(108) CRU RGB → YCbCr Color Space Conversion Y Coefficient 2 Register (CRUm_ICnYCCR2) (m = 0)

Access Size : 32 bits

Address : <CRUm_base> + 031Ch

Initial Value : 0064_0204h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	YCLBP[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	1	1	0	0	1	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	YCLGP[12:0]												
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	1	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	YCLBP[12:0]	0064h	RW	B multiplication coefficient in Y calculation (B multiplication coefficient for the Y data equation in RGB → YCbCr color space conversion)
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	YCLGP[12:0]	0204h	RW	G multiplication coefficient in Y calculation (G multiplication coefficient for the Y data equation in RGB → YCbCr color space conversion)

(109) CRU RGB → YCbCr Color Space Conversion Y Coefficient 3 Register (CRUm_ICnYCCR3) (m = 0)

Access Size : 32 bits

Address : <CRUm_base> + 0320h

Initial Value : 0A00_0100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	YCLSFT[4:0]					-	-	-	-	-	-	-	YCLCEN
Initial Value	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	YCLAP[11:0]											
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	RW	Reserved A register that can be read and written. Do not change the value of this bit from the initial value.
30, 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 24	YCLSFT[4:0]	0Ah	RW	Amount of downward shift in Y calculation (specification of the amount of downward shift for Y calculation in RGB → YCbCr color space conversion)
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	YCLCEN	0h	RW	Y Calculation Data Clip Enable (Data Clipping Process Control for Y Data Calculation in RGB → YCbCr Color Space Conversion) 0b: Data clipping is not performed 1b: Data clipping is performed
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	YCLAP[11:0]	100h	RW	Value added for normalization of Y calculation data (specification of Y data addition constant in RGB → YCbCr color space conversion)

(110) CRU RGB → YCbCr Color Space Conversion Cb Coefficient 1 Register (CRUm_ICnCBCCR1) (m = 0)

Access Size : 32 bits

Address : <CRUm_base> + 0324h

Initial Value : 0000_1F68h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	RW	Reserved A register that can be read and written. Do not change the value of this bit from the initial value.
30, 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 24	CRCLSFT[4:0]	0Ah	RW	Amount of downward shift in Cr calculation (specification of the amount of downward shift for Cr calculation in RGB → YCbCr color space conversion)
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	CRCLCEN	0h	RW	Cr Calculation Data Clip Enable (Data Clipping Process Control for Cr Data Calculation in RGB → YCbCr Color Space Conversion) 0: Data clipping is not performed 1: Data clipping is performed
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	CRCLAP[11:0]	800h	RW	Value added for normalization of Cr calculation data (specification of Cr data addition constant in RGB → YCbCr color space conversion)

(116) CRU Lookup Table Control Register (CRUm_ICnLUT) (m = 0)

Access Size : 32 bits
Address : <CRUm_base> + 034Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LUTWR	LUTSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	LUTWR	0h	RW	Enables APB read/write access to the lookup table (LUT). 0b: Disables APB access (set this bit to 0 in operation with the normal path). 1b: Enables APB access (normal access is unavailable in this case). Note: See **Figure 9.2-57 Storing LUT Data** for the LUT setting procedure.
0	LUTSEL	0h	RW	Specifies the access path of the lookup table (LUT). 0b: Normal path (image conversion by using the LUT) 1b: APB I/F (read/write from registers) Used to write (and confirm) data to the LUT in initial setting. Set this bit to 0 after finishing writing and reading data. Note that the LUT data is retained even after a reset. Note: See **Figure 9.2-57 Storing LUT Data** for the LUT setting procedure.

(117) CRU Lookup Table Status Register (CRUm_ICnLUTS) (m = 0)

Access Size : 32 bits

Address : <CRUm_base> + 0350h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LUTREGSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	LUTREGSEL	0h	R	Indicates that the lookup table (LUT)is writable and readable from the APB. The LUTWR register value is reflected in this register after a while. Access the lookup table after confirming this bit. 0b: Neither writable nor readable. 1b: Writable and readable. Note: See **Figure 9.2-57 Storing LUT Data** for the LUT setting procedure.

(118) CRU Lookup Table Pointer Register (CRUm_ICnLUTP) (m = 0)

Access Size : 32 bits
Address : <CRUm_base> + 0354h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	LTCRPR[9:0]										LTCBPR[9:6]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTCBPR[5:0]						LTYPR[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 20	LTCRPR[9:0]	0h	RW	Lookup table (LUT) Cr/B pointer Specify the current pointer (access point) to the lookup table Cr/B in APB access. The pointer is incremented automatically when ICnLUTD.LTCRDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. Note: See **Figure 9.2-57 Storing LUT Data** for the LUT setting procedure.
19 to 10	LTCBPR[9:0]	0h	RW	Lookup table (LUT) Cb/G pointer Specify the current pointer (access point) to lookup table Cb/G in APB access. The pointer is incremented automatically when ICnLUTD.LTCBDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. Note: See **Figure 9.2-57 Storing LUT Data** for the LUT setting procedure.
9 to 0	LTYPR[9:0]	0h	RW	Lookup table (LUT) Y/R pointer Specify the current pointer (access point) to lookup table Y/R in APB access. The pointer is incremented automatically when ICnLUTD.LTYDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. Note: See **Figure 9.2-57 Storing LUT Data** for the LUT setting procedure.

(119) CRU Lookup Table Data Register (CRUm_ICnLUTD) (m = 0)

Access Size : 32 bits

Address : <CRUm_base> + 0358h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	LTCRDT[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTCBDT[7:0]								LTYDT[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	LTCRDT[7:0]	0h	RW	Lookup table (LUT) Cr/B data Read and write data to the location indicated by the ICnLUTP.LTCRPR[9:0] pointer in lookup table Cr/B through the APB interface.
15 to 8	LTCBDT[7:0]	0h	RW	Lookup table (LUT) Cb/G data Read and write data to the location indicated by the ICnLUTP.LTCBPR[9:0] pointer in lookup table Cb/G through the APB interface.
7 to 0	LTYDT[7:0]	0h	RW	Lookup table (LUT) Y/R data Read and write data to the location indicated by the ICnLUTP.LTYPR[9:0] pointer in lookup table Y/R through the APB interface.

(120) CRU Test Image Generation Control 1 Register (CRUm_ICnTICTRL1) (m = 0)

Access Size : 32 bits

Address : <CRUm_base> + 035Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	TIRATE[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIPTNV1[3:0]				TIPTNU1[3:0]				TIPTNY1[3:0]				-	TIROTSEL	TIMODE	TIEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
20 to 16	TIRATE[4:0]	0h	RW	Specify the test image generation rate. 16 pixels / (18 + TIRATE) cycles It can be used in the following ranges. 1) When ICnDMR.YCMODE = 010b or 110b or ICnDMR.RGBMODE = 00b 3.291 Gbps(ICnTICTRL1.TTIRATE[4:0] = Fh) to 8.488 Gbps(ICnTICTRL1.TTIRATE[4:0] = 1h) 2) When ICnDMR.YCMODE ≠ 010b, ICnDMR.YCMODE ≠ 110b and ICnDMR.RGBMODE ≠ 00b 3.291 Gbps(ICnTICTRL1.TTIRATE[4:0] = Fh) to 8.960 Gbps(ICnTICTRL1.TTIRATE[4:0] = 0h)
15 to 12	TIPTNV1[3:0]	0h	RW	Specify the pixel (V) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
11 to 8	TIPTNU1[3:0]	0h	RW	Specify the pixel (U) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
7 to 4	TIPTNY1[3:0]	0h	RW	Specify the pixel (Y) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
3	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
2	TIROTSEL	0h	RW	Image processing/non-image processing route selection for test image output 0b: Input for image processing 1b: Input for non-image processing
1	TIMODE	0h	RW	Specifies a test image generation pattern. 0b: Selects a counter value for YUV output. 1b: Same-color YUV output for the entire screen

Bit	Bit Name	Initial Value	R/W	Description
0	TIEN	0h	RW	Enables generation of a test image pattern. This test image works with VC0 only. 0b: Does not generate a test image pattern (processes the data type from the LINK). 1b: Generates a test image pattern (process test image pattern data). Note: When this bit is set to 1b, test data is forcibly selected regardless of CRUnCTRL.VINSEL.

(121) CRU Test Image Generation Control 2 Register (CRUm_ICnTICTRL2) (m = 0)

Access Size : 32 bits

Address : <CRUm_base> + 0360h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	TIPTNV2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIPTNU2[7:0]								TIPTNY2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	TIPTNV2[7:0]	0h	RW	Specify V for the entire-screen same-color test image pattern. Note: This bit is valid when ICnTICTRL1.TIMODE=1b.
15 to 8	TIPTNU2[7:0]	0h	RW	Specify U for the entire-screen same-color test image pattern. Note: This bit is valid when ICnTICTRL1.TIMODE=1b.
7 to 0	TIPTNY2[7:0]	0h	RW	Specify Y for the entire-screen same-color test image pattern. Note: This bit is valid when ICnTICTRL1.TIMODE=1b.

(122) CRU Test Image Size Setting 1 Register (CRUm_ICnTISIZE1) (m = 0)

Access Size : 32 bits
Address : <CRUm_base> + 0364h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	TIPPL[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	TIPPL[11:0]	0h	RW	Number of valid pixels per line in the test image pattern Note 1. If a value from 0 to 15 is specified, operation is for the setting of 16. Note 2. The four lower-order bits are invalid.

(123) CRU Test Image Size Setting 2 Register (CRUm_ICnTISIZE2) (m = 0)

Access Size : 32 bits
Address : <CRUm_base> + 0368h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	TIM[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	TIN[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	TIM[11:0]	0h	RW	Invalid period (number of lines) per frame in the test image pattern Note: If 0 is specified, operation is for the setting of 1.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	TIN[11:0]	0h	RW	Valid period (number of lines) per frame in the test image pattern Note: If 0 is specified, operation is for the setting of 1.

9.2.4.3 Function Description

The prefix “CRUm (m = 0)” of the register names is omitted in the following subsections.

9.2.4.3.1 Input Formats and Image Processing

Table 9.2-10, **Table 9.2-11**, and **Table 9.2-12** list the input formats in which images can be processed by this module and the corresponding available forms of image processing.

Table 9.2-10 Input Formats and Corresponding Forms of Image Processing (for Image Processing) (1/3)

| Input Format | | | Processing Indicator | | | | | | | | | | | | | | | | | Interrupt | | | Output Format | | | | | | | | | | | | | | | | |

MIPI recommended memory storage format (full bypass)*2		Both	Non-use	CRUnCTRL.ATH = 1	Byte 32 [7:0]*1	Byte 31 [7:0]*1	Byte 30 [7:0]*1	Byte 29 [7:0]*1	Byte 28 [7:0]*1	Byte 27 [7:0]*1	Byte 26 [7:0]*1	Byte 25 [7:0]*1	Byte 24 [7:0]*1	Byte 23 [7:0]*1	Byte 22 [7:0]*1	Byte 21 [7:0]*1	Byte 20 [7:0]*1	Byte 19 [7:0]*1	Byte 18 [7:0]*1	Byte 17 [7:0]*1

Note 1. Data from MIPI CSI-2 LINK is output in 8-bit units. However, it is output in the data array of the Recommended Memory Storage of the MIPI CSI-2 V2.1 standard.

Note 2. Only data types marked with ✓ in “MIPI Recommended Memory Storage Format” in **Table 9.2-11** are output in this format. Otherwise, the data will be output in one of the above formats.

Note 3. The CbCr(U/V) side is Image Stride(AMnIS) × 2. See **Image Stride** in **9.2.4.3.3(5)(a) Video data frame** for details.

Note 4. The entries in this column have the following meanings.
“Odd” means the image has an odd number of horizontal lines.
“Even” means the image has an even number of horizontal lines.
“Both” means the image has an odd and even number of horizontal lines.

Note 5. When transferring data to memory, there are cases where Cb and Cr data are transferred to one area as Y, or data is divided into two independent areas.
The entries in this column represent the following.
Non-use: Cb and Cr data are transferred to the same area as Y when transferred to memory.
Use: When Cb and Cr data are transferred to memory, they are transferred to an area separate from Y. This separate area is transferred to the area specified in the AMnUVAOFH/L register for the Y data storage destination.

9.2.4.3.3 Transfer to DRAM

In data transfer from the CRU to the DRAM, data are transferred frame by frame separately based on the concept of memory banks. The memory banks can be set to operate with from 1 to 8 planes. As the transfer destination address for each memory bank, the transfer destination start address of the memory bank must be set such that it does not overlap with memory for the previous frames of data. Operation takes a cyclic form whereby the frame data returns to 1 when it reaches the last plane (see **Figure 9.2-9**). Accordingly, data on the DRAM must have been taken for next processing before overwriting. Set the number of memory banks so that this can be done before overwriting.

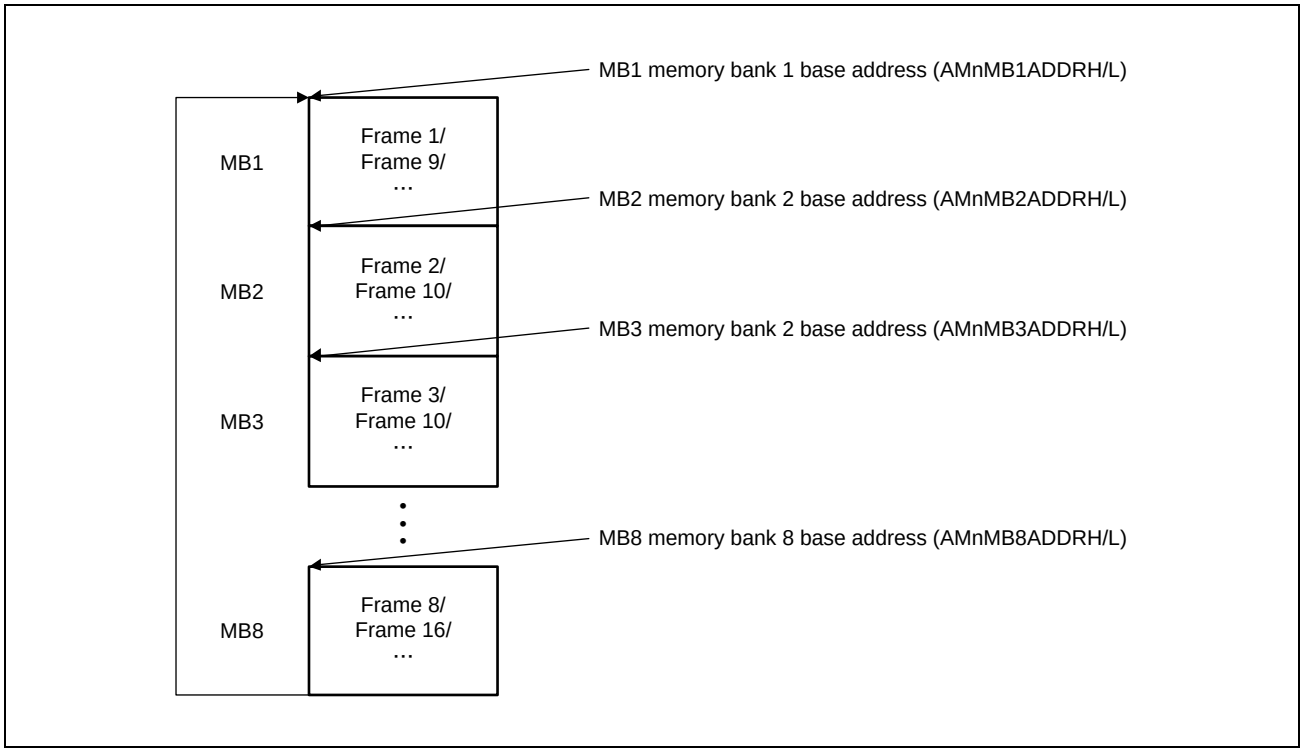

Figure 9.2-9 Image of Data Transfer to DRAM (Example: Eight Destinations in DRAM for the Transfer of Image-Processing Data)

Table 9.2-16 lists the memory bank setting addresses required for the DRAM. In this module, the transfer destination start addresses for the transfer of image data can be specified by setting the offsets listed below to proceed with transfer of up to four planes for SVC, transfer of the UV plane at the time of Y/UV separation, and transfer of non-image processing data or full-bypass data.

Furthermore, the transfer destination start addresses can be specified independently of those for statistics data that are transferred through the statistics bus.

Table 9.2-16 Memory Bank Setting Addresses

x = 0 to 7 (number of memory banks); y = 0 to 3 (number of SVC channels)

Transfer Bus	Processing	Transfer Destination Start Address	Description	Related Section
Video data bus	Image processing data	AMnMBxADDRH/L + AMnSVCAOFH/Lxy	Image data transfer destination. Transfer is possible for SVC0 to 3.	**(1) Video Data Transfer Destination Address (Video Data Storage Destination)**
		AMnMBxADDRH/L + AMnSVCAOFH/Lxy + AMnUVAOFH/L	Transfer destination of the CbCr (UV) plane at the time of YCbCb separation in image data. Transfer is possible for SVC0 to 3.	**(2) Video Data Transfer Destination Address (Storage in Y/UV Separation)**
	Non-Image processing data/ full bypass	AMnMBxADDRH/L + AMnSVCAOFH/Lxy + MnNIAOFH/L	Non-image data/full-bypass transfer destination. Transfer is possible for SVC0 to 3.	**(3) Video Data Transfer Destination Address (Image Processing/Non-Image Processing, 4-ch. SVC, Y/UV Separated Data)**
Statistics data bus	Statistics processing	AMnSDMBxADDRH/L	Statistics data transfer destination. Transfer is only possible for SVC0.	**(4) Statistics Data Transfer Destination Address (Statistics Data Storage Destination)**

Note: x represents the number of planes of each memory bank and it can be set from one to eight planes by the AMnMBVALID and AMnSDMBVALID registers (the number differs between video and statistics).
y represents the channel number of SVC and it can be set from SVC0 to SVC3 by the ICnSVCNUM register.

Data are transferred to the address obtained by adding the given offset to AMnMBxADDRH/L, the image processing data transfer destination start address for SVC0.

1) SVC OFFSET

SVCs from SVC0 to 3 are supported. Data are transferred to the address obtained by adding the offset of SVC1 to 3 to the image data transfer destination start address for SVC0.

SVC1: AMnMBxADDRH/L + AMnSVCAOFH/L
SVC2: AMnMBxADDRH/L + AMnSVCAOFH/L × 2
SVC3: AMnMBxADDRH/L + AMnSVCAOFH/L × 3

2) UV OFFSET

In the separate transfer of Y and CbCr (UV), the CbCr (UV) plane is transferred to the address obtained by adding AMnUVAOFH/L to AMnMBxADDRH/L, the image data transfer destination start address for SVC0.

UV plane for SVC0: AMnMBxADDRH/L + AMnUVAOFH/L
UV plane for SVC1: AMnMBxADDRH/L + AMnSVCAOFH/L + AMnUVAOFH/L
UV plane for SVC2: AMnMBxADDRH/L + AMnSVCAOFH/L × 2 + AMnUVAOFH/L
UV plane for SVC3: AMnMBxADDRH/L + AMnSVCAOFH/L × 3 + AMnUVAOFH/L

3) Non-Image Processing Data

Data are transferred to the address obtained by adding AMnNIAOFH/L to AMnMBxADDRH/L, the image data transfer destination start address for SVC0.

Non-image data plane for SVC0: AMnMBxADDRH/L + AMnNIAOFH/L
Non-image data plane for SVC1: AMnMBxADDRH/L + AMnSVCAOFH/L + AMnNIAOFH/L
Non-image data plane for SVC2: AMnMBxADDRH/L + AMnSVCAOFH/L × 2 + AMnNIAOFH/L
Non-image data plane for SVC3: AMnMBxADDRH/L + AMnSVCAOFH/L × 3 + AMnNIAOFH/L

4) Statistics Data

Statistics data are transferred through the static data (SD) bus, which is independent of the video data bus. Therefore, the destination addresses for these data are defined in the following form, regardless of the address settings for image data. In addition, such data are only transferred to the following set locations, since they are only supported for SVC0.

AMnSDMBxADDRH/L

(1) Video Data Transfer Destination Address (Video Data Storage Destination)

- The start address of each memory bank as the video data transfer destination is determined by the AMnMB1 to 8ADDRL and AMnMB1 to 8ADDRH registers. Valid AMnMB1ADDRH/L, AMnMB2ADDRH/L, … registers are switched by AMnMBVALID. 1 to 8 can be set for one step of memory-bank transfer (examples for settings of 8, 4, and 1 are shown in **(a) AMnMBVALID[7:0] = 1111_1111b (eight transfer destinations)**, **(b) AMnMBVALID[7:0] = 0000_1111b (four transfer destinations)**, and **(c) AMnMBVALID[7:0] = 0000_0001b (one transfer destination)**, respectively).

Set the following offset addresses as required based on the above. Set the following offset addresses as required based on the above description.

- Set the SVC offset addresses, AMnSVCAOFL and AMnSVCAOFH, when SVC1 to 3 are used.
- Set the non-image processing offset addresses, AMnNIAOFL and AMnNIAOFH, when non-image processing/full bypass is selected.
- Set the YC offset addresses, AMnUVAOFL and AMnUVAOFH, when YC separation (ICnDMR.YCMODE[2:0] = 010b/110b) is selected.

(a) AMnMBVALID[7:0] = 1111_1111b (eight transfer destinations)

Order of transfer destinations: MB1 → MB2 → …. → MB8 → MB1 → MB2 → …

Figure 9.2-18 Image of Data Storage (Example of Division by MB)

(4) Statistics Data Transfer Destination Address (Statistics Data Storage Destination)

The results of statistics processing are transferred from the statistics data bus to external memory. Since this statistics function is limited to SVC0, the external transfer destination start address is determined by AMnSDMB1 to 8ADDRL and AMnSDMB1 to 8ADDRH.

The number of planes of the memory bank is determined by AMnSDMBVALID. The transfer start address (statistics data storage destination) is determined by the MnSDMB1 to 8ADDRL and AMnSDMB1 to 8ADDRH registers.

The valid AMnSDMB1ADDR, AMnSDMB2ADDR, …registers are switched by AMnSDMBVALID.

(a) AMnSDMBVALID[7:0] = 1111_1111b (eight transfer destinations)

- Order of transfer destinations: SDMB1 → SDMB2 → … → SDMB8 → SDMB1 → SDMB2 → …

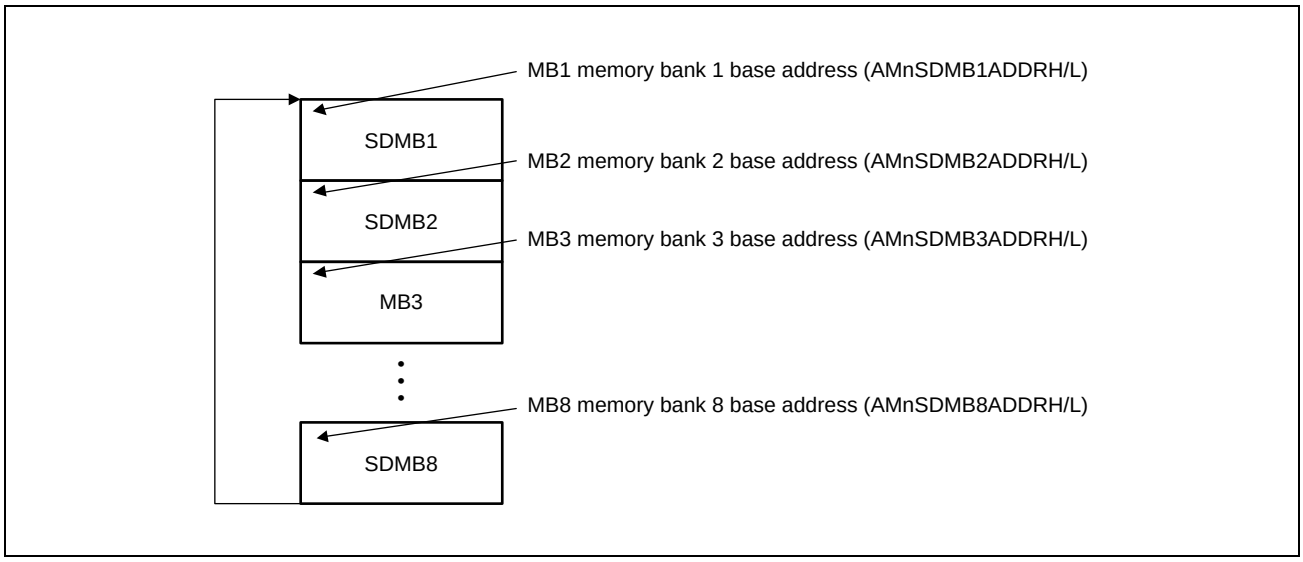

Figure 9.2-19 Image of Memory Bank (Eight Transfer Destinations)

(5) Frame Structure

(a) Video data frame

Image Stride

The image stride function is always handled for image processing and non-image processing from the video data system.

Figure 9.2-20 through **Figure 9.2-22** show the image of the storage of data with the image stride function. The image stride function involves writing from the memory write start address of each line in memory in units of address with the value set by the AMnIS (128-byte Step) register. The end of the line for writing is determined in multiples of 256 bits (32 bytes), so take this into account when setting the address. Furthermore, if a header and footer are to be appended, make the setting in consideration of that amount of data.

The following are the descriptions of storage in memory for each output format.

TYPE1: When the output format is YUV without separation (ICnDMR.YCMODE[2:0] = 000b to 001b, 011b to 101b,111b), RGB, RAW or MIPI Recommended Memory Storage Format.

As shown in **Figure 9.2-20**, the first address of memory write for each horizontal line is written to memory in address units.

TYPE2: When the output format is YUV422 (ICnDMR.YCMODE[2:0] = 010b)

As shown in **Figure 9.2-21**, the first address of memory write for each horizontal line is written to memory in address units.

TYPE3: When the output format is YUV420 (ICnDMR.YCMODE[2:0] = 110b)

As shown in **Figure 9.2-22**, Y writes the first address of memory write for each line to memory in address units of the value set in the AMnIS register.

Note that UV writes the first address of each line to memory in units of twice the value set in the AMnIS register.

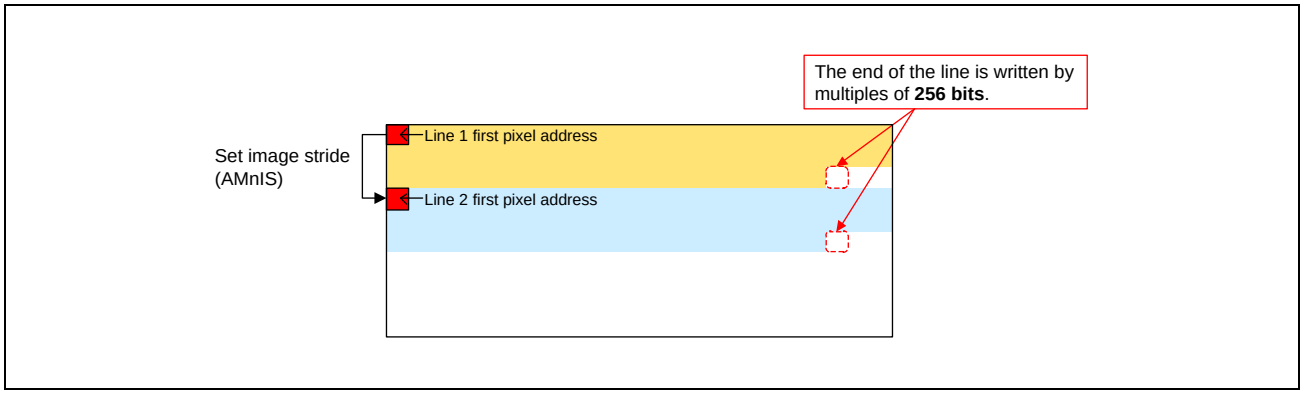

Figure 9.2-20 Image of Data Storage with Image Stride Function (TYPE1)

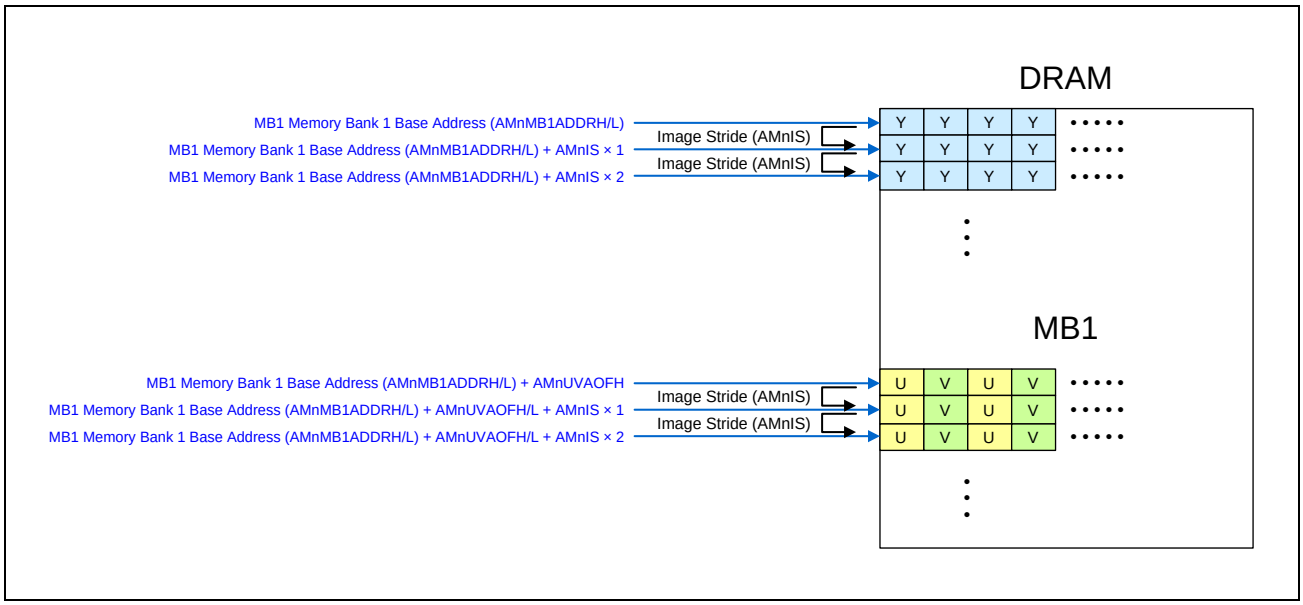

Figure 9.2-21 Image of Data Storage with Image Stride Function (TYPE2)

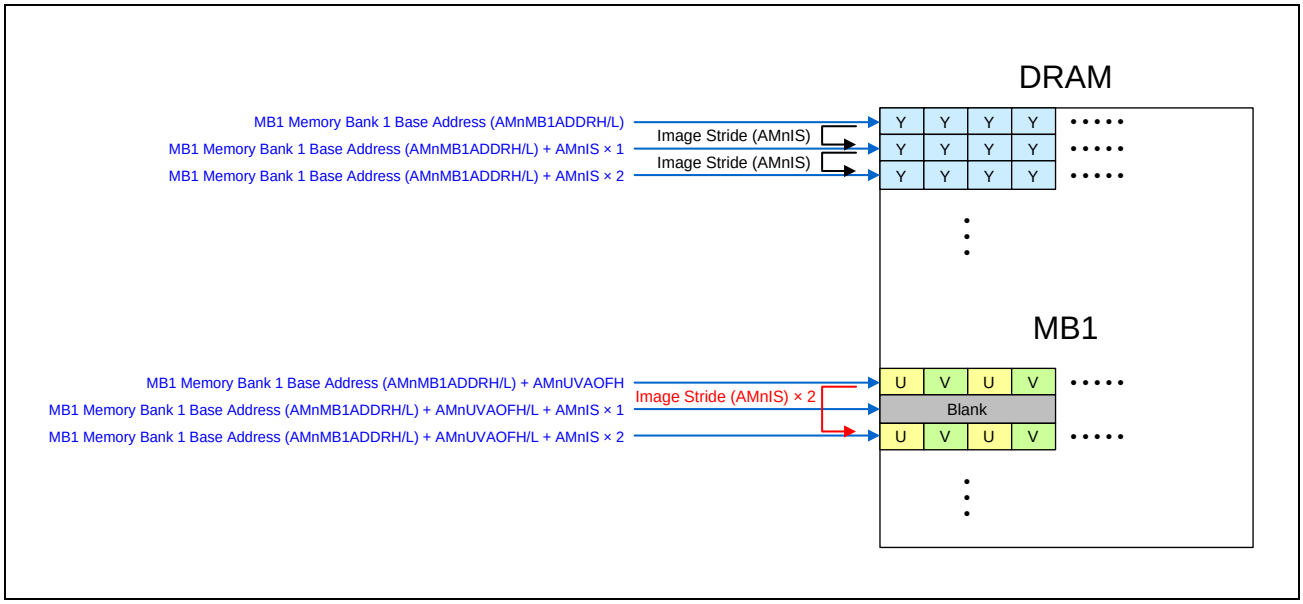

Figure 9.2-22 Image of Data Storage with Image Stride Function (TYPE3)

Image Processing Data Frame

Figure 9.2-23 shows the structure of the image processing data frame.

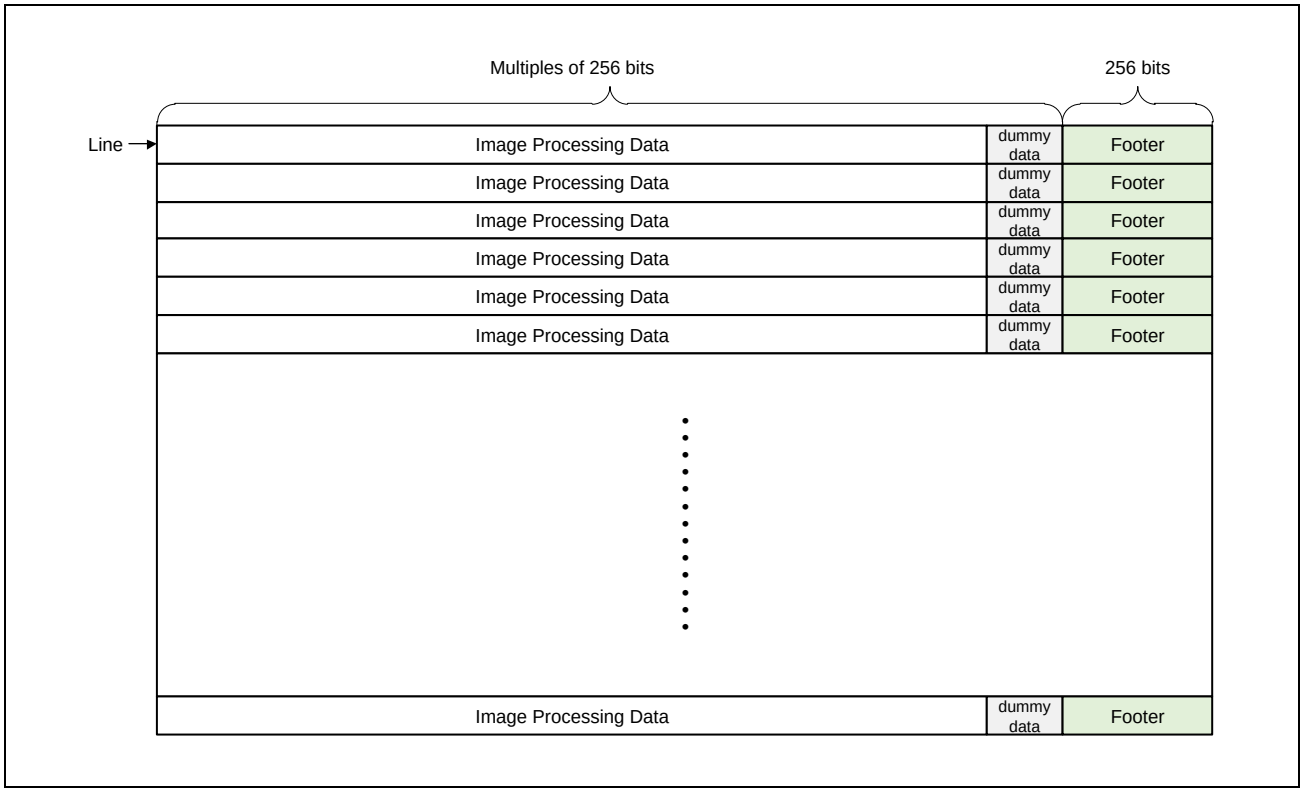

Figure 9.2-23 Image Processing Data Frame Structure

1) Dummy data

Transfer from this module to external memory proceeds in units of 256 bits (32 bytes). Therefore, only the amount of dummy data which is required to reach a 32-byte boundary is transferred. When processing images, ignore the dummy data.

2) Footer

Whether or not to insert footer with the image data can be selected by using the ICnDTVP.FTON register. For the data format of 256 bits of footer data, see **Footer Appending Function**. The value of this footer is updated alternately every time data at the target address are updated. The state of progress can be checked by monitoring which horizontal line has been updated.

This module has functionality for checking the address for transfer from the AXI bus via a register or using an interrupt to indicate the transfer of data to the specified address. Actually, whether or not data have been written to the DRAM can be checked by inspecting the footer to confirm the updating of data.

Non-Image Processing Data/Full-Bypass Data Frame

Figure 9.2-24 shows the structure of the non-image processing data/full-bypass data frame.

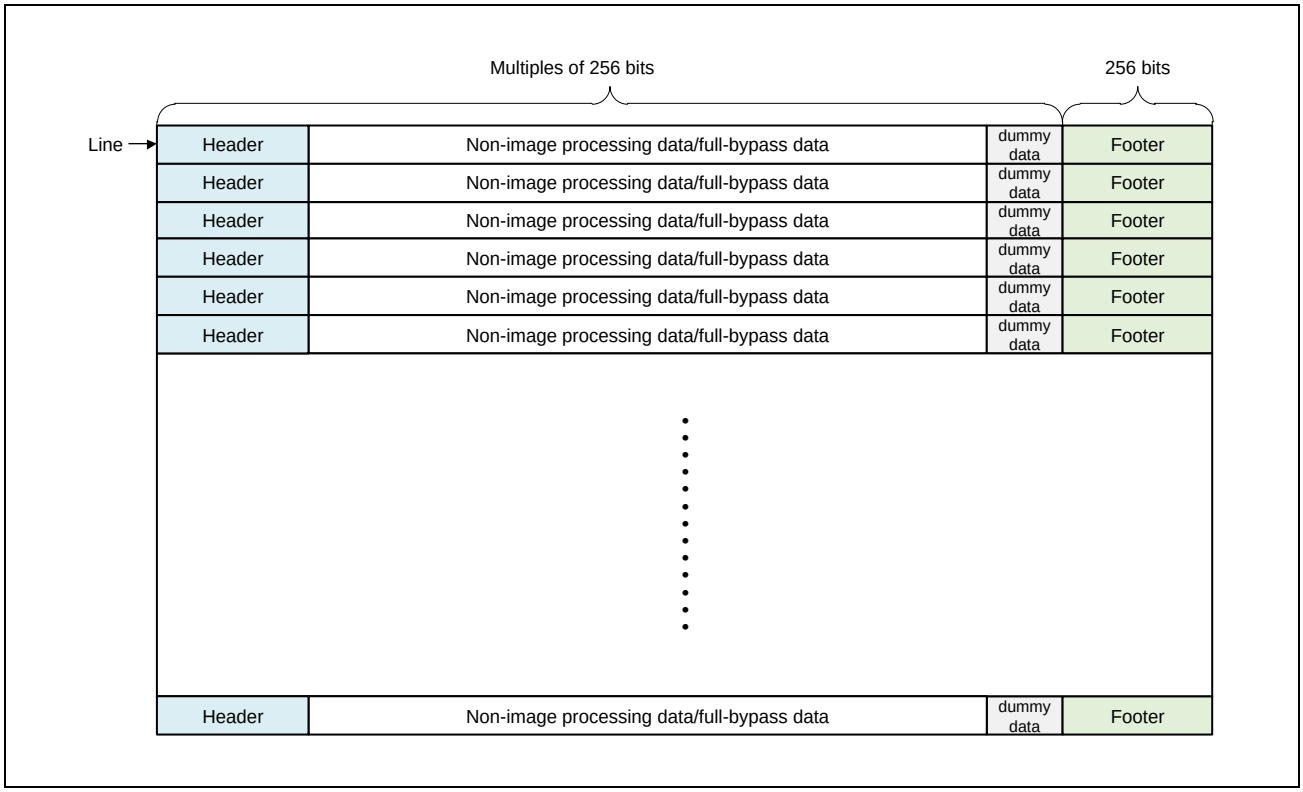

Figure 9.2-24 Non-Image Processing Data/Full-Bypass Data Frame Structure

A difference from an image processing frame is that a header can be inserted for these frame types.

Insertion of the header can be set by using the ICnDTVP.HDON register. For the format of the header, see **Header Appending Function (for Non-Image Processing Data/Full-Bypass Data)**.

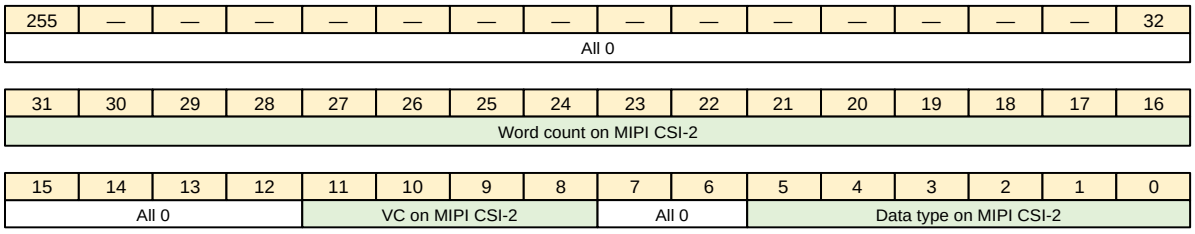
Since there are several data types for non-image processing and full-bypass data whereas image processing data are of one data type, the purpose of the header is to allow the CRU to identify the data type in line units. If the CRU has recognized the data type beforehand or a single data type is selected, headers need not be inserted.

Header Appending Function (for Non-Image Processing Data/Full-Bypass Data)

The data types for non-image processing and full-bypass are selectable from among several data types and the data are stored in a state such that they are mixed in the same SVC memory area, so a header can be appended at the start of each line for non-image processing or full-bypass data so that the data type and data length can be identified when read. Since this header appending function is not required for a sensor that can identify the data types by their order, etc., it can be switched on or off.

However, when the pattern generator is selected for output, a header will not be appended regardless of whether the setting for header appending is on or off.

Figure 9.2-25 shows the contents of the header.



Note: Since “Word count” is the word count value based on MIPI CSI-2, it does not include data such as headers and footers which have been appended by the CRU.

Figure 9.2-25 Header Contents

Footer Appending Function

This function writes footer data to memory so that the user can see up to which horizontal line data has been written in the memory bank set by AMnMB1-8ADDRH/L (for video data).

This function can be switched on or off with ICnDTVP.FTON.

For the video data footer, 256 bits (256’h1/256’h0) are written at the end of each line unit.

At first, 256’h1 is written as a footer. The next time the memory bank is overwritten after round of writing, 256’h0 is written as a footer. Subsequently, 256’h1 and 256’h0 are written alternately each time the memory bank is overwritten.

Accordingly, by checking the value of the footer, it is possible to prevent erroneous use of data before it is overwritten.

A 256-bit footer (256’d1/256’d0) is appended to the end of each line unit from the image system (image processing, non-image processing, or full bypass) and to the end of each frame unit from the statistics system.

(b) Statistics data frame

Figure 9.2-26 shows the structure of the image processing data frame.

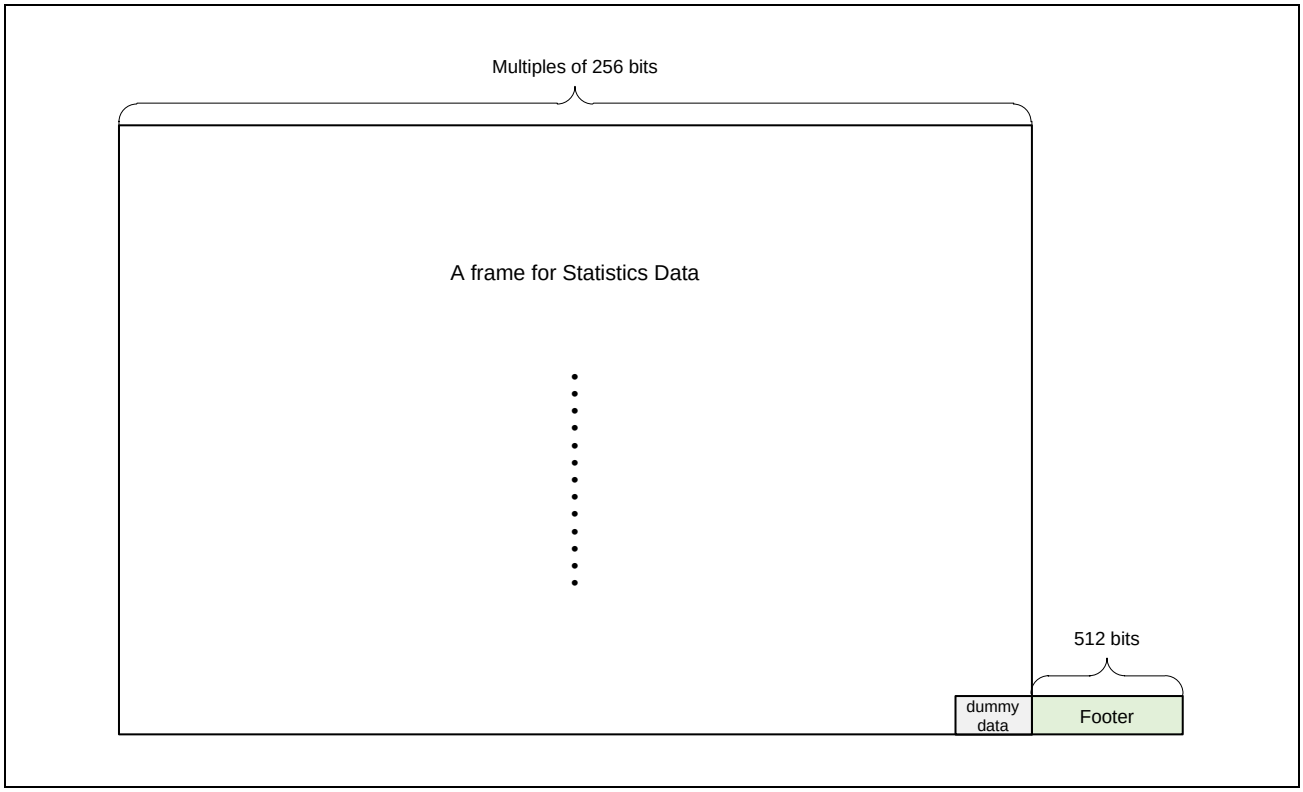


Figure 9.2-26 Statistics Data Frame Structure

Two differences between statistics frames and frames from image processing and non-image processing are that statistics frames have no concept of image striding and that footers are added in frame units. This is because statistics are processed in block units so that line-by-line processing is not possible.

Processing of the Last Line in a Frame (for Statistics Data)

Figure 9.2-27 shows an image of storing frames of statistics data. Statistics data are written to memory with no intervals in the data to reflect line transitions. The end of the frame for writing is determined in multiples of 256 bits (32 bytes), so take this into account when setting the address.

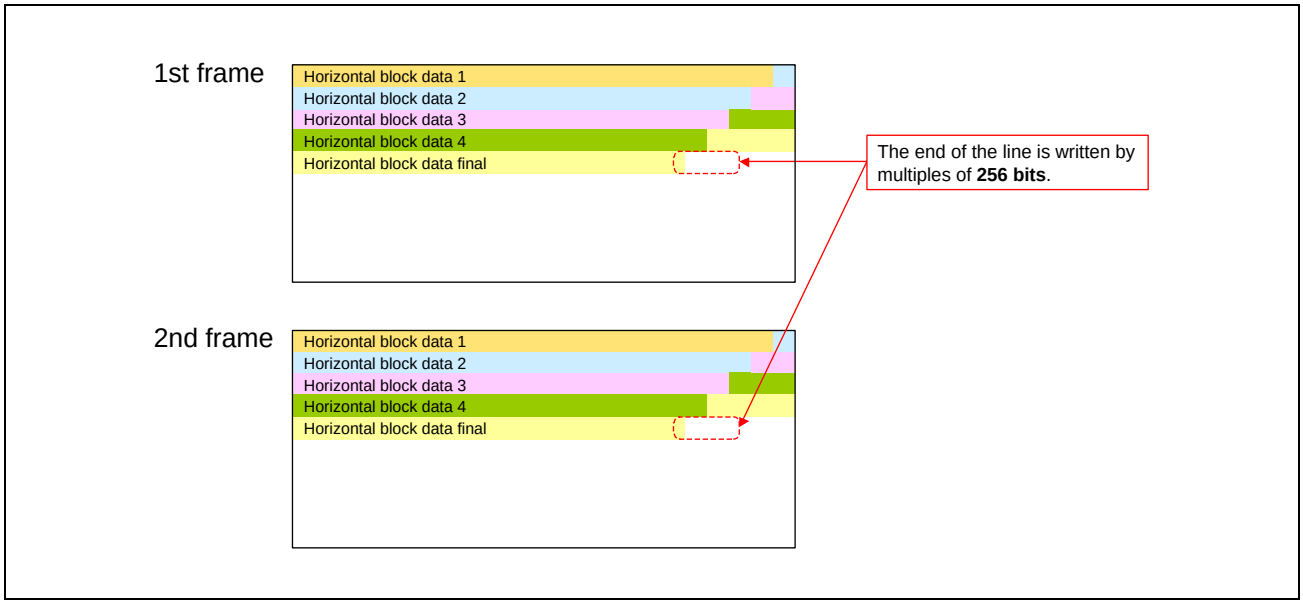

Figure 9.2-27 Image of Storing Frames of Statistics Data

Footer Appending Function

This function writes a footer to the end of each memory so that the user can see which bank number of the memory bank set by MnSDMB1-8ADDRH/L (for statistics data) has been written to the memory.

This function can be switched on or off with ICnDTVP.FTON.

A 512-bit ({higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256’h1} or 512-bit {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256’h0}) footer of statistics data is written at the end of each frame unit.

Ignore the higher-order 256 bits of 512 bits because they are reserved (indefinite value).

At first, 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256’h1} are written as a footer.

The next time the memory bank is overwritten after one round of writing, 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256’h0} are written as a footer.

After that, 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256’h1} and 512 bits {higher-order 256 bits: reserved (indefinite value); lower-order 256 bits: 256’h0} are alternately written each time overwriting is done.

Therefore, by checking the footer value as the video data footer, it is possible to prevent the data from being inadvertently used before overwriting.

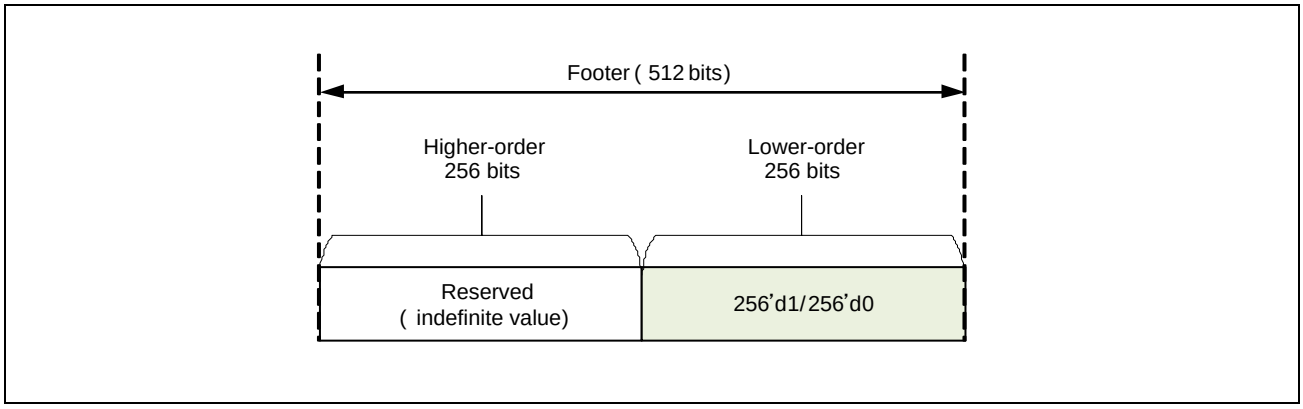

Figure 9.2-28 Statistics Data Footer Structure

9.2.4.3.4 Pattern Generator (for Debugging)

A test image (YUV422 only) can be generated for use as an image converter input by setting the following registers. This function is used for debugging to identify where the problem is originated (in the sensor or in the internal settings). Two modes are implemented for this pattern (monochrome or pattern). This pattern generator operates as VC0. You can select the route of image processing/non-image processing. See **9.2.5 Operation** for the setting procedure.

TIEN = ICnTICTRL1.TIEN: Enables generation of a test image pattern.
TIMODE = ICnTICTRL1.TIMODE: Selects a test image generation pattern (monochrome or pattern).

TIROTSEL = ICnTICTRL1.TIROTSEL: Selects the route of image processing/non-image processing.

TIPTNY1[3:0] = ICnTICTRL1.TIPTNY1[3:0]: Bit settings for the pixel (Y) counter
TIPTNU1[3:0] =ICnTICTRL1.TIPTNU1[3:0]: Bit settings for the pixel (U) counter
TIPTNV1[3:0] = ICnTICTRL1.TIPTNV1[3:0]: Bit settings for the pixel (V) counter

TIRATE[4:0] = ICnTICTRL1.TIRATE[4:0]: Specify a test image generation rate.

TIPTNY2[7:0] = ICnTICTRL2.TIPTNY2[7:0]: Specify Y for the entire-screen same-color test image pattern.
TIPTNU2[7:0] = ICnTICTRL2.TIPTNU2[7:0]: Specify U for the entire-screen same-color test image pattern.
TIPTNV2[7:0] = ICnTICTRL2.TIPTNV2[7:0]: Specify V for the entire-screen same-color test image pattern.

TIPPL[11:0] = ICnTISIZE1.TIPPL[11:0]: Number of valid pixels per line in the test image pattern
TIN[11:0] = ICnTISIZE2.TIN[11:0]: Valid period (number of lines) per frame in the test image pattern
TIM[11:0] = ICnTISIZE2.TIM[11:0]: Invalid period (number of lines) per frame in the test image pattern

(1) Image and Settings (Common to Monochrome and Pattern Generation)

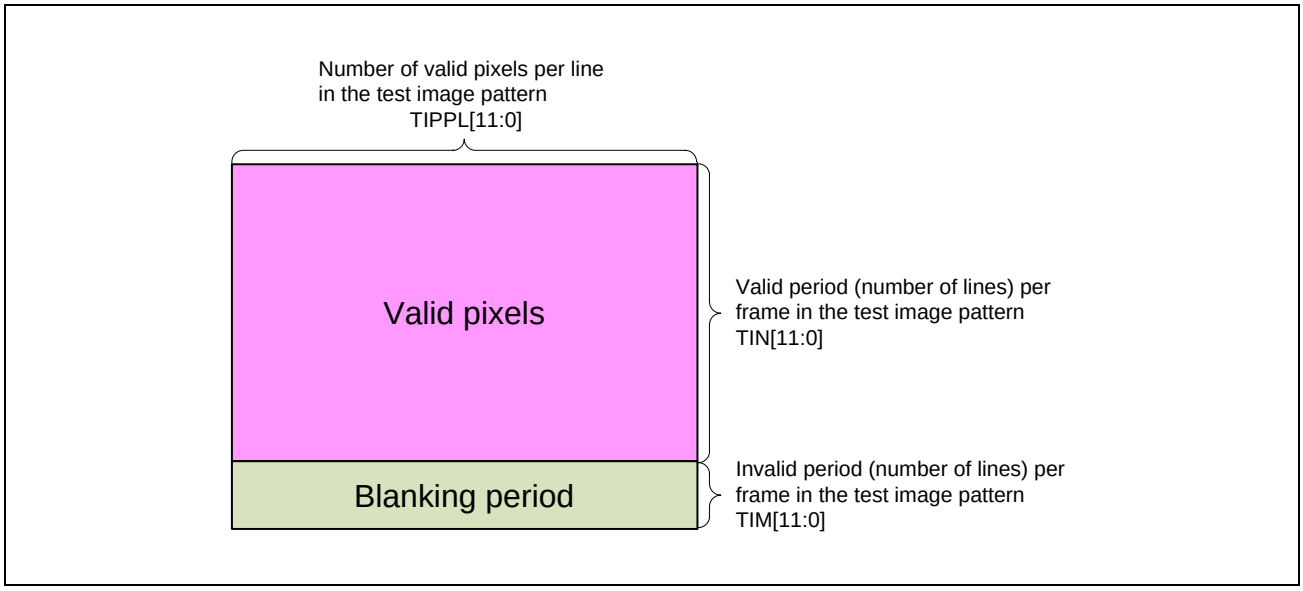

Figure 9.2-29 Image and Settings

(2) Timing Generation and Settings (Common to Monochrome and Pattern Generation)

(Bits TIRATE[4:0] allow the test image generation rate to be set in the range between 3.291 Gbps and 8.960 Gbps with VCLK at 630 MHz.)

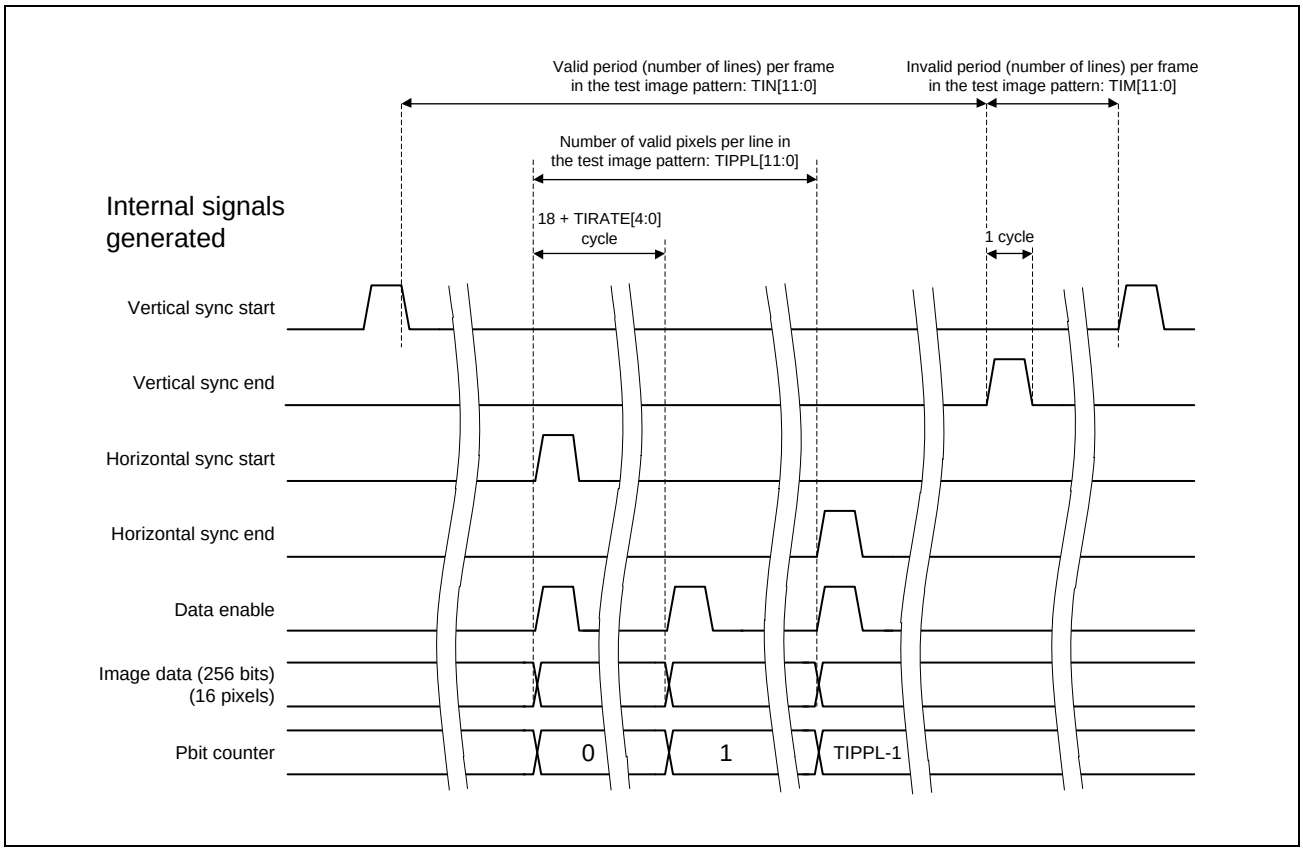

Figure 9.2-30 Timing Generation and Settings

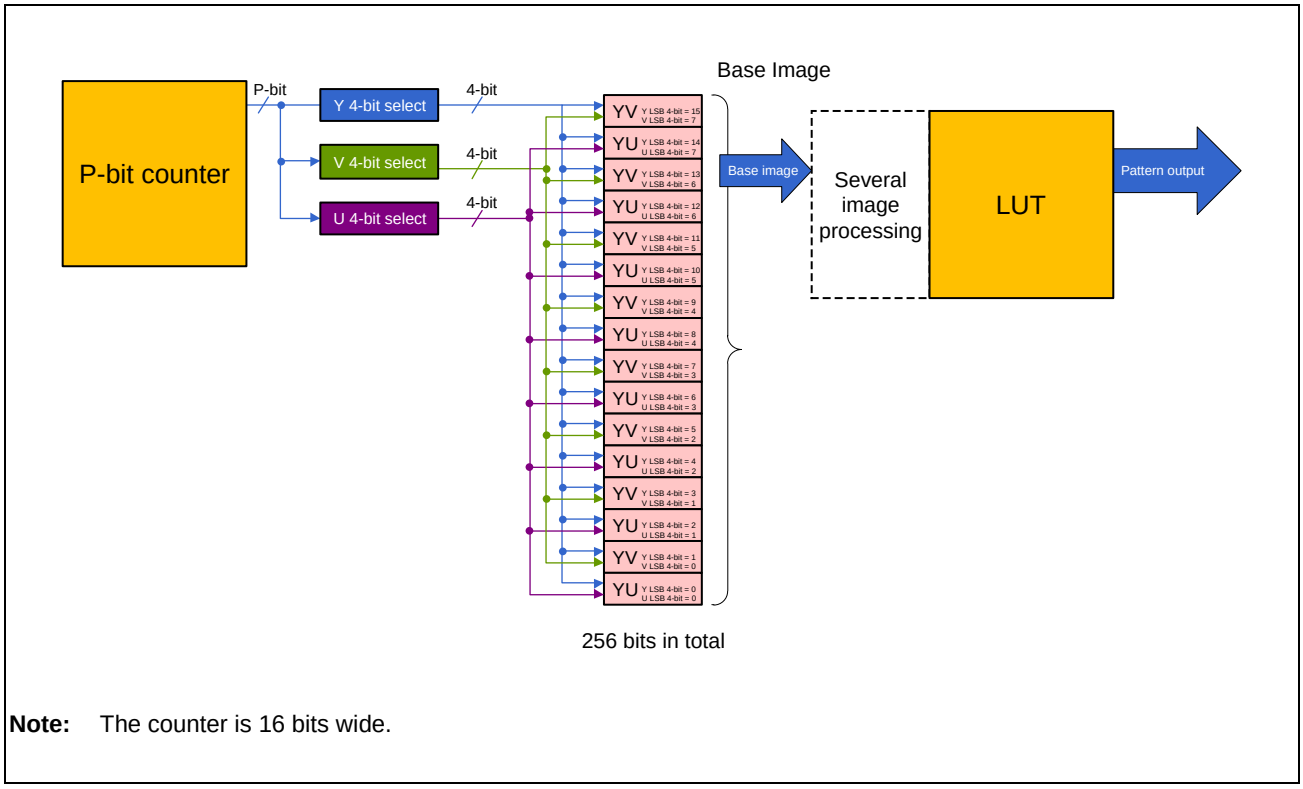
(3) Data Generation Circuit (in the Case of Pattern Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated as follows (other formats cannot be generated). The 16-bit Pbit counter is incremented in 18 + TIRATE[4:0] (cycles at 630 MHz). The bits of this Pbit counter are selected by the TIPTNV1[3:0], TIPTNU1[3:0], and TIPTNY1[3:0] bits, and then they are packed and sent as follows:



Note: The counter is 16 bits wide.

Figure 9.2-31 Data Generation Circuit (in the Case of Pattern Generation)

(4) Data Generation Circuit (in the Case of Monochrome Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated in monochrome as follows (other formats cannot be generated). The values set by the TIPTNV2[7:0], TIPTNU2[7:0], and TIPTNY2[7:0] bits are packed and sent as follows:

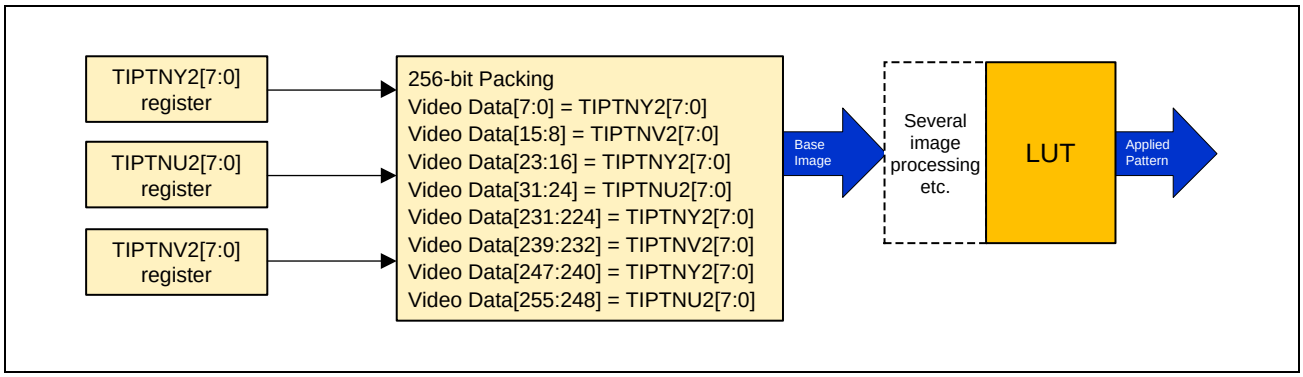


Figure 9.2-32 Data Generation Circuit (in the Case of Monochrome Generation)

(5) Generated Image Data Example (in the Case of Pattern Generation)

VGA (640 × 480): TIEN = 1b, TIMODE = 0b, TIPTNY1[3:0] = 0000b, TIPTNU1[3:0] = 0100b, TIPTNV1[3:0] = 1000b (Offset binary: ICnIPMC_C0/1/2/3.IBINSEL = 0b, ICnDMR.OBINSEL = 0b)

9.2.4.3.5 VC/Data Type Selector (for Image Processing)

Virtual channels from VC0 to VC15 are supported for video input data input from the MIPI CSI2 block. On the other hand, the number of channels which can be handed in image processing is up to four. This block handles assignment of the selected virtual channels (SVCs).

Only one data type can be handled by each SVC and the data types are selected in the ICnIPMC_C0 to 3.INF[5:0] registers.

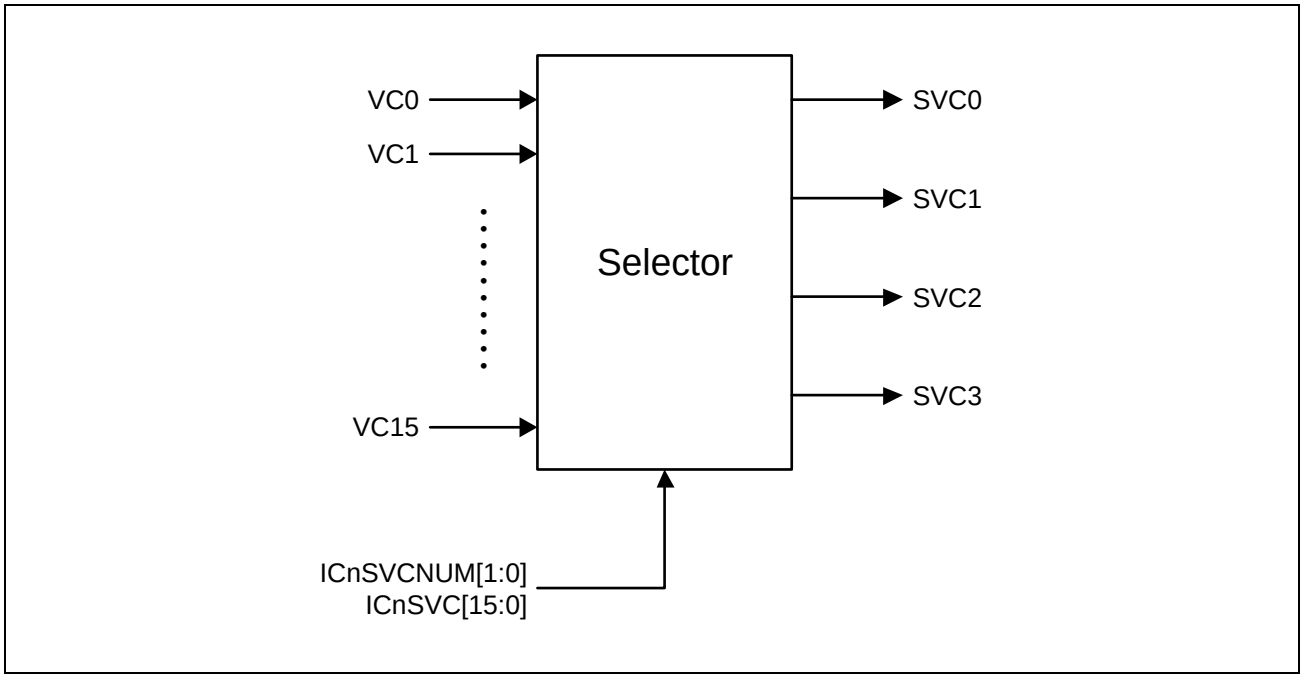

Figure 9.2-35 VC Selector Image

9.2.4.3.6 8-bit Expansion

(1) RGB444/RGB555/RGB565/RGB666 to RGB888

This block handles internal processing of RGB with 8 bits for each color. Inputs with fewer color bits are expanded to 8 bits. The conversion of inputs in the RGB444 and RGB555 and in the RGB565 and RGB666 formats to RGB888 is shown in **Table 9.2-19** and **Table 9.2-20**, respectively.

Table 9.2-19 RGB444/RGB555 to RGB888 Conversion

RGB444	RGB888
R[3:0]	{R[3:0],R[3:0]}
G[3:0]	{G[3:0],G[3:0]}
B[3:0]	{B[3:0],B[3:0]}

RGB555	RGB888
R[4:0]	{R[4:0],R[4:2]}
G[4:0]	{G[4:0],G[4:2]}
B[4:0]	{B[4:0],B[4:2]}

Table 9.2-20 RGB565/RGB666 to RGB888 Conversion

RGB565	RGB888
R[4:0]	{R[4:0],R[4:2]}
G[5:0]	{G[5:0],G[5:4]}
B[4:0]	{B[4:0],B[4:2]}

RGB666	RGB888
R[5:0]	{R[5:0],R[5:4]}
G[5:0]	{G[5:0],G[5:4]}
B[5:0]	{B[5:0],B[5:4]}

(2) RAW6/7 to RAW8

This block handles internal processing of RAW with 8 bits for each color. Inputs with fewer color bits are expanded to 8 bits. The conversion of inputs in the RAW6 and RAW7 formats to RGB888 is shown in **Table 9.2-21**.

Table 9.2-21 RAW6/7 to RAW8 Conversion

RAW6	RAW8
RAW[5:0]	{RAW[5:0],RAW[5:4]}

RAW7	RAW8
RAW[6:0]	{RAW[6:0],RAW[6]}

9.2.4.3.7 Image Clipping

Ranges for the clipping of input images are controlled by register settings. Specifically, the ranges of clipping for each SVC are set through the following register settings.

(Horizontal direction)

- Image clipping start pixel registers: ICnSPPrC_C0~3.SPPrC[12:0]
- Image clipping end pixel registers: ICnEPPrC_C0~3.EPPrC[12:0]

(Vertical direction)

- Image clipping start line registers: ICnSLPrC_C0~3.SLPrC[12:0]
- Image clipping end line registers: ICnELPrC_C0~3.ELPrC[12:0]

While the part of the image with the size after clipping (the gray part below) is being processed, the value of register ICnMS.AV0/1/2/3 = 1b. For the rest of the image, ICnMS.AV0/1/2/3 = 0b. When subsampling is done, operation proceeds in the same way for the subsampled images.

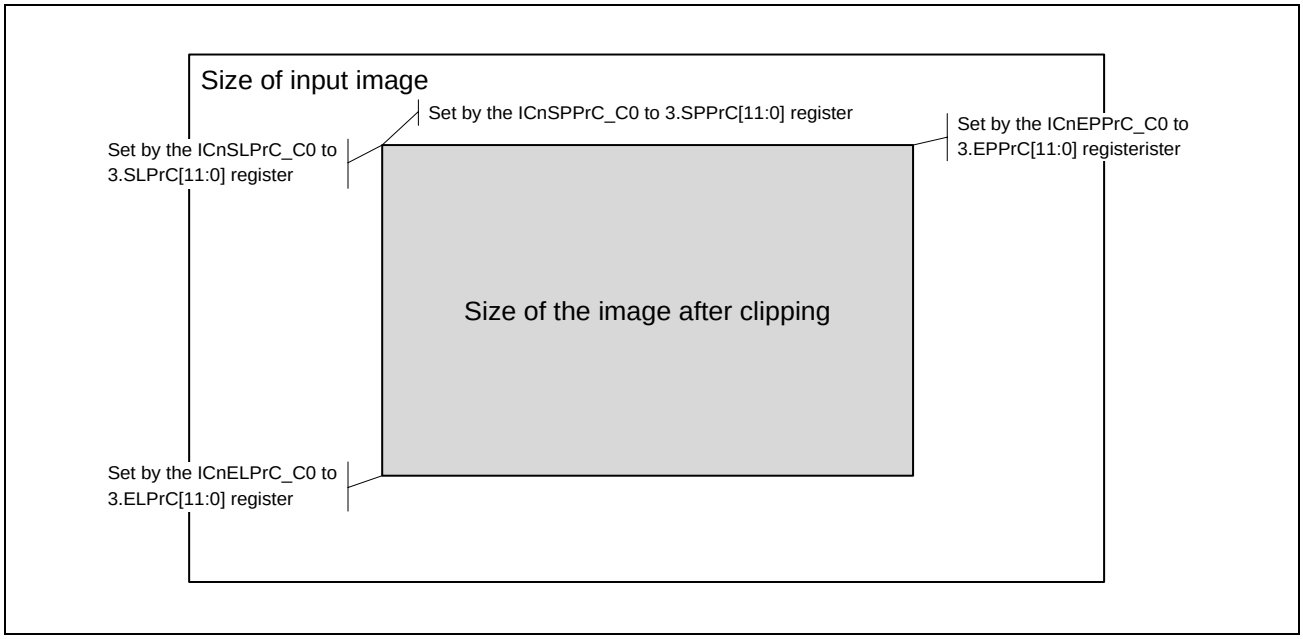

Figure 9.2-36 Image of Image Clipping

9.2.4.3.8 Frame Subsampling

Image frames are subsampled with the use of the registers which set input images. The settings of the following bit fields select the number of frames to be transferred in each round of transfer.

- Frame subsampling control register: ICnDEC.FRMDEC[3:0] (common to all SVCs)

Operation when the setting of ICnDEC.FRMDEC[3:0] = 2h is as follows:

Images are transferred in units of (the above register value + 1) frames. The state of ICnMS.CA0/1/2/3 is 1b when an image which is not to be eliminated by subsampling is being processed, as shown below.

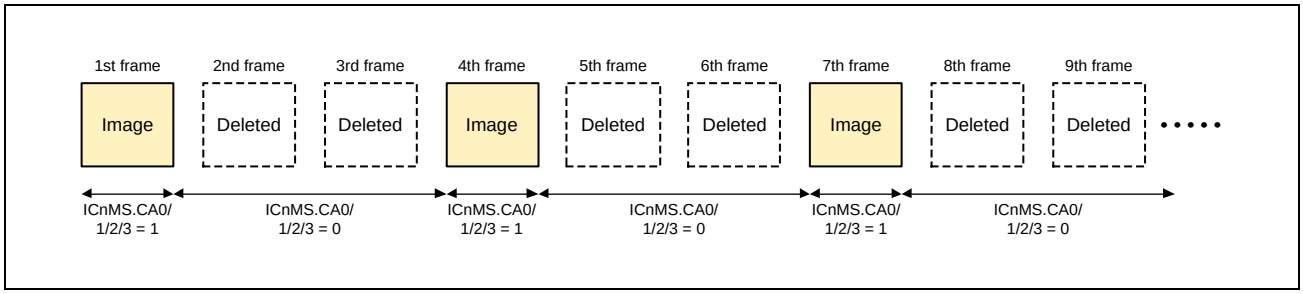

Figure 9.2-37 Frame Subsampling when ICnDEC.FRMDEC[3:0] = 2h

9.2.4.3.9 Data Arrangers 1 and 2

When image data are input and output, UV values expressed in negative form in YUV (YCbCr) data are converted. The data arranger 1 input side and data arranger 2 output side settings can be made by using the ICnDTVP.IBINSEL and ICnDMR.OBINSEL registers, respectively.

Settings for data arranger 1 must suit the specifications of the sensor. Data arranger 1 supports 8 or 10 bits depending on the number of bits of input data. Settings for data arranger 2 must suit the specifications of the destination for output. Data arranger 2 supports 8 bits depending on the output data. YUV of MIPI CSI-2 is usually used in offset binary. However, this depends on the sensor, and it may be output as two's complements. **Table 9.2-22** shows an example of processing when the input is 8 bits. Data arranger 1 also has 10-bit input, and when 10-bit input is used, it can be converted to 10-bit offset binary/2's complement as well as 8-bit.

Table 9.2-22 Input Formats and Corresponding Forms of Image Processing (at 8-bit input)

UV Value (Hex)	Offset Binary (Dec) Register Settings: Data Arranger 1: ICnDTVP.IBINSEL = 0b Data Arranger 2: ICnDMR. OBINSEL =0b	Two's Complements (Dec) Register Settings: Data Arranger 1: ICnDTVP.IBINSEL = 1b Data Arranger 2: ICnDMR. OBINSEL = 1b
FFh	127	−1
FEh	126	−2
…	…	…
81h	1	−127
80h	0	−128
7Fh	−1	127
…	…	…
01h	−127	1
00h	−128	0

9.2.4.3.10 Data Clipping

Data clipping is performed on the YUV (YCbCr) format. To make input data for RGB conversion compliant with the ITU-R BT.601 standard, whether or not to clip values less than or equal to 16 and greater than or equal to 240 in 8-bit encoding (or less than or equal to 64 and greater than or equal to 960 in 10-bit encoding) is specified. This setting is made by using the ICnDTVP.CLP[1:0] register.

9.2.4.3.11 Demosaicing

This function is only valid on input data of the RAW type. Its operation is on the assumption that the RAW data are Bayer data and generates pixel data that are interpolated from the RAW data.

The demosaicing function uses a bilinear method. Of the peripheral 3 × 3 pixels at the position to be calculated, 2 or 4 pixels are used for interpolation processing. The interpolation formula is given below.

The following describes the method of calculating the RGB components (R22, Gb22/Gr22, B22) of the pixels at the center position.

In the case of RAW10/12/14/16/20, the eight higher-order bits are used for the calculation.

(1) RAW20 to RAW16

For a RAW20 input, the higher-order bits of RAW20 are extracted and the lower-order bits are truncated in preprocessing for demosaicing and statistics.

RAW20 → RAW8 (RAW[19:4])

(2) Calculating the Gb22 data portion

Figure 9.2-38 shows the method of interpolation calculation for pixel data (R/G/B) of Gb22.

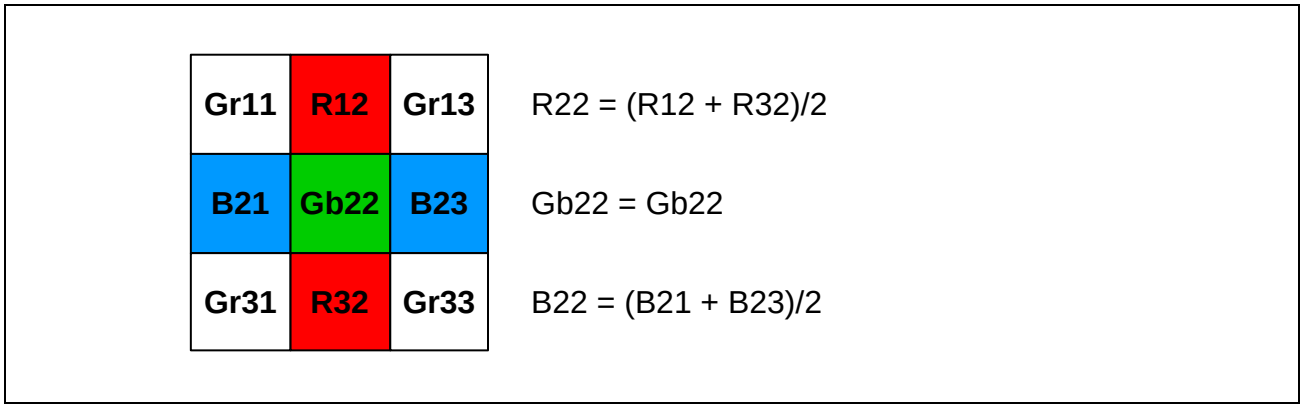

Figure 9.2-38 Calculation of the Gb22 Data Portion

(3) Calculating the B22 data portion

Figure 9.2-39 shows the method of interpolation calculation for pixel data (R/G/B) of B22.

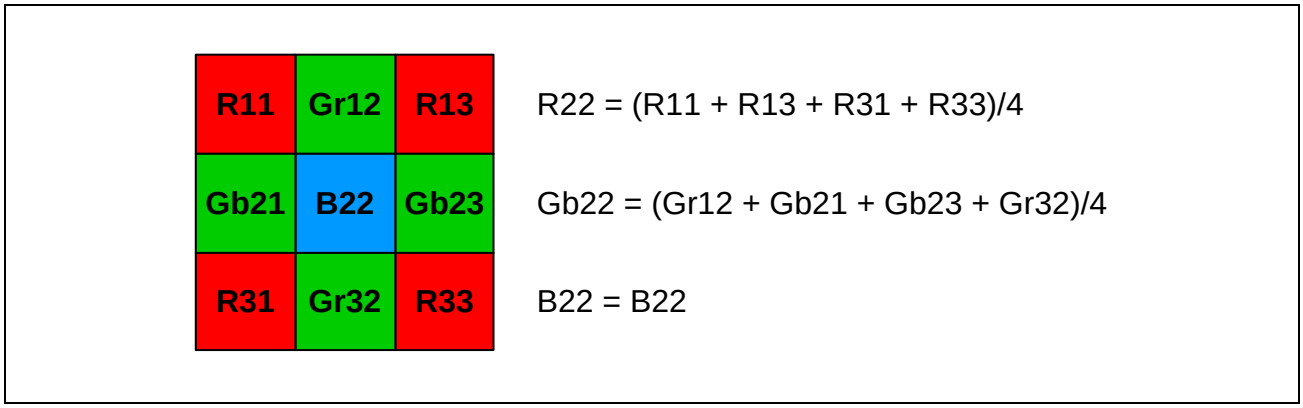

Figure 9.2-39 Calculation of the B22 Data Portion

(4) Calculating the R22 data portion

Figure 9.2-40 shows the method of interpolation calculation for pixel data (R/G/B) of R22.

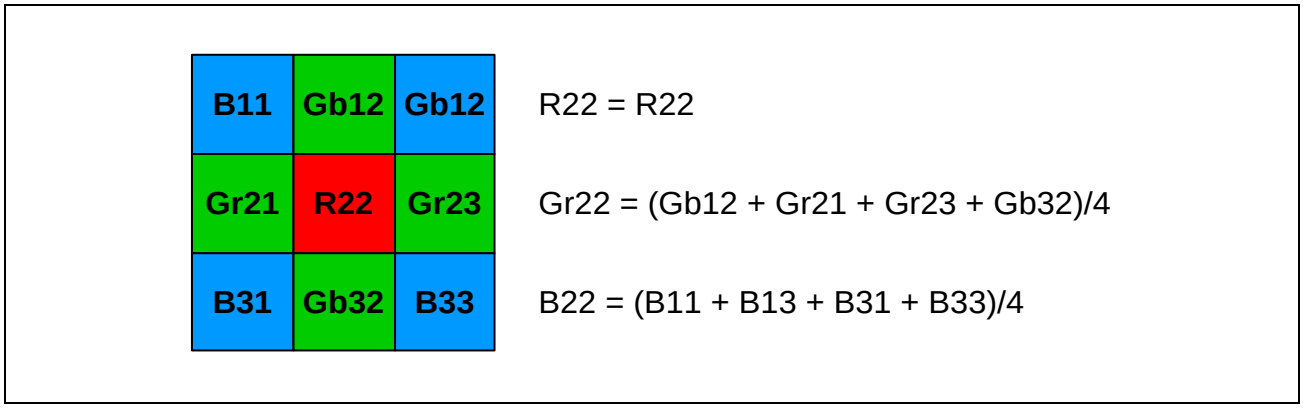

Figure 9.2-40 Calculation of the R22 Data Portion

(5) Calculating the Gr22 data portion

Figure 9.2-41 shows the method of interpolation calculation for pixel data (R/G/B) of G22.

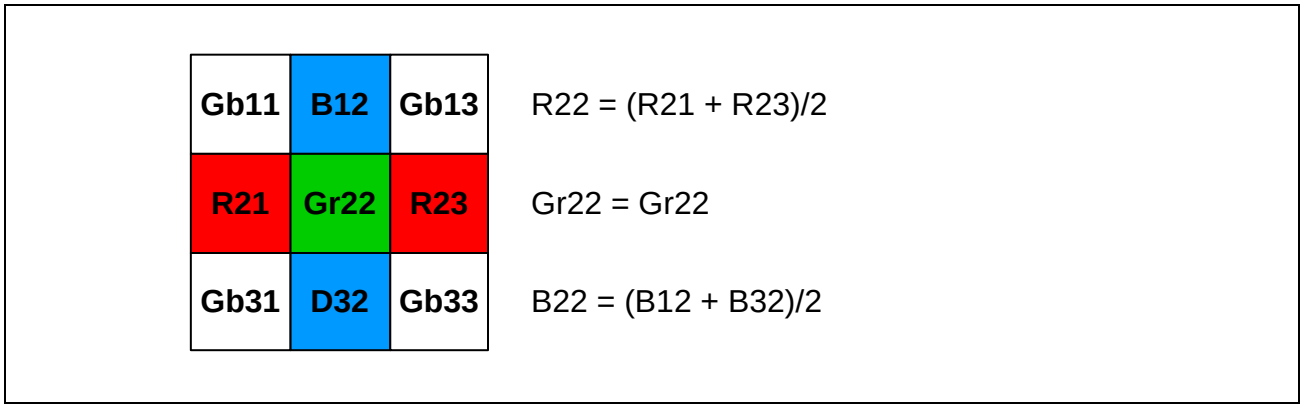

Figure 9.2-41 Calculation of the Gr22 Data Portion

9.2.4.3.12 Linear Matrix

Linear matrix processing involves calculation of the matrix of R', G', and B' (8 bits per color) by using the registers listed below to set the following coefficients for R, G, and B (8 bits per color) after demosaicing as the previous stage.

Gof = Register ICnLMXOF.GOF[7:0]
Rof = Register ICnLMXOF.ROF[7:0]
Bof= Register ICnLMXOF.BOF[7:0]

Rr = Register ICnLMXRC1.RR[12:0]
Rb = Register ICnLMXRC2.RB[12:0]
Rg = Register ICnLMXRC2.RG[12:0]

Gr = Register ICnLMXGC1.GR[12:0]
Gb = Register ICnLMXGC2.GB[12:0]
Gg = Register ICnLMXGC2.GG[12:0]

Br = Register ICnLMXBC1.BR[12:0]
Bb = Register ICnLMXBC2.BB[12:0]
Bg = Register ICnLMXBC2.BG[12:0]

$$R' = \frac{Rr \cdot (R + Rof)^{*1} + Rg \cdot (G + Gof)^{*1} + Rb \cdot (B + Bof)^{*1}}{1024}$$

$$G' = \frac{Gr \cdot (R + Rof)^{*1} + Gg \cdot (G + Gof)^{*1} + Gb \cdot (B + Bof)^{*1}}{1024}$$

$$B' = \frac{Br \cdot (R + Rof)^{*1} + Bg \cdot (G + Gof)^{*1} + Bb \cdot (B + Bof)^{*1}}{1024}$$

Note 1. When the result of addition is a negative value, it is converted to 0.

9.2.4.3.13 Color Space Conversion

(1) RGB to YCbCr

RGB (8/10 bits) data to which image clipping, frame subsampling, or demosaicing has been applied are expanded to 12 bits and then converted to 10-bit YCbCr. Calculations equivalent to those specified in ITU-R BT.601 or ITU-R BT.709 are performed by setting coefficients through registers.

The calculations proceed according to the coefficients and expressions set in the following registers.

YCLRP = Register ICnYCCR1.YCLRP[12:0]
YCLBP = Register ICnYCCR2.YCLBP[12:0]
YCLGP = Register ICnYCCR2.YCLGP[12:0]
YCLSFT = Register ICnYCCR3.YCLSFT[4:0]
YCLAP = Register ICnYCCR3.YCLAP[11:0]

CBCLRP = Register ICnCBCCR1.CBCLRP[12:0]
CBCLBP = Register ICnCBCCR2.CBCLBP[12:0]
CBCLGP = Register ICnCBCCR2.CBCLGP[12:0]
CBCLSFT = Register ICnCBCCR3.CBCLSFT[4:0]
CBCLAP = Register ICnCBCCR3.CBCLAP[11:0]

CRCLRP = Register ICnCRCCR1.CRCLRP[12:0]
CRCLBP = Register ICnCRCCR2.CRCLBP[12:0]
CRCLGP = Register ICnCRCCR2.CRCLGP[12:0]
CRCLSFT = Register ICnCRCCR3.CRCLSFT[4:0]
CRCLAP = Register ICnCRCCR3.CRCLAP[11:0]

$$Y = \left(\frac{YCLRP \times R + YCLGP \times G + YCLBP \times B}{2^{YCLSFT}}\right) + YCLAP$$

$$Cb = \left(\frac{CBCLRP \times R + CBCLGP \times G + CBCLBP \times B}{2^{CBCLSFT}}\right) + CBCLAP$$

$$Cr = \left(\frac{CRCLRP \times R + CRCLGP \times G + CRCLBP \times B}{2^{CRCLSFT}}\right) + CRCLAP$$

For ITU-R BT.601 (8 bits): (Same as the default values)

$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$
$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$
$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$

[Register settings]

YCLRP = 0107h
YCLBP = 0064h
YCLGP = 0204h
YCLSFT = 0Ah
YCLAP = 100h

CBCLRP = 1F68h
CBCLBP = 01C2h
CBCLGP = 1ED6h

CBCLSFT = 0Ah
CBCLAP = 800h

CRCLRP = 01C2h
CRCLBP = 1FB7h
CRCLGP = 1E87h
CRCLSFT = 0Ah
CRCLAP = 800h

(2) YCbCr to RGB

YCbCr (8/10 bits) data which have been arranged and clipped are expanded to 12 bits (by appending zeros as the lower-order bits) and then converted to 10-bit RGB. Calculations equivalent to those specified in ITU-R BT.601 or ITU-R BT.709 are performed by setting coefficients through registers.

The calculations proceed according to the coefficients and expressions set in the following registers.

YMUL = Register ICnCSCC1.YMUL[13:0]
YSUB = RegisterICnCSCC2.YSUB[11:0]
RCRMUL = Register ICnCSCC2.CSUB[11:0]
GCRMUL = Register ICnCSCC3.RCRMUL[13:0]
GCBMUL = Register ICnCSCC3.GCRMUL[13:0]
BCBMUL = Register ICnCSCC4.GCBMUL[13:0]
CSUB = Register ICnCSCC4.BCBMUL[13:0]

$$R = \frac{(YMUL \times (Y - YSUB)^{*1} + RCRMUL \times (Cr - CSUB)}{4096}$$

$$G = \frac{YMUL \times (Y - YSUB)^{*1} - GCRMUL \times (Cr - CSUB) - GCBMUL \times (Cb - CSUB)}{4096}$$

$$B = \frac{YMUL \times (Y - YSUB)^{*1} + BCBMUL \times (Cb - CSUB)}{4096}$$

Note 1. A negative value is rounded up to 0.

For ITU-R BT.601 (8 bits): (Same as the default values)

R = 1.164 × (Y − 16) + 1.596 × (Cr − 128)
G = 1.164 × (Y − 16) − 0.813 × (Cr − 128) − 0.392 × (Cb − 128)
B = 1.164 × (Y − 16) + 2.017 × (Cb − 128)

[Register settings]

YMUL = 129Fh
YSUB = 100h
RCRMUL = 1989h
GCRMUL = 0D02h
GCBMUL = 0645h
BCBMUL = 2045h
CSUB = 800h

9.2.4.3.14 LUT (Lookup Table)

This is used to convert 10-bit data after color space conversion (YCbCr to RGB or RGB to YCbCr) into 8-bit data.

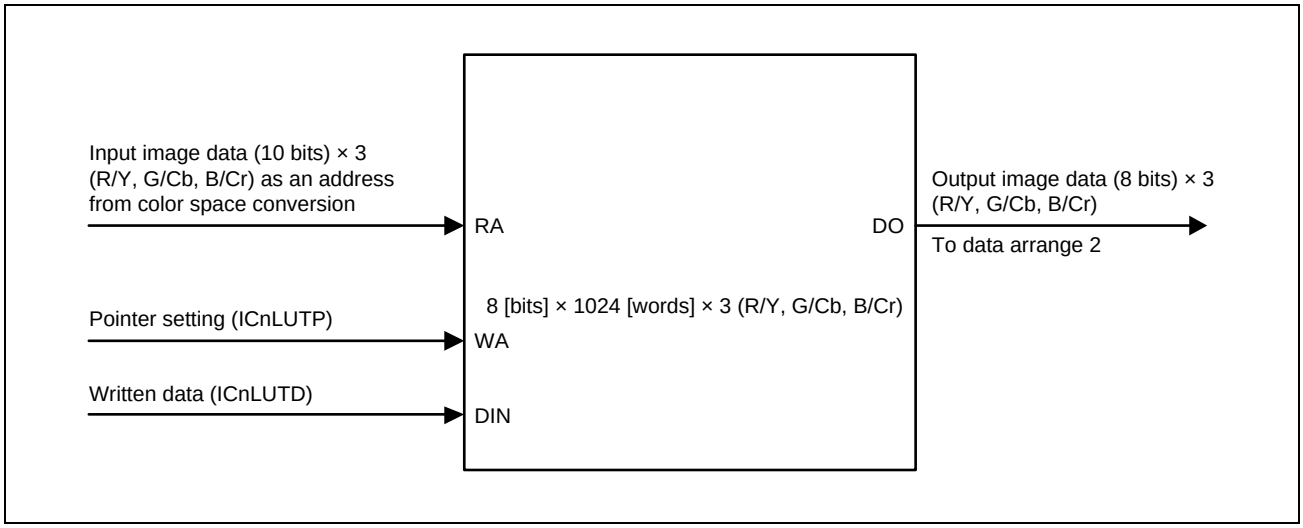

Figure 9.2-42 Lookup Table (LUT)

(1) Pointer Access

The pointer is incremented every time the ICnLUTD register is written.

The incremented value can be read from the ICnLUTP register. When the ICnLUTD register is read, the pointer is not incremented. The pointer must be set immediately before the register is read.

Follow the procedure below to access the lookup table. See **9.2.5.1 Starting Reception for the MIPI CSI-2 Input**.

The lookup table cannot be accessed from the CPU in normal mode.

(2) Usage Notes on LUT

1. Set the lookup table only after the CRU has stopped its operation.
2. Rewrite the entire lookup table before use because the initial values are not guaranteed after the power is turned on.
3. Data to be set in the lookup table must be restricted to the range that is compatible with the input bit width.

9.2.4.3.15 YC Post Processing

(1) YCbCr422 to 420

This function thins out the even-line CbCr data for the image processed in the previous stage and outputs only Y. Averaging or any other calculations are not performed. This conversion can be set by ICnDMR.YCMODE[2:0]=100b/101b/110b.

(2) Y/C Separation

This function separates the Y and C (CbCr) components for storage in two separate memory banks of the DRAM. For details, see **9.2.4.3.3 Transfer to DRAM**.

(3) Y Only

This function changes the method of storage in the DRAM. For details, see **9.2.4.3.3 Transfer to DRAM**.

9.2.4.3.16 VC/Data Type Selector (for Non-Image Processing)

When non-image processing is selected, set the target SVC and data types. When selecting the number of channels of SVC to be used, use the ICnSVCNUM.SVCNUM[1:0] register to set how many channels are used from among SVC0 to 3. Selection of SVCs with the ICnSVC.SVC0~3[3:0] registers determines the allocation of which channels are to be selected from among VC0 to VC15 for SVC0 to 3.

In data type selection, the required type can be selected with the ICnNIPDT_C0~3H/L registers and selection of several types is also possible (see **Figure 9.2-43**).

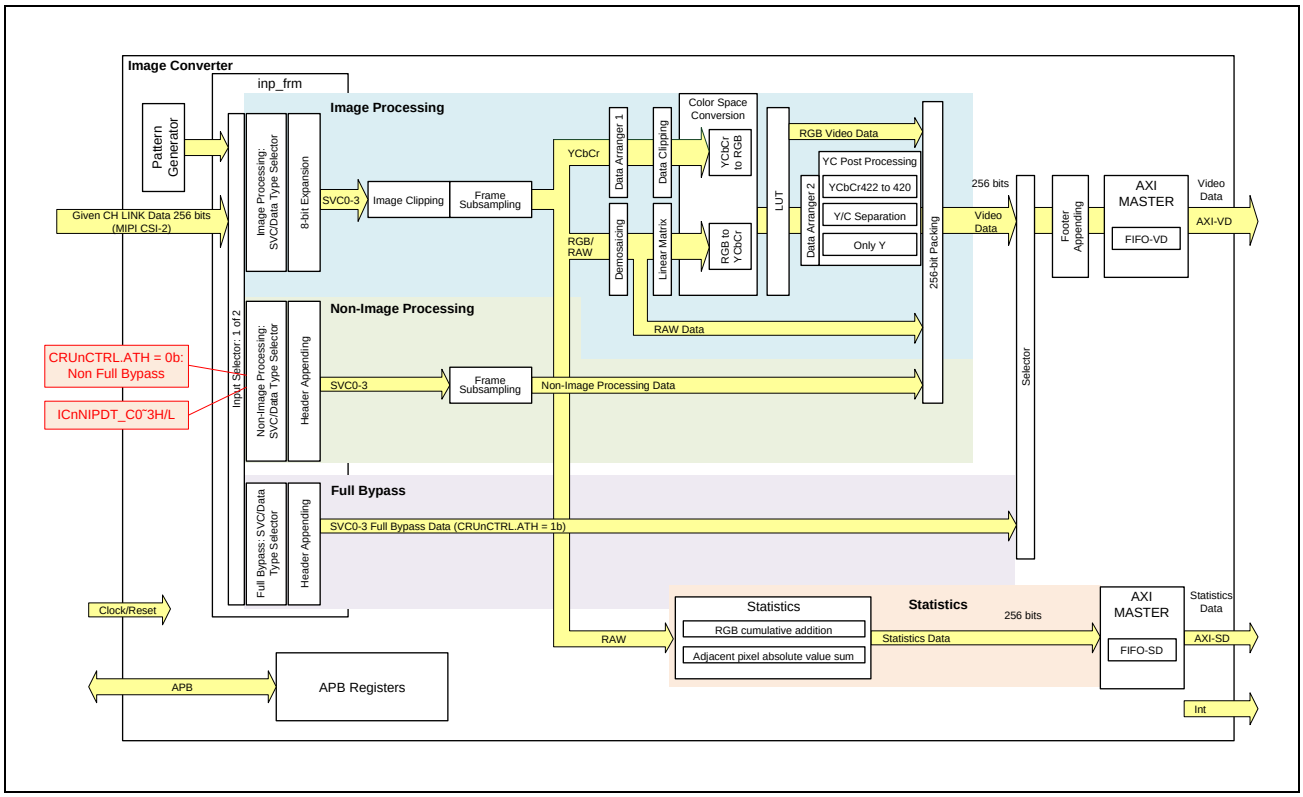

Figure 9.2-43 Example of VC Specification and Selection of Several Data Types for Non-Image Processing

9.2.4.3.17 Full Bypass function

Figure 9.2-44 shows an example of the settings for full bypass. These settings are used when you want to store images in memory without processing them within the CRU (for example, when you want to process images with the unit).

The full bypass function handles the transfer of data of the data type selected for the specified single VC from the video data bus to memory. Data are not corrected at all and are transferred in the recommended memory storage format for MIPI CSI-2.

The data types are not limited to one and several types can be selected by the settings of ICnNIPDT_C0~3H/L.

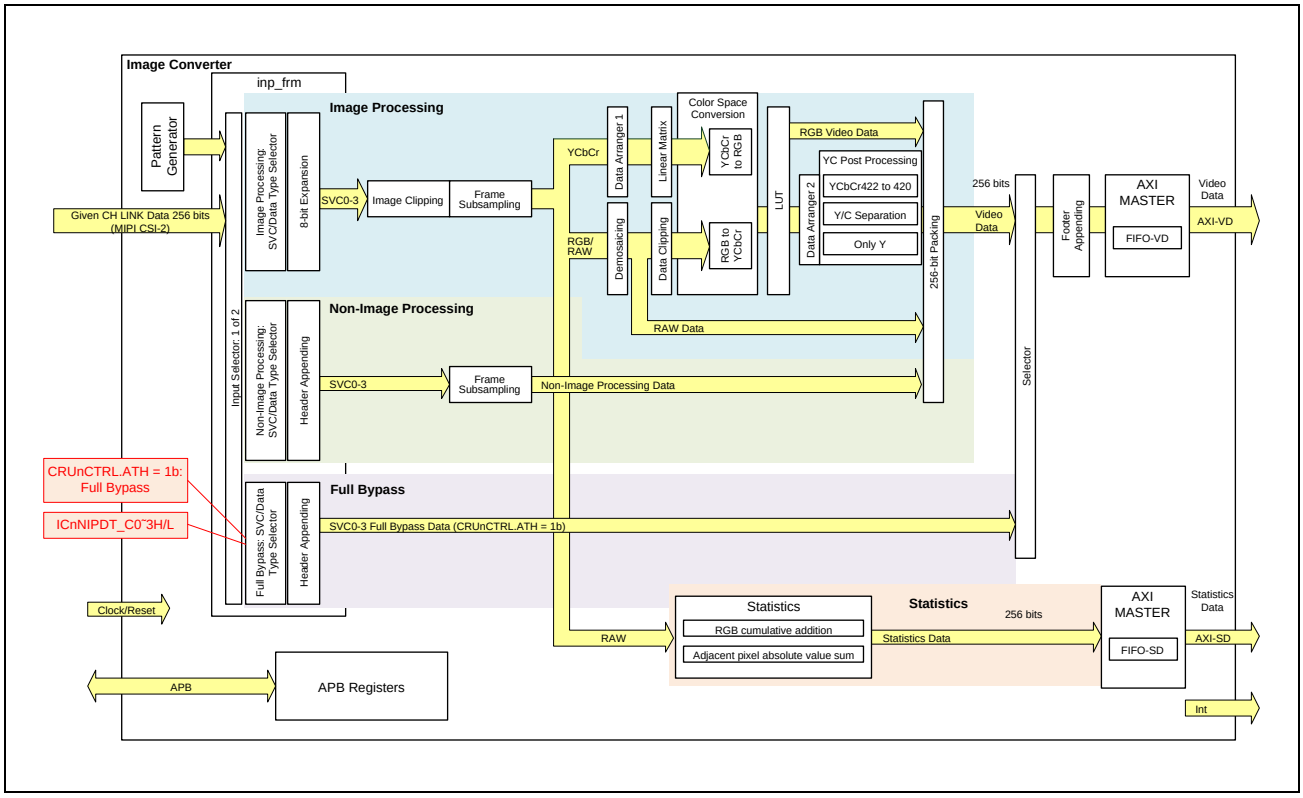

Figure 9.2-44 Example of Settings for Full Bypass

9.2.4.3.18 Statistics

This function is limited to a RAW data input through SVC0. This module divides one image vertically and horizontally into blocks (see **Figure 9.2-45**). The statistical information within this block is transferred to memory and the image is adjusted by weighting the information of every block by the CPU and providing feedback to the external video state.

The number of block divisions can be determined by the setting of register ICnSTIC1.STUNIT[1:0].

The statistical information of each block has two types and their respective purposes are as follows.

1) In-block accumulation

Accumulation of each color component, R, G, and B, is performed within each block.

On the CPU side, the weighting is applied per block based on the information from each block, and the obtained evaluation values can be used for exposure control, etc. from the next frame.

The weighting could in general be center-weighted allocation, weighted allocation according to the subject, and so on. If the subject is judged to be dark, exposure control is applied to widen the aperture, and if the subject is judged to be bright, the aperture is made narrower.

Additionally, each color component among the R, G, and B components is adjusted and the latter stage performs operations in such a way that the B component is reduced, for example, in video which appears bluish in white regions.

This adjustment of each color includes changing the coefficients of the sensor or the linear matrix as the latter stage.

2) In-block sum of absolute difference values

Focusing on the G component within the block, the overall value for the differences from the adjacent parts of the image is extracted and accumulation is performed within the block.

On the CPU side, the weighting is applied per block based on the information from each block, and the obtained evaluation values can be used for focus adjustment, etc. from the next frame.

The weighing could in general be center-weighted allocation, weighted allocation according to the subject, and so on. If the obtained evaluation value is compared with the previous frame and if the amount continues to be reduced, the evaluation value is increased to adjust the focus, for example, by adjusting the distance between the lens and the sensor toward the opposite direction.

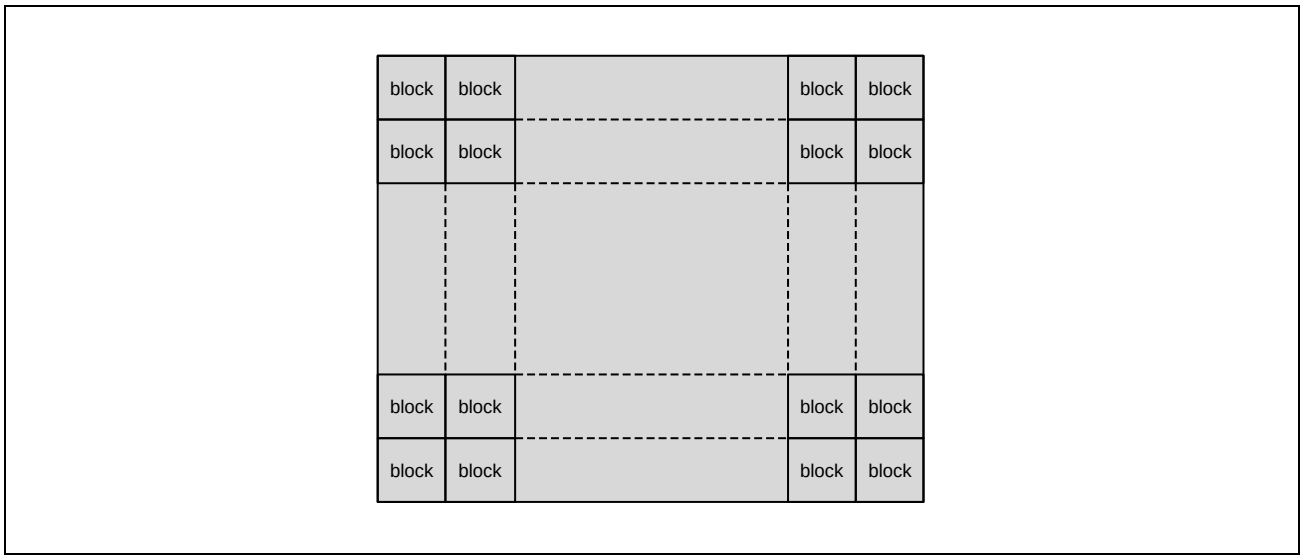

Figure 9.2-45 Image of Dividing an Image into Blocks Vertically and Horizontally

Figure 9.2-46 is a block diagram of statistics. The result of AE/AWB statistical calculations for per block is 8 bits × 3 = 3 bytes, respectively, and that of the AF statistical calculations is 1 byte for G only, so a total of 4 bytes of data are output.

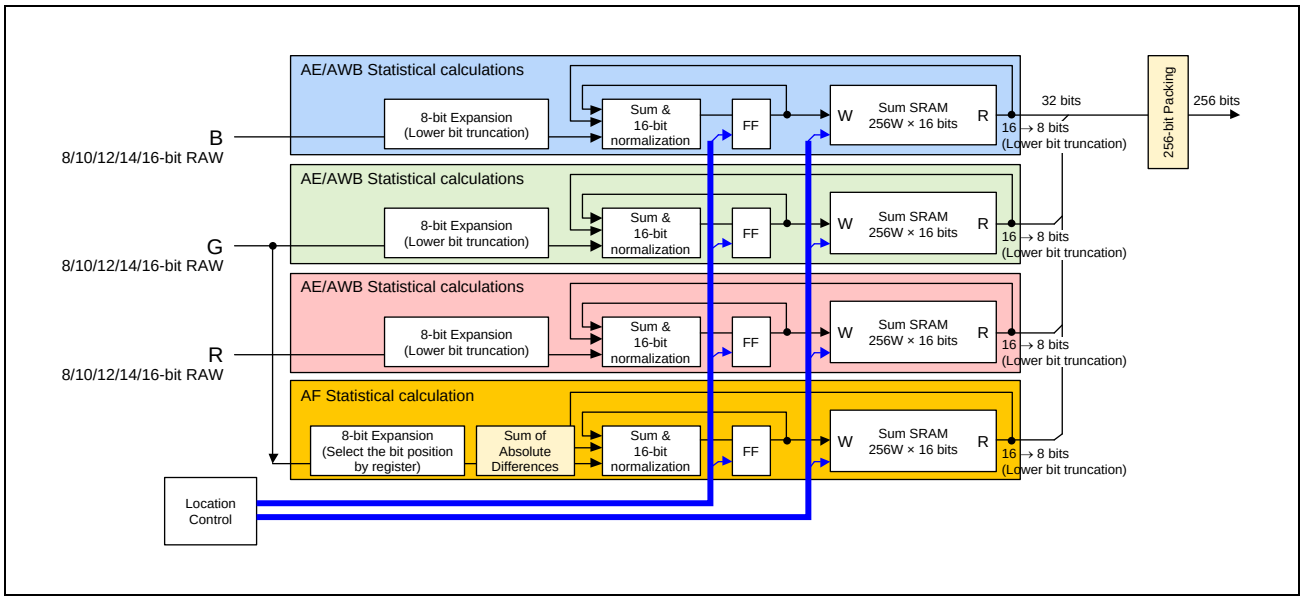

Figure 9.2-46 Statistics Block Diagram

(1) RGB cumulative addition

The STUNIT[1:0] bit fields in each of the ICnSTIC1 registers are used to select the pixel (block) sizes for statistical calculations from among four values, 16×16, 32×32, 64×64, and 128×128. The target pixels when the setting is 16×16 are described in **(a) Target pixels when the block size is selected as 16×16 (ICnSTIC1.STUNIT[1:0] = 0b)** and the methods of calculation for each block-size setting are described in **(b) Methods of calculation for each block-size setting**.

(a) Target pixels when the block size is selected as 16×16 (ICnSTIC1.STUNIT[1:0] = 0b)

G component: 128 pixels are present in the area of 16×16
R and B components: 32 pixels are present in the area of 16×16

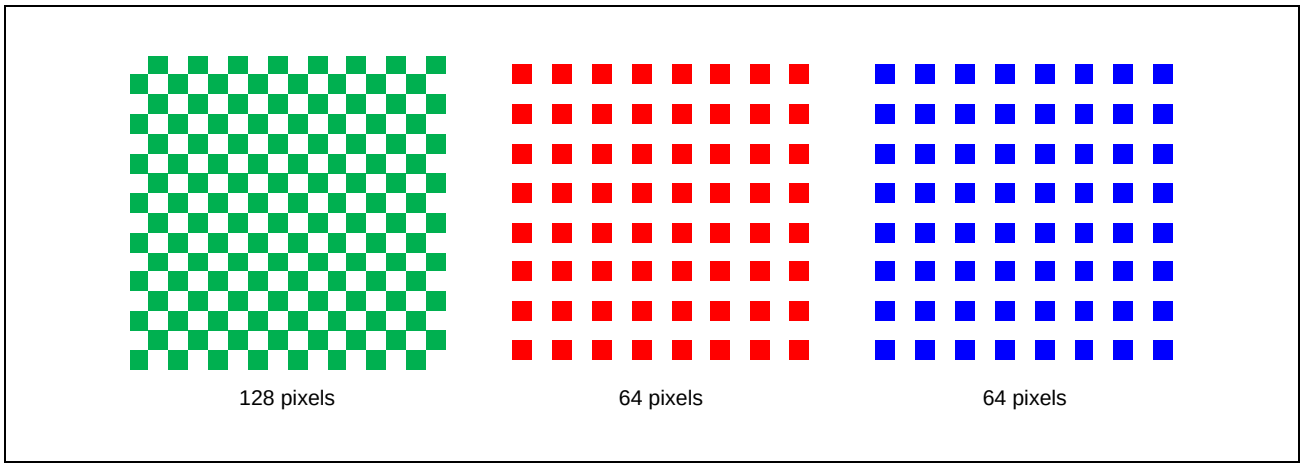

Figure 9.2-47 Target Pixels when the Block Size is Selected as 16×16

(b) Methods of calculation for each block-size setting

[G component]

- When the block size is 16×16: 8 bits × 128 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: 8 bits × 512 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: 8 bits × 2048 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 128×128: 8 bits × 8192 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

[R and B components]

- When the block size is 16×16: 8 bits × 64 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: 8 bits × 256 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: 8 bits × 1024 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 128×128: 8 bits × 4096 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

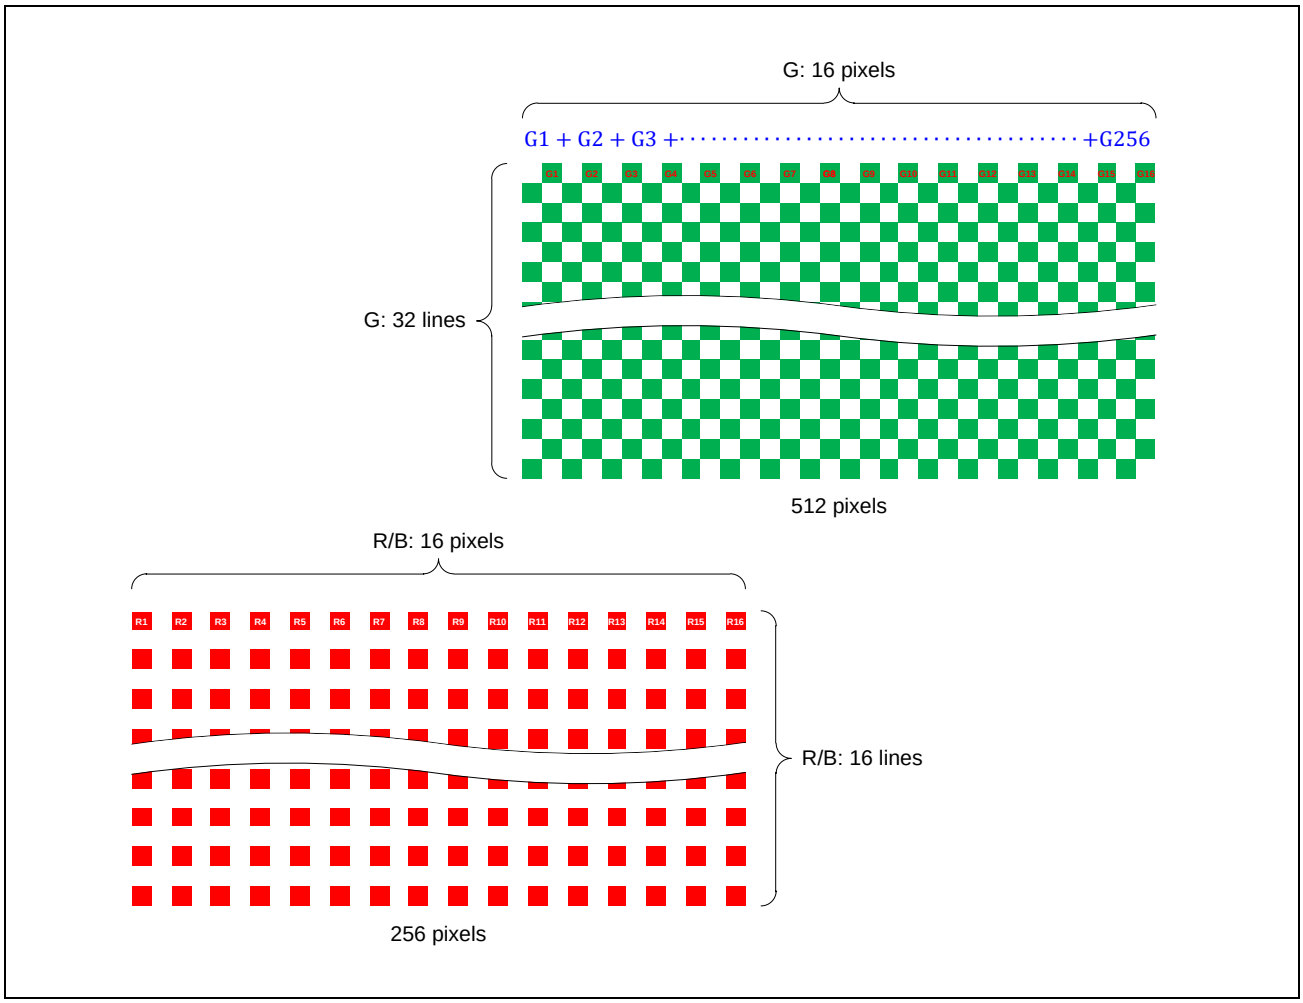

Figure 9.2-48 Illustration Diagram of Accumulation within the Block when the Block Size is 32×32

(2) Sum of absolute values for adjacent pixels

Set the area for which the sum of absolute values for adjacent pixels is taken with the use of register ICnSTIC1.STUNIT[1:0] to make the calculations in the following ways.

