Platform > Logging > function	Name Must Be a Valid C Symbol	NULL	

## Clock Configuration

### Note

*System clock (ICLK): 8 MHz or more*

*Peripheral module clock A (PCLKA): 8MHz or more*

*The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.*

*It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.*

## Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Mesh System Architecture

Purpose of each layer is,

#### Model layer

Model is a standardized typical functionality so that nodes perform operations in accordance with application scenario.

#### Foundation Model layer

Foundation Models are models to configure and manage operations of elements.

#### Access layer

The access layer defines how higher layer applications can use the upper transport layer.

#### Upper transport layer

The upper transport layer encrypts, decrypts, and authenticates application data and is designed to provide confidentiality of access messages.

#### Lower transport layer

The lower transport layer defines how upper transport layer messages are segmented and reassembled into multiple Lower Transport PDUs to deliver large upper transport layer messages to other nodes.

#### Network layer

The network layer defines how transport messages are addressed towards one or more elements.

#### Bearer layer

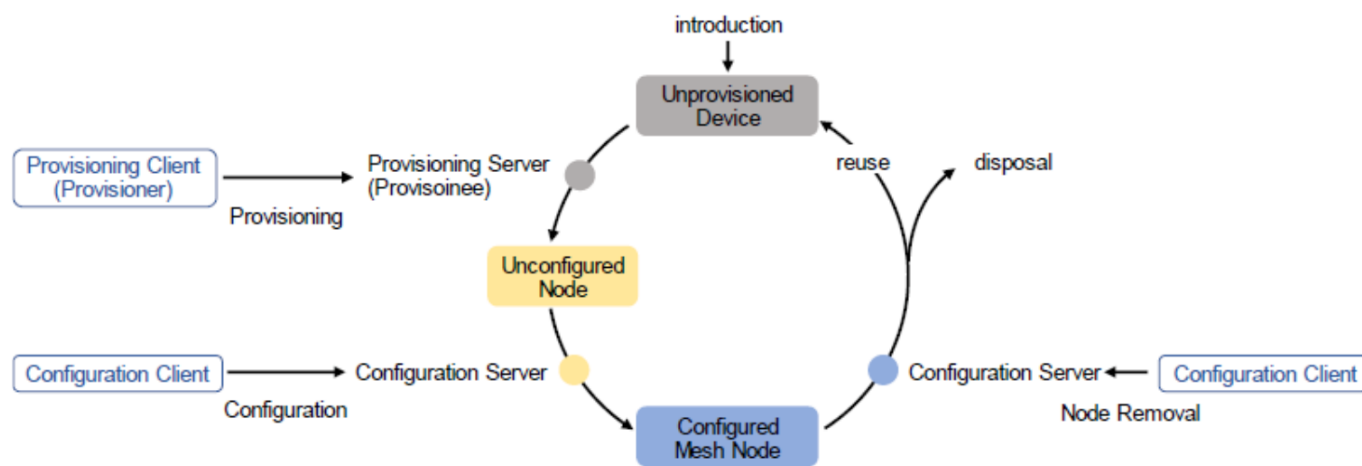

The bearer layer defines how network messages are transported between nodes.

### Device Life Cycle

The device not joined in the mesh network is an Unprovisioned Device and the device joined in the mesh network is called a Node.

- **Unprovisioned Device**  
Unprovisioned device cannot send or receive mesh messages. However, it will advertise its presence to the provisioner. By the provisioner, Unprovisioned Devices are invited to join the mesh network and become nodes(Provisioning).
- **Node**  
Nodes can send and receive mesh messages. It is managed by the configuration client through the mesh network, which configures how the nodes communicate. The configuration client can also remove a Node from the mesh network, which will return the node to an Unprovisioned Device.

To communicate with other nodes by using Models, each node needs Configuration. By Configuration process, information required for Model operation such as Application Keys, Publish Address, Subscription Address is configured. Following shows a typical lifecycle of a node.

Mesh Model communication with other nodes  
Figure 214: Device Life Cycle Image

Newly introduced device is provisioned by Provisioner and joins a network. Furthermore, this device is configured by Configuration Client and becomes to be able to communicate with other nodes with Mesh Model. Generally, Configuration Client is a smart phone or other mobile computing device. Configuration Client removes a node from a network by sending Config Node Reset message. Besides, Configuration Client updates encryption keys used in the network, and the removed node becomes unable to communicate with other nodes.

## Examples

### BLE\_MESH Basic Example

This is a basic example of minimal use of the BLE\_MESH in an application.

## Data Structures

```
struct  rm_ble_mesh_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_ble\_mesh\_instance\_ctrl\_t

```
struct rm_ble_mesh_instance_ctrl_t
```

RM\_BLE\_MESH\_BEARER private control block. DO NOT MODIFY. Initialization occurs when [RM\\_BLE\\_MESH\\_BEARER\\_Open\(\)](#) is called.

## Function Documentation

### ◆ RM\_BLE\_MESH\_Open()

```
fsp_err_t RM_BLE_MESH_Open ( rm_ble_mesh_ctrl_t *const p_ctrl, rm_ble_mesh_cfg_t const *const p_cfg )
```

Open ble mesh middleware. API to initialize Mesh Stack. This is the first API that the application should call before any other API. This function initializes all the internal stack modules and data structures.

Implements `rm_ble_mesh_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_Open(&g_ble_mesh0_ctrl, &g_ble_mesh0_cfg);
```

#### Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

### ◆ RM\_BLE\_MESH\_Close()

```
fsp_err_t RM_BLE_MESH_Close ( rm_ble_mesh_ctrl_t *const p_ctrl)
```

Close ble mesh middleware. API to turn off Bluetooth Hardware. This API should be called after `RM_BLE_MESH_Open`.

Implements `rm_ble_mesh_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_Close(&g_ble_mesh0_ctrl);
```

#### Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_StartTransitionTimer()

```
fsp_err_t RM_BLE_MESH_StartTransitionTimer ( rm_ble_mesh_ctrl_t *const p_ctrl,
rm_ble_mesh_access_state_transition_t const *const p_transition, uint16_t *const
p_transition_time_handle )
```

To start transition timer. API to start a transition timer.

Implements `rm_ble_mesh_api_t::startTransitionTimer`.

Example:

```
/* Start transition timer. */
err = RM_BLE_MESH_StartTransitionTimer(&g_ble_mesh0_ctrl, &transition,
&transition_time_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transition is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.

### ◆ RM\_BLE\_MESH\_StopTransitionTimer()

```
fsp_err_t RM_BLE_MESH_StopTransitionTimer ( rm_ble_mesh_ctrl_t *const p_ctrl, uint16_t
transition_time_handle )
```

To stop transition timer. API to stop a transition timer.

Implements `rm_ble_mesh_api_t::stopTransitionTimer`.

Example:

```
/* Stop transition timer. */
err = RM_BLE_MESH_StopTransitionTimer(&g_ble_mesh0_ctrl, transition_time_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_GetRemainingTransitionTime()

```
fsp_err_t RM_BLE_MESH_GetRemainingTransitionTime ( rm_ble_mesh_ctrl_t*const p_ctrl, uint16_t
transition_time_handle, uint8_t*const p_remaining_transition_time )
```

To get remaining Transition Time. API to get remaining Transition Time.

Implements `rm_ble_mesh_api_t::getRemainingTransitionTime`.

Example:

```
/* Get remaining transition time. */
err = RM_BLE_MESH_GetRemainingTransitionTime(&g_ble_mesh0_ctrl,
transition_time_handle, &remaining_transition_time);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remaining_transition_time is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_GetRemainingTransitionTimeWithOffset()

```
fsp_err_t RM_BLE_MESH_GetRemainingTransitionTimeWithOffset ( rm_ble_mesh_ctrl_t *const
p_ctrl, uint16_t transition_time_handle, uint32_t offset_in_ms, uint8_t *const
p_remaining_transition_time )
```

To get remaining Transition Time, with offset. API to get remaining Transition Time with offset in ms.

Implements `rm_ble_mesh_api_t::getRemainingTransitionTimeWithOffset`.

Example:

```
/* Get remaining transition time with offset. */
err = RM_BLE_MESH_GetRemainingTransitionTimeWithOffset(&g_ble_mesh0_ctrl,
                                                    transition_time_handle,
                                                    offset_in_ms,
&remaining_transition_time);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remaining_transition_time is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ConvertTransitionTimeFromMs()

```
fsp_err_t RM_BLE_MESH_ConvertTransitionTimeFromMs ( rm_ble_mesh_ctrl_t *const p_ctrl,
uint32_t transition_time_in_ms, uint8_t *const p_transition_time )
```

To convert transition time from milisecond. API to convert transition timer in milisecond to Generic Default Transition Time state format.

Implements `rm_ble_mesh_api_t::convertTransitionTimeFromMs`.

Example:

```
/* Convert transition time from milliseconds. */
err = RM_BLE_MESH_ConvertTransitionTimeFromMs(&g_ble_mesh0_ctrl,
transition_time_in_ms, &transition_time);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transition_time is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ConvertTransitionTimeToMs()

```
fsp_err_t RM_BLE_MESH_ConvertTransitionTimeToMs ( rm_ble_mesh_ctrl_t *const p_ctrl, uint8_t
transition_time, uint32_t *const p_transition_time_in_ms )
```

To convert transition time to milisecond. API to convert Generic Default Transition Time state format to required transition time value in milliseconds.

Implements `rm_ble_mesh_api_t::convertTransitionTimeToMs`.

Example:

```
/* Convert transition time to milliseconds. */
err = RM_BLE_MESH_ConvertTransitionTimeToMs(&g_ble_mesh0_ctrl, transition_time,
&transition_time_in_ms);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transition_time_in_ms is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Bearer module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_ble\_mesh\_bearer

The following build time configurations are defined in fsp\_cfg/rm\_ble\_mesh\_bearer\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Bearer (rm\_ble\_mesh\_bearer)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Bearer (rm\_ble\_mesh\_bearer).

Configuration	Options	Default	Description
General > Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_bearer 0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.

## Data Structures

```
struct rm_ble_mesh_bearer_instance_ctrl_t
```

## Data Structure Documentation

◆ **rm\_ble\_mesh\_bearer\_instance\_ctrl\_t**

```
struct rm_ble_mesh_bearer_instance_ctrl_t
```

RM\_BLE\_MESH\_BEARER private control block. DO NOT MODIFY. Initialization occurs when [RM\\_BLE\\_MESH\\_BEARER\\_Open\(\)](#) is called.

**Function Documentation**◆ **RM\_BLE\_MESH\_BEARER\_Open()**

```
fsp_err_t RM_BLE_MESH_BEARER_Open ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_cfg_t const *const p_cfg )
```

Open bearer middleware.

Implements [rm\\_ble\\_mesh\\_bearer\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_MESH_BEARER_Open(&g_ble_mesh_bearer0_ctrl, &g_ble_mesh_bearer0_cfg);
```

**Return values**

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.

◆ **RM\_BLE\_MESH\_BEARER\_Close()**

```
fsp_err_t RM_BLE_MESH_BEARER_Close ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl)
```

Close bearer middleware. Implements [rm\\_ble\\_mesh\\_bearer\\_api\\_t::close](#).

Example:

```
/* Open the module. */
err = RM_BLE_MESH_BEARER_Close(&g_ble_mesh_bearer0_ctrl);
```

**Return values**

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_BEARER\_RegisterInterface()

```
fsp_err_t RM_BLE_MESH_BEARER_RegisterInterface ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_ntf_callback_result_t(*) (
rm_ble_mesh_bearer_ntf_callback_args_t *p_args) p_callback )
```

Register interface with Bearer Layer. This routine registers interface with the Bearer Layer. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::registerInterface`.

Example:

```
/* Register Bearer interface. */
err = RM_BLE_MESH_BEARER_RegisterInterface(&g_ble_mesh_bearer0_ctrl, brr_type,
rm_ble_mesh_bearer_ntf_callback);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_BEARER\_RegisterBeaconHandler()

```
fsp_err_t RM_BLE_MESH_BEARER_RegisterBeaconHandler ( rm_ble_mesh_bearer_ctrl_t *const
p_ctrl, rm_ble_mesh_bearer_beacon_type_t bcon_type,
void(*) (rm_ble_mesh_bearer_beacon_callback_args_t *p_args) p_handler )
```

Register beacon interface with Bearer Layer. This routine registers interface with the Bearer Layer to process Beacons. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::registerBeaconHandler`.

Example:

```
/* Register beacon handler. */
err = RM_BLE_MESH_BEARER_RegisterBeaconHandler(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON,
rm_ble_mesh_bearer_beacon_callback
);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_BEARER\_AddBearer()

```
fsp_err_t RM_BLE_MESH_BEARER_AddBearer ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_info_t const *const p_brr_info,
rm_ble_mesh_bearer_handle_t *const p_brr_handle )
```

Add a bearer to Bearer Layer. This routine adds a bearer that is setup by the application for use by the Mesh Stack. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::addBearer`.

Example:

```
/* Add Bearer. */
err = RM_BLE_MESH_BEARER_AddBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_info, &brr_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter <code>p_brr_info</code> and <code>p_brr_handle</code> are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_BEARER\_RemoveBearer()

```
fsp_err_t RM_BLE_MESH_BEARER_RemoveBearer ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_handle_t const *const p_brr_handle )
```

Remove a bearer from Bearer Layer. This routine removes a bearer from the Mesh Stack. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::removeBearer`.

Example:

```
/* Remove Bearer. */
err = RM_BLE_MESH_BEARER_RemoveBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter <code>p_brr_handle</code> is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_BEARER\_ObserveBeacon()

```
fsp_err_t RM_BLE_MESH_BEARER_ObserveBeacon ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
uint8_t bcon_type, uint8_t enable )
```

Observe on/off for the beacon type. This routine sends enables/disables the observation procedure for the given beacon type.

Implements `rm_ble_mesh_bearer_api_t::observeBeacon`.

Example:

```
/* Observe beacon. */
err = RM_BLE_MESH_BEARER_ObserveBeacon(&g_ble_mesh_bearer0_ctrl, bcon_type,
enable);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_BEARER\_BcastUnprovisionedBeacon()

```
fsp_err_t RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon ( rm_ble_mesh_bearer_ctrl_t *const
p_ctrl, uint8_t type, uint8_t const *const p_dev_uuid, uint16_t oob_info, rm_ble_mesh_buffer_t
const *const p_uri )
```

API to send unprovisioned device beacon. This routine sends Unprovisioned Device Beacon.

Implements `rm_ble_mesh_bearer_api_t::bcastUnprovisionedBeacon`.

Example:

```
/* Broadcast unprovisioned beacon. */
err = RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon(&g_ble_mesh_bearer0_ctrl, type,
&dev_uuid, oob_info, &uri);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_uuid and p_uri are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_BEARER\_BroadcastBeacon()

```
fsp_err_t RM_BLE_MESH_BEARER_BroadcastBeacon ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
uint8_t type, uint8_t const *const p_packet, uint16_t length )
```

API to broadcast a beacon. This routine sends the beacon of given type on Adv and GATT bearers.

Implements `rm_ble_mesh_bearer_api_t::broadcastBeacon`.

Example:

```
/* Broadcast beacon. */
err = RM_BLE_MESH_BEARER_BroadcastBeacon(&g_ble_mesh_bearer0_ctrl, type, &packet,
length);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_packet is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_BEARER\_StartProxyAdv()

```
fsp_err_t RM_BLE_MESH_BEARER_StartProxyAdv ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl, uint8_t type, uint8_t const *const p_data, uint16_t datalen )
```

API to send proxy device ADV. This routine sends Proxy Device ADV.

Implements `rm_ble_mesh_bearer_api_t::startProxyAdv`.

Example:

```
/* Start proxy advertising. */
err = RM_BLE_MESH_BEARER_StartProxyAdv(&g_ble_mesh_bearer0_ctrl, type, &data,
length);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_BEARER\_SendPdu()

```
fsp_err_t RM_BLE_MESH_BEARER_SendPdu ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_handle_t const *const p_brr_handle, rm_ble_mesh_bearer_type_t brr_type,
rm_ble_mesh_buffer_t const *const p_buffer )
```

Send a bearer PDU. This routine sends a PDU from the Mesh stack to over the bearer indicated by the bearer handle.

Implements `rm_ble_mesh_bearer_api_t::sendPdu`.

Example:

```
/* Send common Bearer PDUs. */
err = RM_BLE_MESH_BEARER_SendPdu(&g_ble_mesh_bearer0_ctrl, &brr_handle,
RM_BLE_MESH_BEARER_TYPE_BCON, &buffer);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_brr_handle and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_BEARER\_GetPacketRssi()

```
fsp_err_t RM_BLE_MESH_BEARER_GetPacketRssi ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl, uint8_t * p_rssi_value )
```

Get the RSSI of current received packet being processed. This routine returns the RSSI value of the received packet in its context when called from the Mesh stack.

Implements `rm_ble_mesh_bearer_api_t::getPacketRssi`.

Example:

```
/* Get the RSSI of current received packet being processed. */
err = RM_BLE_MESH_BEARER_GetPacketRssi(&g_ble_mesh_bearer0_ctrl, &rssi_value);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_rssi_value is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_BEARER\_Sleep()

```
fsp_err_t RM_BLE_MESH_BEARER_Sleep ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl)
```

Put the bearer to sleep. This routine requests the underlying bearer interface to sleep. Default bearer interface is that of advertising bearer.

Implements `rm_ble_mesh_bearer_api_t::sleep`.

Example:

```
/* Put the bearer to sleep. */
err = RM_BLE_MESH_BEARER_Sleep(&g_ble_mesh_bearer0_ctrl);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_BEARER\_Wakeup()

```
fsp_err_t RM_BLE_MESH_BEARER_Wakeup ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl, uint8_t mode )
```

Wakeup the bearer. This routine requests the underlying bearer interface to wakeup. Default bearer interface is that of advertising bearer.

Implements `rm_ble_mesh_bearer_api_t::wakeup`.

Example:

```
/* Wakeup the bearer. */
err = RM_BLE_MESH_BEARER_Wakeup(&g_ble_mesh_bearer0_ctrl, mode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

## Bluetooth Low Energy Mesh Network Provision (rm\_ble\_mesh\_provision)

fsp_err_t	RM_BLE_MESH_PROVISION_SetOobPublicKey (rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t const *const p_key, uint8_t size)
fsp_err_t	RM_BLE_MESH_PROVISION_SetOobAuthInfo (rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t const *const p_auth_info, uint8_t size)

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Provision module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_ble\_mesh\_provision

The following build time configurations are defined in fsp\_cfg/rm\_ble\_mesh\_provision\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Provision (rm\_ble\_mesh\_provision)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Provision (rm\_ble\_mesh\_provision).

Configuration	Options	Default	Description
General > Name	Name Must Be a Valid	g_rm_ble_mesh_provisi	Module name.

	C Symbol	on0	
Provision Capabilities > Number of Elements	Invalid Number of Elements	0	Provision capabilities number of elements.
Provision Capabilities > Supported Algorithms	Invalid Supported Algorithms	0	Provision capabilities supported algorithms.
Provision Capabilities > Public Key Type	Invalid Public Key Type	0	Provision capabilities public key type.
Provision Capabilities > Static OOB Type	Invalid Static OOB Type	0	Provision capabilities static OOB type.
Provision Capabilities > Output OOB Action	Invalid Output OOB Action	0	Provision capabilities output OOB action.
Provision Capabilities > Output OOB Size	Invalid Output OOB Size	0	Provision capabilities output OOB size.
Provision Capabilities > Input OOB Action	Invalid Input OOB Action	0	Provision capabilities input OOB action.
Provision Capabilities > Input OOB Size	Invalid Input OOB Size	0	Provision capabilities input OOB size.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Provision Callback	Name Must Be a Valid C Symbol.	NULL	Provision callback function name.

## Data Structures

```
struct rm_ble_mesh_provision_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_ble\_mesh\_provision\_instance\_ctrl\_t

```
struct rm_ble_mesh_provision_instance_ctrl_t
```

RM\_BLE\_MESH\_PROVISION private control block. DO NOT MODIFY. Initialization occurs when [RM\\_BLE\\_MESH\\_PROVISION\\_Open\(\)](#) is called.

## Function Documentation

### ◆ RM\_BLE\_MESH\_PROVISION\_Open()

```
fsp_err_t RM_BLE_MESH_PROVISION_Open ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_cfg_t const *const p_cfg )
```

Open access middleware. This function registers the provisioning capabilities of the application along with the application callback to notify events during the provisioning procedure.

Implements `rm_ble_mesh_provision_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_PROVISION_Open(&g_ble_mesh_provision0_ctrl,
&g_ble_mesh_provision0_cfg);
```

#### Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_PROVISION\_Close()

```
fsp_err_t RM_BLE_MESH_PROVISION_Close ( rm_ble_mesh_provision_ctrl_t *const p_ctrl)
```

Close access middleware. Implements `rm_ble_mesh_provision_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_PROVISION_Close(&g_ble_mesh_provision0_ctrl);
```

#### Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_PROVISION\_Setup()

```
fsp_err_t RM_BLE_MESH_PROVISION_Setup ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_role_t role, rm_ble_mesh_provision_device_info_t info, uint16_t timeout )
```

Setup the device for provisioning. This function configures the device to get in a provisionable state by specifying the role, bearer and creating a context.

Implements `rm_ble_mesh_provision_api_t::setup`.

Example:

```
/* Setup the device for provisioning. */
err = RM_BLE_MESH_PROVISION_Setup(&g_ble_mesh_provision0_ctrl, role, info,
timeout);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter info->p_device is NULL.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_PROVISION\_Bind()

```
fsp_err_t RM_BLE_MESH_PROVISION_Bind ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_device_info_t info, uint8_t attention, rm_ble_mesh_provision_handle_t
*const p_handle )
```

Bind to the peer device for provisioning. This function establishes a provisioning link with the peer device and exchanges the capabilities for provisioning.

Implements `rm_ble_mesh_provision_api_t::bind`.

Example:

```
/* Bind to the peer device for provisioning. */
err = RM_BLE_MESH_PROVISION_Bind(&g_ble_mesh_provision0_ctrl, info, attention,
&provision_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ **RM\_BLE\_MESH\_PROVISION\_SendPdu()**

```
fsp_err_t RM_BLE_MESH_PROVISION_SendPdu ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_handle_t const *const p_handle, rm_ble_mesh_provision_pdu_type_t type,
rm_ble_mesh_buffer_t pdu_data )
```

Send provisioning PDUs to the peer. This function is used by the provisioning application to send the provisioning PDUs to the peer device during the procedure.

Implements `rm_ble_mesh_provision_api_t::sendPdu`.

Example:

```
/* Send provisioning PDUs to the peer. */
err = RM_BLE_MESH_PROVISION_SendPdu(&g_ble_mesh_provision0_ctrl,
&provision_handle, type, pdu_data);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_UNSUPPORTED	The pdu type is not supported.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_PROVISION\_SetAuthVal()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetAuthVal ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_handle_t const *const p_handle, rm_ble_mesh_buffer_t auth_value )
```

Set the display authval. This function shall be used by the provisioning application to set the authval being displayed to the user on receiving `RM_BLE_MESH_PROVISION_EVENT_TYPE_OOB_DISPLAY` event with the respective OOB Action and Size.

Implements `rm_ble_mesh_provision_api_t::setAuthVal`.

Example:

```
rm_ble_mesh_buffer_t auth_value = {.payload = NULL, .length = 0};
/* Set the display authval. */
err = RM_BLE_MESH_PROVISION_SetAuthVal(&g_ble_mesh_provision0_ctrl,
&provision_handle, auth_value);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_PROVISION\_Abort()

```
fsp_err_t RM_BLE_MESH_PROVISION_Abort ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_handle_t const *const p_handle,
rm_ble_mesh_provision_link_close_reason_t reason )
```

Abort the provisioning procedure. This API can be used by the application to abort the ongoing provisioning procedure. This routine closes the provisioning link with the reason as specified.

Implements `rm_ble_mesh_provision_api_t::abort`.

Example:

```
/* Abort the provisioning procedure. */
err = RM_BLE_MESH_PROVISION_Abort(&g_ble_mesh_provision0_ctrl, &provision_handle,
reason);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_PROVISION\_GetLocalPublicKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_GetLocalPublicKey ( rm_ble_mesh_provision_ctrl_t *const
p_ctrl, uint8_t *const p_public_key )
```

Utility API to get current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements `rm_ble_mesh_provision_api_t::getLocalPublicKey`.

Example:

```
/* Get current ECDH Public Key to be used for Provisioning. */
err = RM_BLE_MESH_PROVISION_GetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_PROVISION\_SetLocalPublicKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetLocalPublicKey ( rm_ble_mesh_provision_ctrl_t *const
p_ctrl, uint8_t const *const p_public_key )
```

Utility API to set current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements `rm_ble_mesh_provision_api_t::setLocalPublicKey`.

Example:

```
/* Set current ECDH Public Key to be used for Provisioning. */
err = RM_BLE_MESH_PROVISION_SetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_PROVISION\_GenerateRandomizedNumber()

```
fsp_err_t RM_BLE_MESH_PROVISION_GenerateRandomizedNumber ( rm_ble_mesh_provision_ctrl_t
*const p_ctrl, uint8_t *const p_key )
```

Utility API to generate 128bits (16 bytes) randomized number to be used for provisioning. The randomized number can be used for UUID, Net Key and Application Key.

Implements `rm_ble_mesh_provision_api_t::generateRandomizedNumber`.

Example:

```
/* Generate 128bits (16 bytes) randomized number. */
err = RM_BLE_MESH_PROVISION_GenerateRandomizedNumber(&g_ble_mesh_provision0_ctrl,
p_net_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_PROVISION\_SetOobPublicKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetOobPublicKey ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
uint8_t const *const p_key, uint8_t size )
```

Utility API to set device out of band public key for provisioning.

Implements `rm_ble_mesh_provision_api_t::setOobPublicKey`.

Example:

```
/* Set device out of band public key. */
err = RM_BLE_MESH_PROVISION_SetOobPublicKey(&g_ble_mesh_provision0_ctrl,
p_public_key, size);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key is NULL.
FSP_ERR_INVALID_ARGUMENT	The parameter size is more than 64.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_PROVISION\_SetOobAuthInfo()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetOobAuthInfo ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
uint8_t const *const p_auth_info, uint8_t size )
```

Utility API to set device out of band authentication information for provisioning.

Implements `rm_ble_mesh_provision_api_t::setOobAuthInfo`.

Example:

```
/* Set device out of band authentication information. */
err = RM_BLE_MESH_PROVISION_SetOobAuthInfo(&g_ble_mesh_provision0_ctrl,
p_auth_info, size);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_auth_info is NULL.
FSP_ERR_INVALID_ARGUMENT	The parameter size is more than 16.
FSP_ERR_NOT_OPEN	Module is not open.

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Network module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_ble\_mesh\_network

The following build time configurations are defined in fsp\_cfg/rm\_ble\_mesh\_network\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Network (rm\_ble\_mesh\_network)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network (rm\_ble\_mesh\_network).

Configuration	Options	Default	Description
General > Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_network0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Ignore Netcache Wrapping	<ul style="list-style-type: none"> <li>Processed</li> <li>Dropped</li> </ul>	Dropped	Ignore netcache wrapping.
RX Callback Event Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Whether to enable the RX callback event or not.
TX Callback Event Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Whether to enable the TX callback event or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

### Data Structures

```
struct rm_ble_mesh_network_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_ble\_mesh\_network\_instance\_ctrl\_t

```
struct rm_ble_mesh_network_instance_ctrl_t
```

RM\_BLE\_MESH\_NETWORK private control block. DO NOT MODIFY. Initialization occurs when RM\_BLE\_MESH\_NETWORK\_Open() is called.

### Function Documentation

### ◆ RM\_BLE\_MESH\_NETWORK\_Open()

```
fsp_err_t RM_BLE_MESH_NETWORK_Open ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_cfg_t const *const p_cfg )
```

Register Interface with Network Layer. This routine registers interface with the Network Layer. Network Layer supports only one upper layer, hence this routine shall be called once.

Implements `rm_ble_mesh_network_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_NETWORK_Open(&g_ble_mesh_network0_ctrl,
&g_ble_mesh_network0_cfg);
```

#### Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_ALREADY_OPEN	Module is already open.

### ◆ RM\_BLE\_MESH\_NETWORK\_Close()

```
fsp_err_t RM_BLE_MESH_NETWORK_Close ( rm_ble_mesh_network_ctrl_t *const p_ctrl)
```

Unregister Interface with Network Layer. Implements `rm_ble_mesh_network_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_NETWORK_Close(&g_ble_mesh_network0_ctrl);
```

#### Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_NETWORK\_BroadcastSecureBeacon()

```
fsp_err_t RM_BLE_MESH_NETWORK_BroadcastSecureBeacon ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle )
```

API to send Secure Network Beacon. This routine sends Secure Network Beacon for the given subnet handle.

Implements `rm_ble_mesh_network_api_t::broadcastSecureBeacon`.

Example:

```
/* Send secure network beacon. */
err = RM_BLE_MESH_NETWORK_BroadcastSecureBeacon(&g_ble_mesh_network0_ctrl,
subnet_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_NETWORK\_SendPduOnInterface()

```
fsp_err_t RM_BLE_MESH_NETWORK_SendPduOnInterface ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_route_info_t const *const p_route_info,
rm_ble_mesh_network_header_t const *const p_header, rm_ble_mesh_buffer_t const *const
p_buffer )
```

Extension API to send Network PDUs on selected network interfaces. This routine sends NETWORK PDUs on all or selected Network Interfaces.

Implements `rm_ble_mesh_network_api_t::sendPduOnInterface`.

Example:

```
/* Send network PDUs on selected network interfaces. */
err = RM_BLE_MESH_NETWORK_SendPduOnInterface(&g_ble_mesh_network0_ctrl,
&route_info, &header, &buffer);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info, p_header and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_NETWORK\_GetAddressType()

```
fsp_err_t RM_BLE_MESH_NETWORK_GetAddressType ( rm_ble_mesh_network_ctrl_t *const p_ctrl,  
rm_ble_mesh_network_address_t addr, rm_ble_mesh_network_address_type_t *const p_type )
```

To get address type. This routine is to get address type for a given address.

Implements `rm_ble_mesh_network_api_t::getAddressType`.

Example:

```
/* Get address type. */  
err = RM_BLE_MESH_NETWORK_GetAddressType(&g_ble_mesh_network0_ctrl, addr, &type);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_type is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_NETWORK\_FetchProxyState()

```
fsp_err_t RM_BLE_MESH_NETWORK_FetchProxyState ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_gatt_proxy_state_t *const p_proxy_state )
```

Check if the proxy module is ready to handle proxy messages/events. This routine returns the current state of the Proxy. The valid states of proxy are:

1. RM\_BLE\_MESH\_NETWORK\_GATT\_PROXY\_STATE\_NULL - If no callback registered by Upper Layers
2. RM\_BLE\_MESH\_NETWORK\_GATT\_PROXY\_STATE\_READY - If callback registered and Proxy not connected
3. RM\_BLE\_MESH\_NETWORK\_GATT\_PROXY\_STATE\_CONNECTED - if callback registered and Proxy connected

Implements `rm_ble_mesh_network_api_t::fetchProxyState`.

Example:

```
/* Check if the proxy module is ready to handle proxy messages/events. */
err = RM_BLE_MESH_NETWORK_FetchProxyState(&g_ble_mesh_network0_ctrl,
&proxy_state);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_proxy_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_NETWORK\_SetProxyFilter()

```
fsp_err_t RM_BLE_MESH_NETWORK_SetProxyFilter ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_route_info_t const *const p_route_info, rm_ble_mesh_proxy_filter_type_t
type )
```

Set proxy server's filter type. This function is used by the Proxy Client to set the filter type on the Proxy Server.

Implements `rm_ble_mesh_network_api_t::setProxyFilter`.

Example:

```
/* Set proxy server's filter type. */
err = RM_BLE_MESH_NETWORK_SetProxyFilter(&g_ble_mesh_network0_ctrl, &route_info,
filter_type);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_NETWORK\_ConfigProxyFilter()

```
fsp_err_t RM_BLE_MESH_NETWORK_ConfigProxyFilter ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_route_info_t const *const p_route_info,
rm_ble_mesh_proxy_config_opcode_t opcode, rm_ble_mesh_network_proxy_address_list_t *const
p_addr_list )
```

Add or Delete/Remove addresses to/from proxy filter list. This function is used by the Proxy Client to add/delete Addresses to/from the Proxy Server's filter List.

Implements `rm_ble_mesh_network_api_t::configProxyFilter`.

Example:

```
/* Add or delete/remove addresses to/from proxy filter list. */
err = RM_BLE_MESH_NETWORK_ConfigProxyFilter(&g_ble_mesh_network0_ctrl,
&route_info, opcode, &addr_list);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info and p_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_NETWORK\_StartProxyServerAdv()

```
fsp_err_t RM_BLE_MESH_NETWORK_StartProxyServerAdv ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle,
rm_ble_mesh_network_gatt_proxy_adv_mode_t proxy_adv_mode )
```

Start connectable advertisements for a proxy server. This function is used by the Proxy Server to start Connectable Undirected Advertisements.

Implements `rm_ble_mesh_network_api_t::startProxyServerAdv`.

Example:

```
/* Start connectable advertisements for a proxy server. */
err = RM_BLE_MESH_NETWORK_StartProxyServerAdv(&g_ble_mesh_network0_ctrl,
subnet_handle, proxy_adv_mode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The internal parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ **RM\_BLE\_MESH\_NETWORK\_StopProxyServerAdv()**

```
fsp_err_t RM_BLE_MESH_NETWORK_StopProxyServerAdv ( rm_ble_mesh_network_ctrl_t *const
p_ctrl)
```

Stop connectable advertisements for a proxy server. This function is used by the Proxy Server to stop Connectable Undirected Advertisements.

Implements `rm_ble_mesh_network_api_t::stopProxyServerAdv`.

Example:

```
/* Stop connectable advertisements for a proxy server. */
err = RM_BLE_MESH_NETWORK_StopProxyServerAdv(&g_ble_mesh_network0_ctrl);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_BLE\_MESH\_NETWORK\_AllocateSeqNumber()**

```
fsp_err_t RM_BLE_MESH_NETWORK_AllocateSeqNumber ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, uint32_t *const p_seq_num )
```

To allocate sequence number. This function is used to allocate Sequence Number.

Implements `rm_ble_mesh_network_api_t::allocateSeqNumber`.

Example:

```
/* Allocate sequence number. */
err = RM_BLE_MESH_NETWORK_AllocateSeqNumber(&g_ble_mesh_network0_ctrl, &seq_num);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_NETWORK\_GetSeqNumberState()

```
fsp_err_t RM_BLE_MESH_NETWORK_GetSeqNumberState ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_seq_number_state_t *const p_seq_num_state )
```

To get current sequence number state. This function is used to get current Sequence Number state.

Implements `rm_ble_mesh_network_api_t::getSeqNumberState`.

Example:

```
/* Get current sequence number state. */
err = RM_BLE_MESH_NETWORK_GetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_NETWORK\_SetSeqNumberState()

```
fsp_err_t RM_BLE_MESH_NETWORK_SetSeqNumberState ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_seq_number_state_t const *const p_seq_num_state )
```

To set current sequence number state. This function is used to get current Sequence Number state, which acquiring lock. Used from persistent storage.

Implements `rm_ble_mesh_network_api_t::setSeqNumberState`.

Example:

```
/* Set current sequence number state. */
err = RM_BLE_MESH_NETWORK_SetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_NETWORK\_ResetNetCache()

```
fsp_err_t RM_BLE_MESH_NETWORK_ResetNetCache ( rm_ble_mesh_network_ctrl_t *const p_ctrl)
```

To reinitialize all Network Layer cache entries. This routine clears and reinitializes all Network Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements `rm_ble_mesh_network_api_t::resetNetCache`.

Example:

```
/* Reinitialize all Network Layer cache entries. */
err = RM_BLE_MESH_NETWORK_ResetNetCache(&g_ble_mesh_network0_ctrl);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

## Bluetooth Low Energy Mesh Network Lower Trans (rm\_ble\_mesh\_lower\_trans)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_Open
(rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl,

(rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Lower Trans module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_ble\_mesh\_lower\_trans

The following build time configurations are defined in fsp\_cfg/rm\_ble\_mesh\_lower\_trans\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Lower Trans (rm\_ble\_mesh\_lower\_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Lower Trans (rm\_ble\_mesh\_lower\_trans).

Configuration	Options	Default	Description
General > Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_lower_trans0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Notification Enable	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Whether to enable the notification or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

## Data Structures

```
struct rm_ble_mesh_lower_trans_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_ble\_mesh\_lower\_trans\_instance\_ctrl\_t

```
struct rm_ble_mesh_lower_trans_instance_ctrl_t
```

RM\_BLE\_MESH\_LOWER\_TRANS private control block. DO NOT MODIFY. Initialization occurs when `RM_BLE_MESH_LOWER_TRANS_Open()` is called.

## Function Documentation

### ◆ RM\_BLE\_MESH\_LOWER\_TRANS\_Open()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_Open ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_lower_trans_cfg_t const *const p_cfg )
```

Register Interface with Lower Transport Layer. This routine registers interface with the Lower Transport Layer. Transport Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_lower_trans_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_LOWER_TRANS_Open(&g_ble_mesh_lower_trans0_ctrl,
&g_ble_mesh_lower_trans0_cfg);
```

#### Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_LOWER\_TRANS\_Close()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_Close ( rm_ble_mesh_provision_ctrl_t *const p_ctrl)
```

Unregister Interface with Lower Transport Layer. Implements `rm_ble_mesh_lower_trans_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_LOWER_TRANS_Close(&g_ble_mesh_lower_trans0_ctrl);
```

#### Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_LOWER\_TRANS\_SendPdu()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_SendPdu ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_lower_trans_transmit_setting_t const *const p_transmit_setting,
rm_ble_mesh_buffer_t const *const p_buffer, rm_ble_mesh_lower_trans_reliable_t reliable )
```

API to send transport PDUs. This routine sends transport PDUs to peer device.

Implements `rm_ble_mesh_lower_trans_api_t::sendPdu`.

Example:

```
/* Send transport PDUs. */
err = RM_BLE_MESH_LOWER_TRANS_SendPdu(&g_ble_mesh_lower_trans0_ctrl,
                                     &transmit_setting,
                                     &buffer,
                                     RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transmit_setting and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_LOWER\_TRANS\_ClearSarContexts()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSarContexts ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl)
```

To clear all segmentation and reassembly contexts. This routine clears all segmentation and reassembly contexts.

Implements `rm_ble_mesh_lower_trans_api_t::clearSarContexts`.

Example:

```
/* Clear all segmentation and reassembly contexts. */
err = RM_BLE_MESH_LOWER_TRANS_ClearSarContexts(&g_ble_mesh_lower_trans0_ctrl);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_LOWER\_TRANS\_ClearSubnetSarContexts()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle )
```

To clear all segmentation and reassembly contexts for a given subnet. This routine clears all segmentation and reassembly contexts.

Implements `rm_ble_mesh_lower_trans_api_t::clearSubnetSarContexts`.

Example:

```
/* Clear all segmentation and reassembly contexts for a given subnet. */
err =
RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts(&g_ble_mesh_lower_trans0_ctrl,
subnet_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_LOWER\_TRANS\_ReinitReplayCache()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache ( rm_ble_mesh_lower_trans_ctrl_t
*const p_ctrl)
```

To reinitialize all Lower Transport replay cache entries. This routine clears and reinitializes all Transport Replay Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements `rm_ble_mesh_lower_trans_api_t::reinitReplayCache`.

Example:

```
/* Reinitialize all Lower Transport replay cache Entries. */
err = RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache(&g_ble_mesh_lower_trans0_ctrl);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_LOWER\_TRANS\_TriggerPendingTransmits()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits ( rm_ble_mesh_lower_trans_ctrl_t
*const p_ctrl)
```

To trigger any LTRN pending transmissions. Trigger pending transmits is an interface to check for pending segments in the tx queue and schedule for transmission, which is mainly used by the LPN operation.

Implements `rm_ble_mesh_lower_trans_api_t::triggerPendingTransmits`.

Example:

```
/* Trigger any Lower Transport pending transmissions. */
err =
RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits(&g_ble_mesh_lower_trans0_ctrl);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

## Bluetooth Low Energy Mesh Network Upper Trans (rm\_ble\_mesh\_upper\_trans)

## Modules » Networking » Bluetooth Low Energy Mesh Network Modules

change_in_feature_bit)
```

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Upper Trans module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_ble\_mesh\_upper\_trans

The following build time configurations are defined in fsp\_cfg/rm\_ble\_mesh\_upper\_trans\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Upper Trans (rm\_ble\_mesh\_upper\_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Upper Trans (rm\_ble\_mesh\_upper\_trans).

Configuration	Options	Default	Description
General > Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_upper_trans0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Control Message Event Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Whether to enable the control message event or not.
Access Message Event Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Whether to enable the access message event or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

### Data Structures

```
struct rm_ble_mesh_upper_trans_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_ble\_mesh\_upper\_trans\_instance\_ctrl\_t

```
struct rm_ble_mesh_upper_trans_instance_ctrl_t
```

RM\_BLE\_MESH\_UPPER\_TRANS private control block. DO NOT MODIFY. Initialization occurs when [RM\\_BLE\\_MESH\\_UPPER\\_TRANS\\_Open\(\)](#) is called.

### Function Documentation

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_Open()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_Open ( rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_upper_trans_cfg_t const *const p_cfg )
```

Register Interface with Transport Layer. This routine registers interface with the Transport Layer. Transport Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_upper_trans_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_UPPER_TRANS_Open(&g_ble_mesh_upper_trans0_ctrl,
&g_ble_mesh_upper_trans0_cfg);
```

#### Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_Close()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_Close ( rm_ble_mesh_provision_ctrl_t *const p_ctrl)
```

Unregister Interface with Transport Layer. Implements `rm_ble_mesh_upper_trans_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_UPPER_TRANS_Close(&g_ble_mesh_upper_trans0_ctrl);
```

#### Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_SendAccessPdu()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendAccessPdu ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, rm_ble_mesh_upper_trans_access_layer_pdu_t const *const p_access_layer_pdu,
rm_ble_mesh_lower_trans_reliable_t reliable )
```

API to send Access Layer PDUs. This routine sends Access Layer PDUs to peer device.

Implements `rm_ble_mesh_upper_trans_api_t::sendAccessPdu`.

Example:

```
/* Send Access Layer PDUs. */
err = RM_BLE_MESH_UPPER_TRANS_SendAccessPdu(&g_ble_mesh_upper_trans0_ctrl,
                                             &access_layer_pdu,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_access_layer_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_SendControlPdu()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendControlPdu ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, rm_ble_mesh_upper_trans_control_pdu_t const *const p_control_pdu )
```

API to send transport Control PDUs. This routine sends transport Control PDUs to peer device.

Implements `rm_ble_mesh_upper_trans_api_t::sendControlPdu`.

Example:

```
/* Send Upper Transport control PDUs. */
err = RM_BLE_MESH_UPPER_TRANS_SendControlPdu(&g_ble_mesh_upper_trans0_ctrl,
&control_pdu);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_control_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_LpnSetupFriendship()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_friendship_setting_t const *const p_setting )
```

API to setup Friendship. This routine is used by the device acting as a low power node to setup a friendship procedure to any available friend nodes.

Implements `rm_ble_mesh_upper_trans_api_t::lpnSetupFriendship`.

Example:

```
/* Setup friendship. */
err = RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship(&g_ble_mesh_upper_trans0_ctrl,
&setting);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_setting is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_LpnClearFriendship()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl)
```

API to terminate friendship. This routine is used by the device acting as a low power node terminate friendship with an active Friend node.

Implements `rm_ble_mesh_upper_trans_api_t::lpnClearFriendship`.

Example:

```
/* Terminate friendship. */
err = RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship(&g_ble_mesh_upper_trans0_ctrl);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_LpnManageSubscription()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_control_opcode_t action, uint16_t const *const
p_addr_list, uint16_t count )
```

API to manage friend subscription list. This routine is used by the device acting as a low power node add/remove addresses to/from the friends subscription list.

Implements `rm_ble_mesh_upper_trans_api_t::lpnManageSubscription`.

Example:

```
/* Manage friend subscription list. */
err =
RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription(&g_ble_mesh_upper_trans0_ctrl,
RM_BLE_MESH_UPPER_TRANS_CONTROL_OPCODE_FRIEND_POLL,
&addr_list,
count);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_addr_list is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_LpnPoll()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnPoll ( rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl)
```

To trigger Friend Poll from application. This routine enables the application to trigger a Friend Poll even before the expiry of an active poll period configured during the friendship establishment. The poll period will get reset at this point.

Implements `rm_ble_mesh_upper_trans_api_t::lpnPoll`.

Example:

```
/* Trigger friend poll from application. */
err = RM_BLE_MESH_UPPER_TRANS_LpnPoll(&g_ble_mesh_upper_trans0_ctrl);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_IsValidLpnElementAddress()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress (
rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t addr,
rm_ble_mesh_lower_trans_lpn_handle_t *const p_lpn_handle )
```

To check if address matches with any of the LPN. This routine checks if destination address in a received packet matches with any of the known element address of LPN.

Implements `rm_ble_mesh_upper_trans_api_t::isValidLpnElementAddress`.

Example:

```
/* Check if address matches with any of the LPN. */
err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress(&g_ble_mesh_upper_trans0_ctrl, addr,
&lpn_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_lpn_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_IsValidLpnSubscriptionAddress()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress (
  rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t addr,
  rm_ble_mesh_lower_trans_lpn_handle_t *const p_lpn_handle )
```

To check if valid subscription address of an LPN to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of an LPN.

Implements `rm_ble_mesh_upper_trans_api_t::IsValidLpnSubscriptionAddress`.

Example:

```
/* Check if valid subscription address of an LPN to receive a packet. */
err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress(&g_ble_mesh_upper_trans0_ctrl,
addr, &lpn_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_lpn_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_GetLpnPolltimeout()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_network_address_t lpn_addr, uint32_t *const p_poll_timeout )
```

To get Poll Timeout of an LPN. This routine checks if LPN address is valid and then returns Poll Timeout configured for the LPN.

Implements `rm_ble_mesh_upper_trans_api_t::getLpnPolltimeout`.

Example:

```
/* Get poll timeout of an LPN. */
err = RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout(&g_ble_mesh_upper_trans0_ctrl,
addr, &poll_timeout);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_poll_timeout is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_GetFriendshipInfo()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, rm_ble_mesh_upper_trans_friend_role_t role, uint16_t lpn_index,
rm_ble_mesh_upper_trans_friendship_info_t *const p_node )
```

To get the LPN node information. This routine fetches the node information of the LPN element at the given index

Implements `rm_ble_mesh_upper_trans_api_t::getFriendshipInfo`.

Example:

```
/* Get the LPN node information. */
err = RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo(&g_ble_mesh_upper_trans0_ctrl,
RM_BLE_MESH_UPPER_TRANS_FRIEND_ROLE_FRIEND,
                                lpn_index,
                                &node);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_node is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_LpnRegisterSecurityUpdate()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate (
  rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_subnet_handle_t
  subnet_handle, uint8_t flag, uint32_t ivindex )
```

To add the security update information. This routine updates the security state of the network to all the active LPN elements. This will be forwarded to the elements when it polls for the next packet available.

Implements `rm_ble_mesh_upper_trans_api_t::lpnRegisterSecurityUpdate`.

Example:

```
/* Add the security update information. */
err =
  RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate(&g_ble_mesh_upper_trans0_ctrl,
  subnet_handle, flag, ivindex);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_ClearAllLpn()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_ClearAllLpn ( rm_ble_mesh_upper_trans_ctrl_t *const
  p_ctrl)
```

To clear information related to all LPNs. This routine clears information related to all LPNs.

Implements `rm_ble_mesh_upper_trans_api_t::clearAllLpn`.

Example:

```
/* Clear information related to all LPNs. */
err = RM_BLE_MESH_UPPER_TRANS_ClearAllLpn(&g_ble_mesh_upper_trans0_ctrl);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_SetHeartbeatPublication()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info )
```

To set the Heartbeat publication data. This routine configures the Heartbeat publication information

Implements `rm_ble_mesh_upper_trans_api_t::setHeartbeatPublication`.

Example:

```
/* Set the heartbeat publication data. */
err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_GetHeartbeatPublication()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info )
```

To get the Heartbeat publication data. This routine retrieves the Heartbeat publication information  
Implements `rm_ble_mesh_upper_trans_api_t::getHeartbeatPublication`.

Example:

```
/* Get the heartbeat publication data. */
err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_SetHeartbeatSubscription()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info )
```

To set the Heartbeat subscription data. This routine configures the Heartbeat subscription information

Implements `rm_ble_mesh_upper_trans_api_t::setHeartbeatSubscription`.

Example:

```
/* Set the heartbeat subscription data. */
err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_GetHeartbeatSubscription()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription (
rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info )
```

To get the Heartbeat subscription data. This routine retrieves the Heartbeat subscription information

Implements `rm_ble_mesh_upper_trans_api_t::getHeartbeatSubscription`.

Example:

```
/* Get the heartbeat subscription data. */
err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_UPPER\_TRANS\_TriggerHeartbeat()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, uint8_t change_in_feature_bit )
```

To trigger Heartbeat send on change in feature. This routine triggers the Heartbeat send on change in state of supported features.

Implements `rm_ble_mesh_upper_trans_api_t::triggerHeartbeat`.

Example:

```
/* Trigger heartbeat send on change in feature. */
err = RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat(&g_ble_mesh_upper_trans0_ctrl,
change_in_feature_bit);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_POINTER	The internal parameter is NULL.

## Bluetooth Low Energy Mesh Network Access (rm\_ble\_mesh\_access)

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Access module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_ble\_mesh\_access

The following build time configurations are defined in fsp\_cfg/rm\_ble\_mesh\_access\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Access (rm\_ble\_mesh\_access)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Access (rm\_ble\_mesh\_access).

Configuration	Options	Default	Description
General > Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_access 0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Location Descriptor	Invalid Descriptor	0	Location descriptor.

### Data Structures

```
struct rm_ble_mesh_access_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_ble\_mesh\_access\_instance\_ctrl\_t

```
struct rm_ble_mesh_access_instance_ctrl_t
```

RM\_BLE\_MESH\_ACCESS private control block. DO NOT MODIFY. Initialization occurs when RM\_BLE\_MESH\_ACCESS\_Open() is called.

## Function Documentation

### ◆ RM\_BLE\_MESH\_ACCESS\_Open()

```
fsp_err_t RM_BLE_MESH_ACCESS_Open ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_cfg_t const *const p_cfg )
```

Open access middleware. This routine creates a new node in the device. This can be used by the application to create extra nodes if required in addition to the default primary node. And this routine registers an element that can be populated with the models information to a specific node in the device identified by the node id.

Implements `rm_ble_mesh_access_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_ACCESS_Open(&g_ble_mesh_access0_ctrl, &g_ble_mesh_access0_cfg);
```

#### Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

### ◆ RM\_BLE\_MESH\_ACCESS\_Close()

```
fsp_err_t RM_BLE_MESH_ACCESS_Close ( rm_ble_mesh_access_ctrl_t *const p_ctrl)
```

Close access middleware. Implements `rm_ble_mesh_access_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_ACCESS_Close(&g_ble_mesh_access0_ctrl);
```

#### Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_ACCESS\_RegisterModel()

```
fsp_err_t RM_BLE_MESH_ACCESS_RegisterModel ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_t const *const p_model, rm_ble_mesh_access_model_handle_t *const
p_model_handle )
```

Register a model with the access layer. This routine registers a model associated with an element with the access layer.

Implements `rm_ble_mesh_access_api_t::registerModel`.

Example:

```
/* Register a model with the access layer. */
err = RM_BLE_MESH_ACCESS_RegisterModel(&g_ble_mesh_access0_ctrl, &model,
&model_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_model and p_model_handle are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetElementHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t elem_addr, rm_ble_mesh_access_element_handle_t *const
p_handle )
```

Get element handle. This routine searches for the element handle associated with specific element address.

Implements `rm_ble_mesh_access_api_t::getElementHandle`.

Example:

```
/* Get element handle. */
err = RM_BLE_MESH_ACCESS_GetElementHandle(&g_ble_mesh_access0_ctrl, elem_addr,
&elem_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetElementHandleForModelHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle,
rm_ble_mesh_access_element_handle_t *const p_elem_handle )
```

Get element handle for a given model handle. This routine searches for the element handle associated with specific model handle.

Implements `rm_ble_mesh_access_api_t::getElementHandleForModelHandle`.

Example:

```
/* Get element handle for a given model handle. */
err = RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle(&g_ble_mesh_access0_ctrl,
model_handle, &elem_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_elem_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetModelHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_element_handle_t elem_handle, rm_ble_mesh_access_model_id_t model_id,
rm_ble_mesh_access_model_handle_t *const p_handle )
```

Get model handle. This routine searches for the model handle associated with specific model ID.

Implements `rm_ble_mesh_access_api_t::getModelHandle`.

Example:

```
/* Get model handle. */
err = RM_BLE_MESH_ACCESS_GetModelHandle(&g_ble_mesh_access0_ctrl, elem_handle,
model_id, &model_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_Publish()

```
fsp_err_t RM_BLE_MESH_ACCESS_Publish ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t const *const p_handle, rm_ble_mesh_access_req_msg_raw_t
const *const p_publish_message, uint8_t reliable )
```

API to publish access layer message. This routine publishes Access Layer message to the publish address associated with the model.

Implements `rm_ble_mesh_access_api_t::publish`.

Example:

```
/* Publish access layer message. */
err = RM_BLE_MESH_ACCESS_Publish(&g_ble_mesh_access0_ctrl, &model_handle,
&publish_message, reliable);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle and p_publish_message are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_ACCESS\_ReliablePublish()

```
fsp_err_t RM_BLE_MESH_ACCESS_ReliablePublish ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t const *const p_handle, rm_ble_mesh_access_req_msg_raw_t
const *const p_publish_message, uint32_t rsp_opcode )
```

API to reliably publish Access layer message. This routine reliably publishes Access Layer message to the publish address associated with the model.

Implements `rm_ble_mesh_access_api_t::reliablePublish`.

Example:

```
/* Reliably publish access layer message. */
err = RM_BLE_MESH_ACCESS_ReliablePublish(&g_ble_mesh_access0_ctrl, &model_handle,
&req_msg_raw, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle and p_publish_message are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_ACCESS\_Reply()

```
fsp_err_t RM_BLE_MESH_ACCESS_Reply ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_req_msg_context_t const *const p_req_msg_context, uint8_t ttl,
rm_ble_mesh_access_req_msg_raw_t const *const p_req_msg_raw )
```

API to reply to Access Layer message. This routine replies to Access Layer message.

Implements `rm_ble_mesh_access_api_t::reply`.

Example:

```
/* Reply to access layer message. */
err = RM_BLE_MESH_ACCESS_Reply(&g_ble_mesh_access0_ctrl, &req_msg_context, ttl,
&req_msg_raw);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_req_msg_context and p_req_msg_raw are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

### ◆ RM\_BLE\_MESH\_ACCESS\_ReplyAndPublish()

```
fsp_err_t RM_BLE_MESH_ACCESS_ReplyAndPublish ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_req_msg_context_t const *const p_req_msg_context,
rm_ble_mesh_access_req_msg_raw_t const *const p_req_msg_raw,
rm_ble_mesh_access_publish_setting_t const *const p_publish_setting )
```

API to reply to Access Layer message and optionally also to publish. This routine replies to Access Layer message and also publish if requested by application.

Implements `rm_ble_mesh_access_api_t::replyAndPublish`.

Example:

```
/* Reply to access layer message. */
err =
RM_BLE_MESH_ACCESS_ReplyAndPublish(&g_ble_mesh_access0_ctrl, &req_msg_context,
&req_msg_raw, &publish_setting);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_req_msg_context and p_req_msg_raw are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ **RM\_BLE\_MESH\_ACCESS\_SendPdu()**

```
fsp_err_t RM_BLE_MESH_ACCESS_SendPdu ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_pdu_t const *const p_pdu, uint8_t reliable )
```

API to send access PDUs. This routine sends transport PDUs to peer device.

Implements `rm_ble_mesh_access_api_t::sendPdu`.

Example:

```
/* Send Access PDUs. */
err = RM_BLE_MESH_ACCESS_SendPdu(&g_ble_mesh_access0_ctrl, &pdu, reliable);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ **RM\_BLE\_MESH\_ACCESS\_GetCompositionData()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetCompositionData ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_buffer_t *const p_buffer )
```

Get composition data.

Implements `rm_ble_mesh_access_api_t::getCompositionData`.

Example:

```
/* Get composition data. */
err = RM_BLE_MESH_ACCESS_GetCompositionData(&g_ble_mesh_access0_ctrl, &buffer);
```

**Return values**

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_buffer is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ **RM\_BLE\_MESH\_ACCESS\_Reset()**

```
fsp_err_t RM_BLE_MESH_ACCESS_Reset ( rm_ble_mesh_access_ctrl_t *const p_ctrl)
```

To reset a node. This routine resets a node (other than a Provisioner) and removes it from the network.

Implements `rm_ble_mesh_access_api_t::reset`.

Example:

```
/* Reset a node. */
err = RM_BLE_MESH_ACCESS_Reset(&g_ble_mesh_access0_ctrl);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetElementCount()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetElementCount ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t *const p_count )
```

To get the number of elements in local node. This routine retrieves the number of elements in local node.

Implements `rm_ble_mesh_access_api_t::getElementCount`.

Example:

```
/* Get the number of elements in local node. */
err = RM_BLE_MESH_ACCESS_GetElementCount(&g_ble_mesh_access0_ctrl, &count);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_count is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_SetPrimaryUnicastAddress()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t addr )
```

To set primary unicast address. This routine sets primary unicast address.

Implements `rm_ble_mesh_access_api_t::setPrimaryUnicastAddress`.

Example:

```
/* Set primary unicast address. */
err = RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
addr);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ **RM\_BLE\_MESH\_ACCESS\_GetPrimaryUnicastAddress()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t *const p_addr )
```

To get primary unicast address. This routine gets primary unicast address.

Implements `rm_ble_mesh_access_api_t::getPrimaryUnicastAddress`.

Example:

```
/* Get primary unicast address. */
err = RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
&addr);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ **RM\_BLE\_MESH\_ACCESS\_SetDefaultTtl()**

```
fsp_err_t RM_BLE_MESH_ACCESS_SetDefaultTtl ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
ttl )
```

To set default TTL. This routine sets default TTL.

Implements `rm_ble_mesh_access_api_t::setDefaultTtl`.

Example:

```
/* Set default TTL. */
err = RM_BLE_MESH_ACCESS_SetDefaultTtl(&g_ble_mesh_access0_ctrl, ttl);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetDefaultTtl()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetDefaultTtl ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
const *const p_ttl )
```

To get default TTL. This routine gets default TTL.

Implements `rm_ble_mesh_access_api_t::getDefaultTtl`.

Example:

```
/* Get default TTL. */
err = RM_BLE_MESH_ACCESS_GetDefaultTtl(&g_ble_mesh_access0_ctrl, &t1);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_ttl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_SetIvIndex()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetIvIndex ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint32_t
iv_index, uint8_t iv_update_flag )
```

To set IV Index. This routine sets IV Index.

Implements `rm_ble_mesh_access_api_t::setIvIndex`.

Example:

```
/* Set IV Index. */
err = RM_BLE_MESH_ACCESS_SetIvIndex(&g_ble_mesh_access0_ctrl, iv_index,
iv_update_flag);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_IN_USE	Resource is busy.

◆ **RM\_BLE\_MESH\_ACCESS\_GetIvIndex()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndex ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint32_t
*const p_iv_index, uint8_t *const p_iv_update_flag )
```

To get IV Index. This routine gets IV Index.

Implements `rm_ble_mesh_access_api_t::getIvIndex`.

Example:

```
/* Get IV Index. */
err = RM_BLE_MESH_ACCESS_GetIvIndex(&g_ble_mesh_access0_ctrl, &iv_index,
&iv_update_flag);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_iv_index and p_iv_update_flag are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ **RM\_BLE\_MESH\_ACCESS\_GetIvIndexByIvi()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndexByIvi ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t ivi, uint32_t *const p_iv_index )
```

To get IV Index by IVI. This routine gets IV Index based on the IVI in the received packet.

Implements `rm_ble_mesh_access_api_t::getIvIndexByIvi`.

Example:

```
/* Get IV Index by IVI. */
err = RM_BLE_MESH_ACCESS_GetIvIndexByIvi(&g_ble_mesh_access0_ctrl, ivi,
&iv_index);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_iv_index is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_SetFeaturesField()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetFeaturesField ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t enable, uint8_t feature )
```

To enable/disable a feature. This routine enables/disables a feature field.

Implements `rm_ble_mesh_access_api_t::setFeaturesField`.

Example:

```
/* Enable/Disable a feature. */
err = RM_BLE_MESH_ACCESS_SetFeaturesField(&g_ble_mesh_access0_ctrl, enable,
features);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetFeaturesField()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetFeaturesField ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t *const p_enable, uint8_t feature )
```

To get state of a feature. This routine gets the state of a feature field.

Implements `rm_ble_mesh_access_api_t::getFeaturesField`.

Example:

```
/* Get state of a feature. */
err = RM_BLE_MESH_ACCESS_GetFeaturesField(&g_ble_mesh_access0_ctrl, &enable,
features);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_enable is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetFeatures()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetFeatures ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t *const p_features )
```

To get state of all features. This routine gets the state of all features.

Implements `rm_ble_mesh_access_api_t::getFeatures`.

Example:

```
/* Get state of all features. */
err = RM_BLE_MESH_ACCESS_GetFeatures(&g_ble_mesh_access0_ctrl, &features);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_features is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetFriendshipRole()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetFriendshipRole ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t *const p_friend_role )
```

To get friendship role of the node. This routine gets the current friendship role of the node.

Implements `rm_ble_mesh_access_api_t::getFriendshipRole`.

Example:

```
/* Get friendship role of the node. */
err = RM_BLE_MESH_ACCESS_GetFriendshipRole(&g_ble_mesh_access0_ctrl,
&friend_role);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_friend_role is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_BLE\_MESH\_ACCESS\_SetFriendshipRole()**

```
fsp_err_t RM_BLE_MESH_ACCESS_SetFriendshipRole ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t friend_role )
```

To set friendship role of the node. This routine sets the current friendship role of the node.

Implements `rm_ble_mesh_access_api_t::setFriendshipRole`.

Example:

```
/* Set friendship role of the node. */
err = RM_BLE_MESH_ACCESS_SetFriendshipRole(&g_ble_mesh_access0_ctrl,
friend_role);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_BLE\_MESH\_ACCESS\_AddDeviceKey()**

```
fsp_err_t RM_BLE_MESH_ACCESS_AddDeviceKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
const *const p_dev_key, rm_ble_mesh_network_address_t uaddr, uint8_t num_elements )
```

To add Device Key. This routine adds Device Key entry, along with corresponding Primary Device Address and Number of elements.

Implements `rm_ble_mesh_access_api_t::addDeviceKey`.

Example:

```
/* Add Device Key. */
err = RM_BLE_MESH_ACCESS_AddDeviceKey(&g_ble_mesh_access0_ctrl, &dev_key, uaddr,
num_elements);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OVERFLOW	Device key table is full.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetDeviceKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t dev_key_index, uint8_t **const p_dev_key )
```

To get Device Key. This routine gets Device Key entry.

Implements `rm_ble_mesh_access_api_t::getDeviceKey`.

Example:

```
/* Get Device Key. */
err = RM_BLE_MESH_ACCESS_GetDeviceKey(&g_ble_mesh_access0_ctrl, dev_key_index,
p_dev_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_RemoveAllDeviceKeys()

```
fsp_err_t RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys ( rm_ble_mesh_access_ctrl_t *const p_ctrl)
```

To remove all Device Keys. This routine removes all Device Keys from table.

Implements `rm_ble_mesh_access_api_t::removeAllDeviceKeys`.

Example:

```
/* Remove all Device Keys. */
err = RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys(&g_ble_mesh_access0_ctrl);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetProvisionedDeviceList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetProvisionedDeviceList ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_provisioned_device_entry_t const *const p_prov_dev_list, uint16_t
*const p_num_entries )
```

To get list of Provisioned Device List. This routine returns list of Provisioned Devices from the Device Key Table.

Implements `rm_ble_mesh_access_api_t::getProvisionedDeviceList`.

Example:

```
/* Get list of provisioned device list. */
err = RM_BLE_MESH_ACCESS_GetProvisionedDeviceList(&g_ble_mesh_access0_ctrl,
&prov_dev_list, &num_entries);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_prov_dev_list and p_num_entries are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetDeviceKeyHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKeyHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t prim_elem_uaddr, rm_ble_mesh_access_device_key_handle_t
*const p_handle )
```

To get device key handle. This routine returns Device Key Handle for a given Primary Element Address entry in Device Key Table.

Implements `rm_ble_mesh_access_api_t::getDeviceKeyHandle`.

Example:

```
/* Get Device Key handle. */
err = RM_BLE_MESH_ACCESS_GetDeviceKeyHandle(&g_ble_mesh_access0_ctrl,
prim_elem_uaddr, &handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_appkey_handle_t appkey_handle, uint8_t **const p_app_key, uint8_t
*const p_aid )
```

To get AppKey. This routine gets AppKey along with AID entry.

Implements `rm_ble_mesh_access_api_t::getAppKey`.

Example:

```
/* Get AppKey. */
err = RM_BLE_MESH_ACCESS_GetAppKey(&g_ble_mesh_access0_ctrl, appkey_handle,
p_app_key, &aid);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key and p_aid are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_AddUpdateNetkey()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddUpdateNetkey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint16_t netkey_index, uint32_t opcode, uint8_t const *const p_net_key )
```

To add/update NetKey. This routine adds/updates NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::addUpdateNetkey`.

Example:

```
/* Add/Update NetKey. */
err = RM_BLE_MESH_ACCESS_AddUpdateNetkey(&g_ble_mesh_access0_ctrl, netkey_index,
opcode, &net_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_net_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_AddFriendSecurityCredential()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddFriendSecurityCredential ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t friend_index,
rm_ble_mesh_access_friend_security_credential_info_t info )
```

To add Security Credential of a LPN or the Friend. This routine adds NID, privacy and encryption keys associated with a friendship.

Implements `rm_ble_mesh_access_api_t::addFriendSecurityCredential`.

Example:

```
/* Add security credential of a LPN or the friend. */
err =
RM_BLE_MESH_ACCESS_AddFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index, info);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_DeleteFriendSecurityCredential()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t friend_index )
```

To delete the Security Credential of a LPN or the Friend. This routine deletes NID, privacy and encryption keys associated with a friendship.

Implements `rm_ble_mesh_access_api_t::deleteFriendSecurityCredential`.

Example:

```
/* Delete the security credential of a LPN or the Friend. */
err = RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_FindSubnet()

```
fsp_err_t RM_BLE_MESH_ACCESS_FindSubnet ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint16_t
netkey_index, rm_ble_mesh_network_subnet_handle_t *const p_subnet_handle )
```

To find a Subnet associated with the NetKey. This routine finds a Subnet based on the NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::findSubnet`.

Example:

```
/* Find a subnet associated with the NetKey. */
err = RM_BLE_MESH_ACCESS_FindSubnet(&g_ble_mesh_access0_ctrl, netkey_index,
&subnet_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_subnet_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_FindMasterSubnet()

```
fsp_err_t RM_BLE_MESH_ACCESS_FindMasterSubnet ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t friend_subnet_handle,
rm_ble_mesh_network_subnet_handle_t *const p_master_subnet_handle )
```

To find the Master Subnet associated with the friend security credential, identified by Friend Subnet Handle. This routine finds the Master Subnet based on the friend security credential, identified by Friend Subnet Handle.

Implements `rm_ble_mesh_access_api_t::findMasterSubnet`.

Example:

```
/* Close the module. */
err =
RM_BLE_MESH_ACCESS_FindMasterSubnet(&g_ble_mesh_access0_ctrl, friend_subnet_handle,
&master_subnet_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_master_subnet_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_DeleteNetKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteNetKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle )
```

To delete NetKey. This routine deletes a NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::deleteNetKey`.

Example:

```
/* Delete NetKey. */
err = RM_BLE_MESH_ACCESS_DeleteNetKey(&g_ble_mesh_access0_ctrl, subnet_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_BLE\_MESH\_ACCESS\_GetNetKey()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetNetKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_net_key )
```

To get NetKey. This routine fetches a NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getNetKey`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_ACCESS_GetNetKey(&g_ble_mesh_access0_ctrl, subnet_handle,
&net_key);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_net_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ **RM\_BLE\_MESH\_ACCESS\_GetNetKeyIndexList()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetNetKeyIndexList ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint16_t *const p_netkey_count, uint16_t *const p_netkey_index_list )
```

To get list of all known NetKeys. This routine returns a list of known NetKey Indices.

Implements `rm_ble_mesh_access_api_t::getNetKeyIndexList`.

Example:

```
/* Get list of all known NetKeys. */
err = RM_BLE_MESH_ACCESS_GetNetKeyIndexList(&g_ble_mesh_access0_ctrl,
&netkey_count, &netkey_index_list);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_netkey_count and p_netkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_LookUpNid()

```
fsp_err_t RM_BLE_MESH_ACCESS_LookUpNid ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
nid, rm_ble_mesh_network_subnet_handle_t *const p_subnet_handle,
rm_ble_mesh_access_associated_keys_t *const p_key_set )
```

To search for NID. This routine searches for matching NID in subnet table.

Implements `rm_ble_mesh_access_api_t::lookUpNid`.

Example:

```
/* Search for NID. */
err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_subnet_handle and p_key_set are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_LookUpNetworkId()

```
fsp_err_t RM_BLE_MESH_ACCESS_LookUpNetworkId ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t const *const p_network_id, rm_ble_mesh_network_subnet_handle_t *const
p_subnet_handle, rm_ble_mesh_access_associated_keys_t *const p_key_set )
```

To search for Network ID. This routine searches for matching Network ID in subnet table.

Implements `rm_ble_mesh_access_api_t::lookUpNetworkId`.

Example:

```
/* Search for NID. */
err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_network_id, p_subnet_handle and p_key_set are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ **RM\_BLE\_MESH\_ACCESS\_LookUpAid()**

```
fsp_err_t RM_BLE_MESH_ACCESS_LookUpAid ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
aid, rm_ble_mesh_network_appkey_handle_t *const p_appkey_handle, uint8_t *const p_app_key )
```

To search for AID. This routine searches for matching NID in subnet table.

Implements `rm_ble_mesh_access_api_t::lookUpAid`.

Example:

```
/* Search for AID. */
err = RM_BLE_MESH_ACCESS_LookUpAid(&g_ble_mesh_access0_ctrl, aid, &appkey_handle,
&app_key);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_INVALID_POINTER	The parameter <code>p_appkey_handle</code> and <code>p_app_key</code> are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_SetProvisioningData()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetProvisioningData ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_data_t const *const p_prov_data )
```

Set Provisioning Data. This routine configures the provisioning data with Access Layer.

Implements `rm_ble_mesh_access_api_t::setProvisioningData`.

Example:

```
/* Set provisioning data. */
err = RM_BLE_MESH_ACCESS_SetProvisioningData(&g_ble_mesh_access0_ctrl,
&prov_data);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_prov_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetSubnetNid()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNid ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_nid )
```

To get NID associated with a subnet. This routine fetches the NID associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetNid`.

Example:

```
/* Get NID associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetNid(&g_ble_mesh_access0_ctrl, subnet_handle,
&nid);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_nid is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetSubnetPrivacyKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_privacy_key )
```

To get Privacy Key associated with a subnet. This routine fetches the Privacy Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetPrivacyKey`.

Example:

```
/* Get Privacy Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &privacy_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_privacy_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetSubnetNetworkId()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNetworkId ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_network_id )
```

To get Network ID associated with a subnet. This routine fetches the Network ID associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetNetworkId`.

Example:

```
/* Get Network ID associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetNetworkId(&g_ble_mesh_access0_ctrl,
subnet_handle, &network_id);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_network_id is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetSubnetBeaconKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetBeaconKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_beacon_key )
```

To get Beacon Key associated with a subnet. This routine fetches the Beacon Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetBeaconKey`.

Example:

```
/* Get Beacon Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetBeaconKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &beacon_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_beacon_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetSubnetIdentityKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetIdentityKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_identity_key )
```

To get Identity Key associated with a subnet. This routine fetches the Identity Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetIdentityKey`.

Example:

```
/* Get Identity Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetIdentityKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &identity_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_identity_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetSubnetEncryptionKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_encrypt_key )
```

To get Encryption Key associated with a subnet. This routine fetches the Encryption Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetEncryptionKey`.

Example:

```
/* Get Encryption Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &encrypt_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_encrypt_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetNodeIdentity()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetNodeIdentity ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_id_state )
```

To get Node Identity. This routine gets Node Identity State of a node

Implements `rm_ble_mesh_access_api_t::getNodeIdentity`.

Example:

```
/* Get node identity. */
err = RM_BLE_MESH_ACCESS_GetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_id_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_SetNodeIdentity()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetNodeIdentity ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_id_state )
```

To set Node Identity. This routine sets Node Identity State of a node.

Implements `rm_ble_mesh_access_api_t::setNodeIdentity`.

Example:

```
/* Set node identity. */
err = RM_BLE_MESH_ACCESS_SetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_id_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetKeyRefreshPhase()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetKeyRefreshPhase ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_key_refresh_state )
```

To get Key Refresh Phase. This routine gets Key Refresh Phase State of a node

Implements `rm_ble_mesh_access_api_t::getKeyRefreshPhase`.

Example:

```
/* Get key refresh phase. */
err = RM_BLE_MESH_ACCESS_GetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key_refresh_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_SetKeyRefreshPhase()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetKeyRefreshPhase ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t const *const p_key_refresh_state
)
```

To set Key Refresh Phase. This routine sets Key Refresh Phase State of a node.

Implements `rm_ble_mesh_access_api_t::setKeyRefreshPhase`.

Example:

```
/* Set key refresh phase. */
err = RM_BLE_MESH_ACCESS_SetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key_refresh_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_SetTransmitState()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetTransmitState ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t tx_state_type, uint8_t tx_state )
```

To set Network/Relay Transmit state. This routine sets Network/Relay Transmit state.

Implements `rm_ble_mesh_access_api_t::setTransmitState`.

Example:

```
/* Set network/relay transmit state. */
err = RM_BLE_MESH_ACCESS_SetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, tx_state);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_BLE\_MESH\_ACCESS\_GetTransmitState()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetTransmitState ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t tx_state_type, uint8_t *const p_tx_state )
```

To get Network/Relay Transmit state. This routine gets Network/Relay Transmit state.

Implements `rm_ble_mesh_access_api_t::getTransmitState`.

Example:

```
/* Get network/relay transmit state. */
err = RM_BLE_MESH_ACCESS_GetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, &tx_state);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_tx_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_BLE\_MESH\_ACCESS\_AddAppKey()**

```
fsp_err_t RM_BLE_MESH_ACCESS_AddAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key )
```

To add AppKey. This routine adds AppKey entry. Each AppKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::addAppKey`.

Example:

```
/* Add AppKey. */
err = RM_BLE_MESH_ACCESS_AddAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_UpdateAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_UpdateAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key )
```

To update AppKey. This routine updates AppKey entry. Each AppKey is associated with a subnet. Implements `rm_ble_mesh_access_api_t::updateAppKey`.

Example:

```
/* Update AppKey. */
err = RM_BLE_MESH_ACCESS_UpdateAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_DeleteAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key )
```

To delete AppKey. This routine deletes AppKey entry. Each AppKey is associated with a subnet. Implements `rm_ble_mesh_access_api_t::deleteAppKey`.

Example:

```
/* Delete AppKey. */
err = RM_BLE_MESH_ACCESS_DeleteAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetAppKeyHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key, rm_ble_mesh_network_appkey_handle_t *const p_appkey_handle )
```

To get AppKey Handle for a given AppKey Index. This routine gets AppKey Handle for a given AppKey Index. Each AppKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getAppKeyHandle`.

Example:

```
/* Get AppKey handle for a given AppKey index. */
err = RM_BLE_MESH_ACCESS_GetAppKeyHandle(&g_ble_mesh_access0_ctrl,
                                         subnet_handle,
                                         appkey_index,
                                         &app_key,
                                         &appkey_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetAppKeyIndexList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyIndexList ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t *const p_appkey_count, uint16_t
*const p_appkey_index_list )
```

To get list of all known AppKeys. This routine returns a list of known AppKey Indices associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getAppKeyIndexList`.

Example:

```
/* Get list of all known AppKeys. */
err = RM_BLE_MESH_ACCESS_GetAppKeyIndexList(&g_ble_mesh_access0_ctrl,
                                             subnet_handle,
                                             &appkey_count,
                                             &appkey_index_list);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_count and p_appkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_BindModelWithAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_BindModelWithAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, uint16_t appkey_index )
```

To bind a model with an AppKey. This routine binds a model with an AppKey.

Implements `rm_ble_mesh_access_api_t::bindModelWithAppKey`.

Example:

```
/* Bind a model with an AppKey. */
err = RM_BLE_MESH_ACCESS_BindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_UnbindModelWithAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_UnbindModelWithAppKey ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, uint16_t appkey_index )
```

To unbind a model with an AppKey. This routine unbinds a model with an AppKey.

Implements `rm_ble_mesh_access_api_t::unbindModelWithAppKey`.

Example:

```
/* Unbind a model with an AppKey. */
err = RM_BLE_MESH_ACCESS_UnbindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetModelAppKeyList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelAppKeyList ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, uint16_t *const p_appkey_count, uint16_t
*const p_appkey_index_list )
```

To get list of all AppKeys associated with a model. This routine returns a list of known AppKey Indices associated with a model.

Implements `rm_ble_mesh_access_api_t::getModelAppKeyList`.

Example:

```
/* Get list of all AppKeys associated with a model. */
err = RM_BLE_MESH_ACCESS_GetModelAppKeyList(&g_ble_mesh_access0_ctrl,
                                             model_handle,
                                             &appkey_count,
                                             &appkey_index_list);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_count and p_appkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_SetModelPublication()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublication ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_publish_info_t *const
p_publish_info )
```

To set Publication information associated with a model. This routine sets Publication information associated with a model.

Implements `rm_ble_mesh_access_api_t::setModelPublication`.

Example:

```
/* Set publication information associated with a model. */
err = RM_BLE_MESH_ACCESS_SetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_publish_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_SetModelPublicationPeriodDivisor()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, uint8_t period_divisor )
```

To set Publication Fast Period Divisor information associated with a model. This routine sets Publication Fast Period Divisor information associated with a model.

Implements `rm_ble_mesh_access_api_t::setModelPublicationPeriodDivisor`.

Example:

```
/* Set publication fast period divisor information associated with a model. */
err =
RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor(&g_ble_mesh_access0_ctrl,
model_handle, period_divisor);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetModelPublication()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelPublication ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_publish_info_t *const
p_publish_info )
```

To get Publication information associated with a model. This routine returns Publication information associated with a model.

Implements `rm_ble_mesh_access_api_t::getModelPublication`.

Example:

```
/* Get publication information associated with a model. */
err = RM_BLE_MESH_ACCESS_GetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_publish_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_AddModelSubscription()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddModelSubscription ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_address_t const *const
p_sub_addr )
```

To add an address to a model subscription list. This routine adds an address to a subscription list of a model.

Implements `rm_ble_mesh_access_api_t::addModelSubscription`.

Example:

```
/* Add an address to a model subscription list. */
err = RM_BLE_MESH_ACCESS_AddModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_DeleteModelSubscription()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteModelSubscription ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_address_t const
*const p_sub_addr )
```

To delete an address to a model subscription list. This routine deletes an address to a subscription list of a model.

Implements `rm_ble_mesh_access_api_t::deleteModelSubscription`.

Example:

```
/* Delete an address to a model subscription list. */
err = RM_BLE_MESH_ACCESS_DeleteModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_INVALID_POINTER	The parameter <code>p_sub_addr</code> is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_DeleteAllModelSubscription()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteAllModelSubscription ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

To discard a model subscription list. This routine discards a subscription list of a model.

Implements `rm_ble_mesh_access_api_t::deleteAllModelSubscription`.

Example:

```
/* Discard a model subscription list. */
err = RM_BLE_MESH_ACCESS_DeleteAllModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetModelSubscriptionList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelSubscriptionList ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, uint16_t *const p_sub_addr_count,
uint16_t *const p_sub_addr_list )
```

To get list of subscription addresses of a model. This routine returns a list of subscription addresses of a model.

Implements `rm_ble_mesh_access_api_t::getModelSubscriptionList`.

Example:

```
/* Get list of subscription addresses of a model. */
err = RM_BLE_MESH_ACCESS_GetModelSubscriptionList(&g_ble_mesh_access0_ctrl,
                                                model_handle,
                                                &sub_addr_count,
                                                &sub_addr_list);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_INVALID_POINTER	The parameter <code>p_sub_addr_count</code> and <code>p_sub_addr_list</code> are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_GetAllModelSubscriptionList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, uint16_t *const p_sub_addr_count, uint16_t *const p_sub_addr_list )
```

To get list of subscription addresses of all the models. This routine returns a consolidated list of subscription addresses of all the models.

Implements `rm_ble_mesh_access_api_t::getAllModelSubscriptionList`.

Example:

```
/* Get list of subscription addresses of all the models. */
err = RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList(&g_ble_mesh_access0_ctrl,
&sub_addr_count, &sub_addr_list);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr_count and p_sub_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_BLE\_MESH\_ACCESS\_IsValidElementAddress()

```
fsp_err_t RM_BLE_MESH_ACCESS_IsValidElementAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t addr )
```

To check if valid element address to receive a packet. This routine checks if destination address in a received packet matches with any of the known element address of local or friend device.

Implements `rm_ble_mesh_access_api_t::isValidElementAddress`.

Example:

```
/* Check if valid element address to receive a packet. */
err = RM_BLE_MESH_ACCESS_IsValidElementAddress(&g_ble_mesh_access0_ctrl, addr);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

### ◆ RM\_BLE\_MESH\_ACCESS\_IsFixedGroupAddressToBeProcessed()

```
fsp_err_t RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_network_address_t addr )
```

To check if Fixed Group Address in receive packet to be processed. This routine checks if destination address in a received packet as a Fixed Group Address to be processed.

Implements `rm_ble_mesh_access_api_t::isFixedGroupAddressToBeProcessed`.

Example:

```
/* Check if fixed group address in receive packet to be processed. */
err =
RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed(&g_ble_mesh_access0_ctrl, addr);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_BLE\_MESH\_ACCESS\_IsValidSubscriptionAddress()

```
fsp_err_t RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t addr )
```

To check if valid subscription address to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of local or friend device.

Implements `rm_ble_mesh_access_api_t::isValidSubscriptionAddress`.

Example:

```
/* Check if valid subscription address to receive a packet. */
err = RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress(&g_ble_mesh_access0_ctrl,
addr);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

### ◆ RM\_BLE\_MESH\_ACCESS\_EnableIvUpdateTestMode()

```
fsp_err_t RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_iv_update_test_mode_t mode )
```

To set the IV Update Test Mode feature. This routine is used to set the IV Update Test Mode flag.

Implements `rm_ble_mesh_access_api_t::enableIvUpdateTestMode`.

Example:

```
/* Set the IV update test mode feature. */
err = RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode(&g_ble_mesh_access0_ctrl, mode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

## Bluetooth Low Energy Mesh Network Config Server (rm\_mesh\_config\_srv)

## Modules » Networking » Bluetooth Low Energy Mesh Network Modules

**Functions**

```
fsp_err_t RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

**Detailed Description****Overview****Target Devices**

The Bluetooth Low Energy Energy Mesh Network Config Server module supports the following devices.

- RA4W1

**Configuration****Build Time Configurations for rm\_mesh\_config\_srv**

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_config\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

**Configurations for Networking > BLE Mesh Config Server (rm\_mesh\_config\_srv)**

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Config Server (rm\_mesh\_config\_srv).

Configuration	Options	Default	Description
Interrupts > Callback	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh config client ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_config_srv 0	Module name.

**Data Structures**

```
struct  rm_mesh_config_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_config\_srv\_instance\_ctrl\_t

```
struct rm_mesh_config_srv_instance_ctrl_t
```

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_CONFIG_SRV_Open()` is called.

## Function Documentation

### ◆ RM\_MESH\_CONFIG\_SRV\_Open()

```
fsp_err_t RM_MESH_CONFIG_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize configuration server model. This is to initialize configuration server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_CONFIG_SRV_Open(&g_mesh_config_srv0_ctrl, &g_mesh_config_srv0_cfg);
```

### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

**◆ RM\_MESH\_CONFIG\_SRV\_Close()**

```
fsp_err_t RM_MESH_CONFIG_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate configuration server model. This is to terminate configuration server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_CONFIG_SRV_Close(&g_mesh_config_srv0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

**◆ RM\_MESH\_CONFIG\_SRV\_StateUpdate()**

```
fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_CONFIG_SRV_StateUpdate(&g_mesh_config_srv0_ctrl, &state);
```

**Return values**

FSP_ERR_UNSUPPORTED	This function is unsupported.
---------------------	-------------------------------

**Bluetooth Low Energy Mesh Network Config Client (rm\_mesh\_config\_clt)**

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

**Functions**

```
fsp_err_t RM_MESH_CONFIG_CLT_Open (rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, rm_ble_mesh_config_client_cfg_t const *const p_cfg)
```

fsp_err_t	RM_MESH_CONFIG_CLT_Close (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_SetServer (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t server_addr, uint8_t *p_dev_key)
fsp_err_t	RM_MESH_CONFIG_CLT_SendReliablePdu (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_CONFIG_CLT_BeaconGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_BeaconSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_CompositionDataGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_DefaultTtlGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_DefaultTtlSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_GattProxyGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_GattProxySet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_RelayGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_RelaySet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelPublicationGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelPublicationSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const

	p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelSubscriptionAdd (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelSubscriptionDelete (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_SigModelSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_NetkeyAdd (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_NetkeyUpdate (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_NetkeyDelete (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_NetkeyGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_CONFIG_CLT_AppkeyAdd (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_AppkeyUpdate (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_AppkeyDelete (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_AppkeyGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_NodeIdentityGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_NodeIdentitySet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelAppBind (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_ModelAppUnbind (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_SigModelAppGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_VendorModelAppGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_NodeReset (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_FriendGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_FriendSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const

	p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_HeartbeatPublicationGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_HeartbeatPublicationSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_LpnPolltimeoutGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_NetworkTransmitGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_NetworkTransmitSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Config Client module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_config\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_config\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Config Client (rm\_mesh\_config\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Config Client (rm\_mesh\_config\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh config client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_config_clt0	Module name.

### Data Structures

```
struct rm\_mesh\_config\_clt\_instance\_ctrl\_t
```

### Data Structure Documentation

#### ◆ [rm\\_mesh\\_config\\_clt\\_instance\\_ctrl\\_t](#)

```
struct rm\_mesh\_config\_clt\_instance\_ctrl\_t
```

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_CONFIG\\_CLT\\_Open\(\)](#) is called.

### Function Documentation

### ◆ RM\_MESH\_CONFIG\_CLT\_Open()

```
fsp_err_t RM_MESH_CONFIG_CLT_Open ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
rm_ble_mesh_config_client_cfg_t const *const p_cfg )
```

Open Configuration Client middleware. This is to initialize Configuration Client model and to register with Access layer.

Implements `rm_ble_mesh_config_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_CONFIG_CLT_Open(&g_mesh_config_clt0_ctrl, &g_mesh_config_clt0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_Close()

```
fsp_err_t RM_MESH_CONFIG_CLT_Close ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

Close Configuration Client middleware.

Implements `rm_ble_mesh_config_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_CONFIG_CLT_Close(&g_mesh_config_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_CONFIG\_CLT\_SetServer()

```
fsp_err_t RM_MESH_CONFIG_CLT_SetServer ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t server_addr, uint8_t * p_dev_key )
```

This is to sets the information about server which is to be configured.

Implements `rm_ble_mesh_config_client_api_t::setServer`.

Example:

```
/* Sets the information about server which is to be configured. */
err = RM_MESH_CONFIG_CLT_SetServer(&g_mesh_config_clt0_ctrl, server_addr,
&dev_key);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_CONFIG_CLT_SendReliablePdu ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_config_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_CONFIG_CLT_SendReliablePdu(&g_mesh_config_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_BeaconGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_BeaconGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Beacon Get is an acknowledged message used to get the current Secure Network Beacon state of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_BeaconSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_BeaconSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config Beacon Set is an acknowledged message used to set the current Secure Network Beacon state of a node.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_beacon_set_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_CompositionDataGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_CompositionDataGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Composition Data Get is an acknowledged message used to read one page of the Composition Data.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_composition_data_get_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_DefaultTtlGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

Config Default TTL Get is an acknowledged message used to get the current Default TTL state of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_DefaultTtlSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Default TTL Set is an acknowledged message used to set the Default TTL state of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_default_ttl_set_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_GattProxyGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_GattProxyGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config GATT Proxy Get is an acknowledged message used to get the GATT Proxy state of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_GattProxySet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_GattProxySet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config GATT Proxy Set is an acknowledged message used to set the GATT Proxy state of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_gatt_proxy_set_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_RelayGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_RelayGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Relay Get is an acknowledged message used to get the current Relay and Relay Retransmit states of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_RelaySet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_RelaySet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config Relay Set is an acknowledged message used to set the current Relay and Relay Retransmit states of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_relay_set_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_ModelPublicationGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Model Publication Get is an acknowledged message used to get the publish address and parameters of an outgoing message that originates from a model.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_publication_get_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_ModelPublicationSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationSet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_publication_set_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_ModelPublicationVaddrSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_publication_virtual_address_set_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_ModelSubscriptionAdd()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionAdd ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_subscription_add_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_ModelSubscriptionVaddrAdd()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_subscription_virtual_address_add_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_ModelSubscriptionDelete()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDelete ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_subscription_delete_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_ModelSubscriptionVaddrDelete()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_subscription_virtual_address_delete_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_ModelSubscriptionOverwrite()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_subscription_overwrite_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_ModelSubscriptionVaddrOverwrite()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite (
rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_subscription_virtual_address_overwrite_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_ModelSubscriptionDeleteAll()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Delete All is an acknowledged message used to discard the Subscription List of a model.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_subscription_delete_all_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_SigModelSubscriptionGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_SigModelSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for SIG Models.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_sig_model_subscription_get_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_VendorModelSubscriptionGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for Vendor Models.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_vendor_model_subscription_get_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_NetkeyAdd()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyAdd ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config NetKey Add is an acknowledged message used to add a NetKey to a NetKey List on a node. The added NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_netkey_add_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_NetkeyUpdate()

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyUpdate ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config NetKey Update is an acknowledged message used to update a NetKey on a node. The updated NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_netkey_update_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_NetkeyDelete()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyDelete ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config NetKey Delete is an acknowledged message used to delete a NetKey on a NetKey List from a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_netkey_delete_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_NetkeyGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config NetKey Get is an acknowledged message used to report all NetKeys known to the node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_AppkeyAdd()**

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyAdd ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config AppKey Add is an acknowledged message used to add an AppKey to the AppKey List on a node and bind it to the NetKey identified by NetKeyIndex. The added AppKey can be used by the node only as a pair with the specified NetKey. The AppKey is used to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_appkey_add_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_AppkeyUpdate()

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyUpdate ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config AppKey Update is an acknowledged message used to update an AppKey value on the AppKey List on a node. The updated AppKey is used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_appkey_update_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_AppkeyDelete()**

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyDelete ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config AppKey Delete is an acknowledged message used to delete an AppKey from the AppKey List on a node

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_appkey_delete_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_AppkeyGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The AppKey Get is an acknowledged message used to report all AppKeys bound to the NetKey.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_appkey_get_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_NodeIdentityGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentityGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Node Identity Get is an acknowledged message used to get the current Node Identity state for a subnet.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_node_id_get_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_NodeIdentitySet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentitySet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Node Identity Set is an acknowledged message used to set the current Node Identity state for a subnet.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_node_id_set_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_ModelAppBind()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelAppBind ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Model App Bind is an acknowledged message used to bind an AppKey to a model.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_app_bind_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_ModelAppUnbind()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelAppUnbind ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Model App Unbind is an acknowledged message used to remove the binding between an AppKey and a model.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_model_app_unbind_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_SigModelAppGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_SigModelAppGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config SIG Model App Get is an acknowledged message used to request report of all AppKeys bound to the SIG Model.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_sig_model_app_get_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_VendorModelAppGet()

```
fsp_err_t RM_MESH_CONFIG_CLT_VendorModelAppGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Vendor Model App Get is an acknowledged message used to request report of all AppKeys bound to the Vendor Model.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_vendor_model_app_get_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_NodeReset()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NodeReset ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Node Reset is an acknowledged message used to reset a node (other than a Provisioner) and remove it from the network.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_FriendGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_FriendGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Friend Get is an acknowledged message used to get the current Friend state of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_FriendSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_FriendSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config Friend Set is an acknowledged message used to set the Friend state of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_friend_set_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_KeyrefreshPhaseGet()

```
fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Config Key Refresh Phase Get is an acknowledged message used to get the current Key Refresh Phase state of the identified network key.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_key_refresh_phase_get_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_KeyrefreshPhaseSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Key Refresh Phase Set is an acknowledged message used to set the current Key Refresh Phase state of the identified network key.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_key_refresh_phase_set_parameter_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_HeartbeatPublicationGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl)
```

The Config Heartbeat Publication Get is an acknowledged message used to get the current Heartbeat Publication state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_HeartbeatPublicationSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationSet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Publication state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_heartbeat_publication_set_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_HeartbeatSubscriptionGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl)
```

The Config Heartbeat Subscription Get is an acknowledged message used to get the current Heartbeat Subscription state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_HeartbeatSubscriptionSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Subscription state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_heartbeat_subscription_set_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_LpnPolltimeoutGet()

```
fsp_err_t RM_MESH_CONFIG_CLT_LpnPolltimeoutGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Low Power Node PollTimeout Get is an acknowledged message used to get the current value of PollTimeout timer of the Low Power node within a Friend node. The message is sent to a Friend node that has claimed to be handling messages by sending ACKs On Behalf Of (OBO) the indicated Low Power node. This message should only be sent to a node that has the Friend feature supported and enabled.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_low_power_node_polling_timeout_get_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_CONFIG\_CLT\_NetworkTransmitGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Network Transmit Get is an acknowledged message used to get the current Network Transmit state of a node.

**Parameters**

[in]	p_ctrl	rm_mesh_config_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_CONFIG\_CLT\_NetworkTransmitSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitSet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Network Transmit Set is an acknowledged message used to set the current Network Transmit state of a node.

#### Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_config_clt_network_transmit_set_parameter_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### Bluetooth Low Energy Mesh Network Health Server (rm\_mesh\_health\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

#### Functions

```
fsp_err_t RM_MESH_HEALTH_SERVER_Open (rm_ble_mesh_health_server_ctrl_t
*const p_ctrl, rm_ble_mesh_health_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_HEALTH_SERVER_Close (rm_ble_mesh_health_server_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault
(rm_ble_mesh_health_server_ctrl_t *const p_ctrl, const
rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t
test_id, uint16_t company_id, uint8_t fault_code)
```

```
fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus
(rm_ble_mesh_health_server_ctrl_t *const p_ctrl, uint8_t *status,
uint16_t length)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Health Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_health\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_health\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Health Server (rm\_mesh\_health\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Health Server (rm\_mesh\_health\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh health server ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_health_srv_0	Module name.
Company Id	Invalid Company Id	0	Select company id.
Number of Self Tests	Invalid Number of Self Tests	0	Select number of self tests.
Self Tests	Name Must Be a Valid C Symbol	NULL	Self test

## Data Structures

```
struct rm_mesh_health_server_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_health\_server\_instance\_ctrl\_t

```
struct rm_mesh_health_server_instance_ctrl_t
```

BLE mesh health server instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_HEALTH_SERVER_Open()` is called.

## Function Documentation

### ◆ RM\_MESH\_HEALTH\_SERVER\_Open()

```
fsp_err_t RM_MESH_HEALTH_SERVER_Open ( rm_ble_mesh_health_server_ctrl_t *const p_ctrl,
rm_ble_mesh_health_server_cfg_t const *const p_cfg )
```

API to initialize Health Server model. This is to initialize Health Server model and to register with Access layer.

Implements `rm_ble_mesh_health_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_HEALTH_SERVER_Open(&g_mesh_health_srv0_ctrl,
&g_mesh_health_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_HEALTH\_SERVER\_Close()

```
fsp_err_t RM_MESH_HEALTH_SERVER_Close ( rm_ble_mesh_health_server_ctrl_t *const p_ctrl)
```

API to terminate Health Server model. This is to terminate Health Server model and to register with Access layer.

Implements `rm_ble_mesh_health_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_HEALTH_SERVER_Close(&g_mesh_health_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_HEALTH\_SERVER\_ReportFault()**

```
fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault ( rm_ble_mesh_health_server_ctrl_t *const p_ctrl,
const rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t test_id, uint16_t
company_id, uint8_t fault_code )
```

API to report self-test fault. This is to report fault observed during self-test procedure.

**Parameters**

[in]	p_ctrl	rm_mesh_health_srv control block.
[in]	model_handle	Model Handle identifying the Health Server model instance.
[in]	test_id	Identifier of the self-test.
[in]	company_id	Company Identifier.
[in]	fault_code	Fault value indicating the error.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_MESH\_HEALTH\_SERVER\_PublishCurrentStatus()

```
fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus ( rm_ble_mesh_health_server_ctrl_t
*const p_ctrl, uint8_t* status, uint16_t length )
```

API to publish current status.

#### Parameters

[in]	p_ctrl	rm_mesh_health_srv control block.
[in]	status	Current status.
[in]	length	Length of status.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Health Client (rm\_mesh\_health\_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Close (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_GetModelHandle
```

```
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,  
rm_ble_mesh_access_model_handle_t *const p_model_handle)
```

```
fsp_err_t RM_MESH_HEALTH_CLIENT_SendReliablePdu  
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode,  
void const *const p_parameter, uint32_t rsp_opcode)
```

```

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Health Client module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_health\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_health\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Health Client (rm\_mesh\_health\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Health Client (rm\_mesh\_health\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh health client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_health_clt0	Module name.

### Data Structures

```
struct rm_mesh_health_clt_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_mesh\_health\_clt\_instance\_ctrl\_t

```
struct rm_mesh_health_clt_instance_ctrl_t
```

BLE mesh health client instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_HEALTH\\_CLIENT\\_Open\(\)](#) is called.

### Function Documentation

◆ **RM\_MESH\_HEALTH\_CLIENT\_Open()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Health Client middleware. This is to initialize Health Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_HEALTH_CLIENT_Open(&g_mesh_health_clt0_ctrl,
&g_mesh_health_clt0_cfg);
```

**Return values**

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ **RM\_MESH\_HEALTH\_CLIENT\_Close()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Health Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_HEALTH_CLIENT_Close(&g_mesh_health_clt0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_HEALTH\_CLIENT\_GetModelHandle()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Health client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of health client model. */
err = RM_MESH_HEALTH_CLIENT_GetModelHandle(&g_mesh_health_clt0_ctrl,
&model_handle);
```

**Return values**

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_HEALTH\_CLIENT\_SendReliablePdu()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to set the handle of Health client model.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_HEALTH_CLIENT_SendReliablePdu(&g_mesh_health_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_HEALTH\_CLIENT\_FaultGet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Health Fault Get is an acknowledged message used to get the current Registered Fault state identified by Company ID of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_health_clt_fault_get_clear_info_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_HEALTH\_CLIENT\_FaultClearUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Health Fault Clear Unacknowledged is an unacknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_health_clt_fault_get_clear_info_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_HEALTH\_CLIENT\_FaultClear()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClear ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Fault Clear is an acknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_health_ct control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_health_ct_fault_get_clear_info_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_HEALTH\_CLIENT\_FaultTest()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTest ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Fault Test is an acknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_health_clt_fault_test_info_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_HEALTH\_CLIENT\_FaultTestUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Health Fault Test Unacknowledged is an unacknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_health_clt_fault_test_info_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_HEALTH\_CLIENT\_PeriodGet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Health Period Get is an acknowledged message used to get the current Health Period state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_health_clt control block.
------	--------	-----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_HEALTH\_CLIENT\_PeriodSetUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Health Period Set Unacknowledged is an unacknowledged message used to set the current Health Period state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_health_clt_period_info_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_HEALTH\_CLIENT\_PeriodSet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Period Set is an acknowledged message used to set the current Health Period state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_health_ct control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_health_ct_period_info_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_HEALTH\_CLIENT\_AttentionGet()

`fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

The Health Attention Get is an acknowledged message used to get the current Attention Timer state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
------	--------	-----------------------------------

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_HEALTH\_CLIENT\_AttentionSet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Attention Set is an acknowledged message used to set the Attention Timer state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_health_clt_attention_info_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_HEALTH\_CLIENT\_AttentionSetUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Health Attention Set Unacknowledged is an unacknowledged message used to set the Attention Timer state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_health_clt_attention_info_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Bearer Platform module supports the following

devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_bearer\_platform

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_bearer\_platform\_cfg.h:

Configuration	Options	Default	Description
Debug Public Address	Must be a valid device address	FF:FF:FF:50:90:74	Public Address of firmware initial value.
Debug Random Address	Must be a valid device address	FF:FF:FF:FF:FF:FF	Random Address of firmware initial value.
Maximum number of connections	Value must be an integer between 1 and 7	7	Maximum number of connections.
Maximum connection data length	Value must be an integer between 27 and 251	251	Maximum connection data length.
Maximum advertising data length	Value must be an integer between 31 and 1650	1650	Maximum advertising data length.
Maximum advertising set number	Value must be an integer between 1 and 4	4	Maximum advertising set number.
Maximum periodic sync set number.	Value must be an integer between 1 and 2	2	Maximum periodic sync set number.
Store Security Data	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Store Security Data in DataFlash.
Data Flash Block for Security Data	Value must be an integer between 0 and 7	0	Data Flash Block for Security Data Management.
Remote Device Bonding Number	Value must be an integer between 1 and 7	7	Number of remote device bonding information.
Connection Event Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Connection event start notify enable/disable.
Connection Event Close Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Connection event close notify enable/disable.
Advertising Event Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Advertising event start notify

			enable/disable.
Advertising Event Close Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Advertising event close notify enable/disable.
Scanning Event Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Scanning event start notify enable/disable.
Scanning Event Close Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Scanning event close notify enable/disable.
Initiating Event Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Initiating event start notify enable/disable.
Initiating Event Close Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set Initiating event close notify enable/disable.
RF Deep Sleep Start Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set RF_DEEP_SLEEP start notify enable/disable.
RF Deep Sleep Wakeup Notify	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set RF_DEEP_SLEEP wakeup notify enable/disable.
Bluetooth dedicated clock	Value must be an integer between 0 and 15	6	Load capacitance adjustment.
DC-DC converter	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Set DC-DC converter for RF part.
Slow Clock Source	<ul style="list-style-type: none"> <li>• Use RF_LOCO</li> <li>• Use External 32.768kHz</li> </ul>	Use RF_LOCO	Set slow clock source for RF part.
MCU CLKOUT Port	<ul style="list-style-type: none"> <li>• P109</li> <li>• P205</li> </ul>	P109	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT.
MCU CLKOUT Frequency Output	<ul style="list-style-type: none"> <li>• MCU CLKOUT frequency 32.768kHz</li> <li>• MCU CLKOUT frequency 16.384kHz</li> </ul>	MCU CLKOUT frequency 32.768kHz	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part.
Sleep Clock Accuracy(SCA)	Value must be an integer between 0 and 500	250	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock.

Transmission Power Maximum Value	<ul style="list-style-type: none"> <li>• max +0dBm</li> <li>• max +4dBm</li> </ul>	max +4dBm	Set transmission power maximum value.
Transmission Power Default Value	<ul style="list-style-type: none"> <li>• High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)</li> <li>• Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm)</li> <li>• Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm)</li> </ul>	High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)	Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(MESH_BEARER_PLATFORM_CFG_RF_MAX_TX_POW).
CLKOUT_RF Output	<ul style="list-style-type: none"> <li>• No output</li> <li>• 4MHz output</li> <li>• 2MHz output</li> <li>• 1MHz output</li> </ul>	No output	Set CLKOUT_RF output setting.
RF_DEEP_SLEEP Transition	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Set RF_DEEP_SLEEP transition.
MCU Main Clock Frequency	Value must be an integer between 1000 and 20000	8000	Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz
Code Flash(ROM) Device Data Block	Value must be an integer between -1 and 255	255	Device specific data block on Code Flash (ROM).
Device Specific Data Flash Block	Value must be an integer between -1 and 7	-1	Device specific data block on E2 Data Flash.
MTU Size Configured	Value must be an	247	MTU Size configured by

	integer between 23 and 247		GATT MTU exchange procedure.
Timer Slot Maximum Number	Value must be an integer between 1 and 10	10	The maximum number of timer slot.

## Configurations for Networking > BLE Mesh Bearer Platform (rm\_mesh\_bearer\_platform)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Bearer Platform (rm\_mesh\_bearer\_platform).

Configuration	Options	Default	Description
General > Name	Name Must Be a Valid C Symbol	g_rm_mesh_bearer_platform0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Device Address Type	Invalid Device Address Type	0	Select device address type ( public : 0, random : 1).
GATT Server Callback Number	Invalid Callback Number	1	Number of GATT server callback.
GATT Client Callback Number	Invalid Callback Number	1	Number of GATT client callback.
Vender Specific Callback	Name Must Be a Valid C Symbol.	NULL	Vendor specific callback function name.

## Data Structures

```
struct rm_mesh_bearer_platform_instance_ctrl_t
```

```
struct rm_mesh_bearer_platform_extended_cfg_t
```

## Typedefs

```
typedef void(* rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr)
```

Callback function for GATT interface event. [More...](#)

## Enumerations

```
enum rm_mesh_bearer_platform_interface_event_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_bearer\_platform\_instance\_ctrl\_t

```
struct rm_mesh_bearer_platform_instance_ctrl_t
```

RM\_BLE\_MESH\_BEARER private control block. DO NOT MODIFY. Initialization occurs when [RM\\_BLE\\_MESH\\_BEARER\\_Open\(\)](#) is called.

#### ◆ rm\_mesh\_bearer\_platform\_extended\_cfg\_t

```
struct rm_mesh_bearer_platform_extended_cfg_t
```

Bearer port extension for renesas BLE stack.

## Typedef Documentation

#### ◆ rm\_mesh\_bearer\_platform\_gatt\_iface\_cb\_t

```
typedef void(* rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr)
```

Callback function for GATT interface event.

#### Parameters

event_name	The event defined by <a href="#">rm_mesh_bearer_platform_interface_event_t</a>
event_param	The mode of GATT connection <a href="#">rm_mesh_bearer_platform_gatt_mode_t</a>
conn_hdl	The connection handle
peer_addr	Pointer to the connected device address

## Enumeration Type Documentation

◆ **rm\_mesh\_bearer\_platform\_interface\_event\_t**

enum <code>rm_mesh_bearer_platform_interface_event_t</code>	
GATT Interface Events	
Enumerator	
<code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_UP</code>	The event GATT Bearer BLE Link Layer connected
<code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DOWN</code>	The event GATT Bearer BLE Link Layer disconnected
<code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_ENABLE</code>	The event GATT Bearer service enabled for communication
<code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DISABLE</code>	The event GATT Bearer service disabled for communication
<code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_NOT_FOUND</code>	The event discovery process is not completed
<code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_SCAN</code>	The event that connectable device having Mesh GATT Service is found
<code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_CANCEL</code>	The Event GATT/BLE link layer connection creation is canceled

**Function Documentation**

### ◆ RM\_MESH\_BEARER\_PLATFORM\_Open()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Open ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl,
rm_mesh_bearer_platform_cfg_t const *const p_cfg )
```

Open Bearer Platform middleware. Initialize underlying BLE Protocol Stack to use as a Mesh Bearer. API to initialize underlying BLE Protocol Stack to use as a Mesh Bearer. Completion of the initialization is notified by the callback function.

Implements `rm_mesh_bearer_platform_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_BEARER_PLATFORM_Open(&g_mesh_bearer_platform0_ctrl,
&g_mesh_bearer_platform0_cfg);
```

#### Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

### ◆ RM\_MESH\_BEARER\_PLATFORM\_Close()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Close ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl)
```

Close Bearer Platform middleware. Terminate BLE stack.

Implements `rm_mesh_bearer_platform_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_BEARER_PLATFORM_Close(&g_mesh_bearer_platform0_ctrl);
```

#### Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MESH\_BEARER\_PLATFORM\_Setup()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Setup ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl)
```

Register ADV bearer with Mesh stack and start scan. API to register ADV bearer with Mesh stack. After registering, this routine starts Scan.

**Parameters**

[in]	p_ctrl	rm_mesh_bearer_platform control block.
------	--------	--

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_BEARER\_PLATFORM\_CallbackSet()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_CallbackSet ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl, rm_mesh_bearer_platform_gatt_iface_cb_t callback )
```

Register callback function to receive GATT interface events. API to register callback function to receive GATT interface events.

**Parameters**

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	callback	Callback function.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_BEARER\_PLATFORM\_SetGattMode()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_SetGattMode ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, rm_mesh_bearer_platform_gatt_mode_t mode )
```

Set GATT Bearer mode.

**Parameters**

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_BEARER\_PLATFORM\_GetGattMode()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_GetGattMode ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, rm_mesh_bearer_platform_gatt_mode_t * p_mode )
```

Get current GATT Bearer mode.

**Parameters**

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	p_mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_mode is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_BEARER\_PLATFORM\_SetScanResponseData()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_SetScanResponseData ( rm_mesh_bearer_platform_ctrl_t
*const p_ctrl, uint8_t* p_data, uint8_t len )
```

Set scan response data in connectable and scannable undirected advertising event. API to Set Scan Response Data in Connectable and scannable undirected Advertising event. Scan Response Data can be used for indicating additional information such as << Complete Local Name>>.

Implements `rm_mesh_bearer_platform_api_t::setScanResponseData`.

Example:

```
/* Set scan response data in connectable and scannable undirected advertising
event.. */
err = RM_MESH_BEARER_PLATFORM_SetScanResponseData(&g_mesh_bearer_platform0_ctrl,
&data, length);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_MESH\_BEARER\_PLATFORM\_ScanGattBearer()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_ScanGattBearer ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, rm_mesh_bearer_platform_state_t state, rm_mesh_bearer_platform_gatt_mode_t mode )
```

Manage reporting connectable device having Mesh GATT service. API to manage reporting connectable device having Mesh GATT service.

**Parameters**

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	state	Notification configuration flag; enable if RM_MESH_BEARER_PLATFORM_STATE_ENABLE, or disable if RM_MESH_BEARER_PLATFORM_STATE_DISABLE.
[in]	mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_BEARER\_PLATFORM\_Connect()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Connect ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl,
uint8_t * p_remote_address, uint8_t address_type, rm_mesh_bearer_platform_gatt_mode_t mode
)
```

Request to create connection. API to request to Create Connection. Completion of the establishing a connection is notified by RM\_BLE\_MESH\_BEARER\_IFACE\_UP. After establishing a connection, RM\_MESH\_BEARER\_PLATFORM\_DiscoverService() is invoked automatically.

Implements `rm_mesh_bearer_platform_api_t::connect`.

Example:

```
/* Request to create connection. */
err = RM_MESH_BEARER_PLATFORM_Connect (&g_mesh_bearer_platform0_ctrl,
                                         &remote_address,
                                         bearer_address_type,
                                         RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remote_address is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_MESH\_BEARER\_PLATFORM\_DiscoverService()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_DiscoverService ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, uint16_t handle, rm_mesh_bearer_platform_gatt_mode_t mode )
```

Start service discovery for Mesh GATT service. API to start Service Discovery for Mesh GATT Service. If Mesh GATT Service specified by the "mode" argument, this routine enables Notification of the Mesh GATT Service by invoking [RM\\_MESH\\_BEARER\\_PLATFORM\\_ConfigureNotification\(\)](#).

Implements [rm\\_mesh\\_bearer\\_platform\\_api\\_t::discoverService](#).

Example:

```
/* Start service discovery for Mesh GATT service. */
err = RM_MESH_BEARER_PLATFORM_DiscoverService(&g_mesh_bearer_platform0_ctrl,
                                             handle,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_MESH\_BEARER\_PLATFORM\_ConfigureNotification()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_ConfigureNotification ( rm_mesh_bearer_platform_ctrl_t
*const p_ctrl, uint16_t handle, rm_mesh_bearer_platform_state_t state,
rm_mesh_bearer_platform_gatt_mode_t mode )
```

Configure GATT notification of Mesh GATT service. API to configure GATT Notification of Mesh GATT Service.

Implements `rm_mesh_bearer_platform_api_t::configureNotification`.

Example:

```
/* Configure GATT notification of Mesh GATT service. */
err =
RM_MESH_BEARER_PLATFORM_ConfigureNotification(&g_mesh_bearer_platform0_ctrl,
                                             handle,
RM_MESH_BEARER_PLATFORM_STATE_ENABLE,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_MESH\_BEARER\_PLATFORM\_Disconnect()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Disconnect ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, uint16_t handle )
```

Terminate Connection. API to terminate connection.

Implements `rm_mesh_bearer_platform_api_t::disconnect`.

Example:

```
/* Terminate Connection. */
err = RM_MESH_BEARER_PLATFORM_Disconnect(&g_mesh_bearer_platform0_ctrl, handle);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

## Bluetooth Low Energy Mesh Network Generic Admin Property Server (rm\_mesh\_generic\_admin\_prop\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

           rm_ble_mesh_access_server_state_t const *const p_state)
```

### Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Admin Property Server module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_generic\_admin\_prop\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_admin\_prop\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Generic Admin Property Server (rm\_mesh\_generic\_admin\_prop\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Admin Property Server (rm\_mesh\_generic\_admin\_prop\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server

ISR occurs

Interrupts > Callback  
Provided When an  
Timeout ISR OccursName Must Be a Valid  
C Symbol

NULL

Callback provided  
when mesh generic  
admin property server  
timeout ISR occurs

Name

Name Must Be a Valid  
C Symbolg\_rm\_mesh\_generic\_ad  
min\_prop\_srv0

Module name.

## Data Structures

struct [rm\\_mesh\\_generic\\_admin\\_prop\\_srv\\_info\\_t](#)struct [rm\\_mesh\\_generic\\_admin\\_prop\\_srv\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ [rm\\_mesh\\_generic\\_admin\\_prop\\_srv\\_info\\_t](#)

struct <a href="#">rm_mesh_generic_admin_prop_srv_info_t</a>		
Generic Admin Property is a state representing a device property of an element that can be read or written		
Data Fields		
uint16_t	property_id	Admin Property ID field is a 2-octet Assigned Number value referencing a device property
uint8_t	user_access	Admin User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property
uint8_t *	property_value	Admin Property Value field is a conditional field
uint16_t	property_value_len	

### ◆ [rm\\_mesh\\_generic\\_admin\\_prop\\_srv\\_instance\\_ctrl\\_t](#)

struct <a href="#">rm_mesh_generic_admin_prop_srv_instance_ctrl_t</a>
BLE mesh generic admin prop instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_GENERIC_ADMIN_PROP_SRV_Open()</a> is called.

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_ADMIN\_PROP\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Admin\_Property Server model. This is to initialize Generic\_Admin\_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_Open(&g_mesh_generic_admin_prop_srv0_ctrl,
&g_mesh_generic_admin_prop_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_ADMIN\_PROP\_SRV\_Close()

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic\_Admin\_Property Server model. This is to terminate Generic\_Admin\_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_ADMIN_PROP_SRV_Close(&g_mesh_generic_admin_prop_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_ADMIN\_PROP\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate(&g_mesh_generic_admin_prop_srv0_ctrl,
&state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Battery Client (rm\_mesh\_generic\_battery\_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```

fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Battery Client module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_generic\_battery\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_battery\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Generic Battery Client (rm\_mesh\_generic\_battery\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Battery Client (rm\_mesh\_generic\_battery\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery client ISR occurs
Name	Name Must Be a Valid	g_rm_mesh_generic_ba	Module name.

C Symbol

battery\_clt0

## Data Structures

struct `rm_mesh_generic_battery_clt_instance_ctrl_t`

## Data Structure Documentation

### ◆ `rm_mesh_generic_battery_clt_instance_ctrl_t`

struct `rm_mesh_generic_battery_clt_instance_ctrl_t`

BLE mesh generic battery instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_BATTERY_CLT_Open()` is called.

## Function Documentation

### ◆ `RM_MESH_GENERIC_BATTERY_CLT_Open()`

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic Battery Client middleware. This is to initialize Generic\_Battery Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_BATTERY_CLT_Open(&g_mesh_generic_battery_clt0_ctrl,
&g_mesh_generic_battery_clt0_cfg);
```

### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_BATTERY\_CLT\_Close()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic Battery Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_BATTERY_CLT_Close(&g_mesh_generic_battery_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_BATTERY\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic\_Battery client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic battery client model. */
err =
RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
&model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_GENERIC\_BATTERY\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Generic\_Battery client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of generic battery client model. */
err =
RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_BATTERY\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu(&g_mesh_generic_battery_clt0_ctrl,
                                             req_opcode,
                                             p_parameter,
                                             rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_BATTERY\_CLT\_Get()

`fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Generic Battery Get message is an acknowledged message used to get the Generic Battery state of an element. The response to the Generic Battery Get message is a Generic Battery Status message. There are no parameters for this message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_battery_clt control block.
------	--------	--

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Battery Server (rm\_mesh\_generic\_battery\_srv)

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Battery Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_battery\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_battery\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic Battery Server (rm\_mesh\_generic\_battery\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Battery Server (rm\_mesh\_generic\_battery\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_battery_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_battery_srv_info_t
```

```
struct rm_mesh_generic_battery_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_battery\_srv\_info\_t

```
struct rm_mesh_generic_battery_srv_info_t
```

Generic Battery state is a set of four values representing the state of a battery		
Data Fields		
uint8_t	generic_battery_level	Generic Battery Level state is a value ranging from 0 percent through 100 percent
uint32_t	generic_battery_time_to_discharge	Generic Battery Time to Discharge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFFFF
uint32_t	generic_battery_time_to_charge	Generic Battery Time to Charge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFFFF
uint8_t	generic_battery_flags	Generic Battery Flags state is a concatenation of four 2-bit bit fields: Presence, Indicator, Charging, and Serviceability

#### ◆ rm\_mesh\_generic\_battery\_srv\_instance\_ctrl\_t

struct rm_mesh_generic_battery_srv_instance_ctrl_t
BLE mesh generic_battery instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_GENERIC_BATTERY_SRV_Open()</a> is called.

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_BATTERY\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Battery Server model. This is to initialize Generic\_Battery Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_BATTERY_SRV_Open(&g_mesh_generic_battery_srv0_ctrl,
&g_mesh_generic_battery_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_BATTERY\_SRV\_Close()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic\_Battery Server model. This is to terminate Generic\_Battery Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_BATTERY_SRV_Close(&g_mesh_generic_battery_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_BATTERY\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Client Property Server (rm\_mesh\_generic\_client\_prop\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close
```

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Client Property Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_client\_prop\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_client\_prop\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic Client Property Server (rm\_mesh\_generic\_client\_prop\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Client Property Server (rm\_mesh\_generic\_client\_prop\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic client property server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic client property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_client_prop_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_client_prop_srv_instance_ctrl_t
```

## Data Structure Documentation

◆ **rm\_mesh\_generic\_client\_prop\_srv\_instance\_ctrl\_t**

```
struct rm_mesh_generic_client_prop_srv_instance_ctrl_t
```

BLE mesh generic client prop instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_GENERIC\\_CLIENT\\_PROP\\_SRV\\_Open\(\)](#) is called.

**Function Documentation**◆ **RM\_MESH\_GENERIC\_CLIENT\_PROP\_SRV\_Open()**

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Client\_Property Server model. This is to initialize Generic\_Client\_Property Server model and to register with Access layer.

Implements [rm\\_ble\\_mesh\\_model\\_server\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_CLIENT_PROP_SRV_Open(&g_mesh_generic_client_prop_srv0_ctrl,
                                           &g_mesh_generic_client_prop_srv0_cfg);
```

**Return values**

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

**◆ RM\_MESH\_GENERIC\_CLIENT\_PROP\_SRV\_Close()**

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const  
p_ctrl)
```

API to terminate Generic\_Client\_Property Server model. This is to terminate Generic\_Client\_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err =  
RM_MESH_GENERIC_CLIENT_PROP_SRV_Close(&g_mesh_generic_client_prop_srv0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_CLIENT\_PROP\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate(&g_mesh_generic_client_prop_srv0_ctrl,
&state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Default Transition Time Client (rm\_mesh\_generic\_dtt\_clt)

fsp_err_t	RM_MESH_GENERIC_DTT_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

## Detailed Description

### Overview

#### Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Default Transition Time Client module supports the following devices.

- RA4W1

### Configuration

#### Build Time Configurations for rm\_mesh\_generic\_dtt\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_dtt\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

#### Configurations for Networking > BLE Mesh Model Generic Default Transition Time Client (rm\_mesh\_generic\_dtt\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Default Transition Time Client (rm\_mesh\_generic\_dtt\_clt).

--	--	--	--

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_dtt_clt0	Module name.

