Integrated Development Environment

User's Manual: RL78 Debug

Target Device RL78 Family

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (http://www.renesas.com).

Notice

- Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
- Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
- 3. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
- 4. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics product.
- 5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; and safety equipment etc.

Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (nuclear reactor control systems, military equipment etc.). You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application for which it is not intended. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.

- 6. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
- 7. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or systems manufactured by you.
- 8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
- 9. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You should not use Renesas Electronics products or technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. When exporting the Renesas Electronics products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations.
- 10. It is the responsibility of the buyer or distributor of Renesas Electronics products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the contents and conditions set forth in this document, Renesas Electronics assumes no responsibility for any losses incurred by you or third parties as a result of unauthorized use of Renesas Electronics products.
- 11. This document may not be reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
- 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

How to Use This Manual

This manual describes the role of the CubeSuite+ integrated development environment for developing applications and systems for RL78 family, and provides an outline of its features.

CubeSuite+ is an integrated development environment (IDE) for RL78 family, integrating the necessary tools for the development phase of software (e.g. design, implementation, and debugging) into a single platform.

By providing an integrated environment, it is possible to perform all development using just this product, without the need to use many different tools separately.

Readers This manual is intended for users who wish to understand the functions of the

CubeSuite+ and design software and hardware application systems.

Purpose This manual is intended to give users an understanding of the functions of the

CubeSuite+ to use for reference in developing the hardware or software of systems

using these devices.

Organization This manual can be broadly divided into the following units.

CHAPTER 1 GENERAL CHAPTER 2 FUNCTIONS

APPENDIX A WINDOW REFERENCE
APPENDIX B USER OPEN INTERFACE

APPENDIX C INDEX

How to Read This Manual It is assumed that the readers of this manual have general knowledge of electricity,

logic circuits, and microcontrollers.

Conventions Data significance: Higher digits on the left and lower digits on the right

Active low representation: XXX (overscore over pin or signal name)

Note: Footnote for item marked with Note in the text

Caution: Information requiring particular attention

Remark: Supplementary information

Numeric representation: Decimal ... XXXX

Hexadecimal ... 0xXXXX

CHAPTER 1 GENERAL

CubeSuite+ is a platform of an integrated developing environment for RH850 family, RX family, V850 family, RL78 family, 78K0R microcontrollers, 78K0 microcontrollers.

CubeSuite+ can run all the operations needed for developing the programs such as designing, cording, building, debugging, and flash programming.

In this manual, the debugging is explained out of those operations needed for the program development.

In this chapter, an overview of debugging products that CubeSuite+ provides is explained.

1.1 Summary

You can effectively debug/simulate the program developed for the RL78 family, using the debugger which CubeSuite+provides.

1.2 Features

The following are the features of the debugger provided by CubeSuite+.

- Connecting to the various debug tools

 A pleasant debugging environment for target systems is provided by connecting to the full-spec emulator (IECUBE), the on-chip debugging emulator (E1/E20/EZ Emulator) and Simulator.
- C source text and disassembled text are shown mixed

 The C source text and the disassembled text are shown mixed on the same panel.
- Source level debugging and instruction level debugging

 The source level debugging and the instruction level debugging for a C source program can be done.
- Support of flash self programming emulation (Code flash)
 Flash self programming emulation can be performed with IECUBE.
- Data flash memory writing function

 When the selected microcontroller incorporates the data flash memory, the contents of data flash memory can be displayed and modified by the same access method as an ordinary memory operation (except for Simulator).
- Real-time display update function
 The contents of memory, registers and variables are automatically updated not only when the program execution is stopped, but also in execution.
- Save/restore the debugging environment

 The debugging environment such as breakpoints, event configuration information, file download information, display condition/position of the panel, etc. can be saved.

CHAPTER 2 FUNCTIONS

This chapter describes a debugging process of CubeSuite+ and main functions for debugging.

2.1 Overview

The basic debugging sequence for programs using CubeSuite+ is as follows:

(1) Start CubeSuite+

Launch CubeSuite+ from the [Start] menu of Windows.

Remark For details on "Start CubeSuite+", see "CubeSuite+ Integrated Development Environment User's Manual: Start".

(2) Set a project

Create a new project, or load an existing one.

Remark For details on "Set a project", see "CubeSuite+ Integrated Development Environment User's Manual: Start".

(3) Create a load module

Create a load module by running a build after setting of the active project and the build tool to be used.

Remark For details on "Create a load module" with CA78K0R, see "CubeSuite+ Integrated Development Environment User's Manual: Build".

(4) Confirm the connection to a host machine

Connect the debug tool (IECUBE, E1, E20, EZ Emulator or Simulator) to be used to a host machine.

(5) Select the debug tool to use

Select the debug tool to be used in a project.

(6) Configure operating environment of the debug tool

Configure the operating environment of the debug tool selected in steps (5).

- [IECUBE]
- [E1]
- [E20]
- [EZ Emulator]
- [Simulator]

(7) Connect to the debug tool

Connect the debug tool to CubeSuite+ to start communication.

(8) Execute downloading

Download the load module created in steps (3) to the debug tool.

(9) Display source files

Display the contents of the downloaded load module (source files) on the Editor panel or Disassemble panel.

(10) Execute programs

Execute the program by using the operation method corresponding to a purpose.

If you wish to stop the program at the arbitrary position, set a breakpoint/break event^{Note} before executing the program (see "2.8.3" Stop the program at the arbitrary position (breakpoint)", "2.8.4" Stop the program at the arbitrary position (break event)", or "2.8.5" Stop the program with the access to variables/SFRs").

Note These functions are implemented by setting events to the debug tool used.

See "2.15.7 Notes for setting events", when you use events.

(11) Stop the program manually

Stop the program currently being executed.

Note that if a breakpoint or a break event has been set in steps (10), the program execution will be stopped automatically when the set break condition is met.

(12) Check the result of the program execution

Check the following information that the debug tool acquired by the program execution.

- Display/Change the Memory, Register and Variable
- Display Information on Function Call from Stack
- Collect Execution History of Programs Note
- Measure Execution Time of Programs Note
- Measure Coverage [IECUBE][Simulator]

Note These functions are implemented by setting events to the debug tool used.

See "2.15.7 Notes for setting events", when you use events.

Debug the program, repeating steps (9) to (12) as required.

Note that if the program is modified during debugging, steps (3) and (8) also should be repeated.

- **Remarks 1.** Other than the above, you can also check the result of the program execution by using the following functions.
 - Set an Action into Programs
 - Use Hook Function
 - Use the Simulator GUI [Simulator]
 - 2. The acquired information can be saved to a file.
 - Save the disassembled text contents
 - Save the memory contents
 - Save the CPU register contents
 - Save the SFR contents
 - Save the contents of local variables
 - Save the contents of watch-expressions
 - Save the contents of call stack information
 - Save the contents of execution history

(13) Execute uploading

Save the program (the memory contents) to a file in the arbitrary format (e.g. Intel hex format, binary format, and etc.), as required.

(14) Disconnect from the debug tool

Disconnect the debug tool from CubeSuite+ to terminate communication.

(15) Save the project file

Save the setting information of the project to the project file.

Remark For details on "Save the project file", see "CubeSuite+ Integrated Development Environment User's Manual: Start".

2.2 Preparation before Debugging

This section describes the preparation to start debugging the created program.

2.2.1 Confirm the connection to a host machine

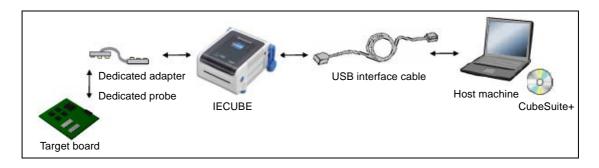

Connection examples for each debug tool are shown.

- (1) [IECUBE]
- (2) [E1]
- (3) [E20]
- (4) [EZ Emulator]
- (5) [Simulator]

(1) [IECUBE]

Connect a host machine and IECUBE. If required, connect a target board, too. See IECUBE User's Manual for details on the connection method.

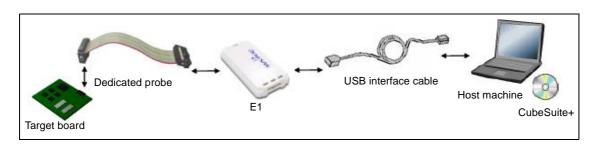

Figure 2-1. Connection Example [IECUBE]

(2) [E1]

Connect a host machine and E1. If required, connect a target board, too. See E1 User's Manual for details on the connection method.

Figure 2-2. Connection Example [E1]

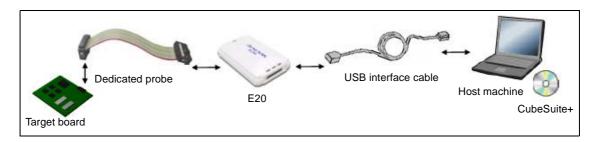

Caution Only serial communications are supported as the communication method with the target board (JTAG communications is not available).

(3) [E20]

Connect a host machine and E20. If required, connect a target board, too. See E20 User's Manual for details on the connection method.

Figure 2-3. Connection Example [E20]

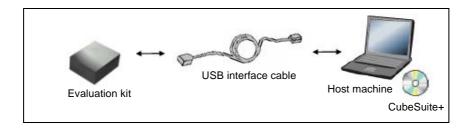

Caution Only serial communications are supported as the communication method with the target board (JTAG communications is not available).

(4) [EZ Emulator]

Connect a host machine and an evaluation kit See EZ Emulator User's Manual for details on the connection method.

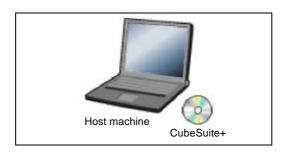

Figure 2-4. Connection Example [EZ Emulator]

(5) [Simulator]

A host machine is only needed for debugging (emulators are not needed).

Figure 2-5. Connection Example [Simulator]

2.3 Configuration of Operating Environment of the Debug Tool

This section describes the configuration of the operating environment for each debug tool.

2.3.1 Select the debug tool to use

You can configure the operating environment in the Property panel corresponding to the debug tool to use.

Therefore, first, select the debug tool to be used in a project (the debug tool to be used can be specified in the individual main projects/subprojects).

To select or switch the debug tool, use the context menu shown by right clicking on the [RL78 *Debug tool name* (Debug Tool)] node on the Project Tree panel.

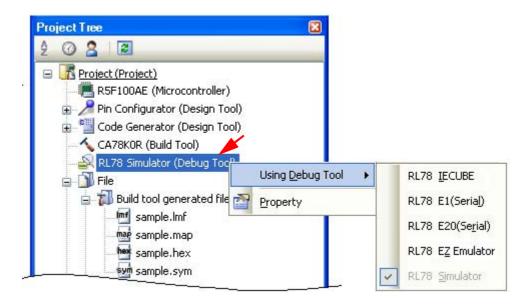

Figure 2-6. Select/Switch Debug Tool to Use

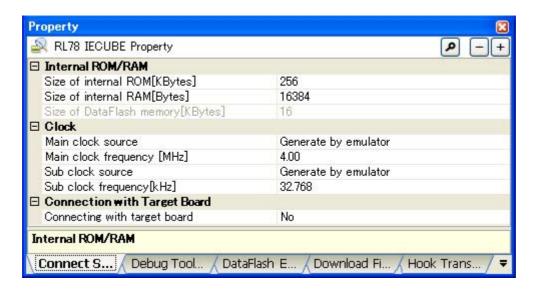

If the Property panel is already open, click the [RL78 *Debug tool name* (Debug Tool)] node again. The view switches to the Property panel of the selected debug tool.

If the Property panel is not open, double-click the above mentioned node to open the corresponding Property panel.

2.3.2 [IECUBE]

Configure the operating environment on the Property panel below when using IECUBE.

Figure 2-7. Example of Property Panel [IECUBE]

Follow the steps below by selecting the corresponding tab on the Property panel.

- (1) [Connect Settings] tab
- (2) [Debug Tool Settings] tab
- (3) [Flash Self Emulation Settings] tab
- (4) [DataFlash Emulation Settings] tab
- (5) [Download File Settings] tab
- (6) [Hook Transaction Settings] tab

(1) [Connect Settings] tab

You configure the connection with the debug tool for each one of the following categories.

- (a) [Internal ROM/RAM]
- (b) [Clock]
- (c) [Connection with Target Board]

(a) [Internal ROM/RAM]

You can configure internal ROM/RAM in this category.

The size of internal ROM/RAM of the selected microcontroller is specified by default.

Caution You should be careful not to overlap the area with other memory mapping area.

Remark There is no need to change the settings in this category if you wish to debug with the same memory mapping of the selected microcontroller.

Figure 2-8. [Internal ROM/RAM] Category [IECUBE]

| □ Internal ROM/RAM | |
|----------------------------------|-------|
| Size of internal ROM[KBytes] | 256 |
| Size of internal RAM[Bytes] | 16384 |
| Size of DataFlash memory[KBytes] | 16 |

<1> [Size of internal ROM[KBytes]]

Select the internal ROM size to emulate (unit: Kbytes).

Change the value only when you perform debugging using IECUBE memory resources after changing the memory mapping.

<2> [Size of internal RAM[Bytes]]

Select the internal RAM size to emulate (unit: bytes).

Change the value only when you perform debugging using IECUBE memory resources after changing the memory mapping.

<3> [Size of DataFlash memory[KBytes]]

The size of the data flash memory area of the selected microcontroller is displayed (unit: Kbytes). You cannot change the value of this property.

(b) [Clock]

You can configure the clock in this category.

Figure 2-9. [Clock] Category [IECUBE]

| □ Clock | | |
|----------------------------|----------------------|--|
| Main clock source | Generate by emulator | |
| Main clock frequency [MHz] | 4.00 | |
| Sub clock source | Generate by emulator | |
| Sub clock frequency[kHz] | 32.768 | |

<1> [Main clock source]

Specify the main clock source to input to the CPU from the following drop-down list.

| Clock socket | Uses a clock of the transmitter on the clock socket. |
|----------------------|--|
| External | Uses a main clock (square wave) on the target board. |
| Generate by emulator | Uses a clock generated inside IECUBE (default). |

Caution This property cannot be changed when IECUBE is connected to CubeSuite+.

<2> [Main clock frequency [MHz]]

This property appears only when the [Main clock source] property is set to [Generate by emulator]. Select the main clock frequency (default: [4.00]).

Remark The selectable frequency differs depending on the selected microcontroller.

<3> [Sub clock source]

Specify the sub clock source to input to the CPU and peripheral devices from the following drop-down list.

| External | Uses a main clock (square wave) on the target board. |
|----------------------|--|
| Generate by emulator | Uses a clock generated inside IECUBE (default). |

Caution This property cannot be changed when IECUBE is connected to CubeSuite+.

<4> [Sub clock frequency[kHz]]

This property appears only when the [Sub clock source] property is set to [Generate by emulator]. Select the sub clock frequency (default: [32.768]).

(c) [Connection with Target Board]

You can configure the connection to the target board in this category.

Figure 2-10. [Connection with Target Board] Category [IECUBE]

<1> [Connecting with target board]

Select whether the target board is connected to IECUBE or not.

Select [Yes] when the target board is connected to IECUBE (default: [No]).

Caution This property cannot be changed when IECUBE is connected to CubeSuite+.

(2) [Debug Tool Settings] tab

You configure the basic settings of the debug tool for each one of the following categories.

- (a) [Memory]
- (b) [Access Memory While Running]
- (c) [Set Event While Running]
- (d) [Break]
- (e) [Fail-safe Break]
- (f) [Trace]
- (g) [Timer]
- (h) [Coverage]
- (i) [Mask for Input Signal]

(a) [Memory]

You can configure the memory in this category.

☐ Memory mappings [10] ⊕ [0] Internal ROM area ⊞ [1] Non-map area ① [2] DataFlash area (3) Non-map area [4] SFR area ① [5] Non-map area [6] Mirror area ⊞ [7] Internal RAM area (8) Register area **⊞** [9] SFR area Yes Verify on writing to memory

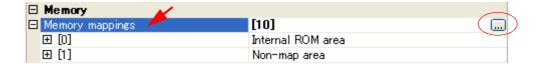

Figure 2-11. [Memory] Category [IECUBE]

<1> [Memory mappings]

Current memory mapping status is displayed for each type of memory area.

The memory mapping status cannot be changed on this panel. If it is necessary to add a memory mapping, click on the [Memory Mapping] property, and click on the [...] button that appears on the right end of the setting field. The Memory Mapping dialog box opens; perform the setting from there. See the section for the Memory Mapping dialog box for details on how to configure the parameters.

Figure 2-12. Opening Memory Mapping Dialog Box

Caution If you are not connected to a debug tool, then only memory mapping areas added by user is displayed.

Connecting to a debug tool (see "2.4.1 Connect to the debug tool") will display details for each memory type.

<2> [Verify on writing to memory]

Select whether to perform a verify check when writing to the memory.

Select [Yes] to perform verification after download or when values are changed in the Memory panel/ Watch panel (default).

(b) [Access Memory While Running]

You can configure the memory access while executing a program (the real-time display update function) in this category. See "(4) Display/modify the memory contents during program execution" for details on the real-time display update function.

Figure 2-13. [Access Memory While Running] Category [IECUBE]

| ☐ Access Memory While Running | |
|-------------------------------------|-----|
| Access by stopping execution | No |
| Update display during the execution | Yes |
| Display update interval[ms] | 500 |

<1> [Access by stopping execution]

For a memory area not accessible during execution of a program (e.g. target memory area/SFR area), select whether to allow access to the area by temporary stopping the execution.

Select [Yes] to allow access (default: [No]).

<2> [Update display during the execution]

Select whether to automatically update the contents in the Memory panel/Watch panel display during execution of a program.

Select [Yes] to update the display automatically (default).

Remark The display contents of the Memory panel/Watch panel can be updated manually by clicking the button on the panel.

<3> [Display update interval[ms]]

This property appears only when the [Update display during the execution] property is set to [Yes]. Specify the interval in 100 ms unit to automatically update the contents in the Memory panel/Watch panel display during execution of a program.

Directly enter the Integer number between 100 and 65500 (rounding up the fractions less than 100ms) (default: [500]).

(c) [Set Event While Running]

You can configure the setting of events while executing a program in this category.

Figure 2-14. [Set Event While Running] Category

Set Event While Running Set event by stopping execution momentarily No

<1> [Set event by stopping execution momentarily]

Select whether to forcibly pause the execution for events that cannot be set while executing a program. For details on the event types that are affected by this property, see "(2) Event types that can be set and deleted during execution".

Select [Yes] to set events above while execution (default: [No]).

(d) [Break]

You can configure the break function.

See "2.8 Stop Programs (Break)" for details on the break function and this category configuration.

(e) [Fail-safe Break]

You can configure the fail-safe break function in this category.

See "2.8.6 Stop the program when an invalid execution is detected [IECUBE]" for details on the fail-safe break function and this category configuration.

(f) [Trace]

You can configure the trace function in this category.

See "2.11 Collect Execution History of Programs" for details on the trace function and this category configuration.

(g) [Timer]

You can configure the timer function in this category.

See "2.12 Measure Execution Time of Programs" for details on the timer function.

Figure 2-15. [Timer] Category [IECUBE]

<1> [Rate of frequency division of timer]

Select the frequency division ratio of the timer counter (120 MHz) used for timer measurement (default: [1/1(8ns/0.6min)]).

Caution It is not possible to divide the timer counter for the Run-Break time.

(h) [Coverage]

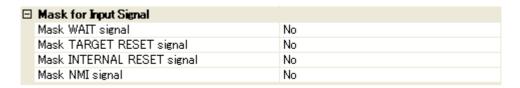

You can configure the coverage function in this category.

See "2.13 Measure Coverage [IECUBE][Simulator]" for details on the coverage function and this category configuration.

(i) [Mask for Input Signal]

You can configure the input signal masking in this category.

Figure 2-16. [Mask for Input Signal] Category [IECUBE]

With the properties shown below, select [Yes] to mask the signal from the drop-down list (default: [No]).

- [Mask WAIT signal] Note
- [Mask TARGET RESET signal] Note
- [Mask INTERNAL RESET signal]
- [Mask NMI signal]

Note If [No] is selected with the [Connection with Target Board] property in the [Connect Setting] tab, these properties are fixed to [Yes] after connecting to the debug tool (changes not allowed).

(3) [Flash Self Emulation Settings] tab

You configure the flash self programming emulation (Code flash).

Note that this tab appears only when the selected microcontroller incorporates the flash memory.

- (a) [Flash Self Emulation]
- (b) [Writing Time/Erasing Time]
- (c) [Macro Service Error]
- (d) [Setting Flash shield window]
- (e) [Security Flag Emulation]

(a) [Flash Self Emulation]

You can configure the flash self programming emulation function in this category.

Figure 2-17. [Flash Self Emulation] Category

<1> [Flash self-programming]

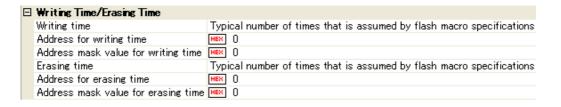

Select whether to use the flash self programming emulation function.

Select [Yes] to use the flash self programming emulation function (default: [No]).

(b) [Writing Time/Erasing Time]

You can configure the delay time for writing to and erasing the flash memory in this category.

Figure 2-18. [Writing Time/Erasing Time] Category

<1> [Writing time]

You can simulate the delay time for writing to the flash memory.

Select the value to simulate the delay time from the following drop-down list.

| No retry | Specifies "0" as the number of times of retry. The delay time is 0 (the writing speed is fastest). |
|---|--|
| Typical number of times that is assumed by flash macro specifications | Specifies the typical number of times that is assumed by flash macro specifications (default). |
| Maximum number of times that is assumed by flash macro specifications | Specifies the maximum number of times that is assumed by flash macro specifications. |
| Retries for the maximum number of times specified | Specifies the maximum number of times of retry. The delay time is maximum (the writing speed is longest). |

<2> [Address for writing time]

Specify the target address at which to simulate the delay time for writing.

Directly enter the address in hexadecimal number from 0x0 to 0xFFFFF (default: [0]).

<3> [Address mask value for writing time]

Specify a mask value for the address for writing time.

Directly enter the address in hexadecimal number from 0x0 to 0xFFFFF (default: [0]).

The address for the writing time is masked bit-wise with a mask value for which "0" is specified.

Example To set an address for writing time between 0x1000 and 0x1FFF

[Address for writing time]: 0x1000 [Address mask value for writing time]: 0xF000

<4> [Erasing time]

You can simulate the delay time for erasing the flash memory.

Select the value to simulate the delay time from the following drop-down list.

| No retry | Specifies "0" as the number of times of retry. The delay time is 0 (the erasing speed is fastest). |
|---|--|
| Typical number of times that is assumed by flash macro specifications | Specifies the typical number of times that is assumed by flash macro specifications (default). |
| Maximum number of times that is assumed by flash macro specifications | Specifies the maximum number of times that is assumed by flash macro specifications. |
| Retries for the maximum number of times specified | Specifies the maximum number of times of retry. The delay time is maximum (the erasing speed is longest). |

<5> [Address for erasing time]

Specify the target address at which to simulate the delay time for erasing.

Directly enter the address in hexadecimal number from 0x0 to 0xFFFFF (default: [0]).

<6> [Address mask value for erasing time]

Specify a mask value for the address for erasing time.

Directly enter the address in hexadecimal number from 0x0 to 0xFFFFF (default: [0]).

The address for the writing time is masked bit-wise with a mask value for which "0" is specified.

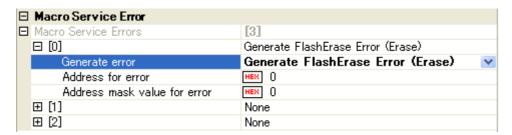

Example To set an address for writing time between 0x1000 and 0x1FFF

[Address for erasing time]: 0x1000 [Address mask value for erasing time]: 0xF000

(c) [Macro Service Error]

In this category, you can configure the operation of flash functions in the self programming library, that are used for the flash macro service when performing the flash self programming.

Figure 2-19. [Macro Service Error] Category

<1> [Macro Service Errors]

Specify the error to generate in the flash macro service to emulate (errors will not be generated during normal emulation).

Three types of errors to generate ([0]/[1]/[2]) can be specified with subproperties for this property. Select any one of the following types from each of the [Generate error] subproperties to return the error values forcibly.

- 1) Generate FlashErase Error (Erase)
- 2) Generate FlashBlankCheck Error (BlankCheck)
- 3) Generate FlashWrite Error (Write)
- 4) Generate FlashIVerify Error (IVerify)
- 5) Generate FlashSetSecurity / FlashSetFSW Error (Erase)
- 6) Generate FlashSetSecurity / FlashSetFSW Error (Write)
- 7) Generate FlashSetSecurity / FlashSetFSW Error (IVerify)

If you select one of 1) to 4), furthermore, specify the address within the flash memory and its mask value at which the corresponding error is to be generated, with the [Address for error] and [Address mask value for error] subproperties that are listed newly in the lower area. Directly enter the address in hexadecimal number from 0x0 to 0xFFFFF (default: [0]).

(d) [Setting Flash shield window]

You can specify the area that can be written or erased by flash self programming (Flash shield window function), in this category.

Caution Settings of this category are applied after CPU reset is generated.

If you changed these settings, execute the program after reset the CPU.

| ı | ☐ Setting Flash shield window | |
|---|---------------------------------|----------|
| | Flash shield window start block | HEX () |
| | Flash shield window end block | HEX FFFF |

<1> [Flash shield window start block]

Specify the start block of the area that can be written to and erased by flash self programming. Directly enter the value in hexadecimal number from 0x0 to 0xFFFF (default: [0]).

<2> [Flash shield window end block]

Specify the end block of the area that can be written to and erased by flash self programming. Directly enter the value in hexadecimal number from 0x0 to 0xFFFF (default: [FFFF]).

(e) [Security Flag Emulation]

You can configure the function on the security flag emulation in this category.

The initial value of the security flag is emulated when the security has been set to the flash memory.

Caution Settings of this category are applied after CPU reset is generated.

If you changed these settings, execute the program after reset the CPU.

Figure 2-20. [Security Flag Emulation] Category

| ☐ Security Flag Emulation | |
|--------------------------------------|----|
| Disable block erase | No |
| Disable program | No |
| Disable boot block cluster reprogram | No |

<1> [Disable block erase]

Specify whether to emulate to disable block erase.

Select [Yes] to emulate to disable block erase (default: [No]).

<2> [Disable program]

Select whether to emulate to disable writing.

Select [Yes] to emulate to disable writing (default: [No]).

<3> [Disable boot block cluster reprogram]

Select whether to emulate to disable rewrite boot area.

Select [Yes] to emulate to disable rewrite boot area (default: [No]).

(4) [DataFlash Emulation Settings] tab

You configure the data flash emulation function.

Note that this tab appears only when the selected microcontroller incorporates the data flash memory.

- (a) [DataFlash Emulation]
- (b) [Writing Time/Erasing Time]
- (c) [Macro Service Error]

(a) [DataFlash Emulation]

You can configure the data flash emulation function in this category.

Figure 2-21. [DataFlash Emulation] Category

<1> [DataFlash emulation]

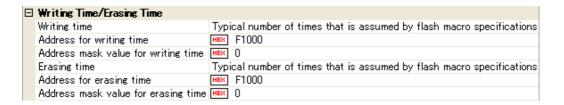

Select whether to use the data flash emulation function.

Select [Yes] to use the data flash emulation function (default: [No]).

(b) [Writing Time/Erasing Time]

You can configure the delay time for writing to and erasing the data flash memory in this category.

Figure 2-22. [Writing Time/Erasing Time] Category

<1> [Writing time]

You can simulate the delay time for writing to the data flash memory.

Select the value to simulate the delay time from the following drop-down list.

| No retry | Specifies "0" as the number of times of retry. The delay time is 0 (the writing speed is fastest). |
|---|--|
| Typical number of times that is assumed by flash macro specifications | Specifies the typical number of times that is assumed by flash macro specifications (default). |
| Maximum number of times that is assumed by flash macro specifications | Specifies the maximum number of times that is assumed by flash macro specifications. |
| Retries for the maximum number of times specified | Specifies the maximum number of times of retry. The delay time is maximum (the writing speed is longest). |

<2> [Address for writing time]

Specify the target address at which to simulate the delay time for writing.

Directly enter the address in hexadecimal number from 0xF1000 to 0xFFFFF (default: [F1000]).

<3> [Address mask value for writing time]

Specify a mask value for the address for writing time.

Directly enter the address in hexadecimal number from 0x0 to 0xFFFFF (default: [0]).

The address for the writing time is masked bit-wise with a mask value for which "0" is specified.

Example To set an address for writing time between 0xF1000 and 0xF1FFF

[Address for writing time]: 0xF1000 [Address mask value for writing time]: 0xFF000

<4> [Erasing time]

You can simulate the delay time for erasing the data flash memory.

Select the value to simulate the delay time from the following drop-down list.

| No retry | Specifies "0" as the number of times of retry. The delay time is 0 (the erasing speed is fastest). |
|---|--|
| Typical number of times that is assumed by flash macro specifications | Specifies the typical number of times that is assumed by flash macro specifications (default). |
| Maximum number of times that is assumed by flash macro specifications | Specifies the maximum number of times that is assumed by flash macro specifications. |
| Retries for the maximum number of times specified | Specifies the maximum number of times of retry. The delay time is maximum (the erasing speed is longest). |

<5> [Address for erasing time]

Specify the target address at which to simulate the delay time for erasing.

Directly enter the address in hexadecimal number from 0xF1000 to 0xFFFFF (default: [F1000]).

<6> [Address mask value for erasing time]

Specify a mask value for the address for erasing time.

Directly enter the address in hexadecimal number from 0x0 to 0xFFFFF (default: [0]).

The address for the writing time is masked bit-wise with a mask value for which "0" is specified.

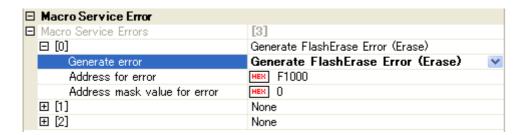

Example To set an address for writing time between 0xF1000 and 0xF1FFF

[Address for erasing time]: 0xF1000 [Address mask value for erasing time]: 0xFF000

(c) [Macro Service Error]

In this category, you can configure the operation of flash functions, that are used for the data flash macro service when performing the data flash emulation.

Figure 2-23. [Macro Service Error] Category

<1> [Macro Service Errors]

Specify the error to generate in the data flash macro service to emulate (errors will not be generated during normal emulation).

Three types of errors to generate ([0]/[1]/[2]) can be specified with subproperties for this property. Select any one of the following types from each of the [Generate error] subproperties to return the error values forcibly, and then specify the address within the data flash memory (0xF1000 to 0xFFFFF) and its mask value (0x0 to 0xFFFFF) at which the corresponding function error is to be generated, with the [Address for error] and [Address mask value for error] subproperties that are listed newly in the lower area [Address for error]: [F1000]/[Address mask value for error]: [0] is specified by default.

- Generate erase error for FlashErase
- Generate write error for FlashWrite
- Generate IVerify error for FlashIVerify
- Generate BlankCheck error for FlashBlankCheck

(5) [Download File Settings] tab

You can configure downloading to the debug tool.

See "2.5.1 Execute downloading" for details on each category configuration.

(6) [Hook Transaction Settings] tab

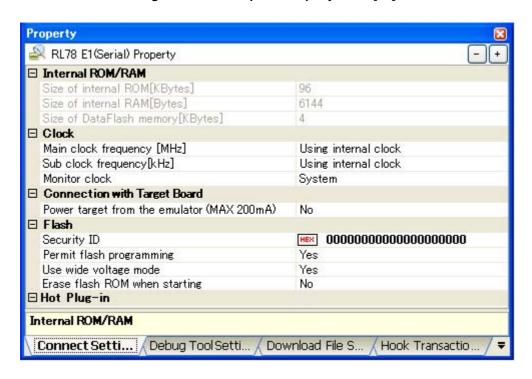

You can configure hook transaction for the debug tool.

See "2.17 Use Hook Function" for details on each category configuration and the function of the hook transaction.

2.3.3 [E1]

Configure the operating environment on the Property panel below when using E1.

Figure 2-24. Example of Property Panel [E1]

Follow the steps below by selecting the corresponding tab on the Property panel.

- (1) [Connect Settings] tab
- (2) [Debug Tool Settings] tab
- (3) [Download File Settings] tab
- (4) [Hook Transaction Settings] tab

(1) [Connect Settings] tab

You configure the connection with the debug tool for each one of the following categories.

- (a) [Internal ROM/RAM]
- (b) [Clock]
- (c) [Connection with Target Board]
- (d) [Flash]
- (e) [Hot Plug-in]

(a) [Internal ROM/RAM]

The configuration of internal ROM/RAM is displayed in this category.

Figure 2-25. [Internal ROM/RAM] Category [E1]

| ☐ Internal ROM/RAM | | |
|----------------------------------|-------|--|
| Size of internal ROM[KBytes] | 256 | |
| Size of internal RAM[Bytes] | 16384 | |
| Size of DataFlash memory[KBytes] | 16 | |

<1> [Size of internal ROM[KBytes]]

The internal ROM size to emulate is displayed (unit: Kbytes).

You cannot change the value of this property.

<2> [Size of internal RAM[Bytes]]

The internal RAM size to emulate is displayed (unit: bytes).

You cannot change the value of this property.

<3> [Size of DataFlash memory[KBytes]]

The data flash memory size is displayed (unit: Kbytes).

If the currently selected microcontroller does not incorporate the data flash, [0] is displayed.

You cannot change the value of this property.

(b) [Clock]

You can configure the clock in this category.

Figure 2-26. [Clock] Category [E1]

| □ Clock | | |
|----------------------------|----------------------|--|
| Main clock frequency [MHz] | Using internal clock | |
| Sub clock frequency[kHz] | Using internal clock | |
| Monitor clock | System | |

<1> [Main clock frequency [MHz]]

Specify the main clock frequency.

You can specify the frequency from the drop-down list or by directly entering a frequency value between 0.001 and 99.999 (unit: MHz) (default: [Using internal clock]).

When using X1/X2 oscillation, specify the clock frequency.

When using an external clock oscillation with the embedded PLL circuit, specify the frequency of the transmitter/resonator (i.e. the frequency before the setting of the PLL clock).

Remark The main clock frequency is used to synchronize the communication between E1 and the host machine. This specification is not for the frequency of the CPU operation.

<2> [Sub clock frequency[kHz]]

Specify the sub clock frequency.

You can specify the frequency from the drop-down list or by directly entering a frequency value number between 0.001 and 99.999 (unit: kHz) (default: [Using internal clock]).

Remark The sub clock frequency is used to synchronize the communication between E1 and the host machine. This specification is not for the frequency of the CPU operation.

<3> [Monitor clock]

Select a clock for monitor programs to operate while the program is stopped, from the following drop-down list.

| System | Operates with main clock (default). |
|--------|---|
| User | Operates with the clock that the program specified. |

(c) [Connection with Target Board]

You can configure the connection between E1 and the target board in this category.

Caution Properties in this category cannot be changed when E1 is connected to CubeSuite+.

Figure 2-27. [Connection with Target Board] Category [E1]

| ☐ Connection with Target Board | | |
|--|---------------------|--|
| Communication method | 1 line type (TOOL0) | |
| Low voltage OCD board | No | |
| Power target from the emulator (MAX 200mA) | Yes | |
| Supply voltage | 3.3V | |

<1> [Communication method]

This property appears only when the communication method of the selected microcontroller can be changed.

Select the communication method for E1 to communicate in serial mode with microcontrollers on the target board, from the following drop-down list.

Note that selectable ports depend on the type of the selected microcontroller.

| 1 line type (TOOL0) | The communication method is to use 1 line type (TOOL0) (default). |
|---------------------------|---|
| 2 line type (TOOL0+TOOL1) | The communication method is to use 2 line type (TOOL0+TOOL1). |

<2> [Low voltage OCD board]

This property appears only when the selected microcontroller supports a low voltage OCD board. Select whether to use a low voltage OCD board.

Select [Yes] to use a low voltage OCD board (default: [No]).

<3> [Power target from the emulator (MAX 200mA)]

This property appears only when the [Low voltage OCD board] property is set to [No] if it is displayed. Select whether to supply power to the target board from E1.

Select [Yes] to supply power to the target board (default: [No]).

<4> [Supply voltage]

This property appears only when the [Power target from the emulator (MAX 200mA)] property is displayed and also [Yes] is set to it.

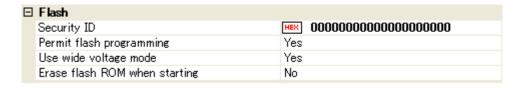

Select the power voltage supplied to the target board (default: [3.3V]).

(d) [Flash]

You can configure the flash memory rewriting in this category.

Caution Properties in this category cannot be changed when E1 is connected to CubeSuite+.

Figure 2-28. [Flash] Category

<1> [Security ID]

This property appears only when the selected microcontroller supports the ROM security function (onchip debug security ID) for flash memory.

Specify a security ID for reading codes in the internal ROM or internal flash memory.

Directly enter 20 digits hexadecimal number (10 bytes: 0x0 to 0xFFFFFFFFFFFFFFFF) (default: [000000000000000000]).

For details on the on-chip debug security ID, see E1 User's Manual.

<2> [Permit flash programming]

Select whether to enable the flash memory rewriting.

Select [Yes] to enable flash rewrite (default).

Note that when [No] is specified with this property, the flash memory area cannot be rewritten at all from the debug tool.

<3> [Use wide voltage mode]

This property appears only when the selected microcontroller supports the wide voltage mode for the flash memory rewriting.

Select whether to rewrite the flash memory with the wide voltage mode.

Select [Yes] to rewrite with the low voltage flash mode (default).

<4> [Erase flash ROM when starting]

This property appears only when the [Permit flash programming] property is set to [Yes].

Select whether to erase flash ROM when connecting to the debug tool.

Select [Yes] to erase flash ROM (default: [No]).

Note that this property is set to [No] after connecting to the debug tool.

Caution When conducting hot plug-in connection, the setting of this property will be ignored and flash ROM will not be erased.

(e) [Hot Plug-in]

You can configure the hot plug-in connection in this category.

Note that this category appears only when the selected microcontroller incorporates the hot plug-in function. See "2.4.3 Connect to the debug tool using hot plug-in [E1][E20] for details on hot plug-in function and this category configuration.

(2) [Debug Tool Settings] tab

You configure the basic settings of the debug tool for each one of the following categories.

- (a) [Memory]
- (b) [Access Memory While Running]
- (c) [Break]
- (d) [Trace]
- (e) [Mask for Input Signal]
- (f) [Smart Analog]

(a) [Memory]

You can configure the memory in this category.

□ Memory ☐ Memory mappings [10] ⊞ [0] Internal ROM area ⊞ [1] Non-map area DataFlash area Non-map area [4] SFR area ⊕ [5] Non-map area ⊕ [6] Mirror area ⊞ [7] Internal RAM area ⊞ [8] Register area ⊕ [9] SFR area

Yes

Figure 2-29. [Memory] Category [E1]

<1> [Memory mappings]

Verify on writing to memory

Current memory mapping status is displayed for each type of memory area.

The memory mapping status cannot be changed on this panel. If it is necessary to add a memory mapping, click on the [Memory Mapping] property, and click on the [...] button that appears on the right end of the setting field. The Memory Mapping dialog box opens; perform the setting from there. See the section for the Memory Mapping dialog box for details on how to configure the parameters.

Figure 2-30. Opening Memory Mapping Dialog Box

Caution If you are not connected to a debug tool, then only memory mapping areas added by user is displayed.

Connecting to a debug tool (see "2.4.1 Connect to the debug tool") will display details for each memory type.

<2> [Verify on writing to memory]

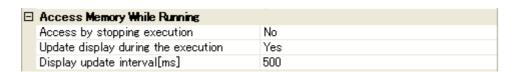

Select whether to perform a verify check when writing to the memory.

Select [Yes] to perform verification after download or when values are changed in the Memory panel/ Watch panel (default).

(b) [Access Memory While Running]

You can configure the memory access while executing a program (the real-time display update function) in this category. See "(4) Display/modify the memory contents during program execution" for details on the real-time display update function.

Figure 2-31. [Access Memory While Running] Category [E1]

<1> [Access by stopping execution]

For a memory area not accessible during execution of a program (e.g. target memory area/SFR area), select whether to allow access to the area by temporary stopping the execution.

Note that if this property is set to [Yes] when the [Communication method] property in the [Connection with Target Board] category is set to [1 line type (TOOL0+TOOL1)], then a message will appear because the debug tool's response speed becomes sluggish.

Select [Yes] to allow access (default: [No]).

<2> [Update display during the execution]

Select whether to automatically update the contents in the Memory panel/Watch panel display while executing a program.

Select [Yes] to update the display automatically (default).

Remark The display contents of the Memory panel/Watch panel can be updated manually by clicking the button on the panel.

<3> [Display update interval[ms]]

This property is valid only when the [Update display during the execution] property is set to [Yes]. Specify the interval in 100ms unit to automatically update the contents in the Memory panel/Watch panel display while executing a program.

Directly enter the Integer number between 100 and 65500 (rounding up the fractions less than 100ms) (default: [500]).

(c) [Break]

You can configure the break function.

See "2.8 Stop Programs (Break)" for details on the break function and this category configuration.

(d) [Trace]

You can configure the trace function in this category.

Note that this category appears only when the selected microcontroller incorporates the OCD trace function. See "2.11 Collect Execution History of Programs" for details on the trace function and this category configuration.

(e) [Mask for Input Signal]

You can configure the input signal masking in this category.

- Cautions 1. The settings of the properties in this category are ignored in the case of a hot plug-in connection. That is, the program operates as if the specification for the properties is [No] (the settings of them become valid again after reconnection with CubeSuite+).
 - 2. Maskable signals differ depending on the selected microcontroller type (a signal that cannot be masked will be hidden).

Figure 2-32. [Mask for Input Signal] Category

| E | Mask for Input Signal | | |
|---|----------------------------|----|--|
| | Mask TARGET RESET signal | No | |
| | Mask INTERNAL RESET signal | No | |

With the properties shown below, select [Yes] to mask the signal from the drop-down list (default: [No]).

- [Mask TARGET RESET signal]

- [Mask INTERNAL RESET signal]

(f) [Smart Analog]

You can configure the Smart Analog function in this category.

Note that this category appears only when the selected microcontroller supports the Smart Analog function. See "2.16 Use Smart Analog Function [E1][E20]" for details on the Smart Analog function and this category configuration.

(3) [Download File Settings] tab

You can configure downloading to the debug tool.

See "2.5.1 Execute downloading" for details on each category configuration.

(4) [Hook Transaction Settings] tab

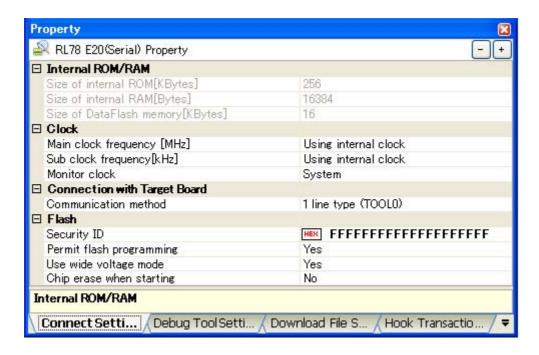

You can configure hook transaction for the debug tool.

See "2.17 Use Hook Function" for details on each category configuration and the function of the hook transaction.

2.3.4 [E20]

Configure the operating environment on the Property panel below when using E20.

Figure 2-33. Example of Property Panel [E20]

Follow the steps below by selecting the corresponding tab on the Property panel.

- (1) [Connect Settings] tab
- (2) [Debug Tool Settings] tab
- (3) [Download File Settings] tab
- (4) [Hook Transaction Settings] tab

(1) [Connect Settings] tab

You configure the connection with the debug tool for each one of the following categories.

- (a) [Internal ROM/RAM]
- (b) [Clock]
- (c) [Connection with Target Board]
- (d) [Flash]
- (e) [Hot Plug-in]

(a) [Internal ROM/RAM]

The configuration of internal ROM/RAM is displayed in this category.

Figure 2-34. [Internal ROM/RAM] Category [E20]

| E | ☐ Internal ROM/RAM | | |
|---|----------------------------------|-------|--|
| | Size of internal ROM[KBytes] | 256 | |
| | Size of internal RAM[Bytes] | 16384 | |
| | Size of DataFlash memory[KBytes] | 16 | |

<1> [Size of internal ROM[KBytes]]

The internal ROM size to emulate is displayed (unit: Kbytes).

You cannot change the value of this property.

<2> [Size of internal RAM[Bytes]]

The internal RAM size to emulate is displayed (unit: bytes).

You cannot change the value of this property.

<3> [Size of DataFlash memory[KBytes]]

The data flash memory size is displayed (unit: Kbytes).

If the currently selected microcontroller does not incorporate the data flash, [0] is displayed.

You cannot change the value of this property.

(b) [Clock]

You can configure the clock in this category.

Figure 2-35. [Clock] Category [E20]

| □ Clock | |
|----------------------------|----------------------|
| Main clock frequency [MHz] | Using internal clock |
| Sub clock frequency[kHz] | Using internal clock |
| Monitor clock | System |

<1> [Main clock frequency [MHz]]

Specify the main clock frequency.

You can specify the frequency from the drop-down list or by directly entering a frequency value between 0.001 and 99.999 (unit: MHz) (default: [Using internal clock]).

When using X1/X2 oscillation, specify the clock frequency.

When using an external clock oscillation with the embedded PLL circuit, specify the frequency of the transmitter/resonator (i.e. the frequency before the setting of the PLL clock).

Remark The main clock frequency is used to synchronize the communication between E20 and the host machine. This specification is not for the frequency of the CPU operation.

<2> [Sub clock frequency[kHz]]

Specify the sub clock frequency.

You can specify the frequency from the drop-down list or by directly entering a frequency value number between 0.001 and 99.999 (unit: kHz) (default: [Using internal clock]).

Remark The sub clock frequency is used to synchronize the communication between E20 and the host machine. This specification is not for the frequency of the CPU operation.

<3> [Monitor clock]

Select a clock for monitor programs to operate while the program is stopped, from the following drop-down list.

| System | Operates with main clock (default). |
|--------|---|
| User | Operates with the clock that the program specified. |

(c) [Connection with Target Board]

You can configure the connection between E20 and the target board in this category.

Note that this category does not appear if no property displayed exists according to the type of the selected microcontroller.

Caution Properties in this category cannot be changed when E20 is connected to CubeSuite+.

Figure 2-36. [Connection with Target Board] Category [E20]

| ☐ Connection with Target Board | |
|--------------------------------|---------------------------|
| Communication method | 2 line type (TOOL0+TOOL1) |

<1> [Communication method]

This property appears only when the communication method of the selected microcontroller can be changed.

Select the communication method for E20 to communicate in serial mode with microcontrollers on the target board, from the following drop-down list.

Note that selectable ports depend on the type of the selected microcontroller.

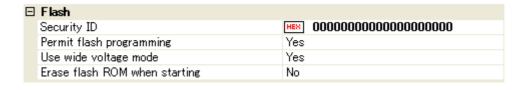

| 1 line type (TOOL0) | The communication method is to use 1 line type (TOOL0) (default). |
|---------------------------|---|
| 2 line type (TOOL0+TOOL1) | The communication method is to use 2 line type (TOOL0+TOOL1). |

(d) [Flash]

You can configure the flash memory rewriting in this category.

Caution Properties in this category cannot be changed when E20 is connected to CubeSuite+.

Figure 2-37. [Flash] Category

<1> [Security ID]

This property appears only when the selected microcontroller supports the ROM security function (onchip debug security ID) for flash memory.

Specify a security ID for reading codes in the internal ROM or internal flash memory.

Directly enter 20 digits hexadecimal number (10 bytes: 0x0 to 0xFFFFFFFFFFFFFFFF) (default: [000000000000000000]).

For details on the on-chip debug security ID, see E20 User's Manual.

<2> [Permit flash programming]

Select whether to enable the flash memory rewriting.

Select [Yes] to enable flash rewrite (default).

Note that when [No] is specified with this property, the flash memory area cannot be rewritten at all from the debug tool.

<3> [Use wide voltage mode]

This property appears only when the selected microcontroller supports the wide voltage mode for the flash memory rewriting.

Select whether to rewrite the flash memory with the wide voltage mode.

Select [Yes] to rewrite with the low voltage flash mode (default).

<4> [Erase flash ROM when starting]

This property appears only when the [Permit flash programming] property is set to [Yes].

Select whether to erase flash ROM when connecting to the debug tool.

Select [Yes] to erase flash ROM (default: [No]).

Note that this property is set to [No] after connecting to the debug tool.

Caution When conducting hot plug-in connection, the setting of this property will be ignored and flash ROM will not be erased.

(e) [Hot Plug-in]

You can configure the hot plug-in connection in this category.

Note that this category appears only when the selected microcontroller incorporates the hot plug-in function. See "2.4.3 Connect to the debug tool using hot plug-in [E1][E20] for details on hot plug-in function and this category configuration.

(2) [Debug Tool Settings] tab

You configure the basic settings of the debug tool for each one of the following categories.

- (a) [Memory]
- (b) [Access Memory While Running]
- (c) [Break]
- (d) [Trace]
- (e) [Mask for Input Signal]
- (f) [Smart Analog]

(a) [Memory]

You can configure the memory in this category.

Figure 2-38. [Memory] Category [E20]

| ∃ Memory | |
|-----------------------------|-------------------|
| | [10] |
| ⊞ [0] | Internal ROM area |
| ⊞ [1] | Non-map area |
| ⊞ [2] | DataFlash area |
| ⊞ [3] | Non-map area |
| ⊞ [4] | SFR area |
| ⊞ [5] | Non-map area |
| ⊞ [6] | Mirror area |
| ⊞ [7] | Internal RAM area |
| ⊞ [8] | Register area |
| ⊞ [9] | SFR area |
| Verify on writing to memory | Yes |

<1> [Memory mappings]

Current memory mapping status is displayed for each type of memory area.

The memory mapping status cannot be changed on this panel. If it is necessary to add a memory mapping, click on the [Memory Mapping] property, and click on the [...] button that appears on the right end of the setting field. The Memory Mapping dialog box opens; perform the setting from there. See the section for the Memory Mapping dialog box for details on how to configure the parameters.

Figure 2-39. Opening Memory Mapping Dialog Box

Caution If you are not connected to a debug tool, then only memory mapping areas added by user is displayed.

Connecting to a debug tool (see "2.4.1 Connect to the debug tool") will display details for each memory type.

<2> [Verify on writing to memory]

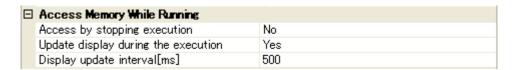

Select whether to perform a verify check when writing to the memory.

Select [Yes] to perform verification after download or when values are changed in the Memory panel/ Watch panel (default).

(b) [Access Memory While Running]

You can configure the memory access while executing a program (the real-time display update function) in this category. See "(4) Display/modify the memory contents during program execution" for details on the real-time display update function.

Figure 2-40. [Access Memory While Running] Category [E20]

<1> [Access by stopping execution]

For a memory area not accessible during execution of a program (e.g. target memory area/SFR area), select whether to allow access to the area by temporary stopping the execution.

Note that if this property is set to [Yes] when the [Communication method] property in the [Connection with Target Board] category is set to [1 line type (TOOL0+TOOL1)], then a message will appear because the debug tool's response speed becomes sluggish.

Select [Yes] to allow access (default: [No]).

<2> [Update display during the execution]

Select whether to automatically update the contents in the Memory panel/Watch panel display while executing a program.

Select [Yes] to update the display automatically (default).

Remark The display contents of the Memory panel/Watch panel can be updated manually by clicking the button on the panel.

<3> [Display update interval[ms]]

This property is valid only when the [Update display during the execution] property is set to [Yes]. Specify the interval in 100ms unit to automatically update the contents in the Memory panel/Watch panel display while executing a program.

Directly enter the Integer number between 100 and 65500 (rounding up the fractions less than 100ms) (default: [500]).

(c) [Break]

You can configure the break function.

See "2.8 Stop Programs (Break)" for details on the break function and this category configuration.

(d) [Trace]

You can configure the trace function in this category.

Note that this category appears only when the selected microcontroller incorporates the OCD trace function. See "2.11 Collect Execution History of Programs" for details on the trace function and this category configuration.

(e) [Mask for Input Signal]

You can configure the input signal masking in this category.

- Cautions 1. The settings of the properties in this category are ignored in the case of a hot plug-in connection. That is, the program operates as if the specification for the properties is [No] (the settings of them become valid again after reconnection with CubeSuite+).
 - 2. Maskable signals differ depending on the selected microcontroller type (a signal that cannot be masked will be hidden).

Figure 2-41. [Mask for Input Signal] Category

| E | Mask for Input Signal | | |
|---|----------------------------|----|--|
| | Mask TARGET RESET signal | No | |
| | Mask INTERNAL RESET signal | No | |

With the properties shown below, select [Yes] to mask the signal from the drop-down list (default: [No]).

- [Mask TARGET RESET signal]
- [Mask INTERNAL RESET signal]

(f) [Smart Analog]

You can configure the Smart Analog function in this category.

Note that this category appears only when the selected microcontroller supports the Smart Analog function. See "2.16 Use Smart Analog Function [E1][E20]" for details on the Smart Analog function and this category configuration.

(3) [Download File Settings] tab

You can configure downloading to the debug tool.

See "2.5.1 Execute downloading" for details on each category configuration.

(4) [Hook Transaction Settings] tab

You can configure hook transaction for the debug tool.

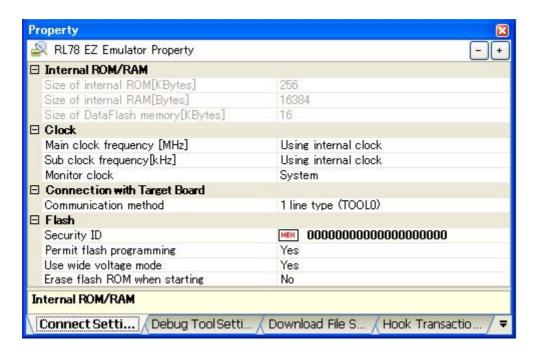

See "2.17 Use Hook Function" for details on each category configuration and the function of the hook transaction.

2.3.5 [EZ Emulator]

Configure the operating environment on the Property panel below when using EZ Emulator.

Figure 2-42. Example of Property Panel [EZ Emulator]

Follow the steps below by selecting the corresponding tab on the Property panel.

- (1) [Connect Settings] tab
- (2) [Debug Tool Settings] tab
- (3) [Download File Settings] tab
- (4) [Hook Transaction Settings] tab

(1) [Connect Settings] tab

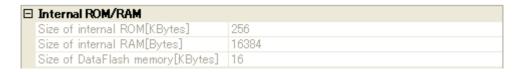

You configure the connection with the debug tool for each one of the following categories.

- (a) [Internal ROM/RAM]
- (b) [Clock]
- (c) [Connection with Target Board]
- (d) [Flash]

(a) [Internal ROM/RAM]

The configuration of internal ROM/RAM is displayed in this category.

Figure 2-43. [Internal ROM/RAM] Category [EZ Emulator]

<1> [Size of internal ROM[KBytes]]

The internal ROM size to emulate is displayed (unit: Kbytes).

You cannot change the value of this property.

<2> [Size of internal RAM[Bytes]]

The internal RAM size to emulate is displayed (unit: bytes).

You cannot change the value of this property.

<3> [Size of DataFlash memory[KBytes]]

The data flash memory size is displayed (unit: Kbytes).

If the currently selected microcontroller does not incorporate the data flash, [0] is displayed.

You cannot change the value of this property.

(b) [Clock]

You can configure the clock in this category.

Figure 2-44. [Clock] Category [EZ Emulator]

| □ Clock | |
|----------------------------|----------------------|
| Main clock frequency [MHz] | Using internal clock |
| Sub clock frequency[kHz] | Using internal clock |
| Monitor clock | System |

<1> [Main clock frequency [MHz]]

Specify the main clock frequency.

You can specify the frequency from the drop-down list or by directly entering a frequency value between 0.001 and 99.999 (unit: MHz) (default: [Using internal clock]).

When using X1/X2 oscillation, specify the clock frequency.

When using an external clock oscillation with the embedded PLL circuit, specify the frequency of the transmitter/resonator (i.e. the frequency before the setting of the PLL clock).

Remark The main clock frequency is used to synchronize the communication between EZ Emulator and the host machine. This specification is not for the frequency of the CPU operation.

<2> [Sub clock frequency[kHz]]

Specify the sub clock frequency.

You can specify the frequency from the drop-down list or by directly entering a frequency value number between 0.001 and 99.999 (unit: kHz) (default: [Using internal clock]).

Remark The sub clock frequency is used to synchronize the communication between EZ Emulator and the host machine.

This specification is not for the frequency of the CPU operation.

<3> [Monitor clock]

Select a clock for monitor programs to operate while the program is stopped, from the following dropdown list.

| System | Operates with main clock (default). |
|--------|---|
| User | Operates with the clock that the program specified. |

(c) [Connection with Target Board]

You can configure the connection between EZ Emulator and the target board in this category.

Note that this category does not appear if no property displayed exists according to the type of the selected microcontroller.

Figure 2-45. [Connection with Target Board] Category [EZ Emulator]

| [| ∃ Connection with Target Board | |
|---|--------------------------------|---------------------------|
| | Communication method | 2 line type (TOOL0+TOOL1) |
| | Low voltage OCD board | No |

<1> [Communication method]

This property appears only when the communication method of the selected microcontroller can be changed.

Select the communication method for EZ Emulator to communicate in serial mode with microcontrollers on the target board, from the following drop-down list.

Note that selectable ports depend on the type of the selected microcontroller.

| 1 line type (TOOL0) | The communication method is to use 1 line type (TOOL0) (default). |
|---------------------------|---|
| 2 line type (TOOL0+TOOL1) | The communication method is to use 2 line type (TOOL0+TOOL1). |

Caution This property cannot be changed when EZ Emulator is connected to CubeSuite+.

<2> [Low voltage OCD board]

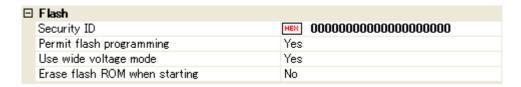

This property appears only when the selected microcontroller supports a low voltage OCD board. Select whether to use a low voltage OCD board.

Select [Yes] to use a low voltage OCD board (default: [No]).

(d) [Flash]

You can configure the flash memory rewriting in this category.

Figure 2-46. [Flash] Category [EZ Emulator]

<1> [Security ID]

This property appears only when the selected microcontroller supports the ROM security function (onchip debug security ID) for flash memory.

Specify a security ID for reading codes in the internal ROM or internal flash memory.

Directly enter 20 digits hexadecimal number (10 bytes: 0x0 to 0xFFFFFFFFFFFFFFFF) (default: [00000000000000000]).

For details on the on-chip debug security ID, see EZ Emulator User's Manual.

Caution This property cannot be changed when EZ Emulator is connected to CubeSuite+.

<2> [Permit flash programming]

Select whether to enable the flash memory rewriting.

Select [Yes] to enable flash rewrite (default).

Note that when [No] is specified with this property, the flash memory area cannot be rewritten at all from the debug tool.

<3> [Use wide voltage mode]

This property appears only when the selected microcontroller supports the wide voltage mode for the flash memory rewriting.

Select whether to rewrite the flash memory with the wide voltage mode.

Select [Yes] to rewrite with the low voltage flash mode (default).

Caution This property cannot be changed when EZ Emulator is connected to CubeSuite+.

<4> [Erase flash ROM when starting]

This property appears only when the [Permit flash programming] property is set to [Yes].

Select whether to erase flash ROM when connecting to the debug tool.

Select [Yes] to erase the flash ROM (default: [No]).

Note that this property is set to [No] after connecting to the debug tool.

Caution This property cannot be changed when EZ Emulator is connected to CubeSuite+.

(2) [Debug Tool Settings] tab

You configure the basic settings of the debug tool for each one of the following categories.

- (a) [Memory]
- (b) [Access Memory While Running]
- (c) [Break]
- (d) [Trace]
- (e) [Mask for Input Signal]

(a) [Memory]

You can configure the memory in this category.

Figure 2-47. [Memory] Category [EZ Emulator]

| ⊟ Memory | |
|-----------------------------|-------------------|
| ☐ Memory mappings | [10] |
| ⊞ [0] | Internal ROM area |
| ⊞ [1] | Non-map area |
| ⊕ [2] | DataFlash area |
| ⊕ [3] | Non-map area |
| ⊕ [4] | SFR area |
| ⊞ [5] | Non-map area |
| ⊞ [6] | Mirror area |
| ⊞ [7] | Internal RAM area |
| ⊕ [8] | Register area |
| ⊞ [9] | SFR area |
| Verify on writing to memory | Yes |

<1> [Memory mappings]

Current memory mapping status is displayed for each type of memory area.

The memory mapping status cannot be changed on this panel. If it is necessary to add a memory mapping, click on the [Memory Mapping] property, and click on the [...] button that appears on the right end of the setting field. The Memory Mapping dialog box opens; perform the setting from there.

See the section for the Memory Mapping dialog box for details on how to configure the parameters.

Figure 2-48. Opening Memory Mapping Dialog Box

Caution If you are not connected to a debug tool, then only memory mapping areas added by user is displayed.

Connecting to a debug tool (see "2.4.1 Connect to the debug tool") will display details for each memory type.

<2> [Verify on writing to memory]

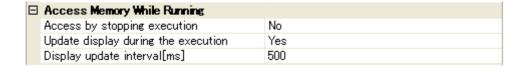

Select whether to perform a verify check when writing to the memory.

Select [Yes] to perform verification after download or when values are changed in the Memory panel/ Watch panel (default).

(b) [Access Memory While Running]

You can configure the memory access while executing a program (the real-time display update function) in this category. See "(4) Display/modify the memory contents during program execution" for details on the real-time display update function.

Figure 2-49. [Access Memory While Running] Category [EZ Emulator]

<1> [Access by stopping execution]

Select whether to allow access to the memory area while executing a program.

Select [Yes] to allow access (default: [No]).

Note that if this property is set to [Yes] when the [Communication method] property in the [Connection with Target Board] category is set to [1 line type (TOOL0+TOOL1)], then a message will appear because the debug tool's response speed becomes sluggish.

<2> [Update display during the execution]

Select whether to automatically update the contents in the Memory panel/Watch panel display while executing a program.

Select [Yes] to update the display automatically (default).

Remark The display contents of the Memory panel/Watch panel can be updated manually by clicking the button on the panel.

<3> [Display update interval[ms]]

This property is valid only when the [Update display during the execution] property is set to [Yes]. Specify the interval in 100ms unit to automatically update the contents in the Memory panel/Watch panel display while executing a program.

Directly enter the Integer number between 100 and 65500 (rounding up the fractions less than 100ms) (default: [500]).

(c) [Break]

You can configure the break function.

See "2.8 Stop Programs (Break)" for details on the break function and this category configuration.

(d) [Trace]

You can configure the trace function in this category.

Note that this category appears only when the selected microcontroller incorporates the OCD trace function. See "2.11 Collect Execution History of Programs" for details on the trace function and this category configuration.

(e) [Mask for Input Signal]

You can configure the input signal masking in this category.

Caution Maskable signals differ depending on the selected microcontroller type (a signal that cannot be masked will be hidden).

Figure 2-50. [Mask for Input Signal] Category [EZ Emulator]

| Mask for Input Signal | |
|----------------------------|----|
| Mask TARGET RESET signal | No |
| Mask INTERNAL RESET signal | No |

With the properties shown below, select [Yes] to mask the signal from the drop-down list (default: [No]).

- [Mask TARGET RESET signal]
- [Mask INTERNAL RESET signal]

(3) [Download File Settings] tab

You can configure downloading to the debug tool.

See "2.5.1 Execute downloading" for details on each category configuration.

(4) [Hook Transaction Settings] tab

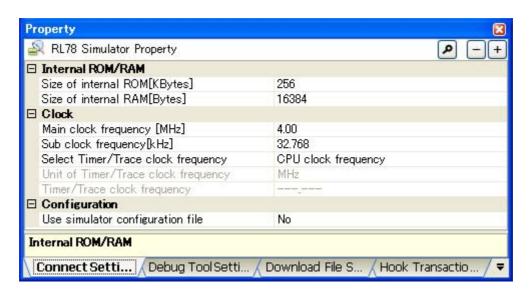

You can configure hook transaction for the debug tool.

See "2.17 Use Hook Function" for details on each category configuration and the function of the hook transaction.

2.3.6 [Simulator]

Configure the operating environment on the Property panel below when using Simulator.

Figure 2-51. Example of Property Panel [Simulator]

Follow the steps below by selecting the corresponding tab on the Property panel.

- (1) [Connect Settings] tab
- (2) [Debug Tool Settings] tab
- (3) [Download File Settings] tab
- (4) [Hook Transaction Settings] tab

Caution The following cautions apply to the instruction simulator for RL78:

- The data flash is not supported.
- The Pipeline is not supported.
- The CPU operation clock operates by the specification of RL78/G13.
- When using Multiplier and Divider/Multiply-Accumulator by division mode, the division processing will be finished in by 1 clock.
- When using Multiplier and Divider/Multiply-Accumulator by division mode, the interrupt for the end of division operation is not occurred. But DIVST bit of Multiplication/Division Control Register "MDUC" is changed (DIVST bit displays division operation status).

Remark When Simulator to be used corresponds to peripheral function simulations, you can use the Simulator GUI. See "2.18 Use the Simulator GUI [Simulator]" for details on the Simulator GUI.

(1) [Connect Settings] tab

You configure the connection with the debug tool for each one of the following categories.

- (a) [Internal ROM/RAM]
- (b) [Clock]
- (c) [Configuration]

(a) [Internal ROM/RAM]

You can configure internal ROM/RAM in this category.

The size of internal ROM/RAM of the selected microcontroller is specified by default.

There is no need to change the settings in this category if you wish to debug with the same memory mapping of the selected microcontroller.

Figure 2-52. [Internal ROM/RAM] Category [Simulator]

| Internal ROM/RAM | |
|------------------------------|-------|
| Size of internal ROM[KBytes] | 256 |
| Size of internal RAM[Bytes] | 16384 |

<1> [Size of internal ROM[KBytes]

Select the internal ROM size to simulate (unit: Kbytes).

Change the value only when you perform debugging after changing the memory mapping.

<2> [Size of internal RAM[Bytes]]

Select the internal RAM size to simulate (unit: bytes).

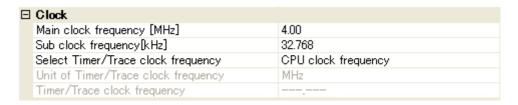

Change the value only when you perform debugging after changing the memory mapping.

Remark The data flash memory is not supported by Simulator.

(b) [Clock]

You can configure the clock in this category.

Figure 2-53. [Clock] Category [Simulator]

<1> [Main clock frequency [MHz]]

Specify the main clock frequency.

You can specify the frequency from the drop-down list or by directly entering a frequency value between 0.001 and 99.999 (unit: MHz) (default: [4.00]).

<2> [Sub clock frequency[kHz]]

Specify the sub clock frequency.

You can specify the frequency from the drop-down list or by directly entering a frequency value between 0.001 and 99.999 (unit: kHz) (default: [32.768]).

<3> [Select Timer/Trace clock frequency]

Select the clock frequency for using timer/trace function, from the following drop-down list.

| CPU clock frequency | Uses the CPU clock frequency (default). | |
|-------------------------|--|--|
| Specify clock frequency | Specifies an arbitrary frequency (property items to specify become valid in the lower area). | |

<4> [Unit of Timer/Trace clock frequency]

This property appears only when the [Select Timer/Trace clock frequency] property is set to [Specify clock frequency].

Select the unit of the clock frequency for timer/trace, from the following drop-down list.

| MHz | The unit of the frequency is in MHz (default). |
|-----|--|
| KHz | The unit of the frequency is in kHz. |

<5> [Timer/Trace clock frequency]

The operation of this property differs depending on the specification of the [Select Timer/Trace clock frequency] property.

- When [CPU clock frequency] is selected:

The following value is displayed (this cannot be changed).

While disconnected from the debug tool: "---_---

While connected to the debug tool: "CPU clock frequency"

- When [Specify clock frequency] is selected:

Specify the clock frequency for timer/trace.

Directly enter the value between 1 [kHz] and 99.999 [MHz] (default: [4.00]).

Unit is depending on the specification with the [Unit of Timer/Trace clock frequency] property.

(c) [Configuration]

You can configure the customization of the simulator in this category.

Caution Properties in this category cannot be changed when Simulator is connected to CubeSuite+.

Figure 2-54. [Configuration] Category

<1> [Use simulator configuration file]

Select whether to use the simulator configuration file to perform user customization (adding of user models) of the simulator.

Select [Yes] to use the simulator configuration file (default: [No]).

<2> [Simulator configuration file]

This property appears only when the [Use simulator configuration file] property is set to [Yes]. Specify the simulator configuration file to use.

Directly enter the file name, or select the file with the Select Simulator Configuration File dialog box [Simulator] opened by clicking on the [...] button that appears on the right end of the setting field.

(2) [Debug Tool Settings] tab

You configure the basic settings of the debug tool for each one of the following categories.

- (a) [Memory]
- (b) [Access Memory While Running]
- (c) [Break]
- (d) [Trace]

- (e) [Timer]
- (f) [Coverage]
- (g) [Simulator GUI]

(a) [Memory]

You can configure the memory in this category.

Figure 2-55. [Memory] Category [Simulator]

| □ Memory | | |
|-------------------|--|--|
| [10] | | |
| Internal ROM area | | |
| Non-map area | | |
| DataFlash area | | |
| Non-map area | | |
| SFR area | | |
| Non-map area | | |
| Mirror area | | |
| Internal RAM area | | |
| Register area | | |
| SFR area | | |
| | | |

<1> [Memory mappings]

Current memory mapping status is displayed for each type of memory area.

The memory mapping status cannot be changed on this panel. If it is necessary to add a memory mapping, click on the [Memory Mapping] property, and click on the [...] button that appears on the right end of the setting field. The Memory Mapping dialog box opens; perform the setting from there. See the section for the Memory Mapping dialog box for details on how to configure the parameters.

Figure 2-56. Opening Memory Mapping Dialog Box

Caution If you are not connected to a debug tool, then only memory mapping areas added by user is displayed.

Connecting to a debug tool (see "2.4.1 Connect to the debug tool") will display details for each memory type.

(b) [Access Memory While Running]

You can configure the memory access while executing a program (the real-time display update function) in this category. See "(4) Display/modify the memory contents during program execution" for details on the real-time display update function.

Figure 2-57. [Access Memory While Running] Category [Simulator]

| Access Memory While Running | |
|-------------------------------------|-----|
| Update display during the execution | Yes |
| Display update interval[ms] | 500 |

<1> [Update display during the execution]

Select whether to automatically update the contents in the Memory panel/Watch panel display during a program execution.

Select [Yes] to update the display automatically (default).

Remark The display contents of the Memory panel/Watch panel can be updated manually by clicking the button on the panel.

<2> [Display update interval[ms]]

This property is valid only when the [Update display during the execution] property is set to [Yes].

Specify the interval in 100ms unit to automatically update the contents in the Memory panel/Watch panel display while executing a program.

Directly enter the Integer number between 100 and 65500 (rounding up the fractions less than 100ms) (default: [500]).

(c) [Break]

You can configure the break function.

See "2.8 Stop Programs (Break)" for details on the break function and this category configuration.

(d) [Trace]

You can configure the trace function in this category.

See "2.11 Collect Execution History of Programs" for details on the trace function and this category configuration.

(e) [Timer]

You can configure the timer function in this category.

See "2.12 Measure Execution Time of Programs" for details on the timer function.

Figure 2-58. [Timer] Category [Simulator]

<1> [Use timer function]

Select whether to use the timer function.

Select [Yes] to use the timer function (default: [No]).

(f) [Coverage]

You can configure the coverage function in this category.

See "2.13 Measure Coverage [IECUBE][Simulator]" for details on the coverage function and this category configuration.

(g) [Simulator GUI]

You can configure the Simulator GUI function in this category.

See "2.18 Use the Simulator GUI [Simulator]" for details on the Simulator GUI function and this category configuration.

(3) [Download File Settings] tab

You can configure downloading to the debug tool.

See "2.5.1 Execute downloading" for details on each category configuration.

(4) [Hook Transaction Settings] tab

You can configure hook transaction for the debug tool.

See "2.17 Use Hook Function" for details on each category configuration and the function of the hook transaction.

2.4 Connect to/Disconnect from the Debug Tool

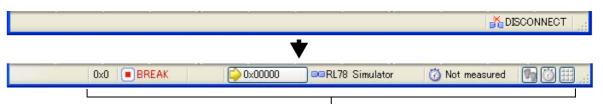

This section describes how to connect to/disconnect from the debug tool.

2.4.1 Connect to the debug tool

By selecting [Connect to Debug Tool] from the [Debug] menu, CubeSuite+ starts communicating with the debug tool selected in the active project.

After succeeding in the connection to the debug tool, the Statusbar of the Main window changes as follows: For details on each item displayed on the Statusbar, see the section of the "Main window".

Figure 2-59. Statusbar Indicating Successful Connection to Debug Tool

The information of the debug tool appears at this area.

Caution If the version of compiler being used is not supported by CubeSuite+, [Connect to Debug Tool] will be disabled.

Remarks 1. When the button on the Debug toolbar is clicked, the specified file is downloaded automatically after connecting to the debug tool (see "2.5.1 Execute downloading").

When the button on this toolbar is clicked, the project is built automatically, and then the built file is downloaded after connecting to the debug tool.

2. [Simulator]

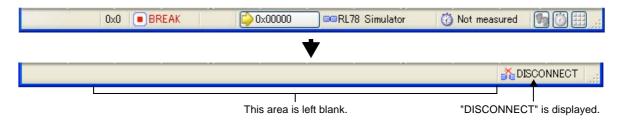

When a microcontroller whose Simulator supports peripheral function simulations is selected, the Simulator GUI window is automatically opened after connecting to the debug tool (default).

2.4.2 Disconnect from the debug tool

By clicking the button on the Debug toolbar, CubeSuite+ cuts off the communication with the connected debug tool.

After disconnecting from the debug tool, the Statusbar of the Main window changes as follows:

Figure 2-60. Statusbar Indicating Disconnection from Debug Tool

Caution The debug tool cannot be disconnected from CubeSuite+ while the program is running.

Remark Disconnecting the debug tool will close all the panels and dialog boxes that can be displayed only during the connection.

2.4.3 Connect to the debug tool using hot plug-in [E1][E20]

With hot plug-in function, you can connect the debug tool to the target board during execution of a program (without having to turn off the system) and debug the program while it is in execution.

Follow the steps below to establish hot plug-in connection.

Cautions 1. The hot plug-in connection is enabled only when the selected microcontroller incorporates the hot plug-in function.

- 2. When a hot plug-in connection is made, the settings of the following properties are ignored (i.e. the program operates as if the specification for them is [No]). The settings of them become valid again after reconnection with CubeSuite+.
 - [Mask TARGET RESET signal]
 - [Mask INTERNAL RESET signal]
 - [Power target from the emulator (MAX 200mA)]
 - [Erase flash ROM when starting]
- 3. When a hot plug-in connection is made, events currently being set in the project are ignored. They become valid again after reconnection with CubeSuite+.

(1) Set the number of times and interval to retry

Set the interval and number of times to retry connection when the emulator fails to communicate with the microcontroller on the target board.

You can configure this settings in [Hot Plug-in] category on the [Connect Settings] tab of the Property panel.

Figure 2-61. [Hot Plug-in] Category

| ⊟ Hot Plug-in | | |
|-----------------------------|------|--|
| Retrying interval[ms] | 1000 | |
| Number of times of retrying | 3 | |

<1> [Retrying interval[ms]]

Specify an interval in 1 ms unit to retry the connection.

Directly enter the decimal number between 0 and 60000 (default: [1000]).

<2> [Number of times of retrying]

Specify the number of times to retry the connection.

Directly enter the decimal number between 0 and 3 (default: [3]).

(2) Execute the program

Execute the program which has been downloaded onto the microcontroller on the target board without connecting to the emulator.

(3) Select the debug tool

In the active project, select the debug tool which supports hot plug-in connection (E1/ E20).

(4) Connect the debug tool to CubeSuite+ using hot plug-in

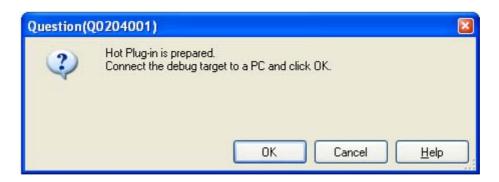

Select [Hot Plug-in] from [Debug] menu to initiate the preparation for hot plug-in connection.

(5) Connect to the target board

Following message will appear once you are ready to start hot plug-in connection. Connect the emulator to the target system and click [OK]. This will start the communication with the debug tool which is selected in the currently active project.

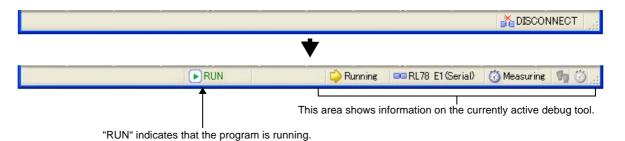

Figure 2-62. Message Indicating that Hot Plug-in Connection Is Ready to Be Started

(6) Hot plug-in connection completed

Once the connection to the debug tool is successfully completed, the Statusbar on the Main window will change as shown below. For details on each item displayed on the statusbar, see the section of the "Main window".

Figure 2-63. Statusbar Indicating Successful Hot plug-in Connection to Debug Tool

2.5 Download/Upload Programs

This section describes how to download programs (such as load module files (*.lmf)) to debug to CubeSuite+ and how to upload the memory contents being debugged from CubeSuite+ to files.

2.5.1 Execute downloading

Download the load module file to be debugged to the debug tool that is currently connected.

Follow the steps below on the [Download File Settings] tab in the Property panel for the downloading, and then execute the downloading.

(1) [Download] category setting

Figure 2-64. [Download] Category

| □ Download | |
|---|-------------------|
| ☐ Download files | [1] |
| □ [0] | Debug Build\a.lmf |
| File | Debug Build\a.lmf |
| File type | Load module file |
| Download object | Yes |
| Download symbol information | Yes |
| CPU Reset after download | Yes |
| Download Mode | Speed priority |
| Erase flash ROM before download | No |
| Automatic change method of event setting position | Suspend event |
| Check reserved area overwriting when downloading | Yes |

Caution Properties displayed in this category differ depending on the debug tool used in the project.

(a) [Download files]

The names of files to be downloaded and download conditions are displayed (the number enclosed with "[]" indicates the number of files to be download).

Files that are specified as build target files in the main project or subprojects will automatically be selected as the files to be downloaded^{Note}.

However, you can manually change the download files and the condition. In this case, see "2.5.2 Advanced downloading".

Note To download the load module files created by an external build tool (e.g., compilers and assemblers other than the build tools supplied with CubeSuite+), a debug-dedicated project needs to be created. If you use a debug-dedicated project as the subject to debug, add your a download file to Download files node on project tree. The file to be downloaded will be reflected in this property. See "CubeSuite+ Integrated Development Environment User's Manual: Start" for details on the using an external build tool and a debug-dedicated project.

(b) [CPU Reset after download]

Specify whether to reset the CPU after downloading.

Select [Yes] to reset the CPU (default).

Note, however, that this property does not appear if the selected microcontroller always resets the CPU after downloading.

(c) [Download Mode] (except [Simulator])

Specify the download mode for downloading to the flash ROM.

Select one of the options from the following drop-down list.

| Speed priority | Fills free space between the first data and the final data with FFH (the previous value in free space before the first data and after the final data is retained). Download speed will be faster because the writing data is reduced (default). |
|----------------|--|
| Data priority | Retains the previous value in free space. Download speed will be very slow because data in free space are read once. |

(d) [Erase flash ROM before download]

This property is valid only when the [Download Mode] (except [Simulator]) property is set to [Speed priority](default).

Specify whether to erase the flash ROM before downloading.

Select [Yes] to erase the flash ROM (default: [No]).

(e) [Automatic change method of event setting position]

If the file is downloaded again during debugging then the location (address) set for the currently configured event may change to midway in the instruction.

Specify with this property how to handle the target event in this circumstance.

Select one of the options from the following drop-down list.

| Move to the head of instruction | Resets the subject event at the beginning address of the instruction. | |
|---------------------------------|---|--|
| Suspend event | Leaves the subject event pending (default). | |

Note, however, that this property setting only applies to the location setting of events without debugging information. The location setting of events with debug information is always moved to the beginning of the source text line.

(f) [Check reserved area overwriting when downloading] [E1][E20][EZ Emulator]

Specify whether to output a message when overwriting to an area reserved for use by the emulator is attempted at the time of downloading.

Select [Yes] to output a message (default).

(2) [Debug Information] category setting

Figure 2-65. [Debug information] Category

| Debug Information | |
|---|----------|
| Execute to the specified symbol after CPU Reset | Yes |
| Specified symbol | _main |
| Startup start symbol | _@cstart |
| Startup end symbol | _@cend |

(a) [Execute to the specified symbol after CPU Reset]

Specify from the drop-down list whether to execute the program to the specified symbol position after CPU reset or downloading (for only when the [CPU Reset after download] property is set to [Yes]). Select [Yes] to execute the program to the specified symbol position after CPU reset (default).

Remark When the [CPU Reset after download] property is set to [Yes], the operation after downloading is as follows:

If [Yes] is selected for this property, the Editor panel will open automatically with displaying source text of the position specified with the [Specified symbol] property after downloading.

If [No] is selected for this property, the Editor panel will open with displaying source text of the reset address (when if the source text has not been allocated to the reset address, the contents of the reset address is displayed in the Disassemble panel).

(b) [Specified symbol]

This property appears only when the [Execute to the specified symbol after CPU Reset] property is set to [Yes].

Specify the position at which the program is stop after CPU reset.

Directly enter an address expression between 0 and "last address in address space" (default: [_main]).

Note, however, that the program will not be executed if the specified address expression cannot be converted into an address.

Remark Normally, specify the following.

For assembler source: Start label corresponding to main function

For C source: Symbol assigned to the start of the main function name

(c) [Startup start symbol]

Specify the start symbol of the text area (code area) of the startup routine.

Directly enter an address expression between 0 and "last address in address space" (default: [_@cstart]).

This setting is not needed if the source is assembly language.

(d) [Startup end symbol]

Specify the end symbol of the text area (code area) of the startup routine.

Directly enter an address expression between 0 and "last address in address space" (default: [_@cend]).

This setting is not needed if the source is assembly language.

- Cautions 1. To automatically display the source text right after downloading the file, the startup symbol must be correctly specified.
 - By default, CPU reset automatically occurs after downloading the file, and then the program
 is executed to the specified symbol position. If this operation above is not needed, specify
 [No] with both of the [CPU Reset after download] and [Execute to the specified symbol after
 CPU Reset] property.

(3) Execute download

Click the button on the Debug toolbar.

If this operation is performed while disconnecting from the debug tool, the application automatically connects to the debug tool, and then performs the download.

Remark When a program that has been modified during debugging is re-downloaded, you can easily build and download it by selecting [Build & Download] from the [Debug] menu on the Main window.

(4) Canceling a download

To cancel a download, click the [Cancel] button on the Progress Status dialog box, which displays the progress of downloading, or press the [Esc] key.

If the load module file is successfully downloaded, the Editor panel opens automatically, and the contents of the downloaded file's source text are displayed.

Remark You can automatically overwrite the value of SFR/CPU register with the specified values before and after performing the download (see "2.17" Use Hook Function" for details).

2.5.2 Advanced downloading

You can change the download files and the condition to download. With CubeSuite+, the following file types can be downloaded.

Table 2-1. Type of Files That Can be Downloaded

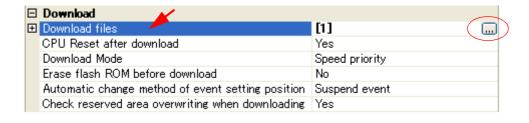

| File Type | File Format Extension | |
|------------------|---|------------------|
| Load module file | Load module format .lmf | |
| Hex file | Intel standard Hex format | .hex, .hxb, .hxf |
| | Intel expanded Hex format ^{Note} | .hex, .hxb, .hxf |
| | Motorola S type format | .hex, .hxb, .hxf |
| | - (S0, S1, S9 - 16 bit-address) | |
| | - (S0, S2, S8 - 24 bit-address) | |
| | - (S0, S3, S7 - 32 bit-address) | |
| | Expanded Tektronix Hex format | .hex, .hxb, .hxf |
| Binary data file | Binary format .bin | |

Note Can be up to 1 Mbyte

You can change the download files or download conditions in the following Download Files dialog box.

The Download Files dialog box is opened by clicking the [...] button that appears at the right edge in the column of the [Download files] property when you select it in the [Download] category on the [Download File Settings] tab of the Property panel.

Figure 2-66. Opening Download Files Dialog Box

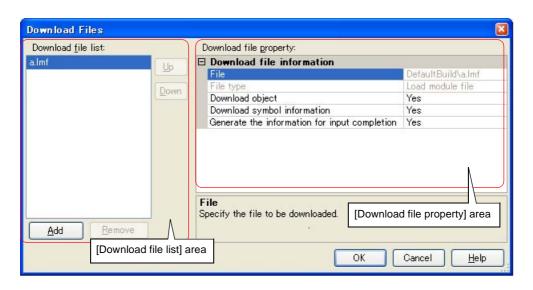

Figure 2-67. Advanced Downloading (Download Files Dialog Box)

This section describes how to configure on the Download Files dialog box above when the following cases. For details on the contents and function in each area, see the section for the Download Files dialog box.

Caution You cannot download more than one load module file (*.lmf).

- (1) Change download conditions for load module files
- (2) Add download files (*.hex/*.hxb/*.hxf/*.bin)
- (3) Perform source level debugging with files other than the load module file format

(1) Change download conditions for load module files

Follow the steps below in the Download Files dialog box to change the download conditions (object information and symbol information) for load module files (*.lmf) to download.

(a) Select a load module file

Select a load module file to download in the [Download file list] area.

(b) Change download conditions

Current download conditions for the selected load module file are displayed in the [Download file property] area

Change each items displayed in the property.

| Download object | Specify whether to download the object information from the specified file. | | |
|----------------------|---|-------------|---------------------------------------|
| | Default | Yes | |
| Modifying Select for | | Select from | the drop-down list. |
| | Available | Yes | Downloads object information. |
| | values | No | Does not download object information. |

| Download symbol | Specify whether to download the symbol information from the specified file Note 1. | | |
|------------------------------|--|---|---|
| information | Default | Yes | |
| | Modifying | Select from the drop-down list. | |
| | Available | Yes | Downloads symbol information. |
| | values | No | Does not download symbol information. |
| Generate the information for | Select whethe downloading ^N | er to generate the information for the Symbol name completion function when Note 2. | |
| input completion | Default | Yes | |
| | Modifying | Select from the drop-down list. | |
| | Available values | Yes | Generates the information for the symbol name completion function. (i.e. uses the symbol name completion function.) |
| | | No | Does not generate the information for the symbol name completion function. (i.e. does not use the symbol name completion function.) |

Notes 1. If the symbol information have not been downloaded, the source level debugging cannot be performed.

2. When [Yes] is selected, the time taken for downloading and the memory usage on the host machine will increase. We recommend selecting [No] in this item if you do not intend to use the symbol name completion function.

(c) Click the [OK] button

Enable all the configuration in this dialog box and change the download conditions.

(2) Add download files (*.hex/*.hxb/*.hxf/*.bin)

Follow the steps below to add download files other than the load module format (hex files (*.hex/*.hxb/*.hxf) or binary data files (*.bin)) in the Download Files dialog box.

Caution You cannot download more than one load module file (*.lmf).

(a) Click the [Add] button

When the [Add] button is clicked, a blank list item "-" is displayed in the last line of the [Download file list] area.

(b) Property configuration of the download files to add

Configure the download conditions for the download file to add in the [Download file property] area. Configure each item displayed with the following condition.

When the configuration is completed, the file name specified in this property is displayed in the blank list of the [Download file list] area.

| File | Specify the do (up to 259 cha | wnload file (in hex format (*.hex/*.hxb/*.hxf/in binary format (*.bin)) to download racters). |
|---------------|-------------------------------|---|
| Default Blank | | Blank |
| | Modifying | Directly enter from the keyboard, or specify with the Select Download File dialog box opened by clicking the [] button. |
| | Available values | See "Table 2-1. Type of Files That Can be Downloaded". |

| File type Specify the type of the file to download. | | | | | |
|--|---|--|--|--|--|
| | Select [Hex file] or [Binary data file]. | | | | |
| Default Load module | | Load module file | | | |
| Modifying Select from the | | Select from the drop-down list. | | | |
| | Available | Either one of the following | | | |
| | values | - Load module file | | | |
| | | - Hex file | | | |
| | | - Binary data file | | | |
| Offset Specify the offs | | eet from the address at which the file's download is to start. | | | |
| | Note that this item appears only when [File type] is set to [Hex file]. | | | | |
| | Default | 0 | | | |
| | Modifying | Directly enter from the keyboard. | | | |
| | Available | 0x0 to 0xFFFFFFFF in hexadecimal number | | | |
| values | | | | | |
| Start address | Specify the ad | dress at which to start the file's download. | | | |
| Note that this item appears only when [Fil- | | em appears only when [File type] is set to [Binary data file]. | | | |
| | Default | 0 | | | |
| | Modifying | Directly enter from the keyboard. | | | |
| | Available values | 0x0 to 0xFFFFFFF in hexadecimal number | | | |

Remark The settings of whether to download the object information or symbol information can be made only when the type of the file to download is load module files.

(c) Check the order of download

The order of the download is the display order of the files displayed in the [Download file list] area. If you want to change the order, use the [Up]/[Down] button.

(d) Click the [OK] button

Enable all the configuration in this dialog box and add a download file (the file name is displayed in the [Download] category on the [Download File Settings] tab of the Property panel).

(3) Perform source level debugging with files other than the load module file format

Even when a hex file (*.hex/*.hxb/*.hxf) or a binary data file (*.bin) is specified to be the subject file to download, it is possible to do source level debugging by downloading symbol information for the load module file from which the subject file was created, along with the subject file that you download.

To do so, follow the steps below on the Download Files dialog box.

(a) Click the [Add] button

When the [Add] button is clicked, a blank list item "-" is displayed in the last line of the [Download file list] area.

(b) Property configuration of the load module file to add

Configure each item displayed with the following condition in the [Download file property] area.

| File | Specify a load module file from which the hex file (*.hex/*.hxb/*.hxf) or binary data file (*.bin) that you want to download was created. Directly enter from the keyboard, or specify with the Select Download File dialog box opened by clicking the [] button that appears at right by selecting this property. | | |
|---|---|---------------------------------|---|
| File type | type Select [Load module file] (default). | | |
| Download object | Download object Specify [No]. | | |
| Download symbol Select [Yes] (default). information | | efault). | |
| Generate the information for | Select whether to generate the information for the Symbol name completion function when downloading Note. | | |
| input completion | Default | Yes | |
| | Modifying | Select from the drop-down list. | |
| | Available values | Yes | Generates the information for the symbol name completion function. (i.e. uses the symbol name completion function.) |
| | | No | Does not generate the information for the symbol name completion function. (i.e. does not use the symbol name completion function.) |

Note When [Yes] is selected, the time taken for downloading and the memory usage on the host machine will increase. We recommend selecting [No] in this item if you do not intend to use the symbol name completion function.

(c) Click the [OK] button

Enable all the configuration in this dialog box and add the specified load module file (Only the symbol information included in the load module file will be downloaded).

2.5.3 Execute uploading

The contents of the memory of the debug tool currently connected can be saved (uploaded) in an arbitrary file. You can upload the data in the Data Save dialog box that is opened by selecting the [Debug] menu >> [Upload...]. In this dialog box, follow the steps below.

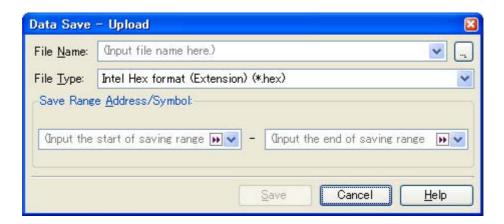

Figure 2-68. Execute Uploading (Data Save Dialog Box)

(1) Specify [File Name]

Specify the name of the file to save.

You can either type a filename directly into the text box (up to 259 characters), or select one from the input history via the drop-down list (up to 10 items). You can also specify the file by clicking the [...] button, and selecting a file via the Select Data Save File dialog box.

(2) Specify [File Type]

Select the format in which to save the file from the following drop-down list. The following file formats can be selected.

Table 2-2. Type of Files That Can be Uploaded

| Displayed List Items | File Format |
|--|--|
| Intel Hex format (Extension) (*.hex) | Intel expanded Hex format |
| Intel Hex format (Flash Programmer) (*.hex) ^{Note} [IECUBE][E1][E20] | Intel expanded Hex format (for flash programmer) |
| Motorola Hex format (S0, S2, S8 - 24bit-address) (*.hex) | Motorola S type format |
| Motorola Hex format (S0, S2, S8 - 24bit-address) (Flash Programmer) (*.hex) Note [IECUBE][E1][E20] | Motorola S type format (for flash programmer) |
| Extended Tektronix Hex format (*.hex) | Expanded Tektronix Hex format |
| Binary data (*.bin) | Binary format |

Note [IECUBE][E1][E20]

This item is displayed only when the selected microcontroller incorporates the data flash memory.

(3) Specify [Save Range Address/Symbol]

Specify the range of addresses to save via "start address" and "end addresses".

Directly enter hexadecimal number/address expression in each text box or select from the input history displayed in the drop-down list (up to 10 items).

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in each text box (see "2.19.2 Symbol name completion function").

(4) Click the [Save] button

Save the contents of the memory in the specified file in specified format as upload data.

2.6 Display/Change Programs

This section describes how to display and change programs when a load module file with the debug information is downloaded to a debug tool.

Downloaded programs can be displayed in the following panels.

- Editor panel

The source file is displayed and can be edited.

Furthermore, the source level debugging/instruction level debugging (see "2.7.3 Execute programs in steps") and the display of the code coverage measurement result (see "2.13.2 Display the coverage measurement result") can be performed in this panel.

- Disassemble panel

The result of disassembling the downloaded program (the memory contents) is displayed and can be edited (line assemble).

Furthermore, the instruction level debugging (see "2.7.3 Execute programs in steps") and the display of the code coverage measurement result (see "2.13.2 Display the coverage measurement result") can be performed in this panel. In this panel, the disassemble results can be displayed with the corresponding source text (default).

Remark It is normally necessary to download a load module file (*.lmf) with debugging information in order to perform the source level debugging, but it is also possible to do so by downloading a hex format (*.hex/ *.hxb/*.hxf) or binary format (*.bin) file (see "(3) Perform source level debugging with files other than the load module file format").

2.6.1 Display source files

The source file is displayed in the Editor panel below. The Editor panel automatically opens with displaying source text of the specified position (see "2.5.1 Execute downloading") when a load module file (*.lmf) is successfully downloaded. If you want to open the Editor panel manually, double-click on the source file in the Project Tree panel. For details on the contents and function in each area, see the section for the Editor panel.

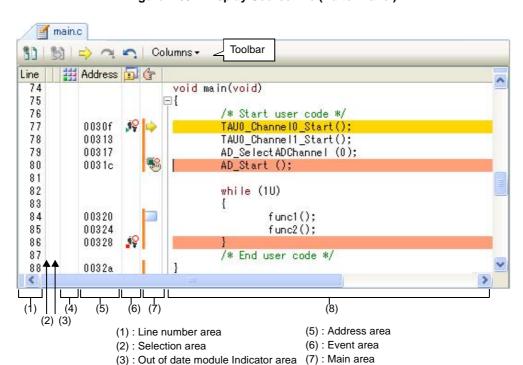

Figure 2-69. Display Source File (Editor Panel)

(8): Characters area

(4): Coverage area

- Cautions 1. When a project is closed, all of the Editor panels displaying a file being registered in the project are closed.
 - 2. When a file is excluded from a project, the Editor panel displaying the file is closed.
- **Remarks 1.** You can open a file with a specific encoding selected in the Encoding dialog box that is opened by selecting the [File] menu >> [Open with encoding...].
 - 2. When a file whose size is greater than 24MB is opened, a message dialog box is shown for confirmation of whether or not to disable all of the functions listed below (if you select [No] in this message dialog box, the operation speed may become sluggish).
 - Syntax (reserved words, comments, etc.) coloring
 - Code outlining

This section describes the following.

- (1) Change display mode
- (2) Set the columns to display
- (3) Display multiple source files in a single panel
- (4) Display variables
- (5) Search characters
- (6) Move to the specified line
- (7) Jump to functions
- (8) Jump to a desired line (tag jump)
- (9) Register a bookmark

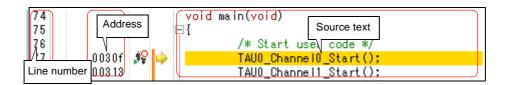

(1) Change display mode

You can change the display mode of the Editor panel by clicking the [5] button (toggle) on the toolbar.

- Normal display mode

In this display mode (default), the line number, address and source text, etc. are displayed.

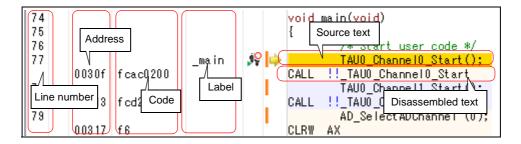

Figure 2-70. Normal Display Mode (Editor Panel)

- Mixed display mode

In this display mode, the code data, label and disassembled text are displayed combined with the source text.

Figure 2-71. Mixed Display Mode (Editor Panel)

- Cautions 1. The mixed display mode is enabled only when connected to the debug tool and the downloaded source file is opened in this panel.
 - In the mixed display mode, the source text and the corresponding code information that
 were acquired from the downloaded load module file are displayed. Therefore, to display
 the source text that has been modified in the mixed display mode, you need to run a rebuild
 and download it.
 - In the mixed display mode, the source files cannot be edited. In addition, [Redo]/[Cut]/
 [Paste]/[Delete]/[Select All]/[Replace...]/[Bookmark]/[Outlining]/[Advanced] from the [Edit]
 menu are disabled.

Remark You can save the contents of the current mixed display to a file in the text or CSV format by selecting [Save Source Mixed Data As...] from the [File] menu (the contents of hidden columns cannot be saved).

(2) Set the columns to display

The columns and marks displayed on the Editor panel can be set by selecting the toolbar items shown below. Note that this setting applies to all of the Editor panels.

| (| Columns | The following items are displayed to show or hide the columns or marks on all of the Editor panels. Remove the check to hide the items (all the items are checked by default). |
|---|------------------------------|---|
| _ | | Remove the check to filde the items (all the items are checked by deladit). |
| | Line Number | Shows the line number, in the line number area. |
| | Selection | Shows the mark that indicates the line modification status, in the line number area. |
| | Out of date module indicator | Shows the mark that indicates the update status of the downloaded load module file, in the line number area. |
| | | Note that this item is enabled only when connected to the debug tool. |
| | Coverage | Shows the coverage area. |
| | | Note that this item is enabled only when connected to the debug tool. |
| | Address | Shows the address area. |
| | | Note that this item is enabled only when connected to the debug tool. |
| | Op Code | Shows the code area. |
| | | Note that this item is enabled only when connected to the debug tool and the mixed display mode is selected. |
| | Label | Shows the label area. |
| | | Note that this item is enabled only when connected to the debug tool and the mixed display mode is selected. |
| | Event | Shows the event area. |
| | | Note that this item is enabled only when connected to the debug tool. |
| | Main | Shows the main area. |
| | Column Header | Shows the column header. |
| | | |

(3) Display multiple source files in a single panel

If the current PC moves between multiple source files when debugging (e.g. when performing step execution), each of the source files will be opened in a separate editor panel. If this is the case, the recycle mode lets you display multiple source files in a single Editor panel.

Select the [Use window recycling] check box on the [General - Text Editor] category in the Option dialog box to enable this feature.

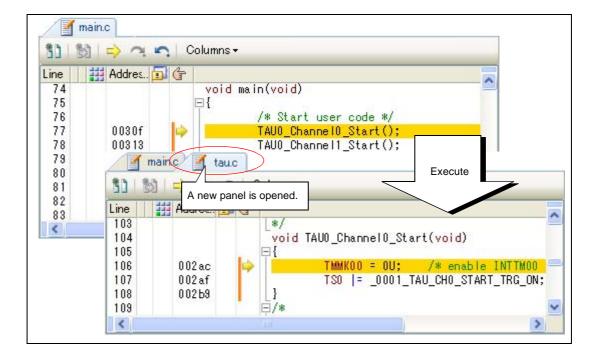

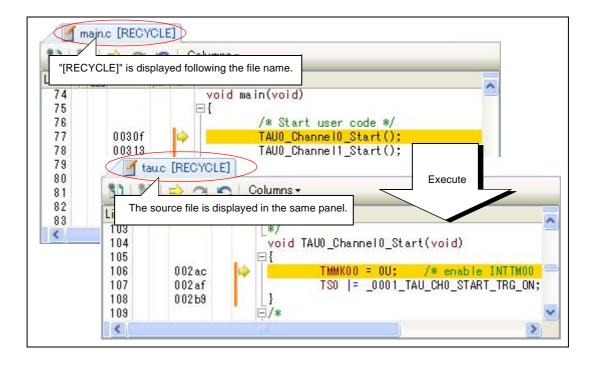

Figure 2-72. Normal Operation

Figure 2-73. Recycle Mode Operation

- Cautions 1. The recycle mode is enabled only when connected to the debug tool and the downloaded source file is opened in this panel.
 - When the current PC value in program execution corresponds to a line in the Editor panel
 while editing is being conducted in the recycle mode, that Editor panel is released from the
 recycle mode, and a new Editor panel is opened in the recycle mode.

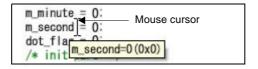

Remark If the Editor panel that displays the corresponding source file is already opened, then the source file is not opened in the panel of the recycle mode, but the Editor panel being opened is displayed.

(4) Display variables

When hovering the mouse cursor over a variable in the source text, a pop-up that shows the name and value of the variable is displayed ("<*variable name*>=<*variable value*>").

The display format of the variable value is same as "Table A-9. Display Format of Watch-Expressions (Default)" depending on the type of the variable.

Figure 2-74. Pop-up Display of Variables (Editor Panel)

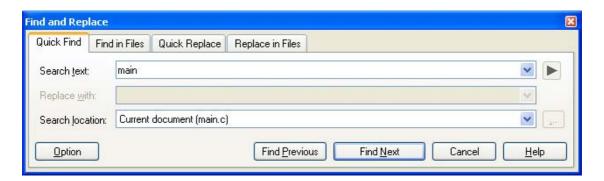

Caution A pop-up display is enabled only when connected to the debug tool and the downloaded source file is opened in this panel.

(5) Search characters

Character searching in the source text is taken place in the Find and Replace dialog box opens with selecting the button on the toolbar.

In this dialog box, follow the steps below.

Figure 2-75. Character Search in Source Text (Find and Replace Dialog Box)

(a) Specify [Search text]

Enter characters to search.

A word (variable/function) at the caret position in the Editor panel is specified by default.

If you want to change it, directly enter the characters into the text box (up to 1024 characters) or select from the input history in the drop-down list (up to 10 items).

(b) Specify [Search location]

Select [Current document (file name)] from the drop-down list.

(c) Click the [Find Previous]/[Find Next] button

When the [Find Previous] button is clicked, search will start in the order from the large address number to small and the search results are displayed selected in the Editor panel.

When the [Find Next] button is clicked, search will start in the order from the small address number to large and the search results are displayed selected in the Editor panel.