- **In the case of 16×16 pixel unit operations (ICnSTIC1.STUNIT[1:0] = 0b):**
  - For 8-bit data: Up to 16 bits
  - For 10- to 16-bit data: A sum-of-absolute-differences (SAD) operation is performed with the eight higher-order bits (default).
  - Addition can also be performed with the eight lower-order bits by shifting the bits by setting register ICnSTIC1.STSADPOS[3:0].

- **Methods of calculation for the setting area:**

[G component calculation]

- When the block size is 16×16: Adjacent differences × 112 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: Adjacent differences × 480 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: Adjacent differences × 1984 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 128×128: Adjacent differences × 8064 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

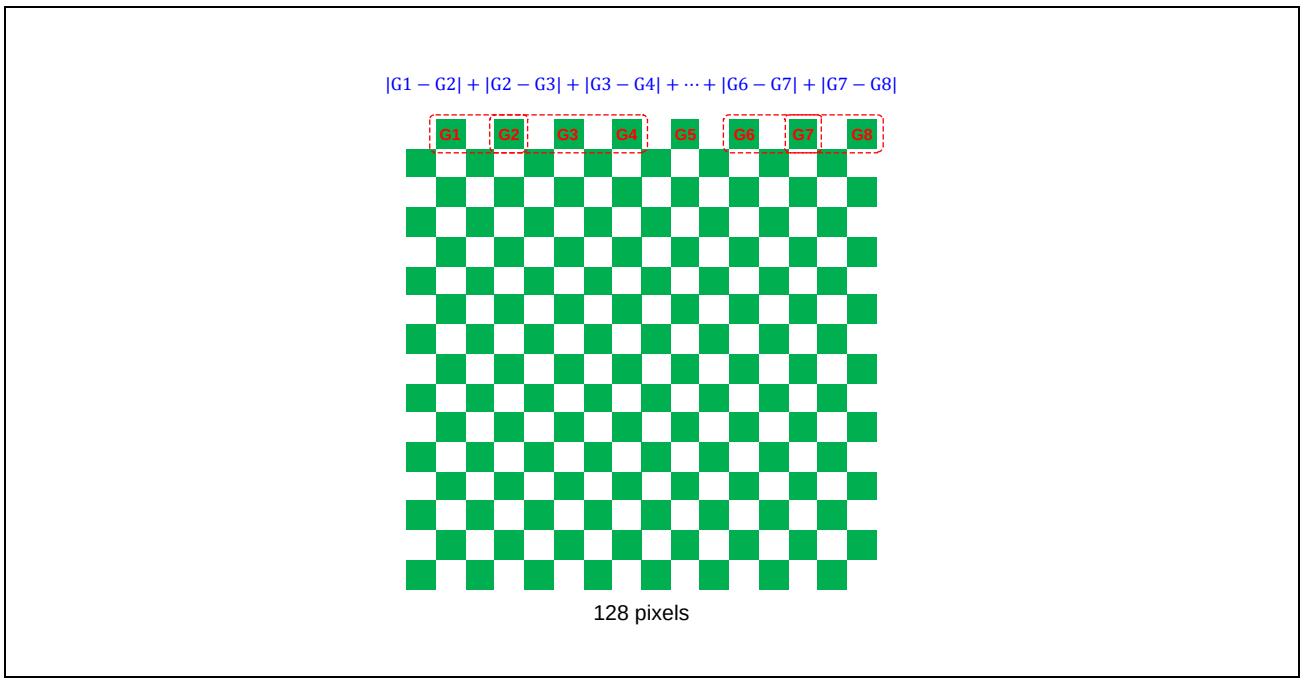

Figure 9.2-49 Illustration Diagram of Sum of Absolute Values for Adjacent Pixels when the Block Size is 16×16

(3) Statistics data generated image

The following describes the amounts of data in the operations when a 1920×1080 pixel area is set as 16×16 blocks and as 128×128 blocks for the statistics function. The numerals in the figures below represent the block numbers. In processing of the right end or bottom of the image, if the input image size is greater than the size specified as the number of blocks in the horizontal direction, that difference does not fall within the target range for arithmetic processing. This also applies in the vertical direction.

- **In the case of operations for a 1920×1080 pixel area as 16×16 blocks:**

As shown in **Figure 9.2-50**, the calculated values for each of the blocks are transferred sequentially. A total of 31 Kbytes of data are transferred for one frame. For the format of data for transmission, see **Table 9.2-15**.

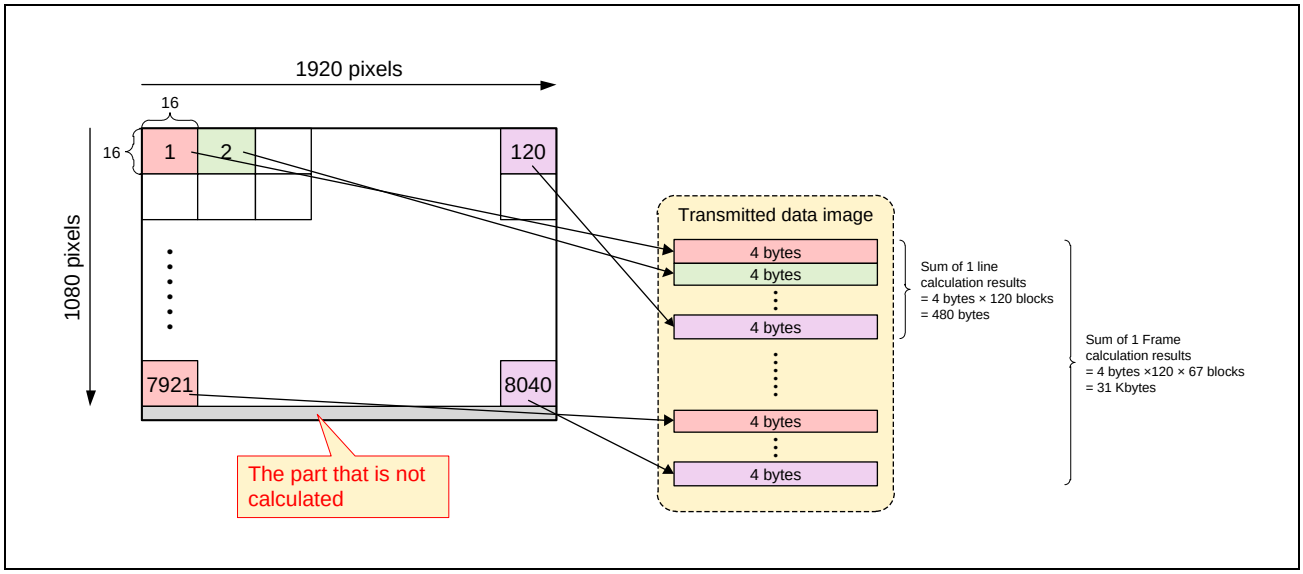

Figure 9.2-50 Illustration Diagram of the Amounts of Data in the Operations when a 1920×1080 Pixel Area is Set as 16×16 Blocks

● **In the case of operations for a 1920×1080 pixel area as 128×128 blocks:**

The calculated values for the corresponding blocks are sequentially transferred. A total of 480 bytes of data are transferred for one frame.

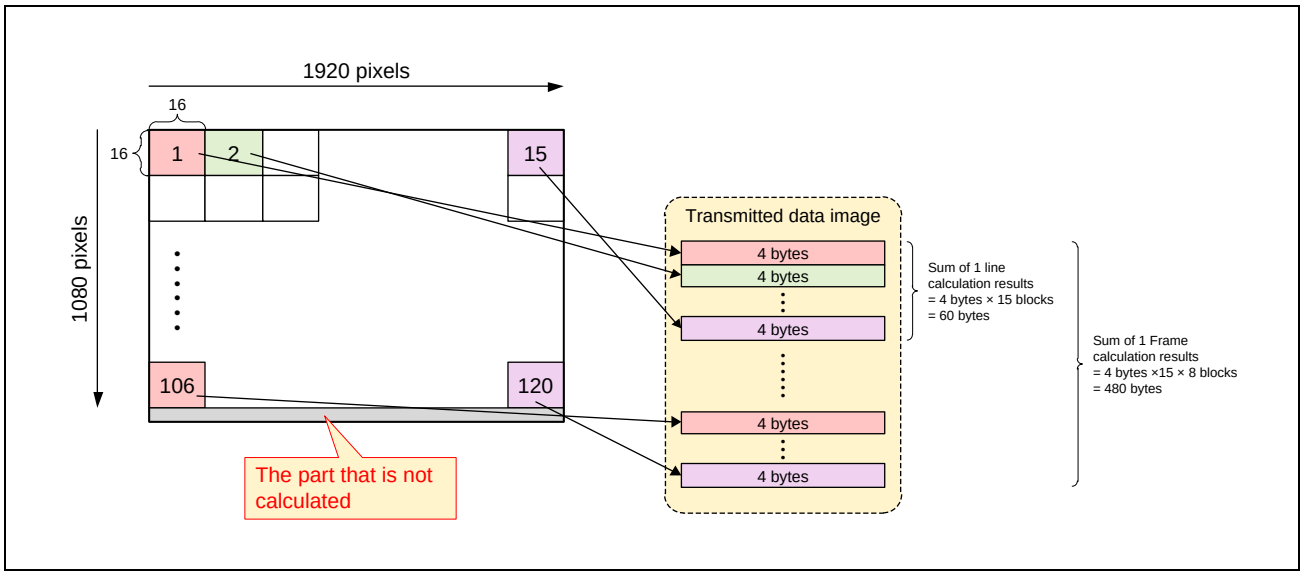

Figure 9.2-51 Illustration Diagram of the Amounts of Data in the Operations when a 1920×1080 Pixel Area is Set as 16×16 Blocks

Confirm the completion of transfer for one frame by setting the specified address interrupt described in **9.2.4.4.2 Designated address forwarding completion interrupt**.

9.2.4.4 Interrupts

9.2.4.4.1 Interrupt list

Table 9.2-23 lists the interrupt sources and registers, and the interrupt signals to the interrupt controller.

Table 9.2-23 Interrupt Sources and Registers, and Interrupt Signals (1/2) [n = 0]

Internal Signal Name	Kind	Item	Interrupt Source Status/Clear	Interrupt Enable Register Field	Generated Blocks	Conditions for Occurrence
axi_mst_err_int*4	Level	FIFO-VD overflow (video data) (for debugging)	CRUnINTS1.FOS	CRUnIE1.FOE	FIFO-VD	When Video data FIFO-VD overflows.
		SLVERR error (video data)	CRUnINTS1.SLVES	CRUnIE1.SLVEE	AXI-VD	When Video Data AXI-VD SLVERR error occurs.
		DECERR error (video data)	CRUnINTS1.DECES	CRUnIE1.DECEE	AXI-VD	When Video Data AXI-VD SLVERR error occurs.
		FIFO-SD overflow*1 (statistics data) (for debugging)	CRUnINTS1.SDFOS	CRUnIE1.SDFOE	FIFO-SD	When Statistics Data FIFO-SD overflows.
		SLVERR error*1 (statistics data)	CRUnINTS1.SDSLVES	CRUnIE1.SDSLVEE	AXI-SD	When the SLVERR error of Statistics Data AXI-SD occurs.
		DECERR error*1 (statistics data)	CRUnINTS1.SDDECES	CRUnIE1.SDDECEE	AXI-SD	When the Statistics Data AXI-SD DECERR error.
image_conv_int*2	Level	SVC0 frame start	CRUnINTS2.FS0S	CRUnIE2.FS0E	Image Clipping	When SVC0 frame starts.*3
	Level	SVC0 frame end	CRUnINTS2.FE0S	CRUnIE2.FE0E	Image Clipping	When SVC0 frame ends.*3
	Level	SVC0 scan line	CRUnINTS2.SL0S	CRUnIE2.SL0E	Image Clipping	When the SVC0 register (ICnSI_C0.SI[11:0]) matches the set number of lines.*3
	Level	SVC1 frame start	CRUnINTS2.FS1S	CRUnIE2.FS1E	Image Clipping	When SVC1 frame starts.*3
	Level	SVC1 frame end	CRUnINTS2.FE1S	CRUnIE2.FE1E	Image Clipping	When SVC1 frame ends.*3
	Level	SVC1 scan line	CRUnINTS2.SL1S	CRUnIE2.SL1E	Image Clipping	When the SVC1 register (ICnSI_C1.SI[11:0]) matches the set number of lines.*3
	Level	SVC2 frame start	CRUnINTS2.FS2S	CRUnIE2.FS2E	Image Clipping	When SVC2 frame starts.*3
	Level	SVC2 frame end	CRUnINTS2.FE2S	CRUnIE2.FE2E	Image Clipping	When SVC2 frame ends.*3
	Level	SVC2 scan line	CRUnINTS2.SL2S	CRUnIE2.SL2E	Image Clipping	When the SVC2 register (ICnSI_C2.SI[11:0]) matches the set number of lines.*3
	Level	SVC3 frame start	CRUnINTS2.FS3S	CRUnIE2.FS3E	Image Clipping	When SVC3 frame starts.*3
	Level	SVC3 frame end	CRUnINTS2.FE3S	CRUnIE2.FE3E	Image Clipping	When SVC3 frame ends.*3
	Level	SVC3 scan line	CRUnINTS2.SL3S	CRUnIE2.SL3E	Image Clipping	When the SVC3 register (ICnSI_C3.SI[11:0]) matches the set number of lines.*3
cru_vd_addr_wend	Edge	Specified address 0 write completed (video data)	—	CRUnIE2.VDADR0WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 0 Higher/Lower Register (AMnIVT0ADDRH/L) address is completed.
cru_sd_addr_wend	Edge	Specified address 0 write completed*1 (statistics data)	—	CRUnIE2.SDADR0WE	AXI-SD	When AXI-SD bus write to the AXI-SD Bus Transfer Completion Event Address 0 Higher/Lower Register (AMnSDIVT0ADDRH/L) address is completed.

Table 9.2-23 Interrupt Sources and Registers, and Interrupt Signals (2/2) [n = 0]

Internal Signal Name	Kind	Item	Interrupt Factor Status/Clear	Interrupt Enable Register Field	Generation Blocks	Conditions of Occurrence
cru_vsd_addr_wend	Level	Specified address 1 write completed (video data)	CRUnINTS2. VDADR1WS	CRUnIE2.VDADR1WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 1 Higher/Lower Register (AMnIVT1ADDRH/L) address is completed.
		Specified address 2 write completed (video data)	CRUnINTS2. VDADR2WS	CRUnIE2.VDADR2WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 2 Higher/Lower Register (AMnIVT2ADDRH/L) address is completed.
		Specified address 3 write completed (video data)	CRUnINTS2. VDADR3WS	CRUnIE2.VDADR3WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 3 Higher/Lower Register (AMnIVT3ADDRH/L) address is completed.
		Specified address 4 write completed (video data)	CRUnINTS2. VDADR4WS	CRUnIE2.VDADR4WE	AXI-VD	When AXI-VD bus write to the AXI-VD Bus Transfer Completion Event Address 4 Higher/Lower Register (AMnIVT4ADDRH/L) address is completed.
		Specified address 1 write completed*1 (statistics data)	CRUnINTS2. SDADR1WS	CRUnIE2.SDADR1WE	AXI-SD	When AXI-SD bus write to the AXI-SD Bus Transfer Completion Event Address 1 Higher/Lower Register (AMnISDIVT1ADDRH/L) address is completed.

Note 1. An interrupt from SVC is detected in image processing. It is not detected in non-image processing/full bypass.

Note 2. The ICnINTCTRL.DECINT register allows you to set whether or not interrupts are issued for subsampled frames.

Note 3. If an error interrupt occurs, a reset is required after the CRU has been stopped.

9.2.4.4.2 Designated address forwarding completion interrupt

This interrupt function is used to notify the CPU of the timing of fetching video and statistics data by using an interrupt.

Set the desired addresses in the DRAM as the destinations for data transfer by using the AMnIVT0/1/2/3/4ADDRH/L (for video data) and AMnSDIVT0ADDRH/L (for statistics data) registers. Up to four addresses can be set for video data and up to two addresses can be set for statistics data. These must be set according to the number of memory banks and the speed of reading by the CPU. An interrupt is generated upon the completion of writing to the address set by the AXI master (AXI-VD, AXI-SD).

Figure 9.2-52 shows an example when the number of memory banks is 4 for video data and the last addresses of memory banks 2 and 4 are set as the completion addresses.

The CPU reads data from the initial data in bank 1 in response to the first interrupt as a trigger and then reads up to the end of bank 2. When the next interrupt arrives, the CPU reads data from the initial data in bank 3 and then reads up to the end of bank 4. This is thereafter repeated and consecutive data can thus be read.

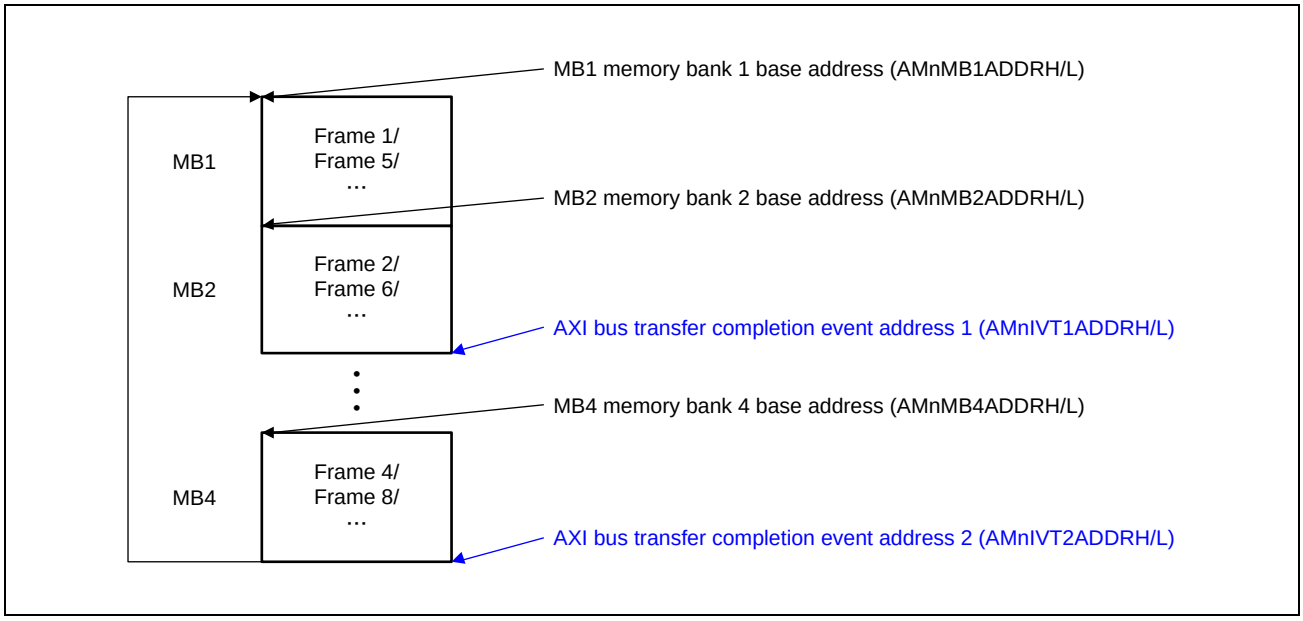

Figure 9.2-52 Example when the Number of Memory Banks is 4 for Video Data and the Last Addresses of Memory Banks 2 and 4 are Set as the Completion Addresses

9.2.4.5 Usage Notes

Use of this CRU requires caution on the following points.

(1) The following functions can only be used with SVC0 (that is, they cannot be used with SVC1 to SVC3).
- Demosaicing
- Statistics
- Changing the frame synchronization

(2) The same data (the same data type for the same VC) cannot be set for image processing and non-image processing. For example, making the following register settings is prohibited.

(Case1) This is an example of setting the same VC data type in Image Process to SVC0 and SVC1.
- SVC0: VC0, YUV422 8-bit: ICnSVC.SVC0[3:0] = 0h, ICnIPMC_C0.INF[5:0] = 1Eh
- SVC1: VC0, YUV422 8-bit: ICnSVC.SVC1[3:0] = 0h, ICnIPMC_C1.INF[5:0] = 1Eh

(Case2) This is an example of setting the same VC data type in Non Image Process to SVC0 and SVC1.
- SVC0: VC0, YUV422 8-bit: ICnSVC.SVC0[3:0] = 0h, ICnNIPDT_C0L.INF[5:0] =1b
- SVC1: VC0, YUV422 8-bit: ICnSVC.SVC1[3:0] = 0h, ICnNIPDT_C1L.INF[5:0] = 1b

(Case3) This is an example of setting the same VC data type in Image Process and Non Image Process on the same SVC0.
- SVC0: VC0, YUV422 8-bit: ICnSVC.SVC0[3:0] = 0h, ICnIPMC_C0.INF[5:0] = 1Eh
- SVC1: VC0, YUV422 8-bit: ICnNIPDT_C0L[30]=1b

(3) Interlacing is not supported.

(4) The timing for periodic deskewing calibration for the DPHY is 2^13 to 10 µs. Be sure to use a sensor that conforms to this specification.

(5) When FIFO-VD and FIFO-SD are in use, make sure that they do not overflow. In the event that an overflow occurs during operation with footers appended, the footer value following the overflow is not guaranteed. In such cases, reset the CRU after it has been stopped.

(6) An interrupt will not occur unless the addresses that are set for the specified address 0 to 4 write completed interrupt are set as addresses to which video or statistics data are to be written, so take care on this point. For example, an interrupt will not occur if video or statistics data are not written to the address which has been set for the specified address 0 to 4 write completed interrupt and the address jumps to the start of the next line due to the image-stride setting.

(7) For the order of the startup of the sensor and CRU, be sure to initialize the CRU before sending data from the sensor, as stated in **9.2.5.1 Starting Reception for the MIPI CSI-2 Input**. If this order is not observed, the CRU may receive incomplete packets of MIPI CSI-2 signals and various errors may occur.

(8) Parameter setting of the SVCs are as follows.

Table 9.2-24 Parameter Setting of the SVCs

Function	SVC0	SVC1	SVC2	SVC3	Note
Image Clipping	(A)	(A)	(A)	(A)	—
Frame Subsampling	(B)	(B)	(B)	(B)	—
Data Arrange 1/2	(B)	(B)	(B)	(B)	—
Data Clip	(B)	(B)	(B)	(B)	—
Color Space Conversion	(B)	(B)	(B)	(B)	—
Demosaic	(C)	(D)	(D)	(D)	When any of the Demosaic, Linear Matrix, and Statistic functions are used, SVC1 to SVC3 cannot be used for other functions.
Linear Matrix	(C)	(D)	(D)	(D)	
Statistics	(C)	(D)	(D)	(D)	
LUT	(B)	(B)	(B)	(B)	—
YCbCr422 to a420	(A)	(A)	(A)	(A)	—
Y/C Separation	(A)	(A)	(A)	(A)	—
Only Y	(A)	(A)	(A)	(A)	—

Note: (A): Can be set independently of other SVCs
(B): Parameter setting common to SVC0 to SVC3
(C): Functions only with SVC0
(D): Cannot be set

(9) Image Stride when output format is YUV420
Note that when the output format is set to YUV420 (ICnDMR.YCMODE[2:0] = 110b), the U/V side is written to RAM as Image Stride (AMnIS) × 2.
See **Image Stride** in **9.2.4.3.3(5)(a) Video data frame** for details.

9.2.5.3 Frame Synchronization Settings

While the CRU is receiving data using SVC0, the following registers can only be changed with frame synchronization:

- ICnSVC.SVC0[3:0]
- ICnIPMC_C0.STITHR
- ICnNIPDT_C0L
- ICnNIPDT_C0H
- ICnSLPrC_C0
- ICnELPrC_C0
- ICnSPPrC_C0
- ICnEPPrC_C0
- ICnSI_C0
- ICnLMXOF
- ICnLMXRC1
- ICnLMXRC2
- ICnLMXGC1
- ICnLMXGC2
- ICnLMXBC1
- ICnLMXBC2
- ICnSTIC1

9.2.5.3.1 Changing Frame Synchronization Settings (by Setting Registers)

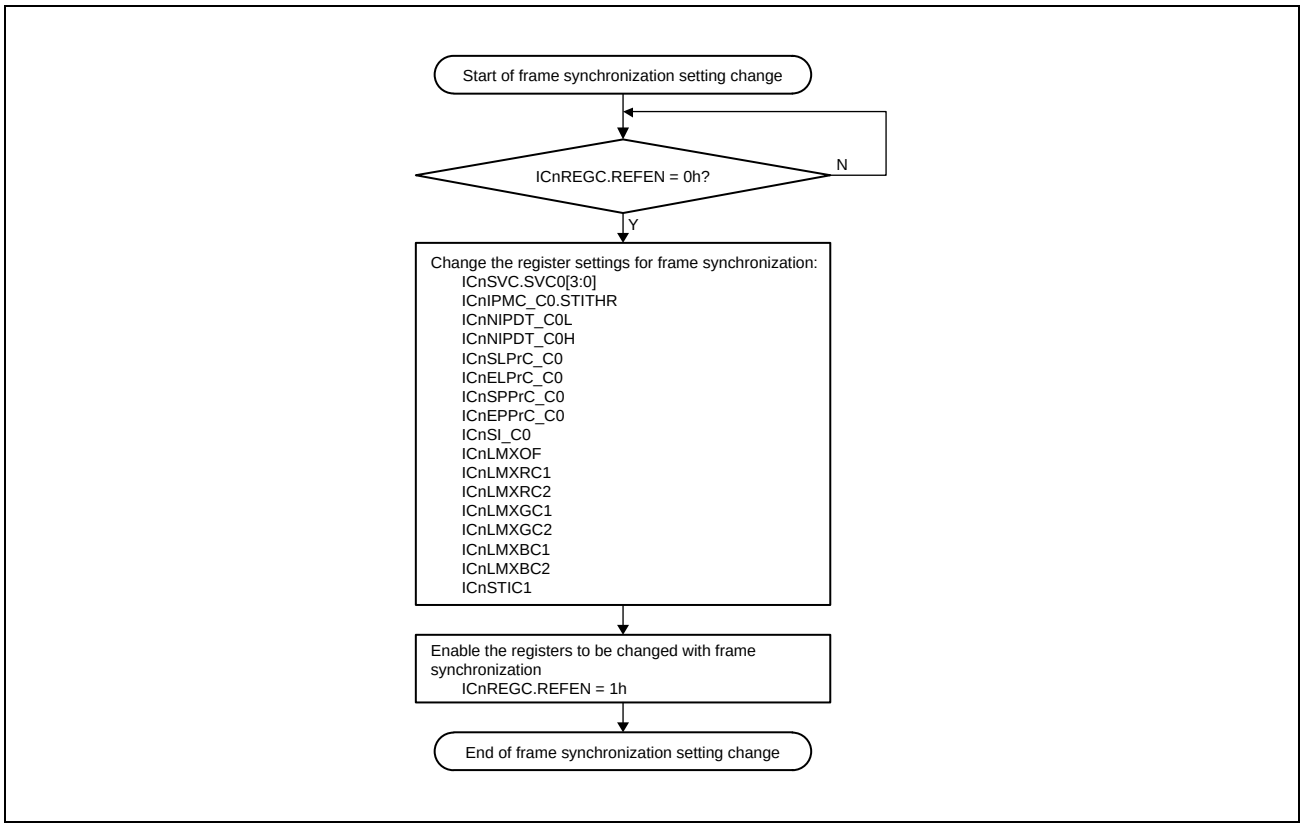

Figure 9.2-63 Flow for Changing the Frame Synchronization Settings (by Setting Registers)

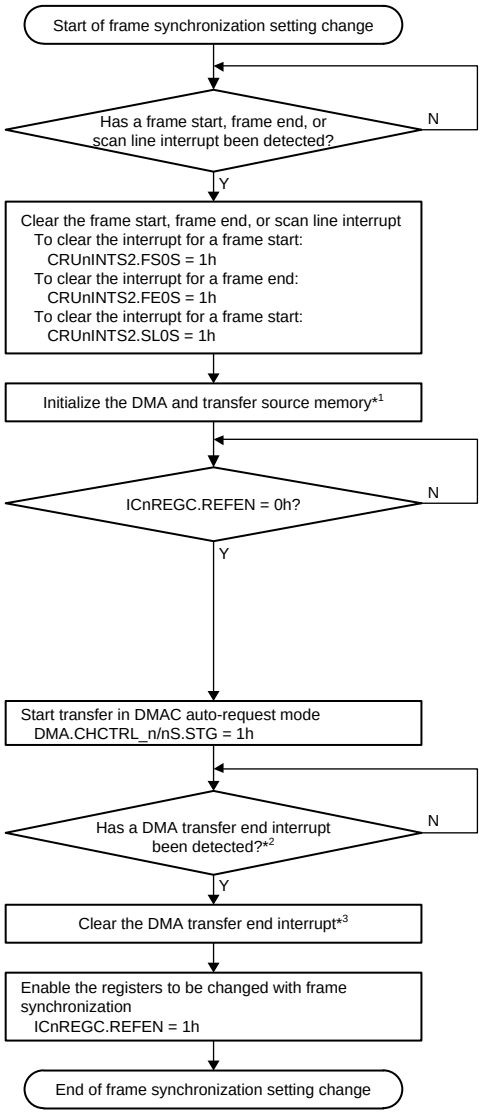
9.2.5.3.2 Changing Frame Synchronization Settings (by Using the DMAC)



NOTES:

1. This flow for changing the frame synchronization settings is only valid for the MIPI CSI-2 input. It cannot be used for the parallel input.
2. In the initial settings when the CRU starts, interrupts for a frame start, frame end and scan line must be set.

   To set an interrupt for a frame start:
   CRUnIE2.FS0E = 1h

   To set an interrupt for a frame end:
   CRUnIE2.FE0E = 1h

   To set an interrupt for a frame start:
   CRUnIE2.SL0E = 1h

   In addition, CRU and DMA interrupts must be enabled by seeing the section about the interrupt controller.

Note 1. Perform initialization by seeing the section about DMA.

- Note that the following register settings are required:
  DMA.CHCFG_n/nS.DAD = 0h: Increment
  DMA.CHCFG_n/nS.SAD = 0h: Increment
  DMA.CHCFG_n/nS.DDS = 3h: 32 bits
- Set the DMA transfer size to 32 bits for both transfer destination and transfer source
- In transfer source memory initialization, store the values that set the following register: (Start address: Up to 68 bytes in ICnSVC)

  ICnSVC.SVC0[3:0]
  ICnIPMC_C0.STITHR
  ICnNIPDT_C0L
  ICnNIPDT_C0H
  ICnSLPrC_C0
  ICnELPrC_C0
  ICnSPPrC_C0
  ICnEPPrC_C0
  ICnSI_C0
  ICnLMXOF
  ICnLMXRC1
  ICnLMXRC2
  ICnLMXGC1
  ICnLMXGC2
  ICnLMXBC1
  ICnLMXBC2
  ICnSTIC1

Note 2. A setting is required in advance (see the sections about DMA and interrupt controller).

Note 3. Clear the interrupt by seeing the section about DMA and interrupt controller.

SECTION 9 IMAGE

9.4 LCD Controller (LCDC)

9.4.1 Overview

This chapter describes the features of the LCDC unit of this LSI.

This unit is an LCD controller and it is composed of Frame Compression Processor (FCPVD), Video Signal Processor (VSPD), and Display Unit (DU).

This LSI has two these units, each unit is called as LCDC0 and LCDC1, respectively. LCDC0 is connected to LVDS (single or dual ch) and DSI. LCDC1 is connected to LVDS (single ch), DSI, and GPIO (Parallel I/F). The video data, which is output by this unit, is input to DSI, LVDS, and GPIO, and DSI converts to MIPI DSI (Display Serial Interface), LVDS converts to single channel or dual channel LVDS (Low Voltage Differential Signaling), GPIO converts only the IO voltage, and output.

9.4.1.1 Features

The following is key features of this unit.

- FCPVD
  - Supports out-of-order for the whole outstanding transactions
  - Read linear addressing image data
  - Read display list data
  - Write image data

- VSPD
  - Supports various data formats and conversion
    - Supports YCbCr444/422/420, RGB, α RGB, α plane
    - Color space conversion and changes to the number of colors by dithering
    - Color keying
    - Supports combination between pixel alpha and global alpha
    - Supports generating pre multiplied alpha
  - Video processing
    - Blending of two picture layers and raster operations (ROPs)
    - Clipping
    - 1D look up table
    - Vertical flipping in case of output to memory
  - Direct connection to display module
    - Supports up to 1920 pixels in horizontal direction

- Writing back image data which is transferred to Display Unit (DU) to memory

- DU
  - Supports Display Parallel Interface (DPI), and inputs the video data to DSI and/or LVDS
  - Display timing master
    - Generates video timings (Front porch, Back porch, Sync active, Active video area)
    - Selects the polarity of output DCLK, HSYNC, VSYNC, and DE
  - Supports Progressive (Non-interlace)
  - Not supports Interlace
  - Input data format (from VSPD): RGB888, RGB666 (not supports dithering of RGB565)
  - Output data format: same as Input data format
  - Supports up to 187.5 MHz of the pixel clock frequency
  - Examples of the supported resolutions is below if using LVDS dual ch or DSI:
    - RGB888, 1920 pixels × 1200 lines, 60 fps
    - RGB888, 1920 pixels × 1080 lines, 60 fps (FHD)
    - RGB888, 1280 pixels × 1024 lines, 120 fps
  - Examples of the supported resolutions is below if using LVDS single ch or Parallel I/F:
    - RGB888, 1366 pixels × 768 lines, 60 fps (WXGA)
    - RGB888, 1280 pixels × 800 lines, 60 fps (WXGA)
    - RGB888, 800 pixels × 480 lines, 60 fps (WVGA)
    - RGB888, 640 pixels × 480 lines, 60 fps (VGA)

9.4.1.2 Block Diagram

Figure 9.4-1 and **Figure 9.4-2** show block diagrams.

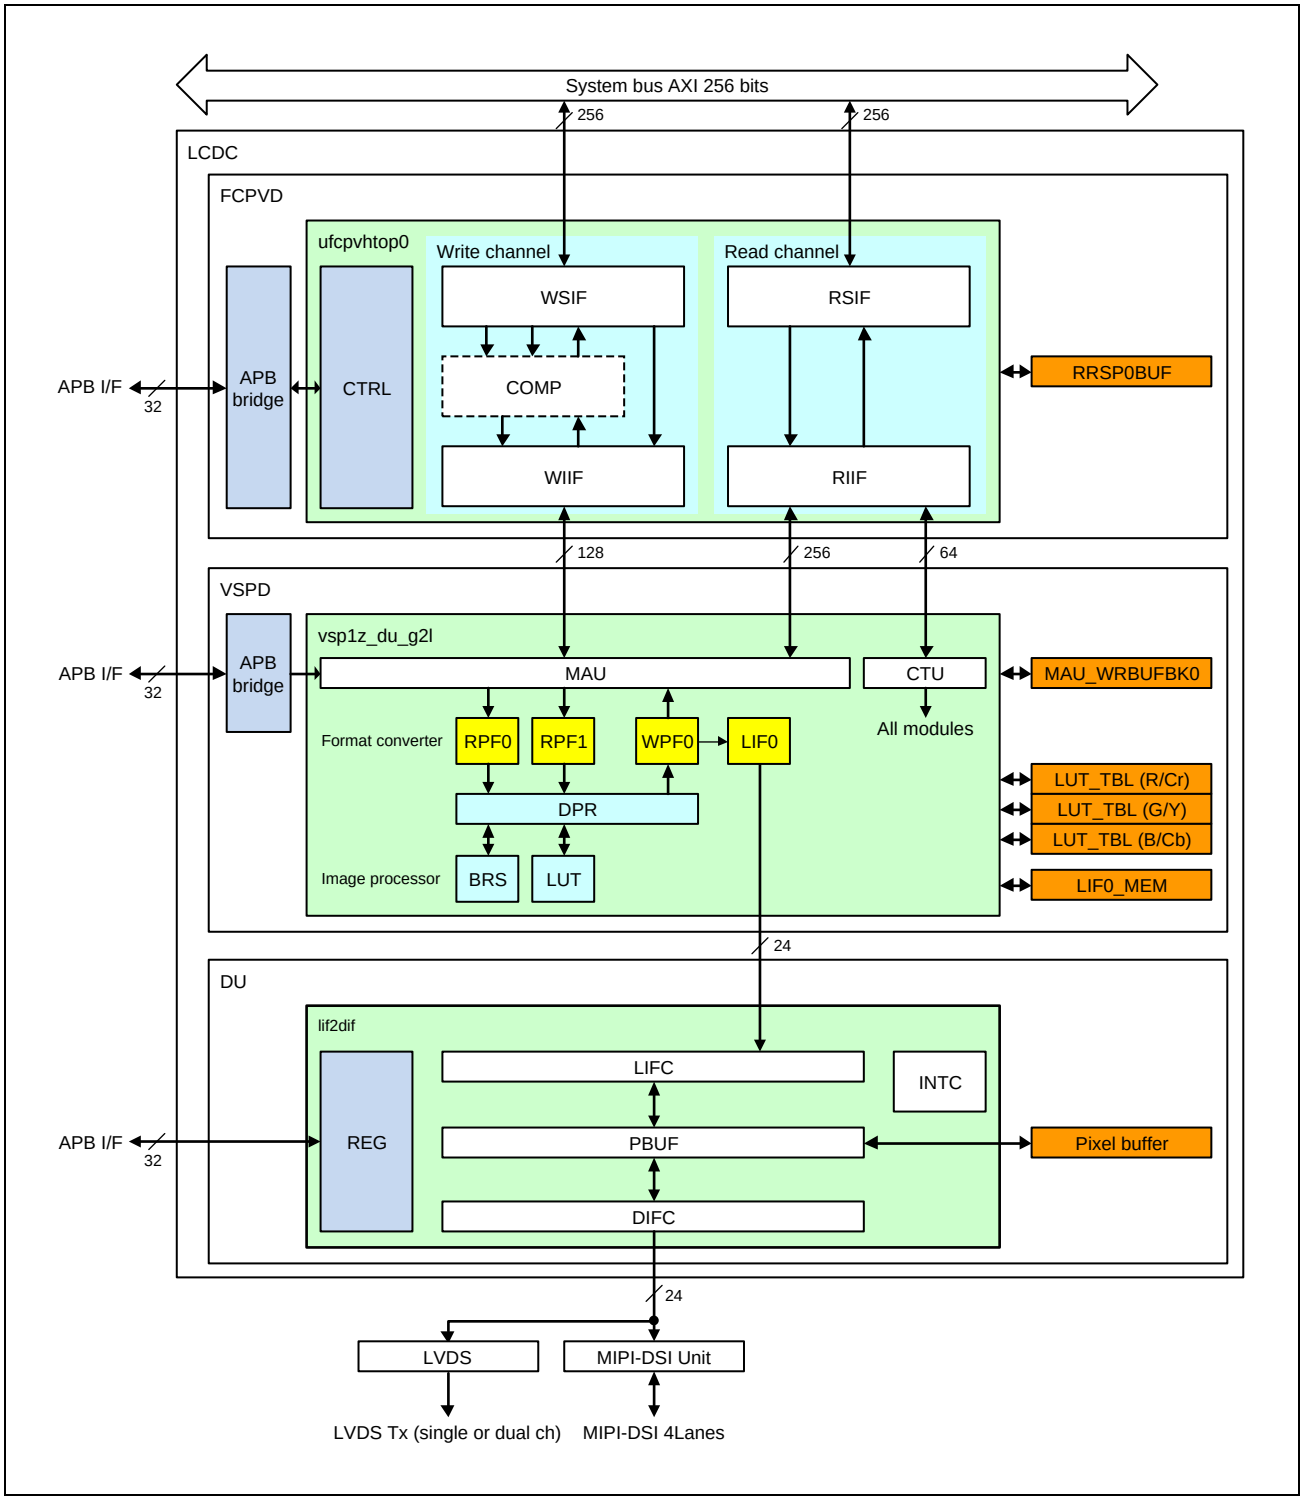

Figure 9.4-1 Block Diagram (LCDC0)

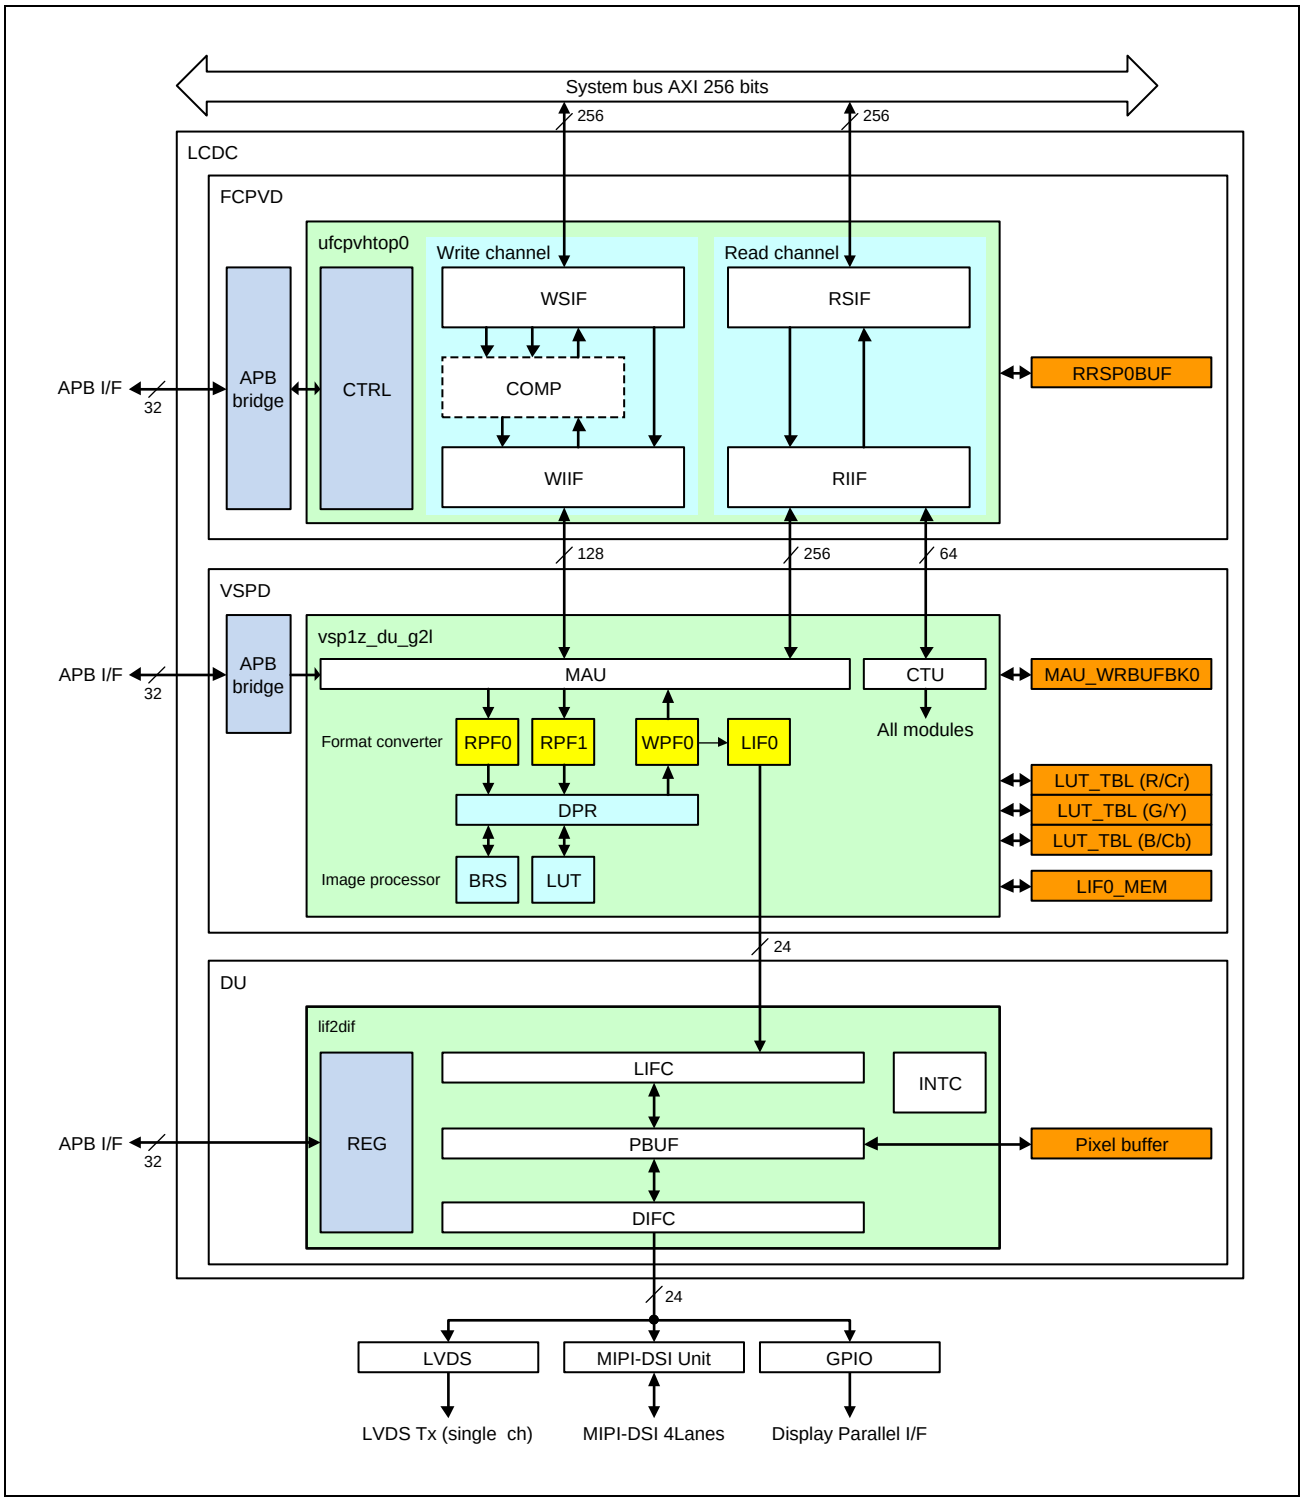

Figure 9.4-2 Block Diagram (LCDC1)

9.4.1.2.1 FCPVD

FCPVD has the following sub modules.

Table 9.4-1 Sub Modules in FCPVD

Abbreviation	Description
CTRL	FCPVD controller
WIIF	VSPD write channel interface
WSIF	System AXI write channel interface
RIIF	VSPD read channel interface
RSIF	System AXI read channel interface
COMP	Compression module (This is a dummy module)

9.4.1.2.2 VSPD

VSPD has the following sub modules.

(1) Memory Access Unit (MAU)

The VSPD applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and VSPD necessary for this operation is done by the MAU, which works as the bus master, according to the register settings. The MAU executes this data transfer between the external memory and VSPD.

(2) Command Transfer Unit (CTU)

The VSPD can directly read register parameters for image processing by display lists stored in external memory. The CTU module is a bus interface and controls display lists when the CTU reads display lists as a bus master.

(3) Read Pixel Formatter (RPF)

The RPF reads image data from the external memory through the MAU, unpacks data according to the specified format, converts the color space, converts the number of colors, executes color keying, ROP operation, Multiply-alpha and OSD processing, and outputs the resultant data to the DPR. The RPF has an input format unpacking unit, a 1-bit mask generator, a raster operation unit (ROP unit), a color keying unit, a color space converter and multiply-alpha. **Figure 9.4-3** show the processing flow in the RPF.

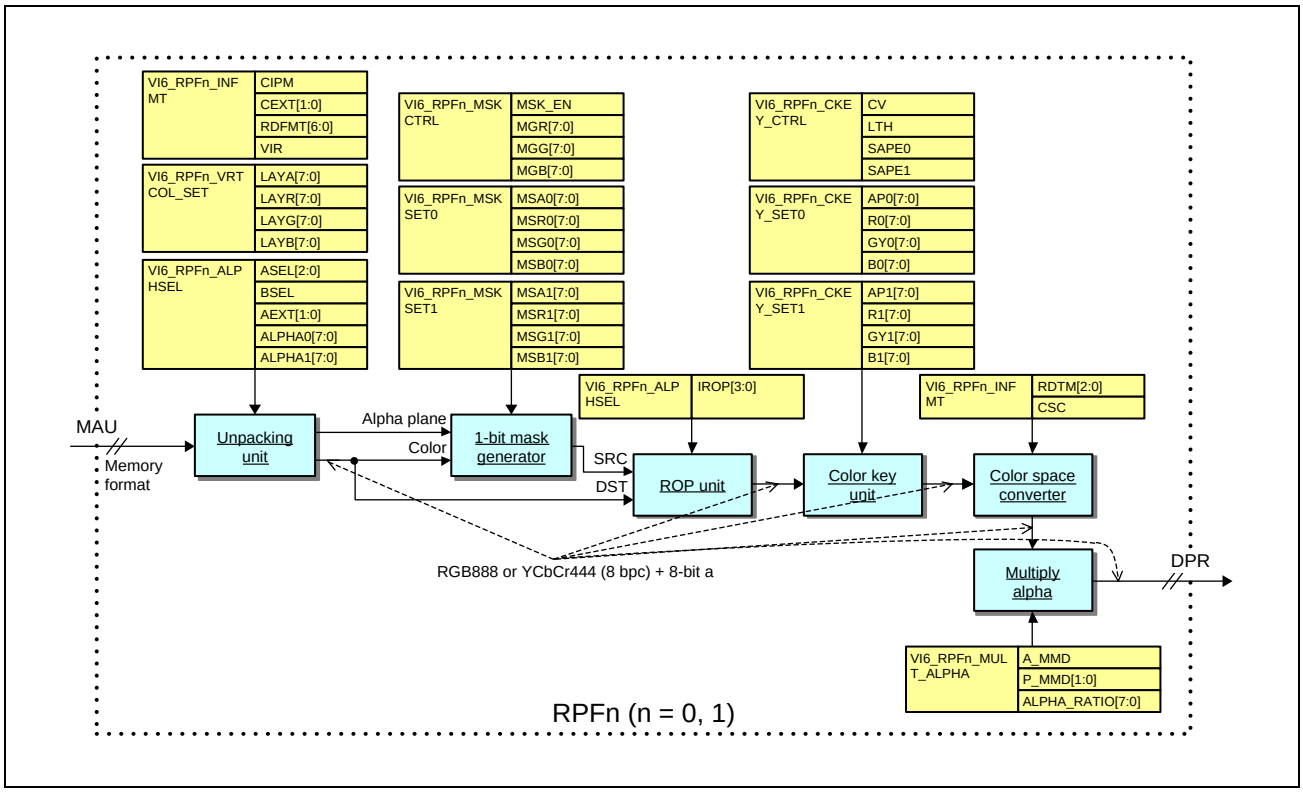

Figure 9.4-3 RPF Processing Flow

The input format unpacking unit expand the image data input from the MAU into the image format for internal processing (YCbCr444 8bpc or RGB888 8bpc), and the 1-bit mask generator generates a 1-bit image mask from the image data expanded through the unpacking unit. Alternately, a 1-bit image mask can be generated from the alpha plane that is different from the picture plane read through the MAU.

The raster operation unit (ROP unit) executes raster operation between the data from the 1-bit mask generator and the image data expanded from the input format, and the color keying unit applies color replacement and specifies the transparent color for the image data input from the ROP unit. The color space converter converts the color space (RGB-YCbCr) of the image data input from the color keying unit as necessary. The multiply-alpha unit multiplies pixel-alpha by specified alpha or/and multiplies image data by pixel-alpha or/and specified alpha.

The VSPD provides maximum two RPF modules (RPF0 to RPF1).

(4) Data Path Router (DPR)

The DPR controls the data paths among RPFs, function modules, and WPFs. The DPR selects one of the images input from RPFs, outputs it to a function module (BRS or LUT), and selects one of WPFs as the destination where the image data processed in the function module will be output. Before output to the WPF, the output from each function module can be input to another function module, which enables multiple image processing functions to be executed continuously without involving the external memory.

(5) Look Up Table (LUT)

This is a 1D-LUT that converts each of three color components by using a lookup table. The LUT is connected to the DPR and can be used for gamma correction, negative-positive conversion, posterization, and binarization through desired tone curve settings.

The LUT supports local area processing for Y component. The LUT can apply 1D look up table for Y component per area where a image is divided into multiple area specified by registers and command list.

(6) Blend ROP Sub Unit (BRS)

The BRS is a module connected to the DPR, which executes the image blending processing and ROP operation. The BRS has two blend/ROP operation units (blend/ROP unit m, m = A to B), a blend/ROP input switch (SEL) for selecting the input to these operation units, and a divider for normalization (div unit).

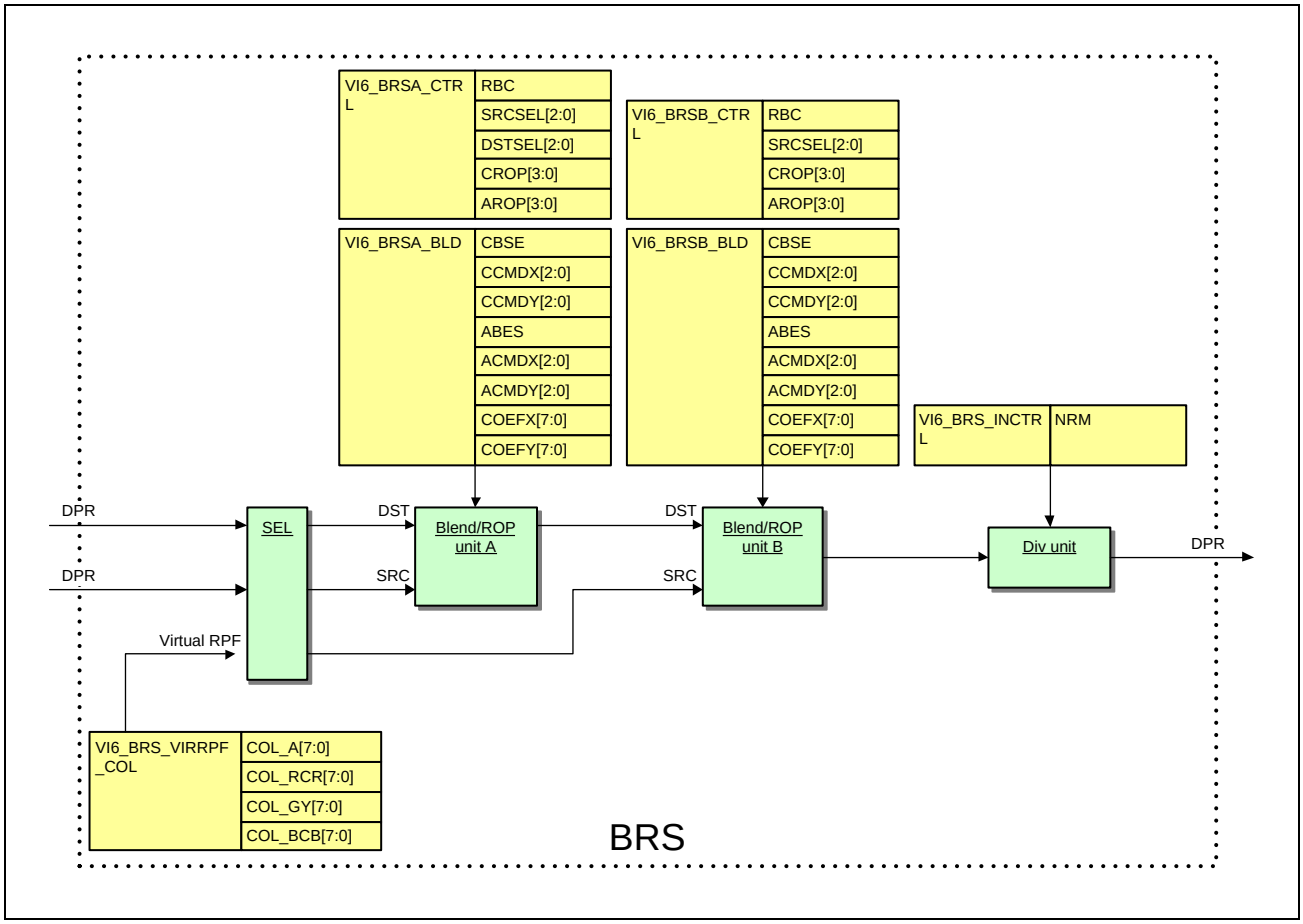

Figure 9.4-4 BRS Processing Flow

Each of the two blend-ROP operation units (blend/ROP unit m) receives the output from the SEL or blend/ROP Unit m, and executes blending or raster operation (ROP) of images.

The divider for normalization (div unit) divides the pixel value by the α value.

(7) Write Pixel Formatter (WPF)

The WPF is an output module that receives 32bits image data (YCbCr444 or RGB888 + 8-bitα) from the DPR, converts the color space, number of colors, and format of the data, and outputs the results of VSPD image processing to external memory through the MAU. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

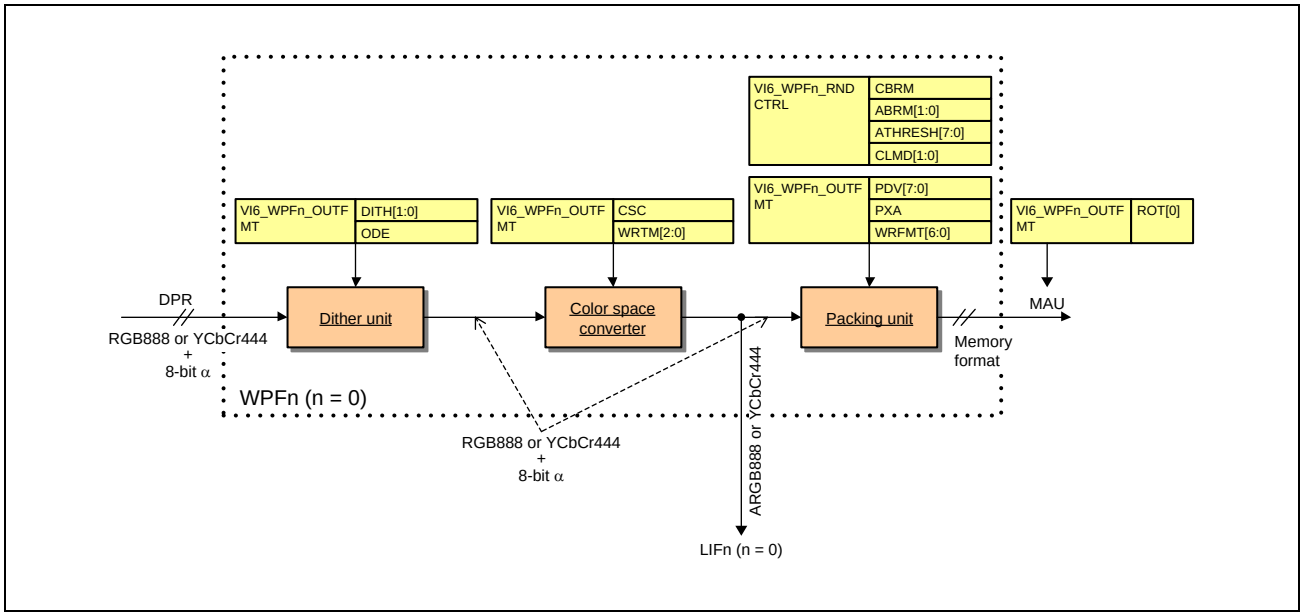

Figure 9.4-5 WPF Processing Flow

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The VSPD provides one WPF (WPF0). The WPF has the output to LIF module after the color space conversion for transferring the video data to the display module. Image data to LIF is 24bits (YCbCr444 or RGB888) format, and its' color space is after color space conversion.

(8) Display Unit Interface (LIF)

The LIF module is used for transferring image data to the display module. The input port of the LIFn (n = 0) module is connected to WPFn (n = 0), and the output port of the LIF module is connected to DU (Display Unit). Data flow in LIF is shown in **Figure 9.4-31**.

(9) Detail Function

Table 9.4-2 Detail Function of VSPD (1/4)

• Image Data Transfer Function			
Bus interface	Protocol		AXI 256 bits through FCPVD
	Data alignment	Conversion method	Byte, Word, LW, or LLW data swapping
		Channel	Data alignment can be specified separately for each input/output channel
Image memory	Input	Address setting	1-byte units
	Output	Address setting	1-byte units
		Memory area	Images can be written to the same memory area where the master layer is stored. Note the restrictions shown in **Table 9.4-38**
Tile transfer mode			Supported by RPF0 to RPF1
YCbCr memory storage format			Interleaved, planar, or semi-planar
• Display list/Extended Display List Transfer Function			
Bus interface	Protocol		AXI 256 bits through FCPVD
	Data alignment	Conversion method	Byte, Word, LW data swapping
		Channel	Data alignment can be specified separately for display list and each entry of extended display list
Data memory	Load	Address setting	8-byte units
	Store	—	Not available

Table 9.4-2 Detail Function of VSPD (2/4)

• Read Pixel Formatter (RPF)			
Number of channels			Two channels (RPF0 to RPF1)
Input color bit-depth		Color	2- to 8-bit
		Alpha	1-/2-/4-/8-bit
Operation bit-depth		Color	8-bit
		Alpha	8-bit
Image format	Input	RGB	RGB888, RGB565, RGB666, αRGB8888, αRGB4444, αRGB1555 α plane (8 bpp, 1 bpp)
		YCbCr	• YCbCr4:4:4 (8 bpc) Planar/Semi planar/Interleaved • YCbCr4:2:2 (8 bpc) Planar/Semi planar/Interleaved • YCbCr4:2:0 (8 bpc) Planar/Semi planar/Interleaved α plane (8 bpp, 1 bpp)
		Maximum size	1920 × 1200 pixels, 1200 × 1920 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to **9.4.6.3 Input Image Size**.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to **9.4.6.3 Input Image Size**.
		Size setting unit	• YCbCr420: 2-pixel units both horizontally and vertically. • YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color keying	Color replacement	Compared data	RGB or Y (8 bpc)
		Replaced data	αRGB or αYCbCr (8 bpc for R, G, B, Y, Cb, Cr, α)
		Comparison Mode	Matched color mode
		Input source	RPF0 to RPF1
	Transparent color	Compared data	RGB or Y (8 bpc)
		Replaced data	α 8 bpp
		Comparison Mode	Matched color mode, Luma threshold mode
		Input source	RPF0 to RPF1
Raster operation	ROP2 (within input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	ROP2 operation between the 1-bpp α plane and RGB/YCbCr data in RPF0 to RPF1. Note that 1-bpp α is converted to αRGB or αYCbCr4:4:4. (8 bpc)
Color space conversion	RGB to YCbCr	Conversion expression	• RGB (0, $2^n - 1$) to BT601 (2^{n-4}, $235\times2^{n-8}$/$240\times2^{n-8}$) • RGB (0, $2^n - 1$) to BT709 (2^{n-4}, $235\times2^{n-8}$/$240\times2^{n-8}$) • RGB (0, $2^n - 1$) to BT601 (0, $2^n - 1$) • RGB (2^{n-4}, $235\times2^{n-8}$) to BT709 (2^{n-4}, $235\times2^{n-8}$/$240\times2^{n-8}$) (n = 8)
		Target of conversion	RPF0 to RPF1
	YCbCr to RGB	Conversion expression	• BT.601 (2^{n-4}, $235\times2^{n-8}$/$240\times2^{n-8}$) to RGB (0, $2^n - 1$) • BT.709 (2^{n-4}, $235\times2^{n-8}$/$240\times2^{n-8}$) to RGB (0, $2^n - 1$) • BT.601 (0, $2^n - 1$) to RGB (0, $2^n - 1$) • BT.709 (2^{n-4}, $235\times2^{n-8}$/$240\times2^{n-8}$) to RGB (2^{n-4}, $235\times2^{n-8}$) (n = 8)
		Target of conversion	RPF0 to RPF1

Table 9.4-2 Detail Function of VSPD (3/4)

• Read Pixel Formatter (RPF)			
Changing number of colors	Bit extension	Extended bits	Input bitdepth (2bpc to 6bpc) to operation bitdepth 8bpc
		Target format	RGB666, RGB565, RGB555, RGB444, or RGB332
		Bit reduction method	Padded with 0. Copied from the most significant bits.
		Target of conversion	RPF0 to RPF1
	YCbCr444 generation	Vertical	CbCr copying
		Horizontal	copying or interpolation.
α bit count conversion	Bit extension	Extended bits	Input bitdepth 1bpc to operation bitdepth 8bpc
		Method	Padded with 0. Copied from the most significant bits.
Multiply-alpha function	Fade-alpha		RPF0 to RPF1 Available for straight pixel and pre-multiplied pixel.
	Generate pre-multiplied alpha		RPF0 to RPF1
Virtual display	RPF0 to RPF1	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Same as the size of the input channel
	Virtual RPF	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Maximum: 1920 × 1200 pixels, 1200 × 1920 pixels Minimum: 4 × 4 pixels
• Write Pixel Formatter (WPF)			
Number of channels			One channel (WPF0)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555
		YCbCr	YCbCr4:4:4, YCbCr4:2:2, YCbCr4:2:0
		Maximum size	1920 × 1200 pixels, 1200 × 1920 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to **9.4.6.4 Output Image Size**.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to **9.4.6.4 Output Image Size**.
		Size setting unit	• YCbCr420: 2-pixel units both horizontally and vertically. • YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	RGB to YCbCr	Conversion expression	• RGB (0, 255) to BT.601 (16, 235/240) • RGB (0, 255) to BT.709 (16, 235/240) • RGB (0, 255) to BT.601 (0, 255) • RGB (16, 235) to BT.709 (16, 235/240)
		Target of conversion	WPF0
	YCbCr to RGB	Conversion expression	• BT.601 (16, 235/240) to RGB (0, 255) • BT.709 (16, 235/240) to RGB (0, 255) • BT.601 (0, 255) to RGB (0, 255) • BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	WPF0
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping
α bit count conversion	Output	Bit reduction	Truncation, rounding, or comparison with threshold (for 1 bpp)

Table 9.4-2 Detail Function of VSPD (4/4)

• Image Compositing			
α blending	Input α value selection	RGB	Pixel α, fixed α value, α plane, or 1-bit α converted from the color specified for pixels
		YCbCr	α plane, fixed α value, or 1-bit α converted from the color specified for pixels
	α blending expression	Layer A: Upper layer Layer B: Lower layer	xA + yB, xA − yB Coefficients x and y should be selected from the following. Fixed α value, (α for layer A), (1 − α for layer A), (α for layer B), (1 − α for layer B)
	Output α value selection	RGB	Fixed α value, x (α for layer A) + y (α for layer B), x (α for layer A) – y (α for layer B) Coefficients x and y should be selected from the following. Fixed α value, (α for layer A), (1 − α for layer A), (α for layer B), (1 − α for layer B)
	Blending layers	Number of layers	Two layers selected from RPF0 to RPF1 and video processing function output, and virtual RPF; three layers in total
		Order of layers	The order of three layers selected from RPF0 to RPF1, virtual RPF, and video processing function output can be changed as desired.
	α plane	Format	8 bpp or 1 bpp (α value can be specified through register)
		Input source	RPF0 to RPF1
	Fixed α value	Format	8 bpp
		Input source	RPF0 to RPF1, virtual RPF, or video processing function output
Raster operation	ROP2 (between input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	RPF0 to RPF1, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
	ROP3 (between input channels)	Operator	256-type ROP3 is available by combining ROP2 operations
		Sources of operation	RPF0 to RPF1, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
• Color Adjustment Function			
1D-LUT	LUT configuration		Independent R/Y, G/Cb, and B/Cr. 256 entries each
• Direct connection to Display module			
Display I/F	Destination		DU
	Direct connection		Can transfer data without going through external memory to DU
Line padding	Padding cycles		1 to 32 cycles
	Padding pattern		Arbitrarily setting up to 32 cycles

9.4.1.2.3 DU

DU has the following sub modules.

(1) REG

The REG controls registers for DU. The DU has APB4 interface, its transaction is transfer with no wait states.

(2) LIFC

The LIFC is the interface block from/to VSPD. The LIFC receives image data from VSPD, sends to PBUF in a pixel unit. The LIFC continues to receive the image data from VSPD unless FIFO will be full.

(3) PBUF

The PBUF is the asynchronous FIFO which convert clock domain of image data from System Bus Clock to Video Clock. The PBUF monitors the FIFO underflow.

(4) DIFC

The DIFC is the display timing master. The DIFC controls the polarity and the timing of the Video Output signals. Controllable timings are the followings.

- Hfront: Horizontal front porch (pixels)
- Hback: Horizontal back porch (pixels)
- Hsync: Horizontal sync active (pixels)
- Hactive: Horizontal active area (pixels)
- Vfront: Vertical front porch (lines)
- Vback: Vertical back porch (lines)
- Vsync: Vertical sync active (lines)
- Vactive: Vertical active area (lines)

(5) INTC

The INTC generates the interrupt when PBUF will detect a FIFO underflow. The interrupt is level signal.

9.4.1.3 Clock and Interrupt signal

The following clocks are supplied to the LCDC.

Table 9.4-3 Clock List

Clock Name	Description	Frequency (MHz)
LCDC_0_clk_a	AXI clock.	400/200/100/50/13
LCDC_0_clk_p	APB clock.	100
LCDC_0_clk_d	Video clock.	5.44 to 187.5
LCDC_1_clk_a	AXI clock.	400/200/100/50/13
LCDC_1_clk_p	APB clock.	100
LCDC_1_clk_d	Video clock.	5.44 to 187.5

The LCDC transmits the following interrupt signals to the interrupt controller.

Table 9.4-4 Interrupt List

Signal Name	Interrupt Condition	Interrupt Source Register
VSPD_INT	Frame End	VI6_WPF0_IRQ_STA.FRE
	Display List Frame End	VI6_WPF0_IRQ_STA.DFE
	DU Connection UnderRun Error	VI6_WPF0_IRQ_STA.UND
DU_INT	PBUF FIFO Underflow	DU_MSR0.ST_PB_RUF

Note: Refer to **(13) WPF0 Interrupt Status Register (LCDC_VSPD_VI6_WPF0_IRQ_STA)** and **9.4.4.2.1 DU Module Control Register 0 (LCDC_DU_MCR0)** for details.

9.4.2 FCPVD Registers

The FCPVD contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits) in the registers. Therefore, read-modify-write is needed to change partial bits in the 32-bit register.

Never access the registers when the FCPVD is in the module standby mode (with the operation clock placed in hold status).

Table 9.4-5 FCPVD Register Base Address

Base Register Name	LCDC Ch.	Base Address
<LCDC0_fcpvd_base>	LCDC0	0_1647_0000h (5647_0000h*1, 4647_0000h*2)
<LCDC1_fcpvd_base>	LCDC1	0_164A_0000h (564A_0000h*1, 464A_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.4.2.1 List of FCPVD Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
FCPV version control register	LCDC_FCPVD_FCP_VCR	0000_0109h	0000h	32

9.4.2.2 FCPVD Register Description

The prefix (LCDC_FCPVD_) of the register names is omitted in this and subsequent sections.

9.4.2.2.1 FCPVD Version Control Register (LCDC_FCPVD_FCP_VCR)

FCP_VCR is the version control register of the FCPVD. The value read is fixed.

Access Size : 32 bits
Address : <LCDC_fcpvd_base> + 0000h
Initial Value : 0000_0109h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CATEGORY[7:0]								REVISION[7:0]							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	1	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	CATEGORY [7:0]	1h	R	FCP use case category.
7 to 0	REVISION[7:0]	9h	R	Version of LSI product 09h: FCP revision is the Simple LCDC

9.4.3 VSPD Registers

In the following, “n” in a register name or a offset address indicates an integer, and the range of value n is defined when necessary. For RPFn and WPFn, when the range of value n is not defined, RPFn (n = 0, 1) and WPFn (n = 0) are assumed.

Table 9.4-6 VSPD Register Base Address

Base Register Name	LCDC Ch.	Base Address
<LCDC0_vspd_base>	LCDC0	0_1648_0000h (5648_0000h*1, 4648_0000h*2)
<LCDC1_vspd_base>	LCDC1	0_164B_0000h (564B_0000h*1, 464B_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.4.3.1 List of VSPD Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
VSPD Start Register 0	LCDC_VSPD_VI6_CMD0	0000_0000h	0000h	32
Reserve	-	-	0004h to 000Fh	-
Clock Control Register 0	LCDC_VSPD_VI6_CLK_CTRL0	0000_0000h	0010h	32
Clock Control Register 1	LCDC_VSPD_VI6_CLK_CTRL1	0000_0000h	0014h	32
Dynamic Clock Stop Control Register	LCDC_VSPD_VI6_CLK_DCSWT	0000_0000h	0018h	32
Dynamic Clock Stop Disable Register 0	LCDC_VSPD_VI6_CLK_DCSM0	0000_0000h	001Ch	32
Dynamic Clock Stop Disable Register 1	LCDC_VSPD_VI6_CLK_DCSM1	0000_0000h	0020h	32
Reserve	-	-	0024h to 0027h	-
Software Reset Register	LCDC_VSPD_VI6_SRESET	0000_0000h	0028h	32
Module Reset Enable Register 0	LCDC_VSPD_VI6_MRESET_ENB 0	0000_0000h	002Ch	32
Module Reset Enable Register 1	LCDC_VSPD_VI6_MRESET_ENB 1	0000_0000h	0030h	32
Module Reset Issuing Register	LCDC_VSPD_VI6_MRESET	0000_0000h	0034h	32
Operating Status Register	LCDC_VSPD_VI6_STATUS	0000_0000h	0038h	32
Reserve	-	-	003Ch to 0047h	-
WPF0 Interrupt Enable Register	LCDC_VSPD_VI6_WPF0_IRQ_EN B	0000_0000h	0048h	32
WPF0 Interrupt Status Register	LCDC_VSPD_VI6_WPF0_IRQ_ST A	0000_0000h	004Ch	32
Reserve	-	-	0050h to 0077h	-
Display-0 Interrupt Enable Register	LCDC_VSPD_VI6_DISP0_IRQ_EN B	0000_0000h	0078h	32
Display-0 Interrupt Status Register	LCDC_VSPD_VI6_DISP0_IRQ_ST A	0000_0000h	007Ch	32
Reserve	-	-	0080h to 00FFh	-
Display List Control Register	LCDC_VSPD_VI6_DL_CTRL	0000_0000h	0100h	32
Reserve	-	-	0108h to 0113h	-

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Display List-0 Data Swapping Register	LCDC_VSPD_VI6_DL_SWAP0	0000_0000h	0114h	32
Reserve	-	-	0118h to 011Bh	-
Extended Display List-0 Control Register	LCDC_VSPD_VI6_DL_EXT_CTRL0	0000_0000h	011Ch	32
Display List Body Size Register 0	LCDC_VSPD_VI6_DL_BODY_SIZE0	0000_0000h	0120h	32
Display List-0 Header Address Register	LCDC_VSPD_VI6_DL_HDR_ADDR0	0000_0000h	0104h	32
Reserve	-	-	0124h to 012Fh	-
Display List-0 Header Reference Address Register	LCDC_VSPD_VI6_DL_HDR_REF_ADDR0	0000_0000h	0130h	32
Reserve	-	-	0134h to 0157h	-
Display List-0 Wake Up Counter Register	LCDC_VSPD_VI6_DL_WUPCNT0	0000_0000h	0158h	32
Reserve	-	-	015Ch to 02FFh	-
RPF0 Basic Read Size Register	LCDC_VSPD_VI6_RPF0_SRC_BSIZE	0000_0000h	0300h	32
RPF0 Extended Read Size Register	LCDC_VSPD_VI6_RPF0_SRC_ESIZE	0000_0000h	0304h	32

Note: Read only bits or write only bits or read/write bits are mixed in the registers.

9.4.3.2 VSPD Register Description

The prefix (LCDC_VSPD_) of the register names is omitted in this and subsequent sections.

9.4.3.2.1 Notational Conventions for Registers and Bit Fields

This section uses the following notational conventions for the VSPD registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the VI6_CMD0 register is indicated as VI6_CMD0.STRCMD.
3. Lowercase “n” in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For RPFn, and WPFn, when the range of value n is not defined, RPFn (n = 0, 1), WPFn (n = 0) are assumed.
4. In each subsection for register description in **9.4.3.2 VSPD Register Description**, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are two registers VI6_RPF_SRC_BSIZE and VI6_RPF_SRC_ESIZE, VI6_RPF_SRC_* indicates both registers.

9.4.3.2.2 Register Classification

The VSPD registers are arranged in the following order; the general control registers to display list control registers control operation of the entire VSPD, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from **9.4.3.2.4 General Control Registers**.

1. General control registers (VI6_CMDn (n = 0, 1), VI6_SRESET, VI6_STATUS, VI6_WPFn_IRQ_* (n = 0))
2. Display list control registers (VI6_DL_*)
3. RPF control registers (VI6_RPFn_* (n = 0, 1))
4. WPF control registers (VI6_WPFn_* (n = 0))
5. DPR control registers (VI6_DPR_*)
6. LUT control register (VI6_LUT_CTRL)
7. BRS control registers (VI6_BRS_*)
8. LIFn control registers (VI6_LIFn_* (n = 0))

The VSPD has two RPF channels and the register configuration is the same for all of RPFn (n = 0, 1). However, some bit fields have restrictions in certain RPFs. These restrictions are included in the description of the corresponding bit fields and registers. Likewise, the register configuration is the same for all WPFn (n = 0), but some bit fields have restrictions in certain WPFs; the restrictions are included in the description of the corresponding bit fields and registers.

For each register address, refer to **9.4.3.1 List of VSPD Registers**.

9.4.3.2.3 Restrictions on Access to Registers and Lookup Tables

The VSPD has control registers and lookup tables. All VSPD registers are writable and readable by only 32 bits unit. To write partial bits in each register, read-modify-write is needed. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the VSPD will not operate correctly.

1. For the read-only bits and reserved bits in all VSPD registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in **9.4.3.1 List of VSPD Registers** are reserved areas and write access is prohibited in these areas.
3. For all registers and lookup tables, except VI6_CMDn, VI6_SRESET, VI6_*IRQ* and two plane registers such as VI6_DL_HDR_ADDRn, VI6_DL_BODY_SIZE0, modifying register values during operation of the module is prohibited. Modify registers while the corresponding module is stopped. For the operating status of the target module, refer to **9.4.5.4 Concept of VSPD Operation Starting and Stopping**.
4. There are three types about General control registers (**9.4.3.2.4 General Control Registers**) and Display List Control Registers (**9.4.3.2.5 Display List Control Registers**) as below.
   - Controlling WPF0 (ex. VI6_CMD0, VI6_SRESET.SRST0)
   - Common setting of WPF0 (ex. VI6_DL_CTRL.AR_WAIT [15:0])

Table 9.4-7 Correspondence between Modules and Register Names

Module Name	Register Name
RPFn (n = 0, 1)	VI6_RPFn_*
WPFn (n = 0)	VI6_WPFn_*
DPR	VI6_DPR_*
LUT	VI6_LUT_CTRL
BRS	VI6_BRS_*
LIFn (n = 0)	VI6_LIFn_*

9.4.3.2.4 General Control Registers

(1) VSPD Start Register 0 (LCDC_VSPD_VI6_CMD0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	UPDHDR	-	-	-	STRCMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	UPDHDR	0h	RW	Reserved state of updating Display List Header (DLH) address. UPDHDR can be negated by software reset (VI6_SRESET.SRST0). [Write] 0b: NOP 1b: Do not set 1b to this bit [Read] 0b: Not reserved to update DLH address. 1b: Reserved to update DLH address. Set 0b to this bit when STRCMD bit is set to 1b.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	STRCMD	0h	RW	Start reservation of WPF VI6_CMD0.STRCMD controls WPF0. Writing 1b to this bit starts WPF0 in VSPD. Set this bit for activation only after all register settings in each output channel have been completed. If WPF0 is idle, WPF0 starts right after this bit is set to 1b. If WPF0 is active, writing 1b to this bit reserves starting WPF0 operation. Wait to set 1b to VI6_CMD0.STRCMD until this bit is read as 0b. VI6_CMD0.STRCMD can be negated by software reset (VI6_SRESET.SRST0). [Write] 0b: Start reservation of WPF0 is canceled. 1b: Start reservation of WPF0 is set. [Read] 0b: Starting VSPD is not reserved. 1b: Starting VSPD is reserved.

The basic concept of image processing operation started by activating the VSPD is shown in **Figure 9.4-6**. The actual data input/output is executed by the MAU, which is the bus interface module, as described in **9.4.1.2 Block Diagram**, but conceptually the RPF works as the data entry point to the VSPD and the WPF works as the data exit point. To process images through the VSPD, the RPF (entrance) and WPF (exit) should be connected and a data path from the RPF to the WPF should be formed.

To connect RPFn to WPFn, specify RPFn as the source RPF for WPFn in VI6_WPFn_SRCRPF, which is a register for WPFn (refer to **(1) WPF0-Source-RPF Register (LCDC_VSPD_VI6_WPF0_SRCRPF)**). This setting determines that RPFn will be started when WPFn is started through VI6_CMDn.

A data path to execute desired image processing should then be formed between the RPF (entrance) and WPF (exit). To form a data path, connect the necessary function modules in the VSPD between RPF and WPF. This function is

provided by the DPR; specify the information for each module connection in data path routing registers VI6_DPR_*_ROUTE (refer to **9.4.3.2.8 DPR Control Registers**).

After a data path is formed (RPFn → WPFn) as described above, starting output module WPFn in the VSPD through VI6_CMDn starts all function modules connected to WPFn and the desired image processing is executed. According to this design concept, starting a WPF module means starting the VSPD.

There are two types of data path configuration in the VSPD; one is “a single input module to a single output module” as shown in **Figure 9.4-6** (A), and the other is “multiple input modules to a single output module” as shown in **Figure 9.4-6** (B).

Figure 9.4-6 (A) shows an example of a configuration where modules with single input and single output are implemented through the DPR.

Figure 9.4-6 (B) shows another configuration example where the module with multiple input and single output is implemented through the DPR.

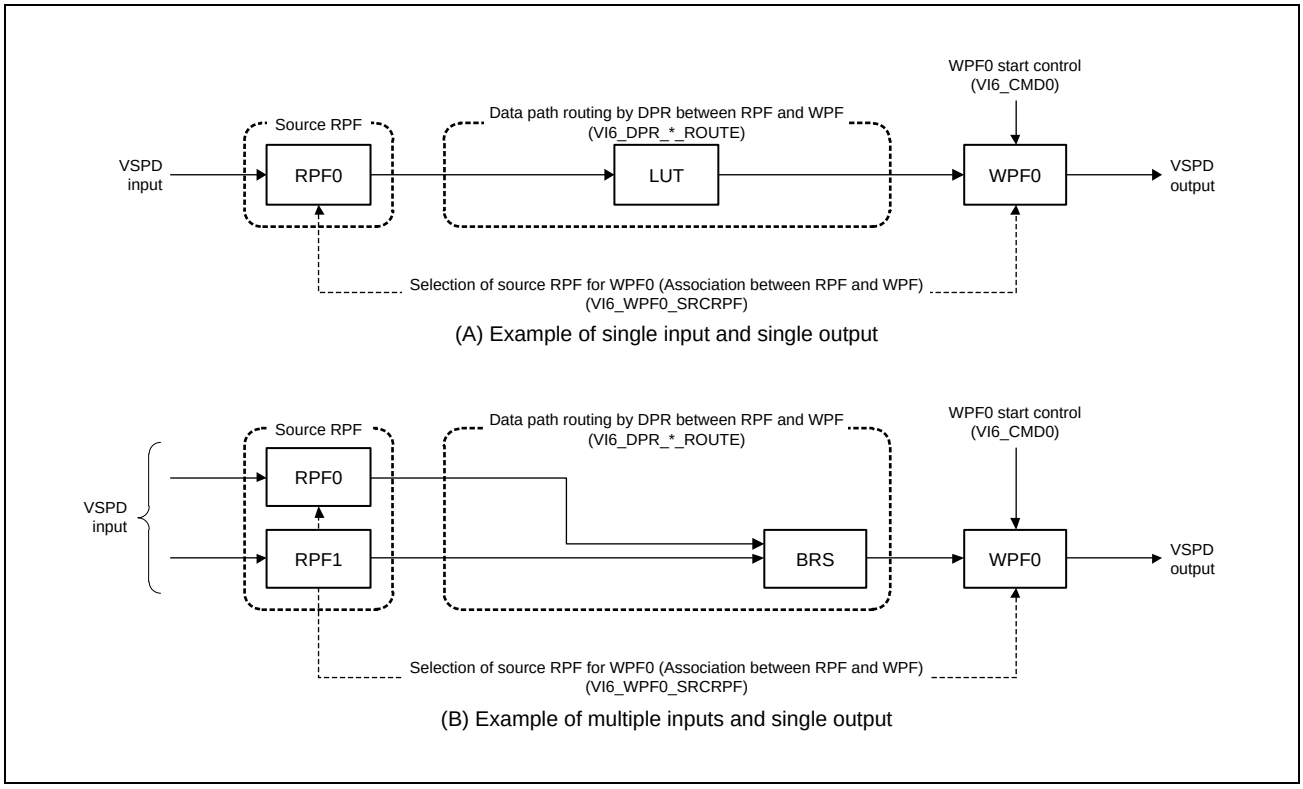

Figure 9.4-6 Basic Concept of VSPD Startup

(2) Clock Control Register 0 (LCDC_VSPD_VI6_CLK_CTRL0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	GCS0	-	-	-	-	-	-	-	-	-	-	-	GCS1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	GCS2[3:0]				-	-	-	GCS3[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	GCS0	0h	RW	Clock Control Setting0
27 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	GCS1	0h	RW	Clock Control Setting1
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	GCS2[3:0]	0h	RW	Clock Control Setting2
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4 to 0	GCS3[4:0]	00h	RW	Clock Control Setting3

VSPD can stop its operating clock for reducing power consumption.

To enable clock stop function, set following registers:

- VI6_CLK_CTRL0 = 0000_0000h
- VI6_CLK_CTRL1 = 0000_0000h
- VI6_CLK_DCSWT = 0000_0808h
- VI6_CLK_DCSM0 = 0000_0000h
- VI6_CLK_DCSM1 = 0000_0000h

To disable clock stop function, set following registers:

- VI6_CLK_CTRL0 = 1001_0F1Fh
- VI6_CLK_CTRL1 = FF10_FFFFh
- VI6_CLK_DCSWT = 0033_0808h
- VI6_CLK_DCSM0 = 1FFF_0F1Fh
- VI6_CLK_DCSM1 = FF10_FFFFh

When the clock gating is enabled, the supply of the clock signal is stopped for the module which is not operated. If the bit field of this register is changed from 0 to 1, the supply of the clock signal for the module is immediately started. If

the bit field of the register is changed from 1 to 0, the clock supply is immediately stopped. Therefore, please do not change this register field from 1 to 0 in operation because the VSPD may be stalled.

(3) Clock Control Register 1 (LCDC_VSPD_VI6_CLK_CTRL1)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GCS4[7:0]								-	-	-	GCS6	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	RW	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GCS5[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GCS4[7:0]	00h	RW	Clock Control Setting4
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	GCS6	0h	RW	Clock Control Setting6
19 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	GCS5[15:0]	0000h	RW	Clock Control Setting5

See **(2) Clock Control Register 0 (LCDC_VSPD_VI6_CLK_CTRL0)** for detail.

(4) Dynamic Clock Stop Control Register (LCDC_VSPD_VI6_CLK_DCSWT)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	DCD5	0h	RW	Dynamic Clock Stop Disable Setting5
19 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	DCD4[15:0]	0000h	RW	Dynamic Clock Stop Disable Setting4

See **(2) Clock Control Register 0 (LCDC_VSPD_VI6_CLK_CTRL0)** for detail.

(7) Software Reset Register (LCDC_VSPD_VI6_SRESET)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0028h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SRST0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SRST0	0h	RW	WPF0 Software Reset Writing 1b to this bit aborts the current processing in WPF0 (the partially-completed image undergoing processing is output). The period until this software reset processing is completed depends on the bus state. When this reset processing is completed, the VI6_WPF0_IRQ_STA.FRE interrupt source bit is set to 1b; when the FRE interrupt is enabled, the FRE end interrupt is output to notify the end of the reset processing. This bit is always read as 0b. 0b: NOP 1b: WPF0 software reset*[1]

Note 1. Applying a software reset to each WPF has the following restrictions.

1. A software reset can be applied to only one of WPF0 through single write access to VI6_SRESET.
2. After a software reset is issued, no more software reset can be issued to another WPF until the issued software reset processing is completed
3. The end of software reset processing is notified through the FRE bit in VI6_WPFn_IRQ_STA, but the software reset issued while WPF is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the VSPD may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the VSPD completes operation.
4. If a software reset is issued during downloading of a display list, the downloading processing is not aborted. After the end of downloading that is in progress when a software reset is issued, a frame end interrupt is output.

(8) Module Reset Enable Register 0 (LCDC_VSPD_VI6_MRESET_ENB0)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 002Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	MRSTE0[1:0]		-	-	-	-	-	-	-	-	-	-	-	-

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MRSTE3[7:0]	00h	RW	Module Reset Enable 3
23 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	MRSTE4[15:0]	0000h	RW	Module Reset Enable 4

This register is for purpose of h/w debugging.

(10) Module Reset Issuing Register (LCDC_VSPD_VI6_MRESET)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0034h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	MRST	0h	RW	Module Reset Assertion

This register is for purpose of h/w debugging.

(11) Operating Status Register (LCDC_VSPD_VI6_STATUS)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0038h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	FLDST0	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	SYS0_ACT	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	FLDST0	0h	R	Field status of previous frame of WPF0. 0b: Previous finished frame is TOP field. 1b: Previous finished frame is BOT field. This bit can be referred in case of AUTO-FLD or AUTO-DISP. This bit is changed at the timing of VI6_WPF0_IRQ_STA.FRE.
27 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	SYS0_ACT	0h	R	WPF0 Operating Status Each bit indicates the operating or stopped state of control channel n (WPF0). 0b: WPF0 is stopped. 1b: WPF0 is operating.
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(12) WPF0 Interrupt Enable Register (LCDC_VSPD_VI6_WPF0_IRQ_ENB)

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt disabled
1: Interrupt enabled

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0048h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DFEE	FREE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	UNDE	0h	RW	Interrupt Enable for WPF0 Underrun in case of DU connection.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	DFEE	0h	RW	Interrupt Enable for WPF0 Display List Frame End
0	FREE	0h	RW	Interrupt Enable for WPF0 Frame End

Each bit in VI6_WPFn_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_WPFn_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1.

(13) WPF0 Interrupt Status Register (LCDC_VSPD_VI6_WPF0_IRQ_STA)

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt
1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0
1: Hold the interrupt status value

Access Size : 32 bits
Address : <LCDC_vspd_base> + 004Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DFE	FRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	UND	0h	RW	Interrupt Status and Clear for WPF0 Underrun in case of DU connection. This interrupt source bit is set to 1b when data underrun occurs in case of DU connection. Timing that this bit is set to 1b is at end of 1 frame.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	DFE	0h	RW	Interrupt Status and Clear for WPF0 Display List Frame End This interrupt source bit is set to 1b when VSPD completes one-frame processing while the current frame in enable value stored in the display list header is 1 (refer to **9.4.5.4 Concept of VSPD Operation Starting and Stopping**). When display lists are not used, this bit is not used. In this case, clear VI6_WPF0_IRQ_ENB.DFEE to 0b to mask the interrupt generation by this interrupt source. This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0b to this bit, the oldest interrupt status is cleared. And the status bit becomes 0b after all interrupt statuses are cleared.
0	FRE	0h	RW	Interrupt Status and Clear for WPF0 Frame End This interrupt source bit is set to 1b when VSPD completes one-frame processing. This bit is also set to 1b when one-frame processing using a display list is completed. The interrupt status is set to 1b by any of the following conditions. a) Processing one frame is finished normally b) Software reset is issued during VSPD is processing. c) One frame's data from DU is displayed while VSPD couldn't transfer one frame data to DU. (in case of Linked with DU) This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0b to this bit, the oldest interrupt status is cleared. And the status bit becomes 0b after all interrupt statuses are cleared.

VI6_WPFn_IRQ_STA indicates the state of the interrupt sources generated in the VSPD. Whether to output a VSPD interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in VI6_WPFn_IRQ_ENB. While an interrupt is disabled in VI6_WPFn_IRQ_ENB, the VSPD does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

(14) Display-0 Interrupt Enable Register (LCDC_VSPD_VI6_DISP0_IRQ_ENB)

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt disabled
1: Interrupt enabled

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0078h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DSTE	-	-	MAEE	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	RW	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	DSTE	0h	RW	Interrupt Enable for Display Start
7 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	MAEE	0h	RW	Interrupt Enable for Display Read Data End
4 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(15) Display-0 Interrupt Status Register (LCDC_VSPD_VI6_DISP0_IRQ_STA)

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt
1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0
1: Hold the interrupt status value

Access Size : 32 bits
Address : <LCDC_vspd_base> + 007Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DST	-	-	MAE	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	RW	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	DST	0h	RW	Interrupt Status and Clear for Display Start This bit is set to 1b when LIF module transfers the first data to the display module at the beginning of each frame. The timing depends on the output buffer status of LIF module.
7 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	MAE	0h	RW	Interrupt Status and Clear for Display Read Data End This bit is set to 1b when all RPFs transfer the last data of the frame to LIF module. The RPF module which is not used by LIF module does not affect this bit.
4 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.4.3.2.5 Display List Control Registers

(1) Display List Control Register (LCDC_VSPD_VI6_DL_CTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0100h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AR_WAIT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	DC2	-	-	-	DC1	-	-	-	DLE1	RLM0	CFM0	NH0	DLE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	AR_WAIT[15:0]	0000h	RW	Display List Control Setting Always specify 256.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	DC2	0h	RW	This bit doesn't affect anything to VSPD (NOP)
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	DC1	0h	RW	This bit doesn't affect anything to VSPD (NOP)
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	DLE1	0h	RW	This bit doesn't affect anything to VSPD (NOP)
3	RLM0	0h	RW	Loading two plane Registers Mode for WPF0. 0b: Reserved status (VI6_CMD0.UPDHDR) is accepted by next frame auto start. Two plane registers are downloaded by next_frame_start also. 1b: Reserved status (VI6_CMD0.UPDHDR) is not accepted by next frame auto start. pNextHeader in previous frame's DLH is used for loading DisplayList. Two plane registers are not downloaded by next_frame_start also.
2	CFM0	0h	RW	Continuous Frame Mode for Header-less Display List for WPF0 This bit determines whether the next frame is automatically started or not. When the updated flag of the display list, VI6_DL_BODY_SIZE0.UPD0, is not updated, the display list of the next frame is not transferred and the same register values are used for the next frame. When the value of VI6_DL_BODY_SIZE0.UPD0 is updated, the new display list is transferred. 0b: Stopped at the end of every frame 1b: The next frame is automatically started
1	NH0	0h	RW	Header-less Display List Mode This bit is used for specifying the header-less display list mode. In case of header-less mode, the number of the display lists is 1. The address of the display body is set in VI6_DL_HDR_ADDR0 register, and the body size is set in VI6_DL_BODY_SIZE0 register. When this bit is changed, make sure that VSPD is stopped. And also make sure the following before starting VSPD. - Header Address (VI6_DL_HDR_ADDR0) - Body Size (VI6_DL_BODY_SIZE0) in case of header-less mode 0b: Use Display List Header (Normal DL Mode) 1b: Do not use Display List Header (Header-less Mode) Note: When DLE0 bit is 0b, set 0b to NH0 bit.

Bit	Bit Name	Initial Value	R/W	Description
0	DLE0	0h	RW	Display List Enable/Disable for WPF0 Enables or disables the WPF0 display list function. When the display list function is enabled through this bit, all WPF processing channels work in display list mode. When using display lists, note the restrictions in **9.4.3.2.3 Restrictions on Access to Registers and Lookup Tables**. 0b: The display list function is disabled 1b: The display list function is enabled

(2) Display List-0 Header Address Register (LCDC_VSPD_VI6_DL_HDR_ADDR0)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0104h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DL_HDR_PTR-0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL_HDR_PTR-0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_PTR-0[31:0]	0000_0000h	RW	Display List-0 Header Address These bits specify the address of the display list header to be read for display list-n in 16-byte units (the lower-order four bits are read-only). When WPF0 is first started in display list mode, the display list header is loaded from the address specified in this register. After loading of the header is completed, the register value of the display list address is updated to the next header address stored in the loaded header to prepare for loading of the next display list header. After that, this header address updating is repeated. A value from 0000_0000h to FFFF_FFF0h can be specified.

(3) Display List-0 Data Swapping Register (LCDC_VSPD_VI6_DL_SWAP0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0114h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	LWS	WDS	BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	LWS	0h	RW	Display List Data Swapping in long word Units The effect of this bit setting is defined in **Table 9.4-8**. 0b: Data swapping in long word (32-bit) units is disabled 1b: Data swapping in long word (32-bit) units is enabled
1	WDS	0h	RW	Display List Data Swapping in Word Units The effect of this bit setting is defined in **Table 9.4-8**. 0b: Data swapping in word (16-bit) units is disabled 1b: Data swapping in word (16-bit) units is enabled
0	BTS	0h	RW	Display List Data Swapping in Byte Units The effect of this bit setting is defined in **Table 9.4-8**. 0b: Data swapping in byte (8-bit) units is disabled 1b: Data swapping in byte (8-bit) units is enabled

Table 9.4-8 shows the data order before and after swapping according to the long word, word, and byte swapping settings.

When data order in memory for each format is the same as **Table 9.4-34**, set 111b to {LWS, WDS, BTS}. If data order is not the same as the definition, change data order within 8byte unit by these bits as shown in **Table 9.4-8**.

Table 9.4-8 Changing Data Order According to Display List Swap Register

Data order in memory											
Byte address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7	*_LWS	*_WDS	*_BTS
Data	0	1	2	3	4	5	6	7	1	1	1
	1	0	3	2	5	4	7	6	1	1	0
	2	3	0	1	6	7	4	5	1	0	1
	3	2	1	0	7	6	5	4	1	0	0
	4	5	6	7	0	1	2	3	0	1	1
	5	4	7	6	1	0	3	2	0	1	0
	6	7	4	5	2	3	0	1	0	0	1
	7	6	5	4	3	2	1	0	0	0	0

Data order defined in **Table 9.4-34**								
Byte address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7
Data	0	1	2	3	4	5	6	7

(4) Extended Display List-0 Control Register (LCDC_VSPD_VI6_DL_EXT_CTRL0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 011Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NWE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	POLINT[5:0]						-	-	DLPRI	EXPRI	-	-	-	EXT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	NWE	0h	RW	No Wait for Polling When this bit is set to 1b, the polling condition for extended display lists is always assumed to be true.
15 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	POLINT[5:0]	00h	RW	Extended Display List Command Control Always specify 2h.
7 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5	DLPRI	0h	RW	Display List Control 0 Always specify 1b.
4	EXPRI	0h	RW	Display List Control 1 Always specify 0b.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	EXT	0h	RW	Extended Display List for WPF0 Enables or disables the extended display list function. When extended display lists are used, the display list header size is 96 bytes; when they are not used, the header size is 80 bytes. 0b: No extended display lists are used 1b: Extended display lists are used [Note] When using extended display lists, be sure to also use normal display list mode (VI6_DL_CTRL.DLE0); executing only extended display lists is not possible. When the header-less display list mode is activated, this bit should be set to 0. The extended display list cannot be used with the header-less display list mode. Extended Display List is available only for VSPD/LIF0 to realized AUTO-FLD or AUTO-DISP.

(5) Display List Body Size Register-0 (LCDC_VSPD_VI6_DL_BODY_SIZE0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 0120h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	UPD0	-	-	-	-	-	-	-	BS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BS0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	UPD0	0h	RW	Update Flag This bit controls the download of the display list at the next downloading timing in case that the header-less display list mode is used. Set 1b to this bit when display list need to be downloaded for next frame. This bit is automatically cleared to 0b after VI6_DL_HDR_ADDRn and VI6_DL_BODY_SIZE0.BS0 is downloaded in H/W side. When this bit is set to 1b, the value of VI6_DL_HDR_ADDR0 and VI6_DL_BODY_SIZE0.BS0 should not be changed. 0b: Updating display list for the next frame is not reserved 1b: Updating display list for the next frame is reserved
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16 to 0	BS0[16:0]	00000h	RW	Header-less Display List Body Size (WPF0) These bits are used for specifying the body size of the display list in case of header-less display list mode. The unit of the size is byte. The value should be set in multiples of 8.

See **9.4.5.8.2 Controlling two register planes using display lists** for detail.

(6) Display List-0 Header Reference Address Register (LCDC_VSPD_VI6_DL_HDR_REF_ADDR0)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0130h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DL_HDR_REF_PTR-0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL_HDR_REF_PTR-0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_REF_ PTR-0[31:0]	00000000h	R	Display List-n reference Header Address Following value is read out from the VI6_DL_HDR_REF_ADDR0 for each period. (1) When H/W is reading display list from external memory, header address of the display list referred by VSPD-H/W is read out. (2) When H/W is not reading display list from external memory, the value of VI6_DL_HDR_ADDR0 is read out. For details, refer to **9.4.5.8.1 Operation flow of VSPD and DU**.

(7) Display List-0 Wake Up Counter Register (VI6_DL_WUPCNT0)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0158h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.4.3.2.6 RPF Control Registers

(1) RPFn Basic Read Size Registers (LCDC_VSPD_VI6_RPFn_SRC_BSIZE) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0300h (n = 0)
<LCDC_vspd_base> + 0400h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	BHSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	BVSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	BHSIZE[12:0]	0000h	RW	Horizontal Size of RPF Basic Read Area These bits specify the horizontal size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 1920 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EHSIZE).
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	BVSIZE[12:0]	0000h	RW	Vertical Size of RPF Basic Read Area These bits specify the vertical size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 1920 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EVSIZE).

Figure 9.4-7 shows the relationship between the basic read size and extended read size. The RPF reads data from the source memory area specified by the basic read size. The RPF repeats reading the basic read area in the horizontal and vertical directions up to the extended read size and sends the read data to the processing modules in the VSPD.

For basic read size reading, the reading start address, called the RPFn source image storing address, should be specified in VI6_RPFn_SRCM_ADDR_*. In the memory area where the basic read area image is stored, the distance (number of bytes) between addresses for lines n and n + 1 of two-dimensional image data, called the memory stride, should be specified in VI6_RPFn_SRCM_PSTRIDE.

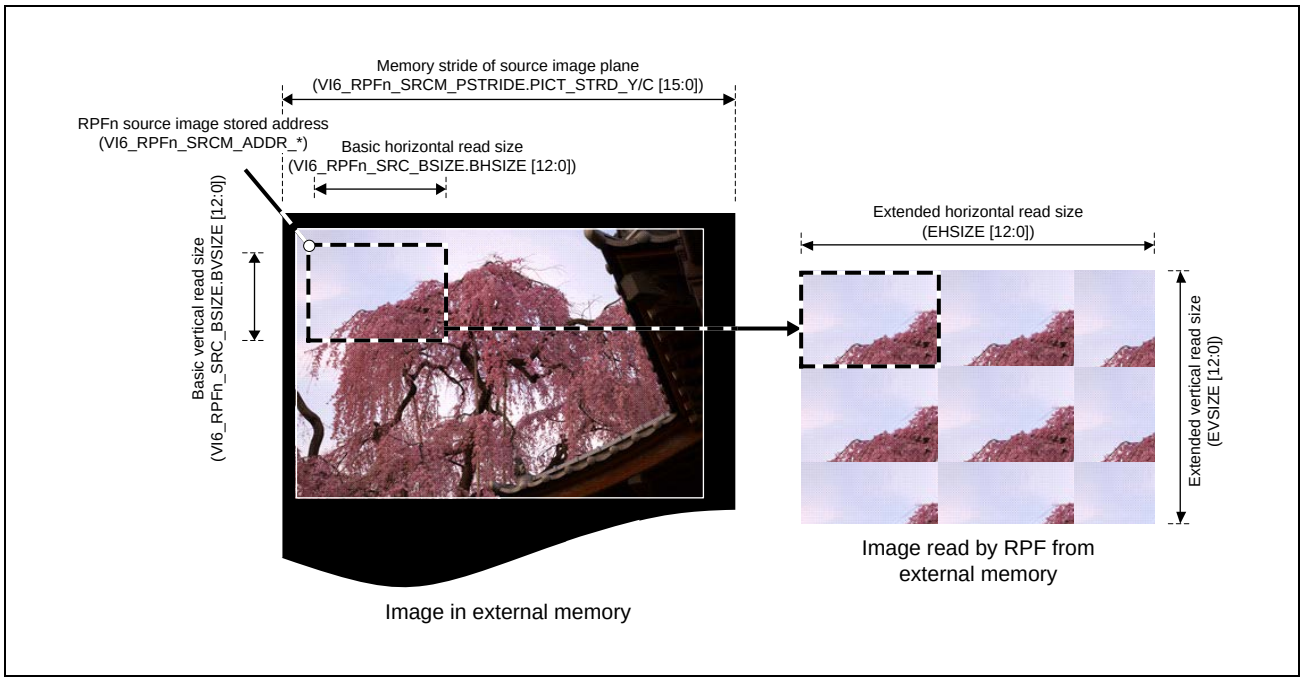

Figure 9.4-7 Relationship between Basic Read Size and Extended Read Size

Refer also to the following sections.

- **(2) RPFn Extended Read Size Registers (LCDC_VSPD_VI6_RPFn_SRC_ESIZE)**
- **(13) RPFn Source Picture Memory Stride Setting Registers (LCDC_VSPD_VI6_RPFn_SRCM_PSTRIDE)**
- **(15) RPFn Source Y/RGB Address Registers (LCDC_VSPD_VI6_RPFn_SRCM_ADDR_Y)**
- **(16) RPFn Source Chroma Address Registers 0 (LCDC_VSPD_VI6_RPFn_SRCM_ADDR_C0)**
- **(17) RPFn Source Chroma Address Registers 1 (LCDC_VSPD_VI6_RPFn_SRCM_ADDR_C1)**

(2) RPFn Extended Read Size Registers (LCDC_VSPD_VI6_RPFn_SRC_ESIZE)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0304h (n = 0)
<LCDC_vspd_base> + 0404h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	EHSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	EVSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	EHSIZE[12:0]	0000h	RW	RPF Extended Horizontal Read Size These bits specify the horizontal size of the extended read area to which the RPFn reads data from the external RAM. As shown in **Figure 9.4-7**, the basic read area image is repeatedly placed in the extended read area; in the EHSIZE bits, specify a value not smaller than the horizontal size of the basic read area. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 1920 can be specified.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	EVSIZE[12:0]	0000h	RW	RPF Extended Vertical Read Size These bits specify the vertical size of the extended read area to which the RPFn reads data from the external RAM. As shown in **Figure 9.4-7**, the basic read area image is repeatedly placed in the extended read area; in the EVSIZE bits, specify a value not smaller than the vertical size of the basic read area. When the input format is YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 1920 can be specified.

VI6_RPFn_SRC_ESIZE specifies the extended size for RPFn. The extended horizontal and vertical sizes should be equal to or greater than the basic sizes specified in VI6_RPFn_SRC_BSIZE. The RPF internal data processing described later and image processing described in **9.4.3.2.8 DPR Control Registers** and later sections are all applied to the image in the extended read size shown on the right side in **Figure 9.4-7**.

(3) RPFn Input Format Registers (LCDC_VSPD_VI6_RPFn_INFMT) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0308h (n = 0)
<LCDC_vspd_base> + 0408h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VIR	-	-	-	-	-	-	-	-	-	-	-	CIPM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPYCS	SPUVS	CEXT[1:0]		RDTM[2:0]			CSC	-	RDFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	VIR	0h	RW	Virtual Input Enable Enables or disables the virtual input function of the RPFn. The image to be processed by the RPFn is usually read from the external memory by the MAU. Instead of this input, the virtual input function generates a single-color image within the RPFn and sends it to the modules in VSPD. When the virtual input function is enabled, the fixed value specified in VI6_RPFn_VRTCOL_SET is used as the input to the RPFn. While the virtual input function is enabled, data is not read from the external memory; that is, the α plane is not read and the IROP calculation thus cannot be executed. In this case, set VI6_RPFn_ALPH_SEL.ASEL to 4. Neither the color space conversion through CSC nor the color keying described in **9.4.3.2.6 (11) RPFn Color Keying Control Registers (VI6_RPFn_CKEY_CTRL)** can be used. 0b: RPFn uses general input. 1b: RPFn uses virtual input.
27 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	CIPM	0h	RW	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside VSPD in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is up-sampled as shown in **Figure 9.4-8** for internal processing. This bit specifies the method of up-sampling for this purpose. 0b: The nearest-neighbor method is used for horizontal chrominance interpolation. 1b: The bilinear method is used for horizontal chrominance interpolation.
15	SPYCS	0h	RW	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1b and set the RDFMT bits to 71 (47h). When the input format is YVYU, set this bit and the SPUVS bit to 1b and set the RDFMT bits to 71 (47h). In other cases, set this bit to 0b.
14	SPUVS	0h	RW	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1b and set the RDFMT bits to 65 (41h). When the input format is NV21, set this bit to 1b and set the RDFMT bits to 66 (42h). When the input format is YVYU, set this bit and the SPYCS bit to 1b and set the RDFMT bits to 71 (47h). In other cases, set this bit to 0b.
13, 12	CEXT[1:0]	0h	RW	Lower-Bit Color Data Extension Method Setting When an RGB input format where each color component is expressed in less than 8 bits are selected from **Table 9.4-10** through the RDFMT bits, VSPD internally extends each color component to 8 bits before using the data. These bits select this extension method. 00b: Lower-order bits of color data are extended with 0. 01b: Upper-order bits of color data are copied to the lower -order bits. 10b: Lower-order bits of color data are extended with 0. The maximum value is limited to FFh. 11b: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
11 to 9	RDTM[2:0]	0h	RW	CSC Conversion Expression Setting These bits select the expression used for color space conversion. The conversion direction is RGB → YCbCr when RGB is selected through the RDFMT bits; the direction is YCbCr → RGB when YCbCr is selected. 0h: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 1h: BT.601 YCbCr [0,255] ↔ RGB [0,255] 2h: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 3h: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 4h to 7h: Setting prohibited
8	CSC	0h	RW	Color Space Conversion Enable Enables or disables color space conversion between YCbCr and RGB to be executed in RPFn. The characteristics of color space conversion are determined by the RDTM bit setting.*1 When using the virtual input (VIR = 1b), specify 0b. 0b: Color space conversion is disabled. 1b: Color space conversion is enabled.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 0	RDFMT[6:0]	00h	RW	RPF Input Image Format Setting These bits select the format of the image input from the external RAM to the RPFn. Select a value corresponding to the desired format from those shown in **Table 9.4-10**, **Table 9.4-11**, and **Table 9.4-12**. When the virtual input function is used (VIR = 1b), the color information for the virtual input should be specified in VI6_RPFn_VRTCOL_SET. If this color information is in the RGB format, set the RDFMT bits to 19. If the color information is in the YCbCr format, set these bits to 64. [Note] Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. Observe these restrictions when specifying the image size in VI6_RPFn_SRC_BSIZE and VI6_RPFn_SRC_ESIZE.

Note 1. Note on color space settings

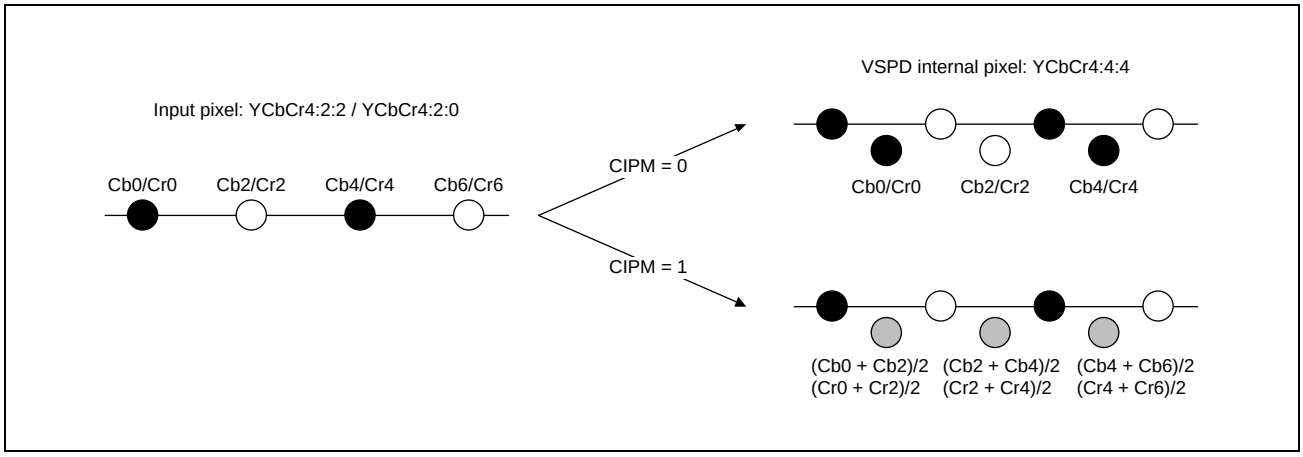

Figure 9.4-8 Chrominance Interpolation Methods Selectable through CIPM Setting

The color space for the image output from the RPF to VSPD internal modules is determined by the combination of the color space for the image input to the RPF, which is selected through the VI6_RPFn_INFMT.RDFMT setting, and the enabled or disabled state of the color space conversion function, which is selected through the VI6_RPFn_INFMT.CSC setting (**Table 9.4-9**). For example, when the image input to the RPF is in the YCbCr format, the RPF outputs data to VSPD internal modules in the YCbCr format if color space conversion is disabled through the CSC bit, and the RPF outputs data in the RGB format if color space conversion is enabled. When the image input to the RPF is in the RGB format, the relationship between the output format and the color space conversion setting is the opposite of the YCbCr case. For some VSPD internal modules, the YCbCr format is recommended for image processing because of the characteristics of the processing, or the same color space needs to be specified between multiple RPF outputs. In these

cases, set VI6_RPFn_INFMT.RDFMT and VI6_RPFn_INFMT.CSC appropriately so that the RPFs can output the required color space according to the color space conditions described above.

Table 9.4-9 RPFn Input Color Space and Output Color Space

RPFn Input Color Space (VI6_RPFn_INFMT. RDFMT)		Color Space Conversion Setting (VI6_RPFn_INFMT.CSC)		RPFn Output Color Space
RGB	(00h to 3Fh)*1	Disabled	(0)*1	RGB
		Enabled	(1)*1	YCbCr
YCbCr	(40h to 7Fh)*1	Disabled	(0)*1	YCbCr
		Enabled	(1)*1	RGB

Note 1. Value specified in the register

A color space conversion function equivalent to that in the RPFn is also provided by the WPF. As shown in **Table 9.4-9**, the color space (YCbCr or RGB) output from the RPF becomes the input format for the WPF. Here, the color space of the output image obtained by the color space conversion function of the WPF must match the color space of the format specified through VI6_WPFn_OUTFMT.WRFMT.

Figure 9.4-9 shows the relationship between the input/output format and color space. The input color space for the RPF is determined when the input image format for the RPF is specified through the RDFMT bits. The color space for the image output from the RPF to subsequent VSPD internal modules depends on the combination of the RPF input format and CSC (color space conversion function) enabled or disabled state in the RPF as shown in **Table 9.4-9** and **Figure 9.4-9**. The user should first determine whether the image processing in the VSPD is done in YCbCr or RGB, and then specify the RPF input format and CSC enabled or disabled state to obtain the desired color space. The color space of the RPF output image is also that of the WPF input image; the color space of the data output from the WPF to the outside of VSPD depends on the combination of the WPF input color space and the enabled or disabled state of the CSC implemented in the WPF as shown in **Figure 9.4-9**. The color space of the WPF output image must match that of the WPF output format (determined by VI6_WPFn_OUTFMT.WRFMT). For example, in the flow shown in **Figure 9.4-9**, YCbCr should not be specified as the WPF output format regardless of the fact that the color space of the WPF output image is in RGB format.