## Data Structures

```
struct rm_mesh_generic_dtt_clt_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_dtt\_clt\_instance\_ctrl\_t

```
struct rm_mesh_generic_dtt_clt_instance_ctrl_t
```

BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_GENERIC\\_DTT\\_CLT\\_Open\(\)](#) is called.

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_DTT\_CLT\_Open()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic Default Transition Time Client middleware. This is to initialize Generic\_Default\_Transition\_Time Client model and to register with Access layer.

Implements [rm\\_ble\\_mesh\\_model\\_client\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_DTT_CLT_Open(&g_mesh_generic_dtt_clt0_ctrl,
&g_mesh_generic_dtt_clt0_cfg);
```

### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_DTT\_CLT\_Close()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic Default Transition Time Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_DTT_CLT_Close(&g_mesh_generic_dtt_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_DTT\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic\_Default\_Transition\_Time client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic default transition time client model. */
err = RM_MESH_GENERIC_DTT_CLT_GetModelHandle(&g_mesh_generic_dtt_clt0_ctrl,
&model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_GENERIC\_DTT\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Generic\_Default\_Transition\_Time client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of generic default transition time client model. */
err = RM_MESH_GENERIC_DTT_CLT_SetModelHandle(&g_mesh_generic_dtt_clt0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_DTT\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands */
err = RM_MESH_GENERIC_DTT_CLT_SendReliablePdu(&g_mesh_generic_dtt_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_DTT\_CLT\_Get()**

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Default Transition Time Get is an acknowledged message used to get the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Get message is a Generic Default Transition Time Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.
------	--------	--

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_DTT\_CLT\_Set()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Generic Default Transition Time Set is an acknowledged message used to set the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Set message is a Generic Default Transition Time Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.
[in]	p_parameter	Pointer to transition time.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_DTT\_CLT\_SetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Default Transition Time Set Unacknowledged is an unacknowledged message used to set the Generic Default Transition Time state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.
[in]	p_parameter	Pointer to transition time.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Default Transition Time Server (rm\_mesh\_generic\_dtt\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_Open

```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Default Transition Time Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_dtt\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_dtt\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic Default Transition Time Server (rm\_mesh\_generic\_dtt\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Default Transition Time Server (rm\_mesh\_generic\_dtt\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Tmeout Occurs	Name must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_dtt_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_dtt_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_dtt\_srv\_instance\_ctrl\_t

```
struct rm_mesh_generic_dtt_srv_instance_ctrl_t
```

BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_DTT_SRV_Open()` is called.

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_DTT\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Default\_Transition\_Time Server model. This is to initialize Generic\_Default\_Transition\_Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_DTT_SRV_Open(&g_mesh_generic_dtt_srv0_ctrl,
&g_mesh_generic_dtt_srv0_cfg);
```

### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_DTT\_SRV\_Close()

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic\_Default\_Transition\_Time Server model. This is to terminate Generic\_Default\_Transition\_Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_DTT_SRV_Close(&g_mesh_generic_dtt_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_DTT\_SRV\_GetTime()

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_GetTime ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_mesh_generic_dtt_srv_transtion_time_info_t *const p_info )
```

API to get default transition time. This is to get default transition time.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_srv control block.
[in]	p_info	rm_mesh_generic_dtt_srv status information.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_MoveSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Level Client module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_generic\_level\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_level\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Generic Level Client (rm\_mesh\_generic\_level\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Level Client (rm\_mesh\_generic\_level\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_level_clt0	Module name.

### Data Structures

```
struct rm_mesh_generic_level_clt_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_mesh\_generic\_level\_clt\_instance\_ctrl\_t

```
struct rm_mesh_generic_level_clt_instance_ctrl_t
```

BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_GENERIC\\_LEVEL\\_CLT\\_Open\(\)](#) is called.

### Function Documentation

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_Open()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic\_Level Client middleware. This is to initialize Generic\_Level Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LEVEL_CLT_Open(&g_mesh_generic_level_clt0_ctrl,
&g_mesh_generic_level_clt0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_Close()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic\_Level Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LEVEL_CLT_Close(&g_mesh_generic_level_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic\_Level client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle()`.

Example:

```
/* Get the handle of generic level client model. */
err = RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle(&g_mesh_generic_level_clt0_ctrl,
&model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Generic\_Level client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of generic level client model. */
err = RM_MESH_GENERIC_LEVEL_CLT_SetModelHandle(&g_mesh_generic_level_clt0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu(&g_mesh_generic_level_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_LEVEL\_CLT\_Get()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Level Get is an acknowledged message used to get the Generic Level state of an element. The response to the Generic Level Get message is a Generic Level Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
------	--------	--

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_Set()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Generic Level Set is an acknowledged message used to set the Generic Level state of an element to a new absolute value. The response to the Generic Level Set message is a Generic Level Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_LEVEL\_CLT\_SetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Level Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element to a new absolute value.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_DeltaSet()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Delta Set is an acknowledged message used to set the Generic Level state of an element by a relative value. The message is transactional, it supports changing the state by a cumulative value with a sequence of messages that are part of a transaction. The response to the Generic Delta Set message is a Generic Level Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_DeltaSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Delta Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element by a relative value.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_MoveSet()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Move Set is an acknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed. The response to the Generic Move Set message is a Generic Level Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_CLT\_MoveSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Move Set Unacknowledged is an unacknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Level Server (rm\_mesh\_generic\_level\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Open

```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Level Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_level\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_level\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic Level Server (rm\_mesh\_generic\_level\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Level Server (rm\_mesh\_generic\_level\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_level_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_level_srv_info_t
```

```
struct rm_mesh_generic_level_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_level\_srv\_info\_t

**struct rm\_mesh\_generic\_level\_srv\_info\_t**

Generic Level state is a 16-bit signed integer (2-s complement) representing the state of an element

## Data Fields

uint16_t	level	Generic Level
uint32_t	delta_level	Delta Level
uint16_t	move_level	Move Level
uint8_t	tid	
uint8_t	transition_time	
uint8_t	delay	
uint16_t	target_level	Target Level

◆ **rm\_mesh\_generic\_level\_srv\_instance\_ctrl\_t****struct rm\_mesh\_generic\_level\_srv\_instance\_ctrl\_t**

BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_GENERIC\\_LEVEL\\_SRV\\_Open\(\)](#) is called.

**Function Documentation**

### ◆ RM\_MESH\_GENERIC\_LEVEL\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Level Server model. This is to initialize Generic\_Level Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LEVEL_SRV_Open(&g_mesh_generic_level_srv0_ctrl,
&g_mesh_generic_level_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_SRV\_Close()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic\_Level Server model. This is to terminate Generic\_Level Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LEVEL_SRV_Close(&g_mesh_generic_level_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_LEVEL\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Location Client (rm\_mesh\_generic\_loc\_clt)

---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Generic Location Client (rm\_mesh\_generic\_loc\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Location Client (rm\_mesh\_generic\_loc\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic location client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_loc_clt0	Module name.

### Data Structures

```
struct rm_mesh_generic_loc_clt_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_mesh\_generic\_loc\_clt\_instance\_ctrl\_t

```
struct rm_mesh_generic_loc_clt_instance_ctrl_t
```

BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_GENERIC\\_LOC\\_CLT\\_Open\(\)](#) is called.

### Function Documentation

### ◆ RM\_MESH\_GENERIC\_LOC\_CLT\_Open()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic\_Location Client middleware. This is to initialize Generic\_Location Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LOC_CLT_Open(&g_mesh_generic_loc_clt0_ctrl,
&g_mesh_generic_loc_clt0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_LOC\_CLT\_Close()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic\_Location Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LOC_CLT_Close(&g_mesh_generic_loc_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_LOC\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic\_Location client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic_location client model. */
err = RM_MESH_GENERIC_LOC_CLT_GetModelHandle(&g_mesh_generic_loc_clt0_ctrl,
&model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_GENERIC\_LOC\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Generic\_Location client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of generic location client model. */
err = RM_MESH_GENERIC_LOC_CLT_SetModelHandle(&g_mesh_generic_loc_clt0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_LOC\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands */
err = RM_MESH_GENERIC_LOC_CLT_SendReliablePdu(&g_mesh_generic_loc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_LOC\_CLT\_LocationGlobalGet()**

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

Generic Location Global Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Global Get message is a Generic Location Global Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
------	--------	--

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LOC\_CLT\_LocationGlobalSet()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Location Global Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Global Set message is a Generic Location Global Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Global Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LOC\_CLT\_LocationGlobalSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Location Global Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Global Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_LOC\_CLT\_LocationLocalGet()**

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Location Local Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Local Get message is a Generic Location Local Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
------	--------	--

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LOC\_CLT\_LocationLocalSet()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Generic Location Local Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Local Set message is a Generic Location Local Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Local Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LOC\_CLT\_LocationLocalSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Location Local Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Local Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Location Server (rm\_mesh\_generic\_loc\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_Open
  (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
  rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_Close
  (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Location Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_loc\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_loc\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic Location Server (rm\_mesh\_generic\_loc\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Location Server (rm\_mesh\_generic\_loc\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic location server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic location server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_loc_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_loc_srv_global_info_t
```

```
struct rm_mesh_generic_loc_srv_local_info_t
```

```
struct rm_mesh_generic_loc_srv_state_info_t
```

```
struct rm_mesh_generic_loc_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_loc\_srv\_global\_info\_t

struct rm_mesh_generic_loc_srv_global_info_t		
Generic Global Location state defines location information of an element		
Data Fields		
uint32_t	global_latitude	Global Coordinates (Latitude)
uint32_t	global_longitude	Global Coordinates (Longitude)
uint16_t	global_altitude	Global Altitude

### ◆ rm\_mesh\_generic\_loc\_srv\_local\_info\_t

struct rm_mesh_generic_loc_srv_local_info_t		
Generic Local Location state defines location information of an element		
Data Fields		
uint16_t	local_north	Local Coordinates (North)
uint16_t	local_east	Local Coordinates (East)
uint16_t	local_altitude	Local Altitude
uint8_t	floor_number	Floor Number
uint16_t	uncertainty	Uncertainty

### ◆ rm\_mesh\_generic\_loc\_srv\_state\_info\_t

struct rm_mesh_generic_loc_srv_state_info_t		
Generic Location state is a composite state that includes a Generic Location Global state and a Generic Location Local state		
Data Fields		
rm_mesh_generic_loc_srv_global_info_t	global_location	Global Location
rm_mesh_generic_loc_srv_local_info_t	local_location	Local Location

### ◆ rm\_mesh\_generic\_loc\_srv\_instance\_ctrl\_t

struct rm_mesh_generic_loc_srv_instance_ctrl_t		
BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when <code>RM_MESH_GENERIC_LOC_SRV_Open()</code> is called.		

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_LOC\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Location Server model and to initialize Generic\_Location\_Setup Server model. This is to initialize Generic\_Location Server model and to register with Access layer. And this is to initialize Generic\_Location\_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LOC_SRV_Open(&g_mesh_generic_loc_srv0_ctrl,
&g_mesh_generic_loc_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_LOC\_SRV\_Close()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic\_Location Server model. This is to terminate Generic\_Location Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LOC_SRV_Close(&g_mesh_generic_loc_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_LOC\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_LOC_SRV_StateUpdate(&g_mesh_generic_loc_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_LOC\_SRV\_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate (
rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_loc_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Manufacturer Property Server (rm\_mesh\_generic\_mfr\_prop\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open

The Bluetooth Low Energy Energy Mesh Network Generic Manufacturer Property Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_mfr\_prop\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_mfr\_prop\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic Manufacturer Property Server (rm\_mesh\_generic\_mfr\_prop\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Manufacturer Property Server (rm\_mesh\_generic\_mfr\_prop\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic manufacturer property server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must be a Valid C Symbol	NULL	Callback provided when mesh generic manufacturer property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_mfr_prop_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_mfr_prop_srv_info_t
```

```
struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_mfr\_prop\_srv\_info\_t

struct rm_mesh_generic_mfr_prop_srv_info_t		
Generic Manufacturer Property is a state representing a device property of an element that is programmed by a manufacturer and can be read		
Data Fields		
uint16_t	property_id	Manufacturer Property ID field is a 2-octet Assigned Number value that references a device property
uint8_t	user_access	Manufacturer User Access field is an enumeration indicating whether or not the device property can be read as a Generic User Property
uint8_t *	property_value	Manufacturer Property Value field is a conditional field
uint16_t	property_value_len	

### ◆ rm\_mesh\_generic\_mfr\_prop\_srv\_instance\_ctrl\_t

struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t
BLE mesh generic mfr prop instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_GENERIC_MFR_PROP_SRV_Open()</a> is called.

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_MFR\_PROP\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Manufacturer\_Property Server model. This is to initialize Generic\_Manufacturer\_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_MFR_PROP_SRV_Open(&g_mesh_generic_mfr_prop_srv0_ctrl,
&g_mesh_generic_mfr_prop_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_MFR\_PROP\_SRV\_Close()

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic\_Manufacturer\_Property Server model. This is to terminate Generic\_Manufacturer\_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_MFR_PROP_SRV_Close(&g_mesh_generic_mfr_prop_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_MFR\_PROP\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate(&g_mesh_generic_mfr_prop_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic On Off Client (rm\_mesh\_generic\_on\_off\_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Open
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Close
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle)
```

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetModelHandle
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle)
```

```

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic On Off Client module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_generic\_on\_off\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_on\_off\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Generic On Off Client (rm\_mesh\_generic\_on\_off\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic On Off Client (rm\_mesh\_generic\_on\_off\_clt).

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_on_off_clt0	Module name.

## Data Structures

```
struct rm_mesh_generic_on_off_clt_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_on\_off\_clt\_instance\_ctrl\_t

```
struct rm_mesh_generic_on_off_clt_instance_ctrl_t
```

BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_GENERIC\\_ON\\_OFF\\_CLT\\_Open\(\)](#) is called.

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_ON\_OFF\_CLT\_Open()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic\_Onoff Client middleware. This is to initialize Generic\_Onoff Client model and to register with Access layer.

Implements [rm\\_ble\\_mesh\\_model\\_client\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_ON_OFF_CLT_Open(&g_mesh_generic_on_off_clt0_ctrl,
&g_mesh_generic_on_off_clt0_cfg);
```

### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ **RM\_MESH\_GENERIC\_ON\_OFF\_CLT\_Close()**

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic\_Onoff Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_ON_OFF_CLT_Close(&g_mesh_generic_on_off_clt0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_GENERIC\_ON\_OFF\_CLT\_GetModelHandle()**

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic\_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic on_off client model. */
err = RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle(&g_mesh_generic_on_off_clt0_ctrl,
&model_handle);
```

**Return values**

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_GENERIC\_ON\_OFF\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Generic\_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of generic on_off client model. */
err = RM_MESH_GENERIC_ON_OFF_CLT_SetModelHandle(&g_mesh_generic_on_off_clt0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_ON\_OFF\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu(&g_mesh_generic_on_off_clt0_ctrl,
                                           req_opcode,
                                           p_parameter,
                                           rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_ON\_OFF\_CLT\_Get()**

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Generic OnOff Get is an acknowledged message used to get the Generic OnOff state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.
------	--------	---

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_ON\_OFF\_CLT\_Set()**

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Generic OnOff Set is an acknowledged message used to get the Generic OnOff state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_generic_on_off_set_info_t</a> .

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_ON\_OFF\_CLT\_SetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Generic OnOff Set is an unacknowledged message used to get the Generic OnOff state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.
[in]	p_parameter	Pointer to the structure populated as in <a href="#">rm_mesh_generic_on_off_set_info_t</a> .

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic On Off Server (rm\_mesh\_generic\_on\_off\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Close
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_access_server_state_t const *const p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic On Off Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_on\_off\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_on\_off\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic On Off Server (rm\_mesh\_generic\_on\_off\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic On Off Server (rm\_mesh\_generic\_on\_off\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_on_off_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_on_off_srv_info_t
```

```
struct rm_mesh_generic_on_off_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_on\_off\_srv\_info\_t

struct rm_mesh_generic_on_off_srv_info_t		
Generic OnOff state is a Boolean value that represents the state of an element		
Data Fields		
uint8_t	onoff	Generic On/Off
uint8_t	target_onoff	Target On/Off - Used in response path
uint8_t	last_onoff	Last On/Off
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

### ◆ rm\_mesh\_generic\_on\_off\_srv\_instance\_ctrl\_t

struct rm_mesh_generic_on_off_srv_instance_ctrl_t	
BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_GENERIC_ON_OFF_SRV_Open()</a> is called.	

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_ON\_OFF\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Onoff Server model. This is to initialize Generic\_Onoff Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_ON_OFF_SRV_Open(&g_mesh_generic_on_off_srv0_ctrl,
&g_mesh_generic_on_off_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_ON\_OFF\_SRV\_Close()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic\_Onoff Server model. This is to terminate Generic\_Onoff Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_ON_OFF_SRV_Close(&g_mesh_generic_on_off_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_ON\_OFF\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate(&g_mesh_generic_on_off_srv0_ctrl,
&state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Power Level Client (rm\_mesh\_generic\_pl\_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```

fsp_err_t	RM_MESH_GENERIC_PL_CLT_LevelSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PL_CLT_LastGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_PL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_PL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_PL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power Level Client module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_generic\_pl\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_pl\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Generic Power Level Client (rm\_mesh\_generic\_pl\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Power Level Client (rm\_mesh\_generic\_pl\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_pl_clt0	Module name.

### Data Structures

```
struct rm_mesh_generic_pl_clt_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_mesh\_generic\_pl\_clt\_instance\_ctrl\_t

```
struct rm_mesh_generic_pl_clt_instance_ctrl_t
```

BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_GENERIC\\_PL\\_CLT\\_Open\(\)](#) is called.

### Function Documentation

### ◆ RM\_MESH\_GENERIC\_PL\_CLT\_Open()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic\_Power\_Level Client middleware. This is to initialize Generic\_Power\_Level Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_PL_CLT_Open(&g_mesh_generic_pl_clt0_ctrl,
&g_mesh_generic_pl_clt0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_PL\_CLT\_Close()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic\_Power\_Level Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_PL_CLT_Close(&g_mesh_generic_pl_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_PL\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic\_Power\_Level client model. Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic power level client model. */
err = RM_MESH_GENERIC_PL_CLT_GetModelHandle(&g_mesh_generic_pl_clt0_ctrl,
&model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_GENERIC\_PL\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Generic\_Power\_Level client model. FIXME XXX.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of generic power level client model. */
err = RM_MESH_GENERIC_PL_CLT_SetModelHandle(&g_mesh_generic_pl_clt0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_PL\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands. Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_GENERIC_PL_CLT_SendReliablePdu(&g_mesh_generic_pl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_PL\_CLT\_LevelGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Level Get message is an acknowledged message used to get the Generic Power Actual state of an element. The response to the Generic Power Level Get message is a Generic Power Level Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
------	--------	---------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_PL\_CLT\_LevelSet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Power Level Set is an acknowledged message used to set the Generic Power Actual state of an element. The response to the Generic Power Level Set message is a Generic Power Level Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Level Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PL\_CLT\_LevelSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Power Level Set Unacknowledged is an unacknowledged message used to set the Generic Power Actual state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Level Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_PL\_CLT\_LastGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LastGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Last Get is an acknowledged message used to get the Generic Power Last state of an element. The response to a Generic Power Last Get message is a Generic Power Last Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
------	--------	---------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_PL\_CLT\_DefaultGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Default Get is an acknowledged message used to get the Generic Power Default state of an element. The response to a Generic Power Default Get message is a Generic Power Default Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
------	--------	---------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PL\_CLT\_DefaultSet()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Power Default Set is an acknowledged message used to set the Generic Power Default state of an element. The response to the Generic Power Default Set message is a Generic Power Default Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Default Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_PL\_CLT\_DefaultSetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Power Default Set Unacknowledged is an unacknowledged message used to set the Generic Power Default state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Default Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_PL\_CLT\_RangeGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Range Get is an acknowledged message used to get the Generic Power Range state of an element. The response to the Generic Power Range Get message is a Generic Power Range Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
------	--------	---------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PL\_CLT\_RangeSet()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Power Range Set is an acknowledged message used to set the Generic Power Range state of an element. The response to the Generic Power Range Set message is a Generic Power Range Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Range Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PL\_CLT\_RangeSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Power Range Set Unacknowledged is an unacknowledged message used to set the Generic Power Range state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Range Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Power Level Server (rm\_mesh\_generic\_pl\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power Level Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_pl\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_pl\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic Power Level Server (rm\_mesh\_generic\_pl\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Power Level Server (rm\_mesh\_generic\_pl\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_pl_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_pl_srv_actual_state_info_t
```

```
struct rm_mesh_generic_pl_srv_last_state_info_t
```

```
struct rm_mesh_generic_pl_srv_default_state_info_t
```

```
struct rm_mesh_generic_pl_srv_range_state_info_t
```

```
struct rm_mesh_generic_pl_srv_state_info_t
```

```
struct rm_mesh_generic_pl_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_pl\_srv\_actual\_state\_info\_t

Data Fields		
uint16_t	power_actual	Generic Power Actual
uint8_t	tid	
uint16_t	power_target	Generic Power Target - Used only in response path
uint8_t	transition_time	Transition Time - Used in request path Used as Remaining Time in response path
uint8_t	delay	
uint16_t	transition_time_handle	Transition Timer Handle

### ◆ rm\_mesh\_generic\_pl\_srv\_last\_state\_info\_t

Data Fields		
uint16_t	power_last	Generic Power Last

### ◆ rm\_mesh\_generic\_pl\_srv\_default\_state\_info\_t

Data Fields		
uint16_t	power_default	Generic Power Default

### ◆ rm\_mesh\_generic\_pl\_srv\_range\_state\_info\_t

struct rm_mesh_generic_pl_srv_range_state_info_t		
Generic Power Range state determines the minimum and maximum power levels of an element relative to the maximum power level an element can output		
Data Fields		
uint16_t	power_range_min	Generic Power Range - Minimum
uint16_t	power_range_max	Generic Power Range - Maximum
uint8_t	status	Status - Used only in the response path

#### ◆ rm\_mesh\_generic\_pl\_srv\_state\_info\_t

struct rm_mesh_generic_pl_srv_state_info_t		
Generic Power Level state is a composite state that includes a Generic Power Actual state, a Generic Power Last state, a Generic Power Default state, and a Generic Power Range state		
Data Fields		
rm_mesh_generic_pl_srv_actual_state_info_t	generic_power_actual	Generic Power Actual
rm_mesh_generic_pl_srv_last_state_info_t	generic_power_last	Generic Power Last
rm_mesh_generic_pl_srv_default_state_info_t	generic_power_default	Generic Power Default
rm_mesh_generic_pl_srv_range_state_info_t	generic_power_range	Generic Power Range

#### ◆ rm\_mesh\_generic\_pl\_srv\_instance\_ctrl\_t

struct rm_mesh_generic_pl_srv_instance_ctrl_t
BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_GENERIC_PL_SRV_Open()</a> is called.

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_PL\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Power\_Level Server model and to initialize Generic\_Power\_Level\_Setup Server model. This is to initialize Generic\_Power\_Level Server model and to register with Access layer. And this is to initialize Generic\_Power\_Level\_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_PL_SRV_Open(&g_mesh_generic_pl_srv0_ctrl,
&g_mesh_generic_pl_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_PL\_SRV\_Close()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic\_Power\_Level Server model. This is to terminate Generic\_Power\_Level Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_PL_SRV_Close(&g_mesh_generic_pl_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_PL\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_PL_SRV_StateUpdate(&g_mesh_generic_pl_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PL\_SRV\_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_pl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

```

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power On Off Client module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_generic\_poo\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_poo\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Generic Power On Off Client (rm\_mesh\_generic\_poo\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Power On Off Client (rm\_mesh\_generic\_poo\_clt).

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_poo_clt0	Module name.

## Data Structures

```
struct rm_mesh_generic_poo_clt_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_poo\_clt\_instance\_ctrl\_t

```
struct rm_mesh_generic_poo_clt_instance_ctrl_t
```

BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_GENERIC\\_POO\\_CLT\\_Open\(\)](#) is called.

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_POO\_CLT\_Open()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic\_Power\_Onoff Client middleware. This is to initialize Generic\_Power\_Onoff Client model and to register with Access layer.

Implements [rm\\_ble\\_mesh\\_model\\_client\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_POO_CLT_Open(&g_mesh_generic_poo_clt0_ctrl,
&g_mesh_generic_poo_clt0_cfg);
```

### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_POO\_CLT\_Close()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic\_Power\_Onoff Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_POO_CLT_Close(&g_mesh_generic_poo_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_POO\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic\_Power\_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic power on off client model. */
err = RM_MESH_GENERIC_POO_CLT_GetModelHandle(&g_mesh_generic_poo_clt0_ctrl,
&model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_GENERIC\_POO\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Generic\_Power\_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of generic power on off client model. */
err = RM_MESH_GENERIC_POO_CLT_SetModelHandle(&g_mesh_generic_poo_clt0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_POO\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_GENERIC_POO_CLT_SendReliablePdu(&g_mesh_generic_poo_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_POO\_CLT\_OnpowerupGet()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic OnPowerUp Get is an acknowledged message used to get the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Get message is a Generic OnPowerUp Status message. There are no parameters for this message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.
------	--------	--

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_POO\_CLT\_OnpowerupSet()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Generic OnPowerUp Set is an acknowledged message used to set the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Set message is a Generic OnPowerUp Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.
[in]	p_parameter	Pointer to Generic OnPowerUp Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_POO\_CLT\_OnpowerupSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic OnPowerUp Set Unacknowledged is an unacknowledged message used to set the Generic OnPowerUp state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.
[in]	p_parameter	Pointer to Generic OnPowerUp Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Power On Off Server (rm\_mesh\_generic\_poo\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_Close
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_StateUpdate
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_access_server_state_t const *const p_state)
```

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_access_server_state_t const *const p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power On Off Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_poo\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_poo\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic Power On Off Server (rm\_mesh\_generic\_poo\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Power On Off Server (rm\_mesh\_generic\_poo\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_poo_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_poo_srv_on_power_up_state_info_t
```

```
struct rm_mesh_generic_poo_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_poo\_srv\_on\_power\_up\_state\_info\_t

```
struct rm_mesh_generic_poo_srv_on_power_up_state_info_t
```

Generic OnPowerUp state is an enumeration representing the behavior of an element when powered up

#### Data Fields

uint8_t	onpowerup	Generic OnPowerUp
---------	-----------	-------------------

### ◆ rm\_mesh\_generic\_poo\_srv\_instance\_ctrl\_t

```
struct rm_mesh_generic_poo_srv_instance_ctrl_t
```

BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_POO_SRV_Open()` is called.

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_POO\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_Power\_Onoff Server model and to initialize Generic\_Power\_Onoff\_Setup Server model. This is to initialize Generic\_Power\_Onoff Server model and to register with Access layer. And this is to initialize Generic\_Power\_Onoff\_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_POO_SRV_Open(&g_mesh_generic_poo_srv0_ctrl,
&g_mesh_generic_poo_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

**◆ RM\_MESH\_GENERIC\_POO\_SRV\_Close()**

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic\_Power\_Onoff Server model. This is to terminate Generic\_Power\_Onoff Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_GENERIC_POO_SRV_Close(&g_mesh_generic_poo_srv0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_POO\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_POO_SRV_StateUpdate(&g_mesh_generic_poo_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_POO\_SRV\_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate (
rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_poo_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic Property Client (rm\_mesh\_generic\_prop\_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_Open
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```

fsp_err_t	RM_MESH_GENERIC_PROP_CLT_UserPropertyGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_UserPropertySet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_AdminPropertySet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet

```
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
```

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
```

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Mesh Network Generic Property Client module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_prop\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_prop\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic Property Client (rm\_mesh\_generic\_prop\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Property Client (rm\_mesh\_generic\_prop\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic property client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_prop_clt0	Module name.

## Data Structures

```
struct rm_mesh_generic_prop_clt_instance_ctrl_t
```

## Data Structure Documentation

◆ **rm\_mesh\_generic\_prop\_clt\_instance\_ctrl\_t**

```
struct rm_mesh_generic_prop_clt_instance_ctrl_t
```

BLE mesh generic prop instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_GENERIC\\_PROP\\_CLT\\_Open\(\)](#) is called.

**Function Documentation**◆ **RM\_MESH\_GENERIC\_PROP\_CLT\_Open()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic\_Property Client middleware. This is to initialize Generic\_Property Client model and to register with Access layer.

Implements [rm\\_ble\\_mesh\\_model\\_client\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_PROP_CLT_Open(&g_mesh_generic_prop_clt0_ctrl,
&g_mesh_generic_prop_clt0_cfg);
```

**Return values**

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_Close()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic\_Property Client middleware. Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_PROP_CLT_Close(&g_mesh_generic_prop_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic\_Property client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic property client model. */
err = RM_MESH_GENERIC_PROP_CLT_GetModelHandle(&g_mesh_generic_prop_clt0_ctrl,
&model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

**◆ RM\_MESH\_GENERIC\_PROP\_CLT\_SetModelHandle()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Generic\_Property client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of generic property client model. */  
err = RM_MESH_GENERIC_PROP_CLT_SetModelHandle(&g_mesh_generic_prop_clt0_ctrl,  
model_handle);
```

**Return values**

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_GENERIC_PROP_CLT_SendReliablePdu(&g_mesh_generic_prop_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_PROP\_CLT\_UserPropertiesGet()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

Generic User Properties Get is an acknowledged message used to get the list of Generic User Property states of an element. The response to the Generic User Properties Get message is a Generic User Properties Status message. The message has no parameters.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
------	--------	---

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_PROP\_CLT\_UserPropertyGet()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertyGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic User Property Get is an acknowledged message used to get the Generic User Property state of an element. The response to the Generic User Property Get message is a Generic User Property Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Get message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_UserPropertySet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic User Property Set is an acknowledged message used to set the Generic User Property state of an element. The response to the Generic User Property Set message is a Generic User Property Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_UserPropertySetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic User Property Set Unacknowledged is an unacknowledged message used to set the Generic User Property state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_AdminPropertiesGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

Generic Admin Properties Get is an acknowledged message used to get the list of Generic Admin Property states of an element. The response to the Generic Admin Properties Get message is a Generic Admin Properties Status message. The message has no parameters.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
------	--------	---

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_AdminPropertyGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Admin Property Get is an acknowledged message used to get the Generic Admin Property state of an element. The response to the Generic Admin Property Get message is a Generic Admin Property Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Get message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_AdminPropertySet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Admin Property Set is an acknowledged message used to set the Generic Admin Property state of an element. The response to the Generic Admin Property Set message is a Generic Admin Property Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_GENERIC\_PROP\_CLT\_AdminPropertySetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Admin Property Set Unacknowledged is an unacknowledged message used to set the Generic Admin Property state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_ManufacturerPropertiesGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Manufacturer Properties Get is an acknowledged message used to get the list of Generic Manufacturer Property states of an element. The response to the Generic Manufacturer Properties Get message is a Generic Manufacturer Properties Status message. The message has no parameters.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
------	--------	---

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_ManufacturerPropertyGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Manufacturer Property Get is an acknowledged message used to get the Generic Manufacturer Property state of an element. The response to the Generic Manufacturer Property Get message is a Generic Manufacturer Property Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Get message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_ManufacturerPropertySet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Manufacturer Property Set is an acknowledged message used to set the Generic Manufacturer Property User Access state of an element. The response to the Generic Manufacturer Property Set message is a Generic Manufacturer Property Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_ManufacturerPropertySetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Generic Manufacturer Property Set Unacknowledged is an unacknowledged message used to set the Generic Manufacturer Property User Access state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_GENERIC\_PROP\_CLT\_ClientPropertiesGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Client Properties Get is an acknowledged message used to get the list of Generic Client Property states of an element. The response to the Generic Client Properties Get message is a Generic Client Properties Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Client Properties Get message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Generic User Property Server (rm\_mesh\_generic\_user\_prop\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Close
```

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic User Property Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_generic\_user\_prop\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_generic\_user\_prop\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Generic User Property Server (rm\_mesh\_generic\_user\_prop\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic User Property Server (rm\_mesh\_generic\_user\_prop\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic user property server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic user property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_user_prop_srv0	Module name.

## Data Structures

```
struct rm_mesh_generic_user_prop_srv_info_t
```

```
struct rm_mesh_generic_user_prop_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_generic\_user\_prop\_srv\_info\_t

struct rm_mesh_generic_user_prop_srv_info_t		
Generic User Property is a state representing a device property of an element		
Data Fields		
uint16_t	property_id	User Property ID field is a 2-octet Assigned Number value referencing a device property
uint8_t	user_access	User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property
uint8_t*	property_value	User Property Value field is a conditional field
uint16_t	property_value_len	

### ◆ rm\_mesh\_generic\_user\_prop\_srv\_instance\_ctrl\_t

struct rm_mesh_generic_user_prop_srv_instance_ctrl_t		
BLE mesh generic user prop instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_GENERIC_USER_PROP_SRV_Open()</a> is called.		

## Function Documentation

### ◆ RM\_MESH\_GENERIC\_USER\_PROP\_SRV\_Open()

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic\_User\_Property Server model. This is to initialize Generic\_User\_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_USER_PROP_SRV_Open(&g_mesh_generic_user_prop_srv0_ctrl,
&g_mesh_generic_user_prop_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_GENERIC\_USER\_PROP\_SRV\_Close()

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic\_User\_Property Server model. This is to terminate Generic\_User\_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_USER_PROP_SRV_Close(&g_mesh_generic_user_prop_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_GENERIC\_USER\_PROP\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate(&g_mesh_generic_user_prop_srv0_ctrl,
&state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Light Control Client (rm\_mesh\_light\_ctl\_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Close (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

fsp_err_t	RM_MESH_LIGHT_CTL_CTL_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_Set (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_TemperatureGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_TemperatureSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_TemperatureSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_TemperatureRangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_CTL_CTL_TemperatureRangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Control Client module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_light\_ctl\_ctl

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_ctl\_ctl\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Light Control Client (rm\_mesh\_light\_ctl\_ctl)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Control Client (rm\_mesh\_light\_ctl\_ctl).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_ctl_ctl_0	Module name.

## Data Structures

```
struct rm_mesh_light_ctl_ctl_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_light\_ctl\_ctl\_instance\_ctrl\_t

```
struct rm_mesh_light_ctl_ctl_instance_ctrl_t
```

BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_LIGHT\\_CTL\\_CLT\\_Open\(\)](#) is called.

## Function Documentation

### ◆ RM\_MESH\_LIGHT\_CTL\_CLT\_Open()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light\_Ctl Client middleware. This is to initialize Light\_Ctl Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_CTL_CLT_Open(&g_mesh_light_ctl_clt0_ctrl,
&g_mesh_light_ctl_clt0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_LIGHT\_CTL\_CLT\_Close()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light\_Ctl Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_CTL_CLT_Close(&g_mesh_light_ctl_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_LIGHT\_CTL\_CTL\_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light\_Ctl client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light ctl client model. */
err = RM_MESH_LIGHT_CTL_CTL_GetModelHandle(&g_mesh_light_ctl_ctl0_ctrl,
&model_handle);
```

**Return values**

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ **RM\_MESH\_LIGHT\_CTL\_CTL\_SetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Light\_Ctl client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of light ctl client model. */
err = RM_MESH_LIGHT_CTL_CTL_SetModelHandle(&g_mesh_light_ctl_ctl0_ctrl,
model_handle);
```

**Return values**

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_CTL\_CTL\_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_CTL_CTL_SendReliablePdu(&g_mesh_light_ctl_ctl0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_CTL\_CLT\_Get()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light CTL Get is an acknowledged message used to get the Light CTL state of an element. The response to the Light CTL Get message is a Light CTL Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_CTL\_CLI\_Set()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLI_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Light CTL Set is an acknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element. The response to the Light CTL Set message is a Light CTL Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_ctl_cli control block.
[in]	p_parameter	Pointer to Light CTL Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_CTL\_CTL\_SetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Light CTL Set Unacknowledged is an unacknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element

**Parameters**

[in]	p_ctrl	rm_mesh_light_ctl_ctl control block.
[in]	p_parameter	Pointer to Light CTL Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_CTL\_CLT\_TemperatureGet()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light CTL Temperature Get is an acknowledged message used to get the Light CTL Temperature state of an element. The response to the Light CTL Temperature Get message is a Light CTL Temperature Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_CTL\_CLT\_TemperatureSet()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light CTL Temperature Set is an acknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element. The response to the Light CTL Temperature Set message is a Light CTL Temperature Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_ctl_ctl control block.
[in]	p_parameter	Pointer to Light CTL Temperature Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_CTL\_CLT\_TemperatureSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light CTL Temperature Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element

#### Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_CTL\_CLT\_DefaultGet()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light CTL Default Get is an acknowledged message used to get the Light CTL Temperature Default and Light CTL Delta UV Default states of an element. The response to the Light CTL Default Get message is a Light CTL Default Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_ctl_ctl control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_CTL\_CTL\_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light CTL Default Set is an acknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element. The response to the Light CTL Set message is a Light CTL Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_ctl_ctl control block.
[in]	p_parameter	Pointer to Light CTL Default Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_CTL\_CLT\_DefaultSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light CTL Default Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Default Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_CTL\_CLT\_TemperatureRangeGet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

The Light CTL Temperature Range Get is an acknowledged message used to get the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message. There are no parameters for this message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_ctl_ctl control block.
------	--------	--------------------------------------

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_CTL\_CLT\_TemperatureRangeSet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light CTL Temperature Range Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Range state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Range Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_CTL\_CLT\_TemperatureRangeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Light CTL Temperature Range Set is an acknowledged message used to set the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Range Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### Bluetooth Low Energy Mesh Network Light Control Server (rm\_mesh\_light\_ctl\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

#### Functions

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_Open (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Control Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_light\_ctl\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_ctl\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Light Control Server (rm\_mesh\_light\_ctl\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Control Server (rm\_mesh\_light\_ctl\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_ctl_sr v0	Module name.

## Data Structures

```
struct rm_mesh_light_ctl_srv_info_t
```

```
struct rm_mesh_light_ctl_srv_default_info_t
```

```
struct rm_mesh_light_ctl_srv_temperature_info_t
```

```
struct rm_mesh_light_ctl_srv_temperature_range_info_t
```

```
struct rm_mesh_light_ctl_srv_extended_cfg_t
```

```
struct rm_mesh_light_ctl_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_light\_ctl\_srv\_info\_t

Data Fields		
uint16_t	ctl_lightness	Light CTL Lightness
uint16_t	target_ctl_lightness	Target Light CTL Lightness - Used in response path
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	target_ctl_temperature	Target Light CTL Temperature - Used in response path
uint16_t	ctl_delta_uv	Light CTL Delta UV
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

### ◆ rm\_mesh\_light\_ctl\_srv\_default\_info\_t

Data Fields		
uint16_t	ctl_lightness	Light CTL Lightness
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	ctl_delta_uv	Light CTL Delta UV

### ◆ rm\_mesh\_light\_ctl\_srv\_temperature\_info\_t

struct rm_mesh_light_ctl_srv_temperature_info_t		
Light CTL Temperature state is a composite state that includes the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	target_ctl_temperature	Target Light CTL Temperature - Used in response path
uint16_t	ctl_delta_uv	Light CTL Delta UV
uint16_t	target_ctl_delta_uv	Target Light CTL Delta UV - Used in response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

#### ◆ rm\_mesh\_light\_ctl\_srv\_temperature\_range\_info\_t

struct rm_mesh_light_ctl_srv_temperature_range_info_t		
Light CTL Temperature Range state determines the minimum and maximum color temperatures of tunable white light an element is capable of emitting		
Data Fields		
uint16_t	ctl_temperature_range_min	CTL Temperature Range Min
uint16_t	ctl_temperature_range_max	CTL Temperature Range Max
uint8_t	status	Status - Used in response path

#### ◆ rm\_mesh\_light\_ctl\_srv\_extended\_cfg\_t

struct rm_mesh_light_ctl_srv_extended_cfg_t		
BLE mesh light ctl extension for BLE mesh light ctl.		
Data Fields		
rm_ble_mesh_access_instance_t const *	p_temperature_access_instance	Pointer to access instance for temperature model.

#### ◆ rm\_mesh\_light\_ctl\_srv\_instance\_ctrl\_t

struct rm_mesh_light_ctl_srv_instance_ctrl_t		
BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_LIGHT_CTL_SRV_Open()</a> is called.		

## Function Documentation

### ◆ RM\_MESH\_LIGHT\_CTL\_SRV\_Open()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light\_Ctl Server model and to initialize Light\_Ctl\_Temperature Server model. This is to initialize Light\_Ctl Server model and to register with Access layer. And this is to initialize Light\_Ctl\_Temperature Server model and to register with Access layer. Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_CTL_SRV_Open(&g_mesh_light_ctl_srv0_ctrl,
&g_mesh_light_ctl_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_LIGHT\_CTL\_SRV\_Close()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light\_Ctl Server model. This is to terminate Light\_Ctl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_CTL_SRV_Close(&g_mesh_light_ctl_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_CTL\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_CTL_SRV_StateUpdate(&g_mesh_light_ctl_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_CTL\_SRV\_TemperatureServerStateUpdate()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate (
  rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
  p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

#### Parameters

[in]	p_ctrl	rm_mesh_light_ctl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Light Hsl Client (rm\_mesh\_light\_hsl\_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```

p_parameter)
```

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Hsl Client module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_light\_hsl\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_hsl\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Light HSL Client (rm\_mesh\_light\_hsl\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light HSL Client (rm\_mesh\_light\_hsl\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_hsl_clt0	Module name.

## Data Structures

```
struct rm_mesh_light_hsl_clt_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_light\_hsl\_clt\_instance\_ctrl\_t

```
struct rm_mesh_light_hsl_clt_instance_ctrl_t
```

BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_LIGHT_HSL_CLT_Open()` is called.

## Function Documentation

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_Open()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light\_Hsl Client middleware. This is to initialize Light\_Hsl Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_HSL_CLT_Open(&g_mesh_light_hsl_clt0_ctrl,
&g_mesh_light_hsl_clt0_cfg);
```

### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ **RM\_MESH\_LIGHT\_HSL\_CLT\_Close()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light\_Hsl Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_HSL_CLT_Close(&g_mesh_light_hsl_clt0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_LIGHT\_HSL\_CLT\_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light\_Hsl client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light hsl client model. */
err = RM_MESH_LIGHT_HSL_CLT_GetModelHandle(&g_mesh_light_hsl_clt0_ctrl,
&model_handle);
```

**Return values**

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

**◆ RM\_MESH\_LIGHT\_HSL\_CLT\_SetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Light\_Hsl client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of light hsl client model. */  
err = RM_MESH_LIGHT_HSL_CLT_SetModelHandle(&g_mesh_light_hsl_clt0_ctrl,  
model_handle);
```

**Return values**

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_HSL_CLT_SendReliablePdu(&g_mesh_light_hsl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_HSL\_CLT\_Get()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light HSL Get is an acknowledged message used to get the Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Get message is a Light HSL Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_HSL\_CLT\_Set()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light HSL Set Unacknowledged is an unacknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_SetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light HSL Set is an acknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element. The response to the Light HSL Set message is a Light HSL Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_HSL\_CLT\_TargetGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_TargetGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light HSL Target Get is an acknowledged message used to get the target Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Target Get message is a Light HSL Target Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_DefaultGet()

`fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Light HSL Default Get is an acknowledged message used to get the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Get message is a Light HSL Default Status message. There are no parameters for this message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
------	--------	--------------------------------------

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light HSL Default Set is an acknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Set message is a Light HSL Default Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_DefaultSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light HSL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_HSL\_CLT\_RangeGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light HSL Range Get is an acknowledged message used to get the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Get message is a Light HSL Range Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_HSL\_CLT\_RangeSet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light HSL Range Set is an acknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Set message is a Light HSL Range Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Range Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_RangeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light HSL Range Set Unacknowledged is an unacknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Range Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_HSL\_CLT\_HueGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light HSL Hue Get is an acknowledged message used to get the Light HSL Hue state of an element. The response to the Light HSL Hue Get message is a Light HSL Hue Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_HueSet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light HSL Hue Set is an acknowledged message used to set the target Light HSL Hue state of an element. The response to the Light HSL Hue Set message is a Light HSL Hue Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Hue Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_HueSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light HSL Hue Set Unacknowledged is an unacknowledged message used to set the target Light HSL Hue state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Hue Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_SaturationGet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationGet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

The Light HSL Saturation Get is an acknowledged message used to get the Light HSL Saturation state of an element. The response to the Light HSL Saturation Get message is a Light HSL Saturation Status message. There are no parameters for this message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
------	--------	--------------------------------------

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_SaturationSet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light HSL Saturation Set is an acknowledged message used to set the target Light HSL Saturation state of an element. The response to the Light HSL Saturation Set message is a Light HSL Saturation Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Saturation Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_CLT\_SaturationSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light HSL Saturation Set Unacknowledged is an unacknowledged message used to set the target Light HSL Saturation state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Saturation Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Light Hsl Server (rm\_mesh\_light\_hsl\_srv)

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Hsl Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_light\_hsl\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_hsl\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Light HSL Server (rm\_mesh\_light\_hsl\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light HSL Server (rm\_mesh\_light\_hsl\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_hsl_sr v0	Module name.

## Data Structures

```
struct rm_mesh_light_hsl_srv_info_t
```

```
struct rm_mesh_light_hsl_srv_target_info_t
```

```
struct rm_mesh_light_hsl_srv_default_info_t
```

```
struct rm_mesh_light_hsl_srv_hue_info_t
```

```
struct rm_mesh_light_hsl_srv_saturation_info_t
```

```
struct rm_mesh_light_hsl_srv_range_info_t
```

```
struct rm_mesh_light_hsl_srv_extended_cfg_t
```

```
struct rm_mesh_light_hsl_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_light\_hsl\_srv\_info\_t

struct rm_mesh_light_hsl_srv_info_t		
Light HSL state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	target_hsl_lightness	Target Perceived lightness - used in the response path
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	target_hsl_hue	Target hue - used in the response path
uint16_t	hsl_saturation	The saturation of a color light
uint16_t	target_hsl_saturation	Target saturation - used in the response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

### ◆ rm\_mesh\_light\_hsl\_srv\_target\_info\_t

struct rm_mesh_light_hsl_srv_target_info_t		

Light HSL Target state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

Data Fields		
uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	hsl_saturation	The saturation of a color light

#### ◆ rm\_mesh\_light\_hsl\_srv\_default\_info\_t

struct rm\_mesh\_light\_hsl\_srv\_default\_info\_t

Light HSL Default state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

Data Fields		
uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	hsl_saturation	The saturation of a color light

#### ◆ rm\_mesh\_light\_hsl\_srv\_hue\_info\_t

struct rm\_mesh\_light\_hsl\_srv\_hue\_info\_t

Light HSL Hue

Data Fields		
uint16_t	hsl_hue	The 16-bit value representing the hue

#### ◆ rm\_mesh\_light\_hsl\_srv\_saturation\_info\_t

struct rm\_mesh\_light\_hsl\_srv\_saturation\_info\_t

Light HSL Saturation

Data Fields		
uint16_t	hsl_saturation	The saturation of a color light

#### ◆ rm\_mesh\_light\_hsl\_srv\_range\_info\_t

struct rm\_mesh\_light\_hsl\_srv\_range\_info\_t

Light HSL Range state is a composite state that includes Minimum and Maximum of the Light HSL Hue and the Light HSL Saturation states

Data Fields		
uint16_t	hue_range_min	The value of the Hue Range Min field of the Light HSL Hue

		Range state
uint16_t	hue_range_max	The value of the Hue Range Max field of the Light HSL Hue Range state
uint16_t	saturation_range_min	The value of the Saturation Range Min field of the Light HSL Saturation Range state
uint16_t	saturation_range_max	The value of the Saturation Range Max field of the Light HSL Saturation Range state
uint8_t	status	Status - Used only in response path

#### ◆ rm\_mesh\_light\_hsl\_srv\_extended\_cfg\_t

struct rm_mesh_light_hsl_srv_extended_cfg_t		
BLE mesh light hsl extension for BLE mesh light hsl.		
Data Fields		
rm_ble_mesh_access_instance_t const *	p_hue_access_instance	Pointer to access instance for hue model.
rm_ble_mesh_access_instance_t const *	p_saturation_access_instance	Pointer to access instance for saturation model.

#### ◆ rm\_mesh\_light\_hsl\_srv\_instance\_ctrl\_t

struct rm_mesh_light_hsl_srv_instance_ctrl_t	
BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_LIGHT_HSL_SRV_Open()</a> is called.	

## Function Documentation

### ◆ RM\_MESH\_LIGHT\_HSL\_SRV\_Open()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light\_Hsl Server/Light\_Hsl\_Hue Server/Light\_Hsl\_Saturation Server model.

1. This is to initialize Light\_Hsl Server model and to register with Access layer.
2. This is to initialize Light\_Hsl\_Hue Server model and to register with Access layer.
3. This is to initialize Light\_Hsl\_Saturation Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_HSL_SRV_Open(&g_mesh_light_hsl_srv0_ctrl,
&g_mesh_light_hsl_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_SRV\_Close()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light\_Hsl Server model. This is to terminate Light\_Hsl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_HSL_SRV_Close(&g_mesh_light_hsl_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_HSL\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_HSL_SRV_StateUpdate(&g_mesh_light_hsl_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_HSL\_SRV\_HueServerStateUpdate()**

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

**Parameters**

[in]	p_ctrl	rm_mesh_light_hsl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_HSL\_SRV\_SaturationServerStateUpdate()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate (
rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

#### Parameters

[in]	p_ctrl	rm_mesh_light_hsl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Light Lightness Client (rm\_mesh\_light\_lightness\_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Open
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Close
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet
          (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
           p_parameter)
```

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged
          (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
           p_parameter)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Lightness Client module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_light\_lightness\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_lightness\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Light Lightness Client (rm\_mesh\_light\_lightness\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Lightness Client (rm\_mesh\_light\_lightness\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lightness_clt0	Module name.

## Data Structures

```
struct rm_mesh_light_lightness_clt_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_light\_lightness\_clt\_instance\_ctrl\_t

```
struct rm_mesh_light_lightness_clt_instance_ctrl_t
```

BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_LIGHT_LIGHTNESS_CLT_Open()` is called.

## Function Documentation

### ◆ `RM_MESH_LIGHT_LIGHTNESS_CLT_Open()`

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light\_Lightness Client middleware. This is to initialize Light\_Lightness Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LIGHTNESS_CLT_Open(&g_mesh_light_lightness_clt0_ctrl,
&g_mesh_light_lightness_clt0_cfg);
```

### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ **RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_Close()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light\_Lightness Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_LIGHTNESS_CLT_Close(&g_mesh_light_lightness_clt0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light\_Lightness client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light lightness client model. */
err =
RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle(&g_mesh_light_lightness_clt0_ctrl,
&model_handle);
```

**Return values**

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Light\_Lightness client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle()`.

Example:

```
/* Set the handle of light lightness client model. */
err =
RM_MESH_LIGHT_LIGHTNESS_CLT_SetModelHandle(&g_mesh_light_lightness_clt0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu(&g_mesh_light_lightness_clt0_ctrl,
                                             req_opcode,
                                             p_parameter,
                                             rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_Get()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light Lightness Get is an acknowledged message used to get the Light Lightness Actual state of an element. The response to the Light Lightness Get message is a Light Lightn

**Parameters**

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
------	--------	--

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_Set()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light Lightness Set is an acknowledged message used to set the Light Lightness Actual state of an element. The response to the Light Lightness Set message is a Light Lightness Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_SetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light Lightness Set Unacknowledged is an unacknowledged message used to set the Light Lightness Actual state of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_LinearGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light Lightness Linear Get is an acknowledged message used to get the Light Lightness Linear state of an element. The response to the Light Lightness Linear Get message is a Light Lightness Linear Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
------	--------	--

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_LinearSet()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light Lightness Linear Set is an acknowledged message used to set the Light Lightness Linear state of an element. The response to the Light Lightness Linear Set message is a Light Lightness Linear Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Linear Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_LinearSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light Lightness Linear Set Unacknowledged is an unacknowledged message used to set the Light Lightness Linear state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Linear Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_LastGet()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

Light Lightness Last Get is an acknowledged message used to get the Light Lightness Last state of an element. The response to the Light Lightness Last Get message is a Light Lightness Last Status message. There are no parameters for this message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
------	--------	--

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_DefaultGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light Lightness Default Get is an acknowledged message used to get the Light Lightness Default state of an element. The response to the Light Lightness Default Get message is a Light Lightness Default Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
------	--------	--

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light Lightness Default Set is an acknowledged message used to set the Light Lightness Default state of an element. The response to the Light Lightness Default Set message is a Light Lightness Default Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Default Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_DefaultSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light Lightness Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Default Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_RangeGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

The Light Lightness Range Get is an acknowledged message used to get the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
------	--------	--

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_RangeSet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Light Lightness Range Set is an acknowledged message used to set the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Range Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_CLT\_RangeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Light Lightness Range Set Unacknowledged is an unacknowledged message used to set the Light Lightness Range state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Range Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Light Lightness Server (rm\_mesh\_light\_lightness\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Lightness Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_light\_lightness\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_lightness\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Light Lightness Server (rm\_mesh\_light\_lightness\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Lightness Server (rm\_mesh\_light\_lightness\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lightness_srv0	Module name.

## Data Structures

```
struct rm_mesh_light_lightness_srv_linear_info_t
```

```
struct rm_mesh_light_lightness_srv_actual_info_t
```

```
struct rm_mesh_light_lightness_srv_last_info_t
```

```
struct rm_mesh_light_lightness_srv_default_info_t
```

```
struct rm_mesh_light_lightness_srv_range_info_t
```

```
struct rm_mesh_light_lightness_srv_info_t
```

```
struct rm_mesh_light_lightness_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_light\_lightness\_srv\_linear\_info\_t

struct rm_mesh_light_lightness_srv_linear_info_t		
Light Lightness Linear state represents the lightness of a light on a linear scale		
Data Fields		
uint16_t	lightness_linear	Light Lightness Linear
uint16_t	lightness_target	Light Lightness Target - Used in response path.
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

### ◆ rm\_mesh\_light\_lightness\_srv\_actual\_info\_t

struct rm_mesh_light_lightness_srv_actual_info_t		
Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale		
Data Fields		
uint16_t	lightness_actual	Light Lightness Actual
uint16_t	lightness_target	Light Lightness Target - Used in response path.
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

uint16_t	transition_time_handle	Transition Timer Handle
----------	------------------------	-------------------------

#### ◆ rm\_mesh\_light\_lightness\_srv\_last\_info\_t

struct rm_mesh_light_lightness_srv_last_info_t		
Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale		
Data Fields		
uint16_t	lightness_last	Light Lightness Last

#### ◆ rm\_mesh\_light\_lightness\_srv\_default\_info\_t

struct rm_mesh_light_lightness_srv_default_info_t		
Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state		
Data Fields		
uint16_t	lightness_default	Light Lightness Default

#### ◆ rm\_mesh\_light\_lightness\_srv\_range\_info\_t

struct rm_mesh_light_lightness_srv_range_info_t		
Light Lightness Range state determines the minimum and maximum lightness of an element		
Data Fields		
uint16_t	lightness_range_min	Light Lightness Range Min
uint16_t	lightness_range_max	Light Lightness Range Max

#### ◆ rm\_mesh\_light\_lightness\_srv\_info\_t

struct rm_mesh_light_lightness_srv_info_t		
Light Lightness state is a composite state that includes the Light Lightness Linear, the Light Lightness Actual, the Light Lightness Last, and the Light Lightness Default states		
Data Fields		
<a href="#">rm_mesh_light_lightness_srv_linear_info_t</a>	light_lightness_linear	Light Lightness Linear state represents the lightness of a light on a linear scale
<a href="#">rm_mesh_light_lightness_srv_actual_info_t</a>	light_lightness_actual	Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale
<a href="#">rm_mesh_light_lightness_srv_last_info_t</a>	light_lightness_last	Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale
<a href="#">rm_mesh_light_lightness_srv_default_info_t</a>	light_lightness_default	Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default

		lightness level for the Light Lightness Actual state
<a href="#">rm_mesh_light_lightness_srv_range_info_t</a>	light_lightness_range	Light Lightness Range state.
uint8_t	range_status	Status field used only for the Range Status

#### ◆ [rm\\_mesh\\_light\\_lightness\\_srv\\_instance\\_ctrl\\_t](#)

```
struct rm_mesh_light_lightness_srv_instance_ctrl_t
```

BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_LIGHT\\_LIGHTNESS\\_SRV\\_Open\(\)](#) is called.

## Function Documentation

### ◆ [RM\\_MESH\\_LIGHT\\_LIGHTNESS\\_SRV\\_Open\(\)](#)

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light\_Lightness Server model and to initialize Light\_Lightness\_Setup Server model. This is to initialize Light\_Lightness Server model and to register with Access layer. And this is to initialize Light\_Lightness\_Setup Server model and to register with Access layer. Implements [rm\\_ble\\_mesh\\_model\\_server\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LIGHTNESS_SRV_Open(&g_mesh_light_lightness_srv0_ctrl,
&g_mesh_light_lightness_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_SRV\_Close()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Light\_Lightness Server model. This is to terminate Light\_Lightness Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_LIGHTNESS_SRV_Close(&g_mesh_light_lightness_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate(&g_mesh_light_lightness_srv0_ctrl,
&state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LIGHTNESS\_SRV\_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate (
  rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
  p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lightness_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LC_CLT_LightOnOffGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_LC_CLT_LightOnOffSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LC_CLT_PropertyGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_LC_CLT_PropertySet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Location Client module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_light\_lc\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_lc\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Light Lightness Controller Client (rm\_mesh\_light\_lc\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Lightness Controller Client (rm\_mesh\_light\_lc\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lc_clt_0	Module name.

## Data Structures

```
struct rm_mesh_light_lc_clt_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_light\_lc\_clt\_instance\_ctrl\_t

```
struct rm_mesh_light_lc_clt_instance_ctrl_t
```

BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_LIGHT\\_LC\\_CLT\\_Open\(\)](#) is called.

## Function Documentation

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_Open()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light\_Lc Client middleware. This is to initialize Light\_Lc Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LC_CLT_Open(&g_mesh_light_lc_clt0_ctrl,
&g_mesh_light_lc_clt0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_Close()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light\_Lc Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_LC_CLT_Close(&g_mesh_light_lc_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light\_Lc client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light lc client model. */
err = RM_MESH_LIGHT_LC_CLT_GetModelHandle(&g_mesh_light_lc_clt0_ctrl,
&model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Light\_Lc client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of light lc client model. */
err = RM_MESH_LIGHT_LC_CLT_SetModelHandle(&g_mesh_light_lc_clt0_ctrl,
model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_LC_CLT_SendReliablePdu(&g_mesh_light_lc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LC\_CLT\_ModeGet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light LC Mode Get is an acknowledged message used to get the Light LC Mode state of an element. The response to the Light LC Mode Get message is a Light LC Mode Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
------	--------	-------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LC\_CLT\_ModeSet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light LC Mode Set is an acknowledged message used to set the Light LC Mode state of an element. The response to the Light LC Mode Set message is a Light LC Mode Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Mode Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_ModeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light LC Mode Set Unacknowledged is an unacknowledged message used to set the Light LC Mode state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Mode Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LC\_CLT\_OmGet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_OmGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light LC OM Get is an acknowledged message used to get the Light LC Occupancy Mode state of an element. The response to the Light LC OM Get message is a Light LC OM Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
------	--------	-------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LC\_CLT\_OmSet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light LC OM Set is an acknowledged message used to set the Light LC Occupancy Mode state of an element. The response to the Light LC OM Set message is a Light LC OM Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC OM Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_OmSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light LC OM Set Unacknowledged is an unacknowledged message used to set the Light LC Occupancy Mode state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC OM Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LC\_CLT\_LightOnOffGet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light LC Light OnOff Get is an acknowledged message used to get the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Get message is a Light LC Light OnOff Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
------	--------	-------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_LC\_CLT\_LightOnOffSet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light LC Light OnOff Set is an acknowledged message used to set the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Set message is a Light LC Light OnOff Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Light OnOff Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_LightOnOffSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light LC Light OnOff Set Unacknowledged is an unacknowledged message used to set the Light LC Light OnOff state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Light OnOff Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_PropertyGet()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertyGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light LC Property Get is an acknowledged message used to get the Light LC Property state of an element. The response to the Light LC Property Get message is a Light LC Property Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Get message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_PropertySet()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light LC Property Set is an acknowledged message used to set the Light LC Property state of an element. The response to the Light LC Property Set message is a Light LC Property Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_LC\_CLT\_PropertySetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light LC Property Set Unacknowledged is an unacknowledged message used to set the Light LC Property state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Light Location Server (rm\_mesh\_light\_lc\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_Open (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```

```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Location Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_light\_lc\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_lc\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Light Lightness Controller Server (rm\_mesh\_light\_lc\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Lightness Controller Server (rm\_mesh\_light\_lc\_srv).

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller server ISR occurs
--	-------------------------------	------	--

Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller server timeout ISR occurs
---	-------------------------------	------	--

Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lc_srv 0	Module name.
------	-------------------------------	-----------------------------	--------------

## Data Structures

```
struct rm_mesh_light_lc_srv_mode_info_t
```

```
struct rm_mesh_light_lc_srv_om_info_t
```

```
struct rm_mesh_light_lc_srv_light_onoff_info_t
```

```
struct rm_mesh_light_lc_srv_property_id_info_t
```

```
struct rm_mesh_light_lc_srv_property_info_t
```

```
struct rm_mesh_light_lc_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_light\_lc\_srv\_mode\_info\_t

struct rm_mesh_light_lc_srv_mode_info_t		
Light LC Mode state		
Data Fields		
uint8_t	present_mode	Light LC Mode state - present
uint8_t	target_mode	Light LC Mode state - target

### ◆ rm\_mesh\_light\_lc\_srv\_om\_info\_t

struct rm_mesh_light_lc_srv_om_info_t		
Light LC Occupancy Mode state		
Data Fields		
uint8_t	present_mode	Light LC Occupancy Mode state - present
uint8_t	target_mode	Light LC Occupancy Mode state - target

### ◆ rm\_mesh\_light\_lc\_srv\_light\_onoff\_info\_t

struct rm_mesh_light_lc_srv_light_onoff_info_t		
Light LC Light OnOff State		
Data Fields		
uint8_t	present_light_onoff	Light LC Light OnOff State
uint8_t	target_light_onoff	Light LC Light OnOff State
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

### ◆ rm\_mesh\_light\_lc\_srv\_property\_id\_info\_t

struct rm_mesh_light_lc_srv_property_id_info_t		
Property ID identifying a Light LC Property		

Data Fields		
uint16_t	property_id	Property ID identifying a Light LC Property

#### ◆ **rm\_mesh\_light\_lc\_srv\_property\_info\_t**

struct rm_mesh_light_lc_srv_property_info_t		
Light LC Property state		
Data Fields		
uint16_t	property_id	Property ID identifying a Light LC Property
uint8_t *	property_value	Raw value for the Light LC Property
uint16_t	property_value_len	

#### ◆ **rm\_mesh\_light\_lc\_srv\_instance\_ctrl\_t**

struct rm_mesh_light_lc_srv_instance_ctrl_t		
BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_LIGHT LC_SRV_Open()</a> is called.		

## Function Documentation

### ◆ RM\_MESH\_LIGHT\_LC\_SRV\_Open()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light\_Lc Server model. This is to initialize Light\_Lc Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LC_SRV_Open(&g_mesh_light_lc_srv0_ctrl,
&g_mesh_light_lc_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_LIGHT\_LC\_SRV\_Close()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light\_Lc Server model. This is to terminate Light\_Lc Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_LC_SRV_Close(&g_mesh_light_lc_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_LC\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_LC_SRV_StateUpdate(&g_mesh_light_lc_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Xyl Client module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_light\_xyl\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_xyl\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Light XYL Client (rm\_mesh\_light\_xyl\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light XYL Client (rm\_mesh\_light\_xyl\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_xyl_clt0	Module name.

### Data Structures

```
struct rm_mesh_light_xyl_clt_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_mesh\_light\_xyl\_clt\_instance\_ctrl\_t

```
struct rm_mesh_light_xyl_clt_instance_ctrl_t
```

BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_LIGHT\\_XYL\\_CLT\\_Open\(\)](#) is called.

### Function Documentation

◆ **RM\_MESH\_LIGHT\_XYL\_CLT\_Open()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light\_Xyl Client middleware. This is to initialize Light\_Xyl Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_XYL_CLT_Open(&g_mesh_light_xyl_clt0_ctrl,
&g_mesh_light_xyl_clt0_cfg);
```

**Return values**

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ **RM\_MESH\_LIGHT\_XYL\_CLT\_Close()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light\_Xyl Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_XYL_CLT_Close(&g_mesh_light_xyl_clt0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_LIGHT\_XYL\_CLT\_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light\_Xyl client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light xyl client model. */
err = RM_MESH_LIGHT_XYL_CLT_GetModelHandle(&g_mesh_light_xyl_clt0_ctrl,
&model_handle);
```

**Return values**

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ **RM\_MESH\_LIGHT\_XYL\_CLT\_SetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Light\_Xyl client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of generic battery client model. */
err =
RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
model_handle);
```

**Return values**

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_XYL\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_XYL_CLT_SendReliablePdu(&g_mesh_light_xyl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_XYL\_CLT\_Get()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light xyL Get is an acknowledged message used to get the Light xyL Lightness, Light xyL x, and Light xyL y states of an element. Upon receiving a Light xyL Get message, the element shall respond with a Light xyL Status message. The response to the Light xyL Get message is a Light xyL Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_XYL\_CLT\_Set()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light xyL Set is an acknowledged message used to set the Light xyL Lightness, Light xyL x state, and the Light xyL y states of an element. The response to the Light xyL Set message is a Light xyL Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_XYL\_CLT\_SetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light xyl Set Unacknowledged is an unacknowledged message used to set the Light xyl Lightness, Light xyl x, and the Light xyl y states of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyl Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_XYL\_CLT\_TargetGet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_TargetGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light xyL Target Get is an acknowledged message used to get the target Light xyL Lightness, Light xyL x, and Light xyL y states of an element. The response to the Light xyL Target Get message is a Light xyL Target Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_XYL\_CLT\_DefaultGet()

`fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Light xyl Default Get is an acknowledged message used to get the Light Lightness Default, the Light xyl x Default, and Light xyl y Default states of an element. The response to the Light xyl Default Get message is a Light xyl Default Status message. There are no parameters for this message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
------	--------	--------------------------------------

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_XYL\_CLT\_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light xyl Default Set is an acknowledged message used to set the Light Lightness Default, the Light xyl x Default, and Light xyl y Default states of an element. The response to the Light xyl Default Set message is a Light xyl Default Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_XYL\_CLT\_DefaultSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light xyl Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light xyl x Default, and Light xyl y Default states of an element.

**Parameters**

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_XYL\_CLT\_RangeGet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light xyL Range Get is an acknowledged message used to get the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Get message is a Light xyL Range Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_LIGHT\_XYL\_CLT\_RangeSet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light xyl Range Set is an acknowledged message used to set the Light xyl x Range and Light xyl y Range states of an element. The response to the Light xyl Range Set message is a Light xyl Range Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyl Range Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_LIGHT\_XYL\_CLT\_RangeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light xyl Range Set Unacknowledged is an unacknowledged message used to set the Light xyl x Range and Light xyl y Range states of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyl Range Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Light Xyl Server (rm\_mesh\_light\_xyl\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_Open (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```

(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Xyl Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_light\_xyl\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_light\_xyl\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Light XYL Server (rm\_mesh\_light\_xyl\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light XYL Server (rm\_mesh\_light\_xyl\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_xyl_sr v0	Module name.

## Data Structures

```
struct rm_mesh_light_xyl_srv_info_t
```

```
struct rm_mesh_light_xyl_srv_target_info_t
```

```
struct rm_mesh_light_xyl_srv_default_info_t
```

```
struct rm_mesh_light_xyl_srv_range_info_t
```

```
struct rm_mesh_light_xyl_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_light\_xyl\_srv\_info\_t

struct rm_mesh_light_xyl_srv_info_t		
Light xyL state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	target_xyl_lightness	Target perceived lightness - used in response path
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	target_xyl_x	Target x coordinate - used in response path
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light
uint16_t	target_xyl_y	Target y coordinate - used in response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

### ◆ rm\_mesh\_light\_xyl\_srv\_target\_info\_t

struct rm_mesh_light_xyl_srv_target_info_t		
Light xyL target state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931

color light

◆ **rm\_mesh\_light\_xyl\_srv\_default\_info\_t**

struct rm\_mesh\_light\_xyl\_srv\_default\_info\_t

Light xyL default state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states

## Data Fields

uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light

◆ **rm\_mesh\_light\_xyl\_srv\_range\_info\_t**

struct rm\_mesh\_light\_xyl\_srv\_range\_info\_t

Light xyL Range state determines the minimum and maximum values of the Light xyL x and syL y state of an element

## Data Fields

uint16_t	xyl_x_range_min	The minimum value of a Light xyL x state of an element
uint16_t	xyl_x_range_max	The maximum value of a Light xyL x state of an element
uint16_t	xyl_y_range_min	The minimum value of a Light xyL y state of an element
uint16_t	xyl_y_range_max	The maximum value of a Light xyL y state of an element
uint8_t	status	Status - Used in the response path

◆ **rm\_mesh\_light\_xyl\_srv\_instance\_ctrl\_t**

struct rm\_mesh\_light\_xyl\_srv\_instance\_ctrl\_t

BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_LIGHT\\_XYL\\_SRV\\_Open\(\)](#) is called.**Function Documentation**

### ◆ RM\_MESH\_LIGHT\_XYL\_SRV\_Open()

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light\_Xyl Server model. This is to initialize Light\_Xyl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_XYL_SRV_Open(&g_mesh_light_xyl_srv0_ctrl,
&g_mesh_light_xyl_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_LIGHT\_XYL\_SRV\_Close()

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light\_Xyl Server model. This is to terminate Light\_Xyl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_XYL_SRV_Close(&g_mesh_light_xyl_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_LIGHT\_XYL\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_XYL_SRV_StateUpdate(&g_mesh_light_xyl_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Scene Client (rm\_mesh\_scene\_clt)

<code>fsp_err_t</code>	<code>RM_MESH_SCENE_CLT_DeleteUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)</code>

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Scene Client module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for `rm_mesh_scene_clt`

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_scene\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Scene Client (rm\_mesh\_scene\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Scene Client (rm\_mesh\_scene\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scene_clt0	Module name.

### Data Structures

```
struct rm_mesh_scene_clt_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_mesh\_scene\_clt\_instance\_ctrl\_t

```
struct rm_mesh_scene_clt_instance_ctrl_t
```

BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_SCENE\\_CLT\\_Open\(\)](#) is called.

### Function Documentation

◆ **RM\_MESH\_SCENE\_CLT\_Open()**

```
fsp_err_t RM_MESH_SCENE_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

open Scene Client middleware. This is to initialize Scene Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCENE_CLT_Open(&g_mesh_scene_clt0_ctrl, &g_mesh_scene_clt0_cfg);
```

**Return values**

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ **RM\_MESH\_SCENE\_CLT\_Close()**

```
fsp_err_t RM_MESH_SCENE_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Scene Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SCENE_CLT_Close(&g_mesh_scene_clt0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_SCENE\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_SCENE_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Scene client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of scene client model. */
err = RM_MESH_SCENE_CLT_GetModelHandle(&g_mesh_scene_clt0_ctrl, &model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_SCENE\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_SCENE_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Scene client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of scene client model. */
err = RM_MESH_SCENE_CLT_SetModelHandle(&g_mesh_scene_clt0_ctrl, model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_SCENE\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_SCENE_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_SCENE_CLT_SendReliablePdu(&g_mesh_scene_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SCENE\_CLT\_Get()**

```
fsp_err_t RM_MESH_SCENE_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Scene Get is an acknowledged message used to get the current status of a currently active scene of an element. The response to the Scene Get message is a Scene Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_scene_clt control block.
------	--------	----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_SCENE\_CLT\_Recall()

```
fsp_err_t RM_MESH_SCENE_CLT_Recall ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Scene Recall is an acknowledged message that is used to recall the current state of an element from a previously stored scene. The response to the Scene Recall message is a Scene Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_SCENE\_CLT\_RecallUnacknowledged()

```
fsp_err_t RM_MESH_SCENE_CLT_RecallUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Scene Recall Unacknowledged is an unacknowledged message used to recall the current state of an element from a previously stored Scene.

#### Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SCENE\_CLT\_RegisterGet()**

```
fsp_err_t RM_MESH_SCENE_CLT_RegisterGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Scene Register Get is an acknowledged message used to get the current status of the Scene Register of an element. The response to the Scene Register Get message is a Scene Register Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_scene_clt control block.
------	--------	----------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SCENE\_CLT\_Store()**

```
fsp_err_t RM_MESH_SCENE_CLT_Store ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Scene Store is an acknowledged message used to store the current state of an element as a Scene, which can be recalled later. The response to the Scene Store message is a Scene Register Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SCENE\_CLT\_StoreUnacknowledged()**

```
fsp_err_t RM_MESH_SCENE_CLT_StoreUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Scene Store Unacknowledged is an unacknowledged message used to store the current state of an element as a Scene, which can be recalled later.

**Parameters**

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SCENE\_CLT\_Delete()**

```
fsp_err_t RM_MESH_SCENE_CLT_Delete ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Scene Delete is an acknowledged message used to delete a Scene from the Scene Register state of an element. The response to the Scene Delete message is a Scene Register Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_SCENE\_CLT\_DeleteUnacknowledged()

```
fsp_err_t RM_MESH_SCENE_CLT_DeleteUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Scene Delete Unacknowledged is an unacknowledged message used to delete a scene from the Scene Register state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Scene Server (rm\_mesh\_scene\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_SCENE_SRV_Open (rm_ble_mesh_scene_server_ctrl_t
*const p_ctrl, rm_ble_mesh_scene_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_SCENE_SRV_Close (rm_ble_mesh_scene_server_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_SCENE_SRV_StateUpdate
```

```
(rm_ble_mesh_scene_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Scene Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_scene\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_scene\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Scene Server (rm\_mesh\_scene\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Scene Server (rm\_mesh\_scene\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scene_srv0	Module name.
Model Handle	Invalid Model Handle	0	Select model handle.
Setup Server Handle	Invalid Setup Server Handle	0	Select setup server handle.

## Data Structures

```
struct rm_mesh_scene_srv_number_info_t
```

```
struct rm_mesh_scene_srv_status_info_t
```

```
struct rm_mesh_scene_srv_register_status_info_t
```

```
struct rm_mesh_scene_srv_ext_tid_and_transition_info_t
```

```
struct rm_mesh_scene_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_scene\_srv\_number\_info\_t

struct rm_mesh_scene_srv_number_info_t		
The state to identify a scene		
Data Fields		
uint16_t	number	The number to identify a scene

### ◆ rm\_mesh\_scene\_srv\_status\_info\_t

struct rm_mesh_scene_srv_status_info_t		
The current status of a currently active scene		
Data Fields		
uint8_t	status_code	Status Code
uint16_t	current_scene	Scene Number of a current scene.
uint16_t	target_scene	Scene Number of a target scene.
uint8_t	remaining_time	

### ◆ rm\_mesh\_scene\_srv\_register\_status\_info\_t

struct rm_mesh_scene_srv_register_status_info_t		
The current status of scene register		
Data Fields		
uint8_t	status_code	Status Code
uint16_t	current_scene	Scene Number of a current scene.
uint16_t *	scenes	A list of scenes stored within an element
uint16_t	scenes_count	

### ◆ rm\_mesh\_scene\_srv\_ext\_tid\_and\_transition\_info\_t

struct rm_mesh_scene_srv_ext_tid_and_transition_info_t		
TID and Transition is a structure which contains Transaction ID (TID) as mandatory field. Other two fields, Transition Time and Delay are optional.		
TID field is a transaction identifier indicating whether the message is a new message or a retransmission of a previously sent message.		

If present, the Transition Time field identifies the time that an element will take to transition to the target state from the present state.

The Delay field shall be present when the Transition Time field is present. It identifies the message execution delay, representing a time interval between receiving the message by a model and executing the associated model behaviors.

#### ◆ **rm\_mesh\_scene\_srv\_instance\_ctrl\_t**

```
struct rm_mesh_scene_srv_instance_ctrl_t
```

BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_SCENE\\_SRV\\_Open\(\)](#) is called.

## Function Documentation

#### ◆ **RM\_MESH\_SCENE\_SRV\_Open()**

```
fsp_err_t RM_MESH_SCENE_SRV_Open ( rm_ble_mesh_scene_server_ctrl_t *const p_ctrl,
rm_ble_mesh_scene_server_cfg_t const *const p_cfg )
```

API to initialize Scene Server model. This is to initialize Scene Server model and to register with Access layer.

Implements [rm\\_ble\\_mesh\\_model\\_server\\_api\\_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_SCENE_SRV_Open(&g_mesh_scene_srv0_ctrl, &g_mesh_scene_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

**◆ RM\_MESH\_SCENE\_SRV\_Close()**

```
fsp_err_t RM_MESH_SCENE_SRV_Close ( rm_ble_mesh_scene_server_ctrl_t *const p_ctrl)
```

API to terminate Scene Server model. This is to terminate Scene Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_SCENE_SRV_Close(&g_mesh_scene_srv0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_SCENE\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_SCENE_SRV_StateUpdate ( rm_ble_mesh_scene_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_SCENE_SRV_StateUpdate(&g_mesh_scene_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### Bluetooth Low Energy Mesh Network Scheduler Client (rm\_mesh\_scheduler\_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

#### Functions

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Close (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_SCHEDULER_CLT_GetModelHandle
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
```

```
rm_ble_mesh_access_model_handle_t *const p_model_handle)
```

```
fsp_err_t RM_MESH_SCHEDULER_CLT_SetModelHandle
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle)
```

```
fsp_err_t RM_MESH_SCHEDULER_CLT_SendReliablePdu
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode,
void const *const p_parameter, uint32_t rsp_opcode)
```

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Get (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionGet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Scheduler Client module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_scheduler\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_scheduler\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Scheduler Client (rm\_mesh\_scheduler\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Scheduler Client (rm\_mesh\_scheduler\_clt).

--	--	--	--

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scheduler_clt0	Module name.

## Data Structures

```
struct rm_mesh_scheduler_clt_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_scheduler\_clt\_instance\_ctrl\_t

```
struct rm_mesh_scheduler_clt_instance_ctrl_t
```

BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_SCHEDULER_CLT_Open()` is called.

## Function Documentation

### ◆ RM\_MESH\_SCHEDULER\_CLT\_Open()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Scheduler Client middleware. This is to initialize Scheduler Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCHEDULER_CLT_Open(&g_mesh_scheduler_clt0_ctrl,
&g_mesh_scheduler_clt0_cfg);
```

### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ **RM\_MESH\_SCHEDULER\_CLT\_Close()**

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Scheduler Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SCHEDULER_CLT_Close(&g_mesh_scheduler_clt0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_SCHEDULER\_CLT\_GetModelHandle()**

```
fsp_err_t RM_MESH_SCHEDULER_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Scheduler client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of scheduler client model. */
err = RM_MESH_SCHEDULER_CLT_GetModelHandle(&g_mesh_scheduler_clt0_ctrl,
&model_handle);
```

**Return values**

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

**◆ RM\_MESH\_SCHEDULER\_CLT\_SetModelHandle()**

```
fsp_err_t RM_MESH_SCHEDULER_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Scheduler client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of scheduler client model. */  
err = RM_MESH_SCHEDULER_CLT_SetModelHandle(&g_mesh_scheduler_clt0_ctrl,  
model_handle);
```

**Return values**

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_SCHEDULER\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_SCHEDULER_CLT_SendReliablePdu(&g_mesh_scheduler_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SCHEDULER\_CLT\_Get()**

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Scheduler Get is an acknowledged message used to get the current Schedule Register state of an element. The response to the Scheduler Get message is a Scheduler Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
------	--------	--------------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SCHEDULER\_CLT\_ActionGet()**

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Scheduler Action Get is an acknowledged message used to report the action defined by the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Get message is a Scheduler Action Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Get message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_SCHEDULER\_CLT\_ActionSet()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Scheduler Action Set is an acknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Set message is a Scheduler Action Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_SCHEDULER\_CLT\_ActionSetUnacknowledged()

`fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )`

Scheduler Action Set Unacknowledged is an unacknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field.

#### Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

`fsp_err_t RM_MESH_SCHEDULER_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)`

`fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate`

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Scheduler Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_scheduler\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_scheduler\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Scheduler Server (rm\_mesh\_scheduler\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Scheduler Server (rm\_mesh\_scheduler\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scheduler_srv0	Module name.

## Data Structures

```
struct rm_mesh_scheduler_srv_schedules_info_t
```

```
struct rm_mesh_scheduler_srv_entry_index_info_t
```

```
struct rm_mesh_scheduler_srv_entry_info_t
```

```
struct rm_mesh_scheduler_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_scheduler\_srv\_schedules\_info\_t

struct rm_mesh_scheduler_srv_schedules_info_t		
The current Schedule Register state of an element.		
Data Fields		
uint16_t	schedules	Bit field indicating defined Actions in the Schedule Register

### ◆ rm\_mesh\_scheduler\_srv\_entry\_index\_info\_t

struct rm_mesh_scheduler_srv_entry_index_info_t		
The entry index of the Schedule Register state		
Data Fields		
uint8_t	index	Index of the Schedule Register entry

### ◆ rm\_mesh\_scheduler\_srv\_entry\_info\_t

struct rm_mesh_scheduler_srv_entry_info_t		
The entry of the Schedule Register state		
Data Fields		
uint8_t	index	Index of the Schedule Register entry
uint8_t	year	Scheduled year for the action
uint16_t	month	Scheduled month for the action
uint8_t	day	Scheduled day of the month for the action
uint8_t	hour	Scheduled hour for the action
uint8_t	minute	Scheduled minute for the action
uint8_t	second	Scheduled second for the action
uint8_t	dayofweek	Schedule days of the week for the action
uint8_t	action	Action to be performed at the scheduled time
uint8_t	transition_time	Transition time for this action
uint16_t	scene_number	Scene number to be used for some actions

◆ **rm\_mesh\_scheduler\_srv\_instance\_ctrl\_t**

```
struct rm_mesh_scheduler_srv_instance_ctrl_t
```

BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_SCHEDULER_SRV_Open()` is called.

**Function Documentation**◆ **RM\_MESH\_SCHEDULER\_SRV\_Open()**

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Scheduler Server model. This is to initialize Scheduler Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCHEDULER_SRV_Open(&g_mesh_scheduler_srv0_ctrl,
&g_mesh_scheduler_srv0_cfg);
```

**Return values**

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

**◆ RM\_MESH\_SCHEDULER\_SRV\_Close()**

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Scheduler Server model. This is to terminate Scheduler Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_SCHEDULER_SRV_Close(&g_mesh_scheduler_srv0_ctrl);
```

**Return values**

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

## ◆ RM\_MESH\_SCHEDULER\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_SCHEDULER_SRV_StateUpdate(&g_mesh_scheduler_srv0_ctrl, &state);
```

### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Sensor Client module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_sensor\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_sensor\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Sensor Client (rm\_mesh\_sensor\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Sensor Client (rm\_mesh\_sensor\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_sensor_clt0	Module name.

## Data Structures

```
struct rm\_mesh\_sensor\_clt\_instance\_ctrl\_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_sensor\_clt\_instance\_ctrl\_t

```
struct rm_mesh_sensor_clt_instance_ctrl_t
```

BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_SENSOR\\_CLT\\_Open\(\)](#) is called.

## Function Documentation

### ◆ RM\_MESH\_SENSOR\_CLT\_Open()

```
fsp_err_t RM_MESH_SENSOR_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Sensor Client middleware. This is to initialize Sensor Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SENSOR_CLT_Open(&g_mesh_sensor_clt0_ctrl, &g_mesh_sensor_clt0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_SENSOR\_CLT\_Close()

```
fsp_err_t RM_MESH_SENSOR_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Sensor Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SENSOR_CLT_Close(&g_mesh_sensor_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_SENSOR\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_SENSOR_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Sensor client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of sensor client model. */
err = RM_MESH_SENSOR_CLT_GetModelHandle(&g_mesh_sensor_clt0_ctrl, &model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_SENSOR\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_SENSOR_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Sensor client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of sensor client model. */
err = RM_MESH_SENSOR_CLT_SetModelHandle(&g_mesh_sensor_clt0_ctrl, model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ **RM\_MESH\_SENSOR\_CLT\_SendReliablePdu()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_SENSOR_CLT_SendReliablePdu(&g_mesh_sensor_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SENSOR\_CLT\_DescriptorGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_DescriptorGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Descriptor Get is an acknowledged message used to get the Sensor Descriptor state of all sensors within an element. The response to a Sensor Descriptor Get message is a Sensor Descriptor Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Descriptor Get message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SENSOR\_CLT\_Get()**

```
fsp_err_t RM_MESH_SENSOR_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Sensor Get is an acknowledged message used to get the Sensor Data state. The response to the Sensor Get message is a Sensor Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Get message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SENSOR\_CLT\_ColumnGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_ColumnGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Column Get is an acknowledged message used to get the Sensor Series Column state. The response to the Sensor Column Get message is a Sensor Column Status message

**Parameters**

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Column Get message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SENSOR\_CLT\_SeriesGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SeriesGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Series Get is an acknowledged message used to get a sequence of the Sensor Series Column states. The response to the Sensor Series Get message is a Sensor Series Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Series Get message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SENSOR\_CLT\_CadenceGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_CadenceGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Cadence Get is an acknowledged message used to get the Sensor Cadence state of an element. The response to the Sensor Cadence Get message is a Sensor Cadence Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Get message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SENSOR\_CLT\_CadenceSet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_CadenceSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Cadence Set is an acknowledged message used to set the Sensor Cadence state of an element. The response to the Sensor Cadence Set message is a Sensor Cadence Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_SENSOR\_CLT\_CadenceSetUnacknowledged()

```
fsp_err_t RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Sensor Cadence Set Unacknowledged is an unacknowledged message used to set the Sensor Cadence state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SENSOR\_CLT\_SettingsGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingsGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Settings Get is an acknowledged message used to get the list of Sensor Setting states of an element. The response to the Sensor Settings Get message is a Sensor Settings Status message

**Parameters**

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Get message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SENSOR\_CLT\_SettingGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Setting Get is an acknowledged message used to get the Sensor Setting state of an element. The response to the Sensor Setting Get message is a Sensor Setting Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Get message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_SENSOR\_CLT\_SettingSet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Setting Set is an acknowledged message used to set the Sensor Setting state of an element. The response to the Sensor Setting Set message is a Sensor Setting Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_SENSOR\_CLT\_SettingSetUnacknowledged()

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Sensor Setting Set Unacknowledged is an unacknowledged message used to set the Sensor Setting state of an element.

#### Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Sensor Server (rm\_mesh\_sensor\_srv)

*const p_ctrl)
```

```
fsp_err_t RM_MESH_SENSOR_SRV_StateUpdate
```

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

```
fsp_err_t RM_MESH_SENSOR_SRV_SetupServerStateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Sensor Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_sensor\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_sensor\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Sensor Server (rm\_mesh\_sensor\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Sensor Server (rm\_mesh\_sensor\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_sensor_srv_0	Module name.

## Data Structures

```
struct rm_mesh_sensor_srv_descriptor_info_t
```

```
struct rm_mesh_sensor_srv_settings_info_t
```

```
struct rm_mesh_sensor_srv_setting_info_t
```

```
struct rm_mesh_sensor_srv_cadence_info_t
```

```
struct rm_mesh_sensor_srv_data_info_t
```

```
struct rm_mesh_sensor_srv_series_column_info_t
```

```
struct rm_mesh_sensor_srv_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_mesh\_sensor\_srv\_descriptor\_info\_t

struct rm_mesh_sensor_srv_descriptor_info_t		
Sensor Descriptor state represents the attributes describing the sensor data		
Data Fields		
uint16_t	sensor_property_id	Sensor Property ID field is a 2-octet value referencing a device property that describes the meaning and the format of data reported by a sensor
uint16_t	sensor_positive_tolerance	Sensor Positive Tolerance field is a 12-bit value representing the magnitude of a possible positive error associated with the measurements that the sensor is reporting
uint16_t	sensor_negative_tolerance	Sensor Negative Tolerance field is a 12-bit value representing the magnitude of a possible negative error associated with the measurements that the sensor is reporting
uint8_t	sensor_sampling_function	Sensor Sampling Function field specifies the averaging operation or type of sampling function applied to the measured value
uint8_t	sensor_measurement_period	Sensor Measurement Period field specifies a uint8 value n that represents the averaging time span, accumulation time, or measurement period in seconds over which the measurement is taken
uint8_t	sensor_update_interval	measurement reported by a sensor is internally refreshed at the frequency indicated in the Sensor Update Interval field

uint8_t	status	Status - used in response to indicate if other fields to be included
---------	--------	--

#### ◆ rm\_mesh\_sensor\_srv\_settings\_info\_t

struct rm_mesh_sensor_srv_settings_info_t		
Sensor Settings state controls parameters of a sensor		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint16_t *	setting_property_ids	Property ID of a setting within a sensor
uint16_t	setting_property_ids_count	

#### ◆ rm\_mesh\_sensor\_srv\_setting\_info\_t

struct rm_mesh_sensor_srv_setting_info_t		
Sensor Setting state controls parameters of a sensor		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint16_t	sensor_setting_property_id	Property ID of a setting within a sensor
uint8_t	sensor_setting_access	Read/Write access rights for the setting
uint8_t *	sensor_setting_raw	Raw value of a setting within a sensor
uint16_t	sensor_setting_raw_len	
uint8_t	status	

#### ◆ rm\_mesh\_sensor\_srv\_cadence\_info\_t

struct rm_mesh_sensor_srv_cadence_info_t		
Sensor Cadence state controls the cadence of sensor reports		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint8_t	fast_cadence_period_divisor	Divisor for the Publish Period
uint8_t	status_trigger_type	Defines the unit and format of the Status Trigger Delta fields
uint8_t *	status_trigger_delta_down	Delta down value that triggers a status message
uint16_t	status_trigger_delta_down_len	
uint8_t *	status_trigger_delta_up	Delta up value that triggers a

		status message
uint16_t	status_trigger_delta_up_len	
uint8_t	status_min_interval	Minimum interval between two consecutive Status messages APPLICATION NOTE: The Current Sensor Server Model implementation does not inherently check for the time interval between two consecutive status messages. The application layer which manages the data for the Sensor Server Model holds the responsibility for interleaving consecutive status messages with the configured Minimum time interval for statuses.
uint8_t *	fast_cadence_low	Low value for the fast cadence range
uint16_t	fast_cadence_low_len	
uint8_t *	fast_cadence_high	High value for the fast cadence range
uint16_t	fast_cadence_high_len	
uint8_t	status	Status - used in response path

#### ◆ rm\_mesh\_sensor\_srv\_data\_info\_t

struct rm_mesh_sensor_srv_data_info_t		
The Sensor Data state is a sequence of one or more pairs of Sensor Property ID and Raw Value fields, with each Raw Value field size and representation defined by the characteristics referenced by the Sensor Property ID		
Data Fields		
uint16_t	property_id_1	ID of the 1st device property of the sensor
uint8_t *	raw_value_1	Raw Value field with a size and representation defined by the 1st device property
uint16_t	raw_value_1_len	
uint16_t	property_id_2	ID of the 2nd device property of the sensor
uint8_t *	raw_value_2	Raw Value field with a size and representation defined by the 2nd device property
uint16_t	raw_value_2_len	
uint16_t	property_id_n	ID of the nth device property of

		the sensor
uint8_t *	raw_value_n	Raw Value field with a size and representation defined by the nth device property
uint16_t	raw_value_n_len	
uint8_t	status	Status - used in response path

#### ◆ rm\_mesh\_sensor\_srv\_series\_column\_info\_t

struct rm_mesh_sensor_srv_series_column_info_t		
Values measured by sensors may be organized as arrays (and represented as series of columns, such as histograms)		
Data Fields		
uint16_t	sensor_property_id	Property describing the data series of the sensor
uint8_t *	sensor_raw_value_x	Raw value representing the left corner of a column on the X axis
uint16_t	sensor_raw_value_x_len	
uint8_t *	sensor_column_width	Raw value representing the width of the column
uint16_t	sensor_column_width_len	
uint8_t *	sensor_raw_value_y	Raw value representing the height of the column on the Y axis
uint16_t	sensor_raw_value_y_len	
uint8_t	status	Status - used in response path

#### ◆ rm\_mesh\_sensor\_srv\_instance\_ctrl\_t

struct rm_mesh_sensor_srv_instance_ctrl_t	
BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_SENSOR_SRV_Open()</a> is called.	

## Function Documentation

### ◆ RM\_MESH\_SENSOR\_SRV\_Open()

```
fsp_err_t RM_MESH_SENSOR_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Sensor Server model and to initialize Sensor\_Setup Server model. This is to initialize Sensor Server model and to register with Access layer. And this is to initialize Sensor\_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SENSOR_SRV_Open(&g_mesh_sensor_srv0_ctrl, &g_mesh_sensor_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_SENSOR\_SRV\_Close()

```
fsp_err_t RM_MESH_SENSOR_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Sensor Server model. This is to terminate Sensor Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SENSOR_SRV_Close(&g_mesh_sensor_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_SENSOR\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_SENSOR_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_SENSOR_SRV_StateUpdate(&g_mesh_sensor_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_SENSOR\_SRV\_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_SENSOR_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

#### Parameters

[in]	p_ctrl	rm_mesh_sensor_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Time Client (rm\_mesh\_time\_clt)

*const p_ctrl)
```

```
fsp_err_t RM_MESH_TIME_CLT_RoleSet (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter)
```

## Detailed Description

## Overview

### Target Devices

The Bluetooth Low Energy Energy Mesh Network Time Client module supports the following devices.

- RA4W1

## Configuration

### Build Time Configurations for rm\_mesh\_time\_clt

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_time\_clt\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

### Configurations for Networking > BLE Mesh Model Time Client (rm\_mesh\_time\_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Time Client (rm\_mesh\_time\_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_time_clt0	Module name.

### Data Structures

```
struct rm_mesh_time_clt_instance_ctrl_t
```

### Data Structure Documentation

#### ◆ rm\_mesh\_time\_clt\_instance\_ctrl\_t

```
struct rm_mesh_time_clt_instance_ctrl_t
```

BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when [RM\\_MESH\\_TIME\\_CLT\\_Open\(\)](#) is called.

### Function Documentation

### ◆ RM\_MESH\_TIME\_CLT\_Open()

```
fsp_err_t RM_MESH_TIME_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Time Client middleware. This is to initialize Time Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_TIME_CLT_Open(&g_mesh_time_clt0_ctrl, &g_mesh_time_clt0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_TIME\_CLT\_Close()

```
fsp_err_t RM_MESH_TIME_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Time Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_TIME_CLT_Close(&g_mesh_time_clt0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_TIME\_CLT\_GetModelHandle()

```
fsp_err_t RM_MESH_TIME_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Time client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of time client model. */
err = RM_MESH_TIME_CLT_GetModelHandle(&g_mesh_time_clt0_ctrl, &model_handle);
```

#### Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

### ◆ RM\_MESH\_TIME\_CLT\_SetModelHandle()

```
fsp_err_t RM_MESH_TIME_CLT_SetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle )
```

This is to set the handle of Time client model.

Implements `rm_ble_mesh_model_client_api_t::setModelHandle`.

Example:

```
/* Set the handle of time client model. */
err = RM_MESH_TIME_CLT_SetModelHandle(&g_mesh_time_clt0_ctrl, model_handle);
```

#### Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_TIME\_CLT\_SendReliablePdu()

```
fsp_err_t RM_MESH_TIME_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_TIME_CLT_SendReliablePdu(&g_mesh_time_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_TIME\_CLT\_Get()**

```
fsp_err_t RM_MESH_TIME_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Time Get is a message used to get the Time state of neighbor nodes. The response to the Time Get message is a Time Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_time_clt control block.
------	--------	---------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_TIME\_CLT\_Set()**

```
fsp_err_t RM_MESH_TIME_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Time Set is an acknowledged message used to set the Time state of an element. The response to the Time Set message is a Time Status message.

**Parameters**

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_TIME\_CLT\_ZoneGet()**

```
fsp_err_t RM_MESH_TIME_CLT_ZoneGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Time Zone Get is an acknowledged message used to get the Time Zone Offset Current state, the Time Zone Offset New state, and the TAI of Zone Change state. The response to the Time Zone Get message is a Time Zone Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_time_clt control block.
------	--------	---------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_TIME\_CLT\_ZoneSet()**

```
fsp_err_t RM_MESH_TIME_CLT_ZoneSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Time Zone Set is an acknowledged message used to set the Time Zone Offset New state and the TAI of Zone Change state.

**Parameters**

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Zone Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_TIME\_CLT\_TaiUtcDeltaGet()**

```
fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

TAI-UTC Delta Get is an acknowledged message used to get the TAI-UTC Delta Current state, the TAI-UTC Delta New state, and the TAI of Delta Change state. The response to the TAI-UTC Delta Get message is a TAI-UTC Delta Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_time_ct control block.
------	--------	--------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_TIME\_CLT\_TaiUtcDeltaSet()**

```
fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

TAI-UTC Delta Set is an acknowledged message used to set the TAI-UTC Delta New state and the TAI of Delta Change state.

**Parameters**

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to TAI-UTC Delta Set message.

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ **RM\_MESH\_TIME\_CLT\_RoleGet()**

```
fsp_err_t RM_MESH_TIME_CLT_RoleGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Time Role Get is an acknowledged message used to get the Time Role state of an element. The response to the Time Role Get message is a Time Role Status message. There are no parameters for this message.

**Parameters**

[in]	p_ctrl	rm_mesh_time_clt control block.
------	--------	---------------------------------

**Return values**

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

### ◆ RM\_MESH\_TIME\_CLT\_RoleSet()

```
fsp_err_t RM_MESH_TIME_CLT_RoleSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Time Role Set is an acknowledged message used to set the Time Role state of an element. The response to the Time Role Set message is a Time Role Status message.

#### Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Role Set message.

#### Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

## Bluetooth Low Energy Mesh Network Time Server (rm\_mesh\_time\_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

### Functions

```
fsp_err_t RM_MESH_TIME_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_TIME_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_TIME_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t
```

```
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const
p_state)
```

## Detailed Description

# Overview

## Target Devices

The Bluetooth Low Energy Energy Mesh Network Time Server module supports the following devices.

- RA4W1

# Configuration

## Build Time Configurations for rm\_mesh\_time\_srv

The following build time configurations are defined in fsp\_cfg/rm\_mesh\_time\_srv\_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

## Configurations for Networking > BLE Mesh Model Time Server (rm\_mesh\_time\_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Time Server (rm\_mesh\_time\_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_time_srv0	Module name.

## Data Structures

```
struct rm_mesh_time_srv_info_t
```

```
struct rm_mesh_time_srv_zone_info_t
```

```
struct rm_mesh_time_srv_tai_utc_delta_info_t
```

```
struct rm_mesh_time_srv_role_info_t
```

```
struct rm_mesh_time_srv_instance_ctrl_t
```

## Data Structure Documentation

◆ **rm\_mesh\_time\_srv\_info\_t**

struct rm_mesh_time_srv_info_t		
Mesh defines times based on International Atomic Time (TAI). The base representation of times is the number of seconds after 00:00:00 TAI on 2000-01-01 (that is, 1999-12-31T23:59:28 UTC)		
Data Fields		
uint8_t	tai_seconds[5]	Current TAI time in seconds since the epoch.
uint8_t	subsecond	The sub-second time in units of 1/256s.
uint8_t	uncertainty	Estimated uncertainty in 10-millisecond steps.
uint8_t	time_authority	0 = No Time Authority. The element does not have a trusted OOB source of time, such as GPS or NTP. 1 = Time Authority. The element has a trusted OOB source of time, such as GPS or NTP or a battery-backed, properly initialized RTC.
uint16_t	tai_utc_delta	Current difference between TAI and UTC in seconds
uint8_t	time_zone_offset	The local time zone offset in 15-minute increments

◆ **rm\_mesh\_time\_srv\_zone\_info\_t**

struct rm_mesh_time_srv_zone_info_t		
Time Zone		
Data Fields		
uint8_t	time_zone_offset_current	Current local time zone offset. Meaningful only in 'Time Zone Status' response.
uint8_t	time_zone_offset_new	Upcoming local time zone offset.
uint8_t	tai_of_zone_change[5]	Absolute TAI time when the Time Zone Offset will change from Current to New.

◆ **rm\_mesh\_time\_srv\_tai\_utc\_delta\_info\_t**

struct rm_mesh_time_srv_tai_utc_delta_info_t		
TAI-UTC Delta		
Data Fields		

uint16_t	tai_utc_delta_current	Current difference between TAI and UTC in seconds. Meaningful only in 'TAI-UTC Delta Status' response.
uint16_t	tai_utc_delta_new	Upcoming difference between TAI and UTC in seconds.
uint8_t	padding	Always 0b0. Other values are Prohibited.
uint8_t	tai_of_delta_change[5]	TAI Seconds time of the upcoming TAI-UTC Delta change

#### ◆ rm\_mesh\_time\_srv\_role\_info\_t

struct rm_mesh_time_srv_role_info_t		
The Time Role state of an element		
Data Fields		
uint8_t	role	Time Role

#### ◆ rm\_mesh\_time\_srv\_instance\_ctrl\_t

struct rm_mesh_time_srv_instance_ctrl_t	
BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">RM_MESH_TIME_SRV_Open()</a> is called.	

## Function Documentation

### ◆ RM\_MESH\_TIME\_SRV\_Open()

```
fsp_err_t RM_MESH_TIME_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Time Server model. This is to initialize Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_TIME_SRV_Open(&g_mesh_time_srv0_ctrl, &g_mesh_time_srv0_cfg);
```

#### Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

### ◆ RM\_MESH\_TIME\_SRV\_Close()

```
fsp_err_t RM_MESH_TIME_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Time Server model. This is to terminate Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_TIME_SRV_Close(&g_mesh_time_srv0_ctrl);
```

#### Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

### ◆ RM\_MESH\_TIME\_SRV\_StateUpdate()

```
fsp_err_t RM_MESH_TIME_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_TIME_SRV_StateUpdate(&g_mesh_time_srv0_ctrl, &state);
```

#### Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

#### 4.2.11.12 Cellular Comm Interface on UART (rm\_cellular\_comm\_uart\_aws)

Modules » Networking

##### Functions

CellularCommInterfaceError\_t [RM\\_CELLULAR\\_COMM\\_UART\\_AWS\\_Open](#)  
(rm\_cellular\_comm\_uart\_aws\_instance\_ctrl\_t \*p\_instance\_ctrl, CellularCommInterfaceReceiveCallback\_t receive\_callback, void \*pUserData)

CellularCommInterfaceError\_t [RM\\_CELLULAR\\_COMM\\_UART\\_AWS\\_Send](#)  
(CellularCommInterfaceHandle\_t commInterfaceHandle, const uint8\_t \*pData, uint32\_t dataLength, uint32\_t timeoutMilliseconds, uint32\_t

\*pDataSentLength)

CellularCommInterfaceError\_t [RM\\_CELLULAR\\_COMM\\_UART\\_AWS\\_Receive](#)  
 (CellularCommInterfaceHandle\_t commInterfaceHandle, uint8\_t \*pBuffer, uint32\_t bufferLength, uint32\_t timeoutMilliseconds, uint32\_t \*pDataReceivedLength)

CellularCommInterfaceError\_t [RM\\_CELLULAR\\_COMM\\_UART\\_AWS\\_Close](#)  
 (CellularCommInterfaceHandle\_t commInterfaceHandle)

void [comm\\_uart\\_aws\\_callback](#) (uart\_callback\_args\_t \*p\_args)

## Detailed Description

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

## Overview

See AWS documentation for how the Cellular Comm Interface works:

[https://www.freertos.org/Documentation/api-ref/cellular/cellular\\_porting.html#cellular\\_porting\\_comm\\_if](https://www.freertos.org/Documentation/api-ref/cellular/cellular_porting.html#cellular_porting_comm_if)

## Configuration

*Note*

*Using DTC with UART is recommended to reduce the number of interrupts in the system.*

### Build Time Configurations for rm\_cellular\_comm\_uart\_aws

The following build time configurations are defined in fsp\_cfg/middleware/rm\_cellular\_comm\_uart\_aws\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	Selects if code for parameter checking is to be included in the build.
Receive Buffer	Size should be greater than zero	256	Temporary buffer for received bytes. When read function is called remaining bytes will be read directly into buffer specified by read function argument.
Receive Transfer Size	Size should be greater than zero	512	The comm interface will break down UART reads into smaller read requests based on this number. For instance if

this is set to 512 bytes then the interface will request 512 bytes at a time until the requested length is met or timeout. This is helpful for making use of DTC without having a long timeout period. AWS Cellular Interface Common->Comm Interface Receive Timeout is the timeout used for individual reads and should set accordingly based on this setting.

### Configurations for Networking > Cellular Comm Interface on UART (rm\_cellular\_comm\_uart\_aws)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_cellular_comm_uart0	Module name.

### Function Documentation

#### ◆ RM\_CELLULAR\_COMM\_UART\_AWS\_Open()

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Open (
  rm_cellular_comm_uart_aws_instance_ctrl_t * p_instance_ctrl,
  CellularCommInterfaceReceiveCallback_t receive_callback, void * pUserData )
```

Implements open for CellularCommInterface\_t

#### Parameters

[in]	receive_callback	Callback to call upon receiving data
[in]	pUserData	Pointer to user data to be passed through callback
[in]	p_instance_ctrl	Pointer to a rm_cellular_comm_uart_aws_instance_ctrl_t

#### Return values

IOT_COMM_INTERFACE_SUCCESS	Open succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

◆ **RM\_CELLULAR\_COMM\_UART\_AWS\_Send()**

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Send (
CellularCommInterfaceHandle_t commInterfaceHandle, const uint8_t* pData, uint32_t
dataLength, uint32_t timeoutMilliseconds, uint32_t* pDataSentLength )
```

Implements send for CellularCommInterface\_t. This function will block the calling thread until data is sent.

**Parameters**

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pData	Pointer to data to send
[in]	dataLength	Length of data to send
[in]	timeoutMilliseconds	Timeout in MS to wait for data to send
[in]	pDataSentLength	Actual length of data sent

**Return values**

IOT_COMM_INTERFACE_SUCCESS	Send succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure
IOT_COMM_INTERFACE_TIMEOUT	Send operation timed out

### ◆ RM\_CELLULAR\_COMM\_UART\_AWS\_Receive()

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Receive (
CellularCommInterfaceHandle_t commInterfaceHandle, uint8_t* pBuffer, uint32_t bufferSize,
uint32_t timeoutMilliseconds, uint32_t* pDataReceivedLength )
```

Implements receive for CellularCommInterface\_t. This function will block the calling thread until data is received.

#### Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pBuffer	Pointer to buffer to receive to
[in]	bufferLength	Length of buffer
[in]	timeoutMilliseconds	Timeout in MS to wait for data reception
[in]	pDataReceivedLength	Actual length of data received

#### Return values

IOT_COMM_INTERFACE_SUCCESS	Receive succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

### ◆ RM\_CELLULAR\_COMM\_UART\_AWS\_Close()

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Close (
CellularCommInterfaceHandle_t commInterfaceHandle)
```

Implements close for CellularCommInterface\_t

#### Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
------	---------------------	--

#### Return values

IOT_COMM_INTERFACE_SUCCESS	Close succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure

◆ **comm\_uart\_aws\_callback()**

```
void comm_uart_aws_callback ( uart_callback_args_t * p_args)
```

Callback for UART driver

**Parameters**

[in]	p_args	Arguments from UART RX/TX callback
------	--------	------------------------------------

**4.2.11.13 Ethernet (r\_ether)**

Modules » [Networking](#)

**Functions**

**fsp\_err\_t** [R\\_ETHER\\_Open](#) (ether\_ctrl\_t \*const p\_ctrl, ether\_cfg\_t const \*const p\_cfg)

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements [ether\\_api\\_t::open](#). [More...](#)

**fsp\_err\_t** [R\\_ETHER\\_Close](#) (ether\_ctrl\_t \*const p\_ctrl)

Disables interrupts. Removes power and releases hardware lock. Implements [ether\\_api\\_t::close](#). [More...](#)

**fsp\_err\_t** [R\\_ETHER\\_BufferRelease](#) (ether\_ctrl\_t \*const p\_ctrl)

Move to the next buffer in the circular receive buffer list. Implements [ether\\_api\\_t::bufferRelease](#). [More...](#)

**fsp\_err\_t** [R\\_ETHER\\_RxBufferUpdate](#) (ether\_ctrl\_t \*const p\_ctrl, void \*const p\_buffer)

Change the buffer pointer of the current rx buffer descriptor. Implements [ether\\_api\\_t::rxBufferUpdate](#). [More...](#)

**fsp\_err\_t** [R\\_ETHER\\_LinkProcess](#) (ether\_ctrl\_t \*const p\_ctrl)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements [ether\\_api\\_t::linkProcess](#). [More...](#)

`fsp_err_t` [R\\_ETHER\\_WakeOnLANEnable](#) (`ether_ctrl_t *const p_ctrl`)

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements [ether\\_api\\_t::wakeOnLANEnable](#). [More...](#)

`fsp_err_t` [R\\_ETHER\\_Read](#) (`ether_ctrl_t *const p_ctrl`, `void *const p_buffer`, `uint32_t *const length_bytes`)

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements [ether\\_api\\_t::read](#). [More...](#)

`fsp_err_t` [R\\_ETHER\\_Write](#) (`ether_ctrl_t *const p_ctrl`, `void *const p_buffer`, `uint32_t const frame_length`)

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements [ether\\_api\\_t::write](#). [More...](#)

`fsp_err_t` [R\\_ETHER\\_TxStatusGet](#) (`ether_ctrl_t *const p_ctrl`, `void *const p_buffer_address`)

## Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the [Ethernet Interface](#).

## Overview

This module performs Ethernet frame transmission and reception using an Ethernet controller and an Ethernet DMA controller.

### Features

The Ethernet module supports the following features:

- Transmit/receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Magic packet detection mode support
- Auto negotiation support
- Flow control support
- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support

## Configuration

### Build Time Configurations for r\_ether

The following build time configurations are defined in fsp\_cfg/r\_ether\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
ETO_LINKSTA Pin Status Flag	<ul style="list-style-type: none"> <li>Fall -&gt; Rise</li> <li>Rise -&gt; Fall</li> </ul>	Fall -> Rise	Specify the polarity of the link signal output by the PHY-LSI. When 0 is specified, link-up and link-down correspond respectively to the fall and rise of the LINKSTA signal. When 1 is specified, link-up and link-down correspond respectively to the rise and fall of the LINKSTA signal.
Link Signal Change Flag	<ul style="list-style-type: none"> <li>Unused</li> <li>Used</li> </ul>	Unused	Use LINKSTA signal for detect link status changes 0 = unused (use PHY-LSI status register) 1 = use (use LINKSTA signal)

### Configurations for Networking > Ethernet (r\_ether)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r\_ether).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_ether0	Module name.
General > Channel	0	0	Select the ether channel number.
General > MAC address	Must be a valid MAC address	00:11:22:33:44:55	MAC address of this channel.
General > Zero-copy Mode	<ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul>	Disable	Enable or disable zero-copy mode.
General > Flow control functionality	<ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul>	Disable	Enable or disable flow control.
Filters > Multicast Mode	<ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul>	Enable	Enable or disable multicast frame reception.

Filters > Promiscuous Mode	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Enable this option to receive packets addressed to other NICs.
Filters > Broadcast filter	Must be a valid non-negative integer with maximum configurable value of 65535.	0	Limit of the number of broadcast frames received continuously
Buffers > Number of TX buffer	Must be an integer from 1 to 8	1	Number of transmit buffers
Buffers > Number of RX buffer	Must be an integer from 1 to 8	1	Number of receive buffers
Buffers > Allocate RX buffer	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Allocates the RX buffer when generating the configuration structure
Buffers > Buffer size	Must be at least 1514 which is the maximum Ethernet frame size.	1514	Size of Ethernet buffer
Buffers > Padding size	<ul style="list-style-type: none"> <li>• Disable</li> <li>• 1 Byte</li> <li>• 2 Bytes</li> <li>• 3 Bytes</li> </ul>	Disable	The padding size that is automatically inserted into the received packets
Buffers > Padding offset	Must be less than 64 bytes.	0	The offset into a receive buffer to insert padding bytes.
Interrupts > Interrupt priority	MCU Specific Options		Select the EDMAC interrupt priority.
Interrupts > Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs

## Interrupt Configuration

The first [R\\_ETHER\\_Open](#) function call sets EINT interrupts. The user could provide callback function which would be invoked when EINT interrupt handler has been completed. The callback arguments will contain information about a channel number, the ETHERC and EDMAC status, the event code, and a pointer to the user defined context.

## Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

## Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6E1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA

#### Note

1. When using *ETHERC*, the *PCLKA* frequency is in the range  $12.5 \text{ MHz} \leq PCLKA \leq 120 \text{ MHz}$ .
2. When using *ETHERC*,  $PCLKA = ICLK$ .

## Pin Configuration

To use the Ethernet module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the [R\\_ETHER\\_Open](#) function.

## Usage Notes

### Ethernet Frame Format

The Ethernet module supports the Ethernet II/IEEE 802.3 frame format.

### Frame Format for Data Transmission and Reception

Figure 215: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

### PAUSE Frame Format

Figure 216: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

### Magic Packet Frame Format

Figure 217: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

### Limitations

#### Memory alignment limitation for Ethernet buffer

The Ethernet Driver has several alignment constraints:

- 16-byte alignment for the descriptor
- 32-byte aligned read buffer for `R_ETHER_RxBufferUpdate` when zero copy mode is enabled

#### Functional limitations in TrustZone Security Extensions

The Ethernet Driver has several security constraints:

MCU	Has Security Extension	Support Flat project	Support TZ project	
			Secure	Non-Secure
RA6M2	-	X	-	-
RA6M3	-	X	-	-
RA6M4	- *1	X	-	X
RA6M5	- *1	X	-	X

Note

1. *ETHERC/EDMAC is always Non-secure peripheral in this MCU.*

## Examples

### ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

Note

*In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.*

```
#define ETHER_EXAMPLE_MAXIMUM_ETHERNET_FRAME_SIZE (1514)
#define ETHER_EXAMPLE_TRANSMIT_ETHERNET_FRAME_SIZE (60)

    } while (FSP_SUCCESS != err);  
/* Transmission is non-blocking. */  
/* User data copy to internal buffer and is transferred by DMA in the background. */  
    err = R_ETHER_Write(&g_ether0_ctrl, (void *) gp_send_data, sizeof(gp_send_data));  
    assert(FSP_SUCCESS == err);  
/* received data copy to user buffer from internal buffer. */  
    err = R_ETHER_Read(&g_ether0_ctrl, (void *) gp_read_buffer, &read_data_size);  
    assert(FSP_SUCCESS == err);  
/* Disable transmission and receive function and close the ether instance. */  
R_ETHER_Close(&g_ether0_ctrl);  
}
```

## ETHER Advanced Example

The example demonstrates using send and receive function in zero copy mode. Transmit buffers must be 32-byte aligned and the receive buffer must be released once its contents have been used.

```
#define ETHER_EXAMPLE_FLAG_ON (1U)  
#define ETHER_EXAMPLE_FLAG_OFF (0U)  
#define ETHER_EXAMPLE_ETHER_ISR_EE_FR_MASK (1UL << 18)

<a href="#">ether_magic_packet_t</a>	magic_packet	status of magic packet detection
<a href="#">ether_link_establish_status_t</a>	link_establish_status	Current Link status.

## Enumeration Type Documentation

### ◆ ether\_previous\_link\_status\_t

enum <a href="#">ether_previous_link_status_t</a>	
Enumerator	
ETHER_PREVIOUS_LINK_STATUS_DOWN	Previous link status is down.
ETHER_PREVIOUS_LINK_STATUS_UP	Previous link status is up.

### ◆ ether\_link\_change\_t

enum <a href="#">ether_link_change_t</a>	
Enumerator	
ETHER_LINK_CHANGE_NO_CHANGE	Link status is no change.
ETHER_LINK_CHANGE_LINK_DOWN	Link status changes to down.
ETHER_LINK_CHANGE_LINK_UP	Link status changes to up.

### ◆ ether\_magic\_packet\_t

enum <a href="#">ether_magic_packet_t</a>	
Enumerator	
ETHER_MAGIC_PACKET_NOT_DETECTED	Magic packet is not detected.
ETHER_MAGIC_PACKET_DETECTED	Magic packet is detected.

## ◆ ether\_link\_establish\_status\_t

enum ether_link_establish_status_t	
Enumerator	
ETHER_LINK_ESTABLISH_STATUS_DOWN	Link establish status is down.
ETHER_LINK_ESTABLISH_STATUS_UP	Link establish status is up.

## Function Documentation

## ◆ R\_ETHER\_Open()

```
fsp_err_t R_ETHER_Open ( ether_ctrl_t *const p_ctrl, ether_cfg_t const *const p_cfg )
```

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements `ether_api_t::open`.

## Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call <code>close()</code> then <code>open()</code> to reconfigure.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	Initialization of PHY-LSI failed.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to MAC address is NULL.
FSP_ERR_INVALID_ARGUMENT	Interrupt is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ **R\_ETHER\_Close()**

`fsp_err_t R_ETHER_Close ( ether_ctrl_t *const p_ctrl)`

Disables interrupts. Removes power and releases hardware lock. Implements `ether_api_t::close`.

**Return values**

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R\_ETHER\_BufferRelease()**

`fsp_err_t R_ETHER_BufferRelease ( ether_ctrl_t *const p_ctrl)`

Move to the next buffer in the circular receive buffer list. Implements `ether_api_t::bufferRelease`.

**Return values**

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.

◆ **R\_ETHER\_RxBufferUpdate()**

```
fsp_err_t R_ETHER_RxBufferUpdate ( ether_ctrl_t *const p_ctrl, void *const p_buffer )
```

Change the buffer pointer of the current rx buffer descriptor. Implements `ether_api_t::rxBufferUpdate`.

**Return values**

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	A pointer argument is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	The pointer of buffer is NULL or not aligned on a 32-bit boundary.
FSP_ERR_INVALID_MODE	Driver is configured to non zero copy mode.
FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE	All descriptor is active.

◆ **R\_ETHER\_LinkProcess()**

```
fsp_err_t R_ETHER_LinkProcess ( ether_ctrl_t *const p_ctrl)
```

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements `ether_api_t::linkProcess`.

**Return values**

FSP_SUCCESS	Link is up.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Link is down.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	When reopening the PHY interface initialization of the PHY-LSI failed.
FSP_ERR_ALREADY_OPEN	When reopening the PHY interface it was already opened.
FSP_ERR_INVALID_CHANNEL	When reopening the PHY interface an invalid channel was passed.
FSP_ERR_INVALID_POINTER	When reopening the PHY interface the MAC address pointer was NULL.
FSP_ERR_INVALID_ARGUMENT	When reopening the PHY interface the interrupt was not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of the PHY-LSI failed.

◆ **R\_ETHER\_WakeOnLANEnable()**

```
fsp_err_t R_ETHER_WakeOnLANEnable ( ether_ctrl_t *const p_ctrl)
```

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements `ether_api_t::wakeOnLANEnable`.

**Return values**

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ **R\_ETHER\_Read()**

```
fsp_err_t R_ETHER_Read ( ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes )
```

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements `ether_api_t::read`.

**Return values**

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_NO_DATA	There is no data in receive buffer.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_FILTERING	Multicast Frame filter is enable, and Multicast Address Frame is received.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.

◆ **R\_ETHER\_Write()**

```
fsp_err_t R_ETHER_Write ( ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t const
frame_length )
```

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements `ether_api_t::write`.

**Return values**

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	Transmit buffer is not empty.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.
FSP_ERR_INVALID_ARGUMENT	Value of the send frame size is out of range.

◆ **R\_ETHER\_TxStatusGet()**

```
fsp_err_t R_ETHER_TxStatusGet ( ether_ctrl_t *const p_ctrl, void *const p_buffer_address )
```

Provides status of Ethernet driver in the user provided pointer. Implements `ether_api_t::txStatusGet`.

**Return values**

FSP_SUCCESS	Transmit buffer address is stored in provided p_buffer_address.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	p_status is NULL.
FSP_ERR_NOT_FOUND	Transmit buffer address has been overwritten in transmit descriptor.

## Functions

---

`fsp_err_t` [R\\_ETHER\\_PHY\\_Open](#) (`ether_phy_ctrl_t *const p_ctrl`, `ether_phy_cfg_t const *const p_cfg`)

Resets Ethernet PHY device. Implements [ether\\_phy\\_api\\_t::open](#). [More...](#)

`fsp_err_t` [R\\_ETHER\\_PHY\\_Close](#) (`ether_phy_ctrl_t *const p_ctrl`)

Closes Ethernet PHY device. Implements [ether\\_phy\\_api\\_t::close](#). [More...](#)

`fsp_err_t` [R\\_ETHER\\_PHY\\_StartAutoNegotiate](#) (`ether_phy_ctrl_t *const p_ctrl`)

Starts auto-negotiate. Implements [ether\\_phy\\_api\\_t::startAutoNegotiate](#). [More...](#)

`fsp_err_t` [R\\_ETHER\\_PHY\\_LinkPartnerAbilityGet](#) (`ether_phy_ctrl_t *const p_ctrl`, `uint32_t *const p_line_speed_duplex`, `uint32_t *const p_local_pause`, `uint32_t *const p_partner_pause`)

Reports the other side's physical capability. Implements [ether\\_phy\\_api\\_t::linkPartnerAbilityGet](#). [More...](#)

`fsp_err_t` [R\\_ETHER\\_PHY\\_LinkStatusGet](#) (`ether_phy_ctrl_t *const p_ctrl`)

Returns the status of the physical link. Implements [ether\\_phy\\_api\\_t::linkStatusGet](#). [More...](#)

---

## Detailed Description

The Ethernet PHY module (`r_ether_phy`) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the [Ethernet PHY Interface](#).

## Overview

The Ethernet PHY module is used to setup and manage an external Ethernet PHY device for use with the on-chip Ethernet Controller (ETHERC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

## Features

The Ethernet PHY module supports the following features:

- Auto negotiation support

- Flow control support
- Link status check support

## Configuration

### Build Time Configurations for r\_ether\_phy

The following build time configurations are defined in fsp\_cfg/r\_ether\_phy\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Select PHY	<ul style="list-style-type: none"> <li>• Default</li> <li>• Other</li> <li>• KSZ8091RNB</li> <li>• KSZ8041</li> <li>• DP83620</li> <li>• ICS1894</li> </ul>	Default	Select PHY chip to use. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.
Reference Clock	<ul style="list-style-type: none"> <li>• Default</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default	Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.

### Configurations for Networking > Ethernet (r\_ether\_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r\_ether\_phy).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ether_phy0	Module name.
Channel	<ul style="list-style-type: none"> <li>• 0</li> <li>• 1</li> </ul>	0	Select the Ethernet controller channel number.
PHY-LSI Address	Specify a value between 0 and 31.	0	Specify the address of the PHY-LSI used.
PHY-LSI Reset Completion Timeout	Specify a value between 0x1 and 0xFFFFFFFF.	0x00020000	Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used.
Select MII type	<ul style="list-style-type: none"> <li>• MII</li> </ul>	RMII	Specify whether to use

MII/RMII Register Access Wait-time	<ul style="list-style-type: none"> <li>• RMII</li> </ul> Specify a value between 0x1 and 0x7FFFFFFF.	8	MII or RMII. Specify the bit timing for MII/RMII register accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used.
Flow Control	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Select whether to enable or disable flow control.

