#### 14.4.5 Software Configurable Interrupts

An interrupt source assigned to each interrupt vector number from 208 to 255 can be selected from multiple sources. Figure 14.4 shows the software configurable interrupt configuration.

**Figure 14.4** Software Configurable Interrupt Configuration

#### 14.4.5.1 Software Configurable Interrupt A

Interrupt sources of peripherals that operates in synchronization with PCLKA can be assigned to interrupt number from 208 to 255. The abbreviation for software configurable interrupt A is PERIA. Interrupt names are indicated by INTA208 to INTA255.

Refer to Table 14.3, Interrupt Sources for Software Configurable Interrupt A for interrupt sources that can be assigned for software configurable interrupt A.

#### 14.4.6 Non-Maskable Interrupts

Non-maskable interrupts include the NMI pin interrupt, oscillation stop detection interrupt, WDT underflow/refresh error interrupt, IWDT underflow/refresh error interrupt, voltage monitoring 1 interrupt, voltage monitoring 2 interrupt, and RAM error interrupt.

Non-maskable interrupts have the highest priority in all interrupts, including the fast interrupt, so are accepted regardless of the settings of the PSW.I bit (interrupt enable) and IPL[3:0] bits (processor interrupt priority level) in the CPU. The NMISR register can be used to confirm whether a non-maskable interrupt is generated.

Only the CPU can be selected as the interrupt request destination of non-maskable interrupt. The DTC and DMAC cannot be selected.

### 14.5 Interrupt Detection

Level detection or edge detection can be used for detecting an interrupt request.

For interrupt requests from the peripherals, edge detection or level detection is fixed for each interrupt source. For interrupt requests of the external pin interrupt, edge detection or level detection can be selected with the `IRQCRi.IRQMD[1:0]` bits ( $i = 0$  to  $15$ ).

Refer to Table 14.4, Interrupt Vector Table for the method to detect each interrupt request.

For group interrupts, interrupt sources are grouped depending on the method to detect interrupt requests.

Interrupt requests by interrupt sources assigned to groups `IE0` and `BE0` are detected by edge detection. Interrupt requests by interrupt sources assigned to groups `BL0`, `BL1`, `BL2`, `AL0`, and `AL1` are detected by level detection. Note that group interrupts (`GROUPIE0`, `GROUPBE0`, `GROUPBL0`, `GROUPBL1`, `GROUPBL2`, `GROUPAL0`, `GROUPAL1`) are detected by level detection.

Refer to section 14.4.4, Group Interrupts for group interrupts. Refer to section 14.5.3, Group Interrupts Using Edge Detection and section 14.5.4, Group Interrupts Using Level Detection for interrupt requests of group interrupts.

#### 14.5.1 Edge Detection

Figure 14.5 shows the operation of the `IRn.IR` flag at edge detection ( $n = 023$  to  $255$ ).

The `IRn.IR` flag becomes 1 when the rising edge of the interrupt request signal is detected. Then, the `IRn.IR` flag does not become 0 by disabling the interrupt request of the peripheral module. When the CPU accepts the interrupt request or the DTC/DMAC accepts the transfer request, the `IRn.IR` flag automatically becomes 0. It is not required to set the `IRn.IR` flag to 0 by software. Refer to Table 14.7, Operations When Starting the DTC/DMAC for details on clearing the `IRn.IR` flag by DTC/DMAC.

For the external pin interrupts of interrupt vector number 64 to 79 and interrupt sources of interrupt vector number 88 to 95, the timing when the `IRn.IR` flag becomes 1 after an interrupt signal occurs is different from the other interrupts. For the external pin interrupts, the timing is delayed for internal delay plus two cycles of `PCLKB` after a signal is input to the `IRQ` pin ( $i = 0$  to  $15$ ). For interrupts of interrupt vector number 88 to 95, the timing is delayed for two cycles of `PCLKB`.

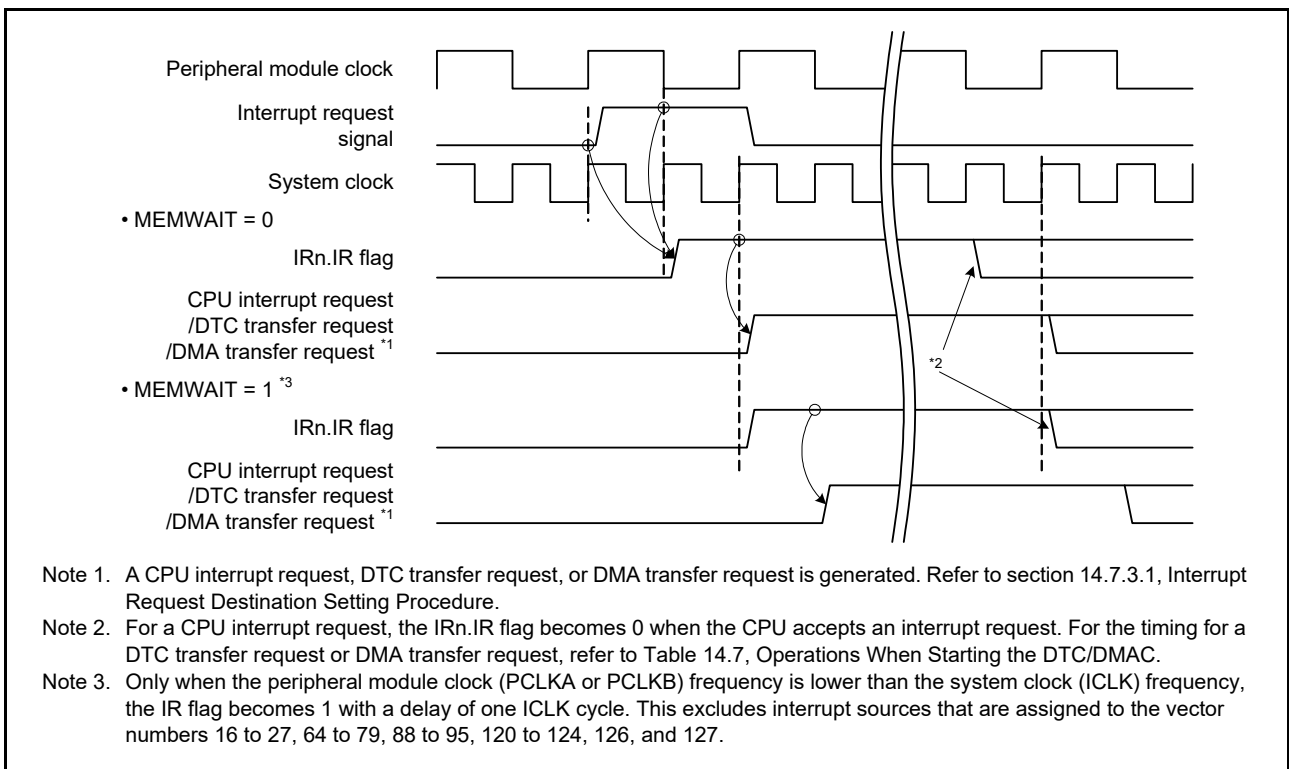

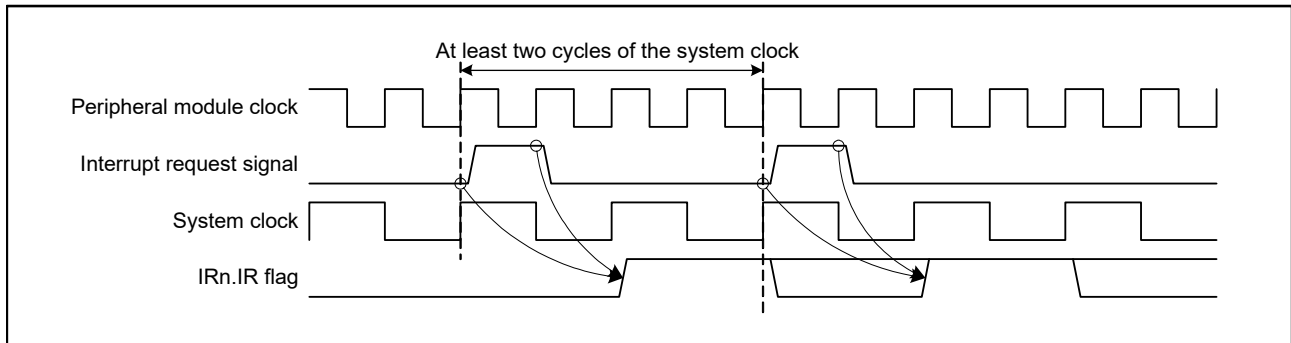

Figure 14.5 IRn.IR Flag Operation for Interrupts Detected by Edge Detection

(1) Detecting Consecutive Interrupt Request Signals

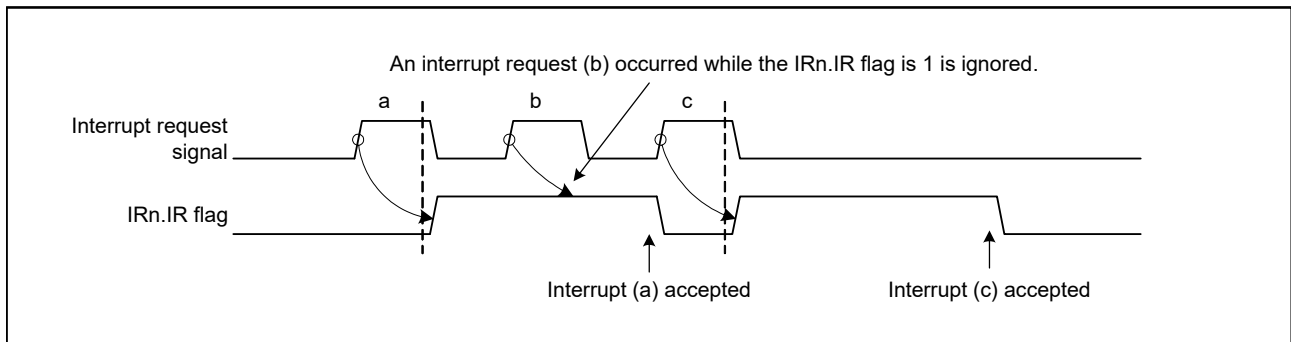

When interrupt request signals occur every cycle, the latter interrupt signal cannot be detected. To accept consecutive interrupt request signals, the interval of at least two cycles of the system clock or peripheral module clock, whichever is lower, is required between interrupt signals. Figure 14.6 shows the interval for accepting consecutive interrupt request signals.

**Figure 14.6** Accepting Consecutive Interrupt Signals (when the system clock frequency is lower than the peripheral clock frequency)

When an interrupt request is generated again while the IRn.IR flag is 1, the interrupt request is ignored (n = 023 to 255). However, for transmit interrupt requests, receive interrupt requests, and buffer access interrupt requests of the SCI, RIIC, and RSPI, when an interrupt request occurs while the IRn.IR flag is 1, the interrupt request is retained in the module. After the IRn.IR flag becomes 0, the IRn.IR flag is set to 1 again by the retained request. Refer to the descriptions for interrupts in each chapter of peripheral modules for details.

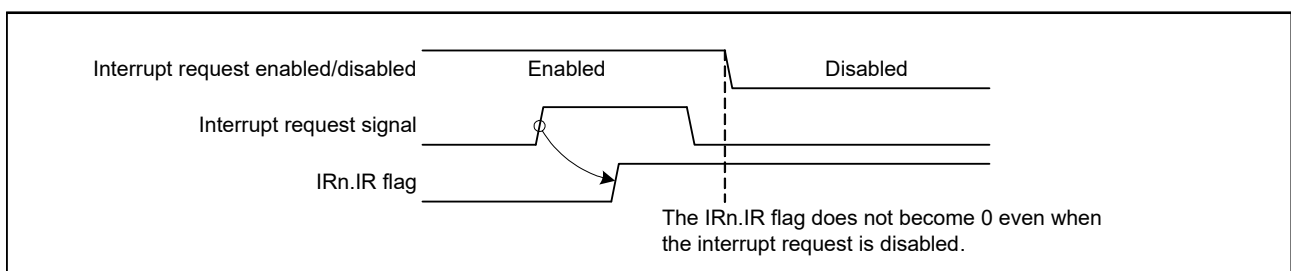

Figure 14.7 shows the timing when the IRn.IR flag is set again.

**Figure 14.7** Timing to Set the IRn.IR Flag Again

(2) Relation between the IRn.IR flag and Interrupt Request Enable Bits

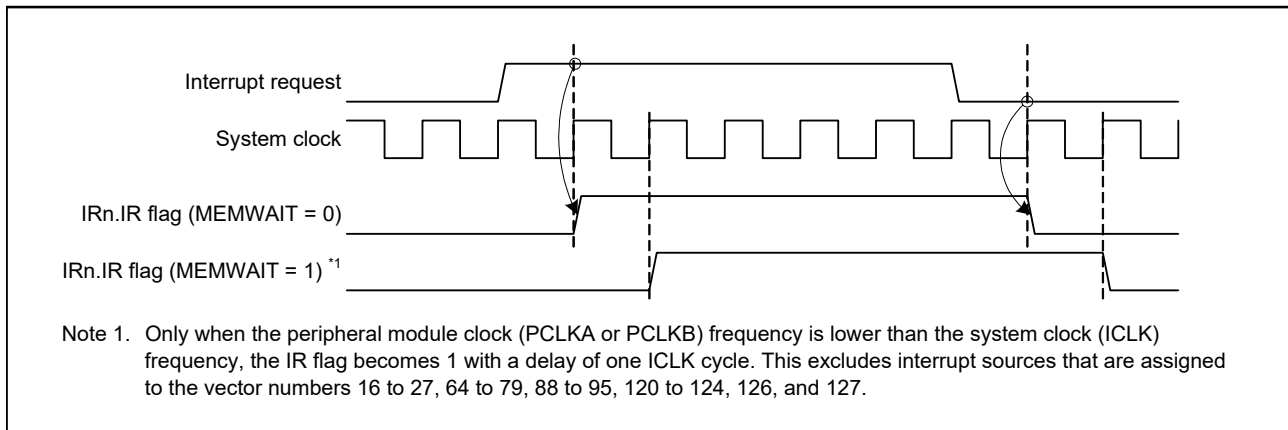

After the IRn.IR flag becomes 1, the IRn.IR flag does not become 0 even when an interrupt request enable bit in the corresponding peripheral module is set to 0.

**Figure 14.8** Relation Between Disabling the Interrupt Request and the IRn.IR Flag

### 14.5.2 Level Detection

Figure 14.9 shows operation of the interrupt request signal and the IRn.IR flag for level detection ( $n = 016$  to  $124$ ). The IRn.IR flag is 1 while the interrupt request signal is 1. To set the IRn.IR flag to 0, set the corresponding interrupt request signal of the peripheral module to 0. Set the corresponding interrupt status flag of the peripheral module to 0 and wait for the time until the value is reflected in the IRn.IR flag before exiting the interrupt handler. Refer to (2) Notes on writing to I/O registers in section 5, I/O Registers for details on waiting for the reflection.

**Figure 14.9 IRn.IR Flag Operation for Level Detection**

Figure 14.10 shows an example of the procedure to handle interrupts for level detection.

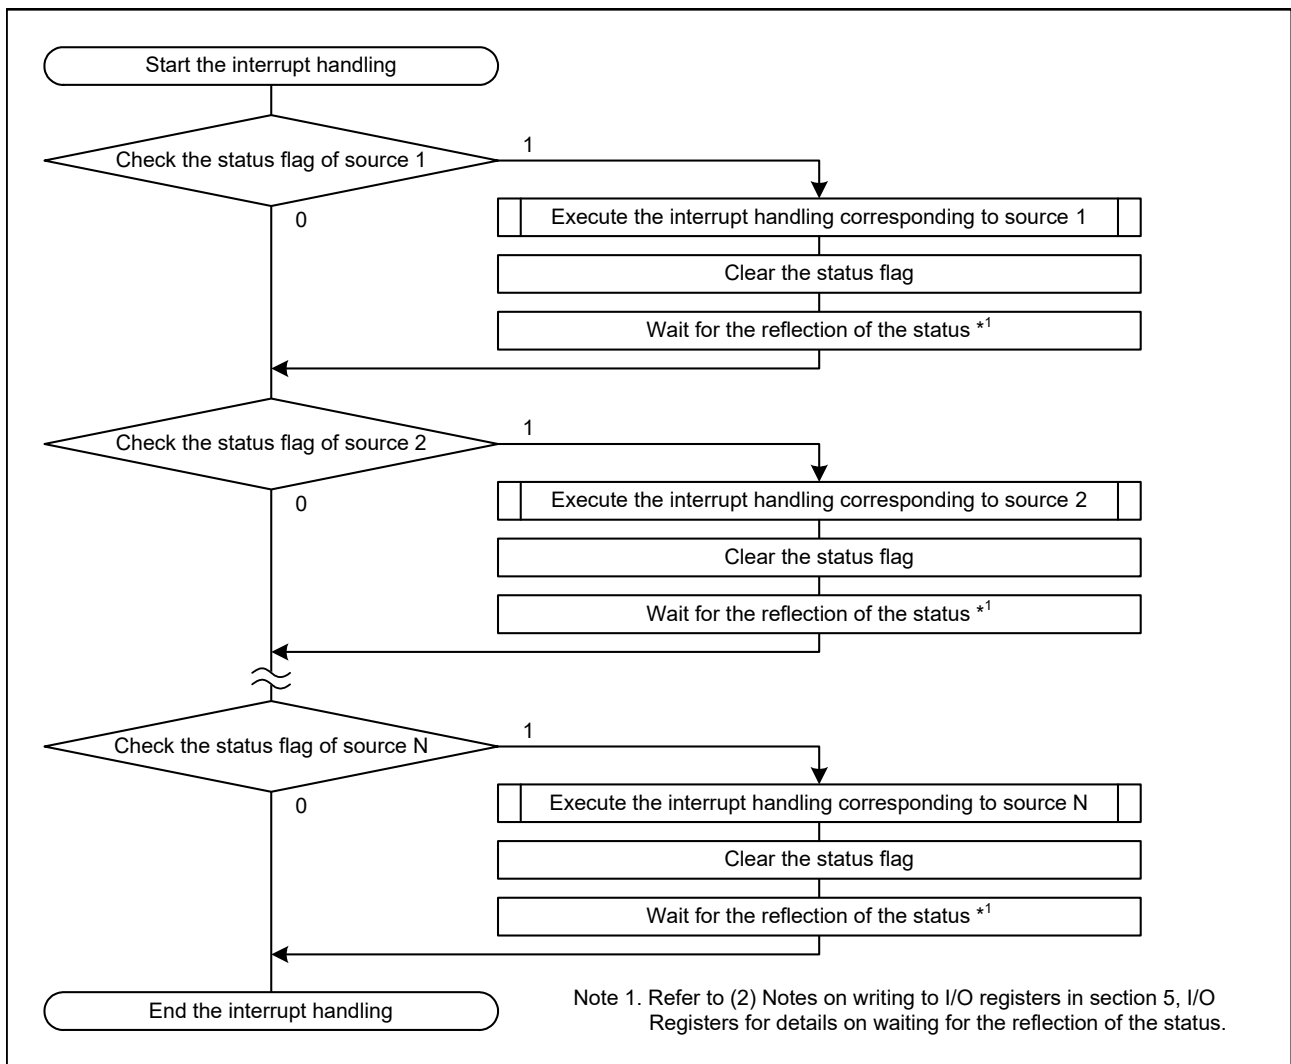

Figure 14.10 Example of Level Detection Interrupt Handling Procedure (N indicates the number of status flags)

### 14.5.3 Group Interrupts Using Edge Detection

Groups IE0 and BE0 of group interrupts include interrupt sources that are detected by edge detection.

While the IR017.IR flag corresponding to the GROUPIE0 interrupt and the IR106.IR flag corresponding to the GROUPBE0 interrupt become 1 under the same conditions as edge detection, the IR017.IR and IR106.IR flags become 0 under the same conditions as level detection.

When the rising edge of an interrupt request signal is detected while the corresponding GENIE0/GENBE0.ENj bit is 1, both the GRPIE0/GRPBE0.ISj flag and IR017/IR106.IR flag become 1 (j = 0 to 31). Then, GRPIE0/GRPBE0.ISj flag and IR017/IR106.IR flag do not become 0 by disabling the interrupt request of the peripheral module or setting the GENIE0/GENBE0.ENj bit to 0.

When the GCRIE0/GCRBE0.CLRj bit is set to 1, the GRPIE0/GRPBE0.ISj flag becomes 0, and consequently the IR017/IR106.IR flag becomes 0.

Figure 14.11 and Figure 14.12 show operation examples of group interrupts using edge detection. Figure 14.13 shows an example of operation when interrupt requests are generated by multiple interrupt sources in the same group.

Note: • There is no register in the group to which no interrupt source is assigned.

Figure 14.11 Example of Interrupt Request for Group Interrupt Using Edge Detection (Group IE0)

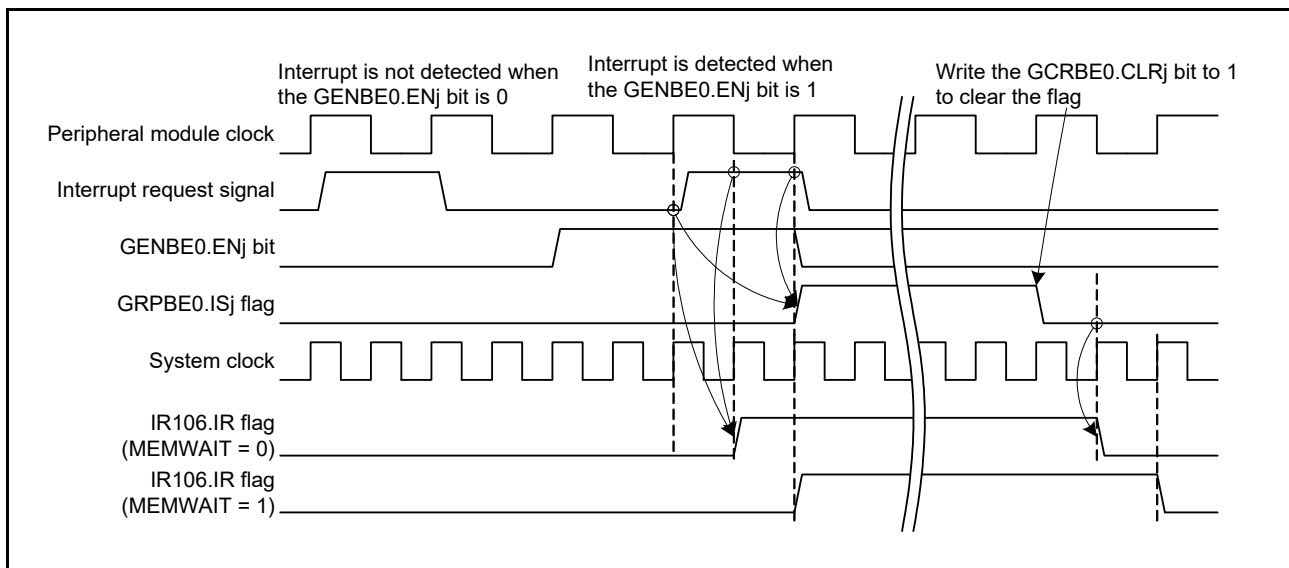

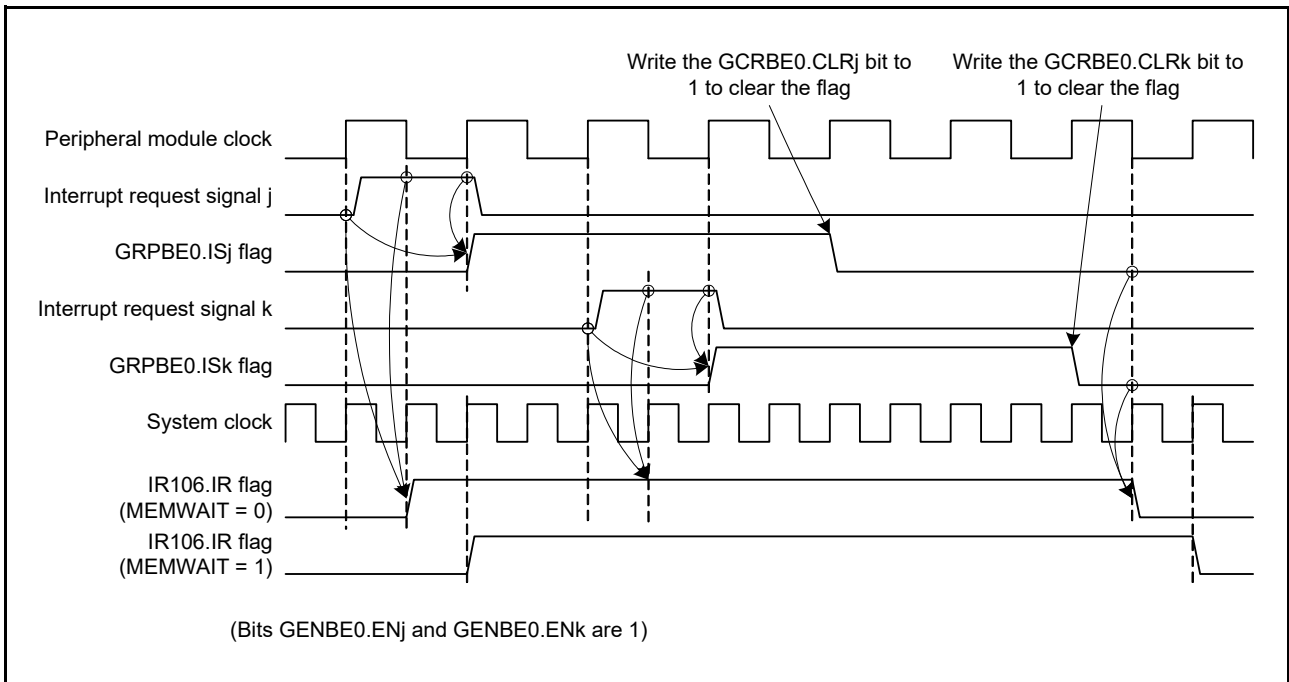

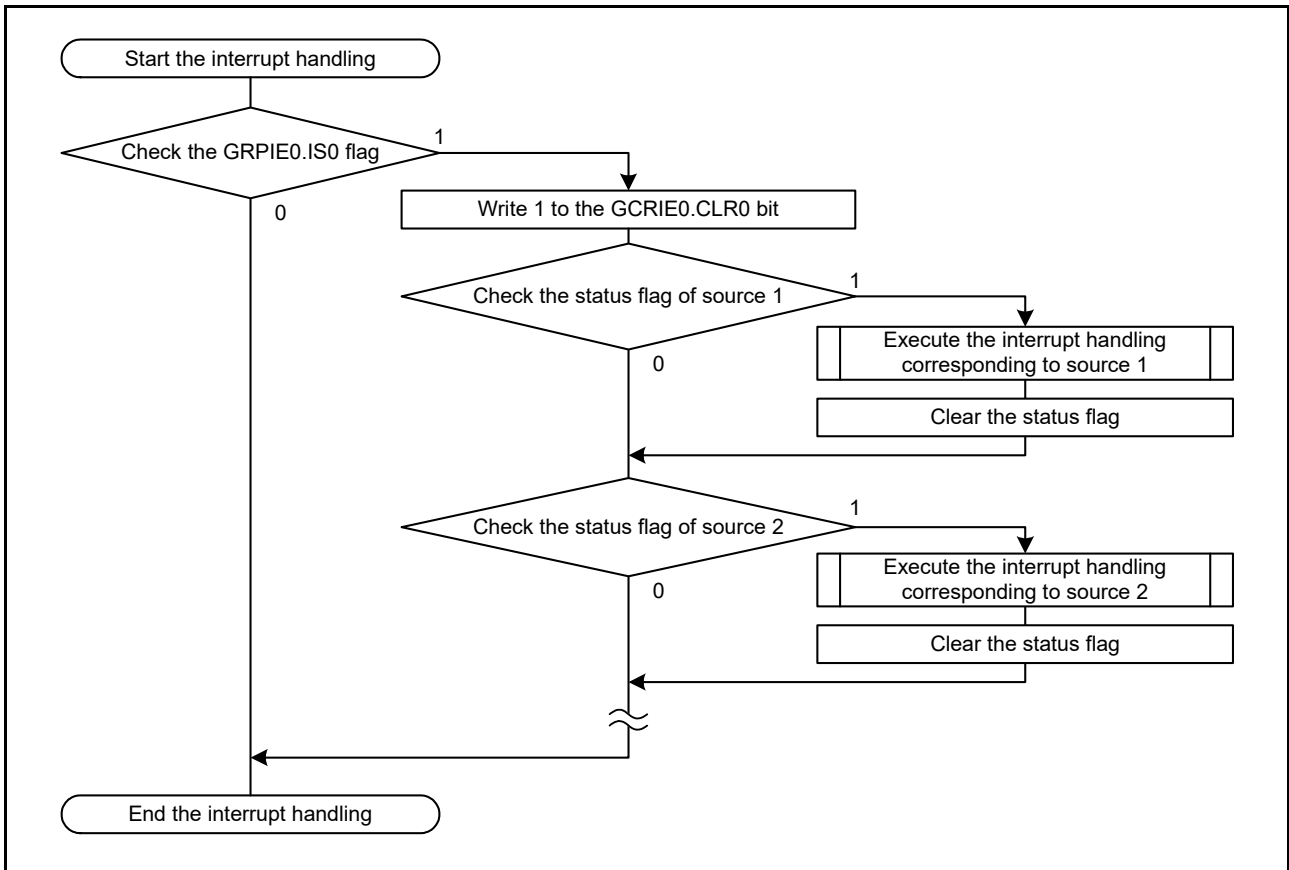

Figure 14.12 Example of Interrupt Request for Group Interrupt Using Edge Detection (Group BE0)

**Figure 14.13** Example of Operation When Multiple Edge Detection Interrupt Requests Are Generated in the Same Group (Group BE0)

Figure 14.14 and Figure 14.15 show examples of the procedure to handle group interrupts using edge detection.

**Figure 14.14** Example of Procedure to Handle Group Interrupts Using Edge Detection (Group IE0)

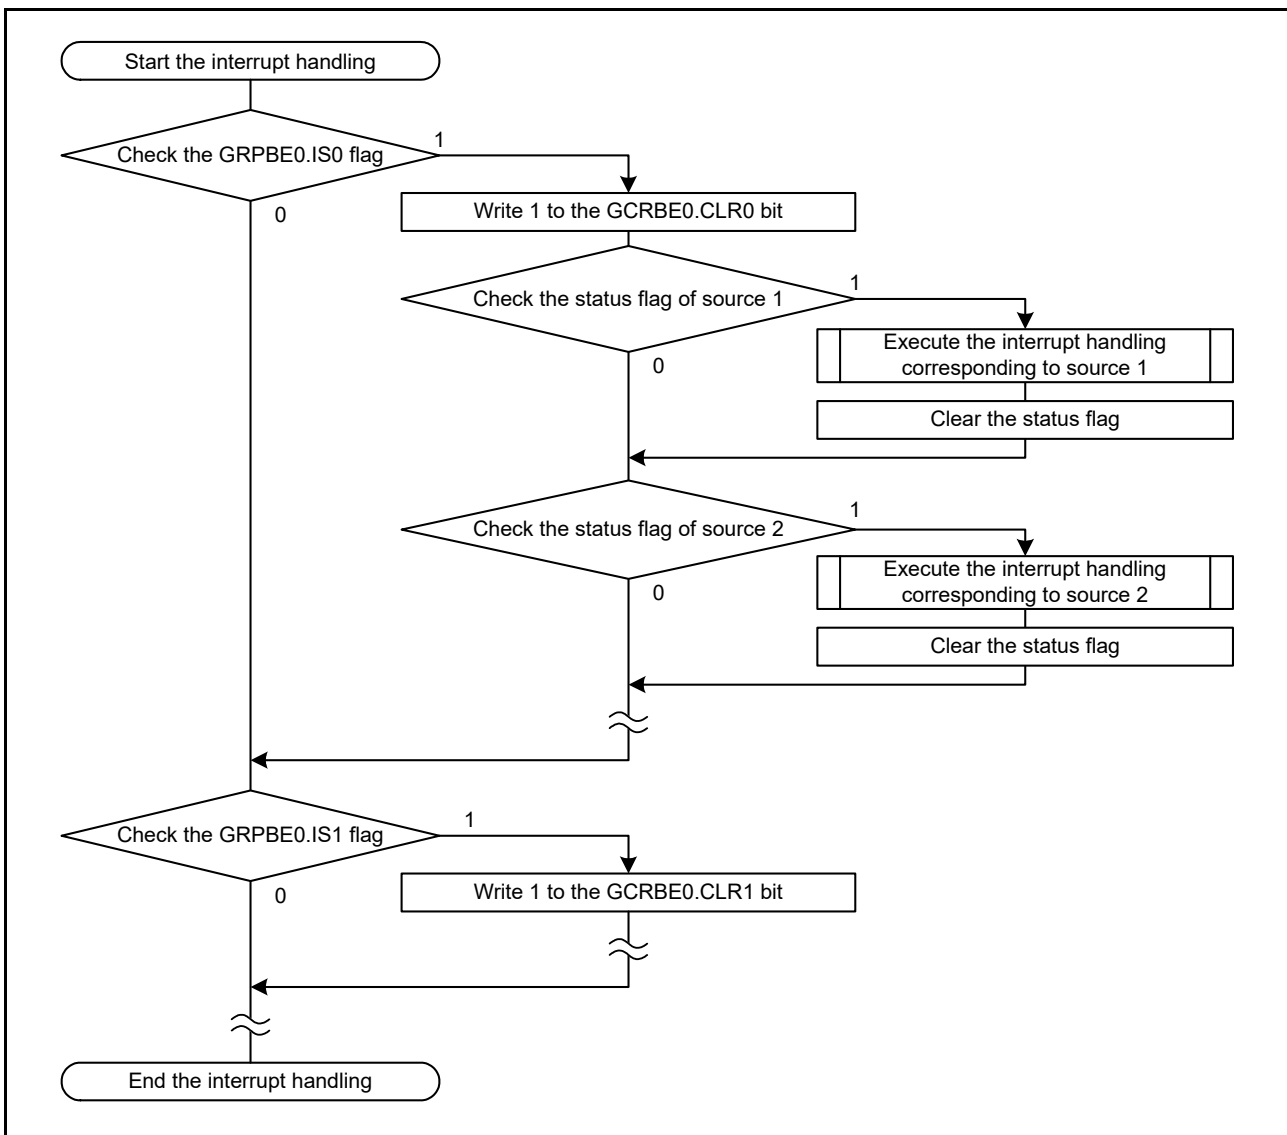

Figure 14.15 Example of Procedure to Handle Group Interrupts Using Edge Detection (Group BE0)

### 14.5.4 Group Interrupts Using Level Detection

Groups BL0, BL1, BL2, AL0, and AL1 of group interrupts includes interrupt sources that are detected by level detection. The IR110.IR flag corresponding to the GROUPBL0 interrupt, the IR111.IR flag corresponding to the GROUPBL1 interrupt, the IR107.IR flag corresponding to the GROUPBL2 interrupt, the IR112.IR flag corresponding to the GROUPAL0 interrupt, and the IR113.IR flag corresponding to the GROUPAL1 interrupt change under the same conditions as level detection.

When an interrupt signal becomes 1 while the corresponding GENBL0/GENBL1/GENBL2/GENAL0/GENAL1.ENj bit is 1, the GRPBL0/GRPBL1/GRPBL2/GRPAL0/GRPAL1.ISj flag and the IRn.IR flag become 1 (j = 0 to 31). Then, the GRPBL0/GRPBL1/GRPBL2/GRPAL0/GRPAL1.ISj flag and IRn.IR flag becomes 0 when the corresponding interrupt request signal becomes 0. Also, when the GENBL0/GENBL1/GENBL2/GENAL0/GENAL1.ENj bit is set to 0, the corresponding GRPBL0/GRPBL1/GRPBL2/GRPAL0/GRPAL1.ISj flag and IRn.IR flag become 0.

Figure 14.16 shows an operation example of group interrupts using edge detection. Figure 14.17 shows an example of operation when interrupt requests are generated by multiple interrupt sources in the same group.

Note: • There is no register in the group to which no interrupt source is assigned.

Figure 14.16 Operation Example of Group Interrupt Using Level Detection (m = BL0, BL1, BL2, AL0, AL1)

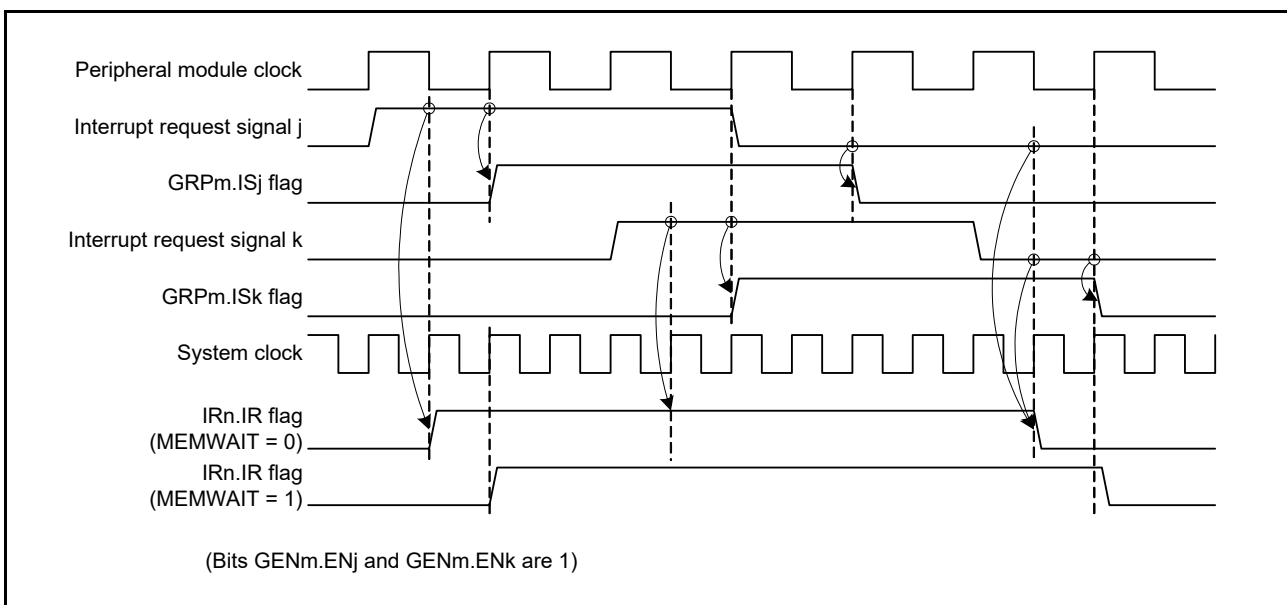

Figure 14.17 Operation Example When Multiple Interrupt Requests are Generated in the Same Group (m = BL0, BL1, BL2, AL0, AL1)

Figure 14.18 shows the procedure to handle group interrupts for level detection.

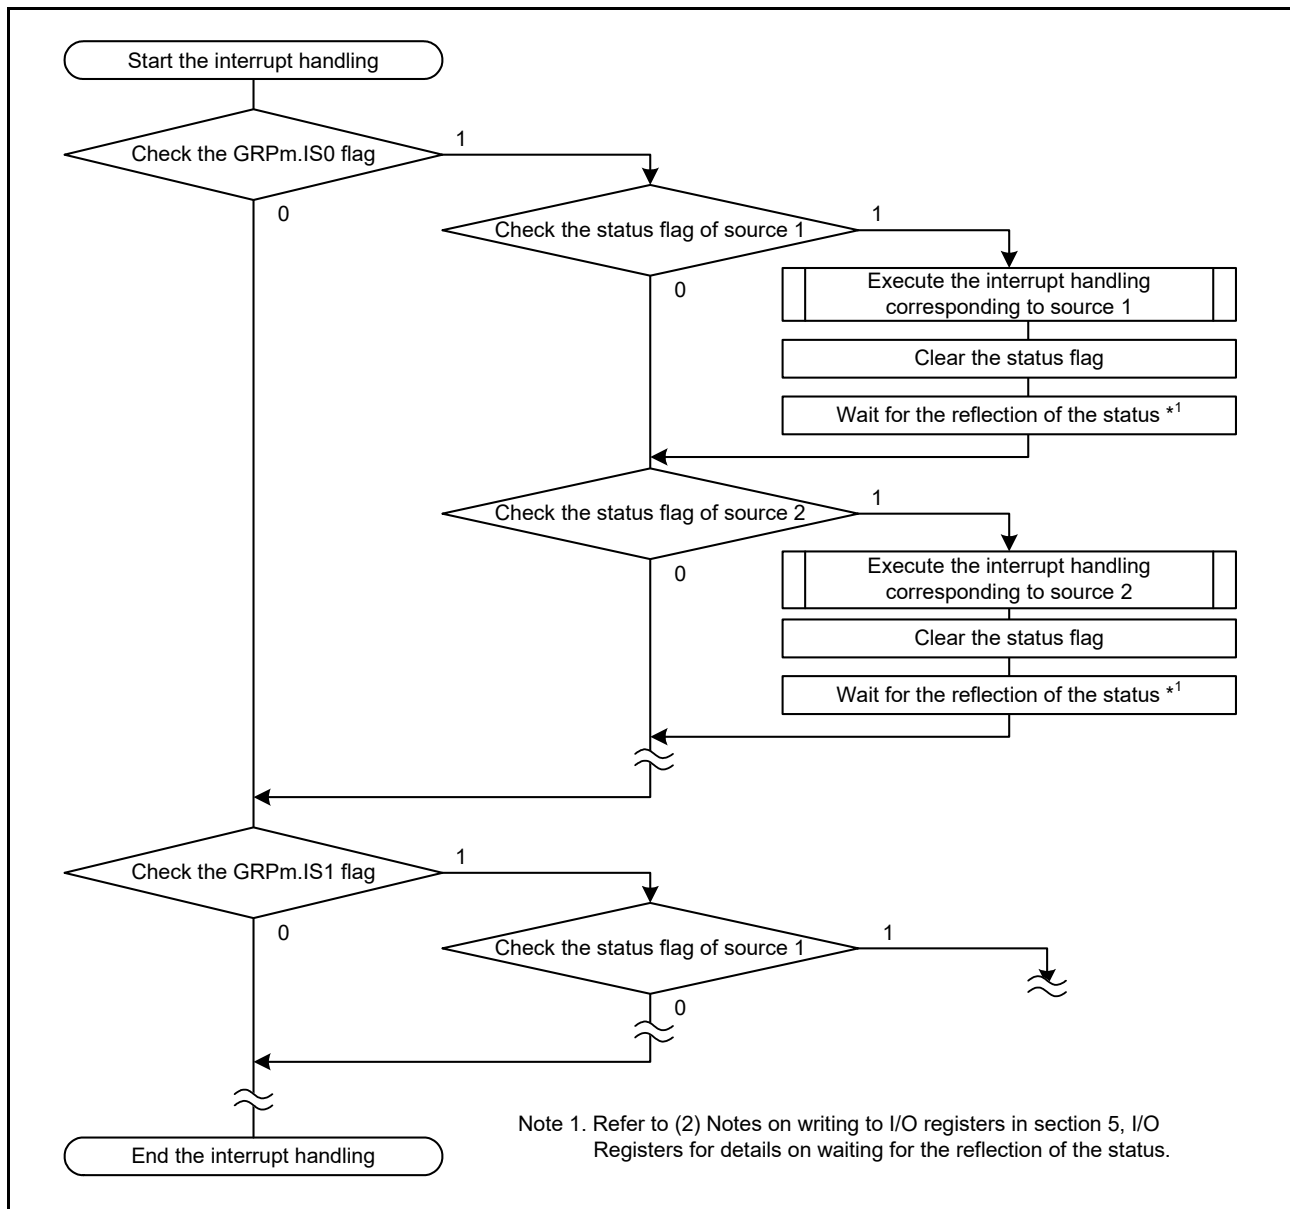

Figure 14.18 Example of Group Interrupt Handling Procedure for Level Detection (m = BL0, BL1, BL2, AL0, AL1)

### 14.5.5 Software Configurable Interrupts

Interrupt sources and interrupt requests for software configurable interrupts are detected by edge detection.

Figure 14.19 shows an operation example of the interrupt request and interrupt status flag for software configurable interrupts.

**Figure 14.19** Operation Example of the Interrupt Request and Interrupt Status Flag for Software Configurable Interrupts

## 14.6 Determining Priority of Interrupt Requests

The ICU determines the priority for each interrupt request destination. The priority for each interrupt request destination is determined as follows.

### (1) Determining Priority when the CPU is the Interrupt Request Destination

A source selected for the fast interrupt has the highest priority. Next to the fast interrupt, the priority is determined by the  $IPRr.IPR[3:0]$  bit value, and an interrupt source with a larger value has priority ( $r = 000$  to  $255$ ). If multiple sources has the same  $IPRr.IPR[3:0]$  bit value, the priority is determined by the interrupt vector number, and the source with the smaller number has priority.

### (2) Determining Priority when the DTC is the Interrupt Request Destination

The  $IPRr.IPR[3:0]$  bits have no effect ( $r = 000$  to  $255$ ). The priority is determined by only the interrupt vector number, and an interrupt source with a smaller number has priority.

### (3) Determining Priority when the DMAC is the Interrupt Request Destination

The  $IPRr.IPR[3:0]$  bits have no effect. The priority is determined by the DMAC channel number. Refer to section 17, DMA Controller (DMAC<sub>Aa</sub>) for details on the DMAC channel priority.

## 14.7 Interrupt Setting Procedure

### 14.7.1 Enabling Interrupt Requests

The following describes the procedure to enable interrupt requests.

- (1) Set the interrupt request enable bit of the peripheral modules to enable output of the interrupt request.
- (2) For group interrupts, set the corresponding EN<sub>j</sub> bit in the group interrupt request enable register to 1 to enable output of the interrupt request to the IS<sub>j</sub> flag in the group interrupt request register (j = 0 to 31).
- (3) Set the corresponding IER<sub>m</sub>.IEN<sub>j</sub> bit to 1 to enable output of the interrupt request to the interrupt request destination (m = 02h to 1Fh; j = 0 to 7).

After the above procedure is completed, when a peripheral interrupt occurs, the IR<sub>n</sub>.IR flag corresponding to the interrupt source becomes 1 (n = 016 to 255).

For group interrupts, the IS<sub>j</sub> flag in the group interrupt request register becomes 1, the IR<sub>n</sub>.IR flag corresponding to the group becomes 1, and an interrupt request is output to the interrupt request destination.

When the IER<sub>m</sub>.IEN<sub>j</sub> bit is 0, the interrupt request corresponding to the interrupt source is not output to the interrupt request destination.

### 14.7.2 Disabling Interrupt Requests

The following describes the procedure to disable interrupt requests.

- (1) Set the corresponding IER<sub>m</sub>.IEN<sub>j</sub> bit to 0 (m = 02h to 1Fh; j = 0 to 7).
- (2) For group interrupts, set the corresponding EN<sub>j</sub> bit in the group interrupt request enable register to 0 to disable output of the interrupt request to the IS<sub>j</sub> flag in the group interrupt request register (j = 0 to 31).
- (3) Set the interrupt request enable bit of the peripheral modules to disable output of the interrupt request. Read the register that has been set to confirm that the value is reflected.
- (4) As needed, read the IR<sub>n</sub>.IR flag or set the IR flag to 0.\*1  
For group interrupts, confirm that the IS<sub>j</sub> flag in the group interrupt request register is 0 or set the IS<sub>j</sub> flag to 0.

Note 1. When disabling the transmit interrupt request, receive interrupt request, or buffer access interrupt requests of the SCI, RIIC, or RSPI, set the IR<sub>n</sub>.IR flag to 0 according to the above procedure. Refer to the description of interrupts in the corresponding section of peripheral modules for details.

### 14.7.3 Selecting Interrupt Request Destination

#### 14.7.3.1 Interrupt Request Destination Setting Procedure

The destination of an interrupt request can be selected from the CPU, DTC, or DMAC for each interrupt source.

Destinations that can be selected differ depending on the interrupt source. Refer to Table 14.4, Interrupt Vector Table for details on the destinations. Do not select a destination that is not indicated as “✓” in Table 14.4.

When set the external pin interrupt as the DTC or DMAC trigger, set the IRQCR<sub>i</sub>.IRQMD[1:0] bits to select edge detection (i = 0 to 15).

The following describes the procedure to select a destination of an interrupt request.

### (1) Setting Interrupt Sources as the DMAC trigger

Perform the following settings while the IERm.IENj bit is 0 of the interrupt source that is selected as the DMAC trigger (m = 02h to 1Fh; j = 0 to 7).

- (1) Set the interrupt vector number of the interrupt source used as the DMAC trigger in the DMRSRm register corresponding to the DMAC channel (m = DMAC channel number).\*1
- (2) Set the DMTMD.DCTG[1:0] bits corresponding to the DMAC channel to 01b in order to select the peripheral interrupt or external pin interrupt as the DMAC trigger.
- (3) Set the DMCNT.DTE bit corresponding to the DMAC channel to 1.

After the above settings are completed, set the corresponding IERm.IENj bit to 1.

Also, set the DMAST.DMST bit to 1 before or after the above settings.

Refer to section 17.3.7, Activating the DMAC in section 17, DMA Controller (DMACa) for the procedure to set the DMAC.

### (2) Setting Interrupt Sources as the DTC trigger

Perform the following setting while the IERm.IENj bit of the interrupt source that is selected as the DTC trigger is 0.

- (1) Set the DTCERn.DTCE bit corresponding to the interrupt vector number n used for the DTC trigger to 1 (n = 026 to 255).\*1

After the above setting is completed, set the IERm.IENj bit to 1.

Also set the DTCST.DTCST bit to 1 before or after the above settings.

Refer to section 18.5, DTC Setting Procedure in section 18, Data Transfer Controller (DTCa) for the procedure to set the DTC.

Note 1. Do not set the same interrupt source as DTC and DMAC triggers. Also, do not set the same interrupt source as triggers of multiple DMAC channels.

### (3) Setting Interrupt Sources for the CPU

When an interrupt source is not selected as the DTC or DMAC trigger, the interrupt request is output to the CPU.

Set the IERm.IENj bit to 1 while the interrupt source is not selected as a DTC or DMAC trigger.

### 14.7.3.2 Operations When the DTC/DMAC Selected

Table 14.7 lists operations when the DTC or DMAC is set as an interrupt request destination.

**Table 14.7 Operations When Starting the DTC/DMAC**

| Interrupt Request Destination | DISEL *1 | Number of Remaining Transfers | Operation per Request           | IR Flag Clear Timing *2                               | Interrupt Request Destination after Transfer |
|-------------------------------|----------|-------------------------------|---------------------------------|-------------------------------------------------------|----------------------------------------------|
| DTC *3                        | 1        | ≠ 0                           | DTC transfer → CPU interrupt    | Cleared when the CPU accepts an interrupt request.    | DTC                                          |
|                               |          | = 0                           | DTC transfer → CPU interrupt    | Cleared when the CPU accepts an interrupt request.    | CPU (DTCERn.DTCE bit becomes 0)              |
|                               | 0        | ≠ 0                           | DTC transfer                    | Cleared when the DTC starts data transfer.            | DTC                                          |
|                               |          | = 0                           | DTC transfer → CPU interrupt *4 | Cleared when the CPU accepts an interrupt request. *4 | CPU (DTCERn.DTCE bit becomes 0)              |
| DMAC                          | 1        | ≠ 0                           | DMA transfer → CPU interrupt    | Cleared when the CPU accepts an interrupt request.    | DMAC                                         |
|                               |          | = 0                           | DMA transfer → CPU interrupt    | Cleared when the CPU accepts an interrupt request.    | CPU (DMACm.DMCNT.DTE bit becomes 0)          |
|                               | 0        | ≠ 0                           | DMA transfer                    | Cleared when the DMAC starts data transfer.           | DMAC                                         |
|                               |          | = 0                           | DMA transfer *4                 | Cleared when the DMAC starts data transfer. *4        | CPU (DMACm.DMCNT.DTE bit becomes 0)          |

Note 1. For the DTC, set the DTC.MRB.DISEL bit; For the DMAC, set the DMACm.DMCSL.DISEL bit.

Note 2. When the IRn.IR flag is 1, an interrupt request (DTC or DMA transfer request) that is generated again is ignored.

Note 3. For chain transfer, the DTC transfer continues until the chain transfer ends. After chain transfer ends, whether a CPU interrupt occurs, the IRn.IR flag clear timing, and the interrupt request destination differ depending on the DISEL bit value the number of remaining transfers. For the chain transfer, refer to Table 18.3, Chain Transfer Conditions in section 18, Data Transfer Controller (DTCa).

Note 4. When the DISEL bit is 0 and the number of remaining transfers is 0, operations in the DTC and DMAC are different.

### 14.7.3.3 Changing the Interrupt Request Destination

Set the IERm.IENj bit to 0 before changing the interrupt request destination (m = 02h to 1Fh; j = 0 to 7).

#### (1) When the current interrupt request destination is the DMAC

To change interrupt request destinations or change the DMAC trigger to another interrupt source while the DMA transfer is not completed (DMCNT.DTE bit is not cleared) after the procedure described in (1) Setting Interrupt Sources as the DMAC trigger of section 14.7.3.1, Interrupt Request Destination Setting Procedure, follow the procedure below.

- (1) Set the IERm.IENj bit of both the current and new triggers to 0.
- (2) Check the DMAC transfer status. If transfer is not completed, wait until the completion of transfer.
- (3) Perform the procedure described in 14.7.3.1 Interrupt Request Destination Setting Procedure.

#### (2) When the current interrupt request destination is the DTC

To change interrupt request destinations or change the DTC transfer information while the DTC transfer is not completed (the DTCERn.DTCE bit is not cleared) after the procedure described in (2) Setting Interrupt Sources as the DTC trigger of section 14.7.3.1, Interrupt Request Destination Setting Procedure, follow the procedure below (n = 026 to 255).

- (1) Set the IERm.IENj bit of both the current and new triggers to 0 (m = 02h to 1Fh; j = 0 to 7).
- (2) Check the DTC transfer status. If transfer is not completed, wait until the completion of transfer.
- (3) Perform the procedure described in 14.7.3.1 Interrupt Request Destination Setting Procedure.

#### 14.7.4 Setting the External Pin Interrupt

The following describes the procedure to use the external pin interrupt.

- (1) Set the IERm.IENj bit corresponding to the IRQi pin to 0 (interrupt request is disabled) (m = 02h to 1Fh; j = 0 to 7; i = 0 to 15).
- (2) Set the IRQFLTE0.FLTENi or IRQFLTE1.FLTENi bit to 0 (digital filter is disabled).
- (3) Set the IRQFLTC0.FCLKSELi[1:0] or IRQFLTC1.FCLKSELi[1:0] bits to select the sampling clock of the digital filter.
- (4) Set the I/O port and confirm the setting.
- (5) Set the IRQCRi.IRQMD[1:0] bits to select the detection method.
- (6) When edge detection is selected, set the corresponding IRn.IR flag to 0 (n = 016 to 255).
- (7) Set the IRQFLTE0.FLTENi or IRQFLTE1.FLTENi bit to 1 (digital filter is enabled).
- (8) To select the DTC as the interrupt request destination, set the DTCERn.DTCE bit. To select the DMAC as the interrupt request destination, set the DMRSRm register. When neither the DTCERn.DTCE bit nor the DMRSRm register is set, the interrupt request is sent to the CPU (m = DMAC channel number; n = 026 to 255).
- (9) Set the corresponding IERm.IENj bit to 1 (interrupt request is enabled).

#### 14.7.5 Setting Non-Maskable Interrupts

After reset, non-maskable interrupts are disabled. To use non-maskable interrupts, follow the procedure below.

- (1) Set the stack pointer (SP).
- (2) When using the NMI pin, set the NMIFLTE.NFLTEN bit to 0 (digital filter is disabled).
- (3) When using the NMI pin, set the NMIFLTC.NFCLKSEL[1:0] bits to select the sampling clock of the digital filter.
- (4) When using the NMI pin, set the NMICR.NMIMD bit to select the edge for detection.
- (5) When using the NMI pin, write 1 to the NMICLR.NMICLR bit to set the NMISR.NMIST flag to 0.
- (6) When using the NMI pin, set the NMIFLTE.NFLTEN bit to 1 (digital filter is enabled).
- (7) To enable generation of the non-maskable interrupt, set the bit in the NMIER register corresponding to the used interrupt source to 1.

Once a bit in the NMIER register is set to 1 (enabled), the bit cannot be rewritten so it cannot be set to 0 (disabled). To disable a non-maskable interrupt that has been enabled, reset the MCU.

Refer to section 13, Exception Handling for details on the flow of non-maskable interrupt handling.

Excluding the RAMST flag, each flag in the NMISR register becomes 0 by writing 1 to the corresponding bit in the NMICLR register. To set the RAMST flag to 0, set the RAM.RAMSTS.RAMERR, RAM.ECCRAM2STS.ECC2ERR, or RAM.ECCRAM1STS.ECC1ERR flag that has become 1 to 0.

Confirm that all flags in the NMISR register are 0 before exiting the interrupt handler of non-maskable interrupts.

Non-maskable interrupts, excluding the NMI pin interrupt, can be used as a maskable interrupt. When using as a maskable interrupt, do not change the NMIER register value from the value after reset. In addition, set the LVD1CR1.LVD1IRQSEL bit and LVD2CR1.LVD2IRQSEL bit to 1 when using voltage monitoring 1 interrupt and voltage monitoring 2 interrupt as a maskable interrupt.

### 14.7.6 Digital Filter

Noise included in signals input to pins IRQ<sub>i</sub> and NMI can be reduced by enabling the digital filter ( $i = 0$  to 15).

The digital filter samples signals input to pins using the sampling clock (PCLKB, PCLKB/8, PCLKB/32, PCLKB/64) for the digital filter, and passes the input signal only when three consecutive sampled signals are the same level.

When using the digital filter for the IRQ<sub>i</sub> pin, refer to section 14.7.4, **Setting the External Pin Interrupt** to set the associated registers. When using the digital filter for the NMI pin, refer to section 14.7.5, **Setting Non-Maskable Interrupts** to set the associated registers.

When the external pin interrupt or the NMI pin interrupt is used as a source to exit software standby mode, the digital filter cannot be used. Set the IRQFLTE0.FLTEN<sub>i</sub> bit, IRQFLTE1.FLTEN<sub>i</sub> bit or NMIFLTE.NFLTEN bit to 0 before entering software standby mode. To enable the digital filter again, set the IRQFLTE0.FLTEN<sub>i</sub> bit, IRQFLTE1.FLTEN<sub>i</sub> bit, or NMIFLTE.NFLTEN bit to 1.

Figure 14.20 shows an example of digital filter operation.

**Figure 14.20 Digital Filter Operation Example (when the IRQCRi.IRQMD[1:0] bits are 00b (low level))**

### 14.7.7 Setting Software Configurable Interrupts

The following describes the procedure to assign interrupt sources to software configurable interrupts.

- (1) Set the IER<sub>m</sub>.IEN<sub>j</sub> bit to 0 ( $m = 02h$  to  $1Fh$ ;  $j = 0$  to 7). This setting is not required when the value does not change from the value after reset.
- (2) Set the interrupt source number in the SLIAR<sub>n</sub> ( $n = 208$  to 255) register. Refer to Table 14.3, **Interrupt Sources for Software Configurable Interrupt A** for details on interrupt source numbers that are assigned to software configurable interrupt A.
- (3) Set the SLIPRCR.WPRC bit to 1.
- (4) Confirm that the SLIPRCR.WPRC bit is 1.
- (5) Select the interrupt request destination from the CPU, DTC, or DMAC. Refer to section 14.7.3.1, **Interrupt Request Destination Setting Procedure** for details on the setting procedure.
- (6) Write 0 to the IR<sub>n</sub>.IR flag only when edge detection is selected ( $n = 208$  to 255).
- (7) Set the IER<sub>m</sub>.IEN<sub>j</sub> bit to 1.

### 14.7.7.1 Polling for Software Configurable Interrupts

When polling an interrupt request by reading the PIARk.PIRj (k = 0h to 12h), follow the procedure below (j = 0 to 7).

- (1) Set the peripheral interrupt used.
- (2) Clear the PIARk.PIRj flag for polling by writing 1 to the flag.\*1
- (3) Enable output of the peripheral interrupt request.
- (4) As needed, read the PIARk.PIRj flag to check the value.
- (5) When clearing the PIARk.PIRj flag, write 1 to the targeted flag.\*1
- (6) As needed, repeat step (4) and (5).

Note 1. Do not use bit manipulation instructions. Multiple status flags may be cleared if a bit manipulation instruction is used. To clear a flag, write the PIARk register in 8-bit units as follows: set the flag that is to be cleared to 1 and set the other flags to 0.

## 14.8 Multiple Interrupt

To enable another interrupt while processing an interrupt (multiple interrupt), set the PSW.I bit to 1 (interrupt enabled) in the interrupt handler of an accepted interrupt.

The PSW.IPL[3:0] bits in the interrupt handler are the same value as the priority level of the accepted interrupt request. In this case, when an interrupt request with the higher priority level than the PSW.IPL[3:0] bit value is generated, the interrupt request is accepted.

The PSW.I bit can be rewritten only in supervisor mode. Since the PSW.PM bit becomes 0 (supervisor mode is selected) when an interrupt is accepted, the PSW.I bit can be rewritten in the interrupt handler.

## 14.9 Fast interrupt

The fast interrupt is an interrupt that the CPU can respond to fast. Only one interrupt source can be assigned to the fast interrupt.

The priority level of the fast interrupt is 15 (highest) regardless of the IPRr.IPR[3:0] bit setting (r = 000 to 255). Also, the fast interrupt has higher priority than the other interrupt sources of which the priority level is 15. Note that the fast interrupt cannot be accepted when the PSW.IPL[3:0] bits are 1111b (priority level 15).

To assign an interrupt source to the fast interrupt, set the FIR.FVCT[7:0] bits to select the vector number of the interrupt source, and set the FIR.FIEN bit to 1 (fast interrupt is enabled).

The fast interrupt is enabled only when the CPU is selected as the interrupt request destination. When the DTC or DMAC is selected as the destination, the fast interrupt is disabled.

Refer to section 2, CPU and section 13, Exception Handling for details on the fast interrupt.

## 14.10 Exiting Low Power Consumption State

Interrupts can be used for exiting sleep mode, all-module clock stop mode, and software standby mode.

Refer to section 11, Low Power Consumption for details. This section describes the procedure to set an interrupt source for exiting each low power consumption mode.

Refer to section 11.5.4, Deep Software Standby Mode for details on exiting deep software standby mode.

### 14.10.1 Exiting Sleep Mode

Non-maskable interrupts and all interrupt sources can be used for exiting sleep mode. The following conditions must be satisfied.

#### (1) Non-maskable interrupts

- Generation of the interrupt that is used for exiting is enabled in the NMIER register.

#### (2) Interrupts

- The CPU is selected as the interrupt request destination.
- The interrupt request is enabled by the IERm.IENj bit (m = 02h to 1Fh; j = 0 to 7).
- The priority level is higher than the PSW.IPL[3:0] bit value in the CPU.
- For group interrupts, the interrupt request is enabled by the corresponding ENj bit in the group interrupt request enable register (GENBE0, GENBL0, GENBL1, GENAL0) (j = 0 to 31).

### 14.10.2 Exiting All-Module Clock Stop Mode

Non-maskable interrupts and interrupt sources that have a “✓” in the Exit from ACS column in Table 14.4, Interrupt Vector Table can be used for exiting all-module clock stop mode. The conditions below must be satisfied.

#### (1) Non-maskable interrupts

- Generation of the interrupt that is used for exiting is enabled in the NMIER register.

#### (2) Interrupts

- The interrupt source can be used for exiting all-module clock stop mode.
- The CPU is selected as the interrupt request destination.
- The interrupt request is enabled by the IERm.IENj bit (m = 02h to 1Fh; j = 0 to 7).
- The priority level is higher than the PSW.IPL[3:0] bit value in the CPU.

### 14.10.3 Exiting Software Standby Mode

Non-maskable interrupts (excluding oscillation stop detection interrupt) and interrupt sources that have a “√” in the Exit from SSBY column in Table 14.4, Interrupt Vector Table can be used for exiting software standby mode. The conditions below must be satisfied.

#### (1) Non-maskable interrupts

- Generation of the interrupt that is used for exiting is enabled in the NMIER register.
- When using the NMI pin interrupt, the digital filter is disabled.

#### (2) Interrupts

- The interrupt source can be used for exiting software standby mode.
- The CPU is selected as the interrupt request destination.
- The interrupt request is enabled by the IERm.IENj bit (m = 02h to 1Fh; j = 0 to 7).
- The priority level is higher than the PSW.IPL[3:0] bit value in the CPU.  
When using the fast interrupt, set not only the FIR register but also the corresponding IPRr.IPR[3:0] bits (r = 000 to 255). Set the IPRr.IPR[3:0] bits to a higher level than the PSW.IPL[3:0] bit value in the CPU.
- When using the external pin interrupt, the digital filter of the IRQi pin used is disabled.

Refer to section 14.7.6, Digital Filter for details on the procedure to set the digital filter.

## 14.11 Usage Notes

### 14.11.1 Notes on the WAIT instruction When Using the Non-Maskable Interrupt

Confirm that all status flags in the NMISR register are 0 before executing the WAIT instruction.

### 14.11.2 Interrupt Requests in Software Standby Mode

When an interrupt request occurs in software standby mode but the interrupt source is not set as a source for exiting software standby mode, the request is held in the ICU. The request is handled after exiting by another interrupt source. Note that the interrupt request for the external pin interrupt is not held.

## 15. Buses

### 15.1 Overview

Table 15.1 lists the bus specifications, Figure 15.1 shows the bus configuration, and Table 15.2 lists the addresses assigned for each bus.

**Table 15.1 Bus Specifications**

| Bus Type                |                           | Description                                                                                                                                                                                                                                      |
|-------------------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU bus                 | Instruction bus           | <ul style="list-style-type: none"> <li>Connected to the CPU (for instructions)</li> <li>Connected to on-chip memory (RAM, ECCRAM, code flash memory)</li> <li>Operates in synchronization with the system clock (ICLK)</li> </ul>                |
|                         | Operand bus               | <ul style="list-style-type: none"> <li>Connected to the CPU (for operands)</li> <li>Connected to on-chip memory (RAM, ECCRAM, code flash memory)</li> <li>Operates in synchronization with the system clock (ICLK)</li> </ul>                    |
| Memory bus              | Memory bus 1              | <ul style="list-style-type: none"> <li>Connected to RAM</li> </ul>                                                                                                                                                                               |
|                         | Memory bus 2              | <ul style="list-style-type: none"> <li>Connected to code flash memory</li> </ul>                                                                                                                                                                 |
|                         | Memory bus 3              | <ul style="list-style-type: none"> <li>Connected to ECCRAM</li> </ul>                                                                                                                                                                            |
| Internal main bus       | Internal main bus 1       | <ul style="list-style-type: none"> <li>Connected to the CPU</li> <li>Operates in synchronization with the system clock (ICLK)</li> </ul>                                                                                                         |
|                         | Internal main bus 2       | <ul style="list-style-type: none"> <li>Connected to the DMAC and DTC</li> <li>Connected to on-chip memory (RAM, ECCRAM, code flash memory)</li> <li>Operates in synchronization with the system clock (ICLK)</li> </ul>                          |
| Internal peripheral bus | Internal peripheral bus 1 | <ul style="list-style-type: none"> <li>Connected to peripheral modules (DTC, DMAC, interrupt controller, and bus error monitoring section)</li> <li>Operates in synchronization with the system clock (ICLK)</li> </ul>                          |
|                         | Internal peripheral bus 2 | <ul style="list-style-type: none"> <li>Connected to peripheral modules (modules other than those connected to internal peripheral buses 1, 3, 4, and 5)</li> <li>Operates in synchronization with the peripheral-module clock (PCLKB)</li> </ul> |
|                         | Internal peripheral bus 3 | <ul style="list-style-type: none"> <li>Connected to peripheral modules (USBb and CMPC)</li> <li>Operates in synchronization with the peripheral-module clock (PCLKB)</li> </ul>                                                                  |
|                         | Internal peripheral bus 4 | <ul style="list-style-type: none"> <li>Connected to peripheral modules (MTU3, GPTW, HRPWM, RSPI, and SCli)</li> <li>Operates in synchronization with the peripheral-module clock (PCLKA)</li> </ul>                                              |
|                         | Internal peripheral bus 5 | <ul style="list-style-type: none"> <li>Reserved area</li> </ul>                                                                                                                                                                                  |
|                         | Internal peripheral bus 6 | <ul style="list-style-type: none"> <li>Connected to code flash (in P/E) and data flash memory</li> <li>Operates in synchronization with the FlashIF clock (FCLK)</li> </ul>                                                                      |
| External bus            | CS area                   | <ul style="list-style-type: none"> <li>Connected to the external devices</li> <li>Operates in synchronization with the external-bus clock (BCLK)</li> </ul>                                                                                      |

P/E: Programming/Erase

BCLK (external-bus clock): 40 MHz (max.) The CSC (CS area controller) operates in synchronization with the BCLK.

BCLK pin output: The frequency is the same as the BCLK as default. 1/2 BCLK can be supplied by setting the BCLK pin output select bit (BCKCR.BCLKDIV) in the external bus clock control register. For details, see section 9, Clock Generation Circuit.

Table 15.2 Addresses Assigned for Each Bus

| Address                  | Bus                       |                      | Area                                                        |                              |
|--------------------------|---------------------------|----------------------|-------------------------------------------------------------|------------------------------|
|                          | On-Chip ROM Enabled       | On-Chip ROM Disabled | On-Chip ROM Enabled                                         | On-Chip ROM Disabled         |
| 0000 0000h to 0001 FFFFh | Memory bus 1              |                      | RAM                                                         |                              |
| 0002 0000h to 0007 FFFFh |                           |                      | Reserved area                                               |                              |
| 0008 0000h to 0008 7FFFh | Internal peripheral bus 1 |                      | Peripheral I/O registers                                    |                              |
| 0008 8000h to 0009 FFFFh | Internal peripheral bus 2 |                      |                                                             |                              |
| 000A 0000h to 000B FFFFh | Internal peripheral bus 3 |                      |                                                             |                              |
| 000C 0000h to 000D FFFFh | Internal peripheral bus 4 |                      |                                                             |                              |
| 000E 0000h to 000F FFFFh | Reserved area             |                      |                                                             |                              |
| 0010 0000h to 007F FFFFh | Internal peripheral bus 6 | Reserved area        | Data flash memory, code flash memory (for programming only) | Reserved area                |
| 0080 0000h to 00FF BFFFh | Memory bus 3              |                      | Reserved area                                               |                              |
| 00FF C000h to 00FF FFFFh |                           |                      | ECCRAM                                                      |                              |
| 0100 0000h to 04FF FFFFh | External bus              |                      | Reserved area                                               |                              |
| 0500 0000h to 07FF FFFFh |                           |                      | External address space (CS1 to CS3)                         |                              |
| 0800 0000h to 0FFF FFFFh |                           |                      | Reserved area                                               |                              |
| 1000 0000h to 7FFF FFFFh | Reserved area             |                      | Reserved area                                               |                              |
| 8000 0000h to FFDF FFFFh | Memory bus 2              | Reserved area        | Code flash memory (for reading only)                        | Reserved area                |
| FFE0 0000h to FFFF FFFFh |                           | External bus         |                                                             | External address space (CS0) |

## 15.2 Description of Buses

### 15.2.1 CPU Buses

The CPU buses consist of the instruction and operand buses, which are connected to internal main bus 1. As the names suggest, the instruction bus is used to fetch instructions for the CPU, while the operand bus is used for operand access. The instruction bus is 64 bits while the operand bus is 32 bits.

Connection of the instruction and operand buses to RAM, ECCRAM, and code flash memory provides the CPU with direct access to these areas, i.e. access is not via internal main bus 1. However, only reading is possible in direct access to code flash memory by the CPU; programming and erasure are handled via an internal peripheral bus.

Bus requests for instruction fetching and operand access are arbitrated through internal main bus 1. The order of priority is operand access then instruction fetching.

If instruction fetching and operand access are requested for different buses (memory bus 1, memory bus 2, memory bus 3, and internal main bus 1), the bus-access operations can proceed simultaneously. For example, parallel access to code flash memory and RAM or to code flash memory and external address space is possible.

### 15.2.2 Memory Buses

The memory buses consist of memory bus 1, memory bus 2, and memory bus 3. The RAM is connected to memory bus 1, code flash memory is connected to memory bus 2, and ECCRAM is connected to memory bus 3. The memory buses are 64 bits. Requests for bus mastership from the CPU buses (instruction fetching and operand) and internal main bus 2 are arbitrated through memory buses 1, 2, and 3.

The priority order of the buses can be set using the memory bus 1 and 3 (RAM/ECCRAM) priority control bits (BPRA[1:0]) and memory bus 2 (code flash memory) priority control bits (BPRO[1:0]) in the bus priority control register (BUSPRI) for the corresponding memory buses. Memory bus 3 has the same configuration as memory bus 1. When the priority order is fixed, internal main bus 2 has priority over the CPU bus (operand over instruction fetching). When the priority order is toggled, a bus has a lower priority when the request of that bus is accepted.

### 15.2.3 Internal Main Buses

The internal main buses consist of a bus for use by the CPU (internal main bus 1) and a bus for use by the other bus-master modules, i.e. the DTC and DMAC (internal main bus 2).

Bus requests for instruction fetching and operand access are arbitrated through internal main bus 1. The order of priority is operand access then instruction fetching.

Requests for bus mastership from the DTC and DMAC are arbitrated by internal main bus 2. The order of priority is DMAC, and then DTC as listed in [Table 15.3](#).

Between the DTC and DMAC, only the one that accepted the transfer request issues the bus mastership request. The priority order of transfer requests between the DTC and DMAC is DMAC0, DMAC1, DMAC2, DMAC3, DMAC4, DMAC5, DMAC6, DMAC7 and then DTC, regardless of the BUSPRI setting.

If the CPU and another bus master are requesting access to different buses (on-chip memory, internal peripheral buses 1 to 6, and external bus), the respective bus-access operations can proceed simultaneously.

However, when the CPU executes the XCHG instruction, requests for bus access from masters other than the CPU are not accepted until data transfer for the XCHG instruction is completed regardless of the bus priority control register (BUSPRI) setting. Furthermore, requests for bus access from masters other than the DTC are not accepted during reading and writing-back of transfer control information for the DTC.

**Table 15.3 Order of Priority for Bus Masters**

| Priority | Bus Master |
|----------|------------|
| High     | DMAC       |
| ↑        | DTC        |
| Low      | CPU        |

Note: The above applies when the priority order of the buses is fixed.

## 15.2.4 Internal Peripheral Buses

Connection of peripheral modules to the internal peripheral buses is as described in Table 15.4.

**Table 15.4 Connection of Peripheral Modules to the Internal Peripheral Buses**

| Type of Bus               | Peripheral Modules                                                                        |
|---------------------------|-------------------------------------------------------------------------------------------|
| Internal peripheral bus 1 | DTC, DMAC, interrupt controller, and bus error monitoring section                         |
| Internal peripheral bus 2 | Peripheral modules other than those connected to internal peripheral buses 1, 3, 4, and 5 |
| Internal peripheral bus 3 | USBb, CMPC                                                                                |
| Internal peripheral bus 4 | MTU3, GPTW, HRPWM, RSPI, and SCLi                                                         |
| Internal peripheral bus 5 | Reserved area                                                                             |
| Internal peripheral bus 6 | Code flash memory (in P/E) or data flash memory                                           |

Requests for bus mastership from the CPU (internal main bus 1) and other bus masters (internal main bus 2) are arbitrated through internal peripheral buses 1 to 6.

The priority order of two internal main buses can be set using the bus priority control register (BUSPRI). The priority order can be set with the internal peripheral bus 1 priority control bits (BUSPRI.BPIB[1:0]), internal peripheral bus 2 and 3 priority control bits (BUSPRI.BPGB[1:0]), internal peripheral bus 4 priority control bits (BUSPRI.BPHB[1:0]), and internal peripheral bus 6 priority control bits (BUSPRI.BPFB[1:0]) for the corresponding internal peripheral buses.

When the priority order is fixed, internal main bus 2 has priority over internal main bus 1. When the priority order is toggled, a bus has a lower priority when the request of that bus is accepted (round-robin method).

The order of accepting requests may change depending on the BUSPRI setting (Refer to Figure 15.2).

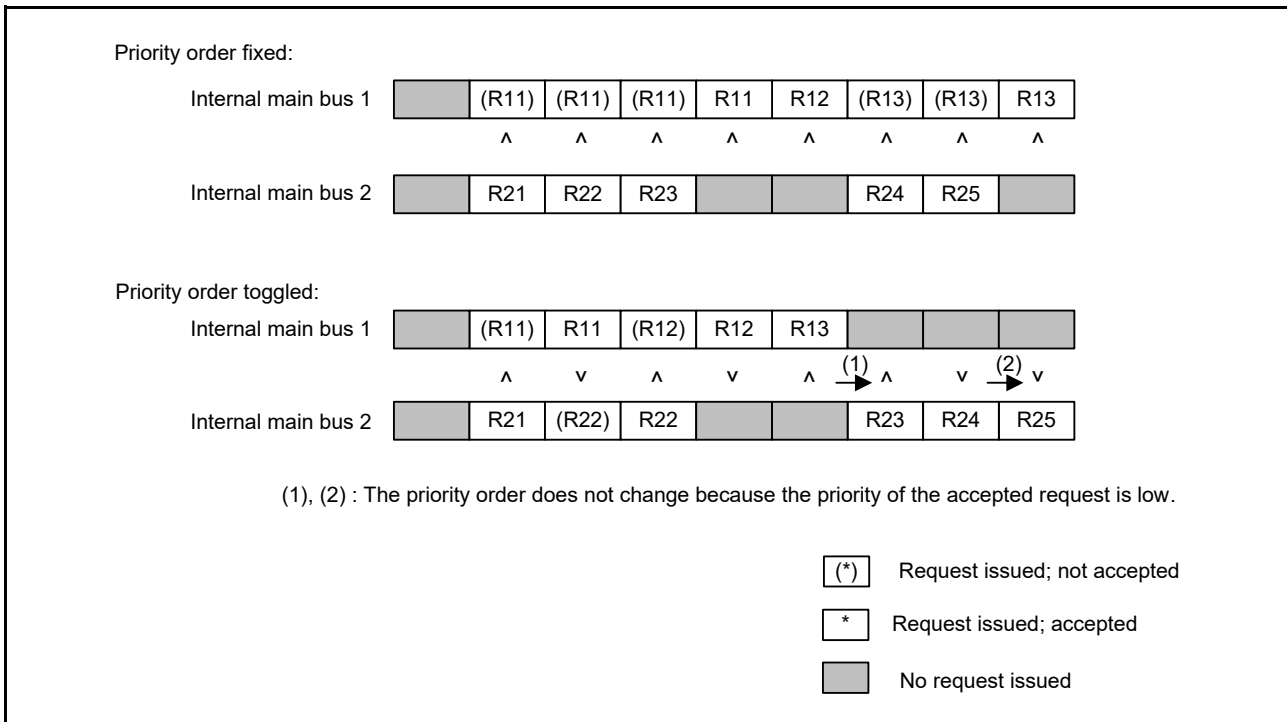

Figure 15.2 Priority Order between Internal Peripheral Bus Accesses

### 15.2.5 Write Buffer Function (Internal Peripheral Bus)

The internal peripheral bus has the write buffer function, which allows the next round of bus access to start, before the current write access is completed, in write access. However, if the following round of bus access is from the same bus master but to the different internal peripheral bus, it is suspended until the bus operations already in progress are completed. When access to the internal memory is scheduled after the write access to the internal peripheral bus from the CPU, the following round of bus access can be started before the current bus operation is completed and thus the order of accesses may be changed (Refer to Figure 15.3).

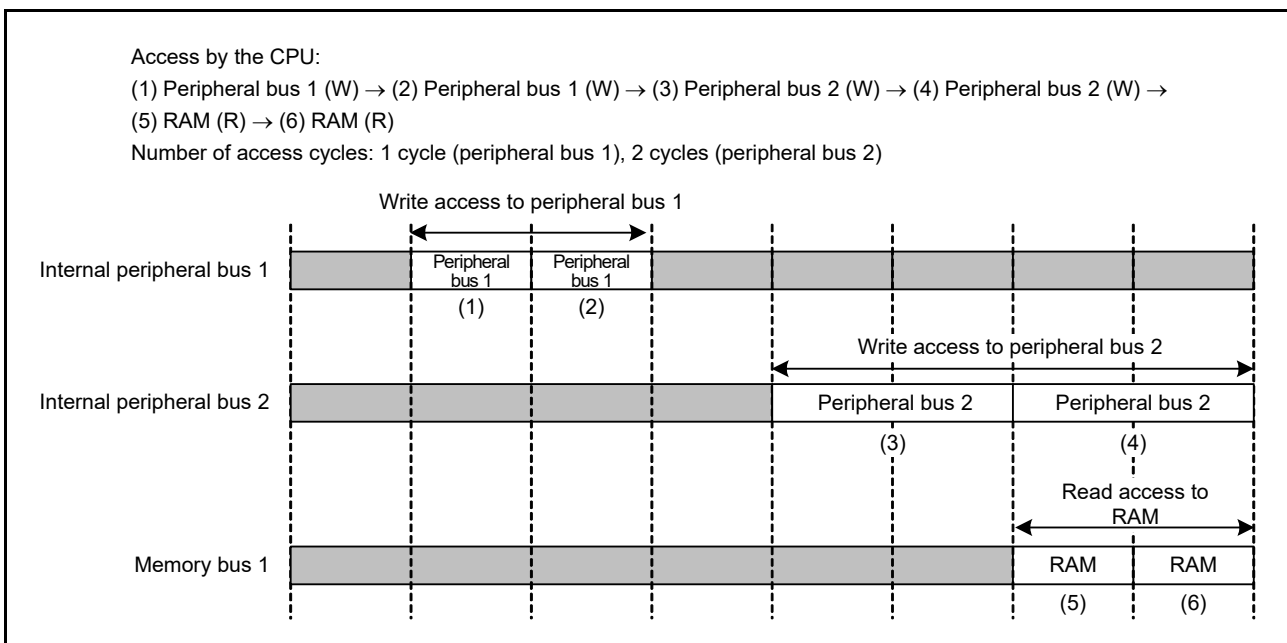

Figure 15.3 Write Buffer Function

### 15.2.6 External Bus

Table 15.5 lists the specifications of the external bus.

The external bus controller arbitrates requests for bus mastership on the external address space and on the external bus controller register (CSC) from the internal main bus 1 and the internal main bus 2.

The priority order of these two buses can be set using the external bus priority control bits (BPEB[1:0]) in the bus priority control register (BUSPRI). When the priority order is fixed, the order is internal main bus 2, and then internal main bus 1. When the priority order is toggled, a bus has a lower priority when the request of that bus is accepted, between internal main bus 1 and internal main bus 2.

The order of accepting requests may change depending on the BUSPRI setting (Refer to Figure 15.4).

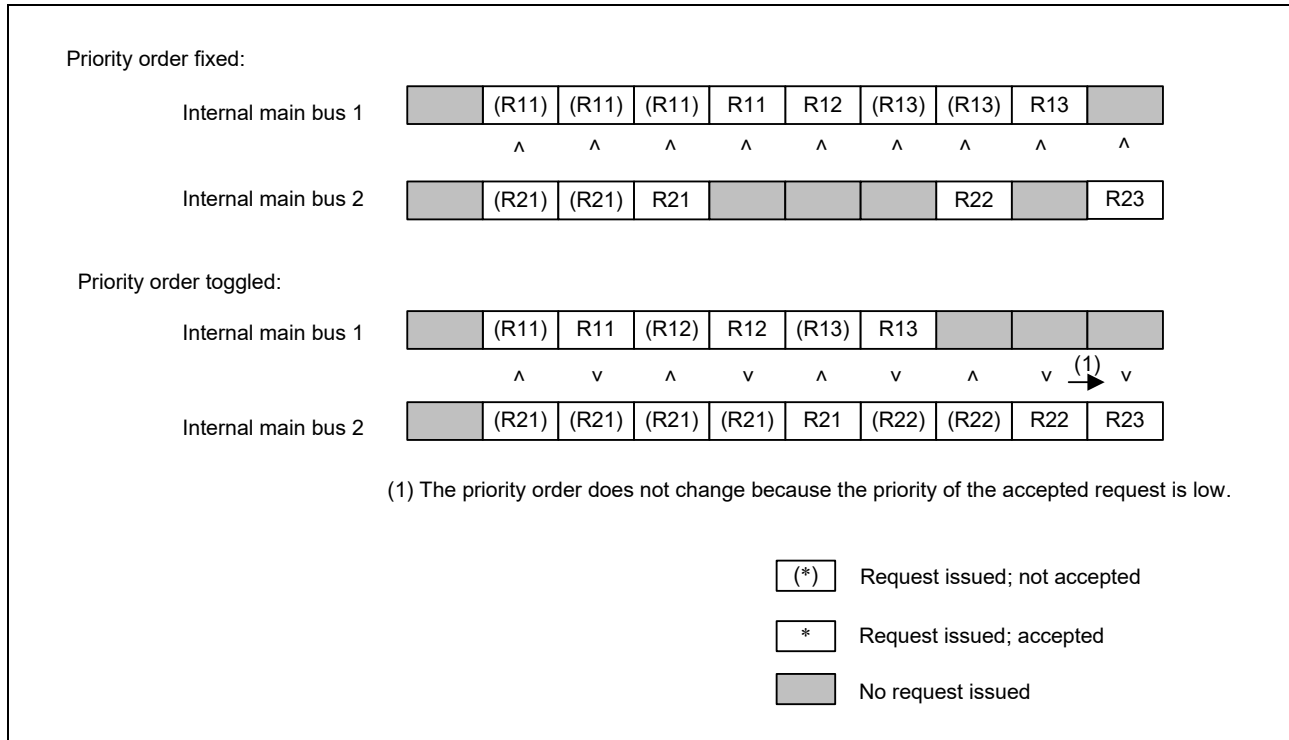

Figure 15.4 Priority Order of Internal Peripheral Bus Accesses

**Table 15.5 Specifications of the External Bus**

| Item                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Write buffer function  | When write data from the bus master has been written to the write buffer, write access by the bus master is completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Frequency              | The CS area controller (CSC) operates in synchronization with the external-bus clock (BCLK).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 15.6 lists the input/output pins of the external bus.

**Table 15.6 Pin Configuration of the External Bus**

| Pin Name    | I/O    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A20 to A0*1 | Output | Address output pins                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| D15 to D0   | I/O    | Data input/output pins<br>D15 to D0 pins are enabled when the 16-bit bus space is specified.<br>D7 to D0 pins are enabled when the 8-bit bus space is specified.                                                                                                                                                                                                                                                                                     |
| BC0#*1      | Output | A strobe signal; (the BC0# signal being at the low level) during access to an external address space in single write strobe mode indicates that D7 to D0 are valid.<br>When an 8-bit bus space is specified, this output pin is always held low regardless of write access mode.                                                                                                                                                                     |
| BC1#        | Output | A strobe signal; (the BC1# signal being at the low level) during access to an external address space in single write strobe mode indicates that D15 to D8 are valid.<br>This pin is not used when the 8-bit bus space is specified.                                                                                                                                                                                                                  |
| CS0#        | Output | A chip select signal for area 0 (CS0)                                                                                                                                                                                                                                                                                                                                                                                                                |
| CS1#        | Output | A chip select signal for area 1 (CS1)                                                                                                                                                                                                                                                                                                                                                                                                                |
| CS2#        | Output | A chip select signal for area 2 (CS2)                                                                                                                                                                                                                                                                                                                                                                                                                |
| CS3#        | Output | A chip select signal for area 3 (CS3)                                                                                                                                                                                                                                                                                                                                                                                                                |
| RD#         | Output | A strobe signal indicating that reading from an external address space (CS0 to CS3) is in progress                                                                                                                                                                                                                                                                                                                                                   |
| WR0#/WR#    | Output | WR0# signal is a strobe signal indicates that (the WR0# signal being at the low level) writing to an external address space is in progress in byte strobe mode, and D7 to D0 are valid.<br>WR# signal is a strobe signal that indicates writing to an external address space is in progress in single write strobe mode.<br>When an 8-bit bus space is specified, this output pin is held low during a write access regardless of write access mode. |
| WR1#        | Output | A strobe signal; (the WR1# signal being at the low level) during writing to an external address space in byte strobe mode indicates that D15 to D8 are valid.<br>This signal is invalid in single write strobe mode.<br>This pin is not used when the 8-bit bus space is specified.                                                                                                                                                                  |
| ALE         | Output | Address latch signal when address/data multiplexed bus is selected.                                                                                                                                                                                                                                                                                                                                                                                  |
| WAIT#       | Input  | A wait request signal when accessing the external address space (CS0 to CS3) (Low: Wait request)                                                                                                                                                                                                                                                                                                                                                     |

Note 1. The A0 and BC0# pin functions share the same pin, and either becomes effective according to the area, with the function being A0 in byte strobe mode and BC0# in single write strobe mode. Note that setting the 8-bit external bus width is prohibited in single write strobe mode. For information on other multiplexed pin functions, see section 20, I/O Ports.

### 15.2.7 Parallel Operation

Parallel operation is possible when different bus-master modules are requesting access to different slave modules. For example, if the CPU is fetching an instruction from code flash memory and an operand from RAM, the DMAC is able to handle transfer between a peripheral bus and the external bus at the same time.

An example of parallel operations is shown in Figure 15.5. In this example, the CPU is able to employ the instruction and operand buses for simultaneous access to code flash memory and RAM, respectively. Furthermore, the DMAC simultaneously employs internal main bus 2 for access to a peripheral bus or the external bus during access to RAM and code flash memory by the CPU.

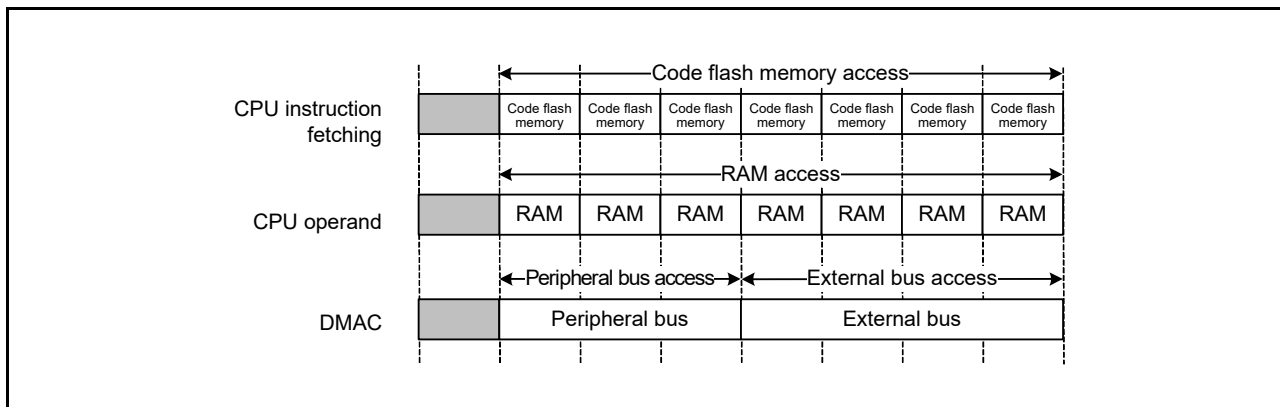

Figure 15.5 Example of Parallel Operations

### 15.2.8 Bus Settings

- (1) Set the mode of the external bus in the CSn mode register (CSnMOD), CSn wait-control register 1 (CSnWCR1), CSn wait-control register 2 (CSnWCR2), CSn control register (CSnCR), CSn recovery-cycle setting register (CSnREC), CS recovery cycle insertion enable register (CSRECEN), bus error monitoring enable register (BEREN), and bus priority control register (BUSPRI).
- (2) Make settings for pins in the CS output enable register (PFCSE), CS output pin select register 0 (PFCSS0), address output enable register 0 (PFAOE0), address output enable register 1 (PFAOE1), external-bus control register 0 (PFBCR0), and external-bus control register 1 (PFBCR1).
- (3) Set up pins to be used as input port pins.
- (4) Set the external-bus enable bit (EXBE) in the system control register 0 (SYSCR0) to 1 (enabling the external bus).

### 15.2.9 Restrictions

#### (1) Prohibition of Access that Spans Areas of Address Space

Single access that spans two areas of the address space is prohibited, and operation of such an access is not guaranteed. Setting must be made so that two areas are not accessed at the same time by a single word or longword access.

#### (2) Restrictions in Relation to RMPA and String-Manipulation Instructions

- (a) Although the external space has a per-area ending-switching facility (only for data), the allocation of data to be handled by RMPA or string-manipulation instructions to an area where the endian differs from that of the chip is prohibited, and operation is not guaranteed if this restriction is not observed. If data to be handled by RMPA or string-manipulation instructions are allocated to the external space, they must be allocated to areas where the endian setting is the same as that for the chip.
- (b) The allocation of data to be handled by RMPA or string-manipulation instructions to I/O registers is prohibited, and operation is not guaranteed if this restriction is not observed.

#### (3) Restriction on Endian

When the endian setting for each area is different from that for the chip, no instruction code can be allocated in the area. The instruction code should be allocated to the external space whose endian setting is the same as that for the chip.

## 15.3 Register Descriptions

### 15.3.1 CSn Control Register (CSnCR) (n = 0 to 3)

Address(es): CS0CR 0008 3802h

|     |     |     |       |     |     |    |           |    |    |            |    |    |    |    |       |
|-----|-----|-----|-------|-----|-----|----|-----------|----|----|------------|----|----|----|----|-------|

| b11 to b9  | —          | Reserved                                      | These bits are read as 0. The write value should be 0.                                                                                       | R/W |
| b12        | MPXEN      | Address/Data Multiplexed I/O Interface Select | 0: Separate bus interface is selected for area n.<br>1: Address/data multiplexed I/O interface is selected for area n.<br>(n = 0 to 3)       | R/W |
| b15 to b13 | —          | Reserved                                      | These bits are read as 0. The write value should be 0.                                                                                       | R/W |

Do not attempt to write the CSnCR register while the external bus is being accessed.

#### EXENB Bit (Operation Enable)

This bit enables or disables operation of the respective CS areas.

After this MCU is reset, operation is enabled (EXENB = 1) only for area 0; operation in other areas is disabled (EXENB = 0).

An attempt at access to an area for which operation has been disabled does not lead to access via the external bus.

However, if the illegal address access detection enable bit in the bus error monitoring enable register has been set to enable detection (BEREN.IGAEN = 1), such an attempt will lead to an illegal-access error.

#### BSIZE[1:0] Bits (External Bus Width Select)

These bits specify the data bus width of each area.

The data bus width of area 0 (CS0) after a reset depends on the setting of the bus width in operating mode.

#### EMODE Bit (Endian Mode)

This bit specifies the endian of each area.

When the endian setting for each area is different from that for the chip, no instruction code can be allocated in the area. The instruction code should be allocated to the external space whose endian setting is the same as that for the chip.

### 15.3.2 CSn Recovery Cycle Register (CSnREC) (n = 0 to 3)

Address(es): CS0REC 0008 380Ah, CS1REC 0008 381Ah, CS2REC 0008 382Ah, CS3REC 0008 383Ah

Do not attempt to write the CSnREC register while the external bus is being accessed.

When the preceding bus access is a separate bus access, CSnREC is valid when the recovery cycle insertion is enabled with the separate bus recovery cycle insertion enable bit (RCVEN<sub>j</sub> (j = 0 to 7)) in CSRECEN. When the preceding bus access is an address/data multiplexed bus access, CSnREC is valid when the recovery cycle insertion is enabled with the multiplexed bus recovery cycle insertion enable bit (RCVENM<sub>j</sub>) in CSRECEN.

#### RRCV[3:0] Bits (Read Recovery)

These bits specify the number of recovery cycles to be inserted after a read access to the external bus.

When the recovery cycle insertion is enabled and a value except 0000b is written to these bits, one to 15 recovery cycles are inserted in the following cases.

- After a read access to the external bus, a read access is made to the external bus in the same area.
- After a read access to the external bus, a read access is made to the external bus in a different area.
- After a read access to the external bus, a write access is made to the external bus in the same area.
- After a read access to the external bus, a write access is made to the external bus in a different area.

#### **WRCV[3:0] Bits (Write Recovery)**

These bits specify the number of recovery cycles to be inserted after a write access to the external bus.

When the recovery cycle insertion is enabled and a value except 0000b is written to these bits, one to 15 recovery cycles are inserted in the following cases.

- After a write access to the external bus, a read access is made to the external bus in the same area.
- After a write access to the external bus, a read access is made to the external bus in a different area.
- After a write access to the external bus, a write access is made to the external bus in the same area.
- After a write access to the external bus, a write access is made to the external bus in a different area.

### 15.3.3 CS Recovery Cycle Insertion Enable Register (CSRECEN)

Do not attempt to write the CSRECEN register while the external bus is being accessed.

#### RCVENn Bit (Separate Bus Recovery Cycle Insertion Enable n) (n = 0 to 7)

This bit enables or disables the insertion of read recovery cycles when, after a read access to the external bus, a read access is made to the external bus in the same area.

#### RCVENMn Bit (Multiplexed Bus Recovery Cycle Insertion Enable n) (n = 0 to 7)

This bit enables or disables the insertion of read recovery cycles when, after a read access to the external bus, a read access is made to the external bus in the same area.

**Table 15.7 Insertion of Recovery Cycles**

| <b>Access Type</b>              | <b>External Address Space</b> | <b>Insertion of Recovery Cycles</b>                           | <b>Corresponding Bits (Separate/Multiplexed)</b> |
|---------------------------------|-------------------------------|---------------------------------------------------------------|--------------------------------------------------|
| Read access after read access   | Same area                     | Recovery cycles specified by the RRCV[3:0] bits are inserted. | RCVEN0/RCVENM0                                   |
|                                 | Different area                | Recovery cycles specified by the RRCV[3:0] bits are inserted. | RCVEN1/RCVENM1                                   |
| Read access after write access  | Same area                     | Recovery cycles specified by the RRCV[3:0] bits are inserted. | RCVEN2/RCVENM2                                   |
|                                 | Different area                | Recovery cycles specified by the RRCV[3:0] bits are inserted. | RCVEN3/RCVENM3                                   |
| Write access after read access  | Same area                     | Recovery cycles specified by the WRCV[3:0] bits are inserted. | RCVEN4/RCVENM4                                   |
|                                 | Different area                | Recovery cycles specified by the WRCV[3:0] bits are inserted. | RCVEN5/RCVENM5                                   |
| Write access after write access | Same area                     | Recovery cycles specified by the WRCV[3:0] bits are inserted. | RCVEN6/RCVENM6                                   |
|                                 | Different area                | Recovery cycles specified by the WRCV[3:0] bits are inserted. | RCVEN7/RCVENM7                                   |

| b15        | PRMOD  | Page Read Access Mode Select | 0: Normal access compatible mode<br>1: External data read continuous assertion mode | R/W |

Do not write to the CSnMOD register while access to the CSn area is in progress.

#### WRMOD Bit (Write Access Mode Select)

This bit selects a write access operating mode.

Writing 0 to this bit selects byte strobe mode where data write operation is controlled by the WRn# (n = 0, 1) signal corresponding to the respective byte positions.

Writing 1 to this bit selects single write strobe mode where data write operation is controlled by the BCn# (n = 0, 1) signal and the WR# signal corresponding to respective byte positions. Note that setting the external bus width of 8 bits is prohibited in single write strobe mode.

**Table 15.8 Control Signals for Write Access Mode**

| Mode                     | Pin Name |              |      |      |
|--------------------------|----------|--------------|------|------|
|                          | WR1#     | WR0#/<br>WR# | BC1# | BC0# |
| Byte strobe mode         | ✓        | ✓ (WR0#)     | ×    | ×    |
| Single write strobe mode | ×        | ✓ (WR#)      | ✓    | ✓    |

✓: Enabled, ×: Disabled

#### EWENB Bit (External Wait Enable)

This bit enables or disables external wait.

Writing 1 to this bit selects external wait and allows control of the number of waits in each cycle with the WAIT# signal.

In this state, wait cycles are inserted while the WAIT# signal is at the low level.

Writing 0 to this bit disables the WAIT# signal.

**PRENB Bit (Page Read Access Enable)**

This bit enables or disables page read accesses.

Note: When the address/data multiplexed I/O interface is selected with the MPXEN bit in CSnCR, this bit should not be set to enable page read accesses. Page read accesses are not supported in the address/data multiplexed I/O interface.

**PWENB Bit (Page Write Access Enable)**

This bit enables or disables page write accesses.

Note: When the address/data multiplexed I/O interface is selected with the MPXEN bit in CSnCR, this bit should not be set to enable page write accesses. Page write accesses are not supported in the address/data multiplexed I/O interface.

**PRMOD Bit (Page Read Access Mode Select)**

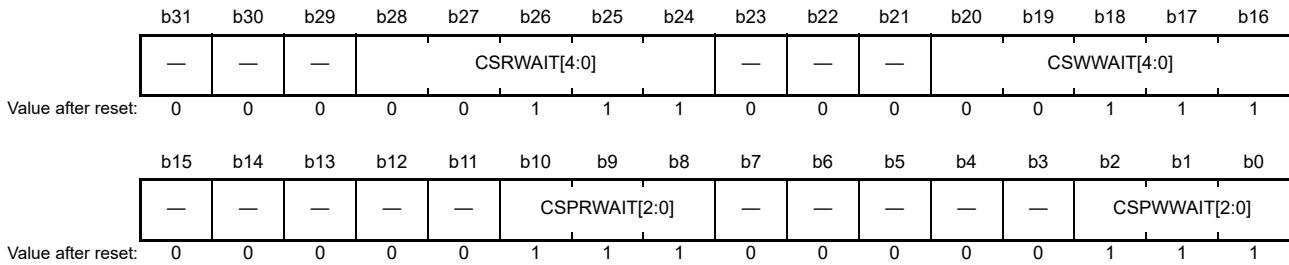

This bit selects a page read access operating mode.

Writing 0 to this bit selects normal access compatible mode where the RD# signal is negated and RD assert wait is inserted each time a piece of data is read. However, when there is no RD assert wait, the RD# signal is negated only in the final transfer of the external bus access.

Writing 1 to this bit selects external data read continuous assertion mode where RD assert wait is inserted and the RD# signal is continuously asserted during this time period.

### 15.3.5 CSn Wait Control Register 1 (CSnWCR1) (n = 0 to 3)

Address(es): CS0WCR1 0008 3004h, CS1WCR1 0008 3014h, CS2WCR1 0008 3024h, CS3WCR1 0008 3034h

Note 1. The CSPWAIT[2:0] value is valid only when the PWENB bit in CSnMOD is set to 1.

Note 2. The CSRWAIT[2:0] value is valid only when the PRENB bit in CSnMOD is set to 1.

Do not attempt to write the CSnWCR1 register while the external bus is being accessed.

Set each of these bits within a range of the restrictions described in section 15.5.7 (1) Limitations on Using Separate Bus Interface or section 15.5.7 (2) Limitations on Using Address/Data Multiplexed Bus Interface, according to the bus interface used.

#### **CSPWAIT[2:0] Bits (Page Write Cycle Wait Select)**

These bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page write cycle.

This setting is enabled when the PWENB bit in CSnMOD is set to 1.

Note: Be sure to satisfy  $1 \leq \text{CSnWCR2.WDON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSPWAIT}[2:0] \text{ value}$  and  $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSPWAIT}[2:0] \text{ value}$ .

#### **CSPRWAIT[2:0] Bits (Page Read Cycle Wait Select)**

These bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page read cycle.

This setting is enabled when the PRENB bit in CSnMOD is set to 1.

Note: Be sure to satisfy  $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.RDON}[2:0] \text{ value} \leq \text{CSnWCR1.CSPRWAIT}[2:0] \text{ value}$ .

#### **CSWWAIT[4:0] Bits (Normal Write Cycle Wait Select)**

These bits specify the number of wait cycles to be inserted into the first access during a normal write cycle or page write cycle.

Note: Be sure to satisfy  $1 \leq \text{CSnWCR2.WDON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSWWAIT}[4:0] \text{ value}$  and  $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSWWAIT}[4:0] \text{ value}$ .

#### **CSRWAIT[4:0] Bits (Normal Read Cycle Wait Select)**

These bits specify the number of wait cycles to be inserted into the first access during a normal read cycle or page read cycle.

Note: Be sure to satisfy  $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.RDON}[2:0] \text{ value} \leq \text{CSnWCR1.CSRWAIT}[4:0] \text{ value}$ .

Do not attempt to write the CSnWCR2 register while the external bus is being accessed.

Set each of these bits within a range of the restrictions described in section 15.5.7 (1) Limitations on Using Separate Bus Interface or section 15.5.7 (2) Limitations on Using Address/Data Multiplexed Bus Interface, according to the bus interface used.

#### CSROFF[2:0] Bits (Read-Access CS Extension Cycle Select)

These bits specify the number of wait cycles to be inserted in a time period from the end of a wait cycle (RD# signal negated) until the CSn# signal (n = 0 to 3) is negated in read access mode.

#### CSWOFF[2:0] Bits (Write-Access CS Extension Cycle Select)

These bits specify the number of wait cycles to be inserted in a time period from the end of a wait cycle (WRn# signal (n = 0, 1) negated) until the CSn# signal (n = 0 to 3) is negated in write access mode.

Note: Be sure to satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

#### WDOFF[2:0] Bits (Write Data Output Extension Cycle Select)

These bits specify the number of wait cycles to be inserted in a time period from the end of a wait cycle (WRn# signal (n = 0, 1) negated) until the write data output is completed in write access mode.

Note: Be sure to satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

#### AWAIT[1:0] Bits (Address Cycle Wait Select)

These bits specify the number of wait cycles to be inserted into an address output cycle with the address/data multiplexed I/O interface.

Note: CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.AWAIT[1:0] value  
 For read access, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSRWAIT[4:0] value.  
 For write access, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value and CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.

### RDON[2:0] Bits (RD Assert Wait Select)

These bits specify the number of wait cycles to be inserted before the RD# signal is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSRWAIT[4:0] value.  
 For page read access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value.  
 Note: When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSRWAIT[4:0] value.

### WRON[2:0] Bits (WR Assert Wait Select)

These bits specify the number of wait cycles to be inserted before the WRn# signal (n = 0, 1) is asserted.

Note: For normal write access, satisfy 1  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value and CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.  
 For page write access, satisfy 1  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value and CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value.  
 Note: When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.

### WDON[2:0] Bits (Write Data Output Wait Select)

These bits specify the number of wait cycles to be inserted before the write data is output.

Note: For normal write access, satisfy 1  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.  
 For page write access, satisfy 1  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value.  
 Note: When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2  $\leq$  CSnWCR2.WDON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.

### CSON[2:0] Bits (CS Assert Wait Select)

These bits specify the number of wait cycles to be inserted before the CSn# signal (n = 0 to 3) is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSRWAIT[4:0] value.  
 For page read access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.RDON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value.  
 For normal write access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSWWAIT[4:0] value.  
 For page write access, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.WRON[2:0] value  $\leq$  CSnWCR1.CSPWAIT[2:0] value.  
 Note: When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.CSON[2:0] value  $\leq$  CSnWCR2.AWAIT[1:0] value.

### 15.3.7 Bus Error Status Clear Register (BERCLR)

Address(es): 0008 1300h

|                    | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0     |
|--------------------|----|----|----|----|----|----|----|--------|
|                    | —  | —  | —  | —  | —  | —  | —  | STSCLR |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0      |

| Bit      | Symbol | Bit Name     | Description                                            | R/W   |
|----------|--------|--------------|--------------------------------------------------------|-------|
| b0       | STSCLR | Status Clear | 0: Invalid<br>1: Bus error status register cleared     | (W)*1 |
| b7 to b1 | —      | Reserved     | These bits are read as 0. The write value should be 0. | R/W   |

Note 1. Only writing 1 is effective; i.e. writing 0 has no effect.

#### STSCLR Bit (Status Clear)

Writing 1 to this bit clears the bus error status registers 1 and 2 (BERSR1 and BERSR2).

Writing 0 has no effect. It is read as 0.

### 15.3.8 Bus Error Monitoring Enable Register (BEREN)

Address(es): 0008 1304h

|                    | b7 | b6 | b5 | b4 | b3 | b2 | b1   | b0    |
|--------------------|----|----|----|----|----|----|------|-------|
|                    | —  | —  | —  | —  | —  | —  | TOEN | IGAEN |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0    | 0     |

| Bit      | Symbol | Bit Name                                | Description                                                                                         | R/W |
|----------|--------|-----------------------------------------|-----------------------------------------------------------------------------------------------------|-----|
| b0       | IGAEN  | Illegal Address Access Detection Enable | 0: Illegal address access detection is disabled.<br>1: Illegal address access detection is enabled. | R/W |
| b1       | TOEN   | Timeout Detection Enable*1, *2          | 0: Bus timeout detection is disabled.<br>1: Bus timeout detection is enabled.                       | R/W |
| b7 to b2 | —      | Reserved                                | These bits are read as 0. The write value should be 0.                                              | R/W |

Note 1. When detection is disabled (the TOEN bit is set to 0), bus access can cause the bus to freeze.

Note 2. Do not set the TOEN bit to 0 (bus timeout detection disabled) while timeout errors are being detected.

### 15.3.9 Bus Error Status Register 1 (BERSR1)

Address(es): 0008 1308h

| Bit      | Symbol   | Bit Name               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | R/W |    |  |   |   |        |   |   |             |   |   |             |   |   |             |   |   |             |   |   |             |   |   |             |   |   |             |   |

#### MST[2:0] Bits (Bus Master Code)

These bits indicate the bus master that accessed a bus when a bus error occurred.

### 15.3.10 Bus Error Status Register 2 (BERSR2)

Address(es): 0008 130Ah

| Bit       | Symbol     | Bit Name                     | Description                                                                                           | R/W |
|-----------|------------|------------------------------|-------------------------------------------------------------------------------------------------------|-----|
| b2 to b0  | —          | Reserved                     | These bits are read as 0. Writing to these bits has no effect.                                        | R   |
| b15 to b3 | ADDR[12:0] | Bus Error Occurrence Address | The upper 13 bits of an address that was accessed when a bus error occurred (in units of 512 Kbytes). | R   |

### 15.3.11 Bus Priority Control Register (BUSPRI)

Address(es): 0008 1310h

| b15, b14 | —         | Reserved                                          | These bits are read as 0. The write value should be 0.                                                                                          | R/W        |

Note 1. These bits can be written to only once while the DTC and DMAC are stopped. Operation is not guaranteed if it is written more than once.

#### BPRA[1:0] Bits (Memory Bus 1 and 3 (RAM/ECCRAM) Priority Control)

These bits specify the priority order for memory bus 1 (RAM) and memory bus 3 (ECCRAM).

When the priority order is fixed, internal main bus 2 has priority over CPU buses (instruction and operand buses).

When the priority order is toggled, the bus from which a request has currently been accepted has the lower priority.

#### BPRO[1:0] Bits (Memory Bus 2 (Code Flash Memory) Priority Control)

These bits specify the priority order for memory bus 2 (code flash memory).

When the priority order is fixed, internal main bus 2 has priority over CPU buses (instruction and operand buses).

When the priority order is toggled, the bus from which a request has currently been accepted has the lower priority.

**BPIB[1:0] Bits (Internal Peripheral Bus 1 Priority Control)**

These bits specify the priority order for internal peripheral bus 1.

When the priority order is fixed, internal main bus 2 has priority over internal main bus 1.

When the priority order is toggled, a bus has a lower priority when the request of that bus is accepted.

**BPGB[1:0] Bits (Internal Peripheral Bus 2 and 3 Priority Control)**

These bits specify the priority order for internal peripheral buses 2 and 3.

When the priority order is fixed, internal main bus 2 has priority over internal main bus 1.

When the priority order is toggled, a bus has a lower priority when the request of that bus is accepted.

**BPHB[1:0] Bits (Internal Peripheral Bus 4 Priority Control)**

These bits specify the priority order for internal peripheral bus 4.

When the priority order is fixed, internal main bus 2 has priority over internal main bus 1.

When the priority order is toggled, a bus has a lower priority when the request of that bus is accepted.

**BPFB[1:0] Bits (Internal Peripheral Bus 6 Priority Control)**

These bits specify the priority order for internal peripheral bus 6.

When the priority order is fixed, internal main bus 2 has priority over internal main bus 1.

When the priority order is toggled, a bus has a lower priority when the request of that bus is accepted.

**BPEB[1:0] Bits (External Bus Priority Control)**

These bits specify the priority order for the external bus.

When the priority order is fixed, the order is internal main bus 2, and then internal main bus 1.

When the priority order is toggled, a bus has a lower priority when the request of that bus is accepted, between internal main bus 1 and internal main bus 2.

## 15.4 Endian and Data Alignment

The external bus has a data-alignment function to control which byte of the data bus (D15 to D8, or D7 to D0) is used according to the bus specifications of the area to be accessed (8-bit or 16-bit bus space), data size, and endian format when accessing the external address space (the CS area).

### 15.4.1 Data Alignment Control for CS Area

#### (1) 16-Bit Bus Space

When a 16-bit width is selected for a bus space by the BSIZE[1:0] bits in CSnCR, the address buses A20 to A1 are enabled to output address signals in units of 16 bits, and the address bus A0 is disabled (always output the low level). When byte strobe mode is selected (the WRMOD bit = 0 in CSnMOD), the WR0# and WR1# pins are enabled. The BC0# and BC1# pins are not used.

When single write strobe mode is selected (the WRMOD bit = 1 in CSnMOD), only the WR0# pin is enabled and always outputs the low level during write access, regardless of the data size. Here, the WR1# pin is invalid (always output the high level). The valid byte position is indicated by the BC0# and BC1# pins.

In 16-bit bus space, page access can occur in access to data in 32-bit units. Specifically, page access can occur when an access does not spread over a 32-bit boundary and causes no change in BC0# and BC1# signals. The situations in which page access occurs are indicated by the letter (p) in Figure 15.6 and Figure 15.7.

In 16-bit bus space, the valid positions of data external to the chip and of control signals differ according to whether the endian is big or little.

| Data Size | Access Address | Number of Access | Bus Cycle | Unit of Data | Address              | Data Bus              |    |    |    |
|-----------|----------------|------------------|-----------|--------------|----------------------|-----------------------|----|----|----|
|           |                |                  |           |              |                      | D15                   | D8 | D7 | D0 |
| 8 bits    | 4n             | One              | First     | 8 bits       | 4n                   | [ 7   0 ]             |    |    |    |
|           | 4n+1           | One              | First     | 8 bits       | 4n                   | [ 7   0 ]             |    |    |    |
|           | 4n+2           | One              | First     | 8 bits       | 4n+2                 | [ 7   0 ]             |    |    |    |
|           | 4n+3           | One              | First     | 8 bits       | 4n+2                 | [ 7   0 ]             |    |    |    |
| 16 bits   | 4n             | One              | First     | 16 bits      | 4n                   | [ 15   8   7   0 ]    |    |    |    |
|           | 4n+1           | Two              | First     | 8 bits       | 4n                   | [ 7   0 ]             |    |    |    |
|           |                |                  | Second    | 8 bits       | 4n+2                 | [ 15   8 ]            |    |    |    |
|           | 4n+2           | One              | First     | 16 bits      | 4n+2                 | [ 15   8   7   0 ]    |    |    |    |
| 4n+3      | Two            | First            | 8 bits    | 4n+2         | [ 7   0 ]            |                       |    |    |    |
|           |                | Second           | 8 bits    | 4n+4         | [ 15   8 ]           |                       |    |    |    |
| 32 bits   | 4n             | Two              | First     | 16 bits      | 4n                   | [ 15   8   7   0 ]    |    |    |    |
|           |                |                  | Second    | 16 bits      | 4n+2 (p)             | [ 31   24   23   16 ] |    |    |    |
|           | 4n+1           | Three            | First     | 8 bits       | 4n                   | [ 7   0 ]             |    |    |    |

(p): Page access (only when page access is enabled with the PRENB and PWENB bits in CSnMOD)

Figure 15.7 Data Alignment (Big Endian) in 16-Bit Bus Space

(2) 8-Bit Bus Space

When an 8-bit bus space is selected by the BSIZE[1:0] bits in CSnCR, the address buses A20 to A0 are enabled to output address signals in byte units.

In 8-bit bus space, only the WR0# pin is valid regardless of write access mode, and always outputs the low level during write access. The WR1# pin, and the BC0# and BC1# pins are not used.

Page access can occur in access to data in 16- or 32-bit units. Specifically, page access can occur when an access does not spread over a 32-bit boundary. The situations in which page access occurs are indicated by the letter (p) in Figure 15.8 and Figure 15.9.

In 8-bit bus space, the valid positions of data external to the chip are D7 to D0 and WR0# is used as the control signal, regardless of the endian mode.

| Data Size | Access Address | Number of Access | Bus Cycle | Unit of Data | Address  | Data Bus |    |    |    |
|-----------|----------------|------------------|-----------|--------------|----------|----------|----|----|----|
|           |                |                  |           |              |          | D15      | D8 | D7 | D0 |
| 8 bits    | 4n             | One              | First     | 8 bits       | 4n       | 7        |    | 0  |    |
|           | 4n+1           | One              | First     | 8 bits       | 4n+1     | 7        |    | 0  |    |

Figure 15.9 Data Alignment (Big Endian) in 8-Bit Bus Space

## 15.5 Operation of CS Area Controller

### 15.5.1 Separate Bus

The various periods in the timing charts are described below.

The CS area controller (CSC) operates in synchronization with the external bus clock (BCLK). The operation cycles, such as wait cycles specified with the CSC register, are counted on BCLK. In the following description, frequencies of BCLK and BCLK pin output are the same, unless otherwise noted.

Access via the external bus starts at the same point as the output of a rising edge on the BCLK pin. However, if the external bus clock (BCLK) and the output on the BCLK pin are at different frequencies so that a single request from a bus master for transfer leads to two or more rounds of access via the external bus, the wait settings may cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the BCLK pin (see Figure 15.15 to Figure 15.19). If recovery cycles are inserted for bus access, the setting for the number of recovery cycles may also cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the BCLK pin (see Figure 15.35).

#### (a) Tw1 to Twn (Clock Cycles of Waiting for a Normal Read Cycle or Normal Write Cycle)

The period Tw1 to Twn is made up of the number of clock cycles between the start of access via the external bus clock and one cycle before the strobe signal is valid. The number of cycles are selectable within the range from zero to 31. Within this period, the timing of CSn#, RD#, and WRn# assertion (placing the signals at the low level) is determined by the respective wait settings. Specifically, the periods of waiting are controlled by the CS assert wait select bits (CSON[2:0]), the RD assert wait select bits (RDON[2:0]), the WR assert wait select bits (WRON[2:0]), and the write data output wait select bits (WDON[2:0]) in CSn wait control register 2 (CSnWCR2). The number of clock cycles for each of these periods of waiting is selectable as a value from zero to seven counted from the start of external bus access. Selectable numbers of cycles are also within the overall number of clock cycles of waiting for reading or writing.

#### (b) Tend (Clock Cycle where the Strobe Signal is Valid)

Tend is the next clock cycle after completion of the period of waiting for a normal cycle of reading or writing or for a cycle of page reading or page writing. If each wait select bit for a normal cycle of reading or writing or for a cycle of page reading or page writing is zero, the clock cycle where bus access starts is the clock cycle where the strobe signal is valid. The RD# and WRn# signals are negated in the next clock cycle after the cycle where the strobe signal is valid. In the case of read access, the clock cycle where the strobe signal is valid becomes the clock cycle where the data to be read are sampled.

If an external wait is enabled, the wait signal is sampled at the time of the cycle where the strobe signal is valid. The bus cycle is extended if the wait signal is at the low level. The bus cycle is completed in the next clock cycle if the wait signal is at the high level. Tend indicates the cycle where sampling of the wait signal starts.

After the first cycle where the strobe signal is valid during page access, second and subsequent page access operations (point (e) below) start in the next cycle except in cases of write access where a setting (other than zero) for write-data output extension clock cycles (point (d) below) has been made. If the setting for the RD or WR assertion wait is a value other than zero, the RD# and WRn# signals are negated in the next clock cycle. If the setting is zero, assertion continues. Furthermore, the CSn# signal continues to be asserted rather than being negated.

#### (c) Tn1 to Tnm (Clock Cycles of CS Extension)

In the case of normal access, Tn1 to Tnm represent the clock cycles of the period following the cycle where the strobe signal is valid (Tend) up to negation of the CSn# signal. For read or write access, the timing of negation can be controlled by the read-access CS extension cycle select bits (CSROFF[2:0]) and the write-access CS extension cycle select bits (CSWOFF[2:0]) in the CSn wait control register 2 (CSnWCR2), respectively.

The number of cycles are counted from the cycle following the cycle where the strobe signal is valid.

In the case of page access, Tn1 to Tnm represent the clock cycles of the period for the cycle following the last cycle where the strobe signal is valid up to negation of the CSn# signal.

For write access, setting the write data output extension cycle select bits (WDOFF) controls extension of the period where the address and output data are valid.

#### (d) Tdw1 to Tdwn (Write-Data Output Extension Clock Cycles)

For write access, if the setting for write-data output extension wait is a value other than zero, clock cycles of write-data output extension are inserted from the cycle that follows the cycle where the strobe signal is valid (Tend).

In the case of normal access, this is inserted within the period of clock cycles of CS extension (point (c) above).

In the case of page access, this is inserted within the period of the cycle where the strobe signal is valid and subsequent page access or within the period of clock cycles of CS extension (point (c) above). Valid address and data output are extended over this period, and the WRn# signal is negated.

#### (e) Tpw1 to TpwN (Page-Read Cycle Wait or Page-Write Cycle Wait)

For the second and subsequent bus cycles during page access, the values for a page-read cycle wait or page-write cycle wait are used instead of the settings for a normal read or write cycle wait. Setting the WR assert wait select bits becomes enabled in the same way as for the first round of access. How the setting for RD assertion controls operation depends on the setting for page-read access mode (the PRMOD bit in CSnMOD) as described below.

CSnMOD.PRMOD = 0: A wait until RD assertion is inserted in the same way as for the first round of access, and the RD# signal is negated.

CSnMOD.PRMOD = 1: Although a wait until RD assertion is inserted in the same way as for normal-access compatibility mode, the RD# signal continues to be asserted over this period.

#### (f) Tr1 to Trn (Recovery Cycles)

Recovery cycles can be inserted from the point where a bus cycle is completed (CSn# signal negation). The number of recovery cycles can be controlled by the setting of the read recovery (RRCV) or write recovery (WRCV) bits in the CSn recovery cycle register (CSnREC). Both numbers of recovery cycles are counted from the end of a bus cycle (CSn# negation) and can be selected from 0 to 15 cycles. For details on recovery cycles, see section 15.5.4, Insertion of Recovery Cycles.

#### (1) Normal Access

When the PRENB and PWENB bits in CSnMOD are set to 0 to disable page-read and page-write access, respectively, all bus accesses will take the form of normal read and write operations.

Even when the PRENB and PWENB bits in CSnMOD are set to 1 to enable page-read and page-write access, respectively, bus access other than page access will take the form of normal read and write operations.

Figure 15.10 to Figure 15.12 show the normal access operations.