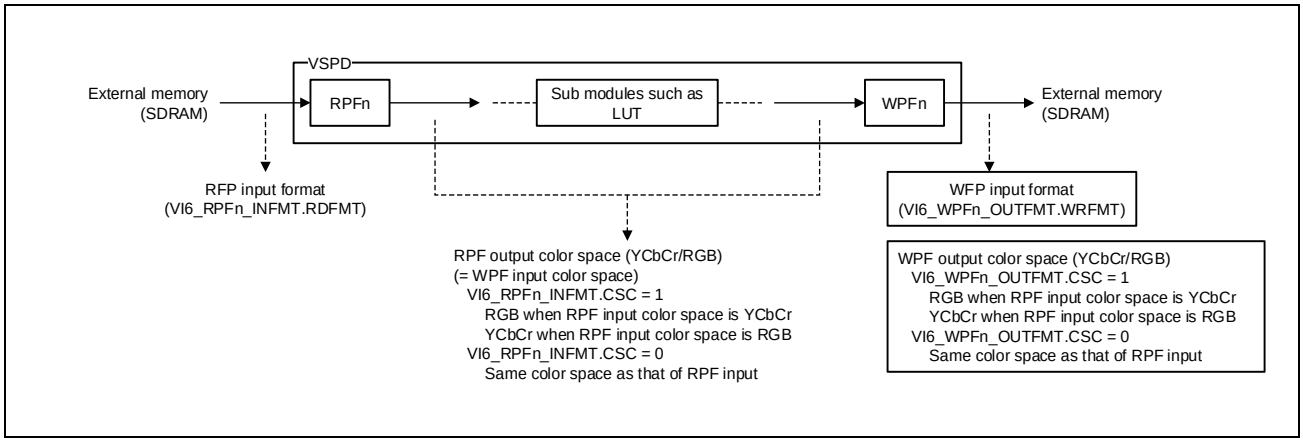

Figure 9.4-9 Relationship between Input/output Format and Color Space

7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	P_LLS	0h	RW	Picture Plane Data Swapping in LONG LWORD Units The effect of this bit setting is defined in **Table 9.4-14**. 0b: Data swapping in LONG LWORD (64-bit) units is disabled 1b: Data swapping in LONG LWORD (64-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.
2	P_LWS	0h	RW	Picture Plane Data Swapping in long word Units The effect of this bit setting is defined in **Table 9.4-14**. 0b: Data swapping in long word (32-bit) units is disabled 1b: Data swapping in long word (32-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.
1	P_WDS	0h	RW	Picture Plane Data Swapping in Word Units The effect of this bit setting is defined in **Table 9.4-14**. 0b: Data swapping in Word (16-bit) units is disabled 1b: Data swapping in Word (16-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.

Bit	Bit Name	Initial Value	R/W	Description
0	P_BTS	0h	RW	Picture Plane Data Swapping in Byte Units The effect of this bit setting is defined in **Table 9.4-14**. 0b: Data swapping in Byte (8-bit) units is disabled 1b: Data swapping in Byte (8-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.

When the virtual input function of the RPFn is used (VI6_RPFn_INFMT.VIR = 1), this register setting is ignored. Swapping of RPF input data can be specified separately for the α plane and picture plane.

Table 9.4-13 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as **Table 9.4-10** for RGB format and **Figure 9.4-10** to **Figure 9.4-13** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in **Table 9.4-13**.

Table 9.4-13 Changing Data Order According to Swap Register

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	HCOORD[12:0]	0000h	RW	Horizontal Coordinate of Sublayer Display Location on Master Layer These bits specify the left-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the horizontal coordinate of the location in pixel units with the left-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0b. If the sublayer extends beyond the master layer according to the HCOORD setting, the extended section is cut off at the right end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the right end of the master layer. A value from 0 to 1919 can be specified.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VCOORD[12:0]	0000h	RW	Vertical Coordinate of Sublayer Display Location on Master Layer These bits specify the top-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the vertical coordinate of the location in pixel units with the top-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0b. If the sublayer extends beyond the master layer according to the VCOORD setting, the extended section is cut off at the bottom end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the bottom end of the master layer. A value from 0 to 1919 can be specified.

Figure 9.4-14 shows an example of RPF1 offsets with respect to master layer RPF0. Although this figure only shows sublayers RPF1, specify offsets for all RPFs other than the master layer in the same way as shown in this example.

Whether an RPFn is the master layer or a sublayer is determined through the selection of the source RPF for WPFn (the VI6_WPFn_SRCRPF setting). For details, refer to **(1) WPF0-Source-RPF Register (LCDC_VSPD_VI6_WPF0_SRCRPF)**.

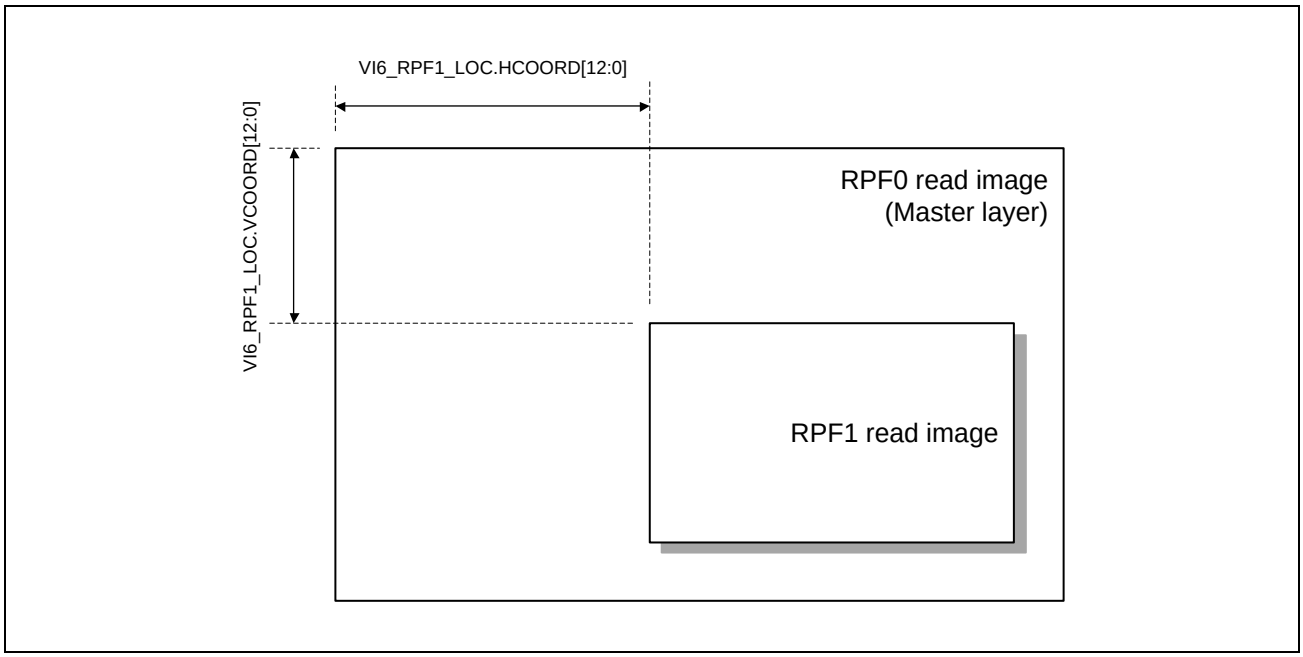

Figure 9.4-14 RPF1 Offsets from Master Layer

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 28	ASEL[2:0]	0h	RW	α Format and Processing Method Select These bits select how to handle the α value to be used. The RPF handles two types of α value; 8-bit and 1-bit values. When a 1-bit α value is used, VSPD assumes that the 1-bpp α value for each pixel is stored in the order from MSB to LSB in each byte (big endian). The α value is used as either transparency information or mask information. Transparency information is included in the α plane read from external memory when the ASEL bits are set to 1 or 3 and in the α value stored in the packed RGB bit field when these bits are set to 0 or 2. The α value as transparency information is sent as the destination value to the IROP as shown in **Figure 9.4-15** and then output to the subsequent modules. The output α value is used, for example, for blending in the BRS. The α value as mask information is used for IROP operation in the RPF. The mask information is included in the α plane read from external RAM when the ASEL bits are set to 0 or 2 and the source value is used in IROP operation (IROP setting other than 0, 5, 10, or 15). This α value is sent as the source value to the IROP as shown in **Figure 9.4-15**. Note that the α value selected through the ASEL bits has a lower priority than the VI6_RPFn_CKEY_SET*.AP* value replaced through the color keying function. When the color keying function is used, the α value may be replaced with the VI6_RPFn_CKEY_SET*.AP* value regardless of the ASEL bit setting. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1b), specify 4. 0h: 1, 4, or 8-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The α bit field in 1, 4, or 8-bit packed α is handled as transparency information. Be sure to specify the packed format that includes α through VI6_RPFn_INFMT.RDFMT. When VI6_RPFn_MSKCTRL.MSK_EN is 0b and the IROP bit value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 1h: 8-bit plane α The 8-bit α plane is read from external RAM as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. The α value goes through the 8-bit transparent α generator shown in **Figure 9.4-15** without change. When VI6_RPFn_MSKCTRL.MSK_EN is 0b, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1b. IROP operation can be executed.

Bit	Bit Name	Initial Value	R/W	Description
				2h: 1-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The 1-bit packed α input is converted by the 8-bit transparent α generator shown in **Figure 9.4-15** according to the ALPHA0/1 setting into the 8-bit α value as transparency information. Select the packed input format that includes a 1-bit α field. When VI6_RPFn_MSKCTRL.MSK_EN is 0b and the IROP value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 3h: 1-bit plane α The 1-bit α plane is read from external RAM and converted by the 8-bit transparent α generator shown in **Figure 9.4-15**. according to the ALPHA0/1 setting into the 8-bit α value as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. When VI6_RPFn_MSKCTRL.MSK_EN is 0b, IROP operation cannot be executed; set the IROP bits to 0b in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1b. IROP operation can be executed. 4h: Fixed α The fixed α value (VI6_RPFn_VRTCOL_SET.LAYA value) is output from the RPF. IROP operation cannot be executed; set the IROP bits to 0 in this case. 5 to 7: Setting prohibited.
27 to 24	IROP[3:0]	0h	RW	IROP Operation Setting These bits specify the operator to be executed in the IROP operation unit shown in **Figure 9.4-15**. The source (S) for the IROP operation is the pixel data and α data specified in the VI6_RPFn_MSKSET0 or VI6_RPFn_MSKSET1 IROP input value register, which is selected according to the value (0 or 1) generated by the 1-bit mask generator. The destination (D) is the image data (RGB/YCbCr) and 8-bit α data output from the unpack/OSD processor. IROP operation is applied both for the image data and α data between the source and destination data. If these bits are set to the operation that involves the source (S) (IROP setting other than 0, 5, 10, or 15) while VI6_RPFn_MSKCTRL.MSK_EN is 0b, the α plane is read from the external RAM to be used for the α value for IROP operation; specify the α plane read start address (VI6_RPFn_SRCM_ADDR_A). When the virtual input function is used (VI6_RPFn_INFMT.VIR = 1b), IROP operation is not available; set these bits to 0000b. 0000b: NOP(D) 0001b: AND(S & D) 0010b: AND_REVERSE(S & ~D) 0011b: COPY(S) 0100b: AND_INVERTED(~S & D) 0101b: CLEAR(0) 0110b: XOR(S ^ D) 0111b: OR(S | D) 1000b: NOR(~(S | D)) 1001b: EQUIV(~(S ^ D)) 1010b: INVERT(~D) 1011b: OR_REVERSE(S | ~D) 1100b: COPY_INVERTED(~S) 1101b: OR_INVERTED(~S | D) 1110b: NAND(~(S & D)) 1111b: SET(all 1)
23	BSEL	0h	RW	α Bit Count Conversion Selection for 1-Bit Mask Generator Specifies the number of bits in the α plane to be read as mask information from the external RAM. The α value in mask information is used for the source (S) in IROP. When α plane data is 8 bits, it is converted to one bit through the 1-bit mask generator shown in **Figure 9.4-15**. Note that this bit setting is valid when the ASEL bits are set to 0 or 2 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0b. In other cases, this bit setting has no effect. 0b: 8-bit α is converted to 1-bit α through the 1-bit mask generator. When the 8-bit α value input to the RPF is not 0, it is converted to 1b; when the value is 0, it is converted to 0b. 1b: α value goes through the 1-bit mask generator. The 1-bit α value input to the RPF is output through the 1-bit mask generator without change.
22 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
19, 18	AEXT[1:0]	0h	RW	Lower-Bit α Value Extension Method Set These bits specify the method for extending the input α data to 8 bits through the unpack processing. 00b: The lower-order bits of α value are extended with 0. 01b: The upper-order bits of α value are copied to the lower-order bits. 10b: The lower-order bits of α value are extended with 0. The maximum value is limited to FFh. 11b: Setting prohibited
17, 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 8	ALPHA1[7:0]	00h	RW	8-Bit α Value Output when 1-Bit α Value is 1 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 9.4-15** is 1b. This setting is valid when the ASEL bits are set to 010b or 011b. A value from 0 to 255 can be specified.
7 to 0	ALPHA0[7:0]	00h	RW	8-Bit α Value Output when 1-Bit α Value is 0 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 9.4-15** is 0b. This setting is valid when the ASEL bits are set to 010b or 011b. A value from 0 to 255 can be specified.

Figure 9.4-15 shows the relationship between the α selector, IROP operation unit, color keying unit, and related registers. The IROP operation unit receives two inputs, source and destination. The image data input from the external memory is processed through the unpack processor and 8-bit transparent α generator and then input to the IROP operation unit as destination data. The α plane data input from the external memory is sent to the 8-bit transparent α generator when the ASEL bits are set to 1 or 3, or sent to the 1-bit mask α generator when the ASEL bits are set to 0 or 2. For the pixel data and 8-bit α value on the source side of the IROP operation unit, either the VI6_RPFn_MSKSET0 value or VI6_RPFn_MSKSET1 values will be selected according to the 1-bit α value output by the 1-bit mask α generator.

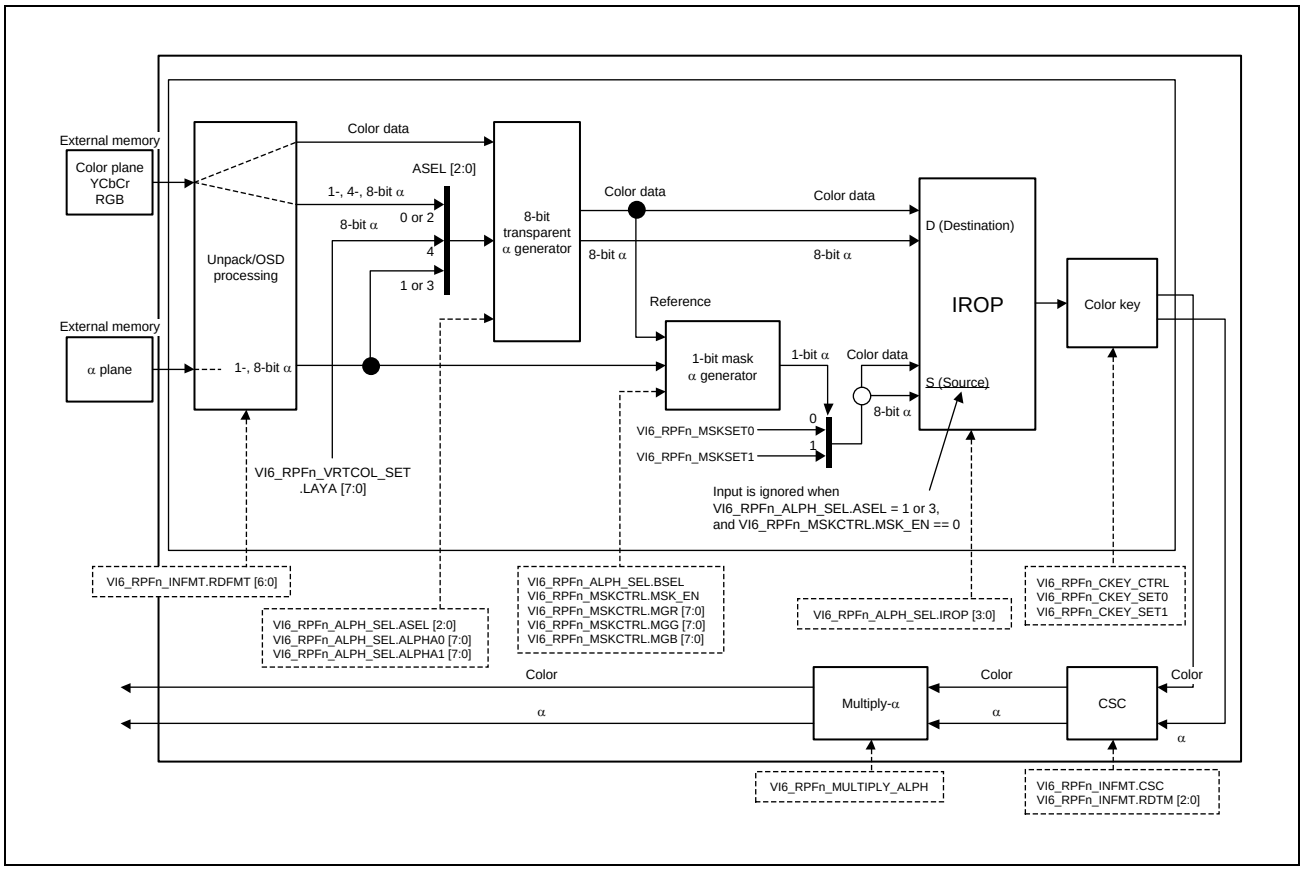

Figure 9.4-15 Configuration of alpha Selector and IROP Operation Unit in RPF

The following describes the function of each block shown in **Figure 9.4-15**. Read the following while referring to the figure as necessary.

Unpack/OSD processor:

Unpacks each component and α value of the image data according to the packed format specified in VI6_RPFn_INFMT.RDFMT.

8-bit transparent α generator:

Converts the input α value into 8-bit α when the input α is four bits or one bit.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α), this generator outputs the input α value without change if the α bit field in the packed α data is 8 bits; if the α bit field is less than 8 bits, it is converted to an 8-bit α value by extending the LSB side according to the VI6_RPFn_ALPH_SEL.AEXT setting.

When VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 4 (fixed α), this generator outputs the input 8-bit plane α without change. If a packed α value is included in RGB data, it is discarded.

When VI6_RPFn_ALPH_SEL.ASEL are set to 2 (1-bit packed α) or 3 (8-bit α generated from 1-bit plane α), an 8-bit α value is generated by using the VI6_RPFn_ALPH_SEL.ALPHA0 [7:0] value when the input 1-bit α value is 0 or by using the VI6_RPFn_ALPH_SEL.ALPHA1 [7:0] value when the input 1-bit α value is 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 3, a packed α value that is included in RGB data is discarded.

1-bit mask α generator:

Generates 1-bit α data from the input 8-bit α data or pixel data. When the input α data is one bit, this generator outputs it without change.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α) or 2 (plane α) and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the α plane read from the external memory to be used in IROP is converted to 1-bit α data when necessary. When the α plane data read from the external RAM is 8 bits (BSEL = 0), if the value is 0, a 1-bit α value of 0b is generated; if the value is not 0, a 1-bit α value of 1b is generated. When the α plane data is one bit (BSEL = 1), this generator outputs it without change.

When the value of the 1-bit α generated by the 1-bit mask α generator is 0b, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET0 are output as the source. When the generated 1-bit α value is 1b, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET1 are output as the source.

As shown in **Figure 9.4-15**, when VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 3 (1-bit plane α), the α plane read from the external RAM is sent to the 8-bit transparent α generator as transparency information. When VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the 1-bit α for masking is generated according to the input α plane (refer to **(8) RPFn Mask Control Registers (LCDC_VSPD_VI6_RPFn_MSKCTRL)**), but the 1-bit mask α generator does not refer to the input α plane because it is input to the 8-bit transparent α generator as transparency information. Accordingly, the 1-bit mask α generator does not generate a 1-bit α for masking and the data on the source side becomes invalid; that is, IROP operation cannot be executed. Set the IROP bits to 0 in this case. In contrast, when VI6_RPFn_MSKCTRL.MSK_EN is set to 1, the 1-bit mask α generator creates α data for masking according to the pixel data instead of the input α plane data, and IROP operation can be executed in this case.

IROP operation unit:

Executes ROP operation according to the opcode specified in VI6_RPFn_ALPH_SEL.IROP. For ROP operation (other than NOP), valid values should be input both for the source and destination. As described in the above (description of the 1-bit mask α generator), when VI6_RPFn_ALPH_SEL.ASEL are set to 1 or 3 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the source data for the IROP operation unit is treated as invalid; set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP). When VI6_RPFn_ALPH_SEL.ASEL are set to 4, a fixed α value is output from the RPF and IROP operation is not available. In the same way as the above case, set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP).

To specify a valid source value for the IROP operation unit and execute IROP operation (specify an opcode other than NOP in the IROP bits), specify register values as shown in **Table 9.4-14**. Where the source input state is indicated as “Valid” in the table, IROP operation can be executed. In the cases where IROP operation is not available, set the IROP bits to 0 (NOP).

Table 9.4-14 Source Input State in IROP Operation Unit

VI6_RPFn_ALPH_SEL.ASEL[2:0]		VI6_RPFn_MSKCTRL.MSK_EN		
		0 (Source data is generated according to input α plane)		1 (Source data is generated according to the destination-side pixel data)
000b	(1-, 4-, or 8-bit packed α + plane α)	Valid	(α plane input)	Valid
001b	(8-bit α plane)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
010b	(8-bit α generated from 1-bit packed α + plane α)	Valid	(α plane input)	Valid
011b	(8-bit α generated from 1-bit plane α)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
100b	(Fixed α)	Invalid (IROP operation is not available; fixed α is output to the subsequent modules behind RPF)		

For the handling of the α values shown in **Figure 9.4-15** and **Table 9.4-14**, the relationship between the RPF input format and RPF output α value is shown in **Table 9.4-15**. Where only bit names are shown in the table, the bits are in VI6_RPFn_ALPH_SEL described in this section.

Table 9.4-15 α Value Selected and Output according to ASEL Bits in Each Input Format

ASEL Setting		α Value Output for Each Input Format	
		RGB	YCbCr
000b	(8-, 4-, or 1-bit packed α is input)	1-, 4-, or 8-bit pixel α	FFh*1
001b	(8-bit plane α is input)	8-bit α plane	8-bit α plane
010b	(8-bit α is generated from the 1-bit packed α input)	ALPHA0 or ALPHA1 setting	FFh*1
011b	(8-bit α is generated from the 1-bit plane α input)	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting
100b	(Fixed α is output)	VI6_RPFn_VRTCOL_SET.LAYA setting	

Note 1. Fixed value FFh is output because packed α is not included in YCbCr.

(7) RPFn Virtual Plane Color Information Registers (LCDC_VSPD_VI6_RPFn_VRTCOL_SET) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0318h (n = 0)
<LCDC_vspd_base> + 0418h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LAYA[7:0]								LAYR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LAYG[7:0]								LAYB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	LAYA[7:0]	00h	RW	Virtual-Input Fixed α Value These bits specify the fixed α value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When the virtual input function is disabled (VI6_RPFn_INFMT.VIR = 0b), these bits are used to specify the fixed α value to be output from the RPF while VI6_RPFn_ALPH_SEL.ASEL are set to 4. A value from 0 to 255 can be specified.
23 to 16	LAYR[7:0]	00h	RW	Virtual-Input Fixed R/Cr Component Value These bits specify the fixed R or Cr value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the R value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cr value. A value from 0 to 255 can be specified.
15 to 8	LAYG[7:0]	00h	RW	Virtual-Input Fixed G/Y Component Value These bits specify the fixed G or Y value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the G value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Y value. A value from 0 to 255 can be specified.
7 to 0	LAYB[7:0]	00h	RW	Virtual-Input Fixed B/Cb Component Value These bits specify the fixed B or Cb value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the B value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cb value. A value from 0 to 255 can be specified.

(8) RPFn Mask Control Registers (LCDC_VSPD_VI6_RPFn_MSKCTRL) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 031Ch (n = 0)
<LCDC_vspd_base> + 041Ch (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	MSK_EN	MGR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MGG[7:0]								MGB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	MSK_EN	0h	RW	Mask Generation Specification Specifies the method of α value generation in the 1-bit mask α generator shown in **Figure 9.4-15**. 0b: A 1-bit mask value is generated according to the input α plane value. When the input α is in the 1-bit format (VI6_RPFn_ALPH_SEL.BSEL = 1b), the 1-bit mask value is output without change. When the input α is in the 8-bit format (VI6_RPFn_ALPH_SEL.BSEL = 0b), the 1-bit mask value is 0 if the α value is 00h; otherwise, the 1-bit mask value is 1. 1b: The R/Cr, G/Y, and B/Cb components of the image input to the destination side of the IROP operation unit are compared with the values specified in the MGR, MGG, and MGB bits, respectively. When all values match, 1 is output as the 1-bit mask value, and in other cases, 0 is output. When the generated 1-bit mask data is not used, set VI6_RPFn_ALPH_SEL.IROP to 0b.
23 to 16	MGR[7:0]	00h	RW	R/Cr Comparison Value for 1-Bit α Generation These bits specify the R/Cr value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R value for comparison. When YCbCr is specified, specify a Cr value for comparison. This setting is ignored when the MSK_EN bit is set 0b. A value from 0 to 255 can be specified.
15 to 8	MGG[7:0]	00h	RW	G/Y Comparison Value for 1-Bit α Generation These bits specify the G/Y value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G value for comparison. When YCbCr is specified, specify a Y value for comparison. This setting is ignored when MSK_EN is set to 0b. A value from 0 to 255 can be specified.
7 to 0	MGB[7:0]	00h	RW	B/Cb Comparison Value for 1-Bit α Generation These bits specify the B/Cb value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B value for comparison. When YCbCr is specified, specify a Cb value for comparison. This setting is ignored when MSK_EN is set to 0b. A value from 0 to 255 can be specified.

(9) RPFn IROP-SRC Input Value Registers 0 (LCDC_VSPD_VI6_RPFn_MSKSET0) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0320h (n = 0)
<LCDC_vspd_base> + 0420h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSA0[7:0]								MSR0[7:0]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA0[7:0]	00h	RW	IROP-Source Input α Value when 1-Bit α is 0 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.4-15**). A value from 0 to 255 can be specified.
23 to 16	MSR0[7:0]	00h	RW	IROP-Source Input R/Cr Value when 1-Bit α is 0 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.4-15**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG0[7:0]	00h	RW	IROP-Source Input G/Y Value when 1-Bit α is 0 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.4-15**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB0[7:0]	00h	RW	IROP-Source Input B/Cb Value when 1-Bit α is 0 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.4-15**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

(10) RPFn IROP-SRC Input Value Registers 1 (LCDC_VSPD_VI6_RPFn_MSKSET1) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0324h (n = 0)
<LCDC_vspd_base> + 0424h (n = 1)

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA1[7:0]	00h	RW	IROP-Source Input α Value when 1-Bit α is 1 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1. A value from 0 to 255 can be specified **(Figure 9.4-15)**.
23 to 16	MSR1[7:0]	00h	RW	IROP-Source Input R/Cr Value when 1-Bit α is 1 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 9.4-15**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG1[7:0]	00h	RW	IROP-Source Input G/Y Value when 1-Bit α is 1 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 9.4-15**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB1[7:0]	00h	RW	IROP-Source Input B/Cb Value when 1-Bit α is 1 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 9.4-15**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

(11) RPFn Color Keying Control Registers (LCDC_VSPD_VI6_RPFn_CKEY_CTRL) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0328h (n = 0)
<LCDC_vspd_base> + 0428h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	LTH	-	-	-	CV	-	-	SAPE1	SAPE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	LTH	0h	RW	Transparent color-luma Threshold Mode Enable/Disable This bit enables or disables transparent color-luma threshold mode for the color keying module. In transparent color-luma threshold mode, color information 0 (GY0) specified in VI6_RPFn_CKEY_SET0 register is compared with the input luma values. When the input data is in YCbCr format, and if input Y value is equal to or smaller than specified color information (VI6_RPFn_CKEY_SET0.GY0), the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP0. This bit is available only when the input data is in YCbCr format. When the input data is in an RGB format, set this bit to 0b. This bit setting is valid only when the CV bit is set to 0b; it is ignored when the CV bit is set to 1b. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1b), set this bit to 0b. 0b: Luma threshold mode is disabled (Matched color mode) 1b: Luma threshold mode is enabled
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	CV	0h	RW	Color Replacement Control This bit controls the color replacement function in the color keying module shown in **Figure 9.4-3**. When an RGB format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, and if all components of an input pixel match the color components specified in VI6_RPFn_CKEY_SET0, the color replacement function replaces the values of the input α and all RGB components with the α and color components specified in VI6_RPFn_CKEY_SET1. When a YCbCr format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, only the Y data is compared; if the luminance component of an input pixel matches the value specified in VI6_RPFn_CKEY_SET0.GY0, the color replacement function replaces the values of the input α and all YCbCr components with the α and color components specified in VI6_RPFn_CKEY_SET1. When the CV bit is set to 1, the color replacement function is enabled. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0b: Color replacement function is disabled (transparent color mode). 1b: Color replacement function is enabled.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1	SAPE1	0h	RW	Comparison Color Data Setting 1 Enable/Disable This bit enables or disables comparison color data setting 1 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. In transparent color mode, color information 1 (VI6_RPFn_CKEY_SET1.R1/GY1/B1) specified in VI6_RPFn_CKEY_SET1 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET1.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0b: Comparison color data setting 1 is disabled. 1b: Comparison color data setting 1 is enabled.
0	SAPE0	0h	RW	Comparison Color Data Setting 0 Enable/Disable This bit enables or disables comparison color data setting 0 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0b; it is ignored when the CV bit is set to 1b. In transparent color mode, color information 0 (VI6_RPFn_CKEY_SET0.R0/GY0/B0) specified in VI6_RPFn_CKEY_SET0 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1b), clear this bit to 0b. 0b: Comparison color data setting 0 is disabled. 1b: Comparison color data setting 0 is enabled.

(12) RPFn Color Keying Color Setting Registers-m (LCDC_VSPD_VI6_RPFn_CKEY_SETm) (n = 0, 1) (m = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 032Ch + m x 0004h (n = 0)
<LCDC_vspd_base> + 042Ch + m x 0004h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GY0[7:0]								B0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	AP0[7:0]	00h	RW	α Data in Color Keying Color Information-1 - In transparent color-matched color mode for color keying When the input data matches color setting-0 (R0, GY0, and B0) for transparent color comparison in the color keying module, the input α value is replaced with the value specified in these bits. Specify the α value to replace the input value. - In transparent color-luma threshold mode for color keying When the input data is in YCbCr format, and if input Y value is equal to or smaller than GY0, the input α value is replaced with the value specified in this bit field (AP0). Specify the α value in this bit field (AP0) to replace the input value. - In color replacement mode for color keying These bits are not used in this mode. Clear them to 0. α value replacement through these bits in transparent color mode for color keying takes priority over the α value selected through the VI6_RPFn_ALPH_SEL.ASEL setting. A value from 0 to 255 can be specified.
23 to 16	R0[7:0]	00h	RW	R*[1]/Cr Component Data in Color Keying Color Information-1 - In transparent color-matched color mode for color keying Specify the R component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPE0 setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cr component, and the setting of these bits is ignored. - In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. - In color replacement mode for color keying Specify the R component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.
15 to 8	GY0[7:0]	00h	RW	G*[1]/Y Component Data in Color Keying Color Information-1 - In transparent color-matched color mode for color keying Specify the G/Y component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPE0 setting. - In transparent color-luma threshold mode for color keying Specify the Y component value in the GY0 to be compared. - In color replacement mode for color keying Specify the G/Y component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	B0[7:0]	00h	RW	B*[1]/Cb Component Data in Color Keying Color Information-1 - In transparent color-matched color mode for color keying Specify the B component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPE0 setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored. - In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. - In color replacement mode for color keying Specify the B component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Note 1. When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not 8 bits, the lower-order bits of input data are extended as specified through VI6_RPFn_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

(13) RPFn Source Picture Memory Stride Setting Registers (LCDC_VSPD_VI6_RPFn_SRCM_PSTRIDE) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0334h (n = 0)
<LCDC_vspd_base> + 0434h (n = 1)

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PICT_STRD_Y [15:0]	0000h	RW	Memory Stride of Source Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPFn. A value from 0 to 65535 can be specified. Refer to **Figure 9.4-16** for settings.
15 to 0	PICT_STRD_C [15:0]	0000h	RW	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPFn. When an RGB-format picture is read, these bits do not need to be set. A value from 0 to 65535 can be specified. Refer to **Figure 9.4-16** for settings. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

This register specifies the memory stride of the picture planes in the source area as shown in **Figure 9.4-16**. The memory stride of the α plane should be specified through VI6_RPFn_SRCM_ASTRIDE.ALPH_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in **Figure 9.4-16**. When the α plane is used, the α plane is also read. According to the image format and the necessity of the α plane, specify the necessary addresses where the source image is stored (VI6_RPFn_SRCM_ADDR_Y, VI6_RPFn_SRCM_ADDR_C, and VI6_RPFn_SRCM_ADDR_AI).

Whether the α plane needs to be read is determined according to the α plane selection method and IROP operation type. For details, refer to **(6) RPFn α Plane Selection Control Registers (LCDC_VSPD_VI6_RPFn_ALPH_SEL)**.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C0[31:0]	0000_0000h	RW	Source Image C Plane Storing Address 0 These bits specify in 1-byte units the start address of the source image C plane read by the RPFn. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Figure 9.4-16** or the Cb plane when a planar format is selected. When an interleaved format is selected or the RPF input is in an RGB format, this setting is not used. A value from 0000_0000h to FFFF_FFFFh can be specified. Refer to **Figure 9.4-16** in **(13) RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE)** for settings.

(17) RPFn Source Chroma Address Registers 1 (LCDC_VSPD_VI6_RPFn_SRCM_ADDR_C1) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0344h (n = 0)
<LCDC_vspd_base> + 0444h (n = 1)

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C1[31:0]	0000_0000h	RW	Source Image C Plane Storing Address 1 These bits specify in 1-byte units the start address of the Cr plane when a planar YCbCr format shown in **Figure 9.4-16** is read by the RPFn. This setting is not used when the RPF input is in YCbCr format that is not a planar format or in an RGB format. A value from 0000_0000h to FFFF_FFFFh can be specified. Refer to **Figure 9.4-16** in **(13) RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE)** for settings.

(18) RPFn Source α Address Registers (LCDC_VSPD_VI6_RPFn_SRCM_ADDR_AI) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 0348h (n = 0)
<LCDC_vspd_base> + 0448h (n = 1)

Initial Value : 0000_0000h

9.4.3.2.7 WPF Control Registers

(1) WPF0-Source-RPF Register (LCDC_VSPD_VI6_WPF0_SRCRPF)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 1000h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	VIR_ACT2[1:0]		-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	RPF1_ACT [1:0]		RPF0_ACT [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25, 24	VIR_ACT2[1:0]	0h	RW	Virtual RPF Start Enable in BRS These bits enable start of the virtual RPF in the BRS as the source RPF for the WPF0 when the WPF0 is started. For details of the virtual RPF, refer to the following. **9.4.3.2.10 (1) BRS Input Control Register (VI6_BRS_INCTRL)** **9.4.3.2.10 (2) Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE)** **9.4.3.2.10 (3) Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC)** **9.4.3.2.10 (4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL)** Note that the virtual RPF is in the BRS as shown in **Figure 9.4-29** and there are no register bits for DPR setting related to the virtual RPF. 0h: The virtual RPF in the BRS is not started. 1h: The virtual RPF in the BRS is started as a sublayer source RPF for the WPF0. 2h: The virtual RPF in the BRS is started as the master-layer source RPF for the WPF0. 3h: Setting prohibited
23 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3, 2	RPF1_ACT[1:0]	0h	RW	RPF1 Start Enable These bits enable start of RPF1 as the source RPF for the WPF0 when the WPF0 is started. When RPF1 is not started by the WPF0, set the VI6_DPR_RPF1_ROUTE.RT_RPF1 bits to 63. 0h: RPF1 is not started. 1h: RPF1 is started as a sublayer source RPF for the WPF0. 2h: RPF1 is started as the master-layer source RPF for the WPF0. 3h: Setting prohibited
1, 0	RPF0_ACT[1:0]	0h	RW	RPF0 Start Enable These bits enable start of RPFn as the source RPF for the WPF0 when the WPF0 is started. When RPF0 is not started by the WPF0, set the VI6_DPR_RPF0_ROUTE.RT_RPF0 bits to 63. 0h: RPF0 is not started. 1h: RPF0 is started as a sublayer source RPF for the WPF0. 2h: RPF0 is started as the master-layer source RPF for the WPF0. 3h: Setting prohibited

When the WPFn is started through the VSPD start register n (VI6_CMDn: n = 0), the RPF and virtual RPF in the BRS specified as the source RPF in this register are also started to supply data to the VSPD internal modules.

Note the following when specifying the source RPF.

(1) When blending or ROP operation is applied to multiple images through the BRS, multiple source RPFs are necessary for one WPF. When multiple source RPFs are used, images should be classified into a master layer and sublayers; assign one of the source RPFs as the master-layer source RPF and other RPFs as sublayer source RPFs. Do not assign all RPFs as sublayer source RPFs (VI6_WPF1_SRCRPF = 00000005h) or two or more RPFs as the master-layer source RPF (VI6_WPF0_SRCRPF = 0000000Ah) (such settings are prohibited).

(2) When the BRS is not used, there should be only one source RPF for one WPF. In this case, the source RPF should be assigned as the master-layer source RPF.

(2) WPF0 Horizontal Input Size Clipping Register (LCDC_VSPD_VI6_WPF0_HSZCLIP)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HCEN	-	-	-	-	HCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	HCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	HCEN	0h	RW	Horizontal Size Clipping Enable/Disable Enables or disables clipping of the horizontal size of the WPF0 input image. 0b: Horizontal size clipping is disabled 1b: Horizontal size clipping is enabled
27 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	HCL_OFST[7:0]	00h	RW	Horizontal Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1b (**Figure 9.4-17**). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0b, this setting is ignored. A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 9.4-17** is made, VSPD does not operate correctly.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	HCL_SIZE [12:0]	0000h	RW	Horizontal Clipping Size Setting When the HCEN bit is 1b, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPF0 input image are discarded. When the HCEN bit is 0b, this setting is ignored. A value from 1 to 1920 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 9.4-17** is made, VSPD does not operate correctly. When the WPF0 output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits.

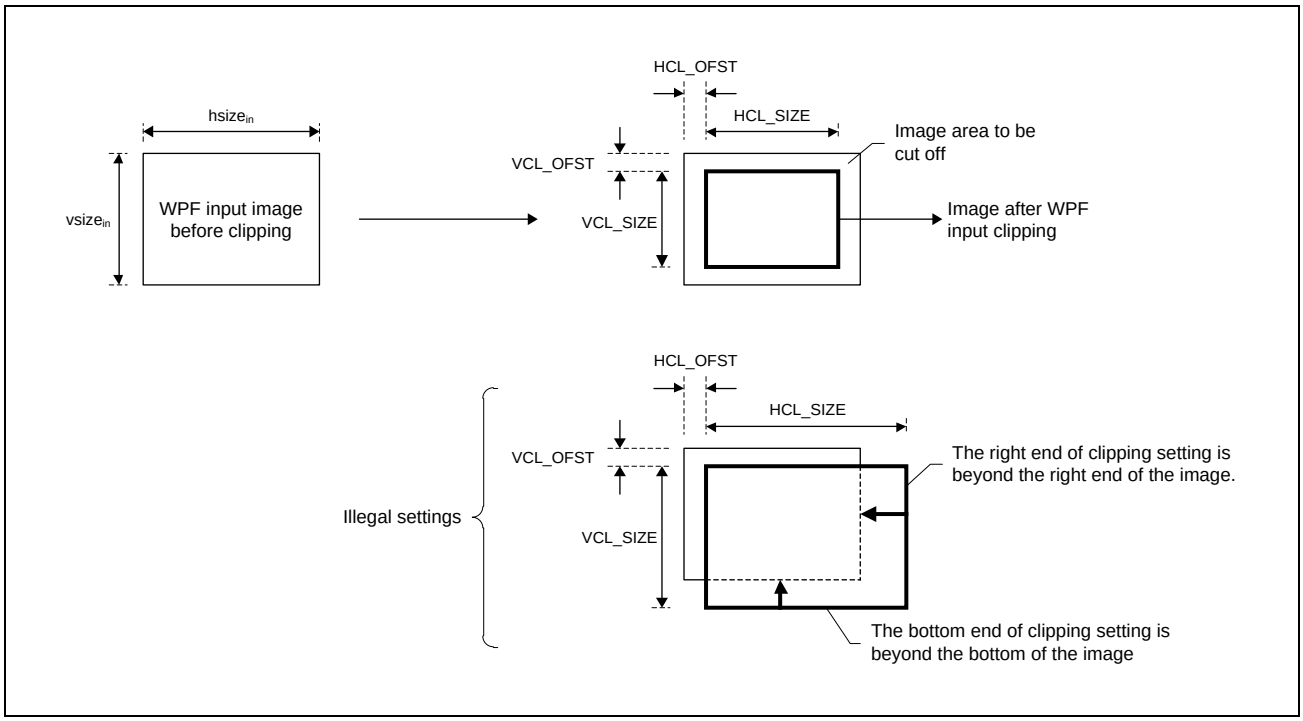

Figure 9.4-17 Image Clipping in WPF Input Section

(3) WPF0 Vertical Input Size Clipping Register (LCDC_VSPD_VI6_WPF0_VSZCLIP)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1008h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VCEN	-	-	-	-	VCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	VCEN	0h	RW	Vertical Size Clipping Enable/Disable Enables or disables clipping of the vertical size of the WPF0 input image. 0b: Vertical size clipping is disabled 1b: Vertical size clipping is enabled
27 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	VCL_OFST [7:0]	00h	RW	Vertical Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the top end of the image in vertical size clipping when the VCEN bit is 1 (**Figure 9.4-17**). The top of the image input to the WPF is cut off for the size specified in these bits. When the VCEN bit is 0b, this setting is ignored. A value from 0 to 255 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 9.4-17** is made, VSPD does not operate correctly.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VCL_SIZE [12:0]	0000h	RW	Vertical Clipping Size Setting When the VCEN bit is 1b, these bits specify the clipping size for vertical clipping processing. Through this processing, the area of the vertical size specified through the VCL_SIZE bits starting from the offset position specified through the VCL_OFST bits is determined as the valid image area. Accordingly, the bottom pixels beyond the (VCL_OFST + VCL_SIZE) size in the WPF0 input image are discarded. When the VCEN bit is 0b, this setting is ignored. A value from 1 to 1920 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 9.4-17** is made, VSPD does not operate correctly. When the WPF0 output format is YCbCr4:2:0, specify an even value in these bits.

(4) WPF0 Output Format Register (LCDC_VSPD_VI6_WPF0_OUTFMT)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 100Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDV [7:0]								PXA	ODE	-	-	-	ROT[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPYCS	SPUVS	DITH[1:0]		WRTM[2:0]			CSC	-	WRFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV [7:0]	00h	RW	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in **Table 9.4-18**. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified.
23	PXA	0h	RW	PAD Data Select Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in **Table 9.4-19**. Both the value specified in the PDV bits and the α data input from the DPR to WPF are 8 bits, but some of the PAD and P bit fields shown in **Table 9.4-18** are four bits or one bit. When the target bit field is not 8 bits, the number of bits in the PDV value and the α data input from the DPR to WPF is reduced according to the VI6_WPF0_RNDCTRL.ABRM setting. For bit count reduction, refer to **Figure 9.4-18** and the description of VI6_WPF0_RNDCTRL.ABRM. 0b: The value specified in the PDV bits is stored in the PAD shown in **Table 9.4-18**. 1b: The α value output from DPR in pixel units is stored in the PAD shown in **Table 9.4-18**.
22	ODE	0h	RW	Ordered Dither (mode A) Enable/Disable 0b: Ordered dither (mode A) is disabled. 1b: Ordered dither (mode A) is enabled. When the output format specified through the WRFMT bits is YCbCr, specify 0b in this bit. And when VI6_WPF0_OUTFMT.CSC is set to 1b, specify 0b in this bit even in the case that the output format specified through the WRFMT bits is RGB. Ordered dither is available only for 18bpp. So, when ODE bit is equal to 1b, set WRFMT at 18bpp format. When ODE bit is equal to 0, WPF dither method is specified by DITH[1:0] in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
21 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	ROT[2:0]	0h	RW	Rotation Processing Select These bits select the flipping processing to be applied to the WPF0 output image. **Figure 9.4-19** shows the correspondence between the original image and the flipping result according to each setting. 0b: No flipping 1b: Vertical flipping Note that the destination address setting should be changed according to the setting of these bits. For details, refer to **9.4.3.2.7 (9) WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)**. When the LIF module is used (VI6_LIF_CTRL.LIF_EN = 1b), set 0b to ROT[2:0].
15	SPYCS	0h	RW	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1b and set the WRFMT bits to 71 (47h). When the output format is YVYU, set this bit and the SPUVS bit to 1b and set the WRFMT bits to 71 (47h). In other cases, set this bit to 0b.

Bit	Bit Name	Initial Value	R/W	Description
14	SPUVS	0h	RW	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1b and set the WRFMT bits to 65 (41h). When the output format is NV21, set this bit to 1b and set the WRFMT bits to 66 (42h). When the output format is YVYU, set this bit and the SPYCS bit to 1b and set the WRFMT bits to 71 (47h). In other cases, set this bit to 0b.
13, 12	DITH[1:0]	0h	RW	Ordered Dither (mode B) Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (260000 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. And when VI6_WPF0_OUTFMT.CSC is set to 1, specify 0 in these bits even in the case that the output format specified through the WRFMT bits is RGB. 0h: Dithering (mode B) is disabled 3h: Dithering (mode B) is enabled 1, 2h: Setting prohibited When ODE bit in the register is 1b, set this bit to 0h.
11 to 9	WRTM[2:0]	0h	RW	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr. 0h: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 1h: BT.601 YCbCr [0,255] ↔ RGB [0,255] 2h: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 3h: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 4h to 7h: Setting prohibited
8	CSC	0h	RW	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPF0. The characteristics of color space conversion are determined by the WRTM setting. There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to (*1) in **9.4.3.2.6 (3) RPFn Input Format Registers (VI6_RPFn_INFMT)**. 0b: Color space is not converted. 1b: Color space is converted.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
6 to 0	WRFMT[6:0]	00h	RW	WPF Output Image Format Setting These bits select the format of the image output from the WPF0 to the external memory from among those listed in **Table 9.4-18** and **Table 9.4-19**. [Note] Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF → DPR → target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (up-scales, down-scales, or clips) the image size, take special care about the module or function settings. [Note] Output lines in YCbCr4:2:0 In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) (conversion from (A) to (B) in. When vertical flipping is also specified through the ROT bits, the flipping processing is executed last and the chrominance line locations are inverted (lines 1, 3, 5, 7, …) in the output image ((C) in **Figure 9.4-20**). [Note] Down sampling of CbCr in horizontal direction in YCbCr4:2:0 or YCbCr4:2:2 In the YCbCr4:2:2 or YCbCr4:2:0 output format, method of down sample of Cb/Cr in horizontal direction is average of neighbor two pixels.

Table 9.4-19 Packed YCbCr Formats for WPF Output

WRFMT[6:0]	Packed YCbCr Output Format	Reference
40h	YCbCr4:4:4 semi-planar	**Figure 9.4-10***4
41h	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
42h	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
43h to 45h	Reserved	—
46h	YCbCr4:4:4 interleaved	**Figure 9.4-11***4
47h	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
48h	YCbCr4:2:2 interleaved type 1	
49h	YCbCr4:2:0 interleaved*5	
4Ah	YCbCr4:4:4 planar	**Figure 9.4-12***4
4Bh	YCbCr4:2:2 planar (YV16)	
4Ch	YCbCr4:2:0 planar (YV12, I420)	
4Dh to 7Fh	Reserved	—

Note 1. When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.

Note 2. When the output format is YUY2, set SPYCS (bit 15) to 1.

Note 3. When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.

Note 4. **Figure 9.4-13** shows the definition of memory address for each pixel in **Figure 9.4-10** to **Figure 9.4-12**.

Note 5. Each line of plane is written twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

For details of each YCbCr format, refer to **Figure 9.4-10** to **Figure 9.4-13**. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

(RPF registers in the figures)	→	(Corresponding WPF registers)
VI6_RPFn_SRCM_ADDR_Y.SRCM_ADDR_Y	→	VI6_WPFn_DSTM_ADDR_Y.DSTM_ADDR_Y
VI6_RPFn_SRCM_ADDR_C0.SRCM_ADDR_C0	→	VI6_WPFn_DSTM_ADDR_C0.DSTM_ADDR_C0
VI6_RPFn_SRCM_ADDR_C1.SRCM_ADDR_C1	→	VI6_WPFn_DSTM_ADDR_C1.DSTM_ADDR_C1

(5) WPF0 Data Swapping Register (LCDC_VSPD_VI6_WPF0_DSWAP)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	P_LLS	P_LWS	P_WDS	P_BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	P_LLS	0h	RW	WPF Output Data Swapping in LONG LWORD Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.4-13**. 0b: Data swapping in LONG LWORD (64-bit) units is disabled 1b: Data swapping in LONG LWORD (64-bit) units is enabled
2	P_LWS	0h	RW	WPF Output Data Swapping in long word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.4-13**. 0b: Data swapping in long word (32-bit) units is disabled 1b: Data swapping in long word (32-bit) units is enabled
1	P_WDS	0h	RW	WPF Output Data Swapping in Word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.4-13**. 0b: Data swapping in word (16-bit) units is disabled 1b: Data swapping in word (16-bit) units is enabled
0	P_BTS	0h	RW	WPF Output Data Swapping in Byte Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.4-13**. 0b: Data swapping in byte (8-bit) units is disabled 1b: Data swapping in byte (8-bit) units is enabled

Table 9.4-13 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as in **Table 9.4-18** for RGB format and **Figure 9.4-10** to **Figure 9.4-13** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in **Table 9.4-13**.

(6) WPF0 Rounding Control Register (LCDC_VSPD_VI6_WPF0_RNDCTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 1014h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	CBRM	-	-	ABRM[1:0]		ATHRESH[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	CLMD[1:0]		-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	CBRM	0h	RW	Bit Count Reduction Method Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in **Table 9.4-18** and the target bit fields are not 8 bits. 0b: Bit count conversion: The lower-order bits are truncated 1b: Bit count conversion: Rounding (rounding off)
27 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25, 24	ABRM[1:0]	0h	RW	Bit Count Reduction Method Selection for Data Storage in PAD These bits specify the method for reducing the number of bits when the data selected through VI6_WPF0_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in **Table 9.4-18** and the target bit field is four bits or one bit. A value of 10b can be specified only when the packed RGB format specified through VI6_WPF0_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPF0_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored. 00b: Bit count conversion: The lower-order bits are truncated 01b: Bit count conversion: Rounding (rounding off) 10b: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit) 11b: Setting prohibited
23 to 16	ATHRESH[7:0]	00h	RW	Threshold for Conversion to 1-Bit α Data These bits specify the threshold value used for conversion from 8-bit α data to one bit when the ABRM bits are set to 10b. When the 8-bit α value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit α data. In other cases, 1 is stored as the 1-bit α data. A value from 0 to 255 can be specified.
15 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13, 12	CLMD[1:0]	0h	RW	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0b in these bits. 00b: Output value is not clipped (0-255) 01b: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) 10b: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) 11b: Setting prohibited
11 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(7) WPF0 Destination Y Plane Memory Stride Register (LCDC_VSPD_VI6_WPF0_DSTM_STRIDE_Y)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 101Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_Y[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	PICT_STRD_Y [15:0]	0000h	RW	Memory Stride of Destination Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPF0 as shown in **Figure 9.4-21**. A value from 0000h to FFFFh can be specified.

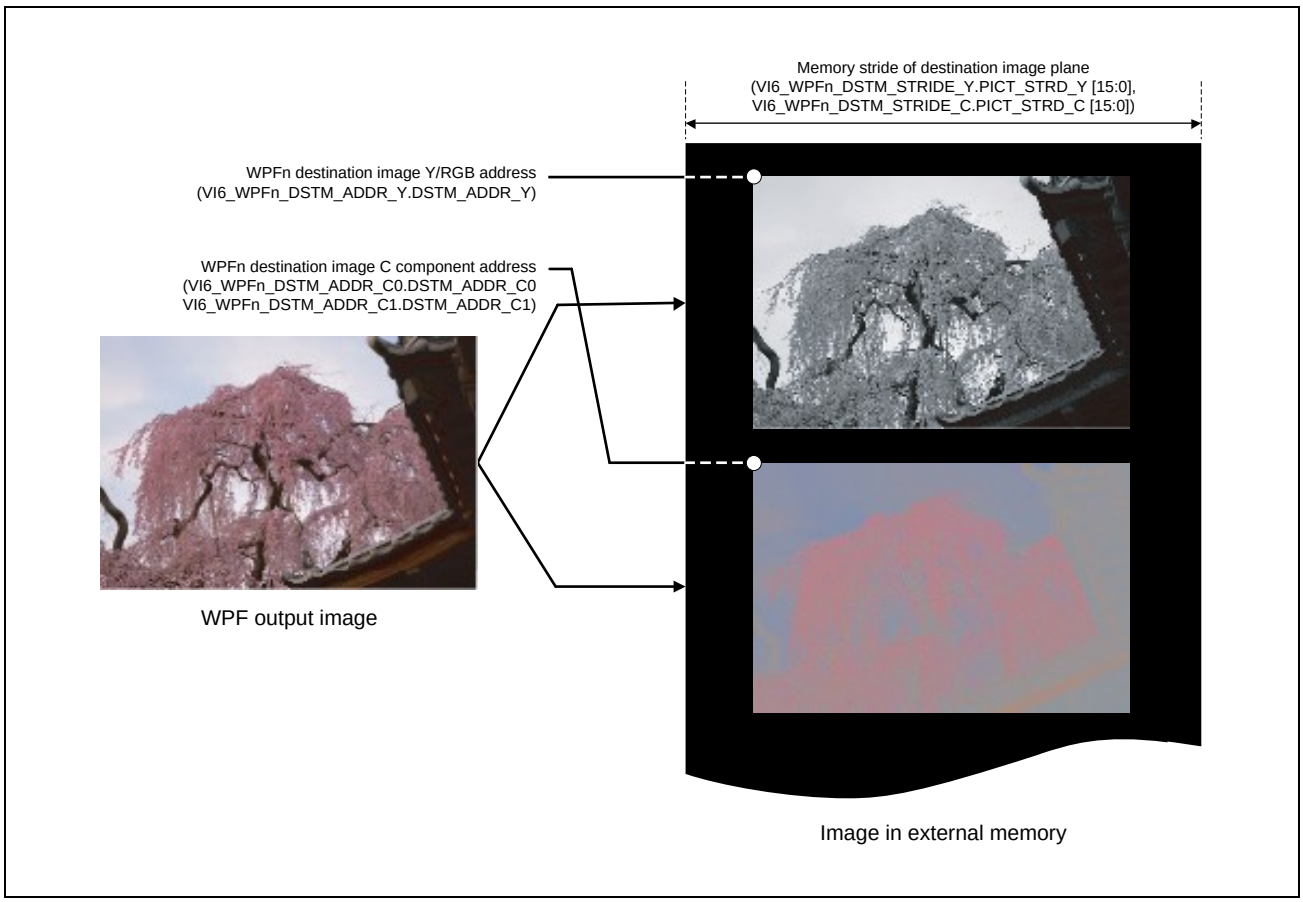

Figure 9.4-21 Writing Image Data to Destination Area in WPFn

(8) WPF0 Destination C Plane Memory Stride Register (LCDC_VSPD_VI6_WPF0_DSTM_STRIDE_C)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 1020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	PICT_STRD_C [15:0]	0000h	RW	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPF0 as shown in **Figure 9.4-21**. When the WPF0 outputs images in an RGB format, this setting is not used. When the WPF0 outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from 0000h to FFFFh can be specified.

(9) WPF0 Destination Y/RGB Address Register (LCDC_VSPD_VI6_WPF0_DSTM_ADDR_Y)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1024h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_Y[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_Y[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_Y [31:0]	0000_0000h	RW	Destination Image Y/RGB Plane Storing Address These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPF0 in the method described later. A value from 0000_0000h to FFFF_FFFFh can be specified.

[Destination Address Specification Method]

When flipping is not used, the start address of a frame (address FHA shown in **Figure 9.4-22**) should be specified as the destination address. When flipping is used, the destination address is not the frame start address (FHA); one of addresses A0 and A2 shown in **Figure 9.4-22** should be selected according to the combination of desired flipping (VI6_WPFn_OUTFMT.ROT setting).

To strictly define locations A0 and A2, let the horizontal size of the output image be H, the vertical size of the output image be V, and the memory stride (VI6_WPFn_DSTM_STRIDE_Y/C setting) be S as shown in **Figure 9.4-22**. Calculate the destination address (one of A0 and A2) using the formula shown in **Table 9.4-20** and specify it in the destination address storing register.

The values of variables L in **Table 9.4-20** depend on the other register settings and luminance and chrominance components. These values should be obtained by referring to **Table 9.4-21** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_Y, or **Table 9.4-22** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_C0 or VI6_WPFn_DSTM_ADDR_C1.

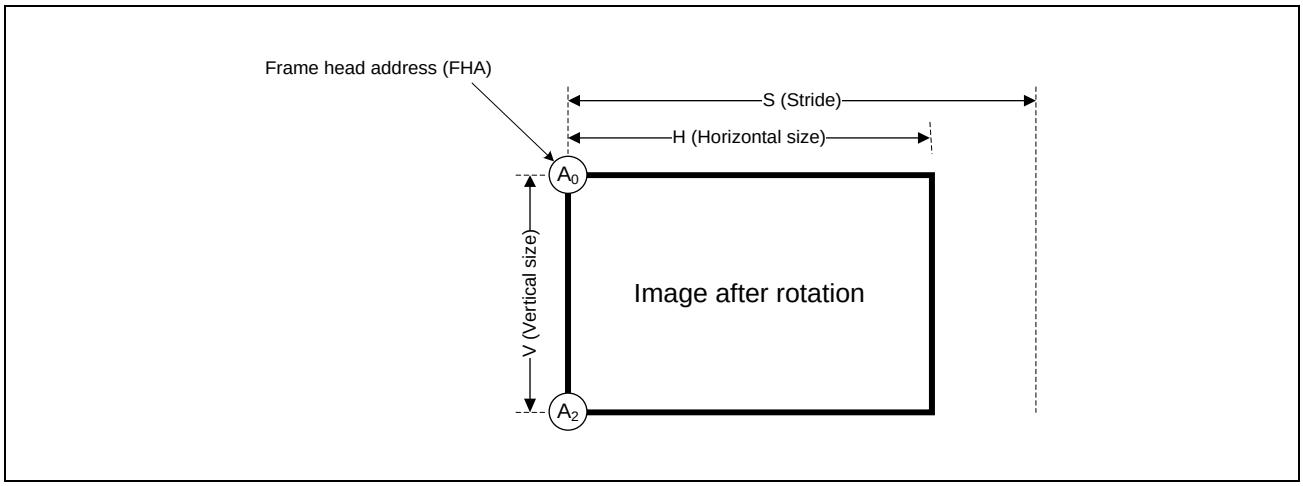

Figure 9.4-22 Location of Destination Address to be Specified for Flipping

Table 9.4-20 Destination Address A_0, A_1, A_2, and A3 Calculation Formulas

VI6_WPFn_OUTFMT.ROT Setting	Formula for Calculating Address to be Set in VI6_WPFn_DSTM_ADDR_Y, VI6_WPFn_DSTM_ADDR_C0, and VI6_WPFn_DSTM_ADDR_C1
0	A_0 = FHA
1	A_2 = FHA + (V×L – 1) × S

Table 9.4-21 Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for RGB and Luminance Y Address Calculation)

VI6_WPFn_OUTFMT.WRFMT	L
73	0.5
0 to 2, 4 to 35, 64 to 66, 70 to 72, or 74 to 76	1

Table 9.4-22 Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for Chrominance C0 and C1 Address Calculation)

VI6_WPFn_OUTFMT.WRFMT	L
70 to 73	Not defined
66, 76	0.5
64 to 65, 74 to 75	1

(10) WPF0 Destination Chroma Address Register 0 (LCDC_VSPD_VI6_WPF0_DSTM_ADDR_C0)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 1028h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_C0[31:16]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_C0[31:0]	0000_0000h	RW	Destination Image C Plane Storing Address 0 These bits specify in 1-byte units the address for storing the destination-image C plane to be written to by the WPF0. Refer to the description of VI6_WPF0_DSTM_ADDR_Y for settings. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Table 9.4-19** or the Cb plane when a planar format is selected. When an interleaved format is selected or the output is in an RGB format, this setting is not used. A value from 0000_0000h to FFFF_FFFFh can be specified. Refer to **Figure 9.4-22** in **9.4.3.2.7 (9) WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)** for settings.

(11) WPF0 Destination Chroma Address Register 1 (LCDC_VSPD_VI6_WPF0_DSTM_ADDR_C1)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 102Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_C1[31:16]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_C1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_C1[31:0]	0000_0000h	RW	Destination Image C Plane Storing Address 1 These bits specify in 1-byte units the address for storing the Cr plane when the WPF0 outputs images to the external memory in YCbCr planar format shown in **Table 9.4-19**. Refer to the description of VI6_WPF0_DSTM_ADDR_Y for settings. This setting is not used when the WPF outputs in YCbCr format that is not a planar format or in an RGB format. A value from 0000_0000h to FFFF_FFFFh can be specified. Refer to **Figure 9.4-22** in **9.4.3.2.7 (9) WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)** for settings.

(12) WPF0 LIF Write Back Control Register (LCDC_VSPD_VI6_WPF0_WRBCK_CTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 1034h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	WBMD[1:0]	0h	RW	Display Data Write Back Control This bit is used for selecting the write back mode when the value of VI6_LIF0_CTRL.LIF_EN bit is set to 1b. 0b: Write Back Disabled 1b: Write Back Enabled

9.4.3.2.8 DPR Control Registers

(1) Concept of DPR Settings

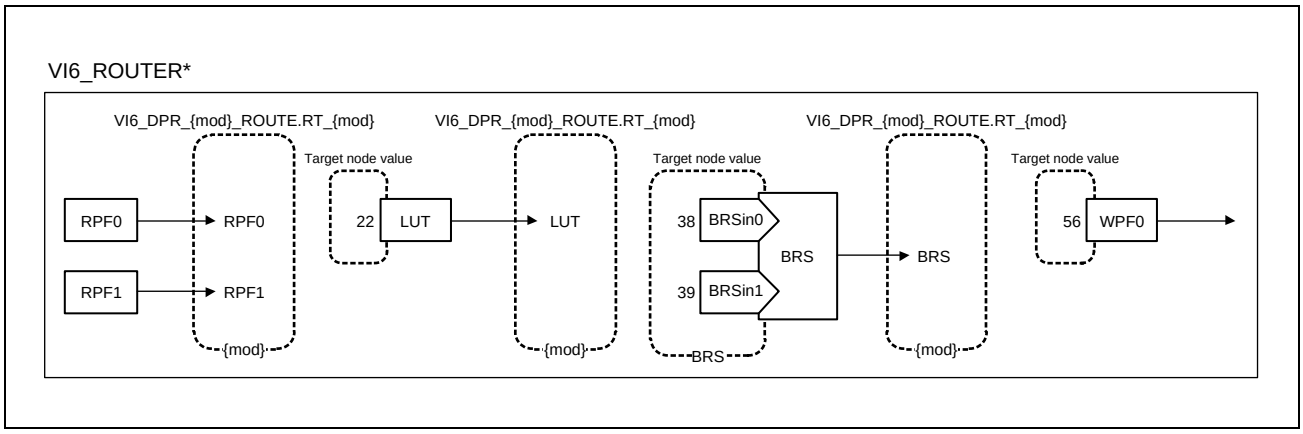

Figure 9.4-23 Node Register Names and Target Node Values on Data Path Router

In the VSPD internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value. Set each bit field in VI6_DPR_*_ROUTE to an appropriate node value shown in **Figure 9.4-23** to specify the target node to be connected behind each module.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, even the WPF paths operating correctly at that time will be affected as well as the WPF paths connected through the DPR, and correct operation will not be guaranteed.

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value. Note: VI6_DPR_{mod}_ROUTE.RT are not implemented in VSPD which doesn't have {mod}. See **Figure 9.4-1** whether VSPD has {mod} or not.
2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0 to RPF1 or virtual RPF) and a target WPF are determined.
3. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.
4. Desired modules can be connected between each RPF and BRS input port, but all RPFs specified as the sources for a BRS input port should have the same target WPF.
5. Make appropriate routing or RPF register settings so that the color space formats (RGB/YCbCr) for all BRS input ports are the same.
6. Do not connect the output of any module as the input to the same module (in the BRS case, any input port) even when there is another module between the output and input (creating a loop is prohibited).
7. Each node can be used only once throughout all paths from RPFn to WPFn. When a module shown in **Figure 9.4-23** is assigned in one RPF to WPF path, it cannot be used in another RPF to WPF path.
8. While a WPF is operating, modifying the DPR connection settings in VI6_DPR_*_ROUTE is prohibited for modules used by the WPF but allowed for modules not used by the WPF. Be careful not to accidentally modify the settings of the modules included in the WPF path that is operating.
9. Be careful to do the following setting when BRS is used.
   VI6_DPR_BRS_ROUTE.BRSSEL = 1

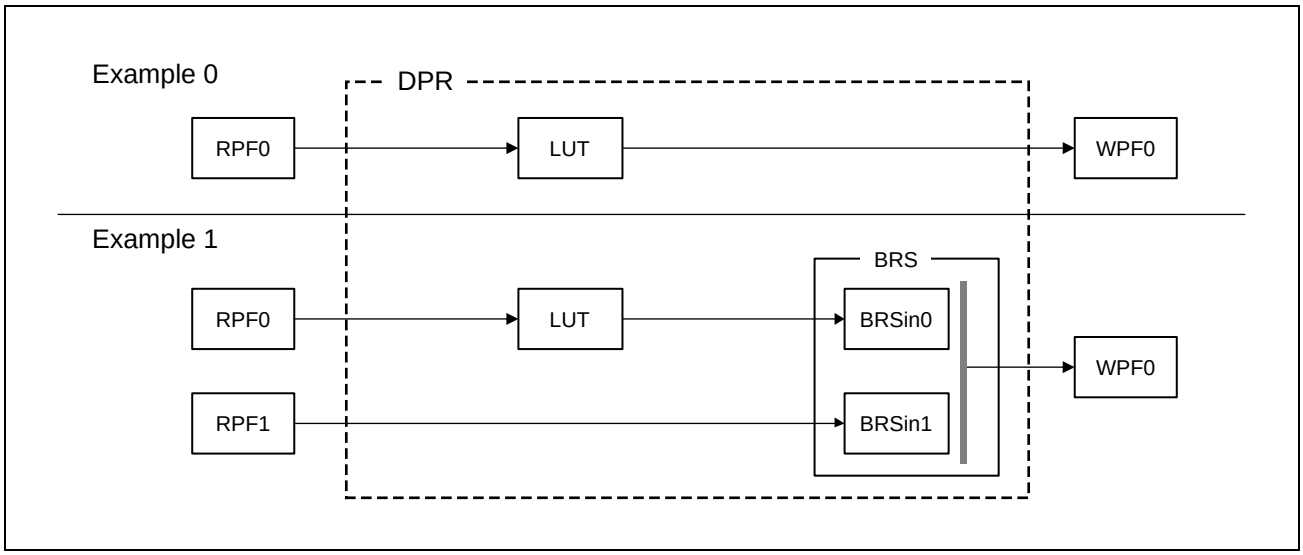

Figure 9.4-24 Examples of Internal Data Path Routing

Figure 9.4-24 shows examples of internal data path routing. Example 0 is WPF0 processing (RPF0 is the source RPF), and example 1 is also WPF0 (RPF0 to RPF1 are the source RPFs). Each example has the configuration shown in **Figure 9.4-24**. Example 0 performs LUT (e.g. γ correction) processing. Example 1 performs LUT processing (e.g. γ correction), for input 0 (RPF0) and then applies blending or raster operation between the resultant data and input data 1 (RPF1). The VI6_ DPR_*_ROUTE settings for these examples are shown in **Table 9.4-23**. The bit fields for the modules that are not used in the examples should be set to 63.

Table 9.4-23 VI6_DPR_*_ROUTE Register Settings in Connection Examples Shown in **Figure 9.4-24**. Although both examples show in **Figure 9.4-24** include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

Table 9.4-23 Examples of Internal Data Path Routing

	Register Name	Setting	
Example 0	VI6_DPR_RPF0_ROUTE.RT_RPF0	22	(To LUT)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	63	(UNUSED)
	VI6_DPR_LUT_ROUTE.RT	56	(To WPF0)
	VI6_DPR_BRS_ROUTE.RT	63	(UNUSED)
Example 1	VI6_DPR_RPF0_ROUTE.RT_RPF0	22	(To LUT)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	39	(To BRSin1)
	VI6_DPR_LUT_ROUTE.RT	38	(To BRSin0)
	VI6_DPR_BRS_ROUTE.RT	56	(To WPF0)

(2) RPFn Routing Register (LCDC_VSPD_VI6_DPR_RPFn_ROUTE) (n = 0, 1)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 2000h (n = 0)
<LCDC_vspd_base> + 2004h (n = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	RT_RPFn[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	RT_RPFn[5:0]	00h	RW	RPFn Target Node Value These bits specify the target node value for RPFn. When using RPFn, refer to **Figure 9.4-23** for settings. When RPFn is not started through the VI6_WPF0_SRCRPF setting, specify 63.

(3) WPF0 Timing Control Register (LCDC_VSPD_VI6_DPR_WPF0_FPORCH)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 2014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FP_WPFn[5:0]						-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	FP_WPFn[5:0]	00h	RW	WPFn Internal Operation Timing Setting Specify 5.
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

(4) LUT Routing Register (LCDC_VSPD_VI6_DPR_LUT_ROUTE)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 203Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	FXA[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FP[5:0]						-	-	RT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 16	FXA[7:0]	00h	RW	Fixed α Output Value for LUT The LUT does not support input/output of the α value. The α value input to the LUT is discarded, and the fixed α value specified in these bits is always output from the LUT. A value from 0 to 255 can be specified.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	FP[5:0]	00h	RW	LUT Internal Operation Timing Setting Specify 0.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	RT[5:0]	00h	RW	LUT Target Node Value These bits specify the target node value for the LUT. When using the LUT, refer to **Figure 9.4-23** for settings. When not using the LUT, specify 63.

(5) BRS Routing Register (LCDC_VSPD_VI6_DPR_BRS_ROUTE)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 2050h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	BRSSEL	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FP[5:0]						-	-	RT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	BRSSEL	0h	RW	Always specify 1.
27 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	FP[5:0]	00h	RW	BRS Internal Operation Timing Setting Specify 0.
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
5 to 0	RT[5:0]	00h	RW	BRS Target Node Value These bits specify the target node value for the BRS. When using the BRS, refer to **Figure 9.4-23** for settings. When not using the BRS, specify 63.

9.4.3.2.9 LUT Control Register

(1) LUT Control Register (LCDC_VSPD_VI6_LUT_CTRL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 2800h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LUT_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	LUT_EN	0h	RW	1D-LUT Enable/Disable Enables or disables the 1D-LUT function by the LUT. When the 1D-LUT is used, the color component curve information needs to be set separately in the LUT table. For the LUT table settings, refer to **9.4.4.7.1 LUT**. 0b: 1D-LUT function is disabled 1b: 1D-LUT function is enabled

In the LUT, various image processing, such as curves with high operation load (e.g., γ correction), negative-positive conversion, and gain adjustment of images, can be achieved by the data replacement processing by the 1D-LUT. As shown in **Figure 9.4-25**, the LUT replaces each component of the input pixel data using the set replacement table of 256 entries. For example, if the LUT is set as in **Figure 9.4-26**, when there is an input of 150, the data stored in address 150 of the 1D-LUT is read and output as the LUT output. **Figure 9.4-26** shows a case in which the input and output become equal for convenience in explaining.

In the LUT settings shown in **Figure 9.4-27**, the input bits are reversed. This has the effect of negative-positive flipping. In **Figure 9.4-28**, γ correction (γ = 1.8 is shown as an example) is possible. As described above, information to be set in the LUT indicates LUT processing characteristics. If the same value is set for each component in the LUT, an equal effect can be obtained for each component of the input image when it is processed. If the LUT is set with different characteristics for each component, the processing characteristics can be changed for each component.

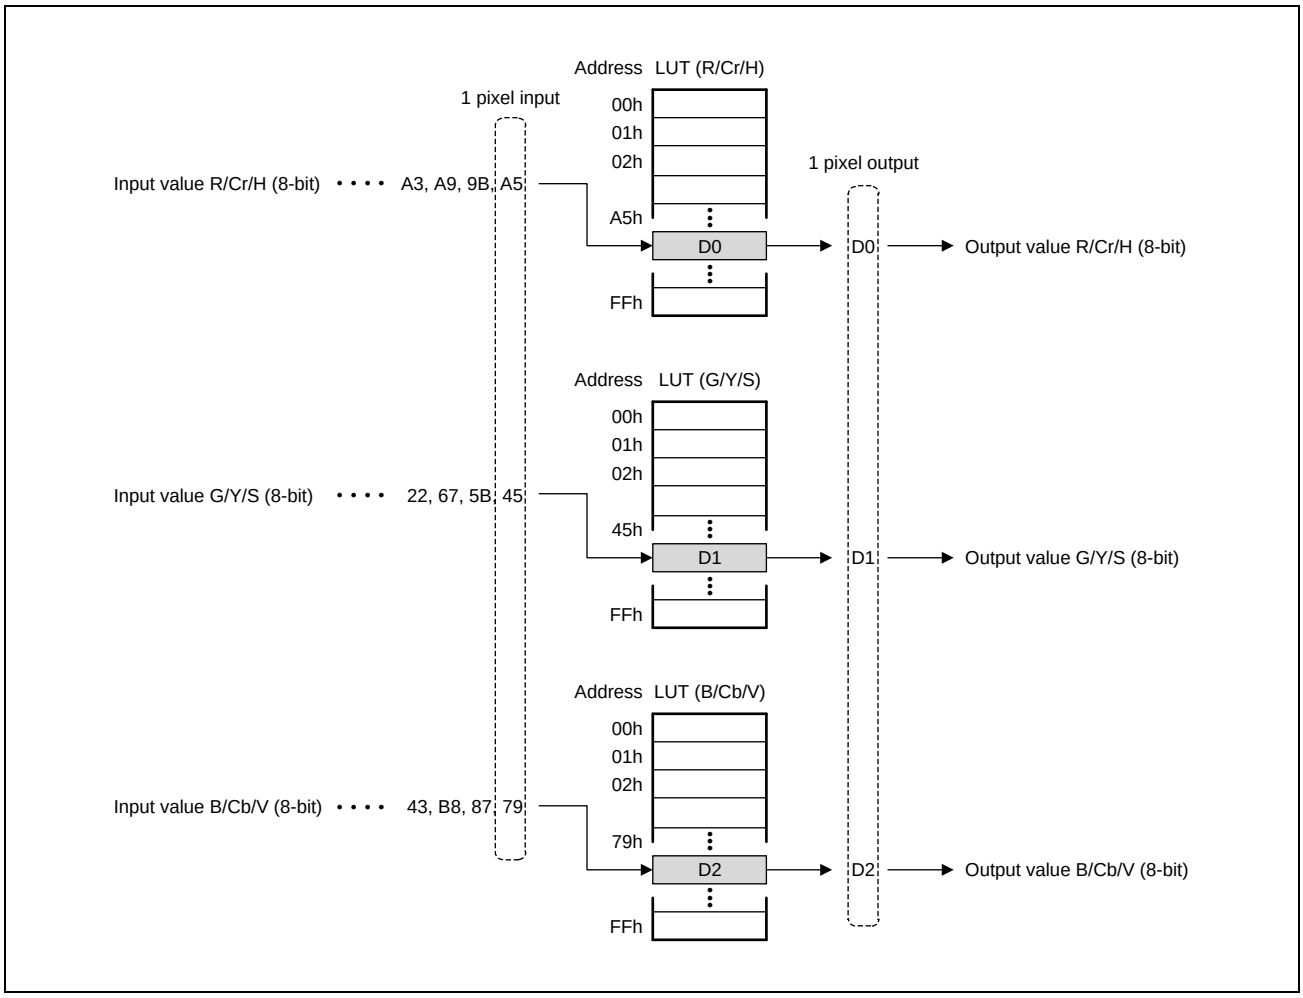

Figure 9.4-25 Relationship between Input and Output for 1D-LUT Table

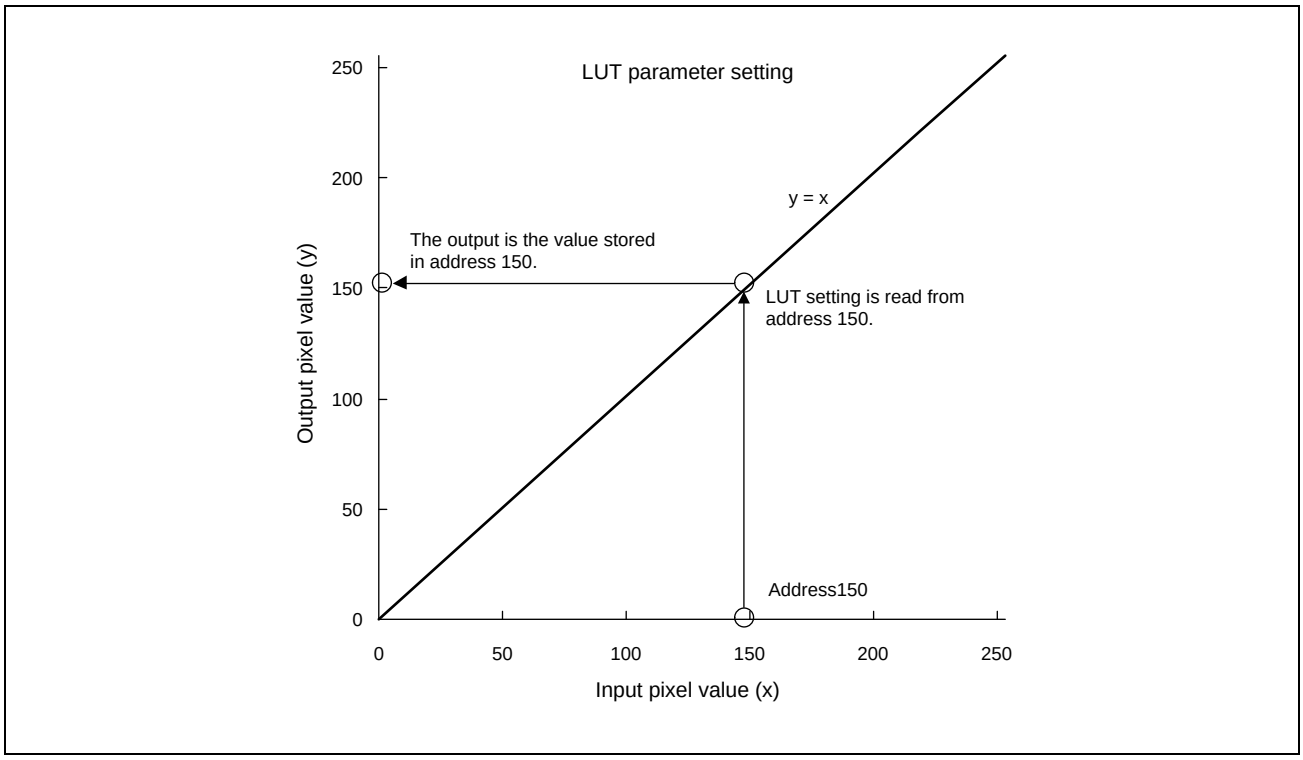

Figure 9.4-26 Setting Example in Which Output Becomes Equal to Input

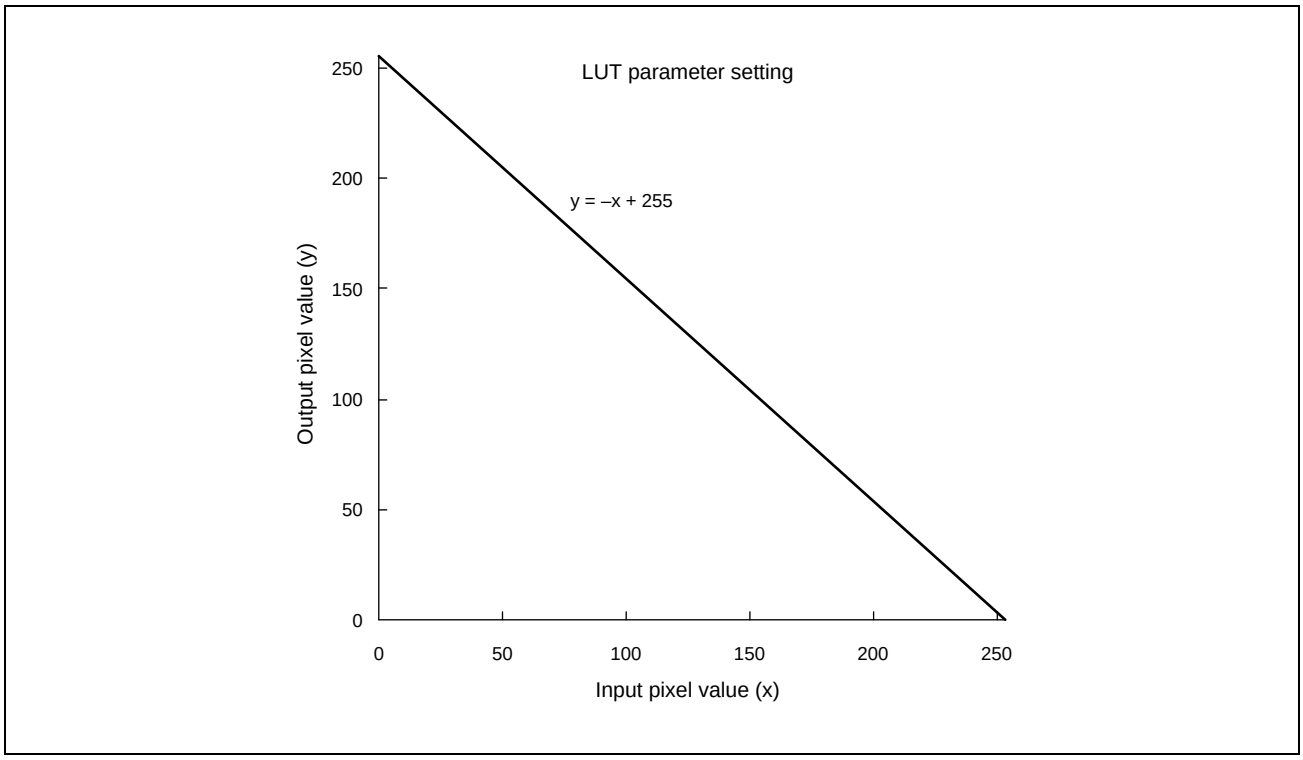

Figure 9.4-27 Setting Example of Negative-positive Conversion

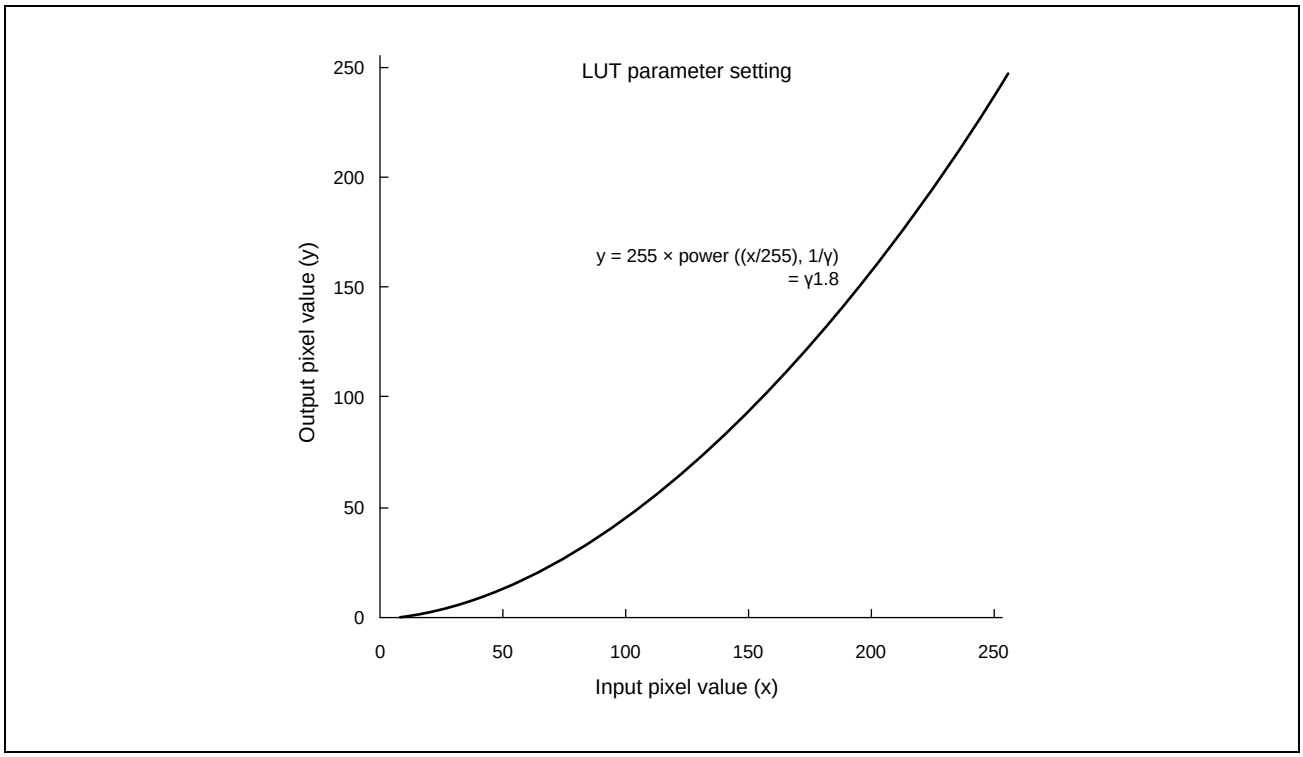

Figure 9.4-28 Setting Example of γ Correction

9.4.3.2.10 BRS Control Registers

(1) BRS Input Control Register (LCDC_VSPD_VI6_BRS_INCTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3900h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	NRM	-	-	-	-	-	-	-	-	-	-	D1ON	D0ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ODE1	DITH1[2:0]			ODE0	DITH0 [2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	NRM	0h	RW	Color Data Normalization Enables or disables division by the α value of the color data in BRS blending operation. This is used when converting the RGB color data format to which the α value is multiplied (pre-multiplied color) into the RGB color data format to which the α value is not multiplied (non pre-multiplied color). Do not use this for the YCbCr format. 0b: Divider (DIV unit in **Figure 9.4-29**) does not divide the color value by α 1b: Divider (DIV unit in **Figure 9.4-29**) divides the color value by α
27 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	D1ON	0h	RW	Ordered dither (mode B) Enable of BRS Input 1 Enables or disables dithering (color reduction) of BRS input 1 (BRSin1 in **Figure 9.4-29**). 0b: Dithering (mode B) of BRSin1 is disabled 1b: Dithering (mode B) of BRSin1 is enabled When ODE1 in this bit is set to 1, set 0 to this bit.
16	D0ON	0h	RW	Ordered dither (mode B) Enable of BRS Input 0 Enables or disables dithering (color reduction) of BRS input 0 (BRSin0 in **Figure 9.4-29**). 0b: Dithering (mode B) of BRSin0 is disabled 1b: Dithering (mode B) of BRSin0 is enabled When ODE0 in this bit is set to 1, set 0 to this bit.
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7	ODE1	0h	RW	Ordered Dither (mode A) of CH1 Input to BRS Enable/Disable 0b: Ordered dither (mode A) of BRSin1 is disabled. 1b: Ordered dither (mode A) of BRSin1 is enabled. Ordered dither is available only for 18bpp. So, when ODE1 bit is equal to 1, set DITH1 = 1. When ODE1 bit is equal to 0, BRSin1 dither method is specified by D1ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
6 to 4	DITH1[2:0]	0h	RW	Dithering of CH1 Input to BRS These bits specify the number of colors for pixels after dithering (color reduction) when dithering (color reduction) for pixel information is enabled through the D1ON bit. When dithering (color reduction) for pixel information is disabled, specify 0h in these bits. 0h: Dithering of BRSin1 input image is disabled 1h: Dithering of BRSin1 input image at 18 bpp (RGB666: 260000 colors) 2h: Dithering of BRSin1 input image at 16 bpp (RGB565: 65535 colors) 3h: Dithering of BRSin1 input image at 15 bpp (RGB555: 32768 colors) 4h: Dithering of BRSin1 input image at 12 bpp (RGB444: 4096 colors) 5h: Dithering of BRSin1 input image at 8 bpp (RGB332: 256 colors) 6, 7h: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3	ODE0	0h	RW	Ordered Dither (mode A) of CH0 Input to BRS Enable/Disable 0b: Ordered dither (mode A) of BRSin0 is disabled. 1b: Ordered dither (mode A) of BRSin0 is enabled. Ordered dither is available only for 18bpp. So, when ODE0 bit is equal to 1b, set DITH0 = 1b. When ODE0 bit is equal to 0, BRSin0 dither method is specified by D0ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
2 to 0	DITH0 [2:0]	0h	RW	Dithering of CH0 Input to BRS These bits specify how to perform dithering of the CH0 input to the BRS. The setting method is the same as that for the DITH1 bits. Read the description of the DITH1 bits with BRSin0 and D0ON replacing BRSin1 and D1ON, respectively.

Figure 9.4-29 shows the configuration of the BRS. For the BRS inputs, there are two inputs from the DPR and one internal input as a virtual RPF. BRSin0 to BRSin1 are input ports that have the target node values shown in **Figure 9.4-23**, and they can be connected to any module on the DPR. The same color space (YCbCr or RGB) has to be used for the two inputs from the DPR to the BRS.

The virtual RPF inside the BRS is an input unit not connected to the DPR. It is called the "virtual RPF" because it outputs images internally created by the BRS. Starting of the virtual RPF is controlled by VI6_WPFn_SRCRPF.VIR_ACT2, and the single-color data created at the virtual RPF can be used for blending or raster operation (ROP) with data from the other input units BRSin0 to BRSin1. The color space for the single color to be set for the virtual RPF needs to match the color space of the two inputs from the DPR to the BRS. For this setting method, see **(4) Color Information Register of BRS Input Virtual RPF (LCDC_VSPD_VI6_BRS_VIRRPF_COL)**.

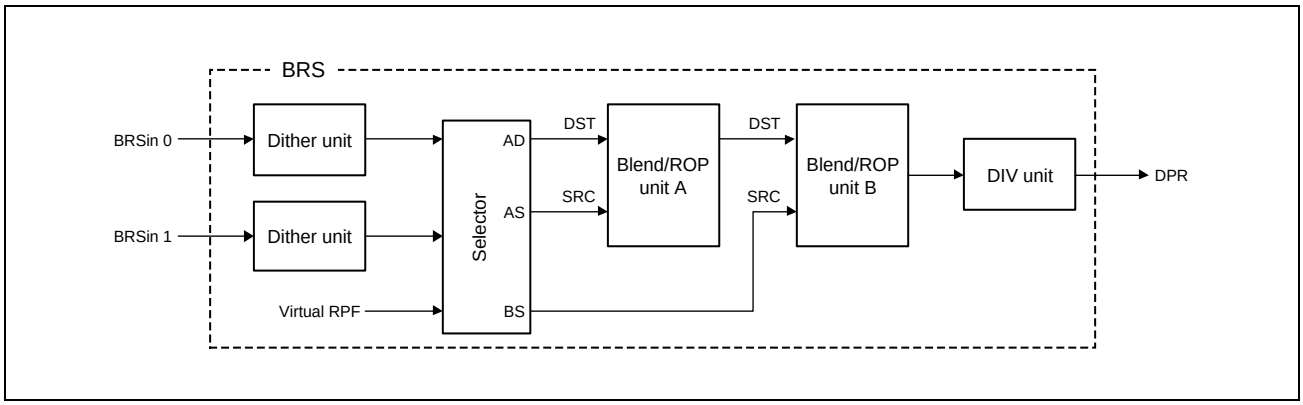

Figure 9.4-29 BRS Configuration

The selector in **Figure 9.4-29** is used to select the SRC and DST inputs to blending/ROP units A to B from BRSin0 to BRSin1 which are inputs from the DPR and the virtual RPF. The SRC and DST input sources for blending/ROP units A to B are either uniquely determined based on the configuration shown in **Figure 9.4-29** or selected as desired by registers. The input sources that can be arbitrarily selected by registers are AD, AS and BS, which correspond to the registers shown in **Table 9.4-24**.

Table 9.4-24 Correspondence between Selector Output Destinations and Register Bits for BRS

Selector Output	Output Destination	Register Bits
AD	Blending/ROP unit A - DST	VI6_BRSA_CTRL.DSTSEL
AS	Blending/ROP unit A - SRC	VI6_BRSA_CTRL.SRCSEL
BS	Blending/ROP unit B - SRC	VI6_BRSB_CTRL.SRCSEL

(2) Size Register of BRS Input Virtual RPF (LCDC_VSPD_VI6_BRS_VIRRPF_SIZE)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3904h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VIR_HSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VIR_VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	VIR_HSIZE [12:0]	0000h	RW	Virtual RPF Horizontal Size These bits set the horizontal size of an image from the virtual RPF shown in **Figure 9.4-29**. A value from 1 to 1920 can be specified.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VIR_VSIZE [12:0]	0000h	RW	Virtual RPF Vertical Size These bits set the vertical size of an image from the virtual RPF shown in **Figure 9.4-29**. A value from 1 to 1920 can be specified.

The virtual RPF has only a function to output a fixed α value and a fixed pixel value. The virtual RPF can internally create a single-color image without accessing external memory via the MAU. Same as images from the other BRS input ports, a sublayer can be blended on an image created in this manner with the image used as the background (master layer). In turn, when using the image as a sublayer, it can be drawn on the master layer as a window.

(3) Display Location Register of BRS Input Virtual RPF (LCDC_VSPD_VI6_BRS_VIRRPF_LOC)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3908h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HCOORD[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VCOORD[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	HCOORD [12:0]	0000h	RW	Horizontal Coordinate of Virtual RPF Location on Master Layer These bits specify the horizontal coordinate of where to locate the left-edge pixel of the virtual RPF's layer, with the left-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 1919 can be specified. When the virtual RPF is specified as the master layer by VI6_WPF0_SRCRPF.VIR_ACT2, set these bits to 0b.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VCOORD[12:0]	0000h	RW	Vertical Coordinate of Virtual RPF Location on Master Layer These bits specify the vertical coordinate of where to locate the top-edge pixel of the virtual RPF's layer, with the top-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 1919 can be specified. When the virtual RPF is specified as the master layer by VI6_WPF0_SRCRPF.VIR_ACT2, set these bits to 0b.

(4) Color Information Register of BRS Input Virtual RPF (LCDC_VSPD_VI6_BRS_VIRRPF_COL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 390Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	COL_A[7:0]								COL_RCR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COL_GY[7:0]								COL_BCB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	COL_A[7:0]	00h	RW	Fixed α of Virtual RPF These bits set the fixed α value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
23 to 16	COL_RCR[7:0]	00h	RW	Fixed R/Cr of Virtual RPF These bits set the fixed R/Cr value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
15 to 8	COL_GY[7:0]	00h	RW	Fixed G/Y of Virtual RPF These bits set the fixed G/Y value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
7 to 0	COL_BCB[7:0]	00h	RW	Fixed B/Cb of Virtual RPF These bits set the fixed B/Cb value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.

The transparency information and color information of the single color that is created by the virtual RPF are set in the bits of this register. As described earlier, the color information is set for the YCbCr or RGB color space. The color space to be set in this register depends on the register settings of the environment and other modules to which the BRS is connected by the DPR. Two cases can be considered. Since the α value (COL_A) is transparency information and irrelevant to the concept of color space, the same setting is made for either the YCbCr or RGB color space.

[Case 1: When an input other than the virtual RPF is used]

When the source RPF is connected to any one of the BRS input ports (BRSin0 to BRSin1) other than the virtual RPF and valid data is being supplied, the same color space data as the color space for the BRS inputs should be set in this register as the color space for the virtual RPF's color information. This is based on the restriction of "all BRS inputs must have the same color space", as described in **(1) Concept of DPR Settings** or **(1) BRS Input Control Register (LCDC_VSPD_VI6_BRS_INCTRL)**.

[Case 2: When only the virtual RPF is used]

When only the virtual RPF is used as the source RPF of WPFn, RPFn is not connected to the BRS, as shown in **Figure 9.4-30**. Thus, there is no color space for another input that the color space for the virtual RPF has to follow, as in case 1. This means that the color space of the data output by the BRS is determined by the WPF setting.

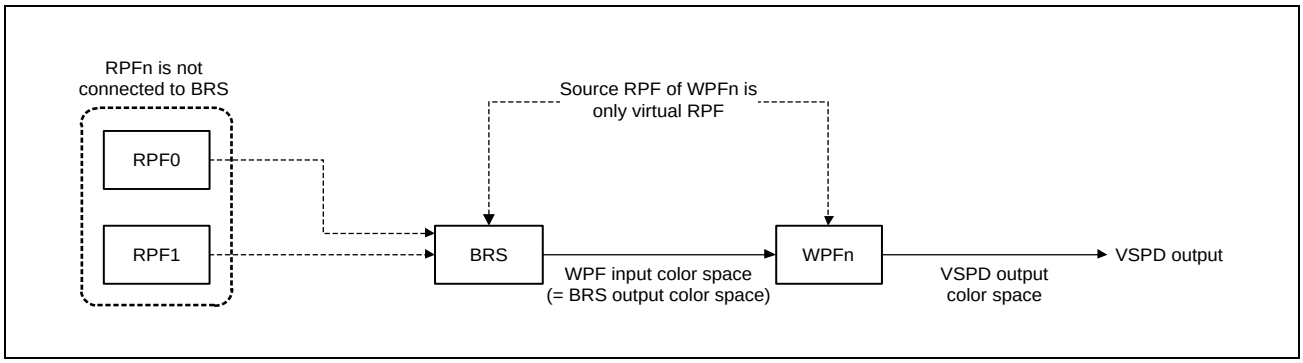

Figure 9.4-30 Relationship between DPR Connection and Color Space When Only Virtual RPF is Used

Figure 9.4-30, the output color space of the VSPD (= output color space of WPFn) is determined by VI6_WPFn_OUTFMT.WRFMT. When bit 6 in VI6_WPFn_OUTFMT.WRFMT (WRFMT [6]) is 0, the color space is RGB, while when it is 1, the color space is YCbCr. Next, the WPF input color space (= BRS output color space) is determined by the relationship between the WPF output color space and VI6_WPFn_OUTFMT.CSC. When VI6_WPFn_OUTFMT.CSC is 0, the WPF output color space and WPF input color space (= BRS output color space) are the same. When VI6_WPFn_OUTFMT.CSC is 1, the WPF output color space and WPF input color space (= BRS output color space) are the opposite. This relationship is summarized in **Table 9.4-25**.

The color space for the virtual RPF's color information should be set in this register according to the "BRS output color space" shown in **Table 9.4-25**.

Table 9.4-25 Relationship between WPF Output Color Space and BRS Output Color Space

VI6_WPFn_OUTFMT Register Bit Settings				BRS Output Color Space (= WPF Input Color Space)
Bit 6 in WRFMT		CSC		
0	(WPF output is RGB)	0	(YCbCr to RGB conversion is disabled)	RGB
0	(WPF output is RGB)	1	(YCbCr to RGB conversion is enabled)	YCbCr
1	(WPF output is YCbCr)	0	(RGB to YCbCr conversion is disabled)	YCbCr
1	(WPF output is YCbCr)	1	(RGB to YCbCr conversion is enabled)	RGB

(5) BRS Control Register A (LCDC_VSPD_VI6_BRSA_CTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3910h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RBC	-	-	-	-	-	-	-	-	DSTSEL[2:0]			-	SRCSEL[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	RW	RW	RW	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CROP[3:0]				AROP[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	RBC	0h	RW	Operation Type of Blending/ROP Unit A Specifies the operation type for blending/ROP unit A shown in **Figure 9.4-29**. 0b: ROP (raster operation) 1b: Blending operation
30 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22 to 20	DSTSEL[2:0]	0h	RW	Input Selection for DST Side of Blending/ROP Unit A These bits select the input for the DST side of blending/ROP unit A shown in **Figure 9.4-29**. These bits specify the connection between the BRS input port and the DST separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to DST 001b: BRS input 1 (BRSin1) is input to DST 100b: Virtual RPF is input to DST 010b, 011b, 101b to 111b: Setting prohibited [Note] The DSTSEL bits for blending/ROP unit B are reserved. The write value should always be 0b.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	SRCSEL[2:0]	0h	RW	Input Selection for SRC Side of Blending/ROP Unit A These bits select the input for the SRC side of blending/ROP unit A shown in **Figure 9.4-29**. These bits specify the connection between the BRS input port and the SRC separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to SRC 001b: BRS input 1 (BRSin1) is input to SRC 100b: Virtual RPF is input to SRC 010b, 011b, 101b to 111b: Setting prohibited
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 4	CROP[3:0]	0h	RW	Color Data ROP Operator These bits select the ROP operator of the color data in blending/ROP unit A. Select the opcode for ROP operation from **Table 9.4-26**.
3 to 0	AROP[3:0]	0h	RW	α Data ROP Operator These bits select the ROP operator of the α data in blending/ROP unit A. Select the opcode for ROP operation from **Table 9.4-26**.

Table 9.4-26 ROP Operator of Blending/ROP Unit m (m = A, B)

Opcode	Operator
0000b	NOP(D)
0001b	AND(S & D)
0010b	AND_REVERSE(S & ~D)
0011b	COPY(S)
0100b	AND_INVERTED(~S & D)
0101b	CLEAR(0)
0110b	XOR(S ^ D)
0111b	OR(S | D)
1000b	NOR(~(S | D))
1001b	EQUIV(~(S ^ D))
1010b	INVERT(~D)
1011b	OR_REVERSE(S | ~D)
1100b	COPY_INVERTED(~S)
1101b	OR_INVERTED(~S | D)
1110b	NAND(~(S & D))
1111b	SET(all1)

(6) BRS Blend Control Register A (LCDC_VSPD_VI6_BRSA_BLD)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3914h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CBES	CCMDX[2:0]			-	CCMDY[2:0]			ABES	ACMDX[2:0]			-	ACMDY[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COEFX[7:0]								COEFY[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	CBES	0h	RW	Blending Expression Selection Selects the blending expression of the color data in the BRS (VI6_BRSA_CTRL.RBC = 1b). Blending coefficients are specified by the CCMDX and CCMDY bits. 0b: CCMDX × (DST color data) + CCMDY × (SRC color data) 1b: CCMDX × (DST color data) - CCMDY × (SRC color data)
30 to 28	CCMDX[2:0]	0h	RW	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient X 001b: 255 - (DST α data) is used as blending coefficient X 010b: SRC α data is used as blending coefficient X 011b: 255 - (SRC α data) is used as blending coefficient X 100b: Fixed α value 0 (COEFX setting)
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26 to 24	CCMDY[2:0]	0h	RW	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient Y 001b: 255 - (DST α data) is used as blending coefficient Y 010b: SRC α data is used as blending coefficient Y 011b: 255 - (SRC α data) is used as blending coefficient Y 100b: Fixed α value 1 (COEFY setting)
23	ABES	0h	RW	Blending α Creation Expression Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B). α creation coefficients are specified by the ACMDX and ACMDY bits. 0b: ACMDX × (DST α data) + ACMDY × (SRC α data) 1b: ACMDX × (DST α data) - ACMDY × (SRC α data)
22 to 20	ACMDX[2:0]	0h	RW	α Creation Coefficient X These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient X) = (DST α data) 001b: (α creation coefficient X) = 255 - (DST α data) 010b: (α creation coefficient X) = (SRC α data) 011b: (α creation coefficient X) = 255 - (SRC α data) 100b: (α creation coefficient X) = Fixed α value 0 (COEFX setting) 101b to 111b: Setting prohibited
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	ACMDY[2:0]	0h	RW	α Creation Coefficient Y These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient Y) = (DST α data) 001b: (α creation coefficient Y) = 255 - (DST α data) 010b: (α creation coefficient Y) = (SRC α data) 011b: (α creation coefficient Y) = 255 - (SRC α data) 100b: (α creation coefficient Y) = Fixed α value 1 (COEFY setting) 101b to 111b: Setting prohibited
15 to 8	COEFX[7:0]	00h	RW	Fixed α Value 0 These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to 100b. A value from 00h to FFh can be specified.
7 to 0	COEFY[7:0]	00h	RW	Fixed α Value 1 These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to 100b. A value from 00h to FFh can be specified.

(7) BRS Control Register B (LCDC_VSPD_VI6_BRSB_CTRL)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3918h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RBC	-	-	-	-	-	-	-	-	-	-	-	-	SRCSEL[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CROP[3:0]				AROP[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	RBC	0h	RW	Operation Type of Blending/ROP Unit B Specifies the operation type for blending/ROP unit B shown in **Figure 9.4-29**. 0b: ROP (raster operation) 1b: Blending operation
30 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18 to 16	SRCSEL[2:0]	0h	RW	Input Selection for SRC Side of Blending/ROP Unit B These bits select the input for the SRC side of blending/ROP unit A shown in **Figure 9.4-29**. These bits specify the connection between the BRS input port and the SRC separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to SRC 001b, 010b, 011b, 100b, 101b to 111b: Setting prohibited
7 to 4	CROP[3:0]	0h	RW	Color Data ROP Operator These bits select the ROP operator of the color data in blending/ROP unit B. Select the opcode for ROP operation from **Table 9.4-26**.
3 to 0	AROP[3:0]	0h	RW	α Data ROP Operator These bits select the ROP operator of the α data in blending/ROP unit B. Select the opcode for ROP operation from **Table 9.4-26**.

(8) BRS Blend Control Register B (LCDC_VSPD_VI6_BRSB_BLD)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 391Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CBES	CCMDX[2:0]			-	CCMDY[2:0]			ABES	ACMDX[2:0]			-	ACMDY[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COEFX[7:0]								COEFY[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	CBES	0h	RW	Blending Expression Selection Selects the blending expression of the color data in the BRS (VI6_BRSB_CTRL.RBC = 1). Blending coefficients are specified by the CCMDX and CCMDY bits. 0b: CCMDX × (DST color data) + CCMDY × (SRC color data) 1b: CCMDX × (DST color data) - CCMDY × (SRC color data)
30 to 28	CCMDX[2:0]	0h	RW	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient X 001b: 255 - (DST α data) is used as blending coefficient X 010b: SRC α data is used as blending coefficient X 011b: 255 - (SRC α data) is used as blending coefficient X 100b: Fixed α value 0 (COEFX setting)
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26 to 24	CCMDY[2:0]	0h	RW	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient Y 001b: 255 - (DST α data) is used as blending coefficient Y 010b: SRC α data is used as blending coefficient Y 011b: 255 - (SRC α data) is used as blending coefficient Y 100b: Fixed α value 1 (COEFY setting)
23	ABES	0h	RW	Blending α Creation Expression Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B). α creation coefficients are specified by the ACMDX and ACMDY bits. 0b: ACMDX × (DST α data) + ACMDY × (SRC α data) 1b: ACMDX × (DST α data) - ACMDY × (SRC α data)
22 to 20	ACMDX[2:0]	0h	RW	α Creation Coefficient X These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient X) = (DST α data) 001b: (α creation coefficient X) = 255 - (DST α data) 010b: (α creation coefficient X) = (SRC α data) 011b: (α creation coefficient X) = 255 - (SRC α data) 100b: (α creation coefficient X) = Fixed α value 0 (COEFX setting) 101b to 111b: Setting prohibited
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	ACMDY[2:0]	0h	RW	α Creation Coefficient Y These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient Y) = (DST α data) 001b: (α creation coefficient Y) = 255 - (DST α data) 010b: (α creation coefficient Y) = (SRC α data) 011b: (α creation coefficient Y) = 255 - (SRC α data) 100b: (α creation coefficient Y) = Fixed α value 1 (COEFY setting) 101b to 111b: Setting prohibited
15 to 8	COEFX[7:0]	00h	RW	Fixed α Value 0 These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to 100b. A value from 00h to FFh can be specified.
7 to 0	COEFY[7:0]	00h	RW	Fixed α Value 1 These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to 100b. A value from 00h to FFh can be specified.

9.4.3.2.11 LIF Control Registers

(1) LIF0 Control Register (LCDC_VSPD_VI6_LIF0_CTRL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3B00h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	OBTH [11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PADL	-	-	-	CFMT	-	-	REQSEL	LIF_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	OBTH [11:0]	000h	RW	Buffer Threshold for Start Ready Notification to Display Module Always specify 1500, when LIF_EN is set to 1b.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	PADL	0h	RW	Enable/Disable of padding with dummy lines to output-image to the DU. Enables or disables of padding with dummy lines to output-image to the DU. 0b: Padding with dummy lines to output image to DU is disabled. 1b: Padding with dummy lines to output image to DU is enabled.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	CFMT	0h	RW	Chroma Format This bit selects the output format from the LIF module to the display module. When RGB format is used, this bit shall be set to 0b. 0b: YCbCr444 or RGB Format 1b: YCbCr422 Format [Note] The DU cannot receive YCbCr422 format. Therefore, when CFMT is 1, YCbCr444 data which information contents is equal to YCbCr422 is output to DU as shown in **Figure 9.4-31**.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	REQSEL	0h	RW	External Display Module Selection 0b: This value is setting prohibited when 1b is set to LIF_EN 1b: DU is selected as the destination external display module.
0	LIF_EN	0h	RW	Enable/Disable of Data Output to External Display Module Enables or disables data output from the LIF to the external display module (DU). 0b: Data output to the external display module is disabled. 1b: Data output to the external display module is enabled.

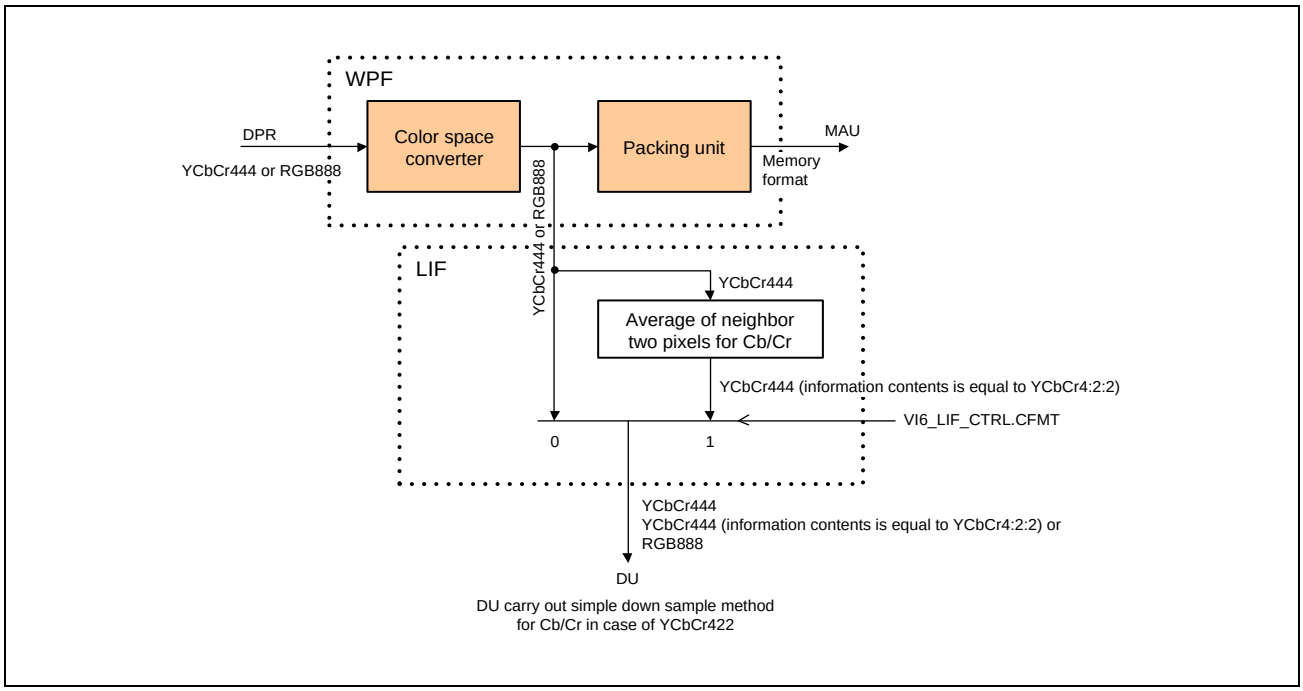

Figure 9.4-31 Data flow between LIF and DU

(2) LIF0 Clock Stop Buffer Control Register (LCDC_VI6_LIF0_CSBTH)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3B04h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	HBTH[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	LBTH[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	HBTH[11:0]	000h	RW	Buffer Threshold for Clock Stop in Dynamic Clock Control Set HBTH[11:0] = 0 (fixed value)
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	LBTH[11:0]	000h	RW	Buffer Threshold for Clock Start in Dynamic Clock Control Set LBTH[11:0] = 0 (fixed value)

(3) LIF0 Buffer Attribute Register (LCDC_VI6_LIF0_LBA)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3B0Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LBA0	-	-	-	LBA1[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	LBA2[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	LBA0	0h	RW	LIF Buffer Attribute Register0 Always specify 1b, when LIF_EN is set to 1b
30 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
27 to 16	LBA1[11:0]	000h	RW	LIF Buffer Attribute Register1 Always specify 1536, when LIF_EN is set to 1b
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	LBA2[11:0]	000h	R	LIF Buffer Attribute Register2 These bits are internal status for purpose of h/w debugging.

(4) LIF0 Padding Line Cycle Register (LCDC_VI6_LIF0_PADLN_CYC)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3B30h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	PADLN_CYC[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	PADLN_CYC [5:0]	00h	RW	Cycle of padding pattern. These bits specify the minimum number of cycles of the padding pattern of valid lines and dummy lines. For example, if PADLN_CYC[5:0] is 4, lower 4 bits of PADLN_PATTERN[3:0] indicates padding pattern. A value from 1 to 32 can be specified.

(5) LIF0 Padding Line Pattern Register (LCDC_VI6_LIF0_PADLN_PT)

Access Size : 32 bits

Address : <LCDC_vspd_base> + 3B34h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PADLN_PATTERN[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PADLN_PATTERN[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PADLN_PATTERN[31:0]	0000_0000h	RW	Pattern of padding with dummy lines These bits specify the padding pattern of valid lines and dummy lines. In each bit, 0b indicates an active line, 1b indicates a dummy line. It starts from the lower bit (Bit 0). First line should be valid line (Always set 0 to PADLN_PATTERN[0]).

(6) LIF0 Padding Line Value Register (LCDC_VI6_LIF0_PADLN_VAL)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3B38h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PADA[7:0]								PADR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PADG[7:0]								PADB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PADA[7:0]	00h	RW	Padding data of EDC code for dummy line.
23 to 16	PADR[7:0]	00h	RW	Padding data of R/Cr for dummy line.
15 to 8	PADG[7:0]	00h	RW	Padding data of G/Y for dummy line.
7 to 0	PADB[7:0]	00h	RW	Padding data of B/Cb for dummy line.

Note: Set the register to 24FF_FFFFh when the output format is YUV422.
Otherwise, set it 2EFF_FFFFh.

(7) LIF0 Padding Line Size Register (LCDC_VI6_LIF0_PADLN_SIZE)

Access Size : 32 bits
Address : <LCDC_vspd_base> + 3B3Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	PADLN_VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	PADLN_VSIZE [12:0]	0000h	RW	Vertical Size of LIF output in case of enabling Padding line When VI6_LIF0_CTRL.PADL is 1b, dummy lines are included in the output data from LIF, so set the LIF output VSIZE including dummy lines to these bits. If the number of output lines does not reach the value of PADLN_VSIZE[12:0] even if all valid lines are output according to padding pattern, dummy lines are inserted until the number of output lines reaches PADLN_VSIZE[12:0]. - Output vsize of LIF is same with input vsize to LIF when VI6_LIF0_CTRL.PADL is 0b - Output vsize of LIF is PADLN_VSIZE[12:0] when VI6_LIF0_CTRL.PADL is 1b

9.4.4 DU Registers

The DU contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits), word (16 bits), and byte (8 bits) in the registers. Therefore, read-modify-write is needed to change partial bits not more than 8 bits in the 32-bit register.

Never access the registers when the DU is in the module standby mode (with the operation clock placed in hold status).