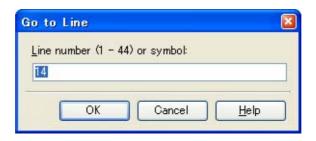

- **Remarks 1.** Click the [Option] button to specify to use wild card, case sensitivity, word by word search, and so on.
 - 2. In the Find and Replace dialog box, various search/replace operation can be performed by selecting [Find in Files], [Quick Replace] or [Replace in Files] tab.

(6) Move to the specified line

You can move to the specified line in the source text in the Go to Line dialog box which opens when selecting [Go to...] from the context menu.

In this dialog box, follow the steps below.

Figure 2-76. Move to Specified Line in Source Text (Go to Line Dialog Box)

(a) Specify [Line number (valid line range)]

Directly enter the line number (decimal number), symbol name^{Note 1} or address^{Note 2} to which you want to move the caret.

"(valid line range)" shows the range of valid lines in the current file.

By default, the number of the line where the caret is currently located in the Editor panel is displayed.

Notes 1. Note the following, when specifying a symbol name:

- Only a function name can be specified as a symbol name.
- Run and complete a build.
- If an error in building occurs, the information before the error occurred is used.
- 2. Note the following, when specifying an address:
 - Only a hexadecimal value with prefix "0x" or "0X" can be specified (a decimal value is treated as a line number).
 - Run and complete a build.
 - If an error in building occurs, the information before the error occurred is used.

(b) Click the [OK] button

Caret is moved to the specified line.

(7) Jump to functions

It automatically recognizes the currently selected characters or the word at the caret position as the function name and jumps to the first executable line of the target function.

Select [Jump to Function] from the context menu after moving the caret to the target function on the source text.

Caution When multiple statements are described in a line, a jump to an illegal location may be made.

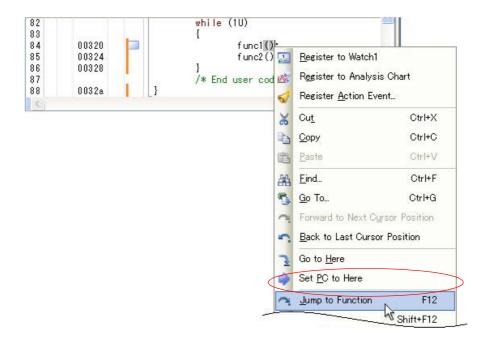

Figure 2-77. Jump to Functions

Note that this function is available only when the following conditions are satisfied for each specific build tool.

(a) When CA78K0R is used

- The target function resides in an active project.
- The type of the project specified as the active project is "Application".
- A file with the symbol information is selected for the [Download files] property. In case it is disconnected from the debug tool, the above file is specified as the first file in the [Download files] property (when the file is in the hex format, the setting for downloading the symbol information is required (see "(3) Perform source level debugging with files other than the load module file format")).

Caution A jump to a static function cannot be made when disconnected from the debug tool.

(b) When an external build tool is used

- The target function resides in an active project.
- A file with the symbol information is selected for the [Download files] property (when the file is in the format other than the load module file, the setting for downloading the symbol information is required (see "(3) Perform source level debugging with files other than the load module file format")). In case it is disconnected from the debug tool, the file above is specified as the first file in the [Download files] property.

Caution A jump to a static function cannot be made when disconnected from the debug tool.

Remark The judgement of words will depend on the build tool being used.

(8) Jump to a desired line (tag jump)

If the information of a file name, a line number and a column number exist in the line at the caret position, you can open the file in another Editor panel and jump to the corresponding line and the corresponding column (if the Editor panel is already open, you can jump to the panel).

Select [Tag Jump] from the context menu after moving the caret to the line on the source text.

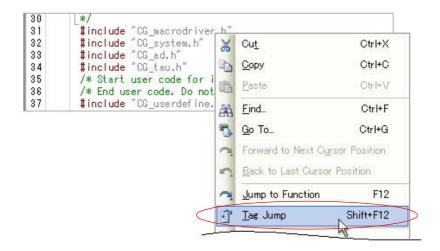

The tag jump is operated as follows:

Table 2-3. Operation of Tag Jump

| Example of Character String | Operation |
|-----------------------------|---|
| C:\work\src.c | Jumps to the top line of the file "C:\work\src.c". |
| Tmp\src.c | Jumps to the top line of the file "Tmp\src.c". (The reference point of the path is the project folder.) |
| C:\work\src.c(10) | Jumps to the tenth line from the top of the file "C:\work\src.c". |
| C:\"work sub\src.c"(10) | Jumps to the tenth line from the top of the file "C:\"work sub\src.c"". (Path specification (path/file name) including space characters must be enclosed in "".) |
| C:\work\src.c(10,5) | Jumps to the fifth column of the tenth line from the top of the file "C:\work\src.c". |

Figure 2-78. Tag Jump

- Remarks 1. Jumps are case-insensitive.
 - 2. The reference point of the path is the project folder in which the file is registered. If the file is not registered in any project, the reference point of the path will be the active folder.
 - 3. Path specifications (path/file names) including space characters must be enclosed in "".

(9) Register a bookmark

You can register a bookmark to the line at the current caret position by clicking the button on the bookmark toolbar. Once a bookmark is registered, the bookmark () is displayed in the [Main] area. When this operation is performed at a place where a bookmark is already being registered, that bookmark is deleted. Up to 50 bookmarks can be registered in one Editor panel.

- Cautions 1. When the Mixed display mode is selected, bookmarks cannot be registered nor displayed.
 - 2. After a line with a bookmark is deleted, the bookmark cannot be restored even if the [Edit] menu >> [Undo] is selected.

Figure 2-79. Register Bookmark

- **Remarks 1.** The bookmark information is saved in the currently open project file and restored when that project is re-opened. Therefore, if bookmarks are set in a file that does not belong to the project, those bookmarks will not be restored.
 - 2. Clicking on the and buttons on the bookmark toolbar moves the caret to the previous and next bookmarks, respectively. Note that the bookmarks are listed in the order of their registration (not in the order of line numbers).
 - 3. Bookmarks currently being registered are listed on the Bookmarks dialog box that is opened by clicking the button on the bookmark toolbar.

2.6.2 Display the result of disassembling

The result of disassembling the downloaded program (disassembled text) is displayed in the Disassemble panel below. Select [View] menu >> [Disassemble] >> [Disassemble 1 - 4].

The maximum of 4 Disassemble panels can be opened. Each panel is identified by the names "Disassemble1",

"Disassemble2", "Disassemble3" and "Disassemble4" on the titlebar.

For details on the contents and function in each area, see the section for the Disassemble panel.

Disassemble1 Toolbar 30 main: 00417 66: unsigned int i; main system clock swtiching 69: fMAIN: fIH -> fMX ******** 73: SCK_INIT(); /* initial setting for fcc30100 CALL 00418 SCK_INIT SCK_STRT(); /* clock output enable 0041c CALL !!_SCK_STRT fcdd0100 75: /* During this period of time, PCLBUZO outputs based o 76: for(i=0; i<1000; i++){ 00420 CLRW HL, AX 00421 MOVW 16 Address area Disassemble area Event area

Figure 2-80. Display Result of Disassembling (Disassemble Panel)

Remark You can set the scroll range of the vertical scroll bar on this panel via the Scroll Range Settings dialog box which is opened by clicking the button from [View] on the toolbar.

This section describes the following.

(1) Change display mode

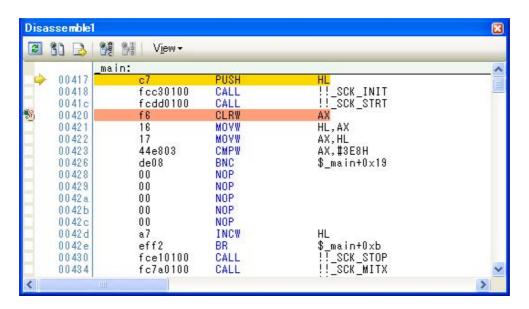

- (2) Change display format
- (3) Move to the specified address
- (4) Move to the symbol defined location
- (5) Save the disassembled text contents

(1) Change display mode

The result of disassembling is displayed in the mixed display mode (both the disassembled text and the source text) by default.

When you click the button (toggle function) on the toolbar, the source text is displayed or hidden.

Figure 2-81. Display Example of Source Text Hidden

(2) Change display format

The display format of the disassemble area can be changed using buttons below on the toolbar.

| View | | The following buttons to change the display format are displayed. | |
|------------|---------|--|--|
| | ra M | Displays the offset value of the label. The offset value from the nearest label is displayed when a label is defined for the address. | |
| (default). | | Displays the address value as the result of disassembling in the format "symbol + offset value" (default). Note that when a symbol has been defined as the address value, only the symbol is displayed. | |
| | a e | Displays the name of the register by its function name (default). | |
| | 100 E | Displays the name of the register by its absolute name. | |

(3) Move to the specified address

You can move to the specified address in the disassembled text in the Go to the Location dialog box which opens when selecting [Go to...] from the context menu.

In this dialog box, follow the steps below.

Figure 2-82. Move to Specified Address in Disassembled Text (Go to the Location Dialog Box)

(a) Specify [Address/Symbol]

Specify the address you want to move the caret to.

You can either type an address expression directly into the text box (up to 1024 characters), or select them from the input history via the drop-down list (up to 10 items).

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").

(b) Click the [OK] button

Caret is moved to the specified address.

(4) Move to the symbol defined location

You can move the caret to the address where the symbol is defined.

Click the button on the toolbar after moving the caret to the instruction which refers to the symbol. Furthermore, click the button on the toolbar following the previous operation returns the caret to the instruction which refers to the symbol at previous caret is defined.

(5) Save the disassembled text contents

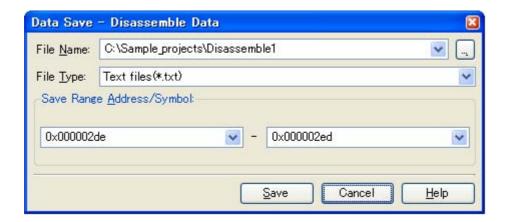

Contents of the disassembled text can be saved in text files (*.txt)/CSV files (*.csv).

When saving to the file, the latest information is acquired from the debug tool, and it is saved in accordance with the display format on this panel.

The Data Save dialog box can be opened by selecting the [File] menu >> [Save Disassemble Data As...] (when this operation takes place with the range selected on the panel, the disassembled data can be saved only for the selected range).

In this dialog box, follow the steps below.

Figure 2-83. Save Disassembled Text Contents (Data Save Dialog Box)

(a) Specify [File Name]

Specify the name of the file to save.

You can either type a filename directly into the text box (up to 259 characters), or select one from the input history via the drop-down list (up to 10 items).

You can also specify the file by clicking the [...] button, and selecting a file via the Select Data Save File dialog box.

(b) Specify [File Type]

Select the format in which to save the file from the following drop-down list.

The following file formats can be selected.

| List Item | Format |
|--|----------------------------|
| Text files (*.txt) | Text format (default) |
| CSV (Comma-Separated Variables)(*.csv) | CSV format ^{Note} |

Note The data is saved with entries separated by commas (,).

If the data contains commas, each entry is surrounded by double quotes "" in order to avoid illegal formatting.

(c) Specify [Save Range Address/Symbol]

Specify the range of addresses to save via "start address" and "end addresses".

Directly enter hexadecimal number/address expression in each text box or select from the input history displayed in the drop-down list (up to 10 items).

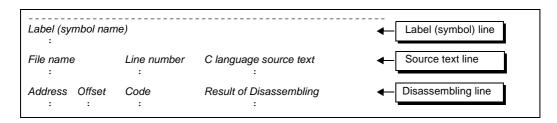

If a range is selected in the panel, that range is specified as the default. If there is no selection, then the range currently visible in the panel is specified.

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in each text box (see "2.19.2 Symbol name completion function").

(d) Click the [Save] button

Disassembling data is saved in the specified file with the specified format.

Figure 2-84. Output Example of Disassembling Data

- Remarks 1. When the contents of the panel are overwritten and saved by selecting the [File] menu >>[Save Disassemble Data], the Disassemble panels (Disassemble1-4) are handled individually for these respectively. In addition, saving range is same as the previously specified address range.
 - 2. You can print the current screen image of this panel by selecting the [File] menu >> [Print...].

2.6.3 Run a build in parallel with other operations

CubeSuite+ can automatically start a build when one of the following events occurs (rapid build function).

- For other than the debug-only project

- When any one of the following files that are added to the project is updated:
 (C source file, assembler source file, header file, link directive file, symbol information file, object module file, and library file)
- When a build target file has been added to or removed from the project
- When the link order of object module files and library files is changed
- When the property of the build tool or the build target file is changed

- For the debug-only project

- When you have edited and saved the C source file, assembler source file and header file that are added to the debug-dedicated project
- When a C source file, assembler source file, or header file has been added to or removed from the debugdedicated project
- When the property of the debug-dedicated project is changed

If a rapid build is enabled, it is possible to perform a build in parallel with the above operations.

To enable/disable a rapid build, select [Rapid Build] from the [Build] menu. A rapid build is enabled by default.

Caution When an external text editor is used, check the [Observe registered files changing] check box on the [General - Build/Debug] category in the Option dialog box to enable this function.

- Remarks 1. After editing source files, it is recommend to save frequently by pressing the [Ctrl] + [S] key.
 - 2. Enable/Disable setting of the rapid build applies to the entire project (main project and subprojects).
 - 3. If you disable a rapid build while it is running, it will be stopped at that time.

2.6.4 Perform line assembly

Instructions and code displayed in the Disassemble panel can be edited (line assembly).

This section describes the following.

- (1) Edit instructions
- (2) Edit code

(1) Edit instructions

Follow the steps below to edit instructions.

(a) Switch to edit mode

Double-click the instruction to edit or select [Edit Disassemble] from the context menu after moving the caret to the instruction to edit.

(b) Edit instructions

Use keyboard to directly edit the instructions.

(c) Write to memory

Press the [Enter] key to line assemble the edited instructions after editing. The code is automatically written to the memory.

If the edited instruction is invalid, the instruction is shown in red and will not be written to the memory.

If there is a space because of overwriting the displayed result of disassembling by another instruction, its byte number is automatically compensated with NOP instruction as follows:

Examples 1. MOVW instruction (4-byte instruction) in the second line is overwritten by DEC instruction (1-byte instruction).

| Before editing | 0461CF | ADDW AX,#0CF61H |
|----------------|----------|------------------|
| | CBF820FE | MOVW SP, #0FE20H |
| | FC8E1800 | CALL !!_funcA |
| | 53C0 | MOV B, #0C0H |
| After editing | 0461CF | ADDW AX,#0CF61H |
| | 93 | DEC B |
| | 00 | NOP |
| | 00 | NOP |
| | 00 | NOP |
| | FC8E1800 | CALL !!_funcA |
| | 53C0 | MOV B, #0C0H |

2. ADDW instruction (3-byte instruction) in the first line is overwritten by MOVW instruction (4-byte instruction).

| Before editing | 0461CF | ADDW AX,#0CF61H |
|----------------|----------|------------------|
| | CBF820FE | MOVW SP,#0FE20H |
| | FC8E1800 | CALL !!_funcA |
| | 53C0 | MOV B, #0C0H |
| After editing | CBF820FE | MOVW SP, #0FE20H |
| | 00 | NOP |
| | 00 | NOP |
| | 00 | NOP |
| | FC8E1800 | CALL !!_funcA |
| | 53C0 | MOV B, #0C0H |

(2) Edit code

Follow the steps below to edit code.

(a) Switch to edit mode

Double-click the code to edit or select [Edit Code] from the context menu after moving the caret to the code to edit.

(b) Edit code

Use keyboard to directly edit the code.

(c) Write to memory

Press the [Enter] key to write the code to the memory after editing.

If the edited instruction is invalid, the instruction is shown in red and will not be written to the memory.

When the code is written to the memory, the result of disassembling is also updated.

2.7 Execute Programs

This section describes how to execute programs.

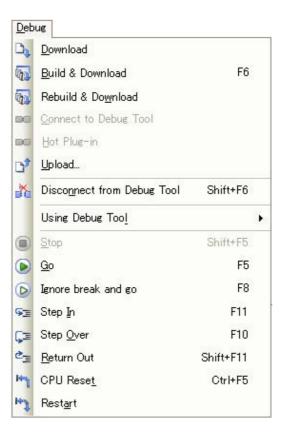

Main operations in this section are taken place from the debug toolbar or the [Debug] menu in the Main window, where commands to control the execution of programs are included.

Caution Items of the debug toolbar and the [Debug] menu are valid only while connected to the debug tool.

Figure 2-85. Debug Toolbar

Figure 2-86. [Debug] Menu

2.7.1 Reset microcontroller (CPU)

To reset CPU, click the button on the debug toolbar.

When CPU is reset, the current PC value is set to the reset address.

Remark You can automatically overwrite the value of SFR/CPU register with the specified values after CPU reset under breaking (see "2.17 Use Hook Function" for details).

2.7.2 Execute programs

The following types of CubeSuite+ execution functions are provided.

Select any of the following operations according to the purpose of debugging.

See "2.8 Stop Programs (Break)" for details on how to stop the program in execution.

- (1) Execute after resetting microcontroller (CPU)
- (2) Execute from the current address
- (3) Execute after changing PC value

Remark You can automatically overwrite the value of SFR/CPU register with the specified values before starting program execution (see "2.17" Use Hook Function" for details).

(1) Execute after resetting microcontroller (CPU)

Click the button on the debug toolbar.

Reset CPU and start execution of the program from the reset address.

When this operation is performed, the program continues to be executed until either of the following occurs:

- The button has been clicked (see "2.8.2 Stop the program manually").
- The PC has reached a breakpoint (see "2.8.3 Stop the program at the arbitrary position (breakpoint)").
- A break event condition has been met (see "2.8.4" Stop the program at the arbitrary position (break event)" or "2.8.5" Stop the program with the access to variables/SFRs").
- A fail-safe break has occurred (see "2.8.6" Stop the program when an invalid execution is detected [IECUBE]").
- Other break causes have occurred.

Remark This operation is the same as when the button is clicked after clicking the button.

(2) Execute from the current address

Perform any of the following operations to start executing the program from the address at the current PC value.

(a) Normal execution

Click the button on the debug toolbar.

When this operation is performed, the program continues to be executed until either of the following occurs:

- The button has been clicked (see "2.8.2" Stop the program manually").
- The PC has reached a breakpoint (see "2.8.3 Stop the program at the arbitrary position (breakpoint)").
- A break event condition has been met (see "2.8.4" Stop the program at the arbitrary position (break event)" or "2.8.5" Stop the program with the access to variables/SFRs").
- A fail-safe break has occurred (see "2.8.6" Stop the program when an invalid execution is detected [IECUBE]").
- Other break causes have occurred.

(b) Execution ignoring break-related events

Click the button on the debug toolbar.

When this operation is performed, the program continues to be executed until either of the following occurs:

- The button has been clicked (see "2.8.2" Stop the program manually").
- A fail-safe break has occurred (see "2.8.6" Stop the program when an invalid execution is detected [IECUBE]").
- Other break causes have occurred.

Remark If you have started the execution with this operation, the occurrence of Action event will also be ignored.

(c) Execution to the caret position

To start this operation, move the caret to the line/instruction to stop the program in the Editor panel/ Disassemble panel, then select [Go to Here] from the context menu.

When this operation is performed, the program continues to be executed until either of the following occurs:

- The PC has reached the address of the caret position.
- The label button has been clicked (see "2.8.2" Stop the program manually").
- A fail-safe break has occurred (see "2.8.6" Stop the program when an invalid execution is detected [IECUBE]").
- Other break causes have occurred.

Caution When the corresponding address of the line at the caret position does not exist, the program is executed to the corresponding address of the lower valid line (if the corresponding address does not exist, an error message will appear).

Remark If you have started the execution with this operation, the occurrence of Action event will also be ignored.

(3) Execute after changing PC value

The program is executed after forcibly changing the current PC value to an arbitrary address.

To start this operation, move the caret to the line/instruction to start the program in the Editor panel/Disassemble panel, then select [Set PC to Here] from the context menu (the current PC value is set to the address of the line/instruction where the caret currently exists).

Then execute either one of the execution method described in "(2) Execute from the current address".

2.7.3 Execute programs in steps

When either of the following operation has occurred, the program will stop automatically after conducting step execution in the source level (1 line of source text) or in the instruction level (1 instruction).

Once the program is stopped, the contents of each panel will be updated automatically. As such, step execution is suited for debugging the program execution in transition either in source or instruction level.

The unit in which the program is step-executed depends on the setting of the Editor panel as follows:

- When the button on the toolbar is invalid (default): Step execution is conducted in source level.
- Note, however, that when the focus is in the Disassemble panel or the line information does not exist in the address specified by the current PC value, the step execution is conducted in instruction level.
- When the button on the toolbar is valid:
 Step execution is conducted in instruction level.

Remark The button is only enabled if the mixed display mode is selected on the Editor panel (see "(1) Change display mode").

Step execution is divided into the following types:

- (1) Step in function (Step in execution)
- (2) Step over function (Step over execution)
- (3) Execute until return is completed (Return out execution)

- Cautions 1. Breakpoints, break events, and action events that have been set do not occur during step execution.
 - 2. An error message will appear while processing a function prologue or epilogue if the return address cannot be acquired.
 - 3. If an instruction to move to standby mode (HALT/STOP) is executed during step execution, the program will break at the next instruction after the standby mode instruction.

This behavior differs depending on the debug tool used.

- For other than [Simulator]
 - It will not go into standby mode during step execution.
- [Simulator]

It will go into standby mode during step execution.

It will appear that standby mode has been released. Check the CPU status on the Main window's statusbar to see if standby mode has been released.

- 4. For other than [Simulator]
 - Interrupts are not acknowledged and fail-safe breaks [IECUBE] do not occur during step execution.
 - It will not go into standby mode during step execution.
 - If step execution is performed in source level, CubeSuite+ determines whether an interrupt is being processed via the NP, EP, and ID flags in the PSW register. For this reason, if the above register or flags are changed (e.g. when using multiple interrupts), then Return out execution may be incorrect.
- 5. [Simulator]

You may jump to an interrupt handler during step execution.

(1) Step in function (Step in execution)

When the function is called, the program is stopped at the top of the called function.

Click the **See** button on the debug toolbar to perform Step in execution.

- Cautions 1. Step in execution for a function without the debug information is not possible.
 - 2. If Step in execution is performed for the longjmp function, program execution may not complete and may wait for a time-out.
 - 3. The beginning of the function (prologue processing) is not skipped. To skip prologue processing, perform Step in execution again.

(2) Step over function (Step over execution)

In the case of a function call by the CALL/CALLT/CALLF instruction, all the source lines/instructions in the function are treated as one step and executed until the position where execution returns from the function (step execution will continue until the same nest is formed as when the CALL/CALLT/CALLF instruction has been executed). Click the button on the debug toolbar to perform Step over execution.

In the case of an instruction other than CALL/CALLT/CALLF, operation is the same as when the button is clicked.

Caution If Step over execution is performed for the longjmp function, program execution may not complete and may wait for a time-out.

(3) Execute until return is completed (Return out execution)

Step-execute the program so that the program will stop when it returns from the current function to the caller function. When the execution of source line/instruction that require checking has been completed, you can perform step execution using this instruction so that you can make the program return to the caller function without step executing the remaining instructions inside the function.

Click the button on the debug toolbar to perform Return out execution.

- Cautions 1. If Return out execution is performed in the main function, the program is stopped in the startup routine.
 - Return out execution cannot be performed immediately after stepping in a function.
 - Return out execution cannot be performed while processing a function prologue or
 - 4. If Return out execution is performed in a function that called the longjmp function, breaks may not occur.
 - Return out execution cannot be performed immediately after a function return.
 - If Return out execution is performed in a recursive function, the program will be executed in free-run mode.

2.8 Stop Programs (Break)

This section describes how to stop the program in execution.

CubeSuite+ can stop the program in execution at the arbitrary position by using the following functions.

(1) Forced break function

Stops the program forcibly.

(2) Hardware break function

The debug tool consecutively checks the break condition while the program is in execution and stops the program when the condition is met. This function is implemented using the debug tool resources.

There are two types of Hardware Break event: "execution type" which stops the program at the arbitrary position; and "access type" which stops the program when an arbitrary variable and so on is accessed with the specified type.

Remarks 1. [IECUBE]

There are two types of Hardware Break event (execution type): "before execution break" which breaks before the instruction at the specified address is executed; and "after execution break" which breaks after the instruction at the specified address is executed. CubeSuite+ starts by using "before execution break" resource to set Hardware Break events, and as soon as that resource becomes unavailable, uses "after execution break" resource (see "(1) Maximum number of enabled events"). For this reason, you cannot select between before and after execution.

2. [E1][E20][EZ Emulator]

Hardware Break events (execution type) break the program after the instruction at the specified address is executed.

3. [Simulator]

For a Hardware Break event (execution type), you can select between "before execution break" which breaks before the instruction at the specified address is executed and "after execution break" which breaks after the instruction at the specified address is executed (see "(3) [Simulator]").

(3) Software break function (except for [Simulator])

Temporarily replaces the instruction code for a specified address with a break instruction and stops the program when this instruction is executed.

Cautions 1. If a forced break is performed while in standby mode (HALT/STOP), the current PC position will indicate the address of the next instruction after the standby mode instruction.

This behavior differs depending on the debug tool used.

- For other than [Simulator]
- The forced break will release standby mode.
- [Simulator]

The forced break will not release standby mode.

It will appear that standby mode has been released. Check the CPU status on the Main window's statusbar to see if standby mode has been released.

2. [E1][E20][EZ Emulator]

Do not decrease the voltage of the target system during a break. A reset that is generated by the low-voltage detector (LVI) or by power-on-clear (POC) during a break causes an incorrect operation of CubeSuite+ or communication errors.

A break during emulation of power supply off also causes communication errors.

Remark When the program in execution is stopped, a statement of the cause of the break appears on the Statusbar in the Main window.

2.8.1 Configure the break function

Before the break function can be used, it is necessary to make settings relating to the operation of a break.

This break operation can be configured in the [Break] category on the [Debug Tool Settings] tab of the Property panel. The setting method differs depending on the debug tool used.

- (1) [IECUBE]
- (2) [E1]/[E20]/[EZ Emulator]
- (3) [Simulator]

(1) [IECUBE]

Figure 2-87. [Break] Category [IECUBE]

| ⊟ Break | | | | |
|-------------------------------------|-------------------|--|--|--|
| First using type of breakpoint | Software break | | | |
| Stop emulation of timer group when | stopping No | | | |
| Stop emulation of serial group when | stopping No | | | |
| Use open break function | No(Output signal) | | | |

(a) [First using type of breakpoint]

Specify the type of preferential breakpoint with a single click of the mouse in the Editor panel/Disassemble panel.

Select from the drop-down list below for each use of the breakpoint.

| Hardware break | Sets hardware breakpoint with priority, by using the Hardware break function. Once set, it is treated as a Hardware Break event (execution system). | |
|----------------|--|--|
| Software break | Sets software breakpoint with priority, by using the Software break function (except for [Simulator]) (default). Once set, it is treated as a Software Break event. | |

Caution If the number of the set breakpoints of the specified type exceeds the limit settable (see "(1) Maximum number of enabled events"), a breakpoint of another type will be used.

(b) [Stop emulation of timer group when stopping]

Select whether to terminate the peripheral emulation of timers while stopping the program execution (Peripheral Break).

Select [Yes] to terminate (default: [No]).

(c) [Stop emulation of serial group when stopping]

This property appears only when the selected microcontroller supports the function that terminates the peripheral emulation of serials (Peripheral Break).

Select whether to terminate the peripheral emulation of serials while stopping the program execution. Select [Yes] to terminate (default: [No]).

(d) [Use open break function]

This property appears only when the selected microcontroller supports the open break function. Select from the following drop-down list whether to use the open break function.

The default value depends on the type of the selected microcontroller.

| Yes(Hi-Z) | The open break target pin becomes the Hi-Z state after the CPU is stopped. |
|-------------------|---|
| No(Output signal) | The open break target pin outputs the signal even after the CPU is stopped. |

(2) [E1]/[E20]/[EZ Emulator]

Figure 2-88. [Break] Category [E1][E20][EZ Emulator]

| ⊟ Break | | | | |
|------------------------|--------------------------|----------------|--|--|
| First using type of br | eakpoint | Software break | | |
| Stop emulation of tim | er group when stopping | No | | |
| Stop emulation of ser | rial group when stopping | No | | |
| Restore the breakpoin | nt when pin reset occurs | Yes | | |

(a) [First using type of breakpoint]

This property appears only when the selected microcontroller supports multipule types of breakpoint. Specify the type of preferential breakpoint with a single click of the mouse in the Editor panel/Disassemble panel.

Select from the drop-down list below for each use of the breakpoint.

| Hardware break | Sets hardware breakpoint with priority, by using the Hardware break function. Once set, it is treated as a Hardware Break event (execution system). | |
|----------------|--|--|
| Software break | Sets software breakpoint with priority, by using the Software break function (except for [Simulator]) (default). Once set, it is treated as a Software Break event. | |

Caution If the number of the set breakpoints of the specified type exceeds the limit settable (see "(1) Maximum number of enabled events"), a breakpoint of another type will be used.

(b) [Stop emulation of timer group when stopping]

Select whether to terminate the peripheral emulation of timers while stopping the program execution (Peripheral Break).

Select [Yes] to terminate (default: [No]).

In the case of the selected microcontroller that provides the open break function, when this property is set to [Yes], the open break target pin becomes the Hi-Z state after the CPU is stopped (when this property is set to [No], the open break target pin outputs the signal even after the CPU is stopped).

(c) [Stop emulation of serial group when stopping]

This property appears only when the selected microcontroller supports the function that terminates the peripheral emulation of serials (Peripheral Break).

Select whether to terminate the peripheral emulation of serials while stopping the program execution. Select [Yes] to terminate (default: [No]).

(d) [Restore the breakpoint when pin reset occurs]

This property only appears if the selected microcontroller supports the function of restoring breakpoints after a pin reset and the [Permit flash programming] property in the [Flash] category on the [Connect Settings] tab is set to [Yes].

Select whether to restore the breakpoints when a pin reset occurs.

When [Yes] is selected, the CPU is briefly halted for restoration of the breakpoints after a pin reset (default). When [No] is selected, the breakpoints are ignored and not restored after a pin reset, but are restored when the program is stopped.

(3) [Simulator]

Figure 2-89. [Break] Category [Simulator]

■ Break
Execute instruction at breakpoint when break No

(a) [Execute instruction at breakpoint when break]

You can specify the timing to stop the program execution by breakpoints whether after or before the execution of the instruction at the breakpoint. Specify in this property whether to break after executing the instruction. Select [Yes] to break after execution of the instruction (default: [No]).

All set breakpoints are handled as Hardware Break events.

Caution When [Yes] is selected, all of action events currently being set are handled as Hardware Break events (see "2.14 Set an Action into Programs").

2.8.2 Stop the program manually

The program in execution is forcibly stopped by clicking the letton on the debug toolbar.

2.8.3 Stop the program at the arbitrary position (breakpoint)

The program in execution can be stopped at the arbitrary position by setting a breakpoint. A breakpoint can be set by one-clicking with the mouse.

You need to configure the type of breakpoints to use before setting a breakpoint.

This section describes the following operations.

- (1) Set a breakpoint
- (2) Edit a breakpoint
- (3) Delete a breakpoint

(1) Set a breakpoint

Breakpoints can be set via the Editor panel/Disassemble panel in which the source text/disassembly text is displayed.

Within the Main area (Editor panel) or Event area (Disassemble panel) in which a valid address is displayed, click on the location where you want to set a breakpoint. A breakpoint whose type is being selected in the [First using type of breakpoint] property is set to the instruction at the start address corresponding to the clicked line.

When a breakpoint is set, the following event mark appears at the breakpoint location, and the source text line/ disassembled text line is highlighted.

It is interpreted as if a break event (Software Break or Hardware Break) has been set at the target address, and it is managed in the Events panel (see "2.15 Manage Events" for details).

Table 2-4. Event Marks of Breakpoint

| Type of Breakpoint | Event Type | Event Mark |
|----------------------|--------------------------------------|------------|
| Hardware breakpoint | Hardware Break event ^{Note} | |
| Software breakpoint | Software Break event ^{Note} | 9 |
| (except [Simulator]) | | |

Note In the [Name] area of the Events panel, "Break" is displayed as the event type name.

Figure 2-90. Breakpoint Setting Example (Disassemble Panel)

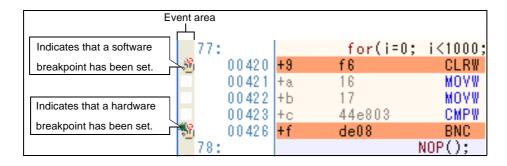

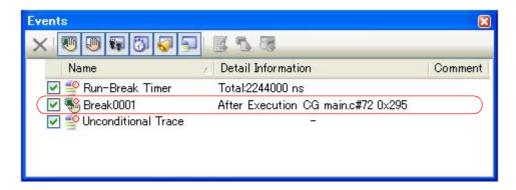

Figure 2-91. Example of Setting Breakpoint in Events Panel

- Cautions 1. Since a breakpoint is set as a break event and managed as a event, restrictions apply to the number of breakpoints that can be simultaneously set. Also see "2.15.7 Notes for setting events" for details on breakpoints (e.g. limits on the number of enabled events).
 - 2. No software breakpoints can be set to the data flash memory area.
 - 3. Breakpoints can only be set at lines that have valid addresses.
- Remarks 1. Event marks differ depending on the event state (see "2.15.1 Change the state of set events (valid/invalid)").

When an event is set at the point where other event is already set, the event mark (is displayed meaning more than one event is set at the point.

2. [Simulator]

The type of breakpoint that can be set is locked to hardware breakpoints.

3. For other than [Simulator]

You can set hardware breakpoints/software breakpoints without depending on the specification of "2.8.1 Configure the break function" by following the step below.

Note, however, that "Operation1" is only available in the Disassemble panel.

| Туре | Operation1 | Operation2 |
|---------------------|-----------------------|--|
| Hardware breakpoint | [Ctrl] + mouse click | Select [Break Settings] >> [Set Hardware Break] from the context menu. |
| Software breakpoint | [Shift] + mouse click | Select [Break Settings] >> [Set Software Break] from the context menu. |

(2) Edit a breakpoint

It is possible to edit a breakpoint you have set.

For details on how to do it, see "(1) Edit execution-related events".

Caution This function applies to only a breakpoint whose type is Hardware Break.

(3) Delete a breakpoint

Click event marks displayed in the Editor panel/Disassemble panel to delete set breakpoints (the event mark will be erased).

2.8.4 Stop the program at the arbitrary position (break event)

The program in execution can be stopped at the arbitrary position by setting a break event (execution type). This section describes the following operations.

- (1) Set a break event (execution type)
- (2) Edit a break event (execution type)
- (3) Delete a break event (execution type)

(1) Set a break event (execution type)

Perform this operation in the Editor panel/Disassemble panel in which the source text/disassembly text is displayed.

Follow the operation listed below from the context menu, in accordance with your desired event type, after moving the caret to the target line that has a valid address.

| Event Type | Operation | Description |
|-------------------------------------|--|---|
| Hardware Break | Select [Break Settings] >> [Set Hardware Break] | Sets a Hardware Break event by using the Hardware break function. |
| Software Break (except [Simulator]) | Select [Break Settings] >> [Set Software Break] | Sets a Software Break event by using the Software break function (except for [Simulator]). |
| Combination Break [E1][E20] | Select [Break Settings] >> [Set Combination Break] | A combined break event, that is, a break condition that is a combination of multiple break events, may be set as the target event condition on the E1 and E20 ^{Note 2} (see "Edit combination conditions of events [E1] [E20]"). |

Note [E1][E20]

This function is enabled only when the selected microcontroller supports a combination break event.

A break event is set to the instruction at the start address corresponding to the line of the caret position. When a break event (execution type) is set, the following event mark appears at the break event location, and the source text line or disassembled text line will be highlighted.

When you have performed this operation, the set break event is managed in the Events panel as a Hardware Break event (execution type)/Software Break event (execution type) or a execution-related event in the detailed information on a Combination Break event (see "2.15 Manage Events" for details).

Table 2-5. Event Marks of Break Event

| Event Type | Event Mark | |
|-------------------------------------|------------|--|
| Hardware Break | • | |
| Software Break (except [Simulator]) | | |
| Combination Break [E1][E20] | | |

Figure 2-92. Break event Setting Example (Disassemble Panel)

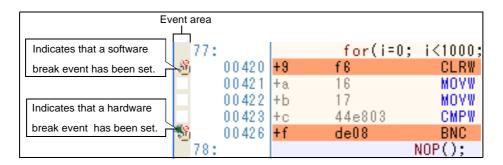

Figure 2-93. Example of Setting Hardware Break Event (Execution Type) in Events Panel

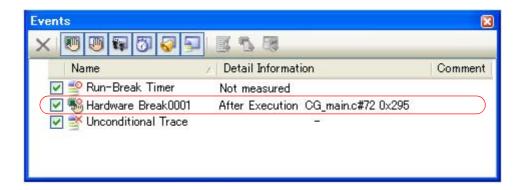

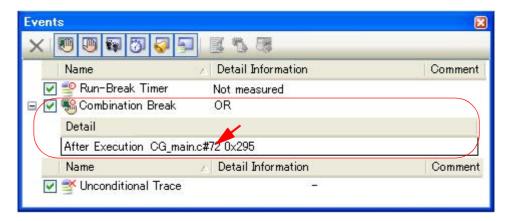

Figure 2-94. Example of Setting Combination Break Event (Execution Type) in Events Panel [E1][E20]

- Cautions 1. When setting a break event (execution type), also see "2.15.7 Notes for setting events" for details (e.g. limits on the number of valid events).
 - 2. No software breakpoints can be set to the data flash memory area.

Remark Event marks differ depending on the event state (see "2.15.1 Change the state of set events (valid/invalid)"). When an event is set at the point where other event is already set, the event mark () is displayed meaning more than one event is set at the point.

(2) Edit a break event (execution type)

It is possible to edit a break event (execution type) you have set.

For details on how to do it, see "(1) Edit execution-related events" or "(3) Edit combination conditions of events [E1] [E20]".

Caution This function applies to only a break event (execution type) whose type is Hardware Break or Combination Break [E1][E20].

(3) Delete a break event (execution type)

To delete a break event (execution type) you have set, click the event mark displayed in the Editor panel/ Disassemble panel.

Also, there is another way to delete a set break event. Select a Software Break event/Hardware Break event, or Combination Break event **[E1][E20]** in the Events panel, and then click the button in the toolbar (see "2.15.5 Delete events").

Caution In the Events panel, you cannot delete a break event (execution type) selectively in the combination breaks. All the break events (including access type) displayed in the detailed information on the combination break will be deleted.

2.8.5 Stop the program with the access to variables/SFRs

By setting a break event with the access, the program can be stopped when an arbitrary variable or SFR is accessed with the specified type.

You can also limit the accessed value.

The following types can be specified with the access.

Table 2-6. Types of Accesses to Variables

| Access Type | Description |
|-------------|--|
| Read | The program is stopped with the read access to (after reading) the specified variable/SFR. |
| Write | The program is stopped with the write access to (after writing) the specified variable/SFR. |
| Read/Write | The program is stopped with the read access/write access to (after reading or writing) the specified variable/SFR. |

Caution [IECUBE][E1][E20][EZ Emulator]

The program is stopped with the access via DMA (Direct Memory Access).

This section describes the following.

- (1) Set a break event (access type)
- (2) Edit a break event (access type)
- (3) Delete a break event (access type)

(1) Set a break event (access type)

Use one of the following methods to set a break event (access type) that stops programs with the access to a variable/SFR.

Cautions 1. Also see "2.15.7 Notes for setting events" for details on breakpoints (e.g. limits on the number of enabled events).

2. For other than [Simulator]

The access break events described here cannot be set for 32-bit (4-byte) variables. Additionally, accessing a single byte of a 16-bit (2-byte) variable will not be detected as an access.

(a) Set a break event to a variable/SFR in the Editor panel/Disassemble panel

Perform this operation in the Editor panel/Disassemble panel in which the source text/disassembly text is displayed.

Follow the operation listed below from the context menu, in accordance with your desired access type, after selecting an arbitrary variable or SFR on the source text/disassembled text. Note, however, that only global variables, static variables inside functions, and file-internal static variables can be used.

| Access Type | Operation |
|-------------|--|
| Read | Select [Break Settings] >> [Set Read Break to]/[Set Read Combination Break to] ^{Note} , and then press the [Enter] key. |
| Write | Select [Break Settings] >> [Set Write Break to]/[Set Write Combination Break to] ^{Note} , and then press the [Enter] key. |
| Read/Write | Select [Break Settings] >> [Set R/W Break to]/[Set R/W Combination Break to] ^{Note} , and then press the [Enter] key. |

Note [E1][E20]

A combined break event, that is, a break condition that is a combination of multiple break events, may be set as the target event condition on the E1 and E20 (see "(3) Edit combination conditions of events [E1] [E20]").

Note, however, that this function is enabled only when the selected microcontroller supports a combination break event.

At this time, if you have specified a value in the text box in the context menu, break will occur only when the specified value is used for the reading, writing or reading/writing. On the other hand, if no value is specified, reading., writing or reading/writing the selected variable by any value will cause the break to occur.

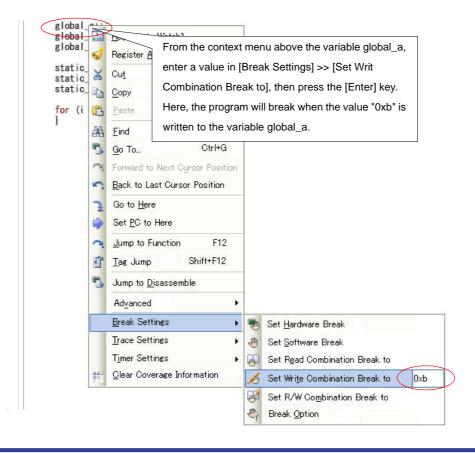

- Cautions 1. Variables within the current scope can be specified.
 - 2. Variables or SFR at lines that have no valid addresses cannot be used for break events.

global_ global Register From the context menu above the variable global_a, global Register Actio enter a value in [Break Settings] >> [Set Writ Break static × Cut static to], then press the [Enter] key. static_ Сору Here, the program will break when the value "0xb" is for (i Paste written to the variable global_a. 品 <u>Find</u> Ctrl+G Go To... Forward to Next Cursor Position Back to Last Cursor Position Go to Here Set PC to Here Jump to Function F12 Tag Jump Shift+F12 4 Jump to <u>D</u>isassemble Advanced Break Settings Set <u>H</u>ardware Break Trace Settings Set Read Break to Timer Settings Set Write Break to 0xb Clear Coverage Information Set R/W Break to Break Option

Figure 2-95. Example of Setting Break Event (Access Type) on Variable in Editor Panel

Figure 2-96. Example of Setting Combination Break Event (Access Type) on Variable in Editor Panel [E1][E20]

(b) Set a break event (access type) to a registered watch-expression

You can set break events in the Watch panel.

Follow the operation listed below from the context menu, in accordance with your desired access type, after selecting the registered watch-expression (multiple selections not allowed).

Note, however, that only global variables, static variables inside functions, file-internal static variables, and SFR can be used.

| Access Type | Operation |
|-------------|--|
| Read | Select [Access Break] >> [Set Read Break to]/[Set Read Combination Break to] ^{Note} , and then press the [Enter] key. |
| Write | Select [Access Break] >> [Set Write Break to]/[Set Write Combination Break to] ^{Note} , and then press the [Enter] key. |
| Read/Write | Select [Access Break] >> [Set R/W Break to]/[Set R/W Combination Break to] ^{Note} , and then press the [Enter] key. |

Note [E1][E20]

A combined break event, that is, a break condition that is a combination of multiple break events, may be set as the target event condition on the E1 and E20 (see "(3) Edit combination conditions of events [E1] [E20]").

Note, however, that this function is enabled only when the selected microcontroller supports a combination break event.

At this time, if you have specified a value in the text box in the context menu, break will occur only when the specified value is used for the reading., writing or reading/writing. On the other hand, if no value is specified, reading., writing or reading/writing the selected watch-expression by any value will cause the break to occur.

Caution A watch-expression within the current scope can be specified.

To target a watch-expression outside the current scope, select a watch-expression with a specified scope.

Figure 2-97. Example of Setting Hardware Break Event (Access Type) on Watch-Expression

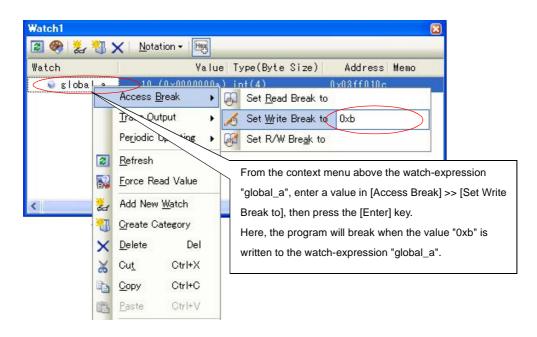

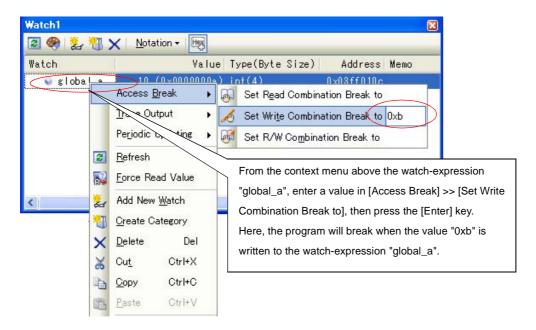

Figure 2-98. Example of Setting Combination Break Event (Access Type) on Watch-Expression [E1][E20]

When you have performed the above operation, the set break event (access type) is managed in the Events panel as a Hardware Break event (access type) or a execution-related event in the detailed information on a Combination Break event (see "2.15 Manage Events" for details).

Figure 2-99. Example of Setting Hardware Break Event (Access Type) in Events Panel

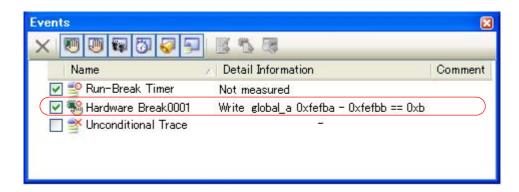

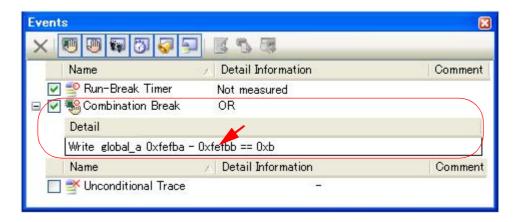

Figure 2-100. Example of Setting Combination Break Event (Access Type) in Events Panel [E1][E20]

(2) Edit a break event (access type)

It is possible to edit a break event (access type) you have set.

the event mark on the Editor panel/Disassemble panel.

For details on how to do it, see "(1) Edit execution-related events" or "(3) Edit combination conditions of events [E1] [E20]".

(3) Delete a break event (access type)

To delete a break event (access type) you have set, select a Hardware Break event, or Combination Break event [E1][E20] in the Events panel, and then click the button in the toolbar (see "2.15.5" Delete events").

For a Combination Break event [E1][E20], it is also possible to delete a break event (access type) by clicking on

Caution In the Events panel, you cannot delete a break event (execution type) selectively in the combination breaks. All the break events (including access type) displayed in the detailed information on the combination break will be deleted.

2.8.6 Stop the program when an invalid execution is detected [IECUBE]

The system forcibly breaks the program execution when unexpected program behavior such as invalid access to internal ROM/internal RAM/SFR/external memory is detected (fail-safe break function).

This function has various break conditions. Enable/disable each break condition in the [Fail-safe Break] category on the [Debug Tool Settings] tab of the Property panel.

Caution The fail-safe break function becomes invalid during step execution.

□ Fail-safe Break Stop when fetched from fetch protected area Yes Stop when wrote to write protected area Yes Stop when read from read protected SFR Yes Stop when wrote to write protected SFR Yes Stop when overflowed user stack No User stack top address @STEND Stop when underflowed user stack No User stack bottom address @STBEG Stop when operated uninitialized stack pointer Yes Stop when read from uninitialized RAM Yes Stop when accessed to non-mapping area Yes Stop when word miss-align accessed Yes Stop when received fail safe from peripheral Yes Stop when occurred flash illegal Yes

Figure 2-101. [Fail-safe Break] Category

In the following property setting, select [Yes] to enable and [No] to disable the function from the drop-down list. All the properties are set to [Yes] by default (with some exceptions).

- [Stop when fetched from fetch protected area]
- [Stop when wrote to write protected area]
- [Stop when read from read protected SFR]
- [Stop when wrote to write protected SFR]
- [Stop when overflowed user stack] Note 1
- [Stop when underflowed user stack] Note 2
- [Stop when operated uninitialized stack pointer]
- [Stop when read from uninitialized RAM]

- [Stop when accessed to non-mapping area]
- [Stop when word miss-align accessed]
- [Stop when received fail safe from peripheral]
- [Stop when occurred flash illegal]

Notes 1. [No] is selected by default.

To set to [Yes], the [User stack top address] property on the bottom must be set to the top address of the user stack (default: [@STEND]).

2. [No] is selected by default.

To set to [Yes], the [User stack bottom address] property on the bottom must be set to the end address of the user stack (default: [@STBEG]).

2.8.7 Other break causes

The cause of the break other than the described above is as follows:

You can confirm the break cause with the Status message on the statusbar in the Main window.

Table 2-7. Other Break Causes

| | Debug Tool to Use | | | |
|--|-------------------|-----------------------|-----------|--|
| Break Cause | IECUBE | E1/E20 EZ Emulator | Simulator | |
| Full of the trace memory ^{Note 1} | ✓ | - | ✓ | |
| An occurrence of Trace Delay Break | ✓ | - | - | |
| Execution time-over detected | ✓ | - | - | |
| An access to non-mapped area | ✓ | - | ✓ | |
| A writing to write-protected area | ✓ | - | ✓ | |
| An access to the odd number address by the word width | ✓ | - | ✓ | |
| An occurrence of Temporary Break ^{Note 2} | ✓ | ✓ | ✓ | |
| An occurrence of Flash Illegal Break | ✓ | - | - | |
| Illegal action of program related to the peripheral chip function Note 3 | ✓ | - | - | |
| Failure to execute/uncertain cause | ✓ | ✓ | - | |

- **Notes 1.** The operation depends on the setting of the [Operation after trace memory is full] property in the [Trace] category on the [Debug Tool Settings] tab of the Property panel.
 - 2. A break that is internally used by CubeSuite+. (Users cannot use it.)
 - 3. See the documentation on peripheral emulation board to use.

2.9 Display/Change the Memory, Register and Variable

This section describes how to display/change the memory, register and variable.

2.9.1 Display/change the memory

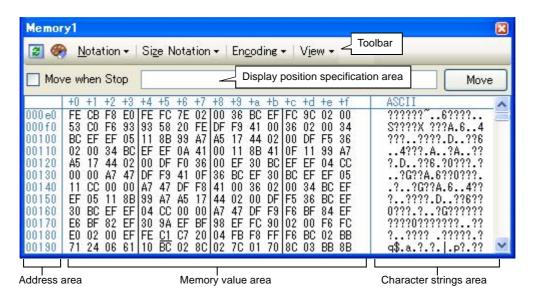

The contents of the memory can be displayed and its values can be changed in the Memory panel below.

Select the [View] menu >> [Memory] >> [Memory 1 - 4].

The maximum of 4 Memory panels can be opened. Each panel is identified by the names "Memory1", "Memory2", "Memory3" and "Memory4" on the titlebar.

For details on the contents and function in each area, see the section for the Memory panel.

Figure 2-102. Display the Contents of Memory (Memory Panel)

Remark You can set the scroll range (as start and end address) of the vertical scroll bar on this panel via the Scroll Range Settings dialog box which is opened by clicking the button from [View] on the toolbar.

This section describes the following.

- (1) Specify the display position
- (2) Change display format of values
- (3) Modify the memory contents
- (4) Display/modify the memory contents during program execution
- (5) Search the memory contents
- (6) Modify the memory contents in batch (initialize)
- (7) Save the memory contents

(1) Specify the display position

It is possible to specify the display start position of the memory contents by specifying an address expression in the display position specification area (starting with address 0x0 by default).

Remark An offset value of the display start position of memory values can be set via the Address Offset Settings dialog box that is opened by selecting [Address Offset Value Settings...] from the context menu.

Figure 2-103. Display Position Specification Area (Memory Panel)

(a) Specify an address expression

Directly enter the address expression of the memory value address to display in the text box. You can specify an input expression with up to 1024 characters. The result of the expression is treated as the display start position address.

Note that if an address value greater than the microcontroller address space is specified, the high-order address value is masked.

An address value greater than the value expressed within 32 bits cannot be specified.

- **Remarks 1.** A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").
 - 2. If the specified address expression is the symbol and its size can be recognized, everything from the start address to the end address of that symbol is displayed selected.

(b) Specify automatic/manual evaluation of the address expression

The timing to change the display start position can be determined by specifying in the [Move when Stop] check box and the [Move] button.

| [Move when Stop] | > | The caret is moved to the address which is automatically calculated from the address expression after the program is stopped. |
|------------------|---|--|
| | | The address expression is not automatically evaluated after the program is stopped. Click the [Move] button to manually evaluate the address expression. |
| [Move] | | When the [Move when Stop] check box is not checked, click this button to evaluate the address expression and move the caret to the result address of the evaluation. |

(2) Change display format of values

The display format of the address area/memory value area/character strings area can be changed using buttons below on the toolbar.

| Notation | The following buttons to change the notation of memory values are displayed. |
|---------------|---|
| Hex | Displays memory values in hexadecimal number (default). |
| S | Displays memory values in signed decimal number. |
| Bec | Displays memory values in unsigned decimal number. |
| Oct | Displays memory values in octal number. |
| Bin | Displays memory values in binary number. |
| Size Notation | The following buttons to change the notation of sizes of memory values are displayed. |
| 4 | Displays memory values in 4-bit width. |
| 8 | Displays memory values in 8-bit width (default). |
| 16 | Displays memory values in 16-bit width. |
| | Values are converted depending on the endian of the target memory area. |
| 32 | Displays memory values in 32-bit width. |
| | Values are converted depending on the endian of the target memory area. |
| 64 | Displays memory values in 64-bit width. |
| | Values are converted depending on the endian of the target memory area. |

| Encoding | The following buttons to change the encoding of character strings are displayed. |
|-------------------------------|--|
| Asq | Displays character strings in ASCII code (default). |
| SIIS | Displays character strings in Shift_JIS code. |
| [EUC] | Displays character strings in EUC-JP code. |
| UTF 8 | Displays character strings in UTF-8 code. |
| 16. | Displays character strings in UTF-16 code. |
| FIO | Displays character strings as a single-precision floating-point value Note. |
| Obl | Displays character strings as a double-precision floating-point value Note. |
| Fig. | Displays character strings as a complex number of single-precision floating-point Note. |
| Dbi | Displays character strings as a complex number of double-precision floating-point Note. |
| Fig | Displays character strings as an imaginary number of single-precision floating-point ^{Note} . |
| Oblimg | Displays character strings as an imaginary number of double-precision floating-point Note. |
| View | The following buttons to change the display format are displayed. |
| # | Opens the Scroll Range Settings dialog box to set the scroll range for this panel. |
| Column Number Settings | Opens the Column Number Settings dialog box to set the number of view columns in the memory value area. |
| Address Offset Value Settings | Opens the Address Offset Settings dialog box to set an offset value for addresses displayed in the address area. |

Note For details on the display of a floating-point value, see the section for the Memory panel.

(3) Modify the memory contents

The memory values can be edited.

Directly edit from the keyboard after moving the caret to the line to modify in memory value area/characters area. The color of the memory value changes when it is in editing. Press the [Enter] key to write the edited value to the target memory (if the [Esc] key is pressed before the [Enter] key is pressed, the editing is cancelled).

However, the character string that can be inputted during the editing is limited to that character string that can be handled by the display notation that has been currently specified. In the character strings area, modification can only be made with "ASCII" character code.

This operation can be taken place while the program is in execution. See "(4) Display/modify the memory contents during program execution" for details on how to operate it.

When you modify the values, be aware of the following examples.

Examples 1. The value exceeds the upper limit of the display bit wide If you edit the display value "105" as "1" to "3" in the decimal 8-bit display, the value will be changed to the upper limit of "127".

- 2. The symbol, "-" is entered between numbers

 If you edit the display value "32768" as "32-68" with signed decimal 16-bit display, "3" and "2" are changed to the blank and the value is changed to "-68".
- 3. The blank symbol (space) is entered between numbers
 If you edit the display value "32767" as "32 67", "3" and "2" are changed to the blank and the value is changed to "67".
- 4. The same value is entered Even if the same value as the current memory value is specified, the specified value is written to the memory.

(4) Display/modify the memory contents during program execution

The Memory panel/Watch panel has the real-time display update function that can update/modify the display contents of the memory/watch-expression in real-time while executing the program.

Using the real-time display update function allows you to display/modify the value of memory/watch-expression not only while the program is stopped, but also in execution.

The real-time display update function is realized by the RRM function (reading) [IECUBE][Simulator], a RAM monitor function (reading) (other than [Simulator]) or by the DMM function (modifying). Each function has a different area that can be used for reading and writing.

Firstly, enable the real-time display update function by making the basic settings below on the [Debug Tool Settings] tab of the Property panel.

Category Property Set Value

[Access memory while running] [Update display during the execution] [Yes] (default)

[Display update interval[ms]] [Integer number between 100

and 65500]

Table 2-8. Basic Settings for Real-time Display Update Function

Caution Local variables are not subject to the real-time display update function.

Remark See "(3) Modify the memory contents" or "(6) Modify the contents of watch-expressions" for details on how to modify values in the Memory panel/Watch panel.

(a) RRM function (reading) [IECUBE][Simulator]

This function is used to read the contents of the memory or of watch-expressions in real-time during execution of a program.

The following area can be read by the RRM function.

Memory and watch-expressions allocated to this area can always be displayed in real-time.

Table 2-9. Target Area of RMM Function

Notes 1. This refers to data that were in the cache before execution, to the values are not real-time.

- 2. Possible only for general-purpose registers and PC
- 3. Impossible during tracer/timer execution

(b) RAM monitor function (reading) (other than [Simulator])

This function is used to read the contents of memory or a watch-expression through software emulation by briefly halting the program.

The following area can be read by the RAM monitor function.

Caution If CPU status shifts to the standby mode (HALT/STOP/IDLE) mode, a monitor time-out error will occur.

Table 2-10. Target Area of RAM Monitor Function

| Area | IECUBE | E1/E20/EZ Emulator |
|-------------------------------------|---------|--------------------|
| Internal ROM | _Note 1 | - |
| Internal RAM (except register area) | _Note 1 | ✓ |
| Data flash | _Note 1 | ✓ |
| Emulation memory | - | - |
| Target memory | ✓ | - |
| CPU register | ✓ | ✓ Note 2 |
| SFR | ✓ | ✓ Note 3 |

- **Notes 1.** When it is available, priority is given to the RRM function. That is, the RAM monitor function is not used in such cases.
 - 2. This only applies to the general-purpose registers corresponding to the bank specification.
 - 3. This does not apply to BCDADJ.

Note that to enable the RAM monitor function, the setting below is required in addition to the Basic Settings for Real-time Display Update Function.

| Category | Property | Set Value |
|-------------------------------|--------------------------------|-----------|
| [Access memory while running] | [Access by stopping execution] | [Yes] |

(c) DMM function (modifying)

This function is used to write to the memory or watch-expressions in real-time during execution of a program. The following area can be modified by the DMM function.

Caution If CPU status shifts to the standby mode (HALT/STOP/IDLE) mode, a monitor time-out error will occur.

Table 2-11. Target Area of DMM Function

| Area | IECUBE | E1/E20/EZ Emulator | Simulator |
|-------------------------------------|----------|--------------------|---------------------|
| Internal ROM | - | - | 0 |
| Internal RAM (except register area) | A | A | 0 |
| Emulation memory | - | - | 0 |
| Target memory | A | - | 0 |
| CPU register | A | Note 1 | O ^{Note 2} |
| SFR | A | Note 3 | O ^{Note 2} |

- Possible by briefly halting execution
- O: Possible without briefly halting execution

Notes 1. This only applies to the general-purpose registers corresponding to the bank specification.

- 2. Impossible during tracer/timer execution
- 3. Possible only for standard SFRs

To enable the DMM function, the setting below is required in addition to the Basic Settings for Real-time Display Update Function.

| Debug Tool | Property | Set Value |
|------------------|--|-----------|
| Simulator | No setting is required. | |
| Other than above | [Access memory while running] category >> [Access by stopping execution] | [Yes] |

Caution When a 2-, 4-, or 8-byte variable is to be read through the RRM or RAM monitor function, the process of assigning a value to the variable may be divided into two steps.

If reading of the variable takes place between the two steps, an incorrect value may be read out because the assignment is not completed.

Example In this example, if reading takes place before "(2)" is executed, the value of variable "value_a" in which only the assignment to the two lower-order bytes has been completed is read out.

[C source text]

```
long int value_a = 0;  // Definition of a 4-byte variable
void func(void)
{
   value_a = 4000000000;  // Assignment to a 4-byte variable
}
```

[Assembly instructions for the assignment processing above]

```
MOVW AX, #2800H
MOVW !_value_a, AX ;(1): Assignment to the two lower-order bytes of variable "value_a"
MOVW AX, #0EE6BH
MOVW !_value_a+2, AX ;(2): Assignment to the two high-order bytes of variable "value_a"
```

On the Memory panel/Watch panel, the memory values/watch-expressions updated by the real-time display update function are highlighted in pink.

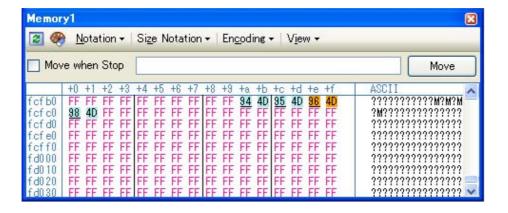

Memory1 Motation - Size Notation - Encoding - View -Move when Stop Move +0 +1 0.8.?.?.. 7.7.7.7.7.7.7.7 7.×.7.7.7.7.7.7 00 000a0 E0 E8 A0 00 78 00 80 00 88 00 90 00 98 00 CC 01 00000 CO 00 01 000c0 D4 01 D8 01 DC 01 B8 01 BC CO 01 01 A8 01 AC A0 01 7C 70 01 74 E1 70 E0 E1 70 E0 E1 30 E0 A4 01 01 B0 01 B4 90 01 94 01 98 00000 01 80 01 84 01 78 01 <u>80</u> 07 01 70 90 01 01 80 88 E1 E1 E1 01 01 000e0 80 84 88 000f0 6C 01 01 07 01 E0 44 .x.?.?p?.D 70 E0 07 70 E0 07 07 07 7.7p?.D.7.7p?.D 7.7p?.D.7.7p?.D 07 07 07 07 44 01 70 E0 44 01 00100 44 01 70 44 00110 FO 07 44 01 07 30 07 0.7 44 ?.?0?.D.?.?0?.D

Figure 2-104. Example of Memory Display by Real-time Display Update Function

Moreover, on the Memory panel using IECUBE, the background color of the memory values updated by the RRM function are highlighted as follows in accordance with the access status (character colors and background colors depend on the configuration in the [General - Font and Color] category of the Option dialog box).

| Access Condition | Display Example | |
|------------------|-----------------|--|
| Read or fetch | 00 00 00 00 | |
| Write | 00 00 00 00 | |
| Read and write | 00 00 00 00 | |

Figure 2-105. Example of Memory Display by Real-time Display Update Function (RRM Function) [IECUBE]

(5) Search the memory contents

Values of memory can be searched in the Memory Search dialog box that is opened by selecting [Find...] from the context menu. The search is operated either in the memory value area or character strings area, in which the caret exists. In this dialog box, follow the steps below.

Memory Search

Search Data:

Search Range:
Specify address range

Address:
0x0

| Oxfffff | Search Backward | Search Forward | Cancel Help | Cancel | Cancel Help | Cancel | C

Figure 2-106. Search Memory Contents (Memory Search Dialog Box)

- Cautions 1. The contents of the memory cannot be searched during execution of a program.
 - 2. Character strings displayed as floating-point values cannot be searched.

(a) Specify [Search Data]

Specify data to search.

You can either type a value directly into the text box (up to 256 bytes), or select one from the input history via the drop-down list (up to 10 items).

If the search is performed in the memory value area, the value must be entered in the same display format (notation and size) as that area.

If the search is performed in the character strings area, then the target of the search must be a string. The specified string is converted into the encoding format displayed in that area, and searched for.

If a memory value was selected immediately prior to opening this dialog box, then that value will appear as default.

(b) Specify [Search Range]

Select the range to search from the following drop-down list.

| Specify address range | Searches in the address range specified in the [Address] area. |
|-----------------------|--|
| Memory mapping | Searches within the selected memory mapping range. |
| | This list item displays individual memory mapping configured in the Memory Mapping |
| | dialog box (except the non-mapped area). |
| | Display format: <memory type=""> <address range=""> <size></size></address></memory> |

(c) Specify [Address]

This item is only enabled if [Specify address range] is selected in the (b) Specify [Search Range].

Specify the range of memory address to search via the start and end addresses. You can either type address expressions directly into the text boxes (up to 1024 characters), or select them from the input history via the drop-down list (up to 10 items).

The results of calculating the address expressions you have entered are treated as start and end addresses, respectively.

Note that if an address value greater than the microcontroller address space is specified, the high-order address value is masked.

An address value greater than the value expressed within 32 bits cannot be specified.

- Remarks 1. A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in each text box (see "2.19.2 Symbol name completion function").
 - 2. If the start address field is left blank, it is treated as if "0x0" were specified.

If the end address field is left blank, then it is treated as if the maximum value in the microcontroller's address space were specified.

(d) Click the [Search Backward]/[Search Forward] button

When the [Search Backward] button is clicked, search will start in the order from the large address number to small and the search results are displayed selected in the Memory panel.

When the [Search Forward] button is clicked, search will start in the order from the small address number to small and the search results are displayed selected in the Memory panel.

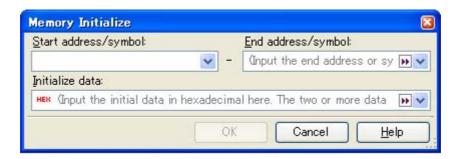

(6) Modify the memory contents in batch (initialize)

Contents of the memory can be modified in batch (initialize).

When [Fill...] from the context menu is selected, the Memory Initialize dialog box opens to modify the memory value of the specified address range in batch.

In this dialog box, follow the steps below.

Figure 2-107. Modify Memory Contents in Batch (Memory Initialize Dialog Box)

(a) Specify [Start address/symbol] and [End address/symbol]

Specify the range of memory address to initialize via the [Start address/symbol] and [End address/symbol]. You can either type address expressions directly into the text boxes (up to 1024 characters), or select them from the input history via the drop-down list (up to 10 items).

The results of calculating the address expressions you have entered are treated as start and end addresses, respectively.

Note that address values greater than the microcontroller address space cannot be specified.

Caution You cannot specify the range of address aligned across the different endian area.

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in each text box (see "2.19.2 Symbol name completion function").

(b) Specify [Initialize data]

Specify the initializing data to write to the memory.

You can either type the initial value into the text box directly in hexadecimal number, or select one from the input history via the drop-down list (up to10 items).

You can specify more than one initial value. Specify up to 16 values of up to 4 bytes (8 characters) each, separated by spaces.

Each initial value is parsed from the end of the string, with each two characters interpreted as a byte.

If the string has an odd number of characters, then the first character is interpreted as one byte.

Note that if a initial value consists of more than one byte, then the target memory is overwritten with the value converted into an array of bytes of the specified address range's endian, as follows.

| Input Character Strings (Initial Value) | How Data is Overwritten (in Bytes) | |
|--|------------------------------------|-------------------|
| | Little Endian | Big Endian |
| 1 | 01 | 01 |
| 0 12 | 00 12 | 00 12 |
| 00 012 345 | 00 12 00 45 03 | 00 00 12 03 45 |
| 000 12 000345 | 00 00 12 45 03 00 | 00 00 12 00 03 45 |

(c) Click the [OK] button

Click the [OK] button.

The memory area in the specified address range is repeatedly overwritten with the specified initial data pattern. If the end address is reached in the middle of the pattern, then writing ends at that point.

Note that if an illegal value is specified, a message will appear, and the memory value will not be initialized.

(7) Save the memory contents

Contents of the memory can be saved with range selection in text files (*.txt)/CSV files (*.csv).

When saving to the file, the latest information is acquired from the debug tool, and it is saved in accordance with the display format on this panel.

The Data Save dialog box can be opened by selecting the [File] menu >> [Save Memory Data As...] (when this operation is taken place with range selection on the panel, the memory data only in the selected range is saved). In this dialog box, follow the steps below.

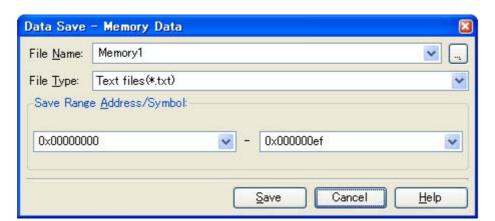

Figure 2-108. Save Memory Data (Data Save Dialog Box)

(a) Specify [File Name]

Specify the name of the file to save.

You can either type a filename directly into the text box (up to 259 characters), or select one from the input history via the drop-down list (up to 10 items).

You can also specify the file by clicking the [...] button, and selecting a file via the Select Data Save File dialog box.

(b) Specify [File Type]

Select the format in which to save the file from the following drop-down list.

The following file formats can be selected.

| List Item | Format |
|--|----------------------------|
| Text files (*.txt) | Text format (default) |
| CSV (Comma-Separated Variables)(*.csv) | CSV format ^{Note} |

Note The data is saved with entries separated by commas (,).

If the data contains commas, each entry is surrounded by double quotes "" in order to avoid illegal formatting.

(c) Specify [Save Range Address/Symbol]

Specify the range of addresses to save via "start address" and "end addresses".

Directly enter hexadecimal number/address expression in each text box or select from the input history displayed in the drop-down list (up to 10 items).

If a range is selected in the panel, that range is specified as the default. If there is no selection, then the range currently visible in the panel is specified.

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in each text box (see "2.19.2 Symbol name completion function").

(d) Click the [Save] button

Saves the memory data to a file with the specified filename, in the specified format.

Figure 2-109. Output Example of Memory Data

[Text files (*.txt)]

(Hexadecimal notation/8-bit width/ASCII code)

[CSV files (*.csv)]

(Hexadecimal notation/8-bit width/ASCII code)

Remark When the contents of the panel are overwritten by selecting the [File] menu>> [Save Memory Data], each Memory panel (Memory1-4) is treated as a different panel.

In addition, saving range is same as the previously specified address range.

2.9.2 Display/change the CPU register

The contents of the CPU register (general-purpose register/control register) can be shown and the value can be changed in the CPU Register panel below.

Select the [View] menu >> [CPU Register].

For details on the contents and function in each area, see the section for the CPU Register panel.

CPU Register Toolbar Notation ▼ Hex Value Register Name ⊟ ∰ General Registers 0xd330 ⊞ BC(RP1) 0×0000 ■ DE(RP2) 0xd330 0xd330 **⊞** ○ Control Registers ⊞ 🗂 General Registers:Register Bank O ⊞ 🗂 General Registers:Register Bank 1 ⊞ 🗂 General Registers:Register Bank 2 ⊞∰ General Registers:Register Bank 3 [Register Name] area [Value] area

Figure 2-110. Display the Contents of CPU Register (CPU Register Panel)

This section describes the following.

- (1) Change display format of values
- (2) Modify the CPU register contents
- (3) Display/modify the CPU register contents during program execution
- (4) Save the CPU register contents

(1) Change display format of values

The display format of the [value] area can be changed using buttons below on the toolbar.

| Notation | The following buttons to change the notation of a data value are displayed. |
|----------|--|
| auto | Displays the value of the selected item (including sub-items) in the default notation (default). |
| Hex | Displays the value of the selected item (including sub-items) in hexadecimal number. |
| S | Displays the value of the selected item (including sub-items) in signed decimal number. |
| Dec | Displays the value of the selected item (including sub-items) in unsigned decimal number. |
| Oct | Displays the value of the selected item (including sub-items) in octal number. |
| Bin | Displays the value of the selected item (including sub-items) in binary number. |
| Asc | Displays the character strings of the selected item (including sub-items) in ASCII code. If the character size is 2 bytes and above, it is displayed with the characters for each 1 byte arranged side-by-side. |
| FIO | Displays the value of the selected item in Float. Note that when the value is not 4-byte data, displays it in the default notation. |
| Dbl | Displays the value of the selected item in Double. Note that when the value is not 8-byte data, displays it in the default notation. |
| Hex | Adds the value in hexadecimal number enclosing with "()" at the end of the value. |

(2) Modify the CPU register contents

The CPU register values can be edited.

Select the value of the CPU register to edit in the [Value] area, then click on it again to switch the value to edit mode (press the [Esc] key to cancel the edit mode).

To write the edited value to the target memory, directly enter the value from the keyboard then press the [Enter] key.

Caution This operation cannot be performed during program execution.

(3) Display/modify the CPU register contents during program execution

By registering a CPU register to the Watch panel as a watch-expression, the value of the CPU register can be displayed/modified not only while the program is stopped, but in execution.

See "2.9.6 Display/change watch-expressions" for details on the watch-expression.

(4) Save the CPU register contents

The Save As dialog box can be opened by selecting the [File] menu >> [Save CPU Register Data As...], and all the contents in the CPU register can be saved to a text file (*.txt) or CSV file (*.csv).

When saving to files, retrieve the latest information from the debug tool.

Figure 2-111. Output Example of CPU Register Data

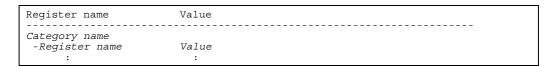

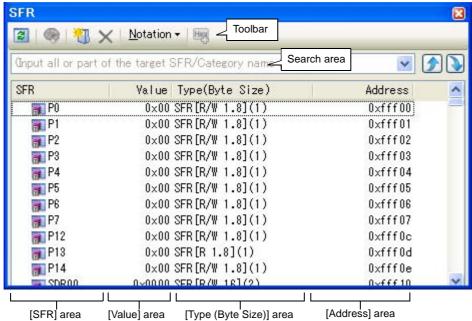

Figure 2-112. Display the Contents of SFR (SFR Panel)

2.9.3 Display/change the SFR

Contents of the SFR can be displayed and its values can be changed in the SFR panel below. Select the [View] menu >> [SFR].

For details on the contents and function in each area, see the section for the SFR panel.

SFR SFR

This section describes the following.

- (1) Search for a SFR
- (2) Organize SFRs
- (3) Change display format of values
- (4) Modify the SFR contents
- (5) Display/modify the SFR contents during program execution
- (6) Save the SFR contents

(1) Search for a SFR

A SFR can be searched for.

Specify the SFR name to search with the text box in the search area (case-insensitive). You can either type character strings directly from the key board (up to 512 characters), or select one from the input history via the drop-down list (up to 10 items).

Then, click either one of the following button.

| • | Searches up for the SFR name containing the string specified in the text box, and selects the SFR that is found. |
|-------------|--|
| > | Searches down for the SFR name containing the string specified in the text box, and selects the SFR that is found. |

- **Remarks 1.** The hidden SFR name being classified with a category can be searched (the category is opened and the SFR is selected).
 - 2. After typing character strings to search, to press the [Enter] key is the same function as clicking the button, and to press the [Shift] + [Enter] key is the same function as clicking the button.

(2) Organize SFRs

The each SFR can be categorized (by folders) and displayed in the tree view.

- Cautions 1. Categories cannot be created within categories.
 - 2. SFRs cannot be added or deleted.

(a) Create new category

Move the caret to the SFR name to create a new category then click the button in the toolbar and directly enter the new category name.

(b) Edit category name

Click the category name to edit, and click it again, then directly modify the category name from the keyboard.

(c) Delete categories

Select categories to delete then click the button in the toolbar. However, the categories that can be deleted are only the empty categories.

(d) Change the display order

SFR name is categorized when SFR is dragged and dropped in the category.

Also, the display order of the categories and the SFR names (upper or lower position) can be changed easily by drag and drop operation.

(3) Change display format of values

The display format of the [value] area can be changed using buttons below on the toolbar.

| Notation | The following buttons to change the notation of a data value are displayed. |
|----------|--|
| Hex | Displays the value of the selected item in hexadecimal number (default). |
| S | Displays the value of the selected item in signed decimal number. |
| Dec | Displays the value of the selected item in unsigned decimal number. |
| Oct | Displays the value of the selected item in octal number. |
| Bin | Displays the value of the selected item in binary number. |
| Asc | Displays the value of the selected item in ASCII code. |
| Heg | Adds the value in hexadecimal number enclosing with "()" at the end of the value of the selected item. |

(4) Modify the SFR contents

The SFR values can be edited.

Select the value of the SFR to edit in the [Value] area, then click on it again to switch the value to edit mode (press the [Esc] key to cancel the edit mode).

To write the edited value to the target memory, directly enter the value from the keyboard then press the [Enter] key.

- Cautions 1. This operation cannot be performed during program execution.
 - 2. The value of the read-only SFR cannot be edited.
- **Remarks 1.** If a number with fewer digits than the size of the SFR is entered, the higher-order digits will be padded with zeroes.
 - 2. If a number with more digits than the size of the SFR is entered, the higher-order digits will be masked.
 - 3. ASCII characters can be entered to the SFR value.
 - When the numeric "0x41" is written to the SFR "DMC0"
 - >> "0x41" is written in the port "DMC0".
 - When the ASCII character "'A'" is written to the SFR "DMC0"
 - >> "0x41" is written in the port "DMC0".

(5) Display/modify the SFR contents during program execution

By registering a SFR to the Watch panel as a watch-expression, the value of the SFR can be displayed/modified not only while the program is stopped, but in execution.

See "2.9.6 Display/change watch-expressions" for details on the watch-expression.

(6) Save the SFR contents

The Save As dialog box can be opened by selecting the [File] menu >> [Save SFR Data As...], and all the contents of the SFR can be saved in a text file (*.txt) or CSV file (*.csv). At this time, the values of all SFRs become targets irrespective of the setting of display/non-display on this panel.

When saving the contents to the file, the values of the SFR are reacquired and save the latest values acquired. Note that the values of read-protected SFR are not re-read. If you want to save the latest values of those, select [Force Read Value] from the context menu then save the file.

Figure 2-113. Output Example of SFR

| SFR name | Value | Type (Byte Size) Address | 5 |
|---------------------------|------------|-----------------------------|---|
| Category name -SFR name : | Value : | Type (Byte Size) Address: : | 3 |

2.9.4 Display/change global variables/static variables

Global variables or static variables are displayed and its values can be changed in the Watch panel.

Register the variables to display/modify their values to the Watch panel as the watch-expressions.

For details, see "2.9.6 Display/change watch-expressions".

2.9.5 Display/change local variables

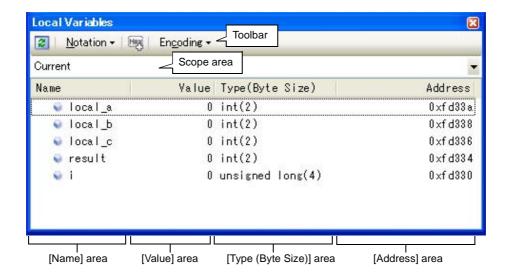

Contents of local variables can be displayed and its values can be changed in the Local Variables panel below. Select the [View] menu >> [Local Variable].

Specify the scope in the scope area to display the contents of the target local variable.

In the Local Variables panel, the name of local variables and functions are displayed. The argument of the function is also displayed as the local variable.

For details on the contents and function in each area, see the section for the Local Variables panel.

Figure 2-114. Display the Contents of Local Variables (Local Variables Panel)

Caution Nothing is displayed on this panel during execution of a program. When the program is stopped, items in each area are displayed.

This section describes the following.

- (1) Change display format of values
- (2) Modify the contents of local variables
- (3) Save the contents of local variables

(1) Change display format of values

The display format of the [value] area can be changed using buttons below on the toolbar.

| Notation | The following buttons to change the notation of a data value are displayed. |
|----------|--|
| auto | Displays values on this panel in the default notation according to the type of variable (default). |
| Hex | Displays values on this panel in hexadecimal number. |
| Dec | Displays values on this panel in decimal number. |
| Oct | Displays values on this panel in octal number. |
| Bin | Displays values on this panel in binary number. |
| Dec | Displays array indexes on this panel in decimal number (default). |
| Hex | Displays array indexes on this panel in hexadecimal number. |
| Flo | Displays values on this panel in Float. |
| | Note that when the value is not 4-byte data, or has the type information, displays it in the default notation. |
| Dbl | Displays values on this panel in Double. |
| | Note that when the value is not 4-byte data, or has the type information, displays it in the default notation. |
| Hex | Adds the value in hexadecimal number enclosing with "()" at the end of the value. |
| Encoding | The following buttons to change the encoding of character variables are displayed. |
| Asc | Displays character variables in ASCII code (default). |
| Suis | Displays character variables in Shift_JIS code. |
| [EUC] | Displays character variables in EUC-JP code. |
| UTF 8 | Displays character variables in UTF-8 code. |
| UTF 16 | Displays character variables in UTF-16 code. |
| | • |

(2) Modify the contents of local variables

Values and arguments of local variables can be edited.

Select the value of the local variables/arguments to edit in the [Value] area, then click on it again to switch the value to edit mode (press the [Esc] key to cancel the edit mode).

To write the edited value to the target memory, directly enter the value from the keyboard then press the [Enter] key. At this time, the edited value is checked and if it is incompatible with the type, the editing is invalidated.

Caution This operation cannot be performed during program execution.

- **Remarks 1.** If a number with fewer digits than the size of the variable is entered, the higher-order digits will be padded with zeroes.
 - **2.** If a number with more digits than the size of the variable is entered, the higher-order digits will be masked.
 - 3. If the display format of a character array (type char or unsigned char) is set to ASCII, then the value can also be entered as a string (ASCII/Shift_JIS/EUC-JP/Unicode (UTF-8/UTF-16)).
 - 4. ASCII characters can be entered to values of local variables.
 - Entering via an ASCII character In the [Value] area for the variable "ch", enter "'A'"
 - >> "0x41" will be written to the memory area allocated to "ch"
 - Entering via a numeric value In the [Value] area for the variable "ch", enter "0x41"
 - >> "0x41" will be written to the memory area allocated to "ch"

Entering via an ASCII string
 Set the display format of character array "str" to ASCII, and in the [Value] area, enter ""ABC""
 "0x41, 0x42, 0x43, 0x00" will be written to the memory area allocated to "str"

(3) Save the contents of local variables

The Save As dialog box can be opened by selecting the [File] menu >> [Save Local Variables Data As...], and all the contents in the local variables can be saved in a text file (*.txt) or CSV file (*.csv).

When saving to files, retrieve the latest information from the debug tool. If arrays, pointer type variables, structures/unions, and CPU registers (only those with the part name) are displayed expanded, the value of each expanded element is also saved. When they are not expanded, "+" mark is added on the top of the item and the value becomes blank.

Figure 2-115. Output Example of Local Variables

| Scope : Current scope [V]Variable [P]Parameter Name | | | Address |
|---|-------|------|---------|
| [V]Variable name[1] - [V]Variable name[0] : | Value | Туре | Address |
| | Value | Туре | Address |
| | : | : | : |

2.9.6 Display/change watch-expressions

By registering C language variables, CPU register, SFR, and assembler symbols to the Watch panel as watch-expressions, you can always retrieve their values from the debug tool and monitor the values in batch.

The values of watch-expressions can be updated during the program is in execution (see "(7) Display/modify the contents of watch-expressions during program execution").

Select the [View] menu >> [Watch] >> [Watch1 - 4] to open the Watch panel.

The Watch panel can be opened up to 4 panels. Each panel is identified by the names "Watch1", "Watch2", "Watch3" and "Watch4" on the titlebar, and the watch-expressions can be registered/deleted/moved individually, and they are saved as the user information of the project.

For details on the contents and function in each area, see the section for the Watch panel.

Watch1 Toolbar 💈 🧠 🎇 📉 💢 Notation 🕶 🔙 Watch Value Type (Byte Size) Address Memo **⊞** AX:REG <mark>Oxe8c6</mark> General Registers(2) -58 (0xc6) ?(1) 0xfd224 📦 global_a [Type (Byte Size)] area [Watch] area [Address] area [Value] area [Memo] area

Figure 2-116. Display the Contents of Watch-Expression (Watch Panel)

This section describes the following.

(1) Register a watch-expression

- (2) Organize the registered watch-expressions
- (3) Edit the registered watch-expressions
- (4) Delete a watch-expression
- (5) Change display format of values
- (6) Modify the contents of watch-expressions
- (7) Display/modify the contents of watch-expressions during program execution
- (8) Export/import watch-expressions
- (9) Save the contents of watch-expressions

(1) Register a watch-expression

There are three ways as follows to register watch-expressions (watch-expressions are not registered as default).

Caution Watch-expressions can be registered up to 128 in one watch panel (if this restriction is violated, a message appears).

- **Remarks 1.** Each watch-expression registered in each watch panel (Watch1 to Watch4) is managed in each panel and saved as the user information of the project.
 - 2. More than one watch-expression with the same name can be registered.

(a) Register from other panels

Watch-expressions can be registered from other panel in CubeSuite+.

In other panel, drag and drop the watch-expression to register in any watch panel (Watch1 to Watch4). For the relationship between panels that can use this operation and targets that can be registered as watch-expressions, see "Table A-4. Relationship between Panels and Targets That Can be Registered as Watch-Expressions".

Disassemble1 Here, the variable "m_minute" in the Disassemble V<u>i</u>ew + panel will be registered as a watch-expression. $m_{hour} = 0;$ 0048d MOVW Drag and drop on the Watch panel after selecting the inute = 00490 MOVW variable "m_minute" in the Disassemble panel. 00493 ₹ 1 X 2 6 Notation + 85: 00496 Value Type(Byte Size) Address Memo Watch 86: 0 (0x0000) int(2) 0xfe3c0 m_hour 0049a

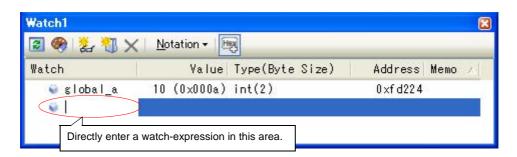

Figure 2-117. Registering Watch-Expressions from Other Panels

Remark You can also add a watch-expression by doing the following. First, select the target for which you wish to register a watch-expression, or move the caret to one of the target strings (the target is determined automatically). Next, from the context menu, select [Register Watch1] (but this is limited to the Watch panel (Watch 1)).

(b) Directly register in the Watch panel

Click the button in the toolbar in any the Watch panel (Watch1 to Watch4) to display the following entry box in the [Watch] area.

Figure 2-118. Entry Box of Watch-Expression

Directly input a watch-expression from the keyboard in the entry box then press the [Enter] key. For the input forms of watch-expressions entered this way, see the tables listed below.

- "Table A-5. Input Format of Watch-Expression"
- "Table A-6. Scope Specification of C language Used with Watch-Expression Registration"
- "Table A-7. Scope Specification of CPU Register with Watch-Expression Registration"
- "Table A-8. Scope Specification of SFR with Watch-Expression Registration"

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this area (see "2.19.2 Symbol name completion function").

(c) Register from other application

Select the character strings of C language variables/CPU registers/SFR/assembler symbols from an external editor and drag and drop it in the Watch panel (Watch 1 to Watch 4).

The dropped character strings are registered as a watch-expression.

(2) Organize the registered watch-expressions

Registered watch-expressions can be organized in categories (folders) and displayed in tree view (there is no category as default).

Cautions 1. Categories cannot be created within categories.

2. Up to 64 categories can be created in one watch panel (if this restriction is violated, a message appears).

(a) Create new category

Move the caret to the position to create a new category then click the button in the toolbar and directly enter the new category name.

(b) Edit category name

Click the category name to edit, and click it again, then directly modify the category name from the keyboard.

(c) Delete categories

Select categories to delete then click the X button in the toolbar.

(d) Change the display order

Registered watch-expressions are categorized when they are dragged and dropped in the category. Also, the display order of the categories and the watch-expressions (upper or lower position) can be changed easily by drag and drop operation.

Remark Drag and drop the watch-expressions/categories in other watch panel (Watch1 to Watch4) to copy them.

(3) Edit the registered watch-expressions

Registered watch-expressions can be edited.

Double-click the watch-expression to edit to switch the watch-expression to edit mode (press the [Esc] key to cancel the edit mode).

Directly edit from the keyboard and then press the [Enter] key.

(4) Delete a watch-expression

To delete watch-expressions, select the one you want to delete in the Watch panel then click the button in the toolbar.

(5) Change display format of values

The display format of the [value] area can be changed using buttons below on the toolbar.

| Notation | The following buttons to change the notation of a data value are displayed. |
|----------|--|
| auto | Displays the value of the selected watch-expression in the default notation (see "Table A-9. Display Format of Watch-Expressions (Default)") according the type of variable (default). |
| Hex | Displays the value of the selected item in hexadecimal number. |
| S | Displays the value of the selected item in signed decimal number. |
| Dec | Displays the value of the selected item in unsigned decimal number. |
| Oct | Displays the value of the selected item in octal number. |
| Bin | Displays the value of the selected item in binary number. |
| Asc | Displays the value of the selected item in ASCII code. |
| Fio | Displays the value of the selected item in Float. Note that this item becomes valid only when the selected watch-expression value is 4-byte data. |
| Dbl | Displays the value of the selected item in Double. Note that this item becomes valid only when the selected watch-expression value is 8-byte data. |
| Hex | Adds the value in hexadecimal number enclosing with "()" at the end of the value of the selected item (except the item displayed in hexadecimal number). |

(6) Modify the contents of watch-expressions

The values of watch-expressions can be edited.

Double-click the value of the watch-expression to edit in the [Value] area to switch the value to edit mode (press the [Esc] key to cancel the edit mode).

To write the edited value to the target memory, directly enter the value from the keyboard then press the [Enter] key.

Note that only those values that correspond one by one to variables of C language, CPU registers, SFR or assembler symbols can be edited. In addition, read-only SFR values cannot be edited.

This operation can be taken place while the program is in execution. See "(4) Display/modify the memory contents during program execution" for details on how to operate it.

- **Remarks 1.** If a number with fewer digits than the size of the variable is entered, the higher-order digits will be padded with zeroes.
 - 2. If a number with more digits than the size of the variable is entered, the higher-order digits will be masked.
 - 3. If the display format of a character array (type char or unsigned char) is set to ASCII, then the value can also be entered as a string (ASCII/Shift_JIS/EUC-JP/Unicode (UTF-8/UTF-16)).
 - 4. ASCII characters can be entered to values of watch-expressions.
 - Entering via an ASCII character

In the [Value] area for the variable "ch", enter "'A'"

- >> "0x41" will be written to the memory area allocated to "ch"
- Entering via a numeric value

In the [Value] area for the variable "ch", enter "0x41"

- >> "0x41" will be written to the memory area allocated to "ch"
- Entering via an ASCII string

Set the display format of character array "str" to ASCII, and in the [Value] area, enter ""ABC""

>> "0x41, 0x42, 0x43, 0x00" will be written to the memory area allocated to "str"

(7) Display/modify the contents of watch-expressions during program execution

The Memory panel/Watch panel has the real-time display update function that can update/modify the display contents of the memory/watch-expression in real-time while executing the program.

Using the real-time display update function allows you to display/modify the value of memory/watch-expression not only while the program is stopped, but also in execution.

See "(4) Display/modify the memory contents during program execution" for details on how to operate it.

(8) Export/import watch-expressions

This feature is for the export of currently registered watch-expressions to a file and the importing of such files, enabling the re-registration of watch-expressions.

To do this, follow the procedure described below.

(a) Export watch-expressions

Save watch-expressions currently being registered (including categories) in a file format that is possible to import.

With the Watch panel in focus, select [Save Watch Data As...] from the [File] menu.

On the Save As dialog box that is automatically opened, specify the following items, and then click the [Save] button.

- [File name]: Specify the name of a file to be saved (the file extension must be "csv").

- [Save as type]: Select "Importable CSV (Comma-Separated Variables)(*.csv)"

Caution Neither values nor the type information of watch-expressions can be saved.

Items that are expanded after analyzing watch-expressions (i.e. an array, structure, and so on) cannot be saved.

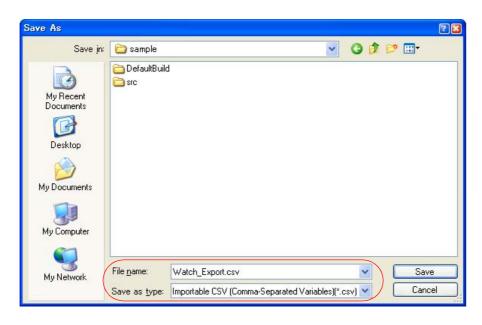

Figure 2-119. Export of Watch-Expressions

(b) Import watch-expressions

Import the file that exported in (a) to the Watch panel.

On the Watch panel to which you want to import watch-expressions, select [Import Watch Expression] from the context menu.

On the Open Watch Expression Data File dialog box that is automatically opened, specify the file that exported previously, and then click the [Open] button.

Remark If watch-expressions have been already registered, then imported watch-expressions will be registered at the bottom of them.

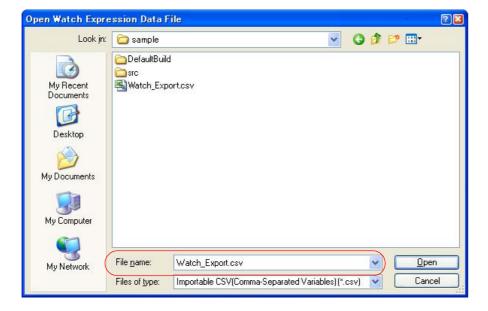

Figure 2-120. Import of Watch-Expressions

(9) Save the contents of watch-expressions

By selecting the [File] menu >> [Save Watch Data As...], the Save As dialog box can be opened, and all the contents of the watch-expression and its value can be saved in a text file (*.txt) or CSV file (*.csv).

When saving the contents to the file, all the values of the watch-expression are reacquired and save the latest values acquired.

If arrays, pointer type variables, structures/unions, and CPU registers (only those with the part name) are displayed expanded, the value of each expanded element is also saved. When they are not expanded, "+" mark is added on the top of the item and the value becomes blank.

Note that the values of read-protected SFR are not re-read. If you want to save the latest values of those, select [Force Read Value] from the context menu then save the file.

Figure 2-121. Output Example of Watch Data

| Watch-expression | Value | Type(Byte Size) | Address | Memo |
|------------------------------------|-------|-----------------|---------|------|
| Watch-expression -Category name | Value | Type(Byte Size) | Address | Memo |
| Watch-expression | Value | Type(Byte Size) | Address | Memo |

Remark When the contents of the panel are overwritten by selecting the [File] menu >> [Save Watch Data], each watch panel (Watch1 to Watch4) is treated as a different panel.

2.10 Display Information on Function Call from Stack

This section describes how to show the information on function call from the stack.

The CubeSuite+ compiler (CA78K0R) pushes function-call information onto the stack, in accordance with the ANSI standard.

It is thus possible to learn the function call depth, the location of the caller, parameters, and other information by analyzing the function-call information.

This "function-call information" is called the call stack information; this term will be used in the rest of this document.

2.10.1 Display call stack information

Call stack information is displayed in the Call Stack panel below.

Select the [View] menu >> [Call Stack].

For details on the contents and function in each area, see the section for the Call Stack panel.

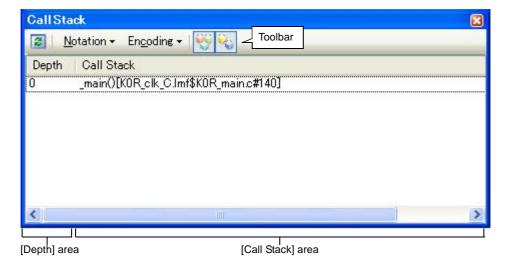

Cautions 1. Nothing is displayed on this panel during execution of a program.

When the program is stopped, items in each area are displayed.

2. Except for [Simulator]

If step execution is performed in source level, CubeSuite+ determines whether an interrupt is being processed via the NP, EP, and ID flags in the PSW register. For this reason, if the above register or flags are changed (e.g. when using multiple interrupts), then call stack information may be incorrect.

Figure 2-122. Display Call Stack Information (Call Stack Panel)

This section describes the following.

- (1) Change display format of values
- (2) Jump to the source line
- (3) Display local variables
- (4) Save the contents of call stack information

(1) Change display format of values

The display format of this panel can be changed using buttons below on the toolbar. Note that these buttons are disabled during execution of a program.

| Notation | The following buttons to change the notation of a data value are displayed. |
|----------|--|
| auto | Displays values on this panel in the default notation according to the type of variable (default). |
| Hex | Displays values on this panel in hexadecimal number. |
| Dec | Displays values on this panel in decimal number. |
| Oct | Displays values on this panel in octal number. |
| Bin | Displays values on this panel in binary number. |
| Encoding | The following buttons to change the encoding of character variables are displayed. |
| Asc | Displays character variables in ASCII code (default). |
| [sus] | Displays character variables in Shift_JIS code. |
| [EUC] | Displays character variables in EUC-JP code. |
| UTF 8 | Displays character variables in UTF-8 code. |
| 16 16 | Displays character variables in UTF-16 code. |

(2) Jump to the source line

Double-clicking on the line will open the Editor panel with the caret moved to the source line of the calling function indicated by the selected line (If the panel is already open, the screen will jump to the editor panel).

Remark Selecting [Jump to Disassemble] from the context menu will open the Disassemble panel (Disassemble 1) with the caret moved to address of the calling function indicated by the selected line (If the panel is already open, the screen will jump to the Disassemble panel (Disassemble 1)).

(3) Display local variables

Selecting [Jump to Local Variable at This Time] from the context menu will open the Local Variables panel that displays the local variables indicated by the currently selected line.

(4) Save the contents of call stack information

By selecting the [File] menu >> [Save Call Stack Data As...], the Save As dialog box can be opened, and all the contents in the call stack information can be saved in a text file (*.txt) or CSV file (*.csv). When saving to files, retrieve the latest information from the debug tool.

Figure 2-123. Output Example of Call Stack Information

| Depth | Call stack |
|-------|---|
| 0 1 : | Call stack information Call stack information : |

Note If old information has been obtained from stack data that has lost its reliability, the information on that line is shown in parentheses "()".

2.11 Collect Execution History of Programs

This section describes how to collect the execution history of the program.

A history of program execution is generally called a trace; this term will be used in the remainder of this document.

It is nearly impossible to find the cause of runaway program execution from the memory contents, stack information, and the like after the runaway has occurred. The collected trace data, however, can be used to trace program execution up to the runaway directly, making this an effective tool for discovering hidden bugs.

Cautions 1. [E1][E20][EZ Emulator]

The trace function is supported only when the selected microcontroller incorporates the OCD trace function.

2. [Simulator]

4 bytes of the final address of the code flash area (when a code flash area is 0x0 - 0x1FFFFF, 0x1FFFC - 1FFFFF corresponds to it) and the RAM area which can be fetched cannot be fetched (a message of "Stopped by accessing to no map area." will appear).

2.11.1 Configure the trace operation

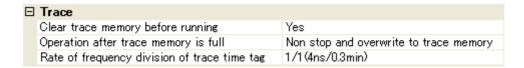

When the trace function starts, trace data which has recorded in it an execution history of the currently executed program is collected in trace memory (when program execution stops, the trace function also automatically stops). Before the trace function can be used, it is necessary to make settings relating to the operation of a trace. Note that the method on how to set differs depending on the debug tool used.

- (1) [IECUBE]
- (2) [E1]/[E20]/[EZ Emulator]
- (3) [Simulator]

(1) [IECUBE]

This trace operation can be configured in the [Trace] category on the [Debug Tool Settings] tab in the Property panel.

Figure 2-124. [Trace] Category [IECUBE]

(a) [Clear trace memory before running]

Select whether to clear (initialize) the trace memory before tracing starts in this property. Select [Yes] to clear the memory (default).

Remark You can forcibly clear the trace memory when clicking the button in the toolbar in the Trace panel.

(b) [Operation after trace memory is full]

Select the operation after the trace memory is full with the collected trace data, from the following drop-down list.

The trace memory size is 128K frames (fixed).

| Non stop and overwrite to trace memory | Continues overwriting the older trace data after the trace memory is full (default). When the [Clear trace memory before running] property is set to [Yes], at the time of a resumption, trace data is collected after clearing the trace memory. | |
|--|--|--|
| Stop trace | When the trace memory is full, CubeSuite+ stops writing trace data (the program does not stop execution). | |
| Stop | When the trace memory is full, CubeSuite+ stops writing trace data and the program stops execution. | |

(c) [Rate of frequency division of trace time tag]

Specify the frequency division ratio of the counter to be used for time tag display (i.e. display of the [Time] item in the Trace panel) (default: [1/1(4ns/0.3min)]).

Remark Values in "()" on the dorop-down list indicate the resolution and the maximum measurement time when using a external clock of 240 MHz.

(2) [E1]/[E20]/[EZ Emulator]

This trace operation can be configured in the [Trace] category on the [Debug Tool Settings] tab of the Property panel.

Caution This category appears only when the selected microcontroller incorporates the OCD trace function.

Figure 2-125. [Trace] Category [E1][E20][EZ Emulator]

| E | Trace | |
|---|--------------------------------------|--|
| | Use trace function | Yes |
| | Operation after trace memory is full | Non stop and overwrite to trace memory |
| | Trace memory size[frames] | 256 |

(a) [Use trace function]

Select whether to use trace function.

Select [Yes] to use the trace function (default: [No]).

(b) [Operation after trace memory is full]

Select the operation after the trace memory is full with the collected trace data, from the following drop-down list.

| Non stop and overwrite to trace memory | Continues overwriting the older trace data after the trace memory is full (default). |
|--|---|
| Stop trace | When the trace memory is full, CubeSuite+ stops writing trace data (the program does not stop execution). |

(c) [Trace memory size[frames]]

The size of trace memory (i.e. the number of trace frames) is displayed.

You cannot change the value of this property.

The trace frame is a unit of trace data. One trace frame is used for each operation in fetch/write/read.

Operation specifications of the OCD trace function are as follows:

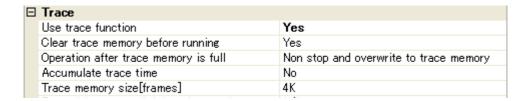

Item Description Clearing the trace The trace memory is cleared when: memory - The program is executed. - The external reset signal is generated (the internal reset signal does not cause clearing the trace memory). Operation after the trace The trace full break is not supported. memory is full Target of trace data Branch origin instructions (internal ROM only) For a branch instruction with a condition, it will be traced only when the condition is met. Complement display of instructions between branch instructions cannot be performed. Note that, for the following instructions, an instruction of the next address of its correct position will be displayed. - BT ES:[HL].bit, \$addr20 - BF ES:[HL].bit, \$addr20 - BTCLR ES:[HL].bit, \$addr20 The following items are supported on the Trace panel. - [Number] - [Line/Address] - [Source/Disassemble] Trace event See "2.15.7 Notes for setting events". Notes The following items cannot be traced. - Interrupt vectors - Instructions during a step execution - Skip instructions with a condition

Table 2-12. Operation Specifications of OCD Trace Function

(3) [Simulator]

This trace operation can be configured in the [Trace] category on the [Debug Tool Settings] tab of the Property panel.

