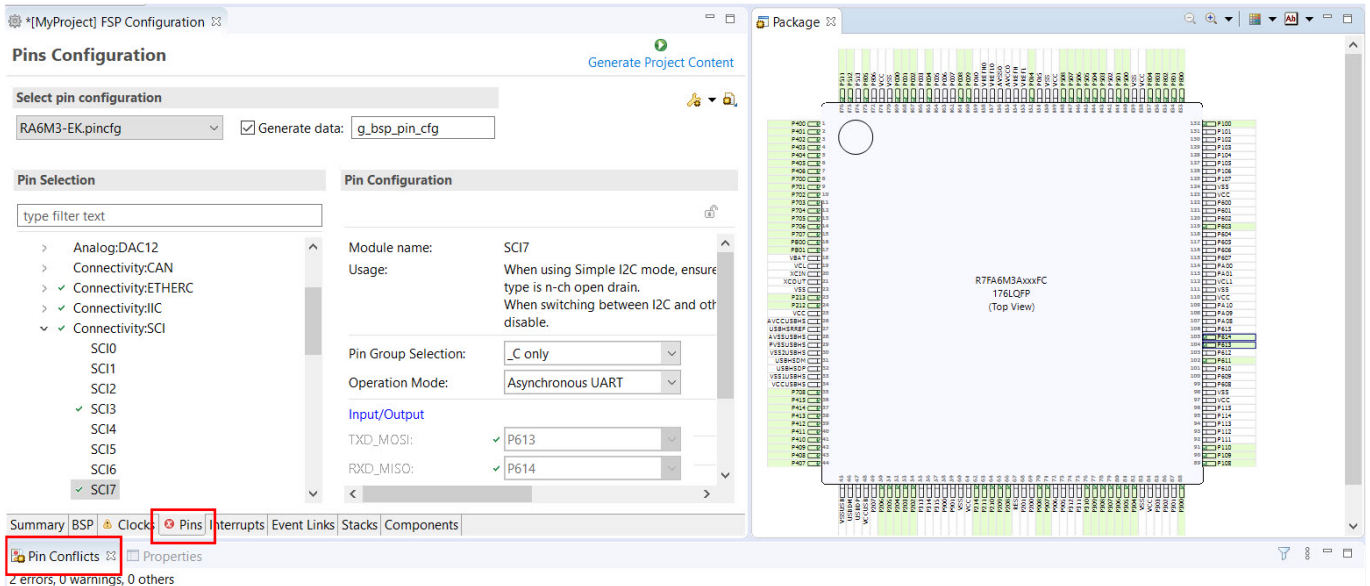

Figure 19: Pins Configuration

The pin configurator includes a built-in conflict checker, so if the same pin is allocated to another peripheral or I/O function the pin will be shown as red in the package view and also with white cross in a red square in the **Pin Selection** pane and **Pin Configuration** pane in the main **Pins** tab. The **Pin Conflicts** view provides a list of conflicts, so conflicts can be quickly identified and fixed.

In the example shown below, port P611 is already used by the CAC, and the attempt to connect this port to the Serial Communications Interface (SCI) results in a dangling connection error. To fix this error, select another port from the pin drop-down list or disable the CAC in the **Pin Selection** pane on the left side of the tab.

Figure 20: e2 studio Pin configurator

The pin configurator also shows a package view and the selected electrical or functional characteristics of each pin.

Figure 21: e2 studio Pin configurator package view

When you click the **Generate Project Content** button, the pin configuration contents are written to: `ra_gen\bsp_pin_cfg.h`

This file will be created if it does not already exist.

#### Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

To make it easy to share pinning information for your project, e2 studio exports your pin configuration settings to a csv format and copies the csv file to `ra_gen/<MCU package>.csv`.

### 2.2.5.5 Configuring Interrupts from the Stacks Tab

You can use the **Properties** view in the **Stacks** tab to enable interrupts by setting the interrupt priority. Select the driver in the **Stacks** pane to view and edit its properties.

Figure 22: Configuring Interrupts in the Stacks tab

### Creating Interrupts from the Interrupts Tab

On the **Interrupts** tab, the user can bypass a peripheral interrupt set by the FSP by setting a user-defined ISR. This can be done by adding a new event via the **New User Event** button.

Figure 23: Configuring interrupt in Interrupt Tab

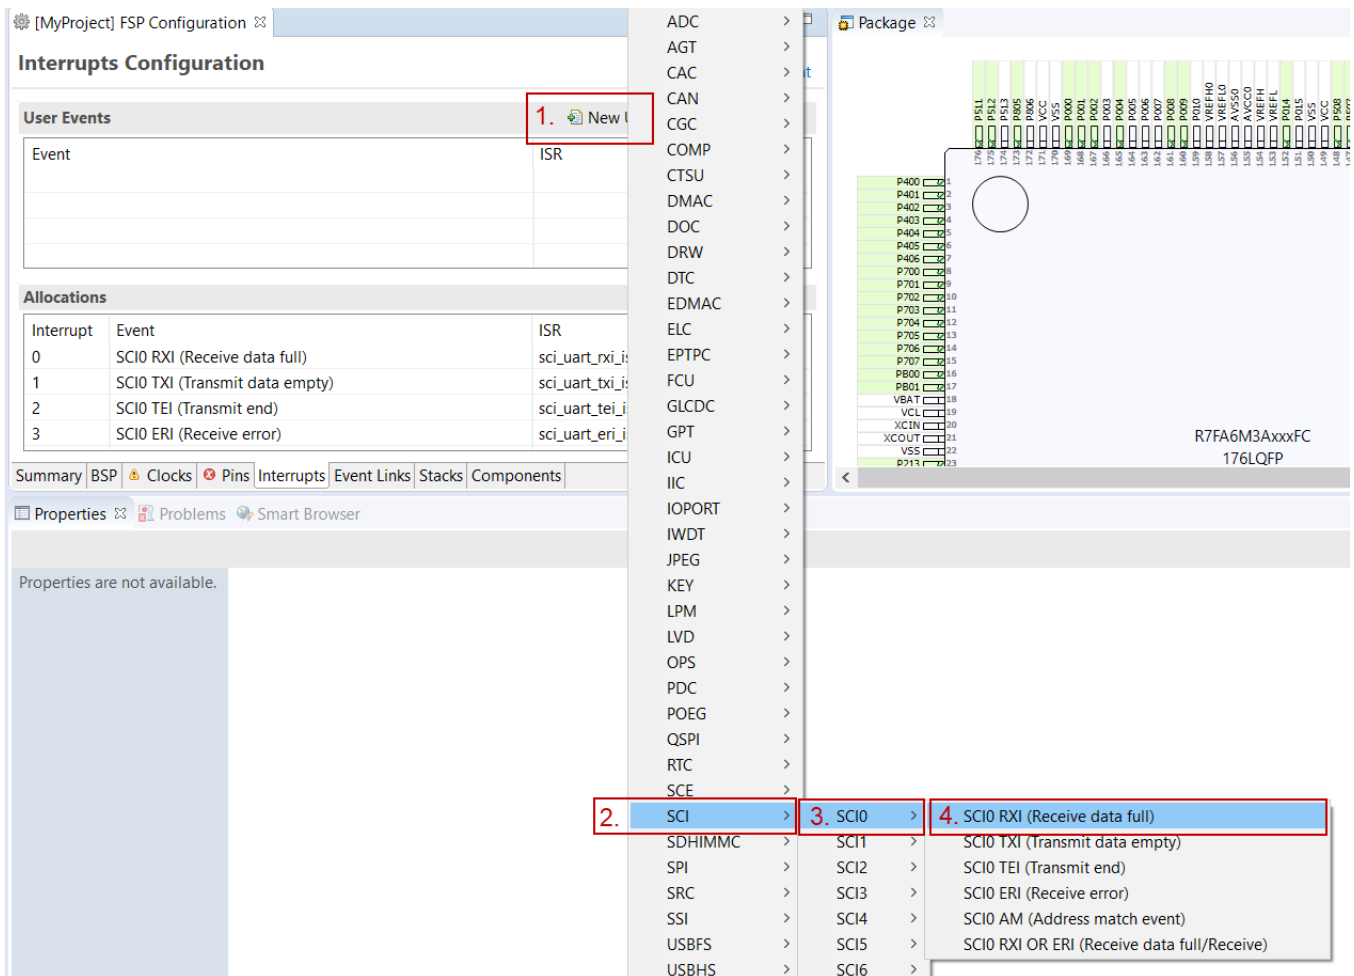

Figure 24: Adding user-defined event

Enter the name of ISR for the new user event.

Figure 25: User-defined event ISR

Figure 26: Using a user-defined event

### 2.2.5.6 Viewing Event Links

The Event Links tab can be used to view the Event Link Controller events. The events are sorted by peripheral to make it easy to find and verify them.

Figure 27: Viewing Event Links

Like the Interrupts tab, user-defined event sources and destinations (producers and consumers) can be defined by clicking the relevant **New User Event** button. Once a consumer is linked to a producer the link will appear in the **Allocations** section at the bottom.

#### Note

*When selecting an ELC event to receive for a module (or when manually defining an event link), only the events that are made available by the modules configured in the project will be shown.*

### 2.2.6 Adding Threads and Drivers

Every RTOS-based RA Project includes at least one RTOS Thread and a stack of FSP modules running

in that thread. The **Stacks** tab is a graphical user interface which helps you to add the right modules to a thread and configure the properties of both the threads and the modules associated with each thread. Once you have configured the thread, e2 studio automatically generates the code reflecting your configuration choices.

For any driver, or, more generally, any module that you add to a thread, e2 studio automatically resolves all dependencies with other modules and creates the appropriate stack. This stack is displayed in the Stacks pane, which e2 studio populates with the selected modules and module options for the selected thread.

The default view of the **Stacks** tab includes a Common Thread called **HAL/Common**. This thread includes the driver for I/O control (IOPORT). The default stack is shown in the **HAL/Common Stacks** pane. The default modules added to the HAL/Common driver are special in that the FSP only requires a single instance of each, which e2 studio then includes in every user-defined thread by default.

In applications that do not use an RTOS or run outside of the RTOS, the HAL/Common thread becomes the default location where you can add additional drivers to your application.

For a detailed description on how to add and configure modules and stacks, see the following sections:

- [Adding and Configuring HAL Drivers](#)
- [Adding Drivers to a Thread and Configuring the Drivers](#)

Once you have added a module either to HAL/Common or to a new thread, you can access the driver's configuration options in the **Properties** view. If you added thread objects, you can access the objects configuration options in the **Properties** view in the same way.

You can find details about how to configure threads here: [Configuring Threads](#)

*Note*

*Driver and module selections and configuration options are defined in the FSP pack and can therefore change when the FSP version changes.*

### 2.2.6.1 Adding and Configuring HAL Drivers

For applications that run outside or without the RTOS, you can add additional HAL drivers to your application using the HAL/Common thread. To add drivers, follow these steps:

1. Click on the HAL/Common icon in the **Stacks** pane. The Modules pane changes to **HAL/Common Stacks**.

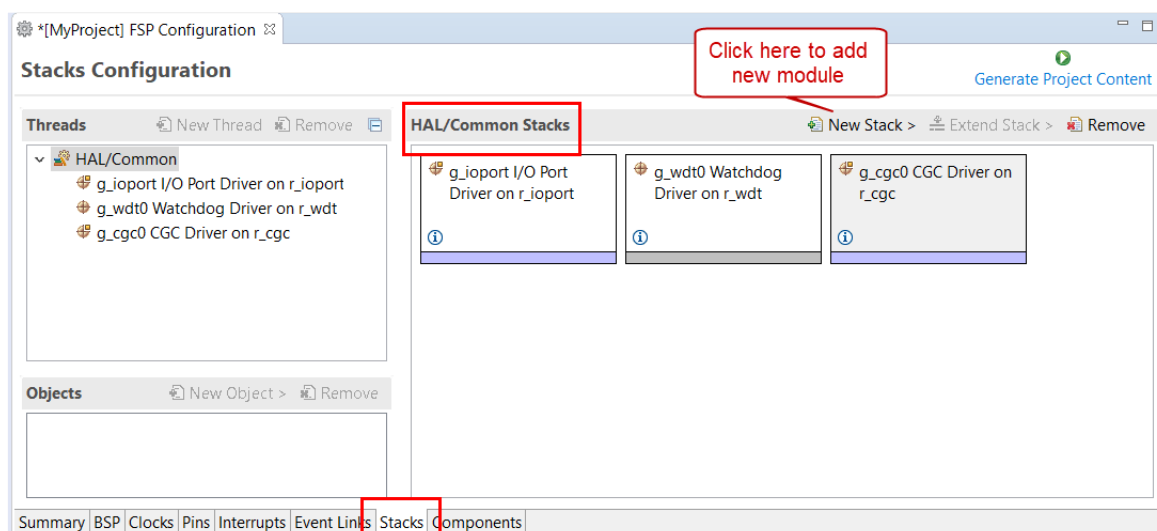

Figure 28: e2 studio Project configurator - Adding drivers

2. Click **New Stack** to see a drop-down list of HAL level drivers available in the FSP.
3. Select a driver from the menu **New Stack > Driver**.

Figure 29: Select a driver

4. Select the driver module in the **HAL/Common Modules** pane and configure the driver properties in the **Properties** view.

e2 studio adds the following files when you click the **Generate Project Content** button:

- The selected driver module and its files to the ra/fsp directory
- The main() function and configuration structures and header files for your application as shown in the table below.

File	Contents	Overwritten by Generate Project Content?
ra_gen/main.c	Contains main() calling generated and user code. When called, the BSP already has initialized the MCU.	Yes
ra_gen/hal_data.c	Configuration structures for HAL Driver only modules.	Yes
ra_gen/hal_data.h	Header file for HAL driver only modules.	Yes
src/hal_entry.c	User entry point for HAL Driver only code. Add your code here.	No

The configuration header files for all included modules are created or overwritten in this folder:  
ra\_cfg/fsp\_cfg

### 2.2.6.2 Adding Drivers to a Thread and Configuring the Drivers

For an application that uses the RTOS, you can add one or more threads, and for each thread at least one module that runs in the thread. You can select modules from the Driver dropdown menu. To add modules to a thread, follow these steps:

1. In the **Threads** pane, click **New Thread** to add a Thread.

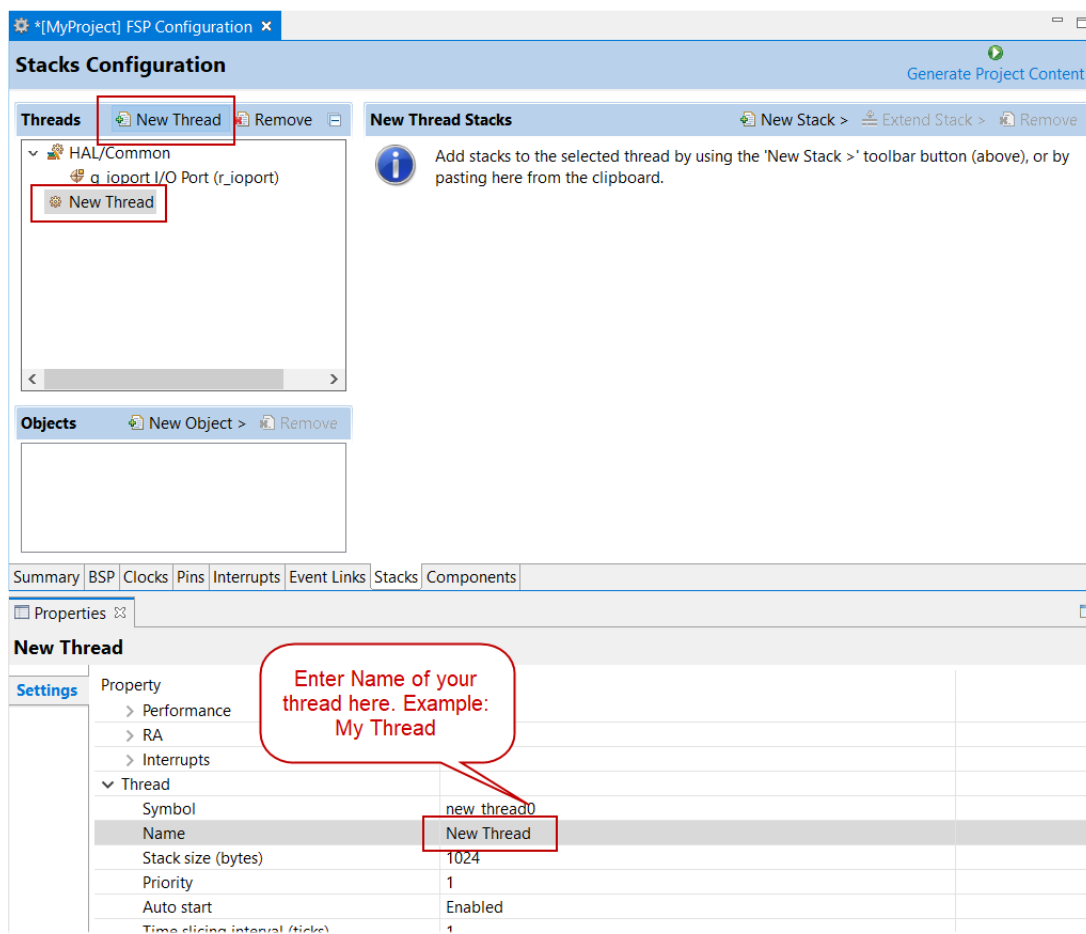

Figure 30: Adding a new RTOS Thread on the Stacks tab

- In the **Properties** view, click on the **Name** and **Symbol** entries and enter a distinctive name and symbol for the new thread.

*Note*

*e2 studio updates the name of the thread stacks pane to **My Thread Stacks**.*

- In the **My Thread Stacks** pane, click on **New Stack** to see a list of modules and drivers. HAL-level drivers can be added here.

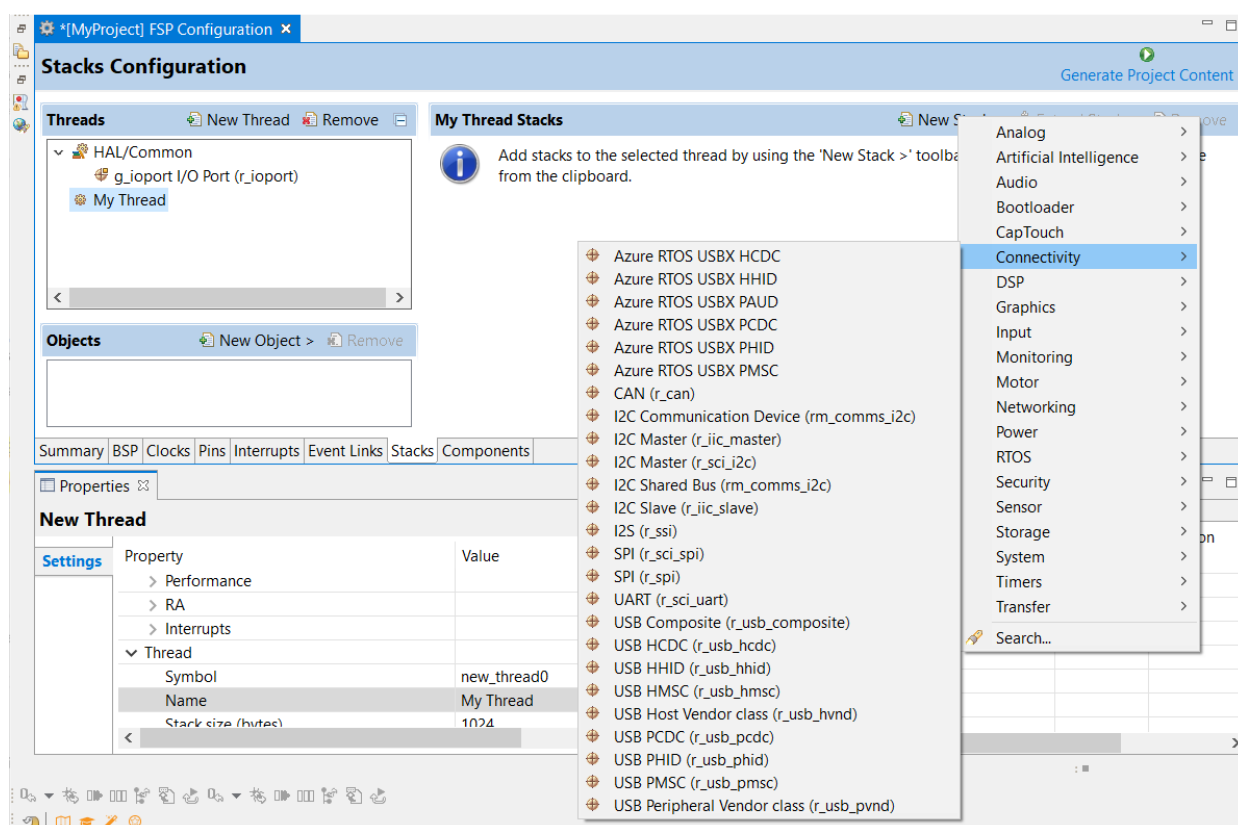

Figure 31: Adding Modules and Drivers to a thread

4. Select a module or driver from the list.
5. Click on the added driver and configure the driver as required by the application by updating the configuration parameters in the **Properties** view. To see the selected module or driver and be able to edit its properties, make sure the Thread containing the driver is highlighted in the **Threads** pane.

Figure 32: Configuring Module or Driver properties

6. If needed, add another thread by clicking **New Thread** in the **Threads** pane.

When you press the **Generate Project Content** button for the example above, e2 studio creates the files as shown in the following table:

File	Contents	Overwritten by Generate Project Content?
ra_gen/main.c	Contains main() calling generated and user code. When called the BSP will have initialized the MCU.	Yes
ra_gen/my_thread.c	Generated thread "my_thread" and configuration structures for modules added to this thread.	Yes
ra_gen/my_thread.h	Header file for thread "my_thread"	Yes
ra_gen/hal_data.c	Configuration structures for HAL Driver only modules.	Yes
ra_gen/hal_data.h	Header file for HAL Driver only modules.	Yes
src/hal_entry.c	User entry point for HAL Driver only code. Add your code here.	No

src/my_thread_entry.c	User entry point for thread "my_thread". Add your code here.	No
-----------------------	--	----

The configuration header files for all included modules and drivers are created or overwritten in the following folders: ra\_cfg/fsp\_cfg/<header files>

### 2.2.6.3 Configuring Threads

If the application uses an RTOS, the **Stacks** tab can be used to simplify the creation of RTOS threads, semaphores, mutexes, and event flags.

The components of each thread can be configured from the **Properties** view as shown below.

Figure 33: New Thread Properties

The **Properties** view contains settings common for all Threads (**Common**) and settings for this particular thread (**Thread**).

For this thread instance, the thread's name and properties (such as priority level or stack size) can be easily configured. e2 studio checks that the entries in the property field are valid. For example, it will verify that the field **Priority**, which requires an integer value, only contains numeric values between 0 and 9.

To add RTOS resources to a Thread, select a thread and click on **New Object** in the Thread Objects pane. The pane takes on the name of the selected thread, in this case **My Thread Objects**.

Figure 34: Configuring Thread Object Properties

Make sure to give each thread object a unique name and symbol by updating the **Name** and **Symbol** entries in the **Properties** view.

## 2.2.7 Reviewing and Adding Components

The **Components** tab enables the individual modules required by the application to be included or excluded. Modules common to all RA MCU projects are preselected (for example: **BSP > BSP > Board-specific BSP** and **HAL Drivers > all > r\_cg**). All modules that are necessary for the modules selected in the **Stacks** tab are included automatically. You can include or exclude additional modules by ticking the box next to the required component.

Figure 35: Components Tab

Clicking the **Generate Project Content** button copies the .c and .h files for each selected component into the following folders:

- ra/fsp/inc/api
- ra/fsp/inc/instances
- ra/fsp/src/bsp
- ra/fsp/src/<Driver\_Name>

e2 studio also creates configuration files in the ra\_cfg/fsp\_cfg folder with configuration options set in the **Stacks** tab.

## 2.2.8 Writing the Application

Once you have added Modules and drivers and set their configuration parameters in the **Stacks** tab, you can add the application code that calls the Modules and drivers.

*Note*

*To check your configuration, build the project once without errors before adding any of your own application code.*

### 2.2.8.1 Coding Features

e2 studio provides several efficiency improving features that help write code. Review these features prior to digging into the code development step-by-step sections that follow.

#### Autocomplete

Autocomplete is a context aware coding accelerator that suggests possible completions for partially

typed-in code elements. If you can 'guess' the first part of a macro, for example, the Autocomplete function can suggest options for completing the rest of the macro.

In the following example, a macro related to a BSP\_IO setting needs to be found. After typing BSP\_IO\_ in a source code file, pressing Ctrl + Space opens the Autocomplete list. This list shows a selection of context aware options for completing the macro. Scroll through the window to find the desired macro (in this case BSP\_IO\_LEVEL\_HIGH) and click on it to add it to your code.

Figure 36: Autocomplete example

Other code elements can use autocomplete too. Some of the more common uses for Autocomplete include Enumerations, Types, and API functions - but try it in any situation you think the tool may have enough context to determine what you might be looking for.

For a hands-on experience using Autocomplete use the Quick FSP Labs for [Creating Blinky from Scratch](#) and [Creating an RTC Blinky from Scratch](#). These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

## Welcome Window

The e2 studio Welcome window displays useful information and common links to assist in development. Check out these resources to see what is available. They are updated with each release, so check back to see what has been added after a new release.

Figure 37: Welcome window

## Cheat Sheets

Cheat sheets are macro driven illustrations of some common tasks. They show, step-by-step, what commands and menus are used. These will be populated with more examples on each release. Cheat Sheets are available from the **Help** menu.

Figure 38: Cheat Sheets

## Developer Assistance

FSP Developer Assistance provides developers with module and Application Programming Interface (API) reference documentation in e2 studio. After configuring the threads and software stacks for an FSP project with the RA Configuration editor, Developer Assistance quickly helps you get started writing C/C++ application code for the project using the configured stack modules.

1. Expand the project explorer to view Developer Assistance

Figure 39: Developer Assistance

2. Expand a stack module to show its APIs

Figure 40: Developer Assistance APIs

3. Dragging and dropping an API from Developer Assistance to a source file helps to write source code quickly.

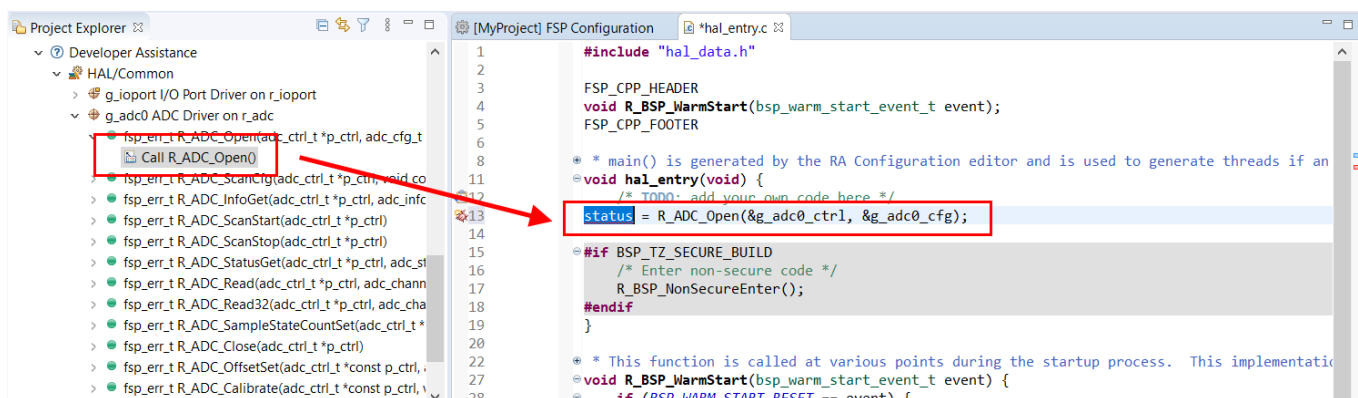

Figure 41: Dragging and Dropping an API in Developer Assistance

For a hands-on experience using Developer Assistance use the Quick FSP Labs for [An Introduction to Developer Assistance](#), [Creating Blinky from Scratch](#) and [Creating an RTC Blinky from Scratch](#). These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

### Information Icon

Information icons are available on each module in the thread stack. Clicking on these icons opens a module folder on GitHub that contains additional information on the module. An example information icon is shown below:

Figure 42: Information icon

### IDE Help

A good source of additional information for many FSP topics is the Help system. To get to the Help system, click on **Help** and then select **Help Contents** as seen below.

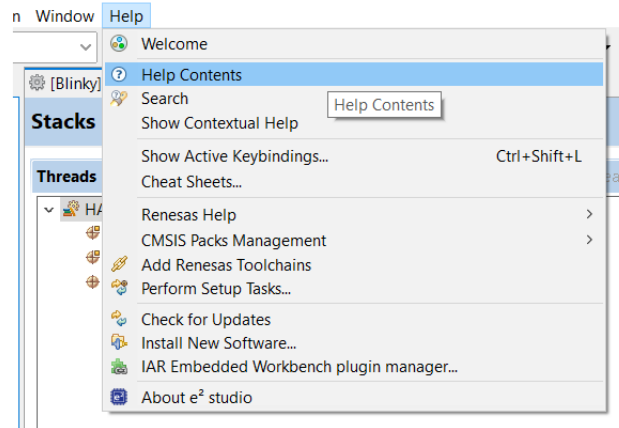

Figure 43: Opening the Help System

Once the Help system is open, select the **RA Contents** entry in the left side Guide-bar. Expand it to see the main RA Topics.

Figure 44: RA Content Help

You can also search for help topics by using the Search bar. Below is an example searching for Visual Expressions, a helpful feature in the e2 studio debugger.

Figure 45: e2 studio Help from the Search Bar

For a hands-on experience using the Help system use the Quick FSP Labs for [An Introduction to Developer Assistance](#), [Creating Blinky from Scratch](#) and [Creating an RTC Blinky from Scratch](#). These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

### 2.2.8.2 HAL Modules in FSP: A Practical Description

The [FSP Architecture](#) section describes FSP stacks, modules and interfaces in significant detail, providing an understanding of the theory behind them. The following sections provides a quick and practical introduction on how to use API functions when writing code and where in the API reference sections you can find useful API related information.

#### Introduction to HAL Modules

In FSP, HAL module drivers provide convenient API functions that access RA processor peripheral features. Module properties are defined in the RA GUI configurator, eliminating the tedious and error prone process of setting peripheral control registers. When configuration is complete, the generator automatically creates the code needed to implement the associated API functions. API functions are the main way a developer interacts with the target processor and peripherals.

#### HAL Driver API Function Call Formats

HAL driver API functions all have a similar format. They all start with "R\_" to indicate they are HAL related functions. Next comes the module name followed by the function and any parameters. This format is illustrated below:

```
R_<module>_<function>( <parameters> );
```

Here are some examples:

```

status = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
status = R_GPT_Start(&g_timer0_ctrl);
status = R_GPT_PeriodSet(&g_timer0_ctrl, period);
status = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
status = R_ADC_InfoGet(&g_adc0_ctrl, &adc_info);

```

## HAL Driver API Call Reference Information

Each HAL module has a useful API Reference section that includes key details on each function. The function prototype is presented first, showing the return type (usually `fsp_status_t` for HAL functions) and the function parameters. A short description and any warnings or notes follow the function definition. In some cases, a code snippet is included to illustrate use of the function. Finally, all possible return values are provided to assist in debugging and error management.

### ◆ R\_GPT\_PeriodSet()

```

fsp_err_t R_GPT_PeriodSet ( timer_ctrl_t *const p_ctrl,
                           uint32_t const   period_counts
                           )

```

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements `timer_api_t::periodSet`.

**Warning**

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```

/* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
 * - If the PCLKD frequency has not changed since reset, the source clock
 *   frequency is
 *   BSP_STARTUP_PCLKD_HZ >> timer_cfg.t::source_div
 * - Use the R_GPT_InfoGet function (it accounts for the divider).
 * - Calculate the current PCLKD frequency using R_FSP_SystemClockHzGet
 *   (FSP_PRIV_CLOCK_PCLKD) and right shift
 *   by timer_cfg.t::source_div.
 * This example uses the 3rd option (R_FSP_SystemClockHzGet).
 */
uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
    g_timer0_cfg.source_div;

/* Calculate the desired period based on the current clock. Note that this
 * calculation could overflow if the
 * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
 * used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
        GPT_EXAMPLE_MSEC_PER_SEC);

/* Set the calculated period. */
err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
handle_error(err);

```

**Return values**

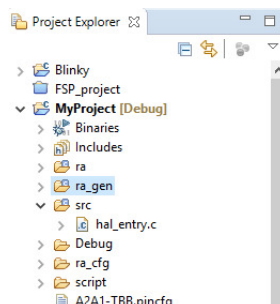

<code>FSP_SUCCESS</code>	Period value written successfully.
<code>FSP_ERR_ASSERTION</code>	<code>p_ctrl</code> was NULL.
<code>FSP_ERR_NOT_OPEN</code>	The instance is not opened.

Figure 46: Module Api Reference Section Example

### 2.2.8.3 RTOS-Independent Applications

To write application code:

1. Add all drivers and modules in the **Stacks** tab and resolve all dependencies flagged by e2 studio such as missing interrupts or drivers.
2. Configure the drivers in the **Properties** view.
3. In the Project Configuration view, click the **Generate Project Content** button.
4. In the **Project Explorer** view, double-click on the src/hal\_entry.c file to edit the source file.

**Note**

All configuration structures necessary for the driver to be called in the application are initialized in `ra_gen/hal_data.c`.

**Warning**

Do not modify the files in the directory `ra_gen`. These files are overwritten every time you push the **Generate Project Content** button.

5. Add your application code here:

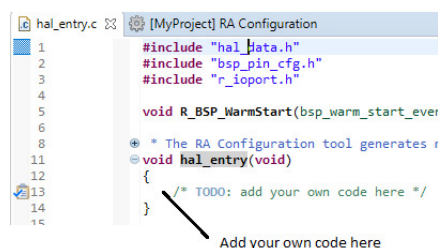

Figure 47: Adding user code to hal\_entry.c

6. Build the project without errors by clicking on **Project > Build Project**.

The following tutorial shows how execute the steps above and add application code: [Tutorial: Using HAL Drivers - Programming the WDT](#).

The WDT example is a HAL level application which does not use an RTOS. The user guides for each module also include basic application code that you can add to `hal_entry.c`.

### 2.2.8.4 RTOS Applications

To write RTOS-aware application code using RTOS, follow these steps:

1. Add a thread using the **Stacks** tab.
2. Provide a unique name for the thread in the **Properties** view for this thread.

3. Configure all drivers and resources for this thread and resolve all dependencies flagged by e2 studio such as missing interrupts or drivers.
  4. Configure the thread objects.
  5. Provide unique names for each thread object in the **Properties** view for each object.
  6. Add more threads if needed and repeat steps 1 to 5.
  7. In the **RA Project Editor**, click the **Generate Project Content** button.
8. In the **Project Explorer** view, double-click on the src/my\_thread\_1\_entry.c file to edit the source file.

Figure 48: Generated files for an RTOS application

*Note*

All configuration structures necessary for the driver to be called in the application are initialized in ra\_gen/my\_thread\_1.c and my\_thread\_2.c

**Warning**

Do not modify the files in the directory ra\_gen. These files are overwritten every time you push the **Generate Project Content** button.

9. Add your application code here:

Figure 49: Adding user code to my\_thread\_1.entry

10. Repeat steps 1 to 9 for the next thread.

11. Build your project without errors by clicking on **Project > Build Project**.

## 2.2.8.5 Additional Resources for Application Development

### Example Projects

A wide variety of Example Projects for FSP and RA MCUs is available on the GitHub site here: <https://github.com/renesas/ra-fsp-examples>. Example projects are organized by target kit so it is easy to find all the examples for your kit of choice.

Figure 50: FSP Example Projects Organized by Kit

Projects are available as both downloadable zip files and as project source files. Typically, there is a project for each module. New example projects are being added periodically, so check back if a particular module isn't yet available.

Figure 51: A Selection of Example Projects Available on GitHub

### Quick Labs

A variety of Hands-on Do It Yourself labs are available on the Renesas RA and FSP Knowledge Base. Quick FSP Labs target the EK-RA6M3 kit and typically require only 15 minutes to complete. Each lab covers a couple related development tools and techniques like Autocomplete, Developer Assistance,

console I/O over RTT, and Visual Expressions, that can speed up the development process. A list of all available Quick Labs can be found here: <https://en-support.renesas.com/knowledgeBase/19450948>

## 2.2.9 Debugging the Project

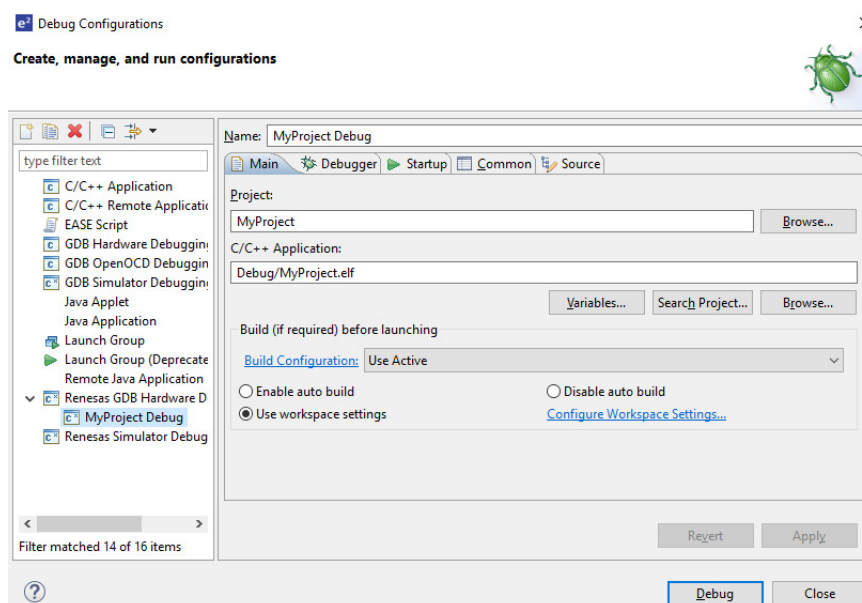

Once your project builds without errors, you can use the Debugger to download your application to the board and execute it.

To debug an application follow these steps:

1. On the drop-down list next to the debug icon, select **Debug Configurations**.

2. In the **Debug Configurations** view, click on your project listed as **MyProject Debug**.

3. Connect the board to your PC via either a standalone Segger J-Link debugger, a Segger J-Link On-Board (included on all RA EKs), or an E2 or E2 Lite and click **Debug**.

*Note*

*For details on using J-Link and connecting the board to the PC, see the Quick Start Guide included in the RA MCU Kit.*

## 2.2.10 Modifying Toolchain Settings

There are instances where it may be necessary to make changes to the toolchain being used (for example, to change optimization level of the compiler or add a library to the linker). Such modifications can be made from within e2 studio through the menu **Project > Properties > Settings** when the project is selected. The following screenshot shows the settings dialog for the GNU Arm toolchain. This dialog will look slightly different depending upon the toolchain being used.

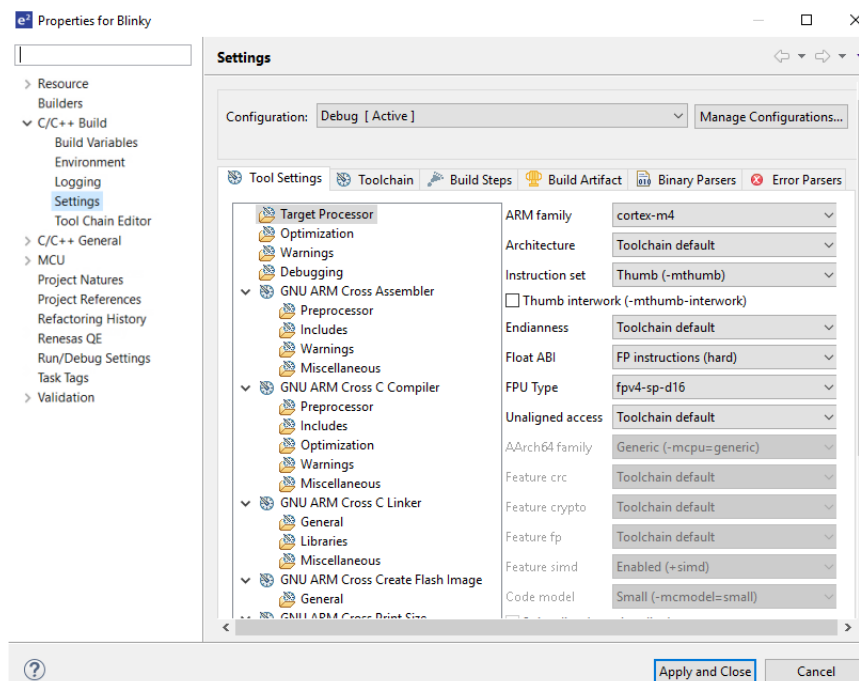

Figure 52: e2 studio Project toolchain settings

The scope for the settings is project scope which means that the settings are valid only for the project being modified.

The settings for the linker which control the location of the various memory sections are contained in a script file specific for the device being used. This script file is included in the project when it is created and is found in the script folder (for example, /script/a6m3.ld).

### 2.2.11 Creating RA project with ARM Compiler 6 in e2 studio

e2 studio does not include the ARM Compiler 6 (AC6) toolchain by default. Follow the steps below to integrate AC6 into e2 studio and create an AC6 RA project.

#### Note

*It is assumed that the user is already familiar with RA project creation in e2 studio. e2 studio does not include ARM Compiler 6 (AC6) toolchain by default.*

Steps 1 through 8 describe the process for integrating ARM Compiler 6 into e2 studio.

1. Download, install, and configure license for the AC6 toolchain (<https://developer.arm.com/tools-and-software/embedded/arm-compiler/downloads/version-6>).
2. Launch e2 studio.
3. Go to **Window > Preferences > Toolchains**.

4. Click **Add**.

Figure 53: Add Toolchain

5. Browse to the path where AC6 toolchain is installed and select the \bin folder. Click **Next**.

Figure 54: Browse to AC6 Compiler

6. Toolchain information is displayed. Click **Finish**.

Figure 55: Toolchain Information

## 7. Click **Apply and Close**.

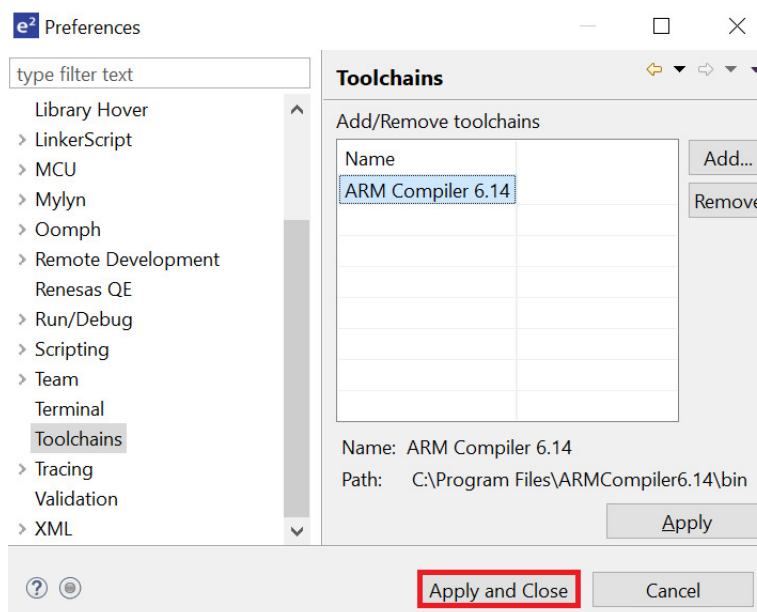

Figure 56: Apply and Close

## 8. Click **Restart Eclipse** when prompted.

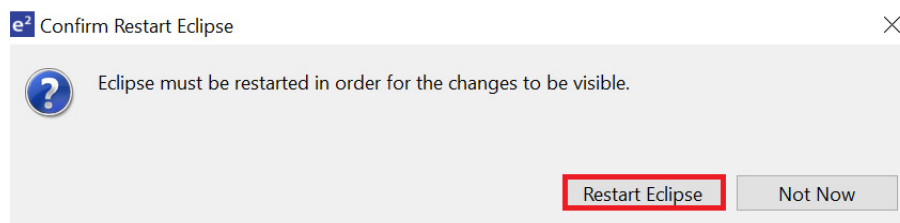

Figure 57: Restart Eclipse

9. When creating a new RA C/C++ project, select **ARM Compiler 6** included in the Toolchains section.

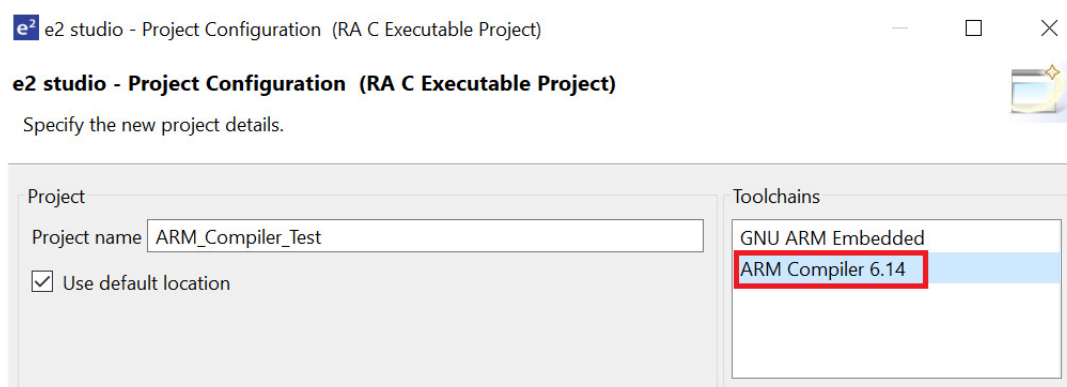

Figure 58: Select Arm Compiler

## 2.2.12 Importing an Existing Project into e2 studio

1. Start by opening e2 studio.
2. Open an existing Workspace to import the project and skip to step d. If the workspace doesn't exist, proceed with the following steps:
  - a. At the end of e2 studio startup, you will see the Workspace Launcher Dialog box as shown in the following figure.

Figure 59: Workspace Launcher dialog

- b. Enter a new workspace name in the Workspace Launcher Dialog as shown in the following figure. e2 studio creates a new workspace with this name.

Figure 60: Workspace Launcher dialog - Select Workspace

- c. Click **Launch**.
- d. When the workspace is opened, you may see the Welcome Window. Click on the **Hide** arrow button to proceed past the Welcome Screen as seen in the following figure.

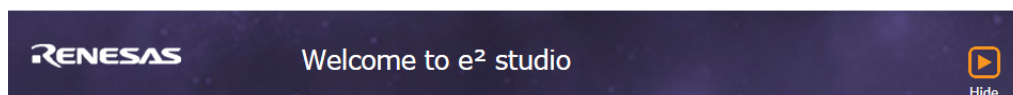

Figure 61: Workbench arrow button

3. You are now in the workspace that you want to import the project into. Click the **File** menu in the menu bar, as shown in the following figure.

Figure 62: Menu and tool bar

4. Click **Import** on the **File** menu or in the menu bar, as shown in the following figure.

Figure 63: File drop-down menu

5. In the **Import** dialog box, as shown in the following figure, choose the **General** option, then **Existing Projects into Workspace**, to import the project into the current workspace.

Figure 64: Project Import dialog with "Existing Projects into Workspace" option selected

6. Click **Next**.
7. To import the project, use either **Select archive file** or **Select root directory**.
  - a. Click **Select archive file** as shown in the following figure.

Figure 65: Import Existing Project dialog 1 - Select archive file

b. Click **Select root directory** as shown in the following figure.

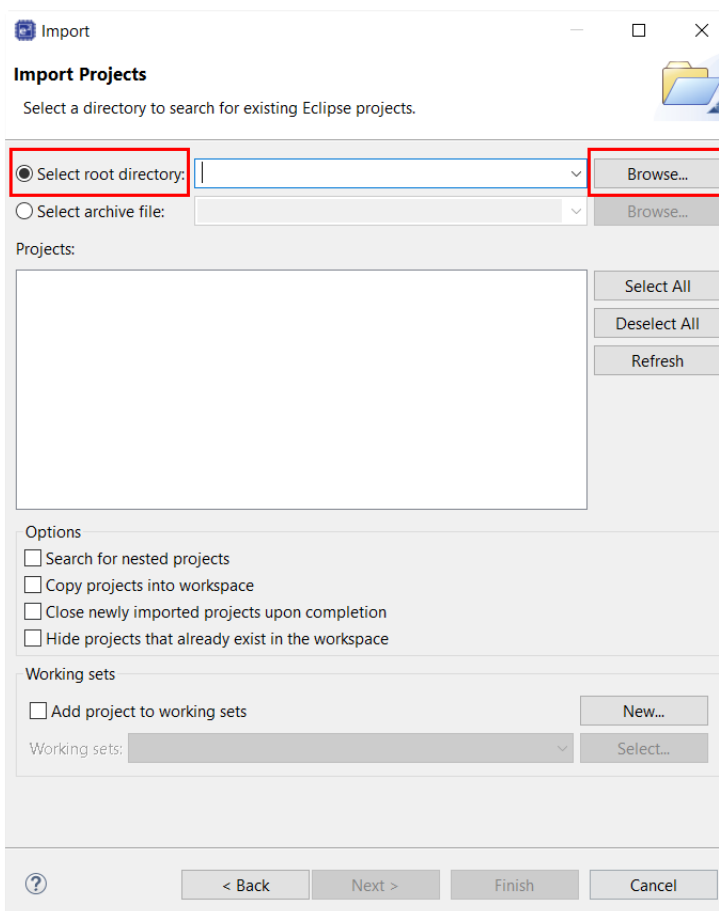

Figure 66: Import Existing Project dialog 1 - Select root directory

8. Click **Browse**.
9. For **Select archive file**, browse to the folder where the zip file for the project you want to import is located. For **Select root directory**, browse to the project folder that you want to import.
10. Select the file for import. In our example, it is CAN\_HAL\_MG\_AP.zip or CAN\_HAL\_MG\_AP.
11. Click **Open**.
12. Select the project to import from the list of **Projects**, as shown in the following figure.

Figure 67: Import Existing Project dialog 2

13. Click **Finish** to import the project.

## 2.3 Tutorial: Your First RA MCU Project - Blinky

### 2.3.1 Tutorial Blinky

The goal of this tutorial is to quickly get acquainted with the Flexible Platform by moving through the

steps of creating a simple application using e2 studio and running that application on an RA MCU board.

## 2.3.2 What Does Blinky Do?

The application used in this tutorial is Blinky, traditionally the first program run in a new embedded development environment.

Blinky is the "Hello World" of microcontrollers. If the LED blinks you know that:

- The toolchain is setup correctly and builds a working executable image for your chip.
- The debugger has installed with working drivers and is properly connected to the board.
- The board is powered up and its jumper and switch settings are probably correct.
- The microcontroller is alive, the clocks are running, and the memory is initialized.

The Blinky example application used in this tutorial is designed to run the same way on all boards offered by Renesas that hold the RA microcontroller. The code in Blinky is completely board independent. It does the work by calling into the BSP (board support package) for the particular board it is running on. This works because:

- Every board has at least one LED connected to a GPIO pin.
- That one LED is always labelled LED1 on the silk screen.
- Every BSP supports an API that returns a list of LEDs on a board, and their port and pin assignments.

## 2.3.3 Prerequisites

To follow this tutorial, you need:

- Windows based PC
- e2 studio
- Flexible Software Package
- An RA MCU board kit

## 2.3.4 Create a New Project for Blinky

The creation and configuration of an RA MCU project is the first step in the creation of an application. The base RA MCU pack includes a pre-written Blinky example application that is simple and works on all Renesas RA MCU boards.

Follow these steps to create an RA MCU project:

1. In e2 studio, click **File > New > C/C++ Project > Renesas RA** and select **Renesas RA C/C++ Project**.
2. Assign a name to this new project. Blinky is a good name to use for this tutorial.
3. Click **Next**. The **Project Configuration** window shows your selection.

Figure 68: e2 studio Project Configuration window (part 1)

4. Select the board support package by selecting the name of your board from the **Device Selection** drop-down list and click **Next**.

Figure 69: e2 studio Project Configuration window (part 2)

5. Select the build artifact and RTOS.

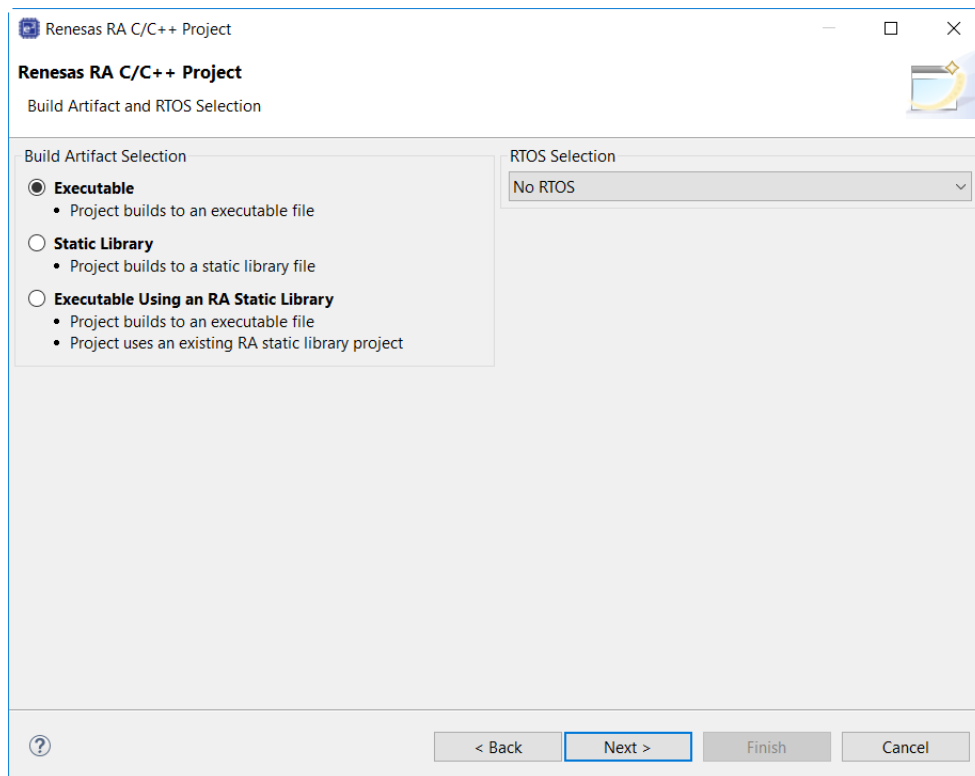

Figure 70: e2 studio Project Configuration window (part 3)

6. Select the Blinky template for your board and click **Finish**.

Figure 71: e2 studio Project Configuration window (part 4)

Once the project has been created, the name of the project will show up in the **Project Explorer** window of e2 studio. Now click the **Generate Project Content** button in the top right corner of the **Project Configuration** window to generate your board specific files.

Figure 72: e2 studio Project Configuration tab

Your new project is now created, configured, and ready to build.

### 2.3.4.1 Details about the Blinky Configuration

The **Generate Project Content** button creates configuration header files, copies source files from templates, and generally configures the project based on the state of the **Project Configuration** screen.

For example, if you check a box next to a module in the **Components** tab and click the **Generate Project Content** button, all the files necessary for the inclusion of that module into the project will be copied or created. If that same check box is then unchecked those files will be deleted.

#### 2.3.4.2 Configuring the Blinky Clocks

By selecting the Blinky template, the clocks are configured by e2 studio for the Blinky application. The clock configuration tab (see [Configuring Clocks](#)) shows the Blinky clock configuration. The Blinky clock configuration is stored in the BSP clock configuration file (see [BSP Clock Configuration](#)).

#### 2.3.4.3 Configuring the Blinky Pins

By selecting the Blinky template, the GPIO pins used to toggle the LED1 are configured by e2 studio for the Blinky application. The pin configuration tab shows the pin configuration for the Blinky application (see [Configuring Pins](#)). The Blinky pin configuration is stored in the BSP configuration file (see [BSP Pin Configuration](#)).

#### 2.3.4.4 Configuring the Parameters for Blinky Components

The Blinky project automatically selects the following HAL components in the Components tab:

- r\_ioport

To see the configuration parameters for any of the components, check the **Properties** tab in the HAL window for the respective driver (see [Adding and Configuring HAL Drivers](#)).

#### 2.3.4.5 Where is main()?

The main function is located in < project >/ra\_gen/main.c. It is one of the files that are generated during the project creation stage and only contains a call to hal\_entry(). For more information on generated files, see [Adding and Configuring HAL Drivers](#).

#### 2.3.4.6 Blinky Example Code

The blinky application is stored in the hal\_entry.c file. This file is generated by e2 studio when you select the Blinky Project template and is located in the project's src/ folder.

The application performs the following steps:

1. Get the LED information for the selected board by bsp\_leds\_t structure.
2. Define the output level HIGH for the GPIO pins controlling the LEDs for the selected board.
3. Get the selected system clock speed and scale down the clock, so the LED toggling can be observed.
4. Toggle the LED by writing to the GPIO pin with R\_BSP\_PinWrite((bsp\_io\_port\_pin\_t) pin, pin\_level);

### 2.3.5 Build the Blinky Project

Highlight the new project in the **Project Explorer** window by clicking on it and build it.

There are three ways to build a project:

1. Click on **Project** in the menu bar and select **Build Project**.
2. Click on the hammer icon.
3. Right-click on the project and select **Build Project**.

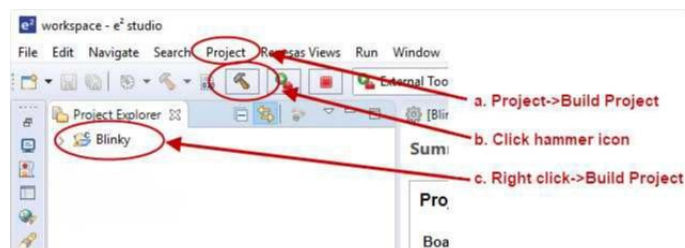

Figure 73: e2 studio Project Explorer window

Once the build is complete a message is displayed in the build **Console** window that displays the final image file name and section sizes in that image.

```

CDT Build Console [Blinky]
'Finished building: ../ra/board/ra6m3_ek/board_leds.c'
'Finished building: ../ra/board/ra6m3_ek/board_init.c'
'

'
'
11:50:45 Build Finished. 0 errors, 0 warnings. (took 19s.208ms)

```

Figure 74: e2 studio Project Build console

## 2.3.6 Debug the Blinky Project

### 2.3.6.1 Debug prerequisites

To debug the project on a board, you need

- The board to be connected to e2 studio
- The debugger to be configured to talk to the board
- The application to be programmed to the microcontroller

Applications run from the internal flash of your microcontroller. To run or debug the application, the application must first be programmed to the microcontroller's flash. There are two ways to do this:

- JTAG debugger
- Built-in boot-loader via UART or USB

Some boards have an on-board JTAG debugger and others require an external JTAG debugger connected to a header on the board.

Refer to your board's user manual to learn how to connect the JTAG debugger to e2 studio.

### 2.3.6.2 Debug steps

To debug the Blinky application, follow these steps:

1. Configure the debugger for your project by clicking **Run > Debugger Configurations ...**

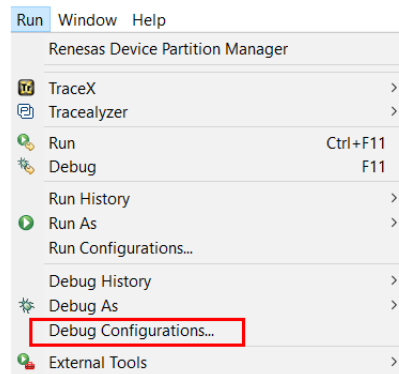

Figure 75: e2 studio Debug icon

or by selecting the drop-down menu next to the bug icon and selecting **Debugger Configurations ...**

Figure 76: e2 studio Debugger Configurations selection option

2. Select your debugger configuration in the window. If it is not visible then it must be created by clicking the **New** icon in the top left corner of the window. Once selected, the **Debug Configuration** window displays the Debug configuration for your Blinky project.

Figure 77: e2 studio Debugger Configurations window with Blinky project

3. Click **Debug** to begin debugging the application.

4. Extracting RA Debug.

### 2.3.6.3 Details about the Debug Process

In debug mode, e2 studio executes the following tasks:

1. Downloading the application image to the microcontroller and programming the image to the internal flash memory.
2. Setting a breakpoint at main().
3. Setting the stack pointer register to the stack.
4. Loading the program counter register with the address of the reset vector.
5. Displaying the startup code where the program counter points to.

Figure 78: e2 studio Debugger memory window

## 2.3.7 Run the Blinky Project

While in Debug mode, click **Run > Resume** or click on the **Play** icon twice.

Figure 79: e2 studio Debugger Play icon

The LEDs on the board marked LED1, LED2, and LED3 should now be blinking.

## 2.4 Tutorial: Using HAL Drivers - Programming the WDT

### 2.4.1 Application WDT

This tutorial illustrates the creation of a simple application that uses the Watchdog Timer module to monitor program operation. The tutorial shows each step in the development process and in particular identifies the auto-generated files and project structure created when using FSP and its GUI based configurator. The level of detail provided here is more than is normally needed during development but can be helpful in explaining how FSP works behind the scenes to simplify your work.

This application makes use of the following FSP modules:

- [MCU Board Support Package](#)
- [Watchdog \(r\\_wdt\)](#)
- [I/O Port \(r\\_ioport\)](#)

### 2.4.2 Creating a WDT Application Using the RA MCU FSP and e2 studio

#### 2.4.2.1 Using the FSP and e2 studio

The Flexible Software Package (FSP) from Renesas provides a complete driver library for developing RA MCU applications. The FSP provides Hardware Abstraction Layer (HAL) drivers, Board Support Package (BSP) drivers for the developer to use to create applications. The FSP is integrated into Renesas e2 studio based on eclipse providing build (editor, compiler and linker) and debug phases with an extended GNU Debug (GDB) interface.

#### 2.4.2.2 The WDT Application

The flowchart for the WDT application is shown below.

Figure 80: WDT Application flow diagram

### 2.4.2.3 WDT Application flow

The main sections of the WDT application are:

1. The BSP initializes the clocks, pins and other elements of the MCU readying the application to run.
2. main() calls hal\_entry(). The function hal\_entry() is created by the FSP with a placeholder for user code. The code for the WDT is added to this function.
3. Initialize the WDT, but do not start it.
4. Start the WDT by refreshing it.
5. In the first loop the red LED flashes 30 times and refreshes the watchdog each time the LED state is changed.
6. In the second loop, the green LED flashes, but the program DOES NOT refresh the watchdog. After the watchdog timeout period the device will reset which can be observed by the red LED flashing again as the sequence repeats.

### 2.4.3 Creating the Project with e2 studio

Start e2 studio and choose a workspace folder in the Workspace Launcher. Configure a new RA MCU project as follows.

1. Select **File > New > RA C/C++ Project**. Then select the template for the project.

Figure 81: Creating a new project

2. In the e2 studio Project **Configuration (RA Project)** window enter a project name, for example, WDT\_Application. In addition, select the toolchain. If you want to choose new locations for the project unselect **Use default location**. Click **Next**.

Figure 82: Project configuration (part 1)

3. This application runs on the EK-RA6M3 board. So, for the **Board** select **EK-RA6M3**.

This will automatically populate the **Device** drop-down with the correct device used on this board. Select the **Toolchain** version. Select **J-Link ARM** as the **Debugger**. Click **Next** to configure the project.

Figure 83: Project configuration (part 2)

The project template is now selected. As no RTOS is required select **Bare Metal - Blinky**.

Figure 84: Project configuration (part 3)

#### 4. Click **Finish**.

e2 studio creates the project and opens the **Project Explorer** and **Project Configuration Settings** views with the **Summary** page showing a summary of the project configuration.

### 2.4.4 Configuring the Project with e2 studio

e2 studio simplifies and accelerates the project configuration process by providing a GUI interface for selecting the options to configure the project.

e2 studio offers a selection of perspectives presenting different windows to the user depending on the operation in progress. The default perspectives are **C/C++**, **FSP Configuration** and **Debug**. The perspective can be changed by selecting a new one from the buttons at the top right.

Figure 85: Selecting a perspective

The **C/C++** perspective provides a layout selected for code editing. The **FSP Configuration** perspective provides elements for configuring a RA MCU project, and the **Debug** perspective provides a view suited for debugging.

1. In order to configure the project settings ensure the **FSP Configuration** perspective is selected.
2. Ensure the **Project Configuration [WDT Application]** is open. It is already open if the Summary information is visible. To open the Project Configuration now or at any time make sure the **RA Configuration** perspective is selected and double-click on the configuration.xml file in the Project Explorer pane on the right side of e2 studio.

Figure 86: RA MCU Project Configuration Settings

At the base of the Project Configuration view there are several tabs for configuring the project. A project may require changes to some or all of these tabs. The tabs are shown below.

Figure 87: Project Configuration Tabs

#### 2.4.4.1 BSP Tab

The **BSP** tab allows the Board Support Package (BSP) options to be modified from their defaults. For this particular WDT project no changes are required. However, if you want to use the WDT in auto-start mode, you can configure the settings of the OFS0 (Option Function Select Register 0) register in the **BSP** tab. See the RA Hardware User's Manual for details on the WDT autostart mode.

#### 2.4.4.2 Clocks Tab

The **Clocks** tab presents a graphical view of the clock tree of the device. The drop-down boxes in the GUI enables configuration of the various clocks. The WDT uses PCLKB. The default output frequency for this clock is 60 MHz. Ensure this clock is outputting this value.

Figure 88: Clock configuration

### 2.4.4.3 Interrupts Tab

The **Interrupts** tab is used to add new user events or interrupts. No new interrupts or events are needed by the application, so no edits in this tab are required.

### 2.4.4.4 Event Links Tab

The **Event Links** tab is used to configure events used by the Event Link Controller (ELC). This project doesn't use the ELC, so no edits in this tab are required.

### 2.4.4.5 Pins Tab

The **Pins** tab provides a graphical tool for configuring the functionality of the pins of the device. For the WDT project no pin configuration is required. Although the project uses two LEDs connected to pins on the device, these pins are pre-configured as output GPIO pins by the BSP.

### 2.4.4.6 Stacks Tab

You can add any driver to the project using the **Stacks** tab. The HAL driver IO port pins are added automatically by e2 studio when the project is configured. The WDT application uses no RTOS Resources, so you only need to add the HAL WDT driver.

Figure 89: Stacks tab

1. Click on the **HAL/Common Panel** in the Threads Window as indicated in the figure above.

The Stacks Panel becomes a **HAL/Common Stacks** panel and is populated with the modules preselected by e2 studio.

2. Click on **New Stack** to find a pop-up window with the available HAL level drivers.
3. Select **WATCHDOG Driver on r\_wdt**.

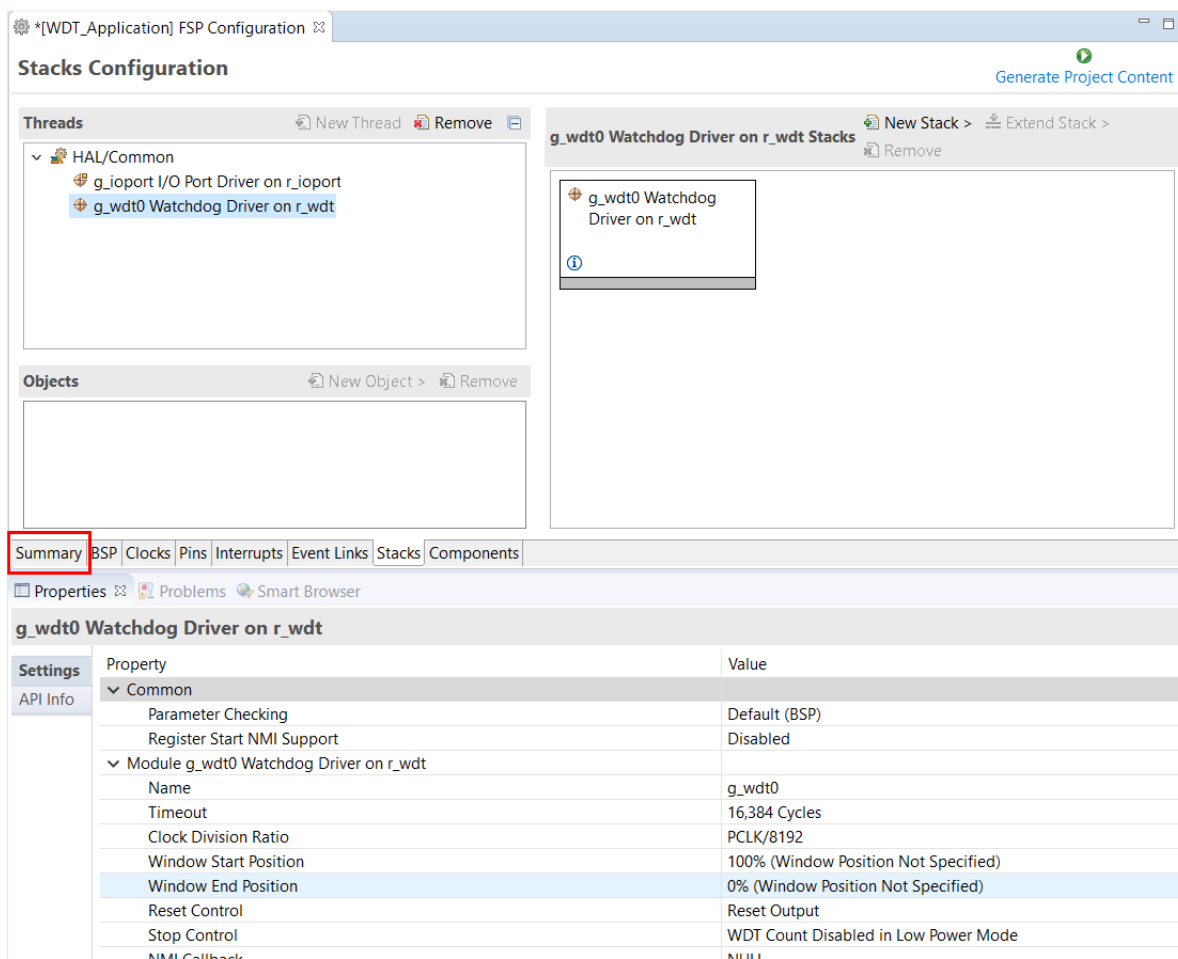

Figure 90: Module Selection

The selected HAL WDT driver is added to the **HAL/Common Stacks** Panel and the **Property** Window shows all configuration options for the selected module. The **Property** tab for the WDT should be visible at the bottom left of the screen. If it is not visible, check that the **FSP Configuration** perspective is selected.

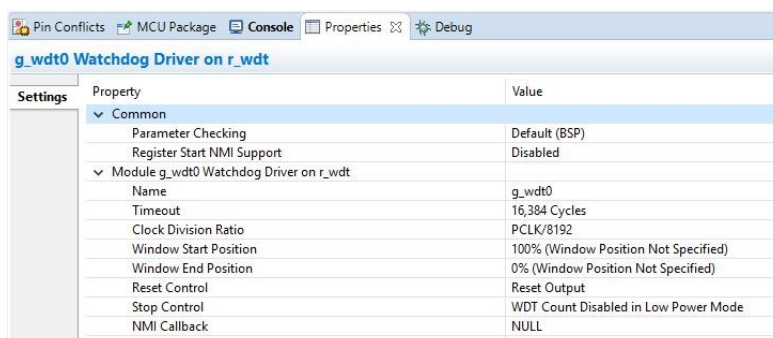

The screenshot shows the 'Stacks Configuration' window with the 'Summary' tab selected. The 'g\_wdt0 Watchdog Driver on r\_wdt' module is selected in the 'Stacks' list. The Properties window displays the following configuration:

Property	Value
Parameter Checking	Default (BSP)
Register Start NMI Support	Disabled
Module g_wdt0 Watchdog Driver on r_wdt	
Name	g_wdt0
Timeout	16,384 Cycles
Clock Division Ratio	PCLK/8192
Window Start Position	100% (Window Position Not Specified)
Window End Position	0% (Window Position Not Specified)
Reset Control	Reset Output
Stop Control	WDT Count Disabled in Low Power Mode
NMI Callback	NULL

Figure 91: Module Properties

All parameters can be left with their default values.

The screenshot shows the 'Properties' window for the 'g\_wdt0 Watchdog Driver on r\_wdt' module. The 'Settings' tab is selected, and the configuration table is visible:

Property	Value
Common	
Parameter Checking	Default (BSP)
Register Start NMI Support	Disabled
Module g_wdt0 Watchdog Driver on r_wdt	
Name	g_wdt0
Timeout	16,384 Cycles
Clock Division Ratio	PCLK/8192
Window Start Position	100% (Window Position Not Specified)
Window End Position	0% (Window Position Not Specified)
Reset Control	Reset Output
Stop Control	WDT Count Disabled in Low Power Mode
NMI Callback	NULL

Figure 92: g\_wdt WATCHDOG Driver on WDT properties

With PCLKB running at 60 MHz the WDT will reset the device 2.23 seconds after the last refresh.

$$\text{WDT clock} = 60 \text{ MHz} / 8192 = 7.32 \text{ kHz}$$

$$\text{Cycle time} = 1 / 7.324 \text{ kHz} = 136.53 \text{ us}$$

Timeout =  $136.53 \text{ us} \times 16384 = 2.23 \text{ seconds}$

Save the **Project Configuration** file and click the **Generate Project Content** button in the top right corner of the **Project Configuration** pane.

Figure 93: Generate Project Content button

e2 studio generates the project files.

#### 2.4.4.7 Components Tab

The components tab is included for reference to see which modules are included in the project. Modules are selected automatically in the Components view after they are added in the Stacks Tab.

For the WDT project ensure that the following modules are selected:

1. HAL\_Drivers -> r\_ioport
2. HAL\_Drivers -> r\_wdt

Figure 94: Component Selection

*Note*

The list of modules displayed in the Components tab depends on the installed FSP version.

## 2.4.5 WDT Generated Project Files

Clicking the Generate Project Content button performs the following tasks.

- r\_wdt folder and WDT driver contents created at:

ra/fsp/src

- r\_wdt\_api.h created in:

ra/fsp/inc/api

- r\_wdt.h created in:

ra/fsp/inc/instances

The above files are the standard files for the WDT HAL module. They contain no specific project contents. They are the driver files for the WDT. Further information on the contents of these files can be found in the documentation for the WDT HAL module.

Configuration information for the WDT HAL module in the WDT project is found in:

ra\_cfg/fsp\_cfg/r\_wdt\_cfg.h

The above file's contents are based upon the **Common** settings in the **g\_wdt WATCHDOG Driver on WDT Properties** pane.

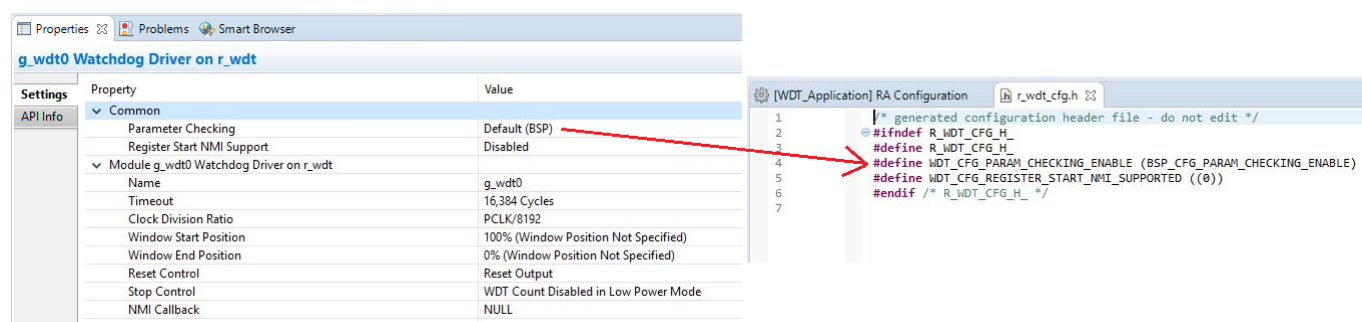

Figure 95: r\_wdt\_cfg.h contents

## Warning

Do not edit any of these files as they are recreated every time the Generate Project Content button is clicked and so any changes will be overwritten.

The r\_ioport folder is not created at ra/fsp/src as this module is required by the BSP and so already exists. It is included in the WDT project in order to include the correct header file in ra\_gen/hal\_data.c—see later in this document for further details. For the same reason the other IOPORT header files— ra/fsp/inc/api/r\_ioport\_api.h and ra/fsp/inc/instances/r\_ioport.h—are not created as they already exist.

In addition to generating the HAL driver files for the WDT and IOPORT files e2 studio also generates files containing configuration data for the WDT and a file where user code can safely be added. These files are shown below.

Figure 96: WDT project files

### 2.4.5.1 WDT hal\_data.h

The contents of hal\_data.h are shown below.

```
/* generated HAL header file - do not edit */  
#ifndef HAL_DATA_H_  
#define HAL_DATA_H_  
#include <stdint.h>  
#include "bsp_api.h"  
#include "common_data.h"  
#include "r_wdt.h"  
#include "r_wdt_api.h"  
#ifdef __cplusplus  
extern "C"  
{  
#endif  
extern const wdt_instance_t g_wdt0;  
#ifndef NULL  
void NULL(wdt_callback_args_t * p_args);  
#endif  
extern wdt_instance_ctrl_t g_wdt0_ctrl;  
extern const wdt_cfg_t g_wdt0_cfg;  
void hal_entry(void);
```

```
void g_hal_init(void);

#ifdef __cplusplus
} /* extern "C" */
#endif

#endif /* HAL_DATA_H_ */
```

hal\_data.h contains the header files required by the generated project. In addition this file includes external references to the **g\_wdt0** instance structure which contains pointers to the configuration, control, api structures used for WDT HAL driver.

#### Warning

This file is regenerated each time Generate Project Content is clicked and must not be edited.

#### 2.4.5.2 WDT hal\_data.c

The contents of hal\_data.c are shown below.

```
/* generated HAL source file - do not edit */
#include "hal_data.h"
wdt_instance_ctrl_t g_wdt0_ctrl;
const wdt_cfg_t g_wdt0_cfg =
{
    .timeout          = WDT_TIMEOUT_16384,
    .clock_division  = WDT_CLOCK_DIVISION_8192,
    .window_start    = WDT_WINDOW_START_100,
    .window_end      = WDT_WINDOW_END_0,
    .reset_control   = WDT_RESET_CONTROL_RESET,
    .stop_control    = WDT_STOP_CONTROL_ENABLE,
    .p_callback      = NULL,
};
/* Instance structure to use this module. */
const wdt_instance_t g_wdt0 =
{.p_ctrl = &g_wdt0_ctrl, .p_cfg = &g_wdt0_cfg, .p_api = &g_wdt_on_wdt};
void g_hal_init (void)
{
    g_common_init();
}
```

hal\_data.c contains g\_wdt0\_ctrl which is the control structure for this instance of the WDT HAL driver. This structure should not be initialized as this is done by the driver when it is opened.

The contents of g\_wdt0\_cfg are populated in this file using the **Watchdog Driver on g\_wdt0** pane in the Project Configuration **Stacks** tab. If the contents of this structure do not reflect the settings made in the IDE, ensure the **Project Configuration** settings are saved before clicking the **Generate Project Content** button.

#### Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

### 2.4.5.3 WDT main.c

Contains main() called by the BSP start-up code. main() calls hal\_entry() which contains user developed code (see next file). Here are the contents of main.c.

```
/* generated main source file - do not edit*/
#include "hal_data.h"

int main (void)
{
    hal_entry();
    return 0;
}
```

#### Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

### 2.4.5.4 WDT hal\_entry.c

This file contains the function hal\_entry() called from main(). User developed code should be placed in this file and function.

For the WDT project edit the contents of this file to contain the code below. This code implements the flowchart in overview section of this document.

```
#include "hal_data.h"
#include "bsp_pin_cfg.h"
#include "r_ioport.h"

#define RED_LED_NO_OF_FLASHES 30
#define RED_LED_PIN BSP_IO_PORT_01_PIN_00
```

```
#define GREEN_LED_PIN BSP_IO_PORT_04_PIN_00
#define RED_LED_DELAY_MS 125
#define GREEN_LED_DELAY_MS 250
volatile uint32_t delay_counter;
volatile uint16_t loop_counter;
void R_BSP_WarmStart(bsp_warm_start_event_t event);
/*****
*****/
void hal_entry (void)
{
    /* Allow the WDT to run when the debugger is connected */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;

    /* Open the WDT */
    R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
    /* Start the WDT by refreshing it */
    R_WDT_Refresh(&g_wdt0_ctrl);
    /* Flash the red LED and feed the WDT for a few seconds */
    for (loop_counter = 0; loop_counter < RED_LED_NO_OF_FLASHES; loop_counter++)
    {
        /* Turn red LED on */
        R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_LOW);
        /* Delay */
        R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
        /* Refresh WDT */
        R_WDT_Refresh(&g_wdt0_ctrl);
        R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_HIGH);
        /* Delay */
        R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
        /* Refresh WDT */
        R_WDT_Refresh(&g_wdt0_ctrl);
    }
    /* Flash green LED but STOP feeding the WDT. WDT should reset the
    * device */
    while (1)
```

```
{
/* Turn green LED on */
R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_LOW);
/* Delay */
R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
/* Turn green off */
R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_HIGH);
/* Delay */
R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
}
}
/*****
*****/
void R_BSP_WarmStart (bsp_warm_start_event_t event)
{
if (BSP_WARM_START_RESET == event)
{
#if BSP_FEATURE_FLASH_LP_VERSION != 0
/* Enable reading from data flash. */
R_FACI_LP->DFLCTL = 1U;
/* Would normally have to wait for tDSTOP(6us) for data flash recovery. Placing the
enable here, before clock and
* C runtime initialization, should negate the need for a delay since the
initialization will typically take more than 6us. */
#endif
}
if (BSP_WARM_START_POST_C == event)
{
/* C runtime environment and system clocks are setup. */
/* Configure pins. */
R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
}
}
```

The WDT HAL driver API functions are defined in `r_wdt.h`. The WDT HAL driver is opened through the open API call using the instance structure defined in `r_wdt_api.h`:

```
/* Open the WDT */  
R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
```

The first passed parameter is the pointer to the control structure `g_wdt0_ctrl` instantiated in `hal_data.c`. The second parameter is the pointer to the configuration data `g_wdt0_cfg` instantiated in the same `hal_data.c` file.

The WDT is started and refreshed through the API call:

```
/* Start the WDT by refreshing it */  
R_WDT_Refresh(&g_wdt0_ctrl);
```

Again the first (and only in this case) parameter passed to this API is the pointer to the control structure of this instance of the driver.

## 2.4.6 Building and Testing the Project

Build the project in e2 studio by clicking **Build > Build Project** or by clicking the build icon. The project should build without errors.

To debug the project

1. Connect the USB cable between the target board debug port and host PC.
2. In the **Project Explorer** pane on the left side of e2 studio, right-click on the WDT project **WDT\_Application** and select **Debug As > Debug Configurations**.
3. Under **Renesas GDB Hardware Debugging** select **WDT\_Application Debug** as shown below.

Figure 97: Debug configuration

- Click the **Debug** button. Click Yes to the debug perspective if asked.

- The code should run the `Reset_Handler()` function.
- Resume execution via **Run > Resume**. Execution will stop in `main()` at the call to `hal_entry()`.
- Resume execution again.

The red LED should start flashing. After 30 flashes the green LED will start flashing and the red LED will stop flashing.

While the green LED is flashing the WDT will underflow and reset the device resulting in the red LED to flash again as the sequence repeats.

- Stop the debugger in e2 studio via **Run > Terminate**.
- Click the reset button on the target board. The LEDs begin flashing.

## 2.5 Primer: ARM® TrustZone® Project Development

This section will introduce the user to the tools supporting ARM® TrustZone® configuration for the RA Family of microcontrollers. It is intended to be read by development engineers implementing RA ARM® TrustZone® projects for the first time. It will introduce basic concepts followed by workflow

and tooling functions designed to simplify and accelerate their first ARM® TrustZone® development. A background knowledge of e<sup>2</sup> studio and RA device hardware is expected.

## Target Device

RA Cortex®-M33 or Cortex®-M23 devices with ARM® TrustZone® security extension.

### 2.5.1 Renesas Implementation of ARM® TrustZone® Technology

For brevity, ARM® TrustZone® will be abbreviated to TZ in this document.

The following section is supplied for reference only. For full details of TZ implementation, refer to Arm documentation (<https://developer.arm.com/ip-products/security-ip/trustzone>) and the RA6M4 device manual.

Arm TZ technology divides the MCU and therefore the application into Secure and Non-Secure partitions. Secure applications can access both Secure and Non-Secure memory and resources. Non-Secure code can access Non-Secure memory and resources as well as Secure resources through a set of so-called veneers located in the Non-Secure Callable (NSC) region. This ensures a single access point for Secure code when called from the Non-Secure partition. The MCU starts up in the Secure partition by default. The security state of the CPU can be either Secure or Non-Secure.

The MCU code flash, data flash, and SRAM are divided into Secure (S) and Non-Secure (NS) regions. Code flash and SRAM include a further region known as Non-Secure Callable (NSC). These memory security attributes are set into the non-volatile memory via SCI or USB boot mode commands when the device lifecycle is Secure Software Debug (SSD) state. The memory security attributes are loaded into the Implementation Defined Attribution Unit (IDAU) peripheral and the memory controller before application execution and cannot be updated by application code.

Figure 98: Secure and Non-Secure Regions

Note: All external memory accesses are considered to be Non-Secure.

Code Flash and SRAM can be divided into Secure, Non-Secure, and Non-Secure Callable. All secure memory accesses from the Non-Secure region MUST go through the Non-Secure Callable gateway and target a specific Secure Gateway (SG) assembler instruction. This forces access to Secure APIs at a fixed location and prevents calls to sub-functions and so on. Failing to target an SG instruction will generate a TZ exception.

TZ enabled compilers will manage generation of the NSC veneer automatically using CMSE extensions.

### 2.5.1.1 Calling from Non-Secure to Secure

A new instruction SG (Secure Gateway) has been added to the Armv8-M architecture. This MUST be the destination instruction for any branch within the Non-Secure Callable region. If an attempt is made to branch to any other instruction from the Non-Secure partition, a TZ exception will be thrown.

Figure 99: Calling from Non-Secure to Secure Functions

### 2.5.1.2 Calling from Secure to Non-Secure

Secure code uses B(L)XNS instructions to make direct calls to Non-Secure functions. While this is certainly possible, it can create a security vulnerability in the application. It is also challenging for the Secure application to determine the address of the non-secure function during build phase. From the RA Tools and FSP point view, calling directly from Secure to Non-Secure via FSP API is not supported.

Preference is for the Secure code to initialise as necessary from reset, then pass control to the Non-Secure partition. It will manage any data transfers and so forth via FSP call-backs as security checks. For example, secure data can be copied to Non-Secure RAM.

Figure 100: Calling from Secure to Non-Secure Functions

## 2.5.2 Workflow

ARM® TrustZone® MCU development normally consists of two projects within a workspace, Secure and Non-Secure. General project workflows are described in the following sections. The Renesas project generator also supports development with "Flat project" model with no ARM® TrustZone® awareness.

### 2.5.2.1 Secure Project

1. Start a new Secure project in e<sup>2</sup> studio.
2. Select and configure pins and drivers/stacks that need to be initialized and used in Secure

- mode. This should be kept to a minimum to reduce the security attack surface.
3. Expose top of stacks as Non-Secure Callable (NSC) **if** they need to be accessed from Non-Secure partition. Again, this should be kept to a minimum.
  4. Generate project content and write Secure code such as key handling and opening drives as needed.
  5. Modify/remove any unnecessary "Guard" functions as needed to control access via NSC.
  6. Build project.
  7. A Non-Secure project will be needed before debugging. If necessary, prepare a "dummy" Non-Secure project or replace `R_BSP_NonSecureEnter();` with `while(1);` in `hal_entry.c`.

### 2.5.2.2 Non-Secure Project

1. Start a new Non-Secure project.
2. If you have access to the Secure project, choose this option. However, if you only have access to a device with pre-programmed Secure code (commonly referred to as provisioned device) choose "Secure Bundle".
3. Select and configure pins and drivers/stacks that need to be initialized and used in Non-Secure mode.
4. Note that you can add NSC drivers and stacks as needed.
5. Generate project content and write Non-Secure code as needed
6. Access NSC drivers and Stacks via Guard functions.
7. Build and debug project.

### 2.5.2.3 Flat Project

A flat project does not technically use ARM® TrustZone® as the developer has made a decision to place the entire application in Secure partition from restart.

Notes:

- Any code placed in external memory (such as OSPI or QSPI) will be Non-Secure.
- The Ethernet EDMAC is designed to be a Non-Secure bus master so associated Ethernet RAM buffers will be placed in Non-Secure RAM. The tooling will automatically manage this.

The workflow is as follows:

1. Start a new Flat project.
2. Select and configure pins and drivers/stacks as needed.
3. Generate project content and write code as needed.
4. Build and debug project.

## 2.5.3 RA Project Generator (PG)

The RA project generators have been created to help users through setting up new TZ enabled projects. User will be prompted for project settings such as Project Type (Secure, Non-Secure, or Flat), compiler, RTOS and debugger. Care is needed when setting up a TZ project to ensure that the connection between Secure and Non-Secure partitions are managed correctly.

Figure 101: Secure Project (following Arm notation as green)

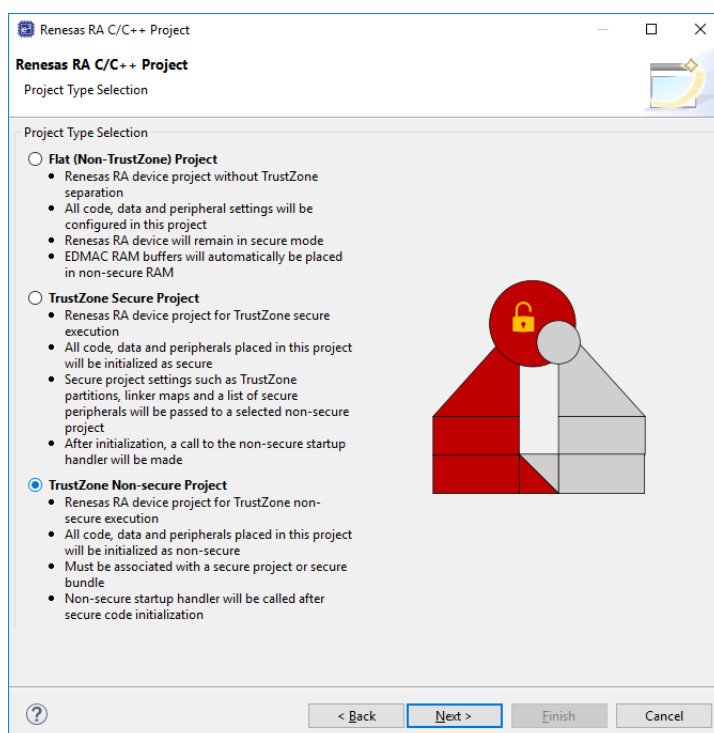

Figure 102: Non-Secure Project (following Arm notation as red)

Figure 103: Flat Project

### 2.5.3.1 Secure Project Set Up

All code, data, and peripherals in this project will be configured as Secure using the device Peripheral Security Attribution (PSA) registers. Although it is very application specific, we recommend keeping the Secure project code as small as possible to reduce the attack surface. For example, secure key handling may be the only application code in the secure project.

Necessary values to set up the TZ memory partition (IDAU registers) will be automatically calculated after the project is built to ensure they match the code and data size, keeping the attack surface as small as possible.

Typically, ANSI C start up code (clearing of RAM, variable initialisation, etc) , clock, and secure peripheral initialisation will occur in this project.

At the end of the Secure code, a call will be made to `R_BSP_NonSecureEnter()`; to pass control to the Non-Secure partition.

Non-Secure Callable (NSC) "Guard" functions are added to the project and expose selected modules to Non-Secure projects. User can add application-specific access checks as needed in these functions.

Output of this project type will be an elf file that must be either pre-programmed (provisioned) into a device or referenced by a Non-Secure project (via Secure bundle \*.SBD) to build a final image.

This project type will NOT typically be debugged in isolation and will normally require a Non-Secure project such as a call to a `R_BSP_NonSecureEnter()` to be made. This can be replaced with `while(1)`; if needed.

### 2.5.3.2 RTOS Support in TZ Project

Although the RTOS kernel and user tasks will reside in the Non-Secure partition, the Secure partition needs to allocate stack space and so on. It is essential when starting a new RTOS project that the TrustZone Secure RTOS-Minimal template is selected. This will add the Arm TrustZone Context RA Port as below.

Figure 104: Secure RTOS-Minimal Template

### 2.5.3.3 Peripheral Security Attribution

Each peripheral can be configured to be Secure or Non-Secure. Peripherals are divided into two types.

Type-1 peripherals have one security attribute. Access to all registers is controlled by one security attribute. The Type-1 peripheral security attribute is set in the PSAR<sub>x</sub> (x = B to E) register by the secure application.

Type-2 peripherals have the security attribute for each register or for each bit. Access to each register or bit field is controlled according to these security attributes. The Type-2 peripheral security

attribute is set in the Security Attribution register in each module by the Secure application. For more information about the Security Attribution register, see sections in the Appropriate MCU's User's Manual for each peripheral.

Table 1. Secure and Non-Secure Peripherals

Type	Peripheral
Type 1	SCI, SPI, USBFS, CAN, IIC, SCE9, DOC, SDHI, SSIE, CTSU, CRC, CAC, TSN, ADC12, DAC12, POEG, AGT, GPT, RTC, IWDT, WDT
Type 2	System control (Resets, LVD, Clock Generation Circuit, Low Power Modes, Battery Backup Function), FLASH CACHE, SRAM controller, CPU CACHE, DMAC, DTC, ICU, MPU, BUS, Security setting, ELC, I/O ports
Always Non-Secure	CS Area Controller, QSPI, OSPI, ETHERC, EDMAC

FSP will initialise the arbitration registers during Secure project BSP start up. User code may also be written to set or clear further arbitration. However care must be taken not to undermine FSP.

#### 2.5.3.4 Non-Secure

All code, data, and peripherals in this project will be configured as Non-Secure. This project type must be associated with a Secure project to enable access to secure code, peripherals, linker scripts and others.

#### 2.5.3.5 Flat Project Type

All code, data, and peripherals are configured in a Secure single partition except for the EDMAC RAM buffers that will remain in the Non-Secure partition. Effectively, TZ is disabled.

#### 2.5.3.6 Secure Connection to Non-Secure Project

When starting a new Non-Secure Project, the user will be prompted for either a Secure Project or Secure Bundle. In each case, details of the linker settings, Non-Secure Callable functions, and Secure peripherals will be read to enable the Non-Secure project setup.

Should the Secure project or bundle be rebuilt, the Non-Secure editor will detect this and prompt user to regenerate the Non-Secure project configuration.

Figure 105: Secure Project or Bundle Selection

### Secure Project (Combined)

A Secure project must reside in the same Workspace as the Non-Secure project and will typically be used when a design engineer has access to both the Secure and Non-Secure project sources. This is sometimes known as "Combined model".

A Secure .elf file will be referenced and included in the debug configuration for download to the target device. The development engineer will have visibility of Secure and Non-Secure project source code and configuration.

### Secure Bundle (Split)

A Secure Bundle will ONLY include linker memory ranges, symbol references, and details of locked Secure peripheral configuration settings but no access to Secure source code (API header files will be included as necessary).

The Secure bundle file (\*.SBD) must be supplied to the Non-Secure developer by the Secure project developer.

The development engineer will typically not have access to the Secure project or .elf file which MUST be pre-programmed or provisioned into the target MCU.

The DLM state of target device should then be switched to NSECSD (see section 6.2) before the device is provided to the non-secure developer.

This is often referred to as "Split model" where a basic security set up is developed by a Secure team and then passed to the Non-Secure team in the same facility or at a third party. The Non-Secure team has no access to the Secure source code and cannot directly access Secure peripherals, data, or APIs.

### 2.5.3.7 Debug Configurations

After each project type has been selected, a suitable debug configuration will be generated.

#### Non-Secure with Secure Project (Combined)

Both Secure and Non-Secure .elf files will be downloaded.

A debug configuration called <project name>\_SSD will be generated.

#### Non-Secure with Secure Bundle (Split)

Only a Non-Secure elf will be downloaded. This configuration must be used with a pre-provisioned device (Secure project pre-programmed into MCU Flash).

A debug configuration called <project name>\_NSECSD will be generated.

#### Flat Debug

A single .elf file will be downloaded.

A debug configuration called <project name>\_FLAT will be generated.

## 2.5.4 Secure Projects

As mentioned, Secure code will be called immediately after device reset and run ANSI C start up, clock, interrupt vector table, and secure peripheral initialization before starting user code. All selected peripheral configuration settings will be automatically initialised as Secure.

### 2.5.4.1 Secure Clock

Device clock settings are the possible exception in that they will be initialised in the Secure project (to enable faster start up from reset) but can be set as Secure or Non-Secure as user application may need to change settings during execution (for low-power mode and so on). The Secure and Non-Secure FSP BSPs can both change the clock settings.

However, clock settings can be locked as Secure should the developer choose to do so.

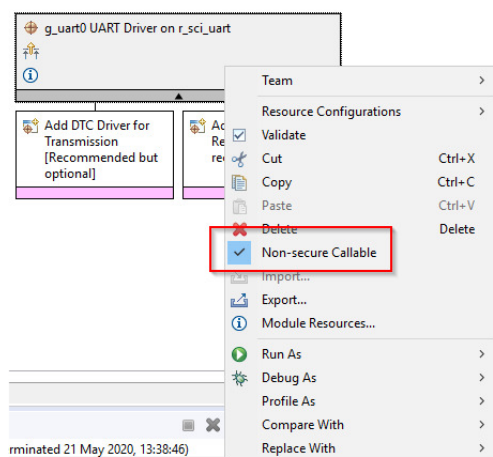

Figure 106: Secure Clock Setting

### 2.5.4.2 Setting Drivers as NSC

Some driver and middleware stacks in the Secure project may need to be accessed by the Non-Secure partition. To enable generation of NSC veneers, set "Non-Secure Callable" from the right-click context menu for the selected modules in the Configurator.

Note: It is only possible to "expose" top of stacks as NSC.

Figure 107: Generate NSC Veneers

The top of the stack will be marked with a new icon and tool tip to signify NSC access.

### 2.5.4.3 Guard Functions

Access to NSC drivers from a Non-Secure project is possible through the Guard APIs. FSP will automatically generate Guard functions for all the top of stack/driver APIs added to the project as Non-Secure Callable.

User can choose to add further levels of access control or delete guard function if they wish to only expose a limited range of APIs to a Non-Secure developer.

```
BSP_CMSE_NONSECURE_ENTRY fsp_err_t g_uart0_open_guard(
    uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg) {
    /* TODO: add your own security checks here */
    FSP_PARAMETER_NOT_USED(p_api_ctrl);
    FSP_PARAMETER_NOT_USED(p_cfg);
    return R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
}
```

For example, an SCI channel may be opened and configured for a desired baud rate by the Secure developer, but only enable the Write API to the Non-Secure developer. In which case, all but `g_uart0_write_guard()` could be deleted. CTRL structures are not required as they will be added on the Secure side.

For example, the call from the Non-Secure partition would be as follows:

```
err = g_uart0_open_guard(0,0);
```

## 2.5.5 Non-Secure projects

Configuration of the project can continue as for other RA devices, but certain resources will be locked if they have been previously set up as Secure.

The Non-Secure project will be called from the Secure project via `R_BSP_NonSecureEnter()`;

### 2.5.5.1 Clock Set Up

You may recall that clocks can be set as Secure or Non-Secure. If they are set as Secure, settings will

only be available to view, and user will not be able to change them. The Override button will be greyed. This is useful to preserve CGC sync with secure project by not overriding unless necessary. If it is NOT set as Secure, user can choose to override the initial Secure settings

Figure 108: Clock Setting as Non-Secure

Figure 109: Clock Setting as Secure

### 2.5.5.2 Selecting NSC Drivers

Drivers declared as NSC in a Secure project can be selected and added to Non-Secure project and will be decorated as before.

Figure 110: Selecting NSC Drivers

### 2.5.5.3 Locked Resources

When a NSC Secure driver is added to a Non-Secure project, the configuration settings are locked and are available for information only. A padlock is added for indication.

Figure 111: Locked Resources

#### 2.5.5.4 Locked Channels

In a peripheral with multiple channels, for example, DMA, if a Non-Secure developer tries to select a channel that has already been defined as Secure, the following error message type will be displayed.

Figure 112: Error Message when Selecting a Secure Channel

### 2.5.6 IDAU registers

Renesas RA TZ-enabled devices include a set of registers known as Implementation Defined Attribution Unit (IDAU) that are used to set up partitions between Secure, Non-Secure Callable, and Non-Secure regions. The IDAU registers can only be programmed during MCU **boot mode** and NOT through the debug interfaces. Because of this, special debugger firmware has been developed to manage bringing the device up in SCI boot mode to set up the IDAU registers (automatically drives MD pin) and then switch back to debug mode as needed.

**Note:** Please be aware of the extra signal connection (MD pin) needed on the debug interface connector. The Renesas Evaluation Kit (EK) for your selected device is a good reference.

Pin No.	SWD	JTAG	Serial Programming using SCI
1	VCC	VCC	VCC
2	P108/SWDIO	P108/TMS	NC
4	P300/SWCLK Wired OR with MD	P300/TCK Wired OR with MD	P201/MD
6	P109/SWO/TXD9	P109/TDO/TXD9	P109/TXD9
8	P110/RXD9	P110/TDI/RXD9	P110/RXD9
9	GNDdetect	GNDdetect	GNDdetect
10	nRESET	nRESET	nRESET
12	P214/TRACECLK	P214/TRACECLK	NC
14	P211/TRACEDATA[0]	P211/TRACEDATA[0]	NC
16	P210/TRACEDATA[1]	P210/TRACEDATA[1]	NC
18	P209/TRACEDATA[2]	P209/TRACEDATA[2]	NC
20	P208/TRACEDATA[3]	P208/TRACEDATA[3]	NC
3, 5, 15,17, 19	GND	GND	GND
7	NC	NC	NC
11, 13	NC	NC	NC

The e<sup>2</sup> studio build phase automatically extracts the IDAU partition register settings from the Secure.elf file and programs them into the device during debug connection, which can be observed in the console.

This is an important phase of TZ development as the Secure partitions should be set as small as possible to ensure that the security attack surface is as small as possible.

However, should the developer wish to make these partitions larger to accommodate, for example during field firmware updates, const or data arrays should be placed in the Secure project as needed.

```

  - SRAM Secure size (kB)      : 2
  - SRAM NSC size (kB)        : 6

```

Figure 113: RA TrustZone Device Current Status

It is also possible to manually set up the partition registers through the Renesas Device Partition Manager.

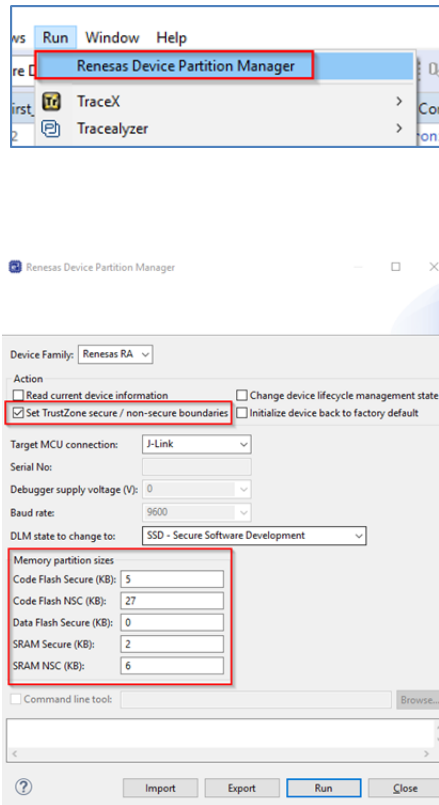

Figure 114: Renesas Device Partition Manager

### 2.5.6.1 SCI Boot Mode

Example of MD mode pin connection to debugger connector (from EK schematic).

Figure 115: Example of MD Mode Pin Connection to Debugger Connector (from EK schematic)

### 2.5.6.2 DLM States

Device lifecycle defines the current phase of the device and controls the capabilities of the debug interface, the serial programming interface and Renesas test mode. The following illustration shows the lifecycle definitions and capability in each lifecycle.

Figure 116: Lifecycle Stages

Note: All authentication key exchange and transitioning to LCK\_DBG, LCK\_BOOT, RMA\_REQ is only managed by Renesas Flash Programmer (RFP) and NOT within e<sup>2</sup> studio.

Lifecycle	Definition	Debug level	Serial programming	Test mode
CM	“Chip Manufacturing” The state when the customer received the device.	DBG2	Available, cannot access code/data flash	Not available
SSD	“Secure Software Development” The secure part of application is being developed.	DBG2	Available can program/erase/read all code/data flash area	Not available
NSECSD	“Non-SECure Software Development” The non-secure part of application is being developed.	DBG1	Available can program/erase/read all code/data flash area	Not available
DPL	“DePloyed” The device is in-field.	DBG0	Available cannot access code/data flash area	Not available
LCK_DBG	“LoCKed DeBuG” The debug interface is permanently disabled.	DBG0	Available cannot access code/data flash area	Not available
LCK_BOOT	“LoCKed BOOT interface” The debug interface and the serial programming interface are permanently disabled.	DBG0	Not available	Not available
RMA_REQ	“Return Material Authorization REQuest” Request for RMA. The customer must send the device to Renesas in this state.	DBG0	Available cannot access code/data flash area	Not available
RMA_ACK	“Return Material Authorization ACKnowledged” Failure analysis in Renesas	DBG2	Available cannot access code/data flash area	Available

Figure 117: Lifecycle Stages and Debug Levels

There are three debug access levels. The debug access level changes according to the lifecycle state.

- DBG2: The debugger connection is allowed, and no restriction to access memories and peripherals

- DBG1: The debugger connection is allowed, and restricted to access only Non-Secure memory regions and peripherals
- DBG0: The debugger connection is not allowed

Transitions for one state to another can be performed using the Renesas Flash Programmer (RFP, see section below) or using the Renesas Device Partition Manager (limited number of states possible). It is possible to secure transitions between states using authentication keys. For more information on DLM states and transitions (device specific), please refer to device user manual.

### 2.5.7 Debug

By default, the device will be in SSD mode and so allow access to Secure and Non-Secure partitions. In this mode both Secure and Non-Secure .elf files will be downloaded.

The current debugger status is displayed in the lower left corner and includes the DLM state (SSD or NSECSD) and current partition (Secure, Non-Secure, or Non-Secure Callable) when the debugger is stopped, for example.

Figure 118: Current Debugger Status

#### 2.5.7.1 Non-Secure Debug

Once the device is transitioned to NSECSD mode, only Non-Secure Flash, RAM and Peripherals can be accessed. In this mode, a Secure .elf must be pre-programmed (provisioned) into the device, and only a Non-Secure .elf file will be downloaded.

When in NSECSD mode access to Secure elements will be blocked and data displayed as ????????.

In NSECSD mode, it is not possible to set breakpoints on Secure code or data.

It is not possible to step into Secure code; the debugger will perform a step-over of any Secure function calls. Should the user press the Suspend button during execution, the debugger will stop at the next Non-Secure code access.

Assuming Secure memory region finishes at 32K (0x8000) in NSECSD debug mode (colour coding added for indication only), memory will be displayed as shown in the following figure.

Figure 119: Memory Display in NSECSD Debug Mode

Disassembly will be displayed as shown in the following figure.

```

Disassembly 0x8000
Cannot access memory at address 0x7ffc
00007ffd: Failed to execute MI command:
-data-disassemble -s 32765 -e 32797 -- 3
Error message from debugger back end:
Cannot access memory at address 0x7ffc
00007ffe: Failed to execute MI command:

Error message from debugger back end:
Cannot access memory at address 0x7ffe
00007fff: Failed to execute MI command:
-data-disassemble -s 32767 -e 32799 -- 3
Error message from debugger back end:
Cannot access memory at address 0x7ffe
vector:
00008000: movs r4, #152 ; 0x98
00008002: movs r0, #0
00008004: ldrh r1, [r7, #12]
00008006: movs r0, r0
00008008: ldrh r5, [r4, #4]

```

Figure 120: Disassembly Display in NSECSD Debug Mode

## 2.5.8 Debugger support

Renesas E2, E2 Lite, and SEGGER J-Link are supported in e<sup>2</sup> studio for TZ projects.

### Debugger Support for TZ Projects

Feature	E2 Lite	E2	J-Link	J-Link OB	ULINK	IAR i-Jet
JTAG	Yes	Yes	Yes	No	Yes	Yes
SWD	Yes	Yes	Yes	Yes	Yes	Yes
ETB trace	Yes	Yes	Yes	Yes	Yes	Yes
ETM trace	No	Yes	Yes	No	Yes	Yes
TZ partition programming	Yes	Yes	Yes	Yes	No	No
Non secure debug	Yes	Yes	Yes	Yes	Yes	Yes
e <sup>2</sup> studio	Yes	Yes	Yes	Yes	No	TBC
IAR EW Arm	Under consideration	Under consideration	Yes	Yes	No	Yes
Keil MDK	Under consideration	Under consideration	Yes	Yes	Yes	No

## 2.5.9 Third-Party IDEs

Third-party IDEs such as IAR Systems EWARM and Keil MDK (uVision) are supported by the RA Smart Configurator (RA SC).

In general, RA SC offers the same configurator functionality as e<sup>2</sup> studio documented above. Project

generators are available to initialise workspaces in the target IDEs as well as setting up debug configurations and so forth. However, there are some limitations that need to be noted especially with regards to IDAU TZ partition register programming. See the specific RA SC documentation for usage details.

### 2.5.10 Renesas Flash Programmer (RFP)

Updated versions of Renesas Flash Programmer (RFP) are available to support setting of partitions, DLM state and Authentication keys.

RFP can be downloaded free of charge on the Renesas web site.

A new mode has been added to Program Flash Options as shown in the following graphics.

Figure 121: RFP Program Flash Options

Options to set partition boundaries are shown in the following figure.

Figure 122: RFP Partition Boundaries

Options to set DLM state, Authentication keys, and Security settings are shown in the following figure.

Figure 123: RFP DLM State, Authentication Keys, and Security Settings

Great care is needed here as some DLM states can **\*\*permanently\*\*** turn off debug and boot mode on the devices. Equally programming a security access authentication key can lead to permanently locked devices if the key is lost.

## 2.5.11 Glossary

### IDAU

Implementation Defined Attribute Unit. Used to program TZ partitions in SCI book mode.

### NSECSD

Non-Secure Software Development mode

### SSD

Secure Software Development mode

### NSC

Non-Secure Callable. Special Secure memory region used for Veneer to allow access to Secure APIs from Non-Secure code.

### Provisioned

Device with Secure code pre-programmed and DLM state set to **NSECSD**

### Flat project

All code, data and peripherals are configured as secure with the exception of the EDMAC RAM buffer which are placed in Non-Secure RAM due to the configuration of the internal bus masters.

### Veneer

Code that resides in Non-Secure Callable region

### Combined model

Development engineer has access to both Secure and Non-Secure project and source code

### Split model

Development Engineer has access to only the Non-Secure partition. No visibility of Secure source code. Secure code will be provisioned into device.

### 2.5.11.1 Configurator Icon Glossary

Figure 124: Configurator Icons

## 2.6 RA SC User Guide for MDK and IAR

### 2.6.1 What is RA SC?

The Renesas RA Smart Configurator (RA SC) is a desktop application designed to configure device hardware such as clock set up and pin assignment as well as initialization of FSP software components for a Renesas RA microcontroller project when using a 3rd-party IDE and toolchain.

The RA Smart Configurator can currently be used with

1. Keil MDK and the Arm compiler toolchain.
2. IAR EWARM with IAR toolchain for Arm

Projects can be configured and the project content generated in the same way as in e2 studio. Please refer to [Configuring a Project](#) section for more details.

### 2.6.2 Using RA Smart Configurator with Keil MDK

#### 2.6.2.1 Prerequisites

- Keil MDK and Arm compiler are installed and licensed. Please refer to the RASC Release notes for the version to be installed.
- Import the RA device pack. Download the RA device pack archive file (ex: MDK\_Device\_Packs\_2.x.x.zip) from the [FSP GitHub release page](#). Extract the archive file to locate the RA device pack. To import the RA device pack, launch the PackInstaller.exe from <keil\_mdk\_install\_dir>\UV4. Select the menu item **File > Import...** and browse to the extracted .pack file.
- Verify that the latest updates for RA devices are included in Keil MDK. To verify, select the menu "Packs" in Pack Installer and verify that the menu item **Check for Updates on Launch** is selected. If not, select **Check for Updates on Launch** and relaunch Pack

Installer.

- For flashing and debugging, the latest Segger J-Link DLL is installed into Keil MDK.
- Install RA SC and FSP using the Platform Installer from the GitHub release page.

### 2.6.2.2 Create new RA project

The following steps are required to create an RA project using Keil MDK, RA SC and FSP:

1. Start the RA Smart Configurator.
2. Enter a project folder and project name.

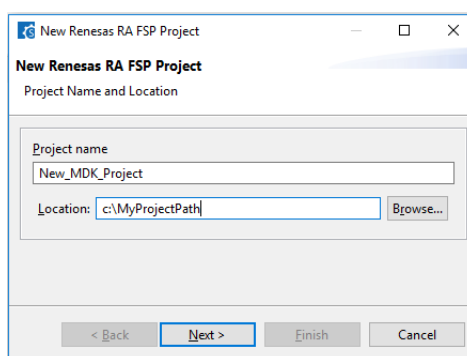

Figure 125: RA SC project settings

3. Select the target device and IDE.

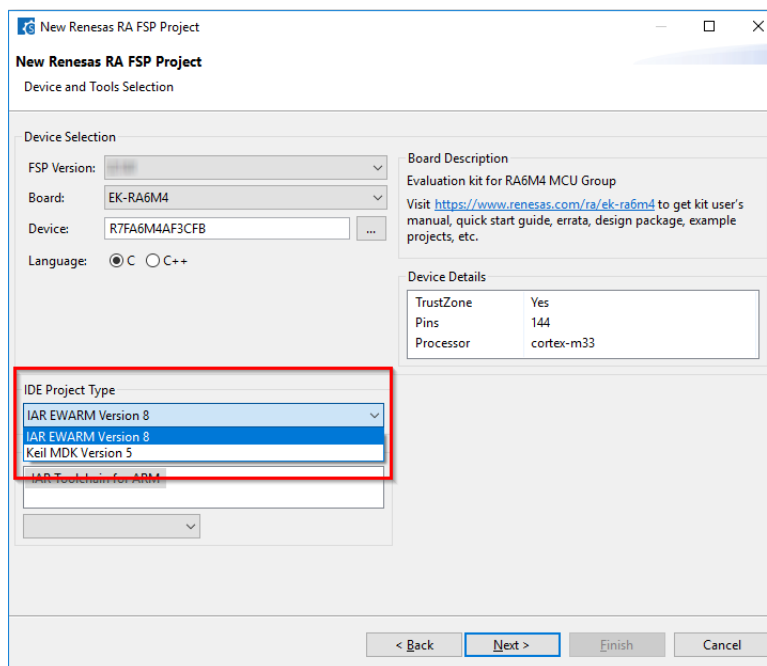

Figure 126: Target device and IDE selection

4. The rest of the project generator and FSP configuration is the same as e2 studio. Please

refer to the previous sections for details.

5. On completion of the FSP configuration, press "Generate Project Content"
6. A new Keil MDK project file will be generated in the project path. Double click this file to open MDK and continue development as usual.

Figure 127: uVision project workspace with imported project data

### 2.6.2.3 Modify existing RA project

Once an initial project has been generated and configured, it is also possible to make changes using RA SC as follows.

*Note*

*This setup only needs to be done once per project.*

Set up the following links to RA SC:

1. In Keil MDK uVision, select **Tools > Customize Tools Menu...**
2. Select the **new** icon and fill in the fields as follows for each tool:
  - a. RA Smart Configurator:
    - Menu item name: Enter: RA Smart Configurator
    - Command: Select "." and navigate to rasc.exe
    - Initial Folder: Enter: \$P
    - Arguments: Enter: --device \$D --compiler ARMv6 configuration.xml
  - b. Device Partition Manager:
    - Menu item name: Enter: Device Partition Manager
    - Command: Select "." and navigate to rasc.exe
    - Initial Folder: Enter: \$P
    - Arguments: Enter: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "SL%L"

To reconfigure an existing project select **Tools > RA Smart Configurator**

To reconfigure the TrustZone partitions select **Tools > Device Partition Manager**

### 2.6.2.4 Build and Debug RA project

The project can be built by selecting the menu item **Project > Build Target** or tool bar item **Rebuild** or the keyboard shortcut F7.

Assembler, Compiler, Linker and Debugger settings can be changed in **Options for Target** dialog, which can be launched using the menu item **Project > Options for Target**, the tool bar item **Options for Target** or the keyboard shortcut Alt+F7.

Figure 128: Options for Target

RA SC will set up the uVision project to debug the selected device using J-Link or J-Link OB debugger by default.

A Debug session can be started or stopped by selecting the menu item **Debug > Start/Stop Debug Session** or keyboard shortcut CTRL+F5. When debugging for the first time, J-Link firmware update may be needed if requested by the tool.

Refer to the documentation from Keil to get more information on the debug features in uVision. Note that not all features supported by uVision debugger are implemented in the J-Link interface. Consult SEGGER J-Link documentation for more information.

### 2.6.2.5 Notes and Restrictions

1. **When debugging a TrustZone based project, the Secure project image MUST be downloaded before the Non Secure project.**
2. For TrustZone enabled devices, the user will need to manually set up the memory partitions using the "Renesas Device Partition Manager" from inside RA SC before downloading.

Figure 129: Renesas Device partition Manager

3. RA FSP contains a full set of drivers and middleware and may not be compatible with other CMSIS packs from Keil, Arm or third parties.
4. Flash programming is currently only supported through the debugger connection.

### 2.6.3 Using RA Smart Configurator with IAR EWARM

IAR Systems Embedded Workbench for Arm (EWARM) includes support for Renesas RA devices. These can be set up as bare metal designs within EWARM. However, most RA developers will want to integrate RA FSP drivers and middleware into their designs. RA SC will facilitate this.

RA SC generates a "Project Connection" file that can be loaded directly into EWARM to update project files.

#### 2.6.3.1 Prerequisites

- IAR EWARM installed and licensed. Please refer to the Release notes for the version to be installed.
- RA SC and FSP Installed

#### 2.6.3.2 Create new RA project

The following steps are required to create an RA project using IAR EWARM, RA SC and FSP:

1. Start the RA Smart Configurator.
2. Enter a project folder and project name.

Figure 130: RA SC project settings

3. Select the target device and IDE.

Figure 131: Target device and IDE selection

4. The rest of the project generator and FSP configuration operates the same as e2 studio. Refer to the previous sections for details.
5. On completion of the FSP configuration, press **Generate Project Content**.
6. A new IAR EWARM project file will be generated in the project path. Double click this file to open IAR EWARM and continue development as usual.
7. To Use RA SC with EWARM, RA SC needs to be configured as a tool in EWARM by selecting the menu item **Tools > Configure Tools...**. Select **New** to create a new tool in the dialog shown and add the following information:
  - Menu Text: **RA Smart Configurator**
    - a. Command: Select **Browse...** and navigate to rasc.exe in the installed RA SC
    - b. Argument: -compiler IAR configuration.xml
    - c. Initial Directory: \$PROJ\_DIR\$
    - d. Tool Available: Always
  - Menu Text: **Device Partition Manager**
    - a. Command: Select **Browse...** and navigate to rasc.exe in the installed RA SC
    - b. Argument: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "\$TARGET\_PATH\$"
    - c. Initial Directory: \$PROJ\_DIR\$
    - d. Tool Available: Always
8. RA SC can now be re-launched from EWARM using the menu item **Tools > RA Smart Configurator**.
9. A Project connection needs to be set up in EWARM to build the project. Select **Project > Add Project Connection** in EWARM and select **IAR Project Connection**. Navigate to the project folder and select buildinfo.ipcf and click **Open**. The project can now build in EWARM.

### 2.6.3.3 Notes and Restrictions

When starting a TrustZone enabled debug session Partition sizes are checked automatically.

- If partition sizes are set correctly, the debug session will launch as normal.

- If partition sizes need to be changed, IAR EWARM will prompt to run the Renesas Device Partition Manager. Select **Yes**. The Device Partition Manager will start with the required partition sizes prefilled.
- Select **Set TrustZone secure / non-secure boundaries** as the only action.
- Enter debugger details, if required.
- Select **Run** to program the partitions.
- Return to the IDE and relaunch the debug session

# Chapter 3 FSP Architecture

## 3.1 FSP Architecture Overview

This guide describes the Renesas Flexible Software Package (FSP) architecture and how to use the FSP Application Programming Interface (API).

### 3.1.1 C99 Use

The FSP uses the ISO/IEC 9899:1999 (C99) C programming language standard. Specific features introduced in C99 that are used include standard integer types (stdint.h), booleans (stdbool.h), designated initializers, and the ability to intermingle declarations and code.

### 3.1.2 Doxygen

Doxygen is the default documentation tool used by FSP. You can find Doxygen comments throughout the FSP source.

### 3.1.3 Weak Symbols

Weak symbols are used occasionally in the FSP. They are used to ensure that a project builds even when the user has not defined an optional function.

### 3.1.4 Memory Allocation

Dynamic memory allocation through use of the malloc() and free() functions are not used in FSP modules; all memory required by FSP modules is allocated in the application and passed to the module in a pointer. Exceptions are considered only for ports of 3rd party code that require dynamic memory.

### 3.1.5 FSP Terms

Term	Description	Reference
BSP	Short for Board Support Package. In the FSP the BSP provides just enough foundation to allow other FSP modules to work together without issue.	<a href="#">MCU Board Support Package</a>

Module	Modules can be peripheral drivers, purely software, or anything in between. Each module consists of a folder with source code, documentation, and anything else that the customer needs to use the code effectively. Modules are independent units, but they may depend on other modules. Applications can be built by combining multiple modules to provide the user with the features they need.	<a href="#">FSP Modules</a>
Driver	A driver is a specific kind of module that directly modifies registers on the MCU.	-
Interface	An interface contains API definitions that can be shared by modules with similar features. Interfaces are definitions only and do not add to code size.	<a href="#">FSP Interfaces</a>
Stacks	The FSP architecture is designed such that modules work together to form a stack. A stack consists of a top level module and all its dependencies.	<a href="#">FSP Stacks</a>
Module Instance	Single and independent instantiation of a module. An application may require two GPT timers. Each of these timers is a module instance of the r_gpt module.	-
Application	Code that is owned and maintained by the user. Application code may be based on sample application code provided by Renesas, but it is the responsibility of the user to maintain as necessary.	-

<p>Callback Function</p>	<p>This term refers to a function that is called when an event occurs. As an example, suppose the user would like to be notified every second based on the RTC. As part of the RTC configuration, a callback function can be supplied that will be jumped to during each RTC interrupt. When a single callback services multiple events, the arguments contain the triggering event. Callback functions for interrupts should be kept short and handled carefully because when they are called the MCU is still inside of an interrupt, delaying any pending interrupts.</p>	-
--------------------------	--	---

## 3.2 FSP Modules

Modules are the core building block of FSP. Modules can do many different things, but all modules share the basic concept of providing functionality upwards and requiring functionality from below.

Figure 132: Modules

The amount of functionality provided by a module is determined based on functional use cases. Common functionality required by multiple modules is often placed into a self-contained submodule so it can be reused. Code size, speed and complexity are also considered when defining a module.

The simplest FSP application consists of one module with the Board Support Package (BSP) and the user application on top.

Figure 133: Module with application

The Board Support Package (BSP) is the foundation for FSP modules, providing functionality to determine the MCU used as well as configuring clocks, interrupts and pins. For the sake of clarity, the BSP will be omitted from further diagrams.

### 3.2.1 Module Sources

Some modules distributed alongside FSP originate from outside sources. A full list of sources for FSP modules, including versions and hyperlinks, can be found in the Third Party Software section of the release notes for each release.

### 3.2.2 Module Distribution

All modules distributed with FSP are packaged as CMSIS components in CMSIS packs. Each module consists of source files and a tooling support file used to integrate the module with e2 studio or RASC. The tooling support file defines the configurations used to generate code in the ra\_gen and ra\_cfg folders.

### 3.2.3 Module Versioning

Module versions can be seen on the Components tab of the FSP Configuration editor. The FSP Configuration editor automatically selects compatible components.

All third party modules have a semantic version are versioned with their original semantic version plus added metadata `fsp.<fsp_semantic_version>`. The metadata is added to reflect the tooling support file added for the FSP configuration tool.

Third party modules versioned with `+renesas.<counter>` in the metadata have been forked and updated for FSP. If `+renesas.<counter>` is not in the metadata, the third party code is unchanged from its original source.

If changes are made to third party module source code to support FSP, the changes are pushed to a public Renesas GitHub fork of the original source. Links to Renesas forks are provided in the Third Party Software section of the release notes for each release.

Modules that originate from outside sources that do not have a semantic version are versioned with the FSP version.

All modules that are part of FSP or integrated with FSP are tested as a package. Mixing versions is not encouraged and may lead to support issues.

### 3.3 FSP Stacks

When modules are layered atop one another, an FSP stack is formed. The stacking process is performed by matching what one module provides with what another module requires. For example, the SPI module ([SPI \(r\\_spi\)](#)) requires a module that provides the transfer interface ([Transfer Interface](#)) to send or receive data without a CPU interrupt. The transfer interface requirement can be fulfilled by the DTC driver module ([Transfer \(r\\_dtc\)](#)).

Through this methodology the same code can be shared by several modules simultaneously. The example below illustrates how the same DTC module can be used with SPI ([SPI \(r\\_spi\)](#)), UART ([UART \(r\\_sci\\_uart\)](#)) and SDHI ([SD/MMC \(r\\_sdhi\)](#)).

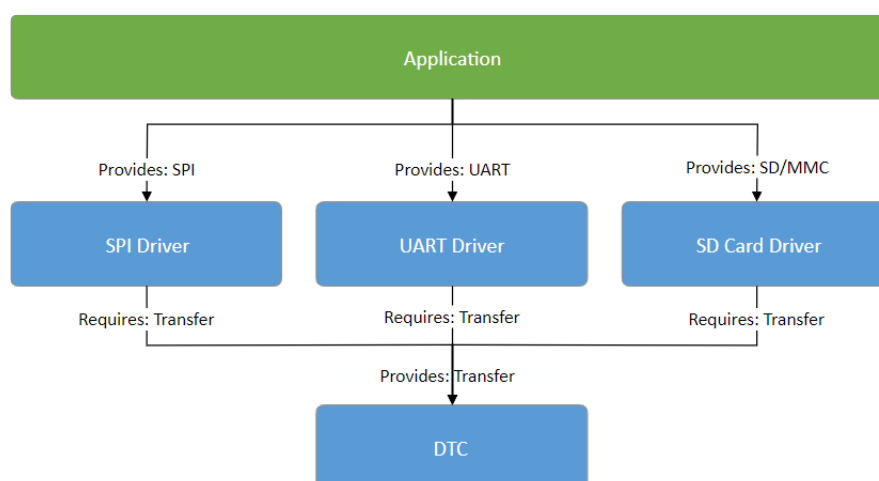

Figure 134: Stacks -- Shared DTC Module

The ability to stack modules ensures the flexibility of the architecture as a whole. If multiple modules include the same functionality issues arise when application features must work across different user designs. To ensure that modules are reusable, any dependent modules must be capable of being swapped out for other modules that provide the same features. The FSP architecture provides this flexibility to swap modules in and out through the use of FSP interfaces.

### 3.4 FSP Interfaces

At the architecture level, interfaces are the way that modules provide common features. This commonality allows modules that adhere to the same interface to be used interchangeably. Interfaces can be thought of as a contract between two modules - the modules agree to work together using the information that was established in the contract.

On RA hardware there is occasionally an overlap of features between different peripherals. For example, I2C communications can be achieved through use of the IIC peripheral or the SCI peripheral. However, there is a difference in the level of features provided by both peripherals; in I2C mode the SCI peripheral will only support a subset of the capabilities of the fully-featured IIC.

Interfaces aim to provide support for the common features that most users would expect. This means that some of the advanced features of a peripheral (such as IIC) might not be available in the interface. In most cases these features are still available through interface extensions.

In FSP design, interfaces are defined in header files. All interface header files are located in the folder

ra/fsp/inc/api and end with \*\_api.h. Interface extensions are defined in header files in the folder ra/fsp/inc/instances. The following sections detail what makes up an interface.

### 3.4.1 FSP Interface Enumerations

Whenever possible, interfaces use typed enumerations for function parameters and structure members.

```
typedef enum e_i2c_master_addr_mode
{
    I2C_MASTER_ADDR_MODE_7BIT = 1,    ///< Use 7-bit addressing mode
    I2C_MASTER_ADDR_MODE_10BIT = 2,   ///< Use 10-bit addressing mode
} i2c_master_addr_mode_t;
```

Enumerations remove uncertainty when deciding what values are available for a parameter. FSP enumeration options follow a strict naming convention where the name of the type is prefixed on the available options. Combining the naming convention with the autocomplete feature available in e2 studio (Ctrl + Space) provides the benefits of rapid coding while maintaining high readability.

### 3.4.2 FSP Interface Callback Functions

Callback functions allow modules to asynchronously alert the user application when an event has occurred, such as when a byte has been received over a UART channel or an IRQ pin is toggled. FSP driver modules define and handle the interrupt service routines for RA MCU peripherals to ensure any required hardware procedures are implemented. The interrupt service routines in FSP modules then call the user-defined callbacks to allow the application to respond.

Callback functions must be defined in the user application. They always return void and take a structure for their one parameter. The structure is defined in the interface for the module and is named <interface>\_callback\_args\_t. The contents of the structure may vary depending on the interface, but two members are common: event and p\_context.

The event member is an enumeration defined in the interface used by the application to determine why the callback was called. Using the UART example, the callback could be triggered for many different reasons, including when a byte is received, all bytes have been transmitted, or a framing error has occurred. The event member allows the application to determine which of these three events has occurred and handle it appropriately.

The p\_context member is used for providing user-specified data to the callback function. In many cases a callback function is shared between multiple channels or module instances; when the callback occurs, the code handling the callback needs context information so that it can determine which module instance the callback is for. For example, if the callback wanted to make an FSP API call in the callback, then at a minimum the callback will need a reference to the relevant control structure. To make this easy, the user can provide a pointer to the control structure as the p\_context. When the callback occurs, the control structure is passed in the p\_context element of the callback structure.

Callback functions are called from within an interrupt service routine. For this reason callback functions should be kept as short as possible so they do not affect the real time performance of the user's system. An example skeleton function for the flash interface callback is shown below.

```
void flash_callback (flash_callback_args_t * p_args)
{
    /* See what event caused this callback. */
    switch (p_args->event)
    {
        case FLASH_EVENT_ERASE_COMPLETE:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_WRITE_COMPLETE:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_BLANK:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_NOT_BLANK:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_ERR_DF_ACCESS:
            {
                /* Handle error. */
                break;
            }
        case FLASH_EVENT_ERR_CF_ACCESS:
            {
                /* Handle error. */
                break;
            }
    }
}
```

```
    }  
    case FLASH_EVENT_ERR_CMD_LOCKED:  
    {  
        /* Handle error. */  
        break;  
    }  
    case FLASH_EVENT_ERR_FAILURE:  
    {  
        /* Handle error. */  
        break;  
    }  
    case FLASH_EVENT_ERR_ONE_BIT:  
    {  
        /* Handle error. */  
        break;  
    }  
}
```

When a module is not directly used in the user application (that is, it is not the top layer of the stack), its callback function will be handled by the module above. For example, if a module requires a UART interface module the upper layer module will control and use the UART's callback function. In this case the user would not need to create a callback function for the UART module in their application code.

### 3.4.3 FSP Interface Data Structures

At a minimum, all FSP interfaces include three data structures: a configuration structure, an API structure, and an instance structure.

#### 3.4.3.1 FSP Interface Configuration Structure

The configuration structure is used for the initial configuration of a module during the <MODULE>\_Open() call. The structure consists of members such as channel number, bitrate, and operating mode.

The configuration structure is used purely as an input into the module. It may be stored and referenced by the module, so the configuration structure and anything it references must persist as long as the module is open.

The configuration structure is allocated for each module instance in files generated by the RA Configuration editor.

When FSP stacks are used, it is also important to understand that configuration structures only have members that apply to the current interface. If multiple layers in the same stack define the same configuration parameters then it becomes difficult to know where to modify the option. For example, the baud rate for a UART is only defined in the UART module instance. Any modules that use the UART interface rely on the baud rate being provided in the UART module instance and do not offer it in their own configuration structures.

### 3.4.3.2 FSP Interface API Structure

All interfaces include an API structure which contains function pointers for all the supported interface functions. An example structure for the DAC ([r\\_dac](#)) is shown below.

```
typedef struct st_dac_api
{
    /** Initial configuration.
     * @par Implemented as
     * - @ref R_DAC_Open()
     * - @ref R_DAC8_Open()
     *
     * @param[in] p_ctrl Pointer to control block. Must be declared by user. Elements
    set here.
     * @param[in] p_cfg Pointer to configuration structure. All elements of this
    structure must be set by user.
     */
    fsp_err_t (* open)(dac_ctrl_t * const p_ctrl, dac_cfg_t const * const p_cfg);
    /** Close the D/A Converter.
     * @par Implemented as
     * - @ref R_DAC_Close()
     * - @ref R_DAC8_Close()
     *
     * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
    timer.
     */
    fsp_err_t (* close)(dac_ctrl_t * const p_ctrl);
    /** Write sample value to the D/A Converter.
     * @par Implemented as
     * - @ref R_DAC_Write()
     * - @ref R_DAC8_Write()
     *

```

```
* @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
* @param[in] value Sample value to be written to the D/A Converter.
*/
fsp_err_t (* write)(dac_ctrl_t * const p_ctrl, uint16_t value);
/** Start the D/A Converter if it has not been started yet.
* @par Implemented as
* - @ref R_DAC_Start()
* - @ref R_DAC8_Start()
*
* @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
*/
fsp_err_t (* start)(dac_ctrl_t * const p_ctrl);
/** Stop the D/A Converter if the converter is running.
* @par Implemented as
* - @ref R_DAC_Stop()
* - @ref R_DAC8_Stop()
*
* @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
*/
fsp_err_t (* stop)(dac_ctrl_t * const p_ctrl);
} dac_api_t;
```

The API structure is what allows for modules to easily be swapped in and out for other modules that are instances of the same interface. Let's look at an example application using the DAC interface above.

RA MCUs have an internal DAC peripheral. If the DAC API structure in the DAC interface is not used the application can make calls directly into the module. In the example below the application is making calls to the [R\\_DAC\\_Write\(\)](#) function which is provided in the `r_dac` module.

Figure 135: DAC Write example

Now let's assume that the user needs more DAC channels than are available on the MCU and decides to add an external DAC module named `dac_external` using I2C for communications. The application must now distinguish between the two modules, adding complexity and further dependencies to the application.

Figure 136: DAC Write with two write modules

The use of interfaces and the API structure allows for the use of an abstracted DAC. This means that no extra logic is needed if the user's `dac_external` module implements the FSP DAC interface, so the application no longer depends upon hard-coded module function names. Instead the application now depends on the DAC interface API which can be implemented by any number of modules.

Figure 137: DAC Interface

### 3.4.3.3 FSP Interface Instance Structure

Every FSP interface also has an instance structure. The instance structure encapsulates everything required to use the module:

- A pointer to the instance API structure ([FSP Instance API](#))
- A pointer to the configuration structure
- A pointer to the control structure

The instance structure is not required at the application layer. It is used to connect modules to their dependencies (other than the BSP).

Instance structures have a standardized name of `<interface>_instance_t`. An example from the [Transfer Interface](#) is shown below.

```
typedef struct st_transfer_instance
{
    transfer_ctrl_t      * p_ctrl; ///< Pointer to the control structure for this
instance
    transfer_cfg_t const * p_cfg;   ///< Pointer to the configuration structure
for this instance
    transfer_api_t const * p_api;   ///< Pointer to the API structure for this
instance
} transfer_instance_t;
```

Note that when an instance structure variable is declared, the API is the only thing that is instance specific, not *module instance* specific. This is because all module instances of the same module share the same underlying module source code. If SPI is being used on SCI channels 0 and 2 then both module instances use the same API while the configuration and control structures are typically different.

## 3.5 FSP Instances

While interfaces dictate the features that are provided, instances actually implement those features. Each instance is tied to a specific interface. Instances use the enumerations, data structures, and API prototypes from the interface. This allows an application that uses an interface to swap out the instance when needed.

On RA MCUs some peripherals are used to implement multiple interfaces. In the example below the IIC and SPI peripherals map to only one interface each while the SCI peripheral implements three interfaces.

Figure 138: Instances

In FSP design, instances consist of the interface extension and API defined in the instance header file located in the folder `ra/fsp/inc/instances` and the module source `ra/fsp/src/<module>`.

### 3.5.1 FSP Instance Control Structure

The control structure is used as a unique identifier for the module instance and contains memory required by the module. Elements in the control structure are owned by the module and *must not be modified* by the application. The user allocates storage for a control structure, often as a global variable, then sends a pointer to it into the `<MODULE>_Open()` call for a module. At this point, the module initializes the structure as needed. The user must then send in a pointer to the control structure for all subsequent module calls.

### 3.5.2 FSP Interface Extensions

In some cases, instances require more information than is provided in the interface. This situation can occur in the following cases:

- An instance offers extra features that are not common to most instances of the interface. An example of this is the start source selection of the GPT (Timer, General PWM (`r_gpt`)). The GPT can be configured to start based on hardware events such as a falling edge on a trigger pin. This feature is not common to all timers, so it is included in the GPT instance.
- An interface must be very generic out of necessity. As an interface becomes more generic, the number of possible instances increases. An example of an interface that must be generic is a block media interface that abstracts functions required by a file system. Possible instances include SD card, SPI Flash, SDRAM, USB, and many more.

The `p_extend` member provides this extension function.

Use of interface extensions is not always necessary. Some instances do not offer an extension since all functionality is provided in the interface. In these cases the `p_extend` member can be set to `NULL`. The documentation for each instance indicates whether an interface extension is available and whether it is mandatory or optional.

#### 3.5.2.1 FSP Extended Configuration Structure

When extended configuration is required it can be supplied through the `p_extend` parameter of the interface configuration structure.

The extended configuration structure is part of the instance, but it is also still considered to be part of the configuration structure. All usage notes about the configuration structure described in [FSP Interface Configuration Structure](#) apply to the extended configuration structure as well.

The extended configuration structure and all typed structures and enumerations required to define it

make up the interface extension.

### 3.5.3 FSP Instance API

Each instance includes a constant global variable tying the interface API functions to the functions provided by the module. The name of this structure is standardized as `g_<interface>_on_<instance>`. Examples include `g_spi_on_spi`, `g_transfer_on_dtc`, and `g_adc_on_adc`. This structure is available to be used through an extern in the instance header file (`r_spi.h`, `r_dtc.h`, and `r_adc.h` respectively).

## 3.6 FSP API Standards

### 3.6.1 FSP Function Names

FSP functions start with the uppercase module name (`<MODULE>`). All modules have `<MODULE>_Open()` and `<MODULE>_Close()` functions. The `<MODULE>_Open()` function must be called before any of the other functions.

Other functions that will commonly be found are `<MODULE>_Read()`, `<MODULE>_Write()`, `<MODULE>_InfoGet()`, and `<MODULE>_StatusGet()`. The `<MODULE>_StatusGet()` function provides a status that could change asynchronously, while `<MODULE>_InfoGet()` provides information that cannot change after open or can only be updated by API calls. Example function names include:

- `R_SPI_Read()`, `R_SPI_Write()`, `R_SPI_WriteRead()`
- `R_SDHI_StatusGet()`
- `R_RTC_CalendarAlarmSet()`, `R_RTC_CalendarAlarmGet()`
- `R_FLASH_HP_AccessWindowSet()`, `R_FLASH_HP_AccessWindowClear()`

### 3.6.2 Use of const in API parameters

The `const` qualifier is used with API parameters whenever possible. An example case is shown below.

```
fsp_err_t R_FLASH_HP_Open(flash_ctrl_t * const p_api_ctrl, flash_cfg_t const * const p_cfg);
```

In this example, `flash_cfg_t` is a structure of configuration parameters for the `r_flash_hp` module. The parameter `p_cfg` is a pointer to this structure. The first `const` qualifier on `p_cfg` ensures the `flash_cfg_t` structure cannot be modified by `R_FLASH_HP_Open()`. This allows the structure to be allocated as a `const` variable and stored in ROM instead of RAM.

The `const` qualifier after the pointer star for both `p_ctrl` and `p_cfg` ensures the FSP function does not modify the input pointer addresses. While not fool-proof by any means this does provide some extra checking inside the FSP code to ensure that arguments that should not be altered are treated as such.

### 3.6.3 FSP Version Information

The BSP provides a function `R_FSP_VersionGet()` which fills in a structure of type `fsp_pack_version_t`. This can be used to determine the FSP version at runtime.

There are also `FSP_VERSION_*` macros in `fsp_version.h` that can be used to determine the FSP version at build time.

## 3.7 FSP Build Time Configurations

All modules have a build-time configuration header file. Most configuration options are supplied at run time, though options that are rarely used or apply to all instances of a module may be moved to build time. The advantage of using a build-time configuration option is to potentially reduce code size reduction by removing an unused feature.

All modules have a build time option to enable or disable parameter checking for the module. FSP modules check function arguments for validity when possible, though this feature is disabled by default to reduce code size. Enabling it can help catch parameter errors during development and debugging. By default, each module's parameter checking configuration inherits the BSP parameter checking setting (set on the BSP tab of the RA Configuration editor). Leaving each module's parameter checking configuration set to Default (BSP) allows parameter checking to be enabled or disabled globally in all FSP code through the parameter checking setting on the BSP tab.

If an error condition can reasonably be avoided it is only checked in a section of code that can be disabled by disabling parameter checking. Most FSP APIs can only return `FSP_SUCCESS` if parameter checking is disabled. An example of an error that cannot be reasonably avoided is the "bus busy" error that occurs when another master is using an I2C bus. This type of error can be returned even if parameter checking is disabled.

## 3.8 FSP File Structure

The high-level file structure of an FSP project is shown below.