Table 9.4-27 DU Register Base Address

Base Register Name	LCDC Ch.	Base Address
<LCDC0_du_base>	LCDC0	0_1646_0000h (5646_0000h*1, 4646_0000h*2)
<LCDC1_du_base>	LCDC1	0_1649_0000h (5649_0000h*1, 4649_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.4.4.1 List of DU Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
DU Module Control Register 0	LCDC_DU_MCR0	0000_0000h	0000h	32, 16, 8
DU Module Status Register 0	LCDC_DU_MSR0	0054_0000h	0004h	32, 16, 8
DU Module Status Register 1	LCDC_DU_MSR1	0000_0000h	0008h	32, 16, 8
DU Interrupt Mask Register 0	LCDC_DU_IMR0	0000_0000h	000Ch	32, 16, 8
DU Display I/F Timing Register 0	LCDC_DU_DITR0	0003_0300h	0010h	32, 16, 8
DU Display I/F Timing Register 1	LCDC_DU_DITR1	0000_0000h	0014h	32, 16, 8
DU Display I/F Timing Register 2	LCDC_DU_DITR2	0000_0000h	0018h	32, 16, 8
DU Display I/F Timing Register 3	LCDC_DU_DITR3	0000_0000h	001Ch	32, 16, 8
DU Display I/F Timing Register 4	LCDC_DU_DITR4	0000_0000h	0020h	32, 16, 8
Reserve	-	-	0024h to 003Fh	-
DU Module Control Register 1	LCDC_DU_MCR1	0000_0000h	0040h	32, 16, 8
Reserve	-	-	0044h to 004Bh	-
DU PBUF Control Register 0	LCDC_DU_PBCR0	0000_001Fh	004Ch	32, 16, 8
DU PBUF Control Register 1	LCDC_DU_PBCR1	0000_0000h	0050h	32, 16, 8
DU PBUF Control Register 2	LCDC_DU_PBCR2	0000_0000h	0054h	32, 16, 8

9.4.4.2 DU Register Description

The prefix (LCDC_) of the register names is omitted in this and subsequent sections.

9.4.4.2.1 DU Module Control Register 0 (LCDC_DU_MCR0)

Access Size : 32, 16, 8 bits
Address : <LCDC_du_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PB_CLR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DI_EN	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	PB_CLR	0h	RW	Clear PBUF pointers. This parameter must be changed while VSPD is not running and DU_MSR0.ST_DIF_BSY is '0b'. Writing '1b' to this parameter starts clearing the PBUF pointers. After clearing the PBUF pointers is completed, DU_MSR0.ST_PB_WINIT and DU_MSR0.ST_PB_RINIT are read as 1b, this parameter must be written back to '0b'.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	DI_EN	0h	RW	Display enable. 1b: Enabled 0b: Disabled
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.

9.4.4.2.2 DU Module Status Register 0 (LCDC_DU_MSR0)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0004h

Initial Value : 0054_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	ST_PB_RINIT	ST_PB_RUF	ST_PB_REMPTY	-	ST_PB_WINIT	-	ST_PB_WFULL
Initial Value	0	0	0	0	0	0	0	0	0	1	0	1	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	ST_DI_BSY	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	ST_PB_RINIT	1h	R	PBUF FIFO read pointer cleared status. 1b: Cleared (initial value) 0b: Not cleared
21	ST_PB_RUF	0h	R	PBUF read underflow status. This parameter clears when PBUF pointers are cleared. 1b: Occur PBUF underflow 0b: Not occur PBUF underflow
20	ST_PB_REMPTY	1h	R	PBUF read empty status. 1b: Empty 0b: Not empty
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18	ST_PB_WINIT	1h	R	PBUF FIFO write pointer cleared status. 1b: Cleared (initial value) 0b: Not cleared
17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	ST_PB_WFULL	0h	R	PBUF write full status. 1b: Full 0b: Not full
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	ST_DI_BSY	0h	R	Display I/F status. 1b: Busy 0b: Idle
7 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.4.4.2.3 DU Module Status Register 1 (LCDC_DU_MSR1)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0008h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	UF_VACT[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	UF_HACT[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	UF_VACT[12:0]	0000h	R	Vactive counter when the PBUF underflow occurs. This parameter is value latched the down counter starting from VACTIVE. This parameter is cleared when DU_MSR0.ST_PB_RUF is cleared.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	UF_HACT[12:0]	0000h	R	Hactive counter when the PBUF underflow occurs. This parameter is value latched the down counter starting from HACTIVE. This parameter is cleared when DU_MSR0.ST_PB_RUF is cleared.

9.4.4.2.4 DU Interrupt Mask Register 0 (LCDC_DU_IMR0)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 000Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	IM_PB_RUF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	IM_PB_RUF	0h	RW	Mask PBUF read underflow interrupt. 1b: Mask interrupt 0b: Not mask interrupt

9.4.4.2.5 DU Display I/F Timing Register 0 (LCDC_DU_DITR0)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0010h

Initial Value : 0003_0300h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	ODDP_EN	-	-	-	-	-	-	HSPOL	VSPOL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	DEMD[1:0]		-	-	-	-	-	-	-	DPI_CLKMD
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	ODDP_EN	0h	RW	LVDS mode. This bit is invalid using DSI and/or Parallel I/F. 0: Single channel LVDS 1: Dual channel LVDS
23 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17	HSPOL	1h	RW	hsync polarity. 1b: High active 0b: Low active
16	VSPOL	1h	RW	vsync polarity. 1b: High active 0b: Low active
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9, 8	DEMD[1:0]	3h	RW	de output mode. 00b: Reserved 01b: Fixed to Low 10b: Reserved 11b: Data enable (High active)
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	DPI_CLKMD	0h	RW	Display parallel interface clock mode. 0b: Through output 1b: Inversion output

9.4.4.2.6 DU Display I/F Timing Register 1 (LCDC_DU_DITR1)

Access Size : 32, 16, 8 bits
Address : <LCDC_du_base> + 0014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VACTIVE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	VSA[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	VACTIVE[12:0]	0000h	RW	The number of lines in the Vactive period. This parameter should be set from 1 to 1920.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	VSA[11:0]	000h	RW	The number of lines in the Vsync period. This parameter should be set from 0 to 4095, and DU_DITR1.VSA + DU_DITR2.VBP should be set more than 0. If set to 0, vsync is not asserted to DU_DITR0.VSPOL.

Figure 9.4-32 shows the relationship between the parameters and the video output timings.

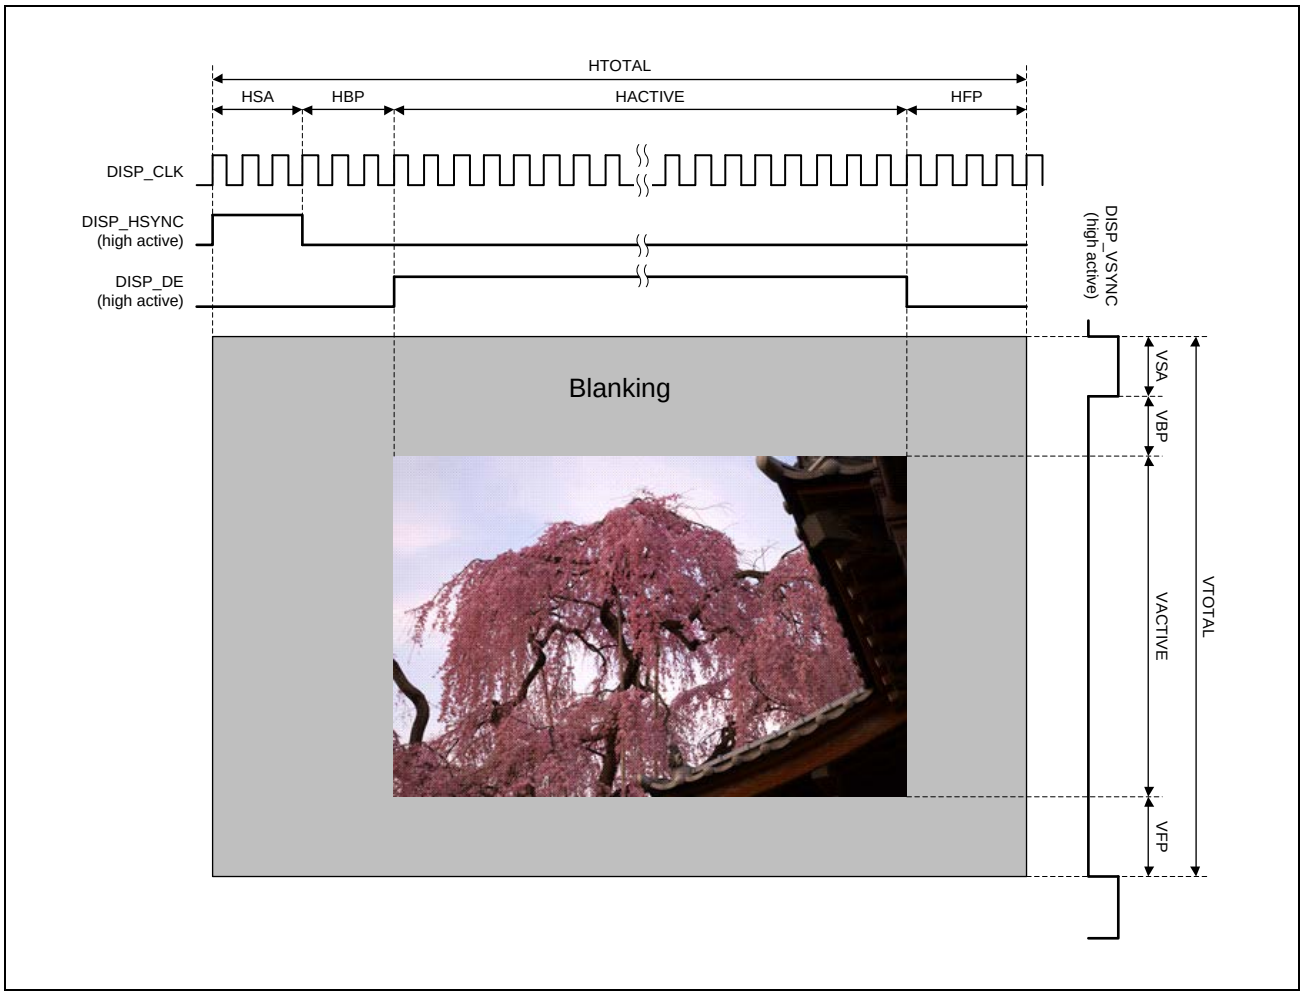

Figure 9.4-32 Video Output Timings

9.4.4.2.7 DU Display I/F Timing Register 2 (LCDC_DU_DITR2)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0018h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VFP[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VBP[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	VFP[12:0]	0000h	RW	The number of lines in the Vfront period. This parameter should be set from 0 to 8191.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	VBP[12:0]	0000h	RW	The number of lines in the Vback period. This parameter should be set from 0 to 8191, and DU_DITR1.VSA + DU_DITR2.VBP should be set more than 0.

9.4.4.2.8 DU Display I/F Timing Register 3 (LCDC_DU_DITR3)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 001Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HACTIVE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	HSA[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	HACTIVE[12:0]	0000h	RW	The number of cycles (pixels) in the Hactive period. This parameter should be set from 1 to 1920.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	HSA[11:0]	000h	RW	The number of cycles in the Hsync period. This parameter should be set from 0 to 4095, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP (=Hblank) should be set 3 or more. If set to 0, hsync is not asserted to DU_DITR0.HSPOL.

9.4.4.2.9 DU Display I/F Timing Register 4 (LCDC_DU_DITR4)

Access Size : 32, 16, 8 bits

Address : <LCDC_du_base> + 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HFP[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

23 to 0	PB_RUFDAT [23:0]	00_0000h	RW	Read data when the PBUF underflow occurs.

9.4.5 Operation

9.4.5.1 Operation Control Setting

(a) To start image process

FCPVD registers do not need to be set when starting an image process. Therefore, refer **9.4.5.4 Concept of VSPD Operation Starting and Stopping** for the guidance of starting an image process.

9.4.5.2 Reset Operation

This unit can be reset by hardware reset. The hardware reset is controlled by LCDC_n_RESET_N (n = 0, 1) of CPG, and this reset initializes the whole this unit immediately.

9.4.5.3 Registers to set fixed value

Set fixed value to following registers in any case.

[1] Always set 0000 0808h to VI6_CLK_DCSWT

[2] Always set 256 to VI6_DL_CTRL.AR_WAIT [7:0] in case of using display list.

[3] Always set 2 to VI6_DL_EXT_CTRLn.POLINT [5:0] in case of using extended display list of WPFn.

[4] Always set 1 to VI6_DL_EXT_CTRLn.DLPRI in case of using extended display list of WPFn.

[5] Always set 0 to VI6_DL_EXT_CTRLn.EXPRI in case of using extended display list of WPFn.

[6] Always set 0000 0500h toVI6_DPR_WPFn_FPORCH (n = 0, 1) in case of using WPFn.

[7] Always set 1500 to VI6_LIF0_CTRL.OBTH [11:0] in case of using LIF (VI6_LIF0_CTRL.LIF_EN = 1).

[8] Always set 8600 0000h to VI6_LIF0_LBA in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

[9] Always set 1 to VI6_LIFn_CTRL.REQSEL in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[10] Always set 0 to VI6_LIFn_CSBTH in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[11] Always set 1Fh to DU_PBCR0 in case of using DU (DU_MCR0.DI_EN = 1).

9.4.5.4 Concept of VSPD Operation Starting and Stopping

The VSPD provides one channel of image processing. Each channel is started by setting the corresponding start register. Here, starting a processing channel means starting one of WPF0, which are output modules of the VSPD. Use the start registers shown in **Table 9.4-28** to start WPF modules.

After a WPF module is started and specified processing is completed, the corresponding channel stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in **Table 9.4-28**; clearing a source register cancels the corresponding interrupt signal. Each of the operating status registers shown in the table indicates the busy state after the corresponding channel is started through the start register until processing is completed and operation stops. **Figure 9.4-34** shows these operation timings.

Table 9.4-28 Target Module and Corresponding Registers for Starting and Stopping Operation

Target Module	Start Register	End Interrupt Source Register	Operating Status Register
WPF0	VI6_CMD0.STRCMD	VI6_WPF0_IRQ_STA. FRE	VI6_STATUS.SYS0_ACT

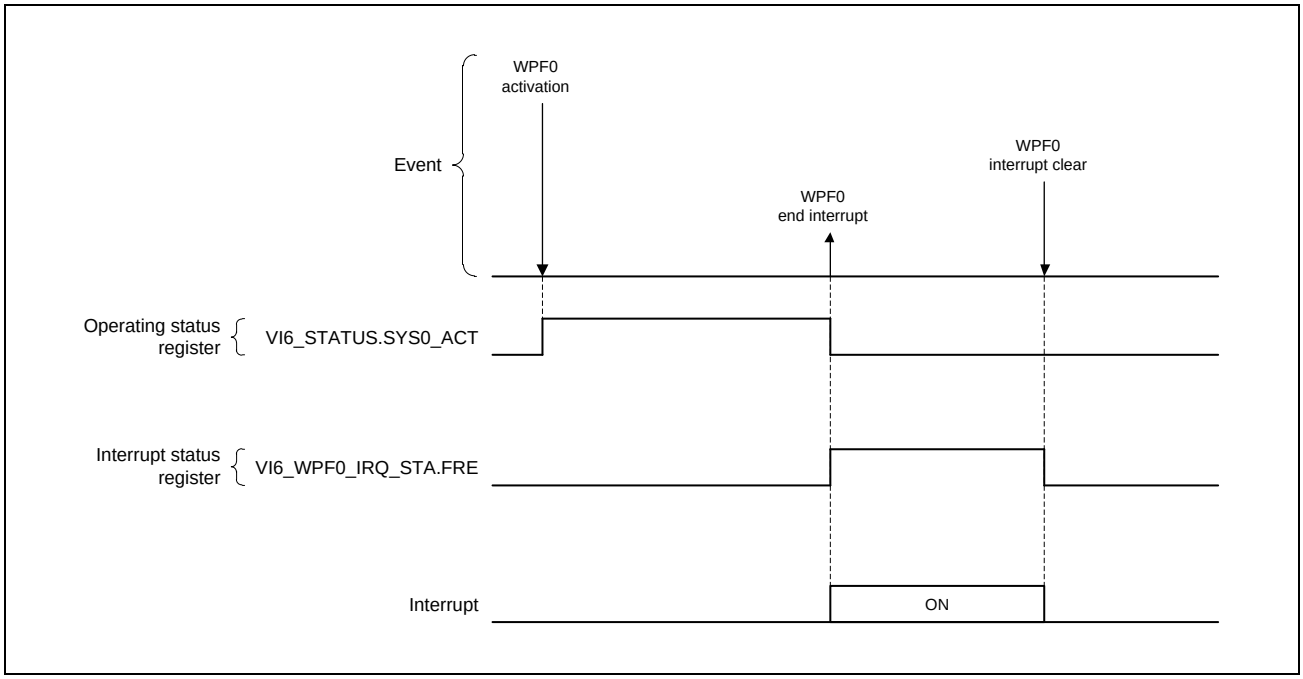

Figure 9.4-33 VSPD Startup and Status of Each Register and Interrupt

The following describes the operating states (operating or stopped) of VSPD internal modules. As described in **9.4.3.2 VSPD Register Description**, the VSPD has several image processing modules and the connections between modules are determined by the DPR. Accordingly, the operating state of a module is the same as that of the target WPF for that module. For example, when the target WPF for the BRS is WPF0, the BRS operating state is the same as that of WPF0; that is, the BRS operating state is indicated by the VI6_STATUS.SYS0_ACT as shown in **Table 9.4-28** and the status change timing is shown as VI6_STATUS. SYS0_ACT in **Figure 9.4-33**. Likewise, the operating states of all modules connected to WPF0 is indicated by VI6_STATUS. SYS0_ACT.

Connections should be changed through the DPR-related registers (described later) while all modules to be affected by any change in connections are stopped. If connections through the DPR are changed during operation, the VSPD will hang.

Figure 9.4-34 shows relation between start reservation and operating status. When start is reserved while VSPD is operating, the reservation is accepted after VSPD status is moved from “operating” into “idle” as shown in **Figure 9.4-34**.

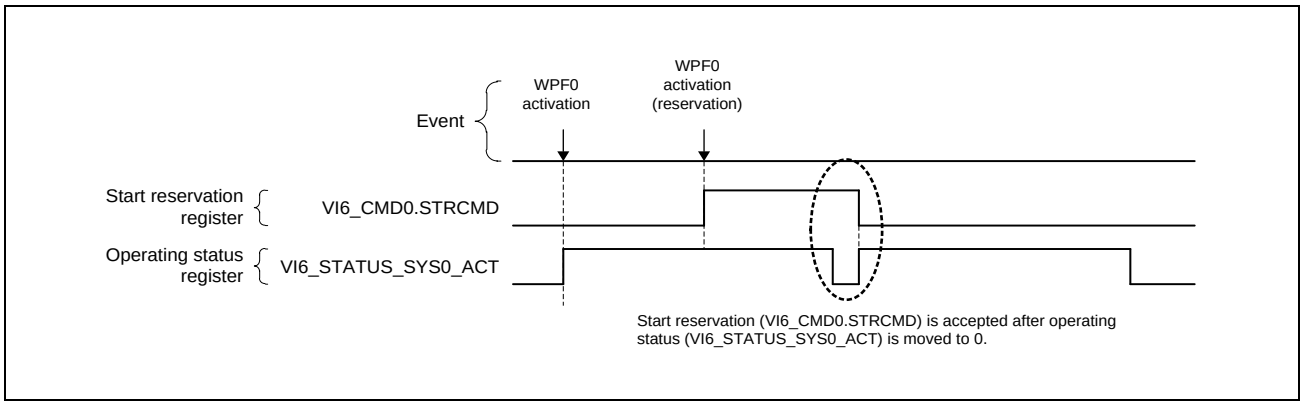

Figure 9.4-34 VSPD Start Reservation and Operating Status

9.4.5.5 Display List

9.4.5.5.1 Functional description

The VSPD provides the display list function. As a display list, the VSPD automatically downloads the register settings except for the control registers (**9.4.3.2.4 General Control Registers** and **9.4.3.2.5 Display List Control Registers**) from external memory and stores the settings in the VSPD registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSPD processing are prepared in advance in external memory such as SDRAM.

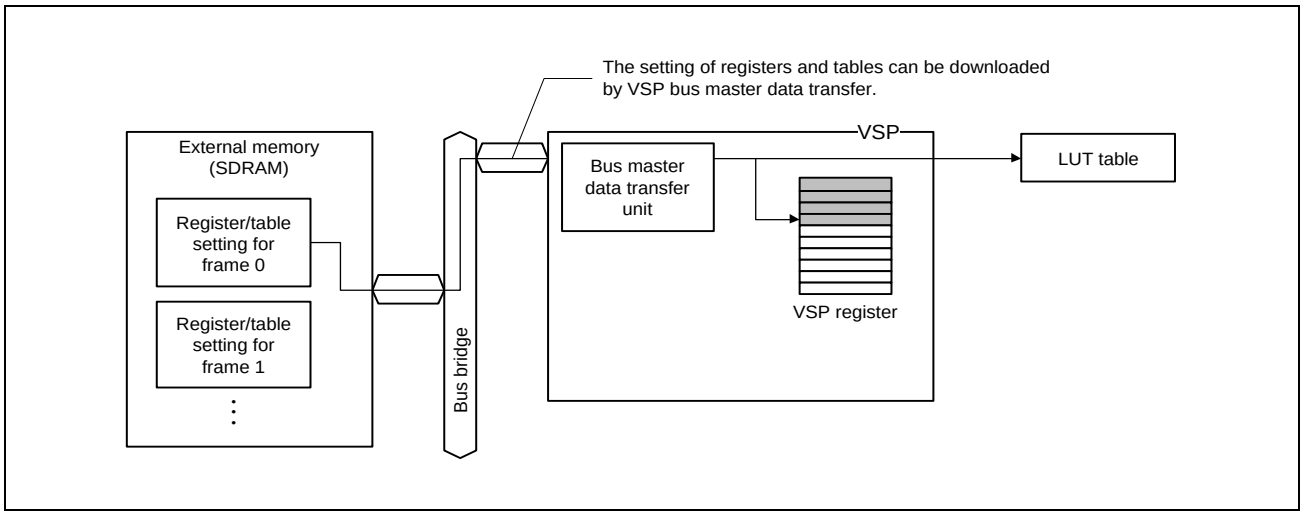

Figure 9.4-35 Concept of Display List

To use display lists, specify the external memory addresses to the display list control registers described in **9.4.3.2.5 Display List Control Registers**. The register settings or various types of information should be stored in external memory in the format described in **9.4.5.5.2 Normal display list mode**. **Figure 9.4-36** shows the difference between VSPD operation through normal register settings and through display lists.

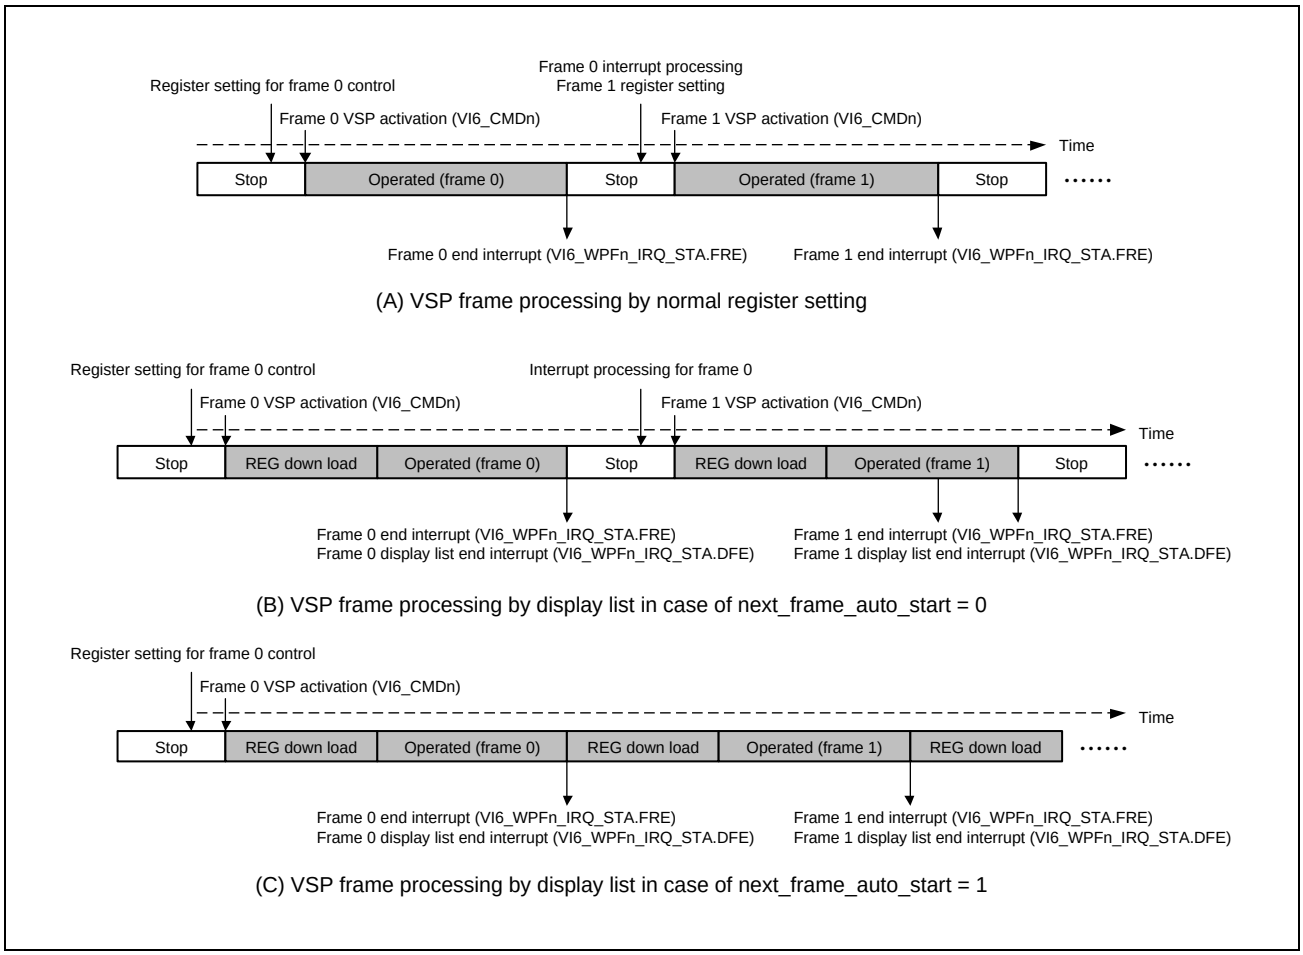

Figure 9.4-36 Comparison of VSPD Operation between Normal Register Settings and Display Lists

As shown in **Figure 9.4-36** (A), in the VSPD processing through normal register settings, all registers should be set up before the VSPD is started for each frame. After the VSPD processing is completed, the VSPD outputs a frame end interrupt (VI6_WPFn_IRQ_STA.FRE). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSPD automatically downloads register settings from external memory as shown in **Figure 9.4-36** (B) and (C), which reduces the load on the CPU between frames.

Figure 9.4-36 (B) shows the display list usage where the VSPD stops at the end of every frame; only the VSPD start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSPD is large. In the case shown in **Figure 9.4-36** (C), as soon as the frame processing ends, the VSPD automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

Table 9.4-29 shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

Table 9.4-29 Display list mode and supported functions

Mode	Extended Display List	Continuous Frames
Normal Display List Mode	Supported	Controlled by “next frame auto start” in the header of the display list.
Header-less Display List Mode	Not Supported	Controlled by VI6_DL_CTRL.CFM0 bit.

9.4.5.5.2 Normal display list mode

The VSPD display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. **Figure 9.4-37** shows the display list structure.

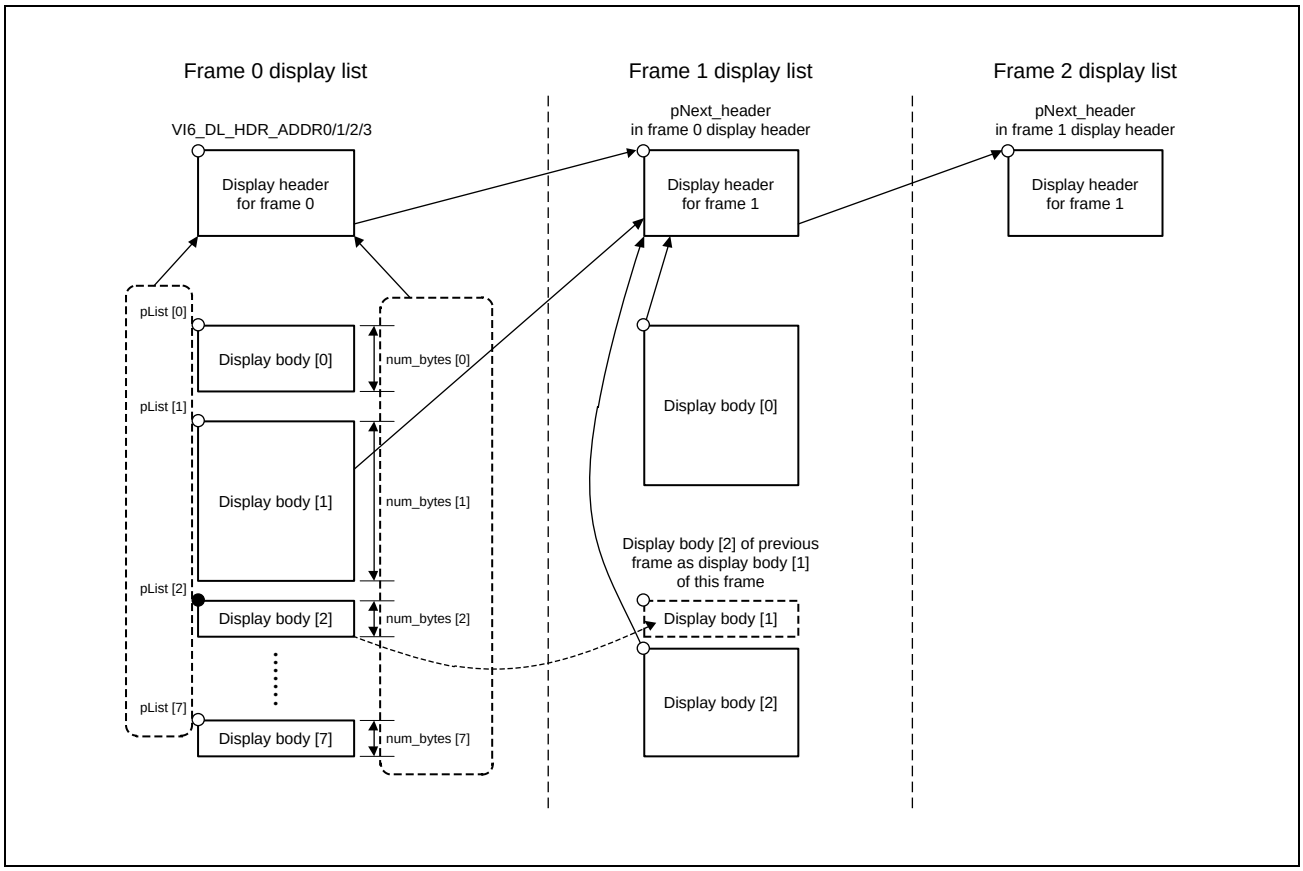

Figure 9.4-37 Structure and Concept of VSPD Display List

A VSPD display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSPD analyzes the header to gather register and table settings stored in separate memory areas and reconfigures the complete register settings.

The addresses of display headers should be specified in the VSPD registers described in **9.4.3.2.5 Display List Control Registers**. When activated in a mode that uses display lists, the VSPD downloads display headers from the

addresses specified in VI6_DL_HDR_ADDR0 (number 0 correspond to the WPF channel index numbers), analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSPD becomes ready for frame image processing; the VSPD then starts the actual frame processing.

After processing of a frame ends, the VSPD proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in **Figure 9.4-36**. In one mode, the VSPD stops operation and waits for the next activation by the CPU in the same way as when display lists are not used. In this mode, the address used for downloading the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6_DL_HDR_ADDR0 while the VSPD is stopped. When the VSPD is started after a correct value is specified, the VSPD starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSPD after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSPD downloads the next display header as soon as the previous frame processing ends. After downloading ends, the VSPD starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, **Table 9.4-30** defines a function. Function zero bits (num bits) generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, **Table 9.4-31** defines the header section format of a display list and **Table 9.4-32** defines the body section format and **Table 9.4-33** defines the extended display list body section format.

Data order of Display List Header Section, Display List Body Section and Extended Display List Body Section are assumed as the data is stored in SDRAM by big endian. **Table 9.4-34** shows an example of data order. If data order is not same as the definition, data order within 8byte unit can be adjusted by setting VI6_DL_SWAP (see **(3) Display List-0 Data Swapping Register (LCDC_VSPD_VI6_DL_SWAP0)**).

Table 9.4-30 Definition of a Function for Simple Description

Syntax	Bit Count
zero_bits (num_bits)	
{	
for (i = 0; i<num_bits; i++) {	
zero_bit	1
}	
}	

Bit String	Contents
zero_bit	zero_bit indicates a 1-bit integer having a value of 0.

Table 9.4-31 Format of Display List Header Section

Syntax	Bit Count
display_header () /* Fixed length */	
{	
zero_bits (29)	
num_list_minus1	3
for (i=0; i<8; i++)	
zero_bits (15)	
num_bytes [i]	17
pList [i]	32
}	
pNext_header	32
zero_bits (23)	
wait_wup	1
zero_bits (3)	
ignore_upd_dl	1
zero_bits (2)	
current_frame_int_enable	1
next_frame_auto_start /* 76 bytes from the beginning of this header*/	1
if (VI6_DL_EXT_CTRL.EXT) {	
zero_bits (32) /* padding zero 4 bytes for alignment */	
zero_bits (6)	
pre_ext_dl_exec	1
post_ext_dl_exec	1
zero_bits (8)	
pre_ext_dl_num_cmd	16
pre_ext_dl_pList	32
zero_bits (16)	
post_ext_dl_num_cmd	16
post_ext_dl_pList /* 96 bytes from the beginning of this header*/	32
}	
}	

Bit String	Contents
num_list_minus1	Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body.
num_bytes [i]	Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pList [i]	Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pNext_header	Specifies the address of the display list header for the next frame. After display list downloading ends, the VSPD keeps its value in the internal memory and uses it in the next display list header downloading. Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0).
wait_wup	When this bit is 1, VSPD starts reading image data from external memory after WUP (Wake Up) signal from any channel of VIN asserts. This bit is available for WPF0.
ignore_upd_dl	If this bit is set to 1, new display list pointed by VI6_DL_HDR_ADDR0 is not downloaded in VSPD H/W for the next frame, even if S/W sets VI6_DL_HDR_ADDR0 during the frame. New display list is downloaded in VSPD H/W at next frame of the processing which this bit is 0. This bit is available for WPF0.
current_frame_int_enable	This is a flag that indicates whether to set the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), no interrupt will be generated. If this flag is set to 1, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), the VSPD generates an interrupt.
Next_frame_auto_start	Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSPD starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the pNext_header address specified in this display header. If this bit is set to 0, the VSPD stops operation when one-frame processing by this display header ends. In this case, start the VSPD through VI6_CMDn to process the next frame.
pre_ext_dl_exec	Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSPD executes the extended display list for frame preprocessing. The VSPD does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_exec	Set 0 to this bit.
pre_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1, and a command is 16 bytes. When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_num_cmd	Set 0 to this bit.
post_ext_dl_pList	Set 0 to this bit.

Table 9.4-32 Format of Display List Body Section

Syntax	Bit Count
display_list (num_bytes) /* Variable length (num_bytes) */	
{	
for (i=0; i<num_bytes; i+=8) {	
set_address	32
set_data	32
}	
}	

Bit String	Contents
set_address	Specifies the address where the value specified by set_data is to be stored. Specify a register address. *Note*: Register space of VSPD is 32 Kbyte (0000h - 7FFCh). So, set 0 to upper 17-bit of set_address in Display List Body Section.
set_data	Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register.

~~	~~~

9.4.5.5.3 Header-less display list mode

The header-less display list does not have the display header listed in **Table 9.4-31**, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6_DL_CTRL.NH0 (see **(1) Display List Control Register (LCDC_VSPD_VI6_DL_CTRL)**) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6_DL_HDR_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6_DL_BODY_SIZE0. The header-less display list is available only in WPF0.

9.4.5.5.4 Restrictions on display list usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed.
2. Do not execute write access to the same LUT lookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 9.4-35**.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same LUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 9.4-35**.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in **9.4.3.2.3 Restrictions on Access to Registers and Lookup Tables**.
6. Manipulation and setting of the registers described in **9.4.3.2.4 General Control Registers** and **9.4.3.2.5 Display List Control Registers** through a display list is prohibited.
7. Do not use extended display lists.

9.4.5.6 Interrupt Processing

9.4.5.6.1 vs1o_intreq_n

When a WPF module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in WPF independently, the VSPD has the following registers to control interrupts in WPF.

- WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0) (refer to **(12) WPF0 Interrupt Enable Register (LCDC_VSPD_VI6_WPF0_IRQ_ENB)**)
- WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0) (refer to **(13) WPF0 Interrupt Status Register (LCDC_VSPD_VI6_WPF0_IRQ_STA)**)

CAUTION

To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear all WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSPD.

9.4.5.6.2 duo_intr_n

When the PBUF will detect a FIFO underflow, an interrupt signal is output. The DU has the following registers to control the interrupt.

- DU Module Status Register 0 (DU_MSR0) (refer to **9.4.4.2.2 DU Module Status Register 0 (LCDC_DU_MSR0)**)
- DU Interrupt Mask Register 0 (DU_IMR0) (refer to **9.4.4.2.4 DU Interrupt Mask Register 0 (LCDC_DU_IMR0)**)

CAUTION

To use interrupts, enable them through DU Interrupt Mask Register. If an interrupt is asserted, the PBUF is underflowing and invalid display data is being output. When an interrupt occurs, the interrupt can only be cleared by DU_MCR0.PB_CLR register.

If DU_MCR1.PB_AUTOCLR is set a value other than 0, an interrupt is cleared according to the DU_MCR1.OPMD register.

9.4.5.7 Lookup Table Settings

9.4.5.7.1 LUT

For a single entry to the LUT space (see **Table 9.4-35**) of the VSPD, the LUT data is set by a write access in the format shown in **Figure 9.4-38**.

The entry address of each space is (start address of the space) + (entry number counting from the base point 0 × 4). For example, the address of entry 7 to the LUT space is (offset address) + 7000h + 7 × 4 = (offset address) + 701Ch.

Table 9.4-35 shows the spaces for which entries can be made. Note that if the module that references that space is operating, write accesses to the relevant space are prohibited. So, while LUT is operating, accesses to the entire space of VI6_LUT_TBL are prohibited. When a read access is made to the relevant space during operation of the referencing module, undefined values will be read out.

The operating/stopped state of each module in **Table 9.4-35** is the operating state of the WPF to which each module is connected. Determine whether the module is operating or stopped using each WPF operating status bit in the VI6_STATUS register.

Table 9.4-35 LUT Space Addresses

Space Name	Space Addresses	Entry Count	Module that References the Space in the Left Column
VI6_LUT_TBL	(offset address) + 7000h to (offset address) + 73FCh	256	LUT

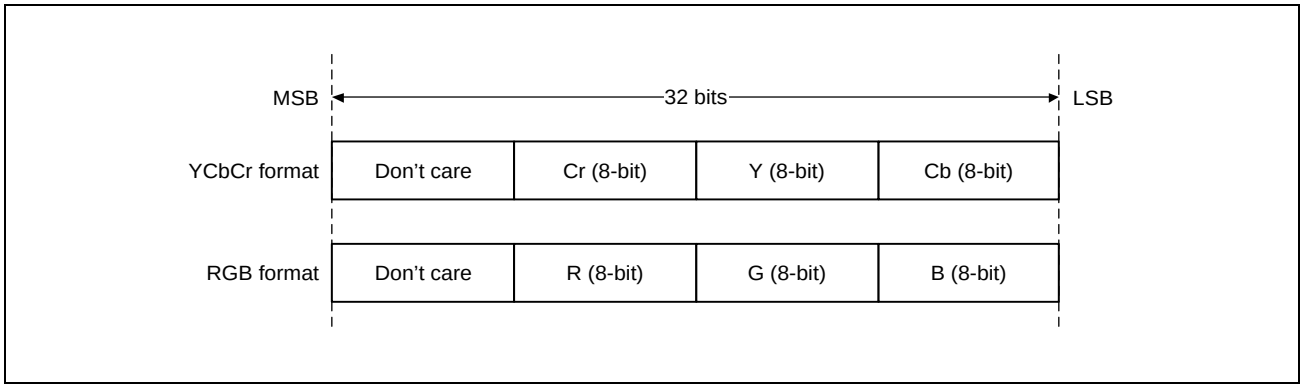

Figure 9.4-38 VI6_LUT_TBL Formats

9.4.5.8 Linked with DU

9.4.5.8.1 Operation flow of VSPD and DU

This section shows operation flow of VSPD by using Normal Display List Mode. For details of Normal Display List Mode, refer to **9.4.5.5.2 Normal display list mode**.

Figure 9.4-39 and **Figure 9.4-40** shows a procedure (register setting flow) to display image data to display panel.

Figure 9.4-39 shows setting flow to start VSPD/LIF0 linked with DU. **Figure 9.4-40** shows setting flow to update display image.

Using display list with enabling next_frame_auto_start shown in **9.4.5.5 Display List** is required to take the flow from **Figure 9.4-39** and **Figure 9.4-40**.

NOTE

If display sync operation ([1-7] step in **Figure 9.4-39**) is set before activating the VSPD, invalid data is displayed until image data read from external memory is ready to be transferred to DU. In this case, image data from external memory is displayed late by one vsync or more.

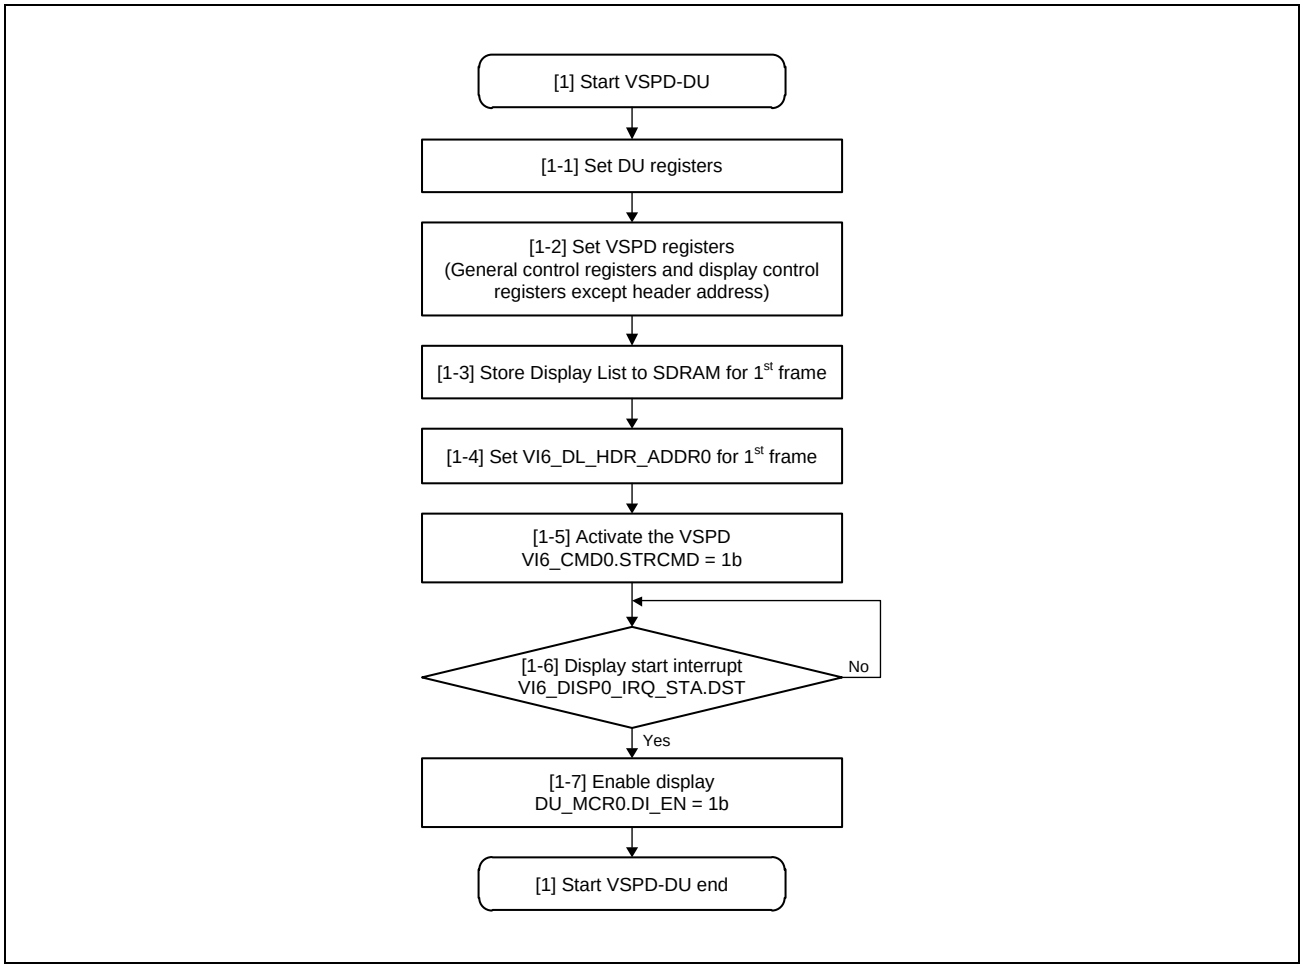

Figure 9.4-39 Setting Flow to Start VSPD Linked with DU

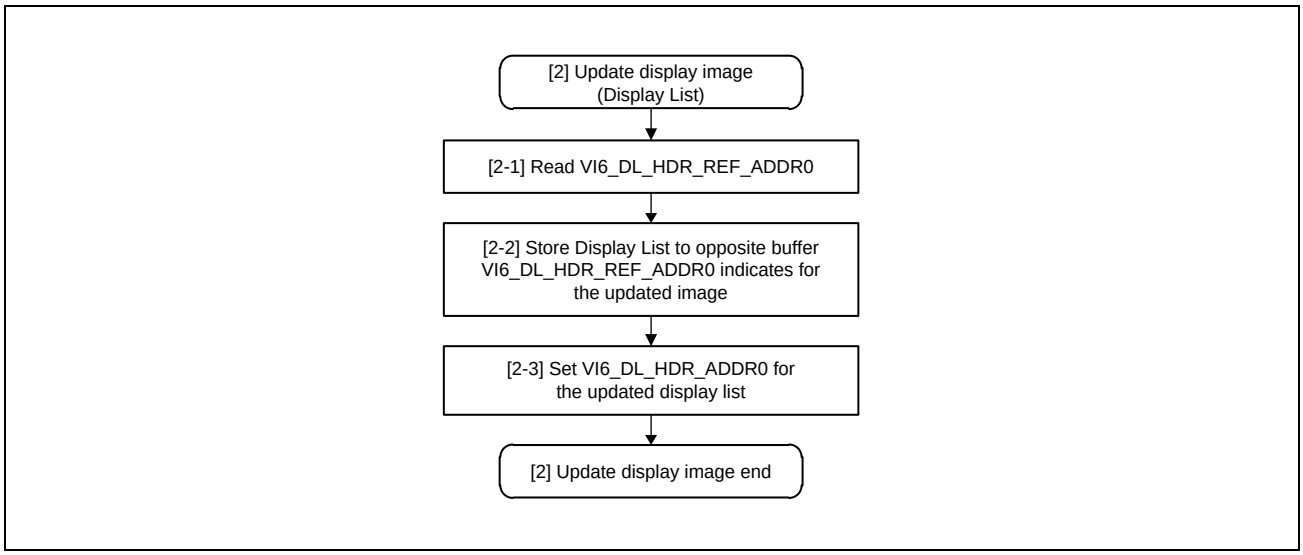

Figure 9.4-40 Setting flow to update display image

It is possible to update display list at any time (arbitrary timing) as shown in **Figure 9.4-40**. Don't overwrite display list in external memory pointed by VI6_DL_HDR_REF_ADDR. It is because VSPD is reading the display list pointed by VI6_DL_HDR_REF_ADDR or will be reading the display list soon.

Detail explanation is shown below.

As shown in **(6) Display List-0 Header Reference Address Register (LCDC_VSPD_VI6_DL_HDR_REF_ADDR0)**, when VSPD is reading display list from external memory (Period [A] in **Figure 9.4-41**), VI6_DL_HDR_REF_ADDRn indicates header address of the display list referred by VSPD. When VSPD is not reading display list from external memory (Period [B] in **Figure 9.4-41**), VI6_DL_HDR_REF_ADDRn indicates the value of VI6_DL_HDR_ADDRn, and there is possibility that the display list is being read soon by VSPD at next frame start timing. Therefore, keep display list in external memory pointed by VI6_DL_HDR_REF_ADDR. Detail software sequence to update display list and VSPD -H/W behavior are shown below.

[1] Store latest display list in external memory area different from the area pointed by VI6_DL_HDR_REF_ADDR, because the area pointed by VI6_DL_HDR_REF_ADDR is being read or is being read soon by VSPD.

[2] Set header address of new display list into VI6_DL_HDR_ADDRn.

[3] VSPD reads display list from the external memory area pointed by VI6_DL_HDR_ADDRn at frame start timing.

Refer also to **(2) Display List-0 Header Address Register (LCDC_VSPD_VI6_DL_HDR_ADDR0)** and **(6) Display List-0 Header Reference Address Register (LCDC_VSPD_VI6_DL_HDR_REF_ADDR0)**.

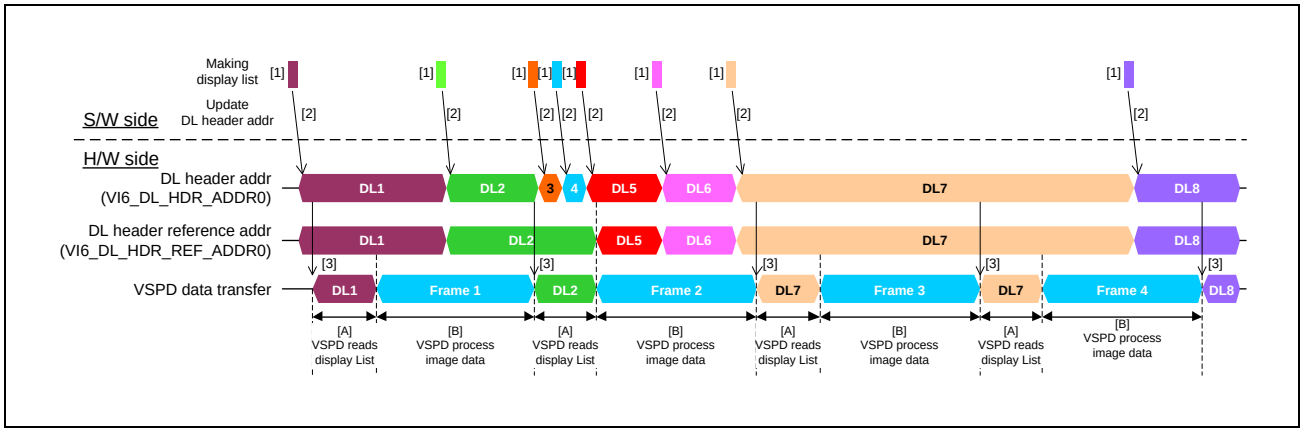

Figure 9.4-41 Updating Display List at Arbitrary Timing

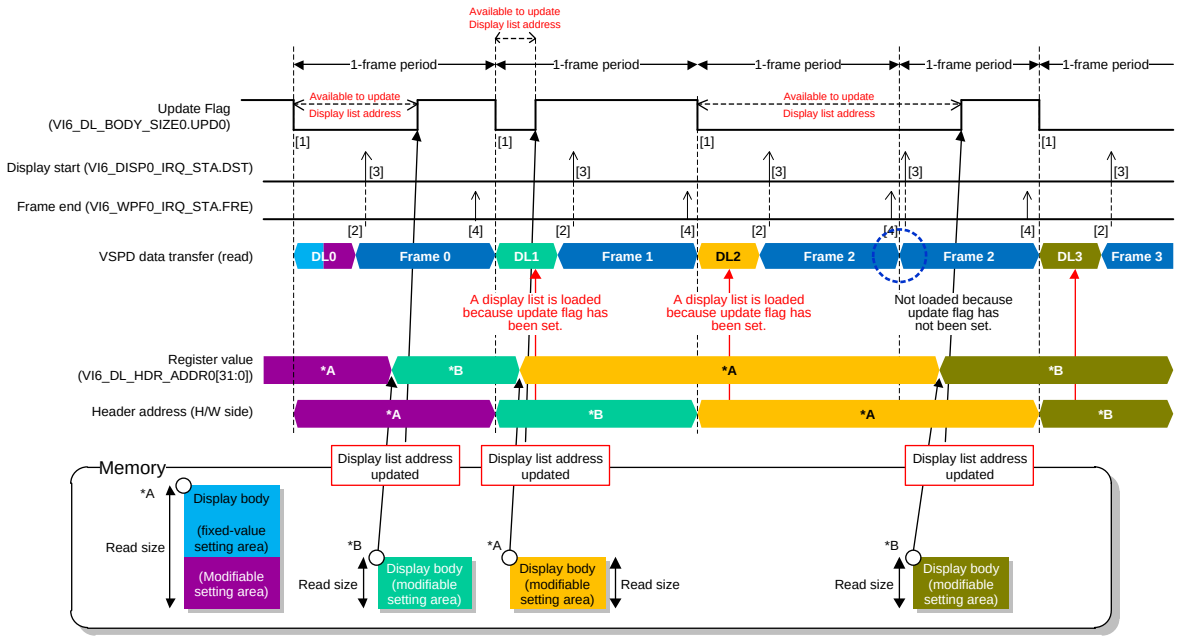
9.4.5.8.2 Controlling two register planes using display lists

This section shows operation flow of VSPD by using Header-less Display List Mode. Start procedure and stop procedure are same with Normal Display List Mode in **9.4.5.8.1 Operation flow of VSPD and DU** except for the point that VI6_DL_BODY_SIZE0 should be set before step [1-5] in start procedure shown in **Figure 9.4-39**. The procedure to update display list is different with Normal Display List Mode, and is described later. **Figure 9.4-42** shows the control of two register planes using header-less display lists (see **9.4.5.5.3 Header-less display list mode**) and its timing. In the description hereafter, the use of header-less display lists is always assumed and they are simply called display lists.



Display list plane A: “Fixed-value settings” and “modifiable settings” are stored as a set in contiguous area A.
Display list plane B: Only the “modifiable settings” are stored in area B, which is separate from display list A.

To switch settings for every frame, modify two display list planes alternately. After every modification, update the display list address register (VI6_DL_HDR_ADDR0[31:0]) and writing 1 to update flag (VI6_DL_BODY_SIZE0.UPD0) in the VSPD.
Update flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically after Header Address is loaded into H/W side.

Figure 9.4-42 Controlling Two Register Planes Using a Display List

The VSPD downloads a display list immediately after activation. In the start frame, download the display list that contains all necessary settings. From the next frame on, only the necessary register or table values should be specified in a display list.

When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 1, VSPD downloads a new display list at the start of the next frame. When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 0, the register settings acquired from the display list previously downloaded are retained and used for the next operation without downloading a new display list.

Order of each VSPD -H/W Events mentioned as [1], [2], [3] and [4] in **Figure 9.4-42** are shown below.

[1] VI6_DL_BODY_SIZE0.BS0 and VI6_DL_HDR_ADDR0 are downloaded in H/W side. And Update Flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically.

[2] Reading DisplayList from external memory into VSPD -H/W is finished through master access.

[3] Display start interrupt status (VI6_DISP_IRQ_STA.DST) asserts.

[4] Frame end interrupt status (VI6_WPF0_IRQ_STA.FRE) asserts.

Don’t overwrite the display list in external memory for a period from “[4] VI6_WPF0_IRQ_STA.FRE” to next “[3] VI6_DISP_IRQ_STA.DST”, because VSPD is reading the display list for the period.

9.4.6 Usage Note

9.4.6.1 Assignment in Memory Space

Make sure that VSPD memory space shall be mapped to Non-Cache region.

9.4.6.2 Limitations on Software Reset and Module Standby

Stop LCDC with the software reset sequence following to the guidance in **9.4.5.1 Operation Control Setting**.

9.4.6.3 Input Image Size

Table 9.4-36 is a list of input size specifications.

Table 9.4-36 List of Input Size Specifications

Module	Min. Input Size (horizontal × vertical)	Max. Input Size (horizontal × vertical)	Restriction on Setting Unit
RPF	1 × 1 pixel	1920 × 1200 pixels 1200 × 1920 pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. *Note 1.* When the 1-bpp alpha plane*1 is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format. *Note 2.* These restrictions including note 1 are applied to the following. VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
LUT	1 × 1 pixel	1920 × 1200 pixels 1200 × 1920 pixels	1-pixel units both horizontally and vertically.
BRS	1 × 1 pixel	1920 × 1200 pixels 1200 × 1920 pixels	1-pixel units both horizontally and vertically.
LIF	1 × 1 pixel	1920 × 1200 pixels 1200 × 1920 pixels	1-pixel units both horizontally and vertically.
WPF	1 × 1 pixel	1920 × 1200 pixels 1200 × 1920 pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. *Note 1.* This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units.

Note 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 011b.

The most important restriction shown in **Table 9.4-36** is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in **Table 9.4-36**.

9.4.6.4 Output Image Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in **Figure 9.4-1**, the data input to the VSPD is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. **Table 9.4-37** is a list of the processing that changes image size.

Table 9.4-37 Image Processing that changes image size

Module	Function*1	Related Register	Size of Output from Module
WPF	Input size clipping	VI6_WPFn_HSZCLIP VI6_WPFn_VSZCLIP	When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size. Horizontal output size: VI6_WPFn_HSZCLIP.HCL_SIZE × 2 setting Vertical output size: VI6_WPFn_VSZCLIP.VCL_SIZE × 2 setting
LIF	Padding line	VI6_LIFn_CTRL	When padding with dummy lines is disabled, output size is same with Input size. When padding with dummy lines is enabled: Horizontal output size: input size Vertical output size: VI6_LIF0_PADLN_SIZE setting

Note 1. For details of each function, refer to the descriptions of the related registers.

Note 2. Refer to **9.4.3.2.1 Notational Conventions for Registers and Bit Fields** for explanation of register bit field.

The input image size can be changed only with the modules and functions shown in **Table 9.4-37**. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSPD output size can also be determined through the following steps.

1. The image size (VI6_RPFn_SRC_ESIZE) read from the external memory and sent to the DPR by the RPFn is the initial value.
2. When the module connected with the DPR is not a module (function) shown in **Table 9.4-37**, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in **Table 9.4-37**, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPFn is determined, this size is the VSPD output size for that WPFn path.

Figure 9.4-43 shows how to determine the image size in a sample DPR connection through the above steps. The related conditions that determine the image size are also shown.

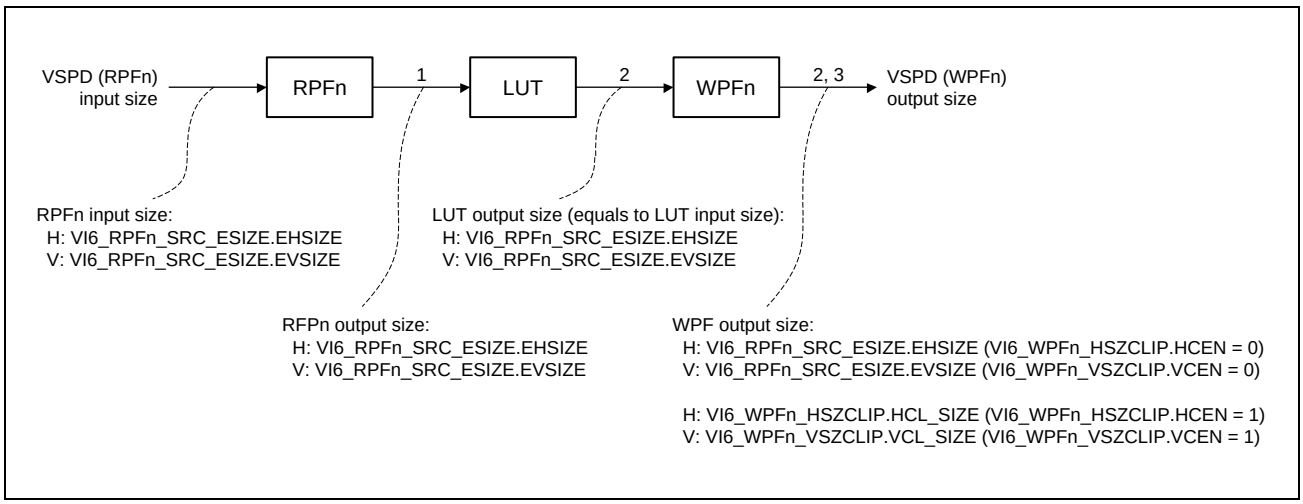


Figure 9.4-43 Input/output Size for Each Module in a Sample DPR Connection

Make appropriate register settings in each module so that the VSPD output image size determined as shown in the figure does not violate the restrictions shown in **Table 9.4-37**.

9.4.6.5 Restriction

When the data output from this unit is written back to the same memory area where the input data for this unit has been read, this unit has the following restrictions.

1. The access order and format on the frame memory are the same between the input pixels and output pixels.
2. Specifying a larger output image size than the input image size, either vertically or horizontally or both vertically and horizontally, is prohibited.
3. When the YCbCr4:2:0 format is input, operation between color components is prohibited.

These restrictions are summarized in. Refer to the descriptions of the registers related to each restriction. In the table, RPFm indicates the RPFn that inputs the master layer, and WPFwb indicates the WPFn that writes back the output image to the source image area for the master layer.

Table 9.4-38 Restrictions on Use when Output Data is Written Back to Input Data Area

No.	Restriction	Related Registers
Restriction 1	The RPFm input format and the WPFwb output format should be the same.	VI6_RPFn_INFMT.RDFMT VI6_RPFn_INFMT.VIR
	The RPFm source image storing address and the WPFwb destination address should be the same.	VI6_RPFn_SRCM_ADDR_*
	The RPFm source picture memory stride and the WPFwb destination memory stride should be the same.	VI6_RPFn_SRCM_PSTRIDE VI6_RPFn_SRCM_ASTRIDE
	The RPFm and WPFwb data swapping settings should be the same.	VI6_WPFn_DSWAP
Restriction 2	The RPFm basic read size and extended read size should be the same.	VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
	Color space conversion is prohibited in RPFm and WPFwb.	VI6_RPFn_INFMT.CSC VI6_WPFn_OUTFMT.CSC
Restriction 3*1	NOP should be specified for IROP operation.	VI6_RPFn_ALPH_SEL.IROP
	Color keying is prohibited.	VI6_RPFn_CKEY_CTRL.CV

Note 1. When the input format is not YCbCr4:2:0, restriction 3 in not applied.

SECTION 9 IMAGE

9.5 MIPI DSI Interface (DSI)

9.5.1 Overview

This section describes the features of the MIPI-DSI unit of this LSI.

This unit is the MIPI-DSI Tx Module; it is composed of the MIPI DSI-2 host controller (LINK) and the MIPI D-PHY Tx (D-PHY).

This unit supports the MIPI Alliance Specification for Display Serial Interface (DSI) Specification. This unit provides a solution for transmitting MIPI DSI compliant digital video and packets. The normative references are listed below.

- MIPI Alliance Specification for Display Serial Interface Version 1.3.1
- MIPI Alliance Specification for D-PHY Version 1.2

9.5.1.1 Features

The following is key features of this unit.

In this document the word “DSI” means “Display Serial Interface Version 1.3.1”.

Overview

- 1 channel
- The number of lanes: 4 lanes
- Supports up to Full HD (1920 × 1200), 60 fps (RGB888)
- Maximum bandwidth: 1.5 Gbps per lane
- Supports the output data format: RGB666 / RGB888

Protocol Interface

- PPI interface (8 bits)
- Packet generation from Video Input signal for Video Mode (Video-Input Operation)
  - Supports the RGB format (18-bit, 18-bit loosely and 24-bit)
  - Not supports the RGB format (30-bit and 36-bit)
  - Not supports the YCbCr 4:2:2 format (16-bit, 20-bit loosely and 24-bit)
  - Not supports the YCbCr 4:2:0 format (12-bit)
  - Not supports Compressed Pixel Stream
  - Supports Blanking Packet or LP-11 selection during each of HSA, HBP, and HFP blanking interval
  - Supports “Non-Burst Mode with Sync Pulse”, “Non-Burst Mode with Sync Event”, and “Burst Mode”
  - Not supports interlaced video
  - Not supports deskew pattern insertion after vertical video data timing

- LP only packet generation and LP packet reception from descriptor list (Sequence Operation channel 0)
  - Supports one sequence input channel
- HS or LP packet generation and LP packet reception from descriptor list (Sequence Operation channel 1)
  - Supports one sequence input channel

Link Layer

- Supports 1, 2, 3, and 4 lane configurations
- Supports unidirectional high-speed mode Tx
- Supports bidirectional LP mode Tx/Rx (Only Lane0)
- Supports ECC/Checksum generation for Tx packet
- Supports ECC/Checksum verification and ECC error correction for Rx packet
- Supports automated insertion of EoTp in HS mode
- Supports ULPS (Tx)
- Supports automated power change to LP mode and return to HS mode
- Supports automated clock stop and resume (non-continuous clock mode)
- Supports assignment for Virtual Channel for video input channel in Video-Input Operation
- Supports assignment for individual Virtual Channel for each packet in Sequence Operation
- Supports detection for PHY contention error and timeout error
- Supports generation of scrambled packets
- Not supports input of TE signal

PHY Layer

- Synchronous link between Master (data source) and Slave (data sink)
- All lanes support high-speed transmission in the forward direction.
- Bi-directional data transmission in Low-Power mode at the Master Data Lane 0 only
- Uses token passing to control the communication direction of the link.
- High-Speed mode for fast data traffic and Low-Power mode for controls and low-speed data transmission.
- High-Speed mode: Differential and terminated, 200 mV swing, and 80 - 1500 Mbps operation speed.
- Low-Power mode: Single-ended and non-terminated, 1.2 V swing, and maximum 10 Mbps speed.
- Number of lanes
  - Master data lane: 4 lanes
  - Master clock lane: 1 lane
- Lane module functions
  - Master data lane 0: CIL-MFAA (HS-TX, LP-TX, LP-RX, LP-CD)
  - Master data lanes 1 to 3: CIL-MFEN (HS-TX, LP-TX)
  - Master clock lane: CIL-MCNN (HS-TX, LP-TX)

- Optional functions

  [Escape mode]

  - LPDT
    - LP transmit: Supported
    - LP receive: Supported (only Master Data Lane 0)
    - ULPS: Supported
    - Reset trigger: Supported
  - Bi-direction
    - Bus turn-around: Supported
    - Contention detection: Supported
  - Calibration
    - Deskew calibration / Preamble: Not-supported
    - Pre/De-Emphasis: Not-supported
    - Equalization: Not-Supported
  - Video Input Interface
    - Selectable 2 channels

9.5.1.2 Block Diagram

Figure 9.5-1 shows a block diagram.

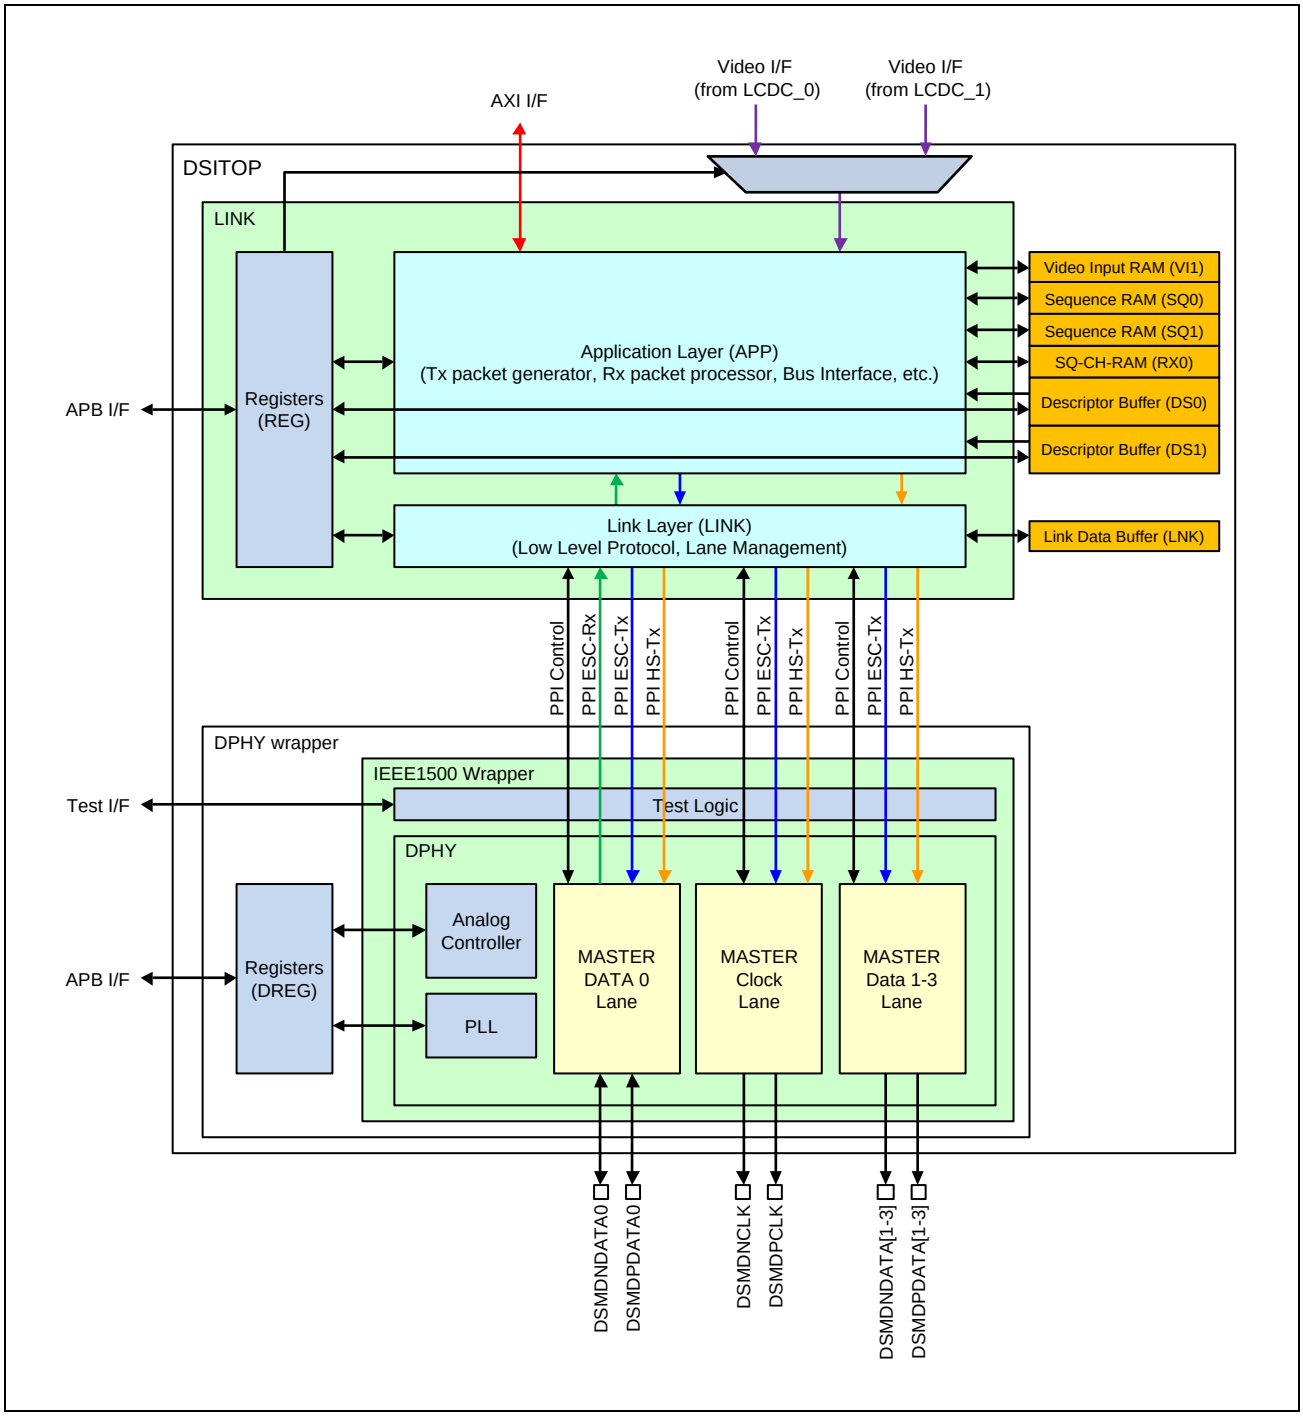

Figure 9.5-1 Block Diagram

9.5.1.3 External Pins

Table 9.5-1 shows the pin configuration.

Table 9.5-1 External Pins

Pin Name	Input/Output	Function
DSI_DPCLK	Output	MIPI DSI Tx clock lane (pos)
DSI_DNCLK	Output	MIPI DSI Tx clock lane (neg)
DSI_DPDATA0	Output	MIPI DSI Tx data 0 lane (pos)
DSI_DNDATA0	Output	MIPI DSI Tx data 0 lane (neg)
DSI_DPDATA1	Output	MIPI DSI Tx data 1 lane (pos)
DSI_DNDATA1	Output	MIPI DSI Tx data 1 lane (neg)
DSI_DPDATA2	Output	MIPI DSI Tx data 2 lane (pos)
DSI_DNDATA2	Output	MIPI DSI Tx data 2 lane (neg)
DSI_DPDATA3	Output	MIPI DSI Tx data 3 lane (pos)
DSI_DNDATA3	Output	MIPI DSI Tx data 3 lane (neg)

9.5.1.4 Clocks

The following shows a list of clocks for this unit.

- T_{LPX}: Transmitted length of any low-power state period (Min: 50 ns)
- $T_{LPX(H)}$: TLPX of the host processor (the DSI-2 TX module)
- $T_{LPX(P)}$: TLPX of the peripheral device (connected device)

Table 9.5-2 Clocks and the Frequency Range

Clock Name	CPG Clock Name	Input/ Output	Description	Frequency (MHz)
pclk	DSI_0_pclk	Input	APB clock	100
aclk	DSI_0_aclk	Input	AXI clock	400/200/100/50/13
vclk1	DSI_0_vclk1	Input	Video clock	187.5 to 5.44
lpclk	DSI_0_lpclk	Input	DSI Escape mode Transmit Clock (TxClkEsc) Set D-PHY TxClkEsc ($1/T_{LPX(H)}$) frequency. $T_{LPX(H)}/T_{LPX(P)}$ needs to set between 2/3 to 3/2.	16/8/4/2
PLLREFCLK	DSI_0_PLLREFCLK	Input	PLL reference input clock	24
hsclk	—	—	DSI High-Speed Transmit Word Clock (TxWordClkHS) Upper limit for D-PHY 1.5 Gbps Lower limit for D-PHY 80 Mbps This clock is supplied from D-PHY directly, and its frequency is 1/8 for the PLL clock frequency (F_{FOUT}).	10 to 187.5
lppclk	—	—	DSI Escape mode Receive Clock (RxClkEsc) This clock is supplied from D-PHY directly, and its frequency is ($1/T_{LPX(P)}$). This clock is generated dividing in D-PHY.	2 to 20

Video clock and DSI HS Byte clock must follow the relationship.

Video clock Frequency [Hz] × Video Pixel Bit Depth [bit]
<= DSI HS Byte clock Frequency [Hz] × 8 [bit] × Number of DSI HS Data Lane

9.5.2 DSI Registers

The base addresses for the DSI are as follows.

Table 9.5-3 Register Base Addresses

Base Register Name	Unit Name	Base Address
<DSI_LINK_base>	DSI (LINK)	0_1643_0000h (5643_0000h*1, 4643_0000h*2)
<DSI_DPHY_base>	DSI (DPHY)	0_1644_0000h (5644_0000h*1, 4644_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.5.2.1 List of Registers

9.5.2.1.1 Registers in LINK

This section describes the registers in LINK. All registers can be accessed in 8/16/32 bits.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Interrupt Status Register	DSI_LINK_ISR	0000_0000h	0000h	8, 16, 32
Reserve	-	-	0004h to 000Fh	-
Link Status Register	DSI_LINK_LINKSR	0000_0000h	0010h	8, 16, 32
Reserve	-	-	0014h to 00BFh	-
General Purpose Output 0 Register	DSI_LINK_GPO0R	0000_0000h	00C0h	8, 16, 32
Reserve	-	-	00C4h to 00FFh	-
Tx Set Register	DSI_LINK_TXSETR	0003_0003h	0100h	8, 16, 32
HS Clock Set Register	DSI_LINK_HSCLKSETR	0000_0000h	0104h	8, 16, 32
ULPS Set Register	DSI_LINK_ULPSSETR	0000_00A0h	0108h	8, 16, 32
ULPS Control Register	DSI_LINK_ULPSCR	0000_0000h	010Ch	8, 16, 32
Reset Control Register	DSI_LINK_RSTCR	0000_0000h	0110h	8, 16, 32
Reset Status Register	DSI_LINK_RSTSR	0000_0F00h	0114h	8, 16, 32
Reserve	-	-	0118h to 011Fh	-
DSI Set Register	DSI_LINK_DSISETR	80F1_0001h	0120h	8, 16, 32
Receive Buffer Size Register	DSI_LINK_RXBUFSZR	0000_0000h	0124h	8, 16, 32
Reserve	-	-	0128h to 015Fh	-
Tx Packet Payload Data 0 Register	DSI_LINK_TXPPD0R	0000_0000h	0160h	8, 16, 32
Tx Packet Payload Data 1 Register	DSI_LINK_TXPPD1R	0000_0000h	0164h	8, 16, 32
Tx Packet Payload Data 2 Register	DSI_LINK_TXPPD2R	0000_0000h	0168h	8, 16, 32
Tx Packet Payload Data 3 Register	DSI_LINK_TXPPD3R	0000_0000h	016Ch	8, 16, 32
Reserve	-	-	0170h to 01FFh	-
Rx Status Register	DSI_LINK_RXSR	0000_0000h	0200h	8, 16, 32
Rx Status Clear Register	DSI_LINK_RXSCR	0000_0000h	0204h	8, 16, 32
Rx Interrupt Enable Register	DSI_LINK_RXIER	0000_0000h	0208h	8, 16, 32
Reserve	-	-	020Ch to 020Fh	-

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Peripheral Response Timeout BTA Set Register	DSI_LINK_PRESPTOBTASETR	0000_0000h	0210h	8, 16, 32
Peripheral Response Timeout LP Set Register	DSI_LINK_PRESPTOLPSETR	0000_0000h	0214h	8, 16, 32

9.5.2.1.2 Registers in D-PHY

This section describes the registers in D-PHY. All registers can be accessed in 8/16/32 bits.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
DSI PLL Enable Register	DSI_DPHY_PLLENR	0000_0000h	0000h	8, 16, 32
DSI PHY Reset Register	DSI_DPHY_PHYRSTR	0000_0000h	0004h	8, 16, 32
Reserve	-	-	0008h to 000Fh	-
DSI PLL Clock Setting 0 Register	DSI_DPHY_PLLCLKSET0R	0000_0000h	0010h	8, 16, 32
DSI PLL Clock Setting 1 Register	DSI_DPHY_PLLCLKSET1R	0000_0000h	0014h	8, 16, 32
Reserve	-	-	0018h to 001Fh	-
DSI PHY TCLK Setting Register	DSI_DPHY_PHYTCLKSETR	0000_0000h	0020h	8, 16, 32
DSI PHY THS Setting Register	DSI_DPHY_PHYTHSSETR	0000_0000h	0024h	8, 16, 32
DSI PHY TLPX Setting Register	DSI_DPHY_PHYTLPXSETR	0000_0000h	0028h	8, 16, 32
Reserve	-	-	002Ch to 002Fh	-
DSI PHY Control Register	DSI_DPHY_PHYCR	0000_0000h	0030h	8, 16, 32
DSI PHY Control 1 Register	DSI_DPHY_PHYC1R	0000_0000h	0034h	8, 16, 32
DSI PHY Control 2 Register	DSI_DPHY_PHYC2R	0000_0000h	0038h	8, 16, 32
DSI PHY Control 3 Register	DSI_DPHY_PHYC3R	0000_0000h	003Ch	8, 16, 32

9.5.2.2 MIPI DSI Register Descriptions

The prefix (DSI_LINK_, DSI_DPHY_) of the register names is omitted in this and subsequent sections.

9.5.2.2.1 Interrupt Status Register (DSI_LINK_ISR)

Access Size : 8, 16, 32 bits
Address : <DSI_LINK_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	PPI	-	-	-	FERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	RCV	-	-	-	VIN1	-	-	-	SQ1	-	-	-	SQ0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	PPI	0h	R	PPI Interrupt When this value is 1b, a DSI D-PHY PPI related interrupt exists. Refer to the description of the PLSR register for more information.
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	FERR	0h	R	FERR Interrupt When this value is 1b, a DSI Fatal Error interrupt exists. Refer to the description of the FERRSR register for more information.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12	RCV	0h	R	RCV Interrupt When this value is 1b, a DSI Packet Receive interrupt exists. Refer to the description of the RXSR register for more information.
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	VIN1	0h	R	VIN1 Interrupt When this value is 1b, a Video Input-Operation channel 1 interrupt exists. Refer to the description of the VICH1SR register for more information.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	SQ1	0h	R	SQ1 Interrupt When this value is 1b, a Sequence Operation channel 1 interrupt exists. Refer to the description of the SQCH1SR register for more information.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SQ0	0h	R	SQ1 Interrupt When this value is 1b, a Sequence Operation channel 0 interrupt exists. Refer to the description of the SQCH0SR register for more information.

9.5.2.2.2 Link Status Register (DSI_LINK_LINKSR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0010h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	LPBUSY	HSBUSY	-	-	-	VICHRUN1	-	-	-	SQCHRUN1	-	-	-	SQCHRUN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	LPBUSY	0h	R	LP Operation Busy The setting 1b indicates that an operation related to LP is in progress.
12	HSBUSY	0h	R	HS Operation Busy The setting 1b indicates that an operation related to HS is in progress.
11 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	VICHRUN1	0h	R	Video-Input Channel 1 Running This bit is a copy of VICH1SR.RUNNING.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	SQCHRUN1	0h	R	Sequence Channel 1 Running This bit is a copy of SQCH1SR.RUNNING.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SQCHRUN0	0h	R	Sequence Channel 0 Running This bit is a copy of SQCH0SR.RUNNING.

9.5.2.2.3 General Purpose Output 0 Register (DSI_LINK_GPO0R)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 00C0h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VICH
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
0	VICH	0h	RW	Select Video Input Channel. 0: Select channel 1 (vclk1, vi1_*) 1: Select channel 2 (vclk2, vi2_*)

9.5.2.2.4 Tx Set Register (DSI_LINK_TXSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0100h

Initial Value : 0003_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NUMLANE CAP[1:0]

R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17, 16	NUMLANE CAP[1:0]	3h	R	Number of Lanes Capability 3h: The maximum Lane count is 4 (Lanes 0 to 3 can be used)
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9	DLEN	0h	RW	Data Lane Enable When this bit is 1b, Data Lanes are enabled by the PHY interface. Lanes to be enabled are determined by NUMLANEUSE.
8	CLEN	0h	RW	Clock Lane Enable When this bit is 1b, Clock Lane is enabled by the PHY interface.
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1, 0	NUMLANE USE[1:0]	3h	RW	Number of Lanes for Use Set the Lane count for use. Selected Data Lanes are enabled if DLEN is “1”. 0h: 1 Lane (use of Lane 0) 1h: 2 Lane (use of Lanes 0 and 1) 2h: 3 Lane (use of Lanes 0 to 2) 3h: 4 Lane (use of Lanes 0 to 3) Setting a value over NUMLANECAP is prohibited.

9.5.2.2.5 HS Clock Set Register (DSI_LINK_HSCLKSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0104h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	HSCLKMO DE	HSCLKRUN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	HSCLKMO DE	0h	RW	HS Clock running Mode 0b: Requests Clock Lane HS transmission when HS transmission is scheduled (non-continuous clock mode). 1b: Keeps Clock Lane HS transmission (continuous clock mode). If HSCLKRUN = 0, this field has no meaning. Changing the value of this bit while HSCLKRUN = 1 is prohibited.
0	HSCLKRUN	0h	RW	Start HS Clock running on Clock Lane 0b: No HS transmission (keep LP) 1b: Allows HS transmission according to HSCLKMODE Confirm stable TxWordClkHS (hsclk) before setting this field to 1. Setting this field to “1” while TXSETR.CLEN = 0 is prohibited.

9.5.2.2.6 ULPS Set Register (DSI_LINK_ULPSSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0108h

Initial Value : 0000_00A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ULPSWKUP[7:0]							
Initial Value	0	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
7 to 0	ULPSWKUP [7:0]	A0h	RW	Twakeup period of ULPS This period is specified by the count value of lpclk *128. This period should be longer than 1 ms. For example, - In the case lpclk is 4/3 MHz and lpclk*128 = 96 µs, set ULPSWKUP = 0Bh and Twakeup period = 1.06 ms (11*96 µs) - In the case lpclk is 20 MHz and lpclk*128 = 6.4 µs, set ULPSWKUP = A0h and Twakeup period = 1.02 ms (160*6.4 µs)

9.5.2.2.7 ULPS Control Register (DSI_LINK_ULPSCR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 010Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	DLULPSEXT	DLULPSENT	-	-	CLULPSEXT	CLULPSENT	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R0W	R0W	R	R	R0W	R0W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DLULPSEXT	0h	R0W	The read value is always 0b. DL ULPS Exit Writing 1b to this bit issues a request for all enabled Data Lanes to exit the Ultra-Low Power State (ULPS). Writing 1b while enabled Data Lanes are not in ULPS is prohibited. Writing 0b has no effect.
28	DLULPSENT	0h	R0W	The read value is always 0b. DL ULPS Enter Writing 1b to this bit issues a request for enabled Data Lanes to enter the Ultra- Low Power State (ULPS). Writing 1b while the enabled Data Lanes are in ULPS is prohibited. Writing 0b has no effect.
27, 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25	CLULPSEXT	0h	R0W	The read value is always 0b. CL ULPS Exit Writing 1b to this bit issues a request for Clock Lane to exit the Ultra-Low Power State (ULPS). Writing 1b while Clock Lane is not in ULPS is prohibited. Writing 0b has no effect.
24	CLULPSENT	0h	R0W	The read value is always 0b. CL ULPS Enter Writing 1b to this bit issues a request for Clock Lane to enter the Ultra-Low Power State (ULPS). Before setting this field, HSCLKSETR.HSCLKRUN must be set to 0b. Writing 1b while Clock Lane is in ULPS is prohibited. Writing 0b has no effect.
23 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.8 Reset Control Register (DSI_LINK_RSTCR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0110h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	FCETXSTP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SWRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	FCETXSTP	0h	RW	Force Tx Stop Mode When this bit is 1b, change to Transmit mode and Stop State is forced by ForceTxStopmode on all PPI Data Lanes. Setting this bit to 1b when SWRST = 0 is prohibited.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	SWRST	0h	RW	Request for Software Reset Set this bit to 1b to request a software reset. Then, wait until you confirm the completion of the Reset procedure by RSTSR.SWRSTx=1. And set to 0b after that.

9.5.2.2.9 Reset Status Register (DSI_LINK_RSTSR)

Access Size : 8, 16, 32 bits

Address : <DSI_LINK_base> + 0114h

Initial Value : 0000_0F00h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL0DIR	-	-	-	DLSTPST[3:0]				-	-	-	SWRSTV1	SWRSTIB	SWRSTAPB	SWRSTLP	SWRSTHS
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15	DL0DIR	0h	R	Direction (Tx or Rx) of PPI Data Lane 0 0b: PHY is in Tx Mode 1b: PHY is in Rx Mode This field is a copy of PLSR.DL0DIR.
14 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 8	DLSTPST[3:0]	Fh	R	Status of Stop State on Data Lane Bit 3: Stop State of Data Lane 3 Bit 2: Stop State of Data Lane 2 Bit 1: Stop State of Data Lane 1 Bit 0: Stop State of Data Lane 0 This field is a copy of PLSR.DLSTPST.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	SWRSTV1	0h	R	Status of Software Reset by RSTCR.SWRST at DSI_0_vclk1 0b: Reset procedure is not underway at DSI_0_vclk1. 1b: Reset procedure is underway DSI_0_vclk1.
3	SWRSTIB	0h	R	Status of Software Reset by RSTCR.SWRST at DSI_0_aclk 0b: Reset procedure is not underway at DSI_0_aclk. 1b: Reset procedure is underway at DSI_0_aclk.
2	SWRSTAPB	0h	R	Status of Software Reset by RSTCR.SWRST at DSI_0_pclk 0b: Reset procedure is not underway at DSI_0_pclk. 1b: Reset procedure is underway at DSI_0_pclk.
1	SWRSTLP	0h	R	Status of Software Reset by RSTCR.SWRST at DSI_0_lpclk 0b: Reset procedure is not underway at DSI_0_lpclk. 1b: Reset procedure is underway at DSI_0_lpclk.
0	SWRSTHS	0h	R	Status of Software Reset by RSTCR.SWRST at hsclk 0b: Reset procedure is not underway at hsclk. 1b: Reset procedure is underway at hsclk.

9.5.2.2.10 DSI Set Register (DSI_LINK_DSISETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0120h

Initial Value : 80F1_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EOTPEN	TEIDIR	SCREN	-	-	-	-	-	CRCEN[3:0]				-	-	-	ECCEN
Initial Value	1	0	0	0	0	0	0	0	1	1	1	1	0	0	0	1
R/W	RW	RW	RW	R	R	R	R	R	RW	RW	RW	RW	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MRPSZ[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	EOTPEN	1h	RW	HS Transfer EoTp Enable 0b: Transfer of EoTp is disabled. 1b: Transfer of EoTp is enabled. EoTp is always disabled in LP Transfer.
30	TEIDIR	0h	RW	Tearing Effect Input Direction External Tearing Effect Setting 0b: Rise edge detection. 1b: Fall edge detection.
29	SCREN	0h	RW	Scramble Enable 0b: Scrambling data is disabled. 1b: Scrambling data is enabled. This bit should not be set to “1” if the peer-device does not support a data scrambling function.
28 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23 to 20	CRCEN[3:0]	Fh	RW	Enable Received CRC check for Virtual Channel Bit 3: Enable Received CRC check for Virtual Channel 3 (0b: Disabled, 1b: Enabled). Bit 2: Enable Received CRC check for Virtual Channel 2 (0b: Disabled, 1b: Enabled). Bit 1: Enable Received CRC check for Virtual Channel 1 (0b: Disabled, 1b: Enabled). Bit 0: Enable Received CRC check for Virtual Channel 0 (0b: Disabled, 1b: Enabled).
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16	ECCEN	1h	RW	Enable Received ECC Check 0b: Received ECC check is disabled. 1b: Received ECC check is enabled.
15 to 0	MRPSZ[15:0]	1h	RW	Maximum Return Packet Size If the returned Long Packet’s WC is over this value, the DSI-Tx module asserts the RXSR.MAXRPSZERR error. In that case, data will not be saved to the memory space. Setting this field to 0b is prohibited. Set this field to a value greater than or equal to the peripheral setting.

9.5.2.2.11 Receive Buffer Size Register (DSI_LINK_RXBUFSZR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0124h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	RXBUFSZ[3:0]				-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	R	Rx Acknowledge and Error Report When this value is 1b, the Acknowledge and Error Report Packet is received. Write 1b to the RXSCR.RXAKE register to clear this field.
29	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	ECCERR1B	0h	R	ECC Error (1 bit) When this value is 1b, the Rx ECC Error (1 bit) is detected. Write 1b to the RXSCR.ECCERR1B register to clear this field.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26	MAXRPSZERR	0h	R	Maximum Return Packet Size Error When this value is 1b, the WC value of Rx Long Packet is larger than DSISETR.MRPSZ. Write 1b to the RXSCR.MAXRPSZERR register to clear this field.
25	NORETERR	0h	R	Nothing Return Error When this value is 1b, no trigger or packet is returned in BTA period. Write 1b to the RXSCR.NORETERR register to clear this field.
24	PRESPTOERR	0h	R	Peripheral Response Timeout Error When this value is 1b, the Rx Peripheral Response Timeout is detected after the transition to Rx mode along with Bus Turn-Around and within the time specified by PRESPTOBTASETR.PRESPTOBTA, PRESPTOLPSETR.PRESPTOLPR, PRESPTOLPSETR.PRESPTOLPW, PRESPTOLPSETR.PRESPTOHSR or PRESPTOLPSETR.PRESPTOHSW. The value is selected from kind of BTA. Write 1b to the RXSCR.PRESPTOERR register to clear this field.
23	RXOVFERR	0h	R	Receive Buffer Overflow Error When this value is 1b, the Buffer Overflow Error is detected at Rx Long Packet. Write 1b to the RXSCR.RXOVFERR register to clear this field.
22	IBERR	0h	R	Internal Bus Error When this value is 1b, the Internal Bus Write had failed to respond. Write 1b to the RXSCR.IBERR register to clear this field.
21	CRCERR	0h	R	CRC Error When this value is 1b, the Rx CRC Error is detected. Write 1b to the RXSCR.CRCERR register to clear this field.
20	WCERR	0h	R	Word Count Error When this value is 1b, the Rx packet's actual WC length is shorter than the packet header's WC. Write 1b the to RXSCR.WCERR register to clear this field.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18	UEXPKTERR	0h	R	Unexpected Packet Error When this value is 1b, an unexpected packet is received. "Unexpected Packet" means unexpected DT for receive or an unexpected response for receive. Write 1b to the RXSCR.UEXPKTERR register to clear this field.

Bit	Bit Name	Initial Value	R/W	Description
17	ECCERR	0h	R	ECC Error (over 1 bit) When this value is 1b, the Rx ECC Error (over 1 bit) is detected. Write 1b to the RXSCR.ECCERR register to clear this field.
16	MLFERR	0h	R	Malform Error When this value is 1b, the Rx packet shorter than 4 bytes is received. Write 1b to the RXSCR.MLFERR register to clear this field.
15	EXTTEDET	0h	R	External Tearing Effect Detect When this value is 1b, External Tearing Effect is detected. Write 1b to the RXSCR.EXTTEDET register to clear this field.
14	RXACK	0h	R	Rx ACK Trigger When this value is 1b, the ACK trigger is received. Write 1b to the RXSCR.RXACK register to clear this field.
13	RXTE	0h	R	Rx Tearing Effect Trigger When this value is 1b, Tearing Effect Trigger is received. Write 1b to the RXSCR.RXTE register to clear this field.
12	RXRTRG	0h	R	Rx Reset Trigger When this value is 1b, Reset Trigger is received. Normally, the DSI-Tx module does not receive Reset Trigger. Write 1b to the RXSCR.RXRTRG register to clear this field.
11	RXUK5TRG	0h	R	Rx Unknown-5 Trigger When this value is 1b, Unknown-5 Trigger is received. Normally, the DSI-Tx module does not receive Unknown-5 Trigger. Write 1b to the RXSCR.RXUK5TRG register to clear this field.
10	RXEOTP	0h	R	Rx EoTp When this value is 1b, the EoTp is received. Write 1b to the RXSCR.RXEOTP register to clear this field.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	RXRESP	0h	R	Rx Response Packet When this value is 1b, the Response Packet is received. Write 1b to the RXSCR.RXRESP register to clear this field.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	R	Turnaround Acknowledge Timeout When this value is 1b, the Turnaround Acknowledge Timeout (TA_TO) is detected. Write 1b to the RXSCR.TATO register to clear this field.
1	LRXHTO	0h	R	LP-RX Host Processor Timeout When this value is 1b, the LP-RX Host Processor Timeout (LRX-H_TO) is detected. Write 1b to RXSCR.LRXHTO register to clear this field.
0	BTAREQEN D	0h	R	BTA Request End When this value is 1b, the completion of the transmission request which includes Rx is detected. This bit is set if all BTA requests are finished including error. The BTA request status is indicated by RXSR[31:1]. Write 1b to the RXSCR.BTAREQEND register to clear this field.

9.5.2.2.17 Rx Status Clear Register (DSI_LINK_RXSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0204h

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	R0W	The read value is always 0b. RXSR.RXAKE Clear Set to 1b to clear RXSR.RXAKE. Writing 0b has no effect.
29	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	ECCERR1B	0h	R0W	The read value is always 0b. RXSR.ECCERR1B Clear Set to 1b to clear RXSR.ECCERR1B. Writing 0b has no effect.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26	MAXRPSZERR	0h	R0W	The read value is always 0b. RXSR.MAXRPSZERR Clear Set to 1b to clear RXSR.MAXRPSZERR. Writing 0b has no effect.
25	NORETERR	0h	R0W	The read value is always 0b. RXSR.NORETERR Clear Set to 1b to clear RXSR.NORETERR. Writing 0b has no effect.
24	PRESPTOERR	0h	R0W	The read value is always 0b. RXSR.PRESPTOERR Clear Set to 1b to clear RXSR.PRESPTOERR. Writing 0b has no effect.
23	RXOVFERR	0h	R0W	The read value is always 0b. RXSR.RXOVFERR Clear Set to 1b to clear RXSR.RXOVFERR. Writing 0b has no effect.
22	IBERR	0h	R0W	The read value is always 0b. RXSR.IBERR Clear Set to 1b to clear RXSR.IBERR. Writing 0b has no effect.
21	CRCERR	0h	R0W	The read value is always 0b. RXSR.CRCERR Clear Set to 1b to clear RXSR.CRCERR. Writing 0b has no effect.
20	WCERR	0h	R0W	The read value is always 0b. RXSR.WCERR Clear Set to 1b to clear RXSR.WCERR. Writing 0b has no effect.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18	UEXPKTER R	0h	R0W	The read value is always 0b. RXSR.UEXPKTERR Clear Set to 1b to clear RXSR.UEXPKTERR. Writing 0b has no effect.
17	ECCERR	0h	R0W	The read value is always 0b. RXSR.ECCERR Clear Set to 1b to clear RXSR.ECCERR. Writing 0b has no effect.
16	MLFERR	0h	R0W	The read value is always 0b. RXSR.MLFERR Clear Set to 1b to clear RXSR.MLFERR. Writing 0b has no effect.
15	EXTTEDET	0h	R0W	The read value is always 0b. RXSR.EXTTTEDET Clear Set to 1b to clear RXSR.EXTTTEDET. Writing 0b has no effect.
14	RXACK	0h	R0W	The read value is always 0b. RXSR.RXACK Clear Set to 1b to clear RXSR.RXACK. Writing 0b has no effect.
13	RXTE	0h	R0W	The read value is always 0b. RXSR.RXTE Clear Set to 1b to clear RXSR.RXTE. Writing 0b has no effect.
12	RXRTRG	0h	R0W	The read value is always 0b. RXSR.RXRTRG Clear Set to 1b to clear RXSR.RXRTRG. Writing 0b has no effect.
11	RXUK5TRG	0h	R0W	The read value is always 0b. RXSR.RXUK5TRG Clear Set to 1b to clear RXSR.RXUK5TRG. Writing 0b has no effect.
10	RXEOTP	0h	R0W	The read value is always 0b. RXSR.RXEOTP Clear Set to 1b to clear RXSR.RXEOTP. Writing 0b has no effect.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	RXRESP	0h	R0W	The read value is always 0b. RXSR.RXRESP Clear Set to 1b to clear RXSR.RXRESP. Writing 0b has no effect.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	R0W	The read value is always 0b. RXSR.TATO Clear Set to 1b to clear RXSR.TATO. Writing 0b has no effect.
1	LRXHTO	0h	R0W	The read value is always 0b. RXSR.LRXHTO Clear Set to 1b to clear RXSR.LRXHTO. Writing 0b has no effect.
0	BTAREQEN D	0h	R0W	The read value is always 0b. RXSR.BTAREQEND Clear Set to 1b to clear RXSR.BTAREQEND. Writing 0b has no effect.

9.5.2.2.18 Rx Interrupt Enable Register (DSI_LINK_RXIER)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0208h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	RW	Interrupt enable for RXSR.RXAKE 0b: Disables interrupt dsi_int_rcv when RXSR.RXAKE = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXAKE = 1.
29	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	ECCERR1B	0h	RW	Interrupt enable for RXSR.ECCERR1B 0b: Disables interrupt dsi_int_rcv when RXSR.ECCERR1B = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.ECCERR1B = 1.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
26	MAXRPSZERR	0h	RW	Interrupt enable for RXSR.MAXRPSZERR 0b: Disables interrupt dsi_int_rcv when RXSR.MAXRPSZERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.MAXRPSZERR = 1.
25	NORETERR	0h	RW	Interrupt enable for RXSR.NORETERR 0b: Disables interrupt dsi_int_rcv when RXSR.NORETERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.NORETERR = 1.
24	PRESPTOERR	0h	RW	Interrupt enable for RXSR.PRESPTOERR 0b: Disables interrupt dsi_int_rcv when RXSR.PRESPTOERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.PRESPTOERR = 1.
23	RXOVFERR	0h	RW	Interrupt enable for RXSR.RXOVFERR 0b: Disables interrupt dsi_int_rcv when RXSR.RXOVFERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXOVFERR = 1.
22	IBERR	0h	RW	Interrupt enable for RXSR.IBERR 0b: Disables interrupt dsi_int_rcv when RXSR.IBERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.IBERR = 1.
21	CRCERR	0h	RW	Interrupt enable for RXSR. CRCERR 0b: Disables interrupt dsi_int_rcv when RXSR.CRCERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.CRCERR = 1.
20	WCERR	0h	RW	Interrupt enable for RXSR. WCERR 0b: Disables interrupt dsi_int_rcv when RXSR.WCERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.WCERR = 1.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
18	UEXPKTERR	0h	RW	Interrupt enable for RXSR.UEXPKTERR 0b: Disables interrupt dsi_int_rcv when RXSR.UEXPKTERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.UEXPKTERR = 1.
17	ECCERR	0h	RW	Interrupt enable for RXSR.ECCERR 0b: Disables interrupt dsi_int_rcv when RXSR.ECCERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.ECCERR = 1.
16	MLFERR	0h	RW	Interrupt enable for RXSR.MLFERR 0b: Disables interrupt dsi_int_rcv when RXSR.MLFERR = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.MLFERR = 1.

Bit	Bit Name	Initial Value	R/W	Description
15	EXTTEDET	0h	RW	Interrupt enable for RXSR.EXTTEDET 0b: Disables interrupt dsi_int_rcv when RXSR.EXTTEDET = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.EXTTEDET = 1.
14	RXACK	0h	RW	Interrupt enable for RXSR.RXACK 0b: Disables interrupt dsi_int_rcv when RXSR.RXACK = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXACK = 1.
13	RXTE	0h	RW	Interrupt enable for RXSR.RXTE 0b: Disables interrupt dsi_int_rcv when RXSR.RXTE = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXTE = 1.
12	RXRTRG	0h	RW	Interrupt enable for RXSR.RXRTRG 0b: Disables interrupt dsi_int_rcv when RXSR.RXRTRG = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXRTRG = 1.
11	RXUK5TRG	0h	RW	Interrupt enable for RXSR.RXUK5TRG 0b: Disables interrupt dsi_int_rcv when RXSR.RXUK5TRG = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXUK5TRG = 1.
10	RXEOTP	0h	RW	Interrupt enable for RXSR.RXEOTP 0b: Disables interrupt dsi_int_rcv when RXSR.RXEOTP = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXEOTP = 1.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	RXRESP	0h	RW	Interrupt enable for RXSR.RXRESP 0b: Disables interrupt dsi_int_rcv when RXSR.RXRESP = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.RXRESP = 1.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	RW	Interrupt enable for RXSR.TATO 0b: Disables interrupt dsi_int_rcv when RXSR.TATO = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.TATO = 1.
1	LRXHTO	0h	RW	Interrupt enable for RXSR.LRXHTO 0b: Disables interrupt dsi_int_rcv when RXSR.LRXHTO = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.LRXHTO = 1.
0	BTAREQEND	0h	RW	Interrupt enable for RXSR.BTAREQEND 0b: Disables interrupt dsi_int_rcv when RXSR.BTAREQEND = 1. 1b: Enables interrupt dsi_int_rcv when RXSR.BTAREQEND = 1.

9.5.2.2.19 Peripheral Response Timeout BTA Set Register (DSI_LINK_PRESPTOBTASETR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0210h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PRESPTOBTA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PRESPTOBTA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PRESPTOBTA [31:0]	0h	RW	Peripheral Response Timeout (Bus Turn Around) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 3h. The limit time for timeout is calculated by the formula of PRESPTOBTA * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOBTA = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.

9.5.2.2.20 Peripheral Response Timeout LP Set Register (DSI_LINK_PRESPTOLPSETR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0214h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PRESPTOLPR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PRESPTOLPW[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

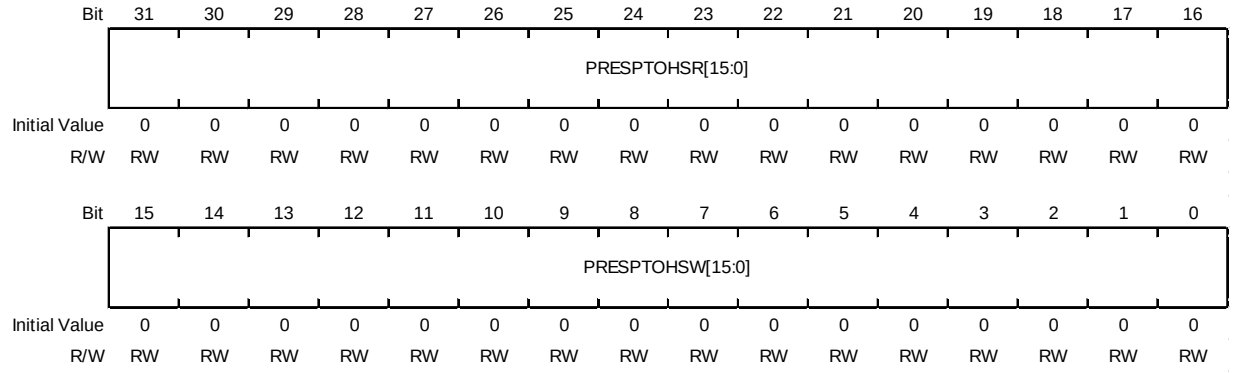
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PRESPTOLPR [15:0]	0h	RW	Peripheral Response Timeout (LPDT READ Request) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 2h and SQCHxDSCyAR.SPD = 1b. The limit time for timeout is calculated by the formula of PRESPTOLPR * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOLPR = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.
15 to 0	PRESPTOLPW [15:0]	0h	RW	Peripheral Response Timeout (LPDT WRITE Request) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 01b and SQCHxDSCyAR.SPD = 1b. The limit time for timeout is calculated by the formula of PRESPTOLPW * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOLPW = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.

9.5.2.2.21 Peripheral Response Timeout HS Set Register (DSI_LINK_PRESPTOHSSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0218h

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PRESPTOHSR [15:0]	0h	RW	Peripheral Response Timeout (HS READ Request) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 2h and SQCHxDSCyAR.SPD = 0b. The limit time for timeout is calculated by the formula of PRESPTOHSR * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOHSR = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.
15 to 0	PRESPTOHSW [15:0]	0h	RW	Peripheral Response Timeout (HS WRITE Request) Count Set the timeout value to measure the interval between the start of Rx mode and the start of packet reception along with Bus Turn-Around while SQCHxDSCyAR.BTA = 1h and SQCHxDSCyAR.SPD = 0b. The limit time for timeout is calculated by the formula of PRESPTOHSW * (the period of DSI_0_lpclk). When RXSR.PRESPTOERR is 1b, a timeout is detected. Note that no timeout is detected when PRESPTOHSW = 0. Since the counting clock is asynchronous with packet reception, there is some jitter in the timeout.

9.5.2.2.22 Acknowledge and Error Report Packet Parameter Latest Info Register (DSI_LINK_AKEPLATIR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0220h

Initial Value : 0000_0000h

19	VC3	0h	R	Virtual Channel Identifier 3 Latest This field indicates the Virtual Channel identifier of a received Acknowledge and Error Report Packet. 0b: Virtual Channel identifier is not 3. 1b: Virtual Channel identifier is 3. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
18	VC2	0h	R	Virtual Channel Identifier 2 Latest This field indicates the Virtual Channel identifier of a received Acknowledge and Error Report Packet. 0b: Virtual Channel identifier is not 2. 1b: Virtual Channel identifier is 2. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
17	VC1	0h	R	Virtual Channel Identifier 1 Latest This field indicates the Virtual Channel identifier of a received Acknowledge and Error Report Packet. 0b: Virtual Channel identifier is not 1. 1b: Virtual Channel identifier is 1. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
16	VC0	0h	R	Virtual Channel Identifier 0 Latest This field indicates the Virtual Channel identifier of a received Acknowledge and Error Report Packet. 0b: Virtual Channel identifier is not 0. 1b: Virtual Channel identifier is 0. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
15 to 0	ERRRPTLAT [15:0]	0h	R	Error Report Latest This field indicates the Error Report of a received Acknowledge and Error Report Packet. This field indicates the latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.

9.5.2.2.23 Acknowledge and Error Report Packet Parameter Accumulate Status Register (DSI_LINK_AKEPACMSR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0224h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	VC3	VC2	VC1	VC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERRRPTACM[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	VC3	0h	R	Virtual Channel Identifier 3 Accumulate This field is set to 1b when an Acknowledge and Error Report Packet whose Virtual Channel identifier = 3 is received. This field indicates accumulated information. This bit is cleared by AKEPSCR.VC3.
18	VC2	0h	R	Virtual Channel Identifier 2 Accumulate This field is set to 1b when an Acknowledge and Error Report Packet whose Virtual Channel identifier = 2 is received. This field indicates accumulated information. This bit is cleared by AKEPSCR.VC2.
17	VC1	0h	R	Virtual Channel Identifier 1 Accumulate This field is set to 1b when an Acknowledge and Error Report Packet whose Virtual Channel identifier = 1 is received. This field indicates accumulated information. This bit is cleared by AKEPSCR.VC1.
16	VC0	0h	R	Virtual Channel Identifier 0 Accumulate This field is set to 1b when an Acknowledge and Error Report Packet whose Virtual Channel identifier = 0 is received. This field indicates accumulated information. This bit is cleared by AKEPSCR.VC0.
15 to 0	ERRRPTACM [15:0]	0h	R	Error Report Accumulate Each bit of this field is set to 1b, when an Acknowledge and Error Report Packet whose each Error Report bit = 1 is received. This field indicates accumulated information. Each bit is cleared by the corresponding AKESCR.ERRRPTACM.

9.5.2.2.24 Acknowledge and Error Report Packet Parameter Status Clear Register (DSI_LINK_AKEPSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0228h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	VC3	VC2	VC1	VC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W	R0W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERRRPTACM[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	VC3	0h	R0W	The read value is always 0b. AKEPACMSR.VC3 Clear Set to 1b to clear AKEPACMSR.VC3. Writing 0b has no effect.
18	VC2	0h	R0W	The read value is always 0b. AKEPACMSR.VC2 Clear Set to 1b to clear AKEPACMSR.VC2. Writing 0b has no effect.
17	VC1	0h	R0W	The read value is always 0b. AKEPACMSR.VC1 Clear Set to 1b to clear AKEPACMSR.VC1. Writing 0b has no effect.
16	VC0	0h	R0W	The read value is always 0b. AKEPACMSR.VC0 Clear Set to 1b to clear AKEPACMSR.VC0. Writing 0b has no effect.
15 to 0	ERRRPTACM[15:0]	0h	R0W	The read value is always 0b. Error Report Accumulate Clear Set to 1b to clear each AKEPACMSR.ERRRPTACM. Writing 0b has no effect.

9.5.2.2.25 Rx Result Saved Status Register (DSI_LINK_RXRSSR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0230h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SLT3VLD	SLT2VLD	SLT1VLD	SLT0VLD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	SLT3VLD	0h	R	Slot 3 Valid Response packet is received, or information is saved to RXRSS3R. Write 1b to RXRSSCR.SLT3C to clear this bit. This bit and RXRSS3R are set if the next receive action is caused with SQCHxDSCyCR.ACTCODE = 03 again.
2	SLT2VLD	0h	R	Slot 2 Valid Response packet is received, or information is saved to RXRSS2R. Write 1b to RXRSSCR.SLT2C to clear this bit. This bit and RXRSS2R are set if the next receive action is caused with SQCHxDSCyCR.ACTCODE = 02 again.
1	SLT1VLD	0h	R	Slot 1 Valid Response packet is received, or information is saved to RXRSS1R. Write 1b to RXRSSCR.SLT1C to clear this bit. This bit and RXRSS1R are set if the next receive action is caused with SQCHxDSCyCR.ACTCODE = 01 again.
0	SLT0VLD	0h	R	Slot 0 Valid Response packet is received, or information is saved to RXRSS0R. Write 1b to RXRSSCR.SLT0C to clear this bit. This bit and RXRSS0R are set if the next receive action is caused with SQCHxDSCyCR.ACTCODE = 00 again.

9.5.2.2.26 Rx Result Saved Status Clear Register (DSI_LINK_RXRSSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0234h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SLT3C	SLT2C	SLT1C	SLT0C
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	SLT3C	0h	R0W	The read value is always 0b. RXRSSR.SLT3VLD Clear Write 1b to clear RXRSSR.SLT3VLD. Writing 0b has no effect.
2	SLT2C	0h	R0W	The read value is always 0b. RXRSSR.SLT2VLD Clear Write 1b to clear RXRSSR.SLT2VLD. Writing 0b has no effect.
1	SLT1C	0h	R0W	The read value is always 0b. RXRSSR.SLT1VLD Clear Write 1b to clear RXRSSR.SLT1VLD. Writing 0b has no effect.
0	SLT0C	0h	R0W	The read value is always 0b. RXRSSR.SLT0VLD Clear Write 1b to clear RXRSSR.SLT0VLD. Writing 0b has no effect.

9.5.2.2.27 Rx Result Info Overwrite Status Register (DSI_LINK_RXRINFOOWSR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0238h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	SLT3INFOOWC	0h	R0W	The read value is always 0b. RXRSS3R.INFOOW Clear Write 1b to clear RXRSS3R.INFOOW. Writing 0b has no effect. To prevent missing of RXRSS3R.INFOOW, clear RXRSS3R.INFOOW before clearing RXRSSR.SLT3VLD.
2	SLT2INFOOWC	0h	R0W	The read value is always 0b. RXRSS2R.INFOOW Clear Write 1b to clear RXRSS2R.INFOOW. Writing 0b has no effect. To prevent missing of RXRSS2R.INFOOW, clear RXRSS2R.INFOOW before clearing RXRSSR.SLT2VLD.
1	SLT1INFOOWC	0h	R0W	The read value is always 0b. RXRSS1R.INFOOW Clear Write 1b to clear RXRSS1R.INFOOW. Writing 0b has no effect. To prevent missing of RXRSS1R.INFOOW, clear RXRSS1R.INFOOW before clearing RXRSSR.SLT1VLD.
0	SLT0INFOOWC	0h	R0W	The read value is always 0b. RXRSS0R.INFOOW Clear Write 1b to clear RXRSS0R.INFOOW. Writing 0b has no effect. To prevent missing of RXRSS0R.INFOOW, clear RXRSS0R.INFOOW before clearing RXRSSR.SLT0VLD.

9.5.2.2.29 Rx Result Save Slot x Register (DSI_LINK_RXRSSxR) (x = 0, 1, 2, 3)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0240h + 0004h × (x)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INFOOW	RXAKE	RXCORERR	RXPKTDFAIL	RXFAIL	RXFATALERR	RXSUC	FMT	VC[1:0]		DT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA1[7:0]								DATA0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	INFOOW	0h	R	Information Overwrite This bit is set if the information of RXRSSxR is updated when RXRSSR.SLTxVLD is 1b. Write 1b to RXRINFOOWSCR.SLTxINFOOWC to clear this bit.
30	RXAKE	0h	R	Receive Acknowledge and Error Report Packet RXSR.RXAKE is also reported.
29	RXCORERR	0h	R	Receive Correctable Error The received packet has a correctable error. RXSR.ECCERR1B is also reported.
28	RXPKTDFAIL	0h	R	Receive Packet Data Fail The packet header was saved correctly but data were not. One or more of the following bits are also reported. RXSR.CRCERR, RXSR.WCERR, RXSR.MAXRPSZERR, RXSR.UEXPKTERR, RXSR.RXOVFERR and RXSR.IBERR. When both of this bit and RXRESP are asserted, it means a redundant packet was received in BTA.
27	RXFAIL	0h	R	Receive Fail Expected reception did not proceed. One or more of the following bits are also reported. RXSR.PRESPTOERR, RXSR.ECCERR, RXSR.MLFERR and RXSR.NORETERR.
26	RXFATALERR	0h	R	Fatal Error A fatal timeout occurred during BTA. One or more of the following bits are also reported. FERRSR.TATO and FERRSR.LRXHTO.
25	RXSUC	0h	R	Receive Success When this value is 1b, the Response Packet or ACK trigger is received. One or more of the following bits are also reported. RXSR.RXRESP and RXSR.RXACK.
24	FMT	0h	R	Packet format of Rx Packet Header 0b: Short Packet 1b: Long Packet This field is valid when RXPKTDFAIL = 1 or (RXSUC = 1 and DT != 0).
23, 22	VC[1:0]	0h	R	Identifier of Virtual Channel of Rx Packet Header This field is valid when (RXSUC = 1 and DT != 0).
21 to 16	DT[5:0]	0h	R	Data Type of Rx Packet Header 00h: ACK trigger received 01h to 3Fh: Data Type This field is valid when RXSUC = 1.
15 to 8	DATA1[7:0]	0h	R	Data1 of Rx Packet Header When the Rx packet format is Long Packet, this value is the upper 8 bits of the word count. This field is valid when (RXSUC = 1 and DT != 0).
7 to 0	DATA0[7:0]	0h	R	Data0 of Rx Packet Header When Rx packet format is Long Packet, this value is the lower 8 bits of the word count. This field is valid when (RXSUC = 1 and DT != 0).