Figure 2-126. [Trace] Category [Simulator]

(a) [Use trace function]

Select whether to use trace function.

Select [Yes] to use the trace function (default: [No]).

(b) [Clear trace memory before running]

Select whether to clear (initialize) the trace memory before tracing starts.

Select [Yes] to clear the memory (default).

Remark You can forcibly clear the trace memory when clicking the button in the toolbar in the Trace panel.

(c) [Operation after trace memory is full]

Select the operation after the trace memory is full with the collected trace data, from the following drop-down list.

| Non stop and overwrite to trace memory | continues overwriting the older trace data after the trace memory is full (default). When the [Clear trace memory before running] property is set to [Yes], at the time of a esumption, the trace data is collected after clearing the trace memory. | |
|--|---|--|
| Stop trace | When the trace memory is full, CubeSuite+ stops writing trace data (the program does not stop execution). | |
| Stop | When the trace memory is full, CubeSuite+ stops writing trace data and the program stops execution. | |

(d) [Accumulate trace time]

Select whether to display the trace time with accumulated time.

Specify [Yew] to display trace time with accumulated time. Specify [No] to display the trace time with differential time (default).

(e) [Trace memory size[frames]]

Selectt the trace memory size (trace frame number) (default: [4K]).

The trace frame is a unit of trace data. One trace frame is used for each operation in fetch/write/read.

2.11.2 Collect execution history until stop of the execution

In the debug tool, there is a function to collect the execution history from the start of program execution to the stop. Therefore, the trace data collection is automatically started when the program starts executing and stopped when the program stops.

See "2.11.6 Display the collected execution history" for how to check the collected trace data.

Remark This function is actuated by an Unconditional Trace event, one of the built-in events that are set in the debug tool by default.

Consequently, if the Unconditional Trace event is set to Invalid state by clearing the check box in the Events panel, trace data linked to the start of program execution will not be collected (the Unconditional Trace event is set to Valid state by default).

Note that Unconditional Trace event and Trace event described later (see "2.11.3 Collect execution history in the arbitrary section") are used exclusively of each other. Therefore, if Trace event with Valid state is set, Unconditional Trace event is automatically set to Invalid state.

2.11.3 Collect execution history in the arbitrary section

The execution history is collected as trace data only for the arbitrary section while the program is in execution by setting a Trace event.

This Trace event consists of a trace start event and a trace end event.

To use this function, follow the procedure described below.

- (1) Set a Trace event
- (2) Execute the program
- (3) Edit a Trace event
- (4) Delete a Trace event

Cautions 1. Also see "2.15.7 Notes for setting events" for details on Trace events (e.g. limits on the number of enabled events).

- 2. The event type (execution type/access type) that can be set as trace start and end events differ with each debug tool used.
- 3. [Simulator]

Trace start events and trace stop events cannot be set/deleted while a tracer is running.

(1) Set a Trace event

To set a Trace event, set a trace start event and a trace end event that starts/stops collecting the trace data. Use one of the following methods to set a trace start event and a trace end event.

(a) For execution-related events

By setting execution-related events for a trace start event and a trace end event, it is possible to start and stop the collection of trace data at any place.

Perform this operation in the Editor panel/Disassemble panel in which the source text/disassembly text is displayed.

Follow the operation listed below from the context menu, in accordance with your desired event type, after moving the caret to the target line that has a valid address.

| Event Type | Operation | |
|-------------|--|--|
| Trace start | Select [Trace Settings] >> [Start Tracing] | |
| Trace end | Select [Trace Settings] >> [Stop Tracing] | |

Caution [Simulator]

Simulator will not display a trace end event as the results of a trace. For this reason, set a trace end event to one line below the range that you wish to display as the trace data.

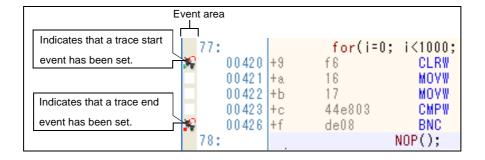

A trace start event or a trace end event is set to the instruction at the start address corresponding to the line of the caret position.

Once a trace start event or a trace end event is set, the following event mark is displayed in the event area of the line that an event is set.

Table 2-13. Event Marks of Trace Start Event and Trace End Events

| Event Type | Event Mark | |
|-------------|------------|--|
| Trace start | № | |
| Trace end | | |

Figure 2-127. Trace Start and Trace End Events Setting Example (Disassemble Panel)

(b) For access-related events [E1][E20]

By setting access-related events for a trace start event and a trace end event, it is possible to start and stop the collection of trace data when a specified access is made to any variable or SFR.

Remark The types of access that can be set by using methods described here are only a read/write (see "Table 2-6. Types of Accesses to Variables"). To change the access type to a read or write, after setting trace start and end events, edit their [access type] item (see "(2) Edit access-related events").

<1> To set events for variables or SFR in the Editor panel/Disassemble panel

Perform this operation in the Editor panel/Disassemble panel in which the source text/disassembly text is displayed.

Follow the operation listed below from the context menu, in accordance with your desired event type, after selecting an arbitrary variable or SFR on the source text/disassembled text. Note, however, that only global variables, static variables inside functions, and file-internal static variables can be used.

| Event Type | Operation | |
|-------------|--|--|
| Trace start | Select [Trace Settings] >> [Record Start R/W Value], and then press the [Enter] key. | |
| Trace end | Select [Trace Settings] >> [Record End R/W Value], and then press the [Enter] key. | |

At this time, if you have specified a value in the text box in the context menu, collection of trace data is started or finished only when a read/write is performed with a specified value. On the other hand, if no value is specified, reading/writing the selected variable or SFR by any value will cause the break to occur.

- Cautions 1. Variables within the current scope can be specified.
 - 2. Variables or SFR at lines that have no valid addresses cannot be used for trace start events and trace end events.

<2> To set events for registered watch-expressions

Perform this operation in the Watch panel.

Follow the operation listed below from the context menu after selecting the registered watch-expression (multiple selections not allowed).

Note, however, that only global variables, static variables inside functions, file-internal static variables, and SFR can be used.

| Event Type Operation | |
|----------------------|--|
| Trace start | Select [Trace Output] >> [Record Start R/W Value], and then press the [Enter] key. |
| Trace end | Select [Trace Output] >> [Record End R/W Value], and then press the [Enter] key. |

At this time, if you have specified a value in the text box in the context menu, collection of trace data is started or finished only when a read/write is performed with a specified watch-expression. On the other hand, if no value is specified, reading/writing the selected watch-expression by any value will cause the break to occur.

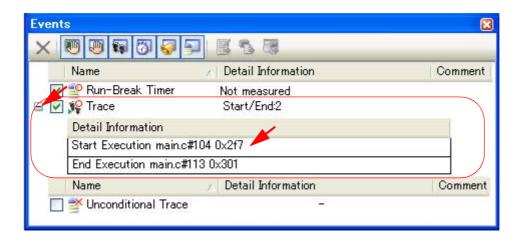

Caution A watch-expression within the current scope can be specified.

To target a watch-expression outside the current scope, select a watch-expression with a specified scope.

When a trace start event and a trace end event are set, they are managed collectively on the Events panel as one instance of a Trace event (see "2.15 Manage Events"). When you click the "+" mark at a Trace event item, detailed information on the trace start event and the trace end event you have set is displayed.

Figure 2-128. Example of Trace Start and Trace End Events (Execution Type) in Events Panel

- Remarks 1. If either one of a trace start event and a trace end event is set as Valid state, the check box of Unconditional Trace event in the Events panel is automatically cleared, therefore, trace data collection does not automatically start with the start of the program execution (the tracer will not run until the condition of the trace start event that has been set is met).
 - 2. A trace end event is not indispensable for a Trace event.
 - 3. Event marks differ depending on the event state (see "2.15.1 Change the state of set events (valid/invalid)").

When an event is set at the point which other event is already set, the event mark () is displayed meaning more than one event is set at the point.

4. [Simulator]

If either one of a trace start event and a trace end event is set to Valid state, the [Use trace function] property in the [Trace] category on the [Debug Tool Settings] tab of the Property panel is automatically set to [Yes] and the trace function will be enabled.

(2) Execute the program

Execute the program (see "2.7 Execute Programs").

Collection of trace data is started or finished when the condition set for a trace start event or a trace end event is met.

See "2.11.6 Display the collected execution history" for how to check the collected trace data.

(3) Edit a Trace event

It is possible to edit a trace start event or a trace end event you have set.

For details on how to do it, see "(1) Edit execution-related events" or "(2) Edit access-related events".

(4) Delete a Trace event

To delete a Trace event you have set, on the Editor panel/Disassemble panel, right-click the event mark in the event area and select [Delete Event] from the context menu that is displayed.

Also, there is another way to delete a set event. Select the Trace event you want to delete on the Events panel, and then click the button in the toolbar (see "2.15.5" Delete events").

Caution It is not possible to delete only a trace start event or a trace end event (i.e. if either a trace start event or a trace end event is deleted from the event marks on the event area, all of the corresponding event marks are deleted).

2.11.4 Collect execution history only when the condition is met [IECUBE][Simulator]

The program execution history can be collected only when a condition is met.

By setting a Point Trace event, the execution history is collected as trace data only when an arbitrary variable or SFR is accessed with the specified type.

To use this function, follow the procedure described below.

- (1) Set a Point Trace event
- (2) Execute the program
- (3) Edit a Point Trace event
- (4) Delete a Point Trace event

Caution [E1][E20][EZ Emulator]

This function is not supported.

(1) Set a Point Trace event

Use one of the following methods to set a Point Trace event.

Cautions 1. Also see "2.15.7 Notes for setting events" for details on Point Trace events (e.g. limits on the number of enabled events).

2. [IECUBE]

Point Trace events cannot be set for 32-bit (4-byte) variables.

Additionally, see "(c) For access to a variable/SFR of 16-bit (2-byte) size [IECUBE]" for setting of Point Trace events for 16-bit (2-byte) variables.

3. [Simulator]

Point Trace events cannot be set/deleted while a tracer is running.

Remarks 1. [IECUBE]

Accesses via DMA can be traced.

2. [Simulator]

When a Point Trace event is set to Valid state, the [Use trace function] property in the [Trace] category on the [Debug Tool Settings] tab of the Property panel is automatically set to [Yes] and the trace function will be enabled.

(a) For access to a variable/SFR on the Editor panel/Disassemble panel

Perform this operation in the Editor panel/Disassemble panel in which the source text/disassembly text is displayed.

Follow the operation listed below from the context menu, in accordance with your desired access type, after selecting the variable or SFR as the subject to access.

Note, however, that only global variables, static variables inside functions, and file-internal static variables can be used.

| Access Type | Operation | |
|-------------|--|--|
| Read | Select [Trace Settings] >> [Record Reading Value]. | |
| Write | Select [Trace Settings] >> [Record Writing Value]. | |
| Read/Write | Select [Trace Settings] >> [Record R/W Value]. | |

Caution Variables within the current scope can be specified.

(b) For access to a registered watch-expression

Perform this operation in the Watch panel.

Select the watch-expression as the subject to access and perform the following operation from the context menu.

Note, however, that only global variables, static variables inside functions, file-internal static variables, and SFR can be used.

| Access Type | Operation | |
|-------------|--|--|
| Read | Select [Trace Output] >> [Record Reading Value]. | |
| Write | Select [Trace Output] >> [Record Writing Value]. | |
| Read/Write | Select [Trace Output] >> [Record R/W Value]. | |

Caution A watch-expression within the current scope can be specified.

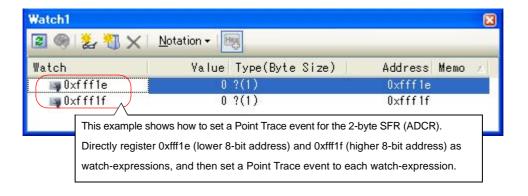

To target a watch-expression outside the current scope, select a watch-expression with a specified scope.

(c) For access to a variable/SFR of 16-bit (2-byte) size [IECUBE]

If you want to set a Point Trace event to a variable/SFR of 16-bit (2-byte) size when using IECUBE, register each address of the higher 8-bit and the lower 8-bit of the variable/SFR in the Watch panel directly as watch-expressions (see "(1) Register a watch-expression").

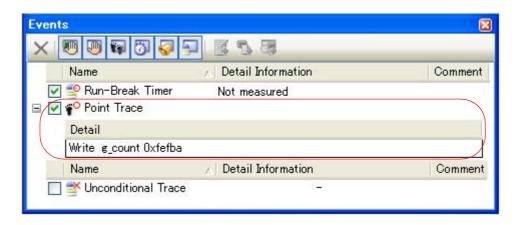

Then, set a Point Trace event to each watch-expression by using the method described in "(b) For access to a registered watch-expression".

Figure 2-129. How to Set Point Trace Event for 16-bit (2-byte) Variable/SFR [IECUBE]

By performing the above operation, it is interpreted as if a Point Trace event has been set at the target variable/ SFR/watch-expression, and it is managed in the Events panel (see "2.15 Manage Events" for details).

Figure 2-130. Example of Setting Point Trace Event in Events Panel

(2) Execute the program

Execute the program (see "2.7 Execute Programs").

If the conditions for a Point Trace event that you have set are met while the program is executing, that information is collected as trace data.

See "2.11.6 Display the collected execution history" for details on checking trace data.

Figure 2-131. Example of Point Trace Event Results View

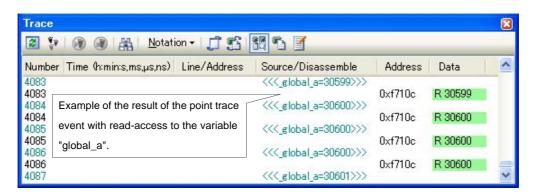

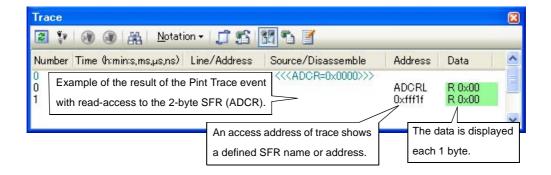

Figure 2-132. Example of Point Trace Event Results View (For 16-bit (2-byte) Variable/SFR) [IECUBE]

(3) Edit a Point Trace event

It is possible to edit a Point Trace event you have set.

For details on how to do it, see "(2) Edit access-related events".

(4) Delete a Point Trace event

To delete a Point Trace event you have set, select the Point Trace event you want to delete on the Events panel, and then click the button in the toolbar (see "2.15.5" Delete events").

2.11.5 Stop/restart collection of execution history [IECUBE][Simulator]

It is possible to temporarily stop or restart the collection of execution history during program execution.

(1) Stop collection of execution history temporarily

By clicking the button on the toolbar in the Trace panel during program execution, it is possible to temporarily stop collection of trace data without stopping program execution.

Use this function when you want to stop only the trace function without halting the program and check the trace data that has been collected until you stop it.

(2) Restart collection of execution history

If you have halted the trace function during program execution, you can start collection of trace data again by clicking the button on the toolbar in the Trace panel.

Note that the trace data that has been collected before you restart is cleared once.

2.11.6 Display the collected execution history

The collected trace data is displayed in the Trace panel below.

Select the [View] menu >> [Trace].

The trace data displays by mixing the disassembled text and source text by default, but it is also possible to display either one of these by selecting the Display mode.

For details on the contents and function in each area, see the section for the Trace panel.

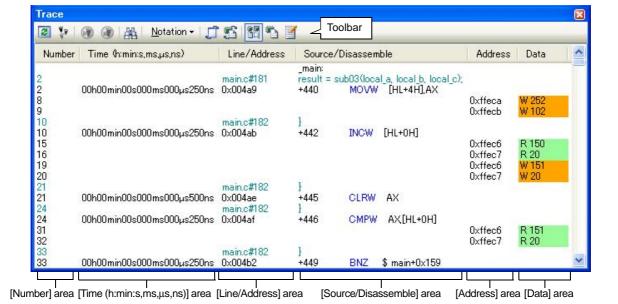

Figure 2-133. Display Trace Data (Trace Panel)

This section describes the following.

- (1) Change display mode
- (2) Change display format of values
- (3) Link with other panels

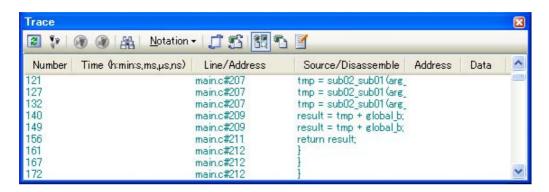

(1) Change display mode

Display mode can be changed to the purpose when clicking the buttons below in the toolbar. Note that these buttons are disabled while the tracer is running.

Table 2-14. Display Modes of Trace Panel

| Button | Display Mode | Displayed Content |
|---------------------|---|--|
| E | Mixed display mode | Displays the instruction (disassemble results), labels, source text (corresponding source line), point trace results [IECUBE][Simulator], reset causes [IECUBE], and break causes (default). |
| | Disassemble display mode Displays the instruction (disassemble results), labels, point trace [IECUBE][Simulator], reset causes [IECUBE], and break causes | |
| Source display mode | | Displays the source text (corresponding source line), reset causes [IECUBE], and break causes. |
| | | However, when a place where no debugging information is present is executed, " <no debug="" information="">" is displayed.</no> |

Figure 2-134. Example of Source Display Mode View (Trace Panel)

(2) Change display format of values

The display format of the [Line Number/Address], [Address] [IECUBE][Simulator] and [Data] [IECUBE][Simulator] area can be changed using buttons below on the toolbar. Note that these buttons are disabled while the tracer is running.

| Notation | | The following buttons to change the notation of a data value are displayed. | |
|---|--|---|--|
| | Displays values on this panel in hexadecimal number (default). | | |
| Displays values on this | | Displays values on this panel in decimal number. | |
| | Displays values on this panel in octal number. | | |
| Displays values on this panel in binary number. | | Displays values on this panel in binary number. | |

(3) Link with other panels

Items in the trace panel can be linked to other panels using the currently selected line address as a pointer (window focus will not move).

Click the button on the toolbar to start linking to the Editor panel. Click the button on the toolbar to start linking to the Disassemble panel.

If the button is clicked again, the link is disconnected.

Remark The Editor panel/Disassemble panel opens when selecting the [Jump to Source]/[Jump to Disassemble] from the context menu with moving the caret to the source line/address corresponding to the address of the currently selected line (focus is moved).

2.11.7 Clear the trace memory

To clear the collected trace data contents, click the button on the toolbar. Note that this button is disabled while a tracer is running.

Remarks 1. [IECUBE][Simulator]

When [Yes] is specified in the [Clear trace memory before running] property in the [Trace] category on the [Debug Tool Settings] tab of the Property panel, the trace memory is cleared each time a program is executed.

2. [E1][E20][EZ Emulator]

The trace memory is cleared each time a program is executed (fixed).

2.11.8 Search the trace data

To search the collected trace data, click the button to open the Trace Search dialog box (note that the search is disabled during execution of a program).

In this dialog box, follow the steps below.

When the tab on the tab selection area is selected, the trace data can be searched in instruction level/source level.

Note however, that if you search the trace data at the instruction level, the display mode must be set in the Trace panel to the Mixed display mode or Disassemble display mode.

When searching at the source level, the mode must be set to the Mixed display mode or Source display mode.

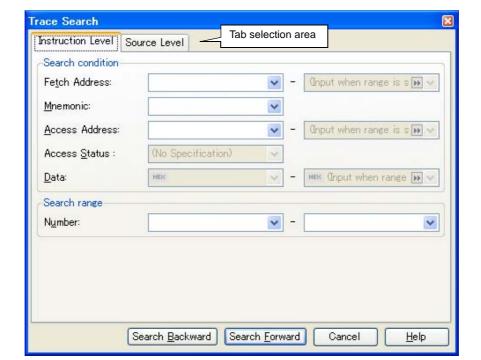

Figure 2-135. Search Trace Data (Trace Search Dialog Box)

This section describes the following.

- (1) Search in the instruction level
- (2) Search in the source level

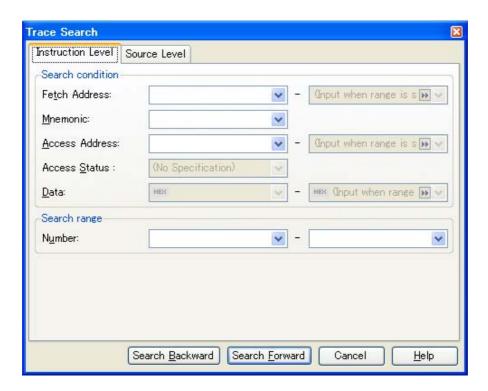

(1) Search in the instruction level

Search the trace data in the instruction level.

Select the [Instruction Level] tab and then follow the steps below.

Figure 2-136. Search Trace Data in Instruction Level

(a) Specify [Fetch Address]

Specify the fetch address if it is a required search parameter.

You can either type address expressions directly into the text boxes, or select it from the input history via the drop-down list (up to 10 items).

The fetch address can also be specified as a range. In this case, specify a range by specifying address expressions in both the left and right text boxes.

If the right-hand text box is blank or contains the text [(Input when range is specified)], then the fixed address specified in the left-hand text box will be searched.

Note that if an address value greater than the microcontroller address space is specified, the high-order address value is masked.

An address value greater than the value expressed within 32 bits cannot be specified.

(b) Specify [Mnemonic]

Specify the mnemonic if it is a required search parameter.

The specified character strings in this area is searched within the [Source/Disassemble] area of the Trace panel.

You can either type a mnemonic directly into the text boxes, or select one from the input history via the drop-down list (up to 10 items).

Searches are case-insensitive, and partial matches are also allowed.

(c) Specify [Access Address] [IECUBE][Simulator]

Specify the access address if it is a required search parameter.

You can either type the address value directly into the text boxes (in hexadecimal number), or select it from the input history via the drop-down list (up to 10 items).

The access address can also be specified as a range. In this case, specify a range by specifying address expressions in both the left and right text boxes.

If the right-hand text box is blank or contains the text [(Input when range is specified)], then the fixed address specified in the left-hand text box will be searched.

Note that if an address value greater than the microcontroller address space is specified, the high-order address value is masked.

An address value greater than the value expressed within 32 bits cannot be specified.

(d) Specify [Access Status] [IECUBE][Simulator]

This item is only enable if a value for Specify [Access Address] [IECUBE][Simulator] is specified. Select the access type (Read/Write, Read, Write, Vector Read and DMA) from drop-down list. Select [(No Specification)] if you do not wish to limit access types.

(e) Specify [Data] [IECUBE][Simulator]

This item is only enable if a value for Specify [Access Address] [IECUBE][Simulator] is specified. Specify the access data.

You can either type the data directly into the text boxes (in hexadecimal number), or select it from the input history via the drop-down list (up to 10 items).

The data can also be specified as a range. In this case, specify a range by specifying data in both the left and right text boxes.

If the right-hand text box is blank or contains the text [(Input when range is specified)], then the fixed data specified in the left-hand text box will be searched.

(f) Specify [Number]

Specify the range within the trace data to search via the number displayed in the [Number] area of the Trace panel.

Specify the starting number in the left text box, and the ending number in the right text box ("0" to "last number" are specified by default).

You can either type the numbers directly into the text boxes (in base-10 format), or select them from the input history via the drop-down list (up to 10 items).

If the left-hand text box is left blank, it is treated as if "0" were specified.

If the right-hand text box is left blank, it is treated as if the last number were specified.

(g) Click the [Search Backward]/[Search Forward] button

When the [Search Backward] button is clicked, search is taken place in the order from the large number to small and the search results are shown selected in the Trace panel.

When the [Search Backward] button is clicked, search is taken place in the order from the small number to large and the search results are shown selected in the Trace panel.

(2) Search in the source level

Search the trace data in the source level. Select the [Source Level] tab.

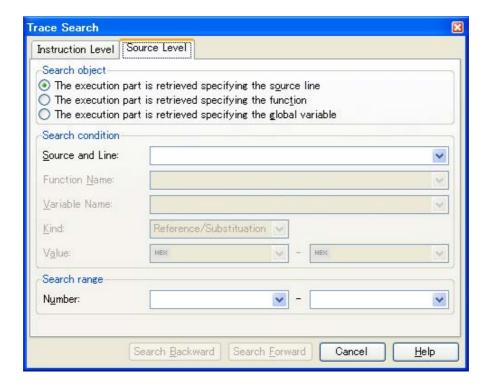

Figure 2-137. Search Trace Data in Source Level

(a) Search with specifying the source line (default)

Select the [The execution part is retrieved specifying the source line] item in the [Search object] area and then follow the operation below.

<1> Specify [Source and Line]

The specified character strings in this area is searched within the [Line/Address] area of the Trace panel.

You can either type the character strings of the source line to be find directly into the text box, or select them from the input history via the drop-down list (up to 10 items).

Searches are case-insensitive, and partial matches are also allowed.

Examples 1. main.c#40

- 2. main.c
- 3. main

<2> Specify [Number]

Specify the range within the trace data to search via the number displayed in the [Number] area of the Trace panel.

Specify the starting number in the left text box, and the ending number in the right text box ("0" to "last number" are specified by default).

You can either type the numbers directly into the text boxes (in base-10 format), or select them from the input history via the drop-down list (up to 10 items).

If the left-hand text box is left blank, it is treated as if "0" were specified.

If the right-hand text box is left blank, it is treated as if the last number were specified.

<3> Click the [Search Backward]/[Search Forward] button

When the [Search Backward] button is clicked, search is taken place in the order from the large number to small and the search results are shown selected in the Trace panel.

When the [Search Backward] button is clicked, search is taken place in the order from the small number to large and the search results are shown selected in the Trace panel.

(b) Search with specifying the function name

Select the [The execution part is retrieved specifying the function] item in the [Search object] area and then follow the operation below.

<1> Specify [Function Name]

You can either type the function name to be find directly into the text box, or select it from the input history via the drop-down list (up to 10 items).

Searches are case-insensitive, and only complete matches are retrieved.

<2> Specify [Number]

Specify the range within the trace data to search via the number displayed in the [Number] area of the Trace panel.

Specify the starting number in the left text box, and the ending number in the right text box ("0" to "last number" are specified by default).

You can either type the numbers directly into the text boxes (in base-10 format), or select them from the input history via the drop-down list (up to 10 items).

If the left-hand text box is left blank, it is treated as if "0" were specified.

If the right-hand text box is left blank, it is treated as if the last number were specified.

<3> Click the [Search Backward]/[Search Forward] button

When the [Search Backward] button is clicked, search is taken place in the order from the large number to small and the search results are shown selected in the Trace panel.

When the [Search Backward] button is clicked, search is taken place in the order from the small number to large and the search results are shown selected in the Trace panel.

(c) Search with specifying the global variable [IECUBE][Simulator]

Select the [The execution part is retrieved specifying the global variable] item in the [Search object] area and then follow the operation below.

<1> Specify [Variable Name]

You can either type the variable name to be find directly into the text box, or select it from the input history via the drop-down list (up to 10 items).

Searches are case-insensitive, and only complete matches are retrieved.

<2> Specify [Kind]

Select the access type ([Reference/Substitution], [Reference], or [Substitution]) from the drop-down list.

<3> Specify [Value]

You can either type the accessed variable value directly into the text box, or select one from the input history via the drop-down list (up to 10 items).

The variable value can also be specified as a range. In this case, specify a range by specifying variable values in both the left and right text boxes.

If the right-hand text box is blank, then access locations with the fixed variable values specified in the left-hand text box will be searched for.

<4> Specify [Number]

Specify the range within the trace data to search via the number displayed in the [Number] area of the Trace panel.

Specify the starting number in the left text box, and the ending number in the right text box ("0" to "*last number*" are specified by default).

You can either type the numbers directly into the text boxes (in base-10 format), or select them from the input history via the drop-down list (up to 10 items).

If the left-hand text box is left blank, it is treated as if "0" were specified.

If the right-hand text box is left blank, it is treated as if the last number were specified.

<5> Click the [Search Backward]/[Search Forward] button

When the [Search Backward] button is clicked, search is taken place in the order from the large number to small and the search results are shown selected in the Trace panel.

When the [Search Backward] button is clicked, search is taken place in the order from the small number to large and the search results are shown selected in the Trace panel.

2.11.9 Save the contents of execution history

Contents of the collected trace data can be saved with range selection in text files (*.txt)/CSV files (*.csv).

When saving to the file, the latest information is acquired from the debug tool, and it is saved in accordance with the display format on this panel.

The following Data Save dialog box can be opened by selecting the [File] menu >> [Save Trace Data As...]. In this dialog box, follow the steps below.

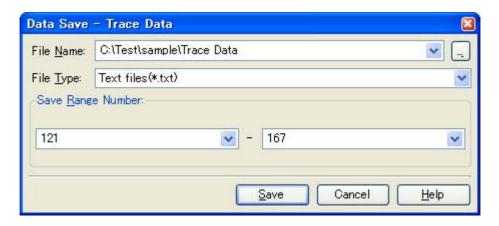

Figure 2-138. Save Execution History (Data Save Dialog Box)

(1) Specify [File Name]

Specify the name of the file to save.

You can either type a filename directly into the text box (up to 259 characters), or select one from the input history via the drop-down list (up to 10 items).

You can also specify the file by clicking the [...] button, and selecting a file via the Select Data Save File dialog box.

(2) Specify [File Type]

Select the format in which to save the file from the following drop-down list.

The following file formats can be selected.

| List Item | Format |
|--------------------|-----------------------|
| Text files (*.txt) | Text format (default) |

| List Item | Format |
|--|----------------------------|
| CSV (Comma-Separated Variables)(*.csv) | CSV format ^{Note} |

Note The data is saved with entries separated by commas (,).

If the data contains commas, each entry is surrounded by double quotes "" in order to avoid illegal formatting.

(3) Specify [Save Range Number]

Specify the range of the number to save via "start number" and "end number".

Directly enter decimal number in each text box or select from the input history displayed in the drop-down list (up to 10 items).

When saving all the trace data, select the [All Trace Data] item in the drop-down list at the left (the right text box becomes invalid).

If a range is selected in the panel, that range is specified as the default. If there is no selection, then the range currently visible in the panel is specified.

(4) Click the [Save] button

Trace data is saved in the specified file with the specified format.

Figure 2-139. Output Example of Trace Data

| Number | Time | Line Number/Address | Source/Disassemble | Address | Data |
|--------|------|---------------------|--------------------|---------|------|
| Number | Time | Line Number/Address | Source/Disassemble | Address | Data |
| : | : | : | : | : | : |

2.12 Measure Execution Time of Programs

This section describes how to measure the execution time of the program.

2.12.1 Measure execution time until stop of the execution

In the debug tool, there is a function to measure the program execution time (Run-Break time) from the start to the stop. Therefore, when the program starts its execution, the execution time is automatically measured.

You can check the result of the measurement by either one of the following.

Cautions 1. [E1][E20][EZ Emulator]

The Run-Break time for a step execution cannot be measured.

2. [Simulator]

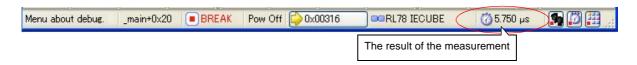

To measure the Run-Break time, [Yes] must be specified with the [Use timer function] property in the [Timer] category oncategory on the [Debug Tool Settings] tab of the Property panel.

Remark This function is operated by a Run-Break Timer event, which is one of the built-in events set by default in the debug tool. The Run-Break timer event is always Valid state (settings not changeable).

(1) Check in the status bar

After the program is stopped, the result of the measurement is displayed in the status bar on the Main window (when measurements have not been performed yet, "Not measured" is displayed).

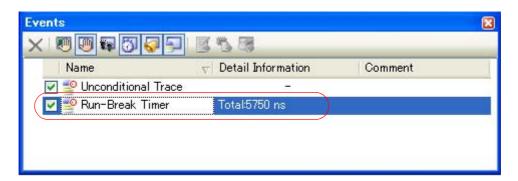

Figure 2-140. Example of Result of Run-Break Timer Event (Status Bar)

(2) Check on the Events panel

After the program is stopped, the result of the measurement is displayed in the Events panel opened by selecting the [View] menu >> [Event], in event type as "Run-Break Timer".

Figure 2-141. Example of Result of Run-Break Timer Event (Events Panel)

2.12.2 Measure execution time in the arbitrary section [IECUBE][Simulator]

In the program execution process, the execution time in the arbitrary section can be measured by setting Timer Result event. This Timer Result event consists of a timer start event and a timer end event.

To use this function, follow the procedure described below.

(1) Set a Timer Result event

- (2) Execute the program
- (3) Edit a Timer Result event
- (4) Delete a Timer Result event

Cautions 1. [E1][E20][EZ Emulator]

Timer Result event is not supported.

- 2. Also see "2.15.7 Notes for setting events" for details on Timer Result events (e.g. limits on the number of enabled events).
- 3. [Simulator]

To use this function, [Yes] must be specified with the [Use timer function] property in the [Timer] category on the [Debug Tool Settings] tab of the Property panel.

(1) Set a Timer Result event

To set a Timer Result event, set a timer start event and a timer end event that starts/stops a timer measurement. Use one of the following methods to set a timer start event and a timer end event.

(a) For execution-related events

Perform this operation in the Editor panel/Disassemble panel in which the source text/disassembly text is displayed.

Follow the operation listed below from the context menu, in accordance with your desired event type, after moving the caret to the target line that has a valid address.

| Event Type | Operation |
|-------------|--|
| Timer start | Select [Timer Settings] >> [Start Timer] |
| Timer end | Select [Timer Settings] >> [Stop Timer] |

Caution [Simulator]

Simulator will not include the time for a timer end event in the measurement results. For this reason, set a timer end event to one line below the range for which you wish to measure the run time.

A timer start event or a timer end event is set to the instruction at the start address corresponding to the line of the caret position.

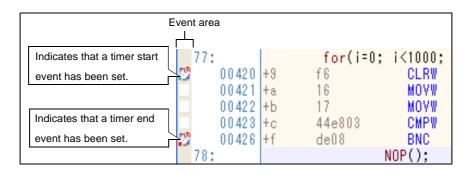

Once a timer start event or a timer end event is set, the following event mark is displayed in the event area of the line that an event is set.

Table 2-15. Event Marks of Timer Start Event/Timer End Event

| Event Type | Event mark |
|-------------|------------|
| Timer start | ₿ |
| Timer end | ₽ |

Figure 2-142. Timer Start and Timer End Events Setting Example (Disassemble Panel)

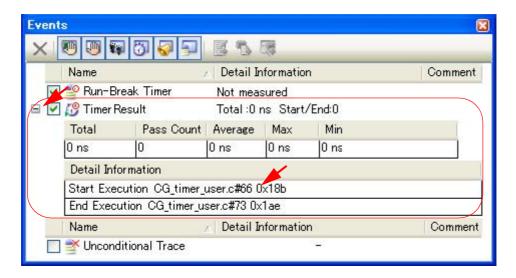

(b) For access-related events

In this product version, this function is not supported.

When a timer start event and a timer end event are set, they are managed collectively on the Events panel as one instance of a Timer Result event (see "2.15 Manage Events"). When you click the "+" mark at a Timer Result event item, detailed information on the timer start event and the timer end event you have set is displayed.

Figure 2-143. Example of Timer Start and Timer End Events (Execution Type) in Events Panel

Remark Event marks differ depending on the event state (see "2.15.1 Change the state of set events (valid/invalid)").

When an event is set at the point which other event is already set, the event mark () is displayed meaning more than one event is set at the point.

(2) Execute the program

Execute the program (see "2.7 Execute Programs").

When an instruction for which a timer start event or a timer end event has been set is executed, a timer measurement is started or finished.

After the program is stopped, the result of the measurement is displayed in the Events panel opened by selecting the [View] menu >> [Event], in event type as "Timer Result".

This Timer Result is a particular type of event that is displayed on only the Events panel when either a timer start event or a timer end event has been set.

Events Name Detail Information Comment Total:1006660312 ns 🔽 🗐 Run-Break Timer Timer Result Total:656 ns Start/End:2 Pass Count | Average Max Min 656 ns 656 ns 656 ns 656 ns Detail Information Start Execution CG timer user.c#66 0x18b End Execution CG_timer_user.c#73 0x1ae Detail Information Comment 🥯 Unconditional Trace

Figure 2-144. Example of Result of Timer Result Event (Timer Start Event/Timer End Event)

(3) Edit a Timer Result event

It is possible to edit a timer start event or a timer end event you have set.

For details on how to do it, see "(1) Edit execution-related events".

(4) Delete a Timer Result event

To delete a Timer Result event you have set, on the Editor panel/Disassemble panel, right-click the event mark in the event area and select [Delete Event] from the context menu that is displayed.

Also, there is another way to delete a set event. Select the Timer Result event you want to delete on the Events panel, and then click the button in the toolbar (see "2.15.5" Delete events").

Caution It is not possible to delete only a timer start event or a timer end event (i.e. if either a timer start event or a timer end event is deleted from the event marks on the event area, all of the corresponding event marks are deleted).

2.12.3 Measurable time ranges

The scope of time that can be measured via timers using Run-Break Timer events (see "2.12.1 Measure execution time until stop of the execution" for details) or Timer Result events (see "2.12.2 Measure execution time in the arbitrary section [IECUBE][Simulator]" for details) is shown below.

If the maximum measurable length of time is exceeded, a timer-over break is generated, and program execution stops.

| Debug Tool | | Run-Break Timer Event | | Timer Result Event |
|-------------|-------|---|-------|---|
| IECUBE | Min. | 8 ns | Min. | 8 ns |
| | Max. | Approx. 40 hours 43 min Overflow detection included | Max. | Approx. 40 hours 43 min (time for 4K cycles) Maximum pass count: 4294967295 times Overflow detection included |
| E1/E20 | Min. | 100 μs | | |
| EZ Emulator | Max. | Approx. 119 hours 18 min | | • |
| Simulator | Depen | ds on the clock frequency for timer/trace | Depen | nds on the clock frequency for timer/trace |

Table 2-16. Measurable Time Ranges

2.13 Measure Coverage [IECUBE][Simulator]

This section describes coverage measurements that are conducted using the coverage function.

There are several kinds of coverage measurement methods. Of these, CubeSuite+ performs, in areas designated below, a code coverage measurement of fetch-related operations on source lines and functions (C0 coverage) and a data coverage measurement of access-related operations on variables.

The area in which CubeSuite+ performs coverage measurements are as follows:

Table 2-17. Subject Areas of Coverage Measurement

| Debug Tool | Code Coverage Measurement Area |
|------------|--|
| IECUBE | Internal ROM/RAM, DataFlash, Target memory |
| Simulator | Internal ROM/RAM, Emulation ROM/RAM, Target memory |

Caution [E1][E20][EZ Emulator]

The coverage function is not supported.

Remark C0 coverage: Instruction coverage (statement coverage)

For example, if all instructions (statements) in code are executed at least once, then C0 = 100%.

2.13.1 Configure the coverage measurement

You need to configure the code coverage measurement before using the coverage function.

The setting method differs depending on the debug tool used.

- (1) [IECUBE]
- (2) [Simulator]

(1) [IECUBE]

You can configure the coverage measurement in the [Coverage] category on the [Debug Tool Settings] tab of the Property panel as follows:

Figure 2-145. [Coverage] Category [IECUBE]

(a) [Reuse coverage result]

The currently obtained results of code coverage measurements are automatically saved when CubeSuite+ is disconnected from the debug tool. The next time it is connected to the debug tool, specify from the drop-down list whether or not you want to reproduce the contents of saved measurement results.

Select [Yes] to reproduce the contents of previously obtained code coverage measurement results (default: [No]).

The file that saves results of code coverage measurements (raw.csr.cv) will be created in the folder where the load module file currently being downloaded exists.

(2) [Simulator]

You can configure the coverage measurement function in the [Coverage] category on the [Debug Tool Settings] tab of the Property panel as follows:

Figure 2-146. [Coverage] Category [Simulator]

| ☐ Coverage | | |
|-----------------------|-----|--|
| Use coverage function | Yes | |
| Reuse coverage result | No | |

(a) [Use coverage function]

Select whether to use the coverage function.

Select [Yes] to use the coverage function (default: [No]).

(b) [Reuse coverage result]

This property appears only when the [Use coverage function] property is set to [Yes].

The currently obtained results of code coverage measurements are automatically saved when CubeSuite+ is disconnected from the debug tool. The next time it is connected to the debug tool, select whether or not you want to reproduce the contents of saved measurement results.

Select [Yes] to reproduce the contents of previously obtained code coverage measurement results (default: [No]).

2.13.2 Display the coverage measurement result

When the program starts running, a coverage measurement is automatically begun, and when the program stops running, the coverage measurement is terminated at the same time.

(1) Code coverage rates

(a) Display of code coverage rates for source text lines and disassembled text lines

The code coverage rates are indicated on the Editor panel/Disassemble panel that is displaying the target program.

On each panel, the target source text lines and disassembled result lines are shown in color-coded background (see "Table 2-19.") according to their code coverage rate that was calculated based on the formula described in "Table 2-18.".

Note that the results are not shown when disconnected from the debug tool or during the program execution. Selecting [Clear coverage information] from the context menu in the Editor panel/Disassemble panel will reset all the coverage information acquired, including the color-coded display on each panel.

Table 2-18. Method for Calculating Code Coverage Rates for Source Lines and Disassemble Lines

| Panel | Calculation Method |
|-------------------|--|
| Editor panel | "Number of bytes of code executed in the address range corresponding to the source text line" / "Total number of bytes of code in the address range corresponding to the source text line" |
| Disassemble panel | "Number of bytes of code executed in the address range corresponding to the disassembled text line" / "Total number of bytes of code in the address range corresponding to the disassembled text line" |

Table 2-19. View of Code Coverage Measurement Result (Default)

| Code Coverage | Background Color |
|------------------------|-------------------------------|
| 100 % | Source text/disassembled text |
| 1 to 99 % | Source text/disassembled text |
| 0 % (not yet executed) | Source text/disassembled text |

- **Remarks 1.** The code coverage measurement result displayed on each panel is automatically updated at every program break.
 - 2. The above background colors depend on the configuration in the [General Font and Color] category of the Option dialog box.
 - 3. The above background colors do not apply to the lines that are outside of the subject area (see "Table 2-17. Subject Areas of Coverage Measurement").
 - **4.** If the downloaded lode module file is older than the source file currently being open, the displaying of the code coverage measurement result is not performed in the Editor panel.

Figure 2-147. View of Code Coverage Measurement Result (Editor Panel)

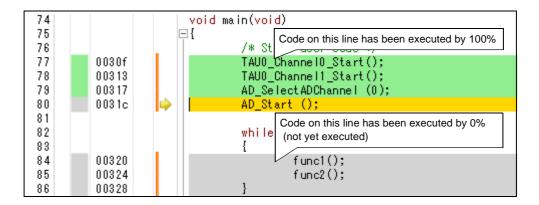

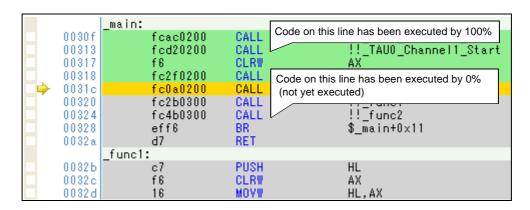

Figure 2-148. View of Code Coverage Measurement Result (Disassemble Panel)

(b) Display of code coverage rates for each function

Code coverage rates of each function can be checked via the [Code Coverage[%]] item in the Function List panel of the analyze tool. For details on "the code coverage rates of the function", see "CubeSuite+ Integrated Development Environment User's Manual: Analysis".

(2) Data coverage rates

Data coverage rates of each variable can be checked via the [Data Coverage[%]] item in the Variable List panel of the analyze tool. For details on "the data coverage rates of the variable", see "CubeSuite+ Integrated Development Environment User's Manual: Analysis".

2.14 Set an Action into Programs

This section describes how to set the specified action into the program.

2.14.1 Inset printf

By setting a Printf event that is one of "action events", the value of the specified variable expression can be output to the Output panel by executing a printf command after temporarily stopping the program in execution at an arbitrary position.

To use this function, follow the steps below.

- Cautions 1. Also see "2.15.7 Notes for setting events" for details on action events (e.g. limits on the number of enabled events).
 - No action events occur during step execution () or execution ignoring breakrelated events ().
 - [Simulator]
 When [Yes] is specified with the [Execute instruction at bre

When [Yes] is specified with the [Execute instruction at breakpoint when break] property in the [Break] category on the [Debug Tool Settings] tab in the Property panel, all of action events currently being set are handled as Hardware Break events (i.e. no Printf events occur).

(1) Set a Printf event

Set a Printf event to the position where you want to execute the printf command in the Editor panel/Disassemble panel.

On each panel, select [Register Action Event...] from the context menu after moving the caret to the line that has a valid address to open the Action Events dialog box below.

In this dialog box, follow the steps below.

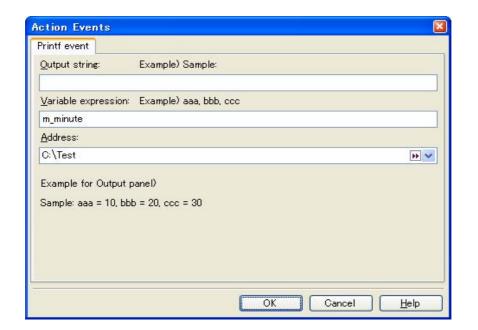

Figure 2-149. Set Printf Event (Action Events Dialog Box: [Printf event] tab)

(a) Specify [Output string]

Directly enter from the keyboard the characters to add when output to the Output panel. Characters must be in one line (spaces allowed).

(b) Specify [Variable expression]

Specify the variable expression for the Printf event to take place.

Type a variable expression directly into the text box (up to 1024 characters).

You can specify up to 10 variable expressions for a single Printf event by separating them with commas ",". If this dialog box opens with a variable expression selected in the Editor panel/Disassemble panel, the selected variable expression appears as the default.

For the basic input format that can be specified as variable expressions and the values output by Printf event, see "Table A-14. Relationship between Variable Expressions and Output Value (Printf Event)".

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").

(c) Specify [Address]

Specify the address at which to set the Printf event.

The address of the location currently being specified is displayed by default.

If you want to edit this area, you can either type an address expression directly into the text box (up to 1024 characters), or select them from the input history via the drop-down list (up to 10 items).

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").

(d) Click the [OK] button

Set the Printf event to the line/address at the caret position in the Editor panel/Disassemble panel.

When the Printf event is set, the panel is displayed in the event area on the Editor panel/Disassemble panel, and the set Printf event is managed in the Events panel (see "2.15" Manage Events").

(2) Execute the program

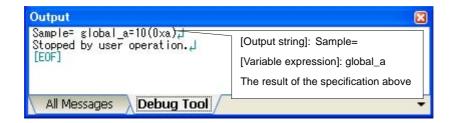

Execute the program (see "2.7 Execute Programs").

By executing the program, the program momentarily stops immediately before executing the instruction at the location where this event is set, and the value of the variable expression specified in this dialog box is output to the Output panel.

(3) Check the output result

The output result format from the Printf event in the [Debug Tool] tab of the Output panel are as follows (see "Figure A-42. Output Result Format of Printf Event").

Figure 2-150. Example of Output Result of Printf Event

(4) Edit the Printf event

You can edit the Print event that has been set once.

To do this, on the Events panel, select [Edit Condition...] from the context menu after selecting the Printf event to be edited. On the Action Events dialog box opened automatically, edit the items, and then click the [OK] button.

2.15 Manage Events

An event represents a certain status of the target system when debugging such as "Address 0x1000 is fetched" and "Data is written to address 0x2000".

In CubeSuite+, these events are used as the action trigger of the debug function such as breakpoint, start/stop the tracing, and start/stop the timer.

This section describes how to manage those events.

Select the [View] menu >> [Event].

Events are all managed in the Events panel. In the Events panel, you can confirm the details of the currently set events in a list, and they can be deleted and changed enable/disable status.

For details on the contents and function in each area, see the section for the Events panel.

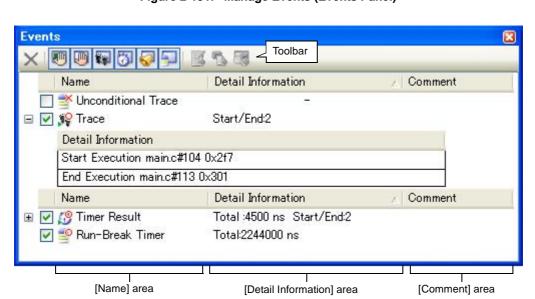

Figure 2-151. Manage Events (Events Panel)

Remark For details on how to set various events, see the section below:

- Set a breakpoint
- Set a break event (execution type)
- Set a break event (access type)
- Set a Trace event
- Set a Point Trace event
- Set a Timer Result event

2.15.1 Change the state of set events (valid/invalid)

By changing the check on the check box of the event name, the setting state of the event can be changed (the Event mark is changed depending on the setting state of the event).

The following are types of the setting state of the event.

Hardware Break0001
Check box Event mark Event name

Figure 2-152. Event Name Check Box

Table 2-20. Setting State of Event

| ~ | Valid state | Event occurs when the specified condition is met. It is possible to set the event to an invalid state by removing the check. |
|---|-----------------|--|
| | Invalid state | Event does not occur when the specified condition is met. It is possible to set the event to a valid state by removing the check. |
| | Suspended State | The conditions that have been specified cannot be set with the program of the debugging target. It is not possible to operate the check box. |

Remarks 1. Both of the timer start event and the timer end event is must be set for the Timer Result event. Therefore, it is not possible to set a particular event to a valid state by only the setting of one of these (at the same time as both events are set, they are treated as grouped events as a Timer Result).

- 2. It is not possible to set the Run-Break Timer event to an invalid/suspended state.
- 3. The setting state of the event can be changed from the menu displayed by right clicking on the Event mark in the Editor panel/Disassemble panel.
- 4. The setting of the Unconditional Trace event and the Trace event to valid or invalid state is exclusively controlled. Therefore, the Unconditional Trace event, which is a built-in event, is valid state by default, but if either a trace start event/trace end event is set, it automatically becomes invalid state, and the Trace event, which is a event name that is collectively called with a trace start event and a trace end event, becomes valid state. Conversely, if the set Trace event is invalid state, the Unconditional Trace event automatically becomes valid state.

2.15.2 Display only particular event types

Click on the toolbar button to display only the particular event type.

| W | Displays events related to the Hardware Break. |
|----------------------|---|
| 100 | Displays events related to the Software Break. |
| (except [Simulator]) | |
| ** | Displays events related to the trace ^{Note} . |
| 3 | Displays events related to the timer. |
| [IECUBE][Simulator] | |
| | Displays events related to the action event (Printf event). |
| | Displays the built-in events (Unconditional Trace event and Run-Break Timer event). |

Note [E1][E20][EZ Emulator]

This button is available only when the selected microcontroller incorporates the OCD trace function.

2.15.3 Jump to the event address

Clicking the following buttons jumps to each panel which selected events address exist.

Note however, that when a Trace event/Timer Result event/ Unconditional Trace event/ Run-Break Timer event is selected, these buttons are disabled.

| Opens the Editor panel and jumps to the source line corresponding to the address where the selected event is being set. |
|--|
| Opens the Disassemble panel and jumps to the disassemble results corresponding to the address where the selected event is being set. |

2.15.4 Edit detailed settings of events

This section describes how to edit detailed settings of various events.

- (1) Edit execution-related events
- (2) Edit access-related events
- (3) Edit combination conditions of events [E1] [E20]

Remark For information on editing of action events (Printf events and interrupt events), see "2.14 Set an Action into Programs".

(1) Edit execution-related events

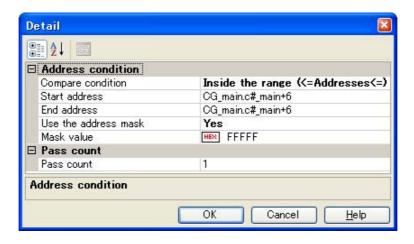

The address condition and pass count condition **[IECUBE][Simulator]** for execution-related events you have set can be edited.

Perform this operation in the Detail dialog box (for execution events) that is opened by selecting [Edit Condition...] from the context menu after moving the caret to an execution-related event^{Note} you want to edit on the Events panel.

Note An execution-related event refers to any one of the following events in the Events panel.

- Hardware Break event (execution type)
- Execution-related break event in detailed information on Combination Break event [E1][E20]
- Execution-related event as start and end condition in detailed information on Trace event
- Execution-related event as start and end condition in detailed information on Timer Result event [IECUBE][Simulator]

Figure 2-153. Example of Detail Dialog Box (for Execution Events) [Simulator]

(a) Editing [Address Condition]

You can edit the address condition for an execution-related event in this area.

Figure 2-154. [Address Condition] [IECUBE]

Figure 2-155. [Address Condition] [E1][E20][EZ Emulator]

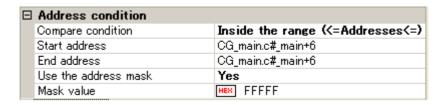

Figure 2-156. [Address Condition] [Simulator]

- For [IECUBE][Simulator]

From the [Compare condition] drop-down list, select the type of condition for address comparison. After that, specify the address for use with the selected type of condition in the field displayed under the list.

| List of [Compare condition] | Setting Method |
|---------------------------------|--|
| Specified address (==) | After selecting any of these conditions, directly enter an address |
| Greater than or equal to (>=) | expression as the address value in the [Address] field displayed under the list for selection of the type of comparison. |
| Less than or equal to (<=) | 3,7 |
| Inside the range (<=Values<=) | After selecting any of these conditions, directly enter an address |
| Outside the range !(<=Values<=) | expression as the address range in the [Start address] and [End address] field displayed under the list for selection of the type of comparison. |

It is possible to specify the value of an address mask for the specified address value [Simulator]. In this case, specify [Yes] in the [Use the address mask], and specify the mask value in the [Mask value] field under the list by directly entering a hexadecimal address.

- For [E1][E20][EZ Emulator]

In [Address], the address at which the execution-related event is currently set is displayed.

To edit this address, directly enter an address expression for the address value at which you want to set the event.

(b) Editing [Pass Count] [IECUBE][Simulator]

You can edit the pass count condition for an execution-related event in this area.

Directry enter a pass count value in decimal notation between 1 and 65535.

Figure 2-157. [Pass Count]

Caution [IECUBE]

A value other than "1" cannot be specified as the pass count condition for an execution-related event (before execution).

(2) Edit access-related events

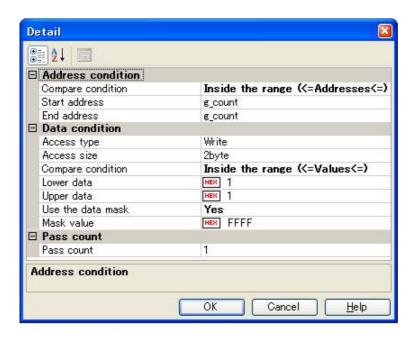

The address condition, data condition and pass count condition **[IECUBE][Simulator]** for access-related events you have set can be edited.

Perform this operation in the Detail dialog box (for access events) that is opened by selecting [Edit Condition...] from the context menu after moving the caret to an access-related event^{Note} you want to edit on the Events panel.

Note An access-related event refers to any one of the following events in the Events panel.

- Hardware Break event (access type)
- Access-related break event in detailed information on Combination Break event [E1][E20]
- Access-related event as start and end condition [E1][E20] in detailed information on Trace event
- Access-related event in detailed information on Point Trace event

Figure 2-158. Example of Detail Dialog Box (for Access Events) [Simulator]

(a) Editing [Address Condition]

You can edit the address condition for an execution-related event in this area.

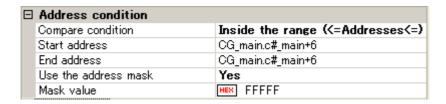

Figure 2-159. [Address Condition] [IECUBE]

Figure 2-160. [Address Condition] [E1][E20][EZ Emulator]

Figure 2-161. [Address Condition] [Simulator]

- For [IECUBE][Simulator]

From the [Compare condition] drop-down list, select the type of condition for address comparison. After that, specify the address for use with the selected type of condition in the field displayed under the list.

| List of [Compare condition] | Setting Method |
|---------------------------------|--|
| Specified address (==) | After selecting any of these conditions, directly enter an address |
| Greater than or equal to (>=) | expression as the address value in the [Address] field displayed under the list for selection of the type of comparison. |
| Less than or equal to (<=) | 3,1 |
| Inside the range (<=Values<=) | After selecting any of these conditions, directly enter an address |
| Outside the range !(<=Values<=) | expression as the address range in the [Start address] and [End address] field displayed under the list for selection of the type of comparison. |

It is possible to specify the value of an address mask for the specified address value [Simulator]. In this case, specify [Yes] in the [Use the address mask], and specify the mask value in the [Mask value] field under the list by directly entering a hexadecimal address.

- For [E1][E20][EZ Emulator]

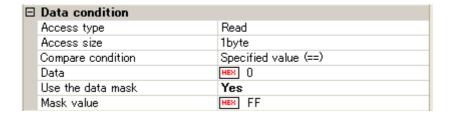

In [Address], the address at which the access-related event is currently set is displayed.

To edit this address, directly enter an address expression for the address value at which you want to set the event.

(b) Editing [Data Condition]

You can edit the data condition for an access-related event in this area.

Figure 2-162. [Data Condition]

<1> Specify an access type

In [Access type], select an access type from the following drop-down list.

| Ī | Read | When a read access occurs, the condition holds true. |
|---|-------|---|
| | Write | When a write access occurs, the condition holds true. |

| Read/Wrote When a read or write access occurs, the condition holds true. |
|--|
|--|

<2> Specify an access size

In [Access size], select an access size from the following drop-down list.

| No conditions | When an access in any size occurs, the condition holds true. |
|---------------|---|
| 1byte | When an access in 1-byte size occurs, the condition holds true. |
| 2byte | When an access in 2-byte size occurs, the condition holds true. |

<3> Specify a data comparison condition

From the [Compare condition] drop-down list, select the type of condition for data comparison.

After that, specify the value of data for use with the selected type of condition in the field displayed under the list.

- For [IECUBE][Simulator]

| No conditions | Comparison data is not specified. | | | |
|---------------------------------|---|--|--|--|
| Specified value (==) | After selecting any of these conditions, directly enter a value in | | | |
| Any other value (!=) | hexadecimal number in the [Data] field displayed under the list for selection of the type of comparison. | | | |
| Greater than or equal to (>=) | | | | |
| Less than or equal to (<=) | | | | |
| Inside the range (<=Values<=) | After selecting any of these conditions, directly enter values in | | | |
| Outside the range !(<=Values<=) | hexadecimal number for the data range in the [Data] field displayed under the list for selection of the type of comparison. | | | |

- For [E1][E20][EZ Emulator]

| No conditions | Comparison data is not specified. | |
|----------------------|--|--|
| Specified value (==) | After selecting this, directly enter a value in hexadecimal number in the [Data] field displayed under this field. | |

<4> Specify a data mask

Select [Yes] in the [Use the data mask] field to specify a mask value for the matching of data values. When [Yes] is selected, a [Mask value] field appears below the [Use a data mask] field. Specify a hexadecimal value with no more than five digits for the data mask by directly entering it in the [Mask value] field.

(c) Editing [Pass Count] [IECUBE][Simulator]

You can edit the pass count condition for an access-related event in this area. Directry enter a pass count value in decimal notation between 1 and 65535.

Figure 2-163. [Pass Count]

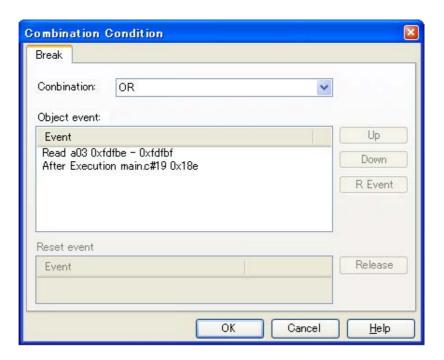

(3) Edit combination conditions of events [E1] [E20]

Edit the combination condition for a combination break event comprised of multiple events set.

Caution This function is enabled only when the selected microcontroller supports combination break events.

Perform this operation in the Combination Condition dialog box [E1][E20] that is opened by selecting [Edit Condition...] from the context menu after moving the caret to a combination break event you want to edit on the Events panel.

Figure 2-164. Example of Combination Condition Dialog Box

(a) Editing [Combination] area

Select the combination condition from the following drop-down list.

| OR | The condition is satisfied when one of the set events is encountered (default). |
|------------|---|
| Sequential | The condition is satisfied when the set events are encountered in the specified sequence. |

Caution When [OR] is selected, up to two break events can be specified.

When [Sequential] is selected, break event can be specified for the 1st to the 2nd position.

(b) Editing [Object event] area

This area displays details on the break event set as a combination break event.

When [Sequential] is specified in the [Combination] area, the order of display here corresponds to the order in which the conditions are to be satisfied. To change the order, select a target event and click on the [Up] or [Down] buttons.

(c) Editing [Reset event] area

Reset events are always enabled.

2.15.5 Delete events

To delete any event and event condition you have set, select the event and click the button on the toolbar. Note that it is not possible to delete the built-in events (Unconditional Trace event and Run-Break Timer event).

- **Remarks 1.** For the Break event of execution type, it is possible to delete the set event to click the event mark displayed in the Editor panel/Disassemble panel.
 - 2. To delete all of the events and event conditions you have set at a time, select [Select All] from the context menu, then click the built-in events).

2.15.6 Write comment to events

The user can write comments for each event that has been set.

To input comments, click the [Comment] area after selecting the event to input comments, then input directly the desired text from the keyboard (the edit mode is cancelled by pressing the [Esc] key).

After editing the comments, complete the editing by pressing the [Enter] key or moving the focus to outside the edit region.

Up to 256 characters can be inputted for the comments, and this is saved as the settings of the user during use.

2.15.7 Notes for setting events

This section describes notes for setting each type of event.

- (1) Maximum number of enabled events
- (2) Event types that can be set and deleted during execution
- (3) Other notes

(1) Maximum number of enabled events

The number of events that can be set to Valid state simultaneously are subject to the following limitations.

Therefore, if this limit is exceeded when you set one or more new valid state events, some of the events that are already set need to be Invalid state before you can set a new one.

The meaning of numbers in the table below is as follows:

| x + y | "Hardware Break (after execution): x" + "Hardware Break (access): y" |
|-------|--|
|-------|--|

Table 2-21. Maximum Number of Enabled Events

| | Debug Tool to Use | | | | |
|-----------------------------------|--------------------------|----------------------------|-------------------------------------|----------------|----------------------|
| | | E | | | |
| Event Type | IECUBE | Without OCD Trace Function | | With OCD | Simulator |
| | | 8-bit bus width products | Except for 8-bit bus width products | Trace Function | |
| Hardware Break (before execution) | 4 to 8 ^{Note 1} | 0 | 0 | 0 | |
| Hardware Break (after execution) | 8 | 2 | 1 Note 2 | 2Note 3 | 64 ^{Note 4} |
| Hardware Break (access) | 8 | 0 | , | 2 | |
| Software Break | 2000 | 0 | 200 | 00 | - |

| | Debug Tool to Use | | | | |
|--------------------------------------|-------------------------|----------------------------|-------------------------------------|---------------------|----------------------|
| | E1/E20/EZ Emulator | | | | |
| Event Type | IECUBE | Without OCD Trace Function | | With OCD | Simulator |
| | | 8-bit bus width products | Except for 8-bit bus width products | Trace Function | |
| Trace (trace start/trace end) | 4 + 4 ^{Note 5} | - | - | 2 ^{Note 3} | 32 ^{Note 5} |
| Point Trace | 8 + 8 ^{Note 6} | - | - | 0 | 64 ^{Note 6} |
| Timer Result (timer start/timer end) | 4 + 4 ^{Note 5} | - | - | - | 1 |
| Action (Printf) | 100 ^{Note 7} | 0 | 100 ^N | ote 7 | 64 ^{Note 8} |

- **Notes 1.** Depending on the address and instruction to which the event is set (however, Hardware Break (before execution) cannot be used in RAM area).
 - 2. A Hardware Break (after execution) and a Software Break are combined use.
 - 3. A Hardware Break and a Trace are exclusive of each other (i.e. if one is set, then the other will become invalid). Total of 2 events (a trace start and a trace end) are available for a Trace.
 - **4.** The before break/after break can be specified in the Property panel.
 - 5. In this version, only one group can be set (however, two or more Start/Stop events can be set).
 - 6. In this version, only one can be set (however, two or more conditions for this event can be set).
 - **7.** Combination with Software Break events (however, up to 100 can be set regardless of their valid/invalid state).
 - **8.** Combination with Hardware Break events (before execution) (however, up to 64 can be set regardless of their valid/invalid state).

(2) Event types that can be set and deleted during execution

Types of events that can be set or removed during execution of the program or during execution of the tracer/timer are described below.

The meaning of each mark in the table below is as follows:

| 0 | Possible |
|----------|--|
| Δ | Possible, if the program execution is allowed to pause for events (Property panel >> [Debug Tool Settings] tab >> [Set Event While Running] category >> [Set event by stopping execution momentarily] property >> [Yes]) |
| A | Impossible while tracer or timer is executing |
| - | Impossible, or not supported |

Table 2-22. Event Types That Can be Set and Deleted during Execution

| Event Type | Debug Tool to Use | | | | |
|-----------------------------------|-------------------|----------------------------|-------------------------------------|----------------|-----------|
| | | E1/E20/EZ Emulator | | | |
| | IECUBE | Without OCD Trace Function | | With OCD | Simulator |
| | | 8-bit bus width products | Except for 8-bit bus width products | Trace Function | |
| Hardware Break (before execution) | 0 | - | - | - | • |

| | Debug Tool to Use | | | | |
|--------------------------------------|-------------------|----------------------------|-------------------------------------|----------------|-------------|
| Event Type | | E1/E20/EZ Emulator | | | |
| | IECUBE | Without OCD Trace Function | | With OCD | Simulator |
| | ILCOBL | 8-bit bus width products | Except for 8-bit bus width products | Trace Function | Olification |
| Hardware Break (after execution) | 0 | 0 | 0 | 0 | A |
| Hardware Break (access) | 0 | - | 0 | 0 | A |
| Software Break | Δ | - | - | - | - |
| Trace (trace start/trace end) | 0 | - | - | - | - |
| Point Trace | 0 | - | - | - | - |
| Timer Result (timer start/timer end) | 0 | - | - | - | - |
| Action (Printf) | Δ | - | - | - | - |

(3) Other notes

- No events can be set to local variables.
- Events do not occur during step execution (including return execution) and program execution by selecting [Go to Here] from the context menu.
- If the location set for an existing event changes to midway in an instruction because the program to debug has been downloaded again, re-set the event using the following method.
 - If debugging information is available:
 The location setting of events is always moved to the beginning of the source text line.
 - If debugging information is not available:
 Depends on the [Automatic change method of event setting position] property in the [Download] category on the [Download File Settings] tab of the Property panel.
- If a change to internal ROM/RAM changes the location the event is set to a non-mapped area, then set events will not occur (they will also not change to Invalid state /Suspended State on the Events panel).
- If you differentiate function or variable names by leading underscores, then CubeSuite+ may misrecognize them, and convert symbols or make break event settings invalid. This applies for cases like when you have two functions, one named "_reset" and the other named "__reset".
- If there is code (text sections) to be ROMified, any software break event set for that code will be deleted during rcopy to RAM. For this reason, no break will occur. Use a hardware break if you are using OCD(JTAG) or OCD(Serial) or IECUBE. Note that if you are using a simulator, execution will not break even if a hardware breakpoint is used, but it will break if the tracer or timer is turned on.
 - For other than [Simulator]
 Use a hardware break event.
 - [Simulator]

 Execution will not break even if a hardware break event is used, but it will break if the trace function or the timer function is valid (on the [Debug Tool Settings] tab of the Property panel, specify [Yes] with the [Use

trace function]/[Use timer function]property on the [Trace]/[Timer] category).

- For other than [IECUBE]

If a software break event is set in a boot-swap area, then a break instruction will be written to the flash ROM. For this reason, a break instruction will remain after the boot swap.

- [E1][E20][EZ Emulator]

Use a hardware break event in a boot-swap area if you wish to.

- [Simulator]

Do not use a break event in a boot-swap area.

- For other than [Simulator]

Hardware Break events with access conditions and Point Trace events [IECUBE] cannot be set for 32-bit (4-byte) variables.

Additionally, Hardware Break events with access conditions and Point Trace events [IECUBE] cannot be detected if a single byte of a 16-bit (2-byte) variable is accessed.

2.16 Use Smart Analog Function [E1][E20]

This section describes how to collect the data using Smart Analog function.

For details on how to check the collected data, see "CubeSuite+ Integrated Development Environment User's Manual: Analysis".

- Cautions 1. Smart Analog function is supported only when the selected microcontroller incorporates a Smart Analog IC.
 - 2. Using the Smart Analog function to collect data requires linking of the monitor program for data collection to the execution program. For details, see the document of SA-Designer.

(1) Set to data collection mode

To collect the data for Smart Analog while execution of a program, specify [Yes] with the [Collect data during the execution] property in the [Smart Analog] category on the [Debug Tool Settings] tab of the Property panel.

Figure 2-165. [Smart Analog] Category

When you have performed the setting above, the debug tool is set to the data collection mode.

Note that when the debug tool is in the data collection mode, the following property values on the Property panel will be automatically changed to [No].

| Tab | Category | Property |
|--------------------------|-------------------------------|---|
| [Debug Tool Settings] | [Access Memory While Running] | [Access by stopping execution] |
| | | [Update display during the execution] |
| [Download File Settings] | [Debug Information] | [Execute to the specified symbol after CPU Reset] |

- Cautions 1. The setting of the [Smart Analog] category cannot be changed while execution of a program.
 - 2. When the setting of the [Smart Analog] category is changed, CPU reset is automatically generated.

(2) Execute the program

To execute the program, click the button on the debug toolbar (this is the same as the selecting [Ignore break and go] from the [Debug] menu). In the data collection mode, all execution-related buttons other than the button will become invalid.

When the program starts running, the data collection for Smart Analog begins automatically.

While the data collection is executed, the following icon and character strings are displayed on the Statusbar in the Main window.

Figure 2-166. Statusbar Under Execution in Data Collection Mode

- Cautions 1. All events are ignored during the program execution.
 - 2. An access to the memory by stopping the execution temporarily (i.e. a read/write by using RAM monitor function) cannot be made during the program execution.
 - 3. On the debug toolbar, no buttons other than the **lead** button are available during the program execution.
 - 4. If you operate plug-in tools other than the analyze tool (Program Analyzer), debug operation cannot be guaranteed.

(3) Stop the program

To stop the program, click the button on the debug toolbar (this is the same as the selecting [Stop] from the [Debug] menu).

When the program stops running, the data collection for Smart Analog terminates.

2.17 Use Hook Function

This section describes how to set hooks in the debug tool by using the hook function.

By setting a hook transaction, you can automatically change the values of the SFR/CPU register before and after downloading a load module or after resetting the CPU.

Configure the hook transaction in the [Hook Transaction Settings] category on the [Hook Transaction Settings] tab of the Property panel.

Remark By setting a SFR by using the [Before download] property, for example, downloading can be executed at high speeds. Downloading to the external RAM is also facilitated by using this function.

Figure 2-167. [Hook Transaction Settings] Category

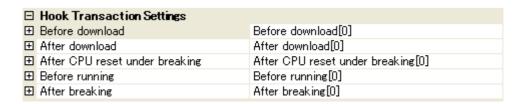

Table 2-23. Properties in [Hook Transaction Settings] Category

| Property | Description |
|--------------------------------|--|
| Before download | Perform the specified process immediately before downloading the load module file. |
| After download | Perform the specified process immediately after downloading the load module file. |
| After CPU reset under breaking | Perform the specified process immediately after resetting the CPU under breaking. |
| Before running | Perform the specified process immediately before starting program execution. |
| After breaking | Perform the specified process immediately after breaking program execution. |

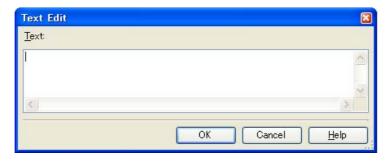

The properties in the [Hook Transaction Settings] category indicate the timing with which the hook process will be performed. "[]" indicates the current number of specified processes (no hook processes are configured by default). Specify the target process in the property for which you want the hook process to be performed.

To specify a process, select the target property, then open the Text Edit dialog box by clicking the [...] button that appears on the right edge of the field.

Figure 2-168. Opening Text Edit Dialog Box

Figure 2-169. Use Hook Function (Text Edit Dialog Box)

In this dialog box, directly enter the desired process from the key board.

The format for specifying processes is as follows:

[Process 1]:

Automatically overwrites the value of SFR with Value.

Specification format:

SFR-name Value

[Process 2]:

Automatically overwrites the value of CPU register with Value.

Specification format:

CPU-register-name Value

[Process 3]:

Automatically executes a script file which is specified with *Python script path* (absolute path or relative path from the project folder).

Specification format:

Source Python-script-path

Remarks 1. When specifying hook processes, lines starting with a hash mark "#" will be treated as comments.

2. A tab character can be used instead of the space character.

Up to 64 characters for one process, and up to 128 processes for each property can be set (one line in the [Text] area in the Text Edit dialog box is equivalent to one processing).

After the specification of the process is complete, click the [OK] button to set the process to the Property panel.

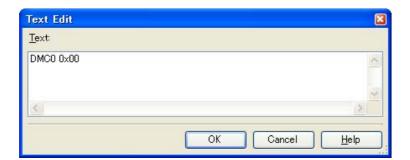

Figure 2-170. Example of Hook Transaction

2.18 Use the Simulator GUI [Simulator]

This section describes how to use the Simulator GUI.

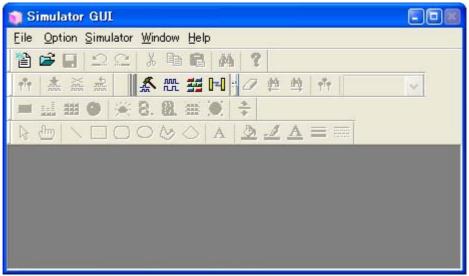

Note that the function of the Simulator GUI described in this section is only supported when a microcontroller whose Simulator supports peripheral function simulations is selected.

Control the Simulator GUI via the Simulator GUI window below.

This window appears automatically by default after connecting to the debug tool when a microcontroller whose Simulator supports peripheral function simulations is selected and [Simulator] is selected as the debug tool to use.

Remark The Simulator GUI window and windows opened from it cannot be docked to the CubeSuite+ Main window.

The setting of the display of the Simulator GUI window can be configured in the [Simulator GUI] category on the [Debug Tool Settings] tab of the Property panel as follows:

Configure the appropriate settings.

Caution After connecting to the debug tool, all the properties in this category will become invalid if a microcontroller whose Simulator does not support peripheral function simulations (instruction simulation version) is selected.

Figure 2-172. [Simulator GUI] Category

| Simulator GUI | |
|---|-----|
| Display Simulator GUI | Yes |
| Display Simulator GUI on top of other windows | Yes |

(1) [Display Simulator GUI]

Specify whether to display the Simulator GUI window from the drop-down list.

Select [Yes] to use the function of the Simulator GUI (default).

When you do not need to use the Simulator GUI, select [No] to close the Simulator GUI window.

(2) [Display Simulator GUI on top of other windows]

This property appears only when the [Display Simulator GUI] property is set to [Yes].

Specify whether to display the Simulator GUI window in the forefront when program execution starts. Select [Yes] to display it in the forefront (default).

2.18.1 Check the I/O waveform of the microcontroller

It is possible to check the I/O waveform of the microcontroller by clicking the button on the Simulator GUI window's toolbar and opening the Timing Chart window (shown below).

This window displays a timing chart of the input and output signals of the microcontroller's pins.

See the section on the Timing Chart window for details about controlling the window.

Figure 2-173. Checking I/O Waveform of Microcontroller (Timing Chart Window)

2.18.2 Input signals to the pins

To configure the input signal to a pin, click the simulator GUI window's toolbar. The following Signal Data Editor window opens.

You can use this window to set the input signal data for the input pin to a numerical value, to be input at an arbitrary time.

See the section on the Signal Data Editor window for details about controlling the window.

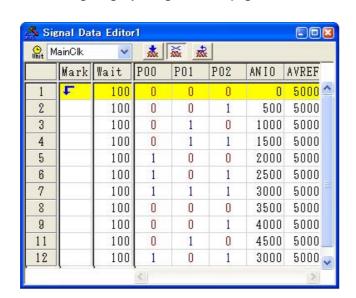

Figure 2-174. Configuring Input Signal to Pin (Signal Data Editor Window)

2.18.3 Perform serial communication

To configure serial communication, click the on the Simulator GUI window's toolbar. The following Serial window opens.

This window provides serial I/O features for communicating with the CPU's built-in serial interface. This enables you to input data to the microcontroller's serial receiver pin, and acquire output data from its serial transmitter pin.

See the section on the Serial window for details about controlling the window.

Figure 2-175. Performing Serial Communication (Serial Window)

2.18.4 Use buttons, LEDs, level gauges, and other components

The Simulator GUI allows input manipulation and output display simulation by providing standard connected parts (buttons, LEDs, level gauges, etc.) in which the I/O block for peripheral I/O designed as a GUI interface.

To configure connected parts, click the **gardy** on the Simulator GUI window's toolbar. The following I/O Panel window opens.

This window enables you to configure the various connected parts, building a dummy target system.

See the section on the I/O Panel window for details about controlling the window.

Figure 2-176. Configuring Connected Parts (I/O Panel Window)

2.19 About Input Value

This section describes consideration to take when inputting values in each panel and dialog box.

2.19.1 Input rule

Following is the rules for input to each panel/dialog box.

(1) Character set

Character sets that are allowed to input are as follows:

Table 2-24. List of Character Set

| Character Set | Outline |
|---------------|--|
| ASCII | 1- byte alphabets, numbers, symbols |
| Shift-JIS | 2-byte alphabet, number, symbol, Hiragana, Katakana, Kanji and 1-byte Katakana. |
| EUC-JP | 2-byte alphabet, number, symbol, Hiragana, Katakana, Kanji and 1-byte Katakana. |
| UTF-8 | 2-byte alphabet, number, symbol, Hiragana, Katakana, Kanji (include Chinese characters) and 1-byte Katakana. |
| UTF-16 | 2-byte alphabet, number, symbol, Hiragana, Katakana, Kanji (include Chinese characters) and 1-byte Katakana. |

(2) Number

Notations allowed when entering numbers are as follows:

Table 2-25. Notation List

| Notation | Outline |
|--------------------|---|
| Binary number | Start with 0b and continues with the numbers from 0 to 1. (Case insensitive for alphabets) |
| Octal number | Start with 0 and continues with the numbers from 0 to 7. |
| Decimal | Start without 0 and continues with the numbers from 0 to 9. |
| Hexadecimal number | Start with 0x and continues with the numbers from 0 to 9 and alphabets a to f. (Case insensitive for alphabets) In the input area with the HEX mark, prefix 0x is not needed. |

(3) Expression and operator

Expression represents constants, register name, SFR name and symbols and those connected with operators. When SFR name, label name, function name and variable name are described as symbols, the address is operated as a value of symbols. The basic input formats are as follows:

Table 2-26. Basic Input Format of Expressions

| Expression | Description |
|-----------------------------|---|
| Variable name of C language | Value of C language variable |
| Expression [Index] | Element of array |
| Expression.Member name | Member of structures/unions |
| Expression->Member name | Member of structures/unions that pointer designates |

| Expression | Description |
|---|---|
| *Expression | Value of pointer variable |
| CPU register name | Value of the CPU register |
| SFR name | SFR value |
| Label name, EQU symbol name and immediate address | Values of label, EQU symbol and immediate address |
| Bit symbol | Bit symbol value |

2.19.2 Symbol name completion function

This function helps users input data by selecting one of the listed symbol names that exist in the program, when specifying an address expression and so on.

The list of symbol names appears by pressing the [Ctrl] + [Space] keys when a part of the target symbol name is being input in the text box that supports this function. In this list, double-click the target symbol name (or press the [Space]/ [Enter] key after selecting it by using the [Up]/[Down] key) to complement the symbol name currently being input.

At this time, if a key other than the [Space]/[Enter] key is pressed or the focus moves to outside the panel/dialog box currently being operated, then the list of symbol names will disappear (the symbol name completion will not be performed).

- Cautions 1. If there are no character strings in the text box or there are no candidates of the symbol, then the list of symbol names will not appear.
 - 2. Since the information for use by the symbol name completion function is generated while symbols are being downloaded, the time taken for downloading and the memory usage on the host machine will increase when this function is enabled. Therefore, if you do not intend to use the symbol name completion function, we recommend invalidating this function by selecting [No] in the [Generate the information for input completion] item in the Download Files dialog box ([Yes] is selected by default).

Remark See the explanation of the corresponding panel/dialog box as to whether this function can be used or not when inputting a symbol name.

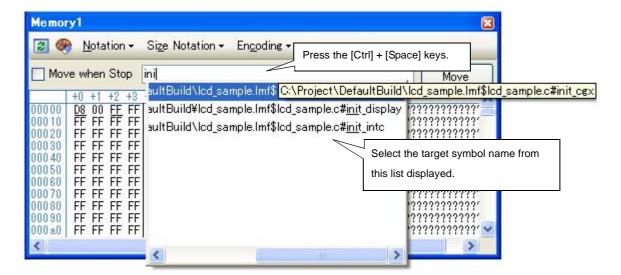

Figure 2-177. Symbol Name Completion Function

2.19.3 Icons for invalid input

In some of the dialogs in CubeSuite+, the [] icon will appear at a point where incorrect characters are entered as a warning sign.

Remark Placing the cursor over the **()** icon will pop up the information that indicates the characters to be entered.

APPENDIX A WINDOW REFERENCE

Appendix A provides detailed explanations of windows/panels/dialog boxes used for debugging with CubeSuite+.

A.1 Description

Windows/panels/dialog boxes for debugging are listed below.

Table A-1. Window/Panel/Dialog Box List

| Window/Panel/Dialog Box Name | Description |
|------------------------------------|---|
| Main window | Controls the program execution. Various windows, panels and dialogs can be opened from this window. |
| Project Tree panel | Selects the debug tool to use. |
| Property panel | Displays detailed information on the debug tool currently selected in the Project Tree panel, and enables the settings of the tool to be changed. |
| Editor panel | Enables text files to be viewed and edited, and is used to execute source level debug. |
| Memory panel | Displays and modifies memory values. |
| Disassemble panel | Displays the results of memory value disassemble and is used to execute line assemble and instruction level debug. |
| CPU Register panel | Displays the contents of CPU registers, and modifies register values. |
| SFR panel | Displays and modifies SFR values. |
| Local Variables panel | Displays and modifies local variables. |
| Watch panel | Displays and modifies registered watch-expression values. |
| Call Stack panel | Displays call stack information on function calls. |
| Trace panel | Displays trace data acquired from the debug tool. |
| Events panel | Displays detailed information on set events, switches the events between enabled and disabled, or deletes them. |
| Output panel | Displays messages output from the build tool/debug tool/plug-ins, or the results of batch searches carried out using the Find and Replace dialog box. |
| Memory Mapping dialog box | Sets the memory mapping. |
| Download Files dialog box | Selects files to be downloaded and sets the download conditions. |
| Text Edit dialog box | Inputs and modifies character strings. |
| Action Events dialog box | Sets action events. |
| Encoding dialog box | Selects a file-encoding. |
| Save Settings dialog box | Specifies the encoding and the new line code of the file being edited. |
| Bookmarks dialog box | Displays and deletes bookmarks. |
| Column Number Settings dialog box | Specifies the number of view columns of memory values on the Memory panel. |
| Address Offset Settings dialog box | Specifies an offset value for the address display on the Memory panel. |
| Memory Initialize dialog box | Initializes memory. |
| Memory Search dialog box | Searches memory. |

| Window/Panel/Dialog Box Name | Description |
|--|---|
| Print Address Range Settings dialog box | Sets the address range to print the contents of the Disassemble panel. |
| Print Preview window | Previews the source file before printing. |
| Trace Search dialog box | Searches trace data. |
| Combination Condition dialog box [E1][E20] | Displays and modifies detailed information on a Combination Break event |
| Detail dialog box (for execution events) | Displays and modifies detailed information on an execution-related event. |
| Detail dialog box (for access events) | Displays and modifies detailed information on an access-related event. |
| Scroll Range Settings dialog box | Sets the scroll range for the Memory panel/Disassemble panel. |
| Go to Line dialog box | Moves the caret to the specified line. |
| Go to the Location dialog box | Moves the caret to the specified position. |
| Data Save dialog box | Saves the settings and other data displayed in the respective windows/panels/ dialogs or saves upload data. |
| Progress Status dialog box | Displays the progress of the processing being executed. |
| Option dialog box | Makes settings for various environments. |
| Select Download File dialog box | Selects files to be downloaded. |
| Open Watch Expression Data File dialog box | Selects a file for importing watch-expressions. |
| Open File dialog box | Selects files to be opened. |
| Save As dialog box | Saves files or the contents of various windows/panels/dialogs. |
| Select Data Save File dialog box | Selects the file to save data. |
| Open Option Setting File dialog box | Selects the option setting file to import to the Option dialog box. |
| Save Option Setting File dialog box | Saves the set contents of the Option dialog box to a option setting file. |
| Select Simulator Configuration File dialog box [Simulator] | Selects simulator configuration file. |

Table A-2. Simulator GUI Block-Dedicated Window/Dialog Box List

| Window/Dialog Box Name | Description |
|---|--|
| Simulator GUI window | Opens and controls various simulator GUI's windows and dialog boxes. |
| Customize dialog box | Setting of window colors and fonts |
| Signal Data Editor window | Setting of input signal data |
| Loop dialog box | Setting of loop information for the Signal Data Editor window |
| Select Pin dialog box | Selection of display pins in the Signal Data Editor window and Timing Chart window |
| Timing Chart window | Timing chart display of input and output signals |
| Search Data dialog box | Detailed search of the Timing Chart window |
| I/O Panel window | Creation of dummy target system |
| Parts Button Properties dialog box | Setting of button pin connection information |
| Analog Button Properties dialog box | Setting of analog button pin connection information |
| Parts Key Properties dialog box | Setting of key matrix LED pin information |
| Parts Level Gauge Properties dialog box | Setting of level gauge pin connection information |

| Window/Dialog Box Name | Description |
|---|--|
| Parts Led Properties dialog box | Setting of key matrix LED pin information |
| Parts Segment LED Properties dialog box | Setting of 7/14-segment LED pin connection information |
| Parts Matrix Led Properties dialog box | Setting of matrix LED pin connection information |
| Parts Buzzer Properties dialog box | Setting of buzzer pin connection information |
| Pull up/Pull down dialog box | Setting of pull-up/pull-down resistor pin connection information |
| Object Properties dialog box | Setting of connection information for figure, character, and bitmap pins |
| Parts List dialog box | List display of object pin connection status in the I/O Panel window |
| Serial window | Serial interface communication window |
| Format (UART) dialog box | Setting of serial format (UART) |
| Format (CSI) dialog box | Setting of serial format (CSI) |

Main window

This window is automatically opened when CubeSuite+ is started up.

In this window, you can control the program execution and open panels for the debugging process.

Figure A-1. Main Window

This section describes the following.

- [How to open]
- [Description of each area]

[How to open]

- From the Windows [Start] menu, select [All Programs] >> [Renesas Electronics CubeSuite+] >> [CubeSuite+].

[Description of each area]

(1) Menubar

Menu items related to the debugging are as follows:

Remark The items that can be selected in each menu can be customized using the User Setting dialog box.

(a) [View]

The [View] menu provides the following items and functions (default).

| Watch | The following cascade menus are displayed to open the Watch panel. |
|-------|--|
| | These items are disabled when disconnected from the debug tool. |

| | Watch1 | Opens the Watch panel (Watch1). |
|----------|------------------------------------|--|
| | Watch2 | Opens the Watch panel (Watch2). |
| | Watch3 | Opens the Watch panel (Watch3). |
| | Watch4 | Opens the Watch panel (Watch4). |
| I | ocal Variable | Opens the Local Variables panel. |
| (| Call Stack | Opens the Call Stack panel. |
| ſ | Memory | The following cascade menus are displayed to open the Memory panel. |
| | | These items are disabled when disconnected from the debug tool. |
| | Memory1 | Opens the Memory panel (Memory1). |
| | Memory2 | Opens the Memory panel (Memory2). |
| | Memory3 | Opens the Memory panel (Memory3). |
| | Memory4 | Opens the Memory panel (Memory4). |
| 3 | SFR | Opens the SFR panel. |
| | | This item is disabled when disconnected from the debug tool. |
| (| CPU Register | Opens the CPU Register panel. |
| | | This item is disabled when disconnected from the debug tool. |
| ľ | Trace | Opens the Trace panel ^{Note} . |
| L | Dia a a a subla | This item is disabled when disconnected from the debug tool. |
| ' | Disassemble | The following cascade menus are displayed to open the Disassemble panel. These items are disabled when disconnected from the debug tool. |
| L | Disassemble1 | Opens the Disassemble panel (Disassemble1). |
| | Disassemble2 | Opens the Disassemble panel (Disassemble2). |
| | Disassemble3 | Opens the Disassemble panel (Disassemble3). |
| | Disassemble4 | Opens the Disassemble panel (Disassemble4). |
| Г | Event | Opens the Events panel. |
| | | This item is disabled when disconnected from the debug tool. |
| 5 | Show Current PC | Displays the current PC position in the Editor panel. |
| L | ocation | This item is disabled when disconnected from the debug tool. |
| | Back to Last Cursor | Goes back to the position before jumping (see "(7) Jump to functions"/"(4) Move to the |
| Position | | symbol defined location") to the defined location. This item is disabled when disconnected from the debug tool. |
| ŀ, | Conserved to New Correct | |
| | Forward to Next Cursor Position | Forwards to the position before operating [Back to Last Cursor Position]. |
| ľ | Гад Jump | Jumps to the corresponding line/column in the corresponding file if the information of a file |
| | | name/line number/column number exists in the line at the caret position on the Editor panel/ Output panel (see "(8) Jump to a desired line (tag jump)"). |
| L | | |

Note [E1][E20][EZ Emulator]

This item is available only when the selected microcontroller incorporates the OCD trace function.

(b) [Debug]

The [Debug] menu provides the following items and functions (default).

| Download | Downloads the specified file(s) into the debug tool currently selected in the active project. If CubeSuite+ is disconnected from the debug tool at this time, it is automatically connected to the debug tool before a download is executed. This item is disabled during program execution/build (not including rapid build) execution. |
|-------------------------------|--|
| Build & Download | Builds a project and executes a download to the debug tool currently selected in the active project after the build is complete. If CubeSuite+ is disconnected from the debug tool at this time, it is automatically connected to the debug tool before a download is executed. This item is disabled during program execution/build (not including rapid build) execution. When the build has failed, download will not be executed. |
| Rebuild & Download | Rebuilds a project and executes a download to the debug tool currently selected in the active project after the rebuild is complete. If CubeSuite+ is disconnected from the debug tool at this time, it is automatically connected to the debug tool before a download is executed. This item is disabled during program execution/build (not including rapid build) execution. When the rebuild has failed, download will not be executed. |
| Connect to Debug Tool | Connects to the debug tool currently selected in the active project. This item is disabled while connected to the debug tool, during build (not including rapid build) execution or if the version of compiler being used is not supported by CubeSuite+. |
| Hot Plug-in [E1][E20] | Connects to the debug tool currently selected in the active project via the hot plug-in function, in order to debug the target system currently running (see "2.4.3 Connect to the debug tool using hot plug-in [E1][E20]"). This item is disabled while connected to the debug tool. |
| Upload | Opens the Data Save dialog box to save the memory contents. This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. |
| Disconnect from Debug Tool | Disconnects from the currently connected debug tool. This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. |
| Using Debug Tool | The following cascade menus are displayed to select the debug tool to use. This item is disabled while connected to the debug tool. |
| RL78 IECUBE | Uses IECUBE as the debug tool. |
| RL78 E1(Serial) | Uses E1 with serial communication method as the debug tool. |
| RL78 E20(Serial) | Uses E20 with serial communication method as the debug tool. |
| RL78 EZ Emulator | Uses EZ Emulator with an evaluation kit and so on. |
| RL78 Simulator | Uses Simulator as the debug tool. |
| Stop | Forcibly stops the program currently being executed. This item is disabled when the program is already halted or disconnected from the debug tool. |
| Go | Executes the program from the current PC position. Execution of the program will be stopped when the condition of a set break event is met. This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. |
| Ignore break and go | Executes the program from the current PC position. Execution of the program continues, ignoring set break events and action events. This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. |

| Cton In | Eventual the program step by step Note from the current DC position (Consideration) |
|------------|---|
| Step In | Executes the program step by step ^{Note} from the current PC position (Step in execution). |
| | However, in the case of a function call, the program is stopped at the beginning of the |
| | function having been called. |
| | This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. |
| Step Over | Executes the program step by step ^{Note} from the current PC position (Step over execution). |
| | In the case of a function call by the CALL/CALLT/CALLF instruction, all the source lines/ instructions in the function are treated as one step and executed until the position where execution returns from the function (step-by-step execution will continue until the same nest is formed as when the CALL/CALLT/CALLF instruction has been executed). |
| | In the case of an instruction other than CALL/CALLT/CALLF, operation is the same as when [Step In] is selected. |
| | This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. |
| Return Out | Executes the program until execution returns from the current function (or returns to the calling function) ^{Note} (Return out execution). |
| | This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. |
| CPU Reset | Resets the CPU (does not execute a program) |
| | This item is disabled during build (not including rapid build) execution or when disconnected from the debug tool. |
| Restart | Resets the CPU and then executes the program from the reset address. |
| | This item is disabled during build (not including rapid build) execution or when disconnected from the debug tool. |

Note Step execution can be carried out either in units of source lines or in units of instructions. For details, see "2.7.3 Execute programs in steps".

(2) Debug toolbar

The debug toolbar includes the buttons that control the execution of programs.

The debug toolbar provides the following buttons and functions (default).

- **Remarks 1.** The buttons on the toolbar can be customized using the User Setting dialog box. Furthermore, a new toolbar can be created using the same dialog box.
 - **2.** A Group of toolbar displayed can be selected with the context menu that is displayed by right-clicking on the toolbar.

| Executes the build of a project and downloads the file into the debug tool currently selected in the active project. If CubeSuite+ is disconnected from the debug tool at this time, it is automatically connected to the debug tool before a download is executed. This item is disabled during program execution/build (not including rapid build) execution. |
|--|
| When the build has failed, download will not be executed. The function of this item is the same as that of [Build & Download] in the [Debug] menu. |
| The function of this item is the same as that of [Build & Download] in the [Debug] menu. |
| Downloads the specified file(s) into the debug tool currently selected in the active project. |
| If CubeSuite+ is disconnected from the debug tool at this time, it is automatically connected to the debug tool before a download is executed. |
| This item is disabled during program execution/build (not including rapid build) execution. |
| The function of this item is the same as that of [Download] in the [Debug] menu. |

| 4 | Resets the CPU (does not execute a program) This item is disabled during build (not including rapid build) execution or when disconnected from the debug tool. |
|-------------|--|
| | The function of this item is the same as that of [CPU Reset] in the [Debug] menu. |
| | Forcibly stops the program currently being executed. This item is disabled when the program is already halted or disconnected from the debug tool. The function of this item is the same as that of [Stop] in the [Debug] menu. |
| | Executes the program from the current PC position. Execution of the program will be stopped when the condition of a set break event is met. This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. The function of this item is the same as that of [Go] in the [Debug] menu. |
| > | Executes the program from the current PC position. Execution of the program continues, ignoring set break events and action events. This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. The function of this item is the same as that of [Ignore break and go] in the [Debug] menu. |
| H-D | Resets the CPU and then executes the program from the reset address. This item is disabled during build (not including rapid build) execution or when disconnected from the debug tool. The function of this item is the same as that of [Restart] in the [Debug] menu. |
| ⊊ 国 | Executes the program step by step ^{Note} from the current PC position (Step in execution). However, in the case of a function call, the program is stopped at the beginning of the function having been called. This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. The function of this item is the same as that of [Step In] in the [Debug] menu. |
| ÇE | Executes the program step by step Note from the current PC position (Step over execution). In the case of a function call by the CALL/CALLT/CALLF instruction, all the source lines/instructions in the function are treated as one step and executed until the position where execution returns from the function (step-by-step execution will continue until the same nest is formed as when the CALL/CALLT/CALLF instruction has been executed). In the case of an instruction other than CALL/CALLT/CALLF, operation is the same as when the button is clicked. This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. The function of this item is the same as that of [Step Over] in the [Debug] menu. |
| ₹ | Executes the program until execution returns from the current function (or returns to the calling function) (Return out execution). This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. The function of this item is the same as that of [Return Out] in the [Debug] menu. |
| X | Disconnects from the currently connected debug tool. This item is disabled during program execution/build (not including rapid build) execution or when disconnected from the debug tool. The function of this item is the same as that of [Disconnect from Debug Tool] in the [Debug] menu. |

Note Step execution can be carried out either in units of source lines or in units of instructions. For details, see "2.7.3 Execute programs in steps".

(3) Panel display area

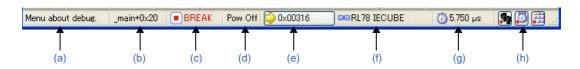

This area displays the various panels.

For details on the display content, see the sections describing the individual panels.

(4) Statusbar

Statusbar displays the following items of information.

Figure A-2. Statusbar

(a) Status message

This area displays the following messages and other information.

- A brief explanation of the selected menu item
- A message reporting that an invalid value has been input in the panel/dialog
- A message reporting that the specified character string has not been found as a result of a search using the Find and Replace dialog box
- A statement of the cause of the break when a break has occurred (see "2.8 Stop Programs (Break)")

(b) Focus panel status information

This area displays status information on the panel currently having the focus.

Note that nothing is displayed here for a panel that has no status information.

(c) Running state

This area displays the state of the program with the following icons and character strings. Note that nothing is displayed here when the debug tool is not connected.

| State of Program | Displayed Content |
|---|-------------------|
| Under execution | ▶RUN |
| Now halted | ■BREAK |
| Step execution in progress | ▶ STEP |
| Data collection in progress ^{Note} | ▶ COLLECTING DATA |

Note See "2.16 Use Smart Analog Function [E1][E20]".

(d) CPU status

This area displays the current CPU status of the debug tool. When there is the possibility that the CPU is in two or more statuses, the corresponding display contents are displayed separated by "&".

Note that nothing is displayed here when the debug tool is not connected.

| Debug Tool | Displayed Content | CPU Status | |
|-------------|-------------------|----------------------------------|--|
| IECUBE | Halt | In HALT mode | |
| | Stop | In STOP mode | |
| | Wait | In wait state | |
| | Reset | In reset state | |
| | Pow Off | Power not supplied to the target | |
| E1/E20 | Reset | In reset state | |
| EZ Emulator | Pow Off | Power not supplied to the target | |
| Simulator | Halt | In HALT mode | |
| | Stop | In STOP mode | |
| | Reset | In reset state | |

Remark Nothing is displayed here when the CPU is in status other than those listed above.

(e) Current PC position

This area displays the current PC position with a hexadecimal value. When this area is clicked, the caret moves to the current PC position on the Editor panel.

In addition, when the mouse pointer is placed over this area, a pop-up window appears to display the following information.

- Current PC: 0x current PC value (source name#line count Note)

Note that nothing is displayed here when the debug tool is not connected.

Note "symbol name+offset value" is displayed when acquisition of information is impossible.

Remark "Running" is displayed in this area during execution of a program.

(f) Connection state

This area displays the current state of connection with the debug tool using the following icons and character strings.

| Connection State | Displayed Content |
|------------------|-------------------|
| Connected | Debug tool name |
| Disconnected | DISCONNECTED |

(g) Run-Break Timer measurement result

This area displays the result of measurement by the Run-Break Timer event (the unit of value used differs depending on the measurement amount). See "2.12.1 Measure execution time until stop of the execution". Note that nothing is displayed here when the debug tool is not connected.

| Condition | Displayed Content |
|--|-------------------|
| Un-measuring | Not measured |
| Under measurement | Measuring |
| When a timer measurement overflow has occurred | OVERFLOW |

(h) Debug tool state [IECUBE][Simulator]

This area displays the current state of debug tool's functions using the following icons and character strings. When a function is stopped, clicking the appropriate icon enables the state to be switched between "Use" and "Not use" Note.

Note that nothing is displayed here when the debug tool is not connected.

| Function | Being Executed | Stopped (Use) | Not Use |
|----------|----------------|---------------|---------|
| Trace | No. | ** | 4.5 |
| Timer | Ø | Ø | Ö |
| Coverage | par . | | |

Note [IECUBE]

Switching is impossible because the trace function, the timer function and the coverage function are always used (the icon for "Not use" is not displayed).

[Simulator]

The result of switching will be reflected in the setting of the [Use trace function]/[Use timer function]/ [Use coverage function] property in the [Trace]/[Timer]/[Coverage] category on the [Debug Tool Settings] tab of the Property panel.

Project Tree panel

This panel is used to display the project components (microcontroller, build tool, debug tool, etc.) in a tree structure. On this panel, you can select or change the debug tool to use.

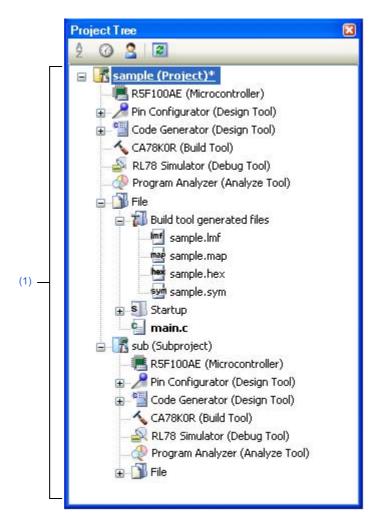

Figure A-3. Project Tree Panel

The following items are explained here.

- [How to open]
- [Description of each area]
- [Context menu]

[How to open]

- From the [View] menu, select [Project Tree].

[Description of each area]

(1) Project tree area

Project components are displayed in tree view with the following given node.

| Node | Description |
|-----------------------------------|---|
| RL78 Debug tool name (Debug tool) | Debug tool name: The debug tool (IECUBE, E1(Serial), E20(Serial), EZ Emulator or Simulator) currently being used in the project is displayed. [Simulator] is selected by default. |

Select the debug tool node to configure with the Property panel. If the Property panel is not being opened, double-click the node to open the corresponding Property panel.

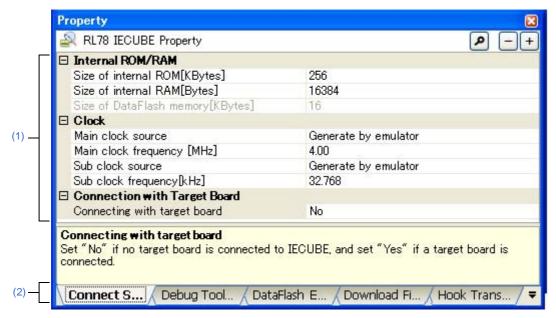

[Context menu]

| L | sing Debug Tool | The following cascade menus are displayed to select the debug tool to use. | |
|--|---|--|--|
| | RL78 IECUBE | Uses IECUBE as the debug tool. | |
| RL78 E1(Serial) Uses E1 with serial communication method as the debug tool. | | Uses E1 with serial communication method as the debug tool. | |
| | RL78 E20(Serial) | Uses E20 with serial communication method as the debug tool. | |
| | RL78 EZ Emulator Uses EZ Emulator with an evaluation kit and so on. | | |
| RL78 Simulator Uses Simulator as the debug tool. | | Uses Simulator as the debug tool. | |
| Property | | Displays the selected category node's property in the Property panel. | |

Property panel

This panel is used to display and set the debug tool operation environment that is selected in the Project Tree panel.