```
ra_gen
ra
+---fsp
    +---inc
    |   +---api
    |   \---instances
    \---src
        +---bsp
        \---r_module
ra_cfg
+---fsp_cfg
    +---bsp
    +---driver
```

Directly underneath the base `ra` folder the folders are split into the source and include folders. Include folders are kept separate from the source for easy browsing and easy setup of include paths.

The `ra_gen` folder contains code generated by the RA Configuration editor. This includes global variables for the control structure and configuration structure for each module.

The `ra_cfg` folder is where configuration header files are stored for each module. See [FSP Build Time Configurations](#) for information on what is provided in these header files.

## 3.9 FSP TrustZone Support

TrustZone support for FSP is primarily handled in the RA Configuration Tool.

### 3.9.1 FSP TrustZone Projects

During development of a TrustZone project, users create an RA TrustZone Secure Project first, followed by an RA TrustZone Non-secure Project that is linked to the RA TrustZone Secure Project. Allocation of secure memory is handled automatically within the tooling. The non-secure project starts at the required alignment boundary beyond the memory taken by the secure project.

### 3.9.2 Non-Secure Callable Guard Functions

The tooling generates guard functions for any module marked as Non-secure Callable. These guard functions are owned by the application once generated, so they can be modified as necessary by the secure application developer.

The default non-secure callable guard functions limit the configuration and control structure to the structures generated in the secure project. They also check any input pointers to ensure the caller does not overwrite secure memory.

### 3.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules

If the non-secure project needs a callback function from a non-secure callable module, the callback can be registered after the module is opened using the `callback_set()` guard function.

### 3.9.4 Migrating TrustZone Project to newer FSP Version

The TrustZone projects can be migrated to newer FSP version as mentioned in the following resource.

- [Migrating Projects to New FSP Version](#) (Application Note)

Additional steps are required if newer FSP version introduces new guard function. In such case, simply migrating the project would result in the build failure for non secure project. Following extra steps are required:

- If `xxx_guard.c` file in `src` folder of secure project was not modified earlier
  1. Delete the `xxx_guard.c` file in secure project before generating the Project Files.
  2. Generate Project contents and build the secure project.
  3. Follow the steps in Application Note to migrate the Non-Secure project.
- If `xxx_guard.c` file in `src` folder of secure project was modified earlier
  1. Take the backup of existing `xxx_guard.c` file and delete it from `src` folder of secure project before generating the Project Files.
  2. Generate Project contents. It creates a new `guard.c` file. Compare the contents of the older file and newly generated `guard.c` file.
  3. Copy the modified code from the older file (i.e Security checks added by user) and add it to newly generated file.

4. Follow the steps in Application Note to migrate the Non-Secure project.

### 3.9.5 Additional TrustZone Information

The following resources provide technical background, application notes and example projects that demonstrate key TrustZone concepts and implementation procedures.

- [The Benefits of Using Arm® TrustZone® in Your Design](#) (Brochure)
- [RA Arm® TrustZone® Tooling Primer](#) (Application Note)
- [Renesas RA Family Security Design with Arm® TrustZone® - IP Protection](#) (Application Note)
- [Renesas RA Family Securing Data at Rest Using the Arm® TrustZone®](#) (Application Note)

## 3.10 FSP Architecture in Practice

### 3.10.1 FSP Connecting Layers

FSP modules are meant to be both reusable and stackable. It is important to remember that modules are not dependent upon other modules, but upon other interfaces. The user is then free to fulfill the interface using the instance that best fits their needs.

Figure 139: Connecting layers

In the image above interface Y is a dependency of interface X and has its own dependency on interface Z. Interface X only has a dependency on interface Y. Interface X has no knowledge of interface Z. This is a requirement for ensuring that layers can easily be swapped out.

### 3.10.2 Using FSP Modules in an Application

The typical use of an FSP module involves generating required module data then using the API in the application.

#### 3.10.2.1 Create a Module Instance in the RA Configuration Editor

The RA Configuration editor (available both in the Renesas e2 studio IDE as well as through the standalone RA Smart Configurator) provides a graphical user interface for setting the parameters of the interface and instance configuration structures. It also automatically includes those structures (once they are configured in the GUI) in application-specific header files that can be included in application code.

The RA Configuration editor allocates storage for the control structures, all required configuration

structures, and the instance structure in generated files in the ra\_gen folder. Use the **Properties** window to set the values for the members of the configuration structures as needed. Refer to the Configuration section of the module usage notes for documentation about the configuration options.

If the interface has a callback function option then the application must declare and define the function. The return value is always of type void and the parameter to the function is a typed structure of name <interface>\_callback\_args\_t. Once the function has been defined, assign its name to the p\_callback member of the configuration structure. Callback function names can be assigned through the **Properties** window for the selected module.

### 3.10.2.2 Use the Instance API in the Application

Call the module's <MODULE>\_Open() function. Pass pointers to the generated control structure and configuration structure. The names of these structures are based on the 'Name' field provided in the configuration editor. The control structure is <Name>\_ctrl and the configuration structure is <Name>\_cfg. An example <MODULE>\_Open() call for an r\_rtc module instance named g\_clock is:

```
R_RTC_Open(&g_clock_ctrl, &g_clock_cfg);
```

#### Note

*Each layer in the FSP Stack is responsible for calling the API functions of its dependencies. This means that users are only responsible for calling the API functions at the layer at which they are interfacing. Using the example above of a SPI module with a DTC dependency, the application uses only SPI APIs. The application starts by calling R\_SPI\_Open(). Internally, the SPI module opens the DTC. It locates R\_DTC\_Open() by accessing the dependent transfer interface function pointers from the pointers DTC instances (spi\_cfg\_t::p\_transfer\_tx and spi\_cfg\_t::p\_transfer\_rx) to open the DTC.*

Refer to the module usage notes for example code to help get started with any particular module.

# Chapter 4 API Reference

This section includes the FSP API Reference for the Module and Interface level functions.

- ▶ [BSP](#)                      Common code shared by FSP drivers
- ▶ [Modules](#)                      Modules are the smallest unit of software available in the FSP. Each module implements one interface
- ▶ [Interfaces](#)                      The FSP interfaces provide APIs for common functionality. They can be implemented by one or more modules. Modules can use other modules as dependencies using this interface layer

## 4.1 BSP

### Detailed Description

Common code shared by FSP drivers.

#### Modules

##### [BSP I/O access](#)

This module provides basic read/write access to port pins.

##### [Common Error Codes](#)

##### [MCU Board Support Package](#)

The BSP is responsible for getting the MCU from reset to the user's application. Before reaching the user's application, the BSP sets up the stacks, heap, clocks, interrupts, C runtime environment, and stack monitor.

#### Data Structures

union [fsp\\_pack\\_version\\_t](#)

struct [fsp\\_pack\\_version\\_t.\\_\\_unnamed\\_\\_](#)

#### Macros

```
#define FSP_VERSION_MAJOR
```

```
#define FSP_VERSION_MINOR
```

```
#define FSP_VERSION_PATCH
```

```
#define FSP_VERSION_BUILD
```

```
#define FSP_VERSION_STRING
```

```
#define FSP_VERSION_BUILD_STRING
```

## Data Structure Documentation

uint32_t	version_id	Version id
struct fsp_pack_version_t	__unnamed__	Code version parameters, little endian order.  DEPRECATED: Anonymous structure.
struct version_id_b_s	version_id_b	

### ◆ fsp\_pack\_version\_t.\_\_unnamed\_\_

struct fsp_pack_version_t.__unnamed__		
Code version parameters, little endian order. DEPRECATED: Anonymous structure.		
Data Fields		
uint8_t	build	Build version of FSP Pack.
uint8_t	patch	Patch version of FSP Pack.
uint8_t	minor	Minor version of FSP Pack.
uint8_t	major	Major version of FSP Pack.

## Macro Definition Documentation

### ◆ FSP\_VERSION\_MAJOR

#define FSP_VERSION_MAJOR
FSP pack major version.

### ◆ FSP\_VERSION\_MINOR

```
#define FSP_VERSION_MINOR
```

FSP pack minor version.

### ◆ FSP\_VERSION\_PATCH

```
#define FSP_VERSION_PATCH
```

FSP pack patch version.

### ◆ FSP\_VERSION\_BUILD

```
#define FSP_VERSION_BUILD
```

FSP pack version build number (currently unused).

### ◆ FSP\_VERSION\_STRING

```
#define FSP_VERSION_STRING
```

Public FSP version name.

### ◆ FSP\_VERSION\_BUILD\_STRING

```
#define FSP_VERSION_BUILD_STRING
```

Unique FSP version ID.

## 4.1.1 BSP I/O access

### BSP

#### Functions

```
__STATIC_INLINE uint32_t R_BSP_PinRead (bsp_io_port_pin_t pin)
```

```
__STATIC_INLINE void R_BSP_PinWrite (bsp_io_port_pin_t pin, bsp_io_level_t level)
```

```
__STATIC_INLINE void R_BSP_PinCfg (bsp_io_port_pin_t pin, uint32_t cfg)
```

```
__STATIC_INLINE void R_BSP_PinAccessEnable (void)
```

```
__STATIC_INLINE void R_BSP_PinAccessDisable (void)
```

## Detailed Description

This module provides basic read/write access to port pins.

## Enumerations

enum [bsp\\_io\\_level\\_t](#)

enum [bsp\\_io\\_direction\\_t](#)

enum [bsp\\_io\\_port\\_t](#)

enum [bsp\\_io\\_port\\_pin\\_t](#)

## Enumeration Type Documentation

### ◆ [bsp\\_io\\_level\\_t](#)

enum <a href="#">bsp_io_level_t</a>	
Levels that can be set and read for individual pins	
Enumerator	
BSP_IO_LEVEL_LOW	Low.
BSP_IO_LEVEL_HIGH	High.

### ◆ [bsp\\_io\\_direction\\_t](#)

enum <a href="#">bsp_io_direction_t</a>	
Direction of individual pins	
Enumerator	
BSP_IO_DIRECTION_INPUT	Input.
BSP_IO_DIRECTION_OUTPUT	Output.

◆ **bsp\_io\_port\_t**

enum <code>bsp_io_port_t</code>	
Superset list of all possible IO ports.	
Enumerator	
<code>BSP_IO_PORT_00</code>	IO port 0.
<code>BSP_IO_PORT_01</code>	IO port 1.
<code>BSP_IO_PORT_02</code>	IO port 2.
<code>BSP_IO_PORT_03</code>	IO port 3.
<code>BSP_IO_PORT_04</code>	IO port 4.
<code>BSP_IO_PORT_05</code>	IO port 5.
<code>BSP_IO_PORT_06</code>	IO port 6.
<code>BSP_IO_PORT_07</code>	IO port 7.
<code>BSP_IO_PORT_08</code>	IO port 8.
<code>BSP_IO_PORT_09</code>	IO port 9.
<code>BSP_IO_PORT_10</code>	IO port 10.
<code>BSP_IO_PORT_11</code>	IO port 11.
<code>BSP_IO_PORT_12</code>	IO port 12.
<code>BSP_IO_PORT_13</code>	IO port 13.
<code>BSP_IO_PORT_14</code>	IO port 14.

◆ **bsp\_io\_port\_pin\_t**

enum <code>bsp_io_port_pin_t</code>	
Superset list of all possible IO port pins.	
Enumerator	
<code>BSP_IO_PORT_00_PIN_00</code>	IO port 0 pin 0.
<code>BSP_IO_PORT_00_PIN_01</code>	IO port 0 pin 1.

BSP_IO_PORT_00_PIN_02	IO port 0 pin 2.
BSP_IO_PORT_00_PIN_03	IO port 0 pin 3.
BSP_IO_PORT_00_PIN_04	IO port 0 pin 4.
BSP_IO_PORT_00_PIN_05	IO port 0 pin 5.
BSP_IO_PORT_00_PIN_06	IO port 0 pin 6.
BSP_IO_PORT_00_PIN_07	IO port 0 pin 7.
BSP_IO_PORT_00_PIN_08	IO port 0 pin 8.
BSP_IO_PORT_00_PIN_09	IO port 0 pin 9.
BSP_IO_PORT_00_PIN_10	IO port 0 pin 10.
BSP_IO_PORT_00_PIN_11	IO port 0 pin 11.
BSP_IO_PORT_00_PIN_12	IO port 0 pin 12.
BSP_IO_PORT_00_PIN_13	IO port 0 pin 13.
BSP_IO_PORT_00_PIN_14	IO port 0 pin 14.
BSP_IO_PORT_00_PIN_15	IO port 0 pin 15.
BSP_IO_PORT_01_PIN_00	IO port 1 pin 0.
BSP_IO_PORT_01_PIN_01	IO port 1 pin 1.
BSP_IO_PORT_01_PIN_02	IO port 1 pin 2.
BSP_IO_PORT_01_PIN_03	IO port 1 pin 3.
BSP_IO_PORT_01_PIN_04	IO port 1 pin 4.
BSP_IO_PORT_01_PIN_05	IO port 1 pin 5.
BSP_IO_PORT_01_PIN_06	IO port 1 pin 6.
BSP_IO_PORT_01_PIN_07	IO port 1 pin 7.
BSP_IO_PORT_01_PIN_08	IO port 1 pin 8.
BSP_IO_PORT_01_PIN_09	IO port 1 pin 9.

BSP_IO_PORT_01_PIN_10	IO port 1 pin 10.
BSP_IO_PORT_01_PIN_11	IO port 1 pin 11.
BSP_IO_PORT_01_PIN_12	IO port 1 pin 12.
BSP_IO_PORT_01_PIN_13	IO port 1 pin 13.
BSP_IO_PORT_01_PIN_14	IO port 1 pin 14.
BSP_IO_PORT_01_PIN_15	IO port 1 pin 15.
BSP_IO_PORT_02_PIN_00	IO port 2 pin 0.
BSP_IO_PORT_02_PIN_01	IO port 2 pin 1.
BSP_IO_PORT_02_PIN_02	IO port 2 pin 2.
BSP_IO_PORT_02_PIN_03	IO port 2 pin 3.
BSP_IO_PORT_02_PIN_04	IO port 2 pin 4.
BSP_IO_PORT_02_PIN_05	IO port 2 pin 5.
BSP_IO_PORT_02_PIN_06	IO port 2 pin 6.
BSP_IO_PORT_02_PIN_07	IO port 2 pin 7.
BSP_IO_PORT_02_PIN_08	IO port 2 pin 8.
BSP_IO_PORT_02_PIN_09	IO port 2 pin 9.
BSP_IO_PORT_02_PIN_10	IO port 2 pin 10.
BSP_IO_PORT_02_PIN_11	IO port 2 pin 11.
BSP_IO_PORT_02_PIN_12	IO port 2 pin 12.
BSP_IO_PORT_02_PIN_13	IO port 2 pin 13.
BSP_IO_PORT_02_PIN_14	IO port 2 pin 14.
BSP_IO_PORT_02_PIN_15	IO port 2 pin 15.
BSP_IO_PORT_03_PIN_00	IO port 3 pin 0.
BSP_IO_PORT_03_PIN_01	IO port 3 pin 1.

BSP_IO_PORT_03_PIN_02	IO port 3 pin 2.
BSP_IO_PORT_03_PIN_03	IO port 3 pin 3.
BSP_IO_PORT_03_PIN_04	IO port 3 pin 4.
BSP_IO_PORT_03_PIN_05	IO port 3 pin 5.
BSP_IO_PORT_03_PIN_06	IO port 3 pin 6.
BSP_IO_PORT_03_PIN_07	IO port 3 pin 7.
BSP_IO_PORT_03_PIN_08	IO port 3 pin 8.
BSP_IO_PORT_03_PIN_09	IO port 3 pin 9.
BSP_IO_PORT_03_PIN_10	IO port 3 pin 10.
BSP_IO_PORT_03_PIN_11	IO port 3 pin 11.
BSP_IO_PORT_03_PIN_12	IO port 3 pin 12.
BSP_IO_PORT_03_PIN_13	IO port 3 pin 13.
BSP_IO_PORT_03_PIN_14	IO port 3 pin 14.
BSP_IO_PORT_03_PIN_15	IO port 3 pin 15.
BSP_IO_PORT_04_PIN_00	IO port 4 pin 0.
BSP_IO_PORT_04_PIN_01	IO port 4 pin 1.
BSP_IO_PORT_04_PIN_02	IO port 4 pin 2.
BSP_IO_PORT_04_PIN_03	IO port 4 pin 3.
BSP_IO_PORT_04_PIN_04	IO port 4 pin 4.
BSP_IO_PORT_04_PIN_05	IO port 4 pin 5.
BSP_IO_PORT_04_PIN_06	IO port 4 pin 6.
BSP_IO_PORT_04_PIN_07	IO port 4 pin 7.
BSP_IO_PORT_04_PIN_08	IO port 4 pin 8.

BSP_IO_PORT_11_PIN_10	IO port 11 pin 10.
BSP_IO_PORT_11_PIN_11	IO port 11 pin 11.
BSP_IO_PORT_11_PIN_12	IO port 11 pin 12.
BSP_IO_PORT_11_PIN_13	IO port 11 pin 13.
BSP_IO_PORT_11_PIN_14	IO port 11 pin 14.
BSP_IO_PORT_11_PIN_15	IO port 11 pin 15.
BSP_IO_PORT_12_PIN_00	IO port 12 pin 0.
BSP_IO_PORT_12_PIN_01	IO port 12 pin 1.

BSP_IO_PORT_12_PIN_02	IO port 12 pin 2.
BSP_IO_PORT_12_PIN_03	IO port 12 pin 3.
BSP_IO_PORT_12_PIN_04	IO port 12 pin 4.
BSP_IO_PORT_12_PIN_05	IO port 12 pin 5.
BSP_IO_PORT_12_PIN_06	IO port 12 pin 6.
BSP_IO_PORT_12_PIN_07	IO port 12 pin 7.
BSP_IO_PORT_12_PIN_08	IO port 12 pin 8.
BSP_IO_PORT_12_PIN_09	IO port 12 pin 9.
BSP_IO_PORT_12_PIN_10	IO port 12 pin 10.
BSP_IO_PORT_12_PIN_11	IO port 12 pin 11.
BSP_IO_PORT_12_PIN_12	IO port 12 pin 12.
BSP_IO_PORT_12_PIN_13	IO port 12 pin 13.
BSP_IO_PORT_12_PIN_14	IO port 12 pin 14.
BSP_IO_PORT_12_PIN_15	IO port 12 pin 15.
BSP_IO_PORT_13_PIN_00	IO port 13 pin 0.
BSP_IO_PORT_13_PIN_01	IO port 13 pin 1.
BSP_IO_PORT_13_PIN_02	IO port 13 pin 2.
BSP_IO_PORT_13_PIN_03	IO port 13 pin 3.
BSP_IO_PORT_13_PIN_04	IO port 13 pin 4.
BSP_IO_PORT_13_PIN_05	IO port 13 pin 5.
BSP_IO_PORT_13_PIN_06	IO port 13 pin 6.
BSP_IO_PORT_13_PIN_07	IO port 13 pin 7.
BSP_IO_PORT_13_PIN_08	IO port 13 pin 8.
BSP_IO_PORT_13_PIN_09	IO port 13 pin 9.

BSP_IO_PORT_13_PIN_10	IO port 13 pin 10.
BSP_IO_PORT_13_PIN_11	IO port 13 pin 11.
BSP_IO_PORT_13_PIN_12	IO port 13 pin 12.
BSP_IO_PORT_13_PIN_13	IO port 13 pin 13.
BSP_IO_PORT_13_PIN_14	IO port 13 pin 14.
BSP_IO_PORT_13_PIN_15	IO port 13 pin 15.
BSP_IO_PORT_14_PIN_00	IO port 14 pin 0.
BSP_IO_PORT_14_PIN_01	IO port 14 pin 1.
BSP_IO_PORT_14_PIN_02	IO port 14 pin 2.
BSP_IO_PORT_14_PIN_03	IO port 14 pin 3.
BSP_IO_PORT_14_PIN_04	IO port 14 pin 4.
BSP_IO_PORT_14_PIN_05	IO port 14 pin 5.
BSP_IO_PORT_14_PIN_06	IO port 14 pin 6.
BSP_IO_PORT_14_PIN_07	IO port 14 pin 7.
BSP_IO_PORT_14_PIN_08	IO port 14 pin 8.
BSP_IO_PORT_14_PIN_09	IO port 14 pin 9.
BSP_IO_PORT_14_PIN_10	IO port 14 pin 10.
BSP_IO_PORT_14_PIN_11	IO port 14 pin 11.
BSP_IO_PORT_14_PIN_12	IO port 14 pin 12.
BSP_IO_PORT_14_PIN_13	IO port 14 pin 13.
BSP_IO_PORT_14_PIN_14	IO port 14 pin 14.
BSP_IO_PORT_14_PIN_15	IO port 14 pin 15.

## Function Documentation

---

◆ **R\_BSP\_PinRead()**

<code>__STATIC_INLINE uint32_t R_BSP_PinRead ( bsp_io_port_pin_t pin)</code>		
Read the current input level of the pin.		
<b>Parameters</b>		
[in]	pin	The pin
<b>Return values</b>		
Current		input level

◆ **R\_BSP\_PinWrite()**

<code>__STATIC_INLINE void R_BSP_PinWrite ( bsp_io_port_pin_t pin, bsp_io_level_t level )</code>		
Set a pin to output and set the output level to the level provided. If PFS protection is enabled, disable PFS protection using <a href="#">R_BSP_PinAccessEnable()</a> before calling this function.		
<b>Parameters</b>		
[in]	pin	The pin
[in]	level	The level

◆ **R\_BSP\_PinCfg()**

<code>__STATIC_INLINE void R_BSP_PinCfg ( bsp_io_port_pin_t pin, uint32_t cfg )</code>		
Configure a pin. If PFS protection is enabled, disable PFS protection using <a href="#">R_BSP_PinAccessEnable()</a> before calling this function.		
<b>Parameters</b>		
[in]	pin	The pin
[in]	cfg	Configuration for the pin (PmnPFS register setting)

◆ **R\_BSP\_PinAccessEnable()**

<code>__STATIC_INLINE void R_BSP_PinAccessEnable ( void )</code>		
Enable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code.		

**◆ R\_BSP\_PinAccessDisable()**

```
__STATIC_INLINE void R_BSP_PinAccessDisable ( void )
```

Disable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code.

**4.1.2 Common Error Codes****BSP****Detailed Description**

All FSP modules share these common error codes.

**Macros**

```
#define FSP_PARAMETER_NOT_USED(p)
```

```
#define FSP_CPP_HEADER
```

```
#define FSP_HEADER
```

```
#define FSP_SECURE_ARGUMENT
```

**Enumerations**

```
enum fsp_err_t
```

**Macro Definition Documentation****◆ FSP\_PARAMETER\_NOT\_USED**

```
#define FSP_PARAMETER_NOT_USED ( p)
```

This macro is used to suppress compiler messages about a parameter not being used in a function. The nice thing about using this implementation is that it does not take any extra RAM or ROM.

**◆ FSP\_CPP\_HEADER**

```
#define FSP_CPP_HEADER
```

Determine if a C++ compiler is being used. If so, ensure that standard C is used to process the API information.

**◆ FSP\_HEADER**

```
#define FSP_HEADER
```

FSP Header and Footer definitions

**◆ FSP\_SECURE\_ARGUMENT**

```
#define FSP_SECURE_ARGUMENT
```

Macro to be used when argument to function is ignored since function call is NSC and the parameter is statically defined on the Secure side.

**Enumeration Type Documentation**

---

## ◆ fsp\_err\_t

enum fsp_err_t	
Common error codes	
Enumerator	
FSP_ERR_ASSERTION	A critical assertion has failed.
FSP_ERR_INVALID_POINTER	Pointer points to invalid memory location.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
FSP_ERR_INVALID_CHANNEL	Selected channel does not exist.
FSP_ERR_INVALID_MODE	Unsupported or incorrect mode.
FSP_ERR_UNSUPPORTED	Selected mode not supported by this API.
FSP_ERR_NOT_OPEN	Requested channel is not configured or API not open.
FSP_ERR_IN_USE	Channel/peripheral is running/busy.
FSP_ERR_OUT_OF_MEMORY	Allocate more memory in the driver's cfg.h.
FSP_ERR_HW_LOCKED	Hardware is locked.
FSP_ERR_IRQ_BSP_DISABLED	IRQ not enabled in BSP.
FSP_ERR_OVERFLOW	Hardware overflow.
FSP_ERR_UNDERFLOW	Hardware underflow.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_APPROXIMATION	Could not set value to exact result.
FSP_ERR_CLAMPED	Value had to be limited for some reason.
FSP_ERR_INVALID_RATE	Selected rate could not be met.
FSP_ERR_ABORTED	An operation was aborted.
FSP_ERR_NOT_ENABLED	Requested operation is not enabled.
FSP_ERR_TIMEOUT	Timeout error.

FSP_ERR_INVALID_BLOCKS	Invalid number of blocks supplied.
FSP_ERR_INVALID_ADDRESS	Invalid address supplied.
FSP_ERR_INVALID_SIZE	Invalid size/length supplied for operation.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_ERASE_FAILED	Erase operation failed.
FSP_ERR_INVALID_CALL	Invalid function call is made.
FSP_ERR_INVALID_HW_CONDITION	Detected hardware is in invalid condition.
FSP_ERR_INVALID_FACTORY_FLASH	Factory flash is not available on this MCU.
FSP_ERR_INVALID_STATE	API or command not valid in the current state.
FSP_ERR_NOT_ERASED	Erase verification failed.
FSP_ERR_SECTOR_RELEASE_FAILED	Sector release failed.
FSP_ERR_NOT_INITIALIZED	Required initialization not complete.
FSP_ERR_NOT_FOUND	The requested item could not be found.
FSP_ERR_NO_CALLBACK_MEMORY	Non-secure callback memory not provided for non-secure callback.
FSP_ERR_BUFFER_EMPTY	No data available in buffer.
FSP_ERR_INVALID_DATA	Accuracy of data is not guaranteed.
FSP_ERR_INTERNAL	Internal error.
FSP_ERR_WAIT_ABORTED	Wait aborted.
FSP_ERR_FRAMING	Framing error occurs.
FSP_ERR_BREAK_DETECT	Break signal detects.
FSP_ERR_PARITY	Parity error occurs.
FSP_ERR_RXBUF_OVERFLOW	Receive queue overflow.
FSP_ERR_QUEUE_UNAVAILABLE	Can't open s/w queue.
FSP_ERR_INSUFFICIENT_SPACE	Not enough space in transmission circular

	buffer.
FSP_ERR_INSUFFICIENT_DATA	Not enough data in receive circular buffer.
FSP_ERR_TRANSFER_ABORTED	The data transfer was aborted.
FSP_ERR_MODE_FAULT	Mode fault error.
FSP_ERR_READ_OVERFLOW	Read overflow.
FSP_ERR_SPI_PARITY	Parity error.
FSP_ERR_OVERRUN	Overrun error.
FSP_ERR_CLOCK_INACTIVE	Inactive clock specified as system clock.
FSP_ERR_CLOCK_ACTIVE	Active clock source cannot be modified without stopping first.
FSP_ERR_NOT_STABILIZED	Clock has not stabilized after its been turned on/off.
FSP_ERR_PLL_SRC_INACTIVE	PLL initialization attempted when PLL source is turned off.
FSP_ERR_OSC_STOP_DET_ENABLED	Illegal attempt to stop LOCO when Oscillation stop is enabled.
FSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detection status flag is set.
FSP_ERR_OSC_STOP_CLOCK_ACTIVE	Attempt to clear Oscillation Stop Detect Status with PLL/MAIN_OSC active.
FSP_ERR_CLKOUT_EXCEEDED	Output on target output clock pin exceeds maximum supported limit.
FSP_ERR_USB_MODULE_ENABLED	USB clock configure request with USB Module enabled.
FSP_ERR_HARDWARE_TIMEOUT	A register read or write timed out.
FSP_ERR_LOW_VOLTAGE_MODE	Invalid clock setting attempted in low voltage mode.
FSP_ERR_PE_FAILURE	Unable to enter Programming mode.
FSP_ERR_CMD_LOCKED	Peripheral in command locked state.
FSP_ERR_FCLK	

	FCLK must be $\geq 4$ MHz.
FSP_ERR_INVALID_LINKED_ADDRESS	Function or data are linked at an invalid region of memory.
FSP_ERR_BLANK_CHECK_FAILED	Blank check operation failed.
FSP_ERR_INVALID_CAC_REF_CLOCK	Measured clock rate < reference clock rate.
FSP_ERR_INVALID_RESULT	The result of one or more calculations was +/- infinity.
FSP_ERR_CLOCK_GENERATION	Clock cannot be specified as system clock.
FSP_ERR_INVALID_TIMING_SETTING	Invalid timing parameter.
FSP_ERR_INVALID_LAYER_SETTING	Invalid layer parameter.
FSP_ERR_INVALID_ALIGNMENT	Invalid memory alignment found.
FSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction parameter.
FSP_ERR_INVALID_LAYER_FORMAT	Invalid color format in layer.
FSP_ERR_INVALID_UPDATE_TIMING	Invalid timing for register update.
FSP_ERR_INVALID_CLUT_ACCESS	Invalid access to CLUT entry.
FSP_ERR_INVALID_FADE_SETTING	Invalid fade-in/fade-out setting.
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid gamma correction parameter.
FSP_ERR_JPEG_ERR	JPEG error.
FSP_ERR_JPEG_SOI_NOT_DETECTED	SOI not detected until EOI detected.
FSP_ERR_JPEG_SOF1_TO_SOFF_DETECTED	SOF1 to SOFF detected.
FSP_ERR_JPEG_UNSUPPORTED_PIXEL_FORMAT	Unprovided pixel format detected.
FSP_ERR_JPEG_SOF_ACCURACY_ERROR	SOF accuracy error: other than 8 detected.
FSP_ERR_JPEG_DQT_ACCURACY_ERROR	DQT accuracy error: other than 0 detected.
FSP_ERR_JPEG_COMPONENT_ERROR1	Component error 1: the number of SOF0 header components detected is other than 1, 3, or 4.
FSP_ERR_JPEG_COMPONENT_ERROR2	Component error 2: the number of components

	differs between SOF0 header and SOS.
FSP_ERR_JPEG_SOF0_DQT_DHT_NOT_DETECTED	SOF0, DQT, and DHT not detected when SOS detected.
FSP_ERR_JPEG_SOS_NOT_DETECTED	SOS not detected: SOS not detected until EOI detected.
FSP_ERR_JPEG_EOI_NOT_DETECTED	EOI not detected (default)
FSP_ERR_JPEG_RESTART_INTERVAL_DATA_NUMBER_ERROR	Restart interval data number error detected.
FSP_ERR_JPEG_IMAGE_SIZE_ERROR	Image size error detected.
FSP_ERR_JPEG_LAST_MCU_DATA_NUMBER_ERROR	Last MCU data number error detected.
FSP_ERR_JPEG_BLOCK_DATA_NUMBER_ERROR	Block data number error detected.
FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	User provided buffer size not enough.
FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE	JPEG Image size is not aligned with MCU.
FSP_ERR_CALIBRATE_FAILED	Calibration failed.
FSP_ERR_IIRFA_ECC_1BIT	1-bit ECC error detected
FSP_ERR_IIRFA_ECC_2BIT	2-bit ECC error detected
FSP_ERR_IP_HARDWARE_NOT_PRESENT	Requested IP does not exist on this device.
FSP_ERR_IP_UNIT_NOT_PRESENT	Requested unit does not exist on this device.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this device.
FSP_ERR_NO_MORE_BUFFER	No more buffer found in the memory block pool.
FSP_ERR_ILLEGAL_BUFFER_ADDRESS	Buffer address is out of block memory pool.
FSP_ERR_INVALID_WORKBUFFER_SIZE	Work buffer size is invalid.
FSP_ERR_INVALID_MSG_BUFFER_SIZE	Message buffer size is invalid.
FSP_ERR_TOO_MANY_BUFFERS	Number of buffer is too many.
FSP_ERR_NO_SUBSCRIBER_FOUND	No message subscriber found.

FSP_ERR_MESSAGE_QUEUE_EMPTY	No message found in the message queue.
FSP_ERR_MESSAGE_QUEUE_FULL	No room for new message in the message queue.
FSP_ERR_ILLEGAL_SUBSCRIBER_LISTS	Message subscriber lists is illegal.
FSP_ERR_BUFFER_RELEASED	Buffer has been released.
FSP_ERR_D2D_ERROR_INIT	D/AVE 2D has an error in the initialization.
FSP_ERR_D2D_ERROR_DEINIT	D/AVE 2D has an error in the initialization.
FSP_ERR_D2D_ERROR_RENDERING	D/AVE 2D has an error in the rendering.
FSP_ERR_D2D_ERROR_SIZE	D/AVE 2D has an error in the rendering.
FSP_ERR_ETHER_ERROR_NO_DATA	No Data in Receive buffer.
FSP_ERR_ETHER_ERROR_LINK	ETHERC/EDMAC has an error in the Auto-negotiation.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, and transmission/reception is not enabled.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	Transmit buffer is not empty.
FSP_ERR_ETHER_ERROR_FILTERING	Detect multicast frame when multicast frame filtering enable.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	ETHERC/EDMAC has an error in the phy communication.
FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE	Receive buffer is active.
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	PHY has an error in the Auto-negotiation.
FSP_ERR_QUEUE_FULL	Queue is full, cannot queue another data.
FSP_ERR_QUEUE_EMPTY	Queue is empty, no data to dequeue.
FSP_ERR_CTSU_SCANNING	Scanning.
FSP_ERR_CTSU_NOT_GET_DATA	Not processed previous scan data.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

FSP_ERR_CTSU_DIAG_NOT_YET	Diagnosis of data collected no yet.
FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE	Diagnosis of LDO over voltage failed.
FSP_ERR_CTSU_DIAG_CCO_HIGH	Diagnosis of CCO into 19.2uA failed.
FSP_ERR_CTSU_DIAG_CCO_LOW	Diagnosis of CCO into 2.4uA failed.
FSP_ERR_CTSU_DIAG_SSCG	Diagnosis of SSCG frequency failed.
FSP_ERR_CTSU_DIAG_DAC	Diagnosis of non-touch count value failed.
FSP_ERR_CTSU_DIAG_OUTPUT_VOLTAGE	Diagnosis of LDO output voltage failed.
FSP_ERR_CTSU_DIAG_OVER_VOLTAGE	Diagnosis of over voltage detection circuit failed.
FSP_ERR_CTSU_DIAG_OVER_CURRENT	Diagnosis of over current detection circuit failed.
FSP_ERR_CTSU_DIAG_LOAD_RESISTANCE	Diagnosis of LDO internal resistance value failed.
FSP_ERR_CTSU_DIAG_CURRENT_SOURCE	Diagnosis of Current source value failed.
FSP_ERR_CTSU_DIAG_SENSCLK_GAIN	Diagnosis of SENSCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_SUCLK_GAIN	Diagnosis of SUCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_CLOCK_RECOVERY	Diagnosis of SUCLK clock recovery function failed.
FSP_ERR_CTSU_DIAG_CFC_GAIN	Diagnosis of CFC oscillator gain failed.
FSP_ERR_CARD_INIT_FAILED	SD card or eMMC device failed to initialize.
FSP_ERR_CARD_NOT_INSERTED	SD card not installed.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low or another operation is ongoing.
FSP_ERR_CARD_NOT_INITIALIZED	SD card was removed.
FSP_ERR_CARD_WRITE_PROTECTED	Media is write protected.
FSP_ERR_TRANSFER_BUSY	Transfer in progress.
FSP_ERR_RESPONSE	Card did not respond or responded with an error.

FSP_ERR_MEDIA_FORMAT_FAILED	Media format failed.
FSP_ERR_MEDIA_OPEN_FAILED	Media open failed.
FSP_ERR_CAN_DATA_UNAVAILABLE	No data available.
FSP_ERR_CAN_MODE_SWITCH_FAILED	Switching operation modes failed.
FSP_ERR_CAN_INIT_FAILED	Hardware initialization failed.
FSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress.
FSP_ERR_CAN_RECEIVE_MAILBOX	Mailbox is setup as a receive mailbox.
FSP_ERR_CAN_TRANSMIT_MAILBOX	Mailbox is setup as a transmit mailbox.
FSP_ERR_CAN_MESSAGE_LOST	Receive message has been overwritten or overrun.
FSP_ERR_CAN_TRANSMIT_FIFO_FULL	Transmit FIFO is full.
FSP_ERR_WIFI_CONFIG_FAILED	WiFi module Configuration failed.
FSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed.
FSP_ERR_WIFI_TRANSMIT_FAILED	Transmission failed.
FSP_ERR_WIFI_INVALID_MODE	API called when provisioned in client mode.
FSP_ERR_WIFI_FAILED	WiFi Failed.
FSP_ERR_WIFI_SCAN_COMPLETE	Wifi scan has completed.
FSP_ERR_WIFI_AP_NOT_CONNECTED	WiFi module is not connected to access point.
FSP_ERR_CELLULAR_CONFIG_FAILED	Cellular module Configuration failed.
FSP_ERR_CELLULAR_INIT_FAILED	Cellular module initialization failed.
FSP_ERR_CELLULAR_TRANSMIT_FAILED	Transmission failed.
FSP_ERR_CELLULAR_FW_UPTODATE	Firmware is uptodate.
FSP_ERR_CELLULAR_FW_UPGRADE_FAILED	Firmware upgrade failed.
FSP_ERR_CELLULAR_FAILED	Cellular Failed.
FSP_ERR_CELLULAR_INVALID_STATE	API Called in invalid state.

FSP_ERR_CELLULAR_REGISTRATION_FAILED	Cellular Network registration failed.
FSP_ERR_BLE_FAILED	BLE operation failed.
FSP_ERR_BLE_INIT_FAILED	BLE device initialization failed.
FSP_ERR_BLE_CONFIG_FAILED	BLE device configuration failed.
FSP_ERR_BLE_PRF_ALREADY_ENABLED	BLE device Profile already enabled.
FSP_ERR_BLE_PRF_NOT_ENABLED	BLE device not enabled.
FSP_ERR_BLE_ABS_INVALID_OPERATION	Invalid operation is executed.
FSP_ERR_BLE_ABS_NOT_FOUND	Valid data or free space is not found.
FSP_ERR_CRYPTO_CONTINUE	Continue executing function.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Hardware resource busy.
FSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
FSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Invalid index.
FSP_ERR_CRYPTO_SCE_RETRY	Retry.
FSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Verify is failed.
FSP_ERR_CRYPTO_SCE_ALREADY_OPEN	HW SCE module is already opened.
FSP_ERR_CRYPTO_NOT_OPEN	Hardware module is not initialized.
FSP_ERR_CRYPTO_UNKNOWN	Some unknown error occurred.
FSP_ERR_CRYPTO_NULL_POINTER	Null pointer input as a parameter.
FSP_ERR_CRYPTO_NOT_IMPLEMENTED	Algorithm/size not implemented.
FSP_ERR_CRYPTO_RNG_INVALID_PARAM	An invalid parameter is specified.
FSP_ERR_CRYPTO_RNG_FATAL_ERROR	A fatal error occurred.
FSP_ERR_CRYPTO_INVALID_SIZE	Size specified is invalid.
FSP_ERR_CRYPTO_INVALID_STATE	Function used in an valid state.
FSP_ERR_CRYPTO_ALREADY_OPEN	control block is already opened

FSP_ERR_CRYPT_INSTALL_KEY_FAILED	Specified input key is invalid.
FSP_ERR_CRYPT_AUTHENTICATION_FAILED	Authentication failed.
FSP_ERR_CRYPT_SCE_KEY_SET_FAIL	Failure to Init Cipher.
FSP_ERR_CRYPT_SCE_AUTHENTICATION	Authentication failed.
FSP_ERR_CRYPT_SCE_PARAMETER	Input date is illegal.
FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION	An invalid function call occurred.
FSP_ERR_CRYPT_COMMON_NOT_OPENED	Crypto Framework Common is not opened.
FSP_ERR_CRYPT_HAL_ERROR	Crypto HAL module returned an error.
FSP_ERR_CRYPT_KEY_BUF_NOT_ENOUGH	Key buffer size is not enough to generate a key.
FSP_ERR_CRYPT_BUF_OVERFLOW	Attempt to write data larger than what the buffer can hold.
FSP_ERR_CRYPT_INVALID_OPERATION_MODE	Invalid operation mode.
FSP_ERR_MESSAGE_TOO_LONG	Message for RSA encryption is too long.
FSP_ERR_RSA_DECRYPTION_ERROR	RSA Decryption error.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.  <i>Note</i> <i>SF_CRYPT APIs may return an error code starting from 0x10000 which is of Crypto module. Refer to sf_cryoto_err.h for Crypto error codes.</i>
FSP_ERR_SENSOR_IN_STABILIZATION	Sensor is stabilizing.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.
FSP_ERR_COMMS_BUS_NOT_OPEN	Bus is not open.

### 4.1.3 MCU Board Support Package

#### BSP

#### Functions

fsp_err_t	R_FSP_VersionGet (fsp_pack_version_t *const p_version)
void	R_BSP_RegisterProtectEnable (bsp_reg_protect_t regs_to_protect)
void	R_BSP_RegisterProtectDisable (bsp_reg_protect_t regs_to_unprotect)
BSP_TFU_INLINE float	__sinf (float angle)
BSP_TFU_INLINE float	__cosf (float angle)
BSP_TFU_INLINE void	__sincosf (float angle, float *sin, float *cos)
BSP_TFU_INLINE float	__atan2f (float y_cord, float x_cord)
BSP_TFU_INLINE float	__hypotf (float x_cord, float y_cord)
BSP_TFU_INLINE void	__atan2hypotf (float y_cord, float x_cord, float *atan2, float *hypot)
fsp_err_t	R_BSP_GroupIrqWrite (bsp_grp_irq_t irq, void(*p_callback)(bsp_grp_irq_t irq))

__STATIC_INLINE bsp_unique_id_t const *	R_BSP_UniqueIdGet (void)
__STATIC_INLINE void	R_BSP_FlashCacheDisable (void)
__STATIC_INLINE void	R_BSP_FlashCacheEnable (void)
void	R_BSP_SoftwareDelay (uint32_t delay, bsp_delay_units_t units)
void	SystemInit (void)
void	R_BSP_WarmStart (bsp_warm_start_event_t event)
void	Reset_Handler (void)
void	Default_Handler (void)

## Detailed Description

The BSP is responsible for getting the MCU from reset to the user's application. Before reaching the user's application, the BSP sets up the stacks, heap, clocks, interrupts, C runtime environment, and stack monitor.

## Overview

### BSP Features

### BSP Clock Configuration

All system clocks are set up during BSP initialization based on the settings in `bsp_clock_cfg.h`. These settings are derived from clock configuration information provided from the RA Configuration editor **Clocks** tab.

- Clock configuration is performed prior to initializing the C runtime environment to speed up the startup process, as it is possible to start up on a relatively slow (that is, 32 kHz) clock.
- The BSP implements the required delays to allow the selected clock to stabilize.
- The BSP will configure the CMSIS `SystemCoreClock` variable after clock initialization with the current system clock frequency.

### System Interrupts

As RA MCUs are based on the Cortex-M ARM architecture, the NVIC Nested Vectored Interrupt Controller (NVIC) handles exceptions and interrupt configuration, prioritization and interrupt masking. In the ARM architecture, the NVIC handles exceptions. Some exceptions are known as System Exceptions. System exceptions are statically located at the "top" of the vector table and occupy vector numbers 1 to 15. Vector zero is reserved for the MSP Main Stack Pointer (MSP). The remaining 15 system exceptions are shown below:

- Reset
- NMI
- Cortex-M4 Hard Fault Handler
- Cortex-M4 MPU Fault Handler
- Cortex-M4 Bus Fault Handler

- Cortex-M4 Usage Fault Handler
- Reserved
- Reserved
- Reserved
- Reserved
- Cortex-M4 SVCALL Handler
- Cortex-M4 Debug Monitor Handler
- Reserved
- Cortex-M4 PendSV Handler
- Cortex-M4 SysTick Handler

NMI and Hard Fault exceptions are enabled out of reset and have fixed priorities. Other exceptions have configurable priorities and some can be disabled.

## Group Interrupts

Group interrupt is the term used to describe the 12 sources that can trigger the Non-Maskable Interrupt (NMI). When an NMI occurs the NMI Handler examines the NMISR (status register) to determine the source of the interrupt. NMI interrupts take precedence over all interrupts, are usable only as CPU interrupts, and cannot activate the RA peripherals Data Transfer Controller (DTC) or Direct Memory Access Controller (DMAC).

Possible group interrupt sources include:

- IWDT Underflow/Refresh Error
- WDT Underflow/Refresh Error
- Voltage-Monitoring 1 Interrupt
- Voltage-Monitoring 2 Interrupt
- VBATT monitor Interrupt
- Oscillation Stop is detected
- NMI pin
- RAM Parity Error
- RAM ECC Error
- MPU Bus Slave Error
- MPU Bus Master Error
- MPU Stack Error
- TrustZone Filter Error A user may enable notification for one or more group interrupts by registering a callback using the BSP API function `R_BSP_GroupIrqWrite()`. When an NMI interrupt occurs, the NMI handler checks to see if there is a callback registered for the cause of the interrupt and if so calls the registered callback function.

## External and Peripheral Interrupts

User configurable interrupts begin with slot 16. These may be external, or peripheral generated interrupts.

Although the number of available slots for the NVIC interrupt vector table may seem small, the BSP defines up to 512 events that are capable of generating an interrupt. By using Event Mapping, the BSP maps user-enabled events to NVIC interrupts. For an RA6M3 MCU, only 96 of these events may be active at any one time, but the user has flexibility by choosing which events generate the active event.

By allowing the user to select only the events they are interested in as interrupt sources, we are able to provide an interrupt service routine that is fast and event specific.

For example, on other microcontrollers a standard NVIC interrupt vector table might contain a single vector entry for the SCIO (Serial Communications Interface) peripheral. The interrupt service routine for this would have to check a status register for the 'real' source of the interrupt. In the RA implementation there is a vector entry for each of the SCIO events that we are interested in.

## BSP Weak Symbols

You might wonder how the BSP is able to place ISR addresses in the NVIC table without the user having explicitly defined one. All that is required by the BSP is that the interrupt event be given a priority.

This is accomplished through the use of the 'weak' attribute. The weak attribute causes the declaration to be emitted as a weak symbol rather than a global. A weak symbol is one that can be overridden by an accompanying strong reference with the same name. When the BSP declares a function as weak, user code can define the same function and it will be used in place of the BSP function. By defining all possible interrupt sources as weak, the vector table can be built at compile time and any user declarations (strong references) will be used at runtime.

Weak symbols are supported for ELF targets and also for a.out targets when using the GNU assembler and linker.

Note that in CMSIS system.c, there is also a weak definition (and a function body) for the Warm Start callback function `R_BSP_WarmStart()`. Because this function is defined in the same file as the weak declaration, it will be called as the 'default' implementation. The function may be overridden by the user by copying the body into their user application and modifying it as necessary. The linker identifies this as the 'strong' reference and uses it.

## Warm Start Callbacks

As the BSP is in the process of bringing up the board out of reset, there are three points where the user can request a callback. These are defined as the 'Pre Clock Init', 'Post Clock Init' and 'Post C' warm start callbacks.

As described above, this function is already weakly defined as `R_BSP_WarmStart()`, so it is a simple matter of redefining the function or copying the existing body from CMSIS system.c into the application code to get a callback. `R_BSP_WarmStart()` takes an event parameter of type `bsp_warm_start_event_t` which describes the type of warm start callback being made.

This function is not enabled/disabled and is always called for both events as part of the BSP startup. Therefore it needs a function body, which will not be called if the user is overriding it. The function body is located in system.c. To use this function just copy this function into your own code and modify it to meet your needs.

## Sub Clock Stabilization Wait Callback

When Sub-Clock oscillator is populated in the application, the BSP startup code waits for some time(sub-clock stabilization time) to allow Sub-clock to stabilize. Enabling the watchdog (IWDT or WDT) timer with Auto start mode in an application using Sub-clock may cause system to generate Reset or NMI interrupt before reaching the application code if watchdog refresh register is not updated in the configured refresh Window. To overcome this problem a weakly defined callback `R_BSP_SubClockStabilizeWait()` can be overridden. Redefine the callback function in the application code and add code to update the watchdog refresh register. `R_BSP_SubClockStabilizeWait()` takes a parameter delay of type `uint32_t` which describes the time in milliseconds required to stabilize the sub-clock.

## C Runtime Initialization

This BSP configuration allows the user to skip the FSP C runtime initialization code by setting the "C Runtime Initialization" to "Disabled" on the BSP tab of the RA Configuration editor. Disabling this option is useful in cases where a non-standard linker script is being used or other modifications to the runtime initialization are desired. If this macro is disabled, the user must use the 'Post Clock Init' event from the warm start (described above) to run their own runtime initialization code.

## Heap Allocation

The relatively low amount of on-chip SRAM available and lack of memory protection in an MCU means that heap use must be very carefully controlled to avoid memory leaks, overruns and attempted overallocation. Further, many RTOSes provide their own dynamic memory allocation system. For these reasons the default heap size is set at 0 bytes, effectively disabling dynamic memory. If it is required for an application setting a positive value to the "Heap size (bytes)" option in the RA Common configurations on the **BSP** tab will allocate a heap.

### Note

*When using printf/sprintf (and other variants) to output floating point numbers a heap is required. A minimum size of 0x1000 (4096) bytes is recommended when starting development in this case.*

## Error Logging

When error logging is enabled, the error logging function can be redefined on the command line by defining `FSP_ERROR_LOG(err)` to the desired function call. The default function implementation is `FSP_ERROR_LOG(err)=fsp_error_log(err, FILE, LINE)`. This implementation uses the predefined macros **FILE** and **LINE** to help identify the location where the error occurred. Removing the line from the function call can reduce code size when error logging is enabled. Some compilers may support other predefined macros like **FUNCTION**, which could be helpful for customizing the error logger.

## Register Protection

The BSP register protection functions utilize reference counters to ensure that an application which has specified a certain register and subsequently calls another function doesn't have its register protection settings inadvertently modified.

Each time `R_BSP_RegisterProtectDisable()` is called, the respective reference counter is incremented.

Each time `R_BSP_RegisterProtectEnable()` is called, the respective reference counter is decremented.

Both functions will only modify the protection state if their reference counter is zero.

```
/* Enable writing to protected CGC registers */
R_BSP_RegisterProtectDisable(BSP_REG_PROTECT_CGC);

/* Insert code to modify protected CGC registers. */

/* Disable writing to protected CGC registers */
R_BSP_RegisterProtectEnable(BSP_REG_PROTECT_CGC);
```

## Option-setting memory

Option-setting memory includes OFS registers OFS0 and OFS1, OSIS debugger ID code, and block protections settings BPS and PBPS. Option-setting memory is MCU specific, and not all MCUs implement all option-setting registers. Option-setting configurations available on the selected device are configurable in the BSP properties. These configurations are placed in sections to be loaded at the required flash address by the linker.

The ID code is a 16-byte value that can be used to protect the MCU from being connected to a debugger or from connecting in Serial Boot Mode. There are different settings that can be set for the ID code; please refer to the hardware manual for your device for available options.

On MCUs that support TrustZone, option-setting registers are placed in a different locations for Non-Secure projects than for Secure or Flat projects. This is handled automatically by the BSP and linker scripts.

All \*\_SEL registers default to allowing both Secure and Non-Secure access unless otherwise noted here. If block protection is configured in a Secure project, the BSP sets the corresponding configuration to Secure access only by updating the corresponding \*\_SEL register. Similarly, the LVD related settings in the OFSn\_SEL registers are automatically set to Secure if the corresponding LVD monitor is used in the Secure project.

### TrustZone Security Attribution Registers

On MCUs that support TrustZone, Security Attribution Registers for modules used in the Secure project are configured to allow Secure access only as part of the startup code of the Secure project. This logic is skipped for Flat projects.

### Software Delay

Implements a blocking software delay. A delay can be specified in microseconds, milliseconds or seconds. The delay is implemented based on the system clock rate.

```
/* Delay at least 1 second. Depending on the number of wait states required for the
region of memory
 * that the software_delay_loop has been linked in this could take longer. The
default is 4 cycles per loop.
 * This can be modified by redefining DELAY_LOOP_CYCLES. BSP_DELAY_UNITS_SECONDS,
BSP_DELAY_UNITS_MILLISECONDS,
 * and BSP_DELAY_UNITS_MICROSECONDS can all be used with R_BSP_SoftwareDelay. */
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
```

### Trigonometric Function

Implements Trigonometric math inline functions utilizing TFU hardware. These functions can calculate sine, cosine, arctangent and hypotenuse. The trigonometric library functions `sinf()`, `cosf()`, `atan2f()`, and `hypotf()` can be mapped to respective TFU functions by enabling TFU Mathlib property in FSP Configuration tool. Extended functions `sincosf()` and `atan2hypotf()` are also available when the TFU Mathlib property is enabled in the RA Configuration editor.

TFU functions are not reentrant. Disable the TFU Mathlib property in RA Configuration editor if

reentrant access to trigonometric library functions is required.

#### Note

*Refer to the MCU hardware user's manual or datasheet to determine if it has TFU support.*

## Critical Section Macros

Implements a critical section. Some MCUs (MCUs with the BASEPRI register) support allowing high priority interrupts to execute during critical sections. On these MCUs, interrupts with priority less than or equal to `BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION` are not serviced in critical sections. Interrupts with higher priority than `BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION` still execute in critical sections.

```
FSP_CRITICAL_SECTION_DEFINE;

/* Store the current interrupt posture. */
FSP_CRITICAL_SECTION_ENTER;

/* Interrupts cannot run in this section unless their priority is less than
BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION. */

/* Restore saved interrupt posture. */
FSP_CRITICAL_SECTION_EXIT;
```

## OctaClock Update

Supports changing the Octal-SPI Clock (OCTACLK) during runtime if supported by the MCU. The OCTACLK source and clock divisor can be updated. It is user's responsibility to ensure the selected clock source is running before attempting to update OCTACLK.

## Sealing the Main Stack (TrustZone Secure Projects)

In TrustZone secure projects, the BSP seals the main stack by placing the value `0xFE5EDA5` above the stack top. For more information, refer to section 3.5 "Sealing a Stack" in "Secure software guidelines for ARMv8-M": <https://developer.arm.com/documentation/100720/0300>.

## Board Specific Features

The BSP will call the board's initialization function (`bsp_init`) which can initialize board specific features. Possible board features are listed below.

Board Feature	Description
SDRAM Support	The BSP will initialize SDRAM if the board supports it
QSPI Support	The BSP will initialize QSPI if the board supports it and put it into ROM mode. Use the <code>R_QSPI</code> module to write and erase the QSPI chip.

## Configuration

The BSP is heavily data driven with most features and functionality being configured based on the content from configuration files. Configuration files represent the settings specified by the user and are generated when the project is built and/or when the Generate Project Content button is clicked in the RA Configuration editor.

### Build Time Configurations for fsp\_common

The following build time configurations are defined in fsp\_cfg/bsp/bsp\_cfg.h:

Configuration	Options	Default	Description
Main stack size (bytes)	Value must be an integer multiple of 8 and between 8 and 0xFFFFFFFF	0x400	Set the size of the main program stack.  NOTE: This entry is for the main stack. When using an RTOS, thread stacks can be configured in the properties for each thread.
Heap size (bytes)	Value must be 0 or an integer multiple of 8 between 8 and 0xFFFFFFFF.	0	The main heap is disabled by default. Set the heap size to a positive integer divisible by 8 to enable it.  A minimum of 4K (0x1000) is recommended if standard library functions are to be used.
MCU Vcc (mV)	Value must between 0 and 5500 (5.5V)	3300	Some peripherals require different settings based on the supplied voltage. Entering Vcc here (in mV) allows the relevant driver modules to configure the associated peripherals accordingly.
Parameter checking	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	When enabled, parameter checking for the BSP is turned on. In addition, any modules whose parameter checking configuration

Assert Failures	<ul style="list-style-type: none"> <li>Return FSP_ERR_ASSERTION</li> <li>Call fsp_error_log then Return FSP_ERR_ASSERTION</li> <li>Use assert() to Halt Execution</li> <li>Disable checks that would return FSP_ERR_ASSERTION</li> </ul>	Return FSP_ERR_ASSERTION	is set to 'Default (BSP)' will perform parameter checking as well.  Define the behavior of the <a href="#">FSP_ASSERT()</a> macro.
Error Log	<ul style="list-style-type: none"> <li>No Error Log</li> <li>Errors Logged via fsp_error_log</li> </ul>	No Error Log	Specify error logging behavior.
Clock Registers not Reset Values during Startup	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Disabled	If enabled, registers are assumed to be set to their reset value during startup. Enable this if another application such as a bootloader or Secure project has already configured the clocks before the startup code runs.
Main Oscillator Populated	<ul style="list-style-type: none"> <li>Populated</li> <li>Not Populated</li> </ul>	Populated	Select whether or not there is a main oscillator (XTAL) on the board. This setting can be overridden in board_cfg.h.
PFS Protect	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Enabled	Keep the PFS registers locked when they are not being modified. If disabled they will be unlocked during startup.
C Runtime Initialization	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	Select if the C runtime initialization in the BSP is to be used. If disabled, use the BSP_WARM_START_POST_CLOCK event to run user defined equivalent.
Early BSP Initialization	<ul style="list-style-type: none"> <li>Enabled</li> </ul>	Disabled	Enable this option to

	<ul style="list-style-type: none"> <li>• Disabled</li> </ul>		use BSP functions before C runtime initialization (BSP_WARM_START_RESET or BSP_WARM_START_POST_CLOCK).
Main Oscillator Clock Source	<ul style="list-style-type: none"> <li>• External Oscillator</li> <li>• Crystal or Resonator</li> </ul>	Crystal or Resonator	Select the main oscillator clock source. This setting can be overridden in board_cfg.h
Subclock Populated	<ul style="list-style-type: none"> <li>• Populated</li> <li>• Not Populated</li> </ul>	Populated	Select whether or not there is a subclock crystal on the board. This setting can be overridden in board_cfg.h.
Subclock Drive (Drive capacitance availability varies by MCU)	<ul style="list-style-type: none"> <li>• Standard/Normal mode</li> <li>• Low/Low power mode 1</li> <li>• Low power mode 2</li> <li>• Low power mode 3</li> </ul>	Standard/Normal mode	Select the subclock oscillator drive capacitance. This setting can be overridden in board_cfg.h
Subclock Stabilization Time (ms)	Value must between 0 and 10000	1000	Select the subclock oscillator stabilization time. This is only used in the startup code if the subclock is selected as the system clock on the Clocks tab or if the HOCO FLL function is enabled. This setting can be overridden in board_cfg.h

## Macro Definition Documentation

### ◆ R\_BSP\_MODULE\_START

```
#define R_BSP_MODULE_START ( ip, channel )
```

Cancels the module stop state.

#### Parameters

ip	fsp_ip_t enum value for the module to be stopped
channel	The channel. Use channel 0 for modules without channels.

### ◆ R\_BSP\_MODULE\_STOP

```
#define R_BSP_MODULE_STOP ( ip, channel )
```

Enables the module stop state.

#### Parameters

ip	fsp_ip_t enum value for the module to be stopped
channel	The channel. Use channel 0 for modules without channels.

**◆ BSP\_STACK\_ALIGNMENT**

```
#define BSP_STACK_ALIGNMENT
```

Stacks (and heap) must be sized and aligned to an integer multiple of this number.

**◆ BSP\_IRQ\_DISABLED**

```
#define BSP_IRQ_DISABLED
```

Used to signify that an ELC event is not able to be used as an interrupt.

**◆ FSP\_LOG\_PRINT**

```
#define FSP_LOG_PRINT ( X)
```

Macro that can be defined in order to enable logging in FSP modules.

**◆ FSP\_RETURN**

```
#define FSP_RETURN ( err)
```

Macro to log and return error without an assertion.

**◆ FSP\_ERROR\_LOG**

```
#define FSP_ERROR_LOG ( err)
```

This function is called before returning an error code. To stop on a runtime error, define `fsp_error_log` in user code and do required debugging (breakpoints, stack dump, etc) in this function.

**◆ FSP\_ASSERT**

```
#define FSP_ASSERT ( a)
```

Default assertion calls [FSP\\_ERROR\\_RETURN](#) if condition "a" is false. Used to identify incorrect use of API's in FSP functions.

**◆ FSP\_ERROR\_RETURN**

```
#define FSP_ERROR_RETURN ( a, err )
```

All FSP error codes are returned using this macro. Calls [FSP\\_ERROR\\_LOG](#) function if condition "a" is false. Used to identify runtime errors in FSP functions.

◆ **FSP\_CRITICAL\_SECTION\_ENTER**

```
#define FSP_CRITICAL_SECTION_ENTER
```

This macro temporarily saves the current interrupt state and disables interrupts.

◆ **FSP\_CRITICAL\_SECTION\_EXIT**

```
#define FSP_CRITICAL_SECTION_EXIT
```

This macro restores the previously saved interrupt state, reenabling interrupts.

◆ **FSP\_INVALID\_VECTOR**

```
#define FSP_INVALID_VECTOR
```

Used to signify that the requested IRQ vector is not defined in this system.

◆ **BSP\_CFG\_HANDLE\_UNRECOVERABLE\_ERROR**

```
#define BSP_CFG_HANDLE_UNRECOVERABLE_ERROR ( x)
```

In the event of an unrecoverable error the BSP will by default call the `__BKPT()` intrinsic function which will alert the user of the error. The user can override this default behavior by defining their own `BSP_CFG_HANDLE_UNRECOVERABLE_ERROR` macro.

**Enumeration Type Documentation**◆ **bsp\_delay\_units\_t**

```
enum bsp_delay_units_t
```

Available delay units for `R_BSP_SoftwareDelay()`. These are ultimately used to calculate a total # of microseconds

Enumerator	
<code>BSP_DELAY_UNITS_SECONDS</code>	Requested delay amount is in seconds.
<code>BSP_DELAY_UNITS_MILLISECONDS</code>	Requested delay amount is in milliseconds.
<code>BSP_DELAY_UNITS_MICROSECONDS</code>	Requested delay amount is in microseconds.

◆ **bsp\_reg\_protect\_t**

enum <a href="#">bsp_reg_protect_t</a>	
The different types of registers that can be protected.	
Enumerator	
BSP_REG_PROTECT_CGC	Enables writing to the registers related to the clock generation circuit.
BSP_REG_PROTECT_OM_LPC_BATT	Enables writing to the registers related to operating modes, low power consumption, and battery backup function.
BSP_REG_PROTECT_LVD	Enables writing to the registers related to the LVD: LVCMPCR, LVDLVLRL, LVD1CR0, LVD1CR1, LVD1SR, LVD2CR0, LVD2CR1, LVD2SR.
BSP_REG_PROTECT_SAR	Enables writing to the registers related to the security function.

◆ **bsp\_warm\_start\_event\_t**

enum <a href="#">bsp_warm_start_event_t</a>	
Different warm start entry locations in the BSP.	
Enumerator	
BSP_WARM_START_RESET	Called almost immediately after reset. No C runtime environment, clocks, or IRQs.
BSP_WARM_START_POST_CLOCK	Called after clock initialization. No C runtime environment or IRQs.
BSP_WARM_START_POST_C	Called after clocks and C runtime environment have been set up.

◆ **fsp\_priv\_source\_clock\_t**

enum fsp_priv_source_clock_t	
Enumerator	
FSP_PRIV_CLOCK_HOCO	The high speed on chip oscillator.
FSP_PRIV_CLOCK_MOCO	The middle speed on chip oscillator.
FSP_PRIV_CLOCK_LOCO	The low speed on chip oscillator.
FSP_PRIV_CLOCK_MAIN_OSC	The main oscillator.
FSP_PRIV_CLOCK_SUBCLOCK	The subclock oscillator.
FSP_PRIV_CLOCK_PLL	The PLL oscillator.
FSP_PRIV_CLOCK_PLL2	The PLL2 oscillator.

◆ **bsp\_grp\_irq\_t**

enum <code>bsp_grp_irq_t</code>	
Which interrupts can have callbacks registered.	
Enumerator	
<code>BSP_GRP_IRQ_IWDT_ERROR</code>	IWDT underflow/refresh error has occurred.
<code>BSP_GRP_IRQ_WDT_ERROR</code>	WDT underflow/refresh error has occurred.
<code>BSP_GRP_IRQ_LVD1</code>	Voltage monitoring 1 interrupt.
<code>BSP_GRP_IRQ_LVD2</code>	Voltage monitoring 2 interrupt.
<code>BSP_GRP_IRQ_VBATT</code>	VBATT monitor interrupt.
<code>BSP_GRP_IRQ_OSC_STOP_DETECT</code>	Oscillation stop is detected.
<code>BSP_GRP_IRQ_NMI_PIN</code>	NMI Pin interrupt.
<code>BSP_GRP_IRQ_RAM_PARITY</code>	RAM Parity Error.
<code>BSP_GRP_IRQ_RAM_ECC</code>	RAM ECC Error.
<code>BSP_GRP_IRQ_MPU_BUS_SLAVE</code>	MPU Bus Slave Error.
<code>BSP_GRP_IRQ_MPU_BUS_MASTER</code>	MPU Bus Master Error.
<code>BSP_GRP_IRQ_MPU_STACK</code>	MPU Stack Error.
<code>BSP_GRP_IRQ_TRUSTZONE</code>	MPU Stack Error.
<code>BSP_GRP_IRQ_CACHE_PARITY</code>	MPU Stack Error.

## ◆ fsp\_ip\_t

enum fsp_ip_t	
Available modules.	
Enumerator	
FSP_IP_CFLASH	Code Flash.
FSP_IP_DFLASH	Data Flash.
FSP_IP_RAM	RAM.
FSP_IP_LVD	Low Voltage Detection.
FSP_IP_CGC	Clock Generation Circuit.
FSP_IP_LPM	Low Power Modes.
FSP_IP_FCU	Flash Control Unit.
FSP_IP_ICU	Interrupt Control Unit.
FSP_IP_DMACH	DMA Controller.
FSP_IP_DTC	Data Transfer Controller.
FSP_IP_IOPORT	I/O Ports.
FSP_IP_PFS	Pin Function Select.
FSP_IP_ELC	Event Link Controller.
FSP_IP_MPU	Memory Protection Unit.
FSP_IP_MSTP	Module Stop.
FSP_IP_MMF	Memory Mirror Function.
FSP_IP_KEY	Key Interrupt Function.
FSP_IP_CAC	Clock Frequency Accuracy Measurement Circuit.
FSP_IP_DOC	Data Operation Circuit.
FSP_IP_CRC	Cyclic Redundancy Check Calculator.

FSP_IP_SCI	Serial Communications Interface.
FSP_IP_IIC	I2C Bus Interface.
FSP_IP_SPI	Serial Peripheral Interface.
FSP_IP_CTSU	Capacitive Touch Sensing Unit.
FSP_IP_SCE	Secure Cryptographic Engine.
FSP_IP_SLCDC	Segment LCD Controller.
FSP_IP_AES	Advanced Encryption Standard.
FSP_IP_TRNG	True Random Number Generator.
FSP_IP_FCACHE	Flash Cache.
FSP_IP_SRAM	SRAM.
FSP_IP_ADC	A/D Converter.
FSP_IP_DAC	12-Bit D/A Converter
FSP_IP_TSN	Temperature Sensor.
FSP_IP_DAAD	D/A A/D Synchronous Unit.
FSP_IP_ACMPHS	High Speed Analog Comparator.
FSP_IP_ACMPLP	Low Power Analog Comparator.
FSP_IP_OPAMP	Operational Amplifier.
FSP_IP_SDADC	Sigma Delta A/D Converter.
FSP_IP_RTC	Real Time Clock.
FSP_IP_WDT	Watch Dog Timer.
FSP_IP_IWDT	Independent Watch Dog Timer.
FSP_IP_GPT	General PWM Timer.
FSP_IP_POEG	Port Output Enable for GPT.
FSP_IP_OPS	Output Phase Switch.

FSP_IP_AGT	Asynchronous General-Purpose Timer.
FSP_IP_CAN	Controller Area Network.
FSP_IP_IRDA	Infrared Data Association.
FSP_IP_QSPI	Quad Serial Peripheral Interface.
FSP_IP_USBFS	USB Full Speed.
FSP_IP_SDHI	SD/MMC Host Interface.
FSP_IP_SRC	Sampling Rate Converter.
FSP_IP_SSI	Serial Sound Interface.
FSP_IP_DALI	Digital Addressable Lighting Interface.
FSP_IP_ETHER	Ethernet MAC Controller.
FSP_IP_EDMAC	Ethernet DMA Controller.
FSP_IP_EPTPC	Ethernet PTP Controller.
FSP_IP_PDC	Parallel Data Capture Unit.
FSP_IP_GLCDC	Graphics LCD Controller.
FSP_IP_DRW	2D Drawing Engine
FSP_IP_JPEG	JPEG.
FSP_IP_DAC8	8-Bit D/A Converter
FSP_IP_USBHS	USB High Speed.
FSP_IP_OSPI	Octa Serial Peripheral Interface.
FSP_IP_CEC	HDMI CEC.
FSP_IP_TFU	Trigonometric Function Unit.
FSP_IP_IIRFA	IIR Filter Accelerator.
FSP_IP_CANFD	CAN-FD.

◆ **fsp\_signal\_t**

enum fsp_signal_t	
Signals that can be mapped to an interrupt.	
Enumerator	
FSP_SIGNAL_ADC_COMPARE_MATCH	ADC COMPARE MATCH.
FSP_SIGNAL_ADC_COMPARE_MISMATCH	ADC COMPARE MISMATCH.
FSP_SIGNAL_ADC_SCAN_END	ADC SCAN END.
FSP_SIGNAL_ADC_SCAN_END_B	ADC SCAN END B.
FSP_SIGNAL_ADC_WINDOW_A	ADC WINDOW A.
FSP_SIGNAL_ADC_WINDOW_B	ADC WINDOW B.
FSP_SIGNAL_AES_RDREQ	AES RDREQ.
FSP_SIGNAL_AES_WRREQ	AES WRREQ.
FSP_SIGNAL_AGT_COMPARE_A	AGT COMPARE A.
FSP_SIGNAL_AGT_COMPARE_B	AGT COMPARE B.
FSP_SIGNAL_AGT_INT	AGT INT.
FSP_SIGNAL_CAC_FREQUENCY_ERROR	CAC FREQUENCY ERROR.
FSP_SIGNAL_CAC_MEASUREMENT_END	CAC MEASUREMENT END.
FSP_SIGNAL_CAC_OVERFLOW	CAC OVERFLOW.
FSP_SIGNAL_CAN_ERROR	CAN ERROR.
FSP_SIGNAL_CAN_FIFO_RX	CAN FIFO RX.
FSP_SIGNAL_CAN_FIFO_TX	CAN FIFO TX.
FSP_SIGNAL_CAN_MAILBOX_RX	CAN MAILBOX RX.
FSP_SIGNAL_CAN_MAILBOX_TX	CAN MAILBOX TX.
FSP_SIGNAL_CGC_MOSC_STOP	CGC MOSC STOP.
FSP_SIGNAL_LPM_SNOOZE_REQUEST	LPM SNOOZE REQUEST.

FSP_SIGNAL_LVD_LVD1	LVD LVD1.
FSP_SIGNAL_LVD_LVD2	LVD LVD2.
FSP_SIGNAL_VBATT_LVD	VBATT LVD.
FSP_SIGNAL_LVD_VBATT	LVD VBATT.
FSP_SIGNAL_ACMPHS_INT	ACMPHS INT.
FSP_SIGNAL_ACMPLP_INT	ACMPLP INT.
FSP_SIGNAL_CTSU_END	CTSU END.
FSP_SIGNAL_CTSU_READ	CTSU READ.
FSP_SIGNAL_CTSU_WRITE	CTSU WRITE.
FSP_SIGNAL_DALI_DEI	DALI DEI.
FSP_SIGNAL_DALI_CLI	DALI CLI.
FSP_SIGNAL_DALI_SDI	DALI SDI.
FSP_SIGNAL_DALI_BPI	DALI BPI.
FSP_SIGNAL_DALI_FEI	DALI FEI.
FSP_SIGNAL_DALI_SDI_OR_BPI	DALI SDI OR BPI.
FSP_SIGNAL_DMAC_INT	DMAC INT.
FSP_SIGNAL_DOC_INT	DOC INT.
FSP_SIGNAL_DRW_INT	DRW INT.
FSP_SIGNAL_DTC_COMPLETE	DTC COMPLETE.
FSP_SIGNAL_DTC_END	DTC END.
FSP_SIGNAL_EDMAC_EINT	EDMAC EINT.
FSP_SIGNAL_ELC_SOFTWARE_EVENT_0	ELC SOFTWARE EVENT 0.
FSP_SIGNAL_ELC_SOFTWARE_EVENT_1	ELC SOFTWARE EVENT 1.
FSP_SIGNAL_EPTPC_IPLS	EPTPC IPLS.

FSP_SIGNAL_EPTPC_MINT	EPTPC MINT.
FSP_SIGNAL_EPTPC_PINT	EPTPC PINT.
FSP_SIGNAL_EPTPC_TIMER0_FALL	EPTPC TIMER0 FALL.
FSP_SIGNAL_EPTPC_TIMER0_RISE	EPTPC TIMER0 RISE.
FSP_SIGNAL_EPTPC_TIMER1_FALL	EPTPC TIMER1 FALL.
FSP_SIGNAL_EPTPC_TIMER1_RISE	EPTPC TIMER1 RISE.
FSP_SIGNAL_EPTPC_TIMER2_FALL	EPTPC TIMER2 FALL.
FSP_SIGNAL_EPTPC_TIMER2_RISE	EPTPC TIMER2 RISE.
FSP_SIGNAL_EPTPC_TIMER3_FALL	EPTPC TIMER3 FALL.
FSP_SIGNAL_EPTPC_TIMER3_RISE	EPTPC TIMER3 RISE.
FSP_SIGNAL_EPTPC_TIMER4_FALL	EPTPC TIMER4 FALL.
FSP_SIGNAL_EPTPC_TIMER4_RISE	EPTPC TIMER4 RISE.
FSP_SIGNAL_EPTPC_TIMER5_FALL	EPTPC TIMER5 FALL.
FSP_SIGNAL_EPTPC_TIMER5_RISE	EPTPC TIMER5 RISE.
FSP_SIGNAL_FCU_FIFERR	FCU FIFERR.
FSP_SIGNAL_FCU_FRDYI	FCU FRDYI.
FSP_SIGNAL_GLCDC_LINE_DETECT	GLCDC LINE DETECT.
FSP_SIGNAL_GLCDC_UNDERFLOW_1	GLCDC UNDERFLOW 1.
FSP_SIGNAL_GLCDC_UNDERFLOW_2	GLCDC UNDERFLOW 2.
FSP_SIGNAL_GPT_CAPTURE_COMPARE_A	GPT CAPTURE COMPARE A.
FSP_SIGNAL_GPT_CAPTURE_COMPARE_B	GPT CAPTURE COMPARE B.
FSP_SIGNAL_GPT_COMPARE_C	GPT COMPARE C.
FSP_SIGNAL_GPT_COMPARE_D	GPT COMPARE D.
FSP_SIGNAL_GPT_COMPARE_E	GPT COMPARE E.

FSP_SIGNAL_GPT_COMPARE_F	GPT COMPARE F.
FSP_SIGNAL_GPT_COUNTER_OVERFLOW	GPT COUNTER OVERFLOW.
FSP_SIGNAL_GPT_COUNTER_UNDERFLOW	GPT COUNTER UNDERFLOW.
FSP_SIGNAL_GPT_AD_TRIG_A	GPT AD TRIG A.
FSP_SIGNAL_GPT_AD_TRIG_B	GPT AD TRIG B.
FSP_SIGNAL_OPS_UVW_EDGE	OPS UVW EDGE.
FSP_SIGNAL_ICU_IRQ0	ICU IRQ0.
FSP_SIGNAL_ICU_IRQ1	ICU IRQ1.
FSP_SIGNAL_ICU_IRQ2	ICU IRQ2.
FSP_SIGNAL_ICU_IRQ3	ICU IRQ3.
FSP_SIGNAL_ICU_IRQ4	ICU IRQ4.
FSP_SIGNAL_ICU_IRQ5	ICU IRQ5.
FSP_SIGNAL_ICU_IRQ6	ICU IRQ6.
FSP_SIGNAL_ICU_IRQ7	ICU IRQ7.
FSP_SIGNAL_ICU_IRQ8	ICU IRQ8.
FSP_SIGNAL_ICU_IRQ9	ICU IRQ9.
FSP_SIGNAL_ICU_IRQ10	ICU IRQ10.
FSP_SIGNAL_ICU_IRQ11	ICU IRQ11.
FSP_SIGNAL_ICU_IRQ12	ICU IRQ12.
FSP_SIGNAL_ICU_IRQ13	ICU IRQ13.
FSP_SIGNAL_ICU_IRQ14	ICU IRQ14.
FSP_SIGNAL_ICU_IRQ15	ICU IRQ15.
FSP_SIGNAL_ICU_SNOOZE_CANCEL	ICU SNOOZE CANCEL.
FSP_SIGNAL_IIC_ERI	IIC ERI.

FSP_SIGNAL_IIC_RXI	IIC RXI.
FSP_SIGNAL_IIC_TEI	IIC TEI.
FSP_SIGNAL_IIC_TXI	IIC TXI.
FSP_SIGNAL_IIC_WUI	IIC WUI.
FSP_SIGNAL_IOPORT_EVENT_1	IOPORT EVENT 1.
FSP_SIGNAL_IOPORT_EVENT_2	IOPORT EVENT 2.
FSP_SIGNAL_IOPORT_EVENT_3	IOPORT EVENT 3.
FSP_SIGNAL_IOPORT_EVENT_4	IOPORT EVENT 4.
FSP_SIGNAL_IOPORT_EVENT_B	IOPORT EVENT B.
FSP_SIGNAL_IOPORT_EVENT_C	IOPORT EVENT C.
FSP_SIGNAL_IOPORT_EVENT_D	IOPORT EVENT D.
FSP_SIGNAL_IOPORT_EVENT_E	IOPORT EVENT E.
FSP_SIGNAL_IWDT_UNDERFLOW	IWDT UNDERFLOW.
FSP_SIGNAL_JPEG_JDTI	JPEG JDTI.
FSP_SIGNAL_JPEG_JEDI	JPEG JEDI.
FSP_SIGNAL_KEY_INT	KEY INT.
FSP_SIGNAL_PDC_FRAME_END	PDC FRAME END.
FSP_SIGNAL_PDC_INT	PDC INT.
FSP_SIGNAL_PDC_RECEIVE_DATA_READY	PDC RECEIVE DATA READY.
FSP_SIGNAL_POEG_EVENT	POEG EVENT.
FSP_SIGNAL_QSPI_INT	QSPI INT.
FSP_SIGNAL_RTC_ALARM	RTC ALARM.
FSP_SIGNAL_RTC_PERIOD	RTC PERIOD.
FSP_SIGNAL_RTC_CARRY	RTC CARRY.

FSP_SIGNAL_SCE_INTEGRATE_RDRDY	SCE INTEGRATE RDRDY.
FSP_SIGNAL_SCE_INTEGRATE_WRRDY	SCE INTEGRATE WRRDY.
FSP_SIGNAL_SCE_LONG_PLG	SCE LONG PLG.
FSP_SIGNAL_SCE_PROC_BUSY	SCE PROC BUSY.
FSP_SIGNAL_SCE_RDRDY_0	SCE RDRDY 0.
FSP_SIGNAL_SCE_RDRDY_1	SCE RDRDY 1.
FSP_SIGNAL_SCE_ROMOK	SCE ROMOK.
FSP_SIGNAL_SCE_TEST_BUSY	SCE TEST BUSY.
FSP_SIGNAL_SCE_WRRDY_0	SCE WRRDY 0.
FSP_SIGNAL_SCE_WRRDY_1	SCE WRRDY 1.
FSP_SIGNAL_SCE_WRRDY_4	SCE WRRDY 4.
FSP_SIGNAL_SCI_AM	SCI AM.
FSP_SIGNAL_SCI_ERI	SCI ERI.
FSP_SIGNAL_SCI_RXI	SCI RXI.
FSP_SIGNAL_SCI_RXI_OR_ERI	SCI RXI OR ERI.
FSP_SIGNAL_SCI_TEI	SCI TEI.
FSP_SIGNAL_SCI_TXI	SCI TXI.
FSP_SIGNAL_SDADC_ADI	SDADC ADI.
FSP_SIGNAL_SDADC_SCANEND	SDADC SCANEND.
FSP_SIGNAL_SDADC_CALIEND	SDADC CALIEND.
FSP_SIGNAL_SDHIMMC_ACCS	SDHIMMC ACCS.
FSP_SIGNAL_SDHIMMC_CARD	SDHIMMC CARD.
FSP_SIGNAL_SDHIMMC_DMA_REQ	SDHIMMC DMA REQ.
FSP_SIGNAL_SDHIMMC_SDIO	SDHIMMC SDIO.

FSP_SIGNAL_SPI_ERI	SPI ERI.
FSP_SIGNAL_SPI_IDLE	SPI IDLE.
FSP_SIGNAL_SPI_RXI	SPI RXI.
FSP_SIGNAL_SPI_TEI	SPI TEI.
FSP_SIGNAL_SPI_TXI	SPI TXI.
FSP_SIGNAL_SRC_CONVERSION_END	SRC CONVERSION END.
FSP_SIGNAL_SRC_INPUT_FIFO_EMPTY	SRC INPUT FIFO EMPTY.
FSP_SIGNAL_SRC_OUTPUT_FIFO_FULL	SRC OUTPUT FIFO FULL.
FSP_SIGNAL_SRC_OUTPUT_FIFO_OVERFLOW	SRC OUTPUT FIFO OVERFLOW.
FSP_SIGNAL_SRC_OUTPUT_FIFO_UNDERFLOW	SRC OUTPUT FIFO UNDERFLOW.
FSP_SIGNAL_SSI_INT	SSI INT.
FSP_SIGNAL_SSI_RXI	SSI RXI.
FSP_SIGNAL_SSI_TXI	SSI TXI.
FSP_SIGNAL_SSI_TXI_RXI	SSI TXI RXI.
FSP_SIGNAL_TRNG_RDREQ	TRNG RDREQ.
FSP_SIGNAL_USB_FIFO_0	USB FIFO 0.
FSP_SIGNAL_USB_FIFO_1	USB FIFO 1.
FSP_SIGNAL_USB_INT	USB INT.
FSP_SIGNAL_USB_RESUME	USB RESUME.
FSP_SIGNAL_USB_USB_INT_RESUME	USB USB INT RESUME.
FSP_SIGNAL_WDT_UNDERFLOW	WDT UNDERFLOW.

## Function Documentation

◆ **R\_FSP\_VersionGet()**

```
fsp_err_t R_FSP_VersionGet ( fsp_pack_version_t *const p_version)
```

Get the FSP version based on compile time macros.

**Parameters**

[out]	p_version	Memory address to return version information to.
-------	-----------	--

**Return values**

FSP_SUCCESS	Version information stored.
FSP_ERR_ASSERTION	The parameter p_version is NULL.

◆ **R\_BSP\_RegisterProtectEnable()**

```
void R_BSP_RegisterProtectEnable ( bsp_reg_protect_t regs_to_protect)
```

Enable register protection. Registers that are protected cannot be written to. Register protection is enabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR).

**Parameters**

[in]	regs_to_protect	Registers which have write protection enabled.
------	-----------------	--

◆ **R\_BSP\_RegisterProtectDisable()**

```
void R_BSP_RegisterProtectDisable ( bsp_reg_protect_t regs_to_unprotect)
```

Disable register protection. Registers that are protected cannot be written to. Register protection is disabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR).

**Parameters**

[in]	regs_to_unprotect	Registers which have write protection disabled.
------	-------------------	---

◆ **\_\_sinf()**BSP\_TFU\_INLINE float \_\_sinf ( float *angle* )

Calculates sine of the given angle.

**Parameters**

[in]	angle	The value of an angle in radian.
------	-------	----------------------------------

**Return values**

Sine	value of an angle.
------	--------------------

◆ **\_\_cosf()**BSP\_TFU\_INLINE float \_\_cosf ( float *angle* )

Calculates cosine of the given angle.

**Parameters**

[in]	angle	The value of an angle in radian.
------	-------	----------------------------------

**Return values**

Cosine	value of an angle.
--------	--------------------

◆ **\_\_sincosf()**BSP\_TFU\_INLINE void \_\_sincosf ( float *angle*, float \* *sin*, float \* *cos* )

Calculates sine and cosine of the given angle.

**Parameters**

[in]	angle	The value of an angle in radian.
[out]	sin	Sine value of an angle.
[out]	cos	Cosine value of an angle.

◆ **\_\_atan2f()**BSP\_TFU\_INLINE float \_\_atan2f ( float *y\_cord*, float *x\_cord* )

Calculates the arc tangent based on given X-cordinate and Y-cordinate values.

**Parameters**

[in]	<i>y_cord</i>	Y-Axis cordinate value.
[in]	<i>x_cord</i>	X-Axis cordinate value.

**Return values**

Arc	tangent for given values.
-----	---------------------------

◆ **\_\_hypotf()**BSP\_TFU\_INLINE float \_\_hypotf ( float *x\_cord*, float *y\_cord* )

Calculates the hypotenuse based on given X-cordinate and Y-cordinate values.

**Parameters**

[in]	<i>y_cord</i>	Y-cordinate value.
[in]	<i>x_cord</i>	X-cordinate value.

**Return values**

Hypotenuse	for given values.
------------	-------------------

◆ **\_\_atan2hypotf()**BSP\_TFU\_INLINE void \_\_atan2hypotf ( float *y\_cord*, float *x\_cord*, float \* *atan2*, float \* *hypot* )

Calculates the arc tangent and hypotenuse based on given X-cordinate and Y-cordinate values.

**Parameters**

[in]	<i>y_cord</i>	Y-cordinate value.
[in]	<i>x_cord</i>	X-cordinate value.
[out]	<i>atan2</i>	Arc tangent for given values.
[out]	<i>hypot</i>	Hypotenuse for given values.

◆ **R\_BSP\_GroupIrqWrite()**

```
fsp_err_t R_BSP_GroupIrqWrite ( bsp_grp_irq_t irq, void(*)(bsp_grp_irq_t irq) p_callback )
```

Register a callback function for supported interrupts. If NULL is passed for the callback argument then any previously registered callbacks are unregistered.

**Parameters**

[in]	irq	Interrupt for which to register a callback.
[in]	p_callback	Pointer to function to call when interrupt occurs.

**Return values**

FSP_SUCCESS	Callback registered
FSP_ERR_ASSERTION	Callback pointer is NULL

◆ **NMI\_Handler()**

```
void NMI_Handler ( void )
```

Non-maskable interrupt handler. This exception is defined by the BSP, unlike other system exceptions, because there are many sources that map to the NMI exception.

◆ **R\_BSP\_SourceClockHzGet()**

```
uint32_t R_BSP_SourceClockHzGet ( fsp_priv_source_clock_t clock)
```

Gets the frequency of a source clock.

**Parameters**

[in]	clock	Pointer to Octack setting structure which provides information regarding Octack source and divider settings to be applied.
------	-------	--

**Returns**

Frequency of requested clock in Hertz.

**◆ R\_FSP\_CurrentIrqGet()**

```
__STATIC_INLINE IRQn_Type R_FSP_CurrentIrqGet ( void )
```

Return active interrupt vector number value

**Returns**

Active interrupt vector number value

**◆ R\_FSP\_SystemClockHzGet()**

```
__STATIC_INLINE uint32_t R_FSP_SystemClockHzGet ( fsp_priv_clock_t clock)
```

Gets the frequency of a system clock.

**Returns**

Frequency of requested clock in Hertz.

**◆ R\_BSP\_UniqueIdGet()**

```
__STATIC_INLINE bsp_unique_id_t const* R_BSP_UniqueIdGet ( void )
```

Get unique ID for this device.

**Returns**

A pointer to the unique identifier structure

**◆ R\_BSP\_FlashCacheDisable()**

```
__STATIC_INLINE void R_BSP_FlashCacheDisable ( void )
```

Disables the flash cache.

**◆ R\_BSP\_FlashCacheEnable()**

```
__STATIC_INLINE void R_BSP_FlashCacheEnable ( void )
```

Enables the flash cache.

◆ **R\_BSP\_SoftwareDelay()**

```
void R_BSP_SoftwareDelay ( uint32_t delay, bsp_delay_units_t units )
```

Delay for at least the specified duration in units and return.

**Parameters**

[in]	delay	The number of 'units' to delay.
[in]	units	The 'base' (bsp_delay_units_t) for the units specified. Valid values are: BSP_DELAY_UNITS_SECONDS , BSP_DELAY_UNITS_MILLISECONDS, BSP_DELAY_UNITS_MICROSECONDS. For example: At 1 MHz one cycle takes 1 microsecond (.000001 seconds). At 12 MHz one cycle takes 1/12 microsecond or 83 nanoseconds. Therefore one run through bsp_prv_software_delay_loop( ) takes: ~ (83 * BSP_DELAY_LOOP_CYCLES) or 332 ns. A delay of 2 us therefore requires 2000ns/332ns or 6 loops.

The 'theoretical' maximum delay that may be obtained is determined by a full 32 bit loop count and the system clock rate. @120MHz:  $((0xFFFFFFFF \text{ loops} * 4 \text{ cycles /loop}) / 120000000) = 143$  seconds. @32MHz:  $((0xFFFFFFFF \text{ loops} * 4 \text{ cycles /loop}) / 32000000) = 536$  seconds

Note that requests for very large delays will be affected by rounding in the calculations and the actual delay achieved may be slightly longer. @32 MHz, for example, a request for 532 seconds will be closer to 536 seconds.

Note also that if the calculations result in a loop\_cnt of zero, the bsp\_prv\_software\_delay\_loop() function is not called at all. In this case the requested delay is too small (nanoseconds) to be carried out by the loop itself, and the overhead associated with executing the code to just get to this point has certainly satisfied the requested delay.

**Note**

*This function calls bsp\_cpu\_clock\_get() which ultimately calls R\_CGC\_SystemClockFreqGet() and therefore requires that the BSP has already initialized the CGC (which it does as part of the Sysinit). Care should be taken to ensure this remains the case if in the future this function were to be called as part of the BSP initialization.*

*This function will delay for **at least** the specified duration. Due to overhead in calculating the correct number of loops to delay, very small delay values (generally 1-5 microseconds) may be significantly longer than specified.*

*Approximate overhead for this function is as follows:*

- CM4: 20-50 cycles

- CM33: 10-60 cycles
- CM23: 75-200 cycles

If more accurate microsecond timing must be performed in software it is recommended to use `bsp_prv_software_delay_loop()` directly. In this case, use `BSP_DELAY_LOOP_CYCLES` or `BSP_DELAY_LOOPS_CALCULATE()` to convert a calculated delay cycle count to a number of software delay loops.

Delays may be longer than expected when compiler optimization is turned off.

### Warning

The delay will be longer than specified on CM23 devices when the core clock is greater than 32 MHz. Setting `BSP_DELAY_LOOP_CYCLES` to 6 will improve accuracy at 48 MHz but will result in shorter than expected delays at lower speeds.

### ◆ SystemInit()

```
void SystemInit ( void )
```

Initialize the MCU and the runtime environment.

### ◆ R\_BSP\_WarmStart()

```
void R_BSP_WarmStart ( bsp_warm_start_event_t event)
```

This function is called at various points during the startup process. This function is declared as a weak symbol higher up in this file because it is meant to be overridden by a user implemented version. One of the main uses for this function is to call functional safety code during the startup process. To use this function just copy this function into your own code and modify it to meet your needs.

#### Parameters

[in]	event	Where the code currently is in the start up process
------	-------	---

This function is called at various points during the startup process. This implementation uses the event that is called right before `main()` to set up the pins.

#### Parameters

[in]	event	Where at in the start up process the code is currently at
------	-------	---

### ◆ Reset\_Handler()

```
void Reset_Handler ( void )
```

MCU starts executing here out of reset. Main stack pointer is set up already.

### ◆ Default\_Handler()

```
void Default_Handler ( void )
```

Default exception handler.

## Variable Documentation

### ◆ BSP\_SECTION\_EARLY\_INIT

```
uint32_t SystemCoreClock BSP_SECTION_EARLY_INIT
```

System Clock Frequency (Core Clock)

enum [icu\\_event\\_t](#)

enum [bsp\\_power\\_mode\\_t](#)

## Enumeration Type Documentation

### ◆ [elc\\_event\\_t](#)

enum [elc\\_event\\_t](#)

Sources of event signals to be linked to other peripherals or the CPU

**Note**

*This list may change based on based on the device.*

◆ **icu\_event\_t**enum `icu_event_t`

Events to be used with the IELSR register to link interrupt events to the NVIC

*Note**This list is device specific.*◆ **bsp\_power\_mode\_t**enum `bsp_power_mode_t`

Voltage regulator mode

## Enumerator

<code>BSP_POWER_MODE_DCDC_2V4_TO_2V7</code>	DCDC mode; 2.4V to 2.7V supply.
<code>BSP_POWER_MODE_DCDC_2V7_TO_3V6</code>	DCDC mode; 2.7V to 3.6V supply.
<code>BSP_POWER_MODE_DCDC_3V6_TO_4V5</code>	DCDC mode; 3.6V to 4.5V supply.
<code>BSP_POWER_MODE_DCDC_4V5_TO_5V5</code>	DCDC mode; 4.5V to 5.5V supply.
<code>BSP_POWER_MODE_LDO</code>	LDO mode.

**Function Documentation**◆ **R\_BSP\_PowerModeSet()**`bsp_power_mode_t R_BSP_PowerModeSet ( bsp_power_mode_t mode)`

Select either the LDO or DCDC regulator and/or update the MCU supply voltage range. Returns the previously selected mode.

*Note**DCDC mode has the following limitations:*

- *Supply voltage must be 2.4V or greater*
- *Low- and Subosc-speed modes are not available*
- *Software Standby is not available. Ensure these limitations are respected before entering DCDC mode. If supply voltage may drop below 2.4V during operation, configure a LVD channel to interrupt or reset the MCU near this threshold to switch back to the LDO.*

*Switching to DCDC mode temporarily disables all interrupts and blocks for 22 microseconds; switching to LDO from DCDC temporarily disables all peripherals and interrupts and blocks for 60 microseconds.**If the supply voltage falls outside the range originally specified when starting the DCDC regulator, call this function again with the updated supply voltage.***Returns**

The previously selected power mode.

## Detailed Description

### Build Time Configurations for ra4e1\_fsp

The following build time configurations are defined in fsp\_cfg/bsp/bsp\_mcu\_family\_cfg.h:

Configuration	Options	Default	Description
Security > Exceptions > Exception Response	<ul style="list-style-type: none"> <li>Non-Maskable Interrupt</li> <li>Reset</li> </ul>	Non-Maskable Interrupt	<p>Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Exceptions > BusFault, HardFault, and NMI Target	<ul style="list-style-type: none"> <li>Non-Secure State</li> <li>Secure State</li> </ul>	Secure State	<p>Value for SCB-&gt;AIRCR register bit BFHFNMINs. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Exceptions > Prioritize Secure Exceptions	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	<p>Value for SCB-&gt;AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the</p>

prioritization of non-secure interrupts is correct.

This setting is only valid when building projects with TrustZone.

Defines whether SRAMPRCR is write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Defines whether SRAM ECC registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Defines whether Standby RAM registers are accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

OFS0 register settings > WDT > Clock Frequency Division Ratio	<ul style="list-style-type: none"> <li>• 4</li> <li>• 64</li> <li>• 128</li> <li>• 512</li> <li>• 2048</li> <li>• 8192</li> </ul>	128
OFS0 register settings > WDT > Window End Position	<ul style="list-style-type: none"> <li>• 75%</li> <li>• 50%</li> <li>• 25%</li> </ul>	0% (no window end position)

	<ul style="list-style-type: none"> <li>0% (no window end position)</li> </ul>		
OFS0 register settings > WDT > Window Start Position	<ul style="list-style-type: none"> <li>25%</li> <li>50%</li> <li>75%</li> <li>100% (no window start position)</li> </ul>	100% (no window start position)	
OFS0 register settings > WDT > Reset Interrupt Request	<ul style="list-style-type: none"> <li>NMI</li> <li>Reset</li> </ul>	Reset	
OFS0 register settings > WDT > Stop Control	<ul style="list-style-type: none"> <li>Counting continues</li> <li>Stop counting when entering Sleep mode</li> </ul>	Stop counting when entering Sleep mode	
OFS1 register settings > Voltage Detection 0 Circuit Start	<ul style="list-style-type: none"> <li>Voltage monitor 0 reset is enabled after reset</li> <li>Voltage monitor 0 reset is disabled after reset</li> </ul>	Voltage monitor 0 reset is disabled after reset	
OFS1 register settings > Voltage Detection 0 Level	<ul style="list-style-type: none"> <li>3.84 V</li> <li>2.82 V</li> <li>2.51 V</li> <li>1.90 V</li> <li>1.70 V</li> </ul>	1.90 V	
OFS1 register settings > HOCO Oscillation Enable	HOCO oscillation is enabled after reset	HOCO oscillation is enabled after reset	HOCO must be enabled out of reset because the MCU starts up in low voltage mode and the HOCO must be operating in low voltage mode.
MPU > Enable or disable PC Region 0	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	
MPU > PC0 Start	Value must be an integer between 0 and 0x00FFFFFFC (ROM) or between 0x1FF00000 and 0x200FFFFFFC (RAM)	0x00FFFFFFC	
MPU > PC0 End	Value must be an integer between 0x00000003 and 0x00FFFFFFF (ROM) or between 0x1FF00003 and 0x200FFFFFFF (RAM)	0x00FFFFFFF	

MPU > Enable or disable PC Region 1	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled
MPU > PC1 Start	Value must be an integer between 0 and 0x00FFFFFFC (ROM) or between 0x1FF00000 and 0x200FFFFFFC (RAM)	0x00FFFFFFC
MPU > PC1 End	Value must be an integer between 0x00000003 and 0x00FFFFFFF (ROM) or between 0x1FF00003 and 0x200FFFFFFF (RAM)	0x00FFFFFFF
MPU > Enable or disable Memory Region 0	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled
MPU > Memory Region 0 Start	Value must be an integer between 0 and 0x00FFFFFFC	0x00FFFFFFC
MPU > Memory Region 0 End	Value must be an integer between 0x00000003 and 0x00FFFFFFF	0x00FFFFFFF
MPU > Enable or disable Memory Region 1	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled
MPU > Memory Region 1 Start	Value must be an integer between 0x1FF00000 and 0x200FFFFFFC	0x200FFFFFFC
MPU > Memory Region 1 End	Value must be an integer between 0x1FF00003 and 0x200FFFFFFF	0x200FFFFFFF
MPU > Enable or disable Memory Region 2	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled
MPU > Memory Region 2 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x407FFFFC
MPU > Memory Region 2 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003	0x407FFFFF

	and 0x407FFFFF		
MPU > Enable or disable Memory Region 3	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	
MPU > Memory Region 3 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x400DFFFC	
MPU > Memory Region 3 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x400DFFFF	
Use Low Voltage Mode	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Use the low voltage mode. This limits the ICLK operating frequency to 4 MHz and requires all clock dividers to be at least 4.
Main Oscillator Wait Time	<ul style="list-style-type: none"> <li>• 2 cycles</li> <li>• 1024 cycles</li> <li>• 2048 cycles</li> <li>• 4096 cycles</li> <li>• 8192 cycles</li> <li>• 16384 cycles</li> <li>• 32768 cycles</li> <li>• 65536 cycles</li> <li>• 131072 cycles</li> <li>• 262144 cycles</li> </ul>	262144 cycles	Number of cycles to wait for the main oscillator clock to stabilize.
ID Code Mode	<ul style="list-style-type: none"> <li>• Unlocked (Ignore ID)</li> <li>• Locked with All Erase support</li> <li>• Locked</li> </ul>	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FF	Set the ID Code for locking debug access. This setting is only used when the ID Code

Mode is not set to Unlocked.

## Build Time Configurations for ra4m2\_fsp

The following build time configurations are defined in `fsp_cfg/bsp/bsp_mcu_family_cfg.h`:

Configuration	Options	Default	Description
Security > Exceptions > Exception Response	<ul style="list-style-type: none"> <li>Non-Maskable Interrupt</li> <li>Reset</li> </ul>	Non-Maskable Interrupt	<p>Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Exceptions > BusFault, HardFault, and NMI Target	<ul style="list-style-type: none"> <li>Non-Secure State</li> <li>Secure State</li> </ul>	Secure State	<p>Value for SCB-&gt;AIRCR register bit BFHFNMIN. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.</p> <p>This setting is only</p>

Security > Exceptions > Prioritize Secure Exceptions	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	valid when building projects with TrustZone.
Security > SRAM Accessibility > SRAM Protection	<ul style="list-style-type: none"> <li>• Both Secure and Non-Secure State</li> <li>• Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Value for SCB-&gt;AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > SRAM Accessibility > SRAM ECC	<ul style="list-style-type: none"> <li>• Both Secure and Non-Secure State</li> <li>• Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether SRAMPRCR is write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> <p>Defines whether SRAM ECC registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > SRAM Accessibility > Standby RAM	<ul style="list-style-type: none"> <li>• Regions 7-0 are all Secure.</li> <li>• Region 7 is Non-secure. Regions 6-0 are Secure.</li> <li>• Regions 7-6 are Non-secure. Regions 5-0 are Secure.</li> <li>• Regions 7-5 are Non-secure.</li> </ul>	config.bsp.fsp.tz.stbramsar.both	<p>Defines whether Standby RAM registers are accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>

Security > BUS Accessibility > Bus Security Attribution Register A	<ul style="list-style-type: none"> <li>Regions 4-0 are Secure.</li> <li>• Regions 7-4 are Non-secure. Regions 3-0 are Secure.</li> <li>• Regions 7-3 are Non-secure. Regions 2-0 are Secure.</li> <li>• Regions 7-2 are Non-secure. Regions 1-0 are Secure.</li> <li>• Regions 7-1 are Non-secure. Region 0 is Secure.</li> <li>• Regions 7-0 are all Non-secure.</li> </ul> <ul style="list-style-type: none"> <li>• Both Secure and Non-Secure State</li> <li>• Secure State</li> </ul>	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.  This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility > Bus Security Attribution Register B	<ul style="list-style-type: none"> <li>• Both Secure and Non-Secure State</li> <li>• Secure State</li> </ul>	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.  This setting is only valid when building projects with TrustZone.
Security > System Reset Request Accessibility	<ul style="list-style-type: none"> <li>• Both Secure and Non-Secure State</li> <li>• Secure State</li> </ul>	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.  This setting is only valid when building projects with

Security > Cache Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	TrustZone. Defines whether the Cache registers are write accessible for the Non-secure application.  This setting is only valid when building projects with TrustZone.
Security > System Reset Status Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.  This setting is only valid when building projects with TrustZone.
Security > Battery Backup Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected.  This setting is only valid when building projects with TrustZone.

#### Build Time Configurations for ra4m3\_fsp

The following build time configurations are defined in fsp\_cfg/bsp/bsp\_mcu\_family\_cfg.h:

Configuration	Options	Default	Description
Security > Exceptions	<ul style="list-style-type: none"> <li>• Non-Maskable</li> </ul>	Non-Maskable Interrupt	Configure the result of

> Exception Response	Interrupt <ul style="list-style-type: none"> <li>Reset</li> </ul>		<p>a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Exceptions > BusFault, HardFault, and NMI Target	<ul style="list-style-type: none"> <li>Non-Secure State</li> <li>Secure State</li> </ul>	Secure State	<p>Value for SCB-&gt;AIRCR register bit BFHFNMINs. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Exceptions > Prioritize Secure Exceptions	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	<p>Value for SCB-&gt;AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > SRAM Accessibility > SRAM Protection	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether SRAMPRCR is write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with</p>

Security > SRAM  
Accessibility > SRAM  
ECC

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

TrustZone.

Defines whether SRAM ECC registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Security > SRAM  
Accessibility > Standby  
RAM

- Regions 7-0 are all Secure.
- Region 7 is Non-secure. Regions 6-0 are Secure.
- Regions 7-6 are Non-secure. Regions 5-0 are Secure.
- Regions 7-5 are Non-secure. Regions 4-0 are Secure.
- Regions 7-4 are Non-secure. Regions 3-0 are Secure.
- Regions 7-3 are Non-secure. Regions 2-0 are Secure.
- Regions 7-2 are Non-secure. Regions 1-0 are Secure.
- Regions 7-1 are Non-secure. Region 0 is Secure.
- Regions 7-0 are all Non-secure.

config.bsp.fsp.tz.stbramsar.both

Defines whether Standby RAM registers are accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Security > BUS  
Accessibility > Bus  
Security Attribution  
Register A

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Security > BUS Accessibility > Bus Security Attribution Register B	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > System Reset Request Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Secure State	<p>Value for SCB-&gt;AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Cache Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether the Cache registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > System Reset Status Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Battery Backup Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are</p>

both read and write protected.

This setting is only valid when building projects with TrustZone.

Clocks > HOCO FLL Function	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	<p>Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.</p> <p>The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time</p>

when setting up clocks at startup.

When FLL is enabled Software Standby and Deep Software Standby modes are not available.

Number of cycles to wait for the main oscillator clock to stabilize. Drive capability automatic switching function is by default disabled.

Main Oscillator Wait Time

- 35 cycles
- 67 cycles
- 131 cycles
- 259 cycles
- 547 cycles
- 1059 cycles
- 2147 cycles
- 4291 cycles
- 8163 cycles

8163 cycles

ID Code Mode

- Unlocked (Ignore ID)
- Locked with All Erase support
- Locked

Unlocked (Ignore ID)

When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.

ID Code (32 Hex Characters)

Value must be a 32 character long hex string

FFFFFFFFFFFFFFFFFFFF  
FFFFFFFFFFFF

Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.

### 4.1.3.13 RA6M3

BSP » MCU Board Support Package

## Detailed Description

### Build Time Configurations for ra6m3\_fsp

The following build time configurations are defined in fsp\_cfg/bsp/bsp\_mcu\_family\_cfg.h:

Configuration	Options	Default	Description
OFS0 register settings > Independent WDT > Start Mode	<ul style="list-style-type: none"> <li>IWDT is Disabled</li> <li>IWDT is automatically activated after a reset (Autostart mode)</li> </ul>	IWDT is Disabled	
OFS0 register settings > Independent WDT > Timeout Period	<ul style="list-style-type: none"> <li>128 cycles</li> <li>512 cycles</li> <li>1024 cycles</li> <li>2048 cycles</li> </ul>	2048 cycles	
OFS0 register settings > Independent WDT > Dedicated Clock Frequency Divisor	<ul style="list-style-type: none"> <li>1</li> <li>16</li> <li>32</li> <li>64</li> <li>128</li> <li>256</li> </ul>	128	
OFS0 register settings > Independent WDT > Window End Position	<ul style="list-style-type: none"> <li>75%</li> <li>50%</li> <li>25%</li> <li>0% (no window end position)</li> </ul>	0% (no window end position)	
OFS0 register settings > Independent WDT > Window Start Position	<ul style="list-style-type: none"> <li>25%</li> <li>50%</li> <li>75%</li> <li>100% (no window start position)</li> </ul>	100% (no window start position)	
OFS0 register settings > Independent WDT > Reset Interrupt Request Select	<ul style="list-style-type: none"> <li>NMI request or interrupt request is enabled</li> <li>Reset is enabled</li> </ul>	Reset is enabled	
OFS0 register settings	<ul style="list-style-type: none"> <li>Counting</li> </ul>	Stop counting when in	

> Independent WDT > Stop Control	continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Snooze mode, or Software Standby	Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT > Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
OFS0 register settings > WDT > Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
OFS0 register settings > WDT > Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
OFS0 register settings > WDT > Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
OFS0 register settings > WDT > Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
OFS0 register settings > WDT > Reset Interrupt Request	• NMI • Reset	Reset
OFS0 register settings > WDT > Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode

OFS1 register settings > Voltage Detection 0 Circuit Start	<ul style="list-style-type: none"> <li>• Voltage monitor 0 reset is enabled after reset</li> <li>• Voltage monitor 0 reset is disabled after reset</li> </ul>	Voltage monitor 0 reset is disabled after reset
OFS1 register settings > Voltage Detection 0 Level	<ul style="list-style-type: none"> <li>• 2.94 V</li> <li>• 2.87 V</li> <li>• 2.80 V</li> </ul>	2.80 V
OFS1 register settings > HOCO Oscillation Enable	<ul style="list-style-type: none"> <li>• HOCO oscillation is enabled after reset</li> <li>• HOCO oscillation is disabled after reset</li> </ul>	HOCO oscillation is disabled after reset
MPU > Enable or disable PC Region 0	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled
MPU > PC0 Start	Value must be an integer between 0 and 0xFFFFFFFF	0xFFFFFFFF
MPU > PC0 End	Value must be an integer between 0x00000003 and 0xFFFFFFFF	0xFFFFFFFF
MPU > Enable or disable PC Region 1	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled
MPU > PC1 Start	Value must be an integer between 0 and 0xFFFFFFFF	0xFFFFFFFF
MPU > PC1 End	Value must be an integer between 0x00000003 and 0xFFFFFFFF	0xFFFFFFFF
MPU > Enable or disable Memory Region 0	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled
MPU > Memory Region 0 Start	Value must be an integer between 0 and 0x00FFFFFF	0x00FFFFFF
MPU > Memory Region 0 End	Value must be an integer between 0x00000003 and 0x00FFFFFF	0x00FFFFFF

MPU > Enable or disable Memory Region 1	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	
MPU > Memory Region 1 Start	Value must be an integer between 0x1FF00000 and 0x200FFFC	0x200FFFC	
MPU > Memory Region 1 End	Value must be an integer between 0x1FF00003 and 0x200FFFF	0x200FFFF	
MPU > Enable or disable Memory Region 2	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	
MPU > Memory Region 2 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFC	0x407FFFC	
MPU > Memory Region 2 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFF	0x407FFFF	
MPU > Enable or disable Memory Region 3	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	
MPU > Memory Region 3 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFC	0x400DFFFC	
MPU > Memory Region 3 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFF	0x400DFFFF	
Clocks > HOCO FLL Function	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.

The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup.

When FLL is enabled Software Standby and Deep Software Standby modes are not available.

Main Oscillator Wait Time	<ul style="list-style-type: none"> <li>• 35 cycles</li> <li>• 67 cycles</li> <li>• 131 cycles</li> <li>• 259 cycles</li> <li>• 547 cycles</li> <li>• 1059 cycles</li> <li>• 2147 cycles</li> <li>• 4291 cycles</li> <li>• 8163 cycles</li> </ul>	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize. Drive capability automatic switching function is by default disabled.
ID Code Mode	<ul style="list-style-type: none"> <li>• Unlocked (Ignore ID)</li> <li>• Locked with All Erase support</li> <li>• Locked</li> </ul>	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF FFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.

## Enumerations

```
enum elc_event_t
```

## Enumeration Type Documentation

### ◆ `elc_event_t`

enum `elc_event_t`

Sources of event signals to be linked to other peripherals or the CPU

*Note*

*This list may change based on based on the device.*

#### 4.1.3.14 RA6M4

[BSP](#) » [MCU Board Support Package](#)

### Build Time Configurations for `ra6m4_fsp`

The following build time configurations are defined in `fsp_cfg/bsp/bsp_mcu_family_cfg.h`:

Configuration	Options	Default	Description
Security > Exceptions > Exception Response	<ul style="list-style-type: none"> <li>Non-Maskable Interrupt</li> <li>Reset</li> </ul>	Non-Maskable Interrupt	<p>Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Exceptions > BusFault, HardFault, and NMI Target	<ul style="list-style-type: none"> <li>Non-Secure State</li> <li>Secure State</li> </ul>	Secure State	<p>Value for SCB-&gt;AIRCR register bit BFHFNMIN. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Exceptions > Prioritize Secure Exceptions	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	<p>Value for SCB-&gt;AIRCR register bit PRIS. When enabled, all Non-secure</p>

interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.

This setting is only valid when building projects with TrustZone.

Defines whether SRAMPRCR is write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Defines whether SRAM ECC registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Defines whether Standby RAM registers are accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

### 4.1.3.17 RA6T2

[BSP](#) » [MCU Board Support Package](#)

## Detailed Description

### Build Time Configurations for [ra6t2\\_fsp](#)

The following build time configurations are defined in `fsp_cfg/bsp/bsp_mcu_family_cfg.h`:

Configuration	Options	Default	Description
Security > Exceptions > Exception Response	<ul style="list-style-type: none"> <li>Non-Maskable Interrupt</li> <li>Reset</li> </ul>	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This

exception is generated when a the TrustZone Filter detects access to a protected region.

This setting is only valid when building projects with TrustZone.

Value for SCB->AIRCR register bit BFHFNMIN. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.

This setting is only valid when building projects with TrustZone.

Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.

This setting is only valid when building projects with TrustZone.

Defines whether SRAMPRCR is write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Security > Exceptions > BusFault, HardFault, and NMI Target

- Non-Secure State
  - Secure State
- Secure State

Security > Exceptions > Prioritize Secure Exceptions

- Enabled
  - Disabled
- Disabled

Security > SRAM Accessibility > SRAM Protection

- Both Secure and Non-Secure State
  - Secure State
- Both Secure and Non-Secure State

Security > SRAM Accessibility > SRAM ECC	<ul style="list-style-type: none"> <li>• Both Secure and Non-Secure State</li> <li>• Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether SRAM ECC registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > SRAM Accessibility > Standby RAM	<ul style="list-style-type: none"> <li>• Regions 7-0 are all Secure.</li> <li>• Region 7 is Non-secure. Regions 6-0 are Secure.</li> <li>• Regions 7-6 are Non-secure. Regions 5-0 are Secure.</li> <li>• Regions 7-5 are Non-secure. Regions 4-0 are Secure.</li> <li>• Regions 7-4 are Non-secure. Regions 3-0 are Secure.</li> <li>• Regions 7-3 are Non-secure. Regions 2-0 are Secure.</li> <li>• Regions 7-2 are Non-secure. Regions 1-0 are Secure.</li> <li>• Regions 7-1 are Non-secure. Region 0 is Secure.</li> <li>• Regions 7-0 are all Non-secure.</li> </ul>	config.bsp.fsp.tz.stbramsar.both	<p>Defines whether Standby RAM registers are accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > BUS Accessibility > Bus Security Attribution Register A	<ul style="list-style-type: none"> <li>• Both Secure and Non-Secure State</li> <li>• Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether the Slave Bus Control Registers (BUSSCNT&lt;slave&gt;) are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > BUS Accessibility > Bus	<ul style="list-style-type: none"> <li>• Both Secure and Non-Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether the Bus and DMAC/DTC</p>

Security Attribution Register B	<ul style="list-style-type: none"> <li>State</li> <li>Secure State</li> </ul>		<p>Error Clear Registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > System Reset Request Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Secure State	<p>Value for SCB-&gt;AIRCRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > Cache Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether the Cache registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
Security > System Reset Status Accessibility	<ul style="list-style-type: none"> <li>Both Secure and Non-Secure State</li> <li>Secure State</li> </ul>	Both Secure and Non-Secure State	<p>Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p>
OFS0 register settings > Independent WDT > Start Mode	<ul style="list-style-type: none"> <li>IWDT is Disabled</li> <li>IWDT is automatically activated after a reset (Autostart mode)</li> </ul>	IWDT is Disabled	
OFS0 register settings > Independent WDT > Timeout Period	<ul style="list-style-type: none"> <li>128 cycles</li> <li>512 cycles</li> <li>1024 cycles</li> <li>2048 cycles</li> </ul>	2048 cycles

OFS0 register settings > WDT > Reset Interrupt Request	<ul style="list-style-type: none"> <li>• NMI</li> <li>• Reset</li> </ul>	Reset
OFS0 register settings > WDT > Stop Control	<ul style="list-style-type: none"> <li>• Counting continues</li> <li>• Stop counting when entering Sleep mode</li> </ul>	Stop counting when entering Sleep mode
OFS1 register settings > Voltage Detection 0 Circuit Start	<ul style="list-style-type: none"> <li>• Voltage monitor 0 reset is enabled after reset</li> <li>• Voltage monitor 0 reset is disabled after reset</li> </ul>	Voltage monitor 0 reset is disabled after reset
OFS1 register settings > Voltage Detection 0 Level	<ul style="list-style-type: none"> <li>• 2.94 V</li> <li>• 2.87 V</li> <li>• 2.80 V</li> </ul>	2.80 V
OFS1 register settings > HOCO Oscillation Enable	<ul style="list-style-type: none"> <li>• HOCO oscillation is enabled after reset</li> <li>• HOCO oscillation is disabled after reset</li> </ul>	HOCO oscillation is disabled after reset
OFS1 register settings > PGA0 Pseudo-Differential Input Enable	<ul style="list-style-type: none"> <li>• Disabled (single-ended input) after reset</li> <li>• Enabled after reset</li> </ul>	Disabled (single-ended input) after reset
OFS1 register settings	<ul style="list-style-type: none"> <li>• Disabled (single-</li> </ul>	Disabled (single-ended

> PGA1 Pseudo-Differential Input Enable	ended input) after reset • Enabled after reset	input) after reset	
OFS1 register settings > PGA2 Pseudo-Differential Input Enable	• Disabled (single-ended input) after reset • Enabled after reset	Disabled (single-ended input) after reset	
OFS1 register settings > PGA3 Pseudo-Differential Input Enable	• Disabled (single-ended input) after reset • Enabled after reset	Disabled (single-ended input) after reset	
Block Protection Settings (BPS) > BPS0	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 0
Permanent Block Protection Settings (PBPS) > PBPS0	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 0
Clocks > HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.  The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup.  When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Startup C-Cache Line Size	• 32 Bytes • 64 Bytes	32 Bytes	Set the C-Cache line size configured during startup.
TFU Mathlib	• Disabled	Enabled	If enabled,

- Enabled

trigonometric library functions `sinf`, `cosf`, `atan2f`, and `hypotf` are replaced with hardware accelerated TFU functions. Disable this if reentrant access to these functions is required.

Main Oscillator Wait Time

- 3 cycles
- 35 cycles
- 67 cycles
- 131 cycles
- 259 cycles
- 547 cycles
- 1059 cycles
- 2147 cycles
- 4291 cycles
- 8163 cycles

8163 cycles

Number of cycles to wait for the main oscillator clock to stabilize.

*This list may change based on based on the device.*

## 4.2 Modules

### Detailed Description

Modules are the smallest unit of software available in the FSP. Each module implements one interface.

For more information on FSP Modules and Interfaces review [FSP Modules](#), [FSP Stacks](#) and [FSP Interfaces](#) in the FSP Architecture section of this manual.

*Note*

*Not all modules are available for all MCUs. For more information, see the User's Manual for the specific MCU.*

### Organization of Module Sections

Each module within FSP has a detailed Users' Guide listed below. Each guide typically includes the following content:

- **Functions:** A list of all the API functions associated with the module
- **Detailed Description:** A short description of the module and the peripherals used
- **Overview:** An operational summary and a list of high level features provided by the module
- **Configuration:** A description of module specific settings available in the configuration tool including clock and pin configurations
- **Usage Notes:** Module specific documentation and limitations
- **Examples:** Illustrative code snippets that help the user better understand API use and operation
- **Data Structure and Enumeration:** Definitions for data structures, enumerations and similar elements used by the module API
- **Function Documentation:** Details on each API function, including the function prototype, a function summary, a simple use example, list of return values and links to documentation for any needed parameter definitions

### 4.2.1 Analog

#### Modules

#### Detailed Description

Analog Modules.

#### Modules

##### ADC (r\_adc)

Driver for the ADC12, ADC14, and ADC16 peripherals on RA MCUs. This module implements the [ADC Interface](#).

##### ADC Driver on r\_adc\_b

Driver for the ADC\_B peripheral on RA MCUs. This module implements the [ADC Interface](#).

##### Comparator, High-Speed (r\_acmphs)

Driver for the ACMPHS peripheral on RA MCUs. This module implements the [Comparator Interface](#).

##### Comparator, Low-Power (r\_acmplp)

Driver for the ACMLP peripheral on RA MCUs. This module implements the [Comparator Interface](#).

##### DAC (r\_dac)

Driver for the DAC12 peripheral on RA MCUs. This module implements the [DAC Interface](#).

##### DAC8 (r\_dac8)

Driver for the DAC8 peripheral on RA MCUs. This module implements the [DAC Interface](#).

### Operational Amplifier (r\_opamp)

Driver for the OPAMP peripheral on RA MCUs. This module implements the [OPAMP Interface](#).

### SDADC Channel Configuration (r\_sdadc)

Driver for the SDADC24 peripheral on RA MCUs. This module implements the [ADC Interface](#).

## 4.2.1.1 ADC (r\_adc)

fsp\_err\_t R\_ADC\_Calibrate (adc\_ctrl\_t \*const p\_ctrl, void const \*p\_extend)

```
fsp_err_t R_ADC_OffsetSet (adc_ctrl_t *const p_ctrl, adc_channel_t const
reg_id, int32_t offset)
```

## Detailed Description

Driver for the ADC12, ADC14, and ADC16 peripherals on RA MCUs. This module implements the [ADC Interface](#).

## Overview

### Features

The ADC module supports the following features:

- 12, 14, or 16 bit maximum resolution depending on the MCU
- Configure scans to include:
  - Multiple analog channels
  - Temperature sensor channel
  - Voltage sensor channel
- Configurable scan start trigger:
  - Software scan triggers
  - Hardware scan triggers (timer expiration, for example)
  - External scan triggers from the ADTRGn port pins
- Configurable scan mode:
  - Single scan mode, where each trigger starts a single scan
  - Continuous scan mode, where all channels are scanned continuously
  - Group scan mode, where channels are grouped into group A and group B. The groups can be assigned different start triggers, and group A can be given priority over group B. When group A has priority over group B, a group A trigger suspends an ongoing group B scan.
- Supports adding and averaging converted samples
- Optional callback when scan completes
- Sample and hold support
- Double-trigger support
- Hardware comparator with interrupt and event output

## Configuration

### Build Time Configurations for r\_adc

The following build time configurations are defined in fsp\_cfg/r\_adc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Analog > ADC (r\_adc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r\_adc). Non-secure

callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_adc0	Module name
General > Unit	Unit must be a non-negative integer	0	Specifies the ADC Unit to be used.
General > Resolution	MCU Specific Options		Specifies the conversion resolution for this unit.
General > Alignment	MCU Specific Options		Specifies the conversion result alignment.
General > Clear after read	<ul style="list-style-type: none"> <li>• Off</li> <li>• On</li> </ul>	On	Specifies if the result register will be automatically cleared after the conversion result is read.
General > Mode	<ul style="list-style-type: none"> <li>• Single Scan</li> <li>• Continuous Scan</li> <li>• Group Scan</li> </ul>	Single Scan	Specifies the mode that this ADC unit is used in.
General > Double-trigger	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> <li>• Enabled (extended mode)</li> </ul>	Disabled	<p>When enabled, the scan-end interrupt for Group A is only thrown on every second scan. Extended double-trigger mode (single-scan only) triggers on both ELC events, allowing (for example) a scan on two different timer compare match values.</p> <p>In group mode Group B is unaffected.</p>
Input > Sample and Hold > Sample and Hold Channels (Available only on selected MCUs)	<ul style="list-style-type: none"> <li>• Channel 0</li> <li>• Channel 1</li> <li>• Channel 2</li> </ul>		Specifies if this channel is included in the Sample and Hold Mask.
Input > Sample and Hold > Sample Hold States (Applies only to channels 0, 1, 2)	Must be a valid non-negative integer with configurable value 4 to 255	24	Specifies the updated sample-and-hold count for the channel dedicated sample-and-

Input > Window Compare > Window A > Enable	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Disabled	hold circuit
Input > Window Compare > Window A > Channels to compare (channel availability varies by MCU and unit)	Refer to the RA Configuration tool for available options.		Enable or disable comparison with Window A.  Select channels to be compared to Window A.
Input > Window Compare > Window A > Channel comparison mode (channel availability varies by MCU and unit)	Refer to the RA Configuration tool for available options.		Checking a box sets the comparison mode for that channel to Greater Than or Inside Window depending on whether Window Mode is disabled or enabled (respectively). If left unchecked the comparison mode will likewise be Less Than or Outside Window (respectively).
Input > Window Compare > Window A > Lower Reference	Must be a positive 16-bit integer.	0	Set the lower comparison value.
Input > Window Compare > Window A > Upper Reference	Must be a positive 16-bit integer.	0	Set the upper comparison value.
Input > Window Compare > Window B > Enable	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Disabled	Enable or disable comparison with Window B.
Input > Window Compare > Window B > Channel to compare (channel availability varies by MCU and unit)	Refer to the RA Configuration tool for available options.	Channel 0	Select a channel to be compared to Window B.
Input > Window Compare > Window B > Comparison mode	<ul style="list-style-type: none"> <li>• Less Than or Outside Window</li> <li>• Greater Than or Inside Window</li> </ul>	module.driver.adc.compare.window_b.mode	Select the comparison mode for Window B. For each option, the first condition applies when Window Mode is disabled and the second option applies when Window Mode is enabled.
Input > Window Compare > Window B	Must be a positive 16-bit integer.	0	Set the lower comparison value.

## &gt; Lower Reference

Input > Window  
Compare > Window B  
> Upper Reference

Must be a positive  
16-bit integer.

0

Set the upper  
comparison value.

Input > Window  
Compare > Window  
Mode

- Disabled
- Enabled

Disabled

When disabled, ADC values will be compared only with the lower reference on each comparator. When enabled, both the lower and upper reference values will be used to create a comparison window.

Input > Window  
Compare > Event  
Output

- OR
- XOR
- AND

OR

Select how comparison results should be composited for event output.

Input > Channel Scan  
Mask (channel  
availability varies by  
MCU)

Refer to the RA  
Configuration tool for  
available options.

In Normal mode of operation, this bitmask field specifies the channels that are enabled in that ADC unit. In group mode, this field specifies which channels belong to group A.

Input > Group B Scan  
Mask (channel  
availability varies by  
MCU)

Refer to the RA  
Configuration tool for  
available options.

In group mode, this field specifies which channels belong to group B.

Input > Add/Average  
Count

MCU Specific Options

Specifies if addition or averaging needs to be done for any of the channels in this unit.

Input > Reference  
Voltage control

MCU Specific Options

Specify  
VREFH/VREFADC  
output voltage control.

Input >  
Addition/Averaging  
Mask (channel  
availability varies by  
MCU and unit)

Refer to the RA  
Configuration tool for  
available options.

Select channels to  
include in the  
Addition/Averaging  
Mask

Interrupts >  
Normal/Group A  
Trigger

MCU Specific Options

Specifies the trigger  
type to be used for this  
unit.

Interrupts > Group B  
Trigger

MCU Specific Options

Specifies the trigger for  
Group B scanning in  
group scanning mode.

Interrupts > Group Priority (Valid only in Group Scan Mode)	<ul style="list-style-type: none"> <li>Group A cannot interrupt Group B</li> <li>Group A can interrupt Group B; Group B scan restarts at next trigger</li> <li>Group A can interrupt Group B; Group B scan restarts immediately</li> <li>Group A can interrupt Group B; Group B scan restarts immediately and scans continuously</li> </ul>	Group A cannot interrupt Group B	<p>This event is also used to trigger Group A in extended double-trigger mode.</p> <p>Determines whether an ongoing group B scan can be interrupted by a group A trigger, whether it should abort on a group A trigger, or if it should pause to allow group A scan and restart immediately after group A scan is complete.</p>
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the ADC scan completes.
Interrupts > Scan End Interrupt Priority	MCU Specific Options		Select scan end interrupt priority.
Interrupts > Scan End Group B Interrupt Priority	MCU Specific Options		Select group B scan end interrupt priority.
Interrupts > Window Compare A Interrupt Priority	MCU Specific Options		Select Window Compare A interrupt priority.
Interrupts > Window Compare B Interrupt Priority	MCU Specific Options		Select Window Compare B interrupt priority.
Extra > ADC Ring Buffer	MCU Specific Options		ADC Ring Buffer to be used only with DMAC transfers, keep this property disabled for normal ADC operations. When enabled, ADC converted data is stored in ADBUF

registers in place of ADDR registers. The read API will not read from this location for normal ADC operations.

## Clock Configuration

The ADC clock is PCLKC if the MCU has PCLKC, or PCLKD otherwise.

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKD
RA2E1	PCLKD
RA2E2	PCLKD
RA2L1	PCLKD
RA4E1	PCLKC
RA4M1	PCLKC
RA4M2	PCLKC
RA4M3	PCLKC
RA4W1	PCLKC
RA6E1	PCLKC
RA6M1	PCLKC
RA6M2	PCLKC
RA6M3	PCLKC
RA6M4	PCLKC
RA6M5	PCLKC
RA6T1	PCLKC

The ADC clock must be at least 1 MHz when the ADC is used. Many MCUs also have PCLK ratio restrictions when the ADC is used. For details on PCLK ratio restrictions, reference the footnotes in the second table of the Clock Generation Circuit chapter of the MCU User's Manual (for example, Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100).

## Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger for unit 0 and 1 respectively. When external triggers are used, ADC scans begin on the falling edge of the ADTRG pin.

# Usage Notes

## Sample Hold

Enabling the sample and hold functionality reduces the maximum scan frequency because the sample and hold time is added to each scan. Refer to the hardware manual for details on the sample and hold time.

## ADC Operational Modes

The driver supports three operation modes: single-scan, continuous-scan, and group-scan modes. In each mode, analog channels are converted in ascending order of channel number, followed by scans of the temperature sensor and voltage sensor if they are included in the mask of channels to scan.

### Single-scan Mode

In single scan mode, one or more specified channels are scanned once per trigger.

### Continuous-scan Mode

In continuous scan mode, a single trigger is required to start the scan. Scans continue until [R\\_ADC\\_ScanStop\(\)](#) is called.

#### Note

- 1) To help ensure a responsive system, developers should consider system clock speed, ADCLK speed, and callback processing time. In particular, using a scan-end callback with a high scan rate relative to core clocks (for example, in continuous scan mode) may result in constant or high-frequency interrupts and is not recommended.
- 2) On some MCUs, scanning the temperature sensor or internal reference voltage in continuous or group scan modes is prohibited. Check the "ADC12 specifications" section of the device's User Manual to see if this restriction applies.

### Group-scan Mode

Group-scan mode allows the application to allocate channels to one of two groups (A and B). Conversion begins when the specified ELC start trigger for that group is received.

With the priority configuration parameter, you can optionally give group A priority over group B. If group A has priority over group B, a group B scan is interrupted when a group A scan trigger occurs. The following options exist for group B when group A has priority:

- To restart the interrupted group B scan after the group A scan completes.
- To wait for another group B trigger and forget the interrupted scan.
- To continuously scan group B and suspend scanning group B only when a group A trigger is received.

#### Note

*If this option is selected, group B scanning begins immediately after [R\\_ADC\\_ScanCfg\(\)](#). Group A scan triggers must be enabled by [R\\_ADC\\_ScanStart\(\)](#) and can be disabled by [R\\_ADC\\_ScanStop\(\)](#). Group B scans can only be disabled by reconfiguring the group A priority to a different mode.*

### Double-triggering

When double-triggering is enabled a single channel is selected to be scanned twice before an interrupt is thrown. The first scan result when using double-triggering is always saved to the selected

channel's data register. The second result is saved to the data duplexing register ([ADC\\_CHANNEL\\_DUPLEX](#)).

Double-triggering uses Group A; only one channel can be selected when enabled. No other scanning is possible on Group A while double-trigger mode is selected. In addition, any special ADC channels (such as temperature sensors or voltage references) are not valid double-trigger channels.

When extended double-triggering is enabled both ADC input events are routed to Group A. The interrupt is still thrown after every two scans regardless of the triggering event(s). While the first and second scan are saved to the selected ADC data register and the ADC duplexing register as before, scans associated with event A and B are additionally copied into duplexing register A and B, respectively ([ADC\\_CHANNEL\\_DUPLEX\\_A](#) and [ADC\\_CHANNEL\\_DUPLEX\\_B](#)).

### When Interrupts Are Not Enabled

If interrupts are not enabled, the `R_ADC_StatusGet` API can be used to poll the ADC to determine when the scan has completed. The read API function is used to access the converted ADC result. This applies to both normal scans and calibration scans for MCUs that support calibration.

### Window Compare Function

The ADC contains comparators that allow scan data to be compared to user-provided reference values. When a value meets the configured condition an interrupt and/or an ELC event can be produced.

Each unit has two configurable comparison units, Window A and Window B. Window A allows for configuring multiple simultaneous channels to compare while Window B only allows one channel at a time.

The window compare function can be configured both through the RA Configuration tool and at runtime by providing a pointer to an `adc_window_cfg_t` struct to `adc_channel_cfg_t::p_window_cfg` when calling `R_ADC_ScanCfg`. The available comparison modes are shown below:

Window setting	Channel mode 0	Channel mode 1
Disabled	Scan < Low Ref	Scan > Low Ref
Enabled	(Scan < Low Ref) OR (Scan > High Ref)	Low Ref < Scan < High Ref

#### Note

*The window setting applies to all channels configured on a unit.*

### Sample-State Count Setting

The application program can modify the setting of the sample-state count for analog channels by calling the `R_ADC_SampleStateCountSet()` API function. The application program only needs to modify the sample-state count settings from their default values to increase the sampling time. This can be either because the impedance of the input signal is too high to secure sufficient sampling time under the default setting or if the ADCLK is too slow. To modify the sample-state count for a given channel, set the channel number and the number of states when calling the `R_ADC_SampleStateCountSet()` API function. Valid sample state counts are 7-255.

#### Note

*Although the hardware supports a minimum number of sample states of 5, some MCUs require 7 states, so the*

*minimum is set to 7. At the lowest supported ADC conversion clock rate (1 MHz), these extra states will lead to, at worst case, a 2 microsecond increase in conversion time. At 60 MHz the extra states will add 33.4 ns to the conversion time.*

If the sample state count needs to be changed for multiple channels, the application program must call the `R_ADC_SampleStateCountSet()` API function repeatedly, with appropriately modified arguments for each channel.

If the ADCLK frequency changes, the sample states may need to be updated.

### Sample States for Temperature Sensor and Internal Voltage Reference

Sample states for the temperature sensor and the internal reference voltage are calculated during `R_ADC_ScanCfg()` based on the ADCLK frequency at the time. The sample states for the temperature sensor and internal voltage reference cannot be updated with `R_ADC_SampleStateCountSet()`. If the ADCLK frequency changes, call `R_ADC_ScanCfg()` before using the temperature sensor or internal reference voltage again to ensure the sampling time for the temperature sensor and internal voltage reference is optimal.

### Selecting Reference Voltage

The ADC high-potential and low-potential reference voltages may be configured for selected MCU's. Please refer to the RA Configuration editor in e2 studio for further details.

#### Note

*When using VREFADC, a stabilization time of 1500us is required after call for `R_ADC_Open()`. Consult Section 32.6 "Selecting Reference Voltage" in the RA2A1 User's Manual (R01UH0888EJ0100) for details.*

*When the internal reference voltage is selected as the high-potential reference voltage, the Low-power A/D Conversion mode will automatically be selected. Consult Section 29.6 "Selecting Reference Voltage" in the RA2E1 User's Manual (R01UH0852EJ0110) for details.*

### Using the Temperature Sensor with the ADC

The ADC HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula,  $T = (V_s - V_1)/\text{slope} + T_1$ , where:

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of temperature measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- T2: Temperature at the experimental measurement of another point (degrees C)
- V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)
- Slope: Temperature gradient of the temperature sensor (V/degrees C); slope =  $(V_2 - V_1)/(T_2 - T_1)$

#### Note

*The slope value can be obtained from the hardware manual for each device in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.*

### Reading CTSU TSCAP with ADC

Some MCUs support reading CTSU TSCAP with ADC. CTSU TSCAP is connected to ADC0 channel 16. Use existing enums for channel 16 to set sample states for the sensor connected to CTSU TSCAP,

enable scanning of CTSU TSCAP, and read results for CTSU TSCAP.

## Usage Notes for ADC16

### Calibration

Calibration is required to use the ADC16 peripheral. When using this driver on an MCU that has ADC16, call `R_ADC_Calibrate()` after open, and prior to any other function.

### Range of ADC16 Results

The range of the ADC16 is from 0 (lowest) to 0x7FFF (highest) when used in single-ended mode. This driver only supports single ended mode.

### Limitations

Developers should be aware of the following limitations when using the ADC:

- When using the Window Compare function:
  - Only Single Scan mode may be configured when match or mismatch ELC events are used.
  - When one compare window is configured to check the temperature sensor or voltage reference the other window cannot be used.
  - Both windows cannot reference the same channel.

## Examples

### Basic Example

This is a basic example of minimal use of the ADC in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_channel_cfg_t elements can be defined
and passed to R_ADC_ScanCfg. */
const adc_channel_cfg_t g_adc0_channel_cfg =
{
    .scan_mask           = ADC_MASK_CHANNEL_0 | ADC_MASK_CHANNEL_1,
    .scan_mask_group_b = 0,
    .priority_group_a   = (adc_group_a_t) 0,
    .add_mask           = 0,
    .sample_hold_mask   = 0,
    .sample_hold_states = 0,
};
void adc_basic_example (void)
{
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initializes the module. */
err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Enable channels. */
err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
assert(FSP_SUCCESS == err);

/* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
modes, enable external
* triggers by calling R_ADC_ScanStart(). */
(void) R_ADC_ScanStart(&g_adc0_ctrl);

/* Wait for conversion to complete. */
adc_status_t status;
status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
    (void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
}

/* Read converted data. */
uint16_t channell_conversion_result;
err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channell_conversion_result);
assert(FSP_SUCCESS == err);
}
```

## Temperature Sensor Example

This example shows how to calculate the MCU temperature using the ADC and the temperature sensor.

```
#define ADC_EXAMPLE_CALIBRATION_DATA_RA6M1 (0x7D5)
#define ADC_EXAMPLE_VCC_MICROVOLT (3300000)
#define ADC_EXAMPLE_TEMPERATURE_RESOLUTION (12U)
#define ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE (127)
void adc_temperature_example (void)
```

```
{
/* The following example calculates the temperature on an RA6M1 device using the
data provided in the section
* 44.3.1 "Preparation for Using the Temperature Sensor" of the RA6M1 manual
R01UH0884EJ0100. */
fsp_err_t err = FSP_SUCCESS;
/* Initializes the module. */
err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Enable temperature sensor. */
err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
assert(FSP_SUCCESS == err);
/* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
modes, enable external
* triggers by calling R_ADC_ScanStart(). */
(void) R_ADC_ScanStart(&g_adc0_ctrl);
/* Wait for conversion to complete. */
adc_status_t status;
status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
(void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
}
/* Read converted data. */
uint16_t temperature_conversion_result;
err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_TEMPERATURE,
&temperature_conversion_result);
assert(FSP_SUCCESS == err);
/* If the MCU does not provide calibration data, use the value in the hardware
manual or determine it
* experimentally. */
/* Get Calibration data from the MCU if available. */
int32_t reference_calibration_data;
```

```
adc_info_t adc_info;

(void) R_ADC_InfoGet(&g_adc0_ctrl, &adc_info);

reference_calibration_data = (int32_t) adc_info.calibration_data;

/* NOTE: The slope of the temperature sensor varies from sensor to sensor. Renesas
recommends calculating
* the slope of the temperature sensor experimentally.
*
* This example uses the typical slope provided in Table 52.38 "TSN characteristics"
in the RA6M1 manual
* R01UM0011EU0050. */

int32_t slope_uv_per_c = BSP_FEATURE_ADC_TSN_SLOPE;

/* Formula for calculating temperature copied from section 44.3.1 "Preparation for
Using the Temperature Sensor"
* of the RA6M1 manual R01UH0884EJ0100:
*
* In this MCU, the TSCDR register stores the temperature value (CAL127) of the
temperature sensor measured
* under the condition Ta = Tj = 127 C and AVCC0 = 3.3 V. By using this value as the
sample measurement result
* at the first point, preparation before using the temperature sensor can be
omitted.
*
* If V1 is calculated from CAL127,
*  $V1 = 3.3 * CAL127 / 4096$  [V]
*
* Using this, the measured temperature can be calculated according to the following
formula.
*
*  $T = (Vs - V1) / Slope + 127$  [C]
* T: Measured temperature (C)
* Vs: Voltage output by the temperature sensor when the temperature is measured (V)
* V1: Voltage output by the temperature sensor when Ta = Tj = 127 C and AVCC0 = 3.3
V (V)
* Slope: Temperature slope given in Table 52.38 / 1000 (V/C)
```

```
*/
int32_t v1_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
    reference_calibration_data;
int32_t vs_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
    temperature_conversion_result;
int32_t temperature_c = (vs_uv - v1_uv) / slope_uv_per_c +
ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE;
/* Expect room temperature, break if temperature is outside the range of 20 C to 25
C. */
if ((temperature_c < 20) || (temperature_c > 25))
{
    __BKPT(0);
}
}
```

## Double-Trigger Example

This example demonstrates reading data from a double-trigger scan. A flag is used to wait for a callback event. Two scans must occur before the callback is called. These results are read via [R\\_ADC\\_Read](#) using the selected channel enum value as well as [ADC\\_CHANNEL\\_DUPLEX](#).

```
volatile bool scan_complete_flag = false;
void adc_callback (adc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    scan_complete_flag = true;
}
void adc_double_trigger_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

```
/* Enable double-trigger channel. */
err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
assert(FSP_SUCCESS == err);

/* Enable scan triggering from ELC events. */
(void) R_ADC_ScanStart(&g_adc0_ctrl);

/* Wait for conversion to complete. Two scans must be triggered before a callback
occurs. */
scan_complete_flag = false;
while (!scan_complete_flag)
{
/* Wait for callback to set flag. */
}

/* Read converted data from both scans. */
uint16_t channell_conversion_result_0;
uint16_t channell_conversion_result_1;

err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channell_conversion_result_0);
assert(FSP_SUCCESS == err);

err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_DUPLEX,
&channell_conversion_result_1);
assert(FSP_SUCCESS == err);
}
```

### ADC-DMAC Repeat-Block Transfer Example

This example demonstrates writing multiple data from DAC peripheral to ADC channels and storing the data in memory through DMAC using Repeat-Block Transfer mode. It creates single block to multiple ring buffer type of transfer topology. Ping-Pong mechanism is used to read the data from memory in between the transfers. This example is valid only for MCUs that have ADBUF.

```
#define ADC_DMACH_EXAMPLE_DATA_LOW (0U)
#define ADC_DMACH_EXAMPLE_DATA_HIGH (0x000FU)
#define ADC_DMACH_EXAMPLE_DELAY_1000_MS (1000U)
#define ADC_DMACH_EXAMPLE_NUM_PING_PONG_BUFFERS (2)
static uint16_t g_adc_dmac_example_buffer[ADC_DMACH_EXAMPLE_NUM_PING_PONG_BUFFERS][
ADC_DMACH_EXAMPLE_ADC_CHANNELS_PER_BLOCK][ADC_DMACH_EXAMPLE_SAMPLES_PER_CHANNEL];
// Destination buffer for DMAC transfers
```

```
static volatile uint16_t g_adc_dmac_example_ping_pong_index = 0U;
static volatile void * gp_read_data;
/* DMAC callback */
void adc_dmac_callback (dmac_callback_args_t * p_args)
{
    (void) p_args;
    /* Store the pointer to the last buffer that was written
     * An array of data for the first enabled channel is at
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0],
     * an array of data for the next channel is at
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][1][0], etc.
     */
    gp_read_data =
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0];
    /* Select the other ping-pong buffer which is free for writing */
    g_adc_dmac_example_ping_pong_index = !g_adc_dmac_example_ping_pong_index;
    /* Reset the destination pointer and DMAC peripheral */
    R_DMAC_Reset(&g_transfer0_ctrl,
                NULL,
                (void *)
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0],
                ADC_DMAC_EXAMPLE_SAMPLES_PER_CHANNEL);
    FSP_PARAMETER_NOT_USED(gp_read_data);
}
void adc_dmac_repeat_block_transfer_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open ADC Module and configure the channels */
    /* Enable the ADBUF property from configurations */

adc_status.state = ADC_STATE_SCAN_IN_PROGRESS;

```

```
while ((ADC_STATE_SCAN_IN_PROGRESS == adc_status.state) && (timeout > 0U))
{
    timeout--;
    R_ADC_StatusGet(&g_adc0_ctrl, &adc_status);
}
R_BSP_SoftwareDelay(ADC_DMACH_EXAMPLE_DELAY_1000_MS, BSP_DELAY_UNITS_MICROSECONDS);
count++;
}
```

## Window Compare Example

This example shows how to configure the window compare function at runtime as well as how to handle events and obtain comparison results through a callback.

```
adc_window_cfg_t g_adc0_window_cfg =
{
    /* Enable Window A and Window B; enable Window mode */
    .compare_cfg =
        (adc_compare_cfg_t) (ADC_COMPARE_CFG_A_ENABLE | ADC_COMPARE_CFG_B_ENABLE |
ADC_COMPARE_CFG_WINDOW_ENABLE),
    /* Compare scan values from Channels 0 and 1 */
    .compare_mask = ADC_MASK_CHANNEL_0 | ADC_MASK_CHANNEL_1,
    /* Set Channel 1 condition to be inside the window instead of outside */
    .compare_mode_mask = ADC_MASK_CHANNEL_1,
    /* Set reference voltage levels for Window A */
    .compare_ref_low = ADC_SCAN_MAX / 3,
    .compare_ref_high = ADC_SCAN_MAX * 2 / 3,
    /* Configure Window B to compare Channel 2 (inside window) */
    .compare_b_channel = ADC_WINDOW_B_CHANNEL_2,
    .compare_b_mode = ADC_WINDOW_B_MODE_GREATER_THAN_OR_INSIDE,
    /* Set reference voltage levels for Window B */
    .compare_b_ref_low = ADC_SCAN_MAX / 4,
    .compare_b_ref_high = ADC_SCAN_MAX * 3 / 4,
};
```

```
void adc0_callback (adc_callback_args_t * p_args)
{
    if (ADC_EVENT_WINDOW_COMPARE_A == p_args->event)
    {
        /* Get channel that met the comparison criteria */
        adc_channel_t channel = p_args->channel;
        /* Process event here */
        FSP_PARAMETER_NOT_USED(channel);
    }
    else if (ADC_EVENT_WINDOW_COMPARE_B == p_args->event)
    {
        /* Process Window B events here */
    }
    else
    {
        /* ... */
    }
}

void adc_window_compare_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the ADC module */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    assert(FSP_SUCCESS == err);
    /* Set the window compare configuration in the channel config */
    g_adc0_channel_runtime_cfg.p_window_cfg = &g_adc0_window_cfg;
    /* The window compare function is configured as part of the scan configuration */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_runtime_cfg);
    assert(FSP_SUCCESS == err);
    /* Main program loop - scan the ADC every second */
    while (1)
    {
        /* Start a scan */
        err = R_ADC_ScanStart(&g_adc0_ctrl);
    }
}
```

```

    assert(FSP_SUCCESS == err);

    /* Delay; any compare events will be handled by the callback */
    R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
}

```

## Data Structure Documentation

### ◆ [adc\\_sample\\_state\\_t](#)

struct [adc\\_sample\\_state\\_t](#)

ADC sample state configuration

Data Fields

<a href="#">adc_sample_state_reg_t</a>	reg_id	Sample state register ID.
uint8_t	num_states	Number of sampling states for conversion. Ch16-20/21 use the same value.

◆ **adc\_window\_cfg\_t**

struct adc_window_cfg_t		
ADC Window Compare configuration		
Data Fields		
uint32_t	compare_mask	Channel mask to compare with Window A.
uint32_t	compare_mode_mask	Per-channel condition mask for Window A.
<a href="#">adc_compare_cfg_t</a>	compare_cfg	Window Compare configuration.
uint16_t	compare_ref_low	Window A lower reference value.
uint16_t	compare_ref_high	Window A upper reference value.
uint16_t	compare_b_ref_low	Window B lower reference value.
uint16_t	compare_b_ref_high	Window A upper reference value.
<a href="#">adc_window_b_channel_t</a>	compare_b_channel	Window B channel.
<a href="#">adc_window_b_mode_t</a>	compare_b_mode	Window B condition setting.

◆ **adc\_extended\_cfg\_t**

struct adc_extended_cfg_t		
Extended configuration structure for ADC.		
Data Fields		
<a href="#">adc_add_t</a>	add_average_count	Add or average samples.
<a href="#">adc_clear_t</a>	clearing	Clear after read.
<a href="#">adc_trigger_t</a>	trigger_group_b	Group B trigger source; valid only for group mode.
<a href="#">adc_double_trigger_t</a>	double_trigger_mode	Double-trigger mode setting.
<a href="#">adc_vref_control_t</a>	adc_vref_control	VREFADC output voltage control.
uint8_t	enable_adbuf	Enable ADC Ring Buffer, Valid only to use along with DMAC transfer.
IRQn_Type	window_a_irq	IRQ number for Window

		Compare A interrupts.
IRQn_Type	window_b_irq	IRQ number for Window Compare B interrupts.
uint8_t	window_a_ipl	Priority for Window Compare A interrupts.
uint8_t	window_b_ipl	Priority for Window Compare B interrupts.

#### ◆ adc\_channel\_cfg\_t

struct adc_channel_cfg_t		
ADC channel(s) configuration		
Data Fields		
uint32_t	scan_mask	Channels/bits: bit 0 is ch0; bit 15 is ch15.
uint32_t	scan_mask_group_b	Valid for group modes.
uint32_t	add_mask	Valid if add enabled in Open().
<a href="#">adc_window_cfg_t</a> *	p_window_cfg	Pointer to Window Compare configuration.
<a href="#">adc_group_a_t</a>	priority_group_a	Valid for group modes.
uint8_t	sample_hold_mask	Channels/bits 0-2.
uint8_t	sample_hold_states	Number of states to be used for sample and hold. Affects channels 0-2.

#### ◆ adc\_instance\_ctrl\_t

struct adc_instance_ctrl_t	
ADC instance control block. DO NOT INITIALIZE. Initialized in <a href="#">adc_api_t::open()</a> .	

## Enumeration Type Documentation

◆ **adc\_mask\_t**

enum <code>adc_mask_t</code>	
For ADC Scan configuration <code>adc_channel_cfg_t::scan_mask</code> , <code>adc_channel_cfg_t::scan_mask_group_b</code> , <code>adc_channel_cfg_t::add_mask</code> and <code>adc_channel_cfg_t::sample_hold_mask</code> . Use bitwise OR to combine these masks for desired channels and sensors.	
Enumerator	
<code>ADC_MASK_OFF</code>	No channels selected.
<code>ADC_MASK_CHANNEL_0</code>	Channel 0 mask.
<code>ADC_MASK_CHANNEL_1</code>	Channel 1 mask.
<code>ADC_MASK_CHANNEL_2</code>	Channel 2 mask.
<code>ADC_MASK_CHANNEL_3</code>	Channel 3 mask.
<code>ADC_MASK_CHANNEL_4</code>	Channel 4 mask.
<code>ADC_MASK_CHANNEL_5</code>	Channel 5 mask.
<code>ADC_MASK_CHANNEL_6</code>	Channel 6 mask.
<code>ADC_MASK_CHANNEL_7</code>	Channel 7 mask.
<code>ADC_MASK_CHANNEL_8</code>	Channel 8 mask.
<code>ADC_MASK_CHANNEL_9</code>	Channel 9 mask.
<code>ADC_MASK_CHANNEL_10</code>	Channel 10 mask.
<code>ADC_MASK_CHANNEL_11</code>	Channel 11 mask.
<code>ADC_MASK_CHANNEL_12</code>	Channel 12 mask.
<code>ADC_MASK_CHANNEL_13</code>	Channel 13 mask.
<code>ADC_MASK_CHANNEL_14</code>	Channel 14 mask.
<code>ADC_MASK_CHANNEL_15</code>	Channel 15 mask.
<code>ADC_MASK_CHANNEL_16</code>	Channel 16 mask.
<code>ADC_MASK_CHANNEL_17</code>	Channel 17 mask.
<code>ADC_MASK_CHANNEL_18</code>	Channel 18 mask.

ADC_MASK_CHANNEL_19	Channel 19 mask.
ADC_MASK_CHANNEL_20	Channel 20 mask.
ADC_MASK_CHANNEL_21	Channel 21 mask.
ADC_MASK_CHANNEL_22	Channel 22 mask.
ADC_MASK_CHANNEL_23	Channel 23 mask.
ADC_MASK_CHANNEL_24	Channel 24 mask.
ADC_MASK_CHANNEL_25	Channel 25 mask.
ADC_MASK_CHANNEL_26	Channel 26 mask.
ADC_MASK_CHANNEL_27	Channel 27 mask.
ADC_MASK_TEMPERATURE	Temperature sensor channel mask.
ADC_MASK_VOLT	Voltage reference channel mask.
ADC_MASK_SENSORS	All sensor channel mask.

◆ **adc\_add\_t**

enum <code>adc_add_t</code>	
ADC data sample addition and averaging options	
Enumerator	
<code>ADC_ADD_OFF</code>	Addition turned off for channels/sensors.
<code>ADC_ADD_TWO</code>	Add two samples.
<code>ADC_ADD_THREE</code>	Add three samples.
<code>ADC_ADD_FOUR</code>	Add four samples.
<code>ADC_ADD_SIXTEEN</code>	Add sixteen samples.
<code>ADC_ADD_AVERAGE_TWO</code>	Average two samples.
<code>ADC_ADD_AVERAGE_FOUR</code>	Average four samples.
<code>ADC_ADD_AVERAGE_EIGHT</code>	Average eight samples.
<code>ADC_ADD_AVERAGE_SIXTEEN</code>	Add sixteen samples.

◆ **adc\_clear\_t**

enum <code>adc_clear_t</code>	
ADC clear after read definitions	
Enumerator	
<code>ADC_CLEAR_AFTER_READ_OFF</code>	Clear after read off.
<code>ADC_CLEAR_AFTER_READ_ON</code>	Clear after read on.

◆ **adc\_vref\_control\_t**

enum <a href="#">adc_vref_control_t</a>	
Enumerator	
ADC_VREF_CONTROL_VREFH	VREFAMPcnt reset value. VREFADC Output voltage is Hi-Z.
ADC_VREF_CONTROL_1_5V_OUTPUT	BGR turn ON. VREFADC Output voltage is 1.5 V.
ADC_VREF_CONTROL_2_0V_OUTPUT	BGR turn ON. VREFADC Output voltage is 2.0 V.
ADC_VREF_CONTROL_2_5V_OUTPUT	BGR turn ON. VREFADC Output voltage is 2.5 V.
ADC_VREF_CONTROL_AVCC0_AVSS0	High potential is AVCC0, low potential is AVSS0.
ADC_VREF_CONTROL_VREFH0_AVSS0	High potential is VREFH0, low potential is AVSS0.
ADC_VREF_CONTROL_IVREF_AVSS0	High potential is internal reference voltage, low potential is AVSS0. When the high potential is set to the internal reference voltage, wait 5 us after <a href="#">R_ADC_Open()</a> to start an ADC measurement.
ADC_VREF_CONTROL_AVCC0_VREFLO	High potential is AVCC0, low potential is VREFLO.
ADC_VREF_CONTROL_VREFH0_VREFLO	High potential is VREFH0, low potential is VREFLO.
ADC_VREF_CONTROL_IVREF_VREFLO	High potential is internal reference voltage, low potential is VREFLO. When the high potential is set to the internal reference voltage, wait 5 us after <a href="#">R_ADC_Open()</a> to start an ADC measurement.

◆ **adc\_sample\_state\_reg\_t**

enum <code>adc_sample_state_reg_t</code>	
ADC sample state registers	
Enumerator	
<code>ADC_SAMPLE_STATE_CHANNEL_0</code>	Sample state register channel 0.
<code>ADC_SAMPLE_STATE_CHANNEL_1</code>	Sample state register channel 1.
<code>ADC_SAMPLE_STATE_CHANNEL_2</code>	Sample state register channel 2.
<code>ADC_SAMPLE_STATE_CHANNEL_3</code>	Sample state register channel 3.
<code>ADC_SAMPLE_STATE_CHANNEL_4</code>	Sample state register channel 4.
<code>ADC_SAMPLE_STATE_CHANNEL_5</code>	Sample state register channel 5.
<code>ADC_SAMPLE_STATE_CHANNEL_6</code>	Sample state register channel 6.
<code>ADC_SAMPLE_STATE_CHANNEL_7</code>	Sample state register channel 7.
<code>ADC_SAMPLE_STATE_CHANNEL_8</code>	Sample state register channel 8.
<code>ADC_SAMPLE_STATE_CHANNEL_9</code>	Sample state register channel 9.
<code>ADC_SAMPLE_STATE_CHANNEL_10</code>	Sample state register channel 10.
<code>ADC_SAMPLE_STATE_CHANNEL_11</code>	Sample state register channel 11.
<code>ADC_SAMPLE_STATE_CHANNEL_12</code>	Sample state register channel 12.
<code>ADC_SAMPLE_STATE_CHANNEL_13</code>	Sample state register channel 13.
<code>ADC_SAMPLE_STATE_CHANNEL_14</code>	Sample state register channel 14.
<code>ADC_SAMPLE_STATE_CHANNEL_15</code>	Sample state register channel 15.
<code>ADC_SAMPLE_STATE_CHANNEL_16_TO_31</code>	Sample state register channel 16 to 31.

◆ **adc\_compare\_cfg\_t**

enum <code>adc_compare_cfg_t</code>
ADC comparison settings

◆ **adc\_window\_b\_channel\_t**

enum <a href="#">adc_window_b_channel_t</a>
ADC Window B channel

◆ **adc\_window\_b\_mode\_t**

enum <a href="#">adc_window_b_mode_t</a>
ADC Window B comparison mode

◆ **adc\_group\_a\_t**

enum <a href="#">adc_group_a_t</a>	
ADC action for group A interrupts group B scan. This enumeration is used to specify the priority between Group A and B in group mode.	
Enumerator	
ADC_GROUP_A_PRIORITY_OFF	Group A ignored and does not interrupt ongoing group B scan.
ADC_GROUP_A_GROUP_B_WAIT_FOR_TRIGGER	Group A interrupts Group B(single scan) which restarts at next Group B trigger.
ADC_GROUP_A_GROUP_B_RESTART_SCAN	Group A interrupts Group B(single scan) which restarts immediately after Group A scan is complete.
ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN	Group A interrupts Group B(continuous scan) which continues scanning without a new Group B trigger.

◆ **adc\_double\_trigger\_t**

enum <code>adc_double_trigger_t</code>	
ADC double-trigger mode definitions	
Enumerator	
<code>ADC_DOUBLE_TRIGGER_DISABLED</code>	Double-triggering disabled.
<code>ADC_DOUBLE_TRIGGER_ENABLED</code>	Double-triggering enabled.
<code>ADC_DOUBLE_TRIGGER_ENABLED_EXTENDED</code>	Double-triggering enabled on both ADC ELC events.

**Function Documentation**◆ **R\_ADC\_Open()**

```
fsp_err_t R_ADC_Open ( adc_ctrl_t* p_ctrl, adc_cfg_t const*const p_cfg )
```

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If interrupt is enabled, the function registers a callback function pointer for notifying the user whenever a scan has completed.

**Return values**

<code>FSP_SUCCESS</code>	Module is ready for use.
<code>FSP_ERR_ASSERTION</code>	An input argument is invalid.
<code>FSP_ERR_ALREADY_OPEN</code>	The instance control structure has already been opened.
<code>FSP_ERR_IRQ_BSP_DISABLED</code>	A callback is provided, but the interrupt is not enabled.
<code>FSP_ERR_IP_CHANNEL_NOT_PRESENT</code>	The requested unit does not exist on this MCU.
<code>FSP_ERR_INVALID_HW_CONDITION</code>	The ADC clock must be at least 1 MHz

◆ **R\_ADC\_ScanCfg()**

```
fsp_err_t R_ADC_ScanCfg ( adc_ctrl_t* p_ctrl, void const *const p_channel_cfg )
```

Configures the ADC scan parameters. Channel specific settings are set in this function. Pass a pointer to `adc_channel_cfg_t` to `p_channel_cfg`.

**Note**

*This starts group B scans if `adc_channel_cfg_t::priority_group_a` is set to `ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN`.*

**Return values**

FSP_SUCCESS	Channel specific settings applied.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R\_ADC\_CallbackSet()**

```
fsp_err_t R_ADC_CallbackSet ( adc_ctrl_t*const p_api_ctrl, void(*)(adc_callback_args_t*)
p_callback, void const *const p_context, adc_callback_args_t*const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `adc_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R\_ADC\_ScanStart()**

```
fsp_err_t R_ADC_ScanStart ( adc_ctrl_t * p_ctrl)
```

Starts a software scan or enables the hardware trigger for a scan depending on how the triggers were configured in the R\_ADC\_Open call. If the unit was configured for ELC or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, then this function starts the software triggered scan.

**Precondition**

Call R\_ADC\_ScanCfg after R\_ADC\_Open before starting a scan.

On MCUs that support calibration, call R\_ADC\_Calibrate and wait for calibration to complete before starting a scan.

**Return values**

FSP_SUCCESS	Scan started (software trigger) or hardware triggers enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.
FSP_ERR_IN_USE	Another scan is still in progress (software trigger).

◆ **R\_ADC\_ScanGroupStart()**

```
fsp_err_t R_ADC_ScanGroupStart ( adc_ctrl_t * p_ctrl, adc_group_mask_t group_id )
```

`adc_api_t::scanStart` is not supported on the ADCH. Use `scanStart` instead.

**Return values**

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.
---------------------	--

◆ **R\_ADC\_ScanStop()**

```
fsp_err_t R_ADC_ScanStop ( adc_ctrl_t* p_ctrl)
```

Stops the software scan or disables the unit from being triggered by the hardware trigger (ELC or external) based on what type of trigger the unit was configured for in the R\_ADC\_Open function. Stopping a hardware triggered scan via this function does not abort an ongoing scan, but prevents the next scan from occurring. Stopping a software triggered scan aborts an ongoing scan.

**Return values**

FSP_SUCCESS	Scan stopped (software trigger) or hardware triggers disabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ **R\_ADC\_StatusGet()**

```
fsp_err_t R_ADC_StatusGet ( adc_ctrl_t* p_ctrl, adc_status_t* p_status )
```

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

**Return values**

FSP_SUCCESS	Module status stored in the provided pointer p_status
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R\_ADC\_Read()**

```
fsp_err_t R_ADC_Read ( adc_ctrl_t* p_ctrl, adc_channel_t const reg_id, uint16_t*const p_data )
```

Reads conversion results from a single channel or sensor.

**Return values**

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ **R\_ADC\_Read32()**

```
fsp_err_t R_ADC_Read32 ( adc_ctrl_t* p_ctrl, adc_channel_t const reg_id, uint32_t*const p_data )
```

Reads conversion results from a single channel or sensor register into a 32-bit result.

**Return values**

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ **R\_ADC\_SampleStateCountSet()**

```
fsp_err_t R_ADC_SampleStateCountSet ( adc_ctrl_t* p_ctrl, adc_sample_state_t* p_sample )
```

Sets the sample state count for individual channels. This only needs to be set for special use cases. Normally, use the default values out of reset.

**Note**

*The sample states for the temperature and voltage sensor are set in R\_ADC\_ScanCfg.*

**Return values**

FSP_SUCCESS	Sample state count updated.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R\_ADC\_InfoGet()**

```
fsp_err_t R_ADC_InfoGet ( adc_ctrl_t* p_ctrl, adc_info_t* p_adc_info )
```

Returns the address of the lowest number configured channel and the total number of bytes to be read in order to read the results of the configured channels and return the ELC Event name. If no channels are configured, then a length of 0 is returned.