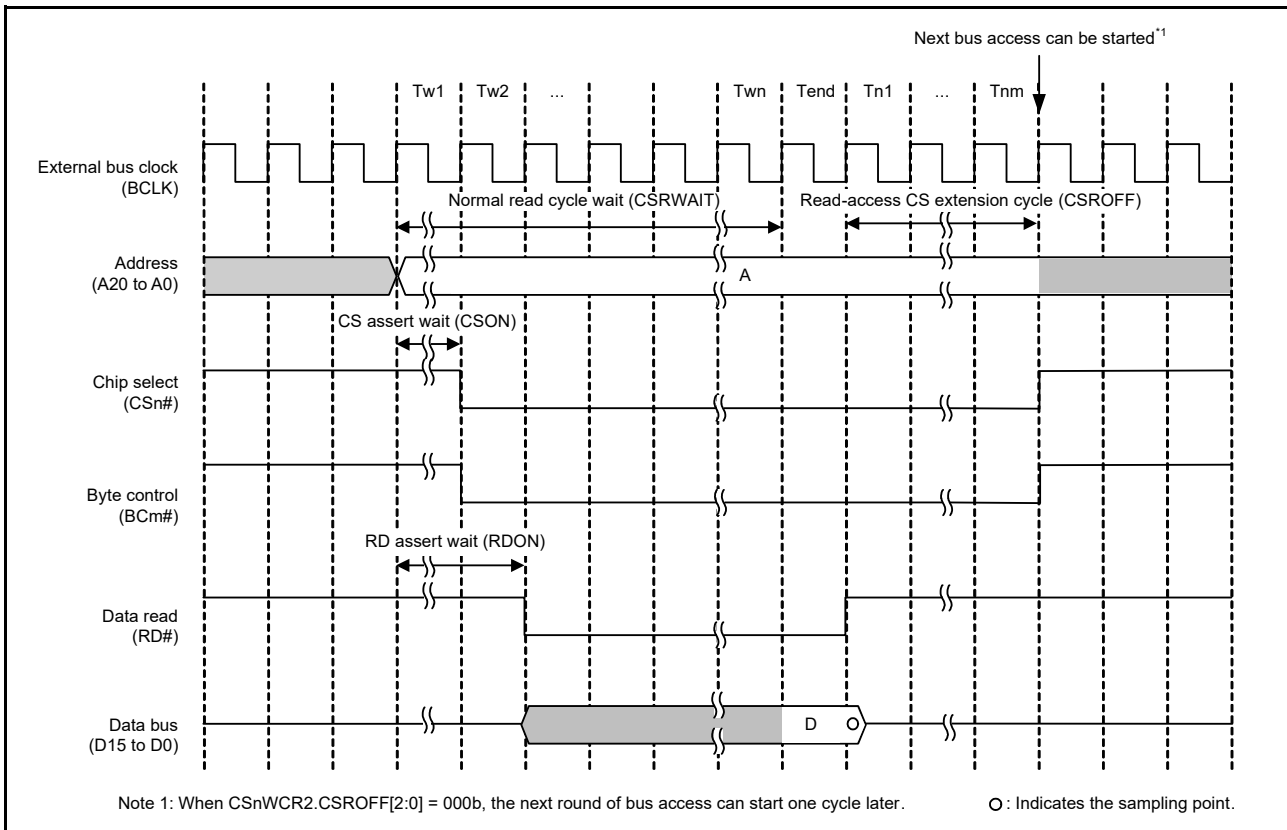

Figure 15.10 Bus Timing (Normal-Read Operation) (n = 0 to 3, m = 0, 1)

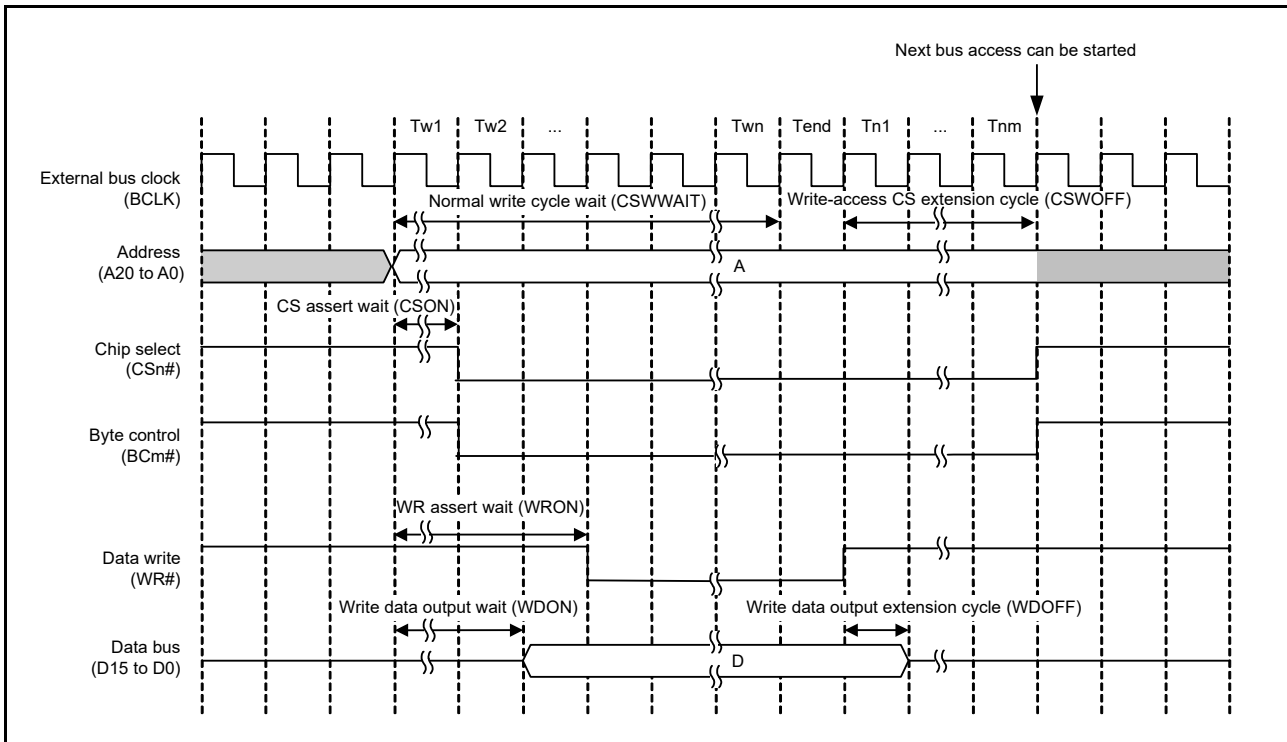

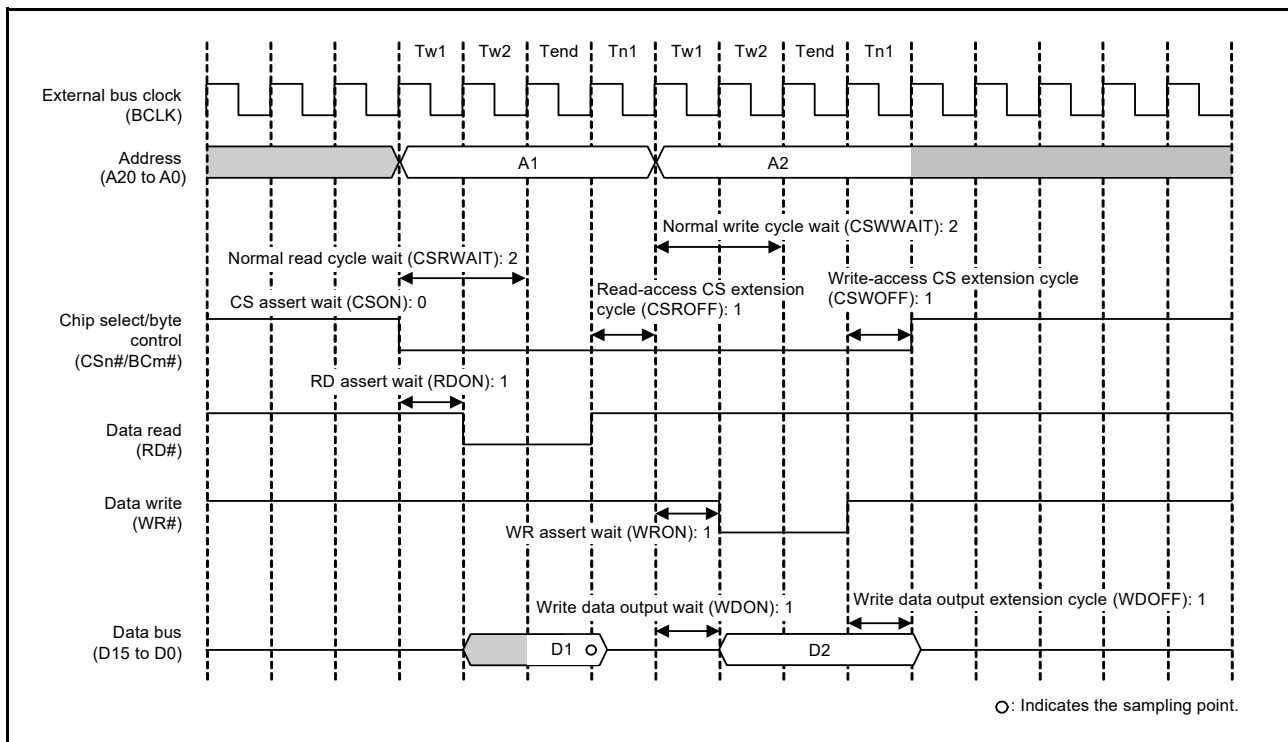

Figure 15.11 Bus Timing (Normal-Write Operation, Single Write Strobe Mode) (n = 0 to 3, m = 0, 1)

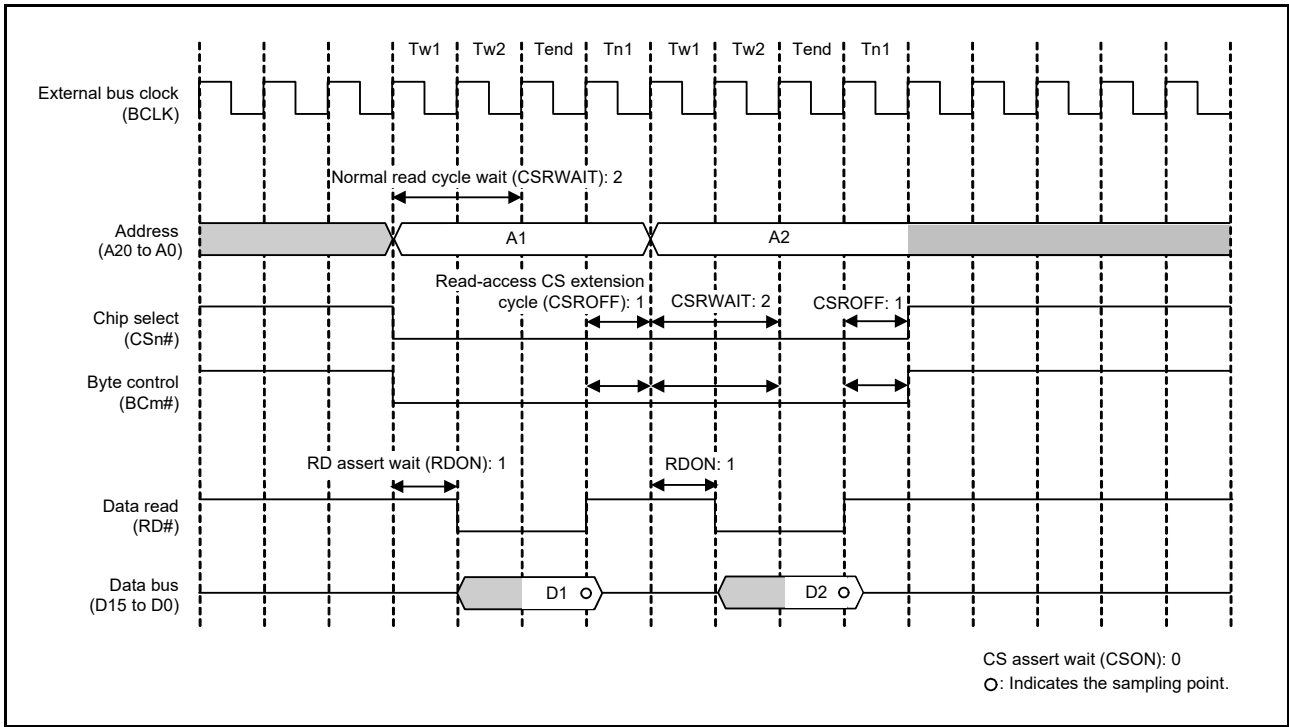

**Figure 15.12 Example of Normal Access Operation (Read/Write) (n = 0 to 3, m = 0, 1)**

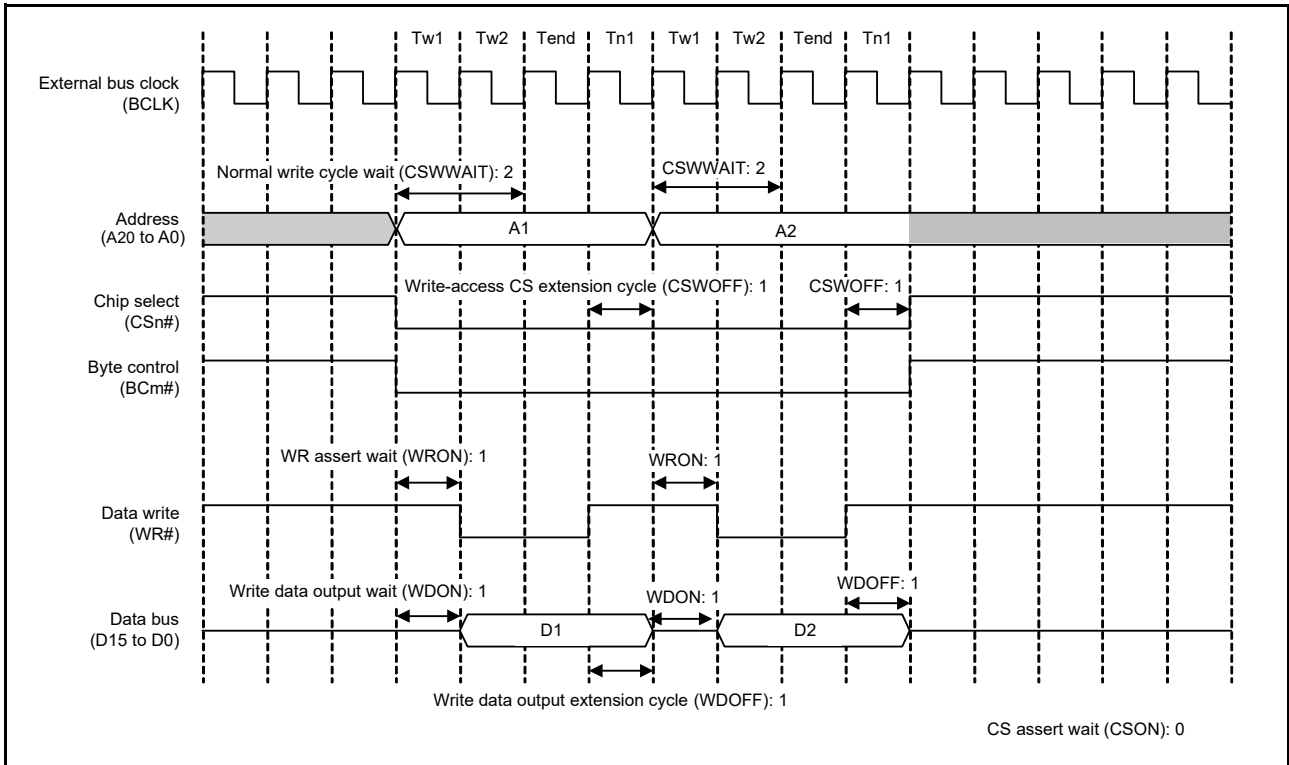

When two or more rounds of external bus access are required in response to a single request for transfer from a bus master, normal access operations (steps (a) to (d) above) are repeated. Figure 15.13 and Figure 15.14 show examples of operations when two rounds of bus access are generated in response to a single request for transfer. If the recovery cycle insertion condition is satisfied, recovery cycles (step (f) above) are also inserted in the second and subsequent external bus accesses (see Figure 15.33).

The values of the wait control registers are example settings. In practice, set the register bits according to the specifications of connected devices.

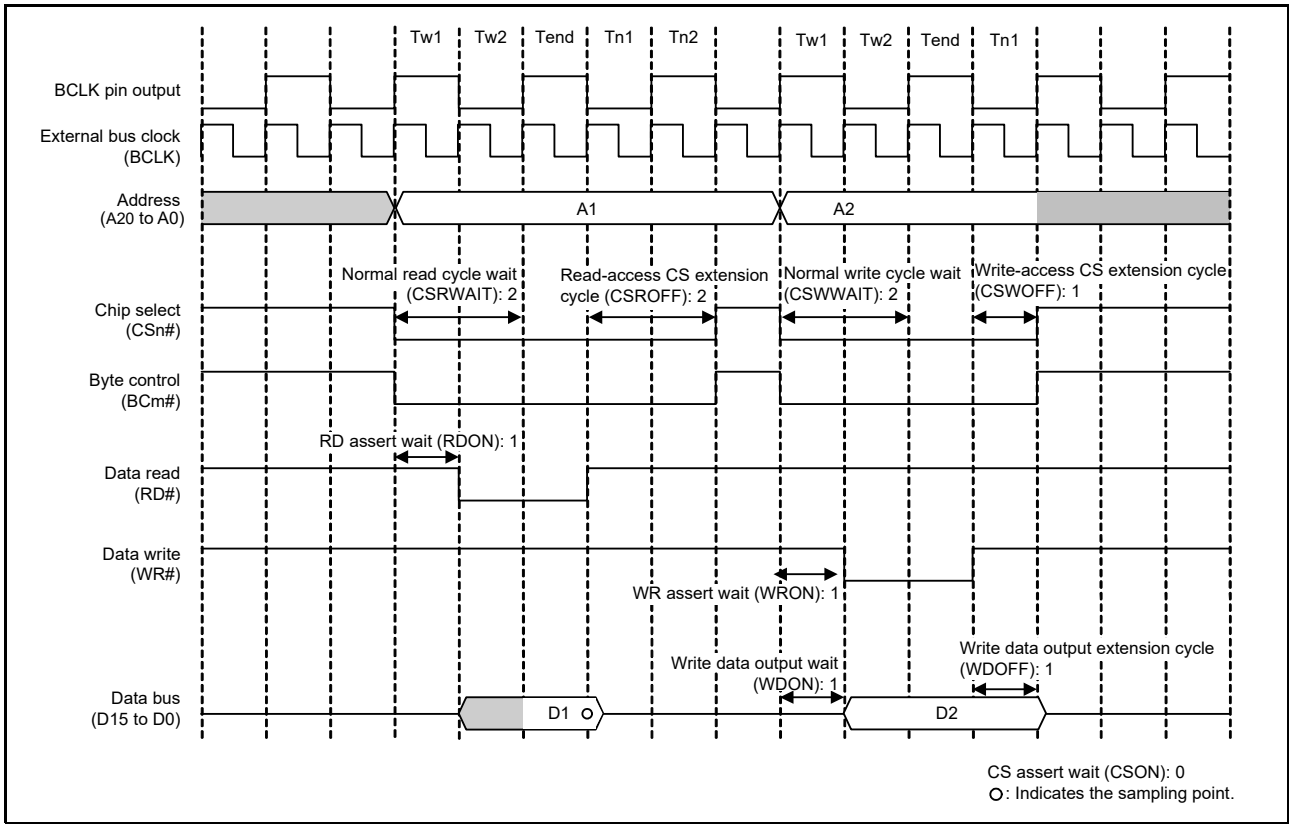

**Figure 15.13 Example of Normal-Read Operation**

**(when 1/2 BCLK is Selected with the BCLK Pin Output Select Bit and Two Rounds of Bus Access are Generated in Response to a Single Request for Transfer) (n = 0 to 3, m = 0, 1)**

## (2) Page Access

When the PRENB and PWENB bits in CSnMOD are set to 1 to enable page-read and page-write access, respectively, the bus access for page access operations becomes page reading and writing. Specifically, page access can occur when two or more rounds of external bus access are required for a single transfer request from the bus master. However, normal access is made when the split accesses are not aligned or the access spreads over the 32-bit boundary. See Figure 15.6 to Figure 15.9 for the conditions under which page access occurs.

Figure 15.20 and Figure 15.21 show examples of page access operations.

Figure 15.20 Page-Read Access Timing (n = 0 to 3, m = 0, 1)

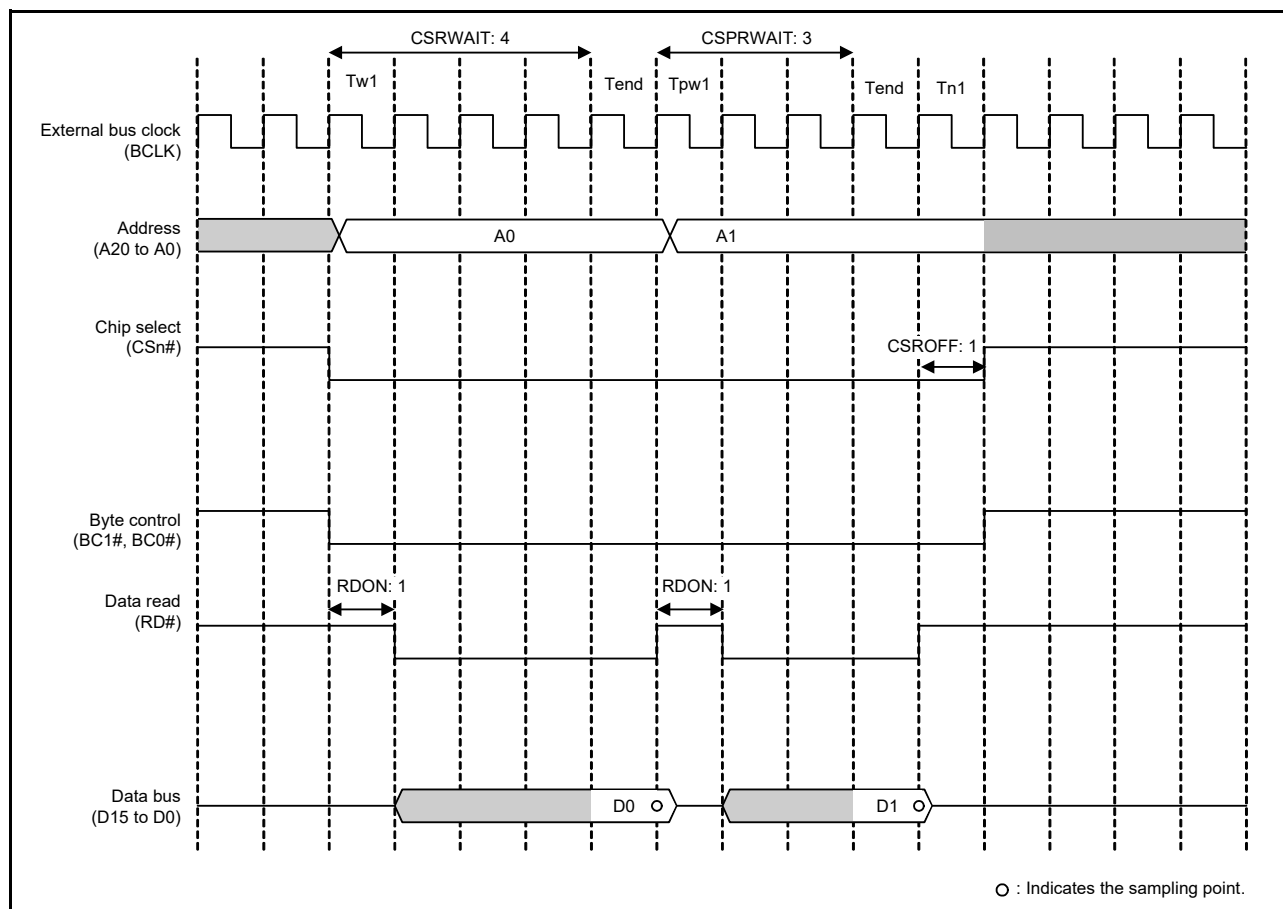

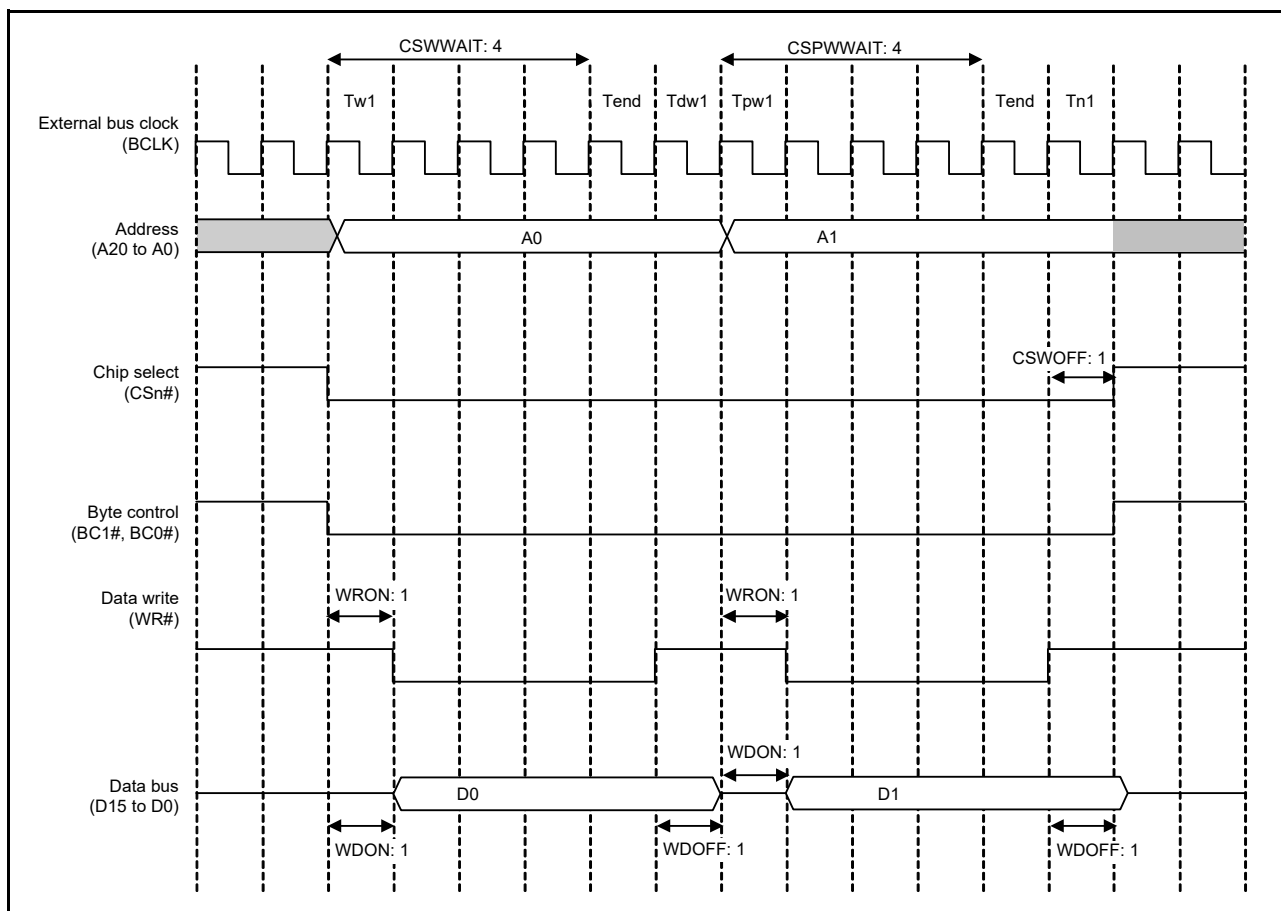

Figure 15.21 Page-Write Access Timing (n = 0 to 3, m = 0, 1)

Figure 15.22 and Figure 15.23 show examples of operations for access to a 16-bit bus space in 32 bits. The values of the wait control registers are example settings. In practice, the register settings will correspond to the specifications of connected devices.

 (n = 0 to 3)

### 15.5.2 Address/Data Multiplexed Bus

When the address/data multiplexed I/O interface select bit (MPXEN) in CSnCR is set to 1, addresses and data can be multiplexing input/output to/from the D15 to D0 pins in the corresponding area. Using this function enables direct connection of this MCU to peripheral LSIs requiring address/data multiplexing. When 8-bit width is selected with the BSIZE[1:0] bits in CSnCR, D7 to D0 are multiplexed with A7 to A0. When 16-bit width is selected, D15 to D0 are multiplexed with A15 to A0. In the address/data multiplexed I/O space, accesses are controlled with the ALE, RD#, WRn#, and BCn# signals.

Byte strobe mode or single-write strobe mode is selectable in the same way as for a separate bus. However, with regard to the BCn# signals within the address cycle, the byte-control signal is output for the data being read or written.

During the address/data multiplexed I/O space access, after the number of wait cycles specified by the address cycle wait select bits (AWAIT[1:0]) in CSnWCR2 is inserted in the address output cycle, data access is performed.

- Ta1 to Tan (Address Cycle Wait)

The period Ta1 to Tan is valid only when the address/data multiplexed I/O space is specified. This period is made up of the number of clock cycles between the start of external bus access and one cycle before the address latch (ALE) signal is negated. The number of cycles are selectable within the range from zero to three. Addresses are output until the next cycle of ALE signal negation (address cycle). The timing of ALE signal is the same as that of CS# assertion. After the address cycle, a data cycle is started. CSnWCR1 and CSnWCR2 should be set so that an address cycle and a data cycle do not overlap.

Page access to the address/data multiplexed I/O space is invalid. When the PRENB or PWENB bit in CSnMOD is set to 1 to enable page-read or page-write access, these settings are ignored and normal read or write operation is performed.

Figure 15.26 to Figure 15.28 show examples of operations with the address/data multiplexed I/O interface.

Figure 15.26 Example of Read Access Operation with Address/Data Multiplexed I/O Interface

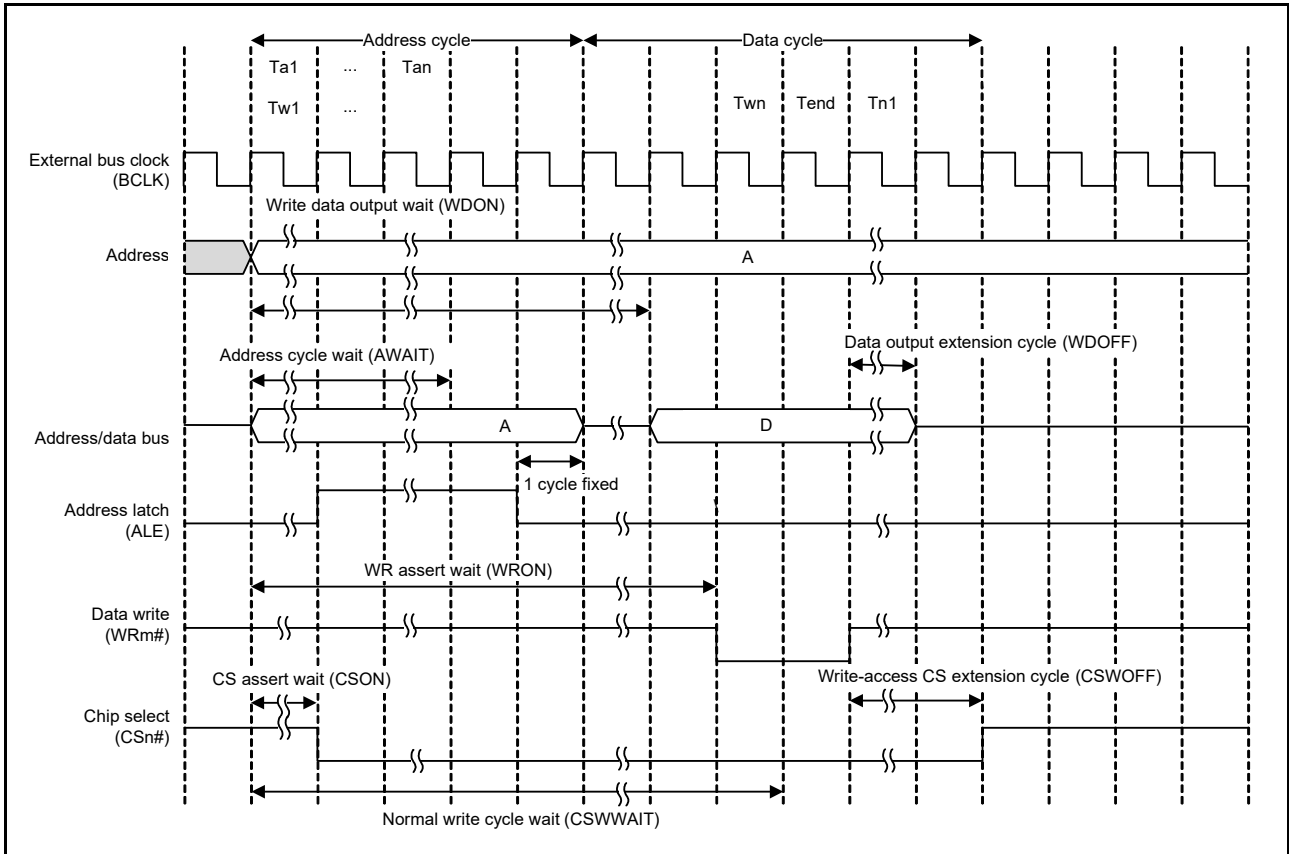

Figure 15.27 Example of Write Access Operation with Address/Data Multiplexed I/O Interface (m = 0, 1)

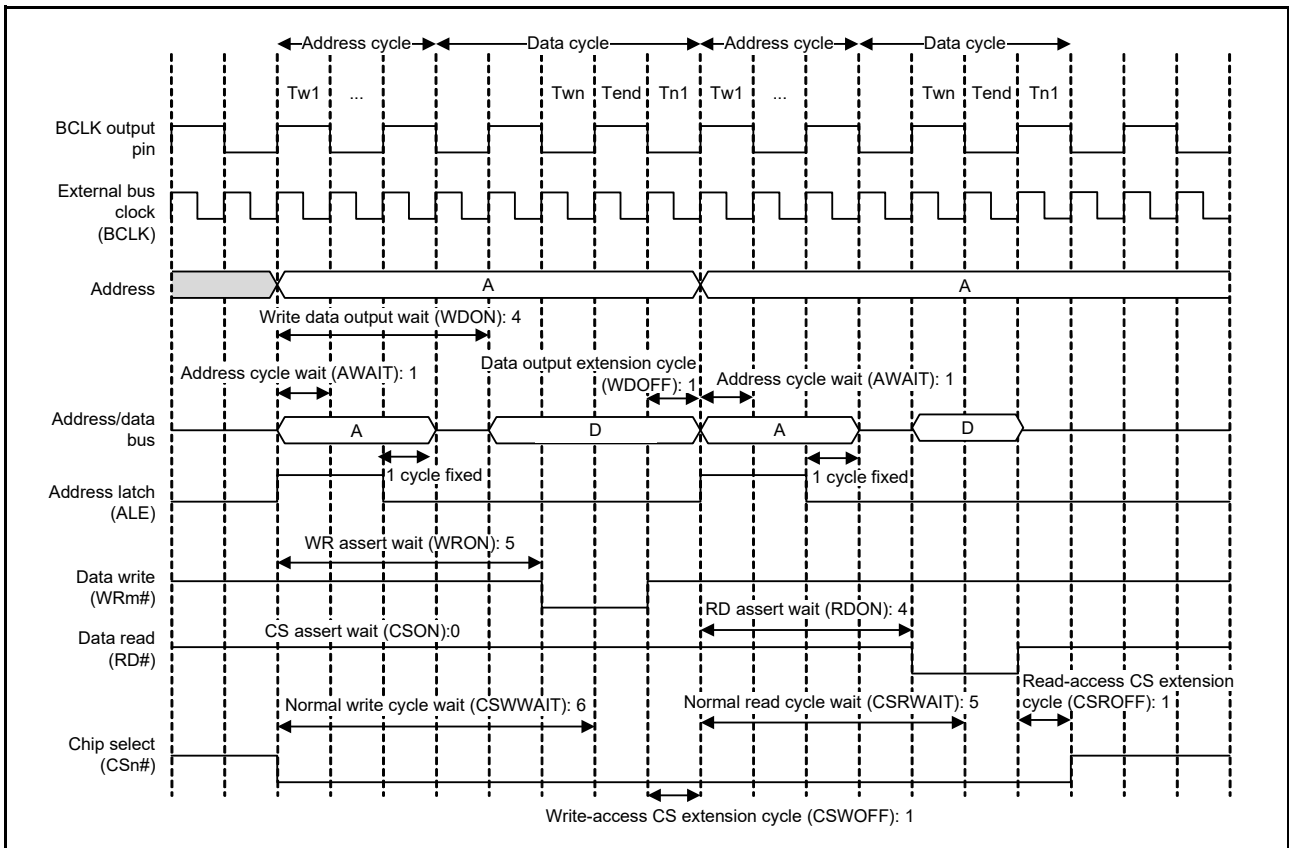

Figure 15.28 Example of Bus Timing with Address/Data Multiplexed I/O Interface (m = 0, 1)

### 15.5.3 External Wait Function

Wait cycles can be extended by the WAIT# signal over the length of normal access cycle wait (specified by the CSRWAIT[4:0] and CSWAIT[4:0] bits in CSnWCR1) and page access cycle wait (specified by the CSPRWAIT[2:0] and CSPWAIT[2:0] bits in CSnWCR1).

When external wait is enabled (the EWENB bit = 1 in CSnMOD), wait cycles are inserted while the WAIT# signal is held low. When external wait is disabled (the EWENB bit = 0 in CSnMOD), the WAIT# signal has no effect.

All wait cycles specified in CSnWCR1 are inserted independently of the WAIT# signal.

#### (1) Normal Access

Sampling of the WAIT# signal begins upon completion of the wait cycle (Tend) specified in CSnWCR1. The bus cycle is extended while the WAIT# signal is held low. The wait cycle ends (Tend) at the next cycle after the WAIT# signal becomes high.

#### (2) Page Access

The first access operation is the same as the normal access operation. Sampling of the WAIT# signal begins upon completion of the wait cycle (Tend) specified in the CSnWCR1 register. The bus cycle is extended while the WAIT# signal is held low. The wait cycle ends (Tend) at the next cycle after the WAIT# signal becomes high.

With respect to the second and subsequent accesses, sampling of the WAIT# signal begins upon completion of the wait cycle of the page access (Tend). The wait cycle of the page access is extended while the WAIT# signal is held low, and ends (Tend) at the next cycle after the WAIT# signal becomes high.

Figure 15.29 and Figure 15.30 show examples of external wait insertion timing with the separate bus interface.

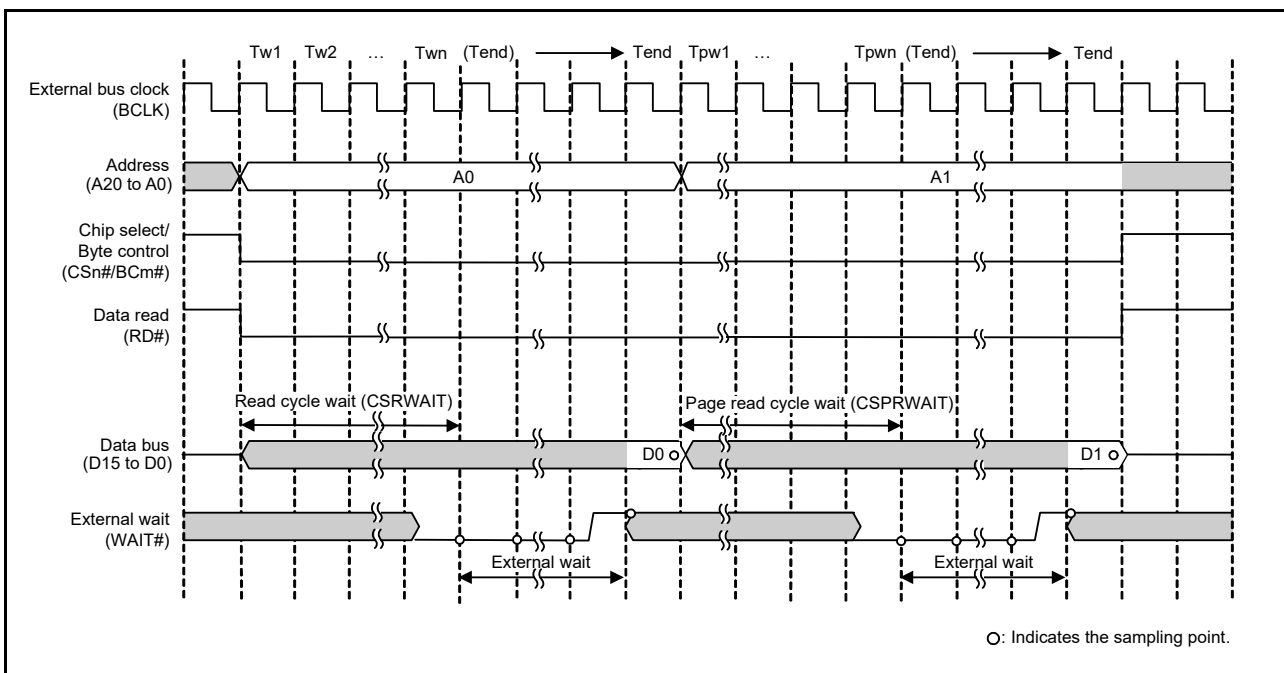

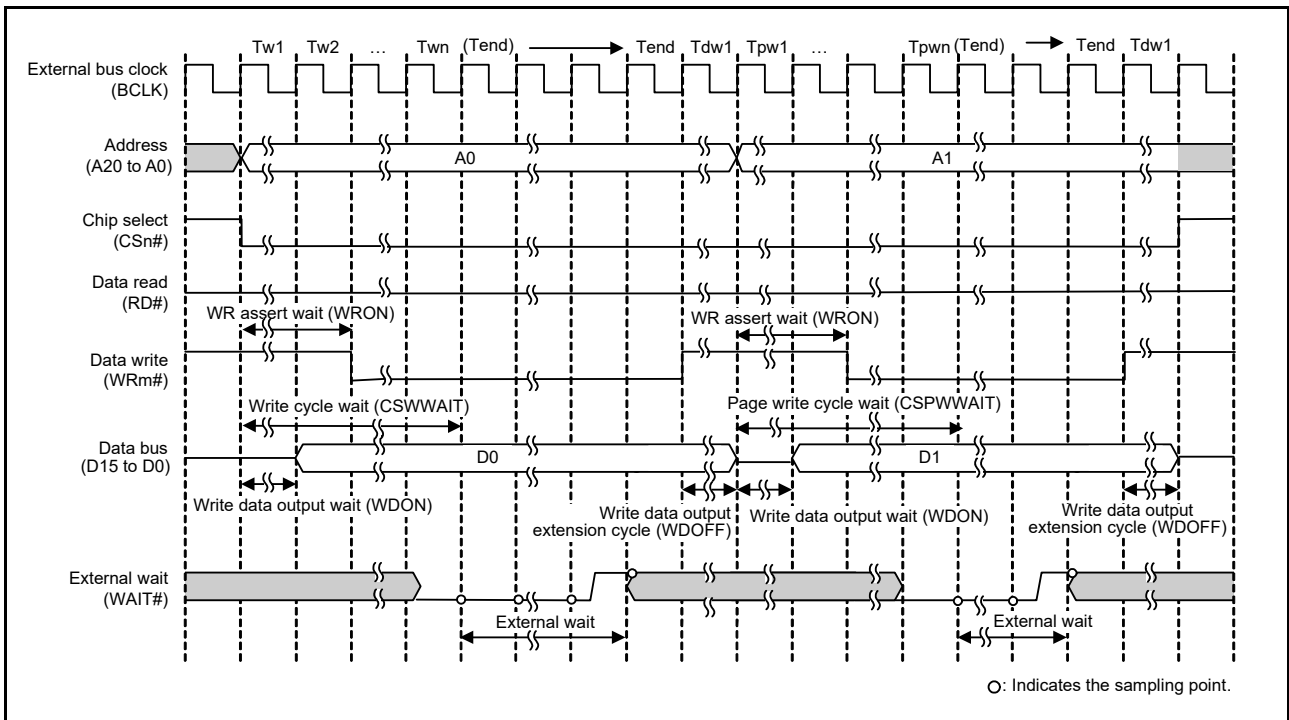

Figure 15.29 Example of External Wait Timing (Page-Read Access to 16-Bit Bus Space) (n = 0 to 3, m = 0, 1)

**Figure 15.30 Example of External Wait Timing (Page-Write Access to 16-Bit Bus Space, in Byte Strobe Mode) (n = 0 to 3, m = 0, 1)**

**(3) Address/Data Multiplexed I/O Interface**

In a data cycle with the address/data multiplexed I/O interface, programmed waits and pin waits using the WAIT pin can be inserted in the same way as that with the separate bus interface.

Address cycles are not affected by the wait control settings. Figure 15.31 shows an example of external wait insertion timing with the address/data multiplexed I/O interface.

**Figure 15.31 Example of External Wait Insertion Timing with Address/Data Multiplexed I/O Interface (m = 0, 1)**

### 15.5.4 Insertion of Recovery Cycles

Recovery cycles can be inserted between consecutive rounds of external bus access by setting the recovery cycle insertion enable bit in CSRECEN to 1.

The number of recovery cycles to be inserted after read cycles and write cycles can be separately set for each area using CSnREC. When the preceding bus cycle is a write access, the number of write recovery cycles should be set with the WRCV[3:0] bits for the area. When the preceding bus cycle is a read access, the number of read recovery cycles should be set with the RRCV[3:0] bits for the area. For example, when CS1 read access occurs after CS0 read access, the number of recovery cycles to be inserted between them is set by the RRCV[3:0] bits in CS0REC.

Recovery cycles can be inserted on any of the following eight conditions. The recovery cycle insertion can be enabled or disabled with the RCVENj (j = 0 to 7) in CSRECEN when the preceding bus access is a separate bus access, and with RCVENMj (j = 0 to 7) when the preceding bus access is an address/data multiplexed bus access.

- After a read access to the external bus, a read access is made to the external bus in the same area.
- After a read access to the external bus, a read access is made to the external bus in a different area.
- After a read access to the external bus, a write access is made to the external bus in the same area.
- After a read access to the external bus, a write access is made to the external bus in a different area.
- After a write access to the external bus, a read access is made to the external bus in the same area.
- After a write access to the external bus, a read access is made to the external bus in a different area.
- After a write access to the external bus, a write access is made to the external bus in the same area.
- After a write access to the external bus, a write access is made to the external bus in a different area.

The recovery cycle starts at the end of the preceding bus cycle, i.e. when the CSn# signal (n = 0 to 3) is negated. A high-level period of the CSn# signal is inserted for the specified recovery cycle period starting from this point.

The CSn# signal for the next round of bus access is asserted immediately after the end of recovery cycles in the fastest case. Even if the next request for access to an external address space is generated during the recovery period, the next round of access over the external bus will start immediately after the end of recovery cycles.

When two or more external bus access cycles are required for a single transfer request from a bus master and the recovery cycle insertion condition is satisfied, recovery cycles are also inserted between these bus access cycles. However, when page read access is enabled (CSnMOD.PRENB = 1) or page write access is enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted except after the last bus access cycle of the transfer even if the recovery cycle insertion condition is satisfied (Figure 15.34).

Similarly, during normal accesses with page access enabled, recovery cycles are not inserted between bus access cycles but inserted only after the last bus access cycle of the transfer.

With the address/data multiplexed I/O interface, when the recovery cycle insertion condition is satisfied, recovery cycles are inserted between bus access cycles regardless of the page access enable setting.

Figure 15.32 to Figure 15.34 show examples of recovery cycle insertion with the separate bus interface.

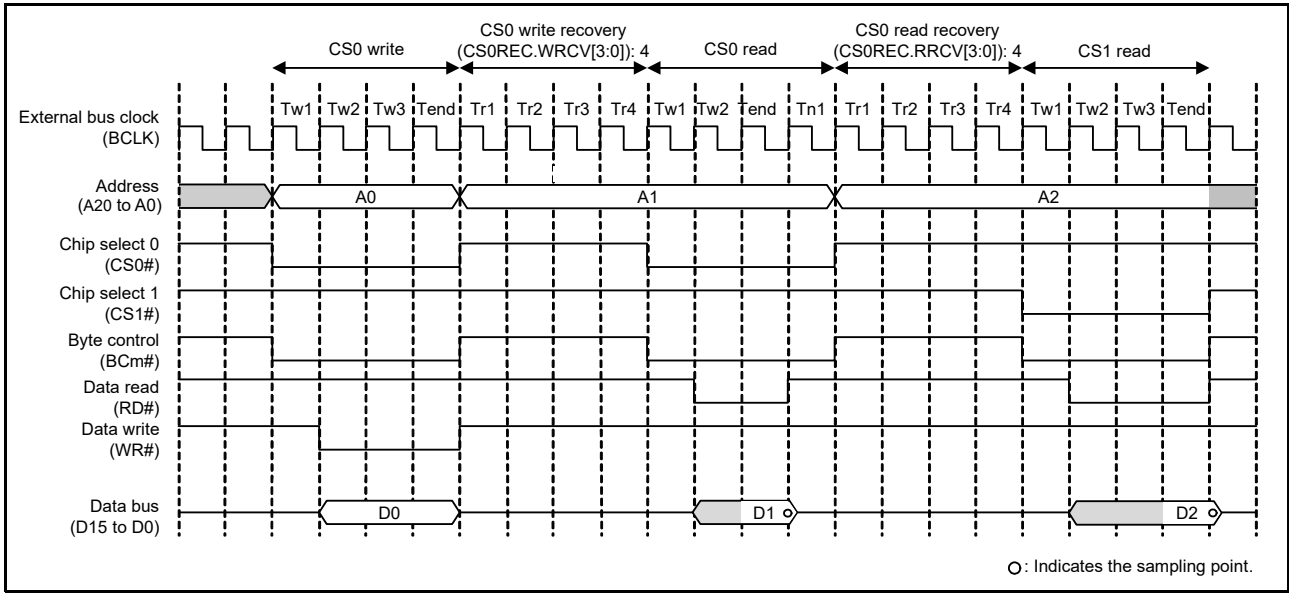

Figure 15.32 Example of Recovery Cycle Insertion with Separate Bus Interface (m = 0, 1)

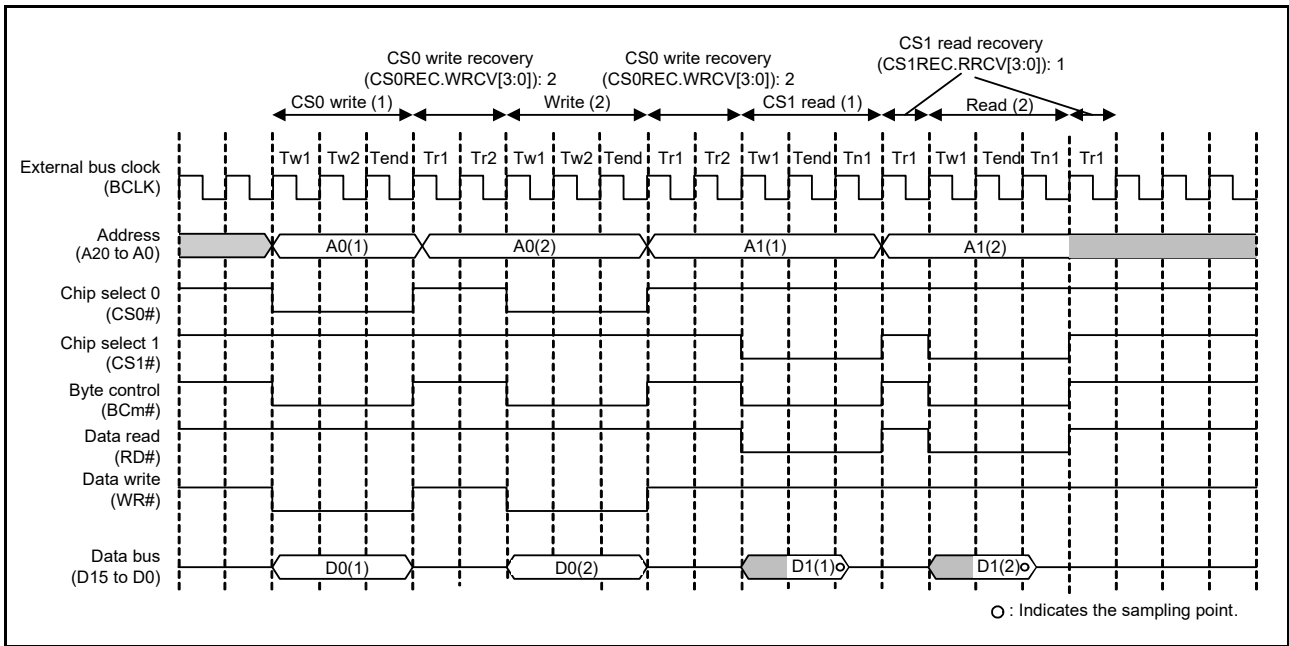

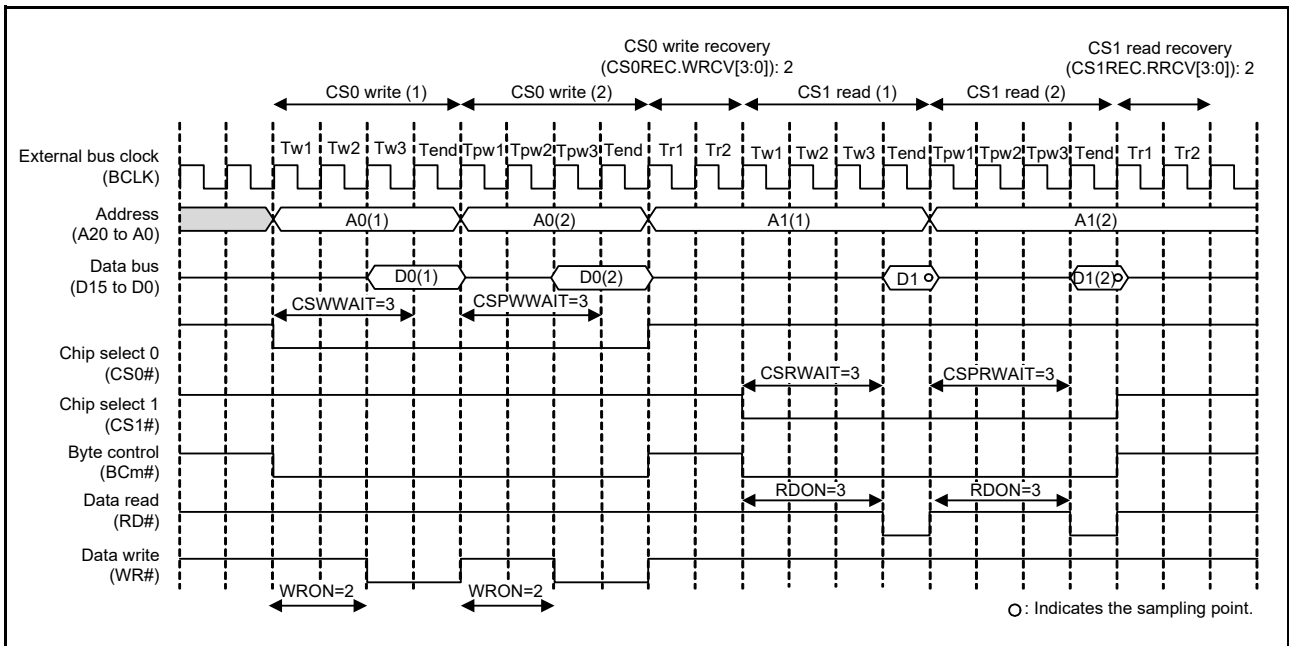

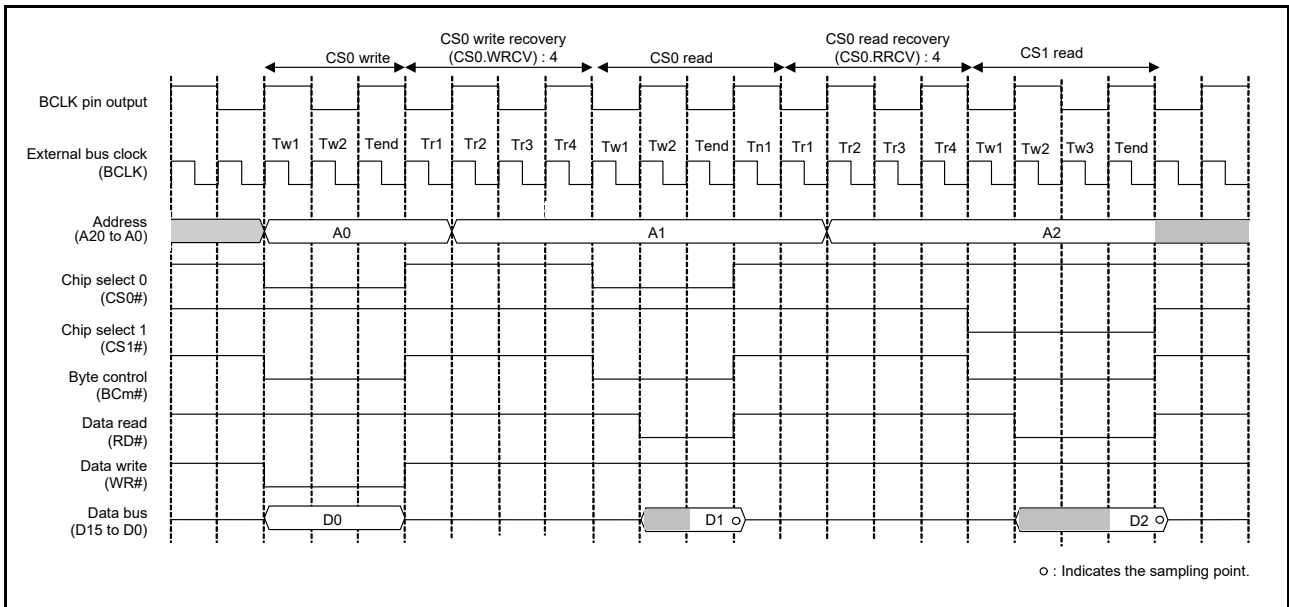

Figure 15.33 Example of Recovery Cycle Insertion When a Bus Access is Split (with Separate Bus Interface, Normal Access) (m = 0, 1)

**Figure 15.34** Example of Recovery Cycle Insertion When a Bus Access is Split (with Separate Bus Interface, Page Access) (m = 0, 1)

Figure 15.35 shows examples of operations when the BCLK pin output selection bits are set for frequency-division of BCLK by 2.

**Figure 15.35** Example of Operation for Recovery Cycles when the BCLK Pin Output Selection Bits are Set for Frequency-Division of BCLK by 2 (For the Case of Normal Access through a Separate Bus Interface) (m = 0, 1)

With the address/data multiplexed I/O interface, recovery cycles are inserted in the same way as that with the separate bus interface. Figure 15.36 and Figure 15.37 show examples of recovery cycle insertion with the address/data multiplexed I/O interface.

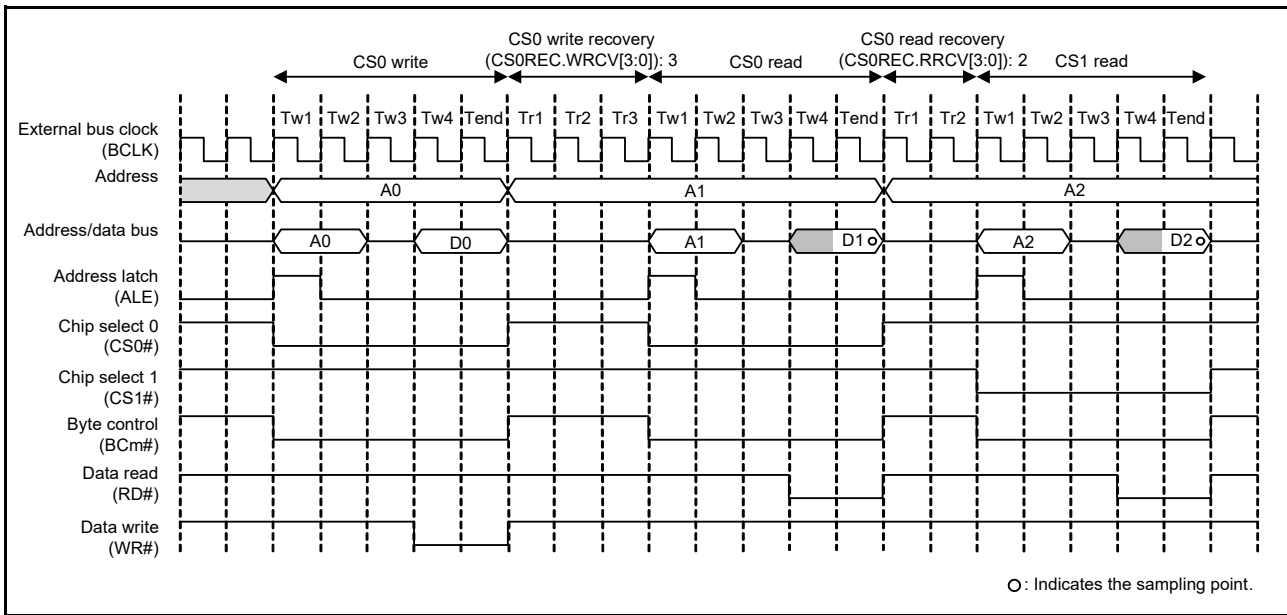

Figure 15.36 Example of Recovery Cycle Insertion with Address/Data Multiplexed I/O Interface (m = 0, 1)

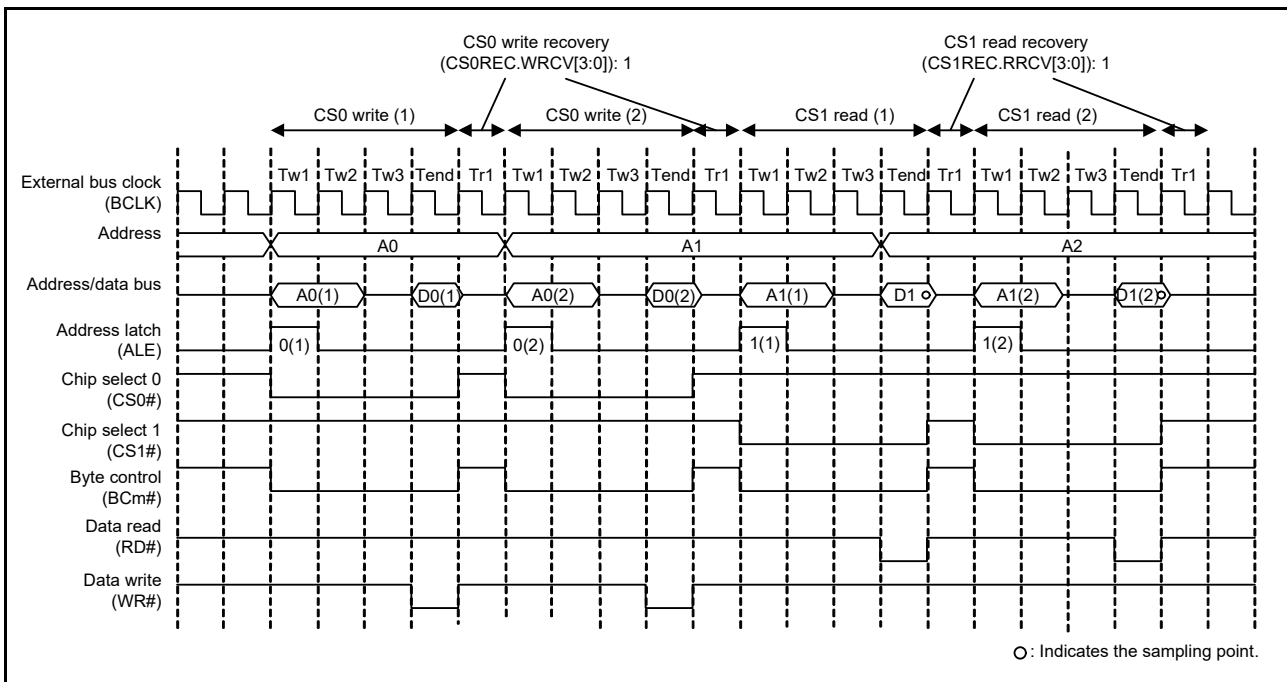

Figure 15.37 Example of Recovery Cycle Insertion When a Bus Access is Split with Address/Data Multiplexed I/O Interface (m = 0, 1)

### 15.5.5 No Access State

When no external address space is accessed, CSn#, BCn#, WRn#, and RDn# signals are high, ALE signal is low, and D15 to D0 are in the high-impedance state.

### 15.5.6 Write Buffer Function (External Bus)

The internal main bus is released by writing data to the write buffer before the write access is completed, which allows the next round of bus access to start. However, if the following round of bus access is to an external address space or to a register of the external bus controller, it is suspended until the external bus operations already in progress are completed. Figure 15.38 shows an example of operation when the write-buffer function is in use. When this function is in use, if the next operation after an external write is internal access, the internal access (access to on-chip memory or a peripheral module) is executed in parallel with the external write, i.e. without waiting for completion of the latter operation.

Figure 15.38 Example of Operation when the Write-Buffer Function is in Use

### 15.5.7 Limitations

#### (1) Limitations on Using Separate Bus Interface

- Limitations that apply to various bits of CSn wait control register 1 (CSnWCR1) and CSn wait control register 2 (CSnWCR2) at the times of normal and page accesses are listed in Table 15.9.

Even if the setting of the page-read access enable bit in the CSn mode register or the page-write access enable bit in the CSn mode register selects permission (CSnMOD.PRENB = 1 or CSnMOD.PWENB = 1), the first round of access for page access and the access that does not fall within the scope of page access are normal access operation, and thus limitations on normal access must be satisfied.

Table 15.9 Limitations at the Time of Normal and Page Access

| Limitations at the Time of Normal Access |                     | Limitations at the Time of Page Access |                      |
|------------------------------------------|---------------------|----------------------------------------|----------------------|
| Reading                                  | Writing             | Reading                                | Writing              |
| CSn[2:0] ≤ CSRWAIT                       | 1 ≤ WDon[2:0]       | CSn[2:0] ≤ CSPRWAIT                    | 1 ≤ WDon[2:0]        |
| RDn[2:0] ≤ CSRWAIT                       | CSn[2:0] ≤ CSWWAIT  | RDn[2:0] ≤ CSPRWAIT                    | CSn[2:0] ≤ CSPWWAIT  |
| CSn[2:0] ≤ RDON                          | WRn[2:0] ≤ CSWWAIT  | CSn[2:0] ≤ RDON                        | WRn[2:0] ≤ CSPWWAIT  |
|                                          | WDon[2:0] ≤ CSWWAIT |                                        | WDon[2:0] ≤ CSPWWAIT |
|                                          | WDOFF[2:0] ≤ CSWOFF |                                        | WDOFF[2:0] ≤ CSWOFF  |
|                                          | WDon[2:0] ≤ WRON    |                                        | WDon[2:0] ≤ WRON     |
|                                          | CSn[2:0] ≤ WRON     |                                        | CSn[2:0] ≤ WRON      |

- When two or more external bus access cycles are required for a single transfer request from a bus master and the recovery cycle insertion condition is satisfied with page read access enabled (CSnMOD.PRENB = 1) or page write access enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted between bus access cycles but inserted only after the last bus access cycle of the transfer.

## (2) Limitations on Using Address/Data Multiplexed Bus Interface

In the address/data multiplexed I/O space, page accesses are invalid. If a page access setting is specified, the setting is ignored and the normal read or write operation is performed.

**Table 15.10 Limitations at the Time of Normal and Page Access**

| Limitations at the Time of Normal Access |                            |
|------------------------------------------|----------------------------|
| Reading                                  | Writing                    |
| $CSON[2:0] \leq CSRWAIT$                 | $CSON[2:0] \leq CSWWAIT$   |
| $RDON[2:0] \leq CSRWAIT$                 | $WRON[2:0] \leq CSWWAIT$   |
| $CSON[2:0] \leq RDON$                    | $WDON[2:0] \leq CSWWAIT$   |
| $AWAIT[1:0] + 2 \leq RDON$               | $WDOFF[2:0] \leq CSWOFF$   |
| $CSON[2:0] \leq AWAIT$                   | $WDON[2:0] \leq WRON$      |
|                                          | $CSON[2:0] \leq WRON$      |
|                                          | $AWAIT[1:0] + 2 \leq WRON$ |
|                                          | $AWAIT[1:0] + 2 \leq WDON$ |
|                                          | $CSON[2:0] \leq AWAIT$     |

## (3) Limitation when a Pin is Multiplexed between A0 and BC0# Functions

When the A0 and BC0# pin functions share the same pin, setting the single write strobe mode is prohibited in the 8-bit bus space; otherwise the operation is not guaranteed.

## (4) Limitations when 1/2 BCLK is Selected with BCLK Pin Output Select Bit

When 1/2 BCLK is selected through the BCLK pin output select bit, the external bus access cycle starts at the rising edge of the BCLK pin output. However, when two or more external bus access cycles are generated for a single transfer request from a bus master, the second or subsequent external bus access cycle may start at the falling edge of the BCLK pin output depending on the wait cycle settings. Make appropriate register settings according to the specifications of the device to be connected.

## (5) Prohibition of Access that Spans Areas of Address Space

Single access that spans several areas of the address space is prohibited, and operation of such an access is not guaranteed. Setting must be made so that two areas are not accessed at the same time by a single word or longword access.

## (6) Restrictions on RMPA and String-Manipulation Instructions

- Although the external space has a per-area ending-switching facility (only for data), the allocation of data to be handled by RMPA or string-manipulation instructions to an area where the endian differs from that of the chip is prohibited, and operation is not guaranteed if this restriction is not observed. If data to be handled by RMPA or string-manipulation instructions are allocated to the external space, they must be allocated to areas where the endian setting is the same as that for the chip.
- The allocation of data to be handled by RMPA or string-manipulation instructions to I/O registers is prohibited, and operation is not guaranteed if this restriction is not observed.

## (7) Restriction on Instruction Code

When the endian setting for each area is different from that for the chip, no instruction code can be allocated in the area. The instruction code should be allocated to the external space whose endian setting is the same as that for the chip.

## 15.6 Bus Error Monitoring Section

The bus error monitoring section monitors the individual areas for bus errors, and when a bus error occurs, the error is indicated to the bus master.

### 15.6.1 Types of Bus Error

There are two types of bus error: illegal address access and timeout.

Illegal address access is the detection of illegal access to an area, and time-out is the detection of a bus-access operation not being completed within 768 cycles.

#### 15.6.1.1 Illegal Address Access

When the illegal address access detection enable bit (IGAEN) in the bus error monitoring enable register (BEREN) is set to 1, access of the following types leads to illegal address access errors.

- Access to areas of external space for which operation has been disabled (CSnCR.EXENB = 0)
- With respect to areas other than those described above, access to illegal address ranges  
The address ranges where access will lead to illegal address access errors are indicated in Table 15.11.

#### 15.6.1.2 Timeout

When the timeout detection enable bit (TOEN) in the bus error monitoring enable register (BEREN) is set to 1, bus access that is not completed within 768 cycles leads to a timeout error.

- CS areas (CS0 to CS3): Bus access is not completed (the WAIT# signal is not negated) within 768 external bus clock (BCLK) cycles from the start of the access.  
Once a timeout error occurs, accesses from the bus master are rejected for 256 BCLK cycles. If multiple external bus accesses are generated with a single request from the bus master during the transfer, the bus accesses cannot be stopped by a timeout. At this time, timeout errors may occur repeatedly.
- Internal peripheral buses (2 and 3): Bus access is not completed within 768 peripheral module clock (PCLKB) cycles from the start of the access. In this MCU, a timeout error does not occur.  
Once a timeout error occurs, accesses from the bus master are rejected for 256 PCLKB cycles.
- Internal peripheral buses (4): Bus access is not completed within 768 peripheral module clock (PCLKA) cycles from the start of the access.  
Once a timeout error occurs, accesses from the bus master are rejected for 256 PCLKA cycles.
- Internal peripheral bus (6): Bus access is not completed within 768 FlashIF clock (FCLK) cycles from the start of the access.  
Once a timeout error occurs, accesses from the bus master are rejected for 256 FCLK cycles. In this MCU, a timeout error does not occur.

### 15.6.2 Operations When a Bus Error Occurs

When a bus error occurs, the error is indicated to the CPU. Operation is not guaranteed when a bus error occurs.

- Bus error indication to the CPU  
An interrupt is generated. The IERn register in the ICU can specify whether to generate an interrupt in the case of a bus error.

### 15.6.3 Conditions Leading to Bus Errors

Table 15.11 lists the types of bus errors for each area in the respective address space.

If an illegal address access error or timeout is detected when no bus error has occurred (bus error status register n (BERSRn; n = 1 or 2) is cleared), the detected error is reflected on the BERSRn. Once a bus error occurs, no subsequent bus errors are reflected on the register unless the register is cleared.

If bus errors are simultaneously caused by two or more bus masters, error information of only one bus master is reflected. Once a bus error occurs, the status is retained until BERSRn is cleared.

**Table 15.11 Types of Bus Errors**

| Address                  | Type of Area                             |                    | Type of Error          |          |                   |          |
|--------------------------|------------------------------------------|--------------------|------------------------|----------|-------------------|----------|
|                          |                                          |                    | Illegal Address Access |          | Timeout           |          |
|                          | Code Flash Memory                        |                    | Code Flash Memory      |          | Code Flash Memory |          |
|                          | Enabled                                  | Disabled           | Enabled                | Disabled | Enabled           | Disabled |
| 0000 0000h to 0007 FFFFh | Memory bus 1                             |                    | —                      | —        | —                 | —        |
| 0008 0000h to 0008 7FFFh | Internal peripheral bus 1                |                    | —                      | —        | —                 | —        |
| 0008 8000h to 0009 FFFFh | Internal peripheral bus 2                |                    | Δ                      | —        | —                 | —        |

| 8000 0000h to FEFF FFFFh | Memory bus 2                             | Reserved area      | —                      | ✓        | —                 | —        |
| FF00 0000h to FF7F FFFFh |                                          | External bus (CS0) | —                      | [IA]     | —                 | [TO]     |
| FF80 0000h to FFFF FFFFh |                                          |                    | —                      | —        | —                 | —        |

—: A bus error does not result.

Δ: A bus error may or may not result.

✓: A bus error results.

[IA]: Access to this area leads to detection of a bus error if operation for this area is disabled (CSnCR.EXENB = 0; n = 0 to 3).

[TO]: Bus access not being completed within 768 cycles leads to detection of a bus error.

Note: The capacity of the RAM, data flash memory, and code flash memory differs depending on the product. For details, see section 43, RAM, section 44, Flash Memory (FLASH).

## 15.7 Interrupt

### 15.7.1 Interrupt Source

An illegal address access error or detection of a timeout leads to a bus error signal for the interrupt controller.

**Table 15.12 Interrupt Source**

| Name   | Interrupt Source                        | DTC Trigger  | DMAC Trigger |
|--------|-----------------------------------------|--------------|--------------|
| BUSERR | Illegal address access error or timeout | Not possible | Not possible |

## 16. Memory-Protection Unit (MPU)

### 16.1 Overview

The RXv3 CPU incorporates a memory-protection unit that checks the addresses of CPU access to the overall address space (0000 0000h to FFFF FFFFh).

Access-control information can be set for up to eight regions, and permission for access to each region is in accord with this information. The default response to the detection of access to a region where permission has not been set is the generation of a memory-protection error.

The supported access-control information for the individual regions consists of permission to read, permission to write, and permission to execute. This access-control information is effective when the processor mode of the CPU is user mode. Memory protection is not applied when the CPU is in supervisor mode.

Table 16.1 lists the specifications of the memory-protection unit, and Figure 16.1 shows a block diagram of the memory-protection unit.

**Table 16.1 Specifications of Memory Protection**

| Specifications                                                                   | Description                                                                                                                                                                                 |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Region to be covered by memory protection and processor mode                     | 0000 0000h to FFFF FFFFh (in user mode)<br>No memory protection in supervisor mode                                                                                                          |
| Number of regions                                                                | 8                                                                                                                                                                                           |
| Page size (smallest unit of protection)                                          | 16 bytes                                                                                                                                                                                    |
| Specifying addresses of individual regions                                       | Setting the page numbers where regions start and end                                                                                                                                        |
| Setting to make memory protection effective or ineffective in individual regions | A V (valid) bit in each region-n end page number register (REPAGEn) makes the settings effective or ineffective for the corresponding region (n = 0 to 7).                                  |
| Access-control information settings for individual regions                       | Instruction execution: Permission to execute<br>Operand access: Permission to read, permission to write                                                                                     |
| Start of memory-protection operations                                            | After the memory-protection unit has been enabled, access monitoring starting up with the transition to user mode.                                                                          |
| Memory-protection error processing                                               | Generation of access exceptions                                                                                                                                                             |
| Addresses where memory-protection errors are generated                           | Address in instruction execution: The PC value is preserved on the stack.<br>Address in operand access: The address is stored in the data memory-protection error address register (MPDEA). |
| Determining the reasons for memory-protection errors                             | The memory-protection error status register (MPESTS) holds indicators of the reason.                                                                                                        |
| Background region setting                                                        | Access-control information can be set for the background region (the whole address space).                                                                                                  |
| Processing where regions overlap                                                 | The access-control information for access to an overlap between regions is the logical OR of the attributes for the given regions, and permission is given priority.                        |

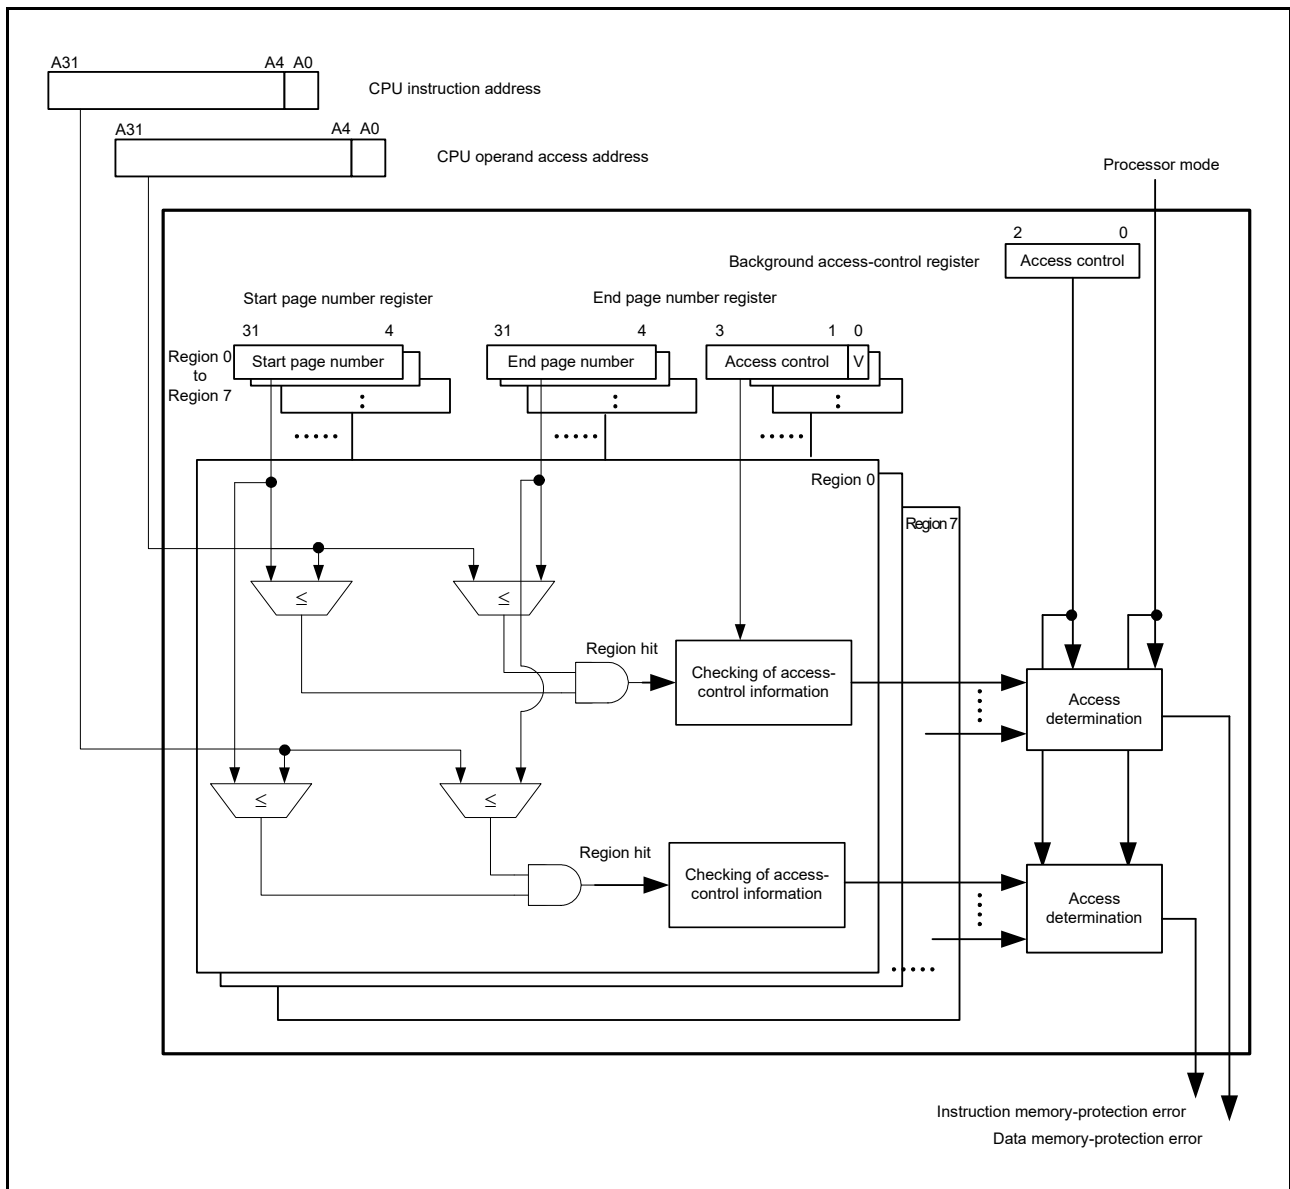

Figure 16.1 Block Diagram of the Memory-Protection Unit

### 16.1.1 Types of Access Control

There are three types of access control information: permission for instruction execution, permission to read operands, and permission to write operands. Violations of these types of access control are only detected when programs are running in user mode. Violations are not detected when programs are running in supervisor mode.

### 16.1.2 Regions for Access Control

Up to eight regions for access control are definable. Settings of the range of memory for each access-control region are made in the corresponding region-n start page number register (RSPAGEn) and region-n end page number register (REPAGEn), where n = 0 to 7.

The minimum unit for control of access is the “page”, by which the address space is divided into 16-byte units. The 28 higher-order bits ([31:4]) of the address [31:0] bits correspond to the page number.

The REPAGEn register specifies the access-control information for each area and whether the area is enabled or not.

### 16.1.3 Background Region

“Background region” refers to the whole address space (0000 0000h to FFFF FFFFh). Access-control information for the background region is set in the background-region access-control register (MPBAC). In contrast to the access-control information for the eight individual regions, protection information for the background region is effective as long as memory protection is enabled (the MPEN bit in the MPEN register is 1).

### 16.1.4 Overlap between Regions

In cases of overlap between multiple regions, the access-control information becomes the logical OR of the access-control bits for the overlapping regions (including the background region), with permission given priority.

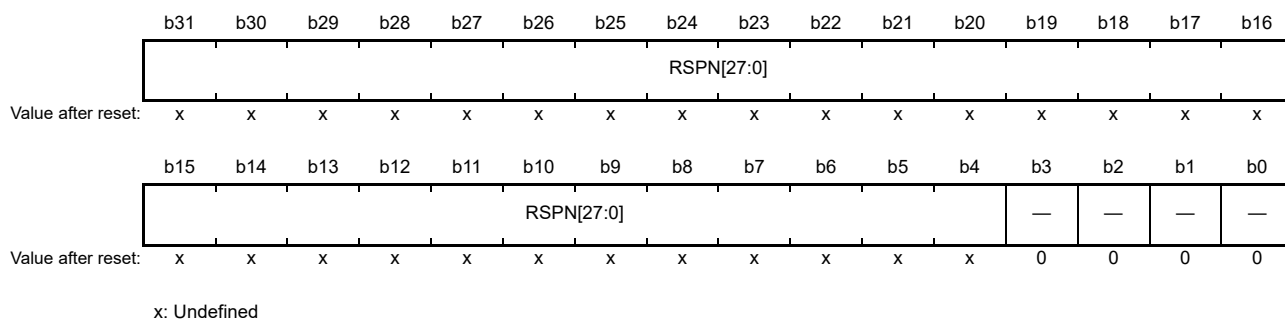

### 16.1.5 Instructions and Data that Span Regions

Operations in response to the detection of memory-protection errors when instructions or data span regions for which different access-control settings have been made are undefined. Ensure that instructions and data do not span regions for which different access-control settings have been made.

## 16.2 Register Descriptions

### 16.2.1 Region-n Start Page Number Register (RSPAGEn) (n = 0 to 7)

Address(es): RSPAGE0 0008 6400h, RSPAGE1 0008 6408h, RSPAGE2 0008 6410h, RSPAGE3 0008 6418h, RSPAGE4 0008 6420h, RSPAGE5 0008 6428h, RSPAGE6 0008 6430h, RSPAGE7 0008 6438h

| Bit       | Symbol     | Bit Name                 | Description                                                          | R/W |
|-----------|------------|--------------------------|----------------------------------------------------------------------|-----|
| b3 to b0  | —          | Reserved                 | These bits are read as 0. The write value should be 0.               | R/W |
| b31 to b4 | RSPN[27:0] | Region-Start Page Number | Page number where the region starts, for use in region determination | R/W |

#### RSPN[27:0] Bits (Region-Start Page Number)

These bits specify the page number where the region starts.

### 16.2.2 Region-n End Page Number Register (REPAGEn) (n = 0 to 7)

Address(es): REPAGE0 0008 6404h, REPAGE1 0008 640Ch, REPAGE2 0008 6414h, REPAGE3 0008 641Ch, REPAGE4 0008 6424h, REPAGE5 0008 642Ch, REPAGE6 0008 6434h, REPAGE7 0008 643Ch

| Bit       | Symbol     | Bit Name                         | Description                                                                                                                                                           | R/W |
|-----------|------------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b0        | V          | Valid Bit                        | 0: Region setting invalid<br>1: Region setting valid                                                                                                                  | R/W |
| b3 to b1  | UAC[2:0]   | Access Control Bits in User Mode | b3<br>0: Reading prohibited<br>1: Reading permitted<br>b2<br>0: Writing prohibited<br>1: Writing permitted<br>b1<br>0: Execution prohibited<br>1: Execution permitted | R/W |
| b31 to b4 | REPN[27:0] | Region-End Page Number           | Page number where the region ends, for use in region determination                                                                                                    | R/W |

#### V Bit (Valid Bit)

This bit enables or disables the settings for the corresponding region.  
 This bit is set to 0 when the region invalidation operation register (MPOPI) invalidates all access-controlled areas.

#### UAC[2:0] Bits (Access Control Bits in User Mode)

These bits specify the access control in user mode.

#### REPN[27:0] Bits (Region-End Page Number)

These bits specify the page number where the region ends.  
 Specify a value that is greater than or equal to the page number where the corresponding region starts. The page specified by the region-end page number is part of the target region for memory protection.

### 16.2.3 Memory-Protection Enable Register (MPEN)

Address(es): 0008 6500h

| Bit       | Symbol | Bit Name                 | Description                                                                   | R/W |
|-----------|--------|--------------------------|-------------------------------------------------------------------------------|-----|
| b0        | MPEN   | Memory-Protection Enable | 0: The memory protection is disabled.<br>1: The memory protection is enabled. | R/W |
| b31 to b1 | —      | Reserved                 | These bits are read as 0. The write value should be 0.                        | R/W |

#### MPEN Bit (Memory-Protection Enable)

This bit enables or disables the memory protection.

After 1 has been written to this bit, address checking for memory protection by the CPU starts on the execution of a branch instruction (RTE or RTFI) that shifts operation to the user mode.

### 16.2.4 Background Access Control Register (MPBAC)

Address(es): 0008 6504h

| Bit       | Symbol    | Bit Name                                    | Description                                                                                                                                                           | R/W |
|-----------|-----------|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b0        | —         | Reserved                                    | This bit is read as 0. The write value should be 0.                                                                                                                   | R/W |
| b3 to b1  | UBAC[2:0] | Background Access Control Bits in User Mode | b3<br>0: Reading prohibited<br>1: Reading permitted<br>b2<br>0: Writing prohibited<br>1: Writing permitted<br>b1<br>0: Execution prohibited<br>1: Execution permitted | R/W |
| b31 to b4 | —         | Reserved                                    | These bits are read as 0. The write value should be 0.                                                                                                                | R/W |

#### UBAC[2:0] Bits (Background Access Control Bits in User Mode)

These bits specify the background access control in user mode.

### 16.2.5 Memory-Protection Error Status-Clearing Register (MPECLR)

Address(es): 0008 6508h

| Bit       | Symbol | Bit Name              | Description                                                                                                                             | R/W |
|-----------|--------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| b0        | CLR    | Error Status-Clearing | [Reading]<br>0: Fixed value for reading<br>[Writing]<br>0: Nothing is done.<br>1: The DRW, DMPER and IMPER bits in MPESTS are set to 0. | R/W |
| b31 to b1 | —      | Reserved              | These bits are read as 0. The write value should be 0.                                                                                  | R/W |

#### CLR Bit (Error Status-Clearing)

This bit clears the data read/write bit (DRW), the data memory-protection error generation bit (DMPER), and the instruction memory-protection error generation bit (IMPER) in the memory-protection error status register (MPESTS) to 0.

## 16.2.6 Memory-Protection Error Status Register (MPESTS)

Address(es): 0008 650Ch

|                    |     |     |     |     |     |     |     |     |     |     |     |     |     |     |       |       |

| b31 to b3 | —      | Reserved                                       | These bits are read as 0. The write value should be 0.                                                            | R/W |

### IMPER Bit (Instruction Memory-Protection Error Generation)

This bit indicates the state of memory-protection error generation by instruction execution.

Setting the error status-clearing bit (CLR) in the memory-protection error status-clearing register (MPECLR) to 1 clears this bit to 0.

### DMPER Bit (Data Memory-Protection Error Generation)

This bit indicates the state of memory-protection error generation by operand access.

Setting the error status-clearing bit (CLR) in the memory-protection error status-clearing register (MPECLR) to 1 clears this bit to 0.

### DRW Bit (Data Read/Write)

For a memory-protection error produced by operand access, this bit indicates the read/write attribute of the access operation. This bit is only valid when the DMPER bit is 1.

Setting the error status-clearing bit (CLR) in the memory-protection error status-clearing register (MPECLR) to 1 clears this bit to 0.

### 16.2.7 Data Memory-Protection Error Address Register (MPDEA)

Address(es): 0008 6514h

| Bit       | Symbol    | Bit Name                             | Description                          | R/W |
|-----------|-----------|--------------------------------------|--------------------------------------|-----|
| b31 to b0 | DEA[31:0] | Data Memory-Protection Error Address | Data memory-protection error address | R   |

#### DEA[31:0] Bits (Data Memory-Protection Error Address)

These bits retain the address for which operand access generated a memory-protection error.

### 16.2.8 Region Search Address Register (MPSA)

Address(es): 0008 6520h

| Bit       | Symbol   | Bit Name              | Description                  | R/W |
|-----------|----------|-----------------------|------------------------------|-----|
| b31 to b0 | SA[31:0] | Region Search Address | Address for region searching | R/W |

#### SA[31:0] Bits (Region Search Address)

These bits specify the address for use in comparison with region-start addresses in the region-n start page number registers (RSPAGEn) and region-end addresses in the region-n end page number registers (REPAGEn).

### 16.2.9 Region Search Operation Register (MPOPS)

Address(es): 0008 6524h

|                    |     |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |

|-----------|--------|-------------------------|-----------------------------------------------------------------------------------------------------------------------|-----|
| b0        | S      | Region Search Operation | [Reading]<br>0: Fixed value for reading<br>[Writing]<br>0: Nothing is done.<br>1: A region-search operation proceeds. | R/W |
| b15 to b1 | —      | Reserved                | These bits are read as 0. The write value should be 0.                                                                | R/W |

#### S Bit (Region Search Operation)

Setting this bit to 1 makes the memory-protection unit perform a region-search operation. The address specified in the region search address register (MPSA) is compared with the address information for individual regions to search for a hitting region.

The result of searching is stored in the data-hit region bits (HITD[7:0]) of the data-hit region register (MHITD).

Moreover, the logical OR of the respective access control bits for hitting regions is stored in the data-hit region access control bits (UHACD[2:0]) in user mode.

### 16.2.10 Region Invalidation Operation Register (MPOPI)

Address(es): 0008 6526h

|                    |     |     |     |     |     |     |    |    |    |    |    |    |    |    |    |     |
|--------------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|-----|
|                    | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0  |
|                    | —   | —   | —   | —   | —   | —   | —  | —  | —  | —  | —  | —  | —  | —  | —  | INV |
| Value after reset: | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0   |

| Bit       | Symbol | Bit Name                | Description                                                                                                                    | R/W |
|-----------|--------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------|-----|
| b0        | INV    | Region Invalidate Start | [Reading]<br>0: Fixed value for reading<br>[Writing]<br>0: Nothing is done.<br>1: All access-controlled areas are invalidated. | R/W |
| b15 to b1 | —      | Reserved                | These bits are read as 0. The write value should be 0.                                                                         | R/W |

#### INV Bit (Region Invalidate Start)

Setting this bit to 1 clears the valid (V) bits in all of the region-n end page number registers (REPAGEn) to 0. After a V bit is set to 0, all settings other than background access-control settings are invalid.

### 16.2.11 Instruction-Hit Region Register (MHITI)

Address(es): 0008 6528h

| Bit        | Symbol     | Bit Name                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | R/W |

#### UHACI[2:0] Bits (Instruction-Hit Region Access Control Bits in User Mode)

These bits hold the user-mode access control bits (REPAGEn.UAC[2:0]) for the region where the instruction memory-protection error was generated.

If the error was generated in an overlap between regions, the value stored here is the logical OR of the user-mode access control bits for the corresponding regions (including the background region).

**HITI[7:0] Bits (Instruction-Hit Region)**

These bits indicate the region where an instruction memory-protection error was generated. These bits are set to 0000 0000b in response to the generation of an instruction memory-protection error in the background region.

### 16.2.12 Data-Hit Region Register (MHITD)

Address(es): 0008 652Ch

**UHACD[2:0] Bits (Data-Hit Region Access Control Bits in User Mode)**

These bits hold the user-mode access control bits (REPAGEn.UAC[2:0]) that have been set for the region where a data memory-protection error was generated or the region that produced a hit in region searching.

When an error is generated in an overlap between regions or a hit was generated in region searching, the value stored here is the logical OR of the user-mode access control bits for the corresponding regions (including the background region).

**HITD[7:0] Bits (Data-Hit Region)**

These bits indicate the region where a data memory-protection error was generated or the region that produced a hit in a region search. These bits are set to 0000 0000b for a data memory-protection error generated in the background region.

**Note:** When access to a register of memory protection unit in user mode generates a data memory-protection error, the value in this register is set to 0000 0000h.

## 16.3 Functions

### 16.3.1 Memory Protection

Memory protection means monitoring, in accord with the access-control information that has been set for the individual access-control regions and the background region, whether or not access by programs running in user mode violates the access-control settings. The memory-protection unit notifies the CPU of access-control violations (or memory-protection errors) when they are detected, causing the CPU to start access-exception processing.

Memory protection is enabled by setting the memory-protection enable (MPEN) bit in the memory-protection enable (MPEN) register to 1.

An instruction memory-protection error is generated on detection of an instruction-execution violation and a data memory-protection error is generated on detection of an operand-access reading or writing violation. Operand access that leads to a data memory-protection error is not actually executed.

### 16.3.2 Region Search

Region search means enquiry as to which of the eight specified access regions was “hit” and how the access-control information (permission to execute, to read, and to write) is set.

When the region search operation (S) bit in the region-search operation (MPOPS) register is set to 1, the address specified in the region search address (MPSA) register is compared with the addresses for the individual regions. After a region search is executed, the data-hit region register (MHITD) indicates the logical OR of the access-control information for the region which was “hit” and for the other regions.

### 16.3.3 Protection of Registers Related to the Memory-Protection Unit

Registers related to the memory-protection unit are not accessible through means of access other than operand access by the CPU (i.e. by instruction fetching or DMA). The registers related to the memory-protection unit are only accessible in supervisor mode. Attempted access to registers related to the memory-protection unit in user mode through operand access by the CPU leads to a data memory-protection error regardless of whether or not memory protection is in effect at the given location.

### 16.3.4 Flow for Determination of Access by the Memory-Protection Function

Figure 16.2 shows the flow of determination in the case of data access and Figure 16.3 shows the flow of determination in the case of instruction access.

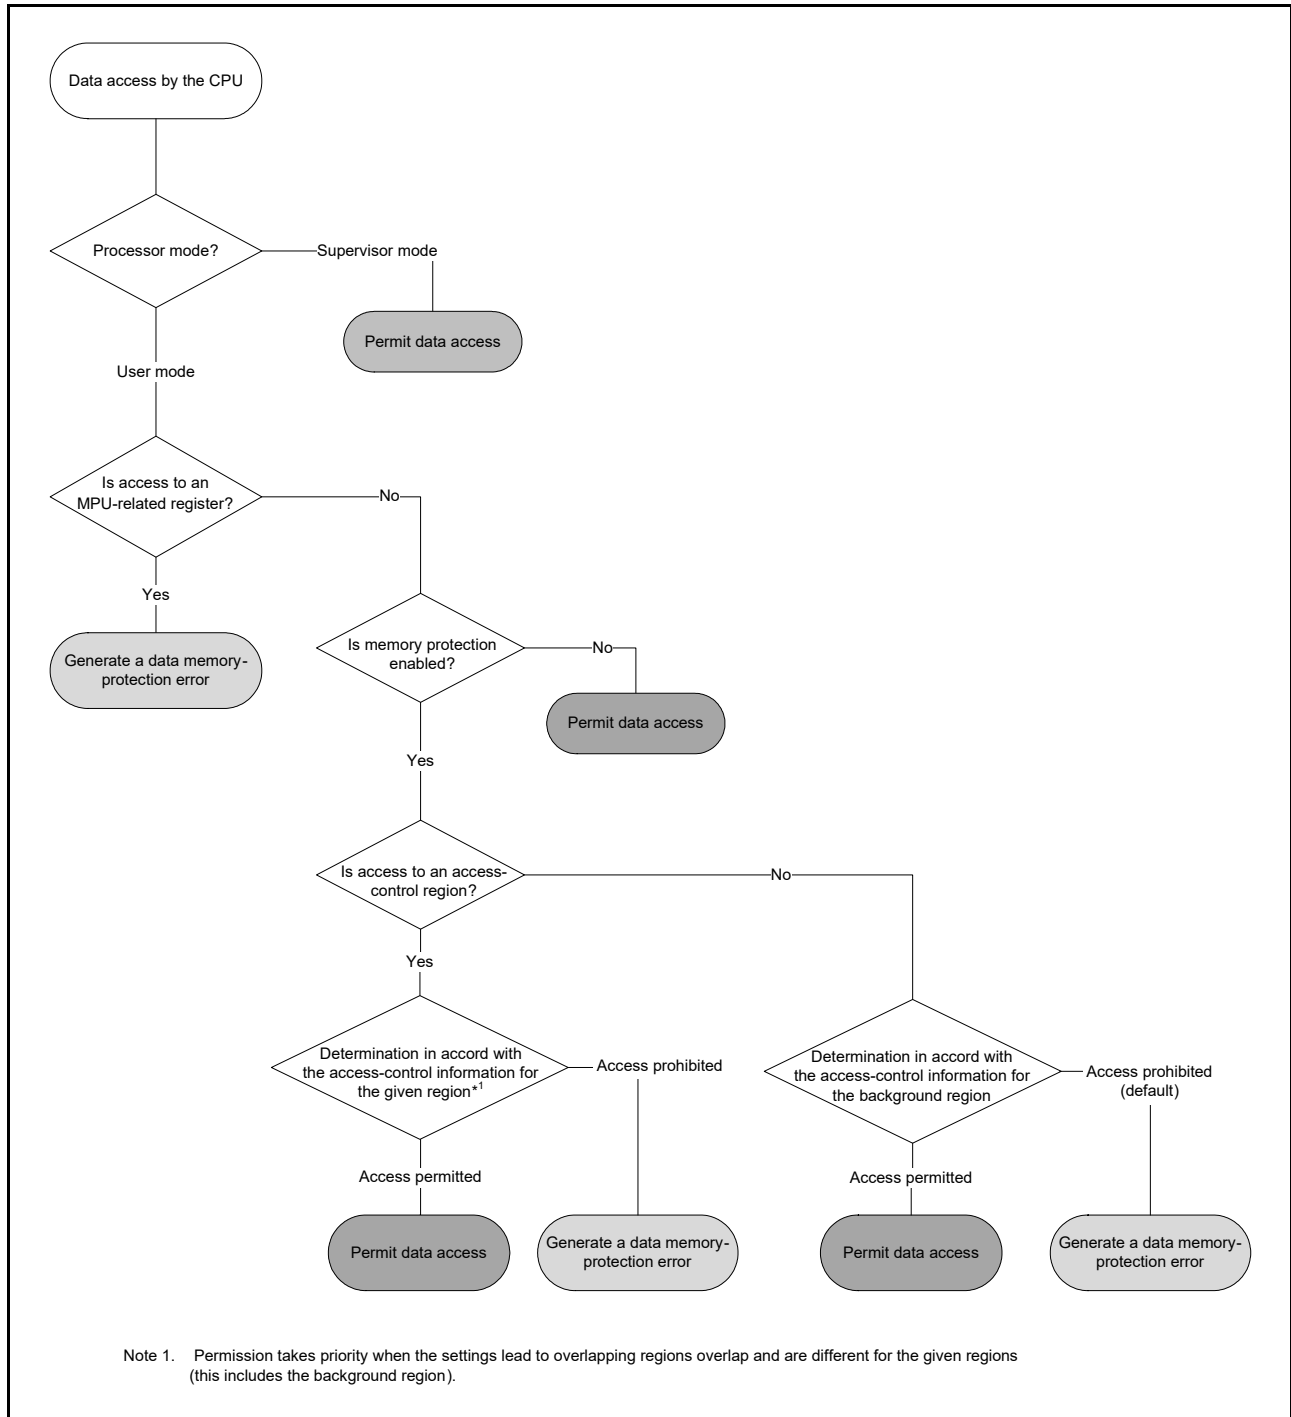

Figure 16.2 Flow of Determination for Data Access

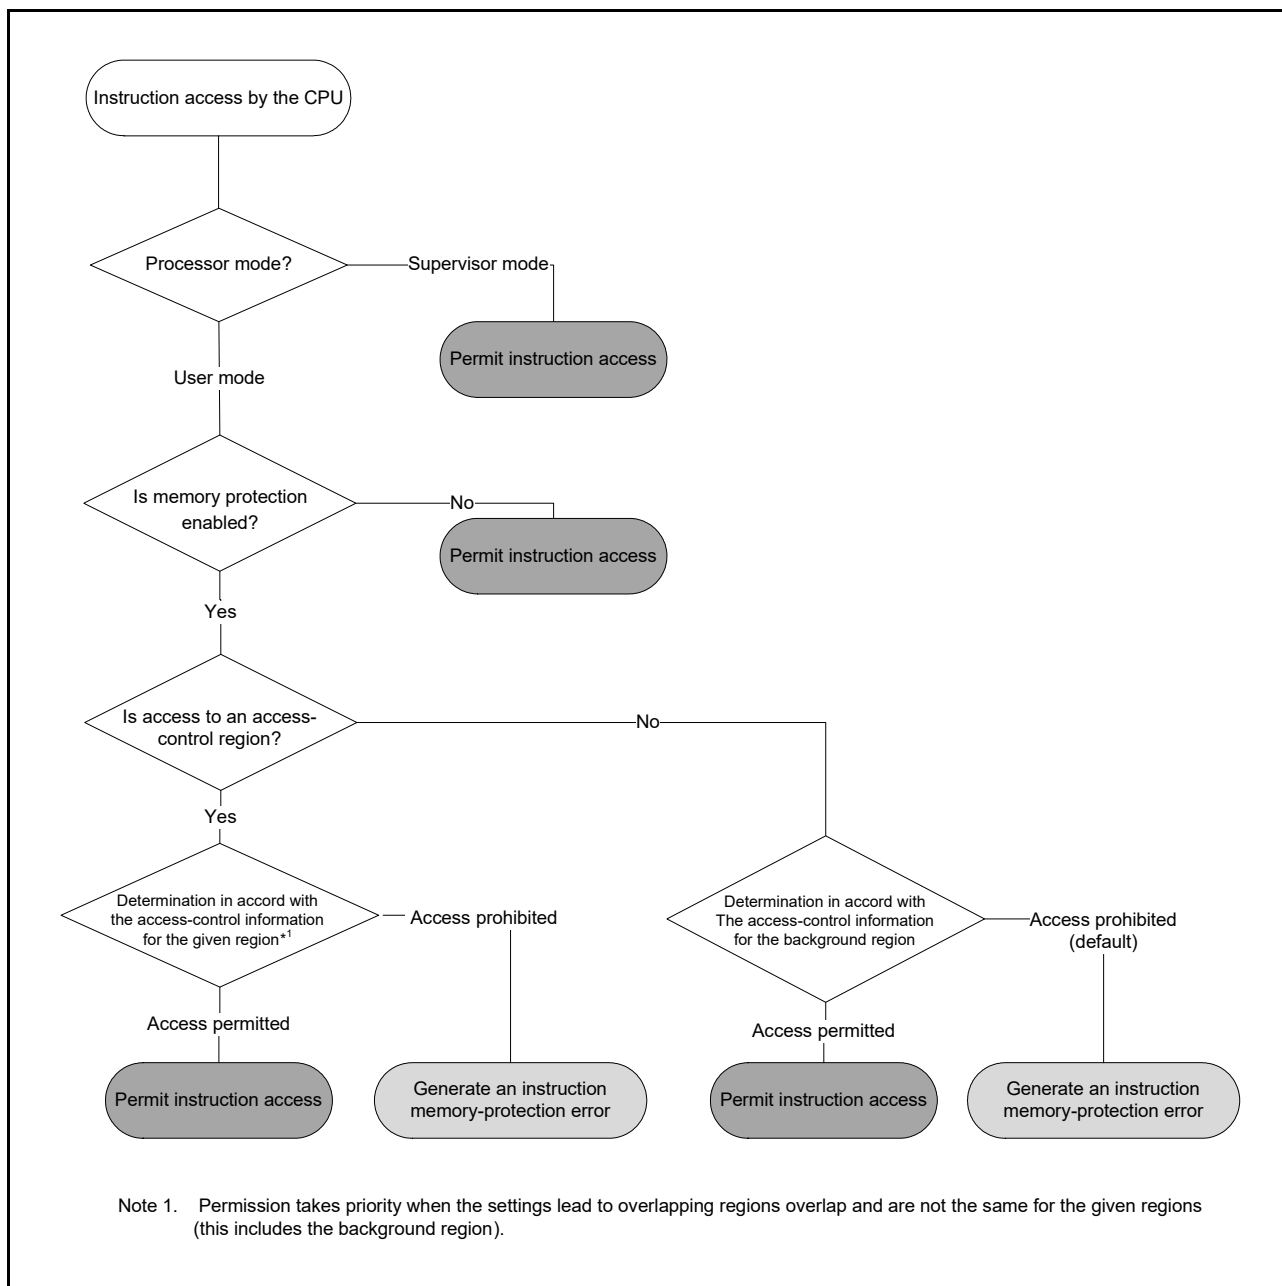

Figure 16.3 Flow of Determination for Instruction Access

## 16.4 Procedures for Using Memory Protection

### 16.4.1 Setting Access-Control Information

Access-control information for the various regions is set in supervisor mode.

Settings for up to eight access-control regions are made in the region-n start page number registers (RSPAGEn) and region-n end page number registers (REPAGEn), where n = 0 to 7.

Settings for the background access-control region are made in the background access-control register (MPBAC).

### 16.4.2 Enabling Memory Protection

Setting the memory-protection enable (MPEN) bit in the memory-protection enable (MPEN) register to 1 while operation is in supervisor mode enables memory protection.

### 16.4.3 Transition to User Mode

After updating the registers related to the memory-protection unit, read any of these registers and check that the settings have been made before the transition to user mode.

Either of the methods below can be used for the transition from supervisor mode to user mode.

- Set the processor mode setting (PM) bit in the copy of the processor status word (PSW) saved in the stack area to 1 (the setting for user mode) and then execute an RTE instruction.
- Set the PM bit in the backup processor status word (BPSW) to 1 and then execute an RTFI instruction.

**Note:** Using an MVTC or POPC instruction to write to the PSW.PM bit is invalid. Use an RTE or RTFI instruction to update the value of the PSW.PM bit.

The memory-protection unit starts checking instruction-execution access and operand access by the CPU on the transition to user mode.

### 16.4.4 Processing in Response to Memory-Protection Errors

The CPU starts access-exception processing on detection of a violation of protection set up by the access-control information (i.e. a memory-protection error). For details on CPU operations in access-exception processing, refer to section 13, Exception Handling.

To determine whether an instruction memory-protection error or data memory-protection error has been generated, check the values of the instruction memory-protection error generation (IMPER) and data memory-protection error generation (DMPER) bits in the memory-protection error status register (MPESTS) from within the exception-processing routine. After confirming the type of error, clear the memory-protection error status register (MPESTS) by writing 1 to the status clearing (CLR) bit in the memory-protection error status clearing register (MPECLR).

#### (1) When a data memory-protection error is generated

Access-exception processing by the CPU saves the address of the instruction that led to the memory-protection error on the stack. Furthermore, the address of the operand for which access led to a memory-protection error is stored in the data memory-protection error address register (MPDEA) and the region information for the region where the memory-protection error was generated is stored in the data-hit region register (MHITD).

- Violations of access control in access to valid regions 0 to 7

The data-hit region bits (MHITD.HITD[7:0]) with the same region number as the region where the error occurred is set to 1. In user mode, the logical “or” of the region access-control information for the location where the error occurred is set in the data-hit region access-control bits (MHITD.UHACD[2:0]).

- Violations of access control for the background region, besides access to outside valid regions 0 to 7

The data-hit region bits (MHITD.HITD[7:0]) are set to 0000 0000b. In user mode, the access-control information for the background region is set in the data-hit region access-control bits (MHITD.UHACD[2:0]).

Referring to this information can pinpoint the sources of errors.

#### (2) When an instruction memory-protection error is generated

Access-exception processing by the CPU saves the address of the instruction that led to the memory-protection error on the stack. Furthermore, the region information for the region where the memory-protection error was generated is stored in the instruction-hit region register (MHITI).

- Violations of access control in access to valid regions 0 to 7

The instruction-hit region bit (MHITI.HITI[7:0]) with the same region number as the region where the error occurred is set to 1. In user mode, the logical “or” of the region access-control information for the location where the error occurred is set in the instruction-hit region access-control bits (MHITI.UHACI[2:0]).

- Violations of access control for the background region, besides access to outside valid regions 0 to 7

The instruction-hit region bits (MHITI.HITI[7:0]) are set to 0000 0000b. In user mode, the access-control information for the background region is set in the instruction-hit region access-control bits (MHITI.UHACI[2:0]).

Referring to this information can pinpoint the sources of errors.

## 17. DMA Controller (DMACAa)

This MCU incorporates an 8-channel direct memory access controller (DMAC).

The DMAC is a module to transfer data without the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

### 17.1 Overview

Table 17.1 lists the specifications of the DMAC, and Figure 17.1 shows a block diagram of the DMAC.

**Table 17.1 Specifications of DMAC**

| Item                                 |                               | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of channels                   |                               | 8 (DMAC <sub>m</sub> (m = 0 to 7))                                                                                                                                                                                                                                                                                                         |
| Transfer space                       |                               | 512 Mbytes<br>(0000 0000h to 0FFF FFFFh and F000 0000h to FFFF FFFFh excluding reserved areas)                                                                                                                                                                                                                                             |
| Maximum transfer volume              |                               | 64 Mbytes<br>(Maximum number of transfers in block transfer mode: 1,024 data × 65,536 blocks)                                                                                                                                                                                                                                              |
| DMA request source                   |                               | <ul style="list-style-type: none"> <li>Request source selectable for each channel</li> <li>Software trigger</li> <li>Interrupt requests from peripheral modules or trigger input to external interrupt input pins*1</li> </ul>                                                                                                             |
| Channel priority                     |                               | Channel 0 > Channel 1 > Channel 2 > Channel 3... > Channel 7 (Channel 0: Highest)                                                                                                                                                                                                                                                          |
| Transfer data                        | Single data                   | Bit length: 8, 16, 32 bits                                                                                                                                                                                                                                                                                                                 |
|                                      | Block size                    | Number of data: 1 to 1,024                                                                                                                                                                                                                                                                                                                 |

| Power consumption reduction function |                               | Module-stop state can be set.                                                                                                                                                                                                                                                                                                              |

Note 1. For details on DMA request sources, see Table 14.4, Interrupt Vector Table in section 14, Interrupt Controller (ICUC).

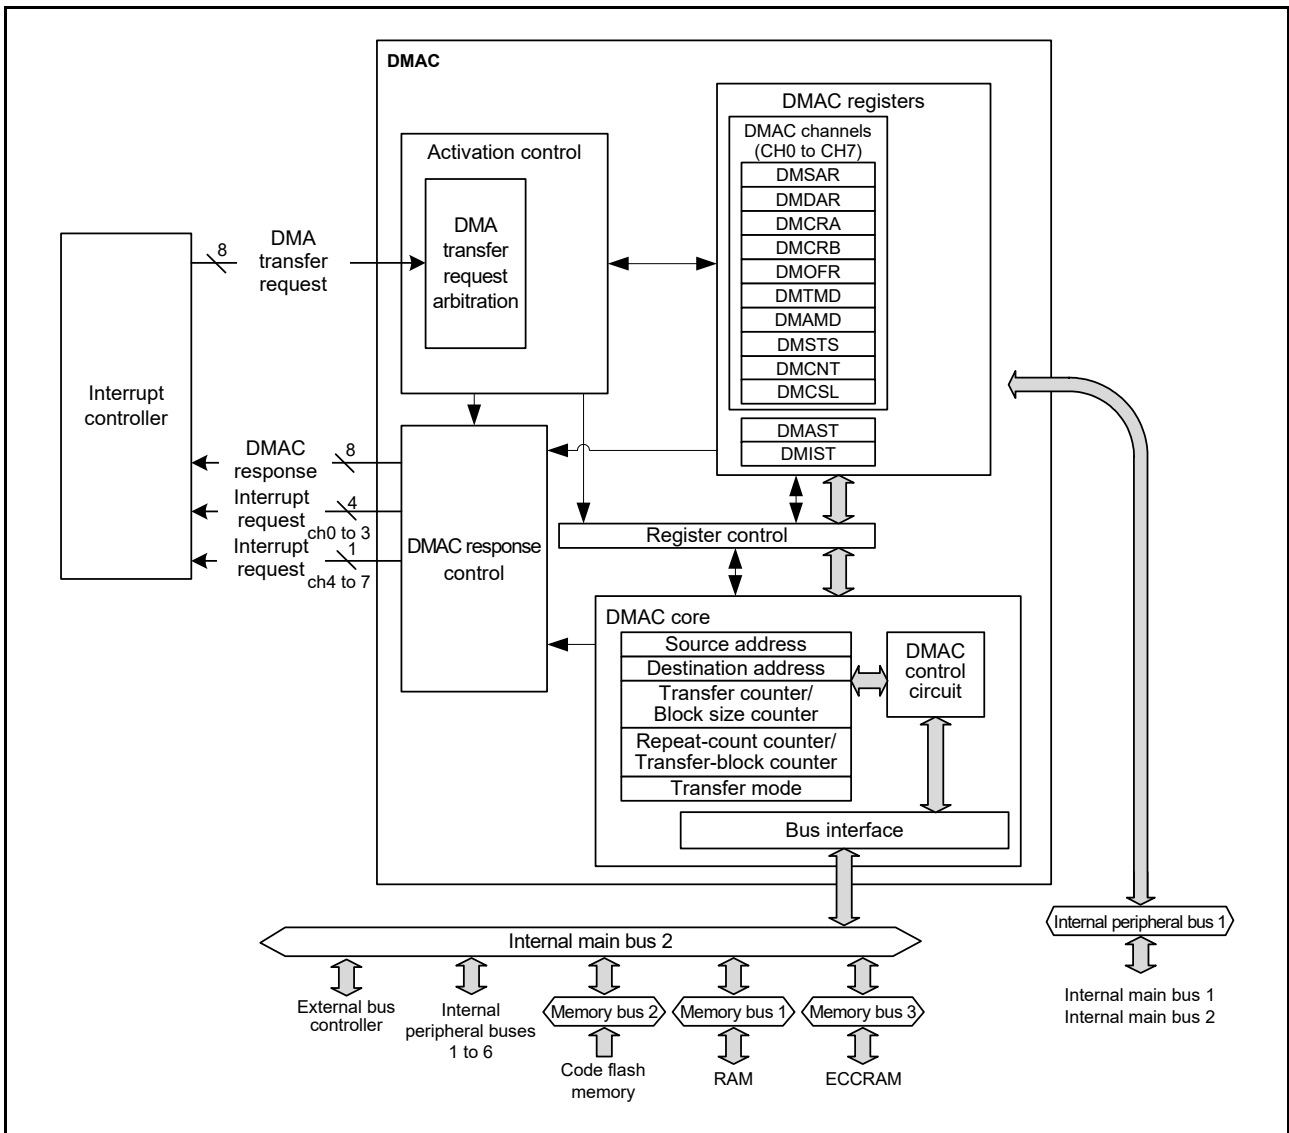

Figure 17.1 Block Diagram of DMAC

## 17.2 Register Descriptions

### 17.2.1 DMA Source Address Register (DMSAR)

Address(es): DMAC0.DMSAR 0008 2000h, DMAC1.DMSAR 0008 2040h, DMAC2.DMSAR 0008 2080h, DMAC3.DMSAR 0008 20C0h, DMAC4.DMSAR 0008 2100h, DMAC5.DMSAR 0008 2140h, DMAC6.DMSAR 0008 2180h, DMAC7.DMSAR 0008 21C0h

| Bit       | Description                                  | Setting Range                                                                  | R/W |
|-----------|----------------------------------------------|--------------------------------------------------------------------------------|-----|
| b31 to b0 | Specifies the transfer source start address. | 0000 0000h to 0FFF FFFFh (256 Mbytes)<br>F000 0000h to FFFF FFFFh (256 Mbytes) | R/W |

Set DMSAR while DMAC stops (the DMST bit in DMAST = 0) or DMA transfer is disabled (the DTE bit in DMCNT = 0).

Setting bits 31 to 29 is invalid; a value of bit 28 is extended to bits 31 to 29. Reading DMSAR returns the extended value.

### 17.2.2 DMA Destination Address Register (DMDAR)

Address(es): DMAC0.DMDAR 0008 2004h, DMAC1.DMDAR 0008 2044h, DMAC2.DMDAR 0008 2084h, DMAC3.DMDAR 0008 20C4h, DMAC4.DMDAR 0008 2104h, DMAC5.DMDAR 0008 2144h, DMAC6.DMDAR 0008 2184h, DMAC7.DMDAR 0008 21C4h

| Bit       | Description                                       | Setting Range                                                                  | R/W |
|-----------|---------------------------------------------------|--------------------------------------------------------------------------------|-----|
| b31 to b0 | Specifies the transfer destination start address. | 0000 0000h to 0FFF FFFFh (256 Mbytes)<br>F000 0000h to FFFF FFFFh (256 Mbytes) | R/W |

Set DMDAR while DMAC stops (the DMST bit in DMAST = 0) or DMA transfer is disabled (the DTE bit in DMCNT = 0).

Setting bits 31 to 29 is invalid; a value of bit 28 is extended to bits 31 to 29. Reading DMDAR returns the extended value.

### 17.2.3 DMA Transfer Count Register (DMCRA)

Address(es): DMAC0.DMCRA 0008 2008h, DMAC1.DMCRA 0008 2048h, DMAC2.DMCRA 0008 2088h, DMAC3.DMCRA 0008 20C8h, DMAC4.DMCRA 0008 2108h, DMAC5.DMCRA 0008 2148h, DMAC6.DMCRA 0008 2188h, DMAC7.DMCRA 0008 21C8h

- Normal transfer mode

- Repeat transfer mode, block transfer mode

| Symbol | Bit Name                     | Description                                 | R/W |
|--------|------------------------------|---------------------------------------------|-----|
| DMCRAL | Lower bits of transfer count | Specifies the number of transfer operations | R/W |
| DMCRAH | Upper bits of transfer count |                                             | R/W |

Note: Set the same value for DMCRAH and DMCRAL in repeat transfer mode and block transfer mode.

#### (1) Normal Transfer Mode (MD[1:0] Bits in DMACm.DMTMD = 00b)

DMCRAL functions as a 16-bit transfer counter.

The number of transfer operations is one when the setting is 0001h, and 65,535 when it is FFFFh. The value is decremented by one each time data is transferred.

When the setting is 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running mode).

DMCRAH is not used in normal transfer mode. Write 0000h to DMCRAH.

**(2) Repeat Transfer Mode (MD[1:0] Bits in DMACm.DMTMD = 01b)**

DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter.

The number of transfer operations is one when the setting is 001h, 1023 when it is 3FFh, and 1024 when it is 000h. In repeat transfer mode, a value in the range of 000h to 3FFh (1 to 1024) can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 000h, at which the value in DMCRAH is loaded into DMCRAL.

**(3) Block Transfer Mode (MD[1:0] Bits in DMACm.DMTMD = 10b)**

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 001h, 1023 when it is 3FFh, and 1024 when it is 000h. In block transfer mode, a value in the range of 000h to 3FFh can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 000h, at which the value in DMCRAH is loaded into DMCRAL.

**17.2.4 DMA Block Transfer Count Register (DMCRB)**

Address(es): DMAC0.DMCRB 0008 200Ch, DMAC1.DMCRB 0008 204Ch, DMAC2.DMCRB 0008 208Ch, DMAC3.DMCRB 0008 20CCh, DMAC4.DMCRB 0008 210Ch, DMAC5.DMCRB 0008 214Ch, DMAC6.DMCRB 0008 218Ch, DMAC7.DMCRB 0008 21CCh

| Bit       | Description                                             | Setting Range                                  | R/W |
|-----------|---------------------------------------------------------|------------------------------------------------|-----|
| b15 to b0 | Specifies the block count or repeat count of transfers. | 0001h to FFFFh (1 to 65,535)<br>0000h (65,536) | R/W |

This register specifies the transfer block count in block transfer mode and the repeat count in repeat transfer mode.

In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred.

In block transfer mode, the value is decremented by one when the final data of one block size is transferred.

In normal transfer mode, DMCRB is not used. The setting is invalid.

## 17.2.5 DMA Transfer Mode Register (DMTMD)

Address(es): DMAC0.DMTMD 0008 2010h, DMAC1.DMTMD 0008 2050h, DMAC2.DMTMD 0008 2090h, DMAC3.DMTMD 0008 20D0h, DMAC4.DMTMD 0008 2110h, DMAC5.DMTMD 0008 2150h, DMAC6.DMTMD 0008 2190h, DMAC7.DMTMD 0008 21D0h

| b4       | DTIE   | Transfer End Interrupt Enable                                      | 0: Disables the transfer end interrupt request.<br>1: Enables the transfer end interrupt request.                                                                                                   | R/W |
| b7 to b5 | —      | Reserved                                                           | These bits are read as 0. The write value should be 0.                                                                                                                                              | R/W |

### DARIE Bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while this bit is set to 1, the DTE bit in DMCNT is set to 0. At the same time, the ESIF flag in DMSTS is set to 1 to indicate that an interrupt by an extended repeat area overflow on the destination address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DTE bit in DMACm.DMCNT of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the destination address, this bit is ignored.

### SARIE Bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while this bit is set to 1, the DTE bit in DMCNT is set to 0. At the same time, the ESIF flag in DMSTS is set to 1 to indicate that an interrupt by an extended repeat area overflow on the source address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DTE bit in DMACm.DMCNT of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the source address, this bit is ignored.

**RPTIE Bit (Repeat Size End Interrupt Enable)**

When this bit is set to 1 in repeat transfer mode, the DTE bit in DMCNT is set to 0 after completion of a 1-repeat size data transfer. At the same time, the ESIF flag in DMSTS is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DTS[1:0] bits in DMTMD are 10b (= repeat area or block area is not specified).

When this bit is set to 1 in block transfer mode, the DTE bit in DMCNT is set to 0 after completion of a 1-block data transfer in the same way as repeat transfer mode. At the same time, the ESIF flag in DMSTS is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DTS[1:0] bits in DMTMD are 10b (= repeat area or block area is not specified).

**ESIE Bit (Transfer Escape End Interrupt Enable)**

This bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that are generated during DMA transfer.

The transfer escape end interrupt is generated when the ESIF flag in DMSTS is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by setting this bit or the ESIF flag in DMSTS to 0.

**DTIE Bit (Transfer End Interrupt Enable)**

This bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers.

The transfer end interrupt is generated when the DTIF bit in DMSTS is set to 1 with this bit set to 1. The transfer end interrupt is cleared by setting this bit or the DTIF bit in DMSTS to 0.

## 17.2.7 DMA Address Mode Register (DMAMD)

Address(es): DMAC0.DMAMD 0008 2014h, DMAC1.DMAMD 0008 2054h, DMAC2.DMAMD 0008 2094h, DMAC3.DMAMD 0008 20D4h, DMAC4.DMAMD 0008 2114h, DMAC5.DMAMD 0008 2154h, DMAC6.DMAMD 0008 2194h, DMAC7.DMAMD 0008 21D4h

| Bit       | Symbol    | Bit Name                                 | Description                                                                                                                                                   | R/W |
|-----------|-----------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b4 to b0  | DARA[4:0] | Destination Address Extended Repeat Area | Specifies the extended repeat area on the destination address. For details on the settings, see Table 17.2.                                                   | R/W |
| b5        | —         | Reserved                                 | This bit is read as 0. The write value should be 0.                                                                                                           | R/W |
| b7, b6    | DM[1:0]   | Destination Address Update Mode          | b7 b6<br>0 0: Destination address is fixed.<br>0 1: Offset addition*1<br>1 0: Destination address is incremented.<br>1 1: Destination address is decremented. | R/W |
| b12 to b8 | SARA[4:0] | Source Address Extended Repeat Area      | Specifies the extended repeat area on the source address. For details on the settings, see Table 17.2.                                                        | R/W |
| b13       | —         | Reserved                                 | This bit is read as 0. The write value should be 0.                                                                                                           | R/W |
| b15, b14  | SM[1:0]   | Source Address Update Mode               | b15 b14<br>0 0: Source address is fixed.<br>0 1: Offset addition*1<br>1 0: Source address is incremented.<br>1 1: Source address is decremented.              | R/W |

Note 1. Offset addition can be specified only for DMAC0.

### DARA[4:0] Bits (Destination Address Extended Repeat Area)

These bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when DMACm.DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DARIE bit in DMINT set to 1. Table 17.2 lists the settings and the corresponding extended repeat areas.

### DM[1:0] Bits (Destination Address Update Mode)

These bits select the mode of updating the destination address.

When increment is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the destination address is incremented by 1, 2, and 4, respectively.

When decrement is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the destination address is decremented by 1, 2, and 4, respectively.

When offset addition is selected, the offset specified by the DMAC0.DMOFR register is added to the address.

Offset addition can be specified only for DMAC0.

**SARA[4:0] Bits (Source Address Extended Repeat Area)**

These bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when DMACm.DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the SARIE bit in DMINT set to 1. Table 17.2 lists the settings and the corresponding extended repeat areas.

**SM[1:0] (Source Address Update Mode)**

These bits select the mode of updating the source address.

When increment is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the source address is incremented by 1, 2, and 4, respectively.

When decrement is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the source address is decremented by 1, 2, and 4, respectively.

When offset addition is selected, the offset specified by the DMAC0.DMOFR register is added to the address. Offset addition can be specified only for DMAC0.

**Table 17.2 SARA[4:0] or DARA[4:0] Settings and Corresponding Repeat Areas**

| <b>SARA[4:0] or DARA[4:0]</b> | <b>Extended Repeat Area</b>                                                      |
|-------------------------------|----------------------------------------------------------------------------------|
| 0000b                         | Not specified                                                                    |
| 00001b                        | 2 bytes specified as extended repeat area by the lower 1 bit of the address      |
| 00010b                        | 4 bytes specified as extended repeat area by the lower 2 bits of the address     |
| 00011b                        | 8 bytes specified as extended repeat area by the lower 3 bits of the address     |
| 00100b                        | 16 bytes specified as extended repeat area by the lower 4 bits of the address    |

## 17.2.8 DMA Offset Register (DMOFR)

Address(es): DMAC0.DMOFR 0008 2018h

| Bit       | Description                                                                                                          | Setting Range                                                                                              | R/W |
|-----------|----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|-----|
| b31 to b0 | Specifies the offset when offset addition is selected as the address update mode for transfer source or destination. | 0000 0000h to 00FF FFFFh (0 bytes to (16 M – 1) bytes)<br>FF00 0000h to FFFF FFFFh (–16 Mbytes to –1 byte) | R/W |

Write to this register while the DMAC operation is stopped or DMA transfer is disabled (not during data transfer). Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading DMOFR returns the extended value.

## 17.2.9 DMA Transfer Enable Register (DMCNT)

Address(es): DMAC0.DMCNT 0008 201Ch, DMAC1.DMCNT 0008 205Ch, DMAC2.DMCNT 0008 209Ch, DMAC3.DMCNT 0008 20DCh, DMAC4.DMCNT 0008 211Ch, DMAC5.DMCNT 0008 215Ch, DMAC6.DMCNT 0008 219Ch, DMAC7.DMCNT 0008 21DCh

| Bit      | Symbol | Bit Name            | Description                                            | R/W |
|----------|--------|---------------------|--------------------------------------------------------|-----|
| b0       | DTE    | DMA Transfer Enable | 0: Disables DMA transfer.<br>1: Enables DMA transfer.  | R/W |
| b7 to b1 | —      | Reserved            | These bits are read as 0. The write value should be 0. | R/W |

### DTE Bit (DMA Transfer Enable)

When the DMST bit in DMAST is set to 1 (DMAC module start) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit.
- When the specified total volume of data transfer is completed.
- When DMA transfer is stopped by the repeat size end interrupt.
- When DMA transfer is stopped by the extended repeat area overflow interrupt.

### 17.2.10 DMA Software Start Register (DMREQ)

Address(es): DMAC0.DMREQ 0008 201Dh, DMAC1.DMREQ 0008 205Dh, DMAC2.DMREQ 0008 209Dh, DMAC3.DMREQ 0008 20DDh, DMAC4.DMREQ 0008 211Dh, DMAC5.DMREQ 0008 215Dh, DMAC6.DMREQ 0008 219Dh, DMAC7.DMREQ 0008 21DDh

| Bit      | Symbol | Bit Name                                 | Description                                                                                                                                  | R/W |
|----------|--------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b0       | SWREQ  | DMA Software Start                       | 0: DMA transfer is not requested.<br>1: DMA transfer is requested.                                                                           | R/W |
| b3 to b1 | —      | Reserved                                 | These bits are read as 0. The write value should be 0.                                                                                       | R/W |
| b4       | CLRS   | DMA Software Start Bit Auto Clear Select | 0: SWREQ bit is cleared after DMA transfer is started by software.<br>1: SWREQ bit is not cleared after DMA transfer is started by software. | R/W |
| b7 to b5 | —      | Reserved                                 | These bits are read as 0. The write value should be 0.                                                                                       | R/W |

#### SWREQ Bit (DMA Software Start)

When 1 is written to this bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is set to 0 if the CLRS bit is set to 0. This bit is not set to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer.

Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the DCTG[1:0] bits in DMTMD are set to 00b (DMA request source is software).

Setting this bit is invalid when the DCTG[1:0] bits in DMTMD are set to a value other than 00b.

To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When 0 is written to this bit.

#### CLRS Bit (DMA Software Start Bit Auto Clear Select)

This bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is set to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not set to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

### 17.2.11 DMA Status Register (DMSTS)

Address(es): DMAC0.DMSTS 0008 201Eh, DMAC1.DMSTS 0008 205Eh, DMAC2.DMSTS 0008 209Eh, DMAC3.DMSTS 0008 20DEh, DMAC4.DMSTS 0008 211Eh, DMAC5.DMSTS 0008 215Eh, DMAC6.DMSTS 0008 219Eh, DMAC7.DMSTS 0008 21DEh

|     |    |    |      |    |    |    |      |
|-----|----|----|------|----|----|----|------|
| b7  | b6 | b5 | b4   | b3 | b2 | b1 | b0   |
| ACT | —  | —  | DTIF | —  | —  | —  | ESIF |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit Name                           | Description                                                                                                          | R/W   |
|----------|--------|------------------------------------|----------------------------------------------------------------------------------------------------------------------|-------|
| b0       | ESIF   | Transfer Escape End Interrupt Flag | 0: A transfer escape end interrupt has not been generated.<br>1: A transfer escape end interrupt has been generated. | R/W*1 |
| b3 to b1 | —      | Reserved                           | These bits are read as 0. Writing to these bits has no effect.                                                       | R     |
| b4       | DTIF   | Transfer End Interrupt Flag        | 0: A transfer end interrupt has not been generated.<br>1: A transfer end interrupt has been generated.               | R/W*1 |
| b6, b5   | —      | Reserved                           | These bits are read as 0. Writing to these bits has no effect.                                                       | R     |
| b7       | ACT    | DMA Active Flag                    | 0: DMAC operation is suspended.<br>1: DMAC is operating.                                                             | R     |

Note 1. Only 0 can be written to clear the flag.

#### ESIF Flag (Transfer Escape End Interrupt Flag)

This flag indicates that the transfer escape end interrupt has been generated.

[Setting conditions]

- When 1-repeat size data transfer is completed in repeat transfer mode with the RPTIE bit in DMINT set to 1.
- When 1-block data transfer is completed in block transfer mode with the RPTIE bit in DMINT set to 1.
- When an extended repeat area overflow on the source address occurs while the SARIE bit in DMINT is set to 1 and the SARA[4:0] bits in DMAMD are set to a value other than 00000b (extended repeat area is specified on the transfer source address)
- When an extended repeat area overflow on the destination address occurs while the DARIE bit in DMINT is set to 1 and the DARA[4:0] bits in DMAMD are set to a value other than 00000b (extended repeat area is specified on the transfer destination address)

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DTE bit in DMCNT.

**DTIF Flag (Transfer End Interrupt Flag)**

This flag indicates that the transfer end interrupt has been generated.

[Setting conditions]

- When the specified number of unit-transfers are completed in normal transfer mode (the value of DMCRAL becoming 0 on completion of transfer)
- When the specified number of repeat transfer operations are completed in repeat transfer mode (the value of DMCRB becoming 0 on completion of transfer)
- When the specified number of blocks have been transferred in block transfer mode (the value of DMCRB becoming 0 on completion of transfer)

[Clearing conditions]

- When 0 is written to this bit
- When 1 is written to the DTE bit in DMCNT

**ACT Flag (DMA Active Flag)**

This flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- When the DMAC starts data transfer operation

[Clearing condition]

- When data transfer in response to one transfer request is completed

**17.2.12 DMA Request Source Flag Control Register (DMCSL)**

Address(es): DMAC0.DMCSL 0008 201Fh, DMAC1.DMCSL 0008 205Fh, DMAC2.DMCSL 0008 209Fh, DMAC3.DMCSL 0008 20DFh, DMAC4.DMCSL 0008 211Fh, DMAC5.DMCSL 0008 215Fh, DMAC6.DMCSL 0008 219Fh, DMAC7.DMCSL 0008 21DFh

|    |    |    |    |    |    |    |       |
|----|----|----|----|----|----|----|-------|
| b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0    |
| —  | —  | —  | —  | —  | —  | —  | DISEL |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit Name         | Description                                                                                                                                                                                                | R/W |
|----------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b0       | DISEL  | Interrupt Select | 0: At the beginning of transfer, clear the interrupt status flag of the request source to 0.<br>1: At the end of transfer, the interrupt status flag of the request source issues an interrupt to the CPU. | R/W |
| b7 to b1 | —      | Reserved         | These bits are read as 0. The write value should be 0.                                                                                                                                                     | R/W |

**DISEL Bit (Interrupt Select)**

This bit selects whether the interrupt status flag of the request source is set to 0 or issues an interrupt request to the CPU, at the beginning of DMA transfer.

When DMTMD.DCTG[1:0] = 00b (trigger by software), the setting of the DISEL bit does not affect the operation.

### 17.2.13 DMAC Module Start Register (DMAST)

Address(es): 0008 2200h

| Bit      | Symbol | Bit Name          | Description                                            | R/W |
|----------|--------|-------------------|--------------------------------------------------------|-----|
| b0       | DMST   | DMAC Module Start | 0: DMAC module stop<br>1: DMAC module start            | R/W |
| b7 to b1 | —      | Reserved          | These bits are read as 0. The write value should be 0. | R/W |

#### DMST Bit (DMAC Module Start)

When this bit is set to 1, DMAC is ready to accept transfer requests for all channels.

When 1 is written to the DMACm.DMCNT.DTE bit (DMA transfer is enabled) of multiple channels and then this bit is set to 1 (DMAC module start), the corresponding multiple channels can be placed in the transfer request acceptable state at the same time.

When the DMST bit is set to 0 during DMA transfer, DMA transfer is suspended after completion of the current data transfer corresponding to a single transfer request. DMA transfer can be resumed by setting the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit

[Clearing condition]

- When 0 is written to this bit

### 17.2.14 DMAC74 Interrupt Status Monitor Register (DMIST)

Address(es): 0008 2204h

| b7    | b6    | b5    | b4    | b3 | b2 | b1 | b0 |
|-------|-------|-------|-------|----|----|----|----|
| DMIS7 | DMIS6 | DMIS5 | DMIS4 | —  | —  | —  | —  |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit Name                    | Description                                                              | R/W |
|----------|--------|-----------------------------|--------------------------------------------------------------------------|-----|
| b3 to b0 | —      | Reserved                    | These bits are read as 0. Writing to these bits has no effect.           | R   |
| b4       | DMIS4  | DMAC4 Interrupt Status Flag | 0: DMAC4 interrupt is not requested.<br>1: DMAC4 interrupt is requested. | R   |
| b5       | DMIS5  | DMAC5 Interrupt Status Flag | 0: DMAC5 interrupt is not requested.<br>1: DMAC5 interrupt is requested. | R   |
| b6       | DMIS6  | DMAC6 Interrupt Status Flag | 0: DMAC6 interrupt is not requested.<br>1: DMAC6 interrupt is requested. | R   |
| b7       | DMIS7  | DMAC7 Interrupt Status Flag | 0: DMAC7 interrupt is not requested.<br>1: DMAC7 interrupt is requested. | R   |

#### DMIS<sub>m</sub> Flag (DMAC<sub>m</sub> Interrupt Status Flag) (m = 4 to 7)

This bit monitors the DMAC<sub>m</sub> interrupt request. Writing to this bit will be ignored.

While the DMAC<sub>m</sub>.DMINT.DTIE bit is 1 and the DMAC<sub>m</sub>.DMSTS.DTIF bit is 1, or the DMAC<sub>m</sub>.DMINT.ESIE bit is 1 and the DMAC<sub>m</sub>.DMSTS.ESIF bit is 1, the DMIST.DMIS<sub>m</sub> bit is set to 1.

## 17.3 Operation

### 17.3.1 Transfer Mode

#### (1) Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the DMCRAL of DMACm. When these bits are set to 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running mode). Setting DMCRB of DMACm is invalid in normal transfer mode. Except in free running mode, a transfer end interrupt request can be generated after completion of the specified number of transfer operations.

Table 17.3 summarizes the register update operation in normal transfer mode, and Figure 17.2 shows the operation in normal transfer mode.

**Table 17.3 Register Update Operation in Normal Transfer Mode**

| Register     | Function                     | Update Operation after Completion of a Transfer by One Transfer Request |
|--------------|------------------------------|-------------------------------------------------------------------------|
| DMACm.DMSAR  | Transfer source address      | Increment/decrement/fixe d/offset addition*1                            |
| DMACm.DMDAR  | Transfer destination address | Increment/decrement/fixe d/offset addition*1                            |
| DMACm.DMCRAL | Transfer counter             | Decremente d by one/not updated (in free running mode)                  |
| DMACm.DMCRAH | —                            | Not updated (Not used in normal transfer mode)                          |
| DMACm.DMCRB  | —                            | Not updated (Not used in normal transfer mode)                          |

Note 1. Offset addition can be specified only for DMAC0.

**Figure 17.2 Operation in Normal Transfer Mode**

## (2) Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request.

A maximum of 1K data can be set as a total repeat transfer size using DMCRA of the DMACm.

A maximum of 64K can be set as the number of repeat transfer operations using DMCRB of the DMACm; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (DMSAR or DMDAR of the DMACm) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DTE bit in DMCNT of DMACm in the repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations. Table 17.4 summarizes the register update operation in repeat transfer mode, and Figure 17.3 shows the operation in repeat transfer mode.

**Table 17.4 Register Update Operation in Repeat Transfer Mode**

| Register     | Function                     | Update Operation after Completion of a Transfer by One Transfer Request |                                                                                                                                                                                                                                                                                             |
|--------------|------------------------------|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |                              | When DMACm.DMCRAL is not 1                                              | When DMACm.DMCRAL is 1<br>(Transfer of the Last Data in Repeat Size)                                                                                                                                                                                                                        |
| DMACm.DMSAR  | Transfer source address      | Increment/decrement/fixed/offset addition*1                             | <ul style="list-style-type: none"> <li>• DMACm.DMTMD.DTS[1:0] = 00b<br/>Increment/decrement/fixed/offset addition*1</li> <li>• DMACm.DMTMD.DTS[1:0] = 01b<br/>Initial value of DMACm.DMSAR</li> <li>• DMACm.DMTMD.DTS[1:0] = 10b<br/>Increment/decrement/fixed/offset addition*1</li> </ul> |
| DMACm.DMDAR  | Transfer destination address | Increment/decrement/fixed/offset addition*1                             | <ul style="list-style-type: none"> <li>• DMACm.DMTMD.DTS[1:0] = 00b<br/>Initial value of DMACm.DMDAR</li> <li>• DMACm.DMTMD.DTS[1:0] = 01b<br/>Increment/decrement/fixed/offset addition*1</li> <li>• DMACm.DMTMD.DTS[1:0] = 10b<br/>Increment/decrement/fixed/offset addition*1</li> </ul> |
| DMACm.DMCRAH | Repeat size                  | Not updated                                                             | Not updated                                                                                                                                                                                                                                                                                 |
| DMACm.DMCRAL | Transfer counter             | Decrement by one                                                        | DMACm.DMCRAH                                                                                                                                                                                                                                                                                |
| DMACm.DMCRB  | Repeat-count counter         | Not updated                                                             | Decrement by one                                                                                                                                                                                                                                                                            |

Note 1. Offset addition can be specified only for DMAC0.

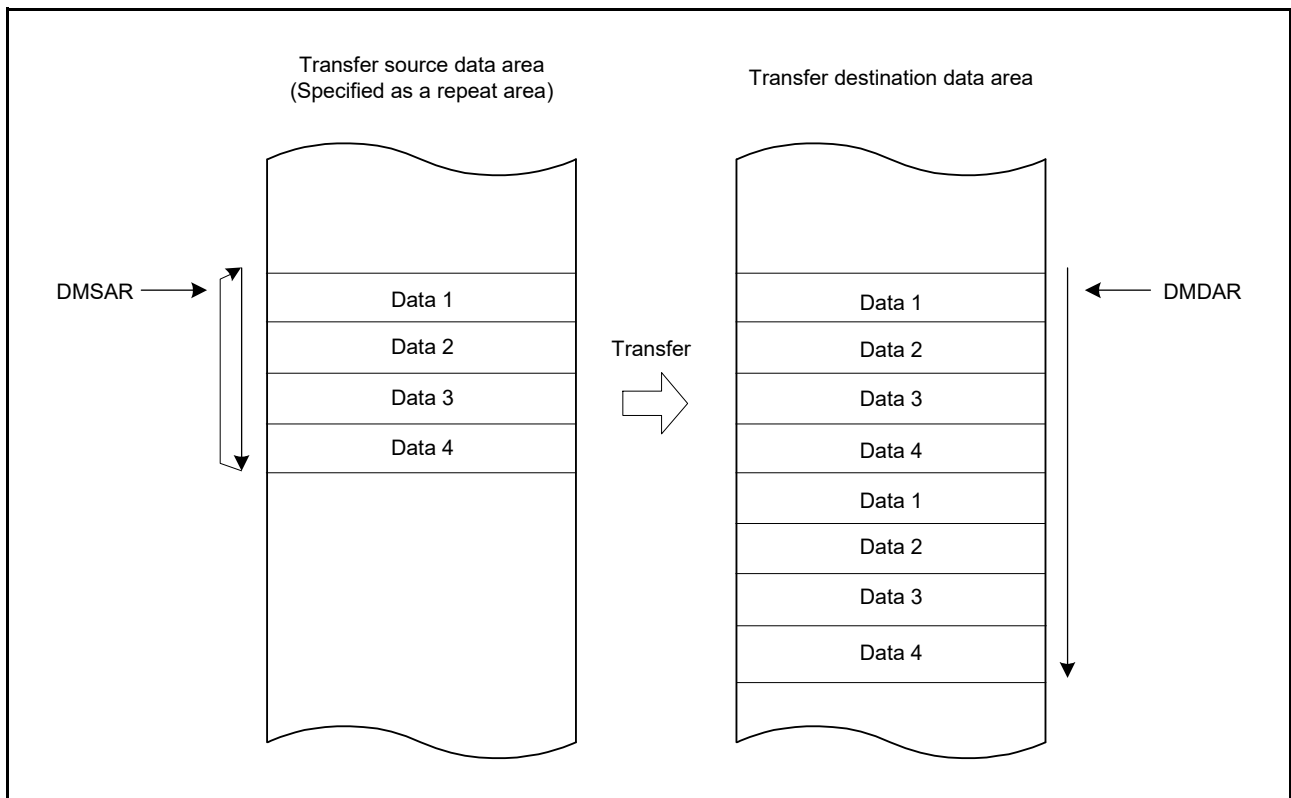

Figure 17.3 Operation in Repeat Transfer Mode

### (3) Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA of the DMACm.

A maximum of 64K can be set as the number of block transfer operations using DMCRB of the DMACm; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (DMSAR or DMDAR of the DMACm) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DTE bit in DMCNT of DMACm in the repeat size end interrupt handling.

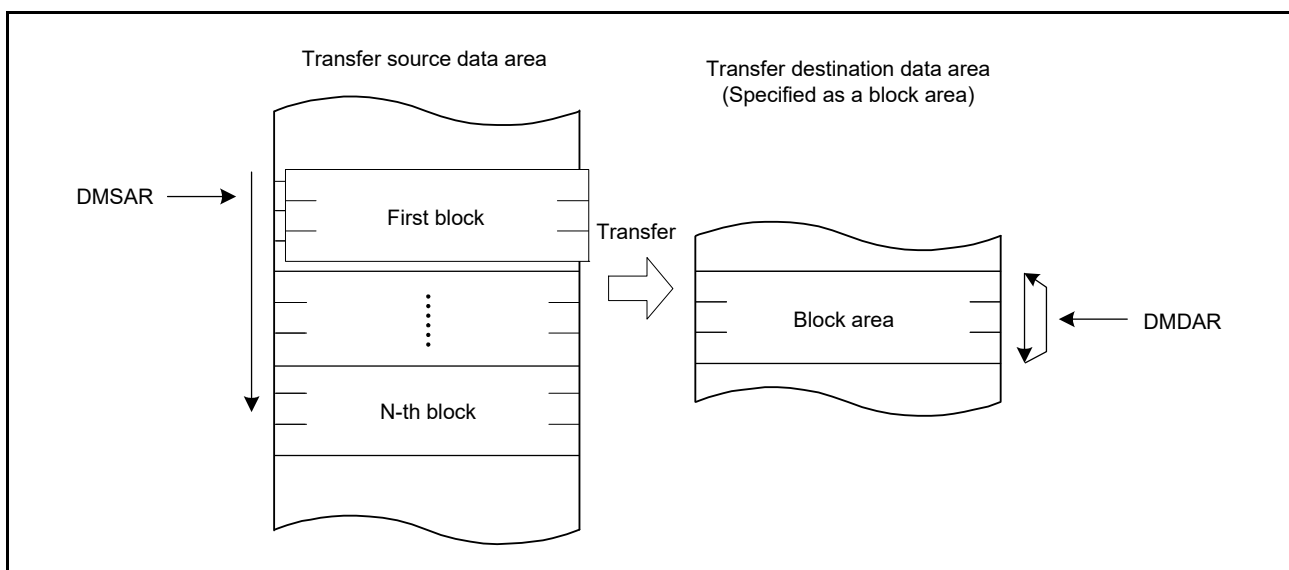

Transfer end interrupt request can be generated after completion of the specified number of block transfer operations.

Table 17.5 summarizes the register update operation in block transfer mode, and Figure 17.4 shows the operation in block transfer mode.

**Table 17.5 Register Update Operation in Block Transfer Mode**

| Register     | Function                     | Update Operation after Completion of Single-Block Transfer by One Transfer Request                                                                                                                                                                                                       |
|--------------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DMACm.DMSAR  | Transfer source address      | <ul style="list-style-type: none"> <li>DMACm.DMTMD.DTS[1:0] = 00b<br/>Increment/decrement/fixed/offset addition*1</li> <li>DMACm.DMTMD.DTS[1:0] = 01b<br/>Initial value of DMACm.DMSAR</li> <li>DMACm.DMTMD.DTS[1:0] = 10b<br/>Increment/decrement/fixed/offset addition*1</li> </ul>    |

| DMACm.DMCRAH | Block size                   | Not updated                                                                                                                                                                                                                                                                              |
| DMACm.DMCRAL | Block size counter           | DMACm.DMCRAH                                                                                                                                                                                                                                                                             |
| DMACm.DMCRB  | Transfer-block counter       | Decrement by one                                                                                                                                                                                                                                                                         |

Note 1. Offset addition can be specified only for DMAC0.

**Figure 17.4 Operation in Block Transfer Mode**

### 17.3.2 Extended Repeat Area Function

The DMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas.

The extended repeat areas can be specified separately to the transfer source address register (DMSAR) and transfer destination address register (DMDAR) of DMACm.

The extended repeat area on the source address is specified by the SARA[4:0] bits in DMAMD of DMACm. The extended repeat area on the destination address is specified by the DARA[4:0] bits in DMAMD of DMACm. The size can be specified separately for the source and destination sides.

However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt by an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the SARIE bit in DMINT of DMACm is set to 1, the ESIF flag in DMSTS of DMACm is set to 1 and the DTE bit in DMCNT of DMACm is set to 0 to stop DMA transfer. At this time, if the ESIE bit in DMINT of DMACm is set to 1, an interrupt by an extended repeat area overflow is requested. When the DARIE bit in DMINT of DMACm is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the DTE bit in DMCNT of DMACm in the interrupt handling.

Figure 17.5 shows an example of the extended repeat area operation.

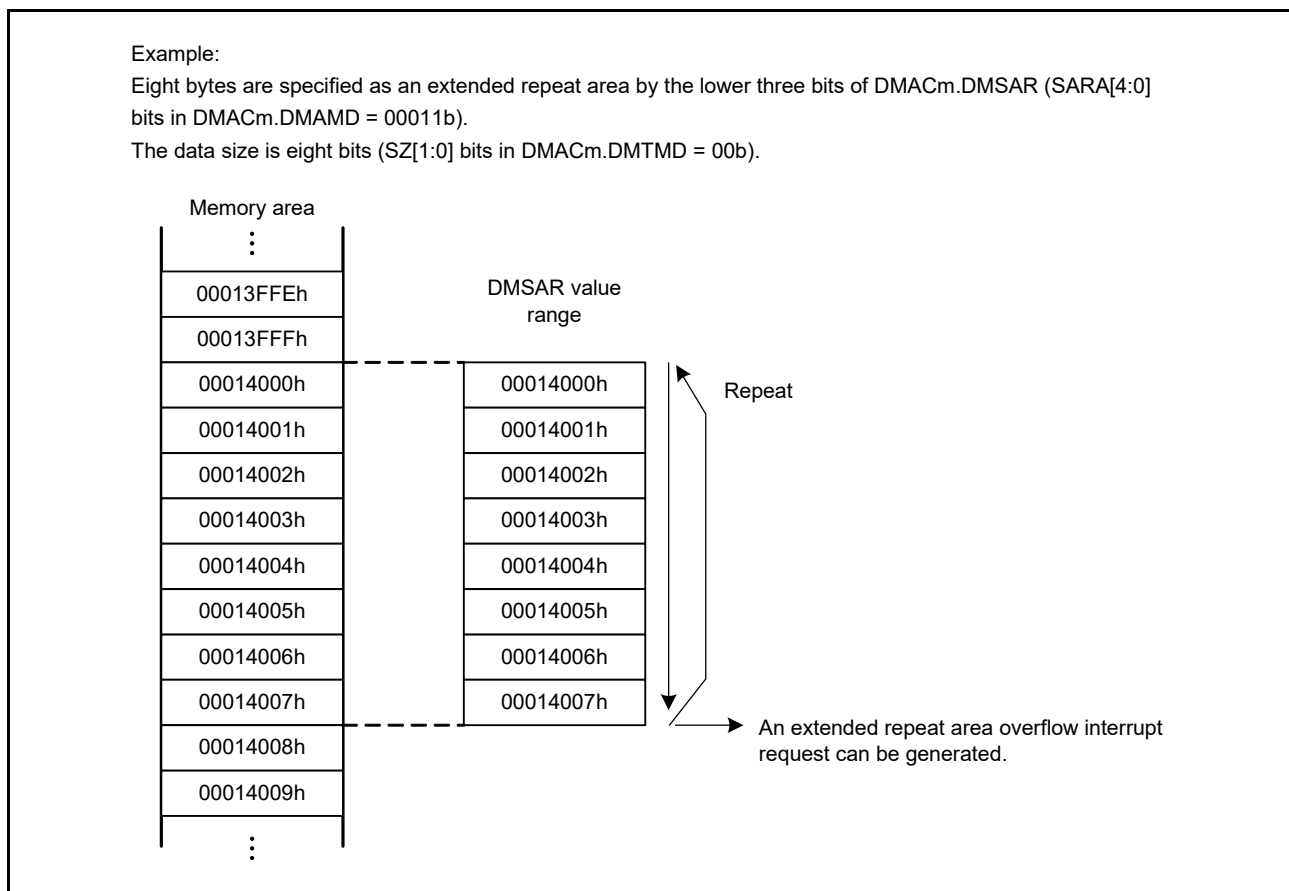

Figure 17.5 Example of Extended Repeat Area Operation

When an interrupt by an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration.

When a transfer is stopped by an interrupt by an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt by the overflow is suspended until transfer of the block is completed, and the transfer overruns.

Figure 17.6 shows an example when the extended repeat area function is used in block transfer mode.

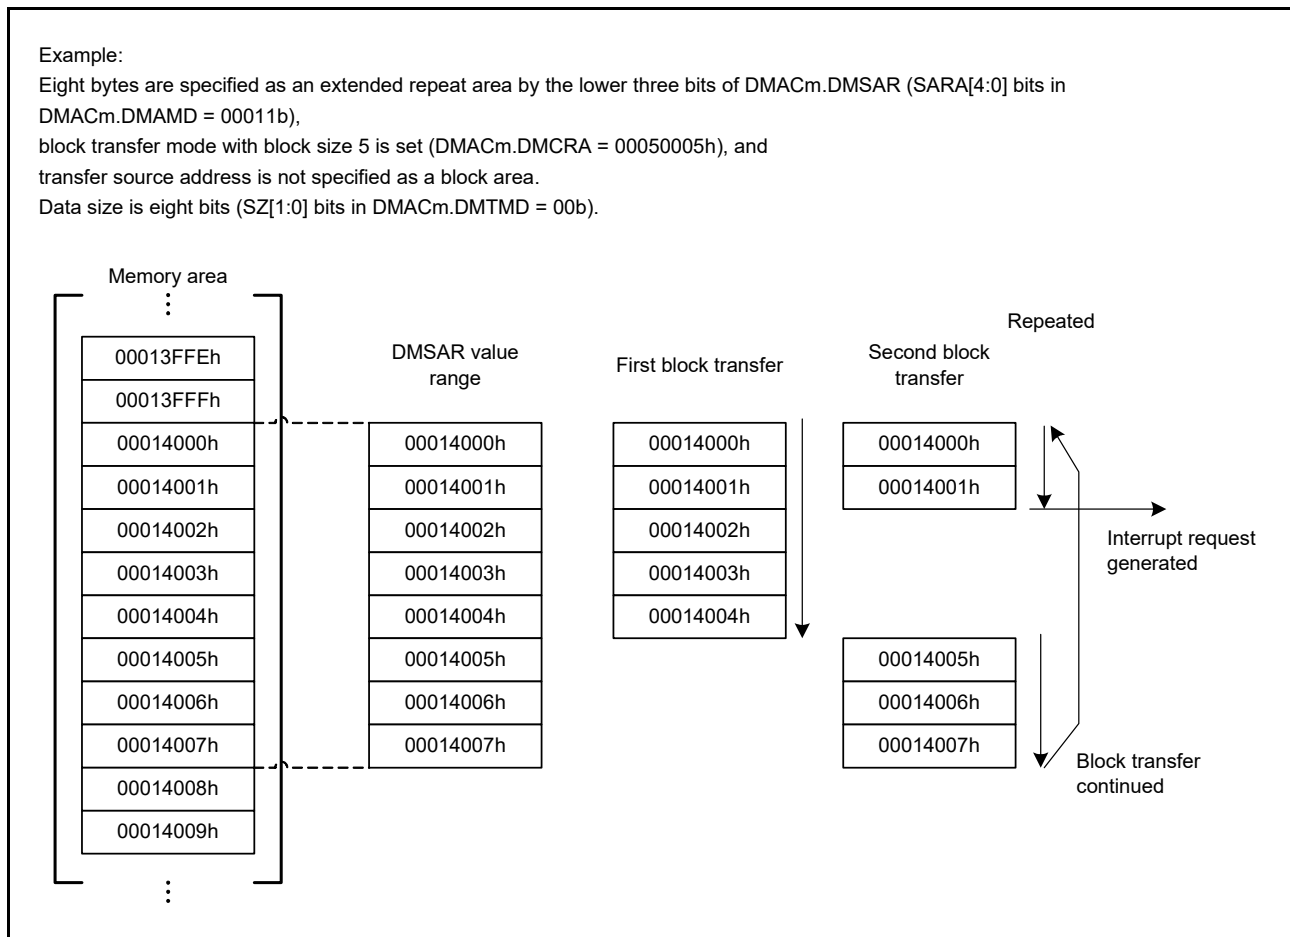

Figure 17.6 Example of Extended Repeat Area Function in Block Transfer Mode

### 17.3.3 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. When the offset addition is selected, the offset specified by the DMA offset register (DMOFR of DMAC<sub>0</sub>) is added to the address every time the DMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas.

Offset subtraction can also be realized by setting a negative value in DMOFR register of DMAC<sub>0</sub>. In this case, the negative value must be 2's complement.

Address update function using offset can be specified only for the DMAC<sub>0</sub> channel.

Table 17.6 shows the address update method in each address update mode.

**Table 17.6 Address Update Method in Each Address Update Mode**

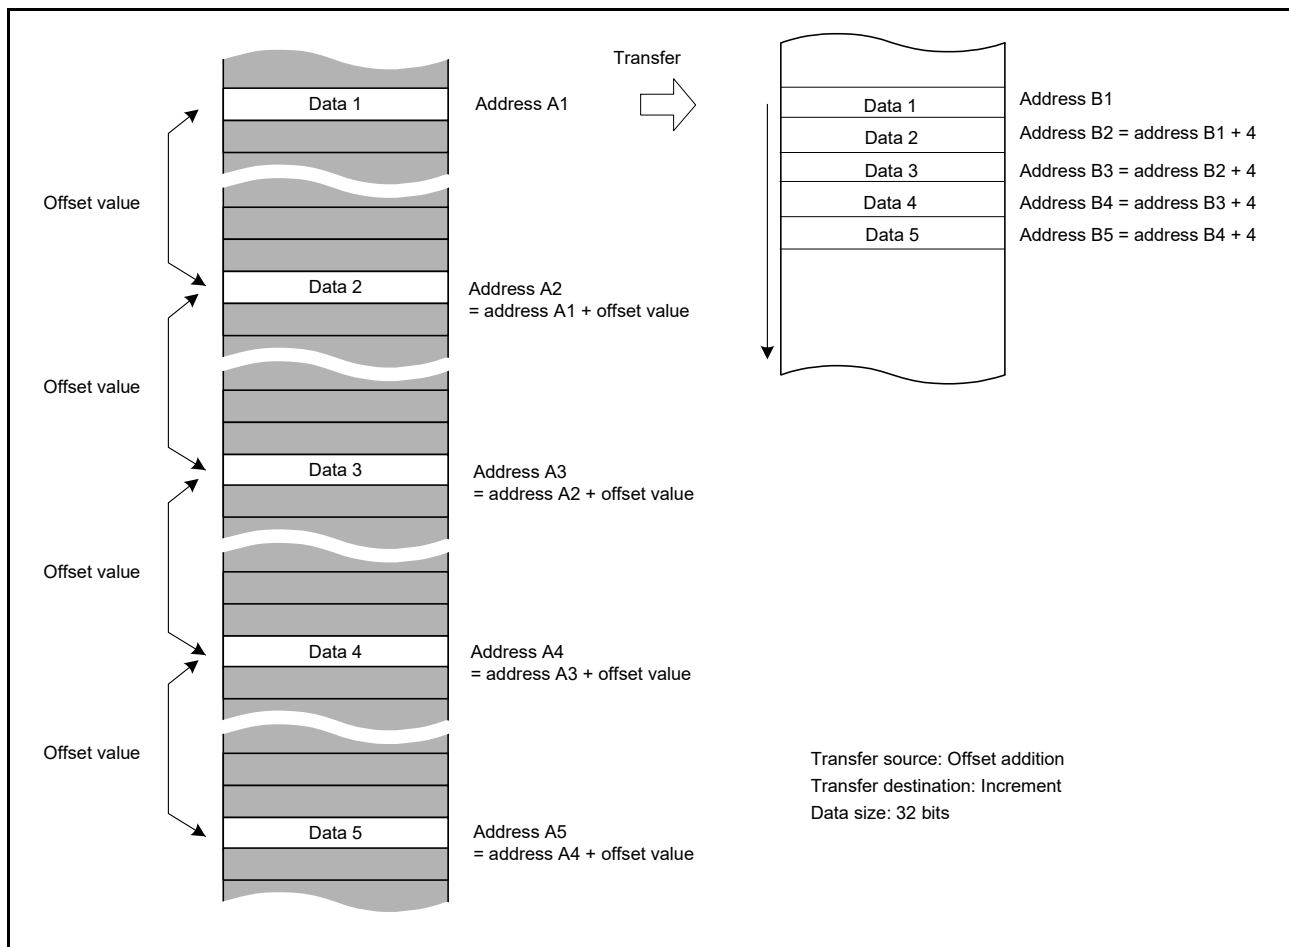

| Address Update Mode | Settings of DMAC <sub>m</sub> .DMAMD.SM[1:0] and DMAC <sub>m</sub> .DMAMD.DM[1:0] for Address Update Modes | Address Update Method<br>(for Different SZ[1:0] Settings in DMTMD of DMAC <sub>m</sub> ) |               |               |
|---------------------|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|---------------|---------------|
|                     |                                                                                                            | SZ[1:0] = 00b                                                                            | SZ[1:0] = 01b | SZ[1:0] = 10b |
| Address fixed       | 00b                                                                                                        | Fixed                                                                                    |               |               |
| Offset addition     | 01b                                                                                                        | +DMAC <sub>m</sub> .DMOFR* <sup>1</sup>                                                  |               |               |
| Increment           | 10b                                                                                                        | +1                                                                                       | +2            | +4            |
| Decrement           | 11b                                                                                                        | -1                                                                                       | -2            | -4            |

Note 1. When setting a negative value in the DMA offset register, the value must be 2's complement. The 2's complement is obtained by the following formula.

2's complement of a negative offset value =  $\sim(\text{offset}) + 1$  ( $\sim$ : bit inversion)

### (1) Basic Transfer Using Offset Addition

Figure 17.7 shows an example of address updating using offset addition.

**Figure 17.7 Example of Address Updating by Offset Addition**

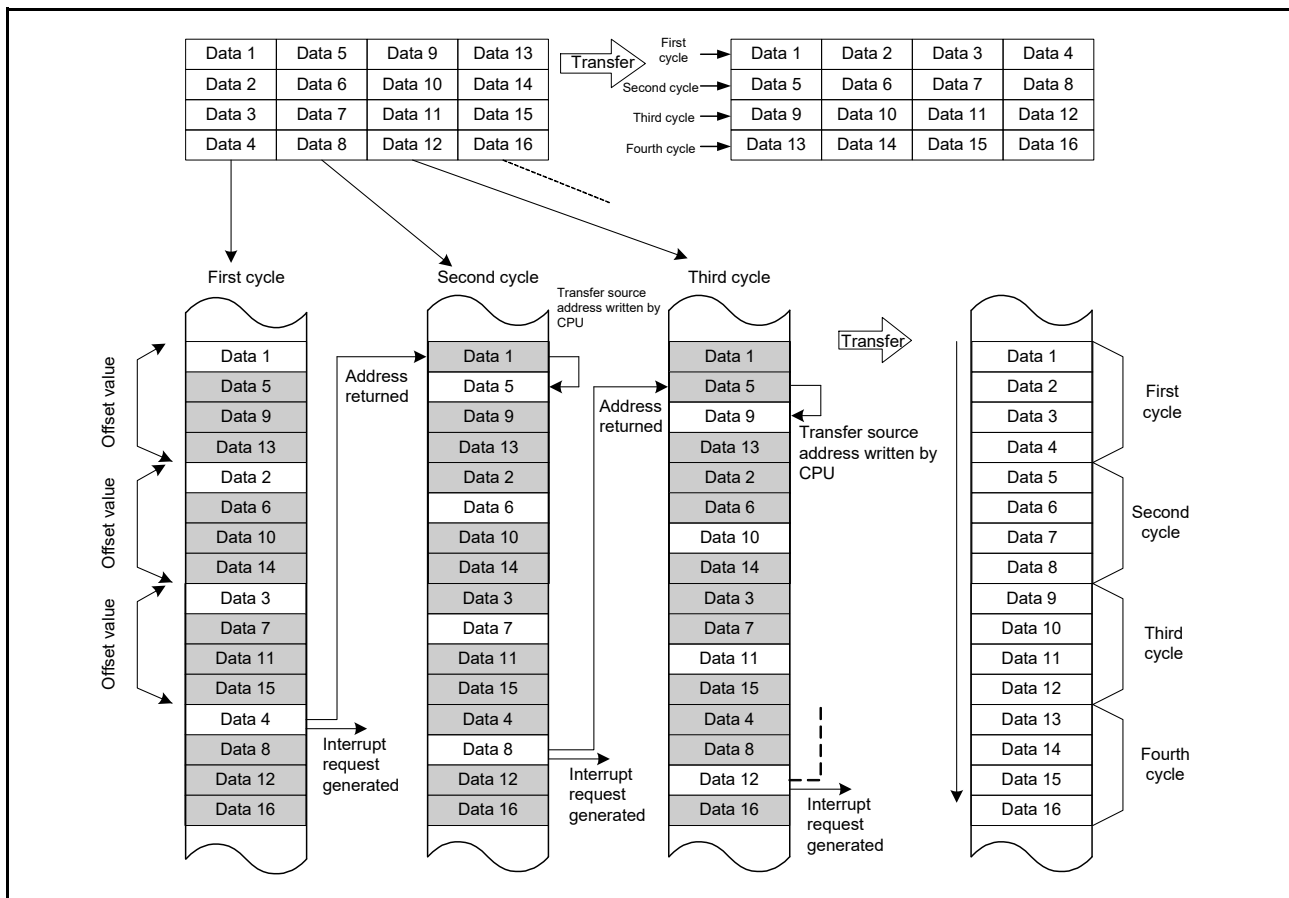

In Figure 17.7, the transfer data is 32 bits long, and offset addition and increment are set as the transfer source address update mode and transfer destination address update mode, respectively. The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

### (2) Example of XY Conversion Using Offset Addition

Figure 17.8 shows the XY conversion using offset addition in repeat transfer mode.

Settings are as follows:

- DMAC0.DMAMD: Transfer source address update mode: Offset addition
- DMAC0.DMAMD: Transfer destination address update mode: Destination address is incremented.
- DMAC0.DMTMD: Transfer data size select: 32 bits
- DMAC0.DMTMD: Transfer mode select: Repeat transfer
- DMAC0.DMTMD: Repeat area select: The source is specified as the repeat area.
- DMAC0.DMOFR: Offset address: 10h
- DMAC0.DMCRA: Repeat size: 4h
- DMAC0.DMINT: The repeat size end interrupt is enabled.

**Figure 17.8 XY Conversion Operation Using Offset Addition in Repeat Transfer Mode**

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to the destination continuous addresses. When data 4 is transferred, which means that the repeat size of transfers is completed, the transfer source address returns to the transfer start address (address of data 1 on the transfer source) and a repeat size end interrupt is requested. While this interrupt stops the transfer temporarily, perform the following.

- **DMAC0.DMSAR:** Rewrite the DMA transfer source address to the address of data 5 (with the above example, the data 1 address + 4).
- **DMAC0.DMCNT:** Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 17.9 shows a flowchart of the XY conversion.

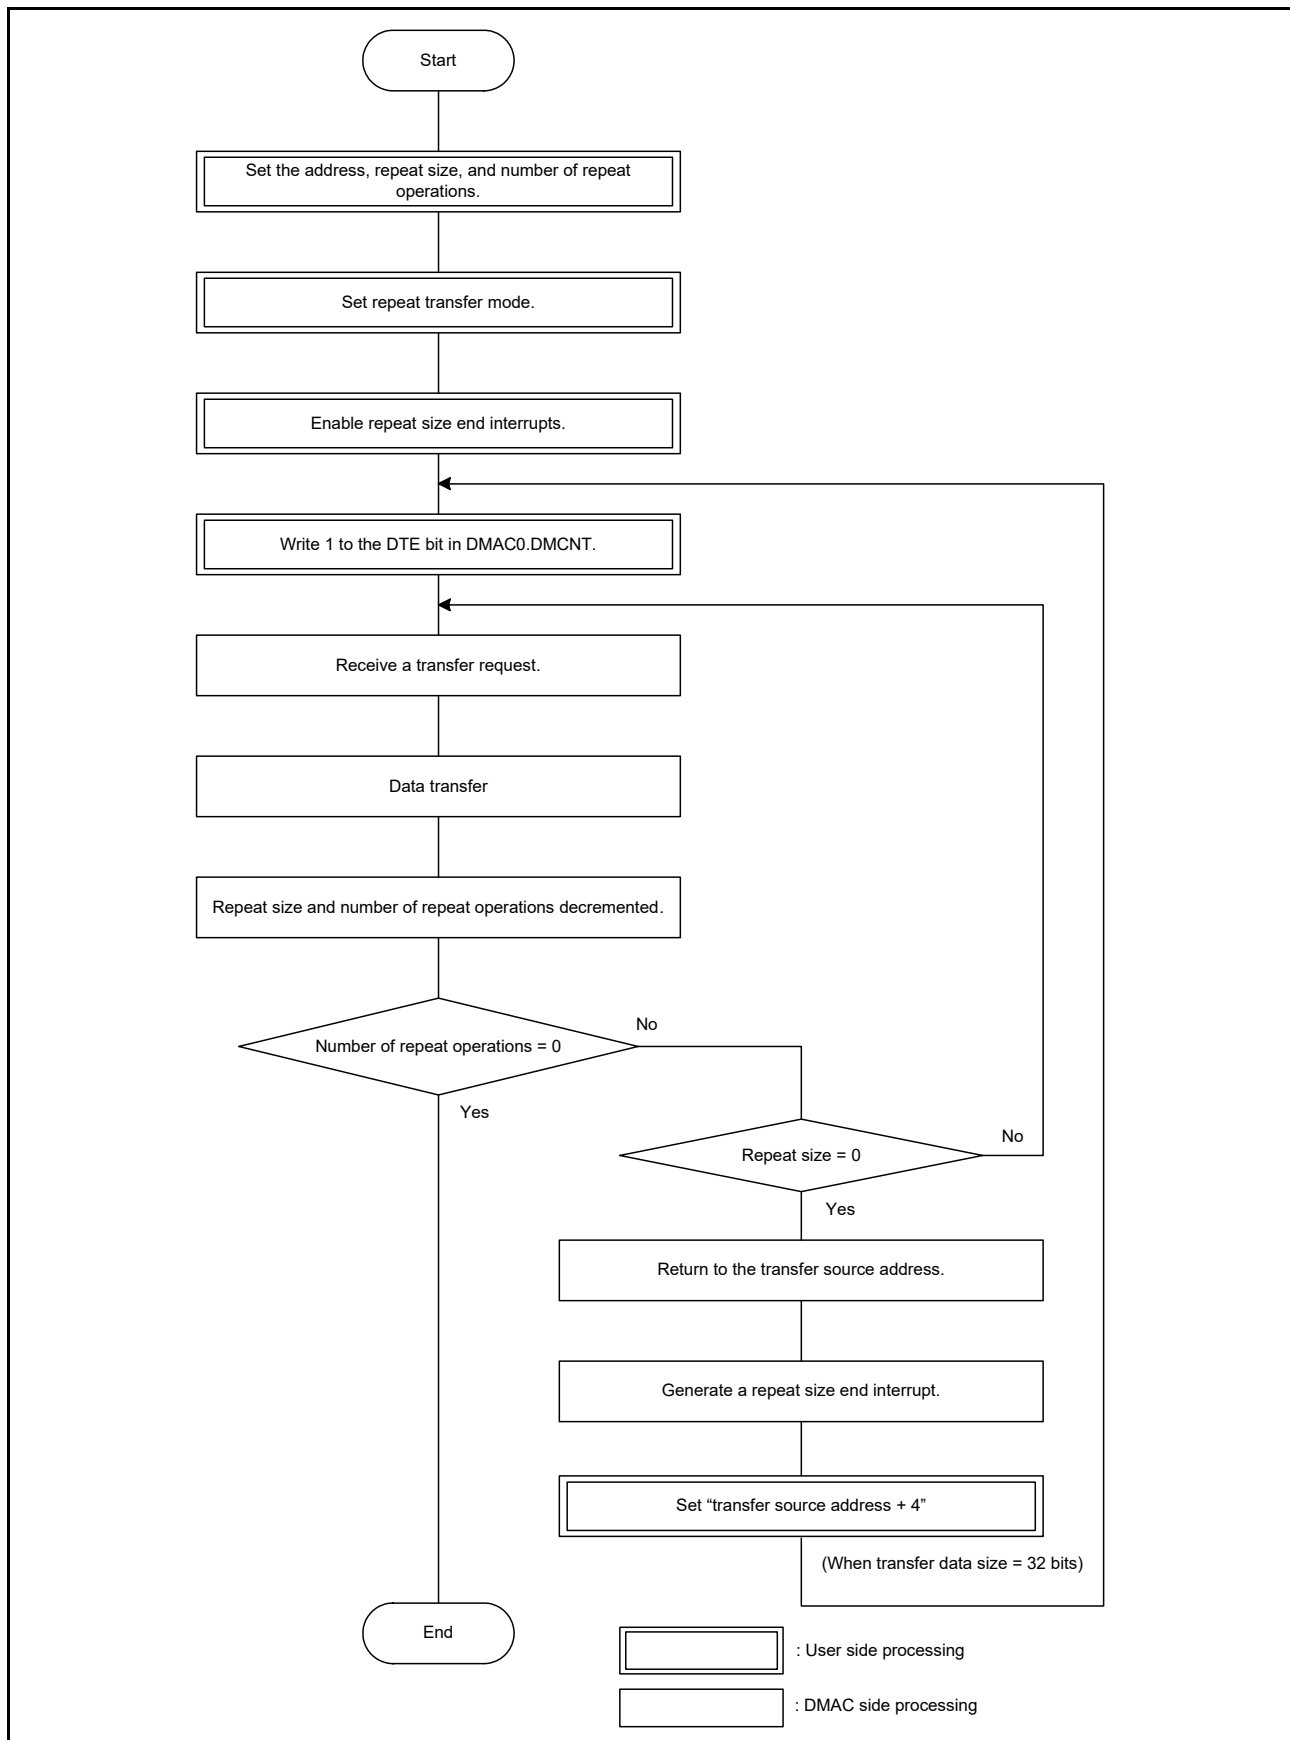

Figure 17.9 XY Conversion Flowchart Using Offset Addition in Repeat Transfer Mode

### 17.3.4 Request Sources

Software, the interrupt requests from the peripheral modules, and the external interrupt requests can be specified as the DMA request sources. Setting the DCTG[1:0] bits in DMTMD of DMAC<sub>m</sub> selects the request source.

#### (1) Trigger by Software

Setting the DCTG[1:0] bits in DMTMD of DMAC<sub>m</sub> to 00b enables the trigger by software.

To start DMA transfer by software, set the DCTG[1:0] bits in DMTMD of DMAC<sub>m</sub> to 00b, and then set the DTE bit in DMCNT of DMAC<sub>m</sub> to 1 (DMA transfer is enabled) and the SWREQ bit in DMREQ of DMAC<sub>m</sub> to 1 (DMA transfer is requested) with the DMST bit in DMAST set to 1 (DMAC module start).

When the DMAC is triggered by software while the CLRS bit in DMREQ of DMAC<sub>m</sub> is 0, the SWREQ bit in DMREQ of DMAC<sub>m</sub> is set to 0 after data transfer is started in response to a DMA transfer request.

When the DMAC is triggered by software while the CLRS bit is 1, the SWREQ bit is not set to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

#### (2) Trigger by Interrupt Requests from On-Chip Peripheral Modules or External Interrupt Requests

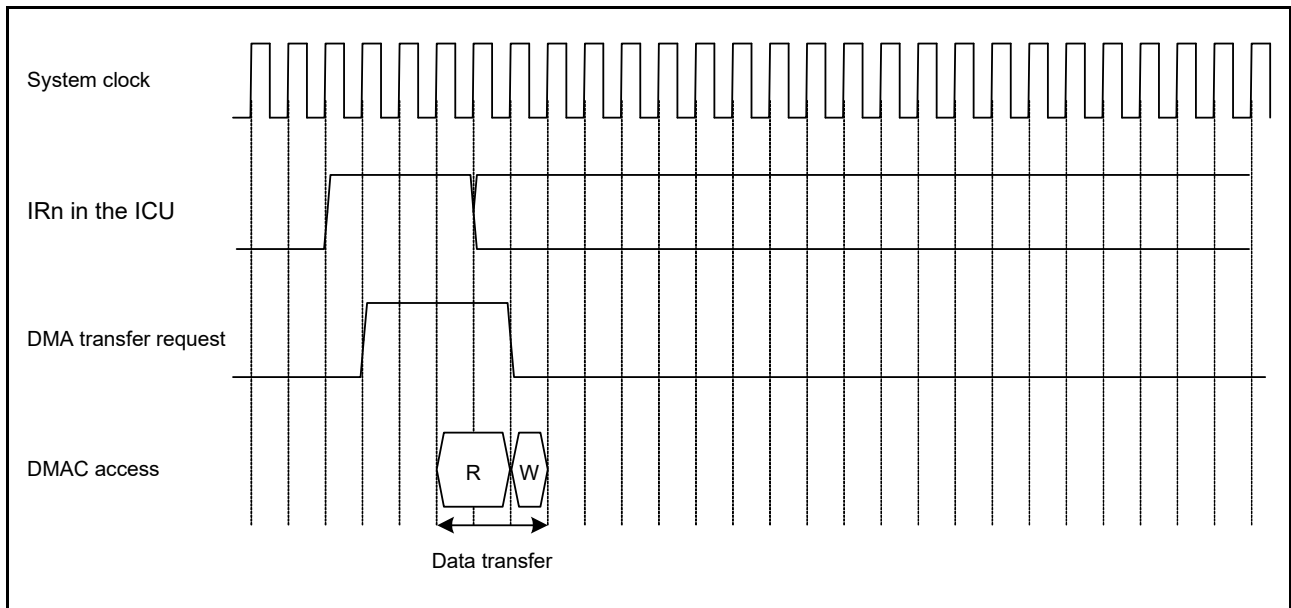

Interrupt requests from the on-chip peripheral modules and external interrupt requests can be specified as the DMA request sources. The request source can be selected separately for each channel using the DMRSR<sub>m</sub> registers (m = 0 to 7) of the ICU.

The DMA transfer is triggered when an interrupt request from the on-chip peripheral module or an external interrupt request is generated while the DCTG[1:0] bits in DMTMD of DMAC<sub>m</sub> are set to 01b (interrupts from the peripheral modules and the external interrupt pins are selected), the DTE bit in DMCNT of DMAC<sub>m</sub> is set to 1 (DMA transfer is enabled), and the DMST bit in DMAST is set to 1 (DMAC module start).

For interrupt requests specified as DMA request sources, refer to Table 14.4, Interrupt Vector Table, in section 14, Interrupt Controller (ICUC).

### 17.3.5 Operation Timing

Figure 17.10 and Figure 17.11 show DMAC operation timing examples.

**Figure 17.10 DMAC Operation Timing Example (1) (Trigger by Interrupt from Peripheral Module/External Interrupt Input Pin, Normal Transfer Mode, Repeat Transfer Mode)**

**Figure 17.11 DMAC Operation Timing Example (2) (Trigger by Interrupt from Peripheral Module/External Interrupt Input Pin, Block Transfer Mode, Block Size = 4)**

### 17.3.6 DMAC Execution Cycles

Table 17.7 lists execution cycles in one DMAC data transfer operation.

**Table 17.7 DMAC Execution Cycles**

| Transfer Mode | Data Transfer (Read) | Data Transfer (Write) |
|---------------|----------------------|-----------------------|
| Normal        | Cr+1                 | Cw                    |
| Repeat        | Cr+1                 | Cw                    |
| Block*1       | P × Cr               | P × Cw                |

Note 1. This is the case when the block size is 2 or more. When the block size is 1, normal transfer cycle is applied.

P: Block size (DMCRAH register setting)

Cr: Data read destination access cycle

Cw: Data write destination access cycle

Cr and Cw depend on the access destination. For the number of cycles for each access destination, see section 43, RAM, section 44, Flash Memory (FLASH), section 5, I/O Registers, and section 15.2.6, External Bus.

The unit for +1 in “Data Transfer (Read)” column is one system clock cycle (ICLK).

For the operation example, see section 17.3.5, Operation Timing.

### 17.3.7 Activating the DMAC

Figure 17.12 shows the register setting procedure.

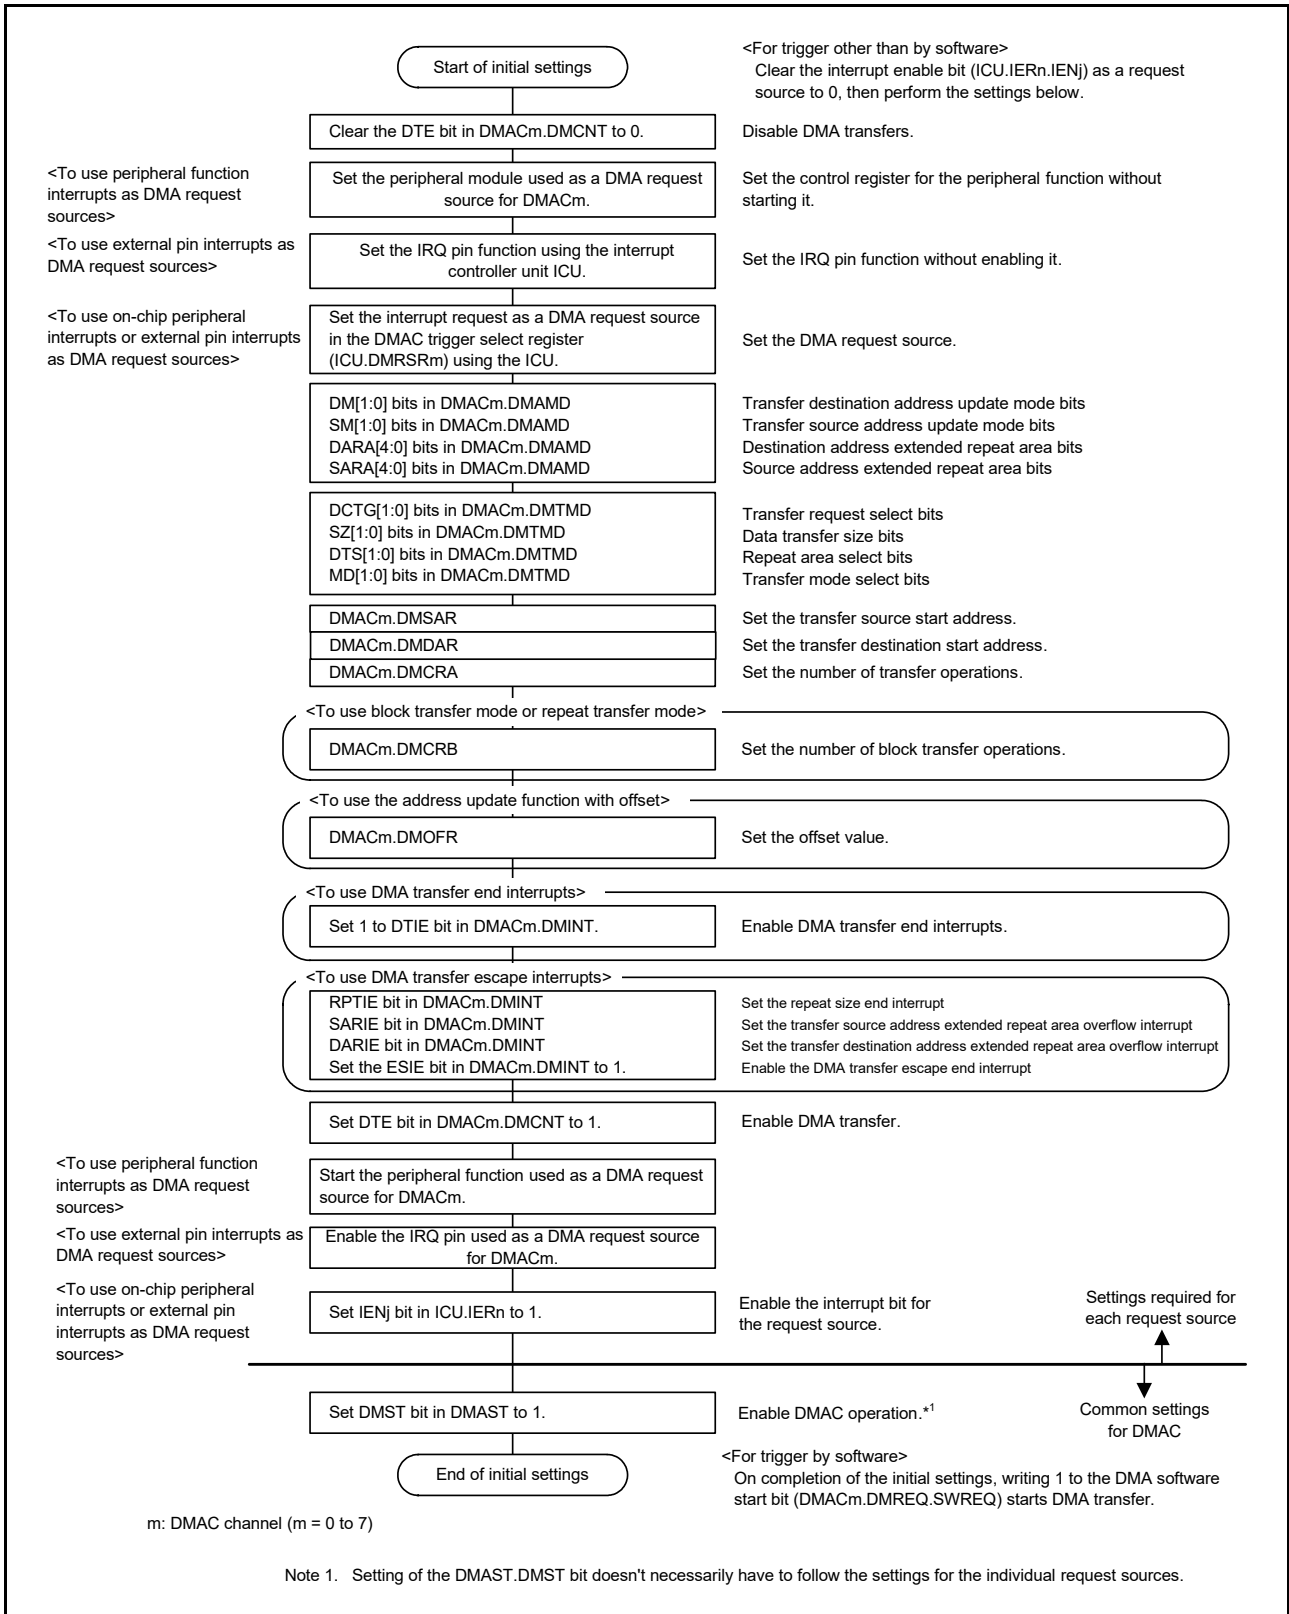

Figure 17.12 Register Setting Procedure

### 17.3.8 Starting DMA Transfer

Setting the DTE bit in DMCNT of DMAC<sub>m</sub> to 1 (DMA transfer enabled) and setting the DMST bit in DMAST to 1 (DMAC module start) enable DMA transfer of channel m (m = 0 to 7).

Another transfer request cannot be accepted during the transfer of other DMAC channel or DTC. When the proceeding transfer is completed, channel arbitration is performed where a DMA transfer request of the highest priority channel is accepted and DMA transfer of the channel starts. When DMA transfer starts, the ACT bit in DMSTS of DMAC<sub>m</sub> is set to 1 (the DMAC is in the active state).

### 17.3.9 Registers during DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMCNT, and DMSTS of DMAC<sub>m</sub>.

#### (1) DMA Source Address Register (DMAC<sub>m</sub>.DMSAR)

When data has been transferred in response to one transfer request, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, refer to Table 17.3 to Table 17.5.

#### (2) DMA Destination Address Register (DMAC<sub>m</sub>.DMDAR)

When data has been transferred in response to one transfer request, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, refer to Table 17.3 to Table 17.5.

#### (3) DMA Transfer Count Register (DMAC<sub>m</sub>.DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, refer to Table 17.3 to Table 17.5.

#### (4) DMA Block Transfer Count Register (DMAC<sub>m</sub>.DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, refer to Table 17.3 to Table 17.5.

#### (5) DMA Transfer Enable Bit (DMAC<sub>m</sub>.DMCNT.DTE)

Although the DMAC<sub>m</sub>.DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically set to 0 by the DMAC according to the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt

Writing to the registers for the channels when the corresponding DMAC<sub>m</sub>.DMCNT.DTE bit is set to 1 is prohibited (except for DMAC<sub>m</sub>.DMCNT). In this case, writing must be performed after the bit is set to 0.

#### (6) DMA Active Flag (DMAC<sub>m</sub>.DMSTS.ACT)

The ACT bit in DMSTS of DMAC<sub>m</sub> indicates whether the DMAC<sub>m</sub> is in the idle or active state.

This flag is set to 1 when the DMAC starts data transfer, and is set to 0 when data transfer in response to one transfer request is completed.

Even when DMA transfer is stopped by writing 0 to the DTE bit in DMCNT of DMAC<sub>m</sub> during DMA transfer, this flag remains 1 until DMA transfer is completed.

#### (7) Transfer End Interrupt Flag (DMAC<sub>m</sub>.DMSTS.DTIF)

The DTIF flag in DMSTS of DMAC<sub>m</sub> is set to 1 after DMA transfer of the total transfer size of data is completed.

When both this flag and the DTIE bit in DMINT of DMAC<sub>m</sub> are set to 1, a transfer end interrupt is requested.

This flag is set to 1 when the DMA transfer bus cycle is completed and the ACT flag in DMSTS of DMAC<sub>m</sub> is set to 0 indicating the DMA transfer end.

This flag is automatically set to 0 when the DTE bit in DMCNT of DMAC<sub>m</sub> is set to 1 during the interrupt handling.

#### (8) Transfer Escape End Interrupt Flag (DMAC<sub>m</sub>.DMSTS.ESIF)

The ESIF flag in DMSTS of DMAC<sub>m</sub> is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When this bit and the ESIE bit in DMINT of DMAC<sub>m</sub> are set to 1, a transfer escape end interrupt is requested.

This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the ACT flag in DMSTS of DMAC<sub>m</sub> is set to 0 indicating the DMA transfer end.

This flag is automatically set to 0 when the DTE bit in DMCNT of DMAC<sub>m</sub> is set to 1 during an interrupt handling.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 14, Interrupt Controller (ICUC).

### 17.3.10 Channel Priority

When multiple DMA transfer requests are present, the DMAC determines the priority of channels that have DMA transfer requests.

The channel priority is fixed as channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7 (channel 0: highest).

When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

## 17.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DTE bit in DMCNT and the ACT flag in DMSTS of DMAC<sub>m</sub> are changed from 1 to 0, indicating that DMA transfer has ended.

### 17.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

#### (1) In Normal Transfer Mode (DMAC<sub>m</sub>.DMTMD.MD[1:0] = 00b)

When the value of DMCRAL of DMAC<sub>m</sub> changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DTE bit in DMCNT of DMAC<sub>m</sub> is set to 0 and the DTIF bit in DMSTS of DMAC<sub>m</sub> is set to 1 at the same time. If the DTIE bit in DMINT of DMAC<sub>m</sub> is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

#### (2) In Repeat Transfer Mode (DMAC<sub>m</sub>.DMTMD.MD[1:0] = 01b)

When the value of DMCRB of DMAC<sub>m</sub> changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DTE bit in DMCNT of DMAC<sub>m</sub> is set to 0 and the DTIF bit in DMSTS of DMAC<sub>m</sub> is set to 1 at the same time. If the DTIE bit in DMINT of DMAC<sub>m</sub> is 1 at this time, an interrupt request is issued to the CPU or the DTC.

#### (3) In Block Transfer Mode (DMAC<sub>m</sub>.DMTMD.MD[1:0] = 10b)

When the value of DMCRB of DMAC<sub>m</sub> changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DTE bit in DMCNT of DMAC<sub>m</sub> is set to 0 and the DTIF bit in DMSTS of DMAC<sub>m</sub> is set to 1 at the same time. If the DTIE bit in DMINT of DMAC<sub>m</sub> is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 14, Interrupt Controller (ICUC).

### 17.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of a 1-repeat size of data is completed while the RPTIE bit in DMINT of DMAC<sub>m</sub> is set to 1. When the interrupt is requested to complete DMA transfer, the DTE bit in DMCNT of DMAC<sub>m</sub> is set to 0 and the ESIF flag in DMSTS of DMAC<sub>m</sub> is set to 1. If the ESIE bit in DMINT of DMAC<sub>m</sub> is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DTE bit in DMCNT of DMAC<sub>m</sub>.

A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of a 1-block size data is completed.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 14, Interrupt Controller (ICUC).

### 17.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the SARIE or DARIE bit in DMINT of DMAC<sub>m</sub> is set to 1, an interrupt by an extended repeat area overflow is requested. When the interrupt is requested, the DMA transfer is terminated, the DTE bit in DMCNT of DMAC<sub>m</sub> is set to 0, and the ESIF flag in DMSTS of DMAC<sub>m</sub> is set to 1. If the ESIE bit in DMINT of DMAC<sub>m</sub> is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Even if an interrupt by an extended repeat area overflow is requested during a read cycle, the following write cycle is performed.

In block transfer mode, even if an interrupt by an extended repeat area overflow is requested during a 1-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 14, Interrupt Controller (ICUC).

### 17.5 Interrupts

Each DMAC channel can output an interrupt request to the CPU or the DTC after transfer in response to one request is completed. When the transfer destination is the external bus or the on-chip peripheral bus, an interrupt request is generated upon completion of data write to the write buffer not to the actual transfer destination.

Table 17.8 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 17.13 shows the schematic logic diagram of interrupt outputs (DMAC0 to DMAC3). Figure 17.14 shows the schematic logic diagram of interrupt outputs (DMAC4 to DMAC7). Figure 17.15 shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

**Table 17.8 Relation among Interrupt Sources, Interrupt Status Flags, and Interrupt Enable Bits**

| Interrupt Sources   | Interrupt Enable Bits                             | Interrupt Status Flags | Request Output Enable Bits |
|---------------------|---------------------------------------------------|------------------------|----------------------------|
| Transfer end        | —                                                 | DMACm.DMSTS.DTIF       | DMACm.DMINT.DTIE           |
| Escape transfer end | Repeat size end                                   | DMACm.DMINT.RPTIE      | DMACm.DMINT.ESIE           |
|                     | Source address extended repeat area overflow      | DMACm.DMINT.SARIE      |                            |
|                     | Destination address extended repeat area overflow | DMACm.DMINT.DARIE      |                            |

**Figure 17.13 Schematic Logic Diagram of Interrupt Outputs (DMAC0 to DMAC3)**

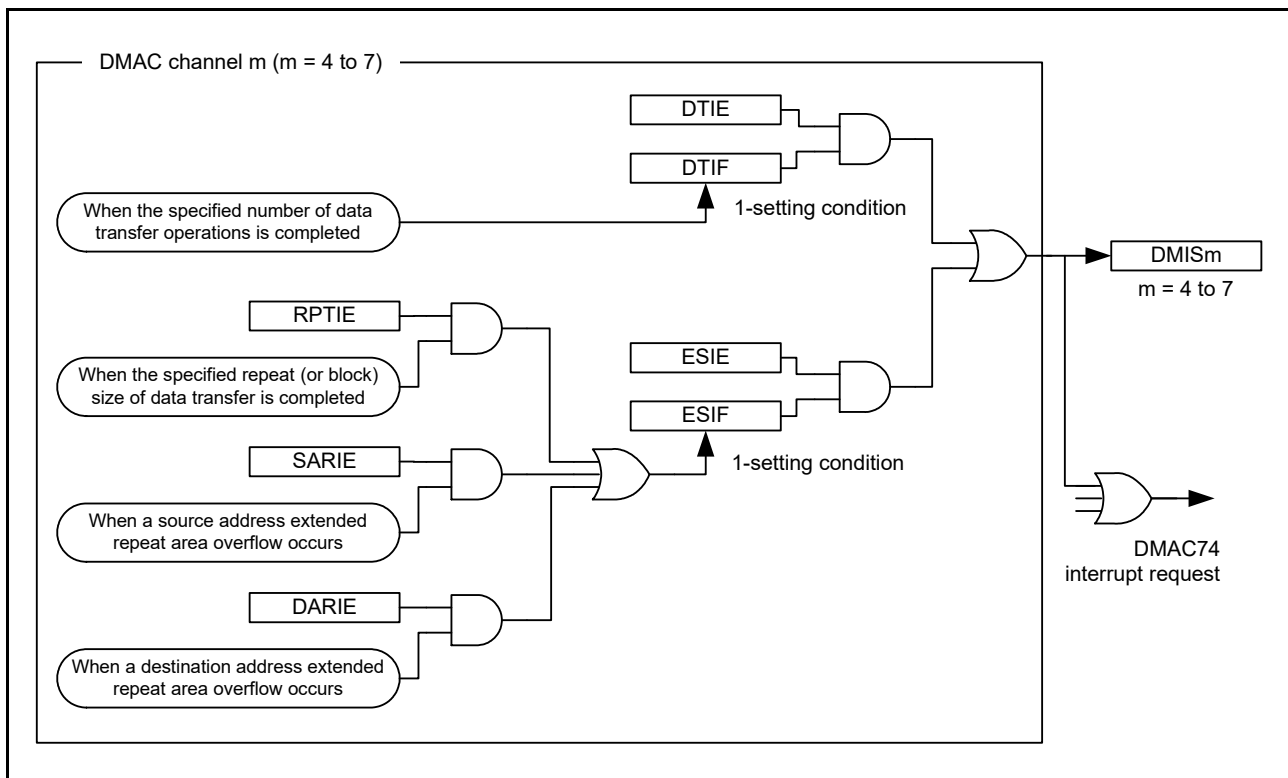

Figure 17.14 Schematic Logic Diagram of Interrupt Outputs (DMAC4 to DMAC7)

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases: (1) discontinuing or terminating DMA transfer and (2) continuing DMA transfer.

#### (1) When Discontinuing or Terminating DMA Transfer

Write 0 to the DTIF bit in DMSTS of DMACm to clear a transfer end interrupt, and to the ESIF bit in DMSTS of DMACm to clear a repeat size interrupt and an extended repeat area overflow interrupt. The DMACm remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DTE bit in DMCNT of DMACm to 1 (DMA transfer enabled).

#### (2) When Continuing DMA Transfer

Write 1 to the DTE bit in DMCNT of DMACm. The ESIF bit in DMSTS of DMACm is automatically set to 0 (interrupt source cleared), and DMA transfer is resumed.

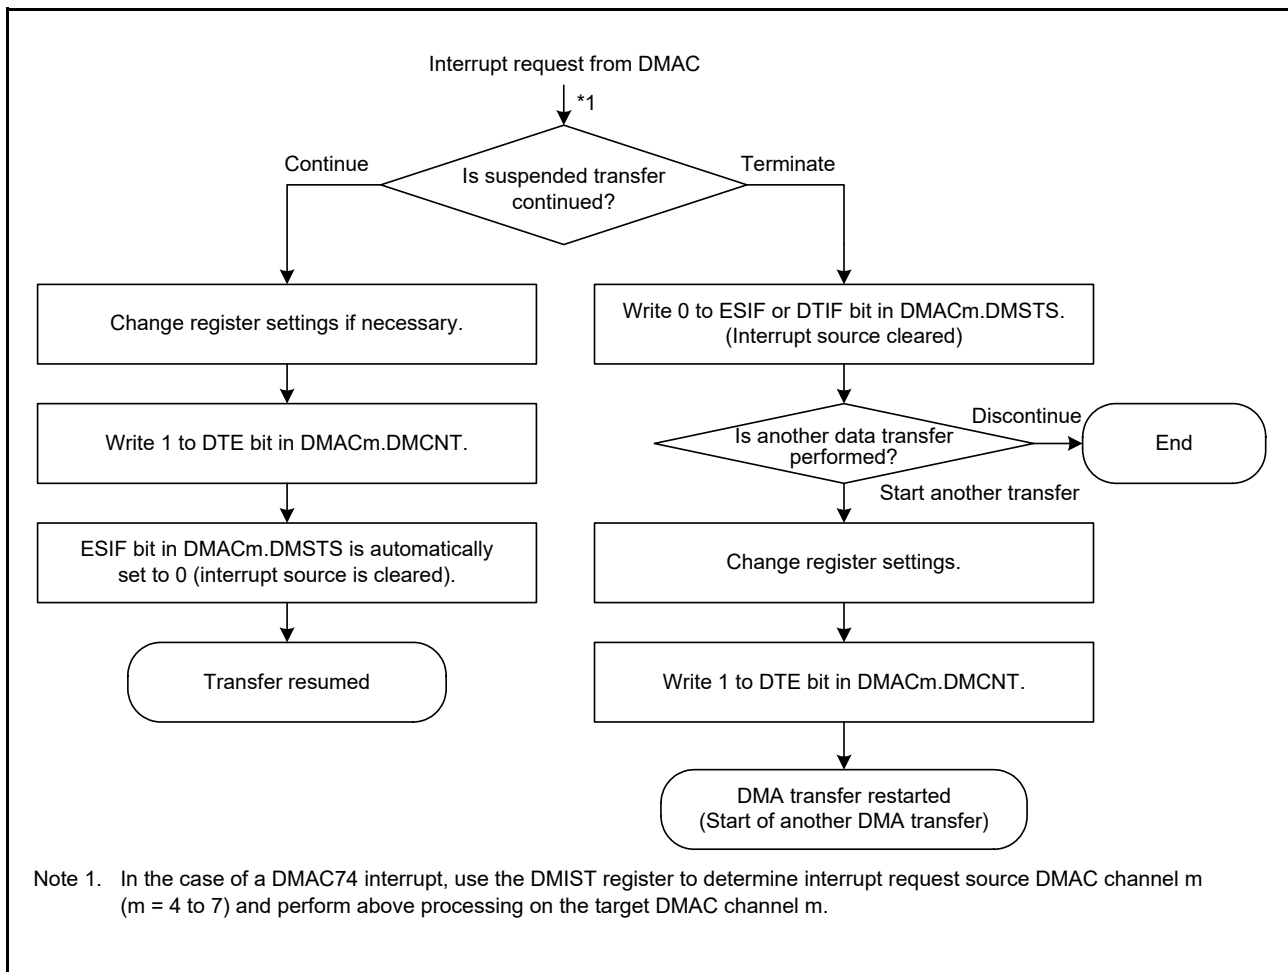

Figure 17.15 DMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

### 17.6 Event Link

Each DMAC channel outputs an event link request signal each time the channel completes data transfer (or block transfer in block transfer mode). However, when the transfer destination is the external bus or internal peripheral bus, an event link request signal is generated when the writing to the write buffer is accepted.

## 17.7 Low-Power Consumption Function

Before transition to the module-stop state, all-module clock stop mode, software standby mode, or deep software standby mode, set the DMST bit in DMAST to 0 (the DMAC suspended), and then perform the following.

### (1) Module-Stop Function

Writing 1 to the MSTPA28 bit (transition to the module-stop state) in MSTPCRA enables the module-stop function of the DMAC. If DMA transfer is in progress at the time a 1 is written to the MSTPA28 bit, the transition to the module-stop state proceeds after DMA transfer has ended. While the MSTPA28 bit is 1, accessing the DMAC registers are prohibited.

Writing 0 to the MSTPA28 bit releases the DMAC from the module-stop state.

### (2) All-Module Clock Stop Mode

Make settings in accord with the procedure under section 11.5.2.1, Transition to All-Module Clock Stop Mode, in section 11, Low Power Consumption.

If DMA transfer operations are in progress at the time the WAIT instruction is executed, the transition to all-module clock stop mode follows the completion of DMA transfer.

The DMAC is released from the module-stop state by writing 0 to the MSTPCRA.MSTPA28 bit following recovery from all-module clock stop mode.

### (3) Software Standby and Deep Software Standby Modes

Make settings in accord with the procedure under section 11.5.3.1, Transition to Software Standby Mode or section 11.5.4.1, Transition to Deep Software Standby Mode, in section 11, Low Power Consumption.

If DMA transfer operations are in progress at the time the WAIT instruction is executed, the transition to software standby or deep software standby follows the completion of DMA transfer.

### (4) Note on Low-Power Consumption Function

For the WAIT instruction and the register setting procedure, see section 11.6.6, Timing of WAIT Instruction in section 11, Low Power Consumption.

To perform DMA transfer after returning from low-power consumption mode, set the DMST bit in DMAST to 1 again. To use a request that is generated in all-module clock-stop mode and software standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination in accordance with the description in section 14, Interrupt Controller (ICUC), and then execute the WAIT instruction.

## 17.8 Usage Notes

### 17.8.1 DMA Transfer to External Devices

In DMA transfer to an external device, the ACT bit in DMSTS of DMAC<sub>m</sub> may be set to 0 (DMAC transfer suspended) during the period from the beginning of the final data write to the end of the external bus access.

### 17.8.2 DMA Transfer to Peripheral Modules

In DMA transfer to a peripheral module, the ACT bit in DMSTS of DMAC<sub>m</sub> may be set to 0 (DMAC transfer suspended) during the period from the beginning of the final data write to the end of the peripheral bus access.

### 17.8.3 Access to the Registers during DMA Transfer

Do not write to the DMSAR, DMDAR, DMCRA, DMCRB, DMTMD, DMINT, DMAMD, DMOFR, and DMCSL registers of DMAC<sub>m</sub> while the ACT bit in DMSTS of the same channel is set to 1 (DMAC active state) or the DTE bit in DMCNT of the same channel is set to 1 (DMA transfer enabled).

### 17.8.4 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see section 4, Address Space.

### 17.8.5 Interrupt Request by the DMA Request Source Flag Control Register (DMCSL) at the End of Each Transfer

While the DMAC<sub>m</sub>.DMCSL.DISEL bit is 1, an interrupt request is issued to the CPU at the end of each transfer that has been triggered by one DMA request. Unlike the transfer end interrupt that the DMAC outputs or the escape end interrupt, the interrupt of this type is issued to the CPU at the end of DMA transfer without clearing the interrupt status flag of the DMA request source to 0 by changing the interrupt request destination to the CPU. In this case, since the interrupt status flag is not set to 0 at the end of DMAC transfer, it should be set to 0 by the CPU interrupt routine.

The interrupt flag is cleared when the CPU interrupt is accepted.

For the change of the settings on the interrupt flag or the interrupt request destination, see section 14, Interrupt Controller (ICUC). For the DMAC<sub>m</sub>.DMCSL.DISEL bit setting, see section 17.2.12, DMA Request Source Flag Control Register (DMCSL).

### 17.8.6 Setting of DMAC Trigger Select Register of the Interrupt Controller (ICU.DMRSR<sub>m</sub>)

The DMAC trigger select register (ICU.DMRSR<sub>m</sub>) should be set while the DMA transfer enable bit (DMAC<sub>m</sub>.DMCNT.DTE) is 0 (DMA transfer is disabled). Moreover, the DTC transfer request enable register (ICU.DTCER<sub>m</sub>) that corresponds to the same vector number that has been set by the ICU.DMRSR<sub>m</sub> register should not be set to 1. For details on the ICU.DTCER<sub>n</sub> and ICU.DMRSR<sub>m</sub>, see section 14, Interrupt Controller (ICUC).

### 17.8.7 Suspending or Restarting DMA Transfer

To suspend a DMA transfer request, write 0 to the interrupt enable bit for the request source (ICU.IER<sub>n</sub>.IEN<sub>j</sub> bit). To restart the DMA transfer, write 1 to the ICU.IER<sub>n</sub>.IEN<sub>j</sub> bit with the setting shown in section 17.3.7, Activating the DMAC.

## 18. Data Transfer Controller (DTCa)

This MCU incorporates a data transfer controller (DTC).

The DTC is triggered by an interrupt request to perform data transfers.

### 18.1 Overview

Table 18.1 lists the specifications of the DTC, and Figure 18.1 shows a block diagram of the DTC.

**Table 18.1 DTC Specifications**

| Item                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| CPU interrupt source           | <ul style="list-style-type: none"> <li>An interrupt request can be generated to the CPU on a request source for a data transfer.</li> <li>An interrupt request can be generated to the CPU after a single data transfer.</li> <li>An interrupt request can be generated to the CPU after data transfer of specified volume.</li> </ul>                                                                                                                                                                                                                                                                                                                     |
| Event link function            | An event link request is generated after one data transfer (for block, after one block transfer).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Read skip                      | Reading of the transfer information can be skipped when the same transfer is repeated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Write-back skip                | Write-back of the transferred data that is not updated can be skipped when the address of the transfer source or destination is fixed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Low power consumption function | Module stop state can be set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Figure 18.1 DTC Block Diagram

## 18.2 Register Descriptions

Registers MRA, MRB, SAR, DAR, CRA, and CRB are DTC internal registers, which cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the RAM area as transfer information. When accepting a transfer request, the DTC reads the transfer information from the RAM area and sets it in the internal registers. After the data transfer ends, the values of the updated internal register are written back to the RAM area as transfer information.

### 18.2.1 DTC Mode Register A (MRA)

Address(es): (inaccessible directly from the CPU)

| Bit    | Symbol  | Bit Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   | R/W |

MRB register is used to select the DTC operating mode and cannot be accessed directly from the CPU.

### DTS Bit (DTC Transfer Mode Select)

The DTS bit specifies the side (transfer source or destination) to be a repeat area or block area in repeat transfer mode or block transfer mode.

### CHNS Bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition.

When the CHNE bit is 0, setting of the CHNS bit is ignored. For details on the conditions to select the chain transfer, refer to Table 18.3, Chain Transfer Conditions.

When the next transfer is chain transfer, completion of the specified number of transfers is not determined, the interrupt status flag for the request source is not cleared, and an interrupt request to the CPU is not generated.

### CHNE Bit (DTC Chain Transfer Enable)

The CHNE bit enables or disables chain transfer.

The chain transfer condition is selected by the CHNS bit.

For details of chain transfer, refer to section 18.4.6, Chain Transfer.

### 18.2.3 DTC Transfer Source Register (SAR)

Address(es): (inaccessible directly from the CPU)

SAR register is used to set the transfer source start address.

In full-address mode, 32 bits are valid.

In short-address mode, lower 24 bits are valid and upper 8 bits (b31 to b24) are ignored. The address of this register is extended by the value specified by b23.

SAR register cannot be accessed directly from the CPU.

### 18.2.4 DTC Transfer Destination Register (DAR)

Address(es): (inaccessible directly from the CPU)

DAR register is used to set the transfer destination start address.

In full-address mode, 32 bits are valid.

In short-address mode, lower 24 bits are valid and upper 8 bits (b31 to b24) are ignored. The address of this register is extended by the value specified by b23.

DAR register cannot be accessed directly from the CPU.

### 18.2.5 DTC Transfer Count Register A (CRA)

- Normal transfer mode

Address(es): (inaccessible directly from the CPU)

- Repeat transfer mode/block transfer mode

Address(es): (inaccessible directly from the CPU)

| Symbol | Register Name                     | Description                                                                             | R/W |
|--------|-----------------------------------|-----------------------------------------------------------------------------------------|-----|
| CRAL   | Transfer Counter A Lower Register | Set transfer count. This register functions as a transfer counter during data transfer. | —   |
| CRAH   | Transfer Counter A Upper Register | Set transfer count. This register functions as a reload register during data transfer.  | —   |

Note: The function depends on transfer mode.

Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

This register is for counting the number of transfers and cannot be accessed directly from the CPU.

#### (1) Normal transfer mode (MRA.MD[1:0] bits = 00b)

CRA register functions as a 16-bit transfer counter in normal transfer mode.

The transfer count is 1, 65535, and 65536 when the set value is 0001h, FFFFh, and 0000h, respectively.

The CRA value is decremented (-1) at each data transfer.

#### (2) Repeat transfer mode (MRA.MD[1:0] bits = 01b)

The CRAH register retains the transfer count and the CRAL register functions as an 8-bit transfer counter.

The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively.

The CRAL value is decremented (-1) at each data transfer. When it reaches 00h, the CRAH value is reloaded to the CRAL register.

#### (3) Block transfer mode (MRA.MD[1:0] bits = 10b)

The CRAH register retains the block size and the CRAL register functions as an 8-bit block size counter.

The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively.

The CRAL value is decremented (-1) at each data transfer. When it reaches 00h, the CRAH value is reloaded to the CRAL register.

## 18.2.6 DTC Transfer Count Register B (CRB)

Address(es): (inaccessible directly from the CPU)

CRB register is used to set the block transfer count for block transfer mode and cannot be accessed directly from the CPU.

The transfer count is 1, 65535, and 65536 when the set value is 0001h, FFFFh, and 0000h, respectively.

The CRB value is decremented (-1) when the final data of a single block size is transferred.

When normal transfer mode or repeat transfer mode is selected, this register is not used and the set value is ignored.

## 18.2.7 DTC Control Register (DTCCR)

Address(es): DTC.DTCCR 0008 2400h

| Bit      | Symbol | Bit Name                                  | Description                                                                                                        | R/W |
|----------|--------|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------|-----|
| b2 to b0 | —      | Reserved                                  | These bits are read as 0. The write value should be 0.                                                             | R/W |
| b3       | —      | Reserved                                  | This bit is read as 1. The write value should be 1.                                                                | R/W |
| b4       | RRS    | DTC Transfer Information Read Skip Enable | 0: Transfer information read is not skipped.<br>1: Transfer information read is skipped when vector numbers match. | R/W |
| b7 to b5 | —      | Reserved                                  | These bits are read as 0. The write value should be 0.                                                             | R/W |

DTCCR register is used to control the DTC operation.

### RRS Bit (DTC Transfer Information Read Skip Enable)

The DTC vector number is compared with the vector number in the previous data transfer.

When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transferred information. However, when the previous transfer was chain transfer, the transferred information is read regardless of the value of the RRS bit.

Furthermore, when the transfer counter (CRA register) became 0 during the previous normal transfer and when the transfer counter (CRB register) became 0 during the previous block transfer, the transferred information is read regardless of the RRS bit value.

## 18.2.8 DTC Vector Base Register (DTCVBR)

Address(es): DTC.DTCVBR 0008 2404h

The DTCVBR register is used to set the base address for calculating the address to which the DTC vector is allocated. Values for the upper 4 bits (b31 to b28) cannot be written but reflect the value written to b27. The lower 10 bits are reserved and the values are fixed to 0. Write 0 to the lower 10 bits if necessary.

It can be set in the range of 0000 0000h to 07FF FC00h and F800 0000h to FFFF FC00h in 1-Kbyte units.

## 18.2.9 DTC Address Mode Register (DTCADM0D)

Address(es): DTC.DTCADM0D 0008 2408h

| Bit      | Symbol | Bit Name               | Description                                            | R/W |
|----------|--------|------------------------|--------------------------------------------------------|-----|
| b0       | SHORT  | Short-Address Mode Set | 0: Full-address mode<br>1: Short-address mode          | R/W |
| b7 to b1 | —      | Reserved               | These bits are read as 0. The write value should be 0. | R/W |

DTCADM0D register is used to specify the area accessible by the DTC.

### SHORT Bit (Short-Address Mode Set)

This bit is used to select address mode of registers SAR and DAR.

Full-address mode allows the DTC to access to a 4-Gbyte space (0000 0000h to FFFF FFFFh).

Short-address mode allows the DTC to access to a 16-Mbyte space (0000 0000h to 007F FFFFh and FF80 0000h to FFFF FFFFh).

### 18.2.10 DTC Module Start Register (DTCST)

Address(es): DTC.DTCST 0008 240Ch

| Bit      | Symbol | Bit Name         | Description                                            | R/W |
|----------|--------|------------------|--------------------------------------------------------|-----|
| b0       | DTCST  | DTC Module Start | 0: DTC module stop<br>1: DTC module start              | R/W |
| b7 to b1 | —      | Reserved         | These bits are read as 0. The write value should be 0. | R/W |

#### DTCST Bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted.

If this bit is set to 0 during data transfer, the accepted transfer request is active until the processing is completed.

Set the DTCST bit to 0 before making a transition to the module stop state, all-module clock stop mode, software standby mode, or deep software standby mode.

Set the DTCST bit to 1 to resume the data transfer after returning from the module stop state, all-module clock stop mode, or software standby mode.

For details on transitions to the module stop state, all-module clock stop mode, software standby mode, and deep software standby mode, refer to section 18.9, Low Power Consumption Function, and section 11, Low Power Consumption.

### 18.2.11 DTC Status Register (DTCSTS)

Address(es): DTC.DTCSTS 0008 240Eh

| Bit       | Symbol    | Bit Name                                 | Description                                                                                                                                                                                  | R/W |
|-----------|-----------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b7 to b0  | VECN[7:0] | DTC Active Vector Number Monitoring Flag | These bits indicate the vector number for the request source when data transfer is in progress.<br>The value is only valid if data transfer is in progress (the value of the ACT flag is 1). | R   |
| b14 to b8 | —         | Reserved                                 | These bits are read as 0. Writing to these bits has no effect.                                                                                                                               | R   |
| b15       | ACT       | DTC Active Flag                          | 0: Data transfer is not in progress.<br>1: Data transfer is in progress.                                                                                                                     | R   |

#### VECN[7:0] Flags (DTC Active Vector Number Monitoring Flag)

While data transfer is in progress, these bits indicate the vector number corresponding to the request source for the transfer.

When the DTCSTS register is read, the value of the VECN[7:0] flags is valid if the value of the ACT flag was 1 (data transfer is in progress) and invalid if the value of the ACT flag was 0 (data transfer is not in progress).

For the correspondence between the DTC request sources and the vector addresses, refer to Table 14.4, Interrupt Vector Table in section 14, Interrupt Controller (ICUC).

#### ACT Flag (DTC Active Flag)

This flag indicates the state of data transfer operation.

[Setting condition]

- When the data transfer is started by a transfer request.

[Clearing condition]

- When the data transfer is completed in response to a transfer request.

### 18.3 Request Sources

The DTC data transfer is triggered by an interrupt request. Setting the `ICU.DTCERn.DTCE` bit ( $n$  = interrupt vector number) to 1 selects the corresponding interrupt request as a request source for the DTC.

For the correspondence between the DTC request sources and the vector addresses, refer to [Table 14.4, Interrupt Vector Table](#) in [section 14, Interrupt Controller \(ICUC\)](#). For request by software, refer to [section 14.2.5, Software Interrupt Generation Register \(SWINTR\)](#) and [section 14.2.6, Software Interrupt 2 Generation Register \(SWINT2R\)](#) in [section 14, Interrupt Controller \(ICUC\)](#).

Once the DTC has accepted a transfer request, it does not accept another transfer request until transfer for that single request is completed, regardless of the priority of the requests.

When multiple transfer requests are generated during data transfer by the DMAC/DTC, the request with the highest priority on completion of the current transfer is accepted. When multiple transfer requests are generated while the `DTCST.DTCST` bit is 0 (DTC module stop), the request with the highest priority at the moment when the bit is subsequently set to 1 (DTC module start) is accepted.

The DTC performs the following operations at the start of a single data transfer (or the last of the consecutive transfers in the case of a chain transfer).

- On completion of a specified number of data transfer, the `ICU.DTCERn.DTCE` bit is set to 0 and an interrupt is requested to the CPU.
- If the `MRB.DISEL` bit is 1, an interrupt is requested to the CPU on completion of data transfer.
- For the other transfers, the interrupt status flag of the request source is set to 0 at the start of data transfer.

#### 18.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information corresponding to each request source from the vector table and reads the transfer information starting at that address.

The vector table should be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC vector base register (`DTCVBR`) to set the base address of the DTC vector table.

Transfer information is allocated in the RAM area. The start address of the transfer information  $n$  with vector number  $n$  should be allocated at `DTCVBR + 4n`.

Transfer information should be aligned on a 4-byte boundary. The size of a transfer information is 12 bytes in short-address mode or 16 bytes in full-address mode. Use the `DTCADMOD.SHORT` bit to select short-address mode (`SHORT` bit = 1) or full-address mode (`SHORT` bit = 0).

[Figure 18.2](#) shows the relationship between the DTC vector table and transfer information.

[Figure 18.3](#) shows the allocation of transfer information in the RAM area. The lower addresses vary according to the endian of the corresponding allocation area. For details, refer to [section 18.10.2, Allocating Transfer Information](#).

Figure 18.2 DTC Vector Table and Transfer Information

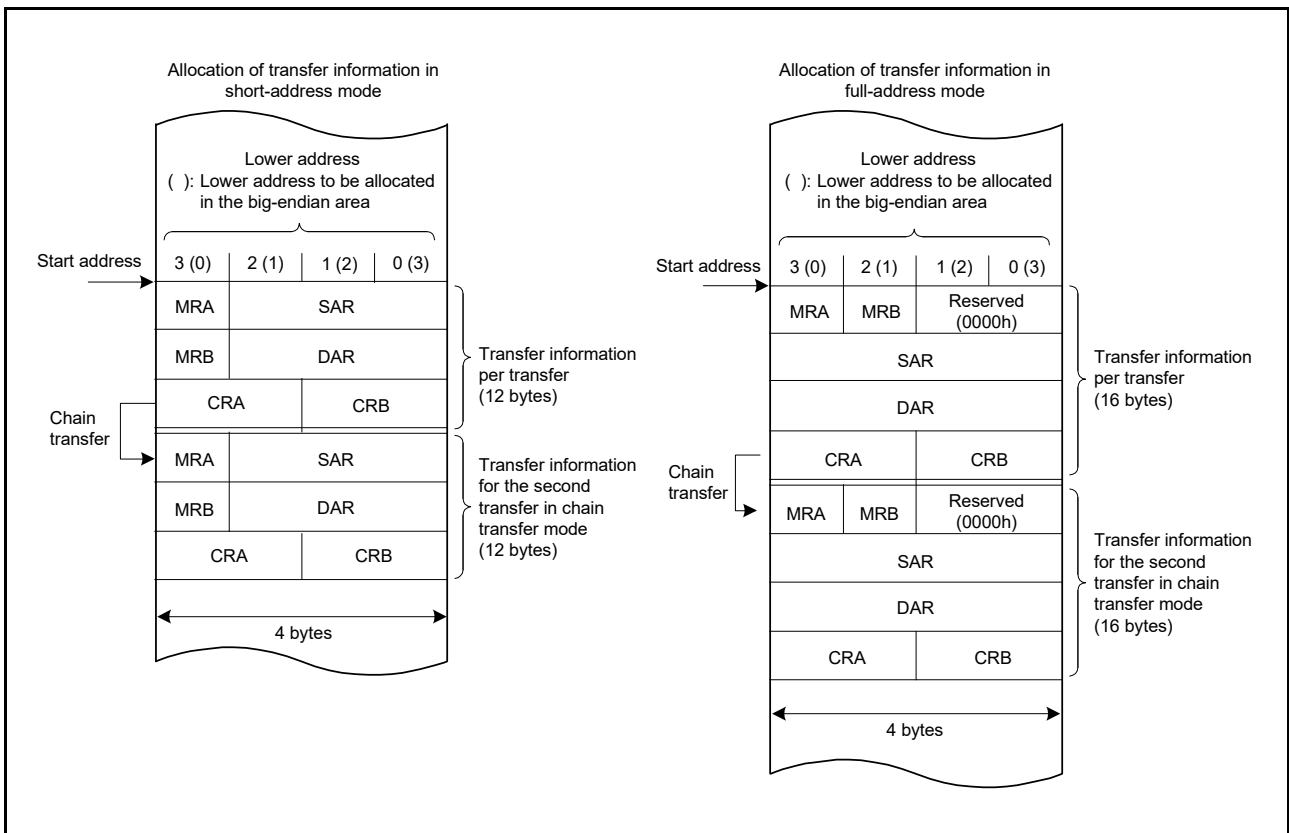

Figure 18.3 Allocation of Transfer Information in the RAM Area

## 18.4 Operation

The DTC transfers data in accordance with the transfer information. Storage of the transfer information in the RAM area is required before DTC operation.

When the DTC accepts a transfer request, it reads the DTC vector corresponding to the vector number. Next, the DTC reads transfer information from the address pointed by the DTC vector, transfers data, and then writes back the transfer information after the data transfer. Allocating transfer information in the RAM area allows data transfer of arbitrary number of channels.

There are three transfer modes: normal transfer mode, repeat transfer mode, and block transfer mode.

Set a transfer source address in the SAR register and a transfer destination address in the DAR register. The SAR and DAR registers are updated after the transfer according to the respective settings (increment, decrement, or fixed).

Table 18.2 lists transfer modes of the DTC.

**Table 18.2 Transfer Modes of the DTC**

| Transfer Mode          | Data Size Transferred on Single Transfer Request                                | Increment/Decrement of Memory Address                  | Settable Transfer Count |
|------------------------|---------------------------------------------------------------------------------|--------------------------------------------------------|-------------------------|
| Normal transfer mode   | 1 byte/1 word/1 longword                                                        | Incremented/decremented by 1, 2, or 4 or address fixed | 1 to 65536              |
| Repeat transfer mode*1 | 1 byte/1 word/1 longword                                                        | Incremented/decremented by 1, 2, or 4 or address fixed | 1 to 256*3              |
| Block transfer mode*2  | Block size specified in CRAH (1 to 256 bytes/1 to 256 words/1 to 256 longwords) | Incremented/decremented by 1, 2, or 4 or address fixed | 1 to 65536              |

Note 1. Set transfer source or transfer destination in the repeat area.

Note 2. Set transfer source or transfer destination in the block area.

Note 3. After data transfer of the specified count, the initial state is restored and the operation is continued (repeated).

Setting the MRB.CHNE bit to 1 allows multiple transfers (chain transfer) on a single transfer request. The setting in combination with the MRB.CHNS bit enables a chain transfer when the specified number of data transfers is completed. Figure 18.4 shows the operation flowchart of the DTC. Table 18.3 lists chain transfer conditions.

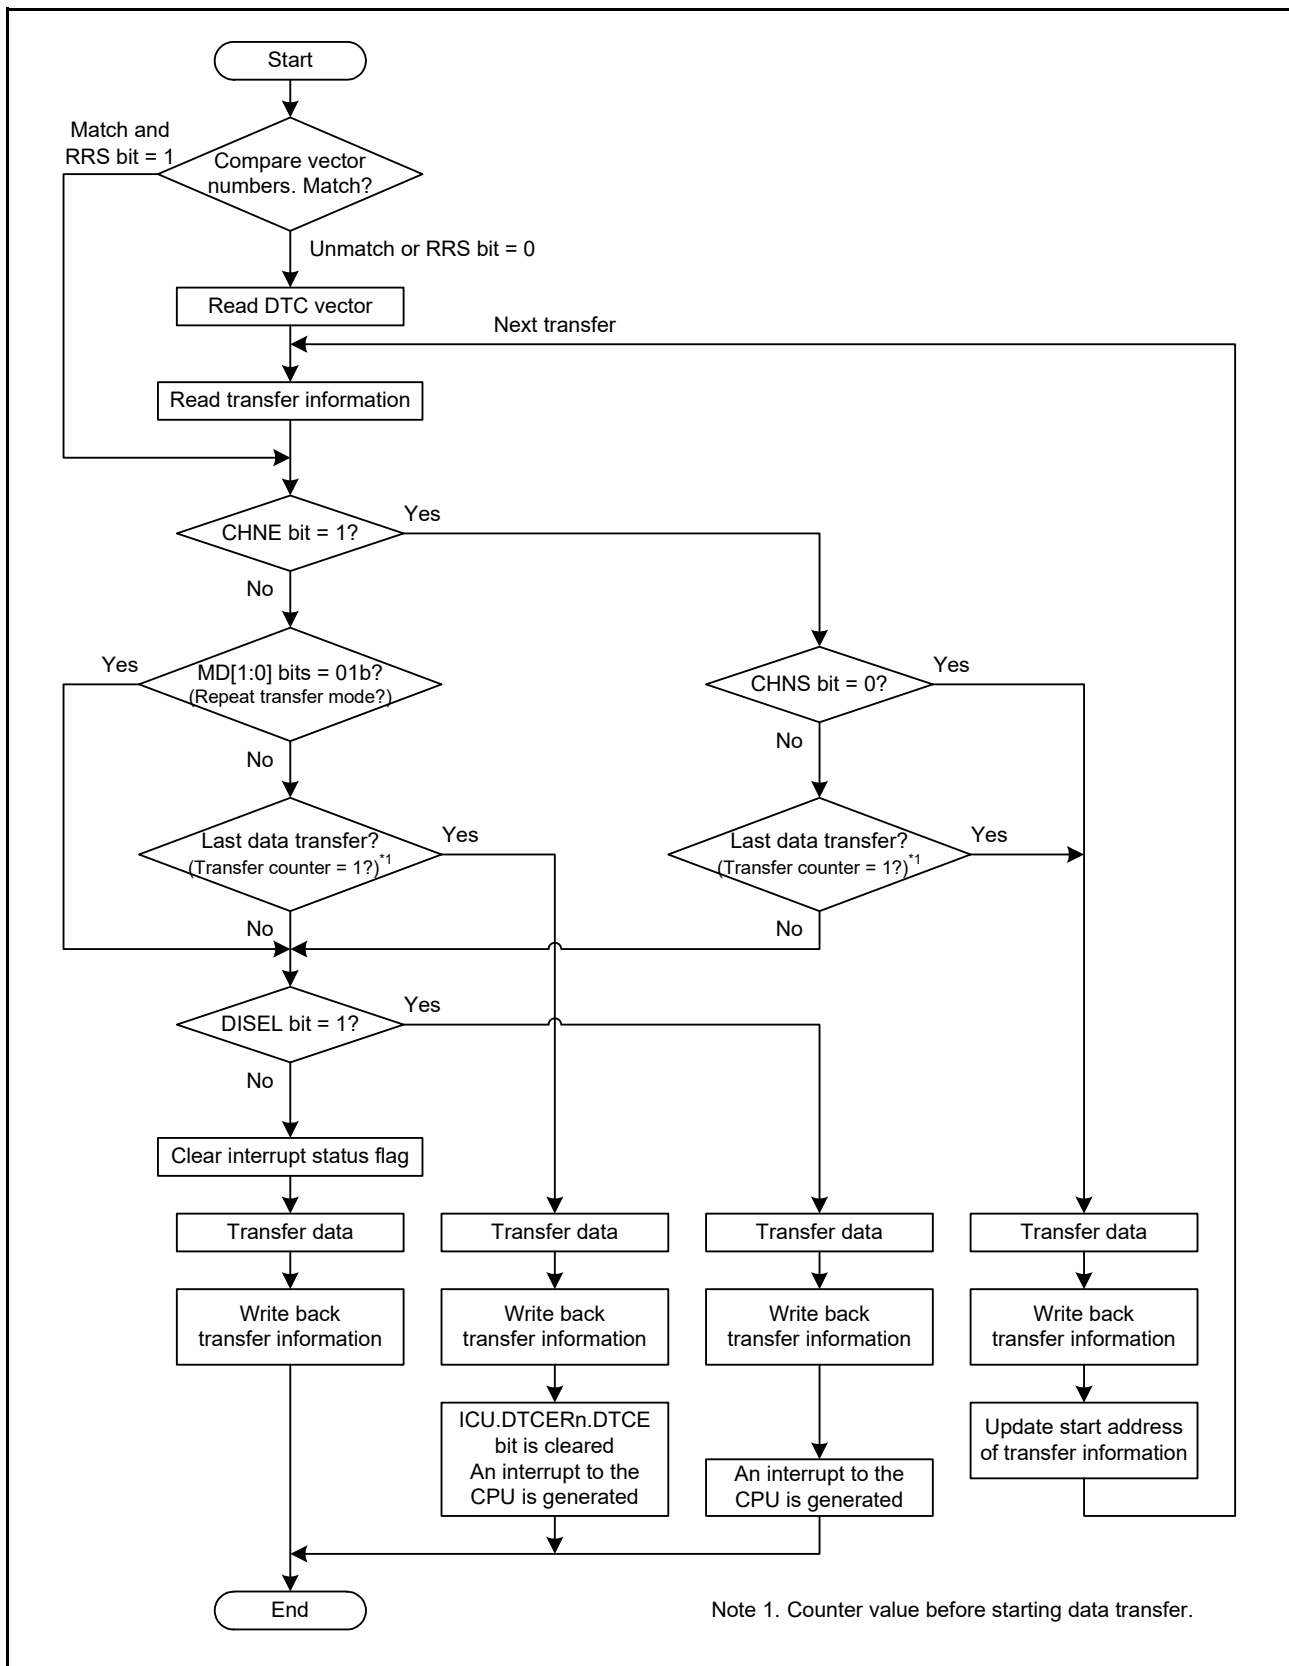

Figure 18.4 Operation Flowchart of the DTC

**Table 18.3 Chain Transfer Conditions**

| First Transfer |          |           |                       | Second Transfer*3 |          |           |                       | Data Transfer                                                       |
|----------------|----------|-----------|-----------------------|-------------------|----------|-----------|-----------------------|---------------------------------------------------------------------|
| CHNE Bit       | CHNS Bit | DISEL Bit | Transfer Counter*1,*2 | CHNE Bit          | CHNS Bit | DISEL Bit | Transfer Counter*1,*2 |                                                                     |
| 0              | —        | 0         | Other than (1 → 0)    | —                 | —        | —         | —                     | Ends after the first transfer                                       |
| 0              | —        | 0         | (1 → 0)               | —                 | —        | —         | —                     | Ends after the first transfer with an interrupt request to the CPU  |
| 0              | —        | 1         | —                     | —                 | —        | —         | —                     |                                                                     |
| 1              | 0        | —         | —                     | 0                 | —        | 0         | Other than (1 → 0)    | Ends after the second transfer                                      |
|                |          |           |                       | 0                 | —        | 0         | (1 → 0)               | Ends after the second transfer with an interrupt request to the CPU |
|                |          |           |                       | 0                 | —        | 1         | —                     |                                                                     |
| 1              | 1        | 0         | Other than (1 → *)    | —                 | —        | —         | —                     | Ends after the first transfer                                       |
| 1              | 1        | —         | (1 → *)               | 0                 | —        | 0         | Other than (1 → 0)    | Ends after the second transfer                                      |
|                |          |           |                       | 0                 | —        | 0         | (1 → 0)               | Ends after the second transfer with an interrupt request to the CPU |
|                |          |           |                       | 0                 | —        | 1         | —                     |                                                                     |
| 1              | 1        | 1         | Other than (1 → *)    | —                 | —        | —         | —                     | Ends after the first transfer with an interrupt request to the CPU  |

Note 1. The transfer counters used depend on transfer modes as follows:

- Normal transfer mode: CRA register
- Repeat transfer mode: CRAL register
- Block transfer mode: CRB register

Note 2. On completion of data transfer, the counters operate as follows:

- 1 → 0 in normal and block transfer modes
- 1 → CRAH in repeat transfer mode
- (1 → \*) in the table indicates both of the two operations above.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The condition combination of “second transfer and the CHNE bit is 1” is omitted.

### 18.4.1 Transfer Information Read Skip Function

Reading of DTC vector and transfer information can be skipped by the setting of the DTCCR.RRS bit.

When a DTC transfer request is accepted, the current DTC vector number is compared with the DTC vector number in the previous data transfer. When these vector numbers match and the RRS bit is 1, the DTC does not read the DTC vector and transfer information, and transfers data according to the transfer information remained in the DTC.

However, when the previous transfer was chain transfer, the DTC vector and transfer information are read. Furthermore, when the transfer counter (CRA register) became 0 during the previous normal transfer and when the transfer counter (CRB register) became 0 during the previous block transfer, transfer information is read regardless of the value of the RRS bit. Figure 18.13 shows an example of transfer information read skip.

When updating the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, and then set the RRS bit to 1. Setting the RRS bit to 0 discards the vector numbers retained in the DTC. The updated DTC vector table and transfer information are read in the next data transfer.

### 18.4.2 Transfer Information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to “address is fixed” (00b or 01b), a part of transfer information is not written back. This function is performed independently of the setting of short-address mode or full-address mode.

Table 18.4 lists transfer information write-back skip conditions and applicable registers. The CRA and CRB registers are written back independently of the setting of short-address mode or full-address mode.

Furthermore, in full-address mode, write-back of registers MRA and MRB is skipped.

**Table 18.4 Transfer Information Write-Back Skip Conditions and Applicable Registers**

| MRA.SM[1:0] Bits |    | MRB.DM[1:0] Bits |    | SAR Register | DAR Register |
|------------------|----|------------------|----|--------------|--------------|
| b3               | b2 | b3               | b2 |              |              |
| 0                | 0  | 0                | 0  | Skip         | Skip         |
| 0                | 0  | 0                | 1  |              |              |
| 0                | 1  | 0                | 0  |              |              |
| 0                | 1  | 0                | 1  |              |              |
| 0                | 0  | 1                | 0  | Skip         | Write-back   |
| 0                | 0  | 1                | 1  |              |              |
| 0                | 1  | 1                | 0  |              |              |
| 0                | 1  | 1                | 1  |              |              |
| 1                | 0  | 0                | 0  | Write-back   | Skip         |
| 1                | 0  | 0                | 1  |              |              |
| 1                | 1  | 0                | 0  |              |              |
| 1                | 1  | 0                | 1  |              |              |
| 1                | 0  | 1                | 0  | Write-back   | Write-back   |
| 1                | 0  | 1                | 1  |              |              |
| 1                | 1  | 1                | 0  |              |              |
| 1                | 1  | 1                | 1  |              |              |

### 18.4.3 Normal Transfer Mode

This mode allows 1-byte, 1-word, or 1-longword data transfer on a single transfer request. The transfer count can be set to 1 to 65536.

Transfer source addresses and transfer destination addresses can be set to increment, decrement, or fixed independently. This mode enables an interrupt request to the CPU to be generated at the end of specified-count transfer.

Table 18.5 lists register functions in normal transfer mode, and Figure 18.5 shows the memory map of normal transfer mode.

**Table 18.5 Register Functions in Normal Transfer Mode**

| Register | Description                  | Value Written Back by Writing Transfer Information |
|----------|------------------------------|----------------------------------------------------|
| SAR      | Transfer source address      | Increment/decrement/fixe*1                         |
| DAR      | Transfer destination address | Increment/decrement/fixe*1                         |
| CRA      | Transfer counter A           | CRA – 1                                            |
| CRB      | Transfer counter B           | Not updated                                        |

Note 1. Write-back operation is skipped when address is fixed.

**Figure 18.5 Memory Map of Normal Transfer Mode**

### 18.4.4 Repeat Transfer Mode

This mode allows 1-byte, 1-word, or 1-longword data transfer on a single transfer request.

Specify either transfer source or transfer destination for the repeat area by the MRB.DTS bit. The transfer count can be set to 1 to 256. When the specified-count transfer is completed, the initial value of the address register specified in the transfer counter and the repeat area is restored and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL is decreased to 00h in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. Thus the transfer counter does not become 00h, which disables an interrupt request to be generated to the CPU when the MRB.DISEL bit is set to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers).

Table 18.6 lists the register functions in repeat transfer mode, and Figure 18.6 shows the memory map of repeat transfer mode.

**Table 18.6 Register Functions in Repeat Transfer Mode**

| Register | Description                               | Value Written Back by Writing Transfer Information |                             |                             |
|----------|-------------------------------------------|----------------------------------------------------|-----------------------------|-----------------------------|
|          |                                           | When CRAL ≠ 1                                      | When CRAL = 1               |                             |
|          |                                           |                                                    | When the MRB.DTS Bit is 0   | When the MRB.DTS Bit is 1   |
| SAR      | Transfer source address                   | Increment/decrement/fixed*1                        | Increment/decrement/fixed*1 | SAR register initial value  |
| DAR      | Transfer destination address              | Increment/decrement/fixed*1                        | DAR register initial value  | Increment/decrement/fixed*1 |
| CRAH     | Retains initial value of transfer counter | CRAH                                               | CRAH                        |                             |
| CRAL     | Transfer counter A                        | CRAL – 1                                           | CRAH                        |                             |
| CRB      | Transfer counter B                        | Not updated                                        | Not updated                 |                             |

Note 1. Write-back operation is skipped when address is fixed.

**Figure 18.6 Memory Map of Repeat Transfer Mode (Transfer Source: Repeat Area)**

### 18.4.5 Block Transfer Mode

This mode allows single-block data transfer on a single transfer request.

Specify either transfer source or transfer destination for the block area by the MRB.DTS bit. The block size can be set to 1 to 256 bytes, 1 to 256 words, or 1 to 256 longwords.

When transfer of the specified one block is completed, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS bit is 1 or the DAR register when the DTS bit is 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set to 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of specified-count block transfer.

Table 18.7 lists register functions in block transfer mode, and Figure 18.7 shows the memory map of block transfer mode.

**Table 18.7 Register Functions in Block Transfer Mode**

| Register | Description                         | Value Written Back by Writing Transfer Information |                                        |
|----------|-------------------------------------|----------------------------------------------------|----------------------------------------|
|          |                                     | When MRB.DTS Bit is 0                              | When MRB.DTS Bit is 1                  |
| SAR      | Transfer source address             | Increment/decrement/fixe <sup>*1</sup>             | SAR register initial value             |
| DAR      | Transfer destination address        | DAR register initial value                         | Increment/decrement/fixe <sup>*1</sup> |
| CRAH     | Retains initial value of block size | CRAH                                               |                                        |
| CRAL     | Block size counter                  | CRAH                                               |                                        |
| CRB      | Block transfer counter              | CRB – 1                                            |                                        |

Note 1. Write-back operation is skipped when address is fixed.

**Figure 18.7 Memory Map of Block Transfer Mode (Transfer Destination: Block Area)**

### 18.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single transfer request. If the MRB.CHNE bit is 1 and the MRB.CHNS bit is 0, an interrupt request to the CPU is not generated when the specified number of data transfers is completed, or while the MRB.DISEL bit is 1 (an interrupt request to the CPU is generated for every data transfer). Data transfer has no effect on the interrupt status flag, which is the request source. The transfer information (SAR, DAR, CRA, CRB, MRA, and MRB) that define a data transfer can be specified independently of each other. Figure 18.8 shows chain transfer operation.

**Figure 18.8 Chain Transfer Operation**

If the MRB.CHNE bit is 1 and the CHNS bit is 1, chain transfer is performed only after completion of specified number of data transfers. In repeat transfer mode, chain transfer is performed after completion of specified number of data transfers.

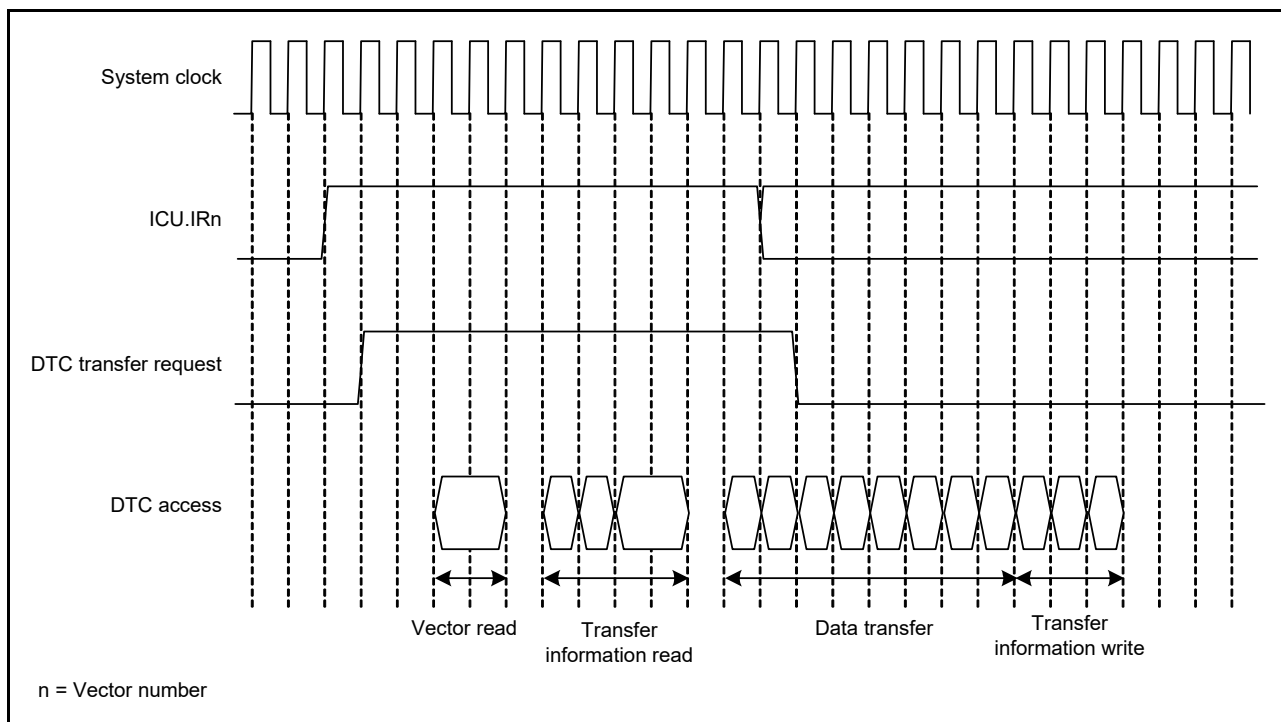

For details on chain transfer conditions, refer to Table 18.3, Chain Transfer Conditions.

### 18.4.7 Operation Timing

Figure 18.9 to Figure 18.13 show examples of DTC operation timing.

**Figure 18.9 Example (1) of DTC Operation Timing (Short-Address Mode, Normal Transfer Mode, Repeat Transfer Mode)**

**Figure 18.10 Example (2) of DTC Operation Timing (Short-Address Mode, Block Transfer Mode, Block Size = 4)**

Figure 18.11 Example (3) of DTC Operation Timing (Short-Address Mode, Chain Transfer)

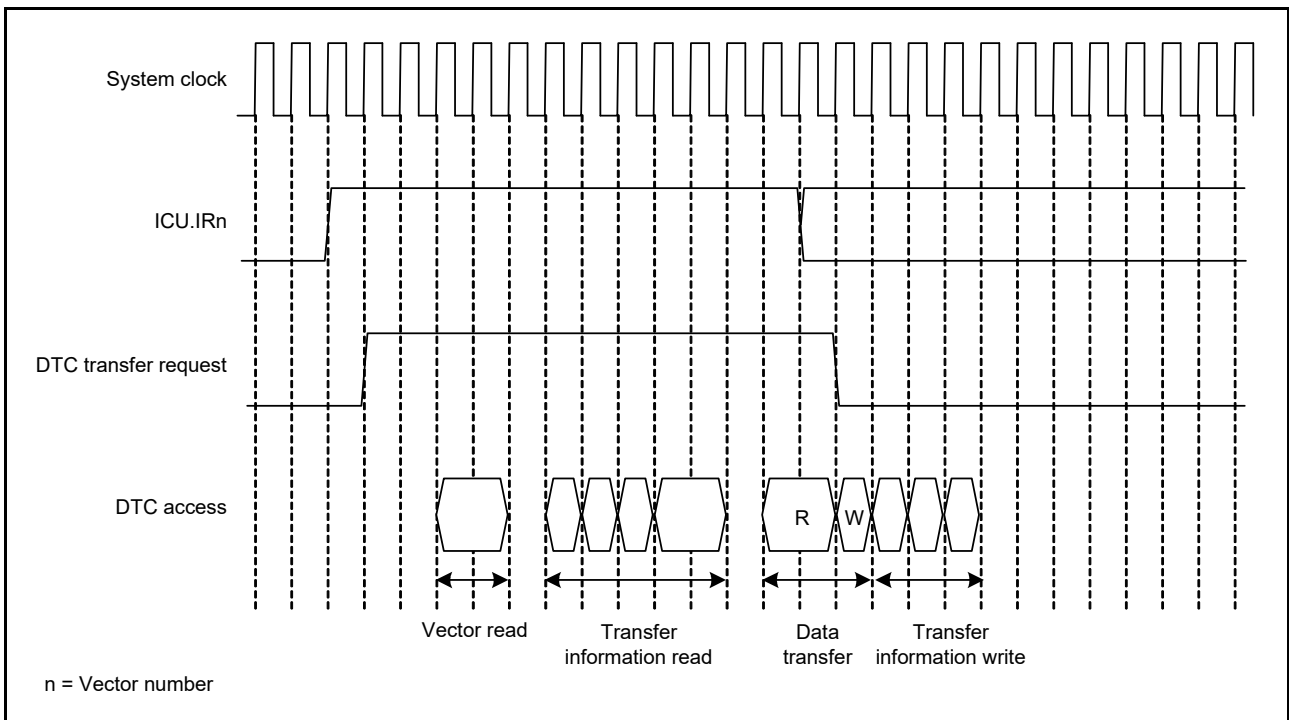

Figure 18.12 Example (4) of DTC Operation Timing (Full-Address Mode, Normal Transfer Mode, Repeat Transfer Mode)

**Figure 18.13 Example of Operation When Transfer Information Read Skip is Executed (Vector, Transfer Information, and Transfer Destination Data on the RAM, and Transfer Source Data on the Peripheral Module)**

### 18.4.8 Execution Cycles of the DTC

Table 18.8 lists the execution cycles of single data transfer of the DTC.

For the order of the execution states, refer to section 18.4.7, Operation Timing.

**Table 18.8 Execution Cycles of the DTC**

| Transfer Mode       | Vector Read |          | Transfer Information Read |                         |          | Transfer Information Write |                     |            | Data Transfer  |                | Internal Operation |          |
|---------------------|-------------|----------|---------------------------|-------------------------|----------|----------------------------|---------------------|------------|----------------|----------------|--------------------|----------|
|                     |             |          |                           |                         |          |                            |                     |            | Read           | Write          |                    |          |
| Normal              | $C_v + 1$   | $0^{*1}$ | $4 \times C_i + 1^{*2}$   | $3 \times C_i + 1^{*3}$ | $0^{*1}$ | $3 \times C_i^{*4}$        | $2 \times C_i^{*5}$ | $C_i^{*6}$ | $C_r + 1$      | $C_w$          | 2                  | $0^{*1}$ |
| Repeat              |             |          |                           |                         |          |                            |                     |            | $C_r + 1$      | $C_w$          |                    |          |
| Block <sup>*7</sup> |             |          |                           |                         |          |                            |                     |            | $P \times C_r$ | $P \times C_w$ |                    |          |

Note 1. When transfer information read is skipped

Note 2. In full-address mode

Note 3. In short-address mode

Note 4. When neither SAR nor DAR is set to address-fixed

Note 5. When SAR or DAR is set to address-fixed

Note 6. When SAR and DAR are set to address-fixed

Note 7. When the block size is 2 or more. If the block size is 1, the cycle number for normal transfer is applied.

P: Block size (initial settings of CRAH and CRAL)

$C_v$ : Cycles for access to vector transfer information storage destination

$C_i$ : Cycles for access to transfer information storage destination address

$C_r$ : Cycles for access to data read destination

$C_w$ : Cycles for access to data write destination

(The unit is system clocks (ICLK) for "+ 1" in the Vector Read, Transfer Information Read, and Data Transfer Read columns and "2" in the Internal Operation column.)

( $C_v$ ,  $C_i$ ,  $C_r$ , and  $C_w$  vary depending on the corresponding access destination. For the number of cycles for respective access destinations, refer to section 43, RAM, section 44, Flash Memory (FLASH), section 5, I/O Registers, and section 15.2.6, External Bus.)

### 18.4.9 DTC Bus Mastership Release Timing

The DTC does not release the bus mastership during transfer information read and transfer information write. While transfer information is not read or written, bus arbitration is made according to the priority determined by the bus master arbitrator.

For bus arbitration, refer to section 15, Buses.

### 18.5 DTC Setting Procedure

Before using the DTC, set the DTC vector base register (DTCVBR).

Figure 18.14 shows the procedure to set the DTC.

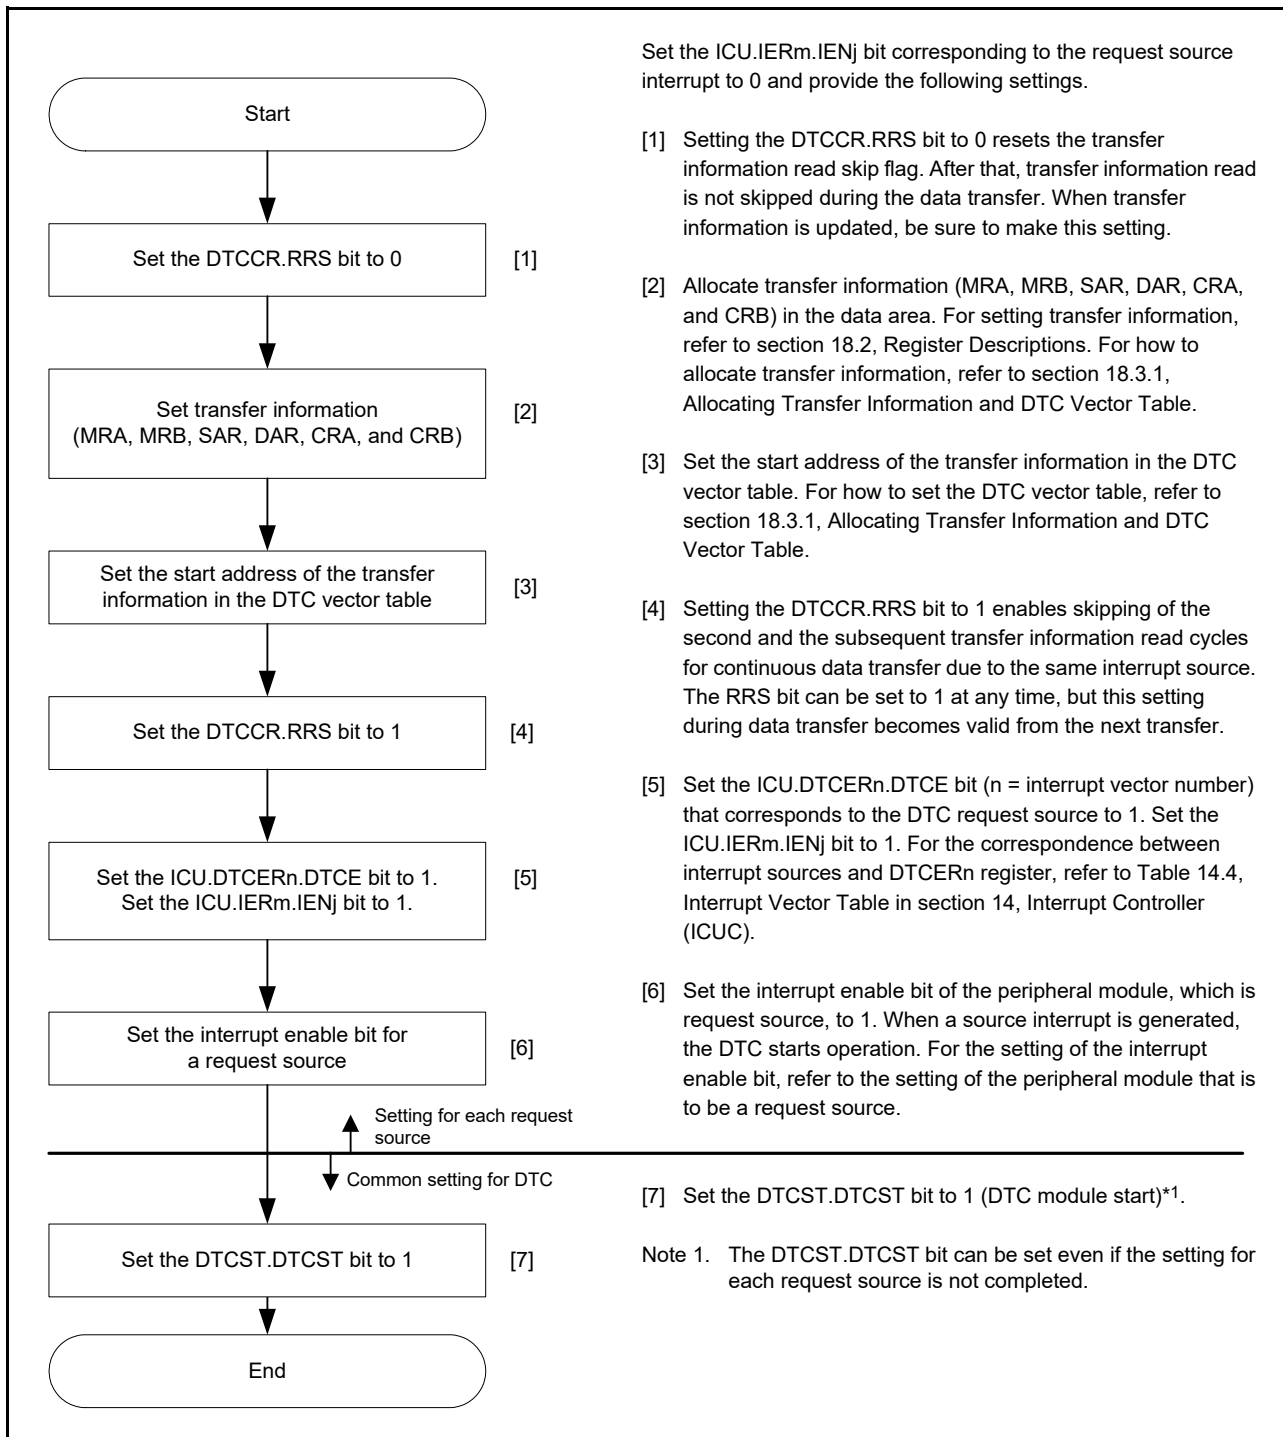

Figure 18.14 Procedure to Set the DTC

## 18.6 Examples of DTC Usage

### 18.6.1 Normal Transfer

As an example of DTC usage, its employment in the reception of 128 bytes of data by an SCI is described below.