## Usage Notes

### Note

See the [example](#) below for details on how to initialize the Ethernet PHY module.

### Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0\_MDC and ET0\_MDIO pins controlled by software.

### MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

Access type	MII and RMII management frame								
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE	
Number of bits	32	2	2	5	5	2	16	1	
Read	1...1	01	10	00001	RRRRR	Z0	DDDDD DDDDD DDDDD D	Z	
Write	1...1	01	01	00001	RRRRR	10	DDDDD DDDDD DDDDD D	Z	

### Note

- PRE (preamble): Send 32 consecutive 1s.
- ST (start of frame): Send 01b.
- OP (operation code): Send 10b for read or 01b for write.
- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.
- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.

- *TA (turnaround)*: Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.

Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).

(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)

- *DATA (data)*: 16-bit data. Sequentially send or receive starting from the MSB.

- *IDLE (IDLE condition)*: Wait time before inputting the next MII or RMI management format. Release the bus during a write

operation (Z is output). No control is required, because a bus was already released during a read operation.

## Limitations

- The r\_ether\_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
  - KSZ8091RNB
  - KSZ8041
  - DP83620
  - ICS1894

## Examples

### ETHER PHY Basic Example

This is a basic example of minimal use of the ETHER PHY in an application.

```
void ether_phy_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    g_ether_phy0_ctrl.open    = 0U;
    g_ether_phy0_cfg.channel = 0;

    /* Initializes the module. */
    err = R_ETHER_PHY_Open(&g_ether_phy0_ctrl, &g_ether_phy0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start auto negotiation. */
    err = R_ETHER_PHY_StartAutoNegotiate(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Polling until link is established. */
    while (FSP_SUCCESS != R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl))
    {
        /* Do nothing */
    }

    /* Get link partner ability from phy interface. */
}
```

```

err = R_ETHER_PHY_LinkPartnerAbilityGet(&g_ether_phy0_ctrl,
                                         &g_ether_phy0_line_speed_duplex,
                                         &g_ether_phy0_local_pause,
                                         &g_ether_phy0_partner_pause);

assert(FSP_SUCCESS == err);

/* Check current link status. */

err = R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl);

assert(FSP_SUCCESS == err);
}

```

## Data Structures

struct [ether\\_phy\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ ether\_phy\_instance\_ctrl\_t

struct ether_phy_instance_ctrl_t		
ETHER PHY control block. DO NOT INITIALIZE. Initialization occurs when <a href="#">ether_phy_api_t::open</a> is called.		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
<a href="#">ether_phy_cfg_t</a> const *	p_ether_phy_cfg	Pointer to initial configurations.
volatile uint32_t *	p_reg_pir	Pointer to ETHERC peripheral registers.
uint32_t	local_advertise	Capabilities bitmap for local advertising.

## Function Documentation

◆ **R\_ETHER\_PHY\_Open()**

```
fsp_err_t R_ETHER_PHY_Open ( ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t const *const p_cfg )
```

Resets Ethernet PHY device. Implements `ether_phy_api_t::open`.

**Return values**

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call <code>close()</code> then <code>open()</code> to reconfigure.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to <code>p_cfg</code> is NULL.
FSP_ERR_TIMEOUT	PHY-LSI Reset wait timeout.

◆ **R\_ETHER\_PHY\_Close()**

```
fsp_err_t R_ETHER_PHY_Close ( ether_phy_ctrl_t *const p_ctrl)
```

Close Ethernet PHY device. Implements `ether_phy_api_t::close`.

**Return values**

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R\_ETHER\_PHY\_StartAutoNegotiate()**

```
fsp_err_t R_ETHER_PHY_StartAutoNegotiate ( ether_phy_ctrl_t *const p_ctrl)
```

Starts auto-negotiate. Implements `ether_phy_api_t::startAutoNegotiate`.

**Return values**

FSP_SUCCESS	ETHER_PHY successfully starts auto-negotiate.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

### ◆ R\_ETHER\_PHY\_LinkPartnerAbilityGet()

```
fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet ( ether_phy_ctrl_t *const p_ctrl, uint32_t *const p_line_speed_duplex, uint32_t *const p_local_pause, uint32_t *const p_partner_pause )
```

Reports the other side's physical capability. Implements [ether\\_phy\\_api\\_t::linkPartnerAbilityGet](#).

#### Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	The auto-negotiation isn't completed

### ◆ R\_ETHER\_PHY\_LinkStatusGet()

```
fsp_err_t R_ETHER_PHY_LinkStatusGet ( ether_phy_ctrl_t *const p_ctrl)
```

Returns the status of the physical link. Implements [ether\\_phy\\_api\\_t::linkStatusGet](#).

#### Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.

#### 4.2.11.15 FreeRTOS+TCP Wrapper to r\_ether (rm\_freertos\_plus\_tcp)

[Modules](#) » [Networking](#)

Middleware for using TCP on RA MCUs.

## Overview

FreeRTOS Plus TCP is a TCP stack created for use with FreeRTOS.

This module provides the NetworkInterface required to use FreeRTOS Plus TCP with the [Ethernet \(r\\_ether\)](#) driver.

Please refer to the [FreeRTOS Plus TCP documentation](#) for further details.

## Configuration

### Build Time Configurations for FreeRTOS\_Plus\_TCP

The following build time configurations are defined in aws/FreeRTOSIPConfig.h:

Configuration	Options	Default	Description
Print debug messages	<ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul>	Disable	If ipconfigHAS_DEBUG_PRINTF is set to 1 then FreeRTOS_debug_printf should be defined to the function used to print out the debugging messages.
Print info messages	<ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul>	Disable	Set to 1 to print out non debugging messages, for example the output of the FreeRTOS_netstat() command, and ping replies. If ipconfigHAS_PRINTF is set to 1 then FreeRTOS_printf should be set to the function used to print out the messages.
Byte order of the target MCU	pdFREERTOS_LITTLE_ENDIAN	pdFREERTOS_LITTLE_ENDIAN	Define the byte order of the target MCU
IP/TCP/UDP checksums	<ul style="list-style-type: none"> <li>Disable</li> <li>Enable</li> </ul>	Enable	If the network card/driver includes checksum offloading (IP/TCP/UDP checksums) then set ipconfigDRIVER_INCLUDED_RX_IP_CHECKSUM to 1 to prevent the software stack repeating the checksum calculations.
Receive Block Time	Value must be a non-negative integer	10000	Amount of time FreeRTOS_recv() will block for. The timeouts can be set per socket,

Send Block Time	Value must be a non-negative integer	10000	using setsockopt(). Amount of time FreeRTOS_send() will block for. The timeouts can be set per socket, using setsockopt().
DNS caching	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	DNS caching
DNS Request Attempts	Value must be an integer	2	When a cache is present, ipconfigDNS_REQUEST_ATTEMPTS can be kept low and also DNS may use small timeouts.
IP stack task priority	Manual Entry	configMAX_PRIORITIES - 2	Set the priority of the task that executes the IP stack.
Stack size in words (not bytes)	Manual Entry	configMINIMAL_STACK_SIZE * 5	The size, in words (not bytes), of the stack allocated to the FreeRTOS+TCP stack.
Network Events call vApplicationIPNetworkEventHook	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	vApplicationIPNetworkEventHook is called when the network connects or disconnects.
Max UDP send block time	Manual Entry	15000 / portTICK_PERIOD_MS	Max UDP send block time
Use DHCP	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	If ipconfigUSE_DHCP is 1 then FreeRTOS+TCP will attempt to retrieve an IP address, netmask, DNS server address and gateway address from a DHCP server.
DHCP Register Hostname	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Register hostname when using DHCP
DHCP Uses Unicast	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	DHCP uses unicast.
DHCP Send Discover After Auto IP	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	DHCP Send Discover After Auto IP
DHCP callback function	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Provide an implementation of the DHCP callback function (xApplicationDHCPHook)

Interval between transmissions	Manual Entry	120000 / portTICK_PERIOD_MS	When ipconfigUSE_DHCP is set to 1, DHCP requests will be sent out at increasing time intervals until either a reply is received from a DHCP server and accepted, or the interval between transmissions reaches ipconfigMAXIMUM_DISCOVER_TX_PERIOD.
ARP Cache Entries	Value must be an integer	6	The maximum number of entries that can exist in the ARP table at any one time
ARP Request Retransmissions	Value must be an integer	5	ARP requests that do not result in an ARP response will be re-transmitted a maximum of ipconfigMAX_ARP_RETRANSMISSIONS times before the ARP request is aborted.
Maximum time before ARP table entry becomes stale	Value must be an integer	150	The maximum time between an entry in the ARP table being created or refreshed and the entry being removed because it is stale
Use string for IP Address	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Take an IP in decimal dot format (for example, "192.168.0.1") as its parameter FreeRTOS_inet_addr_quick() takes an IP address as four separate numerical octets (for example, 192, 168, 0, 1) as its parameters
Total number of available network buffers	Value must be an integer	10	Define the total number of network buffer that are available to the IP stack
Set the maximum number of events	Please enter a valid function name without spaces or funny	ipconfigNUM_NETWORK_BUFFER_DESCRIPTOR + 5	Set the maximum number of events that can be queued for

	characters		
Enable FreeRTOS_sendto() without calling Bind	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Disable	<p>processing at any one time. The event queue must be a minimum of 5 greater than the total number of network buffers</p> <p>Set to 1 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the IP stack automatically binding the socket to a port number from the range socketAUTO_PORT_ALLLOCATION_START_NUMBER to 0xffff. If ipconfigALLOW_SOCKET_SEND_WITHOUT_BIND is set to 0 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the send operation being aborted.</p>
TTL values for UDP packets	Value must be an integer	128	Define the Time To Live (TTL) values used in outgoing UDP packets
TTL values for TCP packets	Value must be an integer	128	Defines the Time To Live (TTL) values used in outgoing TCP packets
Use TCP and all its features	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Use TCP and all its features
Let TCP use windowing mechanism	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Let TCP use windowing mechanism
Maximum number of bytes the payload of a network frame can contain	Value must be an integer	1500	Maximum number of bytes the payload of a network frame can contain
Basic DNS client or resolver	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	Set ipconfigUSE_DNS to 1 to include a basic DNS client/resolver. DNS is used through the FreeRTOS_gethostbyname() API function.
Reply to incoming ICMP echo (ping) requests	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	If ipconfigREPLY_TO_INCOMING_PINGS is set to 1 then the IP stack

			will generate replies to incoming ICMP echo (ping) requests.
FreeRTOS_SendPingRequest() is available	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	If ipconfigSUPPORT_OUTGOING_PINGS is set to 1 then the FreeRTOS_SendPingRequest() API function is available.
FreeRTOS_select() (and associated) API function is available	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	If ipconfigSUPPORT_SELECT_FUNCTION is set to 1 then the FreeRTOS_select() (and associated) API function is available
Filter out non Ethernet II frames.	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	If ipconfigFILTER_OUT_NON_ETHERNET_II_FRAMES is set to 1 then Ethernet frames that are not in Ethernet II format will be dropped. This option is included for potential future IP stack developments
Responsibility of the Ethernet interface to filter out packets	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	If ipconfigETHERNET_DRIVER_FILTERS_FRAME_TYPES is set to 1 then it is the responsibility of the Ethernet interface to filter out packets that are of no interest.
Send RST packets, when receive unknown packets.	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	TCP will not send RST packets in reply to TCP unknown or out-of-order packets
Block time to simulate MAC interrupts	Please enter a valid function name without spaces or funny characters	20 / portTICK_PERIOD_MS	The windows simulator cannot really simulate MAC interrupts, and needs to block occasionally to allow other tasks to run
Access 32-bit fields in the IP packets	Value must be an integer	2	To access 32-bit fields in the IP packets with 32-bit memory instructions, all packets will be stored 32-bit-aligned, plus 16-bits. This has to do with the contents of the IP-packets: all 32-bit fields are 32-bit-aligned, plus 16-bit

Size of the pool of TCP window descriptors	Value must be an integer	240	Define the size of the pool of TCP window descriptors
Size of Rx buffer for TCP sockets	Value must be an integer	3000	Define the size of Rx buffer for TCP sockets
Size of Tx buffer for TCP sockets	Value must be an integer	3000	Define the size of Tx buffer for TCP sockets
TCP keep-alive	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	TCP keep-alive is available or not
TCP keep-alive interval	Value must be an integer	120	TCP keep-alive interval in second
The socket semaphore to unblock the MQTT task (USER_SEMAPHORE)	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (WAKE_CALLBACK)	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Enable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (USE_CALLBACKS)	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (TX_DRIVER)	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (RX_DRIVER)	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	The socket semaphore is used to unblock the MQTT task
Possible optimisation for expert users	<ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul>	Disable	Possible optimisation for expert users - requires network driver support. It is useful when there is high network traffic. If non-zero value then instead of passing received packets into the IP task one at a time the network interface can chain received packets together and pass them into the IP task in one go. If set to 0 then only one buffer will be sent at a time.

## Usage Notes

In order to use the NetworkInterface implementation provided by Renesas for RA devices:

- Configure an r\_ether instance and provide a pointer to the instance of the NetworkInterface as follows:

```
/* Reference used by the NetworkInterface to access the ethernet instance. */
extern ether_instance_t const * gp_freertos_ether;
...
/* Make it reference the configured ether instance. */
ether_instance_t const * gp_freertos_ether = &g_ether_instance;
```

- Follow the TCP stack initialization procedure as described here: [FreeRTOS+TCP Networking Tutorial: Initializing the TCP/IP Stack](#)

#### Note

*The MAC address passed to FreeRTOS\_IPInit must match the MAC address configured in the r\_ether instance. g\_ether\_instance must have vEtherISRcallback configured as the callback. The xApplicationGetRandomNumber and ulApplicationGetNextSequenceNumber functions should be implemented in systems using FreeRTOS Plus TCP without Secure Sockets. To connect to a server using an IP address the macro ipconfigINCLUDE\_FULL\_INET\_ADDR must be set to 1.*

#### Limitations

- Zero-copy is not currently supported by the NetworkInterface.

#### 4.2.11.16 NetX Duo Ethernet Driver (rm\_netxduo\_ether)

[Modules](#) » [Networking](#)

## Overview

This module provides a NetX Duo driver that is implemented using the [Ethernet Interface](#).

Please refer to the [NetXDuo documentation](#) for further details.

### Features

- Packet Types Supported
  - ARP
  - IPv4
  - IPv6
- Link status callback
- Configurable IP MTU

# Configuration

## Configurations for Networking > NetX Duo Ethernet Driver (rm\_netxduo\_ether)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_netxduo_ether_0	Module name.
IP MTU	Value must be in the range [576, 1500] bytes.	1500	IP MTU

## Usage Notes

### Calculating the Packet Size for an IP instance

In order to ensure that there is enough space to store an entire Ethernet frame, the packet pool used for receiving packets must have a payload size that is 32 bytes larger than the configured [ether\\_cfg\\_t::ether\\_buffer\\_size](#). The extra 32 bytes is needed in order to ensure that the allocated packets are properly aligned to 32 bytes.

[ether\\_cfg\\_t::ether\\_buffer\\_size](#) is calculated from the IP MTU using the following formula:

$$\text{ceil}((\text{rm\_netxduo\_ether\_cfg\_t::mtu} + \text{Ethernet Header (14)} + \text{Padding Bytes (2)}) / 32) * 32$$

## Examples

### Basic Example

This is a basic example of minimal use of the NetX Duo Ether Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
    NETXDUO_EXAMPLE_PACKET_NUM)
static NX_IP g_ip;
static NX_PACKET_POOL g_packet_pool;
static uint8_t g_ip_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
```

```
BSP_ALIGN_VARIABLE(4);

static uint8_t g_ip_arp_cache_memory[NETXDUEXAMPLE_ARP_CACHE_SIZE]
BSP_ALIGN_VARIABLE(4);

static void rm_netxduo_ether0 (NX_IP_DRIVER * driver_req_ptr)
{
    /* Pass the driver request and ethernet driver configuration to the NetX Duo Ether
Driver. */
    rm_netxduo_ether(driver_req_ptr, &g_netxduo_ether_instance);
}

void rm_netxduo_ether_example ()
{
    UINT status;

    nx_system_initialize();

    /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool,
"Packet Pool",
                                NETXDUEXAMPLE_PACKET_SIZE,
                                &g_packet_pool_memory[0],
                                NETXDUEXAMPLE_PACKET_POOL_SIZE);

    assert(NX_SUCCESS == status);

    /* Create an IP instance using the rm_netxduo_ether driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip,
"IP Instance",
                        IP_ADDRESS(192, 168, 1, 2),
                        IP_ADDRESS(255, 255, 255, 0),
                        &g_packet_pool,
                        rm_netxduo_ether0,
                        &g_ip_stack_memory[0],
                        sizeof(g_ip_stack_memory),
                        0);

    assert(NX_SUCCESS == status);

    /* Enable all modules that are required by the application. */
    status = nx_arp_enable(&g_ip, g_ip_arp_cache_memory, sizeof
```

```
(g_ip_arp_cache_memory));
    assert(NX_SUCCESS == status);
    status = nx_tcp_enable(&g_ip);
    assert(NX_SUCCESS == status);
    status = nx_icmp_enable(&g_ip);
    assert(NX_SUCCESS == status);
}
```

#### 4.2.11.17 NetX Duo WiFi Driver (rm\_netxduo\_wifi)

[Modules](#) » [Networking](#)

## Overview

This module provides a NetX Duo driver that is implemented using the rm\_wifi\_onchip\_silex driver.

Please refer to the [NetXDuo documentation](#) for further details.

### Features

- Packet Types Supported
  - TCP/IPv4
  - UDP
- Configurable IP MTU

## Configuration

### Build Time Configurations for rm\_netxduo\_wifi

The following build time configurations are defined in fsp\_cfg/middleware/rm\_netxduo\_wifi\_cfg.h:

Configuration	Options	Default	Description
IP MTU (bytes)	Value must be in the range [576, 1500] bytes.	1500	IP MTU

## Usage Notes

### Connecting to a Wireless Network

NetX Duo does not support connecting to a wireless network directly and instead the driver functions should be called directly to establish a connection.

- `rm_wifi_onchip_silex_open()` should be called to initialize the WiFi module driver.
- `rm_wifi_onchip_silex_scan()` should be used to scan for access points.
- `rm_wifi_onchip_silex_connect()` should be used before opening a NetX IP instance in order to connect it to a network.
- `rm_wifi_onchip_silex_network_info_get()` should be used after an access point connection has been established to get DHCP acquired IP address, subnet mask, and gateway.

## Unsupported NetX Duo Features

These features are currently not supported due to lack of support in the `rm_wifi_onchip_silex` driver or in the WiFi module hardware/firmware:

- IPv6 functionality
- TCP/UDP server mode
- ARP is handled directly by the WiFi module
- DHCP is always enabled on module by the `rm_wifi_onchip_silex` driver, thus the software DHCP stack is unsupported.

## On Module Alternatives

Instead of using NetX Duo Software Addons the following features can be performed directly on the WiFi module by calling the appropriate function instead if desired:

- DNS: The user can preform a DNS lookup by calling `rm_wifi_onchip_silex_dns_query`.
- ICMP: The user can perform a ping by calling `rm_wifi_onchip_silex_ping`.
- SNTP: The WiFi module has multiple public APIs for time related functions:
  - `RM_WIFI_ONCHIP_SILEX_EpochTimeGet`
  - `RM_WIFI_ONCHIP_SILEX_LocalTimeGet`
  - `RM_WIFI_ONCHIP_SILEX_SntpEnableSet`
  - `RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet`
  - `RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet`

## Examples

### Basic Example

This is a basic example of minimal use of the NetX Duo WiFi Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
    NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_SSID "ssidName"
```

```
#define NETXDUEXAMPLE_PASSWORD "password"

static NX_IP g_ip0;

static NX_PACKET_POOL g_packet_pool0;

static uint8_t g_ip0_stack_memory[NETXDUEXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);

static uint8_t g_packet_pool0_pool_memory[NETXDUEXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);

extern wifi_onchip_silex_cfg_t g_wifi_onchip_silex_cfg;

void rm_netxduo_wifi_example ()
{
    UINT status;

    fsp_err_t err;

    nx_system_initialize();

    /* Open WiFi module */
    err = rm_wifi_onchip_silex_open(&g_wifi_onchip_silex_cfg);

    assert(FSP_SUCCESS == err);

    /* Connect to desired AP */
    err = rm_wifi_onchip_silex_connect(NETXDUEXAMPLE_SSID, eWiFiSecurityWPA2,
NETXDUEXAMPLE_PASSWORD);

    assert(FSP_SUCCESS == err);

    /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool0,

## Detailed Description

Driver for the PTP peripheral on RA MCUs. This module implements the [PTP Interface](#).

## Overview

PTP allows for multiple devices on a network to synchronize their clocks with very high precision. The PTP peripheral generates and processes PTP messages automatically. In slave mode, it also corrects the local time in order to adjust for any offset from the master clock time.

### Features

- Ordinary clock
  - Master mode
  - Slave mode
- Peer-to-peer
- End-to-end
- Frame formats
  - Ethernet II frames
  - IEEE802.3 + LLC + SNAP frames

- IPv4 + UDP
- Clock correction modes
  - Mode 1: Add the offsetFromMaster value to the local time whenever it is updated.
  - Mode 2: Calculate a clock gradient and continuously adjust the local time in order to minimize the offsetFromMaster value.

## Configuration

### Build Time Configurations for r\_ptp

The following build time configurations are defined in fsp\_cfg/r\_ptp\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Networking > PTP (r\_ptp)

This module can be added to the Stacks tab via New Stack > Networking > PTP (r\_ptp).

Configuration	Options	Default	Description
Clock Properties > Priority 1	Value must in the range [0,255].	128	Priority1 field advertised in generated announce packets.
Clock Properties > Class	Value must in the range [0,255].	248	Class field advertised in generated announce packets.
Clock Properties > Accuracy	Value must in the range [0,255].	0xFE	Accuracy field advertised in generated announce packets.
Clock Properties > Variance	Value must in the range [0,65535].	0xFFFF	Variance field advertised in generated announce packets.
Clock Properties > Priority 2	Value must in the range [0,255].	128	Priority2 field advertised in generated announce packets.
Clock Properties > Time Source	Value must in the range [0,255].	160	Time Source field advertised in generated announce packets.
Ethernet > Multicast Filter MAC address	Must be a valid MAC address	01:1B:19:00:00:00	In Multicast Filtered mode, only multicast addresses that match this address are

			received by the ETHERC EDMAC.
Ethernet > Primary Destination MAC address	Must be a valid MAC address	01:1B:19:00:00:00	The destination MAC address for primary PTP messages.
Ethernet > PDelay Destination MAC address	Must be a valid MAC address	01:80:C2:00:00:0E	The destination MAC address for PDelay messages.
IP > Primary Destination IP address	Must be a valid IP address	224.0.1.129	The destination IPv4 address for primary messages.
IP > PDelay Destination IP address	Must be a valid IP address	224.0.0.107	The destination IPv4 address for PDelay messages.
IP > Event Message TOS	Value must be in the range [0,255].	0	The IP packet TOS for event messages.
IP > General Message TOS	Value must be in the range [0,255].	0	The IP packet TOS for general messages.
IP > Primary Message TTL	Value must be in the range [0,255].	1	The IP packet TTL for primary messages.
IP > PDelay Message TTL	Value must be in the range [0,255].	1	The IP packet TTL for p_delay messages.
IP > Event Port	Value must be in the range [0,65535].	319	The UDP port for event messages.
IP > General Port	Value must be in the range [0,65535].	320	The UDP port for general messages.
Synchronization Detection > Threshold (Nanoseconds)	Value must be greater than 0.	1000000	The minimum offsetFromMaster value required in order to synchronize with the master clock.
Synchronization Detection > Count	Value must be in the range [0,255].	5	The number of times the calculated offsetFromMaster value must be less than the threshold in order to synchronize with the master clock.
Synchronization Lost Detection > Threshold (Nanoseconds)	Value must be greater than 0.	10000000	The minimum offsetFromMaster value required in order to lose synchronization with the master clock.
Synchronization Lost Detection > Count	Value must be in the range [0,255].	5	The number of times the calculated offsetFromMaster value

Interrupts > Callback	Name must be a valid C symbol	ptp0_user_callback	must be greater than the threshold in order to lose synchronization with the master.
Interrupts > MINT Interrupt priority	MCU Specific Options		Called when a STCA/SYNFP event occurs, a PTP message is received, or if a Pulse Timer event occurs.
Interrupts > Pulse Timer Interrupt priority	MCU Specific Options		Select the EPTPC MINT interrupt priority.
Name	Name must be a valid C symbol	g_ptp0	Select the EPTPC IPLS priority.
Ethernet PHY Interface Type	<ul style="list-style-type: none"> <li>MII</li> <li>RMII</li> </ul>	RMII	Module name.
Frame Filter	<ul style="list-style-type: none"> <li>Extended Promiscuous Mode</li> <li>Unicast and Multicast</li> <li>Unicast and Multicast Filtered</li> <li>Unicast</li> </ul>	Unicast	The interface type used to communicate with the Ethernet PHY.
Frame Format	<ul style="list-style-type: none"> <li>Ethernet II</li> <li>Ethernet II   IPv4   UDP</li> <li>IEEE802.3   LLC   SNAP</li> <li>IEEE802.3   LLC   SNAP   IPv4   UDP</li> </ul>	Ethernet II	Selects how packets are filtered based on their destination MAC address. Packets that pass the filter are transferred to the ETHERC EDMAC.
Clock Domain	Value must in the range [0,255].	0	The format of the frames that encapsulate the PTP messages.
Clock Domain Filter	<ul style="list-style-type: none"> <li>Enable</li> <li>Disable</li> </ul>	Enable	The PTP clock will only respond to clocks in its domain.
Buffer Size	Value must in the range [64,1536].	1536	Filter out PTP messages from other clock domains.
Number of transmit buffers	Value must in the range [1,16].	4	The maximum Ethernet packet size that can be transmitted or received by the application from the EDMAC.

Number of receive buffers	Value must in the range [1,16].	4	queue. The number of receive buffers in the packet queue.
Announce message interval.	MCU Specific Options		The period of time between generated announce messages.
Sync message interval.	MCU Specific Options		The period of time between generated sync messages.
Delay_req message interval.	MCU Specific Options		The period of time between generated delay_req messages.
Message timeout	Value must be greater than 0.	4000	The time in milliseconds needed to generate timeout events after not receiving a sync or delay_resp message.
Clock Source	<ul style="list-style-type: none"> <li>• PCLKA / 1</li> <li>• PCLKA / 2</li> <li>• PCLKA / 3</li> <li>• PCLKA / 4</li> <li>• PCLKA / 5</li> <li>• PCLKA / 6</li> <li>• REF50CK0</li> </ul>	PCLKA / 6	The STCA clock source must be 20Mhz, 25Mhz, 50Mhz, or 100Mhz. When REF50CK0 is selected, the STCA frequency is 25Mhz.
Clock Correction Mode	<ul style="list-style-type: none"> <li>• Clock Correction Mode 1</li> <li>• Clock Correction Mode 2</li> </ul>	Clock Correction Mode 1	Clock correction mode 1 corrects the local clock using the current offsetFromMaster value. Clock correction mode 2 calculates a clock gradient in order to continuously correct the local clock.
Gradient Worst10 Interval	Value must in the range [0,255].	32	The number of sync messages to use when calculating the worst10 gradient values (Only applies to clock correction mode 2).

## Clock Configuration

The STCA input clock can be the following clock sources:

- PCLKA / 1
- PCLKA / 2
- PCLKA / 3
- PCLKA / 4

- PCLKA / 5
- PCLKA / 6
- REF50CK0

The STCA input clock is restricted to the following frequencies:

- 20 Mhz
- 25 Mhz
- 50 Mhz
- 100 Mhz

When REF50CK0 is selected, the input clock frequency is 25 Mhz.

### Pin Configuration

The PTP module requires the [Ethernet \(r\\_ether\)](#) instance in order to initialize the Ethernet PHY. This means that the ETHERC pins must be configured.

## Usage Notes

### PTP Port State

The current PTP port state determines which messages need to be generated and processed by the PTP peripheral. It is the application's responsibility to determine what the current state of the PTP port should be.

The following messages can be generated by the PTP peripheral:

- Announce
- Sync
- Delay\_req
- Delay\_resp
- PDelay\_req
- PDelay\_resp

The following messages can be processed by the PTP peripheral:

- Sync
- Follow\_up
- Delay\_req
- Delay\_resp
- PDelay\_req
- PDelay\_resp
- PDelay\_resp\_follow\_up

The application must receive the following messages in order to determine the current state of its PTP port:

- Announce
- Management
- Signaling

The following messages can only be sent manually:

- Management
- Signaling

The PTP API defines the following states:

State	Generated Messages	Processed Messages	Received Messages
Disabled	N/A	N/A	N/A
Passive	N/A	N/A	Announce, Signaling, Management
E2E/P2P Slave	Delay_req/(PDelay_req, PDelay_resp)	Sync, Follow_up, Delay_resp/(PDelay_req, PDelay_resp)	Announce, Signaling, Management
E2E/P2P Master	Announce, Sync, Delay_resp/(PDelay_req, PDelay_resp)	delay_req/(PDelay_req, PDelay_resp)	Announce, Signaling, Management

## Pulse Timers

Pulse Timers are configurable timers used to generate interrupts and ELC events. Each pulse timer has a configurable start time, pulse, and period. At the start of each timer period, a rising edge occurs. After the pulse time has elapsed, a falling edge occurs. ELC events and IRQs can be generated on rising and/or falling edges for each Pulse Timer. There are two types of interrupts generated by each Pulse Timer; MINT and IPLS.

### MINT Interrupts

MINT IRQs are only generated on the rising edge of a Pulse Timer channel. The callback will provide the channel number of the pulse timer that caused the interrupt.

### IPLS Interrupts

Each Pulse Timer channel can be configured as a source for generating IPLS IRQs. All of the pulse timers that are selected as IPLS sources are OR'd together and rising and falling edge IRQs can be generated from the resulting signal. Below is an example of a resulting signal from two IPLS sources. Unlike MINT interrupts, IPLS interrupts do not provide any information about which Pulse Timer caused the IRQ because the IRQs from all the Pulse Timers are OR'd together.

Figure 218: IPLS IRQ Generation

## Ethernet Frame Filter

The PTP driver can filter Ethernet frames that are received by [Ethernet \(r\\_ether\)](#). There are four different filtering modes:

- Extended Promiscuous - All Ethernet frames are received by [Ethernet \(r\\_ether\)](#).
- Unicast and Multicast - All Unicast frames destined for the PTP and Multicast frames are received by [Ethernet \(r\\_ether\)](#).
- Unicast and Multicast Filtered - All Unicast frames destined for the PTP are received by [Ethernet \(r\\_ether\)](#). All multicast frames that match `ptp_synfp_cfg_t::p_multicast_addr_filter` are received by [Ethernet \(r\\_ether\)](#).
- Unicast - Only Unicast frames destined for the PTP are received by [Ethernet \(r\\_ether\)](#).

## Limitations

Developers should be aware of the following limitations when using the PTP:

- PTP will not automatically initialize [Ethernet \(r\\_ether\)](#). This provides flexibility by allowing PTP to be used alongside 3rd party IP stacks (Eg. [FreeRTOS+TCP Wrapper to r\\_ether \(rm\\_freertos\\_plus\\_tcp\)](#)), however this means the application must execute the [Ethernet \(r\\_ether\)](#) link process in order to use PTP.
- The driver will not detect announce message timeouts. This functionality must be handled by the application.
- When IP + UDP frame format is selected, the driver will not automatically join the multicast group. This must be done by the application.
- In order to call PTP API functions from ISRs, the MINT and IPLS interrupt priorities must be configured to be lower than `BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION`. This is to guarantee that PTP register accesses are atomic.

## Examples

### Slave Mode

This is a basic example of minimal use of PTP in slave mode.

```
volatile bool g_first_announce_message_received = false;
volatile bool g_sync_acquired = false;
void slave_mode_basic_example (void)
{
    /* The PTP Instance must be opened before R_ETHER is opened. */

## Master Mode

This is a basic example of minimal use of PTP in master mode.

```
#define PTP_EXAMPLE_CURRENT_UTC_OFFSET (37)
void master_mode_basic_example (void)
{
    /* The PTP Instance must be opened before R_ETHER is opened. */
    fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
    /* Get the current time from an external time source (Eg. RTC). */
    ptp_time_t current_time;
    get_current_time_example(&current_time);
    /* Set the PTP local time to the current time. */
    err = R_PTP_LocalClockValueSet(&g_ptp_ctrl, &current_time);
    assert(FSP_SUCCESS == err);
    /* Set the currentUtcOffset field in announce messages. */
    err = R_PTP_CurrentUtcOffsetSet(&g_ptp_ctrl, PTP_EXAMPLE_CURRENT_UTC_OFFSET);
```

```
    assert(FSP_SUCCESS == err);

    /* Set message flags in announce messages to indicate that the current UTC offset is
    valid and that the PTP timescale is used. */
    ptp_message_flags_t flags;

    flags.value = 0;

    flags.value_b.currentUtcOffsetValid = 1;

    flags.value_b.ptpTimescale          = 1;

    err = R_PTP_MessageFlagsSet(&g_ptp_ctrl, PTP_MESSAGE_TYPE_ANNOUNCE, flags);
    assert(FSP_SUCCESS == err);

    /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);

    /* Wait for the link to be established. */
    do
    {
        err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);

    /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_MASTER);
    assert(FSP_SUCCESS == err);

    /*
     * The master clock is now operational and will automatically generate announce and
    sync messages
     * as well as respond to delay_req messages.
     */
}
```

## Send PTP Messages

This is a basic example of how to send PTP messages.

```
#define PTP_MANAGEMENT_ACTION_GET (0U)
#define PTP_TLV_TYPE_MANAGEMENT (1U)
#define PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION (1U)

static uint32_t g_transmit_complete = 0U;
```

```
void send_message_example (void)
{
    static ptp_message_t message;
    static uint8_t      p_tlv_data[6];
    memset(&message, 0, sizeof(ptp_message_t));
    /* Fill in the required fields for the message header (Note that appropriate fields
will be endian swapped). */
    message.header.message_type = PTP_MESSAGE_TYPE_MANAGEMENT;
    message.header.version      = 2;
    /* The message length is the total number of bytes in the PTP message (Including the
message header). */
    message.header.message_length = (uint16_t) (sizeof(ptp_message_header_t) +
sizeof(ptp_message_management_t) +
sizeof(p_tlv_data));
    memcpy(message.header.clock_id, g_ptp_clock_id, sizeof(g_ptp_clock_id));
    message.header.control_field = PTP_CTRL_FIELD_MANAGEMENT;
    /* Fill in the required fields for the management message. */
    memcpy(message.management.target_clock_id, g_target_clock_id, sizeof
(g_target_clock_id));
    message.management.target_port_id      = 1;
    message.management.starting_boundary_hops = 1;
    message.management.boundary_hops      = 1;
    message.management.action              = PTP_MANAGEMENT_ACTION_GET;
    /*
    * Fill in TLV data (Note that TLV data is big endian).
    *
    * Type (Management)
    */
    p_tlv_data[0] = 0;
    p_tlv_data[1] = PTP_TLV_TYPE_MANAGEMENT;
    /* Length */
    p_tlv_data[2] = 0;
    p_tlv_data[3] = 2;
    /* Management ID (Clock Description) */
```

```
p_tlv_data[4] = 0;
p_tlv_data[5] = PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION;
/* Send the message. */
fsp_err_t err = R_PTP_MessageSend(&g_ptp_ctrl, &message, p_tlv_data, sizeof
(p_tlv_data));
assert(FSP_SUCCESS == err);
uint32_t timeout = EXAMPLE_TIMEOUT;
while (0U == g_transmit_complete && --timeout)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MICROSECONDS);
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_send_message_callback_example (ptp_callback_args_t * p_args)
{
switch (p_args->event)
{
case PTP_EVENT_MESSAGE_TRANSMIT_COMPLETE:
{
g_transmit_complete = 1U;
break;
}
case PTP_EVENT_MESSAGE_RECEIVED:
{
switch (p_args->p_message->header.message_type)
{
case PTP_MESSAGE_TYPE_MANAGEMENT:
{
/* Handle the response message. */
break;
}
default:
{
break;
}
```

```

    }
    }
    }
default:
    {
break;
    }
    }
}

```

## Data Structures

```
struct ptp_instance_ctrl_t
```

## Data Structure Documentation

### ◆ ptp\_instance\_ctrl\_t

struct ptp_instance_ctrl_t		
PTP instance control block.		
Data Fields		
uint32_t	open	Marks if the instance has been opened.
uint32_t	tx_buffer_write_index	Index into the descriptor list to write the next packet.
uint32_t	tx_buffer_complete_index	Index into the descriptor list of the last transmitted packet.
uint32_t	rx_buffer_index	Index into the descriptor of the last received packet.
uint32_t	tslatr	Keep track of whether tslatr was set.
ptp_cfg_t const *	p_cfg	Pointer to the configuration structure.

## Function Documentation

◆ **R\_PTP\_Open()**

```
fsp_err_t R_PTP_Open ( ptp_ctrl_t *const p_ctrl, ptp_cfg_t const *const p_cfg )
```

This function initializes PTP. Implements `ptp_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [PTP Interface](#) functions.

**Return values**

FSP_SUCCESS	The instance has been successfully configured.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_NOT_OPEN	The EDMAC instance was not opened correctly.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.

◆ **R\_PTP\_MacAddrSet()**

```
fsp_err_t R_PTP_MacAddrSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_mac_addr )
```

This function sets the MAC address for the PTP instance. Implements `ptp_api_t::macAddrSet`.

*Note*

*This function may only be called while the PTP instance is in `ptp_port_state_t::PTP_PORT_STATE_DISABLE`.*

**Return values**

FSP_SUCCESS	The MAC address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ **R\_PTP\_IpAddrSet()**

```
fsp_err_t R_PTP_IpAddrSet ( ptp_ctrl_t *const p_ctrl, uint32_t ip_addr )
```

This function sets the IP address for the PTP instance. Implements [ptp\\_api\\_t::ipAddrSet](#).

**Note**

*This function may only be called while the PTP instance is in [ptp\\_port\\_state\\_t::PTP\\_PORT\\_STATE\\_DISABLE](#).*

**Return values**

FSP_SUCCESS	The IP address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_INVALID_MODE	The configured <a href="#">ptp_synfp_cfg_t::frame_format</a> is not configured to use IP packets, or the instance is not in the correct state.

◆ **R\_PTP\_LocalClockIdSet()**

```
fsp_err_t R_PTP_LocalClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id )
```

This function sets the local clock ID for the PTP instance. Implements [ptp\\_api\\_t::localClockIdSet](#).

**Note**

*This function may only be called while the PTP instance is in [ptp\\_port\\_state\\_t::PTP\\_PORT\\_STATE\\_DISABLE](#). Typically the clock ID is derived from the MAC address (E.g. {b1,b2,b3,0xFF,0xFE,b4,b5,b6}).*

**Return values**

FSP_SUCCESS	The local clock ID has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ **R\_PTP\_MasterClockIdSet()**

```
fsp_err_t R_PTP_MasterClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id,
uint16_t port_id )
```

This function sets the master clock ID and port ID that the local clock will synchronize with. Implements [ptp\\_api\\_t::masterClockIdSet](#).

**Return values**

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ **R\_PTP\_MessageFlagsSet()**

```
fsp_err_t R_PTP_MessageFlagsSet ( ptp_ctrl_t *const p_ctrl, ptp_message_type_t message_type,
ptp_message_flags_t flags )
```

This function sets the flags field for the given message type. Implements [ptp\\_api\\_t::messageFlagsSet](#).

**Return values**

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R\_PTP\_CurrentUtcOffsetSet()**

```
fsp_err_t R_PTP_CurrentUtcOffsetSet ( ptp_ctrl_t *const p_ctrl, uint16_t offset )
```

This function sets the currentUtcOffset value in announce messages. [ptp\\_api\\_t::currentUtcOffsetSet](#).

**Return values**

FSP_SUCCESS	The currentUtcOffset has been updated.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R\_PTP\_PortStateSet()**

```
fsp_err_t R_PTP_PortStateSet ( ptp_ctrl_t *const p_ctrl, uint32_t state )
```

This function changes the current state of the PTP instance. Implements `ptp_api_t::portStateSet`.

**Return values**

FSP_SUCCESS	The instance will transition to the new state.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ **R\_PTP\_MessageSend()**

```
fsp_err_t R_PTP_MessageSend ( ptp_ctrl_t *const p_ctrl, ptp_message_t const *const p_message,
uint8_t const *const p_tlv_data, uint16_t tlv_data_size )
```

This function sends a PTP message. `ptp_api_t::messageSend`.

**Return values**

FSP_SUCCESS	The packet has been written to the transmit descriptor.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	There is no space for the packet in the transmit queue.

◆ **R\_PTP\_LocalClockValueSet()**

```
fsp_err_t R_PTP_LocalClockValueSet ( ptp_ctrl_t *const p_ctrl, ptp_time_t const *const p_time )
```

This function sets the local clock value. Implements `ptp_api_t::localClockValueSet`.

**Return values**

FSP_SUCCESS	The local clock value has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R\_PTP\_LocalClockValueGet()**

```
fsp_err_t R_PTP_LocalClockValueGet ( ptp_ctrl_t *const p_ctrl, ptp_time_t *const p_time )
```

This function gets the local clock value. Implements `ptp_api_t::localClockValueGet`.

**Return values**

FSP_SUCCESS	The local clock value has been written in <code>p_time</code> .
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ **R\_PTP\_PulseTimerCommonConfig()**

```
fsp_err_t R_PTP_PulseTimerCommonConfig ( ptp_ctrl_t *const p_ctrl,
ptp_pulse_timer_common_cfg_t *const p_timer_cfg )
```

This function configures IPLS IRQ settings that are common to all pulse timer channels. Implements `ptp_api_t::pulseTimerCommonConfig`.

**Return values**

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R\_PTP\_PulseTimerEnable()**

```
fsp_err_t R_PTP_PulseTimerEnable ( ptp_ctrl_t *const p_ctrl, uint32_t channel,
ptp_pulse_timer_cfg_t *const p_timer_cfg )
```

This function enables a pulse timer channel. Implements `ptp_api_t::pulseTimerEnable`.

**Return values**

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R\_PTP\_PulseTimerDisable()**

```
fsp_err_t R_PTP_PulseTimerDisable ( ptp_ctrl_t *const p_ctrl, uint32_t channel )
```

This function disables a pulse timer channel. Implements `ptp_api_t::pulseTimerDisable`.

**Return values**

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R\_PTP\_Close()**

```
fsp_err_t R_PTP_Close ( ptp_ctrl_t *const p_ctrl)
```

Disable the PTP instance. Implements `ptp_api_t::close`.

**Return values**

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R\_PTP\_BestMasterClock()**

```
fsp_err_t R_PTP_BestMasterClock ( ptp_message_t const *const p_announce1, ptp_message_t const *const p_announce2, int8_t *const p_comparison )
```

This function compares two clocks to determine which one is the better master clock.

`p_comparison`:

- Set to -1 if `p_announce1` defines the best master clock.
- Set to 1 if `p_announce2` defines the best master clock.
- Set to 0 if `p_announce1` and `p_announce2` define the same clock.

**Return values**

FSP_SUCCESS	The valid result has been written to <code>p_use_announce_clock</code> .
FSP_ERR_ASSERTION	An argument was NULL.

**4.2.11.19 SPP BLE Abstraction (rm\_ble\_abs\_spp)**

---

[Modules](#) » [Networking](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

## Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics RYZ012 Bluetooth® Low Energy 5 Module. The rm\_ble\_abs\_spp driver interfaces with the RYZ012 module over UART or SPI.

## Features

The Bluetooth Low Energy Abstraction module with SPP supports the following features:

- Common functionality
  - Open/Close the BLE protocol stack.
  - Setting Transmit Power Level.
- The following GAP Role support
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
  - Initialize the Host stack.
  - Setting address.
  - Start/Stop Advertising.
  - Connect/Disconnect a link.
- GATT Common functionality
  - Get MTU Size.
- GATT Server functionality
  - Initialization of GATT Server.
  - Loading of Profile definition.
  - Notification of characteristics modification.
  - Read/Write of GATT Profile from host.
- Selectable Communication Interfaces
  - [SPI Interface](#)
  - [UART Interface](#)

## Target Devices

The Bluetooth Low Energy Abstraction module supports the following devices.

- RA6 line of devices using the RYZ012 module
- RA4 Line of devices using the RYZ012 module

## Configuration

### Build Time Configurations for rm\_ble\_abs\_spp

The following build time configurations are defined in fsp\_cfg/rm\_ble\_abs\_spp\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enable</li> <li>Disable</li> </ul>	Default (BSP)	Specify whether to include code for API parameter checking.
Reset Port	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin port for the MCU.
Reset Pin	Refer to the RA Configuration tool for available options.	10	Specify the module reset pin for the MCU.
UART/SPI Select Port (PB5)	Refer to the RA Configuration tool for available options.	03	Specify the module PB5 port for the MCU.
UART/SPI Select Pin (PB5)	Refer to the RA Configuration tool for available options.	11	Specify the module PB5 pin for the MCU.
SPI Software SSL Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the port to use for controlling SSL using the ioport module.
SPI Software SSL Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the pin to use for controlling SSL using the ioport module.
Transmit Power Level (in dBm)	Refer to the RA Configuration tool for available options.	4.57	Specify the module transmit power in dBm.

### Configurations for Networking > SPP BLE Abstraction (rm\_ble\_abs\_spp)

This module can be added to the Stacks tab via New Stack > Networking > SPP BLE Abstraction (rm\_ble\_abs\_spp).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_ble_abs0	Module name.
General > GAP callback	Name must be a valid C symbol	gap_cb	If QE is used, set to NULL.
General > Vendor specific callback	Name must be a valid C symbol	vs_cb	If QE is used, set to NULL.
General > GATT server callback parameter	Name must be a valid C symbol	gs_abs_gatts_cb_param	If QE is used, set to NULL.
General > GATT server callback number	Must be a valid number	2	The number of GATT Server callback functions.
General > GATT client	Name must be a valid	gs_abs_gattc_cb_param	Set GATT client

callback parameter	C symbol	callback parameter. If QE is used, set to NULL.
General > GATT client callback number	Must be a valid number 2	The number of GATT Server callback functions.

## Pin Configuration

Pins used by the BLE driver to control the RYZ012 module:

- Reset Pin : Active low reset line for RYZ012 module
- UART/SPI Select Pin : Allows selection between UART or SPI for module communication. UART is selected with output low and SPI with output high.
- [UART Interface](#) : RX/TX Pins
- [SPI Interface](#) : MOSI/MISO/SCK/SSL Pins
  - Data Ready Pin : When the [SPI Interface](#) is selected as the communication interface, the Data Ready pin is asserted in order to notify the MCU that there is data ready to be read.
  - Software SSL Pin : Can be optionally configured in order to drive the SSL Pin using software instead of hardware<sup>1</sup>.

Note

1. The Software SSL Pin is required when using the [SPI \(r\\_sci\\_spi\)](#) driver.

## Usage Notes

### Limitations

Developers should be aware of the following limitations when using the BLE\_ABS:

Currently supported rm\_ble\_abs\_spp interface functions:

- RM\_BLE\_ABS\_Open
- RM\_BLE\_ABS\_Close
- RM\_BLE\_ABS\_StartLegacyAdvertising

Currently supported r\_ble\_spp\_api interface functions:

- R\_BLE\_Open
- R\_BLE\_Close
- R\_BLE\_SetEvent
- R\_BLE\_GAP\_Init
- R\_BLE\_GAP\_StopAdv
- R\_BLE\_GAP\_SetAdvSresData
- R\_BLE\_GAP\_StartAdv
- R\_BLE\_GAP\_SetAdvParam
- R\_BLE\_GATT\_GetMtu
- R\_BLE\_GATTS\_SetDbInst
- R\_BLE\_GATTS\_Init
- R\_BLE\_GATTS\_GetAttr
- R\_BLE\_GATTS\_SetAttr
- R\_BLE\_GATTS\_Notification
- R\_BLE\_GATTS\_Indication

- R\_BLE\_GATTS\_RegisterCb
- R\_BLE\_GATTC\_Init

- R\_BLE\_VS\_SetBdAddr
- R\_BLE\_VS\_SetTxPower

Currently supported callback events:

- BLE\_GAP\_EVENT\_CONN\_IND
- BLE\_GAP\_EVENT\_DISCONN\_IND
- BLE\_GAP\_EVENT\_ADV\_ON
- BLE\_GAP\_EVENT\_ADV\_OFF
- BLE\_GATTC\_EVENT\_CONN\_IND
- BLE\_GATTS\_EVENT\_CONN\_IND
- BLE\_GATTC\_EVENT\_DISCONN\_IND
- BLE\_GATTS\_EVENT\_DISCONN\_IND
- BLE\_GATTS\_EVENT\_WRITE\_RSP\_COMP

## Transmit Power

Specific Operational Use Conditions for RYZ012 BLE module:

**Please consult the laws and regulations of the region(s) in which the device will be used to verify the information below before using this device.**

North America (FCC) The module must not be operated at power levels above 10.0 dBm. Host devices that need higher output power may not be marketed without prior re-certification.

Europe (RED) The module must not be operated at power levels above 8.4 dBm. Host devices that need higher output power may not be marketed in regions covered by RED regulation without prior re-certification.

Japan (MIC) The module must be operated at power level 4.5 dBm. Host devices that need to change output power may not be marketed without prior re-certification.

The current default level used in the E2 Studio Configurator is 4.5 dBm for the transmit power level.

## Examples

### BLE\_ABS\_SPP Basic Example

This is a basic example of minimal use of the BLE\_ABS\_SPP in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
    FSP_PARAMETER_NOT_USED(result);
    FSP_PARAMETER_NOT_USED(p_data);
    switch (type)
```

```
{
case BLE_GAP_EVENT_STACK_ON:
    {
        g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
    }
    break;
case BLE_GAP_EVENT_ADV_ON:
    {
        st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;

        g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
        g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_ON;
    }
    break;
case BLE_GAP_EVENT_ADV_OFF:
    {
        g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
    }
    break;
case BLE_GAP_EVENT_CONN_IND:
    {
        g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
    }
    break;
    {
        /* Do nothing. */
    }
    break;
default:
    break;
}
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
```

fsp\_err\_t RM\_WIFI\_ONCHIP\_SILEX\_SntpServerIpAddressSet (uint8\_t \*p\_ip\_address)

fsp\_err\_t RM\_WIFI\_ONCHIP\_SILEX\_SntpTimeZoneSet (int32\_t hours, uint32\_t minutes, wifi\_onchip\_silex\_sntp\_daylight\_savings\_enable\_t daylightSavingsEnable)

##### Detailed Description

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

## Overview

This Middleware module supplies an implementation for the [FreeRTOS Secure Sockets and WiFi interfaces](#) using the Silex SX-ULPGN module.

You can find specifics about the WiFi and Secure Socket interface APIs supported by this module at these web sites: [Secure Sockets API](#) or [Wifi API](#).

The SX-ULPGN is a low-power, compact IEEE 802.11b/g/n 2.4GHz 1x1 Wireless LAN module equipped with the Qualcomm® QCA4010 Wireless SOC. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the [Silex Web Site](#)

## Features

The WiFi Onchip Silex Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports a BSD style Secure Socket interface.
- Supports both TCP and UDP client sockets.
- Drive supports 1 or 2 UARTs for interfacing with the SX-ULPGN module. The second UART is considered optional.

## Configuration

### Build Time Configurations for rm\_wifi\_onchip\_silex

The following build time configurations are defined in fsp\_cfg/rm\_wifi\_onchip\_silex\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Number of supported socket instances	Refer to the RA Configuration tool for available options.	1	Enable number of socket instances
Size of RX buffer for socket	Manual Entry	4096	
Size of TX buffer for CMD Port	Manual Entry	1500	
Size of RX buffer for CMD Port	Manual Entry	3000	

Semaphore maximum timeout	Manual Entry	10000	
Number of retries for AT commands	Manual Entry	10	
Module Reset Port	Refer to the RA Configuration tool for available options.	06	Specify the module reset pin port for the MCU.
Module Reset Pin	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin for the MCU.
Enable SNTP Client	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Should the SNTP client of the module be enabled

### Configurations for Networking > WiFi Onchip Silex Driver using r\_sci\_uart (rm\_wifi\_onchip\_silex)

Configuration	Options	Default	Description
SNTP server IPv4 address	Must be a valid IPv4 address	0.0.0.0	
STNP Timezone Offset from UTC Hours	Must be between 12 and -12 hours	0	Value in hours from 12 to -12
STNP Timezone Offset from UTC Minutes	Must be between 0 and 59 minutes	0	Value in minutes from 0 to 59
Use Daylight Savings Time	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Specify if daytime savings should be used for local time calculation

Note: It is suggested that when using the Silex Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

### Interrupt Configuration

Refer to [UART \(r\\_sci\\_uart\)](#). [R\\_SCI\\_UART\\_Open\(\)](#) is called by [WiFi Onchip Silex Driver using r\\_sci\\_uart \(rm\\_wifi\\_onchip\\_silex\)](#).

### Clock Configuration

Refer to [UART \(r\\_sci\\_uart\)](#).

## Pin Configuration

Refer to [UART \(r\\_sci\\_uart\)](#). `R_SCI_UART_Open()` is called by [WiFi Onchip Silex Driver using r\\_sci\\_uart \(rm\\_wifi\\_onchip\\_silex\)](#)

## Usage Notes

### Limitations

- WiFi AP connections do not currently support WEP security.
- When operating with a single UART only single socket connections are possible. To support multiple sockets two UART channels must be connected to the module. When using the Renesas-provided SX-ULPGN PMOD board the second UART channel is on pins 9 and 10 of the PMOD header.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the Silex module firmware. The `rm_wifi_onchip_silex_connect()` function will return an error if a comma is detected.
- When operating with a single UART and there is an active socket connection you cannot call `WIFI_Scan()`, `WIFI_Ping()`, `SOCKETS_GetHostByName()`, `WIFI_GetMAC()`, or `WIFI_GetIPInfo()`. Calling one of these function will return an error code in this situation. These commands are blocked in the one UART case during an active socket connection because they could cause data loss. To avoid this limitation please configure the hardware to use both UARTs.
- The Silex WiFi modules SNTP support requires all configuration changes to made when the WiFi is disconnected from an Access Point. This is a limitation of the Silex module firmware. If changes to the default SNTP settings are required then the application will have to close the current AP connection, make the necessary SNTP changes, and then re-establish the original connection.

## Examples

### Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
    WIFIReturnCode_t wifi_err;
    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucChannel                = 0,
        .xPassword.xWPA.cPassphrase = "password",
        .ucSSID                   = "access_point_ssid",
        .xPassword.xWPA.ucLength = 8,
        .ucSSIDLength             = 17,
    }
}
```

```
.xSecurity                = eWiFiSecurityWPA2,
};

SocketsSockaddr_t addr    = {0};

int32_t                number_bytes_rx = 0;
int32_t                number_bytes_tx = 0;

memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);

/* Open connection to the Wifi Module */
wifi_err = WIFI_On();
assert(eWiFiSuccess == wifi_err);

/* Connect to the Access Point */
wifi_err = WIFI_ConnectAP(&net_params);
assert(eWiFiSuccess == wifi_err);

/* Get address assigned by AP */
WIFIIPConfiguration_t ipInfo;
wifi_err = WIFI_GetIPInfo(&ipInfo);
assert(eWiFiSuccess == wifi_err);

/* Ping an address accessible on the network */
uint8_t    ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count    = 3;
const uint32_t intervalMS    = 100;

wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
assert(eWiFiSuccess == wifi_err);

/* Scan the local Wifi network for other APs */
wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
assert(eWiFiSuccess == wifi_err);

/* Do a DNS Query for IP address of server */
addr.ulAddress = SOCKETS_GetHostByName("www.renesas.com");
addr.usPort    = SOCKETS_htons(80);

/* Initialize the Socket Interface */
BaseType_t sock_err = SOCKETS_Init();
assert(pdPASS == sock_err);

/* Create a socket instance */
Socket_t socket1 = SOCKETS_Socket(SOCKETS_AF_INET, SOCKETS SOCK_STREAM,
```

```
SOCKETS_IPPROTO_TCP);
    assert(NULL != socket1);
    /* Connect to an server using address */
    sock_err = SOCKETS_Connect(socket1, &addr, sizeof(SocketsSockaddr_t));
    assert(pdPASS == sock_err);
    /* Send a HTTP Get call to server */
    number_bytes_tx = SOCKETS_Send(socket1, HTTP_GET_string, strlen(HTTP_GET_string),
0);
    assert(number_bytes_tx > 0);
    /* Receive the HTTP GET call reply */
    number_bytes_rx = SOCKETS_Recv(socket1, g_socket_recv_buffer,
SX_WIFI_SOCKET_RX_BUFFER_SIZE, 0);
    assert(number_bytes_rx > 0);
    /* Close the socket connection */
    SOCKETS_Close(socket1);
    /* Shutdown the WIFI and Socket Interfaces */
    WIFI_Off();
}
```

## SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE (64)
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_onchip_sntp_example (void)
{
```

```
/* Setup Access Point connection parameters */
WIFINetworkParams_t net_params =
{
    .ucSSID                = "access_point_ssid",
    .ucSSIDLength          = 17,
    .xPassword.xWPA.cPassphrase = "password",
    .xPassword.xWPA.ucLength  = 8,
    .ucChannel              = 0,
    .xSecurity              = eWiFiSecurityWPA2
};

uint8_t local_time[RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE];
time_t current_sys_time = 0;

// SNTP IP address
uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address

memset(local_time, 0, sizeof(local_time));

/* Open connection to the Wifi Module */
WIFI_On();

/* Connect to the Access Point */
WIFI_ConnectAP(&net_params);

/* Get the Epoch time in seconds since Jan 1, 1970 UTC */
RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);

/* Get the local time string */
RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));

/* Disconnect from the access point to make changes to the SNTP configuration */
WIFI_Disconnect();

/* Change the IP address of the server */
RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet((uint8_t *)
ip_address_sntp_server_valid);

/* Change the timezone to PST with daylight saving enabled */
RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet(-7, 0,
WIFI_ONCHIP_SILEX_Sntp_DAYLIGHT_SAVINGS_ENABLE);

/* Connect back to the access point */
WIFI_ConnectAP(&net_params);
```

```
/* Get the Epoch time in seconds since Jan 1, 1970 UTC */
RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);

/* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));

/* Disconnect from the Access Point and shutdown the WIFI module*/
WIFI_Disconnect();
WIFI_Off();
}
```

## UDP example

An example of using a UDP client socket to send and receive data from UDP server.

```
/*
 * Example of the use of an UDP client with Wifi. It is assumed for this test that
the UDP server that is connected to is an echo server.
 *
 * For brevity error checking has not been implemented.
 *
 */
void wifi_onchip_udp_example (void)
{
/* Setup Access Point connection parameters */
WIFINetworkParams_t net_params =
{
    .ucSSID                = "access_point_ssid",
    .ucSSIDLength          = 17,
    .xPassword.xWPA.cPassphrase = "password",
    .xPassword.xWPA.ucLength   = 8,
    .ucChannel              = 0,
    .xSecurity               = eWiFiSecurityWPA2
};

/* Fill in appropriate UDP echo server address and port */
SocketsSockaddr_t sock_addr;
```

```
sock_addr.ulAddress = SOCKETS_inet_addr_quick(udp_server_ip_addr[0],
                                             udp_server_ip_addr[1],
                                             udp_server_ip_addr[2],
                                             udp_server_ip_addr[3]);

sock_addr.usPort = SOCKETS_htons(UDP_SERVER_PORT);

/* Open connection to the Wifi Module */
WIFI_On();

/* Connect to the Access Point */
WIFI_ConnectAP(&net_params);

/* Create a UDP socket */
Socket_t sock1 = SOCKETS_Socket(SOCKETS_AF_INET, SOCKETS SOCK_DGRAM,
SOCKET_IPPROTO_UDP);

/* Connect UDP socket */
SOCKET_Connect(sock1, &sock_addr, sizeof(SocketsSockaddr_t));

/* Send data to UDP echo server */
SOCKET_Send(sock1, (void *) &udp_test_string[0], sizeof(udp_test_string), 0);

/* Receive data from UDP echo server */
while (bytes_rcv <= 0)
{
    bytes_rcv = SOCKET_Recv(sock1, &udp_rcv_buffer[0], sizeof(udp_rcv_buffer),
0);

    vTaskDelay(10);

    if ((--retry_counter) <= 0)
    {
        break;
    }
}

/* Close UDP socket */
SOCKET_Close(sock1);

/* Disconnect from the Access Point and shutdown the WIFI module*/
WIFI_Disconnect();

WIFI_Off();
}
```

		into callback function.
void const *	p_extend	Pointer to extended configuration by instance of interface.

#### ◆ ulpgn\_socket\_t

struct ulpgn_socket_t		
Silex ULPGN Wifi internal socket instance structure		
Data Fields		
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
uint8_t	socket_recv_buff[WIFI_ONCHIP_SILEX_CFG_MAX_SOCKET_RX_SIZE]	Socket receive buffer used by byte queue.
uint32_t	socket_status	Current socket status.
uint32_t	socket_recv_error_count	Socket receive error count.
uint32_t	socket_create_flag	Flag to determine in socket has been created.
uint32_t	socket_read_write_flag	flag to determine if read and/or write channels are active.

#### ◆ wifi\_onchip\_silex\_instance\_ctrl\_t

struct wifi_onchip_silex_instance_ctrl_t		
WIFI_ONCHIP_SILEX private control block. DO NOT MODIFY.		
Data Fields		
uint32_t	open	Flag to indicate if wifi instance has been initialized.
wifi_onchip_silex_cfg_t const *	p_wifi_onchip_silex_cfg	Pointer to initial configurations.
bsp_io_port_pin_t	reset_pin	Wifi module reset pin.
uint32_t	num_uarts	number of UARTS currently used for communication with module
uint32_t	tx_data_size	Size of the data to send.
uint32_t	num_creatable_sockets	Number of simultaneous sockets supported.
uint32_t	curr_cmd_port	Current UART instance index for AT commands.
uint32_t	curr_data_port	Current UART instance index for data.

uint8_t	cmd_rx_queue_buf[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command port receive buffer used by byte queue // FreeRTOS.
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
volatile uint32_t	curr_socket_index	Currently active socket instance.
uint8_t	cmd_tx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
uint32_t	at_cmd_mode	Current command mode.
uint8_t	curr_ipaddr[4]	Current IP address of module.
uint8_t	curr_subnetmask[4]	Current Subnet Mask of module.
uint8_t	curr_gateway[4]	Current GATeway of module.
SemaphoreHandle_t	tx_sem	Transmit binary semaphore handle.
SemaphoreHandle_t	rx_sem	Receive binary semaphore handle.
uint8_t	last_data[WIFI_ONCHIP_SILEX_RETURN_TEXT_LENGTH]	Tailing buffer used for command parser.
uart_instance_t *	uart_instance_objects[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART instance objects.
SemaphoreHandle_t	uart_tei_sem[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART transmission end binary semaphore.
ulpgn_socket_t	sockets[WIFI_ONCHIP_SILEX_CFG_NUM_CREATEABLE_SOCKETS]	Internal socket instances.

## Enumeration Type Documentation

### ◆ sx\_ulpgn\_socket\_status\_t

enum sx_ulpgn_socket_status_t
Silex ULPGN Wifi socket status types

◆ **sx\_ulpgn\_socket\_rw**enum `sx_ulpgn_socket_rw`

Silex socket shutdown channels

◆ **wifi\_onchip\_silex\_sntp\_enable\_t**enum `wifi_onchip_silex_sntp_enable_t`

Silex WiFi module enable/disable for SNTP

◆ **wifi\_onchip\_silex\_sntp\_daylight\_savings\_enable\_t**enum `wifi_onchip_silex_sntp_daylight_savings_enable_t`

Silex WiFi module enable/disable for SNTP

**Function Documentation**◆ **RM\_WIFI\_ONCHIP\_SILEX\_EpochTimeGet()**`fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet ( time_t * p_utc_time)`

This will retrieve time info from an NTP server at the address entered via an during configuration. If the server isn't set or the client isn't enabled, then it will return an error. The date/time is retrieved as the number of seconds since 00:00:00 UTC January 1, 1970

**Parameters**

[out]	<code>p_utc_time</code>	Returns the epoch time in seconds.
-------	-------------------------	------------------------------------

**Return values**

<code>FSP_SUCCESS</code>	Successfully retrieved the system time from module.
<code>FSP_ERR_ASSERTION</code>	The parameter <code>utc_time</code> or <code>p_instance_ctrl</code> is NULL.
<code>FSP_ERR_WIFI_FAILED</code>	Error occurred with command to Wifi module.
<code>FSP_ERR_NOT_OPEN</code>	Module is not open.

Get the current system time as the number of seconds since epoch 1970-01-01 00:00:00 UTC

◆ **RM\_WIFI\_ONCHIP\_SILEX\_LocalTimeGet()**

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet ( uint8_t * p_local_time, uint32_t size_string )
```

Get the current local time based on current timezone in a string . Exp: Wed Oct 15 1975 07:06:00

**Parameters**

[out]	p_local_time	Returns local time in string format.
[in]	size_string	Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes

**Return values**

FSP_SUCCESS	Successfully returned the local time string.
FSP_ERR_ASSERTION	The parameter local_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	String size value passed in exceeds maximum.

Get the current local time based on current timezone in a string format

◆ **RM\_WIFI\_ONCHIP\_SILEX\_SntpEnableSet()**

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet ( wifi_onchip_silex_sntp_enable_t enable)
```

Set the SNTP Client to Enable or Disable

**Parameters**

[in]	enable	Can be set to enable/disable for SNTP support.
------	--------	--

**Return values**

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Enable or Disable the SNTP Client Service

◆ **RM\_WIFI\_ONCHIP\_SILEX\_SntpServerIpAddressSet()**

fsp\_err\_t RM\_WIFI\_ONCHIP\_SILEX\_SntpServerIpAddressSet ( uint8\_t \* p\_ip\_address)

Set the SNTP Client Server IP Address

**Parameters**

[in]	p_ip_address	Pointer to IP address of SNTP server in byte array format.
------	--------------	--

**Return values**

FSP_SUCCESS	Successfully set the value.
FSP_ERR_ASSERTION	The parameter p_ip_address or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Update the SNTP Server IP Address

### ◆ RM\_WIFI\_ONCHIP\_SILEX\_SntpTimeZoneSet()

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet ( int32_t hours, uint32_t minutes,
wifi_onchip_silex_sntp_daylight_savings_enable_t daylightSavingsEnable )
```

Set the SNTP Client Timezone

#### Parameters

[in]	hours	Number of hours (+/-) used for timezone offset from GMT.
[in]	minutes	Number of minutes used for timezone offset from GMT.
[in]	daylightSavingsEnable	Enable/Disable daylight saving in the timezone calculation.

#### Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Parameter passed into function was invalid.

Update the SNTP Timezone

## 4.2.12 Power

### Modules

#### Detailed Description

Power Modules.

#### Modules

##### Low Power Modes (r\_lpm)

Driver for the LPM peripheral on RA MCUs. This module implements the [Low Power Modes Interface](#).

### 4.2.12.1 Low Power Modes (r\_lpm)

Modules » Power

#### Functions

fsp\_err\_t R\_LPM\_Open (lpm\_ctrl\_t \*const p\_api\_ctrl, lpm\_cfg\_t const \*const p\_cfg)

fsp\_err\_t R\_LPM\_LowPowerReconfigure (lpm\_ctrl\_t \*const p\_api\_ctrl, lpm\_cfg\_t const \*const p\_cfg)

fsp\_err\_t R\_LPM\_LowPowerModeEnter (lpm\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t R\_LPM\_IoKeepClear (lpm\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t R\_LPM\_Close (lpm\_ctrl\_t \*const p\_api\_ctrl)

#### Detailed Description

Driver for the LPM peripheral on RA MCUs. This module implements the [Low Power Modes Interface](#).

## Overview

The low power modes driver is used to configure and place the device into the desired low power mode. Various sources can be configured to wake from standby, request snooze mode, end snooze mode or end deep standby mode.

#### Features

The LPM HAL module has the following key features:

- Supports the following low power modes:
  - Deep Software Standby mode (On supported MCUs)
  - Software Standby mode
  - Sleep mode
  - Snooze mode
- Supports reducing power consumption when in deep software standby mode through internal power supply control and by resetting the states of I/O ports.
- Supports disabling and enabling the MCU's other hardware peripherals

## Configuration

#### Build Time Configurations for r\_lpm

The following build time configurations are defined in fsp\_cfg/r\_lpm\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> </ul>	Default (BSP)	If selected code for parameter checking is

	<ul style="list-style-type: none"> <li>• Disabled</li> </ul>		included in the build.
Standby Limit	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If enabled, standby configuration only applies in R_LPM_LowPowerModeEnter. Otherwise, standby configuration applies to any WFI call.

### Configurations for Power > Low Power Modes (r\_lpm)

This module can be added to the Stacks tab via New Stack > Power > Low Power Modes (r\_lpm). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_lpm0	Module name.
General > Low Power Mode	MCU Specific Options		Power mode to be entered.
General > Output port state in standby and deep standby	MCU Specific Options		Select the state of output pins during standby. Applies to address output, data output, and other bus control output pins.
Standby Options > Wake Sources	MCU Specific Options		Enable wake from standby from these Sources.
Standby Options > Snooze Request Source	MCU Specific Options		Select the event that will enter snooze.
Standby Options > Snooze End Sources	MCU Specific Options		Enable wake from snooze from these sources.
Standby Options > DTC state in Snooze Mode	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Disabled	Enable wake from snooze from this source.
Standby Options > Snooze Cancel Source	MCU Specific Options		Select an interrupt source to cancel snooze.
Deep Standby Options > I/O Port Retention	MCU Specific Options		Select the state of the IO Pins after exiting deep standby mode.
Deep Standby Options > Power-Supply Control	MCU Specific Options		Select the state of the internal power supply in deep standby mode.
Deep Standby Options	MCU Specific Options		Enable wake from deep

> Cancel Sources

standby using these sources.

Deep Standby Options    MCU Specific Options  
> Cancel Edges

Falling edge trigger is default. Select sources to enable wake from deep standby with rising edge.

## Clock Configuration

This module does not have any selectable clock sources.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Sleep Mode

At power on, by default sleep is set as the low-power mode. Sleep mode is the most convenient low-power mode available, as it does not require any special configuration (other than configuring and enabling a suitable interrupt or event to wake the MCU from sleep) to return to normal program-execution mode. The states of the SRAM, the processor registers, and the hardware peripherals are all maintained in sleep mode, and the time needed to enter and wake from sleep is minimal. Any interrupt causes the MCU device to wake from sleep mode, including the SysTick interrupt used by the RTOS scheduler.

## Software Standby Mode

In software-standby mode, the CPU, as well as most of the on-chip peripheral functions and all of the internal oscillators, are stopped. The contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions, and I/O Ports are all retained. Software-standby mode allows significant reduction in power consumption, because most of the oscillators are stopped in this mode. Like sleep mode, standby mode requires an interrupt or event be configured and enabled to wake up.

## Snooze Mode

Snooze mode can be used with some MCU peripherals to execute basic tasks while keeping the MCU in a low-power state. Many core peripherals and all clocks can be selected to run during Snooze, allowing for more flexible low-power configuration than Software Standby mode. To enable Snooze, select "Software Standby mode with Snooze mode enabled" for the "Low Power Mode" configuration option. Snooze mode settings (including entry/exit sources) are available under "Standby Options".

## Deep Software Standby Mode

Deep Software Standby Mode is only available on some MCU devices. The MCU always wakes from Deep Software Standby Mode by going through reset, either by the negation of the reset pin or by one of the wakeup sources configurable in the "Deep Standby Options" configuration group.

The Reset Status Registers can be used to determine if the reset occurred after coming out of deep

software standby. For example, R\_SYSTEM->RSTSR0\_b.DPSRSTF is set to 1 after a deep software standby reset.

I/O Port Retention can be enabled to maintain I/O port configuration across a deep software standby reset. Retention can be cancelled through the [R\\_LPM\\_IoKeepClear](#) API.

## Limitations

Developers should be aware of the following limitations when using the LPM:

- Flash stop (code flash disable) is not supported. See the section "Flash Operation Control Register (FLSTOP)" of the RA2/RA4 Family Hardware User's Manual.
- Reduced SRAM retention area in software standby mode is not supported. See the section "Power Save Memory Control Register (PSMCR)" of the RA4 Hardware User's Manual.
- Only one Snooze Request Source can be used at a time.
- When using Snooze mode with SCI0 RXD as the snooze source the system clock must be HOCO and the MOCO, Main Oscillator and PLL clocks must be turned off.
- If the main oscillator or PLL with main oscillator source is used for the system clock, the wake time from standby mode can be affected by the Main Oscillator Wait Time Setting in the MOSCWTCR register. This register setting is available to be changed through the Main Oscillator Wait Time setting in the CGC module properties. See the "Wakeup Timing and Duration" table in Electrical Characteristics for more information.
- When using the DC-DC regulator (where available), the MCU will temporarily switch to the LDO if Software Standby or Snooze is requested and back again when it is cancelled. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).

## Examples

### LPM Sleep Example

This is a basic example of minimal use of the LPM in an application. The LPM instance is opened and the configured low-power mode is entered.

```
void r_lpm_sleep (void)
{
    fsp_err_t err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_sleep);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### LPM Deep Software Standby Example

```
void r_lpm_deep_software_standby (void)
```

```

{
    fsp_err_t err;

    err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Check the Deep Software Standby Reset Flag. */
    if (1U == R_SYSTEM->RSTSR0_b.DPSRSTF)
    {
        /* Clear the IOKEEP bit to allow I/O Port use. */
        err = R_LPM_IoKeepClear(&g_lpm_ctrl);
        assert(FSP_SUCCESS == err);
    }
    /* Add user code here. */
    /* Reconfigure the module to set the IOKEEP bit before entering deep software
standby. */
    err = R_LPM_LowPowerReconfigure(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
    /* Code after R_LPM_LowPowerModeEnter when using Deep Software Standby never be
executed.
    * Deep software standby exits by resetting the MCU. */
    assert(FSP_SUCCESS == err);
}

```

## Data Structures

struct [lpm\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ lpm\_instance\_ctrl\_t

struct [lpm\\_instance\\_ctrl\\_t](#)

LPM private control block. DO NOT MODIFY. Initialization occurs when [R\\_LPM\\_Open\(\)](#) is called.

## Function Documentation

◆ **R\_LPM\_Open()**

```
fsp_err_t R_LPM_Open ( lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg )
```

Perform any necessary initialization

**Return values**

FSP_SUCCESS	LPM instance opened
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_ALREADY_OPEN	LPM instance is already open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: <ul style="list-style-type: none"> <li>• Invalid snooze entry source</li> <li>• Invalid snooze end sources</li> </ul>
FSP_ERR_INVALID_MODE	One of the following: <ul style="list-style-type: none"> <li>• Invalid low power mode</li> <li>• Invalid DTC option for snooze mode</li> <li>• Invalid deep standby end sources</li> <li>• Invalid deep standby end sources edges</li> <li>• Invalid power supply option for deep standby</li> <li>• Invalid IO port option for deep standby</li> <li>• Invalid output port state setting for standby or deep standby</li> <li>• Invalid sources for wake from standby mode</li> <li>• Invalid power supply option for standby</li> <li>• Invalid IO port option for standby</li> <li>• Invalid standby end sources</li> <li>• Invalid standby end sources edges</li> </ul>

◆ **R\_LPM\_LowPowerReconfigure()**

```
fsp_err_t R_LPM_LowPowerReconfigure ( lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg )
```

Configure a low power mode

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

**Return values**

FSP_SUCCESS	Low power mode successfully applied
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: <ul style="list-style-type: none"> <li>Invalid snooze entry source</li> <li>Invalid snooze end sources</li> </ul>
FSP_ERR_INVALID_MODE	One of the following: <ul style="list-style-type: none"> <li>Invalid low power mode</li> <li>Invalid DTC option for snooze mode</li> <li>Invalid deep standby end sources</li> <li>Invalid deep standby end sources edges</li> <li>Invalid power supply option for deep standby</li> <li>Invalid IO port option for deep standby</li> <li>Invalid output port state setting for standby or deep standby</li> <li>Invalid sources for wake from standby mode</li> <li>Invalid power supply option for standby</li> <li>Invalid IO port option for standby</li> <li>Invalid standby end sources</li> <li>Invalid standby end sources edges</li> </ul>

◆ **R\_LPM\_LowPowerModeEnter()**

`fsp_err_t R_LPM_LowPowerModeEnter ( lpm_ctrl_t *const p_api_ctrl)`

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

**Return values**

FSP_SUCCESS	Successful.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_INVALID_MODE	One of the following: <ul style="list-style-type: none"> <li>• HOCO was not system clock when using snooze mode with SCIO/RXD0.</li> <li>• HOCO was not stable when using snooze mode with SCIO/RXD0.</li> <li>• MOCO was running when using snooze mode with SCIO/RXD0.</li> <li>• MAIN OSCILLATOR was running when using snooze mode with SCIO/RXD0.</li> <li>• PLL was running when using snooze mode with SCIO/RXD0.</li> <li>• Unable to disable oscillator stop detect when using standby or deep standby.</li> </ul>

◆ **R\_LPM\_IoKeepClear()**

`fsp_err_t R_LPM_IoKeepClear ( lpm_ctrl_t *const p_api_ctrl)`

Clear the IOKEEP bit after deep software standby

**Return values**

FSP_SUCCESS	DPSBYCR_b.IOKEEP bit cleared Successfully.
FSP_ERR_UNSUPPORTED	Deep standby mode not supported on this MCU.

**◆ R\_LPM\_Close()**

```
fsp_err_t R_LPM_Close ( lpm_ctrl_t *const p_api_ctrl)
```

Close the LPM Instance

**Return values**

FSP_SUCCESS	LPM driver closed
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_ASSERTION	Null Pointer

**4.2.13 RTOS**

## Modules

**Detailed Description**

RTOS Modules.

**Modules**

[Azure RTOS ThreadX Port \(rm\\_threadx\\_port\)](#)

ThreadX port for RA MCUs.

[FreeRTOS Port \(rm\\_freertos\\_port\)](#)

FreeRTOS port for RA MCUs.

**4.2.13.1 Azure RTOS ThreadX Port (rm\_threadx\_port)**

## Modules » RTOS

ThreadX port for RA MCUs.

**Overview***Note*

*The ThreadX Port does not provide any interfaces to the user. Consult the ThreadX documentation at <https://docs.microsoft.com/en-us/azure/rtos/threadx/> for further information.*

## Features

The RA ThreadX port supports the following features:

- Standard ThreadX configurations
- Hardware stack monitor

## Configuration

### Build Time Configurations for ThreadX

The following build time configurations are defined in fsp\_cfg/azure/tx/tx\_user.h:

Configuration	Options	Default	Description
General > Custom tx_user.h	Manual Entry		Add a path to your custom tx_user.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
General > Error Checking	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	The ThreadX basic API error checking can be bypassed by compiling with the symbol TX_DISABLE_ERROR_CHECKING defined.
General > Max Priorities	Value must be a multiple of 32 or empty	32	Define the priority levels for ThreadX. Legal values range from 32 to 1024 and MUST be evenly divisible by 32.
General > Minimum Stack	Value must be greater than 0 or empty	200	Define the minimum stack for a ThreadX thread on this processor. If the size supplied during thread creation is less than this value, the thread create call will return an error.
General > Stack Filling	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Determine if stack filling is enabled. By default, ThreadX stack filling is enabled, which places an 0xEF pattern in each byte of each thread's stack. This is used by debuggers

General > Preemption Threshold	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	<p>with ThreadX-awareness and by the ThreadX run-time stack checking feature.</p> <p>Determine if preemption-threshold should be disabled. By default, preemption-threshold is disabled. If the application does not use preemption-threshold, it may be disabled to reduce code size and improve performance.</p>
General > Notify Callbacks	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	<p>Determine if the notify callback option should be disabled. By default, notify callbacks are disabled. If the application does not use notify callbacks, they may be disabled to reduce code size and improve performance.</p>
General > Inline Thread Resume Suspend	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	<p>Determine if the tx_thread_resume and tx_thread_suspend services should have their internal code in-line. This results in a larger image, but improves the performance of the thread resume and suspend services.</p>
General > Not Interruptable	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	<p>Determine if the internal ThreadX code is non-interruptable. This results in smaller code size and less processing overhead, but increases the interrupt lockout time.</p>
General > IAR Library Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	<p>Enable IAR library support (IAR compiler only). When IAR Library Support is Enabled, enable the linker option <code>--threaded_lib</code>. In the IAR IDE, this can be</p>

			enabled in Project > Options > General Options > Library Configuration > Enable thread support in library.
General > BSD Support	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Defines TX_THREAD_EXTENSION_1 to bsd_err_no in order to support NXD BSD.
General > FileX Pointer	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Determine if there is a FileX pointer in the thread control block. By default, the pointer is there for legacy/backwards compatibility. The pointer must also be there for applications using FileX. Disable this to save space in the thread control block.
Timer > Timer Ticks Per Second	Value must be greater than 0 or empty	100	Define the number of times the system timer runs per second. Default is 100 ticks per second, which results in a tick every 10ms.
Timer > Timer Thread Stack Size	Value must be greater than 0 or empty	1024	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer > Timer Thread Priority	Value must be greater than 0 or empty	0	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer > Timer Process In ISR	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Determine if timer expirations (application timers, timeouts, and tx_thread_sleep calls should be processed within the a system timer thread or directly in the timer ISR. When disabled, the timer

thread is used. When enabled, timer expiration processing is done directly from the timer ISR, thereby eliminating the timer thread control block, stack, and context switching to activate it.

Determine if in-line timer reactivation should be used within the timer expiration processing. By default, this is disabled and a function call is used. When enabled, reactivating is performed in-line resulting in faster timer processing but slightly larger code size.

Determine if no timer processing is required. This option will help eliminate the timer processing when not needed.

Determine if the trace event logging code should be enabled. This causes slight increases in code size and overhead, but provides the ability to generate system trace information which is available for viewing in TraceX.

Name of trace buffer symbol, only used if Event Trace is enabled.

Specify the memory section where the Trace Buffer will be allocated, only used if Event Trace is enabled. To view TraceX data, export this buffer as raw binary data to a file (.trx extension recommended) and

Timer > Reactivate  
Inline

Performance > Timer Performance Info	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled		When enabled, ThreadX gathers timer performance information.
RA > Hardware Thread Stack Monitoring	MCU Specific Options			Use RA Hardware Stack Monitors to monitor thread stacks for overflow. Not available on MCUs that support PSPLIM.

Interrupts > SysTick  
Interrupt Priority

MCU Specific Options

Select the SysTick interrupt priority.

Interrupts > Maximum  
Interrupt Priority

MCU Specific Options

The maximum priority (lowest numerical value) an interrupt can have and use scheduler services. Interrupts with higher priority can interrupt most scheduler critical sections. Setting this to Priority 0 (highest) disables this feature. This feature is not available on MCUs that do not have the BASEPRI register.

## Clock Configuration

The ThreadX port uses the SysTick timer as the system clock. The timer rate is configured in the ThreadX component under General > Timer Ticks Per Second.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Interrupt Priorities

When no threads are ready to run, the ThreadX port spins in the PendSV\_Handler, which is fixed at the lowest interrupt priority. The MCU does not service any other interrupts of the lowest priority while no threads are ready to run.

To get around this limitation, the application can create an idle thread that is always ready to run. If the idle thread enters a lower power mode, make sure all interrupts that are required to resume the scheduler can wake the MCU in the configured power mode. If the application expects to wake after a certain number of ticks, the idle thread should not enter standby mode because the SysTick cannot wake the MCU from standby mode. See [Low Power Modes \(r\\_lpm\)](#) for more information regarding low power modes.

### Warning

Do not attempt to wake a thread from an interrupt with the lowest available interrupt priority unless the application has created an idle thread.

## Hardware Stack Monitor

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current thread. A callback can be registered using [R\\_BSP\\_GroupIrqWrite\(\)](#) to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

## Low Power Modes

The idle processing executes WFI() when no thread is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle processing executes WFI(), the RA ThreadX port changes the low power mode to sleep mode so the idle processing can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

## TrustZone Integration

When using an RTOS in a TrustZone project, ARM recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the thread has allocated a secure context (using tx\_thread\_secure\_stack\_allocate).

The secure context can be freed by deleting the thread or calling tx\_thread\_secure\_stack\_free.

## Examples

### Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback(bsp_grp_irq_t irq);
void stack_monitor_callback (bsp_grp_irq_t irq)
{
    FSP_PARAMETER_NOT_USED(irq);
    if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
        /* Handle main stack monitor error here. */
    }
    if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
        /* Handle process stack monitor error here. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
    /* Register a callback to be called when the stack goes outside the allocated stack
area. */
    R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
```

```
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);

/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
    register uint32_t cfsr = SCB->CFSR;
    if (cfsr & SCB_CFSR_STKOF_Msk)
    {
        /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
        register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
        __set_PSP((uint32_t) p_exception_stack_frame);
        __set_PSPLIM((uint32_t) p_exception_stack_frame);
        /* Clear XPSR, only set T-bit. */
        p_exception_stack_frame[7] = 1U << 24;
        /* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
 * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
 * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
        p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
    /* Clear flags. */
    SCB->CFSR = cfsr;
}

/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
    /* When recovering from a stack overflow, move the thread to a while(1) loop. */

```

```
while (1)
{
/* Do nothing. */
}
}
void rm_threadx_port_stack_monitor_example (void)
{
/* Enable usage fault. */
SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

### TrustZone Example

This is an example of calling `tx_thread_secure_stack_allocate` before calling any non-secure callable functions in a thread.

```
extern TX_THREAD * _tx_thread_current_ptr;
void rm_threadx_port_trustzone_thread_example (void)
{
/* When ThreadX is used in a non-secure TrustZone application,
tx_thread_secure_stack_allocate must be called prior
* to calling any non-secure callable function in a thread. The first parameter is a
pointer to the thread control block.
* This function can be called when the thread is created or in the thread before an
non-secure callable function is
* called. The second parameter is unused in the FSP implementation. */
UINT status = tx_thread_secure_stack_allocate(_tx_thread_current_ptr, 0);
assert(TX_SUCCESS == status);
rm_threadx_port_nsc_function();
}
```

#### 4.2.13.2 FreeRTOS Port (rm\_freertos\_port)

[Modules](#) » [RTOS](#)

FreeRTOS port for RA MCUs.

## Overview

### Note

*The FreeRTOS Port does not provide any interfaces to the user. Consult the FreeRTOS documentation at <https://www.freertos.org/Documentation> for further information.*

### Features

The RA FreeRTOS port supports the following features:

- Standard FreeRTOS configurations
- Hardware stack monitor

## Configuration

### Build Time Configurations for all

The following build time configurations are defined in aws/FreeRTOSConfig.h:

Configuration	Options	Default	Description
General > Custom FreeRTOSConfig.h	Manual Entry		Add a path to your custom FreeRTOSConfig.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
General > Use Preemption	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Set to Enabled to use the preemptive RTOS scheduler, or Disabled to use the cooperative RTOS scheduler.
General > Use Port Optimised Task Selection	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Some FreeRTOS ports have two methods of selecting the next task to execute - a generic method, and a method that is specific to that port.  The Generic method: Is used when Use Port Optimized Task Selection is set to 0, or when a port specific method is not implemented. Can be used with all

FreeRTOS ports.  
Is completely written in C, making it less efficient than a port specific method.  
Does not impose a limit on the maximum number of available priorities.

A port specific method:  
Is not available for all ports.  
Is used when Use Port Optimized Task Selection is Enabled.  
Relies on one or more architecture specific assembly instructions (typically a Count Leading Zeros [CLZ] or equivalent instruction) so can only be used with the architecture for which it was specifically written.  
Is more efficient than the generic method.  
Typically imposes a limit of 32 on the maximum number of available priorities.

Set Use Tickless Idle to Enabled to use the low power tickless mode, or Disabled to keep the tick interrupt running at all times. Low power tickless implementations are not provided for all FreeRTOS ports.

Enter the frequency in Hz at which the internal clock that drives the peripheral used to generate the tick interrupt will be executing - this is normally the same clock that drives the internal CPU clock. This value is required in order to correctly

General > Use Tickless Idle

- Enabled
- Disabled

Disabled

General > Cpu Clock Hz

Manual Entry

SystemCoreClock

---

General > Tick Rate Hz	Must be an integer and greater than 0	1000	configure timer peripherals.  The frequency of the RTOS tick interrupt. The tick interrupt is used to measure time. Therefore a higher tick frequency means time can be measured to a higher resolution. However, a high tick frequency also means that the RTOS kernel will use more CPU time so be less efficient. The RTOS demo applications all use a tick rate of 1000Hz. This is used to test the RTOS kernel and is higher than would normally be required.  More than one task can share the same priority. The RTOS scheduler will share processor time between tasks of the same priority by switching between the tasks during each RTOS tick. A high tick rate frequency will therefore also have the effect of reducing the 'time slice' given to each task.
General > Max Priorities	Must be an integer and greater than 0	5	The number of priorities available to the application tasks. Any number of tasks can share the same priority. Each available priority consumes RAM within the RTOS kernel so this value should not be set any higher than actually required by your application.
General > Minimal Stack Size	Must be an integer and greater than 0	128	The size of the stack used by the idle task.

Generally this should not be reduced from the value set in the `FreeRTOSConfig.h` file provided with the demo application for the port you are using. Like the stack size parameter to the `xTaskCreate()` and `xTaskCreateStatic()` functions, the stack size is specified in words, not bytes. If each item placed on the stack is 32-bits, then a stack size of 100 means 400 bytes (each 32-bit stack item consuming 4 bytes).

The maximum permissible length of the descriptive name given to a task when the task is created. The length is specified in the number of characters including the NULL termination byte.

Time is measured in 'ticks' - which is the number of times the tick interrupt has executed since the RTOS kernel was started. The tick count is held in a variable of type `TickType_t`. Defining `configUSE_16_BIT_TICK` as 1 causes `TickType_t` to be defined (typedef'ed) as an unsigned 16bit type. Defining `configUSE_16_BIT_TICK` as 0 causes `TickType_t` to be defined (typedef'ed) as an unsigned 32bit type.

Using a 16-bit type will greatly improve

General > Max Task Name Len      Must be an integer and greater than 0      16

General > Use 16-bit Ticks      Disabled      Disabled

performance on 8- and 16-bit architectures, but limits the maximum specifiable time period to 65535 'ticks'. Therefore, assuming a tick frequency of 250Hz, the maximum time a task can delay or block when a 16bit counter is used is 262 seconds, compared to 17179869 seconds when using a 32-bit counter.

This parameter controls the behaviour of tasks at the idle priority. It only has an effect if:  
 The preemptive scheduler is being used.  
 The application creates tasks that run at the idle priority.  
 If Use Time Slicing is Enabled then tasks that share the same priority will time slice. If none of the tasks get preempted then it might be assumed that each task at a given priority will be allocated an equal amount of processing time - and if the priority is above the idle priority then this is indeed the case.  
 When tasks share the idle priority the behaviour can be slightly different. If Idle Should Yield is Enabled then the idle task will yield immediately if any other task at the idle priority is ready to run. This ensures the minimum amount of time is spent in the idle task when application

General > Idle Should Yield

- Enabled
- Disabled

Enabled

tasks are available for scheduling. This behaviour can however have undesirable effects (depending on the needs of your application) as depicted below:

The diagram above shows the execution pattern of four tasks that are all running at the idle priority. Tasks A, B and C are application tasks. Task I is the idle task. A context switch occurs with regular period at times T0, T1, ..., T6. When the idle task yields task A starts to execute - but the idle task has already consumed some of the current time slice. This results in task I and task A effectively sharing the same time slice. The application tasks B and C therefore get more processing time than the application task A.

This situation can be avoided by:

If appropriate, using an idle hook in place of separate tasks at the idle priority. Creating all application tasks at a priority greater than the idle priority. Setting Idle Should Yield to Disabled. Setting Idle Should Yield to Disabled prevents the idle task from yielding processing time until the end of its time

slice. This ensure all tasks at the idle priority are allocated an equal amount of processing time (if none of the tasks get pre-empted) - but at the cost of a greater proportion of the total processing time being allocated to the idle task.

Setting Use Task Notifications to Enabled will include direct to task notification functionality and its associated API in the build.

Setting Use Task Notifications to Disabled will exclude direct to task notification functionality and its associated API from the build.

Each task consumes 8 additional bytes of RAM when direct to task notifications are included in the build.

Set to Enabled to include mutex functionality in the build, or Disabled to omit mutex functionality from the build. Readers should familiarise themselves with the differences between mutexes and binary semaphores in relation to the FreeRTOS functionality.

Set to Enabled to include recursive mutex functionality in the build, or Disabled to omit recursive mutex functionality from the build.

General > Use Task Notifications

- Enabled
- Disabled

Enabled

General > Use Mutexes

- Disabled

Disabled

General > Use Counting Semaphores	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Set to Enabled to include counting semaphore functionality in the build, or Disabled to omit counting semaphore functionality from the build.
General > Queue Registry Size	Must be an integer and greater than 0	10	<p>The queue registry has two purposes, both of which are associated with RTOS kernel aware debugging: It allows a textual name to be associated with a queue for easy queue identification within a debugging GUI.</p> <p>It contains the information required by a debugger to locate each registered queue and semaphore. The queue registry has no purpose unless you are using a RTOS kernel aware debugger. Registry Size defines the maximum number of queues and semaphores that can be registered. Only those queues and semaphores that you want to view using a RTOS kernel aware debugger need be registered. See the API reference documentation for <code>vQueueAddToRegistry()</code> and <code>vQueueUnregisterQueue()</code> for more information.</p>
General > Use Queue Sets	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Set to Enabled to include queue set functionality (the ability to block, or pend, on multiple queues and semaphores), or

General > Use Time Slicing	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	<p>Disabled to omit queue set functionality.</p> <p>If Use Time Slicing is Enabled, FreeRTOS uses prioritised preemptive scheduling with time slicing. That means the RTOS scheduler will always run the highest priority task that is in the Ready state, and will switch between tasks of equal priority on every RTOS tick interrupt. If Use Time Slicing is Disabled then the RTOS scheduler will still run the highest priority task that is in the Ready state, but will not switch between tasks of equal priority just because a tick interrupt has occurred.</p>
General > Use Newlib Reentrant	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	<p>If Use Newlib Reentrant is Enabled then a newlib reent structure will be allocated for each created task. Note Newlib support has been included by popular demand, but is not used by the FreeRTOS maintainers themselves. FreeRTOS is not responsible for resulting newlib operation. User must be familiar with newlib and must provide system-wide implementations of the necessary stubs. Be warned that (at the time of writing) the current newlib design implements a system-wide malloc() that must be provided with locks.</p>
General > Enable Backward Compatibility	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	<p>The FreeRTOS.h header file includes a set of #define macros that</p>

map the names of data types used in versions of FreeRTOS prior to version 8.0.0 to the names used in FreeRTOS version 8.0.0. The macros allow application code to update the version of FreeRTOS they are built against from a pre 8.0.0 version to a post 8.0.0 version without modification. Setting `Enable Backward Compatibility` to `Disabled` in `FreeRTOSConfig.h` excludes the macros from the build, and in so doing allowing validation that no pre version 8.0.0 names are being used.

Sets the number of indexes in each task's thread local storage array.

Sets the type used to specify the stack depth in calls to `xTaskCreate()`, and various other places stack sizes are used (for example, when returning the stack high water mark). Older versions of FreeRTOS specified stack sizes using variables of type `UBaseType_t`, but that was found to be too restrictive on 8-bit microcontrollers. `Stack Depth Type` removes that restriction by enabling application developers to specify the type to use.

FreeRTOS Message buffers use variables of type `Message Buffer`

General > Num Thread Local Storage Pointers    Must be an integer and greater than 0    5

General > Stack Depth Type    Manual Entry    uint32\_t

General > Message Buffer Length Type    Manual Entry    size\_t

Length Type to store the length of each message. If Message Buffer Length Type is not defined then it will default to size\_t. If the messages stored in a message buffer will never be larger than 255 bytes then defining Message Buffer Length Type to uint8\_t will save 3 bytes per message on a 32-bit microcontroller. Likewise if the messages stored in a message buffer will never be larger than 65535 bytes then defining Message Buffer Length Type to uint16\_t will save 2 bytes per message on a 32-bit microcontroller.

The highest interrupt priority that can be used by any interrupt service routine that makes calls to interrupt safe FreeRTOS API functions. **DO NOT CALL INTERRUPT SAFE FREERTOS API FUNCTIONS FROM ANY INTERRUPT THAT HAS A HIGHER PRIORITY THAN THIS!** (higher priorities are lower numeric values)

Below is explanation for macros that are set based on this value from FreeRTOS website.

In the RA port, configKERNEL\_INTERRUPT\_PRIORITY is not used and the kernel runs at the lowest priority.

General > Library Max  
Syscall Interrupt  
Priority      MCU Specific Options

Note in the following discussion that only API functions that end in "FromISR" can be called from within an interrupt service routine.

`configMAX_SYSCALL_INTERRUPT_PRIORITY` sets the highest interrupt priority from which interrupt safe FreeRTOS API functions can be called.

A full interrupt nesting model is achieved by setting `configMAX_SYSCALL_INTERRUPT_PRIORITY` above (that is, at a higher priority level) than `configKERNEL_INTERRUPT_PRIORITY`. This means the FreeRTOS kernel does not completely disable interrupts, even inside critical sections. Further, this is achieved without the disadvantages of a segmented kernel architecture.

Interrupts that do not call API functions can execute at priorities above `configMAX_SYSCALL_INTERRUPT_PRIORITY` and therefore never be delayed by the RTOS kernel execution.

A special note for ARM Cortex-M users: Please read the page dedicated to interrupt priority settings on ARM Cortex-M devices. As a minimum, remember that ARM Cortex-M cores use numerically low priority numbers to represent

HIGH priority interrupts, which can seem counter-intuitive and is easy to forget! If you wish to assign an interrupt a low priority do NOT assign it a priority of 0 (or other low numeric value) as this can result in the interrupt actually having the highest priority in the system - and therefore potentially make your system crash if this priority is above configMAX\_SYSCALL\_INTERRUPT\_PRIORITY.

The lowest priority on a ARM Cortex-M core is in fact 255 - however different ARM Cortex-M vendors implement a different number of priority bits and supply library functions that expect priorities to be specified in different ways. For example, on the RA6M3 the lowest priority you can specify is 15 - and the highest priority you can specify is 0.

The semantics of the configASSERT() macro are the same as the standard C assert() macro. An assertion is triggered if the parameter passed into configASSERT() is zero. configASSERT() is called throughout the FreeRTOS source files to check how the application is using FreeRTOS. It is highly recommended to develop FreeRTOS applications with configASSERT()

General &gt; Assert

Manual Entry

assert(x)

defined.

The example definition (shown at the top of the file and replicated below) calls `vAssertCalled()`, passing in the file name and line number of the triggering `configASSERT()` call (`__FILE__` and `__LINE__` are standard macros provided by most compilers). This is just for demonstration as `vAssertCalled()` is not a FreeRTOS function, `configASSERT()` can be defined to take whatever action the application writer deems appropriate.

It is normal to define `configASSERT()` in such a way that it will prevent the application from executing any further. This is for two reasons; stopping the application at the point of the assertion allows the cause of the assertion to be debugged, and executing past a triggered assertion will probably result in a crash anyway.

Note defining `configASSERT()` will increase both the application code size and execution time. When the application is stable the additional overhead can be removed by simply commenting out the `configASSERT()` definition in `FreeRTOSConfig.h`.

```

/* Define
configASSERT() to call
vAssertCalled() if the
assertion fails. The
assertion
has failed if the value
of the parameter
passed into
configASSERT() equals
zero. */
#define configASSERT(
( x ) ) if( ( x ) == 0 )
vAssertCalled( __FILE__,
__LINE__ )
If running FreeRTOS
under the control of a
debugger, then
configASSERT() can be
defined to just disable
interrupts and sit in a
loop, as demonstrated
below. That will have
the effect of stopping
the code on the line
that failed the assert
test - pausing the
debugger will then
immediately take you
to the offending line so
you can see why it
failed.

```

```

/* Define
configASSERT() to
disable interrupts and
sit in a loop. */
#define configASSERT(
( x ) ) if( ( x ) == 0 ) { t
askDISABLE_INTERRUPTS(); for( ;; ); }

```

General > Include  
Application Defined  
Privileged Functions

- Enabled
  - Disabled
- Disabled

Include Application Defined Privileged Functions is only used by FreeRTOS MPU. If Include Application Defined Privileged Functions is Enabled then the application writer must provide a header file called "application\_defined\_privileged\_functions.h", in which functions the application writer

needs to execute in privileged mode can be implemented. Note that, despite having a .h extension, the header file should contain the implementation of the C functions, not just the functions' prototypes.

Functions implemented in "application\_defined\_privileged\_functions.h" must save and restore the processor's privilege state using the prvRaisePrivilege() function and portRESET\_PRIVILEGE() macro respectively. For example, if a library provided print function accesses RAM that is outside of the control of the application writer, and therefore cannot be allocated to a memory protected user mode task, then the print function can be encapsulated in a privileged function using the following code:

```
void MPU_debug_printf(
const char *pcMessage
)
{
/* State the privilege
level of the processor
when the function was
called. */
 BaseType_t
 xRunningPrivileged =
 prvRaisePrivilege();

/* Call the library
function, which now
has access to all RAM.
*/
 debug_printf(
 pcMessage );
```

```
/* Reset the processor
privilege level to its
original value. */
portRESET_PRIVILEGE(
xRunningPrivileged );
}
```

This technique should only be use during development, and not deployment, as it circumvents the memory protection.

Set to Enabled if you wish to use an idle hook, or Disabled to omit an idle hook.

The kernel uses a call to `pvPortMalloc()` to allocate memory from the heap each time a task, queue or semaphore is created. The official FreeRTOS download includes four sample memory allocation schemes for this purpose. The schemes are implemented in the `heap_1.c`, `heap_2.c`, `heap_3.c`, `heap_4.c` and `heap_5.c` source files respectively. Use Malloc Failed Hook is only relevant when one of these three sample schemes is being used. The `malloc()` failed hook function is a hook (or callback) function that, if defined and configured, will be called if `pvPortMalloc()` ever returns `NULL`. `NULL` will be returned only if there is insufficient FreeRTOS heap memory remaining for the requested allocation to succeed.

If Use Malloc Failed

Hooks > Use Idle Hook

- Enabled
- Disabled

Enabled

Hooks > Use Malloc Failed Hook

- Enabled
- Disabled

Disabled

Hook is Enabled then the application must define a malloc() failed hook function. If Use Malloc Failed Hook is set to Disabled then the malloc() failed hook function will not be called, even if one is defined. Malloc() failed hook functions must have the name and prototype shown below.

```
void vApplicationMallocFailedHook( void );
```

If Use Timers and Use Daemon Task Startup Hook are both Enabled then the application must define a hook function that has the exact name and prototype as shown below. The hook function will be called exactly once when the RTOS daemon task (also known as the timer service task) executes for the first time. Any application initialisation code that needs the RTOS to be running can be placed in the hook function.

```
void vApplicationDaemonTaskStartupHook( void );
```

Set to Enabled if you wish to use an tick hook, or Disabled to omit an tick hook.

The stack overflow detection page describes the use of this parameter. This is not recommended for RA MCUs with hardware stack monitor support. RA MCU designs should enable

```

```
/* Support Static Allocation and Use Timers are both Enabled, so the application must provide an implementation of vApplicationGetTimerTaskMemory() to provide the memory that is used by the Timer service task. */
void vApplicationGetTimerTaskMemory(
    StaticTask_t **ppxTimerTaskTCBBuffer, <br>
    StackType_t **ppxTimerTaskStackBuffer, <br>
    uint32_t *pulTimerTaskStackSize )
{
    /* If the buffers to be provided to the Timer task are declared inside this function then they must be declared static - otherwise they will be allocated on the stack and so not exist after this function exits. */
    static StaticTask_t xTimerTaskTCB;
```

```
static StackType_t
uxTimerTaskStack[ configTIMER_TASK_STACK_
DEPTH ];
```

```
/* Pass out a pointer to
the StaticTask_t
structure in which the
Timer
task's state will be
stored. */
*ppxTimerTaskTCBBuffer =
```

```
/* Pass out the array
that will be used as the
Timer task's stack. */
*ppxTimerTaskStackBuffer =
uxTimerTaskStack;
```

```
/* Pass out the size of
the array pointed to by
*ppxTimerTaskStackBuffer.
```

```
Note that, as the array
is necessarily of type
StackType_t,
configTIMER_TASK_STACK_DEPTH
is specified in words, not bytes. */
*puTimerTaskStackSize = configTIMER_TASK_
STACK_DEPTH;
}
```

Examples of the callback functions that must be provided by the application to supply the RAM used by the Idle and Timer Service tasks if Support Static Allocation is Enabled.

See the Static Vs Dynamic Memory Allocation page for more information.

If Support Dynamic Allocation is Enabled then RTOS objects can be created using RAM

Memory Allocation >  
Support Dynamic  
Allocation

- Enabled
  - Disabled
- Disabled

that is automatically allocated from the FreeRTOS heap. If Support Dynamic Allocation is set to 0 then RTOS objects can only be created using RAM provided by the application writer.

See the Static Vs Dynamic Memory Allocation page for more information.

The total amount of RAM available in the FreeRTOS heap. This value will only be used if Support Dynamic Allocation is Enabled and the application makes use of one of the sample memory allocation schemes provided in the FreeRTOS source code download. See the memory configuration section for further details.

By default the FreeRTOS heap is declared by FreeRTOS and placed in memory by the linker. Setting Application Allocated Heap to Enabled allows the heap to instead be declared by the application writer, which allows the application writer to place the heap wherever they like in memory. If heap\_1.c, heap\_2.c or heap\_4.c is used, and Application Allocated Heap is Enabled, then the application writer must provide a uint8\_t array with the exact name and dimension as shown below. The

Memory Allocation > Total Heap Size      Must be an integer and greater than 0      1024

Memory Allocation > Application Allocated Heap      • Enabled      Disabled  
 • Disabled

array will be used as the FreeRTOS heap. How the array is placed at a specific memory location is dependent on the compiler being used - refer to your compiler's documentation.

```
uint8_t ucHeap[
configTOTAL_HEAP_SIZE
];
```

Set to Enabled to include software timer functionality, or Disabled to omit software timer functionality. See the FreeRTOS software timers page for a full description.

Sets the priority of the software timer service/daemon task. See the FreeRTOS software timers page for a full description.

Sets the length of the software timer command queue. See the FreeRTOS software timers page for a full description.

Sets the stack depth allocated to the software timer service/daemon task. See the FreeRTOS software timers page for a full description.

Include vTaskPrioritySet() function in build

Include uxTaskPriorityGet() function in build

Include vTaskDelete() function in build

Include

Timers > Use Timers      • Enabled      Enabled  
                                  • Disabled

Timers > Timer Task Priority      Must be an integer and greater than 0      3

Timers > Timer Queue Length      Must be an integer and greater than 0      10

Timers > Timer Task Stack Depth      Must be an integer and greater than 0      128

## Clock Configuration

The FreeRTOS port uses the SysTick timer as the system clock. The timer rate is configured in the FreeRTOS component under General > Tick Rate Hz.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Hardware Stack Monitor (PSPLIM)

A UsageFault is generated if PSP goes out of the memory area for the stack allocated for the current task. If UsageFault is not enabled, it is escalated to HardFault.

## Hardware Stack Monitor (SPMON)

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current task. A callback can be registered using [R\\_BSP\\_GroupIrqWrite\(\)](#) to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

## Stack Monitor Underflow Detection

By default the hardware stack monitor only checks for overflow of the process stack. To check for underflow define configRECORD\_STACK\_HIGH\_ADDRESS as 1 on the command line.

## Low Power Modes

When FreeRTOS is configured to use tickless idle, the idle task executes WFI() when no task is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle task executes WFI(), the RA FreeRTOS port changes the low power mode to sleep mode so the idle task can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

## TrustZone Integration

When using an RTOS in a TrustZone project, ARM recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context (using portALLOCATE\_SECURE\_CONTEXT).

The secure context can be freed by deleting the thread or using the portCLEAN\_UP\_TCB(pxTCB) macro.

# Examples

## Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback (bsp_grp_irq_t irq)
{
    FSP_PARAMETER_NOT_USED(irq);
    if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
        /* Handle main stack monitor error here. */
    }
    if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
        /* Handle process stack monitor error here. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
    /* Register a callback to be called when the stack goes outside the allocated stack
area. */
    R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
* occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
    register uint32_t cfsr = SCB->CFSR;
    if (cfsr & SCB_CFSR_STKOF_Msk)
    {
        /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
```

```
overflows. */
register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
    __set_PSP((uint32_t) p_exception_stack_frame);
    __set_PSPLIM((uint32_t) p_exception_stack_frame);
/* Clear XPSR, only set T-bit. */
    p_exception_stack_frame[7] = 1U << 24;
/* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
    * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
    * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
    p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
}
/* Clear flags. */
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
    /* When recovering from a stack overflow, move the task to a while(1) loop. */
    while (1)
    {
        /* Do nothing. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
    /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

## TrustZone Example

This is an example of calling `portALLOCATE_SECURE_CONTEXT` before calling any non-secure callable functions in a task.

```
void rm_freertos_port_trustzone_task_example (void)
{
    /* When FreeRTOS is used in a non-secure TrustZone application,
portALLOCATE_SECURE_CONTEXT must be called prior
    * to calling any non-secure callable function in a task. The parameter is unused in
the FSP implementation. */
    portALLOCATE_SECURE_CONTEXT(0);
    rm_freertos_port_nsc_function();
}
```

## 4.2.14 Security

### Modules

### Detailed Description

Security Modules.

#### Modules

##### [AWS Client Credentials](#)

This module provides the AWS MQTT integration documentation.

##### [AWS Device Provisioning](#)

AWS Device Provisioning example software.

##### [Azure RTOS NetX Crypto HW Acceleration \(rm\\_netx\\_secure\\_crypto\)](#)

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

##### [Mbed Crypto HW Acceleration \(rm\\_psa\\_crypto\)](#)

Hardware acceleration for the mbedCrypto implementation of the ARM PSA Crypto API.

### SCE Protected Mode

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

### Secure Crypto Engine (r\_sce\_protected\_cavp)

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

### TinyCrypt TRNG (rm\_tinycrypt\_port)

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

#### 4.2.14.1 AWS Client Credentials

[Modules](#) » [Security](#)

This module provides the AWS MQTT integration documentation.

## Overview

The AWS MQTT library can connect to either AWS or a third party MQTT broker such as [Mosquitto](#). The documentation for the library can be found at the following link: [coreMQTT](#).

### Features

- MQTT connections over TLS to an AWS IoT Endpoint or Mosquitto server
- Unsecure MQTT connections to Mosquitto servers. This is not recommended for production and should only be done to a local server for testing.

## Configuration

### Memory Usage

The AWS MQTT library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. Depending on the configuration it may be required to provide as much as 110k heap. To decrease this it is recommended to tweak the thread stack configuration values based on usage. Notable values are:

### AWS IoT Common

- IoT Thread Default Stack Size
- IoT Network Receive Task Stack Size

### FreeRTOS Thread

- General|Minimal Stack Size

## FreeRTOS Plus TCP

- Stack size in words (not bytes)

## Usage Notes

The AWS MQTT library utilizes a system taskpool to queue up messages. This system task pool must be created before calling into the MQTT library. `iot_init.c` has been provided for easy initialization of this taskpool via `lotSdk_Init()`.

The AWS MQTT Demo has been provided to easily demonstrate MQTT functionality. An example of initializing the system taskpool and running the MQTT demo has been provided below.

## Limitations

- `aws_clientcredential.h` and `aws_clientcredential_keys.h` need to be added manually.
- The IoT Thread must have a higher priority than the Network Receive Thread.
- MbedTLS must be initialized and key provisioning must be done before starting a secure connection. Refer to [AWS Secure Sockets](#).

## Examples

### Non-secure connection to a Mosquitto server

```
#define IOT_LOG_STACK_SIZE (256)

const uint8_t g_ip_address[4] = {169, 254, 57, 49};
const uint8_t g_net_mask[4] = {255, 255, 0, 0};
const uint8_t g_gateway_address[4] = {169, 254, 57, 49};
const uint8_t g_dns_address[4] = {8, 8, 8, 8};
const uint8_t g_mac_address[6] = {0x66, 0x66, 0x66, 0x66, 0x66, 0x66};

void mqtt_non_secure_example ()
{
    /* Initialize IOT FreeRTOS Libraries */
    SYSTEM_Init();

    /* Initialize the crypto hardware acceleration. */
    mbedtls_platform_setup(NULL);

    xLoggingTaskInitialize(IOT_LOG_STACK_SIZE, 1, 10);

    /* Start up the network stack. */
    FreeRTOS_IPInit(g_ip_address, g_net_mask, g_gateway_address, g_dns_address,
g_mac_address);

    while (pdFALSE == FreeRTOS_IsNetworkUp())
    {
```

```

        vTaskDelay(1);
    }

    /* AWS MQTT APIs can now be called. Please refer to the documentation linked above.
    */

    /* If using the MQTT Wrapper IotSdk_Init() must be called prior to using MQTT. */
}

```

## Secure connection to a Mosquitto server

### Note

*MbedTLS must be initialized and key provisioning must be done before starting a secure connection. Refer to [AWS Secure Sockets](#).*

```

#define keyCLIENT_CERTIFICATE_PEM \
    "-----BEGIN CERTIFICATE-----\n" \
    "example_certificate_formatting\n" \
    "-----END CERTIFICATE-----"

#define keyCLIENT_PRIVATE_KEY_PEM \
    "-----BEGIN RSA PRIVATE KEY-----\n" \
    "example_certificate_formatting\n" \
    "-----END RSA PRIVATE KEY-----"

void mqtt_secure_example ()
{
    /* Initialize IOT FreeRTOS Libraries */
    SYSTEM_Init();

    /* Initialize the crypto hardware acceleration. */
    mbedtls_platform_setup(NULL);

    xLoggingTaskInitialize(IOT_LOG_STACK_SIZE, 1, 10);

    ProvisioningParams_t params;

    /* Write the keys into a secure region in data flash. */
    params.pucClientPrivateKey      = (uint8_t *) keyCLIENT_PRIVATE_KEY_PEM;
    params.pucClientCertificate     = (uint8_t *) keyCLIENT_CERTIFICATE_PEM;
    params.ulClientPrivateKeyLength = 1 + strlen((const char *)
params.pucClientPrivateKey);

    params.ulClientCertificateLength = 1 + strlen((const char *)
params.pucClientCertificate);
}

```

```

params.pucJITPCertificate      = NULL;
params.ulJITPCertificateLength = 0;
vAlternateKeyProvisioning(&params);
/* Start up the network stack. */
FreeRTOS_IPInit(g_ip_address, g_net_mask, g_gateway_address, g_dns_address,
g_mac_address);
while (pdFALSE == FreeRTOS_IsNetworkUp())
{
    vTaskDelay(1);
}
/* AWS MQTT APIs can now be called. Please refer to the documentation linked above.
*/
/* If using the MQTT Wrapper IotSdk_Init() must be called prior to using MQTT. */
}

```

#### 4.2.14.2 AWS Device Provisioning

[Modules](#) » [Security](#)

AWS Device Provisioning example software.

## Overview

### Terminology

The terminology defined below will be used in the following sections.

Term	Description
Service Provider	Entity that provides the cloud infrastructure and associated services, for example, AWS/Azure.
Device Manufacturer	Entity that provides the MCU, for example, Renesas.
OEM	Entity that uses the MCU to create a product.
Customer	End user of OEM product.

### Device ID

For systems that intend to use Public Key Certificate (PKC), the Device ID is in the form of a key pair (RSA or ECC). A PKC comprises of a **public key**, metadata, and finally a signature over all that. This

signature is generated by the entity that issues the certificate and is known as a CA (Certificate Authority). The most common format for a public certificate is the [X.509 format](#) which is typically PEM (base 64) encoded such that the certificate is human-readable. It can also be DER encoded which is binary encoding and thus not human readable. The **public key** portion of the Device ID is used for the Device Certificate.

## Provisioning

Device Provisioning refers to the process by which a service provider links a certificate to a Device ID and thus a device. Depending on the provisioning model, an existing certificate from the device may be used or a new one will be issued at this stage. Provisioning (also referred to as Registration) occurs with respect to a particular service provider, for example, AWS or Azure. It is necessary that the certificate is issued by the service provider or a CA known to those providers. When a device is provisioned with AWS for example, the AWS IoT service associates the Device ID (and thus the device) with a specific certificate. The certificate will be programmed into the device and for all future transactions with AWS, the certificate will be used as the means of identifying the device. The public and private key are also stored on the MCU.

## Provisioning Models

Provisioning services vary between [service providers](#). There are essentially three general provisioning models.

1. Provisioning happens on the production line. This requires the provisioning Infrastructure to be present on the production line. This is the most secure model, but is expensive.
2. Devices are programmed with a shared credential that is linked into the code at build time and the provisioning occurs when a customer uses the device for the first time. The shared credential and a unique device serial number are used to uniquely identify the device during the provisioning process. So long as the product only has the shared credential, it will only operate with limited (as defined by certificate policy) functionality. Once the provisioning is done, then the device will be fully functional. This is the most common use case for consumer products where no sensitive information is being transmitted. AWS provides an [example](#) of this model.
3. Devices have no identity programmed in the factory; provisioning occurs through some other device like a smartphone which is already trusted by the service provider.

In all these cases, the Device Identity

1. Is unique to the device
2. Must have restricted access within the device
3. Can be used to issue more than one certificate and the certificates themselves have to be updatable in the field.

AWS uses the PKCS11 API to erase, store and retrieve certificates. These PKCS11 functions (Write, Read and Erase) are separated out into a Physical Abstraction Layer (PAL) which the OEM/Device Manufacturer is expected to implement for the type of memory that they intend to use. The internal `rm_aws_pkcs11_pal` module implements these requirements on RA MCU data flash.

## AWS Provisioning Example

AWS provides an **example** implementation to support device provisioning. This implementation uses the PKCS11 API to store device credentials into the PKCS11 defined memory. The implementation (`aws_dev_mode_key_provisioning.c`) exposes two functions:

1. vDevModeKeyProvisioning()
2. vAlternateKeyProvisioning()

Both of these functions require that the device credentials be provided in PEM format. Using either of these example functions as is in production is not recommended; but vAlternateKeyProvisioning() provides more flexibility because of the ability to provide credentials as arguments.

Credentials can be created as follows:

- [Create your own CA](#) and use that to generate the device certificate. This CA will have to be registered with the service provider with which the product will be used, for example [Register your CA with AWS](#).
- [Use AWS](#) to generate the device certificate.

## Examples

### Basic Example

This is a basic example of provisioning a device using the AWS demo implementation.

```
#define keyCLIENT_CERTIFICATE_PEM \

params.ulJITPCertificateLength  = 0;
vAlternateKeyProvisioning(&params);
}
```

## Limitations

The provisioning code is an example provided by AWS. It must be modified to meet product requirements.

### 4.2.14.3 Azure RTOS NetX Crypto HW Acceleration (rm\_netx\_secure\_crypto)

[Modules](#) » [Security](#)

#### Detailed Description

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

## Overview

Please refer to the [NetXDuo - NetX Crypto documentation](#) for further details.

#### HW Overview

Crypto Peripheral version	Devices
---------------------------	---------

SCE9	RA6M4, RA4M3, RA4M2, RA6M5
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
AES Engine	RA2A1, RA2E1, RA2E2, RA2L1

*Note*

*NetX Crypto hardware acceleration is unsupported on 'SCE5' and 'AES Engine' crypto peripherals listed above.*

**Features**

This module provides SCE9 hardware support for the following NetX Crypto operations

- SHA256 calculation
- SHA224 calculation
- MAC Operations
  - HMAC with SHA224
  - HMAC with SHA256
- AES
  - Keybits - 128, 192, 256
    - Encryption and Decryption.
    - Chaining Modes: CBC, CTR, GCM mode

AES Chaining Mode	HW Acceleration
CBC	Fully accelerated
CTR	Fully accelerated
GCM	Encrypt - Fully accelerated; Decrypt - Only GHASH and block cipher unit is HW accelerated
CCM	Only block cipher unit is HW accelerated
- Random number generation
- ECC
  - ECDSA: Supported Curves - SECP384R1, SECP256R1, SECP224R1.
  - ECDH: Supported Curves - SECP384R1, SECP256R1, SECP224R1.
- RSA
  - Signature Generation - RSA 2048 (Plain or Wrapped private) key. (This can be used for decryption)
  - Signature Verification - RSA 2048, RSA 3072 and RSA 4096 keys. (This can be used for encryption)
  - Supported encoding scheme: PKCS1V15 This module provides SCE7 hardware support for the following NetX Crypto operations
- AES
  - Keybits - 128, 256
    - Encryption and Decryption.
    - Chaining Modes: CBC, CTR, GCM mode

AES Chaining Mode	HW Acceleration
CBC	Fully accelerated
CTR	Fully accelerated

GCM	Only block cipher unit is HW accelerated
CCM	Only block cipher unit is HW accelerated

## Configuration

### Build Time Configurations for rm\_netx\_secure\_crypto\_sw\_port

The following build time configurations are defined in fsp\_cfg/middleware/rm\_netx\_secure\_crypto\_cfg.h:

Configuration	Options	Default	Description
Standalone Usage	<ul style="list-style-type: none"> <li>Use Standalone Crypto Only</li> <li>Use with TLS</li> </ul>	Use Standalone Crypto Only	Defines NX_CRYPTOSTANDALONE_ENABLE.
Maximum RSA Modulus size (bits)	<ul style="list-style-type: none"> <li>1024</li> <li>2048</li> <li>3072</li> <li>4096</li> </ul>	4096	

### Build Time Configurations for rm\_netx\_secure\_crypto

The following build time configurations are defined in fsp\_cfg/middleware/rm\_netx\_secure\_crypto\_cfg.h:

Configuration	Options	Default	Description
Hardware Acceleration > Hash > SHA256/224	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT.
Hardware Acceleration > Cipher > AES	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT.
Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECC	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT.
Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECDSA Scratch Buffer Size (Bytes)	Value must be an integer	3016	Sets value of NX_CRYPTOTO_ECDSA_SCRATCH_BUFFER_SIZE.
Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECDH Scratch Buffer Size (Bytes)	Value must be an integer	2464	Sets value of NX_CRYPTOTO_ECDH_SCRATCH_BUFFER_SIZE.

Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA	MCU Specific Options		Enables/Disables RSA HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 2048 (HW)	MCU Specific Options		Enables NETX_SECURE_ CRYPTO_NX_CRYPTO_M ETHODS_RSA_2048_AL T to allow HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 3072 Verify/Encryption (HW)	MCU Specific Options		Enables NETX_SECURE_ CRYPTO_NX_CRYPTO_M ETHODS_RSA_3072_AL T to allow HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 4096 Verify/Encryption (HW)	MCU Specific Options		Enables RSA NETX_SEC URE_CRYPTO_NX_CRYP TO_METHODS_RSA_409 6_ALT to allow HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA Scratch Buffer Size (Bytes)	MCU Specific Options		Sets value of NX_CRYP TO_RSA_SCRATCH_BUF FER_SIZE
Hardware Acceleration > TRNG	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Enables NETX_SECURE_ CRYPTO_NX_CRYPTO_M ETHODS_TRNG_ALT.
Standalone Usage	<ul style="list-style-type: none"> <li>• Use Standalone Crypto Only</li> <li>• Use with TLS</li> </ul>	Use Standalone Crypto Only	Defines NX_CRYPTO_ST ANDALONE_ENABLE.

## Random Number Generator Configuration

To enable hardware acceleration for the TRNG, the macro `NETX_SECURE_CRYPTONX_CRYPTOMETHODS_TRNG_ALT` must be defined in the configuration file. By default TRNG is enabled which can be disabled using the RA Configuration editor.

Once enabled 'rand' function will be mapped to HW TRNG; the 'srand' function is not supported, any calls to this function will have no effect. Functionality to re-seed the HW TRNG is not supported by the existing implementation.

If disabled, both 'rand' and 'srand' will be mapped to the C Standard Library. This would require setting up the heap as 'rand' implementation calls 'malloc'.

## SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro `NETX_SECURE_CRYPTONX_CRYPTOMETHODS_SHA256_ALT` must be defined in the configuration file. By default SHA256 is enabled which can be disabled using the RA Configuration editor.

## AES Configuration

To enable hardware acceleration for the AES128/192/256 operation, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT` must be defined in the configuration file. By default AES is enabled which can be disabled using the RA Configuration editor.

## ECC Configuration

To enable hardware acceleration for the ECDSA and ECDH for curves SECP384R1, SECP256R1 and SECP224R1, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT` must be defined in the configuration file. By default ECC operations are enabled which can be disabled using the RA Configuration editor.

## RSA Configuration

To enable hardware acceleration for the RSA Encrypt/Decrypt (or Sign/Verify) operation(s), the macro(s) below must be defined in the configuration file:

Configuration Macro	Feature / Operation
<code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT</code>	Signature Generation / Signature Verification (Encryption / Decryption)
<code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT</code>	Signature Verification (Encryption Only)
<code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT</code>	Signature Verification (Encryption Only)

By default RSA 2048 is enabled which can be disabled using the RA Configuration editor.

RSA software implementation is completely disabled when any of the above macros are enabled.

## Usage Notes

### Memory Alignment

Use 32bit aligned buffer pointers as arguments to APIs for best performance.

### Hardware Initialization

`_nx_crypto_initialize()` must be invoked before using the NetX Crypto APIs to ensure that the SCE peripheral is initialized.

### Memory Usage

Sufficient memory must be allocated to be used as 'crypto\_metadata' for the chosen crypto operation(s). Refer [Azure RTOS NetX Crypto API description](#) for recommended 'crypto\_metadata\_size' based on selected crypto operations. Sufficient amount of memory must be allocated for the thread stack to support low level crypto operations when using this module in the standalone mode or through NetX Secure (TLS). A minimum stack of 0x1000 is required to use ECC and RSA. This is either the main stack in a bare metal application or the specific thread stack for an RTOS based application.

### AES Usage

### GCM mode

The first byte of the IV must indicate the length of the subsequent IV. For example if the IV is {0x00, 0x00, 0x00}, then the IV pointer passed to the `_nx_crypto_method_aes_operation` must store the IV as {0x03, 0x00, 0x00, 0x00}. Refer to the example code for actual usage.

## CTR mode

For CTR mode the IV pointer must be as defined in [Using Advanced Encryption Standard \(AES\) Counter Mode With IPsec Encapsulating Security Payload \(ESP\)](#) under 'Figure 2. Counter Block Format'. The IV must be 8 bytes in length. The Nonce field in the reference above must be 4 bytes and should be passed to `_nx_crypto_method_aes_operation` through the key pointer stored after the actual AES key. For Example, if the AES 128-bit Plain Key is {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00} and the Nonce is {0x01, 0x07, 0xBD, 0xFD}, the key passed to the `_nx_crypto_method_aes_operation` during Encryption/Decryption should be set as {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x01, 0x07, 0xBD, 0xFD}. This format would also be valid for Wrapped keys where the Nonce is appended at the end of the actual Wrapped key. Refer to the example code for actual usage.

The 'Block Counter' field in the above reference is fixed to {0x00, 0x00, 0x00, 0x01} at the beginning and increments internally after every subsequent AES block is processed. Test vectors that have the initial Block Counter not set to {0x00, 0x00, 0x00, 0x01} cannot be used in this implementation.

## ECC Usage

ECC operations include ECDH and ECDSA. As a part of ECDSA operation the input message can be hashed before signing or verification, or the message digest can be provided directly. ECC Scratch buffer size can be optionally reduced as supported ECC computations are now done by the HW. This is controlled by `NX_CRYPT0_ECDSA_SCRATCH_BUFFER_SIZE` and `NX_CRYPT0_ECDH_SCRATCH_BUFFER_SIZE` macros for ECDSA and ECDH respectively.

Operation	Key Format
ECDSA Signature	Plain private key; Wrapped private key
ECDSA Signature-Verify	Uncompressed public key
Key Generation using ECDSA operation API	Wrapped private key; Uncompressed public key
ECDH private key import	Plain private key; Wrapped private key (Allows for Uncompressed and Formatted public key)
ECDH public key export	Uncompressed public key
ECDH setup	Uncompressed public key
ECDH shared secret calculate	Uncompressed public key
Key Generation using ECDH operation API	Wrapped private key; Uncompressed public key

Note:

- Uncompressed public key is of the form (0x04 || Qx || Qy). Refer Section 2.2. Subject Public Key under [RFC5480](#)
- Formatted public key is of the form (Key Info (4 bytes) || Qx || Qy || Key Info (16 bytes)). This is the key which is used internally by SCE peripheral. (Qx and Qy are zero padded for 224 bit curves).

## RSA Usage

### Wrapped Key Usage

To use the NetX Crypto stack with wrapped private keys (for signature generation/decryption), a dummy pointer (non-NULL) should be passed to the 'key' parameter during `_nx_crypto_method_rsa_init` API call. However, the 'key\_size\_in\_bits' parameter should be equal to the intended RSA modulus length in bits. The actual wrapped key must be passed as the 'key' parameter to the `_nx_crypto_method_rsa_operation` API call with its length in bits passed through the 'key\_size\_in\_bits' parameter.

For PKCS1V15 operation 'key' and 'key\_size\_in\_bits' parameters of `_nx_crypto_method_pkcs1_v1_5_init` are unused. These can be passed as NULL and 0 respectively. The actual wrapped key must be passed as the 'key' parameter to the `_nx_crypto_method_pkcs1_v1_5_operation` API call and the intended modulus length in bits must be passed through the 'key\_size\_in\_bits' parameter.

### Limitations

- Only little endian mode is supported.
- RSA CRT keys are not supported.
- ECJPAKE related operations are unsupported for NIST 224, 256 and 384 bit curves when HW ECC is enabled.

## Examples

### Initialization Example

This example shows how to initialize the HW crypto engine. This step must be performed before any crypto algorithm is used.

```
/* Setup the platform; initialize the SCE and the TRNG */  
err = _nx_crypto_initialize();  
assert(NX_CRYPTOSUCCESS == err);
```

### Hash Example

This is an example on calculating the SHA256 hash using the NetX Crypto API.

```
extern NX_CRYPTOMETHOD crypto_method_sha256;  
const uint8_t NIST_SHA256ShortMsgLen200[] =  
{  
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,  
    0x86, 0x47, 0x05,  
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00  
};  
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
```

```
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};

## ECDH Example

This is an example on using the NetX Crypto API to generate a shared secret using ECDH. A shared secret is computed using known public key (from peer) and generated private key. Another shared

secret is computed using the generated public key and known private key (imported to mimic peer). Both the shared secrets are checked to be the same.

```
extern NX_CRYPT_METHOD crypto_method_ecdh;
/*Private key 59137e38152350b195c9718d39673d519838055ad908dd4757152fd8255c09bf */

#### 4.2.14.4 Mbed Crypto HW Acceleration (rm\_psa\_crypto)

Modules » [Security](#)

### Functions

---

```
int mbedtls_platform_setup (mbedtls_platform_context *ctx)
```

```
void mbedtls_platform_teardown (mbedtls_platform_context *ctx)
```

```
fsp_err_t RM_PSA_CRYPTO_TRNG_Read (uint8_t *const p_rngbuf, uint32_t num_req_bytes, uint32_t *p_num_gen_bytes)
```

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p\_rngbuf buffer. [More...](#)

## Detailed Description

Hardware acceleration for the mbedCrypto implementation of the ARM PSA Crypto API.

## Overview

### Note

*The PSA Crypto module does not provide any interfaces to the user. This release uses the Mbed TLS version 2.24.0 which conforms to the PSA Crypto API 1.0 specification. Consult the ARM documentation at <https://armmbed.github.io/mbed-crypto/psa/#application-programming-interface> for further information. FSP 3.0 onward adopts a change by ARM where mbedCrypto has been integrated back to MbedTLS and the term mbedCrypto has been deprecated. The mbedCrypto term in FSP now refers to the crypto portion of the MbedTLS module.*

## HW Overview

Crypto Peripheral version	Devices
SCE9	RA6M4, RA4M3, RA4M2, RA6M5
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
AES Engine	RA2A1, RA2E1, RA2E2, RA2L1

## Features

The PSA\_Crypto module provides hardware support for the following PSA Crypto operations

- SHA256 calculation
- SHA224 calculation
  - MAC Operations
- AES
  - Keybits - 128, 192, 256
  - Plain-Text Key Generation
  - Wrapped Key Generation
  - Encryption and Decryption with no padding and with PKCS7 padding.
  - CBC, CTR, CCM and GCM modes
  - MAC operations
  - Export and Import for Plaintext and Wrapped keys
- ECC
  - Curves:

- SECP256R1
  - SECP256K1
  - Brainpool256R1
  - SECP384R1
  - Brainpool384R1
- Plain-Text Key Generation (Unavailable on SCE9)
- Wrapped Key Generation
- Signing and Verification
- Export and Import for Plaintext and Wrapped keys
- ECDH Support
- RSA
  - Keybits - 2048. Verification only for 3072 and 4096 bits
  - Plain-Text Key Generation (Unavailable on SCE9)
  - Wrapped Key Generation
  - Signature Generation
  - Verification
  - Encryption and Decryption with PKCS1V15 and OAEP padding
  - Export and Import for Plaintext and Wrapped keys
- Random number generation
- Persistent Key Storage

## Configuration

### Build Time Configurations for mbedCrypto

The following build time configurations are defined in arm/mbedtls/config.h:

Configuration	Options	Default	Description
Hardware Acceleration > Key Format > AES	MCU Specific Options		Select AES key formats used
Hardware Acceleration > Key Format > ECC	MCU Specific Options		Select ECC key formats used
Hardware Acceleration > Key Format > RSA	MCU Specific Options		Select RSA key formats used
Hardware Acceleration > Hash > SHA256/224	MCU Specific Options		Defines MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT.
Hardware Acceleration > Cipher > AES	MCU Specific Options		Defines MBEDTLS_AES_ALT, MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT
Hardware Acceleration > Public Key Cryptography (PKC) > ECC	MCU Specific Options		Defines MBEDTLS_ECP_ALT

Hardware Acceleration > Public Key Cryptography (PKC) > ECDSA	MCU Specific Options		Defines MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT
Hardware Acceleration > Public Key Cryptography (PKC) > RSA	MCU Specific Options		Defines MBEDTLS_RSA_ALT.
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 3072 Verify	MCU Specific Options		Enables RSA 3072 Verify.
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 4096 Verify	MCU Specific Options		Enables RSA 4096 Verify.
Hardware Acceleration > TRNG	Enabled	Enabled	Defines MBEDTLS_ENTROPY_HARDWARE_ALT.
Hardware Acceleration > Secure Crypto Engine Initialization	Enabled	Enabled	MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT
Platform > Alternate > MBEDTLS_PLATFORM_EXIT_ALT	<ul style="list-style-type: none"> <li>Define</li> <li>Undefine</li> </ul>	Undefine	MBEDTLS_PLATFORM_EXIT_ALT

## SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro `MBEDTLS_SHA256_ALT` and `MBEDTLS_SHA256_PROCESS_ALT` must be defined in the configuration file. By default SHA256 is enabled. SHA256 can be disabled, but SHA512 then needs to be enabled (software version) because the PSA implementation uses it for the entropy accumulator. This can be done using the RA Configuration editor.

## AES Configuration

To enable hardware acceleration for the AES128/256 operation, the macro `MBEDTLS_AES_SETKEY_ENC_ALT`, `MBEDTLS_AES_SETKEY_DEC_ALT`, `MBEDTLS_AES_ENCRYPT_ALT` and `MBEDTLS_AES_DECRYPT_ALT` must be defined in the configuration file. By default AES is enabled. AES cannot be disabled because the PSA implementation requires it for the CTR\_DRBG random number generator. This can be done using the RA Configuration editor.

## ECC Configuration

To enable hardware acceleration for the ECC Key Generation operation, the macro `MBEDTLS_ECP_ALT` must be defined in the configuration file. For ECDSA, the macros `MBEDTLS_ECDSA_SIGN_ALT` and `MBEDTLS_ECDSA_VERIFY_ALT` must be defined. By default ECC, ECDSA and ECDHE are enabled. To disable ECC, undefine `MBEDTLS_ECP_C`, `MBEDTLS_ECDSA_C` and `MBEDTLS_ECDH_C`. This can be done using the RA Configuration editor.

## RSA Configuration

To enable hardware acceleration for the RSA2048 operation, the macro `MBEDTLS_RSA_ALT` must be

defined in the configuration file. By default RSA is enabled. To disable RSA, undefine MBEDTLS\_RSA\_C, MBEDTLS\_PK\_C, MBEDTLS\_PK\_PARSE\_C, MBEDTLS\_PK\_WRITE\_C. This can be done using the RA Configuration editor.

## Wrapped Key Usage

To use the Secure Crypto Engine to generate and use wrapped keys, use PSA\_KEY\_TYPE\_AES\_WRAPPED or PSA\_KEY\_TYPE\_ECC\_KEY\_PAIR\_WRAPPED(curve) or PSA\_KEY\_TYPE\_RSA\_KEY\_PAIR when setting the key type attribute. Setting the key's type attribute using this value will cause the SCE to use wrapped key mode for all operations related to that key. The user can use the export functionality to save the wrapped keys to user ROM and import it later for usage. This mode requires that Wrapped Key functionality for the algorithm is enabled in the project configuration.

### Note

*On the SCE9 devices, only the RSA public key can be exported. A file system must be used to store the internally generated private key.*

## Persistent Key Storage

Persistent key storage can be enabled by defining MBEDTLS\_FS\_IO, MBEDTLS\_PSA\_CRYPTOSTORAGE\_C, and MBEDTLS\_PSA\_ITS\_FILE\_C. The key lifetime must also be specified as PSA\_KEY\_LIFETIME\_PERSISTENT. A lower level storage module must be added in the RA Configuration editor and initialized in the code before generating persistent keys. Persistent storage supports the use of plaintext and vendor keys. Refer to the lower level storage module documentation for information on how it should be initialized. To generate a persistent key the key must be assigned a unique id prior to calling generate using the psa\_set\_key\_id api.

```
if (PSA_KEY_LIFETIME_IS_PERSISTENT(lifetime))
{
/* Set the id to a positive integer. */
    psa_set_key_id(&attributes, (psa_key_id_t) 5);
}
```

## Platform Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS\_PLATFORM\_SETUP\_TEAR\_DOWN\_ALT must be defined in the configuration file. This enables code that will initialize the SCE. Parameter checking (General|MBEDTLS\_CHECK\_PARAMS) is enabled by default. To reduce code size, disable parameter checking.

## Random Number Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS\_ENTROPY\_HARDWARE\_ALT must be defined in the configuration file. This enables using the TRNG as an entropy source. None of the other cryptographic operations (even in software only mode) will work without this feature.

## Usage Notes

## Hardware Initialization

`mbedtls_platform_setup()` must be invoked before using the PSA Crypto API to ensure that the SCE peripheral is initialized.

## Memory Usage

In general, depending on the mbedCrypto features being used a heap size of 0x1000 to 0x5000 bytes is required. The total allocated heap should be the **sum** of the heap requirements of the individual algorithms:

Algorithm	Required Heap (bytes)
SHA256/224	None
AES	0x200
Hardware ECC	0x400
Software ECC	0x1800
RSA	0x1500

A minimum stack of 0x1000 is required where the module is used. This is either the main stack in a bare metal application or the task stack of the task used for crypto operations.

## Limitations

- Only little endian mode is supported.

## SCE9 Usage

The SCE9 is used in Compatibility Mode for mbedCrypto acceleration. The crypto capabilities in this mode on the SCE9 are different which results in the below usage limitations with mbedCrypto:

- The module includes **both** wrapped and plaintext keys code irrespective of whether the application requires it.
- Plaintext key generation is not supported for RSA and ECC; only wrapped keys can be generated.
- If ECDH is used, only wrapped key will be generated on SCE9 and will not return an error even if the user context is somehow set for plain key. This may be relevant only if the `psa_key_agreement()` function with plaintext key on SCE9 is attempted.

*Note*

*For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.*

## Using PSA Crypto with TrustZone

Unlike FSP drivers, PSA Crypto cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the PSA Crypto code as well as the keys must be placed in the secure region. Since the PSA Crypto API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This section will provide a short explanation of how to add PSA Crypto to a secure project and have it

usable by the non-secure project without exposing the keys. In this example the secure project will contain an RSA private key and the non-secure project is expected to be able to perform sign and verify operations using that key.

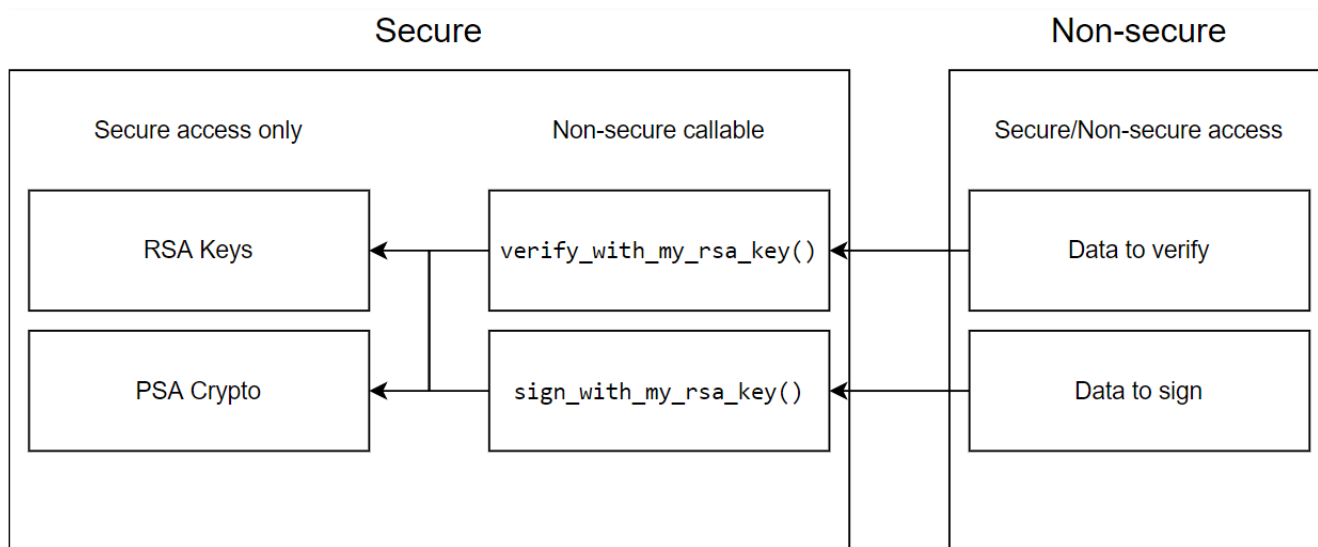

Figure 219: PSA Crypto Non-secure callable example

- Secure project
  - During secure project boot-up, `psa_crypto_init()` is called.
  - The RSA private key is programmed into secure flash either at the factory or by calling `psa_generate_key()` in persistent mode. Note that the data-flash area used by the LittleFS will have to be in the secure region if the key is generated as a persistent.
  - `psa_import_key()/psa_open_key()` are called with the resultant handle held in secure RAM.
  - The Non-secure callable section contains the following **user-defined** functions
  - `verify_with_my_rsa_key(input_signature, input_hash, verification_result)`
  - The implementation of this function in secure region will call `psa_verify_hash()` and return the result via `verification_result`.
  - `sign_with_my_rsa_key(input_hash, output_signature)`
  - The implementation of this function in secure region will call `psa_sign_hash()` and return the signature via `output_signature`.
  
- Non-secure project
  - Calls `verify_with_my_rsa_key()` to verify a signature. The implementation will use the public key that is present in the secure project.
  - Calls `sign_with_my_rsa_key()` to generate a signature. The implementation will use the private key that is present on the secure project.

For more details on how to add user-code to the Non-secure callable region refer to the "Security Design with Arm TrustZone - IP Protection (R11AN0467EU0100)" Application Note.

## Examples

## Hash Example

This is an example on calculating the SHA256 hash using the PSA Crypto API.

```
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
    0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};

const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
    0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
    0xf4, 0x41, 0xb9
};

void psa_crypto_sha256_example (void)
{
    psa_algorithm_t      alg          = PSA_ALG_SHA_256;
    psa_hash_operation_t operation    = {0};

    size_t               expected_hash_len = PSA_HASH_SIZE(alg);
    uint8_t              actual_hash[PSA_HASH_MAX_SIZE];
    size_t               actual_hash_len;

    mbedtls_platform_context ctx = {0};

    /* Setup the platform; initialize the SCE and the TRNG */
    if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
    {
        /* Platform initialization failed */
        debugger_break();
    }
    else if (PSA_SUCCESS != psa_hash_setup(&operation, alg))
    {
        /* Hash setup failed */
        debugger_break();
    }
}
```

```
else if (PSA_SUCCESS != psa_hash_update(&operation, NIST_SHA256ShortMsgLen200,
sizeof(NIST_SHA256ShortMsgLen200)))
{
/* Hash calculation failed */
    debugger_break();
}
else if (PSA_SUCCESS != psa_hash_finish(&operation, &actual_hash[0], sizeof
(actual_hash), &actual_hash_len))
{
/* Reading calculated hash failed */
    debugger_break();
}
else if (0 != memcmp(&actual_hash[0], &NIST_SHA256ShortMsgLen200_expected[0],
actual_hash_len))
{
/* Hash compare of calculated value with expected value failed */
    debugger_break();
}
else if (0 != memcmp(&expected_hash_len, &actual_hash_len, sizeof
(expected_hash_len)))
{
/* Hash size compare of calculated value with expected value failed */
    debugger_break();
}
else
{
/* SHA256 calculation succeeded */
    debugger_break();
}

/* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
mbedtls_platform_teardown(&ctx);
}
```

## AES Example

This is an example on using the PSA Crypto API to generate an AES256 key, encrypting and decrypting multi-block data and using PKCS7 padding.

```
static psa_status_t cipher_operation (psa_cipher_operation_t * operation,
    const uint8_t      * input,

## AES-CCM Example

This is an example on using the PSA Crypto API to generate an AES256 key, encrypting and decrypting multi-block data and using PKCS7 padding using AES-CCM.

```
if (PSA_SUCCESS != psa_generate_random(input, sizeof(input)))
{
/* Random plaintext input generation failed */
    debugger_break();
}
else if (PSA_SUCCESS != psa_generate_key(&attributes, &key_handle))
{
/* Key generation failed */
    debugger_break();
}
/* AES-CCM Encryption */
else if (PSA_SUCCESS !=
        psa_aead_encrypt(key_handle, PSA_ALG_CCM, nonce, sizeof(nonce),
additional_data, sizeof(additional_data),
                        input, sizeof(input), encrypt, sizeof(encrypt),
&output_len))
{
/* AES-CCM Encryption failed */
    debugger_break();
}
/* AES-CCM Decryption */
else if (PSA_SUCCESS !=
        psa_aead_decrypt(key_handle, PSA_ALG_CCM, nonce, sizeof(nonce),
additional_data, sizeof(additional_data),
                        encrypt, output_len, decrypt, sizeof(decrypt),
&output_len))
{
/* AES-CCM Decryption failed */
    debugger_break();
}
```

```
    }
else if (0U != memcmp(input, decrypt, sizeof(input)))
    {
/* The decrypted result did not match the plaintext input */
    debugger_break();
    }
else
    {
/* All operations were successful */
    }
}
```

### CMAC Example

This is an example on using the PSA Crypto API to generate an AES256 key, followed by generation and verification of MAC for random data of known length.

```
if (PSA_SUCCESS != psa_generate_random(input, sizeof(input)))
    {
/* Random number generation failure */
    debugger_break();
    }
else if (PSA_SUCCESS != psa_generate_key(&attributes, &key_handle))
    {
/* Key generation failure */
    debugger_break();
    }
/* Steps to generate the MAC */
else if (PSA_SUCCESS != psa_mac_sign_setup(&operation, key_handle, alg))
    {
/* MAC Sign setup failed */
    debugger_break();
    }
else if (PSA_SUCCESS != psa_mac_update(&operation, input, input_size))
    {
/* MAC update failed */
    }
}
```

```
        debugger_break();
    }
    else if (PSA_SUCCESS != psa_mac_sign_finish(&operation, AES_CMAC_mac, sizeof
(AES_CMAC_mac), &mac_ret))
    {
        /* MAC Sign operation failed */
        debugger_break();
    }
    else
    {
        /* All the operations succeeded for MAC generation */
    }
    /* Steps to verify the generated MAC */
    if (PSA_SUCCESS != psa_mac_verify_setup(&verify_operation, key_handle, alg))
    {
        /* MAC verification setup failure */
        debugger_break();
    }
    else if (PSA_SUCCESS != psa_mac_update(&verify_operation, input, input_size))
    {
        /* MAC update failure */
        debugger_break();
    }
    else if (PSA_SUCCESS != psa_mac_verify_finish(&verify_operation, AES_CMAC_mac,
mac_ret))
    {
        /* MAC verification failed */
        debugger_break();
    }
    else
    {
        /* All the operations succeeded for MAC verification */
    }
}
```

## ECC Example

This is an example on using the PSA Crypto API to generate an ECC-P256R1 key, signing and verifying data after hashing it first using SHA256.

### Note

*Unlike RSA, ECDSA does not have any padding schemes. Thus the hash argument for the ECC sign operation MUST have a size larger than or equal to the curve size; i.e. for PSA\_ECC\_CURVE\_SECP256R1 the payload size must be at least 256/8 bytes. nist.fips.186-4: "A hash function that provides a lower security strength than the security strength associated with the bit length of 'n' ordinarily should not be used, since this would reduce the security strength of the digital signature process to a level no greater than that provided by the hash function."*

```

## Function Documentation

### ◆ mbedtls\_platform\_setup()

```
int mbedtls_platform_setup ( mbedtls_platform_context * ctx)
```

This function initializes the SCE and the TRNG. It **must** be invoked before the crypto library can be used. This implementation is used if MBEDTLS\_PLATFORM\_SETUP\_TEARDOWN\_ALT is defined.

Example:

```

mbedtls_platform_context ctx = {0};

/* Setup the platform; initialize the SCE and the TRNG */
if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))

```

#### Return values

0	Initialization was successful.
MBEDTLS_ERR_PLATFORM_HW_ACCEL_FAILED	SCE Initialization error.

### ◆ mbedtls\_platform\_teardown()

```
void mbedtls_platform_teardown ( mbedtls_platform_context * ctx)
```

This implementation is used if MBEDTLS\_PLATFORM\_SETUP\_TEARDOWN\_ALT is defined. It is intended to de-initialize any items that were initialized in the `mbedtls_platform_setup()` function, but currently is only a placeholder function.

Example:

```

/* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
mbedtls_platform_teardown(&ctx);

```

#### Return values

N/A	
-----	--

### ◆ RM\_PSA\_CRYPTOTRNG\_Read()

```
fsp_err_t RM_PSA_CRYPTOTRNG_Read ( uint8_t *const p_rngbuf, uint32_t num_req_bytes,
uint32_t * p_num_gen_bytes )
```

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p\_rngbuf buffer.

#### Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTOTRNG_UNKNOWN	An unknown error occurred.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- s\_generate\_16byte\_random\_data

## Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

## Overview

This module provides SCE functions in protected mode.

*Note*

*For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.*

## HW Overview

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

## Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
  - ECB 128/256bit

- CBC 128/256bit
    - GCM 128/256bit
    - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1\_5 1024/2048bit
      - RSAES-PKCS1-V1\_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1\_5 1024/2048bit
      - RSASSA-PKCS1-V1\_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp192r1/secp224r1/secp256r1/secp384r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1
  - HMAC-SHA256bit
- TRNG

## Configuration

### Clock Configuration

This module does not require a specific clock configuration.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e2 studio or RA SC. On the Stacks tab, add New > Security > SCE Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

### Limitations

#### Usage of R\_SCE\_ECDSA\_secp384r1\_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE\_USER\_SHA\_384\_ENABLED on RA Smart Configurator and prepare a function called SCE\_USER\_SHA\_384\_FUNCTION. The interface of SCE\_USER\_SHA\_384\_FUNCTION, which is called by the following APIs, is described below.

- R\_SCE\_ECDSA\_secp384r1\_SignatureGenerate()
- R\_SCE\_ECDSA\_secp384r1\_SignatureVerify()

## SCE\_USER\_SHA\_384\_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument `message_length` from the address specified by the argument `message`. The calculation result should be stored at the address specified by the argument `digest`.

### Parameters

<code>message</code>	[in] Start address of message
<code>digest</code>	[in,out] address for storing hash calculation result (48 bytes)
<code>message_length</code>	[in] Effective byte count of message

### Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

## Examples

### AES Example

This is an example of AES-256 encryption and decryption.

```
#include <string.h>
#include "r_sce.h"
#define BLOCK 16
void r_sce_example_aes();
sce_instance_ctrl_t sce_ctrl;
sce_cfg_t sce_cfg =
{
    .lifecycle = SCE_SSD
};
static uint8_t plain[BLOCK * 2] =
{
```

```
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,  
0x72, 0x6f, 0x6e,  
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,  
0x6f, 0x6e, 0x00  
};  
void r_sce_example_aes ()  
{  
    sce_aes_handle_t      handle;  
    sce_aes_wrapped_key_t wrapped_key;  
    uint8_t               cipher_calculated[32] = {0};  
    uint8_t               plain_calculated[32] = {0};  
    uint32_t              dummy;  
    /* SCE power on */  
    R_SCE_Open(&sce_ctrl, &sce_cfg);  
    /* Generate a random key */  
    R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);  
    /* Encrypt a plain text */  
    R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);  
    R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);  
    R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);  
    /* Decrypt a cipher text using same key as Encryption */  
    R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);  
    R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *  
2);  
    R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);  
    /* SCE power off */  
    R_SCE_Close(&sce_ctrl);  
    /* Compare plain and plain_calculated */  
    if (memcmp(plain, plain_calculated, BLOCK * 2))  
    {  
        while (1)

```

## Data Structures

struct [sce\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ [sce\\_instance\\_ctrl\\_t](#)

struct [sce\\_instance\\_ctrl\\_t](#)

SCE private control block. DO NOT MODIFY. Initialization occurs when [R\\_SCE\\_Open\(\)](#) is called.

## Function Documentation

◆ **R\_SCE\_TLS\_RootCertificateVerify()**

```
fsp_err_t R_SCE_TLS_RootCertificateVerify ( uint32_t public_key_type, uint8_t* certificate,
uint32_t certificate_length, uint32_t public_key_n_start_position, uint32_t
public_key_n_end_position, uint32_t public_key_e_start_position, uint32_t
public_key_e_end_position, uint8_t* signature, uint32_t* encrypted_root_public_key )
```

Verify root CA certificate.

**Parameters**

[in]	public_key_type	key type
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[in]	signature	signature for certificates.
[out]	encrypted_root_public_key	public key for RSA 2048bit.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_TLS\_CertificateVerify()

```
fsp_err_t R_SCE_TLS_CertificateVerify ( uint32_t public_key_type, uint32_t *
encrypted_input_public_key, uint8_t * certificate, uint32_t certificate_length, uint8_t * signature,
uint32_t public_key_n_start_position, uint32_t public_key_n_end_position, uint32_t
public_key_e_start_position, uint32_t public_key_e_end_position, uint32_t *
encrypted_output_public_key )
```

Verify server certificate and intermediate certificate.

**Parameters**

[in]	public_key_type	key type
[in]	encrypted_input_public_key	public key.
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	signature	signature for certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[out]	encrypted_output_public_key	public key for RSA 2048bit.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_TLS\_PreMasterSecretGenerateForRSA2048()

```
fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForRSA2048 ( uint32_t * sce_pre_master_secret)
```

Generate encrypted pre-master secret.

**Parameters**

[out]	sce_pre_master_secret	pre-master secret value for SCE.
-------	-----------------------	----------------------------------

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

*Note*

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_TLS\_MasterSecretGenerate()

```
fsp_err_t R_SCE_TLS_MasterSecretGenerate ( uint32_t select_cipher_suite, uint32_t * sce_pre_master_secret, uint8_t * client_random, uint8_t * server_random, uint32_t * sce_master_secret )
```

Generate encrypted master secret.

**Parameters**

[in]	select_cipher_suite	cipher suite type
[in]	sce_pre_master_secret	pre-master secret value for SCE.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[out]	sce_master_secret	master secret value with SCE-specific conversion.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

Generate encrypted master secret.

**Parameters**

[in]	select_cipher_suite	cipher suite type
[in]	sce_pre_master_secret	pre-master secret value for SCE.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[out]	sce_master_secret	master secret value for SCE.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_TLS\_PreMasterSecretEncryptWithRSA2048()

```
fsp_err_t R_SCE_TLS_PreMasterSecretEncryptWithRSA2048 ( uint32_t* encrypted_public_key,
uint32_t* sce_pre_master_secret, uint8_t* encrypted_pre_master_secret )
```

Output the result encrypted pre-master secret with RSA 2048bit

**Parameters**

[in]	encrypted_public_key	public key data.
[in]	sce_pre_master_secret	pre-master secret value.
[out]	encrypted_pre_master_secret	the value encrypted pre-master secret.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_TLS\_SessionKeyGenerate()

```
fsp_err_t R_SCE_TLS_SessionKeyGenerate ( uint32_t select_cipher_suite, uint32_t*
sce_master_secret, uint8_t* client_random, uint8_t* server_random, uint8_t* nonce_explicit,
sce_hmac_sha_wrapped_key_t* client_mac_wrapped_key, sce_hmac_sha_wrapped_key_t*
server_mac_wrapped_key, sce_aes_wrapped_key_t* client_crypto_wrapped_key,
sce_aes_wrapped_key_t* server_crypto_wrapped_key, uint8_t* client_initial_vector, uint8_t*
server_initial_vector )
```

Output various key information.

**Parameters**

[in]	select_cipher_suite	Key suite information number.
[in]	sce_master_secret	master secret value.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	nonce_explicit	nonce value
[out]	client_mac_wrapped_key	the mac key during

		communication from client to server.
[out]	server_mac_wrapped_key	the mac key during communication from server to client.
[out]	client_crypto_wrapped_key	the crypto key during communication from client to server.
[out]	server_crypto_wrapped_key	the crypto key during communication from server to client.
[in]	client_initial_vector	not use.
[in]	server_initial_vector	not use.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_TLS\_VerifyDataGenerate()

```
fsp_err_t R_SCE_TLS_VerifyDataGenerate ( uint32_t select_verify_data, uint32_t *
sce_master_secret, uint8_t * hand_shake_hash, uint8_t * verify_data )
```

Generate verify data.

**Parameters**

[in]	select_verify_data	Select Client/Server data.
[in]	sce_master_secret	master secret data.
[in]	hand_shake_hash	TLS hand shake message SHA256 HASH value.
[out]	verify_data	verify data.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_TLS\_ServerKeyExchangeVerify()

```
fsp_err_t R_SCE_TLS_ServerKeyExchangeVerify ( uint32_t public_key_type, uint8_t *
client_random, uint8_t * server_random, uint8_t * server_ephemeral_ecdh_public_key, uint8_t *
server_key_exchange_signature, uint32_t * encrypted_public_key, uint32_t *
encrypted_ephemeral_ecdh_public_key )
```

Retrives ECDH public key.

**Parameters**

[in]	public_key_type	key type
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	server_ephemeral_ecdh_public_key	Ephemeral ECDH public key from Server.
[in]	server_key_exchange_signature	Server Key Exchange signature.
[in]	encrypted_public_key	encrypted public key.
[out]	encrypted_ephemeral_ecdh_public_key	encrypted Ephemeral ECDH public key.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_TLS\_PreMasterSecretGenerateForECC\_secp256r1()

```
fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1 ( uint32_t *
encrypted_public_key, sce_tls_p256_ecc_wrapped_key_t * tls_p256_ecc_wrapped_key, uint32_t *
sce_pre_master_secret )
```

Generate encrypted pre-master secret.

**Parameters**

[in]	encrypted_public_key	encrypted public key
[in]	tls_p256_ecc_wrapped_key	P-256 ECC key index.
[out]	sce_pre_master_secret	encrypted pre-master secret value for SCE.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES128ECB\_EncryptInit()**

```
fsp_err_t R_SCE_AES128ECB_EncryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_EncryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_EncryptUpdate()` function and `R_SCE_AES128ECB_EncryptFinal()` function.

**Parameters**

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128ECB\_EncryptUpdate()

```
fsp_err_t R_SCE_AES128ECB_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES128ECB_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES128ECB_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in,out]	<code>plain_length</code>	plaintext data length (must be a multiple of 16)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES128ECB\_EncryptFinal()**

```
fsp_err_t R_SCE_AES128ECB_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R\\_SCE\\_AES128ECB\\_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher\_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher\_length. The arguments cipher and cipher\_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES128ECB\_DecryptInit()**

```
fsp_err_t R_SCE_AES128ECB_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_DecryptUpdate()` function and `R_SCE_AES128ECB_DecryptFinal()` function.

**Parameters**

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128ECB\_DecryptUpdate()

```
fsp_err_t R_SCE_AES128ECB_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128ECB_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES128ECB_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES128ECB\_DecryptFinal()**

```
fsp_err_t R_SCE_AES128ECB_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R\\_SCE\\_AES128ECB\\_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain\_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain\_length. The arguments plain and plain\_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256ECB\_EncryptInit()

```
fsp_err_t R_SCE_AES256ECB_EncryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES256ECB_EncryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256ECB_EncryptUpdate()` function and `R_SCE_AES256ECB_EncryptFinal()` function.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES256ECB\_EncryptUpdate()

```
fsp_err_t R_SCE_AES256ECB_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES256ECB_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES256ECB_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES256ECB\_EncryptFinal()**

```
fsp_err_t R_SCE_AES256ECB_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R\\_SCE\\_AES256ECB\\_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher\_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher\_length. The arguments cipher and cipher\_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES256ECB\_DecryptInit()**

```
fsp_err_t R_SCE_AES256ECB_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_DecryptUpdate()` function and `R_SCE_AES128ECB_DecryptFinal()` function.

**Parameters**

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256ECB\_DecryptUpdate()

```
fsp_err_t R_SCE_AES256ECB_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256ECB_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES256ECB_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES256ECB\_DecryptFinal()**

```
fsp_err_t R_SCE_AES256ECB_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R\\_SCE\\_AES256ECB\\_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain\_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain\_length. The arguments plain and plain\_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128CBC\_EncryptInit()

```
fsp_err_t R_SCE_AES128CBC_EncryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R\_SCE\_AES128CBC\_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R\_SCE\_AES128CBC\_EncryptUpdate() function and R\_SCE\_AES128CBC\_EncryptFinal() function.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES128CBC\_EncryptUpdate()

```
fsp_err_t R_SCE_AES128CBC_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES128CBC_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES128CBC_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPT_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES128CBC\_EncryptFinal()**

```
fsp_err_t R_SCE_AES128CBC_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R\\_SCE\\_AES128CBC\\_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher\_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher\_length. The arguments cipher and cipher\_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128CBC\_DecryptInit()

```
fsp_err_t R_SCE_AES128CBC_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R\_SCE\_AES128CBC\_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R\_SCE\_AES128CBC\_DecryptUpdate() function and R\_SCE\_AES128CBC\_DecryptFinal() function.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES128CBC\_DecryptUpdate()

```
fsp_err_t R_SCE_AES128CBC_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128CBC_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES128CBC_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES128CBC\_DecryptFinal()**

```
fsp_err_t R_SCE_AES128CBC_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the **R\_SCE\_AES128CBC\_DecryptFinal()** function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain\_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain\_length. The arguments plain and plain\_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256CBC\_EncryptInit()

```
fsp_err_t R_SCE_AES256CBC_EncryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R\_SCE\_AES256CBC\_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R\_SCE\_AES256CBC\_EncryptUpdate() function and R\_SCE\_AES256CBC\_EncryptFinal() function.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initial vector area (16byte)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES256CBC\_EncryptUpdate()

```
fsp_err_t R_SCE_AES256CBC_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES256CBC_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES256CBC_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES256CBC\_EncryptFinal()**

```
fsp_err_t R_SCE_AES256CBC_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R\\_SCE\\_AES256CBC\\_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher\_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher\_length. The arguments cipher and cipher\_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256CBC\_DecryptInit()

```
fsp_err_t R_SCE_AES256CBC_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R\_SCE\_AES256CBC\_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R\_SCE\_AES256CBC\_DecryptUpdate() function and R\_SCE\_AES256CBC\_DecryptFinal() function.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES256CBC\_DecryptUpdate()

```
fsp_err_t R_SCE_AES256CBC_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256CBC_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES256CBC_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES256CBC\_DecryptFinal()**

```
fsp_err_t R_SCE_AES256CBC_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R\\_SCE\\_AES256CBC\\_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain\_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain\_length. The arguments plain and plain\_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128GCM\_EncryptInit()

```
fsp_err_t R_SCE_AES128GCM_EncryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The R\_SCE\_AES128GCM\_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R\_SCE\_AES128GCM\_EncryptUpdate() function and R\_SCE\_AES128GCM\_EncryptFinal() function.

#### Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128GCM\_EncryptUpdate()

```
fsp_err_t R_SCE_AES128GCM_EncryptUpdate ( sce_gcm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_data_length, uint8_t * aad, uint32_t aad_length )
```

The `R_SCE_AES128GCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES128GCM_EncryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `plain` reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, `cipher`. The lengths of the `plain` and `aad` data to input are respectively specified in the fourth argument, `plain_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `plain` input data, but rather the data length to input when the user calls this function. If the input values `plain` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `plain`. If `aad` data is input after starting to input `plain` data, an error will occur. If `aad` data and `plain` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `plain` data input state.

Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4

#### Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES128GCM\_EncryptFinal()

```
fsp_err_t R_SCE_AES128GCM_EncryptFinal ( sce_gcm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_data_length, uint8_t * atag )
```

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R\_SCE\_AES128GCM\_EncryptUpdate (), the R\_SCE\_AES128GCM\_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128GCM\_DecryptInit()

```
fsp_err_t R_SCE_AES128GCM_DecryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES128GCM_DecryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128GCM_DecryptUpdate()` function and `R_SCE_AES128GCM_DecryptFinal()` function.

#### Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area ( <code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128GCM\_DecryptUpdate()

```
fsp_err_t R_SCE_AES128GCM_DecryptUpdate ( sce_gcm_handle_t* handle, uint8_t* cipher,
uint8_t* plain, uint32_t cipher_data_length, uint8_t* aad, uint32_t aad_length )
```

The `R_SCE_AES128GCM_DecryptUpdate()` function decrypts the ciphertext specified in the second argument, `cipher`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES128GCM_DecryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `cipher` reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, `plain`. The lengths of the `cipher` and `aad` data to input are respectively specified in the fourth argument, `cipher_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `cipher` input data, but rather the data length to input when the user calls this function. If the input values `cipher` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `cipher`. If `aad` data is input after starting to input `cipher` data, an error will occur. If `aad` data and `cipher` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `cipher` data input state. Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `stage`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES128GCM\_DecryptFinal()

```
fsp_err_t R_SCE_AES128GCM_DecryptFinal ( sce_gcm_handle_t* handle, uint8_t* plain, uint32_t* plain_data_length, uint8_t* atag, uint32_t atag_length )
```

The `R_SCE_AES128GCM_DecryptFinal()` function decrypts, in GCM mode, the fractional ciphertext specified by `R_SCE_AES128GCM_DecryptUpdate()` that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, `plain`, and the authentication tag area specified in the fourth argument, `atag`. The decoded data length is output to the third argument, `plain_data_length`. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. For the fourth argument, `atag`, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For `plain` and `atag`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256GCM\_EncryptInit()

```
fsp_err_t R_SCE_AES256GCM_EncryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES256GCM_EncryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256GCM_EncryptUpdate()` function and `R_SCE_AES256GCM_EncryptFinal()` function.

#### Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	256-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area ( <code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256GCM\_EncryptUpdate()

```
fsp_err_t R_SCE_AES256GCM_EncryptUpdate ( sce_gcm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_data_length, uint8_t * aad, uint32_t aad_length )
```

The `R_SCE_AES256GCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES256GCM_EncryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `plain` reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, `cipher`. The lengths of the `plain` and `aad` data to input are respectively specified in the fourth argument, `plain_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `plain` input data, but rather the data length to input when the user calls this function. If the input values `plain` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `plain`. If `aad` data is input after starting to input `plain` data, an error will occur. If `aad` data and `plain` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `plain` data input state.

Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4

#### Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES256GCM\_EncryptFinal()

```
fsp_err_t R_SCE_AES256GCM_EncryptFinal ( sce_gcm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_data_length, uint8_t * atag )
```

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R\_SCE\_AES256GCM\_EncryptUpdate (), the R\_SCE\_AES256GCM\_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256GCM\_DecryptInit()

```
fsp_err_t R_SCE_AES256GCM_DecryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES256GCM_DecryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256GCM_DecryptUpdate()` function and `R_SCE_AES256GCM_DecryptFinal()` function.

#### Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	256-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area ( <code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256GCM\_DecryptUpdate()

```
fsp_err_t R_SCE_AES256GCM_DecryptUpdate ( sce_gcm_handle_t* handle, uint8_t* cipher,
uint8_t* plain, uint32_t cipher_data_length, uint8_t* aad, uint32_t aad_length )
```

The `R_SCE_AES256GCM_DecryptUpdate()` function decrypts the ciphertext specified in the second argument, `cipher`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES256GCM_DecryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `cipher` reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, `plain`. The lengths of the cipher and `aad` data to input are respectively specified in the fourth argument, `cipher_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and cipher input data, but rather the data length to input when the user calls this function. If the input values `cipher` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `cipher`. If `aad` data is input after starting to input cipher data, an error will occur. If `aad` data and cipher data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the cipher data input state. Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `stage`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES256GCM\_DecryptFinal()

```
fsp_err_t R_SCE_AES256GCM_DecryptFinal ( sce_gcm_handle_t* handle, uint8_t* plain, uint32_t* plain_data_length, uint8_t* atag, uint32_t atag_length )
```

The `R_SCE_AES256GCM_DecryptFinal()` function decrypts, in GCM mode, the fractional ciphertext specified by `R_SCE_AES256GCM_DecryptUpdate()` that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, `plain`, and the authentication tag area specified in the fourth argument, `atag`. The decoded data length is output to the third argument, `plain_data_length`. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. For the fourth argument, `atag`, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For `plain` and `atag`, specify RAM addresses that are multiples of 4.

#### Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128CCM\_EncryptInit()

```
fsp_err_t R_SCE_AES128CCM_EncryptInit ( sce_ccm_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* nonce, uint32_t nonce_length, uint8_t* adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The `R_SCE_AES128CCM_EncryptInit()` function prepares to perform CCM computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_AES128CCM_EncryptUpdate()` and `R_SCE_AES128CCM_EncryptFinal()` use `handle` as an argument.

#### Parameters

[in,out]	<code>handle</code>	AES-CCM handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key
[in]	<code>nonce</code>	Nonce
[in]	<code>nonce_length</code>	Nonce data length (7 to 13 bytes)
[in]	<code>adata</code>	additional authentication data
[in]	<code>a_length</code>	additional authentication data length (0 to 110 bytes)
[in]	<code>payload_length</code>	Payload length (any number of bytes)
[in]	<code>mac_length</code>	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES128CCM\_EncryptUpdate()

```
fsp_err_t R_SCE_AES128CCM_EncryptUpdate ( sce_ccm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES128CCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES128CCM_EncryptInit()`. This function buffers internally the data input by the user until the input value of `plain` exceeds 16 bytes. Once the amount of `plain` input data is 16 bytes or greater, the encrypted result is output to `cipher`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES128CCM_EncryptInit()` to specify the total data length of `plain` that will be input. Use `plain_length` in this function to specify the data length to be input when the user calls this function. If the input value of `plain` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `plain` and `cipher` do not overlap. Also, specify RAM addresses that are multiples of 4 for `plain` and `cipher`.

#### Parameters

[in,out]	<code>handle</code>	AES-CCM handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in]	<code>plain_length</code>	plaintext data length

#### Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION</code>	An invalid function was called.
<code>FSP_ERR_CRYPTOSCE_PARAMETER</code>	An invalid handle was input.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128CCM\_EncryptFinal()

```
fsp_err_t R_SCE_AES128CCM_EncryptFinal ( sce_ccm_handle_t * handle, uint8_t * cipher, uint32_t
* cipher_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of plain input in `R_SCE_AES128CCM_EncryptUpdate()` results in leftover data after 16 bytes, the `R_SCE_AES128CCM_EncryptFinal()` function outputs the leftover encrypted data to `cipher`, which is specified in the second argument. The MAC value is output to the fourth argument, `mac`. Set the fifth argument, `mac_length` to the same value as that specified for the argument `mac_length` in `Aes128CcmEncryptInit()`. Also, specify RAM addresses that are multiples of 4 for `cipher` and `mac`.

#### Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128CCM\_DecryptInit()

```
fsp_err_t R_SCE_AES128CCM_DecryptInit ( sce_ccm_handle_t * handle, sce_aes_wrapped_key_t *
wrapped_key, uint8_t * nonce, uint32_t nonce_length, uint8_t * adata, uint8_t a_length, uint32_t
payload_length, uint32_t mac_length )
```

The `R_SCE_AES128CCM_DecryptInit()` function prepares to perform CCM computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_AES128CCM_DecryptUpdate()` and `R_SCE_AES128CCM_DecryptFinal()` use `handle` as an argument.

#### Parameters

[in,out]	<code>handle</code>	AES-CCM handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key
[in]	<code>nonce</code>	Nonce
[in]	<code>nonce_length</code>	Nonce data length (7 to 13 bytes)
[in]	<code>adata</code>	additional authentication data
[in]	<code>a_length</code>	additional authentication data length (0 to 110 bytes)
[in]	<code>payload_length</code>	Payload length (any number of bytes)
[in]	<code>mac_length</code>	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

#### Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPTOSCE_KEY_SET_FAIL</code>	Invalid wrapped key was input.
<code>FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT</code>	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
<code>FSP_ERR_CRYPTOSCE_FAIL</code>	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128CCM\_DecryptUpdate()

```
fsp_err_t R_SCE_AES128CCM_DecryptUpdate ( sce_ccm_handle_t * handle, uint8_t * cipher,
uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128CCM_DecryptUpdate()` function decrypts the ciphertext specified by the second argument, `cipher`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES128CCM_DecryptInit()`. This function buffers internally the data input by the user until the input value of `cipher` exceeds 16 bytes. Once the amount of `cipher` input data is 16 bytes or greater, the decrypted result is output to `plain`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES128CCM_DecryptInit()` to specify the total data length of `cipher` that will be input. Use `cipher_length` in this function to specify the data length to be input when the user calls this function. If the input value of `cipher` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `cipher` and `plain` do not overlap. Also, specify RAM addresses that are multiples of 4 for `cipher` and `plain`.

#### Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES128CCM\_DecryptFinal()**

```
fsp_err_t R_SCE_AES128CCM_DecryptFinal ( sce_ccm_handle_t * handle, uint8_t * plain, uint32_t * plain_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of cipher input in [R\\_SCE\\_AES128GCM\\_DecryptUpdate\(\)](#) results in leftover data after 16 bytes, the [R\\_SCE\\_AES128GCM\\_DecryptFinal\(\)](#) function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac\_length, to the same value as that specified for the argument mac\_length in [Aes128CcmDecryptInit\(\)](#).

**Parameters**

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	Internal error, or authentication failed.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256CCM\_EncryptInit()

```
fsp_err_t R_SCE_AES256CCM_EncryptInit ( sce_ccm_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* nonce, uint32_t nonce_length, uint8_t* adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The R\_SCE\_AES256CCM\_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R\_SCE\_AES256CCM\_EncryptUpdate() and R\_SCE\_AES256CCM\_EncryptFinal() use handle as an argument.

#### Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES256CCM\_EncryptUpdate()

```
fsp_err_t R_SCE_AES256CCM_EncryptUpdate ( sce_ccm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES256CCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES256CCM_EncryptInit()`. This function buffers internally the data input by the user until the input value of `plain` exceeds 16 bytes. Once the amount of `plain` input data is 16 bytes or greater, the encrypted result is output to `cipher`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES256CCM_EncryptInit()` to specify the total data length of `plain` that will be input. Use `plain_length` in this function to specify the data length to be input when the user calls this function. If the input value of `plain` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `plain` and `cipher` do not overlap. Also, specify RAM addresses that are multiples of 4 for `plain` and `cipher`.

#### Parameters

[in,out]	<code>handle</code>	AES-CCM handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in]	<code>plain_length</code>	plaintext data length

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256CCM\_EncryptFinal()

```
fsp_err_t R_SCE_AES256CCM_EncryptFinal ( sce_ccm_handle_t * handle, uint8_t * cipher, uint32_t
* cipher_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of plain input in `R_SCE_AES256CCM_EncryptUpdate()` results in leftover data after 16 bytes, the `R_SCE_AES256CCM_EncryptFinal()` function outputs the leftover encrypted data to `cipher`, which is specified in the second argument. The MAC value is output to the fourth argument, `mac`. Set the fifth argument, `mac_length` to the same value as that specified for the argument `mac_length` in `Aes256CcmEncryptInit()`. Also, specify RAM addresses that are multiples of 4 for `cipher` and `mac`.

#### Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPT_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPT_SCE_FAIL	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256CCM\_DecryptInit()

```
fsp_err_t R_SCE_AES256CCM_DecryptInit ( sce_ccm_handle_t * handle, sce_aes_wrapped_key_t *
wrapped_key, uint8_t * nonce, uint32_t nonce_length, uint8_t * adata, uint8_t a_length, uint32_t
payload_length, uint32_t mac_length )
```

The R\_SCE\_AES256CCM\_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R\_SCE\_AES256CCM\_DecryptUpdate() and R\_SCE\_AES256CCM\_DecryptFinal() use handle as an argument.

#### Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES256CCM\_DecryptUpdate()

```
fsp_err_t R_SCE_AES256CCM_DecryptUpdate ( sce_ccm_handle_t * handle, uint8_t * cipher,
uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256CCM_DecryptUpdate()` function decrypts the ciphertext specified by the second argument, `cipher`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES256CCM_DecryptInit()`. This function buffers internally the data input by the user until the input value of `cipher` exceeds 16 bytes. Once the amount of `cipher` input data is 16 bytes or greater, the decrypted result is output to `plain`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES256CCM_DecryptInit()` to specify the total data length of `cipher` that will be input. Use `cipher_length` in this function to specify the data length to be input when the user calls this function. If the input value of `cipher` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `cipher` and `plain` do not overlap. Also, specify RAM addresses that are multiples of 4 for `cipher` and `plain`.

#### Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES256CCM\_DecryptFinal()**

```
fsp_err_t R_SCE_AES256CCM_DecryptFinal ( sce_ccm_handle_t * handle, uint8_t * plain, uint32_t * plain_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of cipher input in [R\\_SCE\\_AES256GCM\\_DecryptUpdate\(\)](#) results in leftover data after 16 bytes, the [R\\_SCE\\_AES256GCM\\_DecryptFinal\(\)](#) function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac\_length, to the same value as that specified for the argument mac\_length in [Aes256CcmDecryptInit\(\)](#).

**Parameters**

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	Internal error, or authentication failed.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128CMAC\_GenerateInit()

```
fsp_err_t R_SCE_AES128CMAC_GenerateInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128CMAC_GenerateInit()` function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128CMAC_GenerateUpdate()` function and `R_SCE_AES128CMAC_GenerateFinal()` function.

#### Parameters

[in,out]	<code>handle</code>	AES-CMAC handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128CMAC\_GenerateUpdate()

```
fsp_err_t R_SCE_AES128CMAC_GenerateUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The `R_SCE_AES128CMAC_GenerateUpdate()` function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in `R_SCE_AES128CMAC_GenerateInit()`. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

#### Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES128CMAC\_GenerateFinal()**

```
fsp_err_t R_SCE_AES128CMAC_GenerateFinal ( sce_cmac_handle_t* handle, uint8_t* mac )
```

The `R_SCE_AES128CMAC_GenerateFinal()` function outputs the MAC value to the MAC data area specified in the second argument, `mac`, and ends CMAC mode.

**Parameters**

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTTO_SCE_AUTHENTICATION	Not used.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES128CMAC\_VerifyInit()

```
fsp_err_t R_SCE_AES128CMAC_VerifyInit ( sce_cmec_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128CMAC_VerifyInit()` function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128CMAC_VerifyUpdate()` function and `R_SCE_AES128CMAC_VerifyFinal()` function.

#### Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_AES128CMAC\_VerifyUpdate()

```
fsp_err_t R_SCE_AES128CMAC_VerifyUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The R\_SCE\_AES128CMAC\_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped\_key in R\_SCE\_AES128CMAC\_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message\_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

**Parameters**

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES128CMAC\_VerifyFinal()

```
fsp_err_t R_SCE_AES128CMAC_VerifyFinal ( sce_cmact_handle_t* handle, uint8_t* mac, uint32_t mac_length )
```

The R\_SCE\_AES128CMAC\_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP\_ERR\_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

#### Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_AES256CMAC\_GenerateInit()

```
fsp_err_t R_SCE_AES256CMAC_GenerateInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The R\_SCE\_AES256CMAC\_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R\_SCE\_AES256CMAC\_GenerateUpdate() function and R\_SCE\_AES256CMAC\_GenerateFinal() function.

**Parameters**

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES256CMAC\_GenerateUpdate()

```
fsp_err_t R_SCE_AES256CMAC_GenerateUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The `R_SCE_AES256CMAC_GenerateUpdate()` function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in `R_SCE_AES256CMAC_GenerateInit()`. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

#### Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_AES256CMAC\_GenerateFinal()**

```
fsp_err_t R_SCE_AES256CMAC_GenerateFinal ( sce_cmac_handle_t* handle, uint8_t* mac )
```

The **R\_SCE\_AES256CMAC\_GenerateFinal()** function outputs the MAC value to the MAC data area specified in the second argument, *mac*, and ends CMAC mode.

**Parameters**

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Not used.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_AES256CMAC\_VerifyInit()

```
fsp_err_t R_SCE_AES256CMAC_VerifyInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES256CMAC_VerifyInit()` function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256CMAC_VerifyUpdate()` function and `R_SCE_AES256CMAC_VerifyFinal()` function.

#### Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_AES256CMAC\_VerifyUpdate()

```
fsp_err_t R_SCE_AES256CMAC_VerifyUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The R\_SCE\_AES256CMAC\_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped\_key in R\_SCE\_AES256CMAC\_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message\_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

**Parameters**

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_AES256CMAC\_VerifyFinal()

```
fsp_err_t R_SCE_AES256CMAC_VerifyFinal ( sce_cmact_handle_t* handle, uint8_t* mac, uint32_t mac_length )
```

The `R_SCE_AES256CMAC_VerifyFinal()` function inputs the MAC value in the MAC data area specified in the second argument, `mac`, and verifies the MAC value. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

#### Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_ECDSA\_secp192r1\_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp192r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash, sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, `message_hash->data_type`, a SHA-256 hash of the message text input as the first argument, `message_hash->pdata`, is calculated, and the signature text is written to the second argument, `signature`, in accordance with secp192r1 using the private wrapped key input as the third argument, `wrapped_key`.

When a hash value is specified in the first argument, `message_hash->data_type`, the signature text for the first 24 bytes of the SHA-256 hash value input to the first argument, `message_hash->pdata`, is written to the second argument, `signature`, in accordance with secp192r1 using the private wrapped key input as the third argument, `wrapped_key`.

#### Parameters

[in]	message_hash	Message or hash value to which to attach signature
------	--------------	--

		<ul style="list-style-type: none"> <li>message_hash-&gt;pdata : Specifies pointer to array storing the message or hash value</li> <li>message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>
[in,out]	signature	<p>Signature text storage destination information</p> <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits)    signature r (192 bits)    0 padding (64 bits)    signature s (192 bits)".</li> <li>signature-&gt;data_length : Data length (byte units)</li> </ul>
[in]	wrapped_key	Input wrapped key of secp192r1 private key.

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_ECDSA\_secp224r1\_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp224r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message\_hash->data\_type, a SHA-256 hash of the message text input as the first argument, message\_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped\_key.

When a hash value is specified in the first argument, message\_hash->data\_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the first argument, message\_hash->pdata, is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped\_key.

**Parameters**

[in]	message_hash	<p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> <li>message_hash-&gt;pdata : Specifies pointer to array storing the message or hash value</li> <li>message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>
[in,out]	signature	<p>Signature text storage destination information</p> <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits)    signature r (224 bits)    0 padding (32 bits)    signature s (224 bits)".</li> <li>signature-&gt;data_length : Data length (byte units)</li> </ul>

[in]	wrapped_key	Input wrapped key of secp224r1 private key.
------	-------------	---

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

**◆ R\_SCE\_ECDSA\_secp256r1\_SignatureGenerate()**

```
fsp_err_t R_SCE_ECDSA_secp256r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message\_hash->data\_type, a SHA-256 hash of the message text input as the first argument, message\_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped\_key.

When a hash value is specified in the first argument, message\_hash->data\_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the first argument, message\_hash->pdata, is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped\_key.

**Parameters**

[in]	message_hash	<p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> <li>message_hash-&gt;pdata : Specifies pointer to array storing the message or hash value</li> <li>message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>message_hash-&gt;data_type : Selects the data type of message_hash</li> </ul>
------	--------------	--

		(Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits)    signature s (256 bits)".</li> <li>signature-&gt;data_length : Data length (byte units)</li> </ul>
[in]	wrapped_key	Input wrapped key of secp256r1 private key.

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_ECDSA\_secp384r1\_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp384r1_SignatureGenerate ( sce_ecdsa_byte_data_t * message_hash,
sce_ecdsa_byte_data_t * signature, sce_ecc_private_wrapped_key_t * wrapped_key )
```

When a message is specified in the first argument, message\_hash->data\_type, a SHA-384 hash of the message text input as the first argument, message\_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped\_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the first argument, message\_hash->data\_type, the signature text for the first 48 bytes of the SHA-384 hash value input to the first argument, message\_hash->pdata, is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped\_key.

#### Parameters

[in]	message_hash	<p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> <li>message_hash-&gt;pdata : Specifies pointer to array storing the message or hash value</li> <li>message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>
[in,out]	signature	<p>Signature text storage destination information</p> <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits)    signature s (384 bits)".</li> <li>signature-&gt;data_length : Data length (byte units)</li> </ul>
[in]	wrapped_key	Input wrapped key of

secp384r1 private key.

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

**◆ R\_SCE\_ECDSA\_secp192r1\_SignatureVerify()**

```
fsp_err_t R_SCE_ECDSA_secp192r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message\_hash->data\_type, a SHA-256 hash of the message text input as the second argument, message\_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped\_key.

When a hash value is specified in the second argument, message\_hash->data\_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the second argument, message\_hash->pdata, input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped\_key.

**Parameters**

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits)    signature r (192 bits)    0 padding (64 bits)    signature s (192 bits)".</li> <li>signature-&gt;data_length : Specifies the data length (byte units) (nonuse)</li> </ul>
[in,out]	message_hash	Message or hash value to be

verified

- message\_hash->data : Specifies pointer to array storing the message or hash value
- message\_hash->data\_length : Specifies effective data length of the array (Specify only when Message is selected)
- message\_hash->data\_type : Selects the data type of message\_hash (Message: 0 Hash value: 1)

[in]

wrapped\_key

Input wrapped key of secp192r1 public key.

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_ECDSA\_secp224r1\_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp224r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message\_hash->data\_type, a SHA-256 hash of the message text input as the second argument, message\_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped\_key.

When a hash value is specified in the second argument, message\_hash->data\_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the second argument, message\_hash->pdata, input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped\_key.

#### Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits)    signature r (224 bits)    0 padding (32 bits)    signature s (224 bits)".</li> <li>signature-&gt;data_length : Specifies the data length (byte units) (nonuse)</li> </ul>
[in,out]	message_hash	Message or hash value to be verified <ul style="list-style-type: none"> <li>message_hash-&gt;pdata : Specifies pointer to array storing the message or hash value</li> <li>message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>

[in]	wrapped_key	Input wrapped key of secp224r1 public key.
<b>Return values</b>		
FSP_SUCCESS		Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT		A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL		Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL		An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER		Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION		An invalid function was called.
<i>Note</i>		
The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.		

#### ◆ R\_SCE\_ECDSA\_secp256r1\_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp256r1_SignatureVerify ( sce_ecdsa_byte_data_t * signature,
sce_ecdsa_byte_data_t * message_hash, sce_ecc_public_wrapped_key_t * wrapped_key )
```

When a message is specified in the second argument, message\_hash->data\_type, a SHA-256 hash of the message text input as the second argument, message\_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped\_key.

When a hash value is specified in the second argument, message\_hash->data\_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the second argument, message\_hash->pdata, input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped\_key.

#### Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits)    signature s (256 bits)".</li> <li>signature-&gt;data_length : Specifies the data length (byte units) (nonuse)</li> </ul>
[in,out]	message_hash	Message or hash value to be

verified

- message\_hash->data : Specifies pointer to array storing the message or hash value
- message\_hash->data\_length : Specifies effective data length of the array (Specify only when Message is selected)
- message\_hash->data\_type : Selects the data type of message\_hash (Message: 0 Hash value: 1)

[in]

wrapped\_key

Input wrapped key of secp256r1 public key.

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_ECDSA\_secp384r1\_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp384r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message\_hash->data\_type, a SHA-256 hash of the message text input as the second argument, message\_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped\_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the second argument, message\_hash->data\_type, the signature text for the first 48 bytes of the SHA-256 hash value input to the second argument, message\_hash->pdata, input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped\_key.

**Parameters**

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits)    signature s (384 bits)".</li> <li>signature-&gt;data_length : Specifies the data length (byte units) (nonuse)</li> </ul>
[in,out]	message_hash	Message or hash value to be verified <ul style="list-style-type: none"> <li>message_hash-&gt;pdata : Specifies pointer to array storing the message or hash value</li> <li>message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>

[in]	wrapped_key	Input wrapped key of secp384r1 public key.
------	-------------	--

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_ECDH\_secp256r1\_Init()**

```
fsp_err_t R_SCE_ECDH_secp256r1_Init ( sce_ecdh_handle_t * handle, uint32_t key_type, uint32_t use_key_id )
```

The `R_SCE_ECDH_secp256r1_Init()` function prepares to perform ECDH key exchange computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_ECDH_secp256r1_PublicKeySign()`, `R_SCE_ECDH_secp256r1_PublicKeyVerify()`, `R_SCE_ECDH_secp256r1_SharedSecretCalculate()`, and `R_SCE_ECDH_secp256r1_KeyDerivation()` use `handle` as an argument.

Use the second argument, `key_type`, to select the type of ECDH key exchange. When ECDHE is selected, the `R_SCE_ECDH_secp256r1_PublicKeySign()` function uses the SCE's random number generation functionality to generate an secp256r1 key pair. When ECDH is selected, keys installed beforehand are used for key exchange.

Input 1 as the third argument, `use_key_id`, to use `key_id` when key exchange is performed. `key_id` is for applications conforming to the DLMS/COSEM standard for smart meters.

**Parameters**

[in,out]	handle	ECDH handler (work area)
[in]	key_type	Key exchange type (0: ECDHE, 1: ECDH, 2:ECDH(AES-GCM-128 with IV))
[in]	use_key_id	0: key_id not used, 1: key_id used

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPT_SCE_PARAMETER	Input data is invalid.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_ECDH\_secp256r1\_PublicKeySign()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeySign ( sce_ecdh_handle_t * handle,
sce_ecc_public_wrapped_key_t * ecc_public_wrapped_key, sce_ecc_private_wrapped_key_t *
ecc_private_wrapped_key, uint8_t * public_key, sce_ecdsa_byte_data_t * signature,
sce_ecc_private_wrapped_key_t * wrapped_key )
```

The `R_SCE_ECDH_secp256r1_PublicKeySign()` function calculates a signature for a public key user wrapped key used for ECDH key exchange.

If ECDHE is specified by the `key_type` argument of the `R_SCE_ECDH_secp256r1_Init()` function, the SCE's random number generation functionality is used to generate an secp256r1 key pair. The public key is output to `public_key` and the private key is output to `wrapped_key`.

If ECDH is specified by the `key_type` argument of the `R_SCE_ECDH_secp256r1_Init()` function, the public key input as `ecc_public_wrapped_key` is output to `public_key` and nothing is output to `wrapped_key`.

The succeeding function `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` uses the first argument, `handle`, as an argument. `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function uses `wrapped_key` as input to calculate Z.

#### Parameters

[in,out]	handle	ECDH handler (work area) When using <code>key_id</code> , input <code>handle-&gt;key_id</code> after running <code>R_SCE_ECDH_secp256r1_Init()</code> .
[in]	ecc_public_wrapped_key	For ECDHE, input a null pointer. For ECDH, input the wrapped key of a secp256r1 public key.
[in]	ecc_private_wrapped_key	secp256r1 private key for signature generation
[in,out]	public_key	User secp256r1 public key (512-bit) for key exchange. When using <code>key_id</code> , <code>key_id</code> (8-bit)    public key (512-bit)    0 padding (24-bit)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing signature text. The signature format is "signature r (256 bits)    signature s (256 bits)"</li> <li>signature-&gt;data_leng</li> </ul>

		th : Data length (in byte units)
[in,out]	wrapped_key	For ECDHE, a private wrapped key generated from a random number. Not output for ECDH.

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_ECDH\_secp256r1\_PublicKeyVerify()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyVerify ( sce_ecdh_handle_t* handle,
sce_ecc_public_wrapped_key_t* ecc_public_wrapped_key, uint8_t* public_key_data,
sce_ecdsa_byte_data_t* signature, sce_ecc_public_wrapped_key_t* wrapped_key )
```

The R\_SCE\_ECDH\_secp256r1\_PublicKeyVerify() function verifies the signature of the secp256r1 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public wrapped key to the fifth argument. The first argument, handle, is used as an argument in the subsequent function R\_SCE\_ECDH\_secp256r1\_SharedSecretCalculate().

R\_SCE\_ECDH\_secp256r1\_SharedSecretCalculate() uses wrapped\_key as input to calculate Z.

#### Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key area for signature verification
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit)    public key (512-bit)
[in]	signature	ECDSA secp256r1 signature of ecc_public_wrapped_key
[in,out]	wrapped_key	wrapped key of ecc_public_wrapped_key

#### Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_ECDH\_secp256r1\_PublicKeyReadWithoutSignature()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature ( sce_ecdh_handle_t* handle,
uint8_t* public_key_data, sce_ecc_public_wrapped_key_t* wrapped_key )
```

The R\_SCE\_ECDH\_secp256r1\_PublicKeyReadWithoutSignature() function reads the secp256r1 public key of the other ECDH key exchange party and outputs the public wrapped key to the third argument. The first argument, handle, is used as an argument in the subsequent function R\_SCE\_ECDH\_secp256r1\_SharedSecretCalculate(). R\_SCE\_ECDH\_secp256r1\_SharedSecretCalculate() uses wrapped\_key as input to calculate Z. This API does not verify signature of public\_key\_data, please protect this data by upper layer software.

#### Parameters

[in,out]	handle	ECDH handler (work area)
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit)    public key (512-bit)
[in,out]	wrapped_key	wrapped key of public_key_data

#### Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State. Please note that this is slightly contrary to the protected mode policy as it omits signature verification.

### ◆ R\_SCE\_ECDH\_secp256r1\_SharedSecretCalculate()

```
fsp_err_t R_SCE_ECDH_secp256r1_SharedSecretCalculate ( sce_ecdh_handle_t* handle,
sce_ecc_public_wrapped_key_t* ecc_public_wrapped_key, sce_ecc_private_wrapped_key_t*
ecc_private_wrapped_key, sce_ecdh_wrapped_key_t* shared_secret_wrapped_key )
```

The `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own private key. Input as the second argument, `ecc_public_wrapped_key`, the public wrapped key whose signature was verified by `R_SCE_ECDH_secp256r1_PublicKeyVerify()`. When `key_type` of `R_SCE_ECDH_secp256r1_Init()` is 0, input as the third argument, `ecc_private_wrapped_key`, the private wrapped key generated from a random number by `R_SCE_ECDH_secp256r1_PublicKeySign()`, and when `key_type` is other than 0, input the private wrapped key that forms a pair with the second argument of `R_SCE_ECDH_secp256r1_PublicKeySign()`. The subsequent `R_SCE_ECDH_secp256r1_KeyDerivation()` function uses `shared_secret_wrapped_key` as key material for outputting the wrapped key.

#### Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key whose signature was verified by <code>R_SCE_ECDH_secp256r1_PublicKeyVerify()</code>
[in]	ecc_private_wrapped_key	Private wrapped key
[in,out]	shared_secret_wrapped_key	Wrapped key of shared secret Z calculated by ECDH key exchange

#### Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_ECDH\_secp256r1\_KeyDerivation()

```
fsp_err_t R_SCE_ECDH_secp256r1_KeyDerivation ( sce_ecdh_handle_t * handle,
sce_ecdh_wrapped_key_t * shared_secret_wrapped_key, uint32_t key_type, uint32_t kdf_type,
uint8_t * other_info, uint32_t other_info_length, sce_hmac_sha_wrapped_key_t *
salt_wrapped_key, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_ECDH_secp256r1_KeyDerivation()` function uses the shared secret "Z (shared\_secret\_index)" calculated by the `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function as the key material to derive the wrapped key specified by the third argument, `key_type`. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Either SHA-256 or SHA-256 HMAC is specified by the fourth argument, `kdf_type`. When SHA-256 HMAC is specified, the wrapped key output by the `R_SCE_SHA256HMAC_EncryptedKeyWrap()` function is specified as the seventh argument, `salt_wrapped_key`. Enter a fixed value for deriving a key shared with the key exchange partner in the fifth argument, `other_info`. A wrapped key corresponding to `key_type` is output as the eighth argument, `wrapped_key`. The correspondences between the types of derived `wrapped_key` and the functions with which they can be used as listed below.

- AES-128: All AES-128 Init functions
- AES-256: All AES-256 Init functions
- SHA256-HMAC: `R_SCE_SHA256HMAC_GenerateInit()` function and `R_SCE_SHA256HMAC_VerifyInit()` function

#### Parameters

[in,out]	handle	ECDH handler (work area)
[in]	shared_secret_wrapped_key	Z wrapped key calculated by <code>R_SCE_ECDH_secp256r1_SharedSecretCalculate</code>
[in]	key_type	Derived key type (0: AES-128, 1: AES-256, 2:SHA256-HMAC, 3: AES-GCM-128 with IV)
[in]	kdf_type	Algorithm used for key derivation calculation (0: SHA-256, 1:SHA256-HMAC)
[in]	other_info	Additional data used for key derivation calculation: AlgorithmID    PartyUInfo    PartyVInfo
[in]	other_info_length	Data length of other_info (up to 147 byte units)
[in]	salt_wrapped_key	Salt wrapped key (Input NULL when <code>kdf_type</code> is 0.)
[in,out]	wrapped_key	Wrapped key corresponding to <code>key_type</code> . When the value of <code>key_type</code> is 2, an SHA256-HMAC wrapped key is output. <code>wrapped_key</code> can be specified by casting the start address of the area

reserved beforehand by the `sce_hmac_sha_wrapped_key_t` type with the `(sce_aes_wrapped_key_t*)` type.

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

**◆ R\_SCE\_SHA256\_Init()**

`fsp_err_t R_SCE_SHA256_Init ( sce_sha_md5_handle_t * handle)`

The `R_SCE_SHA256_Init()` function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_SHA256_Update()` function and `R_SCE_SHA256_Final()` function.

**Parameters**

[in,out]	handle	SHA handler (work area)
----------	--------	-------------------------

**Return values**

FSP_SUCCESS	Normal termination
-------------	--------------------

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_SHA256\_Update()

```
fsp_err_t R_SCE_SHA256_Update ( sce_sha_md5_handle_t * handle, uint8_t * message, uint32_t message_length )
```

The R\_SCE\_SHA256\_Update() function calculates a hash value based on the second argument, message, and the third argument, message\_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R\_SCE\_SHA256\_Final().

**Parameters**

[in,out]	handle	SHA handler (work area)
[in]	message	message data area
[in]	message_length	message data length

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_SHA256\_Final()

```
fsp_err_t R_SCE_SHA256_Final ( sce_sha_md5_handle_t * handle, uint8_t * digest, uint32_t *
digest_length )
```

Using the handle specified in the first argument, handle, the R\_SCE\_SHA256\_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest\_length.

**Parameters**

[in,out]	handle	SHA handler (work area)
[in,out]	digest	hasha data area
[in,out]	digest_length	hash data length (32bytes)

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_SHA256HMAC\_GenerateInit()**

```
fsp_err_t R_SCE_SHA256HMAC_GenerateInit ( sce_hmac_sha_handle_t* handle,
sce_hmac_sha_wrapped_key_t* wrapped_key )
```

The `R_SCE_SHA256HMAC_GenerateInit()` function uses the second argument `wrapped_key` to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument `handle`. The argument `handle` is used by the subsequent `R_SCE_SHA256HMAC_GenerateUpdate()` function or `R_SCE_SHA256HMAC_GenerateFinal()` function.

**Parameters**

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_SHA256HMAC\_GenerateUpdate()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate ( sce_hmac_sha_handle_t* handle, uint8_t* message, uint32_t message_length )
```

The `R_SCE_SHA256HMAC_GenerateUpdate()` function uses the handle specified by the first argument `handle`, calculates a hash value from the second argument `message` and third argument `message_length`, then writes the intermediate result to the first argument `handle`. After message input finishes, call the `R_SCE_SHA256HMAC_GenerateFinal()` function.

#### Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_SHA256HMAC\_GenerateFinal()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateFinal ( sce_hmac_sha_handle_t* handle, uint8_t* mac )
```

The `R_SCE_SHA256HMAC_GenerateFinal()` function uses the handle specified by the first argument `handle` and writes the calculation result to the second argument `mac`.

#### Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in,out]	mac	HMAC area (32 bytes)

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_SHA256HMAC\_VerifyInit()

```
fsp_err_t R_SCE_SHA256HMAC_VerifyInit ( sce_hmac_sha_handle_t* handle,
sce_hmac_sha_wrapped_key_t* wrapped_key )
```

The R\_SCE\_SHA256HMAC\_VerifyInit() function uses the second argument wrapped\_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R\_SCE\_SHA256HMAC\_VerifyUpdate() function or R\_SCE\_SHA256HMAC\_VerifyFinal() function.

**Parameters**

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPT0_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPT0_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_SHA256HMAC\_VerifyUpdate()**

```
fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate ( sce_hmac_sha_handle_t * handle, uint8_t *
message, uint32_t message_length )
```

The `R_SCE_SHA256HMAC_VerifyUpdate()` function uses the handle specified by the first argument `handle`, calculates a hash value from the second argument `message` and third argument `message_length`, then writes the intermediate result to the first argument `handle`. After message input finishes, call the `R_SCE_SHA256HMAC_VerifyFinal()` function.

**Parameters**

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_SHA256HMAC\_VerifyFinal()**

```
fsp_err_t R_SCE_SHA256HMAC_VerifyFinal ( sce_hmac_sha_handle_t* handle, uint8_t* mac,
uint32_t mac_length )
```

The **R\_SCE\_SHA256HMAC\_VerifyFinal()** function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac\_length. Input a value in bytes from 4 to 32 as mac\_length.

**Parameters**

[in,out]	handle	SHA-HMAC handle (work area)
[in]	mac	HMAC area
[in]	mac_length	HMAC length

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_Open()

```
fsp_err_t R_SCE_Open ( sce_ctrl_t *const p_ctrl, sce_cfg_t const *const p_cfg )
```

Enables use of SCE functionality.

**Parameters**

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	The error-detection self-test failed to terminate normally.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_RETRY	Indicates that an entropy evaluation failure occurred. Run the function again.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes.

**Note**

*The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_Close()

```
fsp_err_t R_SCE_Close ( sce_ctrl_t *const p_ctrl )
```

Stops supply of power to the SCE.

**Parameters**

[in]	p_ctrl	Pointer to control structure.
------	--------	-------------------------------

**Return values**

FSP_SUCCESS	Normal termination
-------------	--------------------

**Note**

*The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.*

## ◆ R\_SCE\_SoftwareReset()

fsp\_err\_t R\_SCE\_SoftwareReset ( void )

Software reset to SCE.

Reverts the state to the SCE initial state.

**Return values**

FSP_SUCCESS	Normal termination
-------------	--------------------

*Note*

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

## ◆ R\_SCE\_RandomNumberGenerate()

fsp\_err\_t R\_SCE\_RandomNumberGenerate ( uint32\_t\* random)

This API can generate 4 words random number.

**Parameters**

[in,out]	random	Stores 4words (16 bytes) random data.
----------	--------	---------------------------------------

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

*Note*

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R\_SCE\_AES128\_WrappedKeyGenerate()**

```
fsp_err_t R_SCE_AES128_WrappedKeyGenerate ( sce_aes_wrapped_key_t * wrapped_key)
```

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

**Parameters**

[in,out]	wrapped_key	128-bit AES wrapped key
----------	-------------	-------------------------

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.*

◆ **R\_SCE\_AES256\_WrappedKeyGenerate()**

```
fsp_err_t R_SCE_AES256_WrappedKeyGenerate ( sce_aes_wrapped_key_t * wrapped_key)
```

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

**Parameters**

[in,out]	wrapped_key	256-bit AES wrapped key
----------	-------------	-------------------------

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.*

## ◆ R\_SCE\_AES128\_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES128_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t* encrypted_key,
sce_key_update_key_t* key_update_key, sce_aes_wrapped_key_t* wrapped_key )
```

This API wraps 128-bit AES key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_AES256\_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES256_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t* encrypted_key,
sce_key_update_key_t* key_update_key, sce_aes_wrapped_key_t* wrapped_key )
```

This API wraps 256-bit AES key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_AES128\_RFC3394KeyWrap()

```
fsp_err_t R_SCE_AES128_RFC3394KeyWrap ( sce_aes_wrapped_key_t* master_key, uint32_t
target_key_type, sce_aes_wrapped_key_t* target_key, uint32_t* rfc3394_wrapped_key )
```

This API wraps 128-bit AES key within the user routine.

**Parameters**

[in]	master_key	AES-128 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

**Return values**

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

## ◆ R\_SCE\_AES256\_RFC3394KeyWrap()

```
fsp_err_t R_SCE_AES256_RFC3394KeyWrap ( sce_aes_wrapped_key_t* master_key, uint32_t
target_key_type, sce_aes_wrapped_key_t* target_key, uint32_t* rfc3394_wrapped_key )
```

This API wraps 256-bit AES key within the user routine.

**Parameters**

[in]	master_key	AES-256 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

**Return values**

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTTO_SCE_FAIL	Internal error occurred.

## ◆ R\_SCE\_AES128\_RFC3394KeyUnwrap()

```
fsp_err_t R_SCE_AES128_RFC3394KeyUnwrap ( sce_aes_wrapped_key_t * master_key, uint32_t
target_key_type, uint32_t * rfc3394_wrapped_key, sce_aes_wrapped_key_t * target_key )
```

This API unwraps 128-bit AES key within the user routine.

**Parameters**

[in]	master_key	AES-128 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

**Return values**

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

## ◆ R\_SCE\_AES256\_RFC3394KeyUnwrap()

```
fsp_err_t R_SCE_AES256_RFC3394KeyUnwrap ( sce_aes_wrapped_key_t * master_key, uint32_t
target_key_type, uint32_t * rfc3394_wrapped_key, sce_aes_wrapped_key_t * target_key )
```

This API unwraps 256-bit AES key within the user routine.

**Parameters**

[in]	master_key	AES-256 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

**Return values**

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

## ◆ R\_SCE\_SHA256HMAC\_EncryptedKeyWrap()

```
fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_hmac_sha_wrapped_key_t*
wrapped_key )
```

This API wraps HMAC-SHA256 key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	HMAC-SHA256 wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_RSA1024\_WrappedKeyPairGenerate()

```
fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate ( sce_rsa1024_wrapped_pair_key_t *
wrapped_pair_key)
```

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped\_pair\_key->pub\_key, and a private wrapped key is generated by wrapped\_pair\_key->priv\_key. As the public key exponent, only 0x00010001 is generated.

**Parameters**

[in,out]	wrapped_pair_key	User key index for RSA 1024-bit public key and private key pair
----------	------------------	---

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred. Key generation failed.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_RSA2048\_WrappedKeyPairGenerate()

```
fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate ( sce_rsa2048_wrapped_pair_key_t *
wrapped_pair_key)
```

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped\_pair\_key->pub\_key, and a private wrapped key is generated by wrapped\_pair\_key->priv\_key. As the public key exponent, only 0x00010001 is generated.

**Parameters**

[in,out]	wrapped_pair_key	User key index for RSA 2048-bit public key and private key pair
----------	------------------	---

**Return values**

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred. Key generation failed.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_RSA1024\_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa1024_public_wrapped_key_t *
wrapped_key )
```

This API wraps 1024-bit RSA public key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_RSA1024\_EncryptedPrivateKeyWrap()**

```
fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_rsa1024_private_wrapped_key_t*
wrapped_key )
```

This API wraps 1024-bit RSA private key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA private wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_RSA2048\_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa2048_public_wrapped_key_t *
wrapped_key )
```

This API wraps 2048-bit RSA public key within the user routine.

#### Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R\_SCE\_RSA2048\_EncryptedPrivateKeyWrap()**

```
fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_rsa2048_private_wrapped_key_t*
wrapped_key )
```

This API wraps 2048-bit RSA private key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA private wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_RSA3072\_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa3072_public_wrapped_key_t *
wrapped_key )
```

This API wraps 3072-bit RSA public key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	3072-bit RSA public wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_RSA4096\_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa4096_public_wrapped_key_t *
wrapped_key )
```

This API wraps 4096-bit RSA public key within the user routine.

#### Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_ECC\_secp192r1\_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

#### Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp192r1 public key and private key pair
----------	-------------------------------	--

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

◆ **R\_SCE\_ECC\_secp224r1\_WrappedKeyPairGenerate()**

```
fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t *
wrapped_pair_key)
```

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped\_pair\_key->pub\_key, and the private key index is generated in wrapped\_pair\_key->priv\_key.

**Parameters**

[in,out]	wrapped_pair_key	Wrapped pair key for secp224r1 public key and private key pair
----------	------------------	--

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_ECC\_secp256r1\_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

#### Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp256r1 public key and private key pair
----------	-------------------------------	--

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R\_SCE\_ECC\_secp384r1\_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

#### Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp384r1 public key and private key pair
----------	-------------------------------	--

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.

#### Note

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_ECC\_secp192r1\_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp192r1 public key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 public wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_ECC\_secp224r1\_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp224r1 public key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 public wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_ECC\_secp256r1\_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp256r1 public key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 public wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_ECC\_secp384r1\_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp384r1 public key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 public wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_ECC\_secp192r1\_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp192r1 private key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 private wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_ECC\_secp224r1\_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp224r1 private key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 private wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_ECC\_secp256r1\_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp256r1 private key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 private wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_ECC\_secp384r1\_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp384r1 private key within the user routine.

**Parameters**

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 private wrapped key

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_TLS\_RootCertificateRSA2048PublicKeyInstall()

```
fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall ( uint8_t *
encrypted_provisioning_key, uint8_t * initial_vector, uint8_t * encrypted_key,
sce_tls_ca_certification_public_wrapped_key_t * wrapped_key )
```

Generate TLS RSA Public key index data

**Parameters**

[in]	encrypted_provisioning_key	the provisioning key includes encrypted CBC/CBC-MAC key for user key
[in]	initial_vector	the initial_vector for user key CBC encrypt
[in]	encrypted_key	the user key encrypted with AES128-ECB mode
[out]	wrapped_key	the user Key Generation Information (141 words) of RSA2048 bit

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_TLS\_ECC\_secp256r1\_EphemeralWrappedKeyPairGenerate()

```
fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate (
sce_tls_p256_ecc_wrapped_key_t* tls_p256_ecc_wrapped_key, uint8_t*
ephemeral_ecdh_public_key )
```

Generate TLS ECC key pair

#### Parameters

[in]	tls_p256_ecc_wrapped_key	P256 ECC key index for TLS
[in]	ephemeral_ecdh_public_key	ephemeral ECDH public key

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_RSASSA\_PKCS1024\_SignatureGenerate()

```
fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate ( sce_rsa_byte_data_t* message_hash,
sce_rsa_byte_data_t* signature, sce_rsa1024_private_wrapped_key_t* wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS1024_SignatureGenerate()` function generates, in accordance with RSASSA-PKCS1-V1\_5, a signature from the message text or hash value that is input in the first argument, `message_hash`, using the private wrapped key input to the third argument, `wrapped_key`, and writes the signature text to the second argument, `signature`. When a message is specified in the first argument, `message_hash->data_type`, a hash value is calculated for the message as specified by the fourth argument, `hash_type`. When specifying a hash value in the first argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

#### Parameters

[in]	message_hash	Message or hash value to which to attach signature <ul style="list-style-type: none"> <li>• <code>message_hash-&gt;pdata</code> : Specifies pointer to array storing the message or hash value</li> <li>• <code>message_hash-&gt;data_length</code> : Specifies</li> </ul>
------	--------------	--

		effective data length of the array (Specify only when Message is selected)
		<ul style="list-style-type: none"> <li>message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>
[in,out]	signature	Signature text storage destination information
		<ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing the signature text</li> <li>signature-&gt;data_length : data length</li> </ul>
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_RSASSA\_PKCS1024\_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa1024_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS1024_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1\_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

**Parameters**

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing the signature text</li> <li>signature-&gt;data_length : Specifies effective data length of the array</li> </ul>
[in]	message_hash	Message text or hash value to verify <ul style="list-style-type: none"> <li>message_hash-&gt;pdata : Specifies pointer to array storing the message or hash value</li> <li>message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported
--	--	-------------------------------------

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_RSAES\_PKCS1024\_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa1024_public_wrapped_key_t* wrapped_key )
```

The R\_SCE\_RSAES\_PKCS1024\_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1\_5. It writes the encryption result to the second argument, cipher.

**Parameters**

[in]	plain	plaintext <ul style="list-style-type: none"> <li>plain-&gt;pdata : Specifies pointer to array containing plaintext.</li> <li>plain-&gt;data_length : Specifies valid data length of plaintext array. data size &lt;= public key n size - 11</li> </ul>
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> <li>cipher-&gt;pdata : Specifies pointer to array containing ciphertext.</li> <li>cipher-&gt;data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).</li> </ul>
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_RSAES\_PKCS1024\_Decrypt()

```
fsp_err_t R_SCE_RSAES_PKCS1024_Decrypt ( sce_rsa_byte_data_t* cipher, sce_rsa_byte_data_t*
plain, sce_rsa1024_private_wrapped_key_t* wrapped_key )
```

The R\_SCE\_RSAES\_PKCS1024\_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1\_5. It writes the decryption result to the second argument, plain.

**Parameters**

[in]	cipher	ciphertext <ul style="list-style-type: none"> <li>• cipher-&gt;pdata : Specifies pointer to array containing ciphertext.</li> <li>• cipher-&gt;data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).</li> </ul>
[in,out]	plain	plaintext <ul style="list-style-type: none"> <li>• plain-&gt;pdata : Specifies pointer to array containing plaintext.</li> <li>• plain-&gt;data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size &gt;= public key n size -11. Outputs valid data length after decryption (public key n size).</li> </ul>
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

FSP\_ERR\_CRYPT0\_SCE\_FAIL

An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_RSASSA\_PKCS2048\_SignatureGenerate()

```
fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureGenerate ( sce_rsa_byte_data_t* message_hash,
sce_rsa_byte_data_t* signature, sce_rsa2048_private_wrapped_key_t* wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS2048_SignatureGenerate()` function generates, in accordance with RSASSA-PKCS1-V1\_5, a signature from the message text or hash value that is input in the first argument, `message_hash`, using the private wrapped key input to the third argument, `wrapped_key`, and writes the signature text to the second argument, `signature`. When a message is specified in the first argument, `message_hash->data_type`, a hash value is calculated for the message as specified by the fourth argument, `hash_type`. When specifying a hash value in the first argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

#### Parameters

[in]	message_hash	Message or hash value to which to attach signature <ul style="list-style-type: none"> <li>• <code>message_hash-&gt;pdata</code> : Specifies pointer to array storing the message or hash value</li> <li>• <code>message_hash-&gt;data_length</code> : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>• <code>message_hash-&gt;data_type</code> : Selects the data type of <code>message_hash</code> (Message: 0 Hash value: 1)</li> </ul>
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> <li>• <code>signature-&gt;pdata</code> : Specifies pointer to array storing the signature text</li> <li>• <code>signature-&gt;data_length</code> : data length</li> </ul>
[in]	wrapped_key	Inputs the 2048-bit RSA

		private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

**◆ R\_SCE\_RSASSA\_PKCS2048\_SignatureVerify()**

```
fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa2048_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS2048_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1\_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

**Parameters**

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing the signature text</li> <li>signature-&gt;data_length : Specifies effective data length of the array</li> </ul>
[in]	message_hash	Message text or hash value to verify

			<ul style="list-style-type: none"> <li>• message_hash-&gt;data : Specifies pointer to array storing the message or hash value</li> <li>• message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>• message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>
[in]		wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]		hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_RSASSA\_PKCS3072\_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS3072_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa3072_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS3072_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1\_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

**Parameters**

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing the signature text</li> <li>signature-&gt;data_length : Specifies effective data length of the array</li> </ul>
[in]	message_hash	Message text or hash value to verify <ul style="list-style-type: none"> <li>message_hash-&gt;pdata : Specifies pointer to array storing the message or hash value</li> <li>message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported
--	--	-------------------------------------

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

**◆ R\_SCE\_RSASSA\_PKCS4096\_SignatureVerify()**

```
fsp_err_t R_SCE_RSASSA_PKCS4096_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa4096_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS4096_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1\_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

**Parameters**

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> <li>signature-&gt;pdata : Specifies pointer to array storing the signature text</li> <li>signature-&gt;data_length : Specifies effective data length of the array</li> </ul>
[in]	message_hash	Message text or hash value to verify

			<ul style="list-style-type: none"> <li>• message_hash-&gt;data : Specifies pointer to array storing the message or hash value</li> <li>• message_hash-&gt;data_length : Specifies effective data length of the array (Specify only when Message is selected)</li> <li>• message_hash-&gt;data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)</li> </ul>
[in]		wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]		hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

### ◆ R\_SCE\_RSAES\_PKCS2048\_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS2048_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa2048_public_wrapped_key_t* wrapped_key )
```

The R\_SCE\_RSAES\_PKCS2048\_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1\_5. It writes the encryption result to the second argument, cipher.

#### Parameters

[in]	plain	plaintext <ul style="list-style-type: none"> <li>plain-&gt;pdata : Specifies pointer to array containing plaintext.</li> <li>plain-&gt;data_length : Specifies valid data length of plaintext array. data size &lt;= public key n size - 11</li> </ul>
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> <li>cipher-&gt;pdata : Specifies pointer to array containing ciphertext.</li> <li>cipher-&gt;data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).</li> </ul>
[in]	wrapped_key	Inputs the 2048-bit RSA public wrapped key.

#### Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

#### Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_RSAES\_PKCS2048\_Decrypt()

```
fsp_err_t R_SCE_RSAES_PKCS2048_Decrypt ( sce_rsa_byte_data_t* cipher, sce_rsa_byte_data_t*
plain, sce_rsa2048_private_wrapped_key_t* wrapped_key )
```

The R\_SCE\_RSAES\_PKCS2048\_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1\_5. It writes the decryption result to the second argument, plain.

**Parameters**

[in]	cipher	ciphertext <ul style="list-style-type: none"> <li>• cipher-&gt;pdata : Specifies pointer to array containing ciphertext.</li> <li>• cipher-&gt;data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).</li> </ul>
[in,out]	plain	plaintext <ul style="list-style-type: none"> <li>• plain-&gt;pdata : Specifies pointer to array containing plaintext.</li> <li>• plain-&gt;data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size &gt;= public key n size -11. Outputs valid data length after decryption (public key n size).</li> </ul>
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPT0_SCE_FAIL	An internal error occurred.
-------------------------	-----------------------------

**Note**

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

## ◆ R\_SCE\_RSAES\_PKCS3072\_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS3072_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa3072_public_wrapped_key_t* wrapped_key )
```

The R\_SCE\_RSAES\_PKCS3072\_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1\_5. It writes the encryption result to the second argument, cipher.

**Parameters**

[in]	plain	plaintext <ul style="list-style-type: none"> <li>plain-&gt;pdata : Specifies pointer to array containing plaintext.</li> <li>plain-&gt;data_length : Specifies valid data length of plaintext array. data size &lt;= public key n size - 11</li> </ul>
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> <li>cipher-&gt;pdata : Specifies pointer to array containing ciphertext.</li> <li>cipher-&gt;data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).</li> </ul>
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

## ◆ R\_SCE\_RSAES\_PKCS4096\_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS4096_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa4096_public_wrapped_key_t* wrapped_key )
```

The R\_SCE\_RSAES\_PKCS4096\_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1\_5. It writes the encryption result to the second argument, cipher.

**Parameters**

[in]	plain	plaintext <ul style="list-style-type: none"> <li>plain-&gt;pdata : Specifies pointer to array containing plaintext.</li> <li>plain-&gt;data_length : Specifies valid data length of plaintext array. data size &lt;= public key n size - 11</li> </ul>
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> <li>cipher-&gt;pdata : Specifies pointer to array containing ciphertext.</li> <li>cipher-&gt;data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).</li> </ul>
[in]	wrapped_key	Inputs the 4096-bit RSA public wrapped key.

**Return values**

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.

**Note**

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

#### 4.2.14.6 Secure Crypto Engine (r\_sce\_protected\_cavp)

[Modules](#) » [Security](#)

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

## Version

v1.0.0

The version that appears on the Components tab of the FSP Configuration editor is v1.0.0+fsp.<fsp\_version>. The <fsp\_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See [Module Versioning](#) for more information about component versioning in FSP.

## Functions

The user documentation for the functions in this module.

- [SCE Protected Mode](#)

## Overview

This module provides SCE CAVP Certified functions.

### HW Overview

Obtained device certification with RA6M4.

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

### Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1\_5 1024/2048bit
      - RSAES-PKCS1-V1\_5 3072/4096bit (Encryption only)

- RSASSA-PKCS1-V1\_5 1024/2048bit
    - RSASSA-PKCS1-V1\_5 3072/4096bit (Verification only)
  - ECC
    - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
    - ECDH secp192r1/secp224r1/secp256r1/secp384r1
- Hash Functions
  - SHA-2
    - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1
  - HMAC-SHA256bit
- TRNG
- TLS
  - SSL / TLS support function (TLS1.2 compliant)

## Configuration

### Clock Configuration

This module does not require a specific clock configuration.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e2 studio or RA SC. On the Stacks tab, add New > Security > SCE Protected Mode(CAVP Certified). For information on how to install and update secure keys, refer to the Application Note R11AN0496.

### Limitations

#### Usage of R\_SCE\_ECDSA\_secp384r1\_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE\_USER\_SHA\_384\_ENABLED on RA Smart Configurator and prepare a function called SCE\_USER\_SHA\_384\_FUNCTION. The interface of SCE\_USER\_SHA\_384\_FUNCTION, which is called by the following APIs, is described below.

- [R\\_SCE\\_ECDSA\\_secp384r1\\_SignatureGenerate\(\)](#)
- [R\\_SCE\\_ECDSA\\_secp384r1\\_SignatureVerify\(\)](#)

#### SCE\_USER\_SHA\_384\_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument `message_length` from the address specified by the argument `message`. The calculation result should be stored at the address specified by the argument `digest`.

#### Parameters

<code>message</code>	[in] Start address of message
<code>digest</code>	[in,out] address for storing hash calculation result (48 bytes)
<code>message_length</code>	[in] Effective byte count of message

#### Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

## Examples

### AES Example

This is an example of AES-256 encryption and decryption.

```
#include <string.h>
#include "r_sce.h"
#define BLOCK 16
void r_sce_example_aes();
sce_instance_ctrl_t sce_ctrl;
sce_cfg_t sce_cfg =
{
    .lifecycle = SCE_SSD
};
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
    0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
```

```
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
    sce_aes_handle_t      handle;
    sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t              dummy;

    /* SCE power on */
    R_SCE_Open(&sce_ctrl, &sce_cfg);
    /* Generate a random key */
    R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
    /* Encrypt a plain text */
    R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
    R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
    R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
    /* Decrypt a cipher text using same key as Encryption */
    R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
    R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);

    R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
    /* SCE power off */
    R_SCE_Close(&sce_ctrl);
    /* Compare plain and plain_calculated */
    if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
        while (1)
        {
            /* plain and plain_calculated are different (incorrect) */
        }
    }
    else
    {
```

```

while (1)
{
/* plain and plain_calculated are the same (correct) */
}
}
}

```

#### 4.2.14.7 TinyCrypt TRNG (rm\_tinycrypt\_port)

Modules » Security

##### Functions

fsp\_err\_t RM\_TINCRYPT\_PORT\_Init ()

fsp\_err\_t RM\_TINCRYPT\_PORT\_TRNG\_Read (uint8\_t \*const p\_rngbuf, uint32\_t num\_req\_bytes)

Reads requested length of random data from the TRNG. Generate num\_req\_bytes of random bytes and store them in p\_rngbuf buffer. [More...](#)

int default\_CSPRNG (uint8\_t \*dest, unsigned int size)

Implements the Cryptographically Secure Pseudo-Random Number Generator function required by TinyCrypt. [More...](#)

##### Detailed Description

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

## Overview

Note

*The TinyCrypt port module does not provide any interfaces to the user. Consult the documentation at <https://github.com/intel/tinycrypt/blob/master/documentation/tinycrypt.rst> for further information.*

TinyCrypt is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP on all RA devices. Hardware acceleration for AES-128 is provided only for the RA2 family. This release uses TinyCrypt v0.2.8.

##### Hardware Overview

Crypto Peripheral version	Devices
AES Engine	RA2A1, RA2E1, RA2L1

## Features

For features supported by the software-only version, refer to the TinyCrypt documentation.

The TinyCrypt port module provides hardware support for the following operations

- AES
  - Keybits - 128
  - ECB, CBC, CTR, CCM and CMAC modes -TRNG

## Configuration

### Build Time Configurations for TinyCrypt\_Acceleration

The following build time configurations are defined in fsp\_cfg/rm\_tinycrypt\_port\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### AES Configuration

To enable hardware acceleration for the AES128 operation, choose TinyCrypt (H/W Accelerated) from the stack options . This feature is only supported on the RA2 family.

## Usage Notes

### Hardware Initialization

Invoke `RM_TINCRYPT_PORT_Init ()` to initialize the hardware before using Tinycrypt if either hardware acceleration or the TRNG is to be used.

### Random Number Generation

There are two Pseudo-random Number Generators (PRNG) provided in TinyCrypt

- CTR-PRNG which uses AES128 internally in its implementation. Enabling AES128 hardware acceleration will improve the performance of this module.
- HMAC-PRNG which uses SHA256 internally in its implementation.

**Both these implementations will only be able to provide a random pseudo-random number sequence if they are seeded with truly random data. The TRNG module that is present in hardware and available in `rm_tinycrypt_port` must be used to seed these modules.** When using CTR-PRNG or HMAC-PRNG, use the `RM_TINCRYPT_PORT_TRNG_Read()` function to obtain random data from the TRNG hardware and use that to seed the PRNG modules before invoking the pseudo-random number generation. If purely random data is sufficient for the application, then `RM_TINCRYPT_PORT_TRNG_Read()` can be used directly instead. The hardware TRNG implements the CTR\_DRBG spec.

### Default CSPRNG

The TinyCrypt ECC implementation requires a platform specific implementation of the `default_CSPRNG()` function. This function has been implemented using the hardware TRNG in the port to support software ECC usage. When using TinyCrypt in S/W mode, it is necessary to implement `default_CSPRNG()` if using ECC signature generation (ECDSA) or key derivation (ECDH).

## AES-128 Usage

The AES ECB mode implementation is provided in `aes_encrypt.decrypt.c`. All the other modes of AES operation including CBC, CCN, CMAC and CTR use the ECB mode for the block operation. On the RA2, the ECB mode has been hardware accelerated which improves performance of the other modes as well. Additionally the CBC and CTR modes are also accelerated.

To use the different AES modes, first initialize the hardware (on the RA2) and then use the functions defined in the header file of each AES mode. Note that TinyCrypt does not provide any type of padding or buffering so the data provided to these modes should be multiples of AES block size.

## Memory Usage

TinyCrypt does not use dynamic allocation so there is no heap requirement.

## Limitations

### Usage with RA4 and RA6 devices

TinyCrypt (S/W Only) can be used on RA4 and RA6 devices. However, since ECC signature generation (ECDSA) and key derivation (ECDH) requires a random number source, that operation is currently not supported on these devices when using TinyCrypt (S/W Only). In order to support those operations the function `default_CSPRNG()` must be implemented in the user code.

## TinyCrypt

- No padding is supported; the user is expected to provide adequately padded data depending on the algorithm used.
- AES Key generation is not supported.
- Key encoding/decoding is not supported.

## Using TinyCrypt with TrustZone

Unlike FSP drivers, TinyCrypt cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the crypto code as well as the keys must be placed in the secure region. Since the `tinycrypt` API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This limitation is identical to that for PSA Crypto. Refer to the documentation of that module on how to create a crypto Non-Secure Callable layer to be used in such situations.

## Examples

### AES-CBC Example

This is an example on using TinyCrypt to encrypt and decrypt data using an AES-128 key in CBC mode.

```
#define TC_INPUT_PLAINTEXT_SIZE 64U
#define TF_AES_IV_SIZE TC_AES_BLOCK_SIZE
#define TC_OUTPUT_CIPHERTEXT_SIZE (TC_INPUT_PLAINTEXT_SIZE + TF_AES_IV_SIZE)

```

## CTR-PRNG Example

This is an example on using the CTR\_PRNG module in TinyCrypt to obtain random data.

```
#define TC_ENTROPY_SIZE 64U
#define TC_CTRPRNG_OUTPUT_SIZE 32U
void tinycrypt_ctr_prng_example (void)
{
```

```
TCCTRPrng_t cprng_ctx;

uint8_t     seed[TC_ENTROPY_SIZE];

uint8_t     ctr_prng_output_1[TC_CTRPRNG_OUTPUT_SIZE] = {0};

uint8_t     ctr_prng_output_2[TC_CTRPRNG_OUTPUT_SIZE] = {0};

/* Setup the platform; initialize the crypto engine. */
if (0 != RM_TINCYRYPT_PORT_Init())
{
    debugger_break();
}

/* Read random data from the TRNG to use as seed for the CTR_PRNG. */
else if (FSP_SUCCESS != RM_TINCYRYPT_PORT_TRNG_Read(seed, sizeof(seed)))
{
    debugger_break();
}

/* Initialize and seed the CTR_PRNG with the random data from the TRNG. */
else if (TC_CRYPTOSUCCESS != tc_ctr_prng_init(&cprng_ctx, seed, sizeof(seed), 0,
0))
{
    debugger_break();
}

/* Read random data from the CTR_PRNG. */
else if (TC_CRYPTOSUCCESS !=
        tc_ctr_prng_generate(&cprng_ctx, 0, 0, ctr_prng_output_1, sizeof
(ctr_prng_output_1)))
{
    debugger_break();
}

/* Check that the generated value is not 0. */
else if (0 != memcmp(&ctr_prng_output_1[0], &ctr_prng_output_2[0], sizeof
(ctr_prng_output_1)))
{
    debugger_break();
}

/* Read random data again from the TRNG. */
```

```
else if (TC_CRYPTTO_SUCCESS !=
        tc_ctr_prng_generate(&cprng_ctx, 0, 0, ctr_prng_output_1, sizeof
(ctr_prng_output_1)))
    {
        debugger_break();
    }
/* Check that the generated value is different than the previous call. */
else if (0 != memcmp(&ctr_prng_output_1[0], &ctr_prng_output_2[0], sizeof
(ctr_prng_output_1)))
    {
        debugger_break();
    }
else
    {
/* Operation successful. */
while (1)
    {
        ;
    }
    }
}
```

## Function Documentation

### ◆ RM\_TINCRYPT\_PORT\_Init()

`fsp_err_t RM_TINCRYPT_PORT_Init ( )`

Initialize the SCE.

### ◆ RM\_TINCYRYPT\_PORT\_TRNG\_Read()

```
fsp_err_t RM_TINCYRYPT_PORT_TRNG_Read ( uint8_t *const p_rngbuf, uint32_t num_req_bytes )
```

Reads requested length of random data from the TRNG. Generate num\_req\_bytes of random bytes and store them in p\_rngbuf buffer.

#### Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- HW\_SCE\_RNG\_Read

### ◆ default\_CSPRNG()

```
int default_CSPRNG ( uint8_t * dest, unsigned int size )
```

Implements the Cryptographically Secure Pseudo-Random Number Generator function required by TinyCrypt.

#### Return values

TC_CRYPTO_SUCCESS	Random number generation successful
TC_CRYPTO_FAIL	Random number generation failed.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- RM\_TINCYRYPT\_PORT\_TRNG\_Read

## 4.2.15 Sensor

### Modules

#### Detailed Description

Sensor Modules.

#### Modules

FS2012 Flow Sensor (rm\_fs2012)

Middleware to implement the FS2012 sensor interface. This module implements the [FSXXXX Middleware Interface](#).

#### HS300X Temperature/Humidity Sensor (rm\_hs300x)

Middleware to implement the HS300X sensor interface. This module implements the [HS300X Middleware Interface](#).

#### OB1203 Light/Proximity/PPG Sensor Middleware (rm\_ob1203)

Middleware to implement the OB1203 sensor interface. This module implements the [OB1203 Middleware Interface](#).

#### ZMOD4XXX Gas Sensor (rm\_zmod4xxx)

Middleware to implement the ZMOD4XXX sensor interface. This module implements the [ZMOD4XXX Middleware Interface](#).

### 4.2.15.1 FS2012 Flow Sensor (rm\_fs2012)

[Modules](#) » [Sensor](#)

#### Functions

`fsp_err_t` [RM\\_FS2012\\_Open](#) (`rm_fsxxxx_ctrl_t *const p_api_ctrl`,  
`rm_fsxxxx_cfg_t const *const p_cfg`)  
Opens and configures the FS2012 Middle module. Implements [rm\\_fsxxxx\\_api\\_t::open](#). [More...](#)

`fsp_err_t` [RM\\_FS2012\\_Close](#) (`rm_fsxxxx_ctrl_t *const p_api_ctrl`)  
Disables specified FS2012 control block. Implements [rm\\_fsxxxx\\_api\\_t::close](#). [More...](#)

`fsp_err_t` [RM\\_FS2012\\_Read](#) (`rm_fsxxxx_ctrl_t *const p_api_ctrl`,  
`rm_fsxxxx_raw_data_t *const p_raw_data`)  
Reads ADC data from FS2012. Implements [rm\\_fsxxxx\\_api\\_t::read](#). [More...](#)

`fsp_err_t` [RM\\_FS2012\\_DataCalculate](#) (`rm_fsxxxx_ctrl_t *const p_api_ctrl`,  
`rm_fsxxxx_raw_data_t *const p_raw_data`, `rm_fsxxxx_data_t *const p_fs2012_data`)  
Calculates flow from ADC data. Unit of Gas flow is SLPM (Standard liter per minute) Unit of Liquid flow is SCCM (Standard cubic

centimeter per minute) Implements [rm\\_fsxxxx\\_api\\_t::dataCalculate](#).  
[More...](#)

## Detailed Description

Middleware to implement the FS2012 sensor interface. This module implements the [FSXXXX Middleware Interface](#).

## Overview

### Features

The FS2012 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

## Configuration

### Build Time Configurations for rm\_fs2012

The following build time configurations are defined in `fsp_cfg/rm_fs2012_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Device Type	<ul style="list-style-type: none"> <li>• FS2012-1020-N G</li> <li>• FS2012-1100-N G</li> </ul>	FS2012-1100-NG	Select FS2012 device type.

### Configurations for Sensor > FS2012 Flow Sensor (rm\_fs2012)

This module can be added to the Stacks tab via New Stack > Sensor > FS2012 Flow Sensor (rm\_fs2012).

Configuration	Options	Default	Description
Name	Manual Entry	g_fs2012_sensor0	Module name.
Callback	Name must be a valid C symbol	fs2012_callback	A user callback function can be provided.

### Pin Configuration

This module uses SDA and SCL pins of I2C Master and SCI I2C.

## Usage Notes

[FS2012 datasheet is here](#). The module only supports FS2012-1020-NG and FS2012-1100-NG.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

## Bus Initialization

The FS2012 interface expects a bus instance to be opened before opening any FS2012 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

## Examples

### Basic Example

This is a basic example of minimal use of FS2012 sensor implementation in an application.

```
void rm_fs2012_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    rm_fsxxxx_raw_data_t fs2012_raw_data;
    rm_fsxxxx_data_t   fs2012_data;
    /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
        (rm_comms_i2c_bus_extended_cfg_t *) g_fs2012_cfg.p_instance->p_cfg->p_extend;
    i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#ifdef BSP_CFG_RTOS
    /* Create a semaphore for blocking if a semaphore is not NULL */
    if (NULL != p_extend->p_blocking_semaphore)
    {
#ifdef BSP_CFG_RTOS == 1 // AzureOS
        tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
            p_extend->p_blocking_semaphore->p_semaphore_name,
            (ULONG) 0);
#endif
#ifdef BSP_CFG_RTOS == 2 // FreeRTOS

```

```
        *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,
                                           p_extend->p_blocking_semaphore->p_semaphore_memory);
    #endif
}

/* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
if (NULL != p_extend->p_bus_recursive_mutex)
{
    #if BSP_CFG_RTOS == 1 // AzureOS
        tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                       p_extend->p_bus_recursive_mutex->p_mutex_name,
                       TX_INHERIT);
    #elif BSP_CFG_RTOS == 2 // FreeRTOS
        *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
            xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
mutex_memory);
    #endif
}
#endif

err = RM_FS2012_Open(&g_fs2012_ctrl, &g_fs2012_cfg);
/* Handle any errors. This function should be defined by the user. */
handle_error(err);

while (true)
{
    g_flag = 0;
    /* Read ADC Data from FS2012 */
    RM_FS2012_Read(&g_fs2012_ctrl,
                  &fs2012_raw_data);
    while (0 == g_flag)
    {
        /* Wait callback */
    }
}
```

```

/* Calculate Flow value from ADC data */
RM_FS2012_DataCalculate(&g_fs2012_ctrl, &fs2012_raw_data, &fs2012_data);
/* FS2012 sample rate. See table 4 on the page 5 of the datasheet. */
/* Gas : 409.6ms, Liquid : 716.8ms */
R_BSP_SoftwareDelay(FS2012_GAS_SAMPLE_RATE, BSP_DELAY_UNITS_MICROSECONDS);
}
}

```

## Data Structures

```
struct rm_fs2012_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_fs2012\_instance\_ctrl\_t

struct rm_fs2012_instance_ctrl_t	
FS2012 Control Block	
<b>Data Fields</b>	
uint32_t	<a href="#">open</a>
	Open flag.
<a href="#">rm_fsxxxx_cfg_t</a> const *	<a href="#">p_cfg</a>
	Pointer to FS2012 Configuration.
<a href="#">rm_comms_instance_t</a> const *	<a href="#">p_comms_i2c_instance</a>
	Pointer of I2C Communications Middleware instance structure.
void const *	<a href="#">p_context</a>
	Pointer to the user-provided context.

## Function Documentation

◆ **RM\_FS2012\_Open()**

```
fsp_err_t RM_FS2012_Open ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_cfg_t const *const p_cfg )
```

Opens and configures the FS2012 Middle module. Implements `rm_fsxxxx_api_t::open`.

Example:

```
err = RM_FS2012_Open(&g_fs2012_ctrl, &g_fs2012_cfg);
```

**Return values**

FSP_SUCCESS	FS2012 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ **RM\_FS2012\_Close()**

```
fsp_err_t RM_FS2012_Close ( rm_fsxxxx_ctrl_t *const p_api_ctrl)
```

Disables specified FS2012 control block. Implements `rm_fsxxxx_api_t::close`.

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_FS2012\_Read()**

```
fsp_err_t RM_FS2012_Read ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data )
```

Reads ADC data from FS2012. Implements `rm_fsxxxx_api_t::read`.

**Return values**

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

### ◆ RM\_FS2012\_DataCalculate()

```
fsp_err_t RM_FS2012_DataCalculate ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t
*const p_raw_data, rm_fsxxxx_data_t *const p_fs2012_data )
```

Calculates flow from ADC data. Unit of Gas flow is SLPM (Standard liter per minute) Unit of Liquid flow is SCCM (Standard cubic centimeter per minute) Implements [rm\\_fsxxxx\\_api\\_t::dataCalculate](#).

#### Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

### 4.2.15.2 HS300X Temperature/Humidity Sensor (rm\_hs300x)

Modules » Sensor

#### Functions

```
fsp_err_t RM_HS300X_Open (rm_hs300x_ctrl_t *const p_api_ctrl,
rm_hs300x_cfg_t const *const p_cfg)
```

Opens and configures the HS300X Middle module. Implements [rm\\_hs300x\\_api\\_t::open](#). [More...](#)

```
fsp_err_t RM_HS300X_Close (rm_hs300x_ctrl_t *const p_api_ctrl)
```

Disables specified HS300X control block. Implements [rm\\_hs300x\\_api\\_t::close](#). [More...](#)

```
fsp_err_t RM_HS300X_MeasurementStart (rm_hs300x_ctrl_t *const p_api_ctrl)
```

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements [rm\\_hs300x\\_api\\_t::measurementStart](#). [More...](#)

```
fsp_err_t RM_HS300X_Read (rm_hs300x_ctrl_t *const p_api_ctrl,
rm_hs300x_raw_data_t *const p_raw_data)
```

Reads ADC data from HS300X. Implements [rm\\_hs300x\\_api\\_t::read](#). [More...](#)

```
fsp_err_t RM_HS300X_DataCalculate (rm_hs300x_ctrl_t *const p_api_ctrl,
```

```
rm_hs300x_raw_data_t *const p_raw_data, rm_hs300x_data_t *const p_hs300x_data)
```

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements [rm\\_hs300x\\_api\\_t::dataCalculate](#). [More...](#)

```
fsp_err_t RM_HS300X_ProgrammingModeEnter (rm_hs300x_ctrl_t *const p_api_ctrl)
```

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements [rm\\_hs300x\\_api\\_t::programmingModeEnter](#). [More...](#)

```
fsp_err_t RM_HS300X_ResolutionChange (rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_data_type_t const data_type, rm_hs300x_resolution_t const resolution)
```

This function must be called after calling the [RM\\_HS300X\\_ProgrammingModeEnter](#) function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements [rm\\_hs300x\\_api\\_t::resolutionChange](#). [More...](#)

```
fsp_err_t RM_HS300X_SensorIdGet (rm_hs300x_ctrl_t *const p_api_ctrl, uint32_t *const p_sensor_id)
```

This function must be called after calling the [RM\\_HS300X\\_ProgrammingModeEnter](#) function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements [rm\\_hs300x\\_api\\_t::sensorIdGet](#). [More...](#)

```
fsp_err_t RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const p_api_ctrl)
```

This function must be called after calling the [RM\\_HS300X\\_ProgrammingModeEnter](#) function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements [rm\\_hs300x\\_api\\_t::programmingModeExit](#). [More...](#)

## Detailed Description

Middleware to implement the HS300X sensor interface. This module implements the [HS300X Middleware Interface](#).

## Overview

## Features

The HS300X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data
- Changing the sensor resolution
- Getting the sensor ID

## Configuration

### Build Time Configurations for rm\_hs300x

The following build time configurations are defined in fsp\_cfg/rm\_hs300x\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Data type	<ul style="list-style-type: none"> <li>• Both humidity and temperature</li> <li>• Humidity only</li> </ul>	Both humidity and temperature	Select Getting humidity only and both humidity and temperature.
Programming Mode	<ul style="list-style-type: none"> <li>• ON</li> <li>• OFF</li> </ul>	OFF	If selected the programming mode can be entered.

### Configurations for Sensor > HS300X Temperature/Humidity Sensor (rm\_hs300x)

This module can be added to the Stacks tab via New Stack > Sensor > HS300X Temperature/Humidity Sensor (rm\_hs300x).

Configuration	Options	Default	Description
Name	Manual Entry	g_hs300x_sensor0	Module name.
Callback	Name must be a valid C symbol	hs300x_callback	A user callback function can be provided.

### Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

## Usage Notes

[HS300x datasheet is here.](#)

If ADC data is valid and calculating humidity and temperature is finished, it is needed to start a measurement again. If ADC data is invalid, it is needed to read ADC data from HS300x again.

If changing the sensor resolution and getting the sensor ID, RM\_HS300X\_ProgrammingModeEnter

function must be called within 10ms after applying power to the sensor. Entering the programming mode takes 120us. Therefore, after calling `RM_HS300X_ProgrammingModeEnter` function, please wait 120us. After calling `RM_HS300X_ResolutionChange` function, 14ms must be waited because failure to comply with these times may result in data corruption and introduce errors in sensor measurements.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

## Bus Initialization

The HS300X interface expects a bus instance to be opened before opening any HS300X device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

## Examples

### Basic Example

This is a basic example of minimal use of HS300X sensor implementation in an application.