Also provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

**Note**

*In group mode, information is returned for group A only. Calculating information for group B is not currently supported.*

**Return values**

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R\_ADC\_Close()**

```
fsp_err_t R_ADC_Close ( adc_ctrl_t* p_ctrl)
```

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

**Return values**

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R\_ADC\_Calibrate()**

```
fsp_err_t R_ADC_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Initiates calibration of the ADC on MCUs that require calibration. This function must be called before starting a scan on MCUs that require calibration.

Calibration is complete when the callback is called with ADC\_EVENT\_CALIBRATION\_COMPLETE or when R\_ADC\_StatusGet returns ADC\_STATUS\_IDLE. Reference Figure 32.35 "Software flow and operation example of calibration operation." in the RA2A1 manual R01UH0888EJ0100.

ADC calibration time: 12 PCLKB + 774,930 ADCLK. (Reference Table 32.16 "Required calibration time (shown as the number of ADCLK and PCLKB cycles)" in the RA2A1 manual R01UH0888EJ0100. The lowest supported ADCLK is 1MHz.

Calibration will take a minimum of 24 milliseconds at 32 MHz PCLKB and ADCLK. This wait could take up to 780 milliseconds for a 1 MHz PCLKD (ADCLK).

**Parameters**

[in]	p_ctrl	Pointer to the instance control structure
[in]	p_extend	Unused argument. Pass NULL.

**Return values**

FSP_SUCCESS	Calibration successfully initiated.
FSP_ERR_INVALID_HW_CONDITION	A scan is in progress or hardware triggers are enabled.
FSP_ERR_UNSUPPORTED	Calibration not supported on this MCU.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R\_ADC\_OffsetSet()**

```
fsp_err_t R_ADC_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t offset )
```

adc\_api\_t::offsetSet is not supported on the ADC.

**Return values**

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.
---------------------	--

### 4.2.1.2 ADC Driver on r\_adc\_b

Modules » Analog

#### Functions

fsp_err_t	R_ADC_B_Open (adc_ctrl_t *p_ctrl, adc_cfg_t const *const p_cfg)
fsp_err_t	R_ADC_B_ScanCfg (adc_ctrl_t *p_ctrl, void const *const p_scan_cfg)
fsp_err_t	R_ADC_B_CallbackSet (adc_ctrl_t *const p_api_ctrl, void(*p_callback)(adc_callback_args_t *), void const *const p_context, adc_callback_args_t *const p_callback_memory)

fsp_err_t	R_ADC_B_InfoGet (adc_ctrl_t *p_ctrl, adc_info_t *p_adc_info)
fsp_err_t	R_ADC_B_Close (adc_ctrl_t *p_ctrl)
fsp_err_t	R_ADC_B_Calibrate (adc_ctrl_t *const p_ctrl, void const *p_extend)
fsp_err_t	R_ADC_B_OffsetSet (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t offset)

#### Detailed Description

Driver for the ADC\_B peripheral on RA MCUs. This module implements the [ADC Interface](#).

## Overview

### Features

The ADC\_B module supports the following features:

- 12 bit resolution
- Configure scans to include:
  - Multiple analog channels
  - Temperature sensor channel
  - Reference Voltage sensor channel
  - Self-Diagnostic channel
- Configurable scan start trigger:
  - Software scan triggers
  - Hardware scan triggers (timer expiration, for example)
  - External scan triggers from the ADTRGn port pins
- Configurable scan modes:
  - Single scan mode, where each trigger starts a single scan
  - Continuous scan mode, where all channels are scanned continuously
  - Synchronous scan mode, where A/D converters operate synchronously
- Variable sampling time
- Self-calibration
- Channel-dedicated sample-and-hold circuits
- Supports adding and averaging converted samples
- Selectable data format (16, 14, 12, and 10-bit)
- Limiter clip function
- User offset adjustment function
- User gain adjustment function
- Built-in FIFO
- Channel-dedicated programable gain amplifier (PGA):
  - Support single-ended or pseudo-differential input
  - 2.5x to 13.33x gain (1.5x to 5.56x for pseudo-differential inputs)
- Optional callback when scan completes, FIFO data is ready, an error occurs, or other conditions are triggered.

## Configuration

### Virtual Channels and Scan Groups

A virtual channel is a group of registers that stores the A/D conversion configuration for a single analog pin. Each virtual channel has a number of options including the channel for conversion, settings for conversion, data processing method and so on.

To perform A/D conversion of an analog pin, the channel associated with the pin must first be assigned to a virtual channel. That virtual channel is then assigned to a scan group, which brings together one or more virtual channels to be converted in sequence with a specified conversion unit.

#### Note

*Analog channels may be assigned to more than one virtual channel. However, a virtual channel can be assigned to only one scan group. When performing A/D conversion on one analog channel in different scan groups or when converting a channel several times within the same scan group, assign several virtual channels to one analog channel.*

*To avoid data being overwritten, when converting a channel multiple times within the same scan group use [R\\_ADC\\_B\\_FifoRead\(\)](#) instead of [R\\_ADC\\_B\\_Read\(\)](#).*

### Configuring a Scan

To perform A/D conversion of a scan group the following should be configured:

- Assign the analog channel for conversion to a virtual channel.
- Assign the virtual channel to a scan group.
- Assign the scan group to an A/D Converter.

*Note*

*Up to 8 virtual channels can be assigned to a scan group. If more than 8 are assigned only the lowest 8 will be targeted for A/D conversion.*

**Build Time Configurations for r\_adc\_b**

The following build time configurations are defined in fsp\_cfg/r\_adc\_b\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	bsp	If selected, code for parameter checking is included in the build.

*Note*

*The instance configurations available in this driver are too numerous to list here. Please refer to the RA Configuration editor in e2 studio for further details.*

**Clock Configuration**

The ADC\_B conversion clock source may be configured to use PCLKC, PCLKA, or GPT with a selectable division ratio. The ADC\_B clock may operate between 25 MHz at a minimum and 60 MHz at a maximum.

**Pin Configuration**

The ANxxx pins are analog input channels that can be used with the ADC\_B.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger. When external triggers are used, ADC\_B scans begin on the falling edge of the ADTRG pin.

## Usage Notes

**Self-Calibration**

Calibration is required to use this peripheral; call [R\\_ADC\\_B\\_Calibrate\(\)](#) after open, and prior to any other function. Self-Calibration should be performed any time ADC operating characteristics are modified, including after reset, releasing module-stop, when returning from software standby or deep software standby mode, or each time the ADC open function is called.

*Note*

*Self-calibration is a non-blocking operation. The application should wait for an `ADC_EVENT_CALIBRATION_COMPLETE` callback before using other ADC\_B functionality.*

**ADC\_B Operational Modes**

The driver supports two primary operational modes, single-scan and continuous-scan. In single scan mode, one or more groups are scanned once per trigger. In continuous scan mode, one or more groups are started with a single trigger. Scans continue until [R\\_ADC\\_B\\_ScanStop\(\)](#) is called. In each

mode, analog groups and virtual channels are converted in ascending order.

## Synchronous-Scan Mode

When synchronous operation is enabled all A/D conversions are guaranteed to begin and end based on a user-configured period. When both conversion units are selected for synchronous scan they run from the same period, allowing for consistent timing of simultaneous conversions.

## Sample and Hold

Enabling sample and hold on one or more channels instructs the ADC to perform sampling on all channels as soon as a group scan is started. Internal circuitry holds the sampled voltages until the conversion unit is ready.

### Note

*Each sample and hold unit is connected to two analog channels (0/1, 2/3 etc). When this function is enabled on both members of a pair only one of the two may be scanned at a time.*

*Enabling sample and hold functionality reduces maximum scan frequency because the sample hold time is added to each scan. Refer to the hardware manual for details on the sample and hold time.*

## Self-Diagnosis

ADC\_B has a built-in self-diagnosis function that can be used to confirm the unit is working correctly. One of three self-diagnosis voltages can be converted and compared to reference values as shown below:

Self-diagnosis mode	Expected reference data	Error condition
Self-diagnosis mode 1	0x0000	Greater or less than reference data (16-bit signed)
Self-diagnosis mode 1	0x8000	Greater than reference data
Self-diagnosis mode 1	0x7FFF	Less than reference data

## Add/Average Function

The ADC can be configured to automatically add or average a number of conversions into a single result. When enabled only the result of the operation is returned.

### Note

*When the A/D-converted value addition/average function is used, overflow of conversion data may occur. However, in certain conditions overflow may not be detected. See the [A/D Conversion Overflow](#) section below for details.*

## Data Format

The A/D converter in this peripheral has a resolution of 12 bits. When 16-bit or 14-bit data format is selected, the lower 2 or 4 bits (respectively) of the A/D conversion result are extended bits for data processing, error calibration (Self-Calibration), gain/offset adjustment and the averaging function. For 10-bit data length, the upper 6 bits (bit 15 to bit 10) are always 0.

## Limiter Clip

The limit clipping function allows for setting upper and lower bounds on converted data. When the A/D conversion data exceeds the specified upper limit value, it is clipped to the upper limit value. If the A/D conversion data falls below the specified lower limit, it is clipped to the lower limit value.

The upper and lower limits are set in one of eight table entries. To perform limit clip functionality, each virtual channel may (optionally) have one of these entries assigned. Interrupts may be enabled for when limiter clip conditions are triggered.

#### Note

*When 14-/12-/10-bit is selected as the data length of the A/D conversion data, the lower bits are cut based on the data-format selection. When 16-bit format is selected, the data length is not rounded.*

## Using the Temperature Sensor with the ADC\_B

The ADC\_B HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula:

$$T = (Vs - V1)/slope + T1$$

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- slope: Temperature gradient of the temperature sensor (V/degrees C), given as  $(V2 - V1) / (T2 - T1)$ 
  - T2: Temperature at the experimental measurement of another point (degrees C)
  - V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)

#### Note

*The slope value can be obtained from the hardware manual for each device in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.*

## User Offset and Gain

The user offset adjustment function adds or subtracts a constant value to or from the A/D conversion data. Virtual channels select an offset from a table of values specified by the user.

The user gain adjustment function multiplies the A/D conversion data by an arbitrary coefficient value. As with offset adjustment, virtual channels may select a gain value from a table specified by the user.

#### Note

*When the offset or gain adjusting functions are used overflow of A/D conversion data may occur. See the [A/D Conversion Overflow](#) section below for details.*

*When 14-/12-/10-bit is selected as the data length of converted data the lower bits of offset values are cut based on the data-format selection.*

## FIFO

The FIFOs consist of 8 stages and can hold up to 8 A/D conversion data. One FIFO is implemented for each scan group. Each FIFO acts as a ring buffer and data will be lost if the FIFO is not read as needed. Interrupts may be enabled for a specific data storage threshold and on overrun.

## Programmable Gain Amplifier

ADC has built-in Programmable Gain Amplifier (PGA). The PGA amplifies an external analog input signal and outputs it to A/D converter, Channel-dedicated sample-and-hold circuit, and High-Speed

Analog Comparator (ACMPHS). PGA units are channel specific and utilize two analog input pins per unit. Please refer to the RA Configuration editor in e2 studio or the hardware manual for further details.

#### Note

*When PGA is used, the analog input pin assigned to PGAVSS pin cannot be input to A/D conversion or Channel-dedicated sample-and-hold circuit.*

### Single-ended input

In single-ended input mode, PGA amplifies the input from PGAIN pin with the specified gain, between  $\times 2.000$  to  $\times 13.333$ . When operating the PGA in single-ended input mode, PGAIN should be connected to the signal source and PGAVSS should be connected to the analog ground (AVSS0). The input voltage to PGAIN must not exceed the range specified in the Electrical Characteristics.

### Pseudo-differential input

In pseudo differential input mode, PGA amplifies the difference between PGAIN pin and PGAVSS pin with the specified gain and output the voltage obtained by adding the offset of  $0.5 * AV_{cc}$ . Settable gains are  $\times 1.500$ ,  $\times 2.333$ ,  $\times 4.000$ , and  $\times 5.667$ .

When operating the PGA in Pseudo Differential Input Mode, PGAIN should be connected to the signal source, and PGAVSS should be connected to the reference ground of the signal source. The inputs to PGAIN and PGAVSS pins must not exceed the range specified in the Electrical Characteristics.

### When Interrupts Are Not Enabled

Interrupts are enabled by default. If scan-complete interrupts are disabled, [R\\_ADC\\_B\\_StatusGet\(\)](#) can be used to poll the ADC\_B driver to determine when the scan has completed. [R\\_ADC\\_B\\_Read\(\)](#) is used to access the converted ADC\_B result.

### A/D Conversion Overflow

A/D conversion overflow is detected when converted data exceeds the range that can be handled in the specified data format. When overflow occurs, data is restricted to the upper or lower limit value of the specified data format. Overflow is detected in the following cases:

- When the input to the A/D converter exceeds VREFH0 or falls below VREFL0
- When overflow occurs by the internal processing (calculation) for the A/D conversion data due to the following: - Gain Error and Offset Error Calibration - User Gain/Offset adjustment function - When using A/D-Converted Value Addition/Averaging Function - Data Formatting Process

## Examples

### Basic Example

This is a basic example of minimal use of the ADC\_B in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
* configurations are desired additional adc_channel_cfg_t elements can be defined
```

```
and passed to R_ADC_B_ScanCfg. */
extern const adc_b_scan_cfg_t g_adc_b0_scan_cfg;
void adc_b_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_ADC_B_Open(&g_adc_b0_ctrl, &g_adc_b0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_ADC_B_Calibrate(&g_adc_b0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
    /* Wait for calibration to complete */
    adc_status_t status = {.state = ADC_STATE_SCAN_IN_PROGRESS};
    while ((ADC_STATE_SCAN_IN_PROGRESS == status.state) &&
           (FSP_SUCCESS == err))
    {
        R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
        err = R_ADC_B_StatusGet(&g_adc_b0_ctrl, &status);
    }
    assert(FSP_SUCCESS == err);
    /* Enable channels. */
    err = R_ADC_B_ScanCfg(&g_adc_b0_ctrl, &g_adc_b0_scan_cfg);
    assert(FSP_SUCCESS == err);
    /* Start one or more scan groups by calling R_ADC_B_ScanGroupStart(). Alternatively,
all scan groups may be started
    * by calling R_ADC_B_ScanCfg(). */
    (void) R_ADC_B_ScanGroupStart(&g_adc_b0_ctrl, ADC_GROUP_MASK_0);
    /* Wait for conversion to complete. */
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
        (void) R_ADC_B_StatusGet(&g_adc_b0_ctrl, &status);
    }
    /* Read converted data. */
    uint16_t channel_0_conversion_result;
```

```
err = R_ADC_B_Read(&g_adc_b0_ctrl, ADC_CHANNEL_0, &channel_0_conversion_result);  
assert(FSP_SUCCESS == err);  
}
```

<code>uint8_t</code>	<code>calibration_end_ipl_adc_1</code>	Calibration end IPL for A/D converter unit 1.
<code>uint8_t</code>	<code>conversion_error_ipl_adc_0</code>	Conversion error IPL for A/D converter unit 0.
<code>uint8_t</code>	<code>conversion_error_ipl_adc_1</code>	Conversion error IPL for A/D converter unit 1.
<code>uint8_t</code>	<code>fifo_overflow_ipl</code>	FIFO Overflow IPL.
<code>uint8_t</code>	<code>fifo_read_ipl_group_0</code>	FIFO Read threshold request IPL for Group 0.
<code>uint8_t</code>	<code>fifo_read_ipl_group_1</code>	FIFO Read threshold request IPL for Group 1.
<code>uint8_t</code>	<code>fifo_read_ipl_group_2</code>	FIFO Read threshold request IPL for Group 2.
<code>uint8_t</code>	<code>fifo_read_ipl_group_3</code>	FIFO Read threshold request IPL for Group 3.
<code>uint8_t</code>	<code>fifo_read_ipl_group_4</code>	FIFO Read threshold request IPL for Group 4.
<code>uint8_t</code>	<code>fifo_read_ipl_group_5678</code>	FIFO Read threshold request IPL

		for Groups 5, 6, 7, and 8.
uint8_t	limit_clip_ipl	Limiter Clip IPL.
uint8_t	overflow_error_ipl_adc_0	Overflow error IPL for A/D converter unit 0.
uint8_t	overflow_error_ipl_adc_1	Overflow error IPL for A/D converter unit 1.
uint8_t	scan_end_ipl_group_0	Scan End IPL for A/D Group 0.
uint8_t	scan_end_ipl_group_1	Scan End IPL for A/D Group 1.
uint8_t	scan_end_ipl_group_2	Scan End IPL for A/D Group 2.
uint8_t	scan_end_ipl_group_3	Scan End IPL for A/D Group 3.
uint8_t	scan_end_ipl_group_4	Scan End IPL for A/D Group 4.
uint8_t	scan_end_ipl_group_5678	Scan End IRQ for A/D Groups 5, 6, 7, and 8.
IRQn_Type	calibration_end_irq_adc_0	Calibration end IRQ for A/D converter unit 0.
IRQn_Type	calibration_end_irq_adc_1	Calibration end IRQ for A/D converter unit 1.
IRQn_Type	conversion_error_irq_adc_0	Conversion error IRQ for A/D converter unit 0.
IRQn_Type	conversion_error_irq_adc_1	Conversion error IRQ for A/D converter unit 1.
IRQn_Type	fifo_overflow_irq	FIFO Overflow IRQ.
IRQn_Type	fifo_read_irq_group_0	FIFO Read threshold request IRQ for Group 0.
IRQn_Type	fifo_read_irq_group_1	FIFO Read threshold request IRQ for Group 1.
IRQn_Type	fifo_read_irq_group_2	FIFO Read threshold request IRQ for Group 2.
IRQn_Type	fifo_read_irq_group_3	FIFO Read threshold request IRQ for Group 3.
IRQn_Type	fifo_read_irq_group_4	FIFO Read threshold request IRQ for Group 4.
IRQn_Type	fifo_read_irq_group_5678	FIFO Read threshold request IRQ for Groups 5, 6, 7, and 8.
IRQn_Type	limit_clip_irq	Limiter Clip IRQ.
IRQn_Type	overflow_error_irq_adc_0	Overflow error IRQ for A/D converter unit 0.
IRQn_Type	overflow_error_irq_adc_1	Overflow error IRQ for A/D converter unit 1.
IRQn_Type	scan_end_irq_group_0	Scan End IRQ for A/D Group 0.

IRQn_Type	scan_end_irq_group_1	Scan End IRQ for A/D Group 1.
IRQn_Type	scan_end_irq_group_2	Scan End IRQ for A/D Group 2.
IRQn_Type	scan_end_irq_group_3	Scan End IRQ for A/D Group 3.
IRQn_Type	scan_end_irq_group_4	Scan End IRQ for A/D Group 4.
IRQn_Type	scan_end_irq_group_5678	Scan End IRQ for A/D Groups 5, 6, 7, and 8.

#### ◆ adc\_b\_extended\_cfg\_t

struct adc_b_extended_cfg_t		
ADC extended configuration data		
Data Fields		
adc_b_pga_gain_t	pga_gain[4]	PGA Gain selection.
union adc_b_extended_cfg_t	__unnamed__	
union adc_b_extended_cfg_t	__unnamed__	
union adc_b_extended_cfg_t	__unnamed__	
uint32_t	adc_b_mode	ADC_B mode register data.
uint32_t	scan_group_enable	Scan Group enable register data.
union adc_b_extended_cfg_t	__unnamed__	
union adc_b_extended_cfg_t	__unnamed__	
uint16_t	fifo_interrupt_enable_mask	FIFO interrupt enable register data.
union adc_b_extended_cfg_t	__unnamed__	
uint32_t	start_trigger_delay_0	Start trigger delay register data for group 0 and 1.
uint32_t	start_trigger_delay_1	Start trigger delay register data for group 2 and 3.
uint32_t	start_trigger_delay_2	Start trigger delay register data for group 4 and 5.
uint32_t	start_trigger_delay_3	Start trigger delay register data for group 6 and 7.
uint32_t	start_trigger_delay_4	Start trigger delay register data for group 8.
uint32_t	calibration_adc_state	Calibration State register data.
uint32_t	calibration_sample_and_hold	Calibration Sample and Hold register data.
const adc_b_isr_cfg_t*	p_isr_cfg	Pointer to ISR configuration.
union adc_b_extended_cfg_t	__unnamed__	

uint8_t	sample_and_hold_enable_mask	Sample and Hold enable register data.
uint32_t	sample_and_hold_config_012	Sample and Hold configuration register data.
uint32_t	sample_and_hold_config_456	Sample and Hold configuration register data.
uint32_t	conversion_state	ADC 0/1 Successive Approximation Time Configuration.
int32_t	user_offset_tables[8]	User Offset Table register data.
uint32_t	user_gain_tables[8]	User Gain Table register data.
uint32_t	limiter_clip_interrupt_enable_mask	Limiter clip interrupt enable register data.
uint32_t	limiter_clip_tables[8]	Limiter clip Table register data.

#### ◆ adc\_b\_instance\_ctrl\_t

struct adc_b_instance_ctrl_t
ADC instance control block. DO NOT INITIALIZE. Initialized in <a href="#">adc_api_t::open()</a> .

## Enumeration Type Documentation

#### ◆ adc\_b\_clock\_source\_t

enum <a href="#">adc_b_clock_source_t</a>	
ADC Clock source selection	
Enumerator	
ADC_B_CLOCK_SOURCE_PCLKC	ADC Clock Source PCLKC.
ADC_B_CLOCK_SOURCE_GPT	ADC Clock Source GPT.
ADC_B_CLOCK_SOURCE_PCLKA	ADC Clock Source PCLKA.

◆ **adc\_b\_clock\_divider\_t**

enum <code>adc_b_clock_divider_t</code>	
ADC clock divider selection	
Enumerator	
<code>ADC_B_CLOCK_DIV_1</code>	ADC Clock Division 1/1.
<code>ADC_B_CLOCK_DIV_2</code>	ADC Clock Division 1/2.
<code>ADC_B_CLOCK_DIV_3</code>	ADC Clock Division 1/3.
<code>ADC_B_CLOCK_DIV_4</code>	ADC Clock Division 1/4.
<code>ADC_B_CLOCK_DIV_5</code>	ADC Clock Division 1/5.
<code>ADC_B_CLOCK_DIV_6</code>	ADC Clock Division 1/6.
<code>ADC_B_CLOCK_DIV_7</code>	ADC Clock Division 1/7.
<code>ADC_B_CLOCK_DIV_8</code>	ADC Clock Division 1/8.

◆ **adc\_b\_resolution\_t**

enum <code>adc_b_resolution_t</code>	
ADC_B data resolution definitions	
Enumerator	
<code>ADC_B_RESOLUTION_16_BIT</code>	16 bit <code>adc_b</code> resolution
<code>ADC_B_RESOLUTION_14_BIT</code>	14 bit <code>adc_b</code> resolution
<code>ADC_B_RESOLUTION_12_BIT</code>	12 bit <code>adc_b</code> resolution
<code>ADC_B_RESOLUTION_10_BIT</code>	10 bit <code>adc_b</code> resolution

◆ **adc\_b\_virtual\_channel\_t**

enum <code>adc_b_virtual_channel_t</code>	
ADC channels	
Enumerator	
<code>ADC_B_VIRTUAL_CHANNEL_0</code>	ADC B virtual channel 0.
<code>ADC_B_VIRTUAL_CHANNEL_1</code>	ADC B virtual channel 1.
<code>ADC_B_VIRTUAL_CHANNEL_2</code>	ADC B virtual channel 2.
<code>ADC_B_VIRTUAL_CHANNEL_3</code>	ADC B virtual channel 3.
<code>ADC_B_VIRTUAL_CHANNEL_4</code>	ADC B virtual channel 4.
<code>ADC_B_VIRTUAL_CHANNEL_5</code>	ADC B virtual channel 5.
<code>ADC_B_VIRTUAL_CHANNEL_6</code>	ADC B virtual channel 6.
<code>ADC_B_VIRTUAL_CHANNEL_7</code>	ADC B virtual channel 7.
<code>ADC_B_VIRTUAL_CHANNEL_8</code>	ADC B virtual channel 8.
<code>ADC_B_VIRTUAL_CHANNEL_9</code>	ADC B virtual channel 9.
<code>ADC_B_VIRTUAL_CHANNEL_10</code>	ADC B virtual channel 10.
<code>ADC_B_VIRTUAL_CHANNEL_11</code>	ADC B virtual channel 11.
<code>ADC_B_VIRTUAL_CHANNEL_12</code>	ADC B virtual channel 12.
<code>ADC_B_VIRTUAL_CHANNEL_13</code>	ADC B virtual channel 13.
<code>ADC_B_VIRTUAL_CHANNEL_14</code>	ADC B virtual channel 14.
<code>ADC_B_VIRTUAL_CHANNEL_15</code>	ADC B virtual channel 15.
<code>ADC_B_VIRTUAL_CHANNEL_16</code>	ADC B virtual channel 16.
<code>ADC_B_VIRTUAL_CHANNEL_17</code>	ADC B virtual channel 17.
<code>ADC_B_VIRTUAL_CHANNEL_18</code>	ADC B virtual channel 18.
<code>ADC_B_VIRTUAL_CHANNEL_19</code>	ADC B virtual channel 19.
<code>ADC_B_VIRTUAL_CHANNEL_20</code>	ADC B virtual channel 20.

ADC_B_VIRTUAL_CHANNEL_21	ADC B virtual channel 21.
ADC_B_VIRTUAL_CHANNEL_22	ADC B virtual channel 22.
ADC_B_VIRTUAL_CHANNEL_23	ADC B virtual channel 23.
ADC_B_VIRTUAL_CHANNEL_24	ADC B virtual channel 24.
ADC_B_VIRTUAL_CHANNEL_25	ADC B virtual channel 25.
ADC_B_VIRTUAL_CHANNEL_26	ADC B virtual channel 26.
ADC_B_VIRTUAL_CHANNEL_27	ADC B virtual channel 27.
ADC_B_VIRTUAL_CHANNEL_28	ADC B virtual channel 28.
ADC_B_VIRTUAL_CHANNEL_29	ADC B virtual channel 29.
ADC_B_VIRTUAL_CHANNEL_30	ADC B virtual channel 30.
ADC_B_VIRTUAL_CHANNEL_31	ADC B virtual channel 31.
ADC_B_VIRTUAL_CHANNEL_32	ADC B virtual channel 32.
ADC_B_VIRTUAL_CHANNEL_33	ADC B virtual channel 33.
ADC_B_VIRTUAL_CHANNEL_34	ADC B virtual channel 34.
ADC_B_VIRTUAL_CHANNEL_35	ADC B virtual channel 35.
ADC_B_VIRTUAL_CHANNEL_36	ADC B virtual channel 36.

◆ **adc\_b\_channel\_mask\_t**

enum <code>adc_b_channel_mask_t</code>	
ADC channel mask	
Enumerator	
<code>ADC_B_CHANNEL_MASK_0</code>	Channel 0.
<code>ADC_B_CHANNEL_MASK_1</code>	Channel 1.
<code>ADC_B_CHANNEL_MASK_2</code>	Channel 2.
<code>ADC_B_CHANNEL_MASK_3</code>	Channel 3.
<code>ADC_B_CHANNEL_MASK_4</code>	Channel 4.
<code>ADC_B_CHANNEL_MASK_5</code>	Channel 5.
<code>ADC_B_CHANNEL_MASK_6</code>	Channel 6.
<code>ADC_B_CHANNEL_MASK_7</code>	Channel 7.
<code>ADC_B_CHANNEL_MASK_8</code>	Channel 8.
<code>ADC_B_CHANNEL_MASK_9</code>	Channel 9.
<code>ADC_B_CHANNEL_MASK_10</code>	Channel 10.
<code>ADC_B_CHANNEL_MASK_11</code>	Channel 11.
<code>ADC_B_CHANNEL_MASK_12</code>	Channel 12.
<code>ADC_B_CHANNEL_MASK_13</code>	Channel 13.
<code>ADC_B_CHANNEL_MASK_14</code>	Channel 14.
<code>ADC_B_CHANNEL_MASK_15</code>	Channel 15.
<code>ADC_B_CHANNEL_MASK_16</code>	Channel 16.
<code>ADC_B_CHANNEL_MASK_17</code>	Channel 17.
<code>ADC_B_CHANNEL_MASK_18</code>	Channel 18.
<code>ADC_B_CHANNEL_MASK_19</code>	Channel 19.
<code>ADC_B_CHANNEL_MASK_20</code>	Channel 20.

ADC_B_CHANNEL_MASK_21	Channel 21.
ADC_B_CHANNEL_MASK_22	Channel 22.
ADC_B_CHANNEL_MASK_23	Channel 23.
ADC_B_CHANNEL_MASK_24	Channel 24.
ADC_B_CHANNEL_MASK_25	Channel 25.
ADC_B_CHANNEL_MASK_26	Channel 26.
ADC_B_CHANNEL_MASK_27	Channel 27.
ADC_B_CHANNEL_MASK_28	Channel 28.
ADC_B_CHANNEL_MASK_DIAGNOSIS	Self-Diagnosis Channel.
ADC_B_CHANNEL_MASK_TEMPERATURE	Temperature sensor channel.
ADC_B_CHANNEL_MASK_VOLT	Voltage Reference channel.
ADC_B_CHANNEL_MASK_DAC0	DAC 0 Channel.
ADC_B_CHANNEL_MASK_DAC1	DAC 1 Channel.
ADC_B_CHANNEL_MASK_DAC2	DAC 2 Channel.
ADC_B_CHANNEL_MASK_DAC3	DAC 3 Channel.

◆ **adc\_b\_limit\_clip\_table\_id\_t**

enum <a href="#">adc_b_limit_clip_table_id_t</a>	
ADC limiter clipping table id selection options	
Enumerator	
ADC_B_LIMIT_CLIP_TABLE_SELECTION_NONE	Limiter Clip Disabled.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_0	Limiter Clip Table 0.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_1	Limiter Clip Table 1.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_2	Limiter Clip Table 2.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_3	Limiter Clip Table 3.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_4	Limiter Clip Table 4.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_5	Limiter Clip Table 5.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_6	Limiter Clip Table 6.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_7	Limiter Clip Table 7.

◆ **adc\_b\_unit\_id\_t**

enum <a href="#">adc_b_unit_id_t</a>	
ADC unit selection options	
Enumerator	
ADC_B_UNIT_ID_0	ADC Unit ID 0.
ADC_B_UNIT_ID_1	ADC Unit ID 1.

◆ **adc\_b\_unit\_mask\_t**

enum <a href="#">adc_b_unit_mask_t</a>	
ADC unit selection options	
Enumerator	
ADC_B_UNIT_MASK_0	ADC Unit Mask 0.
ADC_B_UNIT_MASK_1	ADC Unit Mask 1.
ADC_B_UNIT_MASK_UNDEFINED	ADC Unit Mask Unknown.

◆ **adc\_b\_add\_avg\_mode\_t**

enum <a href="#">adc_b_add_avg_mode_t</a>	
ADC data sample addition and averaging options	
Enumerator	
ADC_B_ADD_AVERAGE_OFF	Add/Average turned off for channels/sensors.
ADC_B_ADD_AVERAGE_ADDITION_ENABLE	Addition Mode Enabled.
ADC_B_ADD_AVERAGE_AVERAGE_ENABLE	Average Mode Enabled.

◆ **adc\_b\_add\_avg\_count\_t**

enum <a href="#">adc_b_add_avg_count_t</a>	
ADC data sample addition and averaging options	
Enumerator	
ADC_B_ADD_AVERAGE_1	Addition turned off for channels/sensors.
ADC_B_ADD_AVERAGE_2	Add/Average 2 samples.
ADC_B_ADD_AVERAGE_4	Add/Average 4 samples.
ADC_B_ADD_AVERAGE_8	Add/Average 8 samples.
ADC_B_ADD_AVERAGE_16	Add/Average 16 samples.
ADC_B_ADD_AVERAGE_32	Add/Average 32 samples.
ADC_B_ADD_AVERAGE_64	Add/Average 64 samples.
ADC_B_ADD_AVERAGE_128	Add/Average 128 samples.
ADC_B_ADD_AVERAGE_256	Add/Average 256 samples.
ADC_B_ADD_AVERAGE_512	Add/Average 512 samples.
ADC_B_ADD_AVERAGE_1024	Add/Average 1024 samples.

◆ **adc\_b\_gpt\_trigger\_t**

enum <a href="#">adc_b_gpt_trigger_t</a>	
ADC GPT Trigger options	
Enumerator	
ADC_B_GPT_TRIGGER_NONE	GPT Trigger Disabled.
ADC_B_GPT_TRIGGER_A0	GPT Trigger A0.
ADC_B_GPT_TRIGGER_A1	GPT Trigger A1.
ADC_B_GPT_TRIGGER_A2	GPT Trigger A2.
ADC_B_GPT_TRIGGER_A3	GPT Trigger A3.
ADC_B_GPT_TRIGGER_A4	GPT Trigger A4.

ADC_B_GPT_TRIGGER_A5	GPT Trigger A5.
ADC_B_GPT_TRIGGER_A6	GPT Trigger A6.
ADC_B_GPT_TRIGGER_A7	GPT Trigger A7.
ADC_B_GPT_TRIGGER_A8	GPT Trigger A8.
ADC_B_GPT_TRIGGER_A9	GPT Trigger A9.
ADC_B_GPT_TRIGGER_B0	GPT Trigger B0.
ADC_B_GPT_TRIGGER_B1	GPT Trigger B1.
ADC_B_GPT_TRIGGER_B2	GPT Trigger B2.
ADC_B_GPT_TRIGGER_B3	GPT Trigger B3.
ADC_B_GPT_TRIGGER_B4	GPT Trigger B4.
ADC_B_GPT_TRIGGER_B5	GPT Trigger B5.
ADC_B_GPT_TRIGGER_B6	GPT Trigger B6.
ADC_B_GPT_TRIGGER_B7	GPT Trigger B7.
ADC_B_GPT_TRIGGER_B8	GPT Trigger B8.
ADC_B_GPT_TRIGGER_B9	GPT Trigger B9.

#### ◆ adc\_b\_external\_trigger\_t

enum <code>adc_b_external_trigger_t</code>	
ADC External Trigger options	
Enumerator	
ADC_B_EXTERNAL_TRIGGER_NONE	External Trigger Disabled.
ADC_B_EXTERNAL_TRIGGER_ADTRG0	External Trigger ADTRG0 Selection.
ADC_B_EXTERNAL_TRIGGER_ADTRG1	External Trigger ADTRG1 Selection.

◆ **adc\_b\_self\_diagnosis\_mode\_t**

enum <code>adc_b_self_diagnosis_mode_t</code>	
ADC Self-Diagnosis mode options	
Enumerator	
<code>ADC_B_SELF_DIAGNOSIS_DISABLED</code>	Self-Diagnosis Disabled.
<code>ADC_B_SELF_DIAGNOSIS_MODE_1</code>	Self-Diagnosis Mode 1.
<code>ADC_B_SELF_DIAGNOSIS_MODE_2</code>	Self-Diagnosis Mode 2.
<code>ADC_B_SELF_DIAGNOSIS_MODE_3</code>	Self-Diagnosis Mode 3.

◆ **adc\_b\_sample\_and\_hold\_mask\_t**

enum <code>adc_b_sample_and_hold_mask_t</code>	
ADC Sample-and-Hold unit enable mask	
Enumerator	
<code>ADC_B_SAMPLE_AND_HOLD_MASK_NONE</code>	Sample-and-Hold Disabled.
<code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_0</code>	Sample-and-Hold Unit 0.
<code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_1</code>	Sample-and-Hold Unit 1.
<code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_2</code>	Sample-and-Hold Unit 2.
<code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_4</code>	Sample-and-Hold Unit 3.
<code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_5</code>	Sample-and-Hold Unit 4.
<code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_6</code>	Sample-and-Hold Unit 5.

◆ **adc\_b\_pga\_gain\_t**

enum <code>adc_b_pga_gain_t</code>	
ADC PGA Gain	
Enumerator	
<code>ADC_B_PGA_GAIN_DISABLED</code>	PGA Gain Disabled.
<code>ADC_B_PGA_GAIN_DIFFERENTIAL_1_500</code>	PGA Gain Setting 1.500.
<code>ADC_B_PGA_GAIN_DIFFERENTIAL_2_333</code>	PGA Gain Setting 2.333.
<code>ADC_B_PGA_GAIN_DIFFERENTIAL_4_000</code>	PGA Gain Setting 4.000.
<code>ADC_B_PGA_GAIN_DIFFERENTIAL_5_667</code>	PGA Gain Setting 5.667.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_2_500</code>	PGA Gain Setting 2.500.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_2_667</code>	PGA Gain Setting 2.667.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_2_857</code>	PGA Gain Setting 2.857.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_3_077</code>	PGA Gain Setting 3.077.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_3_333</code>	PGA Gain Setting 3.333.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_3_636</code>	PGA Gain Setting 3.636.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_4_000</code>	PGA Gain Setting 4.000.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_4_444</code>	PGA Gain Setting 4.444.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_5_000</code>	PGA Gain Setting 5.000.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_5_714</code>	PGA Gain Setting 5.714.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_6_667</code>	PGA Gain Setting 6.667.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_8_000</code>	PGA Gain Setting 8.000.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_10_000</code>	PGA Gain Setting 10.000.
<code>ADC_B_PGA_GAIN_SINGLE_ENDED_13_333</code>	PGA Gain Setting 13.333.

◆ **adc\_b\_sampling\_state\_table\_id\_t**

enum <code>adc_b_sampling_state_table_id_t</code>	
ADC Sampling State table selection options	
Enumerator	
<code>ADC_B_SAMPLING_STATE_TABLE_0</code>	Sampling State Table 0.
<code>ADC_B_SAMPLING_STATE_TABLE_1</code>	Sampling State Table 1.
<code>ADC_B_SAMPLING_STATE_TABLE_2</code>	Sampling State Table 2.
<code>ADC_B_SAMPLING_STATE_TABLE_3</code>	Sampling State Table 3.
<code>ADC_B_SAMPLING_STATE_TABLE_4</code>	Sampling State Table 4.
<code>ADC_B_SAMPLING_STATE_TABLE_5</code>	Sampling State Table 5.
<code>ADC_B_SAMPLING_STATE_TABLE_6</code>	Sampling State Table 6.
<code>ADC_B_SAMPLING_STATE_TABLE_7</code>	Sampling State Table 7.
<code>ADC_B_SAMPLING_STATE_TABLE_8</code>	Sampling State Table 8.
<code>ADC_B_SAMPLING_STATE_TABLE_9</code>	Sampling State Table 9.
<code>ADC_B_SAMPLING_STATE_TABLE_10</code>	Sampling State Table 10.
<code>ADC_B_SAMPLING_STATE_TABLE_11</code>	Sampling State Table 12.
<code>ADC_B_SAMPLING_STATE_TABLE_12</code>	Sampling State Table 13.
<code>ADC_B_SAMPLING_STATE_TABLE_13</code>	Sampling State Table 14.
<code>ADC_B_SAMPLING_STATE_TABLE_14</code>	Sampling State Table 15.
<code>ADC_B_SAMPLING_STATE_TABLE_15</code>	Sampling State Table 16.

◆ **adc\_b\_user\_gain\_table\_id\_t**

enum <code>adc_b_user_gain_table_id_t</code>	
ADC User Gain table options	
Enumerator	
<code>ADC_B_USER_GAIN_TABLE_SELECTION_DISABLE</code>	User Gain disabled.
<code>ADC_B_USER_GAIN_TABLE_SELECTION_0</code>	User Gain table 0.
<code>ADC_B_USER_GAIN_TABLE_SELECTION_1</code>	User Gain table 1.
<code>ADC_B_USER_GAIN_TABLE_SELECTION_2</code>	User Gain table 2.
<code>ADC_B_USER_GAIN_TABLE_SELECTION_3</code>	User Gain table 3.
<code>ADC_B_USER_GAIN_TABLE_SELECTION_4</code>	User Gain table 4.
<code>ADC_B_USER_GAIN_TABLE_SELECTION_5</code>	User Gain table 5.
<code>ADC_B_USER_GAIN_TABLE_SELECTION_6</code>	User Gain table 6.
<code>ADC_B_USER_GAIN_TABLE_SELECTION_7</code>	User Gain table 7.

◆ **adc\_b\_user\_offset\_table\_selection\_id\_t**

enum <code>adc_b_user_offset_table_selection_id_t</code>	
ADC User Offset table options	
Enumerator	
<code>ADC_B_USER_OFFSET_TABLE_SELECTION_DISABLED</code>	User Offset disabled.
<code>ADC_B_USER_OFFSET_TABLE_SELECTION_0</code>	User Offset table 0.
<code>ADC_B_USER_OFFSET_TABLE_SELECTION_1</code>	User Offset table 1.
<code>ADC_B_USER_OFFSET_TABLE_SELECTION_2</code>	User Offset table 2.
<code>ADC_B_USER_OFFSET_TABLE_SELECTION_3</code>	User Offset table 3.
<code>ADC_B_USER_OFFSET_TABLE_SELECTION_4</code>	User Offset table 4.
<code>ADC_B_USER_OFFSET_TABLE_SELECTION_5</code>	User Offset table 5.
<code>ADC_B_USER_OFFSET_TABLE_SELECTION_6</code>	User Offset table 6.
<code>ADC_B_USER_OFFSET_TABLE_SELECTION_7</code>	User Offset table 7.

**Function Documentation**◆ **R\_ADC\_B\_Open()**

`fsp_err_t R_ADC_B_Open ( adc_ctrl_t * p_ctrl, adc_cfg_t const *const p_cfg )`

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If provided, the function registers a callback function pointer for notifying the user whenever a scan has completed, error has occurred, FIFO read request is generated, or other ADC interrupt event occurs. Implements `adc_api_t::open`.

**Return values**

<code>FSP_SUCCESS</code>	Module is ready for use.
<code>FSP_ERR_ASSERTION</code>	An input argument is invalid.
<code>FSP_ERR_ALREADY_OPEN</code>	The instance control structure has already been opened.

◆ **R\_ADC\_B\_ScanCfg()**

```
fsp_err_t R_ADC_B_ScanCfg ( adc_ctrl_t* p_ctrl, void const *const p_scan_cfg )
```

Configures the ADC\_B scan parameters. Channel specific settings are set in this function. Pass a pointer to `adc_b_scan_cfg_t` to `p_channel_cfg`. Implements `adc_api_t::scanCfg`.

**Note**

*This starts group B scans if `adc_b_scan_cfg_t::priority_group_a` is set to `ADC_B_GROUP_A_GROUP_B_CONTINUOUS_SCAN`.*

**Return values**

FSP_SUCCESS	Channel specific settings applied.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_INVALID_STATE	Invalid Scan Configuration.
FSP_ERR_INVALID_CHANNEL	Invalid configured channel for group converter id.

◆ **R\_ADC\_B\_CallbackSet()**

```
fsp_err_t R_ADC_B_CallbackSet ( adc_ctrl_t*const p_api_ctrl, void(*) (adc_callback_args_t*)
p_callback, void const *const p_context, adc_callback_args_t*const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `adc_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

### ◆ R\_ADC\_B\_ScanStart()

`fsp_err_t R_ADC_B_ScanStart ( adc_ctrl_t* p_ctrl)`

Enables the hardware trigger for a scan depending on how the triggers were configured in the R\_ADC\_B\_ScanCfg call. If the unit was configured for ELC, GPT, or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, This function was added to this ADC version for compatability with r\_adc driver. For additional flexibility, it is recommended R\_ADC\_B\_GroupScanStart.

#### Precondition

Call R\_ADC\_B\_ScanCfg after R\_ADC\_B\_Open before starting a scan.

Call R\_ADC\_B\_Calibrate and wait for calibration to complete before starting a scan.

#### Return values

FSP_SUCCESS	Scan started (software trigger) or hardware triggers enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_ARGUMENT	No hardware triggers configured for groups.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.

### ◆ R\_ADC\_B\_ScanGroupStart()

```
fsp_err_t R_ADC_B_ScanGroupStart ( adc_ctrl_t* p_ctrl, adc_group_mask_t group_mask )
```

Starts a software scan or enables the hardware trigger for a scan depending on how triggers were configured. If the group was configured for ELC, GPT, or external hardware triggering then this function allows the trigger signal to get to the ADC unit. The function itself is not able to control the generation of peripheral triggers. If the unit was configured for software triggering, then this function starts the software triggered scan.

#### Precondition

Call R\_ADC\_B\_ScanCfg after R\_ADC\_B\_Open before starting a scan.

Call R\_ADC\_B\_Calibrate and wait for calibration to complete before starting a scan.

#### Return values

FSP_SUCCESS	Scan started (software trigger) or hardware triggers enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_ARGUMENT	An invalid group has been provided.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_IN_USE	Another scan is still in progress (software trigger).

### ◆ R\_ADC\_B\_ScanStop()

```
fsp_err_t R_ADC_B_ScanStop ( adc_ctrl_t* p_ctrl)
```

Disables the hardware trigger for a scan and immediately stops all active converters. This function will abort all active conversions.

#### Return values

FSP_SUCCESS	All scans stopped.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_ARGUMENT	No hardware triggers configured for groups.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.

◆ **R\_ADC\_B\_StatusGet()**

```
fsp_err_t R_ADC_B_StatusGet ( adc_ctrl_t* p_ctrl, adc_status_t* p_status )
```

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

**Return values**

FSP_SUCCESS	Module status stored in the provided pointer p_status
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R\_ADC\_B\_Read()**

```
fsp_err_t R_ADC_B_Read ( adc_ctrl_t* p_ctrl, adc_channel_t const channel_id, uint16_t*const p_data )
```

Reads conversion results from a single channel or sensor.

**Return values**

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_INVALID_DATA	Accuracy of data cannot be guaranteed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_CHANNEL	Invalid channel provided.

## ◆ R\_ADC\_B\_Read32()

```
fsp_err_t R_ADC_B_Read32 ( adc_ctrl_t * p_ctrl, adc_channel_t const channel_id, uint32_t *const p_data )
```

Reads conversion results from a single channel or sensor register into a 32-bit result.

**Return values**

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_INVALID_DATA	Accuracy of data cannot be guaranteed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_CHANNEL	Invalid channel provided.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [adc\\_api\\_t::read](#)

## ◆ R\_ADC\_B\_FifoRead()

```
fsp_err_t R_ADC_B_FifoRead ( adc_ctrl_t * p_ctrl, adc_group_mask_t const group_mask, adc_b_fifo_read_t *const p_data )
```

Reads conversion results from FIFO for the given group mask.

**Return values**

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_ARGUMENT	Invalid group provided.
FSP_ERR_UNDERFLOW	FIFO empty.

◆ **R\_ADC\_B\_InfoGet()**

```
fsp_err_t R_ADC_B_InfoGet ( adc_ctrl_t* p_ctrl, adc_info_t* p_adc_info )
```

Provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

**Return values**

FSP_SUCCESS	Info is read into p_adc_info.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.

◆ **R\_ADC\_B\_Close()**

```
fsp_err_t R_ADC_B_Close ( adc_ctrl_t* p_ctrl )
```

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

**Return values**

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R\_ADC\_B\_Calibrate()**

```
fsp_err_t R_ADC_B_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Initiates calibration of the ADC\_B. This function must be called before starting a scan and again whenever ADC\_B configuration or state is changed.

**Parameters**

[in]	p_ctrl	Pointer to the instance control structure
[in]	p_extend	Unused argument.

**Return values**

FSP_SUCCESS	Calibration successfully initiated.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_HW_CONDITION	Error occurred during calibration.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R\_ADC\_B\_OffsetSet()**

```
fsp_err_t R_ADC_B_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t offset )
```

adc\_api\_t::offsetSet is not supported on the ADC\_B.

**Return values**

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.
---------------------	--

**4.2.1.3 Comparator, High-Speed (r\_acmphs)**

Modules » Analog

**Functions**

```
fsp_err_t R_ACMPHS_Open ( comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg)
```

```
fsp_err_t R_ACMPHS_InfoGet ( comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info)
```

```
fsp_err_t R_ACMPHS_OutputEnable (comparator_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_ACMPHS_StatusGet (comparator_ctrl_t *const p_ctrl,
                               comparator_status_t *const p_status)
```

```
fsp_err_t R_ACMPHS_Close (comparator_ctrl_t *p_ctrl)
```

## Detailed Description

Driver for the ACMPHS peripheral on RA MCUs. This module implements the [Comparator Interface](#).

## Overview

### Features

The ACMPHS HAL module supports the following features:

- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOOUT, CMPOUTn<sup>1</sup>, or CMPOUT012<sup>1</sup> pin
- ELC event output

*Note*

1. This output pin is not available on all MCUs.

## Configuration

### Build Time Configurations for r\_acmphs

The following build time configurations are defined in fsp\_cfg/r\_acmphs\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Analog > Comparator, High-Speed (r\_acmphs)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, High-Speed (r\_acmphs).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_comparator0	Module name.
Channel	Value must be a non-negative integer	0	Select the hardware channel.
Trigger Edge Selector	<ul style="list-style-type: none"> <li>• Rising</li> </ul>	Both Edge	The trigger specifies

	<ul style="list-style-type: none"> <li>Falling</li> <li>Both Edge</li> </ul>		when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL.
Noise Filter	<ul style="list-style-type: none"> <li>No Filter</li> <li>8</li> <li>16</li> <li>32</li> </ul>	No Filter	Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update.
Maximum status retries (CMPMON)	Must be a valid non-negative integer between 2 and 32-bit maximum value	1024	Maximum number of status retries.
Output Polarity	<ul style="list-style-type: none"> <li>Not Inverted</li> <li>Inverted</li> </ul>	Not Inverted	When enabled comparator output is inverted. This affects the output read from <a href="#">R_ACMPHS_StatusGet()</a> , the pin output level, and the edge trigger.
Pin Output	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Disabled	Turn this on to enable the CMPOUTn signal for this channel. The CMPOUTn signal for each channel is OR'd together and the result is output to VCOUT. More pin output options are available on select MCUs.
Callback	Name must be a valid C symbol	NULL	Define this function in the application. It is called when the Trigger event occurs.
Comparator Interrupt Priority	MCU Specific Options		Select the interrupt priority for the comparator interrupt.
Analog Input Voltage Source (IVCMP)	MCU Specific Options		Select the Analog input voltage source. Channel mentioned in the options represents channel in ACMPHS
Reference Voltage Input Source (IVREF)	MCU Specific Options		Select the Analog reference voltage source. Channel mentioned in the

options represents  
channel in ACMPHS

## Clock Configuration

The ACMPHS peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

## Pin Configuration

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The IVCMPn pins are used as comparator inputs. The IVREFn pins are used as comparator reference values.

## Usage Notes

### Noise Filter

When the noise filter is enabled, the ACMPHP0/ACMPHP1 signal is sampled three times based on the sampling clock selected. The filter clock frequency is determined by PCLKB and the `comparator_filter_t` setting.

### Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the [R\\_ACMPHS\\_StatusGet\(\)](#) will return an inverted status.

### Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.
- When the noise filter is not enabled the hardware requires software debouncing of the output (two consecutive equal values). This is automatically managed in [R\\_ACMPHS\\_StatusGet](#) but may result in delay or an API error in rare edge cases.
- Constraints apply on the simultaneous use of ACMPHS analog input and ADC analog input. Refer to the "Usage Notes" section in your MCU's User's Manual for the ADC unit(s) for more details.
- To allow ACMPHS0 to cancel Software Standby mode or enter Snooze, set the CSTEN bit to 1 and the CDFS bits to 00 in the CMPCTL0 register.

## Examples

### Basic Example

The following is a basic example of using the ACMPHS to detect when the analog voltage input to IVCMP rises above the analog voltage input to IVREF. A GPIO output acts as the comparator input and is externally connected to the IVCMP input of the ACMPHS. An analog voltage input should also be supplied to the IVREF input pin.

```
#define ADC_PGA_BYPASS_VALUE (0x9999)

/* Connect this control pin to the IVCMP input of the comparator. This can be any
```

```
GPIO pin

* that is not input only. */
#define ACMPHS_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_05_PIN_03)

volatile uint32_t g_comparator_events = 0U;

/* This callback is called when a comparator event occurs. */
void acmphs_example_callback (comparator_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}

void acmphs_example ()
{
    fsp_err_t err = FSP_SUCCESS;

    /* Disable pin register write protection, if enabled */
    R_BSP_PinAccessEnable();

    /*
     * Start with the IVCMP pin low. This example assumes the comparator is configured
to trigger
     * when the voltage of the analog input to IVCMP rises above voltage of the analog
input to
     * IVREF.
     */
    (void) R_BSP_PinWrite(ACMPHS_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);

    /* Initialize the ACMPHS module */
    err = R_ACMPHS_Open(&g_comparator_ctrl, &g_comparator_cfg);
    assert(FSP_SUCCESS == err);

    /*
     * If an ADC PGA exists for the analog input pin, then the PGA must be manually
configured in order for the pin to be used as
     * an IVCMP input. This procedure is slightly different depending on the MCU (See
below).
     */
#if BSP_MCU_GROUP_RA6M3
    /* The following applies for MCUs with the ADC peripheral:
```

```
*
* Bypass the PGA on ADC unit 0.
* (See Table 50.2 "Input source configuration of the ACPHPS" in the RA6M3 User's
Manual (R01UH0886EJ0100)) */
R_BSP_MODULE_START(FSP_IP_ADC, 0);
    R_ADC0->ADPGACR    = ADC_PGA_BYPASS_VALUE;
    R_ADC0->ADPGADCR0 = 0;
#elif BSP_MCU_GROUP_RA6T2
/* The following applies for MCUs with the ADC_B peripheral:
*
* Configure PGA on ADC unit 0.
* (See Table 36.11 "PGA Settings and Available Related Functions" in the RA6T2
User's Manual (R01UH0951EJ0100)) */
R_BSP_MODULE_START(FSP_IP_ADC, 0);
    R_ADC_B->ADPGACR[0] = R_ADC_B0_ADPGACR_PGAGEN_Msk;
#endif
/* Wait for the minimum stabilization wait time before enabling output. */
comparator_info_t info;
R_ACPHPS_InfoGet(&g_comparator_ctrl, &info);
R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
/* Enable the comparator output */
    (void) R_ACPHPS_OutputEnable(&g_comparator_ctrl);
/* Set the IVCMP pin high. */
    (void) R_BSP_PinWrite(ACMPHS_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
while (0 == g_comparator_events)
    {
/* Wait for interrupt. */
    }
comparator_status_t status;
/* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
    (void) R_ACPHPS_StatusGet(&g_comparator_ctrl, &status);
}
```

## Function Documentation

◆ **R\_ACMPHS\_Open()**

```
fsp_err_t R_ACMPHS_Open ( comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg )
```

Configures the comparator and starts operation. Callbacks and pin output are not active until `outputEnable()` is called. `comparator_api_t::outputEnable()` should be called after the output has stabilized. Implements `comparator_api_t::open()`.

Comparator inputs must be configured in the application code prior to calling this function.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An input pointer is NULL
FSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation.
FSP_ERR_ALREADY_OPEN	The control block is already open or the hardware lock is taken.

◆ **R\_ACMPHS\_InfoGet()**

```
fsp_err_t R_ACMPHS_InfoGet ( comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info )
```

Provides the minimum stabilization wait time in microseconds. Implements `comparator_api_t::infoGet()`.

**Return values**

FSP_SUCCESS	Information stored in <code>p_info</code> .
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_ACMPHS\_OutputEnable()**

```
fsp_err_t R_ACMPHS_OutputEnable ( comparator_ctrl_t *const p_ctrl)
```

Enables the comparator output, which can be polled using `comparator_api_t::statusGet()`. Also enables pin output and interrupts as configured during `comparator_api_t::open()`. Implements `comparator_api_t::outputEnable()`.

**Return values**

FSP_SUCCESS	Comparator output is enabled.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_ACMPHS\_StatusGet()**

```
fsp_err_t R_ACMPHS_StatusGet ( comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status )
```

Provides the operating status of the comparator. Implements `comparator_api_t::statusGet()`.

**Return values**

FSP_SUCCESS	Operating status of the comparator is provided in <code>p_status</code> .
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_TIMEOUT	The debounce filter is off and 2 consecutive matching values were not read within 1024 attempts.

◆ **R\_ACMPHS\_Close()**

```
fsp_err_t R_ACMPHS_Close ( comparator_ctrl_t * p_ctrl)
```

Stops the comparator. Implements `comparator_api_t::close()`.

**Return values**

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

fsp\_err\_t R\_AC MPLP\_Close (comparator\_ctrl\_t \*p\_ctrl)

##### Detailed Description

Driver for the ACMPLP peripheral on RA MCUs. This module implements the [Comparator Interface](#).

## Overview

### Features

The ACMPLP HAL module supports the following features:

- Normal mode or window mode
- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOOUT pin
- ELC event output

## Configuration

### Build Time Configurations for r\_acmplp

The following build time configurations are defined in fsp\_cfg/r\_acmplp\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Reference Voltage Selection for ACMPLP1	<ul style="list-style-type: none"> <li>• IVREF0</li> <li>• IVREF1</li> </ul>	IVREF1	ACMPLP1 may optionally be

(Standard mode only)

configured to use IVREF0 as a reference input instead of IVREF1. Note that if IVREF0 is selected, ACMPLP0 and ACMPLP1 must use the same setting for IVREF.

### Configurations for Analog > Comparator, Low-Power (r\_acmplp)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, Low-Power (r\_acmplp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_comparator0	Module name.
Channel	Value must be a non-negative integer	0	Select the hardware channel.
Mode	<ul style="list-style-type: none"> <li>Standard</li> <li>Window</li> </ul>	Standard	In standard mode, comparator output is high if VCMP > VREF. In window mode, comparator output is high if VCMP is outside the range of VREF0 to VREF1.
Trigger	<ul style="list-style-type: none"> <li>Rising</li> <li>Falling</li> <li>Both Edge</li> </ul>	Both Edge	The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL.
Filter	<ul style="list-style-type: none"> <li>No sampling (bypass)</li> <li>Sampling at PCLKB</li> <li>Sampling at PCLKB/8</li> <li>Sampling at PCLKB/32</li> </ul>	No sampling (bypass)	Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update.
Output Polarity	<ul style="list-style-type: none"> <li>Not Inverted</li> <li>Inverted</li> </ul>	Not Inverted	When enabled comparator output is inverted. This affects the output read from <a href="#">R_ACMLP_StatusGet()</a> , the pin output level, and the edge trigger.
Pin Output (VCOUT)	<ul style="list-style-type: none"> <li>Disabled</li> </ul>	Disabled	Turn this on to include

	<ul style="list-style-type: none"> <li>• Enabled</li> </ul>		the output from this comparator on VCOUT. The comparator output on VCOUT is OR'd with output from all other ACMPHS and ACMPLP comparators.
Vref (Standard mode only)	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If reference voltage selection is enabled then internal reference voltage is used as comparator input
Callback	Name must be a valid C symbol	NULL	Define this function in the application. It is called when the Trigger event occurs.
Comparator Interrupt Priority	MCU Specific Options		Select the interrupt priority for the comparator interrupt.
Analog Input Voltage Source (IVCMP)	MCU Specific Options		Select the comparator input source. Only options for the configured channel are valid.
Reference Voltage Input Source (IVREF)	MCU Specific Options		Select the comparator reference voltage source.  If channel 1 is selected and the 'Reference Voltage Selection (ACMPLP1)' config option is set to IVREF0, select one of the Channel 0 options. In all other cases, only options for the configured channel are valid.

## Clock Configuration

The ACMPLP peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

## Pin Configuration

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The CMPINn pins are used as comparator inputs. The CMPREFn pins are used as comparator reference values.

## Usage Notes

Figure 140: ACMLP Standard Mode Operation

### Noise Filter

When the noise filter is enabled, the ACMLP0/ACMLP1 signal is sampled three times based on the sampling clock selected. The filter clock frequency is determined by PCLKB and the comparator\_filter\_t setting.

### Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the [R\\_ACMLP\\_StatusGet\(\)](#) will return an inverted status.

### Window Mode

In window mode, the comparator indicates if the analog input voltage falls within the window (low and high reference voltage) or is outside the window.

Figure 141: ACMLP Window Mode Operation

### Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.

- Low speed is not supported by the ACMPLP driver.

## Examples

### Basic Example

The following is a basic example of minimal use of the ACMPLP. The comparator is configured to trigger a callback when the input rises above the internal reference voltage (VREF). A GPIO output acts as the comparator input and is externally connected to the CMPIN input of the ACMPLP.

```
/* Connect this control pin to the VCMP input of the comparator. This can be any GPIO
pin
 * that is not input only. */
#define ACMPLP_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_04_PIN_08)
volatile uint32_t g_comparator_events = 0U;
/* This callback is called when a comparator event occurs. */
void acmplp_example_callback (comparator_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}
void acmplp_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Disable pin register write protection, if enabled */
    R_BSP_PinAccessEnable();
    /* Start with the VCMP pin low. This example assumes the comparator is configured to
trigger
 * when VCMP rises above VREF. */
    (void) R_BSP_PinWrite(ACMPLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
    /* Initialize the ACMPLP module */
    err = R_ACMPLP_Open(&g_comparator_ctrl, &g_comparator_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Wait for the minimum stabilization wait time before enabling output. */
    comparator_info_t info;
    R_ACMPLP_InfoGet(&g_comparator_ctrl, &info);
    R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
```

```

/* Enable the comparator output */
(void) R_ACMLP_OutputEnable(&g_comparator_ctrl);
/* Set VCMP low. */
(void) R_BSP_PinWrite(ACMLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
while (0 == g_comparator_events)
{
/* Wait for interrupt. */
}
comparator_status_t status;
/* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
(void) R_ACMLP_StatusGet(&g_comparator_ctrl, &status);
}

```

## Enumerations

## Function Documentation

◆ **R\_ACMLP\_Open()**

```
fsp_err_t R_ACMLP_Open ( comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg )
```

Configures the comparator and starts operation. Callbacks and pin output are not active until `outputEnable()` is called. `comparator_api_t::outputEnable()` should be called after the output has stabilized. Implements `comparator_api_t::open()`.

Comparator inputs must be configured in the application code prior to calling this function.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An input pointer is NULL
FSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation. <code>p_cfg-&gt;p_callback</code> is not NULL, but ISR is not enabled. ISR must be enabled to use callback function.
FSP_ERR_ALREADY_OPEN	The control block is already open or the hardware lock is taken.
FSP_ERR_IN_USE	The channel is already in use.

◆ **R\_ACMLP\_InfoGet()**

```
fsp_err_t R_ACMLP_InfoGet ( comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info )
```

Provides the minimum stabilization wait time in microseconds. Implements `comparator_api_t::infoGet()`.

**Return values**

FSP_SUCCESS	Information stored in <code>p_info</code> .
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_ACMLP\_OutputEnable()**

```
fsp_err_t R_ACMLP_OutputEnable ( comparator_ctrl_t *const p_ctrl)
```

Enables the comparator output, which can be polled using `comparator_api_t::statusGet()`. Also enables pin output and interrupts as configured during `comparator_api_t::open()`. Implements `comparator_api_t::outputEnable()`.

**Return values**

FSP_SUCCESS	Comparator output is enabled.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_ACMLP\_StatusGet()**

```
fsp_err_t R_ACMLP_StatusGet ( comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status )
```

Provides the operating status of the comparator. Implements `comparator_api_t::statusGet()`.

**Return values**

FSP_SUCCESS	Operating status of the comparator is provided in <code>p_status</code> .
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_ACMLP\_Close()**

```
fsp_err_t R_ACMLP_Close ( comparator_ctrl_t * p_ctrl)
```

Stops the comparator. Implements `comparator_api_t::close()`.

**Return values**

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

**4.2.1.5 DAC (r\_dac)**

Modules » [Analog](#)

## Functions

`fsp_err_t R_DAC_Open (dac_ctrl_t *p_api_ctrl, dac_cfg_t const *const p_cfg)`

`fsp_err_t R_DAC_Write (dac_ctrl_t *p_api_ctrl, uint16_t value)`

`fsp_err_t R_DAC_Start (dac_ctrl_t *p_api_ctrl)`

`fsp_err_t R_DAC_Stop (dac_ctrl_t *p_api_ctrl)`

`fsp_err_t R_DAC_Close (dac_ctrl_t *p_api_ctrl)`

## Detailed Description

Driver for the DAC12 peripheral on RA MCUs. This module implements the [DAC Interface](#).

## Overview

### Features

The DAC module outputs one of 4096 voltage levels between the positive and negative reference voltages.

- Supports setting left-justified or right-justified 12-bit value format for the 16-bit input data registers
- Supports output amplifiers on selected MCUs
- Supports charge pump on selected MCUs
- Supports synchronization with the Analog-to-Digital Converter (ADC) module

## Configuration

### Note

For MCUs supporting more than one channel, the following configuration options are shared by all the DAC channels:

- Synchronize with ADC
- Data Format
- Charge Pump

### Build Time Configurations for r\_dac

The following build time configurations are defined in `fsp_cfg/r_dac_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Analog > DAC (r\_dac)

This module can be added to the Stacks tab via New Stack > Analog > DAC (r\_dac). Non-secure

callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_dac0	Module name.
Channel	Value must be an integer greater than or equal to 0	0	Specify the hardware channel.
Synchronize with ADC	MCU Specific Options		Enable DA/AD synchronization.
Data Format	<ul style="list-style-type: none"> <li>• Right Justified</li> <li>• Left Justified</li> </ul>	Right Justified	Specify the DAC data format.
Output Amplifier	MCU Specific Options		Enable the DAC output amplifier.
Charge Pump (Requires MOCO active)	MCU Specific Options		Enable the DAC charge pump.
Internal Output	MCU Specific Options		Enable DAC output to internal modules.
ELC Trigger Source	MCU Specific Options		ELC event source that will trigger the DAC to start a conversion.

## Clock Configuration

The DAC peripheral module uses PCLKB as its clock source.

## Pin Configuration

The DAN pins are used as analog outputs. Each DAC channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply pins for the DAC and ADC.

The VREFH and VREFL pins are top and ground voltage reference pins for the DAC and ADC.

## Usage Notes

### Charge Pump

The charge pump must be enabled when using DAC pin output while operating at  $AV_{CC} < 2.7V$ .

*Note*

*The MOCO must be running to use the charge pump.*

*If the DAC output is to be routed to an internal signal, do not enable the charge pump.*

### Output to Internal Modules

The DAC output can be used as an analog input to other peripherals on the MCU (eg. ACPHPS, ADC) without outputting the voltage to an external pin.

On some MCUs this functionality must be enabled during configuration using `dac_extended_cfg_t::internal_output_enabled`. When internal output is enabled, the DAC output will be routed to internal modules. If the DAC output amplifier is enabled or when internal output is disabled, the output will be routed to the DAC output pin (DAn).

## Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC conversion is started it will automatically be delayed until after the ADC conversion is complete.

## Limitations

- For MCUs supporting ADC unit 1:
  - Once synchronization between DAC and ADC unit 1 is turned on during `R_DAC_Open` synchronization cannot be turned off by the driver. In order to desynchronize DAC with ADC unit 1, manually clear `DAADSCR.DAADST` to 0 when the `ADCSR.ADST` bit is 0 and ADC unit 1 is halted.
  - The DAC module can only be synchronized with ADC unit 1.
  - For MCUs having more than 1 DAC channel, both channels are synchronized with ADC unit 1 if synchronization is enabled.

## Examples

### Basic Example

This is a basic example of minimal use of the `R_DAC` in an application. This example shows how this driver can be used for basic Digital to Analog Conversion operations.

```
void basic_example (void)
{
    fsp_err_t err;
    uint16_t value;
    /* Pin configuration: Output enable DA0 as Analog. */
    /* Initialize the DAC channel */
    err = R_DAC_Open(&g_dac_ctrl, &g_dac_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    value = (uint16_t) DAC_EXAMPLE_VALUE_ABC;
    err = R_DAC_Write(&g_dac_ctrl, value);
    assert(FSP_SUCCESS == err);
    err = R_DAC_Start(&g_dac_ctrl);
    assert(FSP_SUCCESS == err);
}
```

## Data Structures

```
struct dac_instance_ctrl_t
```

```
struct dac_extended_cfg_t
```

## Data Structure Documentation

### ◆ dac\_instance\_ctrl\_t

```
struct dac_instance_ctrl_t
```

DAC instance control block.

### ◆ dac\_extended\_cfg\_t

```
struct dac_extended_cfg_t
```

DAC extended configuration

#### Data Fields

bool	enable_charge_pump	Enable DAC charge pump available on selected MCUs.
bool	output_amplifier_enabled	Output amplifier enable available on selected MCUs.
bool	internal_output_enabled	Internal output enable available on selected MCUs.
<a href="#">dac_data_format_t</a>	data_format	Data format.

## Function Documentation

◆ **R\_DAC\_Open()**

```
fsp_err_t R_DAC_Open ( dac_ctrl_t* p_api_ctrl, dac_cfg_t const *const p_cfg )
```

Perform required initialization described in hardware manual. Implements [dac\\_api\\_t::open](#). Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

**Return values**

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> <li>1. One or both of the following parameters may be NULL: p_api_ctrl or p_cfg</li> <li>2. data_format value in p_cfg is out of range.</li> <li>3. Extended configuration structure is set to NULL for MCU supporting charge pump.</li> </ul>
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel ID requested in p_cfg may not be available on the devices.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.

◆ **R\_DAC\_Write()**

```
fsp_err_t R_DAC_Write ( dac_ctrl_t* p_api_ctrl, uint16_t value )
```

Write data to the D/A converter and enable the output if it has not been enabled.

**Return values**

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

◆ **R\_DAC\_Start()**

```
fsp_err_t R_DAC_Start ( dac_ctrl_t * p_api_ctrl)
```

Start the D/A conversion output if it has not been started.

**Return values**

FSP_SUCCESS	The channel is started successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_IN_USE	Attempt to re-start a channel.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

◆ **R\_DAC\_Stop()**

```
fsp_err_t R_DAC_Stop ( dac_ctrl_t * p_api_ctrl)
```

Stop the D/A conversion and disable the output signal.

**Return values**

FSP_SUCCESS	The control is successfully stopped.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

◆ **R\_DAC\_Close()**

```
fsp_err_t R_DAC_Close ( dac_ctrl_t * p_api_ctrl)
```

Stop the D/A conversion, stop output, and close the DAC channel.

**Return values**

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

**4.2.1.6 DAC8 (r\_dac8)**

## Modules » Analog

**Functions**

```
fsp_err_t R_DAC8_Open (dac_ctrl_t *const p_ctrl, dac_cfg_t const *const p_cfg)
```

```
fsp_err_t R_DAC8_Write (dac_ctrl_t *const p_ctrl, uint16_t value)
```

```
fsp_err_t R_DAC8_Start (dac_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_DAC8_Stop (dac_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_DAC8_Close (dac_ctrl_t *const p_ctrl)
```

**Detailed Description**

Driver for the DAC8 peripheral on RA MCUs. This module implements the [DAC Interface](#).

**Overview****Features**

The DAC8 module outputs one of 256 voltage levels between the positive and negative reference voltages. DAC8 on selected MCUs have below features

- Charge pump control
- Synchronization with the Analog-to-Digital Converter (ADC) module
- Multiple Operation Modes
  - Normal
  - Real-Time (Event Link)

**Configuration***Note*

For MCUs supporting more than one channel, the following configuration options are shared by all the DAC8 channels:

- Synchronize with ADC
- Charge Pump

**Build Time Configurations for r\_dac8**

The following build time configurations are defined in fsp\_cfg/r\_dac8\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

**Configurations for Analog > DAC8 (r\_dac8)**

This module can be added to the Stacks tab via New Stack > Analog > DAC8 (r\_dac8).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_dac8_0	Module name.
Channel	Value must be an integer greater than or equal to 0	0	Specify the hardware channel.
D/A A/D Synchronous Conversion	MCU Specific Options		Synchronize the DAC8 update with the ADC to reduce interference with A/D conversions.
DAC Mode	MCU Specific Options		Select the DAC operating mode
Real-time Trigger Event	MCU Specific Options		Specify the event used to trigger conversion in Real-time mode. This setting is only valid when Real-time mode is enabled.
Charge Pump (Requires MOCO active)	MCU Specific Options		Enable the DAC charge pump.

### Clock Configuration

The DAC8 peripheral module uses the PCLKB as its clock source.

### Pin Configuration

The DA8\_n pins are used as analog outputs. Each DAC8 channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply and reference pins for the DAC8.

## Usage Notes

### Charge Pump

The charge pump must be enabled when using DAC8 pin output while operating at  $AV_{CC} < 2.7V$ .

#### Note

*The MOCO must be running to use the charge pump.*

*If DAC8 output is to be routed to an internal signal, do not enable the charge pump.*

### Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC8 conversion is started it will automatically be delayed until after the ADC conversion is complete.

### Real-time Mode

When Real-time mode is selected, the DAC8 will perform a conversion each time the selected ELC event is received.

## Limitations

- Synchronization between DAC8 and ADC is activated when calling `R_DAC8_Open`. At this point synchronization cannot be deactivated by the driver. In order to desynchronize DAC8 with ADC, manually clear `DACADSCR.DACADST` to 0 while the `ADCSR.ADST` bit is 0 and the ADC is halted.
- For MCUs having more than 1 DAC8 channel, both channels are synchronized with ADC if synchronization is enabled.

## Examples

### Basic Example

This is a basic example of minimal use of the `R_DAC8` in an application. This example shows how this driver can be used for basic 8 bit Digital to Analog Conversion operations.

```
dac8_instance_ctrl_t g_dac8_ctrl;
dac_cfg_t g_dac8_cfg =
{
    .channel          = 0U,
    .ad_da_synchronized = false,
    .p_extend        = &g_dac8_cfg_extend
};
void basic_example (void)
{
    fsp_err_t err;
    uint16_t value;
    /* Pin configuration: Output enable DA8_0(RA2A1) as Analog. */
    /* Initialize the DAC8 channel */
    err = R_DAC8_Open(&g_dac8_ctrl, &g_dac8_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    value = (uint8_t) DAC8_EXAMPLE_VALUE_ABC;
    /* Write value to DAC module */
    err = R_DAC8_Write(&g_dac8_ctrl, value);
    assert(FSP_SUCCESS == err);
    /* Start DAC8 conversion */
    err = R_DAC8_Start(&g_dac8_ctrl);
```

```

assert(FSP_SUCCESS == err);
}

```

## Function Documentation

◆ **R\_DAC8\_Open()**

```
fsp_err_t R_DAC8_Open ( dac_ctrl_t *const p_ctrl, dac_cfg_t const *const p_cfg )
```

Perform required initialization described in hardware manual.

Implements `dac_api_t::open`.

Configures a single DAC channel. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

**Return values**

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	One or both of the following parameters may be NULL: p_ctrl or p_cfg
FSP_ERR_ALREADY_OPEN	The instance control structure has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	An invalid channel was requested.
FSP_ERR_NOT_ENABLED	Setting DACADSCR is not enabled when ADCSR.ADST = 0.

**Note**

*This function is reentrant for different channels. It is not reentrant for the same channel.*

◆ **R\_DAC8\_Write()**

```
fsp_err_t R_DAC8_Write ( dac_ctrl_t *const p_ctrl, uint16_t value )
```

Write data to the D/A converter.

**Return values**

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.
FSP_ERR_OVERFLOW	Data overflow when data value exceeds 8-bit limit.

◆ **R\_DAC8\_Start()**

```
fsp_err_t R_DAC8_Start ( dac_ctrl_t *const p_ctrl)
```

Start the D/A conversion output.

**Return values**

FSP_SUCCESS	The channel is started successfully.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.
FSP_ERR_IN_USE	Attempt to re-start a channel.

◆ **R\_DAC8\_Stop()**

```
fsp_err_t R_DAC8_Stop ( dac_ctrl_t *const p_ctrl)
```

Stop the D/A conversion and disable the output signal.

**Return values**

FSP_SUCCESS	The control is successfully stopped.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.

◆ **R\_DAC8\_Close()**

```
fsp_err_t R_DAC8_Close ( dac_ctrl_t *const p_ctrl)
```

Stop the D/A conversion, stop output, and close the DAC channel.

**Return values**

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.

**4.2.1.7 Operational Amplifier (r\_opamp)**

## Modules » Analog

**Functions**

fsp\_err\_t R\_OPAMP\_Open (opamp\_ctrl\_t \*const p\_api\_ctrl, opamp\_cfg\_t const \*const p\_cfg)

fsp\_err\_t R\_OPAMP\_InfoGet (opamp\_ctrl\_t \*const p\_api\_ctrl, opamp\_info\_t \*const p\_info)

fsp\_err\_t R\_OPAMP\_Start (opamp\_ctrl\_t \*const p\_api\_ctrl, uint32\_t const channel\_mask)

fsp\_err\_t R\_OPAMP\_Stop (opamp\_ctrl\_t \*const p\_api\_ctrl, uint32\_t const channel\_mask)

fsp\_err\_t R\_OPAMP\_StatusGet (opamp\_ctrl\_t \*const p\_api\_ctrl, opamp\_status\_t \*const p\_status)

fsp\_err\_t R\_OPAMP\_Trim (opamp\_ctrl\_t \*const p\_api\_ctrl, opamp\_trim\_cmd\_t const cmd, opamp\_trim\_args\_t const \*const p\_args)

fsp\_err\_t R\_OPAMP\_Close (opamp\_ctrl\_t \*const p\_api\_ctrl)

**Detailed Description**

Driver for the OPAMP peripheral on RA MCUs. This module implements the [OPAMP Interface](#).

**Overview**

The OPAMP HAL module provides a high level API for signal amplification applications and supports the OPAMP peripheral available on RA MCUs.

**Features**

- Low power or high-speed mode
- Start by software or AGT compare match
- Stop by software or ADC conversion end (stop by ADC conversion end only supported on op-amp channels configured to start by AGT compare match)
- Trimming available on some MCUs (see hardware manual)

**Configuration****Build Time Configurations for r\_opamp**

The following build time configurations are defined in fsp\_cfg/r\_opamp\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
--------------------	--	---------------	---

### Configurations for Analog > Operational Amplifier (r\_opamp)

This module can be added to the Stacks tab via New Stack > Analog > Operational Amplifier (r\_opamp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_opamp0	Module name.
AGT Start Trigger Configuration (N/A unless AGT Start Trigger is Selected for the Channel)	<ul style="list-style-type: none"> <li>• AGT1 Compare Match Starts OPAMPs 0 and 2 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 1 and 3 if configured for AGT Start</li> <li>• AGT1 Compare Match Starts OPAMPs 0 and 1 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 2 and 3 if configured for AGT Start</li> <li>• AGT1 Compare Match Starts all OPAMPs configured for AGT Start</li> </ul>	AGT1 Compare Match Starts all OPAMPs configured for AGT Start	Configure which AGT channel event triggers which op-amp channel. The AGT compare match event only starts the op-amp channel if the AGT Start trigger is selected in the Trigger configuration for the channel.
Power Mode	MCU Specific Options		Configure the op-amp based on power or speed requirements. This setting affects the minimum required stabilization time. Middle speed is not available for all MCUs.
Trigger Channel 0	MCU Specific Options		Select the event triggers to start or stop op-amp channel 0. If the event trigger is selected for start, the start() API enables the event trigger for this

Trigger Channel 1	MCU Specific Options		channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
Trigger Channel 2	<ul style="list-style-type: none"> <li>• Software Start</li> <li>• Software Stop</li> <li>• AGT Start</li> <li>• Software Stop</li> <li>• AGT Start ADC Stop</li> </ul>	Software Start Software Stop	Select the event triggers to start or stop op-amp channel 2. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
Trigger Channel 3	MCU Specific Options		Select the event triggers to start or stop op-amp channel 3. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
OPAMP AMP0OS	MCU Specific Options		Select output to connect to AMP0O pin
OPAMP AMP0PS	MCU Specific Options		Select input to connect to AMP0+ pin
OPAMP AMP0MS	MCU Specific Options		Select input to connect to AMP0- pin
OPAMP AMP1PS	MCU Specific Options		Select input to connect to AMP1+ pin
OPAMP AMP1MS	MCU Specific Options		Select input to connect

OPAMP AMP2PS	MCU Specific Options	to AMP1- pin Select input to connect to AMP2+ pin
OPAMP AMP2MS	MCU Specific Options	Select input to connect to AMP2- pin

## Clock Configuration

The OPAMP runs on PCLKB.

## Pin Configuration

To use the OPAMP HAL module, the port pins for the channels receiving the analog input must be set as inputs on the **Pins** tab of the RA Configuration editor.

Refer to the most recent FSP Release Notes for any additional operational limitations for this module.

# Usage Notes

## Trimming the OPAMP

- On MCUs that support trimming, the op-amp trim register is set to the factory default after the Open API is called.
- This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default trim values.
- Supported on selected MCUs. See hardware manual for details.
- Not supported if configured for low power mode (OPAMP\_MODE\_LOW\_POWER).
- This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling the trim API with the command OPAMP\_TRIM\_CMD\_START again.
  - The trim procedure works as follows:
    - Call trim() for the Pch (+) side input with command OPAMP\_TRIM\_CMD\_START.
    - Connect a fixed voltage to the Pch (+) input.
    - Connect the Nch (-) input to the op-amp output to create a voltage follower.
    - Ensure the op-amp is operating and stabilized.
    - Call trim() for the Pch (+) side input with command OPAMP\_TRIM\_CMD\_START.
    - Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
    - Iterate over the following loop 5 times:
      - Call trim() for the Pch (+) side input with command OPAMP\_TRIM\_CMD\_NEXT\_STEP.
      - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
      - If  $A \leq B$ , call trim() for the Pch (+) side input with command OPAMP\_TRIM\_CMD\_CLEAR\_BIT.
    - Call trim() for the Nch (-) side input with command OPAMP\_TRIM\_CMD\_START.
    - Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
    - Iterate over the following loop 5 times:
      - Call trim() for the Nch (-) side input with command OPAMP\_TRIM\_CMD\_NEXT\_STEP.
      - Measure the op-amp output using the SAR ADC (referred to as B in the next step).

- If  $A \leq B$ , call trim() for the Nch (-) side input with command OPAMP\_TRIM\_CMD\_CLEAR\_BIT.

## Examples

### Basic Example

This is a basic example of minimal use of the R\_OPAMP in an application. The example demonstrates configuring OPAMP channel 0 for high speed mode, starting the OPAMP and reading the status of the OPAMP channel running. It also verifies that the stabilization wait time is the expected time for selected power mode

```
#define OPAMP_EXAMPLE_CHANNEL (0U)

void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the OPAMP module. */
    err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start the OPAMP module. */
    err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
    assert(FSP_SUCCESS == err);

    /* Look up the required stabilization wait time. */
    opamp_info_t info;
    err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
    assert(FSP_SUCCESS == err);

    /* Wait for the OPAMP to stabilize. */
    R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
}

```

### Trim Example

This example demonstrates the typical trimming procedure for opamp channel 0 using R\_OPAMP\_Trim() API.

```
#ifndef OPAMP_EXAMPLE_CHANNEL
    #define OPAMP_EXAMPLE_CHANNEL (0U)
#endif

#ifndef OPAMP_EXAMPLE_ADC_CHANNEL

```

```
#define OPAMP_EXAMPLE_ADC_CHANNEL (ADC_CHANNEL_2)
#endif

#define ADC_SCAN_END_DELAY (100U)
#define OPAMP_TRIM_LOOP_COUNT (5)
#define ADC_SCAN_END_MAX_TIMEOUT (0xFFFF)
uint32_t          g_callback_event_counter = 0;
opamp_trim_args_t trim_args_ch =
{
    .channel = OPAMP_EXAMPLE_CHANNEL,
    .input   = OPAMP_TRIM_INPUT_PCH
};

/* This callback is called when ADC Scan Complete event is generated. */
void adc_callback (adc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}

void trimming_example (void)
{
    fsp_err_t err;

    /* On RA2A1, configure negative feedback and put DAC12 signal on AMP0+ Pin. */
    g_opamp_cfg_extend.plus_input_select_opamp0 = OPAMP_PLUS_INPUT_AMPPS7;
    g_opamp_cfg_extend.minus_input_select_opamp0 = OPAMP_MINUS_INPUT_AMPMS7;

    /* Initialize the OPAMP module. */
    err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start the OPAMP module. */
    err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
    assert(FSP_SUCCESS == err);

    /* Look up the required stabilization wait time. */
    opamp_info_t info;
    err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
    assert(FSP_SUCCESS == err);
}
```

```
/* Wait for the OPAMP to stabilize. */
R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
/* Call trim() for the Pch (+) side input */
    trim_procedure(&trim_args_ch);
    assert(FSP_SUCCESS == err);
    trim_args_ch.input = OPAMP_TRIM_INPUT_NCH;
/* Call trim() for the Nch (-) side input */
    trim_procedure(&trim_args_ch);
}
void trim_procedure (opamp_trim_args_t * trim_args)
{
    fsp_err_t err;
    /* Call trim() for the selected channel and input with command OPAMP_TRIM_CMD_START.
    */
    err = R_OPAMP_Trim(&g_opamp_ctrl, OPAMP_TRIM_CMD_START, trim_args);
    assert(FSP_SUCCESS == err);
    /* Measure the fixed voltage connected to the channel input using the SAR ADC and
    save the value
    * (referred to as result_a later in this procedure). */
    /* Reset the ADC callback counter */
    g_callback_event_counter = 0;
    err = R_ADC_ScanStart(&g_adc_ctrl);
    assert(FSP_SUCCESS == err);
    /* Wait for ADC scan complete flag */
    uint32_t timeout = ADC_SCAN_END_MAX_TIMEOUT;
    while (g_callback_event_counter == 0 && timeout != 0)
    {
        timeout--;
    }
    if (0 == timeout)
    {
        err = FSP_ERR_TIMEOUT;
        assert(FSP_SUCCESS == err);
    }
}
```

```
uint16_t result_a;

err = R_ADC_Read(&g_adc_ctrl, OPAMP_EXAMPLE_ADC_CHANNEL, &result_a);
assert(FSP_SUCCESS == err);

/* Iterate over the following loop 5 times: */
/* Call trim() with command OPAMP_TRIM_CMD_NEXT_STEP for the selected channel and
given input. */
uint8_t count = OPAMP_TRIM_LOOP_COUNT;
while (count > 0)
{
    count--;
    err = R_OPAMP_Trim(&g_opamp_ctrl, OPAMP_TRIM_CMD_NEXT_STEP, trim_args);

### ◆ [opamp\\_extended\\_cfg\\_t](#)

struct [opamp\\_extended\\_cfg\\_t](#)

OPAMP configuration extension. This extension is required and must be provided in [opamp\\_cfg\\_t::p\\_extend](#).

#### Data Fields

[opamp\\_agt\\_link\\_t](#)

[agt\\_link](#)

Configure which AGT links are paired to which channel. Only

		applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel.
<a href="#">opamp_mode_t</a>	mode	Low power, middle speed, or high speed mode.
<a href="#">opamp_trigger_t</a>	trigger_channel_0	Start and stop triggers for channel 0.
<a href="#">opamp_trigger_t</a>	trigger_channel_1	Start and stop triggers for channel 1.
<a href="#">opamp_trigger_t</a>	trigger_channel_2	Start and stop triggers for channel 2.
<a href="#">opamp_trigger_t</a>	trigger_channel_3	Start and stop triggers for channel 3.
<a href="#">opamp_plus_input_t</a>	plus_input_select_opamp0	OPAMP0+ connection.
<a href="#">opamp_minus_input_t</a>	minus_input_select_opamp0	OPAMP0- connection.
<a href="#">opamp_output_t</a>	output_select_opamp0	OPAMP0O connection.
<a href="#">opamp_plus_input_t</a>	plus_input_select_opamp1	OPAMP1+ connection.
<a href="#">opamp_minus_input_t</a>	minus_input_select_opamp1	OPAMP1- connection.

<a href="#">opamp_minus_input_t</a>	minus_input_select_opamp2	OPAMP2- connection.

#### ◆ opamp\_instance\_ctrl\_t

struct opamp_instance_ctrl_t
OPAMP instance control block. DO NOT INITIALIZE. Initialized in <a href="#">opamp_api_t::open()</a> .

## Macro Definition Documentation

#### ◆ OPAMP\_MASK\_CHANNEL\_0

#define OPAMP_MASK_CHANNEL_0
Version of code that implements the API defined in this file

## Enumeration Type Documentation

◆ **opamp\_trigger\_t**

enum opamp_trigger_t	
Start and stop trigger for the op-amp.	
Enumerator	
OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP	Start and stop with APIs.
OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP	Start by AGT compare match and stop with API.
OPAMP_TRIGGER_AGT_START_ADC_STOP	Start by AGT compare match and stop after ADC conversion.

◆ **opamp\_agt\_link\_t**

enum opamp_agt_link_t	
Which AGT timer starts the op-amp. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel. If OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP is selected for a channel, then no AGT compare match event will start that op-amp channel.	
Enumerator	
OPAMP_AGT_LINK_AGT1_OPAMP_0_2_AGT0_OPA_MP_1_3	OPAMP channel 0 and 2 are started by AGT1 compare match. OPAMP channel 1 and 3 are started by AGT0 compare match.
OPAMP_AGT_LINK_AGT1_OPAMP_0_1_AGT0_OPA_MP_2_3	OPAMP channel 0 and 1 are started by AGT1 compare match. OPAMP channel 2 and 3 are started by AGT0 compare match.
OPAMP_AGT_LINK_AGT1_OPAMP_0_1_2_3	All OPAMP channels are started by AGT1 compare match.

◆ **opamp\_mode\_t**

enum <code>opamp_mode_t</code>	
Op-amp mode.	
Enumerator	
<code>OPAMP_MODE_LOW_POWER</code>	Low power mode.
<code>OPAMP_MODE_MIDDLE_SPEED</code>	Middle speed mode (not supported on all MCUs)
<code>OPAMP_MODE_HIGH_SPEED</code>	High speed mode.

◆ **opamp\_plus\_input\_t**

enum <code>opamp_plus_input_t</code>	
Options to connect AMPnPS pins.	
Enumerator	
<code>OPAMP_PLUS_INPUT_NONE</code>	No Connection.
<code>OPAMP_PLUS_INPUT_AMPPS0</code>	Set AMPPS0. See hardware manual for channel specific options.
<code>OPAMP_PLUS_INPUT_AMPPS1</code>	Set AMPPS1. See hardware manual for channel specific options.
<code>OPAMP_PLUS_INPUT_AMPPS2</code>	Set AMPPS2. See hardware manual for channel specific options.
<code>OPAMP_PLUS_INPUT_AMPPS3</code>	Set AMPPS3. See hardware manual for channel specific options.
<code>OPAMP_PLUS_INPUT_AMPPS7</code>	Set AMPPS7. See hardware manual for channel specific options.

◆ **opamp\_minus\_input\_t**

enum <code>opamp_minus_input_t</code>	
Options to connect AMPnMS pins.	
Enumerator	
OPAMP_MINUS_INPUT_NONE	No Connection.
OPAMP_MINUS_INPUT_AMPMS0	Set AMPMS0. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS1	Set AMPMS1. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS2	Set AMPMS2. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS3	Set AMPMS3. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS4	Set AMPMS4. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS7	Set AMPMS7. See hardware manual for channel specific options.

◆ **opamp\_output\_t**

enum <code>opamp_output_t</code>	
Options to connect AMP0OS pin.	
Enumerator	
OPAMP_OUTPUT_NONE	No Connection.
OPAMP_OUTPUT_AMPOS0	Set AMPOS0. See hardware manual for channel specific options.
OPAMP_OUTPUT_AMPOS1	Set AMPOS1. See hardware manual for channel specific options.
OPAMP_OUTPUT_AMPOS2	Set AMPOS2. See hardware manual for channel specific options.
OPAMP_OUTPUT_AMPOS3	Set AMPOS3. See hardware manual for channel specific options.

## Function Documentation

### ◆ R\_OPAMP\_Open()

```
fsp_err_t R_OPAMP_Open ( opamp_ctrl_t *const p_api_ctrl, opamp_cfg_t const *const p_cfg )
```

Applies power to the OPAMP and initializes the hardware based on the user configuration. Implements `opamp_api_t::open`.

The op-amp is not operational until the `opamp_api_t::start` is called. If the op-amp is configured to start after AGT compare match, the op-amp is not operational until `opamp_api_t::start` and the associated AGT compare match event occurs.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after `opamp_api_t::open` and before `opamp_api_t::start`.

Example:

```
/* Initialize the OPAMP module. */
err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);
```

### Return values

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	An input pointer is NULL.
FSP_ERR_ALREADY_OPEN	Control block is already opened.
FSP_ERR_INVALID_ARGUMENT	An attempt to configure OPAMP in middle speed mode on MCU that does not support middle speed mode.

◆ **R\_OPAMP\_InfoGet()**

```
fsp_err_t R_OPAMP_InfoGet ( opamp_ctrl_t*const p_api_ctrl, opamp_info_t*const p_info )
```

Provides the minimum stabilization wait time in microseconds. Implements `opamp_api_t::infoGet`.

• **Example:**

```
/* Look up the required stabilization wait time. */
opamp_info_t info;

err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);

assert(FSP_SUCCESS == err);

/* Wait for the OPAMP to stabilize. */
R_BSP_SoftwareDelay(info.min_stabilization_wait_us,
BSP_DELAY_UNITS_MICROSECONDS);
```

**Return values**

FSP_SUCCESS	information on <code>opamp_power_mode</code> stored in <code>p_info</code> .
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_OPAMP\_Start()**

```
fsp_err_t R_OPAMP_Start ( opamp_ctrl_t *const p_api_ctrl, uint32_t const channel_mask )
```

If the OPAMP is configured for hardware triggers, enables hardware triggers. Otherwise, starts the op-amp. Implements `opamp_api_t::start`.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after `opamp_api_t::open` and before `opamp_api_t::start`.

Example:

```
/* Start the OPAMP module. */
err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Op-amp started or hardware triggers enabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

◆ **R\_OPAMP\_Stop()**

```
fsp_err_t R_OPAMP_Stop ( opamp_ctrl_t *const p_api_ctrl, uint32_t const channel_mask )
```

Stops the op-amp. If the OPAMP is configured for hardware triggers, disables hardware triggers. Implements `opamp_api_t::stop`.

**Return values**

FSP_SUCCESS	Op-amp stopped or hardware triggers disabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

### ◆ R\_OPAMP\_StatusGet()

```
fsp_err_t R_OPAMP_StatusGet ( opamp_ctrl_t *const p_api_ctrl, opamp_status_t *const p_status )
```

Provides the operating status for each op-amp in a bitmask. This bit is set when operation begins, before the stabilization wait time has elapsed. Implements `opamp_api_t::statusGet`.

#### Return values

FSP_SUCCESS	Operating status of each op-amp provided in <code>p_status</code> .
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

### ◆ R\_OPAMP\_Trim()

```
fsp_err_t R_OPAMP_Trim ( opamp_ctrl_t *const p_api_ctrl, opamp_trim_cmd_t const cmd, opamp_trim_args_t const *const p_args )
```

On MCUs that support trimming, the op-amp trim register is set to the factory default after `open()`. This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default factory trim values.

Not supported on all MCUs. See hardware manual for details. Not supported if configured for low power mode (`OPAMP_MODE_LOW_POWER`).

This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling `trim()` with command `OPAMP_TRIM_CMD_START` again.

Implements `opamp_api_t::trim`.

Reference: Section 37.9 "User Offset Trimming" RA2A1 hardware manual R01UM0008EU0130. The trim procedure works as follows:

- Call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_START`.
- Connect a fixed voltage to the Pch (+) input.
- Connect the Nch (-) input to the op-amp output to create a voltage follower.
- Ensure the op-amp is operating and stabilized.
- Call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_START`.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
  - Call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_NEXT_STEP`.
  - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
  - If  $A \leq B$ , call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_CLEAR_BIT`.
- Call `trim()` for the Nch (-) side input with command `OPAMP_TRIM_CMD_START`.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
  - Call `trim()` for the Nch (-) side input with command `OPAMP_TRIM_CMD_NEXT_STEP`.

- Measure the op-amp output using the SAR ADC (referred to as B in the next step).
- If  $A \leq B$ , call trim() for the Nch (-) side input with command OPAMP\_TRIM\_CMD\_CLEAR\_BIT.

**Return values**

FSP_SUCCESS	Conversion result in p_data.
FSP_ERR_UNSUPPORTED	Trimming is not supported on this MCU.
FSP_ERR_INVALID_STATE	The command is not valid in the current state of the trim state machine.
FSP_ERR_INVALID_ARGUMENT	The requested channel is not operating or the trim procedure is not in progress for this channel/input combination.
FSP_ERR_INVALID_MODE	Trim is not allowed in low power mode.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

**◆ R\_OPAMP\_Close()**

```
fsp_err_t R_OPAMP_Close ( opamp_ctrl_t*const p_api_ctrl)
```

Stops the op-amps. Implements `opamp_api_t::close`.

**Return values**

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

**Variable Documentation****◆ g\_opamp\_on\_opamp**

```
const opamp_api_t g_opamp_on_opamp
```

OPAMP Implementation of OPAMP interface.

**4.2.1.8 SDADC Channel Configuration (r\_sdadc)**

Modules » Analog

**Functions**

fsp_err_t	R_SDADC_Open (adc_ctrl_t *p_ctrl, adc_cfg_t const *const p_cfg)

fsp_err_t	R_SDADC_Close (adc_ctrl_t *p_ctrl)

## Detailed Description

Driver for the SDADC24 peripheral on RA MCUs. This module implements the [ADC Interface](#).

## Overview

### Features

The SDADC module supports the following features:

- 24 bit maximum resolution
- Configure scans to include:
  - Multiple analog channels
  - Outputs of OPAMP0 (P side) and OPAMP1 (N side) of SDADC channel 4
- Configurable scan start trigger:
  - Software scan triggers
  - Hardware scan triggers (timer expiration, for example)
- Configurable scan mode:
  - Single scan mode, where each trigger starts a single scan
  - Continuous scan mode, where all channels are scanned continuously
- Supports averaging converted samples
- Optional callback when single conversion, entire scan, or calibration completes

- Supports reading converted data
- Sample and hold support

## Selecting an ADC

All RA MCUs have an [ADC \(r\\_adc\)](#). Only select RA MCUs have an SDADC. When selecting between them, consider these factors. Refer to the hardware manual for details.

	ADC	SDADC
Availability	Available on all RA MCUs.	Available on select RA MCUs.
Resolution	The ADC has a maximum resolution of 12, 14, or 16 bits depending on the MCU.	The SDADC has a maximum accuracy of 24 bits.
Number of Channels	The ADC has more channels than the SDADC.	The SDADC 5 channels, one of which is tied to OPAMP0 and OPAMP1.
Frequency	The ADC sampling time is shorter (more samples per second).	The SDADC sampling time is longer (fewer samples per second).
Settling Time	The ADC does not have a settling time when switching between channels.	The SDADC requires a settling time when switching between channels.

## Configuration

### Build Time Configurations for r\_sdadc

The following build time configurations are defined in fsp\_cfg/r\_sdadc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Analog > ADC (r\_sdadc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r\_sdadc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_adc0	Module name.
Mode	<ul style="list-style-type: none"> <li>• Single Scan</li> <li>• Continuous Scan</li> </ul>	Continuous Scan	In single scan mode, all channels are converted once per start trigger, and conversion stops after all enabled channels are scanned.

			In continuous scan mode, conversion starts after a start trigger, then continues until stopped in software.
Resolution	<ul style="list-style-type: none"> <li>• 16 Bit</li> <li>• 24 Bit</li> </ul>	24 Bit	Select 24-bit or 16-bit resolution.
Alignment	<ul style="list-style-type: none"> <li>• Right</li> <li>• Left</li> </ul>	Right	Select left or right alignment.
Trigger	MCU Specific Options		Select conversion start trigger. Conversion can be started in software, or conversion can be started when a hardware event occurs if the hardware event is linked to the SDADC peripheral using the ELC API.
Vref Source	<ul style="list-style-type: none"> <li>• Internal</li> <li>• External</li> </ul>	Internal	Vref can be source internally and output on the SBIAS pin, or Vref can be input from VREFI.
Vref Voltage	<ul style="list-style-type: none"> <li>• 0.8 V</li> <li>• 1.0 V</li> <li>• 1.2 V</li> <li>• 1.4 V</li> <li>• 1.6 V</li> <li>• 1.8 V</li> <li>• 2.0 V</li> <li>• 2.2 V</li> <li>• 2.4 V</li> </ul>	1.0 V	Select Vref voltage. If Vref is input externally, the voltage on VREFI must match the voltage selected within 3%.
Callback	Name must be a valid C symbol	NULL	Enter the name of the callback function to be called when conversion completes or a scan ends.
Conversion End Interrupt Priority	MCU Specific Options		[Required] Select the interrupt priority for the conversion end interrupt.
Scan End Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the scan end interrupt.
Calibration End Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the calibration end

interrupt.

**Configurations for Analog > SDADC Channel Configuration (r\_sdadc)**

Configuration	Options	Default	Description
Input	<ul style="list-style-type: none"> <li>Differential</li> <li>Single Ended</li> </ul>	Differential	Select differential or single-ended input.
Stage 1 Gain	<ul style="list-style-type: none"> <li>1</li> <li>2</li> <li>3</li> <li>4</li> <li>8</li> </ul>	1	Select the gain for stage 1 of the PGA. Must be 1 for single-ended input.
Stage 2 Gain	<ul style="list-style-type: none"> <li>1</li> <li>2</li> <li>4</li> <li>8</li> </ul>	1	Select the gain for stage 2 of the PGA. Must be 1 for single-ended input.
Oversampling Ratio	<ul style="list-style-type: none"> <li>64</li> <li>128</li> <li>256</li> <li>512</li> <li>1024</li> <li>2048</li> </ul>	256	Select the oversampling ratio for the PGA. Must be 256 for single-ended input.
Polarity (Valid for Single-Ended Input Only)	<ul style="list-style-type: none"> <li>Positive</li> <li>Negative</li> </ul>	Positive	Select positive or negative polarity for single-ended input. VBIAS (1.0 V typical) is connected on the opposite input.
Conversions to Average per Result	<ul style="list-style-type: none"> <li>Do Not Average (Interrupt after Each Conversion)</li> <li>Average 8</li> <li>Average 16</li> <li>Average 32</li> <li>Average 64</li> </ul>	Do Not Average (Interrupt after Each Conversion)	Select the number of conversions to average for each result. The AD_C_EVENT_CONVERSION_END event occurs after each average, or after each individual conversion if averaging is disabled.
Invert (Valid for Negative Single-Ended Input Only)	<ul style="list-style-type: none"> <li>Result Not Inverted</li> <li>Result Inverted</li> </ul>	Result Not Inverted	Select whether to invert negative single-ended input. When the result is inverted, the lowest measurable voltage gives a result of 0, and the highest measurable voltage gives a result of $2^{\text{resolution}} - 1$ .
Number of Conversions Per Scan	Refer to the RA Configuration tool for available options.	1	Number of conversions on this channel before AUTOSCAN moves to

the next channel.  
When all conversions of all channels are complete, the ADC\_EVENT\_SCAN\_END event occurs.

## Clock Configuration

The SDADC clock is configurable on the clocks tab.

The SDADC clock must be 4 MHz when the SDADC is used.

## Pin Configuration

The ANSDnP (n = 0-3) pins are analog input channels that can be used with the SDADC.

# Usage Notes

## Scan Procedure

In this document, the term "scan" refers to the AUTOSCAN feature of the SDADC, which works as follows:

1. Conversions are performed on enabled channels in ascending order of channel number. All conversions required for a single channel are completed before the sequencer moves to the next channel.
2. Conversions are performed at the rate (in Hz) of the SDADC oversampling clock frequency / oversampling ratio (configured per channel). The FSP uses the normal mode SDADC oversampling clock frequency.
3. If averaging is enabled for the channel, the number of conversions to average are performed before each conversion end interrupt occurs.
4. If the number of conversions for the channel is more than 1, SDADC performs the number of conversions requested. These are performed consecutively. There is a settling time associated with switching channels. Performing all of the requested conversions for each channel at a time avoids this settling time after the first conversion.

If averaging is enabled for the channel, each averaged result counts as a single conversion.

5. Continues to the next enabled channel only after completing all conversions requested.
6. After all enabled channels are scanned, a scan end interrupt occurs. The driver supports single-scan and continuous scan operation modes.
  - Single-scan mode performs one scan per trigger (hardware trigger or software start using [R\\_SDADC\\_ScanStart](#)).
  - In continuous scan mode, the scan is restarted after each scan completes. A single trigger is required to start continuous operation of the SDADC.

## When Interrupts Are Not Enabled

If interrupts are not enabled, the [R\\_SDADC\\_StatusGet\(\)](#) API can be used to poll the SDADC to determine when the scan has completed. The [R\\_SDADC\\_Read\(\)](#) API function is used to access the converted SDADC result. This applies to both normal scans and calibration scans.

## Calibration

Calibration is required to use the SDADC if any channel is configured for differential mode. Call [R\\_SDADC\\_Calibrate\(\)](#) after open, and prior to any other function, then wait for a calibration complete event before using the SDADC. [R\\_SDADC\\_Calibrate\(\)](#) should not be called if all channels are configured for single-ended mode.

## Examples

### Basic Example

This is a basic example of minimal use of the SDADC in an application.

```
void sdadc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Calibrate all differential channels. */
    sdadc_calibrate_args_t calibrate_args;

    calibrate_args.mode      = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
    calibrate_args.channel = ADC_CHANNEL_0;

    err = R_SDADC_Calibrate(&g_adc0_ctrl, &calibrate_args);
    assert(FSP_SUCCESS == err);

    /* Wait for calibration to complete. */
    adc_status_t status;

    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
        R_SDADC_StatusGet(&g_adc0_ctrl, &status);
    }

    /* In software trigger mode, start a scan by calling R_SDADC_ScanStart(). In other
modes, enable external
    * triggers by calling R_SDADC_ScanStart(). */
    (void) R_SDADC_ScanStart(&g_adc0_ctrl);

    /* Wait for conversion to complete. */
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
```

```
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
R_SDADC_StatusGet(&g_adc0_ctrl, &status);
}
/* Read converted data. */
uint32_t channell_conversion_result;
R_SDADC_Read32(&g_adc0_ctrl, ADC_CHANNEL_1, &channell_conversion_result);
}
```

## Using DTC or DMAC with the SDADC

If desired, the DTC or DMAC can be used to store each conversion result in a circular buffer. An example configuration is below.

```
/* Example DTC transfer settings to used with SDADC. */
/* The transfer length should match the total number of conversions per scan. This
example assumes the SDADC is
* configured to scan channel 1 three times, then channel 2 and channel 4 once, for a
total of 5 conversions. */
#define SDADC_EXAMPLE_TRANSFER_LENGTH (5)

## Data Structure Documentation

### ◆ [sdadc\\_calibrate\\_args\\_t](#)

struct <a href="#">sdadc_calibrate_args_t</a>		
Structure to pass to the <a href="#">adc_api_t::calibrate</a> p_extend argument.		
Data Fields		
<a href="#">adc_channel_t</a>	channel	Which channel to calibrate.
<a href="#">sdadc_calibration_t</a>	mode	Calibration mode.

### ◆ [sdadc\\_channel\\_cfg\\_t](#)

struct <a href="#">sdadc_channel_cfg_t</a>		
SDADC per channel configuration.		

### ◆ [sdadc\\_scan\\_cfg\\_t](#)

struct <a href="#">sdadc_scan_cfg_t</a>		
SDADC active channel configuration		
Data Fields		
uint32_t	scan_mask	Channels/bits: bit 0 is ch0; bit 15 is ch15.

### ◆ [sdadc\\_extended\\_cfg\\_t](#)

struct <a href="#">sdadc_extended_cfg_t</a>		
SDADC configuration extension. This extension is required and must be provided in <a href="#">adc_cfg_t::p_extend</a> .		
Data Fields		
uint8_t	conv_end_ipi	Conversion end interrupt priority.

IRQn_Type	conv_end_irq	
sdadc_vref_src_t	vref_src	Source of Vref (internal or external)
sdadc_vref_voltage_t	vref_voltage	Voltage of Vref, required for both internal and external Vref. If Vref is from an external source, the voltage must match the specified voltage within 3%.
sdadc_channel_cfg_t const *	p_channel_cfgs[SDADC_MAX_NUM_CHANNELS]	Configuration for each channel, set to NULL if unused.

#### ◆ sdadc\_instance\_ctrl\_t

struct sdadc_instance_ctrl_t
ADC instance control block. DO NOT INITIALIZE. Initialized in <code>adc_api_t::open()</code> .

### Enumeration Type Documentation

#### ◆ sdadc\_vref\_src\_t

enum sdadc_vref_src_t	
Source of Vref.	
Enumerator	
SDADC_VREF_SRC_INTERNAL	Vref is internally sourced, can be output as SBIAS.
SDADC_VREF_SRC_EXTERNAL	Vref is externally sourced from the VREFI pin.

◆ **sdadc\_vref\_voltage\_t**

enum <code>sdadc_vref_voltage_t</code>	
Voltage of Vref.	
Enumerator	
<code>SDADC_VREF_VOLTAGE_800_MV</code>	Vref is 0.8 V.
<code>SDADC_VREF_VOLTAGE_1000_MV</code>	Vref is 1.0 V.
<code>SDADC_VREF_VOLTAGE_1200_MV</code>	Vref is 1.2 V.
<code>SDADC_VREF_VOLTAGE_1400_MV</code>	Vref is 1.4 V.
<code>SDADC_VREF_VOLTAGE_1600_MV</code>	Vref is 1.6 V.
<code>SDADC_VREF_VOLTAGE_1800_MV</code>	Vref is 1.8 V.
<code>SDADC_VREF_VOLTAGE_2000_MV</code>	Vref is 2.0 V.
<code>SDADC_VREF_VOLTAGE_2200_MV</code>	Vref is 2.2 V.
<code>SDADC_VREF_VOLTAGE_2400_MV</code>	Vref is 2.4 V (only valid for external Vref)

◆ **sdadc\_channel\_input\_t**

enum <code>sdadc_channel_input_t</code>	
Per channel input mode.	
Enumerator	
<code>SDADC_CHANNEL_INPUT_DIFFERENTIAL</code>	Differential input.
<code>SDADC_CHANNEL_INPUT_SINGLE_ENDED</code>	Single-ended input.

**◆ sdadc\_channel\_stage\_1\_gain\_t**

enum sdadc_channel_stage_1_gain_t	
Per channel stage 1 gain options.	
Enumerator	
SDADC_CHANNEL_STAGE_1_GAIN_1	Gain of 1.
SDADC_CHANNEL_STAGE_1_GAIN_2	Gain of 2.
SDADC_CHANNEL_STAGE_1_GAIN_3	Gain of 3 (only valid for stage 1)
SDADC_CHANNEL_STAGE_1_GAIN_4	Gain of 4.
SDADC_CHANNEL_STAGE_1_GAIN_8	Gain of 8.

**◆ sdadc\_channel\_stage\_2\_gain\_t**

enum sdadc_channel_stage_2_gain_t	
Per channel stage 2 gain options.	
Enumerator	
SDADC_CHANNEL_STAGE_2_GAIN_1	Gain of 1.
SDADC_CHANNEL_STAGE_2_GAIN_2	Gain of 2.
SDADC_CHANNEL_STAGE_2_GAIN_4	Gain of 4.
SDADC_CHANNEL_STAGE_2_GAIN_8	Gain of 8.

◆ **sdadc\_channel\_oversampling\_t**

enum <code>sdadc_channel_oversampling_t</code>	
Per channel oversampling ratio.	
Enumerator	
<code>SDADC_CHANNEL_OVERSAMPLING_64</code>	Oversampling ratio of 64.
<code>SDADC_CHANNEL_OVERSAMPLING_128</code>	Oversampling ratio of 128.
<code>SDADC_CHANNEL_OVERSAMPLING_256</code>	Oversampling ratio of 256.
<code>SDADC_CHANNEL_OVERSAMPLING_512</code>	Oversampling ratio of 512.
<code>SDADC_CHANNEL_OVERSAMPLING_1024</code>	Oversampling ratio of 1024.
<code>SDADC_CHANNEL_OVERSAMPLING_2048</code>	Oversampling ratio of 2048.

◆ **sdadc\_channel\_polarity\_t**

enum <code>sdadc_channel_polarity_t</code>	
Per channel polarity, valid for single-ended input only.	
Enumerator	
<code>SDADC_CHANNEL_POLARITY_POSITIVE</code>	Positive-side single-ended input.
<code>SDADC_CHANNEL_POLARITY_NEGATIVE</code>	Negative-side single-ended input.

◆ **sdadc\_channel\_average\_t**

enum <code>sdadc_channel_average_t</code>	
Per channel number of conversions to average before conversion end callback.	
Enumerator	
<code>SDADC_CHANNEL_AVERAGE_NONE</code>	Do not average (callback for each conversion)
<code>SDADC_CHANNEL_AVERAGE_8</code>	Average 8 samples for each conversion end callback.
<code>SDADC_CHANNEL_AVERAGE_16</code>	Average 16 samples for each conversion end callback.
<code>SDADC_CHANNEL_AVERAGE_32</code>	Average 32 samples for each conversion end callback.
<code>SDADC_CHANNEL_AVERAGE_64</code>	Average 64 samples for each conversion end callback.

◆ **sdadc\_channel\_inversion\_t**

enum <code>sdadc_channel_inversion_t</code>	
Per channel polarity, valid for negative-side single-ended input only.	
Enumerator	
<code>SDADC_CHANNEL_INVERSION_OFF</code>	Do not invert conversion result.
<code>SDADC_CHANNEL_INVERSION_ON</code>	Invert conversion result.

◆ **sdadc\_channel\_count\_formula\_t**

enum <code>sdadc_channel_count_formula_t</code>	
Select a formula to specify the number of conversions. The following symbols are used in the formulas:	
<ul style="list-style-type: none"> <li>• N: Number of conversions</li> <li>• n: <code>sdadc_channel_cfg_t::coefficient_n</code>, do not set to 0 if m is 0</li> <li>• m: <code>sdadc_channel_cfg_t::coefficient_m</code>, do not set to 0 if n is 0</li> </ul> Either m or n must be non-zero.	
Enumerator	
<code>SDADC_CHANNEL_COUNT_FORMULA_EXPONENTIAL</code>	$N = 32 * (2 ^ n - 1) + m * 2 ^ n.$
<code>SDADC_CHANNEL_COUNT_FORMULA_LINEAR</code>	$N = (32 * n) + m.$

◆ **sdadc\_calibration\_t**

enum <code>sdadc_calibration_t</code>	
Calibration mode.	
Enumerator	
<code>SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET</code>	Use internal reference to calibrate offset and gain.
<code>SDADC_CALIBRATION_EXTERNAL_OFFSET</code>	Use external reference to calibrate offset.
<code>SDADC_CALIBRATION_EXTERNAL_GAIN</code>	Use external reference to calibrate gain.

**Function Documentation**

◆ **R\_SDADC\_Open()**

```
fsp_err_t R_SDADC_Open ( adc_ctrl_t * p_ctrl, adc_cfg_t const *const p_cfg )
```

Applies power to the SDADC and initializes the hardware based on the user configuration. As part of this initialization, the SDADC clock is configured and enabled. If an interrupt priority is non-zero, enables an interrupt which will call a callback to notify the user when a conversion, scan, or calibration is complete. [R\\_SDADC\\_Calibrate\(\)](#) must be called after this function before using the SDADC if any channels are used in differential mode. Implements [adc\\_api\\_t::open\(\)](#).

**Note**

*This function delays at least 2 ms as required by the SDADC power on procedure.*

**Return values**

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Control block is already open.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt is disabled

◆ **R\_SDADC\_ScanCfg()**

```
fsp_err_t R_SDADC_ScanCfg ( adc_ctrl_t * p_ctrl, void const *const p_extend )
```

Configures the enabled channels of the ADC. Pass a pointer to [sdadc\\_scan\\_cfg\\_t](#) to p\_extend. Implements [adc\\_api\\_t::scanCfg\(\)](#).

**Return values**

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_SDADC\_InfoGet()**

```
fsp_err_t R_SDADC_InfoGet ( adc_ctrl_t * p_ctrl, adc_info_t * p_adc_info )
```

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements `adc_api_t::infoGet()`.

**Return values**

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_SDADC\_ScanStart()**

```
fsp_err_t R_SDADC_ScanStart ( adc_ctrl_t * p_ctrl)
```

If the SDADC is configured for hardware triggers, enables hardware triggers. Otherwise, starts a scan. Implements `adc_api_t::scanStart()`.

**Return values**

FSP_SUCCESS	Scan started or hardware triggers enabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_IN_USE	A conversion or calibration is in progress.

◆ **R\_SDADC\_ScanGroupStart()**

```
fsp_err_t R_SDADC_ScanGroupStart ( adc_ctrl_t * p_ctrl, adc_group_mask_t group_id )
```

`adc_api_t::scanStart` is not supported on the SDADC. Use `scanStart` instead.

**Return values**

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.
---------------------	--

◆ **R\_SDADC\_ScanStop()**

`fsp_err_t R_SDADC_ScanStop ( adc_ctrl_t * p_ctrl )`

If the SDADC is configured for hardware triggers, disables hardware triggers. Otherwise, stops any in-progress scan started by software. Implements `adc_api_t::scanStop()`.

**Return values**

FSP_SUCCESS	Scan stopped or hardware triggers disabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_SDADC\_StatusGet()**

`fsp_err_t R_SDADC_StatusGet ( adc_ctrl_t * p_ctrl, adc_status_t * p_status )`

Returns the status of a scan started by software, including calibration scans. It is not possible to determine the status of a scan started by a hardware trigger. Implements `adc_api_t::scanStatusGet()`.

**Return values**

FSP_SUCCESS	No software scan or calibration is in progress.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_SDADC\_Read()**

```
fsp_err_t R_SDADC_Read ( adc_ctrl_t * p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data )
```

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. Implements `adc_api_t::read()`.

**Note**

*The result stored in `p_data` is signed when the SDADC channel is configured in differential mode. Do not use this API if the conversion end interrupt (`SDADC0_ADI`) is used to trigger the DTC unless the interrupt mode is set to `TRANSFER_IRQ_EACH`.*

**Return values**

FSP_SUCCESS	Conversion result in <code>p_data</code> .
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_SDADC\_Read32()**

```
fsp_err_t R_SDADC_Read32 ( adc_ctrl_t * p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data )
```

Reads the most recent conversion result from a channel. Implements `adc_api_t::read32()`.

**Note**

*The result stored in `p_data` is signed when the SDADC channel is configured in differential mode. When the SDADC is configured for 24-bit resolution and right alignment, the sign bit is bit 23, and the upper 8 bits are 0. When the SDADC is configured for 16-bit resolution and right alignment, the sign bit is bit 15, and the upper 16 bits are 0. Do not use this API if the conversion end interrupt (`SDADC0_ADI`) is used to trigger the DTC unless the interrupt mode is set to `TRANSFER_IRQ_EACH`.*

**Return values**

FSP_SUCCESS	Conversion result in <code>p_data</code> .
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R\_SDADC\_OffsetSet()**

```
fsp_err_t R_SDADC_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset )
```

Sets the offset. Offset is applied after stage 1 of the input channel. Offset can only be applied when the channel is configured for differential input. Implements `adc_api_t::offsetSet()`.

Note: The offset is cleared if `adc_api_t::calibrate()` is called. The offset can be re-applied if necessary after the the callback with event `ADC_EVENT_CALIBRATION_COMPLETE` is called.

**Parameters**

[in]	p_ctrl	See p_instance_ctrl in <code>adc_api_t::offsetSet()</code> .
[in]	reg_id	See reg_id in <code>adc_api_t::offsetSet()</code> .
[in]	offset	Must be between -15 and 15, offset (mV) = 10.9376 mV * offset_steps / stage 1 gain.

**Return values**

FSP_SUCCESS	Offset updated successfully.
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_IN_USE	A conversion or calibration is in progress.
FSP_ERR_NOT_OPEN	Instance control block is not open.

### ◆ R\_SDADC\_Calibrate()

```
fsp_err_t R_SDADC_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Requires `sdadc_calibrate_args_t` passed to `p_extend`. Calibrates the specified channel. Calibration is not required or supported for single-ended mode. Calibration must be completed for differential mode before using the SDADC. A callback with the event `ADC_EVENT_CALIBRATION_COMPLETE` is called when calibration completes. Implements `adc_api_t::calibrate()`.

During external offset calibration, apply a differential voltage of 0 to ANSDnP - ANSDnN, where n is the input channel and ANSDnP is OPAMP0 for channel 4 and ANSDnN is OPAMP1 for channel 4. Complete external offset calibration before external gain calibration.

During external gain calibration apply a voltage between  $0.4 \text{ V} / \text{total\_gain}$  and  $0.8 \text{ V} / \text{total\_gain}$ . The differential voltage applied during calibration is corrected to a conversion result of `0x7FFFFFFF`, which is the maximum possible positive differential measurement.

This function clears the offset value. If offset is required after calibration, it must be reapplied after calibration is complete using `adc_api_t::offsetSet`.

#### Return values

FSP_SUCCESS	Calibration began successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_IN_USE	A conversion or calibration is in progress.
FSP_ERR_NOT_OPEN	Instance control block is not open.

### ◆ R\_SDADC\_Close()

```
fsp_err_t R_SDADC_Close ( adc_ctrl_t * p_ctrl)
```

Stops any scan in progress, disables interrupts, and powers down the SDADC peripheral. Implements `adc_api_t::close()`.

#### Note

*This function delays at least 3 us as required by the SDADC24 stop procedure.*

#### Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

## 4.2.2 Audio

## Modules

### Detailed Description

Audio Modules.

#### Modules

##### ADPCM Decoder ([rm\\_adpcm\\_decoder](#))

Middleware to implement the ADPCM Audio Decoder. This module implements the [ADPCM Decoder Interface](#).

##### Audio Playback PWM ([rm\\_audio\\_playback\\_pwm](#))

Driver for the Audio Playback middleware on RA MCUs. This module implements the [AUDIO PLAYBACK Interface](#).

#### 4.2.2.1 ADPCM Decoder ([rm\\_adpcm\\_decoder](#))

[Modules](#) » [Audio](#)

### Detailed Description

Middleware to implement the ADPCM Audio Decoder. This module implements the [ADPCM Decoder Interface](#).

## Overview

### Features

The ADPCM Audio Decoder has the following key features:

- Decodes 4-bit ADPCM input to 16-bit PCM output

## Configuration

### Build Time Configurations for rm\_adpcm\_decoder

The following build time configurations are defined in fsp\_cfg/rm\_adpcm\_decoder\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Audio > ADPCM Decoder (rm\_adpcm\_decoder)

This module can be added to the Stacks tab via New Stack > Audio > ADPCM Decoder (rm\_adpcm\_decoder).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_adpcm_decoder0	Module name.

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

## Examples

### Basic Example

This is a basic example of minimal use of the ADPCM Audio Decoder implementation in an application.

```
void rm_adpcm_decoder_example ()
{
    /* Open the ADPCM audio decoder instance. */
    fsp_err_t err = RM_ADPCM_DECODER_Open(&g_adpcmdec_ctrl, &g_adpcmdec_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Decode the data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream1, g_pcm_stream,
    ADPCM_BUFFER_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
    /* Reset the ADPCM audio decoder instance before decoding a new stream. */
}
```

```

err = RM_ADPCM_DECODER_Reset(&g_adpcmdec_ctrl);
assert(FSP_SUCCESS == err);

/* Decode the first chunk of ADPCM data */
err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream2, g_pcm_stream,
(ADPCM_BUFFER_SIZE_BYTES/2));
assert(FSP_SUCCESS == err);

/* Decode the second chunk of ADPCM data */
err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl,
&g_adpcm_stream2[ADPCM_BUFFER_SIZE_BYTES/2],
g_pcm_stream, (ADPCM_BUFFER_SIZE_BYTES/2));
assert(FSP_SUCCESS == err);
}

```

## Data Structures

```
struct adpcm_decoder_instance_ctrl_t
```

## Data Structure Documentation

### ◆ adpcm\_decoder\_instance\_ctrl\_t

```
struct adpcm_decoder_instance_ctrl_t
```

RM\_ADPCM\_DECODER instance control block. DO NOT INITIALIZE. Initialized in [adpcm\\_decoder\\_api\\_t::open\(\)](#).

## Function Documentation

### ◆ RM\_ADPCM\_DECODER\_Open()

```
fsp_err_t RM_ADPCM_DECODER_Open ( adpcm_decoder_ctrl_t* p_ctrl, adpcm_decoder_cfg_t const
*const p_cfg )
```

Initializes ADPCM audio decoder device.

Implements [adpcm\\_decoder\\_api\\_t::open\(\)](#).

#### Return values

FSP_SUCCESS	Module is ready for use.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_ALREADY_OPEN	The instance control structure has already been opened.

◆ **RM\_ADPCM\_DECODER\_Decode()**

```
fsp_err_t RM_ADPCM_DECODER_Decode ( adpcm_decoder_ctrl_t *const p_ctrl, void const * p_src,
void * p_dest, uint32_t src_len_bytes )
```

Decodes 4bit ADPCM data to 16bit PCM data. It reads ADPCM data from area pointed by inputAddr pointer, decodes the number of samples specified and stores the decoded data in buffer pointed with outputAddr pointer.

Implements [adpcm\\_decoder\\_api\\_t::decode\(\)](#).

**Return values**

FSP_SUCCESS	Decode operation successfully completed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **RM\_ADPCM\_DECODER\_Reset()**

```
fsp_err_t RM_ADPCM_DECODER_Reset ( adpcm_decoder_ctrl_t * p_ctrl)
```

This function resets the ADPCM decoder device.

Implements [adpcm\\_decoder\\_api\\_t::reset\(\)](#).

**Return values**

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **RM\_ADPCM\_DECODER\_Close()**

```
fsp_err_t RM_ADPCM_DECODER_Close ( adpcm_decoder_ctrl_t * p_ctrl)
```

This function closes the ADPCM decoder device.

Implements [adpcm\\_decoder\\_api\\_t::close\(\)](#).

**Return values**

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

## 4.2.2.2 Audio Playback PWM (rm\_audio\_playback\_pwm)

Modules » Audio

### Functions

fsp\_err\_t RM\_AUDIO\_PLAYBACK\_PWM\_Open (audio\_playback\_ctrl\_t \*const p\_api\_ctrl, audio\_playback\_cfg\_t const \*const p\_cfg)

fsp\_err\_t RM\_AUDIO\_PLAYBACK\_PWM\_Close (audio\_playback\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t RM\_AUDIO\_PLAYBACK\_PWM\_Start (audio\_playback\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t RM\_AUDIO\_PLAYBACK\_PWM\_Stop (audio\_playback\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t RM\_AUDIO\_PLAYBACK\_PWM\_Play (audio\_playback\_ctrl\_t \*const p\_api\_ctrl, void const \*const p\_buffer, uint32\_t length)

### Detailed Description

Driver for the Audio Playback middleware on RA MCUs. This module implements the [AUDIO PLAYBACK Interface](#).

## Overview

### Features

The Audio Playback with PWM middleware is used to play audio streams at user selected playback rate using Pulse Width Modulation hardware on GPT or AGT timers. This module can play the 16 bit or 32 bit(available on selected MCUs) uncompressed, unsigned PCM audio stream when AGT is selected as PWM interface and can play 32 bit uncompressed, unsigned PCM audio stream when GPT is used as PWM interface. The application code is expected to convert the signed PCM data to unsigned PCM data and scale it with the playback rate before starting the playback.

## Configuration

### Build Time Configurations for rm\_audio\_playback\_pwm

The following build time configurations are defined in fsp\_cfg/rm\_audio\_playback\_pwm\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Select if DMAC will be used.

## Configurations for Audio > Audio Playback PWM (rm\_audio\_playback\_pwm)

This module can be added to the Stacks tab via New Stack > Audio > Audio Playback PWM (rm\_audio\_playback\_pwm).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_rm_audio_playback0	Module name.
General > Playback Speed (Hz)	Manual Entry	44100	Enter playback sample rate in Hz.
Interrupts > Callback	Name must be a valid C symbol	g_rm_audio_playback0_callback	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the playback completes.
PWM Output Pin	<ul style="list-style-type: none"> <li>Pin A</li> <li>Pin B</li> </ul>	Pin A	Select which timer output pin should be used for audio output.

### Clock Configuration

The Audio Playback with PWM module does not require a specific clock configuration.

### Pin Configuration

Configure the PWM output pins for selected PWM HAL layer peripheral (AGT/GPT). One of the following pins needs to be selected and enabled as PWM output for selected channel n,

If GPT is used as PWM interface,

- GTIOCA<sub>n</sub>
- GTIOCB<sub>n</sub>

If AGT is used as PWM interface,

- AGTOA<sub>n</sub>
- AGTOB<sub>n</sub>

## Usage Notes

### DMAC/DTC Integration

DMAC/DTC is used as a lower level transfer instance with this module and is operated in Normal mode to transfer 16 bit or 32 bit data from the audio stream buffer to the PWM peripheral AGT or GPT respectively. Destination address for transfer instance needs to be the Duty Cycle setting register GTCCR for GPT as PWM driver or AGTMA/AGTCMB in case of AGT as PWM driver. The Audio

Playback with PWM module internally configures 'Transfer Size' as 2 Bytes if AGT is used for PWM generation, otherwise it configures 'Transfer Size' as 4 Bytes if GPT or AGTW is used for PWM generation. Refer the hardware manual to check whether the MCU supports AGT or the AGTW peripheral.

## Examples

### Basic Example

This is a basic example of minimal use of the RM\_AUDIO\_PLAYBACK\_PWM in an application. This example shows how this driver can be used for playing a 16 bit uncompressed PCM audio from a single input buffer.

```
int16_t play_buffer[AUDIO_EXAMPLE_LENGTH];
uint32_t g_audio_callback_counter = 0;
void g_audio_example_counter_callback (audio_playback_callback_args_t * p_args)
{
    if (AUDIO_PLAYBACK_EVENT_PLAYBACK_COMPLETE == (p_args->event))
    {
        g_audio_callback_counter++;
    }
}
void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the Audio Playback module for playing an audio stream. */
    err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Set the 16 Bit PCM audio stream to play next */
    err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start to the play the selected audio stream*/
    err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

```
/* Wait till the playback is completed */
while (g_audio_callback_counter == 0)
{
    ;
}

/* Stop playing. */
err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
}
```

## Streaming Example

This is an example of using Audio Playback module to play audio stream. This application uses a double buffer to store PCM sine wave data. It starts playing in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart playing in the main loop. This example also demonstrates conversion of signed PCM format data to unsigned PWM format data along with scaling the data samples for optimum PWM wave generation.

```
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_PERIOD_VALUE_AT_22050HZ (0x11B7U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER (1024U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_CONVERT_TO_PWM_SAMPLES (32768U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_DATA_BIT_SIZE (16U)

int16_t      g_stream_src[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];
q15_t       g_pwm_sample[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];
q15_t       g_pwm_scaled_sample[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];
uint32_t     g_buffer_index          = 0;

volatile bool g_send_data_in_main_loop = true;

## Data Structures

```
struct audio_playback_pwm_instance_ctrl_t
```

## Data Structure Documentation

### ◆ audio\_playback\_pwm\_instance\_ctrl\_t

```
struct audio_playback_pwm_instance_ctrl_t
```

AUDIO\_PLAYBACK\_PWM instance control block. DO NOT MODIFY. Initialization occurs when [RM\\_AUDIO\\_PLAYBACK\\_PWM\\_Open\(\)](#) is called.

Data Fields	
void(* <a href="#">p_callback</a> )(audio_playback_callback_args_t *p_args)	
void * <a href="#">p_context</a>	
audio_playback_cfg_t const * <a href="#">p_cfg</a>	
	Pointer to the configuration structure.
uint32_t <a href="#">open</a>	
	Used by driver to check if the control structure is valid.
timer_instance_t const * <a href="#">p_lower_lvl_timer</a>	
	Timer API used to generate sampling frequency and GPT/AGT API used to access PWM hardware.
transfer_instance_t const * <a href="#">p_lower_lvl_transfer</a>	
	Transfer API used to transfer data each sampling frequency.
Field Documentation	
◆ <b>p_callback</b>	
void(* audio_playback_pwm_instance_ctrl_t::p_callback) ( <a href="#">audio_playback_callback_args_t</a> *p_args)	
Callback called when play is complete.	
◆ <b>p_context</b>	
void* audio_playback_pwm_instance_ctrl_t::p_context	
Placeholder for user data. Passed to the user callback in <a href="#">audio_playback_callback_args_t</a> .	

## Function Documentation

---

◆ **RM\_AUDIO\_PLAYBACK\_PWM\_Open()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Open ( audio_playback_ctrl_t *const p_api_ctrl,
audio_playback_cfg_t const *const p_cfg )
```

Opens and configures the Audio Playback with PWM driver. Sets playback speed and transfer rate to read the audio buffer.

Example:

```
/* Initialize the Audio Playback module for playing an audio stream. */
err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);
```

**Return values**

FSP_SUCCESS	Audio Playback module successfully configured.
FSP_ERR_ALREADY_OPEN	Module already open.
FSP_ERR_ASSERTION	One or more pointers point to NULL or callback is NULL.

◆ **RM\_AUDIO\_PLAYBACK\_PWM\_Close()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Close ( audio_playback_ctrl_t *const p_api_ctrl)
```

Closes the module driver. Enables module stop mode.

**Return values**

FSP_SUCCESS	Module successfully closed.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	Pointer pointing to NULL.

**Note**

*This function will close all the lower level HAL drivers as well.*

◆ **RM\_AUDIO\_PLAYBACK\_PWM\_Start()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Start ( audio_playback_ctrl_t *const p_api_ctrl)
```

Start the PWM HAL driver (AGT or GPT) and timer HAL (AGT or GPT) drivers.

## • Example:

```
/* Start to the play the selected audio stream*/
err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Audio playback hardware started successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not open. This function calls <ul style="list-style-type: none"> <li>• <a href="#">timer_api_t::start</a></li> </ul>

◆ **RM\_AUDIO\_PLAYBACK\_PWM\_Stop()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Stop ( audio_playback_ctrl_t *const p_api_ctrl)
```

Stop the PWM HAL driver (AGT or GPT) and timer HAL driver (AGT or GPT).

## • Example:

```
/* Stop playing. */
err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Audio playback hardware stopped successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not open. This function calls <ul style="list-style-type: none"> <li>• <a href="#">timer_api_t::stop</a></li> </ul>

### ◆ RM\_AUDIO\_PLAYBACK\_PWM\_Play()

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Play ( audio_playback_ctrl_t *const p_api_ctrl, void const
*const p_buffer, uint32_t length )
```

Play a single audio buffer by input samples to the PWM HAL (AGT or GPT) at the sampling frequency configured by the timer.

- Example:

```
/* Set the 16 Bit PCM audio stream to play next */
err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
```

#### Return values

FSP_SUCCESS	Buffer playback began successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl or p_buffer is NULL or buffer length is greater than 0x10000.
FSP_ERR_NOT_OPEN	Driver not open.. This function calls <ul style="list-style-type: none"> <li>• <a href="#">transfer_api_t::reset</a></li> </ul>

## 4.2.3 Bootloader

MCUboot Port for RA MCUs.

### 4.2.3.1 MCUboot Image Utilities

[Modules](#) » [Bootloader](#)

MCUboot Port for RA MCUs.

## Overview

### Note

*The MCUboot Port does not provide any interfaces to the user. Consult the MCUboot documentation at <https://mcu-tools.github.io/mcuboot/> for further information.*

## Configuration

### Build Time Configurations for MCUboot

The following build time configurations are defined in `mcu-tools/include/mcuboot_config/mcuboot_config.h`:

Configuration	Options	Default	Description
General > Custom <code>mcuboot_config.h</code>	Manual Entry		Add a path to your custom <code>mcuboot_config.h</code> file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
General > Upgrade Mode	<ul style="list-style-type: none"> <li>Swap</li> <li>Overwrite Only</li> <li>Overwrite Only Fast</li> <li>Direct XIP</li> </ul>	Overwrite Only	Swap supports A/B image swapping with rollback. Other modes with simpler code path, which only supports overwriting the existing image with the update image or running the newest image directly from its flash partition, are also available.
General > Validate Primary Image	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	Always check the signature of the image in the primary slot before booting, even if no upgrade was performed. This is recommended if the boot time penalty is acceptable.
General > Downgrade Prevention (Overwrite)	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Prevent downgrades by enforcing incrementing

Only)

version numbers. When this option is set, any upgrade must have greater major version or greater minor version with equal major version. This mechanism only protects against some attacks against version downgrades (for example, a JTAG could be used to write an older version).

Number of separately updateable images.

This function might be implemented if the OS / HW watchdog is enabled while doing a swap upgrade and the time it takes for a swapping is long enough to cause an unwanted reset. If implementing this, the OS main.c must also enable the watchdog (if required)!

Copies the boot data into the secure RAM, intended to be used by the secure App.

Copies the user data into the secure RAM, intended to be used by the secure App.

Create CBOR encoded boot record TLV for Image 2. Represents the role of the software component (e.g. CoFM for coprocessor firmware). [max. 12 characters]

Add any custom options to pass to imgtool.py here. --pad places a trailer on the image that indicates that the image should

Flash Layout >  
TrustZone > Non-  
Secure Callable Region  
Size (Bytes)

Value must be an  
integer multiple of the  
1024.

0x0

Flash Layout >  
TrustZone > Non-

Value must be an  
integer multiple of the

0x0

Secure Flash Area Size (Bytes) (TrustZone Non-Secure)	largest erase size on the mcu.		non-zero for all TrustZone projects to ensure memory is partitioned correctly, even if the Secure and Non-Secure regions are treated as a single image. If the Non-Secure region can be updated separately, this size must account for the header and trailer.
Flash Layout > TrustZone > Non-Secure Callable RAM Region Size (Bytes)	Value must be an integer multiple of the 1024.	0x0	Size of the Non-Secure Callable RAM region of the Secure image.
Flash Layout > TrustZone > Non-Secure RAM Region Size (Bytes) (TrustZone Non-Secure)	Value must be an integer multiple of the 8192.	0x0	Size of the Non-Secure RAM region. This must be non-zero for all TrustZone projects to ensure memory is partitioned correctly, even if the Secure and Non-Secure regions are treated as a single image.
Flash Layout > TrustZone > Image 2 Header Size (Bytes)	Value must be an integer multiple of 0x80 (alignment required by VTOR).	0x200	Size of the flash reserved for the application image header for Image 2.
Flash Layout > Bootloader Flash Area Size (Bytes)	Value must be an integer multiple of the largest erase size on the mcu.	0x20000	Size of the flash reserved for the bootloader.
Flash Layout > Image 1 Header Size (Bytes)	Value must be an integer multiple of 0x80 (alignment required by VTOR).	0x200	Size of the flash reserved for the application image header. Must meet minimum VTOR alignment requirements for the core (0x100 for Cortex-M23, 0x80 for Cortex-M4 and Cortex-M33).
Flash Layout > Image 1 Flash Area Size (Bytes)	Value must be an integer multiple of the largest erase size on the mcu.	0x20000	Size of the application image 1, including the header and trailer. For TrustZone projects, enter the combined size of the Secure and

Non-Secure Callable regions if the Non-Secure image can be updated separately, or enter the size of the entire image slot if Secure, Non-Secure Callable, and Non-Secure regions are updated as a single image.

Flash Layout > Scratch Flash Area Size (Bytes)	Value must be an integer multiple of the largest erase size on the mcu.	0x0	Size of the scratch area. Only required for swap update method.
Data Sharing > Maximum Measured Boot Record Size (Bytes)	Value must be an integer.	0x64	Maximum size of the boot record.
Data Sharing > Shared Data Size (Bytes)	Value must be an integer.	0x380	Size of the shared RAM area. Required for Measured Boot.
Data Sharing > Shared Data Address	Value must be an integer	0x20000000	Shared RAM start address. Required for Measured Boot.

## Clock Configuration

This module does not use peripheral clocks.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Getting Started: Creating an MCUboot Project

Start by creating a new project in e2 studio or RA SC. If the MCU supports TrustZone, select a Flat project. The bootloader resides entirely in Secure memory, but it is considered a flat project because it does not provide any Non-Secure Callable functions. On the Stacks tab, add New > Bootloader > MCUboot. Resolve any constraint errors and edit configurations as desired. Add either the example keys or generate your own key. The MCUboot key generation tool is provided at `ra/mcu-tools/MCUboot/scripts/imgtool.py` and documented at <https://github.com/mcu-tools/mcuboot/blob/master/docs/imgtool.md>. Install the following required python packages to use `imgtool.py`: <https://github.com/mcu-tools/mcuboot/blob/master/scripts/requirements.txt>.

In `src/hal_entry.c`, drag in Developer Assistance > HAL/Common > MCUboot > Quick Setup > Call Quick Setup. Add a call to `mcuboot_quick_setup()` in the application and make any desired updates.

*Note*

*MCUboot will contain either the verification public key or its hash. During production it is necessary to*

*permanently lock the flash region where MCUboot is programmed to prevent the keys or the code from being modified.*

## Getting Started: Signing Tool Prerequisite

To use the MCUboot signing tool, ensure you have Python 3.x installed on your system. Then install the Python packages required for the signing tool with the following command:

```
pip3 install --user -r ra/mcu-tools/MCUboot/scripts/requirements.txt
```

## Getting Started: Converting a Project to an MCUboot Image

MCUboot application images must execute from the image slot defined by the MCUboot project. They are also limited to a single downloadable flash region. All of this is handled by specifying a `BootloaderDataFile` in the FSP Configuration tool.

Any existing project can be converted to an MCUboot image.

1. If the project was created with a version prior to FSP v3.0.0, update the linker script to the v3.0.0 version before using it as an MCUboot application image.
2. Right click the project to convert in e2 studio or RA SC and select Properties.
3. Open C/C++ Build and select Build Variables.
4. Click Add...
5. For Variable Name, enter `BootloaderDataFile`. For Type, select File. Browse to the \*.bld file created alongside the \*.elf file for the associated MCUboot project.
6. Click OK, then Apply and Close.

To convert a TrustZone image, follow the steps above for both the Secure project and the Non-Secure project.

MCUboot application images must also be signed to work with MCUboot. At a minimum, this involves adding a SHA and MCUboot specific constant data called boot magic in the image trailer.

Signing can be done on the as a post-build step in e2 studio. To sign the image as a post-build step:

1. If Linux is used to develop the application image, change the MCUboot property Signing > Python to python3.
2. Build the bootloader project to generate the \*.bld file. Make sure to build the bootloader project on the same computer as the application image to ensure the path to the signing script is correct.
3. Define environment variables in the Properties of the application image project in e2 studio.
  - a. Right click the application image project, and select **Properties**.
  - b. Select **C/C++ Build > Environment** on the left.
  - c. Click **Add...**
  - d. Define the following environment variables one at a time:
    - `MCUBOOT_IMAGE_VERSION`: Set to the version of the application image.
    - `MCUBOOT_IMAGE_SIGNING_KEY`: Set the path to the key used for signing. If signing is not required, do not set this variable. If example keys are used, set `MCUBOOT_IMAGE_SIGNING_KEY` as follows (replace <boot\_project> with the bootloader project path):
      - ECC: <boot\_project>/ra/mcu-tools/MCUboot/root-ec-p256.pem
      - RSA 2K: <boot\_project>/ra/mcu-tools/MCUboot/root-rsa-2048.pem
      - RSA 3K: <boot\_project>/ra/mcu-tools/MCUboot/root-rsa-3072.pem

- `MCUBOOT_APP_BIN_CONVERTER`: Optional. Set to path to `objcopy`, `arm-none-eabi-objcopy`, `fromelf`, or `ielftool`. Not required if one of these tools is on the path.
4. Build the project.
  5. The signed image is output next to the application `<project>.elf` file with the name `<project>.bin.signed`.

## Getting Started: Download and Debug

For projects that do not use TrustZone, debug the MCUboot project using the default configuration. Before running, load the signed image to the address specified in the signing comment in `ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h`. This can be done with the Load Ancillary File button when debugging in e2 studio. Upgrade images can be loaded to the upgrade image slots using the same method.

For TrustZone projects, debug using the Secure project to ensure the IDAU is partitioned correctly when debugging in e2 studio. Make the following modifications before debugging in e2 studio:

1. In the Debug Configurations for your project, on the Startup tab, click Add... to add the MCUboot project \*.elf file (Image and Symbols), and optionally the Non-Secure project \*.elf file.
2. For the Secure and Non-Secure project \*.elf file, load Symbols Only.
3. After starting to debug, load the signed Secure image and the signed Non-Secure image into the addresses specified in the signing comment in `ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h`. This can be done with the Load Ancillary File button when debugging in e2 studio. Upgrade images can be loaded to the upgrade image slots using the same method.

## Confirming Upgrade in Swap Mode

In Swap Mode operation, if the upgrade image is signed with the `-pad` option, MCUboot will install that image as a temporary update where if nothing else is done, a reboot will cause MCUboot to revert to the image version that was swapped out during the upgrade. In order for the updated image to prevent this reversion and make the update permanent, the `boot_set_confirmed()` must be called from the application.

To avail this capability in the application image, from the Stacks tab, add New > Bootloader > MCUboot Image Utilities (Swap Mode). Resolve any constraint errors and edit configurations as desired.

In `src/hal_entry.c`, drag in Developer Assistance > HAL/Common > MCUboot Image Utilities > Quick Setup > Confirm Primary Image. Add a call to `boot_set_confirmed()` in the application and confirm the image in the primary slot.

## XIP Mode operation

XIP mode is enabled selecting "Direct XIP" as the Upgrade Mode option in the configurator or by defining "MCUBOOT\_DIRECT\_XIP" in the mcuboot config file. The linker script defines the symbol "XIP\_SECONDARY\_SLOT\_IMAGE" by default to 0. To link an application to the secondary slot in XIP mode, set `XIP_SECONDARY_SLOT_IMAGE` to 1 in the application linker script. Direct XIP mode does not support TrustZone projects.

## Dual Bank operation

MCUboot can be used with Dual bank mode to leverage the advantages of dual bank flash operation.

When Dual Bank mode is enabled, only the XIP upgrade mode can be used.

*Note*

*Unlike in normal XIP Mode operation, the linker script symbol "XIP\_SECONDARY\_SLOT\_IMAGE" must be undefined in Dual Bank mode. An example flash layout in this configuration for a 1 MB is shown below. Note that there are 2 copies of the bootloader, one in Bank 0 and another in Bank 1.*

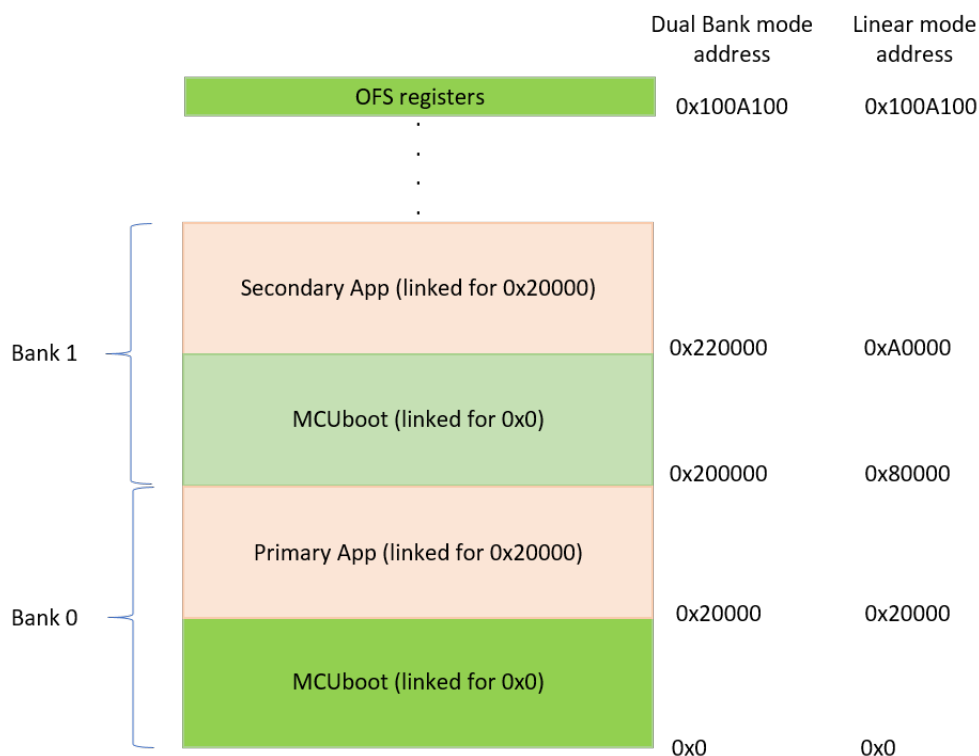

Figure 142: MCUboot Dual Bank layout for 1 MB Memory

For this example layout, the following files are generated when Dual Bank mode with XIP is enabled:

1. Bootloader Project: srec file linked to address 0 and includes the OFS region.
2. Application Project (Primary): signed bin file linked to address 0x20000.
3. Application Project (Secondary): signed bin file linked to address 0x20000.

In Dual Bank mode, the available flash memory is split into two halves and referred to as Bank 0 and Bank 1. In this example Bank 0 would span from address 0x0 - 0x7FFFF and Bank 1 from 0x200000 - 0x27FFFF. In Linear mode, it is possible to program the Bank 1 area by programming to 0x80000 - 0xFFFFF.

### Programming in Dual Bank Mode

The bootloader must be duplicated in Dual Bank mode. Bank 0 can be programmed using the srec file generated from the MCUboot project; this will also program the OFS region which contains the dual bank enable bit, so it must either be programmed last if each file is programmed independently. Another option is to combine all images: MCUboot in Bank 0, primary image, MCUboot in Bank 1 (no OFS), and secondary image (optional). To program MCUboot to Bank 1, offset MCUboot by half the flash size and cut off the OFS region (0x0100A100 to address 0x0100A2FF on CM33 MCUs that support dual bank). Using srec-cat for a 1 MB flash MCU (0x80000 flash per bank), an example command to create the bootloader image for Bank 1: "srec\_cat MCUboot\_dualbank.srec -crop 0

0x80000 -offset 0x80000 -o MCUboot\_dualbank\_offset.srec". The application project for Bank 1 can be similarly offset using srec\_cat: "srec\_cat app1.bin.signed -binary -offset 0xA0000 -o app1\_offset.srec", where 0xA0000 is 0x80000 (half the flash) + 0x20000 (MCUboot size). The signed binary file for Bank 0 can be converted to srec format using srec\_cat: "srec\_cat app0.bin.signed -binary -offset 0x20000 -o app0.srec"

To combine all the files into one srec file, use "srec\_cat MCUboot\_dualbank.srec MCUboot\_dualbank\_offset.srec app0.srec app1\_offset.srec -o combined\_srec".

## External Memory Support

QSPI support for secondary image storage can be enabled in the configurator. The bootloader expects the QSPI memory to be pre-configured by user code in the bootloader for read/write operation. The bootloader code operates under the assumption that the user has configured the QSPI in Extended-SPI mode and that [R\\_QSPI\\_Open\(\)](#) has been called prior to invoking `boot_go()`; For an example on how to initialize the QSPI device, refer to the QSPI module. The QSPI sector size must be the same as that of the MCU internal flash (`BSP_FEATURE_FLASH_HP_CF_REGION1_BLOCK_SIZE`) for swap mode operation.

## MCUboot Memory Map

For single image projects with no external memory support, the default memory map looks like:

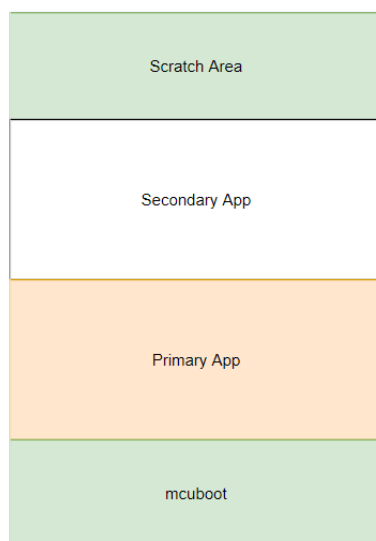

Figure 143: MCUboot Memory Map

For projects with 2 separately updateable images (used for TrustZone applications where the Secure and Non-Secure images can be updated separately), the default memory map with no external memory support looks like:

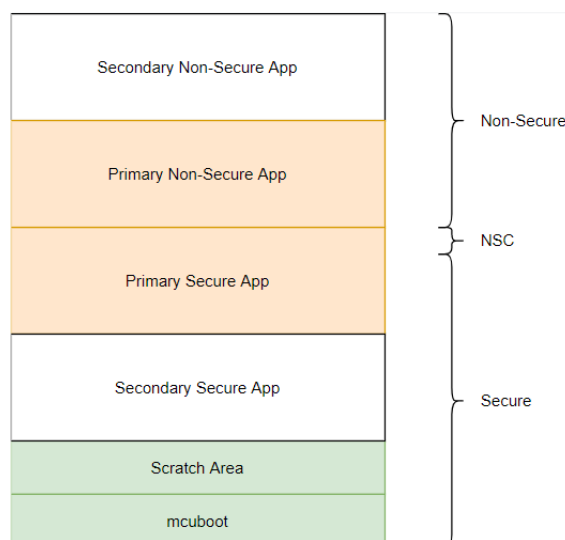

Figure 144: MCUboot Memory Map (TrustZone)

For single image projects with QSPI, the default memory map looks like:

Figure 145: MCUboot Memory Map with QSPI

## MCUboot Crypto Stack Options

The following crypto stacks can be used with MCUboot in FSP:

1. MbedTLS, which is hardware accelerated on all RA devices. On the RA2 which has an AES engine only, ECC/RSA/SHA operations are in software.
2. TinyCrypt (S/W Only) can be used with all devices.
3. TinyCrypt (H/W Accelerated) has AES operations accelerated for the RA2 family only. When using MCUboot without encryption there is no difference between using this or the S/W only version.
4. SCE9 Protected Mode on devices that have the SCE9 (eg: RA6M4, RA4M3, RA4M2)

MbedTLS provides the best performance for MCUBoot signature verification on the RA6 and RA4 devices but has a much larger code footprint compared to TinyCrypt. For RA2 devices TinyCrypt is the best option.

## Using SCE9 Protected Mode Crypto Stack

Using this crypto stack with MCUBoot provides additional security by ensuring that any keys that are used were securely provisioned for the specific device. The Application Note "Installing and Updating Secure Keys for RA Family" (R11AN0496) provides detailed steps on how to go about installing these keys. Since the section "Preparing Keys for Installation and Update Using RFP" document currently only provides information on how to install an AES key, this section will provide information on how to install an ECC public key.

### Note

*When using the SCE9 Protected Mode Stack with MCUboot it is required that the public keys in the format described in the "MCUboot Example Keys" module in the stack is also provided in the project.*

1. Generate an ECC key pair. There are various ways to do this but you can use openssl to do so: "openssl ecparam -name secp256k1 -genkey -noout -out my\_ecc\_secp256k1\_key.pem".
2. Once the key is generated, in order to install the public key using RFP (Renesas Flash Programmer) the user needs to have their own UFPK (User Factory Programming Key) and W-UFPK (Wrapped User Factory Programming Key). Refer to R11AN0496 on how to obtain these keys.
3. Once the UFPK and W-UFPK are available, we need to extract the public key from the pem file. The public key can be viewed by using "openssl ec -noout -text -in my\_ecc\_secp256k1\_key.pem". Note that when the ECC public key is printed out this way, it will contain a 0x04 ASN.1 demarcator at the start which should be discarded.
4. Use the rfp-util.exe utility from the RFP installation folder to wrap the public key using the UFPK and W-UFPK into a format that can be installed by RFP and the factory bootloader on the MCU.
5. Use RFP as described in R11AN0496 to install the key to the location of mcuboot\_sce9\_key section.

These are examples that install the default keys provided with MCUboot in ra/mcu-tools/MCUboot/. The examples assume that UFPK and W-UFPK are already available.

```

// From the bootloader map file determine the address of mcuboot_sce9_key section
Use RFP to install "RSA_3072_pub_install.rkey" as described in "Installing and
Updating Secure Keys for RA Family" (R11AN0496) to the address where the
mcuboot_sce9_key section is located.

```

## Examples

### Basic Example

This is an example of using MCUboot in an application.

```

void rm_mcuboot_port_example (void)
{
#ifdef MCUBOOT_USE_MBED_TLS
/* Initialize mbedtls. */
mbedtls_platform_context ctx = {0};
assert(0 == mbedtls_platform_setup(&ctx));
#elif defined(MCUBOOT_USE_TINYCRYPT)
/* Initialize TinyCrypt port. */
assert(FSP_SUCCESS == RM_TINYCRYPT_PORT_Init());
#else
/* Initialize SCE9 Protected Mode driver. */
sce_instance_ctrl_t sce_ctrl;
const sce_cfg_t sce_cfg =
{.lifecycle = SCE_SSD};
assert(FSP_SUCCESS == R_SCE_Open(&sce_ctrl, &sce_cfg));
#endif

```

```
/* (Optional) To check for updates, call boot_set_pending. */
bool update = 0;
if (update)
{
    boot_set_pending(0);
}
/* Verify the boot image and get its location. */
struct boot_rsp rsp;
    assert(0 == boot_go(&rsp));
/* Enter the application. */
    RM_MCUBOOT_PORT_BootApp(&rsp);
}
```

## 4.2.4 CapTouch

### Modules

### Detailed Description

CapTouch Modules.

#### Modules

##### CTSU (r\_ctsu)

This HAL driver supports the Capacitive Touch Sensing Unit (CTSU). It implements the [CTSU Interface](#).

##### Touch (rm\_touch)

This module supports the Capacitive Touch Sensing Unit (CTSU). It implements the [Touch Middleware Interface](#).

### 4.2.4.1 CTSU (r\_ctsu)

#### Modules » CapTouch

#### Functions

```
fsp_err_t R_CTSU_Open (ctsu_ctrl_t *const p_ctrl, ctstu_cfg_t const *const
```

p\_cfg)

Opens and configures the CTSU driver module. Implements [ctsu\\_api\\_t::open](#). [More...](#)

[fsp\\_err\\_t](#) [R\\_CTSU\\_ScanStart](#) ([ctsu\\_ctrl\\_t](#) \*const p\_ctrl)

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with [R\\_CTSU\\_DataGet\(\)](#). If a different control block scan should be run, check the scan is complete before executing. Implements [ctsu\\_api\\_t::scanStart](#). [More...](#)

[fsp\\_err\\_t](#) [R\\_CTSU\\_DataGet](#) ([ctsu\\_ctrl\\_t](#) \*const p\_ctrl, [uint16\\_t](#) \*p\_data)

This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [ctsu\\_api\\_t::dataGet](#). [More...](#)

[fsp\\_err\\_t](#) [R\\_CTSU\\_ScanStop](#) ([ctsu\\_ctrl\\_t](#) \*const p\_ctrl)

This function scan stops the sensor as scanning by the CTSU. Implements [ctsu\\_api\\_t::scanStop](#). [More...](#)

[fsp\\_err\\_t](#) [R\\_CTSU\\_CallbackSet](#) ([ctsu\\_ctrl\\_t](#) \*const p\_api\_ctrl, void(\*p\_callback)([ctsu\\_callback\\_args\\_t](#) \*), void const \*const p\_context, [ctsu\\_callback\\_args\\_t](#) \*const p\_callback\_memory)

[fsp\\_err\\_t](#) [R\\_CTSU\\_Close](#) ([ctsu\\_ctrl\\_t](#) \*const p\_ctrl)

Disables specified CTSU control block. Implements [ctsu\\_api\\_t::close](#). [More...](#)

[fsp\\_err\\_t](#) [R\\_CTSU\\_SpecificDataGet](#) ([ctsu\\_ctrl\\_t](#) \*const p\_ctrl, [uint16\\_t](#) \*p\_specific\_data, [ctsu\\_specific\\_data\\_type\\_t](#) specific\_data\_type)

This function gets the sensor specific data values as scanned by the CTSU. Call this function after calling the [R\\_CTSU\\_DataGet\(\)](#) function. [More...](#)

[fsp\\_err\\_t](#) [R\\_CTSU\\_DataInsert](#) ([ctsu\\_ctrl\\_t](#) \*const p\_ctrl, [uint16\\_t](#) \*p\_insert\_data)

This function inserts the value of the second argument as the measurement result value. Call this function after calling the [R\\_CTSU\\_DataInsert\(\)](#) function. Implements [ctsu\\_api\\_t::dataInsert](#). [More...](#)

`fsp_err_t R_CTSU_Diagnosis (ctsu_ctrl_t *const p_ctrl)`

Diagnosis the CTSU peripheral. Implements `ctsu_api_t::diagnosis`.  
[More...](#)

## Detailed Description

This HAL driver supports the Capacitive Touch Sensing Unit (CTSU). It implements the [CTSU Interface](#).

## Overview

The capacitive touch sensing unit HAL driver (r\_ctsu) provides an API to control the CTSU peripheral. This module performs capacitance measurement based on various settings defined by the configuration. This module is configured via the [QE for Capacitive Touch](#).

## Features

- Supports multiple scan modes
  - Self-capacitance multi scan mode (CTSU2 support active shield)
  - Mutual-capacitance full scan mode
  - Mutual-capacitance parallel scan mode (CTSU2)
  - Current Measurement mode (CTSU2)
  - Diagnosis scan mode
- Scans may be started by software or an external trigger
- Returns measured capacitance data on scan completion
- Support DTC transfer of scanned data
- Supports TrustZone
- Corrects accuracy for temperature drift (CTSU2)

## Configuration

### Note

*This module is configured via the [QE for Capacitive Touch](#). For information on how to use the QE tool, once the tool is installed click [Help](#) -> [Help Contents in e2 studio](#) and search for "QE".*

### Build Time Configurations for r\_ctsu

The following build time configurations are defined in `fsp_cfg/r_ctsu_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Support for using DTC	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable DTC support for the CTSU module.
Interrupt priority level	MCU Specific Options		Priority level of all CTSU interrupt (CSTU_WR, CTSU_RD, CTSU_FN)

## Configurations for CapTouch > CTSU (r\_ctsu)

This module can be added to the Stacks tab via New Stack > CapTouch > CTSU (r\_ctsu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Scan Start Trigger	MCU Specific Options		CTSU Scan Start Trigger Select

### Interrupt Configuration

The first [R\\_CTSU\\_Open](#) function call sets CTSU peripheral interrupts. The user should provide a callback function to be invoked at the end of the CTSU scan sequence. The callback argument will contain information about the scan status.

### Clock Configuration

The CTSU peripheral module uses PCLKB as its clock source. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

#### Note

*The CTSU Drive pulse will be calculated and set by the tooling depending on the selected transfer rate.*

### Pin Configuration

The TSn pins are sensor pins for the CTSU.

The TSCAP pin is used for an internal low-pass filter and must be connected to an external decoupling capacitor.

## Usage Notes

The CTSU module is a CTSU driver for the Touch module. The CTSU module assumes the access from the Touch middleware layer, and it is also accessible from an user application.

CTSU and CTSU2 are functionally different, so CTSU and CTSU2 are described in this application note as below.

Common description for CTSU and CTSU2 -> CTSU

Description only for CTSU -> CTSU1

Description only for CTSU2 -> CTSU2

Without mention, it means the common description for CTSU and CTSU2.

### Functions

The CTSU module supports the following functions.

### Measurements and Obtaining Data

Measurements can be started by a software trigger or by an external event triggered by the Event Link Controller (ELC).

As the measurement process is carried out by the CTSU2 peripheral, it does not use up main processor processing time.

The CTSU module processes INTCTSUWR and INTCTSURD if generated during a measurement. The

data transfer controller (DTC) can also be used for these processes.

When the measurement complete interrupt (INTCTSUFN) process is complete, the application is notified in a callback function. Make sure you obtain the measurement results before the next measurement is started as internal processes are also executed when a measurement is completed. Start the measurement with API function `R_CTSU_ScanStart()`.

Obtain the measurement results with API function `R_CTSU_DataGet()`.

### Sensor ICO Correction function

The CTSU2 peripheral has a built-in correction circuit to handle the potential microvariations related to the manufacturing process of the sensor ICO MCU.

The module temporarily transitions to the correction process during initialization after power is turned on. In the correction process, the correction circuit is used to generate a correction coefficient (factor) to ensure accurate sensor measurement values.

When temperature correction is enabled, an external resistor connected to a TS terminal is used to periodically update the correction coefficient. By using an external resistor that is not dependent on temperature, you can even correct the temperature drift of the sensor ICO.

### Initial Offset Adjustment

The CTSU2 peripheral was designed with a built-in offset current circuit in consideration of the amount of change in current due to touch. The offset current circuit cancels enough of the parasitic capacitance for it to fit within the sensor ICO dynamic range.

This module automatically adjusts the offset current setting. As the adjustment uses the normal measurement process, `R_CTSU_ScanStart()` and `R_CTSU_DataGet()` must be repeated several times after startup. Because the `ctsu_element_cfg_t` member "so" is the starting point for adjustments, you can set the appropriate value for "so" in order to reduce the number of times the two functions must be run to complete the adjustment. Normally, the value used for "so" is a value adjusted by QE for Capacitive Touch.

Mode	Default target value
Self-capacitance	15360 (37.5%)
Self-capacitance using active shield	6144 (15%)
Mutual-capacitance	10240 (20%)

The percentage is for the CCO's input limit. 100% is the measured value 40960.

The default target value is based on 526us(CTSUS1) or 256us(CTSUS2).

When the measurement time is changed, the target value is adjusted by the ratio with the base time.

Example of target value in combination of CTSUSNUM and CTSUSDPA.

CTSUS1 (CTSUS clock = 32MHz, Self-capacitance mode)

Target value	CTSUSNUM	CTSUSDPA	Measurement time
15360	0x3	0x7	526usec
30720	0x7	0x7	1052usec
30720	0x3	0xF	1052usec
7680	0x1	0x7	263usec

7680	0x3	0x3	263usec
------	-----	-----	---------

The measurement time changes depending on the combination of CTSUSNUM and CTSUSDPA. In the above table, CTSUPRRATIO is the recommended value of 3, and CSTUPRMODE is the recommended value of 2.

When changing CTSUPRRATIO and CTSUPRMODE from the recommended values, follow the Hardware Manual for the measurement time.

CTSUS2 (Self-capacitance mode)

Target value	Target value (multi frequency)	CTSUSNUM	Measurement time
7680	15360 (128us + 128us)	0x7	128usec
15360	30720 (256us + 256us)	0xF	256usec
3840	7680 (64us + 64us)	0x3	64usec

The measurement time changes depending on CTSUSNUM.

If STCLK cannot be set to 0.5MHz, it will not support the table above.

When setting STCLK to other than 0.5MHz because the CTSU clock is not an integer, follow the hardware manual for the measurement time.

### Random Pulse Frequency Measurement (CTSUS1)

The CTSUS1 peripheral measures at one drive frequency.

The drive frequency determines the amperage to the electrode and generally uses the value tuned with QE for Capacitive Touch.

The drive frequency is calculated as below.

It is determined by PCLK frequency input to CTSU, CTSU Count Source Select bit(CTSUSCLK), and CTSU Sensor Drive pulse Division Control bit(CTSUSDPA). For example, If it is set PCLK = 32MHz, CTSUSCLK = PCLK/2, and CTSUSDPA = 1/16, then drive frequency is 0.5MHz. CTSUSDPA can change for each TS port.

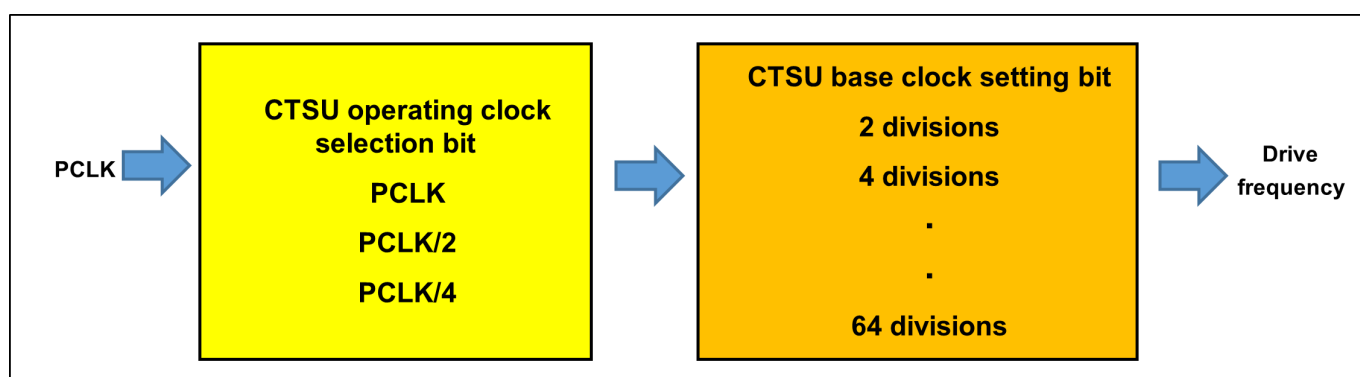

Figure 146: Drive Frequency Settings

The actual drive pulse is phase-shifted and frequency-spread with respect to the clock based on the drive frequency as a measure against external environmental noise. This module is fixed at initialization and sets the following.

CTSUSOFF = 0, CTSUSSMOD = 0, CTSUSSCNT = 3

### Multi-frequency Measurements (CTSU2)

The CTSU2 peripheral can measure in one of four drive frequencies to avoid synchronous noise. With the default settings, the module takes measurements at three different frequencies. After standardizing the results obtained at the three frequencies in accordance with the first frequency reference value, the measured value is determined based on majority in a process referred to as "normalization."

The three values standardized to the first frequency reference value are called correction data. You can get the three correction data with `R_CTSU_SpecificDataGet()`.

Figure 147: Multi-frequency Measurements

Drive frequency is determined based on the config settings. The module sets registers according to the config settings, and sets the three drive frequencies.

Drive frequency is calculated in the following equation:

$$(PCLKB \text{ frequency} / CLK / STCLK) \times SUMULTIn / 2 / SDPA : n = 0, 1, 2$$

The figure below shows the settings for generating a 2MHz drive frequency when the PCLKB frequency is 32 MHz. SDPA can be set for each touch interface configuration.

Figure 148: Drive Frequency Settings

### Shield Function(CTSU2)

The CTSU2 peripheral has a built-in function that outputs a shield signal in phase with the drive pulse from the shield terminal and the non-measurement terminal in order to shield against external influences while suppressing any increase in parasitic capacitance. This function can only be used during self-capacitance measurements.

This module allows the user to set a shield for each touch interface configuration.

For example, for the electrode configuration shown in , the members of `ctsu_cfg_t` should be set as follows. Other members have been omitted for the example.