#### (1) Transfer Information Setting

Set the MRA.MD[1:0] bits to 00b (normal transfer mode), the MRA.SZ[1:0] bits to 00b (byte transfer), and the MRA.SM[1:0] bits to 00b (source address is fixed). Set the MRB.CHNE bit to 0 (chain transfer is disabled), the MRB.DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers), and the MRB.DM[1:0] bits to 10b (DAR is incremented after data transfer). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the RAM area for data storage in the DAR register, and 128 (0080h) in the CRA register. The CRB register can be set to any value.

#### (2) DTC Vector Table Setting

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

#### (3) ICU Setting and DTC Module Activation

Set the corresponding ICU.DTCERn.DTCE bit to 1 and the ICU.IERm.IENj bit to 1.  
Set the DTCST.DTCST bit to 1.

#### (4) SCI Setting

Enable the RXI interrupt by setting the SCR.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, further reception is not performed. Accordingly, make settings so that the CPU can accept receive error interrupts.

#### (5) DTC Transfer

Every time the reception of 1 byte by the SCI is completed, an RXI interrupt is generated to start the data transfer. The DTC transfers the received byte from the RDR of the SCI to RAM, after which the DAR register is incremented and the CRA register is decremented.

#### (6) Interrupt Handling

After 128 times of data transfers have been completed and the value in the CRA register becomes 0, an RXI interrupt request is output to the CPU. Complete the process in the handling routine for this interrupt.

### 18.6.2 Chain Transfer When the Counter is 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second data transfer. Repeating this chain transfer enables transfers to be repeated more than 256 times.

The following shows an example of configuring a 128-Kbyte input buffer to addresses 20 0000h to 21 FFFFh (where the input buffer is set so that its lower address starts with 0000h). Figure 18.15 shows a chain transfer when the counter is 0.

- (1) Set normal transfer mode for input data for the first data transfer. Set the following:  
Transfer source address: Fixed, the CRA register is 0000h (65,536 times), the MRB.CHNE bit is 1 (chain transfer is enabled), the MRB.CHNS bit is 1 (chain transfer is performed only when the transfer counter becomes 0), and the MRB.DISEL bit is 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers).
- (2) Prepare the upper 8 bits (in this case, 21h and 20h) of the start address at every 65,536 times of the transfer destination address for the first data transfer in another area (such as ROM).
- (3) For the second data transfer, set repeat transfer mode (source is repeat area) for rewriting the transfer destination address of the first data transfer. The transfer destination is the address where the upper 8 bits of the DAR register in the first transfer information is allocated. In this case, set the MRB.CHNE bit to 0 (chain transfer is disabled) and the MRB.DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers). In this case, set the transfer counter to 2.
- (4) When a transfer request is accepted, the first data transfer is executed. When transfer is executed 65,536 times and the transfer counter of the first data transfer becomes 0, the second data transfer is started and the upper 8 bits of the transfer destination address of the first data transfer is set to 21h. At this time, the lower 16 bits of the transfer destination address and the transfer counter of the first data transfer have become 0000h.
- (5) In succession, when another transfer request is accepted, the first data transfer is executed. When transfer is executed 65,536 times and the transfer counter of the first data transfer becomes 0, the second data transfer is started and the upper 8 bits of the transfer destination address of the first data transfer is set to 20h. At this time, the lower 16 bits of the transfer destination address and the transfer counter of the first data transfer have become 0000h.
- (6) Steps (4) and (5) above are repeated infinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

Figure 18.15 Chain Transfer When the Counter is 0

## 18.7 Interrupt Source

When the DTC has finished data transfer of specified count or when data transfer with the MRB.DISEL bit set to 1 (an interrupt request to the CPU is generated each time the data transfer is performed) has been completed, an interrupt to the CPU is generated by the DTC trigger source. Such interrupts to the CPU are controlled according to the PSW.I bit (interrupt enable) of the CPU, the PSW.IPL[3:0] bits (processor interrupt priority level), and the priority level of the interrupt controller.

## 18.8 Event Link

The DTC outputs an event signal on completing data transfer in response to one request. When the destination for transfer is an external bus or an internal peripheral bus, however, the event signal will be output after completion of writing to the write buffer rather than after completion of writing to the actual destination for transfer.

## 18.9 Low Power Consumption Function

Before making a transition to the module stop state, all-module clock stop mode, software standby mode, or deep software standby mode, set the DTCST.DTCST bit to 0 (DTC module stop), and then perform the following.

### (1) Module Stop Function

Writing 1 (transition to the module-stop state is made) to the MSTPCRA.MSTPA28 bit enables the module stop function of the DTC. If data transfer is in progress at the time 1 is written to the MSTPCRA.MSTPA28 bit, the transition to the module stop state proceeds after data transfer has ended. While the MSTPCRA.MSTPA28 bit is 1, accessing the DTC registers is prohibited.

Writing 0 (release from the module-stop state) to the MSTPCRA.MSTPA28 bit releases the DTC from the module stop state.

### (2) All-Module Clock Stop Mode

Make settings according to the procedure under section 11.5.2.1, Transition to All-Module Clock Stop Mode, in section 11, Low Power Consumption.

If any data transfer is in progress at the time the WAIT instruction is executed, the transition to all-module clock stop mode follows the completion of the data transfer.

The DTC is released from the module stop state by writing 0 to the MSTPCRA.MSTPA28 bit following recovery from all-module clock stop mode.

### (3) Software Standby and Deep Software Standby Modes

Make settings according to the procedure under section 11.5.3.1, Transition to Software Standby Mode, or section 11.5.4.1, Transition to Deep Software Standby Mode, in section 11, Low Power Consumption.

If any data transfer is in progress at the time the WAIT instruction is executed, the transition to software standby mode or deep software standby mode follows the completion of the data transfer.

### (4) Notes on Low Power Consumption Function

For the WAIT instruction and the register setting procedure, refer to section 11.6.6, Timing of WAIT Instruction in section 11, Low Power Consumption.

To perform data transfer after returning from a low power consumption mode, set the DTCST.DTCST bit to 1 again.

To use a request that is generated in all-module clock stop mode or software standby mode as an interrupt request to the CPU but not as a DTC transfer request, specify the CPU as the interrupt request destination according to the description in section 14.7.3.1, Interrupt Request Destination Setting Procedure in section 14, Interrupt Controller (ICUC), and then execute the WAIT instruction.

## 18.10 Usage Notes

### 18.10.1 Start Address of Transfer Information

Set multiples of 4 for the start addresses of the transfer information to be specified in the DTC vector table. If any value other than a multiple of 4 is specified, access still proceeds with the lower 2 bits of the address regarded as 00b.

### 18.10.2 Allocating Transfer Information

Allocate transfer information in the memory area according to the endian of the area as shown in Figure 18.16. For example, when writing CRA and CRB settings in 16-bit units in big endian, write the CRA setting to the address plus 8h (Ch) and the CRB setting to the address plus Ah (Eh). In little endian, write the CRB setting to the address plus 8h (Ch) and the CRA setting to the address plus Ah (Eh). When writing CRA and CRB settings in 32-bit units, allocate the CRA setting at the MSB side of the 32 bits and the CRB setting at the LSB side, and write the settings to the address plus 8h (Ch), regardless of endian.

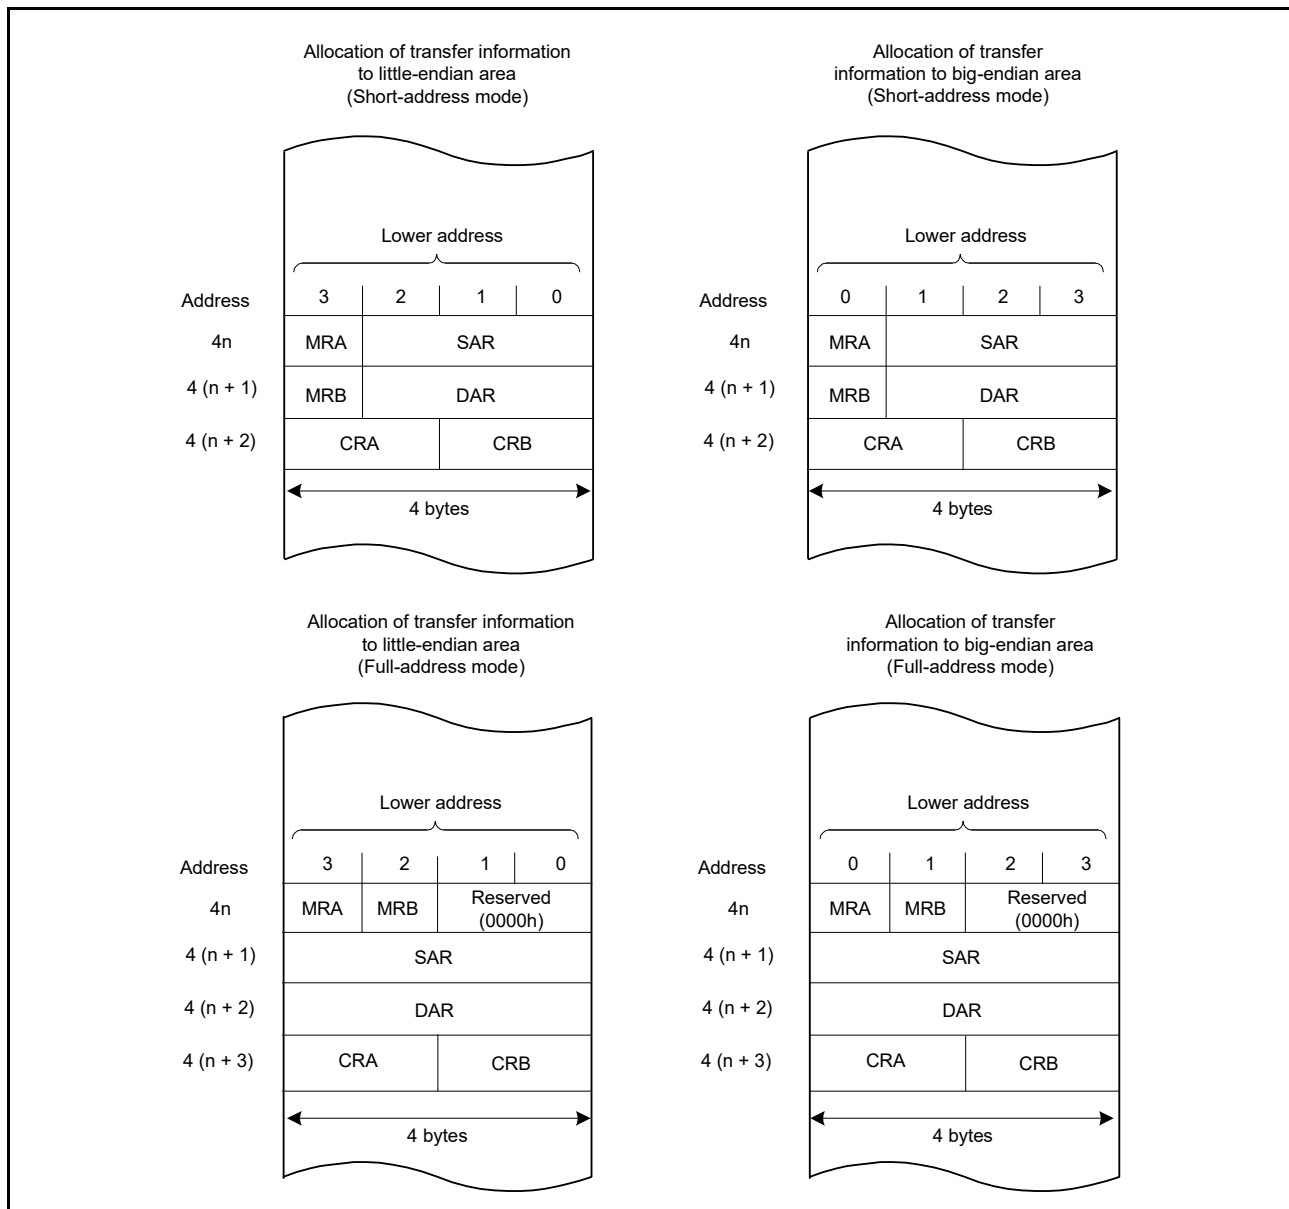

Figure 18.16 Allocation of Transfer Information

### 18.10.3 Setting the DTC Transfer Request Enable Register in the Interrupt Controller (ICU.DTCERn)

The DMA request should not be issued by setting the DMAC trigger select register (ICU.DMRSRm (m = DMAC channel number)) to the same vector number that has been specified by setting the ICU.DTCERn.DTCE bit to 1 (the corresponding interrupt source is selected as the DTC trigger). For details on the ICU.DTCERn and ICU.DMRSRm registers (m = DMAC channel number), refer to section 14, Interrupt Controller (ICUC).

## 19. Event Link Controller (ELC)

### 19.1 Overview

The event link controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals, and interconnects (links) peripheral modules. As a result, peripheral modules can directly perform interlinked operation among them without using software.

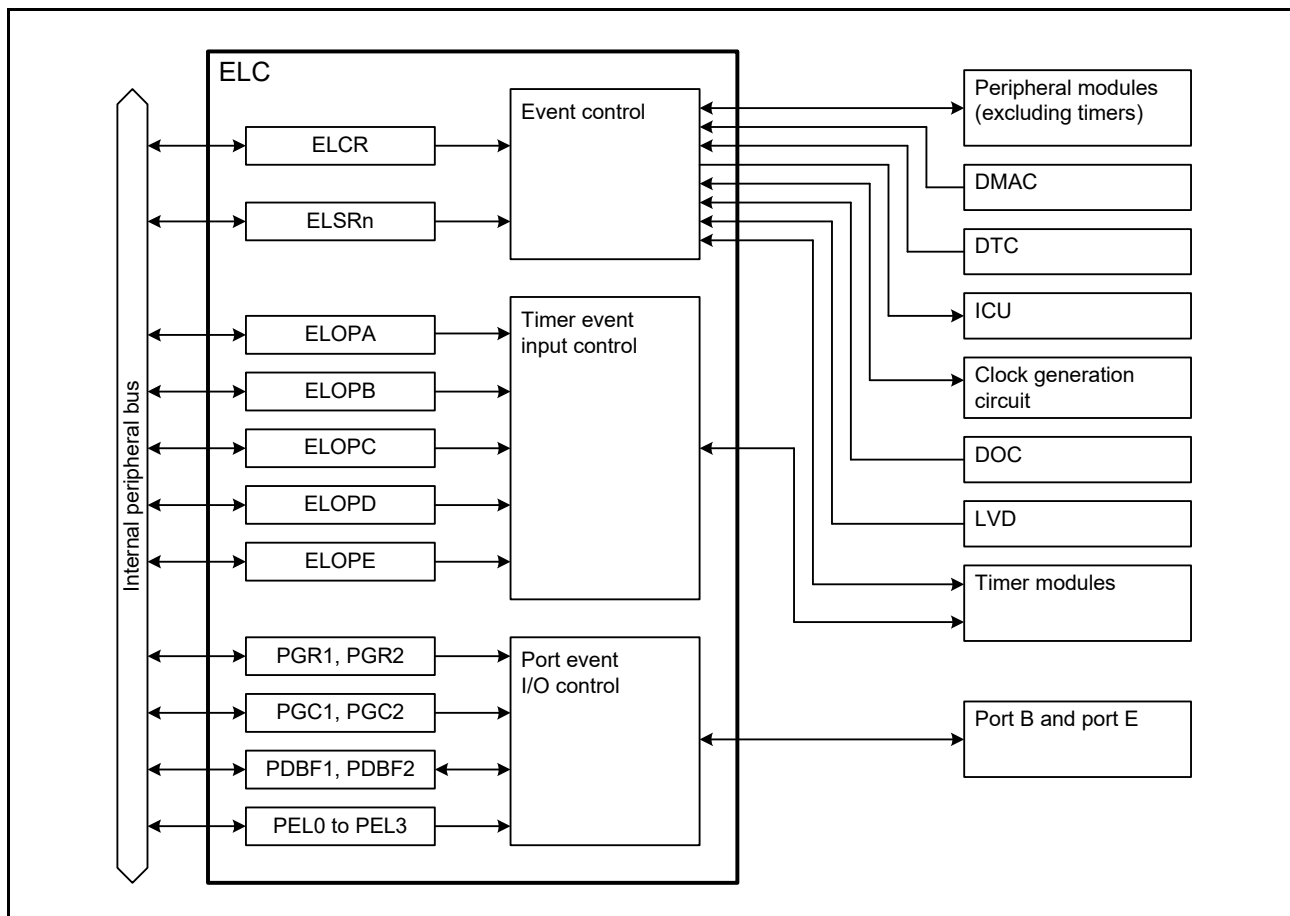

Event signals can be output regardless of the settings of the corresponding interrupt request enable bits.

Table 19.1 lists the specifications of the ELC, and Figure 19.1 shows a block diagram of the ELC.

**Table 19.1 ELC Specifications**

| Item                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event link function            | <ul style="list-style-type: none"> <li>• 188 types of event signals can be directly interconnected to modules.</li> <li>• Operation for timer modules when inputting an event signal can be selected.</li> <li>• Event linkage operation is possible for port B and port E.<br/>                     Single port*1: Event linkage operation can be set in a single specified port.<br/>                     Port group*1: Event linkage operation can be set by grouping multiple specified ports among total of eight ports.</li> </ul> |
| Low power consumption function | Module stop state can be set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Note 1. When an input signal to a corresponding pin changes, an event is generated in a single port or in a port group specified as the input.

**Figure 19.1 ELC Block Diagram (n = 0, 3, 4, 7, 10 to 13, 15, 16, 18 to 28, 30, 31, 45 to 58)**

## 19.2 Register Descriptions

### 19.2.1 Event Link Control Register (ELCR)

Address(es): ELC.ELCR 0008 B100h

| Bit      | Symbol | Bit Name              | Description                                                 | R/W |
|----------|--------|-----------------------|-------------------------------------------------------------|-----|
| b6 to b0 | —      | Reserved              | These bits are read as 1. The write value should be 1.      | R/W |
| b7       | ELCON  | All Event Link Enable | 0: ELC function is disabled.<br>1: ELC function is enabled. | R/W |

The ELCR register controls operation of the ELC.

## 19.2.2 Event Link Setting Register n (ELSRn) (n = 0, 3, 4, 7, 10 to 13, 15, 16, 18 to 28, 30, 31, 45 to 58)

Address(es): ELC.ELSR0 0008 B101h, ELC.ELSR3 0008 B104h, ELC.ELSR4 0008 B105h, ELC.ELSR7 0008 B108h, ELC.ELSR10 0008 B10Bh, ELC.ELSR11 0008 B10Ch, ELC.ELSR12 0008 B10Dh, ELC.ELSR13 0008 B10Eh, ELC.ELSR15 0008 B110h, ELC.ELSR16 0008 B111h, ELC.ELSR18 0008 B113h, ELC.ELSR19 0008 B114h, ELC.ELSR20 0008 B115h, ELC.ELSR21 0008 B116h, ELC.ELSR22 0008 B117h, ELC.ELSR23 0008 B118h, ELC.ELSR24 0008 B119h, ELC.ELSR25 0008 B11Ah, ELC.ELSR26 0008 B11Bh, ELC.ELSR27 0008 B11Ch, ELC.ELSR28 0008 B11Dh, ELC.ELSR30 0008 B12Eh, ELC.ELSR31 0008 B12Fh, ELC.ELSR45 0008 B13Dh, ELC.ELSR46 0008 B144h, ELC.ELSR47 0008 B145h, ELC.ELSR48 0008 B146h, ELC.ELSR49 0008 B147h, ELC.ELSR50 0008 B148h, ELC.ELSR51 0008 B149h, ELC.ELSR52 0008 B14Ah, ELC.ELSR53 0008 B14Bh, ELC.ELSR54 0008 B14Ch, ELC.ELSR55 0008 B14Dh, ELC.ELSR56 0008 B14Eh, ELC.ELSR57 0008 B14Fh, ELC.ELSR58 0008 B150h

| Bit      | Symbol   | Bit Name          | Description                                                                                                                                                                                | R/W |
|----------|----------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b7 to b0 | ELS[7:0] | Event Link Select | 00h: Event signal output to the corresponding peripheral module is disabled.<br>01h to F1h: Set the number for the event signal to be linked.<br>Settings other than above are prohibited. | R/W |

The ELSRn register specifies an event signal to be linked to for each peripheral module. Table 19.2 shows the correspondence between the ELSRn register and the peripheral modules. Table 19.3 shows the correspondence between values set in the ELSRn register and event signals.

**Table 19.2 Correspondence between the ELSRn Register and the Peripheral Modules**

| Register Name | Peripheral Module                            |
|---------------|----------------------------------------------|
| ELSR0         | MTU0                                         |
| ELSR3         | MTU3                                         |
| ELSR4         | MTU4                                         |
| ELSR7         | CMT1                                         |

Settings other than above are prohibited.

### 19.2.3 Event Link Option Setting Register A (ELOPA)

Address(es): ELC.ELOPA 0008 B11Fh

| Bit      | Symbol      | Bit Name              | Description                                                                                                                             | R/W |
|----------|-------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| b1, b0   | MTU0MD[1:0] | MTU0 Operation Select | b1 b0<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Input capture* <sup>1</sup><br>1 1: Event output is disabled. | R/W |
| b5 to b2 | —           | Reserved              | These bits are read as 1. The write value should be 1.                                                                                  | R/W |
| b7, b6   | MTU3MD[1:0] | MTU3 Operation Select | b7 b6<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Input capture* <sup>2</sup><br>1 1: Event output is disabled. | R/W |

Note 1. The MTU0.TCNT value is captured into the MTU0.TGRA register.

Note 2. The MTU3.TCNT value is captured into the MTU3.TGRA register.

The ELOPA register specifies the operations of MTU0 and MTU3 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

### 19.2.4 Event Link Option Setting Register B (ELOPB)

Address(es): ELC.ELOPB 0008 B120h

| Bit      | Symbol      | Bit Name              | Description                                                                                                                             | R/W |
|----------|-------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| b1, b0   | MTU4MD[1:0] | MTU4 Operation Select | b1 b0<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Input capture* <sup>1</sup><br>1 1: Event output is disabled. | R/W |
| b7 to b2 | —           | Reserved              | These bits are read as 1. The write value should be 1.                                                                                  | R/W |

Note 1. The MTU4.TCNT value is captured into the MTU4.TGRA register.

The ELOPB register specifies the operation of MTU4 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

### 19.2.5 Event Link Option Setting Register C (ELOPC)

Address(es): ELC.ELOPC 0008 B121h

| Bit      | Symbol      | Bit Name              | Description                                                                                                               | R/W |
|----------|-------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------|-----|
| b1, b0   | —           | Reserved              | These bits are read as 1. The write value should be 1.                                                                    | R/W |
| b3, b2   | CMT1MD[1:0] | CMT1 Operation Select | b3 b2<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Event counter<br>1 1: Event output is disabled. | R/W |
| b7 to b4 | —           | Reserved              | These bits are read as 1. The write value should be 1.                                                                    | R/W |

The ELOPC register specifies the operation of CMT1 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

### 19.2.6 Event Link Option Setting Register D (ELOPD)

Address(es): ELC.ELOPD 0008 B122h

| Bit    | Symbol      | Bit Name              | Description                                                                                                               | R/W |
|--------|-------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------|-----|
| b1, b0 | TMR0MD[1:0] | TMR0 Operation Select | b1 b0<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Event counter<br>1 1: Event output is disabled. | R/W |
| b3, b2 | TMR1MD[1:0] | TMR1 Operation Select | b3 b2<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Event counter<br>1 1: Event output is disabled. | R/W |
| b5, b4 | TMR2MD[1:0] | TMR2 Operation Select | b5 b4<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Event counter<br>1 1: Event output is disabled. | R/W |
| b7, b6 | TMR3MD[1:0] | TMR3 Operation Select | b7 b6<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Event counter<br>1 1: Event output is disabled. | R/W |

The ELOPD register specifies the operations of TMR0 to TMR3 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

## 19.2.7 Event Link Option Setting Register E (ELOPE)

Address(es): ELC.ELOPE 0008 B13Eh

| Bit    | Symbol      | Bit Name              | Description                                                                                                                             | R/W |
|--------|-------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| b1, b0 | MTU6MD[1:0] | MTU6 Operation Select | b1 b0<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Input capture* <sup>1</sup><br>1 1: Event output is disabled. | R/W |
| b3, b2 | MTU7MD[1:0] | MTU7 Operation Select | b3 b2<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Input capture* <sup>2</sup><br>1 1: Event output is disabled. | R/W |
| b5, b4 | —           | Reserved              | These bits are read as 1. The write value should be 1.                                                                                  | R/W |
| b7, b6 | MTU9MD[1:0] | MTU9 Operation Select | b7 b6<br>0 0: Counting is started.<br>0 1: Counting is restarted.<br>1 0: Input capture* <sup>3</sup><br>1 1: Event output is disabled. | R/W |

Note 1. The MTU6.TCNT value is captured into the MTU6.TGRA register.

Note 2. The MTU7.TCNT value is captured into the MTU7.TGRA register.

Note 3. The MTU9.TCNT value is captured into the MTU9.TGRA register.

The ELOPE register specifies the operations of MTU6, MTU7, and MTU9 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

### 19.2.8 Port Group Setting Register n (PGRn) (n = 1, 2)

Address(es): ELC.PGR1 0008 B123h, ELC.PGR2 0008 B124h

| Bit | Symbol | Bit Name             | Description                                                                                                         | R/W |
|-----|--------|----------------------|---------------------------------------------------------------------------------------------------------------------|-----|
| b0  | PGR0   | Port Group Setting 0 | 0: Does not specify the port as a member of the port group.<br>1: Specifies the port as a member of the port group. | R/W |
| b1  | PGR1   | Port Group Setting 1 |                                                                                                                     | R/W |
| b2  | PGR2   | Port Group Setting 2 |                                                                                                                     | R/W |
| b3  | PGR3   | Port Group Setting 3 |                                                                                                                     | R/W |
| b4  | PGR4   | Port Group Setting 4 |                                                                                                                     | R/W |
| b5  | PGR5   | Port Group Setting 5 |                                                                                                                     | R/W |
| b6  | PGR6   | Port Group Setting 6 |                                                                                                                     | R/W |
| b7  | PGR7   | Port Group Setting 7 |                                                                                                                     | R/W |

The PGRn register specifies a group of I/O ports. Among the ports, ports corresponding to bits set to 1 in the register are selected for a port group.

For example, when the PGR6 and PGR3 bits in the PGR1 register are set to 1, the PB6 and PB3 pins are selected to a port group.

Table 19.4 shows the PGRn register and corresponding ports.

**Table 19.4 Registers Related to Port Groups and Corresponding Port Numbers**

| Port Number | Port Group Setting Register (PGRn) | Port Group Control Register (PGCn) | Port Buffer Register (PDBFn) |
|-------------|------------------------------------|------------------------------------|------------------------------|
| Port B      | PGR1 register                      | PGC1 register                      | PDBF1 register               |
| Port E      | PGR2 register                      | PGC2 register                      | PDBF2 register               |

### 19.2.9 Port Group Control Register n (PGCn) (n = 1, 2)

Address(es): ELC.PGC1 0008 B125h, ELC.PGC2 0008 B126h

| Bit      | Symbol    | Bit Name                    | Description                                                                                                                                                                                                                                                                                                                                                                | R/W |
|----------|-----------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b1, b0   | PGC1[1:0] | Event Output Edge Select    | b1 b0<br>0 0: Event signal is output upon detection of the rising edge of the input signal to the port.<br>0 1: Event signal is output upon detection of the falling edge of the input signal to the port.<br>1 x: Event signal is output upon detection of both the rising and falling edges of the input signal to the port.                                             | R/W |
| b2       | PGCOVE    | PDBF Overwrite              | 0: Overwriting the PDBFn register is disabled.<br>1: Overwriting the PDBFn register is enabled.                                                                                                                                                                                                                                                                            | R/W |
| b3       | —         | Reserved                    | This bit is read as 1. The write value should be 1.                                                                                                                                                                                                                                                                                                                        | R/W |
| b6 to b4 | PGC0[2:0] | Port Group Operation Select | b6 b4<br>0 0 0: Low is output when an event signal is input.<br>0 0 1: High is output when an event signal is input.<br>0 1 0: The output is toggled (inverted) when an event signal is input.<br>0 1 1: The buffer value is output when an event signal is input.<br>1 x x: The output data is rotated (from MSB to LSB) in the port group when an event signal is input. | R/W |
| b7       | —         | Reserved                    | This bit is read as 1. The write value should be 1.                                                                                                                                                                                                                                                                                                                        | R/W |

x: Don't care

For the port group set as an output, the PGCn register specifies the form of outputting the signal from the port when an event signal is input. For the port group set as an input, the PGCn register enables/disables overwriting of the PDBFn register and specifies the conditions of event generation (edge of the input signal). Specify the I/O direction of the port by the corresponding bit in the PDR register. Refer to Table 19.4 for the PGCn register and corresponding ports.

### 19.2.10 Port Buffer Register n (PDBFn) (n = 1, 2)

Address(es): ELC.PDBF1 0008 B127h, ELC.PDBF2 0008 B128h

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Bit Name      | Description                                                                                                                                                                                                                                                                                        | R/W |
|-----|--------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b0  | PDBF0  | Port Buffer 0 | Specify the data to be transferred to the PODR register when an event signal is input. The setting value is valid when the PGCn.PGCO[2:0] bits are 011b or 1xxb. Write access to the bit specified as a member of the input port group is disabled. For details, refer to section 19.3, Operation. | R/W |
| b1  | PDBF1  | Port Buffer 1 |                                                                                                                                                                                                                                                                                                    | R/W |
| b2  | PDBF2  | Port Buffer 2 |                                                                                                                                                                                                                                                                                                    | R/W |
| b3  | PDBF3  | Port Buffer 3 |                                                                                                                                                                                                                                                                                                    | R/W |
| b4  | PDBF4  | Port Buffer 4 |                                                                                                                                                                                                                                                                                                    | R/W |
| b5  | PDBF5  | Port Buffer 5 |                                                                                                                                                                                                                                                                                                    | R/W |
| b6  | PDBF6  | Port Buffer 6 |                                                                                                                                                                                                                                                                                                    | R/W |

x: Don't care

The PELm register specifies the single port, the operation upon an event signal input, and the conditions of event generation. This MCU can specify a total of four bits in port B and port E to respective single ports. Specify the I/O direction of the port by the corresponding bit in the PDR register.

## 19.2.12 Event Link Software Event Generation Register (ELSEGR)

Address(es): ELC.ELSEGR 0008 B12Dh

| Bit      | Symbol | Bit Name                      | Description                                                                         | R/W |
|----------|--------|-------------------------------|-------------------------------------------------------------------------------------|-----|
| b0       | SEG    | Software Event Generation     | 0: Normal operation<br>1: Software event is generated.                              | W   |
| b5 to b1 | —      | Reserved                      | These bits are read as 1. The write value should be 1.                              | R/W |
| b6       | WE     | SEG Bit Write Enable          | 0: Write to SEG bit is disabled.<br>1: Write to SEG bit is enabled.                 | R/W |
| b7       | WI     | ELSEGR Register Write Disable | 0: Write to ELSEGR register is enabled.<br>1: Write to ELSEGR register is disabled. | W   |

The MOV instruction must be used to write to this register.

### SEG Bit (Software Event Generation)

When 1 is written to this bit while the WE bit is 1, a software event is generated.

This bit is read as 0. Even if 1 is written to this bit, this bit does not become 1.

### WE Bit (SEG Bit Write Enable)

The SEG bit can be written to only when the WE bit is 1.

To set this bit to 1, write 0 to the WI bit and write 1 to this bit simultaneously.

To set this bit to 0, write 0 to the WI bit and write 0 to this bit simultaneously.

### WI Bit (ELSEGR Register Write Disable)

The ELSEGR register can be written to only when the value to be written to the WI bit is 0.

This bit is read as 1.

## 19.3 Operation

### 19.3.1 Relation between Interrupt Handling and Event Linking

The peripheral modules incorporated in the MCU are provided with the interrupt request status flags and the interrupt enable bits to enable/disable these interrupt requests. When an interrupt request is generated in a peripheral module, the corresponding interrupt request status flag becomes 1. If the corresponding interrupt request is enabled then, the interrupt is requested to the CPU.

In contrast, the event link controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals, interconnects (links) peripheral modules, and then, makes peripheral modules perform direct interlinked operation among them without using software. Event signals can be output regardless of the setting of the corresponding interrupt enable bit.

Figure 19.2 shows the relation between the interrupt handling and ELC.

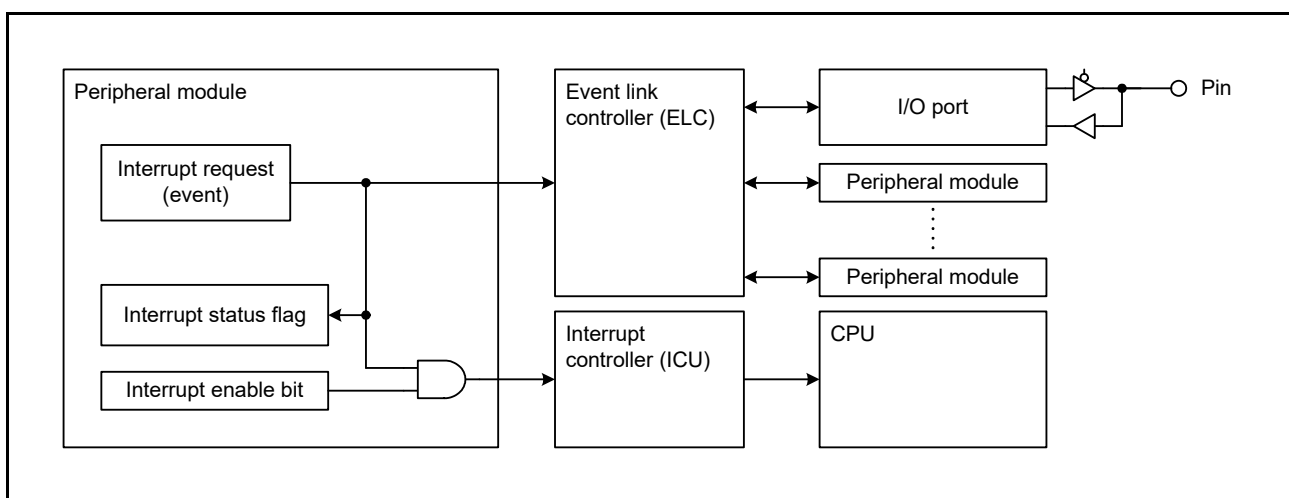

Figure 19.2 Relation between Interrupt Handling and ELC

### 19.3.2 Event Linkage

When events are specified in the ELSRn registers, the corresponding peripheral modules can be operated at generation of the specified events. A single peripheral module can link only with a single event. Set the ELSRn register after completing the initialization of the peripheral module to operate by an event. Table 19.5 lists the operations of peripheral modules when an event signal is input.

**Table 19.5 Operations of Peripheral Modules When Event Signal is Input**

| Peripheral Module        | Operations When Event Signal is Input                                                                                                                                                                                                                                                                                                                                                                                                                                                            |             |                                                                                                                                                                                                                                  |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Single port | This combination cannot be used.                                                                                                                                                                                                 |
| Clock generation circuit | Switches the clock source to the low-speed on-chip oscillator when an event signal is input.*1                                                                                                                                                                                                                                                                                                                                                                                                   |             |                                                                                                                                                                                                                                  |
| Interrupt controller     | Request an interrupt to the CPU, starts DMA transfer, or starts DTC transfer when an event signal is input.                                                                                                                                                                                                                                                                                                                                                                                      |             |                                                                                                                                                                                                                                  |

Note 1. The SCKCR3.CKSEL[2:0] bits are modified to 000b (LOCO) regardless of the value of the protect register (PRCR.PRC0).

### 19.3.3 Operation of Peripheral Timer Modules When Event Signal is Input

For the timer modules except GPTW, set the ELOPA to ELOPE register to specify the operation for when an event signal is input.

#### (1) Count Start Operation

When an event signal is input, the timer starts counting and the count start bit\*1 in each timer control register becomes 1. An event signal that is input while the count start bit is 1 is ignored.

#### (2) Count Restart Operation

When an event signal is input, the timer counter is cleared. Since the count start bit\*1 in each timer control register is retained, counting is restarted when an event signal is input while the count start bit is 1.

#### (3) Event Counter Operation

Event signal is selected as the timer count source. When an event signal is input, the timer counter is incremented.

#### (4) Input Capture Operation

When an event signal is input, the timer performs input-capture operation.

Note 1. Refer to the register descriptions on starting the timer in the relevant peripheral timer module section.

### 19.3.4 Operation of GPTW When Event Signal is Input

Eight event signals specified by the ELSR48 to ELSR55 registers are connected to every channel of GPTW as GPTW event sources A to H. To set the operation of GPTW when inputting an event signal, enable any of the event sources A to H by a corresponding bit in registers listed in Table 19.6.

**Table 19.6 Operations When Event Signal is Input and Corresponding Source Select Registers**

| Operations on Event | Register Symbol | Register Name                                            |
|---------------------|-----------------|----------------------------------------------------------|
| Count start         | GTSSR           | General PWM Timer Start Source Select Register           |
| Count stop          | GTPSR           | General PWM Timer Stop Source Select Register            |
| Counter clear       | GTCSR           | General PWM Timer Clear Source Select Register           |
| Count-up            | GTUPSR          | General PWM Timer Count-Up Source Select Register        |
| Count-down          | GTDNSR          | General PWM Timer Count-Down Source Select Register      |
| Input capture A     | GTICASR         | General PWM Timer Input Capture Source Select Register A |
| Input capture B     | GTICBSR         | General PWM Timer Input Capture Source Select Register B |

### 19.3.5 Operation of A/D and D/A Converters When Event Signal is Input

When an event signal is input, the ADCSR.ADST bit and the DACR.DAOE0 bit\*1 are set to 1 and the A/D and D/A converter start A/D and D/A conversion, respectively.

Note 1. Refer to the bit descriptions in the A/D converter and D/A converter sections.

### 19.3.6 I/O Port Operation When Event Signal is Input and Event Generation

The I/O port operation at an event signal input and conditions for event generation are set by the registers in ELC. The I/O ports that are used to set an event linkage are port B and port E.

#### (1) Single Ports and Port Groups

There are two event link modes: event link to single ports and event link to port groups. In the former mode, events can be interconnected to any one of the I/O ports. In the latter mode, events can be interconnected to port groups consisting of any two or more bits in the same I/O ports.

A single port can be set by the PELm.PSP[1:0] and PSB[2:0] bits ( $m = 0$  to 3). A port group can be specified by setting two or more bits in the PGRn register ( $n = 1, 2$ ) to 1. Among the ports corresponding to the bits set to 1 in the PGRn register, a port set as output becomes an output port group member, and a port set as input becomes an input port group member.

If an I/O port is specified as both a single port and a member of a port group, both functions are enabled when the corresponding port is input, whereas only the port group function is enabled when the corresponding port is output. Set the PDR register to select the direction of the I/O ports.

#### (2) Event Generation in Single Input Ports

A single port that is set as input generates an event signal when the input signal to the corresponding pin changes. The event generation condition is specified using the PELm.PSM[1:0] bits ( $m = 0$  to 3). An example of operation is shown in Figure 19.3 (1).

#### (3) Single Output Ports Operation When Event Signal is Input

When an event signal is input to a single port set as output, the output level (the PODR register value) of the corresponding pin changes as specified by the PELm.PSM[1:0] bits. An example of operation is shown in Figure 19.3 (2).

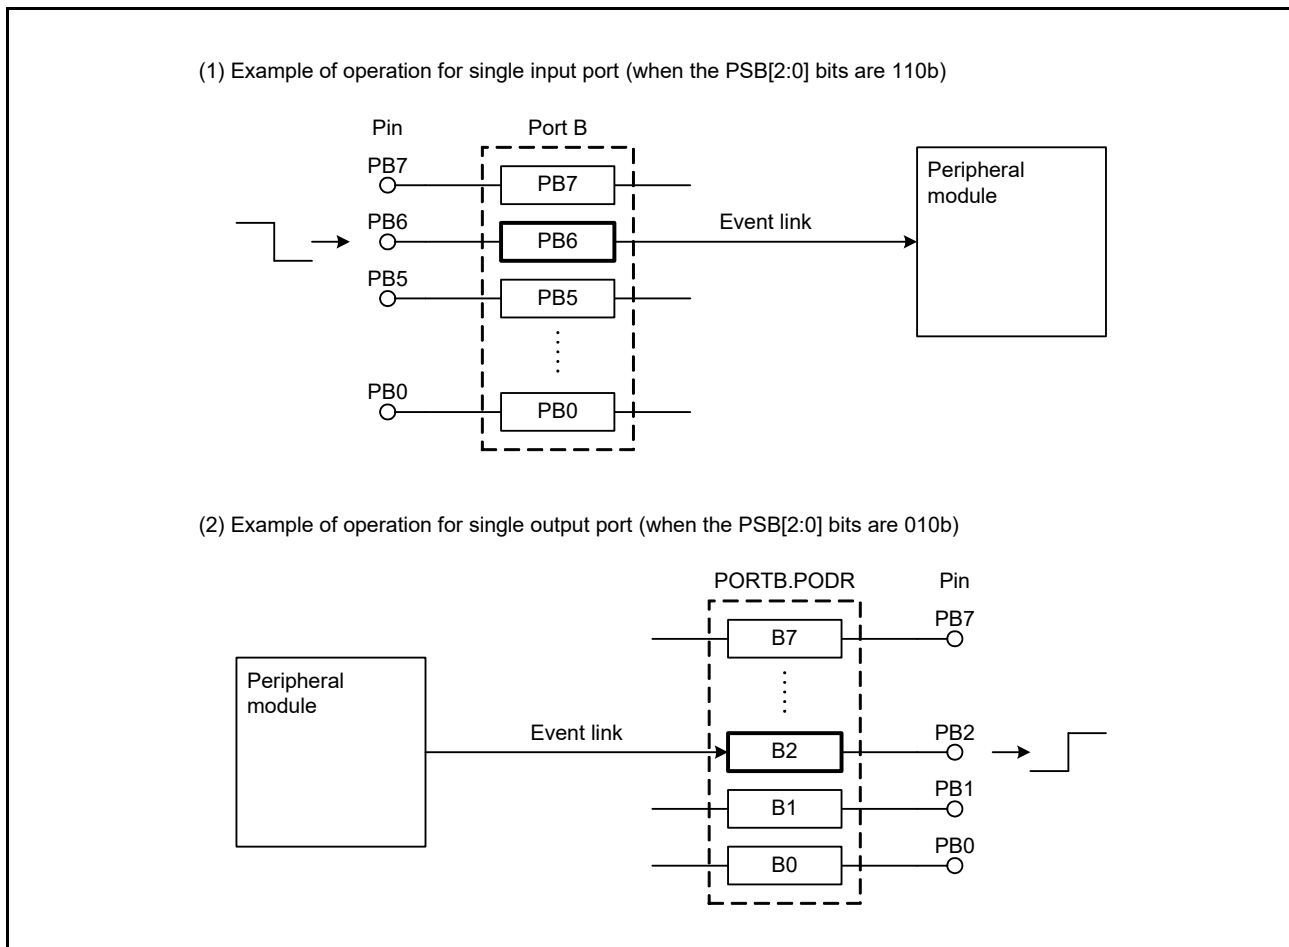

Figure 19.3 Event Linkage Related to Single Ports (Port B)

#### (4) Event Generation in Input Port Group

An input port group generates an event signal when any of input signals to the corresponding pins change. The event generation condition is specified using the PGCn.PGCI[1:0] bits (n = 1, 2).

(5) Input Port Group Operation When Event Signal is Input

When an event signal is input to an input port group, the level of the corresponding pins is transferred to the PDBFn register. Values of the bits corresponding to ports that are not specified as members of the input port group do not change. An example of operation is shown in Figure 19.4.

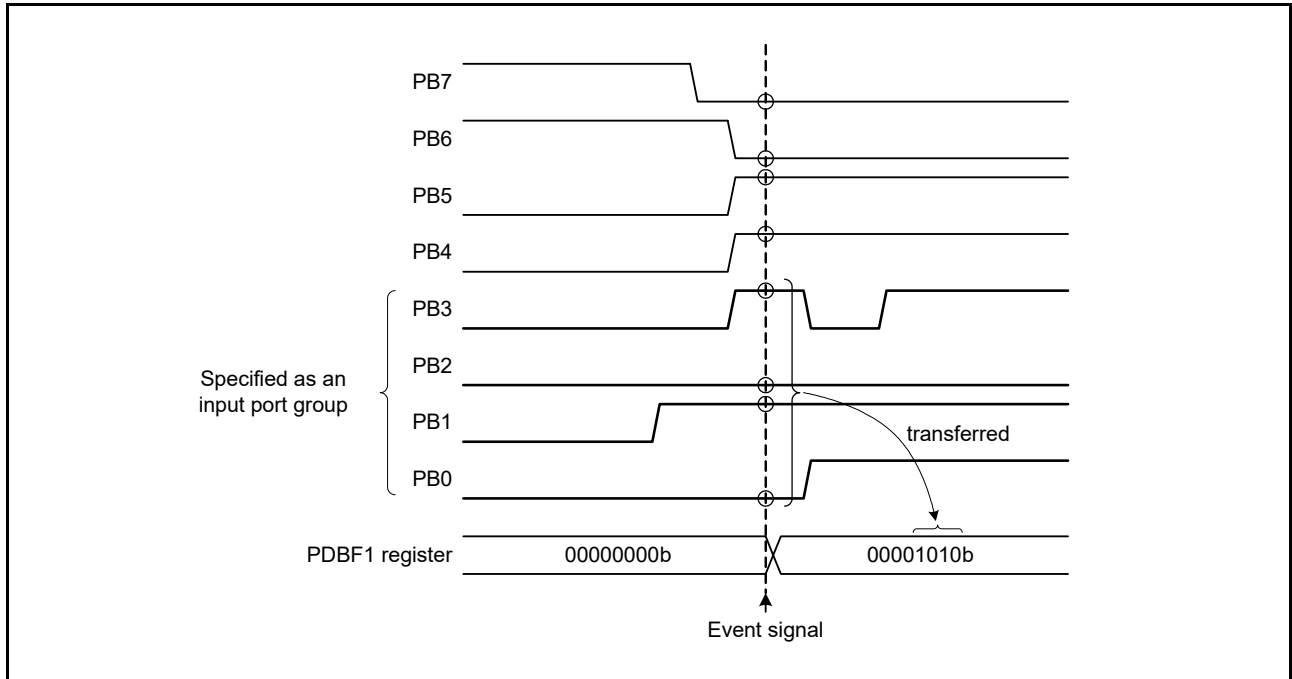

Figure 19.4 Event Linkage Related to Input Port Groups (Port B)

(6) Output Port Group Operation When Event Signal is Input

When an event signal is input to an output port group, the value of the corresponding PODR register changes according to a setting of the PGCn.PGCO[2:0] bits (n = 1, 2). An example of operation is shown in Figure 19.5.

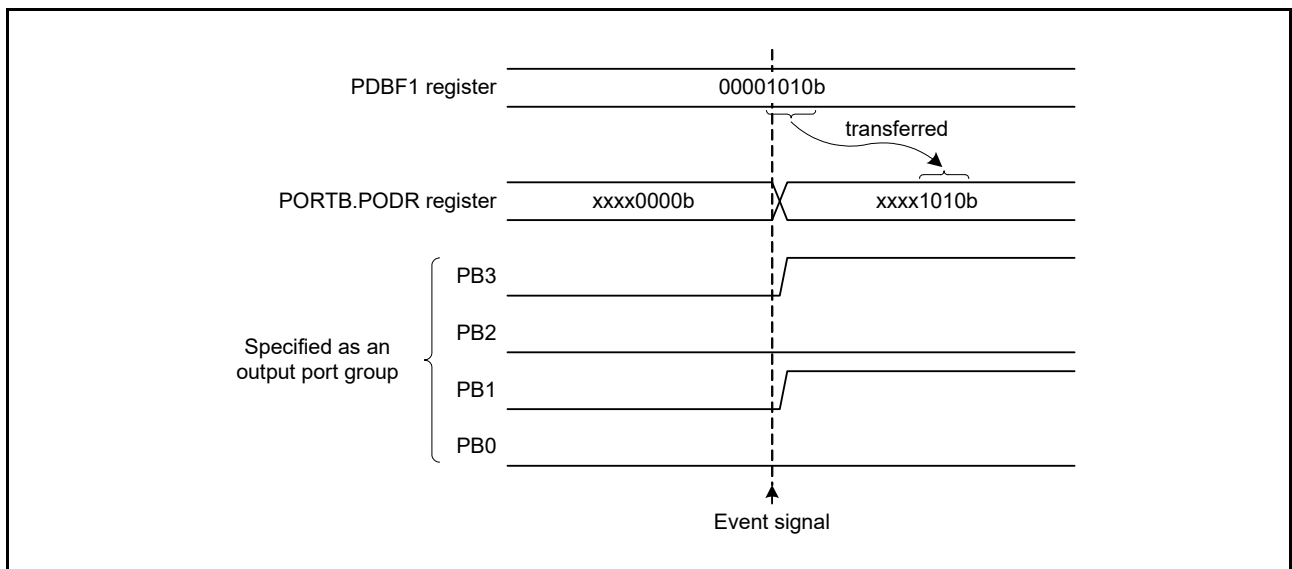

Figure 19.5 Event Linkage Related to Output Port Groups (Port B)

(7) Operation of the PDBFn Registers

(a) Input Port Groups

When an event signal is input to an input port group, the level of the corresponding pins is transferred to the PDBFn register (n = 1, 2). When another event signal is input to the input port group in this condition, different operations are performed depending on the PGCn.PGCOVE bit setting described as below.

- When the PGCn.PGCOVE bit is 0 (overwriting is disabled)
 

When the value transferred to the PDBFn register after an input of the last event signal has already been read by the CPU or DTC, the level of the corresponding pins at the time is transferred to the PDBFn register. When the value has not been read, the level of the pins is not transferred to the PDBFn register, and the input event signal is ignored.
- When the PGCn.PGCOVE bit is 1 (overwriting is enabled)
 

When another event signal is input to the input port group, the level of the corresponding pins is transferred to the PDBFn register.

(b) Output Port Groups

When an output port group is specified to output the PDBFn register value (PGCn.PGCO[2:0] bits = 011b), the PDBFn register value is transferred to the PODR register following an input of an event signal to the output port group. Data is not transferred to the bits corresponding to the ports that are not specified as members of the output port group. When output data is specified to rotate in an output port group (PGCn.PGCO[2:0] bits = 1xxb), the data is transferred from the PDBFn register to the PODR register at first event signal, and the PODR register value is rotated from MSB to LSB within the relevant group at second and subsequent signals.

Examples of operation are shown in Figure 19.6.

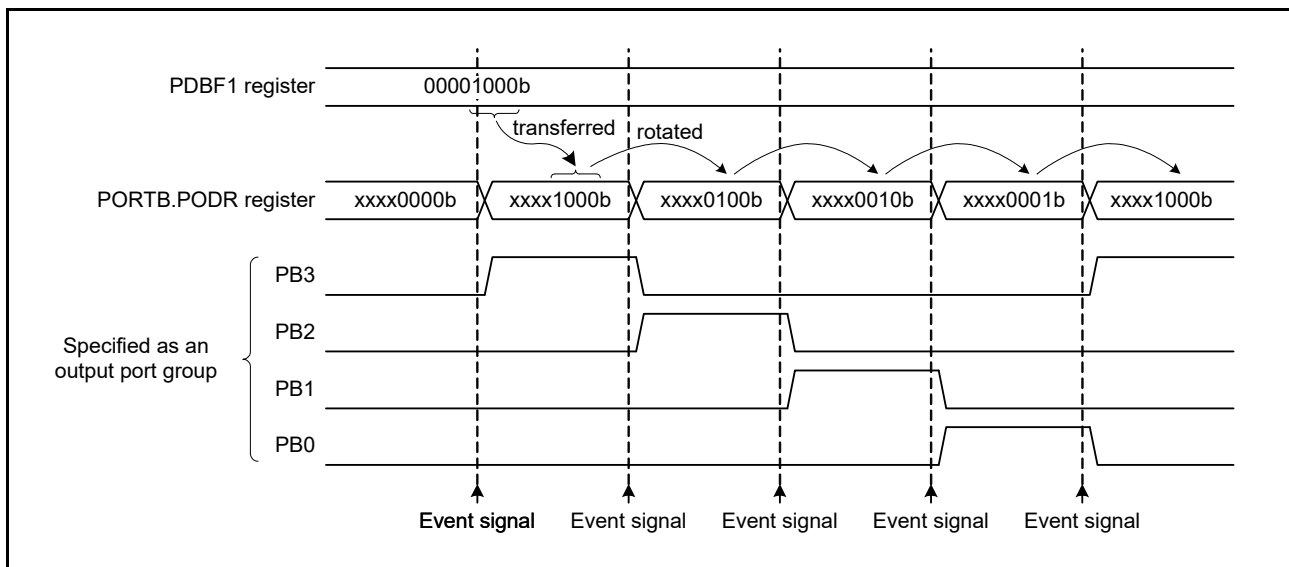

Figure 19.6 Bit-Rotating Operation of Output Port Groups (Port B)

### (8) Restrictions on Writing to PODR and PDBF Registers

When the ELCR.ELCON bit is 1 (ELC function is enabled), write access to the PODR and PDBFn registers (n = 1, 2) becomes disabled at the following conditions.

- When a port is specified as a member of the input port group and when the event linkage is set, write access to the corresponding bit in the PDBFn register becomes disabled.
- When a port is specified as a member of the output port group, write access to the corresponding bit in the PODR register becomes disabled.
- When a port is specified as a single output port and when the event linkage for the port is set by the ELSRn register, write access to the corresponding bit in the PODR register becomes disabled.

### 19.3.7 Example of Procedure for Linking Events

The following describes the procedure for linking events.

- (1) Initialize the peripheral module (destination) that operates based on an event signal.
- (2) When event linkage is set to a port, set the following registers corresponding to the port.
  - PODR register: Set the initial values of the output ports.
  - PDR register: Set the I/O direction of the ports.
  - PGRn register: To operate ports for a port group, select ports to be specified as port group members (n = 1, 2).
  - PGCn register: Set the operation of the port group.
  - PELm register: When a port is operated as a single port, specify the port to be used, an operation of the port at an input of event signal, and the event generation condition (m = 0 to 3).
- (3) Set the number of the event signal to the ELSRn register corresponding to the destination peripheral module.
- (4) To link an event to a timer module, set any of the ELOPA to ELOPE registers corresponding to the timer as required.
- (5) Set the ELCR.ELCON bit to 1, which enables linkage of all the events.
- (6) Set the operation of the peripheral module (source) from which an event signal is output, and activate the module. The preset operation of the destination peripheral module is started by the event signal that is output from the source peripheral module.
- (7) To stop event linkage of independent peripheral module, set 00h to the ELSRn register corresponding to the peripheral module. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

**Note:** When using event signal output from the LVD, set the LVD and then the ELC. Set the corresponding ELSRn register to 00h and then disable the LVD.

## 19.4 Usage Notes

### 19.4.1 Setting ELSRn Register

#### (1) Setting ELSR18 and ELSR19 Registers

Specify an event number from among EAh to F1h. Do not set the value other than preceding numbers.

### 19.4.2 Setting Bit-Rotating Operation of Output Port Groups

When the values of the PDBFn register (n = 1, 2) are changed in the bit-rotating operation mode of the output port group, set the ELSRn register again. Set intervals for generating the event as at least one PCLKB cycle when using it for bit-rotating operation.

### 19.4.3 Linking DMA/DTC Transfer End Signal as Event

When linking the DMA/DTC transfer end signal as an event signal, do not set the same peripheral module as the DMA/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMA/DTC transfer to the peripheral module is completed.

### 19.4.4 Clock Settings

To link events, make sure that the ELC and the related peripheral modules are in an operational condition. The peripheral modules cannot operate if they are in the module stop state or in mode which they stop (all-module clock stop mode, software standby mode, or deep software standby mode).

### 19.4.5 Module Stop Function Setting

ELC operation can be disabled or enabled using module stop control register B (MSTPCRB). After reset is released, the ELC function is disabled. Register access is enabled by releasing the module stop state. For details, refer to [section 11, Low Power Consumption](#).

## 20. I/O Ports

### 20.1 Overview

The pins of an I/O port for this MCU function as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, or bus control pins.

Each pin is also configurable as an I/O pin of a peripheral module or an input pin for an interrupt. All pins function as input pins immediately after a reset, and pin functions are switched by register settings. The setting of each pin is specified by the registers for the corresponding I/O port and peripheral modules.

Each port has the port direction register (PDR) that selects input or output direction, the port output data register (PODR) that holds data for output, the port input register (PIDR) that indicates the pin states, the open-drain control register y (ODRy, y = 0, 1) that selects the output type of each pin, the pull-up resistor control register (PCR) that controls on/off of the input pull-up MOS, the drive capacity control register (DSCR, DSCR2) that selects the drive capacity, and the port mode register (PMR) that specifies the pin function of each port.

For details on PMR, refer to section 21, Multi-Function Pin Controller (MPC).

The configuration of the I/O ports differs depending on the package. Table 20.1 to Table 20.4 show the specifications of I/O ports, and Table 20.5 lists the port functions.

**Table 20.1 Specifications of I/O Ports (1)**

With Programmable Gain Amplifier (PGA) Pseudo Differential Input (1)

| Port  | Package       |               | Package              |               |
|-------|---------------|---------------|----------------------|---------------|
|       | 144 Pins      | Number of Pin | 112 Pins             | Number of Pin |
| PORT0 | P00, P01      | 2             | P00, P01             | 2             |
| PORT1 | P10 to P17    | 8             | P10 to P17           | 8             |
| PORT2 | P20 to P27    | 8             | P20 to P24, P27      | 6             |

Note 1. This is only available for products with 128 Kbytes of RAM.

The settings for input pull-up, open-drain output, switching of driving ability, and 5-V tolerance are also applied to other signals multiplexed on the general I/O pins. However, input pull-up becomes disabled while an external bus pin except for the WAIT pin is used.

20.2 I/O Port Configuration

- Port 0: P00, P01\*1
- Port 1: P11
- Port 2: P22 to P27\*1, \*7
- Port 3: P30 to P35\*1
- Port 7: P70 to P76\*1
- Port 8: P80 to P82\*1
- Port 9: P96
- Port A: PA2 to PA7\*1, \*7
- Port B: PB0 to PB7\*1, \*7
- Port C: PC0 to PC2, PC4\*1
- Port D: PD0 to PD2\*1
- Port E: PE0, PE1, PE3 to PE6\*1
- Port F: PF0 to PF3\*1
- Port G: PG0 to PG2\*1
- Port K: PK0 to PK2\*1

- Note 1. P01, P34, P70, P96, PA3 to PA6, PD0 to PD2, PE3, and PE4 are not provided on the 48-pin product. P30, P31, PA3, PA5, PD2, PE3, and PE4 are not provided on the product with 64 or fewer pins. P27 is not provided on the product with 64 or fewer pins and the 100-pin product without PGA pseudo differential input. P23, P24, P32, P33, P80 to P82, PA2, PA4, PE0, PE1, and PE5 are not provided on the product with 80 or fewer pins. Products with 80 or fewer pins and products with 100 pins that have PGA pseudo differential input and those that have a USB interface do not have PB7, PD0, and PD1. PC0 to PC2, and PG0 to PG2 are not provided on the product with 100 or fewer pins. P25, P26, P34, P35, PA6, PA7, PC4, PE6, PF0 to PF3, and PK0 to PK2 are not provided on the products with 112 or fewer pins.
- Note 2. Control signal for N-channel open-drain output
- Note 3. An external interrupt function is multiplexed on this pin.
- Note 4. Output from peripheral modules is multiplexed on this pin.
- Note 5. A pin which has a data bus function
- Note 6. The products with 80 or fewer pins does not have an external bus function.
- Note 7. The external bus function of P27, PA3 to PA5, and PB1 to PB3 is only available for products with 128 Kbytes of RAM.

| b7  | B7     | Pm7 I/O Select |                                         | R/W |

m = 0 to 9, A to H, K

PDR is a register which is used to select the input or output direction for individual pins of the corresponding port when the pins are configured as the general I/O pins.

Each bit of PORTm.PDR corresponds to each pin of port m; I/O direction can be specified in 1-bit units.

Each bit of PDR corresponding to port m that does not exist is reserved.

Also, each bit of PDR corresponding to P40 to P42, P44 to P46, PH0, PH4, and PE2 pins is reserved, because such pins are input only.

Make settings of the reserved bit according to the description in section 20.4.1, Initialization of the Port Direction Register (PDR).

### 20.3.2 Port Output Data Register (PODR)

Address(es): PORT0.PODR 0008 C020h, PORT1.PODR 0008 C021h, PORT2.PODR 0008 C022h, PORT3.PODR 0008 C023h, PORT4.PODR 0008 C024h, PORT5.PODR 0008 C025h, PORT6.PODR 0008 C026h, PORT7.PODR 0008 C027h, PORT8.PODR 0008 C028h, PORT9.PODR 0008 C029h, PORTA.PODR 0008 C02Ah, PORTB.PODR 0008 C02Bh, PORTC.PODR 0008 C02Ch, PORTD.PODR 0008 C02Dh, PORTE.PODR 0008 C02Eh, PORTF.PODR 0008 C02Fh, PORTG.PODR 0008 C030h, PORTH.PODR 0008 C031h, PORTK.PODR 0008 C033h

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Bit Name              | Description    | R/W |
|-----|--------|-----------------------|----------------|-----|
| b0  | B0     | Pm0 Output Data Store | 0: Low output  | R/W |
| b1  | B1     | Pm1 Output Data Store | 1: High output | R/W |
| b2  | B2     | Pm2 Output Data Store |                | R/W |
| b3  | B3     | Pm3 Output Data Store |                | R/W |
| b4  | B4     | Pm4 Output Data Store |                | R/W |
| b5  | B5     | Pm5 Output Data Store |                | R/W |
| b6  | B6     | Pm6 Output Data Store |                | R/W |
| b7  | B7     | Pm7 Output Data Store |                | R/W |

m = 0 to 9, A to H, and K

PODR is a register which holds the data to be output from the pins used for general I/O.

Bits that correspond to port m that does not exist is reserved. Write 0 (low output) to these bits.

Each bit of PODR corresponding to P40 to P42, P44 to P46, PH0, PH4, and PE2 pins is reserved, because such pins are input only. Data is not output from the corresponding pins even if these bits are set.

The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0. The write value should always be 0.

### 20.3.3 Port Input Register (PIDR)

Address(es): PORT0.PIDR 0008 C040h, PORT1.PIDR 0008 C041h, PORT2.PIDR 0008 C042h, PORT3.PIDR 0008 C043h, PORT4.PIDR 0008 C044h, PORT5.PIDR 0008 C045h, PORT6.PIDR 0008 C046h, PORT7.PIDR 0008 C047h, PORT8.PIDR 0008 C048h, PORT9.PIDR 0008 C049h, PORTA.PIDR 0008 C04Ah, PORTB.PIDR 0008 C04Bh, PORTC.PIDR 0008 C04Ch, PORTD.PIDR 0008 C04Dh, PORTE.PIDR 0008 C04Eh, PORTF.PIDR 0008 C04Fh, PORTG.PIDR 0008 C050h, PORTH.PIDR 0008 C051h, PORTK.PIDR 0008 C053h

Value after reset: x x x x x x x x

x: Undefined

| Bit | Symbol | Bit Name | Description   | R/W |
|-----|--------|----------|---------------|-----|
| b0  | B0     | Pm0      | 0: Low input  | R   |
| b1  | B1     | Pm1      | 1: High input | R   |
| b2  | B2     | Pm2      |               | R   |
| b3  | B3     | Pm3      |               | R   |
| b4  | B4     | Pm4      |               | R   |
| b5  | B5     | Pm5      |               | R   |
| b6  | B6     | Pm6      |               | R   |
| b7  | B7     | Pm7      |               | R   |

m = 0 to 9, A to H, K

PIDR is a register which reflects individual pin states of the port.

The pin states of port m can be read with the PORTm.PIDR, regardless of the values of PORTm.PDR and PORTm.PMR.

The states of pins cannot be read when the PmnPFS.ASEL bit is set to 1.

The NMI pin state is reflected in the PE2 bit.

The bit corresponding to a pin that does not exist is reserved. A reserved bit is read as undefined, and cannot be modified.

**Note:** Set the VOLSr.PGAVLS bit to 1 when both PH0 and PH4 are to be used as input pins while the AVCC voltage is no less than 4.0 V on the product with the PGA pseudo differential input.

When only PH0 is to be used as an input pin, set all S12AD.ADPGADCR0.PxDEN bits (x = 000 to 002) to 0, and when only PH4 is to be used as an input pin, set all S12AD1.ADPGADCR0.PxDEN bits (x = 100 to 102) to 0.

### 20.3.4 Port Mode Register (PMR)

Address(es): PORT0.PMR 0008 C060h, PORT1.PMR 0008 C061h, PORT2.PMR 0008 C062h, PORT3.PMR 0008 C063h, PORT4.PMR 0008 C064h, PORT5.PMR 0008 C065h, PORT6.PMR 0008 C066h, PORT7.PMR 0008 C067h, PORT8.PMR 0008 C068h, PORT9.PMR 0008 C069h, PORTA.PMR 0008 C06Ah, PORTB.PMR 0008 C06Bh, PORTC.PMR 0008 C06Ch, PORTD.PMR 0008 C06Dh, PORTE.PMR 0008 C06Eh, PORTF.PMR 0008 C06Fh, PORTG.PMR 0008 C070h, PORTH.PMR 0008 C071h, PORTK.PMR 0008 C073h

Value after reset: 0 0 0 0 0 0 0 0

m = 0 to 9, A to H, and K

PMR is a register which specifies the function of the pins of the port.

Each bit of PORTm.PMR corresponds to each pin of port m; pin function can be specified in 1-bit units.

The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0. The write value should always be 0.

### 20.3.5 Open-Drain Control Register 0 (ODR0)

Address(es): PORT0.ODR0 0008 C080h, PORT1.ODR0 0008 C082h, PORT2.ODR0 0008 C084h, PORT3.ODR0 0008 C086h, PORT4.ODR0 0008 C088h, PORT5.ODR0 0008 C08Ah, PORT6.ODR0 0008 C08Ch, PORT7.ODR0 0008 C08Eh, PORT8.ODR0 0008 C090h, PORT9.ODR0 0008 C092h, PORTA.ODR0 0008 C094h, PORTB.ODR0 0008 C096h, PORTC.ODR0 0008 C098h, PORTD.ODR0 0008 C09Ah, PORTE.ODR0 0008 C09Ch, PORTF.ODR0 0008 C09Eh, PORTG.ODR0 0008 C0A0h, PORTH.ODR0 0008 C0A2h, PORTK.ODR0 0008 C0A6h

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Bit Name               | Description                                 | R/W |

| b7  | —      | Reserved               |                                             | R/W |

m = 0 to 9, A to H, and K

ODR0 is a register which is used to select an output type for the pins of the port.

In the ODR0 register, the odd bits (b1, b3, b5, and b7) are reserved.

The bits corresponding to a pin that does not exist or that the open-drain output is not allocated to are reserved. A reserved bit is always read as 0. The write value should always be 0.

### 20.3.6 Open-Drain Control Register 1 (ODR1)

Address(es): PORT1.ODR1 0008 C083h, PORT2.ODR1 0008 C085h, PORT3.ODR1 0008 C087h, PORT4.ODR1 0008 C089h, PORT5.ODR1 0008 C08Bh, PORT6.ODR1 0008 C08Dh, PORT7.ODR1 0008 C08Fh, PORT9.ODR1 0008 C093h, PORTA.ODR1 0008 C095h, PORTB.ODR1 0008 C097h, PORTC.ODR1 0008 C099h, PORTD.ODR1 0008 C09Bh, PORTE.ODR1 0008 C09Dh, PORTH.ODR1 0008 C0A3h

|    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|

| b7  | —      | Reserved               |                           | R/W |

m = 1 to 7, 9, A to E, and H

ODR1 is used to select an output type for each pin of the port.

The odd bits (b1, b3, b5, and b7) in the ODR1 register are reserved.

The bits corresponding to a pin that does not exist or that the open-drain output is not allocated to are reserved. A reserved bit is always read as 0. The write value should always be 0.

### 20.3.7 Pull-Up Resistor Control Register (PCR)

Address(es): PORT0.PCR 0008 C0C0h, PORT1.PCR 0008 C0C1h, PORT2.PCR 0008 C0C2h, PORT3.PCR 0008 C0C3h, PORT4.PCR 0008 C0C4h, PORT5.PCR 0008 C0C5h, PORT6.PCR 0008 C0C6h, PORT7.PCR 0008 C0C7h, PORT8.PCR 0008 C0C8h, PORT9.PCR 0008 C0C9h, PORTA.PCR 0008 C0CAh, PORTB.PCR 0008 C0CBh, PORTC.PCR 0008 C0CCh, PORTD.PCR 0008 C0CDh, PORTE.PCR 0008 C0CEh, PORTF.PCR 0008 C0CFh, PORTG.PCR 0008 C0D0h, PORTH.PCR 0008 C0D1h, PORTK.PCR 0008 C0D3h

| b4  | B4     | Pm4 Input Pull-Up Resistor Control |                                                                                 | R/W |
| b5  | B5     | Pm5 Input Pull-Up Resistor Control |                                                                                 | R/W |
| b6  | B6     | Pm6 Input Pull-Up Resistor Control |                                                                                 | R/W |
| b7  | B7     | Pm7 Input Pull-Up Resistor Control |                                                                                 | R/W |

m = 0 to 9, A to H, K

PCR is a register which enables or disables an input pull-up resistor for individual pins of the port.

While a pin is in the input state with the corresponding bit in PORTm.PCR set to 1, the pull-up resistor connected to the pin is enabled.

When a pin is in use for the external bus pin (except for the WAIT pin), general-purpose output port, or peripheral function output, the pull-up resistor for the pin is disabled regardless of the settings of PCR.

However, when a pin is used as an address bus or bus control signal and the MCU transitions to software standby mode or deep software standby mode while the output port enable bit (SBYCR.OPE) in the standby control register is cleared to 0, the value in the PCR register becomes enabled.

The pull-up resistor is also disabled in the reset state.

The bits corresponding to a pin that does not exist or that the input pull-up is not allocated to are reserved. A reserved bit is always read as 0. The write value should always be 0.

### 20.3.8 Drive Capacity Control Register (DSCR)

Address(es): PORT0.DSCR 0008 C0E0h, PORT1.DSCR 0008 C0E1h, PORT2.DSCR 0008 C0E2h, PORT3.DSCR 0008 C0E3h, PORT7.DSCR 0008 C0E7h, PORT8.DSCR 0008 C0E8h, PORT9.DSCR 0008 C0E9h, PORTA.DSCR 0008 C0EAh, PORTB.DSCR 0008 C0EBh, PORTC.DSCR 0008 C0ECh, PORTD.DSCR 0008 C0EDh, PORTE.DSCR 0008 C0EEh, PORTF.DSCR 0008 C0EFh, PORTG.DSCR 0008 C0F0h, PORTK.DSCR 0008 C0F3h

|    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|
| b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Bit Name                   | Description            | R/W |
|-----|--------|----------------------------|------------------------|-----|
| b0  | B0     | Pm0 Drive Capacity Control | 0: Normal drive output | R/W |
| b1  | B1     | Pm1 Drive Capacity Control | 1: High-drive output   | R/W |
| b2  | B2     | Pm2 Drive Capacity Control |                        | R/W |
| b3  | B3     | Pm3 Drive Capacity Control |                        | R/W |
| b4  | B4     | Pm4 Drive Capacity Control |                        | R/W |
| b5  | B5     | Pm5 Drive Capacity Control |                        | R/W |
| b6  | B6     | Pm6 Drive Capacity Control |                        | R/W |
| b7  | B7     | Pm7 Drive Capacity Control |                        | R/W |

m = 0 to 3, 7 to 9, A to G, and K

DSCR is a register which is used to switch the drive capacity of the port.

The bits corresponding to a pin that does not exist or whose drive capacity is fixed are reserved. A reserved bit is always read as 0. The write value should always be 0.

### 20.3.9 Drive Capacity Control Register 2 (DSCR2)

Address(es): PORT7.DSCR2 0008 C12Fh, PORT8.DSCR2 0008 C130h, PORT9.DSCR2 0008 C131h, PORTB.DSCR2 0008 C133h, PORTD.DSCR2 0008 C135h

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Bit Name                     | Description                                                    | R/W |
|-----|--------|------------------------------|----------------------------------------------------------------|-----|
| b0  | B0     | Pm0 Drive Capacity Control 2 | 0: Normal drive/high-drive output*1<br>1: Large current output | R/W |
| b1  | B1     | Pm1 Drive Capacity Control 2 |                                                                | R/W |
| b2  | B2     | Pm2 Drive Capacity Control 2 |                                                                | R/W |
| b3  | B3     | Pm3 Drive Capacity Control 2 |                                                                | R/W |
| b4  | B4     | Pm4 Drive Capacity Control 2 |                                                                | R/W |
| b5  | B5     | Pm5 Drive Capacity Control 2 |                                                                | R/W |
| b6  | B6     | Pm6 Drive Capacity Control 2 |                                                                | R/W |
| b7  | —      | Reserved                     |                                                                | R/W |

m = 7 to 9, B, and D

Note 1. Pins that support switching drive capacity by the DSCR register depend on the setting of the DSCR register.

DSCR2 is a register which is used to switch the drive capacity of the port.

Table 20.6 shows the setting of drive capacity by the DSCR and DSCR2 registers.

The bits corresponding to a pin that does not exist or that cannot be switched to large current output are reserved. A reserved bit is always read as 0. The write value should always be 0.

**Table 20.6 Drive Capacity Setting by DSCR and DSCR2 Registers**

| PORTm.DSCR2.Bx | PORTm.DSCR.Bx | Drive Capacity*1     |
|----------------|---------------|----------------------|
| 0              | 0             | Normal drive output  |
| 0              | 1             | High-drive output    |
| 1              | Don't care    | Large current output |

Note 1. When drive capacity is fixed, or drive capacity of a pin whose drive capacity cannot be switched cannot be changed.

## 20.4 Usage Notes

### 20.4.1 Initialization of the Port Direction Register (PDR)

Initialize reserved bits in the PDR register according to Table 20.7 to Table 20.14.

- The blank columns in Table 20.7 to Table 20.14 indicate the bits corresponding to the pins listed in Table 20.1, Specifications of I/O Ports (1) to Table 20.4, Specifications of I/O Ports (4).

The corresponding bits should be set to 1 (output) or 0 (input) depending on the user system.

However, each bit of PDR corresponding to P40 to P42, P44 to P46, PH0, PH4, and PE2 pins which are input only is reserved.

This bit should be set to 0 (input).

- The columns other than the blank columns in Table 20.7 to Table 20.14 indicate reserved bits (input-dedicated pins are excluded).

A reserved bit should be set to 0 (input) or 1 (output) according to Table 20.7 to Table 20.14.

When setting a value to a reserved bit, access in byte units.

**Table 20.7 PDR Register Settings in 144-Pin Packages with programmable gain amplifier (PGA) pseudo differential input**

| Port Symbol | PDR Register |    |    |    |    |    |    |    |
|-------------|--------------|----|----|----|----|----|----|----|
|             | b7           | b6 | b5 | b4 | b3 | b2 | b1 | b0 |

### 20.4.2 Settings when PH0 and PH4 are to be Used as General Purpose Input Port Pins

To use PH0 and PH4 as general purpose input port pins, make settings in accord with Figure 20.7.

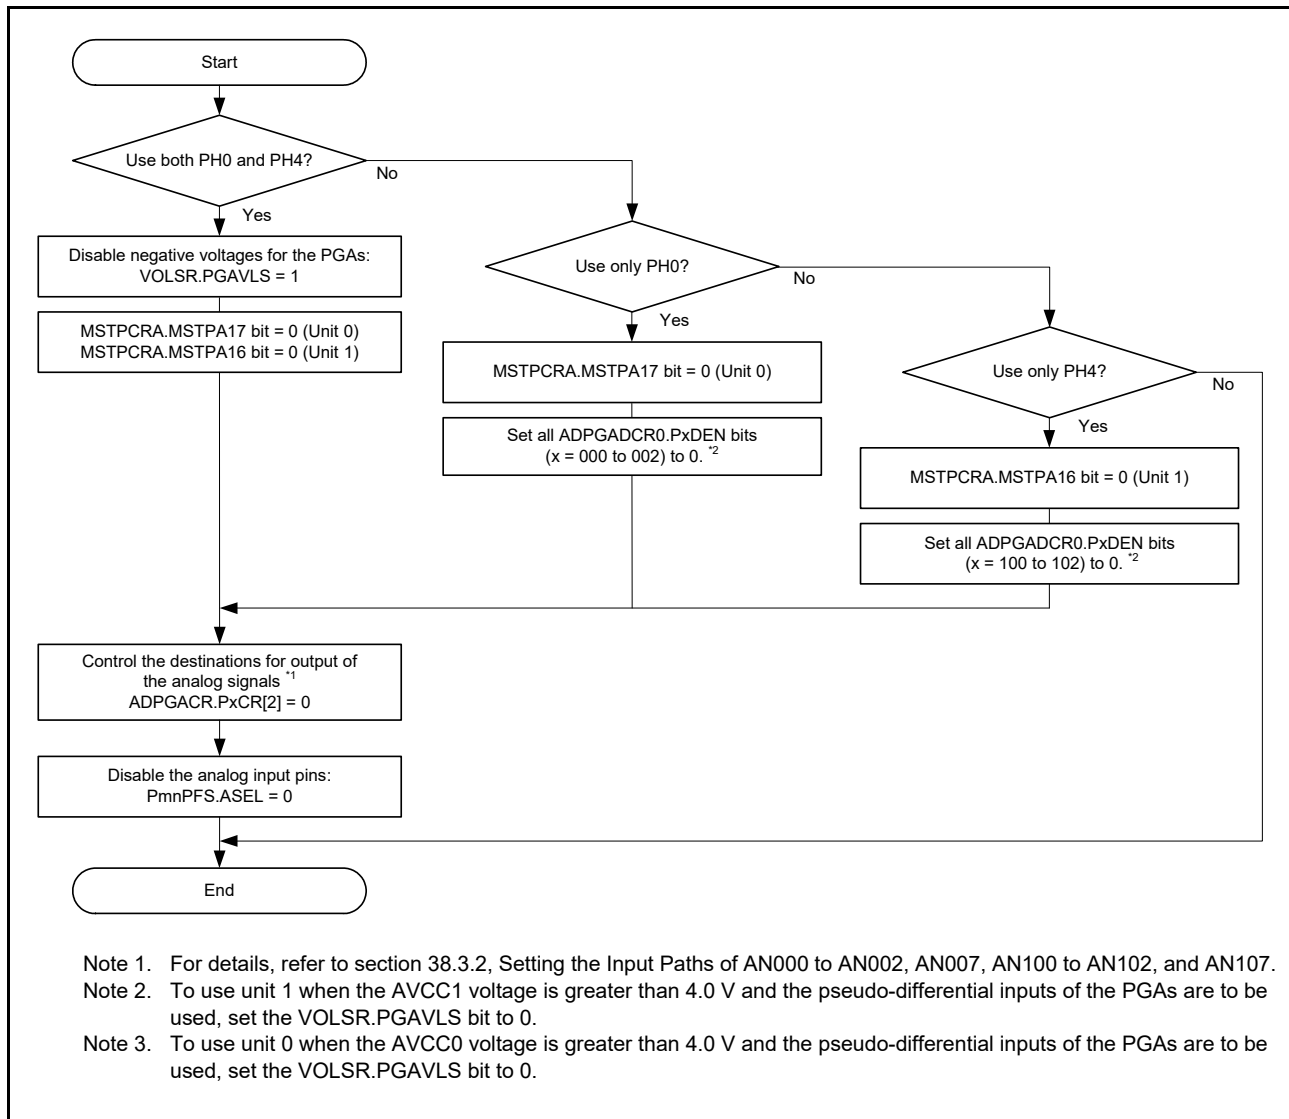

Figure 20.7 Settings when PH0 and PH4 are to be Used as General Purpose Input Port Pins

### 20.4.3 Handling of Unused Pins

Details on the handling of unused pins are given in Table 20.15.

**Table 20.15 Handling of Unused Pins**

| Pin Name                                                        | Handling                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EMLE                                                            | Connect this pin to VSS via a resistor (pulling down).                                                                                                                                                                                                                                                                           |
| MD                                                              | Use this as a mode pin.                                                                                                                                                                                                                                                                                                          |
| RES#                                                            | Connect this pin to VCC via a resistor (pulling up).                                                                                                                                                                                                                                                                             |

| Port 0 to Port 3, Port 7 to Port 9,<br>Port A to Port G, Port K | <ul style="list-style-type: none"> <li>If the direction setting is for input (PORTn.PDR = 0), the corresponding pin is connected to VCC (pulled up) via a resistor or to VSS (pulled down) via a resistor.*1</li> <li>If the direction setting is for output (PORTn.PDR = 1), leave these pins open-circuit.*1, *2</li> </ul>    |
| Port 4 to Port 6,<br>Port H (except for PH0 and PH4)            | <ul style="list-style-type: none"> <li>The corresponding pin is connected to analog power supply (AVCC1/AVCC2) (pulled up) via a resistor or to analog ground (AVSS1/AVSS2) (pulled down) via a resistor.*3</li> <li>If the direction setting is for output (PORTn.PDR = 1), leave these pins open-circuit.*1, *2, *4</li> </ul> |
| PH0/PGAVSS0                                                     | The pin is connected to analog power supply (AVCC0) (pulled up) via a resistor.                                                                                                                                                                                                                                                  |
| PH4/PGAVSS1                                                     | The pin is connected to analog power supply (AVCC1) (pulled up) via a resistor.                                                                                                                                                                                                                                                  |

Note 1. Clear the PORTn.PMR bit, the PmnPFS.ISEL bit and the PmnPFS.ASEL bit to 0.

Note 2. In the case of release when the setting is for output, the port is an input over the period from release from the reset state to the pin becoming an output. Since the voltage on the pin is undefined while it is an input, this may lead to an increase in the current drawn.

Note 3. Connect the P4 and PH pins to AVCC1/AVSS1 as the power source via resistor, and connect the P5 and P6 pins to AVCC2/AVSS2 as the power source via resistor.

Note 4. Do not set PORTn.PDR to 1 for input-dedicated pins.

## 21. Multi-Function Pin Controller (MPC)

### 21.1 Overview

The multi-function pin controller (MPC) selects and assigns input/output of peripheral functions and interrupt input signals from multiple ports. The MPC also assigns the port of external bus related signals.

Table 21.1 lists the functions assigned to each multiplexed pin. The symbols ✓ and × in the table indicate whether the pin is available or unavailable for the package. Selecting a single function for multiple pins is prohibited.

**Table 21.1 Functions Assigned to Each Multiplexed Pin (1/17)**

| Module/<br>Function | Channel         | Pin Functions   | Allocation<br>Port | Package                            |                |             |                |                |                |                                             |                |   |

|                     | CMPC53 (input)*2 | P65              | ✓                  | ✓                                  | ✓              | ✓           | ✓              | ✓              | ✓              | ✓                                           | ✓              |   |

Note 1. This pin is only available on the products with 128K bytes of RAM.

Note 2. To use this pin function, set the corresponding pin as general input (set the PORTm.PDR.Bn and PORTm.PMR.Bn bits to 0).

## 21.2 Register Descriptions

The registers and bits of unsupported pins, depending on the package, are reserved. The write value to the reserved bits is the value after a reset.

### 21.2.1 Write-Protect Register (PWPR)

Address(es): 0008 C11Fh

| b7   | b6    | b5 | b4 | b3 | b2 | b1 | b0 |
|------|-------|----|----|----|----|----|----|
| B0WI | PFSWE | —  | —  | —  | —  | —  | —  |

Value after reset: 1 0 0 0 0 0 0 0

| Bit      | Symbol | Bit Name                  | Description                                                                             | R/W |
|----------|--------|---------------------------|-----------------------------------------------------------------------------------------|-----|
| b5 to b0 | —      | Reserved                  | These bits are read as 0. The write value should be 0.                                  | R/W |
| b6       | PFSWE  | PFS Register Write Enable | 0: Writing to the PFS register is disabled<br>1: Writing to the PFS register is enabled | R/W |
| b7       | B0WI   | PFSWE Bit Write Disable   | 0: Writing to the PFSWE bit is enabled<br>1: Writing to the PFSWE bit is disabled       | R/W |

#### PFSWE Bit (PFS Register Write Enable)

Writing to PmnPFS register is enabled only when the PFSWE bit is set to 1.

To set the PFSWE bit to 1, write 1 to the PFSWE bit after writing 0 to the B0WI bit.

#### B0WI Bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

### 21.2.2 P0n Pin Function Control Register (P0nPFS) (n = 0, 1)

Address(es): P00PFS 0008 C140h, P01PFS 0008 C141h

| Bit      | Symbol    | Bit Name                        | Description                                                                                                                             | R/W |
|----------|-----------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| b5 to b0 | PSEL[5:0] | Pin Function Select             | These bits select the peripheral function. For individual pin functions, see Table 21.2.                                                | R/W |
| b6       | ISEL      | Interrupt Input Function Select | 0: Not used as IRQn input pin<br>1: Used as IRQn input pin<br>P00: IRQ2 (48/64/80/100/112/144 pin)<br>P01: IRQ4 (64/80/100/112/144 pin) | R/W |
| b7       | —         | Reserved                        | This bit is read as 0. The write value should be 0.                                                                                     | R/W |

The port mn pin function control register (PmnPFS) selects the pin function. Bits PSEL[5:0] select the peripheral function which is assigned to bits.

The ISEL bit is set when a pin is used as an IRQ input pin. This setting can be used with the combination of the peripheral function, though IRQn (external pin interrupt) of the same number should not be enabled by two or more pins. The ASEL bit is set when a pin is used as an analog pin. When the pin is set as an analog pin by the ASEL bit, select the general I/O port by the port mode register (PORTm.PMR) and specify input by the port direction register (PORTm.PDR). The pin state cannot be read at this point, since the PmnPFS register is protected by the write-protect register (PWPR). Modify the register after releasing the protection.

The ISEL bit to which IRQn is not specified is reserved. The ASEL bit to which analog input/output is not specified is reserved.

**Table 21.2 Register Settings for Input/Output Pin Function in 144-/112-/100-/80-/64-/48-Pin Products**

| PSEL[5:0] Settings      | Pin                                  |                                                |

### 21.2.21 CS Output Enable Register (PFCSE)

Address(es): 0008 C100h

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit Name   | Description                                            | R/W |
|----------|--------|------------|--------------------------------------------------------|-----|
| b0       | CS0E   | CS0 Enable | 0: Disables CSn# output.<br>1: Enables CSn# output.    | R/W |
| b1       | CS1E   | CS1 Enable | (n = 0 to 3)                                           | R/W |
| b2       | CS2E   | CS2 Enable |                                                        | R/W |
| b3       | CS3E   | CS3 Enable |                                                        | R/W |
| b7 to b4 | —      | Reserved   | These bits are read as 0. The write value should be 0. | R/W |

#### CSnE Bit (CSn Enable) (n = 0 to 3)

These bits enable or disable the corresponding pins to output the CSn# signal.

To enable output of the CSn# signal, set the corresponding CSnE bit in PFCSE to 1.

## 21.2.22 CS Output Pin Select Register 0 (PFCSS0)

Address(es): 0008 C102h

**BCLKO Bit (BCLK Forced Output)**

This bit enables or disables forced output on the BCLK pin.

When this bit is set to 0, BCLK output is enabled or disabled according to the setting of the EXBE bit; when this bit is 1, BCLK is output regardless of the setting of the EXBE bit.

Note that if the bit is set to 1, BCLK is output regardless of the PMR register.

[Setting procedure]

Output enabled: PSTOP1 (stopped) → BCLKO = 1 → PSTOP1 (operating)

Output disabled: PSTOP1 (operating) → PSTOP1 (stopped) → BCLKO = 0

| b7 to b3 | —          | Reserved          | These bits are read as 0. The write value should be 0.                                                                                                                                                          | R/W |

### WAITS[1:0] Bits (WAIT Select)

The port pin specified by the WAITS[1:0] bits becomes the WAIT# pin when the external bus is enabled. However, if the setting is WAITS[1:0] = 00, the pin is not specified. When the external wait is used, make sure that the WAIT# pin is specified to the value other than WAITS[1:0] = 00. In addition, if the specified port pin is not to be used as the WAIT# pin, the external wait enable bit (EWENB) in the CSn mode register (CSnMOD) can be cleared (disabling external wait) to make the pin available for use as a general input port pin or as an input or output pin for peripheral functions. If the specified WAIT# pin is not to be used as the WAIT input or as a general input port pin, pull the level on the WAIT# pin up or down.

### ALEOE Bit (ALE Output Enable)

This bit enables or disables output of the ALE pin.

## 21.2.27 External Bus Control Register 2 (PFBCR2)

| b5       | —       | Reserved                      | The write value should be 0.                                                                   | R/W |
| b6       | ADRHMS2 | A12 to A20 Output Selection 2 | Refer to Table 21.37                                                                           | R/W |
| b7       | —       | Reserved                      | This bit is read as 0. The write value should be 0.                                            | R/W |

Note: The PFBCR4 register is only available for products with 128 Kbytes of RAM.

**Table 21.36 External Address Bus A1 to A7**

| ADRLMS bit | External Address Bus A1 to A7                                               |
|------------|-----------------------------------------------------------------------------|
| 0          | Configures PB4 to PB7, and PD0 to PD2 as the external address bus A1 to A7. |
| 1          | Configures PA3 to PA5, and PB0 to PB3 as the external address bus A1 to A7. |

**Table 21.37 External Address Bus A12 to A20**

| ADRHMS2 bit | ADRHMS bit | External Address Bus A12 to A20                                                                 |
|-------------|------------|-------------------------------------------------------------------------------------------------|
| 0           | 0          | Configures P65 to P60, and P55 to P53 as the external address bus A12 to A20.                   |
| 0           | 1          | Configures P34, P35, PA6, PA7, PC1, PF1 to PF3, and PC4 as the external address bus A12 to A20. |
| 1           | X          | Configures P63 to P60, and P55 to P53 as the external address bus A12 to A18.                   |

### 21.3 How to Set the External Bus Interface

If the external bus interface is to be used, set the MPC registers according to Table 21.38 and then set the external bus enable bit (EXBE) in system control register 0 (SYSCR0) to 1.

Table 21.38 lists how to set up port pins to act as the external bus interface. For details on the relevant registers of the MPC, refer to section 21.2, Register Descriptions.

**Table 21.38 How to Set the External Bus Interface (1/3)**

| Port | Output Signal | Products with 128 Kbytes of RAM                              |                | Products with 64 Kbytes of RAM     |         |

Note 1. The 100-pin products with USB are not equipped with this pin.

Note 2. The 100-pin products without PGA pseudo differential input are not equipped with these pins.

## 21.4 Usage Notes

### 21.4.1 Procedure for Specifying Input/Output Pin Function

Use the following procedure to specify the input/output pin functions.

- (1) Clear the port mode register (PMR) for the target pin to 0 to select the general I/O port.
- (2) Specify the assignments of input/output signals for peripheral modules to the desired pins.
- (3) Enable writing to the Pmn pin function control register (PmnPFS) through the write-protect register (PWPR) setting. (m = 0 to 9, A to H, and K, n = 0 to 7)
- (4) Specify the input/output function for the pin through the PSEL[5:0] bit settings in the PmnPFS register.
- (5) Clear the PFSWE bit in the PWPR register to 0 to disable writing to the PmnPFS register.
- (6) Set the PMR to 1 as necessary to switch to the selected input/output function for the pin.

### 21.4.2 Notes on MPC Register Setting

- (1) Settings of the Pmn pin function control register (PmnPFS) should be made only while the PMR register for the target pin is set to 0. If the PmnPFS register is set while the PMR register is 1, unexpected edges may be input through the input pin or unexpected pulses are output through the output pin.
- (2) Only the allowed values (functions) should be specified in the Pmn pin function control registers. If a value that is not allowed for the register is specified, correct operation is not guaranteed.
- (3) Do not assign a single function to multiple pins through the MPC settings.
- (4) Ports 2, 4 to 6, and H also function as analog Input/output pins for the A/D converter, comparator, and D/A converter. When using these ports as analog Input/output pins, set them to general input pins by clearing the corresponding bits in the port mode register (PMR) and port direction register (PDR) to 0 and set the PmnPFS.ASEL bit to 1, to avoid degradation of accuracy.
- (5) Points to note regarding the port mode register (PMR), port direction register (PDR), and the PmnPFS register settings for pins that have multiplexed pin functions are listed in Table 21.39. The pin states are readable if the value of the ASEL bit is 0. Ensure that the PMR.Bn bit is 0 when changes to the PSEL[5:0] bits are made.

**Table 21.39 Register Settings**

| Item                      | PMR.Bn | PDR.Bn          | PmnPFS |                 |                                                      | Point to Note                                                                     |
|---------------------------|--------|-----------------|--------|-----------------|------------------------------------------------------|-----------------------------------------------------------------------------------|
|                           |        |                 | ASEL   | ISEL            | PSEL[5:0]                                            |                                                                                   |
| After a reset             | 0      | 0               | 0      | 0               | 000000b                                              | Pins function as general input port pins after release from the reset state.      |
| General input ports       | 0      | 0               | 0      | 0/1             | x                                                    | Set the PmnPFS.ISEL bit to 1 if these are multiplexed with interrupt inputs.      |
| General output ports      | 0      | 1               | 0      | 0               | x                                                    |                                                                                   |
| Peripheral functions      | 1      | x               | 0      | 0/1             | Peripheral functions (see Table 21.2 to Table 21.35) | Set the PmnPFS.ISEL bit to 1 if these are multiplexed with interrupt inputs.      |
| Interrupt inputs          | 0      | 0               | 0      | 1               | x                                                    |                                                                                   |
| NMI                       | x      | x               | x      | x <sup>*1</sup> | x                                                    | Register settings are not required.                                               |
| Analog inputs and outputs | 0      | 0               | 1      | x <sup>*1</sup> | x                                                    | Set these as general input port pins so that the output buffers are turned off.   |
| External bus              | 0      | x <sup>*2</sup> | 0      | 0               | x                                                    | Set the PMR.Bn bit to 0 and do not select the peripheral function.                |
| JTAG interface            | 0      | x               | x      | 0               | x                                                    | Set the PMR.Bn bit and the PmnPFS.ISEL bit to 0 and switch the input buffers off. |
| FINE interface            | 0      | x               | x      | 0               | x                                                    | Set the PMR.Bn bit and the PmnPFS.ISEL bit to 0 and switch the input buffers off. |
| EXTAL/XTAL                | 0      | 0               | x      | x <sup>*1</sup> | x                                                    | Set these as general input port pins so that the output buffers are turned off.   |

x: Setting not required.

0/1: Setting the PmnPFS.ISEL bit to 0 makes the pin incapable of functioning as an IRQ pin.

Setting the PmnPFS.ISEL bit to 1 makes the pin capable of functioning as an IRQ pin (if the IRQ is selected from the multiplexed functions).

Note 1. Even if the PmnPFS.ISEL bit is set to 1, the pin will not function as an IRQn input pin.

Note 2. To use the WAIT# input pin, set the corresponding bit in the PORTm.PDR register to 0.

- Note:
- The pin state is readable when the PmnPFS.ASEL bit is 0.
  - If the value of the PmnPFS.PSEL[5:0] bits is to be changed, do so while the PMR.Bn bit is 0.
  - If an RIIC function is assigned to a port pin, clear the PMR.Bn (to 0); pulling up is automatically turned off for outputs from peripheral modules other than the RIIC.
  - Do not make settings to assign multiple external bus signals to a single pin.

### 21.4.3 Notes on the Use of Analog Functions

To use an analog function, set the corresponding bits in both the port mode register (PMR) and port direction register (PDR) to 0 so that the pin acts as a general input port. After that, set the pin function select bit in the Pmn pin function control register (PmnPFS.ASEL) to 1.

### 21.4.4 Notes on Controlling the Switch to General I/O Port Pin Operation by POE3

On the generation of requests for disabling of output specified by the POE3, the pins for which the setting is 1 in the corresponding PMMCRn register (n = 0 to 3) of the POE3 are switched to general I/O port pins. Set the bits of the corresponding POE3 register (n = 0 to 3) to 0 beforehand.

### 21.4.5 Notes on Inverting Input/Output Function for the MTU and GPTW Input/Output Pins

The MTU and GPTW input/output pins shown in Table 21.40 can invert and output the signal captured by inverting the input signal when the PmnPFS.PSEL[5:0] bit for the target pins is set. Setting for switching the state between the normal input/output and the inverting input/output must be done while the PMR register for the target pins is set as 0.

**Table 21.40 MTU and GPTW Input/Output Pins (1/2)**

| Module/Function             | Channel | Normal Input/Output | Inverting Input/Output |
|-----------------------------|---------|---------------------|------------------------|
| Multi-function timer unit 3 | MTU0    | MTIOC0A             | MTIOC0A#               |
|                             |         | MTIOC0B             | MTIOC0B#               |

## 22. Multi-Function Timer Pulse Unit 3 (MTU3d)

### 22.1 Overview

This MCU has an on-chip multi-function timer pulse unit 3 (MTU3d), consisting of nine 16-bit timer channels. Table 22.1 shows the specifications of the MTU and Table 22.2 lists the functions of the MTU. Figure 22.1 and Figure 22.2 show block diagrams of the MTU.

**Table 22.1 MTU Specifications**

| Item                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

✓: Possible —: Not possible

Note 1. When LWA is 1, the TGRALW capture source can be selected from either of the following: an input from MTIOC1A or MTU0.TGRA compare match/input capture event.  
The TGRBLW capture source can be selected from any of the following: an input from MTIOC1B, MTU0.TGRC compare match/input capture event.

Note 2. Underflow is available only in complementary PWM mode.

Note 3. For details on the module stop function, refer to section 11, Low Power Consumption.

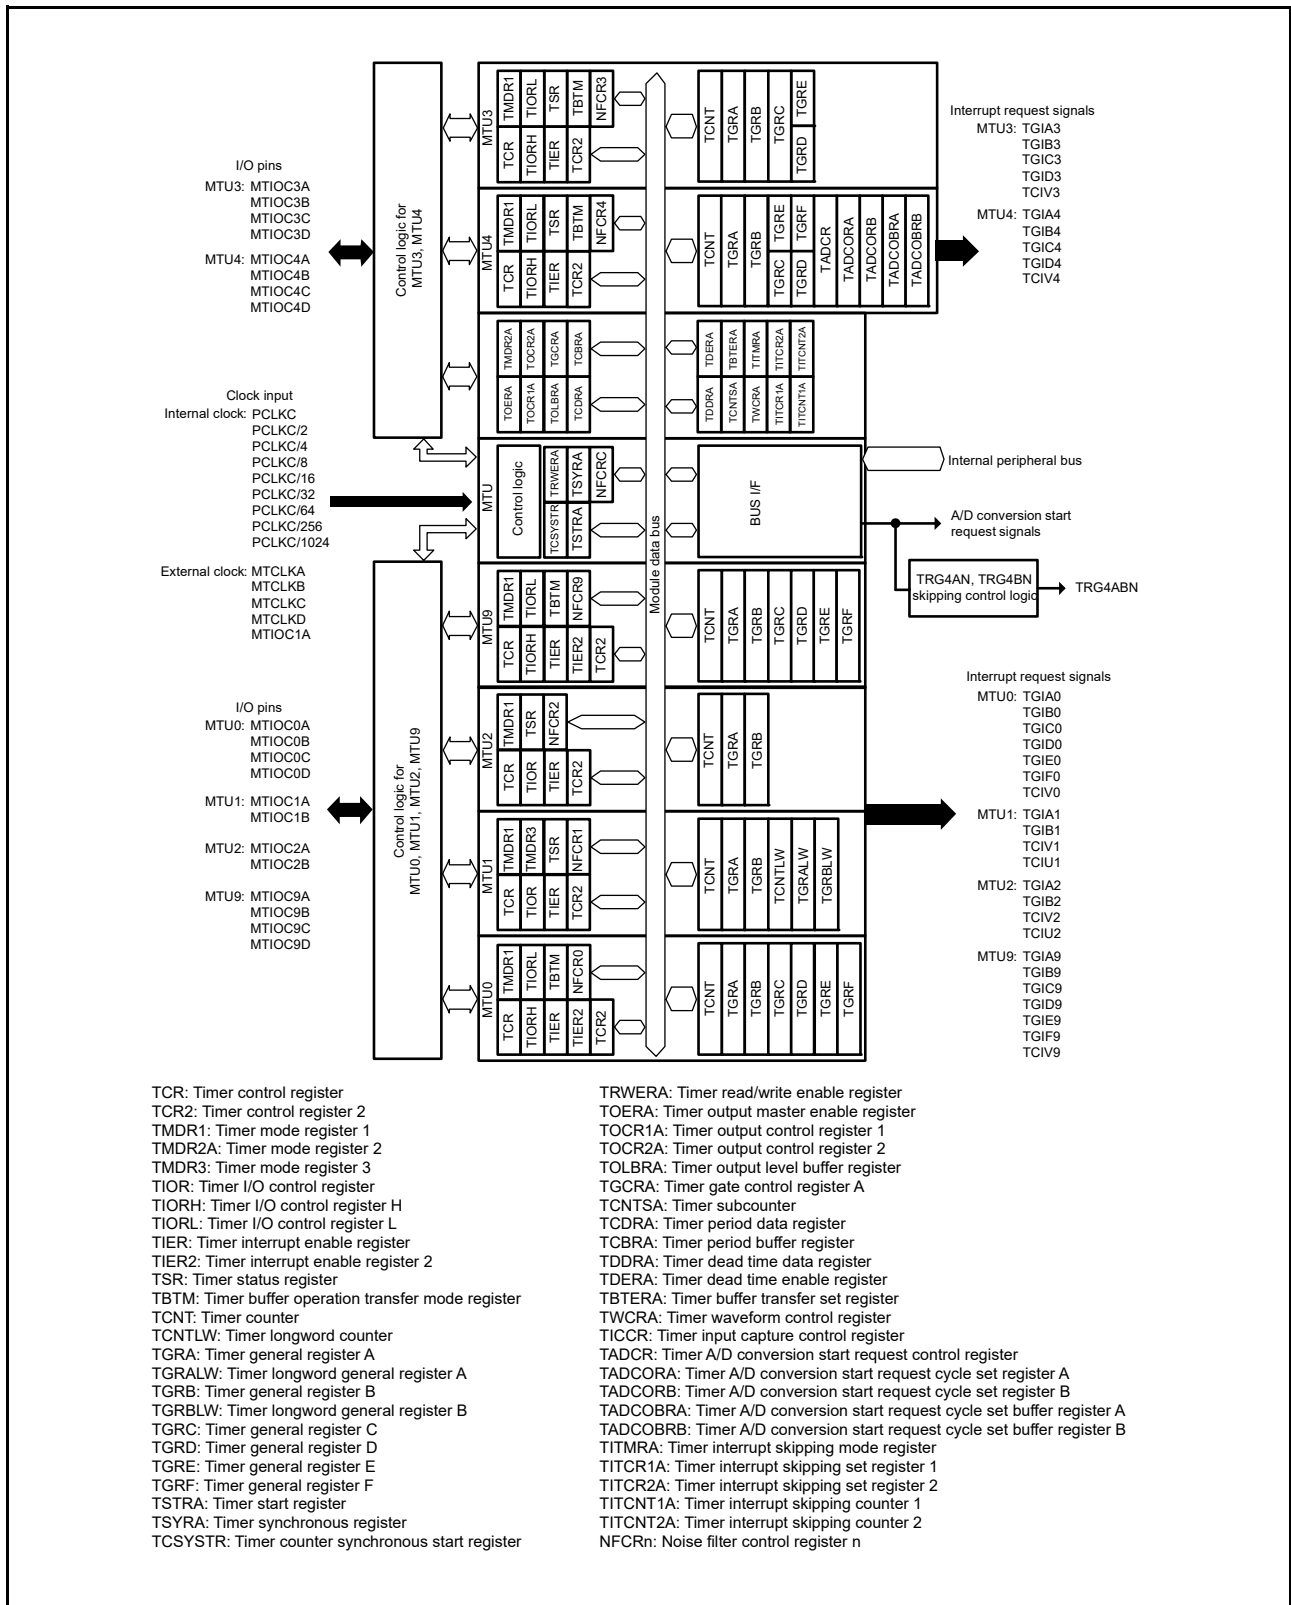

Figure 22.1 Block Diagram of MTU (MTU0 to MTU4, MTU9)

Figure 22.2 Block Diagram of MTU (MTU5 to MTU7)

Table 22.3 shows the configuration of pins for the MTU.

**Table 22.3 Pin Configuration of the MTU**

| Channel | Pin Name | I/O    | Function                                                                     |
|---------|----------|--------|------------------------------------------------------------------------------|
| MTU     | MTCLKA   | Input  | External clock A input pin (MTU1 and MTU2 phase counting mode A phase input) |
|         | MTCLKB   | Input  | External clock B input pin (MTU1 and MTU2 phase counting mode B phase input) |
|         | MTCLKC   | Input  | External clock C input pin (MTU2 phase counting mode A phase input)          |
|         | MTCLKD   | Input  | External clock D input pin (MTU2 phase counting mode B phase input)          |
|         | ADSM0    | Output | A/D conversion start request frame synchronization signal 0 output pin       |
|         | ADSM1    | Output | A/D conversion start request frame synchronization signal 1 output pin       |
| MTU0    | MTIOC0A  | I/O    | MTU0 TGRA input capture input/output compare output/PWM output pin           |
|         | MTIOC0B  | I/O    | MTU0 TGRB input capture input/output compare output/PWM output pin           |
|         | MTIOC0C  | I/O    | MTU0 TGRC input capture input/output compare output/PWM output pin           |
|         | MTIOC0D  | I/O    | MTU0 TGRD input capture input/output compare output/PWM output pin           |

## 22.2 Register Descriptions

### 22.2.1 Timer Control Register (TCR)

- MTU0.TCR, MTU1.TCR, MTU2.TCR, MTU3.TCR, MTU4.TCR, MTU6.TCR, MTU7.TCR, MTU9.TCR

Address(es): MTU0.TCR 000C 1300h, MTU1.TCR 000C 1380h, MTU2.TCR 000C 1400h, MTU3.TCR 000C 1200h, MTU4.TCR 000C 1201h, MTU6.TCR 000C 1A00h, MTU7.TCR 000C 1A01h, MTU9.TCR 000C 1580h

| Bit      | Symbol    | Bit Name                    | Description                                                                                  | R/W |
|----------|-----------|-----------------------------|----------------------------------------------------------------------------------------------|-----|
| b2 to b0 | TPSC[2:0] | Time Prescaler Select       | Refer to Table 22.6 to Table 22.9.                                                           | R/W |
| b4, b3   | CKEG[1:0] | Clock Edge Select           | b4 b3<br>0 0: Count at rising edge<br>0 1: Count at falling edge<br>1 x: Count at both edges | R/W |
| b7 to b5 | CCLR[2:0] | Counter Clear Source Select | Refer to Table 22.4 and Table 22.5.                                                          | R/W |

x: Don't care

The TCR register controls the TCNT operation for each channel in combination with the TCR2 register. The MTU has a total of 11 TCR registers, one each for MTU0 to MTU4, MTU6, MTU7, and MTU9 and three (TCRU, TCRV, and TCRW) for MTU5. TCR values should be specified only while TCNT operation is stopped.

#### TPSC[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. The count clock source can be selected independently for each channel. Refer to Table 22.6 to Table 22.9 for details.

#### CKEG[1:0] Bits (Clock Edge Select)

These bits select the clock edge, including the MTIOC1A pin. When the internal clock is counted at both edges, the count clock period is halved (e.g. PCLKC/4 at both edges = PCLKC/2 at rising edge). If phase counting mode is used on MTU1 and MTU2, the setting of these bits is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the count clock source is PCLKC/2 or slower. When PCLKC/1 or the overflow/underflow in another channel is selected for the count clock source, a value can be written to these bits but counter operation compiles with the initial value.

#### CCLR[2:0] Bits (Counter Clear Source Select)

These bits select the TCNT counter clearing source. Refer to Table 22.4 and Table 22.5 for details.

**Table 22.4 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, MTU9)**

| Channel | Bit 7   | Bit 6   | Bit 5   | Description                                                                                                 |
|---------|---------|---------|---------|-------------------------------------------------------------------------------------------------------------|
|         | CCLR[2] | CCLR[1] | CCLR[0] |                                                                                                             |
| MTU0    | 0       | 0       | 0       | TCNT clearing disabled                                                                                      |
| MTU3    | 0       | 0       | 1       | TCNT cleared by TGRA compare match/input capture                                                            |
| MTU4    | 0       | 1       | 0       | TCNT cleared by TGRB compare match/input capture                                                            |
| MTU7    | 0       | 1       | 1       | TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1 |
| MTU9    | 1       | 0       | 0       | TCNT clearing disabled                                                                                      |
|         | 1       | 0       | 1       | TCNT cleared by TGRC compare match/input capture*2                                                          |
|         | 1       | 1       | 0       | TCNT cleared by TGRD compare match/input capture*2                                                          |
|         | 1       | 1       | 1       | TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1 |

Note 1. Synchronous operation is selected by setting the TSYRA.SYNCn or TSYRB.SYNCn bit to 1

Note 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority and compare match/input capture does not occur.

**Table 22.5 CCLR[2:0] (MTU1 and MTU2)**

| Channel | Bit 7      | Bit 6   | Bit 5   | Description                                                                                                                            |
|---------|------------|---------|---------|----------------------------------------------------------------------------------------------------------------------------------------|
|         | Reserved*2 | CCLR[1] | CCLR[0] |                                                                                                                                        |
| MTU1    | 0          | 0       | 0       | TCNT clearing disabled                                                                                                                 |
| MTU2    | 0          | 0       | 1       | TCNT cleared by TGRA compare match/input capture (when LWA = 0)<br>TCNTLW cleared by TGRALW compare match/input capture (when LWA = 1) |
|         | 0          | 1       | 0       | TCNT cleared by TGRB compare match/input capture (when LWA = 0)<br>TCNTLW cleared by TGRBLW compare match/input capture (when LWA = 1) |
|         | 0          | 1       | 1       | TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1                            |

Note 1. Synchronous operation is selected by setting the TSYRA.SYNCn and TSYRB.SYNCn bits to 1.

Note 2. Bit 7 is reserved in MTU1 and MTU2. It is read as 0. The write value is ignored.

- MTU5.TCRU, MTU5.TCRV, MTU5.TCRW

Address(es): MTU5.TCRU 000C 1C84h, MTU5.TCRV 000C 1C94h, MTU5.TCRW 000C 1CA4h

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol    | Bit Name              | Description                                            | R/W |
|----------|-----------|-----------------------|--------------------------------------------------------|-----|
| b1, b0   | TPSC[1:0] | Time Prescaler Select | Refer to Table 22.10.                                  | R/W |
| b7 to b2 | —         | Reserved              | These bits are read as 0. The write value should be 0. | R/W |

### TPSC[1:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. Refer to Table 22.10 for details.

### 22.2.2 Timer Control Register 2 (TCR2)

- MTU0.TCR2, MTU3.TCR2, MTU4.TCR2, MTU6.TCR2, MTU7.TCR2, MTU9.TCR2

Address(es): MTU0.TCR2 000C 1328h, MTU3.TCR2 000C 124Ch, MTU4.TCR2 000C 124Dh, MTU6.TCR2 000C 1A4Ch, MTU7.TCR2 000C 1A4Dh, MTU9.TCR2 000C 15A8h

Value after reset: 0 0 0 0 0 0 0 0

- MTU1.TCR2, MTU2.TCR2

Address(es): MTU1.TCR2 000C 1394h, MTU2.TCR2 000C 140Ch

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol     | Bit Name                                       | Description                                                       | R/W |
|----------|------------|------------------------------------------------|-------------------------------------------------------------------|-----|
| b2 to b0 | TPSC2[2:0] | Time Prescaler Select                          | Refer to Table 22.6 to Table 22.9.                                | R/W |
| b4, b3   | PCB[1:0]   | Phase Counting Mode Function Expansion Control | Functional Expansion Control for Phase Counting Modes 2, 3, and 5 | R/W |
| b7 to b5 | —          | Reserved                                       | These bits are read as 0. The write value should be 0.            | R/W |

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. The MTU has a total of 11 TCR2 registers, one each for MTU0 to MTU4, MTU6, MTU7, and MTU9 and three (TCR2U, TCR2V, and TCR2W) for MTU5. TCR2 values should be specified only while TCNT operation is stopped.

#### TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. The count clock source can be selected independently for each channel. Refer to Table 22.6 to Table 22.9 for details.

#### PCB[1:0] Bits (Phase Counting Mode Function Expansion Control)

These bits control extended functions for phase counting mode 2, 3, and 5 in MTU1 and MTU2. Refer to section 22.3.6, Phase Counting Mode.

- MTU5.TCR2U, MTU5.TCR2V, MTU5.TCR2W

Address(es): MTU5.TCR2U 000C 1C85h, MTU5.TCR2V 000C 1C95h, MTU5.TCR2W 000C 1CA5h

| Bit      | Symbol     | Bit Name              | Description                                                                                                | R/W |
|----------|------------|-----------------------|------------------------------------------------------------------------------------------------------------|-----|
| b2 to b0 | TPSC2[2:0] | Time Prescaler Select | Refer to Table 22.10.                                                                                      | R/W |
| b4, b3   | CKEG[1:0]  | Clock Edge Select     | b4 b3<br>0 0: Counts at the rising edge.<br>0 1: Counts at the falling edge.<br>1 x: Counts at both edges. | R/W |
| b7 to b5 | —          | Reserved              | These bits are read as 0. The write value should be 0.                                                     | R/W |

x: Don't care

### TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. Refer to Table 22.10 for details.

### CKEG[1:0] Bits (Clock Edge Select)

These bits select the edge of the count clock signal input from the MTIOC1A pin.

**Table 22.6 TPSC[2:0], TPSC2[2:0] (MTU0 and MTU9)**

| Channel | TCR2 register |          |          | TCR register |         |         | Description                                 |
|---------|---------------|----------|----------|--------------|---------|---------|---------------------------------------------|
|         | Bit 2         | Bit 1    | Bit 0    | Bit 2        | Bit 1   | Bit 0   |                                             |
| MTU0    | TPSC2[2]      | TPSC2[1] | TPSC2[0] | TPSC[2]      | TPSC[1] | TPSC[0] | Internal clock: counts on PCLKC/1           |
| MTU9    | 0             | 0        | 0        | 0            | 0       | 0       | Internal clock: counts on PCLKC/4           |
|         | 0             | 0        | 0        | 0            | 1       | 0       | Internal clock: counts on PCLKC/16          |
|         | 0             | 0        | 0        | 0            | 1       | 1       | Internal clock: counts on PCLKC/64          |
|         | 0             | 0        | 0        | 1            | 0       | 0       | External clock: counts on MTCLKA pin input  |
|         | 0             | 0        | 0        | 1            | 0       | 1       | External clock: counts on MTCLKB pin input  |
|         | 0             | 0        | 0        | 1            | 1       | 0       | External clock: counts on MTCLKC pin input  |
|         | 0             | 0        | 0        | 1            | 1       | 1       | External clock: counts on MTCLKD pin input  |
|         | 0             | 0        | 1        | x            | x       | x       | Internal clock: counts on PCLKC/2           |
|         | 0             | 1        | 0        | x            | x       | x       | Internal clock: counts on PCLKC/8           |
|         | 0             | 1        | 1        | x            | x       | x       | Internal clock: counts on PCLKC/32          |
|         | 1             | 0        | 0        | x            | x       | x       | Internal clock: counts on PCLKC/256         |
|         | 1             | 0        | 1        | x            | x       | x       | Internal clock: counts on PCLKC/1024        |
|         | 1             | 1        | 0        | x            | x       | x       | Setting prohibited                          |

| b7       | —       | Reserved           | This bit is read as 0. The write value should be 0.                                                                                                                    | R/W |

The TMDR1 register specifies the operating mode of each channel. The MTU has a total of eight TMDR1 registers, one each for MTU0 to MTU4, MTU6, MTU7, and MTU9. TMDR1 register values should be specified only while TCNT operation is stopped.

**Table 22.11 Operating Mode Setting by MD[3:0] Bits (MTU0 to MTU4, MTU6, MTU7, and MTU9)**

| Bit 3 | Bit 2 | Bit 1 | Bit 0 |                                                           | MTU0 | MTU1 | MTU2 | MTU1 & MTU2<br>(LWA = 1) | MTU3 | MTU4 | MTU6 | MTU7 | MTU9 |

| 1     | 1     | 1     | 1     | Complementary PWM mode 3 (transfer at crest and trough)*1 |      |      |      |                          | ✓    |      | ✓    |      |      |

x: Don't care

Note: Only set the corresponding operating mode listed above for each channel.

Note 1. Reset-synchronized PWM mode and complementary PWM mode can only be set for MTU3 and MTU6.

When MTU3 or MTU6 is set to reset-synchronized PWM mode or complementary PWM mode, the MTU4 or MTU7 settings become ineffective and automatically conform to the MTU3 or MTU6 setting, respectively. MTU4 and MTU7 should be set to the initial values (normal mode).

### BFA Bit (Buffer Operation A)

This bit specifies whether to operate TGRA in the normal way or to use TGRA and TGRC together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRC occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIEC bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFA bit of MTU3.TMDR1 (MTU6.TMDR1). The BFA bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRC, this bit is reserved. It is read as 0. The write value should be 0.

Refer to Figure 22.49 for an illustration of the Tb interval in complementary PWM mode.

### BFB Bit (Buffer Operation B)

This bit specifies whether to operate TGRB in the normal way or to use TGRB and TGRD together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRD occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIED bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFB bit of MTU3.TMDR1 (MTU6.TMDR1). The BFB bit of MTU4.TMDR1

(MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRD, this bit is reserved. It is read as 0. The write value should be 0. Refer to Figure 22.49 for an illustration of the Tb interval in complementary PWM mode.

### BFE Bit (Buffer Operation E)

This bit specifies whether to operate MTU0.TGRE and MTU0.TGRF, and MTU9.TGRE and MTU9.TGRF in the normal way or to use them together for buffer operation. Compare match with TGRF occurs even when TGRF is used as a buffer register.

In MTU0 to MTU4, MTU6, MTU7, this bit is reserved. It is read as 0. The write value should be 0.

## 22.2.4 Timer Mode Register 2m (TMDR2m) (m = A, B)

Address(es): MTU.TMDR2A 000C 1270h, MTU.TMDR2B 000C 1A70h

| Bit      | Symbol | Bit Name             | Description                                                                   | R/W |
|----------|--------|----------------------|-------------------------------------------------------------------------------|-----|
| b0       | DRS    | Double Buffer Select | 0: Double buffer function is disabled<br>1: Double buffer function is enabled | R/W |
| b7 to b1 | —      | Reserved             | These bits are read as 0. The write value should be 0.                        | R/W |

TMDR2A and TMDR2B specify the double buffer function in complementary PWM mode 3 (transfer at the crest and trough of the counter value). The MTU has two TMDR2m registers: one each for MTU3 (TMDR2A) and MTU6 (TMDR2B). TMDR2A and TMDR2B values should be specified only while TCNT operation is stopped.

### DRS Bit (Double Buffer Select)

This bit enables or disables the double buffer function in complementary PWM mode.

## 22.2.5 Timer Mode Register 3 (TMDR3)

Address(es): MTU1.TMDR3 000C 1391h

| Bit      | Symbol  | Bit Name                                      | Description                                                                                                                        | R/W |
|----------|---------|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|-----|
| b0       | LWA     | MTU1/MTU2 Combination Longword Access Control | 0: 16-bit access is enabled.<br>1: 32-bit access is enabled.                                                                       | R/W |
| b1       | PHCKSEL | External Input Phase Clock Select             | 0: MTCLKA and MTCLKB are selected for the external phase clock.<br>1: MTCLKC and MTCLKD are selected for the external phase clock. | R/W |
| b7 to b2 | —       | Reserved                                      | These bits are read as 0. The write value should be 0.                                                                             | R/W |

The TMDR3 register controls longword access to a 32-bit register or counter in a combination of MTU1 and MTU2. There is only one TMDR3 register in MTU1. The counter (TCNTLW), general register A (TGRALW), and general register B (TGRBLW) of MTU1 and MTU2 are accessed in the combinations listed in Table 22.12.

### LWA Bit (MTU1/MTU2 Combination Longword Access Control)

This bit selects a 32-bit access in a combination of MTU1 and MTU2.

When LWA is set to 0, the MTU1 and MTU2 independently operate as a 16-bit timer. therefore registers TCNTLW, TGRALW, and TGRBLW cannot be accessed.

When LWA is set to 1, MTU1 and MTU2 operate as a 32-bit cascaded timer and the timer is controlled by registers MTU1.TCR, MTU1.TCR2, MTU1.TIOR, and MTU1.TMDR1. The settings of registers MTU2.TCR, MTU2.TCR2, MTU2.TIOR, and MTU2.TMDR1 are disabled and the 16-bit registers (TCNT, TGRA, and TGRB) in MTU1 and MTU2 cannot be accessed. Furthermore, MTU2 input capture and compare match are also disabled, which in turn disables any linked operation with the ELC.

The cascaded connection of MTU1 and MTU2 with the LWA bit set to 1 can only be used in phase counting mode, but not in normal mode, PWM1 mode, or PWM2 mode. Select phase counting mode when setting the LWA bit to 1.

Initialize the registers TCNT, TGRA, and TGRB in MTU1 and MTU2 in advance before setting the LWA bit to 1.

### PHCKSEL Bit (External Input Phase Clock Select)

When the MTU1 and MTU2 registers are combined for 32-bit phase counting mode or MTU2 phase counting mode, this bit selects either the A- or B-phase signal from the external clock. Refer to Table 22.66, Clock Input Pins in Phase Counting Mode for details.

**Table 22.12 Setting and Combination of the TMDR3 Register**

| Register                   | TMDR3.LWA = 0 |             | TMDR3.LWA = 1 |             |
|----------------------------|---------------|-------------|---------------|-------------|
|                            | Symbol        | Access mode | Symbol        | Access mode |
| Counter in MTU1*1          | MTU1.TCNT     | Word        | MTU1.TCNTLW   | Longword    |
| Counter in MTU2            | MTU2.TCNT     | Word        |               |             |
| General register A in MTU1 | MTU1.TGRA     | Word        | MTU1.TGRALW   | Longword    |
| General register A in MTU2 | MTU2.TGRA     | Word        |               |             |
| General register B in MTU1 | MTU1.TGRB     | Word        | MTU1.TGRBLW   | Longword    |
| General register B in MTU2 | MTU2.TGRB     | Word        |               |             |

Note 1. When the LWA bit is set to 1, setting the count clock for MTU1 as MTU2.TCNT overflow/underflow is not required.

### 22.2.6 Timer I/O Control Register (TIOR)

- MTU0.TIORH, MTU1.TIOR, MTU2.TIOR, MTU3.TIORH, MTU4.TIORH, MTU6.TIORH, MTU7.TIORH, MTU9.TIORH

Address(es): MTU0.TIORH 000C 1302h, MTU1.TIOR 000C 1382h, MTU2.TIOR 000C 1402h, MTU3.TIORH 000C 1204h, MTU4.TIORH 000C 1206h, MTU6.TIORH 000C 1A04h, MTU7.TIORH 000C 1A06h, MTU9.TIORH 000C 1582h

| Bit      | Symbol   | Bit Name        | Description                                                                                                                                                                                                                                          | R/W |
|----------|----------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

Note 1. When the value of IOm[3:0] (m = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

- MTU5.TIORU, MTU5.TIORV, MTU5.TIORW

Address(es): MTU5.TIORU 000C 1C86h, MTU5.TIORV 000C 1C96h, MTU5.TIORW 000C 1CA6h

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol   | Bit Name      | Description                                                                      | R/W |
|----------|----------|---------------|----------------------------------------------------------------------------------|-----|
| b4 to b0 | IOC[4:0] | I/O Control C | Refer to the following table.<br>MTU5.TIORU, MTU5.TIORV, MTU5.TIORW: Table 22.41 | R/W |
| b7 to b5 | —        | Reserved      | These bits are read as 0. The write value should be 0.                           | R/W |

The TIOR register controls the TGRm register. The MTU has a total of 17 TIOR registers, two each for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU9, one each for MTU1 and MTU2, and three (MTU5.TIORU/TIORV/TIORW) for MTU5. The TIOR register should be set when the TMDR register setting is normal mode, PWM mode, or phase counting mode.

Note that TIOR is affected by the TMDR1 setting.

The initial output specified by TIOR is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). Note also that, in PWM mode 2, the output at the point at which the counter becomes 0000h is specified.

When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

Table 22.13 TIORH (MTU0)

x: Don't care

Note 1. Set the IOC[4:0] bits to 19h, 1Ah, 1Bh, 1Dh, 1Eh, or 1Fh only when using external pulse width measurement or only when using dead time compensation linked with MTU6 and MTU7. For details, refer to section 22.3.11, External Pulse Width Measurement and section 22.3.12, Dead Time Compensation.

### 22.2.7 Timer Compare Match Clear Register (TCNTCMPCLR)

Address(es): MTU5.TCNTCMPCLR 000C 1CB6h

| Bit      | Symbol   | Bit Name              | Description                                                                                                                                                                                                         | R/W |

| b6  | TTGE2  | A/D Conversion Start Request Enable 2 | 0: A/D conversion start request generation by MTUn.TCNT underflow (trough) disabled<br>1: A/D conversion start request generation by MTUn.TCNT underflow (trough) enabled | R/W |
| b7  | TTGE   | A/D Conversion Start Request Enable   | 0: A/D conversion start request generation disabled<br>1: A/D conversion start request generation enabled                                                                 | R/W |

n = 4, 7

The TIER register enables or disables interrupt requests from each channel. The MTU has a total of eleven TIER registers, two for MTU0 and MTU9 and one each for MTU1 to MTU7.