```
void rm_hs300x_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    rm_hs300x_raw_data_t hs300x_raw_data;
    rm_hs300x_data_t   hs300x_data;
    uint8_t            calculated_flag = 0;
    /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
        (rm_comms_i2c_bus_extended_cfg_t *) g_hs300x_cfg.p_instance->p_cfg->p_extend;
    i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#ifdef BSP_CFG_RTOS
    /* Create a semaphore for blocking if a semaphore is not NULL */
    if (NULL != p_extend->p_blocking_semaphore)
    {
#ifdef BSP_CFG_RTOS == 1 // AzureOS
        tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
```

```
        p_extend->p_blocking_semaphore->p_semaphore_name,
        (ULONG) 0);

#elif BSP_CFG_RTOS == 2 // FreeRTOS
    *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
        xSemaphoreCreateCountingStatic((UBaseType_t) 1,
        (UBaseType_t) 0,
p_extend->p_blocking_semaphore->p_semaphore_memory);
#endif
}

/* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
if (NULL != p_extend->p_bus_recursive_mutex)
{
#if BSP_CFG_RTOS == 1 // AzureOS

## Function Documentation

### ◆ RM\_HS300X\_Open()

```
fsp_err_t RM_HS300X_Open ( rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_cfg_t const *const p_cfg )
```

Opens and configures the HS300X Middle module. Implements `rm_hs300x_api_t::open`.

Example:

```
err = RM_HS300X_Open(&g_hs300x_ctrl, &g_hs300x_cfg);
```

#### Return values

FSP_SUCCESS	HS300X successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ **RM\_HS300X\_Close()**

```
fsp_err_t RM_HS300X_Close ( rm_hs300x_ctrl_t *const p_api_ctrl)
```

Disables specified HS300X control block. Implements `rm_hs300x_api_t::close`.

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_HS300X\_MeasurementStart()**

```
fsp_err_t RM_HS300X_MeasurementStart ( rm_hs300x_ctrl_t *const p_api_ctrl)
```

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements `rm_hs300x_api_t::measurementStart`.

**Return values**

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_HS300X\_Read()**

```
fsp_err_t RM_HS300X_Read ( rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t *const p_raw_data )
```

Reads ADC data from HS300X. Implements `rm_hs300x_api_t::read`.

**Return values**

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_HS300X\_DataCalculate()**

```
fsp_err_t RM_HS300X_DataCalculate ( rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t
*const p_raw_data, rm_hs300x_data_t *const p_hs300x_data )
```

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements [rm\\_hs300x\\_api\\_t::dataCalculate](#).

**Return values**

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

◆ **RM\_HS300X\_ProgrammingModeEnter()**

```
fsp_err_t RM_HS300X_ProgrammingModeEnter ( rm_hs300x_ctrl_t *const p_api_ctrl)
```

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements [rm\\_hs300x\\_api\\_t::programmingModeEnter](#).

**Return values**

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ **RM\_HS300X\_ResolutionChange()**

```
fsp_err_t RM_HS300X_ResolutionChange ( rm_hs300x_ctrl_t *const p_api_ctrl,
rm_hs300x_data_type_t const data_type, rm_hs300x_resolution_t const resolution )
```

This function must be called after calling the RM\_HS300X\_ProgrammingModeEnter function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements [rm\\_hs300x\\_api\\_t::resolutionChange](#).

**Return values**

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ **RM\_HS300X\_SensorIdGet()**

```
fsp_err_t RM_HS300X_SensorIdGet ( rm_hs300x_ctrl_t *const p_api_ctrl, uint32_t *const
p_sensor_id )
```

This function must be called after calling the RM\_HS300X\_ProgrammingModeEnter function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements [rm\\_hs300x\\_api\\_t::sensorIdGet](#).

**Return values**

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

### ◆ RM\_HS300X\_ProgrammingModeExit()

`fsp_err_t RM_HS300X_ProgrammingModeExit ( rm_hs300x_ctrl_t *const p_api_ctrl)`

This function must be called after calling the `RM_HS300X_ProgrammingModeEnter` function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements `rm_hs300x_api_t::programmingModeExit`.

#### Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

### 4.2.15.3 OB1203 Light/Proximity/PPG Sensor Middleware (rm\_ob1203)

Modules » Sensor

#### Functions

`fsp_err_t RM_OB1203_Open (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_cfg_t const *const p_cfg)`  
 Opens and configures the OB1203 Middle module. Implements `rm_ob1203_api_t::open`. [More...](#)

`fsp_err_t RM_OB1203_Close (rm_ob1203_ctrl_t *const p_api_ctrl)`  
 Disables specified OB1203 control block. Implements `rm_ob1203_api_t::close`. [More...](#)

`fsp_err_t RM_OB1203_MeasurementStart (rm_ob1203_ctrl_t *const p_api_ctrl)`  
 Start measurement. Implements `rm_ob1203_api_t::measurementStart`. [More...](#)

`fsp_err_t RM_OB1203_MeasurementStop (rm_ob1203_ctrl_t *const p_api_ctrl)`  
 Stop measurement. If device interrupt is enabled, interrupt bits are cleared after measurement stop. If PPG mode, FIFO information is also reset after measurement stop. In RTOS and Light/Proximity/Light Proximity mode, if device interrupt is enabled,

blocks 2 bytes on the I2C bus. In RTOS and PPG mode, if device interrupt is enabled, blocks 6 bytes on the I2C bus. If device interrupt is disabled, blocks 4 bytes on the I2C bus. Implements [rm\\_ob1203\\_api\\_t::measurementStop](#). [More...](#)

`fsp_err_t` [RM\\_OB1203\\_LightRead](#) ([rm\\_ob1203\\_ctrl\\_t](#) \*const p\_api\_ctrl, [rm\\_ob1203\\_raw\\_data\\_t](#) \*const p\_raw\_data, [rm\\_ob1203\\_light\\_data\\_type\\_t](#) type)

Reads Light ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Light mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements [rm\\_ob1203\\_api\\_t::lightRead](#). [More...](#)

`fsp_err_t` [RM\\_OB1203\\_LightDataCalculate](#) ([rm\\_ob1203\\_ctrl\\_t](#) \*const p\_api\_ctrl, [rm\\_ob1203\\_raw\\_data\\_t](#) \*const p\_raw\_data, [rm\\_ob1203\\_light\\_data\\_t](#) \*const p\_ob1203\_data)

Calculate light data from raw data. Implements [rm\\_ob1203\\_api\\_t::lightDataCalculate](#). [More...](#)

`fsp_err_t` [RM\\_OB1203\\_ProxRead](#) ([rm\\_ob1203\\_ctrl\\_t](#) \*const p\_api\_ctrl, [rm\\_ob1203\\_raw\\_data\\_t](#) \*const p\_raw\_data)

Reads Proximity ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Proximity mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements [rm\\_ob1203\\_api\\_t::proxRead](#). [More...](#)

`fsp_err_t` [RM\\_OB1203\\_ProxDDataCalculate](#) ([rm\\_ob1203\\_ctrl\\_t](#) \*const p\_api\_ctrl, [rm\\_ob1203\\_raw\\_data\\_t](#) \*const p\_raw\_data, [rm\\_ob1203\\_prox\\_data\\_t](#) \*const p\_ob1203\_data)

Calculate proximity data from raw data. Implements [rm\\_ob1203\\_api\\_t::proxDataCalculate](#). [More...](#)

`fsp_err_t` [RM\\_OB1203\\_PpgRead](#) ([rm\\_ob1203\\_ctrl\\_t](#) \*const p\_api\_ctrl, [rm\\_ob1203\\_raw\\_data\\_t](#) \*const p\_raw\_data, [uint8\\_t](#) const number\_of\_samples)

Reads PPG ADC data from OB1203 device. One sample requires three bytes. 0 cannot set to the number of samples. Implements [rm\\_ob1203\\_api\\_t::ppgRead](#). [More...](#)

`fsp_err_t` [RM\\_OB1203\\_PpgDataCalculate](#) ([rm\\_ob1203\\_ctrl\\_t](#) \*const p\_api\_ctrl, [rm\\_ob1203\\_raw\\_data\\_t](#) \*const p\_raw\_data, [rm\\_ob1203\\_ppg\\_data\\_t](#) \*const p\_ob1203\_data)

Calculate PPG data from raw data. Implements [rm\\_ob1203\\_api\\_t::ppgDataCalculate](#). [More...](#)

`fsp_err_t RM_OB1203_GainSet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_gain_t const gain)`

Set gain. This function should be called after calling `RM_OB1203_MeasurementStop()`. In RTOS and Light Proximity mode, blocks 2 bytes on the I2C bus. Implements `rm_ob1203_api_t::gainSet`. [More...](#)

`fsp_err_t RM_OB1203_LedCurrentSet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_led_current_t const led_current)`

Set currents. This function should be called after calling `RM_OB1203_MeasurementStop()`. Implements `rm_ob1203_api_t::ledCurrentSet`. [More...](#)

`fsp_err_t RM_OB1203_DeviceInterruptCfgSet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_device_interrupt_cfg_t const interrupt_cfg)`

Set device interrupt configurations. This function should be called after calling `RM_OB1203_MeasurementStop()`. Implements `rm_ob1203_api_t::deviceInterruptCfgSet`. [More...](#)

`fsp_err_t RM_OB1203_FifoInfoGet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_fifo_info_t *const p_fifo_info)`

Get FIFO information from OB1203 device. Implements `rm_ob1203_api_t::fifoInfoGet`. [More...](#)

`fsp_err_t RM_OB1203_DeviceStatusGet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_device_status_t *const p_status)`

Get device status from OB1203 device. Clear all interrupt bits. Implements `rm_ob1203_api_t::deviceStatusGet`. [More...](#)

## Detailed Description

Middleware to implement the OB1203 sensor interface. This module implements the [OB1203 Middleware Interface](#).

## Overview

This module provides APIs for configuring and controlling the OB1203 sensor operation modes. Supported OB1203 sensor operation modes are below.

- Light mode
- Proximity mode
- Light Proximity mode
- PPG mode

## Features

The OB1203 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start and stop a measurement at any time
- Get the ADC data from the sensor
- Calculate the Light/Proximity/PPG values.
- Software reset

## Configuration

### Build Time Configurations for rm\_ob1203

The following build time configurations are defined in fsp\_cfg/rm\_ob1203\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Sensor > OB1203 Light/Proximity/PPG Sensor (rm\_ob1203)

This module can be added to the Stacks tab via New Stack > Sensor > OB1203 Light/Proximity/PPG Sensor (rm\_ob1203).

Configuration	Options	Default	Description
Name	Manual Entry	g_ob1203_sensor0	Module name.
Semaphore Timeout (RTOS only)	Value must be a non-negative integer	0xFFFFFFFF	Set timeout for blocking in using RTOS.
Comms I2C Callback	Name must be a valid C symbol	ob1203_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	ob1203_irq_callback	A user IRQ callback function can be provided.

### Configurations for Sensor > OB1203 Light mode (rm\_ob1203)

Configuration	Options	Default	Description
Operation Mode	<ul style="list-style-type: none"> <li>• LS mode</li> <li>• CS mode</li> </ul>	LS mode	Set operation mode.
Interrupt Type	<ul style="list-style-type: none"> <li>• Threshold</li> <li>• Variation</li> </ul>	Threshold	Set interrupt type.
Interrupt Source	<ul style="list-style-type: none"> <li>• Clear channel</li> <li>• Green channel</li> <li>• Red channel (CS mode only)</li> <li>• Blue channel</li> </ul>	Clear channel	Set interrupt source.

## (CS mode only)

The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Light mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Sleep after Interrupt	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Set sleep after interrupt.
Gain	<ul style="list-style-type: none"> <li>1</li> <li>3</li> <li>6</li> </ul>	3	Set gain for detection range.
Resolution and Measurement Period	Refer to the RA Configuration tool for available options.	Resolution:18bit. Measurement Period:100ms	Set resolution and measurement period.
Upper Threshold	Value must be a non-negative integer	0x00CCC	Set upper threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Lower Threshold	Value must be a non-negative integer	0x00000	Set lower threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Variance Threshold	<ul style="list-style-type: none"> <li>+/- 8 counts</li> <li>+/- 16 counts</li> <li>+/- 32 counts</li> <li>+/- 64 counts</li> <li>+/- 128 counts</li> <li>+/- 256 counts</li> <li>+/- 512 counts</li> <li>+/- 1024 counts</li> </ul>	+/- 128 counts	Set variance threshold. New data varies by selected counts compared to previous result.

**Configurations for Sensor > OB1203 Proximity mode (rm\_ob1203)**

Configuration	Options	Default	Description
Interrupt Type	<ul style="list-style-type: none"> <li>Normal</li> <li>Logic</li> </ul>	Normal	Set interrupt type.
The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Proximity mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Sleep after Interrupt	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Set sleep after interrupt.
Gain	<ul style="list-style-type: none"> <li>1</li> </ul>	1	Set gain of ADC output

	<ul style="list-style-type: none"> <li>• 1.5</li> <li>• 2</li> <li>• 4</li> </ul>		and noise.
LED Current	Value must be a non-negative integer	0x100	Set Current for LED (10bits). Min = 0x000 and Max = 0x3FF
LED Order	<ul style="list-style-type: none"> <li>• IR LED first, Red LED second</li> <li>• Red LED first, IR LED second</li> </ul>	IR LED first, Red LED second	Set LED order.
LED Analog Cancellation	<ul style="list-style-type: none"> <li>• Enabled (50% offset of the full-scale value)</li> <li>• Disabled</li> </ul>	Disabled	Set analog cancellation level.
LED Digital Cancellation	Value must be a non-negative integer	0x100	Set digital cancellation level (16bits). Min = 0x0000 and Max = 0xFFFF
Number of LED pulses	<ul style="list-style-type: none"> <li>• 1 pulse</li> <li>• 2 pulses</li> <li>• 4 pulses</li> <li>• 8 pulses</li> <li>• 16 pulses</li> <li>• 32 pulses</li> </ul>	8 pulses	Set number of LED pulses.
Pulse Width and Measurement Period	Refer to the RA Configuration tool for available options.	Pulse width:42us. Measurement Period:100ms	Set pulse width and measurement period.
Moving Average	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Set moving average.
Hysteresis	Value must be a non-negative integer	0x00	Set hysteresis level (7bits). Min = 0x00 and Max = 0x7F.
Upper Threshold	Value must be a non-negative integer	0x0600	Set upper threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.
Lower Threshold	Value must be a non-negative integer	0x0000	Set lower threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.

### Configurations for Sensor > OB1203 PPG mode (rm\_ob1203)

Configuration	Options	Default	Description
Operation Mode	<ul style="list-style-type: none"> <li>• PPG1 mode</li> <li>• PPG2 mode</li> </ul>	PPG2 mode	Set operation mode.
Interrupt Type	<ul style="list-style-type: none"> <li>• Data</li> <li>• FIFO Almost Full</li> </ul>	Data	Set interrupt type.

Gain	<ul style="list-style-type: none"> <li>• 1</li> <li>• 1.5</li> <li>• 2</li> <li>• 4</li> </ul>	1	Set gain of ADC output and noise.
IR LED Current	Value must be a non-negative integer	0x366	Set Current for IR LED (10bits). Min = 0x000 and Max = 0x3FF
Red LED Current	Value must be a non-negative integer	0x1B3	Set Current for Red LED (9bits). Min = 0x000 and Max = 0x1FF
Power Save Mode	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Set power save mode.
LED Order	<ul style="list-style-type: none"> <li>• IR LED first, Red LED second</li> <li>• Red LED first, IR LED second</li> </ul>	IR LED first, Red LED second	Set LED order.
IR LED Analog Cancellation	<ul style="list-style-type: none"> <li>• Enabled (50% offset of the full-scale value)</li> <li>• Disabled</li> </ul>	Disabled	Set analog cancellation level.
Red LED Analog Cancellation	<ul style="list-style-type: none"> <li>• Enabled (50% offset of the full-scale value)</li> <li>• Disabled</li> </ul>	Disabled	Set analog cancellation level.
Number of Averaged PPG Samples	<ul style="list-style-type: none"> <li>• 1 (No averaging)</li> <li>• 2 consecutives samples are averaged</li> <li>• 4 consecutives samples are averaged</li> <li>• 8 consecutives samples are averaged</li> <li>• 16 consecutives samples are averaged</li> <li>• 32 consecutives samples are averaged</li> </ul>	8 consecutives samples are averaged	Set number of averaged for PPG samples.
Pulse Width and Measurement Period	Refer to the RA Configuration tool for available options.	Pulse width:130us. Measurement Period:1.25ms	Set pulse width and measurement period.
FIFO Rollover	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Set FIFO rollover.
FIFO Almost Full Value	Value must be a non-	0x0C	Set the number of

negative integer

empty FIFO words when the FIFO almost full interrupt is issued (4bits). Min = 0x0 and Max = 0xF. In PPG2 Mode, only even values must be used.

**Configurations for Sensor > OB1203 Light Proximity mode (rm\_ob1203)**

Configuration	Options	Default	Description
General > Device Interrupt	<ul style="list-style-type: none"> <li>Light mode</li> <li>Proximity mode</li> </ul>	Light mode	Select an operation mode using device interrupt.
Light mode > Operation Mode	<ul style="list-style-type: none"> <li>LS mode</li> <li>CS mode</li> </ul>	LS mode	Set operation mode.
Light mode > Interrupt Type	<ul style="list-style-type: none"> <li>Threshold</li> <li>Variation</li> </ul>	Threshold	Set interrupt type.
Light mode > Interrupt Source	<ul style="list-style-type: none"> <li>Clear channel</li> <li>Green channel</li> <li>Red channel (CS mode only)</li> <li>Blue channel (CS mode only)</li> </ul>	Clear channel	Set interrupt source.
Light mode > The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Light mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Light mode > Sleep after Interrupt	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Set sleep after interrupt.
Light mode > Gain	<ul style="list-style-type: none"> <li>1</li> <li>3</li> <li>6</li> </ul>	3	Set gain for detection range.
Light mode > Resolution and Measurement Period	Refer to the RA Configuration tool for available options.	Resolution:18bit. Measurement Period:100ms	Set resolution and measurement period.
Light mode > Upper Threshold	Value must be a non-negative integer	0x00CCC	Set upper threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Light mode > Lower Threshold	Value must be a non-negative integer	0x00000	Set lower threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Light mode > Variance	<ul style="list-style-type: none"> <li>+/- 8 counts</li> </ul>	+/- 128 counts	Set variance threshold.

Threshold	<ul style="list-style-type: none"> <li>• +/- 16 counts</li> <li>• +/- 32 counts</li> <li>• +/- 64 counts</li> <li>• +/- 128 counts</li> <li>• +/- 256 counts</li> <li>• +/- 512 counts</li> <li>• +/- 1024 counts</li> </ul>		New data varies by selected counts compared to previous result.
Proximity mode > Interrupt Type	<ul style="list-style-type: none"> <li>• Normal</li> <li>• Logic</li> </ul>	Normal	Set interrupt type.
Proximity mode > The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Proximity mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Proximity mode > Sleep after Interrupt	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Set sleep after interrupt.
Proximity mode > Gain	<ul style="list-style-type: none"> <li>• 1</li> <li>• 1.5</li> <li>• 2</li> <li>• 4</li> </ul>	1	Set gain of ADC output and noise.
Proximity mode > LED Current	Value must be a non-negative integer	0x100	Set Current for LED (10bits). Min = 0x000 and Max = 0x3FF
Proximity mode > LED Order	<ul style="list-style-type: none"> <li>• IR LED first, Red LED second</li> <li>• Red LED first, IR LED second</li> </ul>	IR LED first, Red LED second	Set LED order.
Proximity mode > LED Analog Cancellation	<ul style="list-style-type: none"> <li>• Enabled (50% offset of the full-scale value)</li> <li>• Disabled</li> </ul>	Disabled	Set analog cancellation level.
Proximity mode > LED Digital Cancellation	Value must be a non-negative integer	0x100	Set digital cancellation level (16bits). Min = 0x0000 and Max = 0xFFFF
Proximity mode > Number of LED pulses	<ul style="list-style-type: none"> <li>• 1 pulse</li> <li>• 2 pulses</li> <li>• 4 pulses</li> <li>• 8 pulses</li> <li>• 16 pulses</li> <li>• 32 pulses</li> </ul>	8 pulses	Set number of LED pulses.
Proximity mode > Pulse Width and Measurement Period	Refer to the RA Configuration tool for available options.	Pulse width:42us. Measurement Period:100ms	Set pulse width and measurement period.
Proximity mode > Moving Average	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Set moving average.

Proximity mode > Hysteresis	Value must be a non-negative integer	0x00	Set hysteresis level (7bits). Min = 0x00 and Max = 0x7F.
Proximity mode > Upper Threshold	Value must be a non-negative integer	0x0600	Set upper threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.
Proximity mode > Lower Threshold	Value must be a non-negative integer	0x0000	Set lower threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.

## Pin Configuration

This module uses I2C Master, SCI I2C and IRQ drivers. Therefore, this module uses SDA and SCL pins of I2C Master and SCI I2C and an IRQ pin.

## Usage Notes

[OB1203 datasheet is here.](#)

The OB1203 has four operation modes.

### Light mode

Light mode has two operation modes.

Operation mode	Red	Green	Blue	Clear	Comp *1
LS mode		✓		✓	✓
CS mode	✓	✓	✓	✓	✓

\*1 : Temperature compensation data

Light mode features are below.

- High lux accuracy over different light sources
- Absolute sensitivity: 0.06 lux to > 150000 lux
- Output resolution: 13 to 20 bits
- Three LS/CS gain modes: x1 to x6
- Highly linear output, 50Hz/60Hz light and fluorescent light flicker immunity
- Four parallel channels (red, green, blue, clear)
- Accurate Correlated Color Temperature (CCT)
- Accurate CIE 1931 XYZ (RGB) color measurement
- Very stable spectral response over angle of light incidence

### Proximity mode

Proximity mode features are below.

- Integrated and trimmed LED source, driver, and photodetector
- Programmable pulsed LED up to 250mA output current
- High resolution (12 to 16 bits)
- Object movement detection (in/out)
- Ambient light suppression > 100klx sun light
- Crosstalk cancelation (analog and digital)

### PPG mode

PPG mode has two operation modes.

Operation mode	Discription
PPG1 mode	Only one LED is used. This mode allows determination of parameters related to heart rate with an appropriate algorithm
PPG2 mode	Two LED are used. Second LED is used as a transmitter. This mode supports further analysis, such as SpO2 and respiration rate determination.

PPG mode features are below.

- SpO2 measurement behind visibly dark, IR transmissive ink
- Industry's smallest optical biosensor module
- Fully integrated and trimmed module, including two LEDs, 250mA maximum drive current, and photodetectors
- Output resolution PPG: 16 to 18 bits
- Data stored in 18-bit wide, 32-sample FIFO memory
- Integrated averaging function for higher signal-to-noise ratio(SNR) and data rate reduction
- Programmable measurement rate: up to 3200 samples per second
- High SNR

### Light Proximity mode

Light mode and Proximity mode can be used in parallel.

### Bus Initialization

The OB1203 interface expects a bus instance to be opened before opening any OB1203 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

If an RTOS is used, blocking and bus lock for I2C bus are available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

### Initialization

Initialize with [RM\\_OB1203\\_Open\(\)](#).

## From measurement start to data acquisition

After normal completion, start the measurement with `RM_OB1203_MeasurementStart()`.

### Light mode

#### If IRQ is enabled

1. Wait until `RM_OB1203_EVENT_THRESHOLD_CROSSED` is received via IRQ callback.
2. Call `RM_OB1203_LightRead()`. This function will read the ADC data and clear the interrupt bits.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_LightDataCalculate()`. This function will calculate light data from the ADC data.

#### If IRQ is disabled

1. Wait for measurement period configured.
2. Call `RM_OB1203_LightRead()`. This function will read the ADC data.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_LightDataCalculate()`. This function will calculate light data from the ADC data.

### Proximity mode

#### If IRQ is enabled

1. Wait until `RM_OB1203_EVENT_THRESHOLD_CROSSED` or `RM_OB1203_EVENT_OBJECT_NEAR` is received via IRQ callback.
2. Call `RM_OB1203_ProxRead()`. This function will read the ADC data and clear the interrupt bits.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_ProxDataCalculate()`. This function will calculate proximity data from the ADC data.

#### If IRQ is disabled

1. Wait for measurement period configured.
2. Call `RM_OB1203_ProxRead()`. This function will read the ADC data.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_ProxDataCalculate()`. This function will calculate proximity data from the ADC data.

### PPG mode

#### If IRQ is enabled

1. Wait until `RM_OB1203_EVENT_MEASUREMENT_COMPLETE` is received via IRQ callback.
2. Call `RM_OB1203_PpgRead()`. This function will read the ADC data and clear the interrupt bits. In PPG2 mode, the number of read FIFO samples must be even value because two samples is one pair.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_PpgDataCalculate()`. This function will calculate PPG data from the ADC data.

## If IRQ is disabled

1. Wait for measurement period configured.
2. Call `RM_OB1203_PpgRead()`. This function will read the ADC data. In PPG2 mode, the number of read FIFO samples must be even value because two samples is one pair.
3. Wait until `RM_OB1203_EVENT_SUCCESS` is received.
4. Call `RM_OB1203_PpgDataCalculate()`. This function will calculate PPG data from the ADC data.

## Light Proximity mode

Combination of the above Light mode and Proximity mode.

## Getting device status

Call `RM_OB1203_DeviceStatusGet()`. This function will get device status over I2C.

- If `power_on_reset_occur` is true, the part has had a power-up event, either because the part was turned on or because there was a power-supply voltage disturbance.
- If `light_interrupt_occur` is true, Light mode interrupt condition has occurred.
- If `light_measurement_complete` is true, Light mode measurement is complete.
- If `ts_measurement_complete` is true, TS measurement is complete.
- If `fifo_alfull_interrupt_occur` is true, FIFO almost full interrupt condition has occurred.
- If `ppg_measurement_complete` is true, PPG mode measurement is complete.
- If `object_near` is true, an object is near.
- If `prox_interrupt_occur` is true, Proximity mode interrupt condition has occurred.
- If `prox_measurement_complete` is true, Proximity mode measurement is complete.

## Clearing interrupt bits

If interrupt bits are needed to clear without calling `RM_OB1203_LightRead()`, `RM_OB1203_ProxRead()`, `RM_OB1203_PpgRead()` and `RM_OB1203_MeasurementStop()`, please call `RM_OB1203_DeviceStatusGet()`. Interrupt bits are reset by `STATUS_0` and `STATUS_1` registers read.

## Sleep after interrupt

Sleep after interrupt is valid in Light mode and Proximity mode. If a sleep after interrupt bit are set, a measurement will be stopped after an interrupt occurs. After `STATUS_0` and `STATUS_1` registers are read, a measurement will be started. please call `RM_OB1203_DeviceStatusGet()`.

## PPG FIFO

PPG FIFO data is stored in 18-bit wide, 32-sample FIFO memory.

The FIFO almost full interrupt is triggered when a certain number of free FIFO registers are remaining.

If FIFO informations (write index, read index, overflow counter, unread\_samples) are got, Call `RM_OB1203_FifoInfoGet()`.

- `write_index` is the FIFO index where the next sample of PPG data will be written in the FIFO.
- `read_index` is the index of the next sample to be read from the `FIFO_DATA` register.
- `overflow_counter` is the number of old samples (up to 15) which are overwritten by new data. If the FIFO Rollover is enabled, the FIFO overflow counter counts.
- `unread_samples` is the number of unread FIFO samples, which can be calculated by write index and read index.

## Reconfiguration

The interface supports the following APIs for reconfiguration.

API	Discription
<a href="#">RM_OB1203_GainSet()</a>	Set gain
<a href="#">RM_OB1203_LedCurrentSet()</a>	Set LED currents. Proximity mode and Light Proximity mode: LED Current is 10bits. Min = 0x000 and Max = 0x3FF PPG mode: IR/Red LED currents are 10bits/9bits. Min = 0x000/0x000 and Max = 0x3FF/0x1FF
<a href="#">RM_OB1203_DeviceInterruptCfgSet()</a>	Set interrupt configurations.

## Relationship between APIs and registers

The relationship between APIs and registers accessed by the API is below.

API	Registers
<a href="#">RM_OB1203_MeasurementStart()</a>	MAIN_CTRL_0 and MAIN_CTRL_1
<a href="#">RM_OB1203_MeasurementStop()</a>	MAIN_CTRL_0, MAIN_CTRL_1, STATUS_0, STATUS_1, FIFO_WR_PTR, FIFO_RD_PTR and FIFO_OVF_CNT
<a href="#">RM_OB1203_LightRead()</a>	LS_CLEAR_DATA, LS_GREEN_DATA, LS_BULE_DATA, LS_RED_DATA, COMP_DATA, STATUS_0 and STATUS_1
<a href="#">RM_OB1203_ProxRead()</a>	PS_DATA, STATUS_0 and STATUS_1
<a href="#">RM_OB1203_PpgRead()</a>	FIFO_DATA
<a href="#">RM_OB1203_DeviceStatusGet()</a>	STATUS_0 and STATUS_1
<a href="#">RM_OB1203_GainSet()</a>	LS_GAIN and PPG_PS_GAIN
<a href="#">RM_OB1203_LedCurrentSet()</a>	PS_LED_CURR, PPG_IRLED_CURR and PPG_RLED_CURR
<a href="#">RM_OB1203_DeviceInterruptCfgSet()</a>	INT_CFG_0, INT_CFG_1 and INT_PST
<a href="#">RM_OB1203_FifoInfoGet()</a>	FIFO_WR_PTR, FIFO_RD_PTR and FIFO_OVF_CNT

## Examples

### Basic Example

These are basic examples of minimal use of OB1203 sensor implementation in an application.

### Light mode

```

<a href="#">rm_ob1203_fifo_rollover_t</a>	ppg_fifo_rollover	FIFO rollover enable.
uint8_t	ppg_fifo_empty_num	the number of empty FIFO words when the FIFO almost full interrupt is issued. In PPG2 Mode only even values should be used. (4 bits)
uint8_t	ppg_number_of_samples	Number of PPG samples.

#### ◆ [rm\\_ob1203\\_instance\\_ctrl\\_t](#)

struct rm_ob1203_instance_ctrl_t	
OB1203 Control Block	
<b>Data Fields</b>	
<a href="#">rm_ob1203_semaphore_t</a> const *	<a href="#">p_semaphore</a>
	The semaphore to wait for callback. This is used for another data read/write after a communication.
uint32_t	<a href="#">open</a>
	Open flag.

<code>rm_ob1203_cfg_t const *</code>	<code>p_cfg</code>
	Pointer to OB1203 Configuration.
<code>uint8_t</code>	<code>buf [8]</code>
	Buffer for I2C communications.
<code>rm_ob1203_init_process_params_t</code>	<code>init_process_params</code>
	For the initialization process.
<code>uint8_t</code>	<code>register_address</code>
	Register address to access.
<code>volatile rm_ob1203_device_status_t *</code>	<code>p_device_status</code>
	Pointer to device status.
<code>volatile rm_ob1203_fifo_info_t *</code>	<code>p_fifo_info</code>
	Pointer to FIFO information structure.
<code>volatile bool</code>	<code>fifo_reset</code>
	Flag for FIFO reset for PPG mode.
<code>volatile bool</code>	<code>prox_gain_update</code>
	Flag for gain update for Proximity mode.
<code>volatile bool</code>	<code>interrupt_bits_clear</code>
	Flag for clearing interrupt bits.

<code>rm_comms_instance_t const *</code>	<code>p_comms_i2c_instance</code>
	Pointer of I2C Communications Middleware instance structure.
<code>rm_ob1203_mode_extended_cfg_t *</code>	<code>p_mode</code>
	Pointer of OB1203 operation mode extended configuration.
<code>void const *</code>	<code>p_irq_instance</code>
	Pointer to IRQ instance.
<code>void const *</code>	<code>p_context</code>
	Pointer to the user-provided context.
<code>void(*</code>	<code>p_comms_callback</code> )( <code>rm_ob1203_callback_args_t *p_args</code> )
	I2C Communications callback.
<code>void(*</code>	<code>p_irq_callback</code> )( <code>rm_ob1203_callback_args_t *p_args</code> )
	IRQ callback.

## Function Documentation

---

◆ **RM\_OB1203\_Open()**

```
fsp_err_t RM_OB1203_Open ( rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_cfg_t const *const p_cfg )
```

Opens and configures the OB1203 Middle module. Implements `rm_ob1203_api_t::open`.

Example:

```
err = RM_OB1203_Open(&g_ob1203_ctrl, &g_ob1203_cfg);
```

**Return values**

FSP_SUCCESS	OB1203 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ **RM\_OB1203\_Close()**

```
fsp_err_t RM_OB1203_Close ( rm_ob1203_ctrl_t *const p_api_ctrl)
```

Disables specified OB1203 control block. Implements `rm_ob1203_api_t::close`.

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_OB1203\_MeasurementStart()**

```
fsp_err_t RM_OB1203_MeasurementStart ( rm_ob1203_ctrl_t *const p_api_ctrl)
```

Start measurement. Implements `rm_ob1203_api_t::measurementStart`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_OB1203\_MeasurementStop()

```
fsp_err_t RM_OB1203_MeasurementStop ( rm_ob1203_ctrl_t *const p_api_ctrl)
```

Stop measurement. If device interrupt is enabled, interrupt bits are cleared after measurement stop. If PPG mode, FIFO information is also reset after measurement stop. In RTOS and Light/Proximity/Light Proximity mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. In RTOS and PPG mode, if device interrupt is enabled, blocks 6 bytes on the I2C bus. If device interrupt is disabled, blocks 4 bytes on the I2C bus. Implements [rm\\_ob1203\\_api\\_t::measurementStop](#).

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_OB1203\_LightRead()

```
fsp_err_t RM_OB1203_LightRead ( rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data, rm_ob1203_light_data_type_t type )
```

Reads Light ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Light mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements [rm\\_ob1203\\_api\\_t::lightRead](#).

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_OB1203\_LightDataCalculate()

```
fsp_err_t RM_OB1203_LightDataCalculate ( rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data, rm_ob1203_light_data_t *const p_ob1203_data )
```

Calculate light data from raw data. Implements [rm\\_ob1203\\_api\\_t::lightDataCalculate](#).

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM\_OB1203\_ProxRead()**

```
fsp_err_t RM_OB1203_ProxRead ( rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data )
```

Reads Proximity ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Proximity mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements `rm_ob1203_api_t::proxRead`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM\_OB1203\_ProxDataCalculate()**

```
fsp_err_t RM_OB1203_ProxDataCalculate ( rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data, rm_ob1203_prox_data_t *const p_ob1203_data )
```

Calculate proximity data from raw data. Implements `rm_ob1203_api_t::proxDataCalculate`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM\_OB1203\_PpgRead()**

```
fsp_err_t RM_OB1203_PpgRead ( rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data, uint8_t const number_of_samples )
```

Reads PPG ADC data from OB1203 device. One sample requires three bytes. 0 cannot set to the number of samples. Implements `rm_ob1203_api_t::ppgRead`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM\_OB1203\_PpgDataCalculate()**

```
fsp_err_t RM_OB1203_PpgDataCalculate ( rm_ob1203_ctrl_t *const p_api_ctrl,
rm_ob1203_raw_data_t *const p_raw_data, rm_ob1203_ppg_data_t *const p_ob1203_data )
```

Calculate PPG data from raw data. Implements `rm_ob1203_api_t::ppgDataCalculate`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM\_OB1203\_GainSet()**

```
fsp_err_t RM_OB1203_GainSet ( rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_gain_t const gain )
```

Set gain. This function should be called after calling `RM_OB1203_MeasurementStop()`. In RTOS and Light Proximity mode, blocks 2 bytes on the I2C bus. Implements `rm_ob1203_api_t::gainSet`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM\_OB1203\_LedCurrentSet()**

```
fsp_err_t RM_OB1203_LedCurrentSet ( rm_ob1203_ctrl_t *const p_api_ctrl,
rm_ob1203_led_current_t const led_current )
```

Set currents. This function should be called after calling `RM_OB1203_MeasurementStop()`. Implements `rm_ob1203_api_t::ledCurrentSet`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM\_OB1203\_DeviceInterruptCfgSet()**

```
fsp_err_t RM_OB1203_DeviceInterruptCfgSet ( rm_ob1203_ctrl_t *const p_api_ctrl,
rm_ob1203_device_interrupt_cfg_t const interrupt_cfg )
```

Set device interrupt configurations. This function should be called after calling `RM_OB1203_MeasurementStop()`. Implements `rm_ob1203_api_t::deviceInterruptCfgSet`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM\_OB1203\_FifoInfoGet()**

```
fsp_err_t RM_OB1203_FifoInfoGet ( rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_fifo_info_t
*const p_fifo_info )
```

Get FIFO information from OB1203 device. Implements `rm_ob1203_api_t::fifoInfoGet`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM\_OB1203\_DeviceStatusGet()**

```
fsp_err_t RM_OB1203_DeviceStatusGet ( rm_ob1203_ctrl_t *const p_api_ctrl,
rm_ob1203_device_status_t *const p_status )
```

Get device status from OB1203 device. Clear all interrupt bits. Implements `rm_ob1203_api_t::deviceStatusGet`.

**Return values**

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

#### 4.2.15.4 ZMOD4XXX Gas Sensor (rm\_zmod4xxx)

Modules » Sensor

##### Functions

`fsp_err_t RM_ZMOD4XXX_Open (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_cfg_t const *const p_cfg)`

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements `rm_zmod4xxx_api_t::open`. [More...](#)

`fsp_err_t RM_ZMOD4XXX_Close (rm_zmod4xxx_ctrl_t *const p_api_ctrl)`

This function should be called when close the sensor. Implements `rm_zmod4xxx_api_t::close`. [More...](#)

`fsp_err_t RM_ZMOD4XXX_MeasurementStart (rm_zmod4xxx_ctrl_t *const p_api_ctrl)`

This function should be called when start a measurement. Implements `rm_zmod4xxx_api_t::measurementStart`. [More...](#)

`fsp_err_t RM_ZMOD4XXX_MeasurementStop (rm_zmod4xxx_ctrl_t *const p_api_ctrl)`

This function should be called when stop a measurement. Implements `rm_zmod4xxx_api_t::measurementStop`. [More...](#)

`fsp_err_t RM_ZMOD4XXX_StatusCheck (rm_zmod4xxx_ctrl_t *const p_api_ctrl)`

This function should be called when polling is used. It reads the status of sensor. Implements `rm_zmod4xxx_api_t::statusCheck`. [More...](#)

`fsp_err_t RM_ZMOD4XXX_Read (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data)`

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::read`. [More...](#)

`fsp_err_t RM_ZMOD4XXX_Iaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_1st_data_t *const p_zmod4xxx_data)`

This function should be called when measurement finishes. To check

measurement status either polling or busy/interrupt pin can be used. Implements [rm\\_zmod4xxx\\_api\\_t::iaq1stGenDataCalculate](#). [More...](#)

`fsp_err_t` [RM\\_ZMOD4XXX\\_Iaq2ndGenDataCalculate](#) (`rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_2nd_data_t *const p_zmod4xxx_data`)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm\\_zmod4xxx\\_api\\_t::iaq2ndGenDataCalculate](#). [More...](#)

`fsp_err_t` [RM\\_ZMOD4XXX\\_OdorDataCalculate](#) (`rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_odor_data_t *const p_zmod4xxx_data`)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm\\_zmod4xxx\\_api\\_t::odorDataCalculate](#). [More...](#)

`fsp_err_t` [RM\\_ZMOD4XXX\\_SulfurOdorDataCalculate](#) (`rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_sulfur_odor_data_t *const p_zmod4xxx_data`)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm\\_zmod4xxx\\_api\\_t::sulfurOdorDataCalculate](#). [More...](#)

`fsp_err_t` [RM\\_ZMOD4XXX\\_Oaq1stGenDataCalculate](#) (`rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_oaq_1st_data_t *const p_zmod4xxx_data`)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm\\_zmod4xxx\\_api\\_t::oaq1stGenDataCalculate](#). [More...](#)

`fsp_err_t` [RM\\_ZMOD4XXX\\_Oaq2ndGenDataCalculate](#) (`rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_oaq_2nd_data_t *const p_zmod4xxx_data`)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm\\_zmod4xxx\\_api\\_t::oaq2ndGenDataCalculate](#). [More...](#)

`fsp_err_t` [RM\\_ZMOD4XXX\\_TemperatureAndHumiditySet](#) (`rm_zmod4xxx_ctrl_t *const p_api_ctrl, float temperature, float humidity`)

This function is valid only for OAQ\_2nd\_Gen and IAQ\_2nd\_Gen\_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements [rm\\_zmod4xxx\\_api\\_t::temperatureAndHumiditySet](#).

[More...](#)

`fsp_err_t RM_ZMOD4XXX_DeviceErrorCheck (rm_zmod4xxx_ctrl_t *const p_api_ctrl)`

This function is valid only for IAQ\_2nd\_Gen and IAQ\_2nd\_Gen\_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting invalid ADC data. Implements `rm_zmod4xxx_api_t::deviceErrorCheck`. [More...](#)

## Detailed Description

Middleware to implement the ZMOD4XXX sensor interface. This module implements the [ZMOD4XXX Middleware Interface](#).

## Overview

This module provides an API for configuring and controlling the ZMOD4XXX sensor. Supported ZMOD4XXX sensors are below.

- ZMOD4410
- ZMOD4510

I2C communication with the ZMOD4XXX sensor is realized by connecting with the `rm_comms_i2c` module.

## Features

The ZMOD4XXX sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start a measurement at any time
- Read status register for wait until the measurement is done. This will also be signaled by an interrupt
- Get the ADC data from the sensor
- Input the ADC data and acquire the air quality values by calculation in the library.

## Configuration

`RM_ZMOD4XXX_CFG_OPERATION_MODE` is set according to the library selected.

### Build Time Configurations for `rm_zmod4xxx`

The following build time configurations are defined in `fsp_cfg/rm_zmod4xxx_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

## Build Time Configurations for rm\_zmod4410\_iaq\_1st

The following build time configurations are defined in fsp\_cfg/rm\_zmod4xxx\_lib\_cfg.h:

Configuration	Options	Default	Description
[DEPRECATED] Power mode (This will be removed in FSP v4.0.0)	<ul style="list-style-type: none"> <li>Continuous</li> <li>Low Power</li> </ul>	Continuous	Select power mode

## Configurations for Sensor > ZMOD4XXX Gas Sensor (rm\_zmod4xxx)

This module can be added to the Stacks tab via New Stack > Sensor > ZMOD4XXX Gas Sensor (rm\_zmod4xxx).

Configuration	Options	Default	Description
Name	Manual Entry	g_zmod4xxx_sensor0	Module name.
Comms I2C Callback	Name must be a valid C symbol	zmod4xxx_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	zmod4xxx_irq_callback	A user IRQ callback function can be provided.

## Configurations for Sensor > ZMOD4410 IAQ 1st Generation (rm\_zmod4xxx)

Configuration	Options	Default	Description
Operation Mode	<ul style="list-style-type: none"> <li>Continuous</li> <li>Low Power</li> </ul>	Continuous	Select the operation mode.

## Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

## Usage Notes

[ZMOD4410 datasheet is here.](#)

The ZMOD4410 has five modes of operation.

The ZMOD4410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

Method	Description
IAQ 1st Generation Continuous	Measurement of UBA levels for IAQ and eCO <sub>2</sub> , provides continuous data
IAQ 1st Generation Low Power	Measurement of UBA levels for IAQ and eCO <sub>2</sub> , fixed sampling interval of 6 seconds

IAQ 2nd Generation	Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs)
IAQ 2nd Generation Ultra Low Power	Using AI for improved ppm TVOC, IAQ and eCO2 functionality. This method offers a much lower power consumption
Odor	Control signal based on Air Quality Changes
Sulfur-based Odor Discrimination	The odors in "sulfur" (sulfur based) and "acceptable" (organic based) and shows an intensity level of the smell

[ZMOD4510 datasheet is here.](#)

The ZMOD4510 has two modes of operation.

The ZMOD4510 in OAQ 1st Gen operation will respond to typical outdoor gases after a warm-up time of 60 min, consisting of 20 min for stabilization and 40 min for baseline finding.

For OAQ 2nd Gen operation a response to ozone will be seen after a warmup time of 30 min.

In all operation modes a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

Method	Description
OAQ 1st Generation	Measurement of Air Quality
OAQ 2nd Generation	Selective Ozone featuring Ultra-Low Power

A library corresponding to each of these modes is required. By setting in RA Configuration, the library will be generated in the ra/fsp/lib/rm\_zmod4xxx folder of your project.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

## Bus Initialization

The ZMOD4XXX interface expects a bus instance to be opened before opening any ZMOD4XXX device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

## Initialization

Initialize with [RM\\_ZMOD4XXX\\_Open\(\)](#). One channel of timer is required to measure the waiting time at initialization.

## From measurement start to data acquisition

After normal completion, start the measurement with [RM\\_ZMOD4XXX\\_MeasurementStart\(\)](#). An endless loop continuously checks the status of the ZMOD4XXX sensor and reads its data. The raw data is subsequently processed, and the air quality values are calculated.

## If IRQ is enabled

1. Call [RM\\_ZMOD4XXX\\_MeasurementStart\(\)](#).

2. Wait until `RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE` is received via IRQ callback.
3. Call `RM_ZMOD4XXX_Read()`. This function will read the ADC data.
4. Wait until `RM_ZMOD4XXX_EVENT_SUCCESS` is received.
5. Call the DataCalculate API according to the mode.

### If IRQ is disabled

1. Call `RM_ZMOD4XXX_MeasurementStart()`.
2. Wait until `RM_ZMOD4XXX_EVENT_SUCCESS` is received.
3. Call `RM_ZMOD4XXX_StatusCheck()`. This function will execute a status check over I2C.
4. If `RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE` is received in callback, user should wait some time and then call `RM_ZMOD4XXX_StatusCheck()` again.
5. Wait until `RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE` is received.
6. Call `RM_ZMOD4XXX_Read()` and read the ADC data.
7. Wait until `RM_ZMOD4XXX_EVENT_SUCCESS` is received.
8. Call the DataCalculate API according to the mode.

### Checking device error for IAQ 2nd Gen.

1. Call `RM_ZMOD4XXX_DeviceErrorCheck()`. This function will execute a device error check over I2C.
2. If any device error occurs, `RM_ZMOD4XXX_EVENT_DEV_ERR_POWER_ON_RESET` or `RM_ZMOD4XXX_EVENT_DEV_ERR_ACCESS_CONFLICT` are received in callback. If no device error, `RM_ZMOD4XXX_EVENT_SUCCESS` is received in callback.

## Examples

### Basic Example

These are basic examples of minimal use of ZMOD4XXX sensor implementation in an application.

#### IAQ 1st Gen. Continuous mode

```
void rm_zmod4xxx_iaq_1st_gen_continuous_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    rm_zmod4xxx_raw_data_t  raw_data;
    rm_zmod4xxx_iaq_1st_data_t zmod4410_data;
    /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
        (rm_comms_i2c_bus_extended_cfg_t *)
g_zmod4xxx_cfg.p_comms_instance->p_cfg->p_extend;
    i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
}
```

```
#if BSP_CFG_RTOS

/* Create a semaphore for blocking if a semaphore is not NULL */

## Data Structures

struct [rm\\_zmod4xxx\\_init\\_process\\_params\\_t](#)

struct [rm\\_zmod4xxx\\_instance\\_ctrl\\_t](#)

## Enumerations

enum [rm\\_zmod4xxx\\_lib\\_type\\_t](#)

## Data Structure Documentation

### ◆ [rm\\_zmod4xxx\\_init\\_process\\_params\\_t](#)

struct <a href="#">rm_zmod4xxx_init_process_params_t</a>		
ZMOD4XXX initialization process block		
Data Fields		
volatile uint32_t	delay_ms	Delay milliseconds.
volatile bool	communication_finished	Communication flag for blocking.
volatile bool	measurement_finished	IRQ flag.
volatile <a href="#">rm_zmod4xxx_event_t</a>	event	Callback event.

### ◆ [rm\\_zmod4xxx\\_instance\\_ctrl\\_t](#)

struct <a href="#">rm_zmod4xxx_instance_ctrl_t</a>		
ZMOD4XXX control block		
<b>Data Fields</b>		
uint32_t	<a href="#">open</a>	Open flag.
uint8_t	<a href="#">buf</a> [RM_ZMOD4XXX_MAX_I2C_BUF_SIZE]	Buffer for I2C communications.

uint8_t	<a href="#">register_address</a>
	Register address to access.
rm_zmod4xxx_status_params_t	<a href="#">status</a>
	Status parameter.
volatile bool	<a href="#">dev_err_check</a>
	Flag for checking device error.
volatile rm_zmod4xxx_event_t	<a href="#">event</a>
	Callback event.
rm_zmod4xxx_init_process_params_t	<a href="#">init_process_params</a>
	For the initialization process.
rm_zmod4xxx_cfg_t const *	<a href="#">p_cfg</a>
	Pointer of configuration block.
rm_comms_instance_t const *	<a href="#">p_comms_i2c_instance</a>
	Pointer of I2C Communications Middleware instance structure.
rm_zmod4xxx_lib_extended_cfg_t *	<a href="#">p_zmod4xxx_lib</a>
	Pointer of ZMOD4XXX Lib extended configuration.
void const *	<a href="#">p_irq_instance</a>
	Pointer to IRQ instance.

void const *	<a href="#">p_context</a>
	Pointer to the user-provided context.
void(*	<a href="#">p_comms_callback</a> )(rm_zmod4xxx_callback_args_t *p_args)
	I2C Communications callback.
void(*	<a href="#">p_irq_callback</a> )(rm_zmod4xxx_callback_args_t *p_args)
	IRQ callback.

## Enumeration Type Documentation

### ◆ [rm\\_zmod4xxx\\_lib\\_type\\_t](#)

enum <a href="#">rm_zmod4xxx_lib_type_t</a>
ZMOD4XXX Library type

## Function Documentation

### ◆ [RM\\_ZMOD4XXX\\_Open\(\)](#)

[fsp\\_err\\_t](#) [RM\\_ZMOD4XXX\\_Open](#) ( [rm\\_zmod4xxx\\_ctrl\\_t](#) \*const [p\\_api\\_ctrl](#), [rm\\_zmod4xxx\\_cfg\\_t](#) const \*const [p\\_cfg](#) )

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements [rm\\_zmod4xxx\\_api\\_t::open](#).

#### Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Unsupport product ID.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ **RM\_ZMOD4XXX\_Close()**

```
fsp_err_t RM_ZMOD4XXX_Close ( rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function should be called when close the sensor. Implements `rm_zmod4xxx_api_t::close`.

**Return values**

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_ZMOD4XXX\_MeasurementStart()**

```
fsp_err_t RM_ZMOD4XXX_MeasurementStart ( rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function should be called when start a measurement. Implements `rm_zmod4xxx_api_t::measurementStart`.

**Return values**

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ **RM\_ZMOD4XXX\_MeasurementStop()**

```
fsp_err_t RM_ZMOD4XXX_MeasurementStop ( rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function should be called when stop a measurement. Implements `rm_zmod4xxx_api_t::measurementStop`.

**Return values**

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

### ◆ RM\_ZMOD4XXX\_StatusCheck()

```
fsp_err_t RM_ZMOD4XXX_StatusCheck ( rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function should be called when polling is used. It reads the status of sensor. Implements `rm_zmod4xxx_api_t::statusCheck`.

#### Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

### ◆ RM\_ZMOD4XXX\_Read()

```
fsp_err_t RM_ZMOD4XXX_Read ( rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::read`.

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

### ◆ RM\_ZMOD4XXX\_Iaq1stGenDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_Iaq1stGenDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_1st_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::iaq1stGenDataCalculate`.

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_ZMOD4XXX\_Iaq2ndGenDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_Iaq2ndGenDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_2nd_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::iaq2ndGenDataCalculate`.

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_ZMOD4XXX\_OdorDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_OdorDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_odor_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::odorDataCalculate`.

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_ZMOD4XXX\_SulfurOdorDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_SulfurOdorDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_sulfur_odor_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::sulfurOdorDataCalculate`.

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_ZMOD4XXX\_Oaq1stGenDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_Oaq1stGenDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_oaq_1st_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm\\_zmod4xxx\\_api\\_t::oaq1stGenDataCalculate](#).

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_ZMOD4XXX\_Oaq2ndGenDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_Oaq2ndGenDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_oaq_2nd_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm\\_zmod4xxx\\_api\\_t::oaq2ndGenDataCalculate](#).

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_ZMOD4XXX\_TemperatureAndHumiditySet()

```
fsp_err_t RM_ZMOD4XXX_TemperatureAndHumiditySet ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
float temperature, float humidity )
```

This function is valid only for OAQ\_2nd\_Gen and IAQ\_2nd\_Gen\_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements `rm_zmod4xxx_api_t::temperatureAndHumiditySet`.

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

### ◆ RM\_ZMOD4XXX\_DeviceErrorCheck()

```
fsp_err_t RM_ZMOD4XXX_DeviceErrorCheck ( rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function is valid only for IAQ\_2nd\_Gen and IAQ\_2nd\_Gen\_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements `rm_zmod4xxx_api_t::deviceErrorCheck`.

#### Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

## 4.2.16 Storage

### Modules

#### Detailed Description

Storage Modules.

#### Modules

Block Media Custom Implementation (`rm_block_media_user`)

Middleware that implements a block media interface on the media of your choice. This module implements the [Block Media Interface](#).

#### [Block Media SD/MMC \(rm\\_block\\_media\\_sdmmc\)](#)

Middleware to implement the block media interface on SD cards. This module implements the [Block Media Interface](#).

#### [Block Media SPI Flash \(rm\\_block\\_media\\_spi\)](#)

Middleware to implement the block media interface on SPI flash memory. This module implements the [Block Media Interface](#).

#### [Block Media USB \(rm\\_block\\_media\\_usb\)](#)

Middleware to implement the block media interface on USB mass storage devices. This module implements the [Block Media Interface](#).

#### [FileX I/O \(rm\\_filex\\_block\\_media\)](#)

Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.

#### [FileX I/O \(rm\\_filex\\_levelx\\_nor\)](#)

Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.

#### [Flash \(r\\_flash\\_hp\)](#)

Driver for the flash memory on RA high-performance MCUs. This module implements the [Flash Interface](#).

#### [Flash \(r\\_flash\\_lp\)](#)

Driver for the flash memory on RA low-power MCUs. This module implements the [Flash Interface](#).

#### [FreeRTOS+FAT Port for RA \(rm\\_freertos\\_plus\\_fat\)](#)

Middleware for the FAT File System control on RA MCUs.

#### [LevelX NOR Port \(rm\\_levelx\\_nor\\_spi\)](#)

Middleware for using Azure RTOS LevelX on NOR SPI memory.

### LittleFS on Flash (rm\_littlefs\_flash)

Middleware for the LittleFS File System control on RA MCUs.

### OSPI Flash (r\_ospi)

Driver for the OSPI peripheral on RA MCUs. This module implements the [SPI Flash Interface](#).

### QSPI (r\_qspi)

Driver for the QSPI peripheral on RA MCUs. This module implements the [SPI Flash Interface](#).

### SD/MMC (r\_sdhi)

Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the [SD/MMC Interface](#).

### Virtual EEPROM on Flash (rm\_vee\_flash)

Virtual EEPROM on RA MCUs. This module implements the [Virtual EEPROM Interface](#).

#### 4.2.16.1 Block Media Custom Implementation (rm\_block\_media\_user)

[Modules](#) » [Storage](#)

Middleware that implements a block media interface on the media of your choice. This module implements the [Block Media Interface](#).

## Overview

### Features

This module is for using Block media with user-selected media.

## Configuration

Block Media User has no output config settings.

The user is required to create the config settings etc. in the application.

The figure below is an example of the config definition when the user media in USB PMSC is RAM.

```
const rm_block_media_api_t g_rm_block_media_on_user_media =
```

```
{
    .open      = RM_BLOCK_MEDIA_RAM_Open,
    .mediaInit = RM_BLOCK_MEDIA_RAM_MediaInit,
    .read      = RM_BLOCK_MEDIA_RAM_Read,
    .write     = RM_BLOCK_MEDIA_RAM_Write,
    .erase     = RM_BLOCK_MEDIA_RAM_Erase,
    .infoGet   = RM_BLOCK_MEDIA_RAM_InfoGet,
    .statusGet = RM_BLOCK_MEDIA_RAM_StatusGet,
    .close     = RM_BLOCK_MEDIA_RAM_Close,
};

extern void r_usb_pmsc_block_media_event_callback(rm_block_media_callback_args_t *
p_args);

const rm_block_media_cfg_t g_rm_block_media0_cfg =
{.p_extend = NULL, .p_callback = r_usb_pmsc_block_media_event_callback, .p_context =
NULL, };

rm_block_media_instance_t g_rm_block_media0 =
{.p_api = &g_rm_block_media_on_user_media, .p_ctrl = NULL, .p_cfg =
&g_rm_block_media0_cfg, };
```

#### Note

*If you use `block_media_user`, you need to create a function that matches the media you are using. In the above example, this is the function with `RM_BLOCK_MEDIA_`. Register the created function in `rm_block_media_api_t`. The registered `rm_block_media_api_t` is registered in `p_api`, which is a member of `rm_block_media_instance_t`.*

## Clock Configuration

This module has no required clock configurations.

## Pin Configuration

This module does not use I/O pins.

## Examples

### Basic Example

Please refer to [USB PMSC \(r\\_usb\\_pmsc\)](#) for the PMSC application given as an example.

## 4.2.16.2 Block Media SD/MMC (rm\_block\_media\_sdmmc)

### Detailed Description

Middleware to implement the block media interface on SD cards. This module implements the [Block Media Interface](#).

## Overview

### Features

The SD/MMC implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from an SD card
- Callback called when card insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

## Configuration

### Build Time Configurations for rm\_block\_media\_sdmmc

The following build time configurations are defined in driver/rm\_block\_media\_sdmmc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Storage > Block Media SD/MMC (rm\_block\_media\_sdmmc)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SD/MMC (rm\_block\_media\_sdmmc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

## Examples

### Basic Example

This is a basic example of minimal use of the SD/MMC block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE (512)

uint8_t g_dest[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;

void rm_block_media_sdmmc_basic_example (void)
{
```

```
/* Initialize g_src to known data */
for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE; i++)
{
    g_src[i] = (uint8_t) ('A' + (i % 26));
}

/* Open the RM_BLOCK_MEDIA_SDMMC driver. */
fsp_err_t err = RM_BLOCK_MEDIA_SDMMC_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
* "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

/* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
err = RM_BLOCK_MEDIA_SDMMC_MediaInit(&g_rm_block_media0_ctrl);
assert(FSP_SUCCESS == err);

/* Write a block of data to sector 3 of an SD card. */
err = RM_BLOCK_MEDIA_SDMMC_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
assert(FSP_SUCCESS == err);

/* Read a block of data from sector 3 of an SD card. */
err = RM_BLOCK_MEDIA_SDMMC_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
assert(FSP_SUCCESS == err);
}
```

## Function Documentation

---

◆ **RM\_BLOCK\_MEDIA\_SDMMC\_Open()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Open ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_cfg_t const *const p_cfg )
```

Opens the module.

Implements `rm_block_media_api_t::open()`.

**Return values**

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `sdmmc_api_t::open`

◆ **RM\_BLOCK\_MEDIA\_SDMMC\_MediaInit()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_MediaInit ( rm_block_media_ctrl_t *const p_ctrl)
```

Initializes the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements `rm_block_media_api_t::mediaInit()`.

**Return values**

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `sdmmc_api_t::mediaInit`

◆ **RM\_BLOCK\_MEDIA\_SDMMC\_Read()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Read ( rm_block_media_ctrl_t *const p_ctrl, uint8_t *const
p_dest_address, uint32_t const block_address, uint32_t const num_blocks )
```

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements [rm\\_block\\_media\\_api\\_t::read\(\)](#).

**Return values**

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [sdmmc\\_api\\_t::read](#)

◆ **RM\_BLOCK\_MEDIA\_SDMMC\_Write()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Write ( rm_block_media_ctrl_t *const p_ctrl, uint8_t const
*const p_src_address, uint32_t const block_address, uint32_t const num_blocks )
```

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements [rm\\_block\\_media\\_api\\_t::write\(\)](#).

**Return values**

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [sdmmc\\_api\\_t::write](#)

◆ **RM\_BLOCK\_MEDIA\_SDMMC\_Erase()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Erase ( rm_block_media_ctrl_t *const p_ctrl, uint32_t const
block_address, uint32_t const num_blocks )
```

Erases sectors of an SD card or eMMC device. Implements [rm\\_block\\_media\\_api\\_t::erase\(\)](#).

**Return values**

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [sdmmc\\_api\\_t::erase](#)
- [sdmmc\\_api\\_t::statusGet](#)

◆ **RM\_BLOCK\_MEDIA\_SDMMC\_CallbackSet()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_CallbackSet ( rm_block_media_ctrl_t *const p_ctrl,
void(*) (rm_block_media_callback_args_t *) p_callback, void const *const p_context,
rm_block_media_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements [rm\\_block\\_media\\_api\\_t::callbackSet](#).

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **RM\_BLOCK\_MEDIA\_SDMMC\_StatusGet()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_StatusGet ( rm_block_media_ctrl_t *const p_api_ctrl,
rm_block_media_status_t *const p_status )
```

Provides driver status. Implements `rm_block_media_api_t::statusGet()`.

**Return values**

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_BLOCK\_MEDIA\_SDMMC\_InfoGet()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_InfoGet ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_info_t *const p_info )
```

Retrieves module information. Implements `rm_block_media_api_t::infoGet()`.

**Return values**

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ **RM\_BLOCK\_MEDIA\_SDMMC\_Close()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Close ( rm_block_media_ctrl_t *const p_ctrl)
```

Closes an open SD/MMC device. Implements `rm_block_media_api_t::close()`.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

**4.2.16.3 Block Media SPI Flash (rm\_block\_media\_spi)**

Modules » [Storage](#)

## Functions

fsp_err_t	RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)
fsp_err_t	RM_BLOCK_MEDIA_SPI_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info)
fsp_err_t	RM_BLOCK_MEDIA_SPI_MediaInit (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Read (rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_StatusGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const p_ctrl, void(*p_callback)(rm_block_media_callback_args_t *), void const *const p_context, rm_block_media_callback_args_t *const p_callback_memory)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const start_block, uint32_t const num_blocks)

## Detailed Description

Middleware to implement the block media interface on SPI flash memory. This module implements the [Block Media Interface](#).

## Overview

### Features

The SPI implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from SPI flash memory
- Provides media information such as sector size and total number of sectors.

*Note*

*By default, Block Media SPI Read, Write, and Erase are blocking operations. Non-blocking operation may be achieved by yielding control within the optional callback function.*

## Configuration

### Build Time Configurations for rm\_block\_media\_spi

The following build time configurations are defined in driver/rm\_block\_media\_spi\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected, code for parameter checking is included in the build

### Configurations for Storage > Block Media SPI Flash (rm\_block\_media\_spi)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SPI Flash (rm\_block\_media\_spi).

Configuration	Options	Default	Description
Module Instance Name	Name must be a valid C symbol	g_rm_block_media0	Module name
Block size (bytes)	Manual Entry	4096	Specify the size of a block in bytes.
Block count	Minimum block count is 1, maximum is defined by hardware and software design.	8192	Number of blocks available for use by this driver instance.
Base Address	Manual Entry	0	Base address offset (bytes) for instance memory region.
Callback Function	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback is provided, it will be called after the completion of Read, Write, and Erase operations, or anytime these functions are waiting on hardware.
[DEPRECATED] Callback Context	Name must be a valid C symbol	NULL	A user specified context that will be provided back to the user when a callback occurs.

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

## Limitations

Developers should be aware of the following limitations when using RM\_BLOCK\_MEDIA\_SPI:

- Getting and setting Block Protection or Advanced Sector Protection modes is not supported.
- Addressing QSPI memory address ranges greater than 64 MB (one bank) is not supported.

## Examples

### Basic Example

This is a basic example of minimal use of the SPI block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SPI_BLOCK_SIZE (256U)
uint8_t g_dest[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_spi_basic_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the RM_BLOCK_MEDIA_SPI driver. */
    fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
    &g_rm_block_media0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Write a block of data to block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);

    /* Read a block of data from block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

```
}
```

## Non-Blocking Example

This is a basic example of using the optional SPI callback to impliment non-blocking operation.

```
#define RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT 0x1000
void rm_block_media_spi_non_blocking_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the RM_BLOCK_MEDIA_SPI driver. This enables the card detection interrupt. */
    fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
    &g_rm_block_media0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize the Block Media SPI driver. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Erase a large quantity of data from SPI Flash Memory */
    err = RM_BLOCK_MEDIA_SPI_Erase(&g_rm_block_media0_ctrl, 0,
    RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT);
    assert(FSP_SUCCESS == err);
}

/* The optional callback is invoked for Read, Write, and Erase operations, whenever
the operation completes or has
* been blocked by the lower level SPI driver busy indication.
*/
void rm_block_media_spi_example_callback (rm_block_media_callback_args_t * p_args)
{
    if (RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE == p_args->event)
    {
```

```
/* TODO: Process operation complete. */
}
else if (RM_BLOCK_MEDIA_EVENT_POLL_STATUS == p_args->event)
{
    rm_block_media_status_t status;
    rm_block_media_ctrl_t * p_ctrl = (rm_block_media_ctrl_t *) p_args->p_context;
    fsp_err_t err = RM_BLOCK_MEDIA_SPI_StatusGet(p_ctrl, &status);
    assert(FSP_SUCCESS == err);
    if (true == status.busy)
    {
        /* Run waiting tasks */
        vTaskSuspend(xTaskGetCurrentTaskHandle());
    }
}
else
{
    assert(RM_BLOCK_MEDIA_EVENT_ERROR == p_args->event);
    /* TODO: Process Read, Write, or Erase error. */
}
}
```

## Function Documentation

---

◆ **RM\_BLOCK\_MEDIA\_SPI\_Open()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Open ( rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t
const *const p_cfg )
```

Parameter checking and Acquires mutex, then handles driver initialization at the HAL SPI layer and marking the open flag in control block.

Implements `rm_block_media_api_t::open`.

**Return values**

FSP_SUCCESS	Block media for SPI framework is successfully opened.
FSP_ERR_ASSERTION	One of the input parameters or their data references may be null.
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. See HAL driver for other possible causes.

**Returns**

See [Common Error Codes](#) or HAL driver for other possible return codes or causes. This function calls

- `spi_flash_api_t::open`

◆ **RM\_BLOCK\_MEDIA\_SPI\_InfoGet()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_InfoGet ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_info_t *const p_info )
```

Retrieves module information.

Implements `rm_block_media_api_t::infoGet`.

**Return values**

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ **RM\_BLOCK\_MEDIA\_SPI\_MediaInit()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_MediaInit ( rm_block_media_ctrl_t *const p_ctrl)
```

Initializes the Block Media SPI Flash device.

Implements `rm_block_media_api_t::mediaInit`.

**Return values**

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_BLOCK\_MEDIA\_SPI\_Read()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Read ( rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest,
uint32_t const start_block, uint32_t const num_blocks )
```

Reads a number of blocks from spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements `rm_block_media_api_t::read`.

**Return values**

FSP_SUCCESS	SPI data read successfully
FSP_ERR_ASSERTION	p_ctrl or p_dest is NULL, or num_blocks is zero
FSP_ERR_NOT_OPEN	Block Media SPI module is not yet open
FSP_ERR_INVALID_ADDRESS	Invalid address range for read operation
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

◆ **RM\_BLOCK\_MEDIA\_SPI\_StatusGet()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_StatusGet ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_status_t *const p_status )
```

Provides driver status.

Implements `rm_block_media_api_t::statusGet`.

**Return values**

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

**Returns**

See [Common Error Codes](#) or HAL driver for other possible return codes or causes. This function calls

- `spi_flash_api_t::statusGet`

◆ **RM\_BLOCK\_MEDIA\_SPI\_Write()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Write ( rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const
p_src, uint32_t const start_block, uint32_t const num_blocks )
```

Writes provided data to a number of blocks of spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements `rm_block_media_api_t::write`.

**Return values**

FSP_SUCCESS	Flash write finished successfully.
FSP_ERR_ASSERTION	p_ctrl or p_src is NULL. Or num_blocks is zero.
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

**Returns**

See [Common Error Codes](#) or HAL driver for other possible return codes or causes. This function calls

- `spi_flash_api_t::write`

◆ **RM\_BLOCK\_MEDIA\_SPI\_CallbackSet()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_CallbackSet ( rm_block_media_ctrl_t *const p_ctrl,
void(*) (rm_block_media_callback_args_t *) p_callback, void const *const p_context,
rm_block_media_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. API not supported.

Implements `rm_block_media_api_t::callbackSet`.

**Return values**

FSP_ERR_UNSUPPORTED	API not supported by RM_BLOCK_MEDIA_SPI.
---------------------	--

◆ **RM\_BLOCK\_MEDIA\_SPI\_Close()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Close ( rm_block_media_ctrl_t *const p_ctrl)
```

Closes the Block Media SPI device. Implements `rm_block_media_api_t::close`.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	One of the following parameters may be null: <code>p_ctrl</code> .
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.

**Returns**

See [Common Error Codes](#) or HAL driver for other possible return codes or causes. This function calls

- `spi_flash_api_t::close`

### ◆ RM\_BLOCK\_MEDIA\_SPI\_Erase()

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Erase ( rm_block_media_ctrl_t *const p_ctrl, uint32_t const
start_block, uint32_t const num_blocks )
```

This function erases blocks of the SPI device. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements `rm_block_media_api_t::erase`.

#### Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `spi_flash_api_t::erase`
- `spi_flash_api_t::statusGet`

## 4.2.16.4 Block Media USB (rm\_block\_media\_usb)

Modules » Storage

### Functions

```
fsp_err_t RM_BLOCK_MEDIA_USB_Open (rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_MediaInit (rm_block_media_ctrl_t *const
p_ctrl)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_Read (rm_block_media_ctrl_t *const p_ctrl,

```

```
fsp_err_t RM_BLOCK_MEDIA_USB_InfoGet (rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_info_t *const p_info)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_Close (rm_block_media_ctrl_t *const p_ctrl)
```

## Detailed Description

Middleware to implement the block media interface on USB mass storage devices. This module implements the [Block Media Interface](#).

## Overview

### Features

The USB implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from a USB mass storage device
- Callback called when device insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

## Configuration

### Build Time Configurations for rm\_block\_media\_usb

The following build time configurations are defined in driver/rm\_block\_media\_usb\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Storage > Block Media USB (rm\_block\_media\_usb)

This module can be added to the Stacks tab via New Stack > Storage > Block Media USB (rm\_block\_media\_usb).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this

callback function is provided, it will be called when a device is attached or removed.

A user context can be provided. If this context is provided, it will be passed to callback function when a device is attached or removed.

Pointer to user context    Name must be a valid C symbol    NULL

#### Note

*RM\_BLOCK\_MEDIA\_USB\_MediaInit function must be called after receiving the insert event notification.*

## Clock Configuration

This module has no required clock configurations.

## Pin Configuration

This module does not use I/O pins.

## Examples

### Basic Example

This is a basic example of minimal use of the USB mass storage block media implementation in an application.

```
#define RM_BLOCK_MEDIA_USB_BLOCK_SIZE (512)
volatile bool g_usb_inserted = false;
uint8_t      g_dest[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t      g_src[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_usb_basic_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < RM_BLOCK_MEDIA_USB_BLOCK_SIZE; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Open the RM_BLOCK_MEDIA_USB driver. */
    fsp_err_t err = RM_BLOCK_MEDIA_USB_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
    /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
while (!g_usb_inserted)
    {
    /* Wait for a card insertion interrupt. */
    }

    /* Initialize the mass storage device. This should not be done until the device is
plugged in and initialized. */
    err = RM_BLOCK_MEDIA_USB_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Write a block of data to sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);

    /* Read a block of data from sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

## Device Insertion

This is an example of using a callback to determine when a mass storage device is plugged in and enumerated.

```
/* The callback is called when a media insertion event occurs. */
void rm_block_media_usb_media_insertion_example_callback
(rm_block_media_callback_args_t * p_args)
{
    if (RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED == p_args->event)
    {
        g_usb_inserted = true;
    }

    if (RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED == p_args->event)
    {
        g_usb_inserted = false;
    }
}
```

## Function Documentation

### ◆ RM\_BLOCK\_MEDIA\_USB\_Open()

```
fsp_err_t RM_BLOCK_MEDIA_USB_Open ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_cfg_t const *const p_cfg )
```

Opens the module.

Implements `rm_block_media_api_t::open()`.

#### Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

### ◆ RM\_BLOCK\_MEDIA\_USB\_MediaInit()

```
fsp_err_t RM_BLOCK_MEDIA_USB_MediaInit ( rm_block_media_ctrl_t *const p_ctrl)
```

Initializes the USB device.

Implements `rm_block_media_api_t::mediaInit()`.

#### Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM\_BLOCK\_MEDIA\_USB\_Read()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_Read ( rm_block_media_ctrl_t *const p_ctrl, uint8_t *const
p_dest_address, uint32_t const block_address, uint32_t const num_blocks )
```

Reads data from an USB device. Implements `rm_block_media_api_t::read()`.

This function blocks until the data is read into the destination buffer.

**Return values**

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM\_BLOCK\_MEDIA\_USB\_Write()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_Write ( rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const
p_src_address, uint32_t const block_address, uint32_t const num_blocks )
```

Writes data to an USB device. Implements `rm_block_media_api_t::write()`.

This function blocks until the write operation completes.

**Return values**

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes.

### ◆ RM\_BLOCK\_MEDIA\_USB\_Erase()

```
fsp_err_t RM_BLOCK_MEDIA_USB_Erase ( rm_block_media_ctrl_t *const p_ctrl, uint32_t const
block_address, uint32_t const num_blocks )
```

Erases sectors of an USB device. Implements `rm_block_media_api_t::erase()`.

This function blocks until erase is complete.

#### Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

### ◆ RM\_BLOCK\_MEDIA\_USB\_CallbackSet()

```
fsp_err_t RM_BLOCK_MEDIA_USB_CallbackSet ( rm_block_media_ctrl_t *const p_ctrl,
void(*) (rm_block_media_callback_args_t *) p_callback, void const *const p_context,
rm_block_media_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `rm_block_media_api_t::callbackSet`.

#### Note

*This function is currently unsupported for Block Media over USB.*

#### Return values

FSP_ERR_UNSUPPORTED	CallbackSet is not currently supported for Block Media over USB.
---------------------	--

◆ **RM\_BLOCK\_MEDIA\_USB\_StatusGet()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_StatusGet ( rm_block_media_ctrl_t *const p_api_ctrl,
rm_block_media_status_t *const p_status )
```

Provides driver status. Implements `rm_block_media_api_t::statusGet()`.

**Return values**

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

**Returns**

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM\_BLOCK\_MEDIA\_USB\_InfoGet()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_InfoGet ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_info_t *const p_info )
```

Retrieves module information. Implements `rm_block_media_api_t::infoGet()`.

**Return values**

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ **RM\_BLOCK\_MEDIA\_USB\_Close()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_Close ( rm_block_media_ctrl_t *const p_ctrl)
```

Closes an open USB device. Implements `rm_block_media_api_t::close()`.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

### 4.2.16.5 FileX I/O (rm\_filex\_block\_media)

Modules » Storage

#### Functions

fsp\_err\_t RM\_FILEX\_BLOCK\_MEDIA\_Open (rm\_filex\_block\_media\_ctrl\_t \*const p\_ctrl, rm\_filex\_block\_media\_cfg\_t const \*const p\_cfg)

fsp\_err\_t RM\_FILEX\_BLOCK\_MEDIA\_Close (rm\_filex\_block\_media\_ctrl\_t \*const p\_ctrl)

void RM\_FILEX\_BLOCK\_MEDIA\_BlockDriver (FX\_MEDIA \*p\_fx\_media)

Access Block Media device functions open, close, read, write and control. [More...](#)

#### Detailed Description

Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.

## Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: <https://docs.microsoft.com/en-us/azure/rtos/filex/>

#### Features

The FileX Block Media module supports the following features:

- Callbacks for insertion and removal for removable devices.
- ThreadX is typically required for FileX. To use FileX without ThreadX `FX_STANDALONE_ENABLE` must be defined.
- Unless `FX_SINGLE_THREAD` or `FX_STANDALONE_ENABLE` are defined, all FileX operations are thread safe.

## Configuration

### Build Time Configurations for rm\_filex\_block\_media

The following build time configurations are defined in `fsp_cfg/middleware/rm_filex_block_media_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	Selects if code for parameter checking is to be included in the build.

**Configurations for Storage > FileX I/O (rm\_filex\_block\_media)**

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_filex_block_media_0	Module name.
Callback	Name must be a valid C symbol	g_rm_filex_block_media_0_callback	A user callback function can be provided. If this callback function is provided, it will be called when media is inserted or removed. It will also be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
Partition Number	<ul style="list-style-type: none"> <li>• 0</li> <li>• 1</li> <li>• 2</li> <li>• 3</li> </ul>	0	The partition to use for partitioned media. This partition will only be used if a Master Boot Record with partition table exists at block 0 of the media, otherwise the FileX FAT boot record should exist or be formatted to block 0.

**Build Time Configurations for fx**

The following build time configurations are defined in fsp\_cfg/azure/fx/fx\_user.h:

Configuration	Options	Default	Description
Common > Max Long Name Len	Value must be greater than or equal to 13 and less than or equal to 256, or empty		Specifies the maximum file name size for FileX. If left blank the default value is 256. Legal values range between 13 and 256.
Common > Max Last Name Len	Value must be greater than or equal to 13 and less than or equal to 256, or empty		This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.
Common > Max Sector	Value must be greater		Specifies the maximum

Cache	than 0 or empty			number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at <code>fx_media_open</code> . The default value if left blank is 256. All values must be a power of 2.
Common > Fat Map Size	Value must be greater than 0 or empty			Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Common > Max Fat Cache	Value must be greater than 0 or empty			Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading > Update Rate (Seconds)	Value must be greater than 0 or empty			Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10 seconds.
Threading > No Timer	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)		Eliminates the ThreadX timer setup to update the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Threading > Single Thread	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)		Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from one thread.
Threading >	<ul style="list-style-type: none"> <li>• Enabled</li> </ul>	Disabled (default)		Enables FileX to be

Standalone	<ul style="list-style-type: none"> <li>• Disabled (default)</li> </ul>		used in standalone mode (without Azure RTOS).
Extra Features > Don't Update Open Files	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, FileX does not update already opened files.
Extra Features > Media Search Cache	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	When disabled, the file search cache optimization is disabled.
Extra Features > Direct Data Read Cache Fill	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Extra Features > Media Statistics	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	When disabled, gathering of media statistics is disabled.
Extra Features > Single Open Legacy	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.
Extra Features > Rename Path Inherit	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, renaming inherits path information.
Extra Features > No Local Path	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, removes local path logic from FileX, resulting in smaller code size.
Extra Features > 64-bit LBA	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, 64-bits sector addresses are used in I/O driver.
Extra Features > Cache	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables the cache, default is enabled.
Extra Features > File Close	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables file close, default is enabled.
Extra Features > Fast Close	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables fast open, default is enabled.
Extra Features > Force Memory Operation	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables force memory operation, default is enabled.
Extra Features > Build Options	<ul style="list-style-type: none"> <li>• Enabled (default)</li> </ul>	Enabled (default)	Enables or disables build options, default is

	<ul style="list-style-type: none"> <li>• Disabled</li> </ul>		enabled.
Extra Features > One Line Function	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables one line function, default is enabled.
Extra Features > FAT Entry Refresh	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables FAT entry refresh, default is enabled.
Extra Features > Consecutive Detect	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables consecutive detect, default is enabled.
Extra Features > Enable exFAT	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	Enables exFAT support in FileX.
Fault Tolerant > Fault Tolerant Service	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol <code>FX_FAULT_TOLERANT</code> and <code>FX_FAULT_TOLERANT_DATA</code> .
Fault Tolerant > Fault Tolerant Data	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant > Fault Tolerant	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, FileX immediately passes write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled

separately.

Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.

Fault Tolerant > Fault Tolerant Boot Index	Value must be greater than or equal to 116 and less than or equal to 119	
Error Checking	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)

### Configurations for Storage > Azure RTOS FileX on Block Media

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on Block Media.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a valid C symbol	Volume 1	Volume name string, which is a maximum of 11 characters.
Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time.
Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an integer	0	Number of sectors hidden before this media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired

Total Sectors	Total Sectors must be an integer greater than 0	3751936	partition. Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Bytes per Sector	Bytes per Sector must be multiple of 32	512	Number of bytes per sector, which is typically 512. FileX requires this to be a multiple of 32. When using a Renesas provided block media implementation, bytes per sector can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer greater than 0	12345	Serial number to be used for this volume. exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal to the size of one sector.

## Usage Notes

### Pending during Read/Write

The FileX Block Media driver provides a number of events in the user callback to handle waiting or pending while it is doing blocking operations. The events received in the callback will differ depending on the lower level block media driver in use.

If the lower level block media driver is `rm_block_media_spi` (SPI blocks on read/write operations):

- The user will receive `RM_BLOCK_MEDIA_EVENT_POLL_STATUS` in the user callback while the lower level driver is polling for the read/write operation to be complete. The user can choose to do a thread sleep or software delay upon receiving this event in the callback.
- Once the operation is complete no other callbacks will be received.

If the lower level block media driver is `rm_block_media_sdmmc` (SDMMC is interrupt based, the FileX Block Media driver will still block while waiting for interrupts from SDMMC):

- The user will receive `RM_BLOCK_MEDIA_EVENT_WAIT` in the user callback when the FileX Block Media driver begins waiting for an interrupt event from SDMMC. This is sent from a thread context. The user can choose to pend on a semaphore, sleep the thread, or do a software delay upon receiving this event in the callback. The FileX Block Media driver thread will block until an interrupt is received.
- Once an SDMMC interrupt is received the user will receive `RM_BLOCK_MEDIA_EVENT_WAIT_END` in the user callback. This is sent from an interrupt context. The user can choose to give a semaphore on this event or do nothing.
- If SDMMC is busy on a long erase after receiving the interrupt the FileX Block Media driver will send `RM_BLOCK_MEDIA_EVENT_POLL_STATUS` to the user callback and proceed to do a blocking poll on SDMMC status. The user can choose to do a thread sleep or software delay upon receiving this event in the callback. This event will not be received by the user on typical operations by FileX.

## Partitioned Media

When using `fx_format` to format a partition the number of hidden sectors should match the starting block number of the partition and the total number of sectors should be equal to the number of sectors in the partition.

## Unused User Callback Events

Certain events are defined in `rm_block_media_event_t` but not returned by the FileX Block Media user callback:

- `RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE`: This event is handled internally and operation success is indicated by FileX API calls returning `FX_SUCCESS`.
- `RM_BLOCK_MEDIA_EVENT_ERROR`: This event is handled internally and operation failure will be indicated by an error return code from FileX API calls.

## Examples

### Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_PARTITION_NUMBER (0)
```

```
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS (1073741824)

    handle_fx_error(fx_err);
}
```

## Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_filex_block_media_format_example (void)
{
    /* Open media driver.*/
    fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0,          // Pointer to
FileX media control block.
    RM_FILEX_BLOCK_MEDIA_BlockDriver,    // Driver entry
    &g_filex_block_media0, // Pointer to Block Media
Driver
    g_fx_media0_memory, // Media buffer pointer
    sizeof(g_fx_media0_memory), // Media buffer size
    "EXAMPLE_VOLUME", // Volume Name
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS, // Total sectors
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER, // Sectors per cluster
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
```

```
// Sectors per track
    handle_fx_error(fx_err);
}
```

## Callback Pend Example

This shows how to use the I/O driver callback with ThreadX in order to wait/pend for operations to complete.

```
TX_SEMAPHORE g_operation_wait_semaphore;

/* Callback called by FileX block media I/O driver needs to pend on operation. */
void rm_filex_block_media_test_callback_pend (rm_filex_block_media_callback_args_t *
p_args)
{
    if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT)
    {
        /* Interrupt has not happened for operation, get semaphore to wait for it. This will
be called from the FileX I/O driver thread. */
        tx_semaphore_get(&g_operation_wait_semaphore, TX_WAIT_FOREVER);
    }

    if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT_END)
    {
        /* Interrupt has occurred for operation, post semaphore so that wait will end. This
will be called from an interrupt context. */
        tx_semaphore_put(&g_operation_wait_semaphore);
    }

    if (p_args->event & RM_BLOCK_MEDIA_EVENT_POLL_STATUS)
    {
        /* Interrupt has been received from block media device but operation is still
ongoing. The FileX I/O driver will wait on the driver busy status.

        * This event can be used to put the thread to sleep while waiting. This will be
called from the FileX I/O driver thread. */
        tx_thread_sleep(1);
    }
}
```

```
void rm_filex_block_media_callback_pend_example (void)
{
    /* Create semaphore for driver use */
    tx_semaphore_create(&g_operation_wait_semaphore, "operation_wait_semaphore", 0);
    /* Open media driver.*/
    fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0, // Pointer to
FileX media control block.
    RM_FILEX_BLOCK_MEDIA_BlockDriver, // Driver entry
    &g_filex_block_media0, // Pointer to Block Media
Driver
    g_fx_media0_memory, // Media buffer pointer
    sizeof(g_fx_media0_memory), // Media buffer size
    "EXAMPLE_VOLUME", // Volume Name
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS, // Total sectors
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER, // Sectors per cluster
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
```

```
// Sectors per track
    handle_fx_error(fx_err);
}
```

## Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
volatile uint32_t g_rm_filex_block_media_insertion_events = 0;
volatile uint32_t g_rm_filex_block_media_removal_events = 0;
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_filex_block_media_test_callback (rm_filex_block_media_callback_args_t *
p_args)
{
    if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED)
    {
        g_rm_filex_block_media_insertion_events++;
    }
    if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED)
    {
        g_rm_filex_block_media_removal_events++;
    }
}
void rm_filex_block_media_media_insertion_example (void)
{
    /* Open media driver.*/
    fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Wait for media insertion. */
    while (0U == g_rm_filex_block_media_insertion_events)
    {
        /* Wait for media insertion. */
    }
}
```

```

/* Open the media. If the media is removable, it must be inserted before calling
 * fx_media_open. This assumes the disk is already partitioned and formatted. */
UINT fx_err = fx_media_open(&g_fx_media0,
"filex_example_media",
RM_FILEX_BLOCK_MEDIA_BlockDriver,
                                &g_filex_block_media0,
                                g_fx_media0_memory,
sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
}

```

## Using FileX with Custom Block Media Implementations

When using a Custom Block Media implementation with `rm_filex_block_media` the custom implementation must call `rm_filex_block_media_memory_callback` upon the completion of a read/write operation. This callback should be called with an event of `RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE` and `p_context` of `rm_filex_block_media_instance_ctrl_t`\*. The following example shows how this should be done in the context of a demo RAM block media read function.

```

#define EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR (0x20004AFE)
#define EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES (512)
/* Example implementation of rm_block_media_api_t::read(), user should define custom
block media RAM implementation. */
fsp_err_t RM_BLOCK_MEDIA_CUSTOM_RAM_Read (rm_block_media_ctrl_t * const p_ctrl,
                                           uint8_t * const
                                           p_dest_address,
                                           uint32_t const
block_address,
                                           uint32_t const          num_blocks)
{
    FSP_PARAMETER_NOT_USED(p_ctrl);
    memcpy(p_dest_address,
           (void *) (EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR + (block_address *
EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES)),
           (EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES * num_blocks));
    /* Notify FileX port of operation complete through calling the callback, this is

```

```
required for custom block media/FileX port integration */
rm_block_media_callback_args_t args;
    args.event      = RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE;
    args.p_context  = (void *) &g_filex_block_media0_ctrl;
    rm_filex_block_media_memory_callback(&args);
return FSP_SUCCESS;
}
```

## Data Structures

```
struct  rm_filex_block_media_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_filex\_block\_media\_instance\_ctrl\_t

```
struct rm_filex_block_media_instance_ctrl_t
```

Common macro for FSP header files. There is also a corresponding FSP\_FOOTER macro at the end of this file. FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM\_FILEX\_BLOCK\_MEDIA\_Open is called.

## Function Documentation

### ◆ RM\_FILEX\_BLOCK\_MEDIA\_Open()

```
fsp_err_t RM_FILEX_BLOCK_MEDIA_Open ( rm_filex_block_media_ctrl_t *const p_ctrl,
rm_filex_block_media_cfg_t const *const p_cfg )
```

The file system relies on the media to be formatted prior to creating directories and files. The sector size and sector count will change depending on the media type and size.

The File Allocation Table (FAT) starts after the reserved sectors in the media. The FAT area is basically an array of 12-bit, 16-bit, or 32-bit entries that determine if that cluster is allocated or part of a chain of clusters comprising a subdirectory or a file. The size of each FAT entry is determined by the number of clusters that need to be represented. If the number of clusters (derived from the total sectors divided by the sectors per cluster) is less than 4,086, 12-bit FAT entries are used. If the total number of clusters is greater than 4,086 and less than or equal to 65,525, 16-bit FAT entries are used. Otherwise, if the total number of clusters is greater than 65,525, 32-bit FAT entries are used. Initializes callback and configuration for FileX Block Media interface. Call this before calling any FileX functions.

Implements `rm_filex_block_media_api_t::open()`.

#### Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

### ◆ RM\_FILEX\_BLOCK\_MEDIA\_Close()

```
fsp_err_t RM_FILEX_BLOCK_MEDIA_Close ( rm_filex_block_media_ctrl_t *const p_ctrl)
```

Closes media device.

Implements `rm_filex_block_media_api_t::close()`.

#### Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

**◆ RM\_FILEX\_BLOCK\_MEDIA\_BlockDriver()**

```
void RM_FILEX_BLOCK_MEDIA_BlockDriver ( FX_MEDIA * p_fx_media)
```

Access Block Media device functions open, close, read, write and control.

The RM\_FILEX\_BLOCK\_MEDIA\_BlockDriver function is called from the FileX file system driver and issues requests to a Block Media device through the FSP Block Media Interface. Uses block media driver for accesses.

**Parameters**

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.
----------	------------	---

**Return values**

None	
------	--

**Returns**

Nothing, but updates FileX media control block.

**4.2.16.6 FileX I/O (rm\_filex\_levelx\_nor)**

Modules » [Storage](#)

**Functions**

```
void RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA *p_fx_media)
```

Access LevelX NOR device functions open, close, read, write and control. [More...](#)

**Detailed Description**

Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.

**Overview**

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: <https://docs.microsoft.com/en-us/azure/rtos/filex/>

## Features

The FileX LevelX NOR module supports the following features:

- ThreadX is typically required for FileX. To use FileX without ThreadX `FX_STANDALONE_ENABLE` must be defined.
- Unless `FX_SINGLE_THREAD` or `FX_STANDALONE_ENABLE` are defined, all FileX operations are thread safe.

## Configuration

### Build Time Configurations for rm\_filex\_levelx\_nor

The following build time configurations are defined in `fsp_cfg/middleware/rm_filex_levelx_nor_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	Selects if code for parameter checking is to be included in the build.

### Configurations for Storage > FileX I/O (rm\_filex\_levelx\_nor)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	<code>g_rm_filex_levelx_nor0</code>	Module name.
Callback	Name must be a valid C symbol	<code>g_rm_filex_levelx_nor_0_callback</code>	A user callback function can be provided. If this callback function is provided, it will be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
LevelX NOR Name (String)	Manual Entry	<code>g_rm_filex_levelx_nor_0</code>	String name to be input into LevelX API.

### Build Time Configurations for fx

The following build time configurations are defined in `fsp_cfg/azure/fx/fx_user.h`:

Configuration	Options	Default	Description
Common > Max Long Name Len	Value must be greater than or equal to 13 and less than or equal to		Specifies the maximum file name size for FileX. If left blank the default

	256, or empty		value is 256. Legal values range between 13 and 256.
Common > Max Last Name Len	Value must be greater than or equal to 13 and less than or equal to 256, or empty		This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.
Common > Max Sector Cache	Value must be greater than 0 or empty		Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at <code>fx_media_open</code> . The default value if left blank is 256. All values must be a power of 2.
Common > Fat Map Size	Value must be greater than 0 or empty		Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Common > Max Fat Cache	Value must be greater than 0 or empty		Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading > Update Rate (Seconds)	Value must be greater than 0 or empty		Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10 seconds.
Threading > No Timer	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled (default)	Eliminates the ThreadX timer setup to update

	(default)		the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Threading > Single Thread	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from one thread.
Threading > Standalone	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	Enables FileX to be used in standalone mode (without Azure RTOS).
Extra Features > Don't Update Open Files	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, FileX does not update already opened files.
Extra Features > Media Search Cache	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	When disabled, the file search cache optimization is disabled.
Extra Features > Direct Data Read Cache Fill	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Extra Features > Media Statistics	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	When disabled, gathering of media statistics is disabled.
Extra Features > Single Open Legacy	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.
Extra Features > Rename Path Inherit	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, renaming inherits path information.
Extra Features > No Local Path	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, removes local path logic from FileX, resulting in smaller code size.
Extra Features > 64-bit LBA	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, 64-bits sector addresses are used in I/O driver.
Extra Features > Cache	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables the cache, default is enabled.

Extra Features > File Close	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables file close, default is enabled.
Extra Features > Fast Close	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables fast open, default is enabled.
Extra Features > Force Memory Operation	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables force memory operation, default is enabled.
Extra Features > Build Options	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables build options, default is enabled.
Extra Features > One Line Function	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables one line function, default is enabled.
Extra Features > FAT Entry Refresh	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables FAT entry refresh, default is enabled.
Extra Features > Consecutive Detect	<ul style="list-style-type: none"> <li>• Enabled (default)</li> <li>• Disabled</li> </ul>	Enabled (default)	Enables or disables consecutive detect, default is enabled.
Extra Features > Enable exFAT	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	Enables exFAT support in FileX.
Fault Tolerant > Fault Tolerant Service	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol <code>FX_FAULT_TOLERANT</code> and <code>FX_FAULT_TOLERANT_DATA</code> .
Fault Tolerant > Fault Tolerant Data	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant > Fault Tolerant	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled (default)	When enabled, FileX immediately passes

(default)

write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.

Fault Tolerant > Fault Tolerant Boot Index

Value must be greater than or equal to 116 and less than or equal to 119

Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.

Error Checking

- Enabled (default)
- Disabled

Enabled (default)

### Configurations for Storage > Azure RTOS FileX on LevelX NOR

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on LevelX NOR.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a valid C symbol	Volume 1	Volume name string, which is a maximum of 11 characters.
Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time.

Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an integer	0	Number of sectors hidden before this media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition.
Total Sectors	Total Sectors must be an integer greater than 0	3751936	Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer greater than 0	12345	Serial number to be used for this volume. exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal to the size of one sector.

## Usage Notes

### Pending during Write/Erase

If the underlying LevelX NOR driver performs a blocking operation that requires waiting to complete (such as a long write/erase on NOR SPI), a callback can be provided to provide a way to wait with an

OS-specific thread wait. This callback will also pass up block erase events.

## Partitioned Media

Partitioned media is not supported directly by the FileX LevelX NOR port.

# Examples

## Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK (1)
extern rm_filex_levelx_nor_instance_t g_filex_levelx_nor0;
extern rm_filex_levelx_nor_instance_ctrl_t g_filex_levelx_nor0_ctrl;
extern rm_filex_levelx_nor_cfg_t g_filex_levelx_nor0_cfg;
extern FX_MEDIA g_fx_media0;
extern uint8_t g_fx_media0_memory[RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE];
extern uint8_t g_file_data[RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_filex_levelx_nor_example (void)
{
    /* Initialize FileX */
    fx_system_initialize();

    /* Initialize LevelX */
    lx_nor_flash_initialize();

    /* Open the media. This assumes the flash is already formatted. */
}
```

```
    UINT fx_err = fx_media_open(&g_fx_media0,
    "filex_example_media",
    RM_FILEX_LEVELX_NOR_DeviceDriver,
                                &g_filex_levelx_nor0,
                                g_fx_media0_memory,
    sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
    /* Create a file */
    fx_err = fx_file_create(&g_fx_media0, RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME);
    handle_fx_error(fx_err);
    /* Open source file for writing. */
    FX_FILE sourceFile;
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
    RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME, FX_OPEN_FOR_WRITE);
    handle_fx_error(fx_err);
    /* Write file data. */
    fx_err = fx_file_write(&sourceFile, g_file_data, sizeof(g_file_data));
    handle_fx_error(fx_err);
    /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
    /* Open the source file in read mode. */
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
    RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME, FX_OPEN_FOR_READ);
    handle_fx_error(fx_err);
    /* Read file data. */
    ULONG actual_size_read;
    fx_err = fx_file_read(&sourceFile, g_read_buffer, sizeof(g_file_data),
    &actual_size_read);
    handle_fx_error(fx_err);
    assert(sizeof(g_file_data) == actual_size_read);
    /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
```

```
/* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
/* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

## Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE (4096)
void rm_filex_levelx_nor_format_example (void)
{
    spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
    spi_flash_status_t    status;
    /* Erase flash prior to usage */
    fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
    for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
        i < g_levelx_nor_spi0_cfg.size;
        i += RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE)
    {
        err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                                (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,
RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE);
        assert(FSP_SUCCESS == err);
        status.write_in_progress = true;
        while (status.write_in_progress)
        {
```

```
        err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
        assert(FSP_SUCCESS == err);
    }
}

err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
assert(FSP_SUCCESS == err);

/* Format the media */
UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
    RM_FILEX_LEVELX_NOR_DeviceDriver,           // Driver entry
    &g_filex_levelx_nor0, // Pointer to Block Media
Driver
    g_fx_media0_memory, // Media buffer pointer
    sizeof(g_fx_media0_memory), // Media buffer size
    "EXAMPLE_VOLUME", // Volume Name
    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
    RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors
    RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS, // Total sectors
    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,
// Sector size
    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER, // Sectors per cluster
    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

## Callback Wait Example

This shows how to use the I/O driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by FileX block media I/O driver needs to wait on operation. */
void rm_filex_levelx_nor_test_callback_wait (rm_filex_levelx_nor_callback_args_t *
p_args)
{
    if (p_args->event & RM_FILEX_LEVELX_NOR_EVENT_BUSY)
    {
        /* Put the thread to sleep while waiting for operation to complete. */
        tx_thread_sleep(1);
    }
}

void rm_filex_levelx_nor_callback_wait_example (void)
{
    /* Format the media */
    UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
    RM_FILEX_LEVELX_NOR_DeviceDriver, // Driver entry
    &g_filex_levelx_nor0, // Pointer to Block Media
Driver
    g_fx_media0_memory, // Media buffer pointer
    sizeof(g_fx_media0_memory), // Media buffer size
    "EXAMPLE_VOLUME", // Volume Name
    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
    RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors
    RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS, // Total sectors
```

```

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,

// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER, // Sectors per cluster

RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,

// Heads

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);

// Sectors per track

handle_fx_error(fx_err);
}

```

## Data Structures

#define [VOID](#)

## Enumerations

enum [rm\\_filex\\_levelx\\_nor\\_event\\_t](#)

## Data Structure Documentation

### ◆ [rm\\_filex\\_levelx\\_nor\\_callback\\_args\\_t](#)

struct <a href="#">rm_filex_levelx_nor_callback_args_t</a>		
Callback function parameter data		
Data Fields		
<a href="#">rm_filex_levelx_nor_event_t</a>	event	The event can be used to identify what caused the callback.
void const *	p_context	Placeholder for user data.

### ◆ [rm\\_filex\\_levelx\\_nor\\_cfg\\_t](#)

struct <a href="#">rm_filex_levelx_nor_cfg_t</a>
FileX LevelX configuration

Data Fields	
UINT(*)	<a href="#">nor_driver_initialize</a> (LX_NOR_FLASH *)
	Pointer to the initialization function.
LX_NOR_FLASH *	<a href="#">p_nor_flash</a>
	NOR Flash instance.
CHAR *	<a href="#">p_nor_flash_name</a>
	NOR Flash instance name.
<a href="#">fsp_err_t</a> (*)	<a href="#">close</a> ()
	Pointer to underlying driver close.
void(*)	<a href="#">p_callback</a> (rm_filex_levelx_nor_callback_args_t *p_args)
	Pointer to callback function.
void const *	<a href="#">p_context</a>
	Placeholder for user data.

#### ◆ [rm\\_filex\\_levelx\\_nor\\_instance\\_ctrl\\_t](#)

struct <a href="#">rm_filex_levelx_nor_instance_ctrl_t</a>		
FileX block media private control block. DO NOT MODIFY. Initialization occurs when <a href="#">RM_FILEX_LEVELX_NOR_Open</a> is called.		
Data Fields		
<a href="#">rm_filex_levelx_nor_cfg_t</a> const *	<a href="#">p_cfg</a>	Pointer to instance configuration.

#### ◆ [rm\\_filex\\_levelx\\_nor\\_instance\\_t](#)

struct <a href="#">rm_filex_levelx_nor_instance_t</a>	
This structure encompasses everything that is needed to use an instance of this interface.	
Data Fields	

<code>rm_filex_levelx_nor_instance_ctrl_t*</code>	<code>p_ctrl</code>	Pointer to the control structure for this instance.
<code>rm_filex_levelx_nor_cfg_t const*</code>	<code>p_cfg</code>	Pointer to the configuration structure for this instance.

## Macro Definition Documentation

### ◆ VOID

<code>#define VOID</code>
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file.

## Enumeration Type Documentation

### ◆ `rm_filex_levelx_nor_event_t`

<code>enum rm_filex_levelx_nor_event_t</code>	
Options for the callback events.	
Enumerator	
<code>RM_FILEX_LEVELX_NOR_EVENT_BUSY</code>	Pending operation, user can define their own wait functionality.

## Function Documentation

◆ **RM\_FILEX\_LEVELX\_NOR\_DeviceDriver()**

```
void RM_FILEX_LEVELX_NOR_DeviceDriver ( FX_MEDIA * p_fx_media)
```

Access LevelX NOR device functions open, close, read, write and control.

The RM\_FILEX\_LEVELX\_NOR\_DeviceDriver function is called from the FileX file system driver and issues requests to a LevelX NOR device through the LevelX API.

**Parameters**

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.
----------	------------	---

**Return values**

None	
------	--

**Returns**

Nothing, but updates FileX media control block.

**4.2.16.7 Flash (r\_flash\_hp)**

Modules » Storage

**Functions**

```
fsp_err_t R_FLASH_HP_Open (flash_ctrl_t *const p_api_ctrl, flash_cfg_t const *const p_cfg)

<code>fsp_err_t</code>	<code>R_FLASH_HP_CallbackSet (flash_ctrl_t *const p_api_ctrl, void(*p_callback)(flash_callback_args_t *), void const *const p_context, flash_callback_args_t *const p_callback_memory)</code>

## Detailed Description

Driver for the flash memory on RA high-performance MCUs. This module implements the [Flash Interface](#).

## Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and ROM flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

### Features

The R\_FLASH\_HP module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank-checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for ROM Flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.

## Configuration

### Build Time Configurations for r\_flash\_hp

The following build time configurations are defined in fsp\_cfg/r\_flash\_hp\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Code Flash Programming Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API.
Data Flash Programming Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.

### Configurations for Storage > Flash (r\_flash\_hp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r\_flash\_hp). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background Operation	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	Enabling allows Flash API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.
Flash Error Interrupt	MCU Specific Options		Select the flash error

Priority

interrupt priority.

## Clock Configuration

Flash uses FCLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

## Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the `r_flash_hp` module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

## Data Flash Background Operation (BGO) Precautions

When using the data flash BGO (Background Operation) mode, you can still access the user ROM, RAM and external memory. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

## Code Flash Precautions

Code flash cannot be accessed while writing, erasing or blank checking code flash. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash all supporting code must reside in RAM. This is only done when code flash programming is enabled. BGO mode is not supported for code flash, so a code flash operation will not return before the operation has completed. By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must insure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

## Flash Clock (FCLK)

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the `flash_api_t::open` function the Flash clock source is checked will return `FSP_ERR_FCLK` if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the `flash_api_t::updateFlashClockFreq` API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

## Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, `flash_api_t::FLASH_EVENT_ERASE_COMPLETE`) When the FLASH FRDYI interrupt is enabled, the

corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the `flash_api_t::open` API.

#### Note

*The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).*

## Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased data flash blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.

## Examples

### High-Performance Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 64 B: 0x40100000 - 0x4010003F */
#define FLASH_CF_BLOCK_8 0x00010000 /* 32 KB: 0x00010000 - 0x00017FFF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_HP_EXAMPLE_WRITE_SIZE 32
uint8_t      g_dest[TRANSFER_LENGTH];
uint8_t      g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
void r_flash_hp_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Open the flash hp instance. */
    fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
    /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

```
    assert(FSP_SUCCESS == err);
/* Check if block 0 is erased. */
    err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
/* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
/* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
/* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
/* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_8, 1);
    assert(FSP_SUCCESS == err);
/* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
/* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
```

## High-Performance Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
```

```
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback      = flash_callback,
    .p_context       = 0,
    .p_extend        = NULL,
    .data_flash_bgo = true,
    .ipl             = 5,
    .irq             = BSP_VECTOR_FLASH_HP_FRDYI_ISR,
};

void r_flash_hp_bgo_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the flash hp instance. */
    fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
    /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;

    /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
    while (!interrupt_called)
    {
        ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;

    /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
}
```

```
flash_status_t status;

/* Wait until the current flash operation completes. */
do
{
    err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
} while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));

/* If the interrupt wasn't called process the error. */
assert(interrupt_called);

/* If the event wasn't a write complete process the error. */
assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);

/* Verify the data was written correctly. */
assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}

void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

## High-Performance Flash Bank Swap Example

This example demonstrates swapping which flash bank is located at address 0. This feature is only on select MCUs.

```
void r_flash_hp_bankswap_example (void)
{
    /* Open the flash hp instance. */
    fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);

    /* Handle any errors. */
    assert(FSP_SUCCESS == err);

    /* Write the new application starting at 0x00200000. */
    /* Swap the block at address 0 with the one at 0x00200000 after the next restart.
    * The application at 0x00200000 must be written there by application code. */
    err = R_FLASH_HP_BankSwap(&g_flash_ctrl);
}
```

```

/* Handle any errors. */
    assert(FSP_SUCCESS == err);

/* Handle any pre-reset operations here */

/* Reset the MCU to swap to the other bank */
    __NVIC_SystemReset();
}

```

## Data Structures

struct [flash\\_hp\\_instance\\_ctrl\\_t](#)

## Enumerations

enum [flash\\_bgo\\_operation\\_t](#)

## Data Structure Documentation

### ◆ flash\_hp\_instance\_ctrl\_t

struct flash\_hp\_instance\_ctrl\_t

Flash HP instance control block. DO NOT INITIALIZE.

#### Data Fields

uint32_t	<a href="#">opened</a>
	To check whether api has been opened or not.
<a href="#">flash_bgo_operation_t</a>	<a href="#">current_operation</a>
	Operation in progress, for example, FLASH_OPERATION_CF_ERASE.

## Enumeration Type Documentation

### ◆ flash\_bgo\_operation\_t

enum [flash\\_bgo\\_operation\\_t](#)

Possible Flash operation states

## Function Documentation

◆ **R\_FLASH\_HP\_Open()**

```
fsp_err_t R_FLASH_HP_Open ( flash_ctrl_t *const p_api_ctrl, flash_cfg_t const *const p_cfg )
```

Initializes the high performance flash peripheral. Implements `flash_api_t::open`.

The Open function initializes the Flash.

Example:

```
/* Open the flash hp instance. */
fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
```

**Return values**

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ALREADY_OPEN	The flash control block is already open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.

◆ **R\_FLASH\_HP\_Write()**

```
fsp_err_t R_FLASH_HP_Write ( flash_ctrl_t *const p_api_ctrl, uint32_t const src_address, uint32_t
flash_address, uint32_t const num_bytes )
```

Writes to the specified Code or Data Flash memory area. Implements `flash_api_t::write`.

Example:

```
/* Write 32 bytes to the first block of data flash. */
err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
```

**Return values**

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

### ◆ R\_FLASH\_HP\_Erase()

```
fsp_err_t R_FLASH_HP_Erase ( flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t const num_blocks )
```

Erases the specified Code or Data Flash blocks. Implements `flash_api_t::erase` by the `block_erase_address`.

#### Note

*Code flash may contain blocks of different sizes. When erasing code flash it is important to take this into consideration to prevent erasing a larger address space than desired.*

#### Example:

```
/* Erase 1 block of data flash starting at block 0. */
err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

#### Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified. If the address is in code flash then code flash programming must be enabled.
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ **R\_FLASH\_HP\_BlankCheck()**

```
fsp_err_t R_FLASH_HP_BlankCheck ( flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t
num_bytes, flash_result_t * p_blank_check_result )
```

Performs a blank check on the specified address area. Implements `flash_api_t::blankCheck`.

Example:

```
/* Check if block 0 is erased. */
err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Blank check operation completed with result in p_blank_check_result, or blank check started and in-progress (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input.
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Other flash operation in progress or API not initialized.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_BLANK_CHECK_FAILED	Blank check operation failed.

◆ **R\_FLASH\_HP\_StatusGet()**

```
fsp_err_t R_FLASH_HP_StatusGet ( flash_ctrl_t *const p_api_ctrl, flash_status_t *const p_status )
```

Query the FLASH peripheral for its status. Implements `flash_api_t::statusGet`.

Example:

```
flash_status_t status;

/* Wait until the current flash operation completes. */
do
{
    err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
} while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

**Return values**

FSP_SUCCESS	FLASH peripheral is ready to use.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The Flash API is not Open.

◆ **R\_FLASH\_HP\_IdCodeSet()**

```
fsp_err_t R_FLASH_HP_IdCodeSet ( flash_ctrl_t *const p_api_ctrl, uint8_t const *const p_id_code,
flash_id_code_mode_t mode )
```

Implements `flash_api_t::idCodeSet`.

**Return values**

FSP_SUCCESS	ID Code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

### ◆ R\_FLASH\_HP\_AccessWindowSet()

```
fsp_err_t R_FLASH_HP_AccessWindowSet ( flash_ctrl_t *const p_api_ctrl, uint32_t const start_addr,
uint32_t const end_addr )
```

Configure an access window for the Code Flash memory using the provided start and end address. An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start\_addr is the first block. The block containing end\_addr is the last block. The access window then becomes first block -> last block inclusive. Anything outside this range of Code Flash is then write protected.

#### Note

*If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R\_FLASH\_HP\_AccessWindowClear().*

Implements [flash\\_api\\_t::accessWindowSet](#).

#### Return values

FSP_SUCCESS	Access window successfully configured.
FSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ **R\_FLASH\_HP\_AccessWindowClear()**

```
fsp_err_t R_FLASH_HP_AccessWindowClear ( flash_ctrl_t *const p_api_ctrl)
```

Remove any access window that is currently configured in the Code Flash. Subsequent to this call all Code Flash is writable. Implements `flash_api_t::accessWindowClear`.

**Return values**

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ **R\_FLASH\_HP\_Reset()**

```
fsp_err_t R_FLASH_HP_Reset ( flash_ctrl_t *const p_api_ctrl)
```

Reset the FLASH peripheral. Implements `flash_api_t::reset`.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

**Return values**

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

### ◆ R\_FLASH\_HP\_StartUpAreaSelect()

```
fsp_err_t R_FLASH_HP_StartUpAreaSelect ( flash_ctrl_t *const p_api_ctrl, flash_startup_area_swap_t swap_type, bool is_temporary )
```

Selects which block, Default (Block 0) or Alternate (Block 1), is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window. Implements [flash\\_api\\_t::startupAreaSelect](#).

#### Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ **R\_FLASH\_HP\_BankSwap()**

```
fsp_err_t R_FLASH_HP_BankSwap ( flash_ctrl_t *const p_api_ctrl)
```

Swaps the flash bank located at address 0x00000000 and address 0x00200000. This can only be done when in dual bank mode. Dual bank mode can be enabled in the FSP Configuration Tool under BSP Properties. After a bank swap is done the MCU will need to be reset for the changes to take place. [flash\\_api\\_t::bankSwap](#).

**Return values**

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_INVALID_MODE	Cannot switch banks while flash is in Linear mode.
FSP_ERR_WRITE_FAILED	Flash write operation failed.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ **R\_FLASH\_HP\_UpdateFlashClockFreq()**

```
fsp_err_t R_FLASH_HP_UpdateFlashClockFreq ( flash_ctrl_t *const p_api_ctrl)
```

Indicate to the already open Flash API that the FCLK has changed. Implements `flash_api_t::updateFlashClockFreq`.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

**Return values**

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_FCLK	FCLK is not within the acceptable range.

◆ **R\_FLASH\_HP\_InfoGet()**

```
fsp_err_t R_FLASH_HP_InfoGet ( flash_ctrl_t *const p_api_ctrl, flash_info_t *const p_info )
```

Returns the information about the flash regions. Implements `flash_api_t::infoGet`.

**Return values**

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

◆ **R\_FLASH\_HP\_Close()**

```
fsp_err_t R_FLASH_HP_Close ( flash_ctrl_t *const p_api_ctrl)
```

Releases any resources that were allocated by the Open() or any subsequent Flash operations. Implements `flash_api_t::close`.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

◆ **R\_FLASH\_HP\_CallbackSet()**

```
fsp_err_t R_FLASH_HP_CallbackSet ( flash_ctrl_t *const p_api_ctrl, void(*) (flash_callback_args_t *)
p_callback, void const *const p_context, flash_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `flash_api_t::callbackSet`.

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

**4.2.16.8 Flash (r\_flash\_lp)**

Modules » Storage

**Functions**

```
fsp_err_t R_FLASH_LP_Open (flash_ctrl_t *const p_api_ctrl, flash_cfg_t const
*const p_cfg)
```

```
fsp_err_t R_FLASH_LP_Write (flash_ctrl_t *const p_api_ctrl, uint32_t const
src_address, uint32_t flash_address, uint32_t const num_bytes)

fsp_err_t	R_FLASH_LP_UpdateFlashClockFreq (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_LP_InfoGet (flash_ctrl_t *const p_api_ctrl, flash_info_t *const p_info)
fsp_err_t	R_FLASH_LP_Close (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_LP_CallbackSet (flash_ctrl_t *const p_api_ctrl, void(*p_callback)(flash_callback_args_t *), void const *const p_context, flash_callback_args_t *const p_callback_memory)

## Detailed Description

Driver for the flash memory on RA low-power MCUs. This module implements the [Flash Interface](#).

## Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and code flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

## Features

The Low-Power Flash HAL module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for code flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.

## Configuration

### Build Time Configurations for r\_flash\_lp

The following build time configurations are defined in fsp\_cfg/r\_flash\_lp\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> </ul>	Default (BSP)	If selected code for parameter checking is

	<ul style="list-style-type: none"> <li>• Disabled</li> </ul>		included in the build.
Code Flash Programming	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API.
Data Flash Programming	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.

### Configurations for Storage > Flash (r\_flash\_lp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r\_flash\_lp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background Operation	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Enabling allows Flash API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.

### Clock Configuration

Flash either uses FCLK or ICLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r\_flash\_lp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

## Data Flash Background Operation (BGO) Precautions

When using the data flash BGO, the code flash, RAM and external memory can still be accessed. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

## Code Flash Precautions

Code flash cannot be accessed while writing, erasing or blank checking code flash. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash all supporting code must reside in RAM. This is only done when code flash programming is enabled. BGO mode is not supported for code flash, so a code flash operation will not return before the operation has completed. By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must insure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

## Flash Clock Source

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the [flash\\_api\\_t::open](#) function the Flash clock source is checked will return FSP\_ERR\_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the [flash\\_api\\_t::updateFlashClockFreq](#) API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

## Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, [flash\\_api\\_t::FLASH\\_EVENT\\_ERASE\\_COMPLETE](#)) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the [flash\\_api\\_t::open](#) API.

### Note

*The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).*

## Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is still executing from code flash. Data flash is also guaranteed for a larger number of

reprogramming/erasure cycles than code flash.

- Read values of erased blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.

## Examples

### Low-Power Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 1 KB: 0x40100000 - 0x401003FF */
#define FLASH_CF_BLOCK_10 0x00005000 /* 2 KB: 0x00005000 - 0x000057FF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_LP_EXAMPLE_WRITE_SIZE 32
uint8_t      g_dest[TRANSFER_LENGTH];
uint8_t      g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
void R_FLASH_LP_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the flash lp instance. */
    fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);

    /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);

    /* Check if block 0 is erased. */
    err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);

    /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);

    /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
```

```
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
    /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
    /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_10, 1);
    assert(FSP_SUCCESS == err);
    /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    /* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE));
}
```

## Low-Power Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context     = 0,
    .p_extend      = NULL,
    .data_flash_bgo = true,
    .ipl           = 5,
    .irq           = BSP_VECTOR_FLASH_LP_FRDYI_ISR,
};
```

```
void R_FLASH_LP_bgo_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the flash lp instance. */
    fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;

    /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
    while (!interrupt_called)
    {
        ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;

    /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    flash_status_t status;
    /* Wait until the current flash operation completes. */
    do
    {
        err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
    /* If the interrupt wasn't called process the error. */
    assert(interrupt_called);
    /* If the event wasn't a write complete process the error. */
}
```

```
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);

    /* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
}

void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

## Data Structures

```
struct flash_lp_instance_ctrl_t
```

## Data Structure Documentation

### ◆ flash\_lp\_instance\_ctrl\_t

```
struct flash_lp_instance_ctrl_t
```

Flash instance control block. DO NOT INITIALIZE. Initialization occurs when [R\\_FLASH\\_LP\\_Open\(\)](#) is called.

## Function Documentation

◆ **R\_FLASH\_LP\_Open()**

```
fsp_err_t R_FLASH_LP_Open ( flash_ctrl_t *const p_api_ctrl, flash_cfg_t const *const p_cfg )
```

Initialize the Low Power flash peripheral. Implements `flash_api_t::open`.

The Open function initializes the Flash.

This function must be called once prior to calling any other FLASH API functions. If a user supplied callback function is supplied, then the Flash Ready interrupt will be configured to call the users callback routine with an Event type describing the source of the interrupt for Data Flash operations.

Example:

```
/* Open the flash lp instance. */
fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
```

**Note**

*Providing a callback function in the supplied `p_cfg->callback` field automatically configures the Flash for Data Flash to operate in non-blocking background operation (BGO) mode.*

**Return values**

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	NULL provided for <code>p_ctrl</code> , <code>p_cfg</code> or <code>p_callback</code> if BGO is enabled.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.
FSP_ERR_ALREADY_OPEN	Flash Open() has already been called.
FSP_ERR_TIMEOUT	Failed to exit P/E mode after configuring flash.
FSP_ERR_INVALID_STATE	The system is not running from the required clock.

◆ **R\_FLASH\_LP\_Write()**

```
fsp_err_t R_FLASH_LP_Write ( flash_ctrl_t *const p_api_ctrl, uint32_t const src_address, uint32_t
flash_address, uint32_t const num_bytes )
```

Write to the specified Code or Data Flash memory area. Implements `flash_api_t::write`.

Example:

```
/* Write 32 bytes to the first block of data flash. */
err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
```

**Return values**

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.

◆ **R\_FLASH\_LP\_Erase()**

```
fsp_err_t R_FLASH_LP_Erase ( flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t const num_blocks )
```

Erase the specified Code or Data Flash blocks. Implements `flash_api_t::erase`.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

**Return values**

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for FCU to be ready.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.

◆ **R\_FLASH\_LP\_BlankCheck()**

```
fsp_err_t R_FLASH_LP_BlankCheck ( flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t
num_bytes, flash_result_t * p_blank_check_result )
```

Perform a blank check on the specified address area. Implements `flash_api_t::blankCheck`.

Example:

```
/* Check if block 0 is erased. */
err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progress (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_BLANK_CHECK_FAILED	An error occurred during blank checking.

### ◆ R\_FLASH\_LP\_StatusGet()

```
fsp_err_t R_FLASH_LP_StatusGet ( flash_ctrl_t *const p_api_ctrl, flash_status_t *const p_status )
```

Query the FLASH for its status. Implements `flash_api_t::statusGet`.

Example:

```
flash_status_t status;

/* Wait until the current flash operation completes. */
do
{
    err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
} while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

#### Return values

FSP_SUCCESS	Flash is ready and available to accept commands.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

### ◆ R\_FLASH\_LP\_AccessWindowSet()

```
fsp_err_t R_FLASH_LP_AccessWindowSet ( flash_ctrl_t *const p_api_ctrl, uint32_t const start_addr,
uint32_t const end_addr )
```

Configure an access window for the Code Flash memory. Implements `flash_api_t::accessWindowSet`.

An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing `start_addr` is the first block. The block containing `end_addr` is the last block. The access window then becomes first block (inclusive) -> last block (exclusive). Anything outside this range of Code Flash is then write protected. As an example, if you wanted to place an accesswindow on Code Flash Blocks 0 and 1, such that only those two blocks were writable, you would need to specify (address in block 0, address in block 2) as the respective start and end address.