Figure A-4. Property Panel (When IECUBE Is Selected)

This section describes the following.

- [How to open]
- [Description of each area]
- [[Edit] menu (Property panel-dedicated items)]
- [Context menu]

[How to open]

- On the Project Tree panel, select the [RL78 *Debug tool name* (Debug Tool)] node to use, and then select [Property] from the [View] menu or the context menu.
- On the Project Tree panel, double-click the [RL78 Debug tool name (Debug Tool)] node to use.

Remark If this panel has been opened, the detailed information on the debug tool is displayed by selecting the [RL78 *Debug tool name* (Debug Tool)] node on the Project Tree panel.

[Description of each area]

(1) Detailed information display/change area

In this area, the detailed information on the debug tool that is selected in Project Tree panel is displayed by category in the list. Also, you can directly change its settings.

The \blacksquare mark is indicates all the items in the category are expanded. The \blacksquare mark indicates all the items are collapsed. You can expand/collapse the items by clicking these marks or double-clicking the category name. Note that only the hexadecimal number is allowed in the text box if the \blacksquare mark is displayed in the property configuration area.

For details on the information/how to setup in the category and property items contained in it, see the section explaining the corresponding tab.

(2) Tab selection area

Categories for the display of the detailed information are changed when each tab is selected. In this panel, following tabs are contained (see the section explaining each tab for details on the display/setting on the tab).

- [Connect Settings] tab
- [Debug Tool Settings] tab
- [Flash Self Emulation Settings] tab [IECUBE]
- [DataFlash Emulation Settings] tab [IECUBE]
- [Download File Settings] tab
- [Hook Transaction Settings] tab

[[Edit] menu (Property panel-dedicated items)]

| Undo | Undoes the latest property value editing being done. | | |
|------------|---|--|--|
| Cut | Deletes the selected character string(s) and copies them to the clipboard while editing the property value. | | |
| Сору | Copies the contents of the selected range to the clipboard as character string(s). | | |
| Paste | Pastes the contents of the clipboard to the property value while editing the property value. | | |
| Delete | Deletes the selected character string(s) while editing the property value. | | |
| Select All | Selects all the character strings in the selected property while editing the property value. | | |

[Context menu]

[While not editing the property value]

| Reset to Default | Restores the selected setting of the property item to default value. | |
|----------------------|---|--|
| Reset All to Default | Restores all the selected settings of the property items on the tab to default value. | |

[While editing the property value]

| Undo | Undoes the latest property value editing being done. | | |
|------------|---|--|--|
| Cut | Deletes the selected character string(s) and copies them to the clipboard while editing the property value. | | |
| Сору | Copies the contents of the selected range to the clipboard as character string(s). | | |
| Paste | Pastes the contents of the clipboard to the property value while editing the property value. | | |
| Delete | Deletes the selected character string(s) while editing the property value. | | |
| Select All | Selects all the character strings in the selected property while editing the property value. | | |

[Connect Settings] tab

This tab is used to display the detailed information categorized by the following and the configuration can be changed.

- (1) [Internal ROM/RAM]
- (2) [Clock]
- (3) [Connection with Target Board] (except [Simulator])
- (4) [Flash] [E1][E20][EZ Emulator]
- (5) [Hot Plug-in] [E1][E20]
- (6) [Configuration] [Simulator]

Figure A-5. Property Panel: [Connect Settings] Tab [IECUBE]

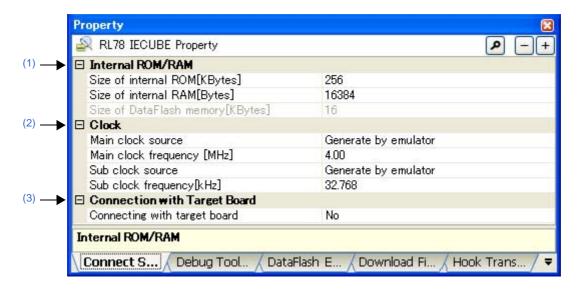

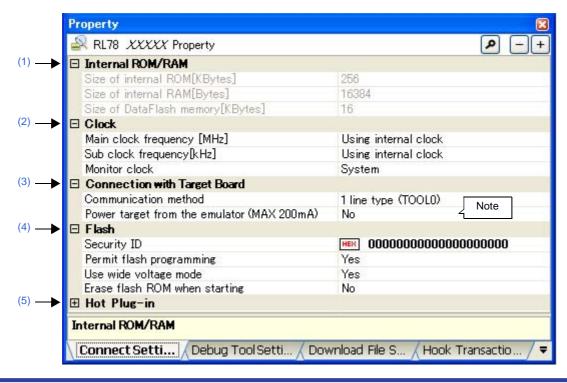

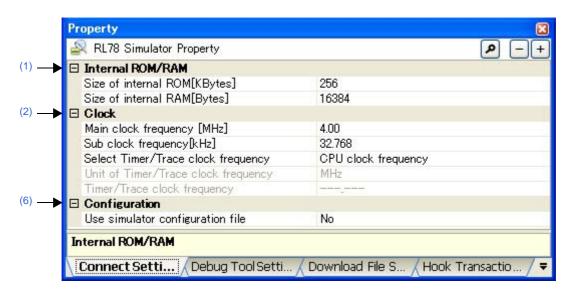

Figure A-6. Property Panel: [Connect Settings] Tab [E1][E20][EZ Emulator]

Note The [Power target from the emulator (MAX200mA)] property appears only when E1 is used.

Figure A-7. Property Panel: [Connect Settings] Tab [Simulator]

[Description of each category]

(1) [Internal ROM/RAM]

The detailed information on internal ROM/RAM is displayed and its configuration can be changed.

Caution You should be careful not to overlap the area with other memory mapping area.

| Size of internal | Display and | Display and change the internal ROM size of the selected microcontroller. | | |
|-------------------------------------|---|---|--|--|
| ROM[KBytes] | Default | Internal ROM size of the selected microcontroller | | |
| | Modifying | [IECUBE][Simulator] | | |
| | | Select from the drop-down list. | | |
| | | [E1][E20][EZ Emulator] | | |
| | | Changes not allowed | | |
| | Available values | le Depends on the selected microcontroller. | | |
| Size of internal | Display and change the internal RAM size of the selected microcontroller. | | | |
| RAM[Bytes] | Default | Internal RAM size of the selected microcontroller | | |
| | Modifying | [IECUBE][Simulator] Select from the drop-down list. | | |
| | | [E1][E20][EZ Emulator] | | |
| | | Changes not allowed | | |
| | Available values | Depends on the selected microcontroller. | | |
| Size of DataFlash | Displays the | e size of the data flash memory area of the selected microcontroller. | | |
| memory[KBytes] (except [Simulator]) | Default | Data flash memory size of the selected microcontroller | | |
| (oxcopt [c.malator]) | Modifying | Changes not allowed | | |

(2) [Clock]

The detailed information on clocks is displayed and its configuration can be changed.

| Main clock source | Select the r | main clock source to input to the CPU. | | |
|---------------------------------------|---|--|--|--|
| [IECUBE] | Default | Generate by emulator | | |
| | Modifying | Select from the drop-down list. | | |
| | | Note that changes can be made only when disconnected from the debug tool. | | |
| | Available | Generate by emulator | Uses a clock generated inside IECUBE. | |
| | values | External | Uses a main clock (square wave) on the target board. | |
| | | Clock socket | Uses a clock of the transmitter on the clock socket. | |
| Main clock frequency [MHz] | Specify the main clock frequency in MHz unit. [IECUBE] This property appears only when the [Main clock source] property is set to [Generate by emulator]. | | | |
| | Default | [IECUBE][Simulator] | | |
| | | 4.00 | , | |
| | | [E1][E20][EZ Emulator Using internal clock | 1 | |
| | Modifying | Select from the drop-down list or directly enter from the keyboard. | | |
| Sub clock source | Available values | [IECUBE] - Either one of the following from the drop-down list ^{Note 1} 1.00, 2.00, 3.00, 3.57, 4.00, 4.19, 4.91, 5.00, 6.00, 8.00, 8.38, 10.00, 12.00, 16.00, 20.00 (unit: MHz) [E1][E20][EZ Emulator] ^{Note 2} - Either one of the following from the drop-down list Using internal clock, 2.00, 3.00, 3.57, 4.00, 4.19, 4.91, 5.00, 6.00, 8.00, 8.38, 10.00, 12.00, 16.00, 20.00 (unit: MHz) - Directly enter the numbers ranged below 0.001 to 99.999 (unit: MHz) [Simulator] - Either one of the following from the drop-down list 2.00, 3.00, 3.57, 4.00, 4.19, 4.91, 5.00, 6.00, 8.00, 8.38, 10.00, 12.00, 16.00, 20.00 (unit: MHz) - Directly enter the numbers ranged below 0.001 to 99.999 (unit: MHz) | | |
| Sub clock source | Select the s | e sub clock source to input to the CPU and peripheral microcontrollers. | | |
| [IECUBE] Default Generate by emulator | | Generate by emulator | | |
| | Modifying | Select from the drop-down list. Note that changes can be made only when disconnected from the debug tool. | | |
| | Available values | Generate by emulator | Uses a clock generated inside IECUBE. | |
| | | External | Uses a main clock (square wave) on the target board. | |
| 1 | 1 | 1 | 1 | |

| Sub clock | Specify the sub clock frequency in kHz unit. | | | | | | |
|-------------------------------------|---|--|--|--|--|--|--|
| frequency[kHz] | [IECUBE] | | | | | | |
| | This property appears only when the [Sub clock source] property is set to [Generate by emulator]. | | | | | | |
| | Default | [IECUBE][Simulator] | | | | | |
| | | 32.768 | | | | | |
| | | [E1][E20][EZ Emulator] | | | | | |
| | | Using internal clock | | | | | |
| | Modifying | Select from the drop-down list or directly enter from the keyboard. | | | | | |
| | Available | [IECUBE] | | | | | |
| | values | 32.768 or 38.40 (unit: | kHz) | | | | |
| | | [E1][E20][EZ Emulator | 1 | | | | |
| | | - Either one of the follo | wing from the drop-down list | | | | |
| | | Using internal clock, 3 | 32.768, 38.40 (unit: kHz) | | | | |
| | | - Directly enter the num | • | | | | |
| | | 0.001 to 99.999 (unit: | kHz) | | | | |
| | | [Simulator] | | | | | |
| | | - Either one of the following from the drop-down list | | | | | |
| | | 32.768 or 38.40 (unit: kHz) | | | | | |
| | | - Directly enter the numbers ranged below | | | | | |
| | | 0.001 to 99.999 (unit: kHz) | | | | | |
| Monitor clock [E1][E20] | Select a cic | ock for monitor programs to operate while the program is stopped. | | | | | |
| [EZ Emulator] | Default | System | | | | | |
| | Modifying | Select from the drop-down list. | | | | | |
| | Available | System | Operates with main clock. | | | | |
| | values | User | Operates with the clock that the program specified. | | | | |
| Select Timer/Trace | Select the o | clock frequency for using timer/trace function. | | | | | |
| clock frequency [Simulator] | Default | CPU clock frequency | | | | | |
| [o.maiator] | Modifying | Select from the drop-do | wn list. | | | | |
| | Available | CPU clock frequency | Uses the CPU clock frequency. | | | | |
| | values | Specify clock frequency | Specifies an arbitrary frequency (property items to specify become valid in the lower area). | | | | |
| He's of The control of | Octobrillor | | · | | | | |
| Unit of Timer/Trace clock frequency | | unit of the clock frequency | | | | | |
| [Simulator] | | This property appears only when the [Select Timer/Trace clock frequency] property is set to [Specify clock frequency]. | | | | | |
| | Default | MHz | | | | | |
| | Modifying | Select from the drop-do | wn list. | | | | |
| | Available | MHz | The unit of the frequency is in MHz. | | | | |
| | values | IVII IZ | The different frequency to in this iz. | | | | |

| Timer/Trace clock frequency | The operation of this property differs depending on the specification with the [Select Timer/Trace clock frequency] property. | | | | | |
|-----------------------------|---|--|--|--|--|--|
| [Simulator] | - When [Specify clock frequency] is specified Specify the clock frequency for timer/trace. | | | | | |
| | While dis | PU clock frequency] is specified, displays the following (changes not allowed) connected from the debug tool: [] nnected to the debug tool: [CPU clock frequency] | | | | |
| | Default 4.00 | | | | | |
| | Modifying | Directly enter from the keyboard. | | | | |
| | Available values | 1 kHz to 99.999 MHz Unit is depending on the specification with the [Unit of Timer/Trace clock frequency property. | | | | |

Notes 1. You can also select the frequency greater than 20.00 MHz, depending on the selected microcontroller.

2. When using X1/X2 oscillation, specify the clock frequency.
When using an external clock oscillation with the embedded PLL circuit, specify the frequency of the transmitter/resonator (the frequency before the setting of the PLL clock).

(3) [Connection with Target Board] (except [Simulator])

The detailed information on the connection to the target board is displayed and its configuration can be changed. Note that this category does not appear if no property displayed exists according to the type of the selected microcontroller.

| Connecting with target | Select if the target board is connected to IECUBE or not. | | | | | |
|--|--|--|--|---|--|--|
| board [IECUBE] | Default | No | | | | |
| [120052] | Modifying | | Select from the drop-down list. Note that changes can be made only when disconnected from the debug tool. | | | |
| | Available | Yes | Yes Target board is connected. | | | |
| | values | No | No Target board is not connected. | | | |
| Communication method [E1][E20] [EZ Emulator] | microcontro | Select the communication method for the emulator to communicate in serial mode with microcontrollers on the target board. This property appears only when the communication method of the selected microcontroller be changed | | | | |
| | Default | 1 line typ | 1 line type (TOOL0) | | | |
| | Modifying | Select from the drop-down list. Note that changes can be made only when disconnected from the debug tool. | | | | |
| | Available | 1 line type (TOOL0) | | The communication method is to use 1 line type (TOOL0). | | |
| | values | 2 line type (TOOL0+TOOL1) | | The communication method is to use 2 line type (TOOL0+TOOL1). | | |
| Low voltage OCD board [E1] | Select whether to use a low voltage OCD board. This property appears only when the selected microcontroller supports board. | | | | | |
| [EZ Emulator] | Default | No | | | | |
| | Modifying | Select fro | om the drop-d | own list. | | |
| | Available | Yes Uses a low voltage OCD board. | | | | |
| | values | No | Does not us | e a low voltage OCD board. | | |

| Power target from the emulator (MAX 200mA) [E1] | | | ply power to the target board from E1. only when the [Low voltage OCD board] property is set to [No] if it is | | |
|---|------------------|--|---|--|--|
| | Default | No | No | | |
| | Modifying | | om the drop-down list. t changes can be made only when disconnected from the debug tool. | | |
| | Available | Yes | Supplies power to the target board. | | |
| | values | No | Does not supply power to the target board. | | |
| Supply voltage [E1] | | age supplied to the target board. only when the [Power target from the emulator (MAX 200mA)] property is | | | |
| | Default | 3.3V | | | |
| | Modifying | Select from the drop-down list. Note that changes can be made only when disconnected from the debug tool. | | | |
| | Available values | | | | |

(4) [Flash] [E1][E20][EZ Emulator]

The detailed information on the flash memory writing is displayed and its configuration can be changed.

| Security ID | Specify a security ID for reading codes in the internal ROM or internal flash memory Note. This property appears only when the selected microcontroller supports the ROM security function (security ID) for flash memory. | | | | |
|-----------------------|---|---|--|--|--|
| | Default 000000000000000000000000000000000000 | | | | |
| | Modifying | 1 | Directly enter from the keyboard. Note that changes can be made only when disconnected from the debug tool. | | |
| | Available values | 0x0 to 0x | 0x0 to 0xFFFFFFFFFFFFFFFFFF in hexadecimal number | | |
| Permit flash | Select whet | lect whether to enable flash rewrite. | | | |
| programming | Default | Yes | | | |
| | Modifying | Select from the drop-down list. | | | |
| | Available | Yes | Enables flash rewrite. | | |
| | values | No | Disables flash rewrite. The flash memory area cannot be rewritten at all from the debug tool. | | |
| Use wide voltage mode | This proper | ect whether to rewrite the flash memory with the wide voltage mode. s property appears only when the selected microcontroller supports the wide voltage mode the flash memory rewriting. | | | |
| | Default | Yes | | | |
| | Modifying | Select from the drop-down list. Note that changes can be made only when disconnected from the debug tool. | | | |
| | Available values | Yes No | Rewrites the flash memory with the wide voltage mode. Rewrites the flash memory with the normal mode. | | |

| Erase flash ROM when starting | This proper [E1][E20] When co | Select whether to erase flash ROM when connecting to the debug tool. This property appears only when the [Permit flash programming] property is set to [Yes]. [E1][E20] When conducting hot plug-in connection, the setting of this property will be ignored and flash ROM will not be erased. | | | |
|-------------------------------|-------------------------------|---|--|--|--|
| | Default | Default No Modifying Select from the drop-down list. Note that changes can be made only when disconnected from the debug tool. | | | |
| | Modifying | | | | |
| | Available values | Yes | Erases the flash ROM when connecting to the debug tool. Note that after connecting to the debug tool, this property automatically selects [No]. | | |
| | | No | Does not erase flash ROM when connecting to the debug tool. | | |

Note For details on the on-chip debug security ID, see User's Manual of the emulator.

(5) [Hot Plug-in] [E1][E20]

The detailed information on hot plug-in connection is displayed and its configuration can be changed.

Note that this category appears only when the selected microcontroller incorporates the hot plug-in function.

| Retrying interval[ms] | . , | interval in 1-ms units for retrying connection in the case of hot plug-in connection mulator fails to communicate with the microcontroller on the target board. | | |
|-----------------------------|------------------|---|--|--|
| | Default | 1000 | | |
| | Modifying | Directly enter from the keyboard. Note that changes can be made only when disconnected from the debug tool. | | |
| | Available values | 0 to 60000 in decimal number | | |
| Number of times of retrying | ' ' | number of times for retrying connection in the case of hot plug-in connection when or fails to communicate with the microcontroller on the target board. | | |
| | Default | 3 | | |
| | Modifying | Directly enter from the keyboard. Note that changes can be made only when disconnected from the debug tool. | | |
| | Available values | 0 to 3 in decimal number | | |

(6) [Configuration] [Simulator]

The detailed information when customizing the simulator is displayed and its configuration can be changed.

| Use simulator configuration file | | Select whether to use the simulator configuration file to perform user customization (adding of user models) of the simulator. | | |
|----------------------------------|-----------|--|---|--|
| | Default | No | | |
| | Modifying | | m the drop-down list. changes can be made only when disconnected from the debug tool. | |
| | Available | Yes | Uses the simulator configuration file. | |
| values | No | Does not use the simulator configuration file. | | |

| Simulator configuration file | Specify the simulator configuration file to be use. This property appears only when the [Use simulator configuration file] property is set to [Yes]. | | | | | | |
|------------------------------|---|---|--|--|--|--|--|
| | Default | Default Blank | | | | | |
| | Modifying | Directly enter from the keyboard, or specify with the Select Simulator Configuration File dialog box [Simulator] opened by clicking the [] button. Note that changes can be made only when disconnected from the debug tool. | | | | | |

[Debug Tool Settings] tab

This tab is used to display the detailed information categorized by the following and the configuration can be changed.

- (1) [Memory]
- (2) [Access Memory While Running]
- (3) [Set Event While Running] [IECUBE]
- (4) [Break]
- (5) [Fail-safe Break] [IECUBE]
- (6) [Trace]
- (7) [Timer] [IECUBE][Simulator]
- (8) [Coverage] [IECUBE][Simulator]
- (9) [Mask for Input Signal] (except [Simulator])
- (10) [Smart Analog] [E1][E20]
- (11) [Simulator GUI] [Simulator]

Figure A-8. Property Panel: [Debug Tool Settings] Tab [IECUBE]

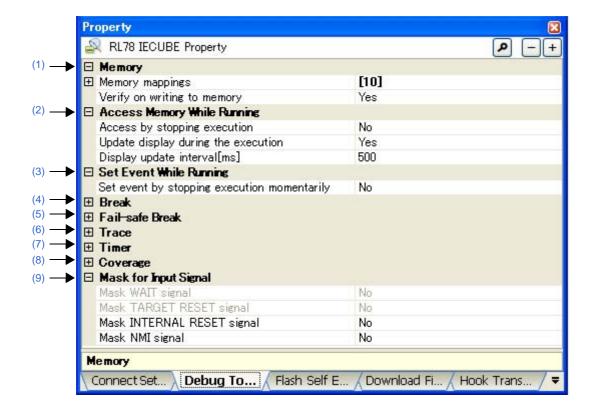

Figure A-9. Property Panel: [Debug Tool Settings] Tab [E1][E20][EZ Emulator]

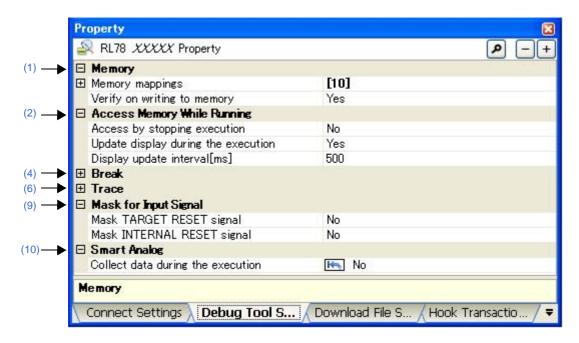

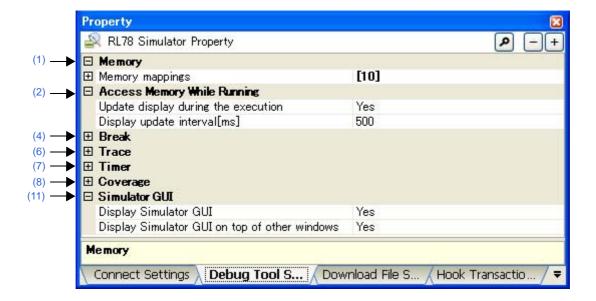

Figure A-10. Property Panel: [Debug Tool Settings] Tab [Simulator]

[Description of each category]

(1) [Memory]

The detailed information on memories is displayed and its configuration can be changed. For details on memory types that are displayed, see the "Memory Mapping dialog box".

| Memory mappings | Current me | mory mapp | ing status is displayed by the types of memory area ^{Note} . | |
|-----------------------------|----------------------|--|---|--|
| | Default | [Total number of the memory mapping types] | | |
| | Modifying | Specify with the Memory Mapping dialog box. The Memory Mapping dialog box is opened by clicking the [] button that appears at the right edge of this field when you select the mapping value (you cannot change the mapping value on this panel). | | |
| | Displayed Content | Displays the memory mapping status by the types of memory area. The following detailed information is displayed by clicking the "+" mark of each memory type. - Memory type - Start address - End address - Access width[bits] | | |
| Verify on writing to | Select whet | her to perfo | orm a verify check when the memory value is initialized. | |
| memory (except [Simulator]) | Default | Yes | | |
| (oxcopt [omaiator]) | Modifying | Select from the drop-down list. | | |
| | Available | Yes | Executes the verify check. | |
| values | values | No | Does not execute the verify check. | |

Note The type is of the memory mapping area registered in the device file.

(2) [Access Memory While Running]

The detailed information on memory accesses while executing a program (real-time display update function: see "(4) Display/modify the memory contents during program execution") is displayed and its configuration can be changed.

| Access by stopping | [IECUBE] | | | |
|----------------------|---|--|---|--|
| execution | For a memory area not accessible during execution of a program, select whether access to | | | |
| (except [Simulator]) | the area i | the area is permitted (target memory area/SFR area/CPU registers). | | |
| | [E1][E20][E | [E1][E20][EZ Emulator] | | |
| | Select whether to allow access to the memory area while executing a program ^{Not.e} . Default No Modifying Select from the drop-down list. | | | |
| | | | | |
| | | | | |
| | Available | Yes | Temporarily stops execution and reads/writes. | |
| values | No | Does not access to the memory during execution of a program. | | |

| Update display during the execution | Select whether to update the display in the Memory panel/Watch panel during a program execution. | | | | |
|-------------------------------------|--|--|---|--|--|
| | Default | Yes | Yes | | |
| | Modifying | Select fro | Select from the drop-down list. | | |
| | Available | Yes | Updates the display during program execution. | | |
| | values | No | Does not update the display during program execution. | | |
| Display update interval[ms] | display whil | le executing | 100ms unit to update the contents in the Memory panel/Watch panel g a program. only when the [Update display during the execution] property is set to | | |
| | Default | 500 | | | |
| | Modifying | Directly enter from the keyboard. | | | |
| | Available values | Integer number between 100 and 65500 (rounding up the fractions less than 100 ms). | | | |

Note [E1][E20][EZ Emulator]

When [1 line type (TOOL0)] is specified with the [Communication method] property in the [Connection with Target Board] (except [Simulator]) category, if this property is set to [Yes], the debug tool's response speed will be greatly slow.

(3) [Set Event While Running] [IECUBE]

The detailed information on the function of the event setting during program execution is displayed and its configuration can be changed.

| Set event by stopping execution momentarily | Select whether to forcibly pause the execution for events that cannot be set while executing the program. For details on the event types that are affected by this property, see "(2) Event types that can be set and deleted during execution". | | | |
|---|---|--|--|--|
| Default Modifying Available values | No | | | |
| | Modifying | Select from the drop-down list. | | |
| | | Yes | Sets these events by stopping the program execution momentarily. | |
| | No | Does not allow to set these events during program execution. | | |

(4) [Break]

The detailed information on break functions is displayed and its configuration can be changed.

| First using type of breakpoint | Select the type of the breakpoint to use with priority when setting it at the source line or the execution address with a one click operation of the mouse in the Editor panel/Disassemble | | | | | | | |
|--------------------------------|--|--|---|--|--|--|--|--|
| (except [Simulator]) | panel. | panel. | | | | | | |
| | This proper type. | This property does not appear when the selected microcontroller supports only one breakpoint type. | | | | | | |
| | Default Modifying | ult Software break | | | | | | |
| | | Select from the drop-down list. | | | | | | |
| | Available | Software break | Sets software breakpoint with priority. | | | | | |
| | values | Hardware break | Sets hardware breakpoint with priority. | | | | | |

| Stop emulation of timer group when stopping | Select whether to terminate the peripheral emulation of timers while stopping the program execution (Peripheral Break). | | | | | |
|--|--|---|--|--|--|--|
| (except [Simulator]) | Default | No | | | | |
| | Modifying | Select fro | m the drop | -down list. | | |
| | Available | Yes Terminates the peripheral emulation of timers ^{Note 1} . | | | | |
| | values | No | Does not | terminate the peripheral emulation of timers. | | |
| Stop emulation of serial group when stopping | Select whether to terminate the peripheral emulation of serials while stopping the program execution (Peripheral Break). This property appears only when the selected microcontroller supports this function. | | | | | |
| (except [Simulator]) | Default | No | | | | |
| | Modifying | Select fro | m the drop | -down list. | | |
| | Available | Yes | Terminate | s the peripheral emulation of serials. | | |
| | values | No | Does not | terminate the peripheral emulation of serials. | | |
| Use open break function | | elect whether to use the open break function. his property appears only when the selected microcontroller supports the open break function. | | | | |
| [IECUBE] | Default | Depends on the selected microcontroller. | | | | |
| | Modifying | Select from the drop-down list. | | | | |
| | Available values | Yes(Hi-Z) | | The open break target pin becomes the Hi-Z state after the CPU is stopped. | | |
| | | No(Output signal) The open break target pin outputs the signal even after the CPU is stopped. | | | | |
| Restore the breakpoint when pin reset occurs [E1][E20] [EZ Emulator] | This proper | or whether to restore the breakpoints when a pin reset occurs. Droperty appears only when the selected microcontroller supports this function, and fied for the [Permit flash programming] property. | | | | |
| [22 2a.a.c.r] | Default | Yes | | | | |
| | Modifying | Select fro | m the drop | -down list. | | |
| | Available values | Yes | Yes The CPU is briefly halted for restoration of the breakpoints a reset. | | | |
| | | No | No The breakpoints are ignored and not restored after a pin reservestored when the program is stopped. | | | |
| Execute instruction at breakpoint when break | | timing to stop the program execution by breakpoints either after or before the of the instruction at the breakpoint. | | | | |
| [Simulator] | Default | efault No | | | | |
| | Modifying | Select fro | m the drop | -down list. | | |
| | Available | Yes | Breaks af | ter executing the instruction ^{Note 2} . | | |
| | values | No | Breaks be | efore executing the instruction. | | |

Notes 1. [E1][E20][EZ Emulator]

In the case of the selected microcontroller that provides the open break function, when this property is set to [Yes], the open break target pin becomes the Hi-Z state after the CPU is stopped (when this property is set to [No], the open break target pin outputs the signal even after the CPU is stopped).

2. When [Yes] is selected, all of action events currently being set are handled as Hardware Break events (see "2.14 Set an Action into Programs").

(5) [Fail-safe Break] [IECUBE]

The detailed information on fail-safe break functions is displayed and its configuration can be changed.

| Stop when fetched | Select whe | ther to stop the execution right after fetching from the fetch protected area. | | | | |
|----------------------------------|------------------|---|--|--|--|--|
| from fetch protected area | Default | Yes | | | | |
| aroa | Modifying | Select fro | om the drop-down list. | | | |
| | Available | Yes | Stops right after fetching. | | | |
| | values | No | Does not stop even after fetching. | | | |

(6) [Trace]

The detailed information on trace functions is displayed and its configuration can be changed.

Caution [E1]E20][EZ Emulator]

This category appears only when the selected microcontroller incorporates the OCD trace function.

| Use trace function | Select whet | ether to use the trace function ^{Note 1} . | | | | | |
|-------------------------------------|------------------|--|--|--|--|--|--|
| [E1][E20] | Default | No | No | | | | |
| [EZ Emulator] [Simulator] | Modifying | Select from | Select from the drop-down list. | | | | |
| | Available | Yes | Uses trace fur | Uses trace functions. | | | |
| | values | No | Does not use | trace functions. | | | |
| Clear trace memory | Select whet | her to clear | the trace memo | ry before executing. | | | |
| before running [IECUBE] [Simulator] | Default | Yes | | | | | |
| | Modifying | Select from | m the drop-dowr | n list. | | | |
| | Available | Yes | Clears the trace | ce memory. | | | |
| | values | No | Does not clea | r the trace memory. | | | |
| Operation after trace | Select the o | peration afte | er the trace mer | nory is full with the collecte | ed trace data. | | |
| memory is full | Default | Non stop a | and overwrite to | trace memory | | | |
| | Modifying | Select from | n the drop-dowr | ı list. | | | |
| | Available values | Non stop a to trace me | and overwrite emory | Continues overwriting trace data even after trace memory is used up. | | | |
| | | Stop trace | Stop trace Stops overwriting trace data when trace memory is used up (the program execution will not be stopped) | | | | |
| | | Stop [IECUBE] [Simulato | | Stops running the progra when trace memory is u | am and overwriting trace data sed up. | | |
| Rate of frequency | Select the f | requency div | vision ratio of the | counter to be used for tir | me tag display. | | |
| division of trace time tag | Default | 1/1(4ns/0.3min) | | | | | |
| [IECUBE] | Modifying | Select from the drop-down list. | | | | | |
| | Available values | 1/512(213 1/4096(17 (Values in ' | 2.4min) s/19.1min) 3ns/2.5h) 067ns/20.4h) | | 1/4(17ns/1.2min) 1/32(133ns/9.5min) 1/256(1067ns/1.3h) 1/2048(8533ns/10.2h) | | |
| Accumulate trace time | Select whet | ther to display the accumulated tracing time in the Trace panel. | | | | | |
| [Simulator] | Default | No | | | | | |
| | Modifying | Select from | n the drop-dowr | n list. | | | |
| | Available | Yes | Displays the a | accumulated tracing time. | | | |
| | values | No | Displays the to | race time with differential v | value. | | |

| size[frames] [E1][E20] [EZ Emulator] [Simulator] Modifyin | Select the size of memory that stores trace data by the number of trace frames ^{Note 2} . | | | |
|--|--|---|--|--|
| | Default | [E1][E20][EZ Emulator] Depends on the selected microcontroller. [Simulator] 4K | | |
| | Modifying | [E1][E20][EZ Emulator] Changes not allowed [Simulator] Select from the drop-down list. | | |
| | Available values | [Simulator] 4K, 8K, 12K, 16K, 20K, 24K, 28K,32K, 36K, 40K, 44K, 48K, 52K,56K, 60K, 64K, 128K, 192K, 256K, 320K, 384K, 448K, 512K, 576K, 640K, 704K, 768K, 832K, 896K, 960K, 1M, 2M, 3M | | |

Notes 1. This property is automatically set to [Yes] when selecting [Start Tracing]/[Stop Tracing] from the context menu in the Editor panel/Disassemble panel.

[E1]E20][EZ Emulator]

This property is automatically changed in accordance with the property setting of the build tool used.

2. The trace frame is a unit of trace data. Each fetch/write/read uses one trace frame.

(7) [Timer] [IECUBE][Simulator]

The detailed information on timer functions is displayed and its configuration can be changed.

| Rate of frequency division of timer | Select the frequency division ratio of the timer counter (120 MHz) used for timer measurement ^{Note} . | | | | | | |
|-------------------------------------|---|-----------------------------------|---|--|--|--|--|
| [IECUBE] | Default | 1/2(17ns | 1/2(17ns/1.2min) (Resolution/maximum measurement time are displayed in "()"). | | | | |
| | Modifying | Select fr | om the drop-do | wn list. | | | |
| | Available values | 1/8(67ns 1/64(533 1/512(42 | 0.6min), s/4.8min), 3ns/38.2min), 267ns/5.1h), 34133ns/40.7h | 1/2(17ns/1.2min), 1/16(133ns/9.5min), 1/128(1067ns/1.3h), 1/1024(8533ns/10.2h), | 1/4(33ns/2.4min), 1/32(267ns/19.1min), 1/256(2133ns/2.5h), 1/2048(17067ns/20.4h), | | |
| Use timer function | Select whet | nether to use the timer function. | | | | | |
| [Simulator] | Default | No | | | | | |
| | Modifying | Select from the drop-down list. | | | | | |
| | Available | Yes | Yes Uses timer functions. | | | | |
| | values | No | Does not use timer functions. | | | | |

Note It is not possible to divide the timer counter for the Run-Break time.

(8) [Coverage] [IECUBE][Simulator]

The detailed information on coverage functions is displayed and its configuration can be changed.

| Use coverage function | Select whether to use the coverage function. | | | | | |
|-----------------------|--|--|---|--|--|--|
| [Simulator] | Default | No | | | | |
| | Modifying | Select f | from the drop-down list. | | | |
| | Available | Yes | Uses coverage functions | | | |
| | values | No | No Does not use coverage functions | | | |
| Reuse coverage result | | ect whether to load/save the coverage measurement result when connecting to or connecting from the debug tool. nulator] | | | | |
| Defaul Modify | This prop | roperty appears only when the [Use coverage function] property is set to [Yes]. | | | | |
| | Default | No | | | | |
| | Modifying | Select from the drop-down list. | | | | |
| | Available | Yes | Loads/saves the coverage measurement result. | | | |
| | values | No | Does not load/save the coverage measurement result. | | | |

(9) [Mask for Input Signal] (except [Simulator])

The detailed information on the masking input signal is displayed and its configuration can be changed.

Cautions 1. [E1][E20]

The properties in this category are disabled in the case of a hot plug-in connection. That is, the program operates as if the specification for the properties is [No] (the properties become enabled again after reconnection with CubeSuite+).

2. [E1][E20]

Maskable signals differ depending on the selected microcontroller type (a signal that cannot be masked will be hidden).

| Mask WAIT signal | Select whether to mask WAIT signal to prevent the signal input to emulators. | | | | | |
|--------------------------------------|--|---------------------------------|---|--|--|--|
| [IECUBE] | Default | No ^{Note} | | | | |
| | Modifying | Select f | from the drop-down list. | | | |
| | Available | Yes | Masks WAIT signal. | | | |
| | values | No | Does not mask WAIT signal. | | | |
| Mask TARGET RESET | Select whet | her to ma | ask TARGET RESET signal to prevent the signal input to emulators. | | | |
| Default Modifying Available values | No ^{Note} | | | | | |
| | Modifying | Select from the drop-down list. | | | | |
| | | Yes | Masks TARGET RESET signal. | | | |
| | values | No | Does not mask TARGET RESET signal. | | | |
| Mask INTERNAL | Select whet | her to ma | ask INTERNAL RESET signal to prevent the signal input to emulators. | | | |
| RESET signal | Default | No | No | | | |
| | Modifying | Select from the drop-down list. | | | | |
| | Available | Yes | Masks INTERNAL RESET signal. | | | |
| | values | No | Does not mask INTERNAL RESET signal. | | | |

| [IECUBE] Defi | Select whether to mask NMI signal to prevent the signal input to emulators. | | | | | |
|---------------|---|----------|---------------------------------|--|--|--|
| | Default | No | | | | |
| | Modifying | Select f | Select from the drop-down list. | | | |
| | Available | Yes | Masks NMI signal. | | | |
| | values | No | Does not mask NMI signal. | | | |

Note [IECUBE]

When the [Connecting with target board] property in the [Connection with Target Board] (except [Simulator]) category on the [Connect Settings] tab is set to [No], this property is fixed to [Yes] automatically after connecting to the debug tool (changes not allowed).

(10)[Smart Analog] [E1][E20]

The detailed information on the Smart Analog function is displayed and its configuration can be changed. Note that this category appears only when the selected microcontroller supports the Smart Analog function.

| Collect data during the execution | | ther to collect the data during execution of a program, using the Smart Analog ee "2.16 Use Smart Analog Function [E1][E20]"). | | | |
|--------------------------------------|----------|--|--|--|--|
| Default Modifying Available values | No | No | | | |
| | Select f | Select from the drop-down list. | | | |
| | Yes | Collects the data during execution of a program. | | | |
| | No | Does not collect the data during execution of a program. | | | |

(11) [Simulator GUI] [Simulator]

The detailed information on the Simulator GUI is displayed and its configuration can be changed.

Caution After connecting to the debug tool, all the properties in this category will become invalid when a microcontroller whose Simulator does not support peripheral function simulations (instruction simulation version) is selected.

| Display Simulator GUI | Select whether to display the Simulator GUI window to use the Simulator GUI. | | | | |
|--|--|---------------------------------|--|--|--|
| | Default | Yes | | | |
| | Modifying | Select from the drop-down list. | | | |
| | | (Chang | (Changes not allowed during execution of a program.) | | |
| | Available | Yes | Uses the function of the Simulator GUI. | | |
| | values | No | Does not use the function of the Simulator GUI. | | |
| Display Simulator GUI on top of other | Select whether to display the Simulator GUI window in the forefront when program execution starts. | | | | |
| windows | This property appears only when the [Display Simulator GUI] property is set to [Yes]. | | | | |
| | Default | Yes | | | |
| | Modifying | Select from the drop-down list. | | | |
| | Available Y | Yes | Displays it in the forefront. | | |
| | values | No | Does not display it in the forefront. | | |

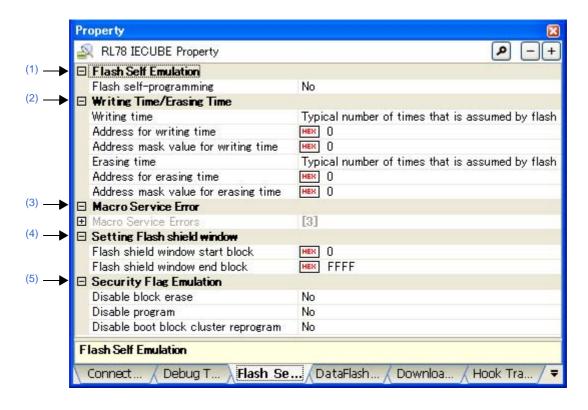

[Flash Self Emulation Settings] tab [IECUBE]

This tab is used to display the detailed information categorized by the following and the configuration can be changed. Note that this tab appears only when the selected microcontroller incorporates the flash memory.

- (1) [Flash Self Emulation]
- (2) [Writing Time/Erasing Time]
- (3) [Macro Service Error]
- (4) [Setting Flash shield wIndow]
- (5) [Security Flag Emulation]

Figure A-11. Property Panel: [Flash Self Emulation Settings] Tab

[Description of each category]

(1) [Flash Self Emulation]

The detailed information on flash self programming emulation functions is displayed and its configuration can be changed.

| Flash self- programming | Select whether to use the flash self programming emulation function. | | | | |
|----------------------------|--|---------------------------------|---|--|--|
| | Default | No | No | | |
| | Modifying | Select from the drop-down list. | | | |
| | Available | Yes | Uses the flash self programming emulation function. | | |
| | values | No | Does not use the flash self programming emulation function. | | |

(2) [Writing Time/Erasing Time]

The detailed information on the time for writing to and erasing the flash memory is displayed and its configuration can be changed.

| Writing time | Select the | value to simulate the delay tim | e for writing to the flash memory. | | | |
|---------------------|------------------|---|--|--|--|--|
| | Default | Typical number of times that | t is assumed by flash macro specifications | | | |
| | Modifying | Select from the drop-down list. | | | | |
| | Available values | No retry | Specifies "0" as the number of times of retry. The delay time is 0 (the writing speed is fastest). | | | |
| | | Typical number of times that is assumed by flash macro specifications | Specifies the typical number of times that is assumed by flash macro specifications. | | | |
| | | Maximum number of times that is assumed by flash macro specifications | Specifies the maximum number of times that is assumed by flash macro specifications. | | | |
| | | Retries for the maximum number of times specified | Specifies the maximum number of times of retry. The delay time is maximum (the writing speed is longest). | | | |
| Address for writing | Specify the | target address at which to sim | nulate the delay time for writing. | | | |
| time | Default | 0 | | | | |
| | Modifying | Directly enter from the keyboard. | | | | |
| | Available values | 0x0 to 0xFFFFF in hexadecimal number | | | | |
| Address mask value | Specify a m | ecify a mask value for the address for writing time. | | | | |
| for writing time | Default | 0 | | | | |
| | Modifying | Directly enter from the keyboard. | | | | |
| | Available values | 0x0 to 0xFFFFF in hexadecimal number | | | | |
| Erasing time | Select the | value to simulate the delay time for erasing the flash memory. | | | | |
| | Default | Typical number of times that | t is assumed by flash macro specifications | | | |
| | Modifying | Select from the drop-down li | ist. | | | |
| | Available values | No retry | Specifies "0" as the number of times of retry. The delay time is 0 (the erasing speed is fastest). | | | |
| | | Typical number of times that is assumed by flash macro specifications | Specifies the typical number of times that is assumed by flash macro specifications. | | | |
| | | Maximum number of times that is assumed by flash macro specifications | Specifies the maximum number of times that is assumed by flash macro specifications. | | | |
| | | Retries for the maximum number of times specified | Specifies the maximum number of times of retry. The delay time is maximum (the erasing speed is longest). | | | |

| Address for erasing | Specify the target address at which to simulate the delay time for erasing. | | | | |
|---------------------|---|--------------------------------------|--|--|--|
| time | Default | 0 | | | |
| | Modifying | Directly enter from the keyboard. | | | |
| | Available values | 0x0 to 0xFFFFF in hexadecimal number | | | |
| Address mask value | Specify a mask value for the address for erasing time. | | | | |
| for erasing time | Default | 0 | | | |
| | Modifying | Directly enter from the keyboard. | | | |
| | Available values | 0x0 to 0xFFFFF in hexadecimal number | | | |

(3) [Macro Service Error]

The detailed information on the flash macro service is displayed and its configuration can be changed.

The error values that are not returned during normal emulation can be forcibly returned by setting the properties of this category.

| Macro Service Errors | Specify the error to generate in the flash macro service to emulate. | | | | |
|-----------------------|--|--|--|--|--|
| Madro Colvido Elitoro | Up to three types of errors to generate ([0]/[1]/[2]) can be specified with subproperties for this | | | | |
| | property. | | | | |
| Generate error | Select the t | Select the type of error to generate. | | | |
| (Subproperty) | Default | None | | | |
| | Modifying | Select from the drop-down list. | | | |
| | Available | None | | | |
| | values | Generate FlashErase Error (Erase) | | | |
| | | Generate FlashBlankCheck Error (BlankCheck) | | | |
| | | Generate FlashWrite Error (Write) | | | |
| | | Generate FlashIVerify Error (IVerify) | | | |
| | | Generate FlashSetSecurity / FlashSetFSW Error (Erase) | | | |
| | | Generate FlashSetSecurity / FlashSetFSW Error (Write) | | | |
| | | Generate FlashSetSecurity / FlashSetFSW Error (IVerify) | | | |
| Address for error | Specify an | address at which the error is to be generated, within the flash memory area. | | | |
| (Subproperty) | for FlashEra | ty appears only when the [Generate error] subproperty is set to [Generate erase error ase]/[Generate write error for FlashWrite]/[Generate IVerify error for FlashIVerify]/ BlankCheck error for FlashBlankCheck]. | | | |
| | Default | 0 | | | |
| | Modifying | Directly enter from the keyboard. | | | |
| Available values | Available values | 0x0 to 0xFFFFF in hexadecimal number | | | |

| Address mask value | Specify a m | Specify a mask value for the address, at which the error is to be generated. | | | | |
|--------------------|--|---|--|--|--|--|
| for error | This property appears only when the [Generate error] subproperty is set to [Generate erase error | | | | | |
| (Subproperty) | | for FlashErase]/[Generate write error for FlashWrite]/[Generate IVerify error for FlashIVerify]/ | | | | |
| | [Generate BlankCheck error for FlashBlankCheck]. | | | | | |
| | Default | Default 0 | | | | |
| | Modifying | Modifying Directly enter from the keyboard. Available values Ox0 to 0xFFFFF in hexadecimal number | | | | |
| | | | | | | |

(4) [Setting Flash shield wlndow]

The detailed information on the flash shield window function is displayed and its configuration can be changed.

Caution Settings of this category are applied after CPU reset is generated. If you changed these settings, execute the program after reset the CPU.

| Flash shield window | Specify the start block of the area that can be written to and erased by flash self programming. | | |
|---------------------|--|-------------------------------------|--|
| start block | Default | 0 | |
| | Modifying | Directly enter from the keyboard. | |
| Available values | | 0x0 to 0xFFFF in hexadecimal number | |
| Flash shield window | Specify the end block of the area that can be written to and erased by flash self programming. | | |
| end block | Default | FFFF | |
| | Modifying | Directly enter from the keyboard. | |
| | Available values | 0x0 to 0xFFFF in hexadecimal number | |

(5) [Security Flag Emulation]

The detailed information on the security flag emulation function is displayed and its configuration can be changed.

Caution Settings of this category are applied after CPU reset is generated. If you changed these settings, execute the program after reset the CPU.

| Disable block erase | Select whether to emulate to disable block erase. | | | |
|---------------------|---|---------------------------------|--|--|
| | Default | No | | |
| | Modifying | Select from the drop-down list. | | |
| | Available | Yes | Emulates to disable block erase. | |
| | values | No | Does not emulate to disable block erase. | |
| Disable program | Select whether to emulate to disable writing. | | | |
| | Default | No | | |
| | Modifying | Select from the drop-down list. | | |
| | Available | Yes | Emulates to disable writing. | |
| val | values | No | Does not emulate to disable writing. | |

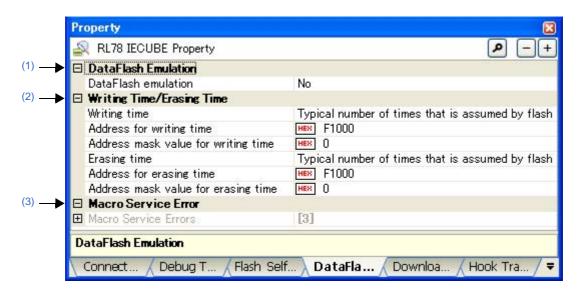

| Disable boot block cluster reprogram | Select whether to emulate to disable rewrite boot area. | | | | |
|--------------------------------------|---|---------------------------------|--|--|--|
| | Default | No | No | | |
| | Modifying | Select from the drop-down list. | | | |
| | Available | Yes | Emulates to disable rewrite boot area. | | |
| | values | No | Does not emulate to disable rewrite boot area. | | |

[DataFlash Emulation Settings] tab [IECUBE]

This tab is used to display the detailed information categorized by the following and the configuration can be changed. Note that this tab appears only when the selected microcontroller incorporates the data flash memory.

- (1) [DataFlash Emulation]
- (2) [Writing Time/Erasing Time]
- (3) [Macro Service Error]

Figure A-12. Property Panel: [DataFlash Emulation Settings] Tab

[Description of each category]

(1) [DataFlash Emulation]

The detailed information on the data flash emulation functions is displayed and its configuration can be changed.

| DataFlash emulation | Select whether to use the data flash emulation function. | | | |
|---------------------|--|---------------------------------|--|--|
| | Default | No | | |
| | Modifying | Select from the drop-down list. | | |
| | Available | Yes | Uses data flash emulation functions. | |
| | values | No | Does not use data flash emulation functions. | |

(2) [Writing Time/Erasing Time]

The detailed information on the time for writing to and erasing the data flash memory is displayed and its configuration can be changed.

| Writing time | Select the value to simulate the delay time for writing to the data flash memory. | | | | | | |
|---------------------|---|---|--|--|--|--|--|
| | Default | Typical number of times that is assumed by flash macro specifications | | | | | |
| | Modifying | Select from the drop-down li | ist. | | | | |
| | Available values | No retry | Specifies "0" as the number of times of retry. The delay time is 0 (the writing speed is fastest). | | | | |
| | | Typical number of times that is assumed by flash macro specifications | Specifies the typical number of times that is assumed by flash macro specifications. | | | | |
| | | Maximum number of times that is assumed by flash macro specifications | Specifies the maximum number of times that is assumed by flash macro specifications. | | | | |
| | | Retries for the maximum number of times specified | Specifies the maximum number of times of retry. The delay time is maximum (the writing speed is longest). | | | | |
| Address for writing | Specify the | target address at which to sim | nulate the delay time for writing. | | | | |
| time | Default | F1000 | | | | | |
| | Modifying | Directly enter from the keybo | oard. | | | | |
| | Available values | 0xF1000 to 0xFFFFF in hex | adecimal number | | | | |
| Address mask value | Specify a m | pecify a mask value for the address for writing time. | | | | | |
| for writing time | Default | 0 | | | | | |
| | Modifying | Directly enter from the keybo | oard. | | | | |
| | Available values | 0x0 to 0xFFFFF in hexadeci | imal number | | | | |
| Erasing time | Select the v | value to simulate the delay tim | e for erasing the data flash memory. | | | | |
| | Default | Typical number of times that is assumed by flash macro specifications | | | | | |
| | Modifying | Select from the drop-down list. | | | | | |
| | Available values | No retry | Specifies "0" as the number of times of retry. The delay time is 0 (the erasing speed is fastest). | | | | |
| | | Typical number of times that is assumed by flash macro specifications | Specifies the typical number of times that is assumed by flash macro specifications. | | | | |
| | | Maximum number of times that is assumed by flash macro specifications | Specifies the maximum number of times that is assumed by flash macro specifications. | | | | |
| | | Retries for the maximum number of times specified | Specifies the maximum number of times of retry. The delay time is maximum (the erasing speed is longest). | | | | |
| Address for erasing | Specify the target address at which to simulate the delay time for erasing. | | | | | | |
| time | Default | ult F1000 | | | | | |
| | Modifying | Directly enter from the keyboard. | | | | | |
| | Available values | 0xF1000 to 0xFFFFF in hexadecimal number | | | | | |

| Address mask value | Specify a mask value for the address for erasing time. | | |
|--------------------|--|--------------------------------------|--|
| for erasing time | Default | 0 | |
| | Modifying | Directly enter from the keyboard. | |
| | Available values | 0x0 to 0xFFFFF in hexadecimal number | |

(3) [Macro Service Error]

The detailed information on the data flash macro service is displayed and its configuration can be changed. The error values that are not returned during normal emulation can be forcibly returned by setting the properties of this category.

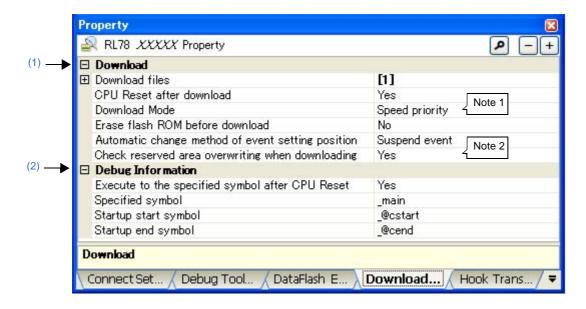

| Macro Service Errors | Specify the error to generate in the data flash macro service to emulate. | | | | |
|--|--|---|--|--|--|
| | Up to three types of errors to generate ([0]/[1]/[2]) can be specified with subproperties for this property. | | | | |
| Generate error (Subproperty) | Select the type of error to generate. | | | | |
| | Default | None | | | |
| | Modifying | Select from the drop-down list. | | | |
| | Available values | None | | | |
| | | Generate FlashErase Error (Erase) | | | |
| | | Generate FlashBlankCheck Error (BlankCheck) | | | |
| | | Generate FlashWrite Error (Write) | | | |
| | | Generate FlashIVerify Error (IVerify) | | | |
| Address for error (Subproperty) | Specify an address at which the error is to be generated, within the flash memory area. This property appears only when the [Generate error] subproperty is set to the value other than [None]. | | | | |
| | Default | F1000 | | | |
| | Modifying | Directly enter from the keyboard. | | | |
| | Available values | 0xF1000 to 0xFFFFF in hexadecimal number | | | |
| Address mask value for error (Subproperty) | Specify a mask value for the address, at which the error is to be generated. This property appears only when the [Generate error] subproperty is set to the value other than [None]. | | | | |
| | Default | 0 | | | |
| | Modifying | Directly enter from the keyboard. | | | |
| | Available values | 0x0 to 0xFFFFF in hexadecimal number | | | |

[Download File Settings] tab

This tab is used to display the detailed information categorized by the following and the configuration can be changed. For details on the download function, see "2.5 Download/Upload Programs".

- (1) [Download]
- (2) [Debug Information]

Figure A-13. Property Panel: [Download File Settings] Tab

Notes 1. The [Download Mode] property appears only when the debug tool other than Simulator is used.

2. The [Check reserved area overwriting when downloading] property appears only when E1/E20/EZ Emulator is used.

[Description of each category]

(1) [Download]

The detailed information on download is displayed and its configuration can be changed.

| Download files | Specify the file to download Note 1. The names of files to be downloaded and the download conditions are listed in the lower area. | | | | |
|----------------|---|---|--|--|--|
| | The figures of most to be defined and the definition of the field in the lower and. | | | | |
| | Default [Number of files to download] | | | | |
| | Modifying | Specify with the Download Files dialog box. | | | |
| | | The Download Files dialog box is opened by clicking the [] button that appears at right edge of this field when you select this property (you cannot specify the file to download on this panel). | | | |

| CPU Reset after download | Select whether to reset the CPU after downloading. This property does not appear when the selected microcontroller always resets the CPU after downloading. | | | | | |
|--|--|--|--|--|--|--|
| | Default | Yes | | | | |
| | Modifying | Select from the drop-down list. | | | | |
| | Available values | Yes Resets the CPU after downloading. | | | | |
| | | No Does not reset the CPU after downloading. | | | | |
| Download Mode (except [Simulator]) | Select the o | download mode for downloading to the flash ROM. | | | | |
| | Default | Speed priority | | | | |
| | Modifying | Select from the drop-down list. | | | | |
| | Available values | Speed priority | | Fills free space between the first data and the final data with FFH. | | |
| | | | | Download speed will be faster because the writing data is reduced (default). | | |
| | | Data priority | | Retains the previous value in free space. | | |
| | | | | Download speed will be very slow because data in free space are read once. | | |
| Erase flash ROM | Select when | Select whether to erase the flash ROM before downloading. | | | | |
| before download | Default | No | | | | |
| | Modifying | Select from the drop-down list. Note that changes cannot be made when the [Download Mode] property is set to [Data priority]. | | | | |
| | Available values | Yes | Yes Erases the flash ROM before downloading. | | | |
| | | No Does not erase the flash ROM before downloading. | | | | |
| Automatic change method of event setting position | | ow to perform the setting again if the file is downloaded again, and the location s) set for the currently set event changes to midway in the instruction solution has been set for the currently set event changes to midway in the instruction solution. | | | | |
| | Default | Suspend event | | | | |
| | Modifying | Select from the drop-down list. | | | | |
| | Available values | Move to the head of instruction | | Sets the event to the top address of the instruction. | | |
| | | Suspen | d event | Disables the event (suspended state). | | |
| Check reserved area overwriting when downloading [E1][E20] [EZ Emulator] | | Select whether to output a message when overwriting to an area reserved for use by the emulator is attempted at the time of downloading. | | | | |
| | Default | Yes | | | | |
| | Modifying | Select from the drop-down list. | | | | |
| | Available values | Yes Outputs a message when overwriting to an area reserved is attempted. | | | | |
| | | No Does not output a message when overwriting to an area reserved is attempted. | | | | |

Notes 1. Files specified as build targets in a main project or sub-project cannot be deleted from the target files to download (These files are automatically registered as download files by default).

See "Table 2-1. Type of Files That Can be Downloaded" for downloadable file format.

2. This property setting works only for the location setting of events without the debug information. The location setting of events with the debug information is always moved to the beginning of the source text line.

(2) [Debug Information]

The detailed information on debugging is displayed and its configuration can be changed.

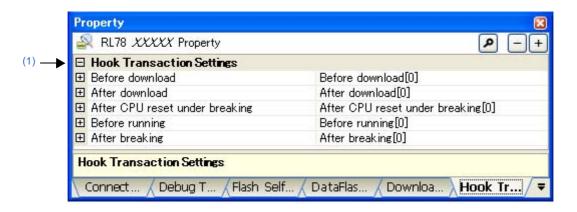

| Execute to the | Select whet | her to exe | cute the program to the specified symbol position after CPU reset. |
|----------------------------------|---|------------|--|
| specified symbol after CPU Reset | Default | Yes | |
| | Modifying | Select fro | om the drop-down list. |
| | Available | Yes | Executes the program to the specified symbol position after CPU reset. |
| | values | No | Does not execute the program after CPU reset. |
| Specified symbol | Specify the position at which the program is stop after CPU reset. This property appears only when the [Execute to the specified symbol after CPU Reset] property is set to [Yes]. | | |
| | Default | _main | |
| | Modifying | Directly 6 | enter from the keyboard. |
| | Available values | Address | expression from 0 to the "end address of the address space". |
| Startup start symbol | Specify the | start symb | ol of the text area of the startup routine. |
| | Default | _@cstart | |
| | Modifying | Directly 6 | enter from the keyboard. |
| | Available values | Address | expression from 0 to the "end address of the address space". |
| Startup end symbol | Specify the | end symbo | ol of the text area of the startup routine. |
| | Default | _@cend | |
| | Modifying | Directly 6 | enter from the keyboard. |
| | Available values | Address | expression from 0 to the "end address of the address space". |

[Hook Transaction Settings] tab

This tab is used to display the detailed information categorized by the following and the configuration can be changed. For details on the hook transaction, see "2.17 Use Hook Function".

(1) [Hook Transaction Settings]

Figure A-14. Property Panel: [Hook Transaction Settings] Tab

[Description of each category]

(1) [Hook Transaction Settings]

The detailed information on the hook transaction is displayed and its configuration can be changed. Note that the properties on this tab can be specified via the Text Edit dialog box, which is opened by clicking the [...] button that appears at right edge of a field when you select each property (you cannot specify the process directly on this panel).

Caution Up to 64 characters for one process, and up to 128 processes for each property can be set (one line in the [Text] area in the Text Edit dialog box is equivalent to one processing).

| Before download | Specify the | process to proceed right before downloading the load module file. |
|-----------------|-------------|---|
| | Default | Before download[0] ("[]" is the current number of specified processes.) |
| | Modifying | Specify with the Text Edit dialog box. |
| | Format | Either one of the following - SFR name + space + Value |
| | | [Process] Automatically overwrites the value of SFR with Value. |
| | | - CPU register name + space + Value |
| | | [Process] Automatically overwrites the value of CPU register with Value. |
| | | - Source Python script path |
| | | [Process] Automatically executes a script file specified with Python script path. |

| After download Specify the process to proceed right after downloading the load module file. | | process to proceed right after downloading the load module file. |
|---|-------------|---|
| | Default | After download[0] ("[]" is the current number of specified processes.) |
| | Modifying | Specify with the Text Edit dialog box. |
| | Format | Either one of the following |
| | | - SFR name + space + Value |
| | | [Process] Automatically overwrites the value of SFR with Value. |
| | | - CPU register name + space + Value |
| | | [Process] Automatically overwrites the value of CPU register with Value. |
| | | - Source Python script path |
| | | [Process] Automatically executes a script file specified with Python script path. |
| After CPU reset under breaking | Specify the | process to proceed right after CPU reset during break. |
| breaking | Default | After CPU reset under breaking[0] ("[]" is the current number of specified |
| | | processes.) |
| | Modifying | Specify with the Text Edit dialog box. |
| | Format | Either one of the following |
| | | - SFR name + space + Value |
| | | [Process] Automatically overwrites the value of SFR with Value. |
| | | - CPU register name + space + Value |
| | | [Process] Automatically overwrites the value of CPU register with Value. |
| | | - Source Python script path |
| | | [Process] Automatically executes a script file specified with Python script path. |
| Before running | Specify the | process to proceed right before the execution of the program. |
| | Default | Before running[0] ("[]" is the current number of specified processes.) |
| | Modifying | Specify with the Text Edit dialog box. |
| | Format | Either one of the following |
| | | - SFR name + space + Value |
| | | [Process] Automatically overwrites the value of SFR with Value. |
| | | - CPU register name + space + Value |
| | | [Process] Automatically overwrites the value of CPU register with Value. |
| | | - Source Python script path |
| | | [Process] Automatically executes a script file specified with Python script path. |
| After breaking | Specify the | process to proceed right after the program break. |
| | Default | After breaking[0] ("[]" is the current number of specified processes.) |
| | Modifying | Specify with the Text Edit dialog box. |
| | Format | Either one of the following |
| | | - SFR name + space + Value |
| | | [Process] Automatically overwrites the value of SFR with Value. |
| | | - CPU register name + space + Value |
| | | [Process] Automatically overwrites the value of CPU register with Value. |
| | | - Source Python script path |
| | | [Process] Automatically executes a script file specified with Python script path. |

Editor panel

This panel is used to display and edit files.

Furthermore, the source level debugging/instruction level debugging (see "2.7.3 Execute programs in steps") and the code coverage measurement result display [IECUBE][Simulator] (see "2.13 Measure Coverage [IECUBE][Simulator]") can be performed when connected to the debug tool and the downloaded source file is opened in this panel.

The code data, label and disassembled text can be displayed combined with the source code by selecting the Mixed display mode (see "(1) Change display mode").

When opened the file encoding and newline code is automatically detected and retained when it is saved. You can open a file with a specific encoding selected in the Encoding dialog box. If the encoding and newline code is specified in the Save Settings dialog box then the file is saved with those settings.

This panel can be opened multiple times (up to 100 panels).

- Cautions 1. When a project is closed, all of the Editor panels displaying a file being registered in the project are closed.
 - 2. When a file is excluded from a project, the Editor panel displaying the file is closed.
- Remarks 1. This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.
 - 2. When a file whose size is greater than 24MB is opened, a message dialog box is shown for confirmation of whether or not to disable all of the functions listed below (if you select [No] in this message dialog box, the operation speed may become sluggish).
 - Syntax (reserved words, comments, etc.) coloring
 - Code outlining

(3)main.c [Toolbar] Columns + (2) Line ## Address 74 void main(void) 75 \square { /* Start user code */ TAUO_ChannelO_Start(); 76 77 0030f TAU0_Channel1_Start(); 00313 78 79 00317 AD_SelectADChannel (0); 80 0031c AD Start (); 81 82 while (10) 83 84 00320 func1(); 85 00324 func2(); 86 00328 87 /* End user code */ 88 0032a (13)

Figure A-15. Editor Panel

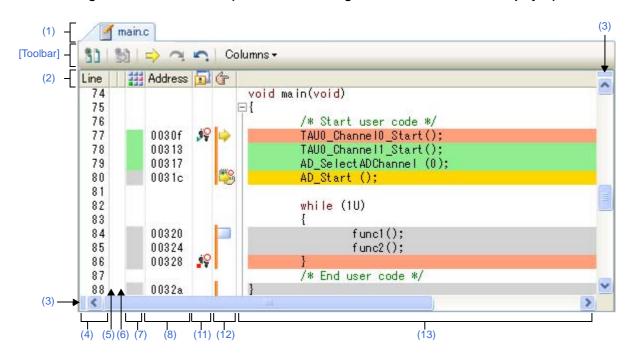

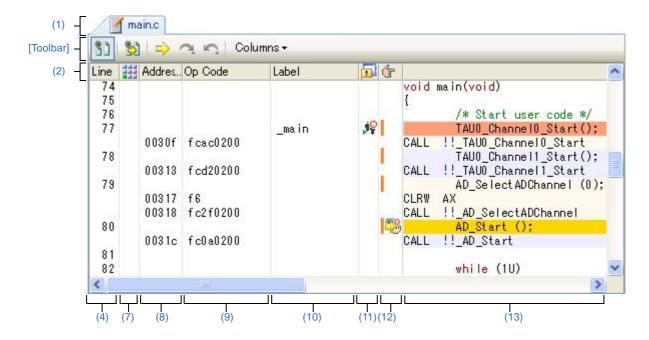

Figure A-16. Editor Panel (When Code Coverage Measurement Result Is Displayed)

Figure A-17. Editor Panel (When Mixed Display Mode Is Selected)

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[File] menu (Editor panel-dedicated items)]
- [[Edit] menu (Editor panel-dedicated items)]
- [[Window] menu (Editor panel-dedicated items)]
- [Context menu]

[How to open]

- Automatically opens after downloading the load module file with debug information.
- On the Project Tree panel, double click a file.
- On the Project Tree panel, select a source file, and then select [Open] from the context menu.
- On the Project Tree panel, select a file, and then select [Open with Internal Editor...] from the context menu.
- On the Project Tree panel, select [Add] >> [Add New File...] from the context menu, and then create a text file or source file
- On the Disassemble panel, Call Stack panel, Trace panel, or Events panel, select [Jump to Source] from the context menu.
- Automatically opens if there is a source text line corresponding to the current PC value when the current PC value is forcibly changed or the program stops executing.

[Description of each area]

(1) Title bar

The name of the opened text file or source file is displayed.

Marks displayed at the end of the file name indicate the following:

| Mark | Description |
|-------------|---|
| * | The file has been modified since being opened. |
| ! | Update time and date of the source file opened are later than the one of the downloaded load module file. Note that this mark is valid only when connected to the debug tool and the downloaded source file is opened. |
| [RECYCLE] | The recycle mode (see "(3) Display multiple source files in a single panel") is valid. Note that this mark is valid only when connected to the debug tool and the downloaded source file is opened. |
| (Read only) | The opened file is read only. |

(2) Column header

The title of each column on the Editor panel is displayed.

Hovering the mouse cursor over this area displays the title name.

| Display | Title Name | Description |
|--------------|---------------------------------|--|
| Line | Line | Displays line numbers (see "(4) Line number area"). |
| (No display) | Selection | The display is colored to reflect the state in terms of saving of the state of editing (see "(5) Selection area"). However, this column is not displayed in the Mixed display mode. |
| (No display) | Out of Date Module Indicator | The display is colored to reflect cases where a source file has been updated more recently than the corresponding load module file (see "(6) Out of date module Indicator area"). However, this column is not displayed when disconnected from the debug tool or in the Mixed display mode. |
| | Coverage | Displays the coverage information (see "(7) Coverage area"). However, this column is not displayed when disconnected from the debug tool. |
| Address | Address | Displays addresses (see "(8) Address area"). However, this column is not displayed when disconnected from the debug tool. |

| Display | Title Name | Description |
|----------|------------|--|
| Op code | Op code | Displays instruction codes (see "(9) Op code area"). |
| | | However, this column is displayed only in the Mixed display mode. |
| Label | Label | Displays labels (see "(10) Label area"). |
| | | However, this column is displayed only in the Mixed display mode. |
| | Event | Sets events (see "(11) Event area"). |
| | | However, this column is not displayed when disconnected from the debug tool. |
| (| Main | Displays bookmarks, address marks and the current PC mark. |
| | | Furthermore, sets breakpoints (see "(12) Main area"). |

Remark Show/hide of the column header can be switched by the setting of the toolbar.

(3) Splitter bars

You can split the Editor panel by using the horizontal and vertical splitter bars within the view. This panel can be split up to two times vertically, and two times horizontally.

- To split this panel, drag the splitter bar down or to the right to the desired position, or double-click any part of the splitter bar.
- To remove the split, double-click any part of the splitter bar.

Caution The split is enabled only when this panel is in the normal display mode (setting to the Mixed display mode removes the split).

能引 Columns + 苦门 Line Line void main(void) func1() 91 void 75 92 76 /* Start user code */ 93 UINT i; 77 TAU0_Channel0_Start(); 94 78 TAU0_Channel1_Start(); 95 for (i = 0; j < 20; i++){ AD Select ADChannel (0); 79 96 functa(): 80 97 } AD Start (); Line Line 1 func2() while (10) 108 void 82 83 109 ⊟{ UINT i; 84 func1(); 110 85 func2(); 111 86 112 for (i = 0; i < 10; i++){ 87 /* End user code */ func2a(); 113

Figure A-18. Editor Panel (Vertical/Horizontal Two-way Split View)

(4) Line number area

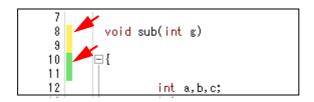

This area displays the line number of the opened file.

(5) Selection area

This area displays the following indicators that shows the line modification status (except in the Mixed display mode).

| | This means new or modified line but unsaved. |
|--|--|
| | This means new or modified line and saved. |
| | To erase this mark, close the panel, and then open this source file again. |

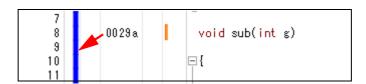

(6) Out of date module Indicator area

This area is valid only when connected to the debug tool and the downloaded source file is opened (except in the Mixed display mode).

If the update time and date of the source file opened are later than the one of the downloaded load module file, the following indicator is displayed (the color of the indicator depends on the "Warning" color of the [General - Font and Color] category of the Option dialog box).

To erase this mark, run a build and then download the load module file again.

(7) Coverage area

This area is valid only when connected to the debug tool and the downloaded source file is opened.

When the coverage function is valid^{Note}, lines corresponding to the specified coverage measurement area are shown highlighted based on the code coverage measurement result that is acquired by executing the program (the color depends on the configuration in the [General - Font and Color] category of the Option dialog box).

See "2.13 Measure Coverage [IECUBE][Simulator]" for details on the coverage measurement.

Note [IECUBE]

The coverage function is always valid.

(8) Address area

This area is valid only when connected to the debug tool and the downloaded source file is opened.

This area shows the address corresponding to where the instruction is located in the memory space of the selected microcontroller.

The format of this area is fixed as hexadecimal number notation.

The address width corresponds to the one in memory space of the selected microcontroller in the project.

(9) Op code area

This area is valid only when connected to the debug tool and the downloaded source file is opened in the Mixed display mode.

This area shows the code corresponding to the source code.

(10) Label area

This area is valid only when connected to the debug tool and the downloaded source file is opened in the Mixed display mode.

This area shows the label name when a label is defined for the address.

(11) Event area

This area is valid only when connected to the debug tool and the downloaded source file is opened.

This area is provided with the following functions.

(a) Setting/deleting of various events

By selecting a item from the context menu on the line that has the address mark (), a Timer event, Trace event or action event (Printf event) can be set/deleted.

Once an event is set, the Event mark corresponding to the event is displayed at the line that is set. In addition, the detailed information about the set event is reflected in the Events panel.

(b) Pop-up display

By hovering the mouse cursor over the Event mark, the name of the event, the detailed information for the event and the comments added to the event are a pop-up displayed.

When multiple events have been set in the applicable place, information for each event, up to a maximum of three events, is listed and displayed.

(12) Main area

This area is provided with the following functions.

(a) Error marks and warning marks display

When an error or warning has been output via the last build command^{Note}, an error mark ((()) or warning mark (()) is displayed at the corresponding line.

To erase these marks, run a clean.

Note Compiling or assembling of source files and running a build, rebuild, or rapid build of the project

Outnut لر:' CC78KOR error EO301: Syntax error لر:' Missing main.c(78) CC78KOR warning W0745: Expected function prototype, When hovering the mouse cursor over int main() a mark, a pop-up that shows the 75 ⊟{ 76 int tmp; corresponding message is displayed. 77 int warning 78 int error; 79 CC78KOR error £0301: Syntax error main.c(78) : CC78KOR error £0301: Syntax (main.c(78) : CC78KOR error E0323: Missing 80 81 82 tmp = Test_function(tmp); 83 84 return tmp; 85

Figure A-19. Error Marks and Warning Marks Display

- Cautions 1. This function is disabled when connected to the debug tool.
 - 2. This function targets only a source file that have been registered in the project.
 - Even when the line number of the source text is changed by modifying, the position of a mark currently being displayed is not moved.

(b) Bookmarks display

Bookmarks () that have been registered are displayed. See "(9) Register a bookmark" for details on the bookmark.

Caution This function is disabled when the Mixed display mode is selected.

The following functions are also available when the debug tool is connected and a downloaded source file is open.

(c) Address marks display

Address marks () are displayed at lines that have valid addresses.

Breakpoints or various events can be set at lines with the address mark.

(d) Current PC mark display

The current PC mark () that corresponds to the current PC position (PC register value) is displayed. Note that the current PC mark is only displayed if the current PC value corresponds to the source text line, when the state of the debug tool is changed from execution to stop.

Remark When the Mixed display mode is selected, if the unit of step execution is set to instruction level by selecting the button on the toolbar, then the current PC mark will be moved to a disassembled text line.

(e) Setting/deleting breakpoints

By clicking the line that has the address mark () with the mouse, the breakpoints can be set easily.

Once a breakpoint is set, an Event mark is displayed at the line that is set. In addition, the detailed information about the set breakpoint is reflected in the Events panel.

When this operation is performed at a place where a breakpoint is already set, that breakpoint is deleted and the setting of breakpoints cannot be done.

See "2.8.3 Stop the program at the arbitrary position (breakpoint)" for details on how to set the breakpoint.

Remark Setting a breakpoint and changing the state of a breakpoint can also be done from the context menu in this area.

(f) Pop-up display

By hovering the mouse cursor over the Event mark, the name of the event, the detailed information for the event and the comments added to the event are a pop-up displayed.

When multiple events have been set in the applicable place, information for each event, up to a maximum of three events, is listed and displayed.

(13) Characters area

This area displays character strings of files and you can edit it.

This area is provided with the following functions.

(a) Characters editing

Characters can be entered from the keyboard.

Various shortcut keys can be used to enhance the edit function.

Caution This function is disabled when the Mixed display mode is selected.

Remark The following items can be customized by setting the Option dialog box.

- Display fonts
- Tab interval
- Show or hide white space marks (blank symbols)
- Colors of syntax (reserved words, comments, etc.)

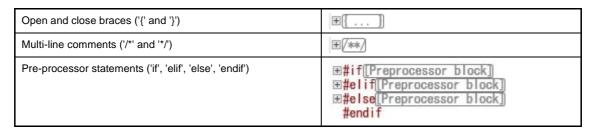

(b) Code outlining

This allows you to expand and collapse source code blocks so that you can concentrate on the areas of code which you are currently modifying or debugging. This is only available for only C source file types.

This is achieved by clicking the plus and minus symbols to the left of the Characters area.

Types of source code blocks that can be expanded or collapsed are:

Caution This function is disabled when the Mixed display mode is selected.

(c) Highlighting the current line

By selecting the [Enable line highlight for current] check box in the []General - Text Editor] category of the Option dialog box, the line at the current caret position can be displayed within a rectangle (the rectangle color depends on the highlight color in the [General - Font and Color] category of the same dialog box above).

Figure A-20. Highlighting Current Line

```
11
12
13
13
□ {
14 | gc_pe1 = 0x12;
```

(d) Emphasizing brackets

The bracket that corresponds to a bracket at the caret position is shown emphasized. Supported types of brackets vary with the file type.

| File Type | Types of Brackets |
|-------------|---------------------------|
| C or Python | (and), { and }, [and] |
| HTML or XML | < and > |

Remark

When CubeSuite+ emphasizes the corresponding bracket, it does not consider those within comments, character constants, character strings, or string constants. For this reason, if the bracket at the position of the caret is within a comment, character constant, character string, or string constant, CubeSuite+ may emphasize a bracket that is not actually the corresponding bracket.

(e) Multiple lines selection and block selection

You can select multiple lines or a block that consists of multiple lines by any one of the following methods:

- Multiple lines selection
 - Drag the left-mouse button
 - Press the [Right], [Left], [Up] or [Down] key while holding down the [Shift] key
- Block selection
 - Drag the left-mouse button while holding down the [Alt] key
 - Press the [Right], [Left], [Up] or [Down] key while holding down the [Alt] + [Shift] key

Figure A-21. Multiple Lines Selection and Block Selection

[Multiple lines selection]

[Block selection]

Caution The information on bookmarks is not included in the selected contents.

Remark Editing of the selected contents can be done by using [Cut], [Copy], [Paste], or [Delete] from the [Edit] menu.

(f) Jump to functions

It automatically recognizes the currently selected characters or the word at the caret position as the function name and jumps to the target function.

See "(7) Jump to functions" for details on the jump to functions.

(g) Tag jump

If the information of a file name, a line number and a column number exists in the line at the caret position, selecting [Tag Jump] from the context menu opens the file in a new Editor panel and jumps to the corresponding line and the corresponding column (if the target file is already opened in the Editor panel, you can jump to the panel).

See "(8) Jump to a desired line (tag jump)" for details on the tag jump.

(h) Registration of bookmarks

By clicking the button on the bookmark toolbar or selecting [Bookmark] >> [Toggle Bookmark] from the context menu on this area, a bookmark can be registered to the line at the caret position.

See "(9) Register a bookmark" for details on the bookmark.

Caution This function is disabled when the Mixed display mode is selected.

(i) File monitor

If the contents of the currently displayed file is changed (including renaming or deleting) without using CubeSuite+, a message will appear asking you whether you wish to update the file or not.

The following functions are also available when the debug tool is connected and a downloaded source file is open.

(j) Highlighting the current PC line

When the current PC position (PC register value) corresponds to the source text lines, those lines are shown highlighted (the highlighting color depends on the current PC color in the [General - Font and Color] category of the Option dialog box).

(k) Highlighting lines with breakpoints

Lines where the breakpoints are set are shown highlighted (the highlighting color depends on the breakpoint color in the [General - Font and Color] category of the Option dialog box).

(I) Code coverage measurement result display [IECUBE][Simulator]

When the coverage function is valid^{Note}, lines corresponding to the specified coverage measurement area are shown highlighted based on the code coverage measurement result that is acquired by executing the program

(the highlighting color depends on the configuration in the [General - Font and Color] category of the Option dialog box).

See "2.13 Measure Coverage [IECUBE][Simulator]" for details on the coverage measurement.

Note [IECUBE]

The coverage function is always valid.

(m) Pop-up display of variables

When hovering the mouse cursor over a variable in the source text, a pop-up that shows the name and value of the variable is displayed (see "(4) Display variables").

Remark When hovering the mouse cursor over a constant, because a constant value is interpreted as an address, a pop-up that shows the memory value of the address is displayed.

(n) Setting of various events

By selecting a item from the context menu on the line that has the address mark (), various events can be set. Once an event is set, the Event mark corresponding to the event is displayed at the line that is set in the Event area or the Main area. In addition, the detailed information about the set event is reflected in the Events panel. See the following for details on how to set events.

- "2.8.4 Stop the program at the arbitrary position (break event)"
- "2.8.5 Stop the program with the access to variables/SFRs"
- "2.11.3 Collect execution history in the arbitrary section"
- "2.11.4 Collect execution history only when the condition is met [IECUBE][Simulator]"
- "2.12.2 Measure execution time in the arbitrary section [IECUBE][Simulator]"
- "2.14.1 Inset printf"

(o) Registering watch expressions

C language variable, CPU registers, SFR, and assembler symbols can be registered in the Watch panel as watch expressions.

See "(1) Register a watch-expression" for details on how to operate it.

[Toolbar]

| 31 | Toggles between the normal display mode (default) and the mixed display mode, as the display mode of this panel (see "(1) Change display mode"). Note that this item is enabled only when connected to the debug tool and the downloaded source file is opened in this panel. |
|-------------|---|
| § | Toggles between source (default) and instruction level, as the unit in which the program is step-executed (see "2.7.3 Execute programs in steps"). When the unit of a step execution is set to instruction level, then the current PC mark will be moved to a disassembled text line Note that this item is enabled only when connected to the debug tool and the downloaded source file is opened in this panel. |
| > | Displays the current PC position. Note that this item is enabled only when connected to the debug tool. |
| ₹ | Forwards to the position before operating [Back To Last Cursor Position]. Note that this item is disabled when this panel is in the mixed display mode. |

| lad | | Goes back to the position before operating [Jump to Function]/[Find]/[Go To]/[Next Bookmark]/ [Previous Bookmark] or moving the caret by clicking the mouse. The jump history is cleared when all of the Editor panel currently being opened are closed. Note that this item is disabled when this panel is in the mixed display mode. |
|-----|------------------------------|--|
| С | olumns | The following items are displayed to show or hide the columns or marks on all of the Editor panels. Remove the check to hide the items (all the items are checked by default). This setting is reflected in all the Editor panels. |
| | Line Number | Shows the line number, in the line number area. |
| Î | Selection | Shows the mark that indicates the line modification status, in the line number area. |
| | Out of date module indicator | Shows the mark that indicates the update status of the downloaded load module file, in the line number area. |
| | | Note that this item is enabled only when connected to the debug tool. |
| | Coverage | Shows the coverage area. |
| | | Note that this item is enabled only when connected to the debug tool. |
| | Address | Shows the address area. |
| | | Note that this item is enabled only when connected to the debug tool. |
| | Op Code | Shows the code area. Note that this item is enabled only when connected to the debug tool and the mixed display mode is selected. |
| Î | Label | Shows the label area. |
| | | Note that this item is enabled only when connected to the debug tool and the mixed display mode is selected. |
| Ì | Event | Shows the event area. |
| | | Note that this item is enabled only when connected to the debug tool. |
| Î | Main | Shows the main area. |
| İ | Column Header | Shows the column header. |
| 1 | | l |

[[File] menu (Editor panel-dedicated items)]

The following items are exclusive for the [File] menu in the Editor panel (other items are common to all the panels).

| Close file name | Closes the currently editing Editor panel. When the contents of the panel have not been saved, a confirmation message is shown. |
|----------------------------|---|
| Save file name | Overwrites the contents of the currently editing Editor panel. When the file has never been saved or the file is read only, the same operation is applied as the selection in [Save <i>file name</i> As]. Note that this item is disabled when this panel is in the mixed display mode. |
| Save file name As | Opens the Save As dialog box to newly save the contents of the currently editing Editor panel. Note that if this panel is in the mixed display mode, then "file name" will be changed to "Source Mixed Data". |
| File name Save Settings | Opens the Save Settings dialog box to change the encoding and newline code of the file being opened in the currently editing Editor panel. |
| Page Setup | This item is always disabled. |
| Print | Opens the Windows dialog box for printing the contents of the currently editing Editor panel. |
| Print Preview | Opens the Print Preview window to preview the file contents to be printed. |

[[Edit] menu (Editor panel-dedicated items)]

The following items are exclusive for [Edit] menu in the Editor panel (all other items are disabled).

| Undo | Cancels the previous operation and restores the characters and the caret position (up to 100 |
|--------------------------|---|
| | times). |
| | Note that this item is disabled when this panel is in the mixed display mode. |
| Redo | Cancels the previous [Undo] operation and restores the characters and the caret position. |
| | Note that this item is disabled when this panel is in the mixed display mode. |
| Cut | Cuts the selected character string and copies it to the clipboard. |
| | If there is no selection, the entire line is cut. |
| | Note that this item is disabled when this panel is in the mixed display mode. |
| Сору | Copies the contents of the selected range to the clipboard as character string(s). |
| | If there is no selection, the entire line is copied. |
| Paste | Inserts (insert mode) or overwrites (overwrite mode) the characters that are copied on the clip board into the caret position. |
| | Note that this item is disabled when the contents of the clipboard are not recognized as characters or this panel is in the mixed display mode. |
| Delete | Deletes one character at the caret position. |
| | When there is a selection area, all the characters in the area are deleted. |
| | Note that this item is disabled when this panel is in the mixed display mode. |
| Select All | Selects all the characters from beginning to the end in the currently editing text file. |
| | Note that this item is disabled when this panel is in the mixed display mode. |
| Find | Opens the Find and Replace dialog box with selecting [Quick Find] tab. |
| Replace | Opens the Find and Replace dialog box with selecting [Quick Replace] tab. |
| | Note that this item is disabled when this panel is in the mixed display mode. |
| Go To | Opens the Go to Line dialog box to move the caret to the specified line. |
| Bookmark | Displays a cascading menu for bookmarks (see "(9) Register a bookmark"). |
| Toggle Bookmark | Inserts/deletes a bookmark on the line at the current caret position. |
| | Note that this item is disabled when this panel is in the mixed display mode. |
| Next Bookmark | Moves a caret to the position of the next bookmark, in the active Editor panel. |
| | Note that this item is disabled in the following cases: |
| | - No bookmark is registered. |
| | - A bookmark is registered only in one line with a caret. |
| | - This panel is in the mixed display mode. |
| Previous Bookmark | Moves a caret to the position of the previous bookmark, in the active Editor panel. |
| | Note that this item is disabled in the following cases: |
| | - No bookmark is registered. |
| | - A bookmark is registered only in one line with a caret.- This panel is in the mixed display mode. |
| Cloor All De alima anti- | |
| Clear All Bookmarks | Clears all the registered bookmarks, in the active Editor panel. Note that this item is disabled in the following cases: |
| | - No bookmark is registered. |
| | - This panel is in the mixed display mode. |
| List Bookmarks | Opens the Bookmarks dialog box for displaying the list of bookmarks. |
| Lot Bookmand | Note that this item is disabled when the project is closed. |
| | rvote that this item is disabled when the project is closed. |

| Г | |
|---------------------------------|--|
| Outlining | Displays a cascading menu for controlling expand and collapse states of source file outlining (see "(b) Code outlining"). |
| | Note that these items are disabled when this panel is in the mixed display mode. |
| Collapse to Definitions | Collapses all nodes that are marked as implementation blocks (e.g. function definitions). |
| Toggle Outlining Expansion | Toggles the current state of the innermost outlining section in which the cursor lies when you are in a nested collapsed section. |
| Toggle All Outlining | Toggles the collapsed state of all outlining nodes, setting them all to the same expanded or collapsed state. If there is a mixture of collapsed and expanded nodes, all nodes will be expanded. |
| Stop Outlining | Stops code outlining and remove all outlining information from source files. |
| Start Automatic Outlining | Starts automatic code outlining and automatically displayed in supported source files. |
| Advanced | Displays a cascading menu for performing an advanced operation for the Editor panel. Note that these items are disabled when this panel is in the mixed display mode. |
| Increase Line Indent | Increases the indentation of the current cursor line by one tab. |
| Decrease Line Indent | Decreases the indentation of the current cursor line by one tab. |
| Uncomment Lines | Removes the first set of line-comment delimiters from the start of the current cursor line, appropriate to the current language. This operation will only be available when the language of the current source file has line-comment delimiters specified. |
| Comment Lines | Places line-comment delimiters at the start of the current cursor line, appropriate to the current language. This operation will only be available when the language of the current source file has line-comment delimiters specified. |
| Convert Tabs to Spaces | Converts all tabs on the current cursor line into spaces. |
| Convert Spaces to Tabs | Converts each set of consecutive space characters on the current line to tab characters, but only for those sets of spaces that are at least equal to one tab size. |
| Tabify Selected Lines | Tabifies the current line, causing all spaces at the start of the line (prior to any text) to be converted to tabs where possible. |
| Untabify Selected Lines | Untabifies the current line, causing all tabs at the start of the line (prior to any text) to be converted to spaces. |
| Make Uppercase | Converts all letters within the selection to uppercase. |
| Make Lowercase | Converts all letters within the selection to lowercase. |
| Toggle Character Casing | Toggles the character cases (uppercase / lowercase) of all letters within the selection. |
| Capitalize | Capitalizes the first character of every word within the selection. |
| Delete Horizontal Whitespace | Deletes any excess white space either side of the cursor position, leaving only one whitespace character remaining. If there the cursor is within a word or not surrounded by whitespace, this operation will have no effect. |
| Trim Trailing Whitespace | Deletes any trailing whitespace that appears after the last non-whitespace character on the cursor line. |
| Delete Line | Completely delete the current cursor line. |
| Duplicate Line | Duplicates the cursor line, inserting a copy of the line immediately after the cursor line. |
| Delete Blank Lines | Deletes the line at the cursor if it is empty or contains only whitespace. |
| | |

[[Window] menu (Editor panel-dedicated items)]

The following items are exclusive for the [Window] menu in the Editor panel (other items are common to all the panels).

| Split | Splits the active Editor panel horizontally. |
|--------------|--|
| | Only the active Editor panel can be split. Other panels will not be split. A panel can be split up to two times. |
| Remove Split | Removes the split view of the Editor panel. |

[Context menu]

- (1) Titlebar area
- (2) Coverage area [IECUBE][Simulator]
- (3) Event area
- (4) Main area (when connected to the debug tool)
- (5) Characters area (when disconnected from the debug tool)
- (6) Characters area (when connected to the debug tool)

(1) Titlebar area

| Close Panel | Closes the currently selected panel. |
|-----------------------------|---|
| Close All but This | Closes all other panels being displayed in the same panel display area as the selected panel, except for the currently selected panel. |
| Save file name | Saves the contents of the opened text file. |
| Copy FUII Path | Copies the full path of the opened text file to the clipboard. |
| Open Containing Folder | Opens the folder where the text file is saved in Explorer. |
| New Horizontal Tab Group | The area for the display of active panels is evenly divided into two areas in the horizontal direction, and the panels are displayed as a new group of tabbed pages. Only one panel is active in the new group. The area may be divided into up to four panels. This item is not displayed in the following cases. Only one panel is open. The group has already been divided in the vertical direction. |
| | - The group has already been divided into four panels. |
| New Vertical Tab Group | The area for the display of active panels is evenly divided into two areas in the vertical direction, and the panels are displayed as a new group of tabbed pages. Only one panel is active in the new group. The area may be divided into up to four panels. This item is not displayed in the following cases. Only one panel is open. The group has already been divided in the horizontal direction. The group has already been divided into four panels. |
| Go to Next Tab Group | When the display area is divided in the horizontal direction, this moves the displayed panel to the group under that displaying the selected panel. When the display area is divided in the vertical direction, this moves the displayed panel to the group to the right of that displaying the selected panel. This item is not displayed if there is no group in the given direction. |

| Go to Previous Tab | When the display area is divided in the horizontal direction, this moves the displayed panel to |
|--------------------|---|
| Group | the group over that displaying the selected panel. |
| | When the display area is divided in the vertical direction, this moves the displayed panel to the |
| | group to the left of that displaying the selected panel. |
| | This item is not displayed if there is no group in the given direction. |

(2) Coverage area [IECUBE][Simulator]

| Clear Coverage | Clears all the coverage measurement results currently being stored in the debug tool. |
|----------------|---|
| Information | |

(3) Event area

| Set Timer Start Event | Sets a timer start event to start measuring the execution time of the program when the line at caret is executed (see "2.12.2 Measure execution time in the arbitrary section [IECUBE][Simulator]"). |
|--------------------------------|--|
| Set Timer End Event | Sets a timer end event to stop measuring the execution time of the program when the line at caret is executed (see "2.12.2 Measure execution time in the arbitrary section [IECUBE][Simulator]"). |
| Set Trace Start Event | Sets a trace start event to start collecting the trace data when the line at the caret is executed (see "2.11.3 Collect execution history in the arbitrary section") Note. |
| Set Trace End Event | Sets a trace end event to stop collecting the trace data when the line at the caret is executed (see "2.11.3 Collect execution history in the arbitrary section") Note. |
| Register Action Event | Opens the Action Events dialog box to set an action event to the corresponding address of the line at the caret position (see "2.14.1 Inset printf"). |
| Enable Event(s) | Changes the state of a selected event to a Valid state. If the event mark (() which indicates that multiple events have been set is selected, all of the events that have been set are enabled. |
| Disable Events(s) | Changes the state of a selected event to an Invalid state. If the event mark (() which indicates that multiple events have been set is selected, all of the events that have been set are disabled. |
| Delete Event(s) | Deletes a selected event. If the event mark () which indicates that multiple events have been set is selected, all of the events that have been set are deleted. |
| View Details in Event Panel | Opens the Events panel to display the detailed information of the selected event. |

Note [E1][E20][EZ Emulator]

This item is enabled only when the selected microcontroller incorporates the OCD trace function.

(4) Main area (when connected to the debug tool)

| Set Breakpoint | Sets a breakpoint to the line at the caret position (see "2.8.3 Stop the program at the arbitrary position (breakpoint)") ^{Note} . If a breakpoint is already being set to the line, then the breakpoint will be deleted. |
|--|---|
| Set Hardware Breakpoint (except [Simulator]) | Sets a breakpoint (Hardware Break event) to the line at the caret position. |

| Set Software Breakpoint (except [Simulator]) | Sets a breakpoint (Software Break event) to the line at the caret position. |
|--|---|
| Hardware Break First (except [Simulator]) | The type of break that can be set by a one click operation of the mouse is set as a hardware breakpoint (this is reflected in the setting of the [First using type of breakpoint] property in the [Break] category from the [Debug Tool Settings] tab on the Property panel). |
| Software Break First (except [Simulator]) | The type of break that can be set by a one click operation of the mouse is set as a software breakpoint (this is reflected in the setting of the [First using type of breakpoint] property in the [Break] category from the [Debug Tool Settings] tab on the Property panel). |
| Enable Breakpoint | Changes the selected breakpoint state to a Valid state. If the event mark (() which indicates that multiple events have been set is selected, all of the breakpoints that have been set are enabled. |
| Disable Breakpoint | Changes the selected breakpoint state to an Invalid state. If the event mark () which indicates that multiple events have been set is selected, all of the breakpoints that have been set are disabled. |
| Delete Breakpoint | Deletes the selected breakpoint. If the event mark () which indicates that multiple events have been set is selected, all of the breakpoints that have been set are deleted. |
| View Details in Event Panel | Opens the Events panel to display the detailed information of the selected event. |

Note Except for [Simulator]

By default the debug tool will set a hardware break when resources are available.

This behavior can be customized by using the [Hardware Break First] or [Software Break First] menu items.

(5) Characters area (when disconnected from the debug tool)

| Cut | Cuts the selected character string and copies it to the clipboard. If there is no selection, the entire line is cut. |
|------------------------------------|--|
| Сору | Copies the contents of the selected range to the clipboard as character string(s). If there is no selection, the entire line is copied. |
| Paste | Inserts (insert mode) or overwrites (overwrite mode) the characters that are copied on the clip board into the caret position. When the contents of the clipboard are not recognized as characters, the operation is invalid. |
| Find | Opens the Find and Replace dialog box with selecting [Quick Find] tab. |
| Go To | Opens the Go to Line dialog box to move the caret to the specified line. |
| Forward To Next Cursor Position | Forwards to the position before operating [Back To Last Cursor Position]. |
| Back To Last Cursor Position | Goes back to the position before operating [Jump to Function]/[Find]/[Go To]/[Next Bookmark]/[Previous Bookmark] or moving the caret by clicking the mouse. The jump history is cleared when all of the Editor panel currently being opened are closed. |
| Jump to Function | Jumps to the function that is selected or at the caret position regarding the selected characters and the words at the caret position as functions (see "(7) Jump to functions"). |
| Tag Jump | Jumps to the corresponding line and column in the corresponding file if the information of a file name, a line number and a column number exists in the line at the caret position (see "(g) Tag jump"). |
| Bookmark | Displays a cascading menu for bookmarks (see "(9) Register a bookmark"). |

| I | |
|-----------------------|--|
| Toggle Bookmark | Inserts/deletes a bookmark on the line at the current caret position. |
| Next Bookmark | Moves a caret to the position of the next bookmark, in the active Editor panel. |
| | Note that this item is disabled in the following cases: |
| | - No bookmark is registered. |
| | - A bookmark is registered only in one line with a caret. |
| Previous Bookmark | Moves a caret to the position of the previous bookmark, in the active Editor panel. |
| | Note that this item is disabled in the following cases: |
| | - No bookmark is registered. - A bookmark is registered only in one line with a caret. |
| Ole an All Dead and a | |
| Clear All Bookmarks | Clears all the registered bookmarks, in the active Editor panel. Note that this item is disabled when no bookmark is registered. |
| | , and the second |
| List Bookmarks | Opens the Bookmarks dialog box for displaying the list of bookmarks. |
| | Note that this item is disabled when the project is closed. |
| Advanced | Displays a cascading menu for performing an advanced operation for the Editor panel. |
| Increase Line Indent | Increases the indentation of the current cursor line by one tab. |
| Decrease Line Indent | Decreases the indentation of the current cursor line by one tab. |
| Uncomment Lines | Removes the first set of line-comment delimiters from the start of the current cursor line, |
| | appropriate to the current language. This operation will only be available when the language of |
| | the current source file has line-comment delimiters specified. |
| Comment Lines | Places line-comment delimiters at the start of the current cursor line, appropriate to the current |
| | language. This operation will only be available when the language of the current source file has line-comment delimiters specified. |
| Convert Tabs to | Converts all tabs on the current cursor line into spaces. |
| Spaces | Converts all tabs on the current cursor line into spaces. |
| Convert Spaces to | Converts each set of consecutive space characters on the current line to tab characters, but |
| Tabs | only for those sets of spaces that are at least equal to one tab size. |
| Tabify Selected Lines | Tabifies the current line, causing all spaces at the start of the line (prior to any text) to be |
| , | converted to tabs where possible. |
| Untabify Selected | Untabifies the current line, causing all tabs at the start of the line (prior to any text) to be |
| Lines | converted to spaces. |
| Make Uppercase | Converts all letters within the selection to uppercase. |
| Make Lowercase | Converts all letters within the selection to lowercase. |
| Toggle Character | Toggles the character cases (uppercase / lowercase) of all letters within the selection. |
| Casing | 100 |
| Capitalize | Capitalizes the first character of every word within the selection. |
| Delete Horizontal | Deletes any excess white space either side of the cursor position, leaving only one whitespace |
| Whitespace | character remaining. If there the cursor is within a word or not surrounded by whitespace, this |
| | operation will have no effect. |
| Trim Trailing | Deletes any trailing whitespace that appears after the last non-whitespace character on the |
| Whitespace | cursor line. |
| Delete Line | Completely delete the current cursor line. |
| Duplicate Line | Duplicates the cursor line, inserting a copy of the line immediately after the cursor line. |
| Delete Blank Lines | Deletes the line at the cursor if it is empty or contains only whitespace. |
| | |

(6) Characters area (when connected to the debug tool)

| Register to Watch1 | Registers a selected character string or a word at the caret position to the Watch panel (Watch1) as a watch-expression (the judgment of the word depends on current build tool). Note that this item is disabled when no corresponding address exists in the line at caret. |
|------------------------------------|--|
| Register to Analysis Chart | Registers a selected character string or a word at the caret position to the Analysis Chart panel of the analyze tool (Program Analyzer) as a variable. If variables have been already registered to all channels, a message is displayed and this operation will have no effect. Note that this item is disabled when the active project does not support a plug-in of the analyze tool. |
| Register Action Event | Opens the Action Events dialog box to set an action event to the corresponding address of the line at the caret position ^{Note 1} . Note that this item is disabled when no corresponding address exists in the line at caret. |
| Cut | Deletes the selected character string(s) and copies them to the clipboard. If there is no selection, the entire line is cut. Note that this item is disabled when this panel is in the mixed display mode. |
| Сору | Copies the contents of the selected range to the clipboard as character string(s). If there is no selection, the entire line is copied. |
| Paste | Inserts (insert mode) or overwrites (overwrite mode) the characters that are copied on the clip board into the caret position. Note that this item is disabled when the contents of the clipboard are not recognized as characters or this panel is in the mixed display mode. |
| Find | Opens the Find and Replace dialog box with selecting [Quick Find] tab. |
| Go To | Opens the Go to Line dialog box to move the caret to the specified line. |
| Forward To Next Cursor Position | Forwards to the position before operating [Back To Last Cursor Position]. Note that this item is disabled when this panel is in the mixed display mode. |
| Back To Last Cursor Position | Goes back to the position before operating [Jump to Function]/[Find]/[Go To]/[Next Bookmark]/[Previous Bookmark] or moving the caret by clicking the mouse. The jump history is cleared when all of the Editor panel currently being opened are closed. Note that this item is disabled when this panel is in the mixed display mode. |
| Go to Here | Executes the program from the address indicated by the current PC value to the address corresponding to the line at the caret position Note 1. Note that this item is disabled during program execution/build (not including rapid build) execution. |
| Set PC to Here | Sets the address of the line at the current caret position to the current PC value ^{Note 1} . Note that this item is disabled when no corresponding address exists in the line at caret, or during program execution/build (not including rapid build) execution |
| Jump to Function | Jumps to the function that is selected or at the caret position regarding the selected characters and the words at the caret position as functions (see "(7) Jump to functions"). |
| Tag Jump | Jumps to the corresponding line and column in the corresponding file if the information of a file name, a line number and a column number exists in the line at the caret position (see "(g) Tag jump"). |
| Jump to Disassemble | Opens the Disassemble panel and jumps to the address corresponding to the line at the caret Note 1. |
| | Note that this item is disabled when no corresponding address exists in the line at caret. |
| Bookmark | Displays a cascading menu for bookmarks (see "(9) Register a bookmark"). |

| Toggle Bookmark | Inserts/deletes a bookmark on the line at the current caret position. |
|------------------------|---|
| | Note that this item is disabled when this panel is in the mixed display mode. |
| Next Bookmark | Moves a caret to the position of the next bookmark, in the active Editor panel. |
| | Note that this item is disabled in the following cases: |
| | - No bookmark is registered. |
| | - A bookmark is registered only in one line with a caret. |
| | - This panel is in the mixed display mode. |
| Previous Bookmark | Moves a caret to the position of the previous bookmark, in the active Editor panel. |
| | Note that this item is disabled in the following cases: |
| | - No bookmark is registered. |
| | - A bookmark is registered only in one line with a caret. |
| | - This panel is in the mixed display mode. |
| Clear All Bookmarks | Clears all the registered bookmarks, in the active Editor panel. |
| | Note that this item is disabled in the following cases: |
| | - No bookmark is registered. |
| | - This panel is in the mixed display mode. |
| List Bookmarks | Opens the Bookmarks dialog box for displaying the list of bookmarks. |
| | Note that this item is disabled when the project is closed. |
| Advanced | Displays a cascading menu for performing an advanced operation for the Editor panel. |
| Advanced | Note that these items are disabled when this panel is in the mixed display mode. |
| | |
| Increase Line Indent | Increases the indentation of the current cursor line by one tab. |
| Decrease Line Indent | Decreases the indentation of the current cursor line by one tab. |
| Uncomment Lines | Removes the first set of line-comment delimiters from the start of the current cursor line, appropriate to |
| | the current language. This operation will only be available when the language of the current source file has line-comment delimiters specified. |
| Comment Lines | Places line-comment delimiters at the start of the current cursor line, appropriate to the current |
| | language. This operation will only be available when the language of the current source file has line- |
| | comment delimiters specified. |
| Convert Tabs to Spaces | Converts all tabs on the current cursor line into spaces. |
| Convert Spaces to | Converts each set of consecutive space characters on the current line to tab characters, but only for |
| Tabs | those sets of spaces that are at least equal to one tab size. |
| Tabify Selected Lines | Tabifies the current line, causing all spaces at the start of the line (prior to any text) to be converted to tabs where possible. |
| Untabify Selected | Untabifies the current line, causing all tabs at the start of the line (prior to any text) to be converted to |
| Lines | spaces. |
| Make Uppercase | Converts all letters within the selection to uppercase. |
| Make Lowercase | Converts all letters within the selection to lowercase. |
| Toggle Character | Toggles the character cases (uppercase / lowercase) of all letters within the selection. |
| Casing | , |
| Capitalize | Capitalizes the first character of every word within the selection. |
| Delete Horizontal | Deletes any excess white space either side of the cursor position, leaving only one whitespace |
| Whitespace | character remaining. If there the cursor is within a word or not surrounded by whitespace, this |
| • | operation will have no effect. |
| Trim Trailing | Deletes any trailing whitespace that appears after the last non-whitespace character on the cursor |
| Whitespace | line. |
| i | 1 |

| 5 | | | | |
|--|--|--|--|--|
| Delete Line | Completely delete the current cursor line. | | | |
| Duplicate Line | Duplicates the cursor line, inserting a copy of the line immediately after the cursor line. | | | |
| Delete Blank Lines | Deletes the line at the cursor if it is empty or contains only whitespace. | | | |
| Break Settings | The following cascade menus are displayed to set the break-related event. | | | |
| Set Hardware Break | Sets a breakpoint (Hardware Break event) to the line at the caret position (see "2.8.4 Stop the program at the arbitrary position (break event)") ^{Note 1} . | | | |
| Set Software Break (except [Simulator]) | Sets a breakpoint (Software Break event) to the line at the caret position (see "2.8.4 Stop the program at the arbitrary position (break event)") ^{Note 1} . | | | |
| Set Combination Break [E1][E20] | Sets a break event (execution type) to the line at the caret position as one of the condition for a combination break event (see "(1) Set a break event (execution type)") Note 1, 2. | | | |
| Set Read Break to | Sets a break event with read access condition to the line at the caret or the selected variable (global variable, static variable inside functions, or file-internal static variable)/SFR (see "2.8.5 Stop the program with the access to variables/SFRs"). | | | |
| Set Write Break to | Sets a break event with write access condition to the line at the caret or the selected variable (global variable, static variable inside functions, or file-internal static variable)/SFR (see "2.8.5 Stop the program with the access to variables/SFRs"). | | | |
| Set R/W Break to | Sets a break event with read/write access condition to the line at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable)/SFR (see "2.8.5" Stop the program with the access to variables/SFRs"). | | | |
| Set Read Combination Break to [E1][E20] | Sets a break event with read access condition to the line at the caret or the selected variable (global variable, static variable inside functions, or file-internal static variable)/SFR as one of the condition for a combination break event (see "2.8.5" Stop the program with the access to variables/SFRs") ^{Note 2} . | | | |
| Set Write Combination Break to [E1][E20] | Sets a break event with write access condition to the line at the caret or the selected variable (global variable, static variable inside functions, or file-internal static variable)/SFR as one of the condition for a combination break event (see "2.8.5" Stop the program with the access to variables/SFRs") ^{Note 2} . | | | |
| Set R/W Combination Break to [E1][E20] | Sets a break event with read/write access condition to the line at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable)/SFR as one of the condition for a combination break event (see "2.8.5" Stop the program with the access to variables/SFRs") ^{Note 2} . | | | |
| Break Option | Opens the Property panel to set the break function. | | | |
| Trace Settings | The following cascade menus are displayed to set the trace-related event ^{Note 3} . | | | |
| Start Tracing | Sets a trace start event to start collecting the trace data when the line at the caret is executed (see "2.11.3 Collect execution history in the arbitrary section") Note 1,4. | | | |
| Stop Tracing | Sets a trace end event to stop collecting the trace data when the line at the caret is executed (see "2.11.3 Collect execution history in the arbitrary section") Note 1,4. | | | |
| Record Reading Value | Sets a Point Trace event to record the access value as the trace data when a variable at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable) /SFR is read accessed (see "2.11.4 Collect execution history only when the condition is met [IECUBE][Simulator]"). | | | |
| Record Writing Value | Sets a Point Trace event to record the access value as the trace data when a variable at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable) /SFR is write accessed (see "2.11.4 Collect execution history only when the condition is met [IECUBE][Simulator]"). | | | |

| Record R/W Value | Sets a Point Trace event to record the access value as the trace data when a variable at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable) /SFR is read/ write accessed (see "2.11.4 Collect execution history only when the condition is met [IECUBE][Simulator]"). |
|--|--|
| Record Start R/W Value [E1][E20] | Sets a trace start event to start collecting the trace data when a variable at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable) / SFR is read/ write accessed (see "2.11.3 Collect execution history in the arbitrary section"). |
| Record End R/W Value [E1][E20] | Sets a trace end event to stop collecting the trace data when a variable at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable) / SFR is read/ write accessed (see "2.11.3 Collect execution history in the arbitrary section"). |
| Show Trace Result | Opens the Trace panel and displays the acquired trace data. |
| Trace Settings | Opens the Property panel to set the trace function. Note that this item is disabled the trace function is in operation. |
| Timer Settings [IECUBE][Simulator] | The following cascade menus are displayed to set the timer-related event (see "2.12.2 Measure execution time in the arbitrary section [IECUBE][Simulator]"). |
| Start timer | Sets a timer start event to start measuring the execution time of the program when an instruction of an address at the caret position is executed Note 1, 5. |
| Stop timer | Sets a timer end event to stop measuring the execution time of the program when an instruction of an address at the caret position is executed Note 1, 5. |
| View Result of Timer | Opens the Events panel and displays only timer-related events. |
| Clear Coverage Information [IECUBE][Simulator] | Clears all the coverage measurement results currently being stored in the debug tool. |
| Save Source Mixed Data As | Opens the Save As dialog box to newly save the contents of the currently editing Editor panel. Note that this item is enabled only when the Editor panel is in the mixed display mode. |

Notes 1. A message is displayed if these items are selected when the downloaded load module file is older than the opened source file.