9.5.2.2.30 Rx Packet Payload Data 0 Register (DSI_LINK_RXPPD0R)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 02C0h

Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28	ERRCLP1S	0h	R	Status of Contention Error of LP1 (ErrContentionLP1)
27	ERRCLP0S	0h	R	Status of Contention Error of LP0 (ErrContentionLP0)
26 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	ERRCLP1	0h	R	Contention Error of LP1 (ErrContentionLP1) When this value is 1b, the Contention Error of LP1 (ErrContentionLP1) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRCLP1 register to clear this field.
19	ERRCLP0	0h	R	Contention Error of LP0 (ErrContentionLP0) When this value is 1b, the Contention Error of LP0 (ErrContentionLP0) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRCLP0 register to clear this field.
18	ERRCTRL	0h	R	Control Error (ErrControl) When this value is 1b, the Control Error (ErrControl) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRCTRL register to clear this field.
17	ERRSYNESC	0h	R	Sync Error of LPDT (ErrSyncEsc) When this value is 1b, the Sync Error of LPDT (ErrSyncEsc) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRSYNESC register to clear this field.
16	ERRESC	0h	R	Escape mode Entry Error (ErrEsc) When this value is 1b, the Escape mode Entry Error (ErrEsc) is detected on PPI Data Lane 0. Write 1b to the FERRSCR.ERRESC register to clear this field.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	R	Turnaround Acknowledge Timeout (TA_TO) When this value is 1b, the Turnaround Acknowledge Timeout (TA_TO) is detected. Write 1b to the FERRSCR.TATO register to clear this field.
1	LRXHTO	0h	R	LP-RX Host Processor Timeout (LRX-H_TO) When this value is 1b, the LP-RX Host Processor Timeout (LRX-H_TO) is detected. Write 1b to the FERRSCR.LRXHTO register to clear this field.
0	HTXTO	0h	R	HS TX Timeout (HTX_TO) When this value is 1b, the HS TX Timeout (HTX_TO) is detected. Write 1b to the FERRSCR.HTXTO register to clear this field.

9.5.2.2.38 Fatal Error Status Clear Register (DSI_LINK_FERRSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0304h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	ERRCLP1	ERRCLP0	ERRCTRL	ERRSYNESC	ERRESC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W	R0W	R0W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	TATO	LRXHTO	HTXTO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	ERRCLP1	0h	R0W	The read value is always 0b. FERRSR.ERRCLP1 Clear Set to 1b to clear FERRSR.ERRCLP1. Writing 0b has no effect.
19	ERRCLP0	0h	R0W	The read value is always 0. FERRSR.ERRCLP0 Clear Set to 1b to clear FERRSR.ERRCLP0. Writing 0b has no effect.
18	ERRCTRL	0h	R0W	The read value is always 0. FERRSR.ERRCTRL Clear Set to 1b to clear FERRSR.ERRCTRL. Writing 0b has no effect.
17	ERRSYNESC	0h	R0W	The read value is always 0. FERRSR.ERRSYNESC Clear Set to 1b to clear FERRSR.ERRSYNESC. Writing 0b has no effect.
16	ERRESC	0h	R0W	The read value is always 0. FERRSR.ERRESC Clear Set to 1b to clear FERRSR.ERRESC. Writing 0b has no effect.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	R0W	The read value is always 0b. FERRSR.TATO Clear Set to 1b to clear FERRSR.TATO. Writing 0b has no effect.
1	LRXHTO	0h	R0W	The read value is always 0b. FERRSR.LRXHTO Clear Set to 1b to clear FERRSR.LRXHTO. Writing 0b has no effect.
0	HTXTO	0h	R0W	The read value is always 0. FERRSR.HTXTO Clear Set to 1b to clear FERRSR.HTXTO. Writing 0b has no effect.

9.5.2.2.39 Fatal Error Interrupt Enable Register (DSI_LINK_FERRIER)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0308h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	ERRCLP1	0h	RW	Interrupt enable for the Contention Error of LP1 on PPI Data Lane 0 (ErrContentionLP1) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRCLP1 = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRCLP1 = 1
19	ERRCLP0	0h	RW	Interrupt enable for the Contention Error of LP0 on PPI Data Lane 0 (ErrContentionLP0) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRCLP0 = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRCLP0 = 1
18	ERRCTRL	0h	RW	Interrupt enable for the Control Error on PPI Data Lane 0 (ErrControl) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRCTRL = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRCTRL = 1
17	ERRSYNESC	0h	RW	Interrupt enable for the LPDT Sync Error on PPI Data Lane 0 (ErrSyncEsc) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRSYNESC = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRSYNESC = 1
16	ERRESC	0h	RW	Interrupt enable for the Escape mode Error on PPI Data Lane 0 (ErrEsc) 0b: Disables interrupt dsi_int_ferr when FERRSR.ERRESC = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.ERRESC = 1
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	TATO	0h	RW	Interrupt enable for Turnaround Acknowledge Timeout (TA_TO) 0b: Disables interrupt dsi_int_ferr when FERRSR.TATO = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.TATO = 1
1	LRXHTO	0h	RW	Interrupt enable for LP-RX Host Processor Timeout (LRX_H_TO) 0b: Disables interrupt dsi_int_ferr when FERRSR.LRXHTO = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.LRXHTO = 1
0	HTXTO	0h	RW	Interrupt enable for HS TX Timeout (HTX_TO) 0b: Disables interrupt dsi_int_ferr when FERRSR.HTXTO = 1 1b: Enables interrupt dsi_int_ferr when FERRSR.HTXTO = 1

9.5.2.2.40 Clock Lane Stop Time Set Register (DSI_LINK_CLSTPTSETR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0314h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CLKKPT[7:0]								CLKBFHT[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	CLKSTPT[9:0]										-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CLKKPT[7:0]	0h	RW	Clock Keep Time The time period over which the HS Clock Lane keeps active after HS packet transfer. The time is calculated by the formula of CLKKPT * (the period of high-speed serial UI * 32). This time corresponds to the D-PHY specification's ($T_{HS-TRAIL}$ + $T_{CLK-POST}$). The value must be greater than the one calculated. For information about each parameter, see **Table 9.5-4**. Set an appropriate value (other than 0) before HSCLKSETR.HSCLKRUN is set to "1".
23 to 16	CLKBFHT[7:0]	0h	RW	Clock Beforehand Time The time period over which Clock Lane is changed back to HS before HS packet transfer. If HS transfers are scheduled in LP, Clock Lane will start before HS transfer by this setting. The time is calculated by the formula of CLKBFHT * (the period of high-speed serial UI * 32). This time corresponds to the D-PHY specification's (T_{LPX}(For Clock Lane HS Entry) + $T_{CLK-PREPARE}$ + $T_{CLK-ZERO}$ + $T_{CLK-PRE}$). The value must be greater than the one calculated. For information about each parameter, see **Table 9.5-4**. Set an appropriate value (other than 0) before HSCLKSETR.HSCLKRUN is set to "1". The "T_{LPX}(For Clock Lane HS Entry)" means the period of LP-01 in HS entry sequence of Clock Lane. If this period is not same as normal T_{LPX} value of host device (in the range of 67% to 150% of the T_{LPX} value of peripheral device), use the actual period for this calculation.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 2	CLKSTPT[9:0]	0h	RW	Clock Stop Time The time period over which the HS Clock Lane is changed to LP and back to HS. If Data Lanes exit HS and the time of CLKKPT expires, and the scheduled time till the next HS transfer is more than this setting, Clock Lane will be changed to LP. This setting has no meaning if HSCLKSETR.HSCLKMODE is 1b or if HSCLKSETR.HSCLKRUN is 0b. The time is calculated by the formula of CLKSTPT * (the period of high-speed serial UI * 32) This time corresponds to the D-PHY specification's ($T_{HS-TRAIL}$ + $T_{CLK-POST}$ + $T_{CLK-TRAIL}$ + $T_{HS-EXIT}$ + T_{LPX} * 2 + T_{LPX}(For Clock Lane HS Entry) + $T_{CLK-PREPARE}$ + $T_{CLK-ZERO}$ + $T_{CLK-PRE}$ + T_{LPX}(For Data Lane HS Entry) + $T_{HS-PREPARE}$ + $T_{HS-ZERO}$ + $T_{HS-SYNC}$). For information about each parameter, see **Figure 9.5-2** and **Table 9.5-4**. Of these parameters, it is necessary to set the time actually set in CLKKPT for ($T_{HS-TRAIL}$ + $T_{CLK-POST}$) and that actually set in CLKBFHT for (T_{LPX}(For Clock Lane HS Entry) + $T_{CLK-PREPARE}$ + $T_{CLK-ZERO}$ + $T_{CLK-PRE}$). Set the rounded-up value plus at least 3. Setting this field to "0" is prohibited. The "T_{LPX}(For Clock Lane HS Entry)" means the period of LP-01 in HS entry sequence of Clock Lane. And the "T_{LPX}(For Data Lane HS Entry)" means the period of LP-01 in HS entry sequence of Data Lane. If these periods are not same as normal T_{LPX} value of host device (in the range of 67% to 150% of the T_{LPX} value of peripheral device), use the actual periods for this calculation.
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

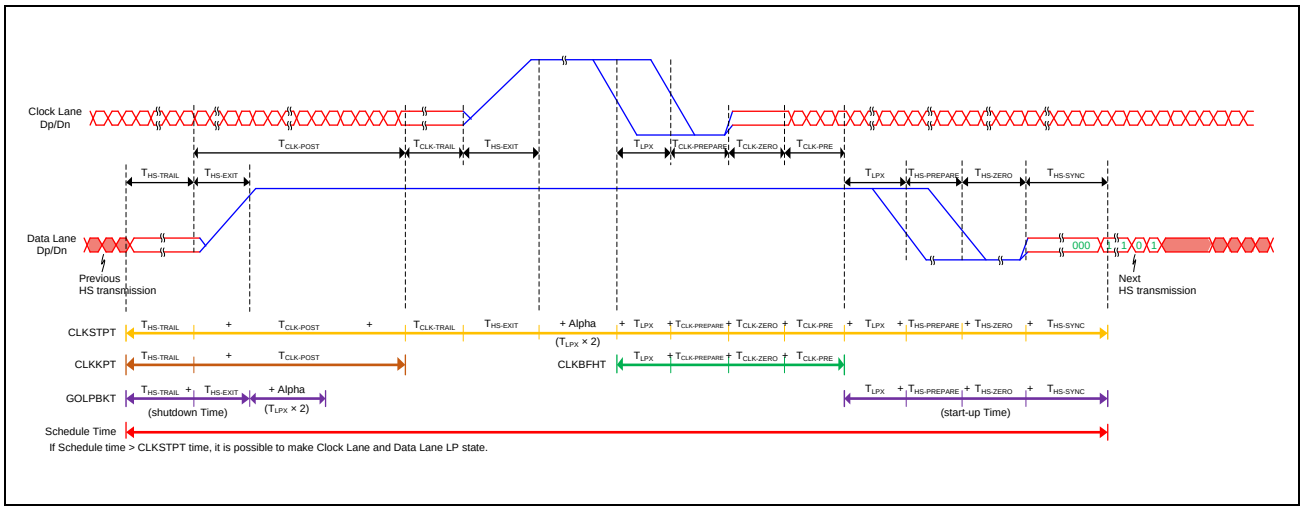

Figure 9.5-2 Switching the Clock Lane between Clock Transmission and Low-Power Mode

9.5.2.2.41 LP Transition Time Set Register (DSI_LINK_LPTRNSTSETR)

Access Size : 8, 16, 32 bits
Offset Address : <DSI_LINK_base> + 0318h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	GOLPBKT[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
9 to 0	GOLPBKT[9:0]	0h	RW	Go LP and Back Time The time period over which the HS Data Lanes are changed to LP and back to HS. If the scheduled time between HS transfers is more than this setting, Data Lanes will be changed to LP. The time is calculated by the formula of GOLPBKT * (the period of high-speed serial 8 * UI). This time corresponds to D-PHY specification's ($T_{HS-TRAIL}$ + $T_{HS-EXIT}$ + T_{LPX} * 2 + T_{LPX}(For Data Lane HS Entry) + $T_{HS-PREPARE}$ + $T_{HS-ZERO}$ + $T_{HS-SYNC}$). For information about each parameter, see **Figure 9.5-3** and **Table 9.5-4**. The unit of this setting is 8 UIs, so if the result of this formula contains a fraction of less than 8 UIs, round it up. Set the rounded-up value plus at least 3. The "T_{LPX}(For Data Lane HS Entry)" means the period of LP-01 in HS entry sequence of Data Lane. If this period is not same as normal T_{LPX} value of host device (in the range of 67% to 150% of the T_{LPX} value of peripheral device), use the actual period for this calculation.

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DLFROMULPS	0h	R	From ULPS (Data Lane) When this value is 1b, all PPI Data Lanes enabled by TXSETR.NUMLANEUSE were changed from ULPS to Stop State by exiting ULPS. Write 1b to the PLSCR.DLFROMULPS register to clear this field.
28	DLTOULPS	0h	R	To ULPS (Data Lane) When this value is 1b, all PPI Data Lanes enabled by TXSETR.NUMLANEUSE were changed from Stop State to ULPS by entering ULPS. Write 1b to the PLSCR.DLTOULPS register to clear this field.
27	CLHS2LP	0h	R	HS to LP (Clock Lane) When this value is 1b, a transition of Clock Lane from HS to LP is detected. Checking this bit during non-continuous clock mode operation has no meaning. Therefore, ignore this bit when HSCLKSETR.HSCLKMODE = 0b. Write 1b to the PLSCR.CLHS2LP register to clear this field.
26	CLLP2HS	0h	R	LP to HS (Clock Lane) When this value is 1b, a transition of Clock Lane from LP to HS is detected. Checking this bit during non-continuous clock mode operation has no meaning. Therefore, ignore this bit when HSCLKSETR.HSCLKMODE = 0b. Write 1b to the PLSCR.CLLP2HS register to clear this field.
25	CLFROMULPS	0h	R	From ULPS (Clock Lane) When this value is 1b, Clock Lane exiting ULPS is detected. Write 1b to the PLSCR.CLFROMULPS register to clear this field.
24	CLTOULPS	0h	R	To ULPS (Clock Lane) When this value is 1b, Clock Lane entering ULPS is detected. Write 1b to the PLSCR.CLTOULPS register to clear this field.
23 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15	DL0DIR	0h	R	Direction (Tx or Rx) of Data Lane 0 0b: PHY is in Tx Mode 1b: PHY is in Rx Mode This field indicates Direction of PPI Data Lane 0 after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
14	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	DL0TX2RX	0h	R	Tx to Rx on Data Lane 0 When this value is 1b, a transition of Direction from 0 (Tx) to 1 (Rx) is detected on Data Lane 0. Write 1b to the PLSCR.DL0TX2RX register to clear this field.
12	DL0RX2TX	0h	R	Rx to Tx on Data Lane 0 When this value is 1b, a transition of Direction from 1 (Rx) to 0 (Tx) is detected on Data Lane 0. Write 1b to the PLSCR.DL0RX2TX register to clear this field.

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	DLSTPST[3:0]	Fh	R	Stop State of Data Lane bit 3: Stop State of Data Lane 3 bit 2: Stop State of Data Lane 2 bit 1: Stop State of Data Lane 1 bit 0: Stop State of Data Lane 0 This field indicates Stop State of a PPI Data Lane after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
7 to 4	DLULPSACTN [3:0]	Fh	R	UlpsActiveNot of Data Lane bit 3: UlpsActiveNot of Data Lane 3 bit 2: UlpsActiveNot of Data Lane 2 bit 1: UlpsActiveNot of Data Lane 1 bit 0: UlpsActiveNot of Data Lane 0 This field indicates UlpsActiveNot of a PPI Data Lane after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
3	DL0RXULPSESC	0h	R	RxUlpsEsc of Data Lane 0 This field indicates RxUlpsEsc of PPI Data Lane 0 after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
2	DL0RXLPDTESC	0h	R	RxLpdtEsc of Data Lane 0 This field indicates RxLpdtEsc of PPI Data Lane 0 after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
1	CLSTPST	1h	R	Stop State of PPI Clock Lane This field indicates Stop State of the PPI Clock Lane after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.
0	CLULPSACTN	1h	R	UlpsActiveNot of PPI Clock Lane This field indicates UlpsActiveNot of the PPI Clock Lane after synchronization to lpclk. This field does not indicate the current status while lpclk is not running.

9.5.2.2.43 Physical Lane Status Clear Register (DSI_LINK_PLSCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0324h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	DLFROMULPS	DLTOULPS	CLHS2LP	CLLP2HS	CLFROMULPS	CLTOULPS	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R0W	R0W	R0W	R0W	R0W	R0W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	DL0TX2RX	DL0RX2TX	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R0W	R0W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DLFROMULPS	0h	R0W	The read value is always 0b. PLSR.DLFROMULPS Clear Set to 1b to clear PLSR.DLFROMULPS. Writing 0b has no effect.
28	DLTOULPS	0h	R0W	The read value is always 0b. PLSR.DLTOULPS Clear Set to 1b to clear PLSR.DLTOULPS. Writing 0b has no effect.
27	CLHS2LP	0h	R0W	The read value is always 0b. PLSR.CLHS2LP Clear Set to 1b to clear PLSR.CLHS2LP. Writing 0b has no effect.
26	CLLP2HS	0h	R0W	The read value is always 0b. PLSR.CLLP2HS Clear Set to 1b to clear PLSR.CLLP2HS. Writing 0b has no effect.
25	CLFROMULPS	0h	R0W	The read value is always 0b. PLSR.CLFROMULPS Clear Set to 1b to clear PLSR.CLFROMULPS. Writing 0b has no effect.
24	CLTOULPS	0h	R0W	The read value is always 0b. PLSR.CLTOULPS Clear Set to 1b to clear PLSR.CLTOULPS. Writing 0b has no effect.
23 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	DL0TX2RX	0h	R0W	The read value is always 0b. PLSR.DL0TX2RX Clear Set to 1b to clear PLSR.DL0TX2RX. Writing 0b has no effect.
12	DL0RX2TX	0h	R0W	The read value is always 0b. PLSR.DL0RX2TX Clear Set to 1b to clear PLSR.DL0RX2TX. Writing 0b has no effect.
11 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.44 Physical Lane Interrupt Enable Register (DSI_LINK_PLIER)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0328h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	DLFROMULPS	DLTOULPS	CLHS2LP	CLLP2HS	CLFROMULPS	CLTOULPS	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	DL0TX2RX	DL0RX2TX	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29	DLFROMULPS	0h	RW	Interrupt enable for all Data Lane transition from ULPS 0b: Disables interrupt dsi_int_ppi when PLSR.DLFROMULPS = 1. 1b: Enables interrupt dsi_int_ppi when PLSR.DLFROMULPS = 1.
28	DLTOULPS	0h	RW	Interrupt enable for all Data Lane transition to ULPS 0b: Disables interrupt dsi_int_ppi when PLSR.DLTOULPS = 1. 1b: Enables interrupt dsi_int_ppi when PLSR.DLTOULPS = 1.
27	CLHS2LP	0h	RW	Interrupt enable for Clock Lane transition to LP from HS 0b: Disables interrupt dsi_int_ppi when PLSR.CLHS2LP = 1. 1b: Enables interrupt dsi_int_ppi when PLSR.CLHS2LP = 1.
26	CLLP2HS	0h	RW	Interrupt enable for Clock Lane transition to HS from LP 0b: Disables interrupt dsi_int_ppi when PLSR.CLLP2HS = 1. 1b: Enables interrupt dsi_int_ppi when PLSR.CLLP2HS = 1.
25	CLFROMULPS	0h	RW	Interrupt enable for Clock Lane transition from ULPS 0b: Disables interrupt dsi_int_ppi when PLSR.CLFROMULPS = 1. 1b: Enables interrupt dsi_int_ppi when PLSR.CLFROMULPS = 1.
24	CLTOULPS	0h	RW	Interrupt enable for Clock Lane transition to ULPS 0b: Disables interrupt dsi_int_ppi when PLSR.CLTOULPS = 1. 1b: Enables interrupt dsi_int_ppi when PLSR.CLTOULPS = 1.
23 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	DL0TX2RX	0h	RW	Interrupt enable for Data Lane 0 direction change from Tx to Rx 0b: Disables interrupt dsi_int_ppi when PLSR.DL0TX2RX = 1. 1b: Enables interrupt dsi_int_ppi when PLSR.DL0TX2RX = 1.
12	DL0RX2TX	0h	RW	Interrupt enable for Data Lane 0 direction change from Rx to Tx 0b: Disables interrupt dsi_int_ppi when PLSR.DL0RX2TX = 1. 1b: Enables interrupt dsi_int_ppi when PLSR.DL0RX2TX = 1.
11 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.45 Video-Input Channel 1 Set 0 Register (DSI_LINK_VICH1SET0R)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0400h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VSEN	-	HFPNOLP	HBPNOLP	HSANOLP	-	-	-	-	-	-	VSTPAFT	VSTART
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	VSEN	0h	RW	Video Skew Calibration Enable 0b: No skew calibration is issued by this channel. 1b: Periodic skew calibration is issued in the first line of VBP. When periodic skew calibration is enabled, set HSCLKSETR.HSCLKMODE = 1.
11	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
10	HFPNOLP	0h	RW	HFP period No LP Specifies whether suppress to transition to LP during the HFP period. 0b: Does not suppress transition to LP during the period 1b: Suppresses transition to LP during the period and keeps HS. HS is kept by sending a blanking packet.
9	HBPNOLP	0h	RW	HBP period No LP Specifies whether suppress transition to LP during the HBP period. 0b: Does not suppress transition to LP during the period 1b: Suppresses transition to LP during the period and keeps HS. HS is kept by sending a blanking packet.
8	HSANOLP	0h	RW	HSA period No LP Specifies whether suppress transition to LP during the HSA period. When TXESYNC=0, this field has no meaning. 0b: Does not suppress transition to LP during the period 1b: Suppresses transition to LP during the period and keeps HS. HS is kept by sending a blanking packet.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	VSTPAFT	0h	R0W	The read value is always 0b. Video-Input signals stop after Video-Input Operation stop Stop Video-Input Operation. Video-Input Operation will end at the end of video-frame. After Video-Input Operation end, stop Video-Input signals. If Video-Input Operation is stopped, VICH1SR.RUNNING bit will change to 0b. Set 1b to both VSTPAFT and VSTART is prohibited. Set 1b during VICH1SR.RUNNING=0 is prohibited. Writing 0b has no effect.

Bit	Bit Name	Initial Value	R/W	Description
0	VSTART	0h	R0W	The read value is always 0b. Video-Input Operation Start Write 1b to start Video-Input Operation. Setting both VSTART and VSTPAFT to 1b is prohibited. Setting this bit to 1b while VICH1SR.RUNNING = 1 is prohibited. Writing 0b has no effect.

9.5.2.2.46 Video-Input Channel 1 Set 1 Register (DSI_LINK_VICH1SET1R)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0404h

Initial Value : 1093_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSPC	-	BPP[5:0]						CHBUFSZ[3:0]				-	-	-	-
Initial Value	0	0	0	1	0	0	0	0	1	0	0	1	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	DLY[11:0]												-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CSPC	0h	R	Color Space of Input Video Pixel This field reflects the color space of Data Type selected by VICH1PPSETR.DT. 0h: RGB 1h: Reserved
30	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
29 to 24	BPP[5:0]	10h	R	Bit Per Pixel of Input Video Pixel This field reflects bits per pixel of Data Type selected by VICH1PPSETR.DT. 10h: 16 bpp 12h: 18 bpp 18h: 24 bpp, 18 bpp (Loosely Packed) (RGB)
23 to 20	CHBUFSZ [3:0]	9h	R	Channel Buffer Size 9h: 64 kB Buffer size = 128 x 2 CHBUFSZ
19, 18	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
17, 16	-	3h	R	Reserved Whenever it is read, 1b is read. The written value will be ignored.
15, 14	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 2	DLY[11:0]	0h	RW	Delay Value The delay time is calculated by the formula of DLY * (the period of high-speed serial UI * 32). Setting to this field to 0b is prohibited. If VICH1SET0R.HFPNOLP = 1, set this field to a value greater than the HFP period. If VICH1SET0R.HBPNOLP = 1, set this field to a value greater than the HBP period. If VICH1SET0R.HSANOLP = 1, set this field to a value greater than the HSA period.
1, 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.47 Video-Input Channel 1 Status Register (DSI_LINK_VICH1SR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0410h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	VBUFOVF	VBUFUDF	-	TIMERR	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	VIRDY	RUNNING	STOP	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23	VBUFOVF	0h	R	Video-Input Buffer Overflow Error A data overflow has occurred in Video-Input Buffer. Write 1b to the VICH1SCR.VBUFOVF register to clear this field.
22	VBUFUDF	0h	R	Video-Input Buffer Underflow Error A data underflow has occurred in Video-Input Buffer. Write 1b to the VICH1SCR.VBUFUDF register to clear this field.
21	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
20	TIMERR	0h	R	Timing Error A timing error has occurred during Video-Input Operation. Write 1b to the VICH1SCR.TIMERR register to clear this field.
19 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	VIRDY	0h	R	Video-Input Signal Accept Ready The value will be set to 1b when the input signal can be accepted by Video-Input Operation channel 1 ready.
2	RUNNING	0h	R	Video-Input Operation channel 1 Transfer Running The value will be set to 1b while Video-Input Operation channel 1 transfer is in progress. Changing the values of the VICH1SET0R, VICH1SET1R, VICH1PPSETR, VICH1VSSETR, VICH1VPSETR, VICH1HSSETR and VICH1HPSETR is prohibited while the transfer is in progress (VICH1SR.RUNNING = 1).
1	STOP	0h	R	Video Input Operation channel 1 Transfer Stop Write 1b to the VICH1SCR.STOP register to clear this field.
0	START	0h	R	Video Input Operation channel 1 Transfer Start. Write 1b to the VICH1SCR.START register to clear this field.

9.5.2.2.48 Video-Input Channel 1 Status Clear Register (DSI_LINK_VICH1SCR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0414h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	VBUFOVF	VBUFUDF	-	TIMERR	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R0W	R0W	R0W	R0W	R0W	R	R	R0W	R0W	R0W	R0W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	VIRDY	-	STOP	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R0W	R	R	R	R	R	R	R	R	R	R	R0W	R	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 26	-	All 0	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25, 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23	VBUFOVF	0h	R0W	The read value is always 0b. VICH1SR.VBUFOVF Clear Set to 1b to clear VICH1SR.VBUFOVF. Writing 0b has no effect.
22	VBUFUDF	0h	R0W	The read value is always 0b. VICH1SR.VBUFUDF Clear Set to 1b to clear VICH1SR.VBUFUDF. Writing 0b has no effect.
21	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	TIMERR	0h	R0W	The read value is always 0b. VICH1SR.TIMERR Clear Set to 1b to clear VICH1SR.TIMERR. Writing 0b has no effect.
19 to 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	VIRDY	0h	R0W	The read value is always 0b. VICH1SR.VIRDY Clear Set to 1b to clear VICH1SR.VIRDY. Writing 0b has no effect.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	STOP	0h	R0W	The read value is always 0b. VICH1SR.STOP Clear Set to 1b to clear VICH1SR.STOP. Writing 0b has no effect.
0	START	0h	R0W	The read value is always 0b. VICH1SR.START Clear Set to 1b to clear VICH1SR.START. Writing 0b has no effect.

9.5.2.2.49 Video-Input Channel 1 Interrupt Enable Register (DSI_LINK_VICH1IER)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0418h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	VBUFOVF	VBUFUDF	-	TIMERR	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	R	R	R	R	R	R	R	R	R	R	RW	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 26	-	All 0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25, 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23	VBUFOVF	0h	RW	Interrupt enable for the Video-Input Buffer Overflow Error 0b: Disables interrupt dsi_int_vin1 when VICH1SR.VBUFOVF = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.VBUFOVF = 1.
22	VBUFUDF	0h	RW	Interrupt enable for the Video-Input Buffer Underflow Error 0b: Disables interrupt dsi_int_vin1 when VICH1SR.VBUFUDF = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.VBUFUDF = 1.
21	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	TIMERR	0h	RW	Interrupt enable for the Timing Error 0b: Disables interrupt dsi_int_vin1 when VICH1SR.TIMERR = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.TIMERR = 1.
19 to 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
14	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3	VIRDY	0h	RW	Interrupt enable for the Video Input Accept Ready 0b: Disables interrupt dsi_int_vin1 when VICH1SR.VIRDY = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.VIRDY = 1.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	STOP	0h	RW	Interrupt enable for the Video Input Operation channel 1 Transfer Stop 0b: Disables interrupt dsi_int_vin1 when VICH1SR.STOP = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.STOP = 1.
0	START	0h	RW	Interrupt enable for the Video Input Operation channel 1 Transfer Start 0b: Disables interrupt dsi_int_vin1 when VICH1SR.START = 1. 1b: Enables interrupt dsi_int_vin1 when VICH1SR.START = 1.

9.5.2.2.50 Video-Input Channel 1 Pixel Packet Set Register (DSI_LINK_VICH1PPSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0420h

Initial Value : 000E_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	VC[1:0]		DT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
23, 22	VC[1:0]	0h	RW	Video-Input Operation Channel 1 Pixel Stream Packet Header Virtual Channel Identifier
21 to 16	DT[5:0]	Eh	RW	Video-Input Operation Channel 1 Pixel Stream Packet Header Data Type The following values can be set. 0Eh: Packed Pixel Stream, 16-bit RGB 1Eh: Packed Pixel Stream, 18-bit RGB 2Eh: Loosely Packed Pixel Stream, 18-bit RGB 3Eh: Packed Pixel Stream, 24-bit RGB Setting any other values is prohibited.
15	TXESYNC	0h	RW	Transmit End of Sync Pulse 0b: HSE and VSE are NOT transmitted 1b: HSE and VSE are transmitted The setting 0b is used for “Burst Mode” sequence or “Non-Burst Mode with Sync Events” sequence. The setting 1b is used for “Non-Burst Mode with Sync Pulse” sequence.
14 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
3 to 0	-	All 0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

9.5.2.2.51 Video-Input Channel 1 Vertical Size Set Register (DSI_LINK_VICH1VSSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0428h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	VACTIVE[14:0]														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VSPOL	-	-	-	VSA[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 16	VACTIVE[14:0]	0h	RW	Sets the Line count of VACTIVE (Vertical Active lines)
15	VSPOL	0h	RW	Polarity of VSYNC Sets the polarity (active state) of the VSYNC signal. 0b: Active high 1b: Active low
14 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	VSA[11:0]	0h	RW	VSA Count Sets the Line count of VSA (Vertical Sync Active)

9.5.2.2.52 Video-Input Channel 1 Vertical Porch Set Register (DSI_LINK_VICH1VPSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 042Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VFP[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

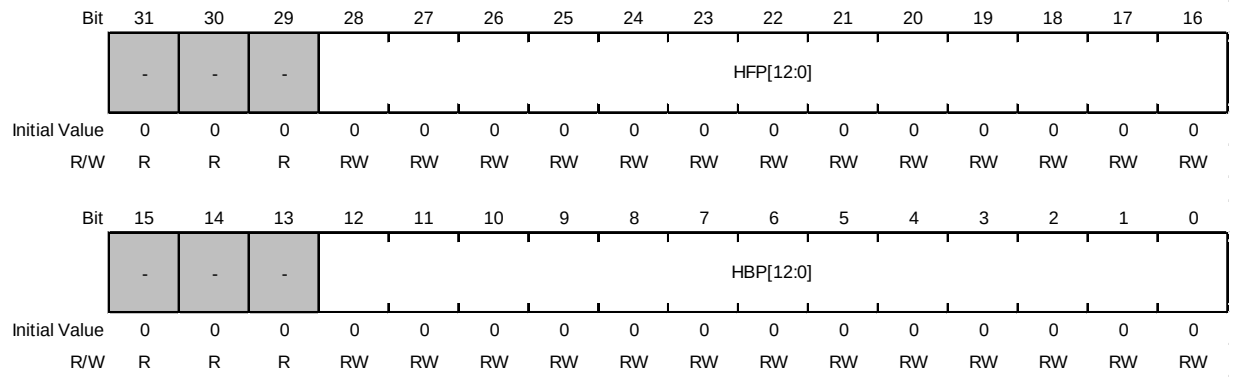
Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30 to 16	HACTIVE [14:0]	0h	RW	HACTIVE Count Sets the pixel count of HACTIVE (Horizontal Active pixels)
15	HSPOL	0h	RW	Polarity of HSYNC Sets the polarity (active state) of the HSYNC signal. 0b: Active high 1b: Active low
14 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
11 to 0	HSA[11:0]	0h	RW	HSA Count Sets the pixel count of HSA (Horizontal Sync Active)

9.5.2.2.54 Video-Input Channel 1 Horizontal Porch Set Register (DSI_LINK_VICH1HPSETR)

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 0434h

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
28 to 16	HFP[12:0]	0h	RW	HFP Count Sets the pixel count of HFP (Horizontal Front Porch)
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
12 to 0	HBP[12:0]	0h	RW	HBP Count Sets the pixel count of HBP (Horizontal Back Porch)

9.5.2.2.55 Sequence Channel x Set 0 Register (DSI_LINK_SQCHxSET0R)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05C0h (x = 0)
<DSI_LINK_base> + 0600h (x = 1)

Initial Value : 0080_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	R0W	RW	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	R	R	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23	-	1h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
22 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8 to 4	-	All 0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
1	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	START	0h	R0W	The read value is always 0b. Sequence Operation Start Write 1b to start running from Descriptor #0. Setting it to 1b while RUNNING = 1 is prohibited. Writing 0b has no effect.

9.5.2.2.56 Sequence Channel x Set 1 Register (DSI_LINK_SQCHxSET1R)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05C4h (x = 0)
<DSI_LINK_base> + 0604h (x = 1)

Initial Value : 0800_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MAXDESNUM[7:0]								CHBUFSZ[3:0]				-	-	-	-
Initial Value	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MAXDESNUM [7:0]	8h	RW	Max Descriptor Number This field indicates the maximum number of descriptors, with the descriptor numbers starting from zero (e.g. the setting 8 means #0 to #7 can be used as descriptors). Writing a value other than the initial value is prohibited.
23 to 20	CHBUFSZ [3:0]	0h	R	Sequence Channel x Buffer Size 0h: 128 B 1h: 256 B 2h: 512 B 3h: 1 kB 4h: 2 kB 5h: 4 kB 6h: 8 kB 7h: 16 kB 8h: 32 kB 9h: 64 kB Buffer size = 128 x 2 CHBUFSZ Setting a transfer packet size larger than this field is prohibited.
19 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.57 Sequence Channel x Status Register (DSI_LINK_SQCHxSR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05D0h (x = 0)
<DSI_LINK_base> + 0610h (x = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	RXAKE	RXCORERR	RXPKTDFAIL	RXFAIL	RXFATALERR	-	TXIBERR	-	-	-	-	PKTBIGERR	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	ADESFIN	-	-	-	AACTFIN	-	RUNNING	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	R	Receive Acknowledge and Error Report Packet RXSR.RXAKE is also reported. Write 1b to the SQCHxSCR.RXAKE register to clear this field.
29	RXCORERR	0h	R	Receive Correctable Error The received packet has a correctable error. RXSR.ECCERR1B is also reported. Write 1b to the SQCHxSCR.RXCORERR register to clear this field.
28	RXPKTDFAIL	0h	R	Receive Packet Data Fail The packet Header was saved correctly but data were not. One or more of the following bits are also reported. RXSR.CRCERR, RXSR.WCERR, RXSR.UEXPKTERR, RXSR.MAXRPSZERR, RXSR.RXOVFERR and RXSR.IBERR. Write 1b to the SQCHxSCR.RXPKTDFAIL register to clear this field.
27	RXFAIL	0h	R	Receive Fail Expected reception did not proceed. One or more of the following bits are also reported. RXSR.PRESPTOERR, RXSR.ECCERR, RXSR.MLFERR and RXSR.NORETERR. Write 1b to the SQCHxSCR.RXFAIL register to clear this field.
26	RXFATALERR	0h	R	Receive Fatal Error A fatal timeout occurred during BTA. One or more of the following bits are also reported. FERRSR.TATO and FERRSR.LRXHTO. Write 1b to the SQCHxSCR.RXFATALERR register to clear this field.
25	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	TXIBERR	0h	R	Tx Internal Bus Error When this value is 1b, the Internal Bus Read had failed to respond. Write 1b to the SQCHxSCR.TXIBERR register to clear this field.
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PKTBIGERR	0h	R	Packet is too big Error Sequence Operation channel 0: Hard wired to 0b. Sequence Operation channel 1: This bit is set when the length of a sequence packet is bigger than Video-Input channel's BLLP. Write 1b to the SQCHxSCR.PKTBIGERR register to clear this field.
18 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	ADESFIN	0h	R	All Descriptor Finished by Setting The descriptor is finished by setting SQCHxDSCyAR.NXACT = 0h for the descriptor. Write 1b to the SQCHxSCR.ADESFIN register to clear this field.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	AACTFIN	0h	R	Descriptor's All Action Finished This bit is set if this descriptor's all actions are finished with SQCHxDSCyCR.FINACT[0] =1b. Write 1b to the SQCHxSCR.AACTFIN register to clear this field.
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2	RUNNING	0h	R	Sequence Operation Running The value will be set to "1" during Sequence Operation. Do not change descriptor values while this bit is 1b. Do not change the values in SQCHxSET0R and SQCHxSET1R.
1, 0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.58 Sequence Channel x Status Clear Register (DSI_LINK_SQCHxSCR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05D4h (x = 0)
<DSI_LINK_base> + 0614h (x = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	RXAKE	RXCORERR	RXPKTDFAIL	RXFAIL	RXFATALERR	-	TXIBERR	-	-	-	-	PKTBIGERR	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R0W	R0W	R0W	R0W	R0W	R	R0W	R	R0W	R	R	R0W	R	R	R0W

	-	-	-	-	-	-	-	ADESFIN	-	-	-	AACTFIN	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0W	R	R	R	R	R	R	R0W	R	R	R	R0W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	R0W	The read value is always 0b. SQCHxSR.RXAKE Clear Set to 1b to clear SQCHxSR.RXAKE. Writing 0b has no effect.
29	RXCORERR	0h	R0W	The read value is always 0b. SQCHxSR.RXCORERR Clear Set to 1b to clear SQCHxSR.RXCORERR. Writing 0b has no effect.
28	RXPKTDFAIL	0h	R0W	The read value is always 0b. SQCHxSR.RXPKTDFAIL Clear Set to 1b to clear SQCHxSR.RXPKTDFAIL. Writing 0b has no effect.
27	RXFAIL	0h	R0W	The read value is always 0b. SQCHxSR.RXFAIL Clear Set to 1b to clear SQCHxSR.RXFAIL. Writing 0b has no effect.
26	RXFATALERR	0h	R0W	The read value is always 0b. SQCHxSR.RXFATALERR Clear Set to 1b to clear SQCHxSR.RXFATALERR. Writing 0b has no effect.
25	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	TXIBERR	0h	R0W	The read value is always 0b. SQCHxSR.TXIBERR Clear Set to 1b to clear SQCHxSR.TXIBERR. Writing 0b has no effect.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21, 20		0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PKTBIGERR	0h	R0W	The read value is always 0b. SQCHxSR.PKTBIGERR Clear Set to 1b to clear SQCHxSR.PKTBIGERR. Writing 0b has no effect.

Bit	Bit Name	Initial Value	R/W	Description
18, 17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16, 15	-	0h	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
14 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	ADESFIN	0h	R0W	The read value is always 0b. SQCHxSR.ADESFIN Clear Set to 1b to clear SQCHxSR.ADESFIN. Writing 0b has no effect.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	AACTFIN	0h	R0W	The read value is always 0b. SQCHxSR.AACTFIN Clear Set to 1b to clear SQCHxSR.AACTFIN. Writing 0b has no effect.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.59 Sequence Channel x Interrupt Enable Register (DSI_LINK_SQCHxIER)

"x" indicates the channel number.

Note: "x" is 0 or 1.

Access Size : 8, 16, 32 bits

Offset Address : <DSI_LINK_base> + 05D8h (x = 0)
<DSI_LINK_base> + 0618h (x = 1)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	RXAKE	RXCORERR	RXPKTDFAIL	RXFAIL	RXFATALERR	-	TXIBERR	-	-	-	-	PKTBIGERR	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	R	RW	R	RW	R	R	RW	R	R	RW

R/W	RW	R	R	R	R	R	R	RW	R	R	R	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
30	RXAKE	0h	RW	Interrupt enable for the Receive Acknowledge and Error Report Packet 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXAKE = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXAKE = 1.
29	RXCORERR	0h	RW	Interrupt enable for the Receive Correctable Error 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXCORERR = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXCORERR = 1.
28	RXPKTDFAIL	0h	RW	Interrupt enable for the Receive Packet Data Fail 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXPKTDFAIL = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXPKTDFAIL = 1.
27	RXFAIL	0h	RW	Interrupt enable for the Receive Fail 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXFAIL = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXFAIL = 1.
26	RXFATALERR	0h	RW	Interrupt enable for the Receive Fatal Error 0b: Disables interrupt dsi_int_sqx when SQCHxSR.RXFATALERR = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.RXFATALERR = 1.
25	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
24	TXIBERR	0h	RW	Interrupt enable for the Tx Internal Bus Error 0b: Disables interrupt dsi_int_sqx when SQCHxSR.TXIBERR = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.TXIBERR = 1.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21, 20		0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
19	PKTBIGERR	0h	RW	Interrupt enable for the Packet is too big Error Sequence Operation channel 0: This field has no meaning. Sequence Operation channel 1: 0b: Disables interrupt dsi_int_sqx when SQCHxSR.PKTBIGERR = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.PKTBIGERR = 1.
18, 17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
16, 15	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
14 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
8	ADESFIN	0h	RW	Interrupt enable for the Descriptor Finished by Setting 0b: Disables interrupt dsi_int_sqx when SQCHxSR.ADESFIN = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.ADESFIN = 1.
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
4	AACTFIN	0h	RW	Interrupt enable for the Descriptor's All Action Finished 0b: Disables interrupt dsi_int_sqx when SQCHxSR.AACTFIN = 1. 1b: Enables interrupt dsi_int_sqx when SQCHxSR.AACTFIN = 1.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.2.2.60 Sequence Channel x Descriptor y-A Register (DSI_LINK_SQCHxDSCyAR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

"y" indicates the descriptor number.

Note: "y" is 00 to 07.

Access Size : 32 bits

Offset Address : <DSI_LINK_base> + 0780h + 0010h × (y) (x = 0)
<DSI_LINK_base> + 0800h + 0010h × (y) (x = 1)

Initial Value : xxxx_xxxxh

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	xh*2	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.
29, 28	NXACT[1:0]	xh*2	RW	Next Action 0h: Terminates operation after this descriptor is finished. 1h: Operates the next descriptor after this descriptor is finished. 2h: Reserved 3h: Reserved
27, 26	BTA[1:0]	xh*2	RW	Bus Turn Around Sets Tx Request without either Bus Turn-Around (BTA) or no-operation. Or else, sets Tx Request with BTA. 0h: Tx Request without BTA or no-operation. 1h: Tx non-Read Request with BTA. 2h: Tx Read Request with BTA. 3h: BTA only
25	SPD	xh*2	RW	Speed Sets the speed type in Tx Request. 0b: High Speed 1b: Low Power Setting this bit to "1" during Video-Input Operation is prohibited.
24	FMT	xh*2	RW	Format Packet format of Tx Packet Header. This field should be set by Data Type. 0b: Short Packet 1b: Long Packet
23, 22	VC[1:0]	xh*2	RW	Virtual Channel Identifier of Virtual Channel of Tx Packet Header.
21 to 16	DT[5:0]	xh*2	RW	Data Type Data Type of Tx Packet Header.
15 to 8	DATA1[7:0]	xh*2	RW	Data 1 Data 1 of Tx Packet Header*1. When Tx Packet format is Long Packet, this value is the upper 8 bits of the word count. The maximum Long Packet size in Command Transfer mode which uses registers is 16 bytes. (SQCHxDSCyBR.DTSEL = 0h and SQCHxDSCyAR.FMT = 1) The maximum Long Packet size in Command Transfer mode which uses the internal bus memory is the number of bytes indicated by SQCHxSET1R.CHBUFSZ. (SQCHxDSCyBR.DTSEL = 1h and SQCHxDSCyAR.FMT = 1)

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	DATA0[7:0]	xh*2	RW	Data 0 Data 0 of Tx Packet Header*1. When Tx Packet format is Long Packet, this value is the lower 8 bits of the word count. The maximum Long Packet size in Command Transfer mode which uses registers is 16 bytes. (SQCHxDSCyBR.DTSEL = 0h and SQCHxDSCyAR.FMT = 1) The maximum Long Packet size in Command Transfer mode which uses the internal bus memory is the number of bytes indicated by SQCHxSET1R.CHBUFSZ. (SQCHxDSCyBR.DTSEL = 1h and SQCHxDSCyAR.FMT = 1)

x = Undefined

Note 1. The maximum size for Command Transfer mode Long Packet by using the register is 16 bytes. (SQCHxDSCyBR.DTSEL = 0h and SQCHxDSCyAR.FMT = 1h)
The maximum size for Command Transfer mode Long Packet by using the internal bus memory is SQCHxSET1R.CHBUFSZ bytes. (SQCHxDSCyBR.DTSEL = 1h and SQCHxDSCyAR.FMT = 1h)

Note 2. The initial values are determined by the initial value of Descriptor RAM.

9.5.2.2.61 Sequence Channel x Descriptor y-B Register (DSI_LINK_SQCHxDSCyBR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

"y" indicates the descriptor number.

Note: "y" is 00 to 07.

Access Size : 32 bits

Offset Address : <DSI_LINK_base> + 0784h + 0010h × (y) (x = 0)
<DSI_LINK_base> + 0804h + 0010h × (y) (x = 1)

Initial Value : xxxx_xxxxh

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	xh*[1]	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.
25, 24	DTSEL[1:0]	xh*[1]	RW	Data Select 0h: Packet Payload Data register 1h: Long Packet data use memory space. In the case of writing, internal read causes reading from the SQCHxDSCyDR address. In the case of reading, internal write causes writing to the SQCHxDSCyDR address. Note: Read Header is always saved to the RXRSSxR register. 2h, 3h: Reserved If a write request with Short packet, then set 0h. When DTSEL = 0h, Long packet write request data size shall be equal to or smaller than 16 bytes. If read request data to save exceeds 16 bytes, this is reported as an error.
23 to 0	-	xh*[1]	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.

x = Undefined

Note 1. The initial values are determined by the initial value of Descriptor RAM.

9.5.2.2.62 Sequence Channel x Descriptor y-C Register (DSI_LINK_SQCHxDSCyCR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

"y" indicates the descriptor number.

Note: "y" is 00 to 07.

Access Size : 32 bits

Offset Address : <DSI_LINK_base> + 0788h + 0010h × (y) (x = 0)
<DSI_LINK_base> + 0808h + 0010h × (y) (x = 1)

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ACTCODE[7:0]								-	AUXOP	-	-	-	-	-	-

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ACTCODE[7:0]	xh*1	RW	Action Code Indicates the rx result same slot number for BTA action. Setting a value greater than or equal to 4 is prohibited. Setting the same rx result save slot number to a different descriptor is prohibited. When AUXOP is 1. 00h: Sends Reset-Trigger. 04h: Sends initial skew calibration Prohibited to use in channel 0 (LP only). 05h: Sends periodic skew calibration Prohibited to use in channel 0 (LP only). 08h: No-operation Other: Reserved Set 00h in other cases.
23	-	xh*1	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.
22	AUXOP	xh*1	RW	Auxiliary Operation Used for auxiliary operation execution. When this bit is set to 1b, SQCHxDSCyBR.BTA should be set to 0h. Set this bit to 1b with BTA = 0h. Setting this bit to 1b during Video-Input Operation is prohibited.
21 to 3	-	xh*1	RW	Reserved When read, the last written value is read. When writing, be sure to write 0b. Operation is not guaranteed if a value other than 0b is written.
2 to 0	FINACT[2:0]	xh*1	RW	Finish Action Bit 2: Set to 0b. Bit 1: Set to 0b. Bit 0: Sets SQCHxSR.AACTFIN if this descriptor's all actions have finished. (0b: Disabled, 1b: Enabled). Since each descriptor's operation is not the same, descriptors may finish out of order. For example, Descriptor#1 may finish before Descriptor#0.

x = Undefined

Note 1. The initial values are determined by the initial value of Descriptor RAM.

9.5.2.2.63 Sequence Channel x Descriptor y-D Register (DSI_LINK_SQCHxDSCyDR)

"x" indicates the channel number.

Note: "x" is 0 or 1.

"y" indicates the descriptor number.

Note: "y" is 00 to 07.

Access Size : 32 bits

Offset Address : <DSI_LINK_base> + 078Ch + 0010h × (y) (x = 0)
<DSI_LINK_base> + 080Ch + 0010h × (y) (x = 1)

Initial Value : xxxx_xxxxh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LADDR[31:0]	xh*1	RW	Lower Address Sets the lower 32-bit address for Long Packet Payload Data in Sequence Operation channel x Descriptor y. When Sequence Operation Data Select is "use memory space" (SQCHxDSCyBR.DTSEL =1h) and Sequence Operation Format is Long packet (SQCHxDSCyAR.FMT=1b), the DSI-Tx module accesses the address by internal bus Master Read in Write action and internal bus Write in Read action. Set the lower three bits to "000b".

x = Undefined

Note 1. The initial values are determined by the initial value of Descriptor RAM.

9.5.2.3 Registers in D-PHY

9.5.2.3.1 DSI PLL Enable Register (DSI_DPHY_PLLENR)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0000h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
0	PHYMRSTN	0h	RW	PHY Master Clock and Data Lane Reset

9.5.2.3.3 DSI PLL Clock Setting 0 Register (DSI_DPHY_PLLCLKSET0R)

Access Size : 8, 16, 32 bits
Address : <DSI_DPHY_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	PLL_M[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	PLL_P[5:0]						-	-	-	-	-	PLL_S[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
25 to 16	PLL_M[9:0]	0h	RW	Value of the main-divider in PLL Can be set in the range of 64 to 1023. Values outside this range are prohibited.
15, 14	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
13 to 8	PLL_P[5:0]	0h	RW	Value of the pre-divider in PLL Can be set in the range of 1 to 4. Values outside this range are prohibited.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
2 to 0	PLL_S[2:0]	0h	RW	Value of Scaler in PLL Can be set in the range of 0 to 5. Values outside this range are prohibited.

The PLL clock frequency (F_{FOUT}) is expressed by the following equation.

$$F_{FREF} = 24MHz/PLL_P, 6MHz \leq F_{FREF} \leq 24MHz$$

$$F_{FVCO} = (PLL_M + (PLL_K/65536)) \times F_{FREF}, 1050MHz \leq F_{FVCO} \leq 2100MHz$$

$$F_{FOUT} = F_{FVCO}/2^{PLL_S}, 80MHz \leq F_{FOUT} \leq 1500MHz$$

$$1 \leq PLL_P \leq 4, 64 \leq PLL_M \leq 1023, 0 \leq PLL_S \leq 5, -32768 \leq PLL_K \leq 32767$$

9.5.2.3.4 DSI PLL Clock Setting 1 Register (DSI_DPHY_PLLCLKSET1R)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0014h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PLL_K[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
15 to 0	PLL_K[15:0]	0h	RW	Value of DSM in PLL PLL_K is a two's complement, and the range is -32768 to 32767.

9.5.2.3.5 DSI PHY TCLK Setting Register (DSI_DPHY_PHYTCLKSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TCLKPRPRCTL[7:0]								TCLKZEROCTL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCLKPOSTCTL[7:0]								TCLKTRAILCTL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

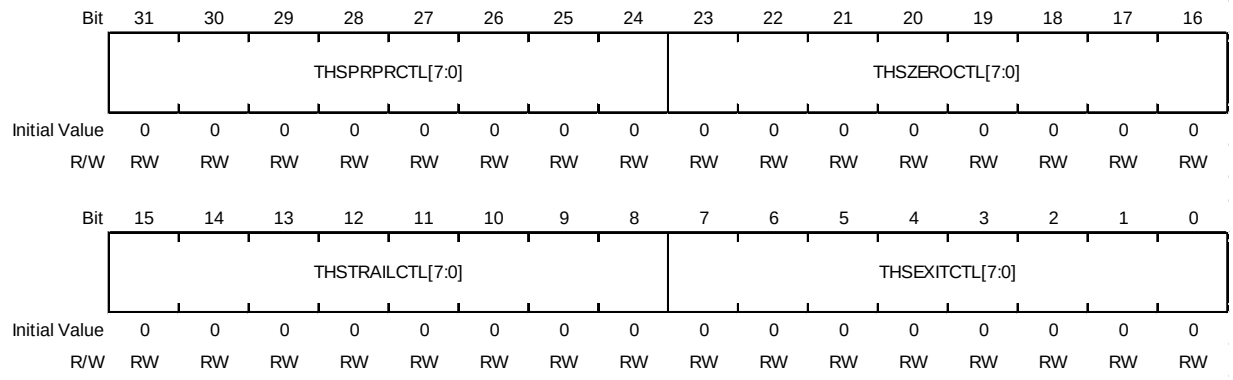
Bit	Bit Name	Initial Value	R/W	Description
31 to 24	TCLKPRPRCTL [7:0]	0h	RW	Control TCLK-PREPARE of the Master Clock Lane.
23 to 16	TCLKZEROCTL [7:0]	0h	RW	Control TCLK-ZERO of the Master Clock Lane.
15 to 8	TCLKPOSTCTL [7:0]	0h	RW	Control TCLK-POST of the Master Clock Lane.
7 to 0	TCLKTRAILCTL [7:0]	0h	RW	Control TCLK-TRAIL of the Master Clock Lane.

9.5.2.3.6 DSI PHY THS Setting Register (DSI_DPHY_PHYTHSSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0024h

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	THSPRPRCTL [7:0]	0h	RW	Control THS-PREPARE of the Master Data Lanes.
23 to 16	THSZEROCTL [7:0]	0h	RW	Control THS-ZERO of the Master Data Lanes.
15 to 8	THSTRAILCTL [7:0]	0h	RW	Control THS-TRAIL of the Master Data Lanes.
7 to 0	THSEXITCTL [7:0]	0h	RW	Control THS-EXIT of the Master Clock and Data Lanes.

9.5.2.3.7 DSI PHY TLPX Setting Register (DSI_DPHY_PHYTLPXSETR)

Access Size : 8, 16, 32 bits

Address : <DSI_DPHY_base> + 0028h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	0h	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
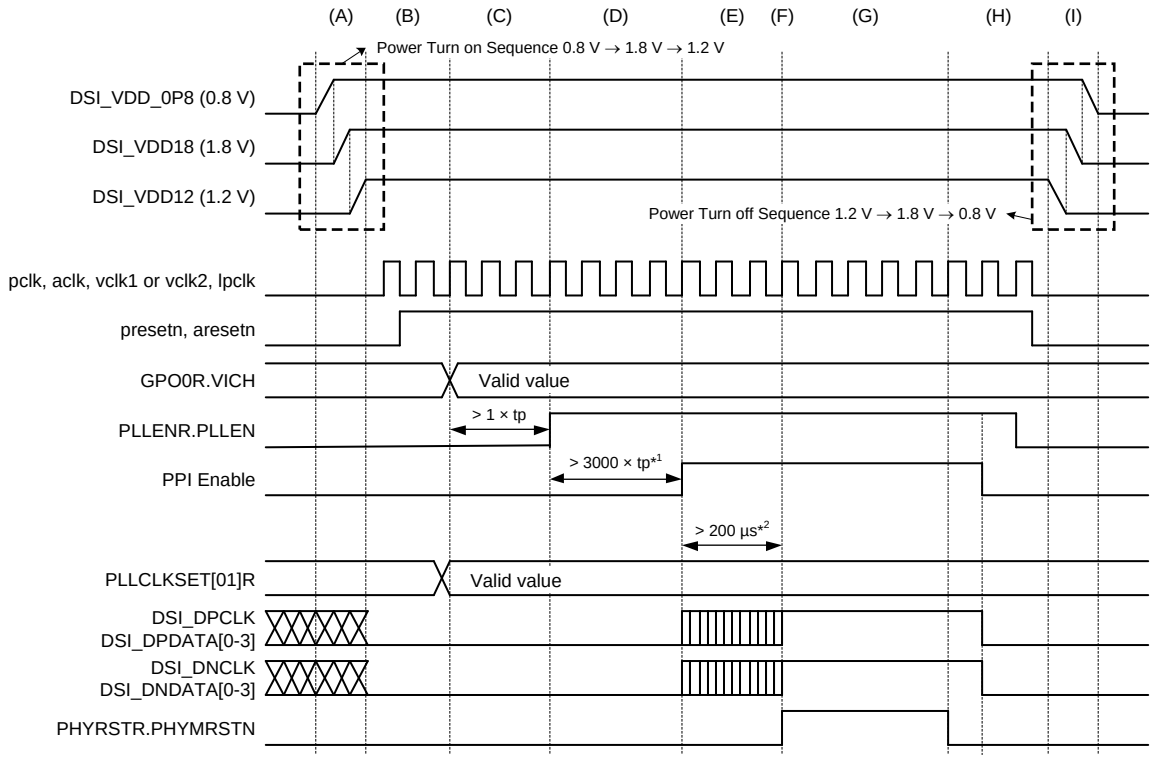
29 to 27	HSTXRFTIM [2:0]	0h	RW	HS-TX Rise & Fall Time Control 000b: 135 ps (default) 001b: 130 ps 010b: 125 ps 011b: 120 ps 100b: 230 ps 101b: 225 ps 110b: 220 ps 111b: 215 ps This is common to both Clock Lane and Data Lane.
26 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.
22 to 20	HSTXTMIMPD [2:0]	0h	RW	HS-TX Driver Termination Impedance Control (Down) 000b: 50 ohm (default) 001b: 52 ohm 010b: 54 ohm 011b: 56 ohm 100b: 44 ohm 101b: 46 ohm 110b: 47 ohm 111b: 48 ohm Note: Set the same value to HSTXMIMPU and HSTXMIMPD. Note: These bits are common to both Clock Lane and Data Lane.
19 to 17	HSTXTMIMPU [2:0]	0h	RW	HS-TX Driver Termination Impedance Control (Up) 000b: 50 ohm (default) 001b: 52 ohm 010b: 54 ohm 011b: 56 ohm 100b: 44 ohm 101b: 46 ohm 110b: 47 ohm 111b: 48 ohm Note: Set the same value to HSTXMIMPU and HSTXMIMPD. Note: These bits are common to both Clock Lane and Data Lane.
16 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value will be ignored.

9.5.3 Operation

This section shows various operation procedures for using the DSI-Tx Module. As for the interrupt operation, Interrupt Enable bit of each interrupt source is enabled (set to 1b) before use, and after confirming the interrupt, the interrupt source is cleared. And more, previous action's interrupt source must be cleared before setting the interrupt enable. Flows in this section indicate only interrupt bit. The DSI-Tx Module does not care whether firmware use the bits by interrupt action or flag polling action. These descriptions are omitted in each flow in this section unless otherwise specified. Error checks are also omitted in normal flow.

9.5.3.1 Power on Reset and Initial Settings for All Operations

The power on/off sequence of the DSI-Tx Module is shown **Figure 9.5-4**.



Note: tp = 1 / (PLLREFCLK / PLLCLKSET0R.PLL_P)

Note 1. PLL Locking Time

Note 2. LP regulator initial time

Figure 9.5-4 Power On/Off Sequence

(A) Bring up DSI_VDD0P8, DSI_VDD18, and DSI_VDD12 in that order.

(B) De-assert presetn and aresetn after clocks are stable.

(C) Write appropriate values to D-PHY registers except PLLENR and PHYRSTR, then wait for more than 1 × tp.

(D) Write 1b to PLLENR.PLLEN, then wait for more than 3000 × tp.

(E) Write TXSETR, then wait for more than 200 µsec.

(F) Write 1b to PHYRSTR.PHYMRSTN and write LINK registers.

(G) The DSI-Tx Module is ready.

At power-on reset, all registers of the DSI-Tx Module are initialized.

Perform the initial settings of the register at Step (C) and (F) in the power-on sequence. It is not necessary to set the register that is used with the default value.

The value to be written to the D-PHY register in Step (C) is as follows.

- Set PLLCLKSET0R and PLLCLKSET1R so that the PLL clock frequency (F_{FOUT}) equals the data rate.
- Follow **Table 9.5-4** to set PHYTCLKSETR, PHYTHSSETR, and PHYTLPXSETR.
- Follow **Table 9.5-5** to set PHYCR.
- Follow register descriptions to set PHYC1R, PHYC2R, and PHYC3R.

120	130	0	4	7	1	1	0	4	0	1
110	120	0	4	7	1	1	0	4	0	1
100	110	0	3	7	1	0	0	4	0	1
90	100	0	3	7	1	0	0	3	0	1
80	90	0	2	7	1	0	0	3	0	1
—	80	0	2	6	1	0	0	3	0	1

Table 9.5-5 Recommend Setting for PHYCR

lpclk [MHz]	ULPSEXIT[9:0]
15.625	391
7.8125	195
3.90625	98
1.953125	49

The LINK registers that need to be initialized in Step (F) are as follows.

- Common Settings
  - TXSETR
  - ULPSSETR
  - DSISETR
  - CLSTPTSETR
  - LPTRNSTSETR
- Timeout Settings
  - PRESPTOBTASETR
  - PRESPTOLPSETR
  - PRESPTOHSSETR
  - HSTXTOSETR
  - LRXHTOSETR
  - TATOSETR

These registers and D-PHY registers can only be changed during the initial setup after a power-on reset and during a software reset in **9.5.3.2.1 Software Reset**. It is prohibited to change at any other time.

9.5.3.2 Reset

9.5.3.2.1 Software Reset

Figure 9.5-5 shows the operation during software reset. Make sure that APB clock (pclk), Internal Bus clock (aclk), Video clock (vclk1), PLL Multiplied clock (PLLREFCLK), and Escape mode Transmit clock (lpclk) are running and PHYRSTR.PHYMRSTN is high before starting software reset.

Writing 1b to RSTCR.SWRST will issue a software reset. After issuing the software reset, check the start of the software reset process with RSTSR.SWRSTxx = 1b. Then write 1b to RSTCR.FCETXSTP to transition the valid data lane of the D-PHY to the Tx Stop State. By checking RSTSR.DL0DIR = 0b and RSTSR.DLSTPST [x] = 1b of the valid data lane, it is possible to confirm that the valid data lane of D-PHY has transitioned to Tx Stop State. After confirming that the valid data lane of the D-PHY has transitioned to the Tx Stop State, write 0b to RSTCR.FCETXSTP. Then write 0b to RSTCR.SWRST and check the completion of the software reset process with RSTSR.SWRSTx = 0b. Since all registers are synchronously reset except for some registers*[1], the software reset process is not completed even if a software reset is issued while the clock is stopped.

Note 1. Registers that require initial settings as described in **9.5.3.1 Power on Reset and Initial Settings for All Operations**, GPO0R register, GPO1R register, RSTCR register, RSTSR register, and SQCHxDSCyAR – SQCHxDSCyDR register are not initialized by software reset.

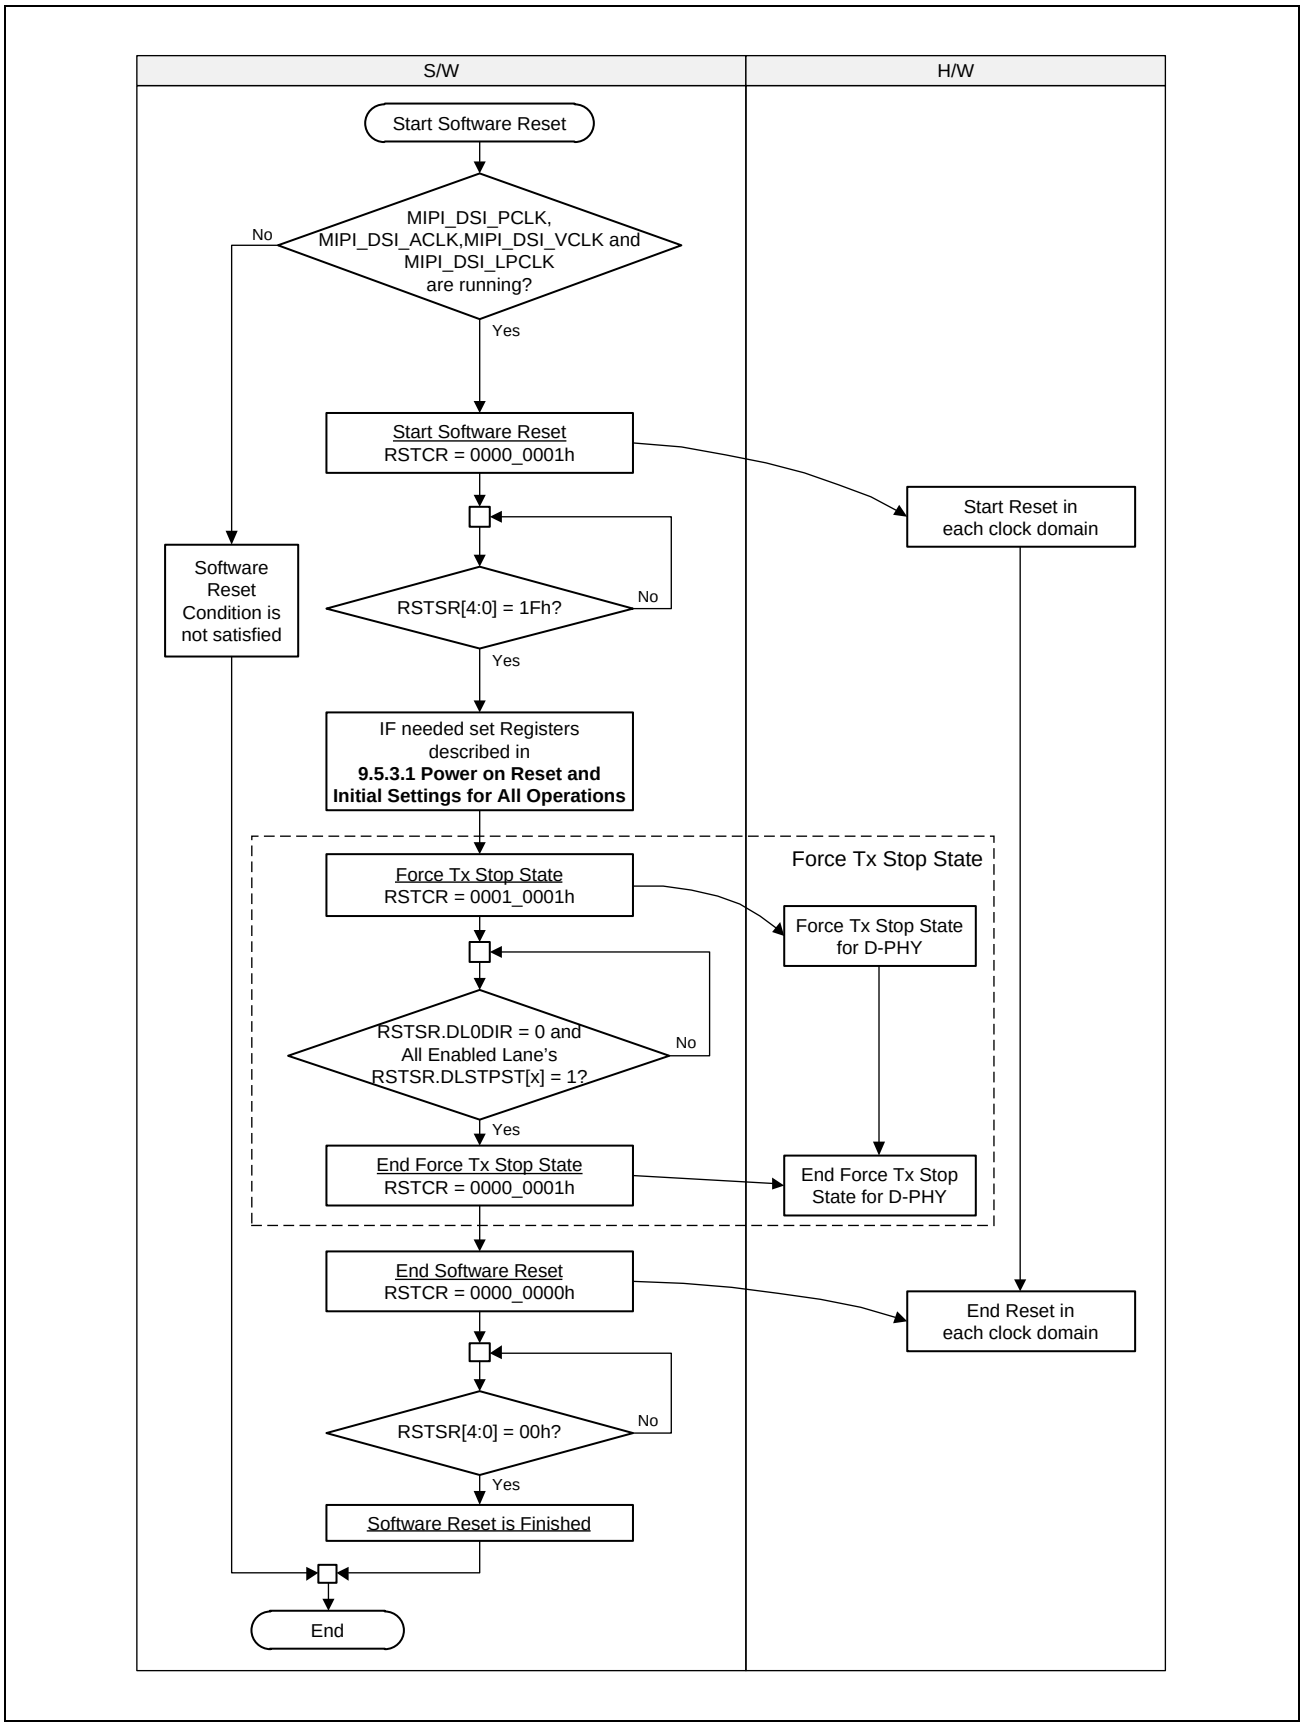

Figure 9.5-5 Software Reset

9.5.3.3 Start/Stop of HS Clock

The following describes the HS Clock Start / Stop sequence. HS Clock Start / Stop is controlled by software.

Figure 9.5-6 shows the operation at HS Clock Start.

Write 1b to TXSETR.CLEN to enable DPHY clock lanes before starting Video-Input Operation or Sequence Operation channel 1 operation.

After the clock lane is enabled and the source clock of the clock lane is stable, write 1b to HSCLKSETR.HSCLKRUN to set the clock lane to HS. It is forbidden to change HSCLKRUN while Sequence Channel is in operation.

At the same time as writing 1b to HSCLKSETR.HSCLKRUN, set continuous clock mode and non-continuous clock mode with HSCLKSETR.HSCLKMODE.

In continuous clock mode, always set the clock lane to HS. PLSR.CLLP2HS is set to 1b when the clock lane transitions from LP to HS. After checking, perform the following operations.

In non-continuous clock mode, the DSI-Tx Module automatically transitions the clock lane from LP to HS depending on the presence or absence of HS Transmission. PLSR.CLLP2HS and PLSR.CLHS2LP are set for each transition, but confirmation is not required.

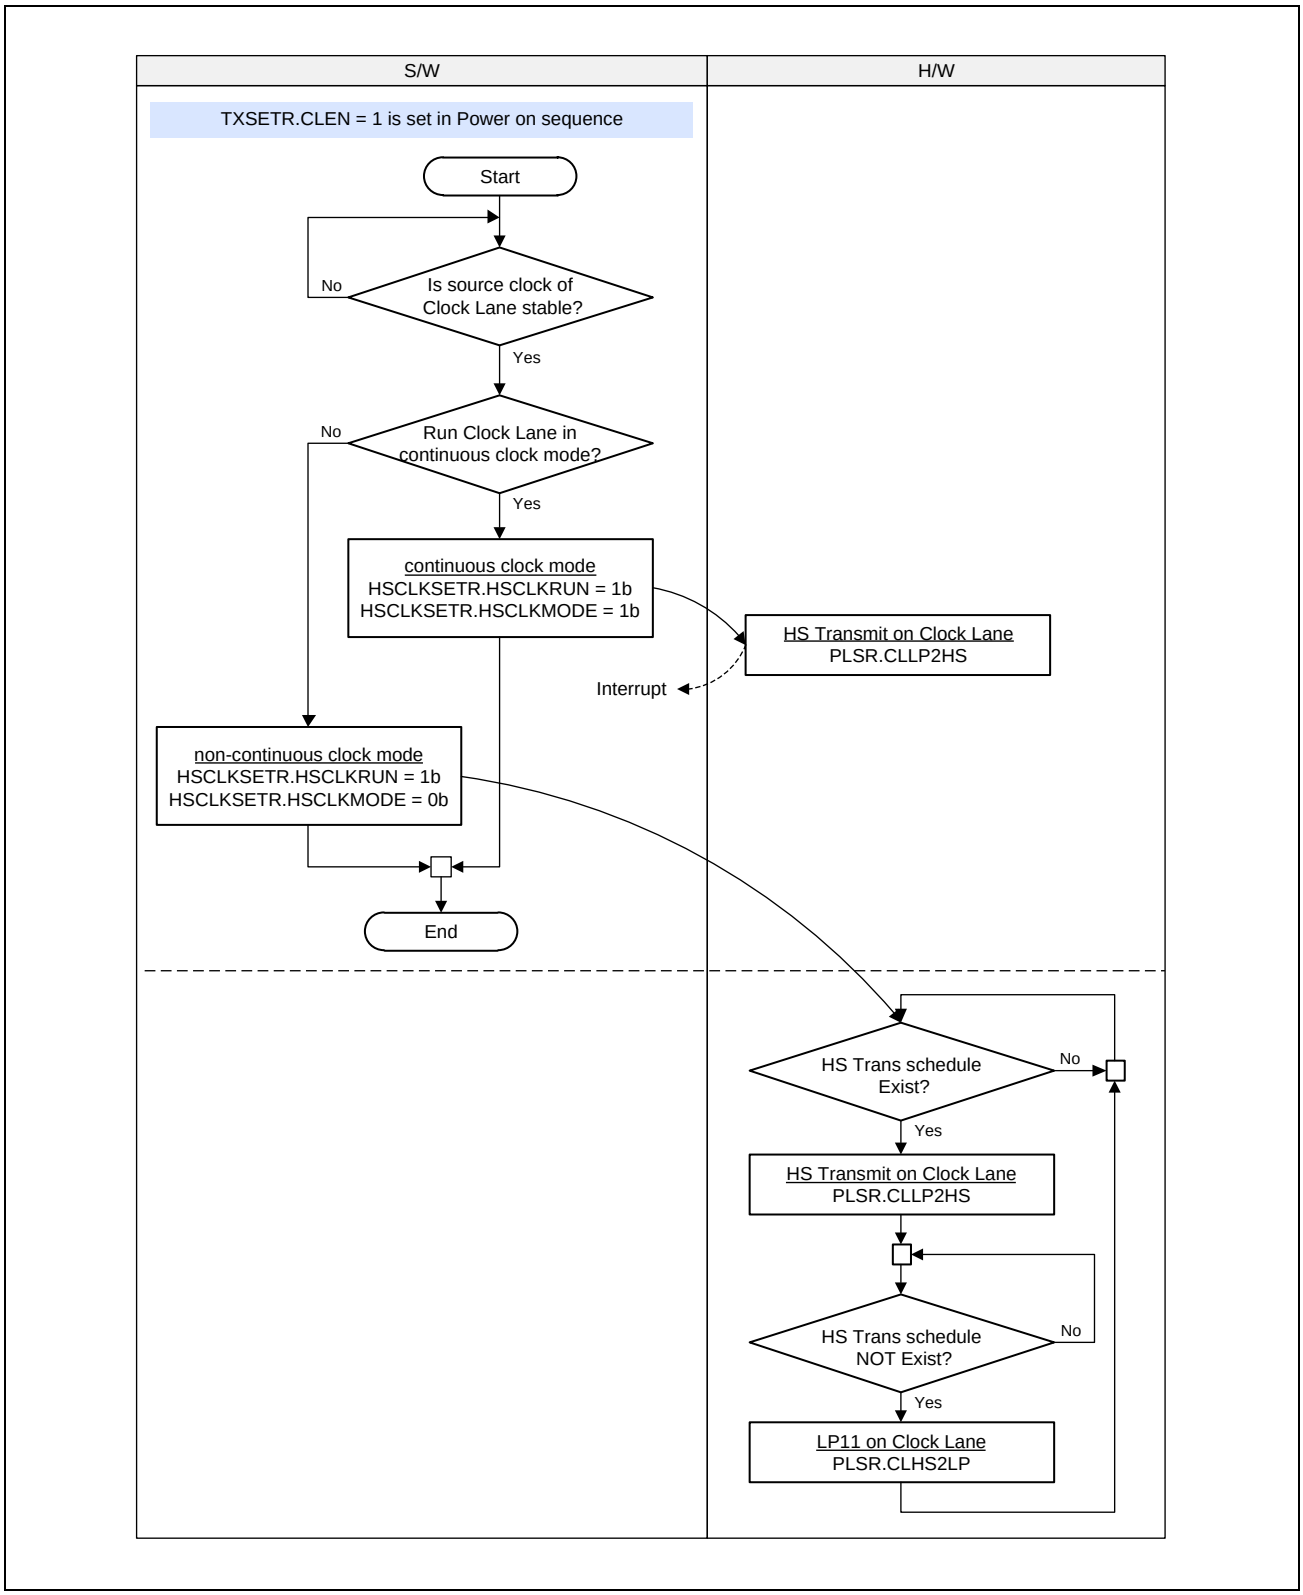

Figure 9.5-6 Start of HS Clock

Figure 9.5-7 shows the operation when HS Clock Stop. After confirming that Video-Input Operation and Sequence Operation channel 1 are not running, write 0b to HSCLKSETR.HSCLKRUN to make the clock lane LP. PLSR.CLHS2LP is set to 1b when the clock lane transitions from HS to LP. In non-continuous clock mode, you do not need to check PLSR.CLHS2LP because the clock lane is likely to be LP already when you write 0b to HSCLKSETR.HSCLKRUN. It is possible to check the clock lane status by reading PLSR.CLSTPST.

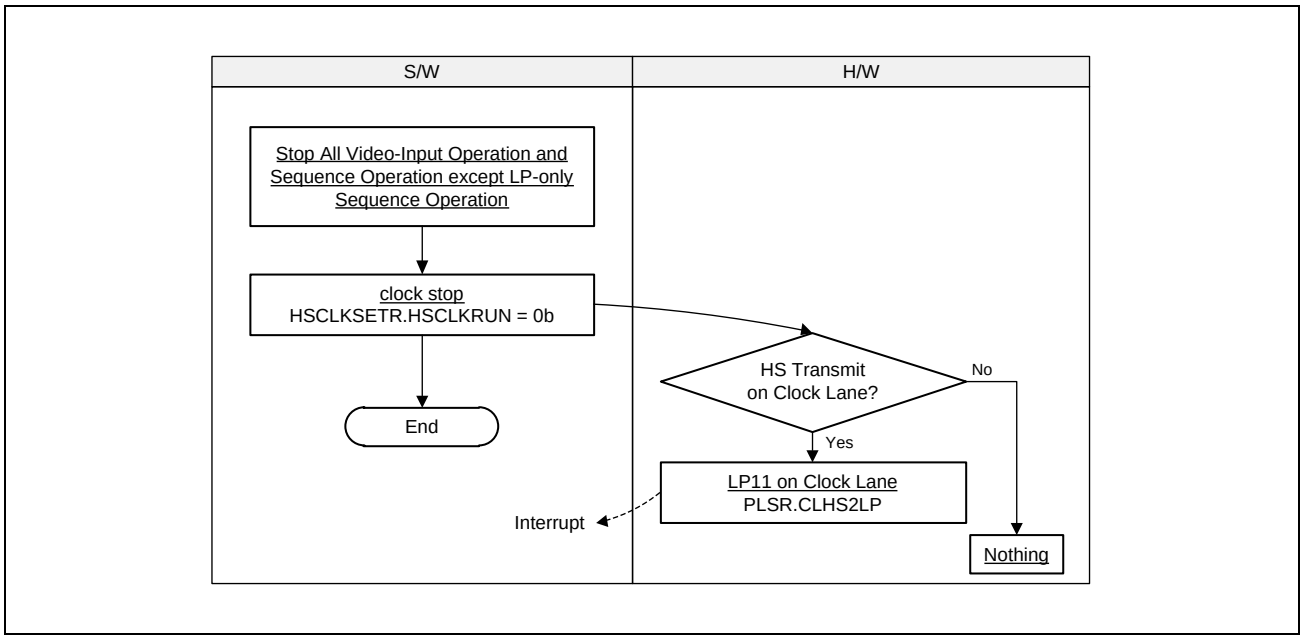

Figure 9.5-7 Stop of HS Clock

9.5.3.4 Sequence Operation

9.5.3.4.1 Basic Running Sequence

Sequence Operation requires initial settings before the operation starts.

- Channel Register Setting
  - Set SQCHxSET1R, SQCHxIER
- Prepare Write Data
  - Prepare Write Data to Memory Area
  - Prepare Write Data to TXPPDxR Registers
- Allocate Read Data Area
  - Clear RXRSSR Register if previous valid flag remains.
  - Allocate each read action’s Memory area.
- Write all Descriptors
- Confirm running HSCLK if Sequence channel 1 is targeted to run.

When “1b” is written to SQCHxSET0R.START, Sequence Operation channel x starts the processing of Descriptor, and when the processing of Descriptor of SQCHxDSCyAR.NXACT = “00b” is completed, the processing of Descriptor ends.

Since Descriptor consists of SRAM, the initial value is indefinite. When the user sets the Descriptor, set all the bits.

After writing 1b to SQCHxSET0R.START on Sequence Operation channel x and SQCHxSR.RUNNING becomes 1b, It is prohibited to change the settings of SQCHxSET1R, SQCHxDSCyAR, SQCHxDSCyBR, SQCHxDSCyCR, and SQCHxDSCyDR until SQCHxSR.RUNNING becomes 0b.

HS-related operations are prohibited on Sequence Operation channel 0.

9.5.3.4.2 Single Packet Transmission

The following describes sending non-read packets using the Sequence Operation channel.

For non-read packet transmission, set the following registers before packet transmission.

- SQCHxDSCyAR.NXACT: “00b”
- SQCHxDSCyAR.FMT: “0b” Short Packet or “1b” Long Packet
- SQCHxDSCyAR.SPD: “0b” High Speed or “1b” Low Speed
- SQCHxDSCyAR.BTA: “00b” without BTA or “01b” with BTA
- SQCHxDSCyAR.VC, DT, DATA0, DATA1
- SQCHxDSCyBR.DTSEL: Specify payload data storage location for non-read packets
  - “00b” TXPPD0R – TXPPD3R. Payloads size is limited up to 16 Bytes.
  - “01b” Memory space. Payloads size is limited up to SQCHxSET1R.CHBUFSZ Bytes.
- SQCHxDSCyCR.AUXOP “0b”

When setting a Long Packet with SQCHxDSCyAR.FMT, prepare the payload data in the location specified by SQCHxDSCyBR.DTSEL in the form of little endian.

No payload data is required when configuring Short Packets with SQCHxDSCyAR.FMT.

After the above settings, write “1b” to SQCHxSET0R.START to send non-read packets.

The user can know the completion of Single Packet Transmission by asserting SQCHxSR.ADESFIN.

If “01b” is set in SQCHxDSCyAR.BTA, BTA is performed after sending a non-read packet.

An ACK trigger or Acknowledge and Error Report Packet may be received when the bus rights are transferred to the peripheral.

The user can get an overview of the reception result by reading the RXRSSxR register with the number specified by SQCHxDSCyCR.ACTCODE. Also, by reading the RXSR register, the user can know the details of the reception result.

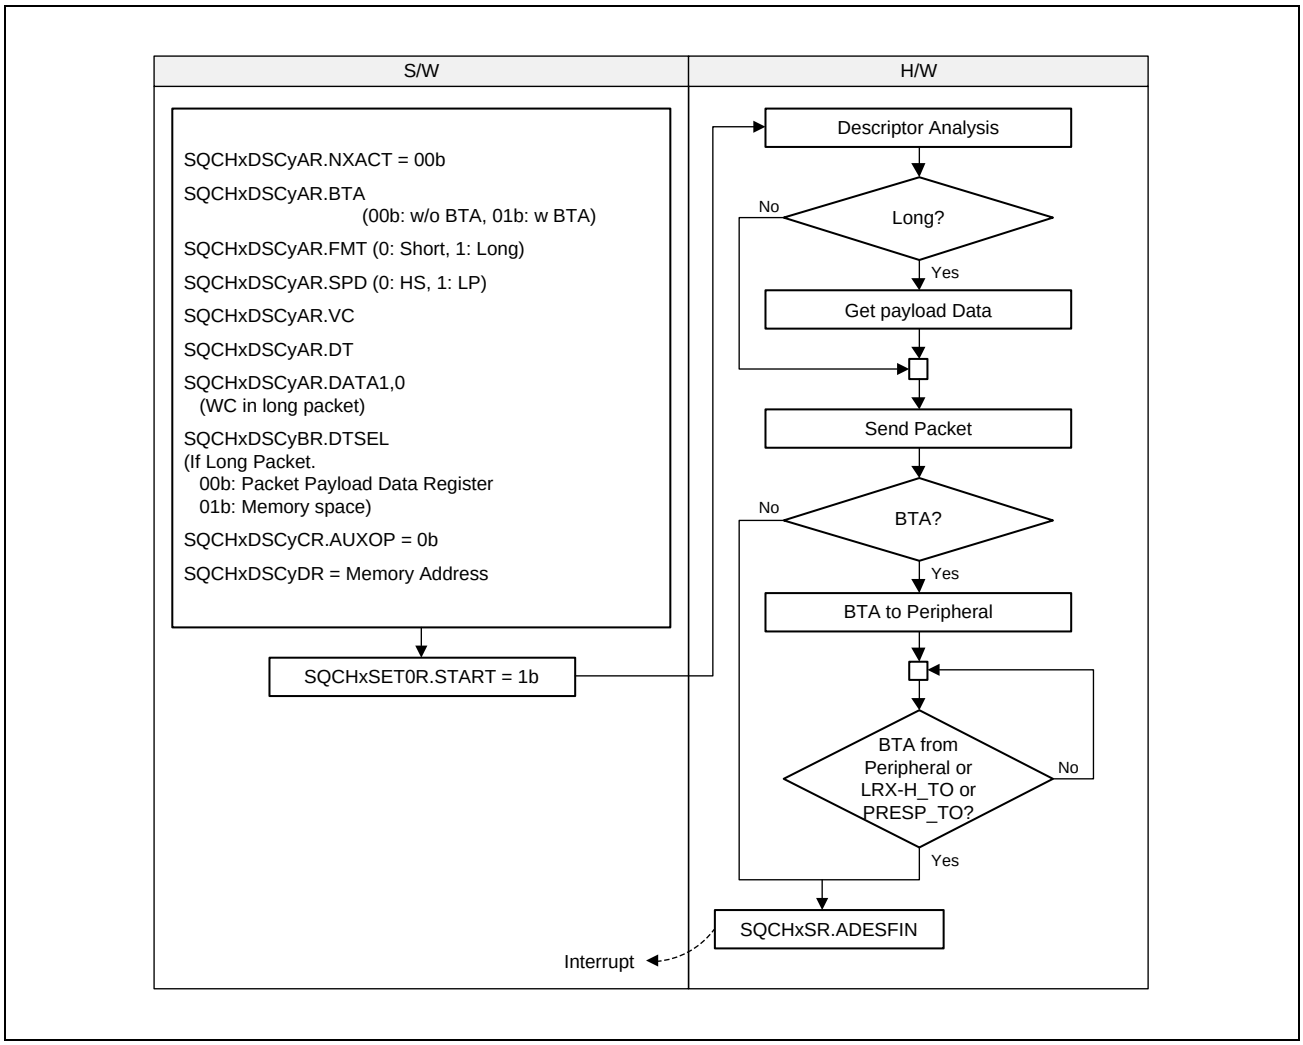

Figure 9.5-8 Single Packet Transfer

9.5.3.4.3 Single Packet Reception

This section describes sending read packets and receiving response packets using the Sequence Operation channel.

Since the read packet is a short packet, set the following registers before sending the packet.

- SQCHxDSCyAR.NXACT: “00b”
- SQCHxDSCyAR.FMT: “0b” Short Packet
- SQCHxDSCyAR.SPD: “0b” High Speed or “1b” Low Speed
- SQCHxDSCyAR.BTA: “10b” Read Request with BTA
- SQCHxDSCyAR.VC, DT, DATA0, DATA1
- SQCHxDSCyBR.DTSEL: Specify the payload data storage location of the response packet
  - “00b” RXPPD0R – RXPPD3R. Payloads size is limited up to 16 Bytes.
  - “01b” Memory space. Payloads size is limited up to RXBUFSZR.RXBUFSZ Bytes.
- SQCHxDSCyCR.AUXOP: “0b”
- SQCHxDSCyCR.ACTCODE: Rx Result Save Slot number

When SQCHxDSC00BR.DTSEL = “00b” is set, receiving payload data of 17 bytes or more is not supported. Therefore, if there is a possibility of receiving payload data of 17 bytes or more, set SQCHxDSC00BR.DTSEL = “01b”.

After the above settings, write “1b” to SQCHxSET0R.START to send the read packet.

BTA is performed after sending the read packet. When the bus right is transferred to the peripheral, the response packet is received. At this time, the Acknowledge and Error Report Packet may also be received at the same time.

The user can know the completion of Single Packet Reception by asserting SQCHxSR.ADESFIN.

The user can get an overview of the reception result by reading the RXRSSxR register with the number specified by SQCHxDSCyCR.ACTCODE, and can know the details of the previous reception result by reading the RXSR register.

If the received response packet is a Short Packet or a Long Packet with WC = 0b, the setting value of SQCHxDSC00BR.DTSEL is meaningless.

Figure 9.5-9 shows the flow of Single Packet Reception.

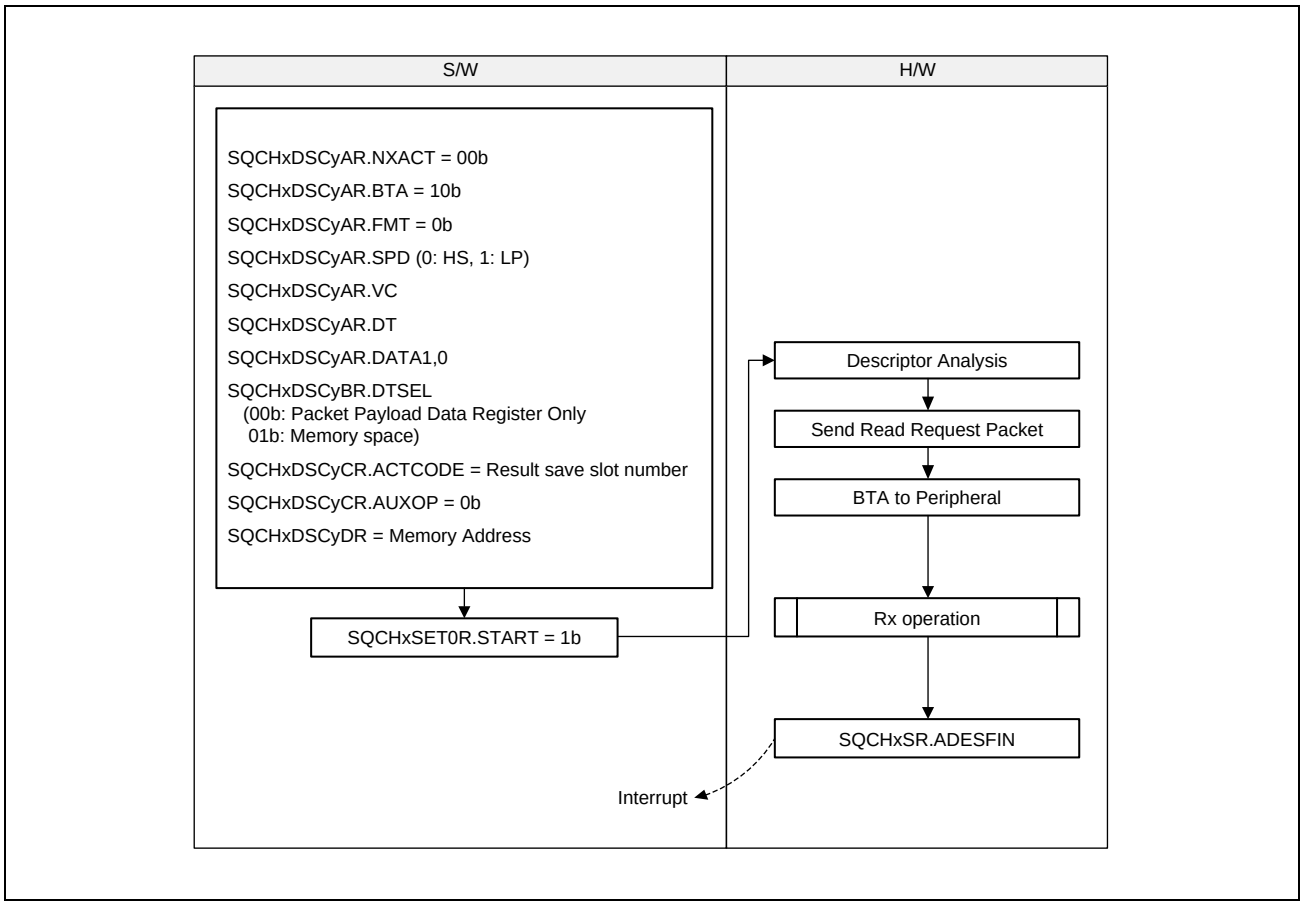

Figure 9.5-9 Single Packet Receive

9.5.3.4.4 Reset Trigger Transmission

The DSI-Tx Module can send triggers using the Sequence Operation channel.

Since the DSI-Tx Module is a host, the only trigger that can be sent is a reset trigger.

After setting SQCHxDSCyAR.NXACT = “00b”, SQCHxDSCyCR.AUXOP = “1b”, and SQCHxDSCyCR.ACTCODE = “00h”, write “1b” to SQCHxSET0R.START to send a reset trigger.

The user can know the completion of reset trigger transmission by asserting SQCHxSR.ADESFIN.

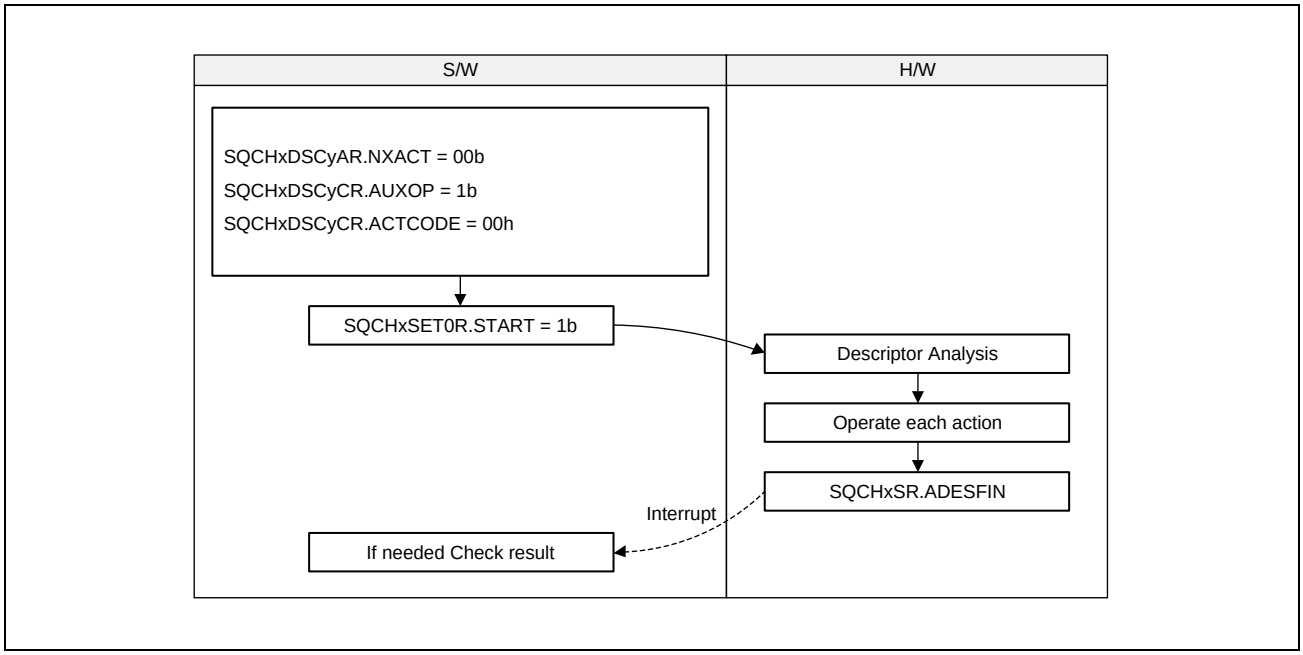

Figure 9.5-10 Trigger Transmission

9.5.3.4.5 Execute Operation in Sequence

The following describes the descriptor in Sequence Operation.

- By writing “1b” to SQCHxSET0R.START, Sequence Operation channel x will be enabled and processing will be performed from descriptor # 0.
- When the processing of the corresponding descriptor is completed, the next processing follows SQCHxDSCyAR.NXACT.
  - SQCHxDSCyAR.NXACT= “00b”:
    Sequence Operation channel x stop after the processing of the corresponding descriptor is completed
  - SQCHxDSCyAR.NXACT= “01b”:
    After the processing of the corresponding descriptor is completed, the next descriptor is executed. The next descriptor after descriptor # N is descriptor # (N + 1).

9.5.3.4.6 Receiving EoTp

The DSI-Tx Module can receive End of Transmission Packets (EoTp).

The DSI-Tx Module notifies the reception of EoTp by setting RXSR.RXEOTP to “1b”.

9.5.3.4.7 Acknowledge and Error Reporting Mechanism

The user can know the reliability of the serial bus by using “Acknowledge and Error Reporting Mechanism”.

If Peripheral detects an error on the serial bus during the period from the previous Peripheral to Host communication to this Peripheral to Host communication, Peripheral will send an “Acknowledge and Error Report” packet.

When the DSI-Tx Module receives the “Acknowledge and Error Report” packet, it sets “1b” to RXRSSxR.RXAKE, RXSR.RXAKE, and SQCHxSR.RXAKE. The Virtual Channel Identifier and Error Report of the latest “Acknowledge and Error Report” packet received are stored in the AKEPLATIR register, and the integrated value is displayed in the AKEPACMSR register.

9.5.3.5 Video-Input Operation

9.5.3.5.1 Video-Input Timing

Video-Input Timing and Video-Input Parameters are described in **Figure 9.5-11** and **Table 9.5-6**.

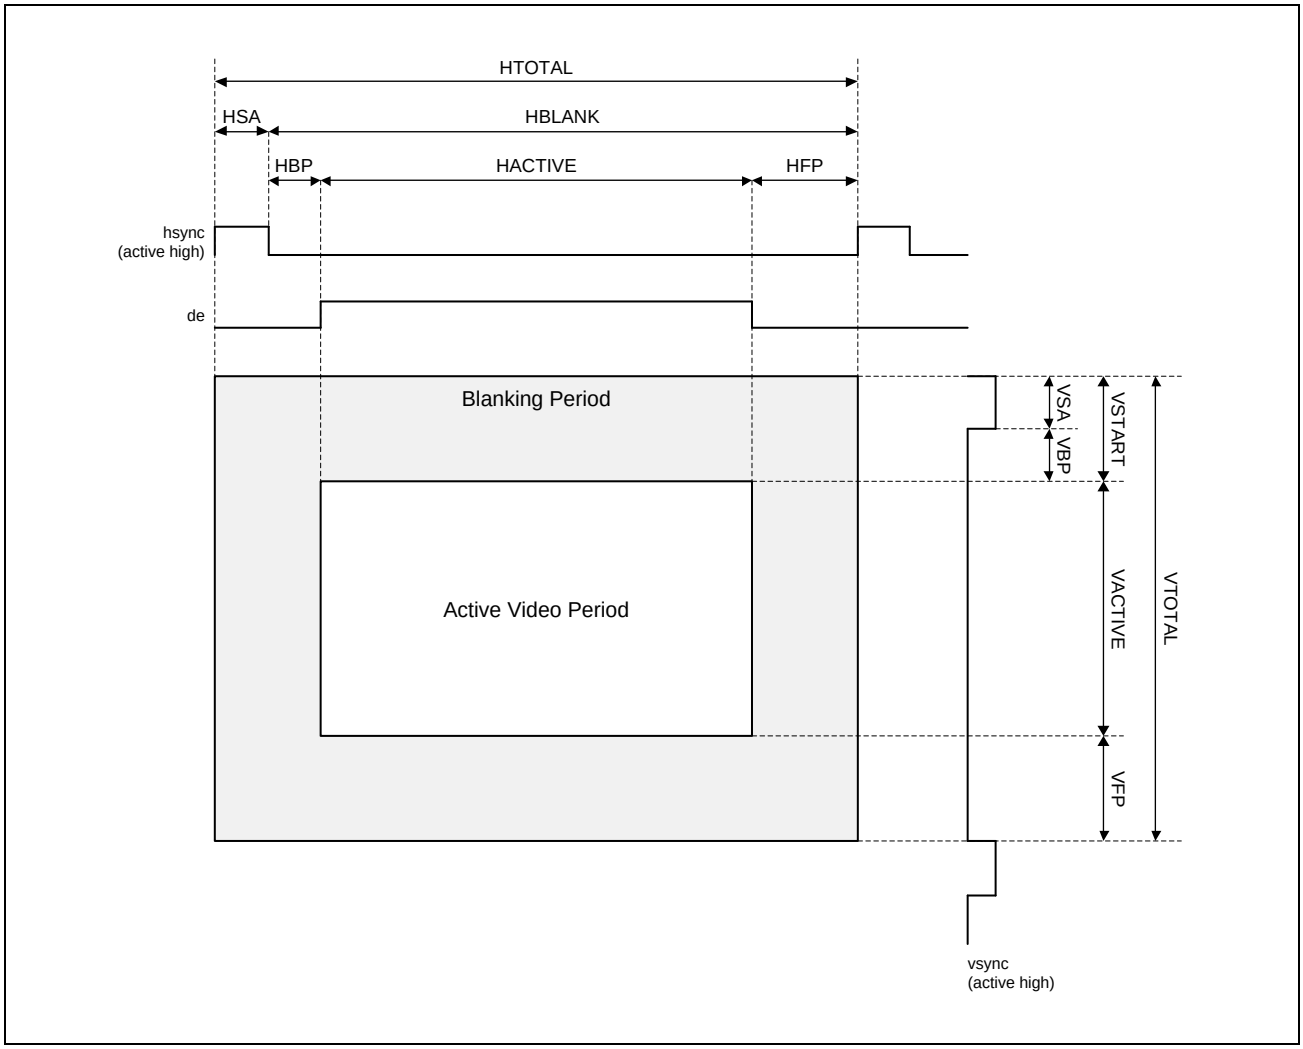

Figure 9.5-11 Video Input Timing

Table 9.5-6 Configurations for Video Input Interface (1/2)

- Common Rules for all mode

Parameter	Description
All	All parameters related to Input Video should be set to the value of not less than 1b. Example for “All parameters”: HSA, HBP, HACTIVE, HFP, VSA, VBP, VACTIVE, VFP
HACTIVE	

VICH1PPSETR.DT	VICH1HSSETR.HACTIVE
1Eh: Packed Pixel Stream, 18-bit RGB	This value should be the multiple of 4.
2Eh: Loosely Packed Pixel Stream, 18-bit RGB 3Eh: Packed Pixel Stream, 24-bit RGB	No limitation

Parameter	Description
HFP	Round down (HFP × BPP/ 8, 0) >= 12, (12 = means Pixel Packet Header & footer 6 + Blanking Packet Header & footer 6)
HTOTAL	

VICH1PPSETR.DT	VICH1HSSETR.HSA + VICH1HPSETR.HBP + VICH1HSSETR.HACTIVE + VICH1HPSETR.HFP
1Eh: Packed Pixel Stream, 18-bit RGB	This value should be the multiple of 4.
2Eh: Loosely Packed Pixel Stream, 18-bit RGB 3Eh: Packed Pixel Stream, 24-bit RGB	No limitation

- Additional Rules for non-burst Sync Pulse mode

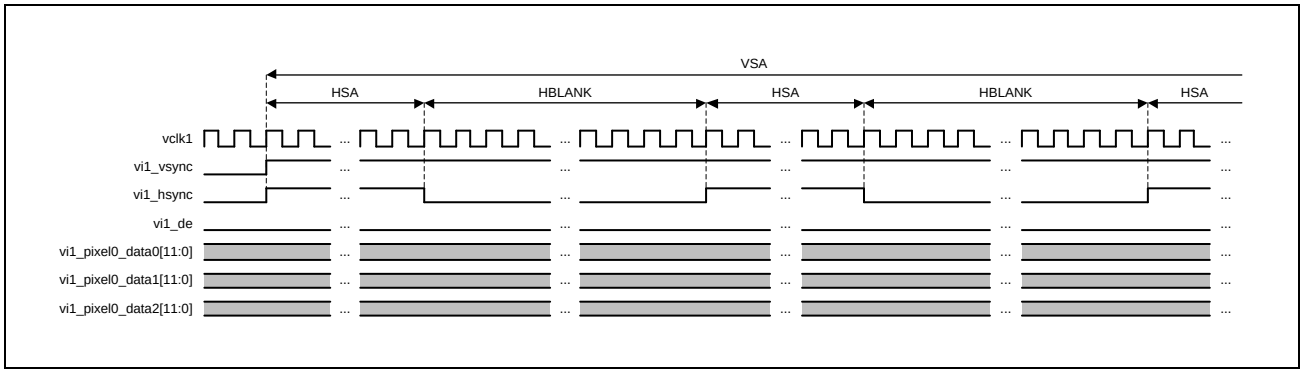
Parameter	Description
Sequence Operation Packet	When a packet by sequence operation is transmitted during Video Operation (VICH1SR.RUNNING=1b), the period of (HBP + HACTIVE + HFP) should be set the value longer than sum of below periods. • Period for the Tx Sync Event packet (4 bytes) • Period for the packet by sequence operation • Period for the Header and CRC of a Blanking Packet (6 bytes)
HBP+HACTIVE+HFP	Transition of HS-LP-HS is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of (HBP+HACTIVE+HFP) should be set to the value within the range described below. (HBP + HACTIVE + HFP) > (period for the Tx Sync Event Packet) + (period for transition time as HS-LP-HS)
HSA	Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HSA should be set to the value within the range described below. (HSA × BPP)/8 >= 10b Notice, HSA should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).
HBP	Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HPB should be set to the value within the range described below. (HBP × BPP)/8 >= 10b Notice, HPB should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).

Table 9.5-6 Configurations for Video Input Interface (2/2)

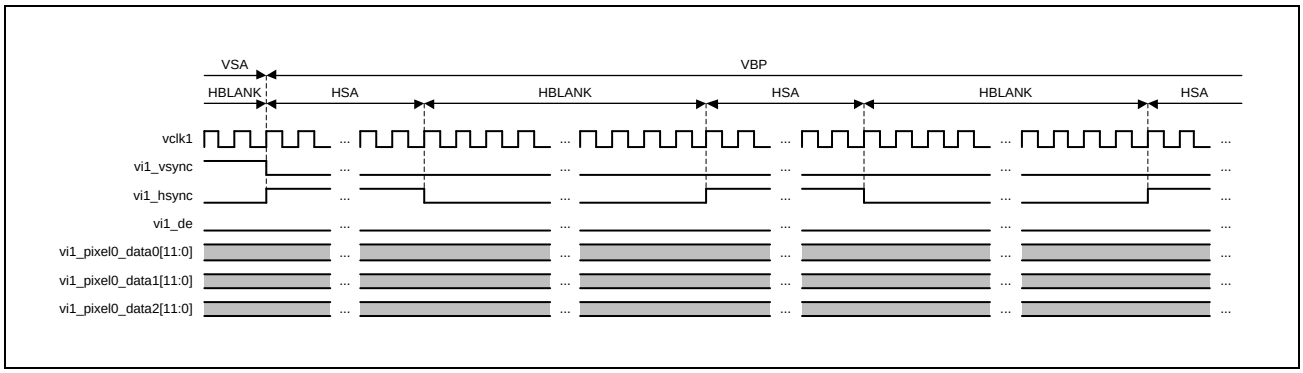
- Additional Rules for non-burst Sync-Event mode and Burst mode

Parameter	Description
Sequence Operation Packet	When a packet by sequence operation is transmitted during Video Operation (VICH1SR.RUNNING=1), the period of HTOTAL should be set the value longer than sum of below periods. • Period for the Tx Sync Event packet (4 bytes) • Period for the packet by sequence operation • Period for the Header and CRC of a Blanking Packet (6 bytes)
HTOTAL	Transition of HS-LP-HS is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HTOTAL should be set to the value within the range described below. HTOTAL > (period for the Tx Sync Event Packet) +(period for transition time as HS-LPHS)
HSA+HBP	Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of (HSA+HBP) should be set to the value within the range described below. ((HAS + HBP) × BPP)/8 >= 10b Notice, HAS + HBP should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).

(1) VSA Start (and VFP End)

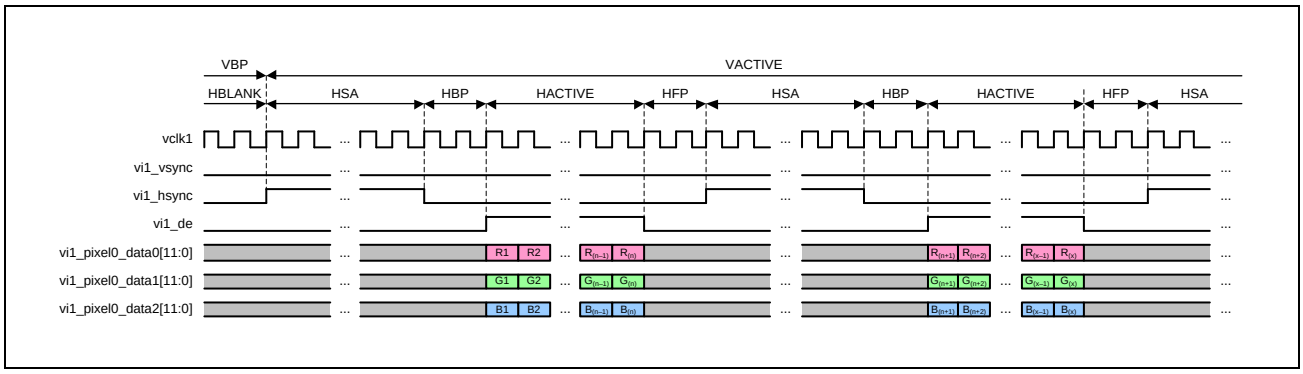


(2) VSA End and VBP Start

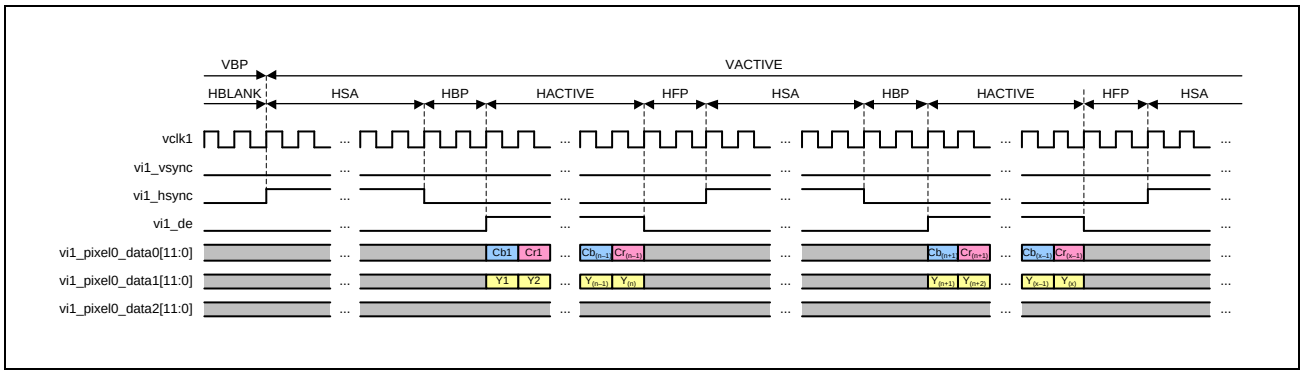


(3) VBP End and VACTIVE Start

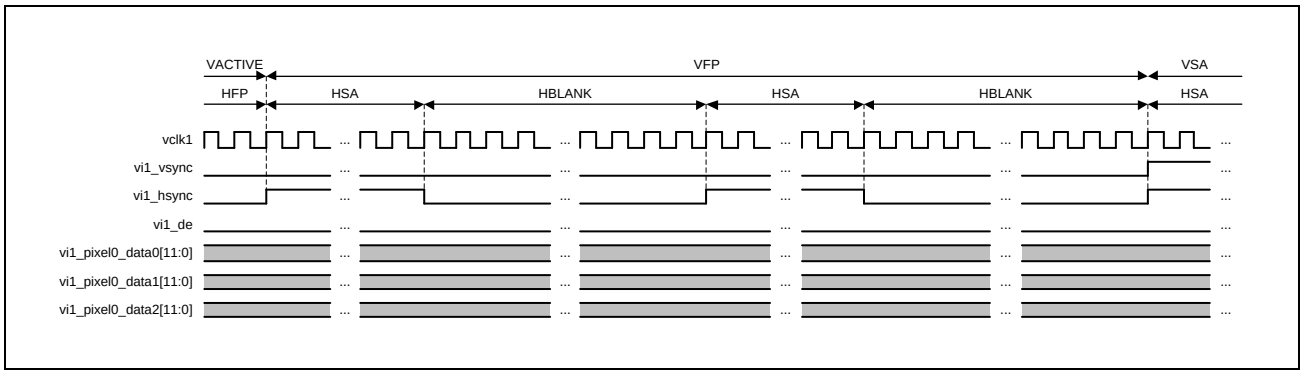
(a) RGB



(b) YCbCr 4: 2: 2



(4) VACTIVE End and VFP Start



9.5.3.5.2 Video-Input Start, End, Change Setting

1) Video Input Start

Video input must be started after Video-Input Operation Start sequence. It must be start from V-Sync start edge.

2) Video Input End

End of Video Input must follow sequence of **9.5.3.5.4 End of Video-Input Operation**.

3) Change of Video Input Setting

Changing of Video-Input setting must be done during Video-Input operation is not running.

9.5.3.5.3 Start of Video-Input Operation

The procedure for Start of Video-Input Operation is shown in **Figure 9.5-12**.

1. Initialize common settings. See **9.5.3.1 Power on Reset and Initial Settings for All Operations**.
2. Some peripheral setting may be done by Sequence operation. Since it is differed from peripheral devices, it is out of this document.
3. Confirm Video-Input clock and hsclk stable and set HS clock. See **9.5.3.3 Start/Stop of HS Clock**.
4. Set Video-Input Operation channel parameters (VICH1PPSETR, VICH1VSSETR, VICH1VPSETR,VICH1HSSETR, VICH1HPSETR)
5. Calculate VICH1SET1R.DLY value and set. See **9.5.3.5.9 Delay about Video-Input Operation**.
6. Set “1b” to VICH1SET0R.VSTART with other VICH1SET0R setting values.
7. Wait until VICH1SR.VIRDY = 1b.
8. Start Video signal input

VICH1SET0R, VICH1SET1R, VICH1PPSETR, VICH1VSSETR, VICH1VPSETR, VICH1HSSETR and VICH1HPSETR are prohibited to change value between VICH1SET0R.VSTART = 1b and VICH1SR.RUNNING=0b after VICH1SET0R.STOP = 1b.