#### Note

*If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as `R_FLASH_LP_AccessWindowClear()`.*

The invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

#### Parameters

	<code>p_api_ctrl</code>	The p api control
[in]	<code>start_addr</code>	The start address
[in]	<code>end_addr</code>	The end address

#### Return values

<code>FSP_SUCCESS</code>	Access window successfully configured.
<code>FSP_ERR_INVALID_ADDRESS</code>	Invalid settings for <code>start_addr</code> and/or <code>end_addr</code> .
<code>FSP_ERR_IN_USE</code>	FLASH peripheral is busy with a prior operation.
<code>FSP_ERR_ASSERTION</code>	NULL provided for <code>p_ctrl</code> .
<code>FSP_ERR_UNSUPPORTED</code>	Code Flash Programming is not enabled.
<code>FSP_ERR_NOT_OPEN</code>	Flash API has not yet been opened.
<code>FSP_ERR_TIMEOUT</code>	Timed out waiting for the FCU to become ready.
<code>FSP_ERR_WRITE_FAILED</code>	Status is indicating a Programming error for the requested operation.

◆ **R\_FLASH\_LP\_AccessWindowClear()**

```
fsp_err_t R_FLASH_LP_AccessWindowClear ( flash_ctrl_t *const p_api_ctrl)
```

Remove any access window that is configured in the Code Flash. Implements `flash_api_t::accessWindowClear`. On successful return from this call all Code Flash is writable.

**Return values**

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ **R\_FLASH\_LP\_IdCodeSet()**

```
fsp_err_t R_FLASH_LP_IdCodeSet ( flash_ctrl_t *const p_api_ctrl, uint8_t const *const p_id_code, flash_id_code_mode_t mode )
```

Write the ID code provided to the id code registers. Implements `flash_api_t::idCodeSet`.

**Return values**

FSP_SUCCESS	ID code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for completion of extra command.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ **R\_FLASH\_LP\_Reset()**

```
fsp_err_t R_FLASH_LP_Reset ( flash_ctrl_t *const p_api_ctrl)
```

Reset the FLASH peripheral. Implements `flash_api_t::reset`.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

**Return values**

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

◆ **R\_FLASH\_LP\_StartUpAreaSelect()**

```
fsp_err_t R_FLASH_LP_StartUpAreaSelect ( flash_ctrl_t *const p_api_ctrl, flash_startup_area_swap_t swap_type, bool is_temporary )
```

Select which block is used as the startup area block. Implements `flash_api_t::startupAreaSelect`.

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window.

**Return values**

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled. Cannot set FLASH_STARTUP_AREA_BTFLG when the temporary flag is false.

◆ **R\_FLASH\_LP\_BankSwap()**

fsp\_err\_t R\_FLASH\_LP\_BankSwap ( flash\_ctrl\_t \*const p\_api\_ctrl)

Unsupported flash\_api\_t::bankSwap.

**Return values**

FSP_ERR_UNSUPPORTED	Module does not support Bank Swap.
---------------------	------------------------------------

◆ **R\_FLASH\_LP\_UpdateFlashClockFreq()**

fsp\_err\_t R\_FLASH\_LP\_UpdateFlashClockFreq ( flash\_ctrl\_t \*const p\_api\_ctrl)

Indicate to the already open Flash API that the FCLK has changed. Implements flash\_api\_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

**Return values**

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_FCLK	Invalid flash clock source frequency.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.

◆ **R\_FLASH\_LP\_InfoGet()**

fsp\_err\_t R\_FLASH\_LP\_InfoGet ( flash\_ctrl\_t \*const p\_api\_ctrl, flash\_info\_t \*const p\_info )

Returns the information about the flash regions. Implements flash\_api\_t::infoGet.

**Return values**

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.
FSP_ERR_NOT_OPEN	The flash is not open.

◆ **R\_FLASH\_LP\_Close()**

```
fsp_err_t R_FLASH_LP_Close ( flash_ctrl_t *const p_api_ctrl)
```

Release any resources that were allocated by the Flash API. Implements `flash_api_t::close`.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_IN_USE	The flash is currently in P/E mode.

◆ **R\_FLASH\_LP\_CallbackSet()**

```
fsp_err_t R_FLASH_LP_CallbackSet ( flash_ctrl_t *const p_api_ctrl, void(*) (flash_callback_args_t *)
p_callback, void const *const p_context, flash_callback_args_t *const p_callback_memory )
```

Stub function Implements `flash_api_t::callbackSet`.

**Return values**

FSP_ERR_UNSUPPORTED	Function has not been implemented.
---------------------	------------------------------------

**4.2.16.9 FreeRTOS+FAT Port for RA (rm\_freertos\_plus\_fat)**

Modules » Storage

**Functions**

```

p_ctrl)
```

## Detailed Description

Middleware for the FAT File System control on RA MCUs.

## Overview

This module provides the hardware port layer for FreeRTOS+FAT file system. After initializing this module, refer to the FreeRTOS+FAT API reference to use the file system:

[https://www.freertos.org/FreeRTOS-Plus/FreeRTOS\\_Plus\\_FAT/index.html](https://www.freertos.org/FreeRTOS-Plus/FreeRTOS_Plus_FAT/index.html)

## Features

The FreeRTOS+FAT port module supports the following features:

- Callbacks for insertion and removal for removable devices.
- Helper function to initialize FF\_Disk\_t
- Blocking read and write port functions that use FreeRTOS task notification to pend if FreeRTOS is used
- FreeRTOS is optional

## Configuration

### Build Time Configurations for rm\_freertos\_plus\_fat

The following build time configurations are defined in fsp\_cfg/middleware/rm\_freertos\_plus\_fat\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Storage > FreeRTOS+FAT Port for RA (rm\_freertos\_plus\_fat)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_freertos_plus_fat_0	Module name.
Total Number of Sectors	Must be a non-negative integer	31293440	Enter the total number of sectors on the device. If this is not known, update rm_freertos_plus_fat_disk_cfg_t::num_blocks after calling <a href="#">RM_FREERTOS_PLUS_FAT_MediaInit()</a> .
Sector Size (bytes)	Must be a power of 2	512	Select the sector size.

	multiple of 512		Must match the underlying media sector size and at least 512. If this is not known, update <code>rm_freertos_plus_fat_disk_cfg_t::num_blocks</code> after calling <code>RM_FREERTOS_PLUS_FAT_MediaInit()</code> .
Cache Size (bytes)	Must be a power of 2 multiple of 512	1024	Select the cache size. Must be a multiple of the sector size and at least 2 times the sector size.
Partition Number	Must be a non-negative integer	0	Select the partition number for this disk.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

## Usage Notes

### Pending during Read/Write

If the underlying driver supports non-blocking operations, the FreeRTOS+FAT port pends the active FreeRTOS task during read and write operations so other tasks can run in the background.

If FreeRTOS is not used, the FreeRTOS+FAT port spins in a while loop waiting for read and write operations to complete.

### FreeRTOS+FAT without FreeRTOS

To use FreeRTOS+FAT without FreeRTOS, copy `FreeRTOSConfigMinimal.h` to one of your project's include paths and rename it `FreeRTOSConfig.h`.

Also, update the Malloc function to `malloc` and the Free function to `free` in the Common configurations.

## Examples

### Basic Example

This is a basic example of FreeRTOS+FAT in an application.

```
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES (10240)
```

```
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER (0)
extern rm_freertos_plus_fat_instance_ctrl_t g_freertos_plus_fat0_ctrl;
extern const rm_freertos_plus_fat_cfg_t g_freertos_plus_fat0_cfg;
extern rm_freertos_plus_fat_disk_cfg_t g_rm_freertos_plus_fat_disk_cfg;
extern uint8_t g_file_data[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_freertos_plus_fat_example (void)
{
    /* Open media driver.*/
    fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
    * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
    /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
    /* Mount each disk. This assumes the disk is already partitioned and formatted. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
    handle_ff_error(ff_err);
    /* Add the disk to the file system. */
    FF_FS_Add("/", &disk);
    /* Open a source file for writing. */
    FF_FILE * pxSourceFile = ff_fopen((const char *)
RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME, "w");
    assert(NULL != pxSourceFile);
}
```

```
/* Write file data. */
size_t size_return = ff_fwrite(g_file_data, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
/* Close the file. */
int close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
/* Open the source file in read mode. */
pxSourceFile = ff_fopen((const char *) RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME,
"r");
    assert(NULL != pxSourceFile);
/* Read file data. */
size_return = ff_fread(g_read_buffer, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
/* Close the file. */
close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
/* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

## Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_freertos_plus_fat_format_example (void)
{
    /* Open media driver.*/
    fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
    * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
```

```
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
    /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
    /* Try to mount the disk. If the disk is not formatted, mount will fail. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
    if (FF_isERR((uint32_t) ff_err))
    {
        /* The disk is likely not formatted. Partition and format the disk, then mount
again. */

assert(0 == close_err);
```

```

/* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}

```

## Data Structures

```
struct  rm_freertos_plus_fat_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_freertos\_plus\_fat\_instance\_ctrl\_t

```
struct rm_freertos_plus_fat_instance_ctrl_t
```

FreeRTOS plus FAT private control block. DO NOT MODIFY. Initialization occurs when RM\_FREERTOS\_PLUS\_FAT\_Open is called.

## Function Documentation

### ◆ RM\_FREERTOS\_PLUS\_FAT\_Open()

```
fsp_err_t RM_FREERTOS_PLUS_FAT_Open ( rm_freertos_plus_fat_ctrl_t *const p_ctrl,
rm_freertos_plus_fat_cfg_t const *const p_cfg )
```

Initializes lower layer media device.

Implements [rm\\_freertos\\_plus\\_fat\\_api\\_t::open\(\)](#).

#### Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_OUT_OF_MEMORY	Not enough memory to create semaphore.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [rm\\_block\\_media\\_api\\_t::open](#)

### ◆ RM\_FREERTOS\_PLUS\_FAT\_MediaInit()

```
fsp_err_t RM_FREERTOS_PLUS_FAT_MediaInit ( rm_freertos_plus_fat_ctrl_t *const p_ctrl,
rm_freertos_plus_fat_device_t *const p_device )
```

Initializes the media device. This function blocks until all identification and configuration commands are complete.

Implements `rm_freertos_plus_fat_api_t::mediaInit()`.

#### Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `rm_block_media_api_t::mediaInit`
- `rm_block_media_api_t::infoGet`

### ◆ RM\_FREERTOS\_PLUS\_FAT\_DiskInit()

```
fsp_err_t RM_FREERTOS_PLUS_FAT_DiskInit ( rm_freertos_plus_fat_ctrl_t *const p_ctrl,
rm_freertos_plus_fat_disk_cfg_t const *const p_disk_cfg, FF_Disk_t *const p_disk )
```

Initializes a FreeRTOS+FAT disk structure. This function calls `FF_CreateIOManger`.

Implements `rm_freertos_plus_fat_api_t::diskInit()`.

#### Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.
FSP_ERR_INTERNAL	Call to <code>FF_CreateIOManger</code> failed.

◆ **RM\_FREERTOS\_PLUS\_FAT\_DiskDeinit()**

```
fsp_err_t RM_FREERTOS_PLUS_FAT_DiskDeinit ( rm_freertos_plus_fat_ctrl_t *const p_ctrl, FF_Disk_t *const p_disk )
```

Deinitializes a FreeRTOS+FAT disk structure. This function calls FF\_DeleteIOManger.

Implements `rm_freertos_plus_fat_api_t::diskDeinit()`.

**Return values**

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

◆ **RM\_FREERTOS\_PLUS\_FAT\_InfoGet()**

```
fsp_err_t RM_FREERTOS_PLUS_FAT_InfoGet ( rm_freertos_plus_fat_ctrl_t *const p_ctrl, FF_Disk_t *const p_disk, rm_freertos_plus_fat_info_t *const p_info )
```

Get partition information. This function can only be called after `rm_freertos_plus_fat_api_t::diskInit()`.

Implements `rm_freertos_plus_fat_api_t::infoGet()`.

**Return values**

FSP_SUCCESS	Information stored in p_info.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.
FSP_ERR_NOT_FOUND	The value of p_iomanager is NULL.

### ◆ RM\_FREERTOS\_PLUS\_FAT\_Close()

`fsp_err_t RM_FREERTOS_PLUS_FAT_Close ( rm_freertos_plus_fat_ctrl_t *const p_ctrl)`

Closes media device.

Implements `rm_freertos_plus_fat_api_t::close()`.

#### Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [rm\\_block\\_media\\_api\\_t::close](#)

### 4.2.16.10 LevelX NOR Port (rm\_levelx\_nor\_spi)

Modules » [Storage](#)

#### Functions

`fsp_err_t RM_LEVELX_NOR_SPI_Open (rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, rm_levelx_nor_spi_cfg_t const *const p_cfg)`

Initializes LevelX NOR SPI port read/write and control. [More...](#)

`fsp_err_t RM_LEVELX_NOR_SPI_Read (rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG *const p_flash_addr, ULONG *const p_dest, ULONG word_count)`

LevelX NOR driver "read sector" service. [More...](#)

`fsp_err_t RM_LEVELX_NOR_SPI_Write (rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG *const p_flash_addr, ULONG *const p_src, ULONG word_count)`

LevelX NOR driver "write sector" service. [More...](#)

`fsp_err_t RM_LEVELX_NOR_SPI_BlockErase (rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG block, ULONG erase_count)`

LevelX NOR driver "block erase" service. [More...](#)

`fsp_err_t` [RM\\_LEVELX\\_NOR\\_SPI\\_BlockErasedVerify](#)  
 (`rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl`, ULONG block)  
 LevelX NOR driver "block erased verify" service. [More...](#)

`fsp_err_t` [RM\\_LEVELX\\_NOR\\_SPI\\_Close](#) (`rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl`)  
 LevelX NOR driver close service. [More...](#)

## Detailed Description

Middleware for using Azure RTOS LevelX on NOR SPI memory.

## Overview

This module provides the hardware port layer for LevelX on NOR SPI flash memory. Setup for this module is done solely through calling LevelX APIs. Please refer to the LevelX API reference: <https://docs.microsoft.com/en-us/azure/rtos/levelx/>

## Configuration

### Build Time Configurations for `rm_levelx_nor_spi`

The following build time configurations are defined in `fsp_cfg/middleware/rm_levelx_nor_spi_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	Selects if code for parameter checking is to be included in the build.
Write Verify	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	When enabled reads back data written to SPI memory in order to verify it.
Page Buffer Size (bytes)	Size should be greater than zero	256	When direct read is enabled in LevelX a situation can occur where the driver has to write to SPI memory with the source location also being within the SPI memory address range. In this situation the driver needs a buffer that is at least the same size as a page in order to temporarily store data

to write out.

### Configurations for Storage > LevelX NOR Port (rm\_levelx\_nor\_spi)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_levelx_nor_spi0	Module name.
Memory Start Address Offset (bytes)	Offset should be greater than or equal to zero	0	Enter the starting offset to use in the SPI memory. The starting address for LevelX memory will be the SPI memory base address plus this offset.
Memory Size (bytes)	Size should be greater than zero	33554432	Enter the size that the LevelX Memory should be. This can be smaller than the SPI memory size in order to use a subset of SPI memory.
Poll Status Count	Poll Status Count should be greater than or equal to zero	0xFFFFFFFF	Number of times to poll for operation complete status for blocking memory operations.

### Build Time Configurations for lx

The following build time configurations are defined in fsp\_cfg/azure/lx/lx\_user.h:

Configuration	Options	Default	Description
NOR > Direct Read	<ul style="list-style-type: none"> <li>Enabled (default)</li> <li>Disabled</li> </ul>	Enabled (default)	When enabled, this option bypasses the NOR flash driver read routine in favor of reading the NOR memory directly, resulting in a significant performance increase.
NOR > Free Sector Data Verify	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled (default)</li> </ul>	Disabled (default)	When enabled, this causes the LevelX NOR instance open logic to verify free NOR sectors are all ones.
NOR > Extended Cache	<ul style="list-style-type: none"> <li>Enabled (default)</li> <li>Disabled</li> </ul>	Enabled (default)	Enables the extended NOR cache.
NOR > Extended Cache Size	Manual Entry		If not set this value defaults to 8, which represents a maximum

NOR > Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty		of 8 sectors that can be cached in a NOR instance.
NAND > Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty		If not set this value defaults to 16 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2.
NAND > Flash Direct Mapping Cache	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, this creates a direct mapping cache, such that there are no cache misses. It also required that LX_NAND_SECTOR_MAPPING_CACHE_SIZE represents the exact number of total pages in your flash device.
Thread Safe	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, this makes LevelX thread-safe by using a ThreadX mutex object throughout the API.
Standalone Mode	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>	Disabled (default)	When enabled, allows LevelX to be used in standalone mode (without Azure RTOS).

## Usage Notes

### Pending during Erase/Write

The LevelX NOR SPI driver is blocking on all SPI operations and will poll device status for operation completion on Writes and Erases. A callback can be provided by the user to wait with an OS-specific thread wait in these instances.

## Closing the driver

When `lx_nor_flash_close` is called to close the LevelX instance it does not call any services within the LevelX NOR SPI driver to close out the driver instance. The user should call the generated close function (i.e. `g_rm_levelx_nor_spi0_close`) in order to close out the driver instance.

## Erasing Flash Memory Prior to Usage

The area of the flash memory being used for the LevelX instance should be erased using the lower level flash API prior to usage. Otherwise, LevelX API may fail on `lx_nor_flash_open` due to any areas in flash memory that have been written/set.

# Examples

## Basic Example

This is a basic example of using the LevelX NOR SPI driver with the LevelX API in an application.

```
#define RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE (512)
#define RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE (0xA5)
#define RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE (4096)
extern rm_levelx_nor_spi_instance_ctrl_t g_levelx_nor_spi0_ctrl;
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
extern LX_NOR_FLASH g_lx_nor_flash0;
void rm_levelx_nor_spi_example (void)
{
    uint8_t          read_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
    uint8_t          write_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
    spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
    spi_flash_status_t  status;
    memset(write_buffer, RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE, sizeof
(write_buffer));
    /* Erase flash prior to usage */
    fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
    for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
        i < g_levelx_nor_spi0_cfg.size;
        i += RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE)
    {
```

```

    err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                           (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,
RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE);
    assert(FSP_SUCCESS == err);
    status.write_in_progress = true;
    while (status.write_in_progress)
    {
        err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
        assert(FSP_SUCCESS == err);
    }
    err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
    assert(FSP_SUCCESS == err);
/* Initialize LevelX */
    lx_nor_flash_initialize();
    UINT lx_err = lx_nor_flash_open(&g_lx_nor_flash0, "LX_NOR_SPI_EXAMPLE",
g_levelx_nor_spi0_initialize);
    handle_lx_error(lx_err);
/* Write test value to sector 0 then read back to verify */
    lx_err = lx_nor_flash_sector_write(&g_lx_nor_flash0, 0, write_buffer);
    handle_lx_error(lx_err);
    lx_err = lx_nor_flash_sector_read(&g_lx_nor_flash0, 0, read_buffer);
    handle_lx_error(lx_err);
    assert(0 == memcmp(read_buffer, write_buffer, sizeof(read_buffer)));
}

```

## Callback Wait Example

This shows how to use the LevelX NOR SPI driver callback with ThreadX in order to wait for operations to complete.

```

/* Callback called by LevelX NOR SPI driver needs to wait on operation. */

```

```

void rm_levelx_nor_spi_callback_wait_example (rm_levelx_nor_spi_callback_args_t *
p_args)
{
    if (p_args->event & RM_LEVELX_NOR_SPI_EVENT_BUSY)
    {
        /* Put the thread to sleep while waiting for operation to complete. */
        tx_thread_sleep(1);
    }
}

```

## Data Structures

struct [rm\\_levelx\\_nor\\_spi\\_callback\\_args\\_t](#)

struct [rm\\_levelx\\_nor\\_spi\\_cfg\\_t](#)

struct [rm\\_levelx\\_nor\\_spi\\_instance\\_ctrl\\_t](#)

## Enumerations

enum [rm\\_levelx\\_nor\\_spi\\_event\\_t](#)

## Data Structure Documentation

### ◆ [rm\\_levelx\\_nor\\_spi\\_callback\\_args\\_t](#)

struct <a href="#">rm_levelx_nor_spi_callback_args_t</a>		
RM_LEVELX_NOR_SPI callback arguments definitions		
Data Fields		
<a href="#">rm_levelx_nor_spi_event_t</a>	event	LevelX NOR driver callback event.
void const *	p_context	Placeholder for user data.

### ◆ [rm\\_levelx\\_nor\\_spi\\_cfg\\_t](#)

struct <a href="#">rm_levelx_nor_spi_cfg_t</a>		
SF_EL_LX_NOR Config Block Type		
<b>Data Fields</b>		
<a href="#">spi_flash_instance_t</a> const *	<a href="#">p_lower_lvl</a>	
		Lower level memory pointer.
LX_NOR_FLASH *	<a href="#">p_lx_nor_flash</a>	

	Pointer to the LevelX nor flash instance.
uint32_t	<a href="#">base_address</a>
	Base address of memory mapped region.
uint32_t	<a href="#">address_offset</a>
	Offset to use subset of available flash size if desired.
uint32_t	<a href="#">size</a>
	Size of the partitioned region.
uint32_t	<a href="#">poll_status_count</a>
	Number of times to poll for operation complete status before returning an error.
void const *	<a href="#">p_context</a>
	Placeholder for user data. Passed to the user callback.
void(*	<a href="#">p_callback</a> )(rm_levelx_nor_spi_callback_args_t *p_args)
	Callback function.

#### ◆ rm\_levelx\_nor\_spi\_instance\_ctrl\_t

struct rm_levelx_nor_spi_instance_ctrl_t		
SF_EL_LX_NOR Control Block Type		
Data Fields		
<a href="#">rm_levelx_nor_spi_cfg_t</a> const *	<a href="#">p_cfg</a>	Pointer to instance configuration.
uint32_t	<a href="#">start_address</a>	Start address of partition to use within memory mapped region.
uint32_t	<a href="#">minimum_erase_size</a>	Minimum erase size of SPI memory.

uint8_t	page_buffer[RM_LEVELX_NOR_SPI_CFG_BUFFER_SIZE]	Page buffer for situations when writing to SPI memory from a source within SPI memory.
uint32_t	open	Used to determine if module is initialized.

## Enumeration Type Documentation

### ◆ rm\_levelx\_nor\_spi\_event\_t

enum <a href="#">rm_levelx_nor_spi_event_t</a>	
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. Options for the callback events.	
Enumerator	
RM_LEVELX_NOR_SPI_EVENT_BUSY	Pending operation, user can define their own wait functionality.

## Function Documentation

### ◆ RM\_LEVELX\_NOR\_SPI\_Open()

<a href="#">fsp_err_t</a> RM_LEVELX_NOR_SPI_Open ( <a href="#">rm_levelx_nor_spi_instance_ctrl_t</a> *const p_ctrl, <a href="#">rm_levelx_nor_spi_cfg_t</a> const *const p_cfg )		
Initializes LevelX NOR SPI port read/write and control. Calls lower level SPI memory functions.		
<b>Parameters</b>		
[in,out]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_cfg	Configuration for LevelX NOR SPI port.
<b>Return values</b>		
FSP_SUCCESS	LevelX NOR driver is successfully opened.	
FSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.	
FSP_ERR_ALREADY_OPEN	Driver is already in OPEN state.	
<b>Returns</b>		
See <a href="#">Common_Error_Codes</a> or lower level drivers for other possible return codes. This function calls <ul style="list-style-type: none"> <li>◦ <a href="#">spi_flash_api_t:open</a></li> </ul>		

◆ **RM\_LEVELX\_NOR\_SPI\_Read()**

```
fsp_err_t RM_LEVELX_NOR_SPI_Read ( rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG
*const p_flash_addr, ULONG *const p_dest, ULONG word_count )
```

LevelX NOR driver "read sector" service.

This is responsible for reading a specific sector in a specific block of the NOR flash. All error checking and correcting logic is the responsibility of this service.

**Parameters**

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in,out]	p_dest	Specifies where to place the sector contents.
[in]	word_count	Specifies how many 32-bit words to read.

**Return values**

FSP_SUCCESS	LevelX NOR flash sector read successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_dest is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for reading.

**Returns**

See `Common_Error_Codes` or lower level drivers for other possible return codes.

### ◆ RM\_LEVELX\_NOR\_SPI\_Write()

```
fsp_err_t RM_LEVELX_NOR_SPI_Write ( rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG
*const p_flash_addr, ULONG *const p_src, ULONG word_count )
```

LevelX NOR driver "write sector" service.

This is responsible for writing a specific sector into a block of the NOR flash. All error checking is the responsibility of the this service.

#### Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in]	p_src	Specifies the source of the write.
[in]	word_count	Specifies how many 32-bit words to write.

#### Return values

FSP_SUCCESS	LevelX NOR flash sector write successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_src is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for writing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.
FSP_ERR_WRITE_FAILED	Verification of Write operation failed.
FSP_ERR_INVALID_ADDRESS	Write address or size falls outside of flash memory range.

#### Returns

See Common\_Error\_Codes or lower level drivers for other possible return codes. This function calls

- [spi\\_flash\\_api\\_t:write](#)

◆ **RM\_LEVELX\_NOR\_SPI\_BlockErase()**

```
fsp_err_t RM_LEVELX_NOR_SPI_BlockErase ( rm_levelx_nor_spi_instance_ctrl_t*const p_ctrl,
ULONG block, ULONG erase_count )
```

LevelX NOR driver "block erase" service.

This is responsible for erasing the specified block of the NOR flash.

**Parameters**

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which NOR block to erase.
[in]	erase_count	Provided for diagnostic purposes(currently unused).

**Return values**

FSP_SUCCESS	LevelX NOR flash block erase successful.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for erasing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.

**Returns**

See Common\_Error\_Codes or lower level drivers for other possible return codes. This function calls

- spi\_flash\_api\_t:erase

◆ **RM\_LEVELX\_NOR\_SPI\_BlockErasedVerify()**

```
fsp_err_t RM_LEVELX_NOR_SPI_BlockErasedVerify ( rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl,
ULONG block )
```

LevelX NOR driver "block erased verify" service.

This is responsible for verifying the specified block of the NOR flash is erased.

**Parameters**

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which block to verify that it is erased.

**Return values**

FSP_SUCCESS	LevelX flash block erase verification successful.
FSP_ERR_ASSERTION	p_ctrl or lower level driver is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for verifying.
FSP_ERR_NOT_ERASED	The block is not erased properly.

**Returns**

See `Common_Error_Codes` or lower level drivers for other possible return codes.

◆ **RM\_LEVELX\_NOR\_SPI\_Close()**

```
fsp_err_t RM_LEVELX_NOR_SPI_Close ( rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl)
```

LevelX NOR driver close service.

This is responsible for closing the driver properly.

**Parameters**

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
------	--------	--

**Return values**

FSP_SUCCESS	LevelX flash is available and is now open for read, write, and control access.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for closing.

**Returns**

See `Common_Error_Codes` or lower level drivers for other possible return codes. This function calls

- `spi_flash_api_t:close`

#### 4.2.16.11 LittleFS on Flash (rm\_littlefs\_flash)

Modules » Storage

##### Functions

```
fsp_err_t RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl,
rm_littlefs_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl)
```

##### Detailed Description

Middleware for the LittleFS File System control on RA MCUs.

## Overview

This module provides the hardware port layer for the LittleFS file system. After initializing this module, refer to the LittleFS documentation to use the file system:

<https://github.com/ARMmbed/littlefs>

## Configuration

### Build Time Configurations for rm\_littlefs\_flash

The following build time configurations are defined in fsp\_cfg/rm\_littlefs\_flash\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Storage > LittleFS on Flash (rm\_littlefs\_flash)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_littlefs0	Module name.
Read Size	Must be a non-negative integer	1	Minimum size of a block read. All read operations will be a multiple of this value.
Program Size	Must be a non-negative integer	4	Minimum size of a block program. All program operations will be a multiple of this value.

Block Size (bytes)	Must be a multiple of 64	128	Size of an erasable block. This does not impact RAM consumption and may be larger than the physical erase size. However, non-inlined files take up at minimum one block. Must be a multiple of the read and program sizes.
Block Count	Manual Entry	(BSP_DATA_FLASH_SIZE_BYTES/128)	Number of erasable blocks on the device.
Block Cycles	Must be an integer	1024	Number of erase cycles before LittleFS evicts metadata logs and moves the metadata to another block. Suggested values are in the range 100-1000, with large values having better performance at the cost of less consistent wear distribution. Set to -1 to disable block-level wear-leveling.
Cache Size	Must be a non-negative integer	64	Size of block caches. Each cache buffers a portion of a block in RAM. The LittleFS needs a read cache, a program cache, and one additional cache per file. Larger caches can improve performance by storing more data and reducing the number of disk accesses. Must be a multiple of the read and program sizes, and a factor of the block size.
Lookahead Size	Must be a non-negative multiple of 8	16	Size of the lookahead buffer in bytes. A larger lookahead buffer increases the number of blocks found during an allocation pass. The lookahead buffer is

stored as a compact bitmap, so each byte of RAM can track 8 blocks. Must be a multiple of 8.

## Common LittleFS Configuration

### Build Time Configurations for LittleFS

The following build time configurations are defined in arm/littlefs/lfs\_util.h:

Configuration	Options	Default	Description
Custom lfs_util.h	Manual Entry		Add a path to your custom lfs_util.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Thread Safe	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enables thread safety in LittleFS.
Use Malloc	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Configures the use of malloc by LittleFS.
Use Assert	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Configures the use of assert by LittleFS.
Debug Messages	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Configures debug messages.
Warning Messages	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Configures warning messages.
Error Messages	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Configures error messages.
Trace Messages	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Configures trace messages.
Intrinsics	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Configures intrinsic functions such as <code>__builtin_clz</code> .
Instance Name for STDIO wrapper	Name must be a valid C symbol	g_rm_littlefs0	The <code>rm_littlefs</code> instance name to use with the STDIO wrapper.

## Usage Notes

### Blocking Read/Write/Erase

The LittleFS port blocks on Read/Write/Erase calls until the operation has completed.

## Memory Constraints

The block size defined in the LittleFS configuration must be a multiple of the data flash erase size of the MCU. It must be greater than 104bytes which is the minimum block size of a LittleFS block. For information about data flash erase sizes refer to the "Specifications of the code flash memory and data flash memory" table of the "Flash Memory" chapter's "Overview" section.

## Limitations

This module is not thread safe.

## Examples

### Basic Example

This is a basic example of LittleFS on Flash in an application.

```
extern const rm_littlefs_cfg_t g_rm_littlefs_flash0_cfg;
#ifdef LFS_NO_MALLOC
static uint8_t g_file_buffer[LFS_CACHE_SIZE];
static struct lfs_file_config g_file_cfg =
{
    .buffer = g_file_buffer
};
#endif
void rm_littlefs_example (void)
{
    uint8_t    buffer[30];
    lfs_file_t file;
    /* Open LittleFS Flash port.*/
    fsp_err_t err = RM_LITTLEFS_FLASH_Open(&g_rm_littlefs_flash0_ctrl,
&g_rm_littlefs_flash0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Format the filesystem. */
    int lfs_err = lfs_format(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
    /* Mount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
}
```

```
/* Create a breakfast directory. */
    lfs_err = lfs_mkdir(&g_rm_littlefs_flash0_lfs, "breakfast");
    handle_lfs_error(lfs_err);

/* Create a file toast in the breakfast directory. */
const char * path = "breakfast/toast";
#ifdef LFS_NO_MALLOC
/*****
*****
* By default LittleFS uses malloc to allocate buffers. This can be disabled in the
RA Configuration editor.
* Buffers will be generated from the configuration for the read, program and
lookahead buffers.
* When opening a file a unique buffer must be passed in for use as a file buffer.
* The buffer size must be equal to the cache size.
*****
*****/
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs,
                              &file,
                              path,
                              LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND,
                              &g_file_cfg);

    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_WRONLY |
LFS_O_CREAT | LFS_O_APPEND);
    handle_lfs_error(lfs_err);
#endif

const char * contents = "butter";
    lfs_size_t len = strlen(contents);

/* Apply butter to toast 10 times. */
for (uint32_t i = 0; i < 10; i++)
{
    lfs_err = lfs_file_write(&g_rm_littlefs_flash0_lfs, &file, contents, len);
    if (lfs_err < 0)
```

```
    {
        handle_lfs_error(lfs_err);
    }
}

/* Close the file. */
lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
handle_lfs_error(lfs_err);

/* Unmount the filesystem. */
lfs_err = lfs_unmount(&g_rm_littlefs_flash0_lfs);
handle_lfs_error(lfs_err);

/* Remount the filesystem. */
lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
handle_lfs_error(lfs_err);

/* Open breakfast/toast. */
#ifdef LFS_NO_MALLOC
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY,
&g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY);
    handle_lfs_error(lfs_err);
#endif
    handle_lfs_error(lfs_err);

/* Verify the toast is buttered the correct amount. */
for (uint32_t i = 0; i < 10; i++)
    {
        lfs_err = lfs_file_read(&g_rm_littlefs_flash0_lfs, &file, buffer, len);
        if (lfs_err < 0)
            {
                handle_lfs_error(lfs_err);
            }
        assert(0 == memcmp(buffer, contents, len));
    }

/* Close the file. */
```

```

lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
handle_lfs_error(lfs_err);
}

```

## Function Documentation

### ◆ RM\_LITTLEFS\_FLASH\_Open()

`fsp_err_t RM_LITTLEFS_FLASH_Open ( rm_littlefs_ctrl_t *const p_ctrl, rm_littlefs_cfg_t const *const p_cfg )`

Opens the driver and initializes lower layer driver.

Implements `rm_littlefs_api_t::open()`.

#### Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_SIZE	The provided block size is invalid.
FSP_ERR_INVALID_ARGUMENT	Flash BGO mode must be disabled.
FSP_ERR_INTERNAL	Failed to create the semaphore.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `flash_api_t::open`

### ◆ RM\_LITTLEFS\_FLASH\_Close()

`fsp_err_t RM_LITTLEFS_FLASH_Close ( rm_littlefs_ctrl_t *const p_ctrl)`

Closes the lower level driver.

Implements `rm_littlefs_api_t::close()`.

#### Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

#### Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `flash_api_t::close`

### 4.2.16.12 OSPI Flash (r\_ospi)

Modules » Storage

#### Functions

fsp_err_t	R_OSPI_Open (spi_flash_ctrl_t *p_ctrl, spi_flash_cfg_t const *const p_cfg)
fsp_err_t	R_OSPI_DirectWrite (spi_flash_ctrl_t *p_ctrl, uint8_t const *const p_src, uint32_t const bytes, bool const read_after_write)
fsp_err_t	R_OSPI_DirectRead (spi_flash_ctrl_t *p_ctrl, uint8_t *const p_dest, uint32_t const bytes)
fsp_err_t	R_OSPI_DirectTransfer (spi_flash_ctrl_t *p_ctrl, spi_flash_direct_transfer_t *const p_transfer, spi_flash_direct_transfer_dir_t direction)
fsp_err_t	R_OSPI_XipEnter (spi_flash_ctrl_t *p_ctrl)
fsp_err_t	R_OSPI_XipExit (spi_flash_ctrl_t *p_ctrl)
fsp_err_t	R_OSPI_Write (spi_flash_ctrl_t *p_ctrl, uint8_t const *const p_src, uint8_t *const p_dest, uint32_t byte_count)
fsp_err_t	R_OSPI_Erase (spi_flash_ctrl_t *p_ctrl, uint8_t *const p_device_address, uint32_t byte_count)
fsp_err_t	R_OSPI_StatusGet (spi_flash_ctrl_t *p_ctrl, spi_flash_status_t *const p_status)
fsp_err_t	R_OSPI_BankSet (spi_flash_ctrl_t *p_ctrl, uint32_t bank)
fsp_err_t	R_OSPI_SpiProtocolSet (spi_flash_ctrl_t *p_ctrl, spi_flash_protocol_t spi_protocol)
fsp_err_t	R_OSPI_AutoCalibrate (spi_flash_ctrl_t *p_ctrl)
fsp_err_t	R_OSPI_Close (spi_flash_ctrl_t *p_ctrl)

#### Detailed Description

Driver for the OSPI peripheral on RA MCUs. This module implements the [SPI Flash Interface](#).

## Overview

The OSPI peripheral interfaces with an external OctaFlash and/or OctaRAM chip(s) to perform data I/O Operations. When both OctaFlash and OctaRAM devices are interfaced, they must be connected to their own chip-select lines. The devices cannot share a single chip-select line.

## Features

The OSPI driver has the following key features to support the **OctaFlash** device:

- Perform data I/O Operation in both SPI and OPI modes
- Can be configured with OctaFlash device on either of the 2 channels
- Memory mapped read access to the OctaFlash
- Programming the OctaFlash device using single continuous write
- Erasing the OctaFlash device
- Sending device specific commands and reading back responses
- Entering and exiting XIP (Single Continuous Read) mode
- 3 byte addressing for SPI
- 4 byte addressing for SPI and OPI
- Auto-calibration for OPI mode (SOPI and DOPI)

The OSPI driver has the following key features to support the **OctaRAM** device:

- Perform data I/O Operation in DOPI mode
- Can be configured with OctaRAM device on either of the 2 channels
- Memory mapped read and write access to the OctaRAM using single continuous mode
- Sending device specific commands and reading back responses
- Auto-calibration for DOPI mode
- Uninitialized global variables or buffers can be allocated in the OSPI RAM address space.

Additional build-time features:

- Optional (build-time) DMAC support for data transmission when used with OctaFlash.

### Note

*For OctaFlash, use of DMAC for data transmission is strongly recommended. Without the use of DMAC, due to the high-speed hardware design of the OSPI peripheral, data transmission can be sensitive to timing variance, which could cause software-based memory-mapped operations to fail unexpectedly.*

## Configuration

### OSPI Flash:

#### Build Time Configurations for r\_ospi

The following build time configurations are defined in driver/r\_ospi\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	<ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul>	Disable	Enable DMAC support for the OSPI module.

#### Configurations for Storage > OSPI Flash (r\_ospi)

This module can be added to the Stacks tab via New Stack > Storage > OSPI Flash (r\_ospi).

Configuration	Options	Default	Description
General > Single Continuous Mode > Read Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	100	Specify the read idle time.
General > Single Continuous Mode > Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	100	Specify the write idle time.
General > Name	Name must be a valid C symbol	g_ospi0	Module name.
General > Channel	Channel should be 0 or 1	0	Specify the OSPI chip select line to use.
General > Flash Size	Must be an integer greater than 0 with maximum configurable value of 0x3FFFFFFF	0x04000000	Specify the OctaFlash size in bytes.
General > SPI Protocol	<ul style="list-style-type: none"> <li>SPI</li> <li>Single data rate OPI</li> <li>Dual data rate OPI</li> </ul>	SPI	Select the initial SPI protocol. SPI protocol can be changed on the OctaFlash using <a href="#">R_OSPI_DirectTransfer()</a> .
General > Address Bytes	<ul style="list-style-type: none"> <li>3</li> <li>4</li> </ul>	4	Select the number of address bytes.
OPI Mode > Auto-Calibration > Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
OPI Mode > Auto-Calibration > Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
OPI Mode > Command Definitions > Page Program Command	Must be a 16-bit OSPI Page Program Command under OPI Mode Command Definitions	0x12ED	The command to program a page in OPI mode.
OPI Mode > Command Definitions > Read Command	Must be a 16-bit OSPI Read Command under OPI Mode Command Definitions	0xEC13	The command to read in SOPI mode (8READ).
OPI Mode > Command Definitions > Dual	Must be a 16-bit OSPI Dual Read Command	0xEE11	The command to read in DOPI mode (8DTRD).

Read Command	under OPI Mode Command Definitions		
OPI Mode > Command Definitions > Write Enable Command	Must be a 16-bit OSPI Write Enable Command under OPI Mode Command Definitions	0x06F9	The command to enable write in OPI mode.
OPI Mode > Command Definitions > Status Command	Must be a 16-bit OSPI Status Command under OPI Mode Command Definitions	0x05FA	The command to query the status of a write or erase command in OPI mode.
OPI Mode > OM_DQS Enable Counter > SOPI	Must be an integer between 0 and 255	9	OM_DQS enable counter for memory access. Setting for SOPI mode.
OPI Mode > OM_DQS Enable Counter > DOPI	Must be an integer between 0 and 255	6	OM_DQS enable counter for memory access. Setting for DOPI mode.
OPI Mode > Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
OPI Mode > Memory Read Dummy Cycles	Must be an integer between 6 and 10	10	Memory read dummy cycles
OPI Mode > DOPI Byte Order	<ul style="list-style-type: none"> <li>• Byte0, Byte1, Byte2, Byte3</li> <li>• Byte1, Byte0, Byte3, Byte2</li> </ul>	Byte0, Byte1, Byte2, Byte3	Byte order on the external bus
SPI Mode > Command Definitions > Page Program Command	Must be a 8-bit OSPI Page Program Command under SPI Mode Command Definitions	0x12	The command to program a page in SPI mode.
SPI Mode > Command Definitions > Read Command	Must be a 8-bit OSPI Read Command under SPI Mode Command Definitions	0x13	The command to read in SPI mode.
SPI Mode > Command Definitions > Write Enable Command	Must be a 16-bit OSPI Write Enable Command under SPI Mode Command Definitions	0x06	The command to enable write in SPI mode.
SPI Mode > Command Definitions > Status Command	Must be a 16-bit OSPI Status Command under SPI Mode Command Definitions	0x05	The command to query the status of a write or erase command in SPI mode.
Common Command	Must be a value	0x21DE	The command to erase

Definitions > Sector Erase Command	greater than or equal to 0		a sector. Set Sector Erase Size to 0 if unused.
Common Command Definitions > Block Erase Command	Must be a value greater than or equal to 0	0xDC23	The command to erase a block. Set Block Erase Size to 0 if unused.
Common Command Definitions > Chip Erase Command	Must be a value greater than or equal to 0	0xC738	The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
Common Command Definitions > Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Common Command Definitions > Write Enable Bit	Must be an integer between 0 and 7	1	Which bit contains the write enable status returned from the Write Enable Command.
Common Command Definitions > Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Common Command Definitions > Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Chip Select Timing Setting > Memory Mapped Read Command Interval	<ul style="list-style-type: none"> <li>• 2</li> <li>• 5</li> <li>• 7</li> <li>• 9</li> <li>• 11</li> <li>• 13</li> <li>• 15</li> <li>• 17</li> </ul>	2	Memory mapped read command execution interval setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Command Interval	<ul style="list-style-type: none"> <li>• 2</li> <li>• 5</li> <li>• 7</li> <li>• 9</li> <li>• 11</li> <li>• 13</li> <li>• 15</li> <li>• 17</li> </ul>	2	Memory mapped write command execution interval setting in OCTACLK units

- DOPI
- 5 SPI/SOPI, 4.5 DOPI

*Note*

The user is expected to modify the command definitions based on the OctaFlash chip and SPI communication mode. The default mode is SPI mode and default erase commands are set for OPI mode based on Macronix OctaFlash MX25LM51245G.

**OSPI RAM:****Build Time Configurations for r\_ospi**

The following build time configurations are defined in driver/r\_ospi\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

**Configurations for Storage > OSPI RAM (r\_ospi)**

This module can be added to the Stacks tab via New Stack > Storage > OSPI RAM (r\_ospi).

Configuration	Options	Default	Description
General > Single Continuous Mode > Read Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the read idle time.
General > Single Continuous Mode > Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the write idle time.
General > Name	Name must be a valid C symbol	g_ospi_ram0	Module name.
General > Channel	Channel should be 0 or 1 [Channel 0 recommended]	0	Specify the OSPI chip select line to use.
General > RAM Size	Must be an integer greater than 0 with maximum configurable value of 0x00800000	0x00800000	Specify the OctaRam size in bytes.
General > SPI Protocol	Dual data rate OPI	Dual data rate OPI	Select the initial SPI protocol. OctaRAM only supports DOPI mode.
General > Address Bytes	4	4	Select the number of address bytes. OctaRAM only supports 4 byte addresses in

Auto-Calibration > Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	DOPI mode. Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
Auto-Calibration > Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
Command Definitions > Memory Read Command	Must be a 16-bit OSPI Dual Read Command under Command Definitions	0xA000	The command to read in DOPI mode.
Command Definitions > Memory Write Command	Must be a 16-bit OSPI Write Command under Command Definitions	0x2000	The command to write in DOPI mode.
OM_DQS Enable Counter > DOPI	Must be an integer between 0 and 255	3	OM_DQS enable counter for memory access. Setting for DOPI mode.
Chip Select Timing Setting > Memory Mapped Read Command Interval	<ul style="list-style-type: none"> <li>• 2</li> <li>• 5</li> <li>• 7</li> <li>• 9</li> <li>• 11</li> <li>• 13</li> <li>• 15</li> <li>• 17</li> </ul>	2	Memory mapped read command execution interval setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Command Interval	<ul style="list-style-type: none"> <li>• 2</li> <li>• 5</li> <li>• 7</li> <li>• 9</li> <li>• 11</li> <li>• 13</li> <li>• 15</li> <li>• 17</li> </ul>	2	Memory mapped write command execution interval setting in OCTACLK units
Chip Select Timing Setting > Command Interval	<ul style="list-style-type: none"> <li>• 2</li> <li>• 5</li> <li>• 7</li> <li>• 9</li> <li>• 11</li> <li>• 13</li> <li>• 15</li> <li>• 17</li> </ul>	2	Command execution interval setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Read Pull-up Timing	<ul style="list-style-type: none"> <li>• 6.5 DOPI</li> <li>• 7.5 DOPI</li> <li>• 8.5 DOPI</li> </ul>	6.5 DOPI	Memory mapped read signal pull-up timing setting in OCTACLK units

Chip Select Timing Setting > Memory Mapped Write Pull-up Timing	<ul style="list-style-type: none"> <li>• 1.5 DOPI</li> <li>• 2.5 DOPI</li> <li>• 3.5 DOPI</li> <li>• 4.5 DOPI</li> <li>• 5.5 DOPI</li> <li>• 6.5 DOPI</li> <li>• 7.5 DOPI</li> <li>• 8.5 DOPI</li> </ul>	1.5 DOPI	Memory mapped write signal pull-up timing setting in OCTACLK units
Chip Select Timing Setting > Pull-up Timing	<ul style="list-style-type: none"> <li>• 6.5 DOPI</li> <li>• 7.5 DOPI</li> <li>• 8.5 DOPI</li> </ul>	6.5 DOPI	Signal pull-up timing setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Read Pull-down Timing	<ul style="list-style-type: none"> <li>• 2.5 DOPI</li> <li>• 3.5 DOPI</li> <li>• 4.5 DOPI</li> </ul>	2.5 DOPI	Memory mapped read signal pull-down timing setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Pull-down Timing	<ul style="list-style-type: none"> <li>• 2.5 DOPI</li> <li>• 3.5 DOPI</li> <li>• 4.5 DOPI</li> </ul>	2.5 DOPI	Memory mapped write signal pull-down timing setting in OCTACLK units
Chip Select Timing Setting > Pull-down Timing	<ul style="list-style-type: none"> <li>• 2.5 DOPI</li> <li>• 3.5 DOPI</li> <li>• 4.5 DOPI</li> </ul>	2.5 DOPI	Signal pull-down timing setting in OCTACLK units
Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
Memory Read Dummy Cycles	Must be an integer between 3 and 8	4	Memory read dummy cycles
Memory Write Dummy Cycles	Must be an integer between 3 and 8	4	Memory write dummy cycles
DOPI Byte Order	<ul style="list-style-type: none"> <li>• Byte0, Byte1, Byte2, Byte3</li> <li>• Byte1, Byte0, Byte3, Byte2</li> </ul>	Byte1, Byte0, Byte3, Byte2	Byte order on the external bus
Chip Select Maximum Low Time (us)	Must be an integer greater than or equal to 0	4	Chip Select Maximum Low Time (tCSM).

## Clock Configuration

PCLKB is the Octal-SPI bus interface, and PCLKA is used to set OSPI registers.

The signals to the OSPI device are derived from OCTASPICK. The OMSCLK signal is OCTASPICK / 2. Data can be output at the OCTASPICK rate if SPI Protocol is set to Dual Data Rate OPI.

The PCLKB, PCLKA, and OCTASPICK frequencies can be set on the **Clocks** tab of the RA Configuration editor.

## Pin Configuration

The following pins are available to connect to an external OSPI device:

- OMCLK: OSPI clock output (OCTASPICLK / 2)
- OMDQS: OSPI data strobe signal
- OMCS0: OSPI device 0 select
- OMCS1: OSPI device 1 select
- OMSIO0: Data 0 I/O
- OMSIO1: Data 1 I/O
- OMSIO2: Data 2 I/O
- OMSIO3: Data 3 I/O
- OMSIO4: Data 4 I/O
- OMSIO5: Data 5 I/O
- OMSIO6: Data 6 I/O
- OMSIO7: Data 7 I/O

#### Note

*Data pins must be configured with IOPORT\_CFG\_DRIVE\_HS\_HIGH.*

*Chip Select pins should be configured with at least IOPORT\_CFG\_DRIVE\_MEDIUM.*

## Usage Notes

### Usage Notes for OctaFlash support

#### Enabling DMAC

DMAC data transmission support is configurable for OSPI Flash and is disabled from the build by default. Use of a high-priority (low channel number) DMAC for data transmission is strongly recommended.

For further details on DMAC please refer [Transfer \(r\\_dmac\)](#).

#### OSPI Memory Mapped Access

After [R\\_OSPI\\_Open\(\)](#) completes successfully, the OctaFlash device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be read like on-chip flash. Channel 0 supports 128 MB while Channel 1 supports 256 MB of address space.

#### Auto-calibration

Auto-calibration procedure is triggered automatically when the 'Data latching delay' field in the configurator properties is set to 0. The user application is responsible for setting the appropriate preamble pattern before calling [R\\_OSPI\\_Open\(\)](#) with SOPI/DOPI mode or changing the SPI protocol to SOPI/DOPI using [R\\_OSPI\\_SpiProtocolSet\(\)](#) API. The appropriate preamble pattern can be written to the desired address using the [R\\_OSPI\\_Write\(\)](#) API while in the SPI mode (recommended). Ensure that the same address is passed through the configurator. If the OctaFlash chip is already in SOPI/DOPI mode, the preamble pattern must be programmed using the debugger before calling [R\\_OSPI\\_Open\(\)](#).

#### Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support SOPI and SPI at minimum latency. In case the driver is opened in SPI mode and will be switched to DOPI mode later using [R\\_OSPI\\_SpiProtocolSet\(\)](#), please select latencies required for DOPI before calling [R\\_OSPI\\_Open\(\)](#).

#### OctaFlash Commands

- Set the erase commands based on intended mode of operation (SPI or OPI). These commands cannot be changed during run-time.
- Read, Write and Status commands for both SPI and OPI are configured allowing switching between the modes at run-time.

## Usage Notes for OctaRAM support

### OSPI Memory Mapped Access

After `R_OSPI_Open()` completes successfully, the OctaRAM device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be written to or read from like on-chip RAM. Channel 0 and 1 support 8 MB of address space.

### Auto-calibration

Since the OctaRAM only supports DOPI mode, the driver allows the user to call `R_OSPI_Open()` without performing the auto-calibration procedure automatically when 'Data latching delay' field is set to 0 in the configurator properties. This is done so that the user can write the appropriate preamble pattern to the desired address using memory mapped writes while in DOPI mode. Ensure that the same address is passed through the configurator. `R_OSPI_AutoCalibrate()` should be then called to perform auto-calibration.

### Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support DOPI at minimum latency.

### Limitations

Developers should be aware of the following limitations when using the OSPI driver:

#### OctaFlash

- Single continuous read in SPI mode is not supported by the peripheral. The maximum amount of data that can be read using a single read command is 4-bytes (When doing a 32-bit access).
- Fast Reads would be slower than regular reads as the SPI mode cannot be operated with an OMCLK greater than 50MHz.

## Examples

### OSPI Flash:

#### Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaFlash.

```
#define OSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_EXAMPLE_DATA_LENGTH];

/* Place data in the .ospi_flash section to flash it during programming. */
const uint8_t g_src[OSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".ospi_flash") =
"ABCDEFGHJKLMNOPQRSTUVWXYZ";
```

```
/* Place code in the .code_in_ospi section to flash it during programming. */
void r_ospi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_ospi")
__attribute__((noinline));

void r_ospi_example_function (void)
{
    /* Add code here. */
}

void r_ospi_basic_example (void)
{
    /* Open the OSPI instancee */
    fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);

    /* (Optional) Change SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();

    /* After R_OSPI_Open() and any required device specific initialization, data can be
read directly from the OSPI flash. */
    memcpy(&g_dest[0], &g_src[0], OSPI_EXAMPLE_DATA_LENGTH);

    /* After R_OSPI_Open() and any required device specific initialization, functions in
the OSPI flash can be called. */
    r_ospi_example_function();
}
}
```

### Reading Status Register Example (R\_OSPI\_DirectTransfer)

This is an example of using R\_OSPI\_DirectWrite followed by R\_OSPI\_DirectRead to send the read status register command and read back the status register from the device.

```
#define OSPI_COMMAND_READ_STATUS_REGISTER (0x05U)

void r_ospi_direct_example (void)
{
    spi_flash_direct_transfer_t ospi_test_direct_transfer =
    {
        .command      = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE,
        .address      = 0U,
        .data         = 0U,
    }
}
```

```

        .command_length = 1U,
        .address_length = 0U,
        .data_length    = 0U,
        .dummy_cycles   = 0U
    };

    /* Open the OSPI instance. */
    fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);

    /* Write Enable */
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);

    /* Read Status Register */
    ospi_test_direct_transfer.command = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE;
    ospi_test_direct_transfer.data_length = 1U;
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);

    /* Check if Write Enable is set */
    if (OSPI_WEN_BIT_MASK != (ospi_test_direct_transfer.data & OSPI_WEN_BIT_MASK))
    {
        __BKPT(0);
    }
}

```

### Auto-calibration Example (R\_OSPI\_DirectTransfer, R\_OSPI\_Write, R\_OSPI\_SpiProtocolSet)

This is an example of using R\_OSPI\_SpiProtocolSet to change the operating mode from SPI to SOPI and allow the driver to initiate auto-calibration.

```

#define OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES (16U)
#define OSPI_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
const uint8_t g_preamble_bytes[OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES] =
{
    0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08,

```

```
0xF7, 0x00, 0xF7
};

void ospi_example_wait_until_wip (void)
{
    fsp_err_t      err = FSP_SUCCESS;
    spi_flash_status_t status;

    status.write_in_progress = true;
    uint32_t timeout = UINT32_MAX;
    while ((status.write_in_progress) && (--timeout))
    {
        err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
        assert(FSP_SUCCESS == err);
    }
    if (0 == timeout)
    {
        assert(FSP_SUCCESS == err);
    }
}

void r_ospi_auto_calibrate_example (void)
{
    /* Open the OSPI instance. */
    /* Set data_latch_delay_clocks to 0x0 to enable auto-calibration */
    fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);

    uint8_t * preamble_pattern_addr = (uint8_t *) OSPI_EXAMPLE_PREAMBLE_ADDRESS;
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);

    /* Wait until write has been completed */
    ospi_example_wait_until_wip();

    /* Change from SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
}
```

## Octaclk Update Example (R\_OSPI\_SpiProtocolSet)

This is an example of using R\_BSP\_OctaclkUpdate to change the Octal-SPI clock frequency during run time. The OCTACLK frequency must be updated before calling the R\_OSPI\_SpiProtocolSet with appropriate clock source and divider settings required to be set for the new SPI protocol mode. Ensure that the clock source selected is started.

```
static void ospi_example_change_omclk (void)
{
    /* Ensure clock source (PLL2 in this example) is running before changing the OCTACLK
    frequency */

    bsp_octaclk_settings_t octaclk_settings;

    octaclk_settings.source_clock = BSP_CLOCKS_CLOCK_PLL2;

    octaclk_settings.divider      = BSP_CLOCKS_OCTACLK_DIV_2;

    R_BSP_OctaclkUpdate(&octaclk_settings);
}
```

## OSPI Data and IAR

When using the IAR compiler, OSPI data must be const qualified to be downloaded by the debugger.

### OSPI RAM:

#### Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaRAM.

```
#define OSPI_RAM_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_RAM_EXAMPLE_DATA_LENGTH];
/* Place uninitialized data buffers in the ospi_device_0_no_load section.
 * Use ospi_device_1_no_load section if the OctaRAM is configured on channel 1.
 */
uint8_t g_src_1[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
uint8_t g_src_2[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
void r_ospi_ram_basic_example (void)
{
    /* Open the OSPI instancee.
     * Ensure valid setting of the 'Data latching delay' field in the configurator.
    */
}
```

```

* To successfully perform OSPI RAM reads this value must not be 0.
*/
fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
/* After R_OSPI_Open() and any required device specific initialization, data can be
read from or written to directly from the OSPI RAM. */
    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}

```

### Auto-calibration Example (R\_OSPI\_DirectTransfer, R\_OSPI\_AutoCalibrate)

This is an example of using R\_OSPI\_AutoCalibrate to calibrate OSPI peripheral to read data from the OctaRAM device.

```

#define OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK (0x00F0U)
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_POS (4U)
#define OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING (1U)
void r_ospi_ram_auto_calibrate_example (void)
{
    /* Open the OSPI instancee */
    fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
        assert(FSP_SUCCESS == err);
    /* OctaRAM Configuration Register (cr) read and write command definition */
    spi_flash_direct_transfer_t read_cr =
        {
            .command      = 0xC000U,    // NOLINT(readability-magic-numbers)
            .address      = 0x00040000U, // NOLINT(readability-magic-numbers)
            .data          = 0U,
            .command_length = 2U,
            .address_length = 4U,
            .data_length   = 2U,

            /* Dummy Cycles set to the default value specified in the OctaRAM device
Configuration Register */

```

```
.dummy_cycles    = 5U
};

spi_flash_direct_transfer_t write_cr =
{
    .command       = 0x4000U,    // NOLINT(readability-magic-numbers)
    .address       = 0x00040000U, // NOLINT(readability-magic-numbers)
    .data         = 0U,
    .command_length = 2U,
    .address_length = 4U,
    .data_length   = 2U,
    .dummy_cycles  = 0U
};

/* Read OctaRAM device Configuration Register */
err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);

assert(FSP_SUCCESS == err);

uint16_t config_reg = (uint16_t) (((uint16_t) (read_cr.data) &
~OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK) |
                                ((uint16_t)
(OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING <<
                                OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_POS) &
                                OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK));

/* Write Configuration Register */
write_cr.data = (uint32_t) config_reg;
err          = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &write_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);

assert(FSP_SUCCESS == err);

read_cr.data = 0;

/* Set Dummy Clocks to value configured above (4 Clocks) */
read_cr.dummy_cycles = 4U;

/* Read Configuration Register */
err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,
```

```

SPI_FLASH_DIRECT_TRANSFER_DIR_READ);

    assert(FSP_SUCCESS == err);

    /* Confirm the intended Configuration Register value */
    assert(config_reg == (uint16_t) (read_cr.data & UINT16_MAX));

    volatile uint32_t * ram_addr = (uint32_t *) OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS;

    /* Write the auto-calibration preamble pattern for DOPI mode as specified by the
Hardware Manual */

    ram_addr[0] = 0xFFFF0000;           // NOLINT(readability-magic-numbers)
    ram_addr[1] = 0x0800FF00;           // NOLINT(readability-magic-numbers)
    ram_addr[2] = 0xFF0000F7;           // NOLINT(readability-magic-numbers)
    ram_addr[3] = 0x00F708F7;           // NOLINT(readability-magic-numbers)

    err = R_OSPI_AutoCalibrate(&g_ospi_ram0_ctrl);

    assert(FSP_SUCCESS == err);

    /* After Auto-calibration data can be read from or written to directly from the OSPI
RAM. */

    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}

```

## Data Structure Documentation

### ◆ [ospi\\_instance\\_ctrl\\_t](#)

struct [ospi\\_instance\\_ctrl\\_t](#)

Instance control block. DO NOT INITIALIZE. Initialization occurs when [spi\\_flash\\_api\\_t::open](#) is called

## Enumeration Type Documentation

### ◆ `ospi_device_number_t`

enum <code>ospi_device_number_t</code>	
Enumerator	
<code>OSPI_DEVICE_NUMBER_0</code>	Device connected to Chip-Select 0.
<code>OSPI_DEVICE_NUMBER_1</code>	Device connected to Chip-Select 1.

### ◆ `ospi_device_type_t`

enum <code>ospi_device_type_t</code>	
Enumerator	
<code>OSPI_DEVICE_FLASH</code>	Device Memory type OctaFlash.
<code>OSPI_DEVICE_RAM</code>	Device Memory type OctaRAM.

◆ **ospi\_command\_cs\_pullup\_clocks\_t**

enum <code>ospi_command_cs_pullup_clocks_t</code>	
Enumerator	
<code>OSPI_COMMAND_CS_PULLUP_CLOCKS_2</code>	1.5 clocks DOPI mode; 2 Clocks all other modes; Unsupported for DOPI Read
<code>OSPI_COMMAND_CS_PULLUP_CLOCKS_3</code>	2.5 clocks DOPI mode; 3 Clocks all other modes; Unsupported for DOPI Read
<code>OSPI_COMMAND_CS_PULLUP_CLOCKS_4</code>	3.5 clocks DOPI mode; 4 Clocks all other modes; Unsupported for DOPI Read
<code>OSPI_COMMAND_CS_PULLUP_CLOCKS_5</code>	4.5 clocks DOPI mode; 5 Clocks all other modes; Unsupported for DOPI Read
<code>OSPI_COMMAND_CS_PULLUP_CLOCKS_6</code>	5.5 clocks DOPI mode; 6 Clocks all other modes; Unsupported for DOPI Read
<code>OSPI_COMMAND_CS_PULLUP_CLOCKS_7</code>	6.5 clocks DOPI mode; 7 Clocks all other modes
<code>OSPI_COMMAND_CS_PULLUP_CLOCKS_8</code>	7.5 clocks DOPI mode; 8 Clocks all other modes
<code>OSPI_COMMAND_CS_PULLUP_CLOCKS_9</code>	8.5 clocks DOPI mode; 9 Clocks all other modes

◆ **ospi\_command\_cspulldown\_clocks\_t**

enum <code>ospi_command_cspulldown_clocks_t</code>	
Enumerator	
<code>OSPI_COMMAND_CS_PULLDOWN_CLOCKS_3</code>	2.5 clocks DOPI mode; 3 Clocks all other modes
<code>OSPI_COMMAND_CS_PULLDOWN_CLOCKS_4</code>	3.5 clocks DOPI mode; 4 Clocks all other modes
<code>OSPI_COMMAND_CS_PULLDOWN_CLOCKS_5</code>	4.5 clocks DOPI mode; 5 Clocks all other modes

◆ **ospi\_dopi\_byte\_order\_t**

enum <code>ospi_dopi_byte_order_t</code>	
Enumerator	
<code>OSPI_DOPI_BYTE_ORDER_0123</code>	DOPI byte order byte 0, byte 1, byte 2, byte 3.
<code>OSPI_DOPI_BYTE_ORDER_1032</code>	DOPI byte order byte 1, byte 0, byte 3, byte 2.

**Function Documentation**◆ **R\_OSPI\_Open()**

```
fsp_err_t R_OSPI_Open ( spi_flash_ctrl_t* p_ctrl, spi_flash_cfg_t const *const p_cfg )
```

Open the OSPI driver module. After the driver is open, the OSPI can be accessed like internal flash memory.

Implements `spi_flash_api_t::open`.

Example:

```
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
```

**Return values**

<code>FSP_SUCCESS</code>	Configuration was successful.
<code>FSP_ERR_ASSERTION</code>	The parameter <code>p_ctrl</code> or <code>p_cfg</code> is NULL.
<code>FSP_ERR_ALREADY_OPEN</code>	Driver has already been opened with the same <code>p_ctrl</code> .
<code>FSP_ERR_CALIBRATE_FAILED</code>	Failed to perform auto-calibrate.
<code>FSP_ERR_INVALID_ARGUMENT</code>	Attempting to open the driver with an invalid SPI protocol for OctaRAM.

◆ **R\_OSPI\_DirectWrite()**

```
fsp_err_t R_OSPI_DirectWrite ( spi_flash_ctrl_t* p_ctrl, uint8_t const *const p_src, uint32_t const bytes, bool const read_after_write )
```

Writes raw data directly to the OctaFlash. API not supported. Use R\_OSPI\_DirectTransfer

Implements `spi_flash_api_t::directWrite`.

**Return values**

FSP_ERR_UNSUPPORTED
---------------------

API not supported by OSPI.
----------------------------

◆ **R\_OSPI\_DirectRead()**

```
fsp_err_t R_OSPI_DirectRead ( spi_flash_ctrl_t* p_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Reads raw data directly from the OctaFlash. API not supported. Use R\_OSPI\_DirectTransfer.

Implements `spi_flash_api_t::directRead`.

**Return values**

FSP_ERR_UNSUPPORTED
---------------------

API not supported by OSPI.
----------------------------

◆ **R\_OSPI\_DirectTransfer()**

```
fsp_err_t R_OSPI_DirectTransfer ( spi_flash_ctrl_t* p_ctrl, spi_flash_direct_transfer_t *const p_transfer, spi_flash_direct_transfer_dir_t direction )
```

Read/Write raw data directly with the OctaFlash/OctaRAM device.

Implements `spi_flash_api_t::directTransfer`.

Example:

```
/* Write Enable */
err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	The flash was programmed successfully.
-------------	--

FSP_ERR_ASSERTION	A required pointer is NULL.
-------------------	-----------------------------

FSP_ERR_NOT_OPEN	Driver is not opened.
------------------	-----------------------

◆ **R\_OSPI\_XipEnter()**

`fsp_err_t R_OSPI_XipEnter ( spi_flash_ctrl_t * p_ctrl)`

Enters Single Continuous Read/Write mode.

Implements `spi_flash_api_t::xipEnter`.

**Return values**

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ **R\_OSPI\_XipExit()**

`fsp_err_t R_OSPI_XipExit ( spi_flash_ctrl_t * p_ctrl)`

Exits XIP (execute in place) mode.

Implements `spi_flash_api_t::xipExit`.

**Return values**

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ **R\_OSPI\_Write()**

```
fsp_err_t R_OSPI_Write ( spi_flash_ctrl_t * p_ctrl, uint8_t const *const p_src, uint8_t *const p_dest,
uint32_t byte_count )
```

Program a page of data to the flash.

Implements `spi_flash_api_t::write`.

Example:

```
err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	Another Write/Erase transaction is in progress.
FSP_ERR_INVALID_SIZE	Write operation crosses page-boundary.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ **R\_OSPI\_Erase()**

```
fsp_err_t R_OSPI_Erase ( spi_flash_ctrl_t* p_ctrl, uint8_t*const p_device_address, uint32_t
byte_count )
```

Erase a block or sector of flash. The `byte_count` must exactly match one of the erase sizes defined in `spi_flash_cfg_t`. For chip erase, `byte_count` must be `SPI_FLASH_ERASE_SIZE_CHIP_ERASE`.

Implements `spi_flash_api_t::erase`.

**Return values**

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> or <code>p_device_address</code> is NULL, <code>byte_count</code> doesn't match an erase size defined in <code>spi_flash_cfg_t</code> , or <code>byte_count</code> is set to 0.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	The device is busy.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ **R\_OSPI\_StatusGet()**

```
fsp_err_t R_OSPI_StatusGet ( spi_flash_ctrl_t* p_ctrl, spi_flash_status_t*const p_status )
```

Gets the write or erase status of the flash.

Implements `spi_flash_api_t::statusGet`.

Example:

```
err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	The write status is in <code>p_status</code> .
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> or <code>p_status</code> is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ **R\_OSPI\_BankSet()**

```
fsp_err_t R_OSPI_BankSet ( spi_flash_ctrl_t * p_ctrl, uint32_t bank )
```

Selects the bank to access.

Implements `spi_flash_api_t::bankSet`.

**Return values**

FSP_ERR_UNSUPPORTED	API not supported by OSPI.
---------------------	----------------------------

◆ **R\_OSPI\_SpiProtocolSet()**

```
fsp_err_t R_OSPI_SpiProtocolSet ( spi_flash_ctrl_t * p_ctrl, spi_flash_protocol_t spi_protocol )
```

Sets the SPI protocol.

Implements `spi_flash_api_t::spiProtocolSet`.

**Return values**

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to set an invalid SPI protocol for OctaRAM.

◆ **R\_OSPI\_AutoCalibrate()**

```
fsp_err_t R_OSPI_AutoCalibrate ( spi_flash_ctrl_t * p_ctrl)
```

Auto-calibrate the OctaRAM device using the preamble pattern.

**Note**

*The preamble pattern must be written to the configured address before calling this API. Implements `spi_flash_api_t::autoCalibrate`.*

**Return values**

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaFlash.

◆ **R\_OSPI\_Close()**

```
fsp_err_t R_OSPI_Close ( spi_flash_ctrl_t * p_ctrl)
```

Close the OSPI driver module.

Implements `spi_flash_api_t::close`.

**Return values**

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

**4.2.16.13 QSPI (r\_qspi)**

Modules » Storage

**Functions**

```
fsp_err_t R_QSPI_Open (spi_flash_ctrl_t *p_ctrl, spi_flash_cfg_t const *const p_cfg)
```

```
fsp_err_t R_QSPI_DirectWrite (spi_flash_ctrl_t *p_ctrl, uint8_t const *const p_src, uint32_t const bytes, bool const read_after_write)
```

```
fsp_err_t R_QSPI_DirectRead (spi_flash_ctrl_t *p_ctrl, uint8_t *const p_dest, uint32_t const bytes)
```

```
fsp_err_t R_QSPI_DirectTransfer (spi_flash_ctrl_t *p_ctrl, spi_flash_direct_transfer_t *const p_transfer, spi_flash_direct_transfer_dir_t direction)
```

```
fsp_err_t R_QSPI_XipEnter (spi_flash_ctrl_t *p_ctrl)
```

```
fsp_err_t R_QSPI_XipExit (spi_flash_ctrl_t *p_ctrl)
```

```
fsp_err_t R_QSPI_Write (spi_flash_ctrl_t *p_ctrl, uint8_t const *const p_src, uint8_t *const p_dest, uint32_t byte_count)
```

```
fsp_err_t R_QSPI_Erase (spi_flash_ctrl_t *p_ctrl, uint8_t *const p_device_address, uint32_t byte_count)
```

```
fsp_err_t R_QSPI_StatusGet (spi_flash_ctrl_t *p_ctrl, spi_flash_status_t *const p_status)
```

```
fsp_err_t R_QSPI_BankSet (spi_flash_ctrl_t *p_ctrl, uint32_t bank)
```

```
fsp_err_t R_QSPI_SpiProtocolSet (spi_flash_ctrl_t *p_ctrl, spi_flash_protocol_t spi_protocol)
```

```
fsp_err_t R_QSPI_AutoCalibrate (spi_flash_ctrl_t *p_ctrl)
```

```
fsp_err_t R_QSPI_Close (spi_flash_ctrl_t *p_ctrl)
```

## Detailed Description

Driver for the QSPI peripheral on RA MCUs. This module implements the [SPI Flash Interface](#).

## Overview

### Features

The QSPI driver has the following key features:

- Memory mapped read access to the QSPI flash
- Programming the QSPI flash device
- Erasing the QSPI flash device
- Sending device specific commands and reading back responses
- Entering and exiting QPI mode
- Entering and exiting XIP mode
- 3 or 4 byte addressing

## Configuration

### Build Time Configurations for r\_qspi

The following build time configurations are defined in driver/r\_qspi\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Support Multiple Line Program in Extended SPI Mode	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	If selected code for programming on multiple lines in extended SPI mode is included in the build.

### Configurations for Storage > QSPI (r\_qspi)

This module can be added to the Stacks tab via New Stack > Storage > QSPI (r\_qspi).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_qspi0	Module name.

General > SPI Protocol	<ul style="list-style-type: none"> <li>Extended SPI</li> <li>QPI</li> </ul>	Extended SPI	Select the initial SPI protocol. SPI protocol can be changed in R_QSPI_Direct().
General > Address Bytes	<ul style="list-style-type: none"> <li>3</li> <li>4</li> <li>4 with 4-byte read code</li> </ul>	3	Select the number of address bytes. Selecting '4 with 4-byte read code' converts the default read code determined in Read Mode to the 4-byte version. If 4-byte mode is selected without using 4-byte commands, the application must issue the EN4B command using R_QSPI_Direct().
General > Read Mode	<ul style="list-style-type: none"> <li>Standard Read</li> <li>Fast Read</li> <li>Fast Read Dual Output</li> <li>Fast Read Dual I/O</li> <li>Fast Read Quad Output</li> <li>Fast Read Quad I/O</li> </ul>	Fast Read Quad I/O	Select the read mode for memory mapped access.
General > Dummy Clocks for Fast Read	Refer to the RA Configuration tool for available options.	Default	Select the number of dummy clocks for fast read operations. Default is 6 clocks for Fast Read Quad I/O, 4 clocks for Fast Read Dual I/O, and 8 clocks for other fast read instructions including Fast Read Quad Output, Fast Read Dual Output, and Fast Read
General > Page Size Bytes	Must be an integer greater than 0	256	The maximum number of bytes allowed for a single write.
Command Definitions > Page Program Command	Must be an 8-bit QSPI Page Program Command under Command Definitions	0x02	The command to program a page. If 'Support Multiple Line Program in Extended SPI Mode' is Enabled, this command must use the same number of data lines as the selected read mode.

Command Definitions > Page Program Address Lines	<ul style="list-style-type: none"> <li>• 1</li> <li>• 2</li> <li>• 4</li> </ul>	1	Select the number of lines to use for the address bytes during write operations. This can be determined by referencing the datasheet for the external QSPI. It should either be 1 or match the number of data lines used for memory mapped fast read operations.
Command Definitions > Write Enable Command	Must be an 8-bit QSPI Write Enable Command under Command Definitions	0x06	The command to enable write.
Command Definitions > Status Command	Must be an 8-bit QSPI Status Command under Command Definitions	0x05	The command to query the status of a write or erase command.
Command Definitions > Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Command Definitions > Sector Erase Command	Must be an 8-bit QSPI Sector Erase Command under Command Definitions	0x20	The command to erase a sector. Set Sector Erase Size to 0 if unused.
Command Definitions > Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Command Definitions > Block Erase Command	Must be an 8-bit QSPI Block Erase Command under Command Definitions	0xD8	The command to erase a block. Set Block Erase Size to 0 if unused.
Command Definitions > Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Command Definitions > Block Erase 32KB Command	Must be an 8-bit QSPI Block Erase 32KB Command under Command Definitions	0x52	The command to erase a 32KB block. Set Block Erase Size to 0 if unused.
Command Definitions > Block Erase 32KB Size	Must be an integer greater than or equal to 0	32768	The block erase 32KB size. Set Block Erase 32KB Size to 0 if Block Erase 32KB is not

Command Definitions > Chip Erase Command	Must be an 8-bit QSPI Chip Erase Command under Command Definitions	0xC7	supported.  The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
Command Definitions > XIP Enter M7-M0	Must be an 8-bit QSPI XIP Enter M7-M0 command under Command Definitions	0x20	How to set M7-M0 to enter XIP mode.
Command Definitions > XIP Exit M7-M0	Must be an 8-bit QSPI XIP Exit M7-M0 command under Command Definitions	0xFF	How to set M7-M0 exit XIP mode.
Bus Timing > QSPKCLK Divisor	Refer to the RA Configuration tool for available options.	2	Select the divisor to apply to PCLK to get QSPCLK.
Bus Timing > Minimum QSSL Deselect Cycles	Refer to the RA Configuration tool for available options.	4 QSPCLK	Define the minimum number of QSPCLK cycles for QSSL to remain high between operations.

## Clock Configuration

The QSPI clock is derived from PCLKA.

## Pin Configuration

The following pins are available to connect to an external QSPI device:

- QSPCLK: QSPI clock output
- QSSL: QSPI slave select
- QIO0: Data 0 I/O
- QIO1: Data 1 I/O
- QIO2: Data 2 I/O
- QIO3: Data 3 I/O

*Note*

*It is recommended to configure the pins with IOPORT\_CFG\_DRIVE\_HIGH.*

## Usage Notes

### QSPI Memory Mapped Access

After [R\\_QSPI\\_Open\(\)](#) completes successfully, the QSPI flash device contents are mapped to address 0x60000000 and can be read like on-chip flash.

### Limitations

Developers should be aware of the following limitations when using the QSPI driver:

- Only P305-P310 are currently supported by the J-Link driver to flash the QSPI.
- The default J-Link downloader requires the device to be in extended SPI mode (not QPI mode).

## Examples

### Basic Example

This is a basic example of minimal use of the QSPI in an application.

```
#define QSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[QSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .qspi_flash section to flash it during programming. */
const uint8_t g_src[QSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".qspi_flash") =
"ABCDEFGHJKLMNOPQRSTUVWXYZ";
/* Place code in the .code_in_qspi section to flash it during programming. */
void r_qspi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_qspi")
__attribute__((noinline));
void r_qspi_example_function (void)
{
    /* Add code here. */
}
void r_qspi_basic_example (void)
{
    /* Open the QSPI instance. */
    fsp_err_t err = R_QSPI_Open(&g_qspi0_ctrl, &g_qspi0_cfg);
    assert(FSP_SUCCESS == err);
    /* (Optional) Send device specific initialization commands. */
    r_qspi_example_init();
    /* After R_QSPI_Open() and any required device specific initialization, data can be
read directly from the QSPI flash. */
    memcpy(&g_dest[0], &g_src[0], QSPI_EXAMPLE_DATA_LENGTH);
    /* After R_QSPI_Open() and any required device specific initialization, functions in
the QSPI flash can be called. */
    r_qspi_example_function();
}
```

## Initialization Command Structure Example

This is an example of the types of commands that can be used to initialize the QSPI.

```
#define QSPI_COMMAND_WRITE_ENABLE (0x06U)
#define QSPI_COMMAND_WRITE_STATUS_REGISTER (0x01U)
#define QSPI_COMMAND_ENTER_QPI_MODE (0x38U)
#define QSPI_EXAMPLE_STATUS_REGISTER_1 (0x40)
#define QSPI_EXAMPLE_STATUS_REGISTER_2 (0x00)
static void r_qspi_example_init (void)
{
    /* Write status registers */
    /* Write one byte to enable writing to the status register, then deassert QSSL. */
    uint8_t data[4];
    fsp_err_t err;
    data[0] = QSPI_COMMAND_WRITE_ENABLE;
    err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
    assert(FSP_SUCCESS == err);
    /* Write 3 bytes, including the write status register command followed by values for
both status registers. In the
    * status registers, set QE to 1 and other bits to their default setting. After all
data is written, deassert the
    * QSSL line. */
    data[0] = QSPI_COMMAND_WRITE_STATUS_REGISTER;
    data[1] = QSPI_EXAMPLE_STATUS_REGISTER_1;
    data[2] = QSPI_EXAMPLE_STATUS_REGISTER_2;
    err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 3, false);
    assert(FSP_SUCCESS == err);
    /* Wait for status register to update. */
    spi_flash_status_t status;
    do
    {
        (void) R_QSPI_StatusGet(&g_qspi0_ctrl, &status);
    } while (true == status.write_in_progress);
    /* Write one byte to enter QSPI mode, then deassert QSSL. After entering QPI mode on
the device, change the SPI
```

```
* protocol to QPI mode on the MCU peripheral. */
data[0] = QSPI_COMMAND_ENTER_QPI_MODE;
err      = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
assert(FSP_SUCCESS == err);
(void) R_QSPI_SpiProtocolSet(&g_qspi0_ctrl, SPI_FLASH_PROTOCOL_QPI);
}
```

### Reading Status Register Example (R\_QSPI\_DirectWrite, R\_QSPI\_DirectRead)

This is an example of using R\_QSPI\_DirectWrite followed by R\_QSPI\_DirectRead to send the read status register command and read back the status register from the device.

```
#define QSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_qspi_direct_example (void)
{
    /* Read a status register. */
    /* Write one byte to read the status register. Do not deassert QSSL. */
    uint8_t data;
    fsp_err_t err;
    data = QSPI_COMMAND_READ_STATUS_REGISTER;
    err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data, 1, true);
    assert(FSP_SUCCESS == err);
    /* Read one byte. After all data is read, deassert the QSSL line. */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data, 1);
    assert(FSP_SUCCESS == err);
    /* Status register contents are available in variable 'data'. */
}
```

### Querying Device Size Example (R\_QSPI\_DirectWrite, R\_QSPI\_DirectRead)

This is an example of using R\_QSPI\_DirectWrite followed by R\_QSPI\_DirectRead to query the device size.

```
#define QSPI_EXAMPLE_COMMAND_READ_ID (0x9F)
#define QSPI_EXAMPLE_COMMAND_READ_SFDP (0x5A)
void r_qspi_size_example (void)
{
```

```
/* Many QSPI devices support more than one way to query the device size. Consult the
datasheet for your
* QSPI device to determine which of these methods are supported (if any). */
uint32_t device_size_bytes;

fsp_err_t err;

#ifdef QSPI_EXAMPLE_COMMAND_READ_ID
/* This example shows how to get the device size by reading the manufacturer ID. */
uint8_t data[4];

### ◆ [qspi\\_instance\\_ctrl\\_t](#)

struct [qspi\\_instance\\_ctrl\\_t](#)

Instance control block. DO NOT INITIALIZE. Initialization occurs when [spi\\_flash\\_api\\_t::open](#) is called

---

## Enumeration Type Documentation

---

◆ **qspi\_qssl\_min\_high\_level\_t**

enum qspi_qssl_min_high_level_t	
Enumerator	
QSPI_QSSL_MIN_HIGH_LEVEL_1_QSPCLK	QSSL deselected for at least 1 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_2_QSPCLK	QSSL deselected for at least 2 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_3_QSPCLK	QSSL deselected for at least 3 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_4_QSPCLK	QSSL deselected for at least 4 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_5_QSPCLK	QSSL deselected for at least 5 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_6_QSPCLK	QSSL deselected for at least 6 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_7_QSPCLK	QSSL deselected for at least 7 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_8_QSPCLK	QSSL deselected for at least 8 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_9_QSPCLK	QSSL deselected for at least 9 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_10_QSPCLK	QSSL deselected for at least 10 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_11_QSPCLK	QSSL deselected for at least 11 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_12_QSPCLK	QSSL deselected for at least 12 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_13_QSPCLK	QSSL deselected for at least 13 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_14_QSPCLK	QSSL deselected for at least 14 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_15_QSPCLK	QSSL deselected for at least 15 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_16_QSPCLK	QSSL deselected for at least 16 QSPCLK.

◆ **qspi\_qspclk\_div\_t**

enum <code>qspi_qspclk_div_t</code>	
Enumerator	
<code>QSPI_QSPCLK_DIV_2</code>	$QSPCLK = PCLK / 2.$

QSPI_QSPCLK_DIV_34	QSPCLK = PCLK / 34.
QSPI_QSPCLK_DIV_36	QSPCLK = PCLK / 36.
QSPI_QSPCLK_DIV_38	QSPCLK = PCLK / 38.
QSPI_QSPCLK_DIV_40	QSPCLK = PCLK / 40.
QSPI_QSPCLK_DIV_42	QSPCLK = PCLK / 42.
QSPI_QSPCLK_DIV_44	QSPCLK = PCLK / 44.
QSPI_QSPCLK_DIV_46	QSPCLK = PCLK / 46.
QSPI_QSPCLK_DIV_48	QSPCLK = PCLK / 48.

## Function Documentation

### ◆ R\_QSPI\_Open()

```
fsp_err_t R_QSPI_Open ( spi_flash_ctrl_t * p_ctrl, spi_flash_cfg_t const *const p_cfg )
```

Open the QSPI driver module. After the driver is open, the QSPI can be accessed like internal flash memory starting at address 0x60000000.

Implements `spi_flash_api_t::open`.

#### Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter <code>p_instance_ctrl</code> or <code>p_cfg</code> is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same <code>p_instance_ctrl</code> .

◆ **R\_QSPI\_DirectWrite()**

```
fsp_err_t R_QSPI_DirectWrite ( spi_flash_ctrl_t* p_ctrl, uint8_t const *const p_src, uint32_t const bytes, bool const read_after_write )
```

Writes raw data directly to the QSPI.

Implements `spi_flash_api_t::directWrite`.

**Return values**

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ **R\_QSPI\_DirectRead()**

```
fsp_err_t R_QSPI_DirectRead ( spi_flash_ctrl_t* p_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Reads raw data directly from the QSPI. This API can only be called after `R_QSPI_DirectWrite` with `read_after_write` set to true.

Implements `spi_flash_api_t::directRead`.

**Return values**

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function must be called after <code>R_QSPI_DirectWrite</code> with <code>read_after_write</code> set to true.

◆ **R\_QSPI\_DirectTransfer()**

```
fsp_err_t R_QSPI_DirectTransfer ( spi_flash_ctrl_t * p_ctrl, spi_flash_direct_transfer_t *const
p_transfer, spi_flash_direct_transfer_dir_t direction )
```

Read/Write raw data directly with the OctaFlash/OctaRAM device. Unsupported by QSPI.

Implements `spi_flash_api_t::directTransfer`.

**Return values**

FSP_ERR_UNSUPPORTED	API not supported by QSPI.
---------------------	----------------------------

◆ **R\_QSPI\_XipEnter()**

```
fsp_err_t R_QSPI_XipEnter ( spi_flash_ctrl_t * p_ctrl)
```

Enters XIP (execute in place) mode.

Implements `spi_flash_api_t::xipEnter`.

**Return values**

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R\_QSPI\_XipExit()**

```
fsp_err_t R_QSPI_XipExit ( spi_flash_ctrl_t * p_ctrl)
```

Exits XIP (execute in place) mode.

Implements `spi_flash_api_t::xipExit`.

**Return values**

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R\_QSPI\_Write()**

```
fsp_err_t R_QSPI_Write ( spi_flash_ctrl_t* p_ctrl, uint8_t const *const p_src, uint8_t *const p_dest,
uint32_t byte_count )
```

Program a page of data to the flash.

Implements `spi_flash_api_t::write`.

**Return values**

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> , <code>p_dest</code> or <code>p_src</code> is NULL, or <code>byte_count</code> crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ **R\_QSPI\_Erase()**

```
fsp_err_t R_QSPI_Erase ( spi_flash_ctrl_t* p_ctrl, uint8_t *const p_device_address, uint32_t
byte_count )
```

Erase a block or sector of flash. The `byte_count` must exactly match one of the erase sizes defined in `spi_flash_cfg_t`. For chip erase, `byte_count` must be `SPI_FLASH_ERASE_SIZE_CHIP_ERASE`.

Implements `spi_flash_api_t::erase`.

**Return values**

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> or <code>p_device_address</code> is NULL, or <code>byte_count</code> doesn't match an erase size defined in <code>spi_flash_cfg_t</code> , or device is in XIP mode.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ **R\_QSPI\_StatusGet()**

```
fsp_err_t R_QSPI_StatusGet ( spi_flash_ctrl_t * p_ctrl, spi_flash_status_t *const p_status )
```

Gets the write or erase status of the flash.

Implements `spi_flash_api_t::statusGet`.

**Return values**

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.

◆ **R\_QSPI\_BankSet()**

```
fsp_err_t R_QSPI_BankSet ( spi_flash_ctrl_t * p_ctrl, uint32_t bank )
```

Selects the bank to access. A bank is a 64MB sliding access window into the QSPI device flash memory space. To access chip address 0x4000000, select bank 1, then read from internal flash address 0x60000000. To access chip address 0x8001000, select bank 2, then read from internal flash address 0x60001000.

This function is not required for memory devices less than or equal to 512 Mb (64MB).

Implements `spi_flash_api_t::bankSet`.

**Return values**

FSP_SUCCESS	Bank successfully selected.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R\_QSPI\_SpiProtocolSet()**

```
fsp_err_t R_QSPI_SpiProtocolSet ( spi_flash_ctrl_t * p_ctrl, spi_flash_protocol_t spi_protocol )
```

Sets the SPI protocol.

Implements [spi\\_flash\\_api\\_t::spiProtocolSet](#).

**Return values**

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid SPI protocol requested.

◆ **R\_QSPI\_AutoCalibrate()**

```
fsp_err_t R_QSPI_AutoCalibrate ( spi_flash_ctrl_t * p_ctrl)
```

Auto-calibrate the OctaRAM device using the preamble pattern. Unsupported by QSPI. Implements [spi\\_flash\\_api\\_t::autoCalibrate](#).

**Return values**

FSP_ERR_UNSUPPORTED	API not supported by QSPI
---------------------	---------------------------

◆ **R\_QSPI\_Close()**

```
fsp_err_t R_QSPI_Close ( spi_flash_ctrl_t * p_ctrl)
```

Close the QSPI driver module.

Implements [spi\\_flash\\_api\\_t::close](#).

**Return values**

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

**4.2.16.14 SD/MMC (r\_sdhi)**

fsp_err_t	R_SDHI_CallbackSet (sdmmc_ctrl_t *const p_api_ctrl, void(*p_callback)(sdmmc_callback_args_t *), void const *const p_context, sdmmc_callback_args_t *const p_callback_memory)
fsp_err_t	R_SDHI_Close (sdmmc_ctrl_t *const p_api_ctrl)

## Detailed Description

Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the [SD/MMC Interface](#).

## Overview

### Features

- Supports the following memory devices: SDSC (SD Standard Capacity), SDHC (SD High Capacity), SDXC (SD Extended Capacity) and eMMC (embedded Multi Media Card)
  - Supports reading, writing and erasing SD memory devices
  - Supports 1, 4 or 8-bit data bus (8-bit bus is supported for eMMC only)
  - Supports detection of device write protection (SD cards only)
  - Supports high speed mode
- Automatically configures the clock to the maximum clock rate supported by both host (MCU) and device
- Supports hardware acceleration using DMAC or DTC
- Supports callback notification when an operation completes or an error occurs

## Configuration

### Build Time Configurations for r\_sdhi

The following build time configurations are defined in fsp\_cfg/r\_sdhi\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Unaligned Access Support	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Enabled	If enabled, code for supporting buffers that are not aligned on a 4-byte boundary is included in the build. Only disable this if all buffers passed to the driver are 4-byte aligned.
SD Support	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Enabled	If selected code for SD card support is included in the build.
eMMC Support	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> </ul>	Disabled	If selected code for eMMC device support is included in the build.

### Configurations for Storage > SD/MMC (r\_sdhi)

This module can be added to the Stacks tab via New Stack > Storage > SD/MMC (r\_sdhi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_sdmmc0	Module name.

Channel	Value must be a non-negative integer	0	Select the channel.
Bus Width	MCU Specific Options		Select the bus width.
Block Size	Value must be an integer between 1 and 512	512	Select the media block size. Must be 512 for SD cards or eMMC devices. Must be 1-512 for SDIO.
Card Detection	<ul style="list-style-type: none"> <li>• Not Used</li> <li>• CD Pin</li> </ul>	CD Pin	Select the card detection method.
Write Protection	<ul style="list-style-type: none"> <li>• Not Used</li> <li>• WP Pin</li> </ul>	WP Pin	Select whether or not to use the write protect pin. Select Not Used if the MCU or device does not have a write protect pin.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Access Interrupt Priority	MCU Specific Options		Select the access interrupt priority.
Card Interrupt Priority	MCU Specific Options		Select the card interrupt priority.
DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

### Interrupt Configurations:

The following interrupts are required to use the r\_sdhi module:

Using SD/MMC with DTC:

- Access Interrupt
- DTC Interrupt

Using SD/MMC with DMAC:

- Access Interrupt
- DMAC Interrupt (in DMAC instance)

The Card interrupt is optional and only available on MCU packages that have the SDnCD pin (n = channel number).

### Clock Configuration

The SDMMC MCU peripheral (SDHI) uses the PCLKA for its clock source. The SDMMC driver selects the optimal built-in divider based on the PCLKA frequency and the maximum clock rate allowed by the device obtained at media initialization.

## Pin Configuration

The SDMMC driver supports the following pins (n = channel number):

- SDnCLK
- SDnCMD
- SDnDAT0
- SDnDAT1
- SDnDAT2
- SDnDAT3
- SDnDAT4 (not available on all MCUs)
- SDnDAT5 (not available on all MCUs)
- SDnDAT6 (not available on all MCUs)
- SDnDAT7 (not available on all MCUs)
- SDnCD (not available on all MCUs)
- SDnWP

The drive capacity for each pin should be set to "Medium" or "High" for most hardware designs. This can be configured in the **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection -> Ports.

## Usage Notes

### Card Detection

When Card Detection is configured to "CD Pin" in the RA Configuration editor, interrupt flags are cleared and card detection is enabled during [R\\_SDHI\\_Open\(\)](#).

[R\\_SDHI\\_StatusGet\(\)](#) can be called to retrieve the current status of the card (including whether a card is present). If the Card Interrupt Priority is enabled, a callback is called when a card is inserted or removed.

If a card is removed and reinserted, [R\\_SDHI\\_MediaInit\(\)](#) must be called before reading from the card or writing to the card.

*Note*

*[R\\_SDHI\\_StatusGet\(\)](#) should be used to initially determine the card state after opening the interface.*

### DMA Request Interrupt Priority

When data transfers are not 4-byte aligned or not a multiple of 4 bytes, a software copy of the block size (up to 512 bytes) is done in the DMA Request interrupt. This blocks all other interrupts that are a lower or equal priority to the access interrupt until the software copy is complete.

### Timing Notes for R\_SDHI\_MediaInit

The [R\\_SDHI\\_MediaInit\(\)](#) API completes the entire device identification and configuration process. This involves several command-response cycles at a bus width of 1 bit and a bus speed of 400 kHz or less.

## Limitations

Developers should be aware of the following limitations when using the SDHI:

## Blocking Calls

The following functions block execution until the response is received for at least one command:

- [R\\_SDHI\\_MediaInit](#)
- [R\\_SDHI\\_Erase](#)

Once the function returns the status of the operation can be determined via [R\\_SDHI\\_StatusGet](#) or through receipt of a callback.

### Note

*Due to the variability in clocking configurations it is recommended to determine blocking delays experimentally on the target system.*

## Data Alignment and Size

Data transfers should be 4-byte aligned and a multiple of 4 bytes in size whenever possible. This recommendation applies to the `read()`, `write()`, `readloExt()`, and `writeloxExt()` APIs. When data transfers are 4-byte aligned and a multiple of 4-bytes, the `r_sdhi` driver is zero copy and takes full advantage of hardware acceleration by the DMAC or DTC. When data transfers are not 4-byte aligned or not a multiple of 4 bytes an extra CPU interrupt is required for each block transferred and a software copy is used to move data to the destination buffer.

## Examples

### Basic Example

This is a basic example of minimal use of the `r_sdhi` in an application.

```
uint8_t g_dest[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void r_sdhi_basic_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < SDHI_MAX_BLOCK_SIZE; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Open the SDHI driver. */
    fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
    assert(FSP_SUCCESS == err);
}
```

```
/* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
 * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
/* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
assert(FSP_SUCCESS == err);
err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
assert(FSP_SUCCESS == err);
while (!g_transfer_complete)
{
/* Wait for transfer. */
}
err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
assert(FSP_SUCCESS == err);
while (!g_transfer_complete)
{
/* Wait for transfer. */
}
}
/* The callback is called when a transfer completes. */
void r_sdhi_example_callback (sdmmc_callback_args_t * p_args)
{
if (SDMMC_EVENT_TRANSFER_COMPLETE == p_args->event)
{
g_transfer_complete = 1;
}
}
}
```

## Card Detection Example

This is an example of using SDHI when the card may not be plugged in. The card detection interrupt must be enabled to use this example.

```
bool g_card_inserted = false;
void r_sdhi_card_detect_example (void)
{
    /* Open the SDHI driver. This enables the card detection interrupt. */
    fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Check if card is inserted. */
    sdmmc_status_t status;
    err = R_SDHI_StatusGet(&g_sdmmc0_ctrl, &status);
    assert(FSP_SUCCESS == err);
    if (!status.card_inserted)
    {
        while (!g_card_inserted)
        {
            /* Wait for a card insertion interrupt. */
        }
    }
    /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
    * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    /* Initialize the SD card after card insertion is detected. */
    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
}
/* The callback is called when a card detection event occurs if the card detection
interrupt is enabled. */
void r_sdhi_card_detect_example_callback (sdmmc_callback_args_t * p_args)
{
    if (SDMMC_EVENT_CARD_INSERTED == p_args->event)
    {
        g_card_inserted = true;
    }
}
```

```

    }
    if (SDMMC_EVENT_CARD_REMOVED == p_args->event)
    {
        g_card_inserted = false;
    }
}

```

## Function Documentation

### ◆ R\_SDHI\_Open()

```
fsp_err_t R_SDHI_Open ( sdmmc_ctrl_t *const p_api_ctrl, sdmmc_cfg_t const *const p_cfg )
```

Opens the driver. Resets SDHI, and enables card detection interrupts if card detection is enabled. [R\\_SDHI\\_MediaInit](#) must be called after this function before any other functions can be used.

Implements [sdmmc\\_api\\_t::open\(\)](#).

Example:

```

/* Open the SDHI driver. */
fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);

```

### Return values

FSP_SUCCESS	Module is now open.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices. It is configurable for SDIO only.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with this instance of the control structure.
FSP_ERR_IRQ_BSP_DISABLED	Access interrupt is not enabled.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this MCU.

◆ **R\_SDHI\_MediaInit()**

```
fsp_err_t R_SDHI_MediaInit ( sdmmc_ctrl_t *const p_api_ctrl, sdmmc_device_t *const p_device )
```

Initializes the SDHI hardware and completes identification and configuration for the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements `sdmmc_api_t::mediaInit()`.

Example:

```
/* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
 * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
/* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
```

**Return values**

FSP_SUCCESS	Module is now ready for read/write access.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices. It is configurable for SDIO only.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_INIT_FAILED	Device was not identified as an SD card, eMMC device, or SDIO card.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R\_SDHI\_Read()**

```
fsp_err_t R_SDHI_Read ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const
start_sector, uint32_t const sector_count )
```

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements `sdmmc_api_t::read()`.

A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the read data is available.

Example:

```
err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
```

**Return values**

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.

◆ **R\_SDHI\_Write()**

```
fsp_err_t R_SDHI_Write ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t const *const p_source, uint32_t
const start_sector, uint32_t const sector_count )
```

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements `sdmmc_api_t::write()`.

A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the all data has been written and the device is no longer holding `DAT0` low to indicate it is busy.

Example:

```
err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
```

**Return values**

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_WRITE_FAILED	Write operation failed.

◆ **R\_SDHI\_Readlo()**

```
fsp_err_t R_SDHI_Readlo ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t const
function, uint32_t const address )
```

The Read function reads a one byte register from an SDIO card. Implements `sdmmc_api_t::readlo()`.

This function blocks until the command is sent and the response is received. `p_data` contains the register value read when this function returns.

**Return values**

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R\_SDHI\_Writelo()**

```
fsp_err_t R_SDHI_Writelo ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t const
function, uint32_t const address, sdmmc_io_write_mode_t const read_after_write )
```

Writes a one byte register to an SDIO card. Implements `sdmmc_api_t::writelo()`.

This function blocks until the command is sent and the response is received. The register has been written when this function returns. If `read_after_write` is true, `p_data` contains the register value read when this function returns.

**Return values**

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R\_SDHI\_ReadloExt()**

```
fsp_err_t R_SDHI_ReadloExt ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const
function, uint32_t const address, uint32_t *const count, sdmmc_io_transfer_mode_t
transfer_mode, sdmmc_io_address_mode_t address_mode )
```

Reads data from an SDIO card function. Implements `sdmmc_api_t::readloExt()`.

This function blocks until the command is sent and the response is received. A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the read data is available.

**Return values**

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_UNSUPPORTED	SDIO support disabled in <code>SDHI_CFG_SDIO_SUPPORT_ENABLE</code> .

◆ **R\_SDHI\_WriteloExt()**

```
fsp_err_t R_SDHI_WriteloExt ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t const *const p_source,
uint32_t const function, uint32_t const address, uint32_t const count, sdmmc_io_transfer_mode_t
transfer_mode, sdmmc_io_address_mode_t address_mode )
```

Writes data to an SDIO card function. Implements `sdmmc_api_t::writeloExt()`.

This function blocks until the command is sent and the response is received. A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the all data has been written.

**Return values**

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_UNSUPPORTED	SDIO support disabled in <code>SDHI_CFG_SDIO_SUPPORT_ENABLE</code> .

◆ **R\_SDHI\_IoIntEnable()**

```
fsp_err_t R_SDHI_IoIntEnable ( sdmmc_ctrl_t *const p_api_ctrl, bool enable )
```

Enables or disables the SDIO Interrupt. Implements `sdmmc_api_t::IoIntEnable()`.

**Return values**

FSP_SUCCESS	Card enabled or disabled SDIO interrupts successfully.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_UNSUPPORTED	SDIO support disabled in <code>SDHI_CFG_SDIO_SUPPORT_ENABLE</code> .

◆ **R\_SDHI\_StatusGet()**

```
fsp_err_t R_SDHI_StatusGet ( sdmmc_ctrl_t *const p_api_ctrl, sdmmc_status_t *const p_status )
```

Provides driver status. Implements `sdmmc_api_t::statusGet()`.

**Return values**

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

◆ **R\_SDHI\_Erase()**

```
fsp_err_t R_SDHI_Erase ( sdmmc_ctrl_t *const p_api_ctrl, uint32_t const start_sector, uint32_t const sector_count )
```

Erases sectors of an SD card or eMMC device. Implements `sdmmc_api_t::erase()`.

This function blocks until the erase command is sent. Poll the status to determine when erase is complete.

**Return values**

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	A required pointer is NULL or an argument is invalid.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R\_SDHI\_CallbackSet()**

```
fsp_err_t R_SDHI_CallbackSet ( sdmmc_ctrl_t *const p_api_ctrl, void(*) (sdmmc_callback_args_t *)
p_callback, void const *const p_context, sdmmc_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `sdmmc_api_t::callbackSet`.

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R\_SDHI\_Close()**

```
fsp_err_t R_SDHI_Close ( sdmmc_ctrl_t *const p_api_ctrl)
```

Closes an open SD/MMC device. Implements `sdmmc_api_t::close()`.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

**4.2.16.15 Virtual EEPROM on Flash (rm\_vee\_flash)**

Modules » Storage

**Functions**

```
fsp_err_t RM_VEE_FLASH_Open (rm_vee_ctrl_t *const p_api_ctrl, rm_vee_cfg_t
const *const p_cfg)
```

```
fsp_err_t RM_VEE_FLASH_RecordWrite (rm_vee_ctrl_t *const p_api_ctrl,
uint32_t const rec_id, uint8_t const *const p_rec_data, uint32_t const
num_bytes)
```

```
fsp_err_t RM_VEE_FLASH_RefDataWrite (rm_vee_ctrl_t *const p_api_ctrl,
uint8_t const *const p_ref_data)
```

```
fsp_err_t RM_VEE_FLASH_RecordPtrGet (rm_vee_ctrl_t *const p_api_ctrl,
uint32_t const rec_id, uint8_t **const pp_rec_data, uint32_t *const
p_num_bytes)
```

```
fsp_err_t RM_VEE_FLASH_RefDataPtrGet (rm_vee_ctrl_t *const p_api_ctrl,
uint8_t **const pp_ref_data)
```

```
fsp_err_t RM_VEE_FLASH_Refresh (rm_vee_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t RM_VEE_FLASH_Format (rm_vee_ctrl_t *const p_api_ctrl, uint8_t
const *const p_ref_data)
```

```
fsp_err_t RM_VEE_FLASH_CallbackSet (rm_vee_ctrl_t *const p_api_ctrl,
void(*p_callback)(rm_vee_callback_args_t *), void const *const
p_context, rm_vee_callback_args_t *const p_callback_memory)
```

```
fsp_err_t RM_VEE_FLASH_StatusGet (rm_vee_ctrl_t *const p_api_ctrl,
rm_vee_status_t *const p_status)
```

```
fsp_err_t RM_VEE_FLASH_Close (rm_vee_ctrl_t *const p_api_ctrl)
```

## Detailed Description

Virtual EEPROM on RA MCUs. This module implements the [Virtual EEPROM Interface](#).

## Overview

This VEE module emulates basic EEPROM capabilities. Support is provided for reading and writing both common records and reference data (originally programmed during product assembly or test). A count of the number of segments erased throughout the lifetime of the application is maintained and can be accessed at any time. Wear leveling is handled automatically by the driver.

### Features

- Writing and reading user defined records of any length to data flash.
- Wear leveling is handled automatically.
- Reference data such as calibration data programmed at assembly or test time is preserved.
- Reference data can be updated at run time.
- Fault resilient design.

### Data Flash Segmentation

Wear leveling is handled by changing the location in the data flash where a record is stored every time that it is updated. This change in physical location of the record is transparent to the user. Any time an update for a specific record ID is written, it is written to the next unused location in data flash and its location is stored in RAM for quick look-up later. When required, only the most recent version of these records is automatically copied to the next blank segment in data flash. The data flash area is divided into a number of equal-size segments. There is only one segment active at a time. A segment contains two areas- the record area (which is the vast majority of the segment) and

the reference data area which contains optional data typically programmed during assembly or final test. Records and updated reference data are written to this segment until one of the two areas becomes full. The record area must be able to hold at least one of every record ID possible and still have space left over for record updates.

Figure 220: Segment Data Format

When a segment does not have sufficient space for additional records or updated reference data, a Refresh occurs. This process copies the most recent record for each ID as well as the latest version of reference data (if any) to the next segment. The very first time VEE runs on an MCU, it marks the last segment as active whether there is reference data configured or not. The end of VEE data flash area is used to provide an easily identified physical flash address that can be used while programming reference data without requiring Virtual EEPROM middleware.

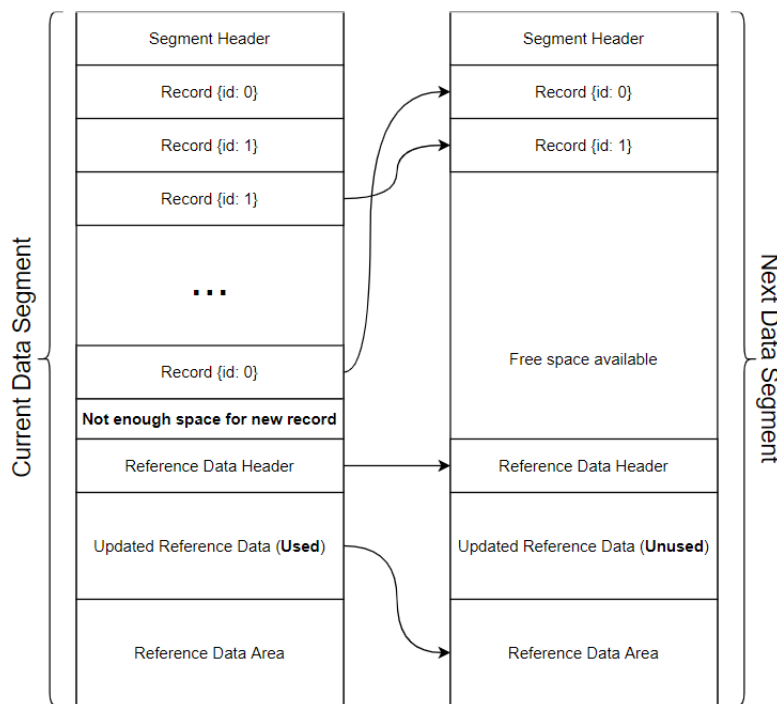

Figure 221: Refresh Operation

## Record Format

Each record begins with a header that contains the record size, followed by the data, and the trailer. The trailer contains a validation code which is used for internal purposes only and is not a 16-bit CRC or ECC value. If that level of error checking is desired, the user should include that in the record data passed to the driver. Padding is added between the end of user data and the trailer to ensure the trailer is aligned properly.

Figure 222: Record Format

## Reference Data Area

VEE can be configured for the presence of reference data. The original programmed reference data must be located at the end of the VEE data flash area. An area of equal size is reserved below this in case updated reference data becomes available later. Below that is a header which indicates whether the update area has been written to.

Figure 223: Reference Data Area Format

Just as with records, the validation code is used for internal purposes only and is not a 16-bit CRC or ECC value. If that level of error checking is desired, the user should include that in the updated reference data passed to the driver.

## Fault Tolerance

The Virtual EEPROM has a fault tolerant design. If for any reason an operation fails before it is completed the next time the module is opened a refresh will occur. Any corrupted data will be discarded.

## Configuration

### Build Time Configurations for rm\_vee\_flash

The following build time configurations are defined in fsp\_cfg/rm\_vee\_flash\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Reference Data Support	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Support writing reference data to the end of the segment.

Refresh Buffer Size	Value must be an integer greater than 0 and a multiple of 4 bytes.	32	The size of the internal buffer used to copying data from one flash segment to another during a refresh operation. This is required because data flash to data flash transfers are not supported by the hardware.
---------------------	--	----	---

### Configurations for Storage > Virtual EEPROM on Flash (rm\_vee\_flash)

This module can be added to the Stacks tab via New Stack > Storage > Virtual EEPROM on Flash (rm\_vee\_flash). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_vee0	Module name.
Record Max ID	Value must be an integer.	16	Set this value to the highest record ID in use.
Number of Segments	Value must be an integer.	2	Set value to number of segments desired in data flash (minimum 2). The fewer the segments, the fewer refreshes occur, but the longer refreshes take to complete (erase time).
Start Address	Manual Entry	BSP_FEATURE_FLASH_DATA_FLASH_START	Start address of the flash area used by Virtual EEPROM.
Total Size	Manual Entry	BSP_DATA_FLASH_SIZE_BYTES	The total size (In bytes) of the flash area used by Virtual EEPROM.
Reference Data Size	Value must be an integer.	0	The size of the reference area (In bytes) used by Virtual EEPROM.
Callback	Name must be a valid C symbol	vee_callback	A user callback function can be provided. If this callback function is provided, it will be called from the flash interrupt service

routine (ISR).

## Clock Configuration

There is no clock configuration for the RM\_VEE\_FLASH module.

## Pin Configuration

This module does not use I/O pins.

## Usage Notes

A refresh buffer is required to copy data between segments. Data flash cannot be simultaneously read from and written to. Data will be temporarily copied into RAM during refresh operations.

## Examples

### Basic Example

This is a basic example of minimal use of the RM\_VEE\_FLASH module in an application.

```
volatile bool callback_called = false;
/* Record ID to use for storing pressure data. */
#define ID_PRESSURE (0U)
/* Example data structure. */
typedef struct st_pressure
{
    uint32_t timestamp;
    uint16_t low;
    uint16_t average;
    uint16_t high;
} pressure_t;
void rm_vee_example ()
{
    /* Open the Virtual EEPROM Module. */
    fsp_err_t err = RM_VEE_FLASH_Open(&g_vee_ctrl, &g_vee_cfg);
    if (FSP_SUCCESS != err)
    {
        error_handler();
    }
    /* Read pressure data from external sensor. */
```

```
    pressure_t pressure_data;
    get_pressure_data(&pressure_data);
    /* Write the pressure data to a Virtual EEPROM Record. */
    err = RM_VEE_FLASH_RecordWrite(&g_vee_ctrl, ID_PRESSURE, (uint8_t *)
&pressure_data, sizeof(pressure_t));
    if (FSP_SUCCESS != err)
    {
        error_handler();
    }
    /* Wait for the Virtual EEPROM callback to indicate it finished writing data. */
    while (false == callback_called)
    {
        ;
    }
    /* Get a pointer to the record that is stored in data flash. */
    uint32_t    length;
    pressure_t * p_pressure_data;
    err = RM_VEE_FLASH_RecordPtrGet(&g_vee_ctrl, ID_PRESSURE, (uint8_t **)
&p_pressure_data, &length);
    if (FSP_SUCCESS != err)
    {
        error_handler();
    }
    /* Close the Virtual EEPROM Module. */
    err = RM_VEE_FLASH_Close(&g_vee_ctrl);
    if (FSP_SUCCESS != err)
    {
        error_handler();
    }
}
void rm_vee_tests_callback (rm_vee_callback_args_t * p_args)
{
    callback_called = true;
    FSP_PARAMETER_NOT_USED(p_args);
}
```

}

## Data Structures

```
struct rm_vee_flash_cfg_t
```

```
struct rm_vee_flash_instance_ctrl_t
```

## Data Structure Documentation

### ◆ rm\_vee\_flash\_cfg\_t

```
struct rm_vee_flash_cfg_t
```

User configuration structure, used in open function

#### Data Fields

<a href="#">flash_instance_t</a> const *	p_flash	Pointer to a flash instance.
--	---------	------------------------------

### ◆ rm\_vee\_flash\_instance\_ctrl\_t

```
struct rm_vee_flash_instance_ctrl_t
```

Instance control block. This is private to the FSP and should not be used or modified by the application.

## Function Documentation

◆ **RM\_VEE\_FLASH\_Open()**

```
fsp_err_t RM_VEE_FLASH_Open ( rm_vee_ctrl_t *const p_api_ctrl, rm_vee_cfg_t const *const p_cfg )
```

Open the RM\_VEE\_FLASH driver module

Implements `rm_vee_api_t::open`

Initializes the driver's internal structures and opens the Flash driver. The Flash driver must be closed prior to opening VEE. The error code FSP\_SUCCESS\_RECOVERY indicates that VEE detected corrupted data; most likely due to a power loss during a data flash write or erase. In these cases, an automatic internal Refresh is performed and the partially written data is lost.

**Return values**

FSP_SUCCESS	Successful. FSP_SUCCESS_RECOVERY changed to FSP_SUCCESS
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_ALREADY_OPEN	This function has already been called.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Interrupts disabled outside of VEE
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.
FSP_ERR_INVALID_ARGUMENT	The supplied configuration is invalid.

◆ **RM\_VEE\_FLASH\_RecordWrite()**

```
fsp_err_t RM_VEE_FLASH_RecordWrite ( rm_vee_ctrl_t *const p_api_ctrl, uint32_t const rec_id,
uint8_t const *const p_rec_data, uint32_t const num_bytes )
```

Writes a record to data flash.

Implements `rm_vee_api_t::recordWrite`

This function writes `num_bytes` of data pointed to by `p_rec_data` to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes. This includes exiting the calling function when the data buffer is a local variable (stack may be used by another function and corrupt the data buffer contents).

**Return values**

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_ARGUMENT	An argument contains an illegal value.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

### ◆ RM\_VEE\_FLASH\_RefDataWrite()

```
fsp_err_t RM_VEE_FLASH_RefDataWrite ( rm_vee_ctrl_t *const p_api_ctrl, uint8_t const *const p_ref_data )
```

Writes new Reference data to the reference update area.

Implements `rm_vee_api_t::refDataWrite`

This function writes VEE\_CFG\_REF\_DATA\_SIZE bytes pointed to by p\_ref\_data to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes.

#### Return values

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ **RM\_VEE\_FLASH\_RecordPtrGet()**

```
fsp_err_t RM_VEE_FLASH_RecordPtrGet ( rm_vee_ctrl_t *const p_api_ctrl, uint32_t const rec_id,
uint8_t **const pp_rec_data, uint32_t *const p_num_bytes )
```

Gets a pointer to the most recent record data.

Implements `rm_vee_api_t::recordPtrGet`

This function sets the argument pointer to the most recent version of the record data in flash. Flash cannot be accessed for reading and writing at the same time. Therefore, reading the data at `p_ref_data` must be completed prior to initiating any type of Flash write.

**Return values**

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	<code>p_ref_data</code> is NULL.
FSP_ERR_INVALID_ARGUMENT	Record data not configured.
FSP_ERR_NOT_FOUND	The record associated with the requested ID could not be found.

◆ **RM\_VEE\_FLASH\_RefDataPtrGet()**

```
fsp_err_t RM_VEE_FLASH_RefDataPtrGet ( rm_vee_ctrl_t *const p_api_ctrl, uint8_t **const
pp_ref_data )
```

Gets a pointer to the most recent reference data.

Implements `rm_vee_api_t::recordPtrGet`

This function sets the argument pointer to the most recent version of the reference data in flash. Flash cannot be accessed for reading and writing at the same time.

**Return values**

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_FOUND	No reference data was found.

### ◆ RM\_VEE\_FLASH\_Refresh()

`fsp_err_t RM_VEE_FLASH_Refresh ( rm_vee_ctrl_t *const p_api_ctrl)`

Manually start a refresh operation

Implements `rm_vee_api_t::refresh`

This function is used to start a segment Refresh at any time. The Refresh process by default occurs automatically when no more record or reference data space is available and a Write is requested. However, the app may desire to force a refresh when it knows it is running low on space and large amounts of data are about to be recorded.

#### Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ **RM\_VEE\_FLASH\_Format()**

```
fsp_err_t RM_VEE_FLASH_Format ( rm_vee_ctrl_t *const p_api_ctrl, uint8_t const *const p_ref_data )
```

Start a manual format operation.

Implements `rm_vee_api_t::format`

**Return values**

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ **RM\_VEE\_FLASH\_CallbackSet()**

```
fsp_err_t RM_VEE_FLASH_CallbackSet ( rm_vee_ctrl_t *const p_api_ctrl, void(*) (rm_vee_callback_args_t *) p_callback, void const *const p_context, rm_vee_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure.

Implements `rm_vee_api_t::callbackSet`.

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

### ◆ RM\_VEE\_FLASH\_StatusGet()

```
fsp_err_t RM_VEE_FLASH_StatusGet ( rm_vee_ctrl_t *const p_api_ctrl, rm_vee_status_t *const p_status )
```

Get the current status of the driver.

Implements [rm\\_vee\\_api\\_t::statusGet](#)

This command is typically used to verify that the last Write or Refresh command has completed before attempting to perform another API call.

#### Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

### ◆ RM\_VEE\_FLASH\_Close()

```
fsp_err_t RM_VEE_FLASH_Close ( rm_vee_ctrl_t *const p_api_ctrl)
```

Closes the Flash driver and VEE driver.

Implements [rm\\_vee\\_api\\_t::close](#)

#### Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

## 4.2.17 System

### Modules

#### Detailed Description

System Modules.

#### Modules

##### Clock Generation Circuit (r\_cgc)

Driver for the CGC peripheral on RA MCUs. This module implements the [CGC Interface](#).

**Event Link Controller (r\_elc)**

Driver for the ELC peripheral on RA MCUs. This module implements the [ELC Interface](#).

**I/O Port (r\_ioport)**

Driver for the I/O Ports peripheral on RA MCUs. This module implements the [I/O Port Interface](#).

**4.2.17.1 Clock Generation Circuit (r\_cgc)**

fsp\_err\_t R\_CGC\_Close (cgc\_ctrl\_t \*const p\_ctrl)

## Detailed Description

Driver for the CGC peripheral on RA MCUs. This module implements the [CGC Interface](#).

### Note

***This module is not required for the initial clock configuration. Initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor. The initial clock settings are applied by the BSP during the startup process before main.***

## Overview

### Features

The CGC module supports runtime modifications of clock settings. Key features include the following:

- Supports changing the system clock source to any of the following options (provided they are supported on the MCU):
  - High-speed on-chip oscillator (HOCO)
  - Middle-speed on-chip oscillator (MOCO)
  - Low-speed on-chip oscillator (LOCO)
  - Main oscillator (external resonator or external clock input frequency)
  - Sub-clock oscillator (external resonator)
  - PLL/PLL2 (not available on all MCUs)
- When the system core clock frequency changes, the following things are updated:
  - The CMSIS standard global variable SystemCoreClock is updated to reflect the new clock frequency.
  - Wait states for ROM and RAM are adjusted to the minimum supported value for the new clock frequency.
  - The operating power control mode is updated to the minimum supported value for the new clock settings.
- Supports starting or stopping any of the system clock sources
- Supports changing dividers for the internal clocks
- Supports the oscillation stop detection feature

### Internal Clocks

The RA microcontrollers have up to seven internal clocks. Not all internal clocks exist on all MCUs. Each clock domain has its own divider that can be updated in [R\\_CGC\\_SystemClockSet\(\)](#). The dividers are subject to constraints described in the footnote of the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual.

The internal clocks include:

- System clock (ICLK): core clock used for CPU, flash, internal SRAM, DTC, and DMAC
- PCLKA/PCLKB/PCLKC/PCLKD: Peripheral clocks, refer to the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual to see which peripherals are controlled by which clocks.
- FCLK: Clock source for reading data flash and for programming/erasure of both code and data flash.
- BCLK: External bus clock

## Configuration

### Note

The initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor.

There is a configuration to enable the HOCO on reset in the OFSI settings on the BSP tab.

The following clock related settings are configurable in the RA Common section on the BSP tab:

- Main Oscillator Wait Time
- Main Oscillator Clock Source (external oscillator or crystal/resonator)
- Subclock Populated
- Subclock Drive
- Subclock Stabilization Time (ms)

The default stabilization times are determined based on development boards provided by Renesas, but are generally valid for most designs. Depending on the target board hardware configuration and requirements these values may need to be adjusted for reliability or startup speed.

## Build Time Configurations for r\_cg

The following build time configurations are defined in fsp\_cfg/r\_cg\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

## Configurations for System > Clock Generation Circuit (r\_cg)

This module can be added to the Stacks tab via New Stack > System > Clock Generation Circuit (r\_cg). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_cg0	Module name.
NMI Callback	Name must be a valid C symbol	NULL	A user callback function must be provided if oscillation stop detection is used. If this callback function is provided, it is called from the NMI handler if the main oscillator stops.

## Clock Configuration

This module is used to configure the system clocks. There are no module specific clock configurations required to use it.

## Pin Configuration

The CGC module controls the output of the CLOCKOUT signal.

If an external oscillator is used the XTAL and EXTAL pins must be configured accordingly. When running from an on chip oscillator there is no requirement for the main clock external oscillator. In this case, the XTAL and EXTAL pins can be set to a different function in the RA Configuration editor.

The functionality of the subclock external oscillator pins XCIN and XCOU is fixed.

## Usage Notes

### NMI Interrupt

The CGC timer uses the NMI for oscillation stop detection of the main oscillator after `R_CGC_OscStopDetectEnable` is called. The NMI is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during `R_CGC_Open()` is called.

### Starting or Stopping the Subclock

If the Subclock Populated property is set to Populated on the BSP configuration tab, then the subclock is started in the BSP startup routine. Otherwise, it is stopped in the BSP startup routine. Starting and stopping the subclock at runtime is not recommended since the stabilization requirements typically negate the negligible power savings.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

#### Warning

The subclock can take up to several seconds to stabilize. RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. In this case the default wait time is 1000ms (1 second). When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation. Because there is no hardware stabilization status bit for the subclock `R_CGC_ClockCheck` cannot be used to optimize this wait.

Changing the subclock state during `R_CGC_ClocksCfg()` is not supported.

### Low Power Operation

If "Use Low Voltage Mode" is enabled in the BSP MCU specific properties (not available on all MCUs), the MCU is always in low voltage mode and no other power modes are considered. The following conditions must be met for the MCU to run in low voltage mode:

- Requires HOCO to be running, so HOCO cannot be stopped in low voltage mode
- Requires PLL to be stopped, so PLL APIs are not available in low voltage mode
- Requires ICLK  $\leq$  4 MHz
- If oscillation stop detection is used, dividers of 1 or 2 cannot be used for any clock

If "Use Low Voltage Mode" is not enabled, the MCU applies the lowest power mode by searching through the following list in order and applying the first power mode that is supported under the current conditions:

- Subosc-speed mode (lowest power)
  - Requires system clock to be LOCO or subclock
  - Requires MOCO, HOCO, main oscillator, and PLL (if present) to be stopped
  - Requires ICLK and FCLK dividers to be 1
- Low-speed mode
  - Requires PLL to be stopped
  - Requires ICLK  $\leq$  1 MHz
  - If oscillation stop detection is used, dividers of 1, 2, 4, or 8 cannot be used for any clock

- Middle-speed mode (not supported on all MCUs)
  - Requires ICLK ≤ 8 MHz
- High-speed mode
  - Default mode if no other operating mode is supported

Refer to the section "Function for Lower Operating Power Consumption" in the "Low Power Modes" chapter of the hardware manual for MCU specific information about operating power control modes.

#### Note

*The DCDC regulator (if present) is only available in Middle- and High-speed modes. The BSP will automatically switch between DCDC and LDO when switching between compatible and incompatible modes if the DCDC regulator is in use. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).*

When low voltage mode is not used, the following functions adjust the operating power control mode to ensure it remains within the hardware specification and to ensure the MCU is running at the optimal operating power control mode:

- `R_CGC_ClockStart()`
- `R_CGC_ClockStop()`
- `R_CGC_SystemClockSet()`
- `R_CGC_OscStopDetectEnable()`
- `R_CGC_OscStopDetectDisable()`

#### Note

*FSP APIs, including these APIs, are not thread safe. These APIs and any other user code that modifies the operating power control mode must not be allowed to interrupt each other. Proper care must be taken during application design if these APIs are used in threads or interrupts to ensure this constraint is met.*

No action is required by the user of these APIs. This section is provided for informational purposes only.

## Examples

### Basic Example

This is a basic example of minimal use of the CGC in an application.