**TGIEA and TGIEB Bits (TGR Interrupt Enable A and B)**

Each bit enables or disables interrupt requests (TGIm) (m = A, B).

**TGIEC and TGIED Bits (TGR Interrupt Enable C and D)**

Each bit enables or disables an interrupt request (TGIm) (m = C, D).

In MTU1 and MTU2, these bits are reserved. They are read as 0. The write value should be 0.

**TCIEV Bit (Overflow Interrupt Enable)**

This bit enables or disables interrupt requests (TCIV).

**TCIEU Bit (Underflow Interrupt Enable)**

This bit enables or disables interrupt requests (TCIU).

In MTU0, MTU3, MTU4, MTU6, MTU7, and MTU9, this bit is reserved. It is read as 0. The write value should be 0.

**TTGE2 Bit (A/D Conversion Start Request Enable 2)**

This bit enables or disables generation of A/D conversion start requests by MTUn.TCNT underflow (trough) in complementary PWM mode (n = 4, 7).

In MTU0 to MTU3, MTU6, and MTU9, this bit is reserved. It is read as 0. The write value should be 0.

**TTGE Bit (A/D Conversion Start Request Enable)**

This bit enables or disables generation of A/D conversion start requests by TGRA input capture/compare match.

| b7       | TTGE2  | A/D Conversion Start Request Enable 2 | 0: A/D conversion start request generation by compare match between MTU0.TCNT and MTU0.TGRE, and MTU9.TCNT and MTU9.TGRE disabled<br>1: A/D conversion start request generation by compare match between MTU0.TCNT and MTU0.TGRE, and MTU9.TCNT and MTU9.TGRE enabled | R/W |

**TGIEE and TGIEF Bits (TGR Interrupt Enable E and F)**

Each bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRm, and MTU9.TCNT and MTU9.TGRm (m = E, F).

**TTGE2 Bit (A/D Conversion Start Request Enable 2)**

Each bit enables or disables A/D conversion start requests by compare match between MTU0.TCNT and MTU0.TGRE, and MTU9.TCNT and MTU9.TGRE.

|----------|--------|----------------------|-----------------------------------------------------------|-----|
| b5 to b0 | —      | Reserved             | The read value is undefined. The write value should be 1. | R/W |
| b6       | —      | Reserved             | This bit is read as 1. The write value should be 1.       | R/W |
| b7       | TCFD   | Count Direction Flag | 0: TCNT counts down<br>1: TCNT counts up                  | R   |

TSR indicates the states of each of the channels. The MTU has a total of six TSR registers, one each for MTU1 to MTU4, MTU6, and MTU7.

#### TCFD Flag (Count Direction Flag)

Status flag that indicates the direction in which TCNT is counting in MTU1 to MTU4, MTU6, and MTU7.

### 22.2.10 Timer Buffer Operation Transfer Mode Register (TBTM)

- MTU0.TBTM, MTU9.TBTM

| b2       | TTSE   | Timing Select E | 0: When compare match E occurs in MTU0 or MTU9, data is transferred from MTU0.TGRF to MTU0.TGRE or MTU9.TGRF to MTU9.TGRE<br>1: When MTU0.TCNT or MTU9.TCNT is cleared, data is transferred from MTU0.TGRF to MTU0.TGRE or MTU9.TGRF to MTU9.TGRE | R/W |
| b7 to b3 | —      | Reserved        | These bits are read as 0. The write value should be 0.                                                                                                                                                                                            | R/W |

TBTM specifies the timing for transferring data from the buffer register to the timer general register in PWM mode. The MTU has a total of six TBTM registers, one each for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU9.

#### TTSA Bit (Timing Select A)

This bit specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSA bit in the channel to 1.

#### TTSB Bit (Timing Select B)

This bit specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSB bit in the channel to 1.

#### TTSE Bit (Timing Select E)

This bit specifies the timing for transferring data from MTU0.TGRF to MTU0.TGRE or MTU9.TGRF to MTU9.TGRE when they are used together for buffer operation.

In MTU3, MTU4, MTU6, and MTU7, this bit is reserved. It is read as 0 and the write value should be 0. When a channel is not set to PWM mode, do not set the TTSE bit in the channel to 1.

### 22.2.11 Timer Input Capture Control Register (TICCR)

Address(es): MTU1.TICCR 000C 1390h

|    |    |    |    |      |      |      |      |

| b3       | I2BE   | Input Capture Enable | 0: Does not include the MTIOC2B pin in the MTU1.TGRB input capture conditions<br>1: Includes the MTIOC2B pin in the MTU1.TGRB input capture conditions | R/W |
| b7 to b4 | —      | Reserved             | These bits are read as 0. The write value should be 0.                                                                                                 | R/W |

TICCR specifies input capture conditions when MTU1.TCNT and MTU2.TCNT are cascaded. The MTU has one TICCR for MTU1.

## 22.2.12 Timer Synchronous Clear Register (TSYCR)

Address(es): MTU6.TSYCR 000C 1A50h

|                    | b7   | b6   | b5   | b4   | b3   | b2   | b1   | b0   |

| b7  | CE0A   | Clear Enable 0A | 0: Disables counter clearing by the MTU0.TGIA0 interrupt generation timing* <sup>1</sup> .<br>1: Enables counter clearing by the MTU0.TGIA0 interrupt generation timing* <sup>1</sup> . | R/W |

Note 1. This does not depend on the TIERn.TGIEm bit setting. (n = 0, 1, 2; m = A, B, C, D)

TSYCR specifies synchronous clear conditions for MTU6.TCNT and MTU7.TCNT. The MTU has one TSYCR for MTU1.

### CE<sub>n</sub>m Bits (Clear Enable nm; n = 0, 1, 2; m = A, B, C, D)

These bits enable or disable counter clearing by the MTU<sub>n</sub>.TGI<sub>m</sub>n interrupt generation timing.

### 22.2.13 Timer Counter (TCNT)

Address(es): MTU0.TCNT 000C 1306h, MTU1.TCNT 000C 1386h, MTU2.TCNT 000C 1406h, MTU3.TCNT 000C 1210h, MTU4.TCNT 000C 1212h, MTU5.TCNTU 000C 1C80h, MTU5.TCNTV 000C 1C90h, MTU5.TCNTW 000C 1CA0h, MTU6.TCNT 000C 1A10h, MTU7.TCNT 000C 1A12h, MTU9.TCNT 000C 1586h

Note: TCNT must not be accessed in 8 bits; it should be accessed in 16 bits.

TCNT is a 16-bit readable/writable counter. The MTU has a total of 11 TCNT counters, one each for MTU0 to MTU4, MTU6, MTU7, and MTU9 and three (MTU5.TCNTU, TCNTV, and TCNTW) for MTU5. The TCNT counters in MTU0 to MTU4, MTU6, MTU7, and MTU9 are initialized to 0000h by a reset. MTU5.TCNTU, MTU5.TCNTV, and MTU5.TCNTW are initialized to 0000h by a reset.

In MTU0 to MTU4, MTU6, MTU7, and MTU9, the TCNT counters must not be accessed in 8-bit units; they should be accessed in 16-bit units.

The MTU1.TCNT and MTU2.TCNT counters are read as 0000h when TMDR3.LWA is 1. Refer to section 22.2.5, Timer Mode Register 3 (TMDR3) for details.

### 22.2.14 Timer Longword Counter (TCNTLW)

Address(es): MTU1.TCNTLW 000C 13A0h

Note: TCNTLW must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The TCNTLW counter is a 32-bit readable/writable counter. Only one counter of this type is provided, and is formed by combining MTU1.TCNT and MTU2.TCNT. Such operation is only effective when TMDR3.LWA is 1. The TCNTLW counter is initialized to 0000 0000h by a reset. This counter is read as 0000 0000h when TMDR3.LWA is 0. Refer to section 22.2.5, Timer Mode Register 3 (TMDR3) for details. This register can only be used in 32-bit phase counting mode.

## 22.2.15 Timer General Register m (TGRm) (m = A, B, C, D, E, F, U, V, W)

Address(es): MTU0.TGRA 000C 1308h, MTU0.TGRB 000C 130Ah, MTU0.TGRC 000C 130Ch, MTU0.TGRD 000C 130Eh, MTU0.TGRE 000C 1320h, MTU0.TGRF 000C 1322h, MTU1.TGRA 000C 1388h, MTU1.TGRB 000C 138Ah, MTU2.TGRA 000C 1408h, MTU2.TGRB 000C 140Ah, MTU3.TGRA 000C 1218h, MTU3.TGRB 000C 121Ah, MTU3.TGRC 000C 1224h, MTU3.TGRD 000C 1226h, MTU3.TGRE 000C 1272h, MTU4.TGRA 000C 121Ch, MTU4.TGRB 000C 121Eh, MTU4.TGRC 000C 1228h, MTU4.TGRD 000C 122Ah, MTU4.TGRE 000C 1274h, MTU4.TGRF 000C 1276h, MTU5.TGRU 000C 1C82h, MTU5.TGRV 000C 1C92h, MTU5.TGRW 000C 1CA2h, MTU6.TGRA 000C 1A18h, MTU6.TGRB 000C 1A1Ah, MTU6.TGRC 000C 1A24h, MTU6.TGRD 000C 1A26h, MTU6.TGRE 000C 1A72h, MTU7.TGRA 000C 1A1Ch, MTU7.TGRB 000C 1A1Eh, MTU7.TGRC 000C 1A28h, MTU7.TGRD 000C 1A2Ah, MTU7.TGRE 000C 1A74h, MTU7.TGRF 000C 1A76h, MTU9.TGRA 000C 1588h, MTU9.TGRB 000C 158Ah, MTU9.TGRC 000C 158Ch, MTU9.TGRD 000C 158Eh, MTU9.TGRE 000C 15A0h, MTU9.TGRF 000C 15A2h

Note: The TGRm registers must not be accessed in 8 bits; They should be accessed in 16 bits. The initial value of the TGRm register is FFFFh.

The TGRm register is 16-bit readable/writable register. The MTU has a total of 41 TGRm registers, six for MTU0 and MTU9, two each for MTU1 and MTU2, five each for MTU3 and MTU6, six each for MTU4 and MTU7, and three for MTU5.

The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU9 can also be designated for operation as buffer registers. TGRm buffer register combinations are TGRA and TGRC, and TGRB and TGRD.

MTU0.TGRE and MTU0.TGRF, and MTU9.TGRE and MTU9.TGRF function as compare registers. When the MTU0.TCNT count matches the MTU0.TGRE value or the MTU9.TCNT count matches the MTU9.TGRE value, an A/D conversion start request can be issued. The TGRF register can also be designated for operation as a buffer register. TGRm buffer register combination is TGRE and TGRF. MTU5.TGRU, MTU5.TGRV, and MTU5.TGRW function as compare match, input capture, or external pulse width measurement registers.

The MTU1.TGRA, MTU2.TGRA, MTU1.TGRB, and MTU2.TGRB registers are read as 0000h when TMDR3.LWA is 1. Refer to section 22.2.5, Timer Mode Register 3 (TMDR3) for details.

### 22.2.16 Timer Longword General Register m (TGRmLW) (m = A, B)

Address(es): MTU1.TGRALW 000C 13A4h, MTU1.TGRBLW 000C 13A8h

Note: TGRALW and TGRBLW must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The TGRmLW register is a 32-bit readable/writable register. Two general registers of this type are provided, and are formed by combining MTU1.TGRm and MTU2.TGRm. Such operation is only effective when TMDR3.LWA is 1. The TGRmLW register is initialized to FFFF FFFFh by a reset, but it is read as 0000 0000h when TMDR3.LWA is 0. Refer to section 22.2.5, Timer Mode Register 3 (TMDR3) for details.

The TGRALW and TGRBLW registers function as compare match or input capture registers which can only be used in 32-bit phase counting mode.

### 22.2.17 Timer Start Registers (TSTRA, TSTRB, TSTR)

- MTU.TSTRA (for MTU0, MTU1, MTU2, MTU3, MTU4, and MTU9)

Address(es): MTU.TSTRA 000C 1280h

|      |      |    |      |    |      |      |      |
|------|------|----|------|----|------|------|------|
| b7   | b6   | b5 | b4   | b3 | b2   | b1   | b0   |
| CST4 | CST3 | —  | CST9 | —  | CST2 | CST1 | CST0 |

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Bit Name        | Description                                                               | R/W |
|-----|--------|-----------------|---------------------------------------------------------------------------|-----|
| b0  | CST0   | Counter Start 0 | 0: MTU0.TCNT counting is stopped<br>1: MTU0.TCNT performs count operation | R/W |
| b1  | CST1   | Counter Start 1 | 0: MTU1.TCNT counting is stopped<br>1: MTU1.TCNT performs count operation | R/W |
| b2  | CST2   | Counter Start 2 | 0: MTU2.TCNT counting is stopped<br>1: MTU2.TCNT performs count operation | R/W |
| b3  | —      | Reserved        | This bit is read as 0. The write value should be 0.                       | R/W |
| b4  | CST9   | Counter start 9 | 0: MTU9.TCNT counting is stopped<br>1: MTU9.TCNT performs count operation | R/W |
| b5  | —      | Reserved        | This bit is read as 0. The write value should be 0.                       | R/W |
| b6  | CST3   | Counter Start 3 | 0: MTU3.TCNT counting is stopped<br>1: MTU3.TCNT performs count operation | R/W |
| b7  | CST4   | Counter Start 4 | 0: MTU4.TCNT counting is stopped<br>1: MTU4.TCNT performs count operation | R/W |

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRA is also set to 1 automatically.

The TSTRA register starts or stops TCNT operation in MTU0 to MTU4 and MTU9.

TSTRB starts or stops TCNT operation in MTU6 and MTU7.

TSTR starts or stops TCNT operation in MTU5.

Before setting the operating mode in TMDR1 or setting the TCNT count clock in TCR, be sure to stop the TCNT counter.

#### CSTn Bits (Counter Start n) (n = 0, 1, 2, 3, 4, 9)

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. At this time, initial output level specified in the TOCR1A or TOCR2A register is output from the MTIOC pin in complementary PWM mode or reset-synchronized PWM mode. In any mode other than complementary PWM mode and reset synchronous PWM mode, the output compare signal level from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the pin output level will be changed to the specified initial output value.

- MTU.TSTRB (for MTU6 and MTU7)

Address(es): MTU.TSTRB 000C 1A80h

|      |      |    |    |    |    |    |    |
|------|------|----|----|----|----|----|----|
| b7   | b6   | b5 | b4 | b3 | b2 | b1 | b0 |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit Name        | Description                                                               | R/W |
|----------|--------|-----------------|---------------------------------------------------------------------------|-----|
| b5 to b0 | —      | Reserved        | These bits are read as 0. The write value should be 0.                    | R/W |
| b6       | CST6   | Counter Start 6 | 0: MTU6.TCNT counting is stopped<br>1: MTU6.TCNT performs count operation | R/W |
| b7       | CST7   | Counter Start 7 | 0: MTU7.TCNT counting is stopped<br>1: MTU7.TCNT performs count operation | R/W |

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRB is also set to 1 automatically.

### CSTn Bits (Counter Start n) (n = 6, 7)

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. At this time the MTIOC pin output the initial output level set in the TOCR1B or TOCR2B register in complementary PWM mode or reset-synchronized PWM mode, but the output compare signal level from the MTIOC pin is retained in the other modes. If TIOR is written to while the CSTn bit is 0, the pin output level will be changed to the specified initial output value.

- MTU5.TSTR

Address(es): MTU5.TSTR 000C 1CB4h

TSYRA selects independent operation or synchronous operation of TCNT in MTU0 to MTU4 and MTU9.

TSYRB selects independent operation or synchronous operation of TCNT in MTU6 and MTU7.

A channel performs synchronous operation when the corresponding bit in TSYR is set to 1.

### SYNCn Bits (Timer Synchronous Operation n) (n = 0, 1, 2, 3, 4, 9)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of the TCR.CCLR[2:0] bits.

- MTU.TSYRB (for MTU6 and MTU7)

### SYNCn Bits (Timer Synchronous Operation n) (n = 6, 7)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits TCR.CCLR[2:0].

## 22.2.19 Timer Counter Synchronous Start Register (TCSYSTR)

Address(es): MTU.TCSYSTR 000C 1282h

|                    |      |      |      |      |      |      |      |      |

|-----|--------|---------------------|-----------------------------------------------------------------------------------------------------|---------|
| b0  | SCH7   | Synchronous Start 7 | 0: Does not specify synchronous start for MTU7.TCNT<br>1: Specifies synchronous start for MTU7.TCNT | R/(W)*1 |
| b1  | SCH6   | Synchronous Start 6 | 0: Does not specify synchronous start for MTU6.TCNT<br>1: Specifies synchronous start for MTU6.TCNT | R/(W)*1 |
| b2  | SCH9   | Synchronous Start 9 | 0: Does not specify synchronous start for MTU9.TCNT<br>1: Specifies synchronous start for MTU9.TCNT | R/(W)*1 |
| b3  | SCH4   | Synchronous Start 4 | 0: Does not specify synchronous start for MTU4.TCNT<br>1: Specifies synchronous start for MTU4.TCNT | R/(W)*1 |
| b4  | SCH3   | Synchronous Start 3 | 0: Does not specify synchronous start for MTU3.TCNT<br>1: Specifies synchronous start for MTU3.TCNT | R/(W)*1 |
| b5  | SCH2   | Synchronous Start 2 | 0: Does not specify synchronous start for MTU2.TCNT<br>1: Specifies synchronous start for MTU2.TCNT | R/(W)*1 |
| b6  | SCH1   | Synchronous Start 1 | 0: Does not specify synchronous start for MTU1.TCNT<br>1: Specifies synchronous start for MTU1.TCNT | R/(W)*1 |
| b7  | SCH0   | Synchronous Start 0 | 0: Does not specify synchronous start for MTU0.TCNT<br>1: Specifies synchronous start for MTU0.TCNT | R/(W)*1 |

Note 1. Only 1 can be written to this bit. This bit is automatically cleared when the corresponding counter starts.

TCSYSTR specifies synchronous start of the counters.

### SCH7 Bit (Synchronous Start 7)

This bit controls synchronous start of MTU7.TCNT.

[Clearing condition]

- When 1 is set to the TSTRB.CST7 bit while SCH7 = 1

### SCH6 Bit (Synchronous Start 6)

This bit controls synchronous start of MTU6.TCNT.

[Clearing condition]

- When 1 is set to the TSTRB.CST6 bit while SCH6 = 1

### SCH9 Bit (Synchronous Start 9)

This bit controls synchronous start of MTU9.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST9 bit while SCH9 = 1

### SCH4 Bit (Synchronous Start 4)

This bit controls synchronous start of MTU4.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST4 bit while SCH4 = 1

**SCH3 Bit (Synchronous Start 3)**

This bit controls synchronous start of MTU3.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST3 bit while SCH3 = 1

**SCH2 Bit (Synchronous Start 2)**

This bit controls synchronous start of MTU2.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST2 bit while SCH2 = 1

**SCH1 Bit (Synchronous Start 1)**

This bit controls synchronous start of MTU1.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST1 bit while SCH1 = 1

**SCH0 Bit (Synchronous Start 0)**

This bit controls synchronous start of MTU0.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST0 bit while SCH0 = 1

## 22.2.20 Timer Read/Write Enable Register m (TRWERm) (m = A, B)

Address(es): MTU.TRWERA 000C 1284h, MTU.TRWERB 000C 1A84h

| Bit      | Symbol | Bit Name          | Description                                                                                           | R/W |
|----------|--------|-------------------|-------------------------------------------------------------------------------------------------------|-----|
| b0       | RWE    | Read/Write Enable | 0: Read/write access to the registers is disabled<br>1: Read/write access to the registers is enabled | R/W |
| b7 to b1 | —      | Reserved          | These bits are read as 0. The write value should be 0.                                                | R/W |

TRWERA enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU3 and MTU4.

TRWERB enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU6 and MTU7.

### RWE Bit (Read/Write Enable)

This bit enables or disables access to the registers that have write-protection capability against accidental modification. [Clearing condition]

- When 0 is written to the RWE bit after reading RWE = 1
- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERA)  
24 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, MTU.TOERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA, and MTUn.TCNT (n = 3, 4)
- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERB)  
24 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TGCRB, MTU.TCDRB, MTU.TDDRB, and MTUn.TCNT (n = 6, 7)

### 22.2.21 Timer Output Master Enable Register m (TOERm) (m = A, B)

- MTU.TOERA

Address(es): MTU.TOERA 000C 120Ah

|                    |    |    |      |      |      |      |      |      |
|--------------------|----|----|------|------|------|------|------|------|
|                    | b7 | b6 | b5   | b4   | b3   | b2   | b1   | b0   |
|                    | —  | —  | OE4D | OE4C | OE3D | OE4B | OE4A | OE3B |
| Value after reset: | 1  | 1  | 0    | 0    | 0    | 0    | 0    | 0    |

| Bit    | Symbol | Bit Name              | Description                                             | R/W |
|--------|--------|-----------------------|---------------------------------------------------------|-----|
| b0     | OE3B   | Master Enable MTIOC3B | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b1     | OE4A   | Master Enable MTIOC4A | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b2     | OE4B   | Master Enable MTIOC4B | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b3     | OE3D   | Master Enable MTIOC3D | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b4     | OE4C   | Master Enable MTIOC4C | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b5     | OE4D   | Master Enable MTIOC4D | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b7, b6 | —      | Reserved              | These bits are read as 1. The write value should be 1.  | R/W |

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the data direction register (PDR) and port output data register (PODR) of I/O ports to output the inactive level from general I/O ports, and then set the port mode register (PMR) to use general I/O ports. For details, refer to section 20, I/O Ports.

TOERA enables or disables output settings for output pins MTIOC4D, MTIOC4C, MTIOC3D, MTIOC4B, MTIOC4A, and MTIOC3B.

These pins do not output correctly if the bits in the TOERA register have not been set. In MTU3 and MTU4, set TOERA prior to setting TIOR.

Set MTU.TOERA after setting the CST3 and CST4 bits in MTU.TSTRA to 0 (refer to Figure 22.43 and Figure 22.47).

- MTU.TOERB

Address(es): MTU.TOERB 000C 1A0Ah

| b7 | b6 | b5   | b4   | b3   | b2   | b1   | b0   |
|----|----|------|------|------|------|------|------|
| —  | —  | OE7D | OE7C | OE6D | OE7B | OE7A | OE6B |

| b0     | OE6B   | Master Enable MTIOC6B | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b1     | OE7A   | Master Enable MTIOC7A | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b2     | OE7B   | Master Enable MTIOC7B | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b3     | OE6D   | Master Enable MTIOC6D | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b4     | OE7C   | Master Enable MTIOC7C | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b5     | OE7D   | Master Enable MTIOC7D | 0: MTU output is disabled*1<br>1: MTU output is enabled | R/W |
| b7, b6 | —      | Reserved              | These bits are read as 1. The write value should be 1.  | R/W |

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the data direction register (PDR) and port output data register (PODR) of I/O ports to output the inactive level from general I/O ports, and then set the port mode register (PMR) to use general I/O ports. For details, refer to section 20, I/O Ports.

TOERB enables or disables output settings for output pins MTIOC7D, MTIOC7C, MTIOC6D, MTIOC7B, MTIOC7A, and MTIOC6B.

These pins do not output correctly if the bits in the TOERB register have not been set. In MTU6, and MTU7, set TOERB prior to setting TIOR.

Set MTU.TOERB after setting the CST6 and CST7 bits in MTU.TSTRB to 0 (refer to Figure 22.43 and Figure 22.47).

## 22.2.22 Timer Output Control Register 1m (TOCR1m) (m = A, B)

Address(es): MTU.TOCR1A 000C 120Eh, MTU.TOCR1B 000C 1A0Eh

|                    | b7 | b6   | b5 | b4 | b3   | b2   | b1   | b0   |

| b2     | TOCS   | TOC Select                          | 0: TOCR1m setting is selected (m = A, B)<br>1: TOCR2m setting is selected                                                   | R/W |
| b3     | TOCL   | TOC Register Write Protection*2, *4 | 0: Write access to the TOCS, OLSN, and OLSP bits is enabled<br>1: Write access to the TOCS, OLSN, and OLSP bits is disabled | R/W |
| b5, b4 | —      | Reserved                            | These bits are read as 0. The write value should be 0.                                                                      | R/W |
| b6     | PSYE   | PWM Synchronous Output Enable       | 0: Toggle output is disabled<br>1: Toggle output is enabled                                                                 | R/W |
| b7     | —      | Reserved                            | This bit is read as 0. The write value should be 0.                                                                         | R/W |

Note 1. Setting the TOCR1m.TOCS bit to 0 makes this bit setting valid.

Note 2. Setting the TOCR1m.TOCL bit to 1 prevents accidental modification when the CPU goes out of control.

Note 3. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSP bit is valid.

Note 4. This bit can be set to 1 only once after a reset. After 1 is written, 0 cannot be written to the bit.

TOCR1A and TOCR1B enable or disable PWM-synchronized toggle output in complementary PWM mode and reset-synchronized PWM mode, and control inversion of PWM output level.

### OLSP Bit (Output Level Select P)

This bit selects the positive-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

### OLSN Bit (Output Level Select N)

This bit selects the negative-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

### TOCS Bit (TOC Select)

This bit selects either the TOCR1m or TOCR2m (m = A, B) setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.

### TOCL Bit (TOC Register Write Protection)

This bit enables or disables write access to the TOCS, OLSN, and OLSP bits in TOCR1m (m = A, B).

### PSYE Bit (PWM Synchronous Output Enable)

This bit enables or disables toggle output synchronized with the PWM period from the MTIOC3A or MTIOC6A pin.

**Table 22.42 Output Level Select Function**

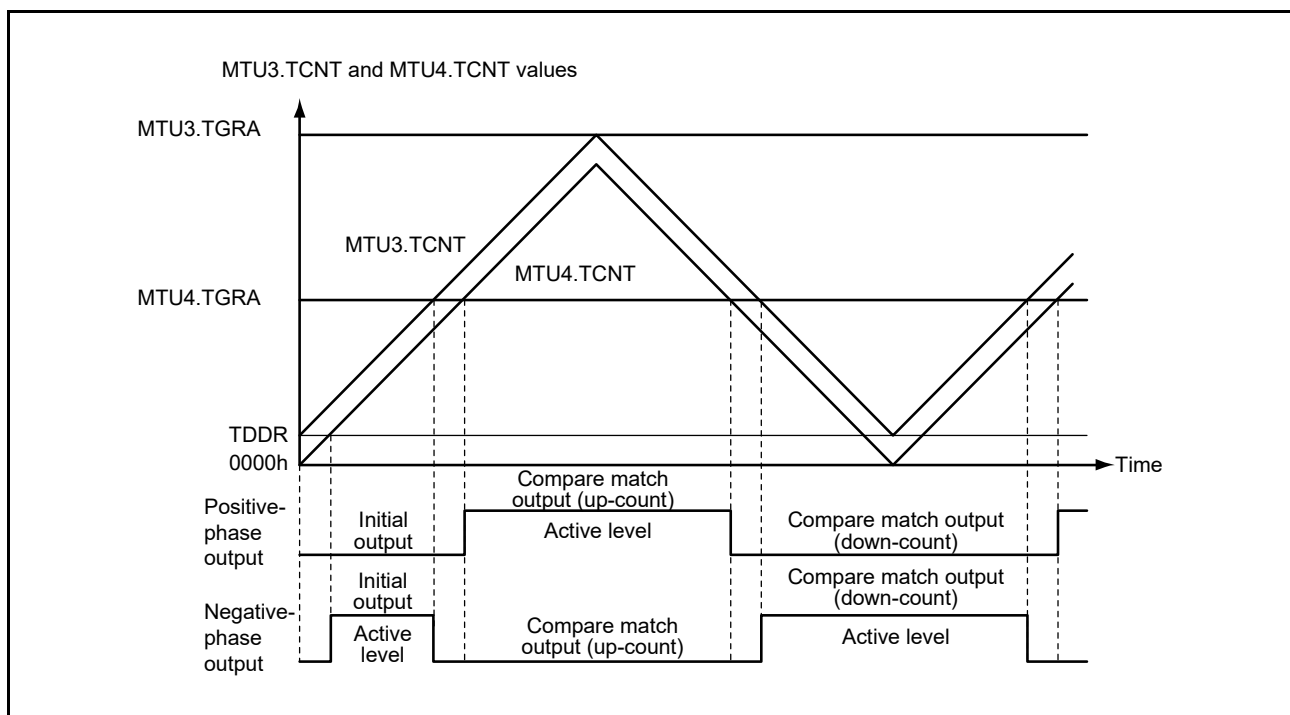

| Bit 0 | Function       |              |                      |               |

| 1     | Low level      | High level   | High level           | Low level     |

**Table 22.43 Output Level Select Function**

| Bit 1 | Function       |              |                      |               |
|-------|----------------|--------------|----------------------|---------------|
| OLSN  | Initial Output | Active Level | Compare Match Output |               |
|       |                |              | Up-Counting          | Down-Counting |
| 0     | High level     | Low level    | High level           | Low level     |
| 1     | Low level      | High level   | Low level            | High level    |

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Figure 22.3 shows an example of output in complementary PWM mode (one phase) when OLSN = 1 and OLSP = 1.

**Figure 22.3 Example of Output in Complementary PWM Mode**

### 22.2.23 Timer Output Control Register 2m (TOCR2m) (m = A, B)

Address(es): MTU.TOCR2A 000C 120Fh, MTU.TOCR2B 000C 1A0Fh

| Bit    | Symbol  | Bit Name                            | Description                                                                                                                              | R/W |
|--------|---------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b0     | OLS1P   | Output Level Select 1P*1, *2        | This bit selects the output level on MTIOC3B or MTIOC6B in reset-synchronized PWM mode and complementary PWM mode. Refer to Table 22.44. | R/W |
| b1     | OLS1N   | Output Level Select 1N*1, *2        | This bit selects the output level on MTIOC3D or MTIOC6D in reset-synchronized PWM mode and complementary PWM mode. Refer to Table 22.45. | R/W |
| b2     | OLS2P   | Output Level Select 2P*1, *2        | This bit selects the output level on MTIOC4A or MTIOC7A in reset-synchronized PWM mode and complementary PWM mode. Refer to Table 22.46. | R/W |
| b3     | OLS2N   | Output Level Select 2N*1, *2        | This bit selects the output level on MTIOC4C or MTIOC7C in reset-synchronized PWM mode and complementary PWM mode. Refer to Table 22.47. | R/W |
| b4     | OLS3P   | Output Level Select 3P*1, *2        | This bit selects the output level on MTIOC4B or MTIOC7B in reset-synchronized PWM mode and complementary PWM mode. Refer to Table 22.48. | R/W |
| b5     | OLS3N   | Output Level Select 3N*1, *2        | This bit selects the output level on MTIOC4D or MTIOC7D in reset-synchronized PWM mode and complementary PWM mode. Refer to Table 22.49. | R/W |
| b7, b6 | BF[1:0] | TOLBR Buffer Transfer Timing Select | These bits select the timing for transferring data from TOLBRm to TOCR2m. Refer to Table 22.50 for details.                              | R/W |

m = A, B

Note 1. Setting the TOCR1m.TOCS bit to 1 makes this bit setting valid.

Note 2. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSiP bits are valid (i = 1 to 3).

TOCR2A and TOCR2B control inversion of PWM output level in complementary PWM mode and reset-synchronized PWM mode.

The initial output is selected while the counter is stopped.

**Table 22.44 MTIOcnB Output Level Select Function**

| Bit 0 | Function       |              |                      |               |
|-------|----------------|--------------|----------------------|---------------|
| OLS1P | Initial Output | Active Level | Compare Match Output |               |
|       |                |              | Up-Counting          | Down-Counting |
| 0     | High level     | Low level    | Low level            | High level    |
| 1     | Low level      | High level   | High level           | Low level     |

n = 3, 6

**Table 22.45 MTIOCnD Output Level Select Function**

| Bit 1 | Function       |              |                      |               |
|-------|----------------|--------------|----------------------|---------------|
| OLS1N | Initial Output | Active Level | Compare Match Output |               |
|       |                |              | Up-Counting          | Down-Counting |
| 0     | High level     | Low level    | High level           | Low level     |
| 1     | Low level      | High level   | Low level            | High level    |

n = 3, 6

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

**Table 22.46 MTIOCnA Output Level Select Function**

| Bit 2 | Function       |              |                      |               |
|-------|----------------|--------------|----------------------|---------------|
| OLS2P | Initial Output | Active Level | Compare Match Output |               |
|       |                |              | Up-Counting          | Down-Counting |
| 0     | High level     | Low level    | Low level            | High level    |
| 1     | Low level      | High level   | High level           | Low level     |

n = 4, 7

| 0     | High level     | Low level    | High level           | Low level     |
| 1     | Low level      | High level   | Low level            | High level    |

n = 4, 7

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

**Table 22.50 Setting of TOCR2m.BF[1:0] Bits**

| Bit 7 | Bit 6 | Description                                                                                                |                                                                                                    |
|-------|-------|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| BF[1] | BF[0] | Complementary PWM Mode                                                                                     | Reset-Synchronized PWM Mode                                                                        |
| 0     | 0     | Does not transfer data from the buffer register (TOLBRm) to TOCR2m.                                        | Does not transfer data from the buffer register (TOLBRm) to TOCR2m.                                |
| 0     | 1     | Transfers data from the buffer register (TOLBRm) to TOCR2m at the crest of the MTUn.TCNT count.            | Transfers data from the buffer register (TOLBRm) to TOCR2m when MTUk.TCNT or MTUn.TCNT is cleared. |
| 1     | 0     | Transfers data from the buffer register (TOLBRm) to TOCR2m at the trough of the MTUn.TCNT count.           | Setting prohibited                                                                                 |
| 1     | 1     | Transfers data from the buffer register (TOLBRm) to TOCR2m at the crest and trough of the MTUn.TCNT count. | Setting prohibited                                                                                 |

n = 4, 7; k = 3, 6; m = A, B

### 22.2.24 Timer Output Level Buffer Register m (TOLBRm) (m = A, B)

Address(es): MTU.TOLBRA 000C 1236h, MTU.TOLBRB 000C 1A36h

| Bit    | Symbol | Bit Name               | Description                                                            | R/W |
|--------|--------|------------------------|------------------------------------------------------------------------|-----|
| b0     | OLS1P  | Output Level Select 1P | Specify the buffer value to be transferred to the OLS1P bit in TOCR2m. | R/W |
| b1     | OLS1N  | Output Level Select 1N | Specify the buffer value to be transferred to the OLS1N bit in TOCR2m. | R/W |
| b2     | OLS2P  | Output Level Select 2P | Specify the buffer value to be transferred to the OLS2P bit in TOCR2m. | R/W |
| b3     | OLS2N  | Output Level Select 2N | Specify the buffer value to be transferred to the OLS2N bit in TOCR2m. | R/W |
| b4     | OLS3P  | Output Level Select 3P | Specify the buffer value to be transferred to the OLS3P bit in TOCR2m. | R/W |
| b5     | OLS3N  | Output Level Select 3N | Specify the buffer value to be transferred to the OLS3N bit in TOCR2m. | R/W |
| b7, b6 | —      | Reserved               | These bits are read as 0. The write value should be 0.                 | R/W |

m = A, B

TOLBRA and TOLBRB are buffer registers for TOCR2A and TOCR2B and specify the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

Figure 22.4 shows an example of the PWM output level setting procedure in buffer operation.

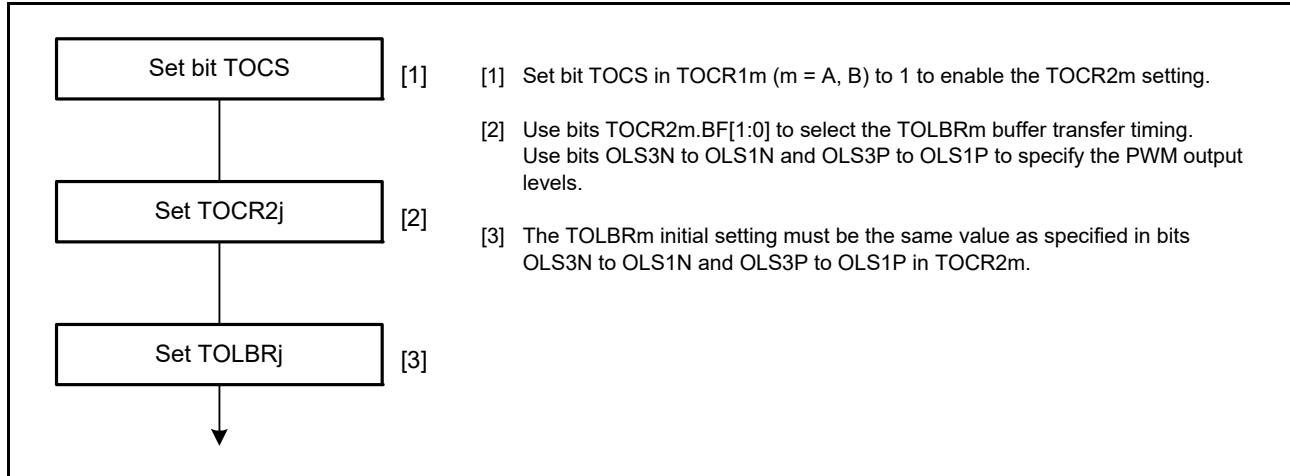

Figure 22.4 Example of PWM Output Level Setting Procedure in Buffer Operation

## 22.2.25 Timer Gate Control Register m (TGCRm) (m = A, B)

Address(es): MTU.TGCRA 000C 120Dh, MTU.TGCRB 000C 1A0Dh

|                    | b7 | b6  | b5 | b4 | b3 | b2 | b1 | b0 |
|--------------------|----|-----|----|----|----|----|----|----|
|                    | —  | BDC | N  | P  | FB | WF | VF | UF |
| Value after reset: | 1  | 0   | 0  | 0  | 0  | 0  | 0  | 0  |

| b6  | BDC    | Brushless DC Motor                | 0: Ordinary output<br>1: Functions of this register are made effective                                                                                                                                                                      | R/W |
| b7  | —      | Reserved                          | This bit is read as 1. The write value should be 1.                                                                                                                                                                                         | R/W |

TGCRA and TGCRB control the output waveform necessary for brushless DC motor control in reset-synchronized PWM mode and complementary PWM mode. TGCRA and TGCRB register settings are ineffective for anything other than complementary PWM mode and reset-synchronized PWM mode.

### UF, VF, and WF Bits (Output Phase Switch)

The setting of these bits is valid only when the FB bit is set to 1. In this case, the setting of b0 to b2 is used instead of the external input. Refer to Table 22.51 for details.

### FB Bit (External Feedback Signal Enable)

This bit selects whether the positive-/negative-phase output is switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0 and MTU9 or by writing 0 or 1 to bits 2 to 0 in TGCRA and TGCRB.

When the TGCRA.FB bit is 0, output of MTU3 and MTU4 can be switched with the TGRA, TGRB, and TGRC input capture signals in MTU0.

When the TGCRB.FB bit is 0, output of MTU6 and MTU7 can be switched with the TGRA, TGRB, and TGRC input capture signals in MTU9.

### P Bit (Positive-Phase Output (P) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the positive-phase output pins (MTIOC3B, MTIOC4A, MTIOC4B, MTIOC6B, MTIOC7A, and MTIOC7B pins).

### N Bit (Negative-Phase Output (N) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the negative-phase output pins (MTIOC3D, MTIOC4C, MTIOC4D, MTIOC6D, MTIOC7C, and MTIOC7D pins).

**BDC Bit (Brushless DC Motor)**

This bit selects whether to make the functions of TGCRA and TGCRB effective or ineffective.

**Table 22.51 Output Level Select Function**

| Bit 2 | Bit 1 | Bit 0 | Function            |                     |                     |                     |                     |                     |

| 1     | 1     | 0     | OFF                 | OFF                 | ON                  | ON                  | OFF                 | OFF                 |
| 1     | 1     | 1     | OFF                 | OFF                 | OFF                 | OFF                 | OFF                 | OFF                 |

**22.2.26 Timer Subcounter m (TCNTSm) (m = A, B)**

Address(es): MTU.TCNTSA 000C 1220h, MTU.TCNTSB 000C 1A20h

Note: TCNTSA and TCNTSB must not be accessed in 8 bits; it should be accessed in 16 bits.

TCNTSA and TCNTSB are 16-bit read-only counters used only in complementary PWM mode.

The initial value of TCNTSA and TCNTSB after a reset is 0000h.

**22.2.27 Timer Period Data Register m (TCDRm) (m = A, B)**

Address(es): MTU.TCDRA 000C 1214h, MTU.TCDRB 000C 1A14h

Note: TCDRA and TCDRB must not be accessed in 8 bits; it should be accessed in 16 bits.

TCDRA and TCDRB are 16-bit readable/writable registers used only in complementary PWM mode. Set half the PWM carrier period as the TCDRA and TCDRB values. The TCDRA and TCDRB registers are constantly compared with the TCNTSA and TCNTSB counters in complementary PWM mode, respectively. When a match occurs, the TCNTSA and TCNTSB counters switch the count direction (down-count to up-count). The initial value of TCDRA and TCDRB after a reset is FFFFh.

### 22.2.28 Timer Period Buffer Register m (TCBRm) (m = A, B)

Address(es): MTU.TCBRA 000C 1222h, MTU.TCBRB 000C 1A22h

Note: TCBRA and TCBRB must not be accessed in 8 bits; it should be accessed in 16 bits.

TCBRA and TCBRB are 16-bit readable/writable registers, used only in complementary PWM mode, that function as buffer registers for TCDRA and TCDRB. The TCBRA and TCBRB values are transferred to TCDRA and TCDRB with the transfer timing set in TMDR1. The initial value of TCBRA and TCBRB after a reset is FFFFh.

### 22.2.29 Timer Dead Time Data Register m (TDDRm) (m = A, B)

Address(es): MTU.TDDRA 000C 1216h, MTU.TDDRB 000C 1A16h

Note: TDDRA and TDDRB must not be accessed in 8 bits; it should be accessed in 16 bits.

TDDRA and TDDRB are 16-bit readable/writable registers, used only in complementary PWM mode, that specify the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counter offset value. In complementary PWM mode, when the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counters are cleared and then restarted, the TDDRA (TDDRB) value is loaded into the MTU3.TCNT (MTU6.TCNT) counter and the count operation starts. The initial value of TDDRA and TDDRB after a reset is FFFFh.

### 22.2.30 Timer Dead Time Enable Register m (TDERm) (m = A, B)

Address(es): MTU.TDERA 000C 1234h, MTU.TDERB 000C 1A34h

| Bit      | Symbol | Bit Name         | Description                                                 | R/W   |
|----------|--------|------------------|-------------------------------------------------------------|-------|
| b0       | TDER   | Dead Time Enable | 0: No dead time is generated<br>1: Dead time is generated*1 | R/(W) |
| b7 to b1 | —      | Reserved         | These bits are read as 0. The write value should be 0.      | R/W   |

Note 1. TDDRA and TDDRb must be set to 1 or a larger value.

TDERA and TDERB control dead time generation in complementary PWM mode. The MTU has one TDER each for MTU3 and MTU6. TDERA and TDERB should be modified only while TCNT stops.

#### TDER Bit (Dead Time Enable)

This bit specifies whether to generate dead time.

[Clearing condition]

- When 0 is written to TDER after reading TDER = 1

### 22.2.31 Timer Buffer Transfer Set Register m (TBTERm) (m = A, B)

Address(es): MTU.TBTERA 000C 1232h, MTU.TBTERB 000C 1A32h

| Bit      | Symbol   | Bit Name                                                    | Description                                                                                                                                                                                                                                     | R/W |
|----------|----------|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b1, b0   | BTE[1:0] | Buffer Transfer Disable and Interrupt Skipping Link Setting | These bits enable or disable transfer from the buffer registers*1 used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping function 1.<br>For details, refer to Table 22.52. | R/W |
| b7 to b2 | —        | Reserved                                                    | These bits are read as 0. The write value should be 0.                                                                                                                                                                                          | R/W |

Note 1. Applicable buffer registers (TBTERA):  
MTU3.TGRC, MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, and TCBRA  
Applicable buffer registers (TBTERB):  
MTU6.TGRC, MTU6.TGRD, MTU7.TGRC, MTU7.TGRD, and TCBRB

TBTERA and TBTERB enable or disable transfer from the buffer registers used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping 1 operation.

**Table 22.52 Setting of TBTERA.BTE[1:0] Bits and TBTERB.BTE[1:0] Bits**

| Bit 1  | Bit 0  | Description                                                                                                                                |
|--------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|
| BTE[1] | BTE[0] |                                                                                                                                            |
| 0      | 0      | Enables transfer from the buffer registers to the temporary registers*1 and does not link the transfer with interrupt skipping function 1. |
| 0      | 1      | Disables transfer from the buffer registers to the temporary registers.                                                                    |
| 1      | 0      | Links transfer from the buffer registers to the temporary registers with interrupt skipping function 1.*2                                  |
| 1      | 1      | Setting prohibited                                                                                                                         |

Note 1. Data is transferred according to the MD3 to MD0 bit setting in TMDR1. For details, refer to section 22.3.8, Complementary PWM Mode.

Note 2. When interrupt skipping is disabled the T3AEN and T4VEN (T6AEN and T7VEN) bits are set to 0 in the timer interrupt skipping set register (TITCR1A (TITCR1B)) or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are set to 0), be sure to disable link of buffer transfer with interrupt skipping (set the BTE1 bit in the timer buffer transfer set register (TBTERA (TBTERB)) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

### 22.2.32 Timer Waveform Control Register m (TWCRm) (m = A, B)

Address(es): MTU.TWCRA 000C 1260h, MTU.TWCRB 000C 1A60h

|     |    |    |    |    |    |     |     |
|-----|----|----|----|----|----|-----|-----|
| b7  | b6 | b5 | b4 | b3 | b2 | b1  | b0  |
| CCE | —  | —  | —  | —  | —  | SCC | WRE |

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit Name                               | Description                                                                                                                                                                                                                                                                | R/W         |
|----------|--------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| b0       | WRE    | Waveform Retain Enable                 | 0: Initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output<br>1: Initial output is inhibited                                                                                                                                                          | R/(W)<br>*3 |
| b1       | SCC    | Synchronous Clearing Control<br>*1, *3 | (Only valid in TWCRB)<br>0: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is enabled.<br>1: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is disabled. | R/(W)       |
| b6 to b2 | —      | Reserved                               | These bits are read as 0. The write value should be 0.                                                                                                                                                                                                                     | R/W         |
| b7       | CCE    | Compare Match Clear Enable<br>*2       | 0: Counters are not cleared at MTU3.TGRA (MTU6.TGRA) compare match<br>1: Counters are cleared at MTU3.TGRA (MTU6.TGRA) compare match                                                                                                                                       | R/(W)       |

Note 1. This bit is only valid in register TWCRB and is a reserved bit in register TWCRA.

Note 2. Do not set to 1 when complementary PWM mode 1 is not selected.

Note 3. Do not set to 1 when complementary PWM mode is not selected.

TWCRA and TWCRB control the output waveform when synchronous counter clearing occurs in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) in complementary PWM mode and specifies whether to clear the counters at MTU3.TGRA (MTU6.TGRA) compare match.

The CCE bit and WRE bit in TWCRA and TWCRB should be modified only while TCNT stops.

#### WRE Bit (Waveform Retain Enable)

This bit selects the waveform output when synchronous counter clearing occurs in complementary PWM mode.

The initial output is inhibited with this function only when synchronous clearing occurs within the  $T_b$  interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output regardless of the WRE bit setting. The initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are also output when synchronous clearing occurs in the  $T_b$  interval at the trough immediately after MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start operation.

For the  $T_b$  interval at the trough in complementary PWM mode, refer to Figure 22.49.

[Setting condition]

- When 1 is written to the WRE bit after reading WRE = 0

**SCC Bit (Synchronous Clearing Control)**

The setting of this bit selects whether MTU6.TCNT and MTU7.TCNT are or are not cleared when counter-synchronous clearing is generated for MTU0, MTU1, MTU2–MTU6, MTU7 in complementary PWM mode.

Make the complementary PWM mode settings for MTU6 and MTU7 when this function is in use. When writing a new value to the SCC bit while the counter is operating, do so in such a way that the values of the CCE and WRE bits are not changed.

Synchronous clearing from the MTU module only becomes disabled due to the setting of the SCC bit when synchronous clearing is generated outside the Tb interval in the trough. If synchronous clearing is generated within the Tb interval in the trough including immediately after the value at which MTU6.TCNT and MTU7.TCNT start, MTU6.TCNT and MTU7.TCNT are cleared.

Regarding the Tb interval in the trough in complementary PWM mode, refer to Figure 22.49.

[Setting condition]

- Writing of 1 to the SCC bit after reading it as 0

The corresponding bit in register TWCRA is reserved and is read as 0. When writing to TWCRA, write 0 to this bit.

**CCE Bit (Compare Match Clear Enable)**

This bit specifies whether to clear counters at MTU3.TGRA (MTU6.TGRA) compare match in complementary PWM mode.

[Setting condition]

- When 1 is written to CCE after reading CCE = 0

### 22.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 9, C)

- MTU0.NFCR0, MTU1.NFCR1, MTU2.NFCR2, MTU3.NFCR3, MTU4.NFCR4, MTU6.NFCR6, MTU7.NFCR7, MTU9.NFCR9

Address(es): MTU0.NFCR0 000C 1290h, MTU1.NFCR1 000C 1291h, MTU2.NFCR2 000C 1292h, MTU3.NFCR3 000C 1293h, MTU4.NFCR4 000C 1294h, MTU6.NFCR6 000C 1A93h, MTU7.NFCR7 000C 1A94h, MTU9.NFCR9 000C 1296h

| Bit    | Symbol    | Bit Name                  | Description                                                                                                 | R/W |
|--------|-----------|---------------------------|-------------------------------------------------------------------------------------------------------------|-----|
| b0     | NFAEN     | Noise Filter A Enable     | 0: The noise filter for the MTIOCnA pin is disabled.<br>1: The noise filter for the MTIOCnA pin is enabled. | R/W |
| b1     | NFBEN     | Noise Filter B Enable     | 0: The noise filter for the MTIOCnB pin is disabled.<br>1: The noise filter for the MTIOCnB pin is enabled. | R/W |
| b2     | NFCEN     | Noise Filter C Enable*1   | 0: The noise filter for the MTIOCnC pin is disabled.<br>1: The noise filter for the MTIOCnC pin is enabled. | R/W |
| b3     | NFDEN     | Noise Filter D Enable*1   | 0: The noise filter for the MTIOCnD pin is disabled.<br>1: The noise filter for the MTIOCnD pin is enabled. | R/W |
| b5, b4 | NFCS[1:0] | Noise Filter Clock Select | b5 b4<br>0 0: PCLKC/1<br>0 1: PCLKC/8<br>1 0: PCLKC/32<br>1 1: Clock source for counting                    | R/W |
| b7, b6 | —         | Reserved                  | These bits are read as 0. The write value should be 0.                                                      | R/W |

Note 1. These bits are reserved in MTU1 and MTU2. These bits are read as 0 and writing to them has no effect.

The NFCRn register (n = 0 to 4, 6, 7, 9) sets the noise filter function of input capture pins for the corresponding channel.

#### NFAEN Bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTIOCnA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

#### NFBEN Bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTIOCnB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

#### NFCEN Bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTIOCnC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

#### NFDEN Bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTIOCnD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

**NFCS[1:0] Bits (Noise Filter Clock Select)**

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

- MTU0.NFCRC

Address(es): MTU0.NFCRC 000C 1299h

| Bit    | Symbol    | Bit Name                  | Description                                                                                               | R/W |

| b7, b6 | —         | Reserved                  | These bits are read as 0. The write value should be 0.                                                    | R/W |

The NFCRC register sets the noise filter function of external clock pins common to each channel.

**NFAEN Bit (Noise Filter A Enable)**

This bit disables or enables the noise filter for input from the MTCLKA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

**NFBEN Bit (Noise Filter B Enable)**

This bit disables or enables the noise filter for input from the MTCLKB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

**NFCEN Bit (Noise Filter C Enable)**

This bit disables or enables the noise filter for input from the MTCLKC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

**NFDEN Bit (Noise Filter D Enable)**

This bit disables or enables the noise filter for input from the MTCLKD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

**NFCS[1:0] Bits (Noise Filter Clock Select)**

These bits set the sampling interval for the noise filters. After setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval to set the input capture function.

**22.2.34 Noise Filter Control Register 5 (NFCR5)**

Address(es): MTU5.NFCR5 000C 1A95h

| b0     | NFUEN     | Noise Filter U Enable     | 0: The noise filter for the MTIC5U pin is disabled.<br>1: The noise filter for the MTIC5U pin is enabled. | R/W |
| b1     | NFVEN     | Noise Filter V Enable     | 0: The noise filter for the MTIC5V pin is disabled.<br>1: The noise filter for the MTIC5V pin is enabled. | R/W |
| b2     | NFWEN     | Noise Filter W Enable     | 0: The noise filter for the MTIC5W pin is disabled.<br>1: The noise filter for the MTIC5W pin is enabled. | R/W |
| b3     | —         | Reserved                  | This bit is read as 0. The write value should be 0.                                                       | R/W |
| b5, b4 | NFCS[1:0] | Noise Filter Clock Select | b5 b4<br>0 0: PCLKC/1<br>0 1: PCLKC/8<br>1 0: PCLKC/32<br>1 1: Clock source for counting                  | R/W |
| b7, b6 | —         | Reserved                  | These bits are read as 0. The write value should be 0.                                                    | R/W |

**NFUEN Bit (Noise Filter U Enable)**

This bit disables or enables the noise filter for input from the MTIC5U pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

**NFVEN Bit (Noise Filter V Enable)**

This bit disables or enables the noise filter for input from the MTIC5V pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

**NFWEN Bit (Noise Filter W Enable)**

This bit disables or enables the noise filter for input from the MTIC5W pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

**NFCS[1:0] Bits (Noise Filter Clock Select)**

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

| b13 to b8 | —       | Reserved                                       | These bits are read as 0. The write value should be 0.                                                                                                                              | R/W |
| b15, b14  | BF[1:0] | MTU4.TADCOBRA/TADCOBRB Transfer Timing Select  | Refer to Table 22.53 for details.<br>These bits specify the transfer timing from MTU4.TADCOBRA and MTU4.TADCOBRB to MTU4.TADCORA and MTU4.TADCORB.                                  | R/W |

Note: MTU4.TADCR must not be accessed in 8 bits; it should be accessed in 16 bits.

Note 1. Set to 0 when interrupt skipping is disabled (the T3AEN and T4VEN bits in TITCR1A are set to 0 or the T3ACOR and T4VCOR bits in TITCR1A are set to 0).

Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D conversion start requests will not be issued.

Note 3. Set to 0 when complementary PWM mode is not selected.

TADCR enables or disables A/D conversion start requests and specifies whether to link A/D conversion start requests with interrupt skipping function. The MTU has one TADCR each for MTU4 and MTU7.

**Table 22.53 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU4)**

| Bit 15 | Bit 14 | Description                                                                                                                                                                            |                                                                                                                                                                                                           |                                                                                                                                                                                                           |                                                                                                                                                                                                           |

| b13 to b8 | —       | Reserved                                       | These bits are read as 0. The write value should be 0.                                                                                                                              | R/W |
| b15, b14  | BF[1:0] | MTU7.TADCOBRA/TADCOBRB Transfer Timing Select  | Refer to Table 22.54 for details.<br>These bits specify the transfer timing from MTU7.TADCOBRA and MTU7.TADCOBRB to MTU7.TADCORA and MTU7.TADCORB.                                  | R/W |

Note: MTU7.TADCR must not be accessed in 8 bits; it should be accessed in 16 bits.

Note 1. Set to 0 when interrupt skipping is disabled (the T6AEN and T7VEN bits in TITCR1B are set to 0 or the T6ACOR and T7VCOR bits in TITCR1B are set to 0).

Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D conversion start requests will not be issued.

Note 3. Set to 0 when complementary PWM mode is not selected.

**Table 22.54 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU7)**

| Bit 15 | Bit 14 | Description                                                                                                                                                                            |                                                                                                                                                                                                           |                                                                                                                                                                                                           |                                                                                                                                                                                                           |

| BF[1]  | BF[0]  | In Complementary PWM Mode                                                                                                                                                              | In Reset-Synchronized PWM Mode                                                                                                                                                                            | In PWM Mode 1                                                                                                                                                                                             | In Normal Mode                                                                                                                                                                                            |
| 0      | 0      | Data is not transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB).                                      | Data is not transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB).                                                         | Data is not transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB).                                                         | Data is not transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB).                                                         |
| 0      | 1      | Data is transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB) at the crest of the MTU7.TCNT.            | Data is transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB) when a compare match occurs between MTU6.TCNT and MTU6.TGRA. | Data is transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB) when a compare match occurs between MTU7.TCNT and MTU7.TGRA. | Data is transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB) when a compare match occurs between MTU7.TCNT and MTU7.TGRA. |
| 1      | 0      | Data is transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB) at the trough of the MTU7.TCNT.           | Setting prohibited                                                                                                                                                                                        | Setting prohibited                                                                                                                                                                                        | Setting prohibited                                                                                                                                                                                        |
| 1      | 1      | Data is transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB) at the crest and trough of the MTU7.TCNT. | Setting prohibited                                                                                                                                                                                        | Setting prohibited                                                                                                                                                                                        | Setting prohibited                                                                                                                                                                                        |

### 22.2.36 Timer A/D Conversion Start Request Cycle Set Register m (TADCORm) (m = A, B)

Address(es): MTU4.TADCORA 000C 1244h, MTU4.TADCORB 000C 1246h, MTU7.TADCORA 000C 1A44h, MTU7.TADCORB 000C 1A46h

Note: TADCORA and TADCORB must not be accessed in 8 bits; it should be accessed in 16 bits.

Note 1. When the A/D conversion start request delaying function linked with skipping function 1 (for details, refer to section 22.3.9 (5), A/D Conversion Start Request Delaying Function Linked with Interrupt Skipping Function 1) is used, the value of this register should be 0002h to TCDRA setting – 2 in MTU4 and 0002h to TCDRB setting – 2 in MTU7.

Note 2. When interrupt skipping function 2 is used and the difference between the TADCORA value and the TADCORB value is small, the skipping count may not be counted correctly and the A/D conversion start request may not be generated with the expected timing in some cases. The TADCORA and TADCORB values should satisfy the following conditions.

- (1) When skipping function 2 is specified with the skipping count set to 0
  - The difference between the TADCORA and TADCORB values should be equal to or greater than 4.
  - The TADCORA compare interval should be equal to or greater than 4 PCLKC cycles (the TADCORA update value should be the previous value + 4 or greater, or previous value – 4 or smaller).
  - The TADCORB compare interval should be equal to or greater than 4 PCLKC cycles (the TADCORB update value should be the previous value + 4 or greater, or previous value – 4 or smaller).
- (2) When skipping function 2 is specified with the skipping count set to 1 or greater
  - The difference between the TADCORA and TADCORB values should be equal to or greater than 2.
  - The TADCORB compare interval should be equal to or greater than 2 PCLKC cycles (the TADCORB update value should be the previous value + 2 or greater, or previous value – 2 or smaller)

TADCORA and TADCORB are 16-bit readable/writable registers that issue a corresponding A/D conversion start request when the MTUn.TCNT (n = 4, 7) count reaches the value in TADCORA or TADCORB.

MTUn.TADCORA and TADCORB are initialized to FFFFh by a reset.

### 22.2.37 Timer A/D Conversion Start Request Cycle Set Buffer Register m (TADCOBRm) (m = A, B)

Address(es): MTU4.TADCOBRA 000C 1248h, MTU4.TADCOBRB 000C 124Ah, MTU7.TADCOBRA 000C 1A48h, MTU7.TADCOBRB 000C 1A4Ah

Note: TADCOBRA and TADCOBRB must not be accessed in 8 bits; it should be accessed in 16 bits.

TADCOBRA and TADCOBRB are 16-bit readable/writable registers whose values are transferred to TADCORA and TADCORB, respectively, when the crest or trough of the MTUn.TCNT count is reached.

TADCOBRA and TADCOBRB are initialized to FFFFh by a reset.

### 22.2.38 Timer Interrupt Skipping Mode Register m (TITMRm) (m = A, B)

Address(es): MTU.TITMRA 000C 123Ah, MTU.TITMRB 000C 1A3Ah

Value after reset: 0 0 0 0 0 0 0 0

| Bit      | Symbol | Bit Name                           | Description                                                                                                                                                                       | R/W |
|----------|--------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b0       | TITM   | Interrupt Skipping Function Select | Selects one of the two types of interrupt skipping functions.<br>0: Selects interrupt skipping function 1* <sup>1</sup><br>1: Selects interrupt skipping function 2* <sup>2</sup> | R/W |
| b7 to b1 | —      | Reserved                           | These bits are read as 0. The write value should be 0.                                                                                                                            | R/W |

Note 1. Setting the TITCR1A or TITCR1B register enables interrupt skipping function 1.

Note 2. Setting the TITCR2A or TITCR2B register enables interrupt skipping function 2.

TITMRA and TITMRB are used to select either of two skipping functions for the TITMRA and TITMRB registers.

### 22.2.39 Timer Interrupt Skipping Set Register 1m (TITCR1m) (m = A, B)

- MTU.TITCR1A

Address(es): MTU.TITCR1A 000C 1230h

| Bit      | Symbol      | Bit Name                               | Description                                                                                                                 | R/W |
|----------|-------------|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-----|
| b2 to b0 | T4VCOR[2:0] | TCIV4 Interrupt Skipping Count Setting | These bits specify the TCIV4 interrupt skipping count within the range from 0 to 7.*1<br>For details, refer to Table 22.55. | R/W |
| b3       | T4VEN       | T4VEN                                  | 0: TCIV4 interrupt skipping disabled<br>1: TCIV4 interrupt skipping enabled                                                 | R/W |
| b6 to b4 | T3ACOR[2:0] | TGIA3 Interrupt Skipping Count Setting | These bits specify the TGIA3 interrupt skipping count within the range from 0 to 7.*1<br>For details, refer to Table 22.56. | R/W |
| b7       | T3AEN       | T3AEN                                  | 0: TGIA3 interrupt skipping disabled<br>1: TGIA3 interrupt skipping enabled                                                 | R/W |

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.  
Before changing the interrupt skipping count, be sure to set the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0 to clear the skipping counter (TITCNT1A).

- MTU.TITCR1B

Address(es): MTU.TITCR1B 000C 1A30h

| Bit      | Symbol      | Bit Name                               | Description                                                                                                                 | R/W |

| b2 to b0 | T7VCOR[2:0] | TCIV7 Interrupt Skipping Count Setting | These bits specify the TCIV7 interrupt skipping count within the range from 0 to 7.*1<br>For details, refer to Table 22.57. | R/W |
| b3       | T7VEN       | T7VEN                                  | 0: TCIV7 interrupt skipping disabled<br>1: TCIV7 interrupt skipping enabled                                                 | R/W |
| b6 to b4 | T6ACOR[2:0] | TGIA6 Interrupt Skipping Count Setting | These bits specify the TGIA6 interrupt skipping count within the range from 0 to 7.*1<br>For details, refer to Table 22.58. | R/W |
| b7       | T6AEN       | T6AEN                                  | 0: TGIA6 interrupt skipping disabled<br>1: TGIA6 interrupt skipping enabled                                                 | R/W |

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.  
Before changing the interrupt skipping count, be sure to set the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0 to clear the skipping counter (TITCNT1B).

Registers TITCR1A and TITCR1B enable or disable interrupt skipping and specify the interrupt skipping count. This setting is valid only while the TITMRA.TITM or TITMRB.TITM bit is set to 0; when the TITMRA.TITM (TITMRB.TITM) bit is set to 1, the setting in the TITCR1A (TITCR1B) register is cleared.

**Table 22.55 Setting of Interrupt Skipping Count by T4VCOR[2:0] Bits**

| Bit 2     | Bit 1     | Bit 0     | Description                                   |
|-----------|-----------|-----------|-----------------------------------------------|
| T4VCOR[2] | T4VCOR[1] | T4VCOR[0] |                                               |
| 0         | 0         | 0         | Does not skip TCIV4 interrupts.               |
| 0         | 0         | 1         | Sets the TCIV4 interrupt skipping count to 1. |
| 0         | 1         | 0         | Sets the TCIV4 interrupt skipping count to 2. |
| 0         | 1         | 1         | Sets the TCIV4 interrupt skipping count to 3. |
| 1         | 0         | 0         | Sets the TCIV4 interrupt skipping count to 4. |
| 1         | 0         | 1         | Sets the TCIV4 interrupt skipping count to 5. |
| 1         | 1         | 0         | Sets the TCIV4 interrupt skipping count to 6. |
| 1         | 1         | 1         | Sets the TCIV4 interrupt skipping count to 7. |

**Table 22.56 Setting of Interrupt Skipping Count by T3ACOR[2:0] Bits**

| Bit 6     | Bit 5     | Bit 4     | Description                                   |
|-----------|-----------|-----------|-----------------------------------------------|
| T3ACOR[2] | T3ACOR[1] | T3ACOR[0] |                                               |
| 0         | 0         | 0         | Does not skip TGIA3 interrupts.               |
| 0         | 0         | 1         | Sets the TGIA3 interrupt skipping count to 1. |
| 0         | 1         | 0         | Sets the TGIA3 interrupt skipping count to 2. |
| 0         | 1         | 1         | Sets the TGIA3 interrupt skipping count to 3. |
| 1         | 0         | 0         | Sets the TGIA3 interrupt skipping count to 4. |
| 1         | 0         | 1         | Sets the TGIA3 interrupt skipping count to 5. |
| 1         | 1         | 0         | Sets the TGIA3 interrupt skipping count to 6. |
| 1         | 1         | 1         | Sets the TGIA3 interrupt skipping count to 7. |

**Table 22.57 Setting of Interrupt Skipping Count by T7VCOR[2:0] Bits**

| Bit 2     | Bit 1     | Bit 0     | Description                                   |
|-----------|-----------|-----------|-----------------------------------------------|
| T7VCOR[2] | T7VCOR[1] | T7VCOR[0] |                                               |
| 0         | 0         | 0         | Does not skip TCIV7 interrupts.               |
| 0         | 0         | 1         | Sets the TCIV7 interrupt skipping count to 1. |
| 0         | 1         | 0         | Sets the TCIV7 interrupt skipping count to 2. |
| 0         | 1         | 1         | Sets the TCIV7 interrupt skipping count to 3. |
| 1         | 0         | 0         | Sets the TCIV7 interrupt skipping count to 4. |
| 1         | 0         | 1         | Sets the TCIV7 interrupt skipping count to 5. |
| 1         | 1         | 0         | Sets the TCIV7 interrupt skipping count to 6. |
| 1         | 1         | 1         | Sets the TCIV7 interrupt skipping count to 7. |

**Table 22.58 Setting of Interrupt Skipping Count by T6ACOR[2:0] Bits**

| Bit 6     | Bit 5     | Bit 4     | Description                                   |
|-----------|-----------|-----------|-----------------------------------------------|
| T6ACOR[2] | T6ACOR[1] | T6ACOR[0] |                                               |
| 0         | 0         | 0         | Does not skip TGIA6 interrupts.               |
| 0         | 0         | 1         | Sets the TGIA6 interrupt skipping count to 1. |
| 0         | 1         | 0         | Sets the TGIA6 interrupt skipping count to 2. |
| 0         | 1         | 1         | Sets the TGIA6 interrupt skipping count to 3. |
| 1         | 0         | 0         | Sets the TGIA6 interrupt skipping count to 4. |
| 1         | 0         | 1         | Sets the TGIA6 interrupt skipping count to 5. |
| 1         | 1         | 0         | Sets the TGIA6 interrupt skipping count to 6. |
| 1         | 1         | 1         | Sets the TGIA6 interrupt skipping count to 7. |

## 22.2.40 Timer Interrupt Skipping Counter 1m (TITCNT1m) (m = A, B)

- MTU.TITCNT1A

Address(es): MTU.TITCNT1A 000C 1231h

| Bit      | Symbol      | Bit Name                | Description                                                                                                             | R/W |
|----------|-------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------|-----|
| b2 to b0 | T4VCNT[2:0] | TCIV4 Interrupt Counter | While the T4VEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TCIV4 interrupt occurs. | R   |
| b3       | —           | Reserved                | This bit is read as 0.                                                                                                  | R   |
| b6 to b4 | T3ACNT[2:0] | TGIA3 Interrupt Counter | While the T3AEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TGIA3 interrupt occurs. | R   |
| b7       | —           | Reserved                | This bit is read as 0.                                                                                                  | R   |

Note: To clear the TITCNT1A, set the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0.

TITCNT1A and TITCNT1B are 8-bit readable/writable counters. TITCNT1A and TITCNT1B retain their values even after stopping the count operation of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

### T4VCNT[2:0] Bits (TCIV4 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T4VEN bit in TITCR1A is set to 0
- When the T4VCOR[2:0] bits in TITCR1A are set to 000b
- When the T4VCNT[2:0] bits in TITCNT1A match the T4VCOR[2:0] bits in TITCR1A

### T3ACNT[2:0] Bits (TGIA3 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T3AEN bit in TITCR1A is set to 0
- When the T3ACOR[2:0] bits in TITCR1A are set to 000b
- When the T3ACNT[2:0] bits in TITCNT1A match the T3ACOR[2:0] bits in TITCR1A

- MTU.TITCNT1B

Address(es): MTU.TITCNT1B 000C 1A31h

| Bit      | Symbol      | Bit Name                | Description                                                                                                             | R/W |
|----------|-------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------|-----|
| b2 to b0 | T7VCNT[2:0] | TCIV7 Interrupt Counter | While the T7VEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TCIV7 interrupt occurs. | R   |
| b3       | —           | Reserved                | This bit is read as 0.                                                                                                  | R   |
| b6 to b4 | T6ACNT[2:0] | TGIA6 Interrupt Counter | While the T6AEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TGIA6 interrupt occurs. | R   |
| b7       | —           | Reserved                | This bit is read as 0.                                                                                                  | R   |

Note: To clear the TITCNT1B, set the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0.

#### T7VCNT[2:0] Bits (TCIV7 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T7VEN bit in TITCR1B is set to 0
- When the T7VCOR[2:0] bits in TITCR1B are set to 000b
- When the T7VCNT[2:0] bits in TITCNT1B match the T7VCOR[2:0] bits in TITCR1B

#### T6ACNT[2:0] Bits (TGIA6 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T6AEN bit in TITCR1B is set to 0
- When the T6ACOR[2:0] bits in TITCR1B are set to 000b
- When the T6ACNT[2:0] bits in TITCNT1B match the T6ACOR[2:0] bits in TITCR1B

### 22.2.41 Timer Interrupt Skipping Set Register 2m (TITCR2m) (m = A, B)

- MTU.TITCR2A

Address(es): MTU.TITCR2A 000C 123Bh

| Bit      | Symbol       | Bit Name                                       | Description                                                                                                                    | R/W |
|----------|--------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|-----|
| b2 to b0 | TRG4COR[2:0] | TRG4AN/TRG4BN Interrupt Skipping Count Setting | These bits specify the TRG4AN/TRG4BN interrupt skipping count within the range from 0 to 7. For details, refer to Table 22.59. | R/W |
| b7 to b3 | —            | Reserved                                       | These bits are read as 0. The write value should be 0.                                                                         | R/W |

TITCR2A and TITCR2B specify the interrupt skipping count for TRG4AN and TRG4BN (TRG7AN and TRG7BN). This setting is valid only while TITMRA or TITMRB is set to 1.

**Table 22.59 Setting of Interrupt Skipping Count by TRG4COR[2:0] Bits**

| Bit 2      | Bit 1      | Bit 0      | Description                                               |
|------------|------------|------------|-----------------------------------------------------------|
| TRG4COR[2] | TRG4COR[1] | TRG4COR[0] |                                                           |
| 0          | 0          | 0          | Does not skip TRG4AN and TRG4BN interrupts.               |
| 0          | 0          | 1          | Sets the TRG4AN and TRG4BN interrupt skipping count to 1. |
| 0          | 1          | 0          | Sets the TRG4AN and TRG4BN interrupt skipping count to 2. |
| 0          | 1          | 1          | Sets the TRG4AN and TRG4BN interrupt skipping count to 3. |
| 1          | 0          | 0          | Sets the TRG4AN and TRG4BN interrupt skipping count to 4. |
| 1          | 0          | 1          | Sets the TRG4AN and TRG4BN interrupt skipping count to 5. |
| 1          | 1          | 0          | Sets the TRG4AN and TRG4BN interrupt skipping count to 6. |
| 1          | 1          | 1          | Sets the TRG4AN and TRG4BN interrupt skipping count to 7. |

| 1          | 1          | 1          | Sets the TRG7AN and TRG7BN interrupt skipping count to 7. |

## 22.2.42 Timer Interrupt Skipping Counter 2m (TITCNT2m) (m = A, B)

- MTU.TITCNT2A

Address(es): MTU.TITCNT2A 000C 123Ch

| Bit      | Symbol       | Bit Name                           | Description                                                                                                                                                                                                              | R/W |
|----------|--------------|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| b2 to b0 | TRG4CNT[2:0] | TRG4AN/TRG4BN<br>Interrupt Counter | These bits start counting from the value set in TRG4COR[2:0] and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid. | R   |
| b7 to b3 | —            | Reserved                           | These bits are read as 0.                                                                                                                                                                                                | R   |

TITCNT2A and TITCNT2B start counting from the values set in the TRG4COR[2:0] and TRG7COR[2:0] bits and the count decrements every time TRG4AN or TRG4BN (TITCNT2A) is generated or TRG7AN or TRG7BN (TITCNT2B) is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts or the TRG7AN and TRG7BN interrupts become valid.

### TRG4CNT[2:0] Bits (TRG4AN/TRG4BN Interrupt Counter)

These bits start counting from the value set in the TRG4COR[2:0] bits and the count decrements every time a TRG4AN or TRG4BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRA is 0
- When the TRG4COR[2:0] bits in TITCR2A are set to 000b
- When the count of TRG4AN and TRG4BN occurrence matches the TRG4COR[2:0] value in TITCR2A

- MTU.TITCNT2B

| b7 to b3 | —            | Reserved                           | These bits are read as 0.                                                                                                                                                                                                | R   |

### TRG7CNT[2:0] Bits (TRG7AN/TRG7BN Interrupt Counter)

These bits start counting from the value set in the TRG7COR[2:0] bits and the count decrements every time a TRG7AN or TRG7BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRB is 0
- When the TRG7COR[2:0] bits in TITCR2B are set to 000b
- When the count of TRG7AN and TRG7BN occurrence matches the TRG7COR[2:0] value in TITCR2B

## 22.3 Operation

### 22.3.1 Basic Functions

Each channel has TCNT and TGR register. TCNT performs up-counting, and is also capable of free-running operation, periodic counting, and external event counting.

Each TGR register can be used as an input capture register or an output compare register.

#### (1) Counter Operation

When one of bits CST0 to CST4 and CST9 in the TSTRA register, bits CST6 and CST7 in the TSTRB register, and bits CSTU5, CSTV5, and CSTW5 in the MTU5.TSTR register is set to 1, TCNT for the corresponding channel begins counting. TCNT can operate as a free-running counter, periodic counter, for example.

#### (a) Example of Count Operation Setting Procedure

Figure 22.5 shows an example of the count operation setting procedure.

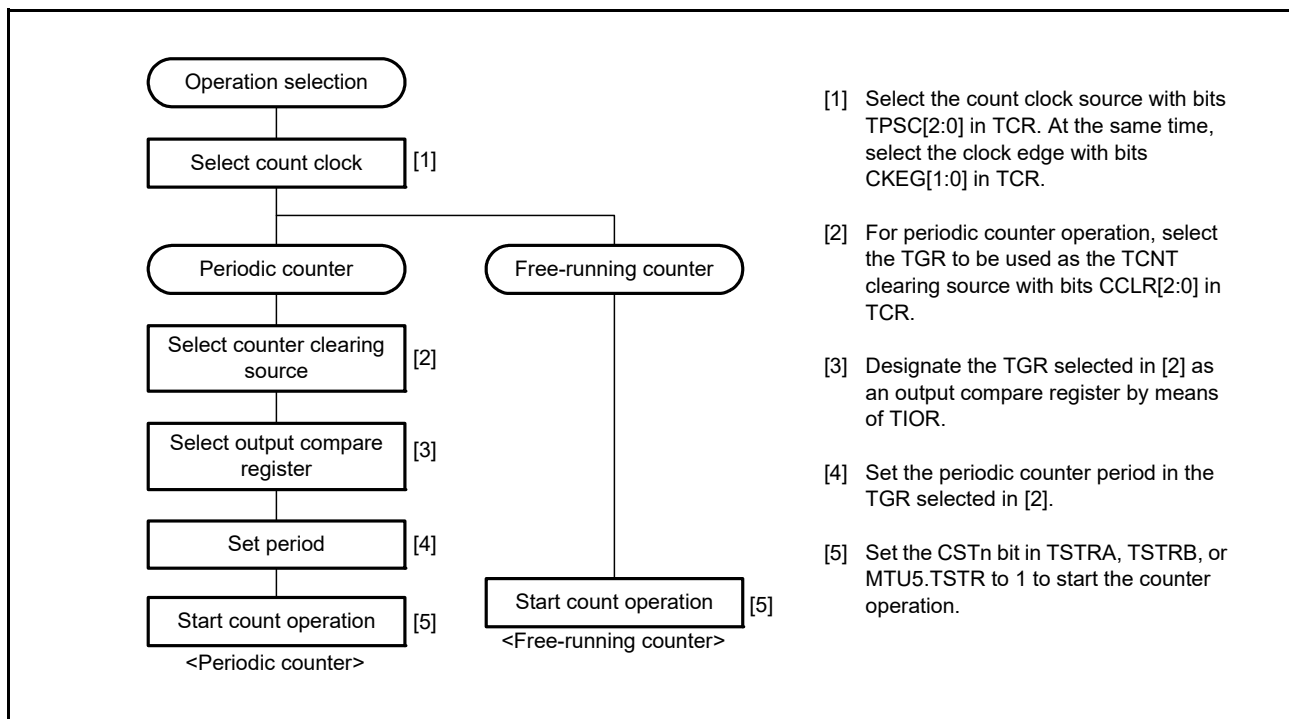

Figure 22.5 Example of Count Operation Setting Procedure

### (b) Free-Running Count Operation and Periodic Count Operation

Immediately after a reset, the TCNT counters are all designated as free-running counters. When the CSTn bit in TSTRA, TSTRB, or MTU5.TSTR is set to 1, the corresponding TCNT counter starts up-count operation as a free-running counter. When TCNT overflows (from FFFFh to 0000h), an interrupt request is issued to the CPU if the corresponding TIER.TCIEV bit is 1. After an overflow, TCNT starts counting up again from 0000h.

Figure 22.6 illustrates free-running counter operation.

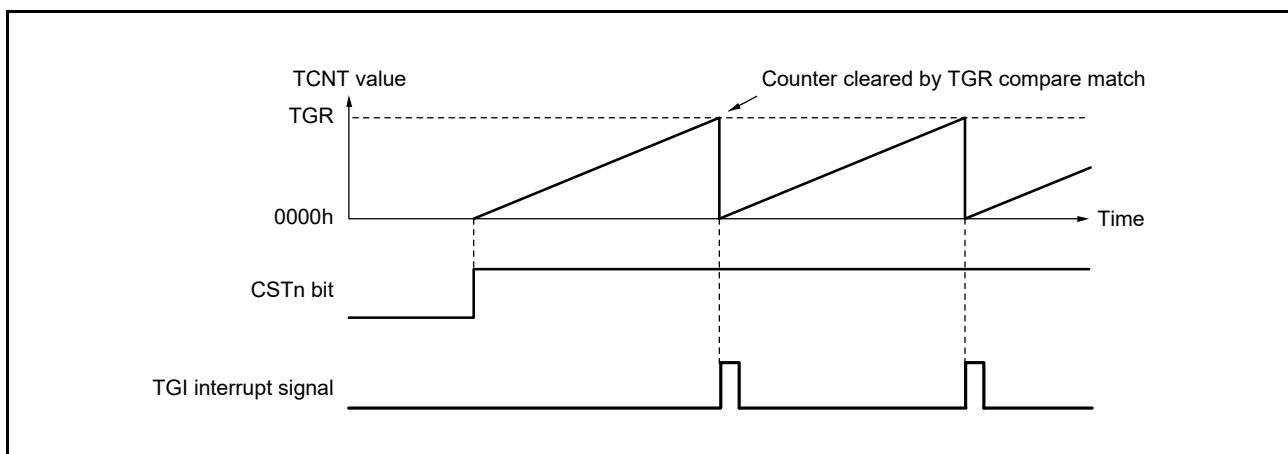

**Figure 22.6 Free-Running Counter Operation**

When compare match is selected as the TCNT clearing source, TCNT for the relevant channel performs periodic count operation. TGR for setting the period is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR[2:0] in TCR. After the settings have been made, TCNT starts up-count operation as a periodic counter when the CSTn bit in TSTRA, TSTRB or MTU5.TSTR is set to 1. When the count matches the value in TGR, TCNT becomes 0000h.

If the value of the corresponding TIER.TGIE bit is 1 at this point, an interrupt request is issued to the CPU. After a compare match, TCNT starts counting up again from 0000h.

Figure 22.7 illustrates periodic counter operation.

**Figure 22.7 Periodic Counter Operation**

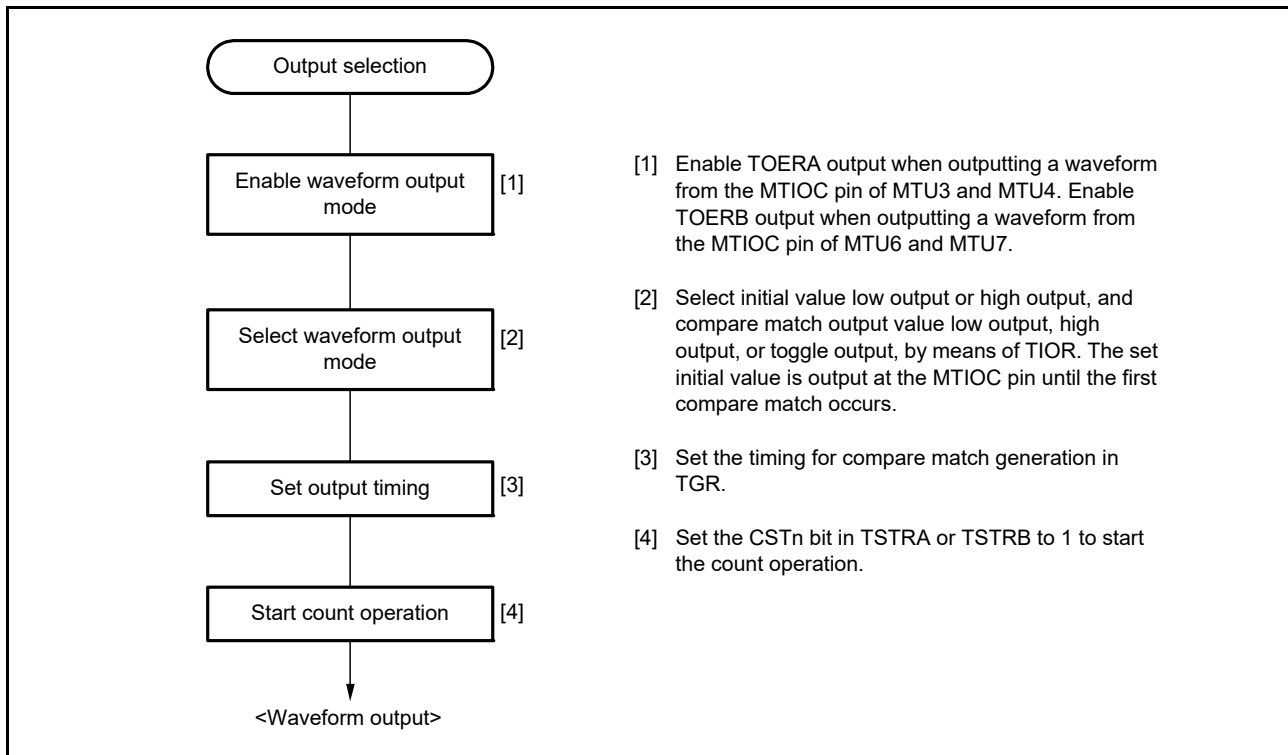

## (2) Waveform Output by Compare Match

Upon compare match, low, high, or toggle output from the corresponding pin can be performed.

### (a) Example of Procedure for Setting Waveform Output by Compare Match

Figure 22.8 shows an example of the procedure for setting waveform output by compare match

**Figure 22.8** Example of Procedure for Setting Waveform Output by Compare Match

(b) Examples of Waveform Output Operation

Figure 22.9 shows an example of low output and high output.

In this example, TCNT has been designated as a free-running counter, and settings have been made so that high is output by compare match A and low is output by compare match B. When the pin level is the same as the specified level, the pin level does not change.

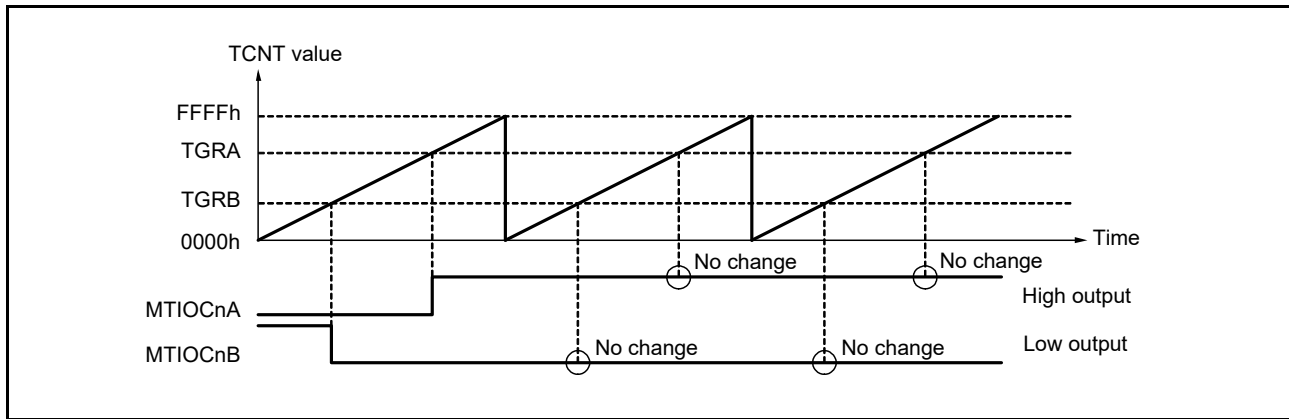

Figure 22.9 Example of low output and high output Operation (n = 0 to 4, 6, 7, 9)

Figure 22.10 shows an example of toggle output.

In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made so that the output is toggled by both compare match A and compare match B.

Figure 22.10 Example of Toggle Output Operation (n = 0 to 4, 6, 7, 9)

### (3) Input Capture Function

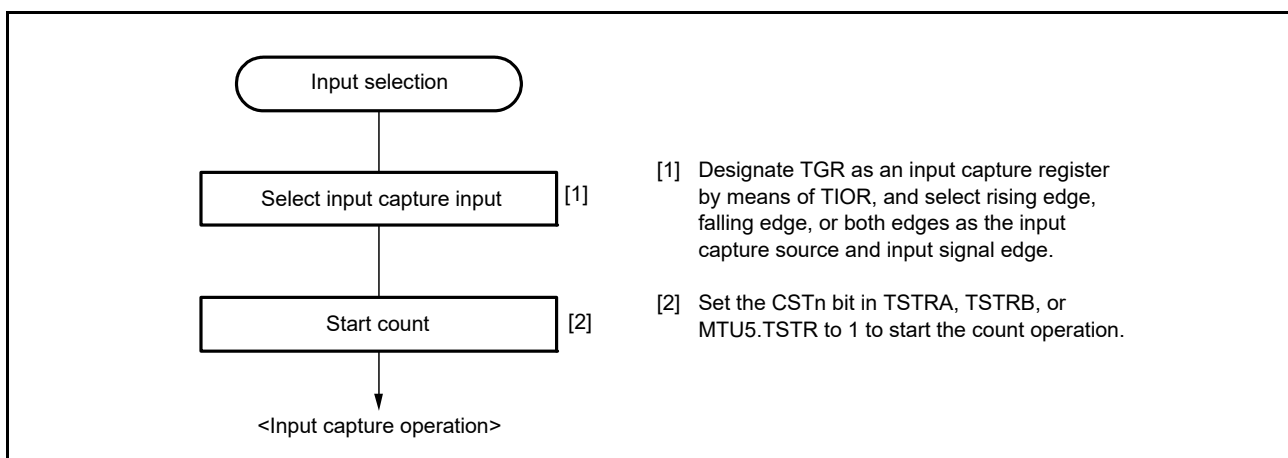

The TCNT value can be transferred to TGR on detection of the MTIOC<sub>n</sub>m pin (n = 0 to 4, 6, 7, 9; m = A to D) or MTIC5<sub>m</sub> pin (m = U, V, W) input edge.

The rising edge, falling edge, or both edges can be selected as the detection edge. For MTU0, MTU1, and MTU9, another channel's count clock or compare match signal can also be specified as the input capture source.

**Note:** When another channel's count clock is used as the input capture input for MTU0, MTU1, and MTU9, PCLKC/1 should not be selected as the count clock used for input capture input. Input capture will not be generated if PCLKC/1 is selected.

#### (a) Example of Input Capture Operation Setting Procedure

Figure 22.11 shows an example of the input capture operation setting procedure.

**Figure 22.11** Example of Input Capture Operation Setting Procedure

(b) Example of Input Capture Operation

Figure 22.12 shows an example of input capture operation.

In this example, both rising and falling edges have been selected as the MTIOcNA pin input capture input edge, the falling edge has been selected as the MTIOcNB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT. (n = 0 to 4, 6, 7, 9)

Figure 22.12 Example of Input Capture Operation (n = 0 to 4, 6, 7, 9)

### 22.3.2 Synchronous Operation

In synchronous operation, the values in multiple TCNT counters can be modified simultaneously (synchronous setting). In addition, multiple TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.

Synchronous operation can increase the number of TGR registers assigned to the same time base.

MTU0 to MTU4, MTU6, MTU7, and MTU9 can all be designated for synchronous operation. MTU5 cannot be used for synchronous operation.

#### (1) Example of Synchronous Operation Setting Procedure

Figure 22.13 shows an example of the synchronous operation setting procedure.

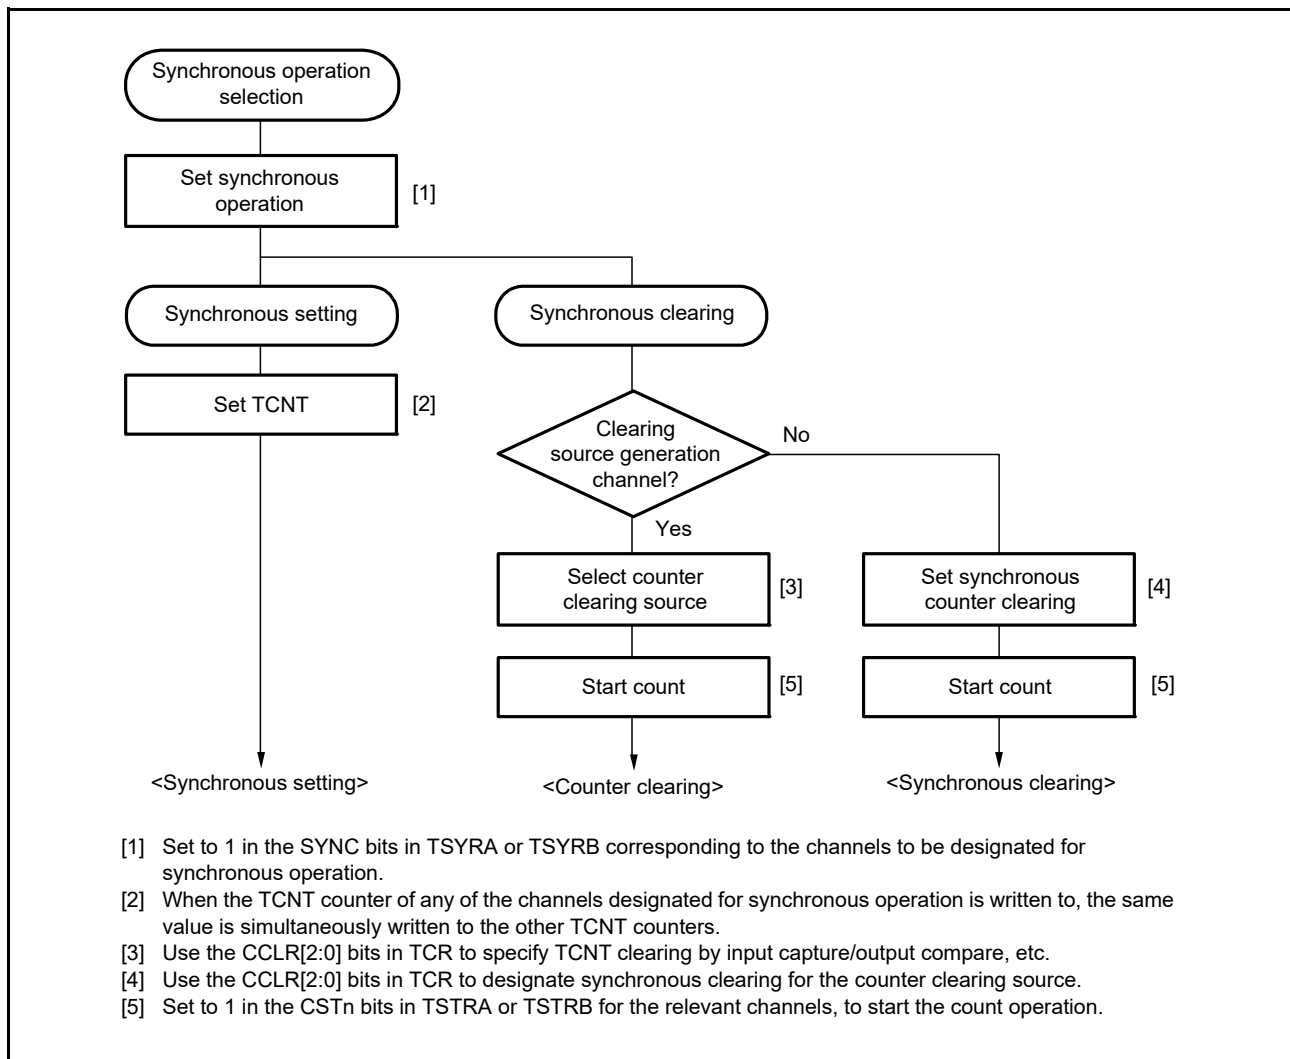

Figure 22.13 Example of Synchronous Operation Setting Procedure

(2) Example of Synchronous Operation

Figure 22.14 shows an example of synchronous operation.

In this example, synchronous operation and PWM mode 1 have been designated for MTU0 to MTU 2, MTU0.TGRB compare match has been set as the counter clearing source in MTU0, and synchronous clearing has been set for the counter clearing source in MTU1 and MTU2.

Three-phase PWM waveforms are output from pins MTIOC0A, MTIOC1A, and MTIOC2A. At this time, synchronous setting and synchronous clearing by MTU0.TGRB compare match are performed for the TCNT counters in MTU0 to MTU2, and the data set in MTU0.TGRB is used as the PWM period.

For details of PWM modes, refer to section 22.3.5, PWM Modes.

Figure 22.14 Example of Synchronous Operation

### 22.3.3 Buffer Operation

Buffer operation, provided for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU9, enables TGRC and TGRD to be used as buffer registers. In MTU0 and MTU9, TGRF can also be used as a buffer register.

Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

Note: MTU0.TGRE and MTU9.TGRE cannot be designated as an input capture register and can only operate as a compare match register.

Table 22.62 shows the register combinations used in buffer operation.

**Table 22.62 Register Combinations in Buffer Operation**

| Channel | Timer General Register | Buffer Register |
|---------|------------------------|-----------------|
| MTU0    | TGRA                   | TGRC            |
|         | TGRB                   | TGRD            |
|         | TGRE                   | TGRF            |
| MTU3    | TGRA                   | TGRC            |
|         | TGRB                   | TGRD            |
| MTU4    | TGRA                   | TGRC            |
|         | TGRB                   | TGRD            |
| MTU6    | TGRA                   | TGRC            |
|         | TGRB                   | TGRD            |
| MTU7    | TGRA                   | TGRC            |
|         | TGRB                   | TGRD            |
| MTU9    | TGRA                   | TGRC            |
|         | TGRB                   | TGRD            |
|         | TGRE                   | TGRF            |

- When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in Figure 22.15.

**Figure 22.15 Compare Match Buffer Operation**

- When TGR is an input capture register

When an input capture occurs, the value in TCNT is transferred to TGR and the value previously held in TGR is transferred to the buffer register.

This operation is illustrated in Figure 22.16.

Figure 22.16 Input Capture Buffer Operation

### (1) Example of Buffer Operation Setting Procedure

Figure 22.17 shows an example of the buffer operation setting procedure.

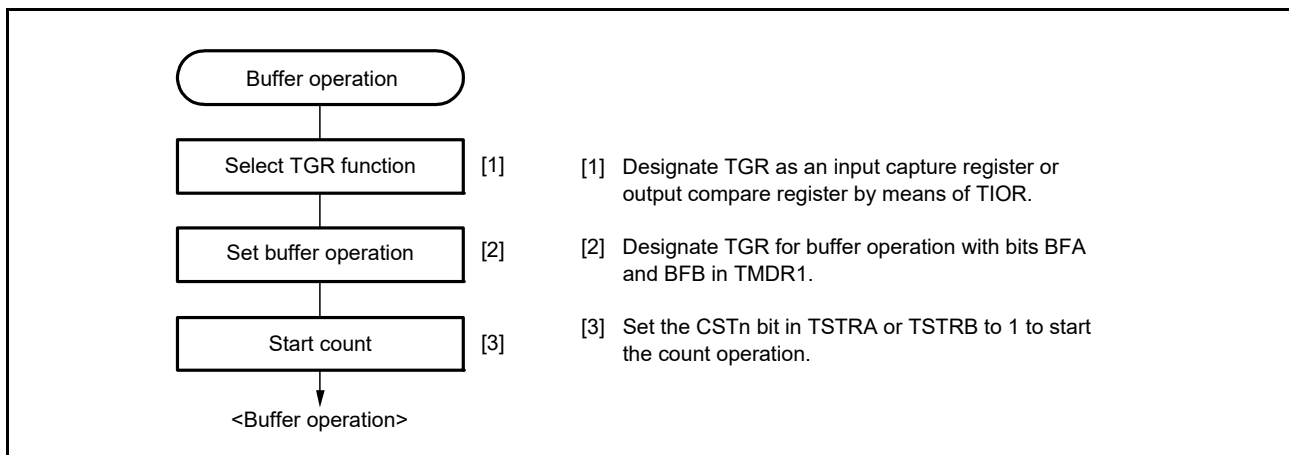

Figure 22.17 Example of Buffer Operation Setting Procedure

### (2) Examples of Buffer Operation

#### (a) When TGR is an Output Compare Register

Figure 22.18 shows an operation example in which PWM mode 1 has been designated for MTU0, and buffer operation has been designated for TGRA and TGRC. The settings used in this example are TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. In this example, the TTSA bit in TBTM is set to 0. As buffer operation has been set, when compare match A occurs, the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details of PWM modes, refer to section 22.3.5, PWM Modes.

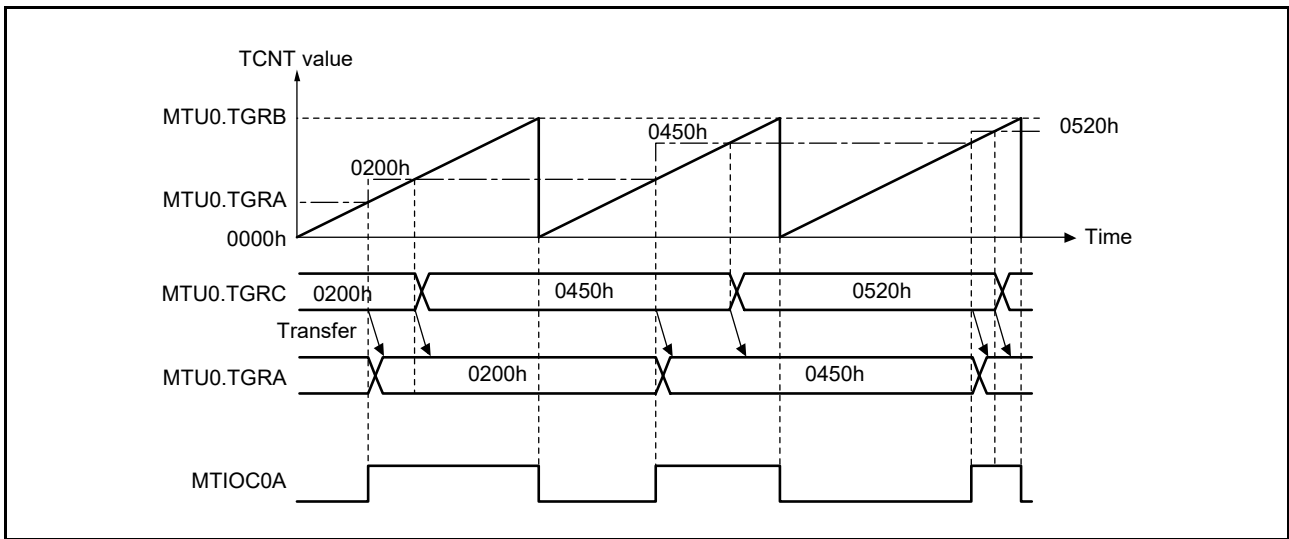

Figure 22.18 Example of Buffer Operation (1)

(b) When TGR is an Input Capture Register

Figure 22.19 shows an operation example in which TGRA has been designated as an input capture register, and buffer operation has been designated for TGRA and TGRC.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the MTIOCnA pin input capture input edge. (n = 0 to 4, 6, 7, 9)

As buffer operation has been set, when the TCNT value is transferred to TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

Figure 22.19 Example of Buffer Operation (2) (n = 0 to 4, 6, 7, 9)

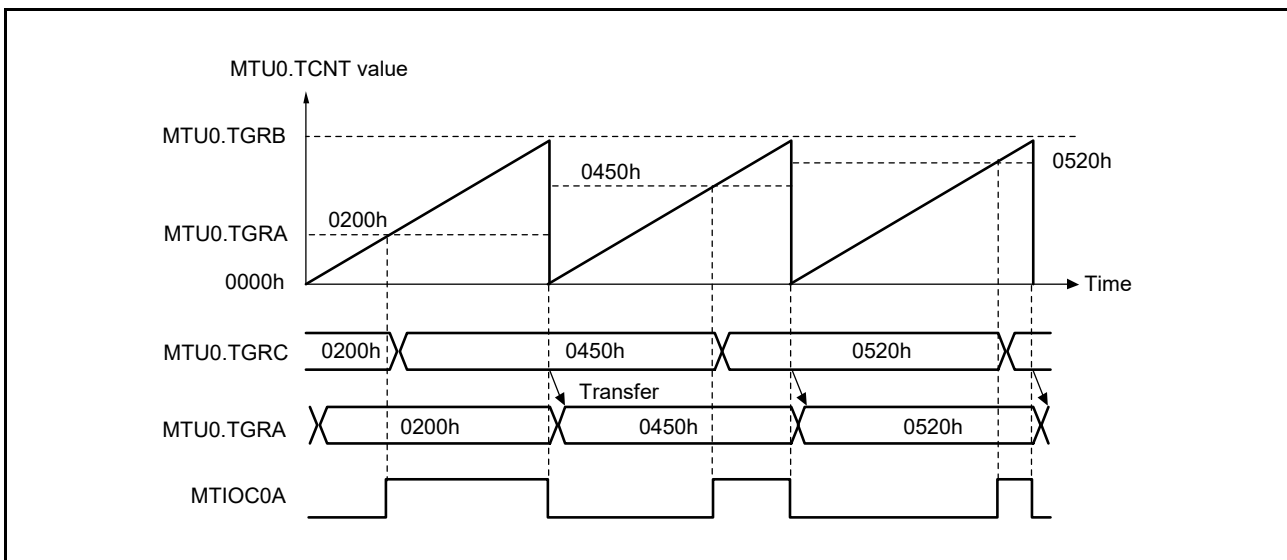

### (3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in Buffer Operation

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode 1 or 2 for MTU0 and MTU9 or in PWM mode 1 for MTU3, MTU4, MTU6, and MTU7 by setting the buffer operation transfer mode registers (MTUn.TBTM (n = 0, 3, 4, 6, 7, 9)). Either compare match (value after reset) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (FFFFh to 0000h)
- When 0000h is written to TCNT during counting
- When TCNT becomes 0000h under the condition specified in the CCLR[2:0] bits in TCR

Note: TBTM must be modified only while TCNT stops.

Figure 22.20 shows an operation example in which PWM mode 1 is designated for MTU0 and buffer operation is designated for MTU0.TGRA and MTU0.TGRC. The settings used in this example are MTU0.TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. The TTSA bit in MTU0.TBTM is set to 1.

**Figure 22.20 Example of Buffer Operation When MTU0.TCNT Clearing is Selected for MTU0.TGRC to MTU0.TGRA Transfer Timing**

### 22.3.4 Cascaded Operation

In cascaded operation, two 16-bit counters in different channels are used together as a 32-bit counter.

There are two functions for connecting MTU1 and MTU2 to use as a 32-bit counter: cascade connection to be set when the MTU1.TMDR3.LWA bit is 0, and cascade connection 32-bit phase counting mode to be set when the MTU1.TMDR3.LWA bit is 1. For details on cascade connection 32-bit phase counting mode, refer to section 22.3.6.2, **Cascade Connection 32-Bit Phase Counting Mode**. This section describes the cascade connection function to be set when the MTU1.TMDR3.LWA bit is 0.

This function operates when the MTU1.TMDR3.LWA bit is set to 0 and the MTU1.TCR.TPSC[2:0] bits are set so that MTU1.TCNT counts at an overflow/underflow of MTU2.TCNT. Underflow occurs only when the MTU2 to which the lower 16 bits allocated is in phase counting mode.

Table 22.63 shows the register combinations used in cascaded operation.

Note: When phase counting mode is set for MTU1, the count clock setting is invalid and the counters operate independently in phase counting mode.

**Table 22.63 Cascaded Combinations**

| Combination   | Upper 16 Bits | Lower 16 Bits |
|---------------|---------------|---------------|
| MTU1 and MTU2 | MTU1.TCNT     | MTU2.TCNT     |

For simultaneous input capture of MTU1.TCNT and MTU2.TCNT during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). The input-capture condition is of edges in the signal produced by taking the logical OR of the input level on the main input pin and the input level on the added input pin. Accordingly, if either is at the high level, a change in the level of the other will not produce an edge for detection. For details, refer to (4), **Cascaded Operation Example (c)**. For input capture in cascade connection, refer to section 22.6.21, **Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection**.

Table 22.64 shows the TICCR setting and input capture input pins.

**Table 22.64 TICCR Setting and Input Capture Input Pins**

| Target Input Capture                      | TICCR Setting                | Input Capture Input Pin |
|-------------------------------------------|------------------------------|-------------------------|
| Input capture from MTU1.TCNT to MTU1.TGRA | I2AE bit = 0 (Initial value) | MTIOC1A                 |
|                                           | I2AE bit = 1                 | MTIOC1A, MTIOC2A        |
| Input capture from MTU1.TCNT to MTU1.TGRB | I2BE bit = 0 (Initial value) | MTIOC1B                 |
|                                           | I2BE bit = 1                 | MTIOC1B, MTIOC2B        |
| Input capture from MTU2.TCNT to MTU2.TGRA | I1AE bit = 0 (Initial value) | MTIOC2A                 |
|                                           | I1AE bit = 1                 | MTIOC2A, MTIOC1A        |
| Input capture from MTU2.TCNT to MTU2.TGRB | I1BE bit = 0 (Initial value) | MTIOC2B                 |
|                                           | I1BE bit = 1                 | MTIOC2B, MTIOC1B        |

(1) Example of Cascaded Operation Setting Procedure

Figure 22.21 shows an example of the cascaded operation setting procedure.

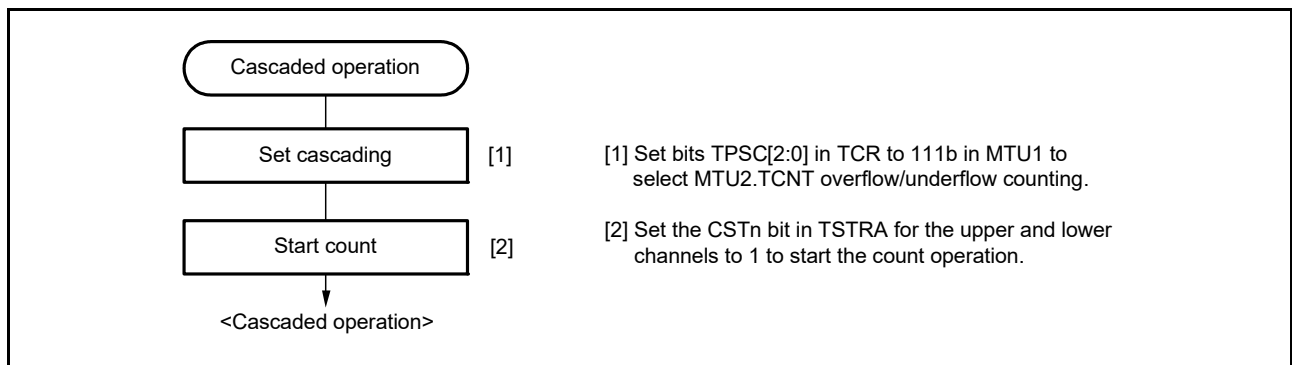

Figure 22.21 Cascaded Operation Setting Procedure

(2) Cascaded Operation Example (a)

Figure 22.22 shows the operation when MTU1.TCNT is set for counting at MTU2.TCNT overflow/underflow and MTU2 is set for phase counting mode 1 while MTU1.TCNT and MTU2.TCNT are cascaded. MTU1.TCNT is incremented by MTU2.TCNT overflow and decremented by MTU2.TCNT underflow.

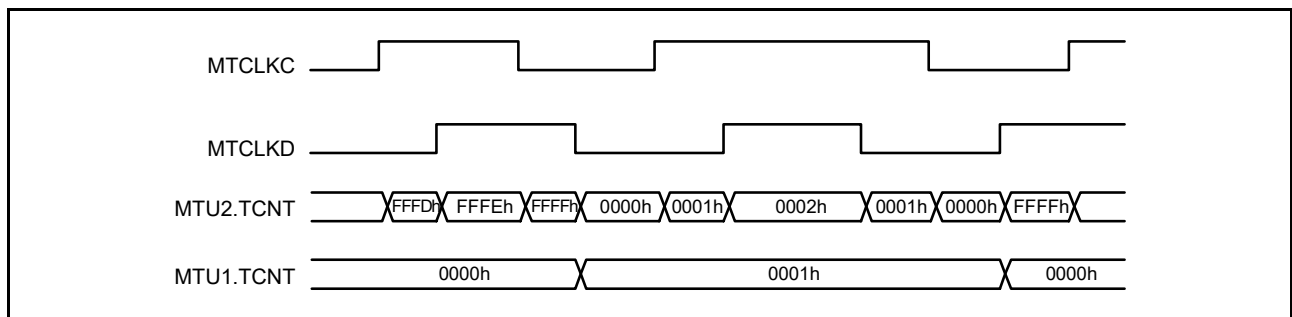

Figure 22.22 Cascaded Operation Example (a)

(3) Cascaded Operation Example (b)

Figure 22.23 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the I2AE bit in TICCR has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the MTU1.TIOR.IOA[3:0] bits have selected the MTIOC1A rising edge for the input capture timing while the MTU2.TIOR.IOA[3:0] bits have selected the MTIOC2A rising edge for the input capture timing. Under these conditions, the rising edge of both MTIOC1A and MTIOC2A is used for the MTU1.TGRA input capture condition. For the MTU2.TGRA input capture condition, the MTIOC2A rising edge is used.

Figure 22.23 Cascaded Operation Example (b)

(4) Cascaded Operation Example (c)

Figure 22.24 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE and I1AE bits have been set to 1 to include the MTIOC2A and MTIOC1A pins in the MTU1.TGRA and MTU2.TGRA input capture conditions, respectively. In this example, the IOA[3:0] bits in both MTU1.TIOR and MTU2.TIOR have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of MTIOC1A and MTIOC2A input is used for the MTU1.TGRA and MTU2.TGRA input capture conditions.

Figure 22.24 Cascaded Operation Example (c)

(5) Cascaded Operation Example (d)

Figure 22.25 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE bit has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the IOA[3:0] bits in MTU1.TIOR have selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing while the IOA[3:0] bits in MTU2.TIOR have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, as MTU1.TIOR has selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing, the MTIOC2A edge is not used for MTU1.TGRA input capture condition although the I2AE bit in TICCR has been set to 1.

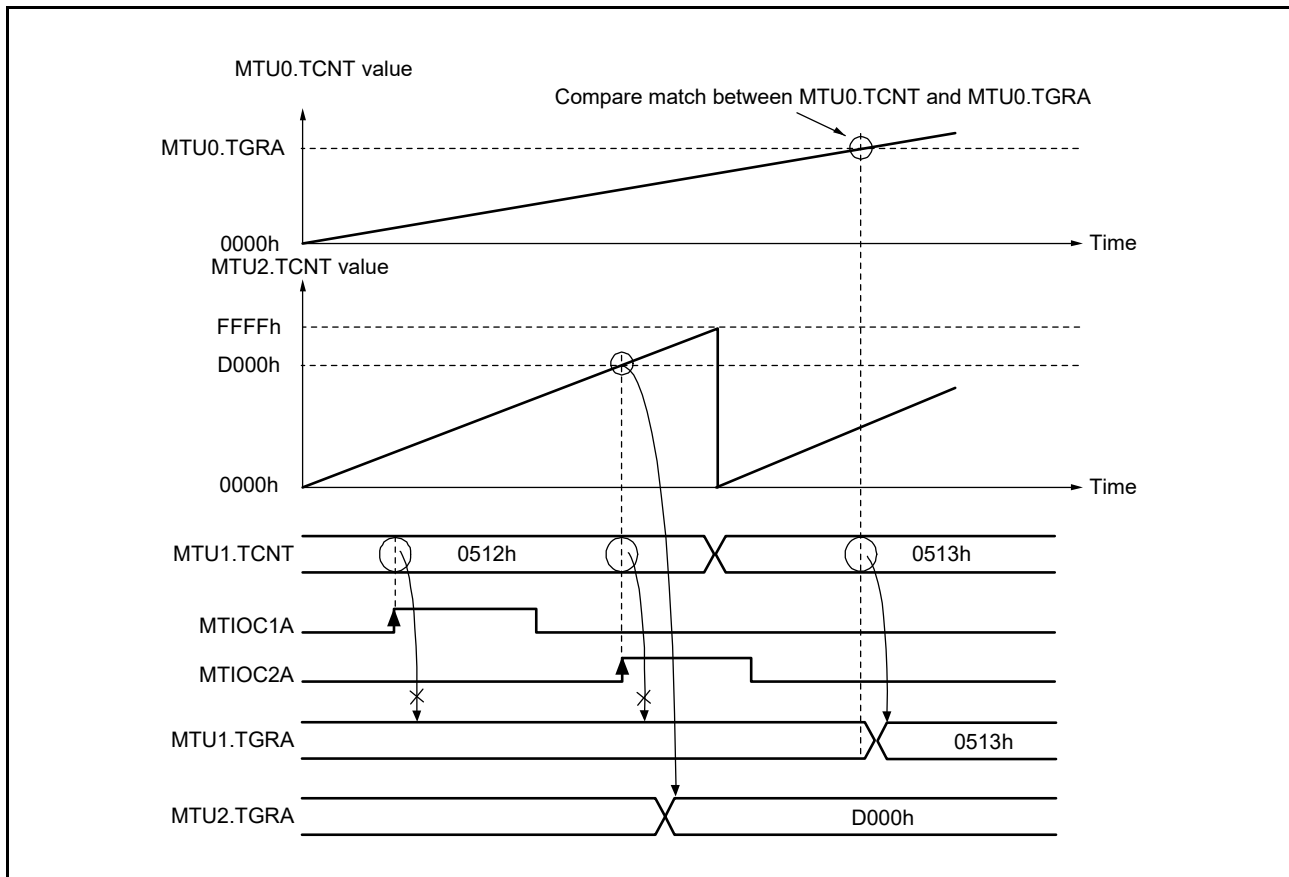

Figure 22.25 Cascaded Operation Example (d)

### 22.3.5 PWM Modes

PWM modes are provided to output PWM waveforms from the external pins. The output level can be selected as low, high, or toggle output in response to a compare match of each TGR.

PWM waveforms in the range of 0% to 100% duty cycle can be output according to the TGR settings.

By designating TGR compare match as the counter clearing source, the PWM period can be specified in that register.

Every channel except MTU5 can be set to PWM mode independently. Channels set to PWM mode can perform synchronous operation with each other or other channels set to any other mode.

There are two PWM modes as described below.

#### (a) PWM Mode 1

PWM waveforms are output from the MTIOCnA and MTIOCnC pins by pairing TGRA with TGRB and TGRC with TGRD. The levels specified by the TIOR.IOA[3:0] and IOC[3:0] bits are output from the MTIOCnA and MTIOCnC pins at compare matches A and C, and the level specified by the TIOR.IOB[3:0] and IOD[3:0] bits are output at compare matches B and D ( $n = 0$  to 4, 6, 7, 9). The initial output value is set in TGRA or TGRC. If the values set in paired TGRs are identical, the output value does not change even when a compare match occurs.

In PWM mode 1, PWM waveforms in up to 14 phases can be output.

## (b) PWM Mode 2

PWM waveform output is generated using one TGR as the period register and the others as duty registers. The level specified in TIOR is output at compare matches. Upon counter clearing by a period register compare match, the initial value set in TIOR is output from each pin. If the values set in the period and duty registers are identical, the output value does not change even when a compare match occurs.

Up to 12 phases of PWM waveforms can be output by combining synchronous clearing of channels that cannot be set to PWM mode 2 as synchronous operation.

The correspondence between PWM output pins and registers is shown in Table 22.65.

**Table 22.65 PWM Output Registers and Output Pins**

| Channel | Register | Output Pins |                    |
|---------|----------|-------------|--------------------|
|         |          | PWM Mode 1  | PWM Mode 2         |
| MTU0    | TGRA     | MTIOC0A     | MTIOC0A            |
|         | TGRB     |             | MTIOC0B            |
|         | TGRC     | MTIOC0C     | MTIOC0C            |
|         | TGRD     |             | MTIOC0D            |
| MTU1    | TGRA     | MTIOC1A     | MTIOC1A            |
|         | TGRB     |             | MTIOC1B            |
| MTU2    | TGRA     | MTIOC2A     | MTIOC2A            |
|         | TGRB     |             | MTIOC2B            |
| MTU3    | TGRA     | MTIOC3A     | Setting prohibited |
|         | TGRB     |             |                    |
|         | TGRC     | MTIOC3C     |                    |
|         | TGRD     |             |                    |
| MTU4    | TGRA     | MTIOC4A     |                    |
|         | TGRB     |             |                    |
|         | TGRC     | MTIOC4C     |                    |
|         | TGRD     |             |                    |
| MTU6    | TGRA     | MTIOC6A     |                    |
|         | TGRB     |             |                    |
|         | TGRC     | MTIOC6C     |                    |
|         | TGRD     |             |                    |
| MTU7    | TGRA     | MTIOC7A     |                    |
|         | TGRB     |             |                    |
|         | TGRC     | MTIOC7C     |                    |
|         | TGRD     |             |                    |
| MTU9    | TGRA     | MTIOC9A     | MTIOC9A            |
|         | TGRB     |             | MTIOC9B            |
|         | TGRC     | MTIOC9C     | MTIOC9C            |
|         | TGRD     |             | MTIOC9D            |

Note: In PWM mode 2, PWM waveform output is not possible for the TGR register in which the PWM period is set.

(1) Example of PWM Mode Setting Procedure

Figure 22.26 shows an example of the PWM mode setting procedure.

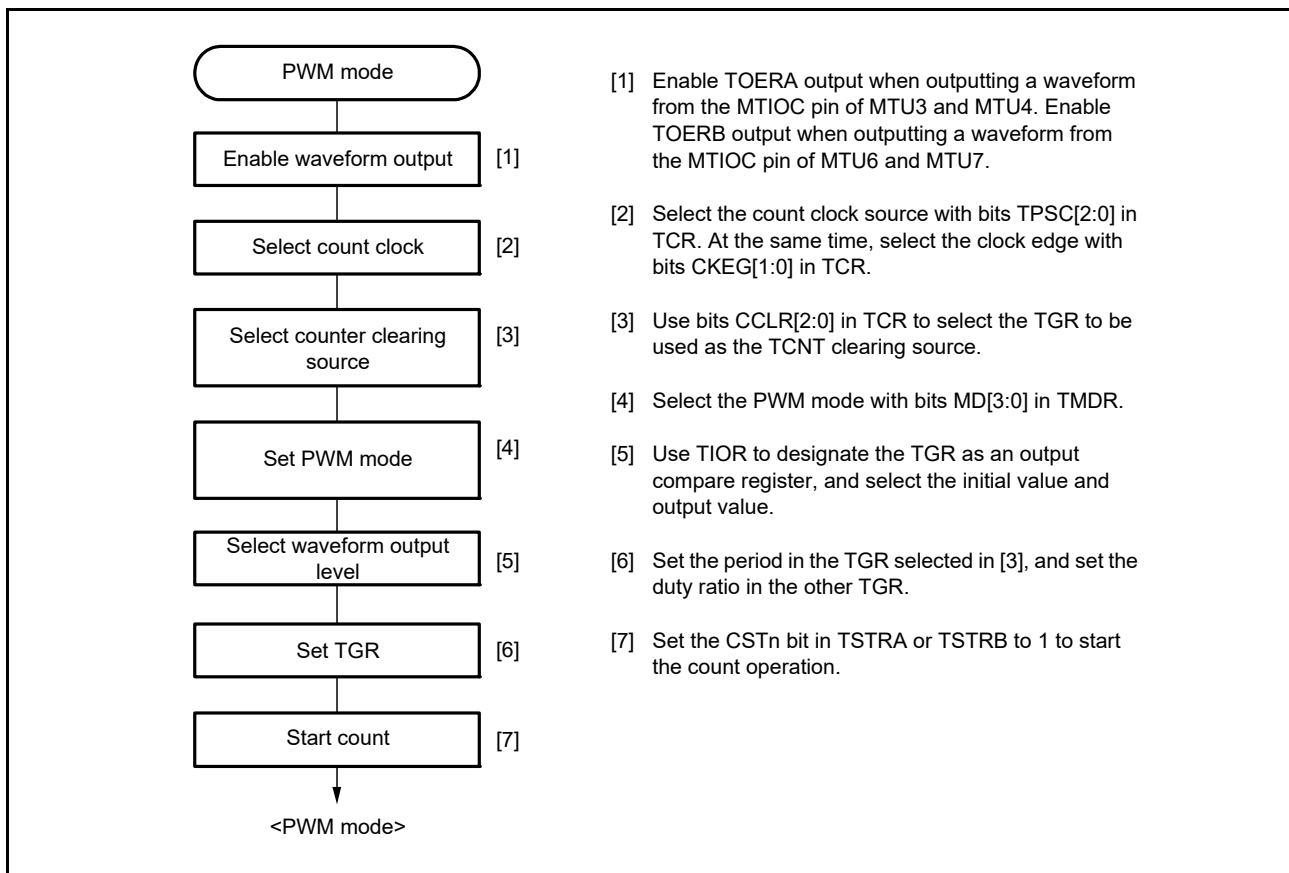

Figure 22.26 Example of PWM Mode Setting Procedure

(2) Examples of PWM Mode Operation

Figure 22.27 shows an example of operation in PWM mode 1.

In this example, TGRA compare match is set as the TCNT clearing source, 0 is set as the initial output value and output value for TGRA, and 1 is set as the output value for TGRB.

In this case, the value set in TGRA is used as the period, and the value set in TGRB is used as the duty ratio.

Figure 22.27 Example of PWM Mode 1 Operation (n = 0 to 4, 6, 7, 9)

Figure 22.28 shows an example of operation in PWM mode 2.

In this example, synchronous operation is designated for MTU0 and MTU1, MTU1.TGRB compare match is set as the TCNT clearing source, and low is set as the initial output value and high as the output value for the other TGR registers (MTU0.TGRA to MTU0.TGRD and MTU1.TGRA), outputting 5-phase PWM waveforms.

In this case, the value set in MTU1.TGRB is used as the period, and the values set in the other TGRs are used as the duty ratio.