```
.txvsel = CTSU_TXVSEL_INTERNAL_POWER,
.txvsel2 = CTSU_TXVSEL_MODE,
.md = CTSU_MODE_SELF_MULTI_SCAN,
.pose1 = CTSU_POSEL_SAME_PULSE,
.ctsuchac0 = 0x0F,
.ctsuchtrc0 = 0x08,
```

Figure 149: Example of Shield Electrode Structure

## Measurement Error Message

When the CTSU2 peripheral detects an abnormal measurement, it sets the status register bit to 1. In the measurement complete interrupt process, the module reads `ICOMP1`, `ICOMP0`, and `SENSOVF` of the status register and notifies the results in the callback function. The status register is reset after the contents are read. For more details on abnormal measurements, refer to "member event" in the `ctsu_callback_args_t` callback function argument.

## Moving Average

This function calculates the moving average of the measured results. Set the number of times the moving average should be calculated in the config settings.

## Diagnosis Function

The CTSU peripheral has a built-in function that diagnoses its own inner circuit. This diagnosis function provides the API for diagnosing the inner circuit.

The diagnostic requirements are different for CTSU1 and CTSU2 providing 5 types of diagnosis for CTSU1 and 9 types for CTSU2.

The diagnosis function is executed by calling the API function. This is executed independently from the other measurements and does not affect them.

To enable the diagnosis function, set `CTSU_CFG_DIAG_SUPPORT_ENABLE` to 1.

For CTSU1, a 27pF condenser should be connected externally.

For CTSU2, use [ADC \(r\\_adc\)](#).

## Measurement Mode

This module supports all three modes offered by the CTSU2 peripheral: self-capacitance, mutual-capacitance, and current measurement modes. The temperature correction mode is also offered as a mode for updating the correction coefficient.

## Self-capacitance Mode

The self-capacitance mode is used to measure the capacitance of each terminal (TS).

The CTSU2 peripheral measures the terminals in ascending order according to the TS numbers, then stores the data. For example, even if you want to use TS5, TS8, TS2, TS3 and TS6 in your application in that order, they will still be measured and stored in the order of TS2, TS3, TS5, TS6, and TS8.

Therefore, you will need to reference buffer indexes [2], [4], [0], [1], and [3].

[CTSU1]

In default settings, the measurement period for each TS is wait-time plus approximately 526us.

Figure 150: Self-capacitance Measurement Period (CTSU1)

[CTSU2]

In default settings, the measurement period for each TS is approximately 576us.

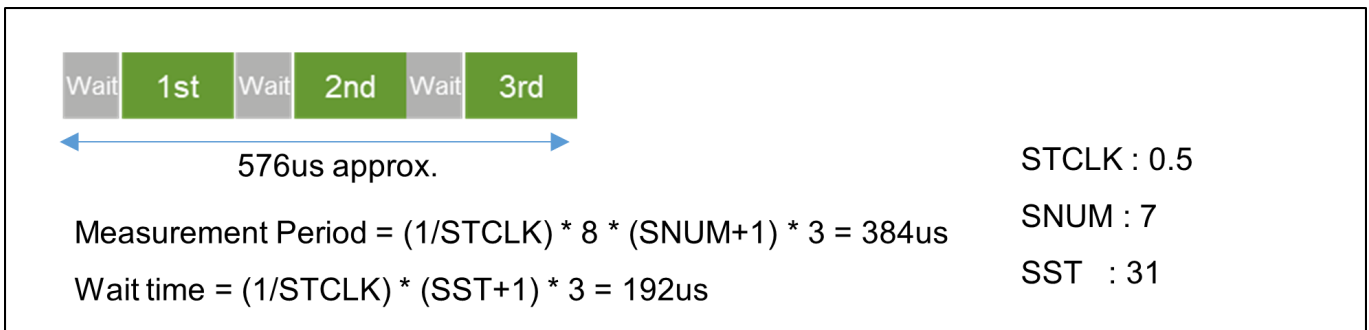

Figure 151: Self-capacitance Measurement Period (CTSU2)

**Mutual-Capacitance Mode**

The mutual-capacitance mode is used to measure the capacitance generated between the receive TS (Rx) and transmit TS (Tx), and therefore requires at least two terminals.

The CTSU2 peripheral measures all specified combinations of Rx and Tx. For example, when Rx is TS1 and TS3, and Tx is TS2, TS7 and TS4, the combinations are measured in the following order and the data is stored.

TS3-TS2, TS3-TS4, TS3-TS7, TS10-TS2, TS10-TS4, TS10-TS7

To measure the mutual-capacitance generated between electrodes, the CTSU2 peripheral performs the measurement process on the same electrode twice.

The mutual-capacitance is obtained by inverting the phase relationship of the pulse output and switched capacitor in the primary and secondary measurements, and calculating the difference between the two measurements. This module does not calculate the difference, but outputs the secondary measured result.

[CTSU1]

In default settings, the measurement period for each TS is twice of wait-time plus approximately 526us.

[CTSU2]

In default settings, the measurement period for each TS is approximately 1152us.

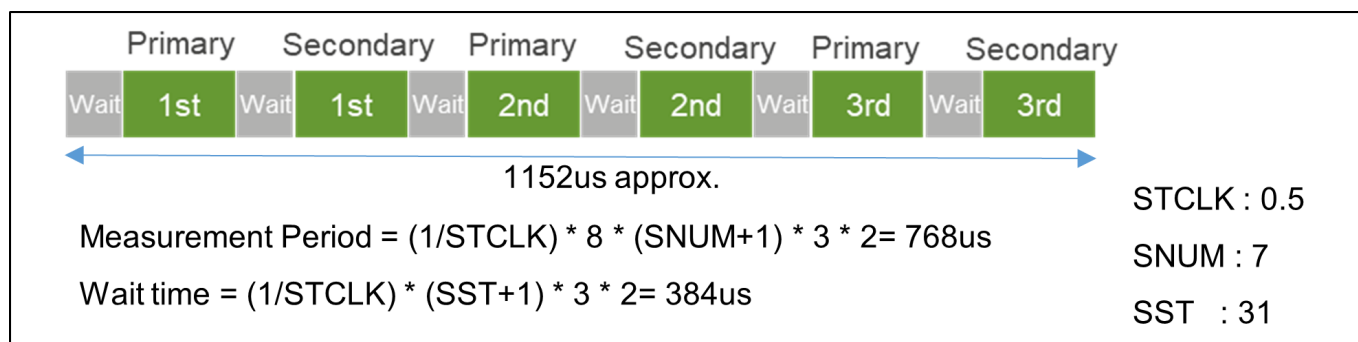

Figure 152: Mutual-capacitance Measurement Period

### Mutual-capacitance parallel scan mode(CTS2)

This mode provides fast measurement time by parallel scanning the RX lines with a CFC circuit. Operation is otherwise identical to normal CTSU mutual scanning.

- Scan Order
  - The hardware scans all RX pins simultaneously for each TX pin.
  - For example, if sensors TS10, TS11, and TS03 are specified as RX sensors, and sensors TS02, TS07, and TS04 are specified as TX sensors, the hardware will scan them in the following sensor-pair order:  
TS02-(TS03, TS10, TS11), TS04-(TS03, TS10, TS11), TS07-(TS03, TS10, TS11)
- Element
  - An element refers to the index of a sensor-pair within the scan order. Using the previous example, TS07-TS10 is element 7.
- Scan Time
  - Because the RX lines are scanned in parallel, CFC mutual-capacitance scan is the same amount of times faster than a basic mutual matrix scan as the number of RX lines. In other words, on a matrix with N receive lines, CFC mutual scanning is N times faster than basic mutual scanning. Set CTSU\_MODE\_MUTUAL\_CFC\_SCAN to "md" of [cts\\_u\\_cfg\\_t](#).  
Also, add the number of matrix used for this measurement to CTSU\_CFG\_NUM\_MUTUAL\_ELEMENTS. In addition, set the number of CTSU\_CFG\_NUM\_CFC and CTSU\_CFG\_NUM\_CFC\_TX.  
For details, refer to the configuration and sample application output by QE for Capacitive Touch.

### Current Measurement Mode(CTS2)

The current measurement mode is used to measure the minute current input to the TS terminal. The order of measurement and data storage is the same as that of the self-capacitance mode. As this does not involve the switched capacitor operation, the measurement is only performed once. The measurement period for one TS under default settings is approximately 256us. The current measurement mode requires a longer stable wait time than the other modes, so the SST is set to 63.

Figure 153: Current Measurement Period

## Temperature Correction Mode(CTS2)

The temperature correction mode is used to periodically update the correction coefficient using an external resistor connected to a TS terminal. This involves three processes as described below. Also refer to the timing chart in Figure of Temperature Correction Measurement Timing Chart.

1. Measure the correction circuit. One set comprises twelve measurements.
2. Measure the current when TSCAP voltage is applied to the external resistor to create a correction coefficient based on an external resistor that does not depend on temperature. Execute the next measurement after the previous measurement set is completed (as described in step 1).
3. Flow offset current to the external resistor and measure the voltage with the ADC. This will adjust the RTRIM register and handle the temperature drift of the internal reference resistor. In the config settings, set the number of times step 2 should be executed before carrying out this measurement.

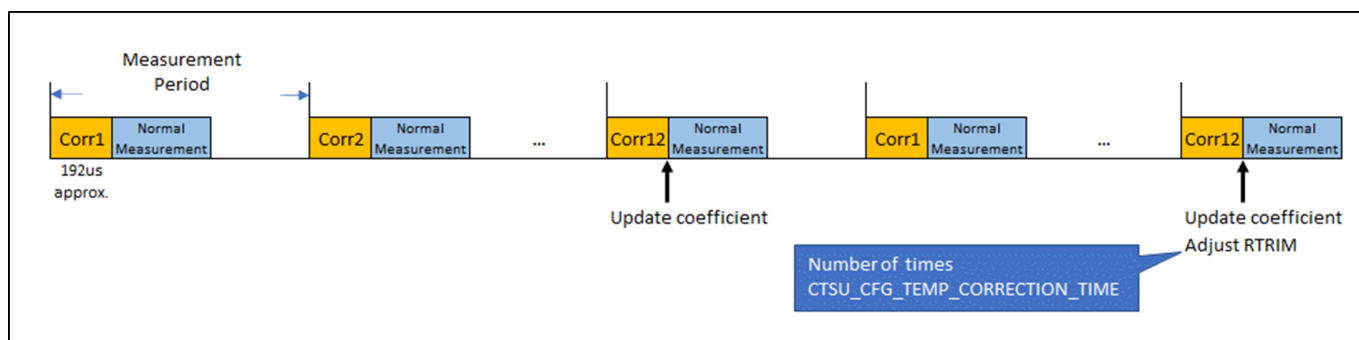

Figure 154: Temperature Correction Measurement Timing Chart

## Diagnosis Mode

The diagnosis mode is a mode in which various internal measurement values are scanned by using this diagnosis function [R\\_CTSU\\_Diagnosis\(\)](#).

## Measurement Timing

Measurements are initiated by a software trigger or an external event which is triggered by the Event Link Controller (ELC).

The most common method is using a timer to carry out periodic measurements. Make sure to set the timer interval to allow the measurement and internal value update processes to complete before the next measurement period. The measurement period differs according to touch interface configuration and measurement mode.

The execution timing of software triggers and external triggers differ slightly.

Since a software trigger sets the start flag after setting the touch interface configuration with [R\\_CTSU\\_ScanStart\(\)](#), there is a slight delay after the timer event occurrence. However, as the delay is much smaller than the measurement period, a software trigger is recommended for most instances as it is easy to set.

An external trigger is recommended for applications in which this slight delay is not acceptable or that require low-power consumption operations. When using an external trigger with multiple touch interface configurations, use [R\\_CTSU\\_ScanStart\(\)](#) to set another touch interface configuration after one measurement is completed.

## TrustZone Support

In `r_cts` and `rm_touch` module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

## Data flow

The flow of storing data in RAM is as follows.

(CTS1)

1. Read registers and stored in RAM as raw data.
2. ICO correction calculation of raw data and stored in RAM as correction data.
3. The correction data is calculated by moving average and stored in RAM as measurement results.

(CTS2)

1. Reads a register and stores raw data measured at three different frequencies in RAM.
2. Three raw data is ICO-corrected, standardized to the first frequency reference value, and stored in RAM as three correction data.
3. Three correction data are calculated by majority decision and moving average, and stored in RAM as measurement results.

## Add user's filter

There are two ways to add the user's filter.

1. Instead of filter calculation of [R\\_CTSU\\_DataGet\(\)](#), perform user filter calculation and use [R\\_CTSU\\_DataInsert\(\)](#) to input user filter calculation result.
2. Using the correction data obtained by [R\\_CTSU\\_SpecificDataGet\(\)](#), instead of majority decision calculation and filter calculation of [R\\_CTSU\\_DataGet\(\)](#), perform user majority decision calculation & filter calculation and use [R\\_CTSU\\_DataInsert\(\)](#) to input user majority decision calculation & filter calculation result.

Please check example.

[User's filter additional Example](#)

## Examples

### Basic Example

This is a basic example of minimal use of the CTSU in an application.

```
volatile bool g_scan_flag = false;

void ctsu_callback (ctsu_callback_args_t * p_args)
{
    if (CTSU_EVENT_SCAN_COMPLETE == p_args->event)
    {
        g_scan_flag = true;
    }
}

void ctsu_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];

    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (true)
    {
        err = R_CTSU_ScanStart(&g_ctsu_ctrl);

        assert(FSP_SUCCESS == err);

        while (!g_scan_flag)
        {
            /* Wait for scan end callback */
        }

        g_scan_flag = false;

        err = R_CTSU_DataGet(&g_ctsu_ctrl, data);

        if (FSP_SUCCESS == err)
        {
            /* Application specific data processing. */
        }
    }
}
```

```
}  
}
```

## Multi-configuration Example

This is an optional example of using both Self-capacitance and Mutual-capacitance configurations in the same project.

```
void ctsu_optional_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS + (CTSU_CFG_NUM_MUTUAL_ELEMENTS * 2)];  
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);  
    assert(FSP_SUCCESS == err);  
    err = R_CTSU_Open(&g_ctsu_ctrl_mutual, &g_ctsu_cfg_mutual);  
    assert(FSP_SUCCESS == err);  
    while (true)  
    {  
        R_CTSU_ScanStart(&g_ctsu_ctrl);  
        while (!g_scan_flag)  
        {  
            /* Wait for scan end callback */  
        }  
        g_scan_flag = false;  
        R_CTSU_ScanStart(&g_ctsu_ctrl_mutual);  
        while (!g_scan_flag)  
        {  
            /* Wait for scan end callback */  
        }  
        g_scan_flag = false;  
        err = R_CTSU_DataGet(&g_ctsu_ctrl, data);  
        assert(FSP_SUCCESS == err);  
        if (FSP_SUCCESS == err)  
        {  
            /* Application specific data processing. */  
        }  
    }  
}
```

```
    }  
    err = R_CTSU_DataGet(&g_ctsu_ctrl_mutual, data);  
    assert(FSP_SUCCESS == err);  
if (FSP_SUCCESS == err)  
    {  
/* Application specific data processing. */  
    }  
    }  
}
```

### Diagnosis function Example

This is a Diagnosis function example of using the configuration in the basic example.

```
void ctsu_diag_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];  
    uint16_t dummy;  
    R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);  
    assert(FSP_SUCCESS == err);  
    R_CTSU_Open(&g_ctsu_ctrl_diagnosis, &g_ctsu_cfg_diagnosis);  
    assert(FSP_SUCCESS == err);  
    while (true)  
    {  
        R_CTSU_ScanStart(&g_ctsu_ctrl);  
        while (!g_scan_flag)  
        {  
/* Wait for scan end callback */  
        }  
        g_scan_flag = false;  
        err = R_CTSU_DataGet(&g_ctsu_ctrl, data);  
        assert(FSP_SUCCESS == err);  
        R_CTSU_ScanStart(&g_ctsu_ctrl_diagnosis);  
        while (!g_scan_flag)
```

```
    {
/* Wait for scan end callback */
    }
    g_scan_flag = false;
    err = R_CTSU_DataGet(&g_ctsu_ctrl_diagnosis, &dummy);
    assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
    {
        err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
        assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
    {
break;
    }
    }
}
}
```

### User's filter additional Example

This is a user's filter additional example of using the configuration in the basic example. To perform user's filter calculation, change the `num_moving_average` of the element in the target `ctsu_cfg_t` to 1.

Perform user filter calculation and use `R_CTSU_DataInsert()` to input user filter calculation result.

```
void ctsu_user_filter_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    uint16_t filter_data[CTSU_CFG_NUM_SELF_ELEMENTS];

    /* If you want to make a touch judgment, call RM_TOUCH_Open() instead of the
following. */

    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
```

```
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
while (true)
{
/* If you want to make a touch judgment, call RM_TOUCH_ScanStart() instead of the
following. */
err = R_CTSU_ScanStart(&g_ctsu_ctrl);
assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
/* User original function. */
ctsu_user_filter(data, filter_data);
err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
assert(FSP_SUCCESS == err);
/* Call RM_TOUCH_DataGet() to make a touch decision. */
}
}
}
```

Using the correction data obtained by [R\\_CTSU\\_SpecificDataGet\(\)](#). Perform user majority decision calculation & filter calculation and use [R\\_CTSU\\_DataInsert\(\)](#) to input user majority decision calculation & filter calculation result.

```
void ctsu_user_majority_decition_example (void)
{
fsp_err_t err = FSP_SUCCESS;
uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
uint16_t corr_data[CTSU_CFG_NUM_SELF_ELEMENTS * CTSU_CFG_NUM_SUMULTI];
uint16_t filter_data[CTSU_CFG_NUM_SELF_ELEMENTS];
```

```
/* If you want to make a touch judgment, call RM_TOUCH_Open()instead of the
following. */
err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
while (true)
{
/* If you want to make a touch judgment, call RM_TOUCH_ScanStart()instead of the
following. */
err = R_CTSU_ScanStart(&g_ctsu_ctrl);
assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSUSPECIFICCORRECTIONDATA);
assert(FSP_SUCCESS == err);
/* User original function */
ctsu_user_filter(corr_data, filter_data);
err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
assert(FSP_SUCCESS == err);
/* Call RM_TOUCH_DataGet() to make a touch decision. */
}
}
}
```

	Pointer to initial configurations.
IRQn_Type	<a href="#">write_irq</a>
	Copy from config by Open API. CTSU_CTSUWR interrupt vector.

IRQn_Type	<a href="#">read_irq</a>
	Copy from config by Open API. CTSU_CTSURD interrupt vector.
IRQn_Type	<a href="#">end_irq</a>
	Copy from config by Open API. CTSU_CTSUFN interrupt vector.
void(*	<a href="#">p_callback</a> )(ctsu_callback_args_t *)
	Callback provided when a CTSUFN occurs.
uint8_t	<a href="#">interrupt_reverse_flag</a>
	Flag in which read interrupt and end interrupt are reversed.
ctsu_event_t	<a href="#">error_status</a>
	error status variable to send to QE for serial tuning.
ctsu_callback_args_t *	<a href="#">p_callback_memory</a>
	Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory.
void const *	<a href="#">p_context</a>
	Placeholder for user data.
bool	<a href="#">serial_tuning_enable</a>
	Flag of serial tuning status.
uint16_t	<a href="#">serial_tuning_mutual_cnt</a>
	Word index into ctsuwr register array.

uint16_t	<a href="#">tuning_self_target_value</a>
	Target self value for initial offset tuning.
uint16_t	<a href="#">tuning_mutual_target_value</a>
	Target mutual value for initial offset tuning.

## Enumeration Type Documentation

### ◆ [ctsu\\_state\\_t](#)

enum <a href="#">ctsu_state_t</a>	
CTSU run state	
Enumerator	
CTSU_STATE_INIT	Not open.
CTSU_STATE_IDLE	Opened.
CTSU_STATE_SCANNING	Scanning now.
CTSU_STATE_SCANNED	Scan end.

### ◆ [ctsu\\_tuning\\_t](#)

enum <a href="#">ctsu_tuning_t</a>	
CTSU Initial offset tuning status	
Enumerator	
CTSU_TUNING_INCOMPLETE	Initial offset tuning incomplete.
CTSU_TUNING_COMPLETE	Initial offset tuning complete.

◆ **ctsu\_correction\_status\_t**

enum <code>ctsu_correction_status_t</code>	
CTSU Correction status	
Enumerator	
<code>CTSU_CORRECTION_INIT</code>	Correction initial status.
<code>CTSU_CORRECTION_RUN</code>	Correction scan running.
<code>CTSU_CORRECTION_COMPLETE</code>	Correction complete.
<code>CTSU_CORRECTION_ERROR</code>	Correction error.

◆ **ctsu\_range\_t**

enum <code>ctsu_range_t</code>	
CTSU range definition	
Enumerator	
<code>CTSU_RANGE_20UA</code>	20uA mode
<code>CTSU_RANGE_40UA</code>	40uA mode
<code>CTSU_RANGE_80UA</code>	80uA mode
<code>CTSU_RANGE_160UA</code>	160uA mode

**Function Documentation**

◆ **R\_CTSU\_Open()**

```
fsp_err_t R_CTSU_Open ( ctsu_ctrl_t *const p_ctrl, ctsu_cfg_t const *const p_cfg )
```

Opens and configures the CTSU driver module. Implements `ctsu_api_t::open`.

Example:

```
err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
```

**Return values**

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

**Note**

*In the first Open, measurement for correction works, and it takes several tens of milliseconds.*

## ◆ R\_CTSU\_ScanStart()

`fsp_err_t R_CTSU_ScanStart ( ctsu_ctrl_t *const p_ctrl)`

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with `R_CTSU_DataGet()`. If a different control block scan should be run, check the scan is complete before executing. Implements `ctsu_api_t::scanStart`.

Example:

```
while (true)
{
    err = R_CTSU_ScanStart(&g_ctsu_ctrl);
    assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
    /* Wait for scan end callback */
}
    g_scan_flag = false;
    err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
    /* Application specific data processing. */
}
}
```

### Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance or other.
FSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.

◆ **R\_CTSU\_DataGet()**

```
fsp_err_t R_CTSU_DataGet ( ctsu_ctrl_t*const p_ctrl, uint16_t* p_data )
```

This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [ctsu\\_api\\_t::dataGet](#).

Example:

```
while (true)
{
    err = R_CTSU_ScanStart(&g_ctsu_ctrl);
    assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
    /* Wait for scan end callback */
}
    g_scan_flag = false;
    err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
    /* Application specific data processing. */
}
}
```

**Return values**

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.
FSP_ERR_CTSU_DIAG_NOT_YET	Diagnosis of data collected no yet.

◆ **R\_CTSU\_ScanStop()**

```
fsp_err_t R_CTSU_ScanStop ( ctsu_ctrl_t *const p_ctrl)
```

This function scan stops the sensor as scanning by the CTSU. Implements `ctsu_api_t::scanStop`.

**Return values**

FSP_SUCCESS	CTSU successfully scan stop.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **R\_CTSU\_CallbackSet()**

```
fsp_err_t R_CTSU_CallbackSet ( ctsu_ctrl_t *const p_api_ctrl, void(*) (ctsu_callback_args_t *)
p_callback, void const *const p_context, ctsu_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `ctsu_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R\_CTSU\_Close()**

```
fsp_err_t R_CTSU_Close ( ctsu_ctrl_t *const p_ctrl)
```

Disables specified CTSU control block. Implements `ctsu_api_t::close`.

**Return values**

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ R\_CTSU\_SpecificDataGet()

```
fsp_err_t R_CTSU_SpecificDataGet ( ctsu_ctrl_t *const p_ctrl, uint16_t * p_specific_data,
ctsu_specific_data_type_t specific_data_type )
```

This function gets the sensor specific data values as scanned by the CTSU. Call this function after calling the [R\\_CTSU\\_DataGet\(\)](#) function.

By setting the third argument to CTSU\_SPECIFIC\_RAW\_DATA, RAW data can be output from the second argument.

By setting the third argument to CTSU\_SPECIFIC\_CORRECTION\_DATA, the corrected data can be output from the second argument.

By setting the third argument to CTSU\_SPECIFIC\_SELECTED\_DATA, Get bitmap of the frequency values used in majority decision from the second argument. The bitmap is shown as follows.

2bit	1bit	0bit
3rd frequency value	2nd frequency value	1st frequency value

Implements [ctsu\\_api\\_t::specificDataGet](#).

Example:

```
err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSU_SPECIFIC_CORRECTION_DATA);
```

#### Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.
FSP_ERR_NOT_ENABLED	CTSU_SPECIFIC_SELECTED_FREQ is not enabled in CTSU1.(CTSU2 Only)

## ◆ R\_CTSU\_DataInsert()

```
fsp_err_t R_CTSU_DataInsert ( ctsu_ctrl_t *const p_ctrl, uint16_t * p_insert_data )
```

This function inserts the value of the second argument as the measurement result value. Call this function after calling the [R\\_CTSU\\_DataInsert\(\)](#) function. Implements [ctsu\\_api\\_t::dataInsert](#).

Example:

```
err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
```

### Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ **R\_CTSU\_Diagnosis()**

```
fsp_err_t R_CTSU_Diagnosis ( ctsu_ctrl_t *const p_ctrl)
```

Diagnosis the CTSU peripheral. Implements `ctsu_api_t::diagnosis`.

Example:

```
err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.
FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE	Diagnosis of LDO over voltage failed.
FSP_ERR_CTSU_DIAG_CCO_HIGH	Diagnosis of CCO into 19.2uA failed.
FSP_ERR_CTSU_DIAG_CCO_LOW	Diagnosis of CCO into 2.4uA failed.
FSP_ERR_CTSU_DIAG_SSCG	Diagnosis of SSCG frequency failed.
FSP_ERR_CTSU_DIAG_DAC	Diagnosis of non-touch count value failed.
FSP_ERR_CTSU_DIAG_OUTPUT_VOLTAGE	Diagnosis of LDO output voltage failed.
FSP_ERR_CTSU_DIAG_OVER_VOLTAGE	Diagnosis of over voltage detection circuit failed.
FSP_ERR_CTSU_DIAG_OVER_CURRENT	Diagnosis of over current detection circuit failed.
FSP_ERR_CTSU_DIAG_LOAD_RESISTANCE	Diagnosis of LDO internal resistance value failed.
FSP_ERR_CTSU_DIAG_CURRENT_SOURCE	Diagnosis of LDO internal resistance value failed.
FSP_ERR_CTSU_DIAG_SENSCLK_GAIN	Diagnosis of SENSCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_SUCLK_GAIN	Diagnosis of SUCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_CLOCK_RECOVERY	Diagnosis of SUCLK clock recovery function failed.
FSP_ERR_CTSU_DIAG_CFC_GAIN	Diagnosis of CFC oscillator gain failed.

**4.2.4.2 Touch (rm\_touch)**

## Modules » CapTouch

**Functions**

`fsp_err_t RM_TOUCH_Open (touch_ctrl_t *const p_ctrl, touch_cfg_t const *const p_cfg)`

Opens and configures the TOUCH Middle module. Implements `touch_api_t::open`. [More...](#)

`fsp_err_t RM_TOUCH_ScanStart (touch_ctrl_t *const p_ctrl)`

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with `RM_TOUCH_DataGet()`. If a different control block scan should be run, check the scan is complete before executing. Implements `touch_api_t::scanStart`. [More...](#)

`fsp_err_t RM_TOUCH_DataGet (touch_ctrl_t *const p_ctrl, uint64_t *p_button_status, uint16_t *p_slider_position, uint16_t *p_wheel_position)`

Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements `touch_api_t::dataGet`. [More...](#)

`fsp_err_t RM_TOUCH_PadDataGet (touch_ctrl_t *const p_ctrl, uint16_t *p_pad_rx_coordinate, uint16_t *p_pad_tx_coordinate, uint8_t *p_pad_num_touch)`

This function gets the current position of pad is being pressed. Implements `touch_api_t::padDataGet` , `g_touch_on_ctsu`. [More...](#)

`fsp_err_t RM_TOUCH_ScanStop (touch_ctrl_t *const p_ctrl)`

Scan stop specified TOUCH control block. Implements `touch_api_t::scanStop`. [More...](#)

`fsp_err_t RM_TOUCH_CallbackSet (touch_ctrl_t *const p_api_ctrl, void(*p_callback)(touch_callback_args_t *), void const *const p_context, touch_callback_args_t *const p_callback_memory)`

`fsp_err_t RM_TOUCH_Close (touch_ctrl_t *const p_ctrl)`

Disables specified TOUCH control block. Implements `touch_api_t::close`. [More...](#)

`fsp_err_t` `RM_TOUCH_SensitivityRatioGet` (`touch_ctrl_t *const p_ctrl`,  
`touch_sensitivity_info_t *p_touch_sensitivity_info`)

Get the touch sensitivity ratio. Implements `touch_api_t::sensitivityRatioGet`. [More...](#)

`fsp_err_t` `RM_TOUCH_ThresholdAdjust` (`touch_ctrl_t *const p_ctrl`,  
`touch_sensitivity_info_t *p_touch_sensitivity_info`)

Adjust the touch judgment threshold. Implements `touch_api_t::thresholdAdjust`. [More...](#)

`fsp_err_t` `RM_TOUCH_DriftControl` (`touch_ctrl_t *const p_ctrl`, `uint16_t`  
`input_drift_freq`)

Control drift correction. Implements `touch_api_t::driftControl`. [More...](#)

## Detailed Description

This module supports the Capacitive Touch Sensing Unit (CTSUS). It implements the [Touch Middleware Interface](#).

## Overview

The Touch Middleware uses the [CTSUS \(r\\_ctsu\)](#) API and provides application-level APIs for scanning touch buttons, sliders, and wheels. This module is configured via the [QE for Capacitive Touch](#).

## Features

- Supports touch buttons (Self and Mutual), sliders, and wheels
- Can retrieve the status of up to 64 buttons at once
- Software and external triggering
- Callback on scan end
- Collects and calculates usable scan results:
  - Slider position from 1 to 100 (percent)
  - Wheel position from 1 to 360 (degrees)
- Dynamic touch-judgment-threshold adjustment
- Calculate the XY coordinates of the pad(CTSUS2)
- Optional (build time) support for real-time monitoring functionality through the QE tool over UART
- Optional (build time) support for tuning function through the QE Standalone Version tool over UART
- TrustZone Support

## Configuration

### Note

*This module is configured via the [QE for Capacitive Touch](#). For information on how to use the QE tool, once the tool is installed click [Help](#) -> [Help Contents in e2 studio](#) and search for "QE".*

This module supports the QE monitor function. The monitor determines whether to use debugger or serial communications, determines the type of the information from QE and sends only the necessary information. This module supports the serial tuning function with the standalone version of QE. Generates a configuration configuration file by UART communication with QE.

*Note*

*Multiple configurations can be defined within a single project allowing for different scan procedures or button layouts.*

### Build Time Configurations for rm\_touch

The following build time configurations are defined in fsp\_cfg/rm\_touch\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Support for QE monitoring using UART	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Enable SCI_UART support for QE monitoring.
Support for QE Tuning using UART	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Enable SCI_UART support for QE Tuning.

### Configurations for CapTouch > Touch (rm\_touch)

This module can be added to the Stacks tab via New Stack > CapTouch > Touch (rm\_touch). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Interrupt Configuration

Refer to the [CTSUS \(r\\_ctors\)](#) section for details.

### Clock Configuration

Refer to the [CTSUS \(r\\_ctors\)](#) section for details.

### Pin Configuration

Refer to the [CTSUS \(r\\_ctors\)](#) section for details.

## Usage Notes

### Measurements and Data Processing

The module determines whether the button has been touched based on the change in capacitance and detects the position of the slider or wheel. This requires continued periodic measurements of capacitance. When developing your application, make sure to periodically call [RM\\_TOUCH\\_ScanStart\(\)](#) and [RM\\_TOUCH\\_DataGet\(\)](#). For more details, refer to the sample application.

## Button Touch Determination

### Creating reference value and threshold

A touch button is not a mechanical button in which the ON/OFF state is switched by hardware. The ON/OFF state is determined via software.

First, a reference value is created based on measurement results in the non-touch state. The initial reference value is the first measured value. The threshold is then determined with an arbitrary offset. If a measured value exceeds the threshold, the button is determined to be in the ON state, if it does not exceed the threshold, it is in the OFF state.

Processing for self-capacitance and mutual capacitance are basically the same. However, because the amount of capacitance decreases when a mutual capacitance button is touched, the user needs to set the threshold based on decreasing measured values to determine the ON/OFF state.

You can set the threshold for each button separately in the configuration settings (threshold in [touch\\_button\\_cfg\\_t](#)). The following functions are also included to deal with issues such as chattering suppression and changes in the external environment which affect actual touch recognition.

### Positive Noise Filter/Negative Noise Filter

As a chattering countermeasure, you can confirm the ON/OFF state after a set number of consecutive ON or OFF determinations.

In the configuration settings (on\_freq and off\_freq in [touch\\_cfg\\_t](#)) set the number of consecutive ON or OFF states. You can do this for all buttons in the touch interface configuration. Be aware that, although this is an effective solution to improving chattering, the greater the number of consecutive states, the slower the response to actual touch.

### Hysteresis

This is another chattering countermeasure. Offset the constant to the threshold after the state goes to ON, and prevent chattering by using hysteresis as the OFF-to-ON and ON-to-OFF threshold.

You can set the hysteresis value for each button in the configuration settings (hysteresis in [touch\\_button\\_cfg\\_t](#)). The larger the hysteresis, the more effective the countermeasure is in suppressing chattering. However, keep in mind that this will make it more difficult to return the state from ON-to-OFF or OFF-to-ON.

### Drift Correction Process

As a countermeasure for changes in the external environment, the drift correction process refreshes the reference value.

After averaging the measured value in the OFF state over a set period, if the button is in the touch OFF state after a set period, the reference value is refreshed. The drift correction is only executed in the OFF state and is cleared when touch ON is determined.

Set the period in the configuration settings (drift\_freq in [touch\\_cfg\\_t](#)). You can do this for all buttons in the touch interface configuration. This allows you to adjust the ability to determine the touch state despite changes in the external environment.

Figure 155: Button Touch Determination

### Press and hold cancel

Strong noise or other sudden environment changes can disable the drift correction process, preventing return from the ON state. The press and hold cancel function implements the drift correction process and returns the button from the ON state by forcibly turning the state to OFF after a certain number of consecutive ON state periods.

Set the number of consecutive ON periods required for the press and hold cancel function to return the button to the OFF state in the configuration settings (`cancel_freq` in `touch_cfg_t`). You can do this for all buttons in the touch interface configuration.

### Touch Position Detection of Slider/Wheel

Configure a slider with multiple terminals to be measured (TS) physically arranged in a straight line. Configure a wheel with multiple terminals physically arranged in a circle.

The touch position is calculated from the measured values of the TS in the configuration. The calculation method for sliders and wheels is fundamentally the same.

1. Detect the maximum value (TS\_MAX) among the terminals in the configuration.
2. Calculate the difference (d1, d2) between TS\_MAX and the terminals on either side. (If the TS\_MAX terminal is at one end of the slider, use the values of the two terminals to the right or left, accordingly.)
3. If the total of d1 and d2 exceeds the threshold, position calculation is initiated. If the total amount does not exceed the threshold, the position calculation process is ended.
4. With TS\_MAX as the middle position, the ratio of d1 to d2 is used to calculate the position. The slider has a range of 1 to 100, and the while has a range of 1 to 360.

	Slider	Wheel
Electrode type	Self capacitance only	Self capacitance only
Number of electrodes	3-10	4+
Touch position output range	1-100	1-360
Default value (no touch)	0xFFFF	0xFFFF

### Tuning the Touch Determination Adjustment

When QE tuning, a measurement is performed with a finger touching the button and the tuned parameters are output in the configuration file. The setting value of the threshold is 60% of the touch sensitivity between touch and non-touch state, and the setting value of the hysteresis coefficient is 5% of the threshold.

This module provides the functions for dynamic adjusting of these threshold and hysteresis coefficient.

They are two functions as below.

### Adjusting the threshold and hysteresis coefficient to an arbitrary ratio.

Use **RM\_TOUCH\_ThresholdAdjust()**.

When changing the touch determination threshold ratio from 60% QE set to 70% user specified, the touch determination thresholds are as below.

If you want to make this setting, set the member of the second argument as follows. It is also necessary to set the ratio of the amount of touch change and the hysteresis value.

```
*p_touch_sensitivity_ratio = 100,
old_threshold_ratio = 60,
new_threshold_ratio = 70,
new_hysteresis_ratio = 5
```

Figure 156: Example of changing the threshold ratio

### Adjusting the threshold and hysteresis coefficient according to the current touch sensitivity.

Use **RM\_TOUCH\_SensitivityRatioGet()**, **RM\_TOUCH\_ThresholdAdjust()**, and **RM\_TOUCH\_DriftControl()**.

When changing the kind of the overlay panel, the touch sensitivity differs from the one QE tuned. Wanting to use the software as it is without re-tuning. If you use a thicker overlay than that at QE tuning, the touch sensitivity decreases, and a touch may not be determined because of the same

touch determination threshold. This function adjusts the touch determination threshold based on the ratio of the touch sensitivity after changing the overlay to the touch sensitivity at the QE tuning.

`RM_TOUCH_SensitivityRatioGet()` outputs the ratio of the current touch sensitivity assuming that the touch sensitivity at the QE setting is 100%.

The following figure shows the case where an overlay panel is thinner and the touch sensitivity increases.

Figure 157: Example of increase touch sensitivity for thin overlay panels

Following figure shows the case where an overlay panel is thicker and the touch sensitivity decreases.

Figure 158: Example of decrease touch sensitivity for thicker overlay panels

[RM\\_TOUCH\\_ThresholdAdjust\(\)](#) sets the new touch determination threshold and the hysteresis value by using the touch sensitivity ratio obtained with [RM\\_TOUCH\\_SensitivityRatioGet\(\)](#) as arguments.

Example of calculation 1:

The touch sensitivity ratio is 140%, and the threshold set by QE is 1500.

Threshold =  $140 * 1500 / 100 = 2100$

\*p\_touch\_sensitivity\_ratio = 140,

old\_threshold\_ratio = 60,

new\_threshold\_ratio = 60,

new\_hysteresis\_ratio = 5

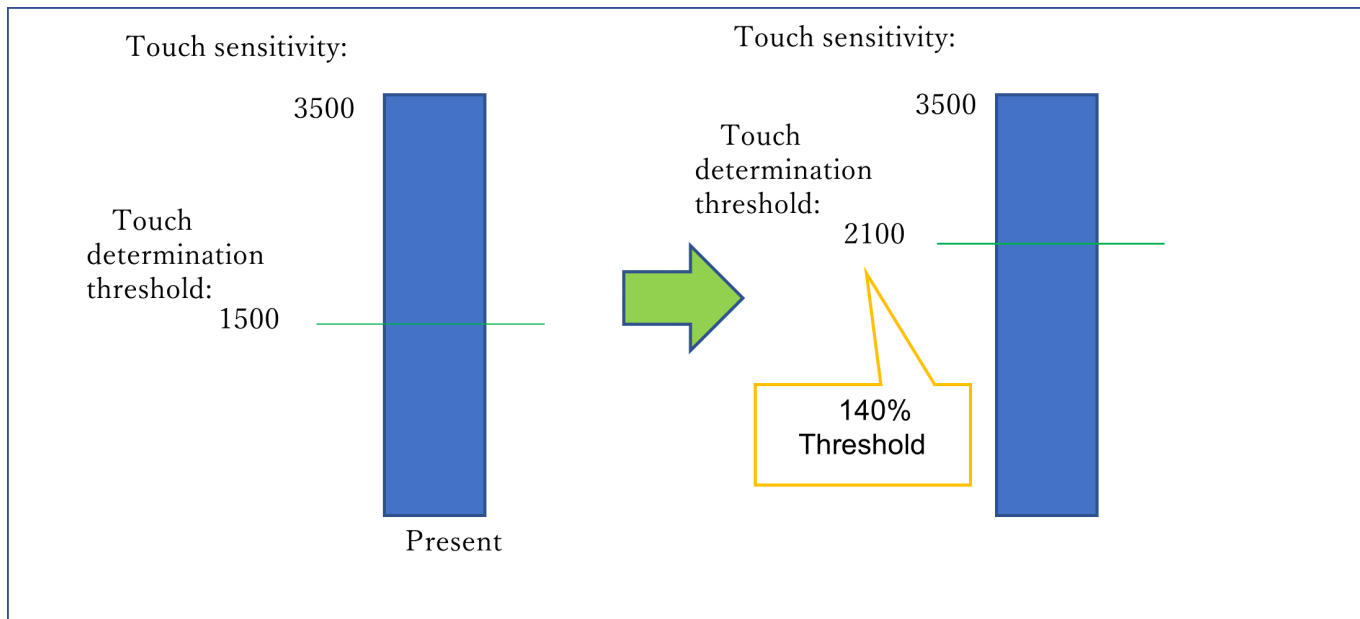

Figure 159: Example of calculation 1

Example of calculation 2:

The touch sensitivity ratio is 60%, and the threshold set by QE is 1500.  
 $\text{Threshold} = 60 * 1500 / 100 = 900$

\*p\_touch\_sensitivity\_ratio = 60,  
 old\_threshold\_ratio = 60,  
 new\_threshold\_ratio = 60,  
 new\_hysteresis\_ratio = 5

Figure 160: Example of calculation 2

RM\_TOUCH\_DriftControl() set the second argument to 0 to stop the drift correction function.

When calculating the ratio of the touch change amount using `RM_TOUCH_SensitivityRatioGet()`, the touch change amount decreases due to the thick overlay, and the threshold value is not exceeded even if touched. Prevents the reference value from drifting.

### Example of the application for adjustment using data flash without re-tuning or software rewriting

Enable UART communication to PC and 'tuning mode'. In tuning mode, the MCU transmits the ratio of the touch sensitivity in the touch state to the PC in real time. A user sends a command to decide the ratio while monitoring on the PC. The MCU stores the received ratio in the data flash. Make sure that the ratio stored in the data flash is read at the software activation, and the touch determination threshold is adjusted based on this stored value.

### Pad

Configure a pad with multiple terminals physically arranged in cross.

The current position is Calculated from the measured values of the CTSU mutual scanning in the configuration.

Use `RM_TOUCH_PadDataGet()`.

Pad is subject so some limitations:

	Pad
Electrode type	CFC mutual capacitance only
Number of electrodes	RX(TS-CFC)3+, TX(Any TS)3+
Touch position output range	rx_coodinate:(0 ~ rx_pixel), tx_coodinate:(0 ~ tx_pixsel)
Default value (no touch)	rx_coodinate:0xFFFF, tx_coodinate:0xFFFF
Pixel range	rx_pixel:(1 ~ 65535), tx_pixsel:(1 ~ 65535)

Pitch for each terminal can be set with QE. Pitch's default value is 64.

The relationship between pixel and pitch :  $\text{Pixel} = \text{Pitch} \times \text{number of TS} - 1$

Figure 161: Example of Pad

## TrustZone Support

In `r_ctsu` and `rm_touch` module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

## Examples

### Basic Example

This is a basic example of minimal use of the TOUCH in an application.

```
void touch_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (true)
    {
        RM_TOUCH_ScanStart(&g_touch_ctrl);
    }
}
```

```
while (0 == g_flag)
{
/* Wait scan end callback */
}
g_flag = 0;
err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
if (FSP_SUCCESS == err)
{
/* Application specific data processing. */
}
}
}
```

## Multi Mode Example

This is an optional example of using both Self-capacitance and Mutual-capacitance. Refer to the Multi Mode Example in CTSU usage notes.

```
void touch_optional_example (void)
{
fsp_err_t err = FSP_SUCCESS;
err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
assert(FSP_SUCCESS == err);
err = RM_TOUCH_Open(&g_touch_ctrl_mutual, &g_touch_cfg_mutual);
assert(FSP_SUCCESS == err);
while (true)
{
RM_TOUCH_ScanStart(&g_touch_ctrl);
while (0 == g_flag)
{
/* Wait scan end callback */
}
g_flag = 0;
RM_TOUCH_ScanStart(&g_touch_ctrl_mutual);
while (0 == g_flag)
```

```

    {
    /* Wait scan end callback */
    }
    g_flag = 0;
    err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
    if (FSP_SUCCESS == err)
    {
    /* Application specific data processing. */
    }
    err = RM_TOUCH_DataGet(&g_touch_ctrl_mutual, &button, slider, wheel);
    if (FSP_SUCCESS == err)
    {
    /* Application specific data processing. */
    }
    }
}

```

uint16_t *	p_threshold	Copy from config by Open API. g_touch_wheel_threshold[] is set by Open API.
------------	-------------	---

#### ◆ touch\_pad\_info\_t

struct touch_pad_info_t		
Information of pad		
Data Fields		
uint16_t *	p_rx_coordinate	RX coordinate.
uint16_t *	p_tx_coordinate	TX coordinate.
uint16_t *	p_num_touch	number of touch
uint16_t *	p_threshold	Coordinate calculation threshold value.
uint16_t *	p_base_buf	ScanData Base Value Buffer.
uint16_t *	p_rx_pixel	X coordinate resolution.
uint16_t *	p_tx_pixel	Y coordinate resolution.
uint8_t *	p_max_touch	Maximum number of touch judgments used by the pad.
int32_t *	p_drift_buf	Drift reference value. g_touch_button_drift_buf[] is set by Open API.
uint16_t *	p_drift_count	Drift counter. g_touch_button_drift_count[] is set by Open API.
uint8_t	num_drift	Copy from config by Open API.

#### ◆ touch\_instance\_ctrl\_t

struct touch_instance_ctrl_t		
TOUCH private control block. DO NOT MODIFY. Initialization occurs when RM_TOUCH_Open() is called.		
Data Fields		
uint32_t	open	Whether or not driver is open.
touch_button_info_t	binfo	Information of button.
touch_slider_info_t	sinfo	Information of slider.
touch_wheel_info_t	winfo	Information of wheel.
bool	serial_tuning_enable	Flag of serial tuning status.
touch_pad_info_t	pinfo	Information of pad.
touch_cfg_t const *	p_touch_cfg	Pointer to initial configurations.
ctsu_instance_t const *	p_ctsu_instance	Pointer to CTSU instance.

## Function Documentation

### ◆ RM\_TOUCH\_Open()

```
fsp_err_t RM_TOUCH_Open ( touch_ctrl_t *const p_ctrl, touch_cfg_t const *const p_cfg )
```

Opens and configures the TOUCH Middle module. Implements `touch_api_t::open`.

Example:

```
err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
```

#### Return values

FSP_SUCCESS	TOUCH successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

### ◆ RM\_TOUCH\_ScanStart()

```
fsp_err_t RM_TOUCH_ScanStart ( touch_ctrl_t *const p_ctrl)
```

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with `RM_TOUCH_DataGet()`. If a different control block scan should be run, check the scan is complete before executing. Implements `touch_api_t::scanStart`.

#### Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance or other.
FSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.

◆ **RM\_TOUCH\_DataGet()**

```
fsp_err_t RM_TOUCH_DataGet ( touch_ctrl_t *const p_ctrl, uint64_t * p_button_status, uint16_t *
p_slider_position, uint16_t * p_wheel_position )
```

Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [touch\\_api\\_t::dataGet](#).

**Return values**

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ **RM\_TOUCH\_PadDataGet()**

```
fsp_err_t RM_TOUCH_PadDataGet ( touch_ctrl_t *const p_ctrl, uint16_t * p_pad_rx_coordinate,
uint16_t * p_pad_tx_coordinate, uint8_t * p_pad_num_touch )
```

This function gets the current position of pad is being pressed. Implements [touch\\_api\\_t::padDataGet](#) , [g\\_touch\\_on\\_ctsu](#).

**Return values**

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.

◆ **RM\_TOUCH\_ScanStop()**

```
fsp_err_t RM_TOUCH_ScanStop ( touch_ctrl_t *const p_ctrl)
```

Scan stop specified TOUCH control block. Implements [touch\\_api\\_t::scanStop](#).

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_TOUCH\_CallbackSet()**

```
fsp_err_t RM_TOUCH_CallbackSet ( touch_ctrl_t *const p_api_ctrl, void(*) (touch_callback_args_t *)
p_callback, void const *const p_context, touch_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `touch_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ **RM\_TOUCH\_Close()**

```
fsp_err_t RM_TOUCH_Close ( touch_ctrl_t *const p_ctrl)
```

Disables specified TOUCH control block. Implements `touch_api_t::close`.

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_TOUCH\_SensitivityRatioGet()**

```
fsp_err_t RM_TOUCH_SensitivityRatioGet ( touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *
p_touch_sensitivity_info )
```

Get the touch sensitivity ratio. Implements `touch_api_t::sensitivityRatioGet`.

**Return values**

FSP_SUCCESS	Successfully touch sensitivity ratio got.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ **RM\_TOUCH\_ThresholdAdjust()**

```
fsp_err_t RM_TOUCH_ThresholdAdjust ( touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *
p_touch_sensitivity_info )
```

Adjust the touch judgment threshold. Implements `touch_api_t::thresholdAdjust`.

**Return values**

FSP_SUCCESS	Successfully touch judgment threshold was adjusted.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_TOUCH\_DriftControl()**

```
fsp_err_t RM_TOUCH_DriftControl ( touch_ctrl_t *const p_ctrl, uint16_t input_drift_freq )
```

Control drift correction. Implements `touch_api_t::driftControl`.

**Return values**

FSP_SUCCESS	Successfully drift correction was controlled.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

## 4.2.5 Connectivity

### Modules

#### Detailed Description

Connectivity Modules.

**Modules**

[Azure RTOS USBX Port \(rm\\_usbx\\_port\)](#)

[CAN \(r\\_can\)](#)

Driver for the CAN peripheral on RA MCUs. This module implements the [CAN Interface](#).

### CAN FD (r\_canfd)

Driver for the CANFD peripheral on RA MCUs. This module implements the [CAN Interface](#).

### CEC (r\_cec)

Driver for the CEC peripheral on RA MCUs. This module implements the [CEC Interface](#).

### I2C Communication Device (rm\_comms\_i2c)

Middleware to implement the I2C communications interface. This module implements the [Communicatons Middleware Interface](#).

### I2C Master (r\_iic\_b\_master)

I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

### I2C Master (r\_iic\_master)

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

### I2C Master (r\_sci\_b\_i2c)

Driver for the SCI\_B peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

### I2C Master (r\_sci\_i2c)

Driver for the SCI peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

### I2C Slave (r\_iic\_b\_slave)

Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

### I2C Slave (r\_iic\_slave)

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

### I2S (r\_ssi)

Driver for the SSIE peripheral on RA MCUs. This module implements the [I2S Interface](#).

#### [I3C \(r\\_i3c\)](#)

Driver for the I3C peripheral on RA MCUs. This module implements the [I3C Interface](#).

#### [SPI \(r\\_sci\\_b\\_spi\)](#)

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

#### [SPI \(r\\_sci\\_spi\)](#)

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

#### [SPI \(r\\_spi\)](#)

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

#### [SPI \(r\\_spi\\_b\)](#)

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

#### [UART \(r\\_sci\\_b\\_uart\)](#)

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

#### [UART \(r\\_sci\\_uart\)](#)

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

#### [USB \(r\\_usb\\_basic\)](#)

Driver for the USB peripheral on RA MCUs. This module implements the [USB Interface](#).

#### [USB Composite \(r\\_usb\\_composite\)](#)

#### [USB HCDC \(r\\_usb\\_hcdc\)](#)

This module provides a USB Host Communications Device Class (HCDC) driver. It implements the [USB HCDC Interface](#).

#### USB HHID (r\_usb\_hhid)

This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the [USB HHID Interface](#).

#### USB HMSC (r\_usb\_hmsc)

This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the [USB HMSC Interface](#).

#### USB Host Vendor class (r\_usb\_hvnd)

#### USB PCDC (r\_usb\_pcdc)

This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the [USB PCDC Interface](#).

#### USB PHID (r\_usb\_phid)

This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the [USB PHID Interface](#).

#### USB PMSC (r\_usb\_pmsc)

This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the [USB PMSC Interface](#).

#### USB Peripheral Vendor class (r\_usb\_pvnd)

### 4.2.5.1 Azure RTOS USBX Port (rm\_usbx\_port)

[Modules](#) » [Connectivity](#)

## Functions

Refer to [USB \(r\\_usb\\_basic\)](#) for the common API (r\_usb\_basic) to be called from the application.

## Overview

This USB driver works by combining USBX and r\_usb\_basic module.

## How to Configuration

- Using a class other than HMSC and OTG. The following describes how to configure USBX using PCDC as an example.

1. Select [New Stack]->[Connectivity]->[Azure RTOS PCDC]

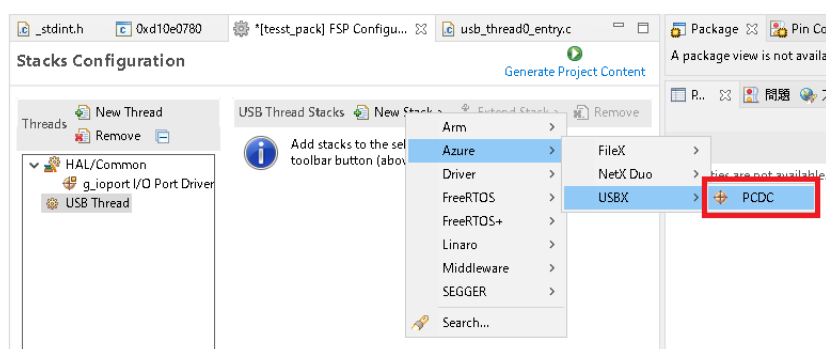

Figure 162: Select USB Device Class

2. Select the USB pipe to use.

Figure 163: Select using USB Pipe

- Using HMSC. Since HMSC is used in a different way from other USBX modules, the usage is described below.

1. Select [New Stack]->[Storage]->[Azure RTOS FileX on USBX]

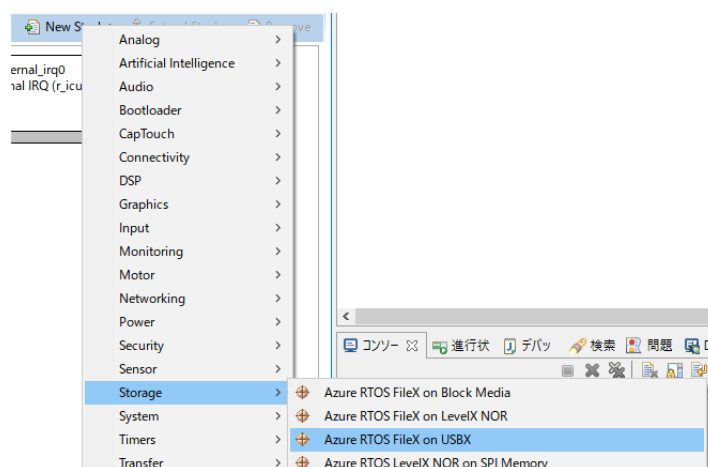

Figure 164: Select USB Device Class

2.The following is displayed when selecting FileX on USBX.

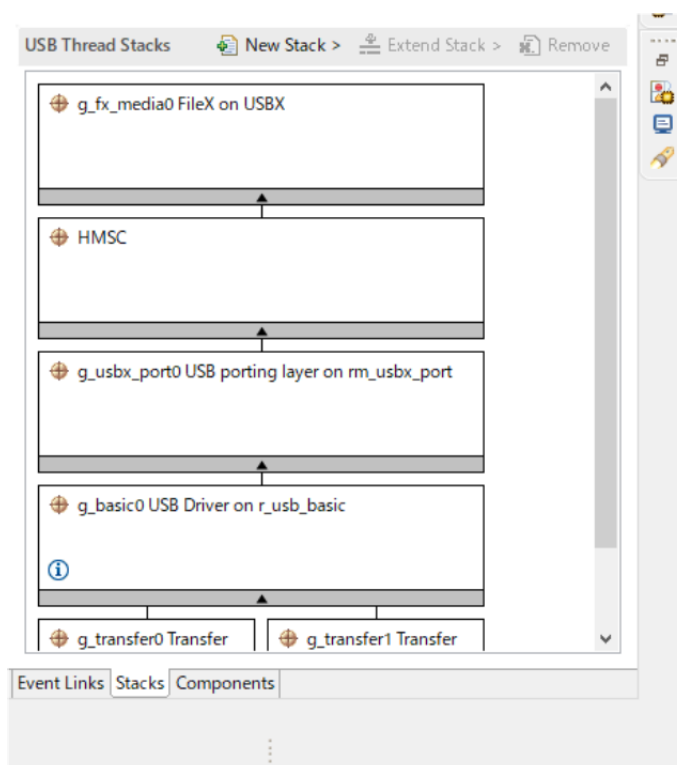

Figure 165: FileX on USBX Stack

- Using OTG. The following describes how to configure USBX using CDC as an example.

1.Select [New Stack]->[Connectivity]->[Azure RTOS USBX OTG CDC]

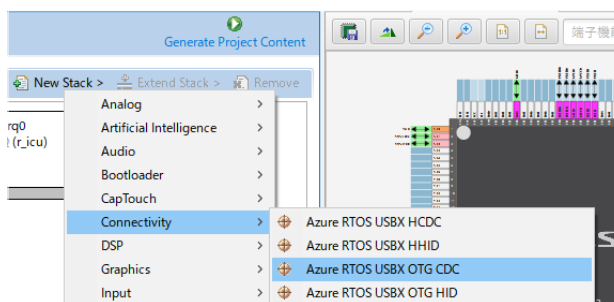

Figure 166: Select USB Device Class for OTG

2.Select [New Stack]->[Input] -> [External IRQ(r\_icu)] (Be sure to select "r\_icu" in OTG. The "r\_icu" is used to detect the attaching of A cable.)

Figure 167: Select USB Device Class for OTG

3. Be sure to set the following to each item in "r\_icu". (1). Specify "7" to "Channel" item. (2). Specify "Both Edges" to "Trigger" item. (3). Specify "Enabled" to "Digital Filtering" item. (4). Specify "usb\_otg\_irq\_callback" to "Callback" item.

Figure 168: Select USB Device Class for OTG

1. Set "Full Speed" to "USB Speed" item in r\_usb\_basic.
2. Set "USB\_IP0 Port" to "USB Module Number" item in r\_usb\_basic.
3. Set "Not Supported" to "USBFS Resume Priority" item in r\_usb\_basic.

Figure 169: Select USB Device Class

1. Set the following pins for USB (r\_usb\_basic).

- (1). VBUSEN

(2). VBUS

(3). EXICEN

2. Set the following pins for IRQ (r\_icu). (1). IRQ07

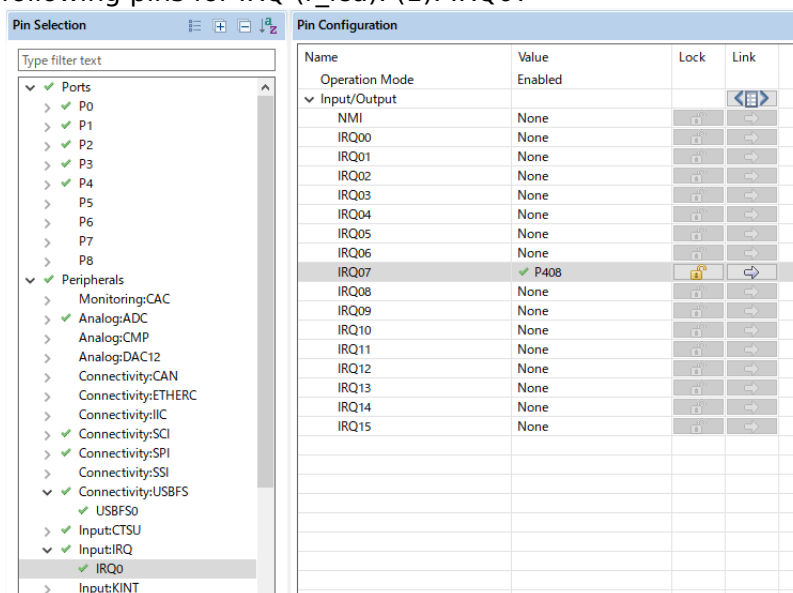

Figure 170: IRQ Pin Setting

## Note

- The following are notes on using the `ux_host_class_cdc_acm_read` function or the `ux_device_class_cdc_acm_read` function.
  - Please specify a multiple of `MaxPacketSize` to the 3rd argument(`requested_length`). since If the value of the 3rd argument is not multiple of `MaxPacketSize`, all data sent by USB Host or USB Peripheral may not be received correctly.
  - Please specify start address of the area allocated a size larger than 3rd argument(`requested_length`) to the 2nd argument(`data_pointer` or `buffer`).
- HMSC uses FileX. For more information on FileX, please refer to the following URL. <https://docs.microsoft.com/en-us/azure/rtos/filex/>
- OTG
  - Be able to set `UX_OTG_HOST_REQUEST_FLAG` in USB Peripheral mode or call `ux_host_stack_role_swap()` function in USB Host mode when data other than control transfer is not being transferred.
  - Register the callback function for the application using `R_USB_OtgCallbackSet()` function. This callback function is called when switching the operation mode(`UX_OTG_MODE_IDLE/UX_OTG_MODE_SLAVE/UX_OTG_MODE_HOST`).
  - Use `R_USB_OtgSRP()` function when doing SRP(Session Request Protocol). The `R_USB_OtgSRP()` function does not support VBUS pulsing.
  - After starting up MCU, USB is initialized as USB peripheral mode until connecting A cable.
  - When A cable is connected, USB module is initialized as USB Host mode.
  - Call `R_ICU_ExtrenalIrqOpen()` and `R_ICU_ExtrenalIrqEnable()` function in the application program since the IRQ interrupt is used to detect attaching or detaching of A cable.
  - Add the OTG descriptor in the configuration descriptor in each descriptor file.

Offset	Field	Size	Value	Description
0	bLength	1	5	Size of Descriptor
1	bDescriptor Type	1	9	OTG type = 9
2	bmAttribute	1	3 or 2	D1: HNP support D0: SRP support
3	bcdOTG	2	0x200	Binary Code Decimal

1. Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

## Limitations

1. Please call the initialization function in the application program. Please be sure to call `R_USB_Open()` function after calling the following functions.

- Peripheral
  - PCDC / PHID / PAUD / PPRN / OTG
    - `ux_system_initialize`
    - `ux_device_stack_initialize`
    - `ux_device_stack_class_register`
  - PMSC
    - `ux_system_initialize`
    - `ux_device_stack_initialize`
- Host
  - HCDC / HHID / OTG
    - `ux_system_initialize`
    - `ux_host_stack_initialize`
  - HMSC
    - `ux_system_initialize`
    - `ux_host_stack_initialize`
    - `fx_system_initialize`

2. Set the value for 1000 Ticks per second in the "Timer Ticks Per Second" item.

Property	Value
Common	
General	
Timer	
Timer Ticks Per Second	1000
Timer Thread Stack Size	1024
Timer Thread Priority	0
Timer Process In ISR	Enabled
Reactivate Inline	Disabled
Timer	Enabled

Figure 171: Specify value of Timer Ticks Per Second

3. Set the Thread priority to a value of 21.

▼ Thread	
Symbol	usb_thread0
Name	USB Thread
Stack size (bytes)	1024
Priority	15
Auto start	Enabled
Time slicing interval (ticks)	1

Figure 172: Specify value of Thread priority

4. When using the following functions, Call the following functions in the following order after calling the R\_USB\_Close function.

- Peripheral
  - PCDC / PHID / PPRN
    - \_ux\_device\_stack\_class\_unregister
    - \_ux\_device\_stack\_uninitialize
  - PMSC
    - \_ux\_device\_stack\_uninitialize
- Host
  - \_ux\_host\_stack\_uninitialize

5. When using USBX HHID, please use Wired device.

6. This module does not support the MCU(RA4M1 and RA2A1) since the RAM size is small.

7. The OTG for High-speed is not supported.

8. The OTG does not support the DMA transfer.

1. Please Specify the correct framework size to the 2nd argument(device\_framework\_length\_high\_speed) and the 4th argument(device\_framework\_length\_full\_speed) in "ux\_device\_stack\_initialize" function. If uncorrect size is specified, USB driver does not work properly.
2. The OTG does not support MSC and HID.

## Descriptor

Templates for USBX descriptors can be found in ra/bsp/src/rm\_usbx\_port folder. Also, please be sure to use your vendor ID.

Change the descriptor.c.template file for each class as follows if High-speed mode is used.

- rm\_usbx\_pcdc\_descriptor.c.template
  1. Comment on lines 108 and 243.
  2. Delete the "//" on lines 109 and 242.
- rm\_usbx\_pmsc\_descriptor.c.template
  1. Comment on lines 78 and 153.
  2. Delete the "//" on lines 79 and 152.
- rm\_usbx\_paud\_descriptor.c.template
  1. Comment on lines 167 and 485.
  2. Delete the "//" on lines 168 and 486.

There are two types of templates for PHID descriptor.  
 Keyboard templates should be referred to `rm_usbx_phid_descriptor_keyboard.c.template`.  
 Mouse templates should be referred to `rm_usbx_phid_descriptor_mouse.c.template`.

## Examples

### USBX PCDC Example

PCDC loopback example is as follows.

```
#define VALUE_105 (105)
#define VALUE_2 (2)
#define VALUE_103 (103)
#define VALUE_93 (93)
/*****
 * Function Name : ux_cdc_device0_instance_activate

```

## USBX HCDC Example

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET\_LINE\_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

```

#define VALUE_100 (100)

UINT ux_host_usr_event_notification (ULONG event, UX_HOST_CLASS * host_class, VOID *
instance)

```

## Detailed Description

Driver for the CAN peripheral on RA MCUs. This module implements the [CAN Interface](#).

## Overview

The Controller Area network (CAN) HAL module provides a high-level API for CAN applications and supports the CAN peripherals available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when transmit, receive or error interrupts are received. The callback is passed a parameter which indicates the channel, mailbox and event as well as the received data (if available).

## Features

- Supports both standard (11-bit) and extended (29-bit) messaging formats
- Supports speeds upto 1 Mbps
- Support for bit timing configuration as defined in the CAN specification
- Supports up to 32 transmit or receive mailboxes with standard or extended ID frames
- Optional support for a 4-stage transmit and receive FIFO
- Receive mailboxes can be configured to capture either data or remote CAN Frames
- Receive mailboxes can be configured to receive a range of IDs using mailbox masks
- Mailboxes can be configured with Overwrite or Overrun mode
- Supports a user-callback function when transmit, receive, or error interrupts are received

## Configuration

### Build Time Configurations for r\_can

The following build time configurations are defined in fsp\_cfg/r\_can\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Disabled	When FIFOs are enabled, a transmit FIFO replaces mailboxes 24-27 and a receive FIFO replaces mailboxes 28-31.

## Configurations for Connectivity > CAN (r\_can)

This module can be added to the Stacks tab via New Stack > Connectivity > CAN (r\_can). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_can0	Module name.
General > Channel	Channel should be 0 or 1	0	Specify the CAN channel to use.
General > Clock Source	MCU Specific Options		Select the CAN clock source.
General > Overwrite/Overrrun Mode	<ul style="list-style-type: none"> <li>• Overwrite Mode</li> <li>• Overrrun Mode</li> </ul>	Overwrite Mode	Select whether receive mailbox will be overwritten or overrun if data is not read in time.
General > Global ID Mode	<ul style="list-style-type: none"> <li>• Standard ID Mode</li> <li>• Extended ID Mode</li> <li>• Mixed ID Mode</li> </ul>	Standard ID Mode	Select whether the driver will use CAN Standard IDs, Extended IDs or a mix of both.
General > Number of Mailboxes	<ul style="list-style-type: none"> <li>• 4 Mailboxes</li> <li>• 8 Mailboxes</li> <li>• 16 Mailboxes</li> <li>• 24 Mailboxes</li> <li>• 32 Mailboxes</li> </ul>	32 Mailboxes	Select 4, 8, 16, 24 or 32 mailboxes. In FIFO mailbox mode up to 24 mailboxes are available.
Baud Rate Settings > Auto-generated Settings > Sample-Point (%)	Must be a valid integer between 0 and 100. Ignore when Override Baud Settings is Enabled.	75	Sample-Point = $(TSEG1 + 1) / (TSEG1 + TSEG2 + 1)$ .
Baud Rate Settings > Auto-generated Settings > CAN Baud Rate (Hz)	Must be a valid integer configurable upto maximum 1MHz. Ignore when Override Baud Settings is Enabled.	500000	Specify baud rate in Hz.  If the requested baud rate cannot be achieved, the settings with the largest possible baud rate that is less than or equal to the requested baud rate is used. If multiple combinations would result in the best baud rate, the combination with the least absolute error for the ratio is chosen. The theoretical

calculated baud rate and ratio are printed in a comment in the generated [can\\_bit\\_timing\\_cfg\\_t](#) structure.

Baud Rate Settings >  
Override Auto-generated Settings >  
Override Baud Settings

- Enabled
- Disabled

Disabled

Override calculated baudrate parameters and instead use the ones specified below. This option ignores the parameters specified under Sample-Point (%) and CAN Baud Rate (Hz)

Baud Rate Settings >  
Override Auto-generated Settings >  
Baud Rate Prescaler

Value must be a non-negative integer between 1 and 1024.

1

Specify division value of baud rate prescaler (baud rate prescaler + 1).

Baud Rate Settings >  
Override Auto-generated Settings >  
Time Segment 1

Refer to the RA Configuration tool for available options.

4 Time Quanta

Select the time segment 1 value. (4-16). Check module usage notes for how to calculate this value.

Baud Rate Settings >  
Override Auto-generated Settings >  
Time Segment 2

- 2 Time Quanta
- 3 Time Quanta
- 4 Time Quanta
- 5 Time Quanta
- 6 Time Quanta
- 7 Time Quanta
- 8 Time Quanta

2 Time Quanta

Select the time segment 2 value (2-8). Check module usage notes for how to calculate this value.

Baud Rate Settings >  
Override Auto-generated Settings >  
Synchronization Jump Width

- 1 Time Quanta
- 2 Time Quanta
- 3 Time Quanta
- 4 Time Quanta

1 Time Quanta

Select the Synchronization Jump Width value (1-4). Check module usage notes for how to calculate this value.

Interrupts > Callback

Name must be a valid C symbol

can\_callback

A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs.

Interrupts > Interrupt Priority Level

MCU Specific Options

Transmit/Receive/Error interrupt priority.

Interrupts > Transmit FIFO Interrupt Mode

- Every Message
- Empty

Every Message

Select whether the receive FIFO should throw an interrupt on every received

Input > Receive FIFO > Receive ID 1 > ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0	message or when it becomes empty.
Input > Receive FIFO > Receive ID 1 > ID Mode	<ul style="list-style-type: none"> <li>Standard ID</li> <li>Extended ID</li> </ul>	Standard ID	Select the first ID for the receive FIFO, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs.
Input > Receive FIFO > Receive ID 1 > Frame Type	<ul style="list-style-type: none"> <li>Data Mailbox</li> <li>Remote Mailbox</li> </ul>	Remote Mailbox	Select whether the receive FIFO is used to capture data frames or remote frames.
Input > Receive FIFO > Receive ID 1 > Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for the receive FIFO. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.
Input > Receive FIFO > Receive ID 2 > ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0	Select the second ID for the receive FIFO, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs.
Input > Receive FIFO > Receive ID 2 > ID Mode	<ul style="list-style-type: none"> <li>Standard ID</li> <li>Extended ID</li> </ul>	Standard ID	Select whether the receive FIFO is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Input > Receive FIFO > Receive ID 2 > Frame Type	<ul style="list-style-type: none"> <li>Data Mailbox</li> <li>Remote Mailbox</li> </ul>	Remote Mailbox	Select whether the receive FIFO is used to capture data frames or remote frames.
Input > Receive FIFO > Receive ID 2 > Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for the receive FIFO. In Mixed ID Mode the Standard ID mask is the upper

Input > Mailbox 0-3 Group > Mailbox ID > Mailbox 0 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0	11 bits of the full 29-bit mask value.
Input > Mailbox 0-3 Group > Mailbox ID > Mailbox 1 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	1	Select the receive ID for mailbox 0, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Input > Mailbox 0-3 Group > Mailbox ID > Mailbox 2 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	2	Select the receive ID for mailbox 1, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Input > Mailbox 0-3 Group > Mailbox ID > Mailbox 3 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	3	Select the receive ID for mailbox 2, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Input > Mailbox 0-3 Group > Mailbox ID Mode > Mailbox 0 ID Mode	<ul style="list-style-type: none"> <li>• Standard ID</li> <li>• Extended ID</li> </ul>	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. Type > Mailbox 2  
Frame Type

capture data frames or remote frames (ignored for transmit mailboxes).

Input > Mailbox 0-3  
Group > Mailbox Frame  
Type > Mailbox 3  
Frame Type

- Data Mailbox      Data Mailbox
- Remote Mailbox

Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).

Input > Mailbox 0-3  
Group > Mailbox 0-3  
Group Mask

Value must be decimal or HEX integer of 0x1FFFFFFF or less.      0x1FFFFFFF

Select the Mask for mailboxes 0-3. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.

Input > Mailbox 4-7  
Group > Mailbox ID >  
Mailbox 4 ID

Value must be decimal or HEX integer of 0x1FFFFFFF or less.      4

Select the receive ID for mailbox 4, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.

Input > Mailbox 4-7  
Group > Mailbox ID >  
Mailbox 5 ID

Value must be decimal or HEX integer of 0x1FFFFFFF or less.      5

Select the receive ID for mailbox 5, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.

Input > Mailbox 4-7  
Group > Mailbox ID >  
Mailbox 6 ID

Value must be decimal or HEX integer of 0x1FFFFFFF or less.      6

Select the receive ID for mailbox 6, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.

Input > Mailbox 4-7  
Group > Mailbox ID >  
Mailbox 7 ID

Value must be decimal or HEX integer of 0x1FFFFFFF or less.      7

Select the receive ID for mailbox 7, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set

Input > Mailbox 4-7 Group > Mailbox ID Mode > Mailbox 4 ID Mode	<ul style="list-style-type: none"> <li>• Standard ID</li> <li>• Extended ID</li> </ul>	Standard ID	as transmit type. Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.

## Clock Configuration

The CAN peripheral uses the CANMCLK (main-clock oscillator) or PCLKB as its clock source (fCAN, CAN System Clock.) The default CAN configuration will provide a CAN bit rate of 500 Kbit using CANMCLK as the clock source. To set the PCLKB frequency, use the **Clocks** tab of the RA Configuration editor. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

## Clock Limitations

The following clock limitations apply when using the CAN peripheral:

- When using the main oscillator (CANMCLK) as the clock source:
  - $f_{PCLKB} \geq f_{CANCLK}$  ( $f_{CANCLK} = XTAL / \text{Baud Rate Prescaler}$ )
  - The user application must start the main-clock oscillator (XTAL) at run-time using the CGC Interface if it has not already started (for example, if it is not used as the MCU clock source.)
- When using PCLKB as the clock source:
  - For RA6 and RA4 MCUs, the source of the peripheral module clocks must be PLL for the CAN HAL module.
- For RA4M1 and RA4W1 MCUs, the clock frequency ratio of PCLKA and PCLKB must be 2:1 when using the CAN HAL module. Operation is not guaranteed for other settings.
- For RA2 MCUs only CANMCLK (XTAL) may be used as a clock source. The clock frequency ratio of ICLK and PCLKB must be 2:1 when using the CAN HAL module. Operation is not

guaranteed for other settings.

*Note*

*When using CANMCLK (XTAL) as the CAN clock source while running at a reduced main clock speed (under 2x XTAL) be sure to confirm that the XTAL frequency divided by the baud rate prescaler is equal to or less than PCLKB.*

## Pin Configuration

The CAN peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. A CAN channel would consist of two pins - CRX and CTX for data transmission/reception.

## Usage Notes

### Bit Rate Calculation

For convenience, the baudrate of the CAN peripheral is automatically set through the RA Configuration editor using a best effort approach. If the auto-generated baud settings cause deviation that is not tolerable by the application, the user can override the auto-generated settings and put in manually calculated values through RA Configuration editor. For more details on how the baudrate is set refer to section 37.4 "Data Transfer Rate Configuration" of the RA6M3 User's Manual (R01UH0886EJ0100).

### FIFO Support

When FIFO Support is enabled, mailboxes 24-27 form a 4-stage transmit FIFO and mailboxes 28-31 form a 4-stage receive FIFO. The receive FIFO supports two independent ID/mask settings for acceptance filtering.

*Note*

*Only the base mailbox of each FIFO may be accessed. When writing to the TX FIFO it is recommended to use CAN\_MAILBOX\_ID\_TX\_FIFO.*

### Limitations

Developers should be aware of the following limitations when using CAN:

- The `can_frame_t::id_mode` field is only used when Global ID Mode is set to Mixed ID. It is ignored in all other modes.

## Examples

### Basic Example

This is a basic example of minimal use of the CAN in an application.

```
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile bool g_rx_flag = false;
volatile bool g_tx_flag = false;
volatile bool g_err_flag = false;
```

```
volatile uint32_t g_rx_id;
void can_callback (can_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case CAN_EVENT_RX_COMPLETE:    /* Receive complete event. */
            {
                g_rx_flag = true;
                g_rx_id  = p_args->frame.id;
                /* Read received frame */
                g_can_rx_frame = p_args->frame;
            }
            break;
        case CAN_EVENT_TX_COMPLETE:    /* Transmit complete event. */
            {
                g_tx_flag = true;
            }
            break;
        case CAN_EVENT_ERR_BUS_OFF:    /* Bus error event. (bus off) */
        case CAN_EVENT_ERR_PASSIVE:    /* Bus error event. (error passive) */
        case CAN_EVENT_ERR_WARNING:    /* Bus error event. (error warning) */
        case CAN_EVENT_BUS_RECOVERY:   /* Bus error event. (bus recovery) */
        case CAN_EVENT_MAILBOX_MESSAGE_LOST: /* Overwrite/overrun error */
            {
                /* Set error flag */
                g_err_flag = true;
            }
            break;
        default:
            {
                break;
            }
    }
}
```

```
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = CAN_BUSY_DELAY;
    /* Initialize the CAN module */
    err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    g_can_tx_frame.id = CAN_DESTINATION_DEVICE_MAILBOX_NUMBER; /* CAN
Destination Device ID */
    g_can_tx_frame.type = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = CAN_FRAME_TRANSMIT_DATA_BYTES;
    /* Write some data to the transmit frame */
    for (i = 0; i < sizeof(g_can_tx_frame.data); i++)
    {
        g_can_tx_frame.data[i] = (uint8_t) i;
    }
    /* Send data on the bus */
    g_tx_flag = false;
    g_err_flag = false;
    err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
    assert(FSP_SUCCESS == err);
    /* Since there is nothing else to do, block until Callback triggers*/
    while ((true != g_tx_flag) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (true == g_err_flag)
    {
        __BKPT(0);
    }
}
```

## External Loop-back Test

This example requires the CTX and CRX pins to be connected. If a CAN transceiver is onboard a 120 Ohm resistor should be connected across CANH and CANL instead. The mailbox numbers are arbitrarily chosen.

```
void can_external_loopback_example (void)
{
    fsp_err_t          err;
    uint32_t          timeout_ms      = CAN_BUSY_DELAY;
    can_operation_mode_t operation_mode = CAN_OPERATION_MODE_NORMAL;
    can_test_mode_t   test_mode       = CAN_TEST_MODE_LOOPBACK_EXTERNAL;
    int               diff = 0;
    uint32_t i          = 0;
    err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
    assert(FSP_SUCCESS == err);
    /* Clear the data part of receive frame */
    memset(g_can_rx_frame.data, 0, CAN_FRAME_TRANSMIT_DATA_BYTES);
    /* CAN Destination Device ID, in this case it is the same device with another
mailbox */
    g_can_tx_frame.id          = CAN_MAILBOX_NUMBER_4;
    g_can_tx_frame.type        = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = CAN_FRAME_TRANSMIT_DATA_BYTES;
    /* Write some data to the transmit frame */
    for (i = 0; i < sizeof(g_can_tx_frame.data); i++)
    {
        g_can_tx_frame.data[i] = (uint8_t) i;
    }
    /* Send data on the bus */
    g_rx_flag = false;
    g_err_flag = false;
    err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
```

```
    assert(FSP_SUCCESS == err);

    /* Since there is nothing else to do, block until Callback triggers*/
    while ((true != g_rx_flag) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

        timeout_ms--;
    }
    if (true == g_err_flag)
    {
        __BKPT(0);
    }

    /* Verify received data */
    diff = memcmp(&g_can_rx_frame.data[0], &g_can_tx_frame.data[0],
CAN_FRAME_TRANSMIT_DATA_BYTES);
    if (0 != diff)
    {
        __BKPT(0);
    }
}
```

<a href="#">can_clock_source_t</a>	clock_source	Source of the CAN clock.
uint32_t *	p_mailbox_mask	Mailbox mask, one for every 4 mailboxes.
<a href="#">can_mailbox_t</a> *	p_mailbox	Pointer to mailboxes.
<a href="#">can_global_id_mode_t</a>	global_id_mode	Standard or Extended ID mode.
uint32_t	mailbox_count	Number of mailboxes.
<a href="#">can_message_mode_t</a>	message_mode	Overwrite message or overrun.
<a href="#">can_fifo_interrupt_cfg_t</a> const *	p_fifo_int_cfg	Pointer to FIFO interrupt configuration.
<a href="#">can_rx_fifo_cfg_t</a> *	p_rx_fifo_cfg	Pointer to RX FIFO configuration.

## Enumeration Type Documentation

◆ **can\_status\_t**

enum <code>can_status_t</code>	
CAN Status	
Enumerator	
<code>CAN_STATUS_NEW_DATA</code>	New Data status flag.
<code>CAN_STATUS_SENT_DATA</code>	Sent Data status flag.
<code>CAN_STATUS_RECEIVE_FIFO</code>	Receive FIFO status flag.
<code>CAN_STATUS_TRANSMIT_FIFO</code>	Transmit FIFO status flag.
<code>CAN_STATUS_NORMAL_MBOX_MESSAGE_LOST</code>	Normal mailbox message lost status flag.
<code>CAN_STATUS_FIFO_MBOX_MESSAGE_LOST</code>	FIFO mailbox message lost status flag.
<code>CAN_STATUS_TRANSMISSION_ABORT</code>	Transmission abort status flag.
<code>CAN_STATUS_ERROR</code>	Error status flag.
<code>CAN_STATUS_RESET_MODE</code>	Reset mode status flag.
<code>CAN_STATUS_HALT_MODE</code>	Halt mode status flag.
<code>CAN_STATUS_SLEEP_MODE</code>	Sleep mode status flag.
<code>CAN_STATUS_ERROR_PASSIVE</code>	Error-passive status flag.
<code>CAN_STATUS_BUS_OFF</code>	Bus-off status flag.

◆ **can\_error\_t**

enum <code>can_error_t</code>	
CAN Error Code	
Enumerator	
<code>CAN_ERROR_STUFF</code>	Stuff Error.
<code>CAN_ERROR_FORM</code>	Form Error.
<code>CAN_ERROR_ACK</code>	ACK Error.
<code>CAN_ERROR_CRC</code>	CRC Error.
<code>CAN_ERROR_BIT_RECESSIVE</code>	Bit Error (recessive) Error.
<code>CAN_ERROR_BIT_DOMINANT</code>	Bit Error (dominant) Error.
<code>CAN_ERROR_ACK_DELIMITER</code>	ACK Delimiter Error.

◆ **can\_mailbox\_number\_t**

enum <code>can_mailbox_number_t</code>
CAN Mailbox IDs (MB + FIFO)

◆ **can\_mailbox\_send\_receive\_t**

enum <code>can_mailbox_send_receive_t</code>	
CAN Mailbox type	
Enumerator	
<code>CAN_MAILBOX_RECEIVE</code>	Mailbox is for receiving.
<code>CAN_MAILBOX_TRANSMIT</code>	Mailbox is for sending.

◆ **can\_global\_id\_mode\_t**

enum <a href="#">can_global_id_mode_t</a>	
Global CAN ID mode settings	
Enumerator	
CAN_GLOBAL_ID_MODE_STANDARD	Standard IDs of 11 bits used.
CAN_GLOBAL_ID_MODE_EXTENDED	Extended IDs of 29 bits used.
CAN_GLOBAL_ID_MODE_MIXED	Both Standard and Extended IDs used.

◆ **can\_message\_mode\_t**

enum <a href="#">can_message_mode_t</a>	
CAN Message Modes	
Enumerator	
CAN_MESSAGE_MODE_OVERWRITE	Receive data will be overwritten if not read before the next frame.
CAN_MESSAGE_MODE_OVERRUN	Receive data will be retained until it is read.

◆ **can\_clock\_source\_t**

enum <a href="#">can_clock_source_t</a>	
CAN Source Clock	
Enumerator	
CAN_CLOCK_SOURCE_PCLKB	PCLKB is the source of the CAN Clock.
CAN_CLOCK_SOURCE_CANMCLK	CANMCLK is the source of the CAN Clock.

◆ **can\_fifo\_interrupt\_mode\_t**

enum <a href="#">can_fifo_interrupt_mode_t</a>	
CAN FIFO Interrupt Modes	

**Function Documentation**

◆ **R\_CAN\_Open()**

```
fsp_err_t R_CAN_Open ( can_ctrl_t *const p_api_ctrl, can_cfg_t const *const p_cfg )
```

Open and configure the CAN channel for operation.

Example:

```
/* Initialize the CAN module */
err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
```

**Return values**

FSP_SUCCESS	Channel opened successfully
FSP_ERR_ALREADY_OPEN	Driver already open.
FSP_ERR_CAN_INIT_FAILED	Channel failed to initialize.
FSP_ERR_ASSERTION	Null pointer presented.

◆ **R\_CAN\_Close()**

```
fsp_err_t R_CAN_Close ( can_ctrl_t *const p_api_ctrl)
```

Close the CAN channel.

**Return values**

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented.

◆ **R\_CAN\_Write()**

```
fsp_err_t R_CAN_Write ( can_ctrl_t *const p_api_ctrl, uint32_t mailbox, can_frame_t *const p_frame )
```

Write data to the CAN channel. Write up to eight bytes to the channel mailbox.

Example:

```
err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress, cannot write data at this time.
FSP_ERR_CAN_TRANSMIT_FIFO_FULL	Transmit FIFO is full.
FSP_ERR_CAN_RECEIVE_MAILBOX	Mailbox is setup for receive and cannot send.
FSP_ERR_INVALID_ARGUMENT	Data length or frame type invalid.
FSP_ERR_ASSERTION	Null pointer presented

◆ **R\_CAN\_Read()**

```
fsp_err_t R_CAN_Read ( can_ctrl_t *const p_api_ctrl, uint32_t mailbox, can_frame_t *const p_frame )
```

Read data from a mailbox or FIFO.

**Note**

*This function is not supported.*

**Return values**

FSP_ERR_UNSUPPORTED	Function not supported.
---------------------	-------------------------

◆ **R\_CAN\_ModeTransition()**

```
fsp_err_t R_CAN_ModeTransition ( can_ctrl_t *const p_api_ctrl, can_operation_mode_t
operation_mode, can_test_mode_t test_mode )
```

CAN Mode Transition is used to change CAN driver state.

Example:

```
err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented

◆ **R\_CAN\_InfoGet()**

```
fsp_err_t R_CAN_InfoGet ( can_ctrl_t *const p_api_ctrl, can_info_t *const p_info )
```

Get CAN state and status information for the channel.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented

### ◆ R\_CAN\_CallbackSet()

```
fsp_err_t R_CAN_CallbackSet ( can_ctrl_t *const p_api_ctrl, void (*)(can_callback_args_t *)
p_callback, void const *const p_context, can_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `can_api_t::callbackSet`.

#### Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

### 4.2.5.3 CAN FD (r\_canfd)

Modules » [Connectivity](#)

#### Functions

```
fsp_err_t R_CANFD_Open (can_ctrl_t *const p_api_ctrl, can_cfg_t const *const
p_cfg)
```

```
fsp_err_t R_CANFD_Close (can_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_CANFD_Write (can_ctrl_t *const p_api_ctrl, uint32_t buffer,
can_frame_t *const p_frame)
```

```
fsp_err_t R_CANFD_Read (can_ctrl_t *const p_api_ctrl, uint32_t buffer,
can_frame_t *const p_frame)
```

```
fsp_err_t R_CANFD_ModeTransition (can_ctrl_t *const p_api_ctrl,
can_operation_mode_t operation_mode, can_test_mode_t test_mode)
```

```
fsp_err_t R_CANFD_InfoGet (can_ctrl_t *const p_api_ctrl, can_info_t *const
p_info)
```

```
fsp_err_t R_CANFD_CallbackSet (can_ctrl_t *const p_api_ctrl,
void (*p_callback)(can_callback_args_t *), void const *const
p_context, can_callback_args_t *const p_callback_memory)
```

#### Detailed Description

Driver for the CANFD peripheral on RA MCUs. This module implements the [CAN Interface](#).

## Overview

The CANFD module can be used to communicate over CAN networks, optionally using Flexible Data (CAN-FD) to accelerate the data phase. A variety of message filtering and buffer options are available.

### Features

#### Common Features

- Compatibility
  - Send and receive CAN 2.0 and CAN-FD frames on the same channel
  - Bitrate up to 1 Mbps with FD data phase speeds up to 5-8 Mbps
  - Supports both ISO 11898-1
- Buffers
  - 32 global receive Message Buffers (RX MBs)
  - 2-8 global receive FIFOs (RX FIFOs)
  - 4-16 transmit Message Buffers (TX MBs) per channel
- Filtering
  - Each filter rule can be individually configured to accept messages based on:
    - ID
    - Standard or Extended ID (IDE bit)
    - Data or Remote Frame (RTR bit)
    - ID/IDE/RTR mask
    - Minimum DLC (data length) value
- Interrupts
  - Configurable Global RX FIFO Interrupt
    - Configurable per FIFO
    - Interrupt at a certain depth or on every received message
  - Channel TX Interrupt
  - Global Error
    - DLC Check
    - Message Lost
    - FD Payload Overflow
  - Channel Error
    - Bus Error
    - Error Warning
    - Error Passive
    - Bus-Off Entry
    - Bus-Off Recovery
    - Overload
    - Bus Lock
    - Arbitration Loss
    - Transmission Aborted

#### Per-MCU Specifications

	RA6M5	RA6T2
Channels	2	1
Max nominal bitrate	1 Mbps	1 Mbps
Max data bitrate	8 Mbps	5 Mbps

Filter rules	128	32
TX message buffers	16/ch	4
RX message buffers	32	32
RX FIFOs	8	2
RX Buffer RAM	4864 bytes	1216 bytes
Standards	ISO or Bosch	ISO

**Note**

Each message buffer comprises 12 header bytes plus data length (8-64 bytes). The above buffer RAM values therefore correspond to the following capacities:

	RA6M5	RA6T2
Max 64-byte storage	64 messages	16 messages
Max 8-byte storage	243 messages	60 messages

## Configuration

### Build Time Configurations for r\_canfd

The following build time configurations are defined in fsp\_cfg/r\_canfd\_cfg.h:

Configuration	Options	Default	Description
Global Error Interrupt > Priority	MCU Specific Options		This interrupt is fired for each of the error sources selected below.
Global Error Interrupt > Sources	<ul style="list-style-type: none"> <li>DLC Check</li> <li>Message Lost</li> <li>FD Payload Overflow</li> </ul>	0U	Select which errors should trigger an interrupt.
Global Error Interrupt > Callback Channel	<ul style="list-style-type: none"> <li>Channel 0</li> <li>Channel 1</li> </ul>	Channel 0	Specify which channel callback should be called to handle global errors. When starting the driver this channel must be opened first.
Flexible Data (FD) > FD Frame Format	MCU Specific Options		Select whether to use the FD frame standard provided by ISO or Bosch.
Flexible Data (FD) > Protocol Exceptions	<ul style="list-style-type: none"> <li>Enabled (ISO 11898-1)</li> <li>Disabled</li> </ul>	Enabled (ISO 11898-1)	Select whether to enter the protocol exception handling state when a RES bit is sampled recessive as defined in

Flexible Data (FD) > Payload Overflow	<ul style="list-style-type: none"> <li>Reject</li> <li>Truncate</li> </ul>	Reject	ISO 11898-1. Configure whether received messages larger than the destination buffer should be truncated or rejected.
Reception > Message Buffers > Number of Buffers	RX Message Buffer number must be an integer between 0 and 32.	0	Number of message buffers available for reception.  As there is no interrupt for message buffer reception it is recommended to use RX FIFOs instead. Set this value to 0 to disable RX Message Buffers.
Reception > Message Buffers > Payload Size	<ul style="list-style-type: none"> <li>8 bytes</li> <li>12 bytes</li> <li>16 bytes</li> <li>20 bytes</li> <li>24 bytes</li> <li>32 bytes</li> <li>48 bytes</li> <li>64 bytes</li> </ul>	8 bytes	Payload size for all RX Message Buffers.
Reception > FIFOs > FIFO 0 > Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	Enable or disable RX FIFO 0.
Reception > FIFOs > FIFO 0 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 0. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 0 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 0. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 0 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 0.
Reception > FIFOs > FIFO 0 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 0.

Reception > FIFOs > FIFO 1 > Enable	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable or disable RX FIFO 1.
Reception > FIFOs > FIFO 1 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 1. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 1 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 1. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 1 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 1.
Reception > FIFOs > FIFO 1 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 1.
Reception > FIFOs > FIFO 2 > Enable	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable or disable RX FIFO 2.
Reception > FIFOs > FIFO 2 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 2. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 2 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 2. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 2 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 2.
Reception > FIFOs > FIFO 2 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 2.
Reception > FIFOs > FIFO 3 > Enable	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable or disable RX FIFO 3.
Reception > FIFOs > FIFO 3 > Interrupt	MCU Specific Options		Set the interrupt mode for RX FIFO 3.

Mode			Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 3 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 3. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 3 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 3.
Reception > FIFOs > FIFO 3 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 3.
Reception > FIFOs > FIFO 4 > Enable	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable or disable RX FIFO 4.
Reception > FIFOs > FIFO 4 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 4. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 4 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 4. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 4 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 4.
Reception > FIFOs > FIFO 4 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 4.
Reception > FIFOs > FIFO 5 > Enable	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable or disable RX FIFO 5.
Reception > FIFOs > FIFO 5 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 5. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set

Reception > FIFOs > FIFO 5 > Interrupt Threshold	MCU Specific Options		below. Set the interrupt threshold value for RX FIFO 5. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 5 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 5.
Reception > FIFOs > FIFO 5 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 5.
Reception > FIFOs > FIFO 6 > Enable	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable or disable RX FIFO 6.
Reception > FIFOs > FIFO 6 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 6. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 6 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 6. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 6 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 6.
Reception > FIFOs > FIFO 6 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 6.
Reception > FIFOs > FIFO 7 > Enable	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable or disable RX FIFO 7.
Reception > FIFOs > FIFO 7 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 7. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 7 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 7. This setting is

			only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 7 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 7.
Reception > FIFOs > FIFO 7 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 7.
Reception > FIFOs > Interrupt Priority	MCU Specific Options		This priority level will apply to all FIFO interrupts globally.
Reception > Acceptance Filtering > Channel 0 Rule Count	The number of AFL rules must be an integer between 0 and 128.	32	Number of acceptance filter list rules dedicated to Channel 0.
Reception > Acceptance Filtering > Channel 1 Rule Count	The number of AFL rules must be an integer between 0 and 128.	0	Number of acceptance filter list rules dedicated to Channel 1.
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Transmission Priority	<ul style="list-style-type: none"> <li>• Message ID</li> <li>• Buffer Number</li> </ul>	Buffer Number	Select how messages should be prioritized for transmission. In either case, lower numbers indicate higher priority.
DLC Check	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> <li>• Enabled w/truncate</li> </ul>	config.driver.canfd.dlc_check.disabled	When enabled received messages will be rejected if their DLC field is less than the value configured in the associated AFL rule. If 'Enabled w/truncate' is selected and a message passes the DLC check the DLC field is set to the value in the associated AFL rule and any excess data is discarded.

### Configurations for Connectivity > CAN FD (r\_canfd)

This module can be added to the Stacks tab via New Stack > Connectivity > CAN FD (r\_canfd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_canfd0	Module name.
General > Channel	Channel should be 0 or 1	0	Specify the CAN channel to use.
Bitrate > Automatic > Nominal Rate (bps)	Must be a valid integer with a maximum of 1MHz.	500000	Specify nominal bitrate in bits per second.
Bitrate > Automatic > Data Rate (bps)	Must be a valid integer greater than 0.	2000000	Specify data bitrate in bits per second.
Bitrate > Automatic > Sample Point (%)	Must be a valid integer between 60 and 99.	75	Specify desired sample point.
Bitrate > Manual > Nominal > Prescaler (divisor)	Value must be a non-negative integer between 1 and 1024.	1	Specify clock divisor for nominal bitrate.
Bitrate > Manual > Nominal > Time Segment 1 (Tq)	Value must be a non-negative integer between 2 and 256.	29	Select the Time Segment 1 value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Nominal > Time Segment 2 (Tq)	Value must be a non-negative integer between 2 and 128.	10	Select the Time Segment 2 value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Nominal > Sync Jump Width (Tq)	Value must be a non-negative integer between 1 and 128.	4	Select the Synchronization Jump Width value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Data > Prescaler (divisor)	Value must be a non-negative integer between 1 and 1024.	1	Specify clock divisor for data bitrate.
Bitrate > Manual > Data > Time Segment 1 (Tq)	Value must be a non-negative integer between 2 and 256.	5	Select the Time Segment 1 value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Data > Time Segment 2 (Tq)	Value must be a non-negative integer between 2 and 128.	2	Select the Time Segment 2 value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Data > Sync Jump Width (Tq)	Value must be a non-negative integer between 1 and 128.	1	Select the Synchronization Jump Width value. Check

module usage notes for how to calculate this value.

Bitrate > Manual > Use manual settings	<ul style="list-style-type: none"> <li>• Yes</li> <li>• No</li> </ul>	No	Select whether or not to override automatic baudrate generation and instead use the values specified here.
Bitrate > Delay Compensation	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Enable	When enabled the CANFD module will automatically compensate for any transceiver or bus delay between transmitted and received bits. When manually supplying bit timing values with delay compensation enabled be sure the data prescaler is 2 or smaller for correct operation.
Interrupts > Callback	Name must be a valid C symbol	canfd0_callback	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs.
Interrupts > Channel Interrupt Priority Level	MCU Specific Options		Channel Error/Transmit interrupt priority.
Transmit Interrupts	MCU Specific Options		Select which TX Message Buffers should trigger an interrupt when transmission is complete.
Channel Error Interrupts	<ul style="list-style-type: none"> <li>• Error Warning</li> <li>• Error Passive</li> <li>• Bus-Off Entry</li> <li>• Bus-Off Recovery</li> <li>• Overload</li> </ul>	0U	Select which channel error interrupt sources to enable.
Filter List Array	Name must be a valid C symbol	p_canfd0_afl	Acceptance Filter List (AFL) rule array symbol name.

## Clock Configuration

The CANFD peripheral uses either PLL, PLL2 or the main oscillator as its clock source. The RA Configuration editor will attempt to get as close as possible to the supplied bitrate with the

configured clock source. To achieve an exact bitrate the CANFD source clock or divisor may need to be adjusted to meet the criteria in the formula below:

```
bitrate = canfd_clock_hz / ((time_segment_1 + time_segment_2 + 1) * prescalar)
```

For CANFD, the possible values for each element are as follows:

Element	Min	Max (Nominal)	Max (Data)
Bitrate	-	1 Mbps	5-8 Mbps*
Time Segment 1	2 Tq	256 Tq	32 Tq
Time Segment 2	2 Tq	128 Tq	16 Tq
<a href="#">Sync Jump Width</a>	1 Tq	Time Segment 2	Time Segment 2
Prescalar	1	1024	256

- RA6M5 supports up to 8 Mbps; RA6T2 supports up to 5 Mbps.

Use the **Clocks** tab of the RA Configuration editor to configure the CANFD clock source/divisor as well as to set the frequency of PLL or PLL2. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

## Pin Configuration

CANFD channels each control two pins: CRX (receive) and CTX (transmit).

## Usage Notes

### Buffers

The CANFD driver provides three types of buffers: Transmit Message Buffers (TX MBs), Receive Message Buffers (RX MBs) and Receive FIFOs (RX FIFOs).

### TX Message Buffers

TX MBs are used for transmission only. Refer to the hardware manual for your device for information on which TX MBs are available.

#### Note

*The CANFD peripheral continually scans TX MBs for new data. Depending on the provided clock it may be possible to write to multiple TX MBs before transmission begins. In this case, messages will be sent in the priority specified by the Transmission Priority option in the RA Configuration editor.*

### RX Message Buffers

RX MBs are for reception only and may only hold one message at a time. 32 total RX MBs are available and are shared across all channels.

No interrupts are provided for RX MBs. Use [R\\_CANFD\\_InfoGet](#) and [R\\_CANFD\\_Read](#) to poll and read them, respectively.

## RX FIFOs

RX FIFOs provide interrupt-driven queue functionality for receiving messages and are shared across all channels. All FIFOs have the following capabilities:

- Up to 64 byte payloads
- Up to 48 (RA6T2) or 128 (RA6M5) message capacity
- Interrupt events:
  - On every received frame OR when filled to a specified fraction of its capacity
  - When a message is overwritten (message received on full FIFO)

Once an interrupt is fired it will continue to fire until the FIFO is emptied and all messages have been passed to user code via the callback. When using the threshold interrupt mode a FIFO can be checked for data and read between interrupts by calling `R_CANFD_InfoGet` and `R_CANFD_Read`, respectively.

## RX Buffer Pool

The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. The RA Configuration editor will provide a warning when the limit is exceeded.

The number of bytes used by RX MBs and individual FIFOs can be calculated as follows:

```
Total RX MB bytes used = (number of RX MBs enabled) * (RX MB payload size + 12 header bytes)
RX FIFO bytes used = (number of FIFO stages) * (FIFO payload size + 12 header bytes)
```

## Message Filtering (Acceptance Filter List)

To filter messages to the desired message buffer or FIFO the CANFD peripheral uses an Acceptance Filter List (AFL). Each entry in the AFL provides a rule to check a message against along with destination and other filtering information. When a message is received the CANFD peripheral internally checks against every configured AFL rule for the channel. If a match is found the message is transferred to the destination(s) specified in the rule. The default template with one entry is shown below:

```
static const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CH0_RULE_NUM] =
{
    {
        .id =
        {
            /* Specify the ID, ID type and frame type to accept. */
            .id          = 0x00000000,
            .frame_type = CAN_FRAME_TYPE_DATA,
            .id_mode     = CAN_ID_MODE_EXTENDED,
        },
    },
}
```

```
.mask =
{
/* These values mask which ID/mode bits to compare when filtering messages. */
.mask_id      = 0x1FFFFFFF,
.mask_frame_type = 1,
.mask_id_mode  = 1,
},
.destination =
{
/* If DLC checking is enabled any messages shorter than the below setting will be
rejected. */
.minimum_dlc = CANFD_MINIMUM_DLC_0,

/* Optionally specify a Receive Message Buffer (RX MB) to store accepted frames. RX
MBs do not have an
* interrupt or overwrite protection and must be checked with R_CANFD_InfoGet and
R_CANFD_Read. */
.rx_buffer    = CANFD_RX_MB_NONE,

/* Specify which FIFO(s) to send filtered messages to. Multiple FIFOs can be OR'd
together. */
.fifo_select_flags = CANFD_RX_FIFO_0,
}
}
};
```

AFL templates can be easily added to a project using the Developer Assistance feature in e2 studio. Once the CANFD module is added to a project, drag and drop the elements circled below to build a filter list:

Figure 173: CANFD Developer Assistance AFL Templates

For an example configuration refer to the [AFL Example](#) below.

## Flexible Data (FD)

Flexible Data is an extension of the CAN protocol allowing for messages up to 64 bytes and higher data bitrates, among other features. The CANFD driver supports the following:

- Sending and receiving FD messages
- Bitrate switching for data phase
- Manual and automatic setting of the error state (ESI) bit

To specify one or more of these options when transmitting set `can_frame_t::options` with combined values from `canfd_frame_options_t`. Received messages will automatically have this field filled, if applicable.

```

/* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
g_can_tx_frame.id           = CAN_EXAMPLE_ID;
g_can_tx_frame.id_mode     = CAN_ID_MODE_STANDARD;
g_can_tx_frame.type        = CAN_FRAME_TYPE_DATA;
g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
g_can_tx_frame.options     = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;

```

### Note

When using bitrate switching be sure to configure the Data Bitrate as desired in the RA Configuration editor.

## Bit Rate Calculation

For convenience, the baudrate of the CAN peripheral is automatically set through the RA

Configuration editor using a best effort approach. To increase compliance and reliability two extra options are provided: Link Prescalers and Delay Compensation.

When Link Prescalers is enabled the prescalers for Nominal and Data bitrates will be kept the same, improving clock tolerance in networks using FD frames. This option somewhat limits the available options for bitrate settings, so be sure to check that the automatically generated values are acceptable.

Enabling Delay Compensation instructs the CANFD peripheral to measure TX to RX transceiver delay and automatically adjust for it, improving the reliability of high-speed FD messages. This option may severely limit available bitrate settings depending on the source clock; it is highly recommended to check the generated values when enabled.

If the auto-generated baud settings cause deviation that is not tolerable by the application the user can override the auto-generated settings and put in manually calculated values through the RA Configuration editor. For more details on how the bitrate is calculated refer to the [Clock Configuration](#) section above.

### Sync Jump Width

The Sync Jump Width option specifies the maximum number of time quanta that the sample point may be delayed by to account for differences in oscillators on the bus. It should be set to a value between 1 and the configured Time Segment 2 value depending on the maximum permissible clock error.

### Error Handling

The CANFD peripheral provides two types of error interrupts: Channel and Global. As the names imply, each channel has its own Channel Error interrupt but there is only one Global Error interrupt. Only the configured channel will receive callbacks for Global Errors.

Error interrupt callbacks will pass either `CAN_EVENT_ERR_CHANNEL` or `CAN_EVENT_ERR_GLOBAL` in the `can_callback_args_t::event` field. A second field, `can_callback_args_t::error`, provides the actual error code as `canfd_error_t`. Cast to this enum to retrieve the error condition. See the callback in the [Basic Example](#) below for a demonstration.

### DLC Checking

When DLC Checking is enabled messages are checked against the `destination.minimum_dlc` value of each AFL rule. If the data length of a message is less than this value the message will be rejected. When DLC checking is set to "Enabled w/truncate" in the RA Configuration editor any data in excess of the minimum DLC setting will be truncated and the DLC value for the frame will be set to match.

### FD Payload Overflow

When an FD message is received with a DLC larger than the destination buffer an FD Payload Overflow interrupt is thrown (if configured). When Payload Overflow is set to "Truncate" the message will still be accepted but only data up to the buffer capacity will be preserved. The DLC value is unchanged in this case; any data beyond this value in the `can_frame_t::data` array should not be used.

### Test Modes

The CANFD peripheral provides three basic test modes: Listen Only, Internal Loopback and External Loopback. Use [R\\_CANFD\\_ModeTransition](#) to switch to a test mode.

On some MCUs an additional "Internal Bus" test mode is available that allows connecting both CANFD channels together on an internal bus, effectively creating an internal CAN network. See the [Internal Bus](#) example below for details.

## Limitations

Developers should be aware of the following limitations when using CANFD:

- On RA6M5, RX Message Buffers do not have an associated interrupt. To use them in an application one of the following is recommended:
  - Use [R\\_CANFD\\_InfoGet](#) to determine if any RX MBs have received data, then use [R\\_CANFD\\_Read](#) to obtain it
  - Select an RX FIFO as an additional destination for the relevant filter rules and configure the FIFO interrupt/callback as desired
- The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. See the [RX Buffer Pool](#) section above for more information.
- When switching modes with [R\\_CANFD\\_ModeTransition](#) a delay of up to several CAN frames may be incurred. Consult Section 32.3.4.2 "Timing of Channel Mode Change" in the RA6M5 User's Manual (R01UH0891EJ0100) for details.
- Only one channel will receive callbacks for Global Errors. If a different channel is opened first these error interrupts will be suppressed until the specified handler channel is opened.

## Examples

### AFL Example

The below is an example Acceptance Filter List (AFL) declaration with two rules.

```
const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CH1_RULE_NUM] =
{
    /* Store all data frames with at least 4 bytes from Standard IDs 0x40-0x4F in RX
    FIFO 0 and RX FIFO 1 */
    {
        .id =
        {
            .id          = 0x40,
            .frame_type = CAN_FRAME_TYPE_DATA,
            .id_mode     = CAN_ID_MODE_STANDARD
        },
        .mask =
        {
            .mask_id          = 0x7F0,
            .mask_frame_type = 1,
            .mask_id_mode     = 1
        }
    }
}
```

```
    },
    .destination =
    {
        .minimum_dlc      = CANFD_MINIMUM_DLC_4,
        .rx_buffer        = CANFD_RX_MB_NONE,
        .fifo_select_flags = (canfd_rx_fifo_t) (CANFD_RX_FIFO_0 |
CANFD_RX_FIFO_1)
    }
},
/* Store all frames from Extended ID 0x1100 in RX FIFO 2 and RX MB 0 */
{
    .id =
    {
        .id          = 0x1100,
        .frame_type = CAN_FRAME_TYPE_DATA, // This setting is ignored by the mask
        .id_mode     = CAN_ID_MODE_EXTENDED
    },
    .mask =
    {
        .mask_id          = 0x1FFFFFFF,
        .mask_frame_type = 0,
        .mask_id_mode     = 1
    },
    .destination =
    {
        .minimum_dlc      = CANFD_MINIMUM_DLC_0,
        .rx_buffer        = CANFD_RX_MB_0,
        .fifo_select_flags = CANFD_RX_FIFO_2
    }
}
};
```

## Basic Example

This is a basic example of minimal use of the CANFD module in an application.

*Note*

*On RA6M5 it is recommended to use RX FIFOs for reception as there are no interrupts for RX message buffers.*

```
#define CAN_EXAMPLE_ID (0x20)
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile canfd_error_t g_err_status = (canfd_error_t) 0;
void canfd_callback (can_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case CAN_EVENT_RX_COMPLETE:    /* Receive complete event. */
            {
                /* Read received frame */
                memcpy(&g_can_rx_frame, p_args->p_frame, sizeof(can_frame_t));
                /* Handle event */
                break;
            }
        case CAN_EVENT_TX_COMPLETE:    /* Transmit complete event. */
            {
                /* Handle event */
                break;
            }
        case CAN_EVENT_ERR_GLOBAL:      /* Global error. */
        case CAN_EVENT_ERR_CHANNEL:    /* Channel error. */
            {
                /* Get error status */
                g_err_status = (canfd_error_t) p_args->error; /* Check error code with
canfd_error_t. */
                /* Handle event */
                break;
            }
        default:
            {
                break;
            }
    }
}
```

```
    }  
  }  
}  
void canfd_basic_example (void)  
{  
    fsp_err_t err;  
    /* Initialize the CAN module */  
    err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
    /* Setup frame to write to CAN ID 0x20 */  
    g_can_tx_frame.id           = CAN_EXAMPLE_ID;  
    g_can_tx_frame.id_mode     = CAN_ID_MODE_STANDARD;  
    g_can_tx_frame.type        = CAN_FRAME_TYPE_DATA;  
    g_can_tx_frame.data_length_code = 8;  
    g_can_tx_frame.options     = 0;  
    /* Write some data to the transmit frame */  
    for (uint32_t i = 0; i < 8; i++)  
    {  
        g_can_tx_frame.data[i] = (uint8_t) i;  
    }  
    /* Send data on the bus */  
    err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);  
    assert(FSP_SUCCESS == err);  
    /* Wait for a transmit callback event */  
}
```

## Flexible Data

This example demonstrates sending an FD message with bitrate switching over external loopback. The CTX and CRX pins must be connected when using external loopback, though if a CAN transceiver is onboard a 120 Ohm resistor should be connected across CANH and CANL instead.

```
#define CAN_EXAMPLE_64_BYTES 64  
void canfd_fd_loopback_example (void)  
{
```

```
fsp_err_t err;

err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Switch to external loopback mode */
err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
assert(FSP_SUCCESS == err);

/* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
g_can_tx_frame.id           = CAN_EXAMPLE_ID;
g_can_tx_frame.id_mode     = CAN_ID_MODE_STANDARD;
g_can_tx_frame.type        = CAN_FRAME_TYPE_DATA;
g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
g_can_tx_frame.options     = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;

/* Write some data to the transmit frame */
for (uint32_t i = 0; i < CAN_DATA_BUFFER_LENGTH; i++)
{
    g_can_tx_frame.data[i] = (uint8_t) i;
}

/* Send data on the bus */
err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
assert(FSP_SUCCESS == err);

/* Wait for a transmit and/or receive callback event */
}
```

## Internal Bus

In this example two CANFD channels are connected to the Internal Bus test mode. API error checking has been omitted for clarity.

### Note

*Internal Bus mode is only available on MCUs with more than one CANFD channel. In addition, use of Global Modes for any other purpose is not recommended without consulting the device User's Manual.*

## Data Structures

```

uint8_t	delay_compensation	FD Transceiver Delay Compensation (enable or disable)
canfd_global_cfg_t *	p_global_cfg	Global configuration (global error callback channel only)

## Enumeration Type Documentation

### ◆ canfd\_status\_t

enum canfd_status_t	
CANFD Status	
Enumerator	
CANFD_STATUS_RESET_MODE	Channel in Reset mode.
CANFD_STATUS_HALT_MODE	Channel in Halt mode.
CANFD_STATUS_SLEEP_MODE	Channel in Sleep mode.
CANFD_STATUS_ERROR_PASSIVE	Channel in error-passive state.
CANFD_STATUS_BUS_OFF	Channel in bus-off state.
CANFD_STATUS_TRANSMITTING	Channel is transmitting.
CANFD_STATUS_RECEIVING	Channel is receiving.
CANFD_STATUS_READY	Channel is ready for communication.
CANFD_STATUS_ESI	At least one CAN-FD message was received with the ESI flag set.

## ◆ canfd\_error\_t

enum canfd_error_t	
CANFD Error Code	
Enumerator	
CANFD_ERROR_CHANNEL_BUS	Bus Error.
CANFD_ERROR_CHANNEL_WARNING	Error Warning (TX/RX error count over 0x5F)
CANFD_ERROR_CHANNEL_PASSIVE	Error Passive (TX/RX error count over 0x7F)
CANFD_ERROR_CHANNEL_BUS_OFF_ENTRY	Bus-Off State Entry.
CANFD_ERROR_CHANNEL_BUS_OFF_RECOVERY	Recovery from Bus-Off State.
CANFD_ERROR_CHANNEL_OVERLOAD	Overload.
CANFD_ERROR_CHANNEL_BUS_LOCK	Bus Locked.
CANFD_ERROR_CHANNEL_ARBITRATION_LOSS	Arbitration Lost.
CANFD_ERROR_CHANNEL_STUFF	Stuff Error.
CANFD_ERROR_CHANNEL_FORM	Form Error.
CANFD_ERROR_CHANNEL_ACK	ACK Error.
CANFD_ERROR_CHANNEL_CRC	CRC Error.
CANFD_ERROR_CHANNEL_BIT_RECESSIVE	Bit Error (recessive) Error.
CANFD_ERROR_CHANNEL_BIT_DOMINANT	Bit Error (dominant) Error.
CANFD_ERROR_CHANNEL_ACK_DELIMITER	ACK Delimiter Error.
CANFD_ERROR_GLOBAL_DLC	DLC Error.
CANFD_ERROR_GLOBAL_MESSAGE_LOST	Message Lost.
CANFD_ERROR_GLOBAL_PAYLOAD_OVERFLOW	FD Payload Overflow.
CANFD_ERROR_GLOBAL_TXQ_OVERWRITE	TX Queue Message Overwrite.
CANFD_ERROR_GLOBAL_TXQ_MESSAGE_LOST	TX Queue Message Lost.
CANFD_ERROR_GLOBAL_CH0_SCAN_FAIL	Channel 0 RX Scan Failure.

CANFD_ERROR_GLOBAL_CH1_SCAN_FAIL	Channel 1 RX Scan Failure.
CANFD_ERROR_GLOBAL_CH0_ECC	Channel 0 ECC Error.
CANFD_ERROR_GLOBAL_CH1_ECC	Channel 1 ECC Error.

#### ◆ canfd\_tx\_mb\_t

enum <a href="#">canfd_minimum_dlc_t</a>
CANFD AFL Minimum DLC settings

◆ **canfd\_frame\_options\_t**

enum <code>canfd_frame_options_t</code>	
CANFD Frame Options	
Enumerator	
<code>CANFD_FRAME_OPTION_ERROR</code>	Error state set (ESI).
<code>CANFD_FRAME_OPTION_BRS</code>	Bit Rate Switching (BRS) enabled.
<code>CANFD_FRAME_OPTION_FD</code>	Flexible Data frame (FDF).

**Function Documentation**◆ **R\_CANFD\_Open()**

```
fsp_err_t R_CANFD_Open ( can_ctrl_t *const p_api_ctrl, can_cfg_t const *const p_cfg )
```

Open and configure the CANFD channel for operation.

Example:

```
/* Initialize the CAN module */
err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
```

**Return values**

<code>FSP_SUCCESS</code>	Channel opened successfully.
<code>FSP_ERR_ALREADY_OPEN</code>	Driver already open.
<code>FSP_ERR_IN_USE</code>	Channel is already in use.
<code>FSP_ERR_IP_CHANNEL_NOT_PRESENT</code>	Channel does not exist on this MCU.
<code>FSP_ERR_ASSERTION</code>	A required pointer was NULL.
<code>FSP_ERR_CAN_INIT_FAILED</code>	The provided nominal or data bitrate is invalid.
<code>FSP_ERR_CLOCK_INACTIVE</code>	CANFD source clock is disabled (PLL or PLL2).

◆ **R\_CANFD\_Close()**

```
fsp_err_t R_CANFD_Close ( can_ctrl_t *const p_api_ctrl)
```

Close the CANFD channel.

**Return values**

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented.

◆ **R\_CANFD\_Write()**

```
fsp_err_t R_CANFD_Write ( can_ctrl_t *const p_api_ctrl, uint32_t buffer, can_frame_t *const p_frame )
```

Write data to the CANFD channel.

Example:

```
/* Send data on the bus */
err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress, cannot write data at this time.
FSP_ERR_INVALID_ARGUMENT	Data length or buffer number invalid.
FSP_ERR_INVALID_MODE	An FD option was set on a non-FD frame.
FSP_ERR_ASSERTION	One or more pointer arguments is NULL.
FSP_ERR_UNSUPPORTED	FD is not supported on this MCU.

◆ **R\_CANFD\_Read()**

```
fsp_err_t R_CANFD_Read ( can_ctrl_t *const p_api_ctrl, uint32_t buffer, can_frame_t *const p_frame )
```

Read data from a CANFD Message Buffer or FIFO.

Example: snippet r\_canfd\_example.c R\_CANFD\_Read

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	Buffer number invalid.
FSP_ERR_ASSERTION	p_api_ctrl or p_frame is NULL.
FSP_ERR_BUFFER_EMPTY	Buffer or FIFO is empty.

◆ **R\_CANFD\_ModeTransition()**

```
fsp_err_t R_CANFD_ModeTransition ( can_ctrl_t *const p_api_ctrl, can_operation_mode_t operation_mode, can_test_mode_t test_mode )
```

Switch to a different channel, global or test mode.

Example:

```
/* Switch to external loopback mode */
err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented
FSP_ERR_INVALID_MODE	Cannot change to the requested mode from the current global mode.

◆ **R\_CANFD\_InfoGet()**

```
fsp_err_t R_CANFD_InfoGet ( can_ctrl_t *const p_api_ctrl, can_info_t *const p_info )
```

Get CANFD state and status information for the channel.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented

◆ **R\_CANFD\_CallbackSet()**

```
fsp_err_t R_CANFD_CallbackSet ( can_ctrl_t *const p_api_ctrl, void(*) (can_callback_args_t *)
p_callback, void const *const p_context, can_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `can_api_t::callbackSet`.

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

**4.2.5.4 CEC (r\_cec)**

Modules » [Connectivity](#)

**Functions**

```
fsp_err_t R_CEC_Open ( cec_ctrl_t *const p_ctrl, cec_cfg_t const *const p_cfg)
```

```
fsp_err_t R_CEC_MediaInit ( cec_ctrl_t *const p_ctrl, cec_addr_t local_address)
```

```
fsp_err_t R_CEC_Close ( cec_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_CEC_Write ( cec_ctrl_t *const p_ctrl, cec_message_t const *const
p_message, uint32_t message_size)
```

```
fsp_err_t R_CEC_StatusGet (cec_ctrl_t *const p_ctrl, cec_status_t *const
p_status)
```

```

void(*p_callback)(cec_callback_args_t *), void const *const
p_context, cec_callback_args_t *const p_callback_memory)
```

## Detailed Description

Driver for the CEC peripheral on RA MCUs. This module implements the [CEC Interface](#).

## Overview

The HDMI CEC HAL module provides a high-level API for CEC applications and supports the CEC peripheral available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when data received, transmission complete, or error interrupts are received. The callback is passed a parameter which indicates the event as well as received data (if available).

## Features

- Conforms to High Definition Multimedia Interface (HDMI) Consumer Electronics Control (CEC) standard Ver. 1.4b.
- Full range of local address settings (TV, Recording Device, Playback Device, etc.)
- Data filtering based on matching destination address and local address.
- Supports a user-callback function (required), invoked when transmit, receive, or error interrupts are received.

## Configuration

### Build Time Configurations for r\_cec

The following build time configurations are defined in fsp\_cfg/r\_cec\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
CEC Message Max Data Size	Manual Entry	14	Maximum Data Size for CEC Message Transmission/Reception.

### Configurations for Connectivity > CEC (r\_cec)

This module can be added to the Stacks tab via New Stack > Connectivity > CEC (r\_cec). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid	g_cec0	Module name

	C symbol		
General > Callback Function	Manual Entry	g_rm_cec0_callback	Callback function
Control Configuration > Clock Select	<ul style="list-style-type: none"> <li>PCLKB / 32</li> <li>PCLKB / 64</li> <li>PCLKB / 128</li> <li>PCLKB / 256</li> <li>PCLKB / 512</li> <li>PCLKB / 1024</li> </ul>	PCLKB / 1024	CEC Clock Select Configuration

## Clock Configuration

The CEC peripheral uses the CECCLK or PCLKB as its clock source. To set the PCLKB frequency, use the Clocks tab of the RA Configuration editor.

### Note

*The selected clock and configured divider must be configured in the range of 23.4375 to 78.125 kHz.*

## Pin Configuration

A CEC channel uses one data pin - CECIO for data transmission and reception.

The output type for each pin should be set to **n-ch open drain** for most hardware designs. This can be configured in **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection->Ports.

## Usage Notes

### CEC Device Addresses

The CEC standard provides 13 device addresses that may be requested based on a device's primary function. Use `R_CEC_MediaInit` to request a specific address before starting communication with other devices.

#### Note

*Address 0 is always the primary display (TV). Do not attempt to allocate this address unless your device is intended to function as a display.*

### Limitations

Developers should be aware of the following limitations when using the CEC module:

- `R_CEC_MediaInit` may return `FSP_ERR_IN_USE` for up to 45 milliseconds after `R_CEC_Open` while the hardware initializes.
- The `CECIO` pin must be set to n-ch open drain mode.

## Examples

### Basic Example

This is a basic example of minimal use of the CEC in an application.

```
/*
*****
*****
* Application defined callback
* - May be assigned at compile-time via the e2 Studio configuration tool or set at
run-time via R_CEC_CallbackSet()
*****
*****/
void cec_callback (cec_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case CEC_EVENT_READY:
            {
                /* Application processing for address allocation success. */
                break;
            }
    }
}
```

```
    }
case CEC_EVENT_TX_COMPLETE:
    {
    /* Any required processing after transmission has completed. */
    break;
    }
case CEC_EVENT_ERR:
    {
    /* Error processing. See cec_error_t for possible errors. */
    break;
    }
case CEC_EVENT_RX_DATA:
    {
    /* Application to store and process received data bytes. */
    break;
    }
case CEC_EVENT_RX_COMPLETE:
    {
    /* Application processing for message reception complete. */
    }
}
/*****
*****
* Basic example
*****
*****/
#define CEC_TIMEOUT_MS (50)
#define CEC_MSG_STANDBY (0X36) /* See CEC Specification for message definitions */
void basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the CEC module */
    err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);
```

```
    assert(FSP_SUCCESS == err);

    /* Initialize the CEC module and allocate an address */
    uint32_t timeout_ms = CEC_TIMEOUT_MS;

do
    {
    /* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
R_CEC_Open */
        err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
        R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
    } while ((FSP_ERR_IN_USE == err) && --timeout_ms);
    assert(timeout_ms);
    assert(FSP_SUCCESS == err);

    /* Wait for local address allocation and CEC bus to be free */
    cec_status_t status;
    err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
while ((FSP_SUCCESS == err) && (CEC_STATE_READY != status.state))
    {
        err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
        assert(FSP_SUCCESS == err);
    }

    cec_message_t cec_msg;

    uint8_t      total_transmit_size;

    cec_msg.destination = CEC_ADDR_BROADCAST;           /* For this example, send message
to all devices on the bus */

    cec_msg.opcode      = CEC_MSG_STANDBY;             /* Send Standby Request */
    memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */

    total_transmit_size = 2U;                          /* Total message size, including
header, opcode, and data */

    /* Send asynchronous message.
* - Application will then be free for other processing while message is being sent.
* - Do not modify the message buffer until transmission has completed. */
    err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);
    assert(FSP_SUCCESS == err);
```

}

## Function Documentation

### ◆ R\_CEC\_Open()

```
fsp_err_t R_CEC_Open ( cec_ctrl_t *const p_ctrl, cec_cfg_t const *const p_cfg )
```

Open and configure the CEC module for operation.

Example:

```
/* Open the CEC module */
err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);
assert(FSP_SUCCESS == err);
```

### Return values

FSP_SUCCESS	CEC Module opened successfully.
FSP_ERR_ALREADY_OPEN	Driver already open.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_IRQ_BSP_DISABLED	Interrupts are not enabled.

◆ **R\_CEC\_MediaInit()**

```
fsp_err_t R_CEC_MediaInit ( cec_ctrl_t*const p_ctrl, cec_addr_t local_address )
```

Allocate provided CEC Local Address and Initialize the CEC module for operation.

**Note**

*After calling R\_CEC\_Open this function may return FSP\_ERR\_IN\_USE for up to 45 milliseconds.*

**Example:**

```
/* Initialize the CEC module and allocate an address */
uint32_t timeout_ms = CEC_TIMEOUT_MS;
do
{
/* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
R_CEC_Open */
err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
} while ((FSP_ERR_IN_USE == err) && --timeout_ms);
assert(timeout_ms);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	CEC Module Initialized successfully.
FSP_ERR_ASSERTION	An input argument is invalid or callback has not been set.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_IN_USE	HDMI CEC Bus is currently in use. Try again later.

◆ **R\_CEC\_Close()**

```
fsp_err_t R_CEC_Close ( cec_ctrl_t*const p_ctrl)
```

Close the CEC module.

**Return values**

FSP_SUCCESS	CEC Module closed successfully.
FSP_ERR_ASSERTION	An input argument is invalid.

◆ **R\_CEC\_Write()**

```
fsp_err_t R_CEC_Write ( cec_ctrl_t *const p_ctrl, cec_message_t const *const p_message, uint32_t message_size )
```

Write data to the CEC bus. Data transmission is asynchronous. Provided message buffer should not be modified until transmission is complete.

Data Transmission follows the pattern defined by the HDMI CEC Specification:

Data	Description	Size
Start Bit	Managed by Hardware, per config	N/A
Header Block	Source/Destination Identifier	1 Byte
Data Block 1	Opcode Value (Optional)	1 Byte
Data Block 2	Operands (Optional)	Variable (0-14 Bytes Typical)

Example:

```
cec_message_t cec_msg;

uint8_t total_transmit_size;

cec_msg.destination = CEC_ADDR_BROADCAST; /* For this example, send message
to all devices on the bus */

cec_msg.opcode = CEC_MSG_STANDBY; /* Send Standby Request */

memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */

total_transmit_size = 2U; /* Total message size, including
header, opcode, and data */

/* Send asynchronous message.
* - Application will then be free for other processing while message is being sent.
* - Do not modify the message buffer until transmission has completed. */

err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);

assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_NOT_INITIALIZED	Module has not been successfully initialized.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_SIZE	Invalid message size.
FSP_ERR_IN_USE	HDMI CEC Bus is currently in use. Try again

later.

◆ **R\_CEC\_StatusGet()**

```
fsp_err_t R_CEC_StatusGet ( cec_ctrl_t *const p_ctrl, cec_status_t *const p_status )
```

Provides the state and status information according to the provided CEC control instance.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	An input argument is invalid.

◆ **R\_CEC\_CallbackSet()**

```
fsp_err_t R_CEC_CallbackSet ( cec_ctrl_t *const p_ctrl, void(*) (cec_callback_args_t *) p_callback, void const *const p_context, cec_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `cec_api_t::callbackSet`.

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

**4.2.5.5 I2C Communication Device (rm\_comms\_i2c)**

Modules » [Connectivity](#)

**Functions**

```
fsp_err_t RM_COMMS_I2C_Open ( rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg )
```

Opens and configures the Communications Middle module. Implements `rm_comms_api_t::open`. [More...](#)

`fsp_err_t` [RM\\_COMMS\\_I2C\\_Close](#) (`rm_comms_ctrl_t *const p_api_ctrl`)

Disables specified Communications Middle module. Implements [rm\\_comms\\_api\\_t::close](#). [More...](#)

`fsp_err_t` [RM\\_COMMS\\_I2C\\_Read](#) (`rm_comms_ctrl_t *const p_api_ctrl`, `uint8_t *const p_dest`, `uint32_t const bytes`)

Performs a read from the I2C device. Implements [rm\\_comms\\_api\\_t::read](#). [More...](#)

`fsp_err_t` [RM\\_COMMS\\_I2C\\_Write](#) (`rm_comms_ctrl_t *const p_api_ctrl`, `uint8_t *const p_src`, `uint32_t const bytes`)

Performs a write from the I2C device. Implements [rm\\_comms\\_api\\_t::write](#). [More...](#)

`fsp_err_t` [RM\\_COMMS\\_I2C\\_WriteRead](#) (`rm_comms_ctrl_t *const p_api_ctrl`, `rm_comms_write_read_params_t const write_read_params`)

Performs a write to, then a read from the I2C device. Implements [rm\\_comms\\_api\\_t::writeRead](#). [More...](#)

`void` [rm\\_comms\\_i2c\\_callback](#) (`i2c_master_callback_args_t *p_args`)

Common callback function called in the I2C driver callback function.

## Detailed Description

Middleware to implement the I2C communications interface. This module implements the [Communicatons Middleware Interface](#).

## Overview

### Features

The implementation of the I2C communications interface has the following key features:

- Reading data from, writing data to I2C bus
- Writes to I2C bus, then reads with restart
- A single I2C bus used by multiple I2C devices

## Configuration

### Build Time Configurations for `rm_comms_i2c`

The following build time configurations are defined in `fsp_cfg/rm_comms_i2c_cfg.h`:

--	--	--	--

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Connectivity > I2C Shared Bus (rm\_comms\_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Shared Bus (rm\_comms\_i2c).

Configuration	Options	Default	Description
Name	Manual Entry	g_comms_i2c_bus0	Module name.
Bus Timeout	Value must be a non-negative integer	0xFFFFFFFF	Set timeout for locking bus in using RTOS.
Semaphore for Blocking (RTOS only)	<ul style="list-style-type: none"> <li>Unuse</li> <li>Use</li> </ul>	Unuse	Set Semaphore for blocking in using RTOS.
Recursive Mutex for Bus (RTOS only)	<ul style="list-style-type: none"> <li>Unuse</li> <li>Use</li> </ul>	Unuse	Set Mutex for locking bus in using RTOS.

### Configurations for Connectivity > I2C Communication Device (rm\_comms\_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Communication Device (rm\_comms\_i2c).

Configuration	Options	Default	Description
Name	Manual Entry	g_comms_i2c_device0	Module name.
Semaphore Timeout (RTOS only)	Value must be a non-negative integer	0xFFFFFFFF	Set timeout for blocking in using RTOS.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> <li>7-Bit</li> <li>10-Bit</li> </ul>	7-Bit	Select the I2C address mode.
Callback	Name must be a valid C symbol	comms_i2c_callback	A user callback function can be provided.

### Pin Configuration

This module uses SDA and SCL pins of I2C Master and SCI I2C.

## Usage Notes

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
  - If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.
- If an RTOS is used and blocking and bus lock is enabled, [RM\\_COMMS\\_I2C\\_Write\(\)](#),

`RM_COMMS_I2C_Read()` and `RM_COMMS_I2C_WriteRead()` cannot be called in callback.

## Bus Initialization

The I2C communications interface expects a bus instance to be opened before opening any specific I2C comms device. The communications interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

## Examples

### Basic Example

This is a basic example of minimal use of I2C communications implementation in an application.

```
void rm_comms_i2c_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
(rm_comms_i2c_bus_extended_cfg_t *) g_comms_i2c_cfg.p_extend;
    i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;

    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#ifdef BSP_CFG_RTOS
    /* Create a semaphore for blocking if a semaphore is not NULL */
    if (NULL != p_extend->p_blocking_semaphore)
    {
#ifdef BSP_CFG_RTOS == 1 // AzureOS
        tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
            p_extend->p_blocking_semaphore->p_semaphore_name,
            (ULONG) 0);
#elif BSP_CFG_RTOS == 2 // FreeRTOS
        *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                (UBaseType_t) 0,
                p_extend->p_blocking_semaphore->p_semaphore_memory);
#endif
    }
#endif
}
```

```
#endif
}

/* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
if (NULL != p_extend->p_bus_recursive_mutex)
{
#ifdef BSP_CFG_RTOS == 1 // AzureOS
    tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                   p_extend->p_bus_recursive_mutex->p_mutex_name,
                   TX_INHERIT);
#elif BSP_CFG_RTOS == 2 // FreeRTOS
    *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
        xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
mutex_memory);
#endif
}
#endif

err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
/* Handle any errors. This function should be defined by the user. */
handle_error(err);

while (true)
{
    g_flag = 0;
    /* Send data to an I2C device. */
    RM_COMMS_I2C_Write(&g_comms_i2c_ctrl, &write_data, 1);
    while (0 == g_flag)
    {
        /* Wait callback */
    }
    g_flag = 0;
    /* Receive data from an I2C device. */
    RM_COMMS_I2C_Read(&g_comms_i2c_ctrl, &read_data, 1);
    while (0 == g_flag)
    {
        /* Wait callback */
    }
}
```

```

    }
}
}

```

## Data Structures

```
struct rm_comms_i2c_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_comms\_i2c\_instance\_ctrl\_t

struct rm_comms_i2c_instance_ctrl_t	
Communications middleware control structure.	
<b>Data Fields</b>	
rm_comms_cfg_t const *	p_cfg
	middleware configuration.
rm_comms_i2c_bus_extende d_cfg_t *	p_bus
	Bus using this device;.
void *	p_lower_level_cfg
	Used to reconfigure I2C driver.
uint32_t	open
	Open flag.
uint32_t	transfer_data_bytes
	Size of transfer data.
uint8_t *	p_transfer_data
	Pointer to transfer data buffer.

void const *	<a href="#">p_context</a>
	Pointer to the user-provided context.

## Function Documentation

### ◆ RM\_COMMS\_I2C\_Open()

```
fsp_err_t RM_COMMS_I2C_Open ( rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg )
```

Opens and configures the Communications Middle module. Implements [rm\\_comms\\_api\\_t::open](#).

Example:

```
err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
```

#### Return values

FSP_SUCCESS	Communications Middle module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_COMMS_BUS_NOT_OPEN	I2C driver is not open.

### ◆ RM\_COMMS\_I2C\_Close()

```
fsp_err_t RM_COMMS_I2C_Close ( rm_comms_ctrl_t *const p_api_ctrl)
```

Disables specified Communications Middle module. Implements [rm\\_comms\\_api\\_t::close](#).

#### Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_COMMS\_I2C\_Read()**

```
fsp_err_t RM_COMMS_I2C_Read ( rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_dest,
uint32_t const bytes )
```

Performs a read from the I2C device. Implements `rm_comms_api_t::read`.

**Return values**

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_COMMS\_I2C\_Write()**

```
fsp_err_t RM_COMMS_I2C_Write ( rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes )
```

Performs a write from the I2C device. Implements `rm_comms_api_t::write`.

**Return values**

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_COMMS\_I2C\_WriteRead()**

```
fsp_err_t RM_COMMS_I2C_WriteRead ( rm_comms_ctrl_t *const p_api_ctrl,
rm_comms_write_read_params_t const write_read_params )
```

Performs a write to, then a read from the I2C device. Implements `rm_comms_api_t::writeRead`.

**Return values**

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

**4.2.5.6 I2C Master (r\_iic\_b\_master)**

## Detailed Description

I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

## Overview

The I2C master on IIC/I3C HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

## Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

## Configuration

### Build Time Configurations for r\_iic\_b\_master

The following build time configurations are defined in fsp\_cfg/r\_iic\_b\_master\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

### Configurations for Connectivity > I2C Master (r\_iic\_b\_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r\_iic\_b\_master). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c_master0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	<ul style="list-style-type: none"> <li>Standard</li> <li>Fast-mode</li> <li>Fast-mode plus</li> </ul>	Standard	Select the transfer rate.  If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated <a href="#">iic_b_master_extended</a>

[\\_cfg\\_t](#) structure.

Rise Time (ns)	Value must be a non-negative integer	120	Set the rise time (tr) in nanoseconds.
Fall Time (ns)	Value must be a non-negative integer	120	Set the fall time (tf) in nanoseconds.
Duty Cycle (%)	Value must be an integer between 0 and 100	50	Set the SCL duty cycle.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> <li>• 7-Bit</li> <li>• 10-Bit</li> </ul>	7-Bit	Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here.
Timeout Mode	<ul style="list-style-type: none"> <li>• Short Mode</li> <li>• Long Mode</li> </ul>	Short Mode	Select the timeout mode to detect bus hang.
Timeout during SCL Low	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Select if the timeout can occur when SCL is held low for a duration longer than what is set in the timeout mode.
Callback	Name must be a valid C symbol	g_iic_b_master0_callback	A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status.
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts.

## Clock Configuration

The I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

## Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two

pins - SDA and SCL for data/address and clock respectively.

## Usage Notes

### Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

### IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current IICCLK/PCLKD (based on the MCU) settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Transfer \(r\\_dtc\)](#)

### Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

### Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

### Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

## Examples

### Basic Example

This is a basic example of minimal use of the r\_iic\_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel      = I2C_CHANNEL,
    .rate        = I2C_MASTER_RATE_FAST,
    .slave       = I2C_SLAVE_EEPROM,
    .addr_mode   = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback  = i2c_callback,    // Callback
    .p_context   = &g_i2c_device_ctrl_1,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend    = &g_iic_b_master_cfg_extend
};

void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}

void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    /* Initialize the IIC module */
    err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Write some data to the transmit buffer */
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
        g_i2c_tx_buffer[i] = (uint8_t) i;
    }
    /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
```

```
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
    /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_B_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
    /* Verify the read data */
    if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
        __BKPT(0);
    }
}
```

## Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

### Note

*The callback function from the first example applies to this example as well.*

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
    .channel          = I2C_CHANNEL,
    .rate             = I2C_MASTER_RATE_STANDARD,
    .slave            = I2C_SLAVE_TEMP_SENSOR,
    .addr_mode        = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback       = i2c_callback,    // Callback
    .p_context        = &g_i2c_device_ctrl_2,
    .p_transfer_tx    = NULL,
    .p_transfer_rx    = NULL,
    .p_extend         = &g_iic_b_master_cfg_extend
};

void single_channel_multi_slave (void)
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
    /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_B_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
```

```

    {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
/* Send data to I2C slave on the same channel */
err = R_IIC_B_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
assert(FSP_SUCCESS == err);
g_i2c_tx_buffer[0] = 0xAA; // NOLINT
g_i2c_tx_buffer[1] = 0xBB; // NOLINT
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
}

```

**Function Documentation**◆ **R\_IIC\_B\_MASTER\_Open()**

fsp_err_t R_IIC_B_MASTER_Open ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg )	
Opens the I2C device.	
<b>Return values</b>	
FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ol style="list-style-type: none"> <li>1. p_api_ctrl or p_cfg is NULL.</li> <li>2. extended parameter is NULL.</li> <li>3. Callback parameter is NULL.</li> <li>4. Set the rate to fast mode plus on a channel which does not support it.</li> <li>5. Invalid IRQ number assigned</li> </ol>

◆ **R\_IIC\_B\_MASTER\_Read()**

```
fsp_err_t R_IIC_B_MASTER_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest,
uint32_t const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C\_MASTER\_EVENT\_RX\_COMPLETE in the callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl, p_dest or bytes is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

◆ **R\_IIC\_B\_MASTER\_Write()**

```
fsp_err_t R_IIC_B_MASTER_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src,
uint32_t const bytes, bool const restart )
```

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C\_MASTER\_EVENT\_TX\_COMPLETE in the callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

◆ **R\_IIC\_B\_MASTER\_Abort()**

```
fsp_err_t R_IIC_B_MASTER_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

**Return values**

FSP_SUCCESS	Channel was reset successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

*Note*

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

◆ **R\_IIC\_B\_MASTER\_SlaveAddressSet()**

```
fsp_err_t R_IIC_B_MASTER_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave, i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

**Return values**

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	Pointer to control structure is NULL.
FSP_ERR_IN_USE	Another transfer was in-progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

◆ **R\_IIC\_B\_MASTER\_CallbackSet()**

```
fsp_err_t R_IIC_B_MASTER_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R\_IIC\_B\_MASTER\_StatusGet()**

```
fsp_err_t R_IIC_B_MASTER_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

**Return values**

FSP_SUCCESS	Status stored in <code>p_status</code> .
FSP_ERR_ASSERTION	NULL pointer.

◆ **R\_IIC\_B\_MASTER\_Close()**

```
fsp_err_t R_IIC_B_MASTER_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers.

**Return values**

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

**Note**

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

fsp_err_t R_IIC_MASTER_Close (i2c_master_ctrl_t *const p_api_ctrl)
```

## Detailed Description

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

## Overview

The I2C master on IIC HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

## Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

## Configuration

### Build Time Configurations for r\_iic\_master

The following build time configurations are defined in fsp\_cfg/r\_iic\_master\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

### Configurations for Connectivity > I2C Master (r\_iic\_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r\_iic\_master). Non-secure callable guard functions can be generated for this module by right clicking

the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c_master0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	<ul style="list-style-type: none"> <li>Standard</li> <li>Fast-mode</li> <li>Fast-mode plus</li> </ul>	Standard	<p>Select the transfer rate.</p> <p>If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated <a href="#">iic_master_extended_cfg_t</a> structure.</p>
Rise Time (ns)	Value must be a non-negative integer	120	Set the rise time (tr) in nanoseconds.
Fall Time (ns)	Value must be a non-negative integer	120	Set the fall time (tf) in nanoseconds.
Duty Cycle (%)	Value must be an integer between 0 and 100	50	Set the SCL duty cycle.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> <li>7-Bit</li> <li>10-Bit</li> </ul>	7-Bit	Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here.
Timeout Mode	<ul style="list-style-type: none"> <li>Short Mode</li> <li>Long Mode</li> </ul>	Short Mode	Select the timeout mode to detect bus hang.
Timeout during SCL Low	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	Select if the timeout can occur when SCL is held low for a duration longer than what is set in the timeout mode.

Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status.
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts.

## Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

## Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

## Usage Notes

### Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

### IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Transfer \(r\\_dtc\)](#)

## Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

## Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

## Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

# Examples

## Basic Example

This is a basic example of minimal use of the r\_iic\_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel      = I2C_CHANNEL,
    .rate         = I2C_MASTER_RATE_FAST,
    .slave        = I2C_SLAVE_EEPROM,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback   = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_1,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend     = &g_iic_master_cfg_extend
};
void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
    fsp_err_t err;
```

```
uint32_t i;
uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
/* Initialize the IIC module */
err = R_IIC_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Write some data to the transmit buffer */
for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
{
    g_i2c_tx_buffer[i] = (uint8_t) i;
}
/* Send data to I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
err = R_IIC_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
err = R_IIC_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
```

```

{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Verify the read data */
if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
{
    __BKPT(0);
}
}

```

### Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

#### Note

*The callback function from the first example applies to this example as well.*

```

iic_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
    .channel      = I2C_CHANNEL,
    .rate         = I2C_MASTER_RATE_STANDARD,
    .slave        = I2C_SLAVE_TEMP_SENSOR,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback   = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_2,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend     = &g_iic_master_cfg_extend
};
void single_channel_multi_slave (void)

```

```
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    err = R_IIC_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
    /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
    /* Send data to I2C slave on the same channel */
    err = R_IIC_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0] = 0xAA; // NOLINT
    g_i2c_tx_buffer[1] = 0xBB; // NOLINT
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
```

```

R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

    timeout_ms--;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
}

```

## Function Documentation

◆ **R\_IIC\_MASTER\_Open()**

```
fsp_err_t R_IIC_MASTER_Open ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg )
```

Opens the I2C device.

**Return values**

FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> <li>1. p_api_ctrl or p_cfg is NULL.</li> <li>2. extended parameter is NULL.</li> <li>3. Callback parameter is NULL.</li> <li>4. Set the rate to fast mode plus on a channel which does not support it.</li> <li>5. Invalid IRQ number assigned</li> </ul>

◆ **R\_IIC\_MASTER\_Read()**

```
fsp_err_t R_IIC_MASTER_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C\_MASTER\_EVENT\_RX\_COMPLETE in the callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl, p_dest or bytes is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

◆ **R\_IIC\_MASTER\_Write()**

```
fsp_err_t R_IIC_MASTER_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C\_MASTER\_EVENT\_TX\_COMPLETE in the callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

◆ **R\_IIC\_MASTER\_Abort()**

```
fsp_err_t R_IIC_MASTER_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

**Return values**

FSP_SUCCESS	Channel was reset successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

**Note**

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

### ◆ R\_IIC\_MASTER\_SlaveAddressSet()

```
fsp_err_t R_IIC_MASTER_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave, i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

#### Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	Pointer to control structure is NULL.
FSP_ERR_IN_USE	Another transfer was in-progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

### ◆ R\_IIC\_MASTER\_CallbackSet()

```
fsp_err_t R_IIC_MASTER_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl, void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context, i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

#### Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R\_IIC\_MASTER\_StatusGet()**

```
fsp_err_t R_IIC_MASTER_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

**Return values**

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

◆ **R\_IIC\_MASTER\_Close()**

```
fsp_err_t R_IIC_MASTER_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers.

**Return values**

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

*Note*

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

**4.2.5.8 I2C Master (r\_sci\_b\_i2c)**

Modules » [Connectivity](#)

**Functions**

```
fsp_err_t R_SCI_B_I2C_Open (i2c_master_ctrl_t *const p_api_ctrl,
i2c_master_cfg_t const *const p_cfg)

i2c_master_status_t *p_status)
```

```
fsp_err_t R_SCI_B_I2C_Close (i2c_master_ctrl_t *const p_api_ctrl)
```

## Detailed Description

Driver for the SCI\_B peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

## Overview

The Simple I2C master on SCI\_B HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100 kHz transaction rate.
  - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

## Configuration

### Build Time Configurations for r\_sci\_b\_i2c

The following build time configurations are defined in fsp\_cfg/r\_sci\_b\_i2c\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, DTC instances will be

included in the build for both transmission and reception.

10-bit slave addressing      • Enabled      Disabled  
    • Disabled

If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

### Configurations for Connectivity > I2C Master (r\_sci\_b\_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r\_sci\_b\_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c0	Module name.
Channel	Value must be an integer between 0 and 9	0	Select the SCI channel.
Slave Address	Value must be a hex value	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> <li>7-Bit</li> <li>10-Bit</li> </ul>	7-Bit	Select the address mode.
Rate	<ul style="list-style-type: none"> <li>Standard</li> <li>Fast-mode</li> </ul>	Standard	Select the I2C data rate.  If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated <a href="#">sci_b_i2c_extended_cfg_t</a> structure.
SDA Output Delay (nano seconds)	Must be a valid non-negative integer with maximum configurable value of 300	300	Specify the SDA output delay in nanoseconds.
Noise Filter Clock Select	<ul style="list-style-type: none"> <li>The on-chip baud rate</li> </ul>	The on-chip baud rate generator source clock	Select the on-chip baud rate generator source

	<ul style="list-style-type: none"> <li>generator source clock divided by 1</li> <li>The on-chip baud rate generator source clock divided by 2</li> <li>The on-chip baud rate generator source clock divided by 4</li> <li>The on-chip baud rate generator source clock divided by 8</li> </ul>	divided by 1	clock division setting for the digital noise filter
Clock Source	<ul style="list-style-type: none"> <li>PCLK</li> <li>SCISPICK</li> </ul>	PCLK	Select the clock source for the SCI I2C module.
Bit Rate Modulation	<ul style="list-style-type: none"> <li>Enable</li> <li>Disable</li> </ul>	Enable	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.
Callback	Name must be a valid C symbol	sci_b_i2c_master_callba ck	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts.
RX Interrupt Priority Level [Only used when DTC is enabled]	MCU Specific Options		Select the interrupt priority level. This is set for RXI only when DTC is enabled.

## Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	PCLKA

The actual I2C transfer rate can be derived from either SCISPICK or the peripheral clock (PCLK)<sup>1</sup>, and will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the selected clock is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

*Note*

1. See Figure 26.2 in the RA6T2 manual for more information.

## Pin Configuration

The SCI\_B I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

## Usage Notes

### Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

### SCI\_B I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Enabling DTC with the SCI\_B I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI\_B I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Transfer \(r\\_dtc\)](#)

### Multiple Devices on the Bus

- A single SCI\_B I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

### Restart

- SCI\_B\_I2C can hold the the bus after an I2C transaction by issuing a repeated start condition.