2. [E1][E20]

This item is displayed only when the selected microcontroller supports combination break events.

3. [E1][E20][EZ Emulator]

This item is enabled only when the selected microcontroller incorporates the OCD trace function.

4. [Simulator]

The [Use trace function] property in the [Trace] category on the Property panel is automatically set to [Yes].

5. [Simulator]

The [Use timer function] property in the [Timer] [IECUBE][Simulator] category on the Property panel is automatically set to [Yes].

Memory panel

This panel is used to display the contents of the memory and change the memory value (see "2.9.1 Display/change the memory").

Furthermore, the contents of data flash memory can be displayed and changed when the selected microcontroller incorporates the data flash memory.

Up to a maximum of four of these panels can be opened. Each panel is identified by the names "Memory1", "Memory2", "Memory3", and "Memory4" on the titlebar.

The display contents are automatically updated when the value of the memory changes after a program is executed (when the execution is done in steps, the display is updated after each step).

In addition, by enabling the Real-time display update function, it is also possible to update the display contents in real-time even while a program is being executed.

This panel appears only when connected to the debug tool.

- Remarks 1. You can set the scroll range of the vertical scroll bar on this panel via the Scroll Range Settings dialog box which is opened by clicking the button from [View] on the toolbar.
 - 2. This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.

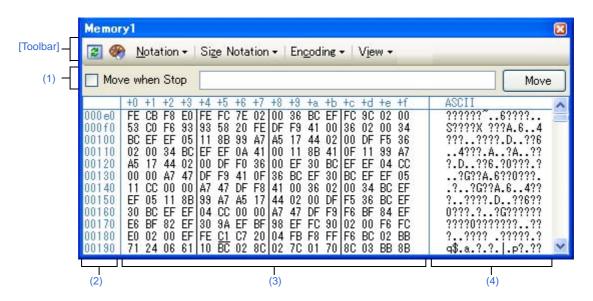

Figure A-22. Memory Panel

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[File] menu (Memory panel-dedicated items)]
- [[Edit] menu (Memory panel-dedicated items)]
- [Context menu]

[How to open]

- From the [View] menu, select [Memory] >> [Memory 1-4].

[Description of each area]

(1) Display position specification area

It is possible to specify the display start position of the memory contents by specifying an address expression. Specify the following items.

(a) Specify an address expression

Directly input the address expression of the memory value address to display in the text box. You can specify an input expression with up to 1024 characters. The result of the expression is treated as the display start position address.

Note that if an address value greater than the microcontroller address space is specified, the high-order address value is masked.

In addition, an address value greater than the value expressed within 32 bits cannot be specified.

- **Remarks 1.** A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").
 - 2. If the specified address expression is the symbol and its size can be recognized, everything from the start address to the end address of that symbol is displayed selected.

(b) Specify automatic/manual evaluation of the address expression

The timing to change the display start position can be determined by specifying in the [Move when Stop] check box and the [Move] button.

| [Move when Stop] | <u>\</u> | The caret is moved to the address which is automatically calculated from the address expression after the program is stopped. | |
|------------------|----------|--|--|
| | | The address expression is not automatically evaluated after the program is stopped. Click the [Move] button to manually evaluate the address expression. | |
| [Move] button | | When the [Move when Stop] check box is not checked, click this button to evaluate the address expression and move the caret to the result address of the evaluation. | |

(2) Address area

The address of the memory is displayed (hexadecimal number notation fixing).

The display starts from address 0x0 by default. However, an offset value of the start address can be set via the Address Offset Settings dialog box that is opened by selecting [Address Offset Value Settings...] from the context menu.

The address width corresponds to the one in memory space of the specified microcontroller in the project. This area cannot be edited.

Caution The offset value that have been set is automatically changed in accordance with the number of view columns in the Memory value area.

(3) Memory value area

The value of the memory is displayed and changed.

Specification of the display notation, display width of memory values or the number of view columns is performed by selecting the buttons on the toolbar or [Notation]/[Size Notation]/[View] from the context menu (see "(2) Change display format of values").

The meanings of the marks and colors displayed as memory values are as follows (character colors and background colors depend on the configuration in the [General - Font and Color] category of the Option dialog box):

| Display Example (Default) | | | | Description | |
|---------------------------|------------------|----------------|--|--|--|
| 00 Character color Blue | | Blue | Memory value that the user is changing | | |
| | Background color | Standard color | Press the [Enter] key to write to the target memory. | | |
| <u>00</u> | Character color | Standard color | 1 | the address whose symbol has been defined | |
| (Under line) | Background color | Standard color | (Registering water | ch-expression can be performed). | |
| 00 | Character color | Brown | | at has been changed because of the execution of a | |
| | Background color | Cream | program ^{Note} To reset the high | lighting, select the 🌏 button on the toolbar. | |
| 00 | Character color | Pink | 1 | r which the Real-time display update function is | |
| | Background color | Standard color | being operated | | |
| 00 | Character color | Standard color | Read/Fetch | Current access condition of the memory value | |
| | Background color | Palegreen | | when the Real-time display update function is being operated | |
| 00 | Character color | Standard color | Write | | |
| | Background color | Orange | | | |
| 00 | Character color | Standard color | Read and Write | | |
| | Background color | Paleturquoise | | | |
| 00 | Character color | Gray | Memory value of the read-protected area | | |
| | Background color | Standard color | | | |
| ?? | Character color | Gray | Areas not memory-mapped | | |
| | Background color | Standard color | | | |
| | Character color | Gray | Areas not rewritable (e.g. SFR area/I/O protection area) or when acquisition of memory values failed | | |
| | Background color | Standard color | | | |
| ** | Character color | Standard color | area during program execution or when acquisition of memory | | |
| | Background color | Standard color | | | |

Note Just before execution of a program, only the memory value in the address range for which the Memory panel had been displayed becomes the target.

In addition, the value is not highlighted if it is same for before and after the execution of the program.

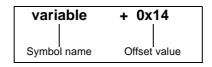

Caution The number of view columns is automatically changed in accordance with the set value of [Size Nortation] of the context menu.

This area is provided with the following functions.

(a) Pop-up display

The following contents are pop-up displayed based on the nearest existing symbol forward from the address the mouse is designating when hovering the mouse cursor over the memory value.

Note that if there is no symbol information (the underlining is non-display), no pop-up display is done.

| Symbol name | Indicates the name of the symbol. | |
|--------------|--|--|
| Offset value | When a symbol has not been defined for the addresses, the offset value from the nearest symbol exists forward is displayed (hexadecimal number notation fixing). | |

(b) Real-time display update function

Using the real-time display update function allows you to display/modify the value of the memory contents not only while the program is stopped, but also in execution.

See "(4) Display/modify the memory contents during program execution" for details on the real-time display update function.

(c) Changing memory values

Directly edit from the keyboard after moving the caret to the memory value to be edited.

The color of the memory value changes when it is in editing. Press the [Enter] key to write the edited value to the target memory (if the [Esc] key is pressed before the [Enter] key is pressed, the editing is cancelled). See "(3) Modify the memory contents" for details on the method for changing the memory value.

(d) Searching/initializing memory value

The Memory Search dialog box is opened to search the memory contents in the specified address range by selecting [Find...] from the context menu (see "(5) Search the memory contents").

In addition, the Memory Initialize dialog box is opened to change the memory contents collectively in the specified address range by selecting [Fill...] from the context menu (see "(6) Modify the memory contents in batch (initialize)").

(e) Copying and pasting

By selecting a range of memory values with the mouse, the contents of the range can be copied to the clipboard as a character string, and these contents can be pasted to the caret position.

These operations are performed by selecting from the context menu or selecting from the [Edit] menu.

However, the paste operation is possible only when the character string to be pasted and the display notation (radix and size) of the area match.

If the display notation does not match, a message is displayed.

The character codes and character strings that can be handled by this area are as follows.

If character strings other than these are pasted, a message is displayed.

| Character code | ASCII |
|------------------|--|
| Character string | 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, a, b, c, d, e, f, A, B, C, D, E, F |

(f) Registering watch-expression

A memory value with underline indicates that a symbol has been defined in the address, and its symbol can be registered as a watch-expression.

After selecting the memory value or placing the caret on the memory value, the symbol name of the address is registered in the Watch panel (Watch1) as a watch-expression by selecting [Register to Watch1] from the context menu.

Caution A memory value without underline cannot be registered as a watch-expression.

(g) Saving the contents of memory values

The Data Save dialog box can be opened by selecting the [File] menu >> [Save Memory Data As...], and the contents of this panel can be saved in a text file (*.txt) or CSV file (*.csv).

See "(7) Save the memory contents" for details on the method for saving the contents of memory values.

(4) Character strings area

Memory values converted into character code are displayed.

The character code can be specified by selecting [Encoding] from the toolbar or context menu (ASCII code is selected by default).

Furthermore, in this area, memory values converted into a floating-point value can be displayed as character strings. To do this, select the following item from [Encording] of the context menu.

| Item | | Size | | |
|------------------|--|--|--------|--|
| Float | Single-precision fl | 32-bit | | |
| | Numeric value | <sign><mantissa>e<sign><exponent></exponent></sign></mantissa></sign> | | |
| | Infinite number | Inf, and -Inf | | |
| | Not a number | NaN | | |
| | Example | + 1.234567e+123 | | |
| Double | Double-precision f | floating-point value | 64-bit | |
| | Numeric value | <sign><mantissa>e<sign><exponent></exponent></sign></mantissa></sign> | | |
| | Infinite number | Inf, and -Inf | | |
| | Not a number | NaN | | |
| | Example | + 1.2345678901234e+123 | | |
| Float Complex | Complex number | 64-bit | | |
| | <single-precision< td=""><td>floating-point value> <single-precision floating-point="" value=""> * I</single-precision></td><td></td></single-precision<> | floating-point value> <single-precision floating-point="" value=""> * I</single-precision> | | |
| Double Complex | Complex number | 128-bit | | |
| | <double-precision floating-point="" value=""> <double-precision floating-point="" value=""> *</double-precision></double-precision> | | | |
| Float Imaginary | Imaginary number | 32-bit | | |
| | <single-precision< td=""><td></td></single-precision<> | | | |
| Double Imaginary | Oouble Imaginary | | 64-bit | |
| | <double-precision floating-point="" value=""> * I</double-precision> | | | |

Caution Nothing is displayed when the minimum size of a character code or a floating-point value is greater than "the number of bytes of display width of memory values" x "the number of bytes of the number of view columns".

This area is provided with the following functions.

(a) Changing character strings

Directly edit from the keyboard after moving the caret to the character string to be edited.

The color of the character string changes when it is in editing. Press the [Enter] key to write the edited value to the target memory (if the [Esc] key is pressed before the [Enter] key is pressed, the editing is cancelled).

Caution Character strings displayed as floating-point values cannot be searched.

(b) Searching character strings

The Memory Search dialog box is opened to search for character strings by selecting [Find...] from the context menu (see "(5) Search the memory contents").

(c) Copying and pasting

By selecting a range of character strings with the mouse, the contents of the range can be copied to the clipboard as a character string, and these contents can be pasted to the caret position.

These operations are performed by the selecting from the context menu or selecting from the [Edit] menu. However, the paste operation is possible only when [ASCII] has been selected as the character code. If other than [ASCII] is selected, a message is displayed.

[Toolbar]

| 2 | Acquires the latest data from the debug tool, and updates the contents of this panel. |
|---------------|--|
| % | Resets highlighting of values that have been changed by executing a program. |
| | This item is disabled during execution of a program. |
| Notation | The following buttons to change the notation of memory values are displayed. |
| | The items below is disabled during execution of a program. |
| Hex | Displays memory values in hexadecimal number (default). |
| S | Displays memory values in signed decimal number. |
| Dec | Displays memory values in unsigned decimal number. |
| Oct | Displays memory values in octal number. |
| Bin | Displays memory values in binary number. |
| Size Notation | The following buttons to change the notation of sizes of memory values are displayed. |
| | The items below is disabled during execution of a program. |
| 4 | Displays memory values in 4-bit width. |
| 8 | Displays memory values in 8-bit width (default). |
| 16 | Displays memory values in 16-bit width. |
| | Values are converted depending on the endian of the target memory area. |
| 32 | Displays memory values in 32-bit width. |
| | Values are converted depending on the endian of the target memory area. |
| 64 | Displays memory values in 64-bit width. |
| Face dia s | Values are converted depending on the endian of the target memory area. |
| Encoding | The following buttons to change the encoding of character strings are displayed. The items below is disabled during execution of a program. |
| Asc | Displays character strings in ASCII code (default). |
| sus | Displays character strings in Shift_JIS code. |
| (EUC) | Displays character strings in EUC-JP code. |
| UTF | Displays character strings in UTF-8 code. |
| | 1 1 1 |
| 16 | Displays character strings in UTF-16 code. |
| Fio | Displays character strings as a single-precision floating-point value. |
| Dbl | Displays character strings as a double-precision floating-point value. |
| Fip | Displays character strings as a complex number of single-precision floating-point. |
| Dbi | Displays character strings as a complex number of double-precision floating-point. |
| FIR | Displays character strings as an imaginary number of single-precision floating-point. |
| Dbl | Displays character strings as an imaginary number of double-precision floating-point. |

| View | | The following buttons to change the display format are displayed. |
|------|-------------------------------|--|
| | * | Opens the Scroll Range Settings dialog box to set the scroll range for this panel. |
| | Column Number Settings | Opens the Column Number Settings dialog box to set the number of view columns in the Memory value area. |
| | Address Offset Value Settings | Opens the Address Offset Settings dialog box to set an offset value for addresses displayed in the Address area. |

[[File] menu (Memory panel-dedicated items)]

The following items are exclusive for the [File] menu in the Memory panel (other items are common to all the panels). Note that all these items are disabled during execution of a program.

| Save Memory Data | Overwrites the contents of this panel to the previously saved text file (*.txt)/CSV file (*.csv) (see "(g) Saving the contents of memory values"). Note that when the file has never been saved or the file is write disabled, the same operation is applied as the selection in [Save Memory Data As]. | |
|---------------------|--|--|
| Save Memory Data As | Opens the Data Save dialog box to newly save the contents of this panel to the specified text file (*.txt)/CSV file (*.csv) (see "(g) Saving the contents of memory values"). | |

[[Edit] menu (Memory panel-dedicated items)]

The following items are exclusive for [Edit] menu in the Memory panel (all other items are disabled). Note that all these items are disabled during execution of a program.

| Сору | Copies the contents of the selected range to the clipboard as character string(s). | | |
|-------|--|--|--|
| Paste | Pastes the character string(s) copied in the clipboard to the caret position. | | |
| | To the memory value area: See "(e) Copying and pasting". | | |
| | - To the character strings area: See "(c) Copying and pasting". | | |
| Find | Opens the Memory Search dialog box. | | |
| | The search is operated either in the Memory value area or the Character strings area, in which a caret is. | | |

[Context menu]

| Register to Watch1 | Registers the symbol at the caret to the Watch panel (Watch1). At this time, since it is registered as a variable name, the symbol name that is displayed changes depending on the scope. Note that this item is disabled when no symbol has been defined in the address corresponding to the memory value at the caret position (see "(f) Registering watch-expression"). | |
|--------------------|--|--|
| Find | Opens the Memory Search dialog box. The search is operated either in the Memory value area or the Character strings area (unless the floating-point value display is selected), in which a caret is. This item is disabled during execution of a program. | |
| Fill | Opens the Memory Initialize dialog box. | |
| Refresh | Acquires the latest data from the debug tool, and updates the contents of this panel. | |
| Сору | Copies the contents of the selected range to the clipboard as character string(s). This item is disabled during execution of a program. | |

| Paste | Pasts the character string(s) copied in the clipboard to the caret position. |
|----------------------------------|---|
| | This item is disabled during execution of a program. |
| | - To the memory value area: See "(e) Copying and pasting". - To the character strings area: See "(c) Copying and pasting". |
| Notation | |
| Notation | The following cascade menus are displayed to specify the notation of memory values. |
| Hexadecimal | Displays memory values in hexadecimal number (default). |
| Signed Decimal | Displays memory values in signed decimal number. |
| Unsigned Decimal | Displays memory values in unsigned decimal number. |
| Octal | Displays memory values in octal number. |
| Binary | Displays memory values in binary number. |
| Size Notation | The following cascade menus are displayed to specify the notation of sizes of memory values. |
| 4 Bits | Displays memory values in 4-bit width. |
| 1 Byte | Displays memory values in 8-bit width (default). |
| 2 Bytes | Displays memory values in 16-bit width. |
| | Values are converted depending on the endian of the target memory area. |
| 4 Bytes | Displays memory values in 32-bit width. |
| | Values are converted depending on the endian of the target memory area. |
| 8 Bytes | Displays memory values in 64-bit width. |
| | Values are converted depending on the endian of the target memory area. |
| Encoding | The following cascade menus are displayed to specify the display format in the character strings area. |
| ASCII | Displays character strings in ASCII code (default). |
| Shift_JIS | Displays character strings in Shift_JIS code. |
| EUC-JP | Displays character strings in EUC-JP code. |
| UTF-8 | Displays character strings in UTF-8 code. |
| UTF-16 | Displays character strings in UTF-16 code. |
| Float | Displays character strings as a single-precision floating-point value. |
| Double | Displays character strings as a double-precision floating-point value. |
| Float Complex | Displays character strings as a complex number of single-precision floating-point. |
| Double Complex | Displays character strings as a complex number of double-precision floating-point. |
| Float Imaginary | Displays character strings as an imaginary number of single-precision floating-point. |
| Double Imaginary | Displays character strings as an imaginary number of double-precision floating-point. |
| View | The following cascade menus are displayed to specify the display format. |
| Settings Scroll Range | Opens the Scroll Range Settings dialog box to set the scroll range for this panel. |
| Column Number | Opens the Column Number Settings dialog box to set the number of view columns in the Memory |
| Settings | value area. |
| Address Offset Value Settings | Opens the Address Offset Settings dialog box to set an offset value for addresses displayed in the Address area. |
| Highlight Accessed | Highlights memory values that have changed by execution of a program if this item is checked (default). |
| | This item is disabled during execution of a program. |

| F | Periodic Updating | The following cascade menus are displayed to set for the real-time display update function (see "(b) Real-time display update function"). |
|---|------------------------------|---|
| | Periodic Updating Options | Opens the Property panel to set for the real-time display update function. |

Disassemble panel

This panel is used to display the results of disassembling the contents of the memory (disassembled text), and execute line assembly (see "2.6.4 Perform line assembly").

Furthermore, the instruction level debugging (see "2.7.3 Execute programs in steps") and the code coverage measurement result display [IECUBE][Simulator] (see "2.13 Measure Coverage [IECUBE][Simulator]") can be performed in this panel.

Up to a maximum of four of these panels can be opened. Each panel is identified by the names "Disassemble1", "Disassemble2", "Disassemble3" and "Disassemble4" on the titlebar.

The source text in the source file corresponding to the code data can also be displayed by setting to the mixed display mode (default).

This panel appears only when connected to the debug tool.

Caution A step execution is performed in instruction level units when the focus is in this panel (see "2.7.3 Execute programs in steps").

- Remarks 1. You can set the scroll range of the vertical scroll bar on this panel via the Scroll Range Settings dialog box which is opened by clicking the button from [View] on the toolbar.
 - 2. You can print the current screen image of this panel by selecting [Print...] from the [File] menu.
 - 3. This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.

Figure A-24. Disassemble Panel (When Mixed Display Mode Is Not Selected)

Figure A-25. Disassemble Panel (When Code Coverage Measurement Result Is Displayed)

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[File] menu (Disassemble panel-dedicated items)]
- [[Edit] menu (Disassemble panel-dedicated items)]
- [Context menu]

[How to open]

- From the [View] menu, select [Disassemble] >> [Disassemble1 - 4].

[Description of each area]

(1) Event area

The lines for which events can be set are shown with the background color in white (this mean that events cannot be set for those lines whose background color in gray).

In addition, the Event mark corresponding to an event that has been currently set is displayed.

This area is provided with the following functions.

(a) Setting/deleting breakpoints

By clicking where you want to set a breakpoint with the mouse, the breakpoint can be set easily.

The breakpoint is set to the instruction at the start address of the clicked line.

Once the breakpoint is set, the Event mark is displayed at the line that is set. In addition, the detailed information about the set breakpoint is reflected in the Events panel.

When this operation is performed at a place where any one of the event marks is already being displayed, that event is deleted and the setting of breakpoints cannot be done.

Note that the setting of events can be done only for those lines where the background color is shown in white. See "2.8.3 Stop the program at the arbitrary position (breakpoint)" for details on how to set the breakpoint.

(b) Changes event status

Event status can be changed from the following menu displayed by right-clicking the event mark.

| Enable Event | Changes the selected event state to a Valid state. Event occurs when the specified condition is met. When the event mark (which indicates that multiple events have been set is selected, all of the events that have been set are enabled. |
|---------------------------|--|
| Disable Event | Changes the selected event state to an Invalid state. Event does not occur when the specified condition is met. When the event mark () which indicates that multiple events have been set is selected, all of the events that have been set are disabled. |
| Delete Event | Deletes the selected event. When the event mark () which indicates that multiple events have been set is selected, all of the events that have been set are deleted. |
| View Event Detailed Setup | Opens the Events panel to display the detailed information of the selected event. |

(c) Pop-up display

By hovering the mouse cursor over the Event mark, the name of the event, the detailed information for the event and the comments added to the event are pop-up displayed.

When multiple events have been set in the applicable place, information for each event, up to a maximum of three events, is listed and displayed.

(2) Address area

The address per line to start disassembling is displayed (hexadecimal number notation fixing). In addition, the current PC mark () that corresponds to the current PC position (PC register value) is displayed. The address width corresponds to the one in memory space of the specified microcontroller in the project. For the source text line in the mixed display mode, line numbers (xxx:) in the source file correspond to the start address are displayed.

This area is provided with the following functions.

(a) Pop-up display

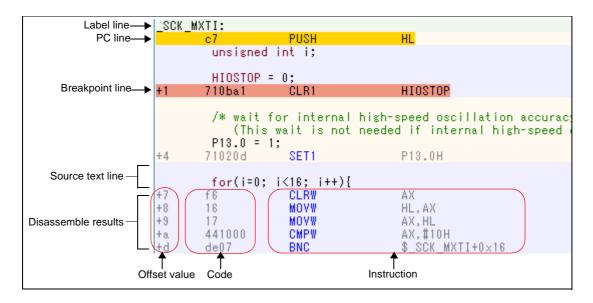

By hovering the mouse cursor over a address or line number, the following information is pop-up displayed.

| Address | Format: <label name=""> + <offset value=""> Example1: main + 0x10</offset></label> |
|--------------------|--|
| | Example: Inall + 0x10 Example2: sub function + 0x20 |
| Source line number | Format: <file name=""> # <line number=""></line></file> |
| | Example1: main.c#40 |
| | Example2: main.c#100 |

(3) Disassemble area

The results of disassembling are displayed next to the corresponding source text as follows.

Figure A-26. Display Contents of Disassemble Area (In Case of Mixed Display Mode)

| Label line | | The label is displayed when a label is defined for the address, and its corresponding line is shown highlighted in lightgreen. |
|---------------------|--------------|--|
| PC line | | A line corresponding to an address of the current PC (PC register value) is shown highlighted Note 1. |
| Breakpoint line | | A line at which a breakpoint is set is shown highlighted Note 1. |
| Source text line | | The source text corresponding to the code data is displayed Note 2. |
| Disassemble results | Offset value | The offset value from the nearest label is displayed when a label is defined for the address ^{Note 3} . |
| | Code | The code that is the target of disassembly is displayed in hexadecimal number. |
| | Instruction | Instruction is displayed as the result of disassembling. The mnemonics are shown highlighted in blue. |

Notes 1. The highlighting color depends on the configuration in the [General - Font and Color] category of the Option dialog box.

- 2. The source text can be set to non-display by clicking the button (toggle) on the toolbar or removing the check for [Mixed Display] from the context menu (this option is checked by default).
- 3. Offset values are not displayed by default. They can be displayed by clicking the button on the toolbar or selecting [Show Offset] from the context menu.

This area is provided with the following functions.

(a) Line assembly

Instructions and code displayed in this panel can be edited (line assembly).

See "2.6.4 Perform line assembly" for details on how to operate it.

(b) Program execution by instruction level

Execution can be controlled at the instruction level unit by step executing a program in a state where there is a focus on this panel.

See "2.7.3 Execute programs in steps" for details on how to operate it.

(c) Setting of various events

Various events can be set to the addresses/lines where the caret currently exists by selecting [Bread Settings], [Trace Settings] or [Timer Settings] from the context menu.

The corresponding Event mark is displayed in the Event area when an event is set. In addition, the detailed information about the set event is reflected in the Events panel.

+Note, however, that the setting of events can be done only for those lines where the background color is shown in white in the event area.

See the following for details on how to set events.

- "2.8.5 Stop the program with the access to variables/SFRs"
- "2.11.3 Collect execution history in the arbitrary section"
- "2.11.4 Collect execution history only when the condition is met [IECUBE][Simulator]"
- "2.12.2 Measure execution time in the arbitrary section [IECUBE][Simulator]"

Remark A breakpoint can be set or deleted easily in the Event area as well (see "(a) Setting/deleting breakpoints").

(d) Registering watch-expression

Variable names of C language, CPU registers, SFR, and assembler symbols can be registered in the Watch panel as watch-expressions.

See "(1) Register a watch-expression" for details on how to operate it.

(e) Moving to symbol definition place

By clicking the button on the toolbar or selecting [Go to Symbol] from the context menu in a state where the caret has been moved to a instruction that has referenced a symbol, the caret position is moved to the address where the symbol at the caret position has been defined.

In addition, when following on this operation you click on the button on the toolbar or select [Back to Address] from the context menu, the caret position is returned to the instruction that has referenced a symbol before the caret was moved (the address value of the instruction that has referenced a symbol is displayed in Address).

(f) Jump to source line and memory

Selecting [Jump to Source] from the context menu will open the Editor panel with the caret moved to the source line corresponding to the address at the current caret position (if the Editor panel is already open, the screen will jump to the panel).

In addition, similarly, selecting [Jump to Memory] will open the Memory panel (Memory1) with the caret moved to the memory value corresponding to the address at the current caret position (if the Memory panel (Memory1) is already open, the screen will jump to the panel).

(g) Code coverage measurement result display [IECUBE][Simulator]

When the coverage function is valid^{Note}, lines corresponding to the specified coverage measurement area are shown highlighted based on the code coverage measurement result that is acquired by executing the program. See "2.13 Measure Coverage [IECUBE][Simulator]" for details on the coverage measurement.

Note [IECUBE]

The coverage function is always valid.

(h) Saving the contents of disassembled data

The Data Save dialog box can be opened by selecting the [File] menu >> [Save Disassemble Data As...], and the contents of this panel can be saved in a text file (*.txt) or CSV file (*.csv).

See "(5) Save the disassembled text contents" for details on the method for saving the contents of disassembled data.

[Toolbar]

| 2 | Acquires the latest data from the debug tool, and updates the contents of this panel. |
|------------------|---|
| 31 | Sets to the mixed display mode and displays the correspondence between the disassembled data and the source text (default). |
| | Specifies the caret position so that it follows the current PC value. |
| a go □ | Moves the caret to the define position of the selected symbol. |
| <u>1</u> 28 | Moves the caret to the position (address) immediately before it is moved with the total button. |
| View | The following buttons to set the display contents in the disassemble area are displayed. |
| 7 | Displays the offset value of the label. The offset value from the nearest label is displayed when a label is defined for the address. |
| 1298 3 C | Displays the address value in the format "symbol + offset value" (default). |
| | Note that when a symbol has been defined as the address value, only the symbol is displayed. |
| 6 | Displays the name of the register by its function name (default). |
| RS | Displays the name of the register by its absolute name. |
| | Opens the Scroll Range Settings dialog box to set the scroll range for this panel. |

[[File] menu (Disassemble panel-dedicated items)]

The following items are exclusive for the [File] menu in the Disassemble panel (other items are common to all the panels).

Note that all these items are disabled during execution of a program.

| Save Disassemble Data | Overwrites the contents of the disassembling to the previously saved text file (*.txt)/CSV file (*.csv) (see "(h) Saving the contents of disassembled data"). Note that when the file has never been saved or the file is write disabled, the same operation is applied as the selection in [Save Disassemble Data As]. |
|-----------------------------|--|
| Save Disassemble Data As | Opens the Data Save dialog box to newly save the contents of the disassembling to the specified text file (*.txt)/CSV file (*.csv) (see "(h) Saving the contents of disassembled data"). |

| Print Opens the Print Address Ra | nge Settings dialog box for printing the contents of this panel. |
|----------------------------------|--|
|----------------------------------|--|

[[Edit] menu (Disassemble panel-dedicated items)]

The following items are exclusive for the [Edit] menu in the Disassemble panel (all other items are disabled).

| Сору | When a line is selected, copies the contents of the selected line to the clipboard as a character string. In the case of the edit mode, copies the selected character string to the clipboard. |
|---------|---|
| Rename | Changes to the edit mode to edit the instruction/code at the caret position (see "2.6.4 Perform line assembly"). This item is disabled during execution of a program. |
| Find | Opens the Find and Replace dialog box with selecting the [Find in Files] tab. |
| Replace | Opens the Find and Replace dialog box with selecting the [Replace in Files] tab. |
| Move | Opens the Go to the Location dialog box to move the caret to the specified address. |

[Context menu]

[Disassemble area and Address area]

| Register to Watch1 | Registers the selected character string or the word at the caret position to the Watch panel |
|-----------------------|---|
| | (Watch1) as a watch-expression (the judgment of the word depends on current build tool). |
| | At this time, since it is registered as a variable name, the symbol name that is displayed |
| | changes depending on the scope. |
| Register Action Event | Opens the Action Events dialog box to set an action event to the address at the caret position. |
| Go to Here | Executes the program from the address indicated by the current PC value to the address |
| | corresponding to the line at the caret position. |
| | This item is disabled during program execution/build (not including rapid build) execution. |
| Set PC to Here | Sets the address of the line at the current caret position to the current PC value. |
| | This item is disabled during program execution/build (not including rapid build) execution. |
| Move | Opens the Go to the Location dialog box to move the caret to the specified address. |
| Go to Symbol | Moves the caret to the define position of the selected symbol. |
| Back to Address | Moves the caret to the position (address) immediately before it is moved by [Go to Symbol]. |
| | Note that this item is disabled when no symbol name is displayed in the address. |
| Break Settings | The following cascade menus are displayed to set the break-related event. |
| | Note that breakpoints can be set only for lines for which events can be set (see "(1) Event area"). |
| Set Hardware Break | Sets a breakpoint (Hardware Break event to the address at the caret position (see "2.8.3 Stop the program at the arbitrary position (breakpoint)"). |
| Set Software Break | Sets a breakpoint (Software Break event) to the address at the caret position (see "2.8.3 Stop |
| (except [Simulator]) | the program at the arbitrary position (breakpoint)"). |
| Set Combination Break | Sets a break event (execution type) to the address at the caret position as one of the condition |
| [E1][E20] | for a combination break event (see "(1) Set a break event (execution type)") ^{Note 1} . |
| Set Read Break to | Sets a break event with read access condition to a variable at the caret or a selected variable (global variable/static variable inside functions/file-internal static variable)/SFR (see "(1) Set a break event (access type)"). |

| Set Write Break to | Sets a break event with write access condition to a variable at the caret or a selected variable (global variable/static variable inside functions/file-internal static variable)/SFR (see "(1) Set a break event (access type)"). |
|--|---|
| Set R/W Break to | Sets a break event with read/write access condition to a variable at the caret or a selected variable (global variable/static variable inside functions/file-internal static variable)/SFR (see "(1) Set a break event (access type)"). |
| Set Read Combination Break to [E1][E20] | Sets a break event with read access condition to the line at the caret or the selected variable (global variable, static variable inside functions, or file-internal static variable)/SFR as one of the condition for a combination break event (see "(1) Set a break event (access type)") ^{Note 1} . |
| Set Write Combination Break to [E1][E20] | Sets a break event with write access condition to the line at the caret or the selected variable (global variable, static variable inside functions, or file-internal static variable)/SFR as one of the condition for a combination break event (see "(1) Set a break event (access type)") ^{Note 1} . |
| Set R/W Combination Break to [E1][E20] | Sets a break event with read/write access condition to the line at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable)/SFR as one of the condition for a combination break event (see "(1) Set a break event (access type)") ^{Note 1} . |
| Break Option | Opens the Property panel to set the break function. |
| Trace Settings | The following cascade menus are displayed to set the trace-related event ^{Note 2} . Note that events can be set only for lines for which events can be set (see "(1) Event area"). |
| Start Tracing | Sets a trace start event to start collecting the trace data when an instruction of an address at the caret position is executed (see "(1) Set a Trace event"). [Simulator] In addition, the selecting of the [Use trace function] property in the [Trace] category on the Property panel is automatically set to [Yes]. |
| Stop Tracing | Sets a trace end event to stop collecting the trace data when an instruction of an address at the caret position is executed (see "(1) Set a Trace event"). [Simulator] In addition, the selecting of the [Use trace function] property in the [Trace] category on the Property panel is automatically set to [Yes]. |
| Record Reading Value | Sets a Point Trace event to record the access value as the trace data when a variable at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable) or SFR is read accessed (see "(1) Set a Point Trace event"). |
| Record Writing Value | Sets a Point Trace event to record the access value as the trace data when a variable at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable) or SFR is write accessed (see "(1) Set a Point Trace event"). |
| Record R/W Value | Sets a Point Trace event to record the access value as the trace data when a variable at the caret or a selected variable (global variable/static variable inside functions/file-internal static variable)/SFR is read/write accessed (see "(1) Set a Point Trace event"). |
| Record Start R/W Value [E1][E20] | Sets a trace start event to start collecting the trace data when a variable at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable) / SFR is read/ write accessed (see "(1) Set a Trace event"). |
| Record End R/W Value [E1][E20] | Sets a trace end event to stop collecting the trace data when a variable at the caret or the selected variable (global variable, static variable inside functions, file-internal static variable) / SFR is read/ write accessed (see "(1) Set a Trace event"). |
| Show Trace Result | Opens the Trace panel and displays the acquired trace data. |
| Trace Settings | Opens the Property panel to set the trace function. |
| | I. |

| Timer Settings [IECUBE][Simulator] | The following cascade menus are displayed to set the timer-related event (see "2.12.2 Measure execution time in the arbitrary section [IECUBE][Simulator]"). Note that events can be set only for lines for which events can be set (see "(1) Event area"). |
|------------------------------------|--|
| Start timer | Sets a timer start event to start measuring the execution time of the program when an instruction of an address at the caret position is executed. [Simulator] In addition, the selecting of the [Use timer function] property in the [Timer] [IECUBE][Simulator] category on the Property panel is automatically set to [Yes]. |
| Stop timer | Sets a timer end event to stop measuring the execution time of the program when an instruction of an address at the caret position is executed. [Simulator] In addition, the selecting of the [Use timer function] property in the [Timer] [IECUBE][Simulator] category on the Property panel is automatically set to [Yes]. |
| View Result of Timer | Opens the Events panel and displays only timer-related events. |
| Clear Coverage Information | Clears all the coverage measurement results currently being stored in the debug tool. Note that this item appears only when the debug tool used supports the coverage function. |
| Edit Disassemble | Changes to the edit mode to edit the instruction of the line at the caret position (see "2.6.4 Perform line assembly"). This item is disabled during execution of a program. |
| Edit Code | Changes to the edit mode to edit the code of the line at the caret position (see "2.6.4 Perform line assembly"). This item is disabled during execution of a program. |
| View | The following cascade menus to set the display contents in the disassemble area are displayed. |
| Show Offset | Displays the offset value of the label. The offset value from the nearest label is displayed when a label is defined for the address. |
| Show Symbol | Displays the address value in the format "symbol + offset value" (default). Note that when a symbol has been defined as the address value, only the symbol is displayed. |
| Show Function Name | Displays the name of the register by its function name (default). |
| Show Absolute Name | Displays the name of the register by its absolute name. |
| Settings Scroll Range | Opens the Scroll Range Settings dialog box to set the scroll range for this panel. |
| Mixed Display | Sets to the mixed display mode and displays the correspondence between the disassembled data and the source text (default). |
| Jump to Source | Opens the Editor panel and jumps to the source line corresponding to the address at the caret position in this panel. |
| Jump to Memory | Opens the Memory panel (Memory1) and jumps to the memory value corresponding to the address at the caret position in this panel. |

Notes 1. [E1][E20]

This item is displayed only when the selected microcontroller supports combination break events.

2. [E1][E20][EZ Emulator]

This item is enabled only when the selected microcontroller incorporates the OCD trace function.

[Event area] (except [Simulator])

| Hardware Break First | The type of break that can be set by a one click operation of the mouse is set as a hardware |
|----------------------|--|
| | breakpoint (this is reflected in the setting of the [First using type of breakpoint] property in the |
| | [Break] category on the Property panel). |

| Software Break First | The type of break that can be set by a one click operation of the mouse is set as a software | |
|----------------------|--|--|
| | breakpoint (this is reflected in the setting of the [First using type of breakpoint] property in the | |
| | [Break] category on the Property panel). | |

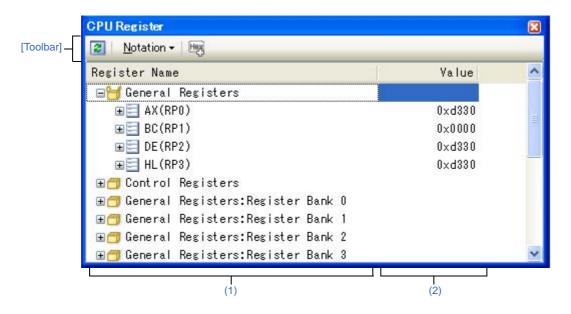

CPU Register panel

This panel is used to display the contents of the CPU register (general-purpose registers and control registers) and change the CPU register values (see "2.9.2 Display/change the CPU register").

This panel appears only when connected to the debug tool.

- Remarks 1. This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.
 - 2. When the separator line of each area in this panel is double-clicked, the width of the area changes to the shortest possible size that can display the contents of the area.

Figure A-27. CPU Register Panel

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[File] menu (CPU Register panel-dedicated items)]
- [[Edit] menu (CPU Register panel-dedicated items)]
- [Context menu]

[How to open]

- From the [View] menu, select [CPU Register].

[Description of each area]

(1) [Register Name] area

The types of register are classified as categories (folders), and a list of the respective register names is displayed. Note that neither category names nor register names can be edited and deleted.

The meanings of the icons are as follows:

| ¥ | Indicates that the register name belonging to this category is displayed. When you double-click on the icon, or click on the "-" mark, the category is closed and the register name is hidden. |
|---|--|
| | Indicates that the register name belonging to this category is hidden. When you double-click on the icon, or click on the "+" mark, the category is opened and the register name is displayed. |
| | Indicates the name of the register. When you double-click on the icon, or click on the "+" or "-" marks, the name of the register part is displayed or hidden. |
| | Indicates the name of the register part. |

Category names and register names displayed are as follows (number of "+" marks before register names indicates the depth of the display level):

Table A-3. Category Names and Register Names in CPU Register Panel

| Category Name | Register Name (Alias) | Bit Width | Description | |
|------------------|-----------------------|-----------|--|--|
| General-purpose | + AX(RP0) | 16 | General-purpose register (current register bank) | |
| register | ++ X(R0) | 8 | | |
| | ++ A(R1) | 8 | | |
| | + BC(RP1) | 16 | | |
| | ++ C(R2) | 8 | | |
| | ++ B(R3) | 8 | | |
| | + DE(RP2) | 16 | | |
| | ++ E(R4) | 8 | | |
| | ++ D(R5) | 8 | | |
| | + HL(RP3) | 16 | | |
| | ++ L(R6) | 8 | | |
| | ++ H(R7) | 8 | | |
| Control register | + PC | 20 | Program counter | |
| | + PSW | 8 | Program status word | |
| | ++ IE | 1 | Interrupt enable flag | |
| | ++ Z | 1 | Zero flag | |
| | ++ RBS1 | 1 | Register bank selection flag | |
| | ++ AC | 1 | Auxiliary carry flag | |
| | ++ RBS0 | 1 | Register bank selection flag | |
| | ++ ISP1 | 1 | In service priority flag | |
| | ++ ISP0 | 1 | In service priority flag | |
| | ++ CY | 1 | Carry flag | |
| | + SP | 16 | Stack pointer | |
| | + ES | 8 | ES register | |
| | + CS | 8 | CS register | |

| Category Name | Register Name (Alias) | Bit Width | Description |
|---|----------------------------|-----------|--|
| General-purpose | ' ' ' ' ' | | General-purpose register (Register bank n) |
| register: Register bank n ^{Note} | + X(R0): Register bank n | 8 | |
| | ++ A(R1): Register bank n | 8 | |
| | +BC(RP1): Register bank n | 16 | |
| | ++ C(R2): Register bank n | 8 | |
| | ++ B(R3): Register bank n | 8 | |
| | + DE(RP2): Register bank n | 16 | |
| | ++ E(R4): Register bank n | 8 | |
| | ++ D(R5): Register bank n | 8 | |
| | + HL(RP3): Register bank n | 16 | |
| | ++ L(R6): Register bank n | 8 | |
| | ++ H(R7): Register bank n | 8 | |

Note "n" indicates the number of the register bank (n = 0, 1, 2, 3).

This area is provided with the following functions.

(a) Registering watch-expression

CPU registers/categories can be registered in the Watch panel as watch-expressions. See "(1) Register a watch-expression" for details on how to operate it.

Remarks 1. When you have registered a watch-expression with a category as the object, all of the CPU registers belonging to that category are registered as watch-expressions.

2. A scope specification is automatically added to a registered watch-expression.

(2) [Value] area

The values of each CPU register are displayed and changed.

The radix of a data value can be selected by the button on the toolbar or the context menu item. In addition, a display format adding the value in hexadecimal number constantly can also be selected as well.

The meanings of the colors of the CPU register values are as follows (character colors and background colors depend on the configuration in the [General - Font and Color] category of the Option dialog box):

| Display Example (Default) | | efault) | Description |
|---------------------------|------------------|----------------|---|
| 0x0 | Character color | Blue | The value of the CPU register that the user is changing |
| | Background color | Standard color | Press the [Enter] key to write to the target memory. |
| 0x0 | Character color | Brown | The value of the CPU register that has been changed because of the |
| | Background color | Cream | execution of a program. The highlighting is rest by executing again the program. |

This area is provided with the following functions.

(a) Changing the CPU register value

To edit the CPU register value, select the value to edit, then change the value directly from the keyboard after clicking again on it (press the [Esc] key to cancel the edit mode).

After you edit the value of the CPU register, it is written to the target memory of the debug tool by pressing the [Enter] key or moving the focus to outside the edit region.

(b) Saving the contents of the CPU register

The Save As dialog box can be opened by selecting the [File] menu >> [Save CPU Register Data As...], and all the contents of this panel can be saved in a text file (*.txt) or CSV file (*.csv).

See "(4) Save the CPU register contents" for details on the method for saving the contents of the CPU register.

[Toolbar]

| 2 | Acquires the latest data from the debug tool, and updates the contents of this panel. | |
|----------|--|--|
| | This item is disabled during execution of a program. | |
| Notation | The following buttons to change the notation of a data value are displayed. | |
| auto | Displays the value of the selected item (including sub-items) in the default notation (default). | |
| Hex | Displays the value of the selected item (including sub-items) in hexadecimal number. | |
| S | Displays the value of the selected item (including sub-items) in signed decimal number. | |
| Dec | Displays the value of the selected item (including sub-items) in unsigned decimal number. | |
| Oct | Displays the value of the selected item (including sub-items) in octal number. | |
| Bin | Displays the value of the selected item (including sub-items) in binary number. | |
| Asc | Displays the character string of the selected item (including sub-items) in ASCII code. If the character size is 2 bytes and above, it is displayed with the characters for each 1 byte arranged side-by-side. | |
| Fio | Displays the value of the selected item in Float. | |
| | Note that when the value is not 4-byte data, displays it in the default notation. | |
| Dbl | Displays the value of the selected item in Double. | |
| | Note that when the value is not 8-byte data, displays it in the default notation. | |
| Hes | Adds the value in hexadecimal number enclosing with "()" at the end of the value. | |

[[File] menu (CPU Register panel-dedicated items)]

The following items are exclusive for the [File] menu in the CPU Register panel (other items are common to all the panels).

Note that all these items are disabled during execution of a program.

| Save CPU Register Data | Overwrites the contents of this panel to the previously saved text file (*.txt)/CSV file (*.csv) (see "(b) Saving the contents of the CPU register"). Note that when the file has never been saved or the file is write disabled, the same operation is applied as the selection in [Save CPU Register Data As]. | |
|---------------------------|---|--|
| Save CPU Register Data As | Opens the Save As dialog box to newly save the contents of this panel to the specified text file (*.txt)/CSV file (*.csv) (see "(b) Saving the contents of the CPU register"). | |

[[Edit] menu (CPU Register panel-dedicated items)]

The following items are exclusive for [Edit] menu in the CPU Register panel (all other items are disabled).

| Cut | Deletes the selected character string and copies it to the clipboard. | |
|-----|---|--|
| | This item becomes valid only when the character string is being edited. | |

| Сору | Copies the selected character string to the clipboard during editing. If a line is selected, copies the register or the category to the clipboard. The copied item can be pasted to the Watch panel. | |
|------------|--|--|
| Paste | Pasts the character string copied in the clipboard to the caret position. This item becomes valid only when the character string is being edited. | |
| Select All | Selects all the items of this panel. | |
| Find | Opens the Find and Replace dialog box with selecting the [Find in Files] tab. | |
| Replace | Opens the Find and Replace dialog box with selecting the [Replace in Files] tab. | |

[Context menu]

| Register to Watch1 Registers the selected register or category to the Watch panel (Watch1). | |
|---|--|
| Сору | Copies the selected character string to the clipboard during editing. If a line is selected, copies the register or the category to the clipboard. |
| | The copied item can be pasted to the Watch panel. |
| Notation | The following cascade menus to specify the notation of a data value are displayed. |
| AutoSelect | Displays the value of the selected item (including sub-items) in the default notation (default). |
| Hexadecimal | Displays the value of the selected item (including sub-items) in hexadecimal number. |
| Signed Decimal | Displays the value of the selected item (including sub-items) in signed decimal number. |
| Unsigned Decimal | Displays the value of the selected item (including sub-items) in unsigned decimal number. |
| Octal Displays the value of the selected item (including sub-items) in octal number. | |
| Binary | Displays the value of the selected item (including sub-items) in binary number. |
| ASCII | Displays the character string of the selected item (including sub-items) in ASCII code. If the character size is 2 bytes and above, it is displayed with the characters for each 1 byte |
| | arranged side-by-side. |
| Float | Displays the value of the selected item in Float. Note that when the value is not 4-byte data, displays it in the default notation. |
| Double Displays the value of the selected item in Double. | |
| | Note that when the value is not 8-byte data, displays it in the default notation. |
| Include Hexadecimal Value | Adds the value in hexadecimal number enclosing with "()" at the end of the value. |

SFR panel

This panel is used to display the contents of the SFR and change the SFR values (see "2.9.3 Display/change the SFR").

This panel appears only when connected to the debug tool.

Caution The SFR that cause the microcontroller to operate when it is read is read-protected and therefore cannot be read ("?" is displayed in the value).

To read the value of read-protected SFR, select [Force Read Value] from the context menu.

- Remarks 1. This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.
 - 2. When the separator line of each area in this panel is double-clicked, the width of the area changes to the shortest possible size that can display the contents of the area.

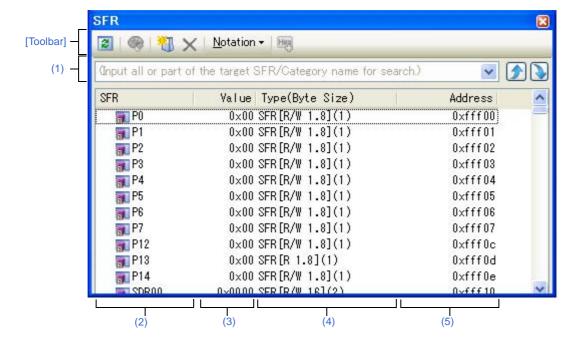

Figure A-28. SFR Panel

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[File] menu (SFR panel-dedicated items)]
- [[Edit] menu (SFR panel-dedicated items)]
- [Context menu]

[How to open]

- From the [View] menu, select [SFR].

[Description of each area]

(1) Search area

This area is used to search for the SFR name.

| ~ | Specifies the character strings to search (case-insensitive). You can either type character strings directly from the key board (up to 512 characters), or select one from the input history via the drop-down list (up to 10 items). |
|----------|--|
| • | Searches up for the SFR name containing the string specified in the text box, and selects the SFR that is found. |
| • | Searches down for the SFR name containing the string specified in the text box, and selects the SFR that is found. |

- **Remarks 1.** A hidden SFR name being classified with a category can be searched (the category is opened and the SFR is selected).
 - 2. After typing character strings to search, to press the [Enter] key is the same function as clicking the button, and to press the [Shift] + [Enter] key is the same function as clicking the button.

(2) [SFR] area

The types of SFR are classified as categories (folders), and a list of the respective SFR name is displayed. The meanings of the icons are as follows:

| Ħ | Indicates that the SFR name belonging to this category is displayed. When you double-click on the icon, or click on the "-" mark, the category is closed and the SFR name is hidden. Note that no categories exist by default. Perform Tree editing if you need a category. |
|---|--|
| | Indicates that the SFR name belonging to this category is hidden. When you double-click on the icon, or click on the "+" mark, the category is opened and the SFR name is displayed. Note that no categories exist by default. Perform Tree editing if you need a category. |
| | Indicates the name of the SFR. |

Remark The category names are sorted in character code order by clicking on the header part of this area (the SFR names in the category are also similarly sorted).

This area is provided with the following functions.

(a) Tree editing

The each SFR can be categorized (by folders) and displayed in the tree view.

To create a category, Click the button on the toolbar or select [Create Category] from the context menu after moving the caret to a SFR name to create a category, and then input a desired name from the keyboard (up to 1024 characters).

To delete a category, select the category then click the button on the toolbar or select [Delete] from the context menu. However, the categories that can be deleted are only the empty categories.

To rename the created category, select the category then do either one of the following.

- Click the name again, then directly rename the category name.
- Select the [Edit] menu >> [Rename], then directly rename the category name.
- Press the [F2] key, then directly rename the category name.

By directly dragging and dropping the SFR in the created category, each SFR is displayed in the categorized tree view.

Also, the display order of the categories and the SFR names (upper or lower position) can be changed easily by drag and drop operation.

- Cautions 1. Categories cannot be created within categories.
 - 2. SFRs cannot be added or deleted.

(b) Registering a watch-expression

Variable names of C language, CPU registers, SFR, and assembler symbols can be registered in the Watch panel as watch-expressions.

See "(1) Register a watch-expression" for details on how to operate it.

- **Remarks 1.** When you have registered a watch-expression with a category as the object, all of SFR belonging to that category are registered as watch-expressions.
 - 2. A scope specification is automatically added to a registered watch-expression.

(3) [Value] area

The value of SFR is displayed and changed.

The radix of a data value can be selected by the button on the toolbar or the context menu item. In addition, a display format adding the value in hexadecimal number constantly can also be selected as well.

The meanings of the marks and colors displayed as SFR values are as follows (character colors and background colors depend on the configuration in the [General - Font and Color] category of the Option dialog box):

| Display Example (Default) | | efault) | Description |
|---------------------------|------------------|----------------|---|
| 0x0 | Character color | Blue | The value of the SFR that the user is changing (press the [Enter] key to |
| | Background color | Standard color | write to the target memory). |
| 0x0 | Character color | Brown | The value of the SFR that has been changed because of the execution |
| | Background color | Cream | of a program To reset the highlighting, select the button on the toolbar or [Reset Color] from the context menu. |
| ? | Character color | Gray | The value of the SFR that is a read-protected object ^{Note} |
| | Background color | Standard color | |

Note An SFR for which the microcontroller ends up being activated by a read operation is shown. To read the value of read-protected SFR, select [Force Read Value] from the context menu.

Caution The timing for acquiring the values differs in the case of a 1 byte/2 bytes SFR and that of 1 bit SFRs that have been allocated to a 1 byte/2 bytes SFR. Owing to this, there are also cases where the values differ even if the value of the same SFR is displayed.

Remark The values are sorted in ascending order of the numerical values by clicking on the header part of this area.

This area is provided with the following functions.

(a) Changing SFR values

To edit the SFR value, select the value to edit, then change the value directly from the keyboard after clicking again on it (press the [Esc] key to cancel the edit mode).

After you edit the value of the SFR, it is written to the register of the debug tool by pressing the [Enter] key, or moving the focus to outside the edit region.

See "(4) Modify the SFR contents" for details on the method for changing the SFR value.

(b) Saving the contents of the SFR

The Save As dialog box can be opened by selecting the [File] menu >> [Save SFR Data As...], and all the contents of the SFR can be saved in a text file (*.txt) or CSV file (*.csv).

See "(6) Save the SFR contents" for details on the method for saving the contents of the SFR.

(4) [Type (Byte Size)] area

The type information of each SFR is displayed in the following formats.

- < Type of SFR> [<Access attribute> < All accessible sizes>](<Size>)

| Access attribute | One of the following is displayed as the access attribute. | | |
|----------------------|---|------------|--|
| | R | Read only | |
| | W | Write only | |
| | R/W | Read/Write | |
| All accessible sizes | All accessible sizes are demarcated by a comma and listed in order of the smallest size in bit units. | | |
| Size | The size of the SFR is displayed. | | |
| | It is displayed by supplying the unit, in byte units in the event that it can be displayed in byte units, and in bit units in the event that it can be displayed on in bit units. | | |

Examples 1. "The case of "SFR [R/W 1.8] (1 byte)"

An SFR that is readable/writable and 1 bit accessible/8 bit accessible, and whose size is 1 byte

2. "The case of "SFR [R/W 1] (1 bit)"

An SFR that is readable/writable and 1 bit accessible, and whose size is 1 byte

Remark The type information is sorted in the character code order by clicking on the header part of this area.

(5) [Address] area

The address that each SFR is mapped is displayed (hexadecimal number notation fixing).

However, in the case of the bit register, it is displayed by providing a bit offset value like the following examples.

Examples 1. The case of "0xFF40"

This is allocated to the address "OxFF40"

2. The case of "0xFF40.4"

This is allocated to bit 4 of the address "0xFF40.4" (bit register)

Remark The addresses are sorted in ascending order of numerical values by clicking on the header part of this area.

[Toolbar]

Acquires the latest data from the debug tool, and updates the contents of this panel.

Note that the values of read-protected SFR are not re-read.

This item is disabled during execution of a program.

| A | Described in the control of the cont |
|------------|--|
| *** | Resets highlighting of the selected SFR whose value has been changed by executing a program. |
| | Note that this item is disabled during execution of a program. |
| *** | Adds a new category (folder). Directly input the category name in the text box. |
| | There are no restrictions on the number of categories that can be created anew (however, it is not possible to |
| | create a category inside a category). |
| | Note that this item is disabled during execution of a program. |
| × | Deletes the selected character string(s). |
| | If an empty category is in a select state, its category is deleted (it is not possible to delete SFRs). |
| Notation | The following buttons to change the notation of a data value are displayed. |
| Hex | Displays the value of the selected item in hexadecimal number (default). |
| S | Displays the value of the selected item in signed decimal number. |
| Dec | Displays the value of the selected item in unsigned decimal number. |
| Oct | Displays the value of the selected item in octal number. |
| Bin | Displays the value of the selected item in binary number. |
| Asc | Displays the value of the selected item in ASCII code. |
| Hex | Adds the value in hexadecimal number enclosing with "()" at the end of the value of the selected item. |

[[File] menu (SFR panel-dedicated items)]

The following items are exclusive for the [File] menu in the SFR panel (other items are common to all the panels). Note that all these items are disabled during execution of a program.

| Save SFR Data | Overwrites the contents of this panel to the previously saved text file (*.txt)/CSV file (*.csv) (see "(b) Saving the contents of the SFR"). Note that when the file has never been saved or the file is write disabled, the same operation is applied as the selection in [Save SFR Data As]. |
|------------------|---|
| Save SFR Data As | Opens the Save As dialog box to newly save the contents of this panel to the specified text file (*.txt)/CSV file (*.csv) (see "(b) Saving the contents of the SFR"). |

[[Edit] menu (SFR panel-dedicated items)]

The following items are exclusive for [Edit] menu in the SFR panel (all other items are disabled).

| Cut | Deletes the selected character string(s) and copies them to the clipboard (it is not possible to cut SFRs/categories). |
|------------|--|
| Сору | Copies the contents of the selected range to the clipboard as character string(s). If the SFR(s)/category(s) are selected, copies them to the clipboard. The copied item can be pasted to the Watch panel. |
| Paste | If texts are in editing, pastes the contents of the clipboard to the caret position (it is not possible to paste SFRs/categories). |
| Delete | Deletes the selected character string(s). If an empty category is in a select state, its category is deleted (it is not possible to delete SFRs). |
| Select All | If texts are in editing, selects all the character strings. If texts are not in editing, selects all the SFRs/categories. |
| Rename | Edits the name of the selected category. |
| Find | Moves the focus to the text box in the Search area. |

| Move Opens the Go to the Location dialog box to move the caret to the specified SFR. |
|--|
|--|

[Context menu]

| Register to Watch1 | Registers the selected SFR or category to the Watch panel (Watch1). |
|------------------------------|--|
| Refresh | Acquires the latest data from the debug tool, and updates the contents of this panel. |
| | Note that the values of read-protected SFR are not re-read. |
| | This item is disabled during execution of a program. |
| Force Read Value | Forcibly reads once the value of the read-protected SFR. |
| Move | Opens the Go to the Location dialog box. |
| Create Category | Adds a new category (folder). Directly input the category name in the text box. |
| | There are no restrictions on the number of categories that can be created anew (however, it is not possible to create a category inside a category). |
| | Note that this item is disabled during execution of a program. |
| Сору | Copies the contents of the selected range to the clipboard as character string(s). |
| | If the SFR(s)/category(s) are selected, copies them to the clipboard. |
| | The copied item can be pasted to the Watch panel. |
| Delete | Deletes the selected character string(s). |
| | If an empty category is in a select state, its category is deleted (it is not possible to delete SFRs). |
| Notation | The following cascade menus are displayed to specify the notation. |
| Hexadecimal number | Displays the value of the selected item in hexadecimal number (default). |
| Signed Decimal | Displays the value of the selected item in signed decimal number. |
| Unsigned decimal number | Displays the value of the selected item in unsigned decimal number. |
| Octal | Displays the value of the selected item in octal number. |
| Binary | Displays the value of the selected item in binary number. |
| ASCII | Displays the value of the selected item in ASCII code. |
| Include Hexadecimal Value | Adds the value in hexadecimal number enclosing with "()" at the end of the value of the selected item. |
| Reset Color | Resets highlighting of the selected SFR whose value has been changed by executing a program. |
| | |

Local Variables panel

This panel is used to display the contents of the local variable and change the local variable values (see "2.9.5 Display/change local variables").

This panel appears only when connected to the debug tool.

Caution Nothing is displayed on this panel during execution of a program. When the execution of a program is stopped, items in each area are displayed.

- Remarks 1. This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.
 - 2. When the separator line of each area in this panel is double-clicked, the width of the area changes to the shortest possible size that can display the contents of the area.

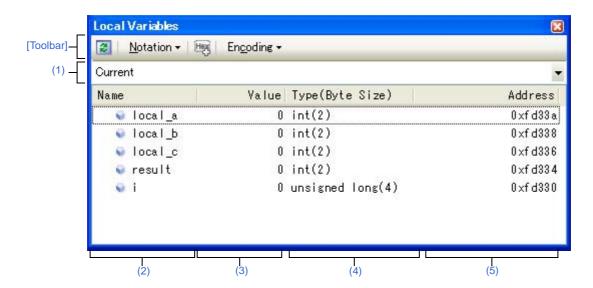

Figure A-29. Local Variables Panel

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[File] menu (Local Variables panel-dedicated items)]
- [[Edit] menu (Local Variables panel-dedicated items)]
- [Context menu]

[How to open]

- From the [View] menu, select [Local Variable].

[Description of each area]

(1) Scope area

Select the scope of the local variable to be displayed from the following drop-down list.

| Item | Operation |
|--|---|
| Current | Displays local variables in the scope of the current PC value. |
| <depth> <function [file="" name#line="" name()="" number]="">Note 1,2</function></depth> | Displays local variables in the scope of the calling function. After the program is executed, the scope that is selected is maintained as long as the selected scope exists. |

- Notes 1. The calling functions displayed on the Call Stack panel are displayed.
 - 2. When scope information that has lost its reliability, items in the list is shown in gray (the character color/background color when showing "Invalid" depends on the configuration in the [General Font and Color] category of the Option dialog box).

(2) [Name] area

The local variable name or function name is displayed.

The argument of the function is also displayed as the local variable.

In addition, the hierarchical structure is displayed in tree format for arrays, pointer variables, and structures or unions.

This area cannot be edited.

The meanings of the icons are as follows:

| * | Indicates the variable. Auto, Internal Static, and Register variables are also displayed Note. In addition, the hierarchical structure is displayed in tree format for arrays, pointer variables, and structures or unions. If "+" mark exist at the top of the name, the next structure is expanded by clicking it (the mark changes to "-" after the expansion). | |
|----------|---|--|
| | Array | All elements in the array |
| | Pointer variables | Variables that the pointer designates If the pointer designates a pointer, add "+" mark and expand it by clicking the mark. Note that if the pointer designates an unknown, "?" mark is displayed. |
| | Structures/Unions | All the member of structures/unions |
| ₩ | Indicates the argument. | |
| ±€ | Indicates the function. | |

Note When Auto variables are used to display local variables, accurate values cannot be displayed at a prologue ("{"}) or epilogue ("}") of a function. The Auto variable addresses are the relative addresses from the address pointed to by the stack pointer (SP), so their addresses are not determined until the SP value is determined in the function. The SP is manipulated via prologues or epilogues, so the accurate value cannot be displayed.

This area is provided with the following functions.

(a) Registering watch-expression

Variable names of C language can be registered in the Watch panel as watch-expressions.

See "(1) Register a watch-expression" for details on how to operate it.

Remark A scope specification is automatically added to a registered watch-expression.

(b) Jump to memory

By selecting [Jump to Memory] from the context menu, the Memory panel (Memory1) opens with moving the caret to the source line corresponding to the address where the selected local variable is disposed (if the Memory panel (Memory1) is already open, the screen will jump to the panel).

(3) [Value] area

The value of the local variable is displayed and changed.

The notation of a data value can be selected by the button on the toolbar or the context menu item. In addition, a display format adding the value in hexadecimal number constantly can also be selected as well.

The meanings of the marks and colors displayed as the values of the local variables are as follows (character colors and background colors depend on the configuration in the [General - Font and Color] category of the Option dialog box):

| Display Example (Default) | | Default) | Description |
|---------------------------|------------------|----------------|--|
| 0x0 | Character color | Blue | The value of the local variable that the user is changing |
| | Background color | Standard color | Press the [Enter] key to write to the target memory. |
| 0x0 | Character color | Brown | The value of the local variable that have been changed because of the |
| | Background color | Cream | execution of a program ^{Note} . The highlighting is rest by executing again the program. |
| ? | Character color | Gray | The value of the local variable that could not be acquired. |
| | Background color | Standard color | |

Note Variables that the name stays same from the start point where the program started executing to the breakpoint and their values are changed are the target.

This area is provided with the following functions.

(a) Changing the local variable/argument value

To edit the local variable value or the argument value, select the value to edit, then change the value directly from the keyboard after clicking again on it (press the [Esc] key to cancel the edit mode).

After you edit the value of the local variable or the argument, it is written to the target memory of the debug tool by pressing the [Enter] key or moving the focus to outside the edit region.

See "(2) Modify the contents of local variables" for details on the method for changing the local variable/ argument value.

(b) Saving the contents of the local variable

The Save As dialog box can be opened by selecting the [File] menu >> [Save Local Variables Data As...], and all the contents of this panel can be saved in a text file (*.txt) or CSV file (*.csv).

See "(3) Save the contents of local variables" for details on the method for saving the contents of the local variable.

(4) [Type (Byte Size)] area

The type name of the local variable is displayed. The notation accords with the description of C language. For an array, an element number is displayed in "[]". For a function, its size (number of bytes) is displayed in "()". This area cannot be edited.

(5) [Address] area

The address of the local variable is displayed. When a variable is assigned to the register, the name of the register is displayed.

This area cannot be edited.

[Toolbar]

These buttons below are disabled during execution of a program.

| 2 | Acquires the latest data from the debug tool, and updates the contents of this panel. |
|----------|--|
| Notation | The following buttons to specify the notation of values are displayed. |
| auto | Displays values on this panel in the default notation according to the type of variable (default). |
| Hex | Displays values on this panel in hexadecimal number. |
| Dec | Displays values on this panel in decimal number. |
| Oct | Displays values on this panel in octal number. |
| Bin | Displays values on this panel in binary number. |
| Dec | Displays array indexes on this panel in decimal number (default). |
| Hex | Displays array indexes on this panel in hexadecimal number. |
| Flo | Displays values on this panel in Float. |
| | Note that when the value is not 4-byte data, or has the type information, displays it in the default notation. |
| ОЫ | Displays values on this panel in Double. |
| | Note that when the value is not 4-byte data, or has the type information, displays it in the default notation. |
| Hex | Adds the value in hexadecimal number enclosing with "()" at the end of the value. |
| Encoding | The following buttons to specify the encoding of character variables are displayed. |
| Asc | Displays character variables in ASCII code (default). |
| Suis | Displays character variables in Shift_JIS code. |
| [EUC] | Displays character variables in EUC-JP code. |
| 8 | Displays character variables in UTF-8 code. |
| 16. | Displays character variables in UTF-16 code. |

[[File] menu (Local Variables panel-dedicated items)]

The following items are exclusive for the [File] menu in the Local Variables panel (other items are common to all the panels).

Note that all these items are disabled during execution of a program.

| Save Local Variables Data | Overwrites the contents of this panel to the previously saved text file (*.txt)/CSV file (*.csv) (see "(b) Saving the contents of the local variable"). Note that when the file has never been saved or the file is write disabled, the same operation is applied as the selection in [Save Local Variables Data As]. |
|------------------------------|--|
| Save Local Variables Data As | Opens the Save As dialog box to newly save the contents of this panel to the specified text file (*.txt)/CSV file (*.csv) (see "(b) Saving the contents of the local variable"). |

[[Edit] menu (Local Variables panel-dedicated items)]

The following items are exclusive for [Edit] menu in the Local Variables panel (all other items are disabled).

| Сору | Copies the contents of the selected line or the character string to the clipboard. |
|------------|--|
| Select All | Selects all the items of this panel. |
| Rename | Changes to the edit mode to edit the selected local variable value (see "(2) Modify the contents of local variables"). This item is disabled during execution of a program. |
| Find | Opens the Find and Replace dialog box with selecting the [Find in Files] tab. |
| Replace | Opens the Find and Replace dialog box with selecting the [Replace in Files] tab. |

[Context menu]

| Register to Watch1 | Registers the selected local variable to the Watch panel (Watch1). |
|--------------------------------------|---|
| Сору | Copies the contents of the selected line or the character string to the clipboard. |
| Notation | The following cascade menus to specify the notation of values are displayed. |
| AutoSelect | Displays values on this panel in the default notation according to the type of variable (default). |
| Hexadecimal | Displays values on this panel in hexadecimal number. |
| Decimal | Displays values on this panel in decimal number. |
| Octal | Displays values on this panel in octal number. |
| Binary | Displays values on this panel in binary number. |
| Decimal Notation for Array Index | Displays array indexes on this panel in decimal number (default). |
| Hexadecimal Notation for Array Index | Displays array indexes on this panel in hexadecimal number. |
| Float | Displays values on this panel in Float. |
| | Note that when the value is not 4-byte data, or has the type information, displays it in the default notation. |
| Double | Displays values on this panel in Double. |
| | Note that when the value is not 4-byte data, or has the type information, displays it in the default notation. |
| Include Hexadecimal Value | Adds the value in hexadecimal number enclosing with "()" at the end of the value. |
| Encoding | The following cascade menus to specify the encoding of character variables are displayed. |
| ASCII | Displays character variables in ASCII code (default). |
| Shift_JIS | Displays character variables in Shift_JIS code. |
| EUC-JP | Displays character variables in EUC-JP code. |
| UTF-8 | Displays character variables in UTF-8 code. |
| UTF-16 | Displays character variables in UTF-16 code. |
| Jump to Memory | Opens the Memory panel (Memory1) and jumps to the memory value corresponding to the address of the selected line in this panel. |

Watch panel

This panel is used to display the contents of the registered watch-expressions and change their values (see "2.9.6 Display/change watch-expressions").

Up to a maximum of four of these panels can be opened. Each panel is identified by the names "Watch1", "Watch2", "Watch3", and "Watch4" on the titlebar, and the watch-expressions can be registered/deleted/moved individually.

Watch-expressions can be registered in this panel as well as in the Editor panel, Disassemble panel, Memory panel, CPU Register panel, Local Variables panel or SFR panel.

When the panel is closed with registered watch-expressions, the panel closes but the information on the registered watch-expressions is retained. Therefore, if the same panel is opened again, it is opened with the watch-expressions registered.

The display contents are automatically updated when the value of the watch-expression changes after a program is executed (when the execution is done in steps, the display is updated after each step).

In addition, by enabling the Real-time display update function, it is also possible to update the display contents in real-time even while a program is being executed.

This panel appears only when connected to the debug tool.

- Remarks 1. This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.
 - 2. When the separator line of each area in this panel is double-clicked, the width of the area changes to the shortest possible size that can display the contents of the area.

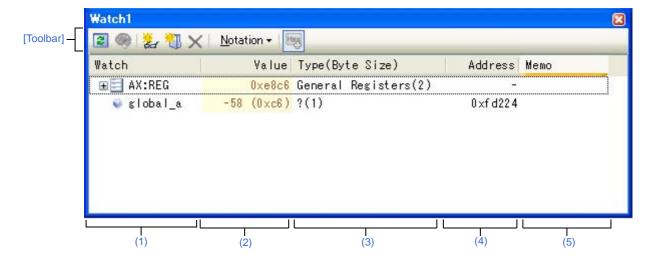

Figure A-30. Watch Panel

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[File] menu (Watch panel-dedicated items)]
- [[Edit] menu (Watch panel-dedicated items)]
- [Context menu]

[How to open]

- From the [View] menu, select [Watch] >> [Watch 1 - 4].

[Description of each area]

(1) [Watch] area

All the registered watch-expressions are displayed in a list.

Clicking the title of the list in this area sorts the watch-expressions in the list in alphabetical order.

Categories (folders) can be created to categorize the watch-expressions and display them in the tree view (see "(a) Tree editing").

The meanings of the icons are as follows:

| Ħ | Indicates that the watch-expression belonging to this category is displayed. When you double-click on the icon, or click on the "-" mark, the category is closed and the watch-expression is hidden. |
|------------------|---|
| | Indicates that the watch-expression belonging to this category is hidden. When you double-click on the icon, or click on the "+" mark, the category is opened and the watch-expression is displayed. |
| ÷ | Indicates that the watch-expression is a variable. At the top of the watch-expression represents arrays, pointer type variables, and structures/unions, "+"/"- " mark is displayed. Click the mark to Expand/shrink display. |
| ±€ | Indicates that the watch-expression is a function. |
| [23] | Indicates that the watch-expression is an immediate value. |
| ∫ (w) | Indicates that the watch-expression is an expression. |
| 8 1 | Indicates that the watch-expression is SFR. |
| 333 | Indicates that the watch-expression is CPU register. At the top of the watch-expression that has the lower level register (part of the register), "+"/"-" mark is displayed. Click the mark to Expand/shrink display. |

This area is provided with the following functions.

(a) Tree editing

Watch-expressions can be categorized (by folders) and displayed in the tree view.

To create a category, click the button on the toolbar or select [Create Category] from the context menu after moving the caret to the position to create a category, and then input a desired name from the keyboard. To delete a category, select the category then click the button on the toolbar or select [Delete] from the context menu.

To rename the created category, select the category then do either one of the following.

- Click the name again, then directly rename the category name.
- Select the [Edit] menu >> [Rename], then directly rename the category name.
- Press the [F2] key, then directly rename the category name.

By directly dragging and dropping the registered watch-expression in the created category, each category is displayed in the categorized tree view.

Also, the display order of the categories and the watch-expressions (upper or lower position) can be changed easily by drag and drop operation.

- Cautions 1. Categories cannot be created within categories.
 - Up to 64 categories can be created in one watch panel (if this restriction is violated, a message appears).

Remark Drag and drop the watch-expressions/categories in other watch panel (Watch1 to Watch4) to copy them.

(b) Expand/shrink display

At the top of the watch-expression represents arrays, pointer type variables, structures/unions, and registers (with the name of the part), "+"/"-" mark is displayed. Click the mark to expand the contents ("+" mark is changed to "-" after the expansion).

| Watch-Expression | Contents When Expanded | | |
|-----------------------|---|--|--|
| Array | All elements in the array Select [Encoding] >> [ASCII] from the context menu to display the value as a string (up to 256 characters). Note, however, that any characters that cannot be displayed in the encoding will be shown as periods "." or "?". | | |
| Pointer type variable | Variables that the pointer designates | | |
| Structure/Union | All the member of structure/union | | |
| Register | Name of the bit/bit string that constructs register Example) AX register A register X register | | |

(c) Registering new watch-expression

There are three ways as follows to register new watch-expressions.

<1> Register from other panels

Do either one of the following to register watch-expressions in other panels.

- Drag and drop the target character string onto this area in the desired watch panel (Watch1 to Watch4).
- Select [Register to Watch1] from the context menu after selecting the target character string or place the caret on either of the target character string (the target is automatically determined).
- Select the [Edit] menu >> [Paste] in this area in the desired watch panel (Watch1 to Watch4) after selecting the [Edit] menu >> [Copy] for the target character string.

The relationship between panels that can use this operation and targets that can be registered as watchexpressions is as follows:

Table A-4. Relationship between Panels and Targets That Can be Registered as Watch-Expressions

| Panel Name | Targets That can be Registered as Watch-Expressions | |
|-----------------------|---|--|
| Editor panel | Variable names of C language, CPU registers, SFR, and assembler symbols | |
| Disassemble panel | Variable names of C language, CPU registers, SFR, and assembler symbols | |
| CPU Register panel | CPU registers ^{Note} | |
| Local Variables panel | Variable names of C language (local variables) | |
| SFR panel | SFR ^{Note} | |

Note The scope-specification is automatically added to the registered watch-expression.

<2> Directly register in the Watch panel

Click the button on the toolbar or select [Add New Watch] from the context menu in the desired watch panel (Watch1 to Watch4) to display an entry box for a new watch-expression in the bottom of this area.

Directly input a watch-expression from the keyboard in the [Watch] area in the entry box then press the [Enter] key.

The input format of the watch-expression is as follows:

Table A-5. Input Format of Watch-Expression

| Watch-Expression | Value to Display |
|---|---|
| Variable name of C language | Value of C language variable |
| Watch-expression[Watch-expression] | Element of array |
| Watch-expression Member name | Member of structures/unions |
| Watch-expression -> Member name | Member of structures/unions that pointer designates |
| *Watch-Expression | Value of pointer variable |
| CPU register name | Value of the CPU register |
| SFR name | SFR value |
| Label, EQU symbol and immediate address | Values of label, EQU symbol and immediate address |
| Bit symbol | Bit symbol value |

Watch-expressions can be registered with specifying the scope. The scope specifications with watch-expression registration are as follows:

Table A-6. Scope Specification of C language Used with Watch-Expression Registration

| Scope Specification | Load Module File Name | Source File Name | Function Name | Variable Name |
|---------------------|--------------------------|---------------------|------------------|---------------|
| prog\$file#func#var | prog | file | func | var |
| prog\$file#var | prog | file | global | var |
| prog\$var | prog | global | global | var |
| file#func#var | current | file | func | var |
| file#var | current | file | global | var |
| var | current | current | current | var |

Table A-7. Scope Specification of CPU Register with Watch-Expression Registration

| Scope Specification | Register Bank | Name of CPU Register | |
|---------------------|-----------------------|----------------------|--|
| AX:RB0 | Register bank 0 | AX | |
| AX:REG | Current register bank | AX | |

Table A-8. Scope Specification of SFR with Watch-Expression Registration

| Scope Specification | Name of SFR |
|---------------------|-------------|
| P0:SFR | P0 |
| P0 | P0 |

- Remarks 1. A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this area (see "2.19.2 Symbol name completion function").
 - **2.** An immediate value is treated as an address. Note, however, that an immediate value with operators cannot be used.
 - 3. An arithmetic expression with symbols cannot be used for a watch-expression.
 - 4. If the same name exists either in C language variables, CPU registers or SFRs, and it is registered without specifying scopes, then its value will be displayed after the symbol is determined in the following order.

Variable of C language > CPU registers > SFR

If "\$" is specified at the top of a watch-expression, then its value will be displayed after the symbol is determined in the following order.

CPU registers > SFR > Variable of C language

- 5. If a local variable and a global variable exist with the same name, and its symbol name is registered without specifying scopes, then its value will be displayed after the symbol is determined based on the scope of the current PC value.
- **6.** When watch-expressions are registered from the SFR panel or the CPU Register panel, the scope specification is automatically added.
- **7.** When only "AX" is specified as a watch-expression, the value of the AX register in the current register bank is displayed.

<3> Register from other application

Select a character string of a variable of C language, CPU register, SFR or assembler symbol from a external editor then do either one of the following.

- Drag and drop the target character string in this area in the desired watch panel (Watch1 to Watch4).
- Select the [Edit] menu >> [Paste] in this area in the desired watch panel (Watch1 to Watch4) after copying the target character string.

Caution Up to 128 watch-expressions can be registered in one watch panel (if this restriction is violated, a message appears).

- **Remarks 1.** Each watch-expression registered in each watch panel (Watch1 to Watch4) is managed in each panel and saved as the user information of the project.
 - 2. More than one watch-expression with the same name can be registered.
 - **3.** You can export registered watch-expressions to a file and import it so that the watch-expressions can be re-registered (see "(8) Export/import watch-expressions").

(d) Editing watch-expression

To edit the registered watch-expression, double-click the watch-expression to be edited to change the watch-expression to edit mode then directly edit from the keyboard (press the [Esc] key to cancel the edit mode). After editing the watch-expression, press the [Enter] key to complete the editing.

(e) Deleting watch-expression

To delete the registered watch-expression, select the watch-expression(s) to be deleted then click the button on the toolbar or select [Delete] from the context menu.

(f) Setting of various events

Various events can be set to the selected watch-expression by selecting [Access Break] or [Trace Output] from the context menu.

If an access event is set, the mark of the watch-expression is changed (the event mark of a break event is displayed under the icon of the watch-expression in layers).

When an event is set, the detailed information about the set event is reflected in the Events panel.

Note that events are only set to the watch-expressions that are global variables, static variables inside functions, or file-internal static variables.

See the following for details on how to set events.

- "2.8.5 Stop the program with the access to variables/SFRs"
- "2.11.4 Collect execution history only when the condition is met [IECUBE][Simulator]"

(g) Jump to the address with memory definition

By selecting [Jump to Memory] from the context menu, the Memory panel (Memory1) opens with moving the caret to the address in which the selected watch-expression is defined (if the Memory panel (Memory1) is already open, the screen will jump to the panel).

Note that this operation is disabled when more than one watch-expression is selected at the same time or the CPU register/SFR is selected.

(2) [Value] area

The value of the registered watch-expression is displayed and changed (if the watch-expression is a function pointer, the function name is displayed in this area).

Notations and encodes can be selected by the button on the toolbar or the context menu item. In addition, a display format adding the value in hexadecimal number constantly can also be selected as well.

The default display format of the values is automatically decided depending on the type of the watch-expression.

Table A-9. Display Format of Watch-Expressions (Default)

| Type of Watch-Expression | Display Format |
|---|--|
| char, signed char, unsigned char | ASCII code with hexadecimal number |
| short, signed short, short int, signed short int, int, signed, signed int, long, signed long, long int, signed long int | Signed decimal number with hexadecimal number |
| unsigned short, unsigned short int, unsigned, unsigned int, unsigned long, unsigned long int | Unsigned decimal number with hexadecimal number |
| float | Float (when the size is 4-byte) with hexadecimal number |
| double, long double | Double (when the size is 8-byte) with hexadecimal number |
| Pointers to char, signed char, unsigned char | Characters Encoding: ASCII |
| Pointers to other than char, signed char, unsigned char | Hexadecimal number |
| Arrays of char, signed char, unsigned char types | Characters Encoding: ASCII |
| bit, boolean, _boolean | Unsigned decimal number with hexadecimal number |
| Enumeration type | Enumeration constant value with hexadecimal number |

| Type of Watch-Expression | Display Format | |
|---|---|--|
| Label, address of immediate value, EQU symbol | Signed decimal number with hexadecimal number | |
| bit symbol | Unsigned decimal number with hexadecimal number | |
| Others | Hexadecimal number | |

The meanings of the marks and colors displayed as the values of watch-expressions are as follows (character colors and background colors depend on the configuration in the [General - Font and Color] category of the Option dialog box):

| Display Example (Default) | | efault) | Description | |
|---------------------------|------------------|----------------|---|--|
| 0x0 | Character color | Blue | The value of the watch-expression that the user is changing | |
| | Background color | Standard color | Press the [Enter] key to write to the target memory. | |
| 0x0 | Character color | Pink | The value of the watch-expression that is displayed with the Real-time | |
| | Background color | Standard color | display update function | |
| 0x0 | Character color | Brown | The value of the watch-expression that has been changed because of | |
| | Background color | Cream | the execution of a program To reset the highlighting, select the button on the toolbar or [Reset Color] from the context menu. | |
| ? | Character color | Gray | Variable that does not exist is registered as a watch-expression or the | |
| | Background color | Standard color | value of the watch-expression cannot be retrieved (variable is out of the scope) | |

- Remarks 1. The SFR that cause the microcontroller to operate when it is read is read-protected and therefore cannot be read. To read the value of read-protected SFR, select [Force Read Value] from the context menu.
 - 2. Each watch-expression acquires the value in the order it was registered.
 As the timing to acquire a value is different, the values displayed may be different if the same SFR is registered more than once.
 - 3. When a hexadecimal value is also given, then values in the specified notation and hexadecimal values are read separately. For this reason, the values with the specified notion and the hexadecimal values may differ due to the time lag between being read.

This area is provided with the following functions.

(a) Real-time display update function

Using the real-time display update function allows you to display/modify the value of the watch-expression not only while the program is stopped, but also in execution.

See "(4) Display/modify the memory contents during program execution" for details on the real-time display update function.

(b) Changing values of watch-expressions

To edit the value of the watch-expression, change the value directly from the keyboard after double-clicking on the value to be edited (press the [Esc] key to cancel the edit mode).

After you edit the value of the watch-expression, it is written to the target memory of the debug tool by pressing the [Enter] key, or moving the focus to outside the edit region.

See "(6) Modify the contents of watch-expressions" for detail on how to change values of watch-expressions.

(c) Saving the contents of watch-expressions

By selecting the [File] menu >> [Save Watch Data As...], the Save As dialog box can be opened, and all the contents of this panel can be saved in a text file (*.txt) or CSV file (*.csv).

See "(9) Save the contents of watch-expressions" for details on the method for saving the contents of watch-expressions.

(3) [Type (Byte Size)] area

The type information of watch-expressions with the following format is displayed.

| Watch-Expression | Display Format | | |
|---------------------|--|----------------------|--|
| Single CPU register | <types cpu="" of="" register=""> (<size<sup>Note 1>)</size<sup></types> | | |
| Single SFR | <sfr type=""> (<access attribute=""> <access type=""><size<sup>Note 1>)</size<sup></access></access></sfr> | | |
| | Access attribute | R: Read only | |
| | | W: Write only | |
| | | R/W: Read/Write only | |
| | Access type | 1: Bit accessible | |
| | | 8: Byte accessible | |
| | | 16: Word accessible | |
| Unknown | ? | | |
| Others | <watch-expression c="" compiler's="" determination<sup="" follow="" that="" the="" type="">Note 2> (<size<sup>Note 1>)</size<sup></watch-expression> | | |

Notes 1. The size of the watch-expression is displayed in bytes.

However, for bit SFR or C language bit field, the size is displayed in bits and "bits" is added to the end of the number.

2. Types to be treated are displayed when compiling the watch-expression.

(4) [Address] area

The address that each watch-expression is mapped is displayed (hexadecimal number notation fixing). If the watch-expression is single CPU register or is unknown, "-" or "?" is displayed instead.

Remark When the watch-expression is the bit SFR, the bit-offset value is also displayed.

Example When the bit register is allocated to bit 4 of the address "0xFF40" Display example:0xFF40.4

(5) [Memo] area

The user can write comments for the watch-expressions/categories.

Each comment for a watch-expression/category written in this area is saved individually as the user information of the project. Therefore, when any of the watch-expression/category is deleted, the comment corresponding to it is also deleted.

Note that when arrays or register are displayed expanded, the comment cannot be input for each element.

To edit the comment, input the character strings directly from the keyboard after double-clicking on the item to be edited (press the [Esc] key to cancel the edit mode).

Up to 256 character strings can be input (line feed code is ignored).

After editing the character strings, complete the editing by pressing the [Enter] key or moving the focus to outside the edit region.

[Toolbar]

| 2 | Reacquires all the values of the registered watch-expression and updates the display. |
|----------|---|
| | Note that read-protected SFR values are not re-read. |
| % | Resets highlighting of the selected watch-expression whose value has been changed by executing a program. |
| | This item is disabled during execution of a program. |
| ider . | Registers a new watch-expression. |
| | Directly input the watch-expression in the text box (see "(c) Registering new watch-expression") |
| | Note that up to 128 watch-expressions can be registered in one watch panel. |
| *** | Adds a new category (folder). |
| | Directly input the category name in the text box. |
| | Note that up to 64 categories can be created in one watch panel (categories cannot be created in categories). |
| × | Deletes the selected character string(s). |
| | If the watch-expression(s)/category(s) are selected, deletes them (except when the expanded item of the |
| | watch-expression is selected). |
| Notation | The following buttons to change the notation of a data value are displayed. |
| auto | Displays the value of the selected watch-expression in the default notation (see "Table A-9. Display Format of Watch-Expressions (Default)") according to the type of variable (default). |
| Hex | Displays the value of the selected item in hexadecimal number. |
| S | Displays the value of the selected item in signed decimal number. |
| Dec | Displays the value of the selected item in unsigned decimal number. |
| Oct | Displays the value of the selected item in octal number. |
| Bin | Displays the value of the selected item in binary number. |
| Asc | Displays the value of the selected item in ASCII code. |
| Flo | Displays the value of the selected item in Float. |
| | Note that this item becomes valid only when the selected watch-expression value is 4-byte data. |
| Dbl | Displays the value of the selected item in Double. |
| | Note that this item becomes valid only when the selected watch-expression value is 8-byte data. |
| Hex | Adds the value in hexadecimal number enclosing with "()" at the end of the value of the selected item (except the item displayed in hexadecimal number). |
| | |

[[File] menu (Watch panel-dedicated items)]

The following items are exclusive for the [File] menu in the Watch panel (other items are common to all the panels). Note that all these items are disabled during execution of a program.

| Save Watch Data | Overwrites the contents of this panel to the previously saved text file (*.txt)/CSV file (*.csv) (see "(c) Saving the contents of watch-expressions"). Note that when the file has never been saved or the file is write disabled, the same operation is applied as the selection in [Save Watch Data As]. |
|--------------------|---|
| Save Watch Data As | Opens the Save As dialog box to newly save the contents of this panel to the specified text file (*.txt)/CSV file (*.csv) (see "(c) Saving the contents of watch-expressions"). |

[[Edit] menu (Watch panel-dedicated items)]

The following items are exclusive for [Edit] menu in the Watch panel (all other items are disabled).

| Cut | Deletes the selected character string(s) and copies them to the clipboard. If the watch-expression(s)/category(s) are selected, deletes them (except when the expanded item of the watch-expression is selected). |
|------------|--|
| Сору | Copies the contents of the selected range to the clipboard as character string(s). If the watch-expression(s)/category(s) are selected, copies them to the clipboard (except when the expanded item of the watch-expression is selected). |
| Paste | If texts are in editing, pastes the contents of the clipboard to the caret position. If texts are not in editing and the watch-expression(s) are copied in the clipboard, registers them to the caret position. |
| Delete | Deletes the selected character string(s). If the watch-expression(s)/category(s) are selected, deletes them (except when the expanded item of the watch-expression is selected). |
| Select All | If texts are in editing, selects all the character strings. If texts are not in editing, selects all the watch-expressions/categories. |
| Rename | Renames the selected watch-expression/category. |
| Find | Opens the Find and Replace dialog box with selecting the [Find in Files] tab. |
| Replace | Opens the Find and Replace dialog box with selecting the [Replace in Files] tab. |

[Context menu]

| Access Break | This item becomes valid only when the selected watch-expression is the global variable, the static variable inside functions, the file-internal static variable, or SFR. The following cascade menus are displayed to set the access break event (see "(1) Set a break event (access type)"). |
|--|--|
| Ц | oron (access type) j. |
| Set Read Break to | Sets a break event with read access condition to the selected watch-expression. |
| Set Write Break to | Sets a break event with write access condition to the selected watch-expression. |
| Set R/W Break to | Sets a break event with read/write access condition to the selected watch-expression. |
| Set Read Combination Break to [E1][E20] | Sets a break event with read access condition to the selected watch-expression Note. |
| Set Write Combination Break to [E1][E20] | Sets a break event with write access condition to the selected watch-expression Note. |
| Set R/W Combination Break to [E1][E20] | Sets a break event with read/write access condition to the selected watch-expression ^{Note} . |
| Trace Output [IECUBE][Simulator] | This item becomes valid only when the selected watch-expression is a global variable, static variable inside functions, file-internal static variable, or SFR. The following cascade menus are displayed to set the trace-related event (see "(1) Set a Point Trace event" or "(1) Set a Trace event"). |

| Record Reading Value | Sets a Point Trace event to record the values in the trace memory when the selected watch- expression is accessed for read. |
|----------------------------------|--|
| Record Writing Value | Sets a Point Trace event to record the values in the trace memory when the selected watch- expression is accessed for write. |
| Record R/W Value | Sets a Point Trace event to record the values in the trace memory when the selected watch- expression is accessed for read/write. |
| Record Start R/W Value [E1][E20] | Sets a trace start event to start collecting the trace data when the selected watch-expression is accessed for read/write. |
| Record End R/W Value [E1][E20] | Sets a trace end event to stop collecting the trace data when the selected watch-expression is accessed for read/write. |
| Trace | Opens the Trace panel and displays the acquired trace data. |
| Periodic Updating | The following cascade menus are displayed to set for the real-time display update function (see "(a) Real-time display update function"). |
| Periodic Updating Options | Opens the Property panel to set for the real-time display update function. |
| Refresh | Reacquires all the values of the registered watch-expression and updates the display. |
| | Note that the values of read-protected SFR are not re-read. |
| Force Read Value | Forcibly reads once the values of the read-protected SFR. |
| | This item is disabled during execution of a program. |
| Add New Watch | Registers a new watch-expression. Directly input the watch-expression in the text box (see "(c) Registering new watch-expression") |
| | Note that up to 128 watch-expressions can be registered in one watch panel. |
| Create Category | Adds a new category (folder). Directly input the category name in the text box. |
| | Note that up to 64 categories can be created in one watch panel (categories cannot be created in categories). |
| Delete | Deletes the selected character string(s). |
| | If the watch-expression(s)/category(s) are selected, deletes them (except when the expanded item of the watch-expression is selected). |
| Cut | Deletes the selected character string(s) and copies them to the clipboard. |
| | If the watch-expression(s)/category(s) are selected, deletes them (except when the expanded item of the watch-expression is selected). |
| Сору | Copies the contents of the selected range to the clipboard as character string(s). |
| | If the watch-expression(s)/category(s) are selected, copies them to the clipboard (except when the expanded item of the watch-expression is selected). |
| Paste | If texts are in editing, pastes the contents of the clipboard to the caret position. |
| | If texts are not in editing and the watch-expression(s) are copied in the clipboard, registers them to the caret position. |
| Rename | Renames the selected watch-expression/category. |
| Import Watch Expression | Opens the Open Watch Expression Data File dialog box to import watch-expressions (see "(8) Export/import watch-expressions"). |
| Notation | The following cascade menus are displayed to specify the notation. |
| | 1 |

| AutoSelect | Displays the value of the selected watch-expression in the default notation (see "Table A-9. Display Format of Watch-Expressions (Default)") according to the type of variable (default). |
|--------------------------------------|---|
| Hexadecimal number | Displays the value of the selected item in hexadecimal number. |
| Signed Decimal | Displays the value of the selected item in signed decimal number. |
| Unsigned decimal number | Displays the value of the selected item in unsigned decimal number. |
| Octal | Displays the value of the selected item in octal number. |
| Binary | Displays the value of the selected item in binary number. |
| ASCII | Displays the value of the selected item in ASCII code. |
| Include Hexadecimal Value | Adds the value in hexadecimal number enclosing with "()" at the end of the value of the selected item (except the item displayed in hexadecimal number). |
| Float | Displays the value of the selected item in Float. |
| | Note that when the selected watch-expression value is not 4-byte data, or has the type information, displays it in the default notation (see "Table A-9. Display Format of Watch-Expressions (Default)"). |
| Double | Displays the value of the selected item in Double. |
| | Note that when the selected watch-expression value is not 8-byte data, or has the type information, displays it in the default notation (see "Table A-9. Display Format of Watch-Expressions (Default)"). |
| Decimal Notation for Array Index | Displays array indexes on this panel in decimal number (default). |
| Hexadecimal Notation for Array Index | Displays array indexes on this panel in hexadecimal number. |
| Encoding | The following cascade menus are displayed to specify the character code. |
| ASCII | Displays the value of the selected item in ASCII code (default). |
| Shift_JIS | Displays the value of the selected item in Shift_JIS code. |
| EUC-JP | Displays the value of the selected item in EUC-JP code. |
| UTF-8 | Displays the value of the selected item in UTF-8 code. |
| UTF-16 | Displays the value of the selected item in UTF-16 code. |
| Size Notation | The following cascade menus are displayed to specify the size notation. |
| 1 Bytes | Displays the value of the selected item as 8-bit data. |
| 2 Bytes | Displays the value of the selected item as 16-bit data. |
| 4 Bytes | Displays the value of the selected item as 32-bit data. |
| 8 Bytes | Displays the value of the selected item as 64-bit data. |
| Jump to Memory | Opens the Memory panel (Memory1) and jumps to the address which the selected watch- expression is defined (see "(g) |
| Reset Color | Resets highlighting of the selected watch-expression whose value has been changed by executing a program. This item is disabled during execution of a program. |

Caution [E1][E20]

This item is displayed only when the selected microcontroller supports combination break events.

Call Stack panel

This panel is used to display the call stack information for the function call (see "2.10.1 Display call stack information"). This panel appears only when connected to the debug tool.

Cautions 1. Nothing is displayed on this panel during execution of a program. When the program is stopped, items in each area are displayed.

2. Except for [Simulator]

If step execution is performed in source level, CubeSuite+ determines whether an interrupt is being processed via the NP, EP, and ID flags in the PSW register. For this reason, if the above register or flags are changed (e.g. when using multiple interrupts), then call stack information may be incorrect.

Remark This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.

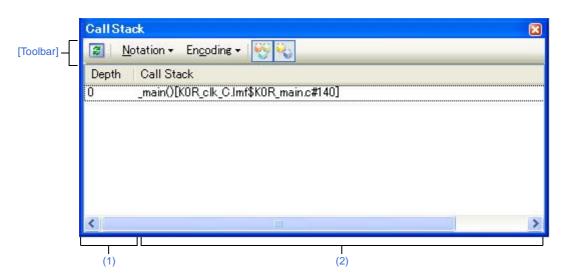

Figure A-31. Call Stack Panel

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[File] menu (Call Stack panel-dedicated items)]
- [[Edit] menu (Call Stack panel-dedicated items)]
- [Context menu]

[How to open]

- From the [View] menu, select [Call Stack].

[Description of each area]

(1) [Depth] area

The depth of the call is displayed.

The line at the current PC position becomes 0 and incremented numbers from 1 is added to the calling function in the order.

(2) [Call Stack] area

The current source position and the call stack information pushed on the stack (position of the calling function and arguments of a each function, etc.) are displayed.

The display format in this area differs depending on the selection condition of the button on the toolbar, or of [Show Parameter]/[Show Module File Name] from the context menu.

| Condition | Display Format |
|--|---|
| - Display arguments - Display module file name | <pre><function>(<argument>=<argument value<sup="">Note>,)[<module file="" name="">\$<file name="">#<line number="">] (default)</line></file></module></argument></argument></function></pre> |
| - Display arguments - Do not display module file name | <pre><function>(<argument>=<argument valuenote="">,)[<file name="">#<line number="">]</line></file></argument></argument></function></pre> |
| - Do not display arguments - Display module file name | <function>()[<module file="" name="">\$<file name="">#<line number="">]</line></file></module></function> |
| - Do not display arguments - Do not display module file name | <function>()[<file name="">#<line number="">]</line></file></function> |

Note When the argument value is character string, up to 20 characters can be displayed.