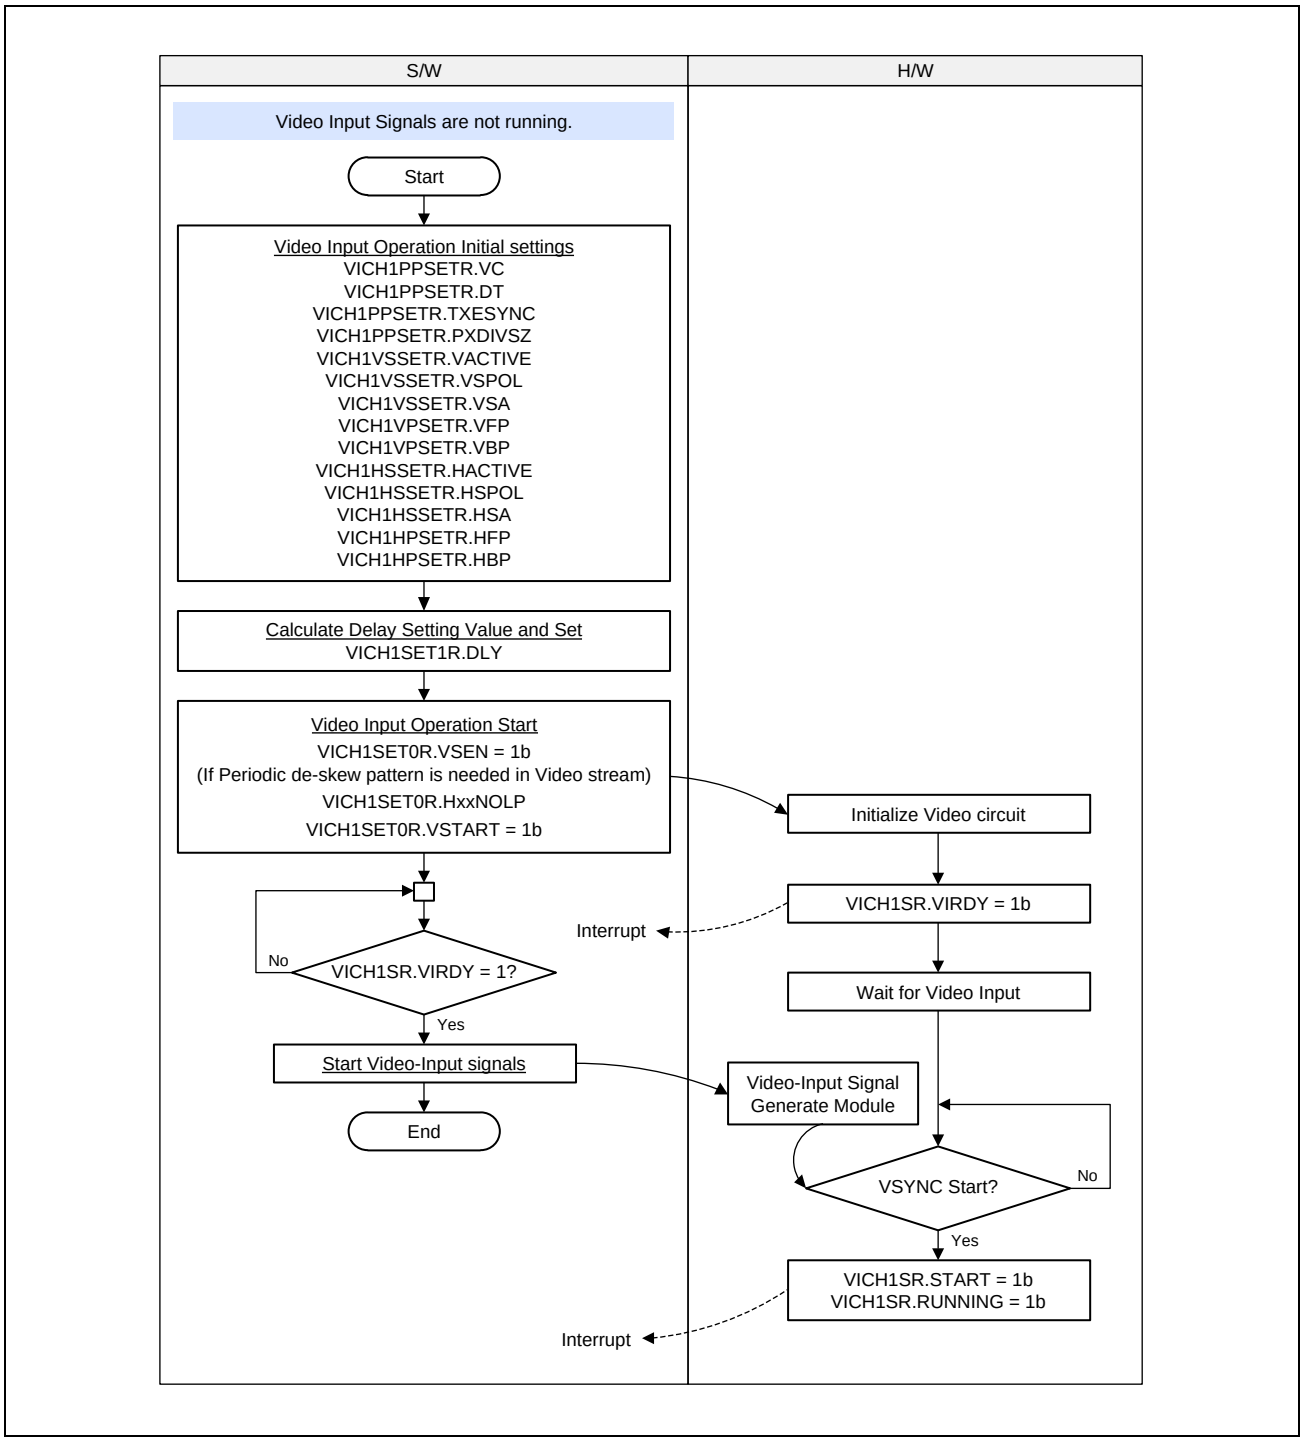


Figure 9.5-12 Video-Input Channel Start

9.5.3.5.4 End of Video-Input Operation

The video-input operation stop flow is shown in **Figure 9.5-13**. Execute the flow when VICH1SR.RUNNING = 1b.

1) VICH1SET0R.VSTPAFT (Figure 9.5-13)

Write 1b to VICH1SET0R.VSTPAFT to request the Video-Input Operation to stop. When the DSI-Tx Module detects the start of one frame (assertion of VSYNC), it stops sending video mode packets and sets VICH1SR.STOP to 1b.
After checking VICH1SR.STOP, stop the video input. The video input can be stopped at any time after VICH1SR.STOP becomes 1b.
After stopping the video input, wait for LINKSR.HSBUSY to become 0b.

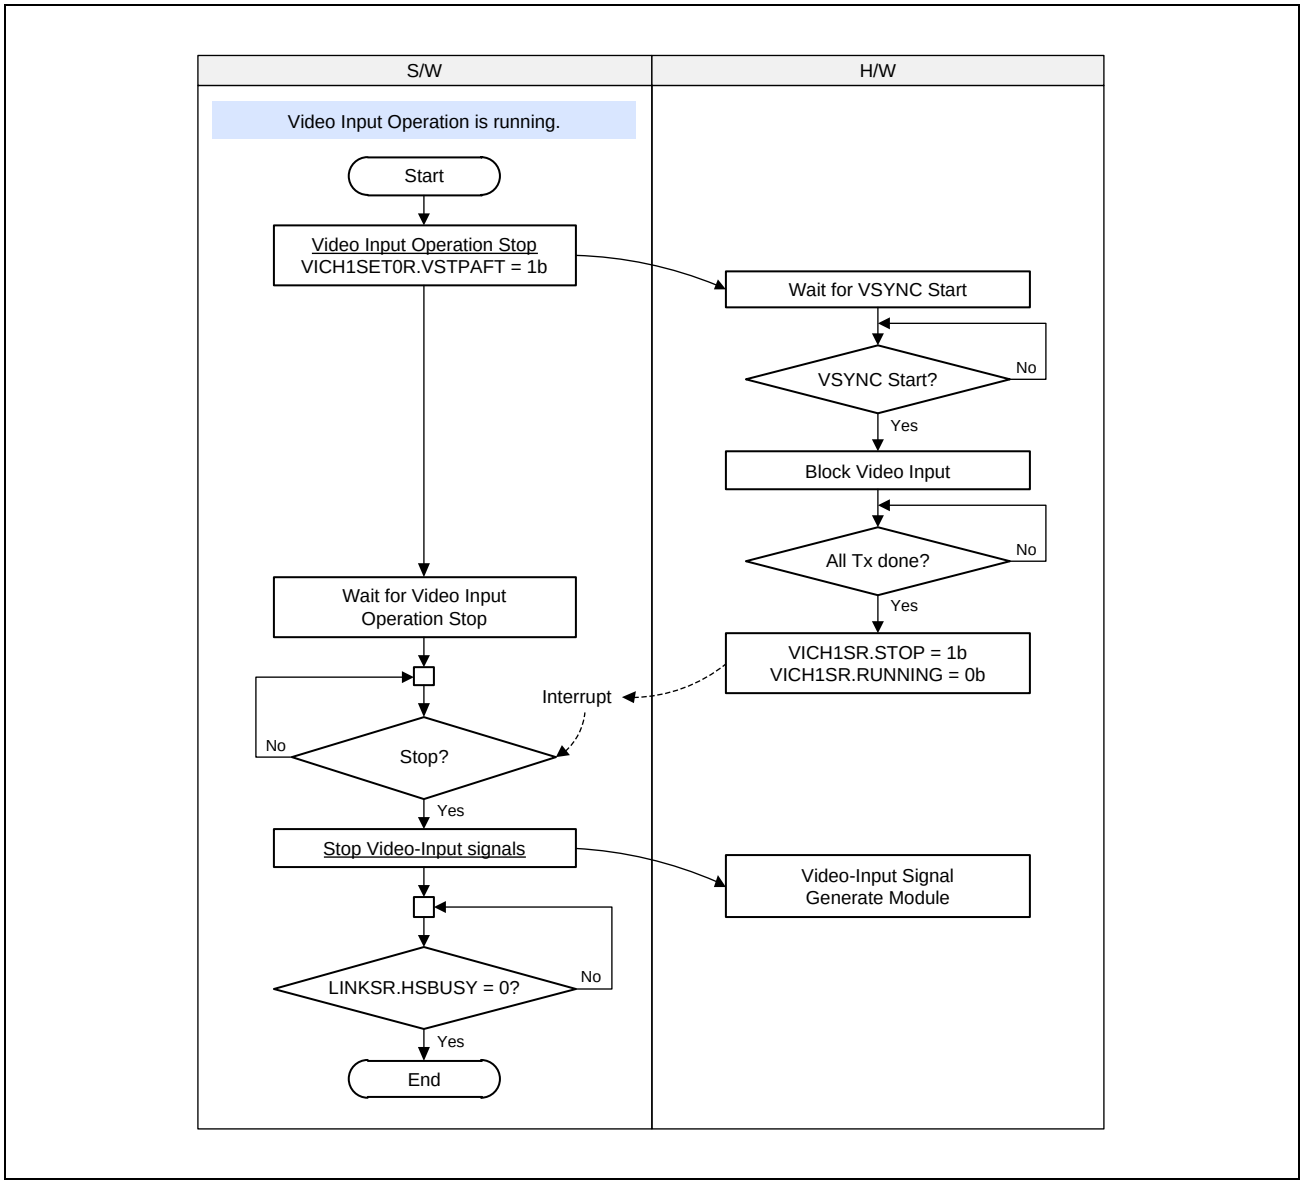

Figure 9.5-13 End of Video-Input Operation (VICH1SET0R.VSTPAFT)

9.5.3.5.5 Burst Mode

The DSI-Tx Module supports Burst Mode.

Burst Mode is a mode that time-compresses pixel data.

Make the D-PHY bandwidth wider than the Video-Input bandwidth for time compression of pixel data. Video transmissions with a 1-line pixel data size (VICH1HSSETR.HACTIVE × VICH1SET1R.BPP / 8) greater than 65,535 Bytes are not supported.

Video clock Frequency [Hz] × Video Pixel Bit Depth (BPP) [bit]
<= DSI HS Byte clock Frequency[Hz] × 8[bit] × Number of DSI HS Data Lane

In the case of Video-Input bandwidth equals DSI output bandwidth, it will be indistinguishable from non-burst sync-event mode.

9.5.3.5.6 Non-Burst Mode

The DSI-Tx Module supports Non-Burst Mode.

Make the D-PHY bandwidth the same as the Video-Input bandwidth. Video transmissions with a 1-line pixel data size (VICH1HSSETR.HACTIVE × VICH1SET1R.BPP / 8) greater than 65,535 bytes are not supported.

Video clock Frequency [Hz] × Video Pixel Bit Depth (BPP) [bit]
= DSI HS Byte clock Frequency[Hz] × 8[bit] × Number of DSI HS Data Lane

9.5.3.5.7 LP Transition and Blanking

The DSI-Tx Module automatically transitions the Data Lane from HS to LP if both of the following two conditions are met:

If it does not transition from HS to LP, it sends a Blanking Packet with the same VC as the VC in the previous packet to maintain the HS.

- There is time to make an HS => LP => HS transition before the next HS transfer starts.
- The period is not prohibited by VICH1SET0R.xxxNOLP to transition to LP

9.5.3.5.8 Non video packet action during Video-Input Operation Running

1) Packet Transmission/Reception by Sequence operation

The DSI-Tx Module can send and receive packets (see **9.5.3.4.2 Single Packet Transmission** and **9.5.3.4.3 Single Packet Reception**) using Sequence Operation while Video-Input Operation is operating*[1].

Make sure that all Sequence Operations are finished before starting the Video-Input Operation.

While Video-Input Operation is operating*[1], packet transmission / reception using Sequence Operation is performed only immediately after the HSE packet (VICH1PPSETR.TXESYNC = 1b) or VSS packet (VICH1PPSETR.TXESYNC = 0b) on the first horizontal line. Also, sending packets using Sequence Operation is possible only with HS (SQCHxDSCyAR.SPD = 0b). Sending with LP (SQCHxDSCyAR.SPD = 1b) is not supported. Send and receive packets that are completed within the BLLP period of the first horizontal line.

Execution of Sequence Operation processing is prohibited except for sending and receiving HS packets.

Note 1. "While Video-Input Operation is operating" here is different from VICH1SR.RUNNING. It means the period from setting VICH1SET0R.VSTART to 0b in the flow of **Figure 9.5-12** until VICH1SR.RUNNING becomes 0 in the flow of **Figure 9.5-13**. Also, Note that there is some latency from executing VICH1SET0R.VSTART to being transmitted to the inside of the module for clock transfer.

9.5.3.5.9 Delay about Video-Input Operation

Video-Input Operation run in some latency which call in the DSI-Tx Module "Delay". "Delay" value must set to VICH1SET1R.DLY before operation.

"Delay" value is defined by calculation using below parameters.

Refer to attached excel file for the "MIPI-DSI_Calculated_register_table" about some calculation results of DLY. (Please double-click the icon on the right side)

- Clock frequencies
  - Video channel 1 clock (MIPI_DSI_VCLK) frequency
  - DSI High-Speed Transmit Word Clock (TxWordClkHS, hsclk) frequency
- Video parameters
  - HSA period, set by VICH1HSSETR.HSA
  - HACTIVE period, set by VICH1HSSETR.HACTIVE
  - HBP period, set by VICH1HPSETR.HBP
  - HFP period, set by VICH1HPSETR.HFP
  - BPP value, shown in VICH1SET1R.BPP and derived from VICH1PPSETR.DT
- Video transmit settings
  - The number of active lanes, set by TXSETR.NUMLANEUSE
  - Transmit mode, set by VICH1PPSETR.TXESYNC
  - No LP, set by VICH1SET0R.HSANOLP, HBPNOLP, HFPNOLP
  - Clock mode, set by HSCLKSETR.HSCLKMODE
  - Clock stop time, set by CLSTPTSETR.CLKSTPT
  - Go LP and back time, set by LPTRNSTSETR.GOLPBKT
- Other parameters
  - Video-Input channel buffer size, shown in VICH1SET1R.CHBUFSZ

9.5.3.6 Enter/Exit of ULPS

The following describes the ULPS transition / return sequence.

The clock lane and data lane (lanes 0 to 3) can be independently transitioned / restored to ULPS.

The clock lane can make ULPS transitions when TXSETR.CLEN = 1b. It is forbidden to change TXSETR.CLEN to 0b while the clock lane is ULPS.

The data lane can make ULPS transitions when TXSETR.DLEN = 1b. It is forbidden to change TXSETR.DLEN to 0b while the data lane is ULPS.

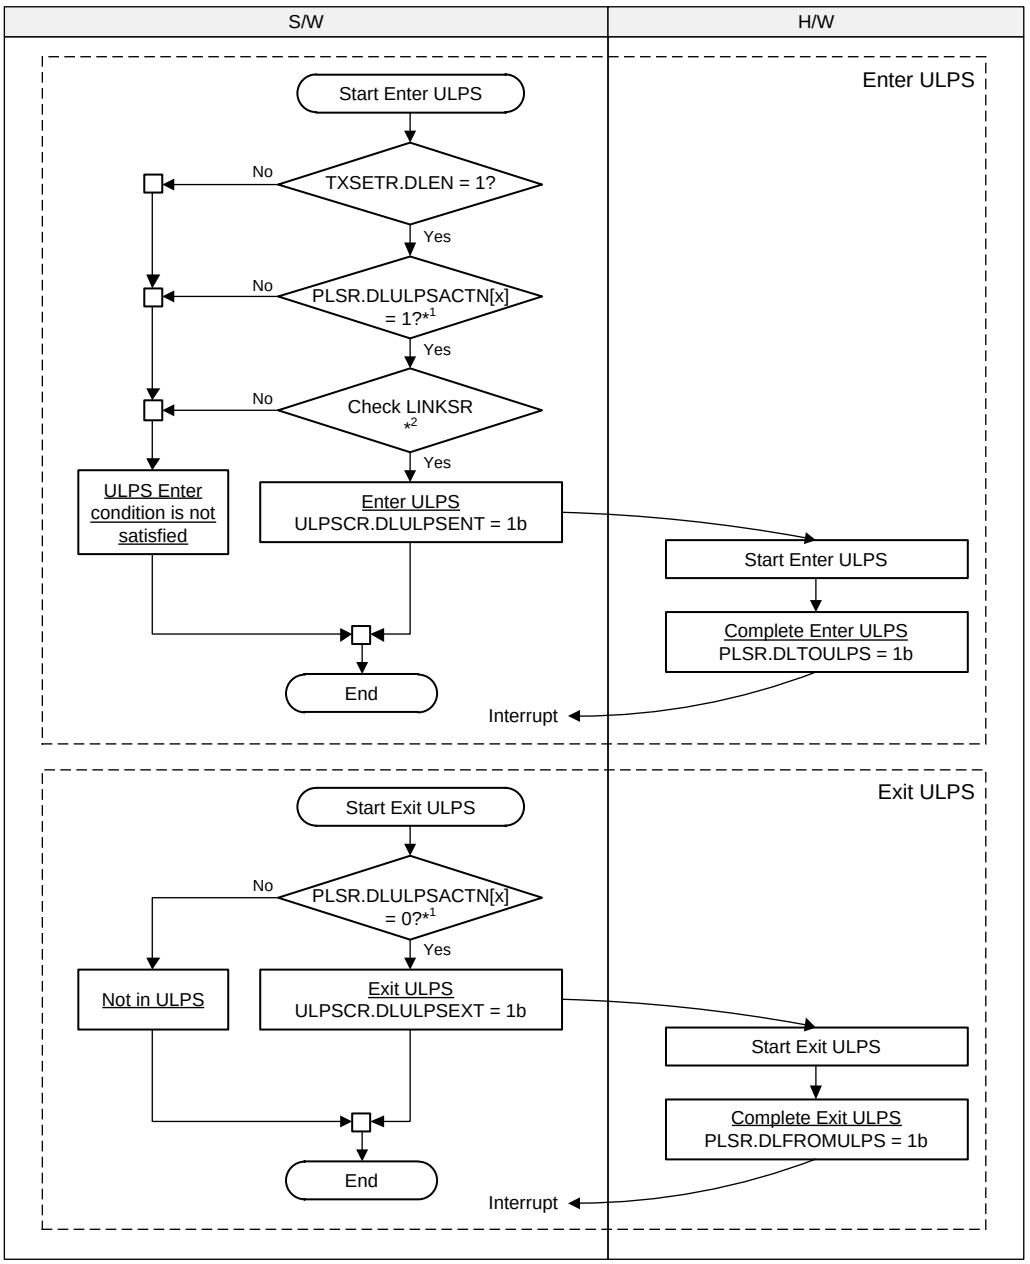
Data lanes enabled in TXSETR.NUMLANEUSE can be ULPS transitioned / restored. ULPS transition / return of data lanes is done simultaneously for all valid lanes. Only certain data lanes cannot be ULPS transitioned / restored.

When the data lane transitions to ULPS, another operation*[1] using the data lane cannot be performed until ULPS is restored.

When the clock lane transitions to ULPS, another operation*[2] using the clock lane cannot be performed until ULPS is restored.

Note 1. Sequence Operation, Video-Input Operation.

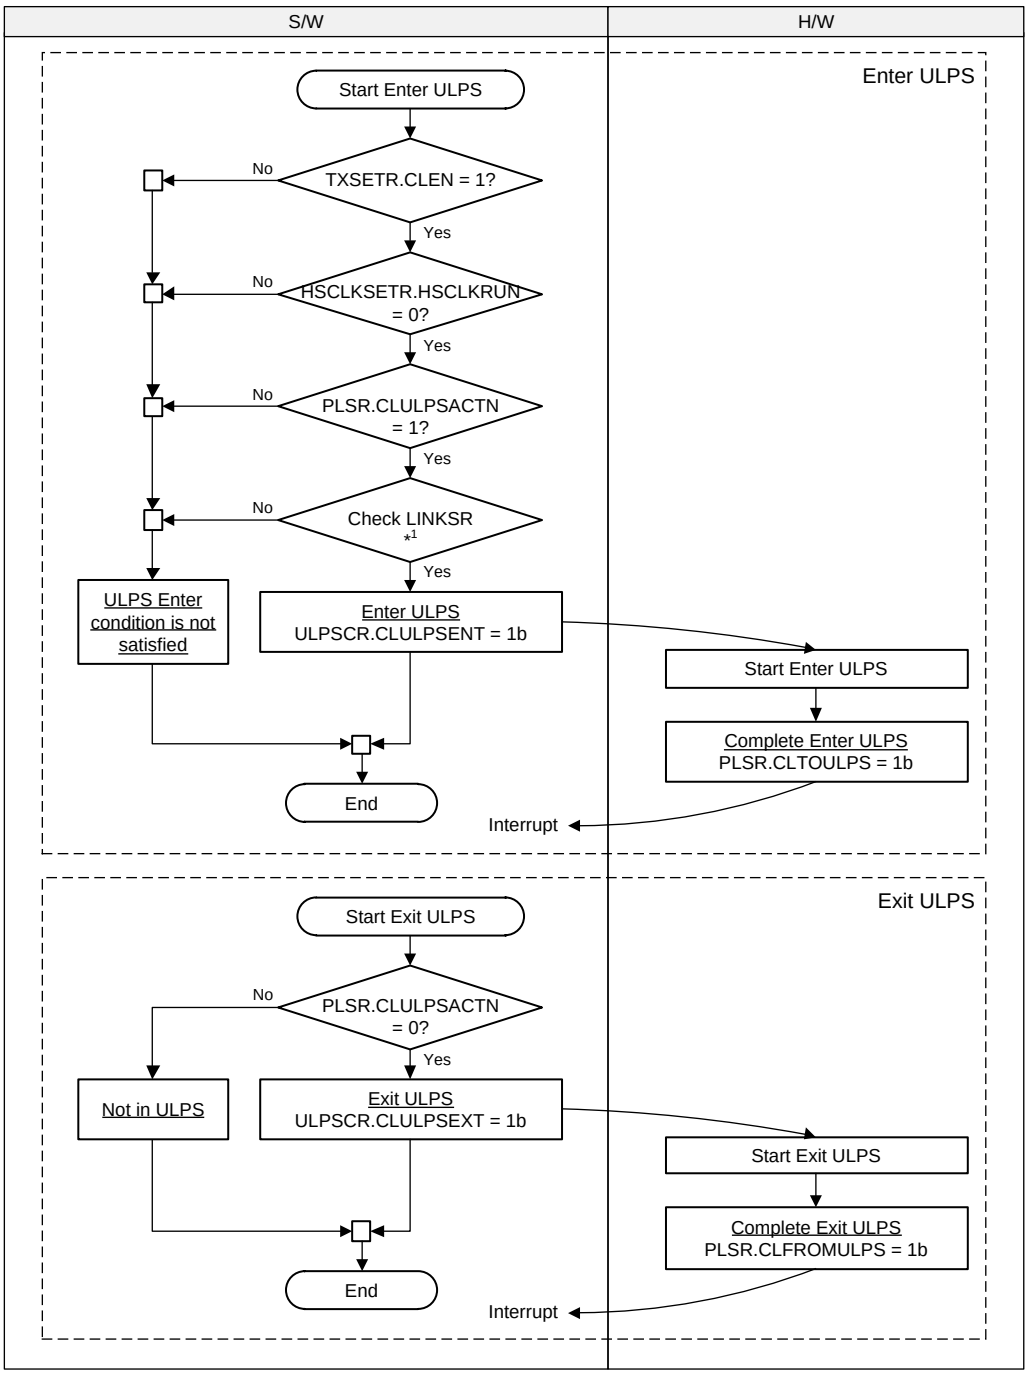
Note 2. HS Sequence Operation, Video-Input Operation.



Note 1. Check all enabled data lanes selected by TXSETR.NUMLANEUSE

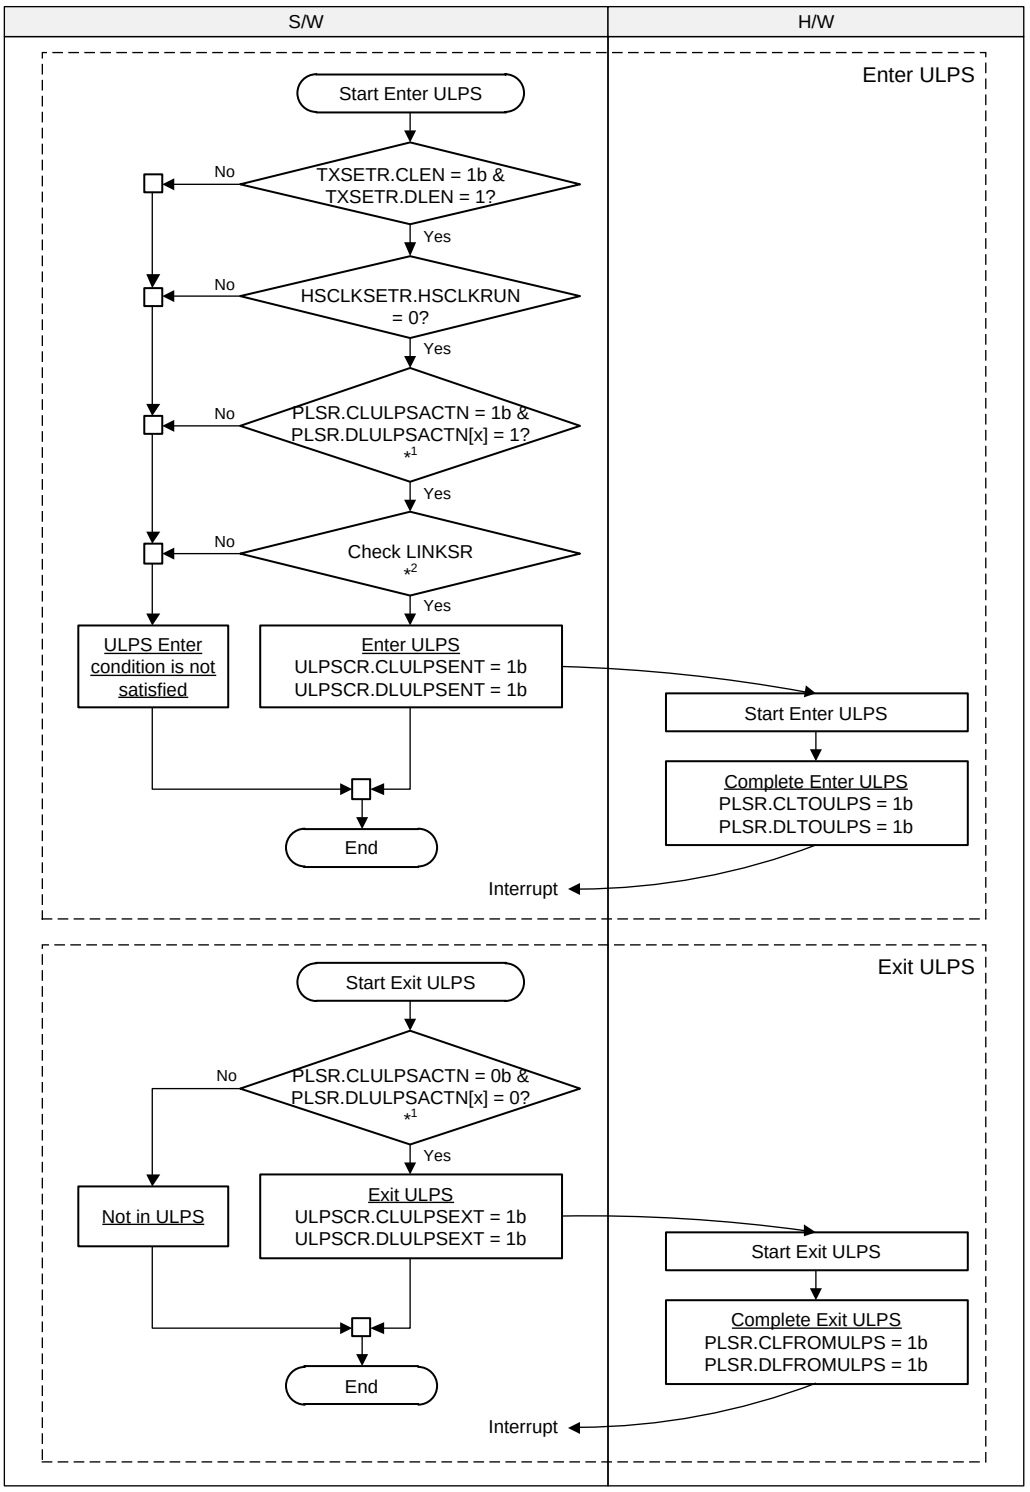
Note 2. (SQCHRUN0 = 0b and SQCHRUN1 = 0b and VICHRUN1 = 0b and HSBUSY = 0b and LPBUSY = 0b)?

Figure 9.5-14 Enter/Exit of ULPS (Data Lane)



Note 1. (SQCHRUN1 = 0b and VICHRUN1 = 0b and HSBUSY = 0b)?

Figure 9.5-15 Enter/Exit of ULPS (Clock Lane)



Note 1. Check all enabled data lanes selected by TXSETR.NUMLANEUSE

Note 2. (SQCHRUN0 = 0b and SQCHRUN1 = 0b and VICHRUN1 = 0b and HSBUSY = 0b and LPBUSY = 0b)?

Figure 9.5-16 Enter/Exit of ULPS (Clock and Data Lane)

9.5.3.7 Error Handling

9.5.3.7.1 Error Detection by Peripheral

Peripheral will notify you of the detected error by “Acknowledge and Error Report” packet.

When the DSI-Tx Module receives the “Acknowledge and Error Report” packet, it displays the latest result in the AKEPLATIR register and the accumulated result in the AKEPACMSR register.

When the user receives the “Acknowledge and Error Report” packet, review and change various settings as necessary.

9.5.3.7.2 Error Detection in D-PHY

If the D-PHY detects an error, the DSI-Tx Module sets the corresponding register flag.

The errors supported by the DSI-Tx Module are as follows. For details on the error, refer to Annex A Logical PHY-Protocol Interface Description of MIPI Alliance Specification for D-PHY Version 1.2.

- ErrEsc
- ErrSyncEsc
- ErrControl
- ErrContentionLP0
- ErrContentionLP1

If the user detects this error, perform Software Reset (**9.5.3.2.1 Software Reset**) and Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

When an ErrContentionLP0 / ErrContentionLP1 error occurs, be sure to execute Software Reset (**9.5.3.2.1 Software Reset**). At that time, write 1b to RSTCR.FCETXSTP, wait for the time when Contention is resolved (equivalent to LRX-H_TO), and then write 0b to RSTCR.FCETXSTP. Also, if necessary, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**).

For more information on returning from Contention, see Section 7.2, Contention Detection and Recovery in the MIPI Alliance Specification for Display Serial Interface 1.3.1.

9.5.3.7.3 Timeout Error

The DSI-Tx Module has the timers defined in Section 7.2.2, Contention Recovery Using Timers of the DSI standard and the DSI-Tx Module original timers.

- Timers defined in DSI Specification
  - HS TX Timeout Error (HTX_TO)
  - LP-RX Host Processor Timeout Error (LRX-H_TO)
  - Turnaround Acknowledge Timeout Error (TA_TO)
- Original Timers
  - Rx Response Timeout Error

(1) HS TX Timeout (HTX_TO) Error

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

If this error is detected, the setting value of HSTXTOSETR.HTXTO may be too small. When multiple channels are operating at the same time, multiple HS packets may be concatenated and transmitted continuously by HS. Set HSTXTOSETR.HTXTO to a value larger than the HS transmission period.

(2) LP-RX Host Processor Timeout (LRX-H_TO) Error

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

If this error is detected, the setting value of LRXHTOSETR. LRXHTO may be too small.

There is a possibility of receiving multiple packets such as response packet and “Acknowledge and Error Report” packet in one reception.

Measure the time from the completion of the Bus Turnaround sequence from Host to Peripheral (LP-11 drive detection by Peripheral) to the completion of Bus Turnaround sequence from Peripheral to Host (LP-11 drive start by Host).

Check the Peripheral specifications, and set the value of DSI_LPCLK cycle count (rounded up) + X or more corresponding to the above time in the LRXHTOSETR.LRXHTO register.

(3) Turnaround Acknowledge Timeout (TA_TO) Error

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**) and Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

If this error is detected, the setting value of TATOSETR.TATO may be too small.

Measure the time from the start of the Peripheral Bus Turnaround sequence (LP-10 drive by the Host) to the completion (LP-11 drive detection by the Peripheral) from the Host.

Check the Peripheral specifications and set the value of DSI_LPCLK cycle count (rounded up) + X or more corresponding to the above time in the TATOSETR.TATO register. This error also occurs if the Peripheral does not support bidirectional communication.

(4) Rx Response Timeout Error

Refer to the Peripheral Response Timeout Error (**(a) Peripheral Response Timeout Error**) for more information.

9.5.3.7.4 Rx Related Error in Sequence Operation

(1) Rx Packet Related Error in Sequence Operation

The following describes the received packet error detected by the DSI-Tx Module.

Detects up to one error per packet. (However, ECC 1bit Error may occur at the same time as other errors.)

Errors are determined in the following order:

Peripheral Response Timeout Error, Malformed Packet Error, ECC Error, Unexpected Packet Error, WC Error, CRC Error, Nothing Return Error

(a) Peripheral Response Timeout Error

RXSR.PRESPTOERR is set to 1b if the BTA does not start receiving packets or triggers within the time set in the register after the bus right transitions from Host to Peripheral.

If this error is detected, packets and triggers will not be received until the bus right transitions from Peripheral to Host.

[Timeout time setting register]

- Peripheral Response Timeout value for BTA-only is set by PRESPTOBTASETR.
- Peripheral Response Timeout value for LP Read with BTA is set by PRESPTOLPSETR.PRESPTOLPR.
- Peripheral Response Timeout value for LP Write with BTA is set by PRESPTOLPSETR.PRESPTOLPW.
- Peripheral Response Timeout value for HS Read with BTA is set by PRESPTOHSSETR.PRESPTOHSR.
- Peripheral Response Timeout value for HS Write with BTA is set by PRESPTOHSSETR.PRESPTOHSW.

If this error is detected, the register setting value may be too small, Measure the time from the completion of the Bus Turnaround sequence of Peripheral from the Host (LP-11 drive detection by Peripheral) to the completion of reception of the first byte of the packet or the completion of trigger reception. After checking the Peripheral specifications, set the value of DSI_LPCLK cycle number (rounded up) + X or more corresponding to the above time.

If this error occurs, perform the necessary processing such as resending the previous command.

(b) Malformed Packet Error

If a packet less than 4 bytes is received, RXSR.MLFERR is set to 1b. Since there is an error in the received data, perform necessary processing such as resending the previous command.

(c) ECC Error

ECC generation is required for DSI v1.3.1 standard compliant Peripherals. However, since ECC generation is an option for “earlier revision of DSI Peripherals”, the DSI-Tx Module can select whether to enable or disable ECC checks using DSISETR.ECCEN.

When connecting to a Peripheral that does not support ECC generation, disable ECC checking by setting DSISETR.ECCEN to 0b.

(d) ECC 1-bit Error

If an ECC 1bit error is detected, RXSR.ECCERR1B is set to 1b and 1bit error correction is performed.

The DSI-Tx Module automatically corrects the error and restores the normal packet header, so the subsequent packet reception processing continues.

(e) ECC Multi-bit Error

If an ECC multi-bit error is detected, RXSR.ECCERR is set to 1b and the received packet is discarded. If this error occurs, perform the necessary processing such as resending the previous command.

(f) Unexpected Packet Error

If an Unexpected Packet is received, RXSR.UEXPKTERR is set to 1b.

When this error occurs, the packet header is stored in the RXRSSxR register, and the subsequent reception processing is stopped until the bus right transitions from Peripheral to Host.

The DSI-Tx Module determines the following packets as Unexpected Packets.

- Received packets in which Data Type field of the packet header is “Reserved” as described in Table 23 Data Types for Peripheral-Sourced Packets of the DSI standard
- Received packets other than “Acknowledge and Error Report” packet and “EoTp” in BTA after sending non-read packet
- Received packets other than “Acknowledge and Error Report” packet and “EoTp” when the BTA is BTA only
- BTA after sending read packet receives response packet and then receives response packet again

(g) WC Error

RXSR.WCERR is set to 1b if a long packet with payload data shorter than the WC value is received.

When this error occurs, there is an error in the payload data length, but the payload data is not discarded due to this error, and the packet header is stored in the RXRSSxR register.

Since there is an error in the received data, perform necessary processing such as resending the previous command.

(h) CRC Error

To connect to Peripherals that do not support CRC generation, the DSI-Tx Module can enable or disable CRC checking for each Virtual Channel using DSISETR.CRCEN[3:0]. When connecting to a Peripheral that does not support CRC generation, disable the CRC check by setting the corresponding bit in DSISETR.CRCEN to 0b.

When this error occurs, there is an error in the payload data, but the payload data is not discarded due to this error, and the packet header is stored in the RXRSSxR register.

If this error occurs, perform the necessary processing such as resending the previous command.

(i) Nothing Return Error

RXSR.NORETERR is set to 1b if the BTA transitions the bus right from Host to Peripheral and then does not receive packets or triggers and the bus right transitions from Peripheral to Host.

If this error occurs, perform the necessary processing such as resending the command. If the error recurs, perform Software Reset (**9.5.3.2.1 Software Reset**) and Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) as necessary.

(2) Rx Long Packet Data Payload Related Error in Sequence Operation

(a) Maximum Return Packet Size Error

RXSR.MAXRPSZERR is set to 1b if the WC value of the received long packet is greater than the DSISETR.MRPSZ setting.

When this error occurs, the packet header is stored in the RXRSSxR register and the payload data is discarded.

Although the payload data is discarded, errors related to payload data reception (WC Error, CRC Error) are detected.

If this error occurs, set DSISETR.MRPSZ to a value greater than or equal to the value set by the Set Max Return Packet Size command.

If you still get this error despite the correct settings, consider setting DSISETR.MRPSZ to a larger value because Peripheral is returning a large packet in violation of the DSI standard.

(b) Internal Bus Error

If Internal Bus Write detects an error, RXSR.IBERR is set to 1b.

Review the settings of SQCHxDSCyDR.LADDR and DSISETR.MRPSZ.

(c) Rx Buffer Overflow Error

If the following Rx Buffer Overflow Error is detected, RXSR.RXOVFERR is set to 1b.

In the case of SQCHxDSCyBR.DTSEL = 00b Packet Payload Data register Mode:

- The Rx Payload Data is over 16 Byte length

In the case of SQCHxDSCyBR.DTSEL = 01b Long Packet data use memory space Mode:

- RAM Overflow for the LP Rx is detected

If this error occurs, execute the following.

In the case of Data register Mode:

- Change to use memory space Mode
- Change peripheral device’s Maximum Return Packet Size as not over 16 bytes

In the case of memory space Mode:

- Change peripheral device’s Maximum Return Packet Size smaller
- Make Internal Bus faster

9.5.3.7.5 Tx Packet Related Error in Sequence Operation

(1) Internal Bus Error

If Internal Bus Read detects an error, SQCHxSR.TXIBERR is set to 1b. Review the settings of SQCHxDSCyAR.DATA1 / 0b and SQCHxDSCyDR.LADDR.

(2) Packet too Big Error

SQCH1SR.PKTBIGERR is set to 1b if the Sequence Operation packet is of a size that cannot be sent within the BLLP period of the first horizontal line of the Video-Input Operation.

If this error occurs, the Sequence Operation packet will not be sent until the Video-Input Operation is completed.

9.5.3.7.6 Error in Video-Input Operation

(1) Video-Input Buffer Overflow Error

VICH1SR.VBUFOVF is set to 1b if Overflow of Video-Input Buffer is detected.

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). Also, take necessary measures such as increasing the frequency of TxWordClkHS (hsclk) and decreasing the VICH1SET1R.DLY value. In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

(2) Video-Input Buffer Underflow Error

If the Video-Input Buffer Underflow is detected, VICH1SR.VBUFUDF is set to 1b.

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). Also, take necessary measures such as lowering the frequency of TxWordClkHS (hsclk) and increasing the VICH1SET1R.DLY value. In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

(3) Timing Error

VICH1SR.TIMERR is set to 1b if no video packets (including Sync Event packets) were sent during the Video-Input Operation at the intended timing.

If this error occurs, perform Software Reset (**9.5.3.2.1 Software Reset**). Also, take necessary measures such as reviewing the setting value of LPTRNSTSETR.GOLPBKT. In addition, perform Reset Trigger Transmission (**9.5.3.4.4 Reset Trigger Transmission**) if necessary.

9.5.4 Interrupts

9.5.4.1 Interrupt List

Interrupts can be divided into the following categories:

Table 9.5-7 Interrupt Signals (1/2)

Interrupt Signal	Category	Interrupt Condition	Interrupt Source Register
dsi_int_sq0	Sequence operation channel 0 interrupt	Receive Acknowledge and Error Report Packet in Sequence Operation BTA	SQCH0SR.RXAKE
		Receive Correctable Error in Sequence Operation BTA	SQCH0SR.RXCORERR
		Receive Packet Data Error in Sequence Operation BTA	SQCH0SR.RXPKTDFAIL
		Receive Fail Error in Sequence Operation BTA	SQCH0SR.RXFAIL
		Receive Fatal Error in Sequence Operation BTA	SQCH0SR.RXFATALERR
		Transmit Internal Bus Error in Sequence Operation	SQCH0SR.TXIBERR
		Descriptor Finished by Setting in Sequence Operation	SQCH0SR.ADESFIN
		Descriptor's All Action Finished in Sequence Operation	SQCH0SR.AACTFIN
dsi_int_sq1	Sequence operation channel 1 interrupt	Receive Acknowledge and Error Report Packet in Sequence Operation BTA	SQCH1SR.RXAKE
		Receive Correctable Error in Sequence Operation BTA	SQCH1SR.RXCORERR
		Receive Packet Data Error in Sequence Operation BTA	SQCH1SR.RXPKTDFAIL
		Receive Fail Error in Sequence Operation BTA	SQCH1SR.RXFAIL
		Receive Fatal Error in Sequence Operation BTA	SQCH1SR.RXFATALERR
		Transmit Internal Bus Error in Sequence Operation	SQCH1SR.TXIBERR
		Transmit Packet is too big Error in Sequence Operation	SQCH1SR.PKTBIGERR
		Descriptor Finished by Setting in Sequence Operation	SQCH1SR.ADESFIN
		Descriptor's All Action Finished in Sequence Operation	SQCH1SR.AACTFIN
dsi_int_vin1	Video-Input operation channel 1 interrupt	Transmit Buffer Overflow in Video-Input Operation	VICH1SR.VBUFOVF
		Transmit Buffer Underflow in Video-Input Operation	VICH1SR.VBUFUDF
		Transmit Timing Error in Video-Input Operation	VICH1SR.TIMERR
		Video-Input Signal Accept Ready	VICH1SR.VIRDY
		Video-Input Operation Stopped	VICH1SR.STOP
		Video-Input Operation Started	VICH1SR.START

Table 9.5-7 Interrupt Signals (2/2)

Interrupt Signal	Category	Interrupt Condition	Interrupt Source Register
dsi_int_rcv	DSI Packet Receive interrupt	Receive Acknowledge and Error Report Packet	RXSR.RXAKE
		Single-bit ECC Error	RXSR.ECCERR1B
		Maximum Return Packet Size Error	RXSR.MAXRPSZERR
		No Return Error	RXSR.NORETERR
		Peripheral Response timeout	RXSR.PRESPTOERR
		Receive Buffer overflow error	RXSR.RXOVFERR
		Internal Bus Error detect on data save	RXSR.IBERR
		CRC Error	RXSR.CRCERR
		Word Count Error	RXSR.WCERR
		Unexpected Packet Error	RXSR.UEXPKTERR
		Multi-bit ECC Error	RXSR.ECCERR
		Malformed Error	RXSR.MLFERR
		External Tearing Effect	RXSR.EXTTEDET
		Receive ACK trigger	RXSR.RXACK
		Receive Tearing Effect trigger	RXSR.RXTE
		Receive Reset trigger	RXSR.RXRTRG
		Receive Unknown-5 trigger	RXSR.RXUK5TRG
		Receive EoTp	RXSR.RXEOTP
		Receive Response packet	RXSR.RXRESP
		Turnaround Acknowledge Timeout	RXSR.TATO
		LP-RX Host Processor Timeout	RXSR.LRXHTO
		BTA request End	RXSR.BTAREQEND
dsi_int_ferr	DSI Fatal Error interrupt	Contention Error LP1	FERRSR.ERRCLP1
		Contention Error LP0	FERRSR.ERRCLP0
		Control Error	FERRSR.ERRCTRL
		Sync Escape Error	FERRSR.ERRSYNESC
		Error Escape	FERRSR.ERRESC
		Turnaround Acknowledge Timeout	FERRSR.TATO
		LP-RX Host Processor Timeout	FERRSR.LRXHTO
		HS TX Timeout	FERRSR.HTXTO
dsi_int_ppi	DSI D-PHY PPI interrupt	Data Lanes return from ULPS	PLSR.DLFROMULPS
		Data Lanes go to ULPS	PLSR.DLTOULPS
		Clock Lane change HS to LP	PLSR.CLHS2LP
		Clock Lane change LP to HS	PLSR.CLLP2HS
		Clock Lanes return from ULPS	PLSR.CLFROMULPS
		Clock Lanes go to ULPS	PLSR.CLTOULPS
		Data Lane 0 change TX to RX	PLSR.DL0TX2RX
		Data Lane 0 change RX to TX	PLSR.DL0RX2TX

The interrupt signal consists of combination logic. The interrupt signal from a Status Register is enabled by the signal related Interrupt Enable Register. These interrupt signals are bound by OR logic.

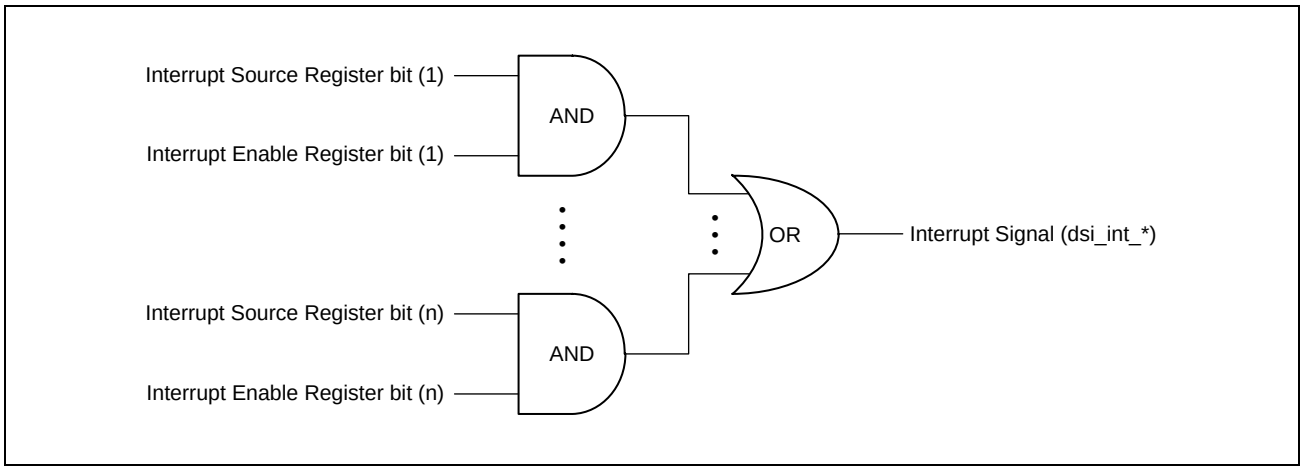


Figure 9.5-17 Interrupt Signal Output

9.5.5 Usage Notes

9.5.5.1 Restriction and Notes

In this section, the restriction and notes on the DSI-Tx Module are described.

Table 9.5-8 Note and Restriction List

Items	Restriction and Notes
TxWordClkHS	Each Lanes TxWordClkHS must be synchronized. The DSI-Tx Module uses Data Lane0 TxWordClkHS as hsclk.
Unused input signals	All unused input signals must be input 0, except following signals. Following signals must be input 1, when they are not used. • ppi_dl1_ulpsactivenot • ppi_dl2_ulpsactivenot • ppi_dl3_ulpsactivenot
TxReadyHS assert	D-PHY must be asserted TxReadyHS within ($2^{RELDSI2TX_LNK_RAM_WORD_DEPTH}$ – 2) hsclk cycles after TxRequestHS asserted.

SECTION 9 IMAGE

9.6 H.265/H.264 Multi Codec (VCD)

This section describes the functions of the H.265/H.264 multi codec (VCD).

9.6.1 Functional Overview

The VCD is a video codec that supports H.264 and H.265. It has the features shown below.

- H.265/HEVC MP (main profile) supported
  - H.265/HEVC main profile at level 5
- H.264/AVC constrained baseline/main/high profile supported
  - High profile at level 4.2,
  - Main profile at level 4.2,
  - Baseline profile at level 4.2
- H.265 encoding and decoding performance
  - 3840 × 2160 encoding, 3840 × 2160 decoding
- H.264 encoding and decoding performance
  - 1920 × 1080 p encoding, 1920 × 1080 p decoding
- Equipped with lossless compression and reference image buffer to reduce memory bandwidth

9.6.2 Connection Configuration

Figure 9.6-1 shows the connection configuration for the H.265/H.264 multi codec (VCD).

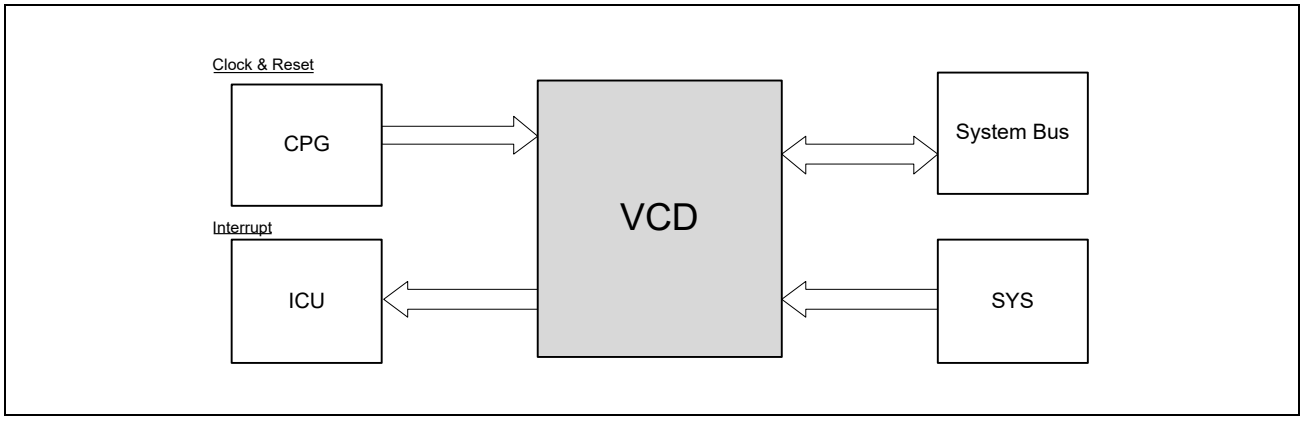

Figure 9.6-1 Configuration Diagram of VCD Connection

9.6.3 Operation Procedure

Use the driver provided by Renesas to operate this unit.

SECTION 9 IMAGE

9.7 3D Graphics Engine (GE3D)

9.7.1 Overview

This LSI includes the Arm Mali-G52 GPU as a 3D Graphics Engine (GE3D). The Arm Mali-G52 GPU is a graphics acceleration platform that is based on open standards. It supports 2D graphics, 3D graphics, and General Purpose computing on GPU (GPGPU).

9.7.1.1 Features

The GE3D has the following features.

- One double-pixel shader core and two execution engine.
- 64 Kbytes L2 cache
- A programmable architecture.
- An API feature set with support for shader-based and fixed-function graphics APIs.
- Anti-aliasing capabilities.
- An effective core for General Purpose computing on GPU (GPGPU) applications.
- High memory bandwidth and low power consumption for 3D graphics content.
- Latency tolerance.
- Compressed texture formats.
- Coherency aware interconnects for system memory and resource sharing.

The GE3D and software support compute and graphics API standards.

— The GE3D supports these compute API standards:

OpenCL 2.0 Full Profile.

— The GE3D supports these graphics API standards:

OpenGL ES 1.1, 2.0, 3.0, 3.1 and 3.2.

9.7.1.2 Block Diagram

The GE3D contains the shader processor core and associated blocks, including the tiler, the memory-management unit, and the level 2 cache memory subsystem.

Figure 9.7-1 shows a block diagram.

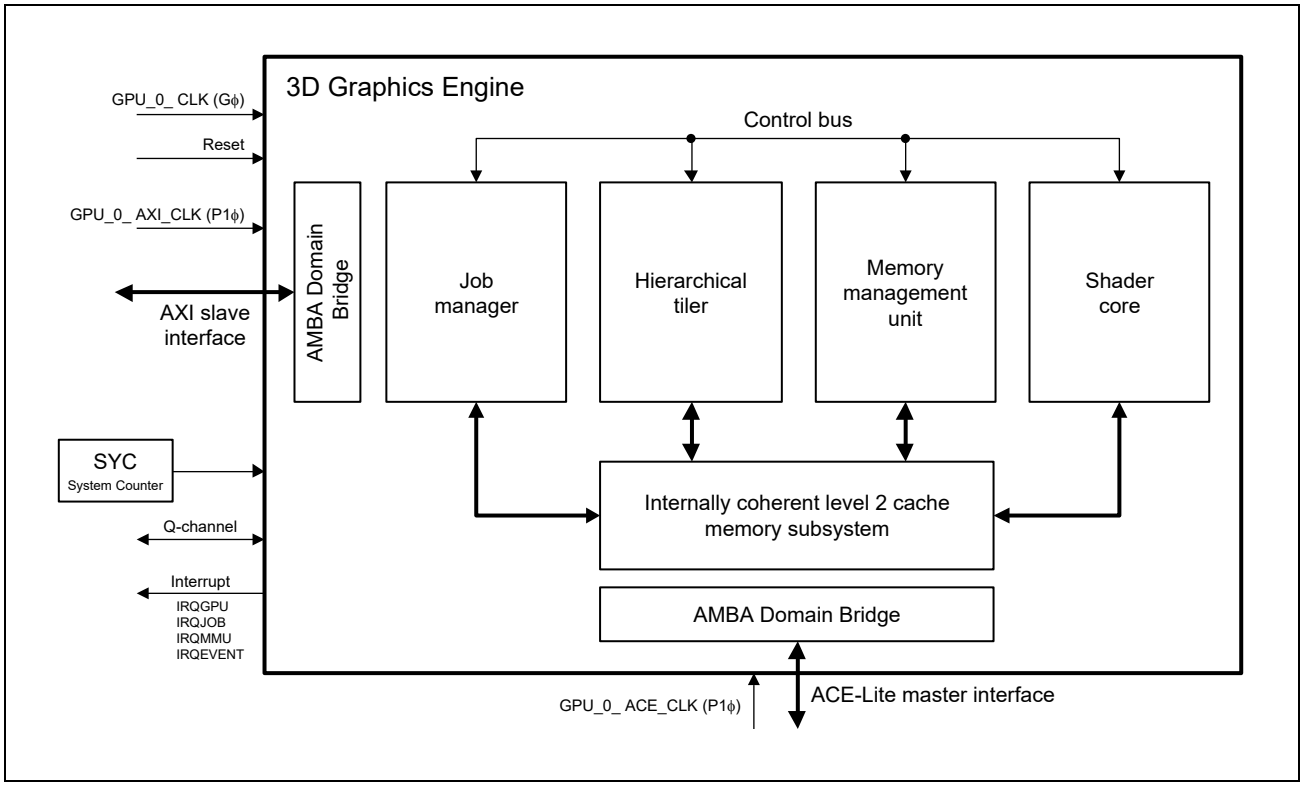

Figure 9.7-1 Block Diagram

The GE3D uses a centralized hardware resource manager, called the job manager, that controls the internal GPU functions.

The application software runs on the application processor. When it requires graphics to be displayed on screen, it uses the graphics device driver to send a graphics job to the GE3D. In the GE3D, the job manager receives the job, interprets it, and then sends a series of graphics tasks to the internal functional units.

The job manager issues and sends commands to specific functional blocks in the GE3D.

- The shader core is the main processing engines of the GE3D. The shader core carries out all the rendering and computation operations.
- The tiler creates lists of all the objects in a scene, so that the shader core processes the objects efficiently.
- The memory management unit performs virtual address to physical address translation of external bus interface accesses.
- The Level 2 cache memory subsystem provides caching for all internal master blocks. It also supports cache coherency for caches in the shader cores. The L2 cache sits between the internal master blocks and the external interconnect. All transactions go through the cache. If the cache cannot service an internal transaction, it performs an external transaction to read or write data.

9.7.1.3 External Pins

In 3D Graphics Engine, there are no external pins.

9.7.1.4 Register Configuration

Base address of registers is allocated to 0_1485_0000h. The address range is 64 KB (0_1485_0000h - 0_1485_FFFFh).

9.7.1.5 Usage Note

Renesas does not provide technical support for users to program GE3D registers directly. Renesas provides users with drivers to program GE3D. GE3D supports OpenGL ES as a graphics API. When drawing graphics, control according to this API.

9.7.1.6 Starting SYC

When using GE3D, it is necessary to supply the clock to the SYC (system counter) and release the reset to keep it running.

SECTION 9 IMAGE

9.9 Video Signal Processor (VSP)

VSP consist of VSPI and FCPVI modules. Refer the detail for **9.9.1 VSPI** and **9.9.2 FCPVI**.

The VSPI supports image processing by memory to memory such as super resolution, sharpness, up/down scaling, look-up tables, histogram and rotation/flipping.

The Clock Divider divides clock from CPG and generates clk_m, clk_a, and clk_p clocks which are used by VSPI and FCPVI.

The ADB400 and APB Bridges are used for bridge for clock domain crossing between CPG generated clock and Clock Divider generated clocks.

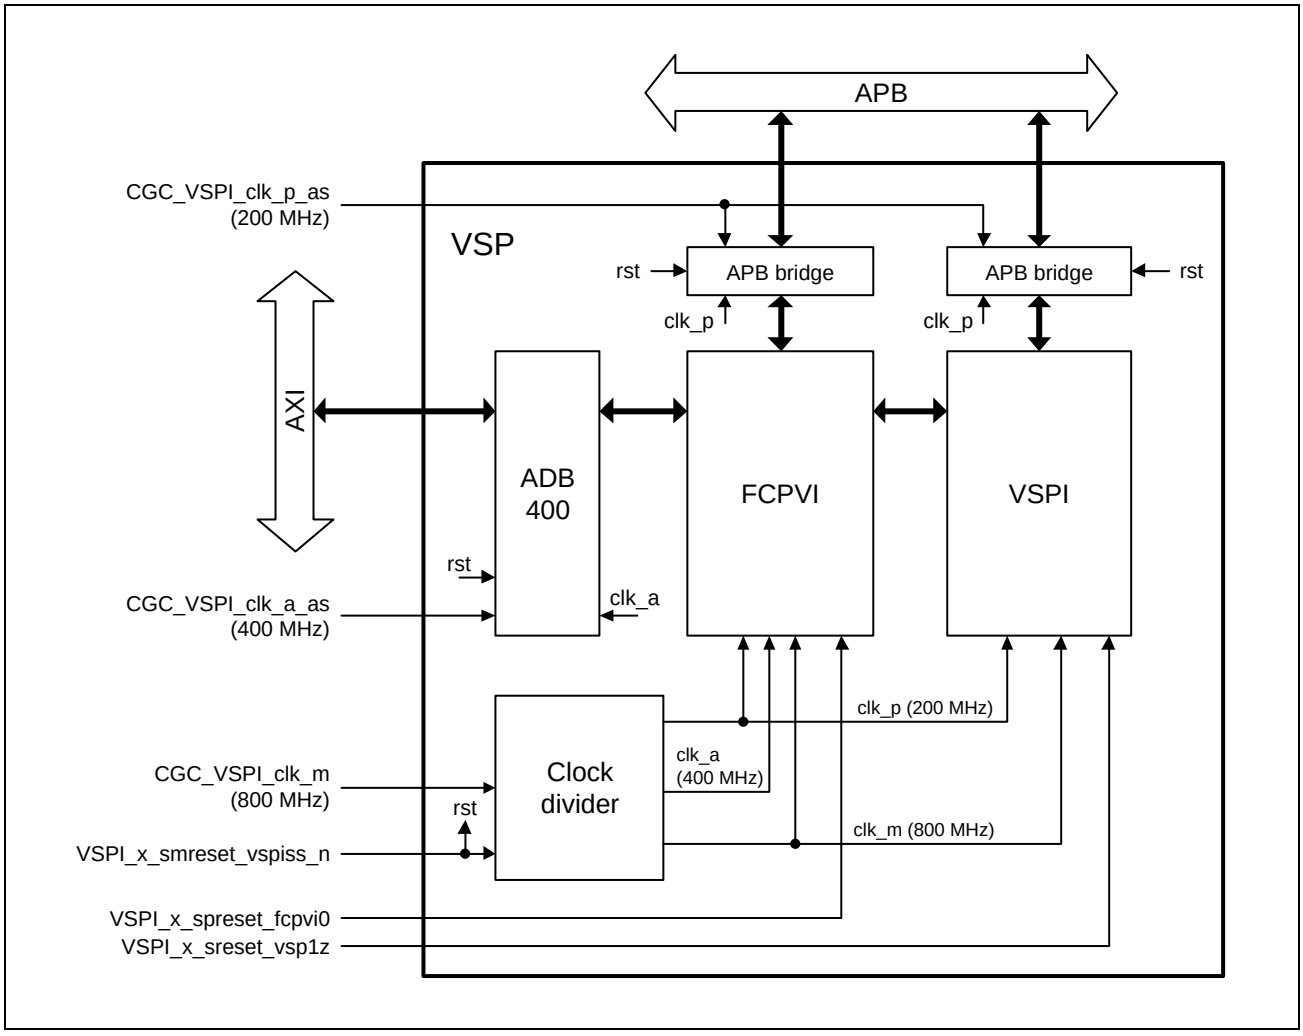

Figure 9.9-1 VSP Modules Configuration

9.9.1 VSPI

The VSPI supports image processing by memory to memory such as super resolution, sharpness, up/down scaling, look-up tables, histogram and rotation/flipping.

9.9.1.1 Features

- Supports various data formats and conversion
  - Supports YCbCr444/422/420, RGB, α RGB, α plane.
  - Color space conversion and changes to the number of colors by dithering
  - Color keying
  - Supports combination between pixel alpha and global alpha.
  - Supports generating pre multiplied alpha.
- Video processing
  - Supporting 3840 pixels × 2160 lines
  - Up and down scaling with arbitrary scaling ratio
  - Super resolution processing
  - Sharpness filter
  - 1D look up table
  - 3D look up table
  - Supports Hue, brightness, and saturation format for look up table or/and histogram.
  - 1D histogram
  - 2D histogram
  - Image rotation with unit of 90-degree, vertical and horizontal flipping
- Performance of VSPI*[1]
  - 500 Mpix/s process rate (processing rate*[2]) × 1 set

Note 1. This performance cannot be realized in some condition. Detail performance is shown in **9.9.1.5.5 (1) Performance of VSPI**.

Note 2. When scale-down is applied to input image, processing rate is input rate. When scale-up is applied to input image, processing rate is output rate. When no-scaling is applied, processing rate is input rate.

9.9.1.1.1 Block diagram of VSPI

Figure 9.9-2 shows the configuration of VSPI module.

All the registers and functions which doesn't appears in the each VSPI unit's block diagram should be treated as un-implemented functions in each VSPI unit. Do not set any registers related to the un-implemented function without any statement.

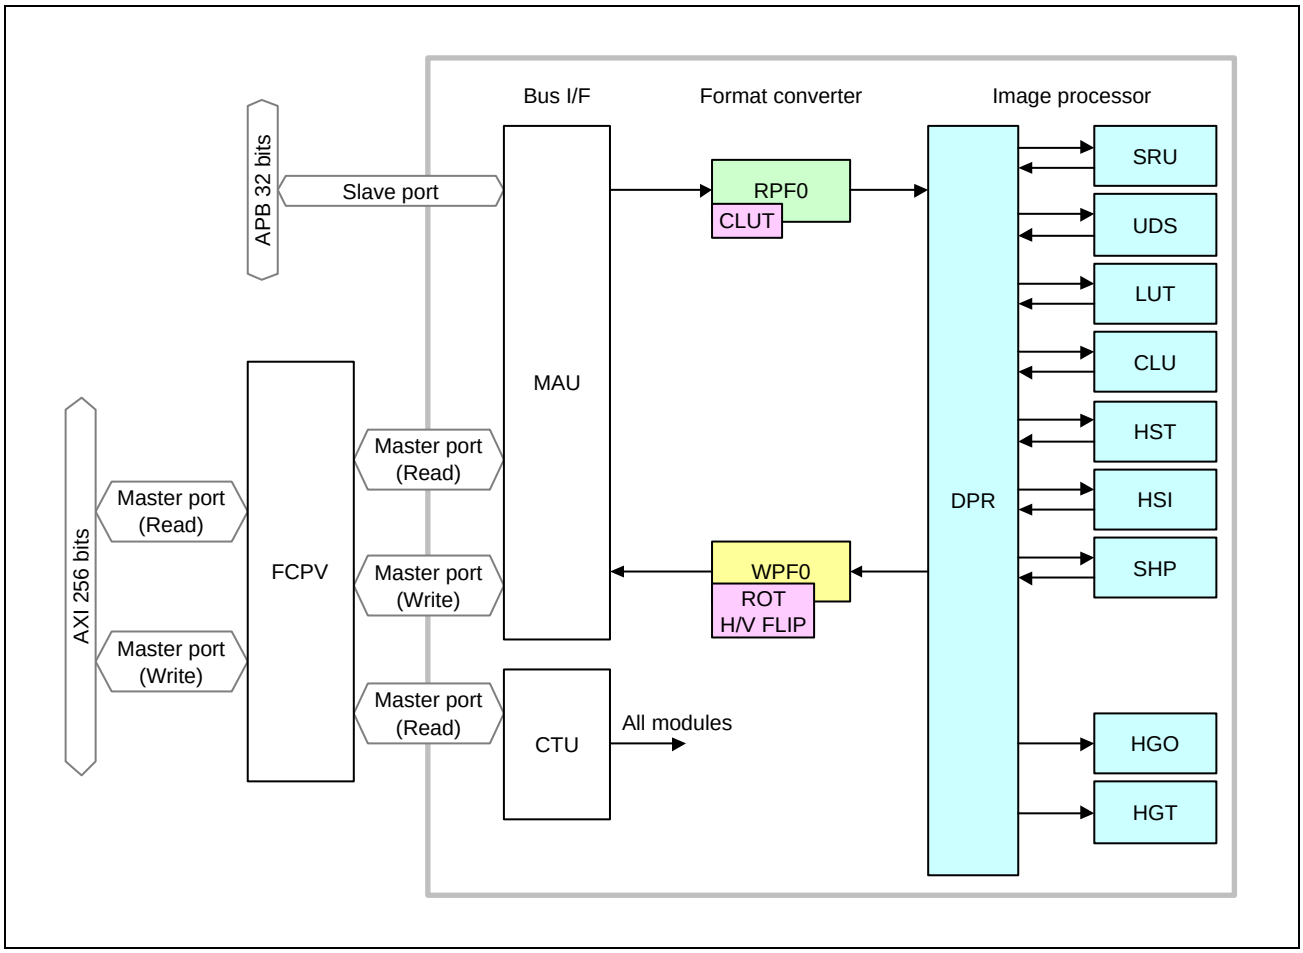

Figure 9.9-2 VSPI Module Configuration

The following descriptions give an overview of the block function shown in **Figure 9.9-2**.

The operation of these functions is determined by the register setting explained in **9.9.1.3 Register Description.** Refer to **9.9.1.3 Register Description** for the relationship between the register setting and the functional behavior.

9.9.1.1.2 Memory Access Unit (MAU)

The VSPI applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and VSPI necessary for this operation is done by the MAU, which works as the bus master, according to the register settings. The MAU executes this data transfer between the external memory and VSPI.

9.9.1.1.3 Command Transfer Unit (CTU)

The VSPI can directly read register parameters for image processing by display lists stored in external memory. The CTU module is a bus interface and controls display lists when the CTU reads display lists as a bus master.

9.9.1.1.4 Read Pixel Formatter (RPF)

The RPF reads image data from the external memory through the MAU, unpacks data according to the specified format, converts the color space, converts the number of colors, executes color keying, ROP operation, Multiply-alpha and OSD processing, and outputs the resultant data to the DPR. The RPF has an input format unpacking unit, an index color expanding unit (OSD-CLUT), a 1-bit mask generator, a raster operation unit (ROP unit),a color keying unit, a color space converter and multiply-alpha. **Figure 9.9-3** shows the processing flow in the RPF.

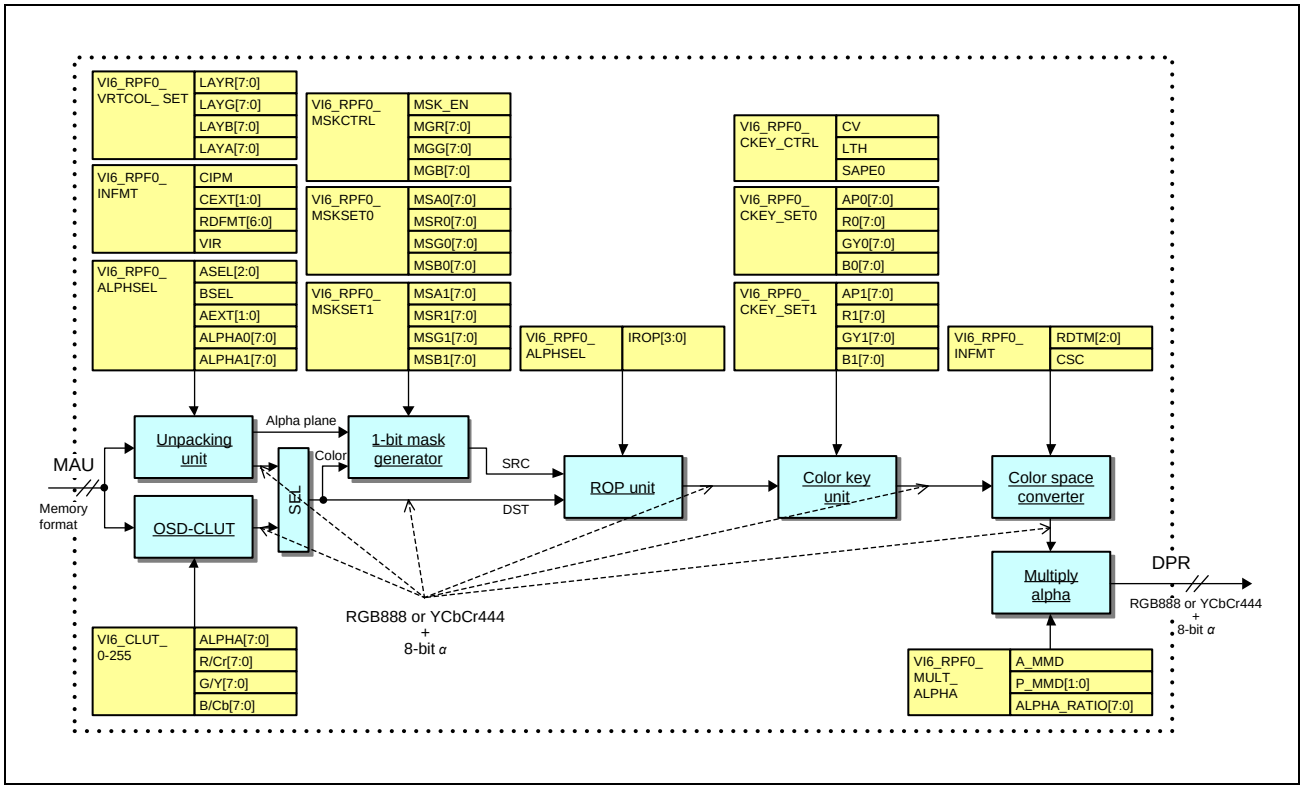

Figure 9.9-3 RPF Processing Flow

The input format unpacking unit and index color expanding unit (OSD-CLUT) expand the image data input from the MAU into the image format for internal processing (YCbCr444 or RGB888), and the 1-bit mask generator generates a 1-bit image mask from the image data expanded through the unpacking unit and OSD-CLUT. Alternately, a 1-bit image mask can be generated from the alpha plane that is different from the picture plane read through the MAU.

The raster operation unit (ROP unit) executes raster operation between the data from the 1-bit mask generator and the image data expanded from the input format, and the color keying unit applies color replacement and specifies the transparent color for the image data input from the ROP unit. The color space converter converts the color space (RGB-YCbCr) of the image data input from the color keying unit as necessary. The multiply-alpha unit multiplies pixel-alpha by specified alpha or/and multiplies image data by pixel-alpha or/and specified alpha.

The implementation of OSD-CLUT depends on the configuration of this LSI.

9.9.1.1.5 Data Path Router (DPR)

The DPR controls the data paths among RPFs, function modules, and WPFs. The DPR selects one of the images input from RPF, outputs it to a function module (SRU, UDS, LUT, CLU, HST, HSI, HGO, HGT, or SHP), and WPF as the destination where the image data processed in the function module will be output. Before output to the WPF, the output from each function module can be input to another function module, which enables multiple image processing functions to be executed continuously without involving the external memory.

9.9.1.1.6 Super Resolution Unit (SRU)

The SRU is a module connected to the DPR, which executes the super resolution processing.

9.9.1.1.7 Up Down Scalar (UDS)

The UDS is a module connected to the DPR, which upscales or downscales the image size. It can also upscale or downscale the alpha value.

9.9.1.1.8 Look Up Table (LUT)

This is a 1D-LUT that converts each of three color components by using a lookup table. The LUT is connected to the DPR and can be used for gamma correction, negative-positive conversion, posterization, and binarization through desired tone curve settings.

9.9.1.1.9 Write Pixel Formatter (WPF)

The WPF is an output module that receives 32 bits image data (YCbCr444 or RGB888 + 8bit-α) from the DPR, converts the color space, number of colors, and format of the data, and outputs the results of VSPI image processing to external memory through the MAU. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

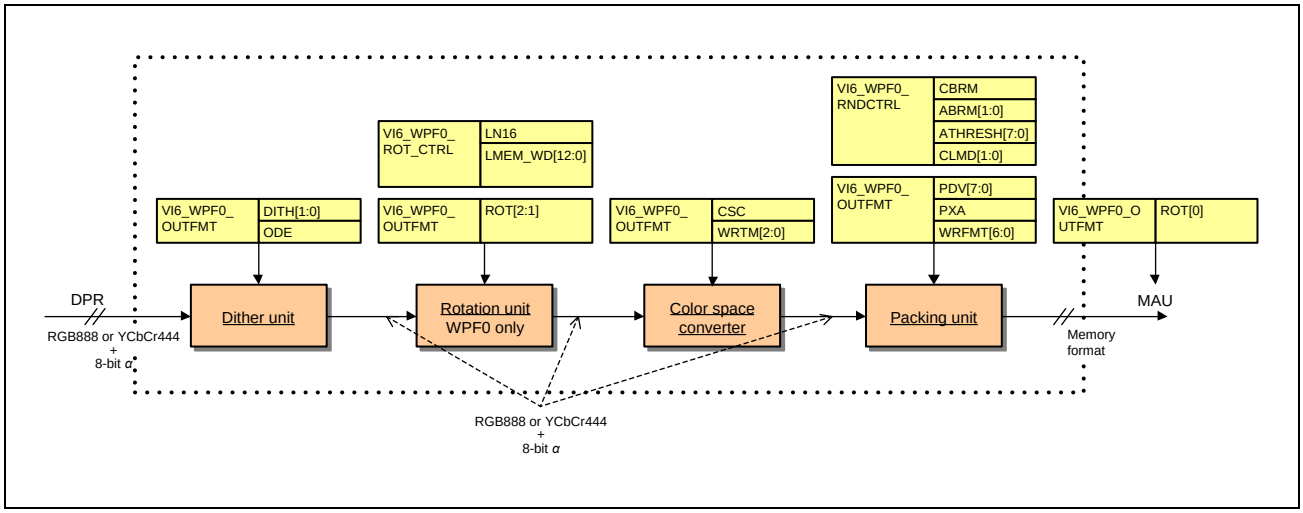

Figure 9.9-4 WPF Processing Flow

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format.

9.9.1.1.10 Cubic Look Up table (CLU)

This is a three-dimensional LUT (3D-LUT) that converts the input three-color-component data into desired three color components by using a lookup table. The 1D-LUT can only control each of three color components separately, but the 3D-LUT can convert a specified color into a different color. The CLU is connected to the DPR and can be used for specific color adjustment, such as correction to memorable color.

9.9.1.1.11 Hue Saturation value Transform (HST)

The HST is a module connected to the DPR, which converts the RGB color space into the HSV color space. The HSV color space can represent a color with the hue, saturation, and value (brightness), and it makes color control through the LUT easier than in the RGB color space.

9.9.1.1.12 Hue Saturation value Inverse transform (HSI)

The HSI is a module connected to the DPR, which converts the HSV color space into the RGB color space. It executes conversion in the direction opposite to that of the HST.

9.9.1.1.13 Histogram Generator-One dimension (HGO)

The HGO is a module connected to the DPR and generates the one-dimensional histogram for the dynamic gamma correction. There is no output port of the image data.

9.9.1.1.14 Histogram Generator-Two dimension (HGT)

The HGT is a module connected to the DPR and generates the two-dimensional histogram for the dynamic color correction. There is no output port of the image data.

9.9.1.1.15 SHarPness (SHP)

The SHP is a module connected to the DPR, which sharpen or un-sharpen the image.

9.9.1.1.16 Detail Function

Table 9.9-1 Detail Function of VSPI (1/4)

• Image Data Transfer Function			
Bus interface	Protocol		AXI 256 bits through FCPVI
	Data alignment	Conversion method	Byte, Word, LW, or LLW data swapping
		Channel	Data alignment can be specified separately for each input/output channel
Image memory	Input	Address setting	1-byte units
	Output	Address setting	1-byte units
		Memory area	Images can be written to the same memory area where the master layer is stored. Note the restrictions shown in **Table 9.9-2**.
YCbCr memory storage format			Interleaved, planar, or semi-planar
• Display list/Extended Display List Transfer Function			
Bus interface	Protocol		AXI 256 bits through FCPVI
	Data alignment	Conversion method	Byte, Word, LW data swapping
		Channel	Data alignment can be specified separately for display list and each entry of extended display list
Data memory	Load	Address setting	8-byte units
	Store	—	Not available

Table 9.9-1 Detail Function of VSPI (2/4)

• Read Pixel Formatter (RPF)			
Number of channels			One channel (RPF0)
Image format	Input	RGB	RGB888, RGB565, RGB666, αRGB8888, αRGB4444, αRGB1555, α plane (8 bpp, 1 bpp)
		YCbCr	YCbCr4:4:4/YCbCr4:2:2/YCbCr4:2:0 α plane (8 bpp, 1 bpp)
		Maximum size	8190 × 8190 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to **9.9.1.5.2 Input Image Size**.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to **9.9.1.5.2 Input Image Size**.
		Size setting unit	• YCbCr420: 2-pixel units both horizontally and vertically. • YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color keying	Color replacement	Compared data	RGB888 or Y
		Replaced data	αRGB8888 or αYCbCr
		Comparison Mode	Matched color mode
	Transparent color	Compared data	RGB888 or Y
		Replaced data	α
		Comparison Mode	Matched color mode, Luma threshold mode
OSD/CLUT	Format	Memory storage format	8 bpp
		Image format	αRGB32 or αYCbCr32
Raster operation	ROP2 (within input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	ROP2 operation between the 1-bpp α plane and RGB/YCbCr data. Note that 1-bpp α is converted to αRGB888 or αYCbCr4:4:4.
Color space conversion	RGB to YCbCr	Conversion expression	• RGB (0, 255) to BT.601 (16, 235/240) • RGB (0, 255) to BT.709 (16, 235/240) • RGB (0, 255) to BT.601 (0, 255) • RGB (16, 235) to BT.709 (16, 235/240)
	YCbCr to RGB		• BT.601 (16, 235/240) to RGB (0, 255) • BT.709 (16, 235/240) to RGB (0, 255) • BT.601 (0, 255) to RGB (0, 255) • BT.709 (16, 235/240) to RGB (16, 235)
Changing number of colors	Reducing RGB color depth	Target format	RGB666, RGB565, RGB555, RGB444, or RGB332
	Increasing RGB color depth		Padded with 0. Copied from the most significant bits.
	YCbCr444 generation		CbCr copying or CbCr vertical copying and horizontal interpolation.
Multiply-alpha function	Fade-alpha		Available for straight pixel and pre-multiplied pixel.
	Generate pre-multiplied alpha		
Virtual display	Color format		αRGB8888 or αYCbCr4:4:4 single-color
	Display size		Same as the size of the input channel
α bit count conversion	Input	Bit increase	Padded with 0. Copied from the most significant bits.

Table 9.9-1 Detail Function of VSPI (3/4)

• Write Pixel Formatter (WPF)			
Number of channels			One channel (WPF0)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555
		YCbCr	YCbCr4:4:4, YCbCr4:2:2, YCbCr4:2:0
		Maximum size	8190 × 8190 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to **9.9.1.5.3 Output Image Size**.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to **9.9.1.5.3 Output Image Size**.
		Size setting unit	• YCbCr420: 2-pixel units both horizontally and vertically. • YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	RGB to YCbCr	Conversion expression	• RGB (0, 255) to BT.601 (16, 235/240) • RGB (0, 255) to BT.709 (16, 235/240) • RGB (0, 255) to BT.601 (0, 255) • RGB (16, 235) to BT.709 (16, 235/240)
	YCbCr to RGB		• BT.601 (16, 235/240) to RGB (0, 255) • BT.709 (16, 235/240) to RGB (0, 255) • BT.601 (0, 255) to RGB (0, 255) • BT.709 (16, 235/240) to RGB (16, 235)
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping
α bit count conversion	Output	Bit reduction	Truncation, rounding, or comparison with threshold (for 1 bpp)
• Video Processing Functions			
Super resolution	Processing method		Processing within one frame
	Scaling ratio		×1 (same size) or ×2
	Arbitrary scaling ratio		Super resolution processing can be combined with the arbitrary ratio scaling function.
	α processing		Fixed α output
Scalar with Arbitrary scaling ratio	Scaling factor		1/16 < scaling factor ≤ 16
	Scaling ratio setting	Expression	1 / [Mant.Frac]
		Precision	Mant = 4 bits, Frac = 12 bits
	α processing		Supported (for 1/4 < scaling factor ≤16)
Sharpness processing	Method		Sharpness or blur is applied in horizontal direction
Rotation/flipping	Rotation function		90, 180 and 270 degree
	Flipping function		Vertical flipping, horizontal flipping
	Combination of rotation and flipping		Supported
	α processing		Supported
Simultaneous processing			All video processing functions and color adjustment functions can be processed simultaneously (the order of function execution is limited).

Table 9.9-1 Detail Function of VSPI (4/4)

• Color Adjustment Function		
1D-LUT	LUT configuration	Independent R/Y, G/Cb, and B/Cr. 256 entries each
3D-LUT	Number of grid points	17 × 17 × 17
HSV color space conversion	RGB to HSV	8 bits each for H/S/V
	HSV to RGB	8 bits each for H/S/V
1D Histogram	Number of bins	• 64 for each color component • 256 for Y component or Max-RGB
2D Histogram	Number of hue areas	6
	Number of bins	32 for each hue area

9.9.1.1.17 Restrictions

When the data output from the VSPI is written back to the same memory area where the input data for the VSPI has been read, the VSPI has the following restrictions.

1. The access order and format on the frame memory are the same between the input pixels and output pixels.
2. Specifying a larger output image size than the input image size, either vertically or horizontally or both vertically and horizontally, is prohibited.
3. When the YCbCr4:2:0 format is input, operation between color components is prohibited.

These restrictions are summarized in **Table 9.9-2**. Refer to the descriptions of the registers related to each restriction.

Table 9.9-2 Restrictions on Use when Output Data is Written Back to Input Data Area

No.	Restriction	Related Registers
Restriction 1	The RPF0 input format and the WPF0 output format should be the same.	VI6_RPF0_INFMT.RDFMT VI6_RPF0_INFMT.VIR
	The RPF0 source image storing address and the WPF0 destination address should be the same.	VI6_RPF0_SRCM_ADDR_*
	The RPF0 source picture memory stride and the WPF0 destination memory stride should be the same.	VI6_RPF0_SRCM_PSTRIDE VI6_RPF0_SRCM_ASTRIDE
	The RPF0 and WPF0 data swapping settings should be the same.	VI6_WPF0_DSWAP
	Super resolution processing with double scale-up by the SRU is prohibited (super resolution processing of the same size is allowed).	VI6_SRU_CTRL0
Restriction 2	Scale-up and color filling by UDS is prohibited.	VI6_UDS_SCALE VI6_UDS_CLIP_SIZE
	The value of scaling filter horizontal and vertical phase registers should be zero in case of using UDS.	VI6_UDS_HPHASE VI6_UDS_VPHASE
	The RPF0 basic read size and extended read size should be the same.	VI6_RPF0_SRC_BSIZE VI6_RPF0_SRC_ESIZE
	Color space conversion is prohibited in RPF0 and WPF0.	VI6_RPF0_INFMT.CSC VI6_WPF0_OUTFMT.CSC
Restriction 3*1	Use of the CLU is prohibited. Make sure that the CLU is not used in DPR routing.	VI6_DPR_CLU_ROUTE.RT
	NOP should be specified for IROP operation.	VI6_RPF0_ALPH_SEL.IROP
	Color keying is prohibited.	VI6_RPF0_CKEY_CTRL.CV

Note 1. When the input format is not YCbCr4:2:0, restriction 3 in not applied.

9.9.1.2 Register Configuration

9.9.1.2.1 Base Address

Below are the base addresses of VSPI has 32 Kbytes address space.

<VSPI0_base>: 00_1605_0000h (5605_0000h*1, 4605_0000h*2)

Note 1. CM33 address space (non-secure)
Note 2. CM33 address space (secure)

9.9.1.2.2 Register/Table Address

Table 9.9-3 shows the VSPI register configuration (represents in relative address).

Table 9.9-3 VSPI Register Configuration

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
VSPI Start Registers 0	VSPI0_VI6_CMD0	0000_0000h	0000h	32
Reserve	-	-	0004h to 000Fh	-
Clock Control Register 0	VSPI0_VI6_CLK_CTRL0	0000_0000h	0010h	32
Clock Control Register 1	VSPI0_VI6_CLK_CTRL1	0000_0000h	0014h	32
Dynamic Clock Stop Control Register	VSPI0_VI6_CLK_DCSWT	0000_0000h	0018h	32
Dynamic Clock Stop Disable Register 0	VSPI0_VI6_CLK_DCSM0	0000_0000h	001Ch	32
Dynamic Clock Stop Disable Register 1	VSPI0_VI6_CLK_DCSM1	0000_0000h	0020h	32
Reserve	-	-	0024h to 0027h	-
Software Reset Register	VSPI0_VI6_SRESET	0000_0000h	0028h	32
Module Reset Enable Register 0	VSPI0_VI6_MRESET_ENB0	0000_0000h	002Ch	32
Module Reset Enable Register 1	VSPI0_VI6_MRESET_ENB1	0000_0000h	0030h	32

HGT Sum Register	VSPI0_VI6_HGT_SUM	0000_0000h	3754h	32
HGT LB Detection Result Register	VSPI0_VI6_HGT_LB_DET	0000_0000h	3758h	32
Reserve	-	-	375Ch to 3768h	-
HGT Histogram Storing Address Register	VSPI0_VI6_HGT_HISTADD	0000_0000h	376Ch	32
HGT Histogram Swapping Register	VSPI0_VI6_HGT_HSWAP	0000_0000h	3770h	32
Reserve	-	-	3774h to 37FBh	-
HGT Parameter Register Reset	VSPI0_VI6_HGT_REGRST	0000_0000h	37FCh	32
Reserve	-	-	3800h to 3DFFh	-
SHP Control Register0	VSPI0_VI6_SHP_CTRL0	0000_0000h	3E00h	32
SHP Control Register1	VSPI0_VI6_SHP_CTRL1	0000_0000h	3E04h	32
SHP Control Register2	VSPI0_VI6_SHP_CTRL2	0000_0000h	3E08h	32
Reserve	-	-	3E0Ch to 3EFFh	-
IP Version Register	VSPI0_VI6_IP_VERSION	0101_1404h	3F00h	32
Reserve	-	-	3F04h to 3FFFh	-
RPF0 OSD-CLUT Table	VSPI0_VI6_CLUTn_TBLp	0000_0000h	4000 + 0004 × p + 0400 × n (n = 0 to 2, p = 0 to 255)h	32

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Reserve	-	-	4700h to 6FFFh	-
LUT table	VSPI0_VI6_LUT_TBL_p	0000_0000h	7000 + 0004 × p (p = 0 to 255)h	32
CLU table address register	VSPI0_VI6_CLU_ADDR	0000_0000h	7400h	32
CLU table data register	VSPI0_VI6_CLU_DATA	0000_0000h	7404h	32

Note: Read only bits or write only bits or read/write bits are mixed in the registers.

Note: Initial value of IP version registers depends on product and Modules. See **9.9.1.3.18 (1) IP Version Register (VI6_IP_VERSION)** for more detail.

9.9.1.3 Register Description

9.9.1.3.1 Notational Conventions for Registers and Bit Fields

This document uses the following notational conventions for the VSPI registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the VI6_CMD0 register is indicated as VI6_CMD0.STRCMD.
3. In each subsection for register description in **9.9.1.3 Register Description**, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
4. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are two registers VI6_RPF_SRC_BSIZE and VI6_RPF_SRC_ESIZE, VI6_RPF_SRC_* indicates both registers.

9.9.1.3.2 Register Classification

The VSPI registers are arranged in the following order; the general control registers to display list control registers control operation of the entire VSPI, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from **9.9.1.3.4 General Control Registers**.

1. General control registers
2. Display list control registers
3. RPF control registers (RPF0)
4. WPF control registers (WPF0)
5. DPR control registers
6. SRU control registers
7. UDS control registers
8. LUT control register
9. CLU control register
10. HST control register
11. HSI control register
12. HGO control registers
13. HGT control registers
14. SHP control registers
15. VSPI internal registers

9.9.1.3.3 Restrictions on Access to Registers and Lookup Tables

The VSPI has control registers and lookup tables. All VSPI registers are writable and readable by only 32 bits unit. To write partial bits in each register, read-modify-write is needed. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the VSPI will not operate correctly.

1. For the read-only bits and reserved bits in all VSPI registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in **9.9.1.2.2 Register/Table Address** are reserved areas and write access is prohibited in these areas.
3. For all registers and lookup tables, except VI6_CMD0, VI6_SRESET, VI6_*IRQ* and two plane registers such as VI6_DL_HDR_ADDR0, and VI6_DL_BODY_SIZE0, modifying register values during operation of the module is prohibited. Modify registers while the corresponding module is stopped. For the operating status of the target module, refer to **9.9.1.4.2 Concept of VSPI Operation Starting and Stopping**.
4. There are three types about General control registers (**9.9.1.3.4 General Control Registers**) and Display List Control Registers (**9.9.1.3.5 Display List Control Registers**) as below.
   - Controlling WPF0 (ex. VI6_CMD0, VI6_SRESET.SRST0)
   - Common setting of WPF0 (ex. VI6_DL_CTRL.AR_WAIT [15:0])

Table 9.9-4 Correspondence between Modules and Register Names

Module Name	Register Name
RPF0	VI6_RPF0_*
WPF0	VI6_WPF0_*
DPR	VI6_DPR_*
SRU	VI6_SRU_*
SHP	VI6_SHP_*
UDS	VI6_UDS_*
LUT	VI6_LUT_CTRL
CLU	VI6_CLU_CTRL
HST	VI6_HST_CTRL
HSI	VI6_HSI_CTRL
HGO	VI6_HGO_*
HGT	VI6_HGT_*

9.9.1.3.4 General Control Registers

(1) VSPI Start Registers 0 (VI6_CMD0)

Access Size : 32 bits
Address : <VSPI0_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	UPDHDR	-	-	-	STRCMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
4	UPDHDR	0h	RW	Reserved state of updating DLH address. UPDHDR can be negated by software reset (VI6_SRESET.SRSTn). [Write]0: NOP 1: Don't set 1 to this bit [Read]0: Not reserved to update DLHeader address and VI6_HGO/HGT_WBUFS. 1: Reserved to update DLHeader address and VI6_HGO/HGT_WBUFS. Set 0 to this bit when STRCMD bit is
3 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	STRCMD	0h	RW	Start reservation of each WPF VSPI has two output channels (WPFs). Two WPFs can be started at the same time. VI6_CMDn.STRCMD controls WPFn. Writing 1 to this bit starts WPFn in VSPI. Set this bit for activation only after all register settings in each output channel have been completed. If WPFn is idle, WPFn starts right after this bit is set to 1. If WPFn is active, writing 1 to this bit reserves starting WPFn operation. Wait to set 1 to VI6_CMDn.STRCMD until this bit is read as 0. VI6_CMDn.STRCMD can be negated by software reset (VI6_SRESET.SRSTn). [Write]0: Start reservation of WPFn is canceled. 1: Start reservation of WPFn is set. [Read]0: Starting VSP is not reserved. 1: Starting VSP is reserved.

The basic concept of image processing operation started by activating the VSPI is shown in **Figure 9.9-5**. The actual data input/output is executed by the MAU, which is the bus interface module, as described in **9.9.1.1.1 Block diagram of VSPI**, but conceptually the RPF works as the data entry point to the VSPI and the WPF works as the data exit point. To process images through the VSPI, the RPF (entrance) and WPF (exit) should be connected and a data path from the RPF to the WPF should be formed.

To connect RPF0 to WPF0, specify RPF0 as the source RPF for WPF0 in VI6_WPF0_SRCRPF, which is a register for WPF0 (refer to **9.9.1.3.7 (1) WPF0-Source-RPF Registers (VI6_WPF0_SRCRPF)**). This setting determines that RPF0 will be started when WPF0 is started through VI6_CMD0.

A data path to execute desired image processing should then be formed between the RPF (entrance) and WPF (exit). To form a data path, connect the necessary function modules in the VSPI between RPF and WPF. This function is provided

by the DPR; specify the information for each module connection in data path routing registers VI6_DPR_*_ROUTE (refer to **9.9.1.3.8 DPR Control Registers**).

After a data path is formed (RPF0 → WPF0) as described above, starting output module WPF0 in the VSPI through VI6_CMDn starts all function modules connected to WPF0 and the desired image processing is executed. According to this design concept, starting a WPF module means starting the VSPI.

Figure 9.9-5 shows an example of a configuration where modules with single input and single output are implemented through the DPR.

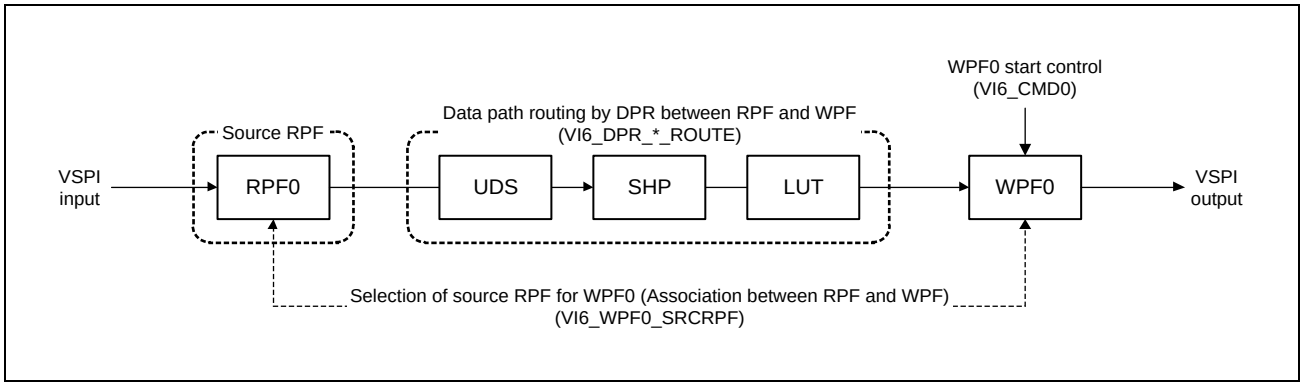

Figure 9.9-5 Basic Concept of VSPI Startup

(2) Clock Control Register 0 (VI6_CLK_CTRL0)

Access Size : 32 bits
Address : <VSPI0_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	GCS0	-	-	-	-	-	-	-	-	-	-	-	GCS1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	GCS2[3:0]				-	-	-	GCS3[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28	GCS0	0h	RW	Clock Control Setting 0
27 to 17	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
16	GCS1	0h	RW	Clock Control Setting 1
15 to 12	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
11 to 8	GCS2[3:0]	0h	RW	Clock Control Setting 2
7 to 5	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
4 to 0	GCS3[4:0]	0h	RW	Clock Control Setting 3

VSPI can stop its operating clock for reducing power consumption.

To enable clock stop function, set following registers:

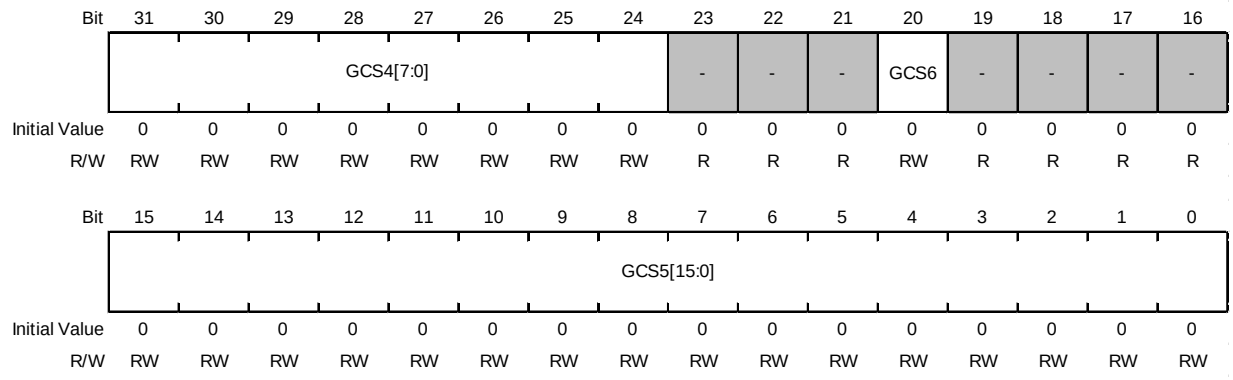
- VI6_CLK_CTRL0 = 0000_0000h
- VI6_CLK_CTRL1 = 0000_0000h
- VI6_CLK_DCSWT = 0000_0808h
- VI6_CLK_DCSM0 = 0000_0000h
- VI6_CLK_DCSM1 = 0000_0000h

To disable clock stop function, set following registers:

- VI6_CLK_CTRL0 = 1001_0F1Fh
- VI6_CLK_CTRL1 = FF10_FFFFh
- VI6_CLK_DCSWT = 0033_0808h
- VI6_CLK_DCSM0 = 1FFF_0F1Fh
- VI6_CLK_DCSM1 = FF10_FFFFh

(3) Clock Control Register 1 (VI6_CLK_CTRL1)

Access Size : 32 bits
Address : <VSPI0_base> + 0014h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GCS4[7:0]	0h	RW	Clock Control Setting 4
23 to 21	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
20	GCS6	0h	RW	Clock Control Setting 6
19 to 16	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
15 to 0	GCS5[15:0]	0h	RW	Clock Control Setting 5

See **9.9.1.3.4 (2) Clock Control Register 0 (VI6_CLK_CTRL0)** for detail.

(4) Dynamic Clock Stop Control Register (VI6_CLK_DCSWT)

Access Size : 32 bits
Address : <VSPI0_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	DCC0[1:0]		-	-	DCC1	DCC2
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSTPW[7:0]								CSTRW[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
21, 20	DCC0[1:0]	0h	RW	Clock Control Setting 0
19 to 18	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
17	DCC1	0h	RW	Clock Control Setting 1
16	DCC2	0h	RW	Clock Control Setting 2
15 to 8	CSTPW[7:0]	0h	RW	Dynamic Clock Stop Control 1 Always specify 8.
7 to 0	CSTRW[7:0]	0h	RW	Dynamic Clock Stop Control 2 Always specify 8.

See **9.9.1.3.4 (2) Clock Control Register 0 (VI6_CLK_CTRL0)** for detail.

(5) Dynamic Clock Stop Disable Register 0 (VI6_CLK_DCSM0)

Access Size : 32 bits
Address : <VSPI0_base> + 001Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	DCD0[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	DCD1[3:0]				-	-	-	DCD2[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28 to 16	DCD0[12:0]	0h	RW	Dynamic Clock Stop Disable Setting 0
15 to 12	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
11 to 8	DCD1[3:0]	0h	RW	Dynamic Clock Stop Disable Setting 1
7 to 5	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
4 to 0	DCD2[4:0]	0h	RW	Dynamic Clock Stop Disable Setting 2

See **9.9.1.3.4 (2) Clock Control Register 0 (VI6_CLK_CTRL0)** for detail.

(6) Dynamic Clock Stop Disable Register 1 (VI6_CLK_DCSM1)

Access Size : 32 bits
Address : <VSPI0_base> + 0020h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCD3[7:0]								-	-	-	DCD5	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	RW	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCD4[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DCD3[7:0]	0h	RW	Dynamic Clock Stop Disable Setting 3
23 to 21	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
20	DCD5	0h	RW	Dynamic Clock Stop Disable Setting 5
19 to 16	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
15 to 0	DCD4[15:0]	0h	RW	Dynamic Clock Stop Disable Setting 4

See **9.9.1.3.4 (2) Clock Control Register 0 (VI6_CLK_CTRL0)** for detail.

(7) Software Reset Register (VI6_SRESET)

Access Size : 32 bits
Address : <VSPI0_base> + 0028h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SRST0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
1	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
0	SRST0	0h	RW	WPF0 Software Reset (SRST0) Writing 1 to this bit aborts the current processing in WPF0 (the partially-completed image undergoing processing is output). The period until this software reset processing is completed depends on the bus state. When this reset processing is completed, the VI6_WPF0_IRQ_STA.FRE interrupt source bit is set to 1; when the FRE interrupt is enabled, the FRE end interrupt is output to notify the end of the reset processing. This bit is always read as 0. 0: NOP 1: WPF0 software reset (*)

Note 1. Applying a software reset to each WPF has the following restrictions.

1) A software reset can be applied to only one of WPF0 through single write access to VI6_SRESET.
2) After a software reset is issued, no more software reset can be issued to another WPF until the issued software reset processing is completed.
3) The end of software reset processing is notified through the FRE bit in VI6_WPF0_IRQ_STA, but the software reset issued while WPF is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the VSPI may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the VSPI completes operation.
4) If a software reset is issued during downloading of a display list, the downloading processing is not aborted. After the end of downloading that is in progress when a software reset is issued, a frame end interrupt is output.
5) When software reset is issued to VSPI, see **9.9.2.6.2 (1) Software Reset**.

(8) Module Reset Enable Register 0 (VI6_MRESET_ENB0)

This register is for purpose of h/w debugging.

Access Size : 32 bits
Address : <VSPI0_base> + 002Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	MRSTE0[1:0]		-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MRSTE1[3:0]				-	-	-	MRSTE2[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29, 28	MRSTE0[1:0]	0h	RW	Module Reset Enable 0
27 to 12	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
11 to 8	MRSTE1[3:0]	0h	RW	Module Reset Enable 1
7 to 5	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
4 to 0	MRSTE2[4:0]	0h	RW	Module Reset Enable 2

(9) Module Reset Enable Register 1 (VI6_MRESET_ENB1)

This register is for purpose of h/w debugging.

Access Size : 32 bits
Address : <VSPI0_base> + 0030h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	MRST	0h	RW	Module Reset Assertion This register is for purpose of h/w debugging.

(11) Operating Status Register (VI6_STATUS)

Access Size : 32 bits
Address : <VSPI0_base> + 0038h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	FLDST0	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	SYS0_ACT	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28	FLDST0	0h	R	Field status of previous frame of WPF0. 0: Previous finished frame is TOP field. 1: Previous finished frame is BOT field. This bit can be referred in case of AUTO-FLD or AUTO-DISP. This bit is changed at the timing of VI6_WPF0_IRQ_STA.FRE.
27 to 9	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
8	SYS0_ACT	0h	R	WPF0 Operating Status (SYS0_ACT) Each bit indicates the operating or stopped state of control channel 0 (WPF0). 0: WPF0 is stopped. 1: WPF0 is operating.
7 to 0	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

(12) WPF0 Interrupt Enable Registers (VI6_WPF0_IRQ_ENB)

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt Disabled

1: Interrupt Enabled

Access Size : 32 bits
Address : <VSPI0_base> + 0048h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DFEE	FREE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
16	UNDE	0h	RW	Interrupt Enable for WPF0 Underrun in case of DU connection.
15 to 2	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
1	DFEE	0h	RW	Interrupt Enable for WPF0 Display List Frame End
0	FREE	0h	RW	Interrupt Enable for WPF0 Frame End

Each bit in VI6_WPF0_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_WPF0_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_WPF0_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_WPF0_IRQ_STA is set to 1.

(13) WPF0 Interrupt Status Registers (VI6_WPF0_IRQ_STA)

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt

1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0

1: Hold the interrupt status value

Access Size : 32 bits
Address : <VSPI0_base> + 004Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DFE	FRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
16	UND	0h	RW	Interrupt Status and Clear for WPF0 Underrun in case of DU connection. This interrupt source bit is set to 1 when data underrun occurs in case of DU connection. Timing that this bit is set to 1 is at end of 1 frame.
15 to 2	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
1	DFE	0h	RW	Interrupt Status and Clear for WPF0 Display List Frame End This interrupt source bit is set to 1 when VSPI completes one-frame processing while the current frame in enable value stored in the display list header is 1 (refer to **9.9.1.4.3 (2)**). When display lists are not used, this bit is not used. In this case, clear VI6_WPFn_IRQ_ENB.DFEE to 0 to mask the interrupt generation by this interrupt source. This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared.
0	FRE	0h	RW	Interrupt Status and Clear for WPF0 Frame End This interrupt source bit is set to 1 when VSPI completes one-frame processing. This bit is also set to 1 when one-frame processing using a display list is completed. The interrupt status is set to 1 by any of the following conditions. a) Processing one frame is finished normally b) Software reset is issued during VSP is processing. c) One frame's data from DU is displayed while VSP couldn't transfer one frame data to DU. (in case of Linked with DU) This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared.

VI6_WPF0_IRQ_STA indicates the state of the interrupt sources generated in the VSPI. Whether to output a VSPI interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in VI6_WPF0_IRQ_ENB. While an interrupt is disabled in VI6_WPF0_IRQ_ENB, the VSPI does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

9.9.1.3.5 Display List Control Registers

(1) Display List Control Register (VI6_DL_CTRL)

Access Size : 32 bits
Address : <VSPI0_base> + 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AR_WAIT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	DC2	-	-	-	DC1	-	-	-	-	RLM0	CFM0	NH0	DLE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	AR_WAIT[15:0]	0h	RW	Display List Control Setting Always specify 256.
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12	DC2	0h	RW	This bit doesn't affect anything to VSP (NOP)
11 to 9	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
8	DC1	0h	RW	This bit doesn't affect anything to VSP (NOP)
7 to 5	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
4	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
3	RLM0	0h	RW	Loading two plane Registers Mode for WPF0. 0: Reserved status (VI6_CMD0.UPDHDR) is accepted by next frame auto start. Two plane registers are downloaded by next_frame_start also. 1: Reserved status (VI6_CMD0.UPDHDR) is not accepted by next frame auto start. pNextHeader in previous frame's DLH is used for loading DisplayList. Two plane registers are not downloaded by next_frame_start also.
2	CFM0	0h	RW	Continuous Frame Mode for Header-less Display List for WPF0 This bit determines whether the next frame is automatically started or not. When the updated flag of the display list, VI6_DL_BODY_SIZE0.UPD0, is not updated, the display list of the next frame is not transferred and the same register values are used for the next frame. When the value of VI6_DL_BODY_SIZE0.UPD0 is updated, the new display list is transferred. 0: Stopped at the end of every frame 1: The next frame is automatically started
1	NH0	0h	RW	Header-less Display List Mode This bit is used for specifying the header-less display list mode. In case of header-less mode, the number of the display lists is 1. The address of the display body is set in VI6_DL_HDR_ADDR0 register, and the body size is set in VI6_DL_BODY_SIZE0 register. When this bit is changed, make sure that VSPI is stopped. And also make sure the following before starting VSP. - Header Address (VI6_DL_HDR_ADDR0) - Body Size (VI6_DL_BODY_SIZE0) in case of header-less mode 0: Use Display List Header (Normal DL Mode) 1: Don't use Display List Header (Header-less Mode) Note: When DLE0 bit is 0, set 0 to NH0 bit.

Bit	Bit Name	Initial Value	R/W	Description
0	DLE0	0h	RW	Display List Enable/Disable for WPF0 Enables or disables the WPF0 display list function. When the display list function is enabled through this bit, all WPF processing channels work in display list mode. When using display lists, note the restrictions in **9.9.1.3.3**. 0: The display list function is disabled 1: The display list function is enabled

(2) Display List-0 Header Address Register (VI6_DL_HDR_ADDR0)

Access Size : 32 bits
Address : <VSPI0_base> + 0104h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DL_HDR_PTR-0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL_HDR_PTR-0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_PTR-0[31:0]	0h	RW	Display List-0 Header Address These bits specify the address of the display list header to be read for display list-0 in 16-byte units (the lower-order four bits are read-only). When WPF0 is first started in display list mode, the display list header is loaded from the address specified in this register. After loading of the header is completed, the register value of the display list address is updated to the next header address stored in the loaded header to prepare for loading of the next display list header. After that, this header address updating is repeated. When VI6_DL_CTRL.NH0 is 0, writing header address to this register reserves updating two plane registers for the next frame. Two plane register is VI6_DL_HDR_ADDR0. A value from 0000_0000h to FFFF_FFF0h can be specified.

(3) Display List-0 Data Swapping Register (VI6_DL_SWAP0)

Access Size : 32 bits
Address : <VSPI0_base> + 0114h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	LWS	WDS	BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

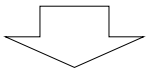
Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved These bits are read as 0b. The write value should always be 0.
2	LWS	0h	RW	Display List Data Swapping in long word Units The effect of this bit setting is defined in **Table 9.9-5**. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
1	WDS	0h	RW	Display List Data Swapping in Word Units The effect of this bit setting is defined in **Table 9.9-5**. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	BTS	0h	RW	Display List Data Swapping in Byte Units The effect of this bit setting is defined in **Table 9.9-5**. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

Table 9.9-5 shows the data order before and after swapping according to the long word, word, and byte swapping settings.

When data order in memory for each format is the same as **Table 9.9-41**, set 111b to {LWS, WDS, BTS}. If data order is not the same as the definition, change data order within 8byte unit by these bits as shown in **Table 9.9-5**.

Table 9.9-5 Changing Data Order According to Display List Swap Register

Data Order in Memory											
Byte Address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7	*_LWS	*_WDS	*_BTS
Data	0	1	2	3	4	5	6	7	1	1	1
	1	0	3	2	5	4	7	6	1	1	0
	2	3	0	1	6	7	4	5	1	0	1
	3	2	1	0	7	6	5	4	1	0	0
	4	5	6	7	0	1	2	3	0	1	1
	5	4	7	6	1	0	3	2	0	1	0
	6	7	4	5	2	3	0	1	0	0	1
	7	6	5	4	3	2	1	0	0	0	0



Data Order Defined in **Table 9.9-41**								
Byte Address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7
Data	0	1	2	3	4	5	6	7

(4) Extended Display List-0 Control Register (VI6_DL_EXT_CTRL0)

Access Size : 32 bits
Address : <VSPI0_base> + 011Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NEW
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	POLINT[5:0]						-	-	DLPRI	EXPRI	-	-	-	EXT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
16	NEW	0h	RW	No Wait for Polling When this bit is set to 1, the polling condition for extended display lists is always assumed to be true.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 8	POLINT[5:0]	0h	RW	Extended Display List Command Control Always specify 2.
7, 6	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
5	DLPRI	0h	RW	Display List Control 0 Always specify 1.
4	EXPRI	0h	RW	Display List Control 1 Always specify 0.
3 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	EXT	0h	RW	Extended Display List for WPF0 Enables or disables the extended display list function. When extended display lists are used, the display list header size is 96 bytes; when they are not used, the header size is 80 bytes. 0: No extended display lists are used 1: Extended display lists are used [Note] When using extended display lists, be sure to also use normal display list mode (VI6_DL_CTRL.DLEn); executing only extended display lists is not possible. When the header-less display list mode is activated, this bit should be set to 0. The extended display list cannot be used with the header-less display list mode.

(5) Display List Body Size Register-0 (VI6_DL_BODY_SIZE0)

Access Size : 32 bits
Address : <VSPI0_base> + 0120h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	UPD0	-	-	-	-	-	-	-	BS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BS0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
24	UPD0	0h	RW	Update Flag This bit controls the download of the display list at the next downloading timing in case that the header-less display list mode is used. Set 1 to this bit when display list need to be downloaded for next frame. This bit is automatically cleared to 0 after VI6_DL_HDR_ADDRn and VI6_DL_BODY_SIZEn.BS0 (n = 0) is downloaded in H/W side. When this bit is set to 1, the value of VI6_DL_HDR_ADDRn and VI6_DL_BODY_SIZEn.BS0 (n = 0) should not be changed. 0: Updating display list for the next frame is not reserved 1: Updating display list for the next frame is reserved
23 to 17	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
16 to 0	BS0[16:0]	0h	RW	Header-less Display List Body Size (WPFn, n = 0) These bits are used for specifying the body size of the display list in case of header-less display list mode. The unit of the size is byte. The value should be set in multiples of 8.

(6) Display List-0 Header Reference Address Register (VI6_DL_HDR_REF_ADDR0)

Access Size : 32 bits

Address : <VSPI0_base> + 0130h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DL_HDR_REF_PTR-0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL_HDR_REF_PTR-0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_REF_ PTR-0[31:0]	0h	R	Display List-0 reference Header Address Following value is read out from the VI6_DL_HDR_REF_ADDR0 for each period. (1) When H/W is reading display list from external memory, header address of the display list referred by VSPI-H/W is read out. (2) When H/W is not reading display list from external memory, the value of VI6_DL_HDR_ADDR0 is read out.

9.9.1.3.6 RPF Control Registers

(1) RPF0 Basic Read Size Registers (VI6_RPF0_SRC_BSIZE)

Access Size : 32 bits
Address : <VSPI0_base> + 0300h
Initial Value : 0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28 to 16	BHSIZE[12:0]	0h	RW	Horizontal Size of RPF Basic Read Area These bits specify the horizontal size of the basic area to be read from the external RAM by the RPF0. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPF0_SRC_ESIZE.EHSIZE).
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 0	BVSIZE[12:0]	0h	RW	Vertical Size of RPF Basic Read Area These bits specify the vertical size of the basic area to be read from the external RAM by the RPF0. When the input format is YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPF0_SRC_ESIZE.EVSIZE).

Figure 9.9-6 shows the relationship between the basic read size and extended read size. The RPF reads data from the source memory area specified by the basic read size. The RPF repeats reading the basic read area in the horizontal and vertical directions up to the extended read size and sends the read data to the processing modules in the VSPI.

For basic read size reading, the reading start address, called the RPF0 source image storing address, should be specified in VI6_RPF0_SRCM_ADDR_*. In the memory area where the basic read area image is stored, the distance (number of bytes) between addresses for lines n and n + 1 of two-dimensional image data, called the memory stride, should be specified in VI6_RPF0_SRCM_PSTRIDE.