## Examples

### Basic Example

This is a basic example of minimal use of the r\_sci\_b\_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    /* Initialize the I2C module */
    err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Write some data to the transmit buffer */
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
        g_i2c_tx_buffer[i] = (uint8_t) i;
    }
    /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
}
```

```
    }

    /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);

    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }

    /* Verify the read data */
    if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
        __BKPT(0);
    }
}
```

### Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI\_B I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);

    /* Handle any errors. This function should be defined by the user. */
}
```

```
    assert(FSP_SUCCESS == err);
/* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
/* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
/* Send data to I2C slave on the same channel */
    err = R_SCI_B_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0] = (uint8_t) I2C_EXAMPLE_DATA_1;
    g_i2c_tx_buffer[1] = (uint8_t) I2C_EXAMPLE_DATA_2;
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
```

```

    __BKPT(0);
}
}

```

enum [sci\\_b\\_i2c\\_clock\\_source\\_t](#)

## Data Structure Documentation

### ◆ sci\_b\_i2c\_clock\_settings\_t

struct sci_b_i2c_clock_settings_t		
I2C clock settings		
Data Fields		
bool	bitrate_modulation	Bit-rate Modulation Function enable or disable.
uint8_t	brr_value	Bit rate register settings.
uint8_t	clk_divisor_value	Clock Select settings.
uint8_t	mddr_value	Modulation Duty Register settings.
uint8_t	cycles_value	SDA Delay Output Cycles Select.
uint8_t	snfr_value	Noise Filter Setting Register value.
<a href="#">sci_b_i2c_clock_source_t</a>	clock_source	Clock source (PCLK or SCISPICK)

### ◆ sci\_b\_i2c\_instance\_ctrl\_t

struct sci_b_i2c_instance_ctrl_t
I2C control structure. DO NOT INITIALIZE.

### ◆ sci\_b\_i2c\_extended\_cfg\_t

struct sci_b_i2c_extended_cfg_t
SCI I2C extended configuration

Data Fields		
<a href="#">sci_b_i2c_clock_settings_t</a>	clock_settings	I2C Clock settings.

## Enumeration Type Documentation

### ◆ sci\_b\_i2c\_clock\_source\_t

enum <a href="#">sci_b_i2c_clock_source_t</a>
SCI clock source

## Function Documentation

### ◆ R\_SCI\_B\_I2C\_Open()

fsp_err_t R_SCI_B_I2C_Open ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg )	
Opens the I2C device.	
<b>Return values</b>	
FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ol style="list-style-type: none"> <li>1. p_api_ctrl or p_cfg is NULL.</li> <li>2. extended parameter is NULL.</li> <li>3. Callback parameter is NULL.</li> <li>4. Clock rate requested is greater than 400KHz</li> <li>5. Invalid IRQ number assigned</li> </ol>

◆ **R\_SCI\_B\_I2C\_Read()**

```
fsp_err_t R_SCI_B_I2C_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C\_MASTER\_EVENT\_RX\_COMPLETE in the callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl, p_dest is NULL, bytes is 0.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R\_SCI\_B\_I2C\_Write()**

```
fsp_err_t R_SCI_B_I2C_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C\_EVENT\_TX\_COMPLETE in the callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_ctrl, p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R\_SCI\_B\_I2C\_Abort()**

```
fsp_err_t R_SCI_B_I2C_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

**Return values**

FSP_SUCCESS	Transaction was aborted without issue.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R\_SCI\_B\_I2C\_SlaveAddressSet()**

```
fsp_err_t R_SCI_B_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave,
i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

**Return values**

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	p_ctrl or address is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.
FSP_ERR_IN_USE	An I2C Transaction is in progress.

◆ **R\_SCI\_B\_I2C\_CallbackSet()**

```
fsp_err_t R_SCI_B_I2C_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R\_SCI\_B\_I2C\_StatusGet()**

```
fsp_err_t R_SCI_B_I2C_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

**Return values**

FSP_SUCCESS	Status stored in <code>p_status</code> .
FSP_ERR_ASSERTION	NULL pointer.

◆ **R\_SCI\_B\_I2C\_Close()**

```
fsp_err_t R_SCI_B_I2C_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

**Return values**

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

fsp_err_t	R_SCI_I2C_StatusGet (i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *p_status)
fsp_err_t	R_SCI_I2C_Close (i2c_master_ctrl_t *const p_api_ctrl)

#### Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

## Overview

The Simple I2C master on SCI HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

#### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100 kHz transaction rate.
  - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.

- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

## Configuration

### Build Time Configurations for r\_sci\_i2c

The following build time configurations are defined in fsp\_cfg/r\_sci\_i2c\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

### Configurations for Connectivity > I2C Master (r\_sci\_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r\_sci\_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c0	Module name.
Channel	Value must be an integer between 0 and 9	0	Select the SCI channel.
Slave Address	Value must be a hex value	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> <li>• 7-Bit</li> <li>• 10-Bit</li> </ul>	7-Bit	Select the address mode.
Rate	<ul style="list-style-type: none"> <li>• Standard</li> <li>• Fast-mode</li> </ul>	Standard	Select the I2C data rate.
			If the requested transfer rate cannot be

achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated [sci\\_i2c\\_extended\\_cfg\\_t](#) structure.

SDA Output Delay (nano seconds)	Must be a valid non-negative integer with maximum configurable value of 300	300	Specify the SDA output delay in nanoseconds.
Noise filter setting	<ul style="list-style-type: none"> <li>• Use clock signal divided by 1 with noise filter</li> <li>• Use clock signal divided by 2 with noise filter</li> <li>• Use clock signal divided by 4 with noise filter</li> <li>• Use clock signal divided by 8 with noise filter</li> </ul>	Use clock signal divided by 1 with noise filter	Select the sampling clock for the digital noise filter
Bit Rate Modulation	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Enable	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.
Callback	Name must be a valid C symbol	sci_i2c_master_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI (if used),

TEI interrupts.

Select the interrupt priority level. This is set for RXI only when DTC is enabled.

RX Interrupt Priority Level [Only used when DTC is enabled]      MCU Specific Options

## Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA

The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the PCLK is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

## Pin Configuration

The SCI I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

## Usage Notes

### Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

### SCI I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Enabling DTC with the SCI I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Transfer \(r\\_dtc\)](#)

### Multiple Devices on the Bus

- A single SCI I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

### Restart

- SCI I2C master can hold the the bus after an I2C transaction by issuing Restart. This will mimic a stop followed by start condition.

## Examples

### Basic Example

This is a basic example of minimal use of the r\_sci\_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
    fsp_err_t err;

    uint32_t i;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    /* Initialize the I2C module */
    err = R_SCI_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);

    /* Handle any errors. This function should be defined by the user. */
}
```

```
    assert(FSP_SUCCESS == err);

    /* Write some data to the transmit buffer */
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
        g_i2c_tx_buffer[i] = (uint8_t) i;
    }

    /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);

    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }

    /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);

    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
```

```
{
    __BKPT(0);
}
/* Verify the read data */
if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
{
    __BKPT(0);
}
}
```

### Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
    /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
```

```

{
    __BKPT(0);
}

/* Send data to I2C slave on the same channel */
err = R_SCI_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2, I2C_SLAVE_DISPLAY_ADAPTER,
I2C_MASTER_ADDR_MODE_7BIT);

assert(FSP_SUCCESS == err);

g_i2c_tx_buffer[0] = (uint8_t) I2C_EXAMPLE_DATA_1;
g_i2c_tx_buffer[1] = (uint8_t) I2C_EXAMPLE_DATA_2;
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;

err = R_SCI_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);

SCI I2C extended configuration		
Data Fields		
sci_i2c_clock_settings_t	clock_settings	I2C Clock settings.

### Function Documentation

#### ◆ R\_SCI\_I2C\_Open()

fsp_err_t R_SCI_I2C_Open ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg )	
Opens the I2C device.	
<b>Return values</b>	
FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> <li>1. p_api_ctrl or p_cfg is NULL.</li> <li>2. extended parameter is NULL.</li> <li>3. Callback parameter is NULL.</li> <li>4. Clock rate requested is greater than 400KHz</li> <li>5. Invalid IRQ number assigned</li> </ul>

◆ **R\_SCI\_I2C\_Read()**

```
fsp_err_t R_SCI_I2C_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C\_MASTER\_EVENT\_RX\_COMPLETE in the callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl, p_dest is NULL, bytes is 0.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R\_SCI\_I2C\_Write()**

```
fsp_err_t R_SCI_I2C_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C\_EVENT\_TX\_COMPLETE in the callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_ctrl, p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R\_SCI\_I2C\_Abort()**

```
fsp_err_t R_SCI_I2C_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

**Return values**

FSP_SUCCESS	Transaction was aborted without issue.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R\_SCI\_I2C\_SlaveAddressSet()**

```
fsp_err_t R_SCI_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave,
i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

**Return values**

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	p_ctrl or address is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.
FSP_ERR_IN_USE	An I2C Transaction is in progress.

◆ **R\_SCI\_I2C\_CallbackSet()**

```
fsp_err_t R_SCI_I2C_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R\_SCI\_I2C\_StatusGet()**

```
fsp_err_t R_SCI_I2C_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t * p_status )
```

Provides driver status.

**Return values**

FSP_SUCCESS	Status stored in <code>p_status</code> .
FSP_ERR_ASSERTION	NULL pointer.

◆ **R\_SCI\_I2C\_Close()**

```
fsp_err_t R_SCI_I2C_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

**Return values**

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

fsp\_err\_t R\_IIC\_B\_SLAVE\_Close (i2c\_slave\_ctrl\_t \*const p\_api\_ctrl)

#### Detailed Description

Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

## Overview

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.
- Write data which is read by master device.
- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.

## Configuration

### Build Time Configurations for r\_iic\_b\_slave

The following build time configurations are defined in fsp\_cfg/r\_iic\_b\_slave\_cfg.h:

--	--	--

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Connectivity > I2C Slave (r\_iic\_b\_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r\_iic\_b\_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Interrupt Priority Level > Transmit, Receive, and Transmit End	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts.
Interrupt Priority Level > Error	MCU Specific Options		Select the interrupt priority level. This is set for ERI interrupt.
Name	Name must be a valid C symbol	g_i2c_slave0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	<ul style="list-style-type: none"> <li>Standard</li> <li>Fast-mode</li> <li>Fast-mode plus</li> </ul>	Standard	Select the transfer rate.  If the delay for the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated delay is printed in a comment in the generated <a href="#">iic_b_slave_extended_cfg_t</a> structure.
Internal Reference Clock	<ul style="list-style-type: none"> <li>I2C Clock / 1</li> <li>I2C Clock / 2</li> <li>I2C Clock / 4</li> <li>I2C Clock / 8</li> <li>I2C Clock / 16</li> <li>I2C Clock / 32</li> <li>I2C Clock / 64</li> <li>I2C Clock / 128</li> </ul>	I2C Clock / 1	Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples. I2C Clock can be either IICCLK or PCLKD based

on the MCU.

Digital Noise Filter Stage Select	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Single-stage filter</li> <li>• 2-stage filter</li> <li>• 3-stage filter</li> <li>• 4-stage filter</li> </ul>	3-stage filter	Select the number of digital filter stages for IIC Slave.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
General Call	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Allows the slave to respond to general call address: 0x00.
Address Mode	<ul style="list-style-type: none"> <li>• 7-Bit</li> <li>• 10-Bit</li> </ul>	7-Bit	Select the slave address mode.
Clock Stretching	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Configure Clock Stretching.
Callback	Name must be a valid C symbol	g_iic_b_slave0_callback	A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status.

## Clock Configuration

The IIC/I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

## Pin Configuration

The IIC/I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

# Usage Notes

## Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.

*Note*

*: During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next*

*transaction is initiated.*

*: To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.*

## Callback

- A callback function must be provided which will be invoked for the cases below:
  - An I2C Master initiates a transmission or reception:  
I2C\_SLAVE\_EVENT\_TX\_REQUEST; I2C\_SLAVE\_EVENT\_RX\_REQUEST
  - A Transmission or reception has been completed:  
I2C\_SLAVE\_EVENT\_TX\_COMPLETE; I2C\_SLAVE\_EVENT\_RX\_COMPLETE
  - An I2C Master is requesting to read or write more data:  
I2C\_SLAVE\_EVENT\_TX\_MORE\_REQUEST; I2C\_SLAVE\_EVENT\_RX\_MORE\_REQUEST
  - Error conditions: I2C\_SLAVE\_EVENT\_ABORTED
  - An I2C Master initiates a general call by passing 0x00 as slave address:  
I2C\_SLAVE\_EVENT\_GENERAL\_CALL
- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

IIC Slave Callback Event	IIC Slave API expected to be called
I2C_SLAVE_EVENT_ABORTED	Handle event based on application
I2C_SLAVE_EVENT_RX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_TX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_RX_REQUEST	R_IIC_B_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_REQUEST	R_IIC_B_SLAVE_Write API
I2C_SLAVE_EVENT_RX_MORE_REQUEST	R_IIC_B_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_MORE_REQUEST	R_IIC_B_SLAVE_Write API
I2C_SLAVE_EVENT_GENERAL_CALL	R_IIC_B_SLAVE_Read

- If parameter checking is enabled and R\_IIC\_B\_SLAVE\_Read API is not called for I2C\_SLAVE\_EVENT\_RX\_REQUEST and/or I2C\_SLAVE\_EVENT\_RX\_MORE\_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R\_IIC\_B\_SLAVE\_Write API is not called for I2C\_SLAVE\_EVENT\_TX\_REQUEST and/or I2C\_SLAVE\_EVENT\_TX\_MORE\_REQUEST:
  - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
  - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

## IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current I2C Clock (IICCLK or PCLKD based on the MCU) settings is calculated and used.

## Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.

## Examples

### Basic Example

This is a basic example of minimal use of the R\_IIC\_B\_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
{
    .channel      = I2C_MASTER_CHANNEL_2,
    .rate         = I2C_MASTER_RATE_STANDARD,
    .slave        = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback   = i2c_master_callback, // Callback
    .p_context    = &g_i2c_master_ctrl,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend     = &g_iic_master_cfg_extend_standard_mode
};
iic_b_slave_instance_ctrl_t g_i2c_slave_ctrl;
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel      = I2C_SLAVE_CHANNEL_0,
    .rate         = I2C_SLAVE_RATE_STANDARD,
    .slave        = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode    = I2C_SLAVE_ADDR_MODE_7BIT,
    .p_callback   = i2c_slave_callback, // Callback
    .p_context    = &g_i2c_slave_ctrl,
```

```
.p_extend = &g_iic_slave_cfg_extend_standard_mode
};

## Function Documentation

◆ **R\_IIC\_B\_SLAVE\_Open()**

```
fsp_err_t R_IIC_B_SLAVE_Open ( i2c_slave_ctrl_t *const p_api_ctrl, i2c_slave_cfg_t const *const p_cfg )
```

Opens the I2C slave device.

**Return values**

FSP_SUCCESS	I2C slave device opened successfully.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_INVALID_ARGUMENT	Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> <li>1. p_api_ctrl or p_cfg is NULL.</li> <li>2. extended parameter is NULL.</li> <li>3. Callback parameter is NULL.</li> <li>4. Set the rate to fast mode plus on a channel which does not support it.</li> <li>5. Invalid IRQ number assigned</li> </ul>

◆ **R\_IIC\_B\_SLAVE\_Read()**

```
fsp_err_t R_IIC_B_SLAVE_Read ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C\_SLAVE\_EVENT\_RX\_COMPLETE in the callback. In case the master continues to write more data, an I2C\_SLAVE\_EVENT\_RX\_MORE\_REQUEST will be issued via callback. In case of errors, an I2C\_SLAVE\_EVENT\_ABORTED will be issued via callback.

**Return values**

FSP_SUCCESS	Function executed without issue
FSP_ERR_ASSERTION	p_api_ctrl, bytes or p_dest is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ **R\_IIC\_B\_SLAVE\_Write()**

```
fsp_err_t R_IIC_B_SLAVE_Write ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes )
```

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C\_SLAVE\_EVENT\_TX\_COMPLETE in the callback. In case the master continues to read more data, an I2C\_SLAVE\_EVENT\_TX\_MORE\_REQUEST will be issued via callback. In case of errors, an I2C\_SLAVE\_EVENT\_ABORTED will be issued via callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ **R\_IIC\_B\_SLAVE\_CallbackSet()**

```
fsp_err_t R_IIC_B_SLAVE_CallbackSet ( i2c_slave_ctrl_t *const p_api_ctrl,
void(*) (i2c_slave_callback_args_t *) p_callback, void const *const p_context,
i2c_slave_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_slave_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

**◆ R\_IIC\_B\_SLAVE\_Close()**

```
fsp_err_t R_IIC_B_SLAVE_Close ( i2c_slave_ctrl_t *const p_api_ctrl)
```

Closes the I2C device.

**Return values**

FSP_SUCCESS	Device closed successfully.
FSP_ERR_NOT_OPEN	Device not opened.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.

**Detailed Description**

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

**Overview****Features**

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.

- Write data which is read by master device.
- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.

## Configuration

### Build Time Configurations for r\_iic\_slave

The following build time configurations are defined in fsp\_cfg/r\_iic\_slave\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Connectivity > I2C Slave (r\_iic\_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r\_iic\_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Interrupt Priority Level > Transmit, Receive, and Transmit End	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts.
Interrupt Priority Level > Error	MCU Specific Options		Select the interrupt priority level. This is set for ERI interrupt.
Name	Name must be a valid C symbol	g_i2c_slave0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	<ul style="list-style-type: none"> <li>• Standard</li> <li>• Fast-mode</li> <li>• Fast-mode plus</li> </ul>	Standard	Select the transfer rate.  If the delay for the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The

theoretical calculated delay is printed in a comment in the generated [iic\\_slave\\_extended\\_cfg\\_t](#) structure.

Internal Reference Clock	<ul style="list-style-type: none"> <li>• PCLKB / 1</li> <li>• PCLKB / 2</li> <li>• PCLKB / 4</li> <li>• PCLKB / 8</li> <li>• PCLKB / 16</li> <li>• PCLKB / 32</li> <li>• PCLKB / 64</li> <li>• PCLKB / 128</li> </ul>	PCLKB / 1	Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples.
Digital Noise Filter Stage Select	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Single-stage filter</li> <li>• 2-stage filter</li> <li>• 3-stage filter</li> <li>• 4-stage filter</li> </ul>	3-stage filter	Select the number of digital filter stages for IIC Slave.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
General Call	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Allows the slave to respond to general call address: 0x00.
Address Mode	<ul style="list-style-type: none"> <li>• 7-Bit</li> <li>• 10-Bit</li> </ul>	7-Bit	Select the slave address mode.
Clock Stretching	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Configure Clock Stretching.
Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status.

## Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected transfer rate cannot be achieved, an error will be returned.

## Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

## Usage Notes

### Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.

*Note*

: During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next transaction is initiated.

: To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.

### Callback

- A callback function must be provided which will be invoked for the cases below:
  - An I2C Master initiates a transmission or reception:  
I2C\_SLAVE\_EVENT\_TX\_REQUEST; I2C\_SLAVE\_EVENT\_RX\_REQUEST
  - A Transmission or reception has been completed:  
I2C\_SLAVE\_EVENT\_TX\_COMPLETE; I2C\_SLAVE\_EVENT\_RX\_COMPLETE
  - An I2C Master is requesting to read or write more data:  
I2C\_SLAVE\_EVENT\_TX\_MORE\_REQUEST; I2C\_SLAVE\_EVENT\_RX\_MORE\_REQUEST
  - Error conditions: I2C\_SLAVE\_EVENT\_ABORTED
  - An I2C Master initiates a general call by passing 0x00 as slave address:  
I2C\_SLAVE\_EVENT\_GENERAL\_CALL
- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

IIC Slave Callback Event	IIC Slave API expected to be called
I2C_SLAVE_EVENT_ABORTED	Handle event based on application
I2C_SLAVE_EVENT_RX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_TX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_RX_REQUEST	R_IIC_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_REQUEST	R_IIC_SLAVE_Write API
I2C_SLAVE_EVENT_RX_MORE_REQUEST	R_IIC_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_MORE_REQUEST	R_IIC_SLAVE_Write API

## I2C\_SLAVE\_EVENT\_GENERAL\_CALL

## R\_IIC\_SLAVE\_Read

- If parameter checking is enabled and R\_IIC\_SLAVE\_Read API is not called for I2C\_SLAVE\_EVENT\_RX\_REQUEST and/or I2C\_SLAVE\_EVENT\_RX\_MORE\_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R\_IIC\_SLAVE\_Write API is not called for I2C\_SLAVE\_EVENT\_TX\_REQUEST and/or I2C\_SLAVE\_EVENT\_TX\_MORE\_REQUEST:
  - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
  - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

### IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.

### Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.

## Examples

### Basic Example

This is a basic example of minimal use of the R\_IIC\_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
{
    .channel      = I2C_MASTER_CHANNEL_2,
    .rate         = I2C_MASTER_RATE_STANDARD,
    .slave        = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback   = i2c_master_callback, // Callback
    .p_context    = &g_i2c_master_ctrl,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend     = &g_iic_master_cfg_extend_standard_mode
};
iic_slave_instance_ctrl_t g_i2c_slave_ctrl;
```

```
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel      = I2C_SLAVE_CHANNEL_0,
    .rate        = I2C_SLAVE_RATE_STANDARD,
    .slave       = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode   = I2C_SLAVE_ADDR_MODE_7BIT,
    .p_callback  = i2c_slave_callback, // Callback
    .p_context   = &g_i2c_slave_ctrl,
    .p_extend    = &g_iic_slave_cfg_extend_standard_mode
};

## Function Documentation

◆ **R\_IIC\_SLAVE\_Open()**

```
fsp_err_t R_IIC_SLAVE_Open ( i2c_slave_ctrl_t *const p_api_ctrl, i2c_slave_cfg_t const *const p_cfg )
```

Opens the I2C slave device.

**Return values**

FSP_SUCCESS	I2C slave device opened successfully.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_INVALID_ARGUMENT	Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> <li>1. p_api_ctrl or p_cfg is NULL.</li> <li>2. extended parameter is NULL.</li> <li>3. Callback parameter is NULL.</li> <li>4. Set the rate to fast mode plus on a channel which does not support it.</li> <li>5. Invalid IRQ number assigned</li> </ul>

◆ **R\_IIC\_SLAVE\_Read()**

```
fsp_err_t R_IIC_SLAVE_Read ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C\_SLAVE\_EVENT\_RX\_COMPLETE in the callback. In case the master continues to write more data, an I2C\_SLAVE\_EVENT\_RX\_MORE\_REQUEST will be issued via callback. In case of errors, an I2C\_SLAVE\_EVENT\_ABORTED will be issued via callback.

**Return values**

FSP_SUCCESS	Function executed without issue
FSP_ERR_ASSERTION	p_api_ctrl, bytes or p_dest is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ **R\_IIC\_SLAVE\_Write()**

```
fsp_err_t R_IIC_SLAVE_Write ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes )
```

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C\_SLAVE\_EVENT\_TX\_COMPLETE in the callback. In case the master continues to read more data, an I2C\_SLAVE\_EVENT\_TX\_MORE\_REQUEST will be issued via callback. In case of errors, an I2C\_SLAVE\_EVENT\_ABORTED will be issued via callback.

**Return values**

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ **R\_IIC\_SLAVE\_CallbackSet()**

```
fsp_err_t R_IIC_SLAVE_CallbackSet ( i2c_slave_ctrl_t *const p_api_ctrl,
void(*) (i2c_slave_callback_args_t *) p_callback, void const *const p_context,
i2c_slave_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_slave_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

**◆ R\_IIC\_SLAVE\_Close()**

```
fsp_err_t R_IIC_SLAVE_Close ( i2c_slave_ctrl_t *const p_api_ctrl)
```

Closes the I2C device.

**Return values**

FSP_SUCCESS	Device closed successfully.
FSP_ERR_NOT_OPEN	Device not opened.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.

```

**Detailed Description**

Driver for the SSIE peripheral on RA MCUs. This module implements the [I2S Interface](#).

## Overview

### Features

The SSI module supports the following features:

- Transmission and reception of uncompressed audio data using the standard I2S protocol in master mode
- Full-duplex I2S communication (channel 0 only)
- Integration with the DTC transfer module
- Internal connection to GPT timer output to generate the audio clock
- Callback function notification when all data is loaded into the SSI FIFO

## Configuration

### Build Time Configurations for r\_ssi

The following build time configurations are defined in fsp\_cfg/r\_ssi\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	If code for DTC transfer support is included in the build.

### Configurations for Connectivity > I2S (r\_ssi)

This module can be added to the Stacks tab via New Stack > Connectivity > I2S (r\_ssi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2s0	Module name.
Channel	Value must be an integer between 0 and 1	0	Specify the I2S channel.
Bit Depth	<ul style="list-style-type: none"> <li>• 8 Bits</li> <li>• 16 Bits</li> <li>• 18 Bits</li> <li>• 20 Bits</li> <li>• 22 Bits</li> <li>• 24 Bits</li> <li>• 32 Bits</li> </ul>	16 Bits	Select the bit depth of one sample of audio data.
Word Length	<ul style="list-style-type: none"> <li>• 8 Bits</li> <li>• 16 Bits</li> </ul>	16 Bits	Select the word length of audio data. Must be

	<ul style="list-style-type: none"> <li>• 24 Bits</li> <li>• 32 Bits</li> <li>• 48 Bits</li> <li>• 64 Bits</li> <li>• 128 Bits</li> <li>• 256 Bits</li> </ul>		at least as large as Data bits.
WS Continue Mode	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable WS continue mode to output the word select (WS) pin even when transmission is idle.
Bit Clock Source	<ul style="list-style-type: none"> <li>• External AUDIO_CLK</li> <li>• Internal AUDIO_CLK</li> </ul>	External AUDIO_CLK	Select External AUDIO_CLK for external signal to AUDIO_CLK input pin or Internal AUDIO_CLK for internal connection to MCU specific GPT channel. Please refer to the hardware manual for which GPT channel is connected to the internal signal
Bit Clock Divider	Refer to the RA Configuration tool for available options.	Audio Clock / 1	Select divider used to generate bit clock from audio clock.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from all three interrupt service routines (ISR).
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Idle/Error Interrupt Priority	MCU Specific Options		Select the Idle/Error interrupt priority.

## Clock Configuration

The SSI peripheral runs on PCLKB. The PCLKB frequency can be configured on the **Clocks** tab of the RA Configuration editor. The SSI audio clock can optionally be supplied from an external source through the AUDIO\_CLK pin in master mode.

## Pin Configuration

The SSI uses the following pins:

- AUDIO\_CLK (optional, master mode only): The AUDIO\_CLK pin is used to supply the audio clock from an external source.
- SSIBCKn: Bit clock pin for channel n
- SSILRCKn/SSIFSn: Channel selection pin for channel n
- SSIRXD0: Reception pin for channel 0
- SSITXD0: Transmission pin for channel 0
- SSIDATA1: Transmission or reception pin for channel 1

## Usage Notes

### SSI Frames

An SSI frame is 2 samples worth of data. The frame boundary (end of previous frame, start of next frame) is on the falling edge of the SSILRCKn signal.

Figure 174: SSI Frame Diagram (8-bit word, 8-bit samples)

#### Note

*If the word length is longer than the sample bit depth, padding bits (0) will be added after the sample.*

### Audio Data

Only uncompressed PCM data is supported.

Data arrays have the following size, alignment, and length based on the "Bit Depth" setting:

Bit Depth	Array Data Type	Required Alignment	Required Length (bytes)
8 Bits	8-bit integer	1 byte alignment	Multiple of 2
16 Bits	16-bit integer	2 byte alignment	Multiple of 4
18 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
20 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
22 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
24 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
32 Bits	32-bit integer	4 byte alignment	Multiple of 8

**Note**

The length of the array must be a multiple of 2 when the data type is the recommended data type. The 2 represents the frame size (left and right channel) of I2S communication. The SSIE peripheral does not support odd read/write lengths in I2S mode.

**Audio Clock**

The audio clock is only required for master mode.

**Audio Clock Frequency**

The bit clock frequency is the product of the sampling frequency and channels and bits per system word:

$$\text{bit\_clock (Hz)} = \text{sampling\_frequency (Hz)} * \text{channels} * \text{system\_word\_bits}$$

I2S data always has 2 channels.

For example, the bit clock for transmitting 2 channels of 16-bit data (using a 16-bit system word) at 44100 Hz would be:

$$44100 * 2 * 16 = 1,411,200 \text{ Hz}$$

The audio clock frequency is used to generate the bit clock frequency. It must be a multiple of the bit clock frequency. Refer to the Bit Clock Divider configuration for divider options. The input audio clock frequency must be:

$$\text{audio\_clock (Hz)} = \text{desired\_bit\_clock (Hz)} * \text{bit\_clock\_divider}$$

To get a bit clock of 1.4 MHz from an audio clock of 2.8 MHz, select the divider Audio Clock / 2.

**Audio Clock Source**

The audio clock source can come from:

- An external source input to the AUDIO\_CLK pin
- An internal connection to the GPT timer output

**Note**

When using the internal GPT timer output, Pin Output Support must be Enabled, and GTIOCA Output Enabled must be True.

See the SSIE section in the MCU hardware manual for information about which GPT channel may be used.

**Limitations**

Developers should be aware of the following limitations when using the SSI:

- When using channel 1, full duplex communication is not possible. Only transmission or reception is possible.
- SSI must go idle before changing the communication mode (between read only, write only, and full duplex)

**Examples**

## Basic Example

This is a basic example of minimal use of the SSI in an application.

```
#define SSI_EXAMPLE_SAMPLES_TO_TRANSFER (1024)
#define SSI_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t g_src[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
int16_t g_dest[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
void ssi_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Create a stereo sine wave. Using formula sample = sin(2 * pi * tone_frequency * t
 / sampling_frequency) */
    uint32_t freq = SSI_EXAMPLE_TONE_FREQUENCY_HZ;
    for (uint32_t t = 0; t < SSI_EXAMPLE_SAMPLES_TO_TRANSFER / 2; t += 1)
    {
        float input = (((float) (freq * t)) * (M_TWOPHI)) /
SSI_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ;

        g_src[2 * t] = (int16_t) ((INT16_MAX * sinf(input)));
        g_src[2 * t + 1] = (int16_t) ((INT16_MAX * sinf(input)));
    }

    /* Initialize the module. */
    err = R_SSI_Open(&g_i2s_ctrl, &g_i2s_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Transfer data. */
    (void) R_SSI_WriteRead(&g_i2s_ctrl,
                          (uint8_t *) &g_src[0],
                          (uint8_t *) &g_dest[0],
                          SSI_EXAMPLE_SAMPLES_TO_TRANSFER * sizeof(int16_t));
}
```

## Streaming Example

This is an example of using SSI to stream audio data. This application uses a double buffer to store PCM sine wave data. It starts transmitting in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to

restart transmission in the main loop.

This example also checks the return code of `R_SSI_Write()` because `R_SSI_Write()` can return an error if a transmit overflow occurs before the FIFO is reloaded. If a transmit overflow occurs before the FIFO is reloaded, the SSI will be stopped in the error interrupt, and it cannot be restarted until the `I2S_EVENT_IDLE` callback is received.

```
#define SSI_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050)
#define SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024)
#define SSI_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t      g_stream_src[2][SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
uint32_t     g_buffer_index      = 0;
volatile bool g_send_data_in_main_loop = true;
volatile bool g_data_ready = false;
/* Example callback called when SSI is ready for more data. */
void ssi_example_callback (i2s_callback_args_t * p_args)
{
    /* Reload the FIFO if we hit the transmit watermark or restart transmission if the
    SSI is idle because it was
    * stopped after a transmit FIFO overflow. */
    if ((I2S_EVENT_TX_EMPTY == p_args->event) || (I2S_EVENT_IDLE == p_args->event))
    {
        if (g_data_ready)
        {
            /* Reload FIFO and handle errors. */
            ssi_example_write();
        }
        else
        {
            /* Data was not ready yet, send it in the main loop. */
            g_send_data_in_main_loop = true;
        }
    }
}
/* Load the transmit FIFO and check for error conditions. */
void ssi_example_write (void)
{
```

```
/* Transfer data. This call is non-blocking. */
fsp_err_t err = R_SSI_Write(&g_i2s_ctrl,
                           (uint8_t *) &g_stream_src[g_buffer_index][0],
                           SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK * sizeof
(int16_t));
if (FSP_SUCCESS == err)
{
/* Switch the buffer after data is sent. */
g_buffer_index = !g_buffer_index;
/* Allow loop to calculate next buffer only if transmission was successful. */
g_data_ready = false;
}
else
{
/* Getting here most likely means a transmit overflow occurred before the FIFO could
be reloaded. The
* application must wait until the SSI is idle, then restart transmission. In this
example, the idle
* callback transmits data or resets the flag g_send_data_in_main_loop. */
}
}
/* Calculate samples. This example is just a sine wave. For this type of data, it
would be better to calculate
* one period and loop it. This example should be updated for the audio data used by
the application. */
void ssi_example_calculate_samples (uint32_t buffer_index)
{
static uint32_t t = 0U;
/* Create a stereo sine wave. Using formula sample = sin(2 * pi * tone_frequency * t
/ sampling_frequency) */
uint32_t freq = SSI_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ;
for (uint32_t i = 0; i < SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK / 2; i += 1)
{
float input = (((float) (freq * t)) * M_TWOPi) /
```

```
SSI_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ;

    t++;

    /* Store sample twice, once for left channel and once for right channel. */
    int16_t sample = (int16_t) ((INT16_MAX * sinf(input)));
    g_stream_src[buffer_index][2 * i] = sample;
    g_stream_src[buffer_index][2 * i + 1] = sample;
}

/* Data is ready to be sent in the interrupt. */
g_data_ready = true;
}

void ssi_streaming_example (void)

    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the module. */
    err = R_SSI_Open(&g_i2s_ctrl, &g_i2s_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    while (true)
    {
        /* Prepare data in a buffer that is not currently used for transmission. */
        ssi_example_calculate_samples(g_buffer_index);
        /* Send data in main loop the first time, and if it was not ready in the interrupt.
        */
        if (g_send_data_in_main_loop)
        {
            /* Clear flag. */
            g_send_data_in_main_loop = false;
            /* Reload FIFO and handle errors. */
            ssi_example_write();
        }
        /* If the next buffer is ready, wait for the data to be sent in the interrupt. */
        while (g_data_ready)
        {
            /* Do nothing. */

```

```

    }
}
}

```

## Data Structures

struct [ssi\\_instance\\_ctrl\\_t](#)

struct [ssi\\_extended\\_cfg\\_t](#)

## Enumerations

enum [ssi\\_audio\\_clock\\_t](#)

enum [ssi\\_clock\\_div\\_t](#)

## Data Structure Documentation

### ◆ [ssi\\_instance\\_ctrl\\_t](#)

struct [ssi\\_instance\\_ctrl\\_t](#)

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when [i2s\\_api\\_t::open](#) is called.

### ◆ [ssi\\_extended\\_cfg\\_t](#)

struct [ssi\\_extended\\_cfg\\_t](#)

SSI configuration extension. This extension is optional.

#### Data Fields

<a href="#">ssi_audio_clock_t</a>	<a href="#">audio_clock</a>	Audio clock source, default is SSI_AUDIO_CLOCK_EXTERNAL.
<a href="#">ssi_clock_div_t</a>	<a href="#">bit_clock_div</a>	Select bit clock division ratio.

## Enumeration Type Documentation

### ◆ [ssi\\_audio\\_clock\\_t](#)

enum [ssi\\_audio\\_clock\\_t](#)

Audio clock source.

#### Enumerator

SSI_AUDIO_CLOCK_EXTERNAL	Audio clock source is the AUDIO_CLK input pin.
SSI_AUDIO_CLOCK_INTERNAL	Audio clock source is internal connection to a MCU specific GPT channel output.

◆ **ssi\_clock\_div\_t**

enum <code>ssi_clock_div_t</code>	
Bit clock division ratio. Bit clock frequency = audio clock frequency / bit clock division ratio.	
Enumerator	
<code>SSI_CLOCK_DIV_1</code>	Clock divisor 1.
<code>SSI_CLOCK_DIV_2</code>	Clock divisor 2.
<code>SSI_CLOCK_DIV_4</code>	Clock divisor 4.
<code>SSI_CLOCK_DIV_6</code>	Clock divisor 6.
<code>SSI_CLOCK_DIV_8</code>	Clock divisor 8.
<code>SSI_CLOCK_DIV_12</code>	Clock divisor 12.
<code>SSI_CLOCK_DIV_16</code>	Clock divisor 16.
<code>SSI_CLOCK_DIV_24</code>	Clock divisor 24.
<code>SSI_CLOCK_DIV_32</code>	Clock divisor 32.
<code>SSI_CLOCK_DIV_48</code>	Clock divisor 48.
<code>SSI_CLOCK_DIV_64</code>	Clock divisor 64.
<code>SSI_CLOCK_DIV_96</code>	Clock divisor 96.
<code>SSI_CLOCK_DIV_128</code>	Clock divisor 128.

**Function Documentation**

◆ **R\_SSI\_Open()**

```
fsp_err_t R_SSI_Open ( i2s_ctrl_t *const p_ctrl, i2s_cfg_t const *const p_cfg )
```

Opens the SSI. Implements [i2s\\_api\\_t::open](#).

This function sets this clock divisor and the configurations specified in [i2s\\_cfg\\_t](#). It also opens the timer and transfer instances if they are provided.

**Return values**

FSP_SUCCESS	Ready for I2S communication.
FSP_ERR_ASSERTION	The pointer to <code>p_ctrl</code> or <code>p_cfg</code> is null.
FSP_ERR_ALREADY_OPEN	The control block has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel number is not available on this MCU.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::open](#)

◆ **R\_SSI\_Write()**

```
fsp_err_t R_SSI_Write ( i2s_ctrl_t *const p_ctrl, void const *const p_src, uint32_t const bytes )
```

Writes data buffer to SSI. Implements [i2s\\_api\\_t::write](#).

This function resets the transfer if the transfer interface is used, or writes the length of data that fits in the FIFO then stores the remaining write buffer in the control block to be written in the ISR.

`Write()` cannot be called if another `write()`, `read()` or `writeRead()` operation is in progress. `Write` can be called when the SSI is idle, or after the `I2S_EVENT_TX_EMPTY` event.

**Return values**

FSP_SUCCESS	Write initiated successfully.
FSP_ERR_ASSERTION	The pointer to <code>p_ctrl</code> or <code>p_src</code> was null, or <code>bytes</code> requested was 0.
FSP_ERR_IN_USE	Another transfer is in progress, data was not written.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_UNDERFLOW	A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reset](#)

◆ **R\_SSI\_Read()**

```
fsp_err_t R_SSI_Read ( i2s_ctrl_t *const p_ctrl, void *const p_dest, uint32_t const bytes )
```

Reads data into provided buffer. Implements `i2s_api_t::read`.

This function resets the transfer if the transfer interface is used, or reads the length of data available in the FIFO then stores the remaining read buffer in the control block to be filled in the ISR.

Read() cannot be called if another write(), read() or writeRead() operation is in progress. Read can be called when the SSI is idle, or after the I2S\_EVENT\_RX\_FULL event.

**Return values**

FSP_SUCCESS	Read initiated successfully.
FSP_ERR_IN_USE	Peripheral is in the wrong mode or not idle.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_dest was null, or bytes requested was 0.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_OVERFLOW	A receive overflow error is pending. Wait for the SSI to go idle before resuming communication.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reset](#)

◆ **R\_SSI\_WriteRead()**

```
fsp_err_t R_SSI_WriteRead ( i2s_ctrl_t *const p_ctrl, void const *const p_src, void *const p_dest,
uint32_t const bytes )
```

Writes from source buffer and reads data into destination buffer. Implements [i2s\\_api\\_t::writeRead](#).

This function calls [R\\_SSI\\_Write](#) and [R\\_SSI\\_Read](#).

[writeRead\(\)](#) cannot be called if another [write\(\)](#), [read\(\)](#) or [writeRead\(\)](#) operation is in progress. [writeRead\(\)](#) can be called when the SSI is idle, or after the [I2S\\_EVENT\\_RX\\_FULL](#) event.

**Return values**

FSP_SUCCESS	Write and read initiated successfully.
FSP_ERR_IN_USE	Peripheral is in the wrong mode or not idle.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_UNDERFLOW	A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication.
FSP_ERR_OVERFLOW	A receive overflow error is pending. Wait for the SSI to go idle before resuming communication.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reset](#)

◆ **R\_SSI\_Stop()**

```
fsp_err_t R_SSI_Stop ( i2s_ctrl_t *const p_ctrl)
```

Stops SSI. Implements [i2s\\_api\\_t::stop](#).

This function disables both transmission and reception, and disables any transfer instances used.

The SSI will stop on the next frame boundary. Do not restart SSI until it is idle.

**Return values**

FSP_SUCCESS	I2S communication stop request issued.
FSP_ERR_ASSERTION	The pointer to <a href="#">p_ctrl</a> was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

**Returns**

See [Common Error Codes](#) or lower level drivers for other possible return codes.

◆ **R\_SSI\_Mute()**

```
fsp_err_t R_SSI_Mute ( i2s_ctrl_t *const p_ctrl, i2s_mute_t const mute_enable )
```

Mutes SSI on the next frame boundary. Implements `i2s_api_t::mute`.

Data is still written while mute is enabled, but the transmit line outputs zeros.

**Return values**

FSP_SUCCESS	Transmission is muted.
FSP_ERR_ASSERTION	The pointer to <code>p_ctrl</code> was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ **R\_SSI\_StatusGet()**

```
fsp_err_t R_SSI_StatusGet ( i2s_ctrl_t *const p_ctrl, i2s_status_t *const p_status )
```

Gets SSI status and stores it in provided pointer `p_status`. Implements `i2s_api_t::statusGet`.

**Return values**

FSP_SUCCESS	Information stored successfully.
FSP_ERR_ASSERTION	The <code>p_instance_ctrl</code> or <code>p_status</code> parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ **R\_SSI\_Close()**

```
fsp_err_t R_SSI_Close ( i2s_ctrl_t *const p_ctrl)
```

Closes SSI. Implements `i2s_api_t::close`.

This function powers down the SSI and closes the lower level timer and transfer drivers if they are used.

**Return values**

FSP_SUCCESS	Device closed successfully.
FSP_ERR_ASSERTION	The pointer to <code>p_ctrl</code> was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

### ◆ R\_SSI\_CallbackSet()

```
fsp_err_t R_SSI_CallbackSet ( i2s_ctrl_t *const p_api_ctrl, void(*) (i2s_callback_args_t *) p_callback,
void const *const p_context, i2s_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [i2s\\_api\\_t::callbackSet](#)

#### Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

## Detailed Description

Driver for the I3C peripheral on RA MCUs. This module implements the [I3C Interface](#).

## Overview

I3C is a communication protocol defined by MIPI that aims to improve on I2C by increasing the maximum transfer rate, as well as providing other features like "In-band Interrupts", "Dynamic Address Assignment", and a set of standard "Common Command Codes".

## Features

- I3C Master Mode
- I3C Slave Mode
- Dynamic Address Assignment (ENTDAA/SETDASA)
- SDR Read/Write transfers
- I2C Legacy Read/Write transfers
- In-Band Interrupts (Interrupt Requests, Hot-Join Requests)
- Common Command Codes
- Clock Stalling
- Timeout Detection

## Master Mode

On an I3C bus, only one device may operate in master mode at a time. The current master is responsible for initiating I2C Legacy transfers, SDR transfers, Common Command Codes, and handling IBIs (Interrupt Requests, Hot-Join Requests). In order to perform these operations, the driver has an internal device table that is used for storing configuration information for each device on the bus (See [i3c\\_device\\_table\\_cfg\\_t](#)). Each entry in the device table contains the static or dynamic address of the device, and IBI permissions for accepting or rejecting IBI requests from the device. The device table has four entries as well as one extended device entry that only contains the static or dynamic address of a device (See below).

## Device Table Entries

- Static/Dynamic Address
- Accept/Reject Interrupt Requests
- Accept/Reject Mastership Requests
- IBI Payload Requirement
- Device Type (I3C / Legacy I2C)

Device Index 0

Device Index 1

Device Index 2

Device Index 3

## Extended Device Table Entry

- Static/Dynamic Address
- Device Type (I3C / Legacy I3C)

Figure 175: Master Device Table

In order to initiate I2C Legacy transfers, SDR transfers, or Common Command Codes, the master must select a device entry from the device table using `i3c_api_t::deviceSelect`. Once a device has been selected, all subsequent operations will be directed to the selected device until a new device is selected using `i3c_api_t::deviceSelect`.

The master may also receive IBI requests that are initiated by slave devices on the bus. If there is a payload, then the driver will write the data into a buffer that is provided by the application by calling `i3c_api_t::ibiRead`. If the application has not provided an IBI buffer prior to receiving an IBI, then the it will get a callback requesting an IBI buffer. Once the IBI is completed, the application will be notified by a callback.

### Note

1. Even though there are only four device table entries and one extended device table entry, the application can operate on more devices by maintaining its own list of devices and updating the extended device entry as needed. Note however that devices defined in the extended device table entry will not be able to initiate IBI requests.

## Main Master

The main master is responsible for configuring the dynamic address of all devices on the bus. The driver initiates this procedure by calling `i3c_api_t::dynamicAddressAssignmentStart`. Before starting address assignment, the application must configure the device table using `i3c_api_t::masterDeviceTableSet`.

## Enter Dynamic Address Assignment (ENTDAA):

The application initiates the ENTDAA operation by calling `i3c_api_t::dynamicAddressAssignmentStart`

with a starting index into the master device table and a count specifying the number of devices to configure. The master starts by sending the ENTDAAs command. Every I3C device on the bus that has not already been initialized will acknowledge the command and attempt to write its Provisional ID, DCR, and BCR registers. The device with the smallest value in these registers will win arbitration and be assigned with the first dynamic address defined in the master device table. The master will then increment the index and repeat the process by assigning the dynamic address to the next device. The process continues until the specified number of devices have been initialized or until there are no more devices to configure.

#### Note

1. The IBI payload setting will automatically be updated in the master device table based on the BCR setting that was read during ENTDAAs.
2. After each device successfully writes its Provisional ID, DCR, and BCR registers, the application will get a callback that will provide the value of the registers.
3. If the starting index is set to the extended device entry, then the device count must be set to 1.
4. The main master assigns its own dynamic address with `i3c_api_t::deviceCfgSet`.

### Set Dynamic Address from Static Address (SETDASA):

The application initiates the SETDASA operation by calling `i3c_api_t::dynamicAddressAssignmentStart` with an index into the master device table. The master sends the SETDASA command to the static address defined in the given device table entry, and then assigns the associated dynamic address.

#### Note

1. Set the count to 0 when using SETDASA.

## Slave Mode

In slave mode, the device configures its static address, Provisional ID, BCR, and DCR registers using `i3c_api_t::deviceCfgSet`, and then waits for the master to initiate communication. Prior to being assigned a dynamic address, the slave will operate as an I2C device using its static address. The application will receive a callback when the master assigns it a dynamic address, after which point, the slave will operate as an I3C device until it receives the RSTDAAs command.

Depending on the capabilities defined in its BCR register, the slave may also initiate IBI Interrupt Requests, and Hot-Join Requests using `i3c_api_t::ibiWrite`

## Configuration

### Build Time Configurations for r\_i3c

The following build time configurations are defined in `fsp_cfg/r_i3c_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Unaligned Buffer Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Unaligned buffer support may be optionally disabled for

improved performance.

Master Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	If only slave mode is required, disable master support to decrease code size.
Slave Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	If only master mode is required, disable slave support to decrease code size.
Error Recovery Procedure	MCU Specific Options		There are two different chip versions of the RA2E2 MCU (Version 1 and Version 2). Each version requires a different procedure for recovering from errors.

### Configurations for Connectivity > I3C (r\_i3c)

This module can be added to the Stacks tab via New Stack > Connectivity > I3C (r\_i3c).

Configuration	Options	Default	Description
Bitrate Settings > Standard Mode > Open-Drain > Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Standard Mode Open Drain transfers.
Bitrate Settings > Standard Mode > Open-Drain > Frequency	Must be an integer greater than 0.	1000000	The Frequency of SCL during Standard Mode Open Drain transfers.
Bitrate Settings > Standard Mode > Push-Pull > Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Standard Mode Push Pull transfers.
Bitrate Settings > Standard Mode > Push-Pull > Frequency	Push-Pull frequency must be greater than or equal to 10000 Hz.	3400000	The Frequency of SCL during Standard Mode Push-Pull transfers.
Bitrate Settings > Extended Mode > Open-Drain > Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Extended Mode Open Drain transfers.
Bitrate Settings > Extended Mode > Open-Drain > Frequency	Must be an integer greater than 0.	1000000	The Frequency of SCL during Extended Mode Open Drain transfers.
Bitrate Settings > Extended Mode > Push-Pull > Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Extended Mode Push Pull transfers.
Bitrate Settings >	Push-Pull frequency	3400000	The Frequency of SCL

Extended Mode > Push-Pull > Frequency	must be greater than or equal to 10000 Hz.		during Extended Mode Push-Pull transfers.
Bitrate Settings > Bus Timing > Open Drain Rising Time (ns)	Rising time must be greater than or equal to 0 nanoseconds.	0	The Open Drain rising time in nanoseconds.
Bitrate Settings > Bus Timing > Open Drain Falling Time (ns)	Falling time must be greater than or equal to 0 nanoseconds.	0	The Open Drain falling time in nanoseconds.
Bitrate Settings > Bus Timing > Push-Pull Rising Time (ns)	Rising time must be greater than or equal to 0 nanoseconds.	0	The Push-Pull rising time in nanoseconds.
Bitrate Settings > Bus Timing > Push-Pull Falling Time (ns)	Falling time must be greater than or equal to 0 nanoseconds.	0	The Push-Pull rising time in nanoseconds.
Bitrate Settings > Clock Stalling > Address Assignment Phase	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable clock stalling during the Address Assignment Phase of ENTDA.
Bitrate Settings > Clock Stalling > Transition Phase	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable clock stalling during the Transition Bit of a read transfer.
Bitrate Settings > Clock Stalling > Parity Phase	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable clock stalling during the Parity Bit of a write transfer.
Bitrate Settings > Clock Stalling > Ack Phase	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable clock stalling during the ACK phase of a transfer.
Bitrate Settings > Clock Stalling > Time (us)	Must be greater than or equal to 0.	0	The amount of time to stall the clock during the Address Assignment Phase, Transition Phase, Parity Phase, and ACK Phase.
Master Mode > ACK Hot-Join Requests	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, the I3C instance will ACK Hot-Join Requests and notify the application.
Master Mode > Notify Rejected Hot-Join Requests.	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, the application will get a callback when an IBI Hot-Join Request is rejected.
Master Mode > Notify Rejected Mastership Requests.	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, the application will get a callback when an IBI Mastership Request is rejected.

Master Mode > Notify Rejected Interrupt Requests.	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, the application will get a callback when an IBI Interrupt Request is rejected.
Slave Mode > Command Response Info > ENEC/DISEC > In-Band Interrupts	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Configure whether the slave can issue IBI requests.
Slave Mode > Command Response Info > ENEC/DISEC > Hot-Join Requests	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Configure whether the slave can issue Hot-Join requests.
Slave Mode > Command Response Info > ENTASn > Activity State	<ul style="list-style-type: none"> <li>• Activity State 0</li> <li>• Activity State 1</li> <li>• Activity State 2</li> <li>• Activity State 3</li> </ul>	Activity State 0	Configure the starting activity state of the slave.
Slave Mode > Command Response Info > SETMWL/GETMWL > Max Write Length	Write length must be in the range of [8, 65535].	65535	Set the max write length.
Slave Mode > Command Response Info > SETMRL/GETMRL > Max Read Length	Read length must be in the range of [16, 65535].	65535	Set the max read length.
Slave Mode > Command Response Info > SETMRL/GETMRL > Max IBI Payload Length	Read length must be in the range of [0, 255].	0	Set the max IBI payload length, or set it to 0 for unlimited.
Slave Mode > Command Response Info > GETMXDS > Write Data Rate	<ul style="list-style-type: none"> <li>• FSCL_MAX</li> <li>• 8Mhz</li> <li>• 6Mhz</li> <li>• 4Mhz</li> <li>• 2Mhz</li> </ul>	2Mhz	Set the max write data rate.
Slave Mode > Command Response Info > GETMXDS > Read Data Rate	<ul style="list-style-type: none"> <li>• FSCL_MAX</li> <li>• 8Mhz</li> <li>• 6Mhz</li> <li>• 4Mhz</li> <li>• 2Mhz</li> </ul>	2Mhz	Set the max read data rate.
Slave Mode > Command Response Info > GETMXDS > Clock to Data Turnaround Time	<ul style="list-style-type: none"> <li>• 8 Nanoseconds</li> <li>• 9 Nanoseconds</li> <li>• 10 Nanoseconds</li> <li>• 11 Nanoseconds</li> <li>• 12 Nanoseconds</li> </ul>	8 Nanoseconds	Set the clock to data turnaround time.

	<ul style="list-style-type: none"> <li>Greater than 12 Nanoseconds</li> </ul>		
Slave Mode > Command Response Info > GETMXDS > Include Max Read Turnaround Time	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Configure whether the Max Read Turnaround time will be transmitted.
Slave Mode > Command Response Info > GETMXDS > Max Read Turnaround Time	Value must be in the range [0, 255].	0	Set max read turnaround time.
Slave Mode > Command Response Info > GETXTIME > Frequency Byte	Value must be in the range [0, 255].	0	Set the internal oscillator frequency in increments of 0.5 Mhz.
Slave Mode > Command Response Info > GETXTIME > Inaccuracy Byte	Value must be in the range [0, 255].	0	Set the oscillator inaccuracy byte in increments of 0.5%
Interrupts > Interrupt Priority	MCU Specific Options		The interrupt priority of the RX, TX, RESPONSE, RCV_STATUS, and IBI ISRs.
Interrupts > Error and Event Interrupt Priority	MCU Specific Options		The interrupt priority of the EEI ISR which is used to notify the application when an Internal Error, HDR Exit Pattern, or Timeout is detected.
Interrupts > Receive Status ICU Group 3	MCU Specific Options		The Receive Status IRQ can use ICU Group 3 or Group 5.
Interrupts > Receive Status ICU Group 5	MCU Specific Options		The Receive Status IRQ can use ICU Group 3 or Group 5.
Name	Name must be a valid C symbol	g_i3c0	Module name.
Callback	Name must be a valid C symbol	g_i3c0_callback	A user callback function must be provided. This will be called in order to notify the application of I3C events and provide status information.
Callback Context	Name must be a valid C symbol	NULL	A pointer to additional application specific information that is

Device Type	<ul style="list-style-type: none"> <li>• Main Master</li> <li>• Slave</li> </ul>	Slave	provided to the callback.
Bus Free Condition Detection Time (ns)	Must be greater than or equal to 38.4 nanoseconds.	38.4	The minimum period occurring after a STOP and before a START.
Bus Available Condition Detection Time (us)	Must be greater than or equal to 1 microsecond.	1	The minimum period occurring after the Bus Free Condition when Slaves can initiate IBI requests.
Bus Idle Condition Detection Time (us)	Must be greater than or equal to 1000 microseconds.	1000	The minimum period occurring after the Bus Available Condition when Slaves can initiate Hot-Join requests.
Timeout Detection	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, the application will get a callback if SCL is stuck at a logic high or logic low level for more than 65535 cycles of the I3C source clock.

## Clock Configuration

The I3C peripheral is clocked off of PCLKB and PCLKD. The SCL clock is generated by the I3C internal clock which is derived from PCLKD.

The following settings are used to configure SCL.

- Frequency of PCLKD
- Standard Mode
  - Open Drain High Period ( $T_{HIGH}$ )
  - Open Drain Frequency
  - Push-Pull High Period ( $T_{HIGH}$ )
  - Push-Pull Frequency
- Extended Mode
  - Open Drain High Period ( $T_{HIGH}$ )
  - Open Drain Frequency
  - Push-Pull High Period ( $T_{HIGH}$ )
  - Push-Pull Frequency
- `i3c_bitrate_mode_t` (Set during `i3c_api_t::deviceSelect`)

The Standard and Extended Mode settings define two separate SCL configurations that can be selected at run-time using `i3c_api_t::deviceSelect`.

In addition to selecting between the Standard and Extended Mode settings, the base SCL period can also be multiplied using the following options:

- `I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2`: Multiple the base Standard Open Drain and Push-Pull period by 2.
- `I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2`: Multiple the base Extended Open Drain and Push-Pull period by 2.
- `I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4`: Multiple the base Extended Open Drain and Push-Pull period by 4.

In order to get accurate frequency calculations, the Rising and Falling edges must be input into the calculation. These values will depend on the topology the I3C bus that will be different for every application.

#### Note

1. The Standard and Extended Open Drain period settings define the period to use during legacy I2C transfers (Only use the following `i3c_bitrate_mode_t` settings with I2C transfers: `I3C_BITRATE_MODE_I2C_STDBR`, `I3C_BITRATE_MODE_I2C_EXTBR`).
2. The clock frequency ratio of `PCLKD` and `PCLKB` must be 2:1 or 1:1 when using the I3C module. Operation is not guaranteed for other settings.
3.  $T_{HIGH}$  is defined in Figure 31 in the MIPI I3C Specification v1.0 and describe the Logic High period.

## Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I3C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

## Usage Notes

### Read and Write in Slave Mode

In slave mode, calling read or write does not start a transfer. Instead, calling read or write will configure the driver to perform the next read or write transfer using the user provided buffer.

Provided that a transfer is not already in progress, `i3c_api_t::read` and `i3c_api_t::write` can be called to update the internal buffers even if the transfer has not been completed yet. Both the read and write buffers can be configured at the same time in order to prepare the driver for when the master initiates a read or a write transfer.

If there is no space remaining in a user configured read buffer, the application will get a `I3C_EVENT_READ_BUFFER_FULL` callback requesting for a new read buffer to be provided.

### Event Status

When a write, read, `ibiWrite`, `ibiRead` or `commandSend`, operation is completed, the `i3c_callback_args_t::event_status` should be checked. The `event_status` will provide information about the success or failure of the operation.

The following are possible statuses:

- `I3C_EVENT_STATUS_SUCCESS`
- `I3C_EVENT_STATUS_PARITY`
- `I3C_EVENT_STATUS_FRAME`
- `I3C_EVENT_STATUS_ADDRESS_HEADER`
- `I3C_EVENT_STATUS_NACK`
- `I3C_EVENT_STATUS_OVERFLOW`

- [I3C\\_EVENT\\_STATUS\\_ABORTED\\_TO\\_MASTER](#)
- [I3C\\_EVENT\\_STATUS\\_ABORTED](#)

#### Note

*In master mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will be [I3C\\_EVENT\\_STATUS\\_ABORTED](#).*

*In slave mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will be [I3C\\_EVENT\\_STATUS\\_ABORTED\\_TO\\_MASTER](#).*

## Direct Get Common Command Codes in Slave Mode

When an I3C slave receives a Command Code of type Direct Get, the response is automatically sent from the device Special Function Registers (SFR). The SFR contains information for each command code and can be configured during open (See [i3c\\_extended\\_cfg\\_t::slave\\_command\\_response\\_info](#)). This allows the slave to respond to Direct Get Command Codes much faster, and removes the burden of responding to these commands from the application.

The response to the GETSTATUS command can be configured at run-time using [i3c\\_api\\_t::slaveStatusSet](#).

## Disabling Unaligned Buffer Support

Support for performing read and write operations on unaligned buffers can be disabled in order to improve performance. When unaligned buffer support is disabled, all buffers passed to read, [ibiRead](#), write, [ibiWrite](#), and [commandSend](#) must be aligned to 4 bytes and the size of the buffers must be a multiple of 4 bytes.

In master mode, the value of the length passed to [i3c\\_api\\_t::read](#) and [i3c\\_api\\_t::write](#) sets the total length of the operation in bytes. During the read or write operation, the driver may read or write to the last word of memory during the operation. This means that the allocated memory for the buffer passed to read and write needs to be a multiple of 4 bytes even though the transfer length is not a multiple of 4 bytes.

In slave mode, the length passed to [i3c\\_api\\_t::read](#) must be a multiple of 4 bytes. The length passed to [i3c\\_api\\_t::write](#) sets the number of bytes that the slave will write. The size of the buffer passed to write still needs to be a multiple of 4 bytes.

## Max Data Speed Limitation

In Slave Mode, it is highly recommended that [BCR\[0\]](#) be set to '1' in order to indicate to the master that the device doesn't support the max data speed. The master is then required to use the [GETMXDS](#) command to get the device specific data speed limitations.

This will allow the slave to specify its Maximum Supported Data Rate for read/write transfers and the Maximum Read Turnaround Time (See [GETMXDS](#) in the MIPI I3C Specification v1.0).

## Mixed Fast Bus

The MIPI I3C Specification v1.0 defines a Mixed Fast Bus as a bus that has legacy I2C devices that all have a 50ns Spike Filter.

On Mixed Fast Buses, SCL has the following constraints during I3C SDR transfers:

- SCL High Period:  $t_{DIG\_H\_MIXED(MIN)}$  to  $t_{DIG\_H\_MIXED(MAX)}$
- SCL Low Period: Up to  $t_{DIG\_L(MAX)}$

In this case, configure the Extended Bitrate settings for I3C SDR transfers, and use the Standard Bitrate settings for I2C transfers.

*Note*

1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.

### Mixed Slow Bus

The MIPI I3C Specification v1.0 defines a Mixed Slow Bus as a bus that has legacy I2C devices that do not have a 50ns Spike Filter.

In this case, the SCL frequency is limited to I2C Fast Mode or I2C Fast Mode Plus.

*Note*

1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.

### RA2E2 MCU Version

There are two versions of the RA2E2. The version number can be identified by the part number or by reading the MCU Version Register.

Part Number	Chip Version
R7FA2E2A72DNK::HA0	Version 1
R7FA2E2A72DNK::HA1	Version 2
R7FA2E2A72DNK::AA0	Version 1
R7FA2E2A72DNK::AA1	Version 2

The I3C peripheral on the RA2E2 Version 1 has a hardware limitation related to using dynamic address assignment in slave mode. When the ENTDA command is received, the peripheral will continue driving its PID, DCR, and BCR registers during arbitration even after its dynamic address has already been configured. This will prevent any other devices on the bus from being configured after the RA2E2 Version 1 device has been configured. One workaround for this limitation is to configure the Provisional ID to all '1's in order to ensure that the RA2E2 Version 1 device is configured last. If more than one RA2E2 Version 1 device is present on the same bus, consider initializing them using another method (Eg. SETDASA). **Note that this issue has been corrected on the RA2E2 Version 2 (Part numbers ending in #AA1 or #HA1).**

In addition to fixing this hardware limitation, the revised I3C peripheral on the RA2E2 version 2 also greatly simplifies the error recovery procedures. By default, the driver will automatically include the error recovery procedures for both versions, however, it can be configured to only support version 1 or version 2 procedures in order to reduce code size.

### Limitations

Developers should be aware of the following limitations when using the I3C:

- The MIPI Reserved area and Vendor Extension area of Command Codes are not supported.
- Mixed Fast Bus topology has the following limitation on RA2E2 MCUs. The minimum SCL high period ( $T_{DIG\_H}$ ) is 156 nanoseconds when PCLKD is 48 Mhz, and 120 nanoseconds when PCLKD is 64 Mhz. On a Mixed Fast Bus, the high period  $T_{DIG\_HIGH\_MIXED}$  must be less than 45 nanoseconds in order to ensure that Legacy I2C devices do not interpret I3C signaling as valid I2C signaling (See Table 111 Push-Pull-Timing Parameters in the MIPI I3C Specification

- v1.1). This required high period cannot be achievable with RA2E2 MCUs.
- Secondary Master device role is not currently supported.

## Examples

### I3C Master Basic Example

This is a basic example of minimal use of the I3C Master in an application.

```
void i3c_master_basic_example (void)
{
    /* Initializes the module. */
    fsp_err_t status = R_I3C_Open(&g_i3c_ctrl, &g_i3c_cfg);
    assert(FSP_SUCCESS == status);

    static i3c_device_cfg_t master_device_cfg =
    {
        /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
        */
        .static_address = EXAMPLE_MASTER_STATIC_ADDRESS,
        /* If the device is a main master, it must configure its own dynamic address. */
        .dynamic_address = EXAMPLE_MASTER_DYNAMIC_ADDRESS,
    };
    status = R_I3C_DeviceCfgSet(&g_i3c_ctrl, &master_device_cfg);
    assert(FSP_SUCCESS == status);

    static i3c_device_table_cfg_t device_table_cfg =
    {
        /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
        */
        .static_address = EXAMPLE_STATIC_ADDRESS,
        /* Dynamic address is not used in I2C. */
        .dynamic_address = EXAMPLE_DYNAMIC_ADDRESS,
        /* This is the type of device. It may be either an I2C device or an I3C device. */
        .device_protocol = I3C_DEVICE_PROTOCOL_I3C,
        .ibi_accept = false,
        /* Depending on the device the IBI requests may have a data payload.
        * Note that this field will be automatically updated if the device is configured
        using ENTDAAs.
        */
    };
}
```

```
*/
    .ibi_payload          = false,
/* Master requests cannot be accepted because Secondary Master is not supported. */
    .master_request_accept = false,
};
/* Set the device configuration in the master device table. */
status = R_I3C_MasterDeviceTableSet(&g_i3c_ctrl, 0, &device_table_cfg);
assert(FSP_SUCCESS == status);
/* Enable the I3C device. */
status = R_I3C_Enable(&g_i3c_ctrl);
assert(FSP_SUCCESS == status);
/* Start assigning dynamic addresses to devices on the bus using the ENTDAAs command.
*/
status = R_I3C_DynamicAddressAssignmentStart(&g_i3c_ctrl,
I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAA, 0, 1);
assert(FSP_SUCCESS == status);
/* Wait for dynamic address assignment to complete. */
i3c_app_event_wait(I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE);
/* Select the configured device and bitrate mode for the following operations. */
status = R_I3C_DeviceSelect(&g_i3c_ctrl, 0, I3C_BITRATE_MODE_I3C_SDR0_STDBR);
assert(FSP_SUCCESS == status);
/* Start a write transfer. */
static uint8_t p_write_buffer[] = {1, 2, 3, 4, 5};
status = R_I3C_Write(&g_i3c_ctrl, p_write_buffer, sizeof(p_write_buffer), false);
assert(FSP_SUCCESS == status);
/* Wait for the write transfer to complete. */
i3c_app_event_wait(I3C_EVENT_WRITE_COMPLETE);
/* Start a read transfer. */
static uint8_t p_read_buffer[16];
status = R_I3C_Read(&g_i3c_ctrl, p_read_buffer, sizeof(p_read_buffer), false);
assert(FSP_SUCCESS == status);
/* Wait for the read transfer to complete. */
i3c_app_event_wait(I3C_EVENT_READ_COMPLETE);
}
```

```
/* This function is called by the I3C driver from ISRs in order to notify the
application of I3C events. */
void i3c_master_basic_example_callback (i3c_callback_args_t const * const p_args)
{
    switch (p_args->event)
    {
        case I3C_EVENT_ENTDAA_ADDRESS_PHASE:
            {
                /* The device PID, DCR, and BCR registers will be available in
i3c_callback_args_t::p_slave_info. */
                break;
            }
        case I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE:
            {
                i3c_app_event_notify(I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE);
                break;
            }
        case I3C_EVENT_WRITE_COMPLETE:
            {
                i3c_app_event_notify(I3C_EVENT_WRITE_COMPLETE);
                break;
            }
        case I3C_EVENT_READ_COMPLETE:
            {
                /* The number of bytes read from the slave will be available in
i3c_callback_args_t::transfer_size. */
                i3c_app_event_notify(I3C_EVENT_READ_COMPLETE);
                break;
            }
        default:
            {
                break;
            }
    }
}
```

```
}
```

## I3C Slave Basic Example

This is a basic example of minimal use of the I3C Slave in an application.

```
void i3c_slave_basic_example (void)
{
    /* Initializes the module. */
    fsp_err_t status = R_I3C_Open(&g_i3c_ctrl, &g_i3c_cfg);
    assert(FSP_SUCCESS == status);
    static i3c_device_cfg_t slave_device_cfg =
    {
        /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
        */
        .static_address = EXAMPLE_STATIC_ADDRESS,
        /* The dynamic address will be automatically updated when the master configures this
        device using ENTDAAs. */
        .dynamic_address = 0,
        /* Device Registers that are read by the master. */
        .slave_info =
        {
            .bcr = EXAMPLE_BCR_SETTING,
            .dcr = EXAMPLE_DCR_SETTING,
            .pid =
            {
                0, 1, 2, 3, 4, 5
            }
        }
    };

        break;
    }
    case I3C_IBI_TYPE_HOT_JOIN:
    {
        /* If a Hot-Join event is received, then the master can initiate the dynamic address
assignment procedure. */
        R_I3C_DynamicAddressAssignmentStart(&g_i3c_ctrl, I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAA,
0, 1);
        break;
    }
    default:
    {
        break;
    }
    }
}
default:
```

```
    {  
break;  
    }  
}  
}
```

### I3C Slave In-band Interrupts Example

This is a basic example of writing In-band Interrupts in I3C Slave mode.

```
void i3c_slave_ibi_write_basic_example (void)  
{  
    uint8_t ibi_write_buffer[EXAMPLE_WRITE_BUFFER_SIZE];  
    /* Initiate an In-band interrupt in slave mode.  
     * Note: If the slave does not have an IBI payload or if it is a Hot-Join request,  
the write buffer should be set  
     * to NULL and the write length should be set to 0. */  
    fsp_err_t status = R_I3C_IbiWrite(&g_i3c_ctrl, I3C_IBI_TYPE_INTERRUPT,  
ibi_write_buffer, sizeof(ibi_write_buffer));  
    assert(FSP_SUCCESS == status);  
    /* Wait for the ibiWrite transfer to complete. */  
    i3c_app_event_wait(I3C_EVENT_IBI_WRITE_COMPLETE);  
}  
void i3c_slave_ibi_write_basic_example_callback (i3c_callback_args_t const * const  
p_args)  
{  
    switch (p_args->event)  
    {  
case I3C_EVENT_IBI_WRITE_COMPLETE:  
    {  
        /* Notify the application that the IBI write is complete. */  
        i3c_app_event_notify(I3C_EVENT_IBI_WRITE_COMPLETE);  
        break;  
    }  
default:
```

```
    {  
break;  
    }  
}  
}
```

### I3C Master Common Command Codes Example

This is a basic example of sending Common Command Codes in I3C Master mode.

```
void i3c_master_ccc_example (void)  
{  
    static uint8_t command_buffer[EXAMPLE_READ_BUFFER_SIZE];  
    /* Setup the command descriptor. */  
    static i3c_command_descriptor_t command_descriptor =  
        {  
            .command_code = I3C_CCC_DIRECT_GETSTATUS,  
/* Set a buffer for storing the data read by the command. */  
            .p_buffer      = command_buffer,  
/* The length for a GETSTATUS command is 2 bytes. */  
            .length        = 2,  
/* Terminate the transfer with a STOP condition. */  
            .restart        = false,  
/* The GETSTATUS command is a Direct Get Command so rnw should be true. */  
            .rnw            = true,  
        };  
    /* Send the command. */  
    fsp_err_t status = R_I3C_CommandSend(&g_i3c_ctrl, &command_descriptor);  
    assert(FSP_SUCCESS == status);  
    /* Wait for the command to complete. */  
    i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);  
    /* The command_buffer will have the status info that was read from the slave device.  
*/  
}  
  
void i3c_master_ccc_example_callback (i3c_callback_args_t const * const p_args)
```

```
{
switch (p_args->event)
{
case I3C_EVENT_COMMAND_COMPLETE:
{
/* Notify the application that the command is complete. */
i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);
break;
}
default:
{
break;
}
}
}
```

### I3C Slave Common Command Codes Example

This is a basic example of receiving Common Command Codes in I3C Slave mode.

```
void i3c_slave_ccc_example (void)
{
static uint8_t read_buffer[EXAMPLE_READ_BUFFER_SIZE];
/* Broadcast and Direct Set commands will be read into the read_buffer the same way
that
* a normal SDR Master Write / Slave Read transfer is read. */
fsp_err_t status = R_I3C_Read(&g_i3c_ctrl, read_buffer, sizeof(read_buffer), false);
assert(FSP_SUCCESS == status);
/* Wait for the command to complete. */
i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);
}
void i3c_slave_ccc_example_callback (i3c_callback_args_t const * const p_args)
{
switch (p_args->event)
{
```

```

case I3C_EVENT_COMMAND_COMPLETE:
    {
/* The command code and transfer size will be available in p_args.
 * If the command code is a Broadcast or Direct Set, then data will
 * be stored in the read buffer provided by i3c_api_t::read.
 * If the command code is a Direct Get, then the data will be automatically
 * sent from device SFR. */
        i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);
break;
    }
default:
    {
break;
    }
}
}

```

## Data Structure Documentation

### ◆ [i3c\\_clock\\_stalling\\_t](#)

struct <a href="#">i3c_clock_stalling_t</a>		
Clock stalling settings.		
Data Fields		
uint32_t	assigned_address_phase_enable: 1	Enable Clock Stalling during the address phase of the ENTDAACOMMAND command.
uint32_t	transition_phase_enable: 1	Enable Clock Stalling during the transition bit in read transfers.
uint32_t	parity_phase_enable: 1	Enable Clock Stalling during the parity bit period in write transfers.
uint32_t	ack_phase_enable: 1	Enable Clock Stalling during the ACK/NACK phase.
uint16_t	clock_stalling_time	The amount of time to stall the clock in I3C source clock ticks.

### ◆ [i3c\\_bitrate\\_settings\\_t](#)

struct <a href="#">i3c_bitrate_settings_t</a>		
Bitrate settings for configuring the SCL clock frequency.		
Data Fields		
uint32_t	stdbr	The standard bitrate settings.
uint32_t	extbr	The extended bitrate settings.
<a href="#">i3c_clock_stalling_t</a>	clock_stalling	Clock Stalling settings (See Master Clock Stalling in the MIPI I3C Specification v1.0).

### ◆ [i3c\\_ibi\\_control\\_t](#)

struct <a href="#">i3c_ibi_control_t</a>		
Settings for controlling the drivers behavior in response to IBIs.		
Data Fields		
uint32_t	hot_join_acknowledge: 1	If false, NACK all Hot Join requests.
uint32_t	notify_rejected_hot_join_requests: 1	Notify the application when an IBI Hot-Join request has been

		NACK'd.
uint32_t	notify_rejected_mastership_requests: 1	Notify the application when an IBI Mastership request has been NACK'd.
uint32_t	notify_rejected_interrupt_requests: 1	Notify the application when an IBI Interrupt request has been NACK'd.

#### ◆ i3c\_slave\_command\_response\_info\_t

struct i3c_slave_command_response_info_t		
Default configuration settings for the slave response to Direct Get Common Command Codes.		
Data Fields		
bool	inband_interrupt_enable	Enable IBI interrupts.  Slave Event Settings (See ENEC and DISEC in the MIPI I3C Specification v1.0).
bool	mastership_request_enable	Enable Mastership requests.
bool	hotjoin_request_enable	Enable Hot-Join requests.
<a href="#">i3c_activity_state_t</a>	activity_state	Starting Activity State (See ENTASn in the MIPI I3C Specification v1.0).
uint16_t	write_length	Max Write Length (See SETMWL and GETMWL in the MIPI I3C Specification v1.0).
uint16_t	read_length	Max Read Length (See SETMRL and GETMRL in the MIPI I3C Specification v1.0).
uint8_t	ibi_payload_length	Number of bytes that will be written by an IBI (See SETMRL and GETMRL in the MIPI I3C Specification v1.0).
<a href="#">i3c_data_rate_setting_t</a>	write_data_rate	Max Write Data Rate.  Max Data Rate Settings (See GETMXDS in the MIPI I3C Specification v1.0).
<a href="#">i3c_data_rate_setting_t</a>	read_data_rate	Max Read Data Rate.
<a href="#">i3c_clock_data_turnaround_t</a>	clock_data_turnaround	Max Data Speed Turnaround.
bool	read_turnaround_time_enable	Enable transmission of the of the Max Read Max Read Turnaround Time.
uint32_t	read_turnaround_time	Max Read Turnaround Time.

uint8_t	oscillator_frequency	This byte represents the Slave's internal oscillator frequency in increments of 0.5 MHz (500kHz), up to 127.5 MHz. (See GETXTIME in the MIPI I3C Specification v1.1).
uint8_t	oscillator_inaccuracy	Oscillator inaccuracy in 0.5% increments of 0% up to 25.5% (See GETXTIME in the MIPI I3C Specification v1.1).

#### ◆ i3c\_instance\_ctrl\_t

struct i3c_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">i3c_api_t::open</a> is called.	
<b>Public Member Functions</b>	
<a href="#">i3c_slave_info_t</a> current_slave_info	<a href="#">BSP_ALIGN_VARIABLE</a> (4)
	The last <a href="#">i3c_slave_info_t</a> read during ENTDAAs.
<b>Data Fields</b>	
uint32_t	<a href="#">open</a>
	Indicates whether the <a href="#">open()</a> API has been successfully called.
R_I3C0_Type *	<a href="#">p_reg</a>
	Base register for this channel.
volatile uint32_t	<a href="#">internal_state</a>
	Used to track the current state of the driver.
uint8_t	<a href="#">current_command_code</a>
	The current Common Command Code that is being transferred.
uint32_t	<a href="#">device_index</a>
	The device index selected using <a href="#">i3c_api_t::deviceSelect</a> .

<code>i3c_bitrate_mode_t</code>	<code>device_bitrate_mode</code>
	Runtime bitrate settings to use for the next transfer.
<code>uint32_t</code>	<code>next_word</code>
	The next word that will be written to the FIFO.
<code>uint32_t</code>	<code>ibi_next_word</code>
	The next word that will be written to the IBI FIFO.
<code>i3c_write_buffer_descriptor_t</code>	<code>write_buffer_descriptor</code>
	Buffer descriptor for keeping track of a write transfer.
<code>i3c_read_buffer_descriptor_t</code>	<code>read_buffer_descriptor</code>
	Buffer descriptor for keeping track of a read transfer.
<code>i3c_read_buffer_descriptor_t</code>	<code>ibi_buffer_descriptor</code>
	Buffer descriptor for keeping track of an IBI read/write transfer.
<code>volatile uint32_t</code>	<code>read_transfer_count_final</code>
	The total number of bytes read during a read transfer.
<code>volatile uint32_t</code>	<code>ibi_transfer_count_final</code>
	The total number of bytes read during an IBI transfer.
<code>i3c_cfg_t const *</code>	<code>p_cfg</code>
	A pointer to the configuration structure provided during open.

## ◆ i3c\_extended\_cfg\_t

struct i3c_extended_cfg_t		
Extended configuration for r_i3c.		
Data Fields		
<a href="#">i3c_bitrate_settings_t</a>	bitrate_settings	Bitrate settings configuring the frequency and duty cycle for SCL.
<a href="#">i3c_ibi_control_t</a>	ibi_control	Configure the driver's behavior in response to IBIs.
uint32_t	bus_free_detection_time	The time in I3C reference clock ticks needed in order to detect the bus free condition (See "Bus Free Condition" in the MIPI I3C Specification v1.0).
uint32_t	bus_available_detection_time	The time in I3C reference clock ticks needed in order to detect the bus available condition (See "Bus Available Condition" in the MIPI I3C Specification v1.0).
uint32_t	bus_idle_detection_time	The time in I3C reference clock ticks needed in order to detect the bus idle condition (See "Bus Idle Condition" in the MIPI I3C Specification v1.0).
bool	timeout_detection_enable	Notify the application if SCL is stuck high or low.
<a href="#">i3c_slave_command_response_info_t</a>	slave_command_response_info	Initial settings for configuring the slave's responses to received commands.
IRQn_Type	resp_irq	Response Queue Full IRQ number.
IRQn_Type	rx_irq	Receive FIFO Full IRQ number.
IRQn_Type	tx_irq	Transmit FIFO Empty IRQ number.
IRQn_Type	rcv_irq	Receive Status Queue Full IRQ number.
IRQn_Type	ibi_irq	IBI IRQ number.
IRQn_Type	eei_irq	EI IRQ number.
uint8_t	ipl	Interrupt Priority for Resp, Rx, Tx, and RCV IRQs.
uint8_t	eei_ipl	Error and Event Interrupt Priority.

## Macro Definition Documentation

---

### ◆ I3C\_ERROR\_RECOVERY\_VERSION\_1

```
#define I3C_ERROR_RECOVERY_VERSION_1
```

Support error recovery procedure for chip version 1.

There are two different versions of the RA2E2 MCU and the error recovery procedure is different for each version.

### ◆ I3C\_DEVICE\_INDEX\_EXTENDED\_DEVICE

```
#define I3C_DEVICE_INDEX_EXTENDED_DEVICE
```

Index for selecting the device defined in the extended address table.

### ◆ I3C\_EVENT\_STATUS\_SUCCESS

```
#define I3C_EVENT_STATUS_SUCCESS
```

The transfer was completed as expected.

Event Status Provided by the callback.

## Enumeration Type Documentation

---

◆ **i3c\_bitrate\_mode\_t**

enum i3c_bitrate_mode_t	
Bitrate settings that can be selected at run-time using <code>i3c_api_t::deviceSelect</code> .	
Enumerator	
I3C_BITRATE_MODE_I2C_STDBR	Use the period settings defined in STDBRH/L.
I3C_BITRATE_MODE_I2C_EXTBR	Use the period settings defined in EXTBRH/L.
I3C_BITRATE_MODE_I3C_SDR0_STDBR	Use the period settings defined in STDBRH/L (I3C Devices only).
I3C_BITRATE_MODE_I3C_SDR1_EXTBR	Use the period settings defined in EXTBRH/L (I3C Devices only).
I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2	Use the period settings defined in STDBRH/L x 2 (I3C Devices only).
I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2	Use the period settings defined in EXTBRH/L x 2 (I3C Devices only).
I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4	Use the period settings defined in EXTBRH/L x 4 (I3C Devices only).

◆ **i3c\_activity\_state\_t**

enum i3c_activity_state_t	
Supported activity states for ENTASn Command (See ENTASn in the MIPI I3C Specification v1.0).	
Enumerator	
I3C_ACTIVITY_STATE_ENTAS0	Activity Interval (1 microsecond).
I3C_ACTIVITY_STATE_ENTAS1	Activity Interval (100 microseconds).
I3C_ACTIVITY_STATE_ENTAS2	Activity Interval (2 milliseconds).
I3C_ACTIVITY_STATE_ENTAS3	Activity Interval (50 milliseconds).

◆ **i3c\_data\_rate\_setting\_t**

enum i3c_data_rate_setting_t	
Maximum Sustained Data Rate for non-CCC messages sent by Master Device to Slave Device (See GETMXDS in the MIPI I3C Specification v1.0).	
Enumerator	
I3C_DATA_RATE_SETTING_FSCL_MAX	There is no data rate limit.
I3C_DATA_RATE_SETTING_8MHZ	The max sustained data rate is 8 Mhz.
I3C_DATA_RATE_SETTING_6MHZ	The max sustained data rate is 6 Mhz.
I3C_DATA_RATE_SETTING_4MHZ	The max sustained data rate is 4 Mhz.
I3C_DATA_RATE_SETTING_2MHZ	The max sustained data rate is 2 Mhz.

◆ **i3c\_clock\_data\_turnaround\_t**

enum i3c_clock_data_turnaround_t	
Clock to Data Turnaround Time (See GETMXDS in the MIPI I3C Specification v1.0).	
Enumerator	
I3C_CLOCK_DATA_TURNAROUND_8NS	Clock to turnaround time is 8 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_9NS	Clock to turnaround time is 9 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_10NS	Clock to turnaround time is 10 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_11NS	Clock to turnaround time is 11 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_12NS	Clock to turnaround time is 12 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_EXTENDED	Clock to turnaround time is greater than 12 nanoseconds.

**Function Documentation**

◆ **R\_I3C\_Open()**

```
fsp_err_t R_I3C_Open ( i3c_ctrl_t *const p_api_ctrl, i3c_cfg_t const *const p_cfg )
```

Configure an I3C instance. Implements `i3c_api_t::open`.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was invalid.
FSP_ERR_ALREADY_OPEN	Open has already been called for this instance.
FSP_ERR_UNSUPPORTED	A selected feature is not supported with the current configuration.

◆ **R\_I3C\_Enable()**

```
fsp_err_t R_I3C_Enable ( i3c_ctrl_t *const p_api_ctrl)
```

Enable the I3C device.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This instance is already enabled.

◆ **R\_I3C\_DeviceCfgSet()**

```
fsp_err_t R_I3C_DeviceCfgSet ( i3c_ctrl_t *const p_api_ctrl, i3c_device_cfg_t const *const p_device_cfg )
```

Set the configuration for this device.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_UNSUPPORTED	The device cannot be a secondary master if master support is disabled.

◆ **R\_I3C\_MasterDeviceTableSet()**

```
fsp_err_t R_I3C_MasterDeviceTableSet ( i3c_ctrl_t *const p_api_ctrl, uint32_t device_index,
i3c_device_table_cfg_t const *const p_device_table_cfg )
```

Configure an entry in the master device table. This function is called in master mode in order to configure the devices on the I3C bus. It may also be called in slave mode when the slave receives the DEFSVLS command.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_UNSUPPORTED	Mastership requests must be rejected is slave support is disabled.

◆ **R\_I3C\_SlaveStatusSet()**

```
fsp_err_t R_I3C_SlaveStatusSet ( i3c_ctrl_t *const p_api_ctrl, i3c_device_status_t status )
```

Set the status returned to the master in response to a GETSTATUS command.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	The instance is not in slave mode.
FSP_ERR_UNSUPPORTED	Slave support is disabled.

◆ **R\_I3C\_DeviceSelect()**

```
fsp_err_t R_I3C_DeviceSelect ( i3c_ctrl_t *const p_api_ctrl, uint32_t device_index, uint32_t
bitrate_mode )
```

In master mode, select the device for the next transfer. This function is not used in slave mode.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This operation is prohibited in slave mode.
FSP_ERR_UNSUPPORTED	Master support is disabled.

◆ **R\_I3C\_DynamicAddressAssignmentStart()**

```
fsp_err_t R_I3C_DynamicAddressAssignmentStart ( i3c_ctrl_t *const p_api_ctrl,
i3c_address_assignment_mode_t address_assignment_mode, uint32_t starting_device_index,
uint32_t device_count )
```

Start the Dynamic Address Assignment Process. Implements `i3c_api_t::dynamicAddressAssignmentStart`.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This operation is prohibited in slave mode.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_UNSUPPORTED	Master support is disabled.

◆ **R\_I3C\_CommandSend()**

```
fsp_err_t R_I3C_CommandSend ( i3c_ctrl_t *const p_api_ctrl, i3c_command_descriptor_t *
p_command_descriptor )
```

Send a broadcast or direct command to slave devices on the bus. Implements `i3c_api_t::commandSend`.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This driver is not in master mode.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes. If it is a read operation, the length also be a multiple of 4 bytes.
FSP_ERR_UNSUPPORTED	Master support must be enabled to call this function. Slave support must be enabled when sending the GETACCMST command.

◆ **R\_I3C\_Write()**

```
fsp_err_t R_I3C_Write ( i3c_ctrl_t *const p_api_ctrl, uint8_t const *const p_data, uint32_t length,
bool restart )
```

Set the write buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements `i3c_api_t::write`.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This driver is disabled.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes.

◆ **R\_I3C\_Read()**

```
fsp_err_t R_I3C_Read ( i3c_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t length, bool restart )
```

Set the read buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements `i3c_api_t::read`.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This driver is disabled.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes.

◆ **R\_I3C\_IbiWrite()**

```
fsp_err_t R_I3C_IbiWrite ( i3c_ctrl_t *const p_api_ctrl, i3c_ibi_type_t ibi_type, uint8_t const *const p_data, uint32_t length )
```

Initiate an IBI write operation (This function is only used in slave mode).

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This function is only called in slave mode.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes.
FSP_ERR_UNSUPPORTED	Slave support is disabled.

◆ **R\_I3C\_IbiRead()**

```
fsp_err_t R_I3C_IbiRead ( i3c_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t length )
```

Set the read buffer for storing received IBI data (This function is only used in master mode).

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This function is only called in master mode.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes.
FSP_ERR_UNSUPPORTED	Master support is disabled.

◆ **R\_I3C\_Close()**

```
fsp_err_t R_I3C_Close ( i3c_ctrl_t *const p_api_ctrl)
```

Close the I3C instance. Implements `i3c_api_t::close`.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.

**4.2.5.14 SPI (r\_sci\_b\_spi)**

Modules » [Connectivity](#)

**Functions**

```
fsp_err_t R_SCI_B_SPI_Open (spi_ctrl_t *p_api_ctrl, spi_cfg_t const *const p_cfg)
```

```
fsp_err_t R_SCI_B_SPI_Read (spi_ctrl_t *const p_api_ctrl, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SCI_B_SPI_Write (spi_ctrl_t *const p_api_ctrl, void const *p_src, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SCI_B_SPI_WriteRead (spi_ctrl_t *const p_api_ctrl, void const
*p_src, void *p_dest, uint32_t const length, spi_bit_width_t const
bit_width)
```

```
fsp_err_t R_SCI_B_SPI_CallbackSet (spi_ctrl_t *const p_api_ctrl,
void(*p_callback)(spi_callback_args_t *), void const *const p_context,
spi_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_SCI_B_SPI_Close (spi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SCI_B_SPI_CalculateBitrate (uint32_t bitrate,
sci_b_spi_clock_source_t clock_source, sci_b_spi_div_setting_t
*sclk_div)
```

## Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

## Overview

### Features

- Standard SPI Modes
  - Master or Slave Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Select data sampling on leading edge, data change on trailing edge
    - CPHA=1 Select data change on leading edge, data sampling on trailing edge
  - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

## Configuration

### Build Time Configurations for r\_sci\_b\_spi

The following build time configurations are defined in fsp\_cfg/r\_sci\_b\_spi\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP)	Default (BSP)	If selected code for

	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>		parameter checking is included in the build.
DTC Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	If support for transferring data using the DTC will be compiled in.

### Configurations for Connectivity > SPI (r\_sci\_b\_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r\_sci\_b\_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Operating Mode	<ul style="list-style-type: none"> <li>• Master</li> <li>• Slave</li> </ul>	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> <li>• Data sampling on odd edge, data variation on even edge</li> <li>• Data sampling on even edge, data variation on odd edge</li> </ul>	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	<ul style="list-style-type: none"> <li>• Low when idle</li> <li>• High when idle</li> </ul>	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> <li>• MSB First</li> <li>• LSB First</li> </ul>	MSB First	Select the data bit order.
Clock Source	<ul style="list-style-type: none"> <li>• PCLK</li> <li>• SCISPICK</li> </ul>	PCLK	Select whether the peripheral clock (PCLK) or SCISPICK is used for generating the SCK frequency.
Callback	Name must be a valid C symbol	sci_b_spi_callback	A user callback function that is called from the sci_b_spi interrupts when a transfer is completed or an error has occurred.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.

Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.
Bitrate	Value must be an integer greater than 0	8000000	Enter the desired bitrate.  If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated <a href="#">sci_spi_extended_cfg_t</a> structure.

## Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	PCLKA

## Pin Configuration

This module uses SCIn\_MOSI, SCIn\_MISO, SCIn\_SPCK, and SCIn\_SS pins to communicate with on board devices.

*Note*

*At high bit rates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.*

## Usage Notes

### Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

### Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

### Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

### Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

## Examples

### Basic Example

This is a basic example of minimal use of the SCI\_B\_SPI module in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_b_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
void sci_b_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SCI_B_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

```
/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}
/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}
/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

## Data Structures

```
struct sci_b_spi_div_setting_t
```

## Data Structure Documentation

### ◆ sci\_b\_spi\_div\_setting\_t

```
struct sci_b_spi_div_setting_t
```

Settings for adjusting the SPI CLK.

## Function Documentation

### ◆ R\_SCI\_B\_SPI\_Open()

```
fsp_err_t R_SCI_B_SPI_Open ( spi_ctrl_t* p_api_ctrl, spi_cfg_t const *const p_cfg )
```

Initialize a channel for SPI communication mode. Implements [spi\\_api\\_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

#### Parameters

p_api_ctrl	Pointer to the control structure.
p_cfg	Pointer to a configuration structure.

#### Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ASSERTION	An input parameter is invalid or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

### ◆ R\_SCI\_B\_SPI\_Read()

```
fsp_err_t R_SCI_B_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length,
spi_bit_width_t const bit_width )
```

Receive data from an SPI device. Implements `spi_api_t::read`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

#### Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

#### Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> <li>• Pointer <code>p_api_ctrl</code> is NULL</li> <li>• Bit width is not 8 bits</li> <li>• Length is equal to 0</li> <li>• Pointer to destination is NULL</li> </ul>
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

### ◆ R\_SCI\_B\_SPI\_Write()

```
fsp_err_t R_SCI_B_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

Transmit data to a SPI device. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

#### Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

#### Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> <li>• Pointer <code>p_api_ctrl</code> is NULL</li> <li>• Pointer to source is NULL</li> <li>• Length is equal to 0</li> <li>• Bit width is not equal to 8 bits</li> </ul>
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reconfigure](#)

### ◆ R\_SCI\_B\_SPI\_WriteRead()

```
fsp_err_t R_SCI_B_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

#### Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_B_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code> ).

#### Return values

<code>FSP_SUCCESS</code>	Write operation successfully completed.
<code>FSP_ERR_ASSERTION</code>	One of the following invalid parameters passed: <ul style="list-style-type: none"> <li>• Pointer <code>p_api_ctrl</code> is NULL</li> <li>• Pointer to source is NULL</li> <li>• Pointer to destination is NULL</li> <li>• Length is equal to 0</li> <li>• Bit width is not equal to 8 bits</li> </ul>
<code>FSP_ERR_NOT_OPEN</code>	The channel has not been opened. Open the channel first.
<code>FSP_ERR_UNSUPPORTED</code>	The given <code>bit_width</code> is not supported.
<code>FSP_ERR_IN_USE</code>	A transfer is already in progress.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reconfigure](#)

**◆ R\_SCI\_B\_SPI\_CallbackSet()**

```
fsp_err_t R_SCI_B_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi\\_api\\_t::callbackSet](#)

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

**◆ R\_SCI\_B\_SPI\_Close()**

```
fsp_err_t R_SCI_B_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

Disable the SCI channel and set the instance as not open. Implements [spi\\_api\\_t::close](#).

**Parameters**

p_api_ctrl	Pointer to an opened instance.
------------	--------------------------------

**Return values**

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

### ◆ R\_SCI\_B\_SPI\_CalculateBitrate()

```
fsp_err_t R_SCI_B_SPI_CalculateBitrate ( uint32_t bitrate, sci_b_spi_clock_source_t clock_source,
sci_b_spi_div_setting_t* sclk_div )
```

Calculate the register settings required to achieve the desired bitrate.

#### Parameters

[in]	bitrate	bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc.
	clock_source	clock source (PCLKA or SCISPICK) used for bit rate calculation.
	sclk_div	Pointer to <a href="#">sci_b_spi_div_setting_t</a> used to configure baudrate settings.

#### Return values

FSP_SUCCESS	Baud rate is set successfully.
FSP_ERR_ASSERTION	Baud rate is not achievable.

#### Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

## 4.2.5.15 SPI (r\_sci\_spi)

Modules » Connectivity

### Functions

```
fsp_err_t R_SCI_SPI_Open (spi_ctrl_t *p_api_ctrl, spi_cfg_t const *const p_cfg)
```

```
fsp_err_t R_SCI_SPI_Read (spi_ctrl_t *const p_api_ctrl, void *p_dest, uint32_t
const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SCI_SPI_Write (spi_ctrl_t *const p_api_ctrl, void const *p_src,
uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SCI_SPI_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src,
void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SCI_SPI_CallbackSet (spi_ctrl_t *const p_api_ctrl,
```

```
void(*p_callback)(spi_callback_args_t*), void const *const p_context,
spi_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_SCI_SPI_Close (spi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SCI_SPI_CalculateBitrate (uint32_t bitrate, sci_spi_div_setting_t
*sclk_div, bool use_mddr)
```

## Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

## Overview

### Features

- Standard SPI Modes
  - Master or Slave Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Select data sampling on leading edge, data change on trailing edge
    - CPHA=1 Select data change on leading edge, data sampling on trailing edge
  - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

## Configuration

### Build Time Configurations for r\_sci\_spi

The following build time configurations are defined in fsp\_cfg/r\_sci\_spi\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	If support for transferring data using the DTC will be compiled in.

## Configurations for Connectivity > SPI (r\_sci\_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r\_sci\_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Operating Mode	<ul style="list-style-type: none"> <li>Master</li> <li>Slave</li> </ul>	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> <li>Data sampling on odd edge, data variation on even edge</li> <li>Data sampling on even edge, data variation on odd edge</li> </ul>	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	<ul style="list-style-type: none"> <li>Low when idle</li> <li>High when idle</li> </ul>	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> <li>Enable</li> <li>Disable</li> </ul>	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> <li>MSB First</li> <li>LSB First</li> </ul>	MSB First	Select the data bit order.
Callback	Name must be a valid C symbol	sci_spi_callback	A user callback function that is called from the sci spi interrupts when a transfer is completed or an error has occurred.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.
Bitrate	Value must be an integer greater than 0	8000000	Enter the desired bitrate.  If the requested bitrate

cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated `sci_spi_extended_cfg_t` structure.

Bitrate Modulation	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Disabled	<p>Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.</p>
--------------------	---	----------	--

## Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA

RA6T1

PCLKA

## Pin Configuration

This module uses SCIn\_MOSI, SCIn\_MISO, SCIn\_SPCK, and SCIn\_SS pins to communicate with on board devices.

### Note

*At high bit rates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.*

## Usage Notes

### Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

### Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

### Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI\_SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

### Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

### Bit Rate Modulation

Depending on the peripheral clock frequency, the desired bit rate may not be achievable. With bit rate modulation, the device can remove a configurable number of input clock pulses to the internal bit rate counter in order to create the desired bit rate. This has the effect of changing the period of individual bits in order to achieve the desired average bit rate. For more information see section 34.9 Bit Rate Modulation Function in the RA6M3 manual.

## Examples

### Basic Example

This is a basic example of minimal use of the SCI\_SPI in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}

void sci_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SCI_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Assert Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
    /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
    {
        ;
    }
    /* De-assert Slave Select Line 1 */
```

```

R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}
/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}

```

## Data Structures

struct [sci\\_spi\\_div\\_setting\\_t](#)

## Data Structure Documentation

### ◆ sci\_spi\_div\_setting\_t

struct sci_spi_div_setting_t		
Settings for adjusting the SPI CLK.		
Data Fields		
uint8_t	brr	
uint8_t	cks: 2	
uint8_t	mddr	Set to 0 to disable MDDR.

## Function Documentation

◆ **R\_SCI\_SPI\_Open()**

```
fsp_err_t R_SCI_SPI_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

Initialize a channel for SPI communication mode. Implements `spi_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

**Parameters**

p_api_ctrl	Pointer to the control structure.
p_cfg	Pointer to a configuration structure.

**Return values**

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ASSERTION	An input parameter is invalid or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

## ◆ R\_SCI\_SPI\_Read()

```
fsp_err_t R_SCI_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length,
spi_bit_width_t const bit_width )
```

Receive data from an SPI device. Implements `spi_api_t::read`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

### Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_SPI (Set to SPI_BIT_WIDTH_8_BITS).

### Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> <li>• Pointer <code>p_api_ctrl</code> is NULL</li> <li>• Bit width is not 8 bits</li> <li>• Length is equal to 0</li> <li>• Pointer to destination is NULL</li> </ul>
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

## ◆ R\_SCI\_SPI\_Write()

```
fsp_err_t R_SCI_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

Transmit data to a SPI device. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

### Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code> ).

### Return values

<code>FSP_SUCCESS</code>	Write operation successfully completed.
<code>FSP_ERR_ASSERTION</code>	One of the following invalid parameters passed: <ul style="list-style-type: none"> <li>• Pointer <code>p_api_ctrl</code> is NULL</li> <li>• Pointer to source is NULL</li> <li>• Length is equal to 0</li> <li>• Bit width is not equal to 8 bits</li> </ul>
<code>FSP_ERR_NOT_OPEN</code>	The channel has not been opened. Open the channel first.
<code>FSP_ERR_UNSUPPORTED</code>	The given <code>bit_width</code> is not supported.
<code>FSP_ERR_IN_USE</code>	A transfer is already in progress.

### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

### ◆ R\_SCI\_SPI\_WriteRead()

```
fsp_err_t R_SCI_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

#### Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code> ).

#### Return values

<code>FSP_SUCCESS</code>	Write operation successfully completed.
<code>FSP_ERR_ASSERTION</code>	One of the following invalid parameters passed: <ul style="list-style-type: none"> <li>• Pointer <code>p_api_ctrl</code> is NULL</li> <li>• Pointer to source is NULL</li> <li>• Pointer to destination is NULL</li> <li>• Length is equal to 0</li> <li>• Bit width is not equal to 8 bits</li> </ul>
<code>FSP_ERR_NOT_OPEN</code>	The channel has not been opened. Open the channel first.
<code>FSP_ERR_UNSUPPORTED</code>	The given <code>bit_width</code> is not supported.
<code>FSP_ERR_IN_USE</code>	A transfer is already in progress.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reconfigure](#)

**◆ R\_SCI\_SPI\_CallbackSet()**

```
fsp_err_t R_SCI_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi\\_api\\_t::callbackSet](#)

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

**◆ R\_SCI\_SPI\_Close()**

```
fsp_err_t R_SCI_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

Disable the SCI channel and set the instance as not open. Implements [spi\\_api\\_t::close](#).

**Parameters**

p_api_ctrl	Pointer to an opened instance.
------------	--------------------------------

**Return values**

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

### ◆ R\_SCI\_SPI\_CalculateBitrate()

```
fsp_err_t R_SCI_SPI_CalculateBitrate ( uint32_t bitrate, sci_spi_div_setting_t * sclk_div, bool use_mddr )
```

Calculate the register settings required to achieve the desired bitrate.

#### Parameters

[in]	bitrate	bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc.
	sclk_div	Pointer to <a href="#">sci_spi_div_setting_t</a> used to configure baudrate settings.
[in]	use_mddr	Calculate the divider settings for use with MDDR.

#### Return values

FSP_SUCCESS	Baud rate is set successfully.
FSP_ERR_ASSERTION	Baud rate is not achievable.

#### Note

*The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.*

### 4.2.5.16 SPI (r\_spi)

Modules » Connectivity

#### Functions

```
fsp_err_t R_SPI_Open (spi_ctrl_t *p_api_ctrl, spi_cfg_t const *const p_cfg)
```

```
fsp_err_t R_SPI_Read (spi_ctrl_t *const p_api_ctrl, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_Write (spi_ctrl_t *const p_api_ctrl, void const *p_src, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_CallbackSet (spi_ctrl_t *const p_api_ctrl, void(*p_callback)(spi_callback_args_t *), void const *const p_context, spi_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_SPI_Close (spi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SPI_CalculateBtrate (uint32_t bitrate, rspck_div_setting_t
*spck_div)
```

## Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

## Overview

### Features

- Standard SPI Modes
  - Master or Slave Mode
  - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
    - CPHA=1 Data Sampled on the odd edge of SCLK
  - MSB/LSB first
  - 8-16 bit, 20-bit, 24-bit, and 32-bit data frames
    - Hardware endian swap in 16-bit and 32-bit modes
  - SSL level keep (burst transfer) supported if available
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
  - TX Underrun Error (No data to load into shift register for transmitting)
  - Parity Error (When parity is enabled and a parity error is detected)

## Configuration

### Build Time Configurations for r\_spi

The following build time configurations are defined in fsp\_cfg/r\_spi\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Enable Support for using DTC	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	If enabled, DTC instances will be

included in the build for both transmission and reception.

Enable Transmitting from RXI Interrupt

- Enabled
- Disabled

Disabled

If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a performance boost when DTC is not used. In addition, Transmit Only mode is not supported when this configuration is enabled.

### Configurations for Connectivity > SPI (r\_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r\_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SPI channel.
Receive Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transmit Buffer Empty Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transfer Complete Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Error Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Operating Mode	<ul style="list-style-type: none"> <li>• Master</li> <li>• Slave</li> </ul>	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> <li>• Data sampling on odd edge, data variation on even edge</li> <li>• Data sampling on even edge, data variation on odd edge</li> </ul>	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.

Clock Polarity	<ul style="list-style-type: none"> <li>• Low when idle</li> <li>• High when idle</li> </ul>	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> <li>• MSB First</li> <li>• LSB First</li> </ul>	MSB First	Select the data bit order.
Callback	Name must be a valid C symbol	spi_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
SPI Mode	<ul style="list-style-type: none"> <li>• SPI Operation</li> <li>• Clock Synchronous Operation</li> </ul>	Clock Synchronous Operation	Select the clock sync mode.
Full or Transmit Only Mode	<ul style="list-style-type: none"> <li>• Full Duplex</li> <li>• Transmit Only</li> </ul>	Full Duplex	Select Full Duplex or Transmit Only Mode.
Slave Select Polarity	<ul style="list-style-type: none"> <li>• Active Low</li> <li>• Active High</li> </ul>	Active Low	Select the slave select active level.
Select SSL(Slave Select)	<ul style="list-style-type: none"> <li>• SSL0</li> <li>• SSL1</li> <li>• SSL2</li> <li>• SSL3</li> </ul>	SSL0	Select which slave to use.
MOSI Idle State	<ul style="list-style-type: none"> <li>• MOSI Idle Value Fixing Disable</li> <li>• MOSI Idle Value Fixing Low</li> <li>• MOSI Idle Value Fixing High</li> </ul>	MOSI Idle Value Fixing Disable	Select the MOSI idle level if MOSI idle is enabled.
Parity Mode	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Odd</li> <li>• Even</li> </ul>	Disabled	Select the parity mode if parity is enabled.
Byte Swapping	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Select the byte swap mode for 16/32-Bit Data Frames.
Bitrate	Value must be an integer greater than 0	16000000	Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested

bitrate is used. The theoretical bitrate is printed in a comment in the generated [spi\\_extended\\_cfg\\_t](#) structure.

Clock Delay	<ul style="list-style-type: none"> <li>• 1 Clock</li> <li>• 2 Clocks</li> <li>• 3 Clocks</li> <li>• 4 Clocks</li> <li>• 5 Clocks</li> <li>• 6 Clocks</li> <li>• 7 Clocks</li> <li>• 8 Clocks</li> </ul>	1 Clock	Configure the number of SPI clock cycles before each data frame.
SSL Negation Delay	<ul style="list-style-type: none"> <li>• 1 Clock</li> <li>• 2 Clocks</li> <li>• 3 Clocks</li> <li>• 4 Clocks</li> <li>• 5 Clocks</li> <li>• 6 Clocks</li> <li>• 7 Clocks</li> <li>• 8 Clocks</li> </ul>	1 Clock	Configure the number of SPI clock cycles after each data frame.
Next Access Delay	<ul style="list-style-type: none"> <li>• 1 Clock</li> <li>• 2 Clocks</li> <li>• 3 Clocks</li> <li>• 4 Clocks</li> <li>• 5 Clocks</li> <li>• 6 Clocks</li> <li>• 7 Clocks</li> <li>• 8 Clocks</li> </ul>	1 Clock	Configure the number of SPI clock cycles between each data frame.

## Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA

---

RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA

## Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

### Note

*At high bitrates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.*

## Usage Notes

### Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

### Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full isr. This only improves performance when the DTC is not being used.

### Note

*Configuring the module to use RX DTC instance without also providing a TX DTC instance results in an invalid configuration when RXI transmit is enabled.*

*Transmit Only mode is not supported when Transmit from RXI is enabled.*

### Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

### Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

## Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP\_ERR\_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- In order to use CPHA=0 setting in slave mode, the master must toggle the SSL pin after every data frame (Even if the device supports SSL Level Keeping). Because of this hardware limitation, the module will return FSP\_ERR\_UNSUPPORTED when it is configured to use CPHA=0 setting in slave mode.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

## Examples

### Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;
void spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start a write/read transfer */
    err = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
```

```
    {  
        ;  
    }  
}  
static void r_spi_callback (spi_callback_args_t * p_args)  
{  
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)  
    {  
        g_transfer_complete = true;  
    }  
}
```

### Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)  
{  
    uint8_t tx_buffer[TRANSFER_SIZE];  
    uint8_t rx_buffer[TRANSFER_SIZE];  
    /* Configure Slave Select Line 1 */  
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);  
    /* Configure Slave Select Line 2 */  
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);  
    fsp_err_t err = FSP_SUCCESS;  
    /* Initialize the SPI module. */  
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
    /* Assert Slave Select Line 1 */  
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);  
    /* Start a write/read transfer */  
    g_transfer_complete = false;  
    err = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,  
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
```

```
    assert(FSP_SUCCESS == err);

    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
    {
        ;
    }

    /* De-assert Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

    /* Wait for minimum time required between transfers. */
    R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);

    /* Assert Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);

    /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);

    assert(FSP_SUCCESS == err);

    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
    {
        ;
    }

    /* De-assert Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

## Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    g_spi_cfg.p_extend = &g_spi_extended_cfg;

    /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the
```

```

desired bitrate. */
    err = R_SPI_CalculateBitrate(BITRATE, &(g_spi_extended_cfg.spck_div));
    assert(FSP_SUCCESS == err);
/* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}

```

## Data Structures

enum [spi\\_delay\\_count\\_t](#)

## Data Structure Documentation

### ◆ [rspck\\_div\\_setting\\_t](#)

struct <a href="#">rspck_div_setting_t</a>		
SPI Clock Divider settings.		
Data Fields		
uint8_t	spbr	SPBR register setting.
uint8_t	brdv: 2	BRDV setting in SPCMD0.

◆ **spi\_extended\_cfg\_t**

struct spi_extended_cfg_t		
Extended SPI interface configuration		
Data Fields		
<a href="#">spi_ssl_mode_t</a>	spi_clksyn	Select spi or clock syn mode operation.
<a href="#">spi_communication_t</a>	spi_comm	Select full-duplex or transmit-only communication.
<a href="#">spi_ssl_polarity_t</a>	ssl_polarity	Select SSLn signal polarity.
<a href="#">spi_ssl_select_t</a>	ssl_select	Select which slave to use: 0-SSL0, 1-SSL1, 2-SSL2, 3-SSL3.
<a href="#">spi_mosi_idle_value_fixing_t</a>	mosi_idle	Select MOSI idle fixed value and selection.
<a href="#">spi_parity_t</a>	parity	Select parity and enable/disable parity.
<a href="#">spi_byte_swap_t</a>	byte_swap	Select byte swap mode.
<a href="#">rspck_div_setting_t</a>	spck_div	Register values for configuring the SPI Clock Divider.
<a href="#">spi_delay_count_t</a>	spck_delay	SPI Clock Delay Register Setting.
<a href="#">spi_delay_count_t</a>	ssl_negation_delay	SPI Slave Select Negation Delay Register Setting.
<a href="#">spi_delay_count_t</a>	next_access_delay	SPI Next-Access Delay Register Setting.

◆ **spi\_instance\_ctrl\_t**

struct spi_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">spi_api_t::open</a> is called.	
Data Fields	
uint32_t	<a href="#">open</a>
	Indicates whether the <a href="#">open()</a> API has been successfully called.
<a href="#">spi_cfg_t</a> const *	<a href="#">p_cfg</a>
	Pointer to instance configuration.
R_SPI0_Type *	<a href="#">p_regs</a>
	Base register for this channel.

void const *	<a href="#">p_tx_data</a>
	Buffer to transmit.
void *	<a href="#">p_rx_data</a>
	Buffer to receive.
uint32_t	<a href="#">tx_count</a>
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	<a href="#">rx_count</a>
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	<a href="#">count</a>
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
<a href="#">spi_bit_width_t</a>	<a href="#">bit_width</a>
	Bits per Data frame (8-bit, 16-bit, 32-bit)

## Enumeration Type Documentation

### ◆ [spi\\_ssl\\_mode\\_t](#)

enum <a href="#">spi_ssl_mode_t</a>	
3-Wire or 4-Wire mode.	
Enumerator	
<a href="#">SPI_SSL_MODE_SPI</a>	SPI operation (4-wire method)
<a href="#">SPI_SSL_MODE_CLK_SYN</a>	Clock Synchronous operation (3-wire method)

## ◆ spi\_communication\_t

enum spi_communication_t	
Transmit Only (Half Duplex), or Full Duplex.	
Enumerator	
SPI_COMMUNICATION_FULL_DUPLEX	Full-Duplex synchronous serial communication.
SPI_COMMUNICATION_TRANSMIT_ONLY	Transit only serial communication.

## ◆ spi\_ssl\_polarity\_t

enum spi_ssl_polarity_t	
Slave Select Polarity.	
Enumerator	
SPI_SSPL_LOW	SSLP signal polarity active low.
SPI_SSPL_HIGH	SSLP signal polarity active high.

## ◆ spi\_ssl\_select\_t

enum spi_ssl_select_t	
The Slave Select Line	
Enumerator	
SPI_SSL_SELECT_SSL0	Select SSL0.
SPI_SSL_SELECT_SSL1	Select SSL1.
SPI_SSL_SELECT_SSL2	Select SSL2.
SPI_SSL_SELECT_SSL3	Select SSL3.

## ◆ spi\_mosi\_idle\_value\_fixing\_t

enum spi_mosi_idle_value_fixing_t	
MOSI Idle Behavior.	
Enumerator	
SPI_MOSI_IDLE_VALUE_FIXING_DISABLE	MOSI output value=value set in MOIFV bit.
SPI_MOSI_IDLE_VALUE_FIXING_LOW	MOSIn level low during MOSI idling.
SPI_MOSI_IDLE_VALUE_FIXING_HIGH	MOSIn level high during MOSI idling.

## ◆ spi\_parity\_t

enum spi_parity_t	
Parity Mode	
Enumerator	
SPI_PARITY_MODE_DISABLE	Disable parity.
SPI_PARITY_MODE_ODD	Select even parity.
SPI_PARITY_MODE_EVEN	Select odd parity.

## ◆ spi\_byte\_swap\_t

enum spi_byte_swap_t	
Byte Swapping Enable/Disable.	
Enumerator	
SPI_BYTE_SWAP_DISABLE	Disable Byte swapping for 16/32-Bit transfers.
SPI_BYTE_SWAP_ENABLE	Enable Byte swapping for 16/32-Bit transfers.

## ◆ spi\_delay\_count\_t

enum spi_delay_count_t	
Delay count for SPI delay settings.	
Enumerator	
SPI_DELAY_COUNT_1	Set RSPCK delay count to 1 RSPCK.
SPI_DELAY_COUNT_2	Set RSPCK delay count to 2 RSPCK.
SPI_DELAY_COUNT_3	Set RSPCK delay count to 3 RSPCK.
SPI_DELAY_COUNT_4	Set RSPCK delay count to 4 RSPCK.
SPI_DELAY_COUNT_5	Set RSPCK delay count to 5 RSPCK.
SPI_DELAY_COUNT_6	Set RSPCK delay count to 6 RSPCK.
SPI_DELAY_COUNT_7	Set RSPCK delay count to 7 RSPCK.
SPI_DELAY_COUNT_8	Set RSPCK delay count to 8 RSPCK.

**Function Documentation**

◆ **R\_SPI\_Open()**

```
fsp_err_t R_SPI_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

This function initializes a channel for SPI communication mode. Implements [spi\\_api\\_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [SPI Interface](#) functions.

**Return values**

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.
FSP_ERR_UNSUPPORTED	A requested setting is not possible on this device with the current build configuration.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer\\_api\\_t::open](#)

*Note*

*This function is reentrant.*

◆ **R\_SPI\_Read()**

```
fsp_err_t R_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length, spi_bit_width_t const bit_width )
```

This function receives data from a SPI device. Implements [spi\\_api\\_t::read](#).

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

**Return values**

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R\_SPI\_Write()**

```
fsp_err_t R_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

**Return values**

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or source parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R\_SPI\_WriteRead()**

```
fsp_err_t R_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest, uint32_t
const length, spi_bit_width_t const bit_width )
```

This function simultaneously transmits and receive data. Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

**Return values**

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control, source or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R\_SPI\_CallbackSet()**

```
fsp_err_t R_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *) p_callback,
void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi\\_api\\_t::callbackSet](#)

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R\_SPI\_Close()**

```
fsp_err_t R_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

This function manages the closing of a channel by the following task. Implements [spi\\_api\\_t::close](#).

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with [SPI Interface](#) functions.

**Return values**

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	A required pointer argument is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

### ◆ R\_SPI\_CalculateBitrate()

```
fsp_err_t R_SPI_CalculateBitrate ( uint32_t bitrate, rspck_div_setting_t * spck_div )
```

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

#### Parameters

[in]	bitrate	Desired bitrate
[out]	spck_div	Memory location to store bitrate register settings.

#### Return values

FSP_SUCCESS	Valid spbr and brdv values were calculated
FSP_ERR_UNSUPPORTED	Bitrate is not achievable

### 4.2.5.17 SPI (r\_spi\_b)

Modules » Connectivity

#### Functions

```
fsp_err_t R_SPI_B_Open (spi_ctrl_t *p_api_ctrl, spi_cfg_t const *const p_cfg)
```

```
fsp_err_t R_SPI_B_Read (spi_ctrl_t *const p_api_ctrl, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_Write (spi_ctrl_t *const p_api_ctrl, void const *p_src, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_CallbackSet (spi_ctrl_t *const p_api_ctrl, void(*p_callback)(spi_callback_args_t *), void const *const p_context, spi_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_SPI_B_Close (spi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SPI_B_CalculateBitrate (uint32_t bitrate, spi_b_clock_source_t clock_source, rspck_div_setting_t *spck_div)
```

## Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

## Overview

### Features

- Standard SPI Modes
  - Master or Slave Mode
  - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
    - CPHA=1 Data Sampled on the odd edge of SCLK
  - MSB/LSB first
  - 8- to 32-Bit data frames
    - Hardware endian swap in 16-Bit and 32-Bit mode
  - SSL level keep (burst transfer) supported
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
  - TX Underrun Error (No data to load into shift register for transmitting)
  - Parity Error (When parity is enabled and a parity error is detected)

## Configuration

### Build Time Configurations for r\_spi\_b

The following build time configurations are defined in fsp\_cfg/r\_spi\_b\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Enable Support for using DTC	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	If enabled, DTC instances will be included in the build for both transmission and reception.
Enable Transmitting from RXI Interrupt	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, all operations will be handled from the RX (receive) interrupt. This

setting only provides a performance boost when DTC is not used. In addition, Transmit Only mode is not supported when this configuration is enabled.

### Configurations for Connectivity > SPI (r\_spi\_b)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r\_spi\_b). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SPI channel.
Receive Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transmit Buffer Empty Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transfer Complete Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Error Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Operating Mode	<ul style="list-style-type: none"> <li>Master</li> <li>Slave</li> </ul>	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> <li>Data sampling on odd edge, data variation on even edge</li> <li>Data sampling on even edge, data variation on odd edge</li> </ul>	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	<ul style="list-style-type: none"> <li>Low when idle</li> <li>High when idle</li> </ul>	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> <li>Enable</li> <li>Disable</li> </ul>	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> <li>MSB First</li> <li>LSB First</li> </ul>	MSB First	Select the data bit order.

Callback	Name must be a valid C symbol	spi_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
SPI Mode	<ul style="list-style-type: none"> <li>• SPI Operation</li> <li>• Clock Synchronous Operation</li> </ul>	Clock Synchronous Operation	Select the clock sync mode.
Full or Transmit Only Mode	<ul style="list-style-type: none"> <li>• Full Duplex</li> <li>• Transmit Only</li> </ul>	Full Duplex	Select Full Duplex or Transmit Only Mode.
Slave Select Polarity	<ul style="list-style-type: none"> <li>• Active Low</li> <li>• Active High</li> </ul>	Active Low	Select the slave select active level.
Select SSL(Slave Select)	<ul style="list-style-type: none"> <li>• SSL0</li> <li>• SSL1</li> <li>• SSL2</li> <li>• SSL3</li> </ul>	SSL0	Select which slave to use.
MOSI Idle State	<ul style="list-style-type: none"> <li>• MOSI Idle Value Fixing Disable</li> <li>• MOSI Idle Value Fixing Low</li> <li>• MOSI Idle Value Fixing High</li> </ul>	MOSI Idle Value Fixing Disable	Select the MOSI idle level if MOSI idle is enabled.
Parity Mode	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Odd</li> <li>• Even</li> </ul>	Disabled	Select the parity mode if parity is enabled.
Byte Swapping	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Select the byte swap mode for 16/32-Bit Data Frames.
Clock Source	<ul style="list-style-type: none"> <li>• SCISPICK</li> <li>• PCLK</li> </ul>	PCLK	Select the clock source for communication.
Bitrate	Value must be an integer greater than 0	16000000	Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated <a href="#">spi_extended_cfg_t</a>

Clock Delay	<ul style="list-style-type: none"> <li>• 1 Clock</li> <li>• 2 Clocks</li> <li>• 3 Clocks</li> <li>• 4 Clocks</li> <li>• 5 Clocks</li> <li>• 6 Clocks</li> <li>• 7 Clocks</li> <li>• 8 Clocks</li> </ul>	1 Clock	structure. Configure the number of SPI clock cycles before each data frame.
SSL Negation Delay	<ul style="list-style-type: none"> <li>• 1 Clock</li> <li>• 2 Clocks</li> <li>• 3 Clocks</li> <li>• 4 Clocks</li> <li>• 5 Clocks</li> <li>• 6 Clocks</li> <li>• 7 Clocks</li> <li>• 8 Clocks</li> </ul>	1 Clock	Configure the number of SPI clock cycles after each data frame.
Next Access Delay	<ul style="list-style-type: none"> <li>• 1 Clock</li> <li>• 2 Clocks</li> <li>• 3 Clocks</li> <li>• 4 Clocks</li> <li>• 5 Clocks</li> <li>• 6 Clocks</li> <li>• 7 Clocks</li> <li>• 8 Clocks</li> </ul>	1 Clock	Configure the number of SPI clock cycles between each data frame.

## Clock Configuration

The SPI peripheral uses the SCISPICK for communication and PCLKB for internal operations. Both can be configured via the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

## Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

### Note

*At high bitrates it may be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH` to maintain signal integrity.*

## Usage Notes

### Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

## Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full ISR. This only improves performance when the DTC is not being used.

### Note

*Configuring the module to use RX DTC instance without also providing a TX DTC instance results in an invalid configuration when RXI transmit is enabled.*

*Transmit Only mode is not supported when Transmit from RXI is enabled.*

## Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

## Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

## Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP\_ERR\_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

## Examples

### Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;
void spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initialize the SPI module. */
err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Start a write/read transfer */
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);

assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

static void r_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
```

## Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];

    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initialize the SPI module. */
err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);

/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 2 */
```

```
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);  
}
```

## Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    g_spi_cfg.p_extend = &g_spi_extended_cfg;  
    /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the  
desired bitrate. */  
    err = R_SPI_B_CalculateBitrate(BITRATE, SPI_B_CLOCK_SOURCE_SCISPICKL,  
&(g_spi_extended_cfg.spck_div));  
    assert(FSP_SUCCESS == err);  
    /* Initialize the SPI module. */  
    err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
}
```

		Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)

<code>spi_bit_width_t</code>	<code>bit_width</code>
	Bits per Data frame (8-bit, 16-bit, 32-bit)

## Enumeration Type Documentation

### ◆ `spi_b_ssl_mode_t`

enum <code>spi_b_ssl_mode_t</code>	
3-Wire or 4-Wire mode.	
Enumerator	
<code>SPI_B_SSL_MODE_SPI</code>	SPI operation (4-wire method)
<code>SPI_B_SSL_MODE_CLK_SYN</code>	Clock Synchronous operation (3-wire method)

### ◆ `spi_b_communication_t`

enum <code>spi_b_communication_t</code>	
Transmit Only (Half Duplex), or Full Duplex.	
Enumerator	
<code>SPI_B_COMMUNICATION_FULL_DUPLEX</code>	Full-Duplex synchronous serial communication.
<code>SPI_B_COMMUNICATION_TRANSMIT_ONLY</code>	Transit only serial communication.

### ◆ `spi_b_ssl_polarity_t`

enum <code>spi_b_ssl_polarity_t</code>	
Slave Select Polarity.	
Enumerator	
<code>SPI_B_SSLP_LOW</code>	SSLP signal polarity active low.
<code>SPI_B_SSLP_HIGH</code>	SSLP signal polarity active high.

## ◆ spi\_b\_ssl\_select\_t

enum spi_b_ssl_select_t	
The Slave Select Line	
Enumerator	
SPI_B_SSL_SELECT_SSL0	Select SSL0.
SPI_B_SSL_SELECT_SSL1	Select SSL1.
SPI_B_SSL_SELECT_SSL2	Select SSL2.
SPI_B_SSL_SELECT_SSL3	Select SSL3.

## ◆ spi\_b\_mosi\_idle\_value\_fixing\_t

enum spi_b_mosi_idle_value_fixing_t	
MOSI Idle Behavior.	
Enumerator	
SPI_B_MOSI_IDLE_VALUE_FIXING_DISABLE	MOSI output value=value set in MOIFV bit.
SPI_B_MOSI_IDLE_VALUE_FIXING_LOW	MOSIn level low during MOSI idling.
SPI_B_MOSI_IDLE_VALUE_FIXING_HIGH	MOSIn level high during MOSI idling.

## ◆ spi\_b\_parity\_t

enum spi_b_parity_t	
Parity Mode	
Enumerator	
SPI_B_PARITY_MODE_DISABLE	Disable parity.
SPI_B_PARITY_MODE_ODD	Select even parity.
SPI_B_PARITY_MODE_EVEN	Select odd parity.

## ◆ spi\_b\_byte\_swap\_t

enum spi_b_byte_swap_t	
Byte Swapping Enable/Disable.	
Enumerator	
SPI_B_BYTE_SWAP_DISABLE	Disable Byte swapping for 16/32-Bit transfers.
SPI_B_BYTE_SWAP_ENABLE	Enable Byte swapping for 16/32-Bit transfers.

## ◆ spi\_b\_delay\_count\_t

enum spi_b_delay_count_t	
Delay count for SPI delay settings.	
Enumerator	
SPI_B_DELAY_COUNT_1	Set RSPCK delay count to 1 RSPCK.
SPI_B_DELAY_COUNT_2	Set RSPCK delay count to 2 RSPCK.
SPI_B_DELAY_COUNT_3	Set RSPCK delay count to 3 RSPCK.
SPI_B_DELAY_COUNT_4	Set RSPCK delay count to 4 RSPCK.
SPI_B_DELAY_COUNT_5	Set RSPCK delay count to 5 RSPCK.
SPI_B_DELAY_COUNT_6	Set RSPCK delay count to 6 RSPCK.
SPI_B_DELAY_COUNT_7	Set RSPCK delay count to 7 RSPCK.
SPI_B_DELAY_COUNT_8	Set RSPCK delay count to 8 RSPCK.

## ◆ spi\_b\_clock\_source\_t

enum spi_b_clock_source_t	
SPI communication clock source.	

## Function Documentation

◆ **R\_SPI\_B\_Open()**

```
fsp_err_t R_SPI_B_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

This function initializes a channel for SPI communication mode. Implements [spi\\_api\\_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [SPI Interface](#) functions.

**Return values**

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.
FSP_ERR_UNSUPPORTED	A requested setting is not possible on this device with the current build configuration.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer\\_api\\_t::open](#)

*Note*

*This function is reentrant.*

◆ **R\_SPI\_B\_Read()**

```
fsp_err_t R_SPI_B_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length, spi_bit_width_t const bit_width )
```

This function receives data from a SPI device. Implements [spi\\_api\\_t::read](#).

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

**Return values**

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R\_SPI\_B\_Write()**

```
fsp_err_t R_SPI_B_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

**Return values**

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or source parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R\_SPI\_B\_WriteRead()**

```
fsp_err_t R_SPI_B_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

This function simultaneously transmits and receive data. Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

**Return values**

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control, source or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R\_SPI\_B\_CallbackSet()**

```
fsp_err_t R_SPI_B_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi\\_api\\_t::callbackSet](#)

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R\_SPI\_B\_Close()**

```
fsp_err_t R_SPI_B_Close ( spi_ctrl_t *const p_api_ctrl)
```

This function manages the closing of a channel by the following task. Implements [spi\\_api\\_t::close](#).

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with [SPI Interface](#) functions.

**Return values**

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	A required pointer argument is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

### ◆ R\_SPI\_B\_CalculateBitrate()

```
fsp_err_t R_SPI_B_CalculateBitrate ( uint32_t bitrate, spi_b_clock_source_t clock_source,
rspck_div_setting_t * spck_div )
```

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

#### Parameters

[in]	bitrate	Desired bitrate
[in]	clock_source	SPI communication clock source to be used
[out]	spck_div	Memory location to store bitrate register settings.

#### Return values

FSP_SUCCESS	Valid spbr and brdv values were calculated
FSP_ERR_UNSUPPORTED	Bitrate is not achievable

### 4.2.5.18 UART (r\_sci\_b\_uart)

Modules » [Connectivity](#)

#### Functions

```
fsp_err_t R_SCI_B_UART_Open (uart_ctrl_t *const p_api_ctrl, uart_cfg_t const
*const p_cfg)
```

```
fsp_err_t R_SCI_B_UART_Close (uart_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SCI_B_UART_Read (uart_ctrl_t *const p_api_ctrl, uint8_t *const
p_dest, uint32_t const bytes)
```

```
fsp_err_t R_SCI_B_UART_Write (uart_ctrl_t *const p_api_ctrl, uint8_t const
*const p_src, uint32_t const bytes)
```

```
fsp_err_t R_SCI_B_UART_CallbackSet (uart_ctrl_t *const p_api_ctrl,
void(*p_callback)(uart_callback_args_t *), void const *const
p_context, uart_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_SCI_B_UART_BaudSet (uart_ctrl_t *const p_api_ctrl, void const
*const p_baud_setting)
```

```
fsp_err_t R_SCI_B_UART_InfoGet (uart_ctrl_t *const p_api_ctrl, uart_info_t
*const p_info)
```

```
fsp_err_t R_SCI_B_UART_Abort (uart_ctrl_t *const p_api_ctrl, uart_dir_t
communication_to_abort)
```

```
fsp_err_t R_SCI_B_UART_ReadStop (uart_ctrl_t *const p_api_ctrl, uint32_t
*remaining_bytes)
```

```
fsp_err_t R_SCI_B_UART_BaudCalculate (uint32_t baudrate, bool
bitrate_modulation, uint32_t baud_rate_error_x_1000,
sci_b_baud_setting_t *const p_baud_setting)
```

## Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

## Overview

### Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

## Configuration

### Build Time Configurations for r\_sci\_b\_uart

The following build time configurations are defined in fsp\_cfg/r\_sci\_b\_uart\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Disable	Enable FIFO support for the SCI_UART module.
DTC Support	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Disable	Enable DTC support for the SCI_UART module.

Flow Control Support	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Disable	Enable RS232 and RS-485 flow control support using a user provided pin.
----------------------	---	---------	---

### Configurations for Connectivity > UART (r\_sci\_b\_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r\_sci\_b\_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_uart0	Module name.
General > Channel	Value must be a non-negative integer	0	Select the SCI channel.
General > Data Bits	<ul style="list-style-type: none"> <li>• 8bits</li> <li>• 7bits</li> <li>• 9bits</li> </ul>	8bits	Select the number of bits per word.
General > Parity	<ul style="list-style-type: none"> <li>• None</li> <li>• Odd</li> <li>• Even</li> </ul>	None	Select the parity mode.
General > Stop Bits	<ul style="list-style-type: none"> <li>• 1bit</li> <li>• 2bits</li> </ul>	1bit	Select the number of stop bits.
Baud > Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate.  If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated <a href="#">sci_b_baud_setting_t</a> structure.
Baud > Baud Rate Modulation	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others.

Baud > Max Error (%)	Must be a valid non-negative integer with a maximum configurable value of 100	5	Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.
Flow Control > CTS/RTS Selection	MCU Specific Options		NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated <a href="#">sci_b_baud_setting_t</a> structure.  Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).
Flow Control > Software RTS Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin port for the MCU.
Flow Control > Software RTS Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin for the MCU.
Extra > RS-485 > DE Pin	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Enable or disable the DE pin for use in RS-485 half-duplex mode.
Extra > RS-485 > DE Pin Polarity	<ul style="list-style-type: none"> <li>• Active Low</li> <li>• Active High</li> </ul>	Active High	Select the polarity of the DE pin.
Extra > RS-485 > DE Pin Assertion Time	Must be a valid integer greater than 0 and less than or equal to 31.	1	Configure the time between assertion of the DE pin and the start of a write transfer. The time is specified in multiples of the SCI base clock period.

Extra > RS-485 > DE Pin Negation Time	Must be a valid integer greater than 0 and less than or equal to 31.	1	Configure the time between the end of a write transfer and the negation of the DE pin. The time is specified in multiples of the SCI base clock period.
Extra > Clock Source	<ul style="list-style-type: none"> <li>Internal Clock</li> <li>Internal Clock With Output on SCK</li> <li>External Clock 8x baud rate</li> <li>External Clock 16x baud rate</li> </ul>	Internal Clock	Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.
Extra > Start bit detection	<ul style="list-style-type: none"> <li>Falling Edge</li> <li>Low Level</li> </ul>	Falling Edge	Start bit detected as falling edge or low level.
Extra > Noise Filter	<ul style="list-style-type: none"> <li>Enable</li> <li>Disable</li> </ul>	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Extra > Receive FIFO Trigger Level	<ul style="list-style-type: none"> <li>One</li> <li>Max</li> </ul>	Max	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupts > Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Interrupts > Transmit Data Empty Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Interrupts > Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.

Interrupts > Error  
Interrupt Priority

MCU Specific Options

Select the error  
interrupt priority.

## Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	SCISPICKL

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

## Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS can be controlled by the hardware. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

## Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CTSn\_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn\_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn\_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

## Limitations

- Reception is still enabled after `uart_api_t::communicationAbort` API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.

## DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to `R_SCI_B_UART_Read()`. The logic required to combine bytes received through `R_SCI_B_UART_Read()` (`UART_EVENT_RX_COMPLETE`) and bytes received between calls (`UART_EVENT_RX_CHAR`) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. `uart_api_t::infoGet` API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

# Examples

## SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_b_uart_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_SCI_B_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    while (!g_transfer_complete)
    {
    }
    while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
    /* Handle the UART event */
    switch (p_args->event)
    {
    }
```

```
/* Received a character */
case UART_EVENT_RX_CHAR:
    {
/* Only put the next character in the receive buffer if there is space for it */
if (sizeof(g_out_of_band_received) > g_out_of_band_index)
    {
/* Write either the next one or two bytes depending on the receive data size */
if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
    {
                g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
    }
else
    {
                uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                *p_dest          = (uint16_t) p_args->data;
                g_out_of_band_index += 2;
    }
    }
break;
    }
/* Receive complete */

## Data Structure Documentation

### ◆ [sci\\_b\\_uart\\_instance\\_ctrl\\_t](#)

struct [sci\\_b\\_uart\\_instance\\_ctrl\\_t](#)

UART instance control block.

### ◆ [sci\\_b\\_baud\\_setting\\_t](#)

struct [sci\\_b\\_baud\\_setting\\_t](#)

Register settings to achieve a desired baud rate and modulation duty.

### ◆ [sci\\_b\\_uart\\_rs485\\_setting\\_t](#)

struct [sci\\_b\\_uart\\_rs485\\_setting\\_t](#)

Configuration settings for controlling the DE signal for RS-485.

#### Data Fields

<a href="#">sci_b_uart_rs485_enable_t</a>	enable	Enable the DE signal.
<a href="#">sci_b_uart_rs485_de_polarity_t</a>	polarity	DE signal polarity.
uint8_t	assertion_time: 5	Time in baseclock units after assertion of the DE signal and before the start of the write transfer.
uint8_t	negation_time: 5	Time in baseclock units after the end of a write transfer and before the DE signal is negated.

### ◆ [sci\\_b\\_uart\\_extended\\_cfg\\_t](#)

struct [sci\\_b\\_uart\\_extended\\_cfg\\_t](#)

UART on SCI device Configuration

#### Data Fields

<a href="#">sci_b_clk_src_t</a>	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
---------------------------------	-------	---

<a href="#">sci_b_uart_start_bit_detect_t</a>	rx_edge_start	Start reception on falling edge.
<a href="#">sci_b_uart_noise_cancellation_t</a>	noise_cancel	Noise cancellation setting.
<a href="#">sci_b_baud_setting_t</a> *	p_baud_setting	Register settings for a desired baud rate.
<a href="#">sci_b_uart_rx_fifo_trigger_t</a>	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.
<a href="#">bsp_io_port_pin_t</a>	flow_control_pin	UART Driver Enable pin.
<a href="#">sci_b_uart_flow_control_t</a>	flow_control	CTS/RTS function of the SSn pin.
<a href="#">sci_b_uart_rs485_setting_t</a>	rs485_setting	RS-485 settings.

## Enumeration Type Documentation

### ◆ sci\_b\_clk\_src\_t

enum <a href="#">sci_b_clk_src_t</a>	
Enumeration for SCI clock source	
Enumerator	
SCI_B_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_B_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_B_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_B_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

### ◆ sci\_b\_uart\_flow\_control\_t

enum <a href="#">sci_b_uart_flow_control_t</a>	
UART flow control mode definition	
Enumerator	
SCI_B_UART_FLOW_CONTROL_RTS	Use CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTS	Use CTSn_RTSn pin for CTS.
SCI_B_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn pin for CTS, CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.

## ◆ sci\_b\_uart\_rx\_fifo\_trigger\_t

enum <a href="#">sci_b_uart_rx_fifo_trigger_t</a>	
Receive FIFO trigger configuration.	
Enumerator	
SCI_B_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_B_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

## ◆ sci\_b\_uart\_start\_bit\_detect\_t

enum <a href="#">sci_b_uart_start_bit_detect_t</a>	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
SCI_B_UART_START_BIT_LOW_LEVEL	Detect low level on RXDn pin as start bit.
SCI_B_UART_START_BIT_FALLING_EDGE	Detect falling level on RXDn pin as start bit.

## ◆ sci\_b\_uart\_noise\_cancellation\_t

enum <a href="#">sci_b_uart_noise_cancellation_t</a>	
Noise cancellation configuration.	
Enumerator	
SCI_B_UART_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_B_UART_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

## ◆ sci\_b\_uart\_rs485\_enable\_t

enum <a href="#">sci_b_uart_rs485_enable_t</a>	
RS-485 Enable/Disable.	
Enumerator	
SCI_B_UART_RS485_DISABLE	RS-485 disabled.
SCI_B_UART_RS485_ENABLE	RS-485 enabled.

◆ **sci\_b\_uart\_rs485\_de\_polarity\_t**

enum <code>sci_b_uart_rs485_de_polarity_t</code>	
The polarity of the RS-485 DE signal.	
Enumerator	
<code>SCI_B_UART_RS485_DE_POLARITY_HIGH</code>	The DE signal is high when a write transfer is in progress.
<code>SCI_B_UART_RS485_DE_POLARITY_LOW</code>	The DE signal is low when a write transfer is in progress.

**Function Documentation**◆ **R\_SCI\_B\_UART\_Open()**

`fsp_err_t R_SCI_B_UART_Open ( uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg )`

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements `uart_api_t::open`

**Return values**

<code>FSP_SUCCESS</code>	Channel opened successfully.
<code>FSP_ERR_ASSERTION</code>	Pointer to UART control block or configuration structure is NULL.
<code>FSP_ERR_IP_CHANNEL_NOT_PRESENT</code>	The requested channel does not exist on this MCU.
<code>FSP_ERR_INVALID_ARGUMENT</code>	Flow control is enabled but flow control pin is not defined.
<code>FSP_ERR_ALREADY_OPEN</code>	Control block has already been opened or channel is being used by another instance. Call <code>close()</code> then <code>open()</code> to reconfigure.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::open`

◆ **R\_SCI\_B\_UART\_Close()**

```
fsp_err_t R_SCI_B_UART_Close ( uart_ctrl_t *const p_api_ctrl)
```

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements [uart\\_api\\_t::close](#)

**Return values**

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R\_SCI\_B\_UART\_Read()**

```
fsp_err_t R_SCI_B_UART_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart\\_api\\_t::read](#)

**Return values**

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_RX_ENABLE is set to 0

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reset](#)

**Note**

*If 9-bit data length is specified at R\_SCI\_B\_UART\_Open call, p\_dest must be aligned 16-bit boundary.*

◆ **R\_SCI\_B\_UART\_Write()**

```
fsp_err_t R_SCI_B_UART_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart\\_api\\_t::write](#)

**Return values**

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_TX_ENABLE is set to 0

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reset](#)

**Note**

*If 9-bit data length is specified at R\_SCI\_B\_UART\_Open call, p\_src must be aligned on a 16-bit boundary.*

◆ **R\_SCI\_B\_UART\_CallbackSet()**

```
fsp_err_t R_SCI_B_UART_CallbackSet ( uart_ctrl_t *const p_api_ctrl, void(*) (uart_callback_args_t *) p_callback, void const *const p_context, uart_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [uart\\_api\\_t::callbackSet](#)

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R\_SCI\_B\_UART\_BaudSet()**

```
fsp_err_t R_SCI_B_UART_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. p\_baud\_setting is a pointer to a sci\_b\_baud\_setting\_t structure. Implements uart\_api\_t::baudSet

**Warning**

This terminates any in-progress transmission.

**Return values**

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R\_SCI\_B\_UART\_InfoGet()**

```
fsp_err_t R_SCI_B_UART_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart\_api\_t::infoGet

**Return values**

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R\_SCI\_B\_UART\_Abort()**

```
fsp_err_t R_SCI_B_UART_Abort ( uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort )
```

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART\_EVENT\_RX\_CHAR. Implements [uart\\_api\\_t::communicationAbort](#)

**Return values**

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::disable](#)

◆ **R\_SCI\_B\_UART\_ReadStop()**

```
fsp_err_t R_SCI_B_UART_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART\_EVENT\_RX\_CHAR. Implements [uart\\_api\\_t::readStop](#)

**Return values**

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::disable](#)

### ◆ R\_SCI\_B\_UART\_BaudCalculate()

```
fsp_err_t R_SCI_B_UART_BaudCalculate ( uint32_t baudrate, bool bitrate_modulation, uint32_t
baud_rate_error_x_1000, sci_b_baud_setting_t *const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

#### Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

#### Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%.

### 4.2.5.19 UART (r\_sci\_uart)

Modules » Connectivity

#### Functions

```
fsp_err_t R_SCI_UART_Open (uart_ctrl_t *const p_api_ctrl, uart_cfg_t const
*const p_cfg)
```

```
fsp_err_t R_SCI_UART_Close (uart_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SCI_UART_Read (uart_ctrl_t *const p_api_ctrl, uint8_t *const
p_dest, uint32_t const bytes)
```

```

```

p\_src, uint32\_t const bytes)

fsp\_err\_t R\_SCI\_UART\_CallbackSet (uart\_ctrl\_t \*const p\_api\_ctrl, void(\*p\_callback)(uart\_callback\_args\_t \*), void const \*const p\_context, uart\_callback\_args\_t \*const p\_callback\_memory)

fsp\_err\_t R\_SCI\_UART\_BaudSet (uart\_ctrl\_t \*const p\_api\_ctrl, void const \*const p\_baud\_setting)

fsp\_err\_t R\_SCI\_UART\_InfoGet (uart\_ctrl\_t \*const p\_api\_ctrl, uart\_info\_t \*const p\_info)

fsp\_err\_t R\_SCI\_UART\_Abort (uart\_ctrl\_t \*const p\_api\_ctrl, uart\_dir\_t communication\_to\_abort)

fsp\_err\_t R\_SCI\_UART\_ReadStop (uart\_ctrl\_t \*const p\_api\_ctrl, uint32\_t \*remaining\_bytes)

fsp\_err\_t R\_SCI\_UART\_BaudCalculate (uint32\_t baudrate, bool bitrate\_modulation, uint32\_t baud\_rate\_error\_x\_1000, baud\_setting\_t \*const p\_baud\_setting)

## Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

## Overview

### Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

## Configuration

### Build Time Configurations for r\_sci\_uart

The following build time configurations are defined in fsp\_cfg/r\_sci\_uart\_cfg.h:

--	--	--	--

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	<ul style="list-style-type: none"> <li>Enable</li> <li>Disable</li> </ul>	Disable	Enable FIFO support for the SCI_UART module.
DTC Support	<ul style="list-style-type: none"> <li>Enable</li> <li>Disable</li> </ul>	Disable	Enable DTC support for the SCI_UART module.
Flow Control Support	<ul style="list-style-type: none"> <li>Enable</li> <li>Disable</li> </ul>	Disable	Enable RS232 and RS-485 flow control support using a user provided pin.
RS-485 Support	<ul style="list-style-type: none"> <li>Enable</li> <li>Disable</li> </ul>	Disable	Enable support for controlling the RS-485 DE pin.

### Configurations for Connectivity > UART (r\_sci\_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r\_sci\_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_uart0	Module name.
General > Channel	Value must be a non-negative integer	0	Select the SCI channel.
General > Data Bits	<ul style="list-style-type: none"> <li>8bits</li> <li>7bits</li> <li>9bits</li> </ul>	8bits	Select the number of bits per word.
General > Parity	<ul style="list-style-type: none"> <li>None</li> <li>Odd</li> <li>Even</li> </ul>	None	Select the parity mode.
General > Stop Bits	<ul style="list-style-type: none"> <li>1bit</li> <li>2bits</li> </ul>	1bit	Select the number of stop bits.
Baud > Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate.  If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated

[baud\\_setting\\_t](#) structure.

Baud > Baud Rate Modulation	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others.
Baud > Max Error (%)	Must be a valid non-negative integer with a maximum configurable value of 100	5	<p>Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.</p> <p>NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated <a href="#">baud_setting_t</a> structure.</p>
Flow Control > CTS/RTS Selection	MCU Specific Options		Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).
Flow Control > Software RTS Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin port for the MCU.
Flow Control > Software RTS Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin for the MCU.
Extra > RS-485 > DE	<ul style="list-style-type: none"> <li>• Disable</li> </ul>	Disable	Enable or disable the

Pin	<ul style="list-style-type: none"> <li>• Enable</li> </ul>		DE pin for use in RS-485 half-duplex mode.
Extra > RS-485 > DE Pin Polarity	<ul style="list-style-type: none"> <li>• Active Low</li> <li>• Active High</li> </ul>	Active High	Select the polarity of the DE pin.
Extra > RS-485 > DE Port Number	Refer to the RA Configuration tool for available options.	Disabled	GPIO output port number to use for generating the DE signal.
Extra > RS-485 > DE Pin Number	Refer to the RA Configuration tool for available options.	Disabled	GPIO output pin number to use for generating the DE signal.
Extra > Clock Source	<ul style="list-style-type: none"> <li>• Internal Clock</li> <li>• Internal Clock With Output on SCK</li> <li>• External Clock 8x baud rate</li> <li>• External Clock 16x baud rate</li> </ul>	Internal Clock	Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.
Extra > Start bit detection	<ul style="list-style-type: none"> <li>• Falling Edge</li> <li>• Low Level</li> </ul>	Falling Edge	Start bit detected as falling edge or low level.
Extra > Noise Filter	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Extra > Receive FIFO Trigger Level	<ul style="list-style-type: none"> <li>• One</li> <li>• Max</li> </ul>	Max	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupts > Receive	MCU Specific Options		Select the receive

Interrupt Priority		interrupt priority.
Interrupts > Transmit Data Empty Interrupt Priority	MCU Specific Options	Select the transmit interrupt priority.
Interrupts > Transmit End Interrupt Priority	MCU Specific Options	Select the transmit end interrupt priority.
Interrupts > Error Interrupt Priority	MCU Specific Options	Select the error interrupt priority.

## Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

## Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. Some MCUs support hardware flow control for both CTS and RTS on some channels. Some MCUs and channels support hardware flow control for either CTS or RTS but not both. If both are desired a GPIO pin can be used for RTS. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same

frequency as the bit rate.

## Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn\_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn\_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn\_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

## Limitations

- Reception is still enabled after `uart_api_t::communicationAbort` API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.

## DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to `R_SCI_UART_Read()`. The logic required to combine bytes received through `R_SCI_UART_Read()` (`UART_EVENT_RX_COMPLETE`) and bytes received between calls (`UART_EVENT_RX_CHAR`) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. `uart_api_t::infoGet` API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

## Examples

### SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_uart_basic_example (void)
{
    /* Initialize p_src to known data */
```

```
for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
{
    g_src[i] = (uint8_t) ('A' + (i % 26));
}

/* Open the transfer instance with initial configuration. */
fsp_err_t err = R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
assert(FSP_SUCCESS == err);
err = R_SCI_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
assert(FSP_SUCCESS == err);
err = R_SCI_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
assert(FSP_SUCCESS == err);

while (!g_transfer_complete)
{
}

while (!g_receive_complete)
{
}
}

void example_callback (uart_callback_args_t * p_args)
{
    /* Handle the UART event */
    switch (p_args->event)
    {
        /* Received a character */
        case UART_EVENT_RX_CHAR:
            {
                /* Only put the next character in the receive buffer if there is space for it */
                if (sizeof(g_out_of_band_received) > g_out_of_band_index)
                {
                    /* Write either the next one or two bytes depending on the receive data size */
                    if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
                    {
                        g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
                    }
                }
            }
        }
    }
}
```

```
    }
else
    {
        uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
        *p_dest          = (uint16_t) p_args->data;
        g_out_of_band_index += 2;
    }
}
break;
}

/* Receive complete */
case UART_EVENT_RX_COMPLETE:
    {
        g_receive_complete = 1;
break;
    }

/* Transmit complete */
case UART_EVENT_TX_COMPLETE:
    {
        g_transfer_complete = 1;
break;
    }
default:
    {
    }
}
}
```

### SCI UART Baud Set Example

```
#define SCI_UART_BAUDRATE_19200 (19200)
#define SCI_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_uart_baud_example (void)
{
```

```

baud_setting_t baud_setting;

uint32_t      baud_rate          = SCI_UART_BAUDRATE_19200;

bool          enable_bitrate_modulation = false;

uint32_t      error_rate_x_1000   = SCI_UART_BAUDRATE_ERROR_PERCENT_5;

fsp_err_t err = R_SCI_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);

assert(FSP_SUCCESS == err);

err = R_SCI_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);

assert(FSP_SUCCESS == err);
}

```

## Data Structure Documentation

### ◆ [sci\\_uart\\_instance\\_ctrl\\_t](#)

struct [sci\\_uart\\_instance\\_ctrl\\_t](#)

UART instance control block.

### ◆ [baud\\_setting\\_t](#)

struct baud_setting_t		
Register settings to achieve a desired baud rate and modulation duty.		
Data Fields		
union <a href="#">baud_setting_t</a>	<code>__unnamed__</code>	
uint8_t	cks: 2	CKS value to get divisor (CKS = N)
uint8_t	brr	Bit Rate Register setting.
uint8_t	mddr	Modulation Duty Register setting.

#### ◆ sci\_uart\_rs485\_setting\_t

struct sci_uart_rs485_setting_t		
Configuration settings for controlling the DE signal for RS-485.		
Data Fields		
<a href="#">sci_uart_rs485_enable_t</a>	enable	Enable the DE signal.
<a href="#">sci_uart_rs485_de_polarity_t</a>	polarity	DE signal polarity.
<a href="#">bsp_io_port_pin_t</a>	de_control_pin	UART Driver Enable pin.

#### ◆ sci\_uart\_extended\_cfg\_t

struct sci_uart_extended_cfg_t		
UART on SCI device Configuration		
Data Fields		
<a href="#">sci_clk_src_t</a>	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
<a href="#">sci_uart_start_bit_detect_t</a>	rx_edge_start	Start reception on falling edge.
<a href="#">sci_uart_noise_cancellation_t</a>	noise_cancel	Noise cancellation setting.
<a href="#">baud_setting_t</a> *	p_baud_setting	Register settings for a desired baud rate.
<a href="#">sci_uart_rx_fifo_trigger_t</a>	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.
<a href="#">bsp_io_port_pin_t</a>	flow_control_pin	UART Driver Enable pin.
<a href="#">sci_uart_flow_control_t</a>	flow_control	CTS/RTS function of the SSn pin.
<a href="#">sci_uart_rs485_setting_t</a>	rs485_setting	RS-485 settings.

## Enumeration Type Documentation

## ◆ sci\_clk\_src\_t

enum sci_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

## ◆ sci\_uart\_flow\_control\_t

enum sci_uart_flow_control_t	
UART flow control mode definition	
Enumerator	
SCI_UART_FLOW_CONTROL_RTS	Use SCI pin for RTS.
SCI_UART_FLOW_CONTROL_CTS	Use SCI pin for CTS.
SCI_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.
SCI_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn_RTSn pin for RTS and CTSn pin for CTS. Available only for some channels on selected MCUs. See hardware manual for channel specific options.

## ◆ sci\_uart\_rx\_fifo\_trigger\_t

enum sci_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

◆ **sci\_uart\_start\_bit\_detect\_t**

enum <a href="#">sci_uart_start_bit_detect_t</a>	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
SCI_UART_START_BIT_LOW_LEVEL	Detect low level on RXDn pin as start bit.
SCI_UART_START_BIT_FALLING_EDGE	Detect falling level on RXDn pin as start bit.

◆ **sci\_uart\_noise\_cancellation\_t**

enum <a href="#">sci_uart_noise_cancellation_t</a>	
Noise cancellation configuration.	
Enumerator	
SCI_UART_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_UART_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

◆ **sci\_uart\_rs485\_enable\_t**

enum <a href="#">sci_uart_rs485_enable_t</a>	
RS-485 Enable/Disable.	
Enumerator	
SCI_UART_RS485_DISABLE	RS-485 disabled.
SCI_UART_RS485_ENABLE	RS-485 enabled.

◆ **sci\_uart\_rs485\_de\_polarity\_t**

enum <a href="#">sci_uart_rs485_de_polarity_t</a>	
The polarity of the RS-485 DE signal.	
Enumerator	
SCI_UART_RS485_DE_POLARITY_HIGH	The DE signal is high when a write transfer is in progress.
SCI_UART_RS485_DE_POLARITY_LOW	The DE signal is low when a write transfer is in progress.

## Function Documentation

### ◆ R\_SCI\_UART\_Open()

`fsp_err_t R_SCI_UART_Open ( uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg )`

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements `uart_api_t::open`

#### Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call <code>close()</code> then <code>open()</code> to reconfigure.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::open`

### ◆ R\_SCI\_UART\_Close()

`fsp_err_t R_SCI_UART_Close ( uart_ctrl_t *const p_api_ctrl)`

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements `uart_api_t::close`

#### Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R\_SCI\_UART\_Read()**

```
fsp_err_t R_SCI_UART_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart\\_api\\_t::read](#)

**Return values**

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_RX_ENABLE is set to 0

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reset](#)

**Note**

*If 9-bit data length is specified at R\_SCI\_UART\_Open call, p\_dest must be aligned 16-bit boundary.*

◆ **R\_SCI\_UART\_Write()**

```
fsp_err_t R_SCI_UART_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart\\_api\\_t::write](#)

**Return values**

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_TX_ENABLE is set to 0

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::reset](#)

**Note**

*If 9-bit data length is specified at R\_SCI\_UART\_Open call, p\_src must be aligned on a 16-bit boundary.*

◆ **R\_SCI\_UART\_CallbackSet()**

```
fsp_err_t R_SCI_UART_CallbackSet ( uart_ctrl_t *const p_api_ctrl, void(*) (uart_callback_args_t *) p_callback, void const *const p_context, uart_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [uart\\_api\\_t::callbackSet](#)

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

## ◆ R\_SCI\_UART\_BaudSet()

```
fsp_err_t R_SCI_UART_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. p\_baud\_setting is a pointer to a `baud_setting_t` structure. Implements `uart_api_t::baudSet`

**Warning**

This terminates any in-progress transmission.