- Remarks 1. When the stack data older than the one that has lost the reliability is acquired, the line including that information is shown in gray (the character color/background color when showing "Invalid" depends on the configuration in the [General Font and Color] category of the Option dialog box).
 - **2.** Array arguments are passed as pointers rather than arrays (C language specification). For this reason, if the argument is an array, it is displayed as a pointer.

This area is provided with the following functions.

(a) Jump to the source line/disassemble line

By selecting [Jump to Source] from the context menu, the Editor panel is opened with moving the caret to the source line corresponding to the calling function at the current caret position (if the Editor panel is already open, the screen will jump to the panel).

In addition, similarly by selecting [Jump to Disassemble], the Disassemble panel (Disassemble1) is opened with moving the caret to the address corresponding to the calling function at the current caret position (if the Disassemble panel is already open, the screen will jump to the panel (Disassemble1)).

Remark It is possible to jump to the target source line by double-clicking on that line as well.

(b) Display of local variables

By selecting [Jump to Local Variable at This Time] from the context menu, the Local Variables panel is opened to display the local variables indicated by the currently selected line.

(c) Saving the contents of call stack information

By selecting the [File] menu >> [Save Call Stack Data As...], the Save As dialog box can be opened, and all the contents of this panel can be saved in a text file (*.txt) or CSV file (*.csv).

See "(4) Save the contents of call stack information" for details on the method for saving the contents of call stack information.

[Toolbar]

The buttons below are disabled during execution of a program.

| 2 | Acquires the latest data from the debug tool, and updates the contents of this panel. |
|-------------|---|
| Notation | The following buttons to specify the notation of values are displayed. |
| auto | Displays values on this panel in the default notation according to the type of variable (default). |
| Hex | Displays values on this panel in hexadecimal number. |
| Dec | Displays values on this panel in decimal number. |
| Oct | Displays values on this panel in octal number. |
| Bin | Displays values on this panel in binary number. |
| Encoding | The following buttons to specify the encoding of character variables are displayed. |
| Aso | Displays character variables in ASCII code (default). |
| SIIS | Displays character variables in Shift_JIS code. |
| [EUC] | Displays character variables in EUC-JP code. |
| UTF 8 | Displays character variables in UTF-8 code. |
| UTF 16 | Displays character variables in UTF-16 code. |
| 89 | Displays the call stack information with the module file name (default). |
| ₹ | Displays the call stack information with the parameters (arguments) of the function call (default). |
| | |

[[File] menu (Call Stack panel-dedicated items)]

The following items are exclusive for the [File] menu in the Call Stack panel (other items are common to all the panels). Note that all these items are disabled during execution of a program.

| Save Call Stack Data | Overwrites the contents of this panel to the previously saved text file (*.txt)/CSV file (*.csv) (see "(c) Saving the contents of call stack information"). Note that when the file has never been saved or the file is write disabled, the same operation is applied as the selection in [Save Call Stack Data As]. |
|-------------------------|---|
| Save Call Stack Data As | Opens the Save As dialog box to newly save the contents of this panel to the specified text file (*.txt)/CSV file (*.csv) (see "(c) Saving the contents of call stack information"). |

[[Edit] menu (Call Stack panel-dedicated items)]

The following items are exclusive for [Edit] menu in the Call Stack panel (all other items are disabled).

| Сору | Copies the contents of the selected line to the clipboard. |
|------------|--|
| Select All | Selects all the items of this panel. |
| Find | Opens the Find and Replace dialog box with selecting the [Find in Files] tab. |
| Replace | Opens the Find and Replace dialog box with selecting the [Replace in Files] tab. |

[Context menu]

| Сору | Copies the contents of the selected line to the clipboard. |
|-----------------------|--|
| Show Module File Name | Displays the call stack information with the module file name (default). |

| Show Parameter | Displays the call stack information with the parameters (arguments) of the function call (default). |
|-------------------------------------|---|
| Notation | The following cascade menus to specify the notation of values are displayed. |
| AutoSelect | Displays values on this panel in the default notation according to the type of variable (default). |
| Hexadecimal | Displays values on this panel in hexadecimal number. |
| Decimal | Displays values on this panel in decimal number. |
| Octal | Displays values on this panel in octal number. |
| Binary | Displays values on this panel in binary number. |
| Encoding | The following cascade menus to specify the encoding of character variables are displayed. |
| ASCII | Displays character variables in ASCII code (default). |
| Shift_JIS | Displays character variables in Shift_JIS code. |
| EUC-JP | Displays character variables in EUC-JP code. |
| UTF-8 | Displays character variables in UTF-8 code. |
| UTF-16 | Displays character variables in UTF-16 code. |
| Jump to Disassemble | Opens the Disassemble panel (Disassemble1) and jumps to the address corresponding to the calling function of the selected line in this panel. |
| Jump to Source | Opens the Editor panel and jumps to the source line corresponding to the calling function of the selected line in this panel. |
| Jump to Local Variable at This Time | Opens the Local Variables panel to display the local variable corresponding to the selected line. |

Trace panel

This panel is used to display trace data recording the execution history of the program (see "2.11 Collect Execution History of Programs").

The trace data displays by mixing the disassembled text and source text by default, but it is also possible to display either one of these by selecting the Display mode.

After the execution of the program is stopped, the display position is automatically updated such that the latest trace data is displayed.

This panel appears only when connected to the debug tool.

Cautions 1. [E1][E20][EZ Emulator]

The trace function is supported only when the selected microcontroller incorporates the OCD trace function. For details on the OCD trace function, see "Table 2-12. Operation Specifications of OCD Trace Function".

2. [Simulator]

4 bytes of the final address of the code flash area (when a code flash area is 0x0 - 0x1FFFFF, 0x1FFFC - 1FFFFF corresponds to it) and the RAM area which can be fetched cannot be fetched (a message of "Stopped by accessing to no map area." will appear).

- **Remarks 1.** When the separator line of each area in this panel is double-clicked, the width of the area changes to the shortest possible size that can display the contents of the area.
 - 2. This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.

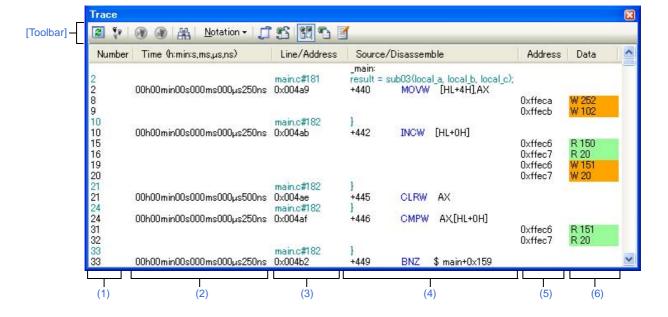

Figure A-32. Trace Panel

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[File] menu (Trace panel-dedicated items)]
- [[Edit] menu (Trace panel-dedicated items)]

- [Context menu]

[How to open]

- From the [View] menu, select [Trace].
- On the Editor panel/Disassemble panel, select [Trace Settings] >> [Show Trace Result] from the context menu.

[Description of each area]

(1) [Number] area

The trace number corresponding to the trace frame is displayed.

(2) [Time (h:min:s,ms,µs,ns)] area [IECUBE][Simulator]

This area displays the time required from the execution start of the program to the execution start of an instruction of each frame or generation of memory access cause.

The time is displayed in units of "hours, minutes, seconds, milliseconds, microseconds and nanoseconds". If overflow occurs, this area is displayed in invalid color (gray).

Remarks 1. [IECUBE]

The precision of the time depends on the setting of the [Rate of frequency division of trace time tag] property on the [Trace] category on the [Debug Tool Settings] tab of the Property panel.

2. [Simulator]

The question of whether to set the time display as an integrated value or differential value depends on the setting of the [Accumulate trace time] property on the [Trace] category on the [Debug Tool Settings] tab of the Property panel.

(3) [Line/Address] area

The address of the assemble code or the line number of a source file is displayed.

The notation of a data value can be selected by the button on the toolbar or the context menu item.

The display formats are as follows:

| Type of Display Line | Display Format |
|-----------------------------------|---|
| Instruction (disassemble results) | <address></address> |
| Source text | <file name="">#<line number=""></line></file> |
| Other than above | - |

Remark Since the following execution histories are not displayed, the line numbers displayed are not consecutive numbers.

- CPU register access
- Operand access
- Invalid fetch

(4) [Source/Disassemble] area

The collected trace data is displayed as follows.

The items displayed in this area differ depending on the selection of the display mode (see "(a) Display mode").

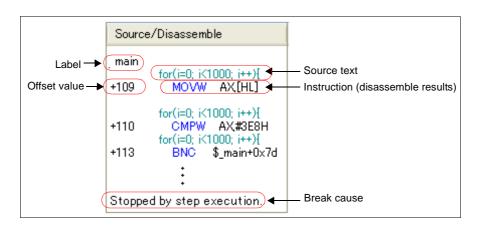

Figure A-33. Display Contents of [Source/Disassemble] Area (Default)

| | <u> </u> |
|-----------------------------------|---|
| Label | The label is displayed when a label is defined for the address. |
| Offset value | The offset value from the nearest label is displayed when a label is defined for the address. |
| Source text | The corresponding source text is displayed when the Mixed display mode or Source display mode is selected. However, when a place where no debugging information is present is executed, " <no debug="" information="">" is displayed.</no> |
| | [IECUBE][Simulator] When the value of a variable Note 1 or an SFR that is accessed during execution of a source line can be analyzed, that value is displayed in the following format at the end of the source line. - <<< Variable name = Variable value>>> - <<< SFR name = SFR value>>> Example: a=b; <<< a=5>>> The results of the Point Trace are displayed as same as format above. |
| Instruction (disassemble results) | The corresponding instructions are displayed as the result of disassembling when the Mixed display mode or Disassemble display mode is selected Note 2. The mnemonics are shown highlighted. |
| Break cause [IECUBE][Simulator] | The reason why the program has broken down is displayed. |
| Reset cause [IECUBE] | The reason why CPU reset has occurred is displayed. |

Notes 1. [IECUBE][Simulator]

When there is a memory access, a symbol will be interpreted as a variable and displayed only if a symbol is assigned to the accessed address. Note, however, that only variables of up to 2 bytes are supported. If multiplication or other code is processed by the standard libraries, the label of the SADDR area used by the standard library may be shown.

2. At a frame for which not all the trace data was fetched, "(LOST)" is displayed. In this case, the corresponding line is shown in error color (the error color depends on the configuration in the [General Font and Color] category of the Option dialog box).

This area is provided with the following functions.

(a) Display mode

It is possible to select the following three display modes by selection of a button on the toolbar or the context menu.

| Display Mode | Displayed Content |
|--------------------------|--|
| Mixed display mode | Displays the instruction (disassemble results), labels, source text (corresponding source line), point trace results, reset causes [IECUBE], and break causes (default). |
| Disassemble display mode | Displays the instruction (disassemble results), labels, point trace results, reset causes [IECUBE], and break causes. |
| Source display mode | Displays the source text (corresponding source line) reset causes [IECUBE], and break causes. However, when a place where no debugging information is present is executed, " <no debug="" information="">" is displayed.</no> |

(b) Jumping to source line or disassemble

By selecting [Jump to Source] from the context menu, the Editor panel opens with moving the caret to the source line corresponding to the line at the current caret position (if the Editor panel is already open, the screen will jump to the panel).

In addition, similarly by selecting [Jump to Disassemble], the Disassemble panel (Disasemble1) is opened with moving the caret to the address corresponding to the fetch address of the line at the current caret position (if the Disassemble panel is already open, the screen will jump to the panel (Disassemble1)).

(c) Linking with other panels

By clicking the ____/___ button on the toolbar, or selecting [Window Connecting] >> [Connect Source Window]/[Connect Disassemble Window] from the context menu, it is possible to link and display the corresponding places on the Editor panel/Disassemble panel, with the address of the caret position on this panel used as the pointer (no movement of the focus is done).

(d) Pop-up display

By hovering the mouse cursor over a line, all the area (item) data corresponding to that line is pop-up displayed in tandem shape.

(e) Saving trace data

The Data Save dialog box can be opened by selecting the [File] menu >> [Save Trace Data As...], and the contents of this panel can be saved in a text file (*.txt) or CSV file (*.csv).

See "2.11.9 Save the contents of execution history" for details on the method for saving trace data.

(5) [Address] area [IECUBE][Simulator]

The target address of memory access is displayed.

However, in the event of access to SFR, the SFR name is displayed instead of the address (when a plurality is accessed these are displayed in the following lines).

The radix of a data value can be selected by the button on the toolbar or the context menu item.

(6) [Data] area [IECUBE][Simulator]

The accessed data value and the access type at that time are displayed.

However, CPU register access is not displayed.

The notation of a data value can be selected by the button on the toolbar or the context menu item.

The display format of the data value and the access type are as follows (character colors and background colors depend on the configuration in the [General - Font and Color] category of the Option dialog box):

| Display Example (Default) | | Memory Access Type | |
|---------------------------|------------------|--------------------|-----------------------|
| RData value | Character color | Standard color | Read access |
| | Background color | Palegreen | |
| W Data value | Character color | Standard color | Write access |
| | Background color | Orange | |
| RWData value | Character color | Standard color | Read and write access |
| | Background color | Paleturquoise | |
| VECTData value | Character color | Standard color | Vector read access |
| | Background color | Palegreen | |

Remark [IECUBE]

If SFR/memory is accessed via DMA, "DMA" will be shown immediately after the data value.

[Toolbar]

| 2 | Acquires the latest data from the debug tool, and updates the contents of this panel. |
|---------------------|---|
| | This item is disabled while the tracer is running. |
| ? | Clears the trace memory and the display of this panel (initialized). |
| | This item is disabled while the tracer is running. |
| (3) | Starts the tracer operation. |
| [IECUBE][Simulator] | The content currently being displayed in this panel is cleared. |
| | This item is disabled while the tracer is running. |
| | Stops the tracer operation. |
| [IECUBE][Simulator] | The contents of trace data newly acquired are displayed. |
| | This item is disabled while the tracer is stopped. |
| 盎 | Opens the Trace Search dialog box. |
| Notation | The following buttons to change the notation of a data value are displayed. |
| | This item is disabled while the tracer is running. |
| Hex | Displays values on this panel in hexadecimal number (default). |
| Dec | Displays values on this panel in decimal number. |
| Oct | Displays values on this panel in octal number. |
| Bin | Displays values on this panel in binary number. |
| | Links with the Editor panel. |
| [IECUBE][Simulator] | |
| 5 | Links with the Disassemble panel. |
| [IECUBE][Simulator] | |
| | Sets to the Mixed display mode as the display mode (default). |
| [IECUBE][Simulator] | This item is disabled while the tracer is running. |
| | Sets to the Disassemble display mode as the display mode. |
| [IECUBE][Simulator] | This item is disabled while the tracer is running. |
| | Sets to the Source display mode as the display mode. |
| [IECUBE][Simulator] | This item is disabled while the tracer is running. |
| | |

[[File] menu (Trace panel-dedicated items)]

The following items are exclusive for the [File] menu in the Trace panel (other items are common to all the panels). Note that all these items are disabled during execution of a program.

| Save Trace Data | Overwrites the contents of this panel to the previously saved text file (*.txt)/CSV file (*.csv) (see "(e) Saving trace data"). Note that when the file has never been saved or the file is write disabled, the same operation is applied as the selection in [Save Trace Data As]. This item is disabled while the tracer is running. |
|--------------------|--|
| Save Trace Data As | Opens the Data Save dialog box to newly save the contents of this panel to the specified text file (*.txt)/CSV file (*.cxv) (see "(e) Saving trace data"). This item is disabled while the tracer is running. |

[[Edit] menu (Trace panel-dedicated items)]

The following items are exclusive for [Edit] menu in the Trace panel (all other items are disabled).

| Сору | Copies the contents of the selected line to the clipboard (multiple line selections impossible). This item is disabled while the tracer is running. |
|------|--|
| Find | Opens the Trace Search dialog box. |

[Context menu]

| Clear Trace | Clears the trace memory and the display of this panel (initialized). |
|---------------------|--|
| | This item is disabled while the tracer is running. |
| Start Trace | Starts the tracer operation. |
| [IECUBE][Simulator] | The content currently being displayed in this panel is cleared. |
| | This item is disabled while the tracer is running. |
| Stop Trace | Stops the tracer operation. |
| [IECUBE][Simulator] | The contents of trace data newly acquired are displayed. |
| | This item is disabled while the tracer is stopped. |
| Find | Opens the Trace Search dialog box. |
| | This item is disabled while the tracer is running. |
| Сору | Copies the contents of the selected line to the clipboard (multiple line selections impossible). |
| | This item is disabled while the tracer is running. |
| Mixed Display | Sets to the Mixed display mode as the display mode. |
| | This item is disabled while the tracer is running. |
| Disassemble View | Sets to the Disassemble display mode as the display mode. |
| | This item is disabled while the tracer is running. |
| Source View | Sets to the Source display mode as the display mode. |
| | This item is disabled while the tracer is running. |
| Notation | The following cascade menus are displayed to specify the notation. |
| | This item is disabled while the tracer is running. |
| Hexadecimal number | Displays values on this panel in hexadecimal number (default). |
| Decimal | Displays values on this panel in decimal number. |
| Octal | Displays values on this panel in octal number. |
| Binary | Displays values on this panel in binary number. |

| Vindow Connecting IECUBE][Simulator] | The following cascade menus are displayed to link with other panels (see "(c) Linking with other panels"). |
|---|--|
| Connect Source Window | Links with the Editor panel. |
| Connect Disassemble Window | Links with the Disassemble panel. |
| lump to Disassemble IECUBE][Simulator] | Opens the Disassemble panel (Disassemble1) and jumps to the fetch address corresponding to the line at the caret position in this panel. |
| lump to Source IECUBE][Simulator] | Opens the Editor panel and jumps to the source line corresponding to the line at the caret position in this panel. |
| lump to Memory IECUBE][Simulator] | Opens the Memory panel and jumps to the memory value corresponding to the line at the caret position in this panel. |

Events panel

This panel is used to display the detailed information about the events that are set on the Editor panel/Disassemble panel/Watch panel. On this panel, you can change the setting state of the event between valid/invalid and delete the event (see "2.15 Manage Events").

This panel appears only when connected to the debug tool.

- Remarks 1. The available event types depend on the type of the selected microcontroller and of the debug tool in use. Refer to the descriptions under "See ..." sentences in the category "Description" in "Table A-11.

 Event Type". Alternatively, see "(1) Maximum number of enabled events".
 - 2. The events that have been set on the Function List panel or Variable List panel of the analyze tool (Program Analyzer) are also managed on this panel.
 - 3. This panel can be zoomed in and out by 100% in the tool bar, or by moving the mouse wheel forward or backward while holding down the [Ctrl] key.
 - **4.** When the separator line of each area in this panel is double-clicked, the width of the area changes to the shortest possible size that can display the contents of the area.

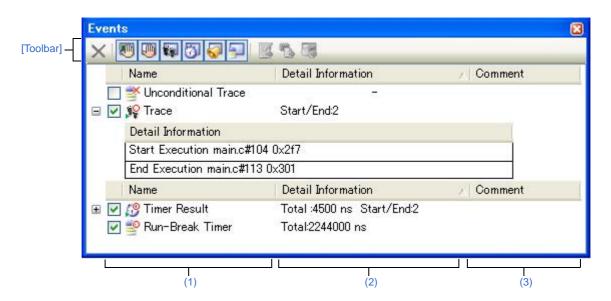

Figure A-34. Events Panel

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [[Edit] menu (Events panel-dedicated items)]
- [Context menu]

[How to open]

- From the [View] menu, select [Event].
- [IECUBE][Simulator]

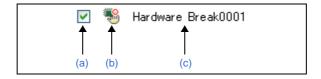

On the Editor panel/Disassemble panel, select [Timer Settings] >> [View Result of Timer] from the context menu.

[Description of each area]

(1) [Name] area

A list of the event names that have currently been set is displayed in the following format.

Remark It is possible to limit the event to be displayed by clicking the button on the toolbar (see "[Toolbar]").

(a) Check box

The setting state of the event is displayed/changed.

Note that the Event mark is changed depending on the setting state of the event.

| ~ | Valid state | Event occurs when the specified condition is met. It is possible to set the event to an invalid state by removing the check. |
|---|-----------------|---|
| | Invalid state | Event does not occur when the specified condition is met. It is possible to set the event to a valid state by removing the check. |
| | Suspended state | The conditions that have been specified cannot be set with the program of the debugging target. It is not possible to operate the check box. |

- Remarks 1. Both of the Timer Start event and Timer Stop event is must be set for the Timer Result event.

 Therefore, it is not possible to set a particular event to a valid state by only the setting of one of these (at the same time as both events are set, they are treated as grouped events as a Timer Result).
 - 2. It is not possible to set the Run-Break Timer event to an invalid/suspended state.
 - 3. The setting of the Unconditional Trace event and the Trace event to valid or invalid state is exclusively controlled. Therefore, the Unconditional Trace event, which is a built-in event, is valid state by default, but if either a trace start event/trace end event is set, it automatically becomes invalid state, and the Trace event, which is a event name that is collectively called with a trace start event and a trace end event, becomes valid state. Conversely, if the set Trace event is invalid state, the Unconditional Trace event automatically becomes valid state.

(b) Event mark

The event mark shows the type of event, and in addition shows the current setting state.

The meanings of the marks displayed are as follows:

Table A-10. Event Mark

| Event Type | Valid State | Invalid State | Suspended State | Note |
|-------------------|-------------|---------------|--------------------|------|
| Hardware Break | • | *** | • | - |
| Software Break | ₽ | ® | () | - |
| Conbination Break | ** | X | • | - |

| Event Type | Valid State | Invalid State | Suspended State | Note |
|-------------------------------|-------------|---------------|--------------------|--|
| Break at start of function | | ₩ | • | A break event that can be set via the |
| Access break to variable | | ₩ | • | analyze tool. |
| Unconditional Trace | 9 | × | None | - |
| Run-Break Timer | 9 | None | None | - |
| Trace | ÿ ₽ | ** | ji y | Displayed on only the Events panel |
| Trace start | ÿ ₽ | ** | ji y | Displayed on only the Editor panel/ |
| Trace end | * | | 39 | Disassemble panel |
| Timer Result | ß | <i>🕉</i> | Ø | Displayed on only the Events panel |
| Timer start | ß | <i>🕉</i> | Ø | Displayed on only the Editor panel/ |
| Timer end | ~ | ₽ | Ø | Disassemble panel |
| Point Trace | ~ 0 | × | Ť | - |
| Printf (Action event) | € | ❖ | V | - |
| Setting of two or more events | Note 1 | Note 2 | Note 3 | Displayed on only the Editor panel/ Disassemble panel |

- Notes 1. There is one or more event with valid state.
 - 2. There is no event with valid state and at least one event with invalid state.
 - 3. All the set events are suspended state.

(c) Event name

The event type and ID number are displayed as the event name.

A number from 0001 is automatically provided as the ID number for each event (no renumbering of the ID number is done even in the event that an event that has been set once is deleted). Event types that are displayed are as follows:

Table A-11. Event Type

| Event Type | Description | | |
|--|---|--|--|
| Hardware Break (Break ^{Note 1}) | Breaks the program when the condition is met while the debug tool monitors the break condition all the time during program execution. | | |
| | -> See "2.8.3 Stop the program at the arbitrary position (breakpoint)" | | |
| | -> See "2.8.4 Stop the program at the arbitrary position (break event)" | | |
| | -> See "2.8.5 Stop the program with the access to variables/SFRs" | | |
| Software Break (Break ^{Note 1}) | Breaks the program when the instruction, which an address code to break is rewritten for the break instruction, is executed. -> See "2.8.3 Stop the program at the arbitrary position (breakpoint)" | | |
| Combination Break | Breaks the program when, while the debug tool successively is checking plural break conditions during program execution, the combination condition is met. -> See "2.8.4 Stop the program at the arbitrary position (break event)" | | |
| | -> See "2.8.5 Stop the program with the access to variables/SFRs" | | |
| Break at start of function | This event type is a Hardware Break (execution type) that is set in the Function panel of the analyze tool (Program Analyzer). | | |

| Event Type | Description |
|--------------------------|---|
| Access break to variable | This event type is a Hardware Break (access type) that is set in the Variable panel of the analyze tool (Program Analyzer). |
| Unconditional Trace | Automatically collects the trace data with start of a program execution, and stops collecting the trace data with stop of the program execution. This event cannot be deleted because of the built-in event Note 2 (this event is set to a Valid state by default). -> See "2.11.2 Collect execution history until stop of the execution" |
| Run-Break Timer | Automatically measures the execution time of a program with start of the program execution, and stops the measurement with stop of the program execution. This event cannot be deleted because of the built-in event ^{Note 2} (this event is set to a Valid state by default). -> See "2.12.1 Measure execution time until stop of the execution" |
| Trace | Starts/stops collecting the trace data when the condition specified with a trace start event and a trace end event is met (this event is displayed when either a trace start event or a trace end event is set). -> See "2.11.3 Collect execution history in the arbitrary section" |
| Timer Result | Starts/stops measuring the execution time of a program when the condition specified with a timer start event and a timer end event is met (this event is displayed when either a timer start event or a timer end event is set). -> See "2.12.2 Measure execution time in the arbitrary section [IECUBE][Simulator]" |
| Point Trace | Records the information as the trace data only when accessing the specified variable or SFR during execution of a program. -> See "2.11.4 Collect execution history only when the condition is met [IECUBE][Simulator]" |
| Printf | Executes printf command in software processing after temporary stopping a program in execution at an arbitrary position (action event). -> See "2.14.1 Inset printf" |

Notes 1. A breakpoint that is set by a one click operation of the mouse is displayed "Break" (see "(1) Set a breakpoint").

2. This is set in the debug tool by default.

(2) [Detail Information] area

Detailed information about each event is displayed.

The contents of the information that is displayed differ depending on the event type as follows:

Caution For an access-related event to which the detailed event conditions have been set via the Detail dialog box (for access events), "[Refer To A Detail Dialog]" may be displayed in this area. If this is the case, refer to the contents of the Detail dialog box (for access events).

Table A-12. Detailed Information with Event Type

| Event Type | | Displayed Content ^{Note 1} |
|---|---------|--|
| Hardware Break | Format1 | <condition occur="" to=""> <file name#line="" number=""> <address></address></file></condition> |
| (Condition: execution) | Example | Before Execution main.c#39 0x100 |
| | | After Execution sub.c#100 0x200 |
| | | Before Execution - 0x300 |
| | | Execution main.c#39 0x300 [Simulator] |
| | Format2 | <condition occur="" to=""> <symbol +="" offset=""> <address></address></symbol></condition> |
| | Example | Before Execution funcA + 0x10 0x100 |
| | | After Execution funcB + 0x20 0x200 |
| | | Before Execution - 0x300 |
| Hardware Break (Condition: access) | Format1 | <condition occur="" to=""> <file name="" name#="" variable=""> <address(range)><comparison condition=""> <comparison value=""></comparison></comparison></address(range)></file></condition> |
| | Example | Read main.c#variable1 0x100 - 0x101 == 0x5 |
| | | Write sub.c#variable2 0x200 - 0x200 == 0x7 |
| | | Read/Write sub2.c#variable3 0x300 - 0x303 == 0x8 |
| | Format2 | <condition occur="" to=""> <file name="" name#function="" name#variable=""> <address(range)> <comparison condition=""> <comparison value=""></comparison></comparison></address(range)></file></condition> |
| | Example | Read main.c#func1#variable1 0x100 - 0x101 == 0x10 |
| | Format3 | <condition occur="" to=""> <variable name=""> <address(range)> <comparison condition=""> <comparison value=""></comparison></comparison></address(range)></variable></condition> |
| | Example | Write variable1 0x100 - 0x101 == 0x10 |
| Software Break | Format1 | <condition occur="" to=""> <file name#line="" number=""> <address></address></file></condition> |
| | Example | Before Execution main.c#40 0x102 |
| | | Before Execution sub.c#101 0x204 |
| | Format2 | <condition occur="" to=""> <symbol +="" offset=""> <address></address></symbol></condition> |
| | Example | Before Execution funcA + 0x120x102 |
| Combination Break (Condition: execution/access) | Format | <combination condition=""> <detailed break="" combination="" event="" information="" of=""></detailed></combination> |
| | Example | OR - After execution main.c#100 0x300 - After execution funcA + 0x10 0x100 - Write sub.c#variable2 0x200 - 0x200 == 0x7 - Read/Write sub2.c#variable3 0x300 - 0x303 ==0x8 |
| Unconditional Trace | Format | - |
| | Example | - |
| Run-Break Timer | Format | Total: <total execution="" time=""></total> |
| | Example | Total: 1000ms |
| | | Total: OVERFLOW |

| Event Type | Displayed Content ^{Note 1} | | |
|--|-------------------------------------|--|--|
| Trace (Condition: execution) | Format | Total of Start/End: < Total number of trace start/trace end events> Note 2 <start end=""> < Detailed information of trace start/trace end event></start> | |
| | Example | Total of Start/End: 4 - Start After Execution main.c#1000x300 - Start After Execution funcA + 0x1000x300 - End After Execution main.c#2000x100 - End After Execution funcA + 0x100x100 | |
| Timer Result (Condition: execution) | Format | Total: <total execution="" time=""> Total of Start/End: <total end="" event="" number="" of="" start="" timer="">Note 2 - <total execution="" time=""> <pass count=""> <average> <max> <min> - <start end=""> <detailed end="" event="" information="" of="" start="" timer=""></detailed></start></min></max></average></pass></total></total></total> | |
| | Example | Total: 10ms Total of Start/End: 4 - Total: 10ms Pass Count: 5 Average: 2ms Max: 4ms Min: 1ms - Start After Execution main.c#1000x300 - Start After Execution funcA + 0x300x100 - End After Execution main.c#1000x300 - End After Execution funcA + 0x500x100 | |
| Point Trace | Format1 | <condition occur="" to=""> <variable name=""> <variable address=""></variable></variable></condition> | |
| (Condition: access) | Example | Read variable1 0x100 | |
| | Format2 | <condition occur="" to=""> <file name="" name#="" variable=""> < Variable address></file></condition> | |
| | Example | Write sub.c#variable2 0x200 | |
| | Format3 | <condition occur="" to=""> <file name="" name#function="" name#variable=""> <variable address=""></variable></file></condition> | |
| | Example | Read/Write sub.c#func1#variabl3 0x300 | |
| Printf (Action event) | Format | <condition occur="" to=""> <file name#line="" number=""> <address> <setting event="" of="" printf=""></setting></address></file></condition> | |
| | Example | Before Execution main.c#39 0x100 aaa, bbb, ccc | |
| | | After Execution sub.c#100 0x200 Result of aaa : aaa | |

 $\textbf{Notes 1.} \quad \text{Following are the details on the display format.}$

| <condition th="" to<=""><th colspan="3">Displays one of the following conditions.</th></condition> | Displays one of the following conditions. | | |
|--|---|-------------------------------------|--|
| occur> | For other than [Simulator] | | |
| | Execution: | Before Execution or After Execution | |
| | Access: | Read, Write, Read/Write | |
| | [Simulator] | | |
| | Execution: | Execution | |
| | Access: | Read, Write, Read/Write | |

| <file name#line<br="">number></file> | Shows the line number of the source. Display format is the same as the watch type scope specification expression. For those events set in the Disassemble panel, display <line number=""> in the format <symbol +="" offset=""> in the condition below. - Line information exists and the specified position that the event is set not the top of the line information - Line information does not exist and symbol information exists.</symbol></line> |
|--|---|
| | Show < Line number> in "-" in the following condition Line information and symbol information does not exist. |
| <variable name=""></variable> | Shows the variable name in the source file. Display format is the same as the watch type scope specification expression. |
| <comparison condition=""></comparison> | Condition to compare (==) is shown. If the comparison value is not specified, comparison condition is not shown. |
| <comparison value=""></comparison> | Comparison value is shown. If the comparison value is not specified, comparison condition is not shown. |
| <address></address> | Address in the memory area is shown (only in hex number). |
| <combination condition=""></combination> | One of the following conditions is displayed: OR, Sequential |
| <start end=""></start> | Shows whether the contents of the detailed information is start event or the stop event. |
| <pass count=""></pass> | Shows the measurement result of the pass count of the timer. If a timer overflow occurs (see "2.12.3 Measurable time ranges"), or if the illegal value was acquired, "OVERFLOW" is displayed. If measurements have not been performed yet, "Not measured" is displayed. |
| <total></total> | Shows the measurement result of the timer total execution time. The unit is either of ns/\(\mu\s,\ms/\s/\mi\)n/clock (if, however, the unit is in "min", a value in "s" unit also appears). If a timer overflow occurs (see "2.12.3 Measurable time ranges"), or if the illegal value was acquired, "OVERFLOW" is displayed. If measurements have not been performed yet, "Not measured" is displayed. |
| <average></average> | Shows the measurement result of average execution of the timer. The unit is either of ns/µs,/ms/s/min/clock (if, however, the unit is in "min", a value in "s" unit also appears). If a timer overflow occurs (see "2.12.3 Measurable time ranges"), or if the illegal value was acquired, "OVERFLOW" is displayed. If measurements have not been performed yet, "Not measured" is displayed. |
| <max></max> | Shows the measurement result of the maximum execution time of the timer. The unit is either of ns/µs,/ms/s/min/clock (if, however, the unit is in "min", a value in "s" unit also appears). If a timer overflow occurs (see "2.12.3 Measurable time ranges"), or if the illegal value was acquired, "OVERFLOW" is displayed. If measurements have not been performed yet, "Not measured" is displayed. |
| <min></min> | Shows the measurement result of the minimum execution time of the timer. The unit is either of ns/\(\mu\s,\ms/\s/\min/\clock\) (if, however, the unit is in "min", a value in "s" unit also appears). If a timer overflow occurs (see "2.12.3 Measurable time ranges"), or if the illegal value was acquired, "OVERFLOW" is displayed. If measurements have not been performed yet, "Not measured" is displayed. |
| <set event="" print=""></set> | Shows the variable expression and the character strings specified in the Action Events dialog box. |

2. Click this line to display the detailed information of the lower lines.

(3) [Comment] area

The user can write comments for each event that has been set.

To input comments, click on this area, or select [Edit Comment] form the context menu after selecting the event in which you want to input comments, and then input directly the desired text from the keyboard (the edit mode is cancelled by pressing down the [Esc] key).

After editing the comments, complete the editing by pressing the [Enter] key or moving the focus to outside the edit region. Up to a maximum of 256 characters can be inputted for the comments, and this is saved as the settings of the user during use.

[Toolbar]

| N. | | | |
|----------------------|--|--|--|
| × | Deletes the selected event and event condition. | | |
| | Note that it is not possible to delete the built-in events (Unconditional Trace event and Run-Break | | |
| | Timer event). | | |
| [[] | <u>'</u> | | |
| | Displays events related to Hardware Break (default). | | |
| | Displays events related to Software Break (default). | | |
| (except [Simulator]) | | | |
| | Displays events related to the trace ^{Note 1} (default). | | |
| 3 | Displays events related to the timer (default). | | |
| [IECUBE][Simulator] | | | |
| | Displays events related to the action event (Printf event) (default). | | |
| <u> </u> | Displays events related to the built-in event (Unconditional Trace event/Run-Break Timer event) (default). | | |
| | Opens the Editor panel and jumps to the source line corresponding to the address where the selected event ^{Note 2} is being set. | | |
| | Opens the Disassemble panel and jumps to the disassemble results corresponding to the address where the selected event ^{Note 2} is being set. | | |
| 3 | Opens the Memory panel and jumps to the memory corresponding to the address where the selected event ^{Note 2} is being set. | | |

Notes 1. [E1][E20][EZ Emulator]

This button is only available when the selected microcontroller incorporates the OCD trace function.

2. Events other than Trace events, Timer Result events and built-in events (Unconditional Trace events/Run-Break Timer events) can be objects of this button.

[[Edit] menu (Events panel-dedicated items)]

The following items are exclusive for [Edit] menu in the Events panel (all other items are disabled).

| Delete | Deletes the selected event and event condition. | | |
|------------|---|--|--|
| | Note that it is not possible to delete the built-in events (Unconditional Trace event and Run-Break Timer event). | | |
| Select All | Selects all the events displayed on the panel. | | |
| Find | Opens the Find and Replace dialog box with selecting [Find in Files] tab. | | |
| Replace | Opens the Find and Replace dialog box with selecting [Replace in Files] tab. | | |

[Context menu]

| Enable Event | Enables the selected event (valid state). Note that this item is disabled if the selected event is a valid state. |
|---------------------|---|
| Disable Event | Disables the selected event (invalid state). |
| | Note that this item is disabled if the selected event is an invalid state. |
| Delete | Deletes the selected event. |
| | Note that it is not possible to delete the built-in events (Unconditional Trace event and Run-Break Timer event). |
| Select All | Selects all the events of this panel. |
| View Select | The following cascade menus are displayed to limit the event type to be displayed. All of the items have been selected by default. |
| Hardware Break | Displays events related to Hardware Break. |
| Software Break | Displays events related to Software Break. |
| Timer Event | Displays events related to the timer. |
| Trace Event | Displays events related to the trace ^{Note 1} . |
| Action Event | Displays events related to action events (Printf events). |
| Built-in Event | Displays events related to built-in events (Unconditional Trace event or Run-Break Timer event). |
| Timer Settings | The following cascade menus are displayed to do the settings related to the timer. |
| | Note that this item is enabled only when a timer-related event has been selected. |
| Init Timer | Initializes the timer used by the selected event (except for Run-Break Timer). |
| Nanosecond | Displays the result of a selected event measured by a timer in nanosecond (ns) units. |
| Microsecond | Displays the result of a selected event measured by a timer in microsecond (µs) units. |
| Millisecond | Displays the result of a selected event measured by a timer in millisecond (ms) units. |
| Second | Displays the result of a selected event measured by a timer in second (s) units. |
| Minute | Displays the result of a selected event measured by a timer in minute (min) units. |
| Clock | Displays the result of a selected event measured by a timer in clock units. |
| Jump to Memory | Opens the Memory panel (Memory1) and jumps to the memory corresponding to the address where the selected event ^{Note 2} is being set. |
| Jump to Disassemble | Opens the Disassemble panel (Disassemble1) and jumps to the disassemble results corresponding to the address where the selected event ^{Note 2} is being set. |
| Jump to Source | Opens the Editor panel and jumps to the source line corresponding to the address where the selected event ^{Note 2} is being set. |
| Edit Condition | Opens one of the following dialog box to edit the selected event |
| | - For an execution-related event |
| | Detail dialog box (for execution events) - For an access-related event |
| | Detail dialog box (for access events) |
| | - For a Combination Break event |
| | Combination Condition dialog box [E1][E20] - For an action event (Printf event) |
| | Action Events dialog box |
| Edit Comment | Sets to the edit mode to input comments for the selected event. |
| | When comments are already present, all of that character string is set to a select state. |

Notes 1. [E1][E20][EZ Emulator]

This button is only available when the selected microcontroller incorporates the OCD trace function.

2. Events other than Trace events, Timer Result events and built-in events (Unconditional Trace events/Run-Break Timer events) can be objects of this button.

Output panel

This panel is used to display operation logs for various components (debug tool, design tool, build tool, etc.) provided by CubeSuite+, in addition to results of batch searches by the Find and Replace dialog box and a Printf event (see "2.14.1 Inset printf").

The messages are classified by the message origination tool and displayed on the individual tabs.

Figure A-35. Output Panel

This section describes the following.

- [How to open]
- [Description of each area]
- [[File] menu (Output panel-dedicated items)]
- [[Edit] menu (Output panel-dedicated items)]
- [Context menu]

[How to open]

- From the [View] menu, select [Output].

[Description of each area]

(1) Message area

The output messages of each tool, search results and results by a Printf event are displayed.

In the case of search results (batch search), every time a search is performed, a new message will be displayed after the previous message is cleared (except for the [All Messages] tab).

The colors of message display differ with the type of message as shown below (character colors and background colors depend on the configuration in the [General - Font and Color] category of the Option dialog box).

| Message Type | Display Example (Default) | | ault) | Description |
|-----------------|---------------------------|------------------|----------------|--|
| Normal message | AaBbCc | Character color | Black | Displayed with information notices |
| | | Background color | White | |
| Warning message | AaBbCc | Character color | Blue | Displayed with warnings about operations |
| | | Background color | Standard color | |

| Message Type | Display Example (Default) | | ault) | Description | |
|---------------|---------------------------|------------------|------------|---|--|
| Error message | AaBbCc | Character color | Red | Displayed when there is a critical error, or | |
| | | Background color | Light gray | when execution is not possible due to a operational mistake | |

This area is provided with the following functions.

(a) Tag jump

By double-clicking on the output message, the Editor panel is opened and the number of the corresponding line in the corresponding file is displayed.

This allows you to jump from error messages that are output when building, etc. to the corresponding error line in the source file.

(b) Help display

If there is a caret on the line where a warning message or error message is being displayed, you can select [Help for Message] from the context menu. You can also display help for that line's message by pressing the [F1] key.

(c) Saving a log

The Save As dialog box can be opened by selecting the [File] menu >> [Save Output-tab name As...], and the contents that are displayed on the currently selected tab can be saved in a text file (*.txt) (messages on deselected tabs will not be saved).

(2) Tab selection area

Select the tab that indicates the origin of message.

The following tabs are available for the debug tool.

| Tab Name | Description |
|------------------|---|
| All Messages | Displays operation logs for all components (debug tool, design tool, build tool, etc.) provided by CubeSuite+ in order of output. |
| Debug Tool | Displays messages output from the debug tool. Display only operation logs for the debug tool out of those for various components (debug tool, design tool, build tool, etc.) provided by CubeSuite+. |
| Find and Replace | Displays the batch search results from the Find and Replace dialog box. |

Caution Even if a new message is output on a deselected tab, tab selection will not automatically switch.

In this case, "*" mark will be added in front of the tab name, indicating that a new message has been output.

[[File] menu (Output panel-dedicated items)]

The following items are exclusive for the [File] menu in the Output panel (other items are common to all the panels). Note that all these items are disabled during execution of a program.

| Save Output-tab name | Overwrites the contents that are displayed on the currently selected tab to the preciously saved text file (see "(c) Saving a log"). |
|----------------------|--|
| | Note that when the file has never been saved or the file is write disabled, the same operation is applied as the selection in [Save Output-tab name As]. |
| | This item is disabled while building. |

| Save Output-file name | Opens the Save As dialog box to newly save the contents that are displayed on the currently selected |
|-----------------------|--|
| As | tab to the specified text file (*.txt) (see "(c) Saving a log"). |

[[Edit] menu (Output panel-dedicated items)]

The following items are exclusive for [Edit] menu in the Output panel (all other items are disabled).

| Сору | Copies the contents of the selected range to the clipboard as character string(s). |
|------------|--|
| Select All | Selects all the messages displayed on the currently selected tab. |
| Find | Opens the Find and Replace dialog box with selecting [Quick Find] tab. |
| Replace | Opens the Find and Replace dialog box with selecting [Replace in Files] tab. |

[Context menu]

| Сору | Copies the contents of the selected range to the clipboard as character string(s). |
|------------------|--|
| Select All | Selects all the messages displayed on the currently selected tab. |
| Clear | Deletes all the messages displayed on the currently selected tab. |
| Tag Jump | Opens the Editor panel and jumps to the number of the corresponding line in the corresponding file of the message at the caret position. |
| Stop Searching | Cancels the search currently being executed. This item is disabled when a search is not being executed. |
| Help for Message | Displays help for the massage on the current caret position. This item only applies to warning messages and error messages. |

Memory Mapping dialog box

This dialog box is used to set the memory mapping for each type of memory.

Caution If you are not connected to a debug tool, then only memory mapping areas added by user is displayed.

Connecting to a debug tool (see "2.4.1 Connect to the debug tool") will display details for each memory type.

Figure A-36. Memory Mapping Dialog Box (for Other Than [Simulator])

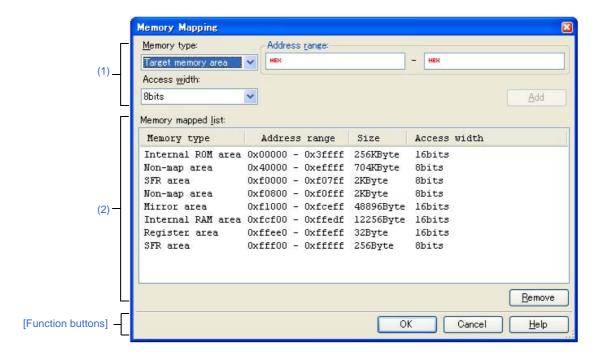

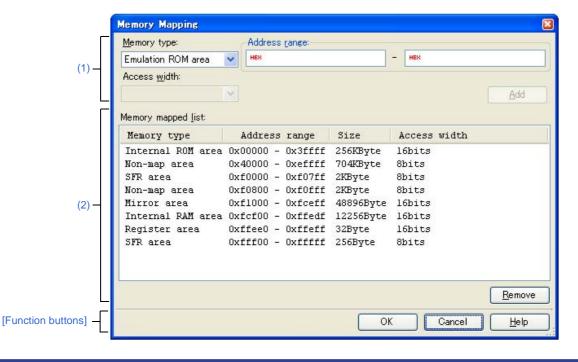

Figure A-37. Memory Mapping Dialog Box [Simulator]

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the [Debug Tool Settings] tab of the Property panel, click the [...] button displayed by selecting one of the values of the [Memory mappings] property in the [Memory] category.

Caution This dialog box cannot be opened during execution of a program.

[Description of each area]

(1) Added memory mapping specification area

Specify the information for a memory mapping newly added.

(a) [Memory type]

Select the memory type for the memory mapping to be added from the following drop-down list. The item selected by default differs depending on the debug tool to use.

| Emulation ROM area [Simulator] | Adds the Emulation ROM area. The simulator alternate ROM is used. |
|--------------------------------|---|
| Emulation RAM area [Simulator] | Adds the Emulation RAM area. The simulator alternate RAM is used. |
| Target memory area | Adds the target memory area. |
| I/O protection area | Adds the I/O protection area ^{Note} . |

Note The I/O protected area is an area protected from access by the debug function.

The address range set to I/O protected area cannot be accessed from the Memory panel (i.e., it can only be accessed via executing the load module). I/O protected area mapping is only possible within the target memory area.

Remark External memory area and guarded areas (areas where access is prohibited) are treated as non-mapped areas. For this reason, if a mapping overlaps a guarded area, then a message will inform the user that the mapping overlaps a non-mapped area.

See the manual of our microcontroller for details onfor details on the mapping information of external memory areas and guarded areas.

Mapping attributes and their sizes that can be set are as follows:

Table A-13. Settable Mapping Attribute

| Attribute | Debug Tool | | |
|--------------------|------------|-----------------------|-----------|
| | IECUBE | E1/E20 EZ Emulator | Simulator |
| Emulation ROM area | - | - | ✓ |
| Emulation RAM area | - | - | ✓ |

| Attribute | Debug Tool | | |
|---------------------|------------|-----------------------|-----------|
| | IECUBE | E1/E20 EZ Emulator | Simulator |
| Target memory area | ✓ Note | ✓ | ✓ |
| I/O protection area | ✓ | ✓ | ✓ |

√: Valid (Mapping unit: 2 bytes)

- : Invalid

Note The target memory area can be mapped to a total of four.

(b) [Address range]

Specify the start address and end address for the memory mapping to be added.

Directly input a hexadecimal number into the text box for each.

In the case of the following settings, however, new memory mappings cannot be added. Clicking the [Add] button in this area causes an error message to be displayed.

- If the specified address range duplicates a separate memory area when [Target memory area] is selected as the memory type
- If the specified address range cannot be put into a single target memory area when [I/O protection area] is selected as the memory type

(c) [Access width] (except [Simulator])

Select the access width of the memory mapping to be added from the following drop-down list (direct input is not possible).

In the case where [I/O protection area] is selected as the memory type, the access width must be set to the same value as the access width of the target memory area.

| 8bits | Sets the access width of the memory mapping to be added to 8 bits (default). |
|--------|--|
| 16bits | Sets the access width of the memory mapping to be added to 16 bits Note. |

Note When being added to memory mapping, fractions in the address value specified as the ending address are automatically rounded up to multiples of 2.

(d) Button

| Button | Function | |
|--------|---|--|
| Add | Adds the content specified in this area to memory mapping. | |
| | The added memory mapping is displayed in the [Memory mapped list] area. | |
| | The changes will not take effect until the [OK] button is clicked. | |

(2) [Memory mapped list] area

(a) List display

Information about the memory mapping added in the Added memory mapping specification area and the microcontroller's internal memory mapping is displayed. This area cannot be edited.

| Memory type | Displays the following memory types. Internal ROM area ^{Note 1} Mirror area Internal RAM area DataFlash area ^{Note 2} (except [Simulator]) Other RAM area SFR area Target memory area Emulation ROM area [Simulator] Emulation RAM area [Simulator] Non-map area |
|---------------|---|
| | - Emulation RAM area [Simulator]- Non-map area- I/O protection area |
| Address range | Displays the address range as < Start address> - < End address>. Display is fixed as "0x"-prefixed hexadecimal numbers. |
| Size | Displays size as a decimal number (unit: bytes/Kbytes ^{Note 3}). |
| Access width | Displays the access width (unit: bits). |

- Notes 1. This item does not appear when the selected microcontroller is a ROMless product.

 In the case that internal emulation ROM area exists in the emulator, however, "Internal ROM area" will be displayed only when the [Size of internal ROM [KBytes]] property of the [Internal ROM/RAM] category is set to a value greater than "0" in the [Connect Settings] tab of the Property panel.
 - 2. This item appears only when the selected microcontroller incorporates the data flash memory.
 - 3. Only in the case of multiple of 1024, displays in kilobyte units.

(b) Button

| Button | Function |
|--------|--|
| Remove | Deletes the memory mapping selected in this area. The memory areas that can be deleted are the Target memory area, I/O protection area, |
| | Emulation ROM area [Simulator], or the Emulation RAM area [Simulator] (the microcontroller's internal memory mapping cannot be deleted). |
| | In the case where you have attempted to delete a target memory area that is specified as an I/O protection area, however, a message will be displayed. The selected target memory area and the I/O protection area mapped to that area will both be deleted only if you click the [OK] button. |

[Function buttons]

| Button | Function | |
|--------|---|--|
| ОК | Sets the currently specified memory mapping to the debug tool and closes this dialog box. | |
| Cancel | Cancels memory mapping changes and closes this dialog box. | |
| Help | Displays the help for this dialog box. | |

Download Files dialog box

This dialog box is used to select files for downloading and configure download conditions (see "2.5 Download/Upload Programs").

Note that files specified as build targets in a project (main project or sub-project) are automatically registered as download targets (they can be unregistered).

Caution This dialog box cannot be opened during execution of a program.

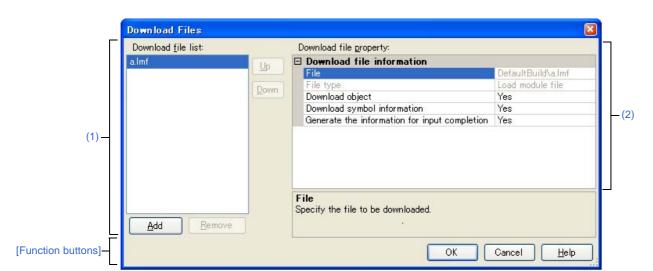

Figure A-38. Download Files Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the [Download File Settings] tab of the Property panel, click the [...] button displayed by selecting the [Download files] property in the [Download] category.

[Description of each area]

(1) [Download file list] area

(a) List display

Displays a list of files to download. The names of files specified as build targets in a project (main project or sub-project) are displayed by default (they can be removed).

Files are downloaded in the order that they are displayed here.

To add a new file to be downloaded, click the [Add] button in this area, then in the [Download file property] area, specify the download conditions of the file to add.

(b) Button

| Button | Function |
|--------|---|
| Up | Moves the selected file up one row in the list. Clicking this for the top file in the list has no effect. |
| Down | Moves the selected file down one row in the list. Clicking this for the bottom file in the list has no effect. |
| Add | Adds an empty item "-" to the list, and selects it. Specify the download conditions of the file to add in the [Download file property] area. Note that this button will be disabled if 20 files have already been registered. |
| Remove | Removes the selected file from the list. Note, however, that this button is disabled if the selected file is a project build target. |

Remarks 1. By hovering the mouse cursor over a file name, the pass information of the file is pop-up displayed.

2. By dragging a file name with the mouse, the display order in the list can be changed. Note, however, that the order of a project build target cannot be changed.

(2) [Download file property] area

(a) [Download file information]

This area is used to display or edit the download conditions of the file selected in the [Download file list] area. It can also be used to specify the download conditions of new download files added via the [Add] button.

| File | Specify the name of the file to download. | | |
|-----------|---|--|--|
| | Default | File name (but it will be blank for newly added files) | |
| | Modifying | Directly enter from the keyboard, or specify with the Select Download File dialog box opened by clicking the [] button Note 1 appears at right by selecting this item. | |
| | Available values | See "Table 2-1. Type of Files That Can be Downloaded" | |
| | | Up to 259 characters | |
| File type | Specify the type of the file to download. | | |
| | Default | Load module file | |
| | Modifying | Select from the drop-down list. | |
| | Available values | Either of the following | |
| | | - Load module file | |
| | | - Hex file | |
| | | - Binary data file | |
| Offset | Specify the offset from the address at which the file's download is to start. | | |
| | Note that this item appears only when [File type] is set to [Hex file]. | | |
| | Default | 0 | |
| | Modifying | Directly enter from the keyboard. | |
| | Available values | 0x0 to 0xFFFFFF in hexadecimal number | |

| Start address | Specify the address at which to start the file's download. Note that this item appears only when [File type] is set to [Binary data file]. | | | |
|------------------------------|---|--|---|--|
| | Default | 0 | | |
| | Modifying | Directly enter from the keyboard. | | |
| | Available values | 0x0 to 0xFFFFF | F in hexadecimal number | |
| Download object | . , | download the object information from the specified file. appears only when [File type] is set to [Load module file]. | | |
| | Default | Yes | | |
| | Modifying | Select from the | drop-down list. | |
| | Available values | Yes | Downloads object information. | |
| | | No | Does not download object information. | |
| Download symbol information | Specify whether to download the symbol information from the specified file ^{Note 2} . Note that this item appears only when [File type] is set to [Load module file]. | | | |
| | Default | Yes | | |
| | Modifying | Select from the drop-down list. | | |
| | Available values | Yes | Downloads symbol information. | |
| | | No | Does not download symbol information. | |
| Generate the information for | Select whether to generate the information for the Symbol name completion function when downloading Note 3. | | | |
| input completion | Note that this item appears only when [File type] is set to [Load module file]. | | | |
| | Default | Yes | | |
| | Modifying | Select from the drop-down list. | | |
| | Available values | Yes | Generates the information for the symbol name completion function. (i.e. uses the symbol name completion function.) | |
| | | No | Does not generate the information for the symbol name completion function. (i.e. does not use the symbol name completion function.) | |

- **Notes 1.** When a file specified as build target in the project is selected in the [Download file list] area, or when the program is executing, the [...] button does not appear.
 - **2.** If the symbol information have not been downloaded, the source level debugging cannot be performed.
 - **3.** When [Yes] is selected, the time taken for downloading and the memory usage on the host machine will increase. We recommend selecting [No] in this item if you do not intend to use the symbol name completion function.

[Function buttons]

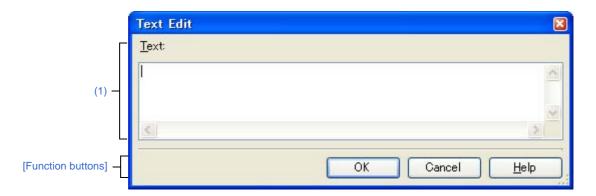

| Button | Function |
|--------|--|
| ОК | Finishes configuring the download files, and closes this dialog box. |
| Cancel | Cancels any changes to the download files, and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Text Edit dialog box

This dialog box is used to input/modify character strings.

Figure A-39. Text Edit Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the [Hook Transaction Settings] tab of the Property panel, click the [...] button displayed by selecting one of the property in the [Hook Transaction Settings] category.

[Description of each area]

(1) [Text] area

Input/modify character strings in this area.

[Function buttons]

| Button | Function |
|--------|---|
| ОК | Sets the input character strings to the caller panel/dialog box and closes this dialog box. |
| Cancel | Closes this dialog box. |
| Help | Displays the help for this dialog box. |

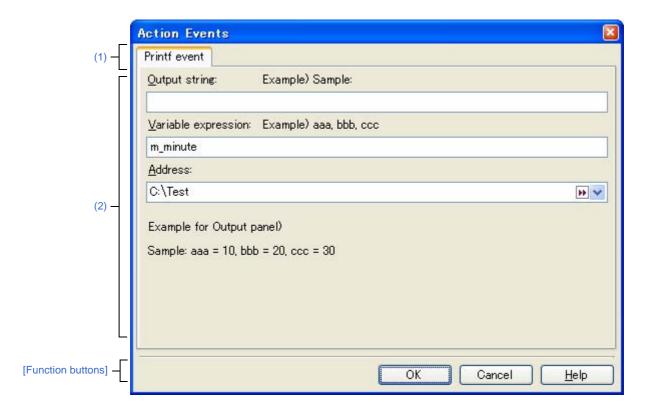

Action Events dialog box

This tab is used to configure action events (see "2.14 Set an Action into Programs").

This dialog box appears only when connected to the debug tool.

Caution Also see "2.15.7 Notes for setting events" for details on Printf events (e.g. limits on the number of enabled events).

Figure A-40. Action Events Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Editor panel, move the caret to the line where you wish to set an action event, then select [Register Action Event...] from the context menu.
- On the Disassemble panel, move the caret to the address where you wish to set an action event, then select [Register Action Event...] from the context menu.
- On the Events panel, select an action event, then select [Edit Condition...] from the context menu.

[Description of each area]

(1) Tab selection area

Select a tab to switch the type of an action event to be set.

This dialog box has the following two tabs.

- [Printf event] tab

Caution If this dialog box is opened by selecting [Edit Condition...] from the context menu, this area does not appear.

(2) Event condition setting area

Use this area to configure detailed condition of an action event.

For details on how to setup an action event, see the section explaining the corresponding tab.

[Function buttons]

| Button | Function |
|--------|--|
| ОК | Finishes configuring the action event, and sets it at the position specified in this dialog box. |
| Cancel | Cancels the action event settings and closes this dialog box. |
| Help | Displays the help for this dialog box. |

[Printf event] tab

Use this tab to configure Printf events as action events (see "2.14" Set an Action into Programs").

A Printf event momentarily stops the execution of the program at a specified location, and executes the printf command via software processing. When a Printf event is set, the program momentarily stops immediately before executing the command at the location where this event is set, and the value of the variable expression specified in this dialog box is output to the Output panel.

This dialog box appears only when connected to the debug tool.

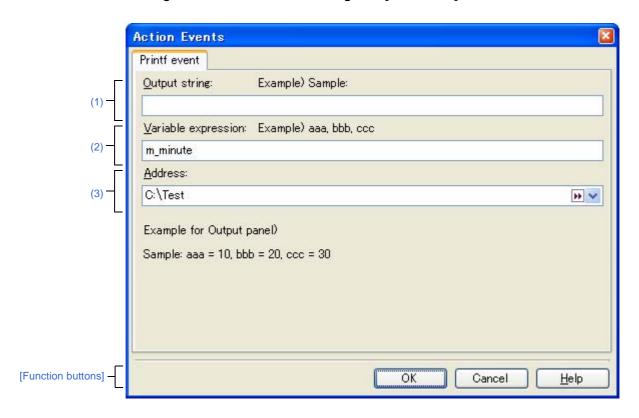

Figure A-41. Action Events Dialog Box: [Printf event] Tab

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Editor panel, move the caret to the line where you wish to set a Printf event, then select [Register Action Event...] from the context menu.
- On the Disassemble panel, move the caret to the address where you wish to set a Printf event, then select [Register Action Event...] from the context menu.
- On the Events panel, select a Printf event, then select [Edit Condition...] from the context menu.

[Description of each area]

(1) [Output string] area

Type in the string to add to the Output panel directly via the keyboard (up to 1024 characters).

Note that the output string can only be one line (spaces allowed).

(2) [Variable expression] area

Specify the variable expression(s) for the Printf event.

Type a variable expression directly into the text box (up to 1024 characters).

You can specify up to 10 variable expressions for a single Printf event by separating them with commas (",").

If this dialog box opens with a variable expression selected in the Editor panel /Disassemble panel, the selected variable expression appears as the default.

The basic input format that can be specified as variable expressions and the values output by Printf event are as follows:

Table A-14. Relationship between Variable Expressions and Output Value (Printf Event)

| Variable Expression | Output Value |
|---|---|
| Variable name of C language | Value of C language variable |
| Variable expression [Variable expression] | Element of array |
| Variable expression.Member name | Member of structure/union |
| Variable expression -> Member name | Member of structure/union that pointer designates |
| *Variable expression | Value of pointer variable |
| CPU register name | Value of the CPU register |
| SFR name | SFR value |
| Label name, EQU symbol name and immediate address | Values of label, EQU symbol and immediate address |
| Bit symbol | Bit symbol value |

Caution A variable expression including an arithmetic expression (e.g. "+"/"-") cannot be specified.

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").

(3) [Address] area

Specify the address at which to set the Printf event.

You can either type an address expression directly into the text box (up to 1024 characters), or select them from the input history via the drop-down list (up to 10 items). The address of the location currently being specified is displayed by default.

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").

Note that the output result format by the Printf event in the Output panel are as follows:

Figure A-42. Output Result Format of Printf Event

Specified-characters Variable-expression-1 = Value-1, Variable-expression-2 = Value-2, ...

| Specified characters | Characters specified with [Output string] |
|----------------------------|---|
| Variable expression 1 - 10 | Characters specified with [Variable expression] |

| Value 1 - 10 | Value of variable corresponds to " Variable expression 1 - 10". | |
|--------------|--|--|
| | The value is displayed in the default notation (see "Table A-9. Display Format of Watch- | |
| | Expressions (Default)") according to the type of the variable (note, however, that "?" will be | |
| | displayed if the specified variable expression cannot be obtained). Moreover, the value in | |
| | hexadecimal number enclosing with "()" is also displayed (note, however, that "-" will be | |
| | displayed if the value cannot be displayed in that notation). | |

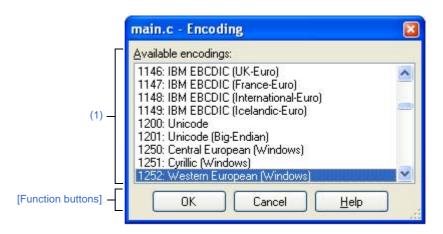

[Function buttons]

| Button | Function |
|--------|---|
| ОК | Finishes configuring the Printf event, and sets it at the caret position in the Editor panel/ Disassemble panel. |
| Cancel | Cancels the Printf event settings and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Encoding dialog box

This dialog box is used to select a file-encoding.

Figure A-43. Encoding Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- From the [File] menu, open the Open File dialog box by selecting [Open with Encoding...], and then click the [Open] button in the dialog box.

[Description of each area]

(1) [Available encodings]

Select the encoding to be set from the drop-down list.

The encoding of the selected file is selected by default.

| Button | Function | |
|--------|---|--|
| ОК | Opens the selected file in the Open File dialog box using a selected file encoding. | |
| Cancel | Not open the selected file in the Open File dialog box and closes this dialog box. | |
| Help | Displays the help for this dialog box. | |

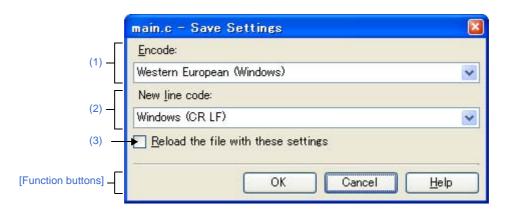

Save Settings dialog box

This dialog box is used to specify the encoding and the new line code of the file being edited in the Editor panel.

Remark The target file name is displayed on the title bar.

Figure A-44. Save Settings Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- With the Editor panel in focus, select [File name Save Settings...] from the [File] menu.

[Description of each area]

(1) [Encode] area

Select the encoding to be set from the drop-down list.

The items of the drop-down list are displayed according to the following sequence.

Note that the same encoding and encoding which are not supported by the current OS will not be displayed.

- Current encoding of the file (default)
- Default encoding of the current OS
- Most recently used encodings (maximum 4)
- Popular encodings for current locale

(e.g. for United States locale it will be:

- Western European (Windows)
- Unicode (UTF-8)
- All other encodings supported by the OS (in alphabetical order)

(2) [New line code] area

Specify the new line code to be set from the drop-down list.

Either of the following can be selected.

- Windows (CR LF)
- Macintosh (CR)
- Unix (LF)

Feb 01, 2014

An active newline entry is selected by default.

(3) [Reload the file with these settings]

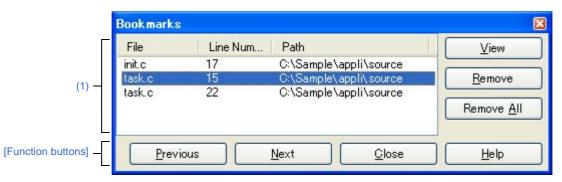

| ~ | Reloads the file with the specified encoding and new line code when the [OK] button is clicked. |
|---|---|
| | Does not reload the file when the [OK] button is clicked (default). |

| Button | Function | |
|--------|---|--|
| OK | Sets the selected encoding and newline code to the target file and closes this dialog box. If [Reload the file with these settings] is selected, sets the selected encoding and newline code to the target file and reloads the file. And then closes this dialog box. | |
| Cancel | Cancels the setting and closes this dialog box. | |
| Help | Displays the help for this dialog box. | |

Bookmarks dialog box

This dialog box is used to display the position where a bookmark is to be set or to delete a bookmark.

Figure A-45. Bookmarks Dialog Box

The following items are explained here.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- Click the 🗇 button on the bookmark toolbar.
- From the [Edit] menu, select [Bookmark] >> [List Bookmarks...].
- On the Editor panel, select [Bookmark] >> [List Bookmarks...] from the context menu.

[Description of each area]

(1) Bookmark list area

Display a list of bookmarks that have been registered.

The bookmarks are listed alphabetically by file name for [Bookmark]. Bookmarks in the same file are listed in line number order.

When a bookmark is added to the Editor panel, a bookmark function is added.

In the bookmark list area, double-clicking on a line moves a caret to the corresponding position for the bookmark.

(a) [File]

Display a file name (without any path) registered as a bookmark.

(b) [Line Number]

Display a line number registered as a bookmark.

(c) [Path]

Display a file path registered as a bookmark.

(d) Buttons

| View | Moves a caret to the selected position for the bookmark. |
|------|--|
| | However, this button is disabled when no bookmark is selected, two or more bookmarks are |
| | selected, or no bookmark is registered. |

| Remove | Removes a selected bookmark. When two or more bookmarks are selected, all of those selected are removed. |
|------------|--|
| | However, this button is disabled when no bookmark is selected or no bookmark is registered. |
| Remove All | Removes all the registered bookmarks. This button is disabled when no bookmark is registered. |

Caution Registered bookmarks are not deleted even if the Editor panel is closed.

Note, however, that if the Editor panel in which a file that has never been saved is being displayed is closed, then registered bookmarks will be deleted.

| Button | Function |
|--|--|
| Previous Moves a caret to the position of the bookmark previous to the selected bookmark | |
| | This button is disabled in the following cases. |
| | - A bookmark shown in the first line has been selected. |
| | - No bookmark is selected. |
| | - Two or more bookmarks are selected. |
| | - No bookmark is registered. |
| | - Only one bookmark is registered. |
| Next | Moves a caret to the position of the bookmark next to the selected bookmark. |
| | This button is disabled in the following cases. |
| | - A bookmark shown in the last line has been selected. |
| | - No bookmark is selected. |
| | - Two or more bookmarks are selected. |
| | - No bookmark is registered. |
| | - Only one bookmark is registered. |
| Close | Closes this dialog box. |
| Help | Displays the help for this dialog box. |

Column Number Settings dialog box

This dialog box is used to set the number of view columns of memory values on the Memory panel.

Figure A-46. Column Number Settings Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Memory panel, select [View] >> [Column Number Settings...] from the context menu.

[Description of each area]

(1) [Column Number] area

Directly enter a decimal value as the number of columns you want to display.

The settable range depends on [Size Notation] currently being set on the Memory panel, as follows:

| Size Notation | Settable Range |
|---------------|--------------------------|
| 4 Bits | 2 - 512r ^{Note} |
| 1 Byte | 1 - 256 |
| 2 Bytes | 1 - 128 |
| 4 Bytes | 1 - 64 |
| 8 Bytes | 1 - 32 |

Note Only an even number is specifiable (if an odd number is specified, then it will be changed to a value one greater than such odd number).

| Button | Function |
|--------|--|
| ОК | Displays memory values in the specified number of columns. |
| Cancel | Cancels the settings and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Address Offset Settings dialog box

This dialog box is used to set an offset value of the start address in the address area on the Memory panel.

Figure A-47. Address Offset Settings Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Memory panel, select [View] >> [Address Offset Value Settings...] from the context menu.

[Description of each area]

(1) [Address Offset Value] area

Directly enter a hexadecimal value as an offset value for the address display.

The settable range depends on the number of bytes of the memory currently being displayed in a line on the Memory panel, as follows:

- Settable range: 0x0 - ("Set value of [Size Notation]" x "The number of view columns") -1

Example When "Set value of [Size Notation]" is 1 byte and "The number of view columns" is 16 columns:

| Offset Value | Displayed Content of Address Area |
|---------------|-----------------------------------|
| 0x0 (default) | 0000 0010 0020 |
| 0x1 | 0001 0011 0021 |
| 0x2 | 0002 0012 0022 |

| Button | Function |
|--------|--|
| ок | Displays memory addresses with the specified offset value. |
| Cancel | Cancels the settings and closes this dialog box. |
| Help | Displays the help for this dialog box. |

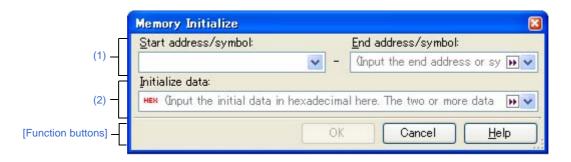

Memory Initialize dialog box

This dialog box is used to initialize memory (see "(6) Modify the memory contents in batch (initialize)").

The memory area in the specified address range is repeatedly overwritten with the specified initial data pattern.

Figure A-48. Memory Initialize Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Memory panel, select [Fill...] from the context menu.

[Description of each area]

(1) Range specification area

Specify the range of memory address to initialize via the [Start address/symbol] and [End address/symbol]. You can either type address expressions directly into the text boxes (up to 1024 characters), or select them from the input history via the drop-down list (up to 10 items).

The results of calculating the address expressions you have entered are treated as start and end addresses, respectively.

Note that address values greater than the microcontroller address space cannot be specified.

Caution You cannot specify the range of address aligned across the different endian area.

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in each text box (see "2.19.2 Symbol name completion function").

(2) [Initialize data] area

Specify the initial value(s) with which to overwrite the memory.

You can either type the initial value into the text box directly in hexadecimal number (the value need not start with "0x"), or select one from the input history via the drop-down list (up to 10 items).

You can specify more than one initial value. Specify up to 16 values of up to 4 bytes (8 characters) each, separated by spaces.

Each initial value is parsed from the end of the string, with each two characters interpreted as a byte.

If the string has an odd number of characters, then the first character is interpreted as one byte.

Note that if a initial value consists of more than one byte, then the target memory is overwritten with the value converted into an array of bytes of the specified address range's endian, as follows.

| Input Character Strings | How Data is Overwritten (in Bytes) | | |
|-------------------------|------------------------------------|-------------------|--|
| (Initial Value) | Little Endian | Big Endian | |
| 1 | 01 | 01 | |
| 0 12 | 00 12 | 00 12 | |
| 00 012 345 | 00 12 00 45 03 | 00 00 12 03 45 | |
| 000 12 000345 | 00 00 12 45 03 00 | 00 00 12 00 03 45 | |

| Button | Function |
|--------|--|
| ОК | The memory area in the specified address range is repeatedly overwritten with the specified initial data pattern. If the end address is reached in the middle of the pattern, then writing ends at that point. |
| Cancel | Cancels the memory initialization and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Memory Search dialog box

This dialog box is used to search memory (see "(5) Search the memory contents").

Search in either the Memory value area or Character strings area where the caret was located in the Memory panel immediately before this dialog box opened.

Figure A-49. Memory Search Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Memory panel, select [Find...] from the context menu.

[Description of each area]

(1) [Search Data] area

Specify data to search.

You can either type a value directly into the text box (up to 256 bytes), or select one from the input history via the drop-down list (up to 10 items).

If the search is performed in the Memory value area of the Memory panel, the value must be entered in the same display format (notation and size) as that area.

If the search is performed in the Character strings area, then the target of the search must be a string. The specified string is converted into the encoding format displayed in that area, and searched for.

If a memory value was selected immediately prior to opening this dialog box, then that value will appear as default.

(2) [Search Range] area

Select the range to search from the following drop-down list.

| Specify address range | Searches in the address range specified in the [Address] area. |
|-----------------------|--|
| Memory mapping | Searches within the selected memory mapping range. |
| | This list item displays the memory mappings set in the Memory Mapping dialog box (except |
| | the non-mapped area). |
| | Display format: <memory type=""> <address range=""> <size></size></address></memory> |

(3) [Address] area

This item is only enabled if [Specify address range] is selected in the [Search Range] area.

Specify the range of memory address to search via the start and end addresses. You can either type address expressions directly into the text boxes (up to 1024 characters), or select them from the input history via the drop-down list (up to 10 items).

The results of calculating the address expressions you have entered are treated as start and end addresses, respectively.

Note that if an address value greater than the microcontroller address space is specified, the high-order address value is masked.

In addition, an address value greater than the value expressed within 32 bits cannot be specified.

- **Remarks 1.** A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in each text box (see "2.19.2 Symbol name completion function").
 - 2. If the start address field is left blank, it is treated as if "0x0" were specified.
 - 3. If the end address field is left blank, then it is treated as if the maximum value in the microcontroller's address space were specified.

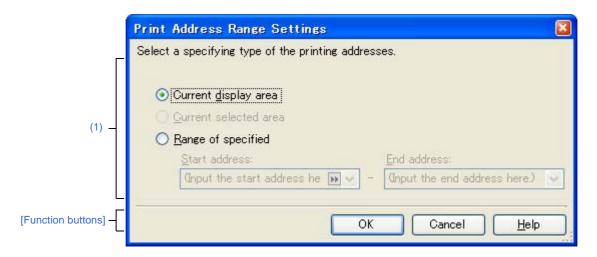

| Button | Function |
|-----------------|---|
| Search Backward | Searches upward within the range specified in the [Address] area or the [Search Range] area. The location found by the search is selected in the Memory panel. Note that if an illegal value is specified or while the program is being executed, a message will appear, and the memory search will not be performed. If focus moves to this dialog box while the memory panel is hidden or another panel has focus, then this button will be disabled. |
| Search Forward | Searches downward within the range specified in the [Address] area or the [Search Range] area. The location found by the search is selected in the Memory panel. Note that if an illegal value is specified or while the program is being executed, a message will appear, and the memory search will not be performed. If focus moves to this dialog box while the memory panel is hidden or another panel has focus, then this button will be disabled. |
| Cancel | Cancels the memory search and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Print Address Range Settings dialog box

This dialog box is used to specify the address range to print the contents of the Disassemble panel.

Figure A-50. Print Address Range Settings Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Disassemble panel, select [Print...] from the [File] menu.

[Description of each area]

(1) Range specification area

Select a range to print from the following option buttons.

(a) [Current display area] (default)

Prints only the contents of the Disassemble panel currently being displayed.

(b) [Current selected area]

Prints only the range currently being selected in the Disassemble panel.

Note, however, that this option button will be disabled when nothing is selected in the Disassemble panel.

(c) [Range of specified]

Specify the range of address to print via [Start address] and [End address]. You can either type address expressions directly into the text boxes (up to 1024 characters), or select them from the input history via the drop-down list (up to 10 items).

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in each text box (see "2.19.2 Symbol name completion function").

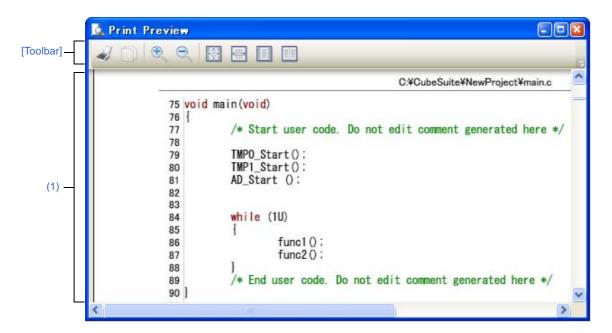

| Button | Function |
|--------|--|
| ОК | Closes this dialog box and opens the Windows dialog box to print the contents of the specified range of the Disassemble panel. |
| Cancel | Cancels the range specification and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Print Preview window

This window is used to preview the file currently being displayed in the Editor panel before printing.

Remark This window can be zoomed in and out by moving the mouse wheel forward or backward while holding down the [Ctrl] key.

Figure A-51. Print Preview Window

The following items are explained here.

- [How to open]
- [Description of each area]
- [Toolbar]
- [Context menu]

[How to open]

- Focus the Editor panel, and then select [Print Preview] from the [File] menu.

[Description of each area]

(1) Preview area

This window displays a form showing a preview of how and what is printed.

The file name (fully qualified path) and the page number are displayed at the page header and page footer.

The display differs according to whether the debug tool is or is not connected, and when it is connected, to whether the display is in normal display mode or mixed display mode. Note, however, that columns that are hidden on the Editor panel are not displayed (these columns are not printed).

[Toolbar]

Opens the Print dialog box provided by Windows to print the current Editor panel as shown by the print preview form.

| | Copies the selection into the clipboard. |
|------------|---|
| (D) | Increases the size of the content. |
| | Decreases the size of the content. |
| | Displays the preview at 100-percent zoom (default). |
| = | Fits the preview to the width of this window. |
| | Displays the whole page. |
| | Displays facing pages. |

[Context menu]

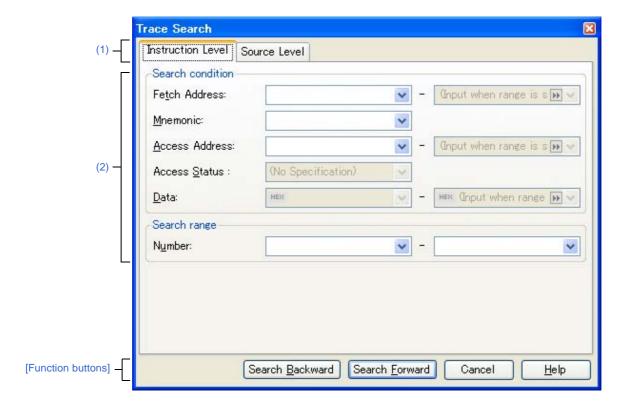

| Increase Zoom | Increases the size of the content. |
|---------------|------------------------------------|
| Decrease Zoom | Decreases the size of the content. |

Trace Search dialog box

This dialog box is used to search trace data (see "2.11.8 Search the trace data").

The search can be performed at the instruction or source level.

Figure A-52. Trace Search Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Trace panel, select hat button on the toolbar.
- On the Trace panel, select [Find...] from the context menu.

[Description of each area]

(1) Tab selection area

Select a tab to switch the level of the search.

This dialog box has the following two tabs.

- [Instruction Level] tab
- [Source Level] tab

(2) Search parameter setup area

Use this area to configure detailed search parameters.

For details on the window elements and how to configure the parameters for a particular tab, see the section for the tab in question.

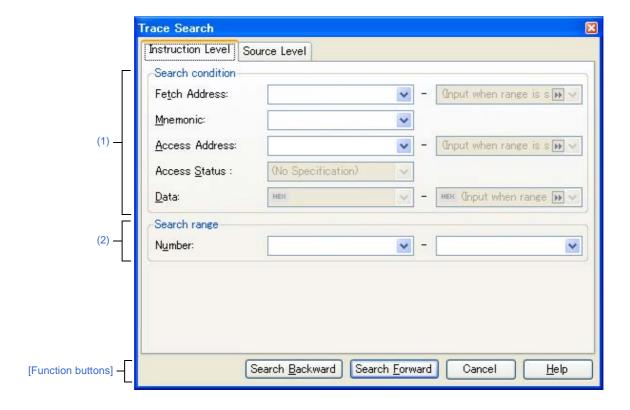

| Button | Function |
|-----------------|---|
| Search Backward | Searches upward (in the direction of larger to smaller numbers) within the specified range. Search matches are selected in the Trace panel. Note that if an illegal value is specified or while the program is being executed, a message will appear, and the trace data search will not be performed. |
| | If focus moves to this dialog box while the Trace panel is hidden or another panel has focus, then this button will be disabled. |
| Search Forward | Searches forward (in the direction of smaller to larger numbers) within the specified range. Search matches are selected in the Trace panel. Note that if an illegal value is specified or while the program is being executed, a message will appear, and the trace data search will not be performed. If focus moves to this dialog box while the Trace panel is hidden or another panel has focus, then this button will be disabled. |
| Cancel | Cancels the trace data search and closes this dialog box. |
| Help | Displays the help for this dialog box. |

[Instruction Level] tab

Use this tab to search the acquired trace data at the instruction level.

Caution If the Trace panel is set to Source display mode, then performing an instruction level search via this tab will not perform the target search correctly. In order to perform an instruction level search, set the mode to Mixed display mode or Disassemble display mode.

Figure A-53. Trace Search Dialog Box: [Instruction Level] Tab

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Trace panel, select | button on the toolbar.
- On the Trace panel, select [Find...] from the context menu.

[Description of each area]

- (1) [Search condition] area
 - (a) [Fetch Address]

Specify the fetch address if it is a required search parameter.

You can either type address expressions directly into the text boxes, or select them from the input history via the drop-down lists (up to 10 items).

The fetch address can also be specified as a range. In this case, specify a range by specifying address expressions in both the left and right text boxes.

If the right-hand text box is blank or contains the text [(Input value when range is specified)], then the fixed address specified in the left-hand text box will be searched.

Note that if an address value greater than the microcontroller address space is specified, the high-order address value is masked.

In addition, an address value greater than the value expressed within 32 bits cannot be specified.

(b) [Mnemonic]

Specify the mnemonic if it is a required search parameter.

The specified character strings in this area are searched within the [Source/Disassemble] area of the Trace panel.

You can either type a mnemonic directly into the text boxes, or select one from the input history via the drop-down list (up to 10 items).

Searches are case-insensitive, and partial matches are also allowed.

(c) [Access Address] [IECUBE][Simulator]

Specify the access address if it is a required search parameter.

You can either type address expressions directly into the text boxes, or select them from the input history via the drop-down lists (up to 10 items).

The access address can also be specified as a range. In this case, specify a range by specifying address expressions in both the left and right text boxes.

If the right-hand text box is blank or contains the text [(Input value when range is specified)], then the fixed address specified in the left-hand text box will be searched.

Note that if an address value greater than the microcontroller address space is specified, the high-order address value is masked.

In addition, an address value greater than the value expressed within 32 bits cannot be specified.

(d) [Access Status] [IECUBE][Simulator]

This item is only enabled if a value for [Access Address] [IECUBE][Simulator] is specified.

Select the access type from the following drop-down list.

Select [No Specification] if you do not wish to limit access types.

| No Specification) | |
|-------------------|--|
| lead/Write | |
| lead | |
| √rite | |
| ector Read | |
| MA | |

(e) [Data] [IECUBE][Simulator]

This item is only enabled if a value for [Access Address] [IECUBE][Simulator] is specified. Specify the access data.

You can either type the data directly into the text boxes (in hexadecimal number), or select it from the input history via the drop-down list (up to 10 items).

The data can also be specified as a range. In this case, specify a range by specifying data in both the left and right text boxes.

If the right-hand text box is blank or contains the text [(Input value when range is specified)], then the fixed data specified in the left-hand text box will be searched.

(2) [Search range] area

(a) [Number]

Specify the range within the trace data to search via the number displayed in the [Number] area of the Trace panel.

Specify the starting number in the left text box, and the ending number in the right text box ("0" to "last number" are specified by default).

You can either type the numbers directly into the text boxes (in base-10 format), or select them from the input history via the drop-down lists (up to 10 items).

If the left-hand text box is left blank, it is treated as if "0" were specified.

If the right-hand text box is left blank, it is treated as if the last number were specified.

| Button | Function |
|-----------------|--|
| Search Backward | Searches upward (in the direction of larger to smaller numbers) within the specified range. |
| | Search matches are selected in the Trace panel. |
| | Note that if an illegal value is specified, a message will appear, and the trace data search will not be performed. |
| | If focus moves to this dialog box while the Trace panel is hidden or another panel has focus, then this button will be disabled. |
| Search Forward | Searches forward (in the direction of smaller to larger numbers) within the specified range. |
| | Search matches are selected in the Trace panel. |
| | Note that if an illegal value is specified, a message will appear, and the trace data search will not be performed. |
| | If focus moves to this dialog box while the Trace panel is hidden or another panel has focus, then this button will be disabled. |
| Cancel | Cancels the trace data search and closes this dialog box. |
| Help | Displays the help for this dialog box. |

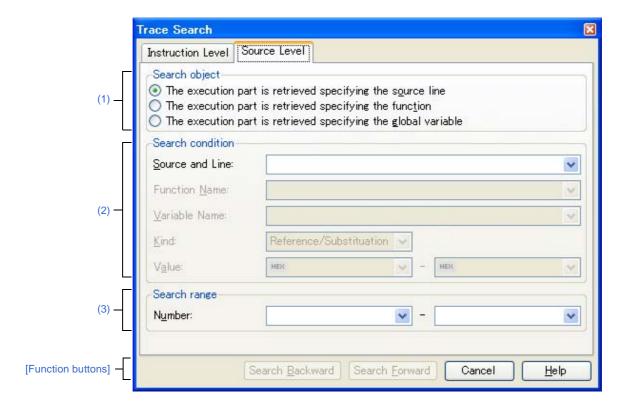

[Source Level] tab

Use this tab to search the acquired trace data at the source level.

Caution If the Trace panel is set to Disassemble display mode, then performing an source level search via this tab will not perform the target search correctly. In order to perform an source level search, set the mode to Mixed display mode or Source display mode.

Figure A-54. Trace Search Dialog Box: [Source Level] Tab

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Trace panel, select button on the toolbar.
- On the Trace panel, select [Find...] from the context menu.

[Description of each area]

(1) [Search object] area

Select the search object from the following option buttons.

| The execution part is retrieved specifying | Finds the execution location in the specified source line (default). |
|--|--|
| the source line | Only [Source and Line] will be enabled as a search parameter. |

| The execution part is retrieved specifying the function | Finds the execution location in the specified function. Only [Function Name] will be enabled as a search parameter. |
|---|--|
| The execution part is retrieved specifying | Finds the location at which the specified global variable was accessed. |
| the global variable | Only [Variable Name] [IECUBE][Simulator], [Kind] [IECUBE][Simulator] and |
| [IECUBE][Simulator] | [Value] [IECUBE][Simulator] will be enabled as a search parameters. |

(2) [Search condition] area

(a) [Source and Line]

This item is only enabled if [The execution part is retrieved specifying the source line] is selected.

The specified character strings in this area are searched within the [Line/Address] area of the Trace panel.

You can either type the character strings of the source line to be find directly into the text box, or select them from the input history via the drop-down list (up to 10 items).

Searches are case-insensitive, and only complete matches are retrieved.

Examples 1. main.c#40

- 2. main.c
- 3. main

(b) [Function Name]

This item is only enabled if [The execution part is retrieved specifying the function] is selected.

You can either type the function name to be find directly into the text box, or select it from the input history via the drop-down list (up to 10 items).

Searches are case-insensitive, and only complete matches are retrieved.

(c) [Variable Name] [IECUBE][Simulator]

This item is only enabled if [The execution part is retrieved specifying the global variable] is selected.

You can either type the variable name to be find directly into the text box, or select it from the input history via the drop-down list (up to 10 items).

Searches are case-insensitive, and only complete matches are retrieved.

(d) [Kind] [IECUBE][Simulator]

This item is only enabled if [The execution part is retrieved specifying the global variable] is selected.

Select the access type ([Reference/Substitution], [Reference], or [Substitution]) from the drop-down list.

(e) [Value] [IECUBE][Simulator]

This item is only enabled if [The execution part is retrieved specifying the global variable] is selected.

Specify the accessed variable value in hexadecimal number.

You can either type a variable value directly into the text box, or select one from the input history via the drop-down list (up to 10 items).

The variable value can also be specified as a range. In this case, specify a range by specifying variable values in both the left and right text boxes.

If the right-hand text box is blank, then access locations with the fixed variable values specified in the left-hand text box will be searched for.

(3) [Search range] area

(a) [Number]

Specify the range within the trace data to search via the number displayed in the [Number] area of the Trace panel.

Specify the starting number in the left text box, and the ending number in the right text box ("0" to "last number" are specified by default).

You can either type the numbers directly into the text boxes (in base-10 format), or select them from the input history via the drop-down lists (up to 10 items).

If the left-hand text box is left blank, it is treated as if "0" were specified.

If the right-hand text box is left blank, it is treated as if the last number were specified.

| Button | Function |
|-----------------|--|
| Search Backward | Searches upward (in the direction of larger to smaller numbers) within the specified range. |
| | Search matches are selected in the Trace panel. |
| | Note that if an illegal value is specified, a message will appear, and the trace data search will not be performed. |
| | If focus moves to this dialog box while the Trace panel is hidden or another panel has focus, then this button will be disabled. |
| Search Forward | Searches forward (in the direction of smaller to larger numbers) within the specified range. |
| | Search matches are selected in the Trace panel. |
| | Note that if an illegal value is specified, a message will appear, and the trace data search will not be performed. |
| | If focus moves to this dialog box while the Trace panel is hidden or another panel has focus, then this button will be disabled. |
| Cancel | Cancels the trace data search and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Combination Condition dialog box [E1][E20]

This dialog box is used to display and modify detailed information on the combination break event selected in the Events panel.

Figure A-55. Combination Condition Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Events panel, move the caret to the combination break event **[E1][E20]**, then select [Edit Condition...] from the context menu.

[Description of each area]

(1) Tab selection area

In this product version, the [Break] tab is displayed in this area.

(2) [Combination] area

Select the combination condition from the following drop-down list.

| OR | The condition is satisfied when one of the events listed in the [Object event] area is encountered (default). |
|------------|---|
| Sequential | The condition is satisfied when the events listed in the [Object event] area are encountered in the specified sequence. |

Caution When [OR] is selected, up to two break events can be specified.

When [Sequential] is selected, break event can be specified for the 1st to 2nd position.

(3) [Object event] area

(a) Display of the list

This area lists the detailed information on the object events to be combined.

When [Sequential] is specified in the [Combination] area, numbers are allocated to each item from the top of the list to indicate the order in which the conditions are to be satisfied.

(b) Buttons

The following buttons are enabled only when [Sequential] is selected in the [Combination] area.

| Button | Function |
|---------|--|
| Up | Moves the event serial number upward in the target event list. |
| Down | Moves the event serial number downward in the target event list. |
| R Event | This button is always invalid. |

(4) [Reset event] area

(a) Display of the list

This area is always invalid.

| Button | Function |
|--------|--|
| ОК | Applies the detailed settings specified in the dialog box to the combination break and closes this dialog box. |
| Cancel | Cancels the save and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Detail dialog box (for execution events)

This dialog box is used to display and modify detailed information on an execution-related event selected in the Events panel.

Note that the execution-related events refer to the following events in the Events panel.

- Hardware Break event (execution type)
- Execution-related break event in detailed information on Combination Break event [E1][E20]
- Execution-related event as start and end condition in detailed information on Trace event
- Execution-related event as start and end condition in detailed information on Timer Result event [IECUBE][Simulator]

Figure A-56. Detail Dialog Box (for Execution Events) [IECUBE]

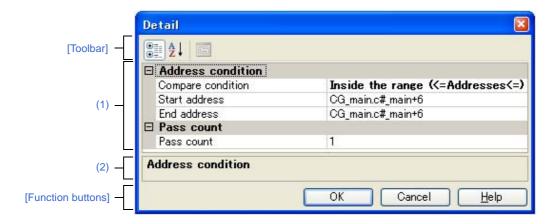

Figure A-57. Detail Dialog Box (for Execution Events) [E1][E20][EZ Emulator]

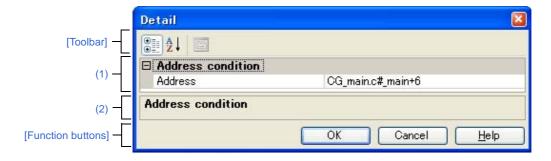

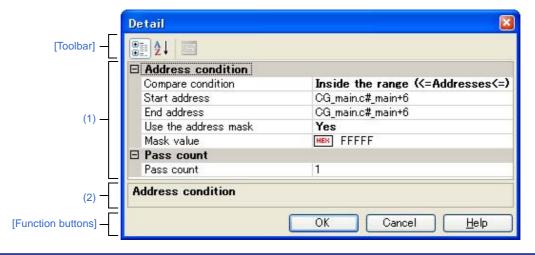

Figure A-58. Detail Dialog Box (for Execution Events) [Simulator]

This section describes the following.

- [How to open]
- [Description of each area]
- [Toolbar]
- [Function buttons]

[How to open]

- On the Events panel, move the caret to any one of the following events, and then select [Edit Condition...] from the context menu.
 - Hardware Break event (execution type)
 - Execution-related break event in detailed information on Combination Break event [E1][E20]
 - Execution-related event as start and end condition in detailed information on Trace event
 - Execution-related event as start and end condition in detailed information on Timer Result event [IECUBE][Simulator]

[Description of each area]

(1) Event conditions setting area

(a) [Address Condition]

Specify the address condition.

| Compare condition | Specify the condition to compare address. | | | |
|-------------------|--|---|--|--|
| [IECUBE] | Default | Specified address (==) | | |
| [Simulator] | Modifying | Select from the drop-down list | | |
| | Available | Specified address (==) | Specifies the address with [Address]. | |
| | values | Greater than or equal to (>=) | | |
| | | Less than or equal to (<=) | | |
| | | Inside the range (<=Values<=) | Specifies the range with [Start address] and | |
| | | Outside the range !(<=Values<=) | [End address]. | |
| Address | Specify the address. | | | |
| | [IECUBE][| ECUBE][Simulator] | | |
| | This item appears only when [Specified address (==)], [Greater than or equal to (>=)] or | | | |
| | [Less than or equal to (<=)] is selected in [Compare condition]. | | | |
| | Default | The current set value | | |
| | Modifying | Directly enter from the keyboard. | | |
| | Available values | Address expression within the valid range | | |

| Start address [IECUBE] [Simulator] | Specify the start address. [IECUBE][Simulator] This item appears only when [Inside the range (<=Values<=)] or [Outside the range !(<=Values<=)] is selected in [Compare condition]. Default The current set value | | | | |
|------------------------------------|---|--|-----------------------------------|--|--|
| | Available values | Directly enter from the keyboard. Address expression within the valid range | | | |
| End address [IECUBE] [Simulator] | Specify the end address. [IECUBE][Simulator] This item appears only when [Inside the range (<=Values<=)] or [Outside the range !(<=Values<=)] is selected in [Compare condition]. | | | | |
| | Default | The current set value | | | |
| | Modifying | enter from the keyboard. | | | |
| | Available values | Address expression within the valid range | | | |
| Use the address | Specify who | ether to sp | pecify an address mask. | | |
| mask [Simulator] | Default | No | | | |
| [Sillidiator] | Modifying | Select from the drop-down list | | | |
| | Available | Yes | Specifies an address mask. | | |
| | values | No | Does not specify an address mask. | | |
| Mask value [Simulator] | Specify the value of address mask. This item appears only when [Use the address mask] is set to [Yes]. | | | | |
| | Default | The cur | rent set value | | |
| | Modifying Directly enter from the keyboard. | | enter from the keyboard. | | |
| | Available values | Hexadecimal number up to five digits | | | |

(b) [Pass Count] [IECUBE][Simulator]

Specify the pass count condition.

| Pass count | Specify a pa The relevan pass count. | nt event occurs when the event condition is met as many times as the specified | | |
|------------|---|--|--|--|
| | Default 1 | | | |
| | Modifying Directly enter from the keyboard. | | | |
| | Available values | 1 to 65535 in decimal number | | |

Caution [IECUBE]

A value other than "1" cannot be specified as the pass count condition for an executionrelated event (before execution).

(2) Description area

This area displays a simple description of the item selected in the Event conditions setting area.

[Toolbar]

| | Displays all categories in the Event conditions setting area. |
|----|--|
| 2. | Hides categories in the Event conditions setting area and rearranges only setting items in the ascending order |
| | This button is always invalid. |

| Button | Function |
|--------|---|
| ОК | Applies detailed settings made in this dialog box to execution-related events and closes this dialog box. |
| Cancel | Cancels the save and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Detail dialog box (for access events)

This dialog box is used to display and modify detailed information on an access-related event selected in the Events panel.

Note that the access-related events refer to the following events in the Events panel.

- Hardware Break event (access type)
- Access-related break event in detailed information on Combination Break event [E1][E20]
- Access-related event as start and end condition [E1][E20] in detailed information on Trace event
- Access-related event in detailed information on Point Trace event

Figure A-59. Detail Dialog Box (for Access Events) [IECUBE]

- [Description of each area]
- [Toolbar]
- [Function buttons]

[How to open]

- On the Events panel, move the caret to any one of the following events, and then select [Edit Condition...] from the context menu.
 - Hardware Break event (access type)
 - Access-related break event in detailed information on Combination Break event [E1][E20]
 - Access-related event as start and end condition [E1][E20] in detailed information on Trace event
 - Access-related event in detailed information on Point Trace event

[Description of each area]

(1) Event conditions setting area

(a) [Address]

Specify the address condition.

| Compare condition | Specify the condition to compare address. | | | | |
|------------------------------------|---|---|--|---|--|
| [IECUBE] | Default | The current set value | | | |
| [Simulator] | Modifying | Select from the drop-down list | | | |
| | Available | e Specified address (==) | | Specifies the address with [Address]. | |
| | values | Greater th | an or equal to (>=) | | |
| | | Less than | or equal to (<=) | | |
| | | Inside the | range (<=Values<=) | Specifies the range with [Start address] | |
| | | Outside th | e range !(<=Values<=) | and [End address]. | |
| Address | Specify the | l address. | | | |
| | [IECUBE][S | Simulator] | | | |
| | | | y when [Specified address (o (<=)] is selected in [Compa | ==)], [Greater than or equal to (>=)] or re condition]. | |
| | Default | The curre | nt set value | | |
| | Modifying | Directly er | nter from the keyboard. | | |
| | Available values | Address e | xpression within the valid ra | nge | |
| Start address [IECUBE] [Simulator] | Specify the start address. [IECUBE][Simulator] This item appears only when [Inside the range (<=Values<=)] or [Outside the range !(<=Values<=)] is selected in [Compare condition]. | | | | |
| | Default | 1 | nt set value | | |
| | Modifying | Directly er | nter from the keyboard. | | |
| | Available values | Address expression within the valid range | | | |
| End address [IECUBE] [Simulator] | Specify the end address. [IECUBE][Simulator] This item appears only when [Inside the range (<=Values<=)] or [Outside the range !(<=Values<=)] is selected in [Compare condition]. | | | , | |
| | Default | The current set value | | | |
| | Modifying | Directly er | nter from the keyboard. | | |
| | Available values | Address e | xpression within the valid ra | nge | |
| Use the address | Specify whether to specify an address mask. | | | | |
| mask | Default | No | | | |
| [Simulator] | Modifying | Select from the drop-down list | | | |
| | Available | Yes Specifies an address mask. | | | |
| | values | No | Does not specify an addre | ss mask. | |
| 1 | 1 | | I . | | |

| Mask value [Simulator] | ' ' | value of address mask. spears only when [Use the address mask] is set to [Yes]. | | |
|------------------------|---|---|--|--|
| | Default The current set value | | | |
| | Modifying Directly enter from the keyboard. | | | |
| | Available values | Hexadecimal number up to five digits | | |

(b) [Data Condition]

Specify the data condition.

| Access type | Specify the t | ype of access. | | | |
|-------------------|---------------|---|------------------|---|--|
| | Default | The current set value | | | |
| | Modifying | Select from the drop-down list | | | |
| | Available | Read Sets a read access as the type of access. | | ccess as the type of access. | |
| | values | Write | Sets a write ac | ccess as the type of access. | |
| | | Read/Write | Sets a read ar | nd a write access as the type of access. | |
| Access size | Specify the a | ccess size. | | | |
| | Default | The current set va | lue | | |
| | Modifying | Select from the dro | pp-down list | | |
| | Available | No conditions | Sets no acces | s size. | |
| | values | | True for all acc | cess sizes. | |
| | | 1byte | Sets 1-byte as | the access size. | |
| | | 2byte | Sets 2-byte as | the access size. | |
| Compare condition | Specify the o | condition to compare the data. | | | |
| | Default | The current set value | | | |
| | Modifying | Select from the drop-down list | | | |
| | Available | No conditions | | Specifies no data value. | |
| | values | Specified value (==) | | Specifies the data with [Compare data]. | |
| | | Any other value (!=) [IECUBE][Simulator] | | | |
| | | Greater than or equal to (>=) [IECUBE][Simulator] | | | |
| | | Less than or equal to (<=) [IECUBE][Simulator] | | | |
| | | Inside the range (<=Values<=) [IECUBE][Simulator] | | Specifies the range with [Lower data] and [Upper data]. | |
| | | Outside the range !(<=Values<=) [IECUBE][Simulator] | | | |

| Compare data | This item app | Specify the data to compare. This item appears only when [Specified value (==)], [Any other value (!=)], [Greater than or equal to (>=)] or [Less than or equal to (<=)] is selected in [Compare condition]. | | |
|---------------------------------|---|---|-----------------------------------|--|
| | Default | The current set value | | |
| | Modifying | Directly enter from | the keyboard. | |
| | Available values | Hexadecimal numb | per up to five digits | |
| Lower data [IECUBE] [Simulator] | This item app | lower data for the range in [Compare condition]. spears only when [Inside the range (<=Values<=)] or [Outside the range =)] is selected in [Compare condition]. | | |
| | Default | The current set va | lue | |
| | Modifying | Directly enter from | the keyboard. | |
| | Available values | Hexadecimal number up to five digits | | |
| Upper data [IECUBE] [Simulator] | Specify the upper data for the range in [Compare condition]. This item appears only when [Inside the range (<=Values<=)] or [Outside the range (<=Values<=)] is selected in [Compare condition]. | | | |
| | Default | The current set value | | |
| | Modifying | Directly enter from the keyboard. | | |
| | Available values | Hexadecimal number up to five digits | | |
| Use the data mask | Specify whet | her to specify a data | mask. | |
| | Default | No | | |
| | Modifying | Select from the drop-down list | | |
| | Available | Yes | Specifies a data mask. | |
| | values | No | Does not specify a data mask. | |
| Mask value | alue Specify the value of data mask. This item appears only when [Use the data mask] is set to [Yes]. Default The current set value | | e the data mask] is set to [Yes]. | |
| | | | The current set value | |
| | Modifying | Directly enter from the keyboard. | | |
| | Available values | Hexadecimal number up to five digits | | |

(c) [Pass Count] [IECUBE][Simulator]

Specify the pass count condition.

| Pass count | Specify a pass count. The relevant event occurs when the event condition is met as many times as the specified pass count. | | | |
|------------|---|------------------------------|--|--|
| | Default 1 | | | |
| | Modifying Directly enter from the keyboard. | | | |
| | Available values | 1 to 65535 in decimal number | | |

(2) Description area

This area displays a simple description of the item selected in the Event conditions setting area.

