RENESAS

LOW-VOLTAGE 10-BIT BUS SWITCH

FEATURES:

- 5Ω A/B bi-directional bus switch
- · Isolation under power-off conditions
- Over-voltage tolerant
- · Latch-up performance exceeds 100mA
- Vcc = 2.3V 3.6V, Normal Range
- ESD > 2000V per MIL-STD-883, Method 3015;
 > 200V using machine model (C = 200pF, R = 0)
- Available in QSOP and TSSOP packages

APPLICATIONS:

• 3.3V High Speed Bus Switching and Bus Isolation

FUNCTIONAL BLOCK DIAGRAM

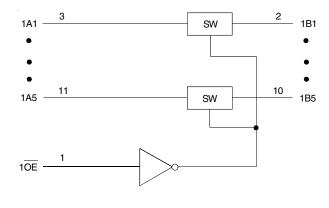

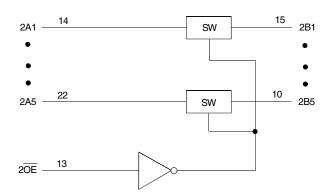

The CBTLV3384 is a ten bit high-speed bus switch with low on-state resistance of the switch allowing connections to be made with minimal propagation delay.

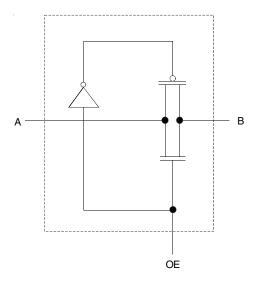

The device is organized as dual 5-bit bus switches with separate outputenable (\overline{OE}) inputs, to allow use as two 5-bit bus switches or one 10-bit bus switch. When \overline{OE} is low, the associated 5-bit bus switch is on and A port is connected to B port. When \overline{OE} is high, the switch is open, and a highimpedance state exists between the two ports.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to Vcc through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

NOTE:

 Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

		VI = 2.4V	Io = 15mA	-	10	15	

NOTES:

1. The increase in supply current is attributable to each current that is at the specified voltage level rather than Vcc or GND.

2. This is measured by the voltage drop between the A and B terminals at the indicated current through the switch. On-state resistance is determined by the lower of the voltages of the two (A or B) terminals.