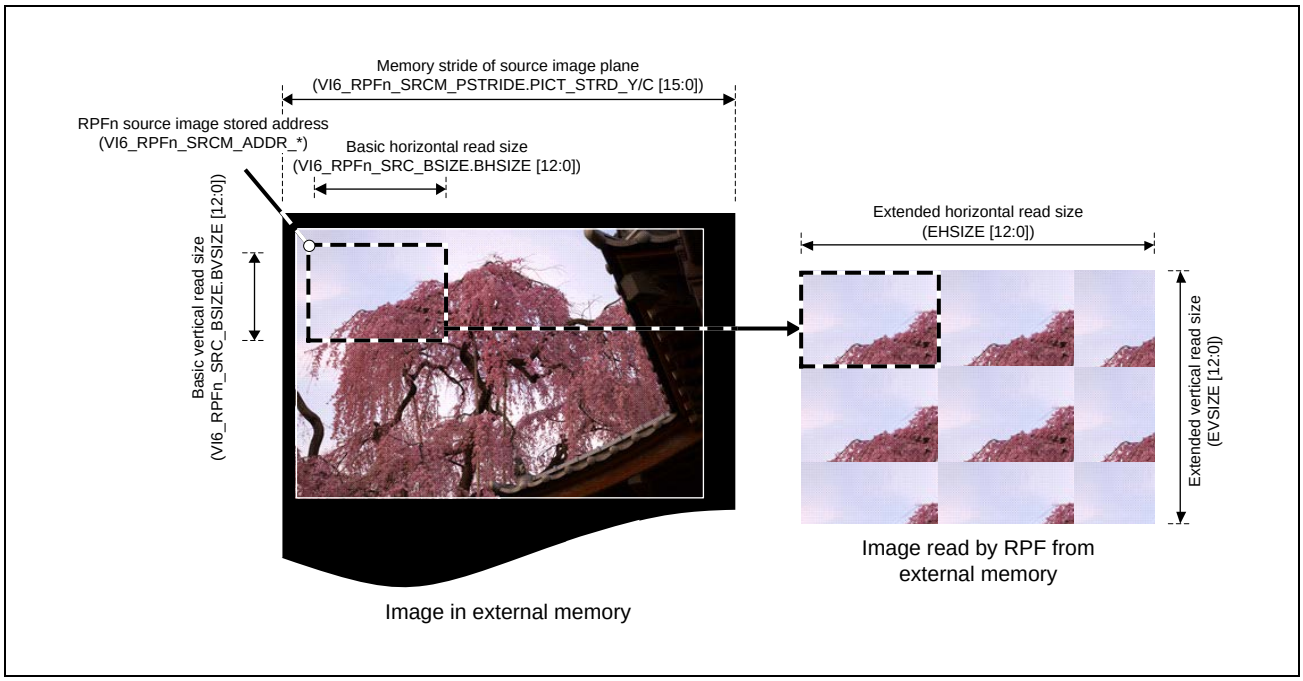

Figure 9.9-6 Relationship between Basic Read Size and Extended Read Size

	-	-	-	EVSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28 to 16	EHSIZE[12:0]	0h	RW	RPF Extended Horizontal Read Size These bits specify the horizontal size of the extended read area to which the RPF0 reads data from the external RAM. As shown in **Figure 9.9-6**, the basic read area image is repeatedly placed in the extended read area; in the EHSIZE bits, specify a value not smaller than the horizontal size of the basic read area. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 8190 can be specified.
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 0	EVSIZE[12:0]	0h	RW	RPF Extended Vertical Read Size These bits specify the vertical size of the extended read area to which the RPF0 reads data from the external RAM. As shown in **Figure 9.9-6**, the basic read area image is repeatedly placed in the extended read area; in the EVSIZE bits, specify a value not smaller than the vertical size of the basic read area. When the input format is YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 8190 can be specified.

VI6_RPF0_SRC_ESIZE specifies the extended size for RPF0. The extended horizontal and vertical sizes should be equal to or greater than the basic sizes specified in VI6_RPF0_SRC_BSIZE. The RPF internal data processing described later and image processing described in **9.9.1.3.8 DPR Control Registers** and later sections are all applied to the image in the extended read size shown on the right side in **Figure 9.9-6**.

(3) RPF0 Input Format Registers (VI6_RPF0_INFMT)

Access Size : 32 bits
Address : <VSPI0_base> + 0308h
Initial Value : 0000_0000h

R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28	VIR	0h	RW	Virtual Input Enable Enables or disables the virtual input function of the RPF0. The image to be processed by the RPF0 is usually read from the external memory by the MAU. Instead of this input, the virtual input function generates a single-color image within the RPF0 and sends it to the modules in VSP. When the virtual input function is enabled, the fixed value specified in VI6_RPF0_VRTCOL_SET is used as the input to the RPF0. While the virtual input function is enabled, data is not read from the external memory; that is, the α plane is not read and the IROP calculation thus cannot be executed. In this case, set VI6_RPF0_ALPH_SEL.ASEL to 4. Neither the color space conversion through CSC nor the color keying described in **9.9.1.3.6 (11)** can be used. 0: RPF0 uses general input. 1: RPF0 uses virtual input.
27 to 17	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
16	CIPM	0h	RW	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside VSP in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is up-sampled as shown in **Figure 9.9-7** for internal processing. This bit specifies the method of up-sampling for this purpose. 0: The nearest-neighbor method is used for horizontal chrominance interpolation. 1: The bilinear method is used for horizontal chrominance interpolation.
15	SPYCS	0h	RW	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1 and set the RDFMT bits to 71 (47h). When the input format is YVYU, set this bit and the SPUVS bit to 1 and set the RDFMT bits to 71 (47h). In other cases, set this bit to 0.
14	SPUVS	0h	RW	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1 and set the RDFMT bits to 65 (41h). When the input format is NV21, set this bit to 1 and set the RDFMT bits to 66 (42h). When the input format is YVYU, set this bit and the SPYCS bit to 1 and set the RDFMT bits to 71 (47h). In other cases, set this bit to 0.
13, 12	CEXT[1:0]	0h	RW	Lower-Bit Color Data Extension Method Setting When an RGB input format where each color component is expressed in less than 8 bits are selected from **Table 9.9-7** through the RDFMT bits, VSP internally extends each color component to 8 bits before using the data. These bits select this extension method. 00b: Lower-order bits of color data are extended with 0. 01b: Upper-order bits of color data are copied to the lower -order bits. 10b: Lower-order bits of color data are extended with 0. The maximum value is limited to FFh. 11b: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
11 to 9	RDTM[2:0]	0h	RW	CSC Conversion Expression Setting These bits select the expression used for color space conversion. The conversion direction is RGB → YCbCr when RGB is selected through the RDFMT bits; the direction is YCbCr → RGB when YCbCr is selected. 000b: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 001b: BT.601 YCbCr [0,255] ↔ RGB [0,255] 010b: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 011b: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 100b to 111b: Setting prohibited
8	CSC	0h	RW	Color Space Conversion Enable Enables or disables color space conversion between YCbCr and RGB to be executed in RPF0. The characteristics of color space conversion are determined by the RDTM bit setting. (*1) When using the virtual input (VIR = 1), specify 0. 0: Color space conversion is disabled. 1: Color space conversion is enabled.
7	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
6 to 0	RDFMT[6:0]	0h	RW	RPF Input Image Format Setting These bits select the format of the image input from the external RAM to the RPF0. Select a value corresponding to the desired format from those shown in **Table 9.9-7** and **Table 9.9-8**. When the virtual input function is used (VIR = 1), the color information for the virtual input should be specified in VI6_RPF0_VRTCOL_SET. If this color information is in the RGB format, set the RDFMT bits to 19. If the color information is in the YCbCr format, set these bits to 64. [Note 1] Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. Observe these restrictions when specifying the image size in VI6_RPF0_SRC_BSIZE and VI6_RPF0_SRC_ESIZE. [Note 2] OSD-CLUT Setting When the RDFMT bits are set to 3Fh, RGB color data should be stored in the OSD-CLUT. When these bits are set to 7Fh, YCbCr color data should be stored in the OSD-CLUT. Note that while the target WPF is operating, the RPF is also operating and the OSD-CLUT cannot be read or written to.

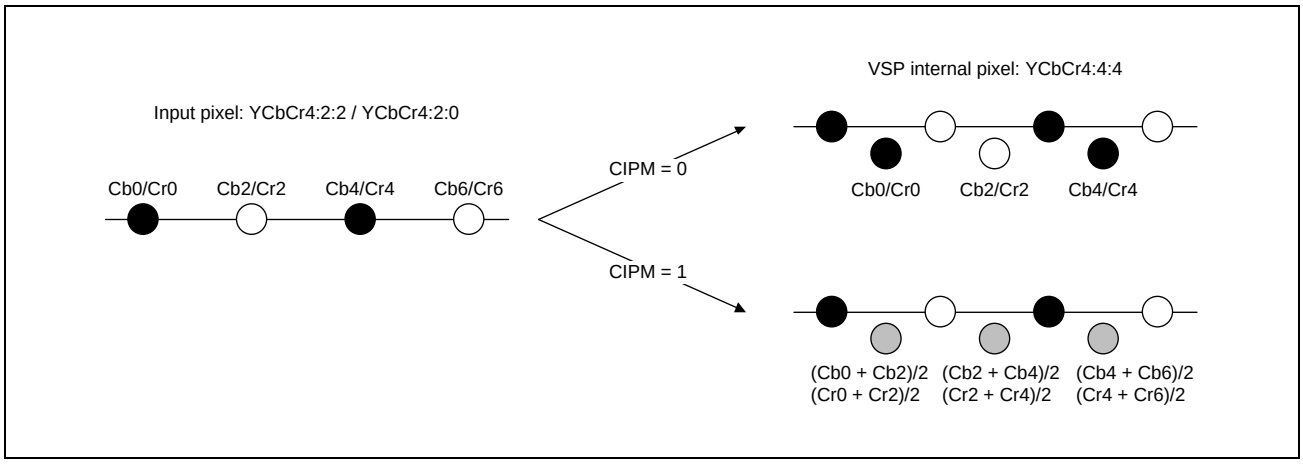

Figure 9.9-7 Chrominance Interpolation Methods Selectable through CIPM Setting

Note on color space settings

The color space for the image output from the RPF to VSPI internal modules is determined by the combination of the color space for the image input to the RPF, which is selected through the VI6_RPF0_INFMT.RDFMT setting, and the enabled or disabled state of the color space conversion function, which is selected through the VI6_RPF0_INFMT.CSC setting (**Table 9.9-6**). For example, when the image input to the RPF is in the YCbCr format, the RPF outputs data to VSPI internal modules in the YCbCr format if color space conversion is disabled through the CSC bit, and the RPF outputs data in the RGB format if color space conversion is enabled. When the image input to the RPF is in the RGB format, the relationship between the output format and the color space conversion setting is the opposite of the YCbCr case. For some VSPI internal modules, the YCbCr format is recommended for image processing because of the

characteristics of the processing, or the same color space needs to be specified between multiple RPF outputs. In these cases, set VI6_RPF0_INFMT.RDFMT and VI6_RPF0_INFMT.CSC appropriately so that the RPF can output the required color space according to the color space conditions described above.

Table 9.9-6 RPF0 Input Color Space and Output Color Space

RPF0 Input Color Space (VI6_RPF0_INFMT. RDFMT)		Color Space Conversion Setting (VI6_RPF0_INFMT.CSC)		RPF0 Output Color Space
RGB	(00h to 3Fh)*1	Disabled	(0)*1	RGB
		Enabled	(1)*1	YCbCr
YCbCr	(40h to 7Fh)*1	Disabled	(0)*1	YCbCr
		Enabled	(1)*1	RGB

Note 1. Value specified in the register

A color space conversion function equivalent to that in the RPF0 is also provided by the WPF. As shown in **Table 9.9-6**, the color space (YCbCr or RGB) output from the RPF becomes the input format for the WPF. Here, the color space of the output image obtained by the color space conversion function of the WPF must match the color space of the format specified through VI6_WPF0_OUTFMT.WRFMT.

Figure 9.9-8 shows the relationship between the input/output format and color space. The input color space for the RPF is determined when the input image format for the RPF is specified through the RDFMT bits. The color space for the image output from the RPF to subsequent VSPI internal modules depends on the combination of the RPF input format and CSC (color space conversion function) enabled or disabled state in the RPF as shown in **Table 9.9-6** and **Figure 9.9-8**. The user should first determine whether the image processing in the VSPI is done in YCbCr or RGB, and then specify the RPF input format and CSC enabled or disabled state to obtain the desired color space. The color space of the RPF output image is also that of the WPF input image; the color space of the data output from the WPF to the outside of VSPI depends on the combination of the WPF input color space and the enabled or disabled state of the CSC implemented in the WPF as shown in **Figure 9.9-8**. The color space of the WPF output image must match that of the WPF output format (determined by VI6_WPF0_OUTFMT.WRFMT). For example, in the flow shown in **Figure 9.9-8**, YCbCr should not be specified as the WPF output format regardless of the fact that the color space of the WPF output image is in RGB format.

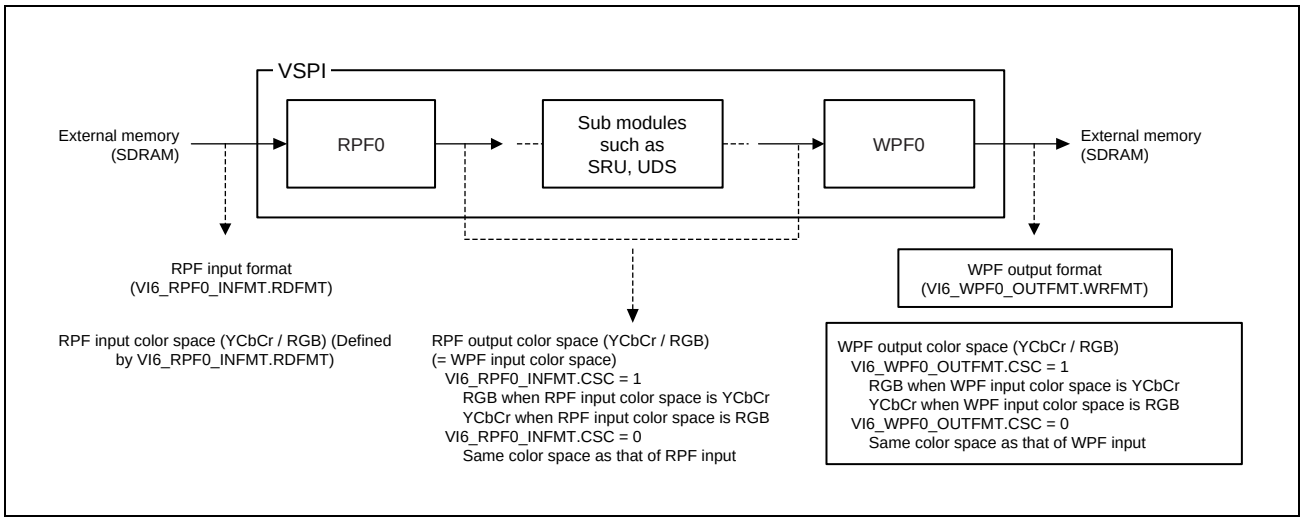

Figure 9.9-8 Relationship between Input/Output Format and Color Space

Table 9.9-7 Packed Formats for RPF Input (2/2)

RDFMT[6:0]	Bit per pixel	Phase	upper row - address / bottom row - bit field																									
			n								n+1								n+2								n+3							
			7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
24h to 3Eh	—	—	Reserved								Reserved								Reserved								Reserved							
3Fh	—	—	RGB_CLUT_DATA0								RGB_CLUT_DATA1								RGB_CLUT_DATA2								RGB_CLUT_DATA3							

When the RDFMT [6:0] bits are set to 3Fh, it is necessary to set up the OSD-CLUT in the RGB color space.

Table 9.9-8 Packed YCbCr Formats for RPF Input

RDFMT[6:0]	Packed YCbCr Input Format	Reference
40h	YCbCr4:4:4 semi-planar	**Figure 9.9-9***6
41h	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
42h	YCbCr4:2:0 semi-planar (NV12, NV21*1)*7	
43h to 45h	Reserved	—
46h	YCbCr4:4:4 interleaved	**Figure 9.9-10***6
47h	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
48h	YCbCr4:2:2 interleaved type 1	
49h	YCbCr4:2:0 interleaved*8	
4Ah	YCbCr4:4:4 planar	**Figure 9.9-11***6
4Bh	YCbCr4:2:2 planar (YV16)	
4Ch	YCbCr4:2:0 planar (YV12, I420)*7	
4Dh to 7Eh	Reserved	—
7Fh	YCBCR_CLUT_DATA*4,*5	—

Note 1. When the input format is NV61 or NV21, set the SPUVS bit to 1.

Note 2. When the input format is YUY2, set the SPYCS bit to 1.

Note 3. When the input format is YVYU, set the SPUVS bit to 1 and SPYCS bit to 1.

Note 4. When the RDFMT[6:0] bits are set to 7Fh, it is necessary to set up the OSD-CLUT in the YCbCr color space.

Note 5. The Monochrome format can be implemented through the OSD-CLUT.

Note 6. **Figure 9.9-12** shows the definition of memory address for each pixel in **Figure 9.9-9** to **Figure 9.9-11**.

Note 7. Each line of C plane is read twice, so byte/pixel of YCbCr420 is 2 byte/pixel (same as YCbCr422).

Note 8. Each line of plane is read twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

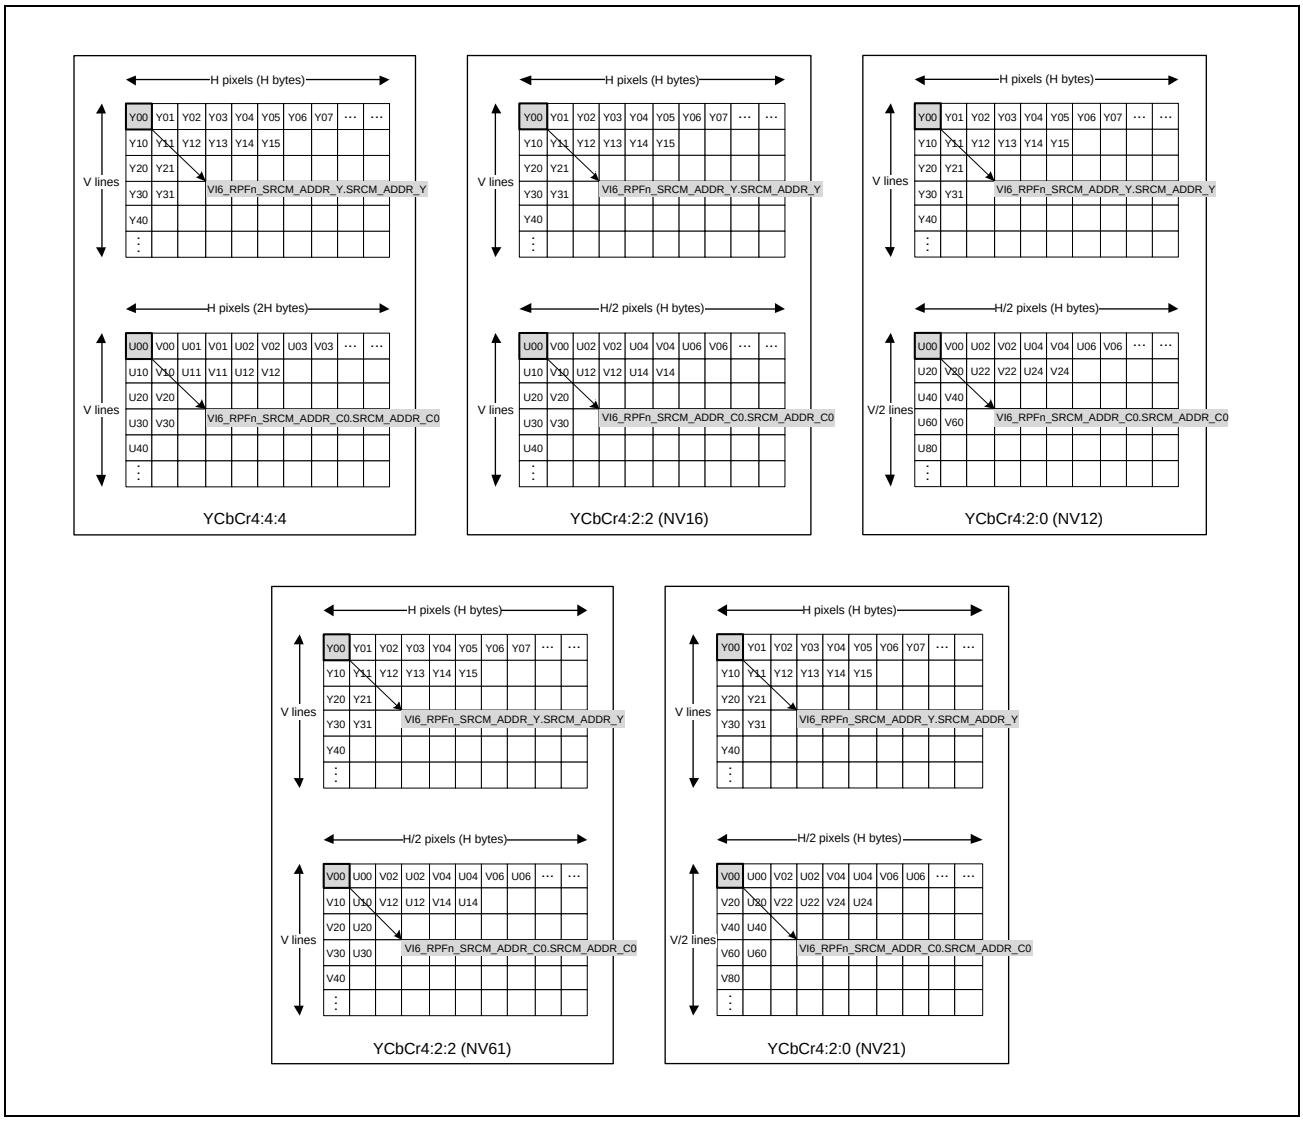

Figure 9.9-9 YCbCr Semi-Planar Formats

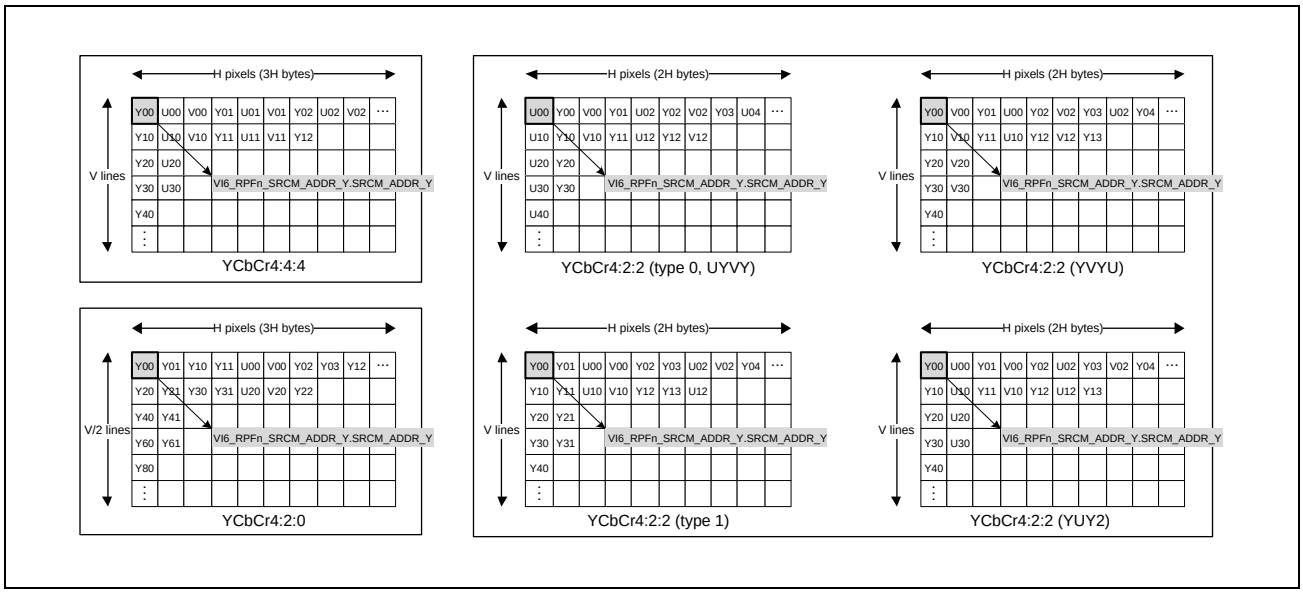

Figure 9.9-10 YCbCr Interleaved Formats

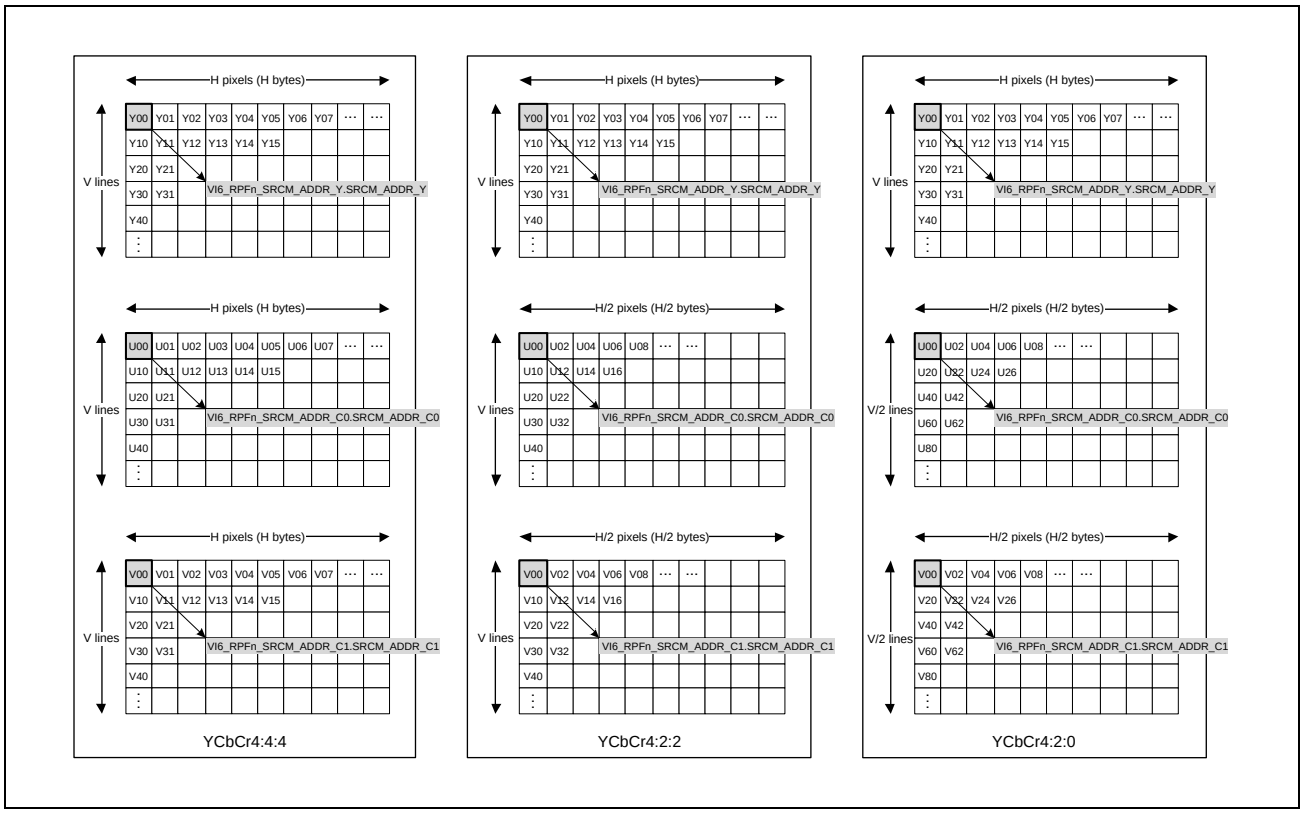

Figure 9.9-11 YCbCr Planar Formats

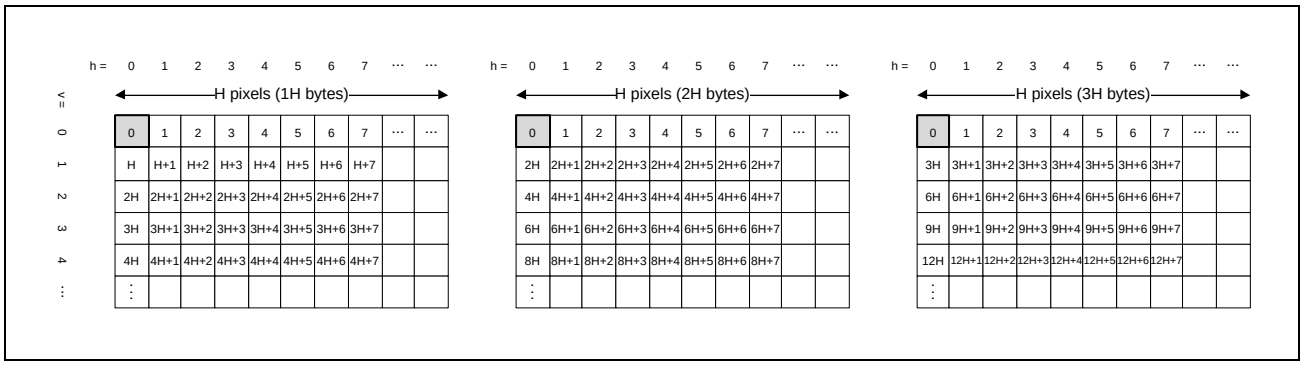

Figure 9.9-12 Memory Address for the Corresponding Pixel's Position

Legend of **Figure 9.9-12**

- H is horizontal image size in pixel unit.
- 1H, 2H and 3H is corresponding to the case 1 pixel has 1 byte, 2 bytes, and 3 bytes of data respectively.

[OSD-CLUT Setting]

To set up the OSD-CLUT, store the values to replace each of R (Cr), G (Y), and B (Cb) components in the OSD-CLUT allocated as shown in **Table 9.9-9**. The OSD-CLUT space has 256 32-bit entries, which should be accessed in 32 bits in the same way as for register access. The address for each entry is obtained from the start address of each space (**Table 9.9-9**) + entry number × 4. For example, the OSD-CLUT address of entry 7 for RPF0 is (offset address) + 401Ch. **Figure 9.9-13** shows the OSD-CLUT format.

Table 9.9-9 OSD-CLUT Space for Each RPF

RPF	Address Area for CLUT Space
RPF0	(offset address) + 4000h to (offset address) + 43FFh

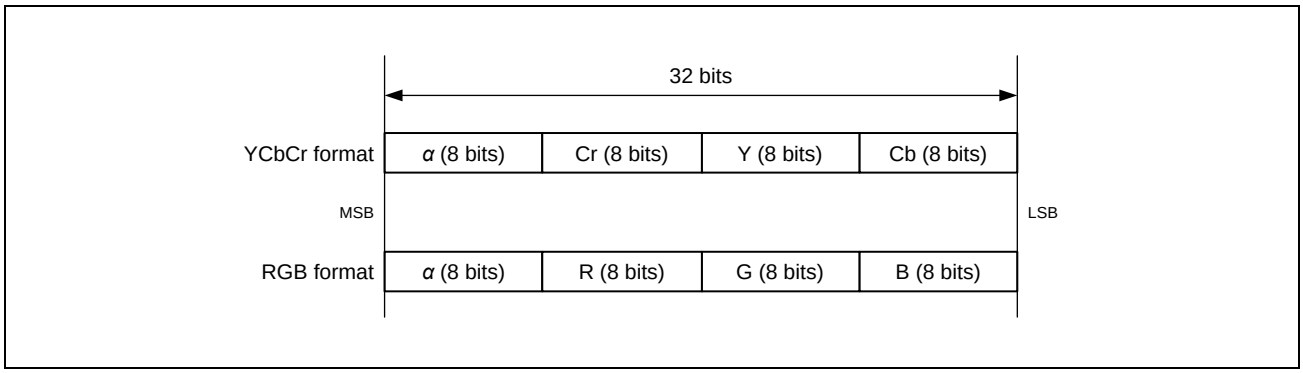

Figure 9.9-13 OSD-CLUT Format

According to the specified 256-entry replacement table (OSD-CLUT), input data is replaced as shown in **Figure 9.9-14**. Input data is 8 bits but output data is 32 bits including α and RGB or YCbCr components.

When writing to an entry in the OSD-CLUT, the host CPU writes all components at the same time. Therefore, specify replacement data for all components in the OSD-CLUT at the same time as shown in **Figure 9.9-13**.

Note that write access to the OSD-CLUT space is prohibited while the RPF is operating.

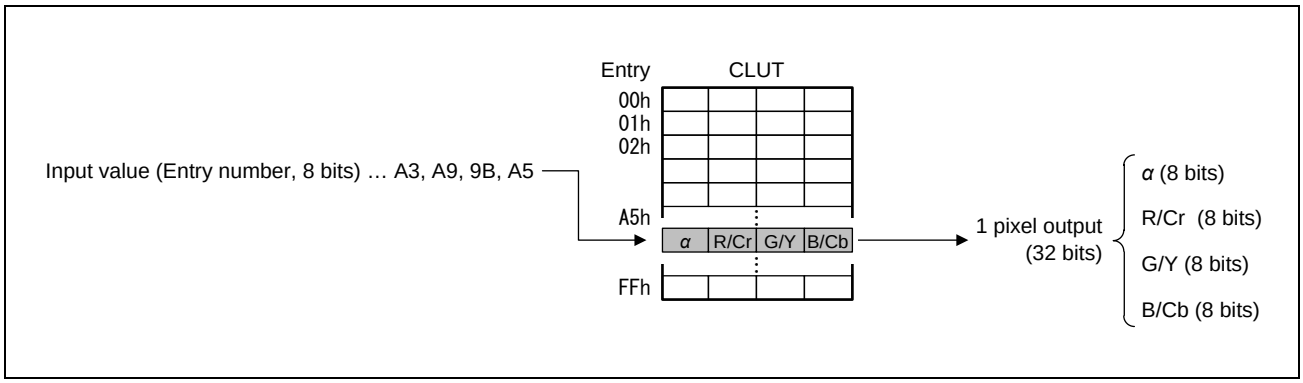

Figure 9.9-14 Replacement of Input Data with Pixel Values Specified in OSD-CLUT

(4) RPF0 Data Swapping Registers (VI6_RPF0_DSWAP)

Access Size : 32 bits
Address : <VSPI0_base> + 030Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
11	A_LLS	0h	RW	α Plane Data Swapping in LONG LWORD Units The effect of this bit setting is defined in **Table 9.9-10**. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
10	A_LWS	0h	RW	α Plane Data Swapping in long word Units The effect of this bit setting is defined in **Table 9.9-10**. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
9	A_WDS	0h	RW	α Plane Data Swapping in Word Units The effect of this bit setting is defined in **Table 9.9-10**. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
8	A_BTS	0h	RW	α Plane Data Swapping in Byte Units The effect of this bit setting is defined in **Table 9.9-10**. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled
7 to 4	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
3	P_LLS	0h	RW	Picture Plane Data Swapping in LONG LWORD Units The effect of this bit setting is defined in **Table 9.9-10**. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
2	P_LWS	0h	RW	Picture Plane Data Swapping in long word Units The effect of this bit setting is defined in **Table 9.9-10**. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
1	P_WDS	0h	RW	Picture Plane Data Swapping in Word Units The effect of this bit setting is defined in **Table 9.9-10**. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	P_BTS	0h	RW	Picture Plane Data Swapping in Word Units The effect of this bit setting is defined in **Table 9.9-10**. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled

When the virtual input function of the RPF0 is used (VI6_RPF0_INFMT.VIR = 1), this register setting is ignored. Swapping of RPF input data can be specified separately for the α plane and picture plane.

Table 9.9-10 shows the data order before and after swapping according to the long word, word, half word, and byte swapping settings.

When data order in memory for each format is the same as **Table 9.9-7** for RGB format and **Figure 9.9-9** to **Figure 9.9-11** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16-byte unit by these bits as shown in **Table 9.9-10**.

Table 9.9-10 Changing Data Order According to Swap Register

Data Order in Memory																	*_LLS	*_LWS	*_WDS	*_BTS

(5) RPF0 Display Location Registers (VI6_RPF0_LOC)

Access Size : 32 bits

Address : <VSPI0_base> + 0310h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HCOORD[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VCOORD[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28 to 16	HCOORD[12:0]	0h	RW	Horizontal Coordinate of Sublayer Display Location on Master Layer These bits specify the left-end location of the sublayer displayed by the RPF0 and the subsequent module connected through the DPR. Specify the horizontal coordinate of the location in pixel units with the left-end pixel of the master layer set at coordinate 0. When the RPF0 is the master layer, set these bits to 0. If the sublayer extends beyond the master layer according to the HCOORD setting, the extended section is cut off at the right end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the right end of the master layer. A value from 0 to 8189 can be specified.
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 0	VCOORD[12:0]	0h	RW	Vertical Coordinate of Sublayer Display Location on Master Layer These bits specify the top-end location of the sublayer displayed by the RPF0 and the subsequent module connected through the DPR. Specify the vertical coordinate of the location in pixel units with the top-end pixel of the master layer set at coordinate 0. When the RPF0 is the master layer, set these bits to 0. If the sublayer extends beyond the master layer according to the VCOORD setting, the extended section is cut off at the bottom end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the bottom end of the master layer. A value from 0 to 8189 can be specified.

(6) RPF0 α Plane Selection Control Registers (VI6_RPF0_ALPH_SEL)

Access Size : 32 bits
Address : <VSPI0_base> + 0314h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	ASEL[2:0]			IROP[3:0]				BSEL	-	-	-	AEXT[1:0]		-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ALPHA1[7:0]								ALPHA0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
30 to 28	ASEL[2:0]	0h	RW	α Format and Processing Method Select These bits select how to handle the α value to be used. The RPF handles two types of α value; 8-bit and 1-bit values. When a 1-bit α value is used, VSPI assumes that the 1-bpp α value for each pixel is stored in the order from MSB to LSB in each byte (big endian). The α value is used as either transparency information or mask information. Transparency information is included in the α plane read from external memory when the ASEL bits are set to 1 or 3 and in the α value stored in the packed RGB bit field when these bits are set to 0 or 2. The α value as transparency information is sent as the destination value to the IROP as shown in **Figure 9.9-15** and then output to the subsequent modules. The α value as mask information is used for IROP operation in the RPF. The mask information is included in the α plane read from external RAM when the ASEL bits are set to 0 or 2 and the source value is used in IROP operation (IROP setting other than 0, 5, 10, or 15). This α value is sent as the source value to the IROP as shown in **Figure 9.9-15**. Note that the α value selected through the ASEL bits has a lower priority than the VI6_RPF0_CKEY_SET*.AP* value replaced through the color keying function. When the color keying function is used, the α value may be replaced with the VI6_RPF0_CKEY_SET*.AP* value regardless of the ASEL bit setting. When using the virtual input function (VI6_RPF0_INFMT.VIR = 1), specify 4. 000b: 1, 4, or 8-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The α bit field in 1, 4, or 8-bit packed α is handled as transparency information. Be sure to specify the packed format that includes α through VI6_RPF0_INFMT.RDFMT. When VI6_RPF0_MSKCTRL.MSK_EN is 0 and the IROP bit value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPF0_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 001b: 8-bit plane α The 8-bit α plane is read from external RAM as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPF0_SRCM_ADDR_AI) should be specified. The α value goes through the 8-bit transparent α generator shown in Figure 9.9-15 without change. When VI6_RPF0_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPF0_MSKCTRL.MSK_EN is 1. IROP operation can be executed.

Bit	Bit Name	Initial Value	R/W	Description
30 to 28	ASEL[2:0]	0h	RW	010b: 1-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The 1-bit packed α input is converted by the 8-bit transparent α generator shown in **Figure 9.9-15** according to the ALPHA0/1 setting into the 8-bit α value as transparency information. Select the packed input format that includes a 1-bit α field. When VI6_RPF0_MSKCTRL.MSK_EN is 0 and the IROP value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPF0_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 011b: 1-bit plane α The 1-bit α plane is read from external RAM and converted by the 8-bit transparent α generator shown in **Figure 9.9-15** according to the ALPHA0/1 setting into the 8-bit α value as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPF0_SRCM_ADDR_AI) should be specified. When VI6_RPF0_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPF0_MSKCTRL.MSK_EN is 1. IROP operation can be executed. 100b: Fixed α The fixed α value (VI6_RPF0_VRTCOL_SET.LAYA value) is output from the RPF. IROP operation cannot be executed; set the IROP bits to 0 in this case. 101b to 111b: Setting prohibited.
27 to 24	IROP[3:0]	0h	RW	IROP Operation Setting These bits specify the operator to be executed in the IROP operation unit shown in **Figure 9.9-15**. The source (S) for the IROP operation is the pixel data and α data specified in the VI6_RPF0_MSKSET0 or VI6_RPF0_MSKSET1 IROP input value register, which is selected according to the value (0 or 1) generated by the 1-bit mask generator. The destination (D) is the image data (RGB/YCbCr) and 8-bit α data output from the unpack/OSD processor. IROP operation is applied both for the image data and α data between the source and destination data. If these bits are set to the operation that involves the source (S) (IROP setting other than 0, 5, 10, or 15) while VI6_RPF0_MSKCTRL.MSK_EN is 0, the α plane is read from the external RAM to be used for the α value for IROP operation; specify the α plane read start address (VI6_RPF0_SRCM_ADDR_AI). When the virtual input function is used (VI6_RPF0_INFMT.VIR = 1), IROP operation is not available; set these bits to 0000b. 0000b: NOP(D) 0001b: AND(S & D) 0010b: AND_REVERSE(S & ~D) 0011b: COPY(S) 0100b: AND_INVERTED(~S & D) 0101b: CLEAR(0) 0110b: XOR(S ^ D) 0111b: OR(S | D) 1000b: NOR(~(S | D)) 1001b: EQUIV(~(S ^ D)) 1010b: INVERT(~D) 1011b: OR_REVERSE(S | ~D) 1100b: COPY_INVERTED(~S) 1101b: OR_INVERTED(~S | D) 1110b: NAND(~(S & D)) 1111b: SET(all 1)
23	BSEL	0h	RW	α Bit Count Conversion Selection for 1-Bit Mask Generator Specifies the number of bits in the α plane to be read as mask information from the external RAM. When α plane data is 8 bits, it is converted to one bit through the 1-bit mask generator shown in **Figure 9.9-15**. Note that this bit setting is valid when the ASEL bits are set to 0 or 2 and VI6_RPF0_MSKCTRL.MSK_EN is set to 0. In other cases, this bit setting has no effect. 0: 8-bit α is converted to 1-bit α through the 1-bit mask generator. When the 8-bit α value input to the RPF is not 0, it is converted to 1b; when the value is 0, it is converted to 0b. 1: α value goes through the 1-bit mask generator. The 1-bit α value input to the RPF is output through the 1-bit mask generator without change.

Bit	Bit Name	Initial Value	R/W	Description
22 to 20	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
19, 18	AEXT[1:0]	0h	RW	Lower-Bit α Value Extension Method Set These bits specify the method for extending the input α data to 8 bits through the unpack processing. 00b: The lower-order bits of α value are extended with 0. 01b: The upper-order bits of α value are copied to the lower-order bits. 10b: The lower-order bits of α value are extended with 0. The maximum value is limited to FFh. 11b: Setting prohibited
17, 16	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
15 to 8	ALPHA1[7:0]	0h	RW	8-Bit α Value Output when 1-Bit α Value is 1 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 9.9-15** is 1b. This setting is valid when the ASEL bits are set to 010b or 011b. A value from 0 to 255 can be specified.
7 to 0	ALPHA0[7:0]	0h	RW	8-Bit α Value Output when 1-Bit α Value is 0 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 9.9-15** is 0b. This setting is valid when the ASEL bits are set to 010b or 011b. A value from 0 to 255 can be specified.

Figure 9.9-15 shows the relationship between the α selector, IROP operation unit, color keying unit, and related registers. The IROP operation unit receives two inputs, source and destination. The image data input from the external memory is processed through the unpack processor and 8-bit transparent α generator and then input to the IROP operation unit as destination data. The α plane data input from the external memory is sent to the 8-bit transparent α generator when the ASEL bits are set to 1 or 3, or sent to the 1-bit mask α generator when the ASEL bits are set to 0 or 2. For the pixel data and 8-bit α value on the source side of the IROP operation unit, either the VI6_RPF0_MSKSET0 value or VI6_RPF0_MSKSET1 values will be selected according to the 1-bit α value output by the 1-bit mask α generator.

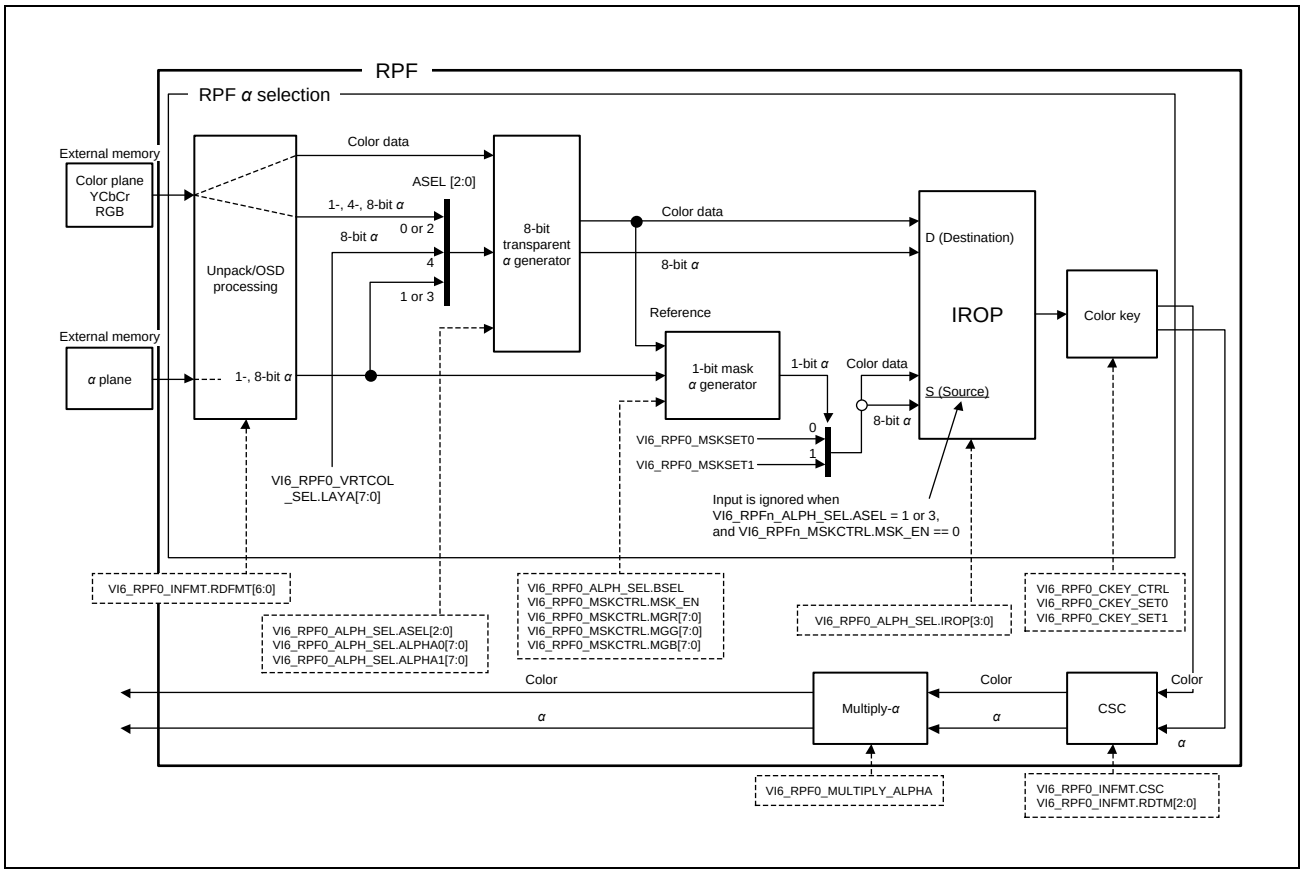

Figure 9.9-15 Configuration of Alpha Selector and IROP Operation Unit in RPF

The following describes the function of each block shown in **Figure 9.9-15**. Read the following while referring to the figure as necessary.

Unpack/OSD processor:

Unpacks each component and α value of the image data according to the packed format specified in VI6_RPF0_INFMT.RDFMT.

8-bit transparent α generator:

Converts the input α value into 8-bit α when the input α is four bits or one bit.

When VI6_RPF0_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α), this generator outputs the input α value without change if the α bit field in the packed α data is 8 bits; if the α bit field is less than 8 bits, it is converted to an 8-bit α value by extending the LSB side according to the VI6_RPF0_ALPH_SEL.AEXT setting.

When VI6_RPF0_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 4 (fixed α), this generator outputs the input 8-bit plane α without change. If a packed α value is included in RGB data, it is discarded.

When VI6_RPF0_ALPH_SEL.ASEL are set to 2 (1-bit packed α) or 3 (8-bit α generated from 1-bit plane α), an 8-bit α value is generated by using the VI6_RPF0_ALPH_SEL.ALPHA0 [7:0] value when the input 1-bit α value is 0 or by using the VI6_RPF0_ALPH_SEL.ALPHA1 [7:0] value when the input 1-bit α value is 1. When VI6_RPF0_ALPH_SEL.ASEL is set to 3, a packed α value that is included in RGB data is discarded.

1-bit mask α generator:

Generates 1-bit α data from the input 8-bit α data or pixel data. When the input α data is one bit, this generator outputs it without change.

When VI6_RPF0_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α) or 2 (plane α) and VI6_RPF0_MSKCTRL.MSK_EN is set to 0, the α plane read from the external memory to be used in IROP is converted to 1-bit α data when necessary. When the α plane data read from the external RAM is 8 bits (BSEL = 0), if the value is 0, a 1-bit α value of 0b is generated; if the value is not 0, a 1-bit α value of 1b is generated. When the α plane data is one bit (BSEL = 1), this generator outputs it without change.

When the value of the 1-bit α generated by the 1-bit mask α generator is 0b, the 8-bit α and pixel data specified in VI6_RPF0_MSKSET0 are output as the source. When the generated 1-bit α value is 1b, the 8-bit α and pixel data specified in VI6_RPF0_MSKSET1 are output as the source.

As shown in **Figure 9.9-15**, when VI6_RPF0_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 3 (1-bit plane α), the α plane read from the external RAM is sent to the 8-bit transparent α generator as transparency information. When VI6_RPF0_MSKCTRL.MSK_EN is set to 0, the 1-bit α for masking is generated according to the input α plane (refer to **9.9.1.3.6 (8) RPF0 Mask Control Registers (VI6_RPF0_MSKCTRL)**), but the 1-bit mask α generator does not refer to the input α plane because it is input to the 8-bit transparent α generator as transparency information. Accordingly, the 1-bit mask α generator does not generate a 1-bit α for masking and the data on the source side becomes invalid; that is, IROP operation cannot be executed. Set the IROP bits to 0 in this case. In contrast, when VI6_RPF0_MSKCTRL.MSK_EN is set to 1, the 1-bit mask α generator creates α data for masking according to the pixel data instead of the input α plane data, and IROP operation can be executed in this case.

IROP operation unit:

Executes ROP operation according to the opcode specified in VI6_RPF0_ALPH_SEL.IROP. For ROP operation (other than NOP), valid values should be input both for the source and destination. As described in the above (description of the 1-bit mask α generator), when VI6_RPF0_ALPH_SEL.ASEL are set to 1 or 3 and VI6_RPF0_MSKCTRL.MSK_EN is set to 0, the source data for the IROP operation unit is treated as invalid; set VI6_RPF0_ALPH_SEL.IROP to 0 (NOP). When VI6_RPF0_ALPH_SEL.ASEL are set to 4, a fixed α value is output from the RPF and IROP operation is not available. In the same way as the above case, set VI6_RPF0_ALPH_SEL.IROP to 0 (NOP).

To specify a valid source value for the IROP operation unit and execute IROP operation (specify an opcode other than NOP in the IROP bits), specify register values as shown in **Table 9.9-11**. Where the source input state is indicated as “Valid” in the table, IROP operation can be executed. In the cases where IROP operation is not available, set the IROP bits to 0 (NOP).

Table 9.9-11 Source Input State in IROP Operation Unit

VI6_RPF0_ALPH_SEL.ASEL [2:0]		VI6_RPF0_MSKCTRL.MSK_EN		
		0 (Source data is generated according to input α plane)		1 (Source data is generated according to the destination-side pixel data)
000b	(1-, 4-, or 8-bit packed α + plane α)	Valid	(α plane input)	Valid
001b	(8-bit α plane)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
010b	(8-bit α generated from 1-bit packed α + plane α)	Valid	(α plane input)	Valid
011b	(8-bit α generated from 1-bit plane α)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
100b	(Fixed α)	Invalid (IROP operation is not available; fixed α is output to the subsequent modules behind RPF)		

For the handling of the α values shown in **Figure 9.9-15** and **Table 9.9-11**, the relationship between the RPF input format and RPF output α value is shown in **Table 9.9-12**. Where only bit names are shown in the table, the bits are in VI6_RPF0_ALPH_SEL described in this section.

Table 9.9-12 α Value Selected and Output According to ASEL Bits in Each Input Format

ASEL Setting		α Value Output for Each Input Format		
		RGB	YCbCr	OSD-CLUT
000b	(8-, 4-, or 1-bit packed α is input)	1-, 4-, or 8-bit pixel α	FFh*1	α value in CLUT
001b	(8-bit plane α is input)	8-bit α plane	8-bit α plane	8-bit α plane
010b	(8-bit α is generated from the 1-bit packed α input)	ALPHA0 or ALPHA1 setting	FFh*1	FFh
011b	(8-bit α is generated from the 1-bit plane α input)	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting
100b	(Fixed α is output)	VI6_RPF0_VRTCOL_SET.LAYA setting		

Note 1. Fixed value FFh is output because packed α is not included in YCbCr.

(7) RPF0 Virtual Plane Color Information Registers (VI6_RPF0_VRTCOL_SET)

Access Size : 32 bits

Address : <VSPI0_base> + 0318h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LAYA[7:0]								LAYR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	LAYA[7:0]	0h	RW	Virtual-Input Fixed α Value These bits specify the fixed α value generated in the RPF0 when the virtual input function is enabled through the VI6_RPF0_INFMT.VIR setting. When the virtual input function is disabled (VI6_RPF0_INFMT.VIR = 0), these bits are used to specify the fixed α value to be output from the RPF while VI6_RPF0_ALPH_SEL.ASEL are set to 4. A value from 0 to 255 can be specified.
23 to 16	LAYR[7:0]	0h	RW	Virtual-Input Fixed R/Cr Component Value These bits specify the fixed R or Cr value generated in the RPF0 when the virtual input function is enabled through the VI6_RPF0_INFMT.VIR setting. When VI6_RPF0_INFMT.RDFMT is set to 19, the value specified in these bits is used as the R value. When VI6_RPF0_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cr value. A value from 0 to 255 can be specified.
15 to 8	LAYG[7:0]	0h	RW	Virtual-Input Fixed G/Y Component Value These bits specify the fixed G or Y value generated in the RPF0 when the virtual input function is enabled through the VI6_RPF0_INFMT.VIR setting. When VI6_RPF0_INFMT.RDFM T is set to 19, the value specified in these bits is used as the G value. When VI6_RPF0_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Y value. A value from 0 to 255 can be specified.
7 to 0	LAYB[7:0]	0h	RW	Virtual-Input Fixed B/Cb Component Value These bits specify the fixed B or Cb value generated in the RPF0 when the virtual input function is enabled through the VI6_RPF0_INFMT.VIR setting. When VI6_RPF0_INFMT.RDFMT is set to 19, the value specified in these bits is used as the B value. When VI6_RPF0_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cb value. A value from 0 to 255 can be specified.

(8) RPF0 Mask Control Registers (VI6_RPF0_MSKCTRL)

Access Size : 32 bits

Address : <VSPI0_base> + 031Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	MSK_EN	MGR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MGG[7:0]								MGB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
24	MSK_EN	0h	RW	Mask Generation Specification Specifies the method of α value generation in the 1-bit mask α generator shown in **Figure 9.9-15**. 0b: A 1-bit mask value is generated according to the input α plane value. When the input α is in the 1-bit format (VI6_RPF0_ALPH_SEL.BSEL = 1), the 1-bit mask value is output without change. When the input α is in the 8-bit format (VI6_RPF0_ALPH_SEL.BSEL = 0), the 1-bit mask value is 0 if the α value is 00h; otherwise, the 1-bit mask value is 1. 1b: The R/Cr, G/Y, and B/Cb components of the image input to the destination side of the IROP operation unit are compared with the values specified in the MGR, MGG, and MGB bits, respectively. When all values match, 1 is output as the 1-bit mask value, and in other cases, 0 is output. When the generated 1-bit mask data is not used, set VI6_RPF0_ALPH_SEL.IROP to 0.
23 to 16	MGR[7:0]	0h	RW	R/Cr Comparison Value for 1-Bit α Generation These bits specify the R/Cr value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPF0 input format through VI6_RPF0_INFMT.RDFMT, specify an R value for comparison. When YCbCr is specified, specify a Cr value for comparison. This setting is ignored when the MSK_EN bit is set 0. A value from 0 to 255 can be specified.
15 to 8	MGG[7:0]	0h	RW	G/Y Comparison Value for 1-Bit α Generation These bits specify the G/Y value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPF0 input format through VI6_RPF0_INFMT.RDFMT, specify a G value for comparison. When YCbCr is specified, specify a Y value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.
7 to 0	MGB[7:0]	0h	RW	B/Cb Comparison Value for 1-Bit α Generation These bits specify the B/Cb value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPF0 input format through VI6_RPF0_INFMT.RDFMT, specify a B value for comparison. When YCbCr is specified, specify a Cb value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.

(9) RPF0 IROP-SRC Input Value Registers 0 (VI6_RPF0_MSKSET0)

Access Size : 32 bits
Address : <VSPI0_base> + 0320h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSG0[7:0]								MSB0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA0[7:0]	0h	RW	IROP-Source Input α Value when 1-Bit α is 0 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.9-15**). A value from 0 to 255 can be specified.
23 to 16	MSR0[7:0]	0h	RW	IROP-Source Input R/Cr Value when 1-Bit α is 0 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.9-15**). When RGB is specified as the RPF0 input format through VI6_RPF0_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG0[7:0]	0h	RW	IROP-Source Input G/Y Value when 1-Bit α is 0 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.9-15**). When RGB is specified as the RPF0 input format through VI6_RPF0_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB0[7:0]	0h	RW	IROP-Source Input B/Cb Value when 1-Bit α is 0 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 9.9-15**). When RGB is specified as the RPF0 input format through VI6_RPF0_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

(10) RPF0 IROP-SRC Input Value Registers 1 (VI6_RPF0_MSKSET1)

Access Size : 32 bits
Address : <VSPI0_base> + 0324h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSA1[7:0]								MSR1[7:0]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSG1[7:0]								MSB1[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA1[7:0]	0h	RW	IROP-Source Input α Value when 1-Bit α is 1 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1. A value from 0 to 255 can be specified (**Figure 9.9-15**).
23 to 16	MSR1[7:0]	0h	RW	IROP-Source Input R/Cr Value when 1-Bit α is 1 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 9.9-15**). When RGB is specified as the RPF0 input format through VI6_RPF0_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG1[7:0]	0h	RW	IROP-Source Input G/Y Value when 1-Bit α is 1 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 9.9-15**). When RGB is specified as the RPF0 input format through VI6_RPF0_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB1[7:0]	0h	RW	IROP-Source Input B/Cb Value when 1-Bit α is 1 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 9.9-15**). When RGB is specified as the RPF0 input format through VI6_RPF0_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

(11) RPF0 Color Keying Control Registers (VI6_RPF0_CKEY_CTRL)

Access Size : 32 bits
Address : <VSPI0_base> + 0328h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	LTH	-	-	-	CV	-	-	SAPE1	SAPE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
8	LTH	0h	RW	Transparent color-luma Threshold Mode Enable/Disable This bit enables or disables transparent color-luma threshold mode for the color keying module. In transparent color-luma threshold mode, color information 0 (GY0) specified in VI6_RPF0_CKEY_SET0 register is compared with the input luma values. When the input data is in YCbCr format, and if input Y value is equal to or smaller than specified color information (VI6_RPF0_CKEY_SET0.GY0), the input α value is replaced with the value specified in VI6_RPF0_CKEY_SET0.AP0. This bit is available only when the input data is in YCbCr format. When the input data is in an RGB format, set this bit to 0. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. When using the virtual input function (VI6_RPF0_INFMT.VIR = 1), set this bit to 0. 0b: Luma threshold mode is disabled (Matched color mode) 1b: Luma threshold mode is enabled
7 to 5	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
4	CV	0h	RW	Color Replacement Control This bit controls the color replacement function in the color keying module shown in **Figure 9.9-3**. When an RGB format is specified as the color space of the RPF0 input data through VI6_RPF0_INFMT.RDFMT, and if all components of an input pixel match the color components specified in VI6_RPF0_CKEY_SET0, the color replacement function replaces the values of the input α and all RGB components with the α and color components specified in VI6_RPF0_CKEY_SET1. When a YCbCr format is specified as the color space of the RPF0 input data through VI6_RPF0_INFMT.RDFMT, only the Y data is compared; if the luminance component of an input pixel matches the value specified in VI6_RPF0_CKEY_SET0.GY0, the color replacement function replaces the values of the input α and all YCbCr components with the α and color components specified in VI6_RPF0_CKEY_SET1. When the CV bit is set to 1, the color replacement function is enabled. When using the virtual input function (VI6_RPF0_INFMT.VIR = 1), set this bit to 0. 0b: Color replacement function is disabled (transparent color mode). 1b: Color replacement function is enabled.
3, 2	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1	SAPE1	0h	RW	Comparison Color Data Setting 1 Enable/Disable This bit enables or disables comparison color data setting 1 in the transparent color mode for the color keying module. This bit setting is valid when the CV bit and the LTH bit are set to 0; it is ignored when the CV bit or the LTH bit is set to 1. In transparent color mode, color information 1 (VI6_RPF0_CKEY_SET1.R1/GY1/B1) specified in VI6_RPF0_CKEY_SET1 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPF0_CKEY_SET1.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPF0_INFMT.VIR = 1), set this bit to 0. 0b: Comparison color data setting 1 is disabled. 1b: Comparison color data setting 1 is enabled.
0	SAPE0	0h	RW	Comparison Color Data Setting 0 Enable/Disable This bit enables or disables comparison color data setting 0 in the transparent color mode for the color keying module. This bit setting is valid when the CV bit and the LTH bit are set to 0; it is ignored when the CV bit or the LTH bit is set to 1. In transparent color mode, color information 0 (VI6_RPF0_CKEY_SET0.R0/GY0/B0) specified in VI6_RPF0_CKEY_SET0 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPF0_CKEY_SET0.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPF0_INFMT.VIR = 1), clear this bit to 0. 0b: Comparison color data setting 0 is disabled. 1b: Comparison color data setting 0 is enabled.

(12) RPF0 Color Keying Color Setting Registers-m (VI6_RPF0_CKEY_SETm) (m = 0, 1)

[m = 0]

Access Size : 32 bits
Address : <VSPI0_base> + 032Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Apm[7:0]	0h	RW	α Data in Color Keying Color Information-m •In transparent color-matched color mode for color keying When the input data matches color setting-m (Rm, GYm, and Bm) for transparent color comparison in the color keying module, the input α value is replaced with the value specified in these bits. Specify the α value to replace the input value. •In transparent color-luma threshold mode for color keying When the input data is in YCbCr format, and if input Y value is equal to or smaller than GY0, the input α value is replaced with the value specified in this bit field (AP0). Specify the α value in this bit field (AP0) to replace the input value. AP1 is not used in this mode. Set AP1 to 0 value. •In color replacement mode for color keying These bits are not used in this mode. Clear them to 0. α value replacement through these bits in transparent color mode for color keying takes priority over the α value selected through the VI6_RPF0_ALPH_SEL.ASEL setting. A value from 0 to 255 can be specified.
23 to 16	Rm[7:0]	0h	RW	R*/Cr Component Data in Color Keying Color Information-m •In transparent color-matched color mode for color keying Specify the R component value for comparison enabled through the VI6_RPF0_CKEY_CTRL.SAPEm setting. When the RPF0 input is in YCbCr format, the color keying module does not compare the Cr component, and the setting of these bits is ignored. •In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. •In color replacement mode for color keying Specify the R component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.
15 to 8	Gym[7:0]	0h	RW	G*/Y Component Data in Color Keying Color Information-m •In transparent color-matched color mode for color keying Specify the G/Y component value for comparison enabled through the VI6_RPF0_CKEY_CTRL.SAPEm setting. •In transparent color-luma threshold mode for color keying Specify the Y component value in the GY0 to be compared. •In color replacement mode for color keying Specify the G/Y component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	Bm[7:0]	0h	RW	B*/Cb Component Data in Color Keying Color Information-m •In transparent color-matched color mode for color keying Specify the B component value for comparison enabled through the VI6_RPF0_CKEY_CTRL.SAPEm setting. When the RPF0 input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored. •In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. •In color replacement mode for color keying Specify the B component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Note 1. When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not 8 bits, the lower-order bits of input data are extended as specified through VI6_RPF0_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PICT_STRD_Y [15:0]	0h	RW	Memory Stride of Source Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPF0. A value from 0 to 65535 can be specified. Refer to **Figure 9.9-16** for settings.
15 to 0	PICT_STRD_C [15:0]	0h	RW	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPF0. When an RGB-format picture is read, these bits do not need to be set. A value from 0 to 65535 can be specified. Refer to **Figure 9.9-16** for settings. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

This register specifies the memory stride of the picture planes in the source area as shown in **Figure 9.9-16**. The memory stride of the α plane should be specified through VI6_RPF0_SRCM_ASTRIDE.ALPH_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in **Figure 9.9-16**. When the α plane is used, the α plane is also read. According to the image format and the necessity of the α plane, specify the necessary addresses where the source image is stored (VI6_RPF0_SRCM_ADDR_Y, VI6_RPF0_SRCM_ADDR_C*, and VI6_RPF0_SRCM_ADDR_AI).

Whether the α plane needs to be read is determined according to the α plane selection method and IROP operation type. For details, refer to **9.9.1.3.6 (6) RPF0 α Plane Selection Control Registers (VI6_RPF0_ALPH_SEL)**.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C0[31:0]	0h	RW	Source Image C Plane Storing Address 0 These bits specify in 1-byte units the start address of the source image C plane read by the RPF0. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Table 9.9-8** or the Cb plane when a planar format is selected. When an interleaved format is selected or the RPF input is in an RGB format, this setting is not used. A value from 0000_0000h to FFFF_FFFFh can be specified. Refer to **Figure 9.9-16** in **9.9.1.3.6 (13)** for settings.

(17) RPF0 Source Chroma Address Registers 1 (VI6_RPF0_SRCM_ADDR_C1)

Access Size : 32 bits
Address : <VSPI0_base> + 0344h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9.9.1.3.7 WPF Control Registers

(1) WPF0-Source-RPF Registers (VI6_WPF0_SRCRPF)

Access Size : 32 bits
Address : <VSPI0_base> + 1000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RPF0_ACT[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29, 28	-	0h	RW	Reserved These bits are always read as 0. The write value should always be 0.
27, 26	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
25, 24	-	0h	RW	Reserved These bits are always read as 0. The write value should always be 0.
23 to 10	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
9 to 2	-	0h	RW	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	RPF0_ACT[1:0]	0h	RW	RPF0 Start Enable (RPF0_ACT) These bits enable start of RPF0 as the source RPF for the WPF0 when the WPF0 is started. When RPF0 is not started by WPF0, set the VI6_DPR_RPF0_ROUTE.RT_RPF0 bits to D'63. 00b: RPF0 is not started. 01b: RPF0 is started as the master-source RPF for the WPF0. 10b: RPF0 is started as the master-layer source RPF for the WPF0. 11b: Setting prohibited

(2) WPF0 Horizontal Input Size Clipping Registers (VI6_WPF0_HSZCLIP)

Access Size : 32 bits
Address : <VSPI0_base> + 1004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HCEN	-	-	-	-	HCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	HCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28	HCEN	0h	RW	Horizontal Size Clipping Enable/Disable Enables or disables clipping of the horizontal size of the WPF0 input image. 0b: Horizontal size clipping is disabled 1b: Horizontal size clipping is enabled
27 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 16	HCL_OFST[7:0]	0h	RW	Horizontal Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1 (**Figure 9.9-17**). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0, this setting is ignored. For WPF0, specify the left-side offset size (pixels) for the image before rotation. A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 9.9-17** is made, VSPI does not operate correctly.
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 0	HCL_SIZE[12:0]	0h	RW	Horizontal Clipping Size Setting When the HCEN bit is 1, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPF0 input image are discarded. When the HCEN bit is 0, this setting is ignored. For WPF0, specify the horizontal clipping size for the image before rotation. A value from 1 to 8190 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 9.9-17** is made, VSPI does not operate correctly. (Note) When the WPF0 does not execute 90° or 270° rotation (bit 2 in VI6_WPF0_OUTFMT.ROT is 0) and the WPF0 output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits. When the WPF0 executes 90° or 270° rotation (bit 2 in VI6_WPF0_OUTFMT.ROT is 1) and the WPF0 output format is YCbCr4:2:0, specify an even value in these bits.

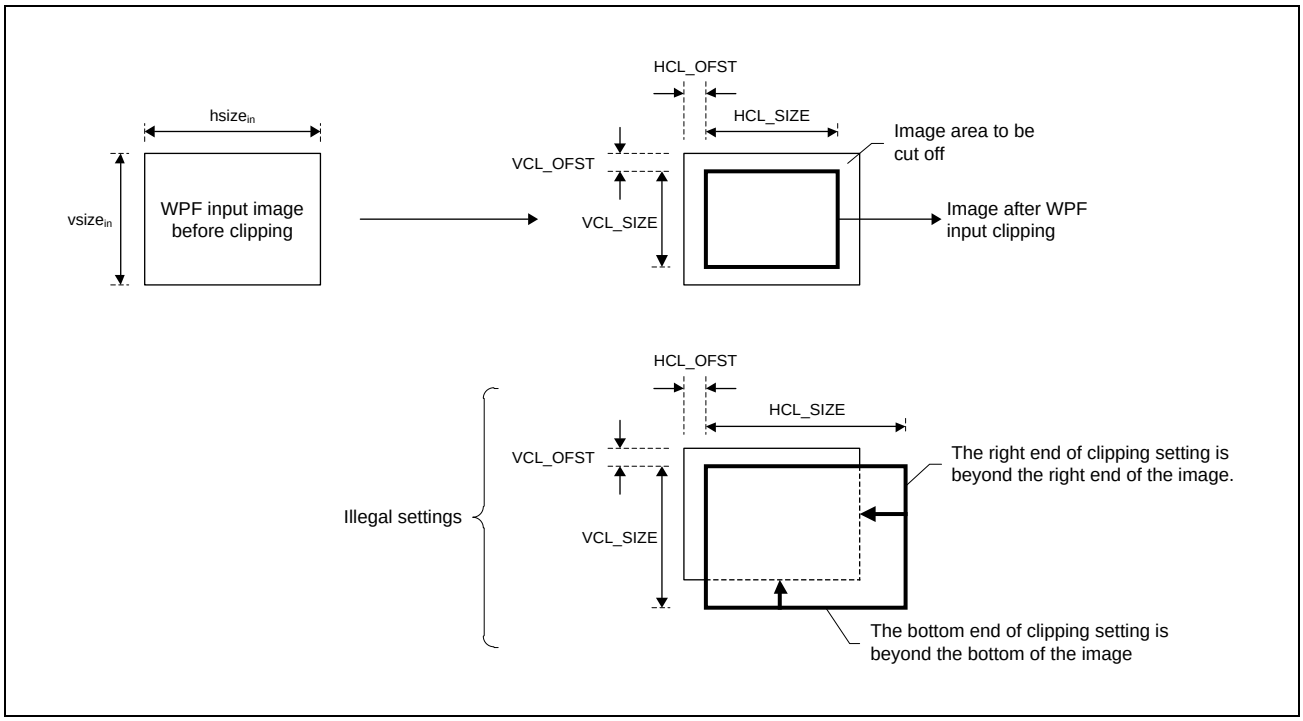

Figure 9.9-17 Image Clipping in WPF Input Section

(3) WPF0 Vertical Input Size Clipping Registers (VI6_WPF0_VSZCLIP)

Access Size : 32 bits
Address : <VSPI0_base> + 1008h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	VCEN	-	-	-	-	VCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28	VCEN	0h	RW	Vertical Size Clipping Enable/Disable Enables or disables clipping of the vertical size of the WPF0 input image. 0b: Vertical size clipping is disabled 1b: Vertical size clipping is enabled
27 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 16	VCL_OFST[7:0]	0h	RW	Vertical Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the top end of the image in vertical size clipping when the VCEN bit is 1b (**Figure 9.9-17**). The top of the image input to the WPF is cut off for the size specified in these bits. When the VCEN bit is 0, this setting is ignored. For WPF0, specify the top offset size (pixels) for the image before rotation. A value from 0 to 255 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 9.9-17** is made, VSPI does not operate correctly.
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 0	VCL_SIZE[12:0]	0h	RW	Vertical Clipping Size Setting When the VCEN bit is 1, these bits specify the clipping size for vertical clipping processing. Through this processing, the area of the vertical size specified through the VCL_SIZE bits starting from the offset position specified through the VCL_OFST bits is determined as the valid image area. Accordingly, the bottom pixels beyond the (VCL_OFST + VCL_SIZE) size in the WPF0 input image are discarded. When the VCEN bit is 0, this setting is ignored. For WPF0, specify the vertical clipping size for the image before rotation. A value from 1 to 8190 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 9.9-17** is made, VSPI does not operate correctly. (Note) When the WPF0 does not execute 90° or 270° rotation (bit 2 in VI6_WPF0_OUTFMT.ROT is 0) and the WPF0 output format is YCbCr4:2:0, specify an even value in these bits. When the WPF0 executes 90°or 270° rotation (bit 2 in VI6_WPF0_OUTFMT.ROT is 1) and the WPF0 output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits.

(4) WPF0 Output Format Registers (VI6_WPF0_OUTFMT)

Access Size : 32 bits
Address : <VSPI0_base> + 100Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDV[7:0]								PXA	ODE	-	-	-	ROT[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPYCS	SPUVS	DITH[1:0]		WRTM[2:0]			CSC	-	WRFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV[7:0]	0h	RW	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in **Table 9.9-15**. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified.
23	PXA	0h	RW	PAD Data Select Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in **Table 9.9-15**. Both the value specified in the PDV bits and the α data input from the DPR to WPF are 8 bits, but some of the PAD and P bit fields shown in **Table 9.9-15** are four bits or one bit. When the target bit field is not 8 bits, the number of bits in the PDV value and the α data input from the DPR to WPF is reduced according to the VI6_WPF0_RNDCTRL.ABRM setting. For bit count reduction, refer to **Figure 9.9-18** and the description of VI6_WPF0_RNDCTRL.ABRM. 0b: The value specified in the PDV bits is stored in the PAD shown in **Table 9.9-15**. 1b: The α value output from DPR in pixel units is stored in the PAD shown in **Table 9.9-15**.
22	ODE	0h	RW	Ordered Dither (mode A) Enable/Disable 0b: Ordered dither (mode A) is disabled. 1b: Ordered dither (mode A) is enabled. When the output format specified through the WRFMT bits is YCbCr, specify 0 in this bit. And when VI6_WPF0_OUTFMT.CSC is set to 1, specify 0 in this bit even in the case that the output format specified through the WRFMT bits is RGB. Ordered dither is available only for 18bpp. So, when ODE bit is equal to 1, set WRFMT at 18bpp format. When ODE bit is equal to 0, WPF dither method is specified by DITH[1:0] in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
21	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
20	-	0h	RW	Reserved These bits are read as 0b. The write value should always be 0b.
19	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	ROT[2:0]	0h	RW	Rotation Processing Select These bits select the rotation/flipping processing to be applied to the WPF0 output image. 90° rotation and 270° rotation are done clockwise. **Figure 9.9-19** and **Figure 9.9-20** show the correspondence between the original image and the rotation/flipping result according to each setting. 000b: No rotation or flipping 001b: Vertical flipping 010b: Horizontal flipping 011b: 180° rotation 100b: 90° rotation 101b: 90° rotation + vertical flipping (equal to 270° rotation + horizontal flipping) 110b: 90° rotation + horizontal flipping (equal to 270° rotation + vertical flipping) 111b: 270° rotation Rotation/flipping can be specified only in VSPI - WPF0. In other channels, refer to **9.9.1.5.4** for restriction of these bits. Note that the destination address setting should be changed according to the setting of these bits. For details, refer to **9.9.1.3.7 (10)**. When the LIF module is used (VI6_LIF_CTRL.LIF_EN = 1), set 0 to ROT [2:0].
15	SPYCS	0h	RW	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (47h). When the output format is YVYU, set this bit and the SPUVS bit to 1 and set the WRFMT bits to 71 (47h). In other cases, set this bit to 0.
14	SPUVS	0h	RW	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (41h). When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (42h). When the output format is YVYU, set this bit and the SPYCS bit to 1 and set the WRFMT bits to 71 (47h). In other cases, set this bit to 0.
13, 12	DITH[1:0]	0h	RW	Ordered Dither (mode B) Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (260000 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. And when VI6_WPF0_OUTFMT.CSC is set to 1, specify 0 in these bits even in the case that the output format specified through the WRFMT bits is RGB. 00b: Dithering (mode B) is disabled 11b: Dithering (mode B) is enabled 01b, 10b: Setting prohibited When ODE bit in the register is 1, set this bit to 0.
11 to 9	WRTM[2:0]	0h	RW	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is YCbCr, or YCbCr to RGB when the format specified in the WRFMT bits is RGB. 000b: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 001b: BT.601 YCbCr [0,255] ↔ RGB [0,255] 010b: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 011b: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 100b to 111b: Setting prohibited
8	CSC	0h	RW	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPF0. The characteristics of color space conversion are determined by the WRTM setting. There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to (*1) in **9.9.1.3.6 (3)**, RPF0 Input Format Registers (VI6_RPF0_INFMT). 0b: Color space is not converted. 1b: Color space is converted.
7	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	WRFMT[6:0]	0h	RW	WPF Output Image Format Setting These bits select the format of the image output from the WPF0 to the external memory from among those listed in **Table 9.9-15** and **Table 9.9-16**. [Note 1] Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF → DPR → target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (up-scales, down-scales, or clips) the image size, take special care about the module or function settings. In addition, note the rotation function of the WPF shown in **Figure 9.9-4** When 90° or 270° rotation is used (bit 2 in the ROT bits has a value of 1), the horizontal size of the WPF output image is equal to the vertical size of the WPF input image, and the vertical size of the output image is equal to the horizontal size of the input image; that is, the horizontal and vertical sizes are switched between the input and output. For example, because of the above restriction on YCbCr4:2:2 that the horizontal output size should be a multiple of 2 pixels, the vertical size of the WPF input should be a multiple of 2 pixels. [Note 2] Output lines in YCbCr4:2:0 In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) (conversion from (A) to (B) in. When vertical flipping is also specified through the ROT bits, the flipping processing is executed last and the chrominance line locations are inverted (lines 1, 3, 5, 7, …) in the output image ((C) in **Figure 9.9-21**). [Note 3] Down sampling of CbCr in horizontal direction in YCbCr4:2:0 or YCbCr4:2:2 In the YCbCr4:2:2 or YCbCr4:2:0 output format, method of down sample of Cb/Cr in horizontal direction is average of neighbor two pixels.

Table 9.9-16 Packed YCbCr Formats for WPF Output

WRFMT[6:0]	Packed YCbCr Output Format	Reference
40h	YCbCr4:4:4 semi-planar	**Figure 9.9-9***4
41h	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
42h	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
43h to 45h	Reserved	—
46h	YCbCr4:4:4 interleaved	**Figure 9.9-10***4
47h	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
48h	YCbCr4:2:2 interleaved type 1	
49h	YCbCr4:2:0 interleaved*5	
4Ah	YCbCr4:4:4 planar	**Figure 9.9-11***4
4Bh	YCbCr4:2:2 planar (YV16)	
4Ch	YCbCr4:2:0 planar (YV12, I420)	
4Dh to 7Fh	Reserved	—

Note 1. When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.

Note 2. When the output format is YUY2, set SPYCS (bit 15) to 1.

Note 3. When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.

Note 4. **Figure 9.9-12** shows the definition of memory address for each pixel in **Figure 9.9-9** to **Figure 9.9-11**.

Note 5. Each line of plane is written twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

For details of each YCbCr format, refer to **Figure 9.9-9**, **Figure 9.9-10**, **Figure 9.9-11**, and **Figure 9.9-12**. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

(RPF registers in the figures)	→	(Corresponding WPF registers)
VI6_RPF0_SRCM_ADDR_Y.SRCM_ADDR_Y	→	VI6_WPF0_DSTM_ADDR_Y.DSTM_ADDR_Y
VI6_RPF0_SRCM_ADDR_C0.SRCM_ADDR_C0	→	VI6_WPF0_DSTM_ADDR_C0.DSTM_ADDR_C0
VI6_RPF0_SRCM_ADDR_C1.SRCM_ADDR_C1	→	VI6_WPF0_DSTM_ADDR_C1.DSTM_ADDR_C1

(5) WPF0 Data Swapping Registers (VI6_WPF0_DSWAP)

Access Size : 32 bits
Address : <VSPI0_base> + 1010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	P_LLS	P_LWS P_LWS	P_WDS	P_BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
3	P_LLS	0h	RW	WPF Output Data Swapping in LONG LWORD Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.9-10**. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
2	P_LWSP_LWS	0h	RW	WPF Output Data Swapping in long word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.9-10**. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
1	P_WDS	0h	RW	WPF Output Data Swapping in Word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.9-10**. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	P_BTS	0h	RW	WPF Output Data Swapping in Byte Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 9.9-10**. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

Table 9.9-10 shows the data order before and after swapping according to the long word, word, half word, and byte swapping settings.

When data order in memory for each format is the same as in **Table 9.9-15** for RGB format and **Figure 9.9-9** to **Figure 9.9-11** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in **Table 9.9-10**.

(6) WPF0 Rounding Control Registers (VI6_WPF0_RNDCTRL)

Access Size : 32 bits
Address : <VSPI0_base> + 1014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	CBRM	-	-	ABRM[1:0]		ATHRESH[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	CLMD[1:0]		-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28	CBRM	0h	RW	Bit Count Reduction Method Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in **Table 9.9-15** and the target bit fields are not 8 bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
27, 26	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
25, 24	ABRM[1:0]	0h	RW	Bit Count Reduction Method Selection for Data Storage in PAD These bits specify the method for reducing the number of bits when the data selected through VI6_WPF0_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in **Table 9.9-15** and the target bit field is four bits or one bit. A value of 10b can be specified only when the packed RGB format specified through VI6_WPF0_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPF0_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored. 00b: Bit count conversion: The lower-order bits are truncated 01b: Bit count conversion: Rounding (rounding off) 10b: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit) 11b: Setting prohibited
23 to 16	ATHRESH[7:0]	0h	RW	Threshold for Conversion to 1-Bit α Data These bits specify the threshold value used for conversion from 8-bit α data to one bit when the ABRM bits are set to 10b. When the 8-bit α value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit α data. In other cases, 1 is stored as the 1-bit α data. A value from 0 to 255 can be specified.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13, 12	CLMD[1:0]	0h	RW	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. 00b: Output value is not clipped (0-255) 01b: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) 10b: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) 11b: Setting prohibited
11 to 0	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

(7) WPF0 Rotation Control Registers (VI6_WPF0_ROT_CTRL)

Access Size : 32 bits

Address : <VSPI0_base> + 1018h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LN16	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	LMEM_WD[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
17	LN16	0h	RW	16-Line Rotation Mode Selects the mode for rotation processing. The 16-line rotation mode can improve the bus transfer efficiency in rotation processing, but the maximum horizontal image size that can be rotated is one half of that in 8-line rotation mode. 0b: 8-line rotation mode 1b: 16-line rotation mode Set 1 to this bit for transfer efficiency.
16 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 0	LMEM_WD [12:0]	0h	RW	Rotation Memory Word Count Always specify 256 here.

(8) WPF0 Destination Y Plane Memory Stride Registers (VI6_WPF0_DSTM_STRIDE_Y)

Access Size : 32 bits
Address : <VSPI0_base> + 101Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_Y[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
15 to 0	PICT_STRD_Y [15:0]	0h	RW	Memory Stride of Destination Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPFn as shown in **Figure 9.9-22**. A value from 0000h to FFFFh can be specified.

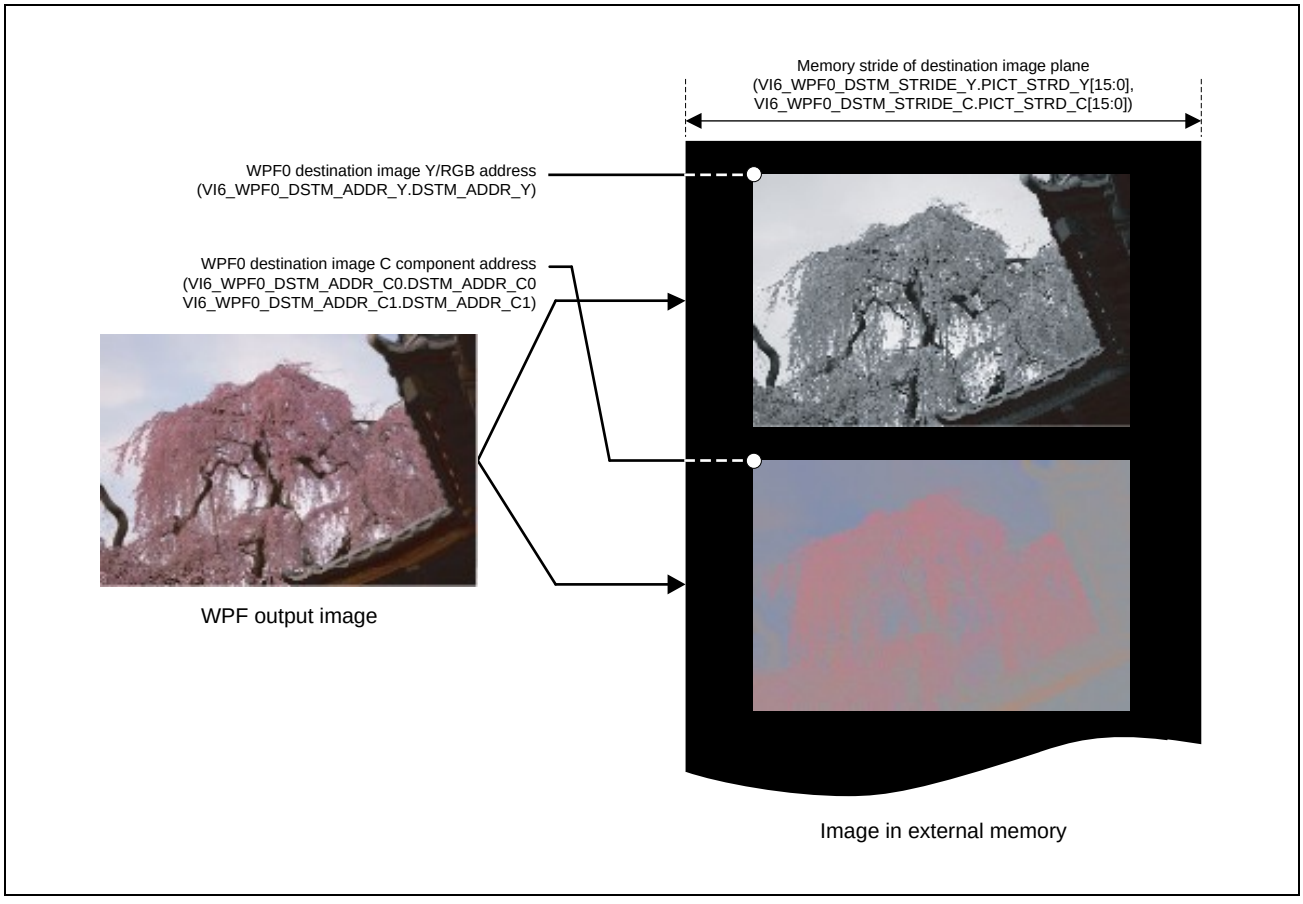

Figure 9.9-22 Writing Image Data to Destination Area in WPF0

(9) WPF0 Destination C Plane Memory Stride Registers (VI6_WPF0_DSTM_STRIDE_C)

Access Size : 32 bits

Address : <VSPI0_base> + 1020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
15 to 0	PICT_STRD_C [15:0]	0h	RW	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPF0 as shown in **Figure 9.9-22**. When the WPF0 outputs images in an RGB format, this setting is not used. When the WPF0 outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from 0000h to FFFFh can be specified.

(10) WPF0 Destination Y/RGB Address Registers (VI6_WPF0_DSTM_ADDR_Y)

Access Size : 32 bits
Address : <VSPI0_base> + 1024h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_Y[31:16]

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_Y[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_Y [31:0]	0h	RW	Destination Image Y/RGB Plane Storing Address These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPF0 in the method described later. A value from 0000_0000h to FFFF_FFFFh can be specified.

[Destination Address Specification Method]

When rotation/flipping is not used, the start addresses of a frame (address FHA shown in **Figure 9.9-23**) should be specified as the destination address. When flipping/rotation is used, the destination address is not the frame start address (FHA); one of addresses A0 to A3 shown in **Figure 9.9-23** should be selected according to the combination of desired rotation and flipping (VI6_WPF0_OUTFMT.ROT setting).

To strictly define locations A0 to A3, let the horizontal size of the output image after rotation be H, the vertical size of the output image after rotation be V, and the memory stride (VI6_WPF0_DSTM_STRIDE_Y/C setting) be S as shown in **Figure 9.9-23**. Calculate the destination address (one of A0 to A3) using the formula shown in **Table 9.9-17** and specify it in the destination address storing register.

The values of variables N, P, and L in **Table 9.9-17** depend on the other register settings and luminance and chrominance components. These values should be obtained by referring to **Table 9.9-18** to **Table 9.9-20** when calculating the address to be specified in VI6_WPF0_DSTM_ADDR_Y, or **Table 9.9-18**, **Table 9.9-21**, and **Table 9.9-22** when calculating the address to be specified in VI6_WPF0_DSTM_ADDR_C0 or VI6_WPF0_DSTM_ADDR_C1.

(11) WPF0 Destination Chroma Address Registers 0 (VI6_WPF0_DSTM_ADDR_C0)

Access Size : 32 bits
Address : <VSPI0_base> + 1028h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_C0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_C0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_C0[31:0]	0h	RW	Destination Image C Plane Storing Address 0 These bits specify in 1-byte units the address for storing the destination-image C plane to be written to by the WPF0. Refer to the description of VI6_WPF0_DSTM_ADDR_Y for settings. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Table 9.9-16** or the Cb plane when a planar format is selected. When an interleaved format is selected or the output is in an RGB format, this setting is not used. A value from 0000_0000h to FFFF_FFFFh can be specified. Refer to **Figure 9.9-23** in **9.9.1.3.7** for settings.

(12) WPF0 Destination Chroma Address Registers 1 (VI6_WPF0_DSTM_ADDR_C1)

Access Size : 32 bits
Address : <VSPI0_base> + 102Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_C1[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_C1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_C1[31:0]	0h	RW	Destination Image C Plane Storing Address 1 These bits specify in 1-byte units the address for storing the Cr plane when the WPF0 outputs images to the external memory in YCbCr planar format shown in **Table 9.9-16**. Refer to the description of VI6_WPF0_DSTM_ADDR_Y for settings. This setting is not used when the WPF outputs in YCbCr format that is not a planar format or in an RGB format. A value from 0000_0000h to FFFF_FFFFh can be specified. Refer to **Figure 9.9-23** in **9.9.1.3.7** for settings.

9.9.1.3.8 DPR Control Registers

(1) Concept of DPR Settings

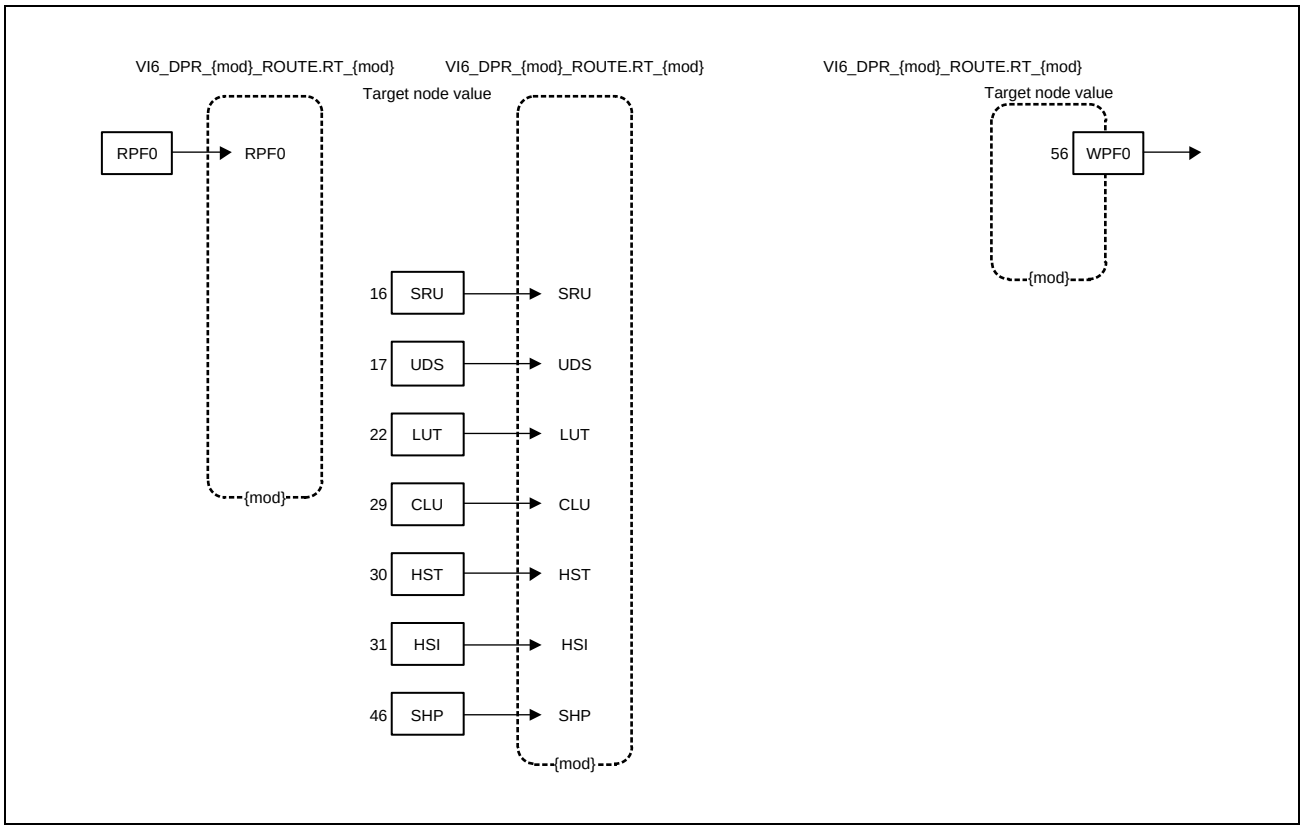

Figure 9.9-24 Node Register Names and Target Node Values on Data Path Router

Remark **Figure 9.9-24** shows node value of all sub modules implemented.

In the VSPI internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value. Set each bit field in VI6_DPR_*_ROUTE to an appropriate node value shown in **Figure 9.9-24**.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, even the WPF paths operating correctly at that time will be affected as well as the WPF paths connected through the DPR, and correct operation will not be guaranteed (for example, if a restriction is violated for the DPR setting related to WPF0 that are operating correctly will be affected).

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value.
2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0) and a target WPF are determined.
3. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.
4. Each node can be used only once throughout all paths from RPF0 to WPF0. When a module shown in **Figure 9.9-24** is assigned in one RPF to WPF path, it cannot be used in another RPF to WPF path.

5. While a WPF is operating, modifying the DPR connection settings in VI6_DPR_*_ROUTE is prohibited for modules used by the WPF but allowed for modules not used by the WPF. Be careful not to accidentally modify the settings of the modules included in the WPF path that is operating.

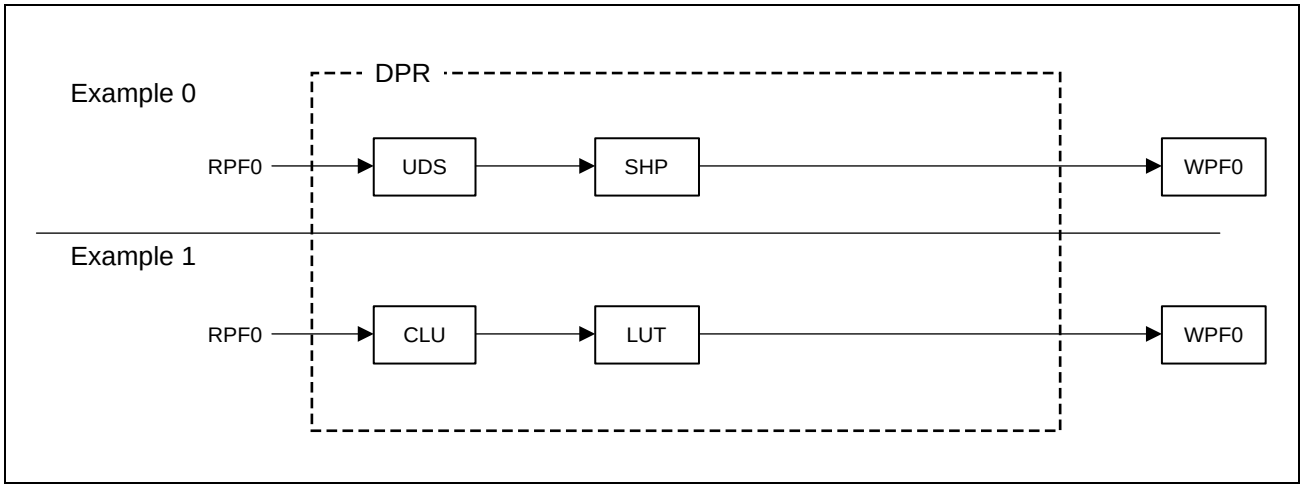

Figure 9.9-25 Examples of Internal Data Path Routing

Figure 9.9-25 shows examples of internal data path routing. Example 0 is WPF0 processing (RPF0 is the source RPF), and example 1 is also WPF0 (RPF0). Each example has the configuration shown in **Figure 9.9-25**. Example 0 performs UDS (up/down scaling) and SHP (sharpness) processing. Example 1 performs CLU and LUT processing (e.g. γ correction), for input 0 (RPF0). The VI6_ DPR_*_ROUTE settings for these examples are shown in **Table 9.9-23**. The bit fields for the modules that are not used in the examples should be set to 63.

Table 9.9-23 VI6_DPR_*_ROUTE Register Settings in Connection Examples Shown in **Figure 9.9-25**

	Register Name	Setting	
Example 0	VI6_DPR_RPF0_ROUTE.RT_RPF0	17	(To UDS)
	VI6_DPR_SRU_ROUTE.RT	63	(UNUSED)
	VI6_DPR_UDS_ROUTE.RT	46	(To SHP)
	VI6_DPR_SHP_ROUTE.RT	56	(To WPF0)
	VI6_DPR_LUT_ROUTE.RT	63	(UNUSED)
	VI6_DPR_CLU_ROUTE.RT	63	(UNUSED)
	VI6_DPR_HST_ROUTE.RT	63	(UNUSED)
	VI6_DPR_HSI_ROUTE.RT	63	(UNUSED)
Example 1	VI6_DPR_RPF0_ROUTE.RT_RPF0	29	(To CLU)
	VI6_DPR_SRU_ROUTE.RT	63	(UNUSED)
	VI6_DPR_UDS_ROUTE.RT	63	(UNUSED)
	VI6_DPR_SHP_ROUTE.RT	63	(UNUSED)
	VI6_DPR_CLU_ROUTE.RT	22	(To LUT)
	VI6_DPR_HST_ROUTE.RT	63	(UNUSED)
	VI6_DPR_HSI_ROUTE.RT	63	(UNUSED)

Although both examples shown in **Figure 9.9-25** include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

(2) RPF0 Routing Register (VI6_DPR_RPF0_ROUTE)

Access Size : 32 bits
Address : <VSPI0_base> + 2000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	RT_RPF0[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
5 to 0	RT_RPF0[5:0]	0h	RW	RPF0 Target Node Value These bits specify the target node value for RPF0. When using RPF0, refer to **Figure 9.9-24** for settings. When RPF0 is not started through the VI6_WPF0_SRCRPF setting, specify 63.

(3) WPF0 Timing Control Register (VI6_DPR_WPF0_FPORCH)

Access Size : 32 bits
Address : <VSPI0_base> + 2014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FP_WPF0[5:0]						-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 8	FP_WPF0[5:0]	0h	RW	WPF0 Internal Operation Timing Setting Specify 5.
7 to 0	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

(4) {mod} Routing Register (VI6_DPR_{mod}_ROUTE) ({mod} = SRU, UDS, LUT, CLU, HST, HSI, SHP)

Access Size : 32 bits

Address : <VSPI0_base> + 2024h/ 2028h/ 203Ch/ 2040h/ 2044h/ 2048h/ 2060h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	FXA[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	FP[5:0]						-	-	RT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28	-	0h	RW	Reserved These bits are read as undefined value. The write value should always be 0b.
27 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 16	FXA[7:0]	0h	RW	Fixed α Output Value for {mod} The {mod} does not support input/output of the α value. The α value input to the {SHP, SRU, LUT, CLU, HST and HSI} is discarded, and the fixed α value specified in these bits is always output from the {SHP, SRU, LUT, CLU, HST and HSI}. A value from 0 to 255 can be specified. These bits are valid for SHP, SRU, LUT, CLU, HST and HSI modules. For UDS, modules, these bits are reserved.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 8	FP[5:0]	0h	RW	{mod} Internal Operation Timing Setting Specify 0.
7, 6	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
5 to 0	RT[5:0]	0h	RW	{mod}Target Node Value These bits specify the target node value for the {mod}. When using the {mod}, refer to **Figure 9.9-24** for settings. When not using the {mod}, specify 63.

(5) {mod} Sampling Point Register (VI6_DPR_{mod}_SMPPT) ({mod} = HGO, HGT)

Access Size : 32 bits
Address : <VSPI0_base> + 2054h/ 2058h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	TGW[2:0]			-	-	PT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
10 to 8	TGW[2:0]	0h	RW	Target WPF Index for HGO These bits are used for specifying the target WPF index of HGO. If HGO is not used, set 7 to these bits.
7, 6	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
5 to 0	PT[5:0]	0h	RW	Target Node Index for HGO Histogram Sampling HGO generates the histogram for the target node specified by these bits. For example, if these bits are set to 0, HGO module generates the histogram for the output data of RPF0. Refer to below table for the target node index which can be used for HGO. If HGO is not used, set 63 to these bits.

Table 9.9-24 Target Node Index for {mod} Module

Node Index	Module for Histogram Generation
0	RPF0
16	SRU
17	UDS
22	LUT
29	CLU
30	HST
31	HSI
46	SHP

9.9.1.3.9 SRU Control Registers

(1) Super Resolution Control Register 0 (VI6_SRU_CTRL0)

Access Size : 32 bits
Address : <VSPI0_base> + 2200h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	SRU_PARAM0[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	SRU_PARAM1[4:0]					-	SRU_MODE[2:0]			SRUPARAM2	SRUPARAM3	SRUPARAM4	SRU_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
24 to 16	SRU_PARAM0 [8:0]	0h	RW	Super Resolution Parameter 0 Specify an appropriate value shown in **Table 9.9-25**; do not specify any other value.
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 8	SRU_PARAM1 [4:0]	0h	RW	Super Resolution Parameter 1 Specify an appropriate value shown in **Table 9.9-25**; do not specify any other value.
7	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
6 to 4	SRU_MODE [2:0]	0h	RW	Super Resolution Mode Setting These bits specify a super resolution mode. In super resolution without scaling, the output size is the same as the input size. In super resolution with double scale-up, the output size is twice the input size. 000b: Super resolution without scaling 100b: Super resolution with double scale-up Other settings are prohibited.
3	SRUPARAM2	0h	RW	Super Resolution Parameter 2 This parameter setting depends on the color space of the image input to the SRU. Specify an appropriate value shown in **Table 9.9-26**; do not specify any other value.
2	SRUPARAM3	0h	RW	Super Resolution Parameter 3 Specify an appropriate value shown in **Table 9.9-26**; do not specify any other value.
1	SRUPARAM4	0h	RW	Super Resolution Parameter 4 This parameter setting depends on the color space of the image input to the SRU. Specify an appropriate value shown in **Table 9.9-26**; do not specify any other value.
0	SRU_EN	0h	RW	Super Resolution Processing Enable/Disable Enables or disables super resolution processing. This setting has the highest priority over all other SRU registers. 0b: Super resolution processing is disabled (input goes through the SRU without change) 1b: Super resolution processing is enabled

YCbCr format is recommended for the super resolution processing. If the super resolution processing is applied to an RGB-format image, adverse effects such as color blur may be generated; when using an RGB format, evaluate the image quality carefully before applying the processing to practical use.

To execute the super resolution processing in YCbCr format, set up the RPF and DPR appropriately so that YCbCr-format image data is input to the SRU. Specifically, make the RPF0 output YCbCr-format image data and send the output data to the SRU through the DPR. For details of RPF0 input/output settings, refer to **9.9.1.3.6 (3) RPF0 Input Format Registers (VI6_RPF0_INFMT)**. For DPR settings, refer to **9.9.1.3.8 (1) Concept of DPR Settings** to

9.9.1.3.8 (4) {mod} Routing Register (VI6_DPR_{mod}_ROUTE) ({mod} = SRU, UDS, LUT, CLU, HST, HSI, SHP).

Table 9.9-25 Super Resolution Parameter Setting 1

Intensity		VI6_SRU_CTRL0			VI6_SRU_CTRL1	VI6_SRU_CTRL2		
		SRU_MODE	SRU_PARAM0	SRU_PARAM1	SRU_PARAM5	SRU_PARAM6	SRU_PARAM7	SRU_PARAM8
Weak	1	0 or 4	256	4	7FFh	24	40	255
	2	0 or 4	256	4	7FFh	8	16	255
	3	0 or 4	384	5	7FFh	36	60	255
	4	0 or 4	384	5	7FFh	12	27	255
	5	0 or 4	511	6	7FFh	48	80	255
Strong	6	0 or 4	511	6	7FFh	16	36	255

Table 9.9-26 Super Resolution Parameter Setting 2

Color Space of SRU Input Image	SRU_PARAM2	SRU_PARAM3	SRU_PARAM4
YCbCr*1	0	1	0
RGB	1	1	1

Note 1. YCbCr format is recommended for the image input to the SRU.

(2) Super Resolution Control Register 1 (VI6_SRU_CTRL1)

Access Size : 32 bits
Address : <VSPI0_base> + 2204h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9.9.1.3.10 UDS Control Registers

(1) Scaling Control Registers (VI6_UDS_CTRL)

Access Size : 32 bits
Address : <VSPI0_base> + 2300h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	AMD	FMD	BLADV	-	-	AON	ATHON	-	-	-	BC	NE_A	NE_RCR	NE_GY	NE_BCB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	R	R	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	AMDSLH	EXT (TDIPC)	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
30	AMD	0h	RW	Pixel Count at Scale-Up Specifies the number of pixels generated through scale-up in the UDS. This bit setting is ignored for scale-down. 0b: Pixel count after scale-up is 1 + < (n - 1) × scale-up factor > 1b: Pixel count after scale-up is 1 + < n × scale-up factor > *n: Number of pixels input to UDS
29	FMD	0h	RW	Padding for Insufficient Clipping Size When the scaling filter outputs an image that is smaller than the clipping size (VI6_UDS_CLIP_SIZE), pixels are interpolated to match the clipping size. This bit specifies the pixel filling method. 0b: Pixels are filled by copying pixels at the right edge and the bottom edge 1b: Pixels are filled with the color specified by VI6_UDS_FILL_COLOR
28	BLADV	0h	RW	Bilinear or Nearest Neighbor Interpolation Characteristic Control Controls the characteristics of bilinear or nearest neighbor interpolation. Setting this bit to 1 improves the aliasing characteristics at ×1/2 to 1/8 scaling (VI6_UDS_SCALE.VMANT/HMANT = 2 to 8). Note that the apparent resolution around edges may deteriorate. In multi-tap mode, this control is not available; to use this control, set the BC bit to 0.
27, 26	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
25	AON	0h	RW	Scale-Up/Down of α Plane These bits specify whether to enable or disable scale-up/-down of the α plane when scaling up/down in the RGB format. When the AON bit is set to 0, the UDS outputs the value of the VI6_UDS_ALPVAL. ALPH_VAL0 bits as a fixed α value. 0b: α scale-up/-down is not performed 1b: α scale-up/-down is performed
24	ATHON	0h	RW	α Output Data Threshold Comparison Enable/Disable Enables or disables comparison with the α output data threshold. When this bit is 1, the output α value is replaced according to the VI6_UDS_ALPTH and VI6_UDS_ALPVAL values. When the AON bit is 0 (scale-up/-down of the α plane is disabled), this bit setting has no effect. 0b: α output data threshold comparison is disabled 1b: α output data threshold comparison is enabled
23 to 21	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
20	BC	0h	RW	Pixel Component Interpolation Method at Scale-Up/Down Specifies the method for interpolating pixel components at scale-up/-down. 0b: Bilinear or nearest neighbor interpolation method is used 1b: Interpolation method equivalent to 4 to 17 taps in accordance with the scaling factor is used (multi-tap mode) Setting 1 to BC bit (Multi tap mode) is recommended. Note that the α component is interpolated by the method specified in the NE_A bit instead of the multi-tap method. When the BC and AON bits are both set to 1, the scaling shall be scale-up, no scaling, or scale-down with scaling factor 1/1 to 1/2.
19	NE_A	0h	RW	α Interpolation Method Specifies the interpolation method of the α plane. When the AON bit is 0 (scale-up/-down of the α plane is disabled), this bit setting has no effect. 0b: Bilinear method 1b: Nearest neighbor method*1
18	NE_RCR	0h	RW	α Interpolation Method Specifies the interpolation method of the α plane. When the AON bit is 0 (scale-up/-down of the α plane is disabled), this bit setting has no effect. 0b: Bilinear method 1b: Nearest neighbor method*1
17	NE_GY	0h	RW	G/Y Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the G/Y component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0b: Bilinear method 1b: Nearest neighbor method*1
16	NE_BCB	0h	RW	B/Cb Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the B/Cb component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0b: Bilinear method 1b: Nearest neighbor method*1
15 to 3	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
2	AMDSLH	0h	RW	Horizontal Filter Phase 0b: The horizontal start and end phase is automatically determined by the setting of AMD. In this case, the value of VI6_UDS_HPHASE.HSTP/HEDP is not valid. 1b: The horizontal start and end phase is determined by the value of VI_UDS_HPHASE.HSTP/HEDP.
1	EXT (TDIPC)	0h	RW	Extended UDS function Enable/Disable Select 0b: Extended UDS function Disable 1b: 2D IPC function or low pass filter Enable UDS execute 2D IPC function based on this bit and the setting of VI6_UDS_IPC register. UDS execute low pass filter based on this bit and the setting of VI6_UDS_IPC register. See **9.9.1.3.10 (7)**, 2D IPC Setting Register (VI6_UDS_IPC) for more details.
0	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

Note 1. This method can be used only when the scale-up/-down factor is 1/1 to 1/4.

(2) Scaling Factor Registers (VI6_UDS_SCALE)

Access Size : 32 bits
Address : <VSPI0_base> + 2304h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	HMANT[3:0]				HFRAC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VMANT[3:0]				VFRAC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	HMANT[3:0]	0h	RW	Multiplier (Integral Part) of Horizontal Scaling Factor These bits specify the integral part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from 0h to Fh can be specified. Select a value within the range shown in **Table 9.9-27**.
27 to 16	HFRAC[11:0]	0h	RW	Multiplier (Fractional Part) of Horizontal Scaling Factor These bits specify the fractional part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from 100h to FFFh can be specified when an image is up-scaled (the HMANT value is 0) in the horizontal direction. A value from 000h to FFFh can be specified when an image is downscaled (the HMANT value is not 0) in the horizontal direction. Select a value within the range shown in **Table 9.9-27**.
15 to 12	VMANT[3:0]	0h	RW	Multiplier (Integral Part) of Vertical Scaling Factor These bits specify the integral part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from 0h to Fh can be specified. Select a value within the range shown in **Table 9.9-27**.
11 to 0	VFRAC[11:0]	0h	RW	Multiplier (Fractional Part) of Vertical Scaling Factor These bits specify the fractional part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from 100h to FFFh can be specified when an image is up-scaled (the VMANT value is 0) in the vertical direction. A value from 000h to FFFh can be specified when an image is downscaled (the VMANT value is not 0) in the vertical direction. Select a value within the range shown in **Table 9.9-27**.

The HMANT and HFRAC bits set the scale-up/-down factor for an image in the horizontal direction, and the VMANT and VFRAC bits set the scale-up/-down factor for an image in the vertical direction. The UDS operation switches between horizontal scale-up and horizontal scale-down according to the HMANT and HFRAC bit settings, as shown in **Table 9.9-27**. (Setting a value outside the ranges of **Table 9.9-27** in UDS operation is prohibited). **Table 9.9-27** is for the horizontal direction, but it is similar for the vertical direction. In this case, replace HMANT with VMANT and HFRAC with VFRAC when reading.

Note that settings for scaling in the horizontal direction and settings for scaling in the vertical direction can be made independently. Therefore, a setting for scale-up in the horizontal direction and scale-down in the vertical direction is possible. In such a case, because the formula (described later) for obtaining the image size after scale-up/-down is different between scale-up and scale-down, a formula matching the scale-up or scale-down operation should be selected independently for the horizontal direction and vertical direction.

Table 9.9-27 Switching of Horizontal Scale-Up/Down Operation According to HMANT and HFRAC Bit Settings

HMANT	HFRAC	UDS Operation
0h	100h to FFFh	Scale-up
1h	000h	Same size (no scale-up/-down)
	001h to FFFh	Scale-down
2h to Fh	000h to FFFh	

Described here is the method for calculating the size of the up-scaled/downscaled image that was obtained based on this register setting. First, define the variables necessary for calculating the horizontal size of the up-scaled/downscaled image, as shown below.

$$hscale = \frac{4096}{4096 \times m_h \times f_h}$$

m_h is the value of VI6_UDS_SCALE.HMANT, and f_h is the value of VI6_UDS_SCALE.HFRAC. This formula expresses the estimate of the scale-up/-down factor processed by the UDS. If the horizontal size of the image before scale-up/-down is set as $hsize_{org}$, the horizontal size of the image after scale-up/-down can be roughly obtained through $hsize_{org} \times hscale$.

Similarly, define the variables necessary for calculating the vertical size of the up-scaled/down-scaled image.

$$vscale = \frac{4096}{4096 \times m_v \times f_v}$$

When setting mv as the value of VI6_UDS_SCALE.VMANT, f_v as the value of VI6_UDS_SCALE.VFRAC, and $vsize_{org}$ as the vertical size of the image before scale-up/-down, the vertical size of the image after scale-up/-down can be roughly obtained through $vsize_{org} \times vscale$.

When the UDS performs scale-down with the settings of **Table 9.9-27**, using the variables defined so far, the horizontal size of the downscaled image $hsize_{down_scaled}$ and the vertical size of the downscaled image $vsize_{down_scaled}$ become as follows:

$$hsize_{down_scaled} = \left\langle 1 + \left(\left(\left\langle 1 + \frac{\langle hsize_{org} - 1 \rangle}{m_h{}'} \right\rangle - 1 \right) \times m_h{}' \times 4096 + hstp + hedp \right) / (4096 \times m_h + f_h) \right\rangle$$

$$vsize_{down_scaled} = \left\langle 1 + \left(\left(\left\langle 1 + \frac{\langle vsize_{org} - 1 \rangle}{m_v{}'} \right\rangle - 1 \right) \times m_v{}' \times 4096 \right) / (4096 \times m_v + f_v) \right\rangle$$

$hstp$ is the value of VI6_UDS_HPHASE.HSTP, $hedp$ is the value of VI6_UDS_HPHASE.HEDP.

The value of $m_h{}'$ or $m_v{}'$, which is shown in **Table 9.9-28**, changes according to the setting of VI6_UDS_SCALE.HMANT or VI6_UDS_SCALE.VMANT and VI6_UDS_CTRL.BLADV.

Table 9.9-28 m_h' or m_v' Setting

VI6_UDS_SCALE.HMANT Setting (VI6_UDS_SCALE.VMANT Setting)	VI6_UDS_CTRL.BLADV	m_h' (m_v')
0 to 3	0	1
4 to 7	0	2
8 to 15	0	4
2 to 3	1	2
4 to 7	1	4
0, 1, 8 to 15	1	Forbidden

When the UDS performs scale-up with the settings of **Table 9.9-27** and VI6_UDS_CTRL.AMD is 0, the horizontal size of the up-scaled image $hsize_{up_scaled}$ and the vertical size of the up-scaled image $vsize_{up_scaled}$ become as follows:

$$hsize_{up_scaled} = \left\langle 1 + \frac{(hsize_{org} - 1) \times 4096 + hstp + hedp}{4096 \times m_h + f_h} \right\rangle$$

$$vsize_{up_scaled} = \left\langle 1 + \frac{(vsize_{org} - 1) \times 4096}{4096 \times m_v + f_v} \right\rangle$$

When VI6_UDS_CTRL.AMD is 1, the horizontal size of the up-scaled image $hsize_{up_scaled}$ and the vertical size of the up-scaled image $vsize_{up_scaled}$ become as follows:

$$hsize_{up_scaled} = \langle hsize_{org} \times hscale \rangle$$

$$vsize_{up_scaled} = \langle vsize_{org} \times vscale \rangle$$

After considering the division of hscale and vscale, the formulas become as follows:

$$hsize_{up_scaled} = \left\langle \frac{hsize_{org} \times 4096}{4096 \times m_h + f_h} \right\rangle$$

$$vsize_{up_scaled} = \left\langle \frac{vsize_{org} \times 4096}{4096 \times m_v + f_v} \right\rangle$$

(3) α Data Threshold Setting Registers (VI6_UDS_ALPTH)

Access Size : 32 bits

Address : <VSPI0_base> + 2308h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
15 to 8	ALPH_TH1[7:0]	0h	RW	α Data Threshold Setting 1 When the α value is equal to or greater than the value of the ALPH_TH1 bits, the α value is replaced with that of VI6_UDS_ALPVAL.ALPH_VAL2. When VI6_UDS_CTRL.AON is 0 (scale-up/-down of the α plane is disabled), the setting of these bits has no effect. A value from 00h to FFh can be specified.
7 to 0	ALPH_TH0[7:0]	0h	RW	α Data Threshold Setting 0 When the α value is equal to or smaller than the value of the ALPH_TH0 bits, the α value is replaced with that of VI6_UDS_ALPVAL.ALPH_VAL0. When VI6_UDS_CTRL.AON is 0 (scale-up/-down of the α plane is disabled), the setting of these bits has no effect. A value from 00h to FFh can be specified.

