

# FREESCALE P10XX AND P20XX SYSTEM CLOCK WITH 66.66M DDR CLOCK

**6V49205A**

## General Description

The 6V49205A is a main clock for Freescale P10xx and P20xx-based systems. It has a selectable System CCB clock and a 66.66MHz DDRCLK. The 6V49205A also provides LP-HCSL PCIe outputs for low power and reduced board space.

## Output Features

- 1 - Sys\_CCB 3.3V LVCMOS output at 100M/83.33M/80M/66.66M
- 1 - DDRCLK 3.3V LVCMOS output at 66.66M
- 1 - 125M 3.3V LVCMOS output
- 6 - LP-HCSL PCIe pairs selectable at 100M or 125M
- 6 - 25MHz 3.3V LVCMOS outputs
- 2 - 2.048M 3.3V LVCMOS outputs
- 2 - USB 3.3V LVCMOS outputs at 12M or 24M

## Key Specifications

- PCIe Gen1–3 compliant
- < 3ps rms phase noise on REF outputs

## Block Diagram

## Recommended Application

System Clock for Freescale P10xx and P20xx-based designs

## Features

- Replaces 11 crystals, 2 oscillators and 3 clock generators; lowers cost, power and area
- Integrated terminations on LP-HCSL PCIe outputs; eliminate 24 resistors, saving 41mm<sup>2</sup> of board area
- Industrial temperature range operation; supports demanding environmental conditions
- Advanced 3.3V CMOS process; high-performance, low-power
- Supports independent spread spectrum on Sys\_CCB/DDRCLK and PCIe outputs
- Packaged as 48-pin TSSOP, Pb-free, RoHS compliant

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 6V49205A. These ratings, which are standard values for Renesas commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

### Notes for PCIe Clocks:

- Guaranteed by design and characterization, not 100% tested in production.
- Clock Frequency specifications are guaranteed assuming that REF is at 25MHz
- Slew rate measured through V<sub>swing</sub> voltage range centered about differential zero
- V<sub>cross</sub> is defined at the voltage where Clock = Clock#.
- Only applies to the differential rising edge (Clock rising, Clock# falling.)
- At default SMBus settings.
- The Freescale P-series CPU's have internal terminations on their SerDes Reference Clock inputs. The resulting amplitude at these inputs will be 1/2 of the values listed, which are well within the 800mV Freescale specification for these inputs.
- This value includes an intentional output-to-output skew of approximately 250ps.

## Electrical Characteristics - Phase Jitter, PCIe Outputs at 100MHz

### Notes on Phase Jitter:

- See <http://www.pcisig.com> for complete specs. Guaranteed by design and characterization, not tested in production.
- Sample size of at least 100K cycles. This figures extrapolates to 108ps pk-pk @ 1M cycles for a BER of 1<sup>-12</sup>
- Applies to PCIe outputs @ default amplitude and 100MHz with spread off or at -0.5%.

### Notes for single-ended clocks:

- Guaranteed by design and characterization, not 100% tested in production.
- Clock Frequency specifications are guaranteed assuming that REF is at 25MHz
- At default SMBus settings
- Measured between 20% and 80% of OVDD
- This is the frequency error with respect to the crystal frequency.
- Measured at the rising and/or falling edge at  $OVDD/2 V$ .
- Phase noise is calculated as the FFT of the TIE jitter.
- Slew rate is measured from  $\pm 0.3\Delta V_{AC}$  at the center of peak to peak voltage at the clock input.

### How to Write

- Controller (host) sends a start bit
- Controller (host) sends the write address
- Renesas clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- Renesas clock will **acknowledge**
- Controller (host) sends the byte count = X
- Renesas clock will **acknowledge**
- Controller (host) starts sending **Byte N through Byte N+X-1**
- Renesas clock will **acknowledge** each byte **one at a time**
- Controller (host) sends a Stop bit

**Note: I2C compatible.** Native mode is SMBus Block mode protocol. To use I2C Byte mode set the 2<sup>7</sup> bit in the command Byte. No Byte count is used.

### How to Read

- Controller (host) will send a start bit
- Controller (host) sends the write address
- Renesas clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- Renesas clock will **acknowledge**
- Controller (host) will send a separate start bit
- Controller (host) sends the read address
- Renesas clock will **acknowledge**
- Renesas clock will send the data byte count = X
- Renesas clock sends **Byte N+X-1**
- Renesas clock sends **Byte 0 through Byte X (if X<sub>(H)</sub> was written to Byte 8)**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

## Marking Diagrams

### Notes:

- '\$' is the mark code.
- YYWW is the last two digits of the year, and the week number that the part was assembled.
- "G" after the two-letter package code denotes Pb free package.
- "I" denotes industrial temperature range.
- Bottom marking: country of origin if not USA.

## Package Outline and Package Dimensions (PAG48, 48-pin TSSOP, 6.10 mm Body, 0.50 Pitch)

## Ordering Information

Part / Order Number	Marking	Shipping Packaging	Package	Temperature
6V49205APAGI	see page 12	Tubes	48-pin TSSOP	-40 to +85°C
6V49205APAGI8		Tape and Reel	48-pin TSSOP	-40 to +85°C
6V49205APAG	see page 12	Tubes	48-pin TSSOP	0 to +70°C
6V49205APAG8		Tape and Reel	48-pin TSSOP	0 to +70°C

"G" after the two-letter package code denotes Pb-Free configuration, RoHS compliant.

For an NLG I-temp device, see the [6V49205B](#).

## Revision History

Revision Date	Description
December 12, 2013	<ol style="list-style-type: none"> <li>1. Extensive overhaul of Electrical tables to more closely align with Freescale published specifications.</li> <li>2. Updated electrical tables with characterization data.</li> <li>3. Clarified SMBus registers for Slew Rate Controls</li> <li>4. Moved electrical tables in front of SMBus for consistency with other data sheets.</li> <li>5. Updated Thermal Data and added test loads for clarity.</li> <li>6. Updated front page text</li> <li>7. Minor updates to pin names (mainly power and ground) for consistency and clarity</li> </ol>
January 9, 2014	Table 2: Sys_CCB and DDR Spread Table; 100~111 marked as Reserved.
February 12, 2014	Added 48-pin VFQFPN package, diagrams, and references
March 24, 2015	Updated ordering information to remove I-temp NLG package, and to add commercial PAG and NLG packages
May 11, 2016	<ol style="list-style-type: none"> <li>1. Correct PCIeT_LRn and PCIeC_LRn to be PCIeT_Ln and PCIeC_Ln to indicate that the Rs for the PCIe outputs is outside the part and to correct the pin description accordingly. The test loads for the device are correct.</li> <li>2. Update block diagram PCIe pin names to be consistent.</li> </ol>
November 22, 2016	<ol style="list-style-type: none"> <li>1. Undo Revision P</li> <li>2. PCIe outputs have integrated terminations for 100ohm differential Zo.</li> <li>3. Update Test Loads</li> <li>4. Update Features/Benefits</li> </ol>
October 21, 2020	Updated Sys_CCB Frequency Select table.