```
void cgc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Change the system clock to LOCO for power saving. */
    /* Start the LOCO. */
}
```

```
err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
assert(FSP_SUCCESS == err);

/* Wait for the LOCO stabilization wait time.
 *
 * NOTE: The MOCO, LOCO and subclock do not have stabilization status bits, so any
stabilization time must be
 * performed via a software wait when starting these oscillators. For all other
oscillators, R_CGC_ClockCheck can
 * be used to verify stabilization status.
 */
R_BSP_SoftwareDelay(BSP_FEATURE_CGC_LOCO_STABILIZATION_MAX_US,
BSP_DELAY_UNITS_MICROSECONDS);

/* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
cgc_divider_cfg_t dividers =
{
/* PCLKB is not used in this application, so select the maximum divisor for lowest
power. */
.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_64,
/* PCLKD is not used in this application, so select the maximum divisor for lowest
power. */
.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_64,
/* ICLK is the MCU clock, allow it to run as fast as the LOCO is capable. */
.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
/* These clocks do not exist on some devices. If any clocks don't exist, set the
divider to 1. */
.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_1,
.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_1,
.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_1,
.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_1,
};
/* Switch the system clock to LOCO. */
err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_LOCO, &dividers);
assert(FSP_SUCCESS == err);
}
```

## Configuring Multiple Clocks

This example demonstrates switching to a new source clock and stopping the previous source clock in a single function call using `R_CGC_ClocksCfg()`.

```
void cgc_clocks_cfg_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Change the system clock to PLL running from the main oscillator. */
    /* Assuming the system clock is MOCO, switch to HOCO. */
    cgc_clocks_cfg_t clocks_cfg;
    clocks_cfg.system_clock                = CGC_CLOCK_PLL;
    clocks_cfg.pll_state                   = CGC_CLOCK_CHANGE_NONE;
    clocks_cfg.pll_cfg.source_clock        = CGC_CLOCK_MAIN_OSC; // unused
    clocks_cfg.pll_cfg.multiplier          = CGC_PLL_MUL_10_0;   // unused
    clocks_cfg.pll_cfg.divider              = CGC_PLL_DIV_2;      // unused
    clocks_cfg.divider_cfg.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1;
    clocks_cfg.divider_cfg.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.mainosc_state                = CGC_CLOCK_CHANGE_NONE;
    clocks_cfg.hoco_state                   = CGC_CLOCK_CHANGE_START;
    clocks_cfg.moco_state                   = CGC_CLOCK_CHANGE_STOP;
    clocks_cfg.loco_state                   = CGC_CLOCK_CHANGE_NONE;
    err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
    assert(FSP_SUCCESS == err);
#ifdef BSP_FEATURE_CGC_HAS_PLL
```

```

/* Assuming the system clock is HOCO, switch to PLL running from main oscillator and
stop MOCO. */
clocks_cfg.system_clock           = CGC_CLOCK_PLL;
clocks_cfg.pll_state              = CGC_CLOCK_CHANGE_START;
clocks_cfg.pll_cfg.source_clock   = CGC_CLOCK_MAIN_OSC;
clocks_cfg.pll_cfg.multiplier     = (cgc_pll_mul_t) BSP_CFG_PLL_MUL;
clocks_cfg.pll_cfg.divider        = (cgc_pll_div_t) BSP_CFG_PLL_DIV;
clocks_cfg.divider_cfg.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1;
clocks_cfg.divider_cfg.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.mainosc_state          = CGC_CLOCK_CHANGE_START;
clocks_cfg.hoco_state             = CGC_CLOCK_CHANGE_STOP;
clocks_cfg.moco_state            = CGC_CLOCK_CHANGE_NONE;
clocks_cfg.loco_state            = CGC_CLOCK_CHANGE_NONE;

err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
assert(FSP_SUCCESS == err);
#endif
}

```

## Oscillation Stop Detection

This example demonstrates registering a callback for oscillation stop detection of the main oscillator.

```

/* Example callback called when oscillation stop is detected. */
void oscillation_stop_callback (cgc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    fsp_err_t err = FSP_SUCCESS;

    /* (Optional) If the MCU was running on the main oscillator, the MCU is now running
on MOCO. Switch clocks if
    * desired. This example shows switching to HOCO. */

```

```
err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_HOCO, NULL);
assert(FSP_SUCCESS == err);

do
{
/* Wait for HOCO to stabilize. */
err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_HOCO);
} while (FSP_SUCCESS != err);
cgc_divider_cfg_t dividers =
{
.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4,
};
err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_HOCO, &dividers);
assert(FSP_SUCCESS == err);
#if BSP_FEATURE_CGC_HAS_PLL
/* (Optional) If the MCU was running on the PLL, the PLL is now in free-running
mode. Switch clocks if
* desired. This example shows switching to the PLL running on HOCO. */
err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_HOCO, NULL);
assert(FSP_SUCCESS == err);
do
{
/* Wait for HOCO to stabilize. */
err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_HOCO);
} while (FSP_SUCCESS != err);
cgc_pll_cfg_t pll_cfg =
{
.source_clock = CGC_CLOCK_HOCO,
.multiplier = (cgc_pll_mul_t) BSP_CFG_PLL_MUL,
```

```
.divider      = (cgc_pll_div_t) BSP_CFG_PLL_DIV,
};

err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_PLL, &pll_cfg);
assert(FSP_SUCCESS == err);

do
{
/* Wait for PLL to stabilize. */
err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_PLL);
} while (FSP_SUCCESS != err);
cgc_divider_cfg_t pll_dividers =
{
.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4,
.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4,
};

err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_PLL, &pll_dividers);
assert(FSP_SUCCESS == err);
#endif

/* (Optional) Clear the error flag. Only clear this flag after switching the MCU
clock source away from the main
* oscillator and if the main oscillator is stable again. */
err = R_CGC_OscStopStatusClear(&g_cgc0_ctrl);
assert(FSP_SUCCESS == err);
}

void cgc_osc_stop_example (void)
{
fsp_err_t err = FSP_SUCCESS;

/* Open the module. */
err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);

/* Handle any errors. This function should be defined by the user. */
```

```

    assert(FSP_SUCCESS == err);

    /* Enable oscillation stop detection. The main oscillator must be running at this
point. */
    err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);

    /* (Optional) Oscillation stop detection must be disabled before entering any low
power mode. */
    err = R_CGC_OscStopDetectDisable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);

    __WFI();

    /* (Optional) Reenable oscillation stop detection after waking from low power mode.
*/
    err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
}

```

## Data Structures

struct [cgc\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ cgc\_instance\_ctrl\_t

struct cgc\_instance\_ctrl\_t

CGC private control block. DO NOT MODIFY. Initialization occurs when [R\\_CGC\\_Open\(\)](#) is called.

#### Data Fields

void const \* [p\\_context](#)

## Field Documentation

### ◆ p\_context

void const\* cgc\_instance\_ctrl\_t::p\_context

Placeholder for user data. Passed to the user callback in [cgc\\_callback\\_args\\_t](#).

## Function Documentation

◆ **R\_CGC\_Open()**

```
fsp_err_t R_CGC_Open ( cgc_ctrl_t *const p_ctrl, cgc_cfg_t const *const p_cfg )
```

Initialize the CGC API. Implements `cgc_api_t::open`.

Example:

```
/* Initializes the CGC module. */
err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
```

**Return values**

FSP_SUCCESS	CGC successfully initialized.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ **R\_CGC\_ClocksCfg()**

```
fsp_err_t R_CGC_ClocksCfg ( cgc_ctrl_t *const p_ctrl, cgc_clocks_cfg_t const *const p_clock_cfg )
```

Reconfigures all main system clocks. This API can be used for any of the following purposes:

- start or stop clocks
- change the system clock source
- configure the PLL/PLL2 multiplication and division ratios when starting the PLL
- change the system dividers

If the requested system clock source has a stabilization flag, this function blocks waiting for the stabilization flag of the requested system clock source to be set. If the requested system clock source was just started and it has no stabilization flag, this function blocks for the stabilization time required by the requested system clock source according to the Electrical Characteristics section of the hardware manual. If the requested system clock source has no stabilization flag and it is already running, it is assumed to be stable and this function will not block. If the requested system clock is the subclock, the subclock must be stable prior to calling this function.

The internal dividers (`cgc_clocks_cfg_t::divider_cfg`) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes of Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100
- RA2A1: see footnotes of Table 9.2 "Clock generation circuit specifications for the internal clocks" in the RA2A1 manual R01UH0888EJ0100

Do not attempt to stop the requested clock source or the source of a PLL if the PLL will be running after this operation completes.

Implements `cgc_api_t::clocksCfg`.

Example:

```
/* Assuming the system clock is MOCO, switch to HOCO. */
```

```

cgc_clocks_cfg_t clocks_cfg;

clocks_cfg.system_clock           = CGC_CLOCK_PLL;
clocks_cfg.pll_state              = CGC_CLOCK_CHANGE_NONE;
clocks_cfg.pll_cfg.source_clock   = CGC_CLOCK_MAIN_OSC; // unused
clocks_cfg.pll_cfg.multiplier     = CGC_PLL_MUL_10_0;   // unused
clocks_cfg.pll_cfg.divider        = CGC_PLL_DIV_2;      // unused
clocks_cfg.divider_cfg.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1;
clocks_cfg.divider_cfg.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.bclk_div  = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.divider_cfg.sckdivcr_b.fclk_div  = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.mainosc_state          = CGC_CLOCK_CHANGE_NONE;
clocks_cfg.hoco_state             = CGC_CLOCK_CHANGE_START;
clocks_cfg.moco_state             = CGC_CLOCK_CHANGE_STOP;
clocks_cfg.loco_state             = CGC_CLOCK_CHANGE_NONE;

err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);

assert(FSP_SUCCESS == err);

```

### Return values

FSP_SUCCESS	Clock configuration applied successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_NOT_STABILIZED	PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

### ◆ R\_CGC\_ClockStart()

```
fsp_err_t R_CGC_ClockStart ( cgc_ctrl_t *const p_ctrl, cgc_clock_t clock_source, cgc_pll_cfg_t const *const p_pll_cfg )
```

Start the specified clock if it is not currently active. The PLL configuration cannot be changed while the PLL is running. Implements `cgc_api_t::clockStart`.

The PLL source clock must be operating and stable prior to starting the PLL.

Example:

```
/* Start the LOCO. */
err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
assert(FSP_SUCCESS == err);
```

#### Return values

FSP_SUCCESS	Clock initialized successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	The clock source is not stabilized after being turned off or PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

◆ **R\_CGC\_ClockStop()**

```
fsp_err_t R_CGC_ClockStop ( cgc_ctrl_t *const p_ctrl, cgc_clock_t clock_source )
```

Stop the specified clock if it is active. Implements `cgc_api_t::clockStop`.

Do not attempt to stop the current system clock source. Do not attempt to stop the source clock of a PLL if the PLL is running.

**Return values**

FSP_SUCCESS	Clock stopped successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_OSC_STOP_DET_ENABLED	Attempt to stop MOCO when Oscillation stop is enabled.
FSP_ERR_NOT_STABILIZED	Clock not stabilized after starting.

◆ **R\_CGC\_SystemClockSet()**

```
fsp_err_t R_CGC_SystemClockSet ( cgc_ctrl_t *const p_ctrl, cgc_clock_t clock_source,
cgc_divider_cfg_t const *const p_divider_cfg )
```

Set the specified clock as the system clock and configure the internal dividers for ICLK, PCLKA, PCLKB, PCLKC, PCLKD, BCLK, and FCLK. Implements `cgc_api_t::systemClockSet`.

The requested clock source must be running and stable prior to calling this function. The internal dividers are subject to constraints described in the hardware manual table "Specifications of the Clock Generation Circuit for the internal clocks".

The internal dividers (`p_divider_cfg`) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes of Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100
- RA2A1: see footnotes of Table 9.2 "Clock generation circuit specifications for the internal clocks" in the RA2A1 manual R01UH0888EJ0100

This function also updates the RAM and ROM wait states, the operating power control mode, and the SystemCoreClock CMSIS global variable.

**Example:**

```
/* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
cgc_divider_cfg_t dividers =
{
```

```

/* PCLKB is not used in this application, so select the maximum divisor for lowest
power. */
    .sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_64,
/* PCLKD is not used in this application, so select the maximum divisor for lowest
power. */
    .sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_64,
/* ICLK is the MCU clock, allow it to run as fast as the LOCO is capable. */
    .sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
/* These clocks do not exist on some devices. If any clocks don't exist, set the
divider to 1. */
    .sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_1,
    .sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_1,
    .sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_1,
    .sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_1,
};
/* Switch the system clock to LOCO. */
err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_LOCO, &dividers);
assert(FSP_SUCCESS == err);

```

**Return values**

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	The specified clock source is inactive.
FSP_ERR_NOT_STABILIZED	The clock source has not stabilized

◆ **R\_CGC\_SystemClockGet()**

```
fsp_err_t R_CGC_SystemClockGet ( cgc_ctrl_t *const p_ctrl, cgc_clock_t *const p_clock_source,
cgc_divider_cfg_t *const p_divider_cfg )
```

Return the current system clock source and configuration. Implements `cgc_api_t::systemClockGet`.

**Return values**

FSP_SUCCESS	Parameters returned successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **R\_CGC\_ClockCheck()**

```
fsp_err_t R_CGC_ClockCheck ( cgc_ctrl_t *const p_ctrl, cgc_clock_t clock_source )
```

Check the specified clock for stability. Implements `cgc_api_t::clockCheck`.

**Return values**

FSP_SUCCESS	Clock is running and stable.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	Clock not stabilized.
FSP_ERR_CLOCK_INACTIVE	Clock not turned on.

◆ **R\_CGC\_OscStopDetectEnable()**

```
fsp_err_t R_CGC_OscStopDetectEnable ( cgc_ctrl_t *const p_ctrl)
```

Enable the oscillation stop detection for the main clock. Implements `cgc_api_t::oscStopDetectEnable`.

The MCU will automatically switch the system clock to MOCO when a stop is detected if Main Clock is the system clock. If the system clock is the PLL, then the clock source will not be changed and the PLL free running frequency will be the system clock frequency.

Example:

```
/* Enable oscillation stop detection. The main oscillator must be running at this
point. */
err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_LOW_VOLTAGE_MODE	Settings not allowed in low voltage mode.

◆ **R\_CGC\_OscStopDetectDisable()**

```
fsp_err_t R_CGC_OscStopDetectDisable ( cgc_ctrl_t *const p_ctrl)
```

Disable the oscillation stop detection for the main clock. Implements `cgc_api_t::oscStopDetectDisable`.

Example:

```
/* (Optional) Oscillation stop detection must be disabled before entering any low
power mode. */
err = R_CGC_OscStopDetectDisable(&g_cgc0_ctrl);
assert(FSP_SUCCESS == err);
__WFI();
```

**Return values**

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detect status flag is set. Under this condition it is not possible to disable the Oscillation stop detection function.

### ◆ R\_CGC\_OscStopStatusClear()

```
fsp_err_t R_CGC_OscStopStatusClear ( cgc_ctrl_t *const p_ctrl)
```

Clear the Oscillation Stop Detection Status register. This register is not cleared automatically if the stopped clock is restarted. Implements `cgc_api_t::oscStopStatusClear`.

After clearing the status, oscillation stop detection is no longer enabled.

This register cannot be cleared while the main oscillator is the system clock or the PLL source clock.

Example:

```
/* (Optional) Clear the error flag. Only clear this flag after switching the MCU
clock source away from the main
* oscillator and if the main oscillator is stable again. */
err = R_CGC_OscStopStatusClear(&g_cgc0_ctrl);
assert(FSP_SUCCESS == err);
```

#### Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	Main oscillator must be running to clear the oscillation stop detection flag.
FSP_ERR_OSC_STOP_CLOCK_ACTIVE	The Oscillation Detect Status flag cannot be cleared if the Main Osc or PLL is set as the system clock. Change the system clock before attempting to clear this bit.
FSP_ERR_INVALID_HW_CONDITION	Oscillation stop status was not cleared. Check preconditions and try again.

◆ **R\_CGC\_CallbackSet()**

```
fsp_err_t R_CGC_CallbackSet ( cgc_ctrl_t *const p_api_ctrl, void(*) (cgc_callback_args_t *)
p_callback, void const *const p_context, cgc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `cgc_api_t::callbackSet`

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R\_CGC\_Close()**

```
fsp_err_t R_CGC_Close ( cgc_ctrl_t *const p_ctrl)
```

Closes the CGC module. Implements `cgc_api_t::close`.

**Return values**

FSP_SUCCESS	The module is successfully closed.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

**4.2.17.2 Event Link Controller (r\_elc)**

Modules » System

**Functions**

```
fsp_err_t R_ELC_Open (elc_ctrl_t *const p_ctrl, elc_cfg_t const *const p_cfg)
```

```
fsp_err_t R_ELC_Close (elc_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_ELC_SoftwareEventGenerate (elc_ctrl_t *const p_ctrl,
elc_software_event_t event_number)
```

```
fsp_err_t R_ELC_LinkSet (elc_ctrl_t *const p_ctrl, elc_peripheral_t peripheral,
elc_event_t signal)
```

```
fsp_err_t R_ELC_LinkBreak (elc_ctrl_t *const p_ctrl, elc_peripheral_t peripheral)
```

```
fsp_err_t R_ELC_Enable (elc_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_ELC_Disable (elc_ctrl_t *const p_ctrl)
```

## Detailed Description

Driver for the ELC peripheral on RA MCUs. This module implements the [ELC Interface](#).

## Overview

The event link controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect (link) them to different modules, allowing direct cooperation between the modules without central processing unit (CPU) intervention. The conceptual diagram below illustrates a potential setup where a pin interrupt triggers a timer which later triggers an ADC conversion and CTSU scan, while at the same time a serial communication interrupt automatically starts a data transfer. These tasks would be automatically handled without the need for polling or interrupt management.

Figure 224: Event Link Controller Conceptual Diagram

In essence, the ELC is an array of multiplexers to route a wide variety of interrupt signals to a subset of peripheral functions. Events are linked by setting the multiplexer for the desired function to the desired signal (through `R_ELC_LinkSet`). The diagram below illustrates one peripheral output of the ELC. In this example, a conversion start is triggered for ADC0 Group A when the GPT0 counter overflows:

Figure 225: ELC Example

## Features

The ELC HAL module can perform the following functions:

- Initialize the ELC to a pre-defined set of links
- Create an event link between two blocks
- Break an event link between two blocks
- Generate one of two software events that interrupt the CPU
- Globally enable or disable event links

A variety of functions can be activated via events, including:

- General-purpose timer (GPT) control
- ADC and DAC conversion start
- Synchronized I/O port output (ports 1-4 only)
- Capacitive touch unit (CTSU) measurement activation

### Note

*The available sources and peripherals may differ between devices. A full list of selectable peripherals and events is available in the User's Manual for your device.*

*Some peripherals have specific settings related to ELC event generation and/or reception. Details on how to enable event functionality for each peripheral are located in the usage notes for the related module(s) as well as in the User's Manual for your device.*

## Configuration

### Note

*Event links will be automatically generated based on the selections made in module properties. To view the currently linked events check the [Event Links tab in the RA Configuration editor](#).*

*Calling [R\\_ELC\\_Open](#) followed by [R\\_ELC\\_Enable](#) will automatically link all events shown in the Event Links tab.*

To manually link an event to a peripheral at runtime perform the following steps:

1. Configure the operation of the destination peripheral (including any configuration necessary to receive events)
2. Use `R_ELC_LinkSet` to set the desired event link to the peripheral
3. Use `R_ELC_Enable` to enable transmission of event signals
4. Configure the signaling module to output the desired event (typically an interrupt)

To disable the event, either use `R_ELC_LinkBreak` to clear the link for a specific event or `R_ELC_Disable` to globally disable event linking.

#### Note

*The ELC module needs no pin, clocking or interrupt configuration; it is merely a mechanism to connect signals between peripherals. However, when linking I/O Ports via the ELC the relevant I/O pins need to be configured as inputs or outputs.*

### Build Time Configurations for r\_elc

The following build time configurations are defined in `fsp_cfg/r_elc_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for System > Event Link Controller (r\_elc)

This module can be added to the Stacks tab via `New Stack > System > Event Link Controller (r_elc)`. Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	ELC instance name must be <code>g_elc</code> to match <code>elc_cfg_t</code> data structure created in <code>elc_data.c</code>	<code>g_elc</code>	Module name. Fixed to <code>g_elc</code> .

## Usage Notes

### Limitations

Developers should be aware of the following limitations when using the ELC:

- To link events it is necessary for the ELC and the related modules to be enabled. The ELC cannot operate if the related modules are in the module stop state or the MCU is in a low power consumption mode for which the module is stopped.
- If two modules are linked across clock domains there may be a 1 to 2 cycle delay between event signaling and reception. The delay timing is based on the frequency of the slowest clock.

## Examples

## Basic Example

Below is a basic example of minimal use of event linking in an application.

```
/* This struct is automatically generated based on the events configured by
peripherals in the RA Configuration editor. */
static const elc_cfg_t g_elc_cfg =
{
    .link[ELC_PERIPHERAL_GPT_A] = ELC_EVENT_ICU_IRQ0,
    .link[ELC_PERIPHERAL_IOPORT1] = ELC_EVENT_GPT4_COUNTER_OVERFLOW
};

void elc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the software and sets the links defined in the control structure. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Create or modify a link between a peripheral function and an event source. */
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);
    assert(FSP_SUCCESS == err);
    /* Globally enable event linking in the ELC. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);
}
```

## Software-Generated Events

This example demonstrates how to use a software-generated event to signal a peripheral. This can be useful when the desired event source is not supported by the ELC hardware.

```
/* Interrupt handler for peripheral event not supported by the ELC */
void peripheral_isr (void)
{
    fsp_err_t err;
    /* Generate an event signal through software to the linked peripheral. */
```

```
err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
assert(FSP_SUCCESS == err);
}
void elc_software_event (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the module. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Link ADC0 conversion start to software event 0. */
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
    while (true)
    {
        /* Application code here. */
    }
}
```

## Data Structures

struct [elc\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ [elc\\_instance\\_ctrl\\_t](#)

struct [elc\\_instance\\_ctrl\\_t](#)

ELC private control block. DO NOT MODIFY. Initialization occurs when [R\\_ELC\\_Open\(\)](#) is called.

## Function Documentation

◆ **R\_ELC\_Open()**

```
fsp_err_t R_ELC_Open ( elc_ctrl_t *const p_ctrl, elc_cfg_t const *const p_cfg )
```

Initialize all the links in the Event Link Controller. Implements `elc_api_t::open`

The configuration structure passed in to this function includes links for every event source included in the ELC and sets them all at once. To set or clear an individual link use `R_ELC_LinkSet` and `R_ELC_LinkBreak` respectively.

Example:

```
/* Initializes the software and sets the links defined in the control structure. */
err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
```

**Return values**

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl or p_cfg was NULL
FSP_ERR_ALREADY_OPEN	The module is currently open

◆ **R\_ELC\_Close()**

```
fsp_err_t R_ELC_Close ( elc_ctrl_t *const p_ctrl)
```

Globally disable ELC linking. Implements `elc_api_t::close`

**Return values**

FSP_SUCCESS	The ELC was successfully disabled
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R\_ELC\_SoftwareEventGenerate()**

```
fsp_err_t R_ELC_SoftwareEventGenerate ( elc_ctrl_t *const p_ctrl, elc_software_event_t
event_number )
```

Generate a software event in the Event Link Controller. Implements `elc_api_t::softwareEventGenerate`

Example:

```
/* Generate an event signal through software to the linked peripheral. */
err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	Invalid event number or p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R\_ELC\_LinkSet()**

```
fsp_err_t R_ELC_LinkSet ( elc_ctrl_t *const p_ctrl, elc_peripheral_t peripheral, elc_event_t signal )
```

Create a single event link. Implements `elc_api_t::linkSet`

Example:

```
/* Create or modify a link between a peripheral function and an event source. */
err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R\_ELC\_LinkBreak()**

```
fsp_err_t R_ELC_LinkBreak ( elc_ctrl_t *const p_ctrl, elc_peripheral_t peripheral )
```

Break an event link. Implements `elc_api_t::linkBreak`

**Return values**

FSP_SUCCESS	Event link broken
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R\_ELC\_Enable()**

```
fsp_err_t R_ELC_Enable ( elc_ctrl_t *const p_ctrl)
```

Enable the operation of the Event Link Controller. Implements `elc_api_t::enable`

**Return values**

FSP_SUCCESS	ELC enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R\_ELC\_Disable()**

```
fsp_err_t R_ELC_Disable ( elc_ctrl_t *const p_ctrl)
```

Disable the operation of the Event Link Controller. Implements `elc_api_t::disable`

**Return values**

FSP_SUCCESS	ELC disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

**4.2.17.3 I/O Port (r\_ioport)**

Modules » System

**Functions**

```
fsp_err_t R_IOPORT_Open (ioport_ctrl_t *const p_ctrl, const ioport_cfg_t *p_cfg)
```

fsp_err_t	R_IOPORT_Close (ioport_ctrl_t *const p_ctrl)
fsp_err_t	R_IOPORT_PinsCfg (ioport_ctrl_t *const p_ctrl, const ioport_cfg_t *p_cfg)
fsp_err_t	R_IOPORT_PinCfg (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, uint32_t cfg)

fsp_err_t	R_IOPORT_PortEventOutputWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t event_data, ioport_size_t mask_value)
fsp_err_t	R_IOPORT_PinEventOutputWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t pin_value)

## Detailed Description

Driver for the I/O Ports peripheral on RA MCUs. This module implements the [I/O Port Interface](#).

## Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC, or bus control pins.

## Features

The IOPORT HAL module can configure the following pin settings:

- Pin direction
- Default output state
- Pull-up
- NMOS/PMOS
- Drive strength
- Event edge trigger (falling, rising or both)
- Whether the pin is to be used as an IRQ pin
- Whether the pin is to be used as an analog pin
- Peripheral connection

The module also provides the following functionality:

- Read/write GPIO pins/ports
- Sets event output data
- Reads event input data

## Configuration

The I/O PORT HAL module must be configured by the user for the desired operation. The operating state of an I/O pin can be set via the RA Configuraton tool. When the project is built a pin configuration file is created. The BSP will automatically configure the MCU IO ports accordingly at startup using the same API functions mentioned in this document.

### Build Time Configurations for r\_ioport

The following build time configurations are defined in fsp\_cfg/r\_ioport\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for System > I/O Port (r\_ioport)

This module can be added to the Stacks tab via New Stack > System > I/O Port (r\_ioport).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ioport	Module name.
Port 1 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT1
Port 2 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT2
Port 3 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT3
Port 4 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT4
Port B ELC Trigger	MCU Specific Options		ELC source that will

Source			trigger PORTB
Port C ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTC
Port D ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTD
Port E ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTE
Pin Configuration Name	Name must be a valid C symbol	g_bsp_pin_cfg	Name for pin configuration structure

## Clock Configuration

The I/O PORT HAL module does not require a specific clock configuration.

## Pin Configuration

The IOPORT module is used for configuring pins.

# Usage Notes

## Port Group Function for ELC

Depending on pin configuration, the IOPORT module can perform automatic reads and writes on ports 1-4 on receipt of an ELC event.

When an event is received by a port, the state of the input pins on the port is saved in a hardware register. Simultaneously, the state of output pins on the port is set or cleared based on settings configured by the user. The functions [R\\_IOPORT\\_PinEventInputRead](#) and [R\\_IOPORT\\_PortEventInputRead](#) allow reading the last event input state of a pin or port, and event-triggered pin output can be configured through [R\\_IOPORT\\_PinEventOutputWrite](#) and [R\\_IOPORT\\_PortEventOutputWrite](#).

In addition, each pin on ports 1-4 can be configured to trigger an ELC event on rising, falling or both edges. This event can be used to activate other modules when the pin changes state.

### Note

*The number of ELC-aware ports vary across MCUs. Refer to the Hardware User's Manual for your device for more details.*

# Examples

## Basic Example

This is a basic example of minimal use of the IOPORT in an application.

```
void basic_example ()
{
    bsp_io_level_t readLevel;
    fsp_err_t      err;
```

```
/* Initialize the IOPORT module and configure the pins
 * Note: The default pin configuration name in the RA Configuraton tool is
g_bsp_pin_cfg */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
/* Call R_IOPORT_PinsCfg if the configuration was not part of initial configurations
made in open */
    err = R_IOPORT_PinsCfg(&g_ioport_ctrl, &g_runtime_pin_cfg);
    assert(FSP_SUCCESS == err);
/* Set Pin 00 of Port 06 to High */
    err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, BSP_IO_LEVEL_HIGH
);
    assert(FSP_SUCCESS == err);
/* Read Pin 00 of Port 06*/
    err = R_IOPORT_PinRead(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, &readLevel);
    assert(FSP_SUCCESS == err);
}
```

## Blinky Example

This example uses IOPORT to configure and toggle a pin to blink an LED.

```
void blinky_example ()
{
    fsp_err_t err;
/* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
/* Configure Pin as output
 * Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00,
IOPORT_CFG_PORT_DIRECTION_OUTPUT);
```

```
    assert(FSP_SUCCESS == err);
    bsp_io_level_t level = BSP_IO_LEVEL_LOW;
    while (1)
    {
        /* Determine the next state of the LEDs */
        if (BSP_IO_LEVEL_LOW == level)
        {
            level = BSP_IO_LEVEL_HIGH;
        }
        else
        {
            level = BSP_IO_LEVEL_LOW;
        }
        /* Update LED on RA6M3-PK */
        err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, level);
        assert(FSP_SUCCESS == err);
        /* Delay */
        R_BSP_SoftwareDelay(100, BSP_DELAY_UNITS_MILLISECONDS); // NOLINT
    }
}
```

## ELC Example

This is an example of using IOPORT with ELC events. The ELC event system allows the captured data to be stored when it occurs and then read back at a later time.

```
static elc_instance_ctrl_t g_elc_ctrl;
static elc_cfg_t g_elc_cfg;
void ioport_elc_example ()
{
    bsp_io_level_t eventValue;
    fsp_err_t err;
    /* Initializes the software and sets the links defined in the control structure. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
    /* Handle any errors. This function should be defined by the user. */
}
```

```

    assert(FSP_SUCCESS == err);

    /* Create or modify a link between a peripheral function and an event source. */
    err = R_ELC_LinkSet(&g_elc_ctrl, (elc_peripheral_t) ELC_PERIPHERAL_IOPORT2,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);

    assert(FSP_SUCCESS == err);

    /* Globally enable event linking in the ELC. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);

    /* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
    assert(FSP_SUCCESS == err);

    /* Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
IOPORT_CFG_PORT_DIRECTION_INPUT);

    assert(FSP_SUCCESS == err);

    /* Generate an event signal through software to the linked peripheral. */
    err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);

    /* Read Pin Event Input. The data(BSP_IO_LEVEL_HIGH/ BSP_IO_LEVEL_LOW) from
BSP_IO_PORT_02_PIN_00 is read into the
    * EIDR bit */
    err = R_IOPORT_PinEventInputRead(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
&eventValue);

    assert(FSP_SUCCESS == err);
}

```

## Data Structures

```
struct ioport_instance_ctrl_t
```

## Enumerations

```
enum ioport_port_pin_t
```

## Data Structure Documentation

### ◆ ioport\_instance\_ctrl\_t

```
struct ioport_instance_ctrl_t
```

IOPORT private control block. DO NOT MODIFY. Initialization occurs when [R\\_IOPORT\\_Open\(\)](#) is called.

## Enumeration Type Documentation

### ◆ ioport\_port\_pin\_t

```
enum ioport_port_pin_t
```

Superset list of all possible IO port pins.

## Function Documentation

### ◆ R\_IOPORT\_Open()

```
fsp_err_t R_IOPORT_Open ( ioport_ctrl_t *const p_ctrl, const ioport_cfg_t * p_cfg )
```

Initializes internal driver data, then calls pin configuration function to configure pins.

#### Return values

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_ALREADY_OPEN	Module is already open.

### ◆ R\_IOPORT\_Close()

```
fsp_err_t R_IOPORT_Close ( ioport_ctrl_t *const p_ctrl)
```

Resets IOPORT registers. Implements `ioport_api_t::close`

#### Return values

FSP_SUCCESS	The IOPORT was successfully uninitialized
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R\_IOPORT\_PinsCfg()**

```
fsp_err_t R_IOPORT_PinsCfg ( ioport_ctrl_t *const p_ctrl, const ioport_cfg_t * p_cfg )
```

Configures the functions of multiple pins by loading configuration data into pin PFS registers. Implements `ioport_api_t::pinsCfg`.

This function initializes the supplied list of PmnPFS registers with the supplied values. This data can be generated by the Pins tab of the RA Configuration editor or manually by the developer. Different pin configurations can be loaded for different situations such as low power modes and testing.

**Return values**

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

◆ **R\_IOPORT\_PinCfg()**

```
fsp_err_t R_IOPORT_PinCfg ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, uint32_t cfg )
```

Configures the settings of a pin. Implements `ioport_api_t::pinCfg`.

**Return values**

FSP_SUCCESS	Pin configured
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

**Note**

*This function is re-entrant for different pins. This function will change the configuration of the pin with the new configuration. For example it is not possible with this function to change the drive strength of a pin while leaving all the other pin settings unchanged. To achieve this the original settings with the required change will need to be written using this function.*

◆ **R\_IOPORT\_PinRead()**

```
fsp_err_t R_IOPORT_PinRead ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t *
p_pin_value )
```

Reads the level on a pin. Implements `ioport_api_t::pinRead`.

**Return values**

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

*Note*

*This function is re-entrant for different pins.*

◆ **R\_IOPORT\_PortRead()**

```
fsp_err_t R_IOPORT_PortRead ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t *
p_port_value )
```

Reads the value on an IO port. Implements `ioport_api_t::portRead`.

The specified port will be read, and the levels for all the pins will be returned. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

**Return values**

FSP_SUCCESS	Port read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

*Note*

*This function is re-entrant for different ports.*

◆ **R\_IOPORT\_PortWrite()**

```
fsp_err_t R_IOPORT_PortWrite ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t value,
ioport_size_t mask )
```

Writes to multiple pins on a port. Implements `ioport_api_t::portWrite`.

The input value will be written to the specified port. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Only the bits with the corresponding bit in the mask value set will be updated. For example, value = 0xFFFF, mask = 0x0003 results in only bits 0 and 1 being updated.

**Return values**

FSP_SUCCESS	Port written to
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointerd

**Note**

*This function is re-entrant for different ports. This function makes use of the PCNTR3 register to atomically modify the levels on the specified pins on a port.*

◆ **R\_IOPORT\_PinWrite()**

```
fsp_err_t R_IOPORT_PinWrite ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t
level )
```

Sets a pin's output either high or low. Implements `ioport_api_t::pinWrite`.

**Return values**

FSP_SUCCESS	Pin written to
FSP_ERR_INVALID_ARGUMENT	The pin and/or level not valid
FSP_ERR_NOT_OPEN	The module has not been opene
FSP_ERR_ASSERTION	NULL pointerd

**Note**

*This function is re-entrant for different pins. This function makes use of the PCNTR3 register to atomically modify the level on the specified pin on a port.*

### ◆ R\_IOPORT\_PortDirectionSet()

```
fsp_err_t R_IOPORT_PortDirectionSet ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t
direction_values, ioport_size_t mask )
```

Sets the direction of individual pins on a port. Implements `ioport_api_t::portDirectionSet()`.

Multiple pins on a port can be set to inputs or outputs at once. Each bit in the mask parameter corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. If a bit is set to 1 then the corresponding pin will be changed to an input or an output as specified by the direction values. If a mask bit is set to 0 then the direction of the pin will not be changed.

#### Return values

FSP_SUCCESS	Port direction updated
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

#### Note

*This function is re-entrant for different ports.*

### ◆ R\_IOPORT\_PortEventInputRead()

```
fsp_err_t R_IOPORT_PortEventInputRead ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port,
ioport_size_t * p_event_data )
```

Reads the value of the event input data. Implements `ioport_api_t::portEventInputRead()`.

The event input data for the port will be read. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

The port event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

#### Return values

FSP_SUCCESS	Port read
FSP_ERR_INVALID_ARGUMENT	Port not a valid ELC port
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

#### Note

*This function is re-entrant for different ports.*

### ◆ R\_IOPORT\_PinEventInputRead()

```
fsp_err_t R_IOPORT_PinEventInputRead ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin,
bsp_io_level_t * p_pin_event )
```

Reads the value of the event input data of a specific pin. Implements `ioport_api_t::pinEventInputRead`.

The pin event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

#### Return values

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_INVALID_ARGUMENT	Port is not valid ELC PORT.

#### Note

*This function is re-entrant.*

### ◆ R\_IOPORT\_PortEventOutputWrite()

```
fsp_err_t R_IOPORT_PortEventOutputWrite ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port,
ioport_size_t event_data, ioport_size_t mask_value )
```

This function writes the set and reset event output data for a port. Implements `ioport_api_t::portEventOutputWrite`.

Using the event system enables a port state to be stored by this function in advance of being output on the port. The output to the port will occur when the ELC event occurs.

The input value will be written to the specified port when an ELC event configured for that port occurs. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

#### Return values

FSP_SUCCESS	Port event data written
FSP_ERR_INVALID_ARGUMENT	Port or Mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

#### Note

*This function is re-entrant for different ports.*

**◆ R\_IOPORT\_PinEventOutputWrite()**

```
fsp_err_t R_IOPORT_PinEventOutputWrite ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin,
bsp_io_level_t pin_value )
```

This function writes the event output data value to a pin. Implements [ioport\\_api\\_t::pinEventOutputWrite](#).

Using the event system enables a pin state to be stored by this function in advance of being output on the pin. The output to the pin will occur when the ELC event occurs.

**Return values**

FSP_SUCCESS	Pin event data written
FSP_ERR_INVALID_ARGUMENT	Port or Pin or value not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

**Note**

*This function is re-entrant for different ports.*

### Detailed Description

Driver for the POEG peripheral on RA MCUs. This module implements the [POEG Interface](#).

## Overview

The POEG module can be used to configure events to disable GPT GTIOC output pins.

### Features

The POEG module has the following features:

- Supports disabling GPT output pins based on GTETRGR input pin level.
- Supports disabling GPT output pins based on comparator crossing events (configurable in the [Comparator, High-Speed \(r\\_acmphs\)](#) driver).

- Supports disabling GPT output pins when GTIOC pins are the same level (configurable in the [Timer, General PWM \(r\\_gpt\)](#) driver).
- Supports disabling GPT output pins when main oscillator stop is detected.
- Supports disabling GPT output pins by software API.
- Supports notifying the application when GPT output pins are disabled by POEG.
- Supports resetting POEG status.

## Configuration

### Build Time Configurations for r\_poeg

The following build time configurations are defined in fsp\_cfg/r\_poeg\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Timers > Port Output Enable for GPT (r\_poeg)

This module can be added to the Stacks tab via New Stack > Timers > Port Output Enable for GPT (r\_poeg). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_poeg0	Module name.
General > Channel	Must be a valid POEG channel	0	Specify the hardware channel.
General > Trigger	MCU Specific Options		Select the trigger sources that will enable POEG. Software disable is always supported. This configuration can only be set once after reset. It cannot be modified after the initial setting.
Input > GTETR Polarity	<ul style="list-style-type: none"> <li>• Active High</li> <li>• Active Low</li> </ul>	Active High	Select the polarity of the GTETR pin. Only applicable if GTETR pin is selected under Trigger.
Input > GTETR Noise Filter	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• PCLKB/1</li> <li>• PCLKB/8</li> <li>• PCLKB/32</li> <li>• PCLKB/128</li> </ul>	Disabled	Configure the noise filter for the GTETR pin. Only applicable if GTETR pin is selected under Trigger.

Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) when GPT output pins are disabled by POEG.
Interrupts > Interrupt Priority	MCU Specific Options		Select the POEG interrupt priority.

## Clock Configuration

The POEG clock is based on the PCLKB frequency.

## Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, or GTETRGD as an input signal to disable GPT output pins.

# Usage Notes

## POEG GTETRGR Pin and Channel

The POEG channel number corresponds to the GTETRGR input pin that can be used with the channel. GTETRGA must be used with POEG channel 0, GTETRGB must be used with POEG channel 1, etc.

## Limitations

The user should be aware of the following limitations when using POEG:

- The POEG trigger source can only be set once per channel. Modifying the POEG trigger source after it is set is not allowed by the hardware.
- The POEG cannot be disabled using this API. The interrupt is disabled in [R\\_POEG\\_Close\(\)](#), but the POEG will still disable the GPT output pins if a trigger is detected even if the module is closed.

# Examples

## POEG Basic Example

This is a basic example of minimal use of the POEG in an application.

```
void poeg_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the POEG. */
    err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
}
```

```
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
}
```

## POEG Callback Example

This is an example of a using the POEG callback to restore GPT output operation.

```
/* Example callback called when POEG disables GPT output pins. */
void poeg_callback (poeg_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);

    /* (Optional) Determine the cause of the POEG event. */
    poeg_status_t status;

    (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);

    /* Correct the cause of the POEG event before resetting POEG. */
    /* Reset the POEG before exiting the callback. */
    (void) R_POEG_Reset(&g_poeg0_ctrl);

    /* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
    * again. */
    do
    {
        (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
    } while (POEG_STATE_NO_DISABLE_REQUEST != status.state);

    /* Alternatively, if the POEG cannot be reset, disable the POEG interrupt to prevent
it from firing continuously.
    * Update the 0 in the macro below to match the POEG channel number. */
    NVIC_DisableIRQ(VECTOR_NUMBER_POEG0_EVENT);
}
```

## Data Structures

```
struct poeg_instance_ctrl_t
```

## Data Structure Documentation

### ◆ poeg\_instance\_ctrl\_t

```
struct poeg_instance_ctrl_t
```

Channel control block. DO NOT INITIALIZE. Initialization occurs when `poeg_api_t::open` is called.

## Function Documentation

### ◆ R\_POEG\_Open()

```
fsp_err_t R_POEG_Open ( poeg_ctrl_t *const p_ctrl, poeg_cfg_t const *const p_cfg )
```

Initializes the POEG module and applies configurations. Implements `poeg_api_t::open`.

#### Note

*The `poeg_cfg_t::trigger` setting can only be configured once after reset. Reopening with a different trigger configuration is not possible.*

#### Example:

```
/* Initializes the POEG. */
err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
```

#### Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	<code>poeg_cfg_t::p_callback</code> is not NULL, but ISR is not enabled. ISR must be enabled to use callback.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the <code>p_cfg</code> parameter is not available on this device.

### ◆ R\_POEG\_OutputDisable()

```
fsp_err_t R_POEG_OutputDisable ( poeg_ctrl_t *const p_ctrl)
```

Disables GPT output pins. Implements `poeg_api_t::outputDisable`.

#### Return values

FSP_SUCCESS	GPT output pins successfully disabled.
FSP_ERR_ASSERTION	<code>p_ctrl</code> was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_POEG\_Reset()**

```
fsp_err_t R_POEG_Reset ( poeg_ctrl_t *const p_ctrl)
```

Resets status flags. Implements `poeg_api_t::reset`.

**Note**

*Status flags are only reset if the original POEG trigger is resolved. Check the status using `R_POEG_StatusGet` after calling this function to verify the status is cleared.*

**Example:**

```
/* Correct the cause of the POEG event before resetting POEG. */
/* Reset the POEG before exiting the callback. */
(void) R_POEG_Reset(&g_poeg0_ctrl);
/* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
* again. */
do
{
(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
} while (POEG_STATE_NO_DISABLE_REQUEST != status.state);
```

**Return values**

FSP_SUCCESS	Function attempted to clear status flags.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_POEG\_StatusGet()**

```
fsp_err_t R_POEG_StatusGet ( poeg_ctrl_t *const p_ctrl, poeg_status_t *const p_status )
```

Get current POEG status and store it in provided pointer p\_status. Implements `poeg_api_t::statusGet`.

Example:

```
/* (Optional) Determine the cause of the POEG event. */
poeg_status_t status;

(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
```

**Return values**

FSP_SUCCESS	Current POEG state stored successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_POEG\_CallbackSet()**

```
fsp_err_t R_POEG_CallbackSet ( poeg_ctrl_t *const p_ctrl, void (*)(poeg_callback_args_t *)
p_callback, void const *const p_context, poeg_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `poeg_api_t::callbackSet`.

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R\_POEG\_Close()**

```
fsp_err_t R_POEG_Close ( poeg_ctrl_t *const p_ctrl)
```

Disables POEG interrupt. Implements `poeg_api_t::close`.

**Note**

*This function does not disable the POEG.*

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

**4.2.18.2 Realtime Clock (r\_rtc)**

Modules » Timers

**Functions**

```
fsp_err_t R_RTC_Open (rtc_ctrl_t *const p_ctrl, rtc_cfg_t const *const p_cfg)

```

```
fsp_err_t R_RTC_CallbackSet (rtc_ctrl_t *const p_ctrl,  
void(*p_callback)(rtc_callback_args_t *), void const *const p_context,  
rtc_callback_args_t *const p_callback_memory)
```

## Detailed Description

Driver for the RTC peripheral on RA MCUs. This module implements the [RTC Interface](#).

## Overview

The RTC HAL module configures the RTC module and controls clock, calendar and alarm functions. A callback can be used to respond to the alarm and periodic interrupt.

### Features

- RTC time and date get and set.
- RTC time and date alarm get and set.
- RTC alarm and periodic event notification.

The RTC HAL module supports three different interrupt types:

- An alarm interrupt generated on a match of any combination of year, month, day, day of the week, hour, minute or second
- A periodic interrupt generated every 2, 1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, or 1/256 second(s)
- A carry interrupt is used internally when reading time from the RTC calendar to get accurate time readings.

#### Note

See section "23.3.5 Reading 64-Hz Counter and Time" of the RA6M3 manual R01UH0886EJ0100 for more details.

A user-defined callback function can be registered (in the `rtc_api_t::open` API call) and will be called from the interrupt service routine (ISR) for alarm and periodic interrupt. When called, it is passed a pointer to a structure (`rtc_callback_args_t`) that holds a user-defined context pointer and an indication of which type of interrupt was fired.

### Date and Time validation

"Parameter Checking" needs to be enabled if date and time validation is required for `calendarTimeSet` and `calendarAlarmSet` APIs. If "Parameter Checking" is enabled, the 'day of the week' field is automatically calculated and updated by the driver for the provided date. When using the `calendarAlarmSet` API, only the fields which have their corresponding match flag set are written to the registers. Other register fields are reset to default value.

### Sub-Clock error adjustment (Time Error Adjustment Function)

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low. The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

The error adjustment is reset every time RTC is reconfigured or time is set.

#### Note

*RTC driver configurations do not do error adjustment internally while initializing the driver. Application must make calls to the error adjustment api's for desired adjustment. See section 26.3.8 "Time Error Adjustment Function" of the RA6M3 manual R01UH0886EJ0100) for more details on this feature*

## Configuration

### Build Time Configurations for r\_rtc

The following build time configurations are defined in fsp\_cfg/r\_rtc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Set Source Clock in Open	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	If enabled RTC source clock is initialized in R_RTC_Open. If disabled, R_RTC_ClockSourceSet must be called to set the RTC source clock. Disable if user wants to control the setting of RTC source clock after warm start.

### Configurations for Timers > Realtime Clock (r\_rtc)

This module can be added to the Stacks tab via New Stack > Timers > Realtime Clock (r\_rtc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rtc0	Module name.
Clock Source	<ul style="list-style-type: none"> <li>• Sub-Clock</li> <li>• LOCO</li> </ul>	LOCO	Select the RTC clock source.
Frequency Comparison Value (LOCO)	Value must be a positive integer between 7 and 511	255	Frequency comparison value when using LOCO
Automatic Adjustment Mode	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Enabled	Enable/ Disable the Error Adjustment mode
Automatic Adjustment	<ul style="list-style-type: none"> <li>• 10 Seconds</li> </ul>	10 Seconds	Select the Error

Period	<ul style="list-style-type: none"> <li>• 1 Minute</li> <li>• NONE</li> </ul>		Adjustment Period for Automatic Adjustment
Adjustment Type (Plus-Minus)	<ul style="list-style-type: none"> <li>• NONE</li> <li>• Addition</li> <li>• Subtraction</li> </ul>	NONE	Select the Error Adjustment type
Error Adjustment Value	Value must be a positive integer less than equal to 63	0	Specify the Adjustment Value (the number of sub-clock cycles) from the prescaler
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Alarm Interrupt Priority	MCU Specific Options		Select the alarm interrupt priority.
Period Interrupt Priority	MCU Specific Options		Select the period interrupt priority.
Carry Interrupt Priority	MCU Specific Options		Select the carry interrupt priority.

*Note*

*See 23.2.20 Frequency Register (RFRH/RFRL) of the RA6M3 manual R01UH0886EJ0100) for more details*

## Interrupt Configuration

To activate interrupts for the RTC module, the desired interrupts must be enabled, The underlying implementation will be expected to handle any interrupts it can support and notify higher layers via callback.

## Clock Configuration

The RTC HAL module can use the following clock sources:

- LOCO (Low Speed On-Chip Oscillator) with less accuracy
- Sub-clock oscillator with increased accuracy

The LOCO is the default selection during configuration.

## Pin Configuration

This module does not use I/O pins.

## Usage Notes

### System Initialization

- RTC driver does not start the sub-clock. The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

### Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

- Carry interrupt priority must be set to avoid incorrect time returned from `calendarTimeGet` API during roll-over.
- Even when only running in Periodic Interrupt mode `R_RTC_CalendarTimeSet` must be called successfully to start the RTC.
- In case of warm start or a hard reset (when VBATT powers RTC in case of power loss), user might not want to reinitialize the clock source after reset. In this case, disable the Set Source Clock in Open property for RTC and call `R_RTC_ClockSourceSet()` only when RTC clock source needs to be set. Application should check for the reset type and should accordingly call the `R_RTC_ClockSourceSet()`.

### Limitations

Developers should be aware of the following limitations when using the RTC:

- R\_RTC operates in 24-hour mode.
- Binary-count mode is not supported.
- The `R_RTC_CalendarTimeGet()` cannot be used from an interrupt that has higher priority than the carry interrupt. Also, it must not be called with interrupts disabled globally, as this API internally uses carry interrupt for its processing. API may return incorrect time if this is done.

## Examples

### RTC Basic Example

This is a basic example of minimal use of the RTC in an application.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_time =
{
    .tm_sec = 10,
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
    .tm_wday = 3,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
rtc_time_t get_time;
```

```
void rtc_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the RTC module */
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
    R_RTC_ClockSourceSet(&g_rtc0_ctrl);
    /* Set the calendar time */
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
    /* Get the calendar time */
    R_RTC_CalendarTimeGet(&g_rtc0_ctrl, &get_time);
}
```

### RTC Clock Source Set Example

This is an example of how to handle call to set the RTC clock.

```
void rtc_clock_source_set_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* This condition can differ based on use case. */
    if (R_SYSTEM->RSTSR0 == 1)
    {
        /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
        R_RTC_ClockSourceSet(&g_rtc0_ctrl);
    }
    /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
}
```

```
R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
/* Set the periodic interrupt rate to 1 second */
R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
/* Wait for the periodic interrupt */
while (1)
{
/* Wait for interrupt */
}
}
```

### RTC Periodic interrupt example

This is an example of periodic interrupt in RTC.

```
void rtc_periodic_irq_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
    R_RTC_ClockSourceSet(&g_rtc0_ctrl);
    /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
    /* Set the periodic interrupt rate to 1 second */
    R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
    /* Wait for the periodic interrupt */
    while (1)
    {
        /* Wait for interrupt */
    }
}
```

## RTC Alarm interrupt example

This is an example of alarm interrupt in RTC.

```
void rtc_alarm_irq_example ()
{
    fsp_err_t err = FSP_SUCCESS;

    /*Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
    R_RTC_ClockSourceSet(&g_rtc0_ctrl);
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
    R_RTC_CalendarAlarmSet(&g_rtc0_ctrl, &set_time1);

    /* Wait for the Alarm interrupt */
    while (1)
    {
        /* Wait for interrupt */
    }
}
```

## RTC Error Adjustment example

This is an example of modifying error adjustment in RTC.

```
void rtc_erroradj_example ()
{
    fsp_err_t err = FSP_SUCCESS;

    /*Open the RTC module*/
    R_RTC_Open(&g_rtc0_ctrl, &g_rtc1_cfg);

    /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
    R_RTC_ClockSourceSet(&g_rtc0_ctrl);
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);

    /* Modify Error Adjustment after RTC is running */
}
```

```
err = R_RTC_ErrorAdjustmentSet(&g_rtc0_ctrl, &err_cfg2);
assert(FSP_SUCCESS == err);
}
```

## Data Structures

struct [rtc\\_instance\\_ctrl\\_t](#)

## Data Structure Documentation

### ◆ [rtc\\_instance\\_ctrl\\_t](#)

struct [rtc\\_instance\\_ctrl\\_t](#)

Channel control block. DO NOT INITIALIZE. Initialization occurs when [rtc\\_api\\_t::open](#) is called

#### Data Fields

uint32_t	<a href="#">open</a>
	Whether or not driver is open.
const <a href="#">rtc_cfg_t</a> *	<a href="#">p_cfg</a>
	Pointer to initial configurations.
volatile bool	<a href="#">carry_isr_triggered</a>
	Was the carry isr triggered.

## Function Documentation

◆ **R\_RTC\_Open()**

```
fsp_err_t R_RTC_Open ( rtc_ctrl_t *const p_ctrl, rtc_cfg_t const *const p_cfg )
```

Opens and configures the RTC driver module. Implements `rtc_api_t::open`. Configuration includes clock source, and interrupt callback function.

Example:

```
/* Open the RTC module */
err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
```

**Return values**

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ **R\_RTC\_Close()**

```
fsp_err_t R_RTC_Close ( rtc_ctrl_t *const p_ctrl)
```

Close the RTC driver. Implements `rtc_api_t::close`

**Return values**

FSP_SUCCESS	De-Initialization was successful and RTC driver closed.
FSP_ERR_ASSERTION	Invalid p_ctrl.
FSP_ERR_NOT_OPEN	Driver not open already for close.

◆ **R\_RTC\_ClockSourceSet()**

```
fsp_err_t R_RTC_ClockSourceSet ( rtc_ctrl_t *const p_ctrl)
```

Sets the RTC clock source. Implements `rtc_api_t::clockSourceSet`.

Example:

```
/* This condition can differ based on use case. */
if (R_SYSTEM->RSTSR0 == 1)
{
/* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
R_RTC_ClockSourceSet (&g_rtc0_ctrl);
}
```

**Return values**

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R\_RTC\_CalendarTimeSet()**

```
fsp_err_t R_RTC_CalendarTimeSet ( rtc_ctrl_t *const p_ctrl, rtc_time_t *const p_time )
```

Set the calendar time.

Implements `rtc_api_t::calendarTimeSet`.

**Return values**

FSP_SUCCESS	Calendar time set operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ **R\_RTC\_CalendarTimeGet()**

```
fsp_err_t R_RTC_CalendarTimeGet ( rtc_ctrl_t *const p_ctrl, rtc_time_t *const p_time )
```

Get the calendar time.

**Warning**

Do not call this function from a critical section or from an interrupt with higher priority than the carry interrupt, or the time returned may be inaccurate.

Implements `rtc_api_t::calendarTimeGet`

**Return values**

FSP_SUCCESS	Calendar time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ **R\_RTC\_CalendarAlarmSet()**

```
fsp_err_t R_RTC_CalendarAlarmSet ( rtc_ctrl_t *const p_ctrl, rtc_alarm_time_t *const p_alarm )
```

Set the calendar alarm time.

Implements `rtc_api_t::calendarAlarmSet`.

**Precondition**

The calendar counter must be running before the alarm can be set.

**Return values**

FSP_SUCCESS	Calendar alarm time set operation was successful.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ **R\_RTC\_CalendarAlarmGet()**

```
fsp_err_t R_RTC_CalendarAlarmGet ( rtc_ctrl_t *const p_ctrl, rtc_alarm_time_t *const p_alarm )
```

Get the calendar alarm time.

Implements `rtc_api_t::calendarAlarmGet`

**Return values**

FSP_SUCCESS	Calendar alarm time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ **R\_RTC\_PeriodicIrqRateSet()**

```
fsp_err_t R_RTC_PeriodicIrqRateSet ( rtc_ctrl_t *const p_ctrl, rtc_periodic_irq_select_t const rate )
```

Set the periodic interrupt rate and enable periodic interrupt.

Implements `rtc_api_t::periodicIrqRateSet`

**Note**

*To start the RTC `R_RTC_CalendarTimeSet` must be called at least once.*

Example:

```
/* Set the periodic interrupt rate to 1 second */
R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
```

**Return values**

FSP_SUCCESS	The periodic interrupt rate was successfully set.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ **R\_RTC\_InfoGet()**

```
fsp_err_t R_RTC_InfoGet ( rtc_ctrl_t *const p_ctrl, rtc_info_t *const p_rtc_info )
```

Set RTC clock source and running status information and store it in provided pointer p\_rtc\_info

Implements [rtc\\_api\\_t::infoGet](#)

**Return values**

FSP_SUCCESS	Get information Successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ **R\_RTC\_ErrorAdjustmentSet()**

```
fsp_err_t R_RTC_ErrorAdjustmentSet ( rtc_ctrl_t *const p_ctrl, rtc_error_adjustment_cfg_t const *const err_adj_cfg )
```

This function sets time error adjustment

Implements [rtc\\_api\\_t::errorAdjustmentSet](#)

**Return values**

FSP_SUCCESS	Time error adjustment successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open for operation.
FSP_ERR_UNSUPPORTED	The clock source is not sub-clock.
FSP_ERR_INVALID_ARGUMENT	Invalid error adjustment value.

### ◆ R\_RTC\_CallbackSet()

```
fsp_err_t R_RTC_CallbackSet ( rtc_ctrl_t *const p_ctrl, void (*)(rtc_callback_args_t *) p_callback,
void const *const p_context, rtc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [rtc\\_api\\_t::callbackSet](#)

#### Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to RTC control block is NULL or the RTC is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

### 4.2.18.3 Three-Phase PWM (r\_gpt\_three\_phase)

Modules » Timers

#### Functions

```
fsp_err_t R_GPT_THREE_PHASE_Open (three_phase_ctrl_t *const p_ctrl,
three_phase_cfg_t const *const p_cfg)
```

```
fsp_err_t R_GPT_THREE_PHASE_Stop (three_phase_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_GPT_THREE_PHASE_Start (three_phase_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_GPT_THREE_PHASE_Reset (three_phase_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_GPT_THREE_PHASE_DutyCycleSet (three_phase_ctrl_t *const
p_ctrl, three_phase_duty_cycle_t *const p_duty_cycle)
```

```
fsp_err_t R_GPT_THREE_PHASE_CallbackSet (three_phase_ctrl_t *const p_ctrl,
void (*p_callback)(timer_callback_args_t *), void const *const
p_context, timer_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_GPT_THREE_PHASE_Close (three_phase_ctrl_t *const p_ctrl)
```

#### Detailed Description

Driver for 3-phase motor control using the GPT peripheral on RA MCUs. This module implements the

## Three-Phase Interface.

# Overview

The General PWM Timer (GPT) Three-Phase driver provides basic functionality for synchronously starting and stopping three PWM channels for use in 3-phase motor control applications. A function is additionally provided to allow setting duty cycle values for all three channels, optionally with double-buffering.

## Features

The GPT Three-Phase driver provides the following functions:

- Synchronize configuration of three GPT channels
- Synchronously start, stop and reset all three GPT channels
- Set duty cycle on all three channels with one function

# Configuration

## Build Time Configurations for r\_gpt\_three\_phase

The following build time configurations are defined in fsp\_cfg/r\_gpt\_three\_phase\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

## Configurations for Timers > Three-Phase PWM (r\_gpt\_three\_phase)

This module can be added to the Stacks tab via New Stack > Timers > Three-Phase PWM (r\_gpt\_three\_phase). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_three_phase0	Module name.
General > Mode	<ul style="list-style-type: none"> <li>• Triangle-Wave Symmetric PWM</li> <li>• Triangle-Wave Asymmetric PWM</li> <li>• Triangle-Wave Asymmetric PWM (Mode 3)</li> </ul>	Triangle-Wave Symmetric PWM	Mode selection. Triangle-Wave Symmetric PWM: Generates symmetric PWM waveforms with duty cycle determined by compare match set during a crest interrupt and updated at the next trough. Triangle-Wave Asymmetric PWM:

Generates asymmetric PWM waveforms with duty cycle determined by compare match set during a crest/trough interrupt and updated at the next trough/crest.

General > Period	Value must be a non-negative integer less than or equal to 0x4000000000	15	<p>Specify the timer period in units selected below. Setting the period to 0x100000000 raw counts results in the maximum period. Set the period to 0x100000000 raw counts for a free running timer or an input capture configuration. The period can be set up to 0x4000000000, which will use a divider of 1024 with the maximum period.</p> <p>If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the generated <a href="#">timer_cfg_t</a> structures for each timer.</p>
General > Period Unit	<ul style="list-style-type: none"> <li>• Raw Counts</li> <li>• Nanoseconds</li> <li>• Microseconds</li> <li>• Milliseconds</li> <li>• Seconds</li> <li>• Hertz</li> <li>• Kilohertz</li> </ul>	Kilohertz	Unit of the period specified above
General > GPT U-Channel	Value must be an integer greater than or equal to 0	0	Specify the GPT channel for U signal output.
General > GPT V-Channel	Value must be an integer greater than or equal to 0	1	Specify the GPT channel for V signal output.

General > GPT W-Channel	Value must be an integer greater than or equal to 0	2	Specify the GPT channel for W signal output.
General > Callback Channel	<ul style="list-style-type: none"> <li>• U-Channel</li> <li>• V-Channel</li> <li>• W-Channel</li> </ul>	U-Channel	Specify the GPT channel to set a callback for when using R_GPT_THREE_PHASE_CallbackSet.
General > Buffer Mode	<ul style="list-style-type: none"> <li>• Single Buffer</li> <li>• Double Buffer</li> </ul>	Single Buffer	When Double Buffer is selected the 'duty_buffer' array in <a href="#">three_phase_duty_cycle_t</a> is used as a buffer for the 'duty' array. This allows setting the duty cycle for the next two crest/trough events in asymmetric mode with only one call to R_GPT_THREE_PHASE_DutyCycleSet.
General > GTIOCA Stop Level	<ul style="list-style-type: none"> <li>• Pin Level Low</li> <li>• Pin Level High</li> </ul>	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
General > GTIOCB Stop Level	<ul style="list-style-type: none"> <li>• Pin Level Low</li> <li>• Pin Level High</li> </ul>	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Extra Features > Dead Time > Dead Time Count Up (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during up counting. This value also applies during down counting for the GPT32 and GPT16 variants.
Extra Features > Dead Time > Dead Time Count Down (Raw Counts) (GPTE/GPTEH only)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during down counting. This value only applies to the GPT32E and GPT32EH variants.

## Clock Configuration

Please refer to the [Timer, General PWM \(r\\_gpt\)](#) section for more information.

## Pin Configuration

Please refer to the [Timer, General PWM \(r\\_gpt\)](#) section for more information.

## Usage Notes

## Warning

Be sure the GTIOCA/B stop level and dead time values are set appropriately for your application before attempting to drive a motor. Failure to do so may result in damage to the motor drive circuitry and/or the motor itself if the timer is stopped by software.

## Initial Setup

The following should be configured once the GPT Three-Phase module has been added to a project:

1. Set "Pin Output Support" in one of the GPT submodules to "Enabled with Extra Features"
2. Configure common settings in the GPT Three-Phase module properties
3. Set the crest and trough interrupt priority and callback function in **one** of the three GPT submodules (if desired)
4. Set the "Extra Features -> Output Disable" settings in each GPT submodule as needed for your application

## Note

*Because all three modules are operated synchronously with the same period interrupts only need to be enabled in one of the three GPT modules.*

## Buffer Modes

There are two buffering modes available for duty cycle values - single- and double-buffered. In single buffer mode only the values specified in the duty array element of `three_phase_duty_cycle_t` are used by `R_GPT_THREE_PHASE_DutyCycleSet`. At the next trough or crest event the output duty cycle will be internally updated to the set values.

In double buffer mode the `duty_buffer` array values are used as buffer values for the duty elements. Once passed to `R_GPT_THREE_PHASE_DutyCycleSet`, the next trough or crest event will update the output duty cycle to the values specified in `duty` as before. However, at the following crest or trough event the output duty cycle will be updated to the values in `duty_buffer`. This allows the duty cycle for both sides of an asymmetric PWM waveform to be set at only one trough or crest event per period instead of at every event.

## Examples

### GPT Three-Phase Basic Example

This is a basic example of minimal use of the GPT Three-Phase module in an application. The duty cycle is updated at every timer trough with the previously loaded buffer value, then the duty cycle buffer is reloaded in the trough interrupt callback.

```
void gpt_callback (timer_callback_args_t * p_args)
{
    fsp_err_t          err;
    three_phase_duty_cycle_t duty_cycle;

    if (TIMER_EVENT_TROUGH == p_args->event)
    {
        /* Update duty cycle values (example) */
        duty_cycle.duty[THREE_PHASE_CHANNEL_U] =
```

```

get_duty_counts(THREE_PHASE_CHANNEL_U);
    duty_cycle.duty[THREE_PHASE_CHANNEL_V] =
get_duty_counts(THREE_PHASE_CHANNEL_V);
    duty_cycle.duty[THREE_PHASE_CHANNEL_W] =
get_duty_counts(THREE_PHASE_CHANNEL_W);
/* Update duty cycle values */
    err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
    assert(FSP_SUCCESS == err);
}
else
{
/* Handle crest event. */
}
}
void gpt_three_phase_basic_example (void)
{
fsp_err_t err = FSP_SUCCESS;
/* Initializes the module. */
    err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
/* Start the timer. */
    (void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
}

```

## Data Structures

```
struct gpt_three_phase_instance_ctrl_t
```

## Data Structure Documentation

### ◆ gpt\_three\_phase\_instance\_ctrl\_t

```
struct gpt_three_phase_instance_ctrl_t
```

Channel control block. DO NOT INITIALIZE. Initialization occurs when `three_phase_api_t::open` is called.

## Function Documentation

◆ **R\_GPT\_THREE\_PHASE\_Open()**

```
fsp_err_t R_GPT_THREE_PHASE_Open ( three_phase_ctrl_t *const p_ctrl, three_phase_cfg_t const *const p_cfg )
```

Initializes the 3-phase timer module (and associated timers) and applies configurations. Implements `three_phase_api_t::open`.

Example:

```
/* Initializes the module. */
err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
```

**Return values**

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ **R\_GPT\_THREE\_PHASE\_Stop()**

```
fsp_err_t R_GPT_THREE_PHASE_Stop ( three_phase_ctrl_t *const p_ctrl)
```

Stops all timers synchronously. Implements `three_phase_api_t::stop`.

**Return values**

FSP_SUCCESS	Timers successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_THREE\_PHASE\_Start()**

```
fsp_err_t R_GPT_THREE_PHASE_Start ( three_phase_ctrl_t *const p_ctrl)
```

Starts all timers synchronously. Implements `three_phase_api_t::start`.

Example:

```
/* Start the timer. */
(void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
```

**Return values**

FSP_SUCCESS	Timers successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_THREE\_PHASE\_Reset()**

```
fsp_err_t R_GPT_THREE_PHASE_Reset ( three_phase_ctrl_t *const p_ctrl)
```

Resets the counter values to 0. Implements `three_phase_api_t::reset`.

**Return values**

FSP_SUCCESS	Counters were reset successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_THREE\_PHASE\_DutyCycleSet()**

```
fsp_err_t R_GPT_THREE_PHASE_DutyCycleSet ( three_phase_ctrl_t *const p_ctrl,
three_phase_duty_cycle_t *const p_duty_cycle )
```

Sets duty cycle for all three timers. Implements `three_phase_api_t::dutyCycleSet`.

In symmetric PWM mode duty cycle values are reflected after the next trough. In asymmetric PWM mode values are reflected at the next trough OR crest, whichever comes first.

When double-buffering is enabled the values in `three_phase_duty_cycle_t::duty_buffer` are set to the double-buffer registers. When values are reflected the first time the single buffer values (`three_phase_duty_cycle_t::duty`) are used. On the second reflection the `duty_buffer` values are used. In asymmetric PWM mode this enables both count-up and count-down PWM values to be set at trough (or crest) exclusively.

**Note**

*It is recommended to call this function in a high-priority callback to ensure that it is not interrupted and that no GPT events occur during setting that would result in a duty cycle buffer load operation.*

**Example:**

```
/* Update duty cycle values */
err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	One or more duty cycle count values was outside the range 0..(period - 1).

### ◆ R\_GPT\_THREE\_PHASE\_CallbackSet()

```
fsp_err_t R_GPT_THREE_PHASE_CallbackSet ( three_phase_ctrl_t *const p_ctrl,
void(*) (timer_callback_args_t *) p_callback, void const *const p_context, timer_callback_args_t
*const p_callback_memory )
```

Updates the user callback for the GPT U-channel with the option to provide memory for the callback argument structure. Implements [three\\_phase\\_api\\_t::callbackSet](#).

#### Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

### ◆ R\_GPT\_THREE\_PHASE\_Close()

```
fsp_err_t R_GPT_THREE_PHASE_Close ( three_phase_ctrl_t *const p_ctrl)
```

Stops counters, disables output pins, and clears internal driver data. Implements [three\\_phase\\_api\\_t::close](#).

#### Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

## 4.2.18.4 Timer, General PWM (r\_gpt)

fsp_err_t	R_GPT_PwmOutputDelayInitialize ( )

## Detailed Description

Driver for the GPT32 and GPT16 peripherals on RA MCUs. This module implements the [Timer Interface](#).

## Overview

The GPT module can be used to count events, measure external input signals, generate a periodic interrupt, or output a periodic or PWM signal to a GTIOC pin.

This module supports the GPT peripherals GPT32EH, GPT32E, GPT32, and GPT16. GPT16 is a 16-bit timer. The other peripherals (GPT32EH, GPT32E, and GPT32) are 32-bit timers. The 32-bit timers are all treated the same in this module from the API perspective.

## Features

The GPT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Supports count source of PCLK, GTETRQ pins, GTIOC pins, or ELC events.
- Supports debounce filter on GTIOC pins.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.
- Supports start, stop, clear, count up, count down, and capture by external sources from GTETRQ pins, GTIOC pins, or ELC events.
- Supports symmetric and asymmetric PWM waveform generation.
- Supports One shot synchronous pulse waveform generation.
- Supports automatic addition of dead time.
- Supports generating ELC events to start an ADC scan at a compare match value (see [Event Link Controller \(r\\_elc\)](#)) and updating the compare match value.
- Supports linking with a POEG channel to automatically disable GPT output when an error condition is detected.
- Supports setting the counter value while the timer is stopped.
- Supports enabling and disabling output pins.
- Supports skipping up to seven overflow/underflow (crest/trough) interrupts at a time
- Supports generating custom PWM waveforms by configuring the pin's output level at each compare match and cycle end.

## Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes.
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock.

## Configuration

## Build Time Configurations for r\_gpt

The following build time configurations are defined in fsp\_cfg/r\_gpt\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> <li>Enabled with Extra Features</li> </ul>	Disabled	Enables or disables support for outputting PWM waveforms on GTIOCx pins. The "Enabled with Extra Features" option enables support for Triangle wave modes and also enables the features located in the "Extra Features" section of each module instance.
Write Protect Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	If selected write protection is applied to all GPT channels.
Clock Source	MCU Specific Options		Select either the synchronous clock (PCLKD) or asynchronous clock (GPTCLK) as the source for the GPT core clock and PWM delay circuit.

## Configurations for Timers > Timer, General PWM (r\_gpt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, General PWM (r\_gpt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_timer0	Module name.
General > Channel	Channel number must exist on this MCU	0	Specify the hardware channel.
General > Mode	<ul style="list-style-type: none"> <li>Periodic</li> <li>One-Shot</li> <li>PWM</li> <li>One-Shot Pulse</li> <li>Triangle-Wave Symmetric PWM</li> </ul>	Periodic	Mode selection. Periodic: Generates periodic interrupts or square waves. One-shot: Generate a single interrupt or a pulse wave. Note: One-

- Triangle-Wave Asymmetric PWM
- Triangle-Wave Asymmetric PWM (Mode 3)

shot mode is implemented in software. ISRs must be enabled for one-shot even if callback is unused.

PWM: Generates basic PWM waveforms.

Triangle-Wave Symmetric PWM: Generates symmetric PWM waveforms with duty cycle determined by compare match set during a crest interrupt and updated at the next trough.

Triangle-Wave Asymmetric PWM: Generates asymmetric PWM waveforms with duty cycle determined by compare match set during a crest/trough interrupt and updated at the next trough/crest.

General > Period

Value must be a non-negative integer less than or equal to 0x4000000000

0x10000000

Specify the timer period in units selected below. Setting the period to 0x10000000 raw counts results in the maximum period. Set the period to 0x10000000 raw counts for a free running timer or an input capture configuration. The period can be set up to 0x4000000000, which will use a divider of 1024 with the maximum period.

If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a

comment in the generated `timer_cfg_t` structure.

General > Period Unit	<ul style="list-style-type: none"> <li>Raw Counts</li> <li>Nanoseconds</li> <li>Microseconds</li> <li>Milliseconds</li> <li>Seconds</li> <li>Hertz</li> <li>Kilohertz</li> </ul>	Raw Counts	Unit of the period specified above
Output > Custom Waveform > GTIOA > Initial Output Level	<ul style="list-style-type: none"> <li>Pin Level Low</li> <li>Pin Level High</li> </ul>	Pin Level Low	Set the initial output level of GTIOCxA.
Output > Custom Waveform > GTIOA > Cycle End Output Level	<ul style="list-style-type: none"> <li>Pin Level Retain</li> <li>Pin Level Low</li> <li>Pin Level High</li> <li>Pin Level Toggle</li> </ul>	Pin Level Retain	Set the output level of GTIOCxA at cycle end.
Output > Custom Waveform > GTIOA > Compare Match Output Level	<ul style="list-style-type: none"> <li>Pin Level Retain</li> <li>Pin Level Low</li> <li>Pin Level High</li> <li>Pin Level Toggle</li> </ul>	Pin Level Retain	Set the output level of GTIOCxA at compare match.
Output > Custom Waveform > GTIOA > Retain Output Level at Count Stop	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Disabled	Retain the current GTIOxA output level when counting is stopped.
Output > Custom Waveform > GTIOB > Initial Output Level	<ul style="list-style-type: none"> <li>Pin Level Low</li> <li>Pin Level High</li> </ul>	Pin Level Low	Set the initial output level of GTIOCxB.
Output > Custom Waveform > GTIOB > Cycle End Output Level	<ul style="list-style-type: none"> <li>Pin Level Retain</li> <li>Pin Level Low</li> <li>Pin Level High</li> <li>Pin Level Toggle</li> </ul>	Pin Level Retain	Set the output level of GTIOCxB at cycle end.
Output > Custom Waveform > GTIOB > Compare Match Output Level	<ul style="list-style-type: none"> <li>Pin Level Retain</li> <li>Pin Level Low</li> <li>Pin Level High</li> <li>Pin Level Toggle</li> </ul>	Pin Level Retain	Set the output level of GTIOCxB at compare match.
Output > Custom Waveform > GTIOB > Retain Output Level at Count Stop	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Disabled	Retain the current GTIOxB output level when counting is stopped.
Output > Custom Waveform > Custom Waveform Enable	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Disabled	Enable custom waveform configuration.
Output > Duty Cycle	Value must be between	50	Specify the timer duty

Percent (only applicable in PWM mode)	0 and 100		cycle percent. Only used in PWM mode.
Output > GTIOCA Output Enabled	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	False	Enable the output of GTIOCA on a pin.
Output > GTIOCA Stop Level	<ul style="list-style-type: none"> <li>• Pin Level Low</li> <li>• Pin Level High</li> </ul>	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Output > GTIOCB Output Enabled	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	False	Enable the output of GTIOCB on a pin.
Output > GTIOCB Stop Level	<ul style="list-style-type: none"> <li>• Pin Level Low</li> <li>• Pin Level High</li> </ul>	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Input > Count Up Source	MCU Specific Options		Select external source that will increment the counter. If any count up source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Input > Count Down Source	MCU Specific Options		Select external source that will decrement the counter. If any count down source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Input > Start Source	MCU Specific Options		Select external source that will start the timer.  For pulse width measurement, set the Start Source and the Clear Source to the trigger edge (the edge to start the measurement), and set the Stop Source and Capture Source (either A or B) to the opposite edge (the edge to stop the measurement).  For pulse period measurement, set the Start Source, the Clear Source, and the Capture Source (either A or B) to the trigger

			edge (the edge to start the measurement).
Input > Stop Source	MCU Specific Options		Select external source that will stop the timer.
Input > Clear Source	MCU Specific Options		Select external source that will clear the timer.
Input > Capture A Source	MCU Specific Options		Select external source that will trigger a capture A event.
Input > Capture B Source	MCU Specific Options		Select external source that will trigger a capture B event.
Input > Noise Filter A Sampling Clock Select	<ul style="list-style-type: none"> <li>• No Filter</li> <li>• Filter PCLKD / 1</li> <li>• Filter PCLKD / 4</li> <li>• Filter PCLKD / 16</li> <li>• Filter PCLKD / 64</li> </ul>	No Filter	Select the input filter for GTIOCA.
Input > Noise Filter B Sampling Clock Select	<ul style="list-style-type: none"> <li>• No Filter</li> <li>• Filter PCLKD / 1</li> <li>• Filter PCLKD / 4</li> <li>• Filter PCLKD / 16</li> <li>• Filter PCLKD / 64</li> </ul>	No Filter	Select the input filter for GTIOCB.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the timer period elapses
Interrupts > Overflow/Crest Interrupt Priority	MCU Specific Options		Select the overflow interrupt priority. This is the crest interrupt for triangle-wave PWM.
Interrupts > Capture A Interrupt Priority	MCU Specific Options		Select the interrupt priority for capture A.
Interrupts > Capture B Interrupt Priority	MCU Specific Options		Select the interrupt priority for capture B.
Interrupts > Underflow/Trough Interrupt Priority	MCU Specific Options		Select the interrupt priority for the trough interrupt (triangle-

wave PWM only).

Extra Features >  
Output Disable > POEG  
Link

- POEG Channel 0
- POEG Channel 1
- POEG Channel 2
- POEG Channel 3

Select which POEG to link this GPT channel to.

Extra Features >  
Output Disable >  
Output Disable POEG  
Trigger

- Dead Time Error
- GTIOCA and GTIOCB High Level
- GTIOCA and GTIOCB Low Level

Select which errors send an output disable trigger to POEG. Dead time error is only available GPT channels that have GTINTAD.GRPDTE.

Extra Features >  
Output Disable >  
GTIOCA Disable Setting

- Disable Prohibited
- Set Hi Z
- Level Low
- Level High

Select the disable setting for GTIOCA.

Extra Features >  
Output Disable >  
GTIOCB Disable Setting

- Disable Prohibited
- Set Hi Z
- Level Low
- Level High

Select the disable setting for GTIOCB.

Extra Features > ADC  
Trigger > Start Event  
Trigger (Channels with  
GTINTAD only)

- Trigger Event A/D Converter Start Request A During Up Counting
- Trigger Event A/D Converter Start Request A During Down Counting
- Trigger Event A/D Converter Start Request B During Up Counting
- Trigger Event A/D Converter Start Request B During Down Counting

Select which A/D converter start request interrupts to generate and at which point in the cycle to generate them.

Extra Features > Dead  
Time > Dead Time  
Count Up (Raw Counts)

Must be a valid non-negative integer with a maximum configurable value of 4294967295

Select the dead time to apply during up counting. This value also applies during

	(0xffffffff).		down counting for channels that do not have GTDVD.
Extra Features > Dead Time > Dead Time Count Down (Raw Counts) (Channels with GTDVD only)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during down counting.
Extra Features > ADC Trigger (Channels with GTADTRA only) > ADC A Compare Match (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the compare match value that generates a GPTn AD TRIG A event.
Extra Features > ADC Trigger (Channels with GTADTRB only) > ADC B Compare Match (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the compare match value that generates a GPTn AD TRIG B event.
Extra Features > Interrupt Skipping (Channels with GTITC only) > Interrupt to Count	<ul style="list-style-type: none"> <li>• None</li> <li>• Overflow and Underflow (sawtooth)</li> <li>• Crest (triangle)</li> <li>• Trough (triangle)</li> </ul>	None	Select the count source for interrupt skipping. The interrupt skip counter increments after each source event. All crest/overflow and trough/underflow interrupts are skipped when the interrupt skip counter is non-zero.
Extra Features > Interrupt Skipping (Channels with GTITC only) > Interrupt Skip Count	<ul style="list-style-type: none"> <li>• 0</li> <li>• 1</li> <li>• 2</li> <li>• 3</li> <li>• 4</li> <li>• 5</li> <li>• 6</li> <li>• 7</li> </ul>	0	Select the number of interrupts to skip.
Extra Features > Interrupt Skipping (Channels with GTITC only) > Skip ADC Events	<ul style="list-style-type: none"> <li>• None</li> <li>• ADC A Compare Match</li> <li>• ADC B Compare Match</li> <li>• ADC A and B Compare Match</li> </ul>	module.driver.timer.interrupt_skip.adc.none	Select ADC events to suppress when the interrupt skip count is not zero.
Extra Features > Extra Features	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Select whether to enable extra features on this channel.

## Clock Configuration

The GPT clock is based on the PCLKD frequency. You can set the PCLKD frequency using the **Clocks**

tab of the RA Configuration editor or by using the CGC Interface at run-time.

## Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, GTETRGD, GTIOCA and GTIOCB pins as count sources.

This module can use GTIOCA and GTIOCB pins as output pins for periodic or PWM signals.

This module can use GTIOCA and GTIOCB as input pins to measure input signals.

## Usage Notes

### Maximum Period for GPT32

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units and clock speed.

When the selected period unit is "Raw counts", the maximum period setting is 0x4000000000 on a 32-bit timer or 0x0x4000000 on a 16-bit timer. This will configure the timer with the maximum period and a count clock divisor of 128.

#### Note

*When manually changing the timer period counts the maximum value for a 32-bit GPT is 0x100000000. This number overflows the 32-bit value for `timer_cfg_t::period_counts`. To configure the timer for the maximum period, set `timer_cfg_t::period_counts` to 0.*

### Updating Period and Duty Cycle

The period and duty cycle are updated after the next counter overflow after calling `R_GPT_PeriodSet()` or `R_GPT_DutyCycleSet()`. To force them to update before the next counter overflow, call `R_GPT_Reset()` while the counter is running.

### One-Shot Mode

The GPT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the [Transfer \(r\\_dtc\)](#).

### One-Shot Mode Output

The output waveform in one-shot mode is one PCLKD cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

## GPT One-Shot Output

Figure 226: GPT One-Shot Output

### One-Shot Pulse Mode

The one-shot pulse mode is an asymmetric PWM mode that provides more control over the rising and falling edges of the output. The user provides a period and initial output level and controls the signal by specifying compare match values for the leading and trailing edges each period.

*Note*

*Despite its name, the One-Shot Pulse Mode operates continuously and does not stop after the first period.*

### One-Shot Pulse Mode Output

Examples of PWM signals that can be generated by this module are shown below. The leading and trailing edge match values can be modified using [R\\_GPT\\_DutyCycleSet\(\)](#) in the overflow interrupt.

## GPT One-Shot Pulse Output

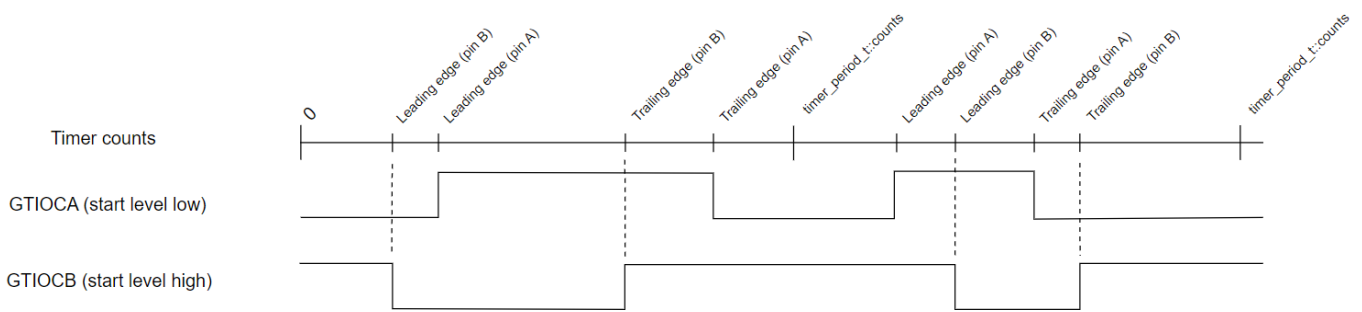

Figure 227: GPT One-Shot Pulse Output (without dead time)

If dead time is enabled only match values for GTIOCnA need to be set; the match values for GTIOCnB will be automatically configured in hardware.

### GPT One-Shot Pulse Output (with dead time)

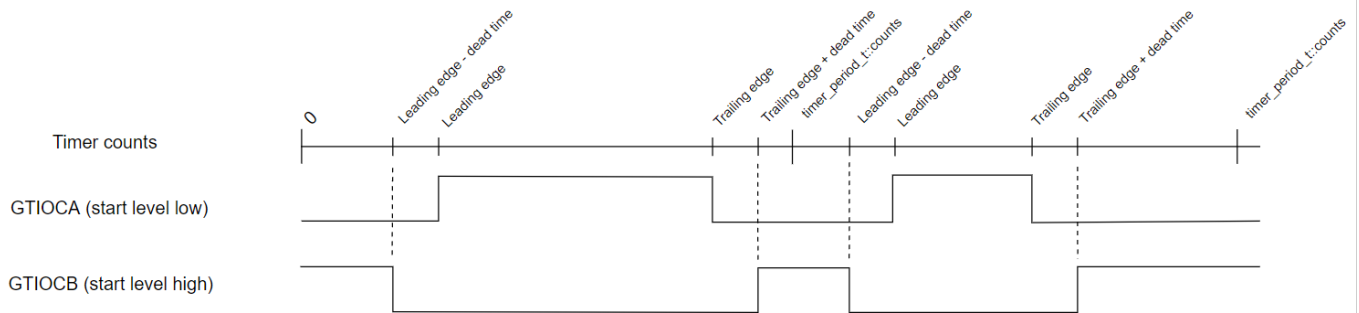

Figure 228: GPT One-Shot Pulse Output (with dead time)

### Periodic Output

The GTIOC pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square wave (from rising edge to rising edge) matches the period of the GPT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

### GPT Periodic Output

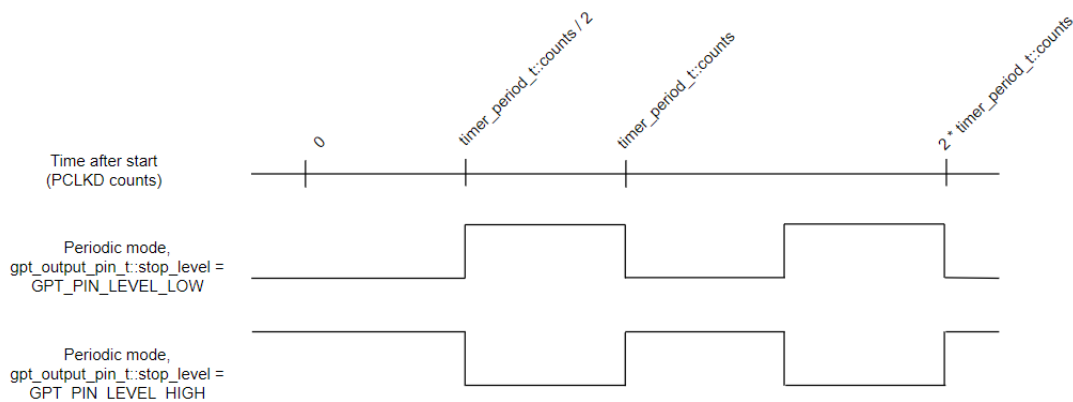

Figure 229: GPT Periodic Output

### PWM Output

The PWM output signal is high at the beginning of the cycle and low at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

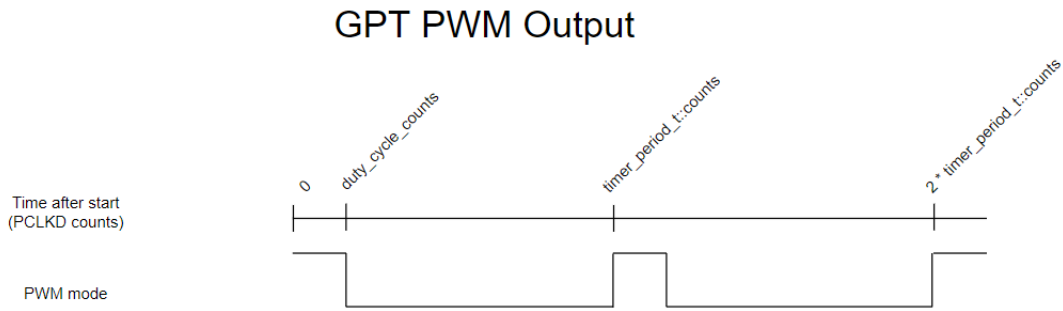

Figure 230: GPT PWM Output

## Triangle-Wave PWM Output

Examples of PWM signals that can be generated by this module are shown below. The `duty_cycle_counts` can be modified using `R_GPT_DutyCycleSet()` in the crest interrupt and updated at the following trough for symmetric PWM or modified in both the crest/trough interrupts and updated at the following trough/crest for asymmetric PWM.

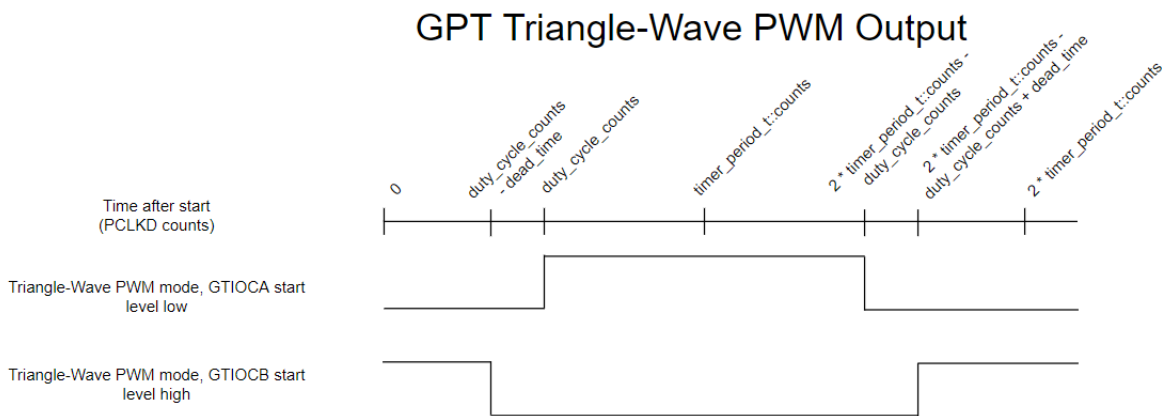

Figure 231: GPT Triangle-Wave PWM Output

## PWM Output Delay Circuit

On select MCUs, an additional PWM output delay circuit can be configured in order to fine tune the rising and falling edge delays in increments of 1/32 times the period of the GPT core clock. The PWM output delay function must be configured prior to initializing the GPT channels using `R_GPT_PwmOutputDelayInitialize`.

### Note

1. In Saw-wave PWM mode, the output delay setting cannot be changed while the capture compare setting (`GTCCRn`) is greater than or equal the period setting (`GTPR`) - 2.
2. In Triangle PWM modes, the output delay setting cannot be changed while the counter is counting down, and the capture compare setting (`GTCCRn`) is less than or equal to 2.
3. When the PWM Output Delay Circuit is enabled, the PWM signal is delayed by 3 GPT core clock cycles.
4. When the `GPTCLK` is used as the GPT core clock, the following delay is required between writes to the rising or falling edge output delay setting for a given pin:  $Write\_Interval[ns] = Period\_of\_PCLKA [ns] \times 6 + Period\_of\_GPTCLK [ns] \times 4$ .

## Event Counting

Event counting can be done by selecting up or down counting sources from GTETRГ pins, ELC events, or GTIOC pins. In event counting mode, the GPT counter is not affected by PCLKD.

*Note*

*In event counting mode, the application must call [R\\_GPT\\_Start\(\)](#) to enable event counting. The counter will not change after calling [R\\_GPT\\_Start\(\)](#) until an event occurs.*

## Pulse Measurement

If the capture edge occurs before the start edge in pulse measurement, the first capture is invalid (0).

## Controlling GPT with GTETRГ Edges

The GPT timer can be configured to stop, start, clear, count up, or count down when a GTETRГ rising or falling edge occurs.

*Note*

*The GTETRГ pins are shared by all GPT channels.  
GTETRГ pins require POEG to be on (example code for this is provided in [GPT Free Running Counter Example](#)).  
If input filtering is required on the GTETRГ pins, that must also be handled outside this module.*

## Controlling GPT with ELC Events

The GPT timer can be configured to stop, start, clear, count up, or count down when an ELC event occurs.

*Note*

*The configurable ELC GPT sources are shared by all GPT channels.  
The event links for the ELC must be configured outside this module.*

## Triggering ELC Events with GPT

The GPT timer can trigger the start of other peripherals. The [Event Link Controller \(r\\_elc\)](#) guide provides a list of all available peripherals.

## Enabling External Sources for Start, Stop, Clear, or Capture

[R\\_GPT\\_Enable\(\)](#) must be called when external sources are used for start, stop, clear, or capture.

## Interrupt Skipping

When an interrupt skipping source is selected a hardware counter will increment each time the selected event occurs. Each interrupt past the first (up to the specified skip count) will be suppressed. If ADC events are selected for skipping they will also be suppressed except during the timer period leading to the selected interrupt skipping event (see below diagram).

Figure 232: Crest interrupt skipping in triangle-wave PWM modes (skip count 2)

## Complementary Output

By using the Custom Waveform option the output pins can be made to output complementary waveforms. To ensure these waveforms stay in sync, the duty cycle for both pins can be set simultaneously by calling `R_GPT_DutyCycleSet` once with a pin parameter of `GPT_IO_PIN_GTIOCA_AND_GTIOCB`.

### Note

*The pin level for 0% and 100% duty cycle is determined by the Cycle End Output Level in normal PWM mode and the Initial Output Level in triangle PWM modes. 100% duty will output the configured level and 0% will output the opposite. Do not use Pin Level Toggle or Pin Level Retain for the Cycle End Output Level if normal PWM waveforms are desired.*

## Examples

### GPT Basic Example

This is a basic example of minimal use of the GPT in an application.

```
void gpt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
}
```

## GPT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
    if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
        /* Add application code to be called periodically here. */
    }
}
```

## GPT Free Running Counter Example

To use the GPT as a free running counter, select periodic mode and set the the Period to 0xFFFFFFFF for a 32-bit timer or 0xFFFF for a 16-bit timer.

```
void gpt_counter_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* (Optional) If event count mode is used to count edges on a GTETRGM pin, POEG must
    be started to use GTETRGM.

    * Reference Note 1 of Table 23.2 "GPT functions" in the RA6M3 manual
    R01UH0886EJ0100. */

    R_BSP_MODULE_START(FSP_IP_POEG, 0U);

    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);

    /* (Optional) Stop the timer. */
    (void) R_GPT_Stop(&g_timer0_ctrl);
}
```

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;

(void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
}
```

## GPT Input Capture Example

This is an example of using the GPT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
    if ((TIMER_EVENT_CAPTURE_A == p_args->event) || (TIMER_EVENT_CAPTURE_B ==
p_args->event))
    {
        /* (Optional) Get the current period if not known. */
        timer_info_t info;
        (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
        uint64_t period = info.period_counts;

        /* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
        * timer_info_t::period_counts. */
        if (0U == period)
        {
            period = UINT32_MAX + 1U;
        }
        g_captured_time = (period * g_capture_overflows) + p_args->capture;
        g_capture_overflows = 0U;
    }
    if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
        /* An overflow occurred during capture. This must be accounted for at the
application layer. */
    }
}
```

```
        g_capture_overflows++;
    }
}

void gpt_capture_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_GPT_Enable(&g_timer0_ctrl);
    /* (Optional) Disable captures. */
    (void) R_GPT_Disable(&g_timer0_ctrl);
}
```

## GPT Period Update Example

This an example of updating the period.

```
#define GPT_EXAMPLE_MSEC_PER_SEC (1000)
#define GPT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void gpt_period_calculation_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
    /* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
     * - If the PCLKD frequency has not changed since reset, the source clock frequency
     is
```

```

* BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
* - Use the R_GPT_InfoGet function (it accounts for the divider).
* - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
* by timer_cfg_t::source_div.
*
* This example uses the 3rd option (R_FSP_SystemClockHzGet).
*/
uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
/* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
* desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. */
err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
assert(FSP_SUCCESS == err);
}

```

## GPT Duty Cycle Update Example

This an example of updating the duty cycle.

```

#define GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define GPT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void gpt_duty_cycle_calculation_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
}

```

```

    assert(FSP_SUCCESS == err);
/* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
/* Get the current period setting. */
timer_info_t info;
    (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. Note that if the
period could be larger than
    * UINT32_MAX / 100, this calculation could overflow. A cast to uint64_t is used to
prevent this. The cast is
    * not required for 16-bit timers. */
    uint32_t duty_cycle_counts =
        (uint32_t) (((uint64_t) current_period_counts *
GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                    GPT_EXAMPLE_MAX_PERCENT);
/* Set the calculated duty cycle. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, GPT_IO_PIN_GTIOCB);
    assert(FSP_SUCCESS == err);
}

```

### GPT A/D Converter Start Request Example

This is an example of using the GPT to start the ADC at a configurable A/D converter compare match value.

```

#if ((1U << GPT_EXAMPLE_CHANNEL) & (BSP_FEATURE_GPTEH_CHANNEL_MASK |
BSP_FEATURE_GPTE_CHANNEL_MASK))
/* This example shows how to configure the GPT to generate an A/D start request at an
A/D start request compare
    * match value. This example can only be used with GPTE or GPTEH variants. */
void gpt_adc_start_request_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
/* Initialize and configure the ELC. */

```

```
err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Configure the ELC to start a scan on ADC unit 0 when GPT channel 0. Note: This is
typically configured in
* g_elc_cfg and already set during R_ELC_Open. */
err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0, ELC_EVENT_GPT0_AD_TRIG_A);
assert(FSP_SUCCESS == err);
/* Globally enable ELC events. */
err = R_ELC_Enable(&g_elc_ctrl);
assert(FSP_SUCCESS == err);
/* Initialize the ADC to start a scan based on an ELC event trigger. Set
adc_cfg_t::trigger to
* ADC_TRIGGER_SYNC_ELC. */
err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
assert(FSP_SUCCESS == err);
err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
assert(FSP_SUCCESS == err);
/* Enable ELC triggers by calling R_ADC_ScanStart(). */
(void) R_ADC_ScanStart(&g_adc0_ctrl);
/* Initializes the GPT module. Configure gpt_extended_pwm_cfg_t::adc_trigger to set
when the A/D start request
* is generated. Set gpt_extended_pwm_cfg_t::adc_a_compare_match to set the desired
compare match value. */
err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
assert(FSP_SUCCESS == err);
/* Start the timer. A/D converter start request events are generated each time the
counter is equal to the
* A/D start request compare match value. */
(void) R_GPT_Start(&g_timer0_ctrl);
}
#endif
```

## GPT One-Shot Pulse Mode Example

This example demonstrates the configuration and use of one-shot pulse mode with GPT timer.

```
/* Example callback called when timer overflows. */
void gpt_overflow_callback (timer_callback_args_t * p_args)
{
    if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
        /* Use R_GPT_DutyCycleSet() API to set new values for each cycle.
         * - Use GPT_IO_PIN_ONE_SHOT_LEADING_EDGE to set the leading edge transition match
         value (GTCCRC or GTCCRE register).
         * - Use GPT_IO_PIN_ONE_SHOT_TRAILING_EDGE to set the trailing edge transition match
         value (GTCCRD or GTCCRF register).
         */
    }
}

#define GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRD_GTCCRF (0x1000U)
#define GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRC (0x800U)
#define GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRE (0x100U)
void gpt_one_shot_pulse_mode_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Set the duty cycle for One-Shot-Pulse mode */
    /* GPT_IO_PIN_ONE_SHOT_LEADING_EDGE sets the initial value for the GTCCRC register
    if GTIOcNA is the selected pin for output. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl,
                             GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRC,
                             GPT_IO_PIN_GTIOCA | GPT_IO_PIN_ONE_SHOT_LEADING_EDGE);
    assert(FSP_SUCCESS == err);
    /* GPT_IO_PIN_ONE_SHOT_LEADING_EDGE sets the initial value for the GTCCRE register
    if GTIOcNB is the selected pin for output. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl,
```

```

        GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRE,
GPT_IO_PIN_GTIOCB | GPT_IO_PIN_ONE_SHOT_LEADING_EDGE);
    assert(FSP_SUCCESS == err);

--

struct gpt\_instance\_ctrl\_t

Channel control block. DO NOT INITIALIZE. Initialization occurs when [timer\\_api\\_t::open](#) is called.

#### ◆ gpt\_extended\_pwm\_cfg\_t

struct gpt\_extended\_pwm\_cfg\_t

GPT extension for advanced PWM features.

##### Data Fields

uint8_t	trough_ipl	Trough interrupt priority.
IRQn_Type	trough_irq	Trough interrupt.
<a href="#">gpt_poeg_link_t</a>	poeg_link	Select which POEG channel controls output disable for this GPT channel.
<a href="#">gpt_output_disable_t</a>	output_disable	Select which trigger sources request output disable from POEG.
<a href="#">gpt_adc_trigger_t</a>	adc_trigger	Select trigger sources to start A/D conversion.
uint32_t	dead_time_count_up	Set a dead time value for counting up.
uint32_t	dead_time_count_down	Set a dead time value for counting down (available on GPT32E and GPT32EH only)
uint32_t	adc_a_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_A.
uint32_t	adc_b_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_B.
<a href="#">gpt_interrupt_skip_source_t</a>	interrupt_skip_source	Interrupt source to count for interrupt skipping.
<a href="#">gpt_interrupt_skip_count_t</a>	interrupt_skip_count	Number of interrupts to skip between events.
<a href="#">gpt_interrupt_skip_adc_t</a>	interrupt_skip_adc	ADC events to skip when interrupt skipping is enabled.
<a href="#">gpt_gtioc_disable_t</a>	gtioca_disable_setting	DEPRECATED - Select how to configure GTIOCA when output is disabled.
<a href="#">gpt_gtioc_disable_t</a>	gtiocb_disable_setting	DEPRECATED - Select how to

		configure GTIOCB when output is disabled.
--	--	---

### ◆ gpt\_extended\_cfg\_t

struct gpt_extended_cfg_t		
GPT extension configures the output pins for GPT.		
Data Fields		
<a href="#">gpt_output_pin_t</a>	gtioca	DEPRECATED - Configuration for GPT I/O pin A.
<a href="#">gpt_output_pin_t</a>	gtiocb	DEPRECATED - Configuration for GPT I/O pin B.
<a href="#">gpt_source_t</a>	start_source	Event sources that trigger the timer to start.
<a href="#">gpt_source_t</a>	stop_source	Event sources that trigger the timer to stop.
<a href="#">gpt_source_t</a>	clear_source	Event sources that trigger the timer to clear.
<a href="#">gpt_source_t</a>	capture_a_source	Event sources that trigger capture of GTIOCA.
<a href="#">gpt_source_t</a>	capture_b_source	Event sources that trigger capture of GTIOCB.
<a href="#">gpt_source_t</a>	count_up_source	Event sources that trigger a single up count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
<a href="#">gpt_source_t</a>	count_down_source	Event sources that trigger a single down count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
<a href="#">gpt_capture_filter_t</a>	capture_filter_gtioca	
<a href="#">gpt_capture_filter_t</a>	capture_filter_gtiocb	
uint8_t	capture_a_ipl	Capture A interrupt priority.
uint8_t	capture_b_ipl	Capture B interrupt priority.
IRQn_Type	capture_a_irq	Capture A interrupt.
IRQn_Type	capture_b_irq	Capture B interrupt.
<a href="#">gpt_extended_pwm_cfg_t</a> const *	p_pwm_cfg	Advanced PWM features, optional.
<a href="#">gpt_gtior_setting_t</a>	gtior_setting	Custom GTIOR settings used for

	configuring GTIOCxA and GTIOCxB pins.
--	---------------------------------------

## Enumeration Type Documentation

### ◆ gpt\_io\_pin\_t

enum gpt_io_pin_t	
Input/Output pins, used to select which duty cycle to update in <a href="#">R_GPT_DutyCycleSet()</a> .	
Enumerator	
GPT_IO_PIN_GTIOCA	GTIOCA.
GPT_IO_PIN_GTIOCB	GTIOCB.
GPT_IO_PIN_GTIOCA_AND_GTIOCB	GTIOCA and GTIOCB.
GPT_IO_PIN_TROUGH	Used in <a href="#">R_GPT_DutyCycleSet</a> when Triangle-wave PWM Mode 3 is selected.
GPT_IO_PIN_CREST	Used in <a href="#">R_GPT_DutyCycleSet</a> when Triangle-wave PWM Mode 3 is selected.
GPT_IO_PIN_ONE_SHOT_LEADING_EDGE	Used in <a href="#">R_GPT_DutyCycleSet</a> to set GTCCRC and GTCCRE registers when One-Shot Pulse mode is selected.
GPT_IO_PIN_ONE_SHOT_TRAILING_EDGE	Used in <a href="#">R_GPT_DutyCycleSet</a> to set GTCCRD and GTCCRF registers when One-Shot Pulse mode is selected.

### ◆ gpt\_buffer\_force\_push

enum gpt_buffer_force_push	
Forced buffer push operation used in One-Sot Pulse mode with <a href="#">R_GPT_DutyCycleSet()</a> .	
Enumerator	
GPT_BUFFER_FORCE_PUSH	Used in <a href="#">R_GPT_DutyCycleSet</a> to force push the data from GTCCRn registers to temporary buffer A or B when One-Shot Pulse mode is selected.

◆ **gpt\_pin\_level\_t**

enum <code>gpt_pin_level_t</code>	
Level of GPT pin	
Enumerator	
<code>GPT_PIN_LEVEL_LOW</code>	Pin level low.
<code>GPT_PIN_LEVEL_HIGH</code>	Pin level high.

◆ **gpt\_source\_t**

enum <code>gpt_source_t</code>	
Sources can be used to start the timer, stop the timer, count up, or count down. These enumerations represent a bitmask. Multiple sources can be ORed together.	
Enumerator	
<code>GPT_SOURCE_NONE</code>	No active event sources.
<code>GPT_SOURCE_GTETRGA_RISING</code>	Action performed on GTETRGA rising edge.
<code>GPT_SOURCE_GTETRGA_FALLING</code>	Action performed on GTETRGA falling edge.
<code>GPT_SOURCE_GTETRGB_RISING</code>	Action performed on GTETRGB rising edge.
<code>GPT_SOURCE_GTETRGB_FALLING</code>	Action performed on GTETRGB falling edge.
<code>GPT_SOURCE_GTETRGC_RISING</code>	Action performed on GTETRGC rising edge.
<code>GPT_SOURCE_GTETRGC_FALLING</code>	Action performed on GTETRGC falling edge.
<code>GPT_SOURCE_GTETRGD_RISING</code>	Action performed on GTETRGB rising edge.
<code>GPT_SOURCE_GTETRGD_FALLING</code>	Action performed on GTETRGB falling edge.
<code>GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_LOW</code>	Action performed when GTIOCA input rises while GTIOCB is low.
<code>GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_HIGH</code>	Action performed when GTIOCA input rises while GTIOCB is high.
<code>GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_LOW</code>	Action performed when GTIOCA input falls while GTIOCB is low.
<code>GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_HIGH</code>	Action performed when GTIOCA input falls while GTIOCB is high.

GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input rises while GTIOCA is low.
GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input rises while GTIOCA is high.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input falls while GTIOCA is low.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input falls while GTIOCA is high.
GPT_SOURCE_GPT_A	Action performed on ELC GPTA event.
GPT_SOURCE_GPT_B	Action performed on ELC GPTB event.
GPT_SOURCE_GPT_C	Action performed on ELC GPTC event.
GPT_SOURCE_GPT_D	Action performed on ELC GPTD event.
GPT_SOURCE_GPT_E	Action performed on ELC GPTE event.
GPT_SOURCE_GPT_F	Action performed on ELC GPTF event.
GPT_SOURCE_GPT_G	Action performed on ELC GPTG event.
GPT_SOURCE_GPT_H	Action performed on ELC GPTH event.

◆ **gpt\_capture\_filter\_t**enum `gpt_capture_filter_t`

Input capture signal noise filter (debounce) setting. Only available for input signals GTIOCxA and GTIOCxB. The noise filter samples the external signal at intervals of the PCLK divided by one of the values. When 3 consecutive samples are at the same level (high or low), then that level is passed on as the observed state of the signal. See "Noise Filter Function" in the hardware manual, GPT section.

## Enumerator

<code>GPT_CAPTURE_FILTER_NONE</code>	None - no filtering.
<code>GPT_CAPTURE_FILTER_PCLKD_DIV_1</code>	PCLK/1 - fast sampling.
<code>GPT_CAPTURE_FILTER_PCLKD_DIV_4</code>	PCLK/4.
<code>GPT_CAPTURE_FILTER_PCLKD_DIV_16</code>	PCLK/16.
<code>GPT_CAPTURE_FILTER_PCLKD_DIV_64</code>	PCLK/64 - slow sampling.

◆ **gpt\_adc\_trigger\_t**

enum <code>gpt_adc_trigger_t</code>	
Trigger options to start A/D conversion.	
Enumerator	
<code>GPT_ADC_TRIGGER_NONE</code>	None - no output disable request.
<code>GPT_ADC_TRIGGER_UP_COUNT_START_ADC_A</code>	Request A/D conversion from ADC unit 0 at up counting compare match of <code>gpt_extended_pwm_cfg_t::adc_a_compare_match</code> .
<code>GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_A</code>	Request A/D conversion from ADC unit 0 at down counting compare match of <code>gpt_extended_pwm_cfg_t::adc_a_compare_match</code> .
<code>GPT_ADC_TRIGGER_UP_COUNT_START_ADC_B</code>	Request A/D conversion from ADC unit 1 at up counting compare match of <code>gpt_extended_pwm_cfg_t::adc_b_compare_match</code> .
<code>GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_B</code>	Request A/D conversion from ADC unit 1 at down counting compare match of <code>gpt_extended_pwm_cfg_t::adc_b_compare_match</code> .

◆ **gpt\_poeg\_link\_t**

enum <code>gpt_poeg_link_t</code>	
POEG channel to link to this channel.	
Enumerator	
<code>GPT_POEG_LINK_POEG0</code>	Link this GPT channel to POEG channel 0 (GTETRGA)
<code>GPT_POEG_LINK_POEG1</code>	Link this GPT channel to POEG channel 1 (GTETRGB)
<code>GPT_POEG_LINK_POEG2</code>	Link this GPT channel to POEG channel 2 (GTETRGC)
<code>GPT_POEG_LINK_POEG3</code>	Link this GPT channel to POEG channel 3 (GTETRGD)

◆ **gpt\_output\_disable\_t**

enum <code>gpt_output_disable_t</code>	
Select trigger to send output disable request to POEG.	
Enumerator	
<code>GPT_OUTPUT_DISABLE_NONE</code>	None - no output disable request.
<code>GPT_OUTPUT_DISABLE_DEAD_TIME_ERROR</code>	Request output disable if a dead time error occurs.
<code>GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_HIGH</code>	Request output disable if GTIOCA and GTIOCB are high at the same time.
<code>GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_LOW</code>	Request output disable if GTIOCA and GTIOCB are low at the same time.

◆ **gpt\_gtioc\_disable\_t**

enum <code>gpt_gtioc_disable_t</code>	
Disable level options for GTIOC pins.	
Enumerator	
<code>GPT_GTIOC_DISABLE_PROHIBITED</code>	Do not allow output disable.
<code>GPT_GTIOC_DISABLE_SET_HI_Z</code>	Set GTIOC to high impedance when output is disabled.
<code>GPT_GTIOC_DISABLE_LEVEL_LOW</code>	Set GTIOC level low when output is disabled.
<code>GPT_GTIOC_DISABLE_LEVEL_HIGH</code>	Set GTIOC level high when output is disabled.

◆ **gpt\_adc\_compare\_match\_t**

enum <code>gpt_adc_compare_match_t</code>	
Trigger options to start A/D conversion.	
Enumerator	
<code>GPT_ADC_COMPARE_MATCH_ADC_A</code>	Set A/D conversion start request value for GPT A/D converter start request A.
<code>GPT_ADC_COMPARE_MATCH_ADC_B</code>	Set A/D conversion start request value for GPT A/D converter start request B.

◆ **gpt\_interrupt\_skip\_source\_t**

enum <a href="#">gpt_interrupt_skip_source_t</a>	
Interrupt skipping modes	
Enumerator	
GPT_INTERRUPT_SKIP_SOURCE_NONE	Do not skip interrupts.
GPT_INTERRUPT_SKIP_SOURCE_OVERFLOW_UNDERFLOW	Count and skip overflow and underflow interrupts.
GPT_INTERRUPT_SKIP_SOURCE_CREST	Count crest interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in <a href="#">gpt_interrupt_skip_count_t</a> . When the interrupt does fire, the trough interrupt fires before the crest interrupt.
GPT_INTERRUPT_SKIP_SOURCE_TROUGH	Count trough interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in <a href="#">gpt_interrupt_skip_count_t</a> . When the interrupt does fire, the crest interrupt fires before the trough interrupt.

◆ **gpt\_interrupt\_skip\_count\_t**

enum <a href="#">gpt_interrupt_skip_count_t</a>	
Number of interrupts to skip between events	
Enumerator	
GPT_INTERRUPT_SKIP_COUNT_0	Do not skip interrupts.
GPT_INTERRUPT_SKIP_COUNT_1	Skip one interrupt.
GPT_INTERRUPT_SKIP_COUNT_2	Skip two interrupts.
GPT_INTERRUPT_SKIP_COUNT_3	Skip three interrupts.
GPT_INTERRUPT_SKIP_COUNT_4	Skip four interrupts.
GPT_INTERRUPT_SKIP_COUNT_5	Skip five interrupts.
GPT_INTERRUPT_SKIP_COUNT_6	Skip six interrupts.
GPT_INTERRUPT_SKIP_COUNT_7	Skip seven interrupts.

◆ **gpt\_interrupt\_skip\_adc\_t**

enum <a href="#">gpt_interrupt_skip_adc_t</a>	
ADC events to skip during interrupt skipping	
Enumerator	
GPT_INTERRUPT_SKIP_ADC_NONE	Do not skip ADC events.
GPT_INTERRUPT_SKIP_ADC_A	Skip ADC A events.
GPT_INTERRUPT_SKIP_ADC_B	Skip ADC B events.
GPT_INTERRUPT_SKIP_ADC_A_AND_B	Skip ADC A and B events.

◆ **gpt\_pwm\_output\_delay\_setting\_t**

enum <a href="#">gpt_pwm_output_delay_setting_t</a>	
Delay setting for the PWM Delay Generation Circuit (PDG).	
Enumerator	
GPT_PWM_OUTPUT_DELAY_SETTING_0_32	Delay is not applied.
GPT_PWM_OUTPUT_DELAY_SETTING_1_32	Delay of 1 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_2_32	Delay of 2 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_3_32	Delay of 3 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_4_32	Delay of 4 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_5_32	Delay of 5 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_6_32	Delay of 6 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_7_32	Delay of 7 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_8_32	Delay of 8 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_9_32	Delay of 9 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_10_32	Delay of 10 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_11_32	Delay of 11 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_12_32	Delay of 12 / 32 GTCLK period applied.

GPT_PWM_OUTPUT_DELAY_SETTING_13_32	Delay of 13 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_14_32	Delay of 14 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_15_32	Delay of 15 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_16_32	Delay of 16 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_17_32	Delay of 17 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_18_32	Delay of 18 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_19_32	Delay of 19 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_20_32	Delay of 20 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_21_32	Delay of 21 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_22_32	Delay of 22 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_23_32	Delay of 23 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_24_32	Delay of 24 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_25_32	Delay of 25 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_26_32	Delay of 26 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_27_32	Delay of 27 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_28_32	Delay of 28 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_29_32	Delay of 29 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_30_32	Delay of 30 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_31_32	Delay of 31 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_BYPASS	Bypass the PWM Output Delay Circuit.

**◆ gpt\_pwm\_output\_delay\_edge\_t**

enum <code>gpt_pwm_output_delay_edge_t</code>	
Select which PWM Output Delay setting to apply.	
Enumerator	
<code>GPT_PWM_OUTPUT_DELAY_EDGE_RISING</code>	Configure the PWM Output Delay setting for rising edge.
<code>GPT_PWM_OUTPUT_DELAY_EDGE_FALLING</code>	Configure the PWM Output Delay setting for falling edge.

**Function Documentation**

◆ **R\_GPT\_Open()**

```
fsp_err_t R_GPT_Open ( timer_ctrl_t *const p_ctrl, timer_cfg_t const *const p_cfg )
```

Initializes the timer module and applies configurations. Implements `timer_api_t::open`.

GPT hardware does not support one-shot functionality natively. When using one-shot mode, the timer will be stopped in an ISR after the requested period has elapsed.

The GPT implementation of the general timer can accept a `gpt_extended_cfg_t` extension parameter.

Example:

```
/* Initializes the module. */
err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

**Return values**

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	<code>timer_cfg_t::mode</code> is <code>TIMER_MODE_ONE_SHOT</code> or <code>timer_cfg_t::p_callback</code> is not NULL, but ISR is not enabled. ISR must be enabled to use one-shot mode or callback.
FSP_ERR_INVALID_MODE	Triangle wave PWM is only supported if <code>GPT_CFG_OUTPUT_SUPPORT_ENABLE</code> is 2. Selected channel does not support external count sources. External and event count sources not are available in this mode.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the <code>p_cfg</code> parameter is not available on this device.

◆ **R\_GPT\_Stop()**

```
fsp_err_t R_GPT_Stop ( timer_ctrl_t *const p_ctrl)
```

Stops timer. Implements `timer_api_t::stop`.

Example:

```
/* (Optional) Stop the timer. */
(void) R_GPT_Stop(&g_timer0_ctrl);
```

**Return values**

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_Start()**

```
fsp_err_t R_GPT_Start ( timer_ctrl_t *const p_ctrl)
```

Starts timer. Implements `timer_api_t::start`.

Example:

```
/* Start the timer. */
(void) R_GPT_Start(&g_timer0_ctrl);
```

**Return values**

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_Reset()**

```
fsp_err_t R_GPT_Reset ( timer_ctrl_t *const p_ctrl)
```

Resets the counter value to 0. Implements `timer_api_t::reset`.

**Note**

*This function also updates to the new period if no counter overflow has occurred since the last call to `R_GPT_PeriodSet()`.*

**Return values**

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_Enable()**

```
fsp_err_t R_GPT_Enable ( timer_ctrl_t *const p_ctrl)
```

Enables external event triggers that start, stop, clear, or capture the counter. Implements `timer_api_t::enable`.