[Toolbar]

| •= | Displays all categories in the Event conditions setting area. |
|-----|--|
| 2.₩ | Hides categories in the Event conditions setting area and rearranges only setting items in the ascending order |
| | This button is always invalid. |

| Button | Function |
|--------|--|
| ОК | Applies detailed settings made in this dialog box to access-related events and closes this dialog box. |
| Cancel | Cancels the save and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Scroll Range Settings dialog box

This dialog box is used to set the scroll range of the vertical scroll bar on the Memory panel/Disassemble panel.

By setting the appropriate range, it is possible to improve the operability of a mouse (e.g. dragging) because the size of the vertical scroll bar on the panel is changed suitably.

Caution After setting a scroll range via this dialog box, the scroll range is not updated automatically even if the address evaluated by the address expression is changed because of such as a line assembly.

Remark It is possible to move outside the scroll range by using the [Page Up]/[Page Down]/[Up]/[Down] key, a button at either end of the scroll bar or a menu item related to the jump function.

Figure A-62. Scroll Range Setting Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Memory panel, click the 📘 button from [View] on the toolbar.
- On the Memory panel, select the [View] menu >> [Settings Scroll Range...] from the context menu.
- On the Disassemble panel, click the [x] button from [View] on the toolbar.
- On the Disassemble panel, select the [View] menu >> [Settings Scroll Range...] from the context menu.

[Description of each area]

(1) [Start address] area

Specify the start address of the range of scrolling.

You can either type an address expression directly into the text box (up to 1024 characters), or select it from the input history via the drop-down list (up to 10 items).

Note that the setting of the scroll range is not performed if "All" is selected in the drop-down list at this time (the scroll range is not limited).

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").

(2) [End address] area

Specify the end address of the range of scrolling.

You can either type an address expression directly into the text box (up to 1024 characters), or select it from the input history via the drop-down list (up to 10 items).

Note that this area becomes invalid if [Start address] is specified with [All].

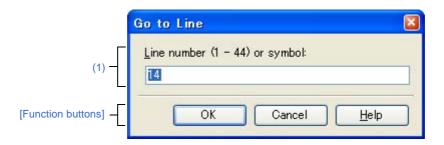

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").

| Button | Function |
|--------|--|
| ОК | Sets the specified scroll range for the target panel. Moves the caret to the start address, from the beginning of the area displayed in the target panel. |
| Cancel | Cancels the jump and closes this dialog box. |
| Help | Displays the help for this dialog box. |

Go to Line dialog box

This dialog box is used to move the caret to a specified line number, symbol, or address.

Figure A-63. Go to Line Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- Focus the Editor panel, and then select [Go to...] from the [Edit] menu.
- On the Editor panel, select [Go to...] from the context menu.

[Description of each area]

(1) [Line number (valid line range) or symbol] area

Directly enter the line number (decimal number), symbol name^{Note 1} or address^{Note 2} to which you want to move the caret.

"(valid line range)" shows the range of valid lines in the current file.

By default, the number of the line where the caret is currently located in the Editor panel is displayed.

Notes 1. Note the following, when specifying a symbol name:

- Only a function name can be specified as a symbol name.
- Run and complete a build.
- If an error in building occurs, the information before the error occurred is used.
- 2. Note the following, when specifying an address:
 - Only a hexadecimal value with prefix "0x" or "0X" can be specified (a decimal value is treated as a line number).
 - Run and complete a build.
 - If an error in building occurs, the information before the error occurred is used.

| Button | Function | |
|--------|---|--|
| ОК | Places the caret at the start of the specified source line. | |
| Cancel | Cancels the jump and closes this dialog box. | |
| Help | Displays the help for this dialog box. | |

Go to the Location dialog box

This dialog box is used to move the caret to a specified position.

Figure A-64. Go to the Location Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- Focus the Disassemble panel, and then select [Go to...] from the [Edit] menu.
- Focus the SFR panel, and then select [Go to...] from the [Edit] menu.
- On the Disassemble panel, select [Go to...] from the context menu.
- On the SFR panel, select [Go to...] from the context menu.

[Description of each area]

(1) [Address/Symbol], or [SFR] area

Specify the location to which the caret jumps.

You can either type a location directly into the text box (up to 1024 characters), or select one from the input history via the drop-down list (up to 10 items).

The data to specify various depending on the target panel, as follows:

| Target Panel | Data Specified |
|-------------------|--------------------|
| Disassemble panel | Address expression |
| SFR panel | SFR name |

Remark If this dialog box is opened from the Disassemble panel, a symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in this text box (see "2.19.2 Symbol name completion function").

| Button | Function | |
|--------|--|--|
| ОК | Moves the caret to the specified location, from the beginning of the area displayed in the target panel. | |
| Cancel | Cancels the jump and closes this dialog box. | |
| Help | Displays the help for this dialog box. | |

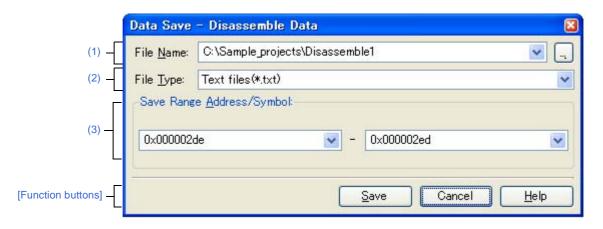

Data Save dialog box

This dialog box is used to save data displayed in the Disassemble panel, Memory panel, or Trace panel, and save uploaded data (see "2.5.3 Execute uploading").

This dialog box appears only when connected to the debug tool.

Figure A-65. Data Save Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- With the Disassemble panel in focus, select [Save Disassemble Data As...] form the [File] menu.
- With the Memory panel in focus, select [Save Memory Data As...] form the [File] menu.
- With the Trace panel in focus, select [Save Trace Data As...] form the [File] menu.
- From the [Debug] menu, select [Upload...].

[Description of each area]

(1) [File Name] area

Specify the name of the file to save.

You can either type a filename directly into the text box (up to 259 characters), or select one from the input history via the drop-down list (up to 10 items).

You can also specify the file by clicking the [...] button, and selecting a file via the Select Data Save File dialog box.

(2) [File Type] area

Select the format in which to save the file from the following drop-down list.

The available file formats will differ as follows depending on the type of data being saved.

(a) When saving the displayed content of a panel

| Text files (*.txt) | Text format (default) |
|---|----------------------------|
| CSV (Comma-Separated Variables) (*.csv) | CSV format ^{Note} |

Note The data is saved with entries separated by commas (,).

If the data contains commas, each entry is surrounded by double quotes ("") in order to avoid illegal formatting.

(b) When saving upload data

| Displayed List Items | File Format |
|--|--|
| Intel Hex format (Extension) (*.hex) | Intel expanded Hex format |
| Intel Hex format (Flash Programmer) (*.hex) ^{Note} [IECUBE][E1][E20] | Intel expanded Hex format (for flash programmer) |
| Motorola Hex format (S0, S2, S8 - 24bit-address) (*.hex) | Motorola S type format |
| Motorola Hex format (S0, S2, S8 - 24bit-address) (Flash Programmer) (*.hex) Note [IECUBE][E1][E20] | Motorola S type format (for flash programmer) |
| Extended Tektronix Hex format (*.hex) | Expanded Tektronix Hex format |
| Binary data (*.bin) | Binary format |

Note [IECUBE][E1][E20]

This item is displayed only when the selected microcontroller incorporates the data flash memory.

Remark See "2.5.3 Execute uploading" for details on uploading.

(3) [Save Range xxx] area

Specify the range of data to save.

You can either type ranges directly into the text boxes, or select them from the input history via the drop-down lists (up to 10 items).

The method of specifying the ranges will differ as follows depending on the type of data to be saved.

| Type of Data | Description |
|-------------------|--|
| Disassemble panel | Specify the range of addresses to save via the start and end addresses. Ranges can be entered as base-16 numbers or as address expressions. When a range is selected in the panel, that range is specified by default. When there is no selection, then the range currently visible in the panel is specified. |
| Memory panel | Specify the range of memory to save via the start and end addresses. Ranges can be entered as base-16 numbers or as address expressions. When a range is selected in the panel, that range is specified by default. When there is no selection, then the range currently visible in the panel is specified. |
| Trace panel | Specifying a range to save Specify the trace range to save via the start and end trace numbers^{Note}. Ranges can only be entered as base-10 numbers. Saving all trace data From the drop-down list to the left, select [All Trace Data]. The text box to the right is disabled. All currently acquired trace data will be saved. The range currently visible in the panel is specified by default. |
| Upload data | Specify the range of memory to save via the start and end addresses. Ranges can be entered as base-16 numbers or as address expressions. |

Note These are the numbers shown in the [Number] area of the Trace panel.

Remark A symbol name at the current caret position can be complemented by pressing the [Ctrl] + [Space] key in each text box (see "2.19.2 Symbol name completion function").

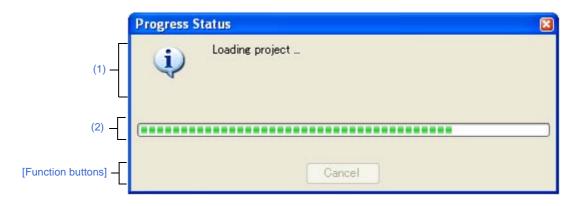

| Button | Function | |
|--------|--|--|
| Save | Saves the data to a file with the specified filename, in the specified format. | |
| Cancel | Cancels the save and closes this dialog box. | |
| Help | Displays the help for this dialog box. | |

Progress Status dialog box

This dialog box is used to display the progress of long processes.

This dialog box closes automatically when the currently executing process completes.

Figure A-66. Progress Status Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- This dialog box appears automatically when a message is displayed during a long process.

[Description of each area]

(1) Message display area

Displays messages during processing (cannot be edited).

(2) Progress bar

The amount of progress made toward completing the current progress is indicated by the length of the bar. The dialog box will automatically close when the progress reaches 100% (the length of the bar reaches the right end).

| Button | Function |
|--------|--|
| Cancel | Cancels the currently executing process, and closes this dialog box. |
| | Note that this button will be disabled if the currently executing process cannot be interrupted. |

Option dialog box

This dialog box is used to configure the CubeSuite+ environment.

All settings made via this dialog box are saved as preferences for the current user.

Figure A-67. Option Dialog Box

This section describes the following.

- [How to open]

[Function buttons] -

- [Description of each area]
- [Function buttons]

[How to open]

- From the [Tool] menu, select [Options...].

Initialize All Settings

[Description of each area]

(1) Category selection area

Select the items to configure from the following categories.

| Category | Description |
|---|---|
| [General - Startup and Exit] category | Configure startup and shutdown. |
| [General - Display] category | Configure messages from the application. |
| [General - External Text Editor] category | Configure the external text editor. |
| [General - Font and Color] category | Configure the fonts and colors shown on each panel. |
| [General - External Tools] category | Configure the startup of external tools. |
| [General - Project] category | Configure the project. |
| [General - Build/Debug] category | Configure building and debugging. |
| [General - PythonConsole] category | Configure the phthon console. |

| Category | Description |
|--------------------------------------|-----------------------------|
| [General - Text Editor] category | Configure the text editor. |
| [General - Update] category | Configure updating. |
| [Others - User Information] category | Configure user information. |

Remark See "CubeSuite+ Integrated Development Environment User's Manual: Start" for details on the categories other than [General - Font and color]/[General - Build/Debug].

(2) Setting area

This area is used to configure the various options for the selected category.

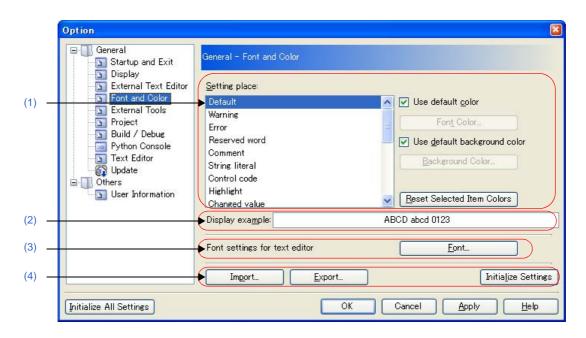

For details about configuration for a particular category, see the section for the category in question.

| Button | Function |
|-------------------------|--|
| Initialize All Settings | Restores all settings on this dialog box to their default values. Note, however, that newly added items in the [General - External Tools] category will not be removed. |
| ОК | Applies all setting and closes this dialog box. |
| Cancel | Ignores the setting and closes this dialog box. |
| Apply | Applies all setting (does not close this dialog box). |
| Help | Displays the help for this dialog box. |

[General - Font and Color] category

Use this category to configure general settings relating to fonts and colors on each panel.

Figure A-68. Option Dialog Box ([General - Font and Color] Category)

The following items are explained here.

- [How to open]
- [Description of each area]

[How to open]

- From the [Tool] menu, select [Options...].

[Description of each area]

(1) Color options area

Use this area to configure the colors.

(a) [Setting place] area

Select a location from the list for which the color will be specified.

The relationships between the list items and default color settings are as follows:

| Item | Example | | | Description |
|-------------------------|---------|------------------|------------------|---|
| Default ^{Note} | AaBbCc | Font color | Black | Standard display colors on all windows and panels |
| | | Background color | White | |
| Warning | AaBbCc | Font color | Blue | Display colors of warning messages on the Output panel, |
| | | Background color | Default color | as well as display colors for file names with "warnings included" on the Project Tree panel |

| Item | Example | | | Description |
|------------------|---------|------------------|------------------|---|
| Error | AaBbCc | Font color | Red | Display colors of warning messages on the Output panel, |
| | | Background color | Whitesmoke | as well as display colors for file names with "errors included" on the Project Tree panel |
| Reserved | AaBbCc | Font color | Maroon | Display colors of reserved words on the Editor panel for |
| word | | Background color | Default color | compilers/assemblers used |
| Comment | AaBbCc | Font color | Green | Display colors of comment parts (for C source files, "/* to */ |
| | | Background color | Default color | ") on the Editor panel |
| String literal | AaBbCc | Font color | Gray | Display colors of string literals on the Editor panel |
| | | Background color | Default color | |
| Control code | AaBbCc | Font color | Darkcyan | Display colors of control characters on the Output panel |
| | | Background color | Default color | |
| Highlight | AaBbCc | Font color | White | Display colors of highlighted spots in plug-in products, etc. |
| | | Background color | Mediumviol etred | |
| Changed value | AaBbCc | Font color | Sienna | Display colors on the Memory panel, CPU Register panel, |
| | | Background color | Lightyellow | Local Variables panel, SFR panel and Watch panel of spots whose values have been changed by program execution |
| Edit value | AaBbCc | Font color | Blue | Display colors on the Memory panel, CPU Register panel, |
| | | Background color | Default color | Local Variables panel, SFR panel and Watch panel of spots whose values have been forcibly changed by user |
| Current PC | AaBbCc | Font color | Black | Display colors on the Editor panel and Disassemble panel |
| | | Background color | Gold | of a line where the current PC position exists |
| Breakpoint | AaBbCc | Font color | Black | Display colors on the Editor panel and Disassemble panel |
| | | Background color | Lightsalmon | of a line where breakpoints are set |
| Update | AaBbCc | Font color | Deeppink | Display colors on the Memory panel and Watch panel of areas |
| periodic | | Background color | Default color | whose display is set to be updated in real time |
| Read or fetch | AaBbCc | Font color | Default color | Display colors on the Memory panel and Trace panel spots that have been read or fetched |
| | | Background color | Palegreen | |
| Write | AaBbCc | Font color | Default color | Display colors on the Memory panel and Trace panel of spots that have been written |
| | | Background color | Orange | |

| Item | | Example | | Description |
|------------------|--------|------------------|--------------------|--|
| Read and write | AaBbCc | Font color | Default color | Display colors on the Memory panel and Trace panel of spots that have been read and written |
| | | Background color | Paletur- quoise | |
| Lost | AaBbCc | Font color | White | Display colors on the Analysis Chart panel of the analyze |
| | | Background color | Lightgray | tool (Program Analyzer) of sections where acquisition of graph data has failed |
| Coverage 100% | AaBbCc | Font color | Default color | Display colors on the Editor panel and Disassemble panel of lines whose code coverage rates are 100 % |
| | | Background color | Lightgreen | |
| Coverage 1 - 99% | AaBbCc | Font color | Default color | Display colors on the Editor panel and Disassemble panel of lines whose code coverage rates are 1 to 99 % |
| | | Background color | Lightpink | |
| Coverage 0% | AaBbCc | Font color | Default color | Display colors on the Editor panel and Disassemble panel of lines whose code coverage rates are 0 % (unexecuted) |
| | | Background color | Lightgray | |
| Invalid | AaBbCc | Font color | Gray | Display colors on the Memory panel of areas that are not |
| | | Background color | Default color | memory-mapped, and of file names that are not actually present on the Project Tree panel |

Note The [Default] text and background colors depends on the Windows settings of the host computer. Here, we use the Windows defaults, which are black text and white background.

(b) [Use default color]

| > | Display items selected via the [Setting place] area using the standard text color. |
|---|---|
| | Display items selected via the [Setting place] area with a user-defined text color. |
| | The [Font color] button is enabled. |

(c) [Use default background color]

| > | Display items selected via the [Setting place] area using the standard background color. |
|---|---|
| | Display items selected via the [Setting place] area with a user-defined background color. |
| | The [Background Color] button is enabled. |

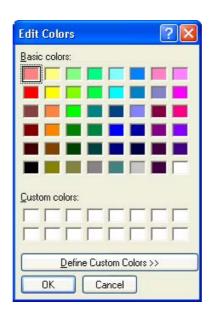

(d) Buttons

| Font Color | The Edit Colors Dialog Box opens. Specify the text color of the item selected via the [Setting place] area. | |
|------------|---|--|
| | Note, however, that this button will be disabled if the [Use default color] check box is selected. | |

| Background Color | The Edit Colors Dialog Box opens. Specify the background color of the item selected via the [Setting place] area. Note, however, that this button will be disabled if the [Use default background color] check box is selected. |
|----------------------------|--|
| Reset Selected Item Colors | Reset the color information for the item selected via the [Setting place] area to the defaults. |

Figure A-69. Edit Colors Dialog Box

(2) [Display example] area

Display sample text using the color and font settings from the Color options area.

By default the string "AaBbCc" is shown, but you can type an arbitrary string directly into the text box.

(3) [Font settings for text editor] area

Click the [Font...] button to open the Font Dialog Box and configure the fonts for your text editor.

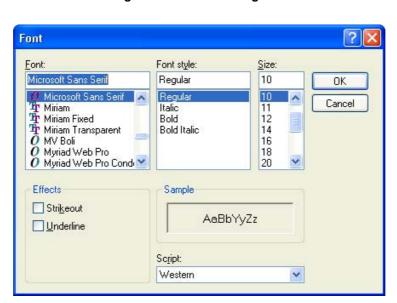

Figure A-70. Font Dialog Box

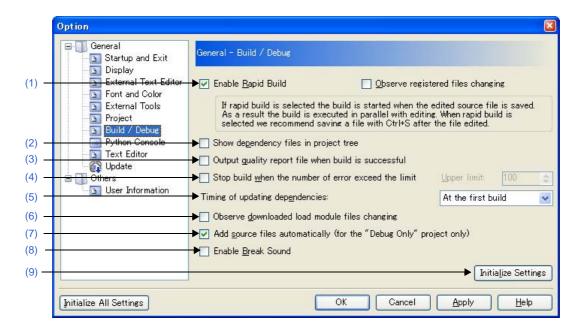

(4) Buttons

| Import | Opens the Open Option Setting File dialog box to reflect the set contents that were saved in a file to this category. |
|---------------------|---|
| Export | Opens the Save Option Setting File dialog box to save the set contents of this category to a file. |
| Initialize Settings | Returns all currently displayed setting to their default values. |

[General - Build/Debug] category

Use this category to configure general setting relating to building and debugging.

Figure A-71. Option Dialog Box ([General - Build/Debug] Category)

The following items are explained here.

- [How to open]
- [Description of each area]

[How to open]

- From the [Tool] menu, select [Options...].

[Description of each area]

(1) [Enable Rapid Build]

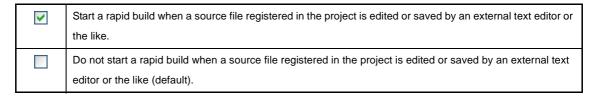

Note This feature automatically begins a build when the source file being edited is saved.

Enabling this feature makes it possible to perform builds while editing source files.

If this feature is used, we recommend saving frequently after editing source files.

(a) [Observe registered files changing]

Remark This item is only enabled if the [Enable Rapid Build] check box is selected.

- Cautions 1. The rapid build will not finish if this item is selected, and the files to be built have been registered for automatic editing or overwriting (e.g. by commands executed before or after the build). If the rapid build does not finish, unselect this item, and stop the rapid build.
 - If this item is selected, a file that is registered in the project but does not exist (a file grayed out) will not be observed even if it is registered again by the Explorer, etc.
 To observe the file, reload the project file, or select this item again after unselecting this item and closing this dialog box.

(2) [Show dependency files in project tree]

| > | Displays the group of files on which the source file depends as a project tree. | |
|---|---|--|
| | Does not display the group of files on which the source file depends as a project tree (default). | |

(3) [Output quality record file when build is successful]

| > | Outputs a quality record file if the build is successful. | |
|---|---|--|
| | Does not output a quality record file if the build is successful (default). | |

- **Remarks 1.** The quality report file is not output when a rapid build is executed, a debug-dedicated project is built, and compiling or assembling is executed in file units.
 - 2. The following information item is output to the quality report file.
 - Time and date on which the file is created
 - Log of the build results
 - Information on the command file which is used during building
 - Information on the detailed version of this product or the current project
 - **3.** The quality report file is output with the file name "QuarityReport(*project-name.build-mode-name*).text" to the project folder of each project.

If a file having the same name exists, it will be overwritten.

It is also shown on the project tree, under the Build tool generated files node.

(4) [Stop build when the number of error exceed the limit]

| > | Stops the build if the total number of errors at the build reaches the number specified in [Upper limit]. |
|---|--|
| | Does not stop the build even if the total number of errors at the build reaches the number specified in [Upper limit] (default). |

(a) [Upper limit]

Specify the upper limit of the number of errors.

Either enter a number between 1 and 10000 directly via the keyboard, or specify a number via the 😂 buttons. The default is 100.

Clicking the [OK]/[Apply] button without specifying any number restores this item to the number that have been saved previously.

Remark This item is only enabled if the [Stop build when the number of error exceed the limit] check box is selected.

(5) [Timing of updating dependencies]

| At the first build | Updates dependencies immediately before executing the first build after opening the project (default). |
|--------------------|--|
| At every build | Updates dependencies immediately before executing the build. |

(6) [Observe downloaded load module files changing]

| > | Watches changes made to the load module files downloaded to the debug tool, so that when changes are made, | |
|-------------|--|--|
| | a message dialog box is displayed for confirmation of whether or not to execute a download. | |
| | Does not watch changes made to the load module files downloaded to the debug tool (default). | |

(7) [Add source files automatically (for the "Debug Only" project only)]

| V | Automatically adds the source files to the project tree when the load-module files are downloaded to the de | |
|----------|--|--|
| | tool in the debug-dedicated project (default). | |
| | Does not automatically add the source files to the project tree when the load-module files are downloaded to the | |
| | debug tool in the debug-dedicated project | |

Caution This function is valid only when the load module files have been added to the Download files node of the project tree. If the load module files have been added via the [Download File Settings] tab in the Property panel of the debug tool, then the source files will not be added to the project tree.

(8) [Enable Break Sound]

| > | Beeps when the execution of a program is halted due to a break event (Hardware or Software break). | |
|-------------|--|--|
| | Does not beep when the execution of a program is halted due to a break event (Hardware or Software break) (default). | |

(9) Buttons

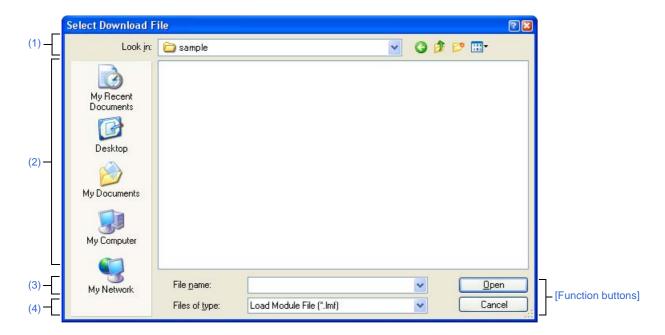

| Initialize Settings | Returns all currently displayed setting to their default values. |
|---------------------|--|

Select Download File dialog box

This dialog box is used to select a downloaded file.

Figure A-72. Select Download File Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the [Download file property] area in the Download Files dialog box, click the [...] button on the [File] property.

[Description of each area]

(1) [Look in] area

Select the folder which contains the file you want to download.

(2) List of files area

This area displays a list of files matching the conditions selected in the [Look in] and [Files of type] areas.

(3) [File name] area

Specify the name of a file you want to download.

(4) [Files of type] area

Select the type of a file to download (file type).

| Load module file (*.lmf) | Load module format (default) |
|------------------------------|------------------------------|
| Hex file (*.hex;*.hxb;*.hxf) | Hex format |

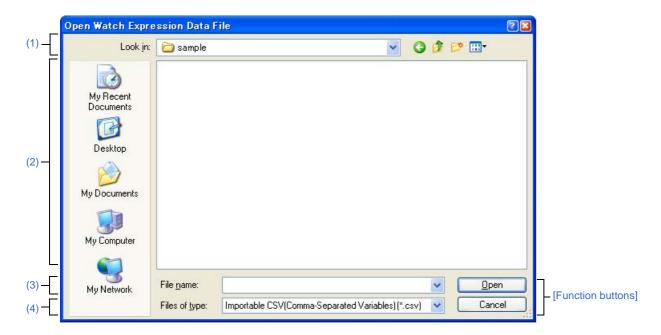

| Binary data file (*.bin) | Binary format |
|--------------------------|------------------|
| All files (*.*) | All file formats |

| Button | Function |
|--------|---|
| Open | Adds the specified file to the Download Files dialog box. |
| Cancel | Closes the dialog box. |

Open Watch Expression Data File dialog box

This dialog box is used to select a file that imports watch-expressions to the Watch panel.

Figure A-73. Open Watch Expression Data File Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the Watch panel, select [Import Watch Expression...] from the context menu.

[Description of each area]

(1) [Look in] area

Select the folder which contains the file you want to import.

(2) List of files area

This area displays a list of files matching the conditions selected in the [Look in] and [Files of type] areas.

(3) [File name] area

Specify the name of a file you want to import.

(4) [Files of type] area

The following type of the file (file type) is shown.

| Importable CSV(Comma-Separated Variables) (*.csv) | CSV format to enable import |
|---|-----------------------------|
|---|-----------------------------|

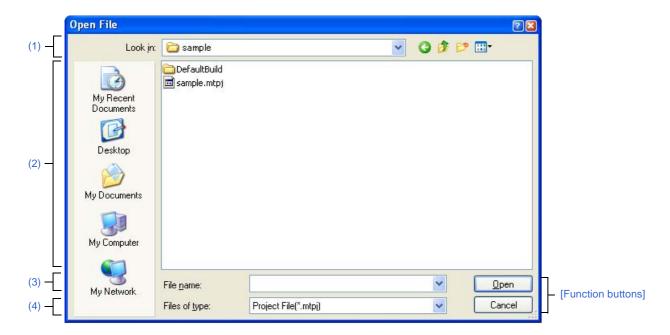

| Button | Function |
|--------|--|
| Open | Imports the specified file to the Watch panel. |
| Cancel | Closes the dialog box. |

Open File dialog box

This dialog box is used to open a file.

Figure A-74. Open File Dialog Box

The following items are explained here.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- From the [File] menu, select [Open File...] or [Open with Encoding...].

[Description of each area]

(1) [Look in] area

Select the folder which contains the file you want to open.

When you first open this dialog box, the folder is set to "C:\Documents and Settings \user-name\My Documents". The second and subsequent times, this defaults to the last folder that was selected.

(2) List of files area

This area displays a list of files matching the conditions selected in the [Look in] and [Files of type] areas.

(3) [File name] area

Specify the name of a file you want to open.

(4) [Files of type] area

Select the type of the file you want to open (file type).

| All files (*.*) All formats |
|------------------------------|
|------------------------------|

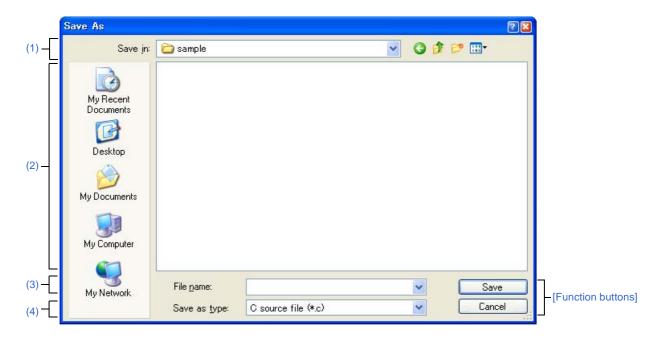

| Project File(*.mtpj) | Project file |
|--|--|
| Project File for e2 studio (*.rcpc) | Project file for e ² studio |
| Project File for CubeSuite(*.cspj) | Project file for CubeSuite |
| Workspace File for HEW(*.hws) | Workspace file for HEW |
| Project File for HEW(*.hwp) | Project file for HEW |
| Workspace File for PM+(*.prw) | Workspace file for PM+ |
| Project File for PM+(*.prj) | Project file for PM+ |
| C source file (*.c) | C language source file |
| Header file (*.h; *.inc) | Header file |
| Assemble file (*.asm) | Assembler source file |
| Link directive file (*.dir; *.dr) | Link directive file |
| Variable and function information file (*.vfi) | Variable and function information file |
| Map file (*.map) | Map file |
| Symbol table file (*.sym) | Symbol table file |
| Hex file (*.hex; *.hxb; *.hxf) | Hex file |
| Python script file (*.py) | Python script file |
| System configuration file (*.cfg) | System configuration file |
| Text file (*.txt) | Text format |

| Button | Function |
|---|---|
| Open - When this dialog box is opened by [Open File] from the [File] menu | |
| | Opens the specified file. |
| | - When this dialog box is opened by [Open with Encoding] from the [File] menu |
| | Opens the Encoding dialog box. |
| Cancel | Closes this dialog box. |

Save As dialog box

This dialog box is used to save the contents of the panel into a specified file.

Figure A-75. Save As Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- With the Editor panel in focus, select [Save file name As...] from the [File] menu.
- With the CPU Register panel in focus, select [Save CPU Register Data As...] from the [File] menu.
- With the Watch panel in focus, select [Save Watch Data As...] from the [File] menu.
- With the SFR panel in focus, select [Save SFR As...]. from the [File] menu.
- With the Call Stack panel in focus, select [Save Call Stack Data As...] from the [File] menu.
- With the Local Variables panel in focus, select [Save Local Variable Data As...] from the [File] menu.
- With the Output panel in focus, select [Save tab name As...] from the [File] menu.

[Description of each area]

(1) [Save in] area

Select the folder in which you want to save the file, from the drop-down list.

(2) List of files area

This area displays a list of files matching the conditions selected in the [Save in] and [Save as type] areas.

(3) [File name] area

Specify a file name under which you want to save.

(4) [Save as type] area

(a) In the Editor panel

The following file types are displayed depending on the file being edited.

| | C |
|---|-------------------------------|
| C source file (*.c) | C language source file |
| Header file (*.h,*.inc) | Header file |
| Assemble file (*.asm) | Assembly language source file |
| Link directive file (*.dr;*.dir) | Link directive file |
| Link order specification file (*.mtls) | Link order specification file |
| Variable and function information file (*.vfi) | Function information file |
| Map file (*.map) | Map file |
| Symbol table file (*.sym) | Symbol table file |
| Hex file (*.hex;*hxb;*hxf) | Hex file |
| Python script file (*.py) | Python script file |
| System configuration file (*.cfg) | System configuration file |
| Preprocess list file(*.ppl) | Preprocess list file |
| Cross reference list file (*.xrf) | Cross reference list file |
| Assemble list file (*.prn) | Assemble list file |
| List file (*.lst) | List file |
| Error list file (*.cer)/(*.ecc)/(*.eoc)/(*.elk)/(*.elv)/(*.er)/(*.era)/ (*.erp)/(*.her) | Error list file |
| Text file (*.txt) | Text format |
| CSV (Comma-Separated Variables)(*.csv) ^{Note 1} | CSV format ^{Note 2} |

- **Notes 1.** This item appears only when this dialog box was opened from the Editor panel in the Mixed display mode.
 - 2. The data is saved with entries separated by commas (,).

 If the data contains commas, each entry is surrounded by double quotes (" ") in order to avoid illegal formatting. Moreover, "0x" is added to the address and code information.

(b) In the CPU Register panel/Watch panel/SFR panel/Call Stack panel/Local Variables panel

The following file types are displayed.

Select the format in which to save the file from the drop-down list.

| Text file (*.txt) | Text format (default) |
|---|---|
| CSV (Comma-Separated Variables)(*.csv) | CSV format ^{Note 1} |
| Importable CSV (Comma-Separated Variables)(*.csv) ^{Note 2} | CSV format ^{Note 1} to enable import |

- **Notes 1.** The data is saved with entries separated by commas (,).

 If the data contains commas, each entry is surrounded by double quotes (" ") in order to avoid illegal formatting.
 - 2. This item appears only when this dialog box was opened from the Watch panel.

(c) In the Output panel

The following file types are displayed.

The contents can be saved only in text format.

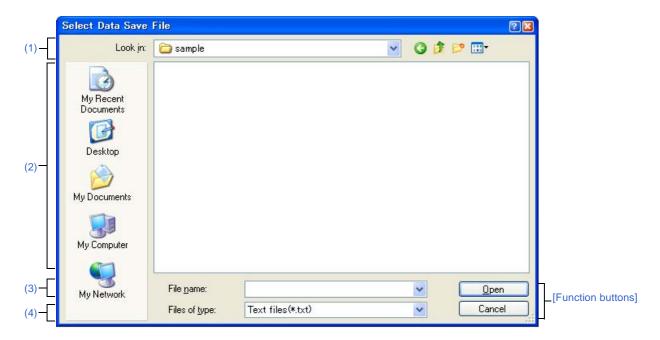

| Text file (*.txt) | Text format (default) |
|-------------------|-----------------------|
|-------------------|-----------------------|

| Button | Function |
|--------|---|
| Save | Saves the file with the specified name. |
| Cancel | Closes the dialog box. |

Select Data Save File dialog box

This dialog box is used to select a file in which to save the data.

Figure A-76. Select Data Save File Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the [File Name] area in the Data Save dialog box, click the [...] button.

[Description of each area]

(1) [Look in] area

Select the folder which contains the file you want to save.

(2) List of files area

This area displays a list of files matching the conditions selected in the [Look in] and [Files of type] areas.

(3) [File name] area

Specify the name of a file you want to save.

(4) [Files of type] area

Select the type of the file (file type).

The available file formats will differ as follows depending on the type of data being saved.

(a) Saving the data displayed in a panel

| Text files (*.txt) | Text format (default) |
|--|----------------------------|
| CSV (Comma-Separated Variables)(*.csv) | CSV format ^{Note} |

Note The data is saved with entries separated by commas (,).

If the data contains commas, each entry is surrounded by double quotes (" ") in order to avoid illegal formatting.

(b) Saving upload data

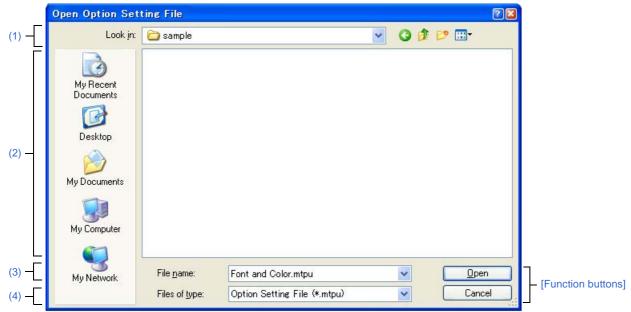

See "Table 2-2. Type of Files That Can be Uploaded".

| Button | Function |
|--------|---|
| Open | Specifies the specified file in the Data Save dialog box. |
| Cancel | Closes the dialog box. |

Open Option Setting File dialog box

This dialog box is used to select a option setting file to import to the [General - Font and Color] category of the Option dialog box.

Figure A-77. Open Option Setting File Dialog Box

The following items are explained here.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the [General - Font and Color] category of the Option dialog box, click the [Import...] button.

[Description of each area]

(1) [Look in] area

Select the folder which contains the option setting file you want to open.

When you first open this dialog box, the folder is set to "C:\Documents and Settings \user-name\My Documents". The second and subsequent times, this defaults to the last folder that was selected.

(2) List of files area

This area displays a list of files matching the conditions selected in the [Look in] and [Files of type] areas.

(3) [File name] area

Specify the name of a option setting file you want to open.

(4) [Files of type] area

The following type of the file (file type) is shown.

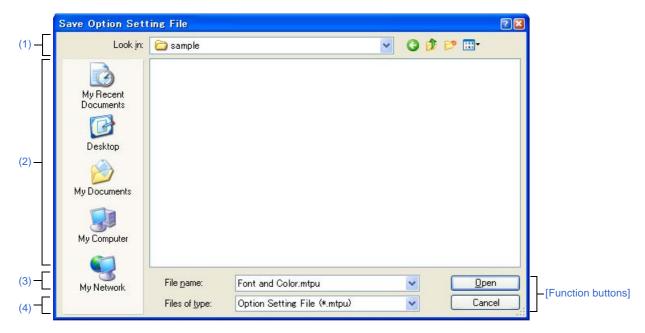

| Option Setting File (*.mtpu) | Option setting file |
|------------------------------|---------------------|
|------------------------------|---------------------|

| Button | Function |
|--------|---|
| Open | Imports the specified file to the [General - Font and Color] category of the Option dialog box. |
| Cancel | Closes this dialog box. |

Save Option Setting File dialog box

This dialog box is used to save the set contents of the [General - Font and Color] category of the Option dialog box to a option setting file.

Figure A-78. Save Option Setting File Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the [General - Font and Color] category of the Option dialog box, click the [Export...] button.

[Description of each area]

(1) [Save in] area

Select the folder in which you want to save the option setting file.

When you first open this dialog box, the folder is set to "C:\Documents and Settings \user-name\My Documents". The second and subsequent times, this defaults to the last folder that was selected.

(2) List of files area

This area displays a list of files matching the conditions selected in the [Save in] and [Save as type] areas.

(3) [File name] area

Specify the name of a option setting file under which you want to save.

(4) [Save as type] area

The following type of the file (file type) is shown.

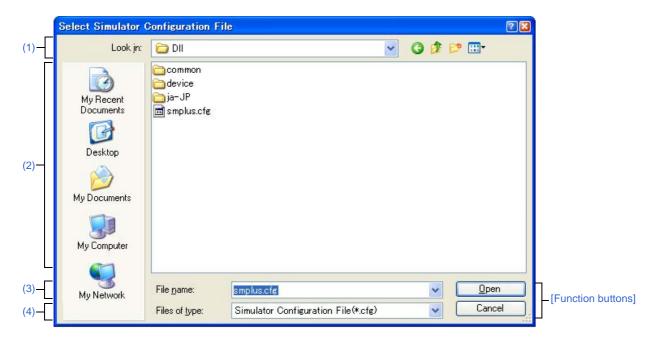

| Option Setting File (*.mtpu) | Option setting file |
|------------------------------|---------------------|
| | |

| Button | Function |
|--------|--|
| Save | Saves the option setting file with the specified name. |
| Cancel | Closes the dialog box. |

Select Simulator Configuration File dialog box [Simulator]

This dialog box is used to select the simulator configuration file to perform use customization (adding of user models) of the simulator.

Figure A-79. Select Simulator Configuration File Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

- On the [Connect Settings] tab of the Property panel, click the [...] button displayed by selecting the [Simulator configuration file] property in the [Configuration] category.

[Description of each area]

(1) [Look in] area

Select the folder which contains the simulator configuration file.

(2) List of files area

This area displays a list of files matching the conditions selected in the [Look in] and [Files of type] areas.

(3) [File name] area

Specify the name of the simulator configuration file to be used.

(4) [Files of type] area

Select the type of the file (file type).

Note that it is fixed to "Simulator Configuration File(*.cfg)".

| Button | Function |
|--------|--|
| Open | Uses the specified simulator configuration file. |
| Cancel | Closes the dialog box. |

Simulator GUI window

This window appears automatically by default after connecting to the debug tool when a microcontroller whose Simulator supports peripheral function simulations is selected and [Simulator] is selected as the debug tool to use (see "2.18 Use the Simulator GUI [Simulator]").

In Simulator GUI, other windows (Signal Data Editor window, Timing Chart window, I/O Panel window, and Serial window) are manipulated from this window.

- Cautions 1. When a microcontroller whose Simulator does not support peripheral function simulations (instruction simulation version) is selected, this window cannot be opened.
 - 2. This window and windows opened from it cannot be docked to the CubeSuite+ Main window.
 - The help for this window will not be displayed even if the [F1] key on the keyboard is pressed when no window opened from this window is opened.
 - To open the help for this window, select the [Help] menu >> [Main Window] on this window.
 - 4. The [x] button on this window's titlebar is invalid (it is invalid even if using the Aero function of Windows Vista). If you wish to close this window, perform the configuration of the Property panel (see "2.18 Use the Simulator GUI [Simulator]").
 - In addition, do not use the [Alt] + [F4] key to close this window.

Remark The language of titlebar/menubar of this window and windows opened from it depends on the setting of [Regional and Language Options] in [Control Panel] of the host machine used (if this setting is set to [Japan]/[Japanese], their titlebar/menubar are displayed in Japanese).

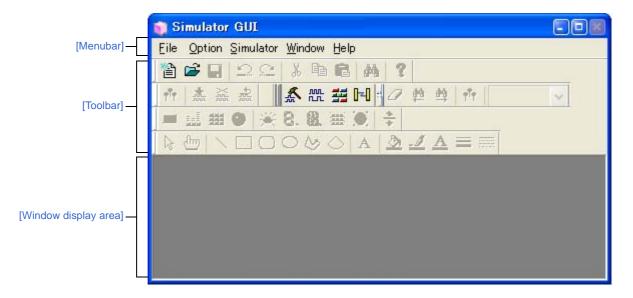

Figure A-80. Simulator GUI Window

This section describes the following.

- [Menubar]
- [Toolbar]
- [Window display area]

[Menubar]

- (1) [File] menu
- (2) [Edit] menu

- (3) [View] menu
- (4) [Parts] menu
- (5) [Figure] menu
- (6) [Option] menu
- (7) [Simulator] menu
- (8) [Window] menu
- (9) [Help] menu

(1) [File] menu

| New File | Opens a new window for the Simulator GUI window. Same operation as the button. |
|----------|---|
| Open | Opens the files handled in the Simulator GUI window. Same operation as the button. |
| Close | Closes the window currently having the focus. |
| Save | Overwrites the contents of the window currently having the focus to the file handled in the Simulator GUI window. Same operation as the button. |
| Save As | Saves the contents of the window currently having the focus to the specified file. |

(2) [Edit] menu

This menu varies depending on the window currently having the focus.

For details on this menu items, see "[Dedicated menu]" section in the Signal Data Editor window, Timing Chart window, I/O Panel window, or Serial window.

(3) [View] menu

This menu varies depending on the window currently having the focus.

For details on this menu items, see "[Dedicated menu]" section in the Signal Data Editor window, Timing Chart window, I/O Panel window, or Serial window.

(4) [Parts] menu

This menu is added when the I/O Panel window is opened.

For details on this menu items, see the [Parts] menu/[Parts] toolbar.

(5) [Figure] menu

This menu is added when the I/O Panel window is opened.

For details on this menu items, see the [Figure] menu/[Figure] toolbar.

(6) [Option] menu

| ToolBar | | Switches on/off display of the toolbar corresponding to the cascade menu. |
|---------|--------------------|---|
| | Simulator Standard | Selects whether the [Simulator Standard] toolbar is displayed or not. |
| | Simulator Tools | Selects whether the [Simulator Tool] toolbar is displayed or not. |
| | Signal Data Editor | Selects whether the [Signal Data Editor] toolbar is displayed or not. |
| | Timing Chart | Selects whether the [Timing Chart] toolbar is displayed or not. |
| | Parts | Selects whether the [Parts] toolbar is displayed or not. |
| | Figure | Selects whether the [Figure] toolbar is displayed or not. |

| T | |
|-----------|---------------------------------|
| Customize | Opens the Customize dialog box. |

(7) [Simulator] menu

| Signal Data Editor | Opens the Signal Data Editor window. Same operation as the button. |
|--------------------|---|
| Timing Chart | Opens the Timing Chart window. Same operation as the button. |
| I/O Panel | Opens the I/O Panel window. Same operation as the button. |
| Serial | Opens the Serial window. Same operation as the button. |

(8) [Window] menu

| Close All | Closes all windows, except this window. |
|---------------|--|
| Cascade | Cascade display of the windows in this window. |
| Tile | Cascade display of the windows in this window. |
| Arrange Icons | Rearranges the icons in this window. |

(9) [Help] menu

| Main Window | Displays the help for this window. |
|----------------|---|
| Current Window | Displays the help for the current window. |

[Toolbar]

- (1) [Simulator Standard] toolbar
- (2) [Simulator Tool] toolbar
- (3) [Signal Data Editor] toolbar
- (4) [Timing Chart] toolbar
- (5) [Parts] toolbar
- (6) [Figure] toolbar

(1) [Simulator Standard] toolbar

| | Opens a new window for the Simulator GUI window. |
|----------|---|
| = | Opens the files handled in the Simulator GUI window. |
| | Overwrites the contents of the window currently having the focus to the file handled in the Simulator GUI window. |
| Ω | Undoes the immediately preceding operation. |
| Cİ | Restores the status undone by the 🚨 button. |
| 8 | Cuts the selected range and saves it to the clipboard. |
| B | Copies the selected range and saves it to the clipboard. |
| @ | Pastes the clipboard contents. |

| # | Opens the Search Data dialog box. |

| 8 | Displays the contents of the help. |

(2) [Simulator Tool] toolbar

| <u>**</u> | Opens the Signal Data Editor window. |
|--------------|--------------------------------------|
| run. run. | Opens the Timing Chart window. |
| <u> </u> | Opens the Serial window. |
| ## | Opens the I/O Panel window. |

(3) [Signal Data Editor] toolbar

This toolbar can be used when the Signal Data Editor window has the focus.

For details on this toolbar, see the [Signal Data Editor toolbar].

(4) [Timing Chart] toolbar

This toolbar can be used when the Timing Chart window has the focus.

For details on this toolbar, see the [Timing Chart toolbar].

(5) [Parts] toolbar

This toolbar can be used when the I/O Panel window has the focus.

For details on this toolbar, see the [Parts] menu/[Parts] toolbar.

(6) [Figure] toolbar

This toolbar can be used when the I/O Panel window has the focus.

For details on this toolbar, see the [Figure] menu/[Figure] toolbar.

[Window display area]

This area is used to display various windows (Signal Data Editor window, Timing Chart window, I/O Panel window, or Serial window).

The displayed window can be changed in size or an icon can be created in this area.

Customize dialog box

This dialog box is used to set or change the color and fonts for the Signal Data Editor window, Timing Chart window or Serial window.

Figure A-81. Customize Dialog Box: [Color] Tab (For Timing Chart Window)

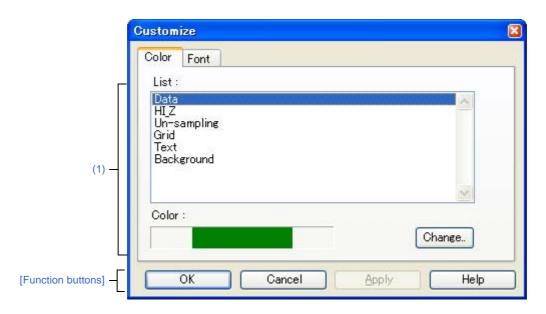

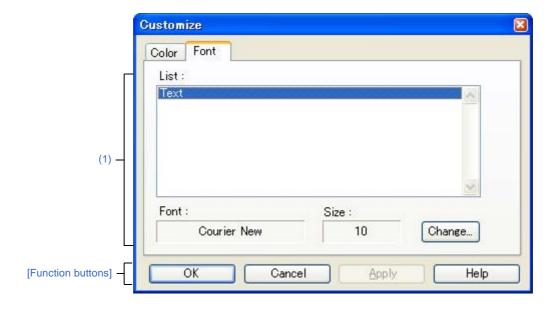

Figure A-82. Customize Dialog Box: [Font] Tab

This section describes the following.

- [How to open]
- [[Color] tab]
- [[Font] tab]
- [Function buttons]

[How to open]

- With the Signal Data Editor window, Timing Chart window or Serial window in focus, select [Customize...] from the [Option] menu.

[[Color] tab]

(1) Color setting area

Set and change the color of each part in the window.

| List | The parts for which color change is possible are displayed in list form. The parts displayed differ depending on the target window. |
|-----------------|--|
| Color | The currently set color of the part is displayed when that part is selected from the list. |
| [Change] button | The color currently set for the relevant part of each listed item can be changed. |

[[Font] tab]

(1) Font setting area

Set and change the text font of each part in the window.

| List | The parts for which font change is possible are displayed in list form. |
|-----------------|---|
| Font | The current font name of the part is displayed, when that part is selected from the list. |
| Size | The current font size of the part is displayed, when that part is selected from the list. |
| [Change] button | The font currently set for the relevant part of each listed item can be changed. |

[Function buttons]

| Button | Function |
|--------|--|
| ОК | Validates the settings and closes this dialog box. |
| Cancel | Cancels the settings and closes this dialog box. |
| Apply | Cannot be selected. |
| Help | Displays the help for this dialog box. |

Signal Data Editor window

This window is used to create and edit the signal data that is input to input pins.

The created signal data can be input to the input pin during simulation by selecting the [Edit] menu >> [Signal Input]. This data can also be saved to the signal data file (*.wvi) by selecting the [File] menu >> [Save]/[Save As...] or by saving the project file.

The saved file contents can be restored by selecting the [File] menu >> [Open...] or by loading the project file.

- Cautions 1. If the saved signal data file is opened or the project file is opened while Simulator GUI is running with a microcontroller different from the one used when the signal data file was created, the settings of pins that are not provided in the microcontroller will not be restored.
 - 2. The main clock and sub clock cannot be input from this window. Set the main clock/sub clock oscillation frequency on the [Connect Settings] tab in the Property panel.
 - 3. If inputting of signals is started during program break, the signals will actually be input when the program is resumed from the break.
- **Remarks 1.** The following data can be displayed or edited in this window:
 - Newly created signal data
 - Previously created signal data files
 - File of signal data previously obtained by performing simulation and saving the results as output signal data
 - 2. On the titlebar of this window, "Project file name + Serial number (from 0).wvi" is displayed when the project file has been loaded. However, after having loaded a project file of PM+, then if you save a file as the project file of CubeSuite+, "Project file name + CS+ Serial number (from 0).wvi" is displayed on the titlebar.

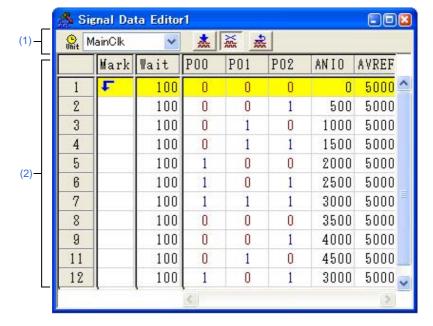

Figure A-83. Signal Data Editor Window

This section describes the following.

- [How to open]
- [Description of each area]
- [Dedicated menu (Signal Data Editor window)]

- [Signal Data Editor toolbar]
- [Context menu]
- [Operation]

[How to open]

- Click the 🚮 button
- Select [Signal Data Editor] from the [Simulator] menu.

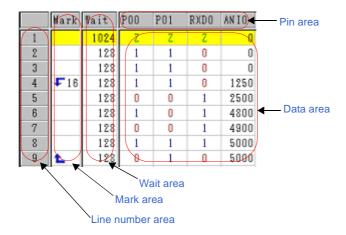

[Description of each area]

(1) Information bar

It can be specified whether this area is displayed or not, by selecting the [View] menu >> [Information Bar].

| MainClk ▼ | Select the unit of the wait time from the drop-down list. The wait time unit can be changed by selecting the [Edit] menu >> [Time unit]. |
|-----------|---|
| <u>**</u> | If this button is clicked while the program is running, signal input starts. If this button is clicked while the program is stopped, signal input starts automatically the next time the program execution is started. |
| × 200 | If this button is clicked while the program is running, signal input is stopped. If this button is clicked while the program is stopped, signal input does not start automatically even if the program execution is started. |
| 煮 | The current signal input line (line highlighted with yellow) is returned to the beginning. |

(2) Client area

| Pin area | Displays the input pin names. The input pin to be used is selected via the Select Pin dialog box opened by clicking the button on the toolbar or selecting the [Edit] menu >> [Select Pin]. Data input to pins can be enabled/disabled by selecting the [Edit] menu >> [Pin Status]. |
|------------------|--|
| Line number area | Displays line number. This area is used when performing editing in line units. Note that up to 1,048,576 (= 1M) lines can be specified as the signal data. |

| Mark area | Displays the loop information for the specified input value. | | |
|-----------|---|--|--|
| | The loop infor | The loop information is specified by selecting from the context menu or the [Edit] menu >> | |
| | [Mark] in the relevant field. | | |
| | The following | The following marks are displayed after the loop information has been specified. | |
| | Ł | Loop | start location (endless loop) |
| | √n | Loop | start location (with loop count) |
| | £ | Loop | end location |
| Wait area | Displays as "wait time" the timing at which the specified input value is input to the pins. | | e" the timing at which the specified input value is input to the pins. |
| | The wait time | is spec | cified by directly writing numeric values in the relevant field. |
| | Note that numeric values (decimal code) from 0 to 4,294,967,295 can be specified (values | | |
| | that exceed 4 | ,294,96 | 67,295 can be set by using one more line). |
| | The wait time | unit ca | n be changed by selecting the [Edit] menu >> [Time unit]. |
| Data area | Displays the input value input to the pins. | | |
| | The input valu | ıe is sp | ecified by directly writing numeric value in the relevant field. |
| | Note that the | Note that the input rules differ as follows according to the pin type. | |
| | Digital pins | Any o | one of the following one character |
| | | 0 | LOW signal |
| | | 1 | HIGH signal |
| | | Z | Hi-Z signal (case insensitive) |
| | Analog pins | A ded | cimal value from 0 to 5000 (unit: mV) |

[Dedicated menu (Signal Data Editor window)]

(1) [Edit] menu

| Undo Cannot be selected. | |
|--------------------------|--|
| Redo | Cannot be selected. |
| Cut | Cuts the selected range and saves it to the clipboard. |
| Сору | Copies the selected range and copies it to the clipboard. |
| Paste | Pastes the contents of the clipboard to the selected location. |
| Delete | Deletes the selected range. |
| Select All | Selects all display data. |
| Find | Cannot be selected. |
| Select Pin | Opens the Select Pin dialog box. The pin(s) for which input signal data is to be created or edited is (are) selected in this dialog box. |
| Time unit | Selects the wait time unit. |
| main clock | Main clock (default) |
| usec | Microsecond |
| msec | Millisecond |
| Pin Status | Selects the input status of the selected pin. |
| Valid | Enables data input to the pin (default). |
| Invalid | Disables data input to the pin. |

| Ν | lark | Sets a mark to the selected Mark area. |
|---|-------------|--|
| | Loop Start | Sets the loop start mark. |
| | Loop End | Sets the loop end mark. |
| | Loop Dialog | Opens the Loop dialog box. Sets the details of loop information. |
| S | ignal Input | Inputs signal data to the simulator. |
| | Start | Starts signal input. |
| | Stop | Stops signal input. |
| | Reset | Returns the current signal input line to the beginning. |

(2) [View] menu

| Information Bar | Selects whether the information bar is displayed or not. |
|-----------------|--|
| | |

(3) [Option] menu

| T | |
|-----------|---------------------------------|
| Customize | Opens the Customize dialog box. |

[Signal Data Editor toolbar]

| र्गंग | Opens the Select Pin dialog box. The pin(s) for which input signal data is to be created or edited is (are) selected in this dialog box. |
|-------|---|
| *** | If this button is clicked while the program is running, signal input starts. If this button is clicked while the program is stopped, signal input starts automatically the next time the program execution is started. |
| × | If this button is clicked while the program is running, signal input is stopped. If this button is clicked while the program is stopped, signal input does not start automatically even if the program execution is started. |
| ** | The current signal input line (line highlighted with yellow) is returned to the beginning. |

[Context menu]

The following context menus are available at each area in the Client area.

(1) Pin area

| Valid | Enables data input to the pin (default). |
|------------|--|
| Invalid | Disables data input to the pin. |
| Select Pin | Opens the Select Pin dialog box. The pin(s) for which input signal data is to be created or edited is (are) selected in this dialog box. |

(2) Line number

| Cut | Cuts the selected range and saves it to the clipboard. |
|-------|--|
| Сору | Copies the selected range and copies it to the clipboard. |
| Paste | Pastes the contents of the clipboard to the selected location. |

| Delete | Deletes the selected range. |
|--------|-----------------------------|
|--------|-----------------------------|

(3) Mark area

| Cut | Cuts the selected cell and saves it to the clipboard. |
|-------------|--|
| Сору | Copies the selected cell and copies it to the clipboard. |
| Paste | Pastes the contents of the clipboard to the selected location. |
| Delete | Deletes the selected cell. |
| Loop Start | Sets the loop start mark. |
| Loop End | Sets the loop end mark. |
| Loop Dialog | Opens the Loop dialog box. Sets the details of loop information. |

(4) Wait area

| Cut | Cuts the data in the selected cell and saves it to the clipboard. The data in the selected cell becomes 0. |
|--------|--|
| Сору | Copies the data in the selected cell and copies it to the clipboard. |
| Paste | Pastes the contents of the clipboard to the selected location. |
| Delete | Deletes the data in the selected cell. The data in the selected cell becomes 0. |

(5) Data area

| Cut | Cuts the data in the selected cell and saves it to the clipboard. The data in the selected cell becomes "Z" (Hi-Z). |
|--------------------|---|
| Сору | Copies the data in the selected cell and copies it to the clipboard. |
| Paste | Pastes the contents of the clipboard to the selected location. |
| Delete | Deletes the data in the selected cell. The data in the selected cell becomes "Z" (Hi-Z). |
| Start Signal Input | Starts signal input. |
| Stop Signal Input | Stops signal input. |
| Reset Signal Input | Returns the current signal input line to the beginning. |

[Operation]

- (1) Pin selection
- (2) Creating signal data
- (3) Data copy and paste
- (4) Single-line editing
- (5) Signal input
- (6) Operation at CPU reset

(1) Pin selection

To create the signal data, it is first necessary to select the pin to be used.

Open the Select Pin dialog box by clicking the full button on the toolbar or selecting the [Edit] menu >> [Select Pin...], and select the pin to be used. Once a pin is selected, its name is displayed in Pin area.

(2) Creating signal data

Create the signal data input to each pin.

(a) Setting of input value

In the Data area, specify the value that is input to each pin (see "Data area").

(b) Setting of input timing

In the Wait area, specify the timing at which the input value is input to each pin as "wait time" (see "Wait area").

(c) Setting of the loop information

When loop processing for the signal data specified in step (a) and (b) is needed, specify the loop information. To specify the loop information, select [Loop Start] from the context menu on the loop start position in the Mark area, and select [Loop End] on the loop stop position.

At this time, the loop count can be specified. In this case, specify the loop count via the Loop dialog box opened by selecting [Loop Dialog...] from the context menu.

The corresponding loop information marks are displayed if the setting of the loop information is completed (see "Mark area").

(3) Data copy and paste

The set values in Mark area/Wait area/Data area can be copied and pasted.

However, copied data can be pasted only in the same area.

| Сору | When one or more (a range of) cells are selected, these cells can be copied by selecting the [Edit] menu >> [Copy] (or pressing the [Ctrl] + [C] key). | |
|-------|--|--|
| Paste | When one or more (a range of) cells are selected, these cells can be pasted by selecting the [Edit] menu >> [Paste] (or pressing the [Ctrl] + [V] key). When multiple (a range of) cells are selected, the copied data is pasted to the cells repeatedly. | |

(4) Single-line editing

Single lines can be edited by selecting Line number area.

The method is the same as that described in "(3) Data copy and paste".

Data pasted during line paste (insertion) is inserted immediately before the selected line.

(5) Signal input

Input the created signal data to the input pins of the simulator while simulation is executed.

At this time, the line whose signal is currently being input (current line) is highlighted in yellow during program breaks (this can be changed via [Inputted current line] item in the Customize dialog box), in order to display signal input progress.

There are the following types of signal data input operations:

| Signal input start | Click the button, or select the [Edit] menu >> [Signal Input] >> [Start]. |
|--------------------|---|
| | As a result, signal input starts from the current signal input line (highlighted line). |
| Signal input stop | Click the button, or select the [Edit] menu >> [Signal Input] >> [Stop]. |
| | This stops signal input. |
| Signal reset | Click the abutton, or select the [Edit] menu >> [Signal Input] >> [Reset]. |
| | This returns the current signal input line to the beginning. If signal reset was performed during signal input, input continues from the beginning. |

Remark The signal data input to the selected pin can be controlled by selecting the [Edit] menu >> [Pin Status] >> [Valid]/[Invalid].

(6) Operation at CPU reset

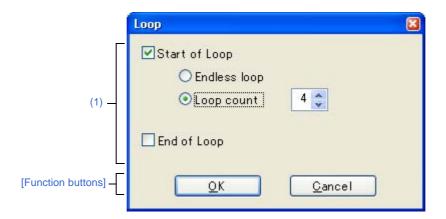

When CPU reset occurs, the current signal input line returns to the beginning.

If a CPU reset occurs during signal input, input continues from the beginning (same operation as the button).

Loop dialog box

This dialog box is used to perform detailed settings (loop start/stop and loop count) related to the loop information in the Signal Data Editor window.

Figure A-84. Loop Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

On the Signal Data Editor window, any one of the following:

- Double-click the Mark area.
- Select the Mark area, then select [Mark] >> [Loop Dialog...] from the [Edit] menu.

[Description of each area]

(1) Loop information setting area

| Start of Loop | Select this check box to set the Start of Loop. | | |
|---------------|---|---|-----------------------------------|
| | Endless loop | Select this option | n button to set the Endless Loop. |
| | Loop count | Select this option button to set the Loop Count. Sets the count value by spin button. | |
| | | 0 | Skip loop |
| | | 1 to 99 | Perform loop the specified count. |
| End of Loop | Select this check | ect this check box to set the End of Loop. | |

[Function buttons]

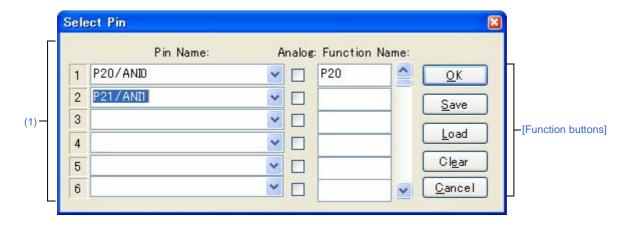

| Butto | on | Function |
|--------|----|--|
| ОК | | Validates the settings and closes this dialog box. |
| Cancel | | Cancels the settings and closes this dialog box. |

Select Pin dialog box

This dialog box is used when selecting pins displayed in the Signal Data Editor window and the Timing Chart window. The pin information set in this dialog box can be saved as a pin information file (*.pin) by clicking the [Save] button. Moreover, the saved file contents can be restored by clicking the [Load] button.

Figure A-85. Select Pin Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

On the Signal Data Editor window/Timing Chart window, any one of the following:

- Click the 🎁 button.
- Select [Select Pin...] from the [Edit] menu.

[Description of each area]

(1) Connection pins setting area

Up to 256 pins can be selected by using the scrollbar located on the right side of the pin name setting area.

| Pin Name | This area is used to specify the pin name to be connected. The connection pins can be specified either via direct input or through selection from the drop-down list. |
|---------------|--|
| Analog | Select this check box to use the specified pin as an analog pin. |
| Function Name | This area is used to set a function name for the pin name. When a character string is input in this area, this character string is displayed as a function name in the pin name part. If nothing is specified, the pin name is displayed. |

Remark For the pin names that can be specified, see the user's manual of the microcontroller that is used.

[Function buttons]

| Button | Function |
|--------|--|
| ОК | Validates the settings and closes this dialog box. The pin name (or display name) is applied in the Pin field of the window from where this dialog box was called up. |
| Save | Saves the display contents to the pin information file (*.pin). |
| Load | Loads the pin setting information of the specified file (*.pin). |
| Clear | Deletes the settings. |
| Cancel | Cancels the settings and closes this dialog box. |

Timing Chart window

This window is used to display the output signals and input signals for pins in the form of a timing chart.

This window allows time measurement in main clock units.

The browsed signal data can be saved to the timing chart file (*.wvo) by selecting the [File] menu >> [Save]/[Save As...]. Moreover, the saved file contents can be restored by selecting [File] menu >> [Open...].

If the project file is saved, signal data is not saved but information of the set pins is saved. (Solely saving the project file is sufficient if saving of the measurement result is unnecessary.)

- Cautions 1. If the saved timing chart file is opened or the project file is opened while Simulator GUI is running with a microcontroller different from the one used when the timing chart file was created, the settings of pins that are not provided in the microcontroller will not be restored.
 - The main clock and sub clock waveforms cannot be displayed in this window. In addition, when using the external bus interface function, the waveforms of pins used for the external bus interface function cannot be displayed.

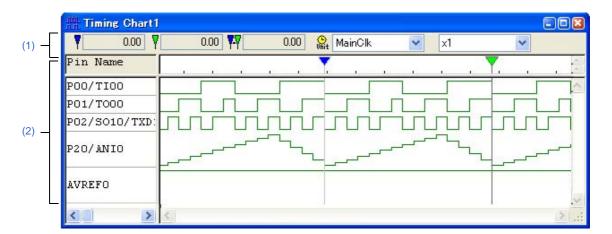

Figure A-86. Timing Chart Window

This section describes the following.

- [How to open]
- [Description of each area]
- [Dedicated menu (Timing Chart window)]
- [Timing Chart toolbar]
- [Context menu]
- [Operation]

[How to open]

- Click the ## button.
- Select [Timing Chart] from the [Simulator] menu.

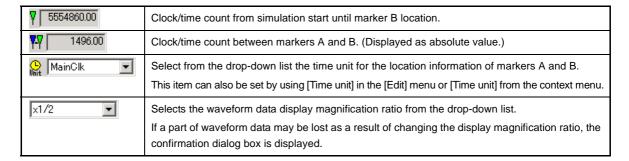

[Description of each area]

(1) Information bar

It can be specified whether this area is displayed or not, by selecting the [View] menu >> [Information Bar].

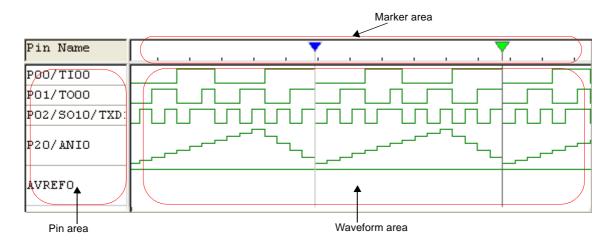

Remarks 1. Up to 4,294,967,262 clocks can be counted from the simulation start up to the marker position. When the count reaches the maximum value, the counter is cleared to 0 and starts counting again.

2. The menu for setting the magnify ratio appears dimmed during program execution, so changing the ratio is unavailable.

(2) Client area

| Pin Name area | Displays the names of the pins for which timing chart display is performed. Pin selection is performed by selecting the [Edit] menu >> [Select Pin] to open the Select Pin dialog box. | |
|---------------|--|---|
| Marker area | Displays the 2 marker headers. These markers can be moved by dragging them with the mouse over this area. | |
| | Y | Maker A |
| | 7 | Maker B |
| Waveform area | | y for the data of the pins specified in the Pin area. ns are used according to the signal by default. |
| | Green | The HIGH and LOW signals of the pins |
| | Red | High-impedance signals |
| | Blue | Unsampled signals |

Remarks 1. When the buffer is full, the data will be overwritten by the latest data starting from the oldest data because the buffer storing the pin data is in a ring buffer format.

The upper limit of the buffer size is one of the following.

- The number of pin change points: 4,096

The number of clocks: 2,147,483,631Horizontal draw width: 134,217,711 pixels

2. The colors and fonts can be changed via the Customize dialog box opened by selecting the [Option] menu >> [Customize...].

[Dedicated menu (Timing Chart window)]

(1) [Edit] menu

| Clear | Deletes all the waveform data. |
|-----------------|---|
| Find | Opens the Search Data dialog box. Waveform data search is performed in this dialog box. |
| Search backward | Searches for the change point of the selected pin in the backward direction (toward the left). |
| Search forward | Searches for the change point of the selected pin in the forward direction (toward the right). |
| Select Pin | Opens the Select Pin dialog box. The pin for which the waveform data is to be displayed is selected in this dialog box. |
| Time unit | Selects the time unit. |
| main clock | Main clock (default) |
| usec | Microsecond |
| msec | Millisecond |

(2) [View] menu

| Waveform | Switches on/off display of the Maker area and Waveform area. | |
|-----------------|---|--|
| Information Bar | Switches on/off display of the information bar. | |
| Zoom | Selects the waveform data display magnification ratio from a cascade menu. | |
| | If a part of waveform data may be lost as a result of changing the display magnification ratio, the confirmation dialog box is displayed. | |
| x 1/32 | Sets the magnification ratio to 1/32. | |
| x 1/16 | Sets the magnification ratio to 1/16. | |
| x 1/8 | Sets the magnification ratio to 1/8. | |
| x 1/4 | Sets the magnification ratio to 1/4. | |
| x 1/2 | Sets the magnification ratio to 1/2. | |
| x 1 | Sets the magnification ratio to 1. | |
| x 2 | Sets the magnification ratio to 2. | |
| x 4 | Sets the magnification ratio to 4. | |
| x 8 | Sets the magnification ratio to 8. | |
| x 16 | Sets the magnification ratio to 16. | |
| x 32 | Sets the magnification ratio to 32. | |

(3) [Option] menu

| (| Customize | Opens the Customize dialog box. |
|---|-----------|---------------------------------|
|---|-----------|---------------------------------|

[Timing Chart toolbar]

| 0 | Deletes all the waveform data. |
|-------------|---|
| ₩ | Searches for the change point of the selected pin in the backward direction (toward the left). |
| 動 | Searches for the change point of the selected pin in the forward direction (toward the right). |
| १ १५ | Opens the Select Pin dialog box. The pin for which the waveform data is to be displayed is selected in this dialog box. |
| x 1 | Selects the waveform data display magnification ratio from the drop-down list. If a part of waveform data may be lost as a result of changing the display magnification ratio, the confirmation dialog box is displayed. |

[Context menu]

The following context menus are available in the Client area.

| Clear | Deletes all the waveform data. |
|-----------------|---|
| Find | Opens the Search Data dialog box. |
| | Waveform data search is performed in this dialog box. |
| Search backward | Searches for the change point of the selected pin in the backward direction (toward the left). |
| Search forward | Searches for the change point of the selected pin in the forward direction (toward the right). |
| Select Pin | Opens the Select Pin dialog box. The pin for which the waveform data is to be displayed is selected in this dialog box. |
| Waveform | Switches on/off display of the Maker area and Waveform area. |
| Time unit | Selects the time unit. |
| Zoom | Selects the waveform data display magnification ratio. |
| | If a part of waveform data may be lost as a result of changing the display magnification ratio, the confirmation dialog box is displayed. |
| Move MakerA | Moves marker A to the cursor location. The same action can be accomplished by pressing the [Shift] key + left-clicking. |
| Move MakerB | Moves market B to the cursor location. The same action can be accomplished by pressing the [Ctrl] key + left-clicking. |

[Operation]

- (1) Pin selection
- (2) Display of timing chart
- (3) Clearing of timing chart
- (4) Timing measurement for timing chart
- (5) Data search function
- (6) Operation at reset

(1) Pin selection

To display the timing chart, it is first necessary to select the pin to be displayed.

Open the Select Pin dialog box by selecting the [Edit] menu >> [Select Pin...] and select the pin to be edited. Once a pin is selected, its name is displayed in the Pin Name area.

(2) Display of timing chart

The waveforms of the selected pins are displayed in timing chart form through execution of the program.

Remark The simulation speed can be increased by hiding the timing chart.

To hide the timing chart, select the [View] menu >> [Waveform] (deselect this item).

When the timing chart is hidden, the Maker area and Waveform area appear dimmed and "Display

OFF" is displayed in the center.

(3) Clearing of timing chart

Timing chart display is cleared by selecting the [Edit] menu >> [Clear].

(4) Timing measurement for timing chart

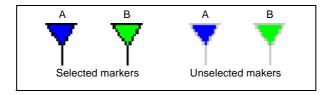

The timing between two points can be measured by marking 2 locations using markers A and B.

The time of each marker and the time between markers are displayed in the information bar.

Each marker can be placed at the target position by dragging the marker head. Moreover, it can also be placed at the position of the current mouse cursor by selecting [Move MarkerA]/[Move MarkerB] from the context menu.

The marker that is clicked last becomes the selected marker and can be subjected to the Data search function.

Figure A-87. Maker A And Maker B

(5) Data search function

There are two data search functions for timing charts.

(a) Simple search

Simple search is a function used to search change points for one pin.

Select the name of the pin for which the search is to be performed in the Pin area and then select the [Edit] menu >> [Search backward] or [Search forward].

As a result, the selected marker moves to the data position at which the change point was detected.

(b) Detailed search

In the case of detailed search, search using a combination of data of multiple pins can be executed.

The search data is set in the Search Data dialog box displayed by selecting the [Edit] menu >> [Find...].

The selected marker moves to the data position that was hit, similarly to simple search results.

(6) Operation at reset

If CPU reset or Simulator GUI reset occurs, the displayed waveforms of the timing chart are all cleared.

Search Data dialog box

This dialog box is used to search the signal data displayed in the Timing Chart window in detail.

Cautions 1. Analog I/O signals cannot be searched.

2. This dialog box cannot be opened during program execution.

Figure A-88. Search Data Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

On the Timing Chart window, any one of the following:

- Click the 👪 button.
- Select [Find...] from the [Edit] menu.

[Description of each area]

(1) Search pin setting area

When multiple search conditions have been specified, the signal data that meets all these search conditions is searched.

Up to 48 search conditions can be specified by using the scrollbar located on the right side.

| Pin Name | This area is used to specify the pin name to be searched. | |
|----------|--|--|
| | The pins can be specified either via direct input or through selection from the drop-down list | |
| | Inputting noting makes an area off-limit to data search and input in the corresponding [Search | |
| | Data] is disabled. | |

| Search Data | Selects the data from drop-down list. The data is searched for the pin to be specified. | | |
|-------------|---|--|--|
| | | Don't care | |
| | Rising Edge | Searches the rising edge of signal data. | |
| | Falling Edge | Searches the falling edge of signal data. | |
| | Rise/Fall Edge | Searches the rising/falling edge of the signal data. | |
| | High | Searches the signal data that is HIGH. | |
| | Low | Searches the signal data that is LOW. | |
| | Hi Z | Searches the signal data that is high impedance. | |
| Direction | | irection by selecting one of the exclusive option buttons. When the search is performed in the direction specified in this area. | |
| | Backward | Searches the data backward (data older than the current location). | |
| | Forward | Searches the data forward (data newer than the current location). (default) | |

[Function buttons]

| Button | Function | |
|--------|--|--|
| Next | Searches in the direction specified. When this button is clicked again following search completion, the next data is searched. | |
| Cancel | Stops the data search and closes the dialog box. | |

I/O Panel window

This window is used to configure a dummy target system, and manipulate created connected parts.

A dummy target system can be constructed by creating and setting connected parts (figure objects and part objects) in this window. The connected parts for which settings have been performed can be moved to any location within the window, and you can manipulate them during simulation to control signal processing.

Information about parts that are placed in the window can be saved to the I/O panel file (*.pnl) by selecting the [File] menu >> [Save]/[Save As...] or by saving the project file.

The saved file contents can be restored by selecting the [File] menu >> [Open...] or by loading the project file.

- Cautions 1. If the saved I/O panel file is opened while Simulator GUI is running with a microcontroller different from the one used when the file was created, information of the parts connected to the pins that are not provided in the microcontroller will not be restored (the [Pin Name] item in the property dialog boxes for parts remains blank).
 - 2. If inputting of signals is started (by an event such as clicking a button) during program break, the signal level will change in actuality when the program is resumed from the break.

Remark On the titlebar of this window, "Project file name + Serial number (from 0).pnl" is displayed when the project file has been loaded. However, after having loaded a project file of PM+, then if you save a file as the project file of CubeSuite+, "Project file name + CS+ Serial number (from 0).pnl" is displayed on the titlebar.

Figure A-89. I/O Panel Window

This section describes the following.

- [How to open]
- [Description of each area]
- [Dedicated menu/toolbar (I/O Panel window)]
- [Context menu]
- [Operation]

[How to open]

- Click the **#** button.
- Select [I/O Panel...] from the [Simulator] menu.

[Description of each area]

(1) Client area

This area is used to create and set connected parts (figure objects and part objects) in order to construct a dummy target system (see "[Operation]").

[Dedicated menu/toolbar (I/O Panel window)]

The menu items and buttons on the toolbar, which are used to perform operations related to this window, are described below.

(1) [Edit] menu

Select this menu to perform basic editing actions on created objects.

| Undo | Undoes the immediately preceding operation, such as object move. | | |
|----------------|--|--|--|
| | Undo can restore up to 5 previous changes. | | |
| Redo | Restores the status undone by the [Undo] command. | | |
| Cut | Cuts the selected range and saves it to the clipboard. | | |
| Сору | Pastes the contents of the clipboard. | | |
| Paste | Pastes the contents of the clipboard. | | |
| Delete | Deletes the selected range. | | |
| Select All | Selects all the objects in the window. | | |
| Group | Groups the selected objects. | | |
| UnGroup | Ungroups the selected objects. | | |
| Bring to Front | Brings the selected object to the front. | | |
| Send to Back | Sends the selected object to the back. | | |
| Bring Forward | Brings the selected object one panel forward. | | |
| Send Backward | Sends the selected object one panel backward. | | |

(2) [View] menu

Select this menu to switch the toolbar/status bar display status in this window, or to show/hide various types of information in this window.

| ToolBar | Switches on and off the display of two toolbars (Figure/Object). | | |
|------------|--|--|--|
| StatusBar | Switches on and off display of the status bar. | | |
| Parts List | Opens the Parts List dialog box. | | |
| | A list of all the figure/part objects in this window is displayed. | | |
| Grid | Shows/hides the window grid. | | |
| Properties | Opens the property dialog box of the selected figure/part object. | | |

(3) [Parts] menu/[Parts] toolbar

This menu and toolbar are used to select connected parts (part objects) provided by Simulator GUI when newly creating or placing parts (see "(3) Creating part objects").

In this menus, similar operations can be performed using the buttons on the [Parts] toolbar.

| Menu Item Button | | Function |
|---------------------|--------------|--|
| Button | | Digital input switch |
| e.g.) P00 | | A button can be connected to any pin. A digital input value can be given to the connected pin by clicking the displayed button. |
| Analog Button | 4 | Analog input switches |
| e.g.) 5V 4V 3V 2V | / 1 V | A button can be connected to any pin. An analog input value can be given to the connected pin by clicking the displayed button. |
| Key Matrix | # | A key matrix consists of multiple pins connected in a matrix array, wherein each con- |
| 4 5 7 8 | 3 6 9 | tact represents a key, and clicking a key results in a specific state. A key matrix can be connected to any pin, and data can be input using multiple keys. |
| Level Gauge | <u>•</u> | Used for inputting analog data such as power supply voltage. Any data within a given |
| e.g.) | | range can be set. Any value within a specified range can be assigned to a pin connected to an A/D converter. |
| LED | * | Light Emitting Diode |
| e.g.) | | An LED can be connected to any pin, and the output from the pin can be indicated by switching the LED on or off. |
| 7-Segment LED | 8. | A product that consists of 7 LEDs configured to represent a numeric figure. |
| e.g.) | | When the output from the pin assigned to the digit signal is active, the corresponding 7-segment LED switches on or off. |
| 14-Segment LED | 8. | A product that consists of 14 LEDs configured to represent an alphabetic character. |
| e.g.) | | When the output from the pin assigned to the digit signal is active, the corresponding 14-segment LED switches on or off. |
| Matrix LED |) | A product that consists of multiple LEDs arranged in a matrix array. |
| e.g.) | | When the output from an assigned pin is active, the corresponding 14-segment LED switches on or off. |
| Buzzer | 0 | A buzzer connected to a pin indicates the output information from the connected pin |
| e.g.) | | with a bitmap. |
| Pull up / Pull down | * | Opens the Pull up/Pull down dialog box. |
| | | Whether a pin is connected to a pull-up/down resistor can be specified via this dialog box. |

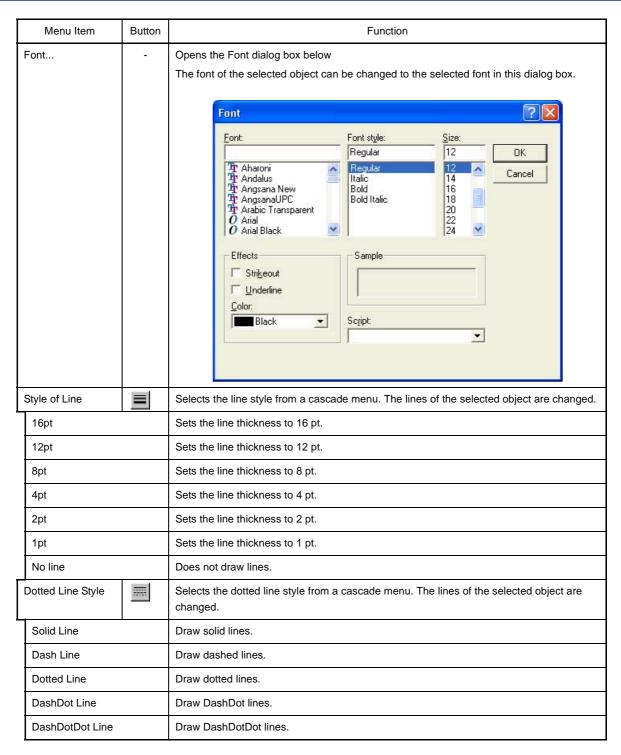

(4) [Figure] menu/[Figure] toolbar

This menu and toolbar are used to set the operation mode of this window, and select connected parts (figure objects) when newly creating or placing parts (see "(2) Creating figure objects").

In this menus, similar operations can be performed using the buttons on the [Figure] toolbar.

| Menu Item | Button | Function | | |
|------------------------|------------|--|--|--|
| Select | B | Changes this window's operation mode to the Edit mode. | | |
| | | The cursor shape changes into an arrow, enabling the edit of objects. | | |
| Simulation Mode | <u>@</u> | Changes this window's operation mode to the Simulation mode. | | |
| | | The cursor shape changes into a hand, enabling simulation of input to connected parts (part objects). | | |
| Line | 1 | Changes the cursor shape into a cross (+), enabling the drawing of lines. | | |
| Rectangle | | Changes the cursor shape into a cross (+), enabling the drawing of rectangles. | | |
| Rounded Rectan- gle | 0 | Changes the cursor shape into a cross (+), enabling the drawing of rectangles with rounded corners. | | |
| Ellipse | 0 | Changes the cursor shape into a cross (+), enabling the drawing of ellipses. | | |
| Polygon | \Diamond | Changes the cursor shape into a cross (+), enabling the drawing of polygons. | | |
| Fan-shaped | \Diamond | Changes the cursor shape into a cross (+), enabling the drawing of fan shapes. | | |
| Text | A | Changes the cursor shape into a cross (+), enabling the drawing of text. | | |
| Paste Bitmap | - | Pastes the selected bitmap file in this window | | |
| Color of Line | <u>2</u> | Opens the Color dialog box below. The color of the lines of the selected object can be changed to the selected color in this dialog box. Color Basic colors: Custom colors: Define Custom Colors >> OK Cancel | | |
| Color of Fill | <u> </u> | Opens the Color dialog box. The color used for the selected object can be changed to the selected color in this dialog box. | | |

[Context menu]

In the Edit mode, the following context menus are available.

| Сору | Copies the selected objects. | | |
|--------|---------------------------------------|--|--|
| Paste | Pastes the contents of the clipboard. | | |
| Delete | Deletes the selected objects. | | |
| Group | Selects from a cascade menu. | | |

| | Group | Groups the selected objects. | |
|--|---|---|--|
| | Ungroup Ungroups the selected objects. | | |
| (| Order | Selects from a cascade menu. | |
| | Bring to Front Brings the selected object to the front. | | |
| Send to Back Sends the selected object to the back. Bring Forward Brings the selected object one panel forward. | | Sends the selected object to the back. | |
| | | Brings the selected object one panel forward. | |
| | Send Backward Sends the selected object one panel backward. | | |
| Properties Opens the property dialog box of the | | Opens the property dialog box of the selected figure/part object. | |

[Operation]

How to create objects (figure objects and part objects) to construct a dummy target system, and manipulate them is as follows:

- (1) Edit mode
- (2) Creating figure objects
- (3) Creating part objects
- (4) Placing objects
- (5) Inputting text
- (6) List display of objects
- (7) The detailed setting for objects
- (8) Simulation mode

(1) Edit mode

Change the operation mode of this window to "edit mode" to create objects.

The edit mode can be set by any one of the following methods.

- Select the [Figure] menu >> [Select].
- Click the 🔓 button on the toolbar.
- Select the [Edit] menu >> [Select All].

(2) Creating figure objects

(a) Line

Select the [Figure] menu >> [Line] or click the button on the toolbar.

-> The mouse cursor changes to a cross (+) shape and line drawing becomes possible.

Drag the cursor from the line start position to the end position.

-> The line start position and the line end position are connected by a straight line. (The line thickness and shape are the default settings.)

(b) Rectangle/Rounded rectangle/Fan shape

Select the [Figure] menu >> [Rectangle]/[Rounded Rectangle]/[Ellipse]/[Fan-shaped] or click the \bigsize / \infty / \infty | button on the toolbar.

-> The mouse cursor changes to a cross (+) shape and each drawings becomes possible.

Drag the mouse cursor from the top left corner to the bottom right corner of the drawing area (rectangular area).

-> The corresponding figure is displayed in the drawing area, with the mouse position forming the lower right corner.

Drop the figure to fix its size.

-> Rectangles are drawn in the same size as the rectangular area, and other figure shapes are drawn in a size that fits in the rectangular area. (The line thickness and shape are the default settings.)

(c) Polygon

Select the [Figure] menu >> [Polygon] or click the 💩 button on the toolbar.

-> The mouse cursor changes to a cross (+) shape and polygon drawing becomes possible.

Click at each position marking an apex of the polygon.

-> The apexes are linked by a straight line in the order in which they were clicked.

Drawing of the polygon is completed by double-clicking.

-> The line thickness and shape are the default settings.

(d) Pasting a bitmap

You can use an arbitrary bitmap file as a figure object.

Select the [Figure] menu >> [Paste Bitmap], and then select the bitmap file (*.bmp) to be pasted.

-> The corresponding bitmap file is pasted in the default position in this window.

(e) Changing the figure object style

The color or line style of the created figure object can be changed by any one of the following methods.

- Specify with the [Style] tab of the Object Properties dialog box opened by double-clicking the figure object.
- Select the [Figure] menu >> [Color of Line]/[Color of Fill]/[Style of Line]/[Dotted Line Style] or click the

(3) Creating part objects

You can create part objects by using connected parts provided by Simulator GUI.

(a) Selecting a part object

Select the part object to be created from the [Parts] menu or the toolbar.

-> The mouse cursor changes to a cross (+) shape.

Click any location.

-> The corresponding part object is created and placed with the clicked location as the top left corner (default size).

(b) Changing the part object style

The style of the created part object can be changed via the [Style] tab of the corresponding property dialog box opened by double-clicking the part object.

For details on the modifiable items, see the section of the property dialog box which is corresponding to the part object (the items differ depending on the part object).

(4) Placing objects

(a) Grid display

A grid is displayed by selecting the [View] menu >> [Grid].

(b) Selecting objects

The selected types and methods are indicated below.

The selected object(s) is displayed surrounded by a tracker indicating its selected status.

- Single selection
- Click the object to be selected.
- Multiple selections

Click the objects to be selected while pressing the [Shift] key.

- Range selection

Drag from the top left corner of the area including the object to be selected, and drop at the lower right corner.

- Select all

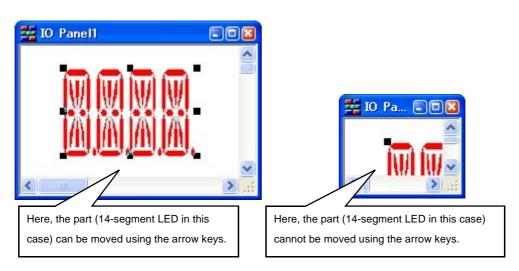

Select [Edit] menu>> [Select All].

(c) Moving objects

After selecting the object to be moved (multiple selections possible), then drag and drop it at the move destination.

Remark Objects can be moved using the arrow keys on the keyboard.

If more than half of the part bitmap is hidden when the window size is reduced, however, the selected part cannot be moved by using the arrow keys.

(d) Changing object size

After selecting the object whose size is to be changed, then drag the tracker displayed.

(e) Cut/Copy/Paste/Delete/Group/UnGroup an object

After selecting the object, select the corresponding item from the [Edit] menu.

(f) Changing object sequence (Bring to Front/Send to Back/Bring Forward/Send Backward)

After selecting the object, select the corresponding item from the [Edit] menu.

(5) Inputting text

Select [Figure] menu >> [Text] or click the A button on the toolbar.

-> The mouse cursor changes to a cross (+) shape.

Drag the mouse cursor from the top left corner of the character drawing area (rectangular area) to the lower right corner.

-> This rectangular area serves as the character drawing area.

Click in the character drawing area.

-> The cursor is displayed and character input becomes possible.

(6) List display of objects

Fugure objects and part objects created in this window can be displayed as a list by selecting the [View] menu >> [Parts List], in addition to display in this window.

(7) The detailed setting for objects

Each created object requires the detailed setting (pin connection information, etc.) in accordance with the target system to be used.

(a) Figure objects

The detailed setting can be performed via the [Object Connection] tab of the Object Properties dialog box opened by double-clicking the target figure object.

By connecting a object to an output pin, show/hide of the object can be switched depending on the output status of the connected pin.

(b) Part objects

The detailed setting can be performed via the [xxx Connection] tab of the property dialog box opened by double-clicking the target part object.

For details on the setable items, see the section of the property dialog box which is corresponding to the part object (the items differ depending on the part object).

(8) Simulation mode

The part objects whose settings have been completed can be manipulated during simulation (input values can be fed to the simulator). Accordingly you can check the I/O results from these displayed part objects in this window. Change the operation mode of this window to "simulation mode" to manipulate part objects.

The simulation mode can be set by any one of the following methods (the mouse cursor changes to a hand shape).

- Select the [Figure] menu >> [Simulation Mode].
- Click the button on the toolbar.

Remark For details on input operation, see the section of the property dialog box which is corresponding to the part object

Parts Button Properties dialog box

This property dialog box is used to set or change the pin connection information of buttons, which are one of the connection parts in the I/O Panel window.

Input to the simulator can be done from pin-connected buttons in the Simulation mode.

There are two types of button display styles, figure and bitmap. These styles can be changed on the [[Style] tab].

Figure A-90. Parts Button Properties Dialog Box: [Button Connection] Tab

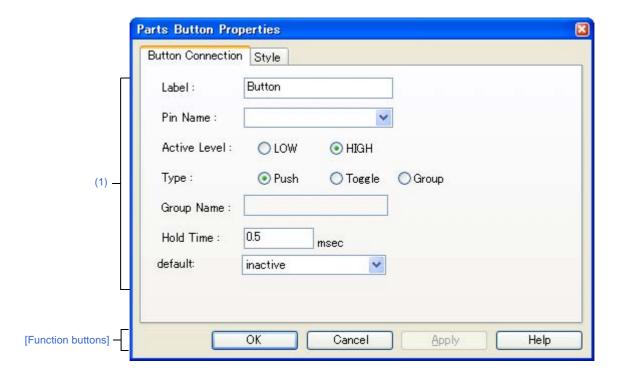

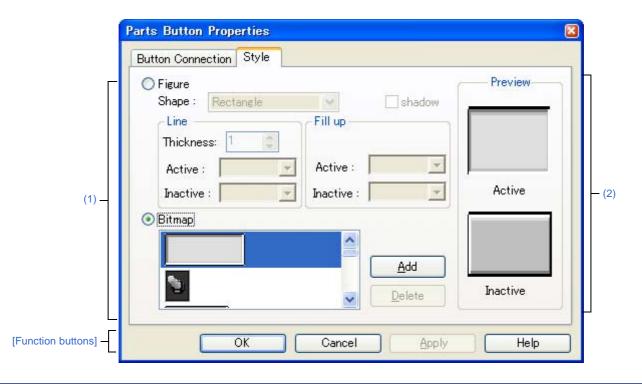

Figure A-91. Parts Button Properties Dialog Box: [Style] Tab

This section describes the following.

- [How to open]
- [[Button Connection] tab]
- [[Style] tab]
- [Function buttons]
- [Operation]

[How to open]

On the I/O Panel window, any one of the following:

- Double-click a part object "Button".
- Select [Properties...] form the context menu on a part object "Button".
- Select a part object "Button", and then select [Properties...] form the [View] menu.

[[Button Connection] tab]

(1) Pin connection information setting area

| Label | This area is used to specify the part name. The part name input here is displayed on the button. Moreover, it is also displayed in the Parts List dialog box as the label. | | |
|--------------|--|--|--|
| Pin Name | This area is used to specify the pin name to be connected. The connection pins can be specified either via direct input or through selection from the drop-down list. | | |
| Active Level | The active state is sele | ected with a option button, as follows: | |
| | LOW | Sets the active level to LOW. | |
| | HIGH | Sets the active level to HIGH (default). | |
| Туре | Button types are selec | ted using option buttons, as follows: | |
| | Push | Makes the button a Push button (default). | |
| | | The [Hold Time] item must be specified. | |
| | Toggle | Makes the button a Toggle button. | |
| | Group | Makes the button a Group button. | |
| | | The [Group Name] item must be specified. | |
| Group Name | This area is used to input the button's group name. Input to this area is possible only when [Group] has been selected in [Type]. | | |
| Hold Time | Specify the time (hold time) for which the input value is to be held (default: 0.5msec). The settable range is from 0.001 to 999 (msec). | | |
| | Input to this area is possible only when [Push] has been selected in [Type]. | | |
| default | Specify the button status after CPU reset. | | |
| | Not change at reset. | Maintains the button status after CPU reset. | |
| | inactive | Buttons are non-depressed after CPU reset (default). | |
| | active | Buttons are depressed after CPU reset. | |

Remark For the pin names that can be specified, see the user's manual of the microcontroller that is used.

[[Style] tab]

(1) Style information setting area

| Figure | Select this option | n button to disp | lay the button with the following specified figure. | | |
|--------|--|--|--|--|--|
| | Shape | Select the figure shape. Two shapes can be selected: rectangle and ellipse. | | | |
| | shadow | Cannot be selected. | | | |
| | Line | Specify and | change the figure line, as follows. | | |
| | | You can char | nge the color of figure line by clicking the pull-down button. | | |
| | | Thickness | Specifies the line thickness. | | |
| | | | Specification is made either using a spin button or through direct input. | | |
| | | | A value from 1 to 100 can be specified. | | |
| | | Active | Specifies the color of the line during active display. | | |
| | | Inactive | Specifies the color of the line during inactive display. | | |
| | Fill up | Specify and | change the figure filling, as follows. | | |
| | | You can char | nge the color of figure filling by clicking the pull-down button. | | |
| | | Active | Specifies the fill color during active display. | | |
| | | Inactive | Specifies the fill color during inactive display. | | |
| Bitmap | Select this option button to display the button with the following specified bitmap (default). | | | | |
| | Selection list | Select a bitmap to be used from the selection list. | | | |
| | | The selectable bitmaps appear in the selection list. | | | |
| | [Add] button | Opens the E | ntry Bitmap dialog box below to add a new bitmap to the selection list. | | |
| | | The bitmap file to be added can be specified either through file selection using the [] button, or through direct input. | | | |
| | | | Entry Bitmap Active Bitmap: \text{\common\bitmap\Parts_on.bmp} Inactive Bitmap: \text{\common\bitmap\Parts_off.bmp} | | |
| | [Delete] button | | | | |
| | | Note that only the bitmap that have been added by user can be deleted. | | | |

(2) Preview area

This area displays the style of the button currently being specified.

[Function buttons]

| Button | Function |
|---|--|
| OK Validates the settings and closes this dialog box. | |
| Cancel | Cancels the settings and closes this dialog box. |
| Apply | Cannot be selected. |
| Help | Displays the help for this dialog box. |

[Operation]

In the Simulation mode, by clicking the displayed button, data can be input to the pin connected to the button. The input format differs depending on the button type (push, toggle, group).

Figure A-92. Connected Parts Display Example (Button)

| Push button | Clicking this button causes the active value to be loaded to the connected pin. The active value is held during the hold time, after which it changes to the original value. | |
|---------------|---|--|
| Toggle button | Clicking this button loads the active value to the connected pin. The active value is held during the hold time, after which it changes to the original value. | |
| Group button | Clicking this button loads the active value to the connected pin. The value of the Group button having the same group name returns to the original value. | |

Analog Button Properties dialog box

This property dialog box is used to set or change the pin connection information of analog buttons, which are one of the connection parts in the I/O Panel window.

Input to the simulator can be done from pin-connected analog buttons in the Simulation mode.

There are two types of analog button display styles, figure and bitmap. These styles can be changed on the [[Style] tab].

Figure A-93. Analog Button Properties Dialog Box: [Analog Button Connection] Tab

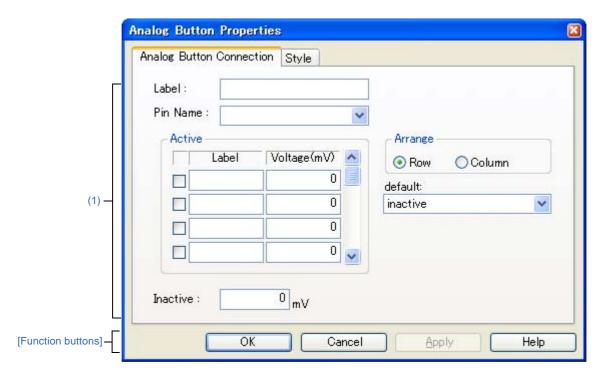

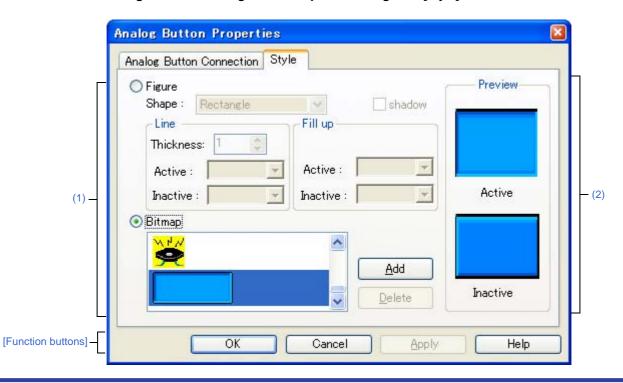

Figure A-94. Analog Button Properties Dialog Box: [Style] Tab

This section describes the following.

- [How to open]
- [[Analog Button Connection] tab]
- [[Style] tab]
- [Function buttons]
- [Operation]

[How to open]

On the I/O Panel window, any one of the following:

- Double-click a part object "Analog Button".
- Select [Properties...] form the context menu on a part object "Analog Button".
- Select a part object "Analog Button", and then select [Properties...] form the [View] menu.

[[Analog Button Connection] tab]

(1) Pin connection information setting area

| Label | | This area is used to specify the part name. The part name input here is displayed on the button. Moreover, it is also displayed in the Parts List dialog box as the label. | | |
|----------|--------------------------|---|--|--|
| Pin Name | | This area is used to specify the pin name to be connected. The connection pins can be specified either via direct input or through selection from the drop-down list. | | |
| Active | Specify the active state | Specify the active state. | | |
| | Check box | Analog buttons are created by the number of selected check boxes. | | |
| | Label | Directly input the name to be displayed on each analog button. | | |
| | Voltage(mV) | Directly input the voltage to be input when each analog button is clicked, in mV units. | | |
| Arrange | Specify the button arra | Specify the button arrangement using the option button. | | |
| | _ | This setting is available if two or more analog buttons have been created in the Active area. This setting is ignored if there is only one analog button or no analog buttons have been created. | | |
| | Row | Analog buttons will be arranged horizontally (default). | | |
| | Column | Analog buttons will be arranged vertically. | | |
| default | Maintains the analog b | Maintains the analog button operation after CPU reset. | | |
| | Not change at reset. | Maintains the analog button status immediately before CPU reset, after CPU reset. | | |
| | inactive | All of the analog buttons are non-depressed after CPU reset (default). | | |
| | Active is 'xxx'yyy(mV) | The analog button specified with "'xxx'(yyymV) " is depressed after CPU reset. | | |
| Inactive | Specify the input level | Specify the input level when no analog buttons are depressed. | | |

Remark For the pin names that can be specified, see the user's manual of the microcontroller that is used.

[[Style] tab]

(1) Style information setting area

| Figure | Select this option button to display the analog button with the following specified figure. | | | |
|--------|---|--|---|--|
| | Shape | Select the figure shape. Two shapes can be selected: rectangle and ellipse. | | |
| | shadow | Cannot be selected. | | |
| | Line | Specify and o | change the figure line, as follows. | |
| | | You can char | nge the color of figure line by clicking the pull-down button. | |
| | | Thickness | Specifies the line thickness. | |
| | | | Specification is made either using a spin button or through direct input. | |
| | | | A value from 1 to 100 can be specified. | |
| | | Active | Specifies the color of the line during active display. | |
| | | Inactive | Specifies the color of the line during inactive display. | |
| | Fill up | Specify and o | change the figure filling, as follows. | |
| | | You can char | nge the color of figure filling by clicking the pull-down button. | |
| | | Active | Specifies the fill color during active display. | |
| | | Inactive | Specifies the fill color during inactive display. | |
| Bitmap | Select this option button to display the analog button with the following specified bitmap (default). | | | |
| | Selection list | Select a bitmap to be used from the selection list. | | |
| | | The selectable bitmaps appear in the selection list. | | |
| | [Add] button | Opens the Entry Bitmap dialog box below to add a new bitmap to the selection list. | | |
| | | The bitmap file to be added can be specified either through file selection using the [] button, or through direct input. | | |
| | | | | |
| | | | Entry Bitmap | |
| | | | Active Bitmap: | |
| | | | \text{common\bitmap\Parts_on.bmp} \text{Inactive Bitmap:} | |
| | | | \common\bitmap\Parts_off.bmp | |
| | | | OK Cancel | |
| | [Delete] button | Deletes the currently selected bitmap from the selection list. | | |
| | | Note that only the bitmap that have been added by user can be deleted. | | |

(2) Preview area

This area displays the style of the analog button currently being specified.

[Function buttons]

| Button | Function |
|--------|--|

[Operation]

In the Simulation mode, while an analog button is depressed, the specified analog voltage value is input to the specified pin.

Clicking the depressed analog button again restores the button to its original state.

