## **General Description**

The 840004I-01 is a 4 output LVCMOS/LVTTL Synthesizer optimized to generate Ethernet reference clock frequencies. Using a 25MHz, 18pF parallel resonant crystal, the following frequencies can be generated based on the 2 frequency select pins (F\_SEL1:0): 156.25MHz, 125MHz, and 62.5MHz. The 840004I-01 uses IDT's 3<sup>rd</sup> generation low phase noise VCO technology and can achieve 1ps or lower typical random rms phase jitter, easily meeting Ethernet jitter requirements. The 840004I-01 is packaged in a small 20-pin TSSOP package.

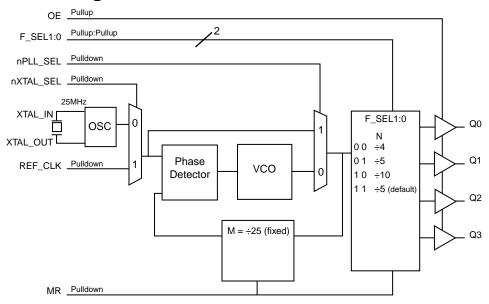

### Features

- Four single-ended LVCMOS/LVTTL outputs 17Ω typical output impedance
- Selectable crystal oscillator interface or single-ended input, Supports the following output frequencies: 156.25MHz, 125MHz and 62.5MHz
- VCO range: 560MHz 700MHz
- RMS phase jitter at 156.25MHz (1.875MHz 20MHz): 0.52ps (typical)
- Output supply modes: Core/Output
  3.3V/3.3V
  3.3V/2.5V
  2.5V/2.5V
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) package
- For functional replacement part use 8T49N241

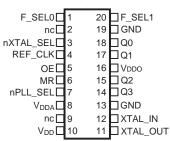

#### **Frequency Select Function Table for Ethernet Frequencies**

|        | Inputs |              |              |                 |   |
|--------|--------|--------------|--------------|-----------------|---|
| F_SEL1 | F_SEL0 | M Div. Value | N Div. Value | M/N Ratio Value | Output Frequency (MHz), (25MHz Reference) |
| 0      | 0      | 25           | 4            | 6.25            | 156.25                                    |
| 0      | 1      | 25           | 5            | 5               | 125                                       |
| 1      | 0      | 25           | 10           | 2.5             | 62.5                                      |
| 1      | 1      | 25           | 5            | 5               | 125 (default)                             |

| R <sub>PULLDOWN</sub> | Input Pulldown Resistor       |                            |         | 51      |         | kΩ    |
| D                     | Output Impedance              | V <sub>DDO</sub> = 3.3V±5% |         | 17      |         | Ω     |
| R <sub>OUT</sub>      |                               | V <sub>DDO</sub> = 2.5V±5% |         | 21      |         | Ω     |

## **Absolute Maximum Ratings**

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics or AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

| Item                                     | Rating                           |
|--|----------------------------------|
| Supply Voltage, V <sub>DD</sub>          | 4.6V                             |
| Inputs, V <sub>I</sub>                   | -0.5V to V <sub>DD</sub> + 0.5V  |
| Outputs, V <sub>O</sub>                  | -0.5V to V <sub>DDO</sub> + 0.5V |
| Package Thermal Impedance, $\theta_{JA}$ | 73.2°C/W (0 lfpm)                |
| Storage Temperature, T <sub>STG</sub>    | -65°C to 150°C                   |

## **DC Electrical Characteristics**

Table 3A. Power Supply DC Characteristics,  $V_{DD} = 3.3V \pm 5\%$ ,  $V_{DDO} = 3.3V \pm 5\%$  or  $2.5V \pm 5\%$ ,  $T_A = -40^{\circ}$ C to  $85^{\circ}$ C

| Symbol                    | Parameter             | Test Conditions | Minimum | Typical | Maximum | Units |

Table 5A. AC Characteristics,  $V_{DD} = V_{DDO} = 3.3V \pm 5\%$ ,  $T_A = -40^{\circ}C$  to  $85^{\circ}C$ 

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at V<sub>DDO</sub>/2.