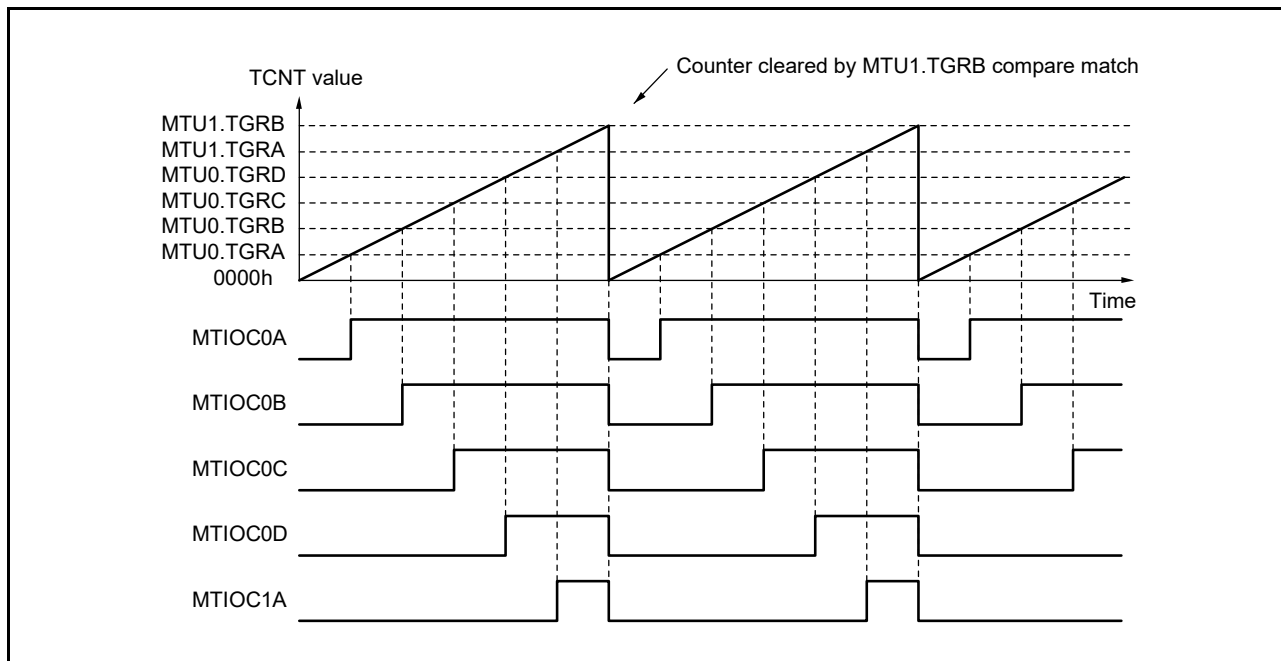

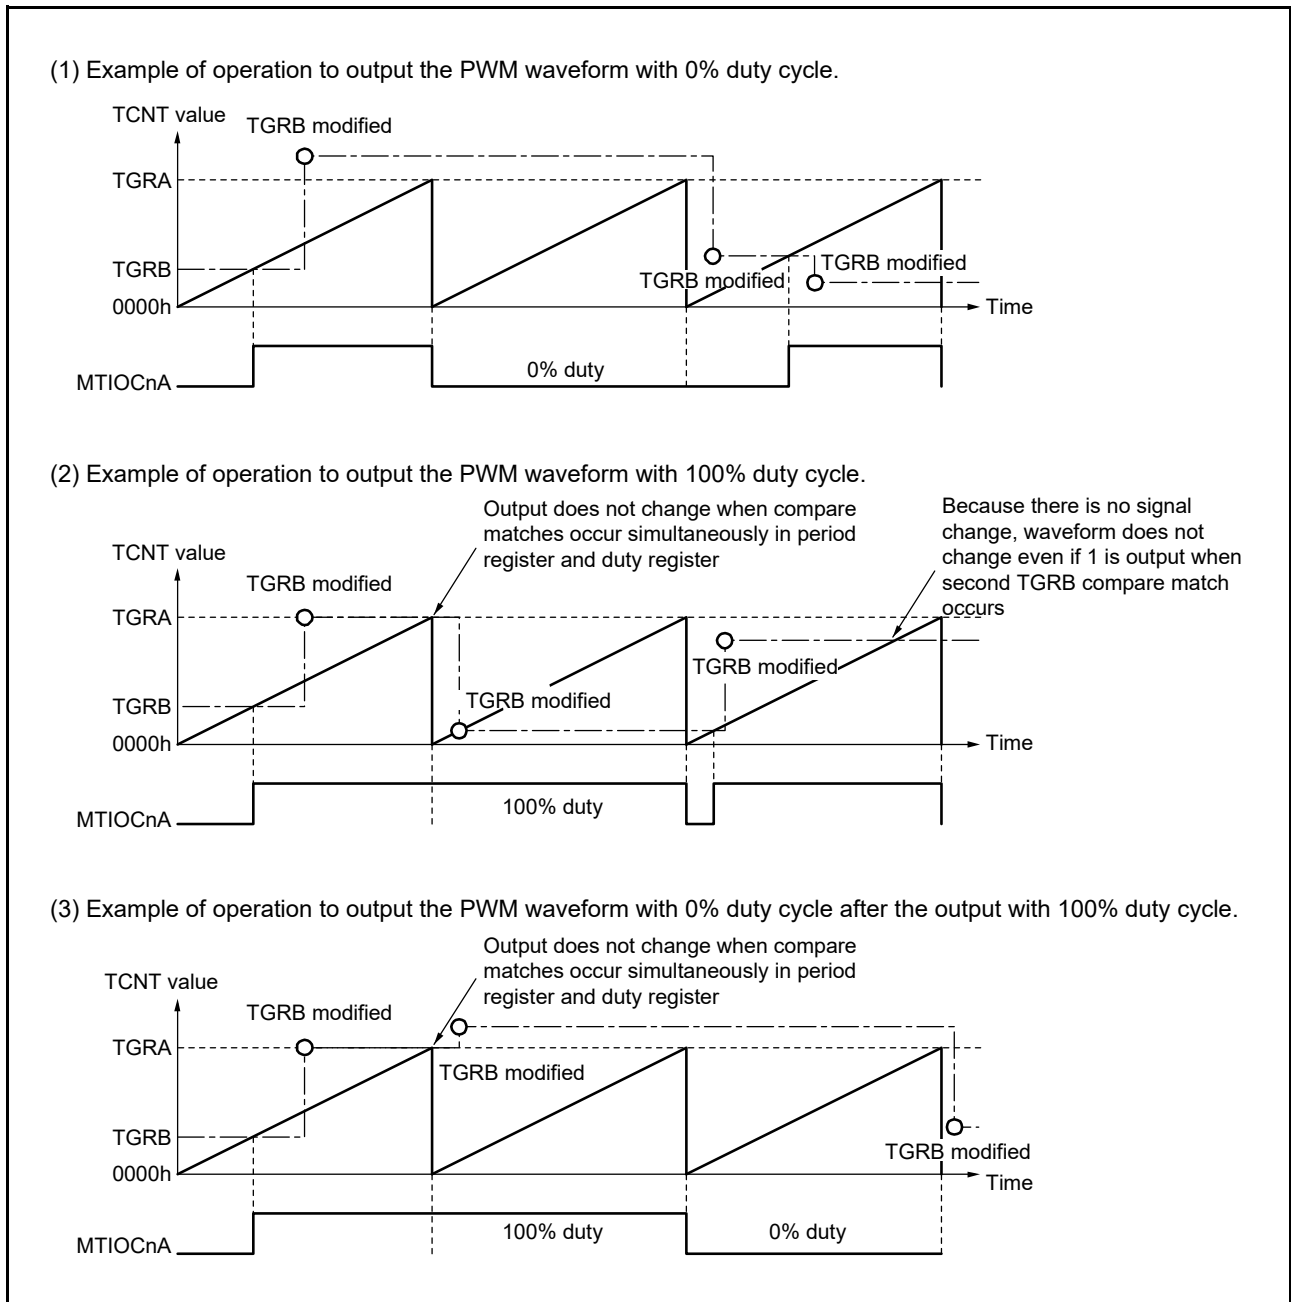

Figure 22.28 Example of PWM Mode 2 Operation

Figure 22.29 shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode 1. In this example, TGRA compare match is set as the TCNT clearing source, a low level is set as the initial output value for TGRA, and a high level is set as the output value for TGRB.

**Figure 22.29** Examples of PWM Mode Operation (PWM Waveform Output with 0% Duty and 100% Duty) (n = 0 to 4, 6, 7, 9)

### 22.3.6 Phase Counting Mode

There are two phase counting modes: 16-bit phase counting mode in which MTU1 and MTU2 operate independently, and cascade connection 32-bit phase counting mode in which MTU1 and MTU2 are cascaded.

In phase counting mode, the phase difference between two external input clocks is detected and the corresponding TCNT is incremented or decremented.

Two external clock input pins for each phase counting mode are not affected by the settings of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. The two external clock input pins used in 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2 can be selected by MTU1.TMDR3.PHCKSEL. In a phase counting mode other than 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2, MTCLKA and MTCLKB are selected for A-phase and B-phase, respectively. In phase counting mode, the external clock pins MTCLKA, MTCLKB, MTCLKC, and MTCLKD are used for two-phase encoder pulse input.

Table 22.66 lists the external clock input pins to be connected in each phase counting mode.

**Table 22.66 Clock Input Pins in Phase Counting Mode**

| Phase Counting Mode                           | TMDR3.PHCKSEL bit | External Clock Input Pins |         |
|-----------------------------------------------|-------------------|---------------------------|---------|
|                                               |                   | A-Phase                   | B-Phase |
| MTU1 16-bit phase counting mode               | x (Don't care)    | MTCLKA                    | MTCLKB  |
| MTU2 16-bit phase counting mode               | 0                 | MTCLKA                    | MTCLKB  |
|                                               | 1 (initial value) | MTCLKC                    | MTCLKD  |
| Cascade connection 32-bit phase counting mode | 0                 | MTCLKA                    | MTCLKB  |
|                                               | 1 (initial value) | MTCLKC                    | MTCLKD  |

#### 22.3.6.1 16-Bit Phase Counting Mode

When the MTU1.TMDR3.LWA is 0, 16-bit phase counting mode can be set individually for MTU1 and MTU2.

In 16-bit phase counting mode, the phase difference between two external input clocks is detected and the 16-bit counter TCNT of the corresponding channel is incremented or decremented.

When 16-bit phase counting mode is specified, an external clock is selected as the count clock and TCNT operates as an up-counter/down-counter regardless of the setting of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. However, the functions of TCR.CCLR[1:0], TIOR, TIER, and TGR are enabled, and input capture/compare match and interrupt functions can be used.

These external input pins can be used for two-phase encoder pulse input.

When an overflow occurs while TCNT is counting up and the corresponding TIER.TCIEV bit is 1, a TCIV interrupt is generated. When an underflow occurs while TCNT is counting down and the corresponding TIER.TCIEU bit is 1, a TCIU interrupt is generated.

The TSR.TCFD flag is the count direction flag. Read the TCFD flag to check whether TCNT is counting up and down.

(1) Example of 16-Bit Phase Counting Mode Setting Procedure

Figure 22.30 shows an example of the phase counting mode setting procedure.

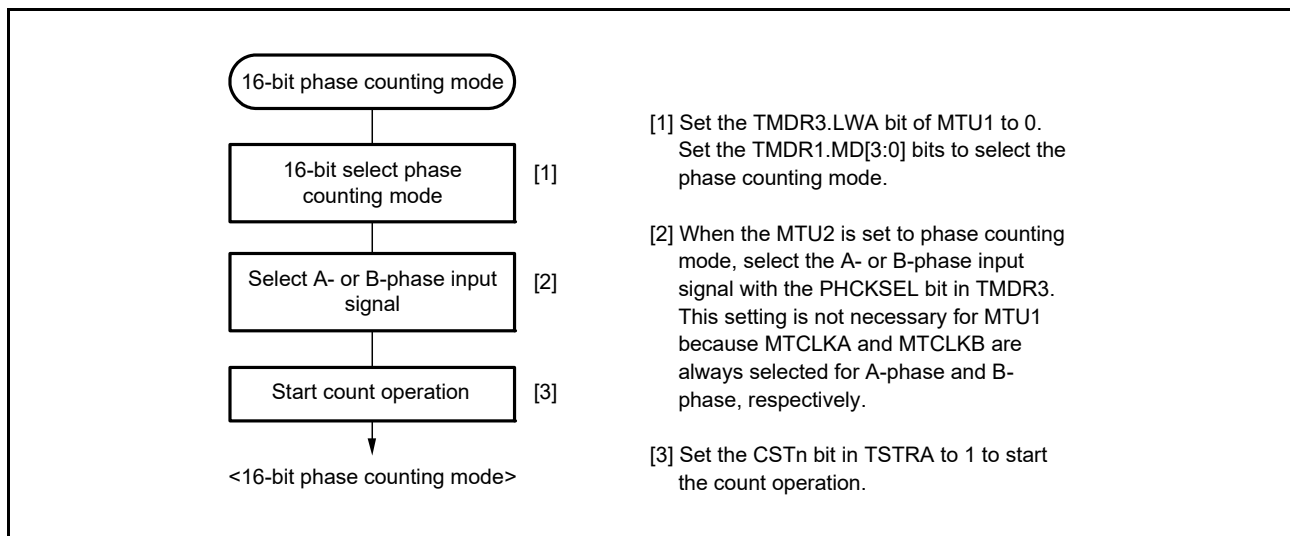

Figure 22.30 Example of 16-Bit Phase Counting Mode Setting Procedure

(2) Examples of 16-Bit Phase Counting Mode Operation

In phase counting mode, TCNT is incremented or decremented according to the phase difference between two external clocks. There are five modes according to the count conditions. Each mode operates under the condition PHCKSEL = 1, which means the phase clock for MTU1 is input from MTCLKA or MTCLKB and that for MTU2 is input from MTCLKC or MTCLKD.

(a) Phase Counting Mode 1

Figure 22.31 shows an example of operation in phase counting mode 1, and Table 22.67 summarizes the TCNT up-counting and down-counting conditions.

Figure 22.31 Example of Operation in Phase Counting Mode 1

Table 22.67 Up-Counting and Down-Counting Conditions in Phase Counting Mode 1

| MTCLKA (MTU1)<br>MTCLKC (MTU2) | MTCLKB (MTU1)<br>MTCLKD (MTU2) | Operation     |
|--------------------------------|--------------------------------|---------------|
| High                           |                                | Up-counting   |
| Low                            |                                |               |
|                                | Low                            |               |
|                                | High                           |               |
| High                           |                                | Down-counting |
| Low                            |                                |               |
|                                | High                           |               |
|                                | Low                            |               |

### (3) 16-Bit Phase Counting Mode Application Example

Figure 22.41 shows an example in which MTU1 is in phase counting mode, and MTU1 is coupled with MTU0 to input 2-phase encoder pulses of a servo motor in order to detect position or speed.

MTU1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to MTCLKA and MTCLKB.

In MTU0, MTU0.TGRC compare match is specified as the TCNT clearing source and MTU0.TGRA and MTU0.TGRC are used for the compare match function and are set with the speed control period and position control period.

MTU0.TGRB is used for input capture, with MTU0.TGRB and MTU0.TGRD operating in buffer mode. The MTU1 count clock is designated as the MTU0.TGRB input capture source, and the widths of 2-phase encoder 4-multiplication pulses are detected.

MTU1.TGRA and MTU1.TGRB for MTU1 are designated for the input capture function and MTU0.TGRA and MTU0.TGRC compare matches in MTU0 are selected as the input capture sources to store the up/down-counter values for the control periods.

This procedure enables the accurate detection of position and speed.

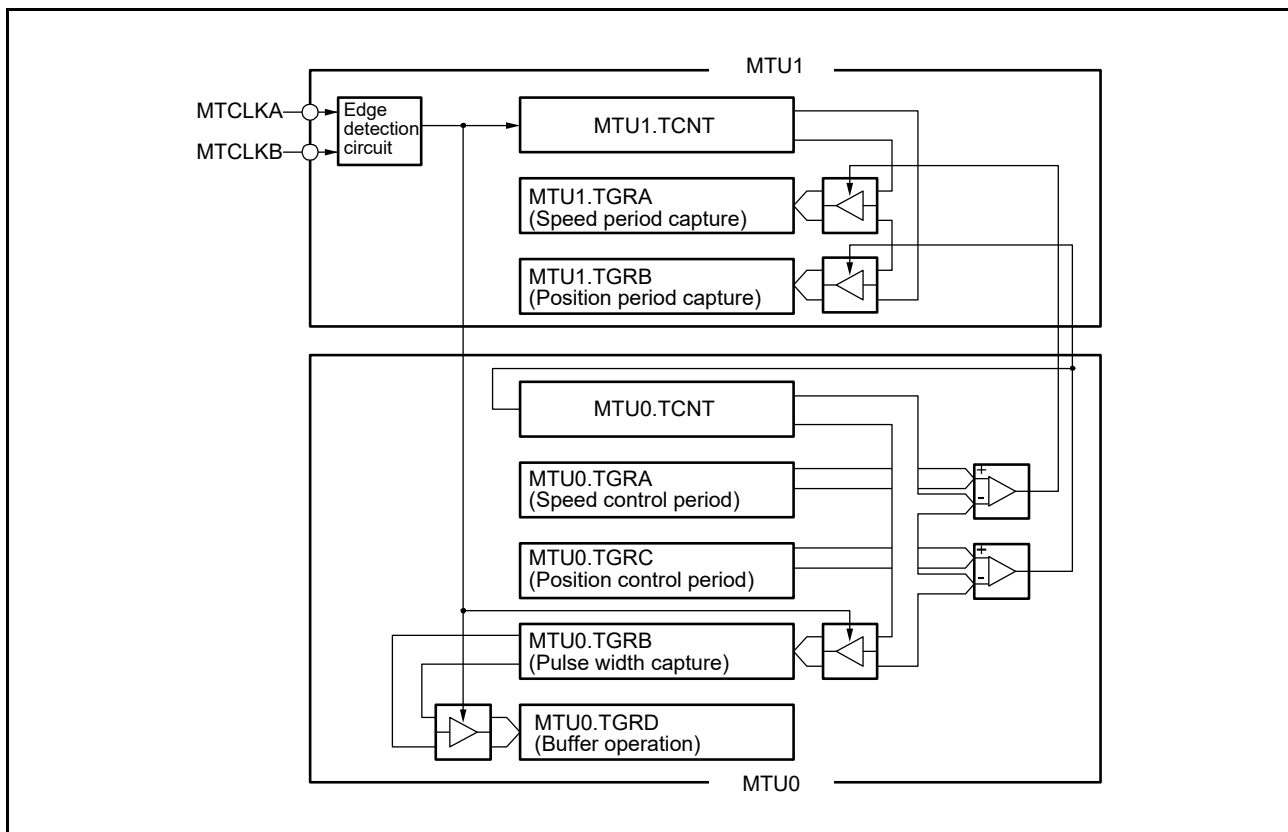

Figure 22.41 16-Bit Phase Counting Mode Application Example

### 22.3.6.2 Cascade Connection 32-Bit Phase Counting Mode

When MTU1 is set to phase counting mode by setting  $MTU1.TMDR3.LWA = 1$ , MTU1 and MTU2 are connected to operate in cascade connection 32-bit phase counting mode. When this mode is used, the TCR, TCR2, TIOR, TIER, TGR, and TSR registers are controlled by MTU1 and the settings of MTU2 are disabled. Refer to Figure 22.42 for the procedure for setting cascade connection 32-bit phase counting mode.

Refer to section 22.3.4, Cascaded Operation, for details on the cascade connection function for connecting MTU1 and MTU2 in a mode other than cascade connection 32-bit phase counting mode.

#### (1) Example of Setting Cascade Connection 32-Bit Phase Counting Mode

Figure 22.42 shows an example of the procedure for setting cascade connection 32-bit phase counting mode.

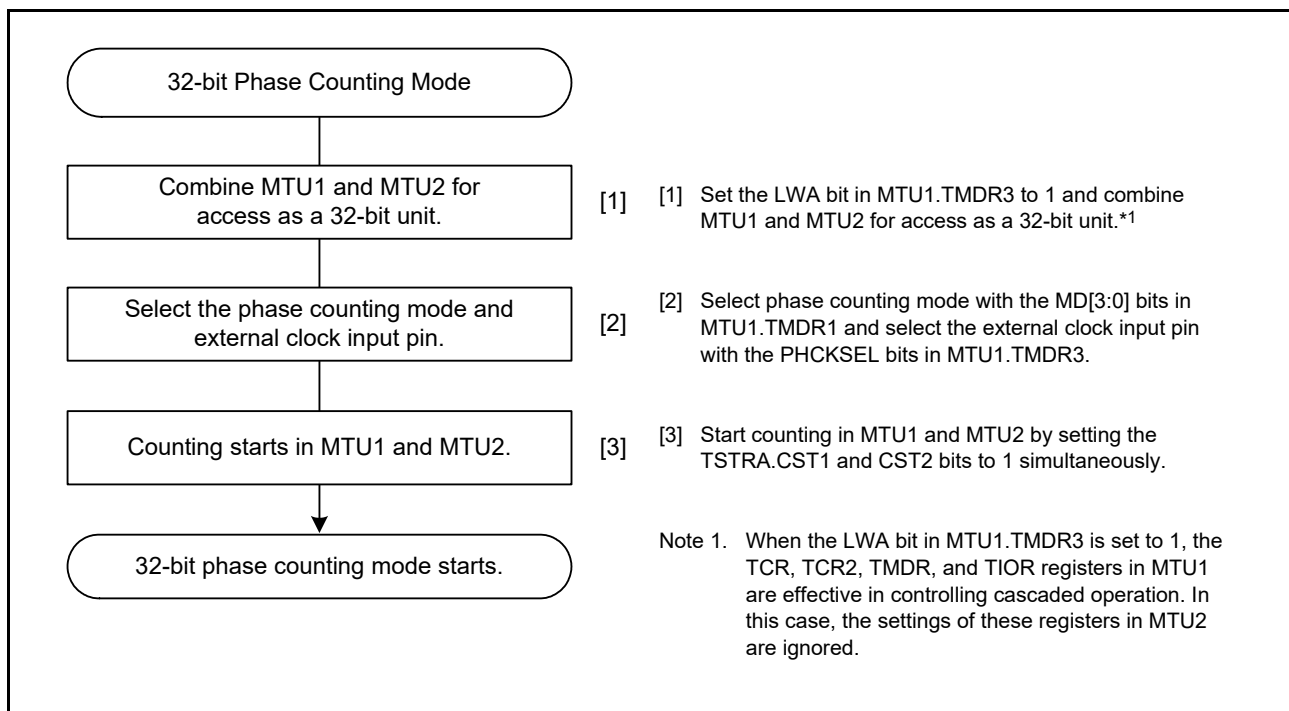

Figure 22.42 Procedure for Setting Cascade Connection 32-Bit Phase Counting Mode

### 22.3.7 Reset-Synchronized PWM Mode

In the reset-synchronized PWM mode, six phases of positive and negative PWM waveforms (12 phases in total) that share a common wave transition point can be output by combining MTU3 and MTU4 and MTU6 and MTU7.

When set for reset-synchronized PWM mode, the MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D pins function as PWM output pins and timer counters 3 and 6 (MTU3.TCNT and MTU6.TCNT) functions as an up-counter.

Table 22.72 shows the PWM output pins used. Table 22.73 shows the settings of the registers.

**Table 22.72 Output Pins for Reset-Synchronized PWM Mode**

| Channel | Output Pin | Description                                                 |
|---------|------------|-------------------------------------------------------------|
| MTU3    | MTIOC3A    | Toggle output synchronized with PWM period (or I/O port)    |
|         | MTIOC3B    | PWM output pin 1                                            |
|         | MTIOC3D    | PWM output pin 1' (negative-phase waveform of PWM output 1) |
| MTU4    | MTIOC4A    | PWM output pin 2                                            |
|         | MTIOC4C    | PWM output pin 2' (negative-phase waveform of PWM output 2) |
|         | MTIOC4B    | PWM output pin 3                                            |
|         | MTIOC4D    | PWM output pin 3' (negative-phase waveform of PWM output 3) |
| MTU6    | MTIOC6A    | Toggle output synchronized with PWM period (or I/O port)    |
|         | MTIOC6B    | PWM output pin 4                                            |
|         | MTIOC6D    | PWM output pin 4' (negative-phase waveform of PWM output 4) |
| MTU7    | MTIOC7A    | PWM output pin 5                                            |
|         | MTIOC7C    | PWM output pin 5' (negative-phase waveform of PWM output 5) |
|         | MTIOC7B    | PWM output pin 6                                            |
|         | MTIOC7D    | PWM output pin 6' (negative-phase waveform of PWM output 6) |

**Table 22.73 Register Settings for Reset-Synchronized PWM Mode**

| Register  | Setting                                                                                     |
|-----------|---------------------------------------------------------------------------------------------|
| MTU3.TCNT | Initial setting (0000h)                                                                     |
| MTU4.TCNT | Initial setting (0000h)                                                                     |
| MTU3.TGRA | Set the count period for MTU3.TCNT                                                          |
| MTU3.TGRB | Set the transition point of the PWM waveform to be output from the MTIOC3B and MTIOC3D pins |
| MTU4.TGRA | Set the transition point of the PWM waveform to be output from the MTIOC4A and MTIOC4C pins |
| MTU4.TGRB | Set the transition point of the PWM waveform to be output from the MTIOC4B and MTIOC4D pins |
| MTU6.TCNT | Initial setting (0000h)                                                                     |
| MTU7.TCNT | Initial setting (0000h)                                                                     |
| MTU6.TGRA | Set the count period for MTU6.TCNT                                                          |
| MTU6.TGRB | Set the transition point of the PWM waveform to be output from the MTIOC6B and MTIOC6D pins |
| MTU7.TGRA | Set the transition point of the PWM waveform to be output from the MTIOC7A and MTIOC7C pins |
| MTU7.TGRB | Set the transition point of the PWM waveform to be output from the MTIOC7B and MTIOC7D pins |

(1) Example of Procedure for Setting Reset-Synchronized PWM Mode

Figure 22.43 shows an example of procedure for setting the reset-synchronized PWM mode.

Figure 22.43 Procedure for Selecting Reset-Synchronized PWM Mode

(2) Example of Reset-Synchronized PWM Mode Operation

Figure 22.44 shows an example of operation in the reset-synchronized PWM mode.

MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) operate as up-counters. The counters are cleared when a compare match occurs between MTU3.TCNT (MTU6.TCNT) and MTU3.TGRA (MTU6.TGRA), and then begin incrementing from 0000h. The output from the PWM pins toggles every time a compare match occurs in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB) and the counters are cleared.

**Figure 22.44 Example of Reset-Synchronized PWM Mode Operation**  
 (When OLSN = 1 and OLSP = 1 in MTU3.TOCR1 and MTU4.TOCR1)

### 22.3.8 Complementary PWM Mode

In complementary PWM mode, dead time can be set for PWM waveforms to be output. The dead time is the period during which the upper and lower arm transistors are set to the inactive level in order to prevent short-circuiting of the arms.

Six positive-phase and six negative-phase PWM waveforms (12 phases in total) with dead time can be output by combining MTU3/ MTU4 and MTU6/MTU7. PWM waveforms without dead time can also be output.

In complementary PWM mode, MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D pins function as PWM output pins, and the MTIOC3A and MTIOC6A pins can be set for toggle output synchronized with the PWM period.

MTU3.TCNT, MTU4.TCNT, MTU6.TCNT, and MTU7.TCNT function as up/down-counters.

Table 22.74 shows the PWM output pins used. Table 22.75 shows the settings of the registers used.

A function to directly cut off the PWM output by using an external signal is supported as a port function.

**Table 22.74 Output Pins for Complementary PWM Mode**

| Channel | Output Pin | Description                                                        |
|---------|------------|--------------------------------------------------------------------|
| MTU3    | MTIOC3A    | Toggle output synchronized with PWM period (or I/O port)           |
|         | MTIOC3B    | PWM output pin 1                                                   |
|         | MTIOC3C    | I/O port*1                                                         |
|         | MTIOC3D    | PWM output pin 1' (negative-phase waveform output of PWM output 1) |
| MTU4    | MTIOC4A    | PWM output pin 2                                                   |
|         | MTIOC4C    | PWM output pin 2' (negative-phase waveform output of PWM output 1) |
|         | MTIOC4B    | PWM output pin 3                                                   |
|         | MTIOC4D    | PWM output pin 3' (negative-phase waveform output of PWM output 1) |
| MTU6    | MTIOC6A    | Toggle output synchronized with PWM period (or I/O port)           |
|         | MTIOC6B    | PWM output pin 4                                                   |
|         | MTIOC6C    | I/O port*1                                                         |
|         | MTIOC6D    | PWM output pin 4' (negative-phase waveform output of PWM output 4) |
| MTU7    | MTIOC7A    | PWM output pin 5                                                   |
|         | MTIOC7C    | PWM output pin 5' (negative-phase waveform output of PWM output 5) |
|         | MTIOC7B    | PWM output pin 6                                                   |
|         | MTIOC7D    | PWM output pin 6' (negative-phase waveform output of PWM output 6) |

Note 1. Avoid setting the MTIOC3C and MTIOC6C pins as timer I/O pins in complementary PWM mode.

**Table 22.75 Register Settings for Complementary PWM Mode (1/2)**

| Channel | Counter/ Register | Description                                                       | Read/Write from CPU                                 |
|---------|-------------------|-------------------------------------------------------------------|-----------------------------------------------------|
| MTU3    | TCNT              | Starts up-counting from the value set in the dead time register   | Maskable by TRWERA setting*1                        |
|         | TGRA              | Set MTU3.TCNT upper limit value (1/2 carrier period + dead time)  | Maskable by TRWERA setting*1                        |
|         | TGRB              | PWM output 1 compare register                                     | Maskable by TRWERA setting*1                        |
|         | TGRC              | MTU3.TGRA buffer register                                         | Readable/writable                                   |
|         | TGRD              | PWM output 1/MTU3.TGRB buffer register                            | Readable/writable                                   |
|         | TGRE              | MTU3.TGRB buffer register B (when double buffer function is used) | Readable/writable                                   |
|         | MTU4              | TCNT                                                              | Starts up-counting after being initialized to 0000h |
| TGRA    |                   | PWM output 2 compare register                                     | Maskable by TRWERA setting*1                        |
| TGRB    |                   | PWM output 3 compare register                                     | Maskable by TRWERA setting*1                        |
| TGRC    |                   | PWM output 2/MTU4.TGRA buffer register                            | Readable/writable                                   |
| TGRD    |                   | PWM output 3/MTU4.TGRB buffer register                            | Readable/writable                                   |
| TGRE    |                   | MTU4.TGRA buffer register B (when double buffer function is used) | Readable/writable                                   |
| TGRF    |                   | MTU4.TGRB buffer register B (when double buffer function is used) | Readable/writable                                   |
| MTU6    | TCNT              | Starts up-counting from the value set in the dead time register   | Maskable by TRWERB setting*2                        |
|         | TGRA              | Set MTU6.TCNT upper limit value (1/2 carrier period + dead time)  | Maskable by TRWERB setting*2                        |
|         | TGRB              | PWM output 4 compare register                                     | Maskable by TRWERB setting*2                        |
|         | TGRC              | MTU6.TGRA buffer register                                         | Readable/writable                                   |
|         | TGRD              | PWM output 4/MTU6.TGRB buffer register                            | Readable/writable                                   |
|         | TGRE              | MTU6.TGRB buffer register B (when double buffer function is used) | Readable/writable                                   |
|         | MTU7              | TCNT                                                              | Starts up-counting after being initialized to 0000h |
| TGRA    |                   | PWM output 5 compare register                                     | Maskable by TRWERB setting*2                        |
| TGRB    |                   | PWM output 6 compare register                                     | Maskable by TRWERB setting*2                        |
| TGRC    |                   | PWM output 5/MTU7.TGRA buffer register                            | Readable/writable                                   |
| TGRD    |                   | PWM output 6/MTU7.TGRB buffer register                            | Readable/writable                                   |

| TGRF    |                   | MTU7.TGRB buffer register B (when double buffer function is used) | Readable/writable                                   |

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).

Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

**Table 22.76 Register Settings for Complementary PWM Mode (2/2)**

| Channel                                 | Counter/ Register | Description                                                                       | Read/Write from CPU           |
|-----------------------------------------|-------------------|-----------------------------------------------------------------------------------|-------------------------------|
| Timer dead time data register A (TDDRA) |                   | Set MTU4.TCNT and MTU3.TCNT offset value (dead time value)                        | Maskable by TRWERA setting*1  |
| Timer dead time data register B (TDDRb) |                   | Set MTU7.TCNT and MTU6.TCNT offset value (dead time value)                        | Maskable by TRWERB setting *2 |
| Timer period data register A (TCDRA)    |                   | Set MTU4.TCNT upper limit value (1/2 carrier period)                              | Maskable by TRWERA setting*1  |
| Timer period data register B (TCDRB)    |                   | Set MTU7.TCNT upper limit value (1/2 carrier period)                              | Maskable by TRWERB setting*2  |
| Timer period buffer register A (TCBRA)  |                   | TCDRA buffer register                                                             | Readable/writable             |
| Timer period buffer register B (TCBRB)  |                   | TCDRB buffer register                                                             | Readable/writable             |
| Subcounter A (TCNTSA)                   |                   | Subcounter A for dead time generation                                             | Read-only                     |
| Subcounter B (TCNTSB)                   |                   | Subcounter B for dead time generation                                             | Read-only                     |
| Temporary register 1A (TEMP1A)          |                   | PWM output 1/MTU3.TGRB temporary register A                                       | Not readable/writable         |
| Temporary register 1B (TEMP1B)          |                   | PWM output 1/MTU3.TGRB temporary register B (when double buffer function is used) | Not readable/writable         |
| Temporary register 2A (TEMP2A)          |                   | PWM output 2/MTU4.TGRA temporary register A                                       | Not readable/writable         |
| Temporary register 2B (TEMP2B)          |                   | PWM output 2/MTU4.TGRA temporary register B (when double buffer function is used) | Not readable/writable         |
| Temporary register 3A (TEMP3A)          |                   | PWM output 3/MTU4.TGRB temporary register A                                       | Not readable/writable         |
| Temporary register 3B (TEMP3B)          |                   | PWM output 3/MTU4.TGRB temporary register B (when double buffer function is used) | Not readable/writable         |
| Temporary register 4A (TEMP4A)          |                   | PWM output 4/MTU6.TGRB temporary register A                                       | Not readable/writable         |
| Temporary register 4B (TEMP4B)          |                   | PWM output 4/MTU6.TGRB temporary register B (when double buffer function is used) | Not readable/writable         |
| Temporary register 5A (TEMP5A)          |                   | PWM output 5/MTU7.TGRA temporary register A                                       | Not readable/writable         |
| Temporary register 5B (TEMP5B)          |                   | PWM output 5/MTU7.TGRA temporary register B (when double buffer function is used) | Not readable/writable         |
| Temporary register 6A (TEMP6A)          |                   | PWM output 6/MTU7.TGRB temporary register A                                       | Not readable/writable         |
| Temporary register 6B (TEMP6B)          |                   | PWM output 6/MTU7.TGRB temporary register B (when double buffer function is used) | Not readable/writable         |

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).

Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

(1) Example of Complementary PWM Mode Setting Procedure

Figure 22.47 shows an example of the complementary PWM mode setting procedure.

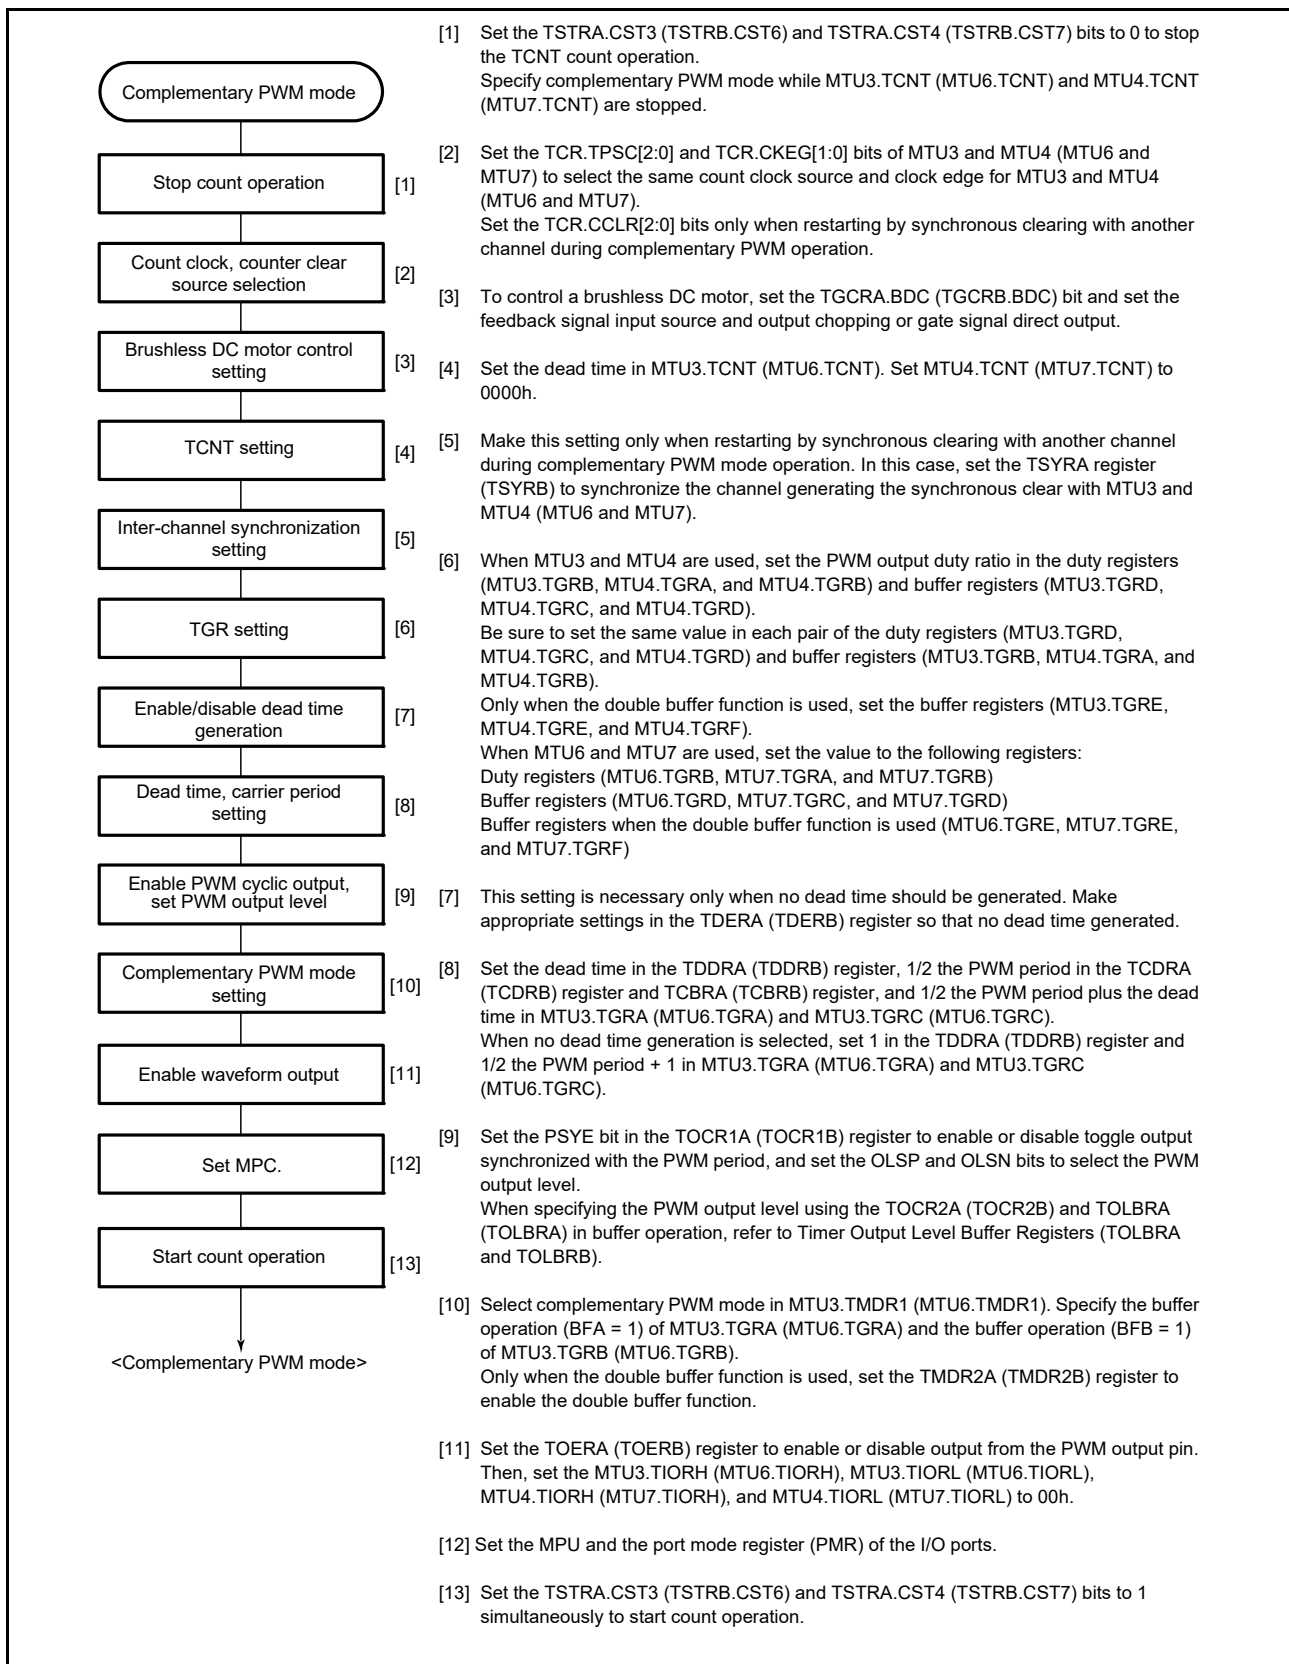

Figure 22.47 Example of Complementary PWM Mode Setting Procedure

## (2) Outline of Complementary PWM Mode Operation

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. Figure 22.48 illustrates counter operation in complementary PWM mode (MTU3 and MTU4), and Figure 22.49 shows an example of operation in complementary PWM mode.

### (a) Counter Operation

In complementary PWM mode, three counters—MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB)—in each unit perform up-/down-count operations.

MTU3.TCNT (MTU6.TCNT) is automatically initialized to the value set in TDDRA (TDDRB) when complementary PWM mode is selected and the CST3 bit in TSTRA (TSTRB) is 0. When the CST3 bit is set to 1, MTU3.TCNT (MTU6.TCNT) counts up to the value set in MTU3.TGRA (MTU6.TGRA), then switches to down-counting when it matches MTU3.TGRA (MTU6.TGRA). When the MTU4.TCNT (MTU7.TCNT) value matches 0000h, MTU3.TCNT (MTU6.TCNT) switches to up-counting, and the operation is repeated in this way.

MTU4.TCNT (MTU7.TCNT) should be initialized to 0000h after a reset. When the CST4 bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA). On reaching 0000h, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way. TCNTSA (TCNTSB) is a read-only counter. It does not need to be initialized after a reset.

In counting up by MTU3.TCNT and MTU4.TCNT (or MTU6.TCNT and MTU7.TCNT), MTU3.TCNT (or MTU6.TCNT) starts counting up when it matches TCDRA (or TCDRB) and switches to counting down when it matches MTU3.TGRA (or MTU6.TGRA). Furthermore, when MTU4.TCNT (or MTU7.TCNT) matches TDDRA (or TDDRB), TCNTSA (or TCNTSB) is set to the value in MTU3.TGRA (or MTU6.TGRA) and counting is stopped.

When MTU4.TCNT (MTU7.TCNT) matches TDDRA (TDDRB) during down-counting of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT), TCNTSA (TCNTSB) starts up-counting, and when MTU4.TCNT (MTU7.TCNT) matches 0000h, the operation switches to down-counting. When MTU3.TCNT (MTU6.TCNT) matches TCDRA (TCDRB), TCNTSA (TCNTSB) becomes 0000h and stops counting.

TCNTSA (TCNTSB) is compared with the compare register and temporary register, in which the PWM duty is specified, only during the count operation.

Figure 22.48 Count Operation in Complementary PWM Mode (MTU3 and MTU4)

## (b) Register Operation

In complementary PWM mode, nine registers (compare registers, buffer registers, and temporary registers) are used to control the duty ratio for the PWM output. Figure 22.49 shows an example of operation in complementary PWM mode (MTU3 and MTU4).

MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB) are constantly compared with the counters to generate PWM waveforms. When these registers match the counter, the value set in the OLSN and OLSP bits in the timer output control registers (TOCR1A and TOCR1B) is output from the PWM output pin. MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD) are buffer registers for these compare registers.

When the double buffer function is used, MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) are also used as buffer registers B. For details of double buffer operation, refer to section 22.3.8 (2) (s), Double Buffer Function in Complementary PWM Mode.

Data in a compare register can be changed by writing new data to the corresponding buffer register. The buffer registers can be read or written at any time.

When modifying data in a buffer register, write to MTU4.TGRD (MTU7.TGRD) last and enable data transfer from the buffer register to a temporary register. At this time, transfer from the TCBRA (TCBRB) register and MTU3.TGRC (MTU6.TGRC) register, which operate as buffer registers for the timer period registers, to temporary registers is also enabled. Data is transferred to all five temporary registers at the same time.

When transfer is enabled in the Ta interval, data written to a buffer register is transferred to the temporary register. The data is not transferred to the temporary register in the Tb1 and Tb2 intervals. Data enabled for transfer in this interval is transferred to the temporary register at the end of this interval.

The value transferred to a temporary register is transferred to the compare register at the end of the Tb1 interval (when matches MTU3.TGRA (MTU6.TGRA) while TCNTSA (TCNTSB) is counting up), or at the end of the Tb2 interval (when matches 0000h while TCNTSA (TCNTSB) is counting down). The timing for transfer from the temporary register to the compare register can be selected with bits MD[3:0] in the timer mode register 1 (TMDR1). Figure 22.49 shows an example in which the trough is selected for the transfer timing.

In the Tb interval in which data is not transferred to the temporary register (Tb1 in Figure 22.49), the temporary register has the same function as the compare register and is compared with the counter. In this interval, therefore, there are two compare match registers for one output phase; the compare register contains the pre-change data and the temporary register contains new data. In this interval, three counters MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) and two registers (compare register and temporary register) are compared, and PWM output is controlled accordingly.

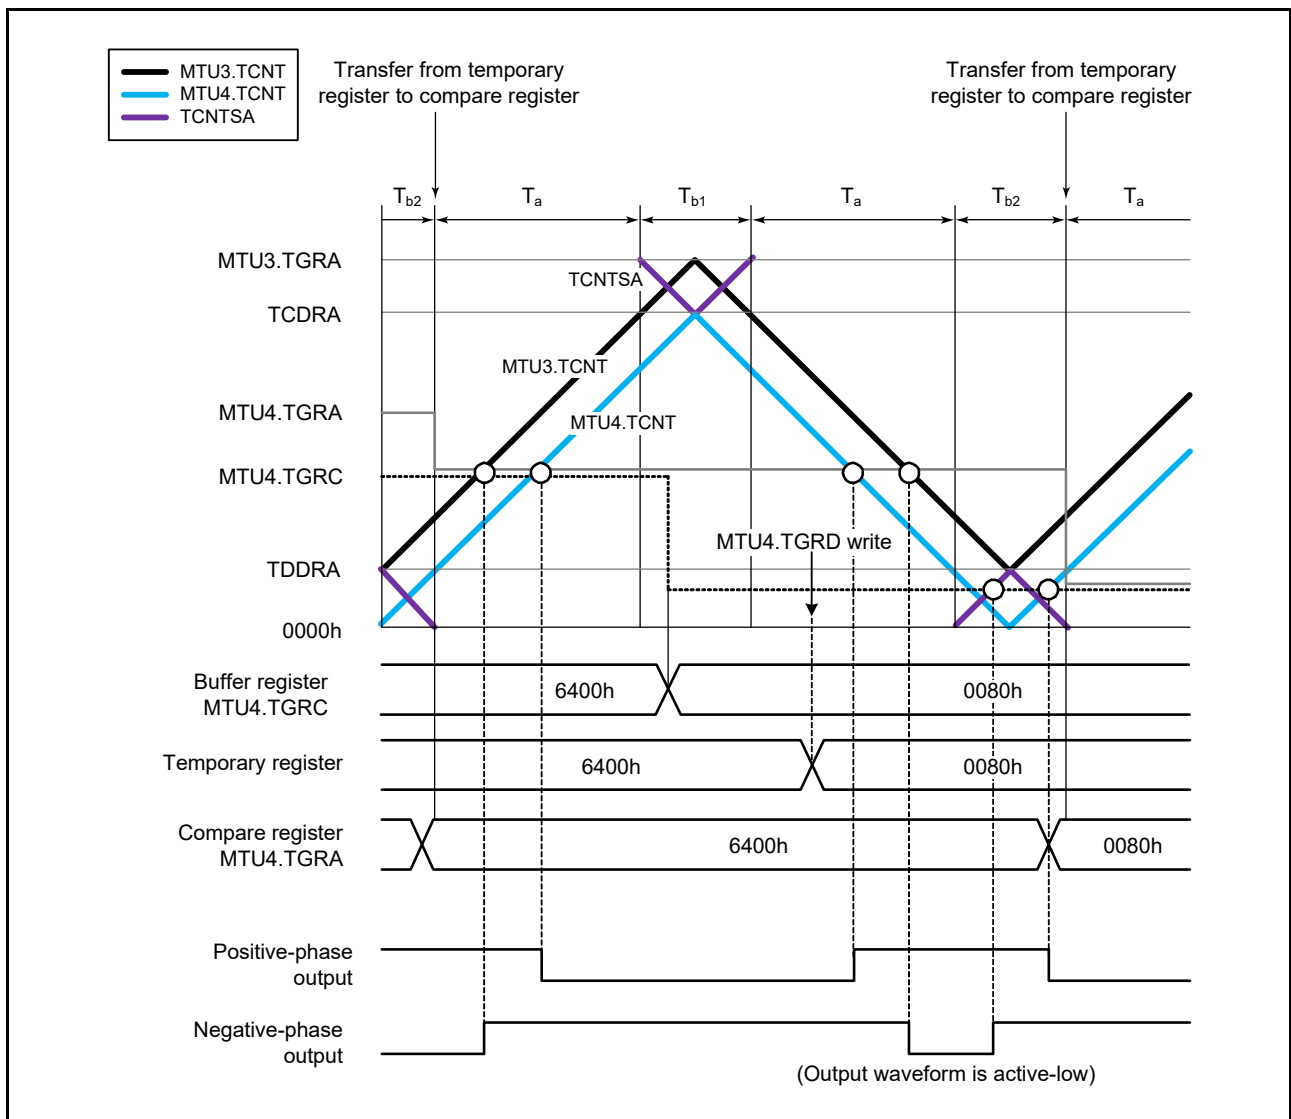

Figure 22.49 Example of Operation in Complementary PWM Mode (MTU3 and MTU4)

### (c) Initial Setting

In complementary PWM mode, there are nine registers that require initial setting. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).

Before setting complementary PWM mode with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits, initial values should be set in the following registers.

The TOCR1A, TOCR2A, TOCR1B, and TOCR2B registers are used to set the PWM output level. MTU3.TGRC (MTU6.TGRC) operates as the buffer register for MTU3.TGRA (MTU6.TGRA), and should be set with  $1/2$  the PWM period + dead time  $T_d$ . The timer period buffer register (TCBRA or TCBRB) operates as the buffer register for the timer period data register (TCDRA or TCDRB), and should be set with  $1/2$  the PWM period. Set dead time  $T_d$  in the timer dead time data register (TDDRA or TDDRB).

When dead time is not needed, the TDER bit in the timer dead time enable register (TDERA or TDERB) should be set to 0, MTU3.TGRC and MTU3.TGRA (MTU6.TGRC and MTU6.TGRA) should be set to  $1/2$  the PWM carrier period + 1, and TDDRA (TDDRB) should be set to 1.

Set the respective initial PWM duty values in three buffer registers A (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)).

Set three buffer registers B (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)) only when the double buffer function is used.

The values set in the five buffer registers excluding TDDRA (TDDRB) are transferred to the corresponding compare registers as soon as complementary PWM mode is set.

Set MTU4.TCNT (MTU7.TCNT) to 0000h before setting complementary PWM mode.

**Table 22.77 Registers and Counters Requiring Initial Setting**

| Register and Counter                                                     | Setting                                                                                                               |
|--------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| TOCR1A, TOCR2A,<br>TOCR1B, TOCR2B                                        | PWM output level                                                                                                      |
| MTU3.TGRC<br>MTU6.TGRC                                                   | $1/2$ PWM period + dead time $T_d$<br>( $1/2$ PWM period + 1 when dead time generation is disabled by TDERA or TDERB) |
| TDDRA, TDDRB                                                             | Dead time $T_d$ (1 when dead time generation is disabled by TDERA or TDERB)                                           |
| TCBRA, TCBRB                                                             | $1/2$ PWM period                                                                                                      |
| MTU3.TGRD, MTU4.TGRC,<br>MTU4.TGRD<br>MTU6.TGRD, MTU7.TGRC,<br>MTU7.TGRD | Initial PWM duty ratio value for each phase                                                                           |
| MTU3.TGRE, MTU4.TGRE,<br>MTU4.TGRF<br>MTU6.TGRE, MTU7.TGRE,<br>MTU7.TGRF | Initial PWM duty ratio value for each phase (only when double buffer function is used)                                |
| MTU4.TCNT<br>MTU7.TCNT                                                   | 0000h                                                                                                                 |

Note: The value set in MTU3.TGRC (MTU6.TGRC) should be the sum of  $1/2$  the PWM period set in TCBRA (TCBRB) and dead time  $T_d$  set in TDDRA (TDDRB). When dead time generation is disabled by TDERA (TDERB), TGRC should be set to  $1/2$  the PWM period + 1.

### (d) PWM Output Level Setting

In complementary PWM mode, the PWM output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2A or TOCR2B).

The output level can be set for each of the three positive phases and three negative phases of 6-phase output.

Complementary PWM mode should be cleared before setting or changing output levels.

(e) Dead Time Setting

In complementary PWM mode, dead time can be set for PWM output.

The dead time is set in the timer dead time data register (TDDRA or TDDRB). The value set in TDDRA (TDDRB) is used as the MTU3.TCNT (MTU6.TCNT) counter start value and creates a non-overlapping interval between MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT). Complementary PWM mode should be cleared before changing the contents of TDDRA (TDDRB).

(f) Dead Time Suppressing

Dead time generation is suppressed by setting the TDER bit in the timer dead time enable register (TDERA or TDERB) to 0. TDERA (TDERB) can be set to 0 only when 0 is written to it after reading TDER = 1.

MTU3.TGRA and MTU3.TGRC (MTU6.TGRA and MTU6.TGRC) should be set to 1/2 PWM period + 1 and the timer dead time data register (TDDRA or TDDRB) should be set to 1.

By the above settings, PWM waveforms without dead time can be obtained. Figure 22.50 shows an example of operation without dead time (MTU3 and MTU4).

Figure 22.50 Example of Operation without Dead Time (MTU3 and MTU4)

(g) PWM Period Setting

In complementary PWM mode, the PWM period is set in two registers—MTU3.TGRA (MTU6.TGRA), in which the MTU3.TCNT (MTU6.TCNT) upper limit value is set, and TCDRA (TCDRB), in which the MTU4.TCNT (MTU7.TCNT) upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + TDDRA (TDDRb) setting  
 Without dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + 1

In addition, the settings should be made so as to achieve the following relationship between the TCDRA (TCDRB) register and the TDDRA (TDDRb) register:

$$TCDRA (TCDRB) \text{ setting} > TDDRA (TDDRb) \text{ setting} \times 2 + 2$$

The MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) settings are made by setting values in buffer registers MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB). When data is written to MTU4.TGRD (MTU7.TGRD) to enable transfers, the values set in MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB) are transferred simultaneously to the MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) with the transfer timing selected with the MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits.

The new PWM period is reflected from the next cycle when data is updated at the crest, or from the current cycle when updated in the trough. Figure 22.51 illustrates the operation when the PWM period is updated at the crest. Refer to the following section, (h), Register Data Updating, for the method of updating the data in each buffer register.

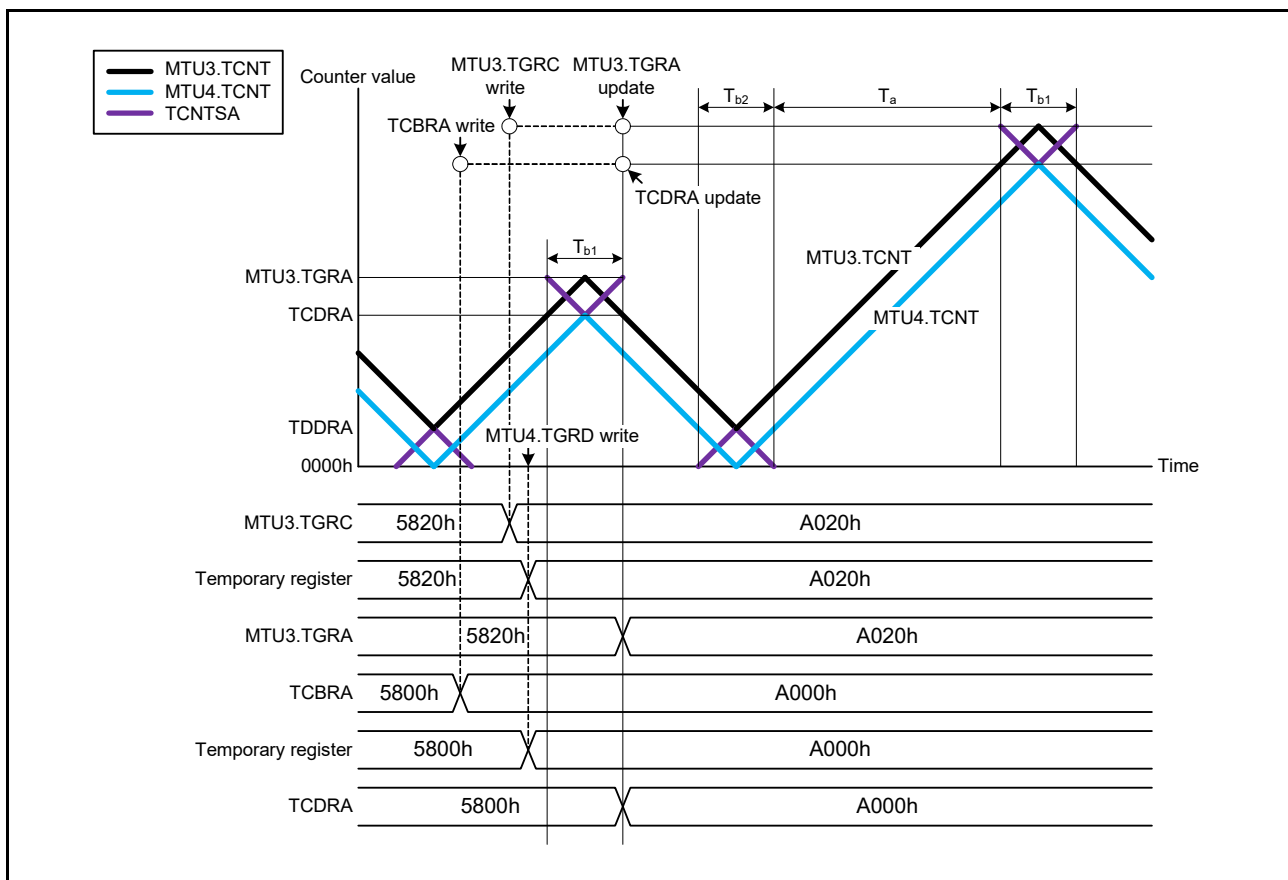

Figure 22.51 Example of PWM Period Updating (MTU3 and MTU4)

### (h) Register Data Updating

The buffer registers are used to update the data in five compare registers for the PWM duty and PWM period in complementary PWM mode. The update data can be written to the buffer register at any time.

There is a temporary register between each of these registers and its buffer register. While subcounter TCNTSA (TCNTSB) is not counting, if buffer register data is updated, the temporary register value also changes. Data is not transferred from buffer registers to temporary registers while TCNTSA (TCNTSB) is counting; in this case, the value written to a buffer register is transferred after TCNTSA (TCNTSB) halts.

The temporary register value is transferred to the compare register at the data update timing set with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits. Figure 22.52 shows an example of data updating in complementary PWM mode (MTU3 and MTU4). This example shows the mode in which data is updated at both the counter crest and trough.

When updating buffer register data, be sure to write to MTU4.TGRD (MTU7.TGRD) at the end of the update. Data is transferred from buffer registers to the temporary registers simultaneously for all five registers after the write to MTU4.TGRD (MTU7.TGRD).

Even when not updating all five registers or when not updating the MTU4.TGRD (MTU7.TGRD) data, be sure to write to MTU4.TGRD (MTU7.TGRD) after writing data to the registers to be updated. In this case, the data written to MTU4.TGRD (MTU7.TGRD) should be the same as the data prior to the write operation.

Refer to section 22.3.8 (2) (s), Double Buffer Function in Complementary PWM Mode, for data updating when the double buffer function is used.

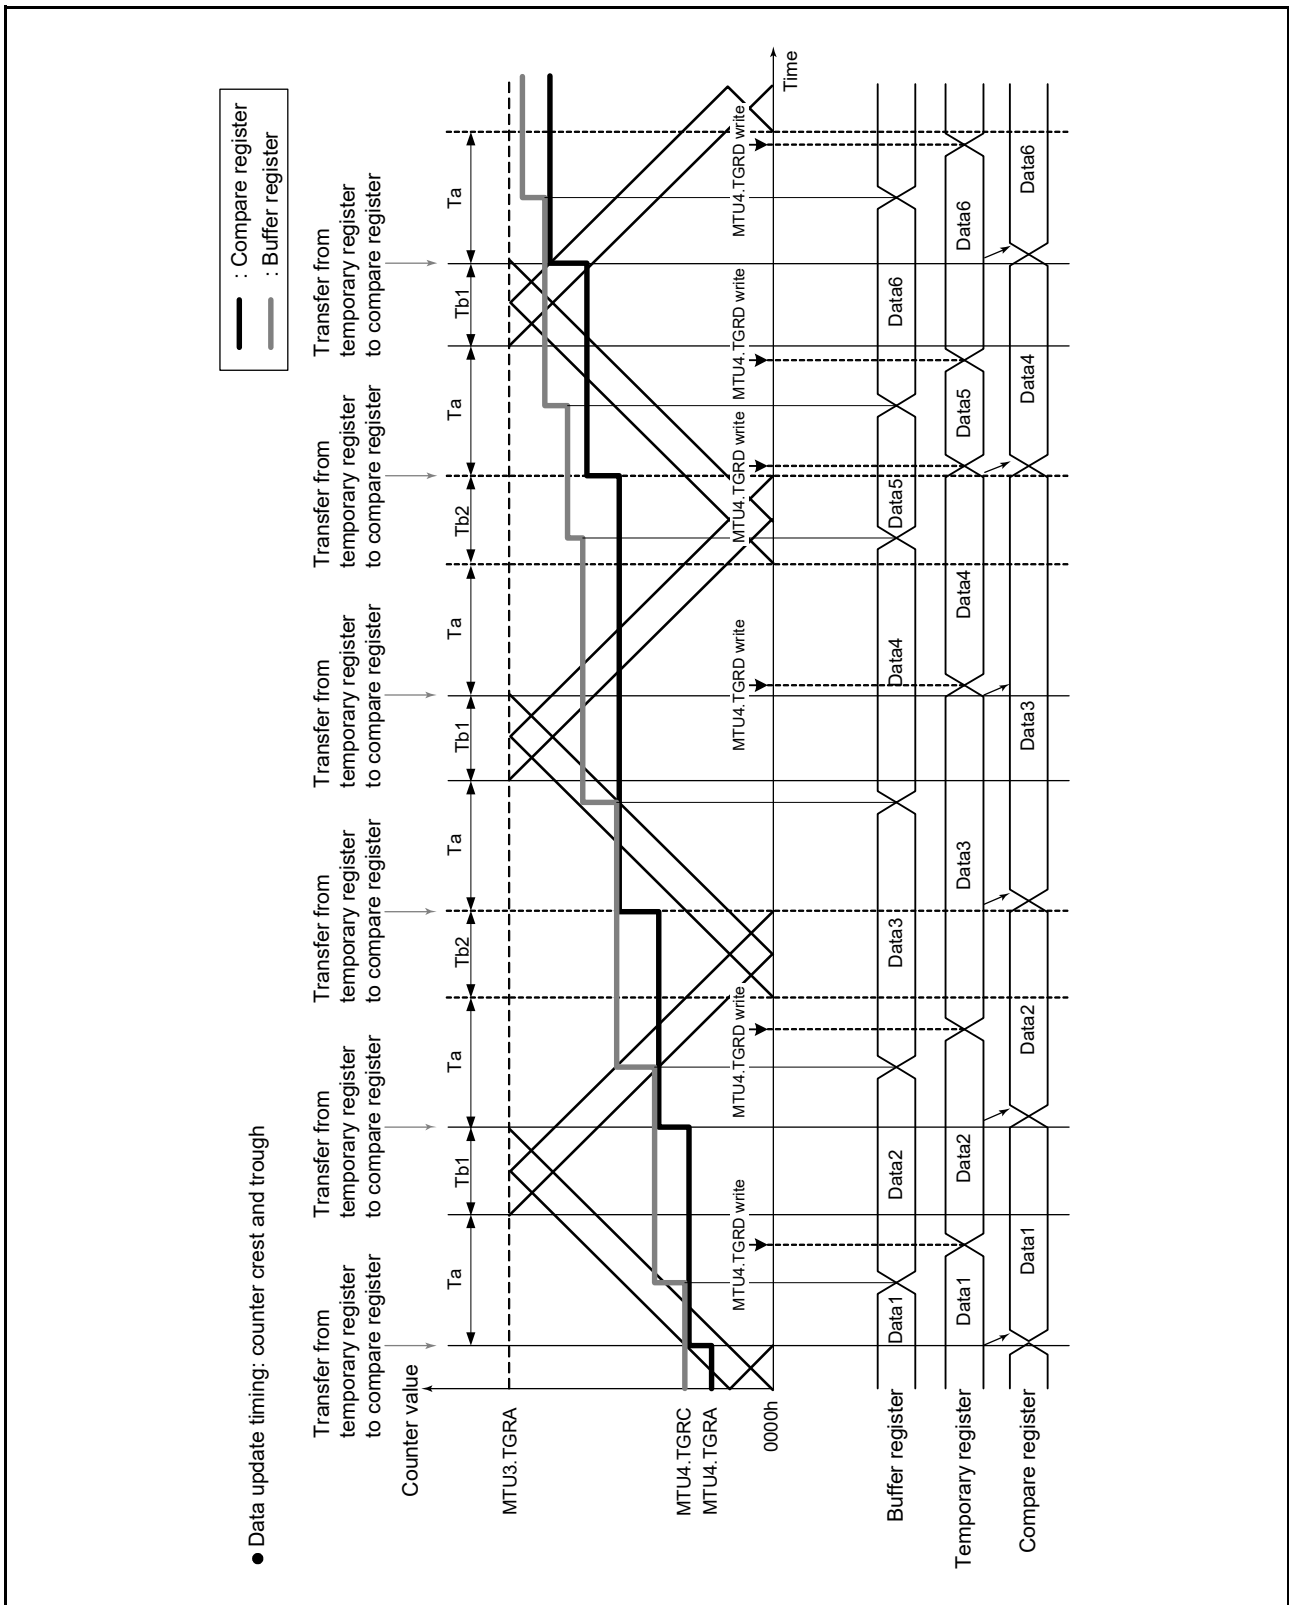

Figure 22.52 Example of Data Updating in Complementary PWM Mode (MTU3 and MTU4)

(i) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of the OLSN and OLSP bits in the TOCR1A (TOCR1B) register or the OLS1N to OLS3N and OLS1P to OLS3P bits in the TOCR2A register (TOCR2B). This initial output is the non-active level of the PWM output and continues from when complementary PWM mode is set with the MTU3.TMDR1 (MTU6.TMDR1) until MTU4.TCNT (MTU7.TCNT) exceeds the value set in the TDDRA (TDDRB) register. Figure 22.53 shows an example of the initial output in complementary PWM mode. An example of the waveform when the initial PWM duty ratio value is smaller than the TDDRA (TDDRB) value is shown in Figure 22.54.

Figure 22.53 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (1))

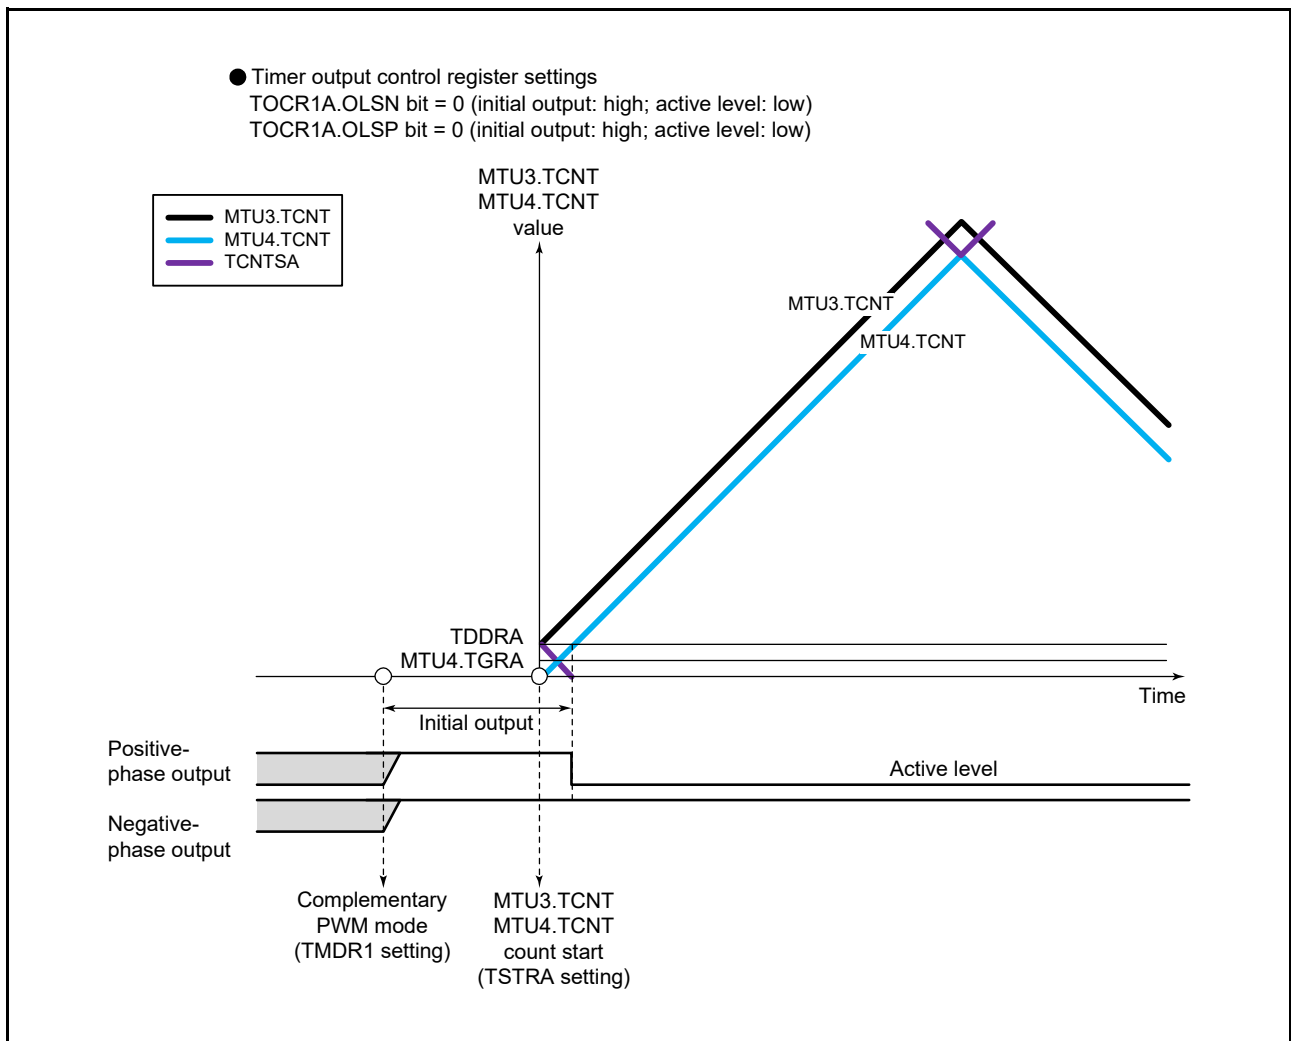

Figure 22.54 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (2)

(j) Method for Generating PWM Output in Complementary PWM Mode

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. Dead time can be set for PWM waveforms to be output.

A PWM waveform is generated by output of the level selected in the timer output control register in the event of a compare match between a counter and a compare register. While TCNTSA (TCNTSB) is counting, the compare register and temporary register values are simultaneously compared to create consecutive PWM output from 0 to 100% duty ratio. The relative timing of turn-on and turn-off compare match occurrence may vary, but the compare match that turns off each phase takes precedence to secure the dead time and ensure that the positive-phase and negative-phase turn-on times do not overlap. Figure 22.55 to Figure 22.57 show examples of waveform generation in complementary PWM mode.

The positive-phase and negative-phase turn-off timing is generated by a compare match with the counter indicated by a solid line, and the turn-on timing is generated by a compare match with the counter indicated by a dotted line, which operates with a delay equal to the dead time behind the counter indicated by a solid line. In the T1 period, compare match a that turns off the negative phase has the highest priority, and compare matches before a are ignored. In the T2 period, compare match c that turns off the positive phase has the highest priority, and compare matches before c are ignored.

In most cases, compare matches occur in the order a → b → c → d (or c → d → a' → b') as shown in Figure 22.55. If compare matches deviate from the a → b → c → d order, since the time for which the negative phase is off is shorter than twice the dead time, the positive phase is not turned on. If compare matches deviate from the c → d → a' → b' order, since the time for which the positive phase is off is shorter than twice the dead time, the negative phase is not turned on. As shown in Figure 22.56, if compare match c follows compare match a before compare match b, compare match b is ignored and the negative phase is turned on by compare match d. This is because turning off the positive phase has priority due to the occurrence of compare match c (positive-phase off timing) before compare match b (positive-phase on timing) (consequently, the waveform does not change because the positive phase goes from off to off).

Similarly, in the example in Figure 22.57, turning off the negative phase has priority due to the occurrence of compare match a' (negative-phase off timing) before compare match d (negative-phase on timing). As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare matches at turn-off timings take precedence, and turn-on timing compare matches that occur before a turn-off timing compare match are ignored.

Figure 22.55 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

Figure 22.56 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (2)

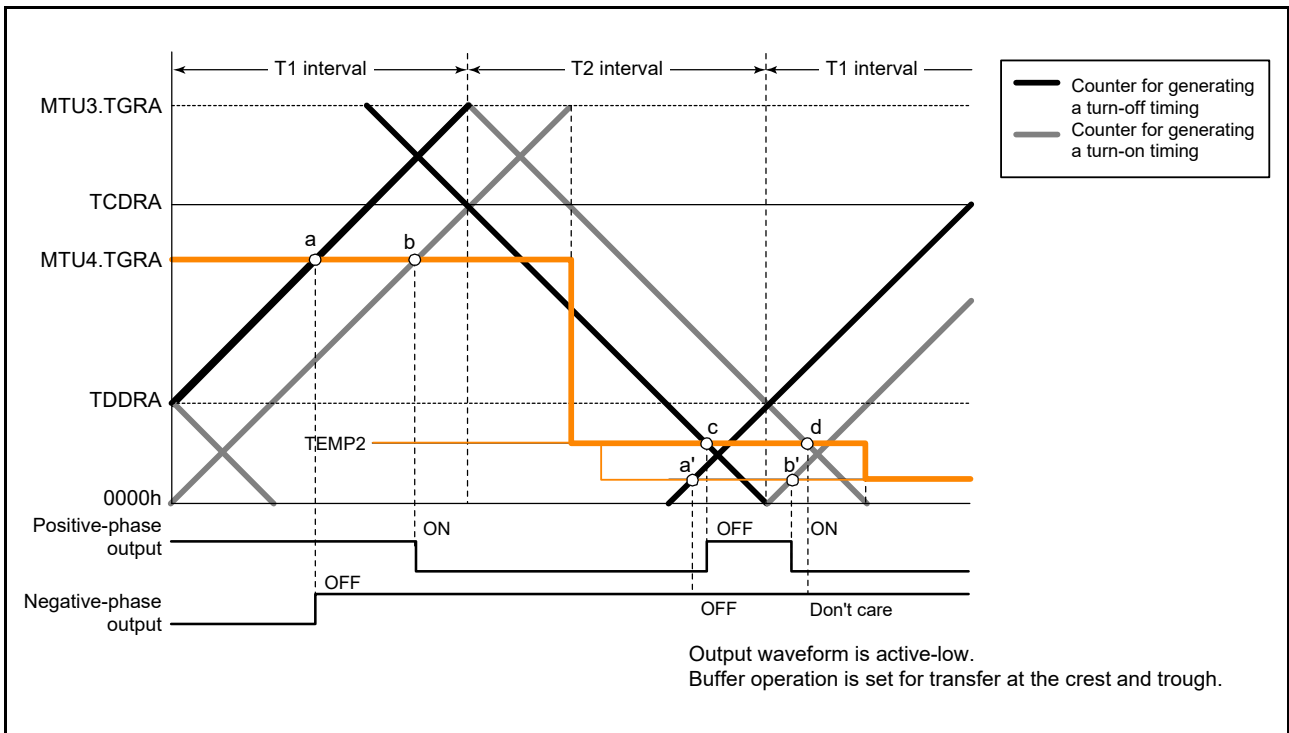

Figure 22.57 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (3)

(k) 0% and 100% Duty Ratio Output in Complementary PWM Mode

In complementary PWM mode, 0% and 100% duty PWM output can be output as required. Figure 22.58 to Figure 22.62 show output examples.

A 100% duty waveform is output when the compare register value is set to 0000h. The waveform in this case has a positive phase with a 100% on-state. A 0% duty waveform is output when the compare register value is set to the same value as MTU3.TGRA (MTU6.TGRA). The waveform in this case has a positive phase with a 100% off-state. Turn-on and turn-off compare matches occur simultaneously, but if a turn-on compare match and turn-off compare match for the same phase occur simultaneously, both compare matches are ignored and the waveform does not change.

Figure 22.58 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

Figure 22.59 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (2)

(I) Toggle Output Synchronized with PWM Period

In complementary PWM mode, toggle output from the PWM output pin in synchronization with the PWM period can be enabled by setting the PSYE bit in the TOCR1A (TOCR1B) register to 1. An example of a toggle output waveform is shown in Figure 22.63.

This output is toggled by a compare match between MTU3.TCNT and MTU3.TGRA (MTU6.TCNT and MTU6.TGRA) and a compare match between MTU4.TCNT (MTU7.TCNT) and 0000h.

The MTIOC3A (MTIOC6A) pin is assigned for this toggle output. The initial output is high-level output.

**Figure 22.63 Example of Toggle Output Waveform Synchronized with PWM Output (MTU3 and MTU4)**

(m) Counter Clearing by Another Channel

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by another channel source when a mode for synchronization with another channel is specified through the TSYRA (TSYRB) register and synchronous clearing is selected with MTU3.TCR.CCLR[2:0] (MTU6.TCR.CCLR[2:0]) bits.

Figure 22.64 illustrates an example of this operation.

Use of this function enables a counter to be cleared and restarted through an external signal.

Figure 22.64 Counter Clearing Synchronized with Another Channel (MTU3 and MTU4)

(n) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCRA (TWCRB) to 1 suppresses initial output when synchronous counter clearing occurs in the Tb interval (Tb2 interval) at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression through the WRE bit = 1 is applicable only when synchronous clearing occurs in the Tb2 interval as indicated by (10) or (11) in Figure 22.65. When synchronous clearing occurs outside that interval, the initial value specified by the OLSN and OLSP bits in TOCR1A (TOCR1B) is output. Even in the Tb2 interval, if synchronous clearing occurs in the initial value output period (indicated by (1) in Figure 22.65) immediately after the counters start operation, initial value output is not suppressed.

This function can be used in both channel combinations of MTU3 and MTU4, and MTU6 and MTU7. In MTU3 and MTU4, synchronous clearing in any of MTU0 to MTU2 can cause counter clearing; in MTU6 and MTU7, compare match or input capture in any of MTU0 to MTU2 can cause counter clearing.

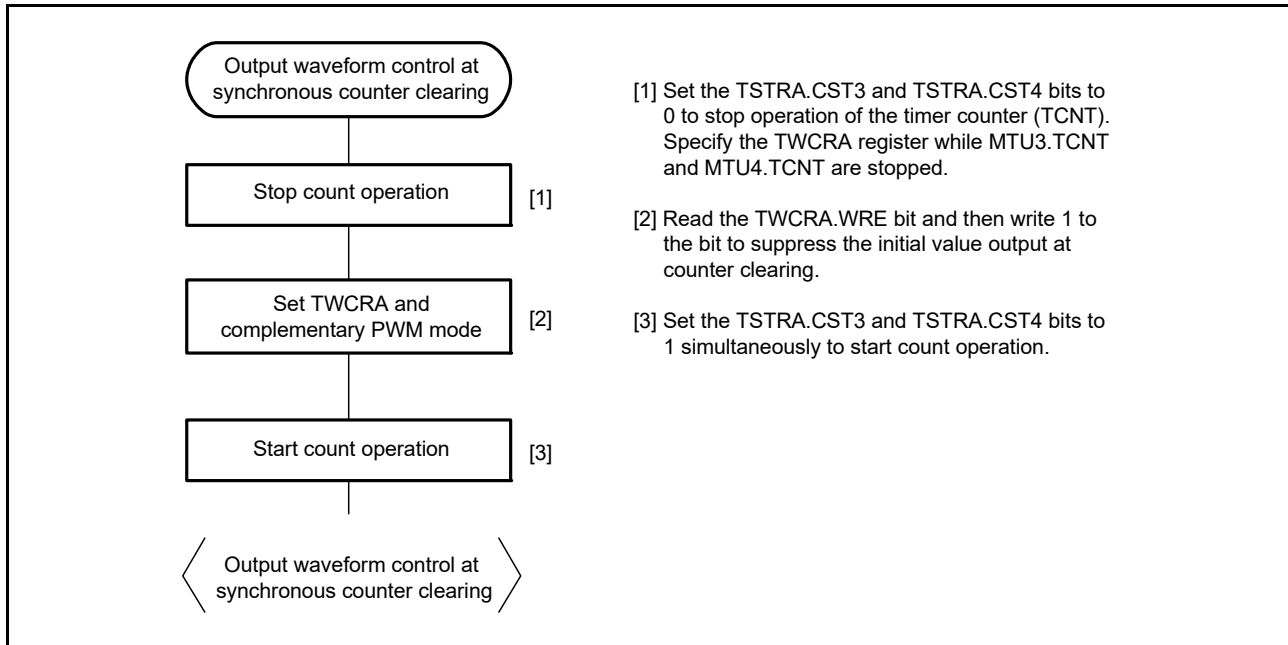

Figure 22.65 Timing for Synchronous Counter Clearing (MTU3 and MTU4)

- Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode.

An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in Figure 22.66.

**Figure 22.66** Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode (MTU3 and MTU4)

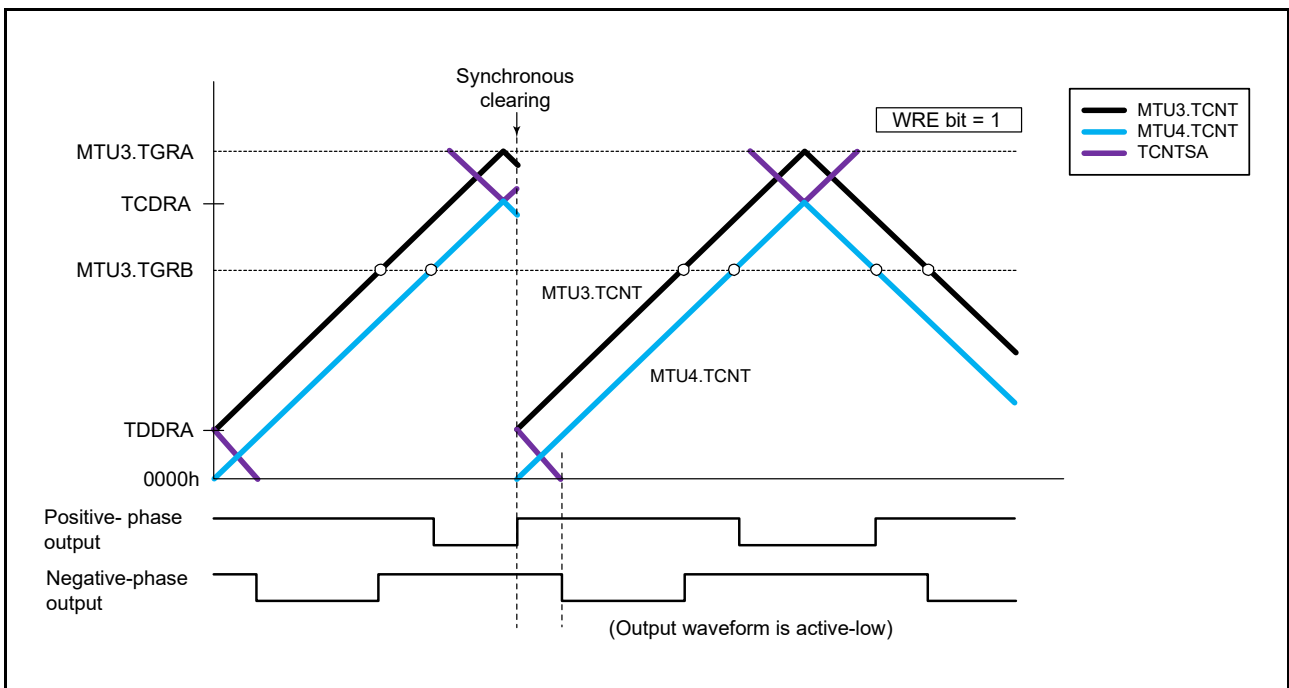

- Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Figure 22.67 to Figure 22.70 show examples of output waveform control in which MTU3 and MTU4 operate in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCRA is set to 1. In the examples shown in Figure 22.67 to Figure 22.70, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 22.65, respectively.

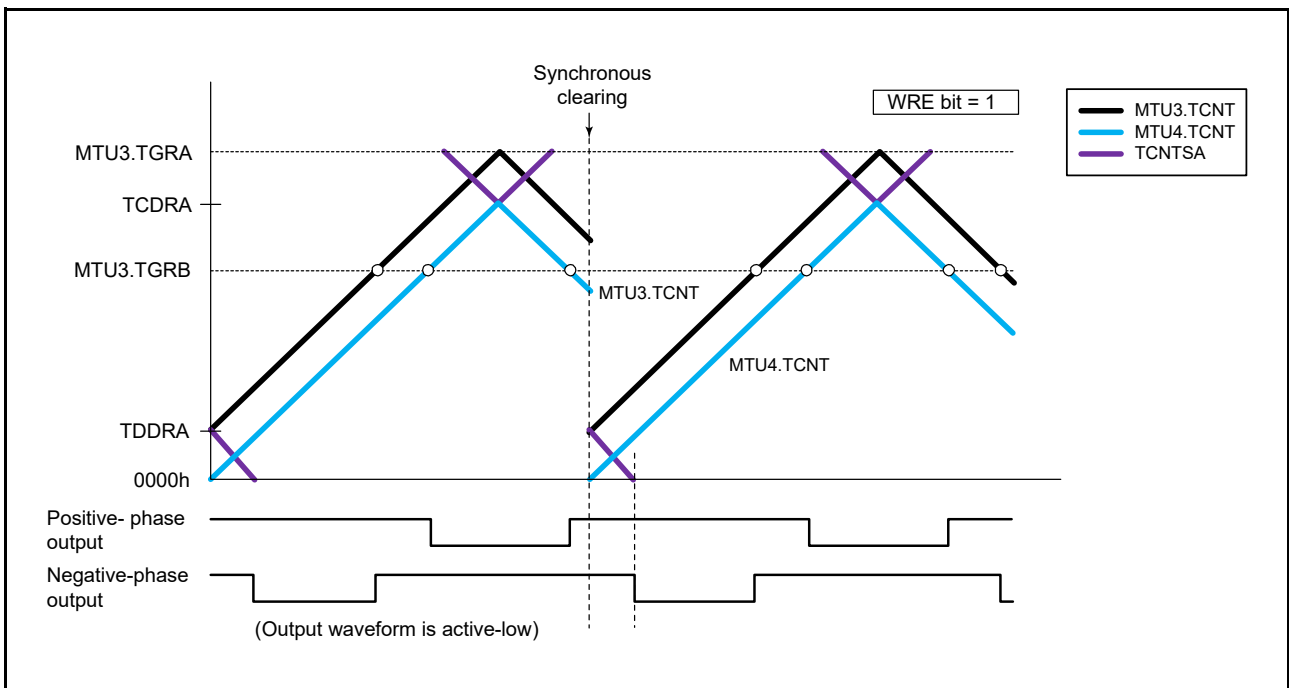

In MTU6 and MTU7, these examples are equivalent to the cases when MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing is generated while the SCC bit is set to 0 and the WRE bit is set to 1 in TWCRA.

**Figure 22.67** Example of Synchronous Clearing in Dead Time during Up-Counting (Timing (3) in Figure 22.65; TWCRA.WRE Bit is 1)

**Figure 22.68** Example of Synchronous Clearing in Tb1 interval (Timing (6) in Figure 22.65; TWCRA.WRE Bit is 1)

**Figure 22.69** Example of Synchronous Clearing in Dead Time during Down-Counting (Timing (8) in Figure 22.65; TWCRA.WRE Bit is 1)

**Figure 22.70** Example of Synchronous Clearing in Tb2 interval (Timing (11) in Figure 22.65; TWCRA.WRE Bit is 1)

(o) Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

In MTU6 and MTU7, setting the SCC bit in TWCRB to 1 suppresses synchronous counter clearing caused by MTU0 to MTU2.

Synchronous counter clearing is suppressed only within the interval shown in Figure 22.71. When using this function, MTU6 and MTU7 should be set to complementary PWM mode.

For details of synchronous clearing caused by MTU0 to MTU2, refer to section 22.3.10 (2), Synchronous Counter Clearing for MTU6 and MTU7.

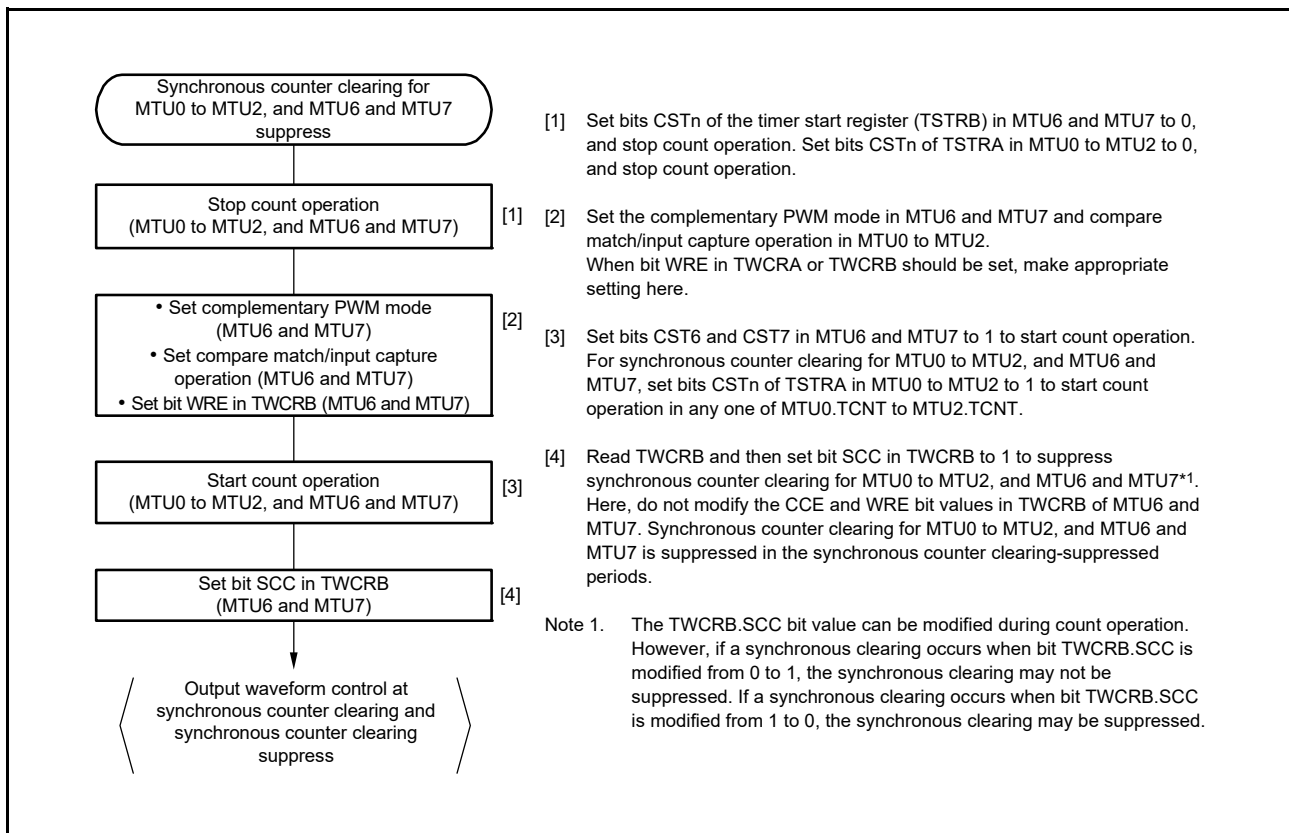

Figure 22.71 Synchronous Clearing-Suppressed Interval Specified by TWCRB.SCC Bit for MTU0 to MTU2, and MTU6 and MTU7

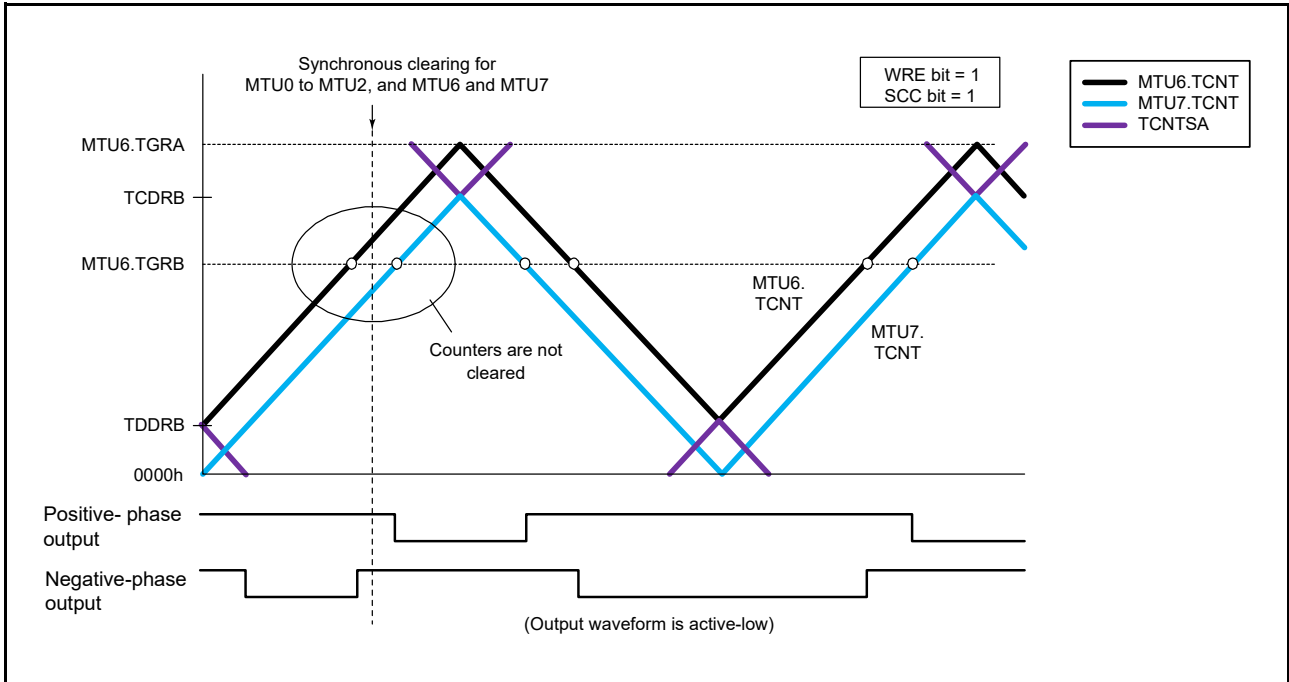

- Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7  
An example of the procedure for suppressing synchronous counter clearing for MTU0 to MTU2, and MTU6 and MTU7 is shown in Figure 22.72.

**Figure 22.72 Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7**

- Examples of Suppression of Synchronous Counter Clearing for MTU 0 to MTU2, and MTU6 and MTU7

Figure 22.73 to Figure 22.76 show examples of operation in which MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing for MTU 0 to MTU2, and MTU6 and MTU7 is suppressed by setting the SCC bit in TWCRB in MTU6 and MTU7 to 1. In the examples shown in Figure 22.73 to Figure 22.76, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 22.65, respectively. In these examples, the WRE bit in TWCRB in MTU6 and MTU7 is set to 1.

**Figure 22.73** Example of Synchronous Clearing in Dead Time during Up-Counting (Timing (3) in Figure 22.65; TWCRB.WRE Bit is 1 and SCC Bit is 1 in MTU6 and MTU7)

(Timing (8) in Figure 22.65; TWCRB.WRE Bit is 1 and SCC Bit is 1 in MTU6 and MTU7)

**Figure 22.76** Example of Synchronous Clearing in Tb2 interval  
(Timing (11) in Figure 22.65; TWCRB.WRE Bit is 1 and SCC Bit is 1 in MTU6 and MTU7)

### (p) Counter Clearing by MTU3.TGRA (MTU6.TGRA) Compare Match

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by MTU3.TGRA (MTU6.TGRA) compare match when the TWCRA.CCE (TWCRB.CCE) bit. Figure 22.77 illustrates an operation example.

Note 1. Use this function only in complementary PWM mode 1 (transfer at crest).

Note 2. Do not specify synchronous clearing by another channel (do not set 1 in the SYNC0 to SYNC4, SYNC9, or SYNC6 and SYNC7 bits in the timer synchronous register (TSYRA or TSYRB) and the CE0A to CE0D, CE1A, CE1B, CE2A, or CE2B bits in TSYCR).

Note 3. Do not set the PWM duty value to 0000h.

Note 4. Do not set the PSYE bit in timer output control register 1 (TOCR1A or TOCR1B) to 1.

Figure 22.77 Example of Counter Clearing Operation by MTU3.TGRA Compare Match

### (q) Example of Waveform Output for Driving AC Synchronous Motor (Brushless DC Motor)

In complementary PWM mode, a brushless DC motor can easily be controlled using the TGCRA (TGCRB) register. Figure 22.78 to Figure 22.81 show examples of brushless DC motor driving waveforms when MTU3 and MTU4 are used.

The TGCRB register enables driving waveform output from MTU6 and MTU7. The MTIOC9A, MTIOC9B, and MTIOC9C pins are used for external signals.

To switch the output phases for a 3-phase brushless DC motor by means of external signals detected with a Hall element, etc., set the TGCRA.FB (TGCRB.FB) bit to 0. In this case, the external signals indicating the magnetic pole position should be input to timer input pins MTIOC0A, MTIOC0B, and MTIOC0C (MTIOC9A, MTIOC9B, and MTIOC9C) in MTU0 (MTU9) (make appropriate settings with the MPC and port mode registers (PMR) of the I/O ports). When an edge is detected at pin MTIOC0A, MTIOC0B, or MTIOC0C (MTIOC9A, MTIOC9B, and MTIOC9C), the output on/off state is switched automatically.

When the TGCRA.FB (TGCRB.FB) bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCRA (TGCRB) is set to 0 or 1.

The driving waveforms are output from the 6-phase PWM output pins for complementary PWM mode.

With this 6-phase output, while the output is turned on, chopping output is available through complementary PWM mode output function by setting the N bit or P bit in TGCRA (TGCRB) to 1. When the N bit or P bit is 0, the level output is selected.

The active level of the 6-phase output (on output level) can be set with the TOCR1A.OLSN (TOCR1B.OLSN) and TOCR1A.OLSP (TOCR1B.OLSP) bits regardless of the setting of the N and P bits.

Figure 22.78 Example of Output Phase Switching by External Input (1)

Figure 22.79 Example of Output Phase Switching by External Input (2)

Figure 22.80 Example of Output Phase Switching through UF, VF, and WF Bit Settings (1)

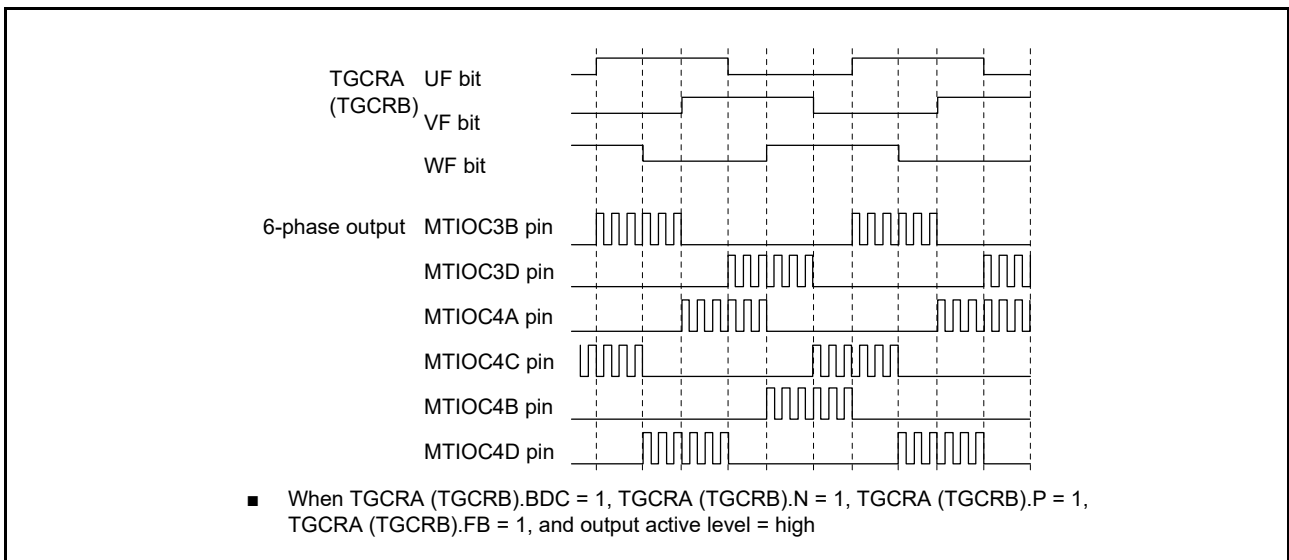

Figure 22.81 Example of Output Phase Switching through UF, VF, and WF Bit Settings (2)

### (r) A/D Conversion Start Request Setting

In complementary PWM mode, an A/D conversion start request can be issued using MTU3.TGRA (MTU6.TGRA) compare match, MTU4.TCNT (MTU7.TCNT) underflow (trough), or compare match on a channel other than MTU3 and MTU4 (MTU6 and MTU7).

When start requests using MTU3.TGRA (MTU6.TGRA) compare match are specified, A/D conversion can be started at the crest of the MTU3.TCNT (MTU6.TCNT) count.

A/D conversion start requests can be specified by setting the TIER.TTGE bit. To issue an A/D conversion start request at an MTU4.TCNT (MTU7.TCNT) underflow (trough), set the MTU4.TIER.TTGE2 (MTU7.TIER.TTGE2) bit to 1.

### (s) Double Buffer Function in Complementary PWM Mode

In complementary PWM mode 3 (transfer at the crest and trough), the PWM output setting resolution can be improved from  $\pm 2$  to  $\pm 1$  by setting the TMDR2A.DRS (TMDR2B.DRS) bit to 1.

When setting buffer registers A (MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD), set also buffer registers B (MTU3.TGRE, MTU4.TGRE, MTU4.TGRF, MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) at the same time. For details of the setting procedure, refer to section 22.3.8 (1), Example of Complementary PWM Mode Setting Procedure

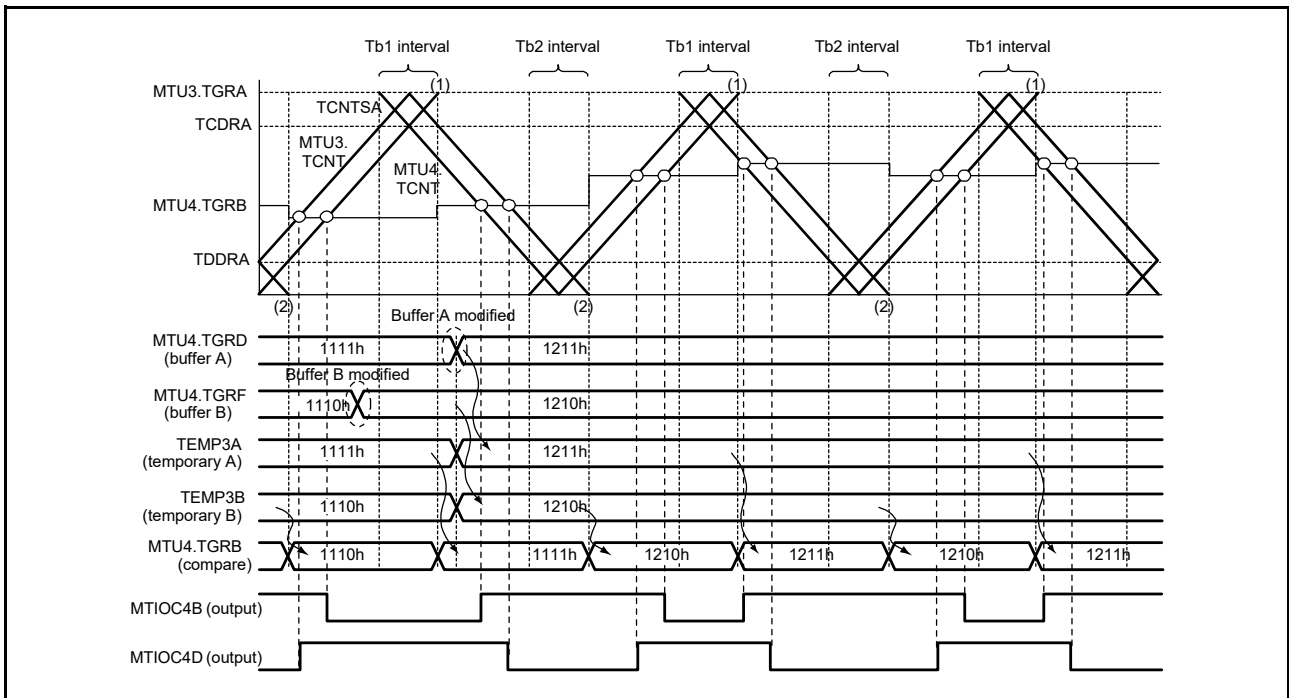

**Note:** When a buffer register B is set to the buffer register A value, symmetric PWM waveforms are output. When a buffer register B is not set to the buffer register A value, asymmetric PWM waveforms are output.

Figure 22.82 shows an example of double buffer operation.

Each register data is transferred as follows.

- After MTU4.TGRD or MTU7.TGRD (buffer A) is written to, data is transferred from MTU4.TGRD or MTU7.TGRD (buffer A) to TEMP3A or TEMP6A (temporary A) and from MTU4.TGRF or MTU7.TGRF (buffer B) to TEMP3B or TEMP6B (temporary B).
- With timing (1) in the figure, data is transferred from TEMP3A or TEMP6A (temporary A) to MTU4.TGRB or MTU7.TGRB (compare).
- With timing (2) in the figure, data is transferred from TEMP3B or TEMP6B (temporary B) to MTU4.TGRB or MTU7.TGRB (compare).

In the crest interval (Tb1 interval), the compare register and temporary register A are valid; in the trough interval (Tb2 interval), the compare register and temporary register B are valid.

**Figure 22.82 Example of Double Buffer Operation**

Figure 22.83 shows an example when the buffer write value is smaller than the TDDRA (TDDRB) value, and Figure 22.84 shows an example when the write value is greater than TCDRA (TCDRB).

In the crest interval, the output is controlled according to the compare match with the compare register or temporary register A; in the trough interval, the output is controlled according to the compare match with the compare register or temporary register B.

**Figure 22.83 Example of Double Buffer Operation (Buffer Write Value is Smaller than TDDRA)**

Figure 22.84 Example of Double Buffer Operation (Buffer Write Value is Greater than TCDRA)

**(3) Interrupt Skipping Function 1 in Complementary PWM Mode**

Interrupts TGIA3 (TGIA6) (at the crest) and TCIV4 (TCIV7) (at the trough) in MTU3 and MTU4 (MTU6 and MTU7) can be skipped up to seven times by making settings in the TITCR1A (TITCR1B) register.

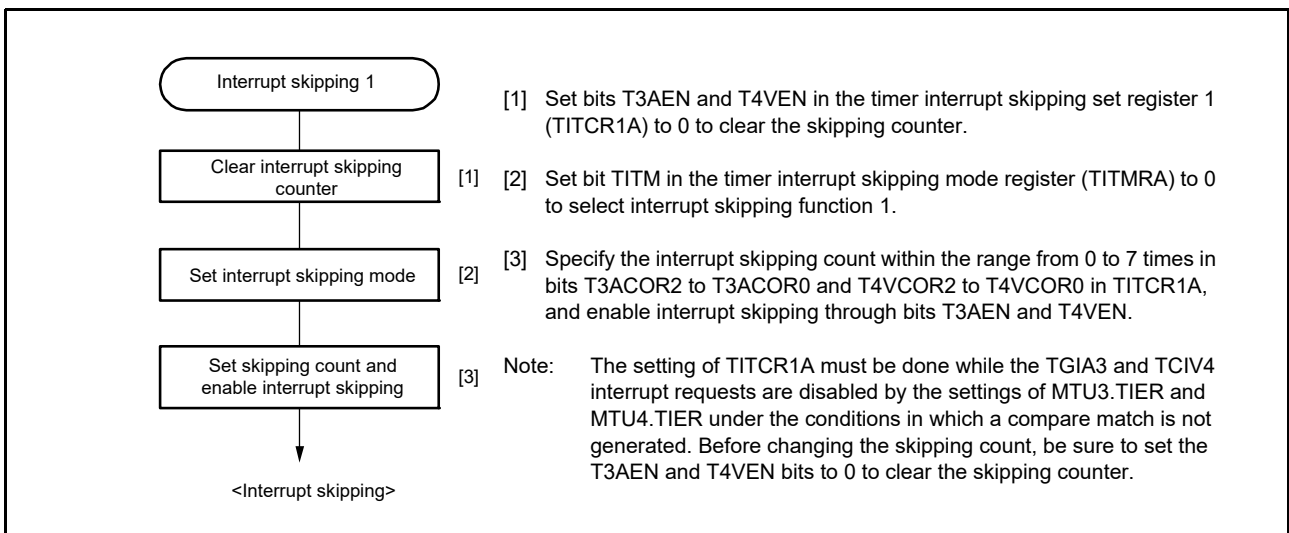

Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the TBTERA (TBTERB) register. For the linkage with buffer registers, refer to description (c), Buffer Transfer Control Linked with Interrupt Skipping, below.

A/D conversion start requests generated by the A/D conversion start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the MTU4.TADCR (MTU7.TADCR) register. For the linkage with the A/D conversion start request delaying function, refer to section 22.3.9, A/D Conversion Start Request Delaying Function.

The TITCR1A (TITCR1B) register should be set while interrupt skipping function 1 is selected by setting the TITM bit in the timer interrupt skipping mode register (TITMRA or TITMRB) to 0, TGIA3 (TGIA6) interrupt requests are disabled by setting the MTU3.TIER (MTU6.TIER) register, TCIV4 (TCIV7) interrupt requests are disabled by setting the MTU4.TIER (MTU7.TIER) register, and a compare match is not generated. Before changing the skipping count, be sure to set the T3AEN (T6AEN) and T4VEN (T7VEN) bits to 0 to clear the skipping counter.

**(a) Example of Interrupt Skipping Function 1 Setting Procedure**

Figure 22.85 shows an example of the interrupt skipping function 1 setting procedure. Figure 22.86 shows the periods during which interrupt skipping count can be changed.

**Figure 22.85 Example of Interrupt Skipping Function 1 Setting Procedure**

**Figure 22.86 Periods during which Interrupt Skipping Count can be Changed**

(b) Example of Interrupt Skipping Function 1

Figure 22.87 shows an example of TGIA3 (TGIA6) interrupt skipping in which the interrupt skipping count is set to three by the T3ACOR (T6ACOR) bits and the T3AEN (T6AEN) bit is set to 1 in the TITCR1A (TITCR1B) register.

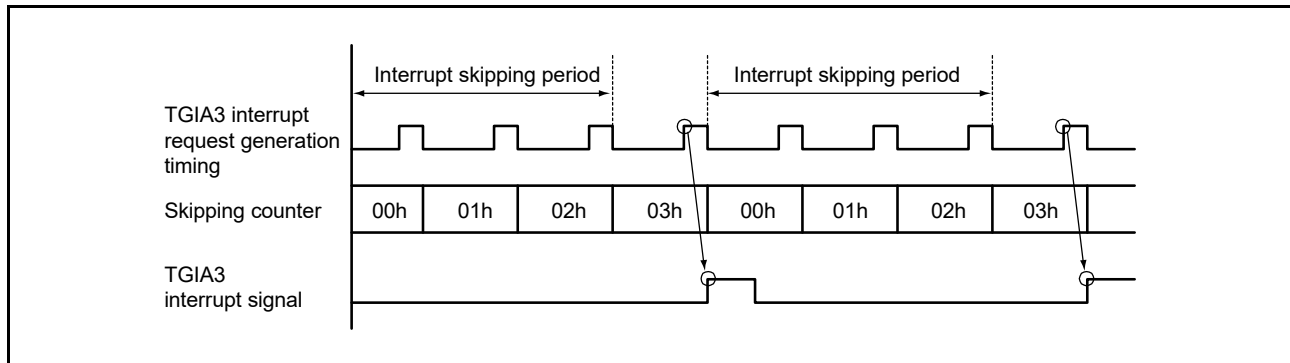

Figure 22.87 Example of Interrupt Skipping Function 1

(c) Buffer Transfer Control Linked with Interrupt Skipping

In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE[1:0] bits in the TBTERA (TBTERB) register.

Figure 22.88 shows an example of operation when buffer transfer is disabled (BTE[1:0] = 01b). While this setting is valid, data is not transferred from the buffer register to the temporary register.

Figure 22.89 shows an example of operation when buffer transfer is linked with interrupt skipping (BTE[1:0] = 10b). While this setting is valid, data is not transferred from the buffer register outside the buffer transfer-enabled period.

Note that the buffer transfer-enabled period differs depending on whether only the T3AEN (T6AEN) bit in the TITCR1A (TITCR1B) register is set to 1, only the T4VEN (T7VEN) bit in the TITCR1A (TITCR1B) register is set to 1, or both the T3AEN and T4VEN (T6AEN and T7VEN) bits are set to 1. Figure 22.90 shows the relationship between the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in TITCR1A (TITCR1B) and buffer transfer-enabled period.

Note: This function must be used in combination with interrupt skipping function 1. When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B) are set to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are set to 0), make sure that buffer transfer is not linked with interrupt skipping (set the BTE1 bit in TBTERA or TBTERB to 0). If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.

Figure 22.88 Example of Operation When Buffer Transfer is Disabled (BTE[1:0] = 01b)

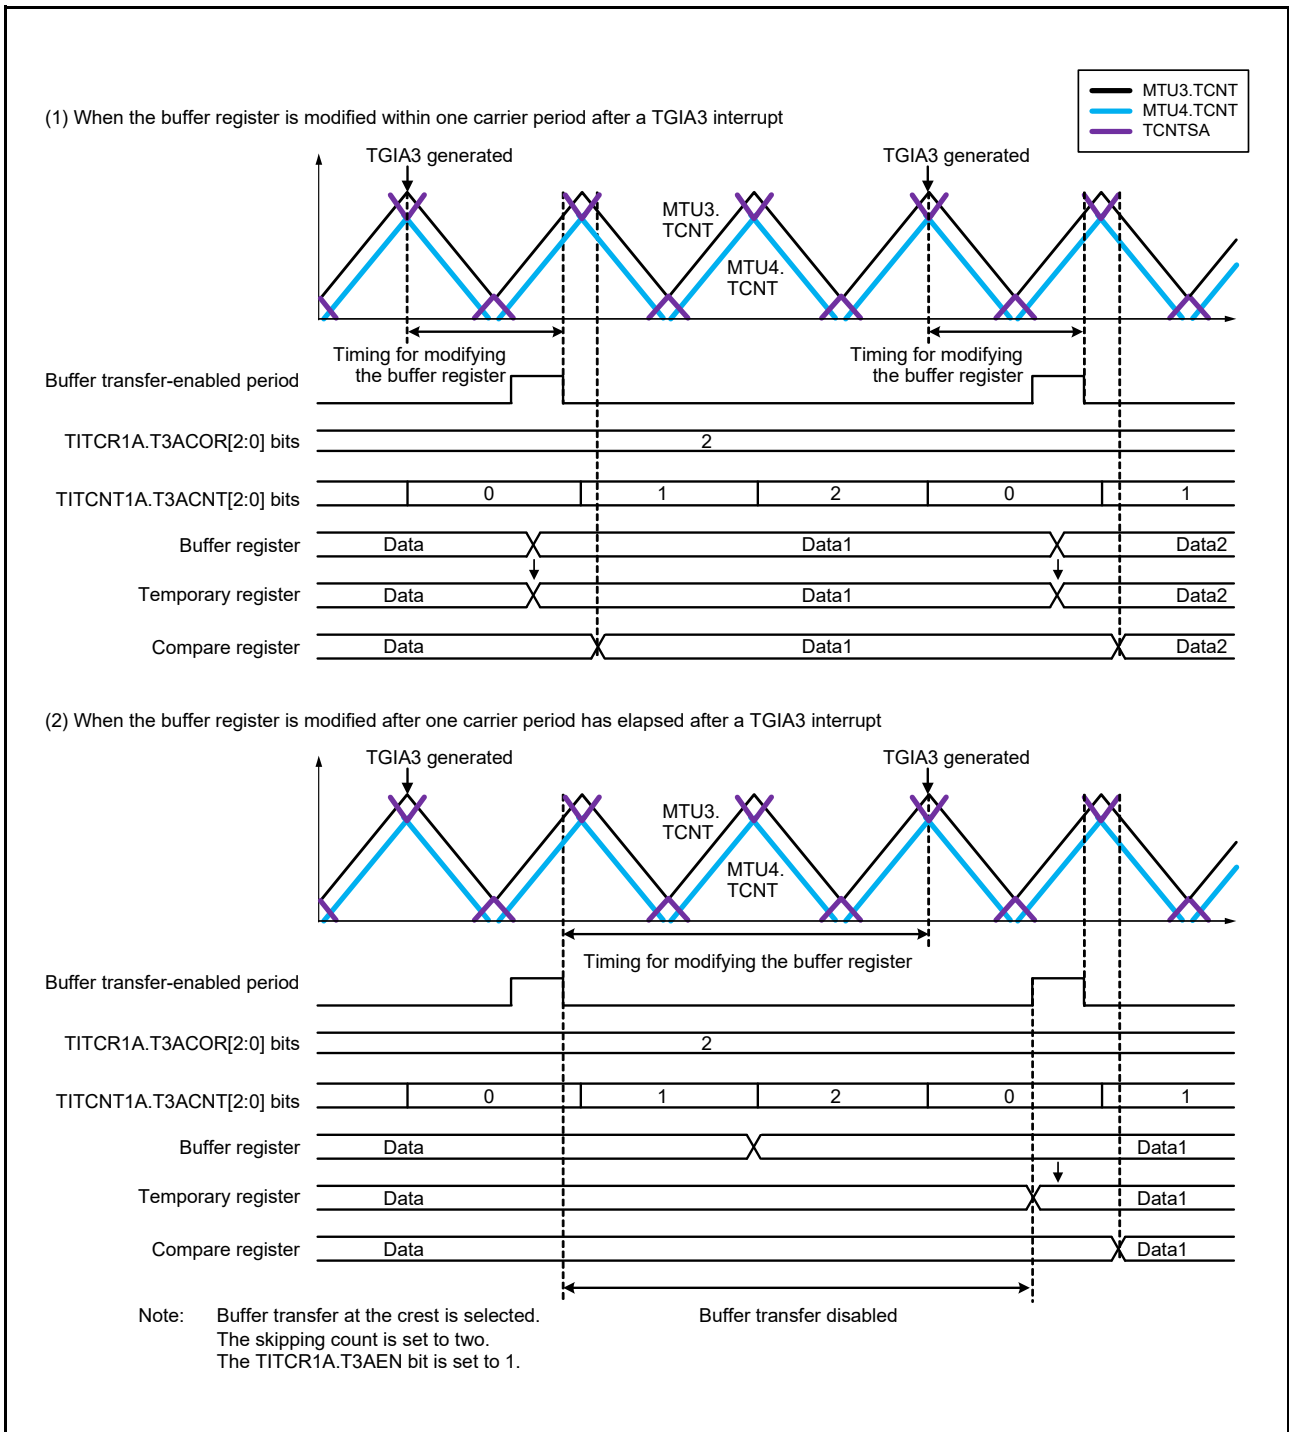

Figure 22.89 Example of Operation When Buffer Transfer is Linked with Interrupt Skipping (BTE[1:0] = 10b)

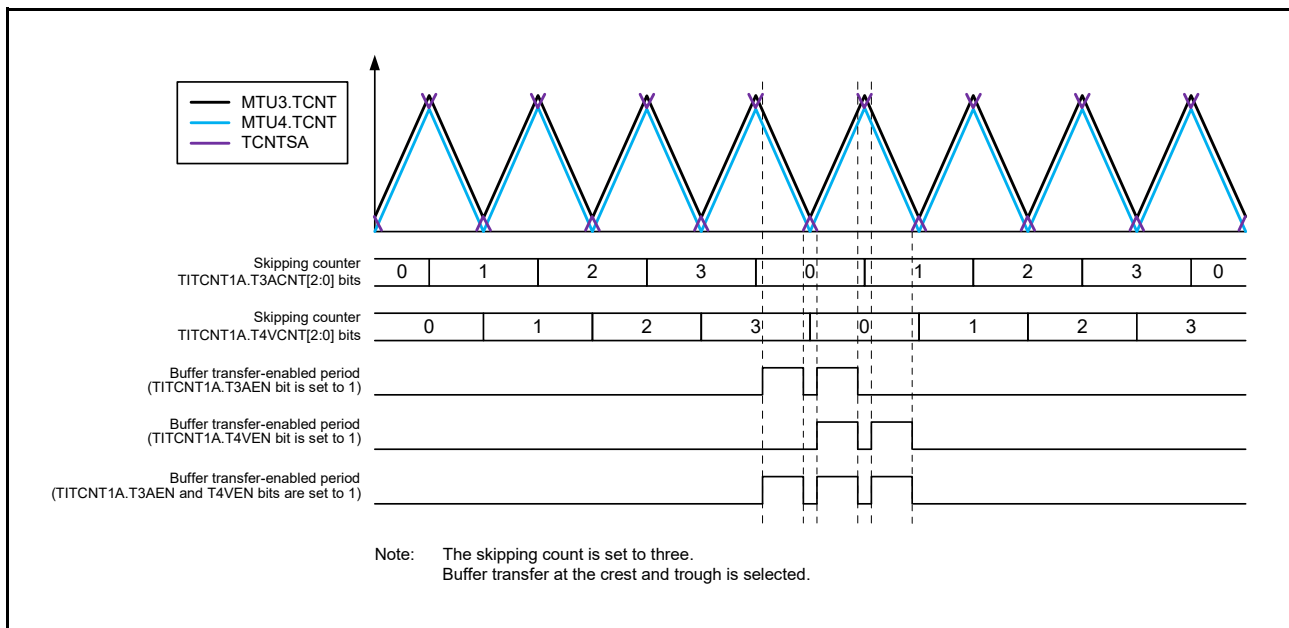

Figure 22.90 Relationship between Bits T3AEN and T4VEN in TITCR1A and Buffer Transfer-Enabled Period

#### (4) Complementary PWM Mode Output Protection Functions

The following output protection functions are provided for complementary PWM mode.

##### (a) Register and Counter Miswrite Prevention Function

Access from the CPU to the mode registers, control registers, compare registers, and counters can be enabled or disabled by setting the RWE bit in the TRWERA (TRWERB) register. The applicable registers are some of the registers in MTU3, MTU4, MTU6, and MTU7 shown below:

48 registers in total

MTU3.TCR, MTU4.TCR, MTU3.TCR2, MTU4.TCR2, MTU3.TMDR1, MTU4.TMDR1, MTU3.TIORH, MTU4.TIORH, MTU3.TIORL, MTU4.TIORL, MTU3.TIER, MTU4.TIER, MTU3.TCNT, MTU4.TCNT, MTU3.TGRA, MTU4.TGRA, MTU3.TGRB, MTU4.TGRB, MTU.TOERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA, MTU6.TCR, MTU7.TCR, MTU6.TCR2, MTU7.TCR2, MTU6.TMDR1, MTU7.TMDR1, MTU6.TIORH, MTU7.TIORH, MTU6.TIORL, MTU7.TIORL, MTU6.TIER, MTU7.TIER, MTU6.TCNT, MTU7.TCNT, MTU6.TGRA, MTU7.TGRA, MTU6.TGRB, MTU7.TGRB, MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TGCRB, MTU.TCDRB, and MTU.TDDRB

This function can disable CPU access to the mode registers, control registers, and counters to prevent miswriting due to CPU runaway. In the access-disabled state, the applicable registers are read as undefined and writing to these registers is ignored.

##### (b) Halting of PWM Output by External Signal

The PWM output pins of MTU0, MTU3, MTU4, MTU6, MTU7, and MTU9 can be set to the high-impedance state automatically.

Refer to section 23, Port Output Enable 3 (POE3B), for details.

### 22.3.9 A/D Conversion Start Request Delaying Function

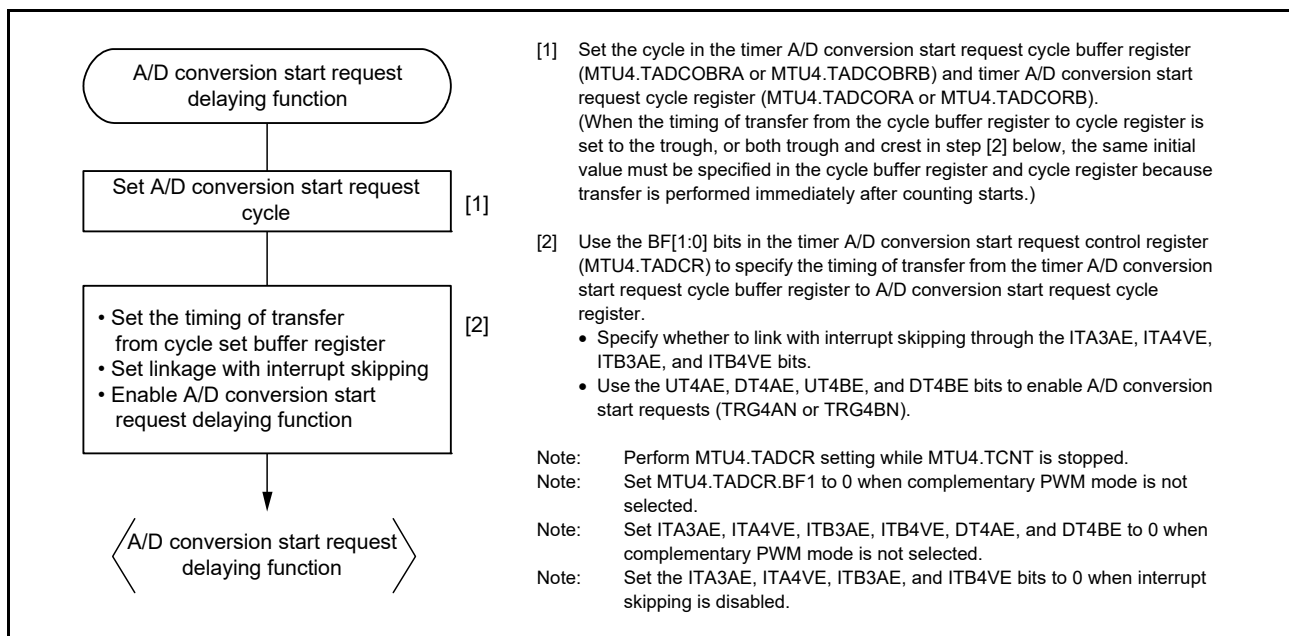

A/D conversion start requests can be issued in MTU4 or MTU7 by making settings in the timer A/D conversion start request control register (MTU4.TADCR or MTU7.TADCR), timer A/D conversion start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB), and timer A/D conversion start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB).

The A/D conversion start request delaying function compares MTU4.TCNT with MTU4.TADCORA or MTU4.TADCORB (MTU7.TCNT with MTU7.TADCORA or MTU7.TADCORB), and when their values match, the function issues a respective A/D conversion start request (TRG4AN or TRG4BN (TRG7AN or TRG7BN)).

A/D conversion start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be skipped in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in MTU4.TADCR (the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in MTU7.TADCR).

#### (1) Example of Procedure for Specifying A/D Conversion Start Request Delaying Function

Figure 22.91 shows an example of procedure for specifying the A/D conversion start request delaying function.