**Example:**

```
/* Enable captures. Captured values arrive in the interrupt. */
(void) R_GPT_Enable(&g_timer0_ctrl);
```

**Return values**

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_Disable()**

```
fsp_err_t R_GPT_Disable ( timer_ctrl_t *const p_ctrl)
```

Disables external event triggers that start, stop, clear, or capture the counter. Implements [timer\\_api\\_t::disable](#).

**Note**

*The timer could be running after [R\\_GPT\\_Disable\(\)](#). To ensure it is stopped, call [R\\_GPT\\_Stop\(\)](#).*

Example:

```
/* (Optional) Disable captures. */
(void) R_GPT_Disable(&g_timer0_ctrl);
```

**Return values**

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_PeriodSet()**

```
fsp_err_t R_GPT_PeriodSet ( timer_ctrl_t *const p_ctrl, uint32_t const period_counts )
```

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements [timer\\_api\\_t::periodSet](#).

**Warning**

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```
/* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
 * - If the PCLKD frequency has not changed since reset, the source clock frequency
is
 * BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
 * - Use the R_GPT_InfoGet function (it accounts for the divider).
 * - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
 * by timer_cfg_t::source_div.
 *
```

```

* This example uses the 3rd option (R_FSP_SystemClockHzGet).
*/
uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
/* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
* desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. */
err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
assert(FSP_SUCCESS == err);

```

**Return values**

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

**◆ R\_GPT\_DutyCycleSet()**

```

fsp_err_t R_GPT_DutyCycleSet ( timer_ctrl_t *const p_ctrl, uint32_t const duty_cycle_counts,
uint32_t const pin )

```

Sets duty cycle on requested pin. Implements [timer\\_api\\_t::dutyCycleSet](#).

Duty cycle is updated in the buffer register. The updated duty cycle is reflected after the next cycle end (counter overflow).

**Example:**

```

/* Get the current period setting. */
timer_info_t info;
(void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. Note that if the
period could be larger than
* UINT32_MAX / 100, this calculation could overflow. A cast to uint64_t is used to

```

```

prevent this. The cast is
* not required for 16-bit timers. */
uint32_t duty_cycle_counts =
    (uint32_t) (((uint64_t) current_period_counts *
GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
    GPT_EXAMPLE_MAX_PERCENT);
/* Set the calculated duty cycle. */
err = R_GPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, GPT_IO_PIN_GTIOCB);
assert(FSP_SUCCESS == err);

```

### Parameters

[in]	p_ctrl	Pointer to instance control block.
[in]	duty_cycle_counts	Duty cycle to set in counts.
[in]	pin	Use gpt_io_pin_t to select GPT_IO_PIN_GTIOCA or GPT_IO_PIN_GTIOCB

### Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL or the pin is not one of gpt_io_pin_t
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Duty cycle is larger than period.
FSP_ERR_INVALID_MODE	GPT_IO_PIN_TROUGH, and GPT_IO_PIN_CREST settings are invalid in the this mode.
FSP_ERR_UNSUPPORTED	GPT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

## ◆ R\_GPT\_InfoGet()

```
fsp_err_t R_GPT_InfoGet ( timer_ctrl_t*const p_ctrl, timer_info_t*const p_info )
```

Get timer information and store it in provided pointer p\_info. Implements `timer_api_t::infoGet`.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
(void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
uint64_t period = info.period_counts;

/* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
* timer_info_t::period_counts. */
if (0U == period)
{
    period = UINT32_MAX + 1U;
}
```

**Return values**

FSP_SUCCESS	Period, count direction, frequency, and ELC event written to caller's structure successfully.
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_StatusGet()**

```
fsp_err_t R_GPT_StatusGet ( timer_ctrl_t *const p_ctrl, timer_status_t *const p_status )
```

Get current timer status and store it in provided pointer p\_status. Implements `timer_api_t::statusGet`.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;

(void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
```

**Return values**

FSP_SUCCESS	Current timer state and counter value set successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_CounterSet()**

```
fsp_err_t R_GPT_CounterSet ( timer_ctrl_t *const p_ctrl, uint32_t counter )
```

Set counter value.

**Note**

*Do not call this API while the counter is counting. The counter value can only be updated while the counter is stopped.*

**Return values**

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IN_USE	The timer is running. Stop the timer before calling this function.

◆ **R\_GPT\_OutputEnable()**

```
fsp_err_t R_GPT_OutputEnable ( timer_ctrl_t *const p_ctrl, gpt_io_pin_t pin )
```

Enable output for GTIOCA and/or GTIOCB.

**Return values**

FSP_SUCCESS	Output is enabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_OutputDisable()**

```
fsp_err_t R_GPT_OutputDisable ( timer_ctrl_t *const p_ctrl, gpt_io_pin_t pin )
```

Disable output for GTIOCA and/or GTIOCB.

**Return values**

FSP_SUCCESS	Output is disabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_AdcTriggerSet()**

```
fsp_err_t R_GPT_AdcTriggerSet ( timer_ctrl_t *const p_ctrl, gpt_adc_compare_match_t  
which_compare_match, uint32_t compare_match_value )
```

Set A/D converter start request compare match value.

**Return values**

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_PwmOutputDelaySet()**

```
fsp_err_t R_GPT_PwmOutputDelaySet ( timer_ctrl_t *const p_ctrl, gpt_pwm_output_delay_edge_t
edge, gpt_pwm_output_delay_setting_t delay_setting, uint32_t const pin )
```

Set the Output Delay setting for the PWM output pin.

**Return values**

FSP_SUCCESS	The output delay was set.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_CHANNEL	The channel does not support this feature.
FSP_ERR_NOT_INITIALIZED	The PWM Output Delay Circuit has not been initialized.
FSP_ERR_INVALID_STATE	The PWM Output Delay setting cannot be updated in the current state.
FSP_ERR_UNSUPPORTED	This feature is not supported on this MCU.

◆ **R\_GPT\_CallbackSet()**

```
fsp_err_t R_GPT_CallbackSet ( timer_ctrl_t *const p_api_ctrl, void(*)(timer_callback_args_t *)
p_callback, void const *const p_context, timer_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `timer_api_t::callbackSet`.

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R\_GPT\_Close()**

`fsp_err_t R_GPT_Close ( timer_ctrl_t *const p_ctrl)`

Stops counter, disables output pins, and clears internal driver data. Implements `timer_api_t::close`.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_GPT\_PwmOutputDelayInitialize()**

`fsp_err_t R_GPT_PwmOutputDelayInitialize ( )`

Initialize the PWM Delay Generation Circuit (PDG). This function must be called before calling `R_GPT_PwmOutputDelaySet`.

*Note*

*This function will delay for 20 microseconds.*

**Return values**

FSP_SUCCESS	Initialization sequence completed successfully.
FSP_ERR_INVALID_STATE	The source clock frequency is out of the required range for the PDG.
FSP_ERR_UNSUPPORTED	This feature is not supported.

**4.2.18.5 Timer, Low-Power (r\_agt)**

Modules » Timers

**Functions**

`fsp_err_t R_AGT_Open (timer_ctrl_t *const p_ctrl, timer_cfg_t const *const p_cfg)`

`fsp_err_t R_AGT_Start (timer_ctrl_t *const p_ctrl)`

`fsp_err_t R_AGT_Stop (timer_ctrl_t *const p_ctrl)`

`fsp_err_t R_AGT_Reset (timer_ctrl_t *const p_ctrl)`

fsp_err_t	R_AGT_Enable (timer_ctrl_t *const p_ctrl)
fsp_err_t	R_AGT_Disable (timer_ctrl_t *const p_ctrl)
fsp_err_t	R_AGT_PeriodSet (timer_ctrl_t *const p_ctrl, uint32_t const period_counts)
fsp_err_t	R_AGT_DutyCycleSet (timer_ctrl_t *const p_ctrl, uint32_t const duty_cycle_counts, uint32_t const pin)
fsp_err_t	R_AGT_InfoGet (timer_ctrl_t *const p_ctrl, timer_info_t *const p_info)
fsp_err_t	R_AGT_StatusGet (timer_ctrl_t *const p_ctrl, timer_status_t *const p_status)
fsp_err_t	R_AGT_CallbackSet (timer_ctrl_t *const p_api_ctrl, void(*p_callback)(timer_callback_args_t *), void const *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_AGT_Close (timer_ctrl_t *const p_ctrl)

## Detailed Description

Driver for the AGT peripheral on RA MCUs. This module implements the [Timer Interface](#).

## Overview

### Features

The AGT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Configurable clock source, including PCLKB, LOCO, SUBCLK, and external sources input to AGTIO.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- Supports counting based on an external clock input to AGTIO.
- Supports debounce filter on AGTIO pins.
- Supports measuring pulse width or pulse period.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.

### Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes (when count source is LOCO or subclock).
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock with a configurable divider up to 8 for PCLKB or up to 128 for LOCO or subclock.

## Configuration

### Build Time Configurations for r\_agt

The following build time configurations are defined in fsp\_cfg/r\_agt\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>Default (BSP)</li> <li>Enabled</li> <li>Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Disabled	If selected code for outputting a waveform to a pin is included in the build.
Pin Input Support	<ul style="list-style-type: none"> <li>Disabled</li> <li>Enabled</li> </ul>	Disabled	Enable input support to use pulse width measurement mode, pulse period measurement mode, or input from P402, P402, or AGTIO.

### Configurations for Timers > Timer, Low-Power (r\_agt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Low-Power (r\_agt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_timer0	Module name.

General > Channel	Channel number does not exist	0	Physical hardware channel.
General > Mode	<ul style="list-style-type: none"> <li>• Periodic</li> <li>• One-Shot</li> <li>• PWM</li> </ul>	Periodic	Mode selection. Note: One-shot mode is implemented in software. ISR's must be enabled for one shot even if callback is unused.
General > Period	Value must be non-negative	0x10000	<p>Specify the timer period based on the selected unit.</p> <p>When the unit is set to 'Raw Counts', setting the period to 0x10000 results in the maximum period at the lowest divisor (fastest timer tick). Set the period to 0x10000 for a free running timer, pulse width measurement or pulse period measurement. Setting the period higher will automatically select a higher divider; the period can be set up to 0x80000 when counting from PCLKB or 0x800000 when counting from LOCO/subclock, which will use a divider of 8 or 128 respectively with the maximum period.</p> <p>If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the <a href="#">timer_cfg_t</a> structure.</p>
General > Period Unit	<ul style="list-style-type: none"> <li>• Raw Counts</li> <li>• Nanoseconds</li> <li>• Microseconds</li> </ul>	Raw Counts	Unit of the period specified above

	<ul style="list-style-type: none"> <li>• Milliseconds</li> <li>• Seconds</li> <li>• Hertz</li> <li>• Kilohertz</li> </ul>

NOTE: The divisor is calculated automatically based on the selected period. See <code>agt_count_source_t</code> documentation for details.
Output > Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
Output > AGTOA Output	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Start Level Low</li> <li>• Start Level High</li> </ul>	Disabled	Configure AGTOA output.
Output > AGTOB Output	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Start Level Low</li> <li>• Start Level High</li> </ul>	Disabled	Configure AGTOB output.
Output > AGTO Output	<ul style="list-style-type: none"> <li>• Disabled</li> <li>• Start Level Low</li> <li>• Start Level High</li> </ul>	Disabled	Configure AGTO output.
Input > Measurement Mode	<ul style="list-style-type: none"> <li>• Measure Disabled</li> <li>• Measure Low Level Pulse Width</li> <li>• Measure High Level Pulse Width</li> <li>• Measure Pulse Period</li> </ul>	Measure Disabled	Select if the AGT should be used to measure pulse width or pulse period. In high level pulse width measurement mode, the AGT counts when AGTIO is high and starts counting immediately in the middle of a pulse if AGTIO is high when <code>R_AGT_Start()</code> is called. In low level pulse width measurement mode, the AGT counts when AGTIO is low and could start counting in the middle of a pulse if AGTIO is low when <code>R_AGT_Start()</code> is called.
Input > Input Filter	<ul style="list-style-type: none"> <li>• No Filter</li> <li>• Filter sampled at PCLKB</li> <li>• Filter sampled at PCLKB / 8</li> </ul>	No Filter	Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode.

	<ul style="list-style-type: none"> <li>Filter sampled at PCLKB / 32</li> </ul>		The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.
Input > Enable Pin	<ul style="list-style-type: none"> <li>Enable Pin Not Used</li> <li>Enable Pin Active Low</li> <li>Enable Pin Active High</li> </ul>	Enable Pin Not Used	Select active edge for the AGTEE pin if used. Only applies if the count source is P402, P403 or AGTIO.
Input > Trigger Edge	<ul style="list-style-type: none"> <li>Trigger Edge Rising</li> <li>Trigger Edge Falling</li> <li>Trigger Edge Both</li> </ul>	Trigger Edge Rising	Select the trigger edge. Applies if measurement mode is pulse period, or if the count source is P402, P403, or AGTIO. Do not select Trigger Edge Both with pulse period measurement.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the timer period elapses.
Interrupts > Underflow Interrupt Priority	MCU Specific Options		Timer interrupt priority.

## Clock Configuration

The AGT clock is based on the PCLKB, LOCO, or Subclock frequency. You can set the clock frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

## Pin Configuration

This module can use the AGTOA and AGTOB pins as output pins for periodic, one-shot, or PWM signals.

For input capture, the input signal must be applied to the AGTIO pin.

For event counting, the AGTEEn enable pin is optional.

## Timer Period

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units, and clock speed.

When the selected unit is "Raw counts", the maximum allowed period setting varies depending on the selected clock source:

Clock source	Maximum period (counts)
LOCO/Subclock	0x800000
PCLKB	0x80000
All other sources	0x10000

**Note**

Though the AGT is a 16-bit timer, because the period interrupt occurs when the counter underflows, setting the period register to 0 results in an effective period of 1 count. For this reason all user-provided raw count values reflect the actual number of period counts (not the raw register values).

## Usage Notes

### Starting and Stopping the AGT

After starting or stopping the timer, AGT registers cannot be accessed until the AGT state is updated after 3 AGTCLK cycles. If another AGT function is called before the 3 AGTCLK period elapses, the function spins waiting for the AGT state to update. The required wait time after starting or stopping the timer can be determined using the frequency of AGTCLK, which is derived from [timer\\_cfg\\_t::source\\_div](#) and [agt\\_extended\\_cfg\\_t::count\\_source](#).

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

**Warning**

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

### Low Power Modes

The AGT1 (channel 1 only) can be used to enter snooze mode or to wake the MCU from snooze, software standby, or deep software standby modes when a counter underflow occurs. The compare match A and B events can also be used to wake from software standby or snooze modes.

### One-Shot Mode

The AGT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the [Transfer \(r\\_dtc\)](#).

### One-Shot Mode Output

The output waveform in one-shot mode is one AGT clock cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

## AGT One-Shot Output

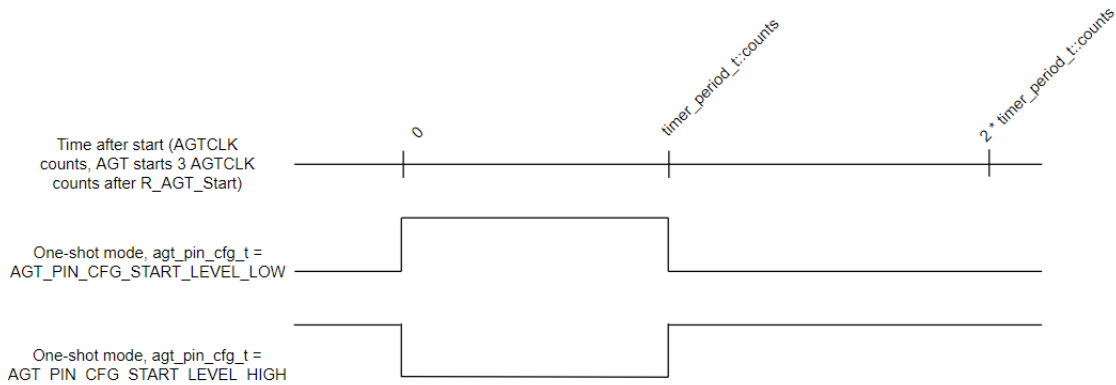

Figure 233: AGT One-Shot Output

## Periodic Output

The AGTOA or AGTOB pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square (from rising edge to rising edge) matches the period of the AGT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

## AGT Periodic Output

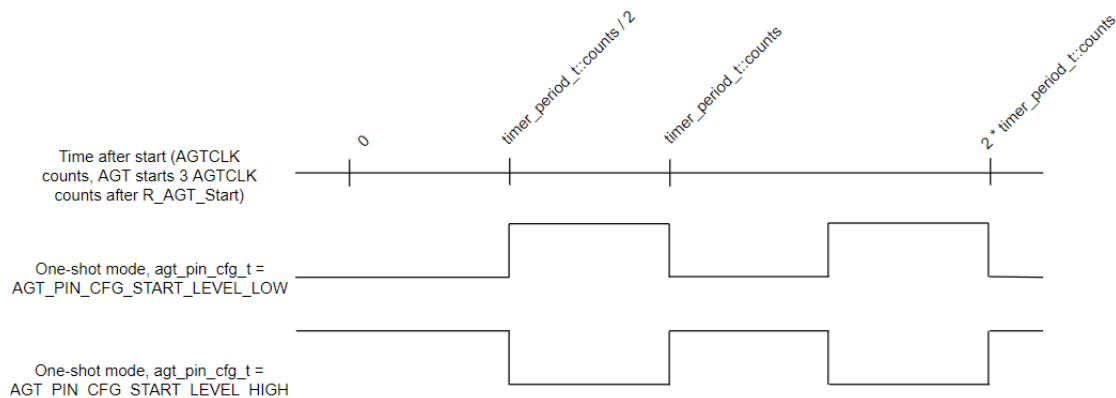

Figure 234: AGT Periodic Output

## PWM Output

This module does not support in phase PWM output. The PWM output signal is low at the beginning of the cycle and high at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

Figure 235: AGT PWM Output

## Triggering ELC Events with AGT

The AGT timer can trigger the start of other peripherals. The [Event Link Controller \(r\\_elc\)](#) guide provides a list of all available peripherals.

## Examples

### AGT Basic Example

This is a basic example of minimal use of the AGT in an application.

```
void agt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
}
```

### AGT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
```

```
void timer_callback (timer_callback_args_t * p_args)
{
    if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
        /* Add application code to be called periodically here. */
    }
}
```

### AGT Free Running Counter Example

To use the AGT as a free running counter, select periodic mode and set the the Period to 0xFFFF.

```
void agt_counter_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
    /* (Optional) Stop the timer. */
    (void) R_AGT_Stop(&g_timer0_ctrl);
    /* Read the current counter value. Counter value is in status.counter. */
    timer_status_t status;
    (void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
}
```

### AGT Input Capture Example

This is an example of using the AGT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
```

```
{
  if (TIMER_EVENT_CAPTURE_A == p_args->event)
  {
    /* (Optional) Get the current period if not known. */
    timer_info_t info;

    (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t period = info.period_counts;

    /* Process capture from AGTIO. */
    g_captured_time = ((uint64_t) period * g_capture_overflows) +
p_args->capture;
    g_capture_overflows = 0U;
  }
  if (TIMER_EVENT_CYCLE_END == p_args->event)
  {
    /* An overflow occurred during capture. This must be accounted for at the
application layer. */
    g_capture_overflows++;
  }
}
void agt_capture_example (void)
{
  fsp_err_t err = FSP_SUCCESS;
  /* Initializes the module. */
  err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
  /* Handle any errors. This function should be defined by the user. */
  assert(FSP_SUCCESS == err);
  /* Enable captures. Captured values arrive in the interrupt. */
  (void) R_AGT_Enable(&g_timer0_ctrl);
  /* (Optional) Disable captures. */
  (void) R_AGT_Disable(&g_timer0_ctrl);
}
```

## AGT Period Update Example

This an example of updating the period.

```
#define AGT_EXAMPLE_MSEC_PER_SEC (1000)
#define AGT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void agt_period_calculation_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
    /* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
    * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
    * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
    * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
    has not changed since reset,
    * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
    * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
    * - Calculate the current PCLKB frequency using
    R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
    * by timer_cfg_t::source_div.
    *
    * This example uses the last option (R_FSP_SystemClockHzGet).
    */
    uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
g_timer0_cfg.source_div;
    /* Calculate the desired period based on the current clock. Note that this
    calculation could overflow if the
    * desired period is larger than UINT32_MAX / pclkb_freq_hz. A cast to uint64_t is
    used to prevent this. */
    uint32_t period_counts =
        (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);
```

```
/* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
* period is larger than UINT16_MAX. */
err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
assert(FSP_SUCCESS == err);
}
```

## AGT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define AGT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void agt_duty_cycle_calculation_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
    /* Get the current period setting. */
    timer_info_t info;
    (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
    /* Calculate the desired duty cycle based on the current period. */
    uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                AGT_EXAMPLE_MAX_PERCENT;
    /* Set the calculated duty cycle. */
    err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA
);
    assert(FSP_SUCCESS == err);
}
```

```
}
```

## AGT Cascaded Timers Example

This is an example of using underflow from an even AGT channel as the count source for the next channel (in this case, AGT0 and AGT1).

```
/* This example shows how use cascaded timers. The count source for AGT channel 1 is
set to AGT0 underflow. */
void agt_cascaded_timers_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the timers in any order. */
    err = R_AGT_Open(&g_timer_channel0_ctrl, &g_timer_channel0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_AGT_Open(&g_timer_channel1_ctrl, &g_timer_channel1_cfg);
    assert(FSP_SUCCESS == err);
    /* Start AGT channel 1 first. */
    (void) R_AGT_Start(&g_timer_channel1_ctrl);
    (void) R_AGT_Start(&g_timer_channel0_ctrl);
    /* (Optional) Stop AGT channel 0 first. */
    (void) R_AGT_Stop(&g_timer_channel0_ctrl);
    (void) R_AGT_Stop(&g_timer_channel1_ctrl);
    /* Read the current counter value. Counter value is in status.counter. */
    timer_status_t status;
    (void) R_AGT_StatusGet(&g_timer_channel1_ctrl, &status);
}
```

## Data Structures

```
struct agt_instance_ctrl_t
```

```
struct agt_extended_cfg_t
```

## Enumerations

```
enum agt_clock_t
```

```
enum agt_measure_t
```

enum [agt\\_agtio\\_filter\\_t](#)enum [agt\\_enable\\_pin\\_t](#)enum [agt\\_trigger\\_edge\\_t](#)enum [agt\\_output\\_pin\\_t](#)enum [agt\\_pin\\_cfg\\_t](#)

## Data Structure Documentation

### ◆ [agt\\_instance\\_ctrl\\_t](#)

struct [agt\\_instance\\_ctrl\\_t](#)Channel control block. DO NOT INITIALIZE. Initialization occurs when [timer\\_api\\_t::open](#) is called.

### ◆ [agt\\_extended\\_cfg\\_t](#)

struct [agt\\_extended\\_cfg\\_t](#)

Optional AGT extension data structure.

#### Data Fields

<a href="#">agt_clock_t</a>	count_source	AGT channel clock source. Valid values are: AGT_CLOCK_PCLKB, AGT_CLOCK_LOCO, AGT_CLOCK_FSUB.
union <a href="#">agt_extended_cfg_t</a>	__unnamed__	
<a href="#">agt_pin_cfg_t</a>	agto: 3	Configure AGTO pin.  <i>Note</i> <i>AGTIO polarity is opposite AGTO</i>
<a href="#">agt_measure_t</a>	measurement_mode	Measurement mode.
<a href="#">agt_agtio_filter_t</a>	agtio_filter	Input filter for AGTIO.
<a href="#">agt_enable_pin_t</a>	enable_pin	Enable pin (event counting only)
<a href="#">agt_trigger_edge_t</a>	trigger_edge	Trigger edge to start pulse period measurement or count external event.

## Enumeration Type Documentation

◆ **agt\_clock\_t**

enum agt_clock_t	
Count source	
Enumerator	
AGT_CLOCK_PCLKB	PCLKB count source, division by 1, 2, or 8 allowed.
AGT_CLOCK_LOCO	LOCO count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_AGT_UNDERFLOW	Underflow event signal from next lowest AGT channel, division must be 1.
AGT_CLOCK_SUBCLOCK	Subclock count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_P402	Counts events on P402, events are counted in deep software standby mode.
AGT_CLOCK_P403	Counts events on P403, events are counted in deep software standby mode.
AGT_CLOCK_AGTIO	Counts events on AGTIO, events are not counted in software standby modes.

◆ **agt\_measure\_t**

enum agt_measure_t	
Enable pin for event counting mode.	
Enumerator	
AGT_MEASURE_DISABLED	AGT used as a counter.
AGT_MEASURE_PULSE_WIDTH_LOW_LEVEL	AGT used to measure low level pulse width.
AGT_MEASURE_PULSE_WIDTH_HIGH_LEVEL	AGT used to measure high level pulse width.
AGT_MEASURE_PULSE_PERIOD	AGT used to measure pulse period.

◆ **agt\_agtio\_filter\_t**

enum agt_agtio_filter_t	
Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.	
Enumerator	
AGT_AGTIO_FILTER_NONE	No filter.
AGT_AGTIO_FILTER_PCLKB	Filter at PCLKB.
AGT_AGTIO_FILTER_PCLKB_DIV_8	Filter at PCLKB / 8.
AGT_AGTIO_FILTER_PCLKB_DIV_32	Filter at PCLKB / 32.

◆ **agt\_enable\_pin\_t**

enum agt_enable_pin_t	
Enable pin for event counting mode.	
Enumerator	
AGT_ENABLE_PIN_NOT_USED	AGTEE/AGTWEE is not used.
AGT_ENABLE_PIN_ACTIVE_LOW	Events are only counted when AGTEE/AGTWEE is low.
AGT_ENABLE_PIN_ACTIVE_HIGH	Events are only counted when AGTEE/AGTWEE is high.

◆ **agt\_trigger\_edge\_t**

enum agt_trigger_edge_t	
Trigger edge for pulse period measurement mode and event counting mode.	
Enumerator	
AGT_TRIGGER_EDGE_RISING	Measurement starts or events are counted on rising edge.
AGT_TRIGGER_EDGE_FALLING	Measurement starts or events are counted on falling edge.
AGT_TRIGGER_EDGE_BOTH	Events are counted on both edges (n/a for pulse period mode)

◆ **agt\_output\_pin\_t**

enum agt_output_pin_t	
Output pins, used to select which duty cycle to update in <a href="#">R_AGT_DutyCycleSet()</a> .	
Enumerator	
AGT_OUTPUT_PIN_AGTOA	AGTOA.
AGT_OUTPUT_PIN_AGTOB	AGTOB.

◆ **agt\_pin\_cfg\_t**

enum agt_pin_cfg_t	
Level of AGT pin	
Enumerator	
AGT_PIN_CFG_DISABLED	Not used as output pin.
AGT_PIN_CFG_START_LEVEL_LOW	Pin level low.
AGT_PIN_CFG_START_LEVEL_HIGH	Pin level high.

**Function Documentation**

◆ **R\_AGT\_Open()**

```
fsp_err_t R_AGT_Open ( timer_ctrl_t *const p_ctrl, timer_cfg_t const *const p_cfg )
```

Initializes the AGT module instance. Implements `timer_api_t::open`.

The AGT hardware does not support one-shot functionality natively. The one-shot feature is therefore implemented in the AGT HAL layer. For a timer configured as a one-shot timer, the timer is stopped upon the first timer expiration.

The AGT implementation of the general timer can accept an optional `agt_extended_cfg_t` extension parameter. For AGT, the extension specifies the clock to be used as timer source and the output pin configurations. If the extension parameter is not specified (NULL), the default clock PCLKB is used and the output pins are disabled.

Example:

```
/* Initializes the module. */
err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

**Return values**

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the period is not in the valid range of 1 to 0xFFFF.
FSP_ERR_ALREADY_OPEN	R_AGT_Open has already been called for this p_ctrl.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt has not been enabled in the vector table.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel number is not available on AGT.

◆ **R\_AGT\_Start()**

```
fsp_err_t R_AGT_Start ( timer_ctrl_t *const p_ctrl)
```

Starts timer. Implements `timer_api_t::start`.

Example:

```
/* Start the timer. */
(void) R_AGT_Start(&g_timer0_ctrl);
```

**Return values**

FSP_SUCCESS	Timer started.
FSP_ERR_ASSERTION	p_ctrl is null.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R\_AGT\_Stop()**

```
fsp_err_t R_AGT_Stop ( timer_ctrl_t *const p_ctrl)
```

Stops the timer. Implements `timer_api_t::stop`.

Example:

```
/* (Optional) Stop the timer. */
(void) R_AGT_Stop(&g_timer0_ctrl);
```

**Return values**

FSP_SUCCESS	Timer stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R\_AGT\_Reset()**

```
fsp_err_t R_AGT_Reset ( timer_ctrl_t *const p_ctrl)
```

Resets the counter value to the period minus one. Implements `timer_api_t::reset`.

**Return values**

FSP_SUCCESS	Counter reset.
FSP_ERR_ASSERTION	p_ctrl is NULL
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R\_AGT\_Enable()**

```
fsp_err_t R_AGT_Enable ( timer_ctrl_t *const p_ctrl)
```

Enables external event triggers that start, stop, clear, or capture the counter. Implements `timer_api_t::enable`.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
(void) R_AGT_Enable(&g_timer0_ctrl);
```

**Return values**

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_AGT\_Disable()**

```
fsp_err_t R_AGT_Disable ( timer_ctrl_t *const p_ctrl)
```

Disables external event triggers that start, stop, clear, or capture the counter. Implements `timer_api_t::disable`.

Example:

```
/* (Optional) Disable captures. */
(void) R_AGT_Disable(&g_timer0_ctrl);
```

**Return values**

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R\_AGT\_PeriodSet()**

```
fsp_err_t R_AGT_PeriodSet ( timer_ctrl_t *const p_ctrl, uint32_t const period_counts )
```

Updates period. The new period is updated immediately and the counter is reset to the maximum value. Implements `timer_api_t::periodSet`.

**Warning**

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and an AGT underflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter underflow after processing completes.

Stop the timer before calling this function if one-shot output is used.

Example:

```
/* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
 * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
 * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
 * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
has not changed since reset,
 * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
 * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
 * - Calculate the current PCLKB frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
 * by timer_cfg_t::source_div.
 *
```

```

* This example uses the last option (R_FSP_SystemClockHzGet).
*/
uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
g_timer0_cfg.source_div;
/* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
* desired period is larger than UINT32_MAX / pclk_freq_hz. A cast to uint64_t is
used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
* period is larger than UINT16_MAX. */
err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
assert(FSP_SUCCESS == err);

```

### Return values

FSP_SUCCESS	Period value updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the period was not in the valid range of 1 to 0xFFFF.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

## ◆ R\_AGT\_DutyCycleSet()

```
fsp_err_t R_AGT_DutyCycleSet ( timer_ctrl_t *const p_ctrl, uint32_t const duty_cycle_counts,
uint32_t const pin )
```

Updates duty cycle. If the timer is counting, the new duty cycle is reflected after the next counter underflow. Implements [timer\\_api\\_t::dutyCycleSet](#).

Example:

```
/* Get the current period setting. */
timer_info_t info;
(void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. */
uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
AGT_EXAMPLE_MAX_PERCENT;
/* Set the calculated duty cycle. */
err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA);
assert(FSP_SUCCESS == err);
```

### Return values

FSP_SUCCESS	Duty cycle updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the pin was not AGT_AGTO_AGTOA or AGT_AGTO_AGTOB.
FSP_ERR_INVALID_ARGUMENT	Duty cycle was not in the valid range of 0 to period (counts) - 1
FSP_ERR_NOT_OPEN	The instance control structure is not opened.
FSP_ERR_UNSUPPORTED	AGT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ **R\_AGT\_InfoGet()**

```
fsp_err_t R_AGT_InfoGet ( timer_ctrl_t *const p_ctrl, timer_info_t *const p_info )
```

Gets timer information and store it in provided pointer p\_info. Implements `timer_api_t::infoGet`.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
(void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
uint32_t period = info.period_counts;
```

**Return values**

FSP_SUCCESS	Period, count direction, and frequency stored in p_info.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R\_AGT\_StatusGet()**

```
fsp_err_t R_AGT_StatusGet ( timer_ctrl_t *const p_ctrl, timer_status_t *const p_status )
```

Retrieves the current state and counter value stores them in p\_status. Implements `timer_api_t::statusGet`.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
(void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
```

**Return values**

FSP_SUCCESS	Current status and counter value provided in p_status.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R\_AGT\_CallbackSet()**

```
fsp_err_t R_AGT_CallbackSet ( timer_ctrl_t *const p_api_ctrl, void (*)(timer_callback_args_t *)
p_callback, void const *const p_context, timer_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `timer_api_t::callbackSet`.

**Return values**

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R\_AGT\_Close()**

```
fsp_err_t R_AGT_Close ( timer_ctrl_t *const p_ctrl)
```

Stops counter, disables interrupts, disables output pins, and clears internal driver data. Implements `timer_api_t::close`.

**Return values**

FSP_SUCCESS	Timer closed.
FSP_ERR_ASSERTION	<code>p_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

## 4.2.19 Transfer

### Modules

### Detailed Description

Transfer Modules.

### Modules

Transfer (r\_dmac)

Driver for the DMAC peripheral on RA MCUs. This module implements the [Transfer Interface](#).

#### Transfer (r\_dtc)

Driver for the DTC peripheral on RA MCUs. This module implements the [Transfer Interface](#).

### 4.2.19.1 Transfer (r\_dmac)

[Modules](#) » [Transfer](#)

#### Functions

fsp\_err\_t R\_DMAC\_Open (transfer\_ctrl\_t \*const p\_api\_ctrl, transfer\_cfg\_t const \*const p\_cfg)

fsp\_err\_t R\_DMAC\_Reconfigure (transfer\_ctrl\_t \*const p\_api\_ctrl, transfer\_info\_t \*p\_info)

fsp\_err\_t R\_DMAC\_Reset (transfer\_ctrl\_t \*const p\_api\_ctrl, void const \*volatile p\_src, void \*volatile p\_dest, uint16\_t const num\_transfers)

fsp\_err\_t R\_DMAC\_SoftwareStart (transfer\_ctrl\_t \*const p\_api\_ctrl, transfer\_start\_mode\_t mode)

fsp\_err\_t R\_DMAC\_SoftwareStop (transfer\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t R\_DMAC\_Enable (transfer\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t R\_DMAC\_Disable (transfer\_ctrl\_t \*const p\_api\_ctrl)

fsp\_err\_t R\_DMAC\_InfoGet (transfer\_ctrl\_t \*const p\_api\_ctrl, transfer\_properties\_t \*const p\_info)

fsp\_err\_t R\_DMAC\_Close (transfer\_ctrl\_t \*const p\_api\_ctrl)

#### Detailed Description

Driver for the DMAC peripheral on RA MCUs. This module implements the [Transfer Interface](#).

## Overview

The Direct Memory Access Controller (DMAC) transfers data from one memory location to another without using the CPU.

## Features

- Supports multiple transfer modes
  - Normal transfer
  - Repeat transfer
  - Block transfer
  - Repeat-Block transfer (Not available on all MCUs)
- Address increment, decrement, fixed, or offset modes
- Triggered by ELC events
  - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

## Configuration

### Build Time Configurations for r\_dmac

The following build time configurations are defined in fsp\_cfg/r\_dmac\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

### Configurations for Transfer > Transfer (r\_dmac)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r\_dmac).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_transfer0	Module name.
Channel	Value must be a non-negative integer	0	Specify the hardware channel.
Mode	<ul style="list-style-type: none"> <li>• Normal</li> <li>• Repeat</li> <li>• Block</li> <li>• Repeat-Block</li> </ul>	Normal	Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers; Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks; Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after

			Number of Blocks.
Transfer Size	<ul style="list-style-type: none"> <li>• 1 Byte</li> <li>• 2 Bytes</li> <li>• 4 Bytes</li> </ul>	2 Bytes	Select the transfer size.
Destination Address Mode	<ul style="list-style-type: none"> <li>• Fixed</li> <li>• Offset addition</li> <li>• Incremented</li> <li>• Decrement</li> </ul>	Fixed	Select the address mode for the destination.
Source Address Mode	<ul style="list-style-type: none"> <li>• Fixed</li> <li>• Offset addition</li> <li>• Incremented</li> <li>• Decrement</li> </ul>	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	<ul style="list-style-type: none"> <li>• Destination</li> <li>• Source</li> </ul>	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Destination Pointer	Manual Entry	NULL	Specify the transfer destination pointer.
Source Pointer	Manual Entry	NULL	Specify the transfer source pointer.
Number of Transfers	Value must be a non-negative integer	1	Specify the number of transfers for repeat and normal mode or block size for repeat-block transfer mode.
Number of Blocks (Valid only in Repeat,Block or Repeat-Block Mode)	Value must be a non-negative integer	0	Specify the number of blocks to transfer in Repeat,Block or Repeat-Block mode.
Activation Source	MCU Specific Options		Select the DMAC transfer start event. If no ELC event is chosen then software start can be used.
Callback	Name must be a valid C symbol	NULL	A user callback that is called at the end of the transfer.
Context	Manual Entry	NULL	Pointer to the context structure passed through the callback argument.
Transfer End Interrupt Priority	MCU Specific Options		Select the transfer end interrupt priority.
Interrupt Frequency	<ul style="list-style-type: none"> <li>• Interrupt after</li> </ul>	Interrupt after all	Select to have interrupt

	all transfers have completed	transfers have completed	after each transfer or after last transfer.
	<ul style="list-style-type: none"> <li>Interrupt after each block, or repeat size is transferred</li> </ul>		
Offset value (Valid only when address mode is '\Offset\')	Value must be a 24 bit signed integer.	1	Offset value is added to the address after each transfer.
Source Buffer Size	Value must be a non-negative integer	1	Specify the size of whole source buffer (valid only for Repeat-Block transfer mode with source address update mode other than offset addition).

## Clock Configuration

The DMAC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build, or by using the CGC module at run-time.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Transfer Modes

The DMAC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transferred every time the configured ELC event is received by the DMAC channel. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment, decrement, or add an offset to the next data unit after each transfer. A 16-bit counter decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the ELC event and the CPU can be interrupted to signal that all transfers have finished.
- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,1024]. When the transfer counter reaches 0, the counter is reset to its configured value, the repeat area (source or destination address) resets to its starting address and the block count remaining will decrement by 1. When the block count reaches 0, transfers will no longer be triggered by the ELC event and the CPU may be interrupted to signal that all transfers have finished.
- **Block Mode** - In block mode, the amount of data units transferred by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or destination address) will reset to the original address and the other address will be incremented or decremented to the next block.
- **Repeat-Block Mode** - In repeat-block mode, the amount of data units transferred by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can be configured to a 16 bit number. If the destination address mode is offset mode, maximum configurable number of blocks is 0xFFFF for block size(length) of one with data

transfer size as byte, 0x7FFF for block size of one with data transfer size as half word and 0x3FFF for block size of one with data size as word. After each block transfer the source address and the destination address will be incremented or decremented to the next block address. In case of offset address mode for source address, the source address size is the total size of source buffer after which the source area is rolled over, block size can be smaller than the source buffer size. For source address mode as offset mode, the maximum configurable source buffer size is 0xFFFF for transfer data size of a byte, 0x7FFF for transfer data size of half word and 0x3FFF for transfer data size of word. Repeat-block mode can be used to implement single ring buffer to multiple ring buffer transfer type design.

## Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	<ul style="list-style-type: none"> <li>Repeats forever</li> <li>Max repeat size is 256 x 4 bytes</li> </ul>	<ul style="list-style-type: none"> <li>Configurable number of repeats</li> <li>Max repeat size is 1024 x 4 bytes</li> </ul>
Block Mode	<ul style="list-style-type: none"> <li>Max block size is 256 x 4 bytes</li> </ul>	<ul style="list-style-type: none"> <li>Max block size is 1024 x 4 bytes</li> </ul>
Channels	<ul style="list-style-type: none"> <li>One instance per interrupt</li> </ul>	<ul style="list-style-type: none"> <li>MCU specific (8 channels or less)</li> </ul>
Chained Transfers	<ul style="list-style-type: none"> <li>Supported</li> </ul>	<ul style="list-style-type: none"> <li>Not Supported</li> </ul>
Software Trigger	<ul style="list-style-type: none"> <li>Must use the software ELC event</li> </ul>	<ul style="list-style-type: none"> <li>Has support for software trigger without using software ELC event</li> <li>Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT</li> </ul>
Offset Address Mode	<ul style="list-style-type: none"> <li>Not supported</li> </ul>	<ul style="list-style-type: none"> <li>Supported</li> </ul>

## Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured IELSR event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The transfer\_info\_t::irq setting also behaves a little differently depending on which mode is selected.

## Normal Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

## Repeat Mode

	DTC	DMAC

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

## Block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

## Additional Considerations

- The DTC requires a moderate amount of RAM (one `transfer_info_t` struct per open instance + `DTC_VECTOR_TABLE_SIZE`).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.

## Offset Address Mode

When the source or destination mode is configured to offset mode, a configurable offset is added to the source or destination pointer after each transfer. The offset is a signed 24 bit number.

## Examples

### Basic Example

This is a basic example of minimal use of the DMAC in an application. In this case, one or more events have been routed to the DMAC for handling so it only needs to be enabled to start accepting transfers.

```
void dmac_minimal_example (void)
{
    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_DMAC_Open(&g_transfer_ctrl, &g_transfer_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable the DMAC so that it responds to transfer requests. */
    err = R_DMAC_Enable(&g_transfer_ctrl);
    assert(FSP_SUCCESS == err);
}
```

## CRC32 Example

In this example the DMAC is used to feed the CRC peripheral to perform a CRC32 operation.

```
volatile bool g_transfer_complete = false;

void dmac_callback (dmac_callback_args_t * cb_data)
{
    FSP_PARAMETER_NOT_USED(cb_data);
    g_transfer_complete = true;
}

void dmac_crc_example (void)
{
    uint8_t p_src[TRANSFER_LENGTH];
    /* Initialize p_src to [ABC..OP] */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        p_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Set transfer source address to p_src */
    g_transfer_cfg.p_info->p_src = (void *) p_src;
    /* Set transfer destination address to the CRC data input register */
    g_transfer_cfg.p_info->p_dest = (void *) &R_CRC->CRCDIR;
    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_DMACE_Open(&g_transfer_ctrl, &g_transfer_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable DMACE transfers. */
    (void) R_DMACE_Enable(&g_transfer_ctrl);
    /* Open the CRC module. */
    err = R_CRC_Open(&g_crc_ctrl, &g_crc_cfg);
    assert(FSP_SUCCESS == err);
    /* Clear the transfer complete flag. */
    g_transfer_complete = false;
    /* Trigger the transfer using software. */
    err = R_DMACE_SoftwareStart(&g_transfer_ctrl, TRANSFER_START_MODE_SINGLE);
    assert(FSP_SUCCESS == err);
}
```

```
while (!g_transfer_complete)
{
/* Wait for transfer complete interrupt */
}

/* Get CRC result and perform final XOR. */
uint32_t crc32;
(void) R_CRC_CalculatedValueGet(&g_crc_ctrl, &crc32);
crc32 ^= CRC32_FINAL_XOR_VALUE;

/* Verify that the CRC32 is calculated correctly. */
/* CRC32("ABCD...NOP") = 0xE0E8FF4D. */
const uint32_t expected_crc32 = 0xE0E8FF4D;
if (expected_crc32 != crc32)
{
/* Handle any CRC errors. This function should be defined by the user. */
handle_crc_error();
}
}
```

◆ **DMAC\_MAX\_REPEAT\_COUNT**

#define DMAC\_MAX\_REPEAT\_COUNT

Max configurable number of repeats to transfer in TRANSFER\_MODE\_REPEAT

◆ **DMAC\_MAX\_BLOCK\_COUNT**

#define DMAC\_MAX\_BLOCK\_COUNT

Max configurable number of blocks to transfer in TRANSFER\_MODE\_BLOCK

**Function Documentation**◆ **R\_DMCA\_Open()**

fsp\_err\_t R\_DMCA\_Open ( transfer\_ctrl\_t\*const p\_api\_ctrl, transfer\_cfg\_t const\*const p\_cfg )

Configure a DMCA channel.

**Return values**

FSP_SUCCESS	Successful open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The configured channel is invalid.
FSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.

◆ **R\_DMCA\_Reconfigure()**

fsp\_err\_t R\_DMCA\_Reconfigure ( transfer\_ctrl\_t\*const p\_api\_ctrl, transfer\_info\_t\* p\_info )

Reconfigure the transfer with new transfer info.

**Return values**

FSP_SUCCESS	Transfer is configured and will start when trigger occurs.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMCA is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMCA_Open to initialize the control block.

◆ **R\_DMACE\_Reset()**

```
fsp_err_t R_DMACE_Reset ( transfer_ctrl_t *const p_api_ctrl, void const *volatile p_src, void *volatile p_dest, uint16_t const num_transfers )
```

Reset transfer source, destination, and number of transfers.

**Return values**

FSP_SUCCESS	Transfer reset successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMACE is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMACE_Open to initialize the control block.

◆ **R\_DMACE\_SoftwareStart()**

```
fsp_err_t R_DMACE_SoftwareStart ( transfer_ctrl_t *const p_api_ctrl, transfer_start_mode_t mode )
```

If the mode is TRANSFER\_START\_MODE\_SINGLE initiate a single transfer with software. If the mode is TRANSFER\_START\_MODE\_REPEAT continue triggering transfers until all of the transfers are completed.

**Return values**

FSP_SUCCESS	Transfer started written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMACE_Open to initialize the control block.
FSP_ERR_UNSUPPORTED	Handle was not configured for software activation.

◆ **R\_DMAC\_SoftwareStop()**

`fsp_err_t R_DMAC_SoftwareStop ( transfer_ctrl_t *const p_api_ctrl)`

Stop software transfers if they were started with TRANSFER\_START\_MODE\_REPEAT.

**Return values**

FSP_SUCCESS	Transfer stopped written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ **R\_DMAC\_Enable()**

`fsp_err_t R_DMAC_Enable ( transfer_ctrl_t *const p_api_ctrl)`

Enable transfers for the configured activation source.

**Return values**

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ **R\_DMAC\_Disable()**

`fsp_err_t R_DMAC_Disable ( transfer_ctrl_t *const p_api_ctrl)`

Disable transfers so that they are no longer triggered by the activation source.

**Return values**

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ **R\_DMACE\_InfoGet()**

```
fsp_err_t R_DMACE_InfoGet ( transfer_ctrl_t *const p_api_ctrl, transfer_properties_t *const p_info )
```

Set driver specific information in provided pointer.

**Return values**

FSP_SUCCESS	Information has been written to p_info.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMACE_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ **R\_DMACE\_Close()**

```
fsp_err_t R_DMACE_Close ( transfer_ctrl_t *const p_api_ctrl)
```

Disable transfer and clean up internal data. Implements [transfer\\_api\\_t::close](#).

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMACE_Open to initialize the control block.

**4.2.19.2 Transfer (r\_dtc)**

```

## Detailed Description

Driver for the DTC peripheral on RA MCUs. This module implements the [Transfer Interface](#).

## Overview

The Data Transfer Controller (DTC) transfers data from one memory location to another without using the CPU.

The DTC uses a RAM based vector table. Each entry in the vector table corresponds to an entry in the ISR vector table. When the DTC is triggered by an interrupt, it reads the DTC vector table, fetches the transfer information, and then executes the transfer. After the transfer is executed, the DTC writes the updated transfer info back to the location pointed to by the DTC vector table.

## Features

- Supports multiple transfer modes
  - Normal transfer
  - Repeat transfer
  - Block transfer
- Chain transfers
- Address increment, decrement or fixed modes
- Can be triggered by any event that has reserved a slot in the interrupt vector table.
  - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

## Configuration

### Build Time Configurations for r\_dtc

The following build time configurations are defined in fsp\_cfg/r\_dtc\_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> <li>• Default (BSP)</li> <li>• Enabled</li> <li>• Disabled</li> </ul>	Default (BSP)	If selected code for parameter checking is included in the build.

Linker section to keep DTC vector table      Manual Entry      .fsp\_dtc\_vector\_table      Section to place the DTC vector table.

### Configurations for Transfer > Transfer (r\_dtc)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r\_dtc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_transfer0	Module name.
Mode	<ul style="list-style-type: none"> <li>• Normal</li> <li>• Repeat</li> <li>• Block</li> </ul>	Normal	Select the transfer mode. Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers; Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer repeats until stopped; Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks.
Transfer Size	<ul style="list-style-type: none"> <li>• 1 Byte</li> <li>• 2 Bytes</li> <li>• 4 Bytes</li> </ul>	2 Bytes	Select the transfer size.
Destination Address Mode	<ul style="list-style-type: none"> <li>• Fixed</li> <li>• Incremented</li> <li>• Decrementd</li> </ul>	Fixed	Select the address mode for the destination.
Source Address Mode	<ul style="list-style-type: none"> <li>• Fixed</li> <li>• Incremented</li> <li>• Decrementd</li> </ul>	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	<ul style="list-style-type: none"> <li>• Destination</li> <li>• Source</li> </ul>	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Destination Pointer	Manual Entry	NULL	Specify the transfer destination pointer.
Source Pointer	Manual Entry	NULL	Specify the transfer source pointer.

Interrupt Frequency	<ul style="list-style-type: none"> <li>• After all transfers have completed</li> <li>• After each transfer</li> </ul>	After all transfers have completed	Select to have interrupt after each transfer or after last transfer.
Number of Transfers	Value must be a non-negative integer	0	Specify the number of transfers.
Number of Blocks (Valid only in Block Mode)	Must be a valid non-negative integer with a maximum configurable value of 65536. Applicable only in Block Mode.	0	Specify the number of blocks to transfer in Block mode.
Activation Source	MCU Specific Options		Select the DTC transfer start event.

## Clock Configuration

The DTC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build or by using the CGC module at runtime.

## Pin Configuration

This module does not use I/O pins.

# Usage Notes

## Transfer Modes

The DTC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transferred every time an interrupt is received by the DTC. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment or decrement to the next data unit after each transfer. A 16-bit counter (length) decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the interrupt source and the CPU can be interrupted to signal that all transfers have finished.
- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,256]. When the transfer counter reaches 0, the counter is reset to its configured value and the repeat area (source or destination address) resets to its starting address and transfers will still be triggered by the interrupt.
- **Block Mode** - In block mode, the amount of data units transferred by each interrupt can be set to an integer in the range [1,256]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or destination address) will reset to the original address and the other address will be incremented or decremented to the next block.

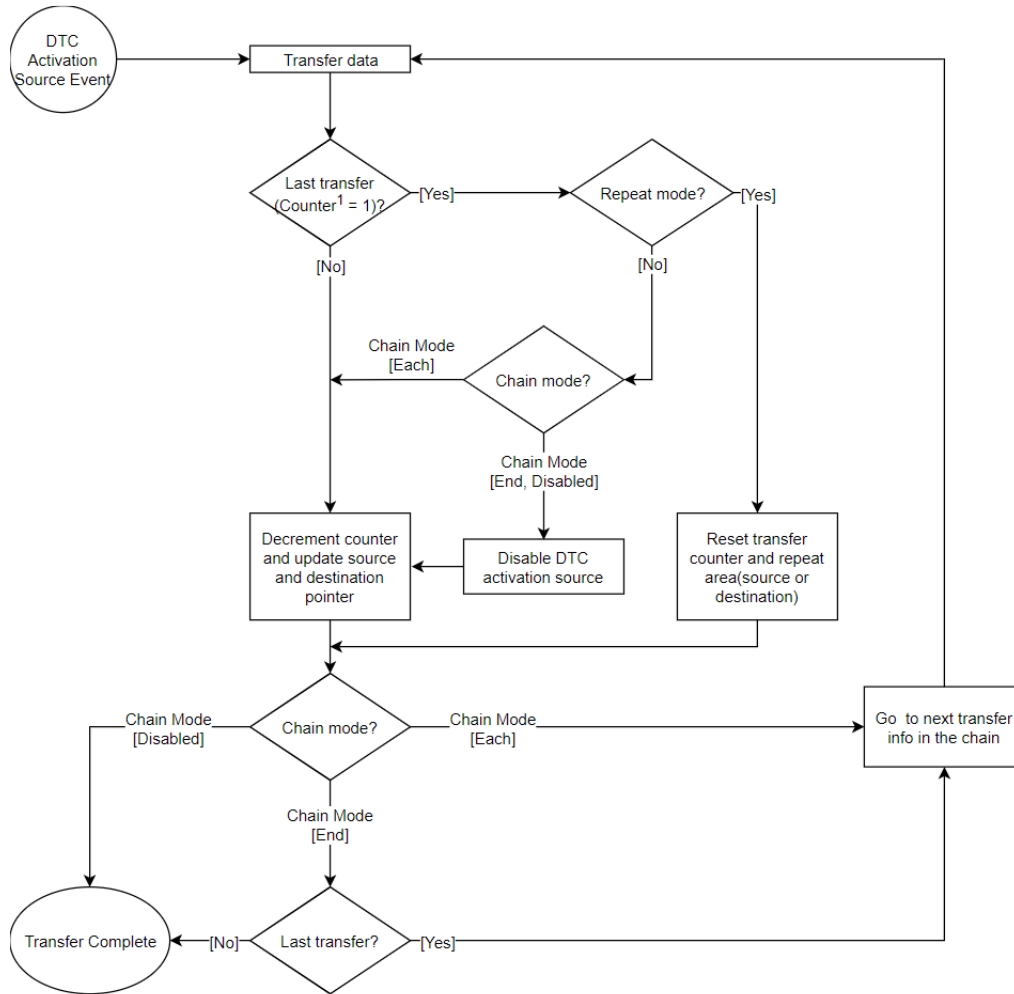

### Note

1. The source and destination address of the transfer must be aligned to the configured data unit.
2. In normal mode the length can be set to [0,65535]. When the length is set to 0, than the transaction will execute 65536 transfers not 0.
3. In block mode, num\_blocks can be set to [0,65535]. When the length is set to 0, than the transaction will execute

65536 transfers not 0.

### Chaining Transfers

Multiple transfers can be configured for the same interrupt source by specifying an array of `transfer_info_t` structs instead of just passing a pointer to one. In this configuration, every `transfer_info_t` struct must be configured for a chain mode except for the last one. There are two types of chain mode; `CHAIN_MODE_EACH` and `CHAIN_MODE_END`. If a transfer is configured in `CHAIN_MODE_EACH` then it triggers the next transfer in the chain after it completes each transfer. If a transfer is configured in `CHAIN_MODE_END` then it triggers the next transfer in the chain after it completes its last transfer.

1. Counter refers to `transfer_info_t.length` in normal and repeat mode and `transfer_info_t.num_blocks` in block mode.

Figure 236: DTC Transfer Flowchart

### Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	• Repeats forever	• Configurable number of

	<ul style="list-style-type: none"> <li>Max repeat size is 256 x 4 bytes</li> </ul>	<ul style="list-style-type: none"> <li>repeats</li> <li>Max repeat size is 1024 x 4 bytes</li> </ul>
Block Mode	<ul style="list-style-type: none"> <li>Max block size is 256 x 4 bytes</li> </ul>	<ul style="list-style-type: none"> <li>Max block size is 1024 x 4 bytes</li> </ul>
Channels	<ul style="list-style-type: none"> <li>One instance per interrupt</li> </ul>	<ul style="list-style-type: none"> <li>MCU specific (8 channels or less)</li> </ul>
Chained Transfers	<ul style="list-style-type: none"> <li>Supported</li> </ul>	<ul style="list-style-type: none"> <li>Not Supported</li> </ul>
Software Trigger	<ul style="list-style-type: none"> <li>Must use the software ELC event</li> </ul>	<ul style="list-style-type: none"> <li>Has support for software trigger without using software ELC event</li> <li>Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT</li> </ul>
Offset Address Mode	<ul style="list-style-type: none"> <li>Not supported</li> </ul>	<ul style="list-style-type: none"> <li>Supported</li> </ul>

### Additional Considerations

- The DTC requires a moderate amount of RAM (one `transfer_info_t` struct per open instance + `DTC_VECTOR_TABLE_SIZE`).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.
- The DTC interrupts the CPU using the activation source's IRQ. Each DMAC channel has its own IRQ.

### Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured IELSR event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The `transfer_info_t::irq` setting also behaves a little differently depending on which mode is selected.

### Normal Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

### Repeat Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

### Block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

*Note*

$DTC\_VECTOR\_TABLE\_SIZE = (ICU\_NVIC\_IRQ\_SOURCES \times 4) \text{ Bytes}$

**Peripheral Interrupts and DTC**

When an interrupt is configured to trigger DTC transfers, the peripheral ISR will trigger on the following conditions:

- Each transfer completed (transfer\_info\_t::irq = TRANSFER\_IRQ\_EACH)
- Last transfer completed (transfer\_info\_t::irq = TRANSFER\_IRQ\_END)

For example, if SCI1\_RXI is configured to trigger DTC transfers and a SCI1\_RXI event occurs, the interrupt will not fire until the DTC transfer is completed. If the DTC transfer\_info\_t::irq is configured to only interrupt on the last transfer, than no RXI interrupts will occur until the last transfer is completed.

*Note*

1. The DTC activation source must be enabled in the NVIC in order to trigger DTC transfers (Modules that are designed to integrate the R\_DTC module will automatically handle this).
2. The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

**Low Power Modes**

DTCST must be set to 0 before transitioning to any of the following:

- Module-stop state
- Software Standby mode without Snooze mode transition
- Deep Software Standby mode

*Note*

1. R\_LPM Module stops the DTC before entering deep software standby mode and software standby without snooze mode transition.
2. For more information see 18.9 and 18.10 in the RA6M3 manual R01UH0886EJ0100.

**Limitations**

Developers should be aware of the following limitations when using the DTC:

- If the DTC is configured to service many different activation sources, the system could run in to performance issues due to memory contention. To address this issue, it is recommended that the DTC vector table and transfer information be moved to their own dedicated memory area (Ex: SRAM0, SRAM1, SRAMHS). This allows memory accesses from different BUS Masters (CPU, DTC, DMAC, EDMAC and Graphics IPs) to occur in parallel.

**Examples****Basic Example**

This is a basic example of minimal use of the DTC in an application.

```
void dtc_minimal_example (void)
{
    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_DTC_Open(&g_transfer_ctrl, &g_transfer_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable the DTC to handle incoming transfer requests. */
    err = R_DTC_Enable(&g_transfer_ctrl);
    assert(FSP_SUCCESS == err);
}
```

## Data Structures

#define [DTC\\_MAX\\_BLOCK\\_COUNT](#)

## Data Structure Documentation

### ◆ [dtc\\_extended\\_cfg\\_t](#)

struct <a href="#">dtc_extended_cfg_t</a>		
DTC transfer configuration extension. This extension is required.		
Data Fields		
IRQn_Type	activation_source	Select which IRQ will trigger the transfer.

### ◆ [dtc\\_instance\\_ctrl\\_t](#)

struct <a href="#">dtc_instance_ctrl_t</a>
Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in <a href="#">transfer_api_t::open</a> .

## Macro Definition Documentation

---

### ◆ DTC\_MAX\_NORMAL\_TRANSFER\_LENGTH

```
#define DTC_MAX_NORMAL_TRANSFER_LENGTH
```

Max configurable number of transfers in NORMAL MODE

### ◆ DTC\_MAX\_REPEAT\_TRANSFER\_LENGTH

```
#define DTC_MAX_REPEAT_TRANSFER_LENGTH
```

Max number of transfers per repeat for REPEAT MODE

### ◆ DTC\_MAX\_BLOCK\_TRANSFER\_LENGTH

```
#define DTC_MAX_BLOCK_TRANSFER_LENGTH
```

Max number of transfers per block in BLOCK MODE

### ◆ DTC\_MAX\_BLOCK\_COUNT

```
#define DTC_MAX_BLOCK_COUNT
```

Max configurable number of blocks to transfer in BLOCK MODE

## Function Documentation

---

◆ **R\_DTC\_Open()**

```
fsp_err_t R_DTC_Open ( transfer_ctrl_t *const p_api_ctrl, transfer_cfg_t const *const p_cfg )
```

Configure the vector table if it hasn't been configured, enable the Module and copy the pointer to the transfer info into the DTC vector table. Implements [transfer\\_api\\_t::open](#).

Example:

```
/* Open the transfer instance with initial configuration. */
fsp_err_t err = R_DTC_Open(&g_transfer_ctrl, &g_transfer_cfg);
```

**Return values**

FSP_SUCCESS	Successful open. Transfer transfer info pointer copied to DTC Vector table. Module started. DTC vector table configured.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_UNSUPPORTED	Address Mode Offset is selected.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.
FSP_ERR_IN_USE	The index for this IRQ in the DTC vector table is already configured.
FSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.

◆ **R\_DTC\_Reconfigure()**

```
fsp_err_t R_DTC_Reconfigure ( transfer_ctrl_t *const p_api_ctrl, transfer_info_t * p_info )
```

Copy pointer to transfer info into the DTC vector table and enable transfer in ICU. Implements [transfer\\_api\\_t::reconfigure](#).

**Return values**

FSP_SUCCESS	Transfer is configured and will start when trigger occurs.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_NOT_ENABLED	Transfer source address is NULL or is not aligned correctly. Transfer destination address is NULL or is not aligned correctly.

**Note**

*p\_info must persist until all transfers are completed.*

◆ **R\_DTC\_Reset()**

```
fsp_err_t R_DTC_Reset ( transfer_ctrl_t *const p_api_ctrl, void const *volatile p_src, void *volatile p_dest, uint16_t const num_transfers )
```

Reset transfer source, destination, and number of transfers. Implements [transfer\\_api\\_t::reset](#).

**Return values**

FSP_SUCCESS	Transfer reset successfully (transfers are enabled).
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_NOT_ENABLED	Transfer source address is NULL or is not aligned correctly. Transfer destination address is NULL or is not aligned correctly.

◆ **R\_DTC\_SoftwareStart()**

```
fsp_err_t R_DTC_SoftwareStart ( transfer_ctrl_t *const p_api_ctrl, transfer_start_mode_t mode )
```

Placeholder for unsupported softwareStart function. Implements [transfer\\_api\\_t::softwareStart](#).

**Return values**

FSP_ERR_UNSUPPORTED	DTC software start is not supported.
---------------------	--------------------------------------

◆ **R\_DTC\_SoftwareStop()**

```
fsp_err_t R_DTC_SoftwareStop ( transfer_ctrl_t *const p_api_ctrl)
```

Placeholder for unsupported softwareStop function. Implements [transfer\\_api\\_t::softwareStop](#).

**Return values**

FSP_ERR_UNSUPPORTED	DTC software stop is not supported.
---------------------	-------------------------------------

◆ **R\_DTC\_Enable()**

```
fsp_err_t R_DTC_Enable ( transfer_ctrl_t *const p_api_ctrl)
```

Enable transfers on this activation source. Implements [transfer\\_api\\_t::enable](#).

Example:

```
/* Enable the DTC to handle incoming transfer requests. */
err = R_DTC_Enable(&g_transfer_ctrl);
assert(FSP_SUCCESS == err);
```

**Return values**

FSP_SUCCESS	Transfers will be triggered by the activation source
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_UNSUPPORTED	Address Mode Offset is selected.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

◆ **R\_DTC\_Disable()**

```
fsp_err_t R_DTC_Disable ( transfer_ctrl_t *const p_api_ctrl)
```

Disable transfer on this activation source. Implements [transfer\\_api\\_t::disable](#).

**Return values**

FSP_SUCCESS	Transfers will not occur on activation events.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

## ◆ R\_DTC\_InfoGet()

```
fsp_err_t R_DTC_InfoGet ( transfer_ctrl_t *const p_api_ctrl, transfer_properties_t *const p_properties )
```

Provides information about this transfer. Implements `transfer_api_t::infoGet`.

**Return values**

FSP_SUCCESS	p_info updated with current instance information.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

## ◆ R\_DTC\_Close()

```
fsp_err_t R_DTC_Close ( transfer_ctrl_t *const p_api_ctrl)
```

Disables DTC activation in the ICU, then clears transfer data from the DTC vector table. Implements `transfer_api_t::close`.

**Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

## 4.2.20 TrustZone

### Modules

#### Detailed Description

Arm TrustZone Modules.

**Modules**

[ARM TrustZone Context RA Port \(rm\\_tz\\_context\)](#)

RTOS Context Management for RA MCUs.

### 4.2.20.1 ARM TrustZone Context RA Port (rm\_tz\_context)

Modules » TrustZone

RTOS Context Management for RA MCUs.

## Overview

Add this module to a secure TrustZone project to allow the associated non-secure project to use an RTOS. It is used by an RTOS port for RA MCUs (for example, the [FreeRTOS Port \(rm\\_freertos\\_port\)](#), which is automatically added to RA projects when FreeRTOS is selected during project creation).

#### Note

*The RTOS Context Management module does not provide any interfaces to the user. To use this module to port an RTOS, consult the Arm documentation at [https://arm-software.github.io/CMSIS\\_5/Core/html/group\\_\\_context\\_\\_trustzone\\_\\_functions.html](https://arm-software.github.io/CMSIS_5/Core/html/group__context__trustzone__functions.html) for further information.*

## Configuration

### Build Time Configurations for rm\_tz\_context

The following build time configurations are defined in fsp\_cfg/rm\_tz\_context\_cfg.h:

Configuration	Options	Default	Description
Process Stack Slots	Value must be a non-negative integer greater than 0	8	The maximum number of threads that can allocate a secure context. For applications using FreeRTOS, the Idle task requires 1 context as well.
Process Stack Size	Value must be a non-negative multiple of 8	256	The maximum stack size of all non-secure callable functions.

### Clock Configuration

This module does not use peripheral clocks.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### TrustZone Integration

When using an RTOS in a TrustZone project, ARM recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context. To allocate a secure context, reference the documentation for the RTOS port used. For example, reference [TrustZone Integration](#) when FreeRTOS is used.

### Sealing the Process Stack

This module seals each process stack by placing the value 0xFE5EDA5 above the stack top. For more information, refer to section 3.5 "Sealing a Stack" in "Secure software guidelines for ARMv8-M": <https://developer.arm.com/documentation/100720/0300>.

## 4.3 Interfaces

### Detailed Description

The FSP interfaces provide APIs for common functionality. They can be implemented by one or more modules. Modules can use other modules as dependencies using this interface layer.

#### Modules

##### ADC Interface

Interface for A/D Converters.

##### ADPCM Decoder Interface

Interface for ADPCM decoder.

##### AUDIO PLAYBACK Interface

Interface for the Audio Playback.

##### BLE ABS Interface

Interface for Bluetooth Low Energy Abstraction functions.

##### BLE Interface

Interface for Bluetooth Low Energy functions.

##### BLE Mesh Access Interface

Interface for Bluetooth Low Energy Mesh Access functions.

### BLE Mesh Bearer Interface

Interface for Bluetooth Low Energy Mesh Bearer functions.

### BLE Mesh Bearer Platform Interface

Interface for Bluetooth Low Energy Mesh Bearer Platform functions.

### BLE Mesh Health Server Interface

Interface for Bluetooth Low Energy Mesh Model Health Server functions.

### BLE Mesh Interface

Interface for Bluetooth Low Energy Abstraction functions.

### BLE Mesh Lower Trans Interface

Interface for Bluetooth Low Energy Mesh Lower Trans functions.

### BLE Mesh Model Client Interface

Interface for Bluetooth Low Energy Mesh Model Model Client functions.

### BLE Mesh Model Configuration Client Interface

Interface for Bluetooth Low Energy Mesh Model Configuration Client functions.

### BLE Mesh Model Server Interface

Interface for Bluetooth Low Energy Mesh Model Model Server functions.

### BLE Mesh Network Interface

Interface for Bluetooth Low Energy Mesh Network functions.

### BLE Mesh Provision Interface

Interface for Bluetooth Low Energy Mesh Provision functions.

### BLE Mesh Scene Server Interface

Interface for Bluetooth Low Energy Mesh Model Scene Server functions.

#### BLE Mesh Upper Trans Interface

Interface for Bluetooth Low Energy Mesh Upper Trans functions.

#### Block Media Interface

Interface for block media memory access.

#### CAC Interface

Interface for clock frequency accuracy measurements.

#### CAN Interface

Interface for CAN peripheral.

#### CEC Interface

Interface for CEC peripheral.

#### CGC Interface

Interface for clock generation.

#### CRC Interface

Interface for cyclic redundancy checking.

#### CTSU Interface

Interface for Capacitive Touch Sensing Unit (CTSU) functions.

#### Communicatons Middleware Interface

Interface for Communications Middleware functions.

#### Comparator Interface

Interface for comparators.

#### DAC Interface

Interface for D/A converters.

#### DOC Interface

Interface for the Data Operation Circuit.

#### Display Interface

Interface for LCD panel displays.

#### ELC Interface

Interface for the Event Link Controller.

#### Ethernet Interface

Interface for Ethernet functions.

#### Ethernet PHY Interface

Interface for Ethernet PHY functions.

#### External IRQ Interface

Interface for detecting external interrupts.

#### FSXXX Middleware Interface

Interface for FSXXX Middleware functions.

#### FileX Block Media Port Interface

Interface for FileX Block Media port.

#### Flash Interface

Interface for the Flash Memory.

#### FreeRTOS+FAT Port Interface

Interface for FreeRTOS+FAT port.

#### HS300X Middleware Interface

Interface for HS300X Middleware functions.

### I/O Port Interface

Interface for accessing I/O ports and configuring I/O functionality.

### I2C Master Interface

Interface for I2C master communication.

### I2C Slave Interface

Interface for I2C slave communication.

### I2S Interface

Interface for I2S audio communication.

### I3C Interface

Interface for I3C.

### IIR Interface

Interface for IIR filter functionality.

### JPEG Codec Interface

Interface for JPEG functions.

### Key Matrix Interface

Interface for key matrix functions.

### LittleFS Interface

Interface for LittleFS access.

### Low Power Modes Interface

Interface for accessing low power modes.

### Low Voltage Detection Interface

Interface for Low Voltage Detection.

### Motor 120-Degree Control Interface

Interface for motor 120 control functions.

### Motor 120-Degree Driver Interface

Interface for motor driver functions.

### Motor Interface

Interface for Motor functions.

### Motor angle Interface

Interface for motor angle and speed calculation functions.

### Motor current Interface

Interface for motor current functions.

### Motor driver Interface

Interface for motor driver functions.

### Motor position Interface

Interface for motor position functions.

### Motor speed Interface

Interface for motor speed functions.

### OB1203 Middleware Interface

Interface for OB1203 Middleware functions.

### OPAMP Interface

Interface for Operational Amplifiers.

### PDC Interface

Interface for PDC functions.

### POEG Interface

Interface for the Port Output Enable for GPT.

#### PTP Interface

Interface for PTP functions.

#### RTC Interface

Interface for accessing the Realtime Clock.

#### SCE Interface

Interface for Secure Crypto Engine (SCE) functions.

#### SD/MMC Interface

Interface for accessing SD, eMMC, and SDIO devices.

#### SLCDC Interface

Interface for Segment LCD controllers.

#### SPI Flash Interface

Interface for accessing external SPI flash devices.

#### SPI Interface

Interface for SPI communications.

#### Three-Phase Interface

Interface for three-phase timer functions.

#### Timer Interface

Interface for timer functions.

#### Touch Middleware Interface

Interface for Touch Middleware functions.

#### Transfer Interface

Interface for data transfer functions.

### UART Interface

Interface for UART communications.

### USB HCDC Interface

Interface for USB HCDC functions.

### USB HHID Interface

Interface for USB HHID functions.

### USB HMSC Interface

Interface for USB HMSC functions.

### USB Interface

Interface for USB functions.

### USB PCDC Interface

Interface for USB PCDC functions.

### USB PHID Interface

Interface for USB PHID functions.

### USB PMSC Interface

Interface for USB PMSC functions.

### USB PPRN Interface

Interface for USB PPRN functions.

### Virtual EEPROM Interface

Interface for Virtual EEPROM access.

### WDT Interface

Interface for watch dog timer functions.

## ZMOD4XXX Middleware Interface

Interface for ZMOD4XXX Middleware functions.

### 4.3.1 ADC Interface

#### Interfaces

#### Detailed Description

Interface for A/D Converters.

## Summary

The ADC interface provides standard ADC functionality including one-shot mode (single scan), continuous scan and group scan. It also allows configuration of hardware and software triggers for starting scans. After each conversion an interrupt can be triggered, and if a callback function is provided, the call back is invoked with the appropriate event information.

### ◆ [adc\\_info\\_t](#)

struct <a href="#">adc_info_t</a>		
ADC Information Structure for Transfer Interface		
Data Fields		
__l void *	p_address	The address to start reading the data from.
uint32_t	length	The total number of transfers to read.

<a href="#">transfer_size_t</a>	transfer_size	The size of each transfer.
<a href="#">elc_peripheral_t</a>	elc_peripheral	Name of the peripheral in the ELC list.
<a href="#">elc_event_t</a>	elc_event	Name of the ELC event for the peripheral.
uint32_t	calibration_data	Temperature sensor calibration data (0xFFFFFFFF if unsupported) for reference voltage.
int16_t	slope_microvolts	Temperature sensor slope in microvolts/degrees C.
bool	calibration_ongoing	Calibration is in progress.

◆ [adc\\_cfg\\_t](#)

struct <a href="#">adc_cfg_t</a>		
ADC general configuration		
<b>Data Fields</b>		
<a href="#">uint16_t</a>	<a href="#">unit</a>	
		ADC unit to be used.
<a href="#">adc_mode_t</a>	<a href="#">mode</a>	
		ADC operation mode.
<a href="#">adc_resolution_t</a>	<a href="#">resolution</a>	
		ADC resolution.
<a href="#">adc_alignment_t</a>	<a href="#">alignment</a>	
		Specify left or right alignment; ignored if addition used.
<a href="#">adc_trigger_t</a>	<a href="#">trigger</a>	
		Default and Group A trigger source.
<a href="#">IRQn_Type</a>	<a href="#">scan_end_irq</a>	
		Scan end IRQ number.

IRQn_Type	<a href="#">scan_end_b_irq</a>
	Scan end group B IRQ number.
uint8_t	<a href="#">scan_end_ipl</a>
	Scan end interrupt priority.
uint8_t	<a href="#">scan_end_b_ipl</a>
	Scan end group B interrupt priority.
void(*	<a href="#">p_callback</a> )(adc_callback_args_t *p_args)
	Callback function; set to NULL for none.
void const *	<a href="#">p_context</a>
	Placeholder for user data. Passed to the user callback in <a href="#">adc_callback_args_t</a> .
void const *	<a href="#">p_extend</a>
	Extension parameter for hardware specific settings.

#### ◆ [adc\\_api\\_t](#)

struct <a href="#">adc_api_t</a>	
ADC functions implemented at the HAL layer will follow this API.	
<b>Data Fields</b>	
<a href="#">fsp_err_t</a> (*	<a href="#">open</a> )(adc_ctrl_t *const p_ctrl, <a href="#">adc_cfg_t</a> const *const p_cfg)
<a href="#">fsp_err_t</a> (*	<a href="#">scanCfg</a> )(adc_ctrl_t *const p_ctrl, void const *const p_extend)
<a href="#">fsp_err_t</a> (*	<a href="#">scanStart</a> )(adc_ctrl_t *const p_ctrl)

<code>fsp_err_t(*</code>	<code>scanGroupStart )(adc_ctrl_t *p_ctrl, adc_group_mask_t group_mask)</code>
<code>fsp_err_t(*</code>	<code>scanStop )(adc_ctrl_t *const p_ctrl)</code>
<code>fsp_err_t(*</code>	<code>scanStatusGet )(adc_ctrl_t *const p_ctrl, adc_status_t *p_status)</code>
<code>fsp_err_t(*</code>	<code>read )(adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data)</code>
<code>fsp_err_t(*</code>	<code>read32 )(adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data)</code>
<code>fsp_err_t(*</code>	<code>calibrate )(adc_ctrl_t *const p_ctrl, void const *p_extend)</code>
<code>fsp_err_t(*</code>	<code>offsetSet )(adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset)</code>
<code>fsp_err_t(*</code>	<code>callbackSet )(adc_ctrl_t *const p_api_ctrl, void(*p_callback)(adc_callback_args_t *), void const *const p_context, adc_callback_args_t *const p_callback_memory)</code>
<code>fsp_err_t(*</code>	<code>close )(adc_ctrl_t *const p_ctrl)</code>
<code>fsp_err_t(*</code>	<code>infoGet )(adc_ctrl_t *const p_ctrl, adc_info_t *const p_adc_info)</code>

## Field Documentation

◆ **open**

```
fsp_err_t(* adc_api_t::open) (adc_ctrl_t *const p_ctrl, adc_cfg_t const *const p_cfg)
```

Initialize ADC Unit; apply power, set the operational mode, trigger sources, interrupt priority, and configurations common to all channels and sensors.

**Implemented as**

- R\_ADC\_Open()
- R\_ADC\_B\_Open()
- R\_SDADC\_Open()

**Precondition**

Configure peripheral clocks, ADC pins and IRQs prior to calling this function.

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ **scanCfg**

```
fsp_err_t(* adc_api_t::scanCfg) (adc_ctrl_t *const p_ctrl, void const *const p_extend)
```

Configure the scan including the channels, groups, and scan triggers to be used for the unit that was initialized in the open call. Some configurations are not supported for all implementations. See implementation for details.

**Implemented as**

- R\_ADC\_ScanCfg()
- R\_ADC\_B\_ScanCfg()
- R\_SDADC\_ScanCfg()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[in]	p_extend	See implementation for details

## ◆ scanStart

```
fsp_err_t(* adc_api_t::scanStart) (adc_ctrl_t *const p_ctrl)
```

Start the scan (in case of a software trigger), or enable the hardware trigger.

**Implemented as**

- R\_ADC\_ScanStart()
- R\_SDADC\_ScanStart()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
------	--------	-------------------------------------

## ◆ scanGroupStart

```
fsp_err_t(* adc_api_t::scanGroupStart) (adc_ctrl_t *p_ctrl, adc_group_mask_t group_mask)
```

Start the scan group (in case of a software trigger), or enable the hardware trigger.

**Implemented as**

- R\_ADC\_B\_ScanGroupStart()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[in]	group_mask	Mask of groups to start

## ◆ scanStop

```
fsp_err_t(* adc_api_t::scanStop) (adc_ctrl_t *const p_ctrl)
```

Stop the ADC scan (in case of a software trigger), or disable the hardware trigger.

**Implemented as**

- R\_ADC\_ScanStop()
- R\_SDADC\_ScanStop()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
------	--------	-------------------------------------

◆ **scanStatusGet**

```
fsp_err_t(* adc_api_t::scanStatusGet) (adc_ctrl_t *const p_ctrl, adc_status_t *p_status)
```

Check scan status.

**Implemented as**

- R\_ADC\_StatusGet()
- R\_ADC\_B\_StatusGet()
- R\_SDADC\_StatusGet()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[out]	p_status	Pointer to store current status in

◆ **read**

```
fsp_err_t(* adc_api_t::read) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data)
```

Read ADC conversion result.

**Implemented as**

- R\_ADC\_Read()
- R\_ADC\_B\_Read()
- R\_SDADC\_Read()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	p_data	Pointer to variable to load value into.

◆ **read32**

```
fsp_err_t(* adc_api_t::read32) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data)
```

Read ADC conversion result into a 32-bit word.

**Implemented as**

- R\_ADC\_Read32()
- R\_ADC\_B\_Read32()
- R\_SDADC\_Read32()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	p_data	Pointer to variable to load value into.

◆ **calibrate**

```
fsp_err_t(* adc_api_t::calibrate) (adc_ctrl_t *const p_ctrl, void const *p_extend)
```

Calibrate ADC or associated PGA (programmable gain amplifier). The driver may require implementation specific arguments to the p\_extend input. Not supported for all implementations. See implementation for details.

**Implemented as**

- R\_ADC\_Calibrate()
- R\_ADC\_B\_Calibrate()
- R\_SDADC\_Calibrate()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[in]	p_extend	Pointer to implementation specific arguments

◆ **offsetSet**

```
fsp_err_t(* adc_api_t::offsetSet) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset)
```

Set offset for input PGA configured for differential input. Not supported for all implementations. See implementation for details.

**Implemented as**

- R\_SDADC\_OffsetSet()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	offset	See implementation for details.

◆ **callbackSet**

```
fsp_err_t(* adc_api_t::callbackSet) (adc_ctrl_t *const p_api_ctrl, void(*p_callback)(adc_callback_args_t *), void const *const p_context, adc_callback_args_t *const p_callback_memory)
```

Specify callback function and optional context pointer and working memory pointer.

**Implemented as**

- R\_ADC\_CallbackSet()
- R\_ADC\_B\_CallbackSet()

**Parameters**

[in]	p_ctrl	Pointer to the ADC control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ **close**

```
fsp_err_t(* adc_api_t::close) (adc_ctrl_t *const p_ctrl)
```

Close the specified ADC unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit.

**Implemented as**

- R\_ADC\_Close()
- R\_ADC\_B\_Close()
- R\_SDADC\_Close()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
------	--------	-------------------------------------

◆ **infoGet**

```
fsp_err_t(* adc_api_t::infoGet) (adc_ctrl_t *const p_ctrl, adc_info_t *const p_adc_info)
```

Return the ADC data register address of the first (lowest number) channel and the total number of bytes to be read in order for the DTC/DMAC to read the conversion results of all configured channels. Return the temperature sensor calibration and slope data.

**Implemented as**

- R\_ADC\_InfoGet()
- R\_ADC\_B\_InfoGet()
- R\_SDADC\_InfoGet()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[out]	p_adc_info	Pointer to ADC information structure

◆ **adc\_instance\_t**

```
struct adc_instance_t
```

This structure encompasses everything that is needed to use an instance of this interface.

## Data Fields

adc_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
adc_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
void const *	p_channel_cfg	Pointer to the channel configuration structure for this instance.
adc_api_t const *	p_api	Pointer to the API structure for

		this instance.
--	--	----------------

## Typedef Documentation

### ◆ `adc_ctrl_t`

typedef void <code>adc_ctrl_t</code>
--------------------------------------

ADC control block. Allocate using driver instance control structure from driver instance header file.
---

## Enumeration Type Documentation

### ◆ `adc_mode_t`

enum <code>adc_mode_t</code>
------------------------------

ADC operation mode definitions
--------------------------------

Enumerator	
------------	--

<code>ADC_MODE_SINGLE_SCAN</code>	Single scan - one or more channels.
<code>ADC_MODE_GROUP_SCAN</code>	Two trigger sources to trigger scan for two groups which contain one or more channels.
<code>ADC_MODE_CONTINUOUS_SCAN</code>	Continuous scan - one or more channels.

### ◆ `adc_resolution_t`

enum <code>adc_resolution_t</code>
------------------------------------

ADC data resolution definitions
---------------------------------

Enumerator	
------------	--

<code>ADC_RESOLUTION_12_BIT</code>	12 bit resolution
<code>ADC_RESOLUTION_10_BIT</code>	10 bit resolution
<code>ADC_RESOLUTION_8_BIT</code>	8 bit resolution
<code>ADC_RESOLUTION_14_BIT</code>	14 bit resolution
<code>ADC_RESOLUTION_16_BIT</code>	16 bit resolution
<code>ADC_RESOLUTION_24_BIT</code>	24 bit resolution

◆ **adc\_alignment\_t**

enum <a href="#">adc_alignment_t</a>	
ADC data alignment definitions	
Enumerator	
ADC_ALIGNMENT_RIGHT	Data alignment right.
ADC_ALIGNMENT_LEFT	Data alignment left.

◆ **adc\_trigger\_t**

enum <a href="#">adc_trigger_t</a>	
ADC trigger mode definitions	
Enumerator	
ADC_TRIGGER_SOFTWARE	Software trigger; not for group modes.
ADC_TRIGGER_SYNC_ELC	Synchronous trigger via ELC.
ADC_TRIGGER_ASYNC_EXTERNAL	External asynchronous trigger; not for group modes.

◆ **adc\_event\_t**

enum <code>adc_event_t</code>	
ADC callback event definitions	
Enumerator	
<code>ADC_EVENT_SCAN_COMPLETE</code>	Normal/Group A scan complete.
<code>ADC_EVENT_SCAN_COMPLETE_GROUP_B</code>	Group B scan complete.
<code>ADC_EVENT_CALIBRATION_COMPLETE</code>	Calibration complete.
<code>ADC_EVENT_CONVERSION_COMPLETE</code>	Conversion complete.
<code>ADC_EVENT_CALIBRATION_REQUEST</code>	Calibration requested.
<code>ADC_EVENT_CONVERSION_ERROR</code>	Scan error.
<code>ADC_EVENT_OVERFLOW</code>	Overflow occurred.
<code>ADC_EVENT_LIMIT_CLIP</code>	Limiter clipping occurred.
<code>ADC_EVENT_FIFO_READ_REQUEST</code>	FIFO read requested.
<code>ADC_EVENT_FIFO_OVERFLOW</code>	FIFO overflow occurred.
<code>ADC_EVENT_WINDOW_COMPARE_A</code>	Window A comparison condition met.
<code>ADC_EVENT_WINDOW_COMPARE_B</code>	Window B comparison condition met.

◆ **adc\_channel\_t**

enum <code>adc_channel_t</code>	
ADC channels	
Enumerator	
<code>ADC_CHANNEL_0</code>	ADC channel 0.
<code>ADC_CHANNEL_1</code>	ADC channel 1.
<code>ADC_CHANNEL_2</code>	ADC channel 2.
<code>ADC_CHANNEL_3</code>	ADC channel 3.
<code>ADC_CHANNEL_4</code>	ADC channel 4.

ADC_CHANNEL_5	ADC channel 5.
ADC_CHANNEL_6	ADC channel 6.
ADC_CHANNEL_7	ADC channel 7.
ADC_CHANNEL_8	ADC channel 8.
ADC_CHANNEL_9	ADC channel 9.
ADC_CHANNEL_10	ADC channel 10.
ADC_CHANNEL_11	ADC channel 11.
ADC_CHANNEL_12	ADC channel 12.
ADC_CHANNEL_13	ADC channel 13.
ADC_CHANNEL_14	ADC channel 14.
ADC_CHANNEL_15	ADC channel 15.
ADC_CHANNEL_16	ADC channel 16.
ADC_CHANNEL_17	ADC channel 17.
ADC_CHANNEL_18	ADC channel 18.
ADC_CHANNEL_19	ADC channel 19.
ADC_CHANNEL_20	ADC channel 20.
ADC_CHANNEL_21	ADC channel 21.
ADC_CHANNEL_22	ADC channel 22.
ADC_CHANNEL_23	ADC channel 23.
ADC_CHANNEL_24	ADC channel 24.
ADC_CHANNEL_25	ADC channel 25.
ADC_CHANNEL_26	ADC channel 26.
ADC_CHANNEL_27	ADC channel 27.
ADC_CHANNEL_28	ADC channel 28.

ADC_CHANNEL_SELF_DIAGNOSIS	Self-Diagnosis channel.
ADC_CHANNEL_TEMPERATURE	Temperature sensor output.
ADC_CHANNEL_VOLT	Internal reference voltage.
ADC_CHANNEL_DA0	D/A Converter Channel 0.
ADC_CHANNEL_DA1	D/A Converter Channel 1.
ADC_CHANNEL_DA2	D/A Converter Channel 2.
ADC_CHANNEL_DA3	D/A Converter Channel 3.
ADC_CHANNEL_0	ADC channel 0.
ADC_CHANNEL_1	ADC channel 1.
ADC_CHANNEL_2	ADC channel 2.
ADC_CHANNEL_3	ADC channel 3.
ADC_CHANNEL_4	ADC channel 4.
ADC_CHANNEL_5	ADC channel 5.
ADC_CHANNEL_6	ADC channel 6.
ADC_CHANNEL_7	ADC channel 7.
ADC_CHANNEL_8	ADC channel 8.
ADC_CHANNEL_9	ADC channel 9.
ADC_CHANNEL_10	ADC channel 10.
ADC_CHANNEL_11	ADC channel 11.
ADC_CHANNEL_12	ADC channel 12.
ADC_CHANNEL_13	ADC channel 13.
ADC_CHANNEL_14	ADC channel 14.
ADC_CHANNEL_15	ADC channel 15.
ADC_CHANNEL_16	ADC channel 16.

ADC_CHANNEL_17	ADC channel 17.
ADC_CHANNEL_18	ADC channel 18.
ADC_CHANNEL_19	ADC channel 19.
ADC_CHANNEL_20	ADC channel 20.
ADC_CHANNEL_21	ADC channel 21.
ADC_CHANNEL_22	ADC channel 22.
ADC_CHANNEL_23	ADC channel 23.
ADC_CHANNEL_24	ADC channel 24.
ADC_CHANNEL_25	ADC channel 25.
ADC_CHANNEL_26	ADC channel 26.
ADC_CHANNEL_27	ADC channel 27.
ADC_CHANNEL_28	ADC channel 28.
ADC_CHANNEL_DUPLEX_A	Data duplexing register A.
ADC_CHANNEL_DUPLEX_B	Data duplexing register B.
ADC_CHANNEL_DUPLEX	Data duplexing register.
ADC_CHANNEL_TEMPERATURE	Temperature sensor output.
ADC_CHANNEL_VOLT	Internal reference voltage.

◆ **adc\_group\_id\_t**

enum <code>adc_group_id_t</code>	
Enumerator	
<code>ADC_GROUP_ID_0</code>	Group ID 0.
<code>ADC_GROUP_ID_1</code>	Group ID 1.
<code>ADC_GROUP_ID_2</code>	Group ID 2.
<code>ADC_GROUP_ID_3</code>	Group ID 3.
<code>ADC_GROUP_ID_4</code>	Group ID 4.
<code>ADC_GROUP_ID_5</code>	Group ID 5.
<code>ADC_GROUP_ID_6</code>	Group ID 6.
<code>ADC_GROUP_ID_7</code>	Group ID 7.
<code>ADC_GROUP_ID_8</code>	Group ID 8.

◆ **adc\_group\_mask\_t**

enum <code>adc_group_mask_t</code>	
Enumerator	
<code>ADC_GROUP_MASK_NONE</code>	Group Mask Unknown or None.
<code>ADC_GROUP_MASK_0</code>	Group Mask 0.
<code>ADC_GROUP_MASK_1</code>	Group Mask 1.
<code>ADC_GROUP_MASK_2</code>	Group Mask 2.
<code>ADC_GROUP_MASK_3</code>	Group Mask 3.
<code>ADC_GROUP_MASK_4</code>	Group Mask 4.
<code>ADC_GROUP_MASK_5</code>	Group Mask 5.
<code>ADC_GROUP_MASK_6</code>	Group Mask 6.
<code>ADC_GROUP_MASK_7</code>	Group Mask 7.
<code>ADC_GROUP_MASK_8</code>	Group Mask 8.
<code>ADC_GROUP_MASK_ALL</code>	All Groups.

◆ **adc\_state\_t**

enum <code>adc_state_t</code>	
ADC states.	
Enumerator	
<code>ADC_STATE_IDLE</code>	ADC is idle.
<code>ADC_STATE_SCAN_IN_PROGRESS</code>	ADC scan in progress.

## 4.3.2 ADPCM Decoder Interface

### Interfaces

#### Detailed Description

Interface for ADPCM decoder.

## Summary

The ADPCM decoder interface provides functionality to decode the 4bit ADPCM data to 16bit PCM output.

Implemented by: [ADPCM Decoder \(rm\\_adpcm\\_decoder\)](#)

### Data Structures

struct [adpcm\\_decoder\\_cfg\\_t](#)

struct [adpcm\\_decoder\\_api\\_t](#)

struct [adpcm\\_decoder\\_instance\\_t](#)

### Typedefs

typedef void [adpcm\\_decoder\\_ctrl\\_t](#)

### Data Structure Documentation

#### ◆ [adpcm\\_decoder\\_cfg\\_t](#)

struct [adpcm\\_decoder\\_cfg\\_t](#)

Audio Decoder general configuration

#### ◆ [adpcm\\_decoder\\_api\\_t](#)

struct [adpcm\\_decoder\\_api\\_t](#)

Audio Decoder interface API.

##### Data Fields

<a href="#">fsp_err_t</a> (*	<a href="#">open</a> )(adpcm_decoder_ctrl_t *const p_ctrl, <a href="#">adpcm_decoder_cfg_t</a> const *const p_cfg)
------------------------------	--

<a href="#">fsp_err_t</a> (*	<a href="#">decode</a> )(adpcm_decoder_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint32_t src_len_bytes)
------------------------------	---

<a href="#">fsp_err_t</a> (*	<a href="#">reset</a> )(adpcm_decoder_ctrl_t *const p_ctrl)
------------------------------	---

<a href="#">fsp_err_t</a> (*	<a href="#">close</a> )(adpcm_decoder_ctrl_t *const p_ctrl)
------------------------------	---

### Field Documentation

◆ **open**

```
fsp_err_t(* adpcm_decoder_api_t::open) (adpcm_decoder_ctrl_t *const p_ctrl, adpcm_decoder_cfg_t
const *const p_cfg)
```

Initialize Audio Decoder device.

**Implemented as**

- [RM\\_ADPCM\\_DECODER\\_Open\(\)](#)

*Note*

To reconfigure after calling this function, call *adpcm\_decoder\_api\_t::close* first.

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ **decode**

```
fsp_err_t(* adpcm_decoder_api_t::decode) (adpcm_decoder_ctrl_t *const p_ctrl, void const *p_src,
void *p_dest, uint32_t src_len_bytes)
```

Decodes the compressed data and stores it in output buffer.

**Implemented as**

- [RM\\_ADPCM\\_DECODER\\_Decode\(\)](#)

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
[in]	p_src	Pointer to a source data buffer from which data will be picked up for decode operation. The argument must not be NULL.
[out]	p_dest	Pointer to the location to store the decoded data.
[in]	p_dest	Number of bytes to be decoded.

◆ **reset**

```
fsp_err_t(* adpcm_decoder_api_t::reset) (adpcm_decoder_ctrl_t *const p_ctrl)
```

Resets the ADPCM driver.

**Implemented as**

- RM\_ADPCM\_DECODER\_Reset()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
------	--------	-------------------------------------

◆ **close**

```
fsp_err_t(* adpcm_decoder_api_t::close) (adpcm_decoder_ctrl_t *const p_ctrl)
```

Close the specified Audio decoder modules.

**Implemented as**

- RM\_ADPCM\_DECODER\_Close()

**Parameters**

[in]	p_ctrl	Pointer to control handle structure
------	--------	-------------------------------------

◆ **adpcm\_decoder\_instance\_t**

```
struct adpcm_decoder_instance_t
```

This structure encompasses everything that is needed to use an instance of this interface.

## Data Fields

adpcm_decoder_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
adpcm_decoder_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
adpcm_decoder_api_t const *	p_api	Pointer to the API structure for this instance.

**Typedef Documentation**

### ◆ `adpcm_decoder_ctrl_t`

```
typedef void adpcm_decoder_ctrl_t
```

Audio Decoder control block. Allocate an instance specific control block to pass into the Audio Decoder API calls.

#### Implemented as

- `adpcm_decoder_instance_ctrl_t`

## 4.3.3 AUDIO PLAYBACK Interface

### Interfaces

#### Detailed Description

Interface for the Audio Playback.

Defines the API and data structures for the Audio Playback implementation.

## Summary

This module provides common interface for Audio Playback.

Implemented by: [Audio Playback PWM \(rm\\_audio\\_playback\\_pwm\)](#)

#### Data Structures

```
struct audio_playback_callback_args_t
```

```
struct audio_playback_cfg_t
```

```
struct audio_playback_api_t
```

```
struct audio_playback_instance_t
```

#### Typedefs

```
typedef void audio_playback_ctrl_t
```

#### Enumerations

```
enum audio_playback_event_t
```

#### Data Structure Documentation

### ◆ `audio_playback_callback_args_t`

struct audio_playback_callback_args_t		
Callback function parameter data		
Data Fields		
void *	p_context	Placeholder for user data.
audio_playback_event_t	event	Event that triggered the callback.

#### ◆ audio\_playback\_cfg\_t

struct audio_playback_cfg_t	
Audio Playback configuration parameters.	
<b>Data Fields</b>	
void const *	p_extend
	Hardware dependent configuration.
void(*	p_callback )(audio_playback_callback_args_t *p_args)
void *	p_context

#### Field Documentation

##### ◆ p\_callback

void(\* audio\_playback\_cfg\_t::p\_callback) (audio\_playback\_callback\_args\_t \*p\_args)

Callback called when play is complete.

##### ◆ p\_context

void\* audio\_playback\_cfg\_t::p\_context

Placeholder for user data. Passed to the user callback in [audio\\_playback\\_callback\\_args\\_t](#).

#### ◆ audio\_playback\_api\_t

struct audio_playback_api_t	
Audio Playback functions implemented by the Audio Playback drivers will follow this API.	
<b>Data Fields</b>	
fsp_err_t(*	open )(audio_playback_ctrl_t *const p_ctrl, audio_playback_cfg_t const *const p_cfg)
fsp_err_t(*	start )(audio_playback_ctrl_t *const p_ctrl)

<code>fsp_err_t(*</code>	<code>stop )(audio_playback_ctrl_t *const p_ctrl)</code>
--------------------------	--

<code>fsp_err_t(*</code>	<code>play )(audio_playback_ctrl_t *const p_ctrl, void const *const p_buffer, uint32_t length)</code>
--------------------------	---

<code>fsp_err_t(*</code>	<code>close )(audio_playback_ctrl_t *const p_ctrl)</code>
--------------------------	---

## Field Documentation

### ◆ open

`fsp_err_t(* audio_playback_api_t::open) (audio_playback_ctrl_t *const p_ctrl, audio_playback_cfg_t const *const p_cfg)`

Open a audio playback module.

#### Implemented as

- `RM_AUDIO_PLAYBACK_PWM_Open()`

#### Parameters

[in]	<code>p_ctrl</code>	Pointer to memory allocated for control block.
[in]	<code>p_cfg</code>	Pointer to the hardware configurations.

### ◆ start

`fsp_err_t(* audio_playback_api_t::start) (audio_playback_ctrl_t *const p_ctrl)`

Start audio playback hardware.

#### Implemented as

- `RM_AUDIO_PLAYBACK_PWM_Start()`

#### Parameters

[in]	<code>p_ctrl</code>	Pointer to control block.
------	---------------------	---------------------------

## ◆ stop

```
fsp_err_t(* audio_playback_api_t::stop) (audio_playback_ctrl_t *const p_ctrl)
```

Stop audio playback hardware.

**Implemented as**

- [RM\\_AUDIO\\_PLAYBACK\\_PWM\\_Stop\(\)](#)

**Parameters**

[in]	p_ctrl	Pointer to control block.
------	--------	---------------------------

## ◆ play

```
fsp_err_t(* audio_playback_api_t::play) (audio_playback_ctrl_t *const p_ctrl, void const *const p_buffer, uint32_t length)
```

Play audio buffer.

**Implemented as**

- [RM\\_AUDIO\\_PLAYBACK\\_PWM\\_Play\(\)](#)

**Parameters**

[in]	p_ctrl	Pointer to control block.
[in]	p_buffer	Pointer to buffer with PCM samples to play. Data must be scaled for audio playback hardware.
[in]	length	Length of data in p_buffer.

## ◆ close

```
fsp_err_t(* audio_playback_api_t::close) (audio_playback_ctrl_t *const p_ctrl)
```

Close the audio driver.

**Implemented as**

- [RM\\_AUDIO\\_PLAYBACK\\_PWM\\_Close\(\)](#)

**Parameters**

[in]	p_ctrl	Pointer to control block initialized in <a href="#">audio_playback_api_t::open</a> .
------	--------	--

## ◆ audio\_playback\_instance\_t

```
struct audio_playback_instance_t
```

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

<a href="#">audio_playback_ctrl_t</a> *	p_ctrl	Pointer to the control structure for this instance.
<a href="#">audio_playback_cfg_t</a> const *	p_cfg	Pointer to the configuration structure for this instance.
<a href="#">audio_playback_api_t</a> const *	p_api	Pointer to the API structure for this instance.

## Typedef Documentation

### ◆ [audio\\_playback\\_ctrl\\_t](#)

typedef void <a href="#">audio_playback_ctrl_t</a>
Audio Playback control block. Allocate an instance specific control block to pass into the AUDIO_PLAYBACK API calls.
<b>Implemented as</b>
<ul style="list-style-type: none"> <li>◦ <a href="#">audio_playback_pwm_instance_ctrl_t</a></li> </ul>

## Enumeration Type Documentation

### ◆ [audio\\_playback\\_event\\_t](#)

enum <a href="#">audio_playback_event_t</a>	
Callback event types.	
Enumerator	
AUDIO_PLAYBACK_EVENT_PLAYBACK_COMPLETE	Audio playback complete event.

## 4.3.4 BLE ABS Interface

### Interfaces

#### Detailed Description

Interface for Bluetooth Low Energy Abstraction functions.

## Summary

The BLE ABS interface for the Bluetooth Low Energy Abstraction (BLE ABS) peripheral provides Bluetooth Low Energy Abstraction functionality.

The Bluetooth Low Energy Abstraction interface can be implemented by:

- BLE Abstraction (rm\_ble\_abs)

## Data Structures

---

struct `ble_device_address_t`

struct `ble_gap_connection_parameter_t`

struct `ble_gap_connection_phy_parameter_t`

struct `ble_gap_scan_phy_parameter_t`

struct `ble_gap_scan_on_t`

struct `ble_abs_callback_args_t`

struct `ble_abs_pairing_parameter_t`

struct `ble_abs_gatt_server_callback_set_t`

struct `ble_abs_gatt_client_callback_set_t`

struct `ble_abs_legacy_advertising_parameter_t`

struct `ble_abs_extend_advertising_parameter_t`

struct `ble_abs_non_connectable_advertising_parameter_t`

struct `ble_abs_periodic_advertising_parameter_t`

struct `ble_abs_scan_phy_parameter_t`

struct `ble_abs_scan_parameter_t`

struct `ble_abs_connection_phy_parameter_t`

struct `ble_abs_connection_parameter_t`

struct `ble_abs_cfg_t`

struct `ble_abs_api_t`

struct `ble_abs_instance_t`

## Macros

---

```
#define BLE_ABS_ADVERTISING_PHY_LEGACY  
    Non-Connectable Legacy Advertising phy setting.
```

## Typedefs

```
typedef void(* ble_gap_application_callback_t) (uint16_t event_type, ble_status_t
event_result, st_ble_evt_data_t *p_event_data)
```

```
typedef void(* ble_vendor_specific_application_callback_t) (uint16_t event_type,
ble_status_t event_result, st_ble_vs_evt_data_t *p_event_data)
```

```
typedef void(* ble_gatt_server_application_callback_t) (uint16_t event_type,
ble_status_t event_result, st_ble_gatts_evt_data_t *p_event_data)
```

```
typedef void(* ble_gatt_client_application_callback_t) (uint16_t event_type,
ble_status_t event_result, st_ble_gattc_evt_data_t *p_event_data)
```

```
typedef void(* ble_abs_delete_bond_application_callback_t) (st_ble_dev_addr_t
*p_addr)
```

```
typedef void ble_abs_ctrl_t
```

## Enumerations

```
enum ble_abs_advertising_filter_t
```

```
enum ble_abs_local_bond_information_t
```

```
enum ble_abs_remote_bond_information_t
```

```
enum ble_abs_delete_non_volatile_area_t
```

## Data Structure Documentation

### ◆ ble\_device\_address\_t

struct ble_device_address_t		
st_ble_device_address is the type of bluetooth device address(BD_ADDR).		
Data Fields		
uint8_t	addr[ <a href="#">BLE_BD_ADDR_LEN</a> ]	bluetooth device address.
uint8_t	type	the type of bluetooth device address.

### ◆ ble\_gap\_connection\_parameter\_t

struct ble_gap_connection_parameter_t		
<a href="#">ble_gap_connection_parameter_t</a> is Connection parameters included in connection interval, slave latency, supervision timeout, ce length.		
Data Fields		
uint16_t	conn_intv_min	Minimum connection interval.

uint16_t	conn_intv_max	Maximum connection interval.
uint16_t	conn_latency	Slave latency.
uint16_t	sup_to	Supervision timeout.
uint16_t	min_ce_length	Minimum CE Length.
uint16_t	max_ce_length	Maximum CE Length.

#### ◆ ble\_gap\_connection\_phy\_parameter\_t

struct ble_gap_connection_phy_parameter_t		
ble_gap_connection_phy_parameter_t is Connection parameters per PHY.		
Data Fields		
uint16_t	scan_intv	Scan interval.
uint16_t	scan_window	Scan window.
ble_gap_connection_parameter_t *	p_conn_param	Connection interval, slave latency, supervision timeout, and CE length.

#### ◆ ble\_gap\_scan\_phy\_parameter\_t

struct ble_gap_scan_phy_parameter_t		
Scan parameters per scan PHY.		
Data Fields		
uint8_t	scan_type	Scan type.
uint16_t	scan_intv	Scan interval.
uint16_t	scan_window	Scan window.

#### ◆ ble\_gap\_scan\_on\_t

struct ble_gap_scan_on_t		
Parameters configured when scanning starts.		
Data Fields		
uint8_t	proc_type	Procedure type.
uint8_t	filter_dups	Filter duplicates.
uint16_t	duration	Scan duration.
uint16_t	period	Scan period.

#### ◆ ble\_abs\_callback\_args\_t

struct ble_abs_callback_args_t		
Callback function parameter data		
Data Fields		

uint32_t	channel	Select a channel corresponding to the channel number of the hardware.
<a href="#">ble_event_cb_t</a>	ble_abs_event	The event can be used to identify what caused the callback.
void const *	p_context	Placeholder for user data. Set in <a href="#">ble_abs_api_t::open</a> function in <a href="#">ble_abs_cfg_t</a> .

#### ◆ ble\_abs\_pairing\_parameter\_t

struct ble_abs_pairing_parameter_t		
st_ble_abs_pairing_parameter_t includes the pairing parameters.		
Data Fields		
uint8_t	io_capabilityie_local_device	IO capabilities of local device.
uint8_t	mitm_protection_policy	MITM protection policy.
uint8_t	secure_connection_only	Determine whether to accept only Secure Connections or not.
uint8_t	local_key_distribute	Type of keys to be distributed from local device.
uint8_t	remote_key_distribute	Type of keys which local device requests a remote device to distribute.
uint8_t	maximum_key_size	Maximum LTK size.
uint8_t	padding[2]	padding

#### ◆ ble\_abs\_gatt\_server\_callback\_set\_t

struct ble_abs_gatt_server_callback_set_t		
GATT Server callback function and the priority.		
Data Fields		
<a href="#">ble_gatt_server_application_callback_t</a>	gatt_server_callback_function	GATT Server callback function.
uint8_t	gatt_server_callback_priority	The priority number of GATT Server callback function.

#### ◆ ble\_abs\_gatt\_client\_callback\_set\_t

struct ble_abs_gatt_client_callback_set_t		
GATT Client callback function and the priority.		
Data Fields		
<a href="#">ble_gatt_client_application_callback_t</a>	gatt_client_callback_function	GATT Client callback function.

uint8_t	gatt_client_callback_priority	The priority number of GATT Client callback function.
---------	-------------------------------	---

#### ◆ ble\_abs\_legacy\_advertising\_parameter\_t

struct ble_abs_legacy_advertising_parameter_t		
st_ble_abs_legacy_advertising_parameter_t is the parameters for legacy advertising.		
Data Fields		
ble_device_address_t *	p_peer_address	The remote device address. If the p_peer_address parameter is not NULL, Direct Connectable Advertising is performed to the remote address. If the p_peer_address parameter is NULL, Undirect Connectable Advertising is performed according to the advertising filter policy specified by the filter parameter.
uint8_t *	p_advertising_data	Advertising Data. If the p_advertising_data is specified as NULL, Advertising Data is not included in the advertising PDU.
uint8_t *	p_scan_response_data	Scan Response Data. If the p_scan_response_data is specified as NULL, Scan Response Data is not included in the advertising PDU.
uint32_t	fast_advertising_interval	Advertising with the fast_advertising_interval parameter continues for the period specified by the fast_period parameter. Time(ms) = fast_advertising_interval * 0.625. If the fast_period parameter is 0, this parameter is ignored. Valid range is 0x00000020 - 0x00FFFFFF.
uint32_t	slow_advertising_interval	After the elapse of the fast_period, advertising with the slow_advertising_interval parameter continues for the period specified by the slow_advertising_interval parameter. Time(ms) =

		<p>slow_advertising_interval * 0.625.</p> <p>If the slow_advertising_interval parameter is 0, this parameter is ignored.</p> <p>Valid range is 0x00000020 - 0x00FFFFFF.</p>
uint16_t	fast_advertising_period	<p>The period which advertising with the fast_advertising_interval parameter continues for. Time = duration * 10ms.</p> <p>After the elapse of the fast_advertising_period, <a href="#">BLE_GAP_EVENT_ADV_OFF</a> event notifies that the advertising has stopped.</p> <p>Valid range is 0x0000 - 0xFFFF.</p> <p>If the fast_advertising_period parameter is 0x0000, advertising with the fast_advertising_interval parameter is not performed.</p>
uint16_t	slow_advertising_period	<p>The period which advertising with the slow_advertising_interval parameter continues for. Time = duration * 10ms.</p> <p>After the elapse of the slow_advertising_period, <a href="#">BLE_GAP_EVENT_ADV_OFF</a> event notifies that the advertising has stopped.</p> <p>Valid range is 0x0000 - 0xFFFF.</p> <p>If the slow_advertising_period parameter is 0x0000, the advertising continues.</p>
uint16_t	advertising_data_length	<p>Advertising data length(byte).</p> <p>Valid range is 0-31.</p> <p>If the advertising_data_length is 0, Advertising Data is not included in the advertising PDU.</p>
uint16_t	scan_response_data_length	<p>Scan response data length (in bytes).</p> <p>Scan Response Data(byte).</p> <p>Valid range is 0-31.</p> <p>If the scan_response_data_length is 0, Scan Response Data is not included in the advertising PDU.</p>
uint8_t	advertising_channel_map	<p>The channel map used for the advertising packet</p>

		<p>transmission. It is a bitwise OR of the following values.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td><code>BLE_GAP_ADV_CH_37(0x01)</code></td> <td>Use 37 CH.</td> </tr> <tr> <td><code>BLE_GAP_ADV_CH_38(0x02)</code></td> <td>Use 38 CH.</td> </tr> <tr> <td><code>BLE_GAP_ADV_CH_39(0x04)</code></td> <td>Use 38 CH.</td> </tr> <tr> <td><code>BLE_GAP_ADV_CH_ALL(0x07)</code></td> <td>Use 37 - 39 CH.</td> </tr> </tbody> </table>	macro	description	<code>BLE_GAP_ADV_CH_37(0x01)</code>	Use 37 CH.	<code>BLE_GAP_ADV_CH_38(0x02)</code>	Use 38 CH.	<code>BLE_GAP_ADV_CH_39(0x04)</code>	Use 38 CH.	<code>BLE_GAP_ADV_CH_ALL(0x07)</code>	Use 37 - 39 CH.
macro	description											
<code>BLE_GAP_ADV_CH_37(0x01)</code>	Use 37 CH.											
<code>BLE_GAP_ADV_CH_38(0x02)</code>	Use 38 CH.											
<code>BLE_GAP_ADV_CH_39(0x04)</code>	Use 38 CH.											
<code>BLE_GAP_ADV_CH_ALL(0x07)</code>	Use 37 - 39 CH.											
uint8_t	advertising_filter_policy	<p>Advertising filter policy. If the p_peer_address parameter is NULL, the advertising is performed according to the advertising filter policy. If the p_peer_address parameter is not NULL, this parameter is ignored.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td><code>BLE_ABS_ADV_ERTISING_FILTER_ALLOW_ANY(0x00)</code></td> <td>Process scan and connection requests from all devices.</td> </tr> <tr> <td><code>BLE_ABS_ADV_ERTISING_FILTER_ALLOW_WHITE_LIST(0x01)</code></td> <td>Process scan and connection requests from only devices in the White List.</td> </tr> </tbody> </table>	macro	description	<code>BLE_ABS_ADV_ERTISING_FILTER_ALLOW_ANY(0x00)</code>	Process scan and connection requests from all devices.	<code>BLE_ABS_ADV_ERTISING_FILTER_ALLOW_WHITE_LIST(0x01)</code>	Process scan and connection requests from only devices in the White List.				
macro	description											
<code>BLE_ABS_ADV_ERTISING_FILTER_ALLOW_ANY(0x00)</code>	Process scan and connection requests from all devices.											
<code>BLE_ABS_ADV_ERTISING_FILTER_ALLOW_WHITE_LIST(0x01)</code>	Process scan and connection requests from only devices in the White List.											
uint8_t	own_bluetooth_address_type	<p>Own Bluetooth address type. Select one of the following.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td><code>BLE_GAP_ADDR_PUBLIC(0x00)</code></td> <td>Public Address</td> </tr> <tr> <td><code>BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)</code></td> <td>Resolvable Private Address. If the IRK of local device has not been</td> </tr> </tbody> </table>	macro	description	<code>BLE_GAP_ADDR_PUBLIC(0x00)</code>	Public Address	<code>BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)</code>	Resolvable Private Address. If the IRK of local device has not been				
macro	description											
<code>BLE_GAP_ADDR_PUBLIC(0x00)</code>	Public Address											
<code>BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)</code>	Resolvable Private Address. If the IRK of local device has not been											

		registered in Resolving List, public address is used.
uint8_t	own_bluetooth_address[6]	Own Bluetooth address.
uint8_t	padding[3]	padding

#### ◆ ble\_abs\_extend\_advertising\_parameter\_t

struct ble_abs_extend_advertising_parameter_t		
st_ble_abs_extend_advertising_parameter_t is the parameters for extended advertising.		
Data Fields		
ble_device_address_t *	p_peer_address	The remote device address. If the p_addr parameter is not NULL, Direct Connectable Advertising is performed to the remote address. If the p_addr parameter is NULL, Undirect Connectable Advertising is performed according to the advertising filter policy specified by the filter parameter.
uint8_t *	p_advertising_data	Advertising data. If p_adv_data is specified as NULL, advertising data is not set.
uint32_t	fast_advertising_interval	Advertising with the fast_advertising_interval parameter continues for the period specified by the fast_advertising_period parameter. Time(ms) = fast_advertising_interval * 0.625. If the fast_advertising_period parameter is 0, this parameter is ignored. Valid range is 0x00000020 - 0x00FFFFFF.
uint32_t	slow_advertising_interval	After the elapse of the fast_advertising_period, advertising with the slow_advertising_interval parameter continues for the period specified by the slow_advertising_period parameter. Time(ms) =

		<p>fast_advertising_interval * 0.625.</p> <p>If the fast_advertising_period parameter is 0, this parameter is ignored.</p> <p>Valid range is 0x00000020 - 0x00FFFFFF.</p>						
uint16_t	fast_advertising_period	<p>The period which advertising with the fast_advertising_interval parameter continues for. Time = duration * 10ms. After the elapse of the fast_advertising_period, <a href="#">BLE_GAP_EVENT_ADV_OFF</a> event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the fast_advertising_period parameter is 0x0000, the fast_advertising_interval parameter is ignored.</p>						
uint16_t	slow_advertising_period	<p>The period which advertising with the slow_advertising_interval parameter continues for. Time = duration * 10ms. After the elapse of the slow_advertising_period, <a href="#">BLE_GAP_EVENT_ADV_OFF</a> event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the slow_advertising_period parameter is 0x0000, the advertising continues.</p>						
uint16_t	advertising_data_length	<p>Advertising data length (in bytes).</p> <p>Valid range is 0-229.</p> <p>If the adv_data_length is 0, Advertising Data is not included in the advertising PDU.</p>						
uint8_t	advertising_channel_map	<p>The channel map used for the advertising packet transmission. It is a bitwise OR of the following values.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td><a href="#">BLE_GAP_ADV_CH_37(0x01)</a></td> <td>Use 37 CH.</td> </tr> <tr> <td><a href="#">BLE_GAP_ADV_CH_38(0x02)</a></td> <td>Use 38 CH.</td> </tr> </tbody> </table>	macro	description	<a href="#">BLE_GAP_ADV_CH_37(0x01)</a>	Use 37 CH.	<a href="#">BLE_GAP_ADV_CH_38(0x02)</a>	Use 38 CH.
macro	description							
<a href="#">BLE_GAP_ADV_CH_37(0x01)</a>	Use 37 CH.							
<a href="#">BLE_GAP_ADV_CH_38(0x02)</a>	Use 38 CH.							

		<p><code>_CH_38(0x02)</code>  <code>BLE_GAP_ADV</code> Use 38 CH.  <code>_CH_39(0x04)</code>  <code>BLE_GAP_ADV</code> Use 37 - 39  <code>_CH_ALL(0x07</code> CH.  <code>)</code></p>						
<code>uint8_t</code>	<code>advertising_filter_policy</code>	<p>Advertising filter policy. If the <code>p_peer_address</code> parameter is NULL, the advertising is performed according to the advertising filter policy. If the <code>p_peer_address</code> parameter is not NULL, this parameter is ignored.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td><code>BLE_ABS_ADV</code> <code>ERTISING_FILT</code> <code>ER_ALLOW_A</code> <code>NY(0x00)</code></td> <td>Process scan and connection requests from all devices.</td> </tr> <tr> <td><code>BLE_ABS_ADV</code> <code>ERTISING_FILT</code> <code>ER_ALLOW_W</code> <code>HITE_LIST(0x01)</code></td> <td>Process scan and connection requests from only devices in the White List.</td> </tr> </tbody> </table>	macro	description	<code>BLE_ABS_ADV</code> <code>ERTISING_FILT</code> <code>ER_ALLOW_A</code> <code>NY(0x00)</code>	Process scan and connection requests from all devices.	<code>BLE_ABS_ADV</code> <code>ERTISING_FILT</code> <code>ER_ALLOW_W</code> <code>HITE_LIST(0x01)</code>	Process scan and connection requests from only devices in the White List.
macro	description							
<code>BLE_ABS_ADV</code> <code>ERTISING_FILT</code> <code>ER_ALLOW_A</code> <code>NY(0x00)</code>	Process scan and connection requests from all devices.							
<code>BLE_ABS_ADV</code> <code>ERTISING_FILT</code> <code>ER_ALLOW_W</code> <code>HITE_LIST(0x01)</code>	Process scan and connection requests from only devices in the White List.							
<code>uint8_t</code>	<code>own_bluetooth_address_type</code>	<p>Own Bluetooth address type. Select one of the following.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td><code>BLE_GAP_ADD</code> <code>R_PUBLIC(0x00)</code></td> <td>Public Address</td> </tr> <tr> <td><code>BLE_GAP_ADD</code> <code>R_RPA_ID_PUB</code> <code>LIC(0x02)</code></td> <td>Resolvable Private Address. If the IRK of local device has not been registered in Resolving List, public address is used.</td> </tr> </tbody> </table>	macro	description	<code>BLE_GAP_ADD</code> <code>R_PUBLIC(0x00)</code>	Public Address	<code>BLE_GAP_ADD</code> <code>R_RPA_ID_PUB</code> <code>LIC(0x02)</code>	Resolvable Private Address. If the IRK of local device has not been registered in Resolving List, public address is used.
macro	description							
<code>BLE_GAP_ADD</code> <code>R_PUBLIC(0x00)</code>	Public Address							
<code>BLE_GAP_ADD</code> <code>R_RPA_ID_PUB</code> <code>LIC(0x02)</code>	Resolvable Private Address. If the IRK of local device has not been registered in Resolving List, public address is used.							
<code>uint8_t</code>	<code>own_bluetooth_address[6]</code>	Own Bluetooth address.						
<code>uint8_t</code>	<code>primary_advertising_phy</code>	Primary advertising PHY. In this parameter, only 1M PHY						

and Coded PHY can be specified, and 2M PHY cannot be specified.

macro	description
<a href="#">BLE_GAP_ADV_PHY_1M(0x01)</a>	Use 1M PHY as Primary Advertising PHY. When the adv_prop_type field is Legacy Advertising PDU type, this field shall be set to BLE_GAP_ADV_PHY_1M.
<a href="#">BLE_GAP_ADV_PHY_CD(0x03)</a>	Use Coded PHY as Primary Advertising PHY. Coding scheme is configured by <a href="#">R_BLE_VS_SetCodingScheme()</a> .

uint8\_t

secondary\_advertising\_phy

Secondary advertising Phy. Select one of the following.

macro	description
<a href="#">BLE_GAP_ADV_PHY_1M(0x01)</a>	Use 1M PHY as Secondary Advertising PHY.
<a href="#">BLE_GAP_ADV_PHY_2M(0x02)</a>	Use 2M PHY as Secondary Advertising PHY.
<a href="#">BLE_GAP_ADV_PHY_CD(0x03)</a>	Use Coded PHY(S=8) as Secondary Advertising PHY. Coding scheme is configured by <a href="#">R_BLE_VS_SetCodingScheme()</a> .

		e()).
uint8_t	padding[3]	padding

#### ◆ ble\_abs\_non\_connectable\_advertising\_parameter\_t

struct ble_abs_non_connectable_advertising_parameter_t		
st_ble_abs_non_connectable_advertising_parameter_t is the parameters for non-connectable advertising.		
Data Fields		
ble_device_address_t *	p_peer_address	The remote device address. If the p_peer_address parameter is not NULL, Direct Connectable Advertising is performed to the remote address. If the p_peer_address parameter is NULL, Undirect Connectable Advertising is performed according to the advertising filter policy specified by the filter parameter.
uint8_t *	p_advertising_data	Advertising data. If p_adv_data is specified as NULL, advertising data is not set.
uint32_t	advertising_interval	Advertising with the advertising_interval parameter continues for the period specified by the duration parameter. Time(ms) = advertising_interval * 0.625. If the duration parameter is 0x0000, the advertising with the advertising_interval parameter continue. Valid range is 0x00000020 - 0x00FFFFFF.
uint16_t	advertising_duration	The period which advertising with the advertising_interval parameter continues for. Time = advertising_duration * 10ms. After the elapse of the advertising_duration, BLE_GAP_EVENT_ADV_OFF event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the advertising_duration parameter is 0x0000, the

		advertising continues.