**Return values**

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

## ◆ R\_SCI\_UART\_InfoGet()

```
fsp_err_t R_SCI_UART_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements `uart_api_t::infoGet`

**Return values**

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R\_SCI\_UART\_Abort()**

```
fsp_err_t R_SCI_UART_Abort ( uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort )
```

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART\_EVENT\_RX\_CHAR. Implements [uart\\_api\\_t::communicationAbort](#)

**Return values**

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::disable](#)

◆ **R\_SCI\_UART\_ReadStop()**

```
fsp_err_t R_SCI_UART_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART\_EVENT\_RX\_CHAR. Implements [uart\\_api\\_t::readStop](#)

**Return values**

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer\\_api\\_t::disable](#)

### ◆ R\_SCI\_UART\_BaudCalculate()

```
fsp_err_t R_SCI_UART_BaudCalculate ( uint32_t baudrate, bool bitrate_modulation, uint32_t
baud_rate_error_x_1000, baud_setting_t*const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

#### Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

#### Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%.

### 4.2.5.20 USB (r\_usb\_basic)

Modules » [Connectivity](#)

#### Functions

```
fsp_err_t R_USB_EventGet (usb_ctrl_t*const p_api_ctrl, usb_status_t*event)
```

Obtains completed USB related events. (OS-less Only) [More...](#)

```
fsp_err_t R_USB_Callback (usb_callback_t*p_callback)
```

Register a callback function to be called upon completion of a USB related event. (RTOS only) [More...](#)

`fsp_err_t` [R\\_USB\\_Open](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_cfg_t const *const p_cfg`)  
Applies power to the USB module specified in the argument (`p_ctrl`). [More...](#)

`fsp_err_t` [R\\_USB\\_Close](#) (`usb_ctrl_t *const p_api_ctrl`)  
Terminates power to the USB module specified in argument (`p_ctrl`). USB0 module stops when USB\_IP0 is specified to the member (module), USB1 module stops when USB\_IP1 is specified to the member (module). [More...](#)

`fsp_err_t` [R\\_USB\\_Read](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t size`, `uint8_t destination`)  
Bulk/interrupt data transfer and control data transfer. [More...](#)

`fsp_err_t` [R\\_USB\\_Write](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t const *const p_buf`, `uint32_t size`, `uint8_t destination`)  
Bulk/Interrupt data transfer and control data transfer. [More...](#)

`fsp_err_t` [R\\_USB\\_Stop](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_transfer_t direction`, `uint8_t destination`)  
Requests a data read/write transfer be terminated when a data read/write transfer is being performed. [More...](#)

`fsp_err_t` [R\\_USB\\_Suspend](#) (`usb_ctrl_t *const p_api_ctrl`)  
Sends a SUSPEND signal from the USB module assigned to the member (module) of the `usb_ctrl_t` structure. [More...](#)

`fsp_err_t` [R\\_USB\\_Resume](#) (`usb_ctrl_t *const p_api_ctrl`)  
Sends a RESUME signal from the USB module assigned to the member (module) of the `usb_ctrl_t` structure. [More...](#)

`fsp_err_t` [R\\_USB\\_VbusSet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint16_t state`)  
Specifies starting or stopping the VBUS supply. [More...](#)

`fsp_err_t` [R\\_USB\\_InfoGet](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_info_t *p_info`, `uint8_t destination`)  
Obtains completed USB-related events. [More...](#)

`fsp_err_t` [R\\_USB\\_PipeRead](#) (`usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size, uint8_t pipe_number`)

Requests a data read (bulk/interrupt transfer) via the pipe specified in the argument. [More...](#)

`fsp_err_t` [R\\_USB\\_PipeWrite](#) (`usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size, uint8_t pipe_number`)

Requests a data write (bulk/interrupt transfer). [More...](#)

`fsp_err_t` [R\\_USB\\_PipeStop](#) (`usb_ctrl_t *const p_api_ctrl, uint8_t pipe_number`)

Terminates a data read/write operation. [More...](#)

`fsp_err_t` [R\\_USB\\_UsedPipesGet](#) (`usb_ctrl_t *const p_api_ctrl, uint16_t *p_pipe, uint8_t destination`)

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information. [More...](#)

`fsp_err_t` [R\\_USB\\_PipeInfoGet](#) (`usb_ctrl_t *const p_api_ctrl, usb_pipe_t *p_info, uint8_t pipe_number`)

Gets the following pipe information regarding the pipe specified in the argument (`p_ctrl`) member (`pipe`): endpoint number, transfer type, transfer direction and maximum packet size. [More...](#)

`fsp_err_t` [R\\_USB\\_PullUp](#) (`usb_ctrl_t *const p_api_ctrl, uint8_t state`)

This API enables or disables pull-up of D+/D- line. [More...](#)

`fsp_err_t` [R\\_USB\\_HostControlTransfer](#) (`usb_ctrl_t *const p_api_ctrl, usb_setup_t *p_setup, uint8_t *p_buf, uint8_t device_address`)

Performs settings and transmission processing when transmitting a setup packet. [More...](#)

`fsp_err_t` [R\\_USB\\_PeriControlDataGet](#) (`usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size`)

Receives data sent by control transfer. [More...](#)

`fsp_err_t` [R\\_USB\\_PeriControlDataSet](#) (`usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size`)

Performs transfer processing for control transfer. [More...](#)

`fsp_err_t R_USB_PeriControlStatusSet (usb_ctrl_t *const p_api_ctrl, usb_setup_status_t status)`

Set the response to the setup packet. [More...](#)

`fsp_err_t R_USB_RemoteWakeup (usb_ctrl_t *const p_api_ctrl)`

Sends a remote wake-up signal to the connected Host. [More...](#)

`fsp_err_t R_USB_ModuleNumberGet (usb_ctrl_t *const p_api_ctrl, uint8_t *module_number)`

This API gets the module number. [More...](#)

`fsp_err_t R_USB_ClassTypeGet (usb_ctrl_t *const p_api_ctrl, usb_class_t *class_type)`

This API gets the class type. [More...](#)

`fsp_err_t R_USB_DeviceAddressGet (usb_ctrl_t *const p_api_ctrl, uint8_t *device_address)`

This API gets the device address. [More...](#)

`fsp_err_t R_USB_PipeNumberGet (usb_ctrl_t *const p_api_ctrl, uint8_t *pipe_number)`

This API gets the pipe number. [More...](#)

`fsp_err_t R_USB_DeviceStateGet (usb_ctrl_t *const p_api_ctrl, uint16_t *state)`

This API gets the state of the device. [More...](#)

`fsp_err_t R_USB_DataSizeGet (usb_ctrl_t *const p_api_ctrl, uint32_t *data_size)`

This API gets the data size. [More...](#)

`fsp_err_t R_USB_SetupGet (usb_ctrl_t *const p_api_ctrl, usb_setup_t *setup)`

This API gets the setup type. [More...](#)

`fsp_err_t R_USB_OtgCallbackSet (usb_ctrl_t *const p_api_ctrl, usb_otg_callback_t *p_callback)`

Set callback function to be called when the OTG role swap was completed on Azure RTOS. [More...](#)

```
fsp_err_t R_USB_OtgSRP (usb_ctrl_t *const p_api_ctrl)
```

Start the SRP processing for OTG on Azure RTOS. [More...](#)

## Detailed Description

Driver for the USB peripheral on RA MCUs. This module implements the [USB Interface](#).

## Overview

The USB module operates in combination with the device class drivers provided by Renesas to form a complete USB stack.

### Features

The USB module has the following key features:

- USB Host mode
  - Enumerates Low/Full/High-speed devices (see note below)
  - Automatic transfer error determination and retry
- USB Peripheral mode
  - Supports USB1.1/2.0/3.0 hosts
- Automatic processing of device connect/disconnect, suspend/resume, and USB bus reset
- Up to 10 pipes
  - Control transfers supported on pipe 0
  - Data transfer on pipes 1 to 9 (Bulk or Interrupt)
- Functions with or without an RTOS

*Note*

*Supported speeds are dependent on the MCU.*

## Configuration

### Build Time Configurations for r\_usb\_basic

The following build time configurations are defined in fsp\_cfg/r\_usb\_basic\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
PLL Frequency	MCU Specific Options		Specify the PLL frequency supplied to the USB module. This setting only applies to USB1 (not USB0).
CPU Bus Access Wait Cycles	MCU Specific Options		This setting controls the delay for consecutive USB

peripheral register access. Set this value to a number of CPU cycles that is equivalent to 40.8ns or more.

Specify whether or not to include battery charging functionality.

Select the polarity of the Shutdown signal on the power supply IC (if provided).

When enabled, USB communication is disabled and the port is used for charging only.

When enabled, the application will receive notifications for SET\_INTERFACE, SET\_FEATURE and CLEAR\_FEATURE messages.

When enabled, the FIFOs for Pipes 1-5 are double-buffered.

Enable or disable continuous transfer mode.

Enable or disable LDO regulator.

Enable or disable DMA support for the USB module.

Set this to match the speed mode when DMA is enabled. Otherwise, set to 'DMA Disabled'.

Set this to match the speed mode when DMA is enabled. Otherwise, set to 'DMA Disabled'.

Display the information required to take the compliance test.

Enter the name of the

Battery Charging	MCU Specific Options		
Power IC Shutdown Polarity	MCU Specific Options		
Dedicated Charging Port (DCP) Mode	MCU Specific Options		
Notifications for SET_INTERFACE/SET_FEATURE/CLEAR_FEATURE	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Enabled	
Double Buffering	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Enabled	
Continuous Transfer Mode	MCU Specific Options		
LDO Regulator	MCU Specific Options		
DMA Support	MCU Specific Options		
DMA Source Address	<ul style="list-style-type: none"> <li>• DMA Disabled</li> <li>• FS Address</li> <li>• HS Address</li> </ul>	DMA Disabled	
DMA Destination Address	<ul style="list-style-type: none"> <li>• DMA Disabled</li> <li>• FS Address</li> <li>• HS Address</li> </ul>	DMA Disabled

USB TPL table name	Enter the TPL table	NULL	

name.

TPL Table.

**Configurations for Connectivity > USB (r\_usb\_basic)**

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_basic0	Module name.
USB Mode	<ul style="list-style-type: none"> <li>• Host mode</li> <li>• Peri mode</li> <li>• OTG mode</li> </ul>	Host mode	Select the usb mode.
USB Speed	<ul style="list-style-type: none"> <li>• Full Speed</li> <li>• Hi Speed</li> <li>• Low Speed</li> </ul>	Full Speed	Select the USB speed.
USB Module Number	<ul style="list-style-type: none"> <li>• USB_IP0 Port</li> <li>• USB_IP1 Port</li> </ul>	USB_IP0 Port	Specify the USB module number to be used.
USB Device Class	<ul style="list-style-type: none"> <li>• Peripheral Communications Device Class</li> <li>• Peripheral Human Interface Device Class</li> <li>• Peripheral Mass Storage Class</li> <li>• Peripheral Vendor Class</li> <li>• Peripheral Audio Class</li> <li>• Peripheral Printer Device Class</li> <li>• Host Communications Device Class</li> <li>• Host Human Interface Device Class</li> <li>• Host Mass Storage Class</li> <li>• Host Vendor Class</li> </ul>	Peripheral Communications Device Class	Select the USB device class.
USB Descriptor	USB Descriptor must be a valid C symbol.	g_usb_descriptor	Enter the name of the descriptor to be used. For how to create a descriptor structure, refer to the Descriptor definition chapter in the usb_basic manual. Specify NULL when using the Host class.

USB Compliance Callback	Compliance Callback must be a valid C symbol.	NULL	Set the callback for compliance tests here.
USBFS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBFS ISR.
USBFS Resume Priority	MCU Specific Options		Select the interrupt priority used by the USBFS Resume ISR.
USBFS D0FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBFS D0FIFO.
USBFS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBFS D1FIFO.
USBHS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBHS ISR.
USBHS D0FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D0FIFO ISR.
USBHS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D1FIFO ISR.
USB RTOS Callback	Enter the address of the function.	NULL	If an FreeRTOS is used, set the callback function here.
USB Callback Context	Enter the address of the context.	NULL	Set the callback context here.

## Clock Configuration

The USB module uses PLL as the clock source. The PLL frequency can be set in the **Clocks** tab of the configuration editor or by using the CGC Interface at run-time.

### Note

*When using HOCO as the PLL source on Cortex M33 parts the FLL function must be enabled for correct USB operation. Refer to the MCU Family -> Clocks group of the BSP properties in the RA configuration tool to adjust FLL settings.*

## Pin Configuration

In peripheral mode the USB\_VBUS and/or USBHS\_VBUS pins are used to detect the USB connection status (connected or disconnected) and should be connected to the USB VBUS signal.

### Note

*USB\_VBUS and USBHS\_VBUS are 5V-tolerant pins.*

In host mode the USBHS\_VBUSEN, USBHS\_OVRCURA and USBHS\_OVRCURB pins should be connected

to the relevant pins of an external power supply IC, if available. These pins will be used to manage the USB VBUS supply.

## DMA Configuration

When using DMA with USB the following properties must be configured for each DMAC module:

Config Name	Select Name	Description
Transfer Size	2 Bytes	In FS mode, select "2 Bytes"
	4 Bytes	In HS mode, select "4 Bytes"
Activation source	USBFS FIFO 0	USB FS Reception
	USBFS FIFO 1	USB FS Transmission
	USBHS FIFO 0	USB HS Reception
	USBHS FIFO 1	USB HS Transmission

## Descriptor definition

In Peripheral mode, the `usb_descriptor_t` structure stores descriptor information including the device and configuration descriptors. The values set in this structure are sent to the USB host as part of enumeration.

```
typedef struct usb_descriptor
{
    uint8_t *p_device;    /* Pointer to device descriptor */
    uint8_t *p_config_f; /* Pointer to full-speed configuration descriptor */
    uint8_t *p_config_h; /* Pointer to high-speed configuration descriptor (HS only)
*/
    uint8_t *p_qualifier; /* Pointer to device qualifier descriptor (HS only) */
    uint8_t **pp_string; /* Pointer to string descriptor table */
    uint8_t num_string; /* Number of strings in table */
} usb_descriptor_t;
```

### Note

*Even in high-speed mode the full-speed configuration must be made available:*

```
/* Example USB FS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
    smp_config_f,
    NULL,
```

```
    NULL,  
    smp_str_table,  
    3,  
};  
/* Example USB HS descriptor struct */  
usb_descriptor_t g_usb_descriptor =  
{  
    smp_device,  
    smp_config_f,  
    smp_config_h,  
    smp_qualifier,  
    smp_str_table,  
    3,  
};
```

## String Descriptor

This USB driver requires string descriptors to be registered in the string descriptor table. Use the following format to define the elements:

```
/* String descriptor 0 is reserved for language ID information */  
uint8_t str_descriptor_0[]  
{  
    0x04,      /* Length */  
    0x03,      /* Descriptor type */  
    0x09, 0x04 /* Language ID */  
};  
uint8_t str_descriptor_manufacturer[] =  
{  
    0x10,      /* Length */  
    0x03,      /* Descriptor type */  
    'R', 0x00,  
    'E', 0x00,  
    'N', 0x00,  
    'E', 0x00,
```

```
'S', 0x00,
'A', 0x00,
'S', 0x00
};
uint8_t str_descriptor_product[] =
{
    0x12,      /* Length */
    0x03,      /* Descriptor type */
    'C', 0x00,
    'D', 0x00,
    'C', 0x00,
    '_', 0x00,
    'D', 0x00,
    'E', 0x00,
    'M', 0x00,
    'O', 0x00
};
/* String descriptor table */
uint8_t * smp_str_table[] =
{
    str_descriptor_0,      /* Index: 0 */
    str_descriptor_manufacturer, /* Index: 1 */
    str_descriptor_product, /* Index: 2 */
};
```

#### Note

Set the string index values in the device/configuration descriptors (*iManufacturer*, *iConfiguration* etc.) to the index of the desired string in the string descriptor table. For example, in the table below, the manufacturer is described in *str\_descriptor\_manufacturer* and the value of *iManufacturer* in the device descriptor is **1**.

## Other Descriptors

Refer to the Universal Serial Bus Revision 2.0 specification (<http://www.usb.org/developers/docs/>) for details on how to construct the device, configuration and qualifier descriptors.

## Usage Notes

### Program Structure

USB applications (whether using an RTOS or not) should be written as an event-handling loop. Either a callback function (RTOS only) or R\_USB\_EventGet should be used to provide event data to the application loop where a switch statement handles the event.

#### Note

1. The `USB_STATUS_CONFIGURED` event should be confirmed before calling `R_USB_Read` or `R_USB_Write`.
2. When attaching to USB Host, Suspend event is notified to the application program in USB peripheral mode. Notification of this event to the application program does not affect the operation.

## Limitations

Developers should be aware of the following limitations when using the USB driver:

- The current USB driver does not support hub.
- In USB host mode, the module does not support suspend during data transfers. Execute suspend only after confirming that all transfers are complete.
- Multiconfigurations are not supported.
- This driver does not support CPU transfers using the D0FIFO/D1FIFO register.
- Only one device-class driver may be used at a time.
- The USB Hi-Speed module only supports Hi-Speed operation.
- In USB host mode, this USB driver does not support the composite device.
- The user can not specify DMA transfer to USB IP0 and IP1 modules at the same time when using USB multi-port feature. USB multi-port function: Simultaneous operation feature of USB Host and Peripheral.

## Compliance Test

Please set as follows to the following items in RA configuration (r\_usb\_basic) when doing the compliance test.

1. USB Compliance Test mode Set "Enabled" in this item.

g_basic0 USB (r_usb_basic)		
Property	Value	
DMA Source Address	FS Address	
DMA Destination Address	FS Address	
USB Compliance Test mode	Enabled	
USB TPL table name	usb_tpl_table	
Module g_basic0 USB (r_usb_basic)		
Name	r_basic0	

Figure 176: Compliance Test Setting

2. USB TPL table name. Set the start address of TPL(Target Peripheral List) defined in the application program.

g_basic0 USB (r_usb_basic)		
Property	Value	
DMA Source Address	FS Address	
DMA Destination Address	FS Address	
USB Compliance Test mode	Enabled	
USB TPL table name	usb_tpl_table	
Module g_basic0 USB (r_usb_basic)		
Name	r_basic0	

Figure 177: TPL Start Address Setting

Please refer to the following about how to define for TPL.  
The following example is when two devices are set in TPL.

```
const uint16_t usb_tpl_table[] =
{
    2,          /* Number of tpl */
    0,          /* Reserved */
    0x0123, 0x4567, /* Vendor ID, Product ID (1st device) */
    0x89ab, 0xcdef /* Vendor ID, Product ID (2nd device) */
};
```

3.USB Compliance Callback Set the start address of the callback function defined in the application program.

Figure 178: Compliance Callback Setting

The user needs to create this callback function by referring to the following.

```
void usb_compliance_disp (void * param)
{
    usb_compliance_t    *disp_data;
    uint8_t              print_data[32];
    disp_data = (usb_compliance_t*)param;
    switch(disp_data->status)
    {
    case USB_COMPLIANCE_TEST_ATTACH:          /* Device Attach Detection */
        display("\nATTACH \n");
        break;
    case USB_COMPLIANCE_TEST_DETACH:         /* Device Detach Detection */
        display("\nDETACH \n");
        break;
    case USB_COMPLIANCE_TEST_TPL:           /* TPL device connect */
```

```
        display("\nTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
break;
case USB_COMPLIANCETEST_NOTTPL:                /* Not TPL device connect */
        display("\nNOTTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
break;
case USB_COMPLIANCETEST_HUB:                   /* USB Hub connect */
        display("\nHub \n");
break;
case USB_COMPLIANCETEST_OVRC:                  /* over current */
break;
case USB_COMPLIANCETEST_NORES:                 /* Responce Time out for Control Read
Transfer */
        display("\nNOTRESP \n");
break;
case USB_COMPLIANCETEST_SETUP_ERR:            /* Setup Transaction Error */
break;
default:
break;
}
} /* End of function usb_compliance_disp() */
```

Please replace the display function described in the example with the display function created by the customer.

## TrustZone

The USB driver for FreeRTOS cannot be allocated in Secure region.

## UCLK setting

Enable UCLK in "Clocks" tab on e2 studio when using the following MCU.

1. RA6M4

## Examples

### USB Basic Example

This is a basic example of minimal use of the USB in an application.

```
void usb_basic_example (void)
{
    usb_event_info_t event_info;
    usb_status_t     event;

    g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
    /* Loop back between PC(TerminalSoft) and USB MCU */
    while (1)
    {
        g_usb_on_usb.eventGet(&event_info, &event);
    switch (event)
        {
    case USB_STATUS_CONFIGURED:
    case USB_STATUS_WRITE_COMPLETE:
            g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
        break;
    case USB_STATUS_READ_COMPLETE:
            g_usb_on_usb.write(&g_basic0_ctrl, g_buf, event_info.data_size,
USB_CLASS_PCDC);
        break;
    case USB_STATUS_REQUEST: /* Receive Class Request */
        if (USB_PCDC_SET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
            {
                g_usb_on_usb.periControlDataGet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
            }
        else if (USB_PCDC_GET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
            {
                g_usb_on_usb.periControlDataSet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
            }
        else
            {
                g_usb_on_usb.periControlStatusSet(&g_basic0_ctrl,
USB_SETUP_STATUS_ACK);
            }
        }
    }
}
```

```

    }
break;
case USB_STATUS_SUSPEND:
case USB_STATUS_DETACH:
break;
default:
break;
    }
}
} /* End of function usb_main() */

```

## Typedefs

```
typedef usb_event_info_t  usb_instance_ctrl_t
```

## Typedef Documentation

### ◆ usb\_instance\_ctrl\_t

```
typedef usb_event_info_t  usb_instance_ctrl_t
```

ICU private control block. DO NOT MODIFY. Initialization occurs when R\_ICU\_ExtrenalIrqOpen is called.

## Function Documentation

### ◆ R\_USB\_EventGet()

```
fsp_err_t R_USB_EventGet ( usb_ctrl_t*const p_api_ctrl, usb_status_t* event )
```

Obtains completed USB related events. (OS-less Only)

In USB host mode, the device address value of the USB device that completed an event is specified in the usb\_ctrl\_t structure member (address) specified by the event's argument. In USB peripheral mode, USB\_NULL is specified in member (address). If this function is called in the RTOS execution environment, a failure is returned.

#### Return values

FSP_SUCCESS	Event Get Success.
FSP_ERR_USB_FAILED	If called in the RTOS environment, an error is returned.

#### Note

Do not use the same variable as the first argument of R\_USB\_Open for the first argument.  
Do not call this API in the interrupt function.

◆ **R\_USB\_Callback()**

```
fsp_err_t R_USB_Callback ( usb_callback_t * p_callback)
```

Register a callback function to be called upon completion of a USB related event. (RTOS only)

This function registers a callback function to be called when a USB-related event has completed. If this function is called in the OS-less execution environment, a failure is returned.

**Return values**

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	If this function is called in the OS-less execution environment, a failure is returned.
FSP_ERR_ASSERTION	Parameter is NULL error.

**Note**

*Do not call this API in the interrupt function.*

◆ **R\_USB\_Open()**

```
fsp_err_t R_USB_Open ( usb_ctrl_t *const p_api_ctrl, usb_cfg_t const *const p_cfg )
```

Applies power to the USB module specified in the argument (p\_ctrl).

**Return values**

FSP_SUCCESS	Success in open.
FSP_ERR_USB_BUSY	Specified USB module now in use.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

*Do not call this API in the following function.*

- (1). *Interrupt function.*
- (2). *Callback function ( for RTOS ).*

◆ **R\_USB\_Close()**

```
fsp_err_t R_USB_Close ( usb_ctrl_t *const p_api_ctrl)
```

Terminates power to the USB module specified in argument (p\_ctrl). USB0 module stops when USB\_IP0 is specified to the member (module), USB1 module stops when USB\_IP1 is specified to the member (module).

**Return values**

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_NOT_OPEN	USB module is not open.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

*Do not call this API in the following function.*

*(1). Interrupt function.*

*(2). Callback function ( for RTOS ).*

## ◆ R\_USB\_Read()

```
fsp_err_t R_USB_Read ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t destination )
```

Bulk/interrupt data transfer and control data transfer.

### 1. Bulk/interrupt data transfer

Requests USB data read (bulk/interrupt transfer). The read data is stored in the area specified by argument (p\_buf). After data read is completed, confirm the operation by checking the return value (USB\_STATUS\_READ\_COMPLETE) of the R\_USB\_GetEvent function. The received data size is set in member (size) of the usb\_ctrl\_t structure. To figure out the size of the data when a read is complete, check the return value (USB\_STATUS\_READ\_COMPLETE) of the R\_USB\_GetEvent function, and then refer to the member (size) of the usb\_ctrl\_t structure.

### 2. Control data transfer

The R\_USB\_Read function is used to receive data in the data stage and the R\_USB\_Write function is used to send data to the USB host.

## Return values

FSP_SUCCESS	Successfully completed (Data read request completed).
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data receive request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

## Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function ( for RTOS ).

## ◆ R\_USB\_Write()

```
fsp_err_t R_USB_Write ( usb_ctrl_t *const p_api_ctrl, uint8_t const *const p_buf, uint32_t size,
uint8_t destination )
```

Bulk/Interrupt data transfer and control data transfer.

### 1. Bulk/Interrupt data transfer

Requests USB data write (bulk/interrupt transfer). Stores write data in area specified by argument (p\_buf). Set the device class type in usb\_ctrl\_t structure member (type). Confirm after data write is completed by checking the return value (USB\_STATUS\_WRITE\_COMPLETE) of the R\_USB\_GetEvent function. For sending a zero-length packet, please refer the following Note.

### 2. Control data transfer

The R\_USB\_Read function is used to receive data in the data stage and the R\_USB\_Write function is used to send data to the USB host.

## Return values

FSP_SUCCESS	Successfully completed. (Data write request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data write request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

## Note

1. The user needs to send the zero-length packet (ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB\_NULL in the third argument (size) of R\_USB\_Write function as follow. e.g)

```
R_USB_Write (&g_basic0_ctrl, &g_buf, USB_NULL);
```

2. Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_Stop()**

```
fsp_err_t R_USB_Stop ( usb_ctrl_t *const p_api_ctrl, usb_transfer_t direction, uint8_t destination )
```

Requests a data read/write transfer be terminated when a data read/write transfer is being performed.

To stop a data read, set USB\_TRANSFER\_READ as the argument (type); to stop a data write, specify USB\_WRITE as the argument (type).

**Return values**

FSP_SUCCESS	Successfully completed. (stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Stop processing is called multiple times.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function ( for RTOS ).

◆ **R\_USB\_Suspend()**

```
fsp_err_t R_USB_Suspend ( usb_ctrl_t *const p_api_ctrl)
```

Sends a SUSPEND signal from the USB module assigned to the member (module) of the usb\_ctrl\_t structure.

After the suspend request is completed, confirm the operation with the return value (USB\_STATUS\_SUSPEND) of the R\_USB\_EventGet function.

**Return values**

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	During a suspend request to the specified USB module, or when the USB module is already in the suspended state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function ( for RTOS ).

◆ **R\_USB\_Resume()**

```
fsp_err_t R_USB_Resume ( usb_ctrl_t *const p_api_ctrl)
```

Sends a RESUME signal from the USB module assigned to the member (module) of the usb\_ctrl\_t structure.

After the resume request is completed, confirm the operation with the return value (USB\_STATUS\_RESUME) of the R\_USB\_EventGet function

**Return values**

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Resume already requested for same device address. (USB host mode only)
FSP_ERR_USB_NOT_SUSPEND	USB device is not in the SUSPEND state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_VbusSet()**

```
fsp_err_t R_USB_VbusSet ( usb_ctrl_t *const p_api_ctrl, uint16_t state )
```

Specifies starting or stopping the VBUS supply.

**Return values**

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_InfoGet()**

```
fsp_err_t R_USB_InfoGet ( usb_ctrl_t *const p_api_ctrl, usb_info_t * p_info, uint8_t destination )
```

Obtains completed USB-related events.

**Return values**

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R\_USB\_PipeRead()**

```
fsp_err_t R_USB_PipeRead ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t pipe_number )
```

Requests a data read (bulk/interrupt transfer) via the pipe specified in the argument.

The read data is stored in the area specified in the argument (p\_buf). After the data read is completed, confirm the operation with the R\_USB\_GetEvent function return value(USB\_STATUS\_READ\_COMPLETE). To figure out the size of the data when a read is complete, check the return value (USB\_STATUS\_READ\_COMPLETE) of the R\_USB\_GetEvent function, and then refer to the member (size) of the usb\_ctrl\_t structure.

**Return values**

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

- Do not call this API in the following function.
- (1). Interrupt function.
  - (2). Callback function ( for RTOS ).

◆ **R\_USB\_PipeWrite()**

```
fsp_err_t R_USB_PipeWrite ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t pipe_number )
```

Requests a data write (bulk/interrupt transfer).

The write data is stored in the area specified in the argument (p\_buf). After data write is completed, confirm the operation with the return value (USB\_STATUS\_WRITE\_COMPLETE) of the EventGet function. For sending a zero-length packet, please refer the following Note.

**Return values**

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

1. The user needs to send the zero-length packet (ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets `USB_NULL` in the third argument (size) of `R_USB_PipeWrite` function as follow.

e.g)

```
R_USB_PipeWrite (&g_basic0_ctrl, &g_buf, USB_NULL, pipe_number);
```

2. Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_PipeStop()**

```
fsp_err_t R_USB_PipeStop ( usb_ctrl_t *const p_api_ctrl, uint8_t pipe_number )
```

Terminates a data read/write operation.

**Return values**

FSP_SUCCESS	Successfully completed. (Stop request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_UsedPipesGet()**

```
fsp_err_t R_USB_UsedPipesGet ( usb_ctrl_t *const p_api_ctrl, uint16_t * p_pipe, uint8_t destination )
```

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information.

The bit map information is stored in the area specified in argument (p\_pipe). Based on the information (module member and address member) assigned to the usb\_ctrl\_t structure, obtains the PIPE information of that USB device.

**Return values**

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R\_USB\_PipeInfoGet()**

```
fsp_err_t R_USB_PipeInfoGet ( usb_ctrl_t *const p_api_ctrl, usb_pipe_t * p_info, uint8_t pipe_number )
```

Gets the following pipe information regarding the pipe specified in the argument (p\_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size.

The obtained pipe information is stored in the area specified in the argument (p\_info).

**Return values**

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R\_USB\_PullUp()**

```
fsp_err_t R_USB_PullUp ( usb_ctrl_t *const p_api_ctrl, uint8_t state )
```

This API enables or disables pull-up of D+/D- line.

**Return values**

FSP_SUCCESS	Successful completion. (Pull-up enable/disable setting completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function ( for RTOS ).

◆ **R\_USB\_HostControlTransfer()**

```
fsp_err_t R_USB_HostControlTransfer ( usb_ctrl_t *const p_api_ctrl, usb_setup_t * p_setup, uint8_t * p_buf, uint8_t device_address )
```

Performs settings and transmission processing when transmitting a setup packet.

**Return values**

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.

**Note**

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_PericontrolDataGet()**

```
fsp_err_t R_USB_PericontrolDataGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size )
```

Receives data sent by control transfer.

**Return values**

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_PeriControlDataSet()**

```
fsp_err_t R_USB_PeriControlDataSet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size )
```

Performs transfer processing for control transfer.

**Return values**

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_PeriControlStatusSet()**

```
fsp_err_t R_USB_PeriControlStatusSet ( usb_ctrl_t *const p_api_ctrl, usb_setup_status_t status )
```

Set the response to the setup packet.

**Return values**

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_RemoteWakeup()**

```
fsp_err_t R_USB_RemoteWakeup ( usb_ctrl_t *const p_api_ctrl)
```

Sends a remote wake-up signal to the connected Host.

**Return values**

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_NOT_SUSPEND	Device is not suspended.
FSP_ERR_USB_BUSY	The device is in resume operation.

**Note**

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function ( for RTOS ).

◆ **R\_USB\_ModuleNumberGet()**

```
fsp_err_t R_USB_ModuleNumberGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * module_number )
```

This API gets the module number.

**Return values**

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R\_USB\_ClassTypeGet()**

```
fsp_err_t R_USB_ClassTypeGet ( usb_ctrl_t *const p_api_ctrl, usb_class_t * class_type )
```

This API gets the class type.

**Return values**

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R\_USB\_DeviceAddressGet()**

```
fsp_err_t R_USB_DeviceAddressGet ( usb_ctrl_t*const p_api_ctrl, uint8_t* device_address )
```

This API gets the device address.

**Return values**

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R\_USB\_PipeNumberGet()**

```
fsp_err_t R_USB_PipeNumberGet ( usb_ctrl_t*const p_api_ctrl, uint8_t* pipe_number )
```

This API gets the pipe number.

**Return values**

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R\_USB\_DeviceStateGet()**

```
fsp_err_t R_USB_DeviceStateGet ( usb_ctrl_t*const p_api_ctrl, uint16_t* state )
```

This API gets the state of the device.

**Return values**

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R\_USB\_DataSizeGet()**

```
fsp_err_t R_USB_DataSizeGet ( usb_ctrl_t*const p_api_ctrl, uint32_t* data_size )
```

This API gets the data size.

**Return values**

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R\_USB\_SetupGet()**

```
fsp_err_t R_USB_SetupGet ( usb_ctrl_t *const p_api_ctrl, usb_setup_t * setup )
```

This API gets the setup type.

**Return values**

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R\_USB\_OtgCallbackSet()**

```
fsp_err_t R_USB_OtgCallbackSet ( usb_ctrl_t *const p_api_ctrl, usb_otg_callback_t * p_callback )
```

Set callback function to be called when the OTG role swap was completed on Azure RTOS.

**Return values**

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

◆ **R\_USB\_OtgSRP()**

```
fsp_err_t R_USB_OtgSRP ( usb_ctrl_t *const p_api_ctrl)
```

Start the SRP processing for OTG on Azure RTOS.

**Return values**

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

*Note*

*Do not support the VBUS Pulsing since OTG 2.0 does not support the VBUS Pulsing..*

**4.2.5.21 USB Composite (r\_usb\_composite)**

Modules » [Connectivity](#)

## Functions

Refer to [USB \(r\\_usb\\_basic\)](#) for the common API (r\_usb\_basic) to be called from the application.

## Overview

USB composite device works as a USB Peripheral by combining two peripheral device classes and r\_usb\_basic module.

This USB driver supports the following composite devices:

1. PCDC + PMSC
2. PCDC + PHID
3. PHID + PMSC
4. PCDC + PCDC
5. PHID + PHID

## How to Configuration

The following shows FSP configuration procedure for USB composite device.

- Select [New Stack]->[USB]->[USB Composite]

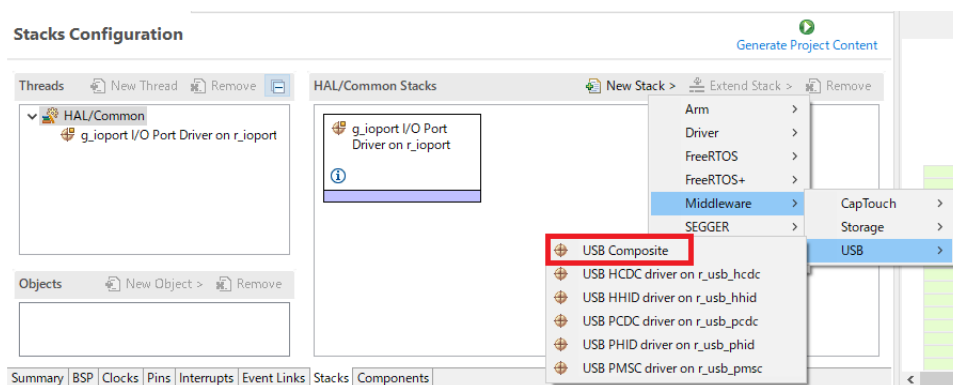

Figure 179: Select USB Composite

- The following is displayed when selecting [USB Composite].

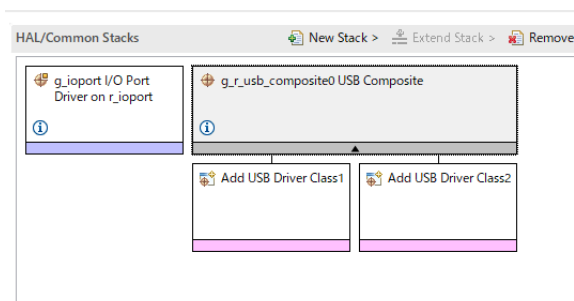

Figure 180: USB Composite Stack

- Select the supported 2 device classes as follows.

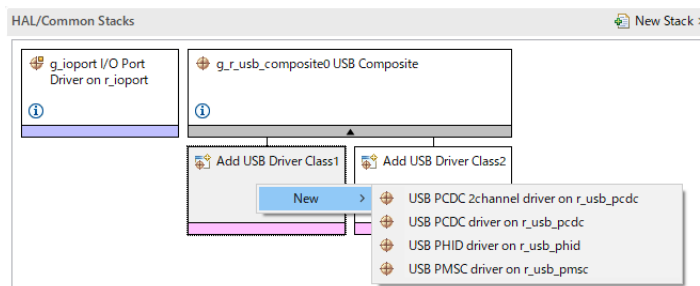

Figure 181: Select Device Classes

*Note*

1. Be sure to select "USB PCDC driver on r\_usb\_pcdc" and "USB PCDC 2channel driver on r\_usb\_pcdc" when configuring for "PCDC + PCDC".
  2. Be sure to select "USB PHID driver on r\_usb\_phid" and "USB PHID 2channel driver on r\_usb\_phid" when configuring for "PHID + PHID".
- Select the supported 2 device classes as follows. The following is displayed when selecting 2 device classes.

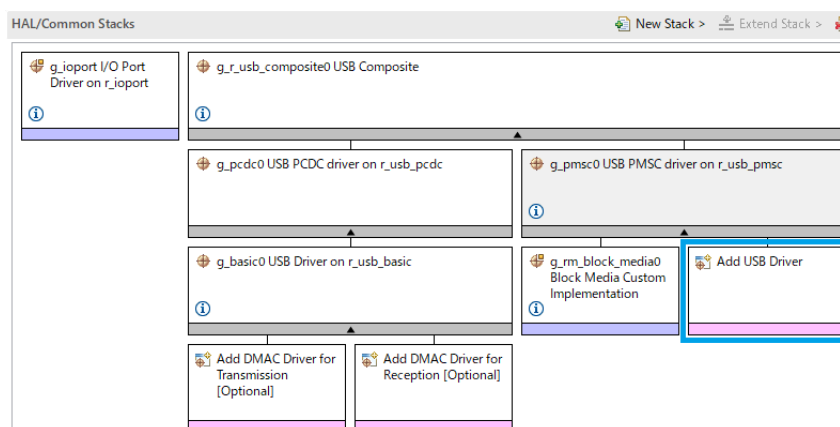

Figure 182: Delete USB Basic Instance

*Note*

1. Delete the "g\_basic1" instance manually since this instance is not used in composite device. (Refer to the blue frame in the above figure.)
2. The error is output when selecting the following device classes.
  - a. PMSC + PMSC

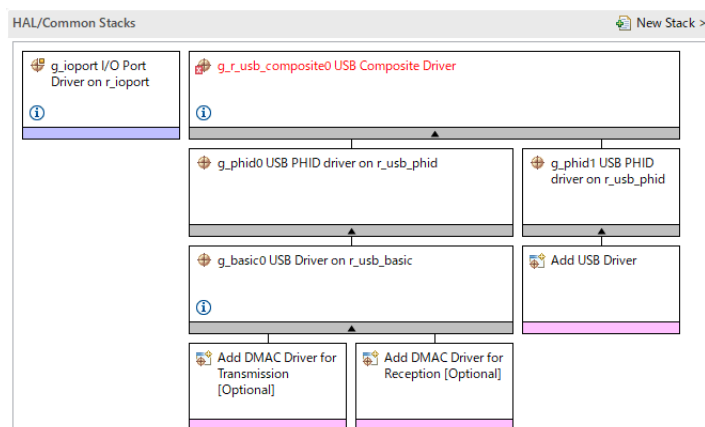

Figure 183: Device Class Selection Error

## Limitations

1. The following composite device is not supported when using RA2A1(MCU).

1. PMSC + PCDC
2. PCDC + PCDC

2. If you use PMSC, make sure to use `usb_basic` module with PMSC. There is a risk that the information on the PMSC storage media cannot be registered normally in the "USB Callback Context".

## Notes

Please determine by the member "pipe" in "usb\_event\_info" structure when getting PCDC channel number which the write event is completed in PCDC + PCDC. Don't refer to the member "type" in "usb\_event\_info" structure.

## Descriptor

Templates for composite device descriptors can be found in `ra/fsp/src/r_usb_composite` folder. Also, please be sure to use your vendor ID.

1. `r_usb_pcdc_pmsc_descriptor.c.template` (for PCDC + PMSC)
2. `r_usb_pcdc_phid_descriptor.c.template` (for PCDC + PHID)
3. `r_usb_phid_pmsc_descriptor.c.template` (for PHID + PMSC)
4. `r_usb_pcdc_pcdc_descriptor.c.template` (for PCDC + PCDC)
5. `r_usb_phid_phid_descriptor.c.template` (for PHID + PHID)

## Examples

### USB COMPOSITE Example

- PCDC + PHID

```
void main_task (void)
{
```

```
#if (BSP_CFG_RTOS == 2)
    usb_event_info_t * p_mess;
#endif

usb_event_info_t usb_event;

#### 4.2.5.22 USB HCDC (r\_usb\_hcdc)

Modules » [Connectivity](#)

This module provides a USB Host Communications Device Class (HCDC) driver. It implements the [USB HCDC Interface](#).

#### Functions

Refer to [USB \(r\\_usb\\_basic\)](#) for the common API (r\_usb\_basic) to be called from the application.

#### Detailed Description

### Overview

The r\_usb\_hcdc module, when used in combination with the r\_usb\_basic module, operates as a USB Host Communications Device Class (HCDC) driver. The HCDC conforms to the PSTN device subclass abstract control model of the USB Communications Device Class (CDC) specification and enables communication with a CDC peripheral device.

#### Features

The r\_usb\_hcdc module has the following key features:

- Checks for connected devices
- Implementation of communication line settings
- Acquisition of the communication line state
- Data transfer to and from a CDC peripheral device

### Configuration

#### Build Time Configurations for r\_usb\_hcdc

The following build time configurations are defined in fsp\_cfg/r\_usb\_hcdc\_cfg.h:

Configuration	Options	Default	Description
Target Peripheral Device Class ID	<ul style="list-style-type: none"> <li>CDC class supported device</li> <li>Vendor class device</li> </ul>	CDC class supported device	Specify the device class ID of the CDC device to be connected.
Bulk Input Transfer Pipe	<ul style="list-style-type: none"> <li>USB PIPE1</li> <li>USB PIPE2</li> <li>USB PIPE3</li> <li>USB PIPE4</li> <li>USB PIPE5</li> </ul>	USB PIPE1	Select the USB pipe to use for bulk input transfers.
Bulk Output Transfer Pipe	<ul style="list-style-type: none"> <li>USB PIPE1</li> <li>USB PIPE2</li> <li>USB PIPE3</li> <li>USB PIPE4</li> <li>USB PIPE5</li> </ul>	USB PIPE2	Select the USB pipe to use for bulk output transfers.
Interrupt In Pipe	<ul style="list-style-type: none"> <li>USB PIPE6</li> <li>USB PIPE7</li> <li>USB PIPE8</li> <li>USB PIPE9</li> </ul>	USB PIPE6	Select the USB pipe to use for interrupts.

### Configurations for Connectivity > USB HCDC (r\_usb\_hcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HCDC (r\_usb\_hcdc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hcdc0	Module name.

#### Note

Refer to the [USB \(r\\_usb\\_basic\)](#) module for hardware configuration options.

### Clock Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

### Pin Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

## Usage Notes

### Communications Device Class (CDC), PSTN and ACM

This software conforms to the Abstract Control Model (ACM) subclass of the Communications Device Class specification as defined in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2. The Abstract Control Model subclass is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections) enabling use of application programs designed for older modems.

### Basic Functions

The main functions of HCDC are the following:

- Verify connected devices
- Make communication line settings
- Acquire the communication line state
- Transfer data to and from the CDC peripheral device

### Abstract Control Model Class Requests - Host to Device

This driver supports the following class requests:

Request	Code	Description
SendEncapsulatedCommand	0x00	Transmits an AT command as defined by the protocol used by the device (normally 0 for USB).
GetEncapsulatedResponse	0x01	Requests a response to a command transmitted by SendEncapsulatedCommand.
SetCommFeature	0x02	Enables or disables features such as device-specific 2-byte code and country setting.
GetCommFeature	0x03	Acquires the enabled/disabled state of features such as device-specific 2-byte code and country setting.
ClearCommFeature	0x04	Restores the default enabled/disabled settings of features such as device-specific 2-byte code and country setting.
SetLineCoding	0x20	Makes communication line settings (communication speed, data length, parity bit, and stop bit length).
GetLineCoding	0x21	Acquires the communication line setting state.
SetControllLineState	0x22	Makes communication line control signal (RTS, DTR) settings.
SendBreak	0x23	Transmits a break signal.

#### Note

*For more information about Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.*

The expected data format for each command is shown below followed by dependent structures.

bmRequestTyp	bRequest	wValue	wIndex	wLength	Data
--------------	----------	--------	--------	---------	------

e					
0x21	SEND_ENCAPSULATED_COMMAND (0x00)	0x0000	0x0000	Data length	usb_hcdc_encapsulated_t
0x21	GET_ENCAPSULATED_RESPONSE (0x01)	0x0000	0x0000	Data length	usb_hcdc_encapsulated_t
0x21	SET_COMM_FEATURE (0x02)	usb_hcdc_feature_selector_t	0x0000	Data length	usb_hcdc_comfeature_t
0x21	GET_COMM_FEATURE (0x03)	usb_hcdc_feature_selector_t	0x0000	Data length	usb_hcdc_comfeature_t
0x21	CLEAR_COMM_FEATURE (0x04)	usb_hcdc_feature_selector_t	0x0000	Data length	None
0x21	SET_LINE_CODING (0x20)	0x0000	0x0000	0x0000	usb_hcdc_linecoding_t
0xA1	GET_LINE_CODING (0x21)	0x0000	0x0000	0x0007	usb_hcdc_linecoding_t
0x21	SET_CONTROL_LINE_STATE (0x22)	usb_hcdc_control_line_state_t	0x0000	0x0000	None
0x21	SEND_BREAK (0x23)	usb_hcdc_break_duration_t	0x0000	0x0000	None

### ACM Notifications from Device to Host

The following class notifications are supported:

Notification	Code	Description
RESPONSE_AVAILABLE	0x01	Response to GET_ENCAPSULATED_RESPONSE
SERIAL_STATE	0x20	Notification of serial line state

The data types returned are as follows:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	RESPONSE_AVAILABLE (0x01)	0x0000	0x0000	0x0000	None
0xA1	SERIAL_STATE (0x20)	0x0000	0x0000	0x0002	usb_hcdc_serialstate_t

#### Note

The host is notified with SERIAL\_STATE whenever a change in the UART port state is detected.

## Limitations

This driver is subject to the following limitations:

- Suspend is not supported when a data transfer is in progress. Confirm that data transfer has completed before executing suspend.
- Use of compound USB devices with CDC class support is not supported.
- This module must be incorporated into a project using r\_usb\_basic and does not provide any public APIs.
- This driver does not support Low-speed.
- This driver does not support simultaneous operation with the other device class.

## Examples

### USB HCD Loopback Example

The main functions of the HCD loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET\_LINE\_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

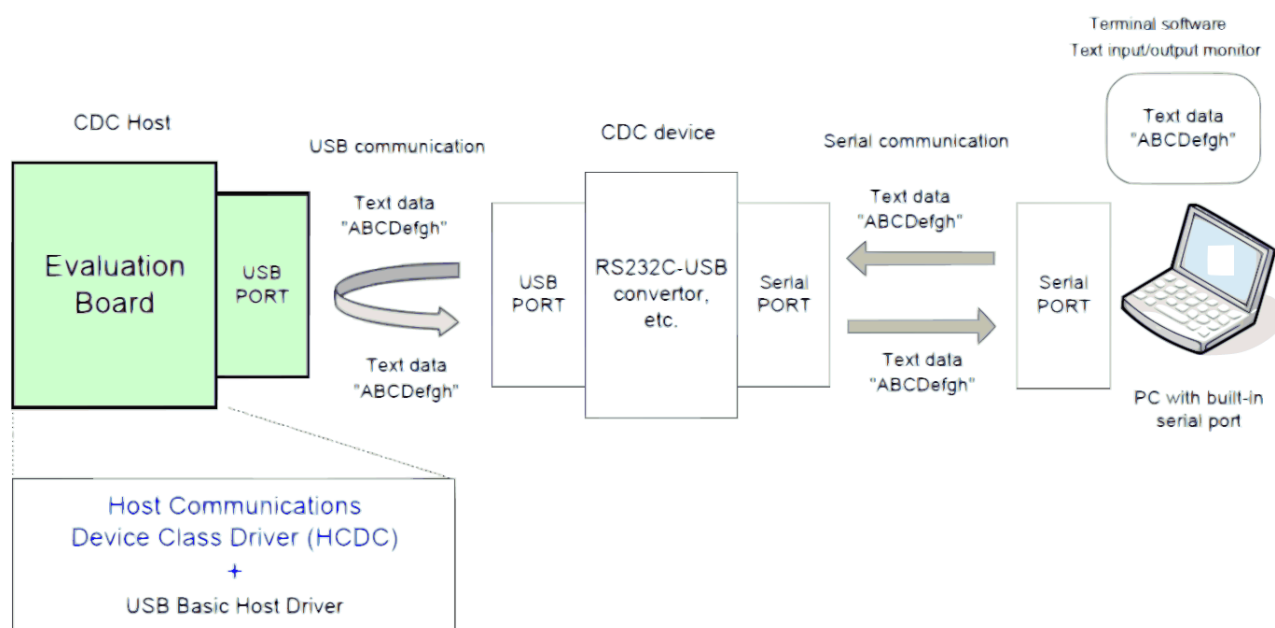

Figure 184: Data Transfer (Loopback)

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

#### 4.2.5.23 USB HHID (r\_usb\_hhid)

Modules » [Connectivity](#)

##### Functions

**fsp\_err\_t** [R\\_USB\\_HHID\\_TypeGet](#) (usb\_ctrl\_t \*const p\_api\_ctrl, uint8\_t \*p\_type, uint8\_t device\_address)

Get HID protocol.(USB Mouse/USB Keyboard/Other Type.) [More...](#)

**fsp\_err\_t** [R\\_USB\\_HHID\\_MaxPacketSizeGet](#) (usb\_ctrl\_t \*const p\_api\_ctrl,

```
uint16_t *p_size, uint8_t direction, uint8_t device_address)
```

Obtains max packet size for the connected HID device. The max packet size is set to the area. Set the direction (USB\_HID\_IN/USB\_HID\_OUT). [More...](#)

## Detailed Description

This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the [USB HHID Interface](#).

## Overview

The r\_usb\_hhid module combines with the r\_usb\_basic module to provide a USB Host Human Interface Device Class (HHID) driver. The HHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID device.

## Features

The r\_usb\_hhid module has the following key features:

- Data communication with a connected HID device (USB mouse, keyboard etc.)
- Issuing of HID class requests to a connected HID device
- Supports Interrupt OUT transfer

## Configuration

### Build Time Configurations for r\_usb\_hhid

The following build time configurations are defined in fsp\_cfg/r\_usb\_hhid\_cfg.h:

Configuration	Options	Default	Description
Interrupt In Pipe	<ul style="list-style-type: none"> <li>• USB PIPE6</li> <li>• USB PIPE7</li> <li>• USB PIPE8</li> <li>• USB PIPE9</li> </ul>	USB PIPE6	Select the pipe number to use for input interrupt events.
Interrupt Out Pipe	<ul style="list-style-type: none"> <li>• USB PIPE6</li> <li>• USB PIPE7</li> <li>• USB PIPE8</li> <li>• USB PIPE9</li> </ul>	USB PIPE9	Select the pipe number to use for output interrupt events.

### Configurations for Connectivity > USB HHID (r\_usb\_hhid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HHID (r\_usb\_hhid). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid	g_hhid0	Module name.

## C symbol

**Clock Configuration**

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

**Pin Configuration**

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

**Usage Notes***Note*

*This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB peripherals.*

**Class Requests**

The class requests supported by this driver are shown below:

Request	Code	Description
USB_GET_REPORT	0x01	Receives a report from the HID device.
USB_SET_REPORT	0x09	Sends a report to the HID device.
USB_GET_IDLE	0x02	Receives a duration (time) from the HID device.
USB_SET_IDLE	0x0A	Sends a duration (time) to the HID device.
USB_GET_PROTOCOL	0x03	Reads a protocol from the HID device.
USB_SET_PROTOCOL	0x0B	Sends a protocol to the HID device.
USB_GET_REPORT_DESCRIPTOR	0x06	Requests a report descriptor.
USB_GET_HID_DESCRIPTOR	0x06	Requests a HID descriptor.

**Data Format**

The boot protocol data format of data received from the keyboard or mouse through interrupt-IN transfers is shown below:

offset	Keyboard (8 Bytes)	Mouse (3 Bytes)
0 (Top Byte)	Modifier keys	b0 : Button 1 b1 : Button 2 b2 : Button 3 b3-b7 : Reserved
+1	Reserved	X displacement

---

+2	Keycode 1	Y displacement
+3	Keycode 2	-
+4	Keycode 3	-
+5	Keycode 4	-
+6	Keycode 5	-
+7	Keycode 6	-

### Limitations

- The HID driver does not analyze the report descriptor. This driver determines the report format from the interface protocol.
- This driver does not support DMA transfers.
- This driver does not support High-speed.
- The transfer rates of Full-speed and Low-speed are the same when the max packet sizes of Full-speed and Low-speed are the same.
- This driver does not support simultaneous operation with the other device class.

## Examples

### USB HHID Example

The main functions of the application are as follows:

1. Performs enumeration and initialization of HID devices.
2. Transfers data to and from a connected HID device (mouse or keyboard). Data received from the device is read and discarded.
3. When an RTOS is used, the USB driver calls the callback (`usb_apl_callback`) in order to pass events to the main loop through a queue.

Figure 185: Example Operating Environment

### Application Processing (for RTOS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing performed by the loop is shown below.

1. When a USB-related event has completed, the USB driver calls the callback function (usb\_apl\_callback). In the callback function (usb\_apl\_callback), the application task (APL) is notified of the USB completion event using the real-time OS functionality.
2. In APL, information regarding the USB completion event was notified from the callback function is retrieved using the real-time OS functionality.
3. If the USB completion event (the event member of the usb\_ctrl\_t structure) retrieved in step 2 above is USB\_STATUS\_CONFIGURED, APL sends the class request (SET\_PROTOCOL) to the HID device.
4. If the USB completion event (the event member of the usb\_ctrl\_t structure) retrieved in step 2 above is USB\_STATUS\_REQUEST\_COMPLETE, APL performs a data reception request to receive data transmitted from the HID device by calling the R\_USB\_Read function.
5. The above processing is repeated.

Figure 186: Main Loop (Normal mode)

### Application Processing (for Non-OS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing of the main loop is presented below.

1. When the R\_USB\_GetEvent function is called after an HID device attaches to the USB host and enumeration completes, USB\_STATUS\_CONFIGURED is set as the return value. When the APL confirms USB\_STATUS\_CONFIGURED, it calls the R\_USB\_Write function to request transmission of data to the HID device.
2. When the R\_USB\_GetEvent function is called after sending of class request SET\_PROTOCOL to the HID device has completed, USB\_STATUS\_REQUEST\_COMPLETE is set as the return value. When the APL confirms USB\_STATUS\_REQUEST\_COMPLETE, it calls the R\_USB\_Read function to make a data receive request for data sent by the HID device.
3. When the R\_USB\_GetEvent function is called after reception of data from the HID device has completed, USB\_STATUS\_READ\_COMPLETE is set as the return value. When the APL confirms USB\_STATUS\_READ\_COMPLETE, it calls the R\_USB\_Read function to make a data receive request for data sent by the HID device.
4. The processing in step 3, above, is repeated.

## Function Documentation

### ◆ R\_USB\_HHID\_TypeGet()

```
fsp_err_t R_USB_HHID_TypeGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_type, uint8_t
device_address )
```

Get HID protocol.(USB Mouse/USB Keyboard/Other Type.)

#### Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

### ◆ R\_USB\_HHID\_MaxPacketSizeGet()

```
fsp_err_t R_USB_HHID_MaxPacketSizeGet ( usb_ctrl_t *const p_api_ctrl, uint16_t * p_size, uint8_t
direction, uint8_t device_address )
```

Obtains max packet size for the connected HID device. The max packet size is set to the area. Set the direction (USB\_HID\_IN/USB\_HID\_OUT).

#### Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

## Detailed Description

This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the [USB HMSC Interface](#).

## Overview

The `r_usb_hmse` module, when used in combination with the `r_usb_basic` module, operates as a USB Host Mass Storage Class (HMSC) driver. It is built on the USB Mass Storage Class Bulk-Only Transport (BOT) protocol. It is possible to communicate with BOT-compatible USB storage devices by combining this module with a file system and storage device driver.

### Note

*This module should be used in combination with the FreeRTOS+FAT File System.*

## Features

The `r_usb_hmse` module has the following key features:

- Checking of connected USB storage devices to determine whether or not operation is supported
- Storage command communication using the BOT protocol

- Support for SFF-8070i (ATAPI) USB mass storage subclass
- Sharing of a single pipe for IN/OUT directions or multiple devices
- Supports up to 4 connected USB storage devices

## Class Requests

The class requests supported by this driver are shown below.

Request	Description
GetMaxLun	Gets the maximum number of units that are supported.
MassStorageReset	Cancels a protocol error.

## Storage Commands

This driver supports the following storage commands:

- TEST\_UNIT\_READY
- MODE\_SELECT10
- MODE\_SENSE10
- PREVENT\_ALLOW
- READ\_FORMAT\_CAPACITY
- READ10
- WRITE10

## Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

### Clock Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

### Pin Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

## Usage Notes

### Warning

Due to the wide variety of USB mass storage device implementations, this driver is not guaranteed to work with all devices. When implementing the driver it is important to verify correct operation with the mass storage devices that the end user is expected to use.

### Multi Port

This driver supports simultaneous operation with Peripheral Communication Device Class(PCDC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run HMSC on one USB module and PCDC on the other. This driver does not support simultaneous operation using device classes other than PCDC.

### For Bare Metal

1. To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.
2. In RA configurator, enter the appropriate values in the Main stack size and Heap size fields. The figure below is an example of the RA6M3-EK board.

RA Common	
Main stack size (bytes)	0x800
Heap size (bytes)	0x800
MCU Vcc (mV)	3300
Parameter checking	Disabled
Assert Failures	Return FSP_ERR_ASSERTION
Error Log	No Error Log
Soft Reset	Disabled
Main Oscillator Populated	Populated
PFS Protect	Enabled
C Runtime Initialization	Enabled
Main Oscillator Clock Source	Crystal or Resonator
Subclock Populated	Populated
Subclock Drive (Drive capac	Standard/Normal mode
Subclock Stabilization Time	1000

Figure 188: BSP Setting

1. In the Bare Metal version, specify "NULL" in the Callback item.

The screenshot shows the RA configurator interface. On the left, a tree view shows the 'FreeRTOS+FAT' module selected. On the right, the 'API Info' panel displays the following settings:

Common	
Parameter Checking	Default (BSP)
Module FreeRTOS+FAT Port for RA	
Name	g_rm_freertos_plus_fat0
Total Number of Sectors	31293440
Sector Size (bytes)	512
Cache Size (bytes)	1024
Partition Number	0
Callback	NULL

Figure 189: For Bare Metal Setting

## Limitations

1. Some MSC devices may be unable to connect because they are not recognized as storage devices.
2. MSC devices that return values of 1 or higher in response to the GetMaxLun command (mass storage class command) are not supported.
3. A maximum of 4 USB storage devices can be connected.
4. Only USB storage devices with a sector size of 512 bytes can be connected.
5. A device that does not respond to the READ\_CAPACITY command operates as a device with a sector size of 512 bytes.
6. The continuous transfer mode cannot be used when using DMA.
7. This module must be incorporated into a project using r\_usb\_basic and does not provide any public APIs.
8. This driver does not support Low-speed.

## Examples

### USB HMSC Example

#### Example Operating Environment

The following shows an example operating environment for the HMSC.

Refer to the associated instruction manuals for details on setting up the evaluation board and using

the emulator, etc.

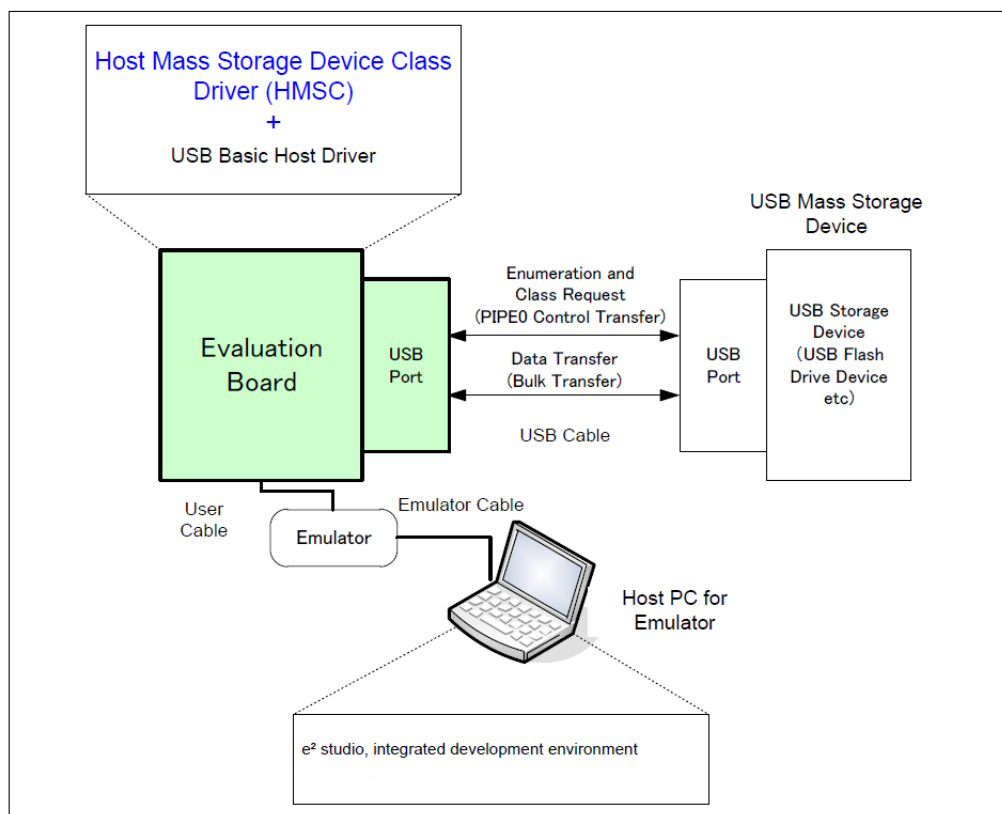

Figure 190: Example Operating Environment

## Application Specifications

The main functions of the application are as follows:

1. Performs enumeration and drive recognition processing on MSC devices.
2. After the above processing finishes, the application writes the file to the MSC device once.
3. After writing the above file, the APL repeatedly reads the file. It continues to read the file repeatedly until the switch is pressed again.

## Application Processing (for RTOS)

This application has two tasks. An overview of the processing in these two tasks is provided below.

### usb\_apl\_task

1. After start up, MCU pin setting, USB controller initialization, and application program initialization are performed.
2. The MSC device is attached to the kit. When enumeration and drive recognition processing have completed, the USB driver calls the callback function (usb\_apl\_callback). In the callback function (usb\_apl\_callback), the application task is notified of the USB completion event using the FreeRTOS functionality.
3. In the application task, information regarding the USB completion event about which notification was received from the callback function is retrieved using the real-time OS functionality.

4. If the USB completion event (the event member of the usb\_ctrl\_t structure) retrieved in step 2 above is USB\_STS\_CONFIGURED then, based on the USB completion event, the MSC device is mounted and the file is written to the MSC device.
5. If the USB completion event (the event member of the usb\_ctrl\_t structure) retrieved in step 2 above is USB\_STS\_DETACH, the application initializes the variables for state management.

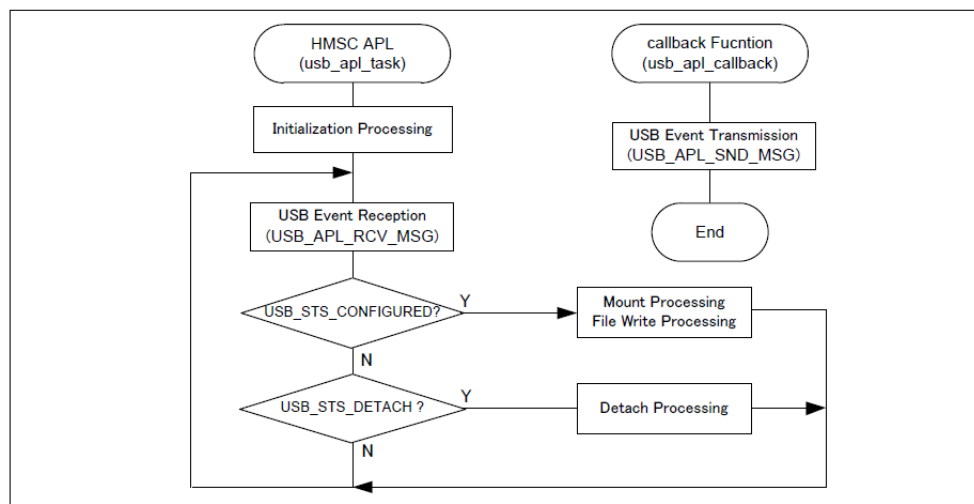

Figure 191: usb\_apl\_task

## file\_read\_task

Of the application tasks `usb_apl_task` and `file_read_task`, `file_read_task` is processed while `usb_apl_task` is in the wait state. This task performs file read processing on the file that was written to the MSC device.

## Function Documentation

### ◆ R\_USB\_HMSC\_StorageCommand()

`fsp_err_t R_USB_HMSC_StorageCommand ( usb_ctrl_t *const p_api_ctrl, uint8_t * buf, uint8_t command, uint8_t destination )`

Processing for MassStorage(ATAPI) command.

#### Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R\_USB\_HMSC\_DriveNumberGet()**

```
fsp_err_t R_USB_HMSC_DriveNumberGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_drive, uint8_t destination )
```

Get number of Storage drive.

**Return values**

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R\_USB\_HMSC\_StorageReadSector()**

```
fsp_err_t R_USB_HMSC_StorageReadSector ( uint16_t drive_number, uint8_t *const buff, uint32_t sector_number, uint16_t sector_count )
```

Read sector information.

**Return values**

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

**Note**

*The address specified in the argument buff must be 4-byte aligned.*

◆ **R\_USB\_HMSC\_StorageWriteSector()**

```
fsp_err_t R_USB_HMSC_StorageWriteSector ( uint16_t drive_number, uint8_t const *const buff,
uint32_t sector_number, uint16_t sector_count )
```

Write sector information.

**Return values**

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

*Note*

The address specified in the argument *buff* must be 4-byte aligned.

◆ **R\_USB\_HMSC\_SemaphoreGet()**

```
fsp_err_t R_USB_HMSC_SemaphoreGet ( void )
```

Get a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

**Return values**

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.

◆ **R\_USB\_HMSC\_SemaphoreRelease()**

```
fsp_err_t R_USB_HMSC_SemaphoreRelease ( void )
```

Release a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

**Return values**

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.

## 4.2.5.25 USB Host Vendor class (r\_usb\_hvnd)

Modules » Connectivity

### Functions

Refer to [USB \(r\\_usb\\_basic\)](#) for the common API (r\_usb\_basic) to be called from the application.

## Overview

USB Host Vendor class works by combining r\_usb\_basic module.

## How to Configuration

The following shows FSP configuration procedure for USB Host Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Host Vendor class driver on r\_usb\_hvnd].

Figure 192: Select USB Host Vendor Class

- The following is displayed when selecting [USB Host Vendor class driver on r\_usb\_hvnd]. The user does not specify USB pipe number in Vendor class.

Figure 193: USB Host Vendor Class Stack

## API

Use the following APIs in Host Vendor class application program.

- For Data Transfer  
Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.
  1. R\_USB\_PipeRead()
  2. R\_USB\_PipeWrite()
  3. R\_USB\_PipeStop()
- For Control Transfer  
Use the following API for the class request processing.
  1. R\_USB\_HostControlTransfer()
- For USB Pipe Information  
The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.
  1. R\_USB\_UsedPipesGet()
  2. R\_USB\_PipeInfoGet()

## USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.

## Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Information
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

```

/*****
**
* Macro definitions
*****
**/

/* for Vendor Class Request */
#define USB_SET_VENDOR_NO_DATA (0x0000U)
#define USB_SET_VENDOR (0x0100U)
#define USB_GET_VENDOR (0x0200U)

```

```

#define SET_VENDOR_NO_DATA (USB_SET_VENDOR_NO_DATA | USB_HOST_TO_DEV |
USB_VENDOR | USB_INTERFACE)

#define SET_VENDOR (USB_SET_VENDOR | USB_HOST_TO_DEV | USB_VENDOR |
USB_INTERFACE)

#define GET_VENDOR (USB_GET_VENDOR | USB_DEV_TO_HOST | USB_VENDOR |
USB_INTERFACE)

#### 4.2.5.26 USB PCDC (r\_usb\_pcdc)

Modules » [Connectivity](#)

This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the [USB PCDC Interface](#).

#### Functions

Refer to [USB \(r\\_usb\\_basic\)](#) for the common API (r\_usb\_basic) to be called from the application.

#### Detailed Description

## Overview

The `r_usb_pcdc` module combines with the `r_usb_basic` module to provide a USB Peripheral Communications Device Class (PCDC) driver. The PCDC driver conforms to Abstract Control Model of the USB Communications Device Class (CDC) specification and enables communication with a CDC host device.

### Features

The `r_usb_pcdc` module has the following key features:

- Data transfer to and from a USB host
- Response to CDC class requests
- Supports CDC notifications

## Configuration

### Build Time Configurations for `r_usb_pcdc`

The following build time configurations are defined in `fsp_cfg/r_usb_pcdc_cfg.h`:

Configuration	Options	Default	Description
Bulk In Pipe	<ul style="list-style-type: none"> <li>• USB PIPE1</li> <li>• USB PIPE2</li> <li>• USB PIPE3</li> <li>• USB PIPE4</li> <li>• USB PIPE5</li> </ul>	USB PIPE1	Select the USB pipe to use for bulk input transfers.
Bulk Out Pipe	<ul style="list-style-type: none"> <li>• USB PIPE1</li> <li>• USB PIPE2</li> <li>• USB PIPE3</li> <li>• USB PIPE4</li> <li>• USB PIPE5</li> </ul>	USB PIPE2	Select the USB pipe to use for bulk output transfers.
Interrupt Out Pipe	<ul style="list-style-type: none"> <li>• USB PIPE6</li> <li>• USB PIPE7</li> <li>• USB PIPE8</li> <li>• USB PIPE9</li> </ul>	USB PIPE6	Select the USB pipe to use for interrupts.

### Configurations for Connectivity > USB PCDC (`r_usb_pcdc`)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PCDC (`r_usb_pcdc`).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	<code>g_pcdc0</code>	Module name.

*Note*

*Refer to the [USB \(r\\_usb\\_basic\)](#) module for hardware configuration options.*

### Clock Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

## Pin Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

## Usage Notes

### Abstract Control Model Overview

The Abstract Control Model subclass of CDC is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections), enabling use of application programs designed for older modems.

### Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
SetLineCoding	0x20	Sets communication line settings (bitrate, data length, parity, and stop bit length)
GetLineCoding	0x21	Acquires the communication line setting state
SetControlLineState	0x22	Set communication line control signals (RTS, DTR)

#### Note

For details concerning the Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.

### Data Format of Class Requests

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0x21	SET_LINE_CODING (0x20)	0x0000	0x0000	0x0007	<a href="#">usb_pcdc_linecoding_t</a>
0xA1	GET_LINE_CODING (0x21)	0x0000	0x0000	0x0007	<a href="#">usb_pcdc_linecoding_t</a>
0x21	SET_CONTROL_LINE_STATE (0x22)	<a href="#">usb_pcdc_ctrlinestates_t</a>	0x0000	0x0000	None

### Class Notifications (Peripheral to Host)

The following class notifications are supported:

--	--	--

Notification	Code	Description
SERIAL_STATE	0x20	Notification of serial line state

The data types returned are as follows:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	SERIAL_STATE (0x20)	0x0000	0x0000	0x0002	<a href="#">usb_serial_state_bitmap_t</a>

#### Note

The host is notified with SERIAL\_STATE whenever a change in the UART port state is detected. This driver will automatically detect overrun, parity and framing errors. A state notification is performed when a transition from normal to error state is detected.

## Virtual COM-port Usage

When connected to a PC the CDC device can be used as a virtual COM port. After enumeration, the CDC class requests GetLineCoding and SetControlLineState are executed by the target, and the CDC device is registered in Windows Device Manager as a virtual COM device.

Registering the CDC device as a virtual COM-port in Windows Device Manager enables data communication with the CDC device via a terminal app such as [PuTTY](#). When changing settings of the serial port in the terminal application, the UART setting is propagated to the firmware via the class request SetLineCoding.

Data input (or file transmission) from the terminal app window is transmitted to the board using endpoint 2 (EP2); data from the board side is transmitted to the PC using EP1.

When the last packet of data received is the maximum packet size, and the terminal determines that there is continuous data, the received data may not be displayed in the terminal. If the received data is smaller than the maximum packet size, the data received up to that point is displayed in the terminal.

## Multi Port

This driver supports simultaneous operation with Host Mass Storage Class(HMSC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run PCDC on one USB module and HMSC on the other. This driver does not support simultaneous operation using device classes other than HMSC.

## Limitations

- This module must be incorporated into a project using r\_usb\_basic and does not provide any public APIs.
- This driver does not support Low-speed.

# Examples

## USB PCDC Loopback Example

The main functions of the PCDC loopback example are as follows:

1. Receives virtual UART configuration data from the host terminal
2. Loops all other received data back to the host terminal

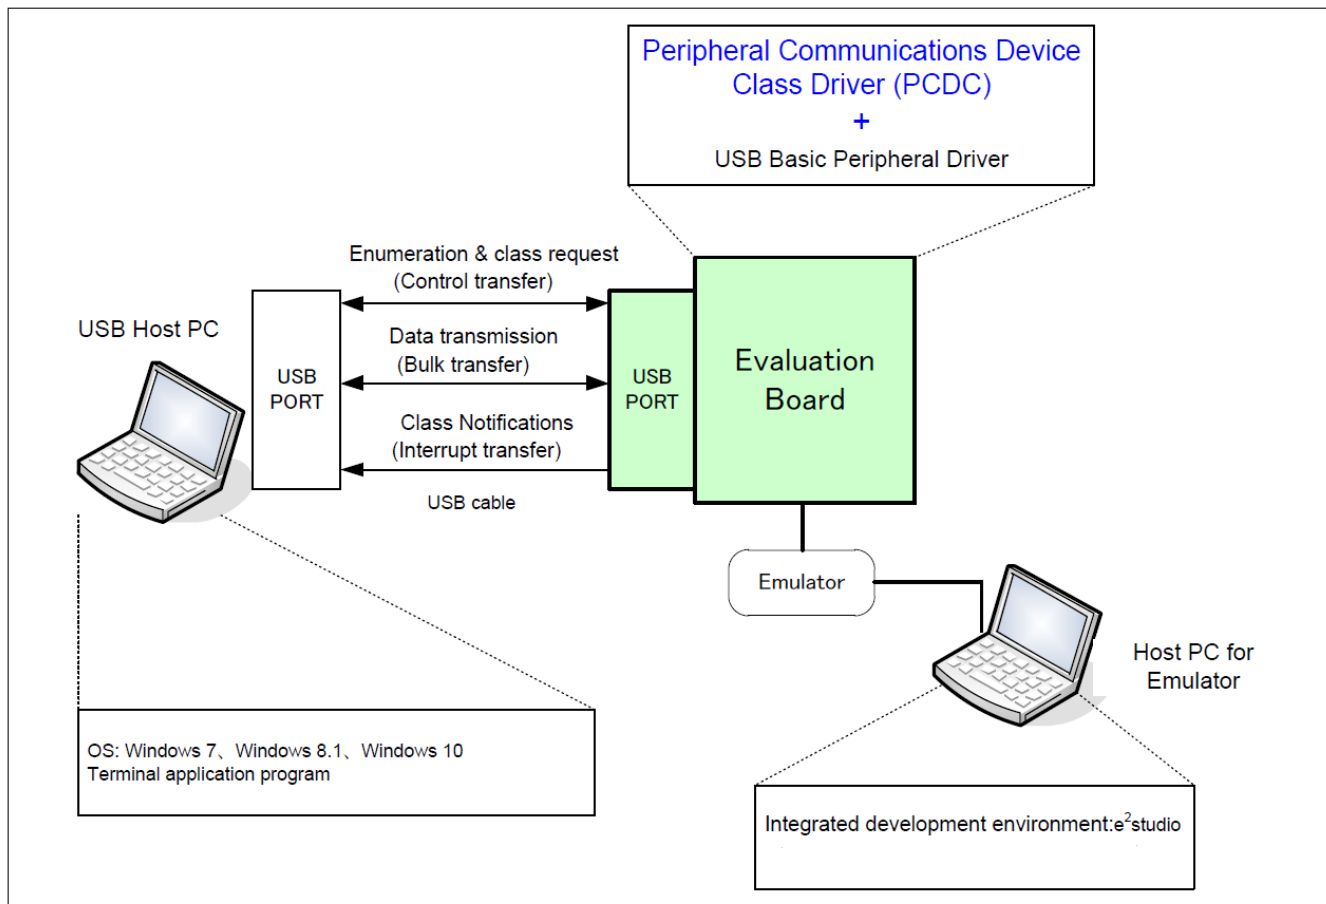

Figure 194: Example Operating Environment

Figure 195: Main Loop processing (Echo mode)

```

void usb_basic_example (void)
{
    usb_event_info_t event_info;
    usb_status_t event;
    g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
    while (1)
    {
        /* Get USB event data */
        g_usb_on_usb.eventGet(&event_info, &event);
        /* Handle the received event (if any) */
        switch (event)
        {
            case USB_STATUS_CONFIGURED:

```

```
case USB_STATUS_WRITE_COMPLETE:
/* Initialization complete; get data from host */
    g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
break;
case USB_STATUS_READ_COMPLETE:
/* Loop back received data to host */
    g_usb_on_usb.write(&g_basic0_ctrl, g_buf, event_info.data_size,
USB_CLASS_PCDC);
break;
case USB_STATUS_REQUEST: /* Receive Class Request */
if (USB_PCDC_SET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
    {
/* Configure virtual UART settings */
    g_usb_on_usb.periControlDataGet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
    }
else if (USB_PCDC_GET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
    {
/* Send virtual UART settings back to host */
    g_usb_on_usb.periControlDataSet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
    }
else
    {
/* ACK all other status requests */
    g_usb_on_usb.periControlStatusSet(&g_basic0_ctrl,
USB_SETUP_STATUS_ACK);
    }
break;
case USB_STATUS_SUSPEND:
case USB_STATUS_DETACH:
break;
default:
break;
```

## Descriptor

A template for PCDC descriptors can be found in `ra/fsp/src/r_usb_pcdc/r_usb_pcdc_descriptor.c.template`. Also, please be sure to use your vendor ID.

### 4.2.5.27 USB PHID (r\_usb\_phid)

Modules » [Connectivity](#)

This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the [USB PHID Interface](#).

## Functions

Refer to [USB \(r\\_usb\\_basic\)](#) for the common API (`r_usb_basic`) to be called from the application.

## Detailed Description

## Overview

The `r_usb_phid` module combines with the `r_usb_basic` module to provide a USB Peripheral Human Interface Device Class (PHID) driver. The PHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID host.

## Features

The `r_usb_phid` module has the following functions:

- Data transfer to and from a USB host
- Response to HID class requests
- Response to function references from the HID host

### Note

*This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.*

## Configuration

### Build Time Configurations for `r_usb_phid`

The following build time configurations are defined in fsp\_cfg/r\_usb\_phid\_cfg.h:

Configuration	Options	Default	Description
Interrupt In Pipe	<ul style="list-style-type: none"> <li>• USB PIPE6</li> <li>• USB PIPE7</li> <li>• USB PIPE8</li> <li>• USB PIPE9</li> </ul>	USB PIPE6	Select the pipe number for input interrupt events.
Interrupt Out Pipe	<ul style="list-style-type: none"> <li>• USB PIPE6</li> <li>• USB PIPE7</li> <li>• USB PIPE8</li> <li>• USB PIPE9</li> </ul>	USB PIPE7	Select the pipe number for output interrupt events.

### Configurations for Connectivity > USB PHID (r\_usb\_phid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PHID (r\_usb\_phid).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_phid0	Module name.

### Clock Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

### Pin Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

## Usage Notes

### Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
Get_Report	0x01	Receives a report from the HID host
Set_Report	0x09	Sends a report to the HID host
Get_Idle	0x02	Receives a duration (time) from the HID host
Set_Idle	0x0A	Sends a duration (time) to the HID host
Get_Protocol	0x03	Reads a protocol from the HID host
Set_Protocol	0x0B	Sends a protocol to the HID host
Get_Descriptor	0x06	Transmits a report or HID

descriptor

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	GET_REPORT (0x01)	ReportType & ReportID	Interface	ReportLength	Report
0x21	SET_REPORT (0x09)	ReportType & ReportID	Interface	ReportLength	Report
0xA1	GET_IDLE (0x02)	0 & ReportID	Interface	1	Idle rate
0x21	SET_IDLE (0x0A)	Duration & ReportID	Interface	0	Idle rate
0xA1	GET_PROTOCOL (0x03)	0	Interface	0	0 (Boot) or 1 (Report)
0x21	SET_PROTOCOL (0x0B)	0 (Boot) or 1 (Report)	Interface	0	Not applicable

### Limitations

- This driver does not support USB Hi-speed mode.
- This driver does not support USB Low-speed mode.
- This driver does not support DMA transfers.
- This driver does not support simultaneous operation with USB Host device class.

## Examples

## Descriptors

A template for PHID descriptors can be found in ra/fsp/src/r\_usb\_phid. Be sure to replace the vendor ID with your own.

Keyboard templates should be referred to r\_usb\_phid\_descriptor\_keyboard.c.template.

Mouse templates should be referred to r\_usb\_phid\_descriptor\_mouse.c.template.

### 4.2.5.28 USB PMSC (r\_usb\_pmsc)

Modules » [Connectivity](#)

This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the [USB PMSC Interface](#).

## Functions

Refer to [USB \(r\\_usb\\_basic\)](#) for the common API (r\_usb\_basic) to be called from the application.

## Detailed Description

## Overview

The r\_usb\_pmse module combines with the r\_usb\_basic module to provide USB Peripheral It operates as a Mass Storage class driver (hereinafter referred to as PMSC).

The USB peripheral mass storage class driver (PMSC) comprises a USB mass storage class bulk-only transport (BOT) protocol.

When combined with a USB peripheral control driver and media driver, it enables communication with a USB host as a BOT-compatible storage device.

## Features

The r\_usb\_pmse module has the following key features:

- Storage command control using the BOT protocol
- Supports SFF-8070i (ATAPI)
- Response to mass storage device class requests from a USB host

## Configuration

### Build Time Configurations for r\_usb\_pmse

The following build time configurations are defined in fsp\_cfg/r\_usb\_pmse\_cfg.h:

Configuration	Options	Default	Description
Bulk Input Transfer Pipe	<ul style="list-style-type: none"> <li>• USB PIPE1</li> <li>• USB PIPE2</li> <li>• USB PIPE3</li> <li>• USB PIPE4</li> <li>• USB PIPE5</li> </ul>	USB PIPE1	Select the USB pipe to use for bulk input transfers.
Bulk Output Transfer Pipe	<ul style="list-style-type: none"> <li>• USB PIPE1</li> <li>• USB PIPE2</li> <li>• USB PIPE3</li> <li>• USB PIPE4</li> <li>• USB PIPE5</li> </ul>	USB PIPE2	Select the USB pipe to use for bulk output transfers.
Vendor Information	Vendor Information must be 8 bytes long; pad with spaces if shorter.	Vendor	Specify the vendor information field (part of the Inquiry command response).
Product Information	Product Information must be 16 bytes long; pad with spaces if shorter.	Mass Storage	Specify the product information field (part of the Inquiry command response).
Product Revision Level	Product Revision Level	1.00	Specify the product

	must be 4 bytes long; pad with spaces if shorter.		revision level field (part of the Inquiry command response).
Sector size	<ul style="list-style-type: none"> <li>• 512</li> <li>• 4096</li> </ul>	512	Specifies the sector size.
Number of Transfer Sectors	Please enter a number between 1 and 255.	8	Specify the maximum sector size to request with one data transfer.

### Configurations for Connectivity > USB PMSC (r\_usb\_pmsc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PMSC (r\_usb\_pmsc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_pmsc0	Module name.

Refer to the [USB \(r\\_usb\\_basic\)](#) module for hardware configuration options.

### Clock Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

### Pin Configuration

Refer to the [USB \(r\\_usb\\_basic\)](#) module.

## Usage Notes

### Class Requests

The class requests supported by this driver are shown below.

Request	Code	Description
Bulk-Only Mass Storage Reset	0xFF	Resets the connection interface to the mass storage device.
Get Max Logical Unit Number	0xFE	Reports the logical numbers supported by the device.

### Storage Commands

This driver supports the following storage commands.

Command	Code	Description
TEST_UNIT_READY	0x00	Checks the state of the peripheral device.
REQUEST_SENSE	0x03	Gets the error information of the previous storage command

INQUIRY	0x12	execution result.
READ_FORMAT_CAPACITY	0x23	Gets the formattable capacity.
READ_CAPACITY	0x25	Gets the capacity information of the logical unit.
READ10	0x28	Reads data.
WRITE10	0x1A	Writes data.
MODE_SENSE10	0x5A	Gets the parameters of the logical unit.

*Note*

A *STALL* or *FAIL* error is sent to the host upon receipt of any command not listed in the above table.

**BOT Protocol Overview**

BOT (USB MSC Bulk-Only Transport) is a transfer protocol that encapsulates command, data, and status (results of commands) using only two endpoints (one bulk in and one bulk out). The ATAPI storage commands and the response status are embedded in a Command Block Wrapper (CBW) and a Command Status Wrapper (CSW). The below image shows an overview of how the BOT protocol progresses with command and status data flowing between USB host and peripheral.

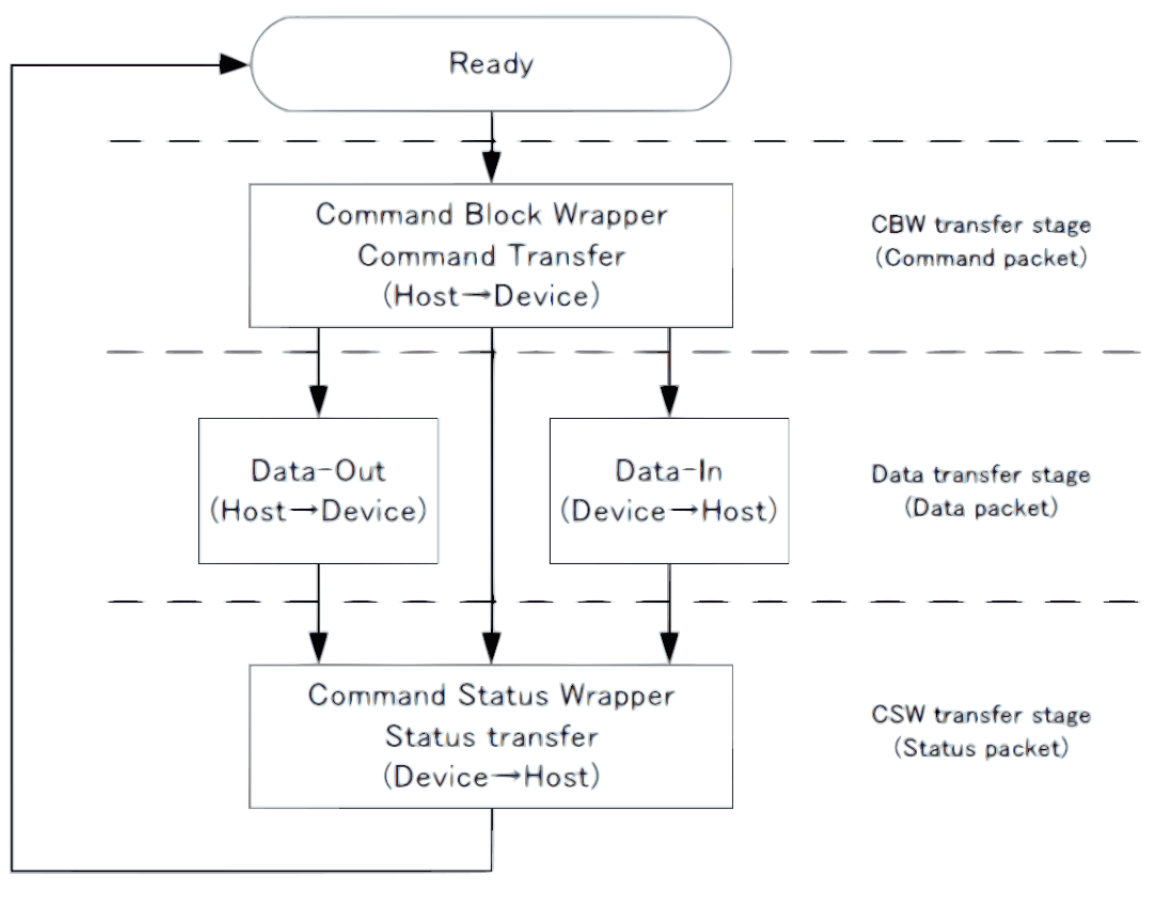

Figure 199: BOT protocol Overview

## Block Media Interface

PMSC implements a block media interface to enable access to higher-level modules. If the block media interface supports multiple media, users can select any media to access.

### Note

*When the user develops the storage media driver, be sure to define the instance named "g\_rm\_block\_media0".*

## Limitations

1. The driver always returns 0 in response to the GetMaxLun command.
2. The driver supports a sector size of 512 bytes only.
3. The only media currently supported by the block media interface is an SD card. The card must be inserted before initializing the driver.
4. When using DMA for Hi-Speed transfers continuous transfer mode must not be used in the USB Basic driver.
5. The storage area must be formatted before use.
6. When using the SD/MMC Block Media Implementation (rm\_block\_media\_sdmmc), "Card Detection" must be set to "Not Used" in the SD/MMC Host Interface (r\_sdhi) settings.
7. The driver does not support Low-speed.
8. This driver does not support simultaneous operation with USB Host device class.

## Examples

### USB PMSC Example

In this example, when the evaluation board is connected to the host PC it is recognized as a removable disk and reading/writing files is possible. The FAT type is either FAT12, FAT16, or FAT32 depending on the size of the media used.

Figure 200: Example Operating Environment

```

void usb_pmsc_example (void)
{
    usb_event_info_t usb_event;
#if (BSP_CFG_RTOS == 2)
    usb_event_info_t * p_mess;
#else

    {
    case USB_STATUS_CONFIGURED:
        {
        break;
        }
    case USB_STATUS_SUSPEND:
    case USB_STATUS_DETACH:
        {
#if USB_SUPPORT_LPW == USB_APL_ENABLE
// @@ low_power_mcu();
#endif /* USB_SUPPORT_LPW == USB_APL_ENABLE */
        break;
        }
    default:
        {
        break;
        }
    }
} /* End of function usb_main() */
```

## Descriptor

A template for PMSC descriptors can be found in `ra/fsp/src/r_usb_pmsc/r_usb_pmse_descriptor.c.template`. Also, please be sure to use your vendor ID.

### 4.2.5.29 USB Peripheral Vendor class (r\_usb\_pvnd)

Modules » [Connectivity](#)

## Functions

Refer to [USB \(r\\_usb\\_basic\)](#) for the common API (r\_usb\_basic) to be called from the application.

## Overview

USB Peripheral Vendor class works by combining r\_usb\_basic module.

## How to Configuration

The following shows FSP configuration procedure for USB Peripheral Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Peripheral Vendor class driver on r\_usb\_pvnd].

Figure 201: Select USB Peripheral Vendor Class

- The following is displayed when selecting [USB Peripheral Vendor class driver on r\_usb\_pvnd]. The user does not specify USB pipe number in Vendor class.

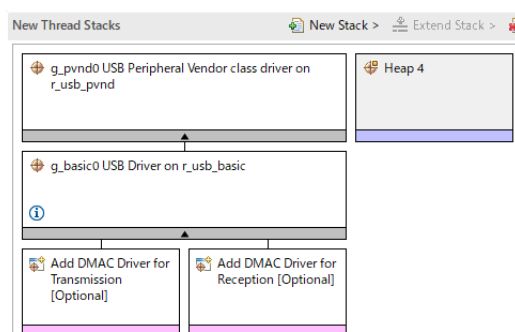

Figure 202: USB Peripheral Vendor Class Stack

## API

Use the following APIs in Peripheral Vendor class application program.

- For Data Transfer  
Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

1. R\_USB\_PipeRead()
2. R\_USB\_PipeWrite()
3. R\_USB\_PipeStop()

- For Control Transfer  
Use the following API for the class request processing.

1. R\_USB\_PeriControlDataGet()
2. R\_USB\_PeriControlDataSet()
3. R\_USB\_PeriControlStatusSet()

- For USB Pipe Information  
The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

1. R\_USB\_UsedPipesGet()
2. R\_USB\_PipeInfoGet()

## USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.

## Limitations

This Peripheral Vendor class can not be included in composite device.

## Descriptor

Template for Vendor class descriptor can be found in ra/fsp/src/r\_usb\_pvnd folder. Also, please be sure to use your vendor ID.

## Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Information
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

```

/*****
**
**
* Macro definitions
*****

## Detailed Description

Driver for the IIRFA peripheral on RA MCUs. This module implements the [IIR Interface](#).

## Overview

The IIR Filter Accelerator (IIRFA) provides hardware acceleration for calculation of single-precision floating point direct form 2 biquad IIR filters. Up to 32 biquad stages can be configured at a time.

### Features

The IIRFA module supports the following features:

- Up to 16 different concurrent configurations/channels

- 32 biquad filter stages (shared between all channels)
- Runtime filter configuration
- ECC error detection for coefficient and delay data
  - 1-bit error correction, 2-bit error detection

## Configuration

### Build Time Configurations for r\_iirfa

The following build time configurations are defined in fsp\_cfg/r\_iirfa\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Polling Mode	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	When enabled the IIRFA driver will poll for completion before reading the output register. This prevents IIRFA operations from delaying global interrupt processing at the cost of slower filter performance.
Software Loop Unroll Depth	Refer to the RA Configuration tool for available options.	1 Sample	Select the number of samples to process for every loop. This setting generally only affects filters that use 1 biquad stage.
ECC Support	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> <li>• Enabled (no writeback)</li> </ul>	Enabled	Select whether to detect ECC errors. When set to 'Enabled (no writeback)' 1-bit ECC errors will not be corrected.
Rounding Mode	<ul style="list-style-type: none"> <li>• Nearest</li> <li>• Toward zero</li> </ul>	Nearest	Select how to round calculation results.

### Configurations for DSP > IIR Filter Accelerator (r\_iirfa)

This module can be added to the Stacks tab via New Stack > DSP > IIR Filter Accelerator (r\_iirfa). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid	g_iirfa0	Module name.

	C symbol		
Channel	Value must be a non-negative integer	0	Select the IIRFA channel.

## Clock Configuration

The clock source for the IIRFA peripheral is ICLK.

## Pin Configuration

IIRFA does not have any pin connections.

## Filter Configuration

Before using IIRFA to filter data the coefficients and state variables must be initialized. See the [Filter Configuration](#) example for how to initialize an `iir_filter_cfg_t` struct to pass to `R_IIRFA_Configure`.

### Note

*There are 32 total biquad stages in the peripheral shared across all channels. Channels may not select the same stages, so it is important to choose `iir_filter_cfg_t::stage_base` and `iir_filter_cfg_t::stage_num` carefully to ensure no overlap.*

# Usage Notes

## Maximizing Performance

The optimum configuration for IIRFA is dependent on the application. It is recommended to consider the following in regards to your project to determine what settings may be ideal.

Regardless of configuration, each filter stage takes 2 ICLK cycles to process per sample and an additional 5 cycles to write state values back to registers. This means single-sample operations only take 2 cycles per stage while multi-sample operations take 7. Additional overhead cycles are required to load and store each sample. The following suggestions may improve performance:

- Either process more data at a time with `R_IIRFA_Filter` or only one sample at a time using `R_IIRFA_SingleFilter`
- Use the unrolled software loop option
  - Provide data in a multiple of the unroll depth
- Disable polling ([see warning](#))

## Polling Mode

By default, the driver will poll a status flag for completion after writing input data to IIRFA. Disabling polling significantly improves performance when using a low number of stages, but may cause higher global interrupt latency during processing.

### Note

*If only one stage is used it is recommended to disable polling as IIRFA will typically execute faster than code resulting in no wait cycles. If polling must be used with a one stage filter, please note that in some situations the ARM CMSIS DSP Library functions `arm_biquad_cascade_df2T_init_f32` and `arm_biquad_cascade_df2T_f32` may provide better performance. It up to the user to evaluate performance within their own project.*

## Warning

When polling is disabled, filter operation works by writing a value to IIRCHnINP then immediately reading IIRCHnOUT. While this maximizes performance, the core will wait for output data to become available before continuing execution. **While execution waits for IIRCHnOUT no interrupts will be processed by the core.** The maximum wait time for a 32-stage filter may be up to approximately 64 ICLK cycles for single sample processing or 224 ICLK cycles for multi-sample processing (decreasing linearly with the number of stages used).

## Single Sample Processing

In applications such as motor control where each sample needs immediate processing, the inline function `R_IIRFA_SingleFilter` is provided. This function has no parameter checking, takes one sample, and returns a filtered sample. Polling is supported by this function (if configured).

## ECC Errors

If configured, `R_IIRFA_Filter` will return an error if a 1- or 2-bit ECC error has occurred.

1-bit errors are automatically corrected unless writeback is disabled. 2-bit errors cannot be automatically corrected. Reset the coefficient and filter data by calling `R_IIRFA_Configure` if a non-correctable ECC error is reported.

## Limitations

- A total of 32 stages may be configured at any one time across all channels.
- When polling is disabled core execution is halted while waiting for data to become available. (See [warning](#))

# Examples

## Filter Configuration

Below is an example of how to initialize a filter configuration to pass to `R_IIRFA_Configure`.

```
#define FILTER_STAGE_NUM (2)
/* Biquad coefficients (4th order Butterworth 200Hz lowpass on 44.1KHz input) */
iir_filter_coeffs_t gp_iirfa0_filter_coeffs[FILTER_STAGE_NUM] =
{
    {
        .b0 = 1.000000000F,
        .b1 = 2.000000000F,
        .b2 = 1.000000000F,
        .a1 = -1.947914029F,
        .a2 = 0.948705125F,
    },
    {
```

```
.b0 = 1.000000000F,  
.b1 = 2.000000000F,  
.b2 = 1.000000000F,  
.a1 = -1.977625722F,  
.a2 = 0.978428884F,  
},  
};  
/* Biquad state data (clear to start) */  
iir_filter_state_t gp_iirfa0_filter_state[FILTER_STAGE_NUM] = {0};  
/* Filter configuration */  
iir_filter_cfg_t g_iirfa0_filter_cfg =  
{  
    .p_filter_coeffs = gp_iirfa0_filter_coeffs, // Pointer to filter coefficient  
array  
    .p_filter_state = gp_iirfa0_filter_state, // Pointer to filter state data array  
    .stage_base      = 0,                      // Which hardware biquad stage to  
start allocation from (0-31)  
    .stage_num       = 2,                      // Number of stages to allocate  
};
```

## Software Example

The following is a basic example of configuring and using a filter with IIRFA.

```
#define NUM_SAMPLES (128)  
#define TWO_PI (2.0F * (float) M_PI)  
float gp_data_in[NUM_SAMPLES];  
float gp_data_out[NUM_SAMPLES];  
void iirfa_filter_example (void)  
{  
    fsp_err_t err;  
    /* Initialize the IIRFA module */  
    err = R_IIRFA_Open(&g_iirfa0_ctrl, &g_iirfa0_cfg);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
}
```

```
/* Initialize filter coefficients and state variables */
err = R_IIRFA_Configure(&g_iirfa0_ctrl, &g_iirfa0_filter_cfg);
assert(FSP_SUCCESS == err);

/* Get input data to be filtered */
get_input_data(gp_data_in);

/* Filter data */
err = R_IIRFA_Filter(&g_iirfa0_ctrl, gp_data_in, gp_data_out, NUM_SAMPLES);

/* R_IIRFA_Filter will return FSP_ERR_INVALID_RESULT when one or more calculations
results in infinity. */
if (FSP_ERR_INVALID_RESULT == err)
{
/* Handle error */
}
else
{
assert(FSP_SUCCESS == err);
}
}
```

## Data Structures

struct [iirfa\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ iirfa\_instance\_ctrl\_t

struct iirfa\_instance\_ctrl\_t

IIRFA instance control block.

## Function Documentation

◆ **R\_IIRFA\_Open()**

```
fsp_err_t R_IIRFA_Open ( iir_ctrl_t *const p_api_ctrl, iir_cfg_t const *const p_cfg )
```

Prepare an IIR channel for filtering.

**Return values**

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	One or both of the parameters was NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	An invalid channel was selected.
FSP_ERR_ALREADY_OPEN	The instance is already opened.

◆ **R\_IIRFA\_Filter()**

```
fsp_err_t R_IIRFA_Filter ( iir_ctrl_t *const p_api_ctrl, float const * p_data_in, float * p_data_out,
uint16_t const num_samples )
```

Start a filter operation on the specified data.

**Return values**

FSP_SUCCESS	Data has been successfully filtered.
FSP_ERR_ASSERTION	One of the provided pointers is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_INVALID_ARGUMENT	num_samples is zero.
FSP_ERR_INVALID_RESULT	The result of one or more calculations was +/- infinity.
FSP_ERR_NOT_INITIALIZED	The filter is not configured.
FSP_ERR_IIRFA_ECC_1BIT	A 1-bit ECC error was detected.
FSP_ERR_IIRFA_ECC_2BIT	A 2-bit ECC error was detected.

◆ **R\_IIRFA\_Configure()**

```
fsp_err_t R_IIRFA_Configure ( iir_ctrl_t *const p_api_ctrl, iir_filter_cfg_t const *const p_filter_cfg )
```

Configure filter coefficients and state values.

**Return values**

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_INVALID_ARGUMENT	Invalid filter stage selection.
FSP_ERR_IN_USE	One or more requested filter stages are currently in use.

◆ **R\_IIRFA\_StatusGet()**

```
fsp_err_t R_IIRFA_StatusGet ( iir_ctrl_t *const p_api_ctrl, iir_status_t *const p_status )
```

Read the current filter state variables.

**Return values**

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

◆ **R\_IIRFA\_Close()**

```
fsp_err_t R_IIRFA_Close ( iir_ctrl_t *const p_api_ctrl)
```

Stop filter operations and close the channel instance.

**Return values**

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

### ◆ R\_IIRFA\_SingleFilter()

```
__STATIC_INLINE float R_IIRFA_SingleFilter ( iir_ctrl_t *const p_api_ctrl, float data_in )
```

Perform a single inline filter operation.

*Note*

*This function is intended to be used in performance-critical applications. As such, no parameter checking or error validation is provided.*

## 4.2.7 Graphics

### Modules

#### Detailed Description

Graphics Modules.

#### Modules

[Azure RTOS GUIX Port \(rm\\_guix\\_port\)](#)

[D/AVE 2D Port Interface \(r\\_drw\)](#)

Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.

[Graphics LCD \(r\\_glcdc\)](#)

Driver for the GLCDC peripheral on RA MCUs. This module implements the [Display Interface](#).

[JPEG Codec \(r\\_jpeg\)](#)

Driver for the JPEG peripheral on RA MCUs. This module implements the [JPEG Codec Interface](#).

[Parallel Data Capture \(r\\_pdc\)](#)

Driver for the PDC peripheral on RA MCUs. This module implements the [PDC Interface](#).

[SEGGER emWin RA Port \(rm\\_emwin\\_port\)](#)

SEGGER emWin port for RA MCUs.

### Segment LCD (r\_slcdc)

Driver for the SLCDC peripheral on RA MCUs. This module implements the [SLCDC Interface](#).

#### 4.2.7.1 Azure RTOS GUIX Port (rm\_guix\_port)

Modules » Graphics

##### Functions

UINT [rm\\_guix\\_port\\_hw\\_initialize](#) (GX\_DISPLAY \*p\_display)

##### Detailed Description

## Overview

The Azure RTOS GUIX Port module provides the configuration and hardware acceleration support necessary for use of GUIX on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG).

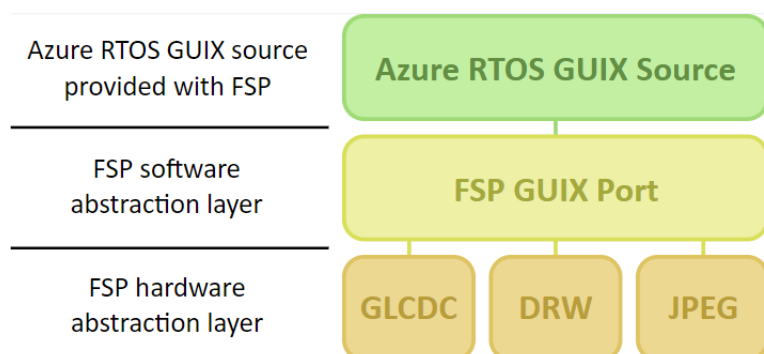

Figure 203: Azure RTOS GUIX Port Block Diagram

##### Note

*This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. For information about how to use GUIX and GUIX Studio (including example code) please consult the [Azure RTOS GUIX documentation](#).*

## Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine ([D/AVE 2D Port Interface \(r\\_drw\)](#))
  - Drawing bitmaps
  - 8, 4 and 1bpp uncompressed and compressed (RLE) font rendering
  - Line and shape drawing

- Anti-aliased operations
  - Circle stroke and fill
  - Polygon stroke and fill
  - Lines and arcs
- [JPEG Codec \(r\\_jpeg\)](#)
  - JPEG decoding
- [Graphics LCD \(r\\_glcddc\)](#)
  - Brightness, contrast and gamma correction
  - Pixel format conversion (framebuffer to LCD)

## Configuration

### Build Time Configurations for gx

The following build time configurations are defined in fsp\_cfg/azure/gx/gx\_user.h:

Configuration	Options	Default	Description
Hardware Acceleration > JPEG Codec Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Select whether or not to use the JPEG Codec for hardware acceleration.
Hardware Acceleration > DRW Engine Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Select whether or not to use the DRW Engine for hardware acceleration.
Hardware Acceleration > Max DRW Operations	Value must be a positive integer	85	Specifies the maximum number of DRW operations before flushing the display list. Reducing this value may reduce the peak heap used by the application but may reduce performance.
Internal Thread > Stack Size	Value must be greater than zero	4096	GUIX internal thread stack size in bytes. Must be greater than zero.
Internal Thread > Priority	Value must be between 0 to 31	30	Priority of the GUIX Internal Thread. The value must be between 0 to 31.
Internal Thread > Time Slice	Value must be a non-negative integer	10	Time Slice value of the GUIX Internal Thread. The value must be between 0 (TX_NO_TIME_SLICE) to 0xFFFFFFFF.
System Timer (ms)	Value must be greater than or equal to 10	20	GUIX system timer period (GX_SYSTEM_TI

MER\_MS). This value will be internally converted to RTOS ticks and will be rounded down to the next smallest multiple of the RTOS tick period (1000 / TX\_TIMER\_TICK\_S\_PER\_SECOND).

Multithread Support	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Enabled	Must be enabled if GUIX functions are called from multiple threads. Set to Disabled when calling GUIX from only one thread to reduce system overhead.
UTF8 Support	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Enabled	Select whether to enable or disable support for UTF8 characters.
Event Queue Size	Value must be greater than zero	48	Maximum number of events in the GUIX event queue.
Enable GX_WIDGET User Data	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Set to Enabled to use the <code>gx_widget_user_data</code> member in the <code>GX_WIDGET</code> structure.

### Build Time Configurations for rm\_guix\_port

The following build time configurations are defined in `fsp_cfg/middleware/rm_guix_port_cfg.h`:

Configuration	Options	Default	Description
DRW Buffer Cache	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	Enabling this option significantly improves DRW Engine performance. Set to Disabled only if Display underflow events are triggered under high graphics load.

### Configurations for Graphics > Azure RTOS GUIX Port (rm\_guix\_port)

Configuration	Options	Default	Description
Display Rotation > Screen Orientation	<ul style="list-style-type: none"> <li>None</li> <li>CW (90 degrees)</li> <li>FLIP (180)</li> </ul>	None	Select the display orientation specified in the GUIX Studio project. The Canvas

	degrees)			Buffer must be enabled when rotating 180 degrees (FLIP).
	<ul style="list-style-type: none"> <li>• CCW (270 degrees)</li> </ul>			
Display Rotation > Use Canvas Buffer	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled		When screen rotation is set to a value other than 0 a canvas buffer must be used. The canvas buffer size will be the same as a frame buffer for the display module.
Display Rotation > Canvas Buffer Memory Section	This property must be a valid section name	bss		Specify the memory section where the GUIX Canvas Buffer will be allocated.
JPEG Decoding > Work Buffer Size	Must be a valid integer	0xC800		Specify the JPEG work buffer size in bytes. A larger buffer can reduce JPEG decode/draw times. The buffer will not be allocated if JPEG Codec support is disabled.
				Unless you are sure of the subsampling used in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory.
JPEG Decoding > Buffer Memory Section	This property must be a valid section name	bss		Specify the memory section where the JPEG Work Buffer will be allocated.
Name	Name must be a valid C symbol	g_rm_guix_port0		Module name.
Target Display Layer	<ul style="list-style-type: none"> <li>• Graphics Layer 1</li> <li>• Graphics Layer 2</li> </ul>	Graphics Layer 1		Specify which graphics screen to inherit the buffer and display dimensions from.
Callback Function	Must be a valid C symbol	NULL		If a callback function is provided it will be called when Display events occur.

## Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

---

# Usage Notes

## Getting Started

To get started with GUIX in an RA project the following must be performed:

1. In e2 studio, open the RA Configuration editor for your GUIX project
2. Select or create a thread
3. Add GUIX to your project in the Stacks view by clicking **New Stack -> Azure RTOS -> GUIX**
4. Ensure the configuration options for GUIX and the port layer are set as necessary for your application
5. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
6. Set the input color format in the GLCDC module (Input -> Graphics Layer \* -> General -> Color format) and the output color format in the JPEG Codec module if applicable (Decode -> Output color format) per your project specification
7. Click the BSP tab in the configuration editor and confirm the heap size in the Properties pane is sufficient (see Note below)
8. Click Generate Project Content to save and commit configuration changes
9. Drop the Quick Setup entry in Developer Assistance into the desired thread entry C file and update the items marked with TODO as necessary
10. Call the Quick Setup function from the thread entry function (or where desired)

At this point the project is now ready to build and run your GUIX Studio project. Please refer to the documentation for Azure RTOS GUIX and GUIX Studio for details on how to create and edit a GUI application.

### Note

*It is recommended to start with 8K-32K of heap to begin development. Actual heap use is typically far lower than this but must be characterized by the developer.*

## Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed:

- Avoid transparent pixelmaps in 8-bit display mode as they are rendered in software. In particular, ensure PNGs to be used in 8bpp GUIX Studio projects are saved without transparency data if no transparency is needed.
- The following items may require a large heap to draw successfully:
  - Polygons (more sides = more heap)
  - Filled arcs and ellipses (more framebuffer lines occupied = more heap)
  - gx\_canvas\_pixelmap\_tile (more tiles = more heap)
- When using hardware acceleration, images used for tile fill of shapes must have dimensions that are a power of 2. This limitation does not apply to gx\_canvas\_pixelmap\_tile as well as certain arc/ellipse fill functions as GUIX manually draws pixelmaps to fill these shapes (at the expense of heap space).

---

# Examples

## Basic Example

This is a basic example demonstrating how to get GUIX up and running given an existing GUIX Studio project. A template for this code is available in Developer Assistance for the GUIX Port module.

*Note*

*GUIX manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.*

```
GX_WINDOW_ROOT * p_window_root;

void guix_user_start (void)
{
    /* Initialize GUIX */
    gx_system_initialize();

    /* Configure GUIX Studio project main display and get a pointer to the root window
    */
    gx_studio_display_configure(MAIN_DISPLAY,
    rm_guix_port_hw_initialize,
                                MAIN_DISPLAY_LANGUAGE_ENGLISH,
                                MAIN_DISPLAY_THEME,
                                &p_window_root);

    /* Set pointer to the first buffer generated by the configuration
    (rm_guix_port_canvas) */
    gx_canvas_memory_define(p_window_root->gx_window_root_canvas,
                            rm_guix_port_canvas,
                            p_window_root->gx_window_root_canvas->gx_canvas_memory_size);

    /* Create and show the root window in the GUIX Studio project */
    gx_studio_named_widget_create("root_widget_name", (GX_WIDGET *) p_window_root,
    GX_NULL);

    gx_widget_show(p_window_root);

    /* Start GUIX */
    gx_system_start();

    /* GUIX will continue to run in its own thread */
}
```

## Data Structures

struct [rm\\_guix\\_port\\_callback\\_args\\_t](#)

## Enumerations

enum `rm_guix_port_device_t`enum `rm_guix_port_event_t`

## Data Structure Documentation

### ◆ `rm_guix_port_callback_args_t`

struct <code>rm_guix_port_callback_args_t</code>		
Callback arguments for the FSP GUIX Port		
Data Fields		
<code>rm_guix_port_device_t</code>	device	Device code.
<code>rm_guix_port_event_t</code>	event	Event code of the low level hardware.
<code>uint32_t</code>	error	Error code if <code>RM_GUIX_PORT_EVENT_ERROR</code> .

## Enumeration Type Documentation

### ◆ `rm_guix_port_device_t`

enum <code>rm_guix_port_device_t</code>	
Low level device code for the GUIX	
Enumerator	
<code>RM_GUIX_PORT_DEVICE_NONE</code>	Non hardware.
<code>RM_GUIX_PORT_DEVICE_DISPLAY</code>	Display device.
<code>RM_GUIX_PORT_DEVICE_DRW</code>	2D Graphics Engine
<code>RM_GUIX_PORT_DEVICE_JPEG</code>	JPEG Codec.

### ◆ `rm_guix_port_event_t`

enum <code>rm_guix_port_event_t</code>	
Display event codes	
Enumerator	
<code>RM_GUIX_PORT_EVENT_ERROR</code>	Low level driver error occurs.
<code>RM_GUIX_PORT_EVENT_DISPLAY_VSYNC</code>	Display interface VSYNC.
<code>RM_GUIX_PORT_EVENT_UNDERFLOW</code>	Display interface underflow.

## Function Documentation

### ◆ rm\_guix\_port\_hw\_initialize()

UINT rm\_guix\_port\_hw\_initialize ( GX\_DISPLAY \* p\_display)

Callback function to be passed to gx\_studio\_display\_configure in order to start hardware modules.

Example:

```
/* Configure GUIX Studio project main display and get a pointer to the root window
*/
gx_studio_display_configure(MAIN_DISPLAY,
rm_guix_port_hw_initialize,
                           MAIN_DISPLAY_LANGUAGE_ENGLISH,
                           MAIN_DISPLAY_THEME,
                           &p_window_root);
```

#### Note

*This function should only be called by GUIX.*

#### Return values

GX_SUCCESS	Device driver setup is successfully done.
GX_FAILURE	Device driver setup failed.

### 4.2.7.2 D/AVE 2D Port Interface (r\_drw)

Modules » Graphics

Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.

## Overview

#### Note

*The D/AVE 2D Port Interface (D1 layer) is a HAL layer for the D/AVE D2 layer API and does not provide any interfaces to the user. Consult the [TES Dave2D Driver Documentation](#) for further information on using the D2 API.*

*For cross-platform compatibility purposes the D1 and D2 APIs are not bound by the FSP coding guidelines for function names and general module functionality.*

## Configuration

## Build Time Configurations for r\_drw

The following build time configurations are defined in fsp\_cfg/r\_drw\_cfg.h:

Configuration	Options	Default	Description
Allow Indirect Mode	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	Enable indirect mode to allow no-copy mode for d2_adddlist (see the TES Dave2D Driver Documentation for details).
Memory Allocation	<ul style="list-style-type: none"> <li>Default</li> <li>Custom</li> </ul>	Default	<p>Set Memory Allocation to Default to use built-in dynamic memory allocation for the D2 heap. This will use an RTOS heap if configured; otherwise, standard C malloc and free will be used. Set to Custom to define your own allocation scheme for the D2 heap. In this case, the developer will need to define the following functions:</p> <pre>void * d1_malloc(size_t size) void d1_free(void * ptr)</pre>

## Configurations for Graphics > D/AVE 2D Port Interface (r\_drw)

This module can be added to the Stacks tab via New Stack > Graphics > D/AVE 2D Port Interface (r\_drw).

Configuration	Options	Default	Description
D2 Device Handle Name	Name must be a valid C symbol	d2_handle0	Set the name for the d2_device handle used when calling D2 layer functions.
DRW Interrupt Priority	MCU Specific Options		Select the DRW_INT (display list completion) interrupt priority.

## Heap Size

The D1 port layer allows the D2 driver to allocate memory as needed. There are three ways the driver can accomplish this:

1. Allocate memory using the main heap
2. Allocate memory using a heap provided by an RTOS
3. Allocate memory via user-provided functions

When the "Memory Allocation" configuration option is set to "Default" the driver will use an RTOS implementation if available and the main heap otherwise. Setting the option to "Custom" allows the user to define their own scheme using the following prototypes:

```
void * dl_malloc(size_t size);
void dl_free(void * ptr);
```

#### Warning

If there is no RTOS-based allocation scheme the main heap will be used. Be sure that it is enabled by setting the "Heap size (bytes)" property under RA Common on the **BSP** tab of the RA Configuration editor.

#### Note

*It is recommended to add 32KB of additional heap space for the D2 driver until the actual usage can be determined in your application.*

#### Interrupt

The D1 port includes one interrupt to handle various events like display list completion or bus error. This interrupt is managed internally by the D2 driver and no callback function is available.

## Usage Notes

### Limitations

Developers should be aware of the following limitations when using the DRW engine:

- The DRW module supports two additional interrupt types - bus error and render complete. These interrupts are not needed for D2 layer operation and thus are not supported.
- If the DRW module is stopped during rendering the render will continue once the module is started again. If this behavior is undesirable in your application it is recommended to call `d2_flushframe` before stopping the peripheral.

### 4.2.7.3 Graphics LCD (r\_glcdc)

[Modules](#) » [Graphics](#)

#### Functions

```
fsp_err_t R_GLCDC_Open (display_ctrl_t *const p_api_ctrl, display_cfg_t const
*const p_cfg)
```

```
fsp_err_t R_GLCDC_Close (display_ctrl_t *const p_api_ctrl)
```

fsp_err_t	R_GLCDC_Start (display_ctrl_t *const p_api_ctrl)
fsp_err_t	R_GLCDC_Stop (display_ctrl_t *const p_api_ctrl)
fsp_err_t	R_GLCDC_LayerChange (display_ctrl_t const *const p_api_ctrl, display_runtime_cfg_t const *const p_cfg, display_frame_layer_t layer)
fsp_err_t	R_GLCDC_BufferChange (display_ctrl_t const *const p_api_ctrl, uint8_t *const framebuffer, display_frame_layer_t layer)
fsp_err_t	R_GLCDC_ColorCorrection (display_ctrl_t const *const p_api_ctrl, display_correction_t const *const p_correction)
fsp_err_t	R_GLCDC_ClutUpdate (display_ctrl_t const *const p_api_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t layer)
fsp_err_t	R_GLCDC_ClutEdit (display_ctrl_t const *const p_api_ctrl, display_frame_layer_t layer, uint8_t index, uint32_t color)
fsp_err_t	R_GLCDC_StatusGet (display_ctrl_t const *const p_api_ctrl, display_status_t *const p_status)

## Detailed Description

Driver for the GLCDC peripheral on RA MCUs. This module implements the [Display Interface](#).

## Overview

The GLCDC is a multi-stage graphics output peripheral designed to automatically generate timing and data signals for LCD panels. As part of its internal pipeline the two internal graphics layers can be repositioned, alpha blended, color corrected, dithered and converted to and from a wide variety of pixel formats.

### Features

The following features are available:

Feature	Options
Input color formats	ARGB8888, ARGB4444, ARGB1555, RGB888 (32-bit), RGB565, CLUT 8bpp, CLUT 4bpp, CLUT 1bpp
Output color formats	RGB888, RGB666, RGB565, Serial RGB888 (8-bit parallel)
Correction processes	Alpha blending, positioning, brightness and contrast, gamma correction, dithering

Timing signals	Dot clock, Vsync, Hsync, Vertical and horizontal data enable (DE)
Maximum resolution	Up to 1016 x 1020 pixels (dependent on sync signal width)
Maximum dot clock	60MHz for serial RGB mode, 54MHz otherwise
Internal clock divisors	1-9, 12, 16, 24, 32
Interrupts	Vsync (line detect), Layer 1 underflow, Layer 2 underflow
Other functions	Byte-order and endianness control, line repeat function

## Configuration

### Build Time Configurations for r\_glcdc

The following build time configurations are defined in fsp\_cfg/r\_glcdc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected, code for parameter checking is included in the build.
Color Correction	<ul style="list-style-type: none"> <li>• On</li> <li>• Off</li> </ul>	Off	If selected, code to adjust brightness, contrast and gamma settings is included in the build. When disabled all color correction configuration options are ignored.

### Configurations for Graphics > Graphics LCD (r\_glcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Graphics LCD (r\_glcdc).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_display0	Module name.
Interrupts > Callback Function	Name must be a valid C symbol	NULL	A user callback function can be defined here.
Interrupts > Line Detect Interrupt Priority	MCU Specific Options		Select the line detect (Vsync) interrupt priority.
Interrupts > Underflow 1 Interrupt Priority	MCU Specific Options		Select the underflow interrupt priority for

Interrupts > Underflow 2 Interrupt Priority	MCU Specific Options		layer 1. Select the underflow interrupt priority for layer 2.
Input > Graphics Layer 1 > General > Enabled	<ul style="list-style-type: none"> <li>• Yes</li> <li>• No</li> </ul>	Yes	Specify Used if the graphics layer 1 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride.
Input > Graphics Layer 1 > General > Horizontal size	Value must be between 16 and 1016	480	Specify the number of horizontal pixels.
Input > Graphics Layer 1 > General > Vertical size	Value must be between 16 and 1020	272	Specify the number of vertical pixels.
Input > Graphics Layer 1 > General > Horizontal position	Must be a valid non- negative integer with a maximum configurable value of 4091	0	Specify the horizontal offset in pixels of the graphics layer from the background layer.
Input > Graphics Layer 1 > General > Vertical position	Must be a valid non- negative integer with a maximum configurable value of 4094	0	Specify the vertical offset in pixels of the graphics layer from the background layer.
Input > Graphics Layer 1 > General > Color format	<ul style="list-style-type: none"> <li>• ARGB8888 (32-bit)</li> <li>• RGB888 (32-bit)</li> <li>• RGB565 (16-bit)</li> <li>• ARGB1555 (16-bit)</li> <li>• ARGB4444 (16-bit)</li> <li>• CLUT8 (8-bit)</li> <li>• CLUT4 (4-bit)</li> <li>• CLUT1 (1-bit)</li> </ul>	RGB565 (16-bit)	Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output.
Input > Graphics Layer 1 > General > Line descending mode	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Select Used if the framebuffer starts from the bottom of the line.
Input > Graphics Layer 1 > Background Color > Alpha	Value must be between 0 and 255	255	Based on the alpha value, either the graphics Layer 2 (foreground graphics layer) is blended into the graphics Layer 1 (background graphics layer) or the graphics Layer 1 is blended into

Input > Graphics Layer 1 > Background Color > Red	Value must be between 0 and 255	255	the monochrome background layer.
Input > Graphics Layer 1 > Background Color > Green	Value must be between 0 and 255	255	Green component of the background color for layer 1.
Input > Graphics Layer 1 > Background Color > Blue	Value must be between 0 and 255	255	Blue component of the background color for layer 1.
Input > Graphics Layer 1 > Framebuffer > Framebuffer name	This property must be a valid C symbol	fb_background	Specify the name for the framebuffer for Layer 1.
Input > Graphics Layer 1 > Framebuffer > Number of framebuffers	Must be a valid non-negative integer with a maximum configurable value of 65535	2	Number of framebuffers allocated for Graphics Layer 1.
Input > Graphics Layer 1 > Framebuffer > Section for framebuffer allocation	Manual Entry	.bss	Specify the section in which to allocate the framebuffer. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.
Input > Graphics Layer 1 > Line Repeat > Enable	<ul style="list-style-type: none"> <li>• On</li> <li>• Off</li> </ul>	Off	Select On if the display will be repeated from a smaller section of the framebuffer.
Input > Graphics Layer 1 > Line Repeat > Repeat count	Must be a valid non-negative integer with a maximum configurable value of 65535 i.e (vertical size) x (lines repeat times) must be equal to the panel vertical size	0	Specify the number of times the image is repeated.
Input > Graphics Layer 1 > Fading > Mode	<ul style="list-style-type: none"> <li>• None</li> <li>• Fade-in</li> <li>• Fade-out</li> </ul>	None	Select the fade method.
Input > Graphics Layer 1 > Fading > Speed	Value must be between 0 and 255	0	Specify the number of frames for the fading transition to complete.
Input > Graphics Layer	<ul style="list-style-type: none"> <li>• Yes</li> </ul>	No	Specify Used if the

2 > General > Enabled	• No		graphics layer 2 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride.
Input > Graphics Layer 2 > General > Horizontal size	Value must be between 16 and 1016	480	Specify the number of horizontal pixels.
Input > Graphics Layer 2 > General > Vertical size	Value must be between 16 and 1020	272	Specify the number of vertical pixels.
Input > Graphics Layer 2 > General > Horizontal position	Must be a valid non-negative integer with a maximum configurable value of 4091	0	Specify the horizontal offset in pixels of the graphics layer from the background layer.
Input > Graphics Layer 2 > General > Vertical position	Must be a valid non-negative integer with a maximum configurable value of 4094	0	Specify the vertical offset in pixels of the graphics layer from the background layer.
Input > Graphics Layer 2 > General > Color format	<ul style="list-style-type: none"> <li>• ARGB8888 (32-bit)</li> <li>• RGB888 (32-bit)</li> <li>• RGB565 (16-bit)</li> <li>• ARGB1555 (16-bit)</li> <li>• ARGB4444 (16-bit)</li> <li>• CLUT8 (8-bit)</li> <li>• CLUT4 (4-bit)</li> <li>• CLUT1 (1-bit)</li> </ul>	RGB565 (16-bit)	Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output.
Input > Graphics Layer 2 > General > Line descending mode	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Select Used if the framebuffer starts from the bottom of the line.
Input > Graphics Layer 2 > Background Color > Alpha	Value must be between 0 and 255	255	Based on the alpha value, either the graphics Layer 2 (foreground graphics layer) is blended into the graphics Layer 1 (background graphics layer) or the graphics Layer 1 is blended into the monochrome background layer.
Input > Graphics Layer 2 > Background Color > Red	Value must be between 0 and 255	255	Red component of the background color for layer 2.

Input > Graphics Layer 2 > Background Color > Green	Value must be between 0 and 255	255	Green component of the background color for layer 2.
Input > Graphics Layer 2 > Background Color > Blue	Value must be between 0 and 255	255	Blue component of the background color for layer 2.
Input > Graphics Layer 2 > Framebuffer > Framebuffer name	This property must be a valid C symbol	fb_foreground	Specify the name for the framebuffer for Layer 2.
Input > Graphics Layer 2 > Framebuffer > Number of framebuffers	Must be a valid non-negative integer with a maximum configurable value of 65535	2	Number of framebuffers allocated for Graphics Layer 2.
Input > Graphics Layer 2 > Framebuffer > Section for framebuffer allocation	Manual Entry	.bss	Specify the section in which to allocate the framebuffer. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.
Input > Graphics Layer 2 > Line Repeat > Enable	<ul style="list-style-type: none"> <li>• On</li> <li>• Off</li> </ul>	Off	Select On if the display will be repeated from a smaller section of the framebuffer.
Input > Graphics Layer 2 > Line Repeat > Repeat count	Must be a valid non-negative integer with a maximum configurable value of 65535 i.e (vertical size) x (lines repeat times) must be equal to the panel vertical size	0	Specify the number of times the image is repeated.
Input > Graphics Layer 2 > Fading > Mode	<ul style="list-style-type: none"> <li>• None</li> <li>• Fade-in</li> <li>• Fade-out</li> </ul>	None	Select the fade method.
Input > Graphics Layer 2 > Fading > Speed	Value must be between 0 and 255	0	Specify the number of frames for the fading transition to complete.
Output > Timing > Horizontal total cycles	Value must be between 24 and 1024	525	Specify the total cycles in a horizontal line. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system
Output > Timing >	Value must be between	480	Specify the number of

Horizontal active video cycles	16 and 1016		active video cycles in a horizontal line (including front and back porch). Set to the number of cycles defined in the data sheet of LCD panel sheet in your system.
Output > Timing > Horizontal back porch cycles	Value must be between 6 and 1006	40	Specify the number of back porch cycles in a horizontal line. Back porch starts from the beginning of Hsync cycles, which means back porch cycles contain Hsync cycles. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system.
Output > Timing > Horizontal sync signal cycles	Value must be between 0 and 1023	1	Specify the number of Hsync signal assertion cycles. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system.
Output > Timing > Horizontal sync signal polarity	<ul style="list-style-type: none"> <li>• Low active</li> <li>• High active</li> </ul>	Low active	Select the polarity of Hsync signal to match your system.
Output > Timing > Vertical total lines	Value must be between 20 and 1024	316	Specify number of total lines in a frame (including front and back porch).
Output > Timing > Vertical active video lines	Value must be between 16 and 1020	272	Specify the number of active video lines in a frame.
Output > Timing > Vertical back porch lines	Value must be between 3 and 1007	8	Specify the number of back porch lines in a frame. Back porch starts from the beginning of Vsync lines, which means back porch lines contain Vsync lines.
Output > Timing > Vertical sync signal lines	Value must be between 0 and 1023	1	Specify the Vsync signal assertion lines in a frame.
Output > Timing >	<ul style="list-style-type: none"> <li>• Low active</li> </ul>	Low active	Select the polarity of

Vertical sync signal polarity	<ul style="list-style-type: none"> <li>High active</li> </ul>		Vsync signal to match to your system.
Output > Timing > Data Enable Signal Polarity	<ul style="list-style-type: none"> <li>Low active</li> <li>High active</li> </ul>	High active	Select the polarity of Data Enable signal to match to your system.
Output > Timing > Sync edge	<ul style="list-style-type: none"> <li>Rising edge</li> <li>Falling edge</li> </ul>	Rising edge	Select the polarity of Sync signals to match to your system.
Output > Format > Color format	<ul style="list-style-type: none"> <li>24bits RGB888</li> <li>18bits RGB666</li> <li>16bits RGB565</li> <li>8bits serial</li> </ul>	16bits RGB565	Specify the graphics layer output format to match to your LCD panel.
Output > Format > Color order	<ul style="list-style-type: none"> <li>RGB</li> <li>BGR</li> </ul>	RGB	Select data order for output signal to LCD panel.
Output > Format > Endian	<ul style="list-style-type: none"> <li>Little endian</li> <li>Big endian</li> </ul>	Little endian	Select data endianness for output signal to LCD panel.
Output > Background > Alpha	Value must be between 0 and 255	255	Alpha component of the background color.
Output > Background > Red	Value must be between 0 and 255	0	Red component of the background color.
Output > Background > Green	Value must be between 0 and 255	0	Green component of the background color.
Output > Background > Blue	Value must be between 0 and 255	0	Blue component of the background color.
CLUT > Enabled	<ul style="list-style-type: none"> <li>Yes</li> <li>No</li> </ul>	No	Specify Used if selecting CLUT formats for a graphics layer input format. If used, a buffer (CLUT_buffer) will be automatically generated based on the selected pixel width.
CLUT > Size	Must be a valid non-negative integer with a maximum configurable value of 256	256	Specify the number of entries for the CLUT source data buffer. Each entry consumes 4 bytes (1 word).
TCON > Hsync pin select	<ul style="list-style-type: none"> <li>Not used</li> <li>LCD_TCON0</li> <li>LCD_TCON1</li> <li>LCD_TCON2</li> <li>LCD_TCON3</li> </ul>	LCD_TCON0	Select the TCON pin used for the Hsync signal to match to your system.
TCON > Vsync pin select	<ul style="list-style-type: none"> <li>Not used</li> <li>LCD_TCON0</li> </ul>	LCD_TCON1	Select TCON pin used for Vsync signal to

	<ul style="list-style-type: none"> <li>• LCD_TCON1</li> <li>• LCD_TCON2</li> <li>• LCD_TCON3</li> </ul>		match to your system.
TCON > Data enable (DE) pin select	<ul style="list-style-type: none"> <li>• Not used</li> <li>• LCD_TCON0</li> <li>• LCD_TCON1</li> <li>• LCD_TCON2</li> <li>• LCD_TCON3</li> </ul>	LCD_TCON2	Select TCON pin used for DataEnable signal to match to your system.
TCON > Panel clock source	<ul style="list-style-type: none"> <li>• Internal clock (GLCDCLK)</li> <li>• External clock (LCD_EXTCLK)</li> </ul>	Internal clock (GLCDCLK)	Choose between an internal GLCDCLK generated from PCLKA or an external clock provided to the LCD_EXTCLK pin.
TCON > Panel clock division ratio	Refer to the RA Configuration tool for available options.	1/24	Select the clock source divider value.
Color Correction > Brightness > Enabled	<ul style="list-style-type: none"> <li>• Yes</li> <li>• No</li> </ul>	No	Enable brightness color correction.
Color Correction > Brightness > Red channel	Value must be between 0 and 1023	512	Red component of the brightness calibration. This value is divided by 512 to determine gain.
Color Correction > Brightness > Green channel	Value must be between 0 and 1023	512	Green component of the brightness calibration. This value is divided by 512 to determine gain.
Color Correction > Brightness > Blue channel	Value must be between 0 and 1023	512	Blue component of the brightness calibration. This value is divided by 512 to determine gain.
Color Correction > Contrast > Enabled	<ul style="list-style-type: none"> <li>• Yes</li> <li>• No</li> </ul>	No	Enable contrast color correction.
Color Correction > Contrast > Red channel gain	Value must be between 0 and 255	128	Red component of the contrast calibration. This value is divided by 128 to determine gain.
Color Correction > Contrast > Green channel gain	Value must be between 0 and 255	128	Green component of the contrast calibration. This value is divided by 128 to determine gain.
Color Correction > Contrast > Blue channel gain	Value must be between 0 and 255	128	Blue component of the contrast calibration. This value is divided by 128 to determine gain.

---

Color Correction > Gamma > Tables > Red > Gain > 0	Value must be between 1024 0 and 2047	Enter a gain value between 0 and 2047 (corresponding to gain of 0 and 1.999, respectively).
Color Correction > Gamma > Tables > Red > Gain > 1	Value must be between 1024 0 and 2047	Enter a gain value between 0 and 2047 (corresponding to gain of 0 and 1.999, respectively).

## Clock Configuration

The peripheral clock for this module is PCLKA.

The dot clock is typically generated from the PLL with a maximum output frequency of 54 MHz in most pixel formats (60 MHz for serial RGB). Optionally, a clock signal can be provided to the LCD\_EXTCLK pin for finer framerate control (60 MHz maximum input). With either clock source dividers of 1-9, 12, 16, 24 and 32 may be used. Clocks must be initialized and settled prior to starting this module.

## Pin Configuration

This module controls a variety of pins necessary for LCD data and timing signal output:

Pin Name	Function	Notes
LCD_EXTCLK	External clock signal input	The maximum input clock frequency is 60MHz.
LCD_CLK	Dot clock output	The maximum output frequency is 54MHz (60MHz in serial RGB mode).

LCD_DATAn	Pixel data output lines	Pin assignment and color order is based on the output block configuration. See the RA6M3 User's Manual (R01UH0886EJ0100) section 58.1.4 "Output Control for Data Format" for details.
LCD_TCONn	Panel timing signal output	These pins can be configured to output vertical and horizontal synchronization and data valid signals.

**Note**

*There are two banks of pins listed for the GLCDC in the RA6M3 User's Manual (\_A and \_B). In most cases the \_B bank will be used as \_A conflicts with SDRAM pins. In either case, it is generally recommended to only use pins from only one bank at a time as this allows for superior signal routing both inside and outside the package. If \_A and \_B pins must be mixed be sure to note the timing precision penalty detailed in Table 60.33 in in the RA6M3 User's Manual.*

## Usage Notes

### Overview

The GLCDC peripheral is a combination of several sub-peripherals that form a pixel data processing pipeline. Each block passes pixel data to the next but otherwise they are disconnected from one another - in other words, changing timing block parameters does not affect the output generation block configuration and vice versa.

### Initial Configuration

During R\_GLCDC\_Open all configured parameters are set in the GLCDC peripheral fully preparing it for operation. Once opened, calling R\_GLCDC\_Start is typically all that is needed for basic operation. Background generation, timing and output parameters are not configurable at runtime, though layer control and color correction options can be altered.

### Framebuffer Allocation

The framebuffer should be allocated in the highest-speed region available (excluding SRAMHS) without displacing the stack, heap and other program-critical structures. While the RA6M3 does contain a relatively large 640K of on-chip SRAM, for many screen sizes and color depths SDRAM will be required. Regardless of the placement two rules must be followed to ensure correct operation of the GLCDC:

- The framebuffer must be aligned on a 64-byte boundary
- The horizontal stride of the buffer must be a multiple of 64 bytes

**Note**

*Framebuffers allocated through the RA Configuraton tool automatically follow the alignment and size requirements.*

If your framebuffer will be placed into internal SRAM please note the following best practices:

- The framebuffer should ideally not be placed in the SRAMHS block of SRAM as there is no speed advantage for doing so. In particular, it is important to ensure the framebuffer does

not push the stack or any heaps outside of SRAMHS to preserve CPU performance.

- It is recommended to not cross the boundary between SRAM0 and SRAM1 with a single framebuffer for performance reasons.
- If double-buffering is desired (and possible within SRAM), place one framebuffer in SRAM0 and the other in SRAM1.

If you are using SRAM for the framebuffer, to ensure correct placement you will need to edit the linker script to add new sections. Below is an example of the required edits in the GCC and IAR formats:

## GCC Linker

```

/*
  Linker File for RA6M3 MCU
*/
/* Linker script to configure memory regions. */
MEMORY
{
  FLASH (rx)          : ORIGIN = 0x00000000, LENGTH = 0x02000000 /* 2M */
  RAM (rwx)           : ORIGIN = 0x1FFE0000, LENGTH = 0x00A00000 /* 640K */
  FB0 (rwx)           : ORIGIN = 0x20000000, LENGTH = 0x00800000 /* 512K */ // Section
for framebuffer 0 (or only framebuffer)
  FB1 (rwx)           : ORIGIN = 0x20040000, LENGTH = 0x00400000 /* 256K */ // Section
for framebuffer 1
  DATA_FLASH (rx)    : ORIGIN = 0x40100000, LENGTH = 0x00100000 /* 64K */
  QSPI_FLASH (rx)     : ORIGIN = 0x60000000, LENGTH = 0x40000000 /* 64M */
  SDRAM (rwx)         : ORIGIN = 0x90000000, LENGTH = 0x20000000 /* 32M */
  ID_CODE (rx)        : ORIGIN = 0x0100A150, LENGTH = 0x10 /* 16 bytes */
}
// ...
.noinit (NOLOAD):
{
  . = ALIGN(4);
  __noinit_start = .;
  KEEP(*(.noinit*))
  __noinit_end = .;
} > RAM
/* Place framebuffer sections first, then the rest of RAM */
.fb0 :

```

```

{
    . = ALIGN(64);
    __fb0_start = .;
    *(.fb0*);
    __fb0_end = .;
} > FB0

.fb1 :
{
    . = ALIGN(64);
    __fb1_start = .;
    *(.fb1*);
    __fb1_end = .;
} > FB1

.bss :
{
    . = ALIGN(4);
    __bss_start__ = .;
    *(.bss*)
    *(COMMON)
    . = ALIGN(4);
    __bss_end__ = .;
} > RAM

// ...

```

## IAR Linker

### Note

*The IAR linker does not place items correctly when sections overlap. As a result, it is advised to place your framebuffer(s) as high as possible in the SRAM region in the linker script to maximize the RAM available for everything else. The below is a general case that should be used unedited only if RAM usage (excluding framebuffers) is less than 128K.*

```

/* ... */

/*-Memory Regions-*/

define symbol region_VECT_start      = 0x00000000;
define symbol region_VECT_end        = 0x000003FF;
define symbol region_ROMREG_start    = 0x00000400;

```

```
define symbol region_ROMREG_end      = 0x000004FF;
define symbol region_FLASH_start     = 0x00000500;
define symbol region_FLASH_end      = 0x001FFFFFF;
define symbol region_RAM_start       = 0x1FFE0000;
define symbol region_RAM_end         = 0x1FFFFFFF; /* RAM limited to SRAMHS */
define symbol region_FB0_start       = 0x20000000;
define symbol region_FB0_end        = 0x2003FFFF; /* SRAM0 dedicated to framebuffer 0
*/
define symbol region_FB1_start       = 0x20040000;
define symbol region_FB1_end        = 0x2007FFFF; /* SRAM1 dedicated to framebuffer 1
*/
define symbol region_DF_start        = 0x40100000;
define symbol region_DF_end         = 0x4010FFFF;
define symbol region_SDRAM_start     = 0x90000000;
define symbol region_SDRAM_end      = 0x91FFFFFF;
define symbol region_QSPI_start      = 0x60000000;
define symbol region_QSPI_end       = 0x63FFFFFF;
/* ... */
define memory mem with size          = 4G;
define region VECT_region            = mem:[from region_VECT_start   to region_VECT_end];
define region ROMREG_region          = mem:[from region_ROMREG_start to region_ROMREG_end];
define region FLASH_region           = mem:[from region_FLASH_start  to
region_FLASH_end];
define region RAM_region              = mem:[from region_RAM_start    to region_RAM_end];
define region FB0_region             = mem:[from region_FB0_start    to region_FB0_end]; /*
Define framebuffer 0 region */
define region FB1_region             = mem:[from region_FB1_start    to region_FB1_end]; /*
Define framebuffer 1 region */
define region DF_region              = mem:[from region_DF_start     to region_DF_end];
define region SDRAM_region           = mem:[from region_SDRAM_start  to
region_SDRAM_end];
define region QSPI_region            = mem:[from region_QSPI_start   to region_QSPI_end];
/* ... */
define block START_OF_RAM with fixed order { rw section .fsp_dtc_vector_table,
```

```
                                block RAM_CODE };

place at start of RAM_region { block START_OF_RAM };

/* Place framebuffer sections first, then the rest of RAM */

place in FB0_region { rw section .fb0 };

place in FB1_region { rw section .fb1 };

place in RAM_region      { rw,
                           rw section .noinit,
                           rw section .bss,
                           rw section .data,
                           rw section HEAP,
                           rw section .stack };
```

## Graphics Layers and Timing Parameters

The GLCDC synthesizes graphics data through two configurable graphics layers onto a background layer. The background is used as a solid-color canvas upon which to composite data from the graphics layers. The two graphics layers are blended on top of each other (Layer 2 above Layer 1) and overlaid on the background layer based on their individual configuration. The placement of the layers (as well as LCD timing parameters) are detailed in Figure 1. The colors of the dimensions indicate which element of the `display_cfg_t` struct is being referenced - for example, the width of the background layer would be `[display_cfg].output.htiming.display_cyc` as shown in the figure below.

Figure 204: GLCDC layers and timing

**Note**

The data enable signal (if configured) is the logical AND of the horizontal and vertical data valid signals. In the GLCDC layers and timing figure, only one graphics layer is shown for simplicity. Additionally, in most applications the graphics layer(s) will be the same dimensions as the background layer.

**Runtime Configuration Options****Note**

All runtime configurations detailed below are also automatically configured during *R\_GLCDC\_Open* based on the options selected in the RA Configuration editor.

**Blend processing**

Control of layer positioning, alpha blending and fading is possible at runtime via *R\_GLCDC\_LayerChange*. This function takes a *display\_runtime\_cfg\_t* parameter which contains the same input and layer elements as the *display\_cfg\_t* control block. Refer to the documentation for *display\_runtime\_cfg\_t* as well as the Examples below to see what options are configurable.

**Brightness and contrast**

Brightness and contrast correction can be controlled through *R\_GLCDC\_ColorCorrection*. The *display\_correction\_t* parameter is used to control enabling, disabling and gain values for both corrections as shown below:

```
display_correction_t correction;

/* Brightness values are 0-1023 with +512 offset being neutral */
correction.brightness.r = 512;
correction.brightness.g = 512;
correction.brightness.b = 512;

/* Contrast values are 0-255 representing gain of 0-2 (128 is gain of 1) */
correction.contrast.r = 128;
correction.contrast.g = 128;
correction.contrast.b = 128;

/* Brightness and contrast correction can be enabled or disabled independent of one
another */
correction.brightness.enable = true;
correction.contrast.enable = true;

/* Enable correction */
R_GLCDC_ColorCorrection(&g_disp_ctrl, &correction);
```

## Color Look-Up Table (CLUT) Modes

The GLCDC supports 1-, 4- and 8-bit color look-up table (CLUT) formats for input pixel data. By using these modes the framebuffer size in memory can be reduced significantly, allowing even high-resolution displays to be buffered in on-chip SRAM. To enable CLUT modes for a layer the color format must be set to a CLUT mode (either at startup or through [R\\_GLCDC\\_LayerChange](#)) in addition to filling the CLUT as appropriate via [R\\_GLCDC\\_ClutUpdate](#) as shown below:

```
/* Basic 4-bit (16-color) CLUT definition */
uint32_t clut_4[16] =
{
    0xFF000000,          // Black
    0xFFFFFFFF,        // White
    0xFF0000FF,        // Blue
    0xFF0080FF,        // Turquoise
    0xFF00FFFF,        // Cyan
    0xFF00FF80,        // Mint Green
    0xFF00FF00,        // Green
    0xFF80FF00,        // Lime Green
    0xFFFF0000,        // Yellow
    0xFFFF8000,        // Orange
```

```
    0xFFFF0000,          // Red
    0xFFFF0080,         // Pink
    0xFFFF00FF,         // Magenta
    0xFF8000FF,         // Purple
    0xFF808080,        // Gray
    0x00000000         // Transparent
};

/* Define the CLUT configuration */
display_clut_cfg_t clut_cfg =
{
    .start = 0,
    .size  = 16,
    .p_base = clut_4
};

/* Update the CLUT in the GLCDC */
R_GLCDC_ClutUpdate(&g_disp_ctrl, &clut_cfg, DISPLAY_FRAME_LAYER_1);
```

#### Note

If individual elements of the CLUT must be changed or if elements must be changed one at a time (for instance, when using *emWin*) it is recommended to use *R\_GLCDC\_ClutEdit* to avoid repeated *memcpy* operations.

## Other Configuration Options

### Gamma correction

Gamma correction is performed based on a gain curve defined in the RA Configuration editor. Each point on the curve is defined by a threshold and a gain value - each gain value represents a multiplier from 0x-2x (set as 0-2047) that sets the Y-value of the slope of the gain curve, while each threshold interval sets the X-value respectively. For a more detailed explanation refer to the RA6M3 User's Manual (R01UH0886EJ0100) Figure 58.12 "Calculation of gamma correction value" and the related description above it.

When setting threshold values three rules must be followed:

- Each threshold value must be greater than the previous value
- Threshold values must be greater than zero and less than 1024
- Threshold values can equal the previous value only if they are 1023 (maximum)

#### Note

Gamma correction can only be applied via *R\_GLCDC\_Open*.

### Dithering

Dithering is a method of pixel blending that allows for smoother transitions between colors when

using a limited palette. A full description of dithering is outside the scope of this document. For more information on the pattern settings and how to configure them refer to the RA6M3 User's Manual (R01UH0886EJ0100) Figure 58.13 "Configuration of dither correction block" and Figure 58.14 "Addition value selection method for 2x2 pattern dither".

## Bus Utilization

### Note

*The data provided in this section consists of estimates only. Experimentation is necessary to obtain real-world performance data on any platform.*

While the GLCDC is very flexible in size and color depth of displays there are considerations to be made in the tradeoff between color depth, framerate and bus utilization. Below is a table showing estimates of the load at various resolutions, framerates and color depths based on a PLL frequency of 120MHz (default) and an effective SDRAM throughput of 60 MB/sec. Bus utilization percentages are provided for the following use cases:

- Static image display (**GLCDC only**): One read
- Redrawing one framebuffer every display frame (**minimal redraw**): One write, one read
- Blitting one buffer to another then redrawing the entire buffer every display frame (**worst case**): Two writes, three reads

Name	Width	Height	Input color depth (bits)	Framerate (FPS)	Buffer size (bytes)	SRAM use	SRAM bus (GLCDC only)	SDRAM bus (GLCDC only)	SRAM bus (minimal redraw)	SDRAM bus (minimal redraw)	SRAM bus (worst case)	SDRAM bus (worst case)
HQVGA	240	160	8	60	38400	6%	1%	4%	2%	8%	5%	19%
HQVGA	240	160	16	60	76800	12%	2%	8%	4%	15%	10%	38%
QVGA	320	240	16	60	153600	23%	4%	15%	8%	31%	19%	77%
WQVGA	400	240	8	60	96000	15%	2%	10%	5%	19%	12%	48%
WQVGA	400	240	16	60	192000	29%	5%	19%	10%	38%	24%	96%
HVGA	480	320	16	60	307200	47%	8%	31%	15%	61%	38%	154%
VGA	640	480	16	30	614400	—	—	31%	—	61%	—	154%
WVGA	800	480	8	60	384000	59%	10%	38%	19%	77%	48%	192%
WVGA	800	480	16	30	768000	—	—	38%	—	77%	—	192%
WVGA	800	480	32	15	1536000	—	—	38%	—	77%	—	192%

FWVG A	960	480	8	30	4608 00	70%	6%	23%	12%	46%	29%	115%
FWVG A	960	480	16	30	9216 00	—	—	46%	—	92%	—	230%
qHD	960	540	8	30	5184 00	79%	6%	26%	13%	52%	32%	130%

*Note*

Bus utilization values over 100% indicate that the bandwidth for that bus is exceeded in that scenario and GLCDC underflow and/or dropped frames may result depending on the bus priority setting. **It is recommended to avoid these scenarios if at all possible by reducing the buffer drawing rate, number of draw/copy operations or the input color depth.** Relaxing vertical timing (increasing total line count) or increasing the clock divider are the easiest ways to increase the time per frame.

**Limitations**

Developers should be aware of the following limitations when using the GLCDC API:

- Due to a limitation of the GLCDC hardware, if the horizontal back porch is less than the number of pixels in a graphics burst read (64 bytes) for a layer and the layer is positioned at a negative X-value then the layer X-position will be locked to the nearest 64-byte boundary, rounded toward zero.
- The GLCDC peripheral offers a chroma-key function that can be used to perform a green-screen-like color replacement. This functionality is not exposed through the GLCDC API. See the descriptions for GRn.AB7 through .AB9 in the RA6M3 User's Manual for further details.
- Use of R\_GLCDC\_ClutUpdate and R\_GLCDC\_ClutEdit may not be mixed on the same frame.

**Examples****Basic Example**

This is a basic example showing the minimum code required to initialize and start the GLCDC module. If the entire display can be drawn within the vertical blanking period no further code may be necessary.

```
void glcdc_init (void)
{
    fsp_err_t err;

    // Open the GLCDC driver
    err = R_GLCDC_Open(&g_disp_ctrl, &g_disp_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    // Start display output
    err = R_GLCDC_Start(&g_disp_ctrl);
    assert(FSP_SUCCESS == err);
}
```

## Layer Transitions

This example demonstrates how to set up and execute both a sliding and fading layer transition. This is most useful in static image transition scenarios as switching between two actively-drawing graphics layers may require up to four framebuffers to eliminate tearing.

```
volatile uint32_t g_vsync_count = 0;
/* Callback function for GLCDC interrupts */
static void glcdc_callback (display_callback_args_t * p_args)
{
    if (p_args->event == DISPLAY_EVENT_LINE_DETECTION)
    {
        g_vsync_count++;
    }
}
/* Simple wait that returns 1 if no Vsync happened within the timeout period */
uint8_t vsync_wait (void)
{
    uint32_t timeout_timer = GLCDC_VSYNC_TIMEOUT;
    g_vsync_count = 0;
    while (!g_vsync_count && --timeout_timer)
    {
        /* Spin here until DISPLAY_EVENT_LINE_DETECTION callback or timeout */
    }
    return timeout_timer ? 0 : 1;
}
/* Initiate a fade on Layer 2
 *
 * Parameters:
 * direction True for fade in, false for fade out
 * speed number of frames over which to fade
 */
void glcdc_layer_transition_fade (display_runtime_cfg_t * disp_rt_cfg, bool
direction, uint16_t speed)
{
```

```
fsp_err_t err;
if (direction)
{
/* Set the runtime struct to the desired buffer */
disp_rt_cfg->input.p_base      = (uint32_t *) g_framebuffer_1;
disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEIN;
}
else
{
disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEOUT;
}
/* Ensure speed is at least 1 frame */
if (!speed)
{
speed = 1;
}
/* Set the fade speed to the desired change in alpha per frame */
disp_rt_cfg->layer.fade_speed = UINT8_MAX / speed;
/* Initiate the fade (will start on the next Vsync) */
err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg, DISPLAY_FRAME_LAYER_2);
assert(FSP_SUCCESS == err);
}
/* Slide Layer 1 out to the left while sliding Layer 2 in from the right */
void glcdc_layer_transition_sliding (display_runtime_cfg_t * disp_rt_cfg_in,
display_runtime_cfg_t * disp_rt_cfg_out)
{
fsp_err_t err;
/* Set the config for the incoming layer to be just out of bounds on the right side
*/
disp_rt_cfg_in->input.p_base      = (uint32_t *) g_framebuffer_1;
disp_rt_cfg_in->layer.coordinate.x = DISPLAY_WIDTH;
/* Move layer 1 out and layer 2 in at a fixed rate of 4 pixels per frame */
for (int32_t x = disp_rt_cfg_in->layer.coordinate.x; x >= 0; x -= 4)
{
```

```
/* Wait for a Vsync before starting */
    vsync_wait();

/* Set the X-coordinate of both layers then update them */
    disp_rt_cfg_out->layer.coordinate.x = (int16_t) (x - DISPLAY_WIDTH);
    disp_rt_cfg_in->layer.coordinate.x = (int16_t) x;
    err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_out, DISPLAY_FRAME_LAYER_1
);
    assert(FSP_SUCCESS == err);
    err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_in, DISPLAY_FRAME_LAYER_2
);
    assert(FSP_SUCCESS == err);
}
}
```

## Double-Buffering

Using a double-buffer allows one to be output to the LCD while the other is being drawn to memory, eliminating tearing and in some cases reducing bus load. The following is a basic example showing integration of the line detect (Vsync) interrupt to set the timing for buffer swapping and drawing.

```
/* User-defined function to draw the current display to a framebuffer */
void display_draw (uint8_t * framebuffer)
{
    FSP_PARAMETER_NOT_USED(framebuffer);
    /* Draw buffer here */
}

/* This function is an example of a basic double-buffered display thread */
void display_thread (void)
{
    uint8_t * p_framebuffer = NULL;
    fsp_err_t err;
    /* Initialize and start the R_GLCDC module */
    glcdc_init();
    while (1)
    {
        /* Swap the active framebuffer */

```

```
    p_framebuffer = (p_framebuffer == g_framebuffer_0) ? g_framebuffer_1 :
g_framebuffer_0;
    /* Draw the new framebuffer now */
    display_draw(p_framebuffer);
    /* Now that the framebuffer is ready, update the GLCDC buffer pointer on the next
Vsync */
    err = R_GLCDC_BufferChange(&g_disp_ctrl, p_framebuffer, DISPLAY_FRAME_LAYER_1
);
    assert(FSP_SUCCESS == err);
    /* Wait for a Vsync event */
    vsync_wait();
}
}
```

<a href="#">glcdc_dithering_mode_t</a>	dithering_mode	Dithering mode.
<a href="#">glcdc_dithering_pattern_t</a>	dithering_pattern_A	Dithering pattern A.
<a href="#">glcdc_dithering_pattern_t</a>	dithering_pattern_B	Dithering pattern B.
<a href="#">glcdc_dithering_pattern_t</a>	dithering_pattern_C	Dithering pattern C.
<a href="#">glcdc_dithering_pattern_t</a>	dithering_pattern_D	Dithering pattern D.

## Enumeration Type Documentation

### ◆ [glcdc\\_clk\\_src\\_t](#)

enum [glcdc\\_clk\\_src\\_t](#)

Clock source select

#### Enumerator

GLCDC_CLK_SRC_INTERNAL	Internal.
GLCDC_CLK_SRC_EXTERNAL	External.