NOTE 2: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 3: Please refer to the Phase Noise Plot.

#### Table 5B. AC Characteristics, $V_{DD} = 3.3V \pm 5\%$ , $V_{DDO} = 2.5V \pm 5\%$ , $T_A = -40^{\circ}C$ to $85^{\circ}C$

## **Application Information**

### **Recommendations for Unused Input and Output Pins**

#### Inputs:

#### **Crystal Inputs**

For applications not requiring the use of the crystal oscillator input, both XTAL\_IN and XTAL\_OUT can be left floating. Though not required, but for additional protection, a  $1k\Omega$  resistor can be tied from XTAL\_IN to ground.

#### **REF\_CLK Input**

For applications not requiring the use of the reference clock, it can be left floating. Though not required, but for additional protection, a  $1k\Omega$  resistor can be tied from the REF\_CLK to ground.

#### **LVCMOS Control Pins**

All control pins have internal pull-downs; additional resistance is not required but can be added for additional protection. A  $1k\Omega$  resistor can be used.

### Outputs:

### LVCMOS Outputs

All unused LVCMOS outputs can be left floating. We recommend that there is no trace attached.

### **Power Supply Filtering Technique**

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter perfor-mance, power supply isolation is required. The 840004I-01 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{DD}$ ,  $V_{DDA}$  and  $V_{DDO}$  should be individually connected to the power supply plane through vias, and  $0.01\mu$ F bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic  $V_{DD}$  pin and also shows that  $V_{DDA}$  requires that an additional  $10\Omega$  resistor along with a  $10\mu$ F bypass capacitor be connected to the  $V_{DDA}$  pin.

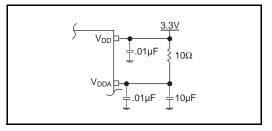

Figure 1. Power Supply Filtering

### **Crystal Input Interface**

The 840004I-01 has been characterized with 18pF parallel resonant crystals. The capacitor values shown in *Figure 2* below were determined using a 25MHz, 18pF parallel resonant crystal and were chosen to minimize the ppm error.

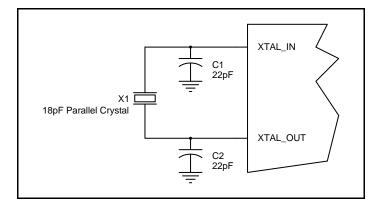

Figure 2. Crystal Input Interface

### LVCMOS to XTAL Interface

The XTAL\_IN input can accept a single-ended LVCMOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure 3*. The XTAL\_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVCMOS inputs, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output

impedance of the driver (Ro) plus the series resistance (Rs) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most 50 $\Omega$  applications, R1 and R2 can be 100 $\Omega$ . This can also be accomplished by removing R1 and making R2 50 $\Omega$ .

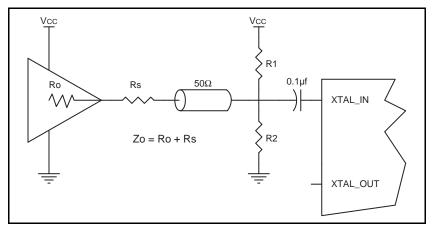

Figure 3. General Diagram for LVCMOS Driver to XTAL Input Interface

### **Schematic Example**

*Figure 4* shows a schematic example of the 840004I-01. An example of LVCMOS termination is shown in this schematic. Additional LVCMOS termination approaches are shown in the LVCMOS Termination Application Note. In this example, an 18pF parallel resonant 25MHz crystal is used. The C1= 22pF and C2 = 22pF

are recommended for frequency accuracy. For different board layouts, the C1 and C2 may be slightly adjusted for optimizing frequency accuracy.  $1k\Omega$  pullup or pulldown resistors can be used for the logic control input pins.