Figure A-95. Connected Parts Display Example (Analog Button)

Parts Key Properties dialog box

This property dialog box is used to set or change the pin connection information of a key matrix, which is one of the connection parts in the I/O Panel window.

Input to the simulator can be done from pin-connected keys in the Simulation mode.

A key matrix consisting of input pins and output pins of up to 16 x 16 can be set.

Either figure or bitmap can be selected as the key matrix display style. These styles can be changed on the [[Style] tab].

Caution When connecting a key matrix to pins, also perform the Pull up/Pull down settings for the connection pins. When a key is pressed, the output value of the output pin connected to that key is input to the input pin connected to that key. The value when the key is not pressed is the value specified in the Pull up/Pull down dialog box.

If the Pull up/Pull down settings are not performed, the input pin becomes the high-impedance state. Consequently, the operation of the function that is connected to the input pin becomes undefined.

- [How to open]
- [[Key Matrix Connection] tab]
- [[Style] tab]
- [Function buttons]
- [Operation]

[How to open]

On the I/O Panel window, any one of the following:

- Double-click a part object "Key matrix".
- Select [Properties...] form the context menu on a part object "Key matrix".
- Select a part object "Key matrix", and then select [Properties...] form the [View] menu.

[[Key Matrix Connection] tab]

(1) Pin connection information setting area

| Label | This area is used to specify the part name. The part name input here is also displayed in t | |
|-------|---|--|
| | Parts List dialog box as the label. | |

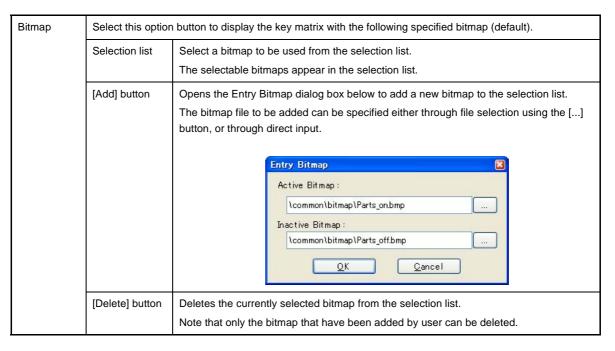

| Pin Name | This area is used to specify the pin name to be connected (input pins and output pins). The connection pins can be specified either via direct input or through selection from the drop-down list. This area can be used to set 16 x 16 pins using the scrollbar. | | |
|-----------|---|---|--|
| | In0 - In15 | Specify input pins. | |
| | Out0 - Out15 | Specify output pins. | |
| | N00 - Nff | This area is where the text strings displayed on the keys of the key matrix are specified. Text strings of any length can be specified. The default description string (N number) is not displayed on the keys. | |
| Hold Time | Specify the time (hold time) for which the input value is to be held (default: 0.5msec). The settable range is from 0.001 to 999 (msec). Moreover, when multiple keys for input to the same input pin are pressed during the hold time, only the key that was clicked last is valid. | | |
| default | Specify the key matrix operation after CPU reset. | | |
| | Not change at reset. | The key matrix status does not change after CPU reset. | |
| | inactive | No key matrix buttons are depressed after CPU reset (default). | |

Remark For the pin names that can be specified, see the user's manual of the microcontroller that is used.

[[Style] tab]

(1) Style information setting area

| Figure | Select this option button to display the key matrix with the following specified figure. | | | |
|--------|--|--|---|--|
| | Shape | Select the fig | Select the figure shape. Two shapes can be selected: rectangle and ellipse. | |
| | shadow | Cannot be selected. | | |
| | Line | Specify and change the figure line, as follows. | | |
| | | You can change the color of figure line by clicking the pull-down button. | | |
| | | Thickness | Specifies the line thickness. | |
| | | | Specification is made either using a spin button or through direct input. | |
| | | | A value from 1 to 100 can be specified. | |
| | | Active | Specifies the color of the line during active display. | |
| | | Inactive | Specifies the color of the line during inactive display. | |
| | Fill up | Specify and c | hange the figure filling, as follows. | |
| | | You can change the color of figure filling by clicking the pull-down button. | | |
| | | Active | Specifies the fill color during active display. | |
| | | Inactive | Specifies the fill color during inactive display. | |

(2) Preview area

This area displays the style of the key matrix currently being specified.

[Function buttons]

| Button | Function | |
|--------|--|--|
| ОК | Validates the settings and closes this dialog box. | |
| Cancel | Cancels the settings and closes this dialog box. | |
| Apply | Cannot be selected. | |
| Help | Displays the help for this dialog box. | |

[Operation]

In the Simulation mode, the following operation can be done.

- (1) Inputting multiple keys simultaneously
- (2) Locking the key input value

(1) Inputting multiple keys simultaneously

To enter two keys, simultaneously press the key to be input and right-click the mouse to enter the wait status. Then, click the other key. This releases the wait status and enables simultaneous input of both keys. Multiple keys can be simultaneously input by setting the wait status for multiple keys, but if input is to be performed to the same input pin, the key that was input last is valid.

(2) Locking the key input value

To enter two keys, simultaneously press the key to be input and right-click the mouse to enter the wait status. Then, click the other key. This releases the wait status and enables simultaneous input of both keys. Multiple keys can be simultaneously input by setting the wait status for multiple keys, but if input is to be performed to the same input pin, the key that was input last is valid

Parts Level Gauge Properties dialog box

This property dialog box is used to set or change the pin connection information of level gauge, which are one of the connection parts in the I/O Panel window.

Input to the simulator can be done from pin-connected level gauge in the Simulation mode.

Note that the connection pin must be an analog input pin.

There are two types of level gauge display styles, slide and dial. These styles can be changed on the [[Style] tab].

Figure A-99. Parts Level Gauge Properties Dialog Box: [Level Gauge Connection] Tab

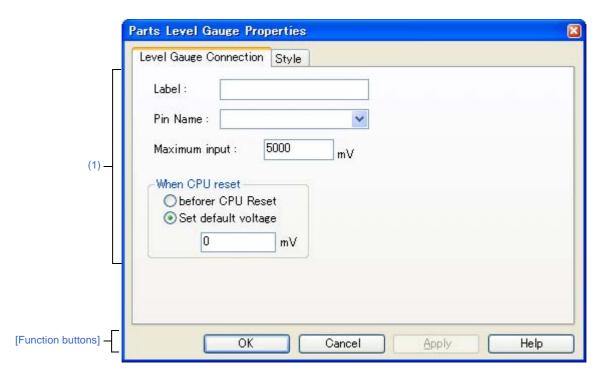

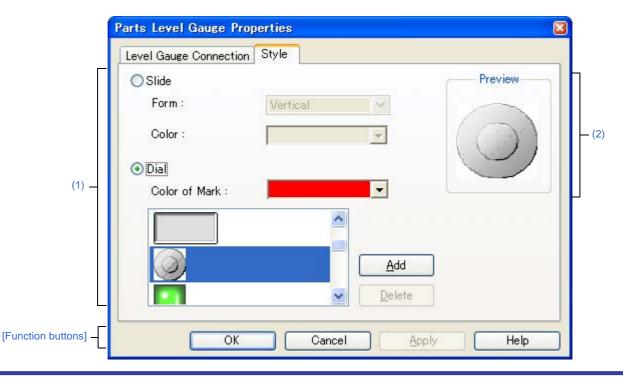

Figure A-100. Parts Level Gauge Properties Dialog Box: [Style] Tab

- [How to open]
- [Level Gauge Connection] tab]
- [[Style] tab]
- [Function buttons]
- [Operation]

[How to open]

On the I/O Panel window, any one of the following:

- Double-click a part object "Level Gauge".
- Select [Properties...] form the context menu on a part object "Level Gauge".
- Select a part object "Level Gauge", and then select [Properties...] form the [View] menu.

[Level Gauge Connection] tab]

(1) Pin connection information setting area

| Label | This area is used to specify the part name. The part name input here is also displayed in the Parts List dialog box as the label. | | |
|----------------|--|---|--|
| Pin Name | This area is used to specify the pin name to be connected. The connection pins can be specified either via direct input or through selection from the drop-down list. | | |
| Maximum input | This area is used to set the maximum level gauge input value (default: 5000mV). The settable range is from 0 to 65535. The operation range of the level gauge displayed in the I/O Panel window is determined by this specified value. | | |
| When CPU reset | Specify the level gauge operation after CPU reset. | | |
| | before CPU Reset | Maintains the level gauge status of immediately before CPU reset, after CPU reset. | |
| | Set default voltage | The level gauge is set to the specified value after CPU reset (default). Specify the value in mV units. Input a value from 0 to "Maximum input:". (default: 0 mV) | |

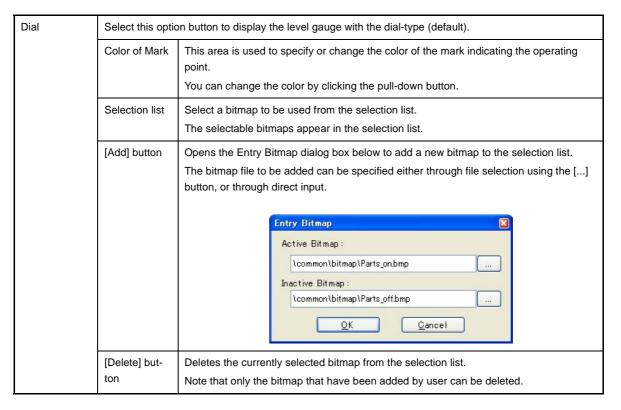

Remark For the pin names that can be specified, see the user's manual of the microcontroller that is used.

[[Style] tab]

(1) Style information setting area

| Slide | Select this option button to display the level gauge with the side-type. | | |
|-------|--|--|--|
| | Form | Select the slide direction (vertical or horizontal) from the drop-down list. | |
| Co | Color | This area is used to specify or change the slide color. You can change the color by clicking the pull-down button. | |

(2) Preview area

This area displays the style of the level gauge currently being specified.

[Function buttons]

| Button | Function |
|--------|--|
| ОК | Validates the settings and closes this dialog box. |
| Cancel | Cancels the settings and closes this dialog box. |
| Apply | Cannot be selected. |
| Help | Displays the help for this dialog box. |

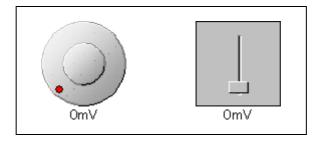

[Operation]

In the Simulation mode, analog input from the level gauge is performed through manipulation of the displayed slider or dial

The value specified in [Maximum input] is the maximum value that can be input.

Input is enabled by selecting the [Figure] menu >> [Simulation Mode].

Figure A-101. Connected Parts Display Example (Level Gauge)

| Dial-type level gauge | The displayed analog value changes as the operating point (red circle) on the dial is moved by dragging it with the mouse. When this analog value has become the value that is to be input, release the operating point. As a result, the displayed analog value is input. The operating point can also be moved by clicking the desired location on the dial. |
|------------------------|--|
| Slide-type level gauge | The displayed analog value changes as the slider button is moved by dragging it with the mouse. When this analog value has become the value that is to be input, release the button. As a result, the displayed analog value is input. The button can also be moved by clicking the desired location on the slider. |

Caution If you drag and drop the dial's operation point (red circle) or the slider's knob away from the level gauge, then the voltage displayed in the level gauge will change, but the voltage actually output by the level gauge will not change. Make sure to always drag and drop over the level gauge.

Parts Led Properties dialog box

This property dialog box is used to set or change the pin connection information of LED, which are one of the connection parts in the I/O Panel window.

A pin-connected LED displays the information output from the simulator through lit/unlit display in the Simulation mode. There are two types of LED display styles, figure and bitmap. These styles can be changed on the [[Style] tab].

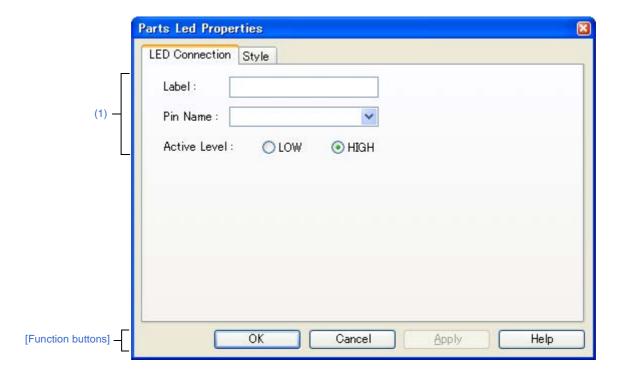

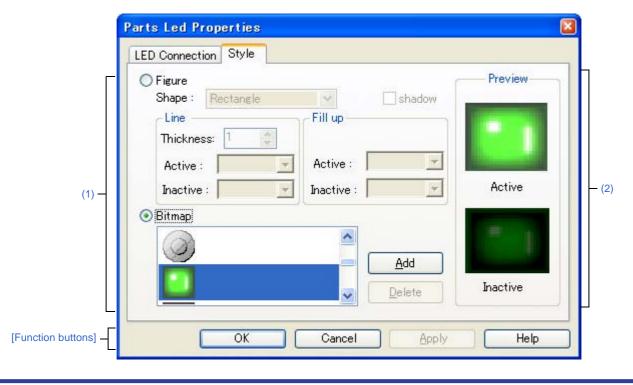

Figure A-103. Parts Led Properties Dialog Box: [Style] Tab

- [How to open]
- [[LED Connection] tab]
- [[Style] tab]
- [Function buttons]

| Cancel | Cancels the settings and closes this dialog box. | |

Object Properties dialog box

This property dialog box is used to set or change the connection information fed to the pins of figure object (including text and bitmap) of the I/O Panel window.

Show/hide can be switched for each pin-connected object by the output status of the connected pins in the Simulation mode.

The default status of each signal is active HIGH. Display styles can be changed on the [[Style] tab].

Figure A-115. Object Properties Dialog Box: [Object Connection] Tab

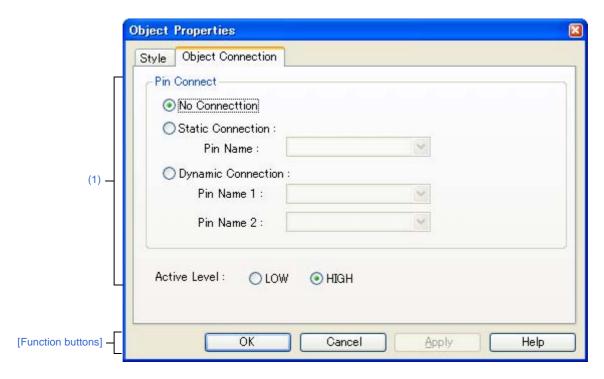

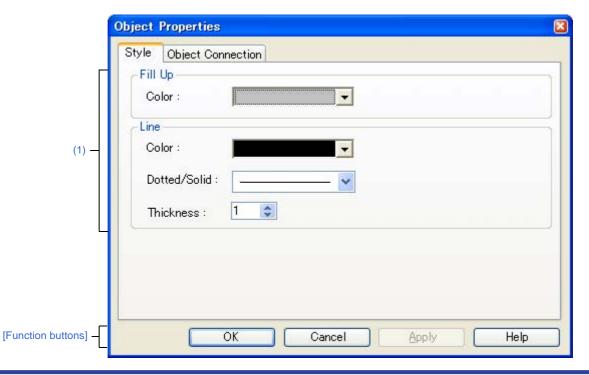

Figure A-116. Object Properties Dialog Box: [Style] Tab

- [How to open]
- [[Object Connection] tab]
- [[Style] tab]
- [Function buttons]

[How to open]

On the I/O Panel window, any one of the following:

- Double-click a figure object.
- Select [Properties...] form the context menu on a figure object.
- Select a figure object, and then select [Properties...] form the [View] menu.

[[Object Connection] tab]

(1) Pin connection information setting area

| Pin Connect | Select the method for connecting objects and output pins by clicking the corresponding option buttons, and specify the output pin name. As a result of the connection, figure display is switched by the ON/OFF status of the connected output pin. | |
|--------------|--|---|
| | No Connection | The object and pin are not connected (default). Objects not connected to pins are always in the displayed status. |
| | Static Connection | Connects the figure to 1 output pin. The connection pin can be specified in [Pin Name] either via direct input or through selection from the drop-down list. During simulation, the object is displayed when the specified output signal data is active. |
| | Dynamic Connection | Connects the figure to 2 output pins. The connection pin can be specified in [Pin Name1] and [Pin Name2] either via direct input or through selection from the drop-down list. During simulation, the object is displayed when the specified output signal 1 data and the specified output signal 2 data are both active. |
| Active Level | The common active status of each output signal can be selected from the option butto | |
| | LOW | Sets the active level to LOW. |
| | HIGH | Sets the active level to HIGH (default). |

Remark For the pin names that can be specified, see the user's manual of the microcontroller that is used.

[[Style] tab]

(1) Style information setting area

| Fill up | The area to lead to le | , Ellipse, Rounded Rectangle a enclosed by contour lines | | |
|---------|--|---|--|--|
| | - Text Inside text - Bitmap | Inside text box | | |
| | Color | Specifies and changes settings of color You can change the color by clicking the pull-down button. | | |
| Line | The definition - Line All areas of the contour line - Polygon Lines that - Text Contour line - Bitmap | used to perform settings and changes related to the lines of objects. In of line for each type of object is provided below. If the object Ellipse, Rounded Rectangle The of the figure Link the apexes of the polygon The of the text box The of figure drawing area | | |
| | Color | Specifies and changes the line color. You can change the color by clicking the pull-down button. | | |
| | Dotted/ Solid | Specifies and changes line shapes (dotted line/solid line). The desired line shape can be selected from the drop-down list. Note that this item can be changed only when [Thickness] is set to "1". | | |
| | Thickness | Specifies and changes the line thickness. The desired line thickness can be specified either via direct input or through selection from the spin button. A value in the range of 1 to 100 (decimal) can be specified. | | |

Note At this time, if the object that have been pasted from a bitmap file, it becomes invisible.

[Function buttons]

Parts List dialog box

This dialog box displays all the figure objects created in the I/O Panel window as well as the pin connection status of part objects.

The pin connection settings for each object can be changed in the property dialog box, which can be opened by double-clicking the relevant object listed in this dialog box, or selecting the relevant object listed in this dialog box and then selecting the [View] menu >> [Properties...].

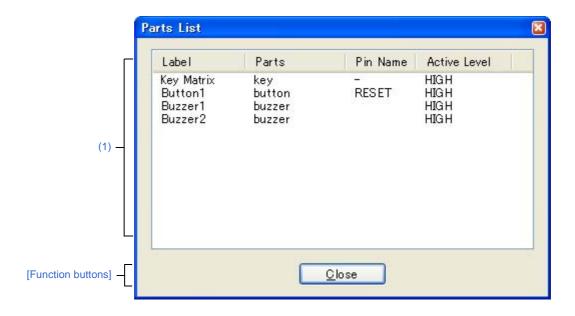

Figure A-117. Parts List Dialog Box

This section describes the following.

Serial window

This window is used to communicate with the serial interface provided in the CPU.

Since this window operates as the serial interface of the remote node of the CPU, transmission data from CPU turns into reception data in this window, and transmission data from this window turns into reception data in the CPU.

The following two types of files can be handled in this window.

The transmission/reception data displayed in the top area in this window can be saved to the serial log data file (*.log) (CSV format) by selecting the [File] menu >> [Save]/[Save As...].

Moreover, the transmission data created in the lower part of this window can be saved to the serial transmission data file (*.ser) (CSV format) by clicking the [Save] button (the contents can be restored by clicking the [Load] button).

Saving/restoring the created data can also be performed by saving/loading the project file. In this case, however, data is not saved as a CSV format text file but saved into the project file.

- Cautions 1. If the saved serial transmission data file is opened or the project file is opened while Simulator GUI is running with a microcontroller different from the one used when the file was created, the settings of the serial interface that are not provided in the microcontroller will not be restored.
 - 2. Multiple instances of this window can be opened. After opening this window, select the serial interface to be verified in the Serial selection area.

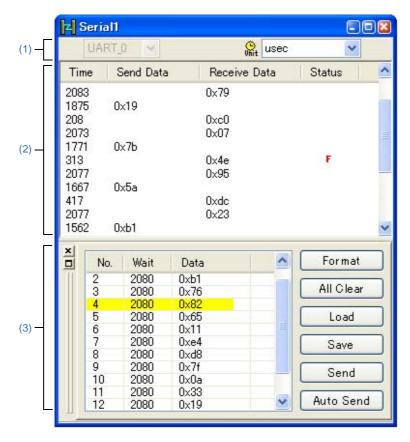

Figure A-118. Serial Window

This section describes the following.

- [How to open]
- [Description of each area]
- [Dedicated menu (Serial window)]
- [Context menu]

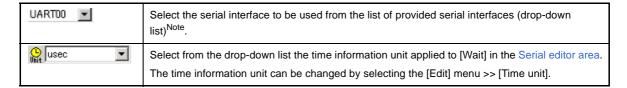

[How to open]

- Click the | button.
- Select [Serial] from the [Simulator] menu.

[Description of each area]

(1) Serial selection area

Select the serial interface to be used.

Note Once selected, the serial interface cannot be changed.

If you wish to change the serial interface, open the another Serial window newly.

(2) Log display area

Displays the transmission/reception data.

The display timing is when all the bits constituting the data have been received or sent.

Only data from which the start bit, stop bit, and parity bit have been deleted is displayed in this area.

The notation of data can be changed by selecting the [View] menu>> [Numeric Representation] >> [Binary]/[Hexadecimal].

Log display is cleared upon debugger or simulator reset.

| Time | Displays the time from the completion of reception/transmission of the previous data until completion of reception/transmission of the current data. The time information unit is specified by selecting the [Edit] menu >> [Time unit]. | | | |
|--------------|---|---|--|--|
| Send Data | Displays the data sent by this window (data received by the CPU). | | | |
| Receive Data | Displays the data received by this window (data sent by the CPU). | | | |
| Status | . , | e status during data reception. ror occurs, one of the following marks is displayed. When everything is normal, isplayed. | | |
| | Р | Parity error (mismatching parity bit) | | |
| | F | Framing error (stop bit not detected) | | |

(3) Serial editor area

This area is where the transmission data is created.

This area can be shown or hidden by selecting the [View] menu >> [Serial Editor].

| No. | This is a number assigned sequentially from the beginning. It cannot be directly written. The maximum number is 9,999 lines. |
|------|--|
| Wait | Specifies the time from the completion of transmission of the immediately previous data until the start of transmission of next data. Valid during transmission using the [Auto send] button. The time information unit is the unit selected by selecting the [Edit] menu >> [Time unit]. |
| | The wait value is input by placing the cursor in the Wait field to be edited and double-clicking. One wait value can be written per operation. |

| Data | This area is used to edit transmission data. | | | | | |
|--------|--|--|--|--|--|--|
| | Data can be directly input by placing the cursor in the data field and double-clicking. | | | | | |
| | Data suffixed by "0x" is treated as hexadecimal data, and data suffixed by "0b" is treated as binary data default code is the hexadecimal code. | | | | | |
| | If a bit length different from that specified in the Format (UART) dialog box or Format (CSI) dialog box is specified, data from the lower bit is valid. | | | | | |
| | One data car | n be written per operation. | | | | |
| Button | Format | Opens the Format (UART) dialog box or Format (CSI) dialog box. | | | | |
| | All Clear | Clears all Serial editor area. | | | | |
| | Loads the contents of the previously saved serial transmission data file (*.ser) and rethem in the Serial editor area. A file created for UART cannot be loaded as a file for CSI and vice versa. | | | | | |
| | | | | | | |
| | Saves the contents of the Serial editor area to the specified serial transmission data file (*.ser). | | | | | |
| | Send | Sends one of the data selected in the Serial editor area. The next data becomes selected upon completion of transmission. If no data is selected, the first data is sent. | | | | |
| | Auto Send | Makes the data selected in the Serial editor area the first data, and automatically transfers from the data to the bottom of the area. The data transmission time interval is the time specified for Wait. | | | | |

Caution The help for this window will not be displayed even if the [F1] key on the keyboard is pressed while the cursor is placed in this area.

Remark When the CSI selected in this window is set to master mode, the clock must be supplied for reception. To perform reception, transmission of dummy data is therefore required.

[Dedicated menu (Serial window)]

(1) [Edit] menu

| Insert | Inserts a new line immediately before the selected line. | |
|---|--|--|
| Cut | Cuts the selected range and saves it to the clipboard. | |
| Сору | Copies the selected range and copies it to the clipboard. | |
| Paste | Pastes the contents of the clipboard to the selected location. | |
| Delete | Deletes the selected range. | |
| Time unit | Selects the time unit. | |
| main clock Main clock (default) | | |
| usec Microsecond | | |
| msec | Millisecond | |
| Format Opens the Format (UART) dialog box or Format (CSI) dialog box. | | |

(2) [View] menu

| Serial Editor | Selects whether Serial editor area is displayed or not. |
|---------------|---|
|---------------|---|

| Numeric Representation | | Changes the notation of the Log display area display method. |
|---------------------------------|---|--|
| Binary Displays binary numbers. | | Displays binary numbers. |
| | Hexadecimal Displays hexadecimal numbers. | |

(3) [Option] menu

| Customize | Opens the Customize dialog box. |
|-----------|-----------------------------------|
| Odotomizo | Opens the oddictimize dialog box. |

[Context menu]

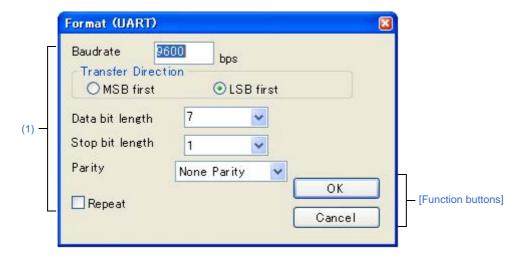

The following context menus are available in the Serial editor area.

| Insert | Inserts a new line immediately before the selected line. | |
|--------|--|--|
| Cut | Cuts the selected range and saves it to the clipboard. | |
| Сору | Copies the selected range and copies it to the clipboard. | |
| Paste | Pastes the contents of the clipboard to the selected location. | |
| Delete | Deletes the selected range. | |

Format (UART) dialog box

This dialog box is used to set the serial format for the asynchronous serial interface (UART).

Figure A-119. Format (UART) Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]

[How to open]

On the Serial window with the UART serial interface, any one of the following:

- Click the [Format] button.
- Select [Format...] from the [Edit] menu

[Description of each area]

(1) Serial format setting area

| Baudrate | Directly input the serial baud rate value as an integer. (Unit: bps) | | |
|--------------------|---|---|--|
| Transfer Direction | Select the transfer direction. | | |
| | MSB first | Sets MSB first as the transfer direction. | |
| | LSB first | Sets LSB first as the transfer direction (default). | |
| Data bit length | Select the bit length of the transmission data from the drop-down list, or specify it through direct input (default:7). | | |
| Stop bit length | Select the stop bit length from the drop-down list (default:1). | | |
| Parity | Select the parity information (none parity (default) /odd parity/even parity/0 parity). | | |

| Repeat | Select this item to repeat data transfer when the [Auto Send] button in the Serial window habeen clicked. | |
|--------|---|--|
| | > | Following transmission of the last data during automatic transmission, returns to the beginning of the data and performs automatic transmission. |
| | | Following transmission of the last data during automatic transmission, stops transmission (default). |

Remark For the selectable range, see the user's manual of the microcontroller that is used.

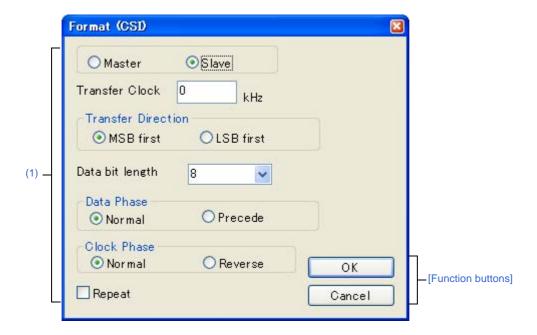

[Function buttons]

| Button Function | | |
|-----------------|--|--|
| ОК | Validates the settings and closes this dialog box. | |
| Cancel | Cancels the settings and closes this dialog box. | |

Format (CSI) dialog box

This dialog box is used to specify the serial format for the 3-wire serial interface (CSI).

Figure A-120. Format (CSI) Dialog Box

This section describes the following.

- [How to open]
- [Description of each area]
- [Function buttons]
- [Transmission/reception when 3-wire serial interface (CSI) is selected]

[How to open]

On the Serial window with the CSI serial interface, any one of the following:

- Click the [Format] button.
- Select [Format...] from the [Edit] menu

[Description of each area]

(1) Serial format setting area

| Master, Slave | Select the transfer mode. | |
|----------------|--|---|
| | Master | Operates this window as a master. Setting of [Transfer Clock] is required for generating the clock during communication. |
| | Slave | Operates this window as a slave (default). Communication is performed using the clock of the serial interface provided in the CPU. |
| Transfer Clock | Directly input the transfer clock value (unit: kHz). Values with decimals can also be set. This item must be set when master is selected. | |

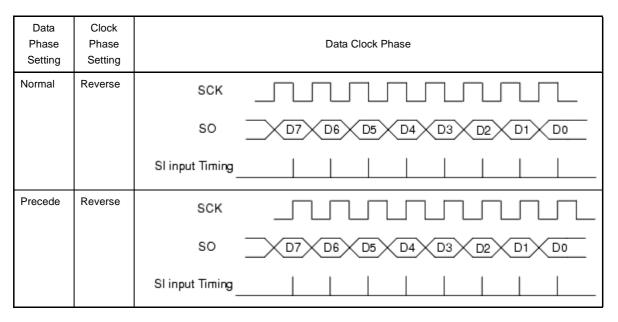

| Transfer Direction | Select the transfer direction. | | |
|--------------------|--|---|--|
| | MSB first | Sets MSB first as the transfer direction (default). | |
| | LSB first | Sets LSB first as the transfer direction. | |
| Data bit length | Select the bit length of the transmission data from the drop-down list, or specify it through direct input (default: 8). | | |
| | | mission/reception timing to set the data phase. The data clock phase is set in h "Clock Phase" as shown in "Table A-15. Data Clock Phase Settings". | |
| | Normal | Transmits/receives data at the normal 3-wire serial transmission/reception timing (default). | |
| | Precede | Transmits/receives data at a timing half a clock of the operation clock earlier than the normal 3-wire serial transmission/reception timing. | |
| Clock Phase | Select the transmission/reception clock waveform to set the clock phase. The data clock phase is set in combination with "Data Phase" as shown in "Table A-15. Data Clock Phase Settings". | | |
| | Normal | Operates on the normal 3-wire serial clock. Transfer starts at the falling edge of the clock (default). | |
| | Reverse | Operates on the reverse clock of the normal 3-wire serial clock. Transfer starts at the rising edge of the clock. | |
| Repeat | Select this item been clicked. | to repeat data transfer when the [Auto Send] button in the Serial window has | |
| | V | Following transmission of the last data during automatic transmission, returns to the beginning of the data and performs automatic transmission. | |
| | | Following transmission of the last data during automatic transmission, stops transmission. | |

Remark For the selectable range, see the user's manual of the microcontroller that is used.

Data Clock Phase Phase Data Clock Phase Setting Setting Normal Normal SCK so D6 D5 D4 D3 D1 SI input Timing Precede Normal SCK SO D6 D5 D4 D3 D1 Dο SI input Timing

Table A-15. Data Clock Phase Settings

[Function buttons]

| Button | Function |
|---|--|
| ОК | Validates the settings and closes this dialog box. |
| Cancel Cancels the settings and closes this dialog box. | |

[Transmission/reception when 3-wire serial interface (CSI) is selected]

The Serial window when CSI serial interface is selected always operates in the transmission/reception mode regardless of whether [Master] or [Slave] is selected in this dialog box.

| When [Master] is selected | Data is transmitted or received immediately after clicking the [Send] button or the [Auto Send] button in the Serial editor area. |
|---------------------------|---|
| When [Slave] is selected | Data becomes ready to be transmitted or received after clicking the [Send] button or the [Auto Send] button in the Serial editor area. Data starts to be transmitted or received when the CSI clock signal is received in the data transmission/reception ready status. This ready status is released when data transmission or reception is completed. (Even if the CSI clock is received, data is not transmitted or received in other than the data transmission/reception ready status.) |

Accordingly, when only wanting to reception data in the Serial window when "Slave" is selected, execute as follows (Reception setting when CSI serial slave is selected):

(1) Set [Repeat]

Set the [Repeat] check box in the [Format (CSI)] dialog box.

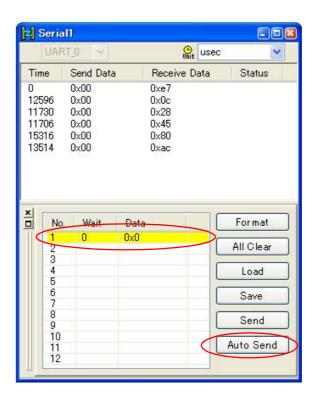

(2) Set Wait time

Set the Wait time to 0 as a dummy setting in the Serial window.

(3) Click the [Auto Send] button

APPENDIX B USER OPEN INTERFACE

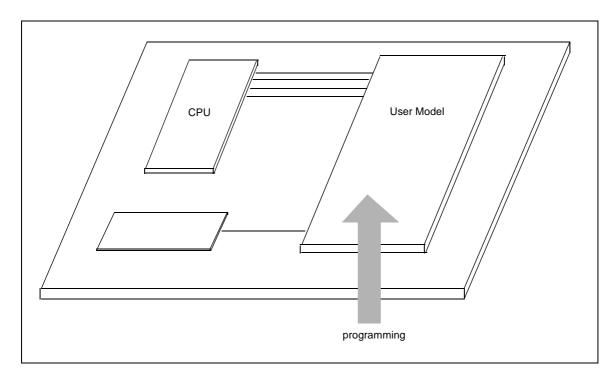

Appendix B provides detailed explanations of the user open interface that is one of the functions provided by Simulator GUI.

B.1 Overview

Simulator GUI provides two ways of creating an environment where a target system, as well as a CPU (CPU core + internal peripherals), can be simulated.

One is the I/O Panel window, via which a user-friendly simulation environment can be organized through GUI manipulation, by supplying standard components for connection and their manipulation environment.

The other is to create the simulation environment of the target system that uses the user open interface to be explained in this appendix. In this environment, functions that cannot be realized on the I/O Panel window can be used if the user programs an external user model.

RENESAS

Figure B-1. Programming Image of User Model

B.1.1 Types of interface functions

Simulator GUI's user open interface supplies the following types of interface functions (see "B.4 Supplied Interface Functions").

Table B-1. Types of Functions Supplied by User Open Interface

| Туре | Description |
|--|--|
| Basic interface functions | Basic function of simulation - Initialization notification - Reset notification, etc. |
| Time interface functions | Cyclic timer function for time-series processing of the user model - Setting of timer - Clearing of timer - Notification of timer time, etc. |
| Pin interface functions | Pin I/O function - Signal output to pin - Notification of signal input to pin |
| External bus interface functions Note | Slave function of external bus - External bus read access notification - External bus write access notification, etc. |
| Serial interface functions | Serial transmission/reception function - Transmission of serial data - Notification of reception of serial data, etc. |
| Signal output unit interface functions | Function to output signals in accordance with signal data file - Signal output in accordance with signal data file, etc. |

Note When using the external bus interface function, the external memory area to use must be set to [Target memory area] with the [Memory Type] area of the Memory Mapping dialog box.

B.1.2 Interface methods

Simulator GUI's user open interface has the following interface methods.

(1) C language interface

The user open interface consists of a C language API (Application Program Interface) function set. Therefore, program the user model in C language.

(2) Callback function method

The user open interface uses the callback function method as a means to call a program from the system.

The callback function method is that a program (user model) is called by the system (CPU) when it is necessary. This method uses the pointer to the function which is defined on the program (user model). The system (CPU) calls

the user program (user model) by using this pointer.

While the provided API functions call the system from the program, the callback function is used to call the program from the system, such as when inputting a signal to a pin.

(3) Event-driven method

The user open interface uses an event-driven method in which processing is described in accordance with occurrence of events.

Therefore, a callback function prepared on the user model side is called if an event such as initialization of simulation, resetting the CPU, signal output to a pin, or access to the external bus occurs on the Simulator GUI side. In addition, a time interface (= timer function) provided to perform time-series processing of a user model also calls a callback function prepared on the user model side when the specified time has elapsed.

B.1.3 Development environment

Use the following development tools to perform programming with the Simulator GUI's user open interface and create a DLL file.

- Microsoft Visual C++ (Ver. 6.00 or later)

B.2 Creating User Model

This section describes how to create a user model.

B.2.1 Program configuration

The following figure shows the program configuration when the Simulator GUI's user open interface is used to expand a system.

[Expanded simulation block] Pin connection (other user models) [Simulator GUI] User open interface User model CPU simulation block Pin connection processing module (UserModel.dll) (CPU core + User open interface internal peripheral blocks) External bus connection Simulation interface : Created by user

Figure B-2. Program Configuration

To expand a system, a user model must be created first.

Because the user model operates in conjunction with the simulation system, it interfaces with the user open interface processing module. This interface is the user open interface.

The user model generates resources such as pins and external bus slaves via the user open interface during configuration (processing to configure the simulator that is performed when Simulator GUI is started). By connecting the pins and external bus slaves to the pins and external bus masters of the CPU simulation block, signals can be input to or output from the pins of the CPU simulation block and the external bus can be accessed from the CPU simulation block.

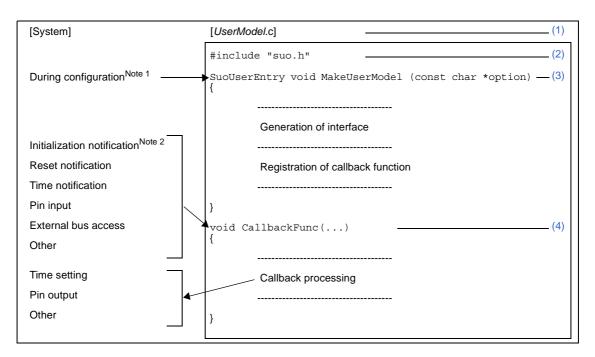

The generated pins and external bus slaves can also be connected to the expansion simulation block (other user models), as well as to the CPU simulation block.

B.2.2 Outline of programming

The user model is programmed in the dynamic link library (DLL) format of WIN32.

The template of a program file is shown below.

Figure B-3. Template of Program File

- Notes 1. "Configuration" means simulator configuration processing that is executed when Simulator GUI is started.
 - 2. An initialization notification is reported only once, immediately after Simulator GUI is started when simulator configuration processing has been completed.

(1) File name

Indicates the file name of the user model to be created.

The file name can be determined freely (the suffix for a C language file is "*.c").

(2) Include file

Indicates a include file.

To use the user open interface, the system header file "suo.h" must be included.

(3) MakeUserModel function

Indicates the MakeUserModel function that is called from the system during configuration of Simulator GUI. Note that the name of this function must be "MakeUserModel".

[Syntax]

SuoUserEntry void MakeUserModel(const char *option);

The following two types of processing are described in this function.

(a) Interface generation

Because Simulator GUI connects pins and buses during configuration processing when it is started, resources such as pins and buses that are to be connected during configuration must be generated.

To do this, call a function that generates an interface in the MakeUserModel function and generate an interface (see "B.4 Supplied Interface Functions"). The necessary resources will be also generated.

(b) Registering callback function

Callback functions can be registered as necessary.

Caution When describing a callback function for initialization, be sure to register it at this time; otherwise callback will not function. This is because initialization notification is reported immediately after the MakeUserModell function is called.

(4) Callback function

Indicates a callback function.

Two or more callback functions, such as those for initialization notification, reset notification, time notification, pin input, and external bus access, can be created. Describe processing in accordance with the callback contents in the callback function (see "B.5" User-Defined Functions").

A callback function that has been created must be registered in advance so that it can be called from the system (see "B.4 Supplied Interface Functions"). The name of a callback function can be determined freely, and the format of the function differs depending on the type of callback.

B.2.3 Example of program file (UserModel.c)

```
#include "suo.h"
#include <memory.h>
void Init(void);
void InputP00(SuoHandle handle, int pinValue);
void ReadBUS1(SuoHandle handle, unsigned long addr, int accessSize, unsigned char data[]);
void WriteBUS1(SuoHandle handle, unsigned long addr, int accessSize, const unsigned char data[]);
SuoHandle p00;
SuoHandle p01;
SuoHandle bus1;
unsigned char mem[0x100];
/* MakeUserModel */
SuoUserEntry void MakeUserModel(const char *option)
    SuoCreatePin("P00", &p00);
    SuoCreatePin("P01", &p01);
    SuoCreateExtbus("BUS1", 0x200000, 0x100, &bus1);
   SuoSetInitCallback(Init);
   SuoSetInputDigitalPinCallback(p00, InputP00);
    SuoSetReadExtbusCallback(bus1, ReadBUS1);
    SuoSetWriteExtbusCallback(bus1, WriteBUS1);
/* callbacks */
void Init(void)
    memset(mem, 0, 0x100);
void InputP00(SuoHandle handle, int pinValue)
    SuoOutputDigitalPin(p01, pinValue);
void ReadBUS1(SuoHandle handle, unsigned long addr, int accessSize, unsigned char data[])
    memcpy(data, &mem[addr-0x200000], accessSize);
void WriteBUS1(SuoHandle handle, unsigned long addr, int accessSize, const unsigned char data[])
    memcpy(&mem[addr-0x200000], data, accessSize);
```

B.2.4 Compilation and linking

Create a UserModel.dll by compiling and linking the created UserModel.c and suolink.cpp.

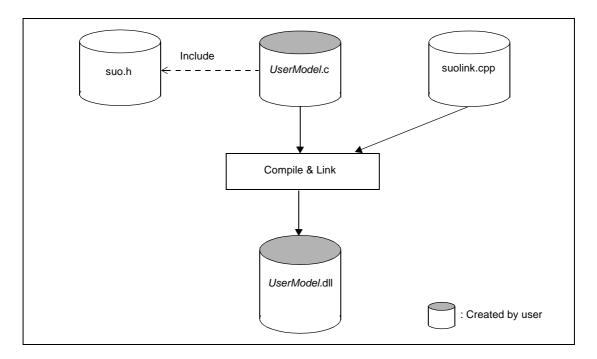

Figure B-4. Flow of Compilation and Linking

| File Name | Description |
|---------------|---|
| suo.h | This is a system header file for the user open interface. This file is included by the program (<i>UserModel.c</i>) but is not compiled. Note that "suo.h" is stored in the following folder by default. - <i>Install-folder</i> \CubeSuite+\DebugTools\DebugTool78K0RSimulator\useropen\sys |
| suolink.cpp | This is a file that performs dynamic link processing with the user open interface processing module of the system. Note that "suolink.cpp" is stored in the following folder by default. - Install-folder \CubeSuite+\DebugTools\DebugTool78K0RSimulator\useropen\sys |
| UserModel.c | This is the source file of the user model to be created. The file name can be determined freely. |
| UserModel.dll | This is a binary file of the user model (DLL file). The file name can be determined freely. |

Caution To execute a DLL file in an environment in which Microsoft Visual C++ is not installed, the DLL file must be created using the release version.

B.3 Embedding User Model

This section describes how to embed the created user model (UserModel.dll) in Simulator GUI.

To embed the user model in Simulator GUI, use a simulator configuration file (*.cfg).

Therefore, when using Simulator GUI embedding the created user model, you need to specify [Yes] with the [Use simulator configuration file] property in the [Configuration] category on the [Connect Settings] tab of the Property panel, and then specify the configuration file to be used with the [Simulator configuration file] property in the category same as above.

B.3.1 Description in simulator configuration file

Describe the user model generation processing, processing to connect pins and an external buses and so on in the simulator configuration file.

- (1) User model generation processing
- (2) Pin connection
- (3) External bus connection
- (4) Other processing

(1) User model generation processing

UserModel1 = Device("USEROPEN", "UserModel1.dll UserOption1");

(a) UserModel1

UserModel1 is a variable that indicates the generated user model. The variable name can be determined freely by user.

(b) Device function

The Device function is used to create a user model.

(c) "USEROPEN"

"USEROPEN" is a user open interface processing module (system module).

(d) UserModel1.dll

UserModel1.dll is the binary file (DLL format) of the user model to be created in "B.2 Creating User Model". The file name can be determined freely by user.

Specify a absolute path or relative path from the folder where the simulator configuration file exists as the file path.

Caution Do not use single-byte spaces for specifying the path name; otherwise, the user model will not be created.

(e) UserOption1

UserOption1 is an option character string for *UserModel1*.dll. This character string is passed to the "option" parameter of the MakeUserModel function as is.

(2) Pin connection

(a) Generation of a wire

Generate a wire (= line that connects pins) by using the Wire function.

Be sure to specify "1" for the argument of the Wire function.

wire1 is a variable that indicates the generated wire. The variable name can be determined freely.

(b) Connection of the wire and CPU

Connect one end of the wire to a pin of the CPU.

Specify the name of the external CPU pin to be connected by using uppercase characters, as "*PinName1*" (note that lowercase characters cannot be used). Enclose the pin name between double quotation marks ("").

(c) Connection of the wire and user model

Connect the other end of the wire to a pin of the user model.

Specify the name of the user model pin to be connected as "*UserPinName1*" (pin name generated in the MakeUserModel function). Enclose the pin name between double quotation marks ("").

Add this line to connect two or more user model pins to the same wire.

(3) External bus connection

```
extbus1 = BUS(n); --- (a)
extbus1 += cpu.BusMasterIF("EXTBUS"); --- (b)
extbus1 += UserModel1.BusSlaveIF("UserExtbusName1"); --- (c)
```

(a) Generation of a bus

Generate a bus by using the BUS function.

Argument *n* of the BUS function is the data bus bit width. This may be 8, 16, or 32. *extbus1* is a variable that indicates the generated bus. The variable name can be determined freely.

(b) Connection of the bus and CPU

Connect one end of the bus to the external bus master of the CPU.

Specify the external bus master "EXTBUS" for the argument.

(c) Connection of the bus and user model

Connect the other end of the bus to the external bus of the user model.

Specify the name of the external bus of the user model to be connected as "*UserExtbusName1*" (the external bus name generated in the MakeUserModel function). Enclose the external bus name between double quotation marks ("").

Add this line to connect two or more user model external buses.

(4) Other processing

In addition to the above, the formulaic connections for the main clock notification pin and the reset notification pin shown below is required to operate the user open interface.

(a) Generation of a wire

Generate a wire (= line that connects pins) by using the Wire function.

Be sure to specify "1" for the argument of the Wire function.

clock1 is a variable that indicates the generated wire. The variable name can be determined freely.

(b) Connection of the wire and main clock notification pin

Connect one end of the wire to Simulator GUI's main clock notification pin.

Specify "debugger_pseudo_pin_main_clkout" for the argument.

(c) Connection of the wire and user model

Connect the other end of the wire to a pin of the user model.

Specify "gui_pseudo_pin_clock_notice" for the argument.

(d) Generation of a wire

Generate a wire (= line that connects pins) by using the Wire function.

Be sure to specify "1" for the argument of the Wire function.

reset1 is a variable that indicates the generated wire. The variable name can be determined freely.

(e) Connection of the wire and reset notification pin

Connect one end of the wire to Simulator GUI's reset notification pin.

Specify "debugger_pseudo_pin_reset_notice" for the argument.

(f) Connection of the wire and user model

Connect the other end of the wire to a pin of the user model.

Specify "gui_pseudo_pin_reset_notice" for the argument.

B.3.2 Example of simulator configuration file

An example of the simulator configuration file is shown below.

In this example, the following connection processing is performed.

| Type of Connection | CPU | | User Model (SampleModel.dll) | |
|--------------------|-------------|---------------------|------------------------------|----------------------|
| Pin | "P00/INTP0" | P00 pin | "P00" | Pin manipulating P00 |
| | "P30/TXD1" | Serial output pin | "RXD" | Serial input pin |
| | "P31/RXD1" | Serial input pin | "TXD" | Serial output pin |
| External bus | "EXTBUS" | External bus master | "EXTBUS1" | External bus slave 1 |
| | "EXTBUS" | External bus master | "EXTBUS2" | External bus slave 2 |

```
cpu = CPU('a');
# -----
# SampleModel description
# -----
# Generate SampleModel.dll
model = Device("USEROPEN", "SampleModel.dll -a -b");
# Connect PIN (CPU.P00-MODEL.P00)
wire_P00 = Wire(1);
wire P00 += cpu.Port("P00/INTP0");
wire P00 += model.Port("P00");
# Connect PIN (CPU.TXD1-MODEL.RXD)
wire RXD = Wire(1);
wire RXD += cpu.Port("P30/TXD1");
wire_RXD += model.Port("RXD");
# Connect PIN (CPU.RXD1-MODEL.TXD)
wire TXD = Wire(1);
wire_TXD += cpu.Port("P31/RXD1");
wire_TXD += model.Port("TXD");
# Connect BUS (CPU.EXTBUS-MODEL.EXTBUS1)
extbus = BUS(32);
extbus += cpu.BusMasterIF("EXTBUS");
extbus += model.BusSlaveIF("EXTBUS1");
extbus += model.BusSlaveIF("EXTBUS2");
# Connect Pseudo PIN
wire clock = Wire(1);
wire_clock += cpu.DebuggerPseudoPort("debugger_pseudo_pin_main_clkout");
wire_clock += model.Port("gui_pseudo_pin_clock_notice");
wire reset = Wire(1);
wire_reset += cpu.DebuggerPseudoPort("debugger_pseudo_pin_reset_notice");
wire_reset += model.Port("gui_pseudo_pin_reset_notice");
```

B.4 Supplied Interface Functions

This section describes the interface functions supplied by Simulator GUI as the user open interface.

B.4.1 Overview

The supplied interface functions are listed below.

Table B-2. List of Supplied Interface Functions

| Туре | Function Name | Outline of Function |
|--|----------------------------------|--|
| Basic interface func- | SuoSetInitCallback | Registers initialization callback. |
| tions | SuoSetResetCallback | Registers reset callback. |
| | SuoGetMainClock | Acquires the cycle of the main clock for simulation. |
| Time interface func- | SuoCreateTimer | Generates timer interface. |
| tions | SuoGetTimerHandle | Acquires timer handle. |
| | SuoSetTimer | Sets cyclic timer. |
| | SuoKillTimer | Stops cyclic timer. |
| | SuoSetNotifyTimerCallback | Registers timer time notification callback. |
| Pin interface functions | SuoCreatePin | Generates pin interface. |
| | SuoGetPinHandle | Acquires pin interface handle. |
| | SuoOutputDigitalPin | Outputs digital pin value. |
| | SuoOutputAnalogPin | Outputs analog pin value. |
| | SuoOutputHighImpedance | Outputs high-impedance for the pin. |
| | SuoSetInputDigitalPinCallback | Registers digital pin value input callback. |
| | SuoSetInputAnalogPinCallback | Registers analog pin value input callback. |
| | SuoSetInputHighImpedanceCallback | Registers pin high-impedance state report callback. |
| External bus interface functions ^{Note} | SuoCreateExtbus | Generates external bus interface. |
| | SuoGetExtbusHandle | Acquires external bus interface handle. |
| | SuoSetReadExtbusCallback | Registers external bus read access callback. |
| | SuoSetWriteExtbusCallback | Registers external bus write access callback. |

| Туре | Function Name | Outline of Function |
|------------------------|--------------------------------|--|
| Serial interface func- | SuoCreateSerialUART | Generates serial interface (UART type). |
| tions | SuoCreateSerialCSI | Generates serial interface (CSI type). |
| | SuoGetSerialHandle | Acquires serial interface handle. |
| | SuoSetSerialParameterUART | Sets serial parameter (UART type). |
| | SuoSetSerialParameterCSI | Sets serial parameter (CSI type). |
| | SuoGetSerialParameterUART | Acquires serial parameter (UART type). |
| | SuoGetSerialParameterCSI | Acquires serial parameter (CSI type). |
| | SuoSendSerialData | Performs serial transmission (1 data). |
| | SuoSendSerialDataList | Performs serial transmission (more than one data). |
| | SuoSendSerialFile | Performs serial transmission (serial transmission data file). |
| | SuoSetNotifySentSerialCallback | Registers serial transmission end notification callback. |
| | SuoSetReceiveSerialCallback | Registers serial reception callback. |
| Signal output unit | SuoCreateWave | Generates signal output unit interface. |
| interface functions | SuoGetWaveHandle | Acquires signal output unit interface handle. |
| | SuoSendWaveFile | Performs transmission via signal output unit. |
| | SuoSetNotifySentWaveCallback | Registers signal output unit transmission end notification callback. |

Note When using the external bus interface function, the external memory area to use must be set to [Target memory area] with the [Memory Type] area of the Memory Mapping dialog box.

B.4.2 Basic interface functions

The basic interface functions that are supplied by Simulator GUI are as follows:

| Function Name | Outline of Function |
|---------------------|--|
| SuoSetInitCallback | Registers initialization callback. |
| SuoSetResetCallback | Registers reset callback. |
| SuoGetMainClock | Acquires the cycle of the main clock for simulation. |

SuoSetInitCallback

Registers initialization callback.

Caution A callback function is not executed unless this function is called in the MakeUserModel function.

[Syntax]

```
#include "suo.h"

void SuoSetInitCallback(SuoInitCallback func);
```

[Argument(s)]

| Argument | Description |
|----------|---|
| func | Pointer to the user-defined function that performs initialization processing (see "InitFunc") |

[Return value]

None

[Description]

- This function registers the user-defined function that performs initialization processing.
- The function registered by this function is called only once, when Simulator GUI is started.
- If NULL is specified for func, registration is canceled.

SuoSetResetCallback

Registers reset callback.

[Syntax]

```
#include    "suo.h"

void    SuoSetResetCallback(SuoResetCallback func);
```

[Argument(s)]

| Argument | Description |
|----------|---|
| func | Pointer to the user-defined function that performs reset processing (see "ResetFunc") |

[Return value]

None

[Description]

- This function registers the user-defined function that performs reset processing.
- The registered function is called when the CPU is reset.
- If NULL is specified for func, registration is canceled.

```
#include "suo.h"
void ResetFunc(void);

void func1(void)
{
    .......
    SuoSetResetCallback(ResetFunc);    /* Set reset function */
}

/* Reset function */
void ResetFunc(void) {
    .......
}
```

SuoGetMainClock

Acquires the cycle of the main clock for simulation.

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoGetMainClock(unsigned long* time);
```

[Argument(s)]

| Argument | Description |
|----------|---|
| time | Location where the main clock cycle value (unit: pS) is to be stored. |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completionNormal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to acquire the cycle of the main clock for the simulation environment currently being executed.

```
#include "suo.h"
unsigned long time;

void funcl(void)
{
    ......
SuoGetMainClock(&time); /* Get main clock */
}
```

B.4.3 Time interface functions

The time interface functions that are supplied by Simulator GUI are as follows:

| Function Name | Outline of Function |
|---------------------------|---|
| SuoCreateTimer | Generates timer interface. |
| SuoGetTimerHandle | Acquires timer handle. |
| SuoSetTimer | Sets cyclic timer. |
| SuoKillTimer | Stops cyclic timer. |
| SuoSetNotifyTimerCallback | Registers timer time notification callback. |

SuoCreateTimer

Generates timer interface.

Caution This function can only be called in the MakeUserModel function. An error occurs if it is called at any other timing.

[Syntax]

```
#include "suo.h"
int SuoCreateTimer(const char* timerName, SuoHandle* handle);
```

[Argument(s)]

| Argument | Description | |
|-----------|--|--|
| timerName | Name of the timer | |
| handle | Location where the handle of the timer interface is to be stored | |

[Return value]

| Macro | Description | |
|--------------|---|--|
| SUO_NOERROR | Normal completion | |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") | |

[Description]

- This function generates a timer interface.
- The generated timer interface is associated with the name specified for timerName.
- If this function is successful, the handle of the generated timer interface can be obtained. The timer interface can then be controlled by specifying this handle.
- The handle can also be obtained by using the SuoGetTimerHandle function.

```
#include "suo.h"
SuoHandle hTim1;

SuoUserEntry void MakeUserModel(const char *option)
{
    .......
SuoCreateTimer("TIM1", &hTim1); /* Create "TIM1" */
}
```

SuoGetTimerHandle

Acquires timer handle.

[Syntax]

```
#include "suo.h"
SuoHandle SuoGetTimerHandle(const char* timerName);
```

[Argument(s)]

| Argument | Description | |
|-----------------------------|-------------|--|
| timerName Name of the timer | | |

[Return value]

| Macro | Description | |
|---|-------------------------|--|
| Handle of the specified timer interface | Normal completion | |
| NULL | Exit with error (abend) | |

[Description]

- This function is used to obtain the handle of the specified timer interface.
- Specify the name specified by the SuoCreateTimer function as *timerName* (if a different name is specified, NULL is returned).

```
#include "suo.h"
SuoHandle hTim1;

void func1(void)
{
    ......
hTim1 = SuoGetTimerHandle("TIM1");  /* Get handle of "TIM1" */
}
```

SuoSetTimer

Sets cyclic timer.

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

| #includ | e "suo.h" |
|---------|---|
| int | SuoSetTimer(SuoHandle handle, int timeUnit, unsigned long timeValue); |

[Argument(s)]

| Argument | Description | |
|-----------|--|--|
| handle | Handle of the timer interface | |
| timeUnit | Time unit (specify any of the following) - SUO_MAINCLK: Main clock cycle units - SUO_USEC: Microsecond units | |
| timeValue | Timer cycle time | |

[Return value]

| Macro | Description | |
|--------------|---|--|
| SUO_NOERROR | Normal completion | |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") | |

[Description]

- This function sets a cyclic timer for the specified timer interface.
- The cycle time is specified by the value of timeValue in units of timeUnit ("0" cannot be specified for timeValue.
- The timer starts operating immediately after this function is called. The timer continues operating until it is stopped by the SuoKillTimer function.
- If a timer notification function has been registered by the SuoSetNotifyTimerCallback function, the timer notification function is called in each cycle.
- If this function is called for the timer that is currently operating, the timer is reset and starts operating with the specified cycle time.

```
#include "suo.h"
SuoHandle hTim1;

void func1(void)
{
........
SuoSetTimer(hTim1, SUO_USEC, 20); /* Invoke 20us cyclic timer */
}
```

SuoKillTimer

Stops cyclic timer.

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoKillTimer(SuoHandle handle);
```

[Argument(s)]

| Argument | Description | |
|----------|-------------------------------|--|
| handle | Handle of the timer interface | |

[Return value]

| Macro | Description | |
|--------------|---|--|
| SUO_NOERROR | Normal completion | |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") | |

[Description]

- This function stops the cyclic timer of the specified timer interface.
- If the timer is operating, the timer is stopped. If the timer is stopped, nothing is done (in this case, an error does not occur).

```
#include "suo.h"
SuoHandle hTim1;

void func1(void)
{
    .......
SuoKillTimer(hTim1); /* Stop timer */
}
```

SuoSetNotifyTimerCallback

Registers timer time notification callback.

[Syntax]

```
#include "suo.h"
int SuoSetNotifyTimerCallback(SuoHandle handle, SuoNotifyTimerCallback func);
```

[Argument(s)]

| Argument | Description | |
|----------|---|--|
| handle | Handle of the timer interface | |
| func | Pointer to the user-defined function that reports the time of the timer (see "NotifyTimerFunc") | |

[Return value]

| Macro | Description | |
|--------------|---|--|
| SUO_NOERROR | Normal completion | |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") | |

[Description]

- This function registers a user-defined function that performs processing when the time of the timer is reported.
- The registered function is called in every timer cycle of the specified timer interface.
- If NULL is specified for func, registration is canceled.

```
#include "suo.h"
void NotifyTimerFunc(SuoHandle handle);
SuoHandle hTim1;
void funcl(void)
{
    .......
    SuoSetNotifyTimerCallback(hTim1, NotifyTimerFunc); /* Set notify-timer function */
}

/* Notify-timer function */
void NotifyTimerFunc(SuoHandle handle)
{
    .......
}
```

B.4.4 Pin interface functions

The pin interface functions that are supplied by Simulator GUI are as follows:

| Function Name | Outline of Function |
|----------------------------------|---|
| SuoCreatePin | Generates pin interface. |
| SuoGetPinHandle | Acquires pin interface handle. |
| SuoOutputDigitalPin | Outputs digital pin value. |
| SuoOutputAnalogPin | Outputs analog pin value. |
| SuoOutputHighImpedance | Outputs high-impedance for the pin. |
| SuoSetInputDigitalPinCallback | Registers digital pin value input callback. |
| SuoSetInputAnalogPinCallback | Registers analog pin value input callback. |
| SuoSetInputHighImpedanceCallback | Registers pin high-impedance state report callback. |

SuoCreatePin

Generates pin interface.

Caution This function can only be called in the MakeUserModel function. An error occurs if it is called at any other timing.

[Syntax]

```
#include "suo.h"
int SuoCreatePin(const char* pinName, SuoHandle* handle);
```

[Argument(s)]

| Argument | Description |
|----------|--|
| pinName | Name of the pin |
| handle | Location where the handle of the pin interface is to be stored |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function generates a pin interface.
- The generated pin interface is associated with the name specified for *pinName*. Also, the pin specified as *pin-Name* is generated.
- If this function is successful, the handle of the generated pin interface can be obtained. The pin interface can then be controlled by specifying this handle.

The handle can also be obtained by using the SuoGetPinHandle function.

SuoGetPinHandle

Acquires pin interface handle.

[Syntax]

```
#include "suo.h"
SuoHandle SuoGetPinHandle(const char* pinName);
```

[Argument(s)]

| Argument | Description |
|----------|-----------------|
| pinName | Name of the pin |

[Return value]

| Macro | Description |
|---------------------------------------|-------------------------|
| Handle of the specified pin interface | Normal completion |
| NULL | Exit with error (abend) |

[Description]

- This function is used to obtain the handle of the specified pin interface.
- Specify the name of a function specified by the SuoCreatePin function as *pinName* (if a different name is specified, NULL is returned).

```
#include "suo.h"
SuoHandle hPinP00;

void func1(void)
{
    ......
hPinP00 = SuoGetPinHandle("P00");  /* Get handle of "P00" */
}
```

SuoOutputDigitalPin

Outputs digital pin value.

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoOutputDigitalPin(SuoHandle handle, int pinValue);
```

[Argument(s)]

| Argument | Description |
|----------|---|
| handle | Handle of the pin interface |
| pinValue | Digital output value (specify any of the following) - SUO_HIGH (=1): HIGH value - SUO_LOW (=0): LOW value |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function outputs a digital data signal specified with pinValue to the specified pin interface.
- To output an analog data signal, use the ${\bf SuoOutputAnalogPin}$ function.

```
#include "suo.h"
SuoHandle hPinP00;

void func1(void)
{
    ......
SuoOutputDigitalPin(hPinP00, SUO_HIGH); /* Output HIGH */
}
```

SuoOutputAnalogPin

Outputs analog pin value.

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoOutputAnalogPin(SuoHandle handle, double pinValue);
```

[Argument(s)]

| Argument | Description |
|----------|-------------------------------|
| handle | Handle of the pin interface |
| pinValue | Analog output value (unit: V) |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function outputs an analog data signal specified with *pinValue* to the specified pin interface.
- Specify pinValue in V (volts), as floating-point data.
- To output a digital data signal, use the SuoOutputDigitalPin function.

```
#include "suo.h"
SuoHandle hPinP00;

void func1(void)
{
    .......
SuoOutputAnalogPin(hPinP00, 3.5); /* Output 3.5V */
}
```

SuoOutputHighImpedance

Outputs high-impedance for the pin.

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoOutputHighImpedance(SuoHandle handle);
```

[Argument(s)]

| Argument | Description |
|----------|-----------------------------|
| handle | Handle of the pin interface |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to output high-impedance for the specified digital/analog pin interface.

```
#include "suo.h"
SuoHandle hPinP00;

void func1(void)
{
    ......
SuoOutputHighImpedance(hPinP00); /* Output High Impedance */
}
```

SuoSetInputDigitalPinCallback

Registers digital pin value input callback.

[Syntax]

```
#include "suo.h"
int SuoSetInputDigitalPinCallback(SuoHandle handle, SuoInputDigitalPinCallback func);
```

[Argument(s)]

| Argument | Description |
|----------|--|
| handle | Handle of the pin interface |
| func | Pointer to a user-defined function that performs digital pin input processing (see "InputDigitalPin-Func") |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to register a user-defined function that performs digital pin input processing.
- The registered function is called when a signal is input to the specified pin.
- If NULL is specified for func, registration is canceled.

```
#include "suo.h"
void InputDigitalPinFunc(SuoHandle handle, int pinValue);
SuoHandle hPinP00;

void funcl(void)
{
    ......
    SuoSetInputDigitalPinCallback(hPinP00, InputDigitalPinFunc); /* Set input-digital-pin function */
}

/* Input-digital-pin function */
void InputDigitalPinFunc(SuoHandle handle, int pinValue)
{
    .......
}
```

SuoSetInputAnalogPinCallback

Registers analog pin value input callback.

[Syntax]

```
#include "suo.h"
int SuoSetInputAnalogPinCallback(SuoHandle handle, SuoInputAnalogPinCallback func);
```

[Argument(s)]

| Argument | Description |
|----------|--|
| handle | Handle of the pin interface |
| func | Pointer to a user-defined function that performs analog pin input processing (see "InputAnalogPin-Func") |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to register a user-defined function that performs analog pin input processing.
- The registered function is called when a signal is input to the specified pin.
- If NULL is specified for func, registration is canceled.

SuoSetInputHighImpedanceCallback

Registers pin high-impedance state report callback.

[Syntax]

```
#include "suo.h"
int SuoSetInputHighImpedanceCallback(SuoHandle handle, SuoInputHighImpedanceCallback func);
```

[Argument(s)]

| Argument | Description |
|----------|---|
| handle | Handle of the pin interface |
| func | Pointer to a user-defined function that performs processing when all the connected pins enter the high-impedance state (see "InputHighImpedanceFunc") |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to register the user-defined function that performs processing when all the pins connected to digital/analog pins enter the high-impedance state.
- If NULL is specified for func, registration is canceled.

B.4.5 External bus interface functions

The external bus interface functions that are supplied by Simulator GUI are as follows:

| Function Name | Outline of Function |
|---------------------------|---|
| SuoCreateExtbus | Generates external bus interface. |
| SuoGetExtbusHandle | Acquires external bus interface handle. |
| SuoSetReadExtbusCallback | Registers external bus read access callback. |
| SuoSetWriteExtbusCallback | Registers external bus write access callback. |

Caution When using the external bus interface function, the external memory area to use must be set to [Target memory area] with the [Memory Type] area of the Memory Mapping dialog box.

SuoCreateExtbus

Generates external bus interface.

- Cautions 1. This function can only be called in the MakeUserModel function. An error occurs if it is called at any other timing.
 - 2. When using the external bus interface function, the external memory area to use must be set to [Target memory area] with the [Memory Type] area of the Memory Mapping dialog box.

[Syntax]

```
#include "suo.h"
int SuoCreateExtbus(const char* extbusName, unsigned long addr, unsigned long size,
SuoHandle* handle);
```

[Argument(s)]

| Argument | Description |
|------------|---|
| extbusName | Name of the external bus |
| addr | The first address of the external memory area |
| size | Size of the external memory area |
| handle | Location where the handle of the external bus interface is to be stored |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to generate an external bus interface.
- The generated external bus interface is associated with the name specified for extbusName.
- If this function is successful, the handle of the generated external bus interface can be obtained. The external bus interface can then be controlled by specifying this handle.

The handle can also be obtained by using the SuoGetExtbusHandle function.

```
#include "suo.h"
SuoHandle hExtbus1;

SuoUserEntry void MakeUserModel(const char *option)
{
    ......
SuoCreateExtbus("EXTBUS1", 0x200000, 0x1000, &hExtbus1); /* Create "EXTBUS1" */
}
```

SuoGetExtbusHandle

Acquires external bus interface handle.

[Syntax]

```
#include "suo.h"
SuoHandle SuoGetExtbusHandle(const char* extbusName);
```

[Argument(s)]

| Argument | Description |
|------------|--------------------------|
| extbusName | Name of the external bus |

[Return value]

| Macro | Description |
|--|-------------------------|
| Handle of the specified external bus interface | Normal completion |
| NULL | Exit with error (abend) |

[Description]

- This function is used to obtain the handle of the specified external bus interface.
- Specify the name specified by the SuoCreateExtbus function as extbusName (if a different name is specified, NULL is returned).

```
#include "suo.h"
SuoHandle hExtbus1;

void func1(void)
{
    ......
hExtbus1 = SuoGetExtbusHandle("EXTBUS1");  /* Get handle of "EXTBUS1" */
}
```

SuoSetReadExtbusCallback

Registers external bus read access callback.

[Syntax]

```
#include "suo.h"
int SuoSetReadExtbusCallback(SuoHandle handle, SuoReadExtbusCallback func);
```

[Argument(s)]

| Argument | Description |
|----------|---|
| handle | Handle of the external bus interface |
| func | Pointer to a user-defined function that performs read access processing of an external bus (see "ReadExtbusFunc") |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to register a user-defined function that performs read access processing of an external bus.
- The registered function is called if a read request is issued to the specified external bus (in the registered address range).
- If NULL is specified for func, registration is canceled.

SuoSetWriteExtbusCallback

Registers external bus write access callback.

[Syntax]

#include "suo.h"
int SuoSetWriteExtbusCallback(SuoHandle handle, SuoWriteExtbusCallback func);

[Argument(s)]

| Argument | Description |
|----------|---|
| handle | Handle of the external bus interface |
| func | Pointer to a user-defined function that performs write access processing of an external bus (see "WriteExtbusFunc") |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to register a user-defined function that performs write access processing of an external bus.
- The registered function is called when a write request is issued to the specified external bus (in the registered address range).
- If NULL is specified for func, registration is canceled.

```
#include    "suo.h"
void WriteExtbusFunc(SuoHandle handle, unsigned long addr, int accessSize, const unsigned char data[]);
SuoHandle hExtbus1;

void func1(void)
{
    .......
    SuoSetWriteExtbusCallback(hExtbus1, WriteExtbusFunc); /* Set write-external-bus function */
}

/* Write-external-bus function */
void WriteExtbusFunc(SuoHandle handle, unsigned long addr, int accessSize, const unsigned char data[])
{
    .......
}
```

B.4.6 Serial interface functions

The serial interface functions that are supplied by Simulator GUI are as follows:

| Function Name | Outline of Function |
|--------------------------------|---|
| SuoCreateSerialUART | Generates serial interface (UART type). |
| SuoCreateSerialCSI | Generates serial interface (CSI type). |
| SuoGetSerialHandle | Acquires serial interface handle. |
| SuoSetSerialParameterUART | Sets serial parameter (UART type). |
| SuoSetSerialParameterCSI | Sets serial parameter (CSI type). |
| SuoGetSerialParameterUART | Acquires serial parameter (UART type). |
| SuoGetSerialParameterCSI | Acquires serial parameter (CSI type). |
| SuoSendSerialData | Performs serial transmission (1 data). |
| SuoSendSerialDataList | Performs serial transmission (more than one data). |
| SuoSendSerialFile | Performs serial transmission (serial transmission data file). |
| SuoSetNotifySentSerialCallback | Registers serial transmission end notification callback. |
| SuoSetReceiveSerialCallback | Registers serial reception callback. |

SuoCreateSerialUART

Generates serial interface (UART type).

Caution This function can only be called in the MakeUserModel function. An error occurs if it is called at any other timing.

[Syntax]

```
#include "suo.h"
int SuoCreateSerialUART(const char* serialName, const char* pinNameTXD, const char*
pinNameRXD, SuoHandle* handle);
```

[Argument(s)]

| Argument | Description |
|------------|---|
| serialName | Name of the serial |
| pinNameTXD | Name of the transmit data pin used by the serial |
| pinNameRXD | Name of the receive data pin used by the serial |
| handle | Location where the handle of the serial interface is to be stored |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to generate a serial interface (UART type).
- The generated serial interface is associated with the name specified for *serialName*. In addition, pins specified as *pinNameTXD* and *pinNameRXD* are also generated.
- If this function is successful, the handle of the generated serial interface can be obtained. The serial interface can then be controlled by specifying this handle.

The handle can also be obtained by using the SuoGetSerialHandle function.

```
#include "suo.h"
SuoHandle hUart1;

SuoUserEntry void MakeUserModel(const char *option)
{
    ......
SuoCreateSerialUART("UART1", "TXD1", "RXD1", &hUart1); /* Create "UART1" */
}
```

SuoCreateSerialCSI

Generates serial interface (CSI type).

Caution This function can only be called in the MakeUserModel function. An error occurs if it is called at any other timing.

[Syntax]

```
#include "suo.h"
int SuoCreateSerialCSI(const char* serialName, const char* pinNameSO, const char*
pinNameSI, const char* pinNameSCK, SuoHandle* handle);
```

[Argument(s)]

| Argument | Description |
|------------|---|
| serialName | Name of the serial |
| pinNameSO | Name of the transmit data pin used by the serial |
| pinNameSI | Name of the receive data pin used by the serial |
| pinNameSCK | Name of the clock pin used by the serial |
| handle | Location where the handle of the serial interface is to be stored |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to generate a serial interface (CSI type).
- The generated serial interface is associated with the name specified for *serialName*. In addition, the pins specified as *pinNameSO*, *pinNameSI*, and *pinNameSCK* are also generated.
- If this function is successful, the handle of the generated serial interface can be obtained. The serial interface can then be controlled by specifying this handle.

The handle can also be obtained by using the SuoGetSerialHandle function.

```
#include "suo.h"
SuoHandle hCsi1;

SuoUserEntry void MakeUserModel(const char *option)
{
    .......
SuoCreateSerialCSI("CSI1", "SO1", "SI1", "SCK1", &hCsi1); /* Create "CSI1" */
}
```

SuoGetSerialHandle

Acquires serial interface handle.

[Syntax]

```
#include "suo.h"
SuoHandle SuoGetSerialHandle(const char* serialName);
```

[Argument(s)]

| Argument | Description |
|------------|--------------------|
| serialName | Name of the serial |

[Return value]

| Macro | Description |
|--|-------------------------|
| Handle of the specified serial interface | Normal completion |
| NULL | Exit with error (abend) |

[Description]

- This function is used to obtain the handle of the specified serial interface.
- Specify the name specified by the SuoCreateSerialUART or SuoCreateSerialCSI function as *serialName* (if a different name is specified, NULL is returned).

```
#include "suo.h"
SuoHandle hSerial1;

void func1(void)
{
    .......
hSerial1 = SuoGetSerialHandle("SERIAL1"); /* Get handle of "SERIAL1" */
}
```

SuoSetSerialParameterUART

Sets serial parameter (UART type).

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoSetSerialParameterUART(SuoHandle handle, const SuoSerialParameterUART* param);
```

[Argument(s)]

| Argument | Description |
|----------|--|
| handle | Handle of the serial interface |
| param | Location where the parameters of the serial interface (UART type) are to be stored Specify a pointer to SuoSerialParameterUART structure ^{Note} . |

Note The configuration of SuoSerialParameterUART structure is as follows:

| Parameter (UART Type) | Value | Description |
|-----------------------|-----------------|---|
| Baud rate | Baud rate value | Unit: bps |
| Transfer direction | SUO_MSBFIRST | MSB first |
| | SUO_LSBFIRST | LSB first |
| Data bit length | 1 to 32 | - |
| Stop bit length | 1 or 2 | - |
| Parity | SUO_NONEPARITY | No parity |
| | SUO_ZEROPARITY | 0 parity (During transmission: parity 0, During reception: no parity check) |
| | SUO_ODDPARITY | Odd parity |
| | SUO_EVENPARITY | Even parity |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to set parameters (UART type) related to the serial operation of the specified serial interface. The default values of the parameters are as follows:

Baud rate: 9600 bps
Transfer direction: LSB first
Data bit length: 7 bits
Stop bit length: 1 bit
Parity: None

```
#include
SuoHandle hUart1;
void func1(void)
    SuoSerialParameterUART param;
    . . . . . . . . .
                                                /* 19200 bps */
    param.baudrate = 19200;
    param.direction = SUO_LSBFIRST;
                                                  /* LSB First */
                                                  /* databit 8 bit */
   param.dataLength = 8;
                                                  /* stopbit 1 bit */
    param.stopLength = 1;
                   = SUO_EVENPARITY;
                                                  /* even parity */
    param.parity
    SuoSetSerialParameterUART(hUart1, &param); /* Set parameter of UART1 */
```

SuoSetSerialParameterCSI

Sets serial parameter (CSI type).

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoSetSerialParameterCSI(SuoHandle handle, const SuoSerialParameterCSI* param);
```

[Argument(s)]

| Argument | Description |
|----------|--|
| handle | Handle of the serial interface |
| param | Location where the parameters of the serial interface (CSI type) are to be stored Specify a pointer to SuoSerialParameterCSI structure ^{Note} . |

Note The configuration of SuoSerialParameterCSI structure is as follows:

| Parameter (CSI Type) | Value | Description | |
|-----------------------------|---------------------------------------|--|------------------|
| Operation mode | SUO_MASTER | Master operation | |
| | SUO_SLAVE | Slave operation | |
| Frequency of transfer clock | Frequency | Unit: Hz Note that "0" cannot be specified if ma | ster operation. |
| Phase | 0 | Normal phase | See "Table B-3." |
| | SUO_PRECEDEDATA | Data output first | |
| | SUO_REVERSECLOCK | Clock reversal | |
| | SUO_PRECEDEDATA SUO_REVERSECLOCK | Specifies both data output first and clock reversal. | |
| Transfer direction | SUO_MSBFIRS | MSB first | |
| | SUO_LSBFIRST | LSB first | |
| Data bit length | 1 to 32 | - | |

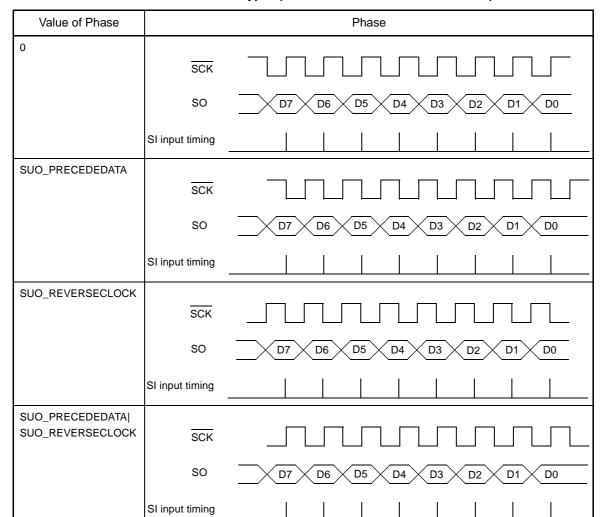

Table B-3. CSI Phase Types (SuoSetSerialParameterCSI Function)

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to set parameters (CSI type) related to the serial operation of the specified serial interface. The default values of the parameters are as follows:

- Operation mode : Slave - Frequency of transfer clock : 0

- Phase : Normal phase
- Transfer direction : MSB first
- Data bit length : 8 bits

- When operating as the master for CSI communication, transmission of dummy data is required for reception because the CSI is the communication mode that performs transmission/reception in response to the clock output from the master.

Remark

If the CSI pin waveform is checked in the Timing Chart window while CSI communication is not performed, an unexpected level will be monitored.

The expected level will be output after communication starts, so this issue does not affect the actual operation.

- SCK pin (in slave mode): High level is output (which should be high impedance).
- SO pin : High level is output (which should be low level).

```
#include
          "suo.h"
SuoHandle hCsi1;
void func1(void)
   SuoSerialParameterCSI param;
   param.mode
                   = SUO_SLAVE;
                                           /* slave */
   param.frequency
                    = 1000000;
                                           /* 1MHz */
                    = 0;
   param.phase
                                           /* normal */
   param.direction
                    = SUO LSBFIRST;
                                           /* LSB First */
                                           /* databit 8bit */
   param.dataLength
                     = 8;
   SuoSetSerialParameterCSI(hCsi1, &param); /* Set parameter of CSI1 */
```

SuoGetSerialParameterUART

Acquires serial parameter (UART type).

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoGetSerialParameterUART(SuoHandle handle, SuoSerialParameterUART* param);
```

[Argument(s)]

| Argument | Description | |
|----------|--|--|
| handle | Handle of the serial interface | |
| param | Location where the parameters of the serial interface (UART type) are to be stored Specify a pointer to SuoSerialParameterUART structure ^{Note} . | |

Note For details on SuoSerialParameterUART structure, see the SuoSetSerialParameterUART function.

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to obtain the parameters (UART type) related to serial operation of the specified serial interface.

```
#include "suo.h"
SuoHandle hUart1;

void func1(void)
{
    SuoSerialParameterUART param;
    ......
    SuoGetSerialParameterUART(hUart1, &param); /* Get parameter of UART1 */
    .......
}
```

SuoGetSerialParameterCSI

Acquires serial parameter (CSI type).

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoGetSerialParameterCSI(SuoHandle handle, SuoSerialParameterCSI* param);
```

[Argument(s)]

| Argument | Description |
|----------|---|
| handle | Handle of the serial interface |
| param | Location where the parameters of the serial interface (UART type) are to be stored Specify a pointer to SuoSerialParameterCSI structure ^{Note} . |

Note For details on SuoSerialParameterCSI structure, see the SuoSetSerialParameterCSI function.

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to obtain the parameters (CSI type) related to serial operation of the specified serial interface.

```
#include "suo.h"
SuoHandle hCsi1;

void funcl(void)
{
    SuoSerialParameterCSI param;
    ......
    SuoGetSerialParameterCSI(hCsi1, &param); /* Get parameter of CSI1 */
    ......
}
```

SuoSendSerialData

Performs serial transmission (1 data).

- Cautions 1. Be sure to use the SuoSendSerialDataList function (for serial transmission of multiple data units) when executing continuous UART transmission.
 - 2. If this function is called using NotifySentSerialFunc function (serial transmission completion report callback function), transmission start is delayed for half the baud rate cycle of UART.
 - 3. This function cannot be called in the MakeUserModel function. It can only be called in a call-back function.

[Syntax]

```
#include    "suo.h"
int    SuoSendSerialData(SuoHandle handle, unsigned long data);
```

[Argument(s)]

| Argument | Description |
|----------|--------------------------------|
| handle | Handle of the serial interface |
| data | Transmit data (1 data) |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to start transmitting one serial data.
- It takes time to complete transmitting the serial data. If you want to know the timing of transmission completion, set the transmission end notification function by using the SuoSetNotifySentSerialCallback function.
- If this function is called for a serial interface that is currently transmitting data, an error occurs.

```
#include "suo.h"
SuoHandle hSerial1;

void func1(void)
{
    ......
SuoSendSerialData(hSerial1, 0x80); /* Send 0x80 */
}
```

SuoSendSerialDataList

Performs serial transmission (more than one data).

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoSendSerialDataList(SuoHandle handle, long count, unsigned long dataList[]);
```

[Argument(s)]

| Argument | Description |
|------------|--|
| handle | Handle of the serial interface |
| count | Number of data to be transmitted (1 to 32767) |
| dataList[] | Transmit data Specify an array consisting of the number of data to be transmitted. |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to start transmitting two or more serial data.
- It takes time to complete transmission of the serial data. If you want to know the timing of transmission completion, set the transmission end notification function by using the SuoSetNotifySentSerialCallback function.
- If this function is called for a serial interface that is currently transmitting data, an error occurs.

```
#include "suo.h"
SuoHandle hSerial1;

void func1(void)
{
   unsigned long dataList[6] = {0x73, 0x65, 0x72, 0x69, 0x61, 0x6c};
   .......
SuoSendSerialDataList(hSerial1, 6, dataList); /* Send dataList */
}
```

SuoSendSerialFile

Performs serial transmission (serial transmission data file).

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoSendSerialFile(SuoHandle handle, const char* serialFile);
```

[Argument(s)]

| Argument | Description |
|------------|--|
| handle | Handle of the serial interface |
| serialFile | Name of the serial transmission data file that has been saved after being edited on the Serial window Note that if serialFile is specified by a relative path, it is treated as relative to the path of the user model (UserModel.dll). |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to start transmitting serial data described in a serial transmission data file (*.ser) that has been saved after being edited on the Serial window.
- It takes time to complete transmission of the serial data. If you want to know the timing of transmission completion, set the transmission end notification function by using the SuoSetNotifySentSerialCallback function.
- If this function is called for a serial interface that is currently transmitting data, an error occurs.

```
#include "suo.h"
SuoHandle hSerial1;

void funcl(void)
{
    .......
SuoSendSerialFile(hSerial1, "foo.ser"); /* Send serial data on "foo.ser" */
}
```

SuoSetNotifySentSerialCallback

Registers serial transmission end notification callback.

[Syntax]

#include "suo.h"
int SuoSetNotifySentSerialCallback(SuoHandle handle, SuoNotifySentSerialCallback func);

[Argument(s)]

| Argument | Description |
|----------|--|
| handle | Handle of the serial interface |
| func | Pointer to a user-defined function that performs processing when serial transmission is completed (see "NotifySentSerialFunc") |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to register a user-defined function that performs processing when serial transmission is completed.
- The registered function is called when one or more serial data specified to be transmitted have been completely transmitted.
- If NULL is specified for func, registration is canceled.

SuoSetReceiveSerialCallback

Registers serial reception callback.

[Syntax]

```
#include "suo.h"
int SuoSetReceiveSerialCallback(SuoHandle handle, SuoReceiveSerialCallback func);
```

[Argument(s)]

| Argument | Description |
|----------|--|
| handle | Handle of the serial interface |
| func | Pointer to a user-defined function that performs processing when serial data is received (see "ReceiveSerialFunc") |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to register a user-defined function that performs processing when serial data is received.
- The registered function is called when one serial data has been received.
- If NULL is specified for func, registration is canceled.

B.4.7 Signal output unit interface functions

The signal output unit interface functions that are supplied by Simulator GUI are as follows:

| Function Name | Outline of Function |
|------------------------------|--|
| SuoCreateWave | Generates signal output unit interface. |
| SuoGetWaveHandle | Acquires signal output unit interface handle. |
| SuoSendWaveFile | Performs transmission via signal output unit. |
| SuoSetNotifySentWaveCallback | Registers signal output unit transmission end notification callback. |

SuoCreateWave

Generates signal output unit interface.

Caution This function can only be called in the MakeUserModel function. An error occurs if it is called at any other timing.

[Syntax]

```
#include "suo.h"
int SuoCreateWave(const char* waveName, int count, const char* pinNameList[], SuoHandle* handle);
```

[Argument(s)]

| Argument | Description |
|---------------|--|
| waveName | Name of the signal output unit |
| count | Number of pins used by the signal output unit |
| pinNameList[] | Names of the pins used by the signal output unit Specify names in an array equivalent to the number of pins. |
| handle | Location where the handle of the signal output unit interface is to be stored |

[Return value]

| Macro | Description |
|--------------|---|
| SUO_NOERROR | Normal completion |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") |

[Description]

- This function is used to generate a signal output unit interface.
- The generated signal output unit interface is associated with the name specified for *waveName*. In addition, the pins specified by *count* and *pinNameList* are also generated.
- If this function is successful, the handle of the generated signal output unit interface can be obtained. The signal output unit interface can then be controlled by specifying this handle.

The handle can also be obtained by using the SuoGetWaveHandle function.

```
#include "suo.h"
SuoHandle hWave1;

SuoUserEntry void MakeUserModel(const char *option)
{
    ......
    char* pinNameList[4] = {"P00", "P01", "P02", "P03"};
    SuoCreateWave("WAVE1", 4, pinNameList, &hWave1); /* Create "WAVE1" */
}
```

SuoGetWaveHandle

Acquires signal output unit interface handle.

[Syntax]

```
#include "suo.h"
SuoHandle SuoGetWaveHandle(const char* waveName);
```

[Argument(s)]

| Argument | Description |
|----------|--------------------------------|
| waveName | Name of the signal output unit |

[Return value]

| Macro | Description |
|---|-------------------------|
| Handle of the signal out- put unit interface | Normal completion |
| NULL | Exit with error (abend) |

[Description]

- This function is used to obtain the handle of the specified signal output unit interface.
- Specify the name specified by the SuoCreateWave function as waveName (if a different name is specified, NULL is returned).

```
#include "suo.h"
SuoHandle hWave1;

void func1(void)
{
    .......
hWave1 = SuoGetWaveHandle("WAVE1");  /* Get handle of "WAVE1" */
}
```

SuoSendWaveFile

Performs transmission via signal output unit.

Caution This function cannot be called in the MakeUserModel function. It can only be called in a callback function.

[Syntax]

```
#include "suo.h"
int SuoSendWaveFile(SuoHandle handle, const char* waveFile);
```

[Argument(s)]

| Argument | Description |
|----------|---|
| handle | Handle of the signal output unit interface |
| waveFile | Name of the signal data file that has been saved after being edited on the Signal Data Editor window Note that if waveFile is specified by a relative path, it is treated as relative to the path of the user model (UserModel.dll). |

[Return value]

| Macro | Description | |
|--------------|---|--|
| SUO_NOERROR | Normal completion | |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") | |

[Description]

- This function is used to start transmitting a signal value whose timing is described in a signal data file (*.wvi) that has been saved after being edited on the Signal Data Editor window.
- It takes time to complete transmitting the signal data file. If you want to know the timing of transmission completion, set the transmission end notification function by using the SuoSetNotifySentWaveCallback function.
- If this function is called for a signal output unit interface that is currently transmitting data, the data being transmitted is canceled and the newly specified data is transmitted.

[Example]

```
#include "suo.h"
SuoHandle hWave1;

void func1(void)
{
    .......
SuoSendWaveFile(hSerial1, "foo.wvi"); /* Send pin data on "foo.wvi" */
}
```

SuoSetNotifySentWaveCallback

Registers signal output unit transmission end notification callback.

[Syntax]

```
#include "suo.h"
int SuoSetNotifySentWaveCallback(SuoHandle handle, SuoNotifySentWaveCallback func);
```

[Argument(s)]

| Argument | Description | |
|----------|---|--|
| handle | Handle of the signal output unit interface | |
| func | Pointer to a user-defined function that performs processing when transmission by the signal output unit is completed (see "NotifySentWaveFunc") | |

[Return value]

| Macro | Description | |
|--------------|---|--|
| SUO_NOERROR | Normal completion | |
| Error number | Exit with error (abend) (see "B.4.8 Error numbers") | |

[Description]

- This function is used to register a user function that performs processing when transmission by the signal output unit is completed.
- The registered function is called when all signal data specified to be transmitted have been completely transmitted.
- If NULL is specified for func, registration is canceled.

[Example]

B.4.8 Error numbers

The meanings of error numbers (macro names) that are returned from the supplied interface function as return values are as follows:

Note that an error number is indicated by a macro name defined by the supplied header file (suo.h).

Table B-4. List of Error Numbers (Macro Names)

| Error number (Macro Name) | Description | | | |
|---------------------------|--|--|--|--|
| SUO_NOERROR | Normal completion | | | |
| SUO_CANTALLOC | Memory cannot be allocated. | | | |
| SUO_ILLIFNAME | The interface name is not correct. NULL or "" is specified for the interface name. Or, an interface name that has not been generated is specified for a handle acquisition function. | | | |
| SUO_ILLHANDLE | The handle is not correct. A handle other than that of the generated interface is specified. | | | |
| SUO_ILLPARAM | The argument (parameter) is not correct. A value other than those that can be specified is specified as a argument (parameter). | | | |
| SUO_CANTCALL | The function cannot be called. A function that can be called only by the MakeUserModel function is called by another function. Or, a function that can be called by a function other than the MakeUserModel function is called by the MakeUserModel function. | | | |
| SUO_CONFLICTRES | The resources to be generated conflict. Two or more names that are the same as an interface name or pin name generated in the MakeUserModel function exist. | | | |
| SUO_ILLFILENAME | The file name is not correct. NULL or a name including an invalid character is specified for a file name. | | | |
| SUO_CANTOPENFILE | The signal data file cannot be opened. The signal data file does not exist, or is not permitted to be read. | | | |
| SUO_ILLFILEFMT | [Serial transmission data file] The file cannot be opened. The file does not exist, is not permitted to be read, or the file name is not correct. [Signal data file] The file format is not correct. NULL or a name including an invalid character is specified for a file name. | | | |
| SUO_ILLFILECONT | The file contents are not correct. The contents of data described in the file include a contradiction, or no data exists in the file. | | | |
| SUO_ILLPINNAME | The pin name is not correct. NULL or "" is specified for the pin name. | | | |
| SUO_ILLADDRRANGE | The address range is not correct. The address range is not valid. | | | |
| SUO_UNDERSENDING | Already being transmitted. New transmission cannot be started because transmission is in progress. | | | |

B.5 User-Defined Functions

This section describes the user-defined functions that user creates.

The user-defined functions are listed below.

Table B-5. List of User-Defined Functions

| Function Name | Outline of Function | |
|------------------------|--|--|
| MakeUserModel | MakeUserModel entry function | |
| InitFunc | Initialization callback function | |
| ResetFunc | Reset callback function | |
| NotifyTimerFunc | Timer time notification callback function | |
| InputDigitalPinFunc | Digital pin input value callback function | |
| InputAnalogPinFunc | Analog pin input value callback function | |
| InputHighImpedanceFunc | Pin high-impedance state report callback function | |
| ReadExtbusFunc | External bus read access callback function | |
| WriteExtbusFunc | External bus write access callback function | |
| NotifySentSerialFunc | Serial interface transmission end notification callback function | |
| ReceiveSerialFunc | Serial interface reception callback function | |
| NotifySentWaveFunc | Serial interface reception callback function | |

MakeUserModel

Creates the resources to be used as the entry function of the user model.

Caution Because MakeUserModel is a static entry function of the user model, this function name must be used.

[Syntax]

#include "suo.h"
SuoUserEntry void MakeUserModel(const char *option);

[Argument(s)]

| Argument | Description |
|----------|---|
| option | Option character string specified in the simulator configuration file |
| | Note that if no option is specified in the simulator configuration file, NULL character (" ") is assumed. |

[Return value]

None

- This function must be used to generate the resources to be used with the user model. Any function other than this function cannot generate the resources.
- This function must be used to register a callback function as necessary. In particular, an initialization callback function must be registered by this function (because the initialization timing has passed even if a function is registered by a function other than this function).

[Example]

```
#include
            "suo.h"
SuoHandle hTim1;
SuoHandle hPinP00;
SuoHandle hExtbus1;
void InitFunc(void);
void ResetFunc(void);
SuoUserEntry void MakeUserModel(const char *option)
{
    /* Create source */
   SuoCreateTimer("TIM1", &hTim1);
                                                             /* Create "TIM1" */
   SuoCreatePin("P00", &hPinP00);
                                                              /* Create "P00" */
   SuoCreateExtbus("EXTBUS1", 0x200000, 0x1000, &hExtbus1); /* Create "EXTBUS1" */
   /* Set callbacks */
    SuoSetInitCallback(InitFunc);
                                                              /* Set initialize function */
    SuoSetResetCallback(ResetFunc);
                                                              /* Set reset function */
```

InitFunc

Performs the initialization processing as a callback function.

Caution InitFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

```
#include "suo.h"

void InitFunc (void);
```

[Argument(s)]

None

[Return value]

None

- InitFunc describes initialization processing.
- Use the SuoSetInitCallback function to register InitFunc as a callback function.

ResetFunc

Performs the reset processing as a callback function.

Caution ResetFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

```
#include "suo.h"

void ResetFunc (void);
```

[Argument(s)]

None

[Return value]

None

- ResetFunc describes the reset processing.
- Use the SuoSetResetCallback function to register ResetFunc as a callback function.

NotifyTimerFunc

Performs the processing when the timer time is reported, as a callback function.

Caution NotifyTimerFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

#include "suo.h"

void NotifyTimerFunc (SuoHandle handle);

[Argument(s)]

| Argument | Description |
|----------|-------------------------------|
| handle | Handle of the timer interface |

[Return value]

None

- NotifyTimerFunc describes the processing when the timer time is reported.
- Use the SuoSetNotifyTimerCallback function to register NotifyTimerFunc as a callback function.

InputDigitalPinFunc

Performs the digital pin input processing, as a callback function.

Caution InputDigitalPinFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

| #include | "suo.h" | |
|----------|---|--|
| void : | inputDigitalPinFunc (SuoHandle handle, int pinValue); | |

[Argument(s)]

| Argument | Description | |
|----------|--|--|
| handle | Handle of the pin interface | |
| pinValue | Digital input value (specify any of the following) - SUO_HIGH (=1): HIGH value - SUO_LOW (=0): LOW value | |

[Return value]

None

- InputDigitalPinFunc describes the digital pin input processing.
- Use the SuoSetInputDigitalPinCallback function to register InputDigitalPinFunc as a callback function.

InputAnalogPinFunc

Performs the analog pin input processing, as a callback function.

Caution InputAnalogPinFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

| #includ | de "suo.h" | | |
|---------|--------------------|--------------------|------------------------------|
| void | InputAnalogPinFunc | (SuoHandle handle, | <pre>double pinValue);</pre> |

[Argument(s)]

| Argument | Description | |
|----------|---|--|
| handle | Handle of the pin interface | |
| pinValue | Value (analog value) input to the pin (unit: V) | |

[Return value]

None

- InputAnalogPinFunc describes the analog pin input processing.
- $\hbox{- Use the $SuoSetInputAnalogPinCallback function to register InputAnalogPinFunc as a callback function.}\\$

InputHighImpedanceFunc

Performs the processing when all the pins connected to digital/analog pins enter the high-impedance state, as a call-back function.

Caution InputHighImpedanceFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

```
#include    "suo.h"

void    InputHighImpedanceFunc (SuoHandle handle);
```

[Argument(s)]

| Argument | Description |
|----------|-----------------------------|
| handle | Handle of the pin interface |

[Return value]

None

- InputHighImpedanceFunc is used to describe the processing when all the pins connected to digital/analog pins enter the high-impedance state.
- Use the SuoSetInputHighImpedanceCallback function to register InputHighImpedanceFunc as a callback function.

ReadExtbusFunc

Performs the read access processing of an external bus, as a callback function.

Caution ReadExtbusFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

| #includ | e "suo.h" | | | | | | | | | |
|---------|----------------|---------------|---------------|-------------|----------|-------------|----------|------|----------|--|
| void | ReadExtbusFunc | (SuoHandle ha | andle, unsigr | ned long ad | ddr, int | accessSize, | unsigned | char | data[]); | |

[Argument(s)]

| Argument | Description |
|------------|---|
| handle | Handle of the external bus interface |
| addr | Address |
| accessSize | Access size |
| data[] | Data storage area As many data as the access size must be stored. |

[Return value]

None

- ReadExtbusFunc describes the read access processing of an external bus.
- Data must be stored in data[].
- Use the SuoSetReadExtbusCallback function to register ReadExtbusFunc as a callback function.

WriteExtbusFunc

Performs the write access processing of an external bus, as a callback function.

Caution WriteExtbusFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

#include "suo.h"

void WriteExtbusFunc (SuoHandle handle, unsigned long addr, int accessSize, const unsigned char
data[]);

[Argument(s)]

| Argument | Description |
|------------|---|
| handle | Handle of the external bus interface |
| addr | Address |
| accessSize | Access size |
| data[] | Data storage area As many data as the access size must be stored. |

[Return value]

None

- WriteExtbusFunc describes the write access processing of an external bus.
- Use the SuoSetWriteExtbusCallback function to register WriteExtbusFunc as a callback function.

NotifySentSerialFunc

Performs the processing when transmission by a serial interface has been completed, as a callback function.

Caution NotifySentSerialFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

#include "suo.h"

void NotifySentSerialFunc (SuoHandle handle);

[Argument(s)]

| Argument | Description |
|----------|--------------------------------|
| handle | Handle of the serial interface |

[Return value]

None

- NotifySentSerialFunc describes the processing when transmission by a serial interface has been completed.
- Use the SuoSetNotifySentSerialCallback function to register NotifySentSerialFunc as a callback function.

ReceiveSerialFunc

Performs the processing during reception by a serial interface, as a callback function.

Caution ReceiveSerialFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

```
#include "suo.h"

void ReceiveSerialFunc (SuoHandle handle, unsigned long data, int status);
```

[Argument(s)]

| Argument | Description | |
|----------|---|---|
| handle | Handle of the serial interface | |
| data | Received serial data | |
| status | Receive status (specify any of the following) | |
| | -0: | Normal reception |
| | - SUO_PARITYERR : | Parity error (if parity bit does not match) |
| | - SUO_FRAMINGERR : | Framing error (if stop bit is not detected) |

[Return value]

None

- Receive SerialFunc describes the processing during reception by a serial interface.
- Use the SuoSetReceiveSerialCallback function to register ReceiveSerialFunc as a callback function.

NotifySentWaveFunc

Performs the processing to be performed when transmission by a signal output unit has been completed, as a callback function.

Caution NotifySentWaveFunc is a place holder for a user-defined function name, so this function name does not have to be used.

[Syntax]

```
#include "suo.h"

void NotifySentWaveFunc (SuoHandle handle);
```

[Argument(s)]

| Argument | Description |
|----------|--|
| handle | Handle of the signal output unit interface |

[Return value]

None

- NotifySentWaveFunc describes the processing to be performed when transmission by a signal output unit has been completed.
- Use the SuoSetNotifySentWaveCallback function to register NotifySentWaveFunc as a callback function.

B.6 Sample Program (Timer Model)

This section describes a sample program (timer model) of a user model created by using the Simulator GUI's user open interface.

B.6.1 Overview

Timer model is a sample program using a timer interface.

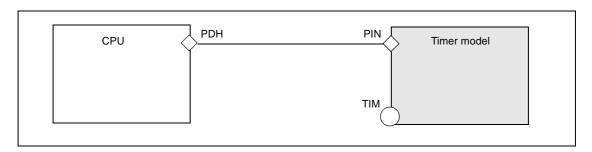

It outputs a value to a pin at fixed time intervals.

B.6.2 Configuration

The timer model generates the PIN pin and TIM timer.

The generated PIN pin is connected to the PDH pin of the CPU.

Figure B-5. Timer Model Configuration

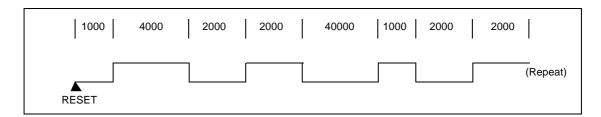

B.6.3 Operation

The timer model calculates a predetermined time by using the timer interface, and alternately outputs a low level and a high level to the PDH pin.

The output value and output time are as shown below.

Figure B-6. Timer Model Operation

B.6.4 Project file

The following table shows the setting information of the Visual C++ project file of the Timer model.

Table B-6. Setting Information of Timer Model

| Information | Description |
|----------------------|----------------------------|
| Project type | Win32 Dynamic-Link Library |
| Source file | suolink.c, uo_timer.c |
| Path of include file | Folder storing suo.h |

B.6.5 Details of program

The following shows the sample programs of the timer model.

- (1)Source file of timer model (uo_timer.c)
- (2) Simulator configuration file (smplus.cfg)
- (3)Source file of target program (Im_timer.c)

(1) Source file of timer model (uo_timer.c)

```
#include <windows.h>
#include "suo.h"
/* Handle */
SuoHandle hTIM;
SuoHandle hPIN;
/* Wave-Table */
#define MAXWAVE 8
struct _WaveTable {
   unsigned longtime;
                                    /* Wait Time [usec] */
   int pinValue;
                                    /* Pin Value (SUO_HIGH or SUO_LOW) */
} waveTable[MAXWAVE] = {
   1000, SUO HIGH,
   4000, SUO LOW,
   2000, SUO_HIGH,
   2000, SUO LOW,
   4000, SUO_HIGH,
   1000, SUO_LOW,
   2000, SUO HIGH,
   2000, SUO_LOW
int waveIndex;
/* Declare */
void Reset(void);
void NotifyTimer(SuoHandle handle);