◆ **glcdc\_panel\_clk\_div\_t**

enum <code>glcdc_panel_clk_div_t</code>	
Clock frequency division ratio	
Enumerator	
<code>GLCDC_PANEL_CLK_DIVISOR_1</code>	Division Ratio 1/1.
<code>GLCDC_PANEL_CLK_DIVISOR_2</code>	Division Ratio 1/2.
<code>GLCDC_PANEL_CLK_DIVISOR_3</code>	Division Ratio 1/3.
<code>GLCDC_PANEL_CLK_DIVISOR_4</code>	Division Ratio 1/4.
<code>GLCDC_PANEL_CLK_DIVISOR_5</code>	Division Ratio 1/5.
<code>GLCDC_PANEL_CLK_DIVISOR_6</code>	Division Ratio 1/6.
<code>GLCDC_PANEL_CLK_DIVISOR_7</code>	Division Ratio 1/7.
<code>GLCDC_PANEL_CLK_DIVISOR_8</code>	Division Ratio 1/8.
<code>GLCDC_PANEL_CLK_DIVISOR_9</code>	Division Ratio 1/9.
<code>GLCDC_PANEL_CLK_DIVISOR_12</code>	Division Ratio 1/12.
<code>GLCDC_PANEL_CLK_DIVISOR_16</code>	Division Ratio 1/16.
<code>GLCDC_PANEL_CLK_DIVISOR_24</code>	Division Ratio 1/24.
<code>GLCDC_PANEL_CLK_DIVISOR_32</code>	Division Ratio 1/32.

◆ **glcdc\_tcon\_pin\_t**

enum <code>glcdc_tcon_pin_t</code>	
LCD TCON output pin select	
Enumerator	
<code>GLCDC_TCON_PIN_NONE</code>	No output.
<code>GLCDC_TCON_PIN_0</code>	<code>LCD_TCON0</code> .
<code>GLCDC_TCON_PIN_1</code>	<code>LCD_TCON1</code> .
<code>GLCDC_TCON_PIN_2</code>	<code>LCD_TCON2</code> .
<code>GLCDC_TCON_PIN_3</code>	<code>LCD_TCON3</code> .

◆ **glcdc\_bus\_arbitration\_t**

enum <code>glcdc_bus_arbitration_t</code>	
Bus Arbitration setting	
Enumerator	
<code>GLCDC_BUS_ARBITRATION_ROUNDROBIN</code>	Round robin.
<code>GLCDC_BUS_ARBITRATION_FIX_PRIORITY</code>	Fixed.

◆ **glcdc\_correction\_proc\_order\_t**

enum <code>glcdc_correction_proc_order_t</code>	
Correction circuit sequence control	
Enumerator	
<code>GLCDC_CORRECTION_PROC_ORDER_BRIGHTNESS_CONTRAST2GAMMA</code>	Brightness -> contrast -> gamma correction.
<code>GLCDC_CORRECTION_PROC_ORDER_GAMMA2BRIGHTNESS_CONTRAST</code>	Gamma correction -> brightness -> contrast.

◆ **glcdc\_tcon\_signal\_select\_t**

enum <a href="#">glcdc_tcon_signal_select_t</a>	
Timing signals for driving the LCD panel	
Enumerator	
GLCDC_TCON_SIGNAL_SELECT_STVA_VS	STVA/VS.
GLCDC_TCON_SIGNAL_SELECT_STVB_VE	STVB/VE.
GLCDC_TCON_SIGNAL_SELECT_STHA_HS	STH/SP/HS.
GLCDC_TCON_SIGNAL_SELECT_STHB_HE	STB/LP/HE.
GLCDC_TCON_SIGNAL_SELECT_DE	DE.

◆ **glcdc\_clut\_plane\_t**

enum <a href="#">glcdc_clut_plane_t</a>	
Clock phase adjustment for serial RGB output	
Enumerator	
GLCDC_CLUT_PLANE_0	GLCDC CLUT plane 0.
GLCDC_CLUT_PLANE_1	GLCDC CLUT plane 1.

◆ **glcdc\_dithering\_mode\_t**

enum <a href="#">glcdc_dithering_mode_t</a>	
Dithering mode	
Enumerator	
GLCDC_DITHERING_MODE_TRUNCATE	No dithering (truncate)
GLCDC_DITHERING_MODE_ROUND_OFF	Dithering with round off.
GLCDC_DITHERING_MODE_2X2PATTERN	Dithering with 2x2 pattern.

◆ **glcdc\_dithering\_pattern\_t**

enum <code>glcdc_dithering_pattern_t</code>	
Dithering mode	
Enumerator	
<code>GLCDC_DITHERING_PATTERN_00</code>	2x2 pattern '00'
<code>GLCDC_DITHERING_PATTERN_01</code>	2x2 pattern '01'
<code>GLCDC_DITHERING_PATTERN_10</code>	2x2 pattern '10'
<code>GLCDC_DITHERING_PATTERN_11</code>	2x2 pattern '11'

◆ **glcdc\_input\_interface\_format\_t**

enum <code>glcdc_input_interface_format_t</code>	
Output interface format	
Enumerator	
<code>GLCDC_INPUT_INTERFACE_FORMAT_RGB565</code>	Input interface format RGB565.
<code>GLCDC_INPUT_INTERFACE_FORMAT_RGB888</code>	Input interface format RGB888.
<code>GLCDC_INPUT_INTERFACE_FORMAT_ARGB1555</code>	Input interface format ARGB1555.
<code>GLCDC_INPUT_INTERFACE_FORMAT_ARGB4444</code>	Input interface format ARGB4444.
<code>GLCDC_INPUT_INTERFACE_FORMAT_ARGB8888</code>	Input interface format ARGB8888.
<code>GLCDC_INPUT_INTERFACE_FORMAT_CLUT8</code>	Input interface format CLUT8.
<code>GLCDC_INPUT_INTERFACE_FORMAT_CLUT4</code>	Input interface format CLUT4.
<code>GLCDC_INPUT_INTERFACE_FORMAT_CLUT1</code>	Input interface format CLUT1.

◆ **glcdc\_output\_interface\_format\_t**

enum <code>glcdc_output_interface_format_t</code>	
Output interface format	
Enumerator	
<code>GLCDC_OUTPUT_INTERFACE_FORMAT_RGB888</code>	Output interface format RGB888.
<code>GLCDC_OUTPUT_INTERFACE_FORMAT_RGB666</code>	Output interface format RGB666.
<code>GLCDC_OUTPUT_INTERFACE_FORMAT_RGB565</code>	Output interface format RGB565.
<code>GLCDC_OUTPUT_INTERFACE_FORMAT_SERIAL_RGB</code>	Output interface format Serial RGB.

◆ **glcdc\_dithering\_output\_format\_t**

enum <code>glcdc_dithering_output_format_t</code>	
Dithering output format	
Enumerator	
<code>GLCDC_DITHERING_OUTPUT_FORMAT_RGB888</code>	Dithering output format RGB888.
<code>GLCDC_DITHERING_OUTPUT_FORMAT_RGB666</code>	Dithering output format RGB666.
<code>GLCDC_DITHERING_OUTPUT_FORMAT_RGB565</code>	Dithering output format RGB565.

**Function Documentation**

◆ **R\_GLCDC\_Open()**

```
fsp_err_t R_GLCDC_Open ( display_ctrl_t *const p_api_ctrl, display_cfg_t const *const p_cfg )
```

Open GLCDC module. Implements `display_api_t::open`.

**Return values**

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ALREADY_OPEN	Device was already open.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_CLOCK_GENERATION	Dot clock cannot be generated from clock source.
FSP_ERR_INVALID_TIMING_SETTING	Invalid panel timing parameter.
FSP_ERR_INVALID_LAYER_SETTING	Invalid layer setting found.
FSP_ERR_INVALID_ALIGNMENT	Input buffer alignment invalid.
FSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction setting found
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid brightness correction setting found

**Note**

*PCLKA must be supplied to Graphics LCD Controller (GLCDC) and GLCDC pins must be set in IOPORT before calling this API.*

◆ **R\_GLCDC\_Close()**

```
fsp_err_t R_GLCDC_Close ( display_ctrl_t *const p_api_ctrl)
```

Close GLCDC module. Implements `display_api_t::close`.

**Return values**

FSP_SUCCESS	Device was closed successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	The function call is performed when the driver state is not equal to <code>DISPLAY_STATE_CLOSED</code> .
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed when the GLCDC is updating register values internally.

**Note**

*This API can be called when the driver is not in `DISPLAY_STATE_CLOSED` state. It returns an error if the register update operation for the background screen generation block is being held.*

◆ **R\_GLCDC\_Start()**

```
fsp_err_t R_GLCDC_Start ( display_ctrl_t *const p_api_ctrl)
```

Start GLCDC module. Implements `display_api_t::start`.

**Return values**

FSP_SUCCESS	Device was started successfully.
FSP_ERR_NOT_OPEN	GLCDC module has not been opened.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.

**Note**

*This API can be called when the driver is not in `DISPLAY_STATE_OPENED` status.*

◆ **R\_GLCDC\_Stop()**

```
fsp_err_t R_GLCDC_Stop ( display_ctrl_t *const p_api_ctrl)
```

Stop GLCDC module. Implements `display_api_t::stop`.

**Return values**

FSP_SUCCESS	Device was stopped successfully
FSP_ERR_ASSERTION	Pointer to the control block is NULL
FSP_ERR_INVALID_MODE	Function call is performed when the driver state is not <code>DISPLAY_STATE_DISPLAYING</code> .
FSP_ERR_INVALID_UPDATE_TIMING	The function call is performed while the GLCDC is updating register values internally.

**Note**

*This API can be called when the driver is in the `DISPLAY_STATE_DISPLAYING` state. It returns an error if the register update operation for the background screen generation blocks, the graphics data I/F blocks, or the output control block is being held.*

◆ **R\_GLCDC\_LayerChange()**

```
fsp_err_t R_GLCDC_LayerChange ( display_ctrl_t const *const p_api_ctrl, display_runtime_cfg_t
const *const p_cfg, display_frame_layer_t layer )
```

Change layer parameters of GLCDC module at runtime. Implements `display_api_t::layerChange`.

**Return values**

FSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating register values internally.

**Note**

*This API can be called when the driver is in DISPLAY\_STATE\_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.*

◆ **R\_GLCDC\_BufferChange()**

```
fsp_err_t R_GLCDC_BufferChange ( display_ctrl_t const *const p_api_ctrl, uint8_t *const
framebuffer, display_frame_layer_t layer )
```

Change the framebuffer pointer for a layer. Implements `display_api_t::bufferChange`.

**Return values**

FSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_ALIGNMENT	The framebuffer pointer is not 64-byte aligned.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating register values internally.

**Note**

*This API can be called when the driver is in DISPLAY\_STATE\_OPENED state or higher. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.*

◆ **R\_GLCDC\_ColorCorrection()**

```
fsp_err_t R_GLCDC_ColorCorrection ( display_ctrl_t const *const p_api_ctrl, display_correction_t const *const p_correction )
```

Perform color correction through the GLCDC module. Implements `display_api_t::correction`.

**Return values**

FSP_SUCCESS	Color correction by GLCDC module was performed successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the display correction structure is NULL.
FSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating registers internally.
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid brightness correction setting found

**Note**

*This API can be called when the driver is in the DISPLAY\_STATE\_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the output control block is being held.*

◆ **R\_GLCDC\_ClutUpdate()**

```
fsp_err_t R_GLCDC_ClutUpdate ( display_ctrl_t const *const p_api_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t layer )
```

Write an entire color look-up table (CLUT) in the GLCDC module. Implements `display_api_t::clut`.

**Return values**

FSP_SUCCESS	CLUT written successfully.
FSP_ERR_ASSERTION	Pointer to the control block or CLUT source data is NULL.
FSP_ERR_INVALID_UPDATE_TIMING	R_GLCDC_ClutEdit was already used to edit the specified CLUT this frame.
FSP_ERR_INVALID_CLUT_ACCESS	Illegal CLUT entry or size is specified.

**Note**

*This API can be called any time. The written data will be used after the next vertical sync event.*

◆ **R\_GLCDC\_ClutEdit()**

```
fsp_err_t R_GLCDC_ClutEdit ( display_ctrl_t const *const p_api_ctrl, display_frame_layer_t layer,
uint8_t index, uint32_t color )
```

Update an element of a color look-up table (CLUT) in the GLCDC module. Implements `display_api_t::clutEdit`.

**Return values**

FSP_SUCCESS	CLUT element updated successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.

*Note*

*This API can be called any time. The written data will be used after the next vertical sync event.*

◆ **R\_GLCDC\_StatusGet()**

```
fsp_err_t R_GLCDC_StatusGet ( display_ctrl_t const *const p_api_ctrl, display_status_t *const
p_status )
```

Get status of GLCDC module. Implements `display_api_t::statusGet`.

**Return values**

FSP_SUCCESS	Got status successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the status structure is NULL.

*Note*

*The GLCDC hardware starts the fading processing at the first Vsync after the previous LayerChange() call is held. Due to this behavior of the hardware, this API may not return DISPLAY\_FADE\_STATUS\_FADING\_UNDERWAY as the fading status, if it is called before the first Vsync after LayerChange() is called. In this case, the API returns DISPLAY\_FADE\_STATUS\_PENDING, instead of DISPLAY\_FADE\_STATUS\_NOT\_UNDERWAY.*

**4.2.7.4 JPEG Codec (r\_jpeg)**

Modules » Graphics

**Functions**

```
fsp_err_t R_JPEG_Open (jpeg_ctrl_t *const p_api_ctrl, jpeg_cfg_t const *const
p_cfg)
```

```
fsp_err_t R_JPEG_OutputBufferSet (jpeg_ctrl_t *p_api_ctrl, void
*p_output_buffer, uint32_t output_buffer_size)
```

```
fsp_err_t R_JPEG_InputBufferSet (jpeg_ctrl_t *const p_api_ctrl, void
*p_data_buffer, uint32_t data_buffer_size)
```

fsp_err_t	R_JPEG_DecodeLinesDecodedGet (jpeg_ctrl_t *p_api_ctrl, uint32_t *p_lines)

fsp_err_t	R_JPEG_DecodeHorizontalStrideSet (jpeg_ctrl_t *p_api_ctrl, uint32_t horizontal_stride)
fsp_err_t	R_JPEG_DecodeImageSizeGet (jpeg_ctrl_t *p_api_ctrl, uint16_t *p_horizontal_size, uint16_t *p_vertical_size)
fsp_err_t	R_JPEG_DecodePixelFormatGet (jpeg_ctrl_t *p_api_ctrl, jpeg_color_space_t *p_color_space)
fsp_err_t	R_JPEG_EncodeImageSizeSet (jpeg_ctrl_t *const p_api_ctrl, jpeg_encode_image_size_t *p_image_size)
fsp_err_t	R_JPEG_ModeSet (jpeg_ctrl_t *const p_api_ctrl, jpeg_mode_t mode)
fsp_err_t	R_JPEG_Close (jpeg_ctrl_t *p_api_ctrl)
fsp_err_t	R_JPEG_StatusGet (jpeg_ctrl_t *p_api_ctrl, jpeg_status_t *p_status)

## Detailed Description

Driver for the JPEG peripheral on RA MCUs. This module implements the [JPEG Codec Interface](#).

## Overview

The JPEG Codec is a hardware block providing accelerated JPEG image encode and decode functionality independent of the CPU. Images can optionally be partially processed facilitating streaming applications.

### Features

The JPEG Codec provides a number of options useful in a variety of applications:

- Basic encoding and decoding
- Streaming input and/or output
- Decoding JPEGs of unknown size
- Shrink (sub-sample) an image during the decoding process
- Rearrange input and output byte order (byte, word and/or longword swap)
- JPEG error detection

The specifications for the codec are as follows:

Feature	Options
Decompression input formats	Baseline JPEG Y'CbCr 4:4:4, 4:2:2, 4:2:0 and 4:1:1
Decompression output formats	ARGB8888, RGB565
Compression input formats	Raw Y'CbCr 4:2:2 only
Compression output formats	Baseline JPEG Y'CbCr 4:2:2 only
Byte reordering	Byte, halfword and/or word swapping on input and output
Interrupt sources	Image size acquired, input/output data pause, decode complete, error
Compatible image sizes	See <a href="#">Minimum Coded Unit (MCU)</a> below

## Configuration

### Build Time Configurations for r\_jpeg

The following build time configurations are defined in fsp\_cfg/r\_jpeg\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected, code for parameter checking is included in the build.
Decode Support	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	If selected, code for decoding JPEG images is included in the build.
Encode Support	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	If selected, code for encoding JPEG images is included in the build.

### Configurations for Graphics > JPEG Codec (r\_jpeg)

This module can be added to the Stacks tab via New Stack > Graphics > JPEG Codec (r\_jpeg).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_jpeg0	Module name.
General > Default mode	<ul style="list-style-type: none"> <li>Decode</li> <li>Encode</li> </ul>	Decode	Set the mode to use when calling R_JPEG_Open. This parameter is only used when both Encode and Decode support are enabled.
Decode > Input byte order	MCU Specific Options		Select the byte order of the input data for

Decode > Output byte order	MCU Specific Options		decoding. Select the byte order of the output data for decoding.
Decode > Output color format	<ul style="list-style-type: none"> <li>• ARGB8888 (32-bit)</li> <li>• RGB565 (16-bit)</li> </ul>	RGB565 (16-bit)	Select the output pixel format for decode operations.
Decode > Output alpha (ARGB8888 only)	Value must be an 8-bit integer (0-255)	255	Specify the alpha value to apply to each output pixel when ARGB8888 format is chosen.
Decode > Callback	Name must be a valid C symbol	NULL	If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers.
Encode > Horizontal resolution	Value cannot be greater than 65535 and must be a non-negative integer divisible by 16	480	Horizontal resolution of the raw image (in pixels). This value can be configured at runtime via <code>R_JPEG_ImageSizeSet</code> .
Encode > Vertical resolution	Value cannot be greater than 65535 and must be a non-negative integer divisible by 8	272	Vertical resolution of the raw image. This value can be configured at runtime via <code>R_JPEG_ImageSizeSet</code> .
Encode > Horizontal stride	Value cannot be greater than 65535 and must be a non-negative integer	480	Horizontal stride of the raw image buffer (in pixels). This value can be configured at runtime via <code>R_JPEG_ImageSizeSet</code> .
Encode > Input byte order	MCU Specific Options		Select the byte order of the input data for encoding.
Encode > Output byte order	MCU Specific Options		Select the byte order of the output data for encoding.
Encode > Reset interval	Value cannot be greater than 65535 and must be a non-negative integer	512	Set the number of MCUs between RST markers. A value of 0 will disable DRI and RST marker output.
Encode > Quality factor	Value must be between 1 and 100 and must be	50	Set the quality factor for encoding (1-100).

	an integer		Lower values produce smaller images at the cost of image quality.
Encode > Callback	Name must be a valid C symbol	NULL	If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers.
Interrupts > Decode Process Interrupt Priority	MCU Specific Options		Select the decompression interrupt priority.
Interrupts > Data Transfer Interrupt Priority	MCU Specific Options		Select the data transfer interrupt priority.

## Clock Configuration

The peripheral clock for this module is PCLKA. No clocks are provided by this module.

## Pin Configuration

This module does not have any input or output pin connections.

# Usage Notes

## Overview

The JPEG Codec contains both decode and encode hardware. While these two functions are largely independent in configuration only one can be used at a time.

To switch from decode to encode mode (or vice versa) use [R\\_JPEG\\_ModeSet](#) while the JPEG Codec is idle.

## Status

The status value ([jpeg\\_status\\_t](#)) provided by the callback and by [R\\_JPEG\\_StatusGet](#) is a bitfield that encompasses all potential status indication conditions. One or more statuses can be set simultaneously.

## Decoding Process

JPEG decoding can be performed in several ways depending on the application:

- To perform the simplest decode operation where all dimensions are known:
  - Set the input buffer, stride and output buffer then wait for a callback with status [JPEG\\_STATUS\\_OPERATION\\_COMPLETE](#).
- To pause after decoding the JPEG header (in order to acquire image dimensions and secure an output buffer):
  - Call [R\\_JPEG\\_InputBufferSet](#) before setting the output buffer and wait for a callback with status [JPEG\\_STATUS\\_IMAGE\\_SIZE\\_READY](#).
- To decode a partial JPEG image then pause until the next chunk is available:
  - Specify a size smaller than the full JPEG data when calling [R\\_JPEG\\_InputBufferSet](#).

- To pause decoding once an output buffer is filled:
  - Specify a size smaller than the full decoded image when calling `R_JPEG_OutputBufferSet`.

The flowchart below illustrates the steps necessary to handle any decode operation. The statuses given in blue are part of `jpeg_status_t` with the `JPEG_DECODE_STATUS` prefix omitted.

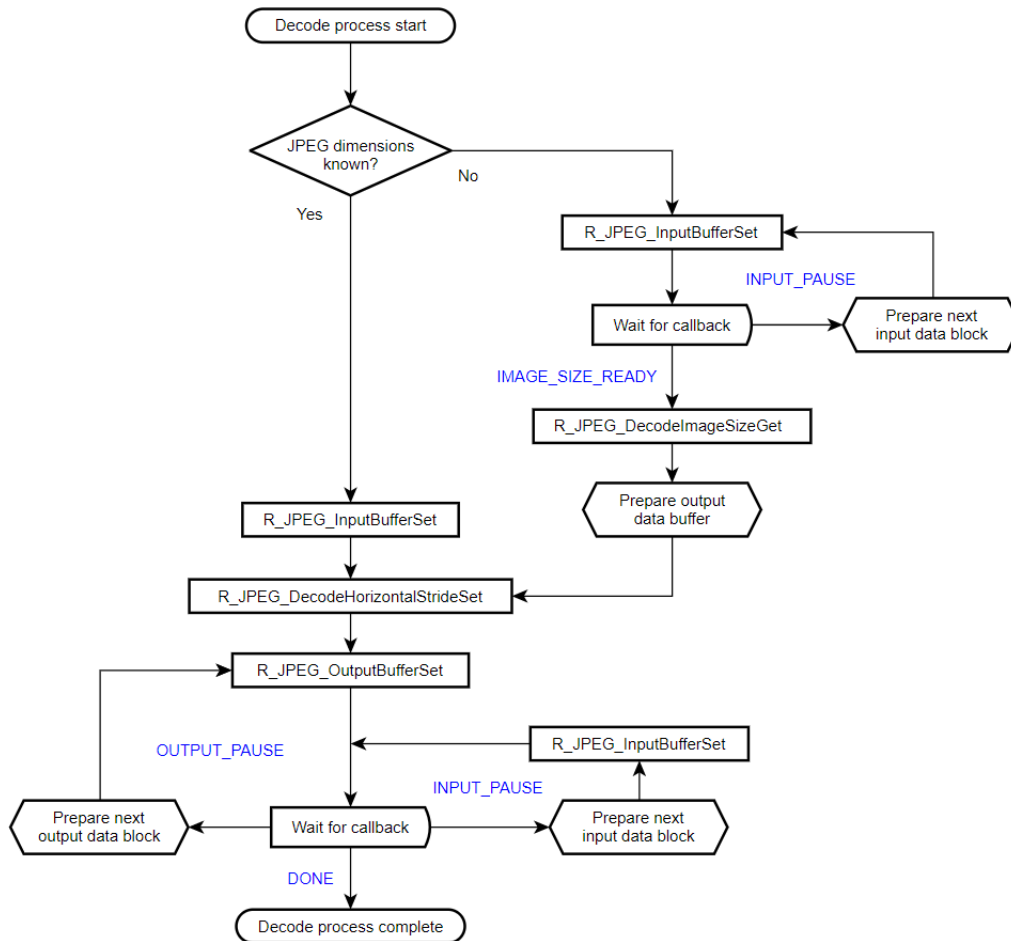

Figure 205: JPEG Decode Operational Flow

## Encoding Process

As compared to decoding, encoding is fairly straightforward. The only option available is to stream input data if desired. The flowchart below details the steps needed to compress an image.

Figure 206: JPEG Encode Operational Flow

## Handling Failed Operations

If an encode or decode operation fails or times out while the codec is running, the peripheral must be reset before it is used again. To reset the JPEG Codec simply close and re-open the module by calling [R\\_JPEG\\_Close](#) followed by [R\\_JPEG\\_Open](#).

## Limitations

Developers should be aware of the following limitations when using the JPEG API.

### Minimum Coded Unit (MCU)

The JPEG Codec can only correctly process images that are an even increment of minimum coded units (MCUs). In other words, depending on the format the width and height of an image to be encoded or decoded must be divisible by the following:

Format	Horizontal	Vertical
Y'CbCr 4:4:4	8 pixels	8 lines
Y'CbCr 4:2:2	16 pixels	8 lines
Y'CbCr 4:1:1	32 pixels	8 lines
Y'CbCr 4:2:0	16 pixels	16 lines

#### Note

*Because encoding is limited to Y'CbCr 4:2:2, raw pixel input data must always be in whole increments of 16x8 pixels.*

## Encoding Input Format

The encoding unit only supports Y'CbCr 4:2:2 input. Raw RGB888 data can be converted to this format as follows:

$$y = (0.299000f * r) + (0.587000f * g) + (0.114000f * b);$$

```
cb = 128 - (0.168736f * r) - (0.331264f * g) + (0.500000f * b);
cr = 128 + (0.500000f * r) - (0.418688f * g) - (0.081312f * b);
```

While these equations are mathematically simple they do use the floating-point unit. To speed things up we can multiply the coefficients by 256 and divide the sum by 256...

```
y = ((76.5440f * r) + (150.272f * g) + (29.1840f * b)) / 256;
cb = 128 - ((43.1964f * r) - (84.8036f * g) + (128.000f * b)) / 256;
cr = 128 + ((128.000f * r) - (107.184f * g) - (20.8159f * b)) / 256;
```

...which allows the formulas to be calculated entirely with shifts and addition (coefficients rounded to the nearest integer):

```
y = ( (r << 6) + (r << 3) + (r << 2) + r
      + (g << 7) + (g << 4) + (g << 2) + (g << 1)
      + (b << 4) + (b << 3) + (b << 2) + b
    ) >> 8;

cb = 128 - ( (r << 5) + (r << 3) + (r << 1) + r
            + (g << 6) + (g << 4) + (g << 2) + g
            - (b << 7)
          ) >> 8;

cr = 128 + ( (r << 7)
            - (g << 6) - (g << 5) - (g << 3) - (g << 1) - g
            - (b << 4) - (b << 2) - b
          ) >> 8;
```

To compose the final Y'CbCr 4:2:2 data the chroma of every two pixels must be averaged. **In addition, the JPEG Codec expects chrominance values to be in the range -127..127 instead of the standard 1..255.**

```
cb = (uint8_t) ((int8_t) ((cb0 + cb1 + 1) >> 1) - 128);
cr = (uint8_t) ((int8_t) ((cr0 + cr1 + 1) >> 1) - 128);
```

Finally, the below equation composes two 4:2:2 output pixels at a time with standard byte order (JPEG\_DATA\_ORDER\_NORMAL):

```
out = y0 + (cb << 8) + (y1 << 16) + (cr << 24);
```

#### Note

RGB565 pixels must be upscaled to RGB888 before using the above formulas. Refer to the below example on [YCbCr Conversion](#) for implementation details.

## Examples

### Basic Decode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and decode an image.

```
void jpeg_decode_basic (void)
{
    fsp_err_t err;
    /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Set input buffer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, JPEG_PTR, JPEG_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
    /* Set horizontal stride of output buffer */
    err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, JPEG_HSIZE);
    assert(FSP_SUCCESS == err);
    /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, decode_buffer, sizeof(decode_buffer));
    assert(FSP_SUCCESS == err);
    /* Wait for decode completion */
    jpeg_status_t status = (jpeg_status_t) 0;
    while (!(status & (JPEG_STATUS_OPERATION_COMPLETE | JPEG_STATUS_ERROR)))
    {
        err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
        assert(FSP_SUCCESS == err);
    }
}
```

## Streaming Input/Output Example

In this example JPEG data is read in 512-byte chunks. Decoding is paused when a chunk is read and once the JPEG header is decoded. The image is decoded 16 lines at a time.

### Note

*Streaming is always bypassed when a given buffer's size encompasses the entire input or output image, respectively. Though this example decodes via smaller chunks the input and output data are still contiguous for ease of demonstration. Refer to the comments for further insight as to how to implement streaming with different JPEG/output buffer size combinations.*

```
#define JPEG_INPUT_SIZE_BYTES 512U
/* JPEG Codec status */
static volatile jpeg_status_t g_jpeg_status = JPEG_STATUS_NONE;
/* JPEG event flag */
static volatile uint8_t jpeg_event = 0;
/* Callback function for JPEG decode interrupts */
void jpeg_decode_callback (jpeg_callback_args_t * p_args)
{
    /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
    /* Set JPEG flag */
    jpeg_event = 1;
}
/* Simple wait that returns 1 if no event happened within the timeout period */
static uint8_t jpeg_event_wait (void)
{
    uint32_t timeout_timer = JPEG_EVENT_TIMEOUT;
    while (!jpeg_event && --timeout_timer)
    {
        /* Spin here until an event callback or timeout */
    }
    jpeg_event = 0;
    return timeout_timer ? 0 : 1;
}
/* Decode a JPEG image to a buffer using streaming input and output */
void jpeg_decode_streaming (void)
```

```
{
    uint8_t      * p_jpeg = (uint8_t *) JPEG_PTR;
    jpeg_status_t status = (jpeg_status_t) 0;
    uint8_t      timeout = 0;
    fsp_err_t     err;
    /* Number of input bytes to read at a time */
    uint32_t input_bytes = JPEG_INPUT_SIZE_BYTES;
    /* Open JPEG unit and start decode */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    while (!(status & JPEG_STATUS_ERROR) && !timeout)
    {
        /* Set the input buffer to read `input_bytes` bytes at a time */
        err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
        assert(FSP_SUCCESS == err);
        /* This delay is required for streaming input mode to function correctly.
         * (Without this delay the JPEG Codec will not correctly locate markers in the file
         header.) */
        R_BSP_SoftwareDelay(10, BSP_DELAY_UNITS_MICROSECONDS);
        /* Wait for a callback */
        timeout = jpeg_event_wait();
        /* Get the status from the callback */
        status = g_jpeg_status;
        /* Break if the header has finished decoding */
        if (status & JPEG_STATUS_IMAGE_SIZE_READY)
        {
            break;
        }
        /* Move pointer to next block of input data (if needed) */
        p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
    }
    /* Get image size */
    uint16_t horizontal;
```

```
uint16_t vertical;
err = R_JPEG_DecodeImageSizeGet(&g_jpeg_ctrl, &horizontal, &vertical);
assert(FSP_SUCCESS == err);
/* Prepare output data buffer here if needed (already allocated in this example) */
uint8_t * p_output = decode_buffer;
/* Set horizontal stride */
err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, horizontal);
assert(FSP_SUCCESS == err);
/* Calculate the number of bytes that will fit in the buffer (16 lines in this
example) */
uint32_t output_size = horizontal * 16U * 4U;
/* Start decoding by setting the output buffer */
err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
assert(FSP_SUCCESS == err);
while (!(status & JPEG_STATUS_ERROR) && !timeout)
{
/* Wait for a callback */
timeout = jpeg_event_wait();
/* Get the status from the callback */
status = g_jpeg_status;
/* Break if decoding is complete */
if (status & JPEG_STATUS_OPERATION_COMPLETE)
{
break;
}
if (status & JPEG_STATUS_OUTPUT_PAUSE)
{
/* Draw the JPEG work buffer to the framebuffer here (if needed) */
/* Move pointer to next block of output data (if needed) */
p_output += output_size;
/* Set the output buffer to the next 16-line block */
err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
assert(FSP_SUCCESS == err);
}
}
```

```
if (status & JPEG_STATUS_INPUT_PAUSE)
{
/* Get next block of input data */
    p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
/* Set the new input buffer pointer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
    assert(FSP_SUCCESS == err);
}
}

/* Close driver to allow encode operations if needed */
err = R_JPEG_Close(&g_jpeg_ctrl);
assert(FSP_SUCCESS == err);
}
```

## Encode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and encode an image.

### Note

*This example assumes image dimensions are provided in the configuration. If this is not the case, [R\\_JPEG\\_EncodeImageSizeSet](#) must be used to set the size before calling [R\\_JPEG\\_InputBufferSet](#).*

```
void jpeg_encode_basic (void)
{
    fsp_err_t err;
/* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
/* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
    assert(FSP_SUCCESS == err);
/* Set input buffer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, RAW_YCBCR_IMAGE_PTR, IMAGE_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
/* Wait for decode completion */
```

```
jpeg_status_t status = (jpeg_status_t) 0;
while (!(status & JPEG_STATUS_OPERATION_COMPLETE))
{
    err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
    assert(FSP_SUCCESS == err);
}
}
```

## Streaming Encode Example

In this example the raw input data is provided in smaller chunks. This can help significantly reduce buffer size and improve throughput when streaming in raw data from an outside source.

```
/* Callback function for JPEG encode interrupts */
void jpeg_encode_callback (jpeg_callback_args_t * p_args)
{
    /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
    /* Set JPEG flag */
    jpeg_event = 1;
}
void jpeg_encode_streaming (void)
{
    uint8_t timeout = 0;
    uint8_t * p_chunk = (uint8_t *) RAW_YCBCR_IMAGE_PTR;
    fsp_err_t err;
    /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
    assert(FSP_SUCCESS == err);
    /* Set the image size */
    jpeg_encode_image_size_t image_size;
```

```
image_size.horizontal_resolution    = X_RESOLUTION;
image_size.vertical_resolution      = Y_RESOLUTION;
image_size.horizontal_stride_pixels = H_STRIDE;
err = R_JPEG_EncodeImageSizeSet(&g_jpeg_ctrl, &image_size);
assert(FSP_SUCCESS == err);

/* Calculate the size of the input data chunk (16 lines in this example) */
uint32_t chunk_size = H_STRIDE * 16U * YCBCR_BYTES_PER_PIXEL;

while (!timeout)
{
/* Set the input buffer */
err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_chunk, chunk_size);
assert(FSP_SUCCESS == err);

/* Wait for a callback */
timeout = jpeg_event_wait();

if (g_jpeg_status & JPEG_STATUS_OPERATION_COMPLETE)
{
/* Encode complete */
break;
}

if (g_jpeg_status & JPEG_STATUS_INPUT_PAUSE)
{
/* Load next block of input data here (if needed) */
p_chunk += chunk_size;
}
}
}
```

## Y'CbCr Conversion

The below function is provided as a reference for how to convert RGB values to Y'CbCr for use with the JPEG Codec.

### Note

*This function is only partially optimized for clarity. Further application-specific size- or speed-based optimizations should be considered when implementing in an actual project.*

```
#define RGB565_G_MASK 0x07E0
```

```
#define RGB565_B_MASK 0x001F

## Data Structures

struct [jpeg\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ jpeg\_instance\_ctrl\_t

struct jpeg_instance_ctrl_t		
JPEG Codec module control block. DO NOT INITIALIZE. Initialization occurs when jpeg_api_t::open is called.		
Data Fields		
uint32_t	open	JPEG Codec driver status.
<a href="#">jpeg_status_t</a>	status	JPEG Codec operational status.
<a href="#">fsp_err_t</a>	error_code	JPEG Codec error code (if any).
jpeg_mode_t	mode	Current mode (decode or encode).
uint32_t	horizontal_stride_bytes	Horizontal Stride settings.
uint32_t	output_buffer_size	Output buffer size.
<a href="#">jpeg_cfg_t</a> const *	p_cfg	JPEG Decode configuration struct.
void const *	p_extend	JPEG Codec hardware

		dependent configuration */.
<a href="#">jpeg_decode_pixel_format_t</a>	pixel_format	Pixel format.
uint16_t	total_lines_decoded	Track the number of lines decoded so far.
<a href="#">jpeg_decode_subsampling_t</a>	horizontal_subsampling	Horizontal sub-sample setting.
uint16_t	lines_to_encode	Number of lines to encode.
uint16_t	vertical_resolution	vertical size
uint16_t	total_lines_encoded	Number of lines encoded.

## Function Documentation

### ◆ R\_JPEG\_Open()

```
fsp_err_t R_JPEG_Open ( jpeg_ctrl_t *const p_api_ctrl, jpeg_cfg_t const *const p_cfg )
```

Initialize the JPEG Codec module.

#### Note

*This function configures the JPEG Codec for operation and sets up the registers for data format and pixel format based on user-supplied configuration parameters. Interrupts are enabled to support callbacks.*

#### Return values

FSP_SUCCESS	JPEG Codec module is properly configured and is ready to take input data.
FSP_ERR_ALREADY_OPEN	JPEG Codec is already open.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_IRQ_BSP_DISABLED	JEDI interrupt does not have an IRQ number.
FSP_ERR_INVALID_ARGUMENT	(Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid.
FSP_ERR_INVALID_ALIGNMENT	(Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes.

## ◆ R\_JPEG\_OutputBufferSet()

```
fsp_err_t R_JPEG_OutputBufferSet ( jpeg_ctrl_t * p_api_ctrl, void * p_output_buffer, uint32_t
output_buffer_size )
```

Assign a buffer to the JPEG Codec for storing output data.

### Note

*In Decode mode, the number of image lines to be decoded depends on the size of the buffer and the horizontal stride settings. Once the output buffer size is known, the horizontal stride value is known, and the input pixel format is known (the input pixel format is obtained by the JPEG decoder from the JPEG headers), the driver automatically computes the number of lines that can be decoded into the output buffer. After these lines are decoded, the JPEG engine pauses and a callback function is triggered, so the application is able to provide the next buffer for the JPEG module to resume the operation.*

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set and the output buffer is big enough to hold at least eight lines of decoded image data.

### Return values

FSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
FSP_ERR_ASSERTION	Pointer to the control block or output_buffer is NULL or output_buffer_size is 0.
FSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE	The number of horizontal pixels exceeds horizontal memory stride.
FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	Invalid buffer size.
FSP_ERR_IN_USE	The output buffer cannot be changed during codec operation.

## ◆ R\_JPEG\_InputBufferSet()

```
fsp_err_t R_JPEG_InputBufferSet ( jpeg_ctrl_t *const p_api_ctrl, void * p_data_buffer, uint32_t data_buffer_size )
```

Assign an input data buffer to the JPEG codec for processing.

**Note**

After the amount of data is processed, the JPEG driver triggers a callback function with the flag `JPEG_PRV_OPERATION_INPUT_PAUSE` set. The application supplies the next chunk of data to the driver so processing can resume.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least one line of decoded image data.

If zero is provided for the decode data buffer size the JPEG Codec will never pause for more input data and will continue to read until either an image has been fully decoded or an error condition occurs.

**Note**

When encoding images the minimum data buffer size is 8 lines by 16 Y'CbCr 4:2:2 pixels (256 bytes). This corresponds to one minimum coded unit (MCU) of the resulting JPEG output.

**Return values**

FSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
FSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the input_buffer is NULL, or the input_buffer_size is 0.
FSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_IN_USE	The input buffer cannot be changed while the codec is running.
FSP_ERR_INVALID_CALL	In encode mode the output buffer must be set first.
FSP_ERR_JPEG_IMAGE_SIZE_ERROR	The buffer size is smaller than the minimum coded unit (MCU).

◆ **R\_JPEG\_DeclineLinesDecodedGet()**

```
fsp_err_t R_JPEG_DeclineLinesDecodedGet ( jpeg_ctrl_t * p_api_ctrl, uint32_t * p_lines )
```

Returns the number of lines decoded into the output buffer.

**Note**

*Use this function to retrieve the number of image lines written to the output buffer after a partial decode operation. Combined with the horizontal stride settings and the output pixel format the application can compute the amount of data to read from the output buffer.*

**Return values**

FSP_SUCCESS	Line count successfully returned.
FSP_ERR_ASSERTION	Pointer to the control block or p_lines is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ **R\_JPEG\_DeclineImageSubsampleSet()**

```
fsp_err_t R_JPEG_DeclineImageSubsampleSet ( jpeg_ctrl_t *const p_api_ctrl,
jpeg_decode_subsample_t horizontal_subsample, jpeg_decode_subsample_t vertical_subsample )
```

Configure horizontal and vertical subsampling.

**Note**

*This function can be used to scale the output of decoded image data.*

**Return values**

FSP_SUCCESS	Horizontal subsample value is properly configured.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ **R\_JPEG\_DeCodeHorizontalStrideSet()**

```
fsp_err_t R_JPEG_DeCodeHorizontalStrideSet ( jpeg_ctrl_t * p_api_ctrl, uint32_t horizontal_stride )
```

Configure horizontal stride setting for decode operations.

**Note**

*If the image size is known prior to the open call and/or the output buffer stride is constant, pass the horizontal stride value in the `jpeg_cfg_t` structure. Otherwise, after the image size becomes available use this function to set the output buffer horizontal stride value.*

**Return values**

FSP_SUCCESS	Horizontal stride value is properly configured.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_INVALID_ALIGNMENT	Horizontal stride is zero or is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ **R\_JPEG\_DeCodeImageSizeGet()**

```
fsp_err_t R_JPEG_DeCodeImageSizeGet ( jpeg_ctrl_t * p_api_ctrl, uint16_t * p_horizontal_size, uint16_t * p_vertical_size )
```

Obtain the size of an image being decoded.

**Return values**

FSP_SUCCESS	The image size is available and the horizontal and vertical values are stored in the memory pointed to by <code>p_horizontal_size</code> and <code>p_vertical_size</code> .
FSP_ERR_ASSERTION	Pointer to the control block is NULL and/or size is not ready.
FSP_ERR_NOT_OPEN	JPEG is not opened.

## ◆ R\_JPEG\_DeclarePixelFormatGet()

```
fsp_err_t R_JPEG_DeclarePixelFormatGet ( jpeg_ctrl_t * p_api_ctrl, jpeg_color_space_t *
p_color_space )
```

Get the color format of the JPEG being decoded.

**Return values**

FSP_SUCCESS	The color format was successfully retrieved.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG is not opened.

## ◆ R\_JPEG\_EncodeImageSizeSet()

```
fsp_err_t R_JPEG_EncodeImageSizeSet ( jpeg_ctrl_t *const p_api_ctrl, jpeg_encode_image_size_t *
p_image_size )
```

Set the image dimensions for an encode operation.

**Note**

*Image dimensions must be set before setting the input buffer.*

**Return values**

FSP_SUCCESS	Image size was successfully written to the JPEG Codec.
FSP_ERR_ASSERTION	Pointer to the control block or p_image_size is NULL.
FSP_ERR_INVALID_ALIGNMENT	Horizontal stride is not 8-byte aligned.
FSP_ERR_INVALID_ARGUMENT	Horizontal or vertical resolution is invalid or zero.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_IN_USE	Image parameters cannot be changed while the codec is running.

## ◆ R\_JPEG\_ModeSet()

```
fsp_err_t R_JPEG_ModeSet ( jpeg_ctrl_t *const p_api_ctrl, jpeg_mode_t mode )
```

Switch between encode and decode mode (or vice-versa).

**Note**

*The codec must not be idle in order to switch modes.*

**Return values**

FSP_SUCCESS	Mode changed successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	JPEG Codec is currently in use.
FSP_ERR_INVALID_ARGUMENT	(Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid.
FSP_ERR_INVALID_ALIGNMENT	(Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes.

## ◆ R\_JPEG\_Close()

```
fsp_err_t R_JPEG_Close ( jpeg_ctrl_t * p_api_ctrl)
```

Cancel an outstanding JPEG codec operation and close the device.

**Return values**

FSP_SUCCESS	The JPEG unit is stopped and the driver is closed.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

**◆ R\_JPEG\_StatusGet()**

```
fsp_err_t R_JPEG_StatusGet ( jpeg_ctrl_t* p_api_ctrl, jpeg_status_t* p_status )
```

Get the status of the JPEG codec. This function can also be used to poll the device.

**Return values**

FSP_SUCCESS	The status information is successfully retrieved.
FSP_ERR_ASSERTION	Pointer to the control block or p_status is NULL.
FSP_ERR_NOT_OPEN	JPEG is not opened.

**4.2.7.5 Parallel Data Capture (r\_pdc)**

Modules » Graphics

**Functions**

```
fsp_err_t R_PDC_Open ( pdc_ctrl_t*const p_api_ctrl, pdc_cfg_t const*const p_cfg)
```

Powers on PDC, handles required initialization described in the hardware manual. [More...](#)

```
fsp_err_t R_PDC_Close ( pdc_ctrl_t*const p_api_ctrl)
```

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts. [More...](#)

```
fsp_err_t R_PDC_CaptureStart ( pdc_ctrl_t*const p_api_ctrl, uint8_t*const p_buffer)
```

Starts a capture. Enables interrupts. [More...](#)

**Detailed Description**

Driver for the PDC peripheral on RA MCUs. This module implements the [PDC Interface](#).

**Overview**

The PDC peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked every time a frame of data is accepted.

## Features

- Capture incoming data into a user defined buffer
- Data bytes per pixel can be configured
- Endianness of the incoming data can be specified
- Supports configuring capture width and height
- Supports configuring vertical and horizontal sync polarity
- Horizontal and Vertical position for image/data capture can be specified
- External clock to the camera module can be adjusted
- Choice between DMA and DTC to transfer out the captured data
- The specified user callback is invoked when a data frame is captured

## Configuration

### Build Time Configurations for r\_pdc

The following build time configurations are defined in fsp\_cfg/r\_pdc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Graphics > Parallel Data Capture (r\_pdc)

This module can be added to the Stacks tab via New Stack > Graphics > Parallel Data Capture (r\_pdc).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_pdc0	Module name.
Input > Signal polarity > HSYNC	<ul style="list-style-type: none"> <li>• High</li> <li>• Low</li> </ul>	High	Specify the active polarity of the HSYNC signal.
Input > Signal polarity > VSYNC	<ul style="list-style-type: none"> <li>• High</li> <li>• Low</li> </ul>	High	Specify the active polarity of the VSYNC signal.
Input > Capture Specifications > Number of pixels to capture horizontally	Value must be an integer greater than 0	640	Specify the number of horizontal pixels to capture.
Input > Capture Specifications > Number of lines to capture vertically	Value must be an integer greater than 0	480	Specify the number of vertical pixels to capture.
Input > Capture Specifications > Horizontal pixel to start capture from	Value must be an integer	0	Specify the horizontal pixel to start capturing image data from. Allows an image

Input > Capture Specifications > Line to start capture from	Value must be an integer	0	smaller than the native resolution of a camera to be captured.
Input > Bytes per pixel	Value must be an integer greater than 0	2	Specify the vertical line to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured.
Input > Clock divider	<ul style="list-style-type: none"> <li>• CLK/2</li> <li>• CLK/4</li> <li>• CLK/6</li> <li>• CLK/8</li> <li>• CLK/10</li> <li>• CLK/12</li> <li>• CLK/14</li> <li>• CLK/16</li> </ul>	CLK/2	Specify the number of bytes per pixel of the captured image data.
Input > Endianess	<ul style="list-style-type: none"> <li>• Little</li> <li>• Big</li> </ul>	Little	Specify the clock divider of the clock input to the PDC peripheral.
Output > Buffer > Image buffer name	Name must be a valid C symbol	g_user_buffer	Specify the endianness of the captured image data.
Output > Buffer > Image buffer section	This property must be a valid section name	.bss	Specify the name of the data buffer to create or set to NULL, if it is to be created by the user external to the PDC driver.
Output > Buffer > Number of image buffers	Value must be an integer greater than 0	1	Specify the RAM section for the image data buffer. Typically .bss (internal RAM) or .sdram. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.
Interrupts > Callback	Name must be a valid C symbol	g_pdc_user_callback	Specify the number of buffers to create.
			A user callback function must be provided. This callback is invoked for every

successful frame capture and any error conditions

Interrupts > PDC  
Interrupt Priority

MCU Specific Options

Select the PDC interrupt priority.

Interrupts > DTC  
Interrupt Priority

MCU Specific Options

Select the DTC interrupt priority.

## Clock Configuration

The PDC peripheral module uses the PCLKB as its clock source. The maximum clock to the camera module is  $PCLKB / 2$ .

## Pin Configuration

The PCKO pin is a clock output and should be connected to the clock input of the camera. The PIXCLK pin is a clock input and should be connected to the output pixel clock of the camera. Likewise, the HSYNC and VSYNC pins must be connected to the horizontal and vertical sync signals of the camera, respectively. The PIXD0-PIXD7 pins are the 8-bit data bus input and should be connected to the relevant output pins of the camera.

### Note

*Camera control and serial communication pins must be configured separately and are not controlled by this module.*

# Usage Notes

## Interrupt Configuration

- PDC error interrupts are used by this module for reporting errors such as overrun, underrun, vertical line number setting and horizontal byte number setting errors.
- In addition to the PDC error interrupts, DMA or DTC interrupts are also used internally to perform data transfer from this peripheral to the specified image buffer.
- Receive data ready interrupt is used as activation source for DMA and DTC trigger.

## Enabling Transfer Modules

- An option to select between DMAC or DTC is provided with DMA as the default transfer choice.
- For further details on DMA please refer [Transfer \(r\\_dmac\)](#)
- For further details on DTC please refer [Transfer \(r\\_dtc\)](#)

## PDC setup with external camera

- Before configuring the external camera device the PDC Open API must be called in order to start clock output.
- Ensure that the memory pointed to by p\_buffer is both valid and large enough to store a complete image.
- The amount of space required (in bytes) can be calculated as:  $\text{size (bytes)} = \text{image width (pixels)} * \text{image height (lines)} * \text{number of bytes per pixel}$
- Ensure that the size above is divisible by and aligned to 32 bytes.

# Examples

## Basic Example

This is a basic example of minimal use of the PDC in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
void g_pdc_user_callback (pdc_callback_args_t * p_args)
{
    if (PDC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_capture_ready = true;
    }
}

void basic_example (void)
{
    fsp_err_t err;
    /* Initialize the PDC module */
    err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Initialize the camera module at this point. This implementation is camera vendor
specific. */
    camera_module_initialization();
    /* Initialize capture ready flag to false. This gets set to true in PDC callback
upon successful frame capture. */
    g_capture_ready = false;
    err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
    assert(FSP_SUCCESS == err);
    uint32_t timeout_ms = PDC_DELAY_MS;
    /* Since there is nothing else to do, block until Callback triggers*/
    while ((true != g_capture_ready) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;;
    }
    if (0U == timeout_ms)
    {
```

```
    __BKPT(0);  
}  
  
static void camera_module_initialization (void)  
{  
    /* Camera vendor specific initialization to be done here */  
}
```

## Data Structures

struct [pdc\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ pdc\_instance\_ctrl\_t

struct pdc\_instance\_ctrl\_t

PDC instance control block. DO NOT INITIALIZE.

## Function Documentation

◆ **R\_PDC\_Open()**

```
fsp_err_t R_PDC_Open ( pdc_ctrl_t *const p_api_ctrl, pdc_cfg_t const *const p_cfg )
```

Powers on PDC, handles required initialization described in the hardware manual.

Implements `pdc_api_t::open`.

The Open function provides initial configuration for the PDC module. It powers on the module and enables the PCLKO output and the PIXCLK input. Further initialization requires the PIXCLK input to be running in order to be able to reset the PDC as part of its initialization. This clock is input from a camera module and so the reset and further initialization is performed in `pdc_api_t::captureStart`. This function should be called once prior to calling any other PDC API functions. After the PDC is opened the Open function should not be called again without first calling the Close function.

Example:

```
/* Initialize the PDC module */
err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
```

**Return values**

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL <ol style="list-style-type: none"> <li>1. p_cfg is NULL</li> <li>2. p_api_ctrl is NULL</li> <li>3. The pointer to the transfer interface in the p_cfg parameter is NULL</li> <li>4. Callback parameter is NULL.</li> <li>5. Invalid IRQ number assigned</li> </ol>
FSP_ERR_INVALID_ARGUMENT	One or more of the following parameters is incorrect <ol style="list-style-type: none"> <li>1. bytes_per_pixel is zero</li> <li>2. x_capture_pixels is zero</li> <li>3. y_capture_pixels is zero</li> <li>4. x_capture_start_pixel + x_capture_pixels is greater than 4095, OR</li> <li>5. y_capture_start_pixel + y_capture_pixels is greater than 4095</li> </ol>
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ **R\_PDC\_Close()**

```
fsp_err_t R_PDC_Close ( pdc_ctrl_t *const p_api_ctrl)
```

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts.

Implements `pdc_api_t::close`.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	<code>p_api_ctrl</code> is NULL
FSP_ERR_NOT_OPEN	Open has not been successfully called.

◆ **R\_PDC\_CaptureStart()**

```
fsp_err_t R_PDC_CaptureStart ( pdc_ctrl_t *const p_api_ctrl, uint8_t *const p_buffer )
```

Starts a capture. Enables interrupts.

Implements `pdc_api_t::captureStart`.

Sets up the transfer interface to transfer data from the PDC into the specified buffer. Configures the PDC settings as previously set by the `pdc_api_t::open` API. These settings are configured here as the PIXCLK input must be active for the PDC reset operation. When a capture is complete the callback registered during `pdc_api_t::open` API call will be called.

Example:

```
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Capture start successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL <ul style="list-style-type: none"> <li>1. <code>p_api_ctrl</code> is NULL</li> <li>2. <code>p_buffer</code> is NULL while <code>p_buffer</code> field of the control structure is NULL</li> </ul>
FSP_ERR_NOT_OPEN	Open has not been successfully called.
FSP_ERR_IN_USE	PDC transfer is already in progress.
FSP_ERR_TIMEOUT	Reset operation timed out.

#### 4.2.7.6 SEGGER emWin RA Port (rm\_emwin\_port)

Modules » Graphics

SEGGER emWin port for RA MCUs.

## Overview

The SEGGER emWin RA Port module provides the configuration and hardware acceleration support necessary for use of emWin on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG) as well as FreeRTOS.

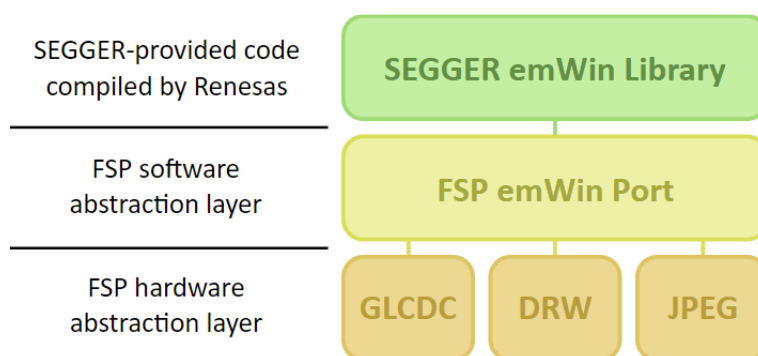

Figure 207: SEGGER emWin FSP Port Block Diagram

### Note

*This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. Please consult the SEGGER emWin User Guide (UM03001) for details on how to use emWin in your project.*

## Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine (r\_drw)
  - Drawing bitmaps (ARGB8888 and RGB565)
  - 4bpp font rendering
  - Rectangle fill
  - Line and shape drawing
  - Anti-aliased operations
    - Circle stroke and fill
    - Polygon stroke and fill
    - Lines and arcs
- JPEG Codec (r\_jpeg)
  - JPEG decoding
- Graphics LCD Controller (r\_glcdc)
  - Brightness, contrast and gamma correction
  - Pixel format conversion (framebuffer to LCD)

## Configuration

## Build Time Configurations for rm\_emwin\_port

The following build time configurations are defined in fsp\_cfg/rm\_emwin\_port\_cfg.h:

Configuration	Options	Default	Description
Memory Allocation > GUI Heap Size	Value must be a non-negative integer	32768	Set the size of the heap to be allocated for use exclusively by emWin.
Memory Allocation > Section for GUI Heap	Manual Entry	.noinit	Specify the section in which to allocate the GUI heap. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.
Memory Allocation > Maximum Layers	Value must be a non-negative integer	16	Set the maximum number of available display layers in emWin.  This setting is not related to GLCDC Layer 1 or 2.
Memory Allocation > AA Font Conversion Buffer Size	Value must be a non-negative integer	400	Set the size of the conversion buffer for anti-aliased font glyphs. This should be set to the size (in bytes) of the largest AA character to be rendered.
Configuration > Multi-thread Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Enable or disable multithreading support.
Configuration > Number of emWin-supported threads	Manual Entry	5	If multithreading support is enabled this configuration specifies the number of different tasks that can call emWin functions.
Configuration > Touch Panel Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Enable or disable touch panel support.
Configuration > Mouse Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable or disable support for mouse input.
Configuration >	<ul style="list-style-type: none"> <li>• Enabled</li> </ul>	Enabled	Enable or disable

Memory Devices	<ul style="list-style-type: none"> <li>• Disabled</li> </ul>		support for memory devices, which allow the user to allocate their own memory in the GUI heap.
Configuration > Text Rotation	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Enable or disable support for displaying rotated text.
Configuration > Window Manager	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Enable or disable the emWin Window Manager (WM).
Configuration > Bidirectional Text	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable or disable support for bidirectional text (such as Arabic or Hebrew).
Configuration > Debug Logging Level	<ul style="list-style-type: none"> <li>• None (0)</li> <li>• Parameter checking only (1)</li> <li>• All checks enabled (2)</li> <li>• Log errors (3)</li> <li>• Log warnings (4)</li> <li>• Log all messages (5)</li> </ul>	All checks enabled (2)	Set the debug logging level.
LCD Settings > Wait for Vertical Sync	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	<p>When enabled emWin will wait for a vertical sync event each time the display is updated. If an RTOS is used the thread will yield; otherwise each frame will block until Vsync.</p> <p><b>WARNING:</b> Disabling vertical sync will result in tearing. It is recommended to always leave this setting Enabled if an RTOS is used.</p>
JPEG Decoding > General > Input Alignment	<ul style="list-style-type: none"> <li>• 8-byte aligned (faster)</li> <li>• Unaligned (slower)</li> </ul>	8-byte aligned (faster)	Setting this option to 8-bit alignment can allow the hardware JPEG Codec to directly read JPEG data. This speeds up JPEG decoding operations and reduces RAM overhead, but all JPEG

images must reside on an 8-byte boundary.

When this option is enabled the input buffer is not allocated.

Enable this option to configure JPEG decoding operations to use a double-buffered output pipeline. This allows the JPEG to be rendered to the display at the same time as decoding at the cost of additional RAM usage.

Enabling this option automatically allocates double the output buffer size.

Set the timeout for JPEG decoding operations (in RTOS ticks) in the event of a decode error.

Set the size of the JPEG decode input buffer (in bytes). This buffer is used to ensure 8-byte alignment of input data. Specifying a size smaller than the size of the JPEG to decode will use additional interrupts to stream data in during the decoding process.

Set the size of the JPEG decode output buffer (in bytes). An output buffer smaller than the size of a decoded image will use additional interrupts to stream the data into a framebuffer.

Unless you are sure of the subsampling used in and the size of the input JPEG images it is

JPEG Decoding >  
General > Double-  
Buffer Output

- Enabled
- Disabled

Disabled

JPEG Decoding >  
General > Error  
Timeout

Value must be a non-  
negative integer

50

JPEG Decoding >  
Buffers > Input Buffer  
Size

Value must be a non-  
negative integer

0x1000

JPEG Decoding >  
Buffers > Output Buffer  
Size

Value must be a non-  
negative integer

0x3C00

recommended to allocate at least 16 framebuffer lines of memory.

JPEG Decoding >  
Buffers > Section for  
Buffers

Manual Entry

.noinit

Specify the section in which to allocate the JPEG work buffers. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be `.bss` or start with `.bss.` to avoid consuming unnecessary ROM space.

## Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

## Usage Notes

### Getting Started

To get started with emWin in an RA project the following must be performed:

1. Open the RA Configuration editor for your project
2. Add emWin to your project in the Stacks view by clicking **New Stack -> SEGGER -> SEGGER emWin**
3. Ensure the configuration options for emWin are set as necessary for your application
4. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
5. Set the JPEG decode color depth to the desired value (if applicable)
6. Ensure interrupts on all modules are enabled:
  - GLCDC Vertical Position (Vpos) Interrupt
  - DRW Interrupt (if applicable)
  - JPEG Encode/Decode and Data Transfer Interrupts (if applicable)
7. Confirm stack and heap are configured as needed
  - When starting development a minimum stack of 0x1000 (4K) and heap of 0x4000 (16K) are recommended until actual usage can be characterized
8. Click Generate Project Content to save and commit configuration changes

At this point the project is now ready to build with emWin. Please refer to the SEGGER emWin User Guide (UM03001) as well as demo and sample code for details on how to create a GUI application.

### Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed depending on the item in question:

- Bitmaps:
  - ARGB8888, RGB888 and RGB565 bitmaps require no additional settings.

- Anti-aliased shapes:
  - Anti-aliased lines, circles, polygons, polygon outlines and arcs are rendered with the DRW Engine.
- Anti-aliased (4bpp) fonts:
  - Set the text mode to GUI\_TM\_TRANS or create the relevant widget with WM\_CF\_HASTRANS set.
  - Ensure the "AA Font Conversion Buffer Size" configuration option is set to a size equal to or greater than the size (in bytes) of the largest glyph.
- 8bpp palletized images:
  - When creating these images ensure transparency is not enabled as the SEGGER method for this is not compatible with the DRW Engine.
- RLE-encoded images:
  - Hardware acceleration is not available for SEGGER's RLE format.
- JPEG images:
  - Align any user-declared JPEG data to an 8-byte boundary. If 8-byte alignment cannot be guaranteed disable the **JPEG Decoding -> General -> Input Alignment** option in the RA Configuration.

## Multi-thread Support

When the "Multi-thread Support" configuration is enabled, emWin can be called from multiple threads. This comes with advantages and disadvantages:

Advantages:

- High flexibility in development of applications
- Threads can pend and post on emWin events

Disadvantages:

- Slightly higher RAM/ROM use
- Large GUI projects can become difficult to debug

*Note*

*Multi-thread support is independent of RTOS support. RTOS support is managed internally and cannot be manually configured.*

## Limitations

Developers should be aware of the following limitations when using SEGGER emWin with FSP:

- Hardware acceleration is not available when using color modes lower than 16 bits.
- Hardware acceleration is not available for SEGGER's RLE image format.
- Rotated screen modes are not supported.

---

# Examples

## Basic Example

This is a basic example demonstrating a very simple emWin application. The screen is cleared to white and "Hello World!" is printed in the center.

*Note*

*emWin manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened*

*directly.*

```
#include "DIALOG.h"
#define COLOR_WHITE 0x00FFFFFFU
#define COLOR_BLACK 0x00000000U
#define GUI_DRAW_DELAY 100
static void _cbMain (WM_MESSAGE * pMsg)
{
    GUI_RECT Rect;
    switch (pMsg->MsgId)
    {
        case WM_CREATE:
            {
                break;
            }
        case WM_PAINT:
            {
                /* Clear background to white */
                GUI_SetBkColor(COLOR_WHITE);
                GUI_Clear();

                /* Draw "Hello World!" in black in the center */
                WM_GetClientRect(&Rect);
                GUI_SetColor(COLOR_BLACK);
                GUI_DispStringInRect("Hello World!", &Rect, GUI_TA_VCENTER |
GUI_TA_HCENTER);
                break;
            }
        default:
            {
                WM_DefaultProc(pMsg);
                break;
            }
    }
}

void emWinTask (void)
```

```

{
    int32_t xSize;
    int32_t ySize;
    /* Initialize emWin */
    GUI_Init();
    /* Get screen dimensions */
    xSize = LCD_GetXSize();
    ySize = LCD_GetYSize();
    /* Create main window */
    WM_CreateWindowAsChild(0, 0, xSize, ySize, WM_HBKWIN, WM_CF_SHOW, _cbMain, 0);
    /* Enter main drawing loop */
    while (1)
    {
        GUI_Delay(GUI_DRAW_DELAY);
    }
}

```

**Note**

For further example code please consult SEGGER emWin documentation, which can be downloaded [here](#), as well as the Quick Start Guide and example project(s) provided with your Evaluation Kit (if applicable).

```

## Detailed Description

Driver for the SLCDC peripheral on RA MCUs. This module implements the [SLCDC Interface](#).

## Overview

The segment LCD controller (SLCDC) utilizes two to four reference voltages to provide AC signals for driving traditional segment LCD panels. Depending on the LCD and MCU package, up to 272 segments can be driven. A built-in link to the RTC allows for up to 152 segments to switch between two patterns at regular intervals. An on-chip boost driver can be used to provide configurable reference voltages up to 5.25V allowing for simple contrast adjustment.

## Features

The SLCDC module can perform the following functions:

- Initialize, start and stop the SLCDC
- Set and modify the output pattern
- Blink between two patterns based on a periodic RTC interrupt signal
- Adjust display contrast (only when using internal voltage boosting)

## Configuration

### Build Time Configurations for r\_slcdc

The following build time configurations are defined in fsp\_cfg/r\_slcdc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Graphics > Segment LCD (r\_slcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Segment LCD (r\_slcdc).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_slcdc0	Module Name

Clock > Source	<ul style="list-style-type: none"> <li>• LOCO</li> <li>• SOSC</li> <li>• MOSC</li> <li>• HOCO</li> </ul>	HOCO	Select the clock source.
Clock > Divisor	Refer to the RA Configuration tool for available options.	(HOCO/MOSC) 16384	Select the clock divisor.
Output > Bias method	<ul style="list-style-type: none"> <li>• 1/2 bias</li> <li>• 1/3 bias</li> <li>• 1/4 bias</li> </ul>	1/2 bias	Select the bias method. This determines the number of voltage levels used to create the waveforms.
Output > Timeslice	<ul style="list-style-type: none"> <li>• Static</li> <li>• 2-slice</li> <li>• 3-slice</li> <li>• 4-slice</li> <li>• 8-slice</li> </ul>	Static	Select the LCD time slice. The number of slices should match the number of common (COM) pins for your LCD panel.
Output > Waveform	<ul style="list-style-type: none"> <li>• Waveform A</li> <li>• Waveform B</li> </ul>	Waveform A	Select the LCD waveform.
Output > Drive method	<ul style="list-style-type: none"> <li>• External resistance division</li> <li>• Internal voltage boosting</li> <li>• Capacitor split</li> </ul>	External resistance division	Select the LCD drive method.
Output > Default contrast	Refer to the RA Configuration tool for available options.	0	Select the default contrast level.

## Valid Configurations

Though there are many setting combinations only a limited subset are supported by the SLCDC peripheral hardware:

Waveform	Slices	Bias	External Resistance	Internal Boost	Capacitor Split
A	8	1/4	Available	Available	—
A	4	1/3	Available	Available	Available
A	3	1/3	Available	Available	Available
A	3	1/2	Available	—	—
A	2	1/2	Available	—	—
A	Static	—	Available	—	—
B	8	1/4	Available	Available	Available
B	4	1/3	Available	Available	—

## Clock Configuration

The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO or LOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 524288 for MOSC/HOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz.

### Note

*Make sure your desired source clock is enabled and running before starting SLCDC output.  
Do not set the segment LCD clock over 512 Hz when using internal boost or capacitor split modes.*

## Pin Configuration

This module controls a variety of pins necessary for segment LCD voltage generation and signal output:

Pin Name	Function	Notes
SEGN	Segment data output	Connect these signals to the segment pins of the LCD.
COMn	Common signal output	Connect these signals to the common pins of the LCD.
VLn	Voltage reference	These pins should be connected to passive components based on the selected drive method (see section 45.7 "Supplying LCD Drive Voltages VL1, VL2, VL3, and VL4" in the RA4M1 User's Manual (R01UH0887EJ0100)).
CAPH, CAPL	Drive voltage generator capacitor	Connect a nonpolar 0.47uF capacitor across these pins when using internal boost or capacitor split modes. This pin is not needed when using resistance division.

## Interrupt Configuration

The SLCDC provides no interrupt signals.

### Note

*Blinking output timing is driven directly from the RTC periodic interrupt. Once the interrupt is enabled setting the display to SLCDC\_DISP\_BLINK will swap between A- and B-pattern each time it occurs. The ELC is not required for this functionality.*

## Usage Notes

### Limitations

Developers should be aware of the following limitations when using the SLCDC:

- Different packages provide different numbers of segment pins. Check the User's Manual for

your device to confirm availability and mapping of segment signals.

- When using internal boost mode a delay of 5ms is required between calling R\_SLCDC\_Open and R\_SLCDC\_Start to allow the boost circuit to charge.
- When using the internal boost or capacitor split method do not set the segment LCD clock higher than 512 Hz.

## Examples

### Basic Example

Below is a basic example of minimal use of the SLCDC in an application. The SLCDC driver is initialized, output is started and a pattern is written to the segment registers.

```
void slcdc_init (void)
{
    fsp_err_t err;

    /* Open SLCDC driver */
    err = R_SLCDC_Open(&g_slcdc_ctrl, &g_slcdc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* When using internal boost mode this delay is required to allow the boost circuit
to charge. See RA4M1 User's
    * Manual (R01UH0887EJ0100) 8.2.18 "Segment LCD Source Clock Control Register
(SLCDSCKCR)" for details. */
    R_BSP_SoftwareDelay(5, BSP_DELAY_UNITS_MILLISECONDS);

    /* Start SLCDC output */
    err = R_SLCDC_Start(&g_slcdc_ctrl);
    assert(FSP_SUCCESS == err);

    /* Write pattern to display */
    err = R_SLCDC_Write(&g_slcdc_ctrl, 0, segment_data, NUM_SEGMENTS);
    assert(FSP_SUCCESS == err);
}
```

#### Note

*While the SLCDC is running, pattern data is constantly being output. No latching or buffering is required when writing or reading segment data.*

### Blinking Output

This example demonstrates how to set up blinking output using the RTC periodic interrupt. In this example it is assumed that the SLCDC has already been started.

```
void slcdc_blink (void)
{
    fsp_err_t err;

    /* Open RTC and set time/date */
    err = R_RTC_Open(&r_rtc_ctrl, &r_rtc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    err = R_RTC_CalendarTimeSet(&r_rtc_ctrl, &g_rtc_time);
    assert(FSP_SUCCESS == err);

    /* Set RTC periodic interrupt to 2 Hz (display blink cycle will be 1 Hz) */
    err = R_RTC_PeriodicIrqRateSet(&r_rtc_ctrl,
    RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_2_SECOND);
    assert(FSP_SUCCESS == err);

    /* Set display to blink */
    err = R_SLCDC_SetDisplayArea(&g_slcdc_ctrl, SLCDC_DISP_BLINK);
    assert(FSP_SUCCESS == err);

    /* Display will now continuously blink */
}
```

## Data Structures

struct [slcdc\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ [slcdc\\_instance\\_ctrl\\_t](#)

struct [slcdc\\_instance\\_ctrl\\_t](#)

SLCDC control block. DO NOT INITIALIZE. Initialization occurs when [slcdc\\_api\\_t::open](#) is called

## Function Documentation

◆ **R\_SLCDC\_Open()**

```
fsp_err_t R_SLCDC_Open ( slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const *const p_cfg )
```

Opens the SLCDC driver. Implements `slcdc_api_t::open`.

**Return values**

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Invalid display mode.

◆ **R\_SLCDC\_Write()**

```
fsp_err_t R_SLCDC_Write ( slcdc_ctrl_t *const p_ctrl, uint8_t const start_segment, uint8_t const *p_data, uint8_t const segment_count )
```

Writes a sequence of display data to the segment data registers. Implements `slcdc_api_t::write`.

**Return values**

FSP_SUCCESS	Data was written successfully.
FSP_ERR_ASSERTION	Pointer to the control block or data is NULL.
FSP_ERR_INVALID_ARGUMENT	Segment index is (or will be) out of range.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

◆ **R\_SLCDC\_Modify()**

```
fsp_err_t R_SLCDC_Modify ( slcdc_ctrl_t *const p_ctrl, uint8_t const segment, uint8_t const data, uint8_t const data_mask )
```

Modifies a single segment register based on a mask and the desired data. Implements `slcdc_api_t::modify`.

**Return values**

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_INVALID_ARGUMENT	Invalid parameter in the argument.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ **R\_SLCDC\_Start()**

```
fsp_err_t R_SLCDC_Start ( slcdc_ctrl_t *const p_ctrl)
```

Starts output of LCD signals. Implements `slcdc_api_t::start`.

**Return values**

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ **R\_SLCDC\_Stop()**

```
fsp_err_t R_SLCDC_Stop ( slcdc_ctrl_t *const p_ctrl)
```

Stops output of LCD signals. Implements `slcdc_api_t::stop`.

**Return values**

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ **R\_SLCDC\_SetContrast()**

```
fsp_err_t R_SLCDC_SetContrast ( slcdc_ctrl_t *const p_ctrl, slcdc_contrast_t const contrast )
```

Sets contrast to the specified level. Implements `slcdc_api_t::setContrast`.

**Note**

*Contrast can be adjusted when the SLCDC is operating in internal boost mode only. The range of values is 0-5 when 1/4 bias setting is used and 0-15 otherwise. See RA4M1 User's Manual (R01UH0887EJ0100) section 45.2.4 "LCD Boost Level Control Register (VLCD)" for voltage levels at each setting.*

**Return values**

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized
FSP_ERR_UNSUPPORTED	Unsupported operation

**◆ R\_SLCDC\_SetDisplayArea()**

```
fsp_err_t R_SLCDC_SetDisplayArea ( slcdc_ctrl_t *const p_ctrl, slcdc_display_area_t const display_area )
```

Sets output to Waveform A, Waveform B or blinking output. Implements `slcdc_api_t::setDisplayArea`.

**Return values**

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_UNSUPPORTED	Pattern selection has no effect in 8-time-slice mode.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

**◆ R\_SLCDC\_Close()**

```
fsp_err_t R_SLCDC_Close ( slcdc_ctrl_t *const p_ctrl)
```

Closes the SLCDC driver. Implements `slcdc_api_t::close`.

**Return values**

FSP_SUCCESS	Device was closed successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

fsp\_err\_t R\_ICU\_ExternalIrqOpen (external\_irq\_ctrl\_t \*const p\_api\_ctrl, external\_irq\_cfg\_t const \*const p\_cfg)

fsp\_err\_t R\_ICU\_ExternalIrqEnable (external\_irq\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t R\_ICU\_ExternalIrqDisable (external\_irq\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t R\_ICU\_ExternalIrqCallbackSet (external\_irq\_ctrl\_t \*const p\_api\_ctrl, void(\*p\_callback)(external\_irq\_callback\_args\_t \*), void const \*const p\_context, external\_irq\_callback\_args\_t \*const p\_callback\_memory)

fsp\_err\_t R\_ICU\_ExternalIrqClose (external\_irq\_ctrl\_t \*const p\_api\_ctrl)

#### Detailed Description

Driver for the ICU peripheral on RA MCUs. This module implements the [External IRQ Interface](#).

## Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC, DTC, and DMAC modules. The R\_ICU software module only implements the [External IRQ Interface](#). The external\_irq interface is for configuring interrupts to fire when a trigger condition is detected on an external IRQ pin.

#### Note

*Multiple instances are used when more than one external interrupt is needed. Configure each instance with different channels and properties as needed for the specific interrupt.*

#### Features

- Supports configuring interrupts for IRQ pins on the target MCUs
  - Enabling and disabling interrupt generation.
  - Configuring interrupt trigger on rising edge, falling edge, both edges, or low level

- signal.
  - Enabling and disabling the IRQ noise filter.
- Supports configuring a user callback function, which will be invoked by the HAL module when an external pin interrupt is generated.

## Configuration

### Build Time Configurations for r\_icu

The following build time configurations are defined in fsp\_cfg/r\_icu\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Input > External IRQ (r\_icu)

This module can be added to the Stacks tab via New Stack > Input > External IRQ (r\_icu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_external_irq0	Module name.
Channel	Value must be an integer between 0 and 15	0	Specify the hardware channel.
Trigger	<ul style="list-style-type: none"> <li>• Falling</li> <li>• Rising</li> <li>• Both Edges</li> <li>• Low Level</li> </ul>	Rising	Select the signal edge or state that triggers an interrupt.
Digital Filtering	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Select if the digital noise filter should be enabled.
Digital Filtering Sample Clock (Only valid when Digital Filtering is Enabled)	<ul style="list-style-type: none"> <li>• PCLK / 1</li> <li>• PCLK / 8</li> <li>• PCLK / 32</li> <li>• PCLK / 64</li> </ul>	PCLK / 64	Select the clock divider for the digital noise filter.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the IRQn triggers

Pin Interrupt Priority      MCU Specific Options

Select the PIN interrupt priority.

## Clock Configuration

The ICU peripheral module doesn't require any specific clock settings.

### Note

*The digital filter uses PCLKB as the clock source for sampling the IRQ pin.*

## Pin Configuration

The pin for the external interrupt channel must be configured as an input with IRQ Input Enabled.

# Usage Notes

## Digital Filter

The digital filter is used to reject trigger conditions that are too short. The trigger condition must be longer than three periods of the filter clock. The filter clock frequency is determined by PCLKB and the `external_irq_pclk_div_t` setting.

$$\text{MIN\_PULSE\_WIDTH} = \text{EXTERNAL\_IRQ\_PCLKB\_DIV} / \text{PCLKB\_FREQUENCY} * 3$$

## DMAC/DTC

When using an External IRQ pin to trigger a DMAC/DTC transfer, the External IRQ pin must be opened before the transfer instance is opened.

# Examples

## Basic Example

This is a basic example of minimal use of the ICU in an application.

```
#define ICU_IRQN_PIN BSP_IO_PORT_02_PIN_06
#define ICU_IRQN 6
/* Called from icu_irq_isr */
void external_irq_callback (external_irq_callback_args_t * p_args)
{
    (void) p_args;
    g_external_irq_complete = 1;
}
void simple_example ()
{
    /* Example Configuration */
}
```

```

external_irq_cfg_t icu_cfg =
{
    .channel      = ICU_IRQN,
    .trigger      = EXTERNAL_IRQ_TRIG_RISING,
    .filter_enable = false,
    .pclk_div     = EXTERNAL_IRQ_PCLK_DIV_BY_1,
    .p_callback   = external_irq_callback,
    .p_context    = 0,
    .ipl          = 0,
    .irq          = (IRQn_Type) 0,
};

/* Configure the external interrupt. */
fsp_err_t err = R_ICU_ExternalIrqOpen(&g_icu_ctrl, &icu_cfg);
assert(FSP_SUCCESS == err);

/* Enable the external interrupt. */
/* Enable not required when used with ELC or DMAC. */
err = R_ICU_ExternalIrqEnable(&g_icu_ctrl);
assert(FSP_SUCCESS == err);

while (0 == g_external_irq_complete)
{
    /* Wait for interrupt. */
}
}

```

## Data Structures

struct [icu\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ icu\_instance\_ctrl\_t

struct [icu\\_instance\\_ctrl\\_t](#)

ICU private control block. DO NOT MODIFY. Initialization occurs when `R_ICU_ExternalIrqOpen` is called.

#### Data Fields

uint32_t	<a href="#">open</a>
	Used to determine if channel control block is in use.

IRQn_Type	<a href="#">irq</a>
	NVIC interrupt number.
uint8_t	<a href="#">channel</a>
	Channel.
void const *	<a href="#">p_context</a>

## Field Documentation

### ◆ p\_context

void const\* icu\_instance\_ctrl\_t::p\_context

Placeholder for user data. Passed to the user callback in [external\\_irq\\_callback\\_args\\_t](#).

## Function Documentation

◆ **R\_ICU\_ExternalIrqOpen()**

```
fsp_err_t R_ICU_ExternalIrqOpen ( external_irq_ctrl_t *const p_api_ctrl, external_irq_cfg_t const *const p_cfg )
```

Configure an IRQ input pin for use with the external interrupt interface. Implements [external\\_irq\\_api\\_t::open](#).

The Open function is responsible for preparing an external IRQ pin for operation.

**Return values**

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	One of the following is invalid: <ul style="list-style-type: none"> <li>• p_ctrl or p_cfg is NULL</li> </ul>
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. No configurations were changed. Call the associated Close function to reconfigure the channel.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in p_cfg is not available on the device selected in r_bsp_cfg.h.
FSP_ERR_INVALID_ARGUMENT	p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function.

**Note**

*This function is reentrant for different channels. It is not reentrant for the same channel.*

◆ **R\_ICU\_ExternalIrqEnable()**

```
fsp_err_t R_ICU_ExternalIrqEnable ( external_irq_ctrl_t *const p_api_ctrl)
```

Enable external interrupt for specified channel at NVIC. Implements [external\\_irq\\_api\\_t::enable](#).

**Return values**

FSP_SUCCESS	Interrupt Enabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_IRQ_BSP_DISABLED	Requested IRQ is not defined in this system

◆ **R\_ICU\_ExternalIrqDisable()**

```
fsp_err_t R_ICU_ExternalIrqDisable ( external_irq_ctrl_t *const p_api_ctrl)
```

Disable external interrupt for specified channel at NVIC. Implements `external_irq_api_t::disable`.

**Return values**

FSP_SUCCESS	Interrupt disabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_IRQ_BSP_DISABLED	Requested IRQ is not defined in this system

◆ **R\_ICU\_ExternalIrqCallbackSet()**

```
fsp_err_t R_ICU_ExternalIrqCallbackSet ( external_irq_ctrl_t *const p_api_ctrl,
void(*) (external_irq_callback_args_t *) p_callback, void const *const p_context,
external_irq_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `external_irq_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R\_ICU\_ExternalIrqClose()**

```
fsp_err_t R_ICU_ExternalIrqClose ( external_irq_ctrl_t *const p_api_ctrl)
```

Close the external interrupt channel. Implements `external_irq_api_t::close`.

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel is not opened.

### 4.2.8.2 Key Matrix (r\_kint)

Modules » Input

#### Functions

fsp\_err\_t R\_KINT\_Open (keymatrix\_ctrl\_t \*const p\_api\_ctrl, keymatrix\_cfg\_t const \*const p\_cfg)

fsp\_err\_t R\_KINT\_Close (keymatrix\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t R\_KINT\_Enable (keymatrix\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t R\_KINT\_Disable (keymatrix\_ctrl\_t \*const p\_api\_ctrl)

#### Detailed Description

Driver for the KINT peripheral on RA MCUs. This module implements the [Key Matrix Interface](#).

## Overview

The KINT module configures the Key Interrupt (KINT) peripheral to detect rising or falling edges on any of the KINT channels. When such an event is detected on any of the configured pins, the module generates an interrupt.

#### Features

- Detect rising or falling edges on KINT channels
- Callback for notifying the application when edges are detected on the configured channels

## Configuration

#### Build Time Configurations for r\_kint

The following build time configurations are defined in fsp\_cfg/r\_kint\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

#### Configurations for Input > Key Matrix (r\_kint)

This module can be added to the Stacks tab via New Stack > Input > Key Matrix (r\_kint).

Configuration	Options	Default	Description
---------------	---------	---------	-------------

General > Name	Name must be a valid C symbol	g_kint0	Module name.
Input > Key Interrupt Flag Mask	<ul style="list-style-type: none"> <li>• Channel 0</li> <li>• Channel 1</li> <li>• Channel 2</li> <li>• Channel 3</li> <li>• Channel 4</li> <li>• Channel 5</li> <li>• Channel 6</li> <li>• Channel 7</li> </ul>		Select channels to enable.
Interrupts > Trigger Type	<ul style="list-style-type: none"> <li>• Falling Edge</li> <li>• Rising Edge</li> </ul>	Rising Edge	Specifies if the enabled channels detect a rising edge or a falling edge. NOTE: either all channels detecting a rising edge or all channels detecting a falling edge.
Interrupts > Callback	Name must be a valid C symbol	kint_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers.
Interrupts > Key Interrupt Priority	MCU Specific Options		Select the key interrupt priority.

## Clock Configuration

The KINT peripheral runs on PCLKB.

## Pin Configuration

The KRn pins are key switch matrix row input pins.

# Usage Notes

## Connecting a Switch Matrix

The KINT module is designed to scan the rows of a switch matrix where each row is connected to a number of columns through switches. A periodic timer (or other mechanism) sets one column pin high at a time. Any switches that are pressed on the driven column cause a rising (or falling) edge on the row pin (KRn) causing an interrupt.

### Note

*In applications where multiple keys may be pressed at the same time it is recommended to put a diode inline with each switch to prevent ghosting.*

## Handling Multiple Pins

When an edge is detected on multiple pins at the same time, a single IRQ will be generated. A mask of all the pins that detected an edge will be passed to the callback.

## Examples

### Basic Example

This is a basic example of minimal use of the KINT in an application.

```
static volatile uint32_t g_channel_mask;
static volatile uint32_t g_kint_edge_detected = 0U;
/* Called from key_int_isr */
void r_kint_callback (keymatrix_callback_args_t * p_args)
{
    g_channel_mask      = p_args->channel_mask;
    g_kint_edge_detected = 1U;
}
void r_kint_example ()
{
    /* Configure the KINT. */
    fsp_err_t err = R_KINT_Open(&g_kint_ctrl, &g_kint_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable the KINT. */
    err = R_KINT_Enable(&g_kint_ctrl);
    assert(FSP_SUCCESS == err);
    while (0 == g_kint_edge_detected)
    {
        /* Wait for interrupt. */
    }
}
```

### Data Structures

```
struct kint_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ kint\_instance\_ctrl\_t

```
struct kint_instance_ctrl_t
```

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when [keymatrix\\_api\\_t::open](#) is called.

## Function Documentation

### ◆ R\_KINT\_Open()

```
fsp_err_t R_KINT_Open ( keymatrix_ctrl_t *const p_api_ctrl, keymatrix_cfg_t const *const p_cfg )
```

Configure all the Key Input (KINT) channels and provides a handle for use with the rest of the KINT API functions. Implements [keymatrix\\_api\\_t::open](#).

#### Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One of the following parameters may be NULL: p_cfg, or p_ctrl or the callback.
FSP_ERR_ALREADY_OPEN	The module has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel mask is invalid.

### ◆ R\_KINT\_Close()

```
fsp_err_t R_KINT_Close ( keymatrix_ctrl_t *const p_api_ctrl)
```

Clear the KINT configuration and disable the KINT IRQ. Implements [keymatrix\\_api\\_t::close](#).

#### Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The module is not opened.

◆ **R\_KINT\_Enable()**

```
fsp_err_t R_KINT_Enable ( keymatrix_ctrl_t *const p_api_ctrl)
```

This function enables interrupts for the KINT peripheral after clearing any pending requests. Implements `keymatrix_api_t::enable`.

**Return values**

FSP_SUCCESS	Interrupt enabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The peripheral is not opened.

◆ **R\_KINT\_Disable()**

```
fsp_err_t R_KINT_Disable ( keymatrix_ctrl_t *const p_api_ctrl)
```

This function disables interrupts for the KINT peripheral. Implements `keymatrix_api_t::disable`.

**Return values**

FSP_SUCCESS	Interrupt disabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

## 4.2.9 Monitoring

### Modules

#### Detailed Description

Monitoring Modules.

#### Modules

##### CRC (r\_crc)

Driver for the CRC peripheral on RA MCUs. This module implements the [CRC Interface](#).

##### Clock Accuracy Circuit (r\_cac)

fsp\_err\_t R\_CRC\_CalculatedValueGet (crc\_ctrl\_t \*const p\_ctrl, uint32\_t \*calculatedValue)

fsp\_err\_t R\_CRC\_SnoopEnable (crc\_ctrl\_t \*const p\_ctrl, uint32\_t crc\_seed)

fsp\_err\_t R\_CRC\_SnoopDisable (crc\_ctrl\_t \*const p\_ctrl)

#### Detailed Description

Driver for the CRC peripheral on RA MCUs. This module implements the [CRC Interface](#).

## Overview

The CRC module provides a API to calculate 8, 16 and 32-bit CRC values on a block of data in memory or a stream of data over a Serial Communication Interface (SCI) channel using industry-standard polynomials.

### Features

- CRC module supports the following 8 and 16 bit CRC polynomials which operates on 8-bit data in parallel
  - $X^8+X^2+X+1$  (CRC-8)
  - $X^{16}+X^{15}+X^2+1$  (CRC-16)
  - $X^{16}+X^{12}+X^5+1$  (CRC-CCITT)
- CRC module supports the following 32 bit CRC polynomials which operates on 32-bit data in parallel
  - $X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^8+X^7+X^5+X^4+X^2+X+1$  (CRC-32)
  - $X^{32}+X^{28}+X^{27}+X^{26}+X^{25}+X^{23}+X^{22}+X^{20}+X^{19}+X^{18}+X^{14}+X^{13}+X^{11}+X^{10}+X^9+X^8+X^6+1$  (CRC-32C)
- CRC module can calculate CRC with LSB first or MSB first bit order.

## Configuration

### Build Time Configurations for r\_crc

The following build time configurations are defined in fsp\_cfg/r\_crc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Monitoring > CRC (r\_crc)

This module can be added to the Stacks tab via New Stack > Monitoring > CRC (r\_crc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_crc0	Module name.
CRC Polynomial	<ul style="list-style-type: none"> <li>• CRC-8</li> <li>• CRC-16</li> <li>• CRC-CCITT</li> <li>• CRC-32</li> <li>• CRC-32C</li> </ul>	CRC-32C	Select the CRC polynomial.

Bit Order	<ul style="list-style-type: none"> <li>• LSB</li> <li>• MSB</li> </ul>	MSB	Select the CRC bit order.
Snoop Address	Refer to the RA Configuration tool for available options.	NONE	Select the SCI register address CRC snoop

## Clock Configuration

There is no clock configuration for the CRC module.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## CRC Snoop

The CRC snoop function monitors reads from and writes to a specified I/O register address and performs CRC calculation on the data read from and written to the register address automatically. Instead of calling `R_CRC_Calculate` on a block of data, `R_CRC_SnoopEnable` is called to start monitoring reads/writes and `R_CRC_CalculatedValueGet` is used to obtain the current CRC.

### Note

*Snoop mode is available for transmit/receive operations on SCI only.*

## Limitations

When using CRC32 polynomial functions the CRC module produces the same results as popular online CRC32 calculators, but it is important to remember a few important points.

- Online CRC32 calculators allow the input to be any number of bytes. The FSP CRC32 API function uses 32-bit words. This means the online calculations must be 'padded' to end on a 32-bit boundary.
- Online CRC32 calculators usually invert the output prior to presenting it as a result. It is up to the application program to include this step if needed.
- The seed value of `0xFFFFFFFF` needs to be used by both the online calculator and the `R_CRC` module API (CRC32 polynomials)
- Make sure the bit orientation of the `R_CRC` CRC32 is set for LSB and that you have CRC32 selected and not CRC32C.
- Some online CRC tools XOR the final result with `0xFFFFFFFF`.

# Examples

## Basic Example

This is a basic example of minimal use of the CRC module in an application.

```
void crc_example ()
{
```

```
uint32_t length;
uint32_t uint8_calculated_value;
length = sizeof(g_data_8bit) / sizeof(g_data_8bit[0]);
crc_input_t example_input =
{
    .p_input_buffer = g_data_8bit,
    .num_bytes      = length,
    .crc_seed       = 0,
};
/* Open CRC module with 8 bit polynomial */
R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
/* 8-bit CRC calculation */
R_CRC_Calculate(&crc_ctrl, &example_input, &uint8_calculated_value);
}
```

## Snoop Example

This example demonstrates CRC snoop operation.

```
void crc_snoop_example ()
{
    /* Open CRC module with 8 bit polynomial */
    R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
    /* Open SCI Driver */
    /* Configure Snoop address and enable snoop mode */
    R_CRC_SnoopEnable(&crc_ctrl, 0);
    /* Perform SCI read/write operation depending on the SCI snoop address configure */
    /* Read CRC value */
    R_CRC_CalculatedValueGet(&crc_ctrl, &g_crc_buff);
}
```

## Data Structures

```
struct crc\_instance\_ctrl\_t
```

## Data Structure Documentation

### ◆ [crc\\_instance\\_ctrl\\_t](#)

```
struct crc_instance_ctrl_t
```

Driver instance control structure.

## Function Documentation

### ◆ R\_CRC\_Open()

```
fsp_err_t R_CRC_Open ( crc_ctrl_t *const p_ctrl, crc_cfg_t const *const p_cfg )
```

Open the CRC driver module

Implements [crc\\_api\\_t::open](#)

Open the CRC driver module and initialize the driver control block according to the passed-in configuration structure.

#### Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Module already open

### ◆ R\_CRC\_Close()

```
fsp_err_t R_CRC_Close ( crc_ctrl_t *const p_ctrl)
```

Close the CRC module driver.

Implements [crc\\_api\\_t::close](#)

#### Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ **R\_CRC\_Calculate()**

```
fsp_err_t R_CRC_Calculate ( crc_ctrl_t *const p_ctrl, crc_input_t *const p_crc_input, uint32_t *
calculatedValue )
```

Perform a CRC calculation on a block of 8-bit/32-bit (for 32-bit polynomial) data.

Implements `crc_api_t::calculate`

This function performs a CRC calculation on an array of 8-bit/32-bit (for 32-bit polynomial) values and returns an 8-bit/32-bit (for 32-bit polynomial) calculated value

**Return values**

FSP_SUCCESS	Calculation successful.
FSP_ERR_ASSERTION	Either p_ctrl, inputBuffer, or calculatedValue is NULL.
FSP_ERR_INVALID_ARGUMENT	length value is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ **R\_CRC\_CalculatedValueGet()**

```
fsp_err_t R_CRC_CalculatedValueGet ( crc_ctrl_t *const p_ctrl, uint32_t * calculatedValue )
```

Return the current calculated value.

Implements `crc_api_t::crcResultGet`

CRC calculation operates on a running value. This function returns the current calculated value.

**Return values**

FSP_SUCCESS	Return of calculated value successful.
FSP_ERR_ASSERTION	Either p_ctrl or calculatedValue is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ **R\_CRC\_SnoopEnable()**

```
fsp_err_t R_CRC_SnoopEnable ( crc_ctrl_t *const p_ctrl, uint32_t crc_seed )
```

Configure the snoop channel and set the CRC seed.

Implements [crc\\_api\\_t::snoopEnable](#)

The CRC calculator can operate on reads and writes over any of the first ten SCI channels. For example, if set to channel 0, transmit, every byte written out SCI channel 0 is also sent to the CRC calculator as if the value was explicitly written directly to the CRC calculator.

**Return values**

FSP_SUCCESS	Snoop configured successfully.
FSP_ERR_ASSERTION	Pointer to control structure is NULL
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ **R\_CRC\_SnoopDisable()**

```
fsp_err_t R_CRC_SnoopDisable ( crc_ctrl_t *const p_ctrl)
```

Disable snooping.

Implements [crc\\_api\\_t::snoopDisable](#)

**Return values**

FSP_SUCCESS	Snoop disabled.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

**4.2.9.2 Clock Accuracy Circuit (r\_cac)**

Modules » [Monitoring](#)

**Functions**

```
fsp_err_t R_CAC_Open ( cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg)
```

```
fsp_err_t R_CAC_StartMeasurement ( cac_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_CAC_StopMeasurement ( cac_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_CAC_Read ( cac_ctrl_t *const p_ctrl, uint16_t *const p_counter)
```

```
fsp_err_t R_CAC_CallbackSet (cac_ctrl_t *const p_ctrl,
void(*p_callback)(cac_callback_args_t *), void const *const
p_context, cac_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_CAC_Close (cac_ctrl_t *const p_ctrl)
```

## Detailed Description

Driver for the CAC peripheral on RA MCUs. This module implements the [CAC Interface](#).

## Overview

The interface for the clock frequency accuracy measurement circuit (CAC) peripheral is used to check a system clock frequency with a reference clock signal by counting the number of measurement clock edges that occur between two edges of the reference clock.

### Features

- Supports clock frequency-measurement and monitoring based on a reference signal input
- Reference can be either an externally supplied clock source or an internal clock source
- An interrupt request may optionally be generated by a completed measurement, a detected frequency error, or a counter overflow.
- A digital filter is available for an externally supplied reference clock, and dividers are available for both internally supplied measurement and reference clocks.
- Edge-detection options for the reference clock are configurable as rising, falling, or both.

## Configuration

### Build Time Configurations for r\_cac

The following build time configurations are defined in fsp\_cfg/r\_cac\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Monitoring > Clock Accuracy Circuit (r\_cac)

This module can be added to the Stacks tab via New Stack > Monitoring > Clock Accuracy Circuit (r\_cac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_cac0	Module name.
Reference clock divider	<ul style="list-style-type: none"> <li>• 32</li> <li>• 128</li> </ul>	32	Reference clock divider.

	<ul style="list-style-type: none"> <li>• 1024</li> <li>• 8192</li> </ul>		
Reference clock source	<ul style="list-style-type: none"> <li>• Main Oscillator</li> <li>• Sub-clock</li> <li>• HOCO</li> <li>• MOCO</li> <li>• LOCO</li> <li>• PCLKB</li> <li>• IWDT</li> <li>• External</li> </ul>	Main Oscillator	Reference clock source.
Reference clock digital filter	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Sampling clock =Measuring freq</li> <li>• Sampling clock =Measuring freq/4</li> <li>• Sampling clock =Measuring freq/16</li> </ul>	Disabled	Reference clock digital filter.
Reference clock edge detect	<ul style="list-style-type: none"> <li>• Rising</li> <li>• Falling</li> <li>• Both</li> </ul>	Rising	Reference clock edge detection.
Measurement clock divider	<ul style="list-style-type: none"> <li>• 1</li> <li>• 4</li> <li>• 8</li> <li>• 32</li> </ul>	1	Measurement clock divider.
Measurement clock source	<ul style="list-style-type: none"> <li>• Main Oscillator</li> <li>• Sub-clock</li> <li>• HOCO</li> <li>• MOCO</li> <li>• LOCO</li> <li>• PCLKB</li> <li>• IWDT</li> </ul>	HOCO	Measurement clock source.
Upper Limit Threshold	Value must be a non-negative integer, between 0 to 65535	0	Top end of allowable range for measurement completion.
Lower Limit Threshold	Value must be a non-negative integer, between 0 to 65535	0	Bottom end of allowable range for measurement completion.
Frequency Error Interrupt Priority	MCU Specific Options		CAC frequency error interrupt priority.
Measurement End Interrupt Priority	MCU Specific Options		CAC measurement end interrupt priority.
Overflow Interrupt Priority	MCU Specific Options		CAC overflow interrupt priority.
Callback	Name must be a valid	NULL	Function name for

C symbol

callback

## Clock Configuration

The CAC measurement clock source can be configured as the following:

1. MAIN\_OSC
2. SUBCLOCK
3. HOCO
4. MOCO
5. LOCO
6. PCLKB
7. IWDT

The CAC reference clock source can be configured as the following:

1. MAIN\_OSC
2. SUBCLOCK
3. HOCO
4. MOCO
5. LOCO
6. PCLKB
7. IWDT
8. External Clock Source (CACREF)

## Pin Configuration

The CACREF pin can be configured to provide the reference clock for CAC measurements.

## Usage Notes

### Measurement Accuracy

The clock measurement result may be off by up to one pulse depending on the phase difference between the edge detection circuit, digital filter, and CACREF pin signal, if applicable.

### Frequency Error Interrupt

The frequency error interrupt is only triggered at the end of a CAC measurement. This means that there will be a measurement complete interrupt in addition to the frequency error interrupt.

## Examples

### Basic Example

This is a basic example of minimal use of the CAC in an application.

```
volatile uint32_t g_callback_complete;

void cac_basic_example ()
{
    g_callback_complete = 0;
}
```

```
fsp_err_t err = R_CAC_Open(&g_cac_ctrl, &g_cac_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

(void) R_CAC_StartMeasurement(&g_cac_ctrl);

/* Wait for measurement to complete. */
while (0 == g_callback_complete)
{
}

uint16_t value;

/* Read the CAC measurement. */
(void) R_CAC_Read(&g_cac_ctrl, &value);
}

/* Called when measurement is completed. */
static void r_cac_callback (cac_callback_args_t * p_args)
{
if (CAC_EVENT_MEASUREMENT_COMPLETE == p_args->event)
{
g_callback_complete = 1U;
}
}
}
```

## Data Structures

struct [cac\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ [cac\\_instance\\_ctrl\\_t](#)

struct [cac\\_instance\\_ctrl\\_t](#)

CAC instance control block. DO NOT INITIALIZE.

## Function Documentation

◆ **R\_CAC\_Open()**

```
fsp_err_t R_CAC_Open ( cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg )
```

The Open function configures the CAC based on the provided user configuration settings.

**Return values**

FSP_SUCCESS	CAC is available and available for measurement(s).
FSP_ERR_ASSERTION	An argument is invalid.
FSP_ERR_ALREADY_OPEN	The CAC has already been opened.

*Note*

*There is only a single CAC peripheral.*

◆ **R\_CAC\_StartMeasurement()**

```
fsp_err_t R_CAC_StartMeasurement ( cac_ctrl_t *const p_ctrl)
```

Start the CAC measurement process.

**Return values**

FSP_SUCCESS	CAC measurement started.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	<a href="#">R_CAC_Open()</a> has not been successfully called.

◆ **R\_CAC\_StopMeasurement()**

```
fsp_err_t R_CAC_StopMeasurement ( cac_ctrl_t *const p_ctrl)
```

Stop the CAC measurement process.

**Return values**

FSP_SUCCESS	CAC measuring has been stopped.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	<a href="#">R_CAC_Open()</a> has not been successfully called.

◆ **R\_CAC\_Read()**

```
fsp_err_t R_CAC_Read ( cac_ctrl_t *const p_ctrl, uint16_t *const p_counter )
```

Read and return the CAC status and counter registers.

**Return values**

FSP_SUCCESS	CAC read successful.
FSP_ERR_ASSERTION	An argument is NULL.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ **R\_CAC\_CallbackSet()**

```
fsp_err_t R_CAC_CallbackSet ( cac_ctrl_t *const p_ctrl, void(*) (cac_callback_args_t *) p_callback, void const *const p_context, cac_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `cac_api_t::callbackSet`.

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R\_CAC\_Close()**

```
fsp_err_t R_CAC_Close ( cac_ctrl_t *const p_ctrl)
```

Release any resources that were allocated by the `Open()` or any subsequent CAC operations.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	NULL provided for <code>p_instance_ctrl</code> or <code>p_cfg</code> .
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

`fsp_err_t` `R_DOC_StatusGet` (`doc_ctrl_t *const p_api_ctrl`, `doc_status_t *const p_status`)

`fsp_err_t` `R_DOC_Read` (`doc_ctrl_t *const p_api_ctrl`, `uint32_t *p_result`)

`fsp_err_t` `R_DOC_Write` (`doc_ctrl_t *const p_api_ctrl`, `uint32_t data`)

`fsp_err_t` `R_DOC_CallbackSet` (`doc_ctrl_t *const p_api_ctrl`, `void(*p_callback)(doc_callback_args_t *)`, `void const *const p_context`, `doc_callback_args_t *const p_callback_memory`)

#### Detailed Description

Driver for the DOC peripheral on RA MCUs. This module implements the [DOC Interface](#).

## Overview

#### Features

The DOC HAL module peripheral is used to compare, add or subtract 16-bit or 32-bit<sup>1</sup> data and can detect the following events:

- Comparison Mode
  - Data is equal to the configured reference data setting.
  - Data is not equal to the configured reference data setting.
  - Data is less than the configured reference data setting<sup>2</sup>.
  - Data is greater than the configured reference data setting<sup>2</sup>.
  - Data is inside of a configurable pair of reference data settings<sup>2</sup>.
  - Data is outside of a configurable pair of reference data settings<sup>2</sup>.
- Addition Mode - Overflow of an addition operation
- Subtraction Mode - Underflow of a subtraction operation

A user-defined callback can be created to inform the CPU when any of above events occur.

#### Note

1. Operating on 32-bit data is not supported on all MCUs.
2. This comparison mode is not supported on all MCUs.

## Configuration

### Build Time Configurations for r\_doc

The following build time configurations are defined in fsp\_cfg/r\_doc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Monitoring > Data Operation Circuit (r\_doc)

This module can be added to the Stacks tab via New Stack > Monitoring > Data Operation Circuit (r\_doc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_doc0	Module name.
Event	MCU Specific Options		Select the event that will trigger the DOC interrupt.
Bit Width	MCU Specific Options		The bit width for DOC operations.
Reference/Initial Data	Value must be an integer greater than or equal to 0.	0	Enter Initial Value for Addition/Subtraction or enter reference value for comparison.
Additional Reference Data	Value must be an integer greater than or equal to 0.	0	Additional reference data used for Window Compare modes.
Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) when the configured DOC event occurs.
DOC Interrupt Priority	MCU Specific Options		Select the DOC interrupt priority.

### Clock Configuration

The DOC HAL module does not require a specific clock configuration.

## Pin Configuration

The DOC HAL module does not require and specific pin configurations.

## Usage Notes

### DMAC/DTC Integration

DOC can be used with [Transfer \(r\\_dmac\)](#) or [Transfer \(r\\_dtc\)](#) to write to the input register without CPU intervention. DMAC is more useful for most DOC applications because it can be started directly from software. To write DOC input data with DTC/DMAC, set [transfer\\_info\\_t::p\\_dest](#) to `R_DOC->DODIR`.

## Examples

### Basic Example

This is a basic example of minimal use of the R\_DOC in an application. This example shows how this driver can be used for continuous 16 bit addition operation while reading the result at every overflow event.

```
#define DOC_EXAMPLE_VALUE 0xF000
uint32_t g_callback_event_counter = 0;
/* This callback is called when DOC overflow event occurs. It is registered in
doc_cfg_t when R_DOC_Open is
 * called. */
void doc_callback (doc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}
void basic_example (void)
{
    fsp_err_t err;
    /* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
    err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Write data to the DOC Data Input Register and read the result of addition from
status register when an
 * interrupt occurs. */
```

```

for (int i = 0; i < 5; i++)
{
    err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
    assert(FSP_SUCCESS == err);
if (g_callback_event_counter >= 1)
{
    uint32_t result;
/* Read the result of the operation */
    err = R_DOC_Read(&g_doc_ctrl, &result);
    assert(FSP_SUCCESS == err);
}
}
}

```

## Function Documentation

### ◆ R\_DOC\_Open()

`fsp_err_t R_DOC_Open ( doc_ctrl_t *const p_api_ctrl, doc_cfg_t const *const p_cfg )`

Opens and configures the Data Operation Circuit (DOC) in comparison, addition or subtraction mode and sets initial data for addition or subtraction, or reference data for comparison.

Example:

```

/* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);

```

#### Return values

FSP_SUCCESS	DOC successfully configured.
FSP_ERR_ALREADY_OPEN	Module already open.
FSP_ERR_ASSERTION	One or more pointers point to NULL or callback is NULL or the interrupt vector is invalid.

## ◆ R\_DOC\_Close()

```
fsp_err_t R_DOC_Close ( doc_ctrl_t *const p_api_ctrl)
```

Closes the module driver. Enables module stop mode.

**Return values**

FSP_SUCCESS	Module successfully closed.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	Pointer pointing to NULL.

*Note*

*This function will disable the DOC interrupt in the NVIC.*

## ◆ R\_DOC\_StatusGet()

```
fsp_err_t R_DOC_StatusGet ( doc_ctrl_t *const p_api_ctrl, doc_status_t *const p_status )
```

DEPRECATED - Returns the result of addition/subtraction.

**Return values**

FSP_SUCCESS	Status successfully read.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

## ◆ R\_DOC\_Read()

```
fsp_err_t R_DOC_Read ( doc_ctrl_t *const p_api_ctrl, uint32_t * p_result )
```

Returns the result of addition/subtraction.

Example:

```
uint32_t result;
/* Read the result of the operation */
err = R_DOC_Read(&g_doc_ctrl, &result);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Status successfully read.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

◆ **R\_DOC\_Write()**

```
fsp_err_t R_DOC_Write ( doc_ctrl_t *const p_api_ctrl, uint32_t data )
```

Writes to the DODIR - DOC Input Register.

Example:

```
err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Values successfully written to the registers.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

◆ **R\_DOC\_CallbackSet()**

```
fsp_err_t R_DOC_CallbackSet ( doc_ctrl_t *const p_api_ctrl, void (*)(doc_callback_args_t *)
p_callback, void const *const p_context, doc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [doc\\_api\\_t::callbackSet](#)

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

**4.2.9.4 Independent Watchdog (r\_iwdt)**

Modules » [Monitoring](#)

**Functions**

```
fsp_err_t R_IWDT_Open ( wdt_ctrl_t *const p_api_ctrl, wdt_cfg_t const *const
p_cfg)
```

fsp_err_t	R_IWDT_Refresh (wdt_ctrl_t *const p_api_ctrl)
fsp_err_t	R_IWDT_StatusGet (wdt_ctrl_t *const p_api_ctrl, wdt_status_t *const p_status)
fsp_err_t	R_IWDT_StatusClear (wdt_ctrl_t *const p_api_ctrl, const wdt_status_t status)
fsp_err_t	R_IWDT_CounterGet (wdt_ctrl_t *const p_api_ctrl, uint32_t *const p_count)
fsp_err_t	R_IWDT_TimeoutGet (wdt_ctrl_t *const p_api_ctrl, wdt_timeout_values_t *const p_timeout)
fsp_err_t	R_IWDT_CallbackSet (wdt_ctrl_t *const p_ctrl, void(*p_callback)(wdt_callback_args_t *), void const *const p_context, wdt_callback_args_t *const p_callback_memory)

## Detailed Description

Driver for the IWDT peripheral on RA MCUs. This module implements the [WDT Interface](#).

## Overview

The independent watchdog timer is used to recover from unexpected errors in an application. The timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the IWDT resets the device or generates an NMI.

## Features

The IWDT HAL module has the following key features:

- When the IWDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
  - Resetting of the device
  - Generation of an NMI
- The IWDT begins counting at reset.

## Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

	WDT	IWDT
Start Mode	The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode).	The IWDT can only be configured by hardware to start automatically.

Clock Source	The WDT runs off a peripheral clock.	The IWDT has its own clock source which improves safety.
--------------	--------------------------------------	--

## Configuration

### Build Time Configurations for r\_iwdt

The following build time configurations are defined in fsp\_cfg/r\_iwdt\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Monitoring > Independent Watchdog (r\_iwdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Independent Watchdog (r\_iwdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_wdt0	Module name.
NMI callback	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) when the watchdog triggers.

#### Note

The IWDT has additional configurable settings in the OFS0 register in the **BSP** tab properties window. These settings include the following:

- Start Mode
- Timeout Period
- Dedicated Clock Frequency Divisor
- Window End Position
- Window Start Position
- Reset Interrupt Request Select
- Stop Control

Review the OFS0 properties window to see additional details.

### Clock Configuration

The IWDT clock is based on the IWDTCLK frequency. You can set the IWDTCLK frequency divider using the **BSP** tab of the RA Configuration editor.

## Pin Configuration

This module does not use I/O pins.

## Usage Notes

### NMI Interrupt

The independent watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

### Period Calculation

The IWDT operates from IWDTCLK. With a IWDTCLK of 15000 Hz, the maximum time from the last refresh to device reset or NMI generation will be just below 35 seconds as detailed below.

```
IWDTCLK = 15000 Hz
Clock division ratio = IWDTCLK / 256
Timeout period = 2048 cycles
WDT clock frequency = 15000 Hz / 256 = 58.59 Hz
Cycle time = 1 / 58.59 Hz = 17.067 ms
Timeout = 17.067 ms x 2048 cycles = 34.95 seconds
```

### Limitations

Developers should be aware of the following limitations when using the IWDT:

- When using a J-Link debugger the IWDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the IWDT to count and generate NMI or reset when the
 * debugger is connected. */
R_DEBUG->DBGSTOPPCR_b.DBGSTOP_IWDT = 0;
```

- If the IWDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling [R\\_IWDT\\_Refresh\(\)](#) after the MCU wakes from low power mode.

## Examples

### IWDT Basic Example

This is a basic example of minimal use of the IWDT in an application.

```
void iwdt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* In auto start mode, the IWDT starts counting immediately when the MCU is powered
```

```
on. */
/* Initializes the module. */
err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
while (true)
{
/* Application work here. */
/* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
(void) R_IWDT_Refresh(&g_iwdt0_ctrl);
}
}
```

## IWDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define IWDT_TIMEOUT_COUNTS (2048U)
#define IWDT_MAX_COUNTER (IWDT_TIMEOUT_COUNTS - 1U)
#define IWDT_START_WINDOW_75 ((IWDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void iwdt_callback (wdt_callback_args_t * p_args)
{
FSP_PARAMETER_NOT_USED(p_args);
fsp_err_t err = FSP_SUCCESS;
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
assert(FSP_SUCCESS == err);
/* (Optional) Log source of NMI and any other debug information. */
/* (Optional) Clear the error flags. */
err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
assert(FSP_SUCCESS == err);
}
```

```
/* (Optional) Issue a software reset to reset the MCU. */
__NVIC_SystemReset();
}
void iwdt_advanced_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* (Optional) Enable the IWDT to count and generate NMI or reset when the
     * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_IWDT = 0;
    /* (Optional) Check if the IWDTRF flag is set to know if the system is
     * recovering from a IWDT reset. */
    if (R_SYSTEM->RSTSR1_b.IWDTRF)
    {
        /* Clear the flag. */
        R_SYSTEM->RSTSR1 = 0U;
    }
    /* Open the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Initialize other application code. */
    /* Do not call R_IWDT_Refresh() in auto start mode unless the
     * counter is in the acceptable refresh window. */
    (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
    while (true)
    {
        /* Application work here. */
        /* (Optional) If there is a chance the application takes less time than
         * the start window, verify the IWDT counter is past the start window
         * before refreshing the IWDT. */
        uint32_t iwdt_counter = 0U;
    do
    {
        /* Read the current IWDT counter value. */
```

```

    err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
    assert(FSP_SUCCESS == err);
} while (iwdt_counter >= IWDT_START_WINDOW_75);
/* Refresh before the counter underflows to prevent reset or NMI. */
(void) R_IWDT_Refresh(&g_iwdt0_ctrl);
}
}

```

## Data Structures

struct [iwdt\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ iwdt\_instance\_ctrl\_t

struct iwdt_instance_ctrl_t	
IWDT control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">wdt_api_t::open</a> is called.	
Data Fields	
uint32_t	<a href="#">wdt_open</a>
	Indicates whether the open() API has been successfully called.
void const *	<a href="#">p_context</a>
	Placeholder for user data. Passed to the user callback in <a href="#">wdt_callback_args_t</a> .
R_IWDT_Type *	<a href="#">p_reg</a>
	Pointer to register base address.
void(*	<a href="#">p_callback</a> )(wdt_callback_args_t *p_args)
	Callback provided when a WDT NMI ISR occurs.

## Function Documentation

◆ **R\_IWDT\_Open()**

```
fsp_err_t R_IWDT_Open ( wdt_ctrl_t *const p_api_ctrl, wdt_cfg_t const *const p_cfg )
```

Register the IWDT NMI callback.

Example:

```
/* Initializes the module. */
err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
```

**Return values**

FSP_SUCCESS	IWDT successfully configured.
FSP_ERR_ASSERTION	Null Pointer.
FSP_ERR_NOT_ENABLED	An attempt to open the IWDT when the OFS0 register is not configured for auto-start mode.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_STATE	The security state of the NMI and the module do not match.

◆ **R\_IWDT\_Refresh()**

```
fsp_err_t R_IWDT_Refresh ( wdt_ctrl_t *const p_api_ctrl)
```

Refresh the Independent Watchdog Timer. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
(void) R_IWDT_Refresh(&g_iwdt0_ctrl);
```

**Return values**

FSP_SUCCESS	IWDT successfully refreshed.
FSP_ERR_ASSERTION	One or more parameters are NULL pointers.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform <a href="#">R_IWDT_Open()</a> first.

◆ **R\_IWDT\_StatusGet()**

```
fsp_err_t R_IWDT_StatusGet ( wdt_ctrl_t*const p_api_ctrl, wdt_status_t*const p_status )
```

Read the IWDT status flags. When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags can be read after reset to establish if the IWDT caused the reset. Reading the status and error flags in NMI output mode indicates whether the IWDT generated the NMI interrupt.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	IWDT status successfully read.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform <a href="#">R_IWDT_Open()</a> first.

◆ **R\_IWDT\_StatusClear()**

```
fsp_err_t R_IWDT_StatusClear ( wdt_ctrl_t*const p_api_ctrl, const wdt_status_t status )
```

Clear the IWDT status and error flags. Implements [wdt\\_api\\_t::statusClear](#).

Example:

```
/* (Optional) Clear the error flags. */
err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	IWDT flag(s) successfully cleared.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform <a href="#">R_IWDT_Open()</a> first.

◆ **R\_IWDT\_CounterGet()**

```
fsp_err_t R_IWDT_CounterGet ( wdt_ctrl_t *const p_api_ctrl, uint32_t *const p_count )
```

Read the current count value of the IWDT. Implements `wdt_api_t::counterGet`.

Example:

```
/* Read the current IWDT counter value. */
err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	IWDT current count successfully read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform <a href="#">R_IWDT_Open()</a> first.

◆ **R\_IWDT\_TimeoutGet()**

```
fsp_err_t R_IWDT_TimeoutGet ( wdt_ctrl_t *const p_api_ctrl, wdt_timeout_values_t *const p_timeout )
```

Read timeout information for the watchdog timer. Implements `wdt_api_t::timeoutGet`.

**Return values**

FSP_SUCCESS	IWDT timeout information retrieved successfully.
FSP_ERR_ASSERTION	One or more parameters are NULL pointers.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform <a href="#">R_IWDT_Open()</a> first.

### ◆ R\_IWDT\_CallbackSet()

```
fsp_err_t R_IWDT_CallbackSet ( wdt_ctrl_t *const p_ctrl, void(*) (wdt_callback_args_t *) p_callback,
void const *const p_context, wdt_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [wdt\\_api\\_t::callbackSet](#)

#### Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

### 4.2.9.5 Low Voltage Detection (r\_lvd)

Modules » [Monitoring](#)

#### Functions

```
fsp_err_t R_LVD_Open (lvd_ctrl_t *const p_api_ctrl, lvd_cfg_t const *const
p_cfg)
```

```
fsp_err_t R_LVD_StatusGet (lvd_ctrl_t *const p_api_ctrl, lvd_status_t
*p_lvd_status)
```

```
fsp_err_t R_LVD_StatusClear (lvd_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_LVD_CallbackSet (lvd_ctrl_t *const p_api_ctrl,
void(*p_callback)(lvd_callback_args_t *), void const *const p_context,
lvd_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_LVD_Close (lvd_ctrl_t *const p_api_ctrl)
```

#### Detailed Description

Driver for the LVD peripheral on RA MCUs. This module implements the [Low Voltage Detection Interface](#).

## Overview

The Low Voltage Detection module configures the voltage monitors to detect when  $V_{CC}$  crosses a specified threshold.

## Features

The LVD HAL module supports the following functions:

- Two run-time configurable voltage monitors (Voltage Monitor 1, Voltage Monitor 2)
  - Configurable voltage threshold
  - Digital filter (Available on specific MCUs)
  - Support for both interrupt or polling
    - NMI or maskable interrupt can be configured
  - Rising, falling, or both edge event detection
  - Support for resetting the MCU when  $V_{CC}$  falls below configured threshold.

## Configuration

### Build Time Configurations for r\_lvd

The following build time configurations are defined in fsp\_cfg/r\_lvd\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Monitoring > Low Voltage Detection (r\_lvd)

This module can be added to the Stacks tab via New Stack > Monitoring > Low Voltage Detection (r\_lvd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_lvd	Module name.
Monitor Number	MCU Specific Options		Select the LVD monitor.
Digital Filter	MCU Specific Options		Enable the digital filter and select the digital filter clock divider.
Voltage Threshold	MCU Specific Options		Select the low voltage detection threshold.
Detection Response	<ul style="list-style-type: none"> <li>• Maskable interrupt</li> <li>• Non-maskable interrupt</li> <li>• Reset MCU (Only available for falling edge)</li> </ul>	No response (Voltage monitor status will be polled)	Select what happens when the voltage crosses the threshold voltage.

	<ul style="list-style-type: none"> <li>No response (Voltage monitor status will be polled)</li> </ul>		
Voltage Slope	<ul style="list-style-type: none"> <li>Falling voltage</li> <li>Rising voltage</li> <li>Rising or falling voltage</li> </ul>	Falling voltage	Select detection on rising voltage, falling voltage or both.
Negation Delay	<ul style="list-style-type: none"> <li>Delay from reset</li> <li>Delay from voltage returning to normal range</li> </ul>	Delay from reset	Negation of the monitor signal can either be delayed from the reset event or from voltage returning to normal range.
Monitor Interrupt Callback	Name must be a valid C symbol.	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers.
LVD Monitor Interrupt Priority	MCU Specific Options		Select the LVD Monitor interrupt priority.

## Clock Configuration

The LOCO clock must be enabled in order to use the digital filter.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Startup Edge Detection

If  $V_{CC}$  is below the threshold prior to configuring the voltage monitor for falling edge detection, the monitor will immediately detect the a falling edge condition. If  $V_{CC}$  is above the threshold prior to configuring the monitor for rising edge detection, the monitor will not detect a rising edge condition until  $V_{CC}$  falls below the threshold and then rises above it again.

## Voltage Monitor 0

The LVD HAL module only supports configuring voltage monitor 1 and voltage monitor 2. Voltage monitor 0 can be configured by setting the appropriate bits in the OFS1 register. This means that voltage monitor 0 settings cannot be changed at runtime.

Voltage monitor 0 supports the following features

- Configurable Voltage Threshold ( $V_{DET0}$ )

- Reset the device when  $V_{CC}$  falls below  $V_{DET0}$

## Limitations

- The digital filter must be disabled when using voltage monitors in Software Standby or Deep Software Standby.
- Deep Software Standby mode is not possible if the voltage monitor is configured to reset the MCU.
- When the detection response is set to reset, only voltage falling edge detection is possible.

## Examples

### Basic Example

This is a basic example of minimal use of the LVD in an application.

```
void basic_example (void)
{
    fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
    assert(FSP_SUCCESS == err);
    while (1)
    {
        lvd_status_t status;
        err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
        assert(FSP_SUCCESS == err);
        if (LVD_THRESHOLD_CROSSING_DETECTED == status.crossing_detected)
        {
            err = R_LVD_StatusClear(&g_lvd_ctrl);
            assert(FSP_SUCCESS == err);
            /* Do something */
        }
    }
}
```

### Interrupt Example

This is a basic example of using a LVD instance that is configured to generate an interrupt.

```
void interrupt_example (void)
{
    fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
```

```
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

while (1)
{
/* Application Process */
/* Application will be interrupted when Vcc crosses the configured threshold. */
}
}

/* Called when Vcc crosses configured threshold. */
void lvd_callback (lvd_callback_args_t * p_args)
{
if (LVD_CURRENT_STATE_BELOW_THRESHOLD == p_args->current_state)
{
/* Do Something */
}
}
```

## Reset Example

This is a basic example of using a LVD instance that is configured to reset the MCU.

```
void reset_example (void)
{
if (1U == R_SYSTEM->RSTSR0_b.LVD1RF)
{
/* The system is coming out of reset because Vcc crossed configured voltage
threshold. */
/* Clear Voltage Monitor 1 Reset Detect Flag. */
R_SYSTEM->RSTSR0_b.LVD1RF = 0;
}

fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

while (1)
{
```

```
/* Application Process */  
/* Application will reset when Vcc crosses the configured threshold. */  
}  
}
```

## Data Structures

```
struct lvd_instance_ctrl_t
```

## Data Structure Documentation

### ◆ lvd\_instance\_ctrl\_t

```
struct lvd_instance_ctrl_t
```

LVD instance control structure

## Function Documentation

◆ **R\_LVD\_Open()**

```
fsp_err_t R_LVD_Open ( lvd_ctrl_t *const p_api_ctrl, lvd_cfg_t const *const p_cfg )
```

Initializes a voltage monitor and detector according to the passed-in configuration structure.

**Parameters**

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
[in]	p_cfg	Pointer to the configuration structure for the driver instance

**Note**

*Digital filter is not to be used with standby modes.*

*Startup time can take on the order of milliseconds for some configurations.*

**Example:**

```
fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
```

**Return values**

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	Requested configuration was invalid
FSP_ERR_ALREADY_OPEN	The instance was already opened
FSP_ERR_IN_USE	Another instance is already using the desired monitor
FSP_ERR_UNSUPPORTED	Digital filter was enabled on a device that does not support it

◆ **R\_LVD\_StatusGet()**

```
fsp_err_t R_LVD_StatusGet ( lvd_ctrl_t *const p_api_ctrl, lvd_status_t * p_lvd_status )
```

Get the current state of the monitor (threshold crossing detected, voltage currently above or below threshold).

**Parameters**

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
[out]	p_lvd_status	Pointer to status structure

Example:

```
err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
```

**Return values**

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

◆ **R\_LVD\_StatusClear()**

```
fsp_err_t R_LVD_StatusClear ( lvd_ctrl_t *const p_api_ctrl)
```

Clears the latched status of the monitor.

**Parameters**

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
------	------------	--

**Return values**

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

◆ **R\_LVD\_CallbackSet()**

```
fsp_err_t R_LVD_CallbackSet ( lvd_ctrl_t *const p_api_ctrl, void(*) (lvd_callback_args_t *)
p_callback, void const *const p_context, lvd_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `lvd_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R\_LVD\_Close()**

```
fsp_err_t R_LVD_Close ( lvd_ctrl_t *const p_api_ctrl)
```

Disables the LVD peripheral. Closes the driver instance.

**Parameters**

[in]	<code>p_api_ctrl</code>	Pointer to the control block structure for the driver instance
------	-------------------------	--

**Return values**

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

**4.2.9.6 Watchdog (r\_wdt)**

Modules » [Monitoring](#)

**Functions**

<code>fsp_err_t</code>	<code>R_WDT_StatusClear (wdt_ctrl_t *const p_ctrl, const wdt_status_t status)</code>
<code>fsp_err_t</code>	<code>R_WDT_CounterGet (wdt_ctrl_t *const p_ctrl, uint32_t *const p_count)</code>
<code>fsp_err_t</code>	<code>R_WDT_CallbackSet (wdt_ctrl_t *const p_ctrl, void(*p_callback)(wdt_callback_args_t *), void const *const p_context, wdt_callback_args_t *const p_callback_memory)</code>

## Detailed Description

---

Driver for the WDT peripheral on RA MCUs. This module implements the [WDT Interface](#).

## Overview

The watchdog timer is used to recover from unexpected errors in an application. The watchdog timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the WDT resets the device or generates an NMI.

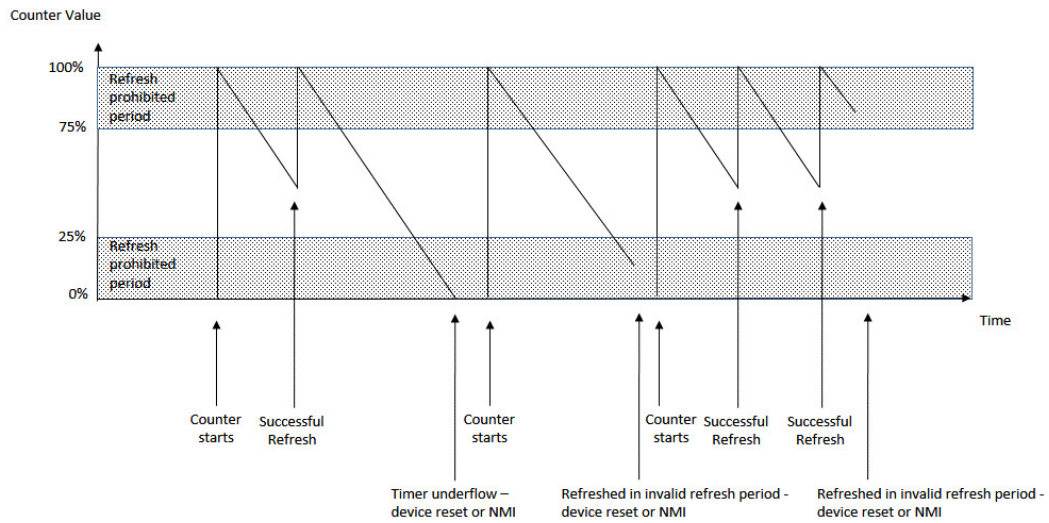

Figure 208: Watchdog Timer Operation Example

**Features**

The WDT HAL module has the following key features:

- When the WDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
  - Resetting of the device
  - Generation of an NMI
- The WDT has two supported modes:
  - In auto start mode, the WDT begins counting at reset.
  - In register start mode, the WDT can be started from the application.

**Selecting a Watchdog**

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

	WDT	IWDT
Start Mode	The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode).	The IWDT can only be configured by hardware to start automatically.
Clock Source	The WDT runs off a peripheral clock.	The IWDT has its own clock source which improves safety.

## Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

### Note

When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the **OFS** settings on the **BSP** tab.

### Build Time Configurations for r\_wdt

The following build time configurations are defined in fsp\_cfg/r\_wdt\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Register Start NMI Support	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	If enabled, code for NMI support in register start mode is included in the build.

### Configurations for Monitoring > Watchdog (r\_wdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Watchdog (r\_wdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_wdt0	Module name.
Timeout	<ul style="list-style-type: none"> <li>1,024 Cycles</li> <li>4,096 Cycles</li> <li>8,192 Cycles</li> <li>16,384 Cycles</li> </ul>	16,384 Cycles	Select the watchdog timeout in cycles.
Clock Division Ratio	<ul style="list-style-type: none"> <li>PCLK/4</li> <li>PCLK/64</li> <li>PCLK/128</li> <li>PCLK/512</li> <li>PCLK/2048</li> <li>PCLK/8192</li> </ul>	PCLK/8192	Select the watchdog clock divisor.
Window Start Position	<ul style="list-style-type: none"> <li>100% (Window Position Not Specified)</li> <li>75%</li> <li>50%</li> <li>25%</li> </ul>	100% (Window Position Not Specified)	Select the allowed watchdog refresh start point.
Window End Position	<ul style="list-style-type: none"> <li>0% (Window Position Not Specified)</li> </ul>	0% (Window Position Not Specified)	Select the allowed watchdog refresh end

	Specified)		point.
	<ul style="list-style-type: none"> <li>• 25%</li> <li>• 50%</li> <li>• 75%</li> </ul>		
Reset Control	<ul style="list-style-type: none"> <li>• Reset Output</li> <li>• NMI Generated</li> </ul>	Reset Output	Select what happens when the watchdog timer expires.
Stop Control	<ul style="list-style-type: none"> <li>• WDT Count Enabled in Low Power Mode</li> <li>• WDT Count Disabled in Low Power Mode</li> </ul>	WDT Count Disabled in Low Power Mode	Select the watchdog state in low power mode.
NMI Callback	Name must be a valid C symbol	NULL	A user callback function must be provided if the WDT is configured to generate an NMI when the timer underflows or a refresh error occurs. If this callback function is provided, it will be called from the NMI handler each time the watchdog triggers.

## Clock Configuration

The WDT clock is based on the PCLKB frequency. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time. The maximum timeout period with PCLKB running at 60 MHz is approximately 2.2 seconds.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## NMI Interrupt

The watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

### Note

*When using the WDT in software start mode with NMI and the timer underflows, the WDT status must be reset by calling [R\\_WDT\\_StatusClear](#) before restarting the timer via [R\\_WDT\\_Refresh](#).*

## Period Calculation

The WDT operates from PCLKB. With a PCLKB of 60 MHz, the maximum time from the last refresh to device reset or NMI generation will be just over 2.2 seconds as detailed below.

PLCKB = 60 MHz

Clock division ratio = PCLKB / 8192  
Timeout period = 16384 cycles  
WDT clock frequency = 60 MHz / 8192 = 7.324 kHz  
Cycle time = 1 / 7.324 kHz = 136.53 us  
Timeout = 136.53 us x 16384 cycles = 2.23 seconds

## Limitations

Developers should be aware of the following limitations when using the WDT:

- When using a J-Link debugger the WDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the WDT to count and generate NMI or reset when the
 * debugger is connected. */
R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
```

- If the WDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling [R\\_WDT\\_Refresh\(\)](#) after the MCU wakes from low power mode.

## Examples

### WDT Basic Example

This is a basic example of minimal use of the WDT in an application.

```
void wdt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* In auto start mode, the WDT starts counting immediately when the MCU is powered
    on. */

    /* Initializes the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* In register start mode, start the watchdog by calling R_WDT_Refresh. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* Application work here. */
    }
}
```

```
/* Refresh before the counter underflows to prevent reset or NMI. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
}
}
```

## WDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define WDT_TIMEOUT_COUNTS (16384U)
#define WDT_MAX_COUNTER (WDT_TIMEOUT_COUNTS - 1U)
#define WDT_START_WINDOW_75 ((WDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void wdt_callback (wdt_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    fsp_err_t err = FSP_SUCCESS;
    /* (Optional) Determine the source of the NMI. */
    wdt_status_t status = WDT_STATUS_NO_ERROR;
    err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
    assert(FSP_SUCCESS == err);
    /* (Optional) Log source of NMI and any other debug information. */
    /* (Optional) Clear the error flags. */
    err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
    assert(FSP_SUCCESS == err);
    /* (Register start mode) In register start mode, call R_WDT_Refresh() to
    * continue using the watchdog after an error. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
    /* (Optional) Issue a software reset to reset the MCU. */
    __NVIC_SystemReset();
}
void wdt_advanced_example (void)
```

```
{
    fsp_err_t err = FSP_SUCCESS;

    /* (Optional) Enable the WDT to count and generate NMI or reset when the
     * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;

    /* (Optional) Check if the WDTRF flag is set to know if the system is
     * recovering from a WDT reset. */
    if (R_SYSTEM->RSTSR1_b.WDTRF)
    {
        /* Clear the flag. */
        R_SYSTEM->RSTSR1 = 0U;
    }

    /* Open the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize other application code. */
    /* (Register start mode) Call R_WDT_Refresh() to start the WDT in register
     * start mode. Do not call R_WDT_Refresh() in auto start mode unless the
     * counter is in the acceptable refresh window. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* Application work here. */
        /* (Optional) If there is a chance the application takes less time than
         * the start window, verify the WDT counter is past the start window
         * before refreshing the WDT. */
        uint32_t wdt_counter = 0U;

    do
        {
            /* Read the current WDT counter value. */
            err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
            assert(FSP_SUCCESS == err);
```

```

    } while (wdt_counter >= WDT_START_WINDOW_75);

/* Refresh before the counter underflows to prevent reset or NMI. */
err = R_WDT_Refresh(&g_wdt0_ctrl);
assert(FSP_SUCCESS == err);
}
}

```

## Data Structures

```
struct wdt_instance_ctrl_t
```

## Data Structure Documentation

### ◆ wdt\_instance\_ctrl\_t

```
struct wdt_instance_ctrl_t
```

WDT private control block. DO NOT MODIFY. Initialization occurs when [R\\_WDT\\_Open\(\)](#) is called.

## Function Documentation

### ◆ R\_WDT\_Open()

```
fsp_err_t R_WDT_Open ( wdt_ctrl_t *const p_ctrl, wdt_cfg_t const *const p_cfg )
```

Configure the WDT in register start mode. In auto-start\_mode the NMI callback can be registered. Implements [wdt\\_api\\_t::open](#).

This function should only be called once as WDT configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```

/* Initializes the module. */
err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);

```

### Return values

FSP_SUCCESS	WDT successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_STATE	The security state of the NMI and the module do not match.

### Note

*In auto start mode the only valid configuration option is for registering the callback for the NMI ISR if NMI output has been selected.*

## ◆ R\_WDT\_TimeoutGet()

```
fsp_err_t R_WDT_TimeoutGet ( wdt_ctrl_t*const p_ctrl, wdt_timeout_values_t*const p_timeout )
```

Read timeout information for the watchdog timer. Implements `wdt_api_t::timeoutGet`.

**Return values**

FSP_SUCCESS	WDT timeout information retrieved successfully.
FSP_ERR_ASSERTION	Null Pointer.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

## ◆ R\_WDT\_Refresh()

```
fsp_err_t R_WDT_Refresh ( wdt_ctrl_t*const p_ctrl)
```

Refresh the watchdog timer. Implements `wdt_api_t::refresh`.

In addition to refreshing the watchdog counter this function can be used to start the counter in register start mode.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI. */
err = R_WDT_Refresh(&g_wdt0_ctrl);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	WDT successfully refreshed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

**Note**

*This function only returns FSP\_SUCCESS. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.*

◆ **R\_WDT\_StatusGet()**

```
fsp_err_t R_WDT_StatusGet ( wdt_ctrl_t *const p_ctrl, wdt_status_t *const p_status )
```

Read the WDT status flags. Implements `wdt_api_t::statusGet`.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	WDT status successfully read.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.
FSP_ERR_UNSUPPORTED	This function is only valid if the watchdog generates an NMI when an error occurs.

**Note**

*When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.*

◆ **R\_WDT\_StatusClear()**

```
fsp_err_t R_WDT_StatusClear ( wdt_ctrl_t *const p_ctrl, const wdt_status_t status )
```

Clear the WDT status and error flags. Implements `wdt_api_t::statusClear`.

Example:

```
/* (Optional) Clear the error flags. */
err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	WDT flag(s) successfully cleared.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.
FSP_ERR_UNSUPPORTED	This function is only valid if the watchdog generates an NMI when an error occurs.

**Note**

*When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.*

◆ **R\_WDT\_CounterGet()**

```
fsp_err_t R_WDT_CounterGet ( wdt_ctrl_t *const p_ctrl, uint32_t *const p_count )
```

Read the current count value of the WDT. Implements `wdt_api_t::counterGet`.

Example:

```
/* Read the current WDT counter value. */
err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	WDT current count successfully read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

### ◆ R\_WDT\_CallbackSet()

```
fsp_err_t R_WDT_CallbackSet ( wdt_ctrl_t *const p_ctrl, void(*) (wdt_callback_args_t *) p_callback,
void const *const p_context, wdt_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [wdt\\_api\\_t::callbackSet](#)

#### Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

## 4.2.10 Motor

### Modules

#### Detailed Description

Motor Modules.

#### Modules

[120-degree conduction control sensorless \(rm\\_motor\\_120\\_control\\_sensorless\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Control Interface](#).

[120-degree conduction control with Hall sensors \(rm\\_motor\\_120\\_control\\_hall\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Control Interface](#).

[ADC and PWM Modulation \(rm\\_motor\\_driver\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor driver Interface](#).

#### ADC and PWM modulation (rm\_motor\_120\_driver)

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Driver Interface](#).

#### Motor 120 degree control (rm\_motor\_120\_degree)

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the [Motor 120 degree control \(rm\\_motor\\_120\\_degree\)](#).

#### Motor Angle (rm\_motor\_estimate)

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

#### Motor Angle (rm\_motor\_sense\_encoder)

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

#### Motor Current Controller (rm\_motor\_current)

Calculation process for the motor control on RA MCUs. This module implements the [Motor current Interface](#).

#### Motor Encoder Vector Control (rm\_motor\_encoder)

Control a SPM motor on RA MCUs. This module implements the [Motor Encoder Vector Control \(rm\\_motor\\_encoder\)](#).

#### Motor Position Controller (rm\_motor\_position)

Calculation process for the motor control on RA MCUs. This module implements the [Motor position Interface](#).

#### Motor Sensorless Vector Control (rm\_motor\_sensorless)

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Sensorless Vector Control \(rm\\_motor\\_sensorless\)](#).

#### Motor Speed Controller (rm\_motor\_speed)

Calculation process for the motor control on RA MCUs. This module implements the [Motor speed Interface](#).

Implements `motor_120_control_api_t::parameterUpdate`. More...

## Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Control Interface](#).

## Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

### Features

The motor 120 control sensorless module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

## Configuration

### Build Time Configurations for rm\_motor\_120\_control\_sensorless

The following build time configurations are defined in fsp\_cfg/rm\_motor\_120\_control\_sensorless\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Motor > 120-degree conduction control sensorless (rm\_motor\_120\_control\_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control sensorless (rm\_motor\_120\_control\_sensorless).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_120_control_s ensorless0	Module name.
General > Conduction type	<ul style="list-style-type: none"> <li>• First 60 degree PWM</li> <li>• Complementary First 60 degree PWM</li> </ul>	First 60 degree PWM	Select conduction type
General > Stop BEMF	Must be a valid non-negative value.	0.5	Value of stop motor BEMF (U+V+W)
General > Timeout counts (msec)	Must be a valid non-negative value.	2000	Undetected time
General > Maximum voltage for BOOT (V)	Must be a valid non-negative value.	8.0	Maximum output voltage for boot mode (V)
General > Maximum	Must be a valid non-	20.0	Maximum output

voltage (V)	negative value.		voltage (V)
General > Minimum voltage (V)	Must be a valid non-negative value.	3.0	Minimum output voltage (V)
General > Carrier frequency (kHz)	Must be a valid non-negative value.	20.0	PWM carrier frequency (kHz)
General > Adjusting angle	Manual Entry	0	Adjusting angle
General > Speed PI decimation	Must be a valid non-negative value.	1	Speed PI control decimation count
General > Free run timer frequency (MHz)	Must be a valid non-negative value.	120	Freerun timer frequency (MHz)
General > Speed LPF K	Must be a valid non-negative value.	1.0	Speed LPF parameter
General > Step of speed change	Must be a valid non-negative value.	0.2	Speed reference change step
General > Boot reference voltage (V)	Must be a valid non-negative value.	3.0	Voltage reference for boot mode
General > Voltage lamping time	Must be a valid non-negative value.	128	Voltage lamping time
General > Voltage constant adjust time	Must be a valid non-negative value.	64	Voltage constant adjust time value (msec)
General > Open loop start speed (rpm)	Manual Entry	150	Open loop start speed (rpm)
General > Open loop mode2 speed (rpm)	Manual Entry	185	to mode2 change speed (rpm)
General > Open loop mode3 speed (rpm)	Manual Entry	1000	to mode3 change speed (rpm)
General > Open loop start voltage (V)	Must be a valid non-negative value.	3.0	start reference voltage (V)
General > Open loop mode1 speed rate	Must be a valid non-negative value.	0.25	increase rate of reference speed (rpm/control period)
General > Open loop mode2 voltage rate	Must be a valid non-negative value.	0.00285	increase rate of reference voltage (v/control period)
General > Open loop mode2 speed rate	Must be a valid non-negative value.	0.71	increase rate of reference speed (rpm/control period)
General > Open loop mode3 voltage rate	Must be a valid non-negative value.	0.002	increase rate of reference voltage (v/control period)
General > Open loop maximum voltage (V)	Must be a valid non-negative value.	6.5	openloop maximum voltage (V)

General > PI control KP	Must be a valid non-negative value.	0.02	PI control gain of proportional term
General > PI control KI	Must be a valid non-negative value.	0.004	PI control gain of integral term
General > PI control limit	Must be a valid non-negative value.	24.0	PI control limit of integral term
Motor Parameter > Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Motor Parameter > Resistance (ohm)	Must be a valid non-negative value.	6.447	Resistance
Motor Parameter > Inductance of d-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid non-negative value.	0.02159	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm <sup>2</sup> )	Must be a valid non-negative value.	1.8	Rotor inertia
Interrupts > Callback	Name must be a valid C symbol	NULL	callback function

## Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

## Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

## Examples

### Basic Example

This is a basic example of minimal use of the motor 120 control sensorless in an application.

```
void motor_120_control_sensorless_basic_example (void)
{
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initializes the module. */
err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
                                     g_motor_120_control_sensorless0.p_cfg);

assert(FSP_SUCCESS == err);

/* Set speed reference before motor run */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,
DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);

/* Start motor rotation */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);

/* Get current motor speed */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);

/* Get current */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);

/* Get wait stop flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                     &smpl_wait_stop_flag);

/* Get timeout error flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                     &smpl_timeout_error_fl
ag);

/* Get pattern error flag */
```

```

    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                     &smpl_pattern_error_fl
ag);
/* Get voltage ref */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,
g_motor_120_control_sensorless0.p_cfg);
/* Stop motor rotation */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
/* Reset the process. */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
/* Close the module. */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
}

```

## Data Structures

```
struct motor_120_control_sensorless_extended_cfg_t
```

```
struct motor_120_control_sensorless_instance_ctrl_t
```

## Enumerations

```
enum motor_120_control_sensorless_draw_in_position_t
```

```
enum motor_120_control_sensorless_pattern_change_flag_t
```

## Data Structure Documentation

### ◆ motor\_120\_control\_sensorless\_extended\_cfg\_t

struct motor_120_control_sensorless_extended_cfg_t		
Extended configurations for motor 120 control sensorless		
Data Fields		
float	f4_stop_bemf	Value of stop motor BEMF (U+V+W)
float	f4_max_boot_v	Max output voltage for boot mode (V)
float	f4_carrier_freq	Carrier wave frequency (kHz)
int32_t	s4_angle_shift_adjust	Adjusting angle.
float	f4_boot_ref_v	Voltage reference when zero speed (V)
uint32_t	u4_v_up_time	Voltage lamping time.
uint32_t	u4_v_const_time	Voltage constant adjust time value (ms)
int32_t	s4_ol_start_rpm	Start speed (rpm)
int32_t	s4_ol_mode1_change_rpm	To mode2 change speed (rpm)
int32_t	s4_ol_mode2_change_rpm	To mode3 change speed (rpm)
float	f4_ol_start_refv	Start reference voltage (V)
float	f4_ol_mode1_rate_rpm	Increase rate of reference speed (rpm/control period)
float	f4_ol_mode2_rate_refv	Increase rate of reference voltage (v/control period)
float	f4_ol_mode2_rate_rpm	Increase rate of reference speed (rpm/control period)
float	f4_ol_mode3_rate_refv	Increase rate of reference voltage (v/control period)
float	f4_ol_mode3_max_refv	Openloop max voltage (V)
motor_120_driver_instance_t const *	p_motor_120_driver_instance	Motor 120 driver access module.
timer_instance_t const *	p_speed_cyclic_timer_instance	Cyclic process of speed control timer module.
timer_instance_t const *	p_speed_calc_timer_instance	Speed calculate timer module.

#### ◆ motor\_120\_control\_sensorless\_instance\_ctrl\_t

struct motor_120_control_sensorless_instance_ctrl_t		
120 control sensorless instance control block		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.

<a href="#">motor_120_control_status_t</a>	active	Flag to set active/inactive the motor 120 control.
<a href="#">motor_120_control_run_mode_t</a>	run_mode	Drive mode.
<a href="#">motor_120_control_timeout_error_flag_t</a>	timeout_error_flag	Timeout error status.
<a href="#">motor_120_control_pattern_error_flag_t</a>	pattern_error_flag	Bemf pattern error status.
<a href="#">motor_120_control_rotation_direction_t</a>	direction	Rotational direction (0:CCW,1:CCW)
float	f4_ol_pattern_set_calc	Counts to change timing of open loop pattern.
float	f4_speed_calc_base	Base counts to calculate rotation speed.
float	f_rpm2rad	Translate value to radian/second to rpm.
float	f4_v_ref	Voltage reference (output of speed PI control)
uint32_t	u4_pwm_duty	PWM duty.
float	f4_ref_speed_rad	Motor speed reference.
float	f4_ref_speed_rad_ctrl	Motor speed reference for speed PI control.
float	f4_speed_rad	Motor speed.
uint32_t	u4_cnt_speed_pi	Counter for period of speed PI control.
<a href="#">motor_120_control_wait_stop_flag_t</a>	flag_wait_stop	Flag for waiting for motor stop.
float	f4_vn_ad	Neutral voltage.
uint32_t	u4_cnt_adj_v	Voltage lamping count adjustment.
<a href="#">motor_120_control_sensorless_draw_in_position_t</a>	flag_draw_in	Status of draw in a initial position.
<a href="#">motor_120_driver_phase_pattern_t</a>	v_pattern	Voltage pattern.
uint32_t	u4_v_pattern_num	Selecting pattern number for openloop drive.
uint32_t	u4_bemf_signal	Pattern of BEMF.
uint32_t	u4_pre_bemf_signal	Previous pattern of BEMF.
<a href="#">motor_120_control_sensorless_pattern_change_flag_t</a>	flag_pattern_change	Pattern change flag.
<a href="#">motor_120_control_speed_ref_t</a>	flag_speed_ref	Speed reference flag.

<a href="#">motor_120_control_voltage_ref_t</a>	flag_voltage_ref	Voltage reference flag.
uint32_t	u4_ol_signal	Pattern of BEMF.
uint32_t	u4_ol_pattern_set	Openloop frequency.
uint32_t	u4_cnt_ol_pattern_set	Counter for openloop pattern change.
uint32_t	u4_cnt_timeout	Counter for timeout error.
uint32_t	u4_bemf_timer_cnt	Value of timer counter.
uint32_t	u4_pre_bemf_timer_cnt	Previous value of timer counter.
int32_t	s4_timer_cnt_ave	Counts for 360 degrees.
uint32_t	u4_timer_cnt_buf[MOTOR_120_CONTROL_SENSORLESS_TIMES]	Counts for 60 degrees.
uint32_t	u4_timer_cnt_num	Array element number before 360 degrees.
uint32_t	u4_cnt_carrier	Counter for carrier interrupt.
uint32_t	u4_pre_cnt_carrier	Previous carrier interrupt count.
uint32_t	u4_angle_shift_cnt	Shift degrees count.
float	f4_pi_ctrl_err	PI control error.
float	f4_pi_ctrl_refi	PI control buffer of integral term.
<a href="#">motor_120_control_cfg_t</a> const *	p_cfg	Pointer of configuration structure.
<a href="#">timer_callback_args_t</a>	timer_args	For call timer callbackSet function.

## Enumeration Type Documentation

### ◆ [motor\\_120\\_control\\_sensorless\\_draw\\_in\\_position\\_t](#)

enum <a href="#">motor_120_control_sensorless_draw_in_position_t</a>	
Draw in a initial position	
Enumerator	
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_INIT	Initial parameter.
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_1ST_TIME	Draw in a initial position of the 1st time.
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_2ND_TIME	Draw in a initial position of the 2nd time.

◆ **motor\_120\_control\_sensorless\_pattern\_change\_flag\_t**

enum <code>motor_120_control_sensorless_pattern_change_flag_t</code>	
Pattern change	
Enumerator	
<code>MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_CLEAR</code>	Initial parameter.
<code>MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_SET</code>	Voltage pattern change.

**Function Documentation**◆ **RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_Open()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Open ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_cfg_t const *const p_cfg )
```

Opens and configures the motor sensorless 120 detection module. Implements `motor_120_control_api_t::open`.

Example:

```
/* Initializes the module. */
err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
g_motor_120_control_sensorless0.p_cfg);
```

**Return values**

<code>FSP_SUCCESS</code>	Motor driver successfully configured.
<code>FSP_ERR_ASSERTION</code>	Null pointer, or one or more configuration options is invalid.
<code>FSP_ERR_ALREADY_OPEN</code>	Module is already open. This module can only be opened once.
<code>FSP_ERR_INVALID_ARGUMENT</code>	Input parameter error.

### ◆ RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_Close()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Close ( motor_120_control_ctrl_t *const p_ctrl)
```

Disables specified motor sensorless 120 detection module. Implements `motor_120_control_api_t::close`.

Example:

```
/* Close the module. */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
```

#### Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_Run()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Run ( motor_120_control_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_control_api_t::run`.

Example:

```
/* Start motor rotation */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
```

#### Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_Stop()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Stop ( motor_120_control_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_control_api_t::stop`.

Example:

```
/* Stop motor rotation */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_Reset()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Reset ( motor_120_control_ctrl_t *const p_ctrl)
```

Reset variables of motor sensorless 120 detection module. Implements `motor_120_control_api_t::reset`.

Example:

```
/* Reset the process. */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_SpeedSet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet ( motor_120_control_ctrl_t *const
p_ctrl, float const speed_rpm )
```

Set speed[rpm]. Implements `motor_120_control_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,
DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_SpeedGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet ( motor_120_control_ctrl_t *const
p_ctrl, float *const p_speed_rpm )
```

Get speed. Implements `motor_120_control_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_CurrentGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_driver_current_status_t *const p_current_status )
```

Get current. Implements `motor_120_control_api_t::currentGet`.

Example:

```
/* Get current */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_120_control_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smpl_wait_stop_flag);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

### ◆ RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_TimeoutErrorFlagGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_timeout_error_flag_t *const p_timeout_error_flag )
```

Get timeout error flag. Implements `motor_120_control_api_t::timeoutErrorFlagGet`.

Example:

```
/* Get timeout error flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smpl_timeout_error_flag);
```

#### Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

### ◆ RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_PatternErrorFlagGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_pattern_error_flag_t *const p_pattern_error_flag )
```

Get pattern error flag. Implements `motor_120_control_api_t::patternErrorFlagGet`.

Example:

```
/* Get pattern error flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smpl_pattern_error_flag);
```

#### Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

### ◆ RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_VoltageRefGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_voltage_ref_t *const p_voltage_ref )
```

Get voltage ref. Implements `motor_120_control_api_t::voltageRefGet`.

Example:

```
/* Get voltage ref */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
```

#### Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

### ◆ RM\_MOTOR\_120\_CONTROL\_SENSORLESS\_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_cfg_t const *const p_cfg )
```

Update the parameters of sensorless 120 detection module. Implements [motor\\_120\\_control\\_api\\_t::parameterUpdate](#).

Example:

```
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,
g_motor_120_control_sensorless0.p_cfg);
```

#### Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

## 4.2.10.2 120-degree conduction control with Hall sensors (rm\_motor\_120\_control\_hall)

Modules » [Motor](#)

### Functions

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Open (motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_cfg_t const *const p_cfg)
```

Opens and configures the motor hall 120 detection module. Implements [motor\\_120\\_control\\_api\\_t::open](#). [More...](#)

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Close (motor_120_control_ctrl_t
*const p_ctrl)
```

Disables specified motor hall 120 detection module. Implements [motor\\_120\\_control\\_api\\_t::close](#). [More...](#)

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Run (motor_120_control_ctrl_t
*const p_ctrl)
```

Run motor (Start motor rotation). Implements [motor\\_120\\_control\\_api\\_t::run](#). [More...](#)

`fsp_err_t RM_MOTOR_120_CONTROL_HALL_Stop (motor_120_control_ctrl_t *const p_ctrl)`

const \*const p\_cfg)

Update the parameters of hall 120 detection module. Implements [motor\\_120\\_control\\_api\\_t::parameterUpdate](#). [More...](#)

## Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Control Interface](#).

## Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

## Features

The motor 120 control hall module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

## Configuration

### Build Time Configurations for `rm_motor_120_control_hall`

The following build time configurations are defined in `fsp_cfg/rm_motor_120_control_hall_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Motor > 120-degree conduction control with Hall sensors

**(rm\_motor\_120\_control\_hall)**

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control with Hall sensors (rm\_motor\_120\_control\_hall).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_120_control_hall0	Module name.
General > Conduction type	<ul style="list-style-type: none"> <li>First 60 degree PWM</li> <li>Complementary First 60 degree PWM</li> </ul>	First 60 degree PWM	Select conduction type
General > Timeout counts (msec)	Must be a valid non-negative value.	200	Counts to judge rotor unrotate
General > Maximum voltage (V)	Must be a valid non-negative value.	20.0	Maximum output voltage (V)
General > Minimum voltage (V)	Must be a valid non-negative value.	3.0	Minimum output voltage (V)
General > Speed PI decimation	Must be a valid non-negative value.	0	Speed PI control decimation count
General > Freerun timer frequency (MHz)	Must be a valid non-negative value.	120	Freerun timer frequency (MHz)
General > Speed LPF	Must be a valid non-negative value.	1.0	Speed LPF parameter
General > Step of speed reference change	Must be a valid non-negative value.	0.2	Speed ref change step
General > Start reference voltage (V)	Must be a valid non-negative value.	5.8	Reference voltage for boot mode (V)
General > Hall wait counts	Must be a valid non-negative value.	12	Wait counts of hall interrupts to start speed calculation
General > Stop judge time	Must be a valid non-negative value.	1000	Stop judge time
General > Minimum limit speed (rpm)	Must be a valid non-negative value.	550	Minimum limit speed (rpm) (mechanical angle)
General > PI control KP	Must be a valid non-negative value.	0.02	PI control gain of proportional term
General > PI control KI	Must be a valid non-negative value.	0.0005	PI control gain of integral term
General > PI control limit	Must be a valid non-negative value.	24.0	PI control limit of integral term

General > Hall interrupt mask value	Must be a valid non-negative value.	15	For limiting hall interrupt processing. Limited by the number of ADC interrupts
Motor Parameter > Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Motor Parameter > Resistance (ohm)	Must be a valid non-negative value.	6.447	Resistance
Motor Parameter > Inductance of d-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid non-negative value.	0.02159	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm <sup>2</sup> )	Must be a valid non-negative value.	1.8	Rotor inertia
Interrupts > Callback	Name must be a valid C symbol	NULL	Callback function
Hall sensor port U	Manual Entry	BSP_IO_PORT_04_PIN_1	Hall sensor port U
Hall sensor port V	Manual Entry	BSP_IO_PORT_04_PIN_1	Hall sensor port V
Hall sensor port W	Manual Entry	BSP_IO_PORT_04_PIN_0	Hall sensor port W

## Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

## Pin Configuration

Depend on included ICU module.

## Usage Notes

### Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

## Examples

### Basic Example

This is a basic example of minimal use of the motor 120 control hall in an application.