**Figure 22.91 Example of Procedure for Specifying A/D Conversion Start Request Delaying Function (MTU3 and MTU4)**

(2) Basic Example of A/D Conversion Start Request Delaying Function Operation

Figure 22.92 shows a basic example of A/D conversion start request signal (TRG4AN (TRG7AN)) operation when the trough of MTU4.TCNT (MTU7.TCNT) is specified for the buffer transfer timing and an A/D conversion start request signal is output during MTU4.TCNT (MTU7.TCNT) down-counting.

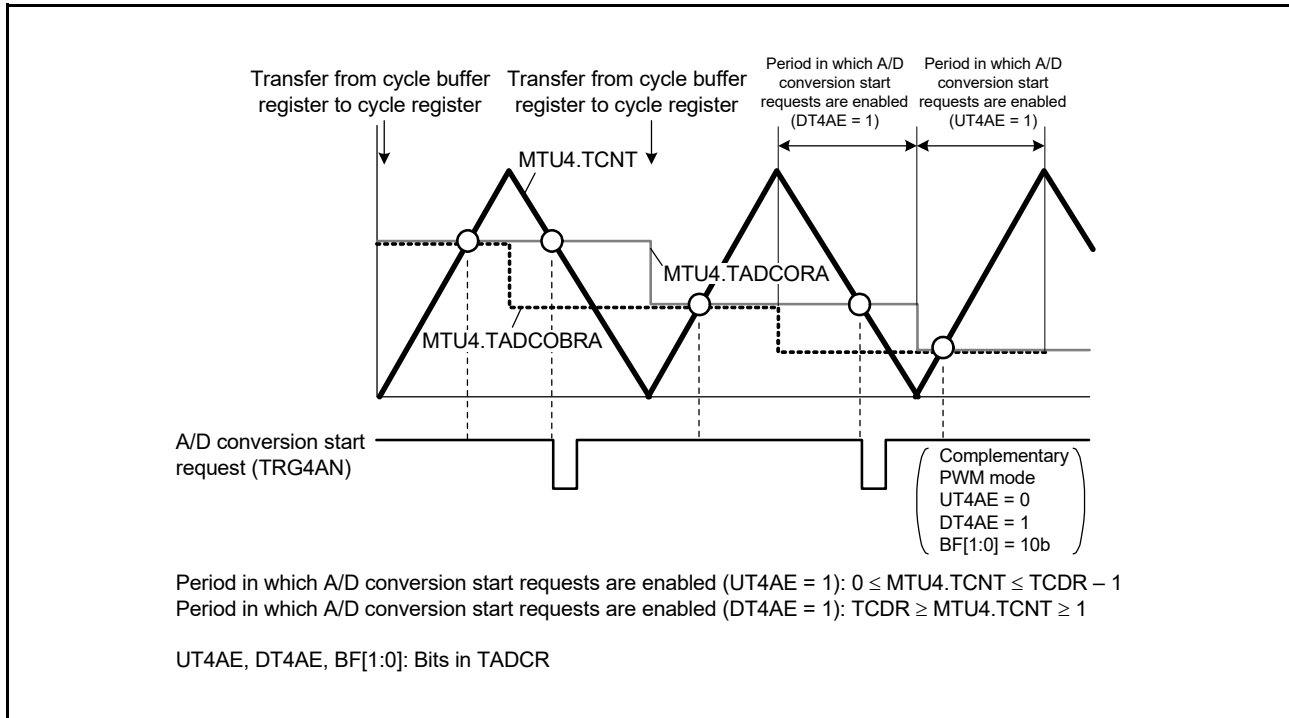

Figure 22.92 Basic Example of A/D Conversion Start Request Signal (TRG4AN) Operation

(3) Period in Which A/D Conversion Start Requests are Enabled

When the MTU4.TCNT (MTU7.TCNT) counter and the MTU4.TADCORA or MTU4.TADCORB (MTU7.TADCORA or MTU7.TADCORB) register matches within the period enabled by the UT4AE and UT4BE (UT7AE and UT7BE) bits, the corresponding A/D conversion start request (TRG4AN or TRG4BN) is issued.

When the UT4AE and UT4BE (UT7AE and UT7BE) bits in the MTU4.TADCR (MTU7.TADCR) register are set to 1 in complementary PWM mode, A/D conversion start requests are enabled during the MTU4.TCNT (MTU7.TCNT) up-counting ( $0 \leq \text{MTU4.TCNT (MTU7.TCNT)} \leq \text{TCDR} - 1$ ). When the DT4AE and DT4BE (DT7AE and DT7BE) bits in the MTU4.TADCR (MTU7.TADCR) register are set to 1, A/D conversion start requests are enabled during MTU4.TCNT (MTU7.TCNT) down-counting ( $\text{TCDR} \geq \text{MTU4.TCNT (MTU7.TCNT)} \geq 1$ ). Refer to Figure 22.92.

(4) Buffer Transfer

The data in the timer A/D conversion start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB) is updated by writing data to the timer A/D conversion start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF[1:0] bits in the MTU4.TADCR (MTU7.TADCR) register.

In complementary PWM mode, data is also transferred from the timer A/D conversion start request cycle set buffer registers to the timer A/D conversion start request cycle set registers when MTU4.TGRD (MTU7.TGRD) register is updated.

There are notes on the timing for transferring data when using buffer transfer in complementary PWM mode.

For details, section 22.6.28, Usage Notes on A/D Conversion Start Request Delaying Function in Complementary PWM Mode.

In modes other than complementary PWM mode, set the BF1 bit in the MTU4.TADCR (MTU7.TADCR) register to 0.

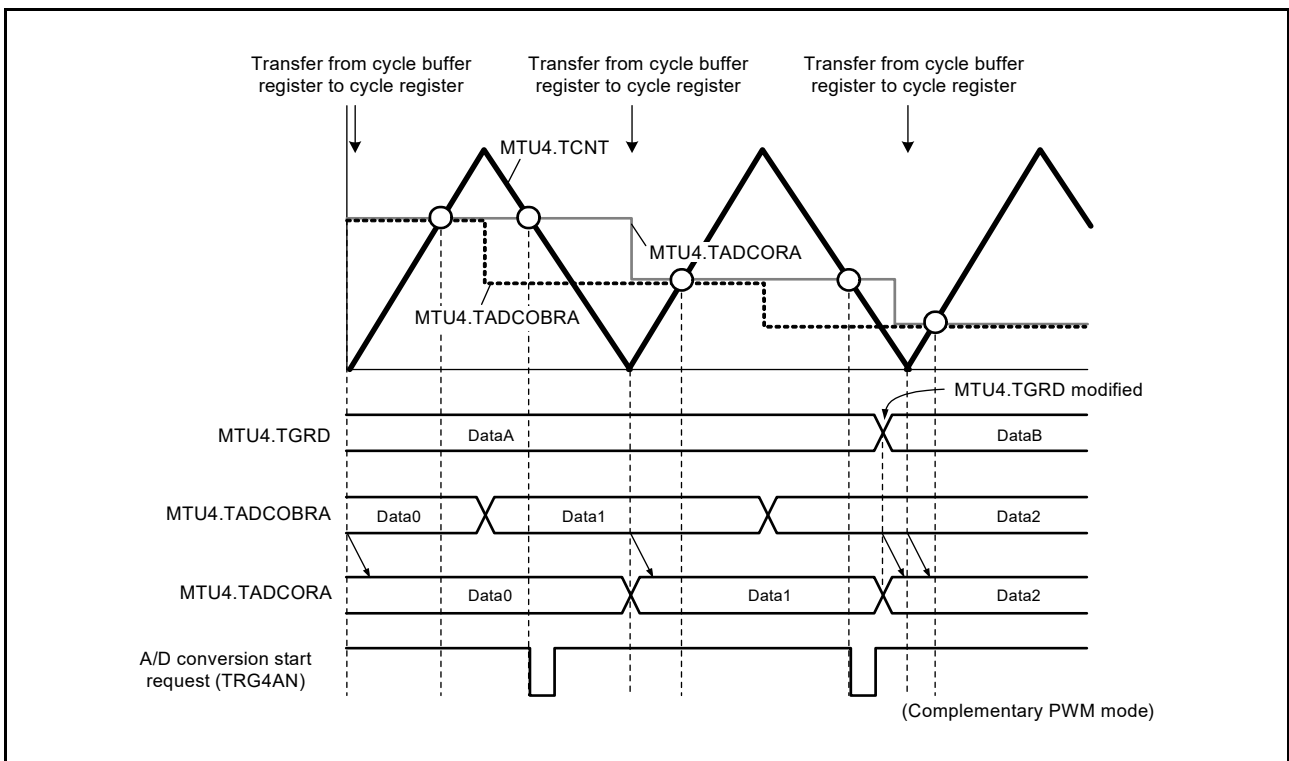

Figure 22.93 Example of A/D Conversion Start Request Signal (TRG4AN) and Buffer Transfer Operation

(5) A/D Conversion Start Request Delaying Function Linked with Interrupt Skipping Function 1

In complementary PWM mode, A/D conversion start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be issued in coordination with interrupt skipping 1 by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the MTU4.TADCR (MTU7.TADCR) register.

Figure 22.94 shows an example of A/D conversion start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and down-counting and A/D conversion start requests are linked with interrupt skipping 1.

Figure 22.95 shows another example of A/D conversion start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and A/D conversion start requests are linked with interrupt skipping 1.

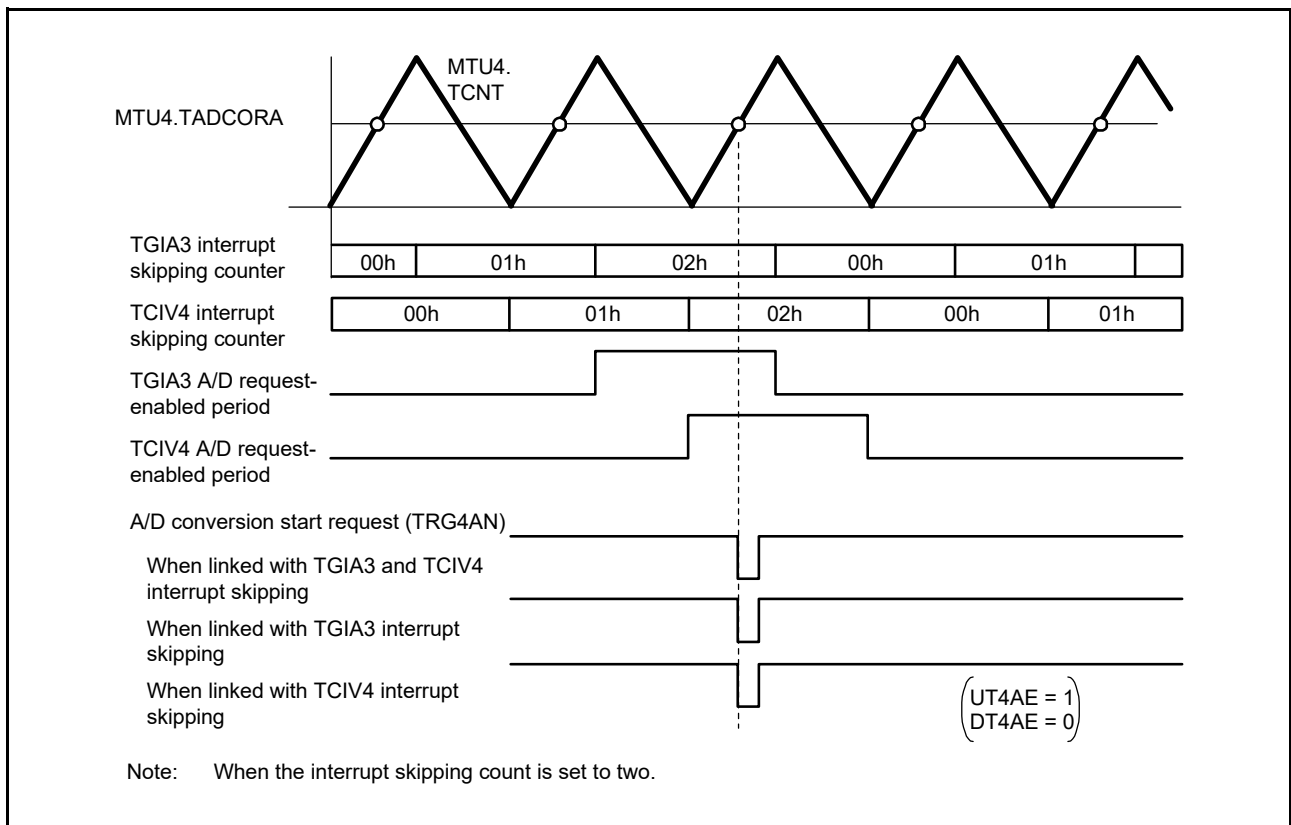

In modes other than complementary PWM mode, do not use the A/D conversion start request delaying function linked with the interrupt skipping function 1.

Set the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the MTU4.TADCR (MTU7.TADCR) register to 0.

**Note:** This function should be used in combination with interrupt skipping 1. When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register (TITCR1A (TITCR1B)) are set to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are set to 0), make sure that A/D conversion start requests are not linked with interrupt skipping 1 (set the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the timer A/D conversion start request control register (MTU4.TADCR (MTU7.TADCR)) to 0). When this function is used, MTU4.TADCORA and MTU4.TADCORB (MTU7.TADCORA and MTU7.TADCORB) should be set with the value ranging 0002h to the value set in TCDRA minus 2 (value set in TCDRB minus 2).

**Figure 22.94** Example of A/D Conversion Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE and DT4AE = 1)

**Figure 22.95 Example of A/D Conversion Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE = 1, DT4AE = 0)**

(6) A/D Conversion Start Request Delaying Function Linked with Interrupt Skipping Function 2

By setting the TITM bit to 1 in the TITMRA (TITMRB) register, the counter starts down-counting from the value (0 to 7) set in the TRG4COR[2:0] (TRG7COR[2:0]) bits in TITCR2A (TITCR2B) register every time an A/D conversion start trigger (TRG4AN or TRG4BN (TRG7AN or TRG7BN)) is generated. When the counter value reaches 0 and is reloaded, the TRG4AN and TRG4BN (TRG7AN and TRG7BN) interrupts become valid and an A/D conversion start request signal (TRG4ABN (TRG7ABN)) is output.

This function is valid only when the A/D conversion start request delaying function is enabled.

(a) Example of Procedure for Setting Interrupt Skipping Function 2

Figure 22.96 shows an example of procedure for setting interrupt skipping function 2.

Figure 22.96 Example of Procedure for Setting Interrupt Skipping Function 2

(b) Example of Interrupt Skipping Function 2 Operation

Figure 22.97 shows an example of interrupt skipping function 2 operation.

Figure 22.97 Example of Interrupt Skipping Function 2 Operation (Skipping Count is Set to Four)

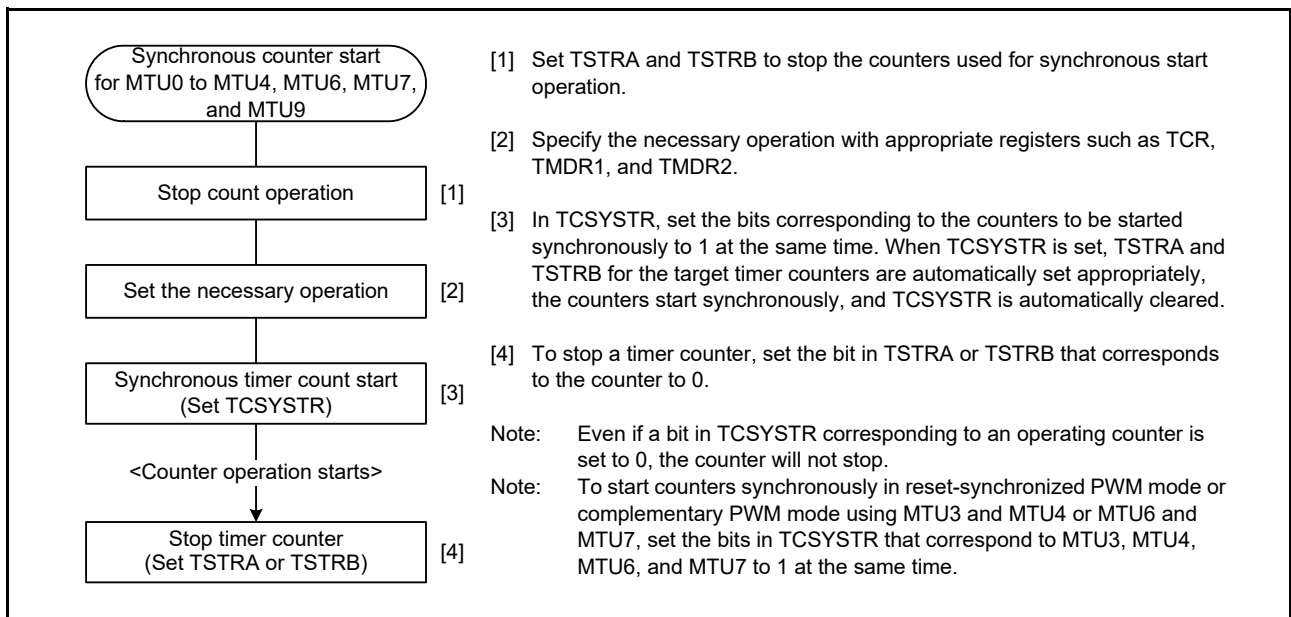

### 22.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, MTU7, and MTU9

#### (1) Synchronous Counter Start for MTU0 to MTU4, MTU6, MTU7, and MTU9

The counters in MTU0 to MTU4, MTU6, MTU7, and MTU9 can be started synchronously by making the TCSYSTR settings.

#### (a) Example of Procedure for Setting Synchronous Counter Start for MTU0 to MTU4, MTU6, MTU7, and MTU9

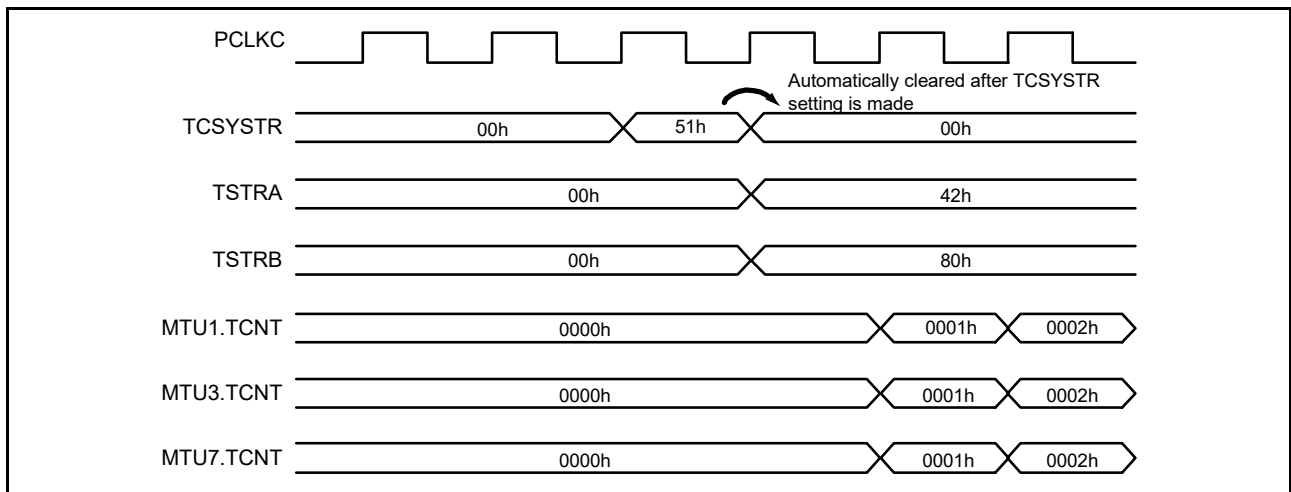

Figure 22.98 shows an example of procedure for setting synchronous counter start for MTU0 to MTU4, MTU6, MTU7, and MTU9.

**Figure 22.98 Example of Procedure for Setting Synchronous Counter Start for MTU0 to MTU4, MTU6, MTU7, and MTU9**

#### (b) Examples of Synchronous Counter Start Operation

Figure 22.99 shows an examples of synchronous counter start operation for MTU0 to MTU4, MTU6, MTU7, and MTU9.

**Figure 22.99 Examples of Synchronous Counter Start Operation for MTU0 to MTU4, MTU6, MTU7, and MTU9**

(2) Synchronous Counter Clearing for MTU6 and MTU7

The counters in MTU6 and MTU7 can be cleared by the TGI<sub>m</sub>n interrupt generation timing (m = A to D; n = 0 to 2) through the TSYCR setting.

(a) Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

Figure 22.100 shows an example of procedure for specifying synchronous counter clearing for MTU6 and MTU7 by interrupt generation timing.

Figure 22.100 Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

(b) Examples of Synchronous Counter Clearing for MTU6 and MTU7

Figure 22.101 and Figure 22.102 show examples of synchronous counter clearing for MTU6 and MTU7 by interrupt generation timing.

Figure 22.101 Example of Synchronous Counter Clearing for MTU6 and MTU7 (1)

Figure 22.102 Example of Synchronous Counter Clearing for MTU6 and MTU7 (2)

### 22.3.11 External Pulse Width Measurement

The pulse widths of up to three external input lines can be measured in MTU5.

When the IOC[4:0] bits in MTU5.TIORU, MTU5.TIORV, MTU5.TIORW are set for pulse width measurement, the pulse width of the signal input to the MTIC5U, MTIC5V, and MTIC5W pins are measured. TCNTU, TCNTV, and TCNTW count up while the level specified by the IOC[4:0] bits is input.

Figure 22.103 shows an example of setting external pulse width measurement, and Figure 22.104 an example of external pulse width measurement.

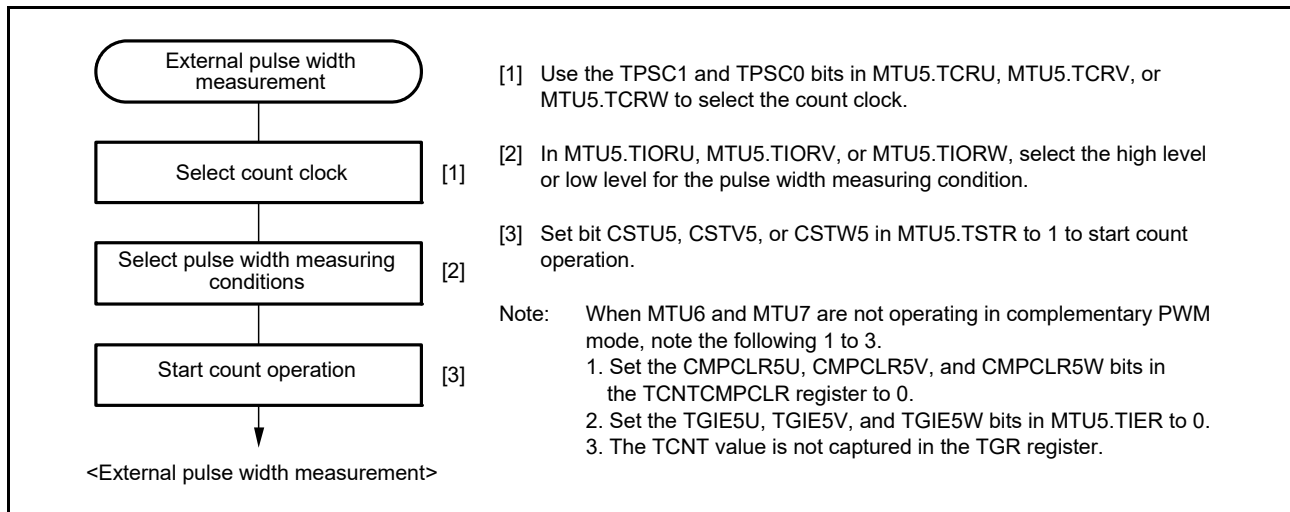

Figure 22.103 Example of External Pulse Width Measurement Setting Procedure

Figure 22.104 Example of External Pulse Width Measurement (Measuring High Pulse Width)

### 22.3.12 Dead Time Compensation

A dead time delay (a propagation delay of the inverter output from the complementary PWM output) can be compensated by combining MTU5 with MTU6 and MTU7. Figure 22.105 shows an example of the motor control circuit compensating a dead time delay by combining MTU5 with MTU6 and MTU7. A dead time for the PWM output waveform during complementary PWM operation using MTU6 and MTU7 can be compensated by adjusting a duty ratio set in a compare register for the PWM output after measuring a delay of the inverter output from the complementary PWM output by an external pulse measurement function for MTU5 (Figure 22.106). Figure 22.107 shows the procedure for setting dead time compensation using MTU5 to MTU7. For details on MTU5 operation at this time, refer to section 22.3.13, TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode.

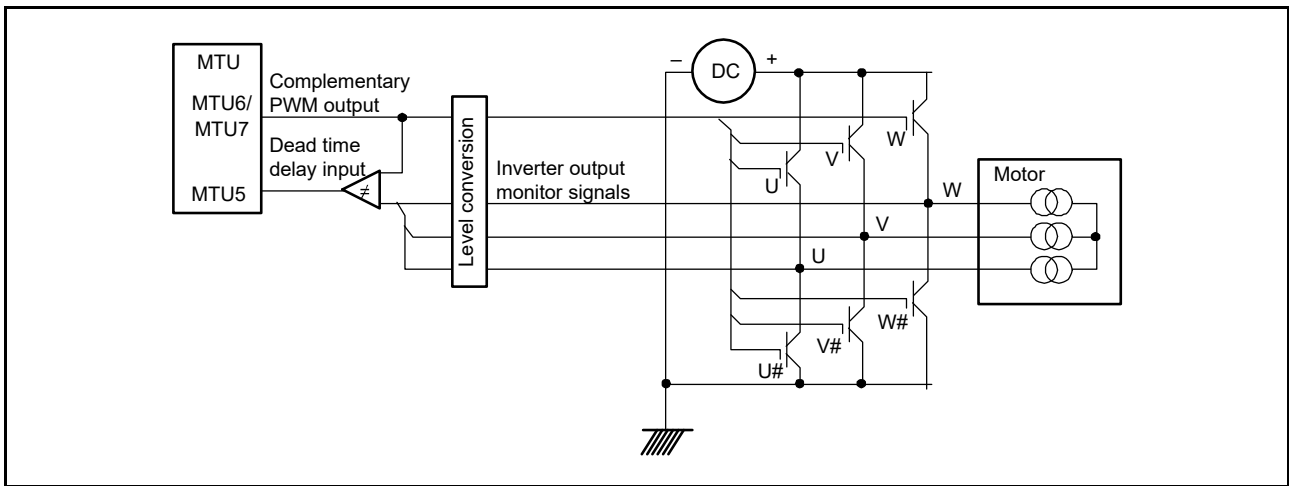

Figure 22.105 Motor Control Circuit Example

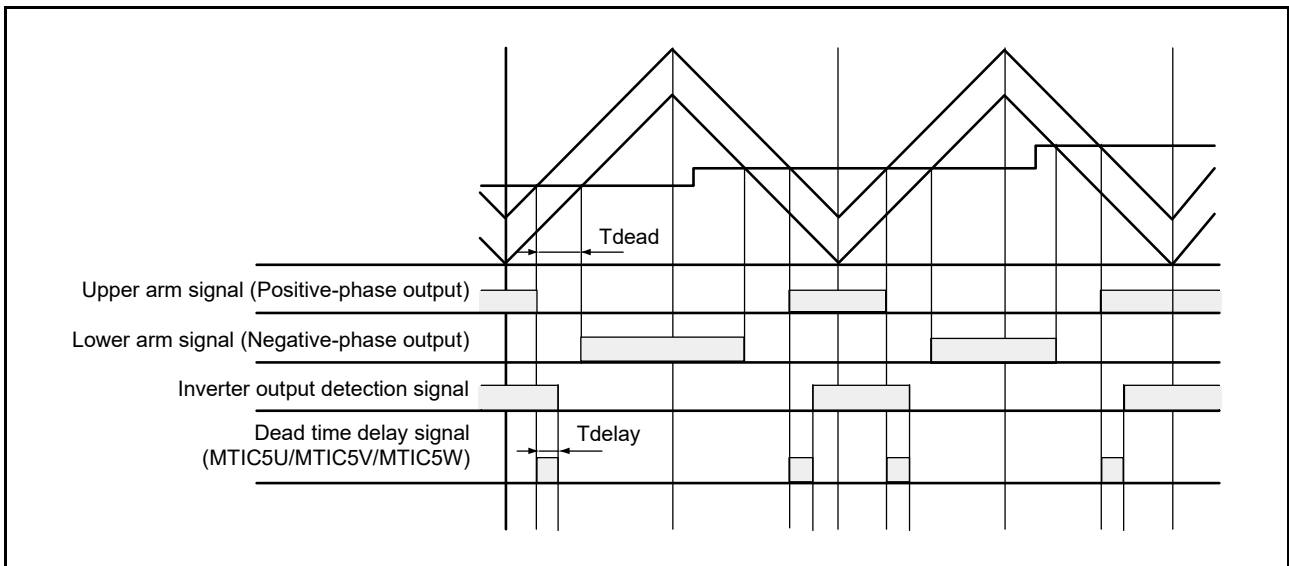

Figure 22.106 Delay in Dead Time in Complementary PWM Operation

## (1) Example of Dead Time Compensation Setting Procedure

Figure 22.107 shows an example of dead time compensation setting procedure by using three counters in MTU5.

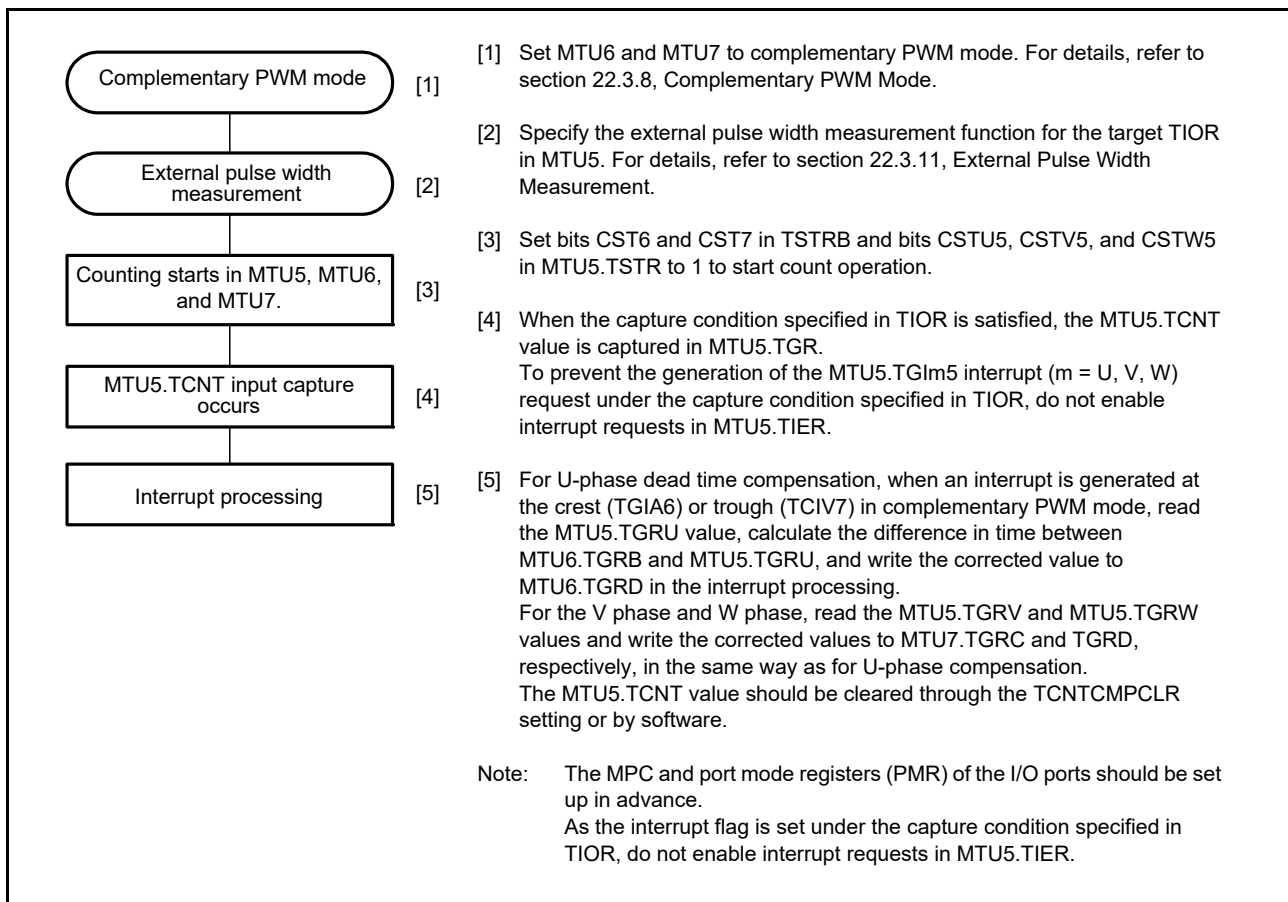

Figure 22.107 Example of Dead Time Compensation Setting Procedure

### 22.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode

The MTU5 external pulse width measurement function allows to transfer the value in TCNTU, TCNTV, and TCNTW to TGRU, TGRV, and TGRW at the crest, or trough, or crest and trough when MTU6 and MTU7 operate in complementary PWM mode. The transfer timing is set in TIORU, TIORV, and TIORW. When the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCMPCLR register are set to 1, TCNTU, TCNTV, and TCNTW become 0000h at the transfer timing for TGRU, TGRV, and TGRW.

When MTU3 and MTU4 operate in complementary PWM mode, MTU5 cannot operate a capture operation of TCNTU, TCNTV, and TCNTW at the crest, or trough, or crest and trough in complementary PWM mode.

Figure 22.108 shows an operation example in which TCNTU is used as a free-running counter without being cleared, and the value is captured in TGRU at the crest and trough in complementary PWM mode.

Figure 22.108 TCNTU Capture at Crest and Trough in Complementary PWM Operation

### 22.3.14 Noise Filter Function

The input capture input pins and external pulse input pins have a noise filter function.

Set the NFCRn register (n = 0 to 7, 9, C) to enable or disable the noise filter function and set the sampling clock. The noise filter for each pin can be enabled or disabled individually, and the sampling clock can be set for each channel.

Figure 22.109 shows the timing of noise filtering.

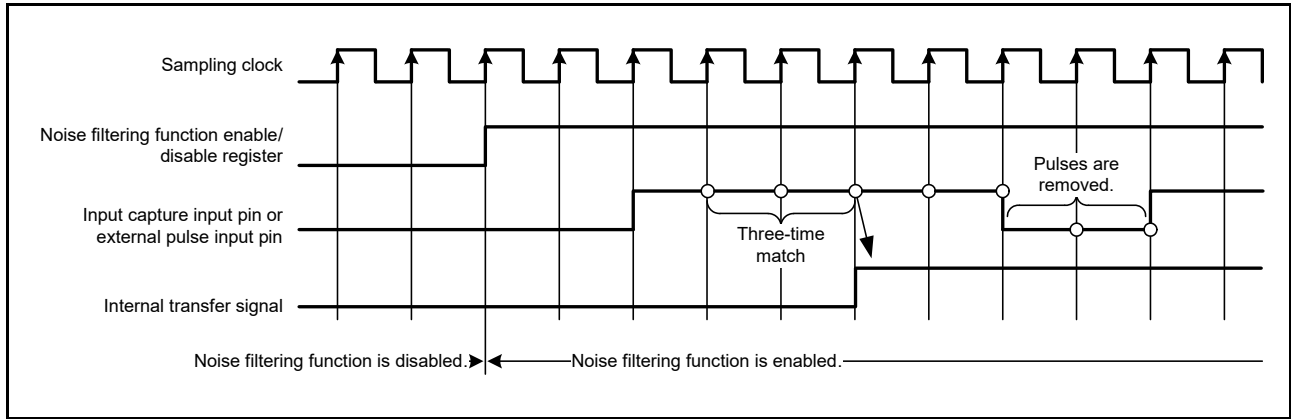

Figure 22.109 Timing of Noise Filtering

### 22.3.15 A/D Conversion Start Request Frame Synchronization Signal

This function can be used to monitor the generation timing of the A/D conversion start request signal using an external pin.

When the A/D conversion start request signal to be monitored is selected by the TADSTRGRn register (n = 0, 1) and the AD SMn pin output is enabled by TADSTRGRn.TADSMENn, a pulse signal is output from the AD SMn pin that is at the high level when the A/D conversion start request signal is generated, and at the low level in the timer cycle used to generate the A/D conversion start request signal.

Figure 22.110 shows an example of outputting the A/D conversion start request frame synchronization signal.

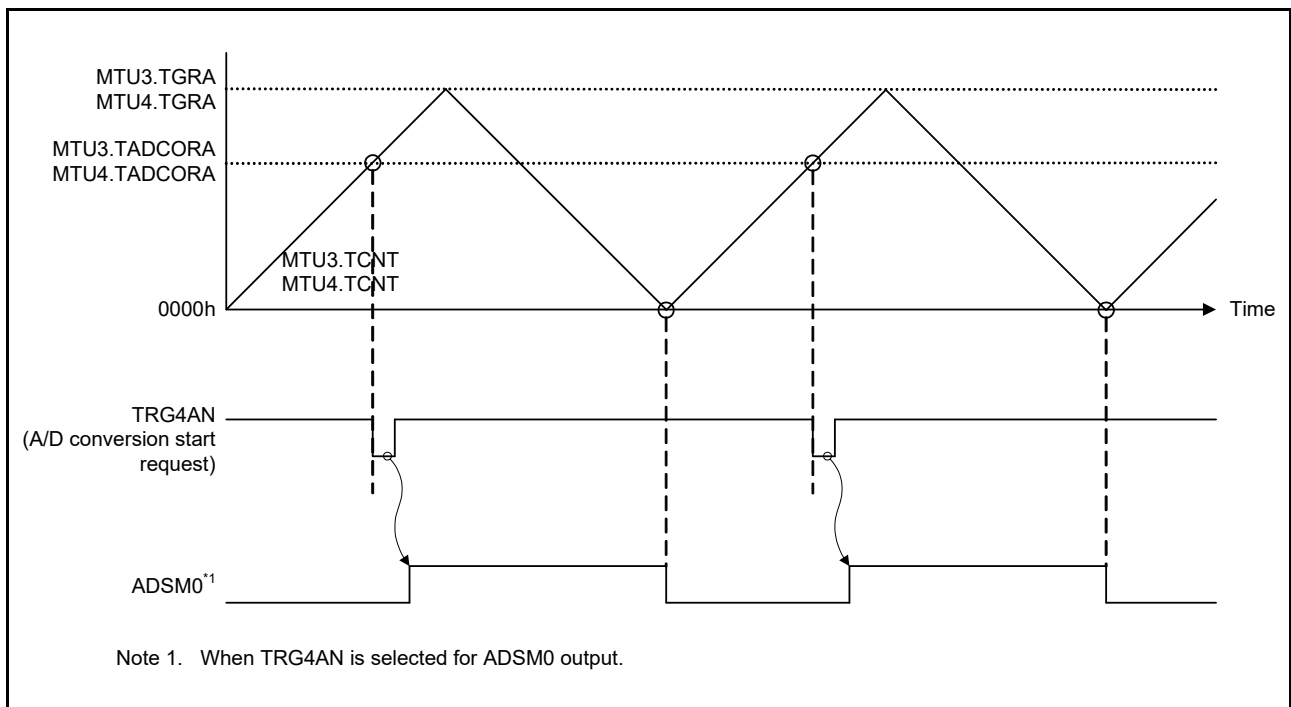

Figure 22.110 Example of Outputting A/D Conversion Start Request Frame Synchronization Signal

## 22.4 Interrupt Sources

### 22.4.1 Interrupt Sources and Priorities

There are three kinds of interrupt source; TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own enable/disable bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt source is generated, if the corresponding enable/disable bit in TIER is set to 1, an interrupt is requested.

Relative channel priorities can be changed by the interrupt controller; however the priority within a channel is fixed. For details, refer to section 14, Interrupt Controller (ICUC). Table 22.78 lists the MTU interrupt sources.

**Table 22.78 MTU Interrupt Sources**

| Channel | Name  | Interrupt Source                      | DMAC/DTC Activation |
|---------|-------|---------------------------------------|---------------------|
| MTU0    | TGIA0 | MTU0.TGRA input capture/compare match | Possible            |
|         | TGIB0 | MTU0.TGRB input capture/compare match | Possible            |
|         | TGIC0 | MTU0.TGRC input capture/compare match | Possible            |
|         | TGID0 | MTU0.TGRD input capture/compare match | Possible            |
|         | TCIV0 | MTU0.TCNT overflow                    | Not possible        |
|         | TGIE0 | MTU0.TGRE compare match               | Not possible        |
|         | TGIF0 | MTU0.TGRF compare match               | Not possible        |
| MTU1    | TGIA1 | MTU1.TGRA input capture/compare match | Possible            |
|         | TGIB1 | MTU1.TGRB input capture/compare match | Possible            |
|         | TCIV1 | MTU1.TCNT overflow                    | Not possible        |
|         | TCIU1 | MTU1.TCNT underflow                   | Not possible        |
| MTU2    | TGIA2 | MTU2.TGRA input capture/compare match | Possible            |
|         | TGIB2 | MTU2.TGRB input capture/compare match | Possible            |
|         | TCIV2 | MTU2.TCNT overflow                    | Not possible        |
|         | TCIU2 | MTU2.TCNT underflow                   | Not possible        |
| MTU3    | TGIA3 | MTU3.TGRA input capture/compare match | Possible            |
|         | TGIB3 | MTU3.TGRB input capture/compare match | Possible            |
|         | TGIC3 | MTU3.TGRC input capture/compare match | Possible            |
|         | TGID3 | MTU3.TGRD input capture/compare match | Possible            |
|         | TCIV3 | MTU3.TCNT overflow                    | Not possible        |
| MTU4    | TGIA4 | MTU4.TGRA input capture/compare match | Possible            |
|         | TGIB4 | MTU4.TGRB input capture/compare match | Possible            |
|         | TGIC4 | MTU4.TGRC input capture/compare match | Possible            |
|         | TGID4 | MTU4.TGRD input capture/compare match | Possible            |
|         | TCIV4 | MTU4.TCNT overflow/underflow*1        | Possible            |
| MTU5    | TGIU5 | MTU5.TGRU input capture/compare match | Possible            |
|         | TGIV5 | MTU5.TGRV input capture/compare match | Possible            |
|         | TGIW5 | MTU5.TGRW input capture/compare match | Possible            |
| MTU6    | TGIA6 | MTU6.TGRA input capture/compare match | Possible            |
|         | TGIB6 | MTU6.TGRB input capture/compare match | Possible            |
|         | TGIC6 | MTU6.TGRC input capture/compare match | Possible            |
|         | TGID6 | MTU6.TGRD input capture/compare match | Possible            |
|         | TCIV6 | MTU6.TCNT overflow                    | Not possible        |
| MTU7    | TGIA7 | MTU7.TGRA input capture/compare match | Possible            |
|         | TGIB7 | MTU7.TGRB input capture/compare match | Possible            |
|         | TGIC7 | MTU7.TGRC input capture/compare match | Possible            |
|         | TGID7 | MTU7.TGRD input capture/compare match | Possible            |
|         | TCIV7 | MTU7.TCNT overflow/underflow*1        | Possible            |
| MTU9    | TGIA9 | MTU9.TGRA input capture/compare match | Possible            |
|         | TGIB9 | MTU9.TGRB input capture/compare match | Possible            |
|         | TGIC9 | MTU9.TGRC input capture/compare match | Possible            |
|         | TGID9 | MTU9.TGRD input capture/compare match | Possible            |
|         | TCIV9 | MTU9.TCNT overflow                    | Not possible        |
|         | TGIF9 | MTU9.TGRF compare match               | Not possible        |

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

Note 1. Underflow is available only in complementary PWM mode.

### (1) Input Capture/Compare Match Interrupt

If the TIER.TGIE bit is set to 1 when a TGR input capture/compare match occurs on a channel, an interrupt is requested. The MTU has 35 input capture/compare match interrupts (six for MTU0 and MTU9, four each for MTU3, MTU4, MTU6, and MTU7, two each for MTU1 and MTU2, and three for MTU5).

### (2) Overflow Interrupt

If the TIER.TCIEV bit is set to 1 when a TCNT overflow occurs on a channel, an interrupt is requested. The MTU has eight overflow interrupts (one for each channel except MTU5).

Note that an overflow interrupt is generated also when an underflow of the MTU4.TCNT and MTU7.TCNT occurs while operating in complementary PWM mode.

### (3) Underflow Interrupt

If the TIER.TCIEU bit is set to 1 when a TCNT underflow occurs on a channel, an interrupt is requested. The MTU has two underflow interrupts (one each for MTU1, and MTU2).

## 22.4.2 DTC/DMAC Trigger Sources

### (1) DTC Trigger Sources

The DTC can be triggered by the TGR input capture/compare match interrupt in each channel or the overflow interrupt in MTU4 and MTU7. For details, refer to [section 18, Data Transfer Controller \(DTCa\)](#).

The MTU provides a total of 33 input capture/compare match interrupts and overflow interrupts that can be used as DTC trigger sources: four each for MTU0, MTU3, MTU6, and MTU9, two each for MTU1 and MTU2, five each for MTU4 and MTU7, and three for MTU5.

### (2) DMAC Trigger Sources

The DMAC can be triggered by the TGR input capture/compare match interrupt in each channel and the overflow interrupt in MTU4 and MTU7. For details, refer to [section 17, DMA Controller \(DMACAa\)](#).

The MTU provides a total of 33 input capture/compare match interrupts and overflow interrupts that can be used as DMAC trigger sources: four each for MTU0, MTU3, MTU6, and MTU9, two each for MTU1 and MTU2, five each for MTU4 and MTU7, and three for MTU5.

If a DMA transfer is initiated by the MTU, the trigger signal is cleared when the DMAC requests ownership of the internal bus. Accordingly, the state of the internal bus may lead to a wait for the start of DMA transfer.

### 22.4.3 A/D Converter Trigger Sources

The A/D converter can be triggered by one of the following three methods in the MTU. Table 22.79 shows the relationship between interrupt sources and A/D conversion start request signals.

#### (1) A/D Conversion Start by TGRA Input Capture/Compare Match or at Trough of MTU4.TCNT (MTU7.TCNT) in Complementary PWM Mode

The A/D converter can be triggered by the occurrence of a TGRA input capture/compare match in each channel. In addition, if complementary PWM operation is performed while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1, the A/D converter can be triggered at the trough of MTU4.TCNT (MTU7.TCNT) count (MTU4.TCNT (MTU7.TCNT) = 0000h).

A/D conversion start request TRGAnN is issued to the A/D converter under either of the following conditions (n = 0 to 4, 6, 7, 9).

- When a TGRA input capture/compare match occurs on a channel while the TIER.TTGE bit is set to 1
- When the MTU4.TCNT (MTU7.TCNT) count reaches the trough (MTU4.TCNT (MTU7.TCNT) = 0000h) during complementary PWM operation while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1

When either condition is satisfied, if A/D conversion start request signal TRGAnN from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

#### (2) A/D Conversion Start by Compare Match between MTU0.TCNT and MTU0.TGRE, or MTU9.TCNT and MTU9.TGRE

A/D conversion start request TRG0N and TRG9N is issued to the A/D converter when a compare match occurs between MTU0.TCNT and MTU0.TGRE, MTU9.TCNT and MTU9.TGRE.

When a compare match occurs between MTU0.TCNT and MTU0.TGRE, MTU9.TCNT and MTU9.TGRE while the TTGE2 bit in MTU0.TIER2, MTU9.TIER2 are set to 1, A/D conversion start request TRG0N, TRG0AEN, TRG9N, TRG9AEN, or TRG09N is issued to the A/D converter. If A/D conversion start request signal TRG0N, TRG0AEN, TRG9N, TRG9AEN, or TRG09N from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

#### (3) A/D Conversion Start by A/D Conversion Start Request Delaying Function

The A/D converter can be triggered by generating A/D conversion start request signal TRG4AN or TRG4BN (TRG7AN or TRG7BN) when the MTU4.TCNT (MTU7.TCNT) count matches the MTU4.TADCORA or MTU4.TADCORB (MTU7.TADCORA or MTU7.TADCORB) value if the UT4AE, DT4AE, UT4BE, or DT4BE (UT7AE, DT7AE, UT7BE, or DT7BE) bit in the A/D conversion start request control register (MTU4.TADCR (MTU7.TADCR)) is set to 1. For details, refer to section 22.3.9, A/D Conversion Start Request Delaying Function.

A/D conversion will start when TRG4AN (TRG7AN) is generated if A/D conversion start request signal TRG4AN (TRG7AN) from the MTU is selected as the trigger in the A/D converter, when TRG4BN (TRG7BN) is generated if TRG4BN (TRG7BN) from the MTU is selected as the trigger in the A/D converter, or when TRG4ABN (TRG7ABN) is generated if TRG4ABN (TRG7ABN) from the MTU is selected as the trigger in the A/D converter.

**Table 22.79 Interrupt Sources and A/D Conversion Start Request Signals**

| Target Registers                                          | Interrupt Source                              | A/D Conversion Start Request Signal |
|-----------------------------------------------------------|-----------------------------------------------|-------------------------------------|
| MTU0.TGRA and MTU0.TCNT                                   | Input capture/compare match                   | TRGA0N                              |
| MTU9.TGRA and MTU9.TCNT                                   |                                               | TRGA9N                              |
| MTU9.TGRA and MTU9.TCNT,<br>MTU9.TGRE and MTU9.TCNT*1     |                                               | TRG9AEN                             |
| MTU0.TGRA and MTU0.TCNT,<br>MTU0.TGRE and MTU0.TCNT*1     |                                               | TRG0AEN                             |
| MTU0.TGRA and MTU0.TCNT,<br>MTU9.TGRA and MTU9.TCNT       |                                               | TRGA09N                             |
| MTU1.TGRA and MTU1.TCNT                                   |                                               | TRGA1N                              |
| MTU2.TGRA and MTU2.TCNT                                   |                                               | TRGA2N                              |
| MTU3.TGRA and MTU3.TCNT                                   |                                               | TRGA3N                              |
| MTU4.TGRA and MTU4.TCNT*2                                 |                                               | TRGA4N                              |
| MTU4.TCNT                                                 | MTU4.TCNT trough in complementary PWM mode    |                                     |
| MTU6.TGRA and MTU6.TCNT                                   | Input capture/compare match                   | TRGA6N                              |
| MTU7.TGRA and MTU7.TCNT*2                                 |                                               | TRGA7N                              |
| MTU7.TCNT                                                 | MTU7.TCNT trough in complementary PWM mode    |                                     |
| MTU0.TGRE and MTU0.TCNT                                   | Compare match                                 | TRG0N                               |
| MTU9.TGRE and MTU9.TCNT                                   |                                               | TRG9N                               |
| MTU0.TGRE and MTU0.TCNT*1,<br>MTU9.TGRE and MTU9.TCNT*1   |                                               | TRG09N                              |
| MTU4.TADCORA and MTU4.TCNT                                |                                               | TRG4AN                              |
| MTU4.TADCORB and MTU4.TCNT                                |                                               | TRG4BN                              |
| MTU7.TADCORA and MTU7.TCNT                                |                                               | TRG7AN                              |
| MTU7.TADCORB and MTU7.TCNT                                |                                               | TRG7BN                              |
| MTU4.TADCORA and MTU4.TCNT,<br>MTU4.TADCORB and MTU4.TCNT | Compare match (interrupt skipping function 2) | TRG4ABN                             |
| MTU7.TADCORA and MTU7.TCNT,<br>MTU7.TADCORB and MTU7.TCNT |                                               | TRG7ABN                             |

Note 1. Since the compare match source of TGRE is used as the A/D trigger start source, set the MTU0.TIER2.TTGE2 and MTU9.TIER2.TTGE2 to 1.

Note 2. Since PWM waveforms are generated in complementary PWM mode, MTU4.TGRA (MTU7.TGRA) compare match not only with MTU4.TCNT (MTU7.TCNT) but also with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) is detected. Accordingly, when compare match with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) occurs, TRGA4N (TRGA7N) is also generated. When MTU3 and MTU 4 (MTU 6 and MTU7) are made to operate in complementary PWM mode for generating an A/D conversion start request, use the A/D conversion start request by compare match between MTU4.TCNT (MTU7.TCNT) and MTU4.TADCORA/TADCORB (MTU7.TADCORA/TADCORB).

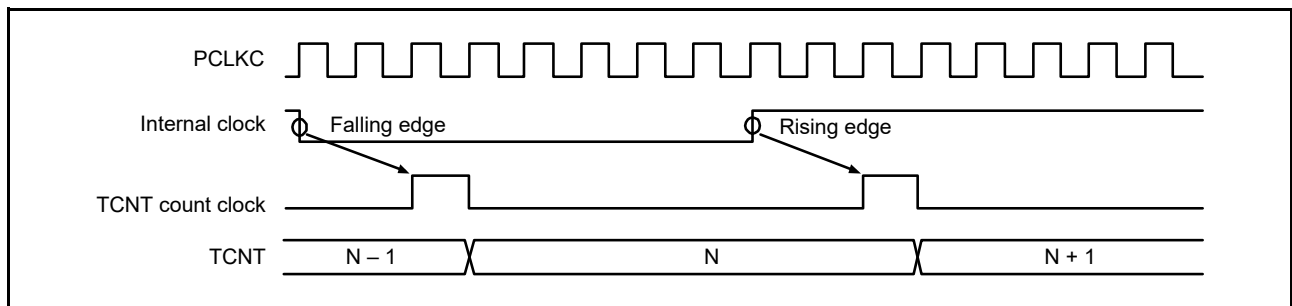

## 22.5 Operation Timing

### 22.5.1 Input/Output Timing

#### (1) TCNT Count Timing

Figure 22.111 and Figure 22.112 show the TCNT count timing in internal clock operation, Figure 22.113 shows the TCNT count timing in external clock operation (normal mode), and Figure 22.114 shows the TCNT count timing in external clock operation (phase counting mode).

**Figure 22.111** Count Timing in Internal Clock Operation (MTU0 to MTU4, MTU6, MTU7, and MTU9)

**Figure 22.112** Count Timing in Internal Clock Operation (MTU5)

**Figure 22.113** Count Timing in External Clock Operation (MTU0 to MTU4, MTU6, MTU7, and MTU9)

**Figure 22.114** Count Timing in External Clock Operation (Phase Counting Mode)

(2) Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the value set in TIOR is output from MTIOCNm pin ( $n = 0$  to  $4, 6, 7, 9$ ;  $m = A$  to  $D$ ). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT count clock is generated.

Figure 22.115 shows the output compare output timing (normal mode or PWM mode) and Figure 22.116 shows the output compare output timing (complementary PWM mode or reset-synchronized PWM mode).

Figure 22.115 Output Compare Output Timing (Normal Mode or PWM Mode) ( $n = 0$  to  $4, 6, 7, 9$ ;  $m = A$  to  $D$ )

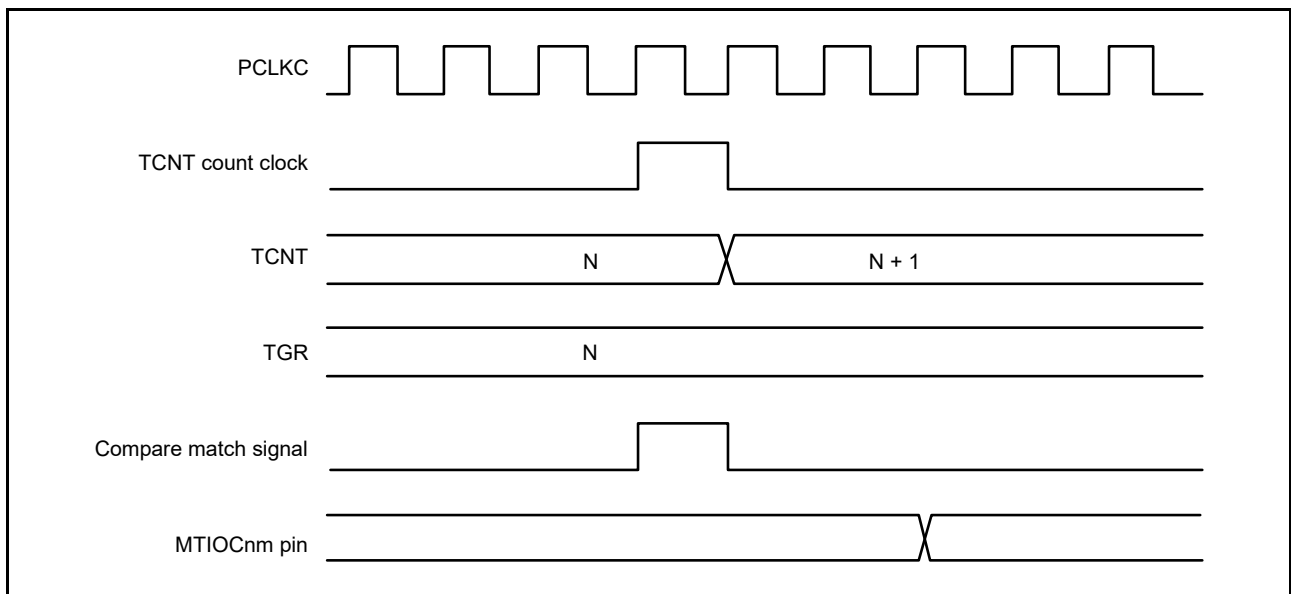

Figure 22.116 Output Compare Output Timing (Complementary PWM Mode or Reset-Synchronized PWM Mode) ( $n = 0$  to  $4, 6, 7, 9$ ;  $m = A$  to  $D$ )

(3) Input Capture Signal Timing

Figure 22.117 shows the input capture signal timing.

Figure 22.117 Input Capture Input Signal Timing

(4) Timing for Counter Clearing by Compare Match/Input Capture

Figure 22.118 and Figure 22.119 show the timing when counter clearing on compare match is specified, and Figure 22.120 shows the timing when counter clearing on input capture is specified.

Figure 22.118 Counter Clear Timing (Compare Match) (MTU0 to MTU4, MTU6, MTU7, and MTU9)

Figure 22.119 Counter Clear Timing (Compare Match) (MTU5)

Figure 22.120 Counter Clear Timing (Input Capture) (MTU0 to MTU7, and MTU9)

(5) Buffer Operation Timing

Figure 22.121 to Figure 22.123 show the timing in buffer operation.

Figure 22.121 Buffer Operation Timing (Compare Match)

Figure 22.122 Buffer Operation Timing (Input Capture)

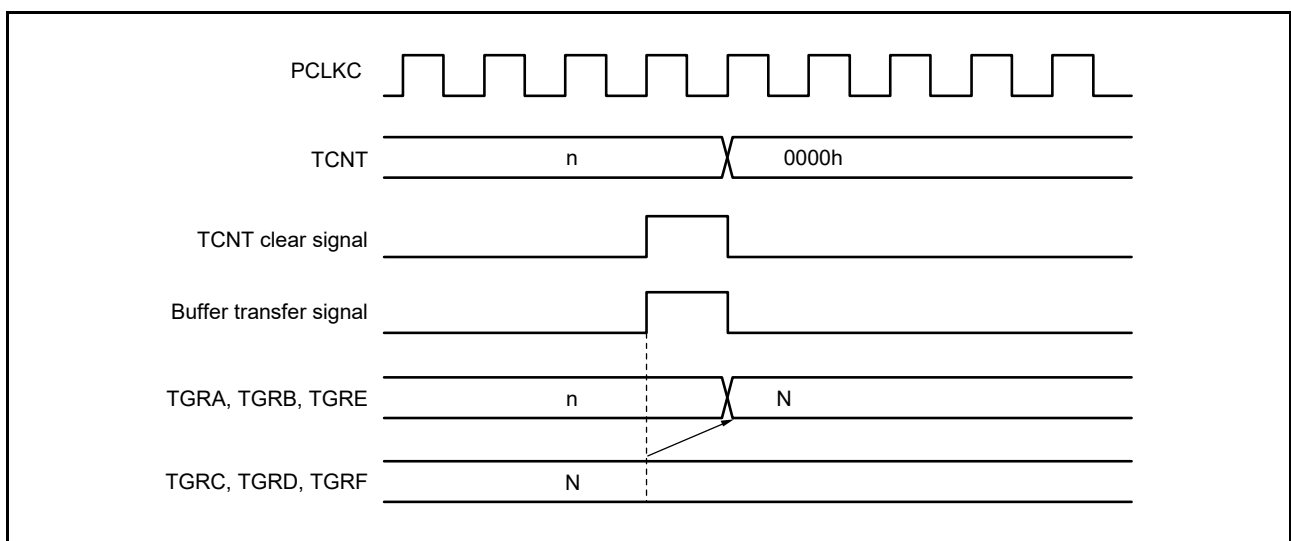

Figure 22.123 Buffer Operation Timing (When TCNT Cleared)

(6) Buffer Transfer Timing (Complementary PWM Mode)

Figure 22.124 to Figure 22.126 show the buffer transfer timing in complementary PWM mode.

Figure 22.124 Transfer Timing from Buffer Register to Temporary Register (TCNTSA Stopped)

Figure 22.125 Transfer Timing from Buffer Register to Temporary Register (TCNTSA Operating)

Figure 22.126 Transfer Timing from Temporary Register to Compare Register

### 22.5.2 Interrupt Signal Timing

#### (1) TGI Interrupt Timing by Compare Match

Figure 22.127 and Figure 22.128 show the TGI interrupt request signal timing when a compare match occurs.

Figure 22.127 TGI Interrupt Timing (Compare Match) (MTU0 to MTU4, MTU6, MTU7, and MTU9)

Figure 22.128 TGI Interrupt Timing (Compare Match) (MTU5)

(2) TGI Interrupt Timing by Input Capture

Figure 22.129 and Figure 22.130 show the TGI interrupt request signal timing when an input capture occurs.

Figure 22.129 TGI Interrupt Timing (Input Capture) (MTU0 to MTU4, MTU6, MTU7, and MTU9)

Figure 22.130 TGI Interrupt Timing (Input Capture) (MTU5)

(3) TCIV and TCIU Interrupt Timing

Figure 22.131 shows the TCIV interrupt request signal timing when an overflow is generated.

Figure 22.132 shows the TCIU interrupt request signal timing when an underflow is generated.

Figure 22.131 TCIV Interrupt Timing

Figure 22.132 TCIU Interrupt Timing

## 22.6 Usage Notes

### 22.6.1 Module Stop Function Setting

MTU operation can be disabled or enabled using the module stop control register. MTU operation is stopped with the initial setting. Register access is enabled by releasing the module clock stop state. For details, refer to section 11, Low Power Consumption.

### 22.6.2 Count Clock Restrictions

The count clock source pulse width must be at least 1.5 PCLKC cycles for single-edge detection, and at least 2.5 PCLKC cycles for both-edge detection. The MTU will not operate properly at narrower pulse widths.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least 1.5 PCLKC cycles, and the pulse width must be at least 2.5 PCLKC cycles. Figure 22.133 shows the input clock conditions in phase counting mode.

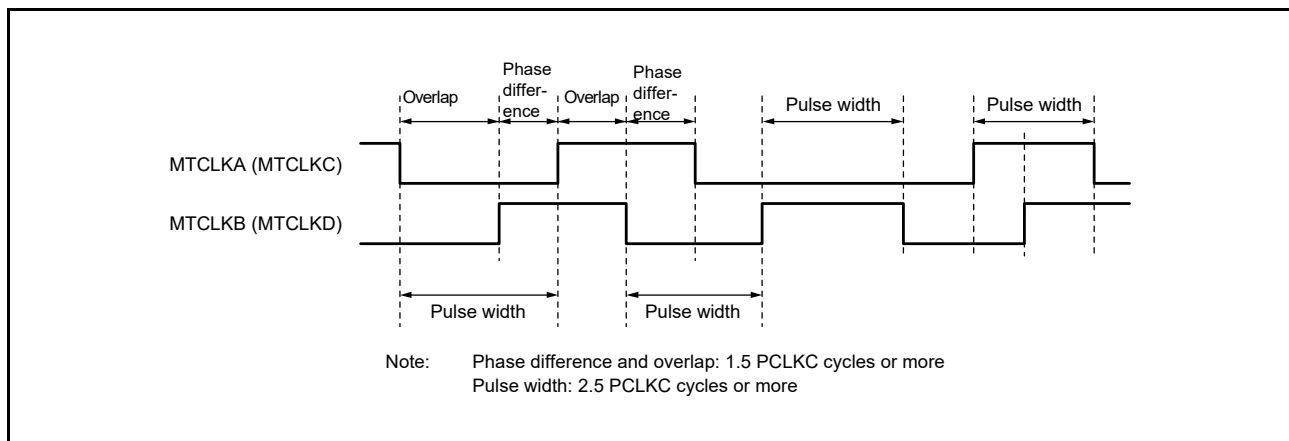

Figure 22.133 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

### 22.6.3 Note on Period Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which TCNT updates the matched count value). Consequently, the actual counter frequency is given by the following formula:

- MTU0 to MTU4, MTU6, MTU7, and MTU9

$$f = \frac{\text{CNTCLK}}{N + 1}$$

- MTU5

$$f = \frac{\text{CNTCLK}}{N}$$

f: Counter frequency

CNTCLK: The count clock frequency set by TCR.TPSC[2:0] and TCR2.TPSC2[2:0]

N: TGR setting

### 22.6.4 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the TCNT write cycle, TCNT clearing takes precedence and TCNT write operation is not performed.

Figure 22.134 shows the timing in this case.

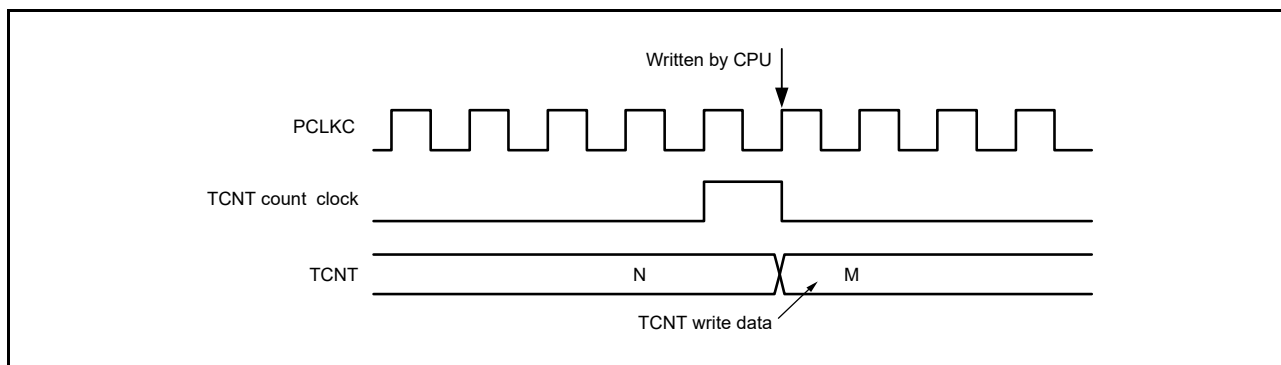

**Figure 22.134 Contention between TCNT Write and Clear Operations**

### 22.6.5 Contention between TCNT Write and Increment Operations

If incrementing occurs in a TCNT write cycle, TCNT write operation takes precedence and TCNT is not incremented.

Figure 22.135 shows the timing in this case.

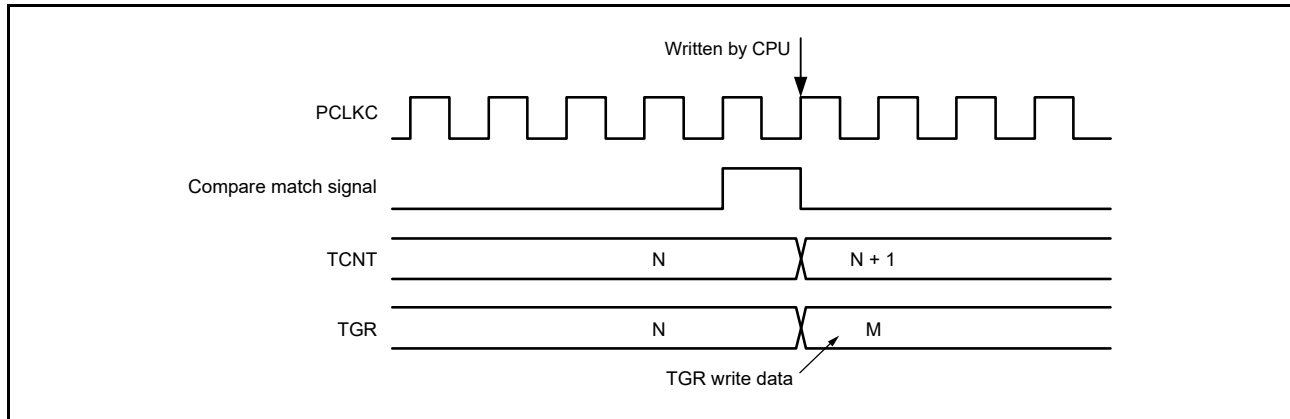

**Figure 22.135 Contention between TCNT Write and Increment Operations**

### 22.6.6 Contention between TGR Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, TGR write operation is executed and the compare match signal is also generated.

Figure 22.136 shows the timing in this case.

**Figure 22.136 Contention between TGR Write Operation and Compare Match**

### 22.6.7 Contention between Buffer Register Write Operation and Compare Match

If a compare match occurs in the T2 state in a TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 22.137 shows the timing in this case.

**Figure 22.137 Contention between Buffer Register Write Operation and Compare Match**

### 22.6.8 Contention between Buffer Register Write and TCNT Clear Operations

When the buffer transfer timing is set at the TCNT clear timing by the timer buffer transfer mode register (TBTM), if TCNT clearing occurs in the TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 22.138 shows the timing in this case.

Figure 22.138 Contention between Buffer Register Write and TCNT Clear Operations

### 22.6.9 Contention between TGR Read Operation and Input Capture

If an input capture signal is generated in a TGR read cycle, the data before input capture transfer is read.

Figure 22.139 shows the timing in this case.

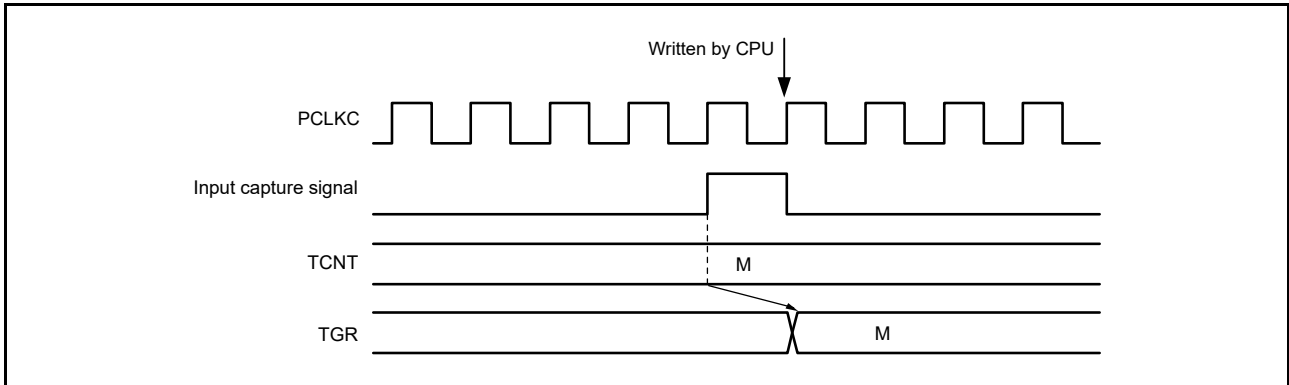

Figure 22.139 Contention between TGR Read Operation and Input Capture (MTU0 to MTU7, and MTU9)

### 22.6.10 Contention between TGR Write Operation and Input Capture

If an input capture signal is generated in the TGR write cycle, the input capture operation takes precedence and the TGR write operation is not performed in MTU0 to MTU4, MTU6, MTU7, and MTU9. In MTU5, the TGR write operation is performed and the input capture signal is generated.

Figure 22.140 and Figure 22.141 show the timing in this case.

**Figure 22.140 Contention between TGR Write Operation and Input Capture (MTU0 to MTU4, MTU6, MTU7, and MTU9)**

**Figure 22.141 Contention between TGR Write Operation and Input Capture (MTU5)**

### 22.6.11 Contention between Buffer Register Write Operation and Input Capture

If an input capture signal is generated in the buffer register write cycle, the buffer operation takes precedence and the buffer register write operation is not performed.

Figure 22.142 shows the timing in this case.

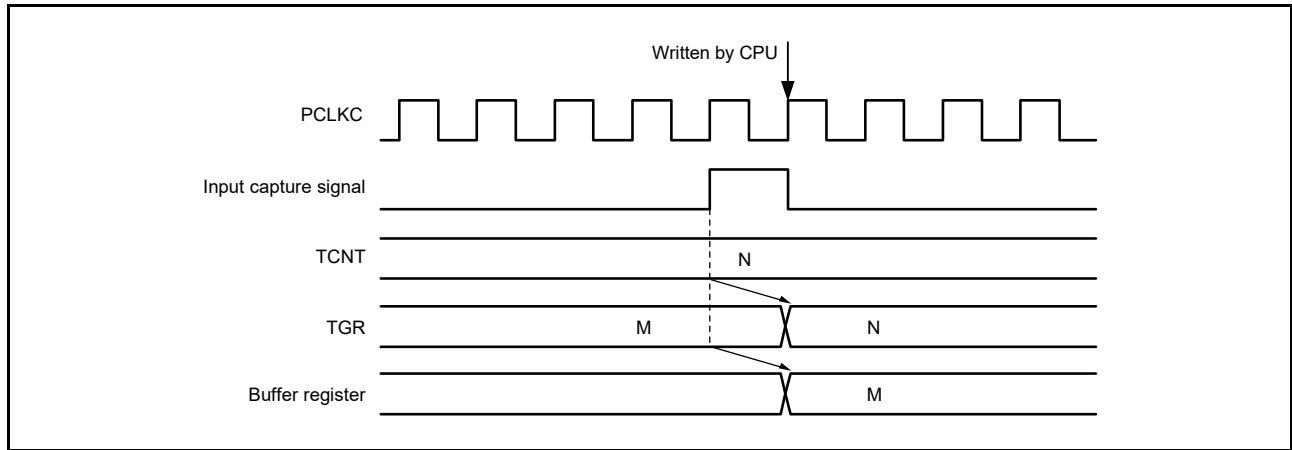

Figure 22.142 Contention between Buffer Register Write Operation and Input Capture

### 22.6.12 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

With timer counters MTU1.TCNT and MTU2.TCNT in a cascade, when a contention occurs between MTU1.TCNT counting (an MTU2.TCNT overflow/underflow) and the MTU2.TCNT write operation, the MTU2.TCNT write operation is performed and the MTU1.TCNT count signal is disabled. In this case, if MTU1.TGRA works as a compare match register and there is a match between the MTU1.TGRA and MTU1.TCNT values, a compare match signal is issued.

Furthermore, when the MTU1.TCNT (MTU2.TCNT) count clock is selected as the input capture source of MTU0 (MTU9), MTU0.TGRA to MTU0.TGRD (MTU9.TGRA to MTU9.TGRD) work in input capture mode. In addition, when the MTU0.TGRC compare match/input capture is selected as the input capture source of MTU1.TGRB, MTU1.TGRB works in input capture mode.

Figure 22.143 shows the timing in this case.

When setting the TCNT clearing function in cascaded operation, be sure to synchronize MTU1 and MTU2.

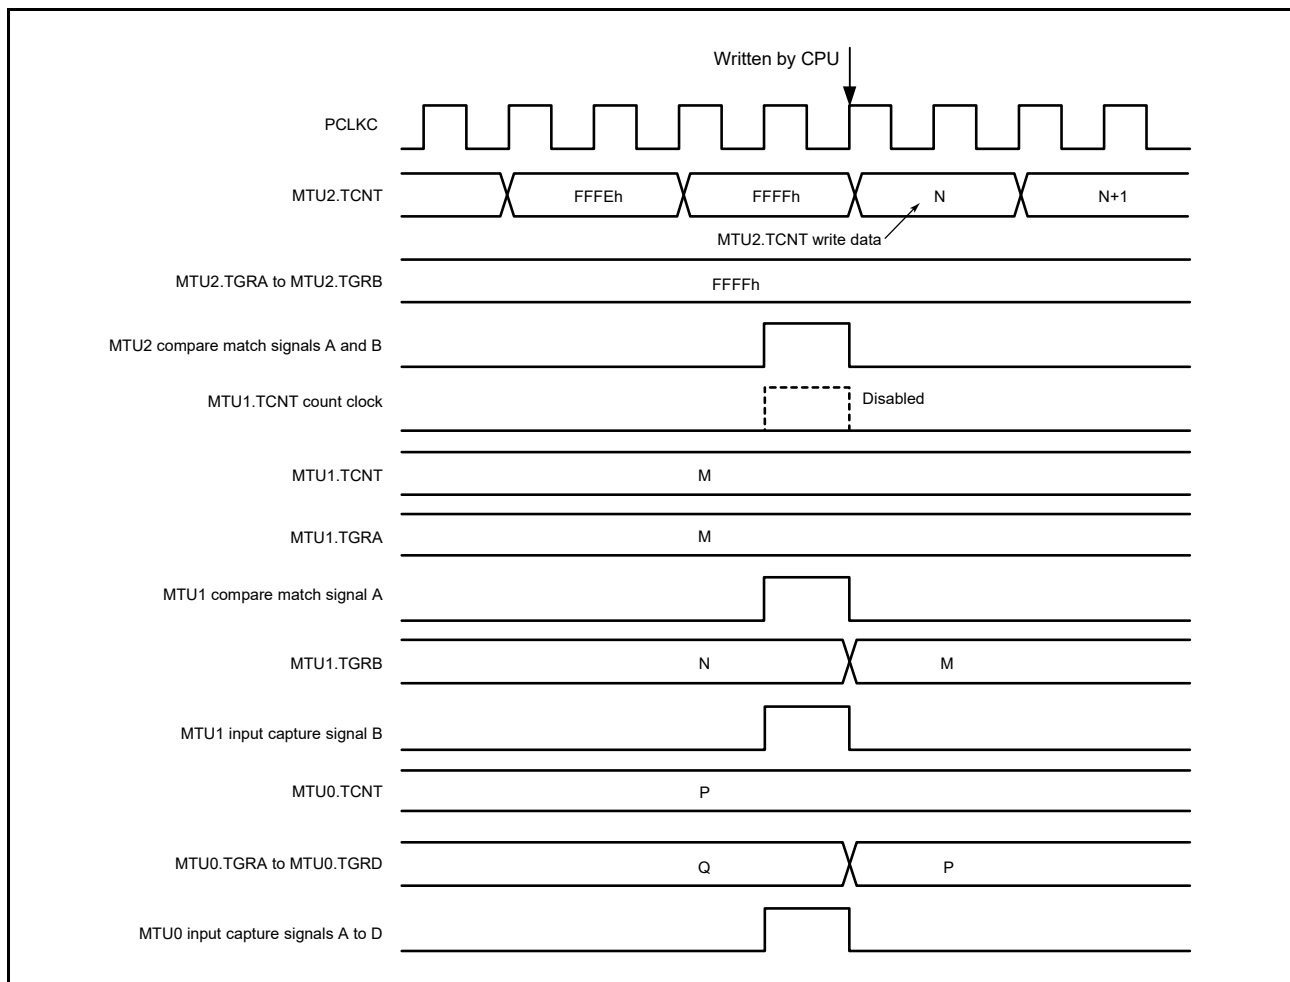

Figure 22.143 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

### 22.6.13 Counter Value When Count Operation is Stopped in Complementary PWM Mode

When counting operation in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) is stopped in complementary PWM mode, the MTU3.TCNT (MTU6.TCNT) value is set to the timer dead time register (TDDRA (TDDRb)) value and MTU4.TCNT (MTU7.TCNT) is set to 0000h.

When operation is restarted in complementary PWM mode, counting begins automatically from the initial setting state. Figure 22.144 shows this operation.

When counting begins in another operating mode, be sure to make initial settings in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

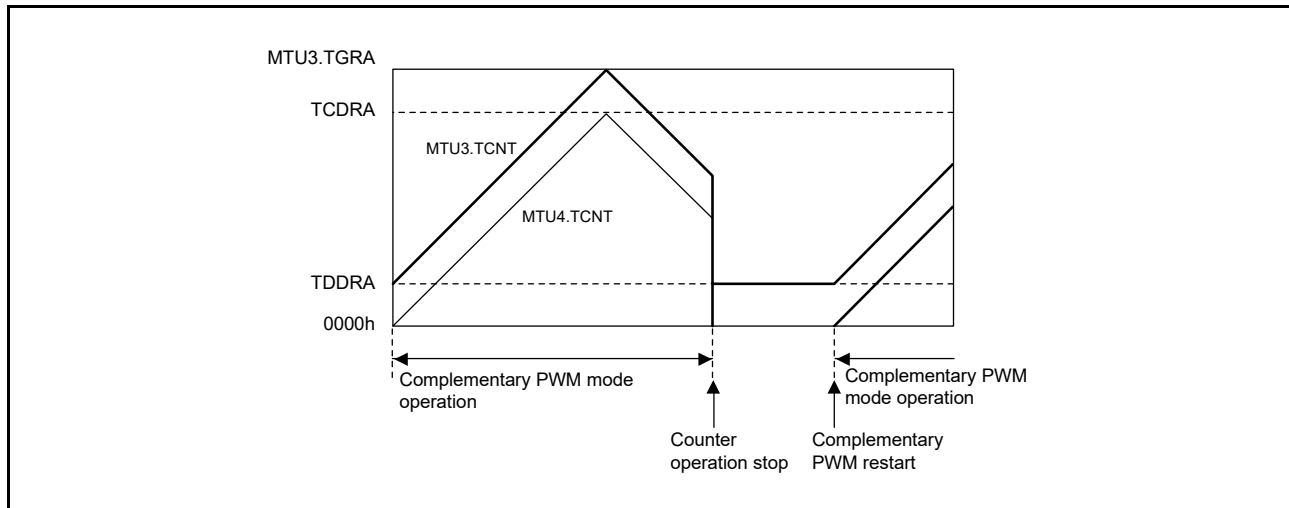

Figure 22.144 Counter Value When Stopped in Complementary PWM Mode

### 22.6.14 Buffer Operation Setting in Complementary PWM Mode

When modifying the PWM period set register (MTU3.TGRC or MTU6.TGRC), timer period data register (TCDRA or TCDRB), and duty set registers (MTU3.TGRB, MTU4.TGRC, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRC, and MTU7.TGRB)) in complementary PWM mode, be sure to use buffer operation. In addition, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in bits BFA and BFB of MTU3.TMDR1 (MTU6.TMDR1). When the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRC (MTU6.TGRC). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRC (MTU7.TGRC), and TCBRA (TCBRB) functions as a buffer register for TCDRA (TCDRB).

### 22.6.15 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

When setting buffer operation in reset-synchronized PWM mode, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In reset-synchronized PWM mode, buffer operation in MTU3 and MTU4 (or MTU 6 and MTU7) depends on the settings in the BFA and BFB bits of MTU3.TMDR1 (MTU6.TMDR1). For example, if the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA).

While the MTU3.TGRC (MTU6.TGRC) and MTU3.TGRD (MTU6.TGRD) are operating as buffer registers, a TGImm interrupt (m = C, D; n = 3, 4 or 6, 7) is not generated.

Figure 22.145 shows an example of MTU3.TGR (MTU6.TGR), MTU4.TGR (MTU7.TGR), MTIOC3 (MTIOC6), and MTIOC4 (MTIOC7) operation with the BFA and BFB bits in MTU3.TMDR1 (MTU6.TMDR1) set to 1 and the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) set to 0.

Figure 22.145 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

### 22.6.16 Overflow in Reset-Synchronized PWM Mode

After reset-synchronized PWM mode is selected, MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start counting when the CST3 (CST6) bit of TSTRA (TSTRB) is set to 1. In this state, the MTU4.TCNT (MTU7.TCNT) count clock source and count edge are determined by the MTU3.TCR (MTU6.TCR) setting.

In reset-synchronized PWM mode, with period register MTU3.TGRA (MTU6.TGRA) set to FFFFh and the MTU3.TGRA (MTU6.TGRA) compare match selected as the counter clearing source, MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) count up to FFFFh, then a compare match occurs with MTU3.TGRA (MTU6.TGRA), and MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) are both cleared. In this case, a TCIVn interrupt (n = 3, 4 or 6, 7) is not generated.

Figure 22.146 shows an example of operation in reset-synchronized PWM mode with period register MTU3.TGRA (MTU6.TGRA) set to FFFFh and the MTU3.TGRA (MTU6.TGRA) compare match specified for the counter clearing source.

Figure 22.146 Overflow in Reset-Synchronized PWM Mode

### 22.6.17 Contention between Overflow/Underflow and Counter Clearing

If an overflow/underflow and counter clearing occur simultaneously, a TCIVn interrupt (n = 0 to 4, 6, 7, 9) nor a TCIUn interrupt (n = 1, 2) is not generated and TCNT clearing takes precedence.

Figure 22.147 shows the operation timing when a TGR compare match is specified as the clearing source and TGR is set to FFFFh.

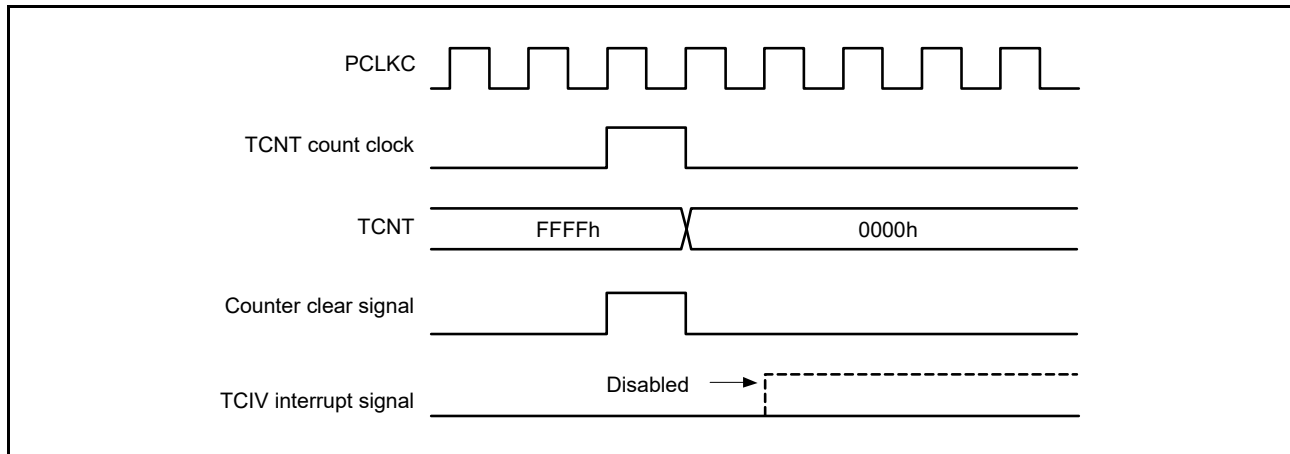

Figure 22.147 Contention between Overflow and Counter Clearing

### 22.6.18 Contention between TCNT Write Operation and Overflow/Underflow

If TCNT counts up or down in a TCNT write cycle and an overflow or an underflow occurs, the TCNT write operation takes precedence. A TCIVn interrupt (n = 0 to 4, 6, 7, 9) nor a TCIUn interrupt (n = 1, 2) is not generated.

Figure 22.148 shows the operation timing when there is contention between TCNT write operation and overflow.

Figure 22.148 Contention between TCNT Write Operation and Overflow

### 22.6.19 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from normal mode or PWM mode 1 to reset-synchronized PWM mode in MTU3 and MTU4 (or MTU6 and MTU7), if the counter is stopped while the output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D) are held at a high level and then operation is started after a transition to reset-synchronized PWM mode, the initial pin output will not be correct.

When making a transition from normal mode to reset-synchronized PWM mode, write 11h to MTU3.TIORH, MTU3.TIORL, MTU4.TIORH, and MTU4.TIORL (MTU6.TIORH, MTU6.TIORL, MTU7.TIORH, and MTU7.TIORL) to initialize the output pin state to a low level, then set the registers to the initial value (00h) before making the mode transition.

When making a transition from PWM mode 1 to reset-synchronized PWM mode, switch to normal mode, initialize the output pin state to a low level, and then set the registers to the initial value (00h) before making the transition to reset-synchronized PWM mode.

### 22.6.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When MTU3 and MTU4 (or MTU6 and MTU7) are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is determined by the OLSP and OLSN bits in the timer output control register (TOCR1A or TOCR1B). In complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to 00h. The output level in negative phase when the TDERA.TDER (TDERB.TDER) bit is set to 0 in complementary PWM mode (the dead time is not generated) does not depend on the setting of the TOCR1A.OLSN (TOCR1B.OLSN) bit. It is equivalent to the inverted level of positive phase output based on the setting of the TOCR1A.OLSP (TOCR1B.OLSP) bit.

### 22.6.21 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection

When timer counters 1 and 2 (MTU1.TCNT and MTU2.TCNT) operate as a 32-bit counter in cascade connection, the cascaded counter value cannot be captured successfully in some cases even if input-capture input is simultaneously done to MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B. This is because the input timing of MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B may not be the same when external input-capture signals input into MTU1.TCNT and MTU2.TCNT are taken in synchronization with the internal clock.

For example, MTU1.TCNT (the counter for upper 16 bits) does not capture the count-up value by an overflow from MTU2.TCNT (the counter for lower 16 bits) but captures the count value before the up-counting. In this case, the values of MTU1.TCNT = FFF1h and MTU2.TCNT = 0000h should be transferred to MTU1.TGRA and MTU2.TGRA or to MTU1.TGRB and MTU2.TGRB, but the values of MTU1.TCNT = FFF0h and MTU2.TCNT = 0000h are erroneously transferred.

The MTU has a function that allows simultaneous capture of MTU1.TCNT and MTU2.TCNT with a single input capture input. This function can be used to read the 32-bit counter such that MTU1.TCNT and MTU2.TCNT are captured at the same time. For details, refer to section 22.2.11, Timer Input Capture Control Register (TICCR).

### 22.6.22 Interrupt Skipping Function 2

When interrupt skipping function 2 is in use and the difference between the values in MTU4.TADCORA and MTU4.TADCORB is small, correct counting of the number skipped may not be possible, in which case requests for A/D conversion will not be generated with the expected timing. The conditions listed below thus apply to these settings. For MTU6 and MTU7, the same conditions apply to the settings of MTU7.TADCORA and MTU7.TADCORB.

- (1) When the number skipped is zero for skipping function 2
  - The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least four.
  - The interval of comparison for MTU4.TADCORA must be at least four cycles of PCLKC (the updated value of MTU4.TADCORA is set to the previous value plus or minus at least four).
  - The interval of comparison for MTU4.TADCORB must be at least four cycles of PCLKC (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least four).
- (2) When the number skipped is one or more for skipping function 2
  - The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least two.
  - The interval of comparison for MTU4.TADCORB must be at least two cycles of PCLKC (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least two).

### 22.6.23 Notes When Complementary PWM Mode Output Protection Function is Not Used

The complementary PWM mode output protection function is initially enabled. For details, refer to section 23, Port Output Enable 3 (POE3B).

### 22.6.24 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR)

Do not set an MTU5.TGR<sub>m</sub> (m = U, V, W) bit to the value of the corresponding MTU5.TCNT<sub>m</sub> (m = U, V, W) plus one while counting by the MTU5.TCNT<sub>m</sub> (m = U, V, W) register is stopped. If an MTU5.TGR<sub>m</sub> (m = U, V, W) bit is set to the value of the corresponding MTU5.TCNT<sub>m</sub> (m = U, V, W) plus one while counting by the MTU5.TCNT<sub>m</sub> (m = U, V, W) is stopped, a compare-match will be generated even though counting is stopped.

In this case, if the compare match enable bit (MTU5.TIER.TGIE5<sub>m</sub> (m = U, V, W) bit is set to 1 (enabling interrupts), a compare-match interrupt will also be generated. If the value of the timer compare match clear register is 1 (enabled), the timer is automatically cleared to 0000h when the compare-match is generated, regardless of whether interrupts from the MTU5.TCNT<sub>m</sub> (m = U, V, W) are enabled or disabled.

### 22.6.25 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode

If control of the output waveform is enabled (TWCRA.WRE bit = 1 or TWCRB.WRE bit = 1) at the time of synchronous counter clearing in complementary PWM mode, satisfaction of either condition 1 or 2 below has the following effects.

- Dead time on the PWM output pins is shortened (or disappears).
- The active level is output on the negative phase PWM output pins beyond the period for active-level output.

Condition 1: In portion (10) of the initial output inhibition period in Figure 22.149, synchronous clearing occurs within the dead-time period for PWM output.

Condition 2: In portions (10) and (11) of the initial output inhibition period in Figure 22.150, synchronous clearing occurs when any condition from among  $MTU3.TGRB (MTU6.TGRB) \leq TDDRA (TDDRB)$ ,  $MTU4.TGRA (MTU7.TGRA) \leq TDDRA (TDDRB)$ , or  $MTU4.TGRB (MTU7.TGRB) \leq TDDRA (TDDRB)$  is satisfied.

The following method avoids the above phenomena.

Ensure that synchronous clearing proceeds with the value of each comparison register ( $MTU3.TGRB (MTU6.TGRB)$ ,  $MTU4.TGRA (MTU7.TGRA)$ , and  $MTU4.TGRB (MTU7.TGRB)$ ) set to at least double the value of the TDDRA register (TDDRB register).

Figure 22.149 Example of Synchronous Clearing (When Condition 1 Applies)

Figure 22.150 Example of Synchronous Clearing (When Condition 2 Applies)

### 22.6.26 Notes on Timer Mode Register Setting for ELC Event Input

When MTU is used in ELC operation, set the timer mode register (TMDR) of the relevant channel to its initial value (00h).

### 22.6.27 Continuous Output of Interrupt Signal in Response to a Compare Match

When the TGR register is set to 0000h, the PCLKC/1 is set as the count clock, and compare match is set as the trigger for clearing of the count clock, the value of the TCNT counter remains 0000h, and the interrupt signal will be output continuously (i.e. its level will be flat) rather than output over a single cycle. Consequently, interrupts will not be detected in response to second and subsequent compare matches.

Figure 22.151 shows the timing for continuous output of the interrupt signal in response to a compare match.

Figure 22.151 Continuous Output of Interrupt Signal in Response to a Compare Match

### 22.6.28 Usage Notes on A/D Conversion Start Request Delaying Function in Complementary PWM Mode

- When data is transferred from a buffer register at the trough of the MTU4.TCNT (MTU7.TCNT) counter while the MTU4.TADCOBRA and MTU4.TADCOBRB (MTU7.TADCOBRA and MTU7.TADCOBRB) registers are set to 0 and the UT4AE and UT4BE (UT7AE and UT7BE) bits in the MTU4.TADCR (MTU7.TADCR) register are set to 1, no A/D conversion start request is issued during up-counting immediately after transfer. Refer to Figure 22.152.
- When data is transferred from a buffer register at the crest of the MTU4.TCNT (MTU7.TCNT) counter while the MTU4.TADCOBRA and MTU4.TADCOBRB (MTU7.TADCOBRA and MTU7.TADCOBRB) registers are set to the same value as the TCDR and the UT4AE and UT4BE (UT7AE and UT7BE) bits in the MTU4.TADCR (MTU7.TADCR) register are set to 1, no A/D conversion start request is issued during down-counting immediately after transfer. Refer to Figure 22.153.
- To issue an A/D conversion start request linked with the interrupt skipping function, set the MTU4.TADCORA and MTU4.TADCORB (MTU7.TADCORA and MTU7.TADCORB) registers so that  $2 \leq \text{MTUn.TADCORA/TADCORB} \leq \text{TCDR} - 2$  is satisfied ( $n = 4, 7$ ).

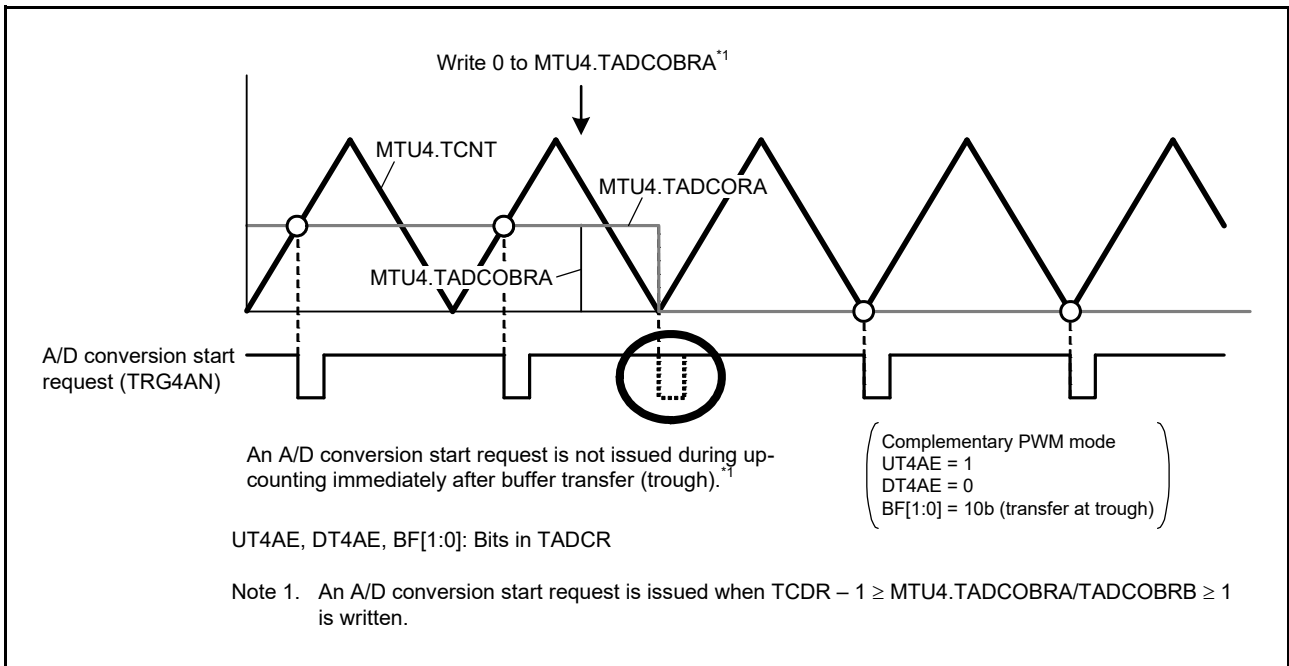

Figure 22.152 A/D Conversion Start Request When 0 is Written to MTU4.TADCOBRA

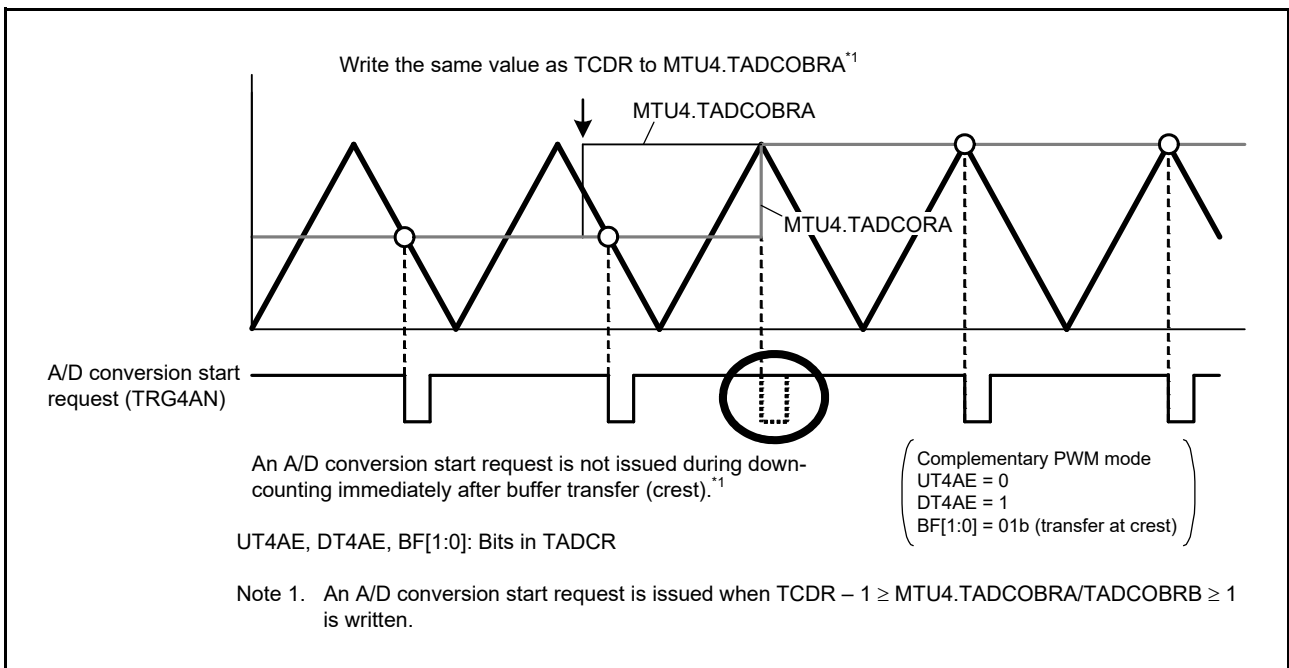

Figure 22.153 A/D Conversion Start Request When the Same Value as TCDR is Written to MTU4.TADCOBRA

## 22.7 MTU Output Pin Initialization

### 22.7.1 Operating Modes

The MTU has the following six operating modes. Waveforms can be output in any of these modes.

- Normal mode (MTU0 to MTU4, MTU6, MTU7, and MTU9)
- PWM mode 1 (MTU0 to MTU4, MTU6, MTU7, and MTU9)
- PWM mode 2 (MTU0 to MTU2, and MTU9)
- Phase counting modes 1 to 5 (MTU1 and MTU2)
- Complementary PWM mode (MTU3, MTU4, MTU6, and MTU7)
- Reset-synchronized PWM mode (MTU3, MTU4, MTU6, and MTU7)

This section describes how to initialize the MTU output pins in each of these modes.

### 22.7.2 Operation in Case of Re-Setting Due to Error during Operation

If an error occurs during MTU operation, MTU output should be cut off by the system. The output can be cut off by allowing non-active level output from the pins by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports. MTU output can be disabled through TIOR settings. Complementary PWM output (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) should be specified through TOERA and TOERB settings. For PWM output pins, output can also be cut by hardware, using port output enable 3 (POE3). The pin initialization procedures for re-setting due to an error during operation and the procedures for restarting in a different mode after re-setting are described below.

The MTU has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Available mode transition combinations are shown in Table 22.80.

**Table 22.80 Mode Transition Combinations**

|        | Normal | PWM1 | PWM2          | PCM           | CPWM          | RPWM          |
|--------|--------|------|---------------|---------------|---------------|---------------|
| Normal | (1)    | (2)  | (3)           | (4)           | (5)           | (6)           |
| PWM1   | (7)    | (8)  | (9)           | (10)          | (11)          | (12)          |
| PWM2   | (13)   | (14) | (15)          | (16)          | Not available | Not available |
| PCM    | (17)   | (18) | (19)          | (20)          | Not available | Not available |
| CPWM   | (21)   | (22) | Not available | Not available | (23) (24)     | (25)          |
| RPWM   | (26)   | (27) | Not available | Not available | (28)          | (29)          |

|         |                             |
|---------|-----------------------------|
| Normal: | Normal mode                 |
| PWM1:   | PWM mode 1                  |
| PWM2:   | PWM mode 2                  |
| PCM:    | Phase counting modes 1 to 5 |
| CPWM:   | Complementary PWM mode      |
| RPWM:   | Reset-synchronized PWM mode |

### 22.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation

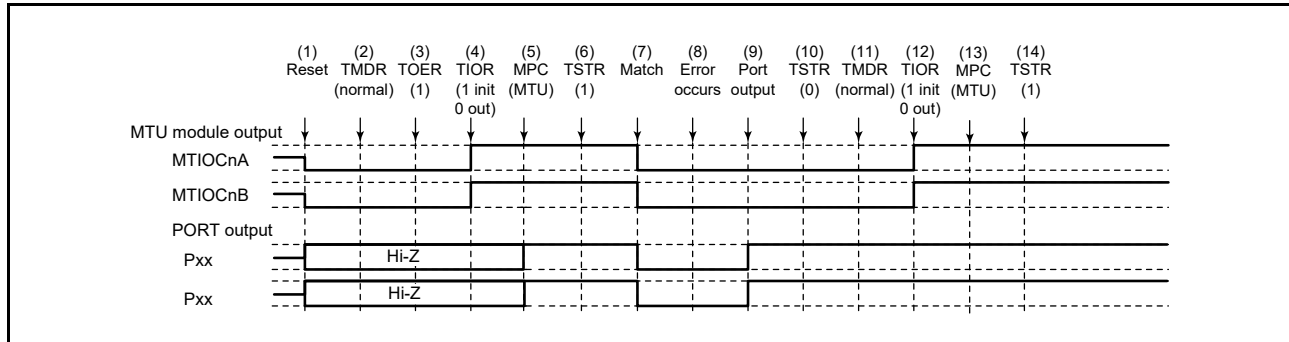

- When making a transition to a mode (Normal, PWM1, PWM2, or PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of TIOR setting.
- In PWM mode 1, waveforms are not output to the MTIOCnB and MTIOCnD ( $n = 3, 4, 6, 7$ ) pins. When a pin is configured for MTIOCnB or MTIOCnD, it enters high-impedance state. To output a specified level, set the pin to general output port.
- In PWM mode 2, a waveform is not output to the pin that corresponds to the TGR register used as a period register. When a pin is configured for MTIOCnm ( $n = 0$  to  $2, 9$ ;  $m = A$  to  $D$ ), it enters high-impedance state. To output a specified level, set the pin to general output port.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, waveforms are not output to the corresponding pins (MTIOCnC or MTIOCnD ( $n = 0, 3, 4, 6, 7, 9$ )). When a pin is configured for MTIOCnC or MTIOCnD, it enters high-impedance state. To output a specified level, set the pin to general output port.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, waveforms are not output to the corresponding pins (MTIOCnC or MTIOCnD ( $n = 0, 3, 4, 6, 7, 9$ )). When a pin is configured for MTIOCnC or MTIOCnD, it enters high-impedance state. To output a specified level, set the pin to general output port.
- When making a transition to a mode (CPWM or RPWM) in which the pin output level is selected by the timer output control register (TOCR1A, TOCR2A, TOCR1B, or TOCR2B) setting, temporarily disable output in MTU3 and MTU4 (or MTU6 and MTU7) with the timer output master enable register (TOERA or TOERB). At this time, when a pin is configured for MTIOCnm ( $n = 3, 4, 6, 7$ ;  $m = A$  to  $D$ ), it enters high-impedance state. To output a specified level, set the pin to general output port. Switch to normal mode, perform initialization with TIOR, restore TIOR to its initial value, then operate the MTU in accordance with the mode setting procedure (TOCR1A setting, TOCR2A setting, TMDR1 setting, and TOERA setting (TOCR1B setting, TOCR2B setting, TMDR1 setting, and TOERB setting)).

Note: Channel number is substituted for “n” indicated in this section.

Pin initialization procedures are described below for the numbered combinations in Table 22.80. The active level is assumed to be low.

### (1) Operation When Error Occurs in Normal Mode and Operation is Restarted in Normal Mode

Figure 22.154 shows a case in which an error occurs in normal mode and operation is restarted in normal mode after re-setting.

**Figure 22.154 Error Occurrence in Normal Mode, Recovery in Normal Mode**

- (1) After a reset, the MTU output goes low and the ports enter high-impedance state.
- (2) After a reset, the TMDR1 setting is for normal mode.
- (3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with the TOERA (TOERB) register before initializing the pins with the TIOR register.
- (4) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)
- (5) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (6) Start count operation by setting the TSTRA (TSTRB) register.
- (7) Output goes low on compare match occurrence.
- (8) An error occurs.
- (9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- (10) Stop count operation by setting the TSTRA (TSTRB) register.
- (11) This step is not necessary when restarting in normal mode.
- (12) Initialize the pins with the TIOR register.
- (13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (14) Restart operation by setting the TSTRA (TSTRB) register.

(2) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM Mode 1

Figure 22.155 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

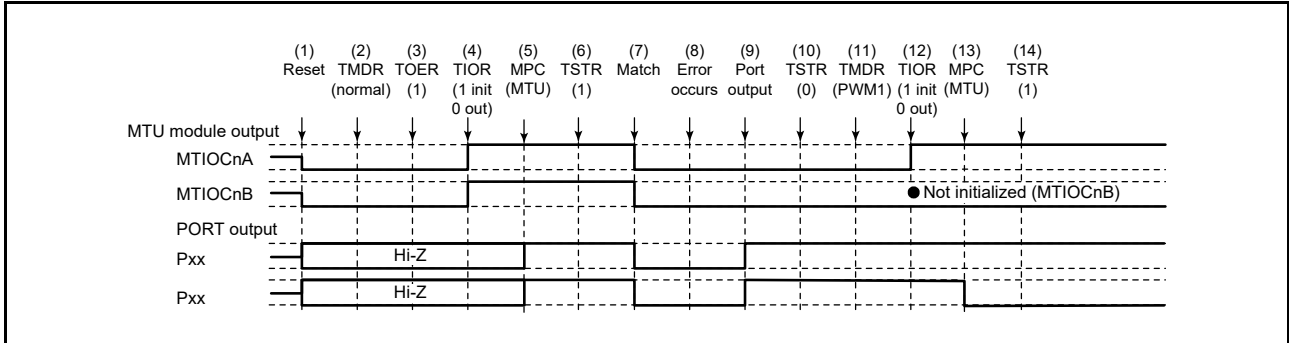

Figure 22.155 Error Occurrence in Normal Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 22.154.

(11) Set PWM mode 1.

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)

(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(14) Restart operation by setting the TSTRB (TSTRB) register.

(3) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM mode 2

Figure 22.156 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

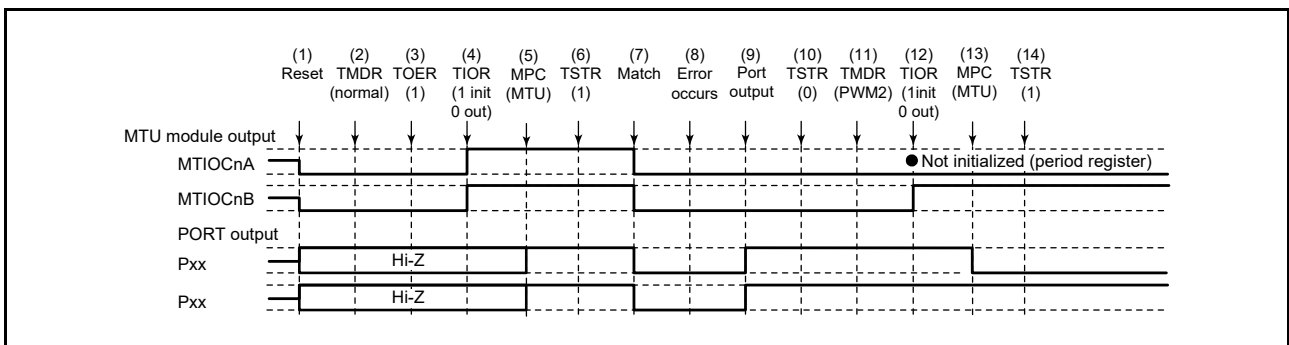

Figure 22.156 Error Occurrence in Normal Mode, Recovery in PWM Mode 2

(1) to (10) are the same as in Figure 22.154.

(11) Set PWM mode 2.

(12) Initialize the pins with the TIOR register. (In PWM mode 2, a waveform is not output to the pin that corresponds to the TGR register used as a period register. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)

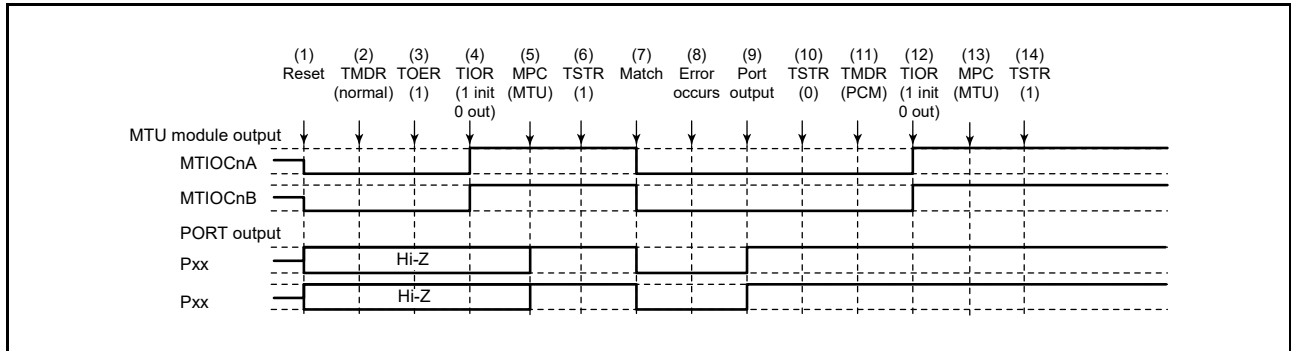

(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(14) Restart operation by setting the TSTRB register.

Note: PWM mode 2 can only be selected for MTU0 to MTU2 and MTU9, and therefore the TOERA register setting is not necessary.

(4) Operation When Error Occurs in Normal Mode and Operation is Restarted in Phase Counting Mode

Figure 22.157 shows a case in which an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

**Figure 22.157 Error Occurrence in Normal Mode, Recovery in Phase Counting Mode**

(1) to (10) are the same as in Figure 22.154.

(11) Set the phase counting mode.

(12) Initialize the pins with the TIOR register.

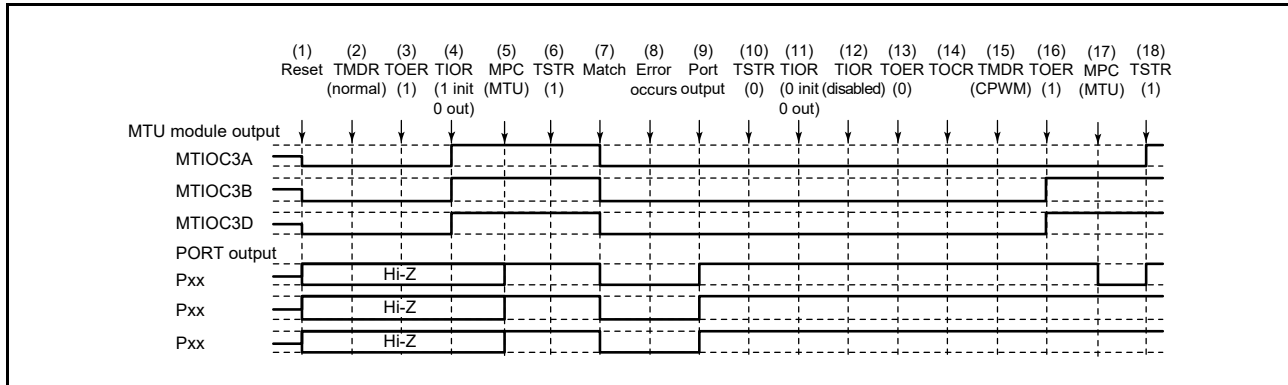

(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(14) Restart operation by setting the TSTR register.

**Note:** The phase counting mode can only be selected for MTU1 and MTU2, and therefore the TOERA register setting is not necessary.

### (5) Operation When Error Occurs in Normal Mode and Operation is Restarted in Complementary PWM Mode

Figure 22.158 shows a case in which an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

**Figure 22.158 Error Occurrence in Normal Mode, Recovery in Complementary PWM Mode**

(1) to (10) are the same as in Figure 22.154.

(11) Initialize the normal mode waveform generation block with the TIOR register.

(12) Disable operation of the normal mode waveform generation block with the TIOR register.

(13) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(14) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set complementary PWM mode.

(16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(17) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(18) Restart operation by setting the TSTR (TSTRB) register.

(6) Operation When Error Occurs in Normal Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 22.159 shows a case in which an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

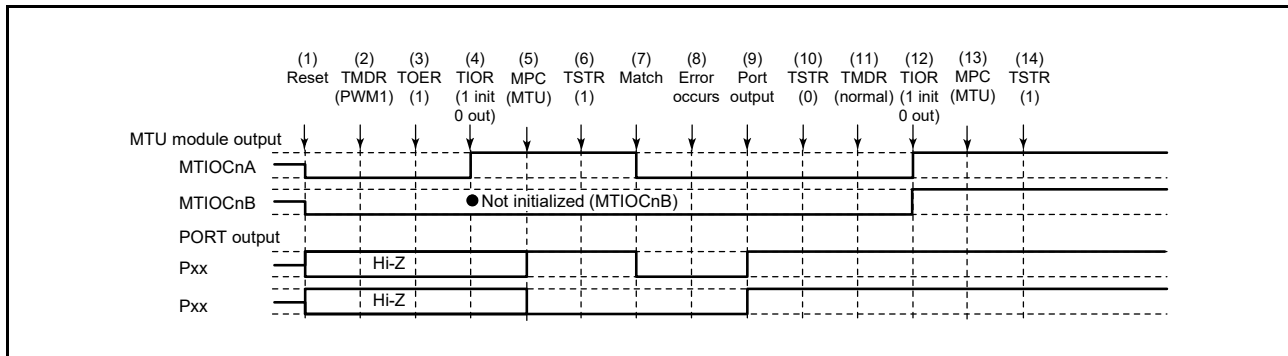

**Figure 22.159 Error Occurrence in Normal Mode, Recovery in Reset-Synchronized PWM Mode**

- (1) to (13) are the same as in Figure 22.158.
- (14) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).
- (15) Set reset-synchronized PWM mode.
- (16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.
- (17) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (18) Restart operation by setting the TSTRA (TSTRB) register.

## (7) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Normal Mode

Figure 22.160 shows a case in which an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

**Figure 22.160 Error Occurrence in PWM Mode 1, Recovery in Normal Mode**

- (1) After a reset, the MTU output goes low and the ports enter high-impedance state.
- (2) Set PWM mode 1.
- (3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with the TOERA (TOERB) register before initializing the pins with the TIOR register.
- (4) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 1, the MTIOcNB side is not initialized.)
- (5) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (6) Start count operation by setting the TSTRA (TSTRB) register.
- (7) Output goes low on compare match occurrence.
- (8) An error occurs.
- (9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- (10) Stop count operation by setting the TSTRA (TSTRB) register.
- (11) Set normal mode.
- (12) Initialize the pins with the TIOR register.
- (13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (14) Restart operation by setting the TSTRA (TSTRB) register.

(8) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 1

Figure 22.161 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

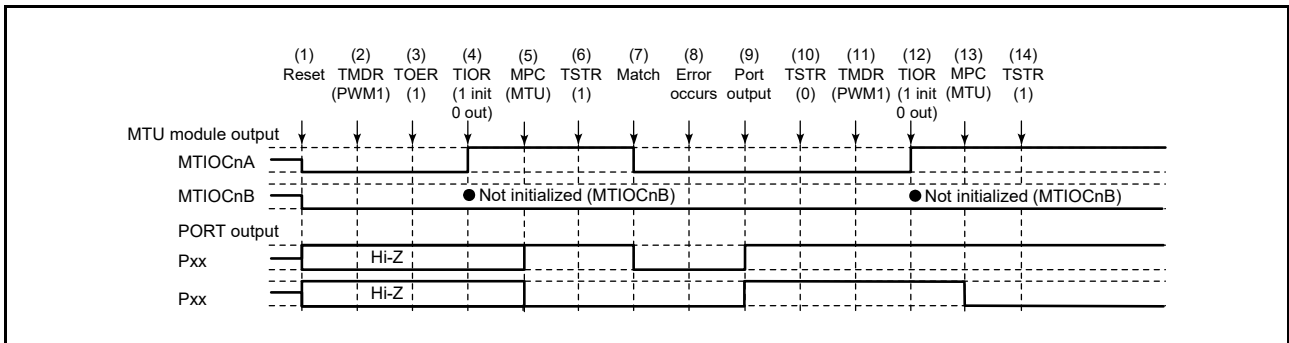

Figure 22.161 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 22.160.

(11) This step is not necessary when restarting in PWM mode 1.

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)

(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

(9) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 2

Figure 22.162 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

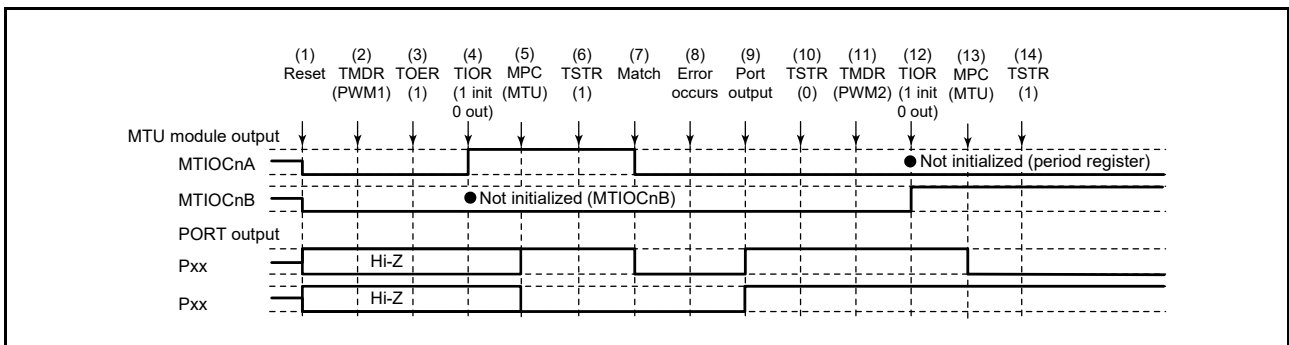

Figure 22.162 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 2

(1) to (10) are the same as in Figure 22.160.

(11) Set PWM mode 2.

(12) Initialize the pins with the TIOR register. (In PWM mode 2, a waveform is not output to the pin that corresponds to the TGR register used as a period register. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)

(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: PWM mode 2 can only be selected for MTU0 to MTU2 and MTU9, and therefore the TOERA register setting is not necessary.

(10) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Phase Counting Mode

Figure 22.163 shows a case in which an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

Figure 22.163 Error Occurrence in PWM Mode 1, Recovery in Phase Counting Mode

(1) to (10) are the same as in Figure 22.160.

(11) Set the phase counting mode.

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: The phase counting mode can only be selected for MTU1 and MTU2, and therefore the TOERA register setting is not necessary.

(11) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Complementary PWM Mode

Figure 22.164 shows a case in which an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

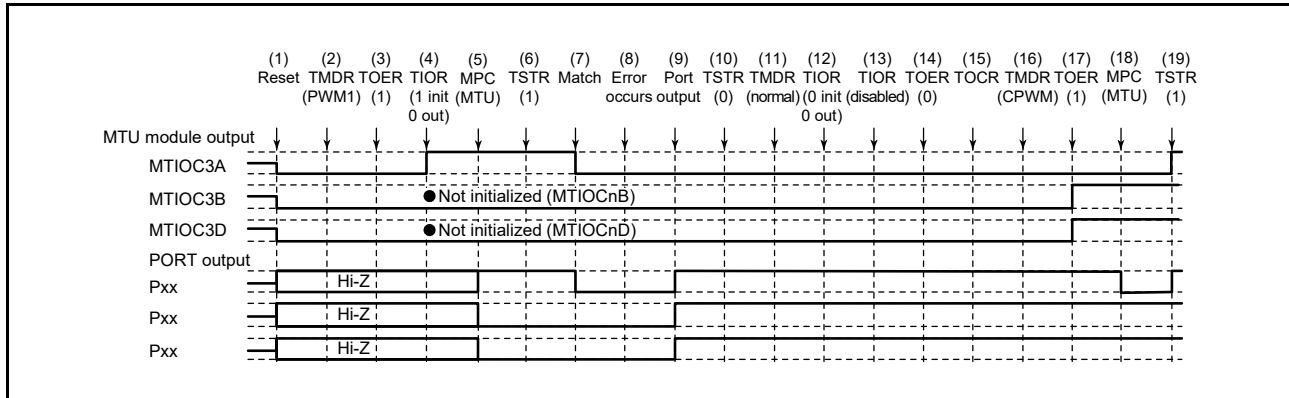

Figure 22.164 Error Occurrence in PWM Mode 1, Recovery in Complementary PWM Mode

(1) to (10) are the same as in Figure 22.160.

- (11) Set normal mode to initialize the normal mode waveform generation block.
- (12) Initialize the PWM mode 1 waveform generation block with the TIOR register.
- (13) Disable operation of the PWM mode 1 waveform generation block with the TIOR register.
- (14) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.
- (15) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TSTRB).
- (16) Set complementary PWM mode.
- (17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.
- (18) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (19) Restart operation by setting the TSTR (TSTRB) register.

(12) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 22.165 shows a case in which an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

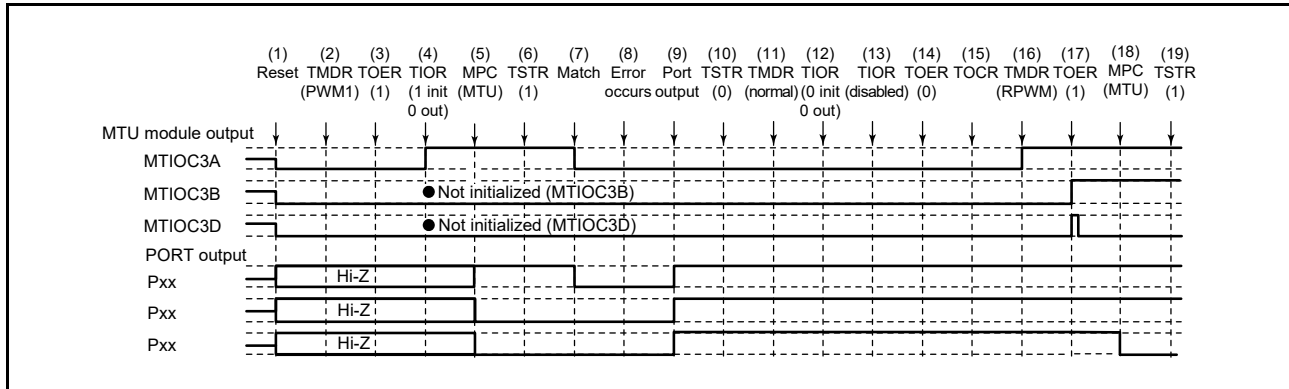

Figure 22.165 Error Occurrence in PWM Mode 1, Recovery in Reset-Synchronized PWM Mode

(1) to (14) are the same as in Figure 22.164.

(15) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(16) Set reset-synchronized PWM mode.

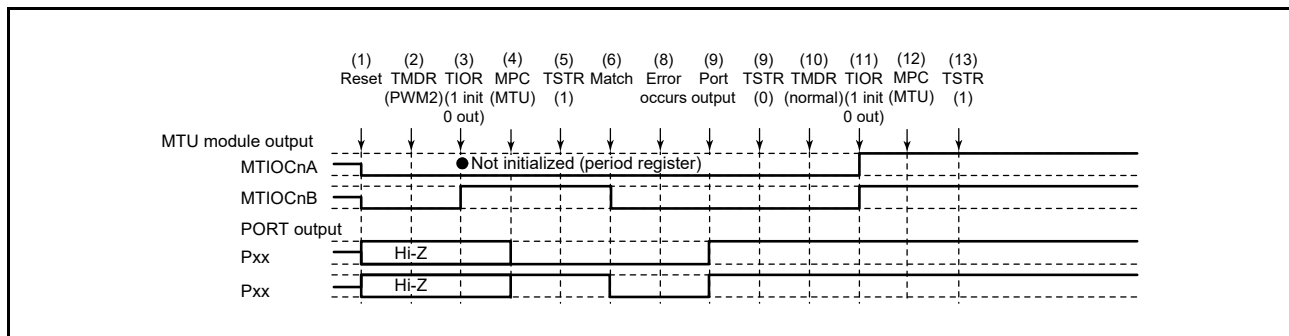

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(18) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(19) Restart operation by setting the TSTRA (TSTRB) register.