```
void motor_120_control_hall_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
    assert(FSP_SUCCESS == err);

    /* Set speed reference before motor run */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);

    /* Start motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);

    /* Get current motor speed */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);

    /* Get current */
    (void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);

    /* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);

    /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);

    /* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);

    /* Get voltage ref */
    (void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);

    (void)
}
```

```

RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);

/* Stop motor rotation */
(void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);

/* Reset the process. */
(void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);

/* Close the module. */
(void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
}

```

## Data Structures

```
struct motor_120_control_hall_extended_cfg_t
```

```
struct motor_120_control_hall_instance_ctrl_t
```

## Data Structure Documentation

### ◆ motor\_120\_control\_hall\_extended\_cfg\_t

struct motor_120_control_hall_extended_cfg_t		
Extended configurations for motor 120 control hall		
Data Fields		
<a href="#">bsp_io_port_pin_t</a>	port_hall_sensor_u	Hall sensor port U.
<a href="#">bsp_io_port_pin_t</a>	port_hall_sensor_v	Hall sensor port V.
<a href="#">bsp_io_port_pin_t</a>	port_hall_sensor_w	Hall sensor port W.
float	f4_start_refv	Reference voltage for boot mode.
uint32_t	u4_hall_wait_cnt	Wait counts of hall interrupts for speed calculation.
uint32_t	u4_stop_judge_time	Stop judge time.
uint32_t	u4_min_speed_rpm	Minimum limit speed (rpm) (mechanical angle)
uint32_t	u4_hall_interrupt_mask_value	For limiting hall interrupt processing. Limited by the number of ADC interrupts.
<a href="#">motor_120_driver_instance_t</a> const *	p_motor_120_driver_instance	Motor 120 driver access module.
<a href="#">timer_instance_t</a> const *	p_speed_cyclic_timer_instance	Cyclic process of speed control timer module.
<a href="#">timer_instance_t</a> const *	p_speed_calc_timer_instance	Speed calculate timer module.

<a href="#">external_irq_instance_t</a> const *	p_u_hall_irq_instance	U phase hall interrupt.
<a href="#">external_irq_instance_t</a> const *	p_v_hall_irq_instance	V phase hall interrupt.
<a href="#">external_irq_instance_t</a> const *	p_w_hall_irq_instance	W phase hall interrupt.

#### ◆ motor\_120\_control\_hall\_instance\_ctrl\_t

struct motor_120_control_hall_instance_ctrl_t		
120 control hall instance control block		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
<a href="#">motor_120_control_status_t</a>	active	Flag to set active/inactive the motor 120 control.
<a href="#">motor_120_control_run_mode_t</a>	run_mode	Drive mode.
<a href="#">motor_120_control_timeout_error_flag_t</a>	timeout_error_flag	Timeout error status.
<a href="#">motor_120_control_pattern_error_flag_t</a>	pattern_error_flag	Hall pattern error status.
<a href="#">motor_120_control_rotation_direction_t</a>	direction	Rotational direction (0: CW, 1: CCW)
float	f4_speed_calc_base	Base counts to calculate rotation speed.
float	f_rpm2rad	Translate value to radian/second to rpm.
float	f4_v_ref	Voltage reference (output of speed PI control)
float	f4_ref_speed_rad	Motor speed reference.
float	f4_ref_speed_rad_ctrl	Motor speed reference for speed PI control.
float	f4_speed_rad	Motor speed.
uint32_t	u4_cnt_speed_pi	Counter for period of speed PI control.
<a href="#">motor_120_control_wait_stop_flag_t</a>	flag_wait_stop	Flag for waiting for motor stop.
uint32_t	u4_cnt_wait_stop	Counter for waiting motor stop.
<a href="#">motor_120_driver_phase_pattern_t</a>	v_pattern	Voltage pattern.
<a href="#">motor_120_control_speed_ref_t</a>	flag_speed_ref	Speed reference flag.
<a href="#">motor_120_control_voltage_ref_t</a>	flag_voltage_ref	Voltage reference flag.

uint32_t	u4_cnt_timeout	Counter for timeout error.
uint32_t	u4_hall_timer_cnt	Value of timer counter.
uint32_t	u4_pre_hall_timer_cnt	Previous value of timer counter.
int32_t	s4_timer_cnt_ave	Counts for 360 degrees.
uint32_t	u4_timer_cnt_buf[MOTOR_120_CONTROL_HALL_TIMES]	Counts for 60 degrees.
uint32_t	u4_timer_cnt_num	Array element number before 360 degrees.
float	f4_pi_ctrl_err	PI control error.
float	f4_pi_ctrl_refi	PI control buffer of integral term.
uint32_t	u4_hall_intr_cnt	For start timing of speed calculation.
uint32_t	u4_adc_interrupt_cnt	Number of ADC interrupt processing.
<a href="#">motor_120_control_cfg_t</a> const *	p_cfg	Pointer of configuration structure.
<a href="#">external_irq_callback_args_t</a>	hall_interrupt_args	For call IRQ callbackSet function.
<a href="#">timer_callback_args_t</a>	timer_args	For call timer callbackSet function.

## Function Documentation

---

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_Open()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Open ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_cfg_t const *const p_cfg )
```

Opens and configures the motor hall 120 detection module. Implements `motor_120_control_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

**Return values**

FSP_SUCCESS	Motor 120 driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_Close()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Close ( motor_120_control_ctrl_t *const p_ctrl)
```

Disables specified motor hall 120 detection module. Implements `motor_120_control_api_t::close`.

Example:

```
/* Close the module. */
(void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_Run()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Run ( motor_120_control_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_control_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_Stop()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Stop ( motor_120_control_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_control_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_Reset()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Reset ( motor_120_control_ctrl_t *const p_ctrl)
```

Reset variables of motor hall 120 detection module. Implements `motor_120_control_api_t::reset`.

Example:

```
/* Reset the process. */
(void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_SpeedSet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedSet ( motor_120_control_ctrl_t *const p_ctrl, float
const speed_rpm )
```

Set speed[rpm]. Implements `motor_120_control_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_SpeedGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedGet ( motor_120_control_ctrl_t *const p_ctrl, float
*const p_speed_rpm )
```

Get speed. Implements `motor_120_control_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_CurrentGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_CurrentGet ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_driver_current_status_t *const p_current_status )
```

Get current. Implements `motor_120_control_api_t::currentGet`.

Example:

```
/* Get current */
(void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_120_control_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_TimeoutErrorFlagGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_timeout_error_flag_t *const p_timeout_error_flag )
```

Get timeout error flag. Implements `motor_120_control_api_t::timeoutErrorFlagGet`.

Example:

```
/* Get timeout error flag */
(void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_PatternErrorFlagGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet ( motor_120_control_ctrl_t *const p_ctrl, motor_120_control_pattern_error_flag_t *const p_pattern_error_flag )
```

Get pattern error flag. Implements `motor_120_control_api_t::patternErrorFlagGet`.

Example:

```
/* Get pattern error flag */
(void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_120\_CONTROL\_HALL\_VoltageRefGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_VoltageRefGet ( motor_120_control_ctrl_t *const p_ctrl, motor_120_control_voltage_ref_t *const p_voltage_ref )
```

Get voltage ref. Implements `motor_120_control_api_t::voltageRefGet`.

Example:

```
/* Get voltage ref */
(void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

### ◆ RM\_MOTOR\_120\_CONTROL\_HALL\_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_ParameterUpdate ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_cfg_t const *const p_cfg )
```

Update the parameters of hall 120 detection module. Implements `motor_120_control_api_t::parameterUpdate`.

Example:

```
(void)
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

#### Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

### 4.2.10.3 ADC and PWM Modulation (rm\_motor\_driver)

Modules » Motor

#### Functions

```
fsp_err_t RM_MOTOR_DRIVER_Open (motor_driver_ctrl_t *const p_ctrl,
motor_driver_cfg_t const *const p_cfg)
```

Opens and configures the Motor Driver module. Implements `motor_driver_api_t::open`. [More...](#)

```
fsp_err_t RM_MOTOR_DRIVER_Close (motor_driver_ctrl_t *const p_ctrl)
```

Disables specified Motor Driver Module. Implements `motor_driver_api_t::close`. [More...](#)

```
fsp_err_t RM_MOTOR_DRIVER_Reset (motor_driver_ctrl_t *const p_ctrl)
```

Reset variables of Motor Driver Module. Implements `motor_driver_api_t::reset`. [More...](#)

```
fsp_err_t RM_MOTOR_DRIVER_PhaseVoltageSet (motor_driver_ctrl_t *const
p_ctrl, float const u_voltage, float const v_voltage, float const
w_voltage)
```

Set Phase Voltage Data to calculate PWM duty. Implements [motor\\_driver\\_api\\_t::phaseVoltageSet](#). [More...](#)

[fsp\\_err\\_t](#) [RM\\_MOTOR\\_DRIVER\\_CurrentGet](#) ([motor\\_driver\\_ctrl\\_t](#) \*const p\_ctrl, [motor\\_driver\\_current\\_get\\_t](#) \*const p\_current\_get)

Get calculated phase Current, Vdc & Va\_max data. Implements [motor\\_driver\\_api\\_t::currentGet](#). [More...](#)

[fsp\\_err\\_t](#) [RM\\_MOTOR\\_DRIVER\\_FlagCurrentOffsetGet](#) ([motor\\_driver\\_ctrl\\_t](#) \*const p\_ctrl, [uint8\\_t](#) \*const p\_flag\_offset)

Get the flag of finish current offset detection. Implements [motor\\_driver\\_api\\_t::flagCurrentOffsetGet](#). [More...](#)

[fsp\\_err\\_t](#) [RM\\_MOTOR\\_DRIVER\\_CurrentOffsetRestart](#) ([motor\\_driver\\_ctrl\\_t](#) \*const p\_ctrl)

Restart the current offset detection. Implements [motor\\_driver\\_api\\_t::currentOffsetRestart](#). [More...](#)

[fsp\\_err\\_t](#) [RM\\_MOTOR\\_DRIVER\\_ParameterUpdate](#) ([motor\\_driver\\_ctrl\\_t](#) \*const p\_ctrl, [motor\\_driver\\_cfg\\_t](#) const \*const p\_cfg)

Update the parameters of Driver Module. Implements [motor\\_driver\\_api\\_t::parameterUpdate](#). [More...](#)

## Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor driver Interface](#).

## Overview

The motor driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current and main line voltage. This module should be called cyclically at included A/D Conversion finish interrupt.

### Features

The Motor Driver Module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current and main line voltage.
- Detect and correct A/D offset at phase current channel

## Configuration

## Build Time Configurations for rm\_motor\_driver

The following build time configurations are defined in fsp\_cfg/rm\_motor\_driver\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
ADC_B Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Select ADC_B module support.

## Configurations for Motor > ADC and PWM Modulation (rm\_motor\_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM Modulation (rm\_motor\_driver).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_driver0	Module name.
General > Shunt type	<ul style="list-style-type: none"> <li>• 1 shunt</li> <li>• 2 shunt</li> <li>• 3 shunt</li> </ul>	2 shunt	Select shunt type
General > Modulation method	<ul style="list-style-type: none"> <li>• SVPWM</li> <li>• SPWM</li> </ul>	SVPWM	Select PWM modulation method
General > PWM Timer Frequency (MHz)	Must be a valid non-negative value.	120	GPT PWM timer frequency
General > PWM Carrier Period (Microseconds)	Must be a valid non-negative value.	50	GPT PWM carrier period
General > Dead Time (Raw Counts)	Must be a valid non-negative value.	240	GPT PWM dead time
General > Current Range (A)	Must be a valid value	27.5F	Current range to measure(Maximum input current)
General > Voltage Range (V)	Must be a valid value	111.0F	Voltage range to measure(Maximum input Main Line Voltage)
General > Counts for current offset measurement	Must be a valid non-negative value.	500	How many times to measure current offset
General > A/D conversion channel for U Phase current	Manual Entry	0	Specify the A/D channel for U phase current
General > A/D conversion channel for W Phase current	Manual Entry	2	Specify the A/D channel for W phase current

General > A/D conversion channel for Main Line Voltage	Manual Entry	5	Specify the A/D channel for main line voltage
General > A/D conversion channel for V Phase current	Manual Entry	1	Specify the A/D channel for V phase current
General > Adjustment value to current A/D	Must be a valid non-negative value.	20.0	Value to adjust 1shunt A/D double buffer
General > Minimum difference of PWM duty	Manual Entry	300	Minimum difference of PWM duty
General > Adjustment delay of A/D conversion	Manual Entry	240	Adjustment delay of A/D conversion
General > Input Voltage (V)	Must be a valid value	24.0F	Input voltage
General > Resolution of A/D conversion	Manual Entry	0xFFF	Resolution of A/D conversion
General > Offset of A/D conversion for current	Manual Entry	0x745	Offset of A/D conversion for current
General > Conversion level of A/D conversion for voltage	Must be a valid value	0.66F	Conversion level of A/D conversion for voltage
General > GTIOCA Stop Level	<ul style="list-style-type: none"> <li>Pin Level Low</li> <li>Pin Level High</li> </ul>	Pin Level High	Select the behavior of the output pin when the timer is stopped.
General > GTIOCB Stop Level	<ul style="list-style-type: none"> <li>Pin Level Low</li> <li>Pin Level High</li> </ul>	Pin Level High	Select the behavior of the output pin when the timer is stopped.
Modulation > Maximum Duty	Must be a valid value	0.9375F	Maximum duty of PWM
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.

## Clock Configuration

Set used clock with included GPT timer.

## Pin Configuration

Depend on included GPT Three Phase Module and ADC Module.

# Usage Notes

## Limitations

Basically no limitation exists.

## Examples

### Basic Example

This is a basic example of minimal use of the Motor Driver in an application.

```
void motor_driver_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_DRIVER_Open(&g_motor_driver0.p_ctrl, &g_motor_driver0.p_cfg);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at cyclic interrupt (e.g. included GPT PWM Carrier
    interrupt).
    * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Get electric current, main line voltage and maximum voltage component */
        (void) RM_MOTOR_DRIVER_CurrentGet(&g_motor_driver0.p_ctrl, &f_get_iu,
        &f_get_iw, &f_get_vdc, &f_get_va_max);

        /* Get the flag of A/D converted current offset */
        (void) RM_MOTOR_DRIVER_FlagCurrentOffsetGet(&g_motor_driver0.p_ctrl,
        &ul_get_flg_offset);

        // Perform current control process here

        /* Set phase voltage */
        (void) RM_MOTOR_DRIVER_PhaseVoltageSet(&g_motor_driver0.p_ctrl, 1.0F, 1.0F,
        1.0F);

        (void) RM_MOTOR_DRIVER_ParameterUpdate(&g_motor_driver0.p_ctrl,
        &g_motor_driver0.p_cfg);
    }

    (void) RM_MOTOR_DRIVER_Reset(&g_motor_driver0.p_ctrl);

    //

    (void) RM_MOTOR_DRIVER_Close(&g_motor_driver0.p_ctrl);
}
```

}

## Enumerations

```
enum motor_driver_modulation_method_t
```

## Enumeration Type Documentation

### ◆ motor\_driver\_modulation\_method\_t

enum motor_driver_modulation_method_t	
Enumerator	
MOTOR_DRIVER_MODULATION_METHOD_SPWM	Sinusoidal pulse-width-modulation.
MOTOR_DRIVER_MODULATION_METHOD_SVPWM	Space vector pulse-width-modulation.

## Function Documentation

### ◆ RM\_MOTOR\_DRIVER\_Open()

fsp_err_t RM_MOTOR_DRIVER_Open ( motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg )	
Opens and configures the Motor Driver module. Implements <a href="#">motor_driver_api_t::open</a> .	
<b>Return values</b>	
FSP_SUCCESS	Motor Driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

### ◆ RM\_MOTOR\_DRIVER\_Close()

fsp_err_t RM_MOTOR_DRIVER_Close ( motor_driver_ctrl_t *const p_ctrl)	
Disables specified Motor Driver Module. Implements <a href="#">motor_driver_api_t::close</a> .	
<b>Return values</b>	
FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_DRIVER\_Reset()**

```
fsp_err_t RM_MOTOR_DRIVER_Reset ( motor_driver_ctrl_t *const p_ctrl)
```

Reset variables of Motor Driver Module. Implements `motor_driver_api_t::reset`.

**Return values**

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_DRIVER\_PhaseVoltageSet()**

```
fsp_err_t RM_MOTOR_DRIVER_PhaseVoltageSet ( motor_driver_ctrl_t *const p_ctrl, float const u_voltage, float const v_voltage, float const w_voltage )
```

Set Phase Voltage Data to calculate PWM duty. Implements `motor_driver_api_t::phaseVoltageSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_DRIVER\_CurrentGet()**

```
fsp_err_t RM_MOTOR_DRIVER_CurrentGet ( motor_driver_ctrl_t *const p_ctrl, motor_driver_current_get_t *const p_current_get )
```

Get calculated phase Current, Vdc & Va\_max data. Implements `motor_driver_api_t::currentGet`.

**Return values**

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_DRIVER\_FlagCurrentOffsetGet()**

```
fsp_err_t RM_MOTOR_DRIVER_FlagCurrentOffsetGet ( motor_driver_ctrl_t *const p_ctrl, uint8_t *const p_flag_offset )
```

Get the flag of finish current offset detection. Implements `motor_driver_api_t::flagCurrentOffsetGet`.

**Return values**

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_DRIVER\_CurrentOffsetRestart()**

```
fsp_err_t RM_MOTOR_DRIVER_CurrentOffsetRestart ( motor_driver_ctrl_t *const p_ctrl)
```

Restart the current offset detection. Implements `motor_driver_api_t::currentOffsetRestart`.

**Return values**

FSP_SUCCESS	Successfully restarted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_DRIVER\_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_DRIVER_ParameterUpdate ( motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg )
```

Update the parameters of Driver Module. Implements `motor_driver_api_t::parameterUpdate`.

**Return values**

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

**4.2.10.4 ADC and PWM modulation (rm\_motor\_120\_driver)**

## Modules » Motor

**Functions**

`fsp_err_t` `RM_MOTOR_120_DRIVER_Open` (`motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_cfg_t const *const p_cfg`)  
 Opens and configures the motor 120 driver module. Implements `motor_120_driver_api_t::open`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DRIVER_Close` (`motor_120_driver_ctrl_t *const p_ctrl`)  
 Disables specified motor 120 driver module. Implements `motor_120_driver_api_t::close`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DRIVER_Run` (`motor_120_driver_ctrl_t *const p_ctrl`)  
 Run motor (Start motor rotation). Implements `motor_120_driver_api_t::run`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DRIVER_Stop` (`motor_120_driver_ctrl_t *const p_ctrl`)  
 Stop motor (Stop motor rotation). Implements `motor_120_driver_api_t::stop`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DRIVER_Reset` (`motor_120_driver_ctrl_t *const p_ctrl`)  
 Reset variables of motor 120 driver module. Implements `motor_120_driver_api_t::reset`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DRIVER_PhaseVoltageSet` (`motor_120_driver_ctrl_t *const p_ctrl, float const u_voltage, float const v_voltage, float const w_voltage`)  
 Set phase voltage data to calculate PWM duty. Implements `motor_120_driver_api_t::phaseVoltageSet`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DRIVER_PhasePatternSet` (`motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_phase_pattern_t const pattern`)  
 Set phase voltage pattern. Implements `motor_120_driver_api_t::phasePatternSet`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DRIVER_CurrentGet` (`motor_120_driver_ctrl_t *const p_ctrl, motor_120_driver_current_status_t *const p_current_status`)  
 Get calculated phase current, Vdc & Va\_max data. Implements

[motor\\_120\\_driver\\_api\\_t::currentGet. More...](#)

`fsp_err_t` [RM\\_MOTOR\\_120\\_DRIVER\\_CurrentOffsetCalc \(motor\\_120\\_driver\\_ctrl\\_t \\*const p\\_ctrl\)](#)

current offset detection. Implements [motor\\_120\\_driver\\_api\\_t::currentOffsetCalc](#) [More...](#)

`fsp_err_t` [RM\\_MOTOR\\_120\\_DRIVER\\_FlagCurrentOffsetGet \(motor\\_120\\_driver\\_ctrl\\_t \\*const p\\_ctrl, motor\\_120\\_driver\\_flag\\_offset\\_calc\\_t \\*const p\\_flag\\_offset\)](#)

Get the flag of finish current offset detection. Implements [motor\\_120\\_driver\\_api\\_t::flagCurrentOffsetGet. More...](#)

`fsp_err_t` [RM\\_MOTOR\\_120\\_DRIVER\\_ParameterUpdate \(motor\\_120\\_driver\\_ctrl\\_t \\*const p\\_ctrl, motor\\_120\\_driver\\_cfg\\_t const \\*const p\\_cfg\)](#)

Update the parameters of 120 driver module. Implements [motor\\_120\\_driver\\_api\\_t::parameterUpdate. More...](#)

## Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Driver Interface](#).

## Overview

The motor 120 degree driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current, voltage and main line voltage. This module should be called cyclically at included A/D conversion finish interrupt.

# BLOCK DIAGRAM OF SENSORLESS VECTOR CONTROL

It is a block diagram of sensorless vector control. This shows the correspondence between modules and functional blocks.

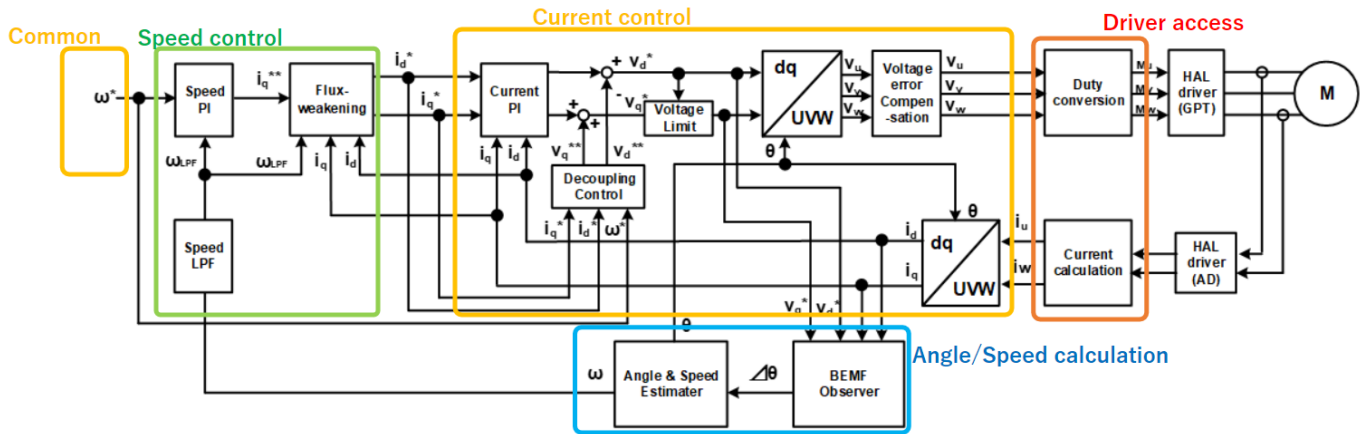

Figure 209: Image of Current Control Module(yellow block)

## Features

The motor 120 degree driver module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current, phase voltage and main line voltage.
- Detect and correct A/D offset at phase current and voltage channel

## Configuration

### Build Time Configurations for rm\_motor\_120\_driver

The following build time configurations are defined in fsp\_cfg/rm\_motor\_120\_driver\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Motor > ADC and PWM modulation (rm\_motor\_120\_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM modulation (rm\_motor\_120\_driver).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_120_driver0	Module name.
General > 120 degree control type	<ul style="list-style-type: none"> <li>• Sensorless</li> <li>• Hall</li> </ul>	Sensorless	120 degree control type

General > PWM output port UP	Manual Entry	BSP_IO_PORT_06_PIN_0	PWM output port UP 1
General > PWM output port UN	Manual Entry	BSP_IO_PORT_06_PIN_0	PWM output port UN 0
General > PWM output port VP	Manual Entry	BSP_IO_PORT_01_PIN_1	PWM output port VP 3
General > PWM output port VN	Manual Entry	BSP_IO_PORT_01_PIN_1	PWM output port VN 4
General > PWM output port WP	Manual Entry	BSP_IO_PORT_01_PIN_1	PWM output port WP 1
General > PWM output port WN	Manual Entry	BSP_IO_PORT_01_PIN_1	PWM output port WN 2
General > PWM timer frequency (MHz)	Must be a valid non-negative value.	120	GPT PWM timer frequency
General > PWM carrier period (Microseconds)	Must be a valid non-negative value.	50	GPT PWM carrier period
General > Dead time (Raw counts)	Must be a valid non-negative value.	240	GPT PWM dead time
General > Current range (A)	Must be a valid non-negative value.	27.5	Current range to measure(Maximum input current)
General > Voltage range (V)	Must be a valid non-negative value.	111.0	Voltage range to measure(Maximum input main line voltage)
General > Resolution of A/D conversion	Manual Entry	0xFFF	Resolution of A/D conversion
General > Offset of A/D conversion for current	Manual Entry	0x745	Offset of A/D conversion for current
General > Conversion level of A/D conversion for voltage	Must be a valid non-negative value.	0.66	Conversion level of A/D conversion for voltage
General > Counts for current offset measurement	Must be a valid non-negative value.	500	How many times to measure current offset
General > Input voltage	Must be a valid non-negative value.	24.0	Input voltage
General > A/D conversion channel for U phase current	Manual Entry	ADC_CHANNEL_0	Specify the A/D channel for U phase current
General > A/D conversion channel for W phase current	Manual Entry	ADC_CHANNEL_2	Specify the A/D channel for W phase current
General > A/D	Manual Entry	ADC_CHANNEL_5	Specify the A/D

conversion channel for main line voltage			channel for main line voltage
General > A/D conversion channel for U phase voltage	Manual Entry	ADC_CHANNEL_18	Specify the A/D channel for U phase voltage
General > A/D conversion channel for V phase voltage	Manual Entry	ADC_CHANNEL_20	Specify the A/D channel for V phase voltage
General > A/D conversion channel for W phase voltage	Manual Entry	ADC_CHANNEL_6	Specify the A/D channel for W phase voltage
General > GTIOCA stop level	<ul style="list-style-type: none"> <li>Pin Level Low</li> <li>Pin Level High</li> </ul>	Pin Level High	Select the behavior of the output pin when the timer is stopped.
General > GTIOCB stop level	<ul style="list-style-type: none"> <li>Pin Level Low</li> <li>Pin Level High</li> </ul>	Pin Level High	Select the behavior of the output pin when the timer is stopped.
Modulation > Maximum duty	Must be a valid non-negative value.	0.9375	Maximum duty of PWM
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.

## Clock Configuration

Set used clock with included GPT timer.

## Pin Configuration

Depend on included GPT three phase module and ADC module.

## Usage Notes

### Limitations

Basically no limitation exists.

## Examples

### Basic Example

This is a basic example of minimal use of the Motor 120 degree driver in an application.

```
void motor_120_driver_basic_example (void)
{
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initializes the module. */
err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);

/* Start PWM output */
err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
assert(FSP_SUCCESS == err);

/* Basically run this module at cyclic interrupt (e.g. included GPT PWM carrier
intterrupt).

* This implementation is an example. */
// while (true)
{
/* Application work here. */
/* Caclutarion of current offset */
(void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
/* Get electric current, main line voltage and maximum voltage component */
(void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
/* Get the flag of A/D convderted current offset */
(void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&ul_get_flg_offset);
// Perform current control process here
/* Set phase voltage */
(void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
/* Set phase pattern */
(void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
(void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
}
(void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
(void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
//
```

```
(void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
}
```

## Data Structures

```
struct motor_120_driver_modulation_t
```

```
struct motor_120_driver_extended_cfg_t
```

## Enumerations

```
enum motor_120_driver_status_t
```

<code>uint32_t</code>	<code>u4_deadtime</code>	PWM deadtime (usec)
<code>float</code>	<code>f_current_range</code>	A/D current measure range (max current) (A)
<code>float</code>	<code>f_vdc_range</code>	A/D main line voltage measure range (max voltage) (V)
<code>float</code>	<code>f_ad_resolution</code>	A/D resolution.
<code>float</code>	<code>f_ad_current_offset</code>	A/D offset (Center value)
<code>float</code>	<code>f_ad_voltage_conversion</code>	A/D conversion level.
<code>uint32_t</code>	<code>u4_offset_calc_count</code>	Calculation counts for current offset.
<a href="#">motor_120_driver_modulation_t</a>	<code>mod_param</code>	Modulation parameter.

## Enumeration Type Documentation

### ◆ [motor\\_120\\_driver\\_status\\_t](#)

enum <a href="#">motor_120_driver_status_t</a>	
120 driver active flag	
Enumerator	
<code>MOTOR_120_DRIVER_STATUS_INACTIVE</code>	120 driver status inactive
<code>MOTOR_120_DRIVER_STATUS_ACTIVE</code>	120 driver status active

◆ **motor\_120\_driver\_type\_t**

enum <code>motor_120_driver_type_t</code>	
120 degree control type	
Enumerator	
<code>MOTOR_120_DRIVER_TYPE_SENSORLESS</code>	120 degree sensorless control
<code>MOTOR_120_DRIVER_TYPE_HALL</code>	120 degree hall control

**Function Documentation**◆ **RM\_MOTOR\_120\_DRIVER\_Open()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Open ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_cfg_t const *const p_cfg )
```

Opens and configures the motor 120 driver module. Implements `motor_120_driver_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

**Return values**

<code>FSP_SUCCESS</code>	Motor 120 driver successfully configured.
<code>FSP_ERR_ASSERTION</code>	Null pointer, or one or more configuration options is invalid.
<code>FSP_ERR_ALREADY_OPEN</code>	Module is already open. This module can only be opened once.
<code>FSP_ERR_INVALID_ARGUMENT</code>	Input parameter error.

◆ **RM\_MOTOR\_120\_DRIVER\_Close()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Close ( motor_120_driver_ctrl_t *const p_ctrl)
```

Disables specified motor 120 driver module. Implements `motor_120_driver_api_t::close`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_DRIVER\_Run()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Run ( motor_120_driver_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_driver_api_t::run`.

Example:

```
/* Start PWM output */
err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_DRIVER\_Stop()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Stop ( motor_120_driver_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_driver_api_t::stop`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_120\_DRIVER\_Reset()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Reset ( motor_120_driver_ctrl_t *const p_ctrl)
```

Reset variables of motor 120 driver module. Implements `motor_120_driver_api_t::reset`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_MOTOR\_120\_DRIVER\_PhaseVoltageSet()

```
fsp_err_t RM_MOTOR_120_DRIVER_PhaseVoltageSet ( motor_120_driver_ctrl_t *const p_ctrl, float
const u_voltage, float const v_voltage, float const w_voltage )
```

Set phase voltage data to calculate PWM duty. Implements `motor_120_driver_api_t::phaseVoltageSet`.

Example:

```
/* Set phase voltage */
(void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
```

#### Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_MOTOR\_120\_DRIVER\_PhasePatternSet()

```
fsp_err_t RM_MOTOR_120_DRIVER_PhasePatternSet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_phase_pattern_t const pattern )
```

Set phase voltage pattern. Implements `motor_120_driver_api_t::phasePatternSet`.

Example:

```
/* Set phase pattern */
(void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
```

#### Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_MOTOR\_120\_DRIVER\_CurrentGet()

```
fsp_err_t RM_MOTOR_120_DRIVER_CurrentGet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_current_status_t *const p_current_status )
```

Get calculated phase current, Vdc & Va\_max data. Implements `motor_120_driver_api_t::currentGet`

Example:

```
/* Get electric current, main line voltage and maximum voltage component */
(void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
```

#### Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

### ◆ RM\_MOTOR\_120\_DRIVER\_CurrentOffsetCalc()

```
fsp_err_t RM_MOTOR_120_DRIVER_CurrentOffsetCalc ( motor_120_driver_ctrl_t *const p_ctrl)
```

current offset detection. Implements `motor_120_driver_api_t::currentOffsetCalc`

Example:

```
/* Caclutarion of current offset */
(void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
```

#### Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

### ◆ RM\_MOTOR\_120\_DRIVER\_FlagCurrentOffsetGet()

```
fsp_err_t RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_flag_offset_calc_t *const p_flag_offset )
```

Get the flag of finish current offset detection. Implements `motor_120_driver_api_t::flagCurrentOffsetGet`.

Example:

```
/* Get the flag of A/D converted current offset */
(void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&ul_get_flg_offset);
```

#### Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

### ◆ RM\_MOTOR\_120\_DRIVER\_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_DRIVER_ParameterUpdate ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_cfg_t const *const p_cfg )
```

Update the parameters of 120 driver module. Implements `motor_120_driver_api_t::parameterUpdate`.

Example:

```
(void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

#### Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

## 4.2.10.5 Motor 120 degree control (rm\_motor\_120\_degree)

Modules » Motor

## Functions

`fsp_err_t RM_MOTOR_120_DEGREE_Open (motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg)`

Configure the motor in register start mode. Implements `motor_api_t::open`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Close (motor_ctrl_t *const p_ctrl)`

Disables specified motor control block. Implements `motor_api_t::close`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Reset (motor_ctrl_t *const p_ctrl)`

Reset motor control block. Implements `motor_api_t::reset`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Run (motor_ctrl_t *const p_ctrl)`

Run motor (Start motor rotation). Implements `motor_api_t::run`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Stop (motor_ctrl_t *const p_ctrl)`

Stop motor (Stop motor rotation). Implements `motor_api_t::stop`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet (motor_ctrl_t *const p_ctrl, motor_error_t const error)`

Set error information. Implements `motor_api_t::errorSet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet (motor_ctrl_t *const p_ctrl, float const speed_rpm)`

Set speed reference[rpm]. Implements `motor_api_t::speedSet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_StatusGet (motor_ctrl_t *const p_ctrl, uint8_t *const p_status)`

Get current control status. Implements `motor_api_t::statusGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet (motor_ctrl_t *const p_ctrl, float *const p_speed_rpm)`

Get rotational speed. Implements `motor_api_t::speedGet`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DEGREE_WaitStopFlagGet` (`motor_ctrl_t *const p_ctrl, motor_wait_stop_flag_t *const p_flag_wait_stop`)  
Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DEGREE_ErrorCheck` (`motor_ctrl_t *const p_ctrl, uint16_t *const p_error`)  
Check the occurrence of error. Implements `motor_api_t::errorCheck`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DEGREE_PositionSet` (`motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position`)  
Set position reference. Implements `motor_api_t::positionSet`. [More...](#)

`fsp_err_t` `RM_MOTOR_120_DEGREE_AngleGet` (`motor_ctrl_t *const p_ctrl, float *const p_angle_rad`)  
Set position reference. Implements `motor_api_t::angleGet`. [More...](#)

## Detailed Description

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the [Motor 120 degree control \(rm\\_motor\\_120\\_degree\)](#).

## Overview

The motor 120 degree control is used to control a motor rotation in an application. This module is implemented with using a SPM motor. User can start/stop motor rotation simply.

### Features

The motor 120 degree module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

## Configuration

### Build Time Configurations for `rm_motor_120_degree`

The following build time configurations are defined in `fsp_cfg/rm_motor_120_degree_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> </ul>	Default (BSP)	If selected code for parameter checking is

- Disabled

included in the build.

## Configurations for Motor > Motor 120 degree control (rm\_motor\_120\_degree)

This module can be added to the Stacks tab via New Stack > Motor > Motor 120 degree control (rm\_motor\_120\_degree).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_120_degree0	Module name.
General > Limit of over current (A)	Must be a valid non-negative value.	4.0	Limit of over current.(Detection threshold)
General > Limit of over voltage (V)	Must be a valid non-negative value.	28.0	Limit of over voltage.(Detection threshold)
General > Limit of over speed (rpm)	Must be a valid non-negative value.	3000.0	Limit of over speed.(Detection threshold)
General > Limit of low voltage (V)	Must be a valid non-negative value.	14.0	Limit of low voltage.(Detection threshold)
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function.

## Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

# Examples

## Basic Example

This is a basic example of minimal use of the motor 120 degree in an application.

```
void motor_120_degree_basic_example (void)
```

```
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
    assert(FSP_SUCCESS == err);
    /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
    /* Start motor rotation */
    (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
    /* Get current status */
    (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
    /* Get current motor speed */
    (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
    /* Get wait stop flag */
    (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
    /* Check error */
    (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
    /* Stop motor rotation */
    (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
    /* Reset the process. */
    (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
    /* Close the module. */
    (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
}
```

## Data Structures

struct [motor\\_120\\_degree\\_statemachine\\_t](#)

struct [motor\\_120\\_degree\\_extended\\_cfg\\_t](#)

## Enumerations

```
enum motor_120_degree_ctrl_status_t
```

```
enum motor_120_degree_ctrl_event_t
```

## Data Structure Documentation

### ◆ motor\_120\_degree\_statemachine\_t

struct motor_120_degree_statemachine_t		
Statemachine structure for motor 120 degree		
Data Fields		
<a href="#">motor_120_degree_ctrl_status_t</a>	status	The current system status.
<a href="#">motor_120_degree_ctrl_status_t</a>	status_next	The next system status.
<a href="#">motor_120_degree_ctrl_event_t</a>	current_event	The current event index.
uint16_t	u2_error_status	The error information.

### ◆ motor\_120\_degree\_extended\_cfg\_t

struct motor_120_degree_extended_cfg_t		
Extended configurations for motor 120 degree		
Data Fields		
<a href="#">motor_120_control_instance_t</a> const *	p_motor_120_control_instance	120 degree control Instance
float	f_overcurrent_limit	Over-current limit (A)
float	f_overvoltage_limit	Over-voltage limit (V)
float	f_overspeed_limit	Over-speed limit (rad/s)
float	f_lowvoltage_limit	Low-voltage limit (V)

## Enumeration Type Documentation

### ◆ motor\_120\_degree\_ctrl\_status\_t

enum motor_120_degree_ctrl_status_t	
Control state	
Enumerator	
MOTOR_120_DEGREE_CTRL_STATUS_STOP	Stop mode.
MOTOR_120_DEGREE_CTRL_STATUS_RUN	Run mode.
MOTOR_120_DEGREE_CTRL_STATUS_ERROR	Error mode.

◆ **motor\_120\_degree\_ctrl\_event\_t**

enum motor_120_degree_ctrl_event_t	
Control event	
Enumerator	
MOTOR_120_DEGREE_CTRL_EVENT_STOP	Stop event.
MOTOR_120_DEGREE_CTRL_EVENT_RUN	Run event.
MOTOR_120_DEGREE_CTRL_EVENT_ERROR	Error event.
MOTOR_120_DEGREE_CTRL_EVENT_RESET	Reset event.

**Function Documentation**◆ **RM\_MOTOR\_120\_DEGREE\_Open()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the motor in register start mode. Implements `motor_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

**Return values**

FSP_SUCCESS	Successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

**Note**

*This function should only be called once as motor configuration registers can only be written to once so subsequent calls will have no effect.*

◆ **RM\_MOTOR\_120\_DEGREE\_Close()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified motor control block. Implements `motor_api_t::close`.

Example:

```
/* Close the module. */
(void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_120\_DEGREE\_Reset()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset motor control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset the process. */
(void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_120\_DEGREE\_Run()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Run ( motor_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_120\_DEGREE\_Stop()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully stopped.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_120\_DEGREE\_ErrorSet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
(void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

**Return values**

FSP_SUCCESS	Successfully set error information.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_120\_DEGREE\_SpeedSet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
```

**Return values**

FSP_SUCCESS	Successfully set speed reference.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_120\_DEGREE\_StatusGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
```

**Return values**

FSP_SUCCESS	Successfully got current control status.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

*Note*

◆ **RM\_MOTOR\_120\_DEGREE\_SpeedGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
```

**Return values**

FSP_SUCCESS	Successfully got rotational speed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

*Note*

### ◆ RM\_MOTOR\_120\_DEGREE\_WaitStopFlagGet()

```
fsp_err_t RM_MOTOR_120_DEGREE_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag_wait_stop )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
```

#### Return values

FSP_SUCCESS	Successfully got wait stop flag.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

*Note*

### ◆ RM\_MOTOR\_120\_DEGREE\_ErrorCheck()

```
fsp_err_t RM_MOTOR_120_DEGREE_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const
p_error )
```

Check the occurrence of error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
```

#### Return values

FSP_SUCCESS	Successfully error checke process.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

*Note*

◆ **RM\_MOTOR\_120\_DEGREE\_PositionSet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_PositionSet ( motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Example:

**Return values**

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

*Note*

◆ **RM\_MOTOR\_120\_DEGREE\_AngleGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad
)
```

Set position reference. Implements `motor_api_t::angleGet`.

Example:

**Return values**

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

*Note*

**4.2.10.6 Motor Angle (rm\_motor\_estimate)**

Modules » Motor

**Functions**

```
fsp_err_t RM_MOTOR_ESTIMATE_Open (motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg)
```

Opens and configures the Angle Estimation module. Implements `motor_angle_api_t::open`. [More...](#)

```
fsp_err_t RM_MOTOR_ESTIMATE_Close (motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Estimation module. Implements `motor_angle_api_t::close`. [More...](#)

```
fsp_err_t RM_MOTOR_ESTIMATE_Reset (motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Estimation module. Implements [motor\\_angle\\_api\\_t::reset](#). [More...](#)

`fsp_err_t` [RM\\_MOTOR\\_ESTIMATE\\_CurrentSet](#) (`motor_angle_ctrl_t *const p_ctrl`, `motor_angle_current_t *const p_st_current`, `motor_angle_voltage_reference_t *const p_st_voltage`)

Set d/q-axis Current Data & Voltage Reference. Implements [motor\\_angle\\_api\\_t::currentSet](#). [More...](#)

`fsp_err_t` [RM\\_MOTOR\\_ESTIMATE\\_SpeedSet](#) (`motor_angle_ctrl_t *const p_ctrl`, `float const speed_ctrl`, `float const damp_speed`)

Set Speed Information. Implements [motor\\_angle\\_api\\_t::speedSet](#). [More...](#)

`fsp_err_t` [RM\\_MOTOR\\_ESTIMATE\\_FlagPiCtrlSet](#) (`motor_angle_ctrl_t *const p_ctrl`, `uint32_t const flag_pi`)

Set the flag of PI Control runs. Implements [motor\\_angle\\_api\\_t::flagPiCtrlSet](#). [More...](#)

`fsp_err_t` [RM\\_MOTOR\\_ESTIMATE\\_AngleSpeedGet](#) (`motor_angle_ctrl_t *const p_ctrl`, `float *const p_angle`, `float *const p_speed`, `float *const p_phase_err`)

Gets the current rotor's angle and rotation speed. Implements [motor\\_angle\\_api\\_t::angleSpeedGet](#). [More...](#)

`fsp_err_t` [RM\\_MOTOR\\_ESTIMATE\\_EstimatedComponentGet](#) (`motor_angle_ctrl_t *const p_ctrl`, `float *const p_ed`, `float *const p_eq`)

Gets estimated d/q-axis component. Implements [motor\\_angle\\_api\\_t::estimatedComponentGet](#). [More...](#)

`fsp_err_t` [RM\\_MOTOR\\_ESTIMATE\\_ParameterUpdate](#) (`motor_angle_ctrl_t *const p_ctrl`, `motor_angle_cfg_t const *const p_cfg`)

Update the parameters of Angle&Speed Estimation. Implements [motor\\_angle\\_api\\_t::parameterUpdate](#). [More...](#)

`fsp_err_t` [RM\\_MOTOR\\_ESTIMATE\\_InternalCalculate](#) (`motor_angle_ctrl_t *const p_ctrl`)

Calculate internal parameters. Implements [motor\\_angle\\_api\\_t::internalCalculate](#). [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_AngleAdjust (motor_angle_ctrl_t *const p_ctrl)`

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`. [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_EncoderCyclic (motor_angle_ctrl_t *const p_ctrl)`

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`. [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_InfoGet (motor_angle_ctrl_t *const p_ctrl, motor_angle_encoder_info_t *const p_info)`

Gets information of Encoder Angle Module. Implements `motor_angle_api_t::infoGet`. [More...](#)

## Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

## Overview

The motor angle and speed estimation module is used to calculate rotor angle and rotational speed in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application.

## Features

The Motor Angle and Speed Estimation Module has below features.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

## Configuration

### Build Time Configurations for `rm_motor_estimate`

The following build time configurations are defined in `fsp_cfg/rm_motor_estimate_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Motor > Motor Angle (`rm_motor_estimate`)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle

(rm\_motor\_estimate).

Configuration	Options	Default	Description
Motor Parameter > Pole pairs	Manual Entry	2	Pole pairs
Motor Parameter > Resistance[ohm]	Must be a valid value	8.5F	Resistance
Motor Parameter > Inductance of d-axis[H]	Must be a valid value	0.0045F	Inductance of d-axis
Motor Parameter > Inductance of q-axis[H]	Must be a valid value	0.0045F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux[Wb]	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia[kgm <sup>2</sup> ]	Must be a valid value	0.0000028F	Rotor inertia
Name	Name must be a valid C symbol	g_motor_angle0	Module name.
Openloop damping	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Openloop damping functionally enable or disable
Natural frequency of BEMF observer	Must be a valid value	1000.0F	Natural frequency of BEMF observer
Damping ratio of BEMF observer	Must be a valid value	1.0F	Damping ratio of BEMF observer
Natural frequency of PLL Speed estimate loop	Must be a valid value	20.0F	Natural frequency of PLL Speed estimate loop
Damping ratio of PLL Speed estimate loop	Must be a valid value	1.0F	Damping ratio of PLL Speed estimate loop
Control period	Must be a valid value	0.00005F	Control period

### Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Limitations

Developers should be aware of the following limitations when using the Motor Angle and Speed Estimation:

# Examples

## Basic Example

This is a basic example of minimal use of the Motor Angle and Speed Estimation in an application.

```
void motor_estimate_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    motor_angle_current_t  smpl_current;
    motor_angle_voltage_reference_t  smpl_voltage;

    /* Initializes the module. */
    err = RM_MOTOR_ESTIMATE_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    while (true)
    {
        /* Application work here. */
        /* Set PI Control Flag before get Angle/Speed and Estimated Component */
        (void) RM_MOTOR_ESTIMATE_FlagPiCtrlSet(&g_mtr_angle0_ctrl, 1U);
        smpl_current.id = 1.0F;
        smpl_current.iq = 1.0F;
        smpl_voltage.vd = 10.0F;
        smpl_voltage.vq = 10.0F;

        /* Set Current and Speed data before get Angle/Speed and Estimated Component */
        (void) RM_MOTOR_ESTIMATE_CurrentSet(&g_mtr_angle0_ctrl, smpl_current,
smpl_voltage);

        /* Set Internal Speed Reference & damping speed data before get Angle/Speed and
Estimated Component */
        (void) RM_MOTOR_ESTIMATE_SpeedSet(&g_mtr_angle0_ctrl, 104.27F, 10.0F);

        /* Get Angle/Speed data */
        (void) RM_MOTOR_ESTIMATE_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);

        /* Get Estimated Component */
        (void) RM_MOTOR_ESTIMATE_EstimatedComponentGet(&g_mtr_angle0_ctrl, &f_get_ed,
```

```
&f_get_eq);
}
}
```

## Function Documentation

### ◆ RM\_MOTOR\_ESTIMATE\_Open()

`fsp_err_t RM_MOTOR_ESTIMATE_Open ( motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg )`

Opens and configures the Angle Estimation module. Implements `motor_angle_api_t::open`.

#### Return values

FSP_SUCCESS	MTR_ANGL_EST successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

### ◆ RM\_MOTOR\_ESTIMATE\_Close()

`fsp_err_t RM_MOTOR_ESTIMATE_Close ( motor_angle_ctrl_t *const p_ctrl)`

Disables specified Angle Estimation module. Implements `motor_angle_api_t::close`.

#### Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_Reset()**

```
fsp_err_t RM_MOTOR_ESTIMATE_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Estimation module. Implements `motor_angle_api_t::reset`.

**Return values**

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_CurrentSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

**Return values**

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_SpeedSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_SpeedSet ( motor_angle_ctrl_t *const p_ctrl, float const
speed_ctrl, float const damp_speed )
```

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

**Return values**

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_FlagPiCtrlSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_FlagPiCtrlSet ( motor_angle_ctrl_t *const p_ctrl, uint32_t const flag_pi )
```

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

**Return values**

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements `motor_angle_api_t::angleSpeedGet`.

**Return values**

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_EstimatedComponentGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_EstimatedComponentGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_ed, float *const p_eq )
```

Gets estimated d/q-axis component. Implements `motor_angle_api_t::estimatedComponentGet`.

**Return values**

FSP_SUCCESS	Successfully data gotten.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_ESTIMATE_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of Angle&Speed Estimation. Implements [motor\\_angle\\_api\\_t::parameterUpdate](#).

**Return values**

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_InternalCalculate()**

```
fsp_err_t RM_MOTOR_ESTIMATE_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements [motor\\_angle\\_api\\_t::internalCalculate](#).

**Return values**

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_AngleAdjust()**

```
fsp_err_t RM_MOTOR_ESTIMATE_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements [motor\\_angle\\_api\\_t::angleAdjust](#).

**Return values**

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_EncoderCyclic()**

```
fsp_err_t RM_MOTOR_ESTIMATE_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements [motor\\_angle\\_api\\_t::encoderCyclic](#).

**Return values**

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_ESTIMATE\_InfoGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Encoder Angle Module. Implements [motor\\_angle\\_api\\_t::infoGet](#).

**Return values**

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

**4.2.10.7 Motor Angle (rm\_motor\_sense\_encoder)**

Modules » [Motor](#)

**Functions**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Open (motor_angle_ctrl_t *const
p_ctrl, motor_angle_cfg_t const *const p_cfg)
```

`fsp_err_t` [RM\\_MOTOR\\_SENSE\\_ENCODER\\_EstimatedComponentGet](#) (`motor_angle_ctrl_t *const p_ctrl, float *const p_ed, float *const p_eq`)

Gets estimated d/q-axis component. Implements [motor\\_angle\\_api\\_t::estimatedComponentGet](#). [More...](#)

## Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

## Overview

The motor angle and speed calculation with an encoder module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (`rm_motor_current`).

## Features

The motor angle and speed calculation with an encoder module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

## Configuration

### Build Time Configurations for `rm_motor_sense_encoder`

The following build time configurations are defined in `fsp_cfg/rm_motor_sense_encoder_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Motor > Motor Angle (`rm_motor_sense_encoder`)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle (rm\_motor\_sense\_encoder).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_sense_encoder0	Module name.
Motor Parameter > Pole pairs	Must be a valid non-negative value.	7	Pole pairs
Motor Parameter > Resistance (ohm)	Must be a valid value	0.453F	Resistance
Motor Parameter > Inductance of d-axis (H)	Must be a valid value	0.0009447F	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid value	0.0009447F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid value	0.006198F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm <sup>2</sup> )	Must be a valid value	0.00000962F	Rotor inertia
Control Type	<ul style="list-style-type: none"> <li>• Speed</li> <li>• Position</li> </ul>	Position	Select control Type
Period of Current control (kHz)	Must be a valid value	20.0F	Period of Current control
Period of Speed control (sec)	Must be a valid value	0.0005F	Period of Speed control
PWM Carrier Frequency (kHz)	Must be a valid value	20.0F	PWM Carrier Frequency
Decimation of Interrupt	Manual Entry	0U	Decimation of Interrupt
Counts per Rotation	Must be a valid non-negative value.	1200U	Encoder Counts per One Rotation
Counts for Angle Adjust	Must be a valid non-negative value.	512U	Counts for Angle Adjust (as working time)
Zero speed counts	Must be a valid non-negative value.	20000000U	Threshold counts to judge zero speed
Occupancy Time	Must be a valid value	0.30F	Occupancy time of carrier interrupt
Carrier Time	Must be a valid value	0.000013F	Processing time of carrier interrupt
Process Time	Must be a valid value	0.000001F	Processing time of encoder interrupt
Highspeed Change	Must be a valid non-	150U	Margin of toggle speed

Margin (rpm)	negative value.		for high speed mode
LPF parameter for Highspeed Filter	Must be a valid value	0.1F	Highspeed mode speed LPF parameter
Counts to change speed	Must be a valid non-negative value.	8U	Counts for mode change of position speed calculation

## Clock Configuration

## Pin Configuration

# Usage Notes

## Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with an encoder: all configurations should be set as positive values.

# Examples

## Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with an encoder in an application.

```
void motor_sense_encoder_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_SENSE_ENCODER_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Initialize motor with the encoder */
        (void) RM_MOTOR_SENSE_ENCODER_AngleAdjust(&g_mtr_angle0_ctrl);
        /* Perform cyclic encoder process*/
        (void) RM_MOTOR_SENSE_ENCODER_EncoderCyclic(&g_mtr_angle0_ctrl);
        /* Calculate information with encoder signal input */
        (void) RM_MOTOR_SENSE_ENCODER_InternalCalculate(&g_mtr_angle0_ctrl);
    }
}
```

```

/* Get angle/speed data */
    (void) RM_MOTOR_SENSE_ENCODER_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
/* Get calculated component */
    (void) RM_MOTOR_SENSE_ENCODER_InfoGet(&g_mtr_angle0_ctrl, &temp_info);
}
/* Reset the module */
    (void) RM_MOTOR_SENSE_ENCODER_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
    (void) RM_MOTOR_SENSE_ENCODER_Close(&g_mtr_angle0_ctrl);
}

```

## Enumerations

enum [motor\\_sense\\_encoder\\_loop\\_t](#)

enum [motor\\_sense\\_encoder\\_mode\\_t](#)

## Enumeration Type Documentation

### ◆ motor\_sense\_encoder\_loop\_t

enum <a href="#">motor_sense_encoder_loop_t</a>	
Enumerator	
MOTOR_SENSE_ENCODER_LOOP_SPEED	Speed control mode.
MOTOR_SENSE_ENCODER_LOOP_POSITION	Position control mode.

### ◆ motor\_sense\_encoder\_mode\_t

enum <a href="#">motor_sense_encoder_mode_t</a>	
Enumerator	
MOTOR_SENSE_ENCODER_MODE_INIT	Initialize mode (Start status)
MOTOR_SENSE_ENCODER_MODE_BOOT	Boot mode (Angle adjustment status)
MOTOR_SENSE_ENCODER_MODE_DRIVE	Drive mode (Normal work status)

## Function Documentation

◆ **RM\_MOTOR\_SENSE\_ENCODER\_Open()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Open ( motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t
const *const p_cfg )
```

Opens and configures the Angle Encoder module. Implements [motor\\_angle\\_api\\_t::open](#).

**Return values**

FSP_SUCCESS	Angle Encoder module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ **RM\_MOTOR\_SENSE\_ENCODER\_Close()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Encoder module. Implements [motor\\_angle\\_api\\_t::close](#).

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SENSE\_ENCODER\_Reset()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Encoder module. Implements [motor\\_angle\\_api\\_t::reset](#).

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SENSE\_ENCODER\_InternalCalculate()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements `motor_angle_api_t::internalCalculate`.

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SENSE\_ENCODER\_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements `motor_angle_api_t::angleSpeedGet`.

**Return values**

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SENSE\_ENCODER\_AngleAdjust()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`.

**Return values**

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SENSE\_ENCODER\_EncoderCyclic()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`.

**Return values**

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SENSE\_ENCODER\_InfoGet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Encoder Angle Module. Implements `motor_angle_api_t::infoGet`.

**Return values**

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SENSE\_ENCODER\_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of Angle&Speed calculation with an encoder. Implements `motor_angle_api_t::parameterUpdate`.

**Return values**

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SENSE\_ENCODER\_CurrentSet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

**Return values**

FSP_ERR_UNSUPPORTED	Motor sense encoder software currentSet is not supported.
---------------------	---

◆ **RM\_MOTOR\_SENSE\_ENCODER\_SpeedSet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_SpeedSet ( motor_angle_ctrl_t *const p_ctrl, float const
speed_ctrl, float const damp_speed )
```

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

**Return values**

FSP_ERR_UNSUPPORTED	Motor sense encoder software speedSet is not supported.
---------------------	---

◆ **RM\_MOTOR\_SENSE\_ENCODER\_FlagPiCtrlSet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_FlagPiCtrlSet ( motor_angle_ctrl_t *const p_ctrl, uint32_t
const flag_pi )
```

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

**Return values**

FSP_ERR_UNSUPPORTED	Motor sense encoder software flagPiCtrlSet is not supported.
---------------------	--

### ◆ RM\_MOTOR\_SENSE\_ENCODER\_EstimatedComponentGet()

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_EstimatedComponentGet ( motor_angle_ctrl_t *const
p_ctrl, float *const p_ed, float *const p_eq )
```

Gets estimated d/q-axis component. Implements [motor\\_angle\\_api\\_t::estimatedComponentGet](#).

#### Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software estimatedComponentGet is not supported.
---------------------	--

## Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor current Interface](#).

## Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

### Features

The Motor Current Module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling Control.
- Voltage Error Compensation.

## Configuration

### Build Time Configurations for rm\_motor\_current

The following build time configurations are defined in fsp\_cfg/rm\_motor\_current\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Motor > Motor Current Controller (rm\_motor\_current)

This module can be added to the Stacks tab via New Stack > Motor > Motor Current Controller (rm\_motor\_current).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_current0	Module name.
General > Sensor type	<ul style="list-style-type: none"> <li>• Sensorless</li> <li>• Encoder</li> </ul>	Sensorless	Select sensor type
General > Shunt type	<ul style="list-style-type: none"> <li>• 1 shunt</li> <li>• 2 shunt</li> <li>• 3 shunt</li> </ul>	2 shunt	Select shunt type
General > Current control decimation	Must be a valid non-negative value.	0	Decimation of current control.
General > PWM carrier frequency (kHz)	Must be a valid value	20.0F	PWM carrier frequency.
General > Input voltage (V)	Must be a valid value	24.0F	Input voltage for limitation of current PI control.

General > Sample delay compensation	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Select enable/disable sample delay compensation.
General > Voltage error compensation	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Select enable/disable voltage error compensation.
General > Voltage error compensation table of voltage 1	Must be a valid value	0.672F	Voltage error compensation table of voltage.
General > Voltage error compensation table of voltage 2	Must be a valid value	0.945F	Voltage error compensation table of voltage.
General > Voltage error compensation table of voltage 3	Must be a valid value	1.054F	Voltage error compensation table of voltage.
General > Voltage error compensation table of voltage 4	Must be a valid value	1.109F	Voltage error compensation table of voltage.
General > Voltage error compensation table of voltage 5	Must be a valid value	1.192F	Voltage error compensation table of voltage.
General > Voltage error compensation table of current 1	Must be a valid value	0.013F	Voltage error compensation table of current.
General > Voltage error compensation table of current 2	Must be a valid value	0.049F	Voltage error compensation table of current.
General > Voltage error compensation table of current 3	Must be a valid value	0.080F	Voltage error compensation table of current.
General > Voltage error compensation table of current 4	Must be a valid value	0.184F	Voltage error compensation table of current.
General > Voltage error compensation table of current 5	Must be a valid value	0.751F	Voltage error compensation table of current.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.
Design Parameter > Current PI loop omega (Hz)	Must be a valid value	300.0F	Current PI loop omega
Design Parameter >	Must be a valid value	1.0F	Current PI loop zeta

## Current PI loop zeta

Motor Parameter > Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Motor Parameter > Resistance (ohm)	Must be a valid value	8.5F	Resistance
Motor Parameter > Inductance of d-axis (H)	Must be a valid value	0.0045F	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid value	0.0045F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm <sup>2</sup> )	Must be a valid value	0.0000028F	Rotor inertia

**Clock Configuration**

This module doesn't depend on clock setting, because this module is a simple calculation process.

**Pin Configuration**

This module does not use I/O pins.

**Usage Notes****Limitations**

- Set the Period of Current Control with none-negative value.
- Set the Reference Voltage with none-negative value.

**Examples****Basic Example**

This is a basic example of minimal use of the Motor Current in an application.

```
void motor_current_basic_example (void)
{
    motor_current_input_current_t temp_input_current;
    motor_current_input_voltage_t temp_input_voltage;
    motor_current_get_voltage_t temp_get_voltage;

    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
}
```

```
err = RM_MOTOR_CURRENT_Open(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
assert(FSP_SUCCESS == err);
/* Basically run this module at A/D conversion finish interrupt.
 * This implementation is an example. */
// while (true)
{
/* Application work here. */
/* Set current reference before get phase voltage */
(void) RM_MOTOR_CURRENT_CurrentReferenceSet(g_test_motor_current.p_ctrl, 1.0F,
1.0F);
/* Set speed and phase data before get phase voltage */
(void) RM_MOTOR_CURRENT_SpeedPhaseSet(g_test_motor_current.p_ctrl, 104.72F,
1.0F);
temp_input_current.iu = 1.0F;
temp_input_current.iv = 1.0F;
temp_input_current.iw = 1.0F;
temp_input_voltage.vdc = 24.0F;
temp_input_voltage.va_max = 24.0F;
/* Set electric current and voltage before get phase voltage */
(void) RM_MOTOR_CURRENT_CurrentSet(g_test_motor_current.p_ctrl,
temp_input_current, temp_input_voltage);
/* Activate the process. */
(void) RM_MOTOR_CURRENT_Run(g_test_motor_current.p_ctrl);
/* Get d/q-axis current*/
(void) RM_MOTOR_CURRENT_CurrentGet(g_test_motor_current.p_ctrl, &f_get_id,
&f_get_iq);
/* Get the flag of PI control */
(void) RM_MOTOR_CURRENT_PhaseVolageGet(g_test_motor_current.p_ctrl,
&temp_get_voltage);
/* Get Output Parameter */
(void) RM_MOTOR_CURRENT_ParameterGet(g_test_motor_current.p_ctrl,
&test_output);
(void) RM_MOTOR_CURRENT_ParameterUpdate(g_test_motor_current.p_ctrl,
```

```

g_test_motor_current.p_cfg);
}

/* Reset the process. */
(void) RM_MOTOR_CURRENT_Reset(g_test_motor_current.p_ctrl);

/* Close the module. */
(void) RM_MOTOR_CURRENT_Close(g_test_motor_current.p_ctrl);
}

```

## Enumerations

enum [motor\\_current\\_shunt\\_type\\_t](#)

### Enumeration Type Documentation

#### ◆ motor\_current\_shunt\_type\_t

enum <a href="#">motor_current_shunt_type_t</a>	
Selection of shunt type	
Enumerator	
MOTOR_CURRENT_SHUNT_TYPE_1_SHUNT	Only use U phase current.
MOTOR_CURRENT_SHUNT_TYPE_2_SHUNT	Use U and W phase current.
MOTOR_CURRENT_SHUNT_TYPE_3_SHUNT	Use all phase current.

### Function Documentation

#### ◆ RM\_MOTOR\_CURRENT\_Open()

fsp_err_t RM_MOTOR_CURRENT_Open ( <a href="#">motor_current_ctrl_t</a> *const <i>p_ctrl</i> , <a href="#">motor_current_cfg_t</a> const *const <i>p_cfg</i> )	
Opens and configures the Motor Current Module. Implements <a href="#">motor_current_api_t::open</a> .	
Return values	
FSP_SUCCESS	Motor Current successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ **RM\_MOTOR\_CURRENT\_Close()**

```
fsp_err_t RM_MOTOR_CURRENT_Close ( motor_current_ctrl_t *const p_ctrl)
```

Disables specified Motor Current Module. Implements `motor_current_api_t::close`.

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_CURRENT\_Reset()**

```
fsp_err_t RM_MOTOR_CURRENT_Reset ( motor_current_ctrl_t *const p_ctrl)
```

Reset variables of Motor Current Module. Implements `motor_current_api_t::reset`.

**Return values**

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_CURRENT\_Run()**

```
fsp_err_t RM_MOTOR_CURRENT_Run ( motor_current_ctrl_t *const p_ctrl)
```

Run(Start) the Current Control. Implements `motor_current_api_t::run`.

**Return values**

FSP_SUCCESS	Successfully run.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_CURRENT\_ParameterSet()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterSet ( motor_current_ctrl_t *const p_ctrl,
motor_current_input_t const *const p_st_input )
```

Set (Input) Parameter Data. Implements `motor_current_api_t::parameterSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input argument error.

◆ **RM\_MOTOR\_CURRENT\_CurrentReferenceSet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentReferenceSet ( motor_current_ctrl_t *const p_ctrl, float
const id_reference, float const iq_reference )
```

Set Current Reference Data. Implements `motor_current_api_t::currentReferenceSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_CURRENT\_SpeedPhaseSet()**

```
fsp_err_t RM_MOTOR_CURRENT_SpeedPhaseSet ( motor_current_ctrl_t *const p_ctrl, float const
speed, float const phase )
```

Set Current Speed & rotor phase Data. Implements `motor_current_api_t::speedPhaseSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_CURRENT\_CurrentSet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentSet ( motor_current_ctrl_t *const p_ctrl,
motor_current_input_current_t const *const p_st_current, motor_current_input_voltage_t const
*const p_st_voltage )
```

Set d/q-axis Current & Voltage Data. Implements [motor\\_current\\_api\\_t::currentSet](#).

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_CURRENT\_ParameterGet()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterGet ( motor_current_ctrl_t *const p_ctrl,
motor_current_output_t *const p_st_output )
```

Get Output Parameters. Implements [motor\\_current\\_api\\_t::parameterGet](#).

**Return values**

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_CURRENT\_CurrentGet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentGet ( motor_current_ctrl_t *const p_ctrl, float *const p_id,
float *const p_iq )
```

Get d/q-axis Current. Implements [motor\\_current\\_api\\_t::currentGet](#).

**Return values**

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_CURRENT\_PhaseVoltageGet()**

```
fsp_err_t RM_MOTOR_CURRENT_PhaseVoltageGet ( motor_current_ctrl_t *const p_ctrl,
motor_current_get_voltage_t *const p_voltage )
```

Gets the set phase voltage. Implements `motor_current_api_t::phaseVoltageGet`.

**Return values**

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM\_MOTOR\_CURRENT\_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterUpdate ( motor_current_ctrl_t *const p_ctrl,
motor_current_cfg_t const *const p_cfg )
```

Update the parameters of Current Control. Implements `motor_current_api_t::parameterUpdate`.

**Return values**

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **rm\_motor\_current\_encoder\_cyclic()**

```
void rm_motor_current_encoder_cyclic ( motor_current_instance_t const * p_ctrl)
```

(end addtogroup MOTOR\_CURRENT)

**4.2.10.9 Motor Encoder Vector Control (rm\_motor\_encoder)**

Modules » Motor

**Functions**

## Detailed Description

Control a SPM motor on RA MCUs. This module implements the [Motor Encoder Vector Control \(rm\\_motor\\_encoder\)](#).

## Overview

The motor encoder vector control is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

### Features

The motor encoder module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

## Configuration

### Build Time Configurations for `rm_motor_encoder`

The following build time configurations are defined in `fsp_cfg/rm_motor_encoder_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Motor > Motor Encoder Vector Control (`rm_motor_encoder`)

This module can be added to the Stacks tab via New Stack > Motor > Motor Encoder Vector Control (`rm_motor_encoder`).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_encoder0	Module name.
General > Limit of over current (A)	Must be a valid value	2.0F	Limit of over current.(Detection threshold)
General > Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
General > Limit of over speed (rpm)	Must be a valid value	2100.0F	Limit of over speed.(Detection threshold)
General > Limit of low voltage (V)	Must be a valid value	18.0F	Limit of low voltage.(Detection threshold)
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

## Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Limitations

# Examples

## Basic Example

This is a basic example of minimal use of the motor encoder module in an application.

```
void motor_encoder_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
    handle_error(err);
}
```

```
/* Set speed reference before motor run */
    (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);

/* Set position reference before motor run */
    (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
/* Start motor rotation */
    (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
/* Get current status */
    (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
/* Get current rotor angle */
    (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
/* Get current motor speed */
    (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
/* Check error */
    (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
/* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
/* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
/* Reset Speed Control */
    (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
/* Close Speed Control */
    (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
}
```

MOTOR_ENCODER_CALLBACK_EVENT_CURRENT_FORWARD	Event forward current control.
MOTOR_ENCODER_CALLBACK_EVENT_CURRENT_BACKWARD	Event backward current control.

**Function Documentation**◆ **RM\_MOTOR\_ENCODER\_Open()**

```
fsp_err_t RM_MOTOR_ENCODER_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements [motor\\_api\\_t::open](#).

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
```

**Return values**

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

*Note*

◆ **RM\_MOTOR\_ENCODER\_Close()**

```
fsp_err_t RM_MOTOR_ENCODER_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Encoder Control block. Implements [motor\\_api\\_t::close](#).

Example:

```
/* Close Speed Control */
(void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_ENCODER\_Reset()**

```
fsp_err_t RM_MOTOR_ENCODER_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Encoder Control block. Implements [motor\\_api\\_t::reset](#).

Example:

```
/* Reset Speed Control */
(void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_ENCODER\_Run()**

```
fsp_err_t RM_MOTOR_ENCODER_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_ENCODER\_Stop()**

```
fsp_err_t RM_MOTOR_ENCODER_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_ENCODER\_ErrorSet()**

```
fsp_err_t RM_MOTOR_ENCODER_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_ENCODER\_SpeedSet()**

```
fsp_err_t RM_MOTOR_ENCODER_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_ENCODER\_PositionSet()**

```
fsp_err_t RM_MOTOR_ENCODER_PositionSet ( motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position )
```

Set position reference[degree]. Implements `motor_api_t::positionSet`.

Example:

```
/* Set position reference before motor run */
(void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data set pointer is invalid..

*Note*

◆ **RM\_MOTOR\_ENCODER\_StatusGet()**

```
fsp_err_t RM_MOTOR_ENCODER_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

*Note*

◆ **RM\_MOTOR\_ENCODER\_AngleGet()**

```
fsp_err_t RM_MOTOR_ENCODER_AngleGet ( motor_ctrl_t*const p_ctrl, float*const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

*Note*

◆ **RM\_MOTOR\_ENCODER\_SpeedGet()**

```
fsp_err_t RM_MOTOR_ENCODER_SpeedGet ( motor_ctrl_t*const p_ctrl, float*const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

*Note*

◆ **RM\_MOTOR\_ENCODER\_ErrorCheck()**

```
fsp_err_t RM_MOTOR_ENCODER_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

*Note*

◆ **RM\_MOTOR\_ENCODER\_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_ENCODER_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

**Return values**

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

*Note*

**4.2.10.10 Motor Position Controller (rm\_motor\_position)**

Modules » Motor

**Functions**

```
fsp_err_t RM_MOTOR_POSITION_Open (motor_position_ctrl_t *const p_ctrl,
motor_position_cfg_t const *const p_cfg)
```

Opens and configures the Motor Position Module. Implements `motor_position_api_t::open`. More...

`fsp_err_t RM_MOTOR_POSITION_Close (motor_position_ctrl_t *const p_ctrl)`

## Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor position Interface](#).

## Overview

The motor position is used to control the position of motor rotor in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates speed reference with inputted position reference and current rotational speed.

## Features

The Motor Position Module has below features.

- Calculate speed reference.

## Configuration

### Build Time Configurations for `rm_motor_position`

The following build time configurations are defined in `fsp_cfg/rm_motor_position_cfg.h`:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
--------------------	--	---------------	---

### Configurations for Motor > Motor Position Controller (rm\_motor\_position)

This module can be added to the Stacks tab via New Stack > Motor > Motor Position Controller (rm\_motor\_position).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_position0	Module name.
General > Position Dead Band	Manual Entry	1U	Ignored Area of Position Control.
General > Position Band Limit	Manual Entry	3U	Ignored Area of Position Control.
General > Speed Feedforward Ratio	Must be a valid value	0.8F	Speed Feedforward Ratio.
General > Encoder Counts per one rotation	Must be a valid value	1200.0F	Encoder Counts per one rotation.
General > Position Omega	Must be a valid value	10.0F	Position Control Omega.
General > Period of Speed Control[sec]	Must be a valid value	0.0005F	Period of Speed Control.
IPD > IPD LPF	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	IPD LPF process enable or disable
IPD > Position Kp ratio	Must be a valid value	0.3F	Position Kp ratio.
IPD > Position Feedforward ratio	Must be a valid value	0.0F	Position Feedforward ratio.
IPD > Speed K ratio	Must be a valid value	2.0F	Speed K ratio
IPD > Error Limit #1	Must be a valid value	10.0F	Error Limitation #1
IPD > Error Limit #2	Must be a valid value	0.2F	Error Limitation #2
IPD > LPF Omega	Must be a valid value	500.0F	LPF Omega.
IPD > LPF Zeta	Must be a valid value	1.0F	LPF Zeta.
Position Profiling > Interval Time	Manual Entry	400U	Interval Time.
Position Profiling > Accel Time	Must be a valid value	0.3F	Accel Time.
Position Profiling > Maximum Accel Time	Must be a valid value	8117.96F	Maximum Acceleration Time [sec]
Position Profiling > Acceleration Maximum	Must be a valid value	2000.0F	Acceleration Maximum Speed.

## Speed

Position Profiling > Update Step of Timer	Must be a valid value	0.0005F	Update Step of Timer.
Motor Parameter > Pole Pair	Manual Entry	7	Pole Pair
Motor Parameter > Resistance[ohm]	Must be a valid value	0.453F	Resistance
Motor Parameter > Inductance of d-axis[H]	Must be a valid value	0.0009447F	Inductance of d-axis
Motor Parameter > Inductance of q-axis[H]	Must be a valid value	0.0009447F	Inductance of q-axis
Motor Parameter > Inertia[kgm <sup>2</sup> ]	Must be a valid value	0.006198F	Inertia
Motor Parameter > Motor Inertia[kgm <sup>2</sup> ]	Must be a valid value	0.00000962F	Motor Inertia

## Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Limitations

- Set the period of speed control with non-negative value.
- Set the limit of speed change step with non-negative value.
- Set the maximum speed with non-negative value.

# Examples

## Basic Example

This is a basic example of using the Motor Position module in an application.

```
void motor_position_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_POSITION_Open(g_motor_position0.p_ctrl, g_motor_position0.p_cfg);
    handle_error(err);
    /* Set working mode */
}
```

```
RM_MOTOR_POSITION_ModeSet(g_motor_position0.p_ctrl,  
MOTOR_POSITION_CTRL_MODE_STEP);  
  
/* Set position reference */  
RM_MOTOR_POSITION_PositionReferenceSet(g_motor_position0.p_ctrl, 180U);  
  
/* Basically run this module at cyclic interrupt (e.g. AGT timer).  
* This implementation is an example. */  
  
// while (true)  
{  
  
/* Application work here. */  
  
/* Perform Position Control Process */  
RM_MOTOR_POSITION_PositionControl(g_motor_position0.p_ctrl);  
  
/* Perform Speed IPD Control Process */  
RM_MOTOR_POSITION_IpdSpeedPControl(g_motor_position0.p_ctrl, 0.0F, 0.0F,  
&temp_iq_ref);  
  
/* Get Position */  
RM_MOTOR_POSITION_PositionGet(g_motor_position0.p_ctrl, &temp_position);  
  
/* Update parameters */  
RM_MOTOR_POSITION_ParameterUpdate(g_motor_position0.p_ctrl,  
&g_motor_position0.p_cfg);  
}  
  
/* Reset Speed Control */  
RM_MOTOR_POSITION_Reset(g_motor_position0.p_ctrl);  
  
/* Close Speed Control */  
RM_MOTOR_POSITION_Close(g_motor_position0.p_ctrl);  
}
```

## Enumerations

```
enum motor_position_ipd_lpf_t
```

## Enumeration Type Documentation

◆ **motor\_position\_ipd\_lpf\_t**

enum motor_position_ipd_lpf_t	
Enumerator	
MOTOR_POSITION_IPD_LPF_DISABLE	ipd control is disabled
MOTOR_POSITION_IPD_LPF_ENABLE	ipd control is enabled

**Function Documentation**◆ **RM\_MOTOR\_POSITION\_Open()**

```
fsp_err_t RM_MOTOR_POSITION_Open ( motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t
const *const p_cfg )
```

Opens and configures the Motor Position Module. Implements [motor\\_position\\_api\\_t::open](#).

**Return values**

FSP_SUCCESS	Motor Position Module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Set parameter is invalid.

◆ **RM\_MOTOR\_POSITION\_Close()**

```
fsp_err_t RM_MOTOR_POSITION_Close ( motor_position_ctrl_t *const p_ctrl)
```

Disables specified Motor Position Module. Implements [motor\\_position\\_api\\_t::close](#).

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_POSITION\_Reset()**

```
fsp_err_t RM_MOTOR_POSITION_Reset ( motor_position_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Position Module. Implements `motor_position_api_t::reset`.

**Return values**

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_POSITION\_PositionGet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionGet ( motor_position_ctrl_t *const p_ctrl, int16_t *const p_position )
```

Get Rotor Position Data [degree]. Implements `motor_position_api_t::positionGet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ **RM\_MOTOR\_POSITION\_PositionSet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionSet ( motor_position_ctrl_t *const p_ctrl, float const position_rad )
```

Set Position Data from Encoder [radian]. Implements `motor_position_api_t::positionSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_POSITION\_PositionReferenceSet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionReferenceSet ( motor_position_ctrl_t *const p_ctrl, int16_t
const position_reference_deg )
```

Set Position Reference Data [degree]. Implements `motor_position_api_t::positionReferenceSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_POSITION\_ControlModeSet()**

```
fsp_err_t RM_MOTOR_POSITION_ControlModeSet ( motor_position_ctrl_t *const p_ctrl,
motor_position_ctrl_mode_t const mode )
```

Set Position Control Mode. Implements `motor_position_api_t::controlModeSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_POSITION\_PositionControl()**

```
fsp_err_t RM_MOTOR_POSITION_PositionControl ( motor_position_ctrl_t *const p_ctrl)
```

Calculates internal position reference.(Main process of Position Control) Implements `motor_position_api_t::positionControl`.

**Return values**

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_MOTOR\_POSITION\_IpdSpeedPControl()

`fsp_err_t RM_MOTOR_POSITION_IpdSpeedPControl ( motor_position_ctrl_t *const p_ctrl, float const ref_speed_rad, float const speed_rad, float *const p_iq_ref )`

Calculates the q-axis current reference by P control. Implements `motor_position_api_t::ipdSpeedPControl`.

#### Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

### ◆ RM\_MOTOR\_POSITION\_SpeedReferencePControlGet()

`fsp_err_t RM_MOTOR_POSITION_SpeedReferencePControlGet ( motor_position_ctrl_t *const p_ctrl, float *const p_speed_ref )`

Get Speed Reference by P Control. Implements `motor_position_api_t::speedReferencePControlGet`.

#### Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

### ◆ RM\_MOTOR\_POSITION\_SpeedReferenceIpdControlGet()

`fsp_err_t RM_MOTOR_POSITION_SpeedReferenceIpdControlGet ( motor_position_ctrl_t *const p_ctrl, float const max_speed_rad, float *const p_speed_ref )`

Get Speed Reference by IPD Control. Implements `motor_position_api_t::speedReferenceIpdControlGet`.

#### Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

### ◆ RM\_MOTOR\_POSITION\_SpeedReferenceFeedforwardGet()

```
fsp_err_t RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet ( motor_position_ctrl_t *const
p_ctrl, float *const p_speed_ref )
```

Get Speed Reference by Feedforward. Implements [motor\\_position\\_api\\_t::speedReferenceFeedforwardGet](#).

#### Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

### ◆ RM\_MOTOR\_POSITION\_ParameterUpdate()

```
fsp_err_t RM_MOTOR_POSITION_ParameterUpdate ( motor_position_ctrl_t *const p_ctrl,
motor_position_cfg_t const *const p_cfg )
```

Update the parameters of Position Control Calculation. Implements [motor\\_position\\_api\\_t::parameterUpdate](#).

#### Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

## 4.2.10.11 Motor Sensorless Vector Control (rm\_motor\_sensorless)

Modules » Motor

### Functions

```
fsp_err_t RM_MOTOR_SENSORLESS_Open (motor_ctrl_t *const p_ctrl,
motor_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MOTOR_SENSORLESS_Close (motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Sensorless Control block. Implements [motor\\_api\\_t::close](#). [More...](#)

`fsp_err_t RM_MOTOR_SENSORLESS_Reset (motor_ctrl_t *const p_ctrl)`  
Reset Motor Sensorless Control block. Implements `motor_api_t::reset`.  
[More...](#)

`fsp_err_t RM_MOTOR_SENSORLESS_Run (motor_ctrl_t *const p_ctrl)`  
Run Motor (Start motor rotation). Implements `motor_api_t::run`.  
[More...](#)

`fsp_err_t RM_MOTOR_SENSORLESS_Stop (motor_ctrl_t *const p_ctrl)`  
Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.  
[More...](#)

`fsp_err_t RM_MOTOR_SENSORLESS_ErrorSet (motor_ctrl_t *const p_ctrl, motor_error_t const error)`  
Set error information. Implements `motor_api_t::errorSet`. [More...](#)

`fsp_err_t RM_MOTOR_SENSORLESS_SpeedSet (motor_ctrl_t *const p_ctrl, float const speed_rpm)`  
Set speed reference[rpm]. Implements `motor_api_t::speedSet`.  
[More...](#)

`fsp_err_t RM_MOTOR_SENSORLESS_StatusGet (motor_ctrl_t *const p_ctrl, uint8_t *const p_status)`  
Get current control status. Implements `motor_api_t::statusGet`.  
[More...](#)

`fsp_err_t RM_MOTOR_SENSORLESS_AngleGet (motor_ctrl_t *const p_ctrl, float *const p_angle_rad)`  
Get current rotor angle. Implements `motor_api_t::angleGet`. [More...](#)

`fsp_err_t RM_MOTOR_SENSORLESS_SpeedGet (motor_ctrl_t *const p_ctrl, float *const p_speed_rpm)`  
Get rotational speed. Implements `motor_api_t::speedGet`. [More...](#)

`fsp_err_t RM_MOTOR_SENSORLESS_ErrorCheck (motor_ctrl_t *const p_ctrl, uint16_t *const p_error)`  
Check the occurrence of Error. Implements `motor_api_t::errorCheck`.  
[More...](#)

```
fsp_err_t RM_MOTOR_SENSORLESS_PositionSet (motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position)
```

Set position reference. Implements [motor\\_api\\_t::positionSet](#). [More...](#)

```
fsp_err_t RM_MOTOR_SENSORLESS_WaitStopFlagGet (motor_ctrl_t *const
p_ctrl, motor_wait_stop_flag_t *const p_flag)
```

Get wait stop flag. Implements [motor\\_api\\_t::waitStopFlagGet](#). [More...](#)

## Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Sensorless Vector Control \(rm\\_motor\\_sensorless\)](#).

## Overview

The motor sensorless vector control is used to control a motor rotation in an application. This module is implemented with using SPM motor. User can start/stop motor rotation simply.

## Features

The Motor Sensorless Module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

## Configuration

### Build Time Configurations for rm\_motor\_sensorless

The following build time configurations are defined in `fsp_cfg/rm_motor_sensorless_cfg.h`:

Configuration	Options	Default	Description
Parameter checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Motor > Motor Sensorless Vector Control (rm\_motor\_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > Motor Sensorless Vector Control (rm\_motor\_sensorless).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_sensorless0	Module name.
General > Limit of over	Must be a valid value	0.42F	Limit of over

current (A)				current.(Detection threshold)
General > Limit of over voltage (V)	Must be a valid value	28.0F		Limit of over voltage.(Detection threshold)
General > Limit of over speed (rpm)	Must be a valid value	3000.0F		Limit of over speed.(Detection threshold)
General > Limit of low voltage (V)	Must be a valid value	14.0F		Limit of low voltage.(Detection threshold)
Interrupts > Callback	Name must be a valid C symbol	NULL		A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

## Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

# Examples

## Basic Example

This is a basic example of minimal use of the Motor Sensorless in an application.

```
void motor_sensorless_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
    g_motor_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
}
```

```

/* Set speed reference before motor run */
    (void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
/* Start motor rotation */
    (void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
/* Get current status */
    (void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
/* Get current rotor angle */
    (void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
/* Get current motor speed */
    (void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
/* Check error */
    (void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
/* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
/* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
/* Reset Speed Control */
    (void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
/* Close Speed Control */
    (void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
}

```

## Data Structures

struct [motor\\_sensorless\\_callback\\_args\\_t](#)

## Enumerations

enum [motor\\_sensorless\\_callback\\_event\\_t](#)

## Data Structure Documentation

### ◆ motor\_sensorless\_callback\_args\_t

struct motor\_sensorless\_callback\_args\_t

Callback function parameter data

Data Fields

void const *	p_context	Placeholder for user data.
<a href="#">motor_sensorless_callback_event_t</a>	event	

## Enumeration Type Documentation

### ◆ [motor\\_sensorless\\_callback\\_event\\_t](#)

enum <a href="#">motor_sensorless_callback_event_t</a>	
Events that can trigger a callback function	
Enumerator	
MOTOR_SENSORLESS_CALLBACK_EVENT_SPEED_FORWARD	Event forward Speed Control.
MOTOR_SENSORLESS_CALLBACK_EVENT_SPEED_BACKWARD	Event backward Speed Control.
MOTOR_SENSORLESS_CALLBACK_EVENT_CURRENT_FORWARD	Event forward Current Control.
MOTOR_SENSORLESS_CALLBACK_EVENT_CURRENT_BACKWARD	Event backward Current Control.

## Function Documentation

### ◆ RM\_MOTOR\_SENSORLESS\_Open()

```
fsp_err_t RM_MOTOR_SENSORLESS_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements [motor\\_api\\_t::open](#).

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
```

#### Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

*Note*

### ◆ RM\_MOTOR\_SENSORLESS\_Close()

```
fsp_err_t RM_MOTOR_SENSORLESS_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Sensorless Control block. Implements [motor\\_api\\_t::close](#).

Example:

```
/* Close Speed Control */
(void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
```

#### Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

### ◆ RM\_MOTOR\_SENSORLESS\_Reset()

```
fsp_err_t RM_MOTOR_SENSORLESS_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Sensorless Control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset Speed Control */
(void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
```

#### Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

### ◆ RM\_MOTOR\_SENSORLESS\_Run()

```
fsp_err_t RM_MOTOR_SENSORLESS_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
```

#### Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

### ◆ RM\_MOTOR\_SENSORLESS\_Stop()

```
fsp_err_t RM_MOTOR_SENSORLESS_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
```

#### Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

### ◆ RM\_MOTOR\_SENSORLESS\_ErrorSet()

```
fsp_err_t RM_MOTOR_SENSORLESS_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

#### Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_SENSORLESS\_SpeedSet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

*Note*

◆ **RM\_MOTOR\_SENSORLESS\_StatusGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

*Note*

◆ **RM\_MOTOR\_SENSORLESS\_AngleGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

*Note*

◆ **RM\_MOTOR\_SENSORLESS\_SpeedGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
```

**Return values**

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

*Note*

### ◆ RM\_MOTOR\_SENSORLESS\_ErrorCheck()

```
fsp_err_t RM_MOTOR_SENSORLESS_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
```

#### Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

*Note*

### ◆ RM\_MOTOR\_SENSORLESS\_PositionSet()

```
fsp_err_t RM_MOTOR_SENSORLESS_PositionSet ( motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Example:

#### Return values

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

*Note*

### ◆ RM\_MOTOR\_SENSORLESS\_WaitStopFlagGet()

```
fsp_err_t RM_MOTOR_SENSORLESS_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

#### Return values

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

*Note*

## 4.2.10.12 Motor Speed Controller (rm\_motor\_speed)

Modules » Motor

### Functions

```
fsp_err_t RM_MOTOR_SPEED_Open (motor_speed_ctrl_t *const p_ctrl,
motor_speed_cfg_t const *const p_cfg)
```

Opens and configures the Motor Speed Module. Implements `motor_speed_api_t::open`. [More...](#)

```
fsp_err_t RM_MOTOR_SPEED_Close (motor_speed_ctrl_t *const p_ctrl)
```

Disables specified Motor Speed Module. Implements `motor_speed_api_t::close`. [More...](#)

```
fsp_err_t RM_MOTOR_SPEED_Reset (motor_speed_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Speed Module. Implements `motor_speed_api_t::reset`. [More...](#)

```
fsp_err_t RM_MOTOR_SPEED_Run (motor_speed_ctrl_t *const p_ctrl)
```

Run(Start) the Motor Speed Control. Implements `motor_speed_api_t::run`. [More...](#)

```
fsp_err_t RM_MOTOR_SPEED_SpeedReferenceSet (motor_speed_ctrl_t *const
p_ctrl, float const speed_reference_rpm)
```

Set Speed Reference Data. Implements `motor_speed_api_t::speedReferenceSet`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_PositionReferenceSet (motor_speed_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position_data)`

Set Position Reference Data. Implements `motor_speed_api_t::positionReferenceSet`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_ParameterSet (motor_speed_ctrl_t *const p_ctrl, motor_speed_input_t const *const p_st_input)`

Set Input parameters. Implements `motor_speed_api_t::parameterSet`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_SpeedControl (motor_speed_ctrl_t *const p_ctrl)`

Calculates the d/q-axis current reference.(Main process of Speed Control) Implements `motor_speed_api_t::speedControl`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_ParameterGet (motor_speed_ctrl_t *const p_ctrl, motor_speed_output_t *const p_st_output)`

Get Speed Control Parameters. Implements `motor_speed_api_t::parameterGet`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_ParameterUpdate (motor_speed_ctrl_t *const p_ctrl, motor_speed_cfg_t const *const p_cfg)`

Update the parameters of Speed Control Calculation. Implements `motor_speed_api_t::parameterUpdate`. [More...](#)

## Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor speed Interface](#).

## Overview

The motor speed is used to control the speed of motor rotation in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates d/q-axis current reference with input speed reference, current rotational speed, and d/q-axis current.

## Features

The motor speed module has below features.

- Calculate d/q-axis electric current reference.
- Flux weakening process at high speed rotation.
- Open loop damping control when using sensorless type.
- Low pass filter of input rotational speed.

- Speed observer function when using encoder type.

## Configuration

### Build Time Configurations for rm\_motor\_speed

The following build time configurations are defined in fsp\_cfg/rm\_motor\_speed\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Position Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enable position algorithm support.

### Configurations for Motor > Motor Speed Controller (rm\_motor\_speed)

This module can be added to the Stacks tab via New Stack > Motor > Motor Speed Controller (rm\_motor\_speed).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_speed0	Module name.
General > Speed control period (sec)	Must be a valid value	0.0005F	Period of speed control function.
General > Step of speed climbing (rpm)	Must be a valid value	0.5F	Step of speed change at start of open-loop.
General > Maximum rotational speed (rpm)	Manual Entry	2650	Maximum rotational speed (Limit speed).
General > Speed LPF omega	Must be a valid value	10.0F	Design parameter for speed LPF.
General > Speed at Id climbing (rpm)	Manual Entry	500	From this speed d-axis current is controlled climbing.
General > Limit of q-axis current (A)	Must be a valid value	0.42F	Limit of q-axis current.
General > Step of speed feedback at open-loop	Must be a valid value	0.20F	Step of speed feedback at open-loop.
General > Open-loop damping	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Select enable/disable Open-loop damping control.
General > Flux weakening	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Select enable/disable flux weakening control.
General > Torque compensation for	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Select enable/disable torque compensation

sensorless transition			for sensorless transition.
General > Speed observer	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Select enable/disable Speed observer process.
General > Control method	<ul style="list-style-type: none"> <li>• PID</li> <li>• IPD</li> </ul>	PID	Select the control method [PID or IPD].
General > Control type	<ul style="list-style-type: none"> <li>• Sensoreless</li> <li>• Encoder</li> </ul>	Sensoreless	
Open-Loop > Step of d-axis current climbing	Must be a valid value	0.3F	Step of d-axis current climbing
Open-Loop > Step of d-axis current descending	Must be a valid value	0.3F	Step of d-axis current descending
Open-Loop > Step of q-axis current descending ratio	Must be a valid value	1.0F	Step of q-axis current descending ratio
Open-Loop > Reference of d-axis current	Must be a valid value	0.3F	Reference of d-axis current
Open-Loop > Threshold of speed control descending	Manual Entry	600	When rotational speed reaches this speed, d-axis current is controlled descending.
Open-Loop > Threshold of speed control climbing	Manual Entry	500	Until rotational speed reaches this speed, d-axis current is controlled climbing.
Open-Loop > Period between open-loop to BEMF (sec)	Must be a valid value	0.025F	Margin time between open-loop control changes to BEMF PI control.
Open-Loop > Phase error(degree) to decide sensor-less switch timing	Manual Entry	10	Phase error(degree) to decide sensor-less switch timing.
Design parameter > Speed PI loop omega	Must be a valid value	5.0F	Speed PI loop omega
Design parameter > Speed PI loop zeta	Must be a valid value	1.0F	Speed PI loop zeta
Design parameter > Estimated d-axis HPF omega	Must be a valid value	2.5F	HPF cutoff frequency for ed (Hz)
Design parameter > Open-loop damping	Must be a valid value	1.0F	Damping ratio of open-loop damping control

## zeta

Design parameter > Cutoff frequency of phase error LPF	Must be a valid value	10.0F	Cutoff frequency of phase error LPF
Design parameter > Speed observer omega	Must be a valid value	200.0F	Speed observer loop omega
Design parameter > Speed observer zeta	Must be a valid value	1.0F	Speed observer loop zeta
Motor Parameter > Pole pairs	Manual Entry	2	Pole pairs
Motor Parameter > Resistance (ohm)	Must be a valid value	8.5F	Resistance
Motor Parameter > Inductance of d-axis (H)	Must be a valid value	0.0045F	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid value	0.0045F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm <sup>2</sup> )	Must be a valid value	0.0000028F	Rotor inertia
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at timer interrupt.
Interrupts > Input data	Name must be a valid C symbol	NULL	Structure for Speed control Input. If you set this content, Speed Control function read these data automatically. (No need to use Set API.)
Interrupts > Output data	Name must be a valid C symbol	NULL	Structure for Speed control Output. If you set this content, Speed Control function write need data automatically. (No need to use Get API.)

**Clock Configuration**

This module doesn't depend on clock setting, because this module is a simple calculation process.

## Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Limitations

- Set the period of speed control with none-negative value.
- Set the limit of speed change step with none-negative value.
- Set the maximum speed with none-negative value.

## Examples

### Basic Example

This is a basic example of minimal use of the motor speed in an application.

```
void motor_speed_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_SPEED_Open(g_motor_speed0.p_ctrl, g_motor_speed0.p_cfg);
    handle_error(err);

    /* Set speed reference before get current reference */
    (void) RM_MOTOR_SPEED_SpeedReferenceSet(g_motor_speed0.p_ctrl, 104.72F);
    /* Set position reference before get current reference
     * (Basically Exclusive to SpeedReferenceSet. This is only sample,) */
    (void) RM_MOTOR_SPEED_PositionReferenceSet(g_motor_speed0.p_ctrl,
    &g_posref_sample);

    /* Basically run this module at cyclic interrupt (e.g. AGT timer).
     * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Set input parameter data before get current reference */
        (void) RM_MOTOR_SPEED_ParameterSet(g_motor_speed0.p_ctrl,
    &g_test_speed_input);

        /* Activate Speed Process */
        (void) RM_MOTOR_SPEED_Run(g_motor_speed0.p_ctrl);
    }
}
```

```

/* Perform Speed Control Process */
    (void) RM_MOTOR_SPEED_SpeedControl(g_motor_speed0.p_ctrl);
/* Get output parameters */
    (void) RM_MOTOR_SPEED_ParameterGet(g_motor_speed0.p_ctrl,
&g_test_speed_output);
//

/* Update parameters */
    (void) RM_MOTOR_SPEED_ParameterUpdate(g_motor_speed0.p_ctrl,
&g_motor_speed0.p_cfg);
}
/* Reset Speed Control */
    (void) RM_MOTOR_SPEED_Reset(g_motor_speed0.p_ctrl);
/* Close Speed Control */
    (void) RM_MOTOR_SPEED_Close(g_motor_speed0.p_ctrl);
}

```

## Enumerations

enum [motor\\_speed\\_control\\_type\\_t](#)

enum [motor\\_speed\\_openloop\\_damping\\_t](#)

enum [motor\\_speed\\_flux\\_weaken\\_t](#)

enum [motor\\_speed\\_less\\_switch\\_t](#)

enum [motor\\_speed\\_observer\\_switch\\_t](#)

enum [motor\\_speed\\_ctrl\\_status\\_t](#)

## Enumeration Type Documentation

### ◆ [motor\\_speed\\_control\\_type\\_t](#)

enum <a href="#">motor_speed_control_type_t</a>	
Enumerator	
MOTOR_SPEED_CONTROL_TYPE_SENSORLESS	Sensorless type.
MOTOR_SPEED_CONTROL_TYPE_ENCODER	Encoder type.

◆ **motor\_speed\_openloop\_damping\_t**

enum <a href="#">motor_speed_openloop_damping_t</a>	
Enumerator	
MOTOR_SPEED_OPENLOOP_DAMPING_DISABLE	Disable openloop damping.
MOTOR_SPEED_OPENLOOP_DAMPING_ENABLE	Enable openloop damping.

◆ **motor\_speed\_flux\_weaken\_t**

enum <a href="#">motor_speed_flux_weaken_t</a>	
Enumerator	
MOTOR_SPEED_FLUX_WEAKEN_DISABLE	Disable flux-weakening control.
MOTOR_SPEED_FLUX_WEAKEN_ENABLE	Enable flux-weakening control.

◆ **motor\_speed\_less\_switch\_t**

enum <a href="#">motor_speed_less_switch_t</a>	
Enumerator	
MOTOR_SPEED_LESS_SWITCH_DISABLE	Disable soft switching between open-loop mode and normal FOC mode.
MOTOR_SPEED_LESS_SWITCH_ENABLE	Enable soft switching between open-loop mode and normal FOC mode.

◆ **motor\_speed\_observer\_switch\_t**

enum <a href="#">motor_speed_observer_switch_t</a>	
Enumerator	
MOTOR_SPEED_OBSERVER_SWITCH_DISABLE	Disable speed observer.
MOTOR_SPEED_OBSERVER_SWITCH_ENABLE	Enable speed observer.

◆ **motor\_speed\_ctrl\_status\_t**

enum <a href="#">motor_speed_ctrl_status_t</a>	
Enumerator	
MOTOR_SPEED_CTRL_STATUS_INIT	Speed control status is INIT.
MOTOR_SPEED_CTRL_STATUS_BOOT	Speed control status is BOOT.
MOTOR_SPEED_CTRL_STATUS_RUN	Speed control status is RUN.

**Function Documentation**◆ **RM\_MOTOR\_SPEED\_Open()**

```
fsp_err_t RM_MOTOR_SPEED_Open ( motor\_speed\_ctrl\_t *const p_ctrl, motor\_speed\_cfg\_t const *const p_cfg )
```

Opens and configures the Motor Speed Module. Implements [motor\\_speed\\_api\\_t::open](#).

**Return values**

FSP_SUCCESS	Motor Speed Module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ **RM\_MOTOR\_SPEED\_Close()**

```
fsp_err_t RM_MOTOR_SPEED_Close ( motor\_speed\_ctrl\_t *const p_ctrl)
```

Disables specified Motor Speed Module. Implements [motor\\_speed\\_api\\_t::close](#).

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SPEED\_Reset()**

```
fsp_err_t RM_MOTOR_SPEED_Reset ( motor_speed_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Speed Module. Implements `motor_speed_api_t::reset`.

**Return values**

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SPEED\_Run()**

```
fsp_err_t RM_MOTOR_SPEED_Run ( motor_speed_ctrl_t *const p_ctrl)
```

Run(Start) the Motor Speed Control. Implements `motor_speed_api_t::run`.

**Return values**

FSP_SUCCESS	Successfully start.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SPEED\_SpeedReferenceSet()**

```
fsp_err_t RM_MOTOR_SPEED_SpeedReferenceSet ( motor_speed_ctrl_t *const p_ctrl, float const speed_reference_rpm )
```

Set Speed Reference Data. Implements `motor_speed_api_t::speedReferenceSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MOTOR\_SPEED\_PositionReferenceSet()**

```
fsp_err_t RM_MOTOR_SPEED_PositionReferenceSet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position_data )
```

Set Position Reference Data. Implements `motor_speed_api_t::positionReferenceSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input structure pointer is NULL.

◆ **RM\_MOTOR\_SPEED\_ParameterSet()**

```
fsp_err_t RM_MOTOR_SPEED_ParameterSet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_input_t const *const p_st_input )
```

Set Input parameters. Implements `motor_speed_api_t::parameterSet`.

**Return values**

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ **RM\_MOTOR\_SPEED\_SpeedControl()**

```
fsp_err_t RM_MOTOR_SPEED_SpeedControl ( motor_speed_ctrl_t *const p_ctrl)
```

Calculates the d/q-axis current reference.(Main process of Speed Control) Implements `motor_speed_api_t::speedControl`.

**Return values**

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_MOTOR\_SPEED\_ParameterGet()

```
fsp_err_t RM_MOTOR_SPEED_ParameterGet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_output_t *const p_st_output )
```

Get Speed Control Parameters. Implements `motor_speed_api_t::parameterGet`.

#### Return values

FSP_SUCCESS	Successfully the flag is gotten.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

### ◆ RM\_MOTOR\_SPEED\_ParameterUpdate()

```
fsp_err_t RM_MOTOR_SPEED_ParameterUpdate ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_cfg_t const *const p_cfg )
```

Update the parameters of Speed Control Calculation. Implements `motor_speed_api_t::parameterUpdate`.

#### Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

## 4.2.11 Networking

### Modules

#### Detailed Description

Networking Modules.

#### Modules

##### [AWS Cellular Interface on RYZ \(rm\\_cellular\\_ryz\\_aws\)](#)

Middleware implementing the AWS Cellular API for RYZ cellular modems.

### [AWS HTTPS](#)

This module provides the AWS HTTPS integration documentation.

### [AWS PKCS11 PAL \(rm\\_aws\\_pkcs11\\_pal\)](#)

PKCS#11 PAL layer implementation for use by FreeRTOS TLS.

### [AWS PKCS11 PAL on LittleFS \(rm\\_aws\\_pkcs11\\_pal\\_littlefs\)](#)

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

### [AWS Secure Sockets](#)

This module provides the AWS Secure Sockets implementation.

### [AWS Transport Interface on MbedTLS/PKCS11 \(rm\\_aws\\_transport\\_interface\\_port\)](#)

Middleware implementing a transport interface through MbedTLS and PKCS11.

### [BLE Abstraction \(rm\\_ble\\_abs\)](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

### [BLE Driver \(r\\_ble\\_balance\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

### [BLE Driver \(r\\_ble\\_compact\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

### [BLE Driver \(r\\_ble\\_extended\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

### [Bluetooth Low Energy Mesh Network Modules](#)

This is a subcategory for Bluetooth Low Energy Mesh Network

modules.

#### [Cellular Comm Interface on UART \(rm\\_cellular\\_comm\\_uart\\_aws\)](#)

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

#### [Ethernet \(r\\_ether\)](#)

Driver for the Ethernet peripheral on RA MCUs. This module implements the [Ethernet Interface](#).

#### [Ethernet \(r\\_ether\\_phy\)](#)

The Ethernet PHY module (r\_ether\_phy) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the [Ethernet PHY Interface](#).

#### [FreeRTOS+TCP Wrapper to r\\_ether \(rm\\_freertos\\_plus\\_tcp\)](#)

Middleware for using TCP on RA MCUs.

#### [NetX Duo Ethernet Driver \(rm\\_netxdue\\_ether\)](#)

#### [NetX Duo WiFi Driver \(rm\\_netxdue\\_wifi\)](#)

#### [PTP \(r\\_ptp\)](#)

Driver for the PTP peripheral on RA MCUs. This module implements the [PTP Interface](#).

#### [SPP BLE Abstraction \(rm\\_ble\\_abs\\_spp\)](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

#### [WiFi Onchip Silex Driver using r\\_sci\\_uart \(rm\\_wifi\\_onchip\\_silex\)](#)

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

### 4.2.11.1 AWS Cellular Interface on RYZ (rm\_cellular\_ryz\_aws)

[Modules](#) » [Networking](#)

Middleware implementing the AWS Cellular API for RYZ cellular modems.

## Overview

See AWS documentation for how the Cellular API works: <https://www.freertos.org/Documentation/api-ref/cellular/index.html>

### Features

All APIs are supported by the RYZ port with the exception of the following RAT APIs:

- Cellular\_SetRatPriority
- Cellular\_GetRatPriority

The following URCs are supported by the RYZ port:

- CERE/CREG (Cellular\_RegisterUrcNetworkRegistrationEventCallback)
- SYSSTART (Cellular\_RegisterModemEventCallback)
- SHUTDOWN (Cellular\_RegisterModemEventCallback)
- SQNSRING (Cellular\_SocketRegisterDataReadyCallback)

Support for other RYZ URCs can be possibly added by request in future releases.

### Limitations

- This module does not handle the RYZ reset pin. The user should manually configure this pin in order to reset the module.
- The RYZ can only be used in buffer reception mode, not transparent mode. When calling Cellular\_SocketConnect only CELLULAR\_ACCESSMODE\_BUFFER is supported.
- The AWS Cellular APIs don't currently allow remote port to be set for UDP. It can be set by modifying the localPort field in CellularSocketHandle\_t after calling Cellular\_CreateSocket but before calling Cellular\_SocketConnect.

## Configuration

### AWS Cellular Interface

#### Build Time Configurations for source

The following build time configurations are defined in aws/cellular\_interface/cellular\_config.h:

Configuration	Options	Default	Description
Mobile Country Code Max Size	Value must be a positive integer	3	Mobile country code max size.
Mobile Network Code Max Size	Value must be a positive integer	3	Mobile network code max size.
Integrated Circuit Card Identity Max Size	Value must be a positive integer	20	Integrated circuit card identity max size.
International Mobile Subscriber Identity Max Size	Value must be a positive integer	15	International Mobile Subscriber Identity max size.

Firmware Version Max Size	Value must be a positive integer	32	Cellular module firmware version max size.
Hardware Version Max Size	Value must be a positive integer	12	Cellular module hardware version max size.
Serial Number Max Size	Value must be a positive integer	12	Cellular module serial number max size.
International Mobile Equipment Identity Max Size	Value must be a positive integer	15	International Mobile Equipment Identity number max size.
Registered Network operator Name Max Size	Value must be a positive integer	32	Registered network operator name max size.
Access Point Name Max Size	Value must be a positive integer	64	Access point name max size.
Packet Data Network Username Max Size	Value must be a positive integer	32	Packet data network username max size.
Packet Data Network Password Max Size	Value must be a positive integer	32	Packet data network password max size.
Data Network IP Address Max Size	Value must be a positive integer	40	Cellular data network IP address max size.
AT Command Max Size	Value must be a positive integer	200	Cellular AT command max size.
Max Number of Sockets	Value must be a positive integer	6	Cellular module number of socket max size.
Manufacturer ID Max Size	Value must be a positive integer	20	Cellular module manufacturer ID max size.
Model ID Max Size	Value must be a positive integer	10	Model ID max size.
EDRX List Max Size	Value must be a positive integer	4	EDRX list max size.
PDN Context ID Min Value	Value must be a positive integer	1	PDN context ID min value.
PDN Context ID Max Value	Value must be a positive integer	16	PDN context ID max value.
RAT Priority Count	Value must be a positive integer	3	RAT (radio access technology) priority count.
Socket Max Send Data Length (bytes)	Value must be a positive integer	1460	Socket max send data length.
Socket Max Receive	Value must be a	1500	Socket max receive

Data Length (bytes)	positive integer		data length.
GetHostByName Support	<ul style="list-style-type: none"> <li>Enabled (default)</li> <li>Disabled</li> </ul>	Enabled (default)	Enables/disable GetHostByName.
Comm Interface Send Timeout (ms)	Value must be a positive integer	1000	Cellular comm interface receive timeout in ms.
Comm Interface Receive Timeout (ms)	Value must be a positive integer	50	Cellular comm interface receive timeout in ms.
Static Allocation Context	<ul style="list-style-type: none"> <li>Enabled (default)</li> <li>Disabled</li> </ul>	Disabled	Use statically allocated context.
Comm Interface Static Allocation Context	<ul style="list-style-type: none"> <li>Enabled (default)</li> <li>Disabled</li> </ul>	Disabled	Use statically allocated context for comm interface.
Default RAT	<ul style="list-style-type: none"> <li>GSM</li> <li>WCDMA</li> <li>EDGE</li> <li>HSDPA</li> <li>HSUPA</li> <li>HSDPAHSUPA</li> <li>LTE</li> <li>CATM1</li> <li>NBIOT</li> </ul>	CATM1	Default Radio Access Technology.
GSM Support	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled (default)</li> </ul>	Disabled (default)	This should be disabled when a modem doesn't support GSM or the AT+CGREG command.
Static Socket Context	<ul style="list-style-type: none"> <li>Enabled (default)</li> <li>Disabled</li> </ul>	Disabled	Use statically allocated socket.
Log Level	<ul style="list-style-type: none"> <li>Off</li> <li>Error</li> <li>Warning</li> <li>Info</li> <li>Debug</li> </ul>	Off	Log level for the cellular interface. Defaults to using printf when enabled

## RYZ Cellular Interface Port

### Configurations for Networking > AWS Cellular Interface on RYZ (rm\_cellular\_ryz\_aws)

This module can be added to the Stacks tab via New Stack > Networking > AWS Cellular Interface on RYZ (rm\_cellular\_ryz\_aws).

Configuration	Options	Default	Description
Module Reset Pin (Port Number)	Refer to the RA Configuration tool for available options.	00	Specify the reset control port for the RYZ module. This property

is only used in devassist.

Specify the reset control pin for the RYZ module. This property is only used in devassist.

Module Reset Pin (Pin Number)      Refer to the RA Configuration tool for available options.      00

## Examples

### Basic Example

```
void rm_cellular_ryz_aws_basic_example (void)
{
    CellularHandle_t      cellular_handle = NULL;
    CellularSimCardStatus_t sim_card_status;
    /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
    /* Get the SIM card status */
    err = Cellular_GetSimCardStatus(cellular_handle, &sim_card_status);
    assert(CELLULAR_SUCCESS == err);
    assert(CELLULAR_SIM_CARD_INSERTED == sim_card_status.simCardState);
}

```

### Socket Example

```
#define SOCKET_EXAMPLE_BUFFER_SIZE (256)
#define SOCKET_EXAMPLE_TIMEOUT (UINT32_MAX)
#define SOCKET_EXAMPLE_IP ("255.255.255.255")
#define SOCKET_EXAMPLE_PORT (80)
uint32_t g_rcv_event_count = 0;
void socket_example_data_ready_callback (CellularSocketHandle_t socketHandle, void *
pCallbackContext)
{
    FSP_PARAMETER_NOT_USED(socketHandle);
    FSP_PARAMETER_NOT_USED(pCallbackContext);
}

```

```
    g_recv_event_count++;
}

void rm_cellular_ryz_aws_socket_example (void)
{
    CellularHandle_t      cellular_handle = NULL;
    char                  * p_data        = "hello_world";
    char                  recv_buffer[SOCKET_EXAMPLE_BUFFER_SIZE] = "\0";
    uint32_t              sent_data_length = 0;
    uint32_t              received_data_length = 0;
    uint32_t              timeout_ms      = SOCKET_EXAMPLE_TIMEOUT;
    CellularSocketHandle_t socket_handle;
    CellularSocketAddress_t socket_address =
    {
        .ipAddress =
        {
            CELLULAR_IP_ADDRESS_V4,
            SOCKET_EXAMPLE_IP
        },
        .port      = SOCKET_EXAMPLE_PORT
    };

    /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);

    /* Create a TCP socket */
    err = Cellular_CreateSocket(cellular_handle,
                                1,
                                CELLULAR_SOCKET_DOMAIN_AF_INET,
                                CELLULAR_SOCKET_TYPE_STREAM,
                                CELLULAR_SOCKET_PROTOCOL_TCP,
                                &socket_handle);

    assert(CELLULAR_SUCCESS == err);

    /* Register the data ready callback */
    err = Cellular_SocketRegisterDataReadyCallback(cellular_handle,
```

```
        socket_handle,
        socket_example_data_ready_callback
    ,
        NULL);

    assert(CELLULAR_SUCCESS == err);
    g_rcv_event_count = 0;
/* Connect the TCP socket */
    err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);
    assert(CELLULAR_SUCCESS == err);
/* Send data over the socket */
    err = Cellular_SocketSend(cellular_handle, socket_handle, (uint8_t *) p_data,
strlen(p_data), &sent_data_length);
    assert(CELLULAR_SUCCESS == err);
    assert(strlen(p_data) == sent_data_length);
/* Wait for data ready callback */
    timeout_ms = SOCKET_EXAMPLE_TIMEOUT;
while (timeout_ms > 0)
    {
if (g_rcv_event_count > 0)
    {
break;
    }
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
    }
    assert(0 != timeout_ms);
/* Receive data back */
    err = Cellular_SocketRecv(cellular_handle,
        socket_handle,
        (uint8_t *) rcv_buffer,
        SOCKET_EXAMPLE_BUFFER_SIZE,
        &received_data_length);
    assert(CELLULAR_SUCCESS == err);
```

```
/* Close the socket */  
err = Cellular_SocketClose(cellular_handle, socket_handle);  
assert(CELLULAR_SUCCESS == err);  
}
```

#### 4.2.11.2 AWS HTTPS

[Modules](#) » [Networking](#)

This module provides the AWS HTTPS integration documentation.

## Overview

The AWS HTTPS core library can be used to send HTTP and HTTPS requests. The documentation for the library can be found at the following link: [coreHTTP](#).

### Features

- Secure and Non-secure HTTP requests
- [Mutually authenticated connections](#)

## Configuration

### Memory Usage

The AWS HTTPS library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. It is recommended to tweak the thread stack configuration values based on usage. Noteable values are:

#### AWS IoT Common

- IoT Thread Default Stack Size
- IoT Network Receive Task Stack Size

#### FreeRTOS Thread

- General|Minimal Stack Size

#### FreeRTOS Plus TCP

- Stack size in words (not bytes)

## Usage Notes

### Limitations

- MbedTLS must be initialized and key provisioning must be done before starting a secure

connection. Refer to [AWS Secure Sockets](#).

## Examples

### HTTPS GET request

```

/* Certificate copied from https://www.amazontrust.com/repository/AmazonRootCA1.pem
*/

```

### 4.2.11.3 AWS PKCS11 PAL (rm\_aws\_pkcs11\_pal)

[Modules](#) » [Networking](#)

PKCS#11 PAL layer implementation for use by FreeRTOS TLS.

## Overview

### Note

*The PKCS#11 PAL Interface does not provide any interfaces to the user. Consult the AWS documentation for more info: <https://docs.aws.amazon.com/freertos/latest/portingguide/afr-porting-pkcs.html>.*

## Configuration

There is no user configuration for this module

### Data Flash Usage

The current implementation utilizes 16K of Data flash of which 8K is used for storage and the other 8K is used for backup.

## Usage Notes

### Limitations

- Interrupts are disabled while write or erase operations are being performed.
- Credentials are stored on data flash with no tamper protection other than SHA256 for integrity.
- Credential access is not limited in any way. The credential access and tamper issues can be resolved by updating the implementation to use code flash instead of data flash and using the Secure MPU to control access to it.

#### 4.2.11.4 AWS PKCS11 PAL on LittleFS (rm\_aws\_pkcs11\_pal\_littlefs)

[Modules](#) » [Networking](#)

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

## Overview

### Note

*The PKCS#11 PAL LittleFS Interface does not provide any interfaces to the user. Consult the AWS documentation for more info: <https://docs.aws.amazon.com/freertos/latest/portingguide/afr-porting-pkcs.html>.*

## Configuration

There is no user configuration for this module

## Usage Notes

The current implementation utilizes [LittleFS on Flash \(rm\\_littlefs\\_flash\)](#) for storage.

## Limitations

- Credential access is not limited in any way.

### 4.2.11.5 AWS Secure Sockets

[Modules](#) » [Networking](#)

This module provides the AWS Secure Sockets implementation.

## Overview

### Features

Information about the features provided by the AWS Secure Sockets Library is available in the [FreeRTOS Libraries User Guide](#).

The FSP implementation supports using Secure Sockets with either Ethernet or WiFi. These stacks can be added in FSP via the RA Configuration editor under FreeRTOS | Secure Sockets.

### Dependencies

The Secure Sockets library has two dependencies:

1. A TCP/IP implementation
2. A TLS implementation

For TCP/IP, AWS have provided the FreeRTOS TCP/IP implementation. For TLS, AWS have chosen mbedTLS, but use PKCS11 for storage and invoking the crypto portion of mbedTLS. For more information about AWS Secure Sockets, refer to the [AWS documentation](#). An example of Secure Sockets usage is on the same page.

### mbedTLS

[mbedTLS](#) is ARM's implementation of the TLS and SSL protocols as well as the cryptographic primitives required by those implementations. mbedTLS is also solely used for its cryptographic features even if the TLS/SSL portions are not used. With [PSA](#), ARM have created a separate API for cryptography. Starting with mbedTLS3, crypto implementation has been moved out to a new module called mbedCrypto (PSA Crypto API) and a build time configuration can direct the mbedTLS3 implementation to use either the old mbedtls cryptography functions or use the new PSA Crypto API. Since the current version of mbedCrypto (PSA Crypto API) implements both the old mbedtls crypto API as well as the new PSA Crypto API, either option is functional for now.

### CipherSuites

During the TLS connection setup stage, the client has to indicate to the server the type of cryptographic operations that it supports. This is referred to as the ciphersuite. The entire list of ciphersuites supported by mbedTLS can be found in `mbedtls/ssl_ciphersuites.h`.

## Configuration

In FSP, Secure Sockets can be added as a new stack via FreeRTOS | Secure Sockets | Secure Sockets on WiFi or Secure Sockets on FreeRTOS Plus TCP. All required dependant modules, except heap, are automatically added. To complete the configuration,

- Add a heap instance and use the same one for all dependencies.
- Resolve the module configuration requirements.

## Usage Notes

For detailed documentation on Secure Sockets consult the [AWS documentation](#).

## Examples

### Basic Example

This is a basic example of using the Secure Sockets API with Ethernet. The message "hello, world!" is sent to a remote socket.

```
#define SECURE_SOCKETS_EXAMPLE_BUFFER_SIZE (64)
static const char SERVER_CERTIFICATE_PEM[] =

#### 4.2.11.6 AWS Transport Interface on MbedTLS/PKCS11 (rm\_aws\_transport\_interface\_port)

Modules » Networking

Middleware implementing a transport interface through MbedTLS and PKCS11.

## Overview

This module implements a transport interface that provides an interface between MbedTLS and CoreMQTT/CoreHTTP. At a lower level the transport interface connects to a sockets wrapper in order to call down to the Cellular API.

### Note

*When using this transport interface with Cellular modules the user should call Cellular\_Init() before trying to connect to anything.*

## Examples

### MQTT Example

```
#define EXAMPLE_PDN_CONTEXT_NUMBER (1)
#define EXAMPLE_TIMEOUT_MS (5000)
#define EXAMPLE_DISABLE_SNI (false)
#define EXAMPLE_MQTT_HOST ("mqtt_host_server")
#define EXAMPLE_MQTT_HOST_PORT (8883)
#define EXAMPLE_MQTT_SEND_TIMEOUT (5000)
#define EXAMPLE_MQTT_RECEIVE_TIMEOUT (5000)
#define EXAMPLE_MQTT_TOPIC ("example_topic")
#define EXAMPLE_MQTT_CLIENT_IDENTIFIER ("client_id")
#define EXAMPLE_MQTT_KEEP_ALIVE_SECONDS (60)
#define EXAMPLE_MQTT_PAYLOAD ("helloworld")
struct NetworkContext
{
    TlsTransportParams_t * pParams;
```

```
};

## Detailed Description

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

## Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

## Features

The Bluetooth Low Energy Abstraction module supports the following features:

- following GAP Role support
  - Central: The device that sends a connection request to the Peripheral device.
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
  - Observer : The device that scans for advertising.
  - Broadcaster : The device that sends advertising.
- LE 2M PHY
  - BLE communication is supported on the 2 Msym/s PHY.
- LE Coded PHY -Supports BLE communication on the Coded PHY. This enables communication over longer distances than 1M PHY and 2M PHY.
- LE Advertising Extensions
  - Up to four independent adverts can be executed simultaneously.
  - The size of Advertising Data/Scan Response Data has been expanded to a

- maximum of 1650 bytes.
- Periodic Advertising is available.
- LE Channel Selection Algorithm #2
  - With the hopping channel selection algorithm added in Version 5.0, the machine that selects the channel it is possible.
- High Duty Cycle Non-Connectable Advertising
  - The ability to support non-connectable advertising with a minimum interval of up to 20 msec.
- LE Secure Connections
  - Elliptic curve Diffie-Hellman key sharing (ECDH) for pairing with passive eavesdropping support.
- Link Layer privacy
  - This feature avoids being tracked by other BLE devices by periodically changing the Bluetooth device address.
- Link Layer Extended Scanner Filter policies
  - Scan Filter support for Resolvable private addresses.
- LE Data Packet Length Extension
  - This function expands the packet size of BLE data communications. It is possible to scale up to 251 bytes.
- LE L2CAP Connection Oriented Channel Support
  - The ability to support communication using the L2CAP credit based flow control channel.
- Low Duty Cycle Directed Advertising
  - The ability to support the advertising of the Low Duty Cycle for reconnecting to a known device.
- LE Link Layer Topology
  - It supports both Master and Slave roles and can operate as Master when connected to one remote device and as Slave when connected to another remote device.
- LE Ping
  - This function checks whether the link is maintained or not by requesting the transmission of packets containing MIC after link encryption.

## BLE Library Configuration

There are three types of BLE Protocol Stacks, and the functions provided are different depending on the type of BLE Protocol Stack you select.

BLE library feature	Extended	Balance	Compact
GAP Role	Central Peripheral Observer Broadcaster	Central Peripheral Observer Broadcaster	Peripheral Broadcaster
LE 2M PHY	Yes	Yes	No
LE Coded PHY	Yes	Yes	No
LE Advertising Extensions	Yes	No	No
LE Channel Selection Algorithm #2	Yes	Yes	No
High Duty Cycle Non-Connectable Advertising	Yes	Yes	Yes

LE Secure Connections	Yes	Yes	Yes
Link Layer privacy	Yes	Yes	Yes
Link Layer Extended Scanner Filter policies	Yes	Yes	No
LE Data Packet Length Extension	Yes	Yes	Yes
LE L2CAP Connection Oriented Channel Support	Yes	No	No
Low Duty Cycle Directed Advertising	Yes	Yes	Yes
LE Link Layer Topology	Yes	Yes	No
LE Ping	Yes	Yes	Yes
32-bit UUID Support in LE	Yes	Yes	Yes

## Target Devices

The Bluetooth Low Energy Abstraction module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_ble\_abs

The following build time configurations are defined in fsp\_cfg/rm\_ble\_abs\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enable</li> <li>• Disable</li> </ul>	Default (BSP)	Specify whether to include code for API parameter checking. Valid settings include.
Debug Public Address	Must be a valid device address	FF:FF:FF:50:90:74	Public Address of firmware initial value.
Debug Random Address	Must be a valid device address	FF:FF:FF:FF:FF:FF	Random Address of firmware initial value.
Maximum number of connections	Value must be an integer between 1 and 7	7	Maximum number of connections.
Maximum connection data length	Value must be an integer between 27 and 251	251	Maximum connection data length.
Maximum advertising data length	Value must be an integer between 31	1650	Maximum advertising data length.

	and 1650		
Maximum advertising set number	Value must be an integer between 1 and 4	4	Maximum advertising set number.
Maximum periodic sync set number.	Value must be an integer between 1 and 2	2	Maximum periodic sync set number.
Store Security Data	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Store Security Data in DataFlash.
Data Flash Block for Security Data	Value must be an integer between 0 and 7	0	Data Flash Block for Security Data Management.
Remote Device Bonding Number	Value must be an integer between 1 and 7	7	Number of remote device bonding information.
Connection Event Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Connection event start notify enable/disable.
Connection Event Close Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Connection event close notify enable/disable.
Advertising Event Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Advertising event start notify enable/disable.
Advertising Event Close Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Advertising event close notify enable/disable.
Scanning Event Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Scanning event start notify enable/disable.
Scanning Event Close Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Scanning event close notify enable/disable.
Initiating Event Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Initiating event start notify enable/disable.
Initiating Event Close Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Initiating event close notify enable/disable.
RF Deep Sleep Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set RF_DEEP_SLEEP start notify enable/disable.
RF Deep Sleep Wakeup Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set RF_DEEP_SLEEP wakeup notify enable/disable.

Bluetooth dedicated clock	Value must be an integer between 0 and 15	6	Load capacitance adjustment.
DC-DC converter	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set DC-DC converter for RF part.
Slow Clock Source	<ul style="list-style-type: none"> <li>• Use RF_LOCO</li> <li>• Use External 32.768kHz</li> </ul>	Use RF_LOCO	Set slow clock source for RF part.
MCU CLKOUT Port	<ul style="list-style-type: none"> <li>• P109</li> <li>• P205</li> </ul>	P109	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT.
MCU CLKOUT Frequency Output	<ul style="list-style-type: none"> <li>• MCU CLKOUT frequency 32.768kHz</li> <li>• MCU CLKOUT frequency 16.384kHz</li> </ul>	MCU CLKOUT frequency 32.768kHz	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part.
Sleep Clock Accuracy(SCA)	Value must be an integer between 0 and 500	250	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock.
Transmission Power Maximum Value	<ul style="list-style-type: none"> <li>• max +0dBm</li> <li>• max +4dBm</li> </ul>	max +4dBm	Set transmission power maximum value.
Transmission Power Default Value	<ul style="list-style-type: none"> <li>• High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)</li> <li>• Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm)</li> <li>• Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm)</li> </ul>	High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)	Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(BLE_ABS_CFG_RF_DEF_TX_POW).

CLKOUT_RF Output	<ul style="list-style-type: none"> <li>No output</li> <li>4MHz output</li> <li>2MHz output</li> <li>1MHz output</li> </ul>	No output	Set CLKOUT_RF output setting.
RF_DEEP_SLEEP Transition	<ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul>	Enable	Set RF_DEEP_SLEEP transition.
MCU Main Clock Frequency	Value must be an integer between 1000 and 20000	8000	Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz
Code Flash(ROM) Device Data Block	Value must be an integer between -1 and 255	255	Device specific data block on Code Flash (ROM).
Device Specific Data Flash Block	Value must be an integer between -1 and 7	-1	Device specific data block on E2 Data Flash.
MTU Size Configured	Value must be an integer between 23 and 247	247	MTU Size configured by GATT MTU exchange procedure.
Timer Slot Maximum Number	Value must be an integer between 1 and 10	10	The maximum number of timer slot.

### Configurations for Networking > BLE Abstraction (rm\_ble\_abs)

This module can be added to the Stacks tab via New Stack > Networking > BLE Abstraction (rm\_ble\_abs).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_ble_abs0	Module name.
General > Gap callback	Name must be a valid C symbol	gap_cb	A user callback function must be provided if the BLE_ABS is configured to generate a GAP. If QE is used, set to NULL.
General > Vendor specific callback	Name must be a valid C symbol	vs_cb	A user callback function must be provided if the BLE_ABS is configured to generate a Vendor Specific. If QE is used,

			set to NULL.
General > GATT server callback parameter	Name must be a valid C symbol	gs_abs_gatts_cb_param	Set GATT server callback parameter. If QE is used, set to NULL.
General > GATT server callback number	Must be a valid number	2	The number of GATT Server callback functions.
General > GATT client callback parameter	Name must be a valid C symbol	gs_abs_gattc_cb_param	Set GATT client callback parameter. If QE is used, set to NULL.
General > GATT client callback number	Must be a valid number	2	The number of GATT Server callback functions.
Security > Pairing parameters	Name must be a valid C symbol	gs_abs_pairing_param	Set pairing parameters.
Security > IO capabilities of local device.	<ul style="list-style-type: none"> <li>• BLE_GAP_IOCAP_DISPLAY_ONLY</li> <li>• BLE_GAP_IOCAP_DISPLAY_YESNO</li> <li>• BLE_GAP_IOCAP_KEYBOARD_ONLY</li> <li>• BLE_GAP_IOCAP_NOINPUT_NOOUTPUT</li> <li>• BLE_GAP_IOCAP_KEYBOARD_DISPLAY</li> </ul>	BLE_GAP_IOCAP_NOINPUT_NOOUTPUT	Select IO capabilities of local device.
Security > MITM protection policy.	<ul style="list-style-type: none"> <li>• BLE_GAP_SEC_MITM_BEST EffORT</li> <li>• BLE_GAP_SEC_MITM_STRICT</li> </ul>	BLE_GAP_SEC_MITM_BEST EffORT	Select MITM protection policy.
Security > Determine whether to accept only Secure Connections or not.	<ul style="list-style-type: none"> <li>• BLE_GAP_SC_BEST EffORT</li> <li>• BLE_GAP_SC_STRICT</li> </ul>	BLE_GAP_SC_BEST EffORT	Select determine whether to accept only Secure Connections or not.
Security > Type of keys to be distributed from local device.	<ul style="list-style-type: none"> <li>• BLE_GAP_KEY_DIST_ENCKEY</li> <li>• BLE_GAP_KEY_DIST_IDKEY</li> <li>• BLE_GAP_KEY_DIST_SIGNKEY</li> </ul>		Select type of keys to be distributed from local device.
Security > Type of keys which local device requests a remote	<ul style="list-style-type: none"> <li>• BLE_GAP_KEY_DIST_ENCKEY</li> <li>• BLE_GAP_KEY_DIST_SIGNKEY</li> </ul>		Set type of keys which local device requests a remote device to

device to distribute.	IST_IDKEY • BLE_GAP_KEY_D IST_SIGNKEY		distribute.
Security > Maximum LTK size.	Valid range is 7 - 16	16	Set Maximum LTK size.
Interrupts > Callback provided when an ISR occurs	Name must be a valid C symbol	NULL	Callback provided when BLE ABS ISR occurs

## Clock Configuration

### Note

*System clock (ICLK): 8 MHz or more*

*Peripheral module clock A (PCLKA): 8MHz or more*

*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*

*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

## Pin Configuration

This module does not use I/O pins.

## Stack Size Configuration

### Note

*When you use BLE on RTOS environment, make sure that thread stack size must be 0x1000 or more which call [R\\_BLE\\_Execute](#).*

# Usage Notes

## Limitations

Developers should be aware of the following limitations when using the BLE\_ABS:

# Examples

## BLE\_ABS Basic Example

This is a basic example of minimal use of the BLE\_ABS in an application.

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)
#define BLE_ABS_EVENT_FLAG_DISCONN_IND (0x01 << 4)
#define BLE_ABS_EVENT_FLAG_RSLV_LIST_CONF_COMP (0x01 << 5)
#define BLE_ABS_EXAMPLE_SHORTENED_LOCAL_NAME 'E', 'x', 'a', 'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_COMPLETE_LOCAL_NAME 'T', 'E', 'S', 'T', '_', 'E', 'x', 'a',
```

```

## Data Structure Documentation

### ◆ abs\_advertising\_parameter\_t

struct abs_advertising_parameter_t		
advertising set parameters structure		
Data Fields		
union <a href="#">abs_advertising_parameter_t</a>	advertising_parameter	Advertising parameters.
uint32_t	advertising_status	Advertising status.
<a href="#">ble_device_address_t</a>	remote_device_address	Remote device address for direct advertising.

### ◆ abs\_scan\_parameter\_t

struct abs_scan_parameter_t		
scan parameters structure		
Data Fields		
<a href="#">ble_abs_scan_parameter_t</a>	scan_parameter	Scan parameters.

<a href="#">ble_abs_scan_phy_parameter_t</a>	scan_phy_parameter_1M	1M phy parameters for scan.
<a href="#">ble_abs_scan_phy_parameter_t</a>	scan_phy_parameter_coded	Coded phy parameters for scan. */.
uint32_t	scan_status	

#### ◆ ble\_abs\_instance\_ctrl\_t

struct ble_abs_instance_ctrl_t		
BLE ABS private control block. DO NOT MODIFY. Initialization occurs when <a href="#">RM_BLE_ABS_Open()</a> is called.		
Data Fields		
uint32_t	open	Indicates whether the <a href="#">open()</a> API has been successfully called.
void const *	p_context	Placeholder for user data. Passed to the user callback in <a href="#">ble_abs_callback_args_t</a> .
<a href="#">ble_gap_application_callback_t</a>	abs_gap_callback	GAP callback function.
<a href="#">ble_vendor_specific_application_callback_t</a>	abs_vendor_specific_callback	Vendor specific callback function.
<a href="#">ble_abs_delete_bond_application_callback_t</a>	abs_delete_bond_callback	Delete bond information callback function.
uint32_t	connection_timer_handle	Cancel a request for connection timer.
uint32_t	advertising_timer_handle	Advertising timer for legacy advertising.
uint32_t	scan_timer_handle	Scan interval timer.
<a href="#">abs_advertising_parameter_t</a>	advertising_sets[ <a href="#">BLE_MAX_NO_OF_ADV_SETS_SUPPORTED</a> ]	Advertising set information.
<a href="#">abs_scan_parameter_t</a>	abs_scan	Scan information.
<a href="#">st_ble_dev_addr_t</a>	loc_bd_addr	Local device address.
uint8_t	privacy_mode	Privacy mode.
uint32_t	set_privacy_status	Local privacy status.
<a href="#">ble_abs_timer_t</a>	timer[ <a href="#">BLE_ABS_CFG_TIMER_NUMBER_OF_SLOT</a> ]	
uint8_t	local_irk[ <a href="#">BLE_GAP_IRK_SIZE</a> ]	
<a href="#">ble_abs_identity_address_info_t</a>	identity_address_info	
uint32_t	current_timeout_ms	Current timeout.
uint32_t	elapsed_timeout_ms	Elapsed timeout.

<code>ble_abs_cfg_t</code> const *	<code>p_cfg</code>	Pointer to the BLE ABS configuration block.
------------------------------------	--------------------	---

### ◆ `st_ble_rf_notify_t`

struct <code>st_ble_rf_notify_t</code>		
This structure is RF event notify management.		
Data Fields		
<code>uint32_t</code>	<code>enable</code>	Set enable/disable of each RF event notification.  Bit0 Notify Connection event start(0:Disable/1:Enable) Bit1 Notify Advertising event start(0:Disable/1:Enable) Bit2 Notify Scanning event start(0:Disable/1:Enable) Bit3 Notify Initiating event start(0:Disable/1:Enable) Bit4 Notify Connection event close(0:Disable/1:Enable) Bit5 Notify Advertising event close(0:Disable/1:Enable) Bit6 Notify Scanning event close(0:Disable/1:Enable) Bit7 Notify Initiating event close(0:Disable/1:Enable) Bit8 Notify RF_DEEP_SLEEP event start(0:Disable/1:Enable) Bit9 Notify RF_DEEP_SLEEP event close(0:Disable/1:Enable) Other Bit: Reserved for future use.
<code>ble_rf_notify_cb_t</code>	<code>start_cb</code>	Set callback function pointer for RF event start.
<code>ble_rf_notify_cb_t</code>	<code>close_cb</code>	Set callback function pointer for RF event close.
<code>ble_rf_notify_cb_t</code>	<code>dsleep_cb</code>	Set callback function pointer for RF_DEEP_SLEEP.

## Typedef Documentation

### ◆ `ble_abs_timer_cb_t`

typedef void(* <code>ble_abs_timer_cb_t</code> ) (uint32_t timer_hdl)
The timer callback invoked when the timer expired.

◆ **ble\_mcu\_clock\_change\_cb\_t**

ble_mcu_clock_change_cb_t	
ble_mcu_clock_change_cb_t is the callback function type to use CLKOUT_RF as the MCU main clock source.	
<b>Parameters</b>	
none	
<b>Returns</b>	
none	

◆ **ble\_rf\_notify\_cb\_t**

ble_rf_notify_cb_t		
ble_rf_notify_cb_t is the RF event notify callback function type.		
<b>Parameters</b>		
[in]	uint32_t	The information of RF event notification.
<b>Returns</b>		
none		

**Enumeration Type Documentation**◆ **e\_ble\_timer\_type\_t**

enum e_ble_timer_type_t	
The timer type.	
Enumerator	
BLE_TIMER_ONE_SHOT	One shot timer type
BLE_TIMER_PERIODIC	Periodic timer type

**Function Documentation**

## ◆ RM\_BLE\_ABS\_Open()

```
fsp_err_t RM_BLE_ABS_Open ( ble_abs_ctrl_t *const p_ctrl, ble_abs_cfg_t const *const p_cfg )
```

Host stack is initialized with this function. Before using All the R\_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE\_GAP\_EVENT\_STACK\_ON event. Implements [ble\\_abs\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

### Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
FSP_ERR_INVALID_MODE	Invalid mode during open call

Host stack is initialized with this function. Before using All the R\_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE\_GAP\_EVENT\_STACK\_ON event. Implements [ble\\_abs\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

### Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_INVALID_CHANNEL	The channel number is invalid.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.

◆ **RM\_BLE\_ABS\_Close()**

```
fsp_err_t RM_BLE_ABS_Close ( ble_abs_ctrl_t *const p_ctrl)
```

Close the BLE channel. Implements `ble_abs_api_t::close`.

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

**Return values**

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

**Return values**

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

◆ **RM\_BLE\_ABS\_Reset()**

```
fsp_err_t RM_BLE_ABS_Reset ( ble_abs_ctrl_t *const p_ctrl, ble_event_cb_t init_callback )
```

This function is not implemented. To perform this function call R\_BLE\_Close followed by R\_BLE\_Open. Implements `ble_abs_api_t::reset`.

**Return values**

FSP_ERR_UNSUPPORTED	Function is not supported
---------------------	---------------------------

BLE is reset with this function. The process is carried out in the following order. R\_BLE\_Close() -> R\_BLE\_GAP\_Terminate() -> R\_BLE\_Open() -> R\_BLE\_SetEvent(). The init\_cb callback initializes the others (Host Stack, timer, etc...). Implements `ble_abs_api_t::reset`.

**Return values**

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

◆ **RM\_BLE\_ABS\_StartLegacyAdvertising()**

```
fsp_err_t RM_BLE_ABS_StartLegacyAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_legacy_advertising_parameter_t const *const p_advertising_parameter )
```

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV\_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE\_GAP\_EVENT\_SCAN\_REQ\_RECV) is not notified. Implements `ble_abs_api_t::startLegacyAdvertising`

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

**Return values**

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.

FSP\_ERR\_INVALID\_ARGUMENT

The advertising parameter is out of range.

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV\_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE\_GAP\_EVENT\_SCAN\_REQ\_RECV) is not notified. Implements [ble\\_abs\\_api\\_t::startLegacyAdvertising](#)

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

### Return values

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

### ◆ RM\_BLE\_ABS\_StartExtendedAdvertising()

```
fsp_err_t RM_BLE_ABS_StartExtendedAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_extend_advertising_parameter_t const *const p_advertising_parameter )
```

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE\_GAP\_EVENT\_SCAN\_REQ\_RECV) is not notified. Implements [ble\\_abs\\_api\\_t::startExtendedAdvertising](#)

#### Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE\_GAP\_EVENT\_SCAN\_REQ\_RECV) is not notified. Implements [ble\\_abs\\_api\\_t::startExtendedAdvertising](#)

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

### ◆ RM\_BLE\_ABS\_StartNonConnectableAdvertising()

```
fsp_err_t RM_BLE_ABS_StartNonConnectableAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_non_connectable_advertising_parameter_t const *const p_advertising_parameter )
```

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE\_GAP\_EVENT\_SCAN\_REQ\_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble\\_abs\\_api\\_t::startNonConnectableAdvertising](#).

#### Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Feature not yet supported.

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE\_GAP\_EVENT\_SCAN\_REQ\_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble\\_abs\\_api\\_t::startNonConnectableAdvertising](#).

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

### ◆ RM\_BLE\_ABS\_StartPeriodicAdvertising()

```
fsp_err_t RM_BLE_ABS_StartPeriodicAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_periodic_advertising_parameter_t const *const p_advertising_parameter )
```

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE\_GAP\_EVENT\_SCAN\_REQ\_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble\\_abs\\_api\\_t::startPeriodicAdvertising](#)

#### Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE\_GAP\_EVENT\_SCAN\_REQ\_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble\\_abs\\_api\\_t::startPeriodicAdvertising](#)

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

### ◆ RM\_BLE\_ABS\_StartScanning()

```
fsp_err_t RM_BLE_ABS_StartScanning ( ble_abs_ctrl_t *const p_ctrl, ble_abs_scan_parameter_t
const *const p_scan_parameter )
```

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE\_GAP\_EVENT\_SCAN\_TO event. If fast\_period is 0, only slow scan is carried out. If scan\_period is 0, slow scan continues. Implements [ble\\_abs\\_api\\_t::startScanning](#).

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

#### Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Function is not supported

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE\_GAP\_EVENT\_SCAN\_TO event. If fast\_period is 0, only slow scan is carried out. If scan\_period is 0, slow scan continues. Implements [ble\\_abs\\_api\\_t::startScanning](#).

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The scan parameter is out of range.
FSP_ERR_IN_USE	This API is called in scanning.
FSP_ERR_BLE_ABS_NOT_FOUND	Usable timer slot not found.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

### ◆ RM\_BLE\_ABS\_CreateConnection()

```
fsp_err_t RM_BLE_ABS_CreateConnection ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_connection_parameter_t const *const p_connection_parameter )
```

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE\_GAP\_EVENT\_CREATE\_CONN\_COMP event is notified. When a link has been established, BLE\_GAP\_EVENT\_CONN\_IND event is notified. Implements [ble\\_abs\\_api\\_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

#### Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE\_GAP\_EVENT\_CREATE\_CONN\_COMP event is notified. When a link has been established, BLE\_GAP\_EVENT\_CONN\_IND event is notified. Implements [ble\\_abs\\_api\\_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_IN_USE	This API is called while creating a link by

	previous API call.
FSP_ERR_BLE_ABS_NOT_FOUND	Couldn't find a valid timer.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

### ◆ RM\_BLE\_ABS\_SetLocalPrivacy()

```
fsp_err_t RM_BLE_ABS_SetLocalPrivacy ( ble_abs_ctrl_t *const p_ctrl, uint8_t const *const p_lc_irk,
uint8_t privacy_mode )
```

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE\_GAP\_ADDR\_RPA\_ID\_PUBLIC is specified as own device address in the advertising/scan/create connection API. Implements [ble\\_abs\\_api\\_t::setLocalPrivacy](#)

#### Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The privacy_mode parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE\_GAP\_ADDR\_RPA\_ID\_PUBLIC is specified as own device address in the advertising/scan/create connection API. Implements [ble\\_abs\\_api\\_t::setLocalPrivacy](#)

Example:

```
/* Set local privacy. */
err = RM_BLE_ABS_SetLocalPrivacy(&g_ble_abs0_ctrl, p_local_irk, privacy_mode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The privacy_mode parameter is out of range.

### ◆ RM\_BLE\_ABS\_StartAuthentication()

```
fsp_err_t RM_BLE_ABS_StartAuthentication ( ble_abs_ctrl_t *const p_ctrl, uint16_t
connection_handle )
```

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by `RM_BLE_ABS_Open()` or `R_BLE_GAP_SetPairingParams()`. If the pairing parameters are configure by `RM_BLE_ABS_Open()`,

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements `ble_abs_api_t::startAuthentication`.

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

#### Return values

FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_UNSUPPORTED	Function is not supported

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by `RM_BLE_ABS_Open()` or `R_BLE_GAP_SetPairingParams()`. If the pairing parameters are configure by `RM_BLE_ABS_Open()`,

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements `ble_abs_api_t::startAuthentication`.

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The connection handle parameter is out of range.

### ◆ RM\_BLE\_ABS\_DeleteBondInformation()

```
fsp_err_t RM_BLE_ABS_DeleteBondInformation ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_bond_information_parameter_t const *const p_bond_information_parameter )
```

Delete bonding information from BLE stack and storage. Implements [ble\\_abs\\_api\\_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

#### Return values

FSP_SUCCESS	Operation was successful
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

Delete bonding information from BLE stack and storage. Implements [ble\\_abs\\_api\\_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

### ◆ RM\_BLE\_ABS\_ImportKeyInformation()

```
fsp_err_t RM_BLE_ABS_ImportKeyInformation ( ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *
p_local_identity_address, uint8_t * p_local_irk, uint8_t * p_local_csrk )
```

Import key information to BLE stack and storage. Implements `ble_abs_api_t::importKeyInformation`.

Example:

```
/* Import local key information. */
err = RM_BLE_ABS_ImportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_HW_CONDITION	Failure to access internal storage.
FSP_ERR_UNSUPPORTED	Not supported in this configuration.

### ◆ RM\_BLE\_ABS\_ExportKeyInformation()

```
fsp_err_t RM_BLE_ABS_ExportKeyInformation ( ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *
p_local_identity_address, uint8_t * p_local_irk, uint8_t * p_local_csrk )
```

Export key information to BLE stack and storage. Implements `ble_abs_api_t::exportKeyInformation`.

Example:

```
/* Export local key information. */
err = RM_BLE_ABS_ExportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_BUFFER_EMPTY	Dynamic memory allocation failed.
FSP_ERR_OUT_OF_MEMORY	Failure to access internal storage.
FSP_ERR_NOT_INITIALIZED	Not initialized internal storage.
FSP_ERR_UNSUPPORTED	Not supported in this configuration.

#### 4.2.11.8 BLE Driver (r\_ble\_balance)

Modules » [Networking](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

## Overview

The bluetooth low energy library of balance configuration (r\_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

### Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.

- Add an event in the BLE protocol stack internal queue.
- **GAP**
  - Initialization of the Host stack.
  - Start/Stop Advertising.
  - Start/Stop Scan.
  - Connect/Disconnect a link.
  - Initiate/Respond a pairing request.
- **GATT Common**
  - Get MTU size.
- **GATT Server**
  - Initialization of GATT Server.
  - Notification/Indication.
- **GATT Client**
  - Discovery services, characteristics.
  - Read/Write characteristic.
- **Vendor Specific**
  - DTM.
  - Set/Get transmit power.
  - Set/Get BD\_ADDR.

## Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	Supported	<b>Supported</b>	Supported
GAP API	Supported	<b>*1 Limited</b>	*1 *2 Limited
GATT Common API	Supported	<b>Supported</b>	Supported
GATT Client API	Supported	<b>Supported</b>	Supported
GATT Client API	Supported	<b>Supported</b>	Supported
L2CAP API	Supported	<b>Not Supported</b>	Not supported
Vendor Specific API	Supported	<b>Supported</b>	Supported

### Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.

## Target Devices

The Renesas Bluetooth Low Energy Library supports the following devices.

- RA4W1

# Configuration

## Clock Configuration

### Note

*System clock (ICLK): 8 MHz or more*

*Peripheral module clock A (PCLKA): 8MHz or more*

*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*

*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

## Pin Configuration

This module does not use I/O pins.

## Usage Notes

Figure shows the software structure of the BLE FSP module.

Figure 210: BLE software structure

The BLE FSP module consists of the BLE library.

The BLE Application uses the BLE functions via the [R\\_BLE API](#) provided by the BLE Library.

The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

## Limitations

Developers should be aware of the following limitations when using the ble:

- This configuration not supports LE Advertising Extensions functionality APIs. If those functionality needs your system, select [BLE Driver \(r\\_ble\\_extended\)](#) configuration.
- This configuration dose not supports L2CAP functionality APIs. If those functionality needs your system, select [BLE Driver \(r\\_ble\\_extended\)](#) configuration.

### 4.2.11.9 BLE Driver (r\_ble\_compact)

[Modules](#) » [Networking](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

## Overview

The bluetooth low energy library of compact configuration (r\_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

## Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.
  - Add an event in the BLE protocol stack internal queue.
- [GAP](#)
  - Initialization of the Host stack.
  - Start/Stop Advertising.
  - Initiate/Respond a pairing request.
- [GATT Common](#)
  - Get MTU size.
- [GATT Server](#)
  - Initialization of GATT Server.
  - Notification/Indication.
- [GATT Client](#)
  - Discovery services, characteristics.
  - Read/Write characteristic.
- [Vendor Specific](#)
  - DTM.
  - Set/Get transmit power.
  - Set/Get BD\_ADDR.

## Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	Supported	Supported	<b>Supported</b>
<a href="#">GATT Common API</a>	Supported	*1 Limited	<b>*1 *2 Limited</b>
<a href="#">GATT Common API</a>	Supported	Supported	<b>Supported</b>
<a href="#">GATT Server API</a>	Supported	Supported	<b>Supported</b>
<a href="#">GATT Client API</a>	Supported	Supported	<b>Supported</b>
<a href="#">L2CAP API</a>	Supported	Not supported	<b>Not supported</b>
<a href="#">Vendor Specific API</a>	Supported	Supported	<b>Supported</b>

*Note*

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.

**Target Devices**

The Renesas Bluetooth Low Energy Library supports the following devices.

- RA4W1

## Configuration

**Clock Configuration***Note*

*System clock (ICLK): 8 MHz or more*

*Peripheral module clock A (PCLKA): 8MHz or more*

*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*

*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

**Pin Configuration**

This module does not use I/O pins.

## Usage Notes

Figure shows the software structure of the BLE FSP module.

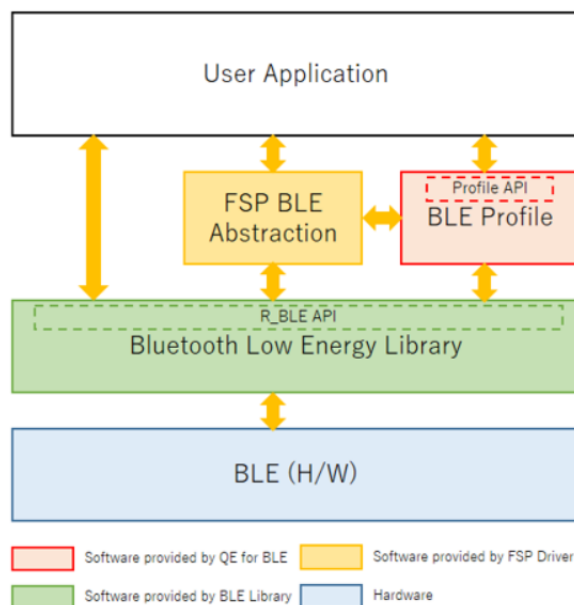

Figure 211: BLE software structure

The BLE FSP module consists of the BLE library.

The BLE Application uses the BLE functions via the [R\\_BLE API](#) provided by the BLE Library. The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

## Limitations

Developers should be aware of the following limitations when using the ble:

- This configuration does not support LE Advertising Extensions functionality APIs. If those functionality needs your system, select [BLE Driver \(r\\_ble\\_extended\)](#) configuration.
- This configuration does not support Central and Observer functionality APIs. If those functionality needs your system, select [BLE Driver \(r\\_ble\\_extended\)](#) or [BLE Driver \(r\\_ble\\_balance\)](#) configuration.
- This configuration does not support L2CAP functionality APIs. If those functionality needs your system, select [BLE Driver \(r\\_ble\\_extended\)](#) configuration.

### 4.2.11.10 BLE Driver (r\_ble\_extended)

[Modules](#) » [Networking](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

## Overview

The bluetooth low energy library of extended configuration (r\_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

## Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.
  - Add an event in the BLE protocol stack internal queue.
- [GAP](#)
  - Initialization of the Host stack.
  - Start/Stop Advertising (Support LE Advertising Extensions).
  - Start/Stop Scan.
  - Connect/Disconnect a link.
  - Initiate/Respond a pairing request.
- [GATT Common](#)
  - Get MTU size.
- [GATT Server](#)
  - Initialization of GATT Server.
  - Notification/Indication.
- [GATT Client](#)
  - Discovery services, characteristics.
  - Read/Write characteristic.
- [L2CAP](#)

- Credit-based flow control transaction.
- **Vendor Specific**
  - DTM.
  - Set/Get transmit power.
  - Set/Get BD\_ADDR.

## Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	<b>Supported</b>	Supported	Supported
GAP API	<b>Supported</b>	*1 Limited	*1 *2 Limited
GATT Common API	<b>Supported</b>	Supported	Supported
GATT Server API	<b>Supported</b>	Supported	Supported
GATT Client API	<b>Supported</b>	Supported	Supported
L2CAP API	<b>Supported</b>	Not supported	Not supported
Vendor Specific API	<b>Supported</b>	Supported	Supported

### Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.

## Target Devices

The Renesas Bluetooth Low Energy Library supports the following devices.

- RA4W1

# Configuration

## Clock Configuration

### Note

*System clock (ICLK): 8 MHz or more*

*Peripheral module clock A (PCLKA): 8MHz or more*

*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*

*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

Figure shows the software structure of the BLE FSP module.

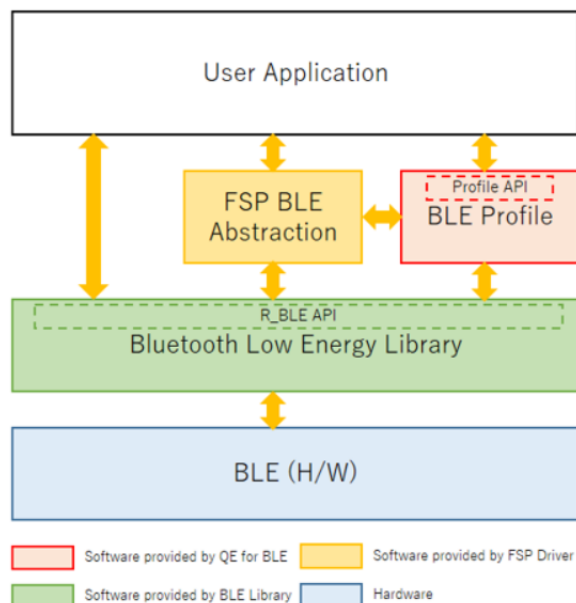

Figure 212: BLE software structure

The BLE FSP module consists of the BLE library.

The BLE Application uses the BLE functions via the [R\\_BLE API](#) provided by the BLE Library.

The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

### Limitations

Developers should be aware of the following limitations when using the ble:

#### 4.2.11.11 Bluetooth Low Energy Mesh Network Modules

## Detailed Description

# Overview

Bluetooth Mesh defines a managed-flood-based mesh network. Any device in the network can send a message at any time as long as there is a sufficient density of devices that are listening and relaying messages. See [this document](#) for information on how to create a BLE MESH application.

Figure 213: Overview Of Bluetooth Mesh

## Features

The BLE Mesh middleware has the following features:

- Supports one-to-one and one-to-many message transmission
- Supports relay messages to other nodes
- Supports secure message transmission against the following attack
  - Wiretap attack
  - Man-in-the-middle attack
  - Replay attack
  - Trash-can attack
  - Brute Force Key attack
- Supports following optional features
  - Supports Relay feature
  - Supports Proxy feature
  - Supports Friend feature
  - Supports Low Power feature

## Target Devices

The Bluetooth Low Energy Mesh Network module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_ble\_mesh

The following build time configurations are defined in fsp\_cfg/rm\_ble\_mesh\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enable</li> <li>Disable</li> </ul>	Default (BSP)	Specify whether to include code for API parameter checking. Valid settings include.

### Configurations for Networking > BLE Mesh (rm\_ble\_mesh)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh (rm\_ble\_mesh).

Configuration	Options	Default	Description
General > Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh0	Module name.
General > Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Bearer > Network Interface Number	Invalid Network Interface Number	2	Network interfaces number.
Bearer > Provisioning Interface Number	Invalid Provisioning Interface Number	2	Provisioning interfaces number.
Provisioning > Unprovisioned Device Beacon Timeout in Milliseconds	Invalid Unprovisioned Device Beacon Timeout in Milliseconds	200	Unprovisioned device beacon timeout in milliseconds.
Network > Network Cache Size	Invalid Network Cache Size	10	Network cache size.
Network > Network Sequence Number Cache Size	Invalid Network Sequence Number Cache Size	32	Network sequence number cache size.
Network > Maximum Number of Subnet	Invalid Maximum Number of Subnets	4	Maximum number of subnets
Network > Maximum Number of Device Key	Invalid Maximum Number of Device Keys	4	Maximum number of device keys.
Network > Proxy Filter List Size	Invalid Proxy Filter List Size	2	Maximum number of addresses present in each proxy filter list.
Network > Network Sequence Number	Invalid Network Sequence Number	2048	The distance between the network sequence

Block Size	Block Size		numbers, for every persistent storage write.
Network > Network Transmit Count for Network Packets	Invalid Network Transmit Count for Network Packets	1	Network transmit count for network packets.
Network > Network Interval Steps for Network Packets	Invalid Network Interval Steps for Network Packets	4	Network interval steps for network packets.
Network > Network Transmit Count for Relayed Packets	Invalid Network Transmit Count for Relayed Packets	0	Network transmit count for relayed packets.
Network > Network Interval Steps for Relayed Packets	Invalid Network Interval Steps for Relayed Packets	9	Network Interval Steps for relayed packets.
Network > Proxy ADV Network ID Timeout for Each Subnet in Milliseconds.	Invalid Proxy ADV Network ID Timeout	100	Proxy ADV network ID timeout for each subnet in milliseconds.
Network > Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds	Invalid Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds	300	ADV node identity timeout for each subnet in milliseconds.
Network > Proxy ADV Node Identity Overall Time Period in Seconds	Invalid Proxy ADV Node Identity Overall Time Period in Seconds	60	Proxy ADV node identity overall time period in seconds.
Network > Maximum Number of Queued Messages for Transmission	Invalid Maximum Number of Queued Messages for Transmission	64	Maximum number of queued messages for transmission.
Transport > Maximum Number of LPN	Invalid Maximum Number of LPNs	1	Maximum number of LPNs.