## (13) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Normal Mode

Figure 22.166 shows a case in which an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

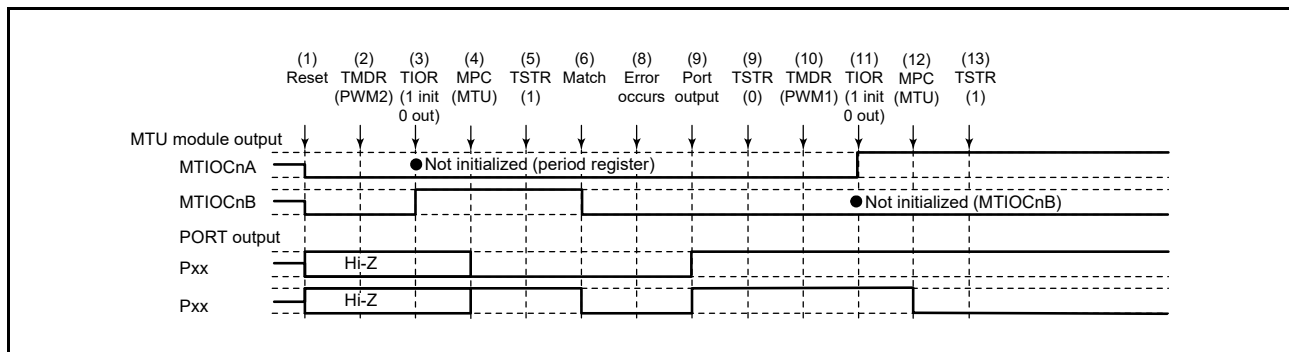

**Figure 22.166 Error Occurrence in PWM Mode 2, Recovery in Normal Mode**

- (1) After a reset, the MTU output goes low and the ports enter high-impedance state.
- (2) Set PWM mode 2.
- (3) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 2, the pin that corresponds to the TGR register used as a period register is not initialized. In the example, the MTU.TGRA register is used as a period register.)
- (4) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (5) Start count operation by setting the TSTR register.
- (6) Output goes low on compare match occurrence.
- (7) An error occurs.
- (8) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- (9) Stop count operation by setting the TSTR register.
- (10) Set normal mode.
- (11) Initialize the pins with the TIOR register.
- (12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (13) Restart operation by setting the TSTR register.

## (14) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 1

Figure 22.167 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

**Figure 22.167 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 1**

(1) to (9) are the same as in Figure 22.166.

(10) Set PWM mode 1.

(11) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOcNB (MTIOcND) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)

(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA register.

(15) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 2

Figure 22.168 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

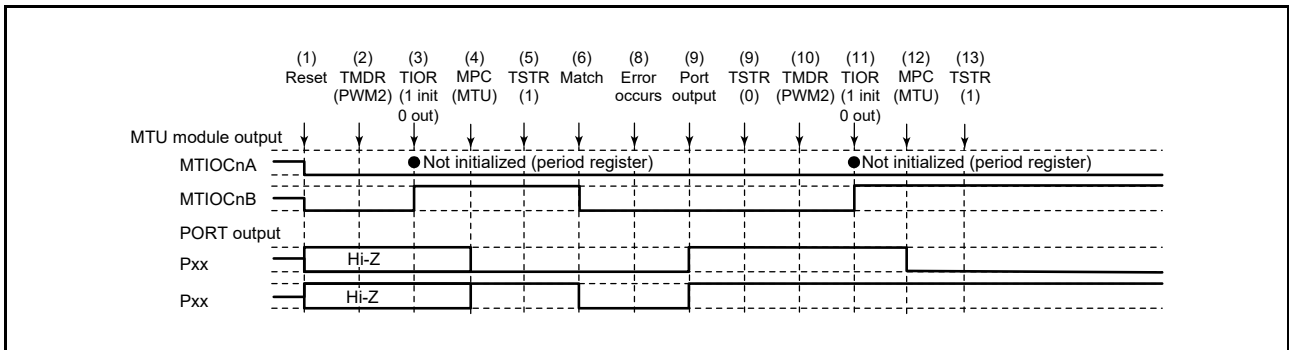

Figure 22.168 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 2

- (1) to (9) are the same as in Figure 22.166.
- (10) This step is not necessary when restarting in PWM mode 2.
- (11) Initialize the pins with the TIOR register. (In PWM mode 2, a waveform is not output to the pin that corresponds to the TGR register used as a period register. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
- (12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (13) Restart operation by setting the TSTR register.

(16) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Phase Counting Mode

Figure 22.169 shows a case in which an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

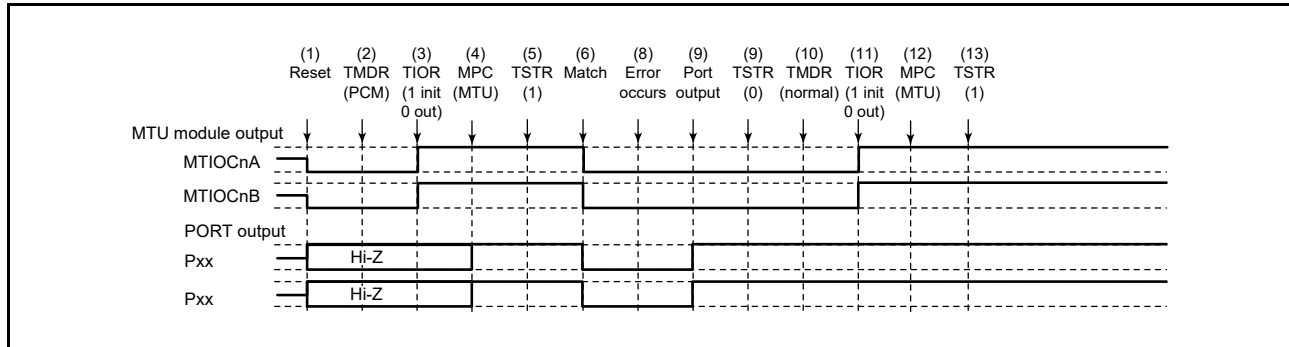

Figure 22.169 Error Occurrence in PWM Mode 2, Recovery in Phase Counting Mode

- (1) to (9) are the same as in Figure 22.166.
- (10) Set the phase counting mode.
- (11) Initialize the pins with the TIOR register.
- (12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (13) Restart operation by setting the TSTR register.

### (17) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Normal Mode

Figure 22.170 shows a case in which an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

**Figure 22.170 Error Occurrence in Phase Counting Mode, Recovery in Normal Mode**

- (1) After a reset, the MTU output goes low and the ports enter high-impedance state.
- (2) Set phase counting mode.
- (3) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)
- (4) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (5) Start count operation by setting the TSTR register.
- (6) Output goes low on compare match occurrence.
- (7) An error occurs.
- (8) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- (9) Stop count operation by setting the TSTR register.
- (10) Set normal mode.
- (11) Initialize the pins with the TIOR register.
- (12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (13) Restart operation by setting the TSTR register.

(18) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 1

Figure 22.171 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

Figure 22.171 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 1

(1) to (9) are the same as in Figure 22.170.

(10) Set PWM mode 1.

(11) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)

(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(13) Restart operation by setting the TSTR register.

(19) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 2

Figure 22.172 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

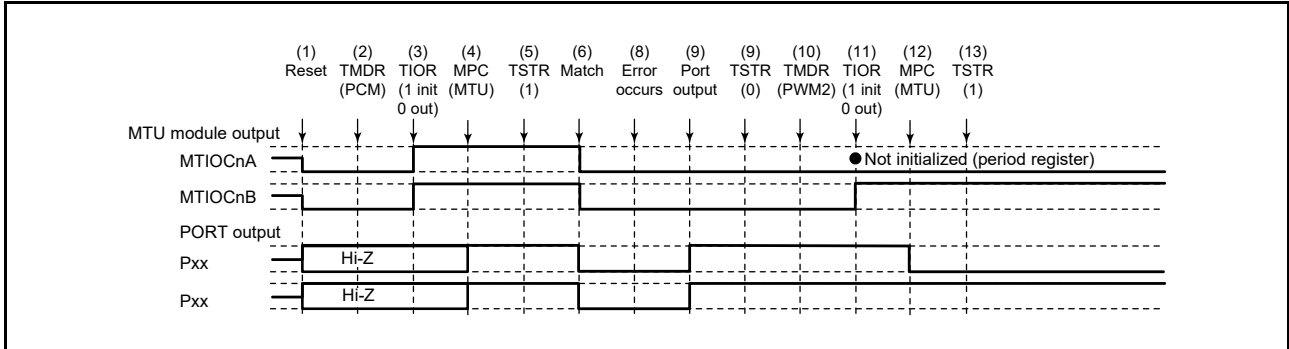

Figure 22.172 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 2

- (1) to (9) are the same as in Figure 22.170.
- (10) Set PWM mode 2.
- (11) Initialize the pins with the TIOR register. (In PWM mode 2, a waveform is not output to the pin that corresponds to the TGR register used as a period register. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
- (12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (13) Restart operation by setting the TSTR register.

(20) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Phase Counting Mode

Figure 22.173 shows a case in which an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

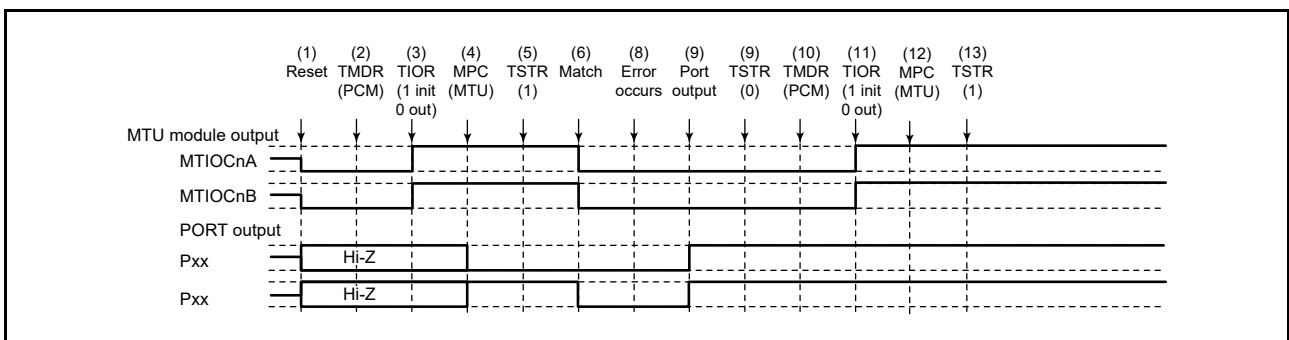

Figure 22.173 Error Occurrence in Phase Counting Mode, Recovery in Phase Counting Mode

- (1) to (9) are the same as in Figure 22.170.
- (10) This step is not necessary when restarting in phase counting mode.
- (11) Initialize the pins with the TIOR register.
- (12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (13) Restart operation by setting the TSTR register.

### (21) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Normal Mode

Figure 22.174 shows a case in which an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

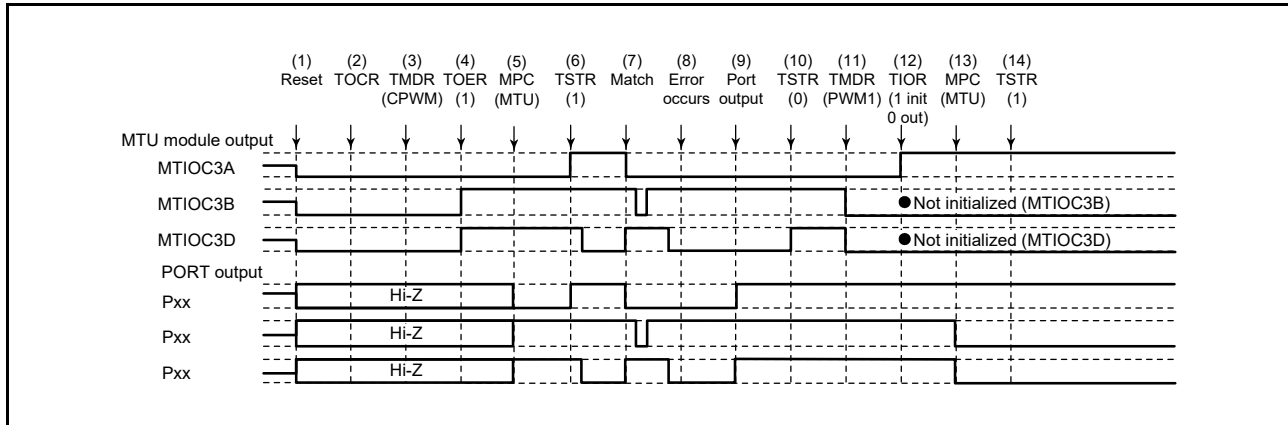

**Figure 22.174 Error Occurrence in Complementary PWM Mode, Recovery in Normal Mode**

- (1) After a reset, the MTU3 output goes low and the ports enter high-impedance state.
- (2) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).
- (3) Set complementary PWM mode.
- (4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.
- (5) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (6) Start count operation by setting the TSTRA (TSTRB) register.
- (7) The complementary PWM waveform is output on compare match occurrence.
- (8) An error occurs.
- (9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- (10) Stop count operation by setting the TSTRA (TSTRB) register. (MTU output becomes the initial complementary PWM output value).
- (11) Set normal mode (MTU output goes low).
- (12) Initialize the pins with the TIOR register.
- (13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (14) Restart operation by setting the TSTRA (TSTRB) register.

## (22) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in PWM Mode 1

Figure 22.175 shows a case in which an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

**Figure 22.175 Error Occurrence in Complementary PWM Mode, Recovery in PWM Mode 1**

(1) to (10) are the same as in Figure 22.174.

(11) Set PWM mode 1 (MTU output goes low).

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)

(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(14) Restart operation by setting the TSTR (TSTRB) register.

(23) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 22.176 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the period and duty settings at the time of stopping the counter).

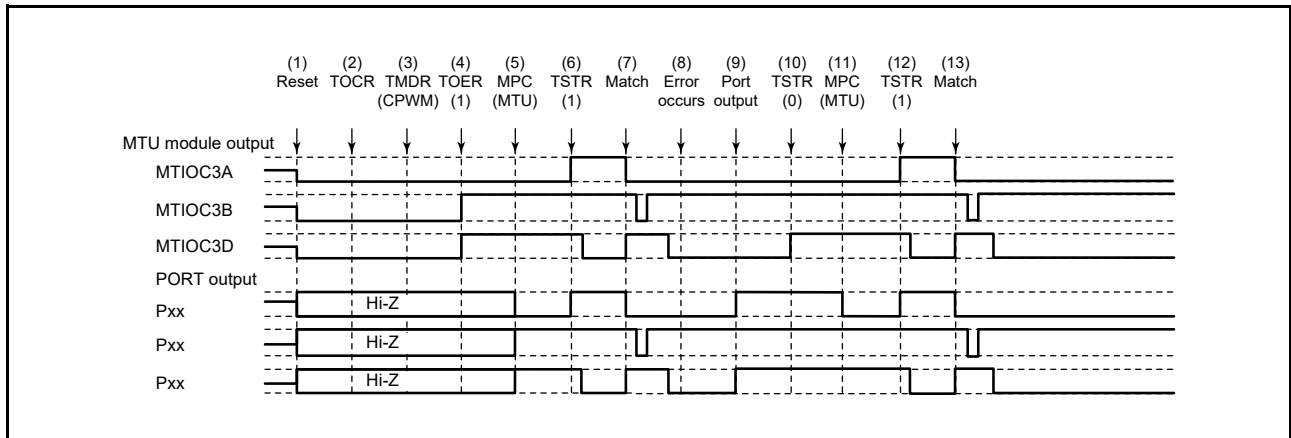

Figure 22.176 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (1)

(1) to (10) are the same as in Figure 22.174.

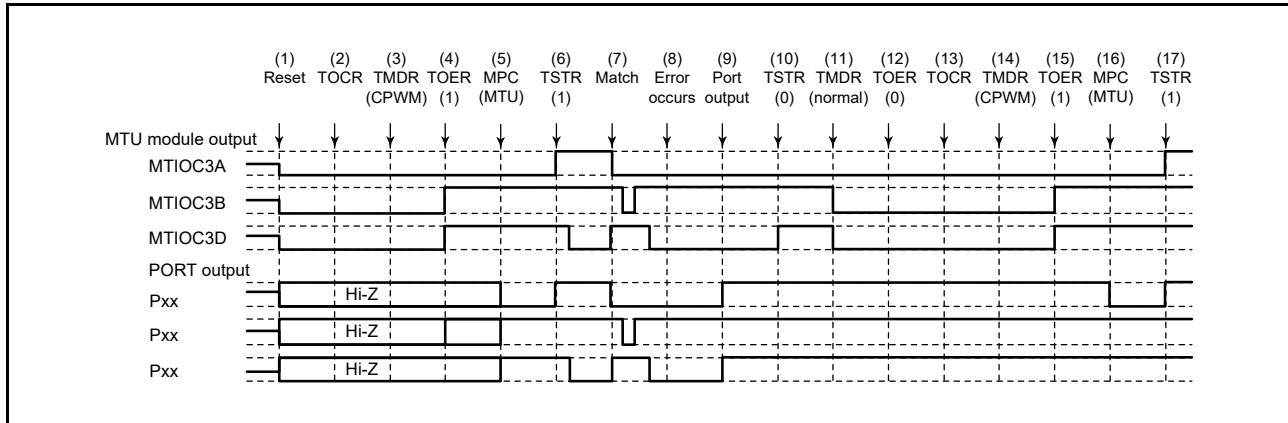

(11) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(12) Restart operation by setting the TSTR (TSTRB) register.

(13) The complementary PWM waveform is output on compare match occurrence.

#### (24) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode with New Settings

Figure 22.177 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (operation is restarted using new period and duty ratio settings).

**Figure 22.177 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (2)**

(1) to (10) are the same as in Figure 22.174.

(11) Set normal mode and make new settings (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(13) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set complementary PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

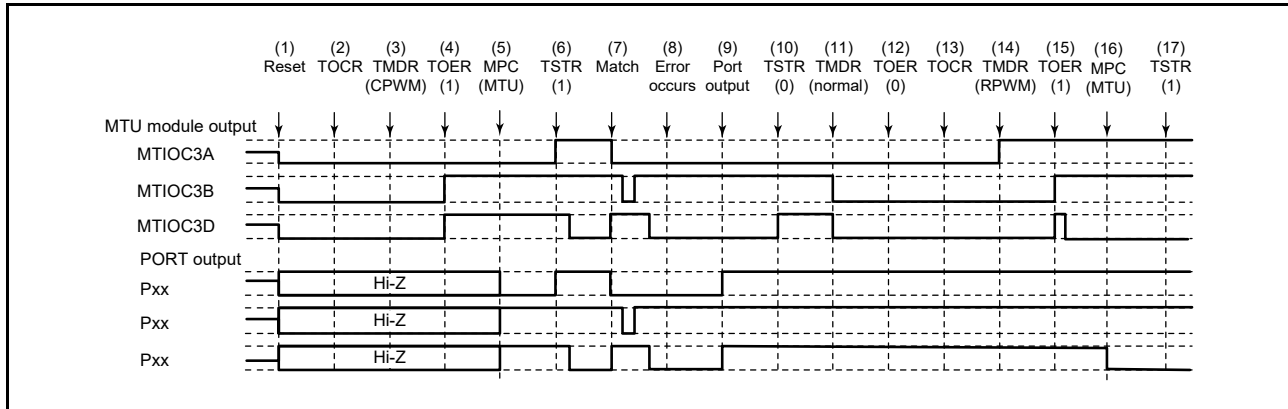

(16) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(17) Restart operation by setting the TSTRA (TSTRB) register.

### (25) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 22.178 shows a case in which an error occurs in complementary PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

**Figure 22.178 Error Occurrence in Complementary PWM Mode, Recovery in Reset-Synchronized PWM Mode**

(1) to (10) are the same as in Figure 22.174.

(11) Set normal mode (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(13) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set reset-synchronized PWM mode.

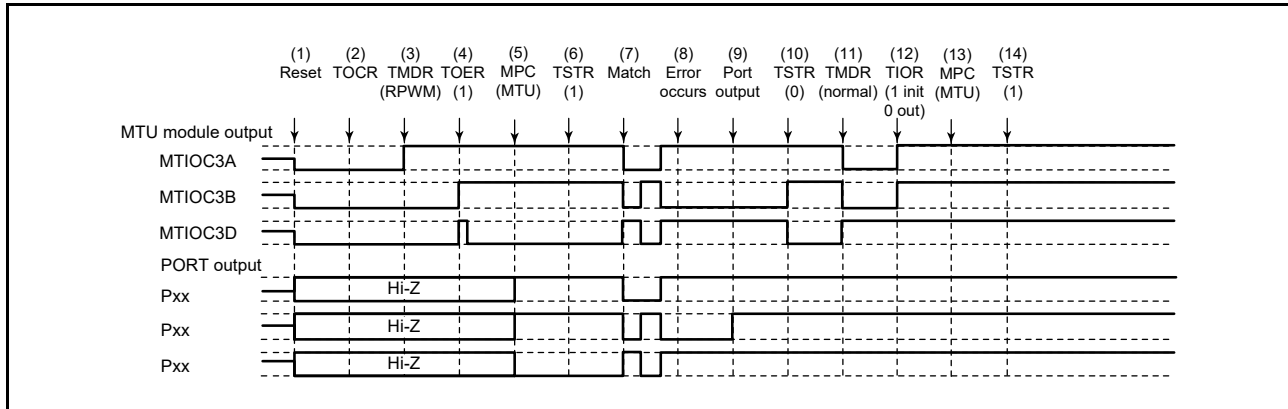

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(16) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(17) Restart operation by setting the TSTR (TSTRB) register.

## (26) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Normal Mode

Figure 22.179 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

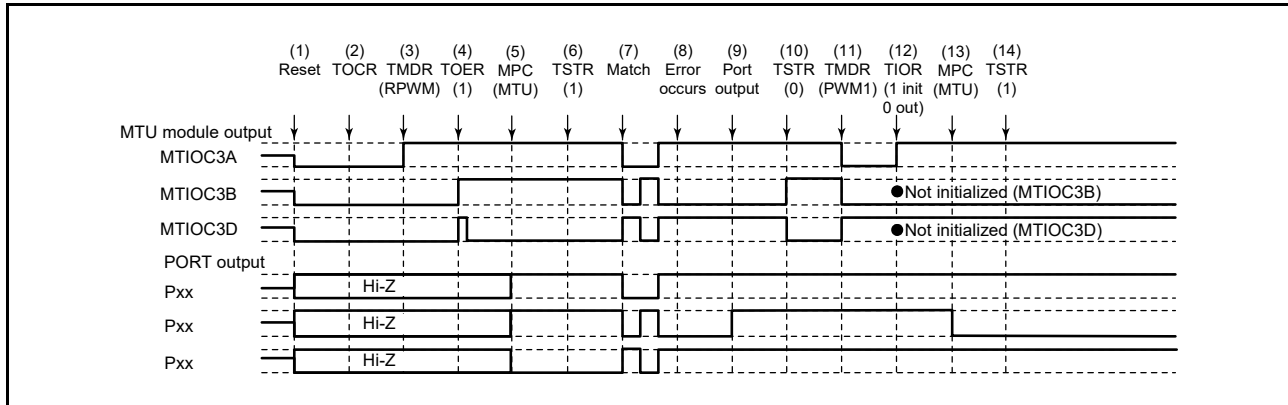

**Figure 22.179 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Normal Mode**

- (1) After a reset, the MTU output goes low and the ports enter high-impedance state.
- (2) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).
- (3) Set reset-synchronized PWM mode.
- (4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.
- (5) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (6) Start count operation by setting the TSTRA (TSTRB) register.
- (7) The reset-synchronized PWM waveform is output on compare match occurrence.
- (8) An error occurs.
- (9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- (10) Stop count operation by setting the TSTRA (TSTRB) register. (MTU output becomes the initial reset-synchronized PWM output value.)
- (11) Set normal mode (positive-phase MTU output goes low, and negative-phase output goes high).
- (12) Initialize the pins with the TIOR register.
- (13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (14) Restart operation by setting the TSTRA (TSTRB) register.

### (27) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in PWM Mode 1

Figure 22.180 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

**Figure 22.180 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in PWM Mode 1**

(1) to (10) are the same as in Figure 22.179.

(11) Set PWM mode 1 (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)

(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

### (28) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 22.181 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

**Figure 22.181 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Complementary PWM Mode**

(1) to (10) are the same as in Figure 22.179.

(11) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(12) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(13) Set complementary PWM mode (MTU cyclic output pin goes low).

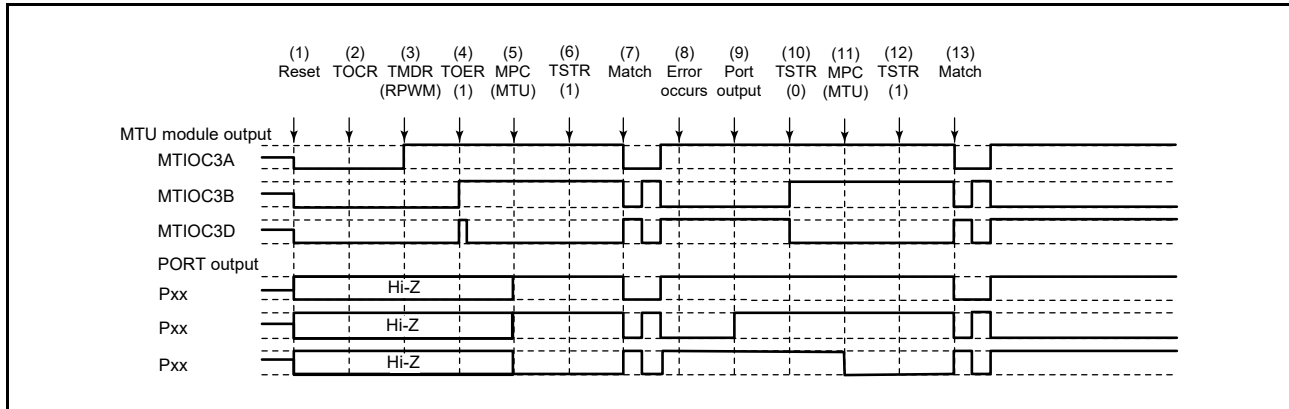

(14) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(15) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.

(16) Restart operation by setting the TSTR (TSTRB) register.

(29) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 22.182 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

**Figure 22.182 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Reset-Synchronized PWM Mode**

- (1) to (10) are the same as in Figure 22.179.
- (11) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
- (12) Restart operation by setting the TSTR (TSTRB) register.
- (13) The reset-synchronized PWM waveform is output on compare match occurrence.

## 22.8 Operations Linked by the ELC

### 22.8.1 Event Signal Output to the ELC

The MTU is capable of operation linked with another module set in advance when its interrupt request signal is used as an event signal by the event link controller (ELC).

The MTU outputs the event signal regardless of the setting of the corresponding interrupt request enable bit.

### 22.8.2 MTU Operations in Response to Receiving Event Signals from the ELC

The MTU can perform the following operations in response to the event set in advance in the ELSRn register of the event link controller (ELC).

#### (1) Start Counting Operation

Select “counting is started” as the operation of the MTU by setting the ELOPA, ELOPB, or ELOPE register in the ELC. The ELOPA register controls the operation of MTU0 and MTU3, the ELOPB register controls the operation of MTU4, and the ELOPE register controls the operation of MTU6, MTU7, and MTU9. When the event specified in the ELSRn register occurs, the CSTn bit in the TSTRA/TSTRB register shown in Table 22.81 is set to 1, and the MTU counter starts.

However, when the specified event is generated while the CSTn bit in the TSTRA/TSTRB register has already been set to 1, the event has no effect. Table 22.81 lists the TSTRA/TSTRB register bits used for each channel.

**Table 22.81 Counter Start Bit Set by the ELC**

| Channel No. | Counter Start Bit |
|-------------|-------------------|
| MTU0        | TSTRA.CST0 bit    |
| MTU3        | TSTRA.CST3 bit    |
| MTU4        | TSTRA.CST4 bit    |
| MTU6        | TSTRB.CST6 bit    |
| MTU7        | TSTRB.CST7 bit    |
| MTU9        | TSTRA.CST9 bit    |

#### (2) Input Capture Operation

Select “input capture” as the operation of the MTU by setting the ELOPA, ELOPB, or ELOPE register in the ELC. The ELOPA register controls the operation of MTU0 and MTU3, the ELOPB register controls the operation of MTU4, and the ELOPE register controls the operation of MTU6, MTU7, and MTU9. When the event specified in the ELSRn register occurs, the value of the TCNT register is captured in the TGR register. When using input capture in response to an event, the corresponding bit of the TIOR register in the MTU should be set for input capture and the CSTn bit of TSTRA/TSTRB register should be set to 1 to start counting by the counter.

In this case, the TIOCnA pin (input capture pin) input has no effect.

Table 22.82 lists the timer general register and I/O control bit used for each channel in input capture operations in response to the ELC.

**Table 22.82 Timer General Register and I/O Control Bit Used in the Input Capture Operation**

| Channel No. | Timer General Register | I/O Control Bit          |
|-------------|------------------------|--------------------------|
| MTU0        | MTU0.TGRA              | MTU0.TIORH.IOA[3:0] bits |
| MTU3        | MTU3.TGRA              | MTU3.TIORH.IOA[3:0] bits |
| MTU4        | MTU4.TGRA              | MTU4.TIORH.IOA[3:0] bits |
| MTU6        | MTU6.TGRA              | MTU6.TIORH.IOA[3:0] bits |
| MTU7        | MTU7.TGRA              | MTU7.TIORH.IOA[3:0] bits |
| MTU9        | MTU9.TGRA              | MTU9.TIORH.IOA[3:0] bits |

### (3) Restart Counting (Clear Counter) Operation

Select “counting is restarted” as the operation of the MTU by setting the ELOPA, ELOPB, or ELOPE register in the ELC. The ELOPA register controls the operation of MTU0 and MTU3, the ELOPB register controls the operation of MTU4, and the ELOPE register controls the operation of MTU6, MTU7, and MTU9. When the event specified in the ELSRn register occurs, the TCNT register is cleared. If the corresponding CSTn bit in the TSTRA/TSTRB register is set to 1, counting continues. For the CSTn bits in the TSTRA/TSTRB register, refer to Table 22.81.

## 22.8.3 Usage Notes on MTU Operation by Event Signal Reception from the ELC

The following notes on usage apply when the MTU is used in event link operation.

### (1) Start Counting

If the event specified in the ELSRn register occurs during a cycle of writing to a CSTn bit in the TSTRA/TSTRB register, writing to the CSTn bit in the TSTRA/TSTRB register does not proceed because setting of the bit to 1 due to the event takes priority.

### (2) Restart Counting (Clear Counter)

If the event specified in the ELSRn register occurs during a cycle of writing to the TCNT counter, writing to the TCNT counter does not proceed because clearing of the counter due to the event takes priority.

In addition, for MTU3 and MTU4 or MTU6 and MTU7 in complementary PWM mode, do not use the counter restarting by the ELC.

## 23. Port Output Enable 3 (POE3B)

This MCU incorporates a port output enable 3 (POE3B) which can be used to, under various conditions, disable output signals for the MTU and the GPTW. The output status can be selected from high-impedance or general I/O port while the output is disabled.

In this section, “PCLK” is used to refer to PCLKB.

### 23.1 Overview

Table 23.1 lists the specifications of the POE. Figure 23.1 and Figure 23.2 show a system block diagram around POE and a block diagram of POE, respectively.

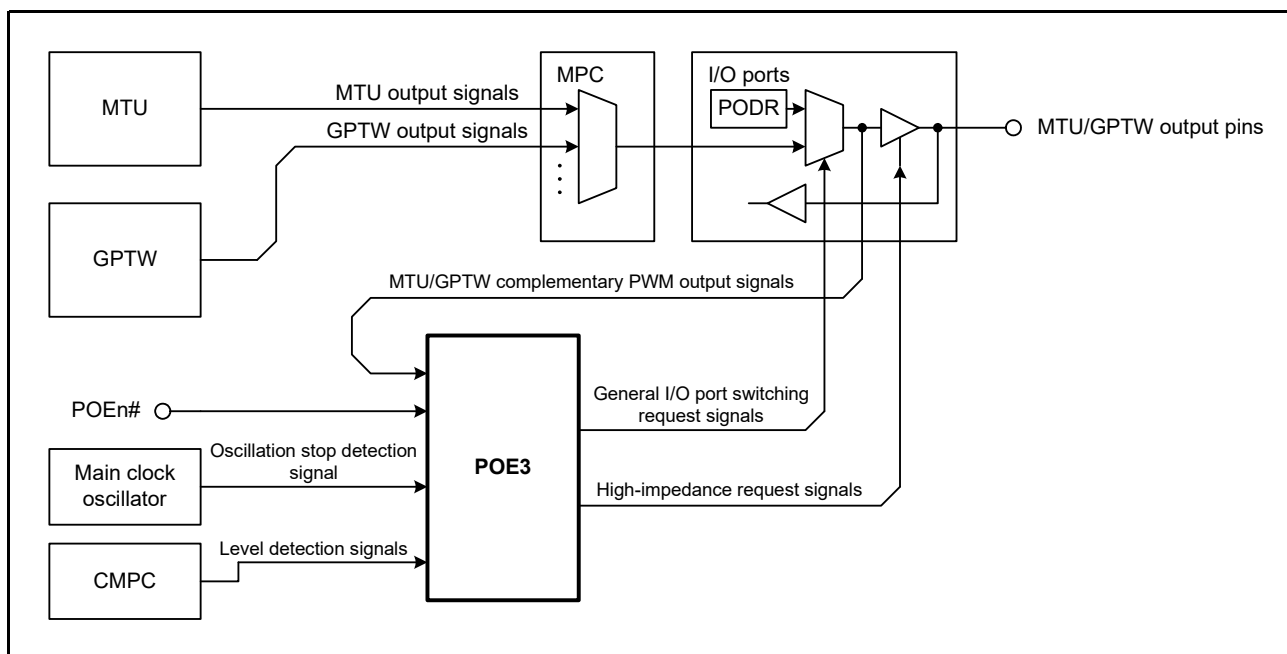

**Table 23.1 POE Specifications (1/2)**

| Item                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |                                      |   |                     |   |                     |   |                     |   |                     |   |                     |   |                     |  |                                       |   |                     |   |                     |   |                     |   |                     |   |                     |   |                     |   |                     |   |                     |   |                     |

When setting a low-level detection, a sampling clock can be selected from PCLK/1, PCLK/2, PCLK/4, PCLK/8, PCLK/16, and PCLK/128, while the number of samples can be selected from four, eight, or 16.</li> <li>The outputs of the target pins can be disabled by detecting falling-edge or low-level of input to the POE0#, POE4#, POE8#, POE10#, POE11#, POE12#, POE9#, POE13#, and POE14# pins.</li> <li>The outputs of the target pins can be disabled when oscillation stop is detected by the oscillation stop detection function of the clock generator.</li> <li>The MTU complementary PWM outputs can be disabled when output levels of the MTU complementary PWM output signals are compared and simultaneous active-level output continues for one cycle or more.</li> <li>The GPTW outputs can be disabled when output levels of the GPTW complementary PWM output signals (GPTW0 to GPTW2, GPTW4 to GPTW6, and GPTW7 to GPTW9) are compared and simultaneous active-level output continues for one cycle or more.</li> <li>The outputs of the target pins can be disabled in response to comparator C (CMPC) output detection.</li> <li>The outputs of the target pins can be disabled by modifying the settings of the POE registers.</li> <li>Interrupts can be generated by input-level sampling or output-level comparison results.</li> </ul> |

**Figure 23.1 POE System Block Diagram**

The POE has input-level detector, pin selector, output-level comparator, and a high-impedance request/port switching request/interrupt request generator as shown in Figure 23.2.

Figure 23.2 POE Block Diagram

Table 23.2 shows I/O pins to be used by the POE.

**Table 23.2 POE I/O Pins**

| Pin Name | I/O   | Description                                                                                                                                                                   |
|----------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POE0#    | Input | Controls all the target pins by register settings. Assigned as a request signal to disable outputs of the MTU complementary PWM output pins (MTU3 and MTU4 pins) after reset. |
| POE4#    | Input | Controls all the target pins by register settings. Assigned as a request signal to disable outputs of the MTU complementary PWM output pins (MTU6 and MTU7 pins) after reset. |
| POE8#    | Input | Controls all the target pins by register settings. Assigned as a request signal to disable outputs of the MTU0 pins after reset.                                              |
| POE9#    | Input | Controls all the target pins by register settings. Assigned as a request signal to disable outputs of the MTU9 pins after reset.                                              |
| POE10#   | Input | Controls all the target pins by register settings. Assigned as a request signal to disable outputs of the GPTW0 and GPTW1 pins after reset.                                   |
| POE11#   | Input | Controls all the target pins by register settings. Assigned as a request signal to disable outputs of the GPTW2 and GPTW3 pins after reset.                                   |
| POE12#   | Input | Controls all the target pins by register settings. Assigned as a request signal to disable outputs of the GPTW0 to GPTW2 pins after reset.                                    |
| POE13#   | Input | Controls all the target pins by register settings. Assigned as a request signal to disable outputs of the GPTW4 to GPTW6 pins after reset.                                    |
| POE14#   | Input | Controls all the target pins by register settings. Assigned as a request signal to disable outputs of the GPTW7 to GPTW9 pins after reset.                                    |

Table 23.3 shows output-level comparisons with signal combinations.

**Table 23.3 Output Signal Combinations**

| Signal Combination  | I/O    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MTIOC3B and MTIOC3D | Output | The MTU complementary PWM output pins (MTU3 and MTU4 pins) are disabled when two signals in a pair simultaneously output the active level (low level when the MTU.TOCR1A.OLSP bit is 0 or high level when the OLSP bit is 1 while the OLSEN bit in the ALR1 register is 0 and the MTU.TOCR1A.TOCS bit is 0, low level when the OLS1P, OLS1N, OLS2P, OLS2N, OLS3P, and OLS3N bits in the MTU.TOCR2A register are 0 or high level when these bits are 1 while the OLSEN bit in the ALR1 register is 0 and the MTU.TOCR1A.TOCS bit is 1, or low level when the OLSG0A, OLSG0B, OLSG1A, OLSG1B, OLSG2A, and OLSG2B bits in the ALR1 register are 0 and high level when these bits are 1 while the OLSEN bit in the ALR1 register is 1) for one or more cycles of the peripheral module clock (PCLK).<br>Pin combinations for output comparison can be selected by registers of POE. |
| MTIOC4A and MTIOC4C | Output |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MTIOC4B and MTIOC4D | Output |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MTIOC6B and MTIOC6D | Output | The MTU complementary PWM output pins (MTU6 and MTU7 pins) are disabled when two signals in a pair simultaneously output the active level (low level when the MTU.TOCR1B.OLSP bit is 0 or high level when the OLSP bit is 1 while the ALR2.OLSEN bit is 0 and the MTU.TOCR1B.TOCS bit is 0, or low level when the OLS1P, OLS1N, OLS2P, OLS2N, OLS3P, and OLS3N bits in the MTU.TOCR2B register are 0 or high level when these bits are 1 while the ALR2.OLSEN bit is 0 and the MTU.TOCR1B.TOCS bit is 1, or low level when the OLSG4A, OLSG4B, OLSG5A, OLSG5B, OLSG6A, and OLSG6B bits in the ALR2 register is 0 or high level when these bits are 1 while the ALR2.OLSEN bit is 1) for one or more cycles of the peripheral module clock (PCLK).<br>Pin combinations for output comparison can be selected by registers of POE.                                                |
| MTIOC7A and MTIOC7C | Output |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR1 register selects the POE0# pin input modes, controls the enable/disable of interrupts, and indicates status.

#### POE0M[3:0] Bits (POE0 Mode Select)

These bits select detection mode for the POE0# pin input. Either of falling-edge detection or low-level detection can be selected.

When low-level detection is selected, a sampling interval can be specified.

**POE0M2[3:0] Bits (POE0 Sampling Count Select)**

These bits specify sampling count when low-level detection is selected.

When falling-edge detection is selected, setting value for these bits is ignored.

**PIE1 Bit (Port Interrupt Enable 1)**

This bit enables or disables interrupt requests when the POE0F flag is set to 1.

**POE0F Flag (POE0 Flag)**

This flag indicates that an output disabling request has been input to the POE0# pin.

[Setting condition]

- When the input set by the POE0M[3:0] and POE0M2[3:0] bits occurs at the POE0# pin

[Clearing condition]

- By writing 0 to the POE0F flag after reading POE0F = 1  
When low-level detection is set by the POE0M[3:0] bits, the high level needs to be input to the POE0# pin to write 0 to this flag. For details, refer to section 23.3.9, Recover from Output Disabled State.

## 23.2.2 Input Level Control/Status Register 2 (ICSR2)

Address(es): POE.ICSR2 0009 E404h

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR2 register selects the POE4# pin input mode, controls the enable/disable of interrupts, and indicates status.

### POE4M[3:0] Bits (POE4 Mode Select)

These bits select detection mode for the POE4# pin input. Either of falling-edge detection or low-level detection can be selected.

When low-level detection is selected, a sampling interval can be specified.

### POE4M2[3:0] Bits (POE4 Sampling Count Select)

These bits specify sampling count when low-level detection is selected.

When falling-edge detection is selected, setting value for these bits is ignored.

**PIE2 Bit (Port Interrupt Enable 2)**

This bit enables or disables interrupt requests when the POE4F flag is set to 1.

**POE4F Flag (POE4 Flag)**

This flag indicates that an output disabling request has been input to the POE4# pin.

[Setting condition]

- When the input set by the POE4M[3:0] and POE4M2[3:0] bits occurs at the POE4# pin

[Clearing condition]

- By writing 0 to POE4F after reading POE4F = 1

When low-level detection is set by the POE4M[3:0] bits, the high level needs to be input to the POE4# pin to write 0 to this flag. For details, refer to section 23.3.9, Recover from Output Disabled State.

### 23.2.3 Input Level Control/Status Register 3 (ICSR3)

Address(es): POE.ICSR3 0009 E408h

| Bit        | Symbol      | Bit Name                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | R/W         |

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR3 register selects the POE8# pin input mode, controls the enable/disable of interrupts, and indicates status.

#### POE8M[3:0] Bits (POE8 Mode Select)

These bits select detection mode for the POE8# pin input. Either of falling-edge detection or low-level detection can be selected.

When low-level detection is selected, a sampling interval can be specified.

**POE8M2[3:0] Bits (POE8 Sampling Count Select)**

These bits specify sampling count when low-level detection is selected.

When falling-edge detection is selected, setting value for these bits is ignored.

**PIE3 Bit (Port Interrupt Enable 3)**

This bit enables or disables interrupt requests when the POE8F flag is set to 1.

**POE8E Bit (POE8 Output Disable)**

This bit specifies whether to disable the output of the corresponding pin when the POE8F flag is set to 1.

**POE8F Flag (POE8 Flag)**

This flag indicates that an output disabling request has been input to the POE8# pin.

[Setting condition]

- When the input set by the POE8M[3:0] and POE8M2[3:0] bits occurs at the POE8# pin

[Clearing condition]

- By writing 0 to the POE8F flag after reading POE8F = 1  
When low-level detection is set by the POE8M[3:0] bits, the high level needs to be input to the POE8# pin to write 0 to this flag. For details, refer to section 23.3.9, Recover from Output Disabled State.

## 23.2.4 Input Level Control/Status Register 4 (ICSR4)

Address(es): POE.ICSR4 0009 E416h

The write value should be 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | R/W     |

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR4 register selects the POE10# pin input mode, controls the enable/disable of interrupts, and indicates status.

### POE10M[3:0] Bits (POE10 Mode Select)

These bits select detection mode for the POE10# pin input. Either of falling-edge detection or low-level detection can be selected.

When low-level detection is selected, a sampling interval can be specified.

**POE10M2[3:0] Bits (POE10 Sampling Count Select)**

These bits specify sampling count when low-level detection is selected.

When falling-edge detection is selected, setting value for these bits is ignored.

**PIE4 Bit (Port Interrupt Enable 4)**

This bit enables or disables interrupt requests when the POE10F flag is set to 1.

**POE10E Bit (POE10 Output Disable)**

This bit specifies whether to disable the output of the corresponding pin when the POE10F flag is set to 1.

**POE10F Flag (POE10 Flag)**

This flag indicates that an output disabling request has been input to the POE10# pin.

[Setting condition]

- When the input set by the POE10M[3:0] and POE10M2[3:0] bits occurs at the POE10# pin

[Clearing condition]

- By writing 0 to the POE10F flag after reading POE10F = 1  
When low-level detection is set by the POE10M[3:0] bits, the high level needs to be input to the POE10# pin to write 0 to this flag. For details, refer to section 23.3.9, Recover from Output Disabled State.

## 23.2.5 Input Level Control/Status Register 5 (ICSR5)

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR5 register selects the POE11# pin input mode, controls the enable/disable of interrupts, and indicates status.

### POE11M[3:0] Bits (POE11 Mode Select)

These bits select detection mode for the POE11# pin input. Either of falling-edge detection or low-level detection can be selected.

When low-level detection is selected, a sampling interval can be specified.

**POE11M2[3:0] Bits (POE11 Sampling Count Select)**

These bits specify sampling count when low-level detection is selected.

When falling-edge detection is selected, setting value for these bits is ignored.

**PIE5 Bit (Port Interrupt Enable 5)**

This bit enables or disables interrupt requests when the POE11F flag is set to 1.

**POE11E Bit (POE11 Output Disable)**

This bit specifies whether to disable the output of the corresponding pin when the POE11F flag is set to 1.

**POE11F Flag (POE11 Flag)**

This flag indicates that an output disabling request has been input to the POE11# pin.

[Setting condition]

- When the input set by the POE11M[3:0] and POE11M2[3:0] bits occurs at the POE11# pin

[Clearing condition]

- By writing 0 to the POE11F flag after reading POE11F = 1  
When low-level detection is set by the POE11M[3:0] bits, the high level needs to be input to the POE11# pin to write 0 to this flag. For details, refer to section 23.3.9, Recover from Output Disabled State.

| b15 to b13 | —      | Reserved                        | These bits are read as 0. The write value should be 0.                                                                                                                             | R/W   |

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR6 register controls the oscillation stop output disabling and indicates status.

### OSTSTE Bit (Oscillation Stop Output Disable)

This bit specifies whether to disable the output of the target pin when oscillation stop is detected.

### OSTSTF Flag (Oscillation Stop Detection Flag)

This flag indicates that an output disabling request by the oscillation stop has been generated.

When the main clock oscillation stops, this flag is set to 1. To clear this flag, wait for at least 10 cycles of PCLK after this flag becomes 1 and write 0 to this flag while the OSTDSR.OSTDF flag is 0. Writing 0 to this flag while the OSTDSR.OSTDF flag is 1 cannot clear this flag. After clearing this flag, confirm that the flag has actually been modified to 0.

[Setting condition]

- When oscillation stop is detected

[Clearing condition]

- By writing 0 to the OSTSTF flag after reading OSTSTF = 1

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR7 register selects the POE12# pin input mode, controls the enable/disable of interrupts, and indicates status.

### POE12M[3:0] Bits (POE12 Mode Select)

These bits select detection mode for the POE12# pin input. Either of falling-edge detection or low-level detection can be selected.

When low-level detection is selected, a sampling interval can be specified.

**POE12M2[3:0] Bits (POE12 Sampling Count Select)**

These bits specify sampling count when low-level detection is selected.

When falling-edge detection is selected, setting value for these bits is ignored.

**PIE7 Bit (Port Interrupt Enable 7)**

This bit enables or disables interrupt requests when the POE12F flag is set to 1.

**POE12E Bit (POE12 Output Disable)**

This bit specifies whether to disable the output of the corresponding pin when the POE12F flag is set to 1.

**POE12F Flag (POE12 Flag)**

This flag indicates that an output disabling request has been input to the POE12# pin.

[Setting condition]

- When the input set by the POE12M[3:0] and POE12M2[3:0] bits occurs at the POE12# pin

[Clearing condition]

- By writing 0 to the POE12F flag after reading POE12F = 1  
When low-level detection is set by the POE12M[3:0] bits, the high level needs to be input to the POE12# pin to write 0 to this flag. For details, refer to section 23.3.9, Recover from Output Disabled State.

## 23.2.8 Input Level Control/Status Register 8 (ICSR8)

Address(es): POE.ICSR8 0009 E440h

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR8 register selects the POE9# pin input mode, controls the enable/disable of interrupts, and indicates status.

### POE9M[3:0] Bits (POE9 Mode Select)

These bits select detection mode for the POE9# pin input. Either of falling-edge detection or low-level detection can be selected.

When low-level detection is selected, a sampling interval can be specified.

**POE9M2[3:0] Bits (POE9 Sampling Count Select)**

These bits specify sampling count when low-level detection is selected.

When falling-edge detection is selected, setting value for these bits is ignored.

**PIE8 Bit (Port Interrupt Enable 8)**

This bit enables or disables interrupt requests when the POE9F flag is set to 1.

**POE9E Bit (POE9 Output Disable)**

This bit specifies whether to disable the output of the corresponding pin when the POE9F flag is set to 1.

**POE9F Flag (POE9 Flag)**

This flag indicates that an output disabling request has been input to the POE9# pin.

[Setting condition]

- When the input set by the POE9M[3:0] and POE9M2[3:0] bits occurs at the POE9# pin

[Clearing condition]

- By writing 0 to the POE9F flag after reading POE9F = 1  
When low-level detection is set by the POE9M[3:0] bits, the high level needs to be input to the POE9# pin to write 0 to this flag. For details, refer to section 23.3.9, Recover from Output Disabled State.

### 23.2.9 Input Level Control/Status Register 9 (ICSR9)

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR9 register selects the POE13# pin input mode, controls the enable/disable of interrupts, and indicates status.

#### POE13M[3:0] Bits (POE13 Mode Select)

These bits select detection mode for the POE13# pin input. Either of falling-edge detection or low-level detection can be selected.

When low-level detection is selected, a sampling interval can be specified.

**POE13M2[3:0] Bits (POE13 Sampling Count Select)**

These bits specify sampling count when low-level detection is selected.

When falling-edge detection is selected, setting value for these bits is ignored.

**PIE9 Bit (Port Interrupt Enable 9)**

This bit enables or disables interrupt requests when the POE13F flag is set to 1.

**POE13E Bit (POE13 Output Disable)**

This bit specifies whether to disable the output of the corresponding pin when the POE13F flag is set to 1.

**POE13F Flag (POE13 Flag)**

This flag indicates that an output disabling request has been input to the POE13# pin.

[Setting condition]

- When the input set by the POE13M[3:0] and POE13M2[3:0] bits occurs at the POE13# pin

[Clearing condition]

- By writing 0 to the POE13F flag after reading POE13F = 1  
When low-level detection is set by the POE13M[3:0] bits, the high level needs to be input to the POE13# pin to write 0 to this flag. For details, refer to section 23.3.9, Recover from Output Disabled State.

## 23.2.10 Input Level Control/Status Register 10 (ICSR10)

Address(es): POE.ICSR10 0009 E444h

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The ICSR10 register selects the POE14# pin input mode, controls the enable/disable of interrupts, and indicates status.

### POE14M[3:0] Bits (POE14 Mode Select)

These bits select detection mode for the POE14# pin input. Either of falling-edge detection or low-level detection can be selected.

When low-level detection is selected, a sampling interval can be specified.

**POE14M2[3:0] Bits (POE14 Sampling Count Select)**

These bits specify sampling count when low-level detection is selected.

When falling-edge detection is selected, setting value for these bits is ignored.

**PIE10 Bit (Port Interrupt Enable 10)**

This bit enables or disables interrupt requests when the POE14F flag is set to 1.

**POE14E Bit (POE14 Output Disable)**

This bit specifies whether to disable the output of the corresponding pin when the POE14F flag is set to 1.

**POE14F Flag (POE14 Flag)**

This flag indicates that an output disabling request has been input to the POE14# pin.

[Setting condition]

- When the input set by the POE14M[3:0] and POE14M2[3:0] bits occurs at the POE14# pin

[Clearing condition]

- By writing 0 to the POE14F flag after reading POE14F = 1  
When low-level detection is set by the POE14M[3:0] bits, the high level needs to be input to the POE14# pin to write 0 to this flag. For details, refer to section 23.3.9, Recover from Output Disabled State.

### 23.2.11 Output Level Control/Status Register 1 (OCSR1)

Address(es): POE.OCSR1 0009 E402h

| b9         | OCE1   | Simultaneous Conduction Output Disable 1   | 0: Does not disable the outputs when they simultaneously go to an active level.<br>1: Disable the outputs when they simultaneously go to an active level. | R/W*1       |
| b14 to b10 | —      | Reserved                                   | These bits are read as 0. The write value should be 0.                                                                                                    | R/W         |
| b15        | OSF1   | Simultaneous Conduction Flag 1             | 0: Indicates that outputs have not simultaneously become an active level.<br>1: Indicates that outputs have simultaneously become an active level.        | R/(W)<br>*2 |

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The OCSR1 register enables/disables comparison of output levels, enables/disables a simultaneous conduction interrupt, and indicates the status for the MTU3 and MTU4 pins.

#### OIE1 Bit (Simultaneous Conduction Interrupt Enable 1)

This bit enables or disables interrupt requests when the OSF1 flag is set to 1.

#### OCE1 Bit (Simultaneous Conduction Output Disable 1)

This bit specifies whether to disable the output of the corresponding pin when the OSF1 flag is set to 1.

#### OSF1 Flag (Simultaneous Conduction Flag 1)

This flag indicates that at least one of the three pairs of two-phase output signals for MTU complementary PWM output (MTU3 and MTU4) has simultaneously become at the active level. If the output disabling control for the corresponding pins is not enabled, this flag does not become 1.

For setting the active level, refer to section 23.2.16, Active Level Setting Register 1 (ALR1).

[Setting condition]

- When the MTIOC3B and MTIOC3D signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE2.MTU3BDZE bit, or either or both of the PMMCR1.MTU3BME and PMMCR1.MTU3DME bits, is 1.
- When the MTIOC4A and MTIOC4C signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE2.MTU4ACZE bit, or either or both of the PMMCR1.MTU4AME and PMMCR1.MTU4CME bits, is 1.
- When the MTIOC4B and MTIOC4D signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE2.MTU4BDZE bit, or either or both of the PMMCR1.MTU4BME and PMMCR1.MTU4DME bits, is 1.

Note 1. The setting condition is judged only by the level of the signal regardless the setting of the MPC.PxyPFS register.

[Clearing condition]

- By writing 0 to the OSF1 flag after reading OSF1 = 1

To write 0 to this flag, the MTU complementary PWM output signals should be set to the inactive level. For details, refer to section 23.3.9, Recover from Output Disabled State.

## 23.2.12 Output Level Control/Status Register 2 (OCSR2)

Address(es): POE.OCSR2 0009 E406h

|                    |      |     |     |     |     |     |      |      |    |    |    |    |    |    |    |    |

| b9         | OCE2   | Simultaneous Conduction Output Disable 2   | 0: Does not disable the outputs when they simultaneously go to an active level.<br>1: Disable the outputs when they simultaneously go to an active level. | R/W*1       |
| b14 to b10 | —      | Reserved                                   | These bits are read as 0. The write value should be 0.                                                                                                    | R/W         |
| b15        | OSF2   | Simultaneous Conduction Flag 2             | 0: Indicates that outputs have not simultaneously become an active level.<br>1: Indicates that outputs have simultaneously become an active level.        | R/(W)<br>*2 |

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The OCSR2 register enables/disables comparison of output levels, enables/disables a simultaneous conduction interrupt, and indicates the status for the MTU6 and MTU7 pins.

### OIE2 Bit (Simultaneous Conduction Interrupt Enable 2)

This bit enables or disables interrupt requests when the OSF2 flag is set to 1.

### OCE2 Bit (Simultaneous Conduction Output Disable 2)

This bit specifies whether to disable the output of the corresponding pin when the OSF2 flag is set to 1.

### OSF2 Flag (Simultaneous Conduction Flag 2)

This flag indicates that at least one of the three pairs of two-phase output signals for MTU complementary PWM output (MTU6 and MTU7) has simultaneously become at the active level. If the output disabling control for the corresponding pins is not enabled, this flag does not become 1.

For setting the active level, refer to section 23.2.17, Active Level Setting Register 2 (ALR2).

[Setting condition]

- When the MTIOC6B and MTIOC6D signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POECSR2.MTU6BDZE bit, or either or both of the PMMCR1.MTU6BME and PMMCR1.MTU6DME bits, is 1.
- When the MTIOC7A and MTIOC7C signals simultaneously go to the active level\*1 for at least one cycle of PCLK

while the value of the POE3B.MTU7ACZE bit, or either or both of the PMMCR1.MTU7AME and PMMCR1.MTU7CME bits, is 1.

- When the MTIOC7B and MTIOC7D signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3B.MTU7BDZE bit, or either or both of the PMMCR1.MTU7BME and PMMCR1.MTU7DME bits, is 1.

Note 1. The setting condition is judged only by the level of the signal regardless the setting of the MPC.PxyPFS register.

[Clearing condition]

- By writing 0 to the OSF2 flag after reading OSF2 = 1

To write 0 to this flag, the MTU complementary PWM output signals should be set to the inactive level. For details, refer to section 23.3.9, Recover from Output Disabled State.

### 23.2.13 Output Level Control/Status Register 3 (OCSR3)

Address(es): POE.OCSR3 0009 E42Ah

|                    | b15  | b14 | b13 | b12 | b11 | b10 | b9   | b8   | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |

| b9         | OCE3   | Simultaneous Conduction Output Disable 3   | 0: Does not disable the outputs when they simultaneously go to an active level.<br>1: Disable the outputs when they simultaneously go to an active level. | R/W*1       |
| b14 to b10 | —      | Reserved                                   | These bits are read as 0. The write value should be 0.                                                                                                    | R/W         |
| b15        | OSF3   | Simultaneous Conduction Flag 3             | 0: Indicates that outputs have not simultaneously become an active level.<br>1: Indicates that outputs have simultaneously become an active level.        | R/(W)<br>*2 |

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The OCSR3 register enables/disables comparison of output levels, enables/disables a simultaneous conduction interrupt, and indicates the status for the GPTW0 to GPTW2 pins.

#### OIE3 Bit (Simultaneous Conduction Interrupt Enable 3)

This bit enables or disables interrupt requests when the OSF3 flag is set to 1.

#### OCE3 Bit (Simultaneous Conduction Output Disable 3)

This bit specifies whether to disable the output of the corresponding pin when the OSF3 flag is set to 1.

#### OSF3 Flag (Simultaneous Conduction Flag 3)

This flag indicates that at least one of the three pairs of two-phase output signals for GPTW complementary PWM output

(GPTW0 to GPTW2) has simultaneously become at the active level. If the output disabling control for the corresponding pins is not enabled, this flag does not become 1.

For setting the active level, refer to section 23.2.18, Active Level Setting Register 3 (ALR3).

[Setting condition]

- When the GTIOC0A and GTIOC0B signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3R3.GPT0ABZE bit, or either or both of the PMMCR2.GPT0AME and PMMCR2.GPT0BME bits, is 1.
- When the GTIOC1A and GTIOC1B signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3R3.GPT1ABZE bit, or either or both of the PMMCR2.GPT1AME and PMMCR2.GPT1BME bits, is 1.
- When the GTIOC2A and GTIOC2B signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3R3.GPT2ABZE bit, or either or both of the PMMCR2.GPT2AME and PMMCR2.GPT2BME bits, is 1.

Note 1. The setting condition is judged only by the level of the signal regardless the setting of the MPC.PxyPFS register.

[Clearing condition]

- By writing 0 to the OSF3 flag after reading OSF3 = 1

To write 0 to this flag, the GPTW complementary PWM output signals should be set to the inactive level. For details, refer to section 23.3.9, Recover from Output Disabled State.

### 23.2.14 Output Level Control/Status Register 4 (OCSR4)

Address(es): POE.OCSR4 0009 E446h

|                    |      |     |     |     |     |     |      |      |    |    |    |    |    |    |    |    |

| Bit        | Symbol | Bit Name                                   | Description                                                                                                                                               | R/W     |
|------------|--------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| b7 to b0   | —      | Reserved                                   | These bits are read as 0. The write value should be 0.                                                                                                    | R/W     |
| b8         | OIE4   | Simultaneous Conduction Interrupt Enable 4 | 0: Interrupt requests disabled<br>1: Interrupt requests enabled                                                                                           | R/W     |
| b9         | OCE4   | Simultaneous Conduction Output Disable 4   | 0: Does not disable the outputs when they simultaneously go to an active level.<br>1: Disable the outputs when they simultaneously go to an active level. | R/W*1   |
| b14 to b10 | —      | Reserved                                   | These bits are read as 0. The write value should be 0.                                                                                                    | R/W     |
| b15        | OSF4   | Simultaneous Conduction Flag 4             | 0: Indicates that outputs have not simultaneously become an active level.<br>1: Indicates that outputs have simultaneously become an active level.        | R/(W)*2 |

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The OCSR4 register enables/disables comparison of output levels, enables/disables a simultaneous conduction interrupt, and indicates the status for the GPTW4 to GPTW6 pins.

**OIE4 Bit (Simultaneous Conduction Interrupt Enable 4)**

This bit enables or disables interrupt requests when the OSF4 flag is set to 1.

**OCE4 Bit (Simultaneous Conduction Output Disable 4)**

This bit specifies whether to disable the output of the corresponding pin when the OSF4 flag is set to 1.

**OSF4 Flag (Simultaneous Conduction Flag 4)**

This flag indicates that at least one of the three pairs of two-phase output signals for GPTW complementary PWM output (GPTW4 to GPTW6) has simultaneously become at the active level. If the output disabling control for the corresponding pins is not enabled, this flag does not become 1.

For setting the active level, refer to section 23.2.19, Active Level Setting Register 4 (ALR4).

[Setting condition]

- When the GTIOC4A and GTIOC4B signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3R3.GPT4ABZE bit, or either or both of the PMMCR2.GPT4AME and PMMCR2.GPT4BME bits, is 1.
- When the GTIOC5A and GTIOC5B signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3R3.GPT5ABZE bit, or either or both of the PMMCR2.GPT5AME and PMMCR2.GPT5BME bits, is 1.
- When the GTIOC6A and GTIOC6B signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3R3.GPT6ABZE bit, or either or both of the PMMCR2.GPT6AME and PMMCR2.GPT6BME bits, is 1.

Note 1. The setting condition is judged only by the level of the signal regardless the setting of the MPC.PxyPFS register.

[Clearing condition]

- By writing 0 to the OSF4 flag after reading OSF4 = 1

To write 0 to this flag, the GPTW complementary PWM output signals should be set to the inactive level. For details, refer to section 23.3.9, Recover from Output Disabled State.

| b9         | OCE5   | Simultaneous Conduction Output Disable 5   | 0: Does not disable the outputs when they simultaneously go to an active level.<br>1: Disable the outputs when they simultaneously go to an active level. | R/W*1       |
| b14 to b10 | —      | Reserved                                   | These bits are read as 0. The write value should be 0.                                                                                                    | R/W         |
| b15        | OSF5   | Simultaneous Conduction Flag 5             | 0: Indicates that outputs have not simultaneously become an active level.<br>1: Indicates that outputs have simultaneously become an active level.        | R/(W)<br>*2 |

Note 1. Can be modified only once after a reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

The OCSR5 register enables/disables comparison of output levels, enables/disables a simultaneous conduction interrupt, and indicates the status for the GPTW7 to GPTW9 pins.

### OIE5 Bit (Simultaneous Conduction Interrupt Enable 5)

This bit enables or disables interrupt requests when the OSF5 flag is set to 1.

### OCE5 Bit (Simultaneous Conduction Output Disable 5)

This bit specifies whether to disable the output of the corresponding pin when the OSF5 flag is set to 1.

### OSF5 Flag (Simultaneous Conduction Flag 5)

This flag indicates that at least one of the three pairs of two-phase output signals for GPTW complementary PWM output (GPTW7 to GPTW9) has simultaneously become at the active level. If the output disabling control for the corresponding pins is not enabled, this flag does not become 1.

For setting the active level, refer to section 23.2.20, Active Level Setting Register 5 (ALR5).

[Setting condition]

- When the GTIOC7A and GTIOC7B signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3R3.GPT7ABZE bit, or either or both of the PMMCR2.GPT7AME and PMMCR2.GPT7BME bits, is 1.
- When the GTIOC8A and GTIOC8B signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3R3.GPT8ABZE bit, or either or both of the PMMCR3.GPT8AME and PMMCR3.GPT8BME bits, is 1.
- When the GTIOC9A and GTIOC9B signals simultaneously go to the active level\*1 for at least one cycle of PCLK while the value of the POE3R3.GPT9ABZE bit, or either or both of the PMMCR3.GPT9AME and PMMCR3.GPT9BME bits, is 1.

Note 1. The setting condition is judged only by the level of the signal regardless the setting of the MPC.PxyPFS register.

[Clearing condition]

- By writing 0 to the OSF5 flag after reading OSF5 = 1

To write 0 to this flag, the GPTW complementary PWM output signals should be set to the inactive level. For details, refer to section 23.3.9, Recover from Output Disabled State.

Note 1. Can be modified only once after a reset.

The ALR1 register specifies active levels for when detecting a simultaneous conduction for the MTU3 and MTU4 by the OCSR1 register.

#### OLSG0A Bit (MTIOC3B Signal Active Level Setting)

This bit sets the active level of the MTIOC3B output. Specifically, setting the OLSG0A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

#### OLSG0B Bit (MTIOC3D Signal Active Level Setting)

This bit sets the active level of the MTIOC3D output. Specifically, setting the OLSG0B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

#### OLSG1A Bit (MTIOC4A Signal Active Level Setting)

This bit sets the active level of the MTIOC4A output. Specifically, setting the OLSG1A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG1B Bit (MTIOC4C Signal Active Level Setting)**

This bit sets the active level of the MTIOC4C output. Specifically, setting the OLSG1B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG2A Bit (MTIOC4B Signal Active Level Setting)**

This bit sets the active level of the MTIOC4B output. Specifically, setting the OLSG2A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG2B Bit (MTIOC4D Signal Active Level Setting)**

This bit sets the active level of the MTIOC4D output. Specifically, setting the OLSG2B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSEN Bit (Active Level Setting Enable)**

This bit determines enabling/disabling the active level setting by the OLSG<sub>n</sub>m bit (n = 0 to 2; m = A, B). When the OLSEN bit is 0, the OLSG<sub>n</sub>m bit setting becomes disabled, and the active level for the MTU3 and MTU4 outputs follows the settings for the MTU.TOCR1A and MTU.TOCR2A registers. When the OLSEN bit is 1, the active level for the MTU3 and MTU4 outputs follows the OLSG<sub>n</sub>m bit setting.

| b7        | OLSEN  | Active Level Setting Enable         | 0: Disabled<br>1: Enabled                              | R/W <sup>*1</sup> |
| b15 to b8 | —      | Reserved                            | These bits are read as 0. The write value should be 0. | R/W               |

Note 1. Can be modified only once after a reset.

The ALR2 register specifies active levels for when detecting a simultaneous conduction for the MTU6 and MTU7 by the OCSR2 register.

**OLSG4A Bit (MTIOC6B Signal Active Level Setting)**

This bit sets the active level of the MTIOC6B output. Specifically, setting the OLSG4A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG4B Bit (MTIOC6D Signal Active Level Setting)**

This bit sets the active level of the MTIOC6D output. Specifically, setting the OLSG4B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG5A Bit (MTIOC7A Signal Active Level Setting)**

This bit sets the active level of the MTIOC7A output. Specifically, setting the OLSG5A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG5B Bit (MTIOC7C Signal Active Level Setting)**

This bit sets the active level of the MTIOC7C output. Specifically, setting the OLSG5B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG6A Bit (MTIOC7B Signal Active Level Setting)**

This bit sets the active level of the MTIOC7B output. Specifically, setting the OLSG6A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG6B Bit (MTIOC7D Signal Active Level Setting)**

This bit sets the active level of the MTIOC7D output. Specifically, setting the OLSG6B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSEN Bit (Active Level Setting Enable)**

This bit determines enabling/disabling the active level setting by the OLSG<sub>n</sub>m bit (n = 4 to 6; m = A, B). When the OLSEN bit is 0, the OLSG<sub>n</sub>m bit setting becomes disabled, and the active level for the MTU6 and MTU7 outputs follows the settings for the MTU.TOCR1B and MTU.TOCR2B registers. When the OLSEN bit is 1, the active level for the MTU6 and MTU7 outputs follows the OLSG<sub>n</sub>m bit setting.

| b15 to b8 | —      | Reserved                            | These bits are read as 0. The write value should be 0. | R/W               |

Note 1. Can be modified only once after a reset.

The ALR3 register specifies active levels for when detecting a simultaneous conduction for the GPTW0 to GPTW2 by the OCSR3 register.

#### OLSG0A Bit (GTIOC0A Signal Active Level Setting)

This bit sets the active level of the GTIOC0A output. Specifically, setting the OLSG0A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

#### OLSG0B Bit (GTIOC0B Signal Active Level Setting)

This bit sets the active level of the GTIOC0B output. Specifically, setting the OLSG0B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

#### OLSG1A Bit (GTIOC1A Signal Active Level Setting)

This bit sets the active level of the GTIOC1A output. Specifically, setting the OLSG1A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

#### OLSG1B Bit (GTIOC1B Signal Active Level Setting)

This bit sets the active level of the GTIOC1B output. Specifically, setting the OLSG1B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

#### OLSG2A Bit (GTIOC2A Signal Active Level Setting)

This bit sets the active level of the GTIOC2A output. Specifically, setting the OLSG2A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG2B Bit (GTIOC2B Signal Active Level Setting)**

This bit sets the active level of the GTIOC2B output. Specifically, setting the OLSG2B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSEN Bit (Active Level Setting Enable)**

This bit determines enabling/disabling the active level setting by the OLSG<sub>n</sub>m bit (n = 0 to 2; m = A, B). When the OLSEN bit is 0, the OLSG<sub>n</sub>m bit setting becomes disabled.

The active level for the GPTW output can be specified only when the OLSEN bit is 1. When detecting a simultaneous conduction for the GPTW, set the OLSEN bit to 1, and specify the active level for the GPTW output by the OLSG<sub>n</sub>m bit.

| b6        | —      | Reserved                            | This bit is read as 0. The write value should be 0.    | R/W   |
| b7        | OLSEN  | Active Level Setting Enable         | 0: Disabled<br>1: Enabled                              | R/W*1 |
| b15 to b8 | —      | Reserved                            | These bits are read as 0. The write value should be 0. | R/W   |

Note 1. Can be modified only once after a reset.

The ALR4 register specifies active levels for when detecting a simultaneous conduction for the GPTW4 to GPTW6 by the OCSR4 register.

**OLSG0A Bit (GTIOC4A Signal Active Level Setting)**

This bit sets the active level of the GTIOC4A output. Specifically, setting the OLSG0A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG0B Bit (GTIOC4B Signal Active Level Setting)**

This bit sets the active level of the GTIOC4B output. Specifically, setting the OLSG0B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG1A Bit (GTIOC5A Signal Active Level Setting)**

This bit sets the active level of the GTIOC5A output. Specifically, setting the OLSG1A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG1B Bit (GTIOC5B Signal Active Level Setting)**

This bit sets the active level of the GTIOC5B output. Specifically, setting the OLSG1B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG2A Bit (GTIOC6A Signal Active Level Setting)**

This bit sets the active level of the GTIOC6A output. Specifically, setting the OLSG2A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG2B Bit (GTIOC6B Signal Active Level Setting)**

This bit sets the active level of the GTIOC6B output. Specifically, setting the OLSG2B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSEN Bit (Active Level Setting Enable)**

This bit determines enabling/disabling the active level setting by the OLSGnm bit ( $n = 0$  to  $2$ ;  $m = A, B$ ). When the OLSEN bit is 0, the OLSGnm bit setting becomes disabled.

The active level for the GPTW output can be specified only when the OLSEN bit is 1. When detecting a simultaneous conduction for the GPTW, set the OLSEN bit to 1, and specify the active level for the GPTW output by the OLSGnm bit.

## 23.2.20 Active Level Setting Register 5 (ALR5)

Note 1. Can be modified only once after a reset.

The ALR5 register specifies active levels for when detecting a simultaneous conduction for the GPTW7 to GPTW9 by the OCSR5 register.

### OLSG0A Bit (GTIOC7A Signal Active Level Setting)

This bit sets the active level of the GTIOC7A output. Specifically, setting the OLSG0A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

### OLSG0B Bit (GTIOC7B Signal Active Level Setting)

This bit sets the active level of the GTIOC7B output. Specifically, setting the OLSG0B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

### OLSG1A Bit (GTIOC8A Signal Active Level Setting)

This bit sets the active level of the GTIOC8A output. Specifically, setting the OLSG1A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

### OLSG1B Bit (GTIOC8B Signal Active Level Setting)

This bit sets the active level of the GTIOC8B output. Specifically, setting the OLSG1B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

### OLSG2A Bit (GTIOC9A Signal Active Level Setting)

This bit sets the active level of the GTIOC9A output. Specifically, setting the OLSG2A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSG2B Bit (GTIOC9B Signal Active Level Setting)**

This bit sets the active level of the GTIOC9B output. Specifically, setting the OLSG2B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of simultaneous conduction.

**OLSEN Bit (Active Level Setting Enable)**

This bit determines enabling/disabling the active level setting by the OLSG<sub>n</sub>m bit (n = 0 to 2; m = A, B). When the OLSEN bit is 0, the OLSG<sub>n</sub>m bit setting becomes disabled.

The active level for the GPTW output can be specified only when the OLSEN bit is 1. When detecting a simultaneous conduction for the GPTW, set the OLSEN bit to 1, and specify the active level for the GPTW output by the OLSG<sub>n</sub>m bit.

**23.2.21 Software Port Output Enable Register (SPOER)**

Address(es): POE.SPOER 0009 E42Eh

The SPOER register is used to disable the outputs of the corresponding pins.

**MTUCH34HIZ Bit (MTU3 and MTU4 Pin Output Disable)**

This bit specifies whether to disable the outputs of the MTU complementary PWM output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D). To set this bit to 0, confirm that the bit is 1 and then write 0 to the bit.

**MTUCH67HIZ Bit (MTU6 and MTU7 Pin Output Disable)**

This bit specifies whether to disable the outputs of the MTU complementary PWM output pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D). To set this bit to 0, confirm that the bit is 1 and then write 0 to the bit.

**MTUCH0HIZ Bit (MTU0 Pin Output Disable)**

This bit specifies whether to disable the outputs of the MTU0 pins. To set this bit to 0, confirm that the bit is 1 and then write 0 to the bit.

**GPT01HIZ Bit (GPTW0 and GPTW1 Pin Output Disable)**

This bit specifies whether to disable the outputs of the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B). To set this bit to 0, confirm that the bit is 1 and then write 0 to the bit.

**GPT23HIZ Bit (GPTW2 and GPTW3 Pin Output Disable)**

This bit specifies whether to disable the outputs of the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B). To set this bit to 0, confirm that the bit is 1 and then write 0 to the bit.

**MTUCH9HIZ Bit (MTU9 Pin Output Disable)**

This bit specifies whether to disable the outputs of the MTU9 pins. To set this bit to 0, confirm that the bit is 1 and then write 0 to the bit.

**GPT02HIZ Bit (GPTW0 to GPTW2 Pin Output Disable)**

This bit specifies whether to disable the outputs of the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B). To set this bit to 0, confirm that the bit is 1 and then write 0 to the bit.

**GPT46HIZ Bit (GPTW4 to GPTW6 Pin Output Disable)**

This bit specifies whether to disable the outputs of the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B). To set this bit to 0, confirm that the bit is 1 and then write 0 to the bit.

**GPT79HIZ Bit (GPTW7 to GPTW9 Pin Output Disable)**

This bit specifies whether to disable the outputs of the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B). To set this bit to 0, confirm that the bit is 1 and then write 0 to the bit.

| b7 to b4 | —       | Reserved                          | These bits are read as 0. The write value should be 0.                                            | R/W   |

Note 1. Can be modified only once after a reset.

The POECR1 register controls high-impedance state of the MTU0 pins.

### MTU0AZE Bit (MTIOC0A Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC0A output to the high-impedance state when any of the SPOER.MTUCH0HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag (n = 1 to 5, 7 to 10; m = 0, 4, 8, 10, 11, 12, 9, 13, 14) additionally selected in the POECR5 register, or the POECMPFR.CjFLAG flag (j = 0 to 5), is set to 1.

Set the PMMCR0.MTU0AME bit to 0 when setting this bit to 1.

### MTU0BZE Bit (MTIOC0B Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC0B output to the high-impedance state when any of the SPOER.MTUCH0HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR5 register, or the POECMPFR.CjFLAG flag, is set to 1.

Set the PMMCR0.MTU0BME bit to 0 when setting this bit to 1.

### MTU0CZE Bit (MTIOC0C Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC0C output to the high-impedance state when any of the SPOER.MTUCH0HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR5 register, or the POECMPFR.CjFLAG flag, is set to 1.

Set the PMMCR0.MTU0CME bit to 0 when setting this bit to 1.

### MTU0DZE Bit (MTIOC0D Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC0D output to the high-impedance state when any of the SPOER.MTUCH0HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR5 register, or the POECMPFR.CjFLAG flag, is set to 1.

Set the PMMCR0.MTU0DME bit to 0 when setting this bit to 1.

### 23.2.23 Port Output Enable Control Register 2 (POECR2)

| b15 to b11 | —        | Reserved                                    | These bits are read as 0. The write value should be 0.                                            | R/W   |

Note 1. Can be modified only once after a reset.

Note 2. Set this bit to 0 when MTU6 or MTU7 is not used.

The POECR2 register controls high-impedance state of the MTU complementary PWM output pins (MTU3, and MTU4, MTU6, and MTU7 pins).

#### MTU7BDZE Bit (MTIOC7B/MTIOC7D Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC7B output and MTIOC7D output to the high-impedance state when at least one of the OCSR2.OSF2 flag (when the OCSR2.OCE2 bit is 1), the SPOER.MTUCH67HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag (n = 1 to 5, 7 to 10; m = 0, 4, 8, 10, 11, 12, 9, 13, 14) additionally selected in the POECR4B register, or the POECMPFR.CjFLAG flag (j = 0 to 5) is set to 1. Set the PMMCR1.MTU7BME and PMMCR1.MTU7DME bits to 0 when setting this bit to 1.

#### MTU7ACZE Bit (MTIOC7A/MTIOC7C Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC7A output and MTIOC7C output to the high-impedance state when at least one of the OCSR2.OSF2 flag (when the OCSR2.OCE2 bit is 1), the SPOER.MTUCH67HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR4B register, or the POECMPFR.CjFLAG flag is set to 1. Set the PMMCR1.MTU7AME and PMMCR1.MTU7CME bits to 0 when setting this bit to 1.

#### MTU6BDZE Bit (MTIOC6B/MTIOC6D Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC6B output and MTIOC6D output to the high-impedance state when at least one of the OCSR2.OSF2 flag (when the OCSR2.OCE2 bit is 1), the SPOER.MTUCH67HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR4B register, or the POECMPFR.CjFLAG flag is set to 1. Set the PMMCR1.MTU6BME and PMMCR1.MTU6DME bits to 0 when setting this bit to 1.

**MTU4BDZE Bit (MTIOC4B/MTIOC4D Pin High-Impedance Enable)**

This bit specifies whether to switch the MTIOC4B output and MTIOC4D output to the high-impedance state when at least one of the OCSR1.OSF1 flag (when the OCSR1.OCE1 bit is 1), the SPOER.MTUCH34HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR4 register, or the POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR1.MTU4BME and PMMCR1.MTU4DME bits to 0 when setting this bit to 1.

**MTU4ACZE Bit (MTIOC4A/MTIOC4C Pin High-Impedance Enable)**

This bit specifies whether to switch the MTIOC4A output and MTIOC4C output to the high-impedance state when at least one of the OCSR1.OSF1 flag (when the OCSR1.OCE1 bit is 1), the SPOER.MTUCH34HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR4 register, or the POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR1.MTU4AME and PMMCR1.MTU4CME bits to 0 when setting this bit to 1.

**MTU3BDZE Bit (MTIOC3B/MTIOC3D Pin High-Impedance Enable)**

This bit specifies whether to switch the MTIOC3B output and MTIOC3D output to the high-impedance state when at least one of the OCSR1.OSF1 flag (when the OCSR1.OCE1 bit is 1), the SPOER.MTUCH34HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR4 register, or the POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR1.MTU3BME and PMMCR1.MTU3DME bits to 0 when setting this bit to 1.

## 23.2.24 Port Output Enable Control Register 3 (POECR3)

Address(es): POE.POECR3 0009 E40Eh

| b15 to b10 | —        | Reserved                                  | These bits are read as 0. The write value should be 0.                                            | R/W   |

Note 1. Can be modified only once after a reset.

The POECR3 register controls high-impedance state of the GPTW pins (GPTW0 to GPTW9).

**GPT0ABZE Bit (GTIOC0A/GTIOC0B Pin High-Impedance Enable)**

This bit determines whether to switch the GTIOC0A and GTIOC0B outputs to the high-impedance state when at least one of the followings is set to 1: the OCSR3.OSF3 flag (when the OCSR3.OCE3 bit is 1), the SPOER.GPT01HIZ bit, the SPOER.GPT02HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit = 1), the ICSRn.POE<sub>m</sub>F flag (n = 1 to 5, 7 to 10; m = 0, 4, 8, 10, 11, 12, 9, 13, 14) additionally selected in the POECR6 register, POECMPFR.CjFLAG flag (j = 0 to 5), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR9 register, and the POECMPFR.CjFLAG flag.

Set the PMMCR2.GPT0AME and PMMCR2.GPT0BME bits to 0 when setting this bit to 1.

**GPT1ABZE Bit (GTIOC1A/GTIOC1B Pin High-Impedance Enable)**

This bit determines whether to switch the GTIOC1A and GTIOC1B outputs to the high-impedance state when at least one of the followings is set to 1: the OCSR3.OSF3 flag (when the OCSR3.OCE3 bit is 1), the SPOER.GPT01HIZ bit, the SPOER.GPT02HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit = 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR6 register, POECMPFR.CjFLAG flag, the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR9 register, and the POECMPFR.CjFLAG flag.

Set the PMMCR2.GPT1AME and PMMCR2.GPT1BME bits to 0 when setting this bit to 1.

**GPT2ABZE Bit (GTIOC2A/GTIOC2B Pin High-Impedance Enable)**

This bit determines whether to switch the GTIOC2A and GTIOC2B outputs to the high-impedance state when at least one of the followings is set to 1: the OCSR3.OSF3 flag (when the OCSR3.OCE3 bit is 1), the SPOER.GPT23HIZ bit, the SPOER.GPT02HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit = 1), the ICSRn.POEEmF flag additionally selected in the POECR6B register, POECMPFR.CjFLAG flag, the ICSRn.POEEmF flag additionally selected in the POECR9 register, and the POECMPFR.CjFLAG flag.

Set the PMMCR2.GPT2AME and PMMCR2.GPT2BME bits to 0 when setting this bit to 1.

**GPT3ABZE Bit (GTIOC3A/GTIOC3B Pin High-Impedance Enable)**

This bit specifies whether to switch the GTIOC3A output and GTIOC3B output to the high-impedance state when at least one of the SPOER.GPT23HIZ bit, ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEEmF flag additionally selected in the POECR6B register, or POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR2.GPT3AME and PMMCR2.GPT3BME bits to 0 when setting this bit to 1.

**GPT4ABZE Bit (GTIOC4A/GTIOC4B Pin High-Impedance Enable)**

This bit specifies whether to switch the GTIOC4A output and GTIOC4B output to the high-impedance state when at least one of the OCSR4.OSF4 flag (when the OCSR4.OCE4 bit is 1), the SPOER.GPT46HIZ bit, ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEEmF flag additionally selected in the POECR10 register, or POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR2.GPT4AME and PMMCR2.GPT4BME bits to 0 when setting this bit to 1.

**GPT5ABZE Bit (GTIOC5A/GTIOC5B Pin High-Impedance Enable)**

This bit specifies whether to switch the GTIOC5A output and GTIOC5B output to the high-impedance state when at least one of the OCSR4.OSF4 flag (when the OCSR4.OCE4 bit is 1), the SPOER.GPT46HIZ bit, ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEEmF flag additionally selected in the POECR10 register, or POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR2.GPT5AME and PMMCR2.GPT5BME bits to 0 when setting this bit to 1.

**GPT6ABZE Bit (GTIOC6A/GTIOC6B Pin High-Impedance Enable)**

This bit specifies whether to switch the GTIOC6A output and GTIOC6B output to the high-impedance state when at least one of the OCSR4.OSF4 flag (when the OCSR4.OCE4 bit is 1), the SPOER.GPT46HIZ bit, ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEEmF flag additionally selected in the POECR10 register, or POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR2.GPT6AME and PMMCR2.GPT6BME bits to 0 when setting this bit to 1.

**GPT7ABZE Bit (GTIOC7A/GTIOC7B Pin High-Impedance Enable)**

This bit specifies whether to switch the GTIOC7A output and GTIOC7B output to the high-impedance state when at least one of the OCSR5.OSF5 flag (when the OCSR5.OCE5 bit is 1), the SPOER.GPT79HIZ bit, ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEEmF flag additionally selected in the POECR11 register, or POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR2.GPT7AME and PMMCR2.GPT7BME bits to 0 when setting this bit to 1.

**GPT8ABZE Bit (GTIOC8A/GTIOC8B Pin High-Impedance Enable)**

This bit specifies whether to switch the GTIOC8A output and GTIOC8B output to the high-impedance state when at least one of the OCSR5.OSF5 flag (when the OCSR5.OCE5 bit is 1), the SPOER.GPT79HIZ bit, ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEEmF flag additionally selected in the POECR11 register, or POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR3.GPT8AME and PMMCR3.GPT8BME bits to 0 when setting this bit to 1.

**GPT9ABZE Bit (GTIOC9A/GTIOC9B Pin High-Impedance Enable)**

This bit specifies whether to switch the GTIOC9A output and GTIOC9B output to the high-impedance state when at least one of the OCSR5.OSF5 flag (when the OCSR5.OCE5 bit is 1), the SPOER.GPT79HIZ bit, ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR11 register, or POECMPFR.CjFLAG flag is set to 1.

Set the PMMCR3.GPT9AME and PMMCR3.GPT9BME bits to 0 when setting this bit to 1.

**23.2.25 Port Output Enable Control Register 4 (POECR4)**

Note 1. Can be modified only once after a reset.

The POECR4 register is used to set the control conditions to disable the output of the MTU complementary PWM output pins (MTU3 and MTU4 pins).

**CMADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition CFLAG Add)**

Adds the POECMPFR.CjFLAG flag (j = 0 to 5) to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

However, when the pins are disabled by the flag, an OEIk interrupt (k = 1 to 5) will not be generated.

**IC1ADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition POE0F Add)**

Adds the ICSR1.POE0F flag to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

**IC2ADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition POE4F Add)**

Adds the ICSR2.POE4F flag to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

**IC3ADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition POE8F Add)**

Adds the ICSR3.POE8F flag to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

**IC4ADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition POE10F Add)**

Adds the ICSR4.POE10F flag to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

**IC5ADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition POE11F Add)**

Adds the ICSR5.POE11F flag to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

**IC6ADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition POE12F Add)**

Adds the ICSR7.POE12F flag to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

**IC8ADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition POE9F Add)**

Adds the ICSR8.POE9F flag to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

**IC9ADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition POE13F Add)**

Adds the ICSR9.POE13F flag to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

**IC10ADDMT34ZE Bit (MTU3 and MTU4 Output Disabling Condition POE14F Add)**

Adds the ICSR10.POE14F flag to the output disabling control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

Note 1. Can be modified only once after a reset.

The POE4B register is used to set the control conditions to disable the output of the MTU complementary PWM output pins (MTU6 and MTU7 pins).

#### CMADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition CFLAG Add)

Adds the POECMPFR.CjFLAG flag (j = 0 to 5) to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

However, when the pins are disabled by the flag, an OEIk interrupt (k = 1 to 5) will not be generated.

#### IC1ADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition POE0F Add)

Adds the ICSRI.POE0F flag to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

**IC2ADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition POE4F Add)**

Adds the ICSR2.POE4F flag to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

**IC3ADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition POE8F Add)**

Adds the ICSR3.POE8F flag to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

**IC4ADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition POE10F Add)**

Adds the ICSR4.POE10F flag to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

**IC5ADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition POE11F Add)**

Adds the ICSR5.POE11F flag to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

**IC6ADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition POE12F Add)**

Adds the ICSR7.POE12F flag to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

**IC8ADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition POE9F Add)**

Adds the ICSR8.POE9F flag to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

**IC9ADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition POE13F Add)**

Adds the ICSR9.POE13F flag to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

**IC10ADDMT67ZE Bit (MTU6 and MTU7 Output Disabling Condition POE14F Add)**

Adds the ICSR10.POE14F flag to the output disabling control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

Note 1. Can be modified only once after a reset.

The POECR5 register is used to set the control conditions to disable the output of the MTU0 pins.

**CMADDMT0ZE Bit (MTU0 Output Disabling Condition CFLAG Add)**

Adds the POECMPFR.CjFLAG flag (j = 0 to 5) to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

However, when the pins are disabled by the flag, an OEIk interrupt (k = 1 to 5) will not be generated.

**IC1ADDMT0ZE Bit (MTU0 Output Disabling Condition POE0F Add)**

Adds the ICSR1.POE0F flag to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

**IC2ADDMT0ZE Bit (MTU0 Output Disabling Condition POE4F Add)**

Adds the ICSR2.POE4F flag to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

**IC3ADDMT0ZE Bit (MTU0 Output Disabling Condition POE8F Add)**

Adds the ICSR3.POE8F flag to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

**IC4ADDMT0ZE Bit (MTU0 Output Disabling Condition POE10F Add)**

Adds the ICSR4.POE10F flag to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

**IC5ADDMT0ZE Bit (MTU0 Output Disabling Condition POE11F Add)**

Adds the ICSR5.POE11F flag to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

**IC6ADDMT0ZE Bit (MTU0 Output Disabling Condition POE12F Add)**

Adds the ICSR7.POE12F flag to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

**IC8ADDMT0ZE Bit (MTU0 Output Disabling Condition POE9F Add)**

Adds the ICSR8.POE9F flag to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

**IC9ADDMT0ZE Bit (MTU0 Output Disabling Condition POE13F Add)**

Adds the ICSR9.POE13F flag to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

**IC10ADDMT0ZE Bit (MTU0 Output Disabling Condition POE14F Add)**

Adds the ICSR10.POE14F flag to the output disabling control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

Note 1. Can be modified only once after a reset.

The POECR6 register is used to set the control conditions to disable the output of the GPTW0 and GPTW1 pins.

### CMADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition CFLAG Add)

Adds the POECMPFR.CjFLAG flag (j = 0 to 5) to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

However, when the pins are disabled by the flag, an OEIk interrupt (k = 1 to 5) will not be generated.

### IC1ADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition POE0F Add)

Adds the ICSR1.POE0F flag to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

**IC2ADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition POE4F Add)**

Adds the ICSR2.POE4F flag to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

**IC3ADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition POE8F Add)**

Adds the ICSR3.POE8F flag to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

**IC4ADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition POE10F Add)**

Adds the ICSR4.POE10F flag to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

**IC5ADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition POE11F Add)**

Adds the ICSR5.POE11F flag to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

**IC6ADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition POE12F Add)**

Adds the ICSR7.POE12F flag to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

**IC8ADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition POE9F Add)**

Adds the ICSR8.POE9F flag to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

**IC9ADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition POE13F Add)**

Adds the ICSR9.POE13F flag to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

**IC10ADDGPT01ZE Bit (GPTW0 and GPTW1 Output Disabling Condition POE14F Add)**

Adds the ICSR10.POE14F flag to the output disabling control conditions for the GPTW0 and GPTW1 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B).

## 23.2.29 Port Output Enable Control Register 6B (POECR6B)

Address(es): POE.POECR6B 0009 E450h

Note 1. Can be modified only once after a reset.

The POECR6B register is used to set the control conditions to disable the output of the GPTW2 and GPTW3 pins.

**CMADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition CFLAG Add)**

Adds the POECMPFR.CjFLAG flag (j = 0 to 5) to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

However, when the pins are disabled by the flag, an OEIk interrupt (k = 1 to 5) will not be generated.

**IC1ADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition POE0F Add)**

Adds the ICSR1.POE0F flag to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

**IC2ADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition POE4F Add)**

Adds the ICSR2.POE4F flag to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

**IC3ADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition POE8F Add)**

Adds the ICSR3.POE8F flag to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

**IC4ADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition POE10F Add)**

Adds the ICSR4.POE10F flag to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

**IC5ADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition POE11F Add)**

Adds the ICSR5.POE11F flag to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

**IC6ADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition POE12F Add)**

Adds the ICSR7.POE12F flag to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

**IC8ADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition POE9F Add)**

Adds the ICSR8.POE9F flag to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

**IC9ADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition POE13F Add)**

Adds the ICSR9.POE13F flag to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

**IC10ADDGPT23ZE Bit (GPTW2 and GPTW3 Output Disabling Condition POE14F Add)**

Adds the ICSR10.POE14F flag to the output disabling control conditions for the GPTW2 and GPTW3 pins (GTIOC2A, GTIOC2B, GTIOC3A, GTIOC3B).

| b15 to b4 | —       | Reserved                          | These bits are read as 0. The write value should be 0.                                            | R/W   |

Note 1. Can be modified only once after a reset.

The POECR7 register controls high-impedance state of the MTU9 pins.

#### MTU9AZE Bit (MTIOC9A Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC9A output for the MTU9 pin to high-impedance state when any of the SPOER.MTUCH9HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag (n = 1 to 5, 7 to 10; m = 0, 4, 8, 10, 11, 12, 9, 13, 14) additionally selected in the POECR8 register, or the POECMPFR.CjFLAG flag (j = 0 to 5), is set to 1.

Set the PMMCR0.MTU9AME bit to 0 when setting this bit to 1.

#### MTU9BZE Bit (MTIOC9B Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC9B output for the MTU9 pin to high-impedance state when any of the SPOER.MTUCH9HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR8 register, or the POECMPFR.CjFLAG flag, is set to 1.

Set the PMMCR0.MTU9BME bit to 0 when setting this bit to 1.

#### MTU9CZE Bit (MTIOC9C Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC9C output for the MTU9 pin to high-impedance state when any of the SPOER.MTUCH9HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR8 register, or the POECMPFR.CjFLAG flag, is set to 1.

Set the PMMCR0.MTU9CME bit to 0 when setting this bit to 1.

#### MTU9DZE Bit (MTIOC9D Pin High-Impedance Enable)

This bit specifies whether to switch the MTIOC9D output for the MTU9 pin to high-impedance state when any of the SPOER.MTUCH9HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR8 register, or POECMPFR.CjFLAG flag, is set to 1.

Set the PMMCR0.MTU9DME bit to 0 when setting this bit to 1.

Note 1. Can be modified only once after a reset.

The POECR8 register is used to set the control conditions to disable the output of the MTU9 pins.

#### CMADDMT9ZE Bit (MTU9 Output Disabling Condition CFLAG Add)

Adds the POECMPFR.CjFLAG flag (j = 0 to 5) to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

However, when the pins are disabled by the flag, an OEIk interrupt (k = 1 to 5) will not be generated.

#### IC1ADDMT9ZE Bit (MTU9 Output Disabling Condition POE0F Add)

Adds the ICSR1.POE0F flag to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

**IC2ADDMT9ZE Bit (MTU9 Output Disabling Condition POE4F Add)**

Adds the ICSR2.POE4F flag to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

**IC3ADDMT9ZE Bit (MTU9 Output Disabling Condition POE8F Add)**

Adds the ICSR3.POE8F flag to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

**IC4ADDMT9ZE Bit (MTU9 Output Disabling Condition POE10F Add)**

Adds the ICSR4.POE10F flag to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

**IC5ADDMT9ZE Bit (MTU9 Output Disabling Condition POE11F Add)**

Adds the ICSR5.POE11F flag to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

**IC6ADDMT9ZE Bit (MTU9 Output Disabling Condition POE12F Add)**

Adds the ICSR7.POE12F flag to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

**IC8ADDMT9ZE Bit (MTU9 Output Disabling Condition POE9F Add)**

Adds the ICSR8.POE9F flag to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

**IC9ADDMT9ZE Bit (MTU9 Output Disabling Condition POE13F Add)**

Adds the ICSR9.POE13F flag to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

**IC10ADDMT9ZE Bit (MTU9 Output Disabling Condition POE14F Add)**

Adds the ICSR10.POE14F flag to the output disabling control conditions for the MTU9 pins (MTIOC9A, MTIOC9B, MTIOC9C, MTIOC9D).

Note 1. Can be modified only once after a reset.

The POECR9 register is used to set the control conditions to disable the output of the GPTW0 to GPTW2 pins.

**CMADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition CFLAG Add)**

Adds the POECMPFR.CjFLAG flag (j = 0 to 5) to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

However, when the pins are disabled by the flag, an OEIk interrupt (k = 1 to 5) will not be generated.

**IC1ADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition POE0F Add)**

Adds the ICSR1.POE0F flag to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

**IC2ADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition POE4F Add)**

Adds the ICSR2.POE4F flag to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

**IC3ADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition POE8F Add)**

Adds the ICSR3.POE8F flag to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

**IC4ADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition POE10F Add)**

Adds the ICSR4.POE10F flag to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

**IC5ADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition POE11F Add)**

Adds the ICSR5.POE11F flag to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

**IC6ADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition POE12F Add)**

Adds the ICSR7.POE12F flag to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

**IC8ADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition POE9F Add)**

Adds the ICSR8.POE9F flag to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

**IC9ADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition POE13F Add)**

Adds the ICSR9.POE13F flag to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

**IC10ADDGPT02ZE Bit (GPTW0 to GPTW2 Output Disabling Condition POE14F Add)**

Adds the ICSR10.POE14F flag to the output disabling control conditions for the GPTW0 to GPTW2 pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B).

Note 1. Can be modified only once after a reset.

The POECR10 register is used to set the control conditions to disable the output of the GPTW4 to GPTW6 pins.

**CMADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition CFLAG Add)**

Adds the POECMPFR.CjFLAG flag (j = 0 to 5) to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

However, when the pins are disabled by the flag, an OEIk interrupt (k = 1 to 5) will not be generated.

**IC1ADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition POE0F Add)**

Adds the ICSR1.POE0F flag to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

**IC2ADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition POE4F Add)**

Adds the ICSR2.POE4F flag to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

**IC3ADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition POE8F Add)**

Adds the ICSR3.POE8F flag to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

**IC4ADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition POE10F Add)**

Adds the ICSR4.POE10F flag to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

**IC5ADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition POE11F Add)**

Adds the ICSR5.POE11F flag to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

**IC6ADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition POE12F Add)**

Adds the ICSR7.POE12F flag to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

**IC8ADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition POE9F Add)**

Adds the ICSR8.POE9F flag to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

**IC9ADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition POE13F Add)**

Adds the ICSR9.POE13F flag to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

**IC10ADDGPT46ZE Bit (GPTW4 to GPTW6 Output Disabling Condition POE14F Add)**

Adds the ICSR10.POE14F flag to the output disabling control conditions for the GPTW4 to GPTW6 pins (GTIOC4A, GTIOC4B, GTIOC5A, GTIOC5B, GTIOC6A, GTIOC6B).

## 23.2.34 Port Output Enable Control Register 11 (POECR11)

| b15 to b11 | —              | Reserved                                             | These bits are read as 0. The write value should be 0.                                                                           | R/W   |

Note 1. Can be modified only once after a reset.

The POECR11 register is used to set the control conditions to disable the output of the GPTW7 to GPTW9 pins.

**CMADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition CFLAG Add)**

Adds the POECMPFR.CjFLAG flag (j = 0 to 5) to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

However, when the pins are disabled by the flag, an OEIk interrupt (k = 1 to 5) will not be generated.

**IC1ADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition POE0F Add)**

Adds the ICSR1.POE0F flag to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

**IC2ADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition POE4F Add)**

Adds the ICSR2.POE4F flag to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

**IC3ADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition POE8F Add)**

Adds the ICSR3.POE8F flag to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

**IC4ADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition POE10F Add)**

Adds the ICSR4.POE10F flag to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

**IC5ADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition POE11F Add)**

Adds the ICSR5.POE11F flag to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

**IC6ADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition POE12F Add)**

Adds the ICSR7.POE12F flag to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

**IC8ADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition POE9F Add)**

Adds the ICSR8.POE9F flag to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

**IC9ADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition POE13F Add)**

Adds the ICSR9.POE13F flag to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

**IC10ADDGPT79ZE Bit (GPTW7 to GPTW9 Output Disabling Condition POE14F Add)**

Adds the ICSR10.POE14F flag to the output disabling control conditions for the GPTW7 to GPTW9 pins (GTIOC7A, GTIOC7B, GTIOC8A, GTIOC8B, GTIOC9A, GTIOC9B).

### 23.2.35 Port Mode Mask Control Register 0 (PMMCR0)

Note 1. Can be modified only once after a reset.

The PMMCR0 register is used to mask the settings of the PMR register related to the MTU0 and MTU9 pins.

#### MTU0AME Bit (MTIOC0A Pin Port Mode Mask Enable)

This bit specifies whether switching the MTIOC0A pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.MTUCH0HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag (n = 1 to 5, 7 to 10; m = 0, 4, 8, 10, 11, 12, 9, 13, 14) additionally selected in the POE<sub>CR5</sub> register, and the POECMPFR.CjFLAG flag (j = 0 to 5).

When setting this bit to 1, set the POE<sub>CR1</sub>.MTU0AZE bit to 0. When the POE<sub>CR1</sub>.MTU0AZE bit is 1, the setting of the bit is ignored.

#### MTU0BME Bit (MTIOC0B Pin Port Mode Mask Enable)

This bit specifies whether switching the MTIOC0B pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.MTUCH0HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR5</sub> register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR1</sub>.MTU0BZE bit to 0. When the POE<sub>CR1</sub>.MTU0BZE bit is 1, the setting of the bit is ignored.

#### MTU0CME Bit (MTIOC0C Pin Port Mode Mask Enable)

This bit specifies whether switching the MTIOC0C pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.MTUCH0HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR5</sub> register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR1.MTU0CZE bit to 0. When the POECR1.MTU0CZE bit is 1, the setting of the bit is ignored.

#### **MTU0DME Bit (MTIOC0D Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC0D pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.MTUCH0HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR5 register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR1.MTU0DZE bit to 0. When the POECR1.MTU0DZE bit is 1, the setting of the bit is ignored.

#### **MTU9AME Bit (MTIOC9A Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC9A pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.MTUCH9HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR8 register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR7.MTU9AZE bit to 0. When the POECR7.MTU9AZE bit is 1, the setting of the bit is ignored.

#### **MTU9BME Bit (MTIOC9B Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC9B pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.MTUCH9HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR8 register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR7.MTU9BZE bit to 0. When the POECR7.MTU9BZE bit is 1, the setting of the bit is ignored.

#### **MTU9CME Bit (MTIOC9C Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC9C pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.MTUCH9HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR8 register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR7.MTU9CZE bit to 0. When the POECR7.MTU9CZE bit is 1, the setting of the bit is ignored.

#### **MTU9DME Bit (MTIOC9D Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC9D pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.MTUCH9HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR8 register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR7.MTU9DZE bit to 0. When the POECR7.MTU9DZE bit is 1, the setting of the bit is ignored.

| b15, b14 | —       | Reserved                          | These bits are read as 0. The write value should be 0.                                                        | R/W   |

Note 1. Can be modified only once after a reset.

The PMMCR1 register is used to mask the settings of the PMR register related to the MTU complementary PWM output pins (MTU3, MTU4, MTU6, MTU7).

**MTU7BME Bit (MTIOC7B Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC7B pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR2.OSF2 flag (when the OCSR2.OCE2 bit is 1), the SPOER.MTUCH67HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag (n = 1 to 5, 7 to 10; m = 0, 4, 8, 10, 11, 12, 9, 13, 14) additionally selected in the POECR4B register, and the POECMPFR.CjFLAG flag (j = 0 to 5).

When setting this bit to 1, set the POECR2.MTU7BDZE bit to 0. When the POECR2.MTU7BDZE bit is 1, the setting of the bit is ignored.

**MTU7AME Bit (MTIOC7A Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC7A pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR2.OSF2 flag (when the OCSR2.OCE2 bit is 1), the SPOER.MTUCH67HIZ bit, the ICSR6.OSTSTF

flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR4B</sub> register, and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR2</sub>.MTU7ACZE bit to 0. When the POE<sub>CR2</sub>.MTU7ACZE bit is 1, the setting of the bit is ignored.

#### **MTU6BME Bit (MTIOC6B Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC6B pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR2.OSF2 flag (when the OCSR2.OCE2 bit is 1), the SPOER.MTUCH67HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR4B</sub> register, and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR2</sub>.MTU6BDZE bit to 0. When the POE<sub>CR2</sub>.MTU6BDZE bit is 1, the setting of the bit is ignored.

#### **MTU7DME Bit (MTIOC7D Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC7D pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR2.OSF2 flag (when the OCSR2.OCE2 bit is 1), the SPOER.MTUCH67HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR4B</sub> register, and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR2</sub>.MTU7BDZE bit to 0. When the POE<sub>CR2</sub>.MTU7BDZE bit is 1, the setting of the bit is ignored.

#### **MTU7CME Bit (MTIOC7C Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC7C pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR2.OSF2 flag (when the OCSR2.OCE2 bit is 1), the SPOER.MTUCH67HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR4B</sub> register, and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR2</sub>.MTU7ACZE bit to 0. When the POE<sub>CR2</sub>.MTU7ACZE bit is 1, the setting of the bit is ignored.

#### **MTU6DME Bit (MTIOC6D Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC6D pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR2.OSF2 flag (when the OCSR2.OCE2 bit is 1), the SPOER.MTUCH67HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR4B</sub> register, and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR2</sub>.MTU6BDZE bit to 0. When the POE<sub>CR2</sub>.MTU6BDZE bit is 1, the setting of the bit is ignored.

#### **MTU4BME Bit (MTIOC4B Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC4B pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR1.OSF1 flag (when the OCSR1.OCE1 bit is 1), the SPOER.MTUCH34HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR4</sub> register, and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR2</sub>.MTU4BDZE bit to 0. When the POE<sub>CR2</sub>.MTU4BDZE bit is 1, the setting of the bit is ignored.

#### **MTU4AME Bit (MTIOC4A Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC4A pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR1.OSF1 flag (when the OCSR1.OCE1 bit is 1), the SPOER.MTUCH34HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR4</sub> register, and the

POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR2.MTU4ACZE bit to 0. When the POECR2.MTU4ACZE bit is 1, the setting of the bit is ignored.

#### **MTU3BME Bit (MTIOC3B Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC3B pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR1.OSF1 flag (when the OCSR1.OCE1 bit is 1), the SPOER.MTUCH34HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR4 register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR2.MTU3BDZE bit to 0. When the POECR2.MTU3BDZE bit is 1, the setting of the bit is ignored.

#### **MTU4DME Bit (MTIOC4D Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC4D pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR1.OSF1 flag (when the OCSR1.OCE1 bit is 1), the SPOER.MTUCH34HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR4 register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR2.MTU4BDZE bit to 0. When the POECR2.MTU4BDZE bit is 1, the setting of the bit is ignored.

#### **MTU4CME Bit (MTIOC4C Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC4C pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR1.OSF1 flag (when the OCSR1.OCE1 bit is 1), the SPOER.MTUCH34HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR4 register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR2.MTU4ACZE bit to 0. When the POECR2.MTU4ACZE bit is 1, the setting of the bit is ignored.

#### **MTU3DME Bit (MTIOC3D Pin Port Mode Mask Enable)**

This bit specifies whether switching the MTIOC3D pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR1.OSF1 flag (when the OCSR1.OCE1 bit is 1), the SPOER.MTUCH34HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR4 register, and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR2.MTU3BDZE bit to 0. When the POECR2.MTU3BDZE bit is 1, the setting of the bit is ignored.

## 23.2.37 Port Mode Mask Control Register 2 (PMMCR2)

Note 1. Can be modified only once after a reset.

The PMMCR2 register is used to mask the settings of the PMR register related to the GPTW output pins (GPTW0 to GPTW7).

**GPT0AME Bit (GTIOC0A Pin Port Mode Mask Enable)**

This bit determines whether to switch the GTIOC0A pin to the general I/O port when at least one of the followings is set to 1: the OCSR3.OSF3 flag (when the OCSR3.OCE3 bit =1), the SPOER.GPT01HIZ bit, the SPOER.GPT02HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit = 1), the ICSRn.POE<sub>m</sub>F flag (n = 1 to 5, 7 to 10; m = 0, 4, 8, 10, 11, 12, 9, 13, 14) additionally selected in the POECR6 register, POECMPFR.CjFLAG flag (j = 0 to 5), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR9 register, and the POECMPFR.CjFLAG flag.

To set this bit to 1, set the POECR3.GPT0ABZE bit to 0. If the POECR3.GPT0ABZE bit is 1, setting of this bit is ignored.

#### **GPT0BME Bit (GTIOC0B Pin Port Mode Mask Enable)**

This bit determines whether to switch the GTIOC0B pin to the general I/O port when at least one of the followings is set to 1: the OCSR3.OSF3 flag (when the OCSR3.OCE3 bit =1), the SPOER.GPT01HIZ bit, the SPOER.GPT02HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit = 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR6 register, POECMPFR.CjFLAG flag, the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR9 register, and the POECMPFR.CjFLAG flag.

To make this bit 1, set the POECR3.GPT0ABZE bit to 0. If the POECR3.GPT0ABZE bit is 1, setting of this bit is ignored.

#### **GPT1AME Bit (GTIOC1A Pin Port Mode Mask Enable)**

This bit determines whether to switch the GTIOC1A pin to the general I/O port when at least one of the followings is set to 1: the OCSR3.OSF3 flag (when the OCSR3.OCE3 bit =1), the SPOER.GPT01HIZ bit, the SPOER.GPT02HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit = 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR6 register, POECMPFR.CjFLAG flag, the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR9 register, and the POECMPFR.CjFLAG flag.

To make this bit 1, set the POECR3.GPT1ABZE bit to 0. If the POECR3.GPT1ABZE bit is 1, setting of this bit is ignored.

#### **GPT1BME Bit (GTIOC1B Pin Port Mode Mask Enable)**

This bit determines whether to switch the GTIOC1B pin to the general I/O port when at least one of the followings is set to 1: the OCSR3.OSF3 flag (when the OCSR3.OCE3 bit =1), the SPOER.GPT01HIZ bit, the SPOER.GPT02HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit = 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR6 register, POECMPFR.CjFLAG flag, the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR9 register, and the POECMPFR.CjFLAG flag.

To make this bit 1, set the POECR3.GPT1ABZE bit to 0. If the POECR3.GPT1ABZE bit is 1, setting of this bit is ignored.

#### **GPT2AME Bit (GTIOC2A Pin Port Mode Mask Enable)**

This bit determines whether to switch the GTIOC2A pin to the general I/O port when at least one of the followings is set to 1: the OCSR3.OSF3 flag (when the OCSR3.OCE3 bit =1), the SPOER.GPT23HIZ bit, the SPOER.GPT02HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit = 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR6B register, POECMPFR.CjFLAG flag, the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR9 register, and the POECMPFR.CjFLAG flag.

To make this bit 1, set the POECR3.GPT2ABZE bit to 0. If the POECR3.GPT2ABZE bit is 1, setting of this bit is ignored.

#### **GPT2BME Bit (GTIOC2B Pin Port Mode Mask Enable)**

This bit determines whether to switch the GTIOC2B pin to the general I/O port when at least one of the followings is set to 1: the OCSR3.OSF3 flag (when the OCSR3.OCE3 bit =1), the SPOER.GPT23HIZ bit, the SPOER.GPT02HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit = 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR6B register, POECMPFR.CjFLAG flag, the ICSRn.POE<sub>m</sub>F flag additionally selected in the POECR9 register, and the POECMPFR.CjFLAG flag.

To make this bit 1, set the POECR3.GPT2ABZE bit to 0. If the POECR3.GPT2ABZE bit is 1, setting of this bit is ignored.

**GPT3AME Bit (GTIOC3A Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC3A pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.GPT23HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR6B register and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR3.GPT3ABZE bit to 0. When the POECR3.GPT3ABZE bit is 1, the setting of the bit is ignored.

**GPT3BME Bit (GTIOC3B Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC3B pin to the general I/O port when one of the following flags and bit is set to 1: the SPOER.GPT23HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR6B register and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR3.GPT3ABZE bit to 0. When the POECR3.GPT3ABZE bit is 1, the setting of the bit is ignored.

**GPT4AME Bit (GTIOC4A Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC4A pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR4.OSF4 flag (when the OCSR4.OCE4 bit is 1), the SPOER.GPT46HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR10 register and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR3.GPT4ABZE bit to 0. When the POECR3.GPT4ABZE bit is 1, the setting of the bit is ignored.

**GPT4BME Bit (GTIOC4B Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC4B pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR4.OSF4 flag (when the OCSR4.OCE4 bit is 1), the SPOER.GPT46HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR10 register and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR3.GPT4ABZE bit to 0. When the POECR3.GPT4ABZE bit is 1, the setting of the bit is ignored.

**GPT5AME Bit (GTIOC5A Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC5A pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR4.OSF4 flag (when the OCSR4.OCE4 bit is 1), the SPOER.GPT46HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR10 register and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR3.GPT5ABZE bit to 0. When the POECR3.GPT5ABZE bit is 1, the setting of the bit is ignored.

**GPT5BME Bit (GTIOC5B Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC5B pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR4.OSF4 flag (when the OCSR4.OCE4 bit is 1), the SPOER.GPT46HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR10 register and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR3.GPT5ABZE bit to 0. When the POECR3.GPT5ABZE bit is 1, the setting of the bit is ignored.

**GPT6AME Bit (GTIOC6A Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC6A pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR4.OSF4 flag (when the OCSR4.OCE4 bit is 1), the SPOER.GPT46HIZ bit, the ICSR6.OSTSTF flag

(when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR10</sub> register and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR3</sub>.GPT6ABZE bit to 0. When the POE<sub>CR3</sub>.GPT6ABZE bit is 1, the setting of the bit is ignored.

#### **GPT6BME Bit (GTIOC6B Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC6B pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR4.OSF4 flag (when the OCSR4.OCE4 bit is 1), the SPOER.GPT46HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR10</sub> register and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR3</sub>.GPT6ABZE bit to 0. When the POE<sub>CR3</sub>.GPT6ABZE bit is 1, the setting of the bit is ignored.

#### **GPT7AME Bit (GTIOC7A Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC7A pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR5.OSF5 flag (when the OCSR5.OCE5 bit is 1), the SPOER.GPT79HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR11</sub> register and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR3</sub>.GPT7ABZE bit to 0. When the POE<sub>CR3</sub>.GPT7ABZE bit is 1, the setting of the bit is ignored.

#### **GPT7BME Bit (GTIOC7B Pin Port Mode Mask Enable)**

This bit specifies whether switching the GTIOC7B pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR5.OSF5 flag (when the OCSR5.OCE5 bit is 1), the SPOER.GPT79HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POE<sub>m</sub>F flag additionally selected in the POE<sub>CR11</sub> register and the POE<sub>CM</sub>PFR.CjFLAG flag.

When setting this bit to 1, set the POE<sub>CR3</sub>.GPT7ABZE bit to 0. When the POE<sub>CR3</sub>.GPT7ABZE bit is 1, the setting of the bit is ignored.

### 23.2.38 Port Mode Mask Control Register 3 (PMMCR3)

Address(es): POE.PMMCR3 0009 E436h

| b3        | GPT9BME | GTIOC9B Pin Port Mode Mask Enable | 0: Switching to the general I/O port pin is disabled.<br>1: Switching to the general I/O port pin is enabled. | R/W*1 |
| b15 to b4 | —       | Reserved                          | These bits are read as 0. The write value should be 0.                                                        | R/W   |

Note 1. Can be modified only once after a reset.

The PMMCR3 register is used to mask the settings of the PMR register related to the GPTW output pins (GPTW8 and GPTW9).

#### GPT8AME Bit (GTIOC8A Pin Port Mode Mask Enable)

This bit specifies whether switching the GTIOC8A pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR5.OSF5 flag (when the OCSR5.OCE5 bit is 1), the SPOER.GPT79HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag (n = 1 to 5, 7 to 10; m = 0, 4, 8, 10, 11, 12, 9, 13, 14) additionally selected in the POECR11 register and the POECMPFR.CjFLAG flag (j = 0 to 5).

When setting this bit to 1, set the POECR3.GPT8ABZE bit to 0. When the POECR3.GPT8ABZE bit is 1, the setting of the bit is ignored.

#### GPT8BME Bit (GTIOC8B Pin Port Mode Mask Enable)

This bit specifies whether switching the GTIOC8B pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR5.OSF5 flag (when the OCSR5.OCE5 bit is 1), the SPOER.GPT79HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR11 register and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR3.GPT8ABZE bit to 0. When the POECR3.GPT8ABZE bit is 1, the setting of the bit is ignored.

#### GPT9AME Bit (GTIOC9A Pin Port Mode Mask Enable)

This bit specifies whether switching the GTIOC9A pin to the general I/O port when one of the following flags and bit is set to 1: the OCSR5.OSF5 flag (when the OCSR5.OCE5 bit is 1), the SPOER.GPT79HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR11 register and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR3.GPT9ABZE bit to 0. When the POECR3.GPT9ABZE bit is 1, the setting of the bit is ignored.

#### GPT9BME Bit (GTIOC9B Pin Port Mode Mask Enable)

This bit specifies whether switching the GTIOC9B pin to the general I/O port when one of the following flags and bit is

set to 1: the OCSR5.OSF5 flag (when the OCSR5.OCE5 bit is 1), the SPOER.GPT79HIZ bit, the ICSR6.OSTSTF flag (when the ICSR6.OSTSTE bit is 1), the ICSRn.POEmF flag additionally selected in the POECR11 register and the POECMPFR.CjFLAG flag.

When setting this bit to 1, set the POECR3.GPT9ABZE bit to 0. When the POECR3.GPT9ABZE bit is 1, the setting of the bit is ignored.

### 23.2.39 Port Output Enable Comparator Output Detection Flag Register (POECMPFR)

Address(es): POE.POECMPFR 0009 E426h

|                    |     |     |     |     |     |     |    |    |    |    |        |        |        |        |        |        |

| b4        | C4FLAG | Comparator Channel 4 Output Detection Flag | 0: Comparator output not detected<br>1: Comparator output detected | R/(W)<br>*1 |
| b5        | C5FLAG | Comparator Channel 5 Output Detection Flag | 0: Comparator output not detected<br>1: Comparator output detected | R/(W)<br>*1 |
| b15 to b6 | —      | Reserved                                   | These bits are read as 0. The write value should be 0.             | R/W         |

Note 1. The flag can only be set to 0 by writing 0 after reading 1.

#### CjFLAG Flag (Comparator Channel j Output Detection Flag) (j = 0 to 5)

This flag indicates whether each comparator output is detected or not detected.

[Setting condition]

- A change from low level to high level in the comparator output is detected.
  - When the comparator is set to non-inverted output, the input voltage changes from lower to higher than the reference voltage
  - When the comparator is set to inverted output, the input voltage changes from higher to lower than the reference voltage

[Clearing condition]

- By writing 0 to the CjFLAG flag after reading CjFLAG = 1

### 23.2.40 Port Output Enable Comparator Request Select Register (POECMPSEL)

Address(es): POE.POECMPSEL 0009 E428h

|                    |     |     |     |     |     |     |    |    |    |    |             |             |             |             |             |             |

Note 1. Can be modified only once after a reset.

The POECMPSEL register sets a comparator output detection flag to use as a control condition to disable the outputs.

#### POEREQj Bit (Comparator Channel j Output Disabling Request Enable) (j = 0 to 5)

This bit disables or enables output disabling request generation in response to each comparator output detection. An output disabling request is generated when one of the comparator outputs is detected.

### 23.2.41 Port Output Enable Comparator Request Extended Selection Register m (POECMPEXm) (m = 0 to 8)

Address(es): POE.POECMPEX0 0009 E438h, POE.POECMPEX1 0009 E439h, POE.POECMPEX2 0009 E43Ah, POE.POECMPEX3 0009 E43Bh, POE.POECMPEX4 0009 E43Ch, POE.POECMPEX5 0009 E43Dh, POE.POECMPEX6 0009 E458h, POE.POECMPEX7 0009 E459h, POE.POECMPEX8 0009 E45Ah

| b7, b6 | —       | Reserved                                             | These bits are read as 0. The write value should be 0.                                                                                                                | R/W   |

Note 1. Can be modified only once after a reset.

The POECMPEXm register specifies the comparator output detection flag to use as a control condition to disable the outputs.

The register can select a source for each output pin group where as the POECMPSEL register selects the source for all pins. Table 23.4 lists the output pin groups and the corresponding POECMPEXm registers.

**Table 23.4 Output Pin Groups and Corresponding POECMPEXm Registers**

| Output Pin Group | Corresponding POECMPEXm Register | Corresponding CFLAG Add Bit |
|------------------|----------------------------------|-----------------------------|
| MTU3, MTU4       | POECMPEX0                        | POECR4.CMADDMT34ZE          |
| MTU6, MTU7       | POECMPEX1                        | POECR4B.CMADDMT67ZE         |
| MTU0             | POECMPEX2                        | POECR5.CMADDMT0ZE           |
| MTU9             | POECMPEX3                        | POECR8.CMADDMT9ZE           |
| GPTW0, GPTW1     | POECMPEX4                        | POECR6.CMADDGPT01ZE         |
| GPTW2, GPTW3     | POECMPEX5                        | POECR6B.CMADDGPT23ZE        |
| GPTW0 to GPTW2   | POECMPEX6                        | POECR9.CMADDGPT02ZE         |
| GPTW4 to GPTW6   | POECMPEX7                        | POECR10.CMADDGPT46ZE        |
| GPTW7 to GPTW9   | POECMPEX8                        | POECR11.CMADDGPT79ZE        |

**POEREQj Bit (Comparator Channel j Output Disabling Request Enable) (j = 0 to 5)**

This bit disables or enables output disabling request generation in response to each comparator output detection. An output disabling request is generated when one of the comparator outputs is detected.

### 23.2.42 MTU0 Pin Select Register 1 (M0SELR1)

Address(es): POE.M0SELR1 0009 E460h

| Bit      | Symbol      | Bit Name                    | Description                                                                                                                                                                                                                                                                                                                                                                          | R/W   |

| b7 to b4 | M0BSEL[3:0] | MTU0-B (MTIOC0B) Pin Select | b7 b4<br>0 0 0 0: Does not perform the output disabling control for any MTIOC0B pin.<br>0 0 0 1: Perform the output disabling control for the PB2 as the MTIOC0B pin.<br>0 0 1 0: Perform the output disabling control for the P30 as the MTIOC0B pin.<br>0 0 1 1: Perform the output disabling control for the PC0 as the MTIOC0B pin.<br>Settings other than above are prohibited. | R/W*1 |

Note 1. Can be modified only once after a reset.

The M0SELR1 register is an 8-bit readable/writable register, and selects relevant pins to the output disabling control from the MTU0-A and MTU0-B pins respectively.

#### M0ASEL[3:0] Bits (MTU0-A (MTIOC0A) Pin Select)

Selects a relevant MTIOC0A pin to the output disabling control.

#### M0BSEL[3:0] Bits (MTU0-B (MTIOC0B) Pin Select)

Selects a relevant MTIOC0B pin to the output disabling control.

### 23.2.43 MTU0 Pin Select Register 2 (M0SELR2)

Address(es): POE.M0SELR2 0009 E461h

| Bit      | Symbol      | Bit Name                    | Description                                                                                                                                                                                                                                                                                                                                                                          | R/W   |
|----------|-------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| b3 to b0 | M0CSEL[3:0] | MTU0-C (MTIOC0C) Pin Select | b3 b0<br>0 0 0 0: Does not perform the output disabling control for any MTIOC0C pin.<br>0 0 0 1: Perform the output disabling control for the PB1 as the MTIOC0C pin.<br>0 0 1 0: Perform the output disabling control for the P27 as the MTIOC0C pin.<br>0 0 1 1: Perform the output disabling control for the PC1 as the MTIOC0C pin.<br>Settings other than above are prohibited. | R/W*1 |
| b7 to b4 | M0DSEL[3:0] | MTU0-D (MTIOC0D) Pin Select | b7 b4<br>0 0 0 0: Does not perform the output disabling control for any MTIOC0D pin.<br>0 0 0 1: Perform the output disabling control for the PB0 as the MTIOC0D pin.<br>0 0 1 1: Perform the output disabling control for the PC2 as the MTIOC0D pin.<br>Settings other than above are prohibited.                                                                                  | R/W*1 |

Note 1. Can be modified only once after a reset.

The M0SELR2 register is an 8-bit readable/writable register, and selects relevant pins to the output disabling control from the MTU0-C and MTU0-D pins respectively.

#### **M0CSEL[3:0] Bits (MTU0-C (MTIOC0C) Pin Select)**

Selects a relevant MTIOC0C pin to the output disabling control.

#### **M0DSEL[3:0] Bits (MTU0-D (MTIOC0D) Pin Select)**

Selects a relevant MTIOC0D pin to the output disabling control.

### 23.2.44 MTU3 Pin Select Register (M3SELR)

Address(es): POE.M3SELR 0009 E462h

| Bit      | Symbol      | Bit Name                    | Description                                                                                                                                                                                                                                                                                         | R/W   |
|----------|-------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| b3 to b0 | M3BSEL[3:0] | MTU3-B (MTIOC3B) Pin Select | b3 b0<br>0 0 0 0: Does not perform the output disabling control for any MTIOC3B pin.<br>0 0 0 1: Perform the output disabling control for the P71 as the MTIOC3B pin.<br>0 0 1 0: Perform the output disabling control for the P12 as the MTIOC3B pin.<br>Settings other than above are prohibited. | R/W*1 |
| b7 to b4 | M3DSEL[3:0] | MTU3-D (MTIOC3D) Pin Select | b7 b4<br>0 0 0 0: Does not perform the output disabling control for any MTIOC3D pin.<br>0 0 0 1: Perform the output disabling control for the P74 as the MTIOC3D pin.<br>0 0 1 0: Perform the output disabling control for the P15 as the MTIOC3D pin.<br>Settings other than above are prohibited. | R/W*1 |

Note 1. Can be modified only once after a reset.

The M3SELR register is an 8-bit readable/writable register, and selects relevant pins to the output disabling control from the MTU3-B and MTU3-D pins respectively.

#### M3BSEL[3:0] Bits (MTU3-B (MTIOC3B) Pin Select)

Selects a relevant MTIOC3B pin to the output disabling control.

#### M3DSEL[3:0] Bits (MTU3-D (MTIOC3D) Pin Select)

Selects a relevant MTIOC3D pin to the output disabling control.

## 23.2.45 MTU4 Pin Select Register 1 (M4SELR1)

Address(es): POE.M4SELR1 0009 E463h