(4) α Data Replacing Value Setting Registers (VI6_UDS_ALPVAL)

Access Size : 32 bits
Address : <VSPI0_base> + 230Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	ALPH_VAL2[7:0]

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 16	ALPH_VAL2 [7:0]	0h	RW	Replacing α Value Setting 2 These bits set a value that replaces the α value when it is equal to or greater than the value of VI6_UDS_ALPTH.ALPH_TH1. When VI6_UDS_CTRL.AON is 0 (scale-up/-down of the α plane is disabled), the setting of these bits has no effect. A value from 00h to FFh can be specified.
15 to 8	ALPH_VAL1 [7:0]	0h	RW	Replacing α Value Setting 1 These bits set a value that replaces the α value when it is greater than the value of VI6_UDS_ALPTH.ALPH_TH0 and also smaller than that of VI6_UDS_ALPTH.ALPH_TH1. When VI6_UDS_CTRL.AON is 0 (scale-up/-down of the α plane is disabled), the setting of these bits has no effect. A value from 00h to FFh can be specified.
7 to 0	ALPH_VAL0 [7:0]	0h	RW	Replacing α Value Setting 0 These bits set a value that replaces the α value when it is equal to or smaller than the value of VI6_UDS_ALPTH.ALPH_TH0. When VI6_UDS_CTRL.AON is 0 (scale-up/-down of the α plane is disabled), α output value for the UDS is the fixed value specified in these bits. A value from 00h to FFh can be specified.

(5) Passband Registers (VI6_UDS_PASS_BWIDTH)

Access Size : 32 bits
Address : <VSPI0_base> + 2310h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	BWIDTH_H[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	BWIDTH_V[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
22 to 16	BWIDTH_H [6:0]	0h	RW	Horizontal Signal Passband at Image Scale-Up/Down Set these bits following the method described later.
15 to 7	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
6 to 0	BWIDTH_V [6:0]	0h	RW	Vertical Signal Passband at Image Scale-Up/Down Set these bits following the method described later.

The method for setting the passband in the horizontal direction of an image is described. When the VI6_UDS_SCALE.HMANT bits for horizontal scale-up/-down factor setting are not 0, set the BWIDTH_H bits according to the following formula. When the VI6_UDS_SCALE.HMANT bits are 0, set 64 in the BWIDTH_H bits.

$$\mathrm{BWIDTH_H} \left\langle 64 \times \frac{4096 \times {m_h}'}{4096 \times m_h + f_h} \right\rangle \quad (\mathrm{VI6_UDS_SCALE.HMANT} \neq 0)$$

$$\mathrm{BWIDTH_H} = 64 \quad (\mathrm{VI6_UDS_SCALE.HMANT} = 0)$$

m_h is the value of VI6_UDS_SCALE.HMANT, and f_h is the value of VI6_UDS_SCALE.HFRAC. For the ${m_h}'$ value, see **Table 9.9-28**. The method for setting the passband in the vertical direction of an image is similar to that for the horizontal direction described earlier. Since only the correspondence relationship of the registers is changed as shown below, replace the variables in the previous explanation as shown below when reading.

BWIDTH_H → BWIDTH_V

${m_h}' \rightarrow {m_v}'$

$m_h \rightarrow m_v$

$f_h \rightarrow f_v$

VI6_UDS_SCALE.HMANT → VI6_UDS_SCALE.VMANT

VI6_UDS_SCALE.HFRAC → VI6_UDS_SCALE.VFRAC

(6) Scaling Filter Horizontal Phase Registers (VI6_UDS_HPHASE)

Access Size : 32 bits
Address : <VSPI0_base> + 2314h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	HSTP[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	HEDP[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
27 to 16	HSTP [11:0]	0h	RW	Horizontal Starting Phase
15 to 12	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
11 to 0	HEDP [11:0]	0h	RW	Horizontal Ending Phase

This register can be used for the image division mode. When this register is not used, set VI6_UDS_CTRL.AMDSLH to 0, and set HSTP and HEDP to 0. When the value of HSTP or HEDP is not equal to 0, the size is different from the value shown in **9.9.1.3.10 (2) Scaling Factor Registers (VI6_UDS_SCALE)**.

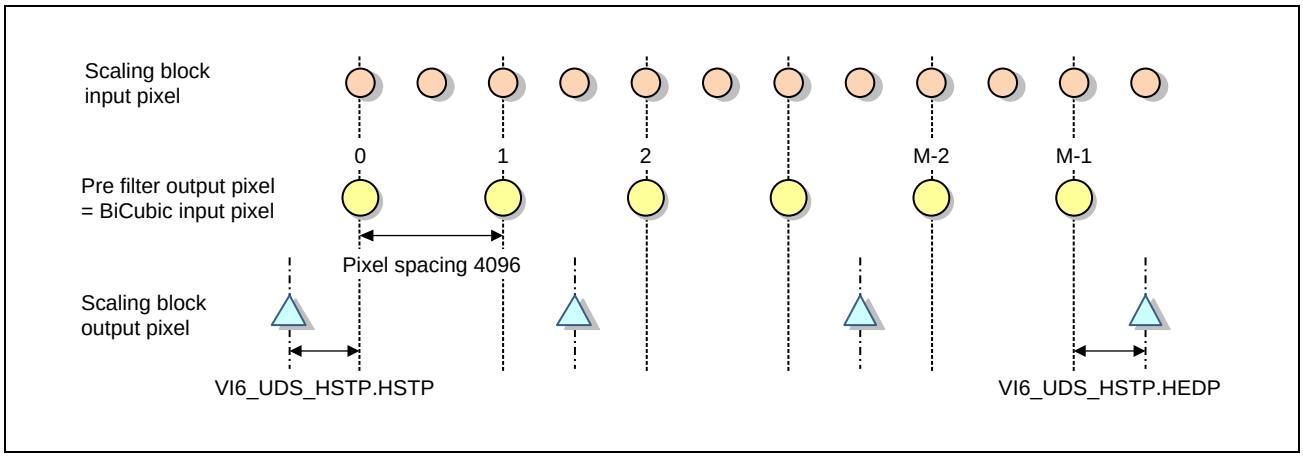

Figure 9.9-26 Horizontal Starting and Ending Phase

(7) 2D IPC Setting Register (VI6_UDS_IPC)

Access Size : 32 bits
Address : <VSPI0_base> + 2318h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	FIELD	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LPFE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
27	FIELD	0h	RW	Top/Bottom Field Select Select Top/Bottom Field of image data when 2D IPC function is enabled (VI6_UDSn_CTRL.EXT = 1). 0b: Top Field 1b: Bottom Field
26 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	LPFE	0h	RW	Low Pass Filter Enable 0b: low pass filter disable 1b: low pass filter enable

IPC setting is shown below.

1. Set 1 to VI6_UDSn_CTRL.EXT.
2. Set UDS register as double up-scale in vertical direction and no scaling in horizontal direction.
3. Set appropriate setting of processing image.

   Top Field: 0000_0000h
   Bottom Field: 0800_0000h
4. Set 0 to VI6_UDS_CTRL.FMD
5. Set 1 to VI6_UDS_CTRL.BC

Low pass filter setting is show in below.

1. Set 1 to VI6_UDS0_CTRL.EXT and set 1 to VI6_UDS0_CTRL.BC
2. Set equal setting (×1) to VI6_UDS_SCALE
3. Set 0 - 64 to VI6_UDS_PASS_BWIDTH. BWIDTH_H for low pass filter in horizontal direction.
4. Set 0 - 64 to VI6_UDS_PASS_BWIDTH. BWIDTH_V for low pass filter in vertical direction.

Strength of low pass filter can be set by VI6_UDS_PASS_BWIDTH.

When UDS is used for IPC processing, low pass filter cannot be enabled.

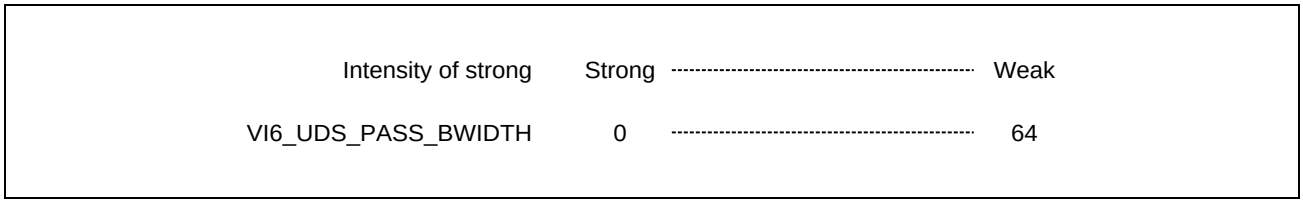

Figure 9.9-27 Strength of Low Pass Filter and Setting of Pass Band Width

(8) UDS Horizontal Input Clipping Registers (VI6_UDS_HSZCLIP)

Access Size : 32 bits
Address : <VSPI0_base> + 231Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HCEN	-	-	-	-	FCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	-	-	-	HCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28	HCEN	0h	RW	Horizontal Input Size Clipping Enable This bit is used for setting the horizontal size clipping of UDS. 0b: Disable Horizontal Size Clipping 1b: Enable Horizontal Size Clipping
27 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 16	FCL_OFST [7:0]	0h	RW	Horizontal Offset Value for Input Size Clipping
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 0	HCL_SIZE [12:0]	0h	RW	Horizontal Clipping Size

This register can be used for the image division mode. If the image partition mode is used, contact to RENESAS for detail.

(9) UDS Output Size Clipping Registers (VI6_UDS_CLIP_SIZE)

Access Size : 32 bits
Address : <VSPI0_base> + 2324h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	CL_HSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	CL_VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28 to 16	CL_HSIZE [12:0]	0h	RW	Clipping Size of Horizontal Pixel Count after Scale-Up/-Down The horizontal width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_HSIZE bits. The setting range is 4 to 2048 in a scale-down operation (see **Table 9.9-27**) and 4 to 8190 in a scale-up operation. These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VI6_UDS_SCALE register.
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 0	CL_VSIZE [12:0]	0h	RW	Clipping Size of Vertical Pixel Count after Scale-Up/-Down The vertical width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_VSIZE bits. The setting range is 4 to 2048 in a scale-down operation (see **Table 9.9-27**) and 4 to 8190 in a scale-up operation. These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VI6_UDS_SCALE register.

Figure 9.9-28 shows the configuration of the UDS. The UDS consists of a scaling filter and clipping circuit, such as the configuration shown in **Figure 9.9-28**. The scaling filter and clipping circuit are independent of each other.

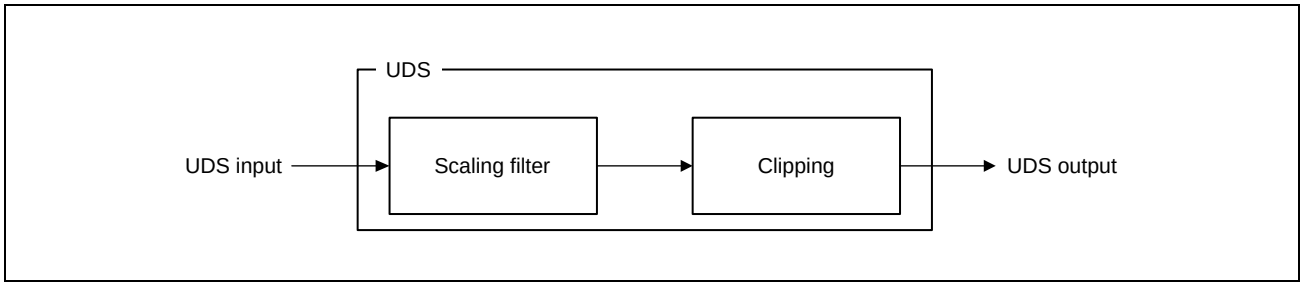

Figure 9.9-28 UDS Configuration

The size of the image actually output by the scaling filter (refer to **9.9.1.3.10 (2) Scaling Factor Registers (VI6_UDS_SCALE)** for calculation) is determined from the size of the image input to the scaling filter and the VI6_UDS_SCALE setting; that is, three types of image are output by the UDS according to the relationship between the size of the image actually output from the scaling filter ($hsize_{scaled}$ and $vsize_{scaled}$) and this register setting as shown in **Figure 9.9-29**.

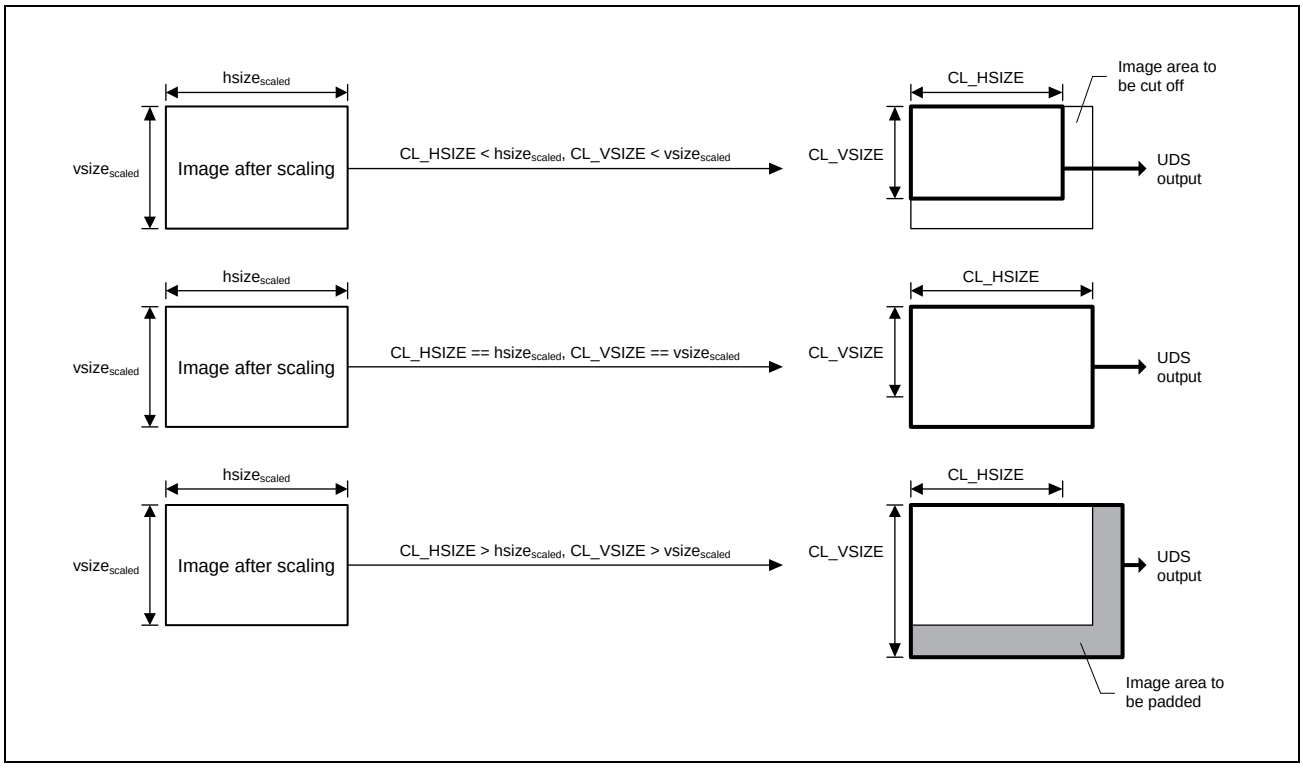

Figure 9.9-29 UDS Output Image for Each CL_HSIZE/VSIZE Setting

When the settings of the CL_HSIZE and CL_VSIZE bits are smaller than the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the up-scaled/down-scaled image is clipped to become the UDS output image.

When the settings of the CL_HSIZE and CL_VSIZE bits are equal to the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the image actually output by the scaling filter becomes the UDS output image without change.

When the settings of the CL_HSIZE and CL_VSIZE bits are greater than the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, in order to obtain the UDS output image, the image is padded in the mode set by VI6_UDS_CTRL.FMD for the area in which the settings of the CL_HSIZE and CL_VSIZE bits have exceeded the number of pixels actually output by the scaling filter.

(10) Color Fill Register (VI6_UDS_FILL_COLOR)

Access Size : 32 bits
Address : <VSPI0_base> + 2328h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	RFILC[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GFILC[7:0]								BFILC[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 16	RFILC [7:0]	0h	RW	R/Cr Component of Fill Color A value from 00h to FFh can be specified.
15 to 8	GFILC [7:0]	0h	RW	G/Y Component of Fill Color A value from 00h to FFh can be specified.
7 to 0	BFILC [7:0]	0h	RW	B/Cb Component of Fill Color A value from 00h to FFh can be specified.

The scaling filter creates an up-scaled/down-scaled image based on the scaling factor settings of the VI6_UDS_SCALE register. If the size of the up-scaled/down-scaled image created by the scaling filter smaller than the clipping size set in the VI6_UDS_CLIP_SIZE register (lowest case in **Figure 9.9-29**) while VI6_UDS_CTRL.FMD is set to 1, the color specified by this register is used to fill the space until the clipping size is reached.

The α value of the area to be padded by this register is dependent on VI6_UDS_CTRL.FMD setting. When VI6_UDS_CTRL.FMD is 0 (repetition), the pixel value at the right edge (bottom edge) of the image is repeated as the α value. When VI6_UDS_CTRL.FMD is 1 (color information of this register is used), the α value is 0.

9.9.1.3.11 LUT Control Register

(1) LUT Control Register (VI6_LUT_CTRL)

Access Size : 32 bits
Address : <VSPI0_base> + 2800h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LUT_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	LUT_EN	0h	RW	1D-LUT Enable/Disable Enables or disables the 1D-LUT function by the LUT. When the 1D-LUT is used, the color component curve information needs to be set separately in the LUT table. For the LUT table settings, refer to **9.9.1.4.5 (1)**. 0b: 1D-LUT function is disabled 1b: 1D-LUT function is enabled

In the LUT, various image processing, such as curves with high operation load (e.g., γ correction), negative-positive conversion, and gain adjustment of images, can be achieved by the data replacement processing by the 1D-LUT. As shown in **Figure 9.9-30**, the LUT replaces each component of the input pixel data using the set replacement table of 256 entries. For example, if the LUT is set as in **Figure 9.9-31**, when there is an input of 150, the data stored in address 150 of the 1D-LUT is read and output as the LUT output. **Figure 9.9-31** shows a case in which the input and output become equal for convenience in explaining.

In the LUT settings shown in **Figure 9.9-32** the input bits are reversed. This has the effect of negative-positive flipping. In **Figure 9.9-33**, γ correction (γ = 1.8 is shown as an example) is possible. As described above, information to be set in the LUT indicates LUT processing characteristics. If the same value is set for each component in the LUT, an equal effect can be obtained for each component of the input image when it is processed. If the LUT is set with different characteristics for each component, the processing characteristics can be changed for each component.

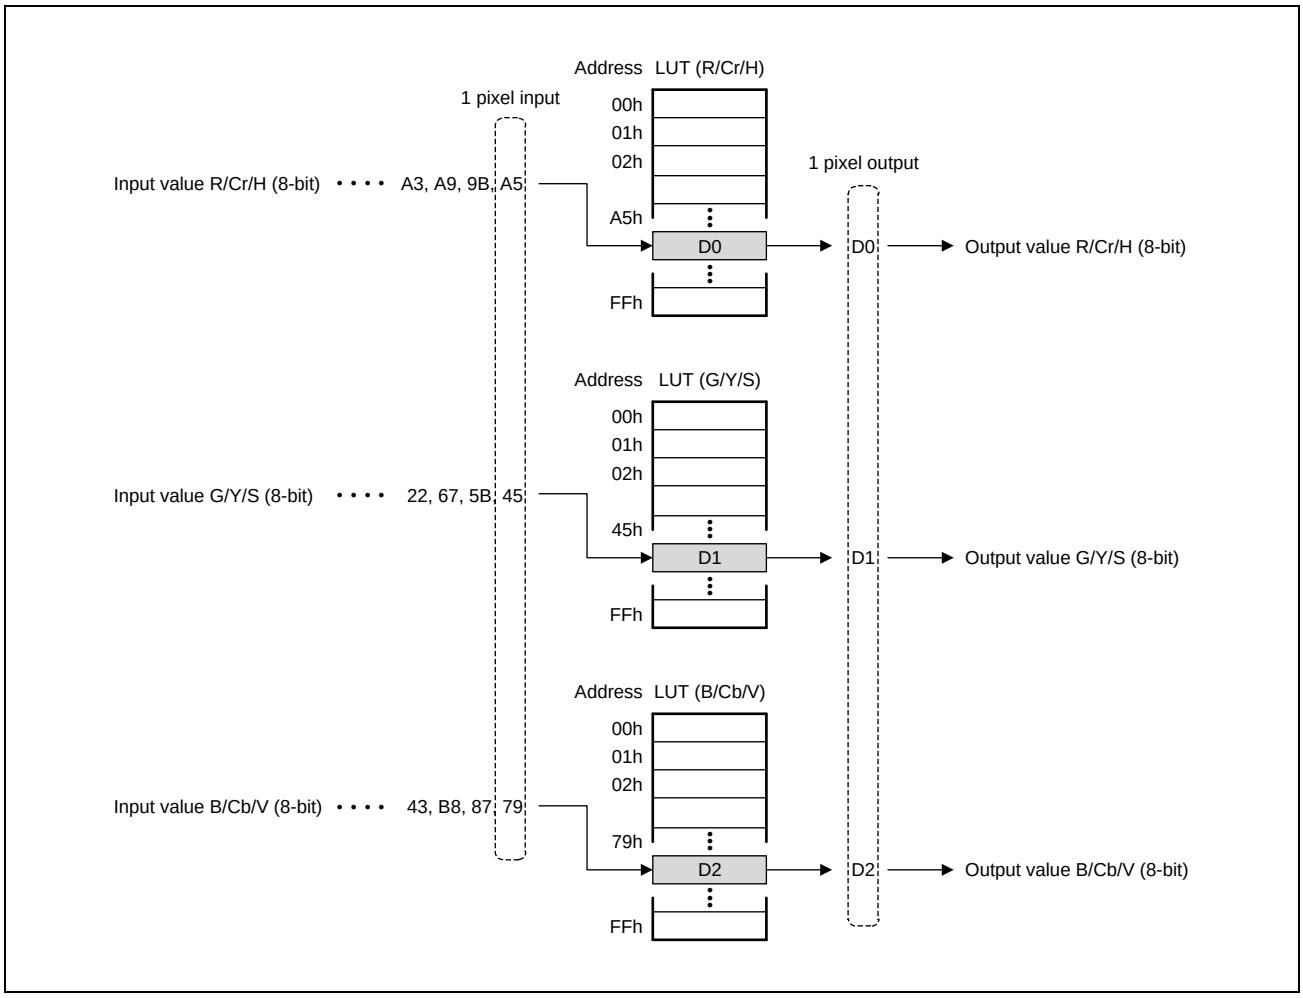

Figure 9.9-30 Relationship between Input and Output for 1D-LUT Table

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28	AAI	0h	RW	Automatic Table Address Increment Selects whether to specify the CLU table address in VI6_CLU_ADDR (refer to **9.9.1.4.5 (2)**) every time or update the address automatically. For details, refer to **9.9.1.4.5 (2)**. 0b: CLU table address should be specified every time 1b: CLU table address is automatically incremented
27 to 25	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
24	MVS	0h	RW	Max Value Stretch Select calculation method in max value region. 0b: Method 0 (Lower compatible) 1b: Method 1 (Improved characteristics) Setting 1 to MVS bit is recommended.
23 to 16	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
15, 14	AX1I[1:0]	0h	RW	Input Control 0 in 2D Mode When setting the M2D bit to 0, be sure to set these bits to 0. When setting the M2D bit to 1, be sure to set these bits to 3.
13, 12	AX2I[1:0]	0h	RW	Input Control 1 in 2D Mode When setting the M2D bit to 0, be sure to set these bits to 0. When setting the M2D bit to 1, be sure to set these bits to 1.
11, 10	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
9, 8	OS0[1:0]	0h	RW	Output Control 0 in 2D Mode When setting the M2D bit to 0, be sure to set these bits to 0. When setting the M2D bit to 1, be sure to set these bits to 3.
7, 6	OS1[1:0]	0h	RW	Output Control 1 in 2D Mode When setting the M2D bit to 0, be sure to set these bits to 0. When setting the M2D bit to 1, be sure to set these bits to 1.
5, 4	OS2[1:0]	0h	RW	Output Control 2 in 2D Mode When setting the M2D bit to 0, be sure to set these bits to 0. When setting the M2D bit to 1, be sure to set these bits to 3.

Bit	Bit Name	Initial Value	R/W	Description
3, 2	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
1	MD2	0h	RW	LUT Dimension Number Specifies the number of LUT dimensions. The details of each mode will be described later. 2D mode can be used only when the CLU input color space is YCbCr. 0b: Operates in 3D mode 1b: Operates in 2D mode
0	CLU_EN	0h	RW	CLU Processing Enable/Disable Enables or disables the 3D/2D color correction function by the CLU. When the CLU is used, the color component information needs to be set in the CLU table. For how to set data in the CLU table, see **9.9.1.4.5 (2)**. 0b: CLU color correction is disabled 1b: CLU color correction is enabled

The CLU handles three-dimensional or two-dimensional LUTs. A three-dimensional LUT is called a 3D-LUT and a two-dimensional LUT is called a 2D-LUT. The 3D or 2D operating mode of the CLU is selected by the M2D bit.

In 3D mode, a three-dimensional space such as that shown in **Figure 9.9-34** (*a*) is considered. The total number of coordinate points that can exist in this three-dimensional space is the total number of combinations of input data. For the CLU, this becomes the cube of each 8-bit component (= 16777216 points). Since it is impractical to have table values (= table memory) for the same number of these coordinate points, the CLU divides the three-dimensional space of **Figure 9.9-34** (*a*) into grids as shown in **Figure 9.9-34** (*b*) in 3D mode. The apex in each divided grid is defined as the coordinate point in the three-dimensional space, and a table value with three component values is set for all of these coordinate points. The total number of coordinate points in **Figure 9.9-34** (*b*) is $17^3 = 4913$. For the method of setting the table value for these 4913 points, refer to **9.9.1.4.5 (2) CLU Table**.

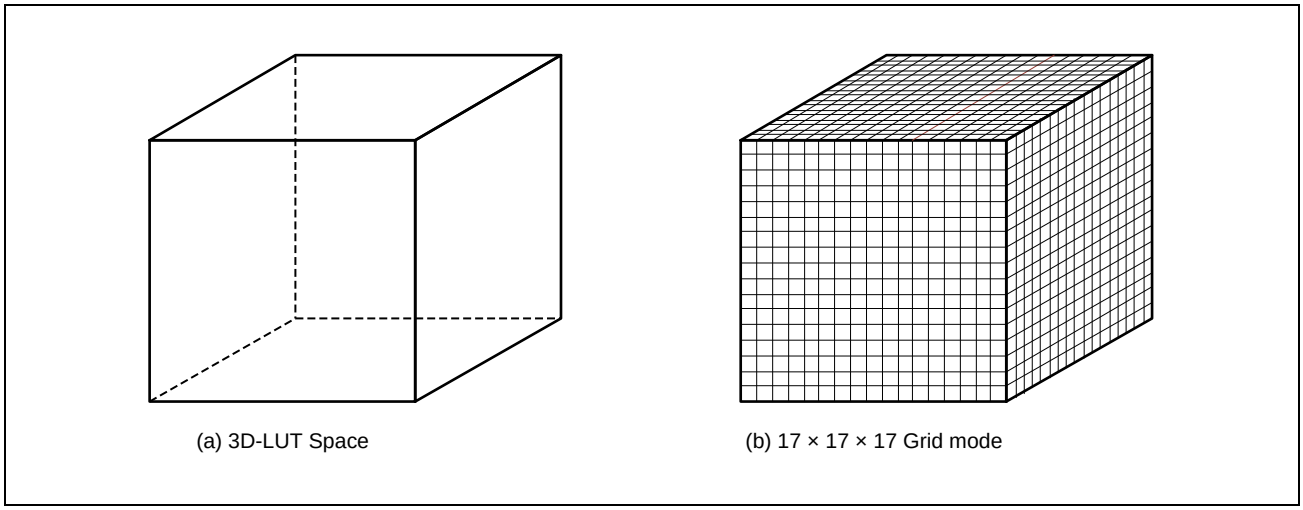

Figure 9.9-34 Concept and Division Count of a 3-Dimensional LUT

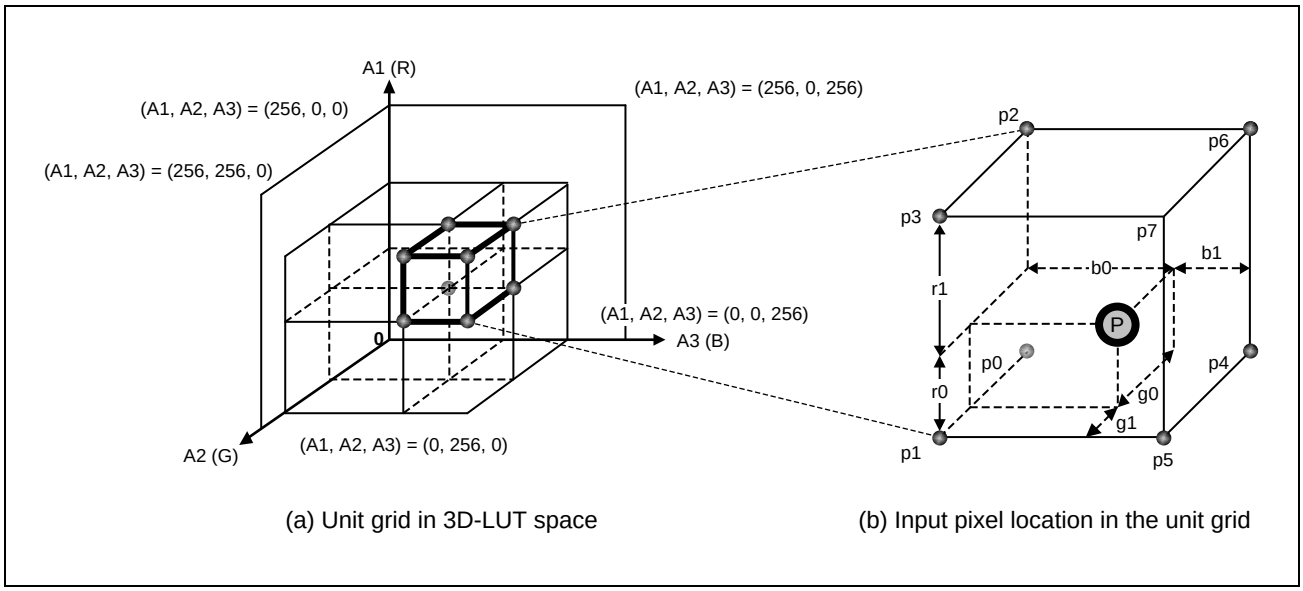

Figure 9.9-35 Conceptual Diagram of LUT Space when CLU is in 3D Mode

To express a three-dimensional space such as that shown in **Figure 9.9-34**, consider the three-dimensional coordinates and axes shown in **Figure 9.9-35** and define the minimum value and maximum value of each axis as 0 and 256, respectively. In 3D-LUT operation, the CLU forcibly assigns the four components of input data (α, R/Cr/H, G/Y/S, and B/Cb/V) to axes: R, Cr, and H components to the first axis (A1), G, Y, and S components to the second axis (A2), and B, Cb, and V components to the third axis (A3). (The case of 2D mode is described later.) Among multiple components assigned to each axis (e.g., R, Cr, and H components for the first axis), one component is selected according to the format of the data input to the CLU. For example, when the color space of the data input to the CLU is RGB, the first axis (A1) shows the R component, the second axis (A2) shows the G component, and the third axis (A3) shows the B component. In a YCbCr color space, the first axis (A1) shows the Cr component, the second axis (A2) shows the Y component, and the third axis (A3) shows the Cb component.

Each component value of the CLU input data becomes a value on each axis. Since the input data ranges from 0 to 255, the maximum value of 256 is handled as a virtual point in a grid space like that shown in **Figure 9.9-34**. In a case where the coordinates obtained by plotting the values of the input three components on axes are exactly on a grid point (e.g., p0 in **Figure 9.9-35** (*b*)), the 3-component value of the table value (p0) set to that location becomes the CLU output. If the input value of the three components result in an intermediate location between grid points and not on a grid point, such as position P in **Figure 9.9-35** (*b*), value P of the three components is interpolated from the table values (p0 to p7 in **Figure 9.9-35** (*b*)) for the eight surrounding grid points and this is used as the CLU output.

By setting arbitrary table value for a three-dimensional LUT space (three-dimensional color space) such as that shown in **Figure 9.9-34** using the processing described above, not only color conversion or color correction for the entire color space, but color conversion or color correction (memory color correction, skin smoothing, etc.) for a particular color area can be achieved.

Next, a 2D-LUT that is used when the CLU is operating in 2D mode is described (M2D bit should be set to 1 for operation in 2D mode). 2D-LUT mode is similar to 3D-LUT mode. However, since the axes for selecting the LUT become two-dimensional, the concept of a 3D-LUT space illustrated in **Figure 9.9-35** changes to a 2D-LUT space like that shown in **Figure 9.9-36**.

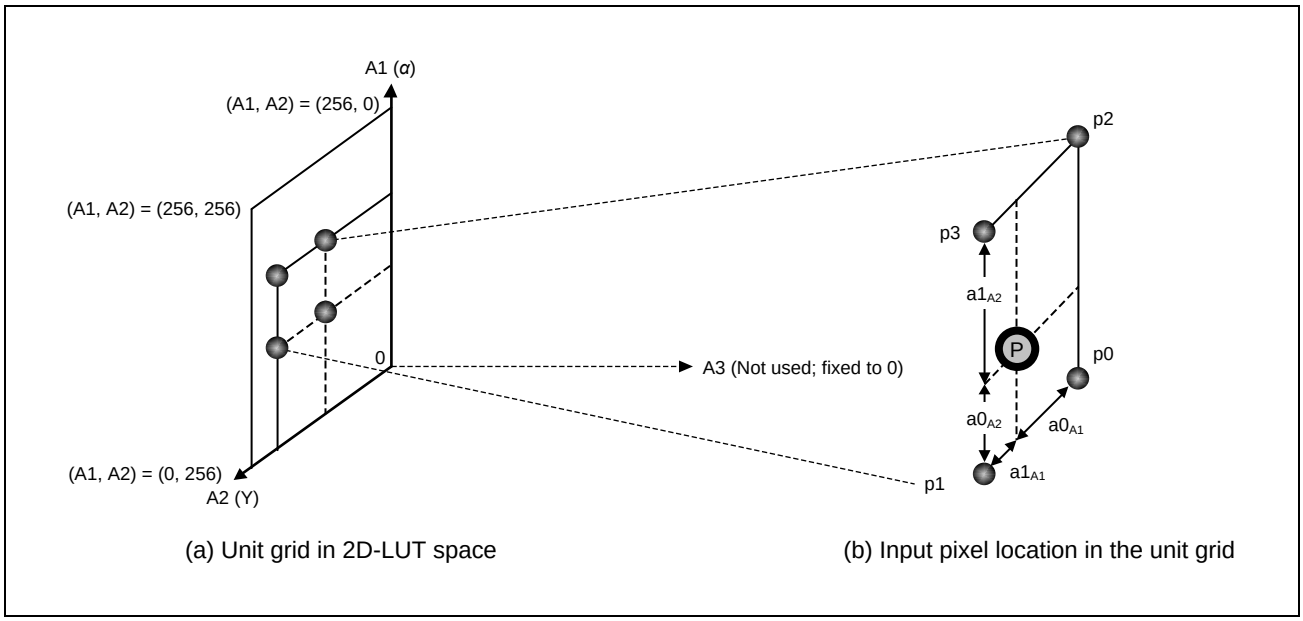

Figure 9.9-36 Conceptual Diagram of LUT Space when CLU is in 2D Mode

As shown in **Figure 9.9-36** (*a*), the first axis (A1) and second axis (A2) are used, and the A1-A2 plane becomes the LUT space in 2D mode. Because the third axis (A3) is not used, the CLU always handles the value on the A3 axis as 0.

2D mode can be used only when the CLU input is in the YCbCr color space. The input value of axis A1 is the input α value of the CLU, and the input value of axis A2 is the input luminance Y of the CLU. If the coordinates in the 2D-LUT space which were determined by the input values are exactly on a grid point (e.g., p2 in **Figure 9.9-36** (*b*)), the table value (p2) set to that location becomes the output value of the 2D-LUT. If the input 2-component value exists at an intermediate location between grid points and not on a grid point, such as position P in **Figure 9.9-36** (*b*), value P is interpolated from the table values (p0 to p3 in **Figure 9.9-36** (*b*)) for the four surrounding grid points and this is used as the 2D-LUT output. The interpolated component of the second axis of the 2D-LUT output acquired in this manner becomes the Y component output of the CLU. In 2D mode, the Cb/Cr component is a pass-through output.

For the CLU table values in **Figure 9.9-36** in 2D mode, set a value for only the component value of the second axis, and set 0 for the component values of the first and third axes. For details on the setting method, see **9.9.1.4.5 (2) CLU Table**.

9.9.1.3.13 HST Control Register

(1) HST Control Register (VI6_HST_CTRL)

Access Size : 32 bits
Address : <VSPI0_base> + 2A00h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	HST_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	HST_EN	0h	RW	HSV Conversion (RGB → HSV) Enable/Disable Enables or disables RGB → HSV conversion. H indicates hue, S indicates saturation, and V indicates a value (brightness). 0b: RGB → HSV conversion is disabled 1b: RGB → HSV conversion is enabled

Various color correction processing can be applied to HSV-format images by combining the 1D-LUT and 3D-LUT. For details on the 1D-LUT and 3D-LUT, see **9.9.1.3.11 (1) LUT Control Register (VI6_LUT_CTRL)** and **9.9.1.3.12 (1) CLU Control Register (VI6_CLU_CTRL)**.

To return HSV-converted data to RGB data, HSV → RGB conversion is used (see **9.9.1.3.14 (1) HSI Control Register (VI6_HSI_CTRL)**). RGB ↔ HSV conversion causes an operation error. Therefore, even when only just performing conversion of RGB → HSV → RGB, the original RGB value and converted RGB value will not completely match.

9.9.1.3.14 HSI Control Register

(1) HSI Control Register (VI6_HSI_CTRL)

Access Size : 32 bits
Address : <VSPI0_base> + 2B00h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	HIS_EN	0h	RW	Reversed HSV Conversion (HSV → RGB) Enable/Disable Enables or disables HSV → RGB conversion to return HSV data that was converted by HSV conversion (see **9.9.1.3.13 (1)**) back to RGB data. 0b: HSV → RGB conversion is disabled 1b: HSV → RGB conversion is enabled

RGB ↔ HSV conversion causes an operation error. Therefore, even when only just performing conversion of RGB → HSV → RGB, the original RGB value and converted RGB value will not completely match.

9.9.1.3.15 HGO Control Registers

(1) HGO Detection Window Offset Register (VI6_HGO_OFFSET)

Access Size : 32 bits
Address : <VSPI0_base> + 3000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	HOFFSET[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	VOFFSET[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29 to 16	HOFFSET[13:0]	0h	RW	Horizontal Offset of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (**Figure 9.9-37**). In these bits, specify the value of horizontal offset (hoffset shown in **Figure 9.9-37**) in pixel units. A value from 0 to 8189 can be specified. The value of HOFFSET shall be smaller than that of the input image size of HGO.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 0	VOFFSET[13:0]	0h	RW	Vertical Offset of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (**Figure 9.9-37**). In these bits, specify the value of vertical offset (voffset shown in **Figure 9.9-37**) in pixel units. A value from 0 to 8189 can be specified. The value of VOFFSET shall be smaller than that of the input image size of HGO.

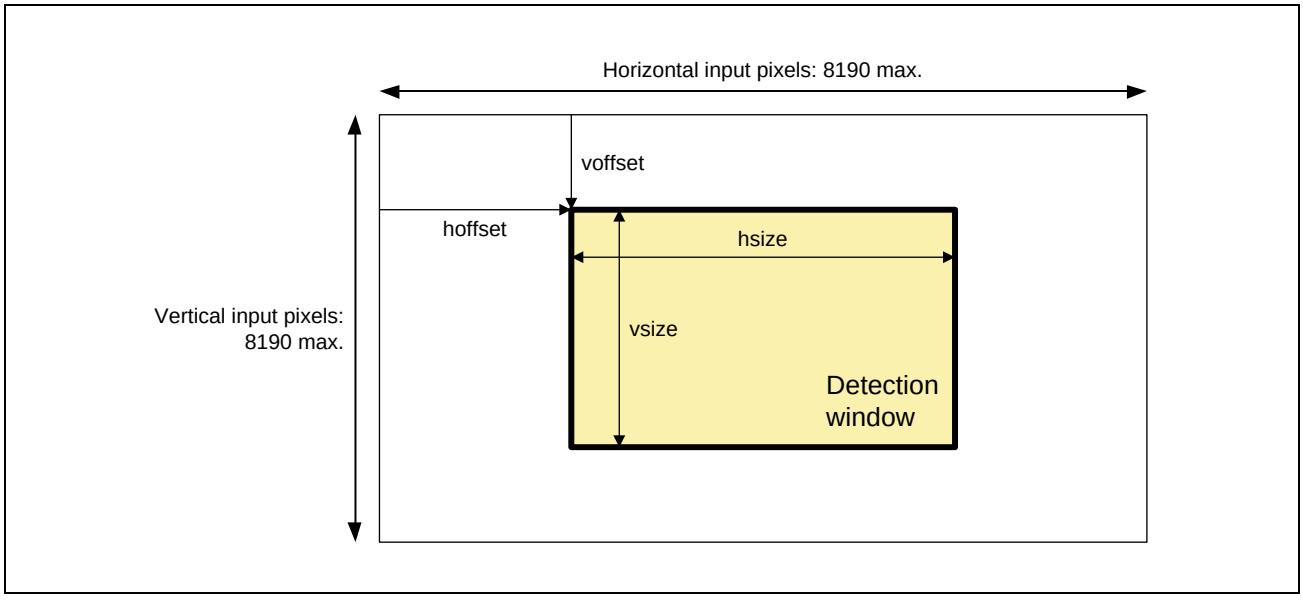

Figure 9.9-37 Histogram Detection Window of HGO

(2) HGO Detection Window Size Register (VI6_HGO_SIZE)

Access Size : 32 bits
Address : <VSPI0_base> + 3004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	HSIZE[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	VSIZE[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29 to 16	HSIZE[13:0]	0h	RW	Horizontal Size of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (**Figure 9.9-37**). In these bits, specify the value of horizontal size (hsize shown in **Figure 9.9-37**) in pixel units. A value from 1 to 8190 can be specified.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 0	VSIZE[13:0]	0h	RW	Vertical Size of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (**Figure 9.9-37**). In these bits, specify the value of vertical size (vsize shown in **Figure 9.9-37** in pixel units. A value from 1 to 8190 can be specified.

(3) HGO Mode Register (VI6_HGO_MODE)

Access Size : 32 bits
Address : <VSPI0_base> + 3008h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	AUTOW	-	STEP	-	-	MAXRGB	OFSB_R	OFSB_G	OFSB_B	HRATIO[1:0]		VRATIO[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	RW	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12	AUTOW	0h	RW	HGO automatically histogram write. 0: Histogram is not dumped to external memory automatically. S/W needs to dump histogram from histogram registers to external memory. 1: Histogram is dumped to SDRAM automatically. Dump format is shown in **Figure 9.9-38**. HGO histogram swapping register in **9.9.1.3.15 (14)** specifies data order in 4byte unit as **Table 9.9-29**.
11	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
10	STEP	0h	RW	Histogram step of Y/MaxRGB. 0: 64 step mode. 1: 256 step mode for Y/MaxRGB histogram. Restriction of color format is shown in **Table 9.9-30** about 64 step mode and **Table 9.9-31** about 256 step mode.
9, 8	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
7	MAXRGB	0h	RW	Histogram Source Component Setting 0: The histogram is generated from 3 color components independently. 1: The histogram is generated from the maximum value of input R, G and B data.
6	OFSB_R	0h	RW	Offset Binary Mode for R/Cr/H Component 0: Straight binary 1: Offset binary In offset binary mode, values are converted to absolute values before they are used to detect the maximum value, minimum value, sum, and black band. Note that values without conversion are always used for histogram creation regardless of this mode setting.
5	OFSB_G	0h	RW	Offset Binary Mode for G/Y/S Component 0: Straight binary 1: Offset binary In offset binary mode, values are converted to absolute values before they are used to detect the maximum value, minimum value, sum, and black band. Note that values without conversion are always used for histogram creation regardless of this mode setting.
4	OFSB_B	0h	RW	Offset Binary Mode for B/Cb/V Component 0: Straight binary 1: Offset binary In offset binary mode, values are converted to absolute values before they are used to detect the maximum value, minimum value, sum, and black band. Note that values without conversion are always used for histogram creation regardless of this mode setting.

Bit	Bit Name	Initial Value	R/W	Description
3, 2	HRATIO[1:0]	0h	RW	Horizontal Pixel Skipping Mode for Histogram Detection 00b: No skipping for horizontal pixels. 01b: Horizontal 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created. 10b: Horizontal 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created. 11b: Setting prohibited. The first pixel in the horizontal direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.
1, 0	VRATIO[1:0]	0h	RW	Vertical Pixel Skipping Mode for Histogram Detection 00b: No skipping for vertical pixels. 01b: Vertical 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created. 10b: Vertical 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created. 11b: Setting prohibited. The first pixel in the vertical direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.

(4) HGO LB Detection Threshold Register (VI6_HGO_LB_TH)

Access Size : 32 bits
Address : <VSPI0_base> + 300Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	BLACK_TH[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
7 to 0	BLACK_TH[7:0]	0h	RW	Threshold for Black Level Determination in Letter Box Detection In letter box detection, when all input pixels have the value equal to or smaller than the value specified in these bits, the image data is determined as black. Note that the letter box detection is not affected by the histogram detection window illustrated in **Figure 9.9-37**. A value from 0 to 255 can be specified.

(5) HGO Horizontal Position Register for LB Detection Zone-n (VI6_HGO_LBn_H) (n = 0, 1, 2, 3)

Access Size : 32 bits

Address : <VSPI0_base> + 3010h /3018h / 3020h / 3028h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	HPOS0[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	HPOS1[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29 to 16	HPOS0[13:0]	0h	RW	Horizontal Start Position for Letter Box Detection Zone-n When all pixels on a line (shown in **Figure 9.9-39**) in the input image have the value equal to or smaller than the threshold value, the HGO determines that there is a letter box. In these bits, specify the value of hpos0 of the detection zone-n (**Figure 9.9-39**) in pixel units. A value from 0 to 8189 can be specified. hpos0 ≤ hpos1 should be satisfied. These bits are valid for Zone-0 and 1. For Zone-2 and 3, these bits are reserved.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 0	HPOS1[13:0]	0h	RW	Horizontal End Position for Letter Box Detection Zone-n When all pixels on a line (shown in **Figure 9.9-39**) in the input image have the value equal to or smaller than the threshold value, the HGO determines that there is a letter box. In these bits, specify the value of hpos1 of the detection zone-n (**Figure 9.9-39**) in pixel units. A value from 0 to 8189 can be specified. hpos0 ≤ hpos1 should be satisfied.

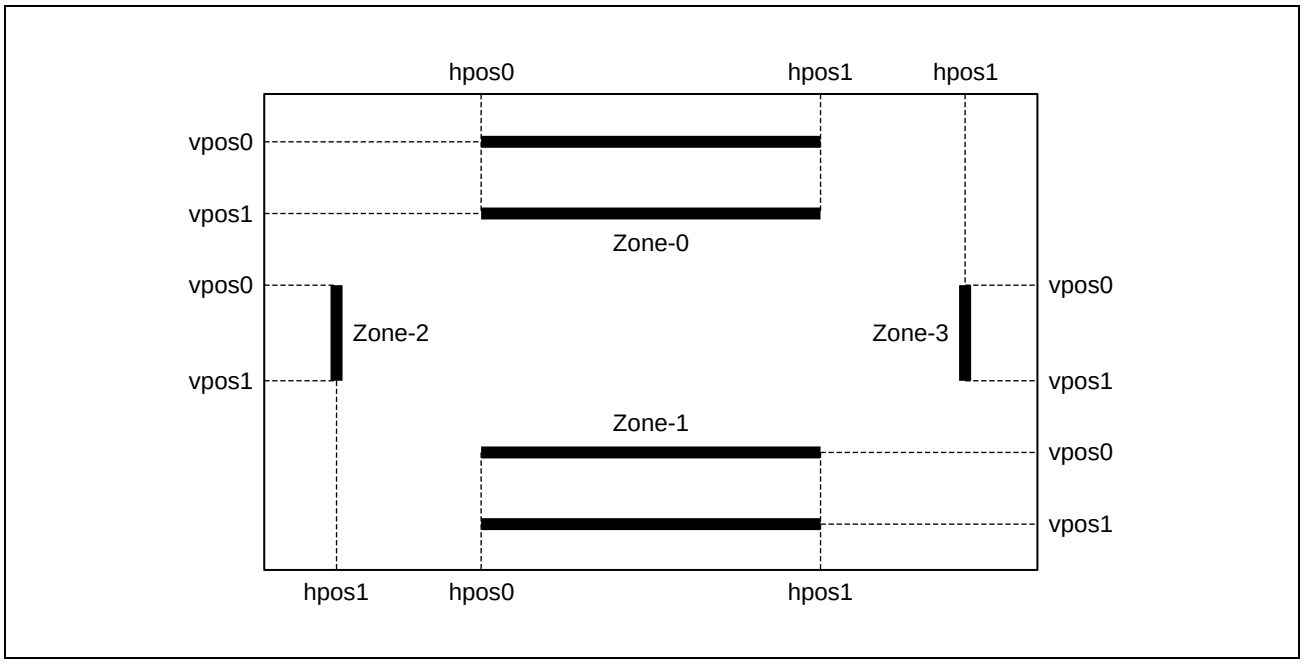

Figure 9.9-39 Letter Box Detection Position Settings for HGO

(6) HGO Vertical Position Register for LB Detection Zone-n (VI6_HGO_LBn_V) (n = 0, 1, 2, 3)

Access Size : 32 bits

Address : <VSPI0_base> + 3014h / 301Ch / 3024h / 302Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	VPOS0[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	VPOS1[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29 to 16	VPOS0[13:0]	0h	RW	Vertical Start Position for Letter Box Detection Zone-n When all pixels on a line (shown in **Figure 9.9-39**) in the input image have the value equal to or smaller than the threshold value, the HGO determines that there is a letter box In these bits, specify the value of vpos0 of the detection zone-n (**Figure 9.9-39**) in pixel units. A value from 0 to 8189 can be specified. vpos0 ≤ vpos1 should be satisfied.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 0	VPOS1[13:0]	0h	RW	Vertical End Position for Letter Box Detection Zone-n When all pixels on a line (shown in **Figure 9.9-39**) in the input image have the value equal to or smaller than the threshold value, the HGO determines that there is a letter box. In these bits, specify the value of vpos1 of the detection zone-n (**Figure 9.9-39**) in pixel units. A value from 0 to 8189 can be specified. vpos0 ≤ vpos1 should be satisfied.

(7) HGO Component-m Histogram Register (VI6_HGO_m_HISTO_n) (n = 0 to 63, m = R, G, B)

Access Size : 32 bits

Address : <VSPI0_base> + 3030 + 0004 × n (n = 0 to 63)h (R)
<VSPI0_base> + 3140 + 0004 × n (n = 0 to 63)h (G)
<VSPI0_base> + 3250 + 0004 × n (n = 0 to 63)h (B)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	HISTOGRAM_n[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HISTOGRAM_n[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 0	HISTOGRAM_n [23:0]	0h	R	Frequency of Component-m in the value range-n From these bits, the count of the pixels whose component-m value (val) satisfies the following condition within the histogram detection window **Figure 9.9-37**) is read (after pixel skipping is applied when skipping mode is selected). $4*n \leq val < 4*(n+1)$ Counting starts after the HGO is activated. To read the histogram, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again. These bits are available when VI6_HGO_MODE.step is 0 (64 step mode). When VI6_HGO_MODE.step is 1 (256 step mode), read Y/MaxRGB histogram from the VI6_HGO_EXT_HIST_DATA after setting histogram address in the VI6_HGO_EXT_HIST_ADDR.

The component-m in a color space is determined by the following table in case of VI6_HGO_MODE.step = 0 (64 step mode)

Table 9.9-30 The Component of Index-m for Each Color Space in 64 Step Mode

	Color Space			
	RGB		YCbCr	HSV
Index-m	VI6_HGO_MODE.MAXRGB = 0	VI6_HGO_MODE.MAXRGB = 1	VI6_HGO_MODE MAXRGB = 0*1	VI6_HGO_MODE.MAXRGB = 0*1
R	R	N/A*2	Cr	H
G	G	max(R, G, B)*3	Y	S
B	B	N/A*2	Cb	V

Note 1. When color space of input data is in YCbCr or HSV, set VI6_HGO_MODE.MAXRGB = 0.

Note 2. When VI6_HGO_MODE.MAXRGB = 1, the histogram of index-R / index-B are not ensured.

Note 3. max(R, G, B) indicates maximum value of input R, G, and B data.

(8) HGO Component-m Min/Max Value Register (VI6_HGO_m_MAXMIN) (m = R, G, B)

Access Size : 32 bits

Address : <VSPI0_base> + 3130h (R)
<VSPI0_base> + 3240h (G)
<VSPI0_base> + 3350h (B)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	MAXVAL[7:0]

	-	-	-	-	-	-	-	-	MINVAL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 16	MAXVAL[7:0]	0h	R	Maximum Value of Component-m From these bits, the maximum value of the component-m of the pixels within the histogram detection window (**Figure 9.9-37**) is read (after pixel skipping is applied when skipping mode is selected). Maximum value detection starts after the HGO is activated. To read the maximum value, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again.
15 to 8	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
7 to 0	MINVAL[7:0]	0h	R	Minimum Value of Component-m From these bits, the minimum value of the component-m of the pixels within the histogram detection window (**Figure 9.9-37**) is read (after pixel skipping is applied when skipping mode is selected). Minimum value detection starts after the HGO is activated. To read the minimum value, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again.

(9) HGO Component-m Sum Register (VI6_HGO_m_SUM) (m = R, G, B)

Access Size : 32 bits

Address : <VSPI0_base> + 3134h (R)
<VSPI0_base> + 3244h (G)
<VSPI0_base> + 3354h (B)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SUMVAL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SUMVAL[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SUMVAL[31:0]	0h	R	Sum of Component-m From these bits, the sum of the component-m of the pixels within the histogram detection window (**Figure 9.9-37**) is read (after pixel skipping is applied when skipping mode is selected). Accumulation starts after the HGO is activated. To read the sum, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again.

(10) HGO Component-m LB Detection Result Register (VI6_HGO_m_LB_DET) (m = R, G, B)

Access Size : 32 bits

Address : <VSPI0_base> + 3138h (R)
<VSPI0_base> + 3248h (G)
<VSPI0_base> + 3358h (B)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	LTRBOX1	LTRBOX2	SIDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
2	LTRBOX1	0h	R	Letter Box Detection Result #1 of Zone-0/1 for Component-m This bit is set to 1 when none of the component-m of the pixels on the lines of zone-0/vpos0 and zone-1/vpos1 (two lines in total) in **Figure 9.9-39** exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGO has completed processing of one screen of data and before the HGO is activated again. The value read during processing is not guaranteed to be correct.
1	LTRBOX2	0h	R	Letter Box Detection Result #2 of Zone-0/1 for Component-m This bit is set to 1 when none of the component-m of the pixels on the four lines of zone-0 and 1 in **Figure 9.9-39** exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGO has completed processing of one screen of data and before the HGO is activated again. The value read during processing is not guaranteed to be correct.
0	SIDE	0h	R	Letter Box Detection Result of Zone-2/3 for Component-m This bit is set to 1 when none of the component-m of the pixels on the two lines of zone-2 and 3 in **Figure 9.9-39** exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGO has completed processing of one screen of data and before the HGO is activated again. The value read during processing is not guaranteed to be correct.

(11) HGO Y/MaxRGB Extended Histogram Address Register (VI6_HGO_EXT_HIST_ADDR)

Access Size : 32 bits
Address : <VSPI0_base> + 335Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	EXT_HIST_ADDR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
7 to 0	EXT_HIST_ADDR[7:0]	0h	RW	Histogram address in case of 256 step histogram mode. Set value-m when user wants to read frequency of Y or MaxRGB pixel value-m. After setting VI6_HGO_EXT_HIST_ADDR, read VI6_HGO_EXT_HIST_DATA to read frequency of Y or MaxRGB pixel value-m. This is in-direct addressing way. This in-direct addressing way is available in case of VI6_HGO_MODE.STEP = 1 (256 step histogram mode).

Table 9.9-31 Restriction in Case of 256 Step Mode (VI6_HGO_MODE.STEP = 1)

Color Space			
RGB		YCbCr	HSV
VI6_HGO_MODE.MAXRGB = 0	VI6_HGO_MODE.MAXRGB = 1	VI6_HGO_MODE MAXRGB = 0*1	VI6_HGO_MODE.MAXRGB = 0*1
N/A	max(R, G, B)*2	Y	N/A

Note 1. When color space of input data is in YCbCr or HSV, set VI6_HGO_MODE.MAXRGB = 0.

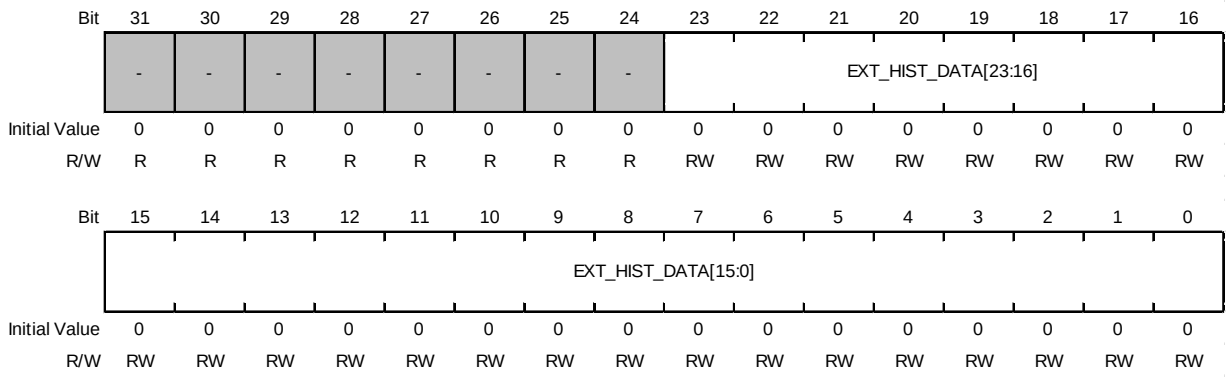
Note 2. max(R, G, B) indicates maximum value of input R, G, and B data.

(12) HGO Y/MaxRGB Extended Histogram Data Register (VI6_HGO_EXT_HIST_DATA)

Access Size : 32 bits

Address : <VSPI0_base> + 3360h

Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 0	EXT_HIST_DATA[23:0]	0h	RW	Histogram data in case of 256 step histogram mode. See VI6_HGO_EXT_HIST_ADDR register's explanation. This in-direct addressing way is available in case of VI6_HGO_MODE.STEP = 1 (256 step histogram mode).

(13) HGO Histogram Storing Address Register (VI6_HGO_HISTADD)

Access Size : 32 bits

Address : <VSPI0_base> + 336Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	HISTADD[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HISTADD[15:8]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	HISTADD[31:8]	0h	RW	HGO histogram storing address These bits specify the start address of storing the HGO histogram plane to be written in case of enabling histogram auto write (VI6_HGO_MODE.AUTOW = 1). Start address of HGO histogram can be set in 256-byte units. And HISTADD [31:8] × 256 is recognized as start address to write HGO histogram.
7 to 0	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

(14) HGO Histogram Swapping Register (VI6_HGO_HSWAP)

Access Size : 32 bits
Address : <VSPI0_base> + 3370h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	H_LWS	H_WDS	H_BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
2	H_LWS	0h	RW	HGO histogram Swapping in Longword Units 0: Data swapping in longword (32-bit) units is disabled 1: Data swapping in longword (32-bit) units is enabled
1	H_WDS	0h	RW	HGO histogram Swapping in Word Units 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	H_BTS	0h	RW	HGO histogram Swapping in Byte Units 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

See **Figure 9.9-38** and **Table 9.9-29** for setting HGO histogram swap.

(15) HGO Parameter Register Reset (VI6_HGO_REGRST)

Access Size : 32 bits
Address : <VSPI0_base> + 33FCh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	RCPART	-	-	-	RCLEA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	W	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
4	RCPART	0h	W	Status Reset Writing 1 to this bit resets counter bits in HGO.
3 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	RCLEA	0h	W	Register Reset Writing 1 to this bit resets all read-only registers (**9.9.1.3.15 (7)** to **9.9.1.3.15 (10)**) to their initial values. This register is write-only and is always read as 0. Note that R/W registers (**9.9.1.3.15 (1)** to **9.9.1.3.15 (6)**) are not affected by write access to this register.

When image partition is used, refer to **9.9.1.4.6 (7) Histogram of HGO/HGT**.

9.9.1.3.16 HGT Control Registers

(1) HGT Detection Window Offset Register (VI6_HGT_OFFSET)

Access Size : 32 bits
Address : <VSPI0_base> + 3400h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	HOFFSET[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	VOFFSET[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29 to 16	HOFFSET[13:0]	0h	RW	Horizontal Offset of Histogram Detection Window The HGT creates a histogram for the detection window in the input image (**Figure 9.9-40**). In these bits, specify the value of horizontal offset (hoffset shown **Figure 9.9-40** in pixel units. A value from 0 to 8189 can be specified. The value of HOFFSET shall be smaller than that of the input image size of HGT.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 0	VOFFSET[13:0]	0h	RW	Vertical Offset of Histogram Detection Window The HGT creates a histogram for the detection window in the input image (**Figure 9.9-40**). In these bits, specify the value of vertical offset (voffset shown in **Figure 9.9-40**) in pixel units. A value from 0 to 8189 can be specified. The value of VOFFSET shall be smaller than that of the input image size of HGT.

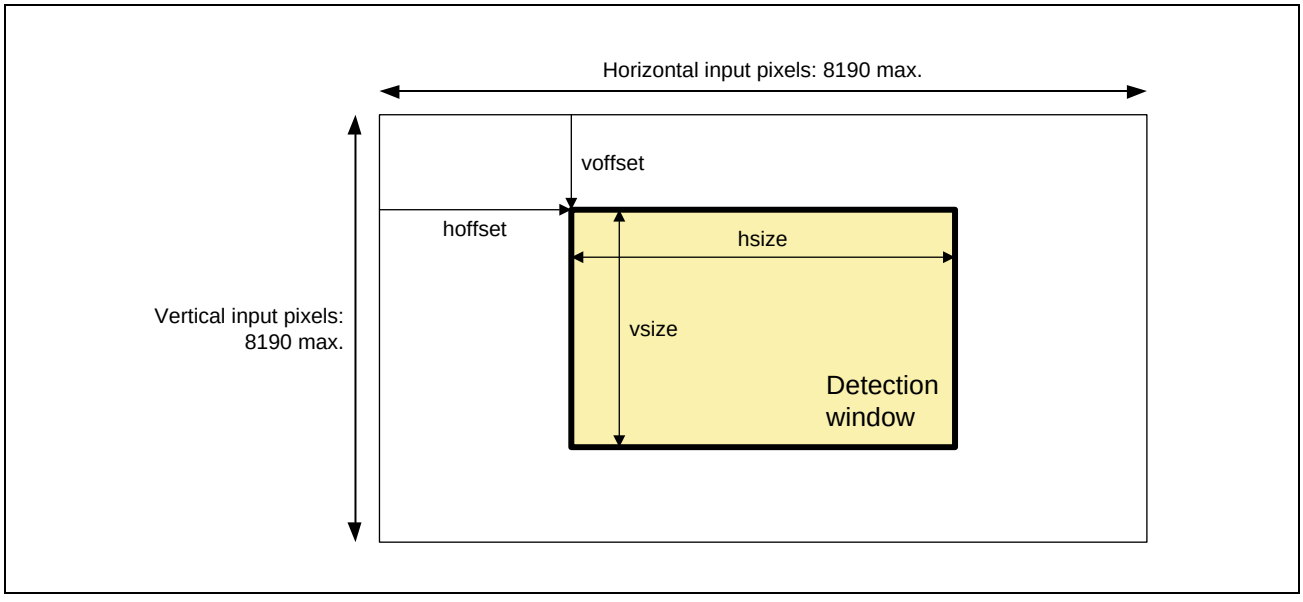


Figure 9.9-40 Histogram Detection Window of HGT

(2) HGT Detection Window Size Register (VI6_HGT_SIZE)

Access Size : 32 bits
Address : <VSPI0_base> + 3404h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	HSIZE[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	VSIZE[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29 to 16	HSIZE[13:0]	0h	RW	Horizontal Size of Histogram Detection Window The HGT creates a histogram for the detection window in the input image (**Figure 9.9-40**). In these bits, specify the value of horizontal offset (hsize shown in **Figure 9.9-40**) in pixel units. A value from 1 to 8190 can be specified.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 0	VSIZE[13:0]	0h	RW	Vertical Size of Histogram Detection Window The HGT creates a histogram for the detection window in the input image **Figure 9.9-40**). In these bits, specify the value of vertical offset (vsize shown in **Figure 9.9-40**) in pixel units. A value from 1 to 8190 can be specified.

(3) HGT Mode Register (VI6_HGT_MODE)

Access Size : 32 bits
Address : <VSPI0_base> + 3408h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	AUTOW	-	-	-	-	-	-	-	-	HRATIO[1:0]		VRATIO[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12	AUTOW	0h	RW	HGT automatically histogram write. 0b: Histogram is not dumped to external memory automatically. S/W needs to dump histogram from histogram registers to external memory. 1b: Histogram is dumped to SDRAM automatically. Dump format is shown in **Figure 9.9-41**. HGT Histogram Swapping Register in **9.9.1.3.16 (16)** specifies data order in 4byte unit as **Table 9.9-32**. Horizontal Pixel Skipping Mode for Histogram Detection
11 to 4	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
3, 2	HRATIO[1:0]	0h	RW	Horizontal Pixel Skipping Mode for Histogram Detection 00b: No skipping for horizontal pixels. 01b: Horizontal 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created. 10b: Horizontal 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created. 11b: Setting prohibited. The first pixel in the horizontal direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.
1, 0	VRATIO[1:0]	0h	RW	Vertical Pixel Skipping Mode for Histogram Detection 00b: No skipping for vertical pixels. 01b: Vertical 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created. 10b: Vertical 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created. 11b: Setting prohibited. The first pixel in the vertical direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.

(4) HGT Hue Area Register (VI6_HGT_HUE_AREA_n) (n = 0 to 5)

Access Size : 32 bits

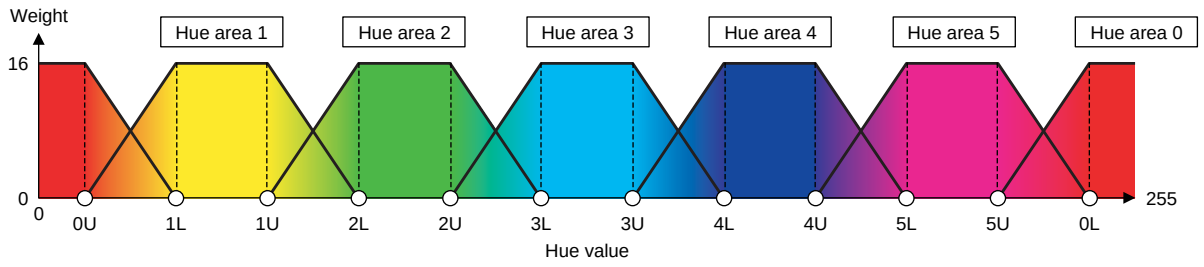
Address : <VSPI0_base> + 340Ch/ 3410h/ 3414h/ 3418h/ 341Ch/ 3420h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	HUE_LOWER_0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	HUE_UPPER_0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 16	HUE_LOWER_0 [7:0]	0h	RW	Lower Boundary Value for Hue Area - n The HGT creates a two-dimensional histogram of H (hue) and S (saturation) components. Division of hue areas and overlapping of adjacent hue areas can be specified through these bits. In these bits, specify the value of n L (hue_lower n) shown in **Figure 9.9-42**. A value from 0 to 255 can be specified. The specified value should satisfy the restrictions shown in **Figure 9.9-42**.
15 to 8	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
7 to 0	HUE_UPPER_0 [7:0]	0h	RW	Upper Boundary Value for Hue Area - n The HGT creates a two-dimensional histogram of H (hue) and S (saturation) components. Division of hue areas and overlapping of adjacent hue areas can be specified through these bits. In these bits, specify the value of n U (hue_upper n) shown in **Figure 9.9-42**. A value from 0 to 255 can be specified. The specified value should satisfy the restrictions shown in **Figure 9.9-42**.



Restrictions: 0U ≤ 1L ≤ 1U ≤ 2L ≤ 2U ≤ 3L ≤ 3U ≤ 4L ≤ 4U ≤ 5L ≤ 5U, 0L ≤ 0U, or 5U ≤ 0L

- Values are rounded down in the diagonal-line sections.
- When overlapped areas are not specified, the boundary value is included in the lower-value area.

0L = HUE_LOWER_0 register setting 0U = HUE_UPPER_0 register setting
1L = HUE_LOWER_1 register setting 1U = HUE_UPPER_1 register setting
2L = HUE_LOWER_2 register setting 2U = HUE_UPPER_2 register setting
3L = HUE_LOWER_3 register setting 3U = HUE_UPPER_3 register setting
4L = HUE_LOWER_4 register setting 4U = HUE_UPPER_4 register setting
5L = HUE_LOWER_5 register setting 5U = HUE_UPPER_5 register setting

Figure 9.9-42 Weighting Histogram Using Hue

(5) HGT LB Detection Threshold Register (VI6_HGT_LB_TH)

Access Size : 32 bits
Address : <VSPI0_base> + 3424h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	BLACK_TH[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
7 to 0	BLACK_TH[7:0]	0h	RW	Threshold for Black Level Determination in Letter Box Detection In letter box detection, when all pixels of the input image data have the value equal to or smaller than the value specified in these bits, the data is determined as black. Note that the letter box detection is not affected by the histogram detection window illustrated in **Figure 9.9-40**. A value from 0 to 255 can be specified.

(6) HGT Horizontal Position Register for LB Detection Zone-n (VI6_HGT_LBn_H) (n = 0, 1, 2, 3)

Access Size : 32 bits

Address : <VSPI0_base> + 3428h/ 3430h/ 3438h/ 3440h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	HPOS0[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	HPOS1[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29 to 16	HPOS0[13:0]	0h	RW	Horizontal Start Position for Letter Box Detection Zone-n When all pixels on a line (shown in **Figure 9.9-43**) in the input image have the value equal to or smaller than the threshold value, the HGT determines that there is a letter box. In these bits, specify the value of hpos0 of the detection zone-n (**Figure 9.9-43**) in pixel units. A value from 0 to 8189 can be specified. hpos0 ≤ hpos1 should be satisfied. These bits are valid for Zone-0 and 1. For Zone-2 and 3, these bits are reserved.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 0	HPOS1[13:0]	0h	RW	Horizontal End Position for Letter Box Detection Zone-n When all pixels on a line (shown in **Figure 9.9-43**) in the input image have the value equal to or smaller than the threshold value, the HGT determines that there is a letter box. In these bits, specify the value of hpos1 of the detection zone-n (**Figure 9.9-43**) in pixel units. A value from 0 to 8189 can be specified. hpos0 ≤ hpos1 should be satisfied.

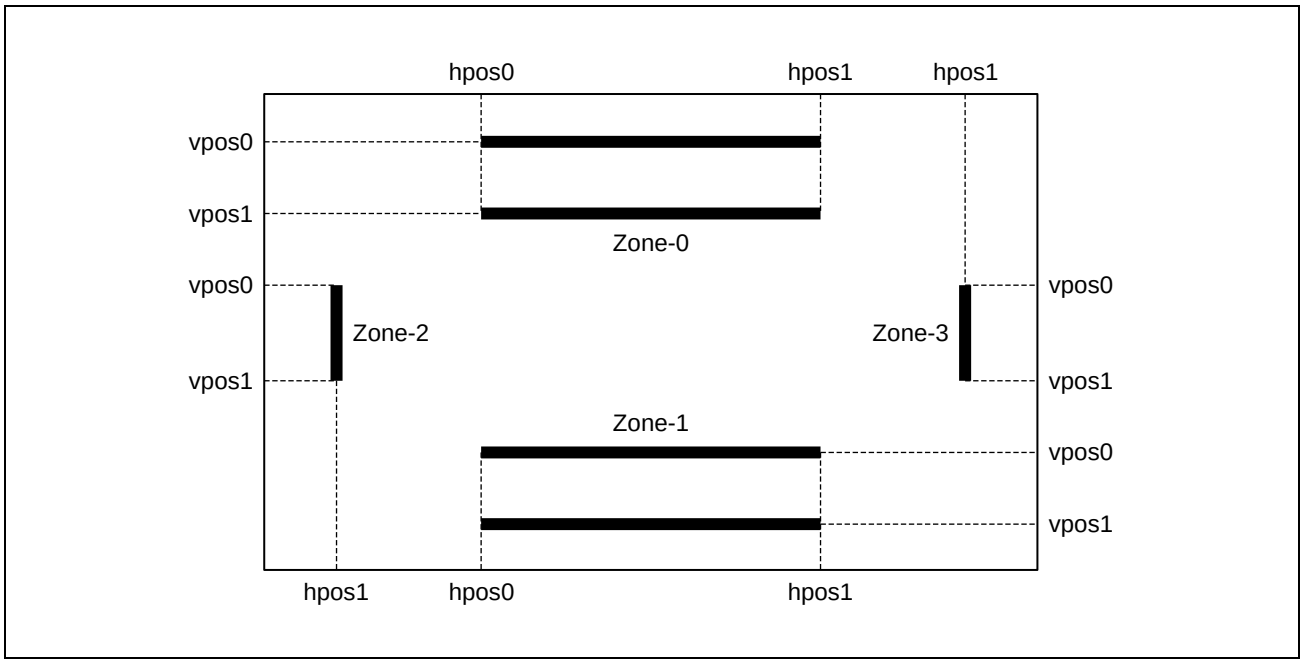


Figure 9.9-43 Letter Box Detection Position Settings for HGT

(7) HGT Vertical Position Register for LB Detection Zone-n (VI6_HGT_LBn_V) (n = 0, 1, 2, 3)

Access Size : 32 bits

Address : <VSPI0_base> + 342Ch/ 3434h/ 343Ch/ 3444h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	VPOS0[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	VPOS1[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29 to 16	VPOS0[13:0]	0h	RW	Vertical Start Position for Letter Box Detection Zone-n When all pixels on a line (shown in **Figure 9.9-43**) in the input image have the value equal to or smaller than the threshold value, the HGT determines that there is a letter box. In these bits, specify the value of vpos0 of the detection zone-n (**Figure 9.9-43**) in pixel units. A value from 0 to 8189 can be specified. vpos0 ≤ vpos1 should be satisfied.
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13 to 0	VPOS1[13:0]	0h	RW	Vertical Position for Letter Box Detection Zone-n When all pixels on a line (shown in **Figure 9.9-43**) in the input image have the value equal to or smaller than the threshold value, the HGT determines that there is a letter box. In these bits, specify the value of vpos1 of the detection zone-n (**Figure 9.9-43**) in pixel units. A value from 0 to 8189 can be specified. vpos0 ≤ vpos1 should be satisfied.

(8) HGT Histogram Register (VI6_HGT_HISTO_m_n) (m = 0 to 5, n = 0 to 31)

Access Size : 32 bits

Address : <VSPI0_base> + 3450h + 0128h × m + 0004h × n (m = 0 to 5, n = 0 to 31)

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	HISTOGRAM_m_n[25:16]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HISTOGRAM_m_n[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
25 to 0	HISTOGRAM_m_n[25:0]	0h	R	Weighted Frequency of Hue Area-m and Saturation Area-n From these bits, the count of weighting for the pixels whose H component value is in hue area m (**Figure 9.9-42**) and whose S component value (val) satisfies the following condition within the histogram detection window (**Figure 9.9-40**) is read (after pixel skipping is applied when skipping mode is selected). $8 \times n \leq val < 8 \times (n + 1)$ The weight is determined by the H component value as shown in **Figure 9.9-42** and the maximum weight is 16. Counting starts after the HGT is activated. To read the histogram, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.

(9) HGT Max/Min Value Register (VI6_HGT_MAXMIN)

Access Size : 32 bits
Address : <VSPI0_base> + 3750h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	MAXVAL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	MINVAL[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
23 to 16	MAXVAL[7:0]	0h	R	Maximum Value of S Components From these bits, the maximum value of the S components of the pixels within the histogram detection window (**Figure 9.9-40**) is read (after pixel skipping is applied when skipping mode is selected). Maximum value detection starts after the HGT is activated. To read the maximum value, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.
15 to 8	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
7 to 0	MINVAL[7:0]	0h	R	Minimum Value of S Components From these bits, the minimum value of the S components of the pixels within the histogram detection window (**Figure 9.9-40**) is read (after pixel skipping is applied when skipping mode is selected). Minimum value detection starts after the HGT is activated. To read the minimum value, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.

(10) HGT Sum Register (VI6_HGT_SUM)

Access Size : 32 bits
Address : <VSPI0_base> + 3754h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	SUMVAL[29:16]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SUMVAL[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
29 to 0	SUMVAL[29:0]	0h	R	Sum of S Components From these bits, the sum of the S components of the pixels within the histogram detection window (**Figure 9.9-40**) is read (after pixel skipping is applied when skipping mode is selected). Accumulation starts after the HGT is activated. To read the sum, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.

(11) HGT LB Detection Result Register (VI6_HGT_LB_DET)

Access Size : 32 bits

Address : <VSPI0_base> + 3758h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	LTRBOX1	LTRBOX2	SIDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
2	LTRBOX1	0h	R	Letter Box Detection Result #1 of Zone-0/1 for V Component This bit is set to 1 when none of the V components of the pixels on the lines of zone-0/vpos0 and zone-1/vpos1 (two lines in total) in **Figure 9.9-43** exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGT has completed processing of one screen of data and before the HGT is activated again. The value read during processing is not guaranteed to be correct.
1	LTRBOX2	0h	R	Letter Box Detection Result #2 of Zone-0/1 for V Component This bit is set to 1 when none of the V components of the pixels on the four lines of zone-0 and 1 in **Figure 9.9-43** exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGT has completed processing of one screen of data and before the HGT is activated again. The value read during processing is not guaranteed to be correct.
0	SIDE	0h	R	Letter Box Detection Result of Zone-2/3 for V Component This bit is set to 1 when none of the V components of the pixels on the two lines of zone-2 and 3 in **Figure 9.9-43** exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGT has completed processing of one screen of data and before the HGT is activated again. The value read during processing is not guaranteed to be correct.

(12) HGT Parameter Register Reset (VI6_HGT_REGRST)

Access Size : 32 bits
Address : <VSPI0_base> + 37FCh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	RCPART	-	-	-	RCLEA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	W	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
4	RCPART	0h	W	Status Reset Writing 1 to this bit resets counter bits in HGT.
3 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	RCLEA	0h	W	Register Reset Writing 1 to this bit resets all read-only registers **(9.9.1.3.16 (8)** to **9.9.1.3.16 (11)**) to their initial values. This register is write-only and is always read as 0. Note that R/W registers (**9.9.1.3.16 (1)** to **9.9.1.3.16 (7)**) are not affected by write access to this register.

When image partition is used, refer to **9.9.1.4.6 (7) Histogram of HGO/HGT**.

(13) HGT Histogram Storing Address Register (VI6_HGT_HISTADD)

Access Size : 32 bits
Address : <VSPI0_base> + 376Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	HISTADD[23:8]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HISTADD[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	HISTADD[23:0]	0h	RW	HGT histogram storing address These bits specify the start address of storing the HGT histogram plane to be written in case of enabling histogram auto write (VI6_HGT_MODE.AUTOW = 1). Start address of HGT histogram can be set in 256-byte units. And HISTADD [31:8] × 256 is recognized as start address to write HGT histogram.
7 to 0	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

(14) HGT Histogram Swapping Register (VI6_HGT_HSWAP)

Access Size : 32 bits

Address : <VSPI0_base> + 3770h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	H_LWS	H_WDS	H_BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
2	H_LWS	0h	RW	HGT histogram Swapping in Longword Units 0b: Data swapping in longword (32-bit) units is disabled 1b: Data swapping in longword (32-bit) units is enabled
1	H_WDS	0h	RW	HGT histogram Swapping in Word Units 0b: Data swapping in word (16-bit) units is disabled 1b: Data swapping in word (16-bit) units is enabled
0	H_BTS	0h	RW	HGT histogram Swapping in Byte Units 0b: Data swapping in byte (8-bit) units is disabled 1b: Data swapping in byte (8-bit) units is enabled

See **Figure 9.9-41** and **Table 9.9-32** for setting HGT histogram swap.

9.9.1.3.17 SHP Control Registers

(1) SHP Control Register0 (VI6_SHP_CTRL0)

Access Size : 32 bits
Address : <VSPI0_base> + 3E00h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Limit0[7:0]								Gain0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SIGN	SHP_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Limit0[7:0]	0h	RW	Sharpness Parameter Limit0 There are 24 types of setting value to apply sharpness as shown in **Table 9.9-33** and 24 types of setting value to apply blurring as shown in **Table 9.9-34**. Specify an appropriate value from among its combination.
23 to 16	Gain0[7:0]	0h	RW	Sharpness Parameter Gain0 There are 24 types of setting value to apply sharpness as shown in **Table 9.9-33** and 24 types of setting value to apply blurring as shown in **Table 9.9-34**. Specify an appropriate value from among its combination.
15 to 2	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
1	SIGN	0h	RW	Sharpness Parameter SIGN There are 24 types of setting value to apply sharpness as shown in **Table 9.9-33** and 24 types of setting value to apply blurring as shown in **Table 9.9-34**. Specify an appropriate value from among its combination.
0	SHP_EN	0h	RW	Sharpness Processing Enable/Disable 0: Sharpness processing is disabled (input goes through the SHP without change) 1: Sharpness processing is enabled When this bit is set to 1, input format to the SHP module should be YCbCr format. Effect of sharpness is applied to Y component, not applied to Cb, Cr component. Effect of sharpness is applied to horizontal direction, not applied to vertical direction.

To execute sharpness processing in YCbCr format, set up the RPF and DPR appropriately so that YCbCr-format image data is input to the SHP. Refer to **9.9.1.3.6 (3) RPF0 Input Format Registers (VI6_RPF0_INFMT)**. For DPR settings, refer to **9.9.1.3.8 (1) Concept of DPR Settings** to **9.9.1.3.8 (4) {mod} Routing Register (VI6_DPR_{mod}_ROUTE) ({mod} = SRU, UDS, LUT, CLU, HST, HSI, SHP)**. Refer to **Table 9.9-33** to apply sharpness. The SHP also has a function of blurring. Refer to **Table 9.9-34** to apply blurring.

Table 9.9-33 Sharpness Parameter Setting (Sharpness)

Intensity		VI6_SHP_CTRL0				VI6_SHP_CTRL1				VI6_SHP_CTRL2			
		shp_en	sign	Gain0	Limit0	Gain10	Limit10	Gain11	Limit11	Gain20	Limit20	Gain21	Limit21

9.9.1.3.20 LUT table

Refer to **9.9.1.4.5 (1) OSD-CLUT or LUT**.

9.9.1.3.21 CLU table address register and table data register

Refer to **9.9.1.4.5 (2) CLU Table**.

9.9.1.4 Operation

9.9.1.4.1 Registers to set fixed value

Set fixed value to following registers in any case.

[1] Always set 0000_0808h to VI6_CLK_DCSWT

[2] Always set D’256 to VI6_DL_CTRL.AR_WAIT [15:0] in case of using display list.

[3] Always set D’2 to VI6_DL_EXT_CTRLn.POLINT [5:0] in case of using extended display list of WPF0.

[4] Always set D’1 to VI6_DL_EXT_CTRLn.DLPRI in case of using extended display list of WPF0.

[5] Always set D’0 to VI6_DL_EXT_CTRLn.EXPRI in case of using extended display list of WPF0.

[6] Always set D’256 to VI6_WPF0_ROT_CTRL.LMEM_WD [12:0] in case of using rotation.

[7] Always set 0000_0500h toVI6_DPR_WPF0_FPORCH in case of using WPF0.

9.9.1.4.2 Concept of VSPI Operation Starting and Stopping

The VSPI is started by setting the corresponding start register. It means starting of WPF, which is output module of the VSPI. Use the start registers shown in **Table 9.9-35** to start WPF modules.

After a WPF module is started and specified processing is completed, the corresponding channel VSPI stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in **Table 9.9-35**; clearing a source register cancels the corresponding interrupt signal (for details of interrupt processing, refer to **9.9.1.4.4 Interrupt Processing**). Each of the operating status registers shown in the table indicates the busy state after the processing is started through the start register until processing is completed and operation stops. **Figure 9.9-44** shows these operation timings.

Table 9.9-35 Target Module and Corresponding Registers for Starting and Stopping Operation

Target Module	Start Register	End Interrupt Source Register	Operating Status Register
WPF0	VI6_CMD0.STRCMD	VI6_WPF0_IRQ_STA.FRE	VI6_STATUS.SYS0_ACT

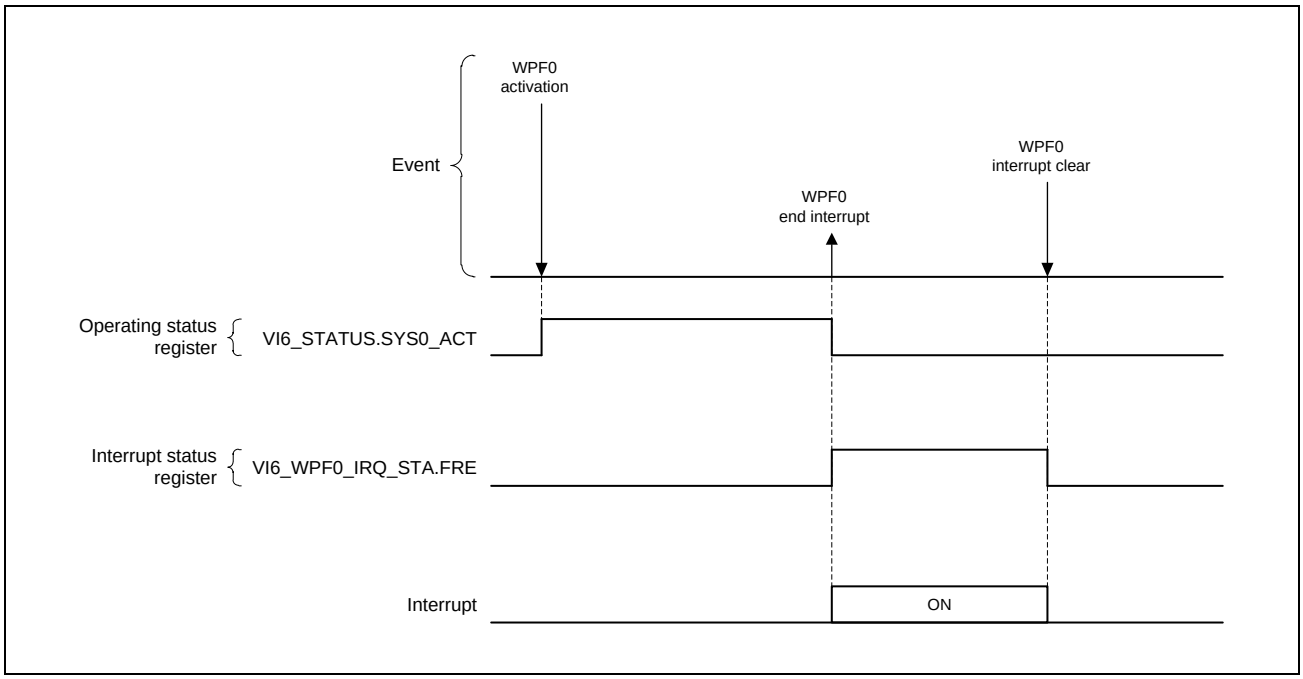

Figure 9.9-44 VSPI Startup and Status of Each Register and Interrupt

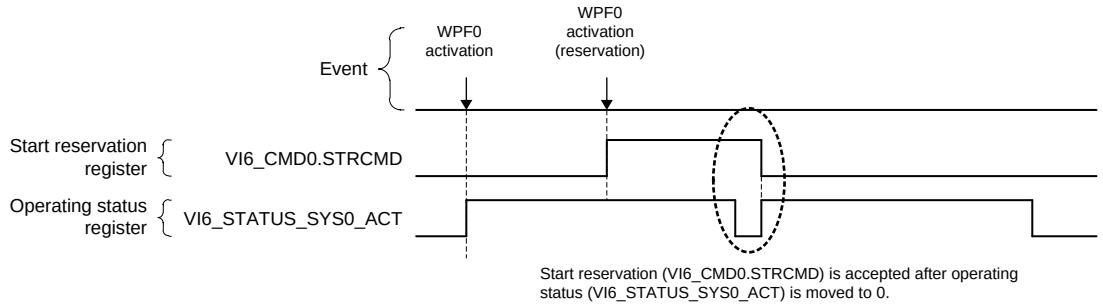
The following describes the operating states (operating or stopped) of VSPI internal modules. As described in **9.9.1.1.1 Block diagram of VSPI**, the VSPI has several image processing modules and the connections between modules are determined by the DPR. Accordingly, the operating state of a module is the same as that of the target WPF for that module.

After connections through the DPR are changed and the target WPF for a module is changed, refer to the correct register for the new target WPF to check the operating state of that module.

Connections should be changed through the DPR-related registers (described later) while all modules to be affected by any change in connections are stopped. If connections through the DPR are changed during operation, the VSPI will hang.

Figure 9.9-45 shows relation between start reservation and operating status. When start is reserved while VSPI is operating, the reservation is accepted after VSPI status is moved from “operating” into “idle” as shown in **Figure 9.9-45**. Therefore, when start reservation is used for VSPI as shown in **9.9.1.4.6 (3) Start Reservation for VSPI** take following procedure to confirm VSPI isn’t operating.

1. Check VI6_CMD0.STRCMD is zero (Start is not reserved)
2. Check VI6_STATUS.SYS0_ACT is zero (VSPI is IDLE status)



Note: WPF0 cannot be executed at same time for VSPI.

Figure 9.9-45 VSPI Start Reservation and Operating Status

9.9.1.4.3 Display List

(1) Functional Description

The VSPI provides the display list function. As a display list, the VSPI automatically downloads the register settings except for the control registers (**9.9.1.3.4 General Control Registers** and **9.9.1.3.5 Display List Control Registers** from external memory and stores the settings in the VSPI registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSPI processing are prepared in advance in external memory such as SDRAM.

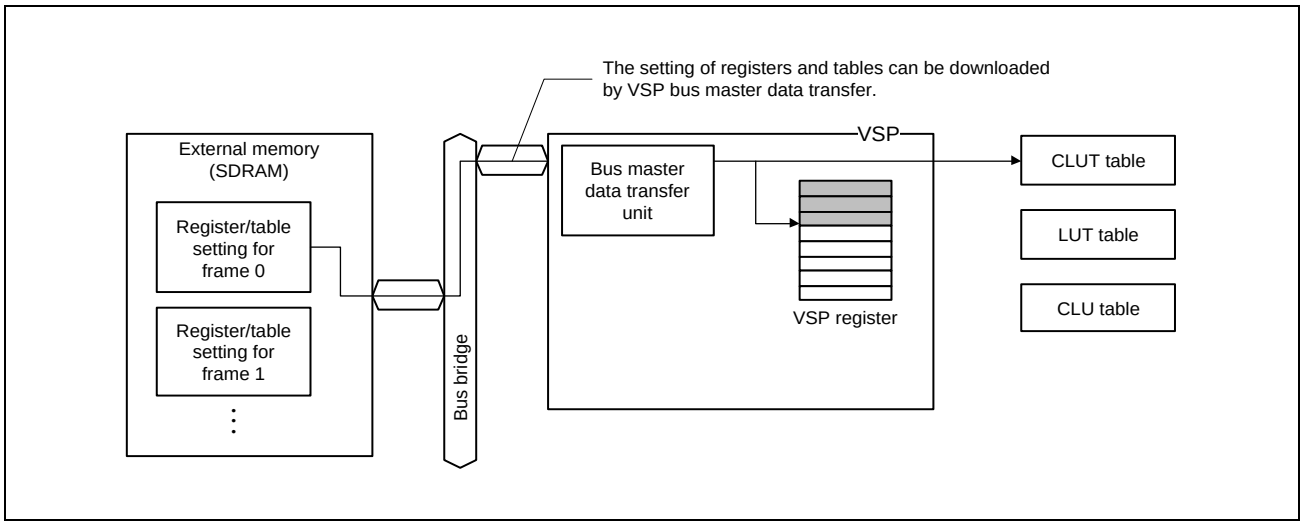


Figure 9.9-46 Concept of Display List

To use display lists, specify the external memory addresses to the display list control registers described in **9.9.1.3.5 Display List Control Registers**. The register settings or various types of information should be stored in external memory in the format described in **9.9.1.4.3 (2) Normal Display List Mode**. **Figure 9.9-47** shows the difference between VSPI operation through normal register settings and through display lists.

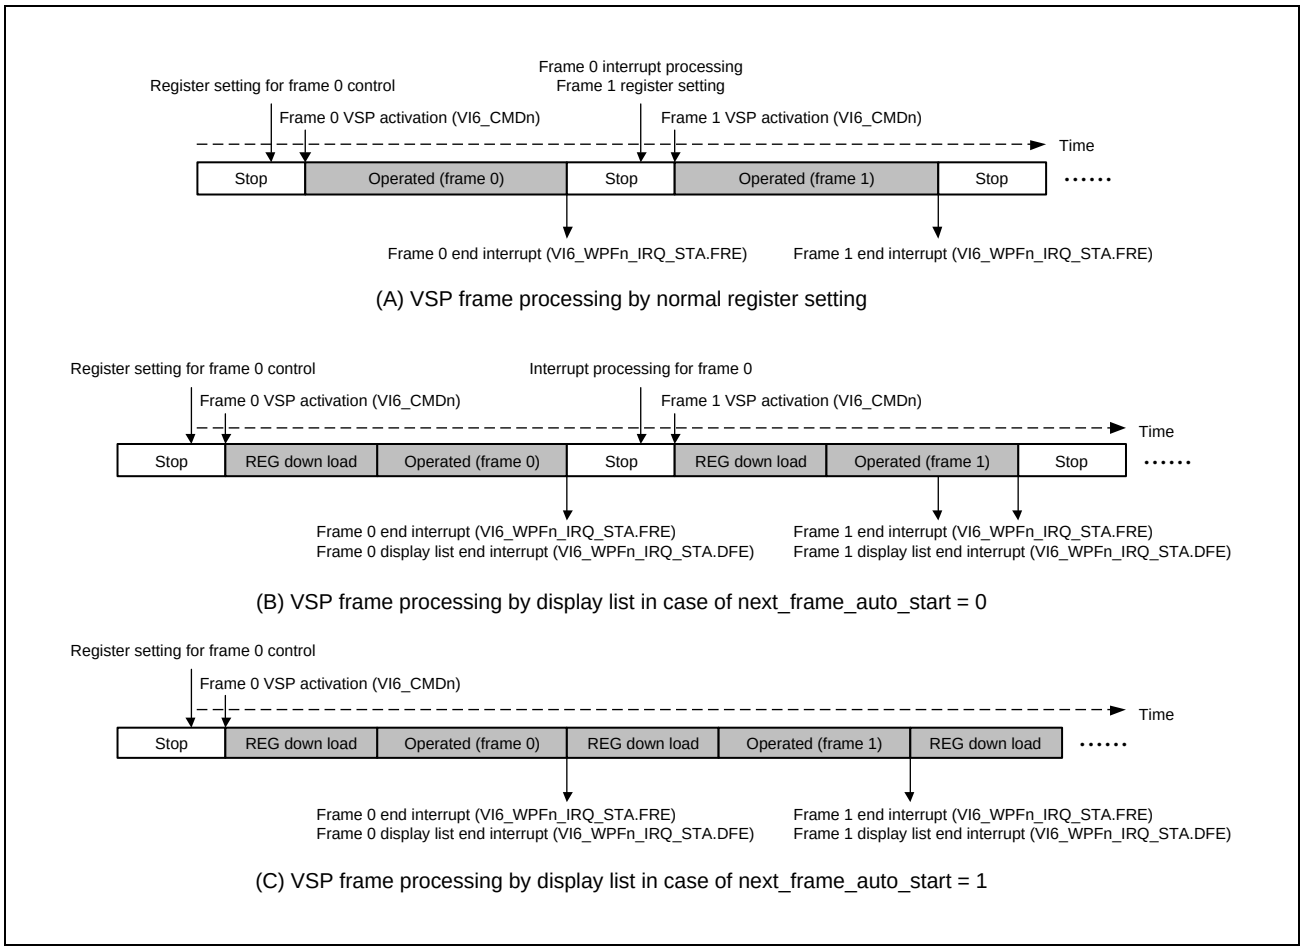

Figure 9.9-47 Comparison of VSPI Operation between Normal Register Settings and Display Lists

As shown in **Figure 9.9-47** (*A*), in the VSPI processing through normal register settings, all registers should be set up before the VSPI is started for each frame. After the VSPI processing is completed, the VSPI outputs a frame end interrupt (VI6_WPF0_IRQ_STA.FRE). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSPI automatically downloads register settings from external memory as shown in **Figure 9.9-47** (*B*) and (*C*), which reduces the load on the CPU between frames.

Figure 9.9-47 (*B*) shows the display list usage where the VSPI stops at the end of every frame; only the VSPI start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSPI is large. In the case shown in **Figure 9.9-47** (*C*), as soon as the frame processing ends, the VSPI automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

Table 9.9-36 shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

Table 9.9-36 Display List Mode and Supported Functions

Mode	Extended Display List	Continuous Frames
Normal Display List Mode	Supported	Controlled by “next frame auto start” in the header of the display list.
Header-less Display List Mode	Not Supported	Controlled by VI6_DL_CTRL.CFM0 bit.

(2) Normal Display List Mode

The VSPI display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. **Figure 9.9-48** shows the display list structure.

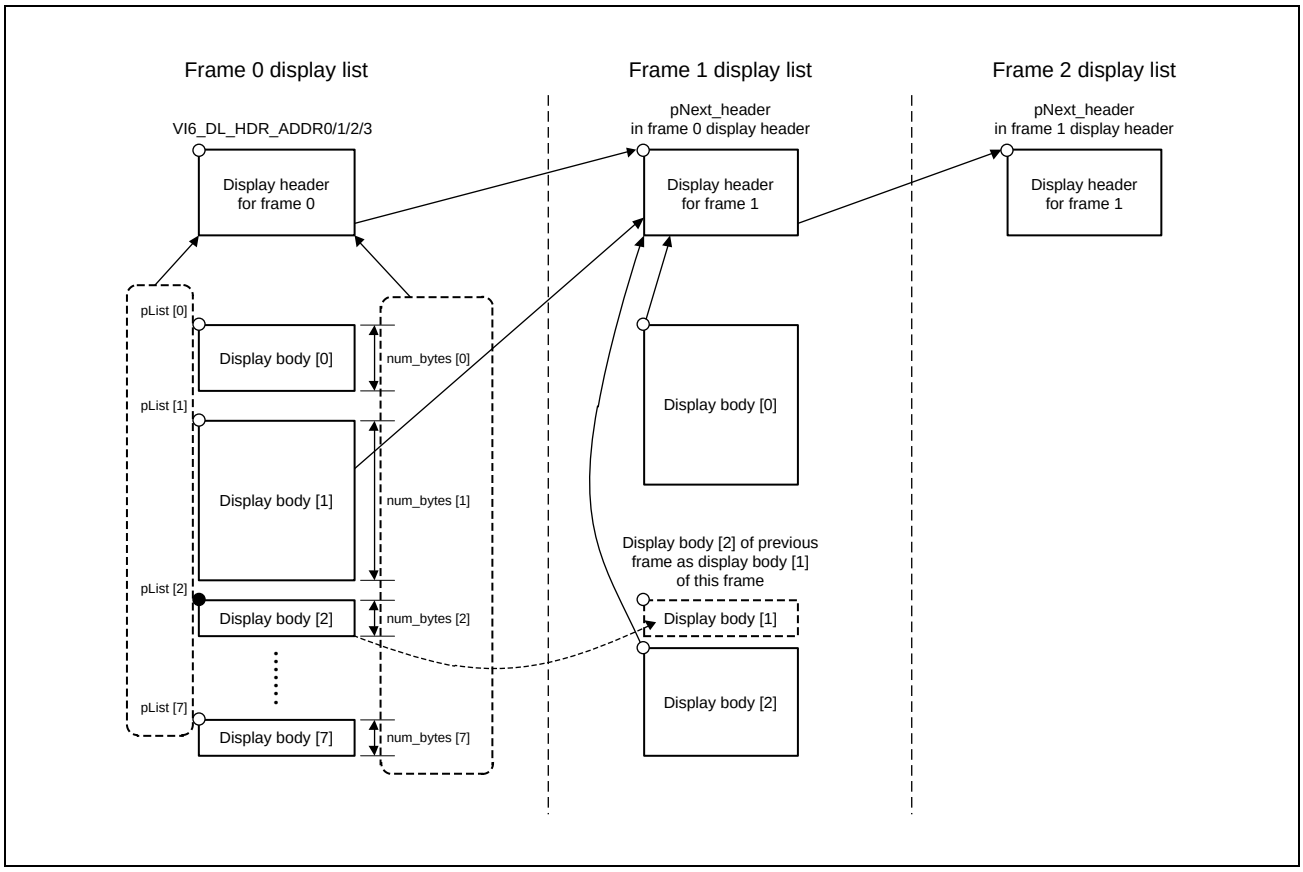

Figure 9.9-48 Structure and Concept of VSPI Display List

A VSPI display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSPI analyzes the header to gather register and table settings stored in separate memory areas and reconfigures the complete register settings.

The addresses of display headers should be specified in the VSPI registers described in **9.9.1.3.5 Display List Control Registers**. When activated in a mode that uses display lists, the VSPI downloads display headers from the addresses specified in VI6_DL_HDR_ADDR0 (number 0 corresponds to the WPF channel index number), analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSPI becomes ready for frame image processing; the VSPI then starts the actual frame processing.

After processing of a frame ends, the VSPI proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in **Figure 9.9-47**. In one mode, the VSPI stops operation and waits for the next activation by the CPU in the same way as when display lists are not used. In this mode, the address used for downloading the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6_DL_HDR_ADDR0 while the VSPI is stopped. When the VSPI is started after a correct value is specified, the VSPI starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSPI after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSPI downloads the next display header as soon as the previous frame processing ends. After downloading ends, the VSPI starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

In the automatic start mode, the VSPI continues processing until the display header for a frame specifies that the next frame should not be started automatically. To stop processing during automatic execution, use a software reset (VI6_SRESET).

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, **Table 9.9-37** defines a function. Function zero bits (num bits) generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, **Table 9.9-38** defines the header section format of a display list and **Table 9.9-39** defines the body section format and **Table 9.9-40** defines the extended display list body section format.

Data order of Display List Header Section, Display List Body Section and Extended Display List Body Section are assumed as the data is stored in SDRAM by big endian. **Table 9.9-41** shows an example of data order. If data order is not same as the definition, data order within 8byte unit can be adjusted by setting VI6_DL_SWAP (**9.9.1.3.5 (3) Display List-0 Data Swapping Register (VI6_DL_SWAP0)**).

Table 9.9-37 Definition of a Function for Simple Description

Syntax	Bit Count
zero_bits (num_bits)	
{	
for (i = 0; i<num_bits; i++) {	
zero_bit	1
}	
}	

Bit String	Contents
zero_bit	zero_bit indicates a 1-bit integer having a value of 0.

Table 9.9-38 Format of Display List Header Section

Syntax	Bit Count
display_header () /* Fixed length */	
{	
zero_bits (29)	
num_list_minus1	3
for (i=0; i<8; i++)	
zero_bits (15)	
num_bytes [i]	17
pList [i]	32
}	
pNext_header	32
zero_bits (30)	
current_frame_int_enable	1
next_frame_auto_start /* 76 bytes from the beginning of this header*/	1
if (VI6_DL_EXT_CTRL.EXT) {	
zero_bits (32) /* padding zero 4 bytes for alignment */	
zero_bits (6)	
pre_ext_dl_exec	1
post_ext_dl_exec	1
zero_bits (8)	
pre_ext_dl_num_cmd	16
pre_ext_dl_pList	32
zero_bits (16)	
post_ext_dl_num_cmd	16
post_ext_dl_pList /* 96 bytes from the beginning of this header*/	32
}	
}	

Bit String	Contents
num_list_minus1	Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body.
num_bytes [i]	Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pList [i]	Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pNext_header	Specifies the address of the display list header for the next frame. After display list downloading ends, the VSPI keeps its value in the internal memory and uses it in the next display list header downloading. Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0).
current_frame_int_enable	This is a flag that indicates whether to set the display list end interrupt source (VI6_WPF0_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPF0_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPF0_IRQ_ENB.DFEE is set to 1), no interrupt will be generated. If this flag is set to 1, the display list end interrupt source (VI6_WPF0_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPF0_IRQ_ENB.DFEE is set to 1), the VSPI generates an interrupt.
Next_frame_auto_start	Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSPI starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the pNext_header address specified in this display header. If this bit is set to 0, the VSPI stops operation when one-frame processing by this display header ends. In this case, start the VSPI through VI6_CMDn to process the next frame.
pre_ext_dl_exec	Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSPI executes the extended display list for frame preprocessing. The VSPI does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_exec	Set 0 to this bit.
pre_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1, and a command is 16 bytes. When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_num_cmd	Set 0 to this bit.
post_ext_dl_pList	Set 0 to this bit.

Table 9.9-39 Format of Display List Body Section

Syntax	Bit Count
display_list (num_bytes) /* Variable length (num_bytes) */	
{	
for (i=0; i<num_bytes; i+=8) {	
set_address	32
set_data	32
}	
}	

Bit String	Contents
set_address	Specifies the address where the value specified by set_data is to be stored. Specify a register address. *Note*: Register space of VSPI is 32 Kbyte (0000h - 7FFCh). So, set 0 to upper 17-bit of set_address in Display List Body Section.
set_data	Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register.

Table 9.9-40 Format of Extended Display List Body Section

For setting extended display list body section.

Table 9.9-41 Data Order of Display List Body

Address	Syntax
pList	set_address [0] (bit31-24)
pList + 1	set_address [0] (bit23-16)
pList + 2	set_address [0] (bit15-8)
pList + 3	set_address [0] (bit7-0)
pList + 4	set_data [0] (bit31-24)
pList + 5	set_data [0] (bit23-16)
pList + 6	set_data [0] (bit15-8)
pList + 7	set_data [0] (bit7-0)
pList + 8	set_address [1] (bit31-24)
pList + 9	set_address [1] (bit23-16)
pList + 10	set_address [1] (bit15-8)
pList + 11	set_address [1] (bit7-0)
pList + 12	set_data [1] (bit31-24)
pList + 13	set_data [1] (bit23-16)
pList + 14	set_data [1] (bit15-8)
pList + 15	set_data [1] (bit7-0)
~~	~~~

(3) Header-less Display List Mode

The header-less display list does not have the display header listed in **Table 9.9-38**, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6_DL_CTRL.NH0 (see the **9.9.1.3.5 (1) Display List Control Register (VI6_DL_CTRL)**) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6_DL_HDR_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6_DL_BODY_SIZE0. The header-less display list is available only in WPF0.

(4) Restrictions on Display List Usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPI is not guaranteed.
2. Do not execute write access to the same OSD-CLUT, CLU, or LUT lookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPI is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 9.9-42** or **Table 9.9-43**.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same OSD-CLUT, CLU, or LUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 9.9-42** or **Table 9.9-43**.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in **9.9.1.3.3 Restrictions on Access to Registers and Lookup Tables**.

6. Manipulation and setting of the registers described in **9.9.1.3.4 General Control Registers** and **9.9.1.3.5 Display List Control Registers** through a display list is prohibited.
7. The extended display list function enabled by VI6_DL_EXT_CTRL.EXT is to control the registers of the ICB connected with the VSPI. Do not use extended display lists for any other purpose.

9.9.1.4.4 Interrupt Processing

The VSPI provides multiple image processing channels (WPF0) and they can operate simultaneously in parallel. When a WPF module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in each WPF independently, the VSPI has the following registers to control interrupts in each WPF.

- WPF0 Interrupt Enable Registers (VI6_WPF0_IRQ_ENB) (refer to **9.9.1.3.4 (12) WPF0 Interrupt Enable Registers (VI6_WPF0_IRQ_ENB)**)
- WPF0 Interrupt Status Registers (VI6_WPF0_IRQ_STA) (refer to **9.9.1.3.4 (13) WPF0 Interrupt Status Registers (VI6_WPF0_IRQ_STA)**)

While multiple WPF modules operate in parallel, they may output interrupt requests at the same time (this is called a multiple interrupt state). Read the WPF0 Interrupt Status Registers (VI6_WPF0_IRQ_STA) in sequence and execute the interrupt response processing for each interrupt source.

CAUTION

To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear all WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSPI.

9.9.1.4.5 Lookup Table Settings

(1) OSD-CLUT or LUT

For a single entry to the OSD-CLUT space (see **Table 9.9-42**) or LUT space (see **Table 9.9-42**) of the VSPI, the OSD-CLUT or LUT data is set by a write access in the format shown in **Figure 9.9-49**.

The entry address of each space is (start address of the space) + (entry number counting from the base point 0 × 4). For example, the address of entry 7 to the LUT space is (offset address) + 7000h + 7 × 4 = (offset address) + 701Ch.

Table 9.9-42 shows the spaces for which entries can be made. Note that if the module that references that space is operating, write accesses to the relevant space are prohibited. For example, while RPF0 is operating, accesses to the entire space of VI6_CLUT2_TBL are prohibited. When a read access is made to the relevant space during operation of the referencing module, undefined values will be read out.

The operating/stopped state of each module in **Table 9.9-42** is the operating state of the WPF to which each module is connected. Determine whether the module is operating or stopped using each WPF operating status bit in the VI6_STATUS register.

Table 9.9-42 OSD-CLUT Space and LUT Space Addresses

Space Name	Space Addresses	Entry Count	Module that References the Space in the Left Column
VI6_CLUT0_TBL	(offset address) + 4000h to (offset address) + 43FCh	256	RPF0
VI6_LUT_TBL	(offset address) + 7000h to (offset address) + 73FCh	256	LUT

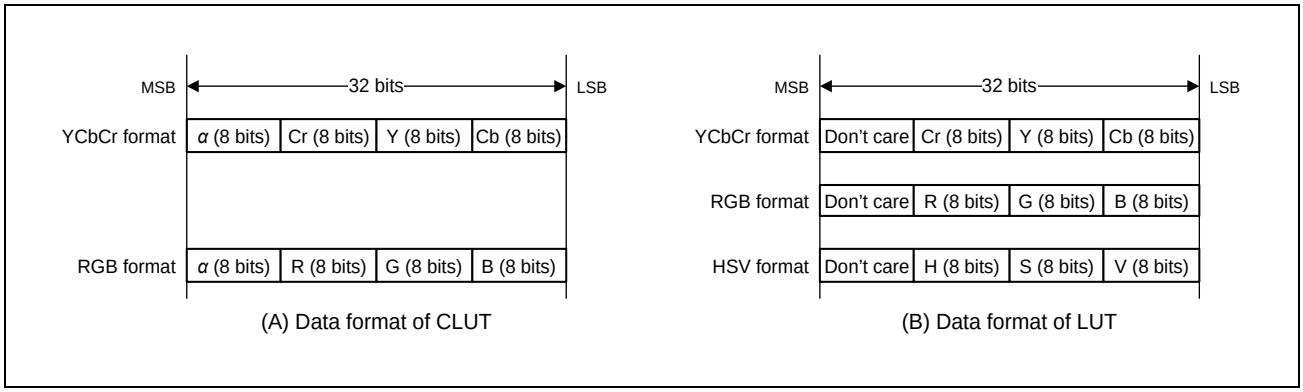

Figure 9.9-49 VI6_CLUT_TBL and VI6_LUT_TBL Formats

(2) CLU Table

Data is set in the CLU table in the space shown in Table 9.9-43 through indirect addressing.

Table 9.9-43 CLU Space Addresses

Space Name	Space Addresses	Module that References the Space in the Left Column
VI6_CLU_TBL	(offset address) + 7400h to (offset address) + 7407h	CLU

The addresses used in indirect addressing (VI6_CLU_ADDR, VI6_CLU_DATA) are shown in **Table 9.9-44**. The CLU table can be accessed by setting the VI6_CLU_ADDR register and then reading from or writing to the VI6_CLU_DATA register. To write-access the CLU table continuously, such as when setting data to the CLU table, perform the following.

1. Set the first CLU table coordinates in VI6_CLU_ADDR.
2. Write the first data to be set in VI6_CLU_DATA.
3. Set the next CLU table coordinates in VI6_CLU_ADDR.
4. Write the next data to be set in VI6_CLU_DATA.
   Execute these processes in a similar manner.

Accesses to VI6_CLU_ADDR and VI6_CLU_DATA registers are repeated in this way. The location where to access the CLU table to write the VI6_CLU_DATA contents immediately takes effect after a value is set in the VI6_CLU_ADDR register.

To read-access the CLU table continuously, change the write-access operation to the read-access operation in the sequence of processes of step 1 to step 4 above.

The following describes how to specify VI6_CLU_ADDR.

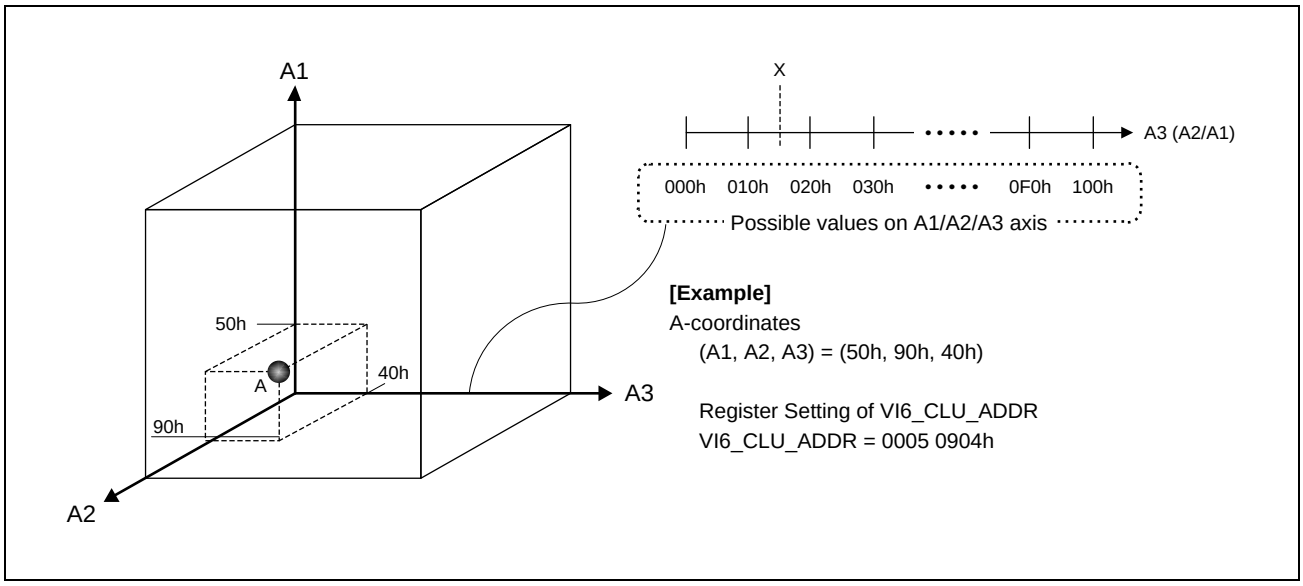

Figure 9.9-50 VI6_CLU_ADDR Setting

In the CLU table, a table value should be specified for every increase by 10h along each of the axes and for every intersection between two axes. For a certain axis, as shown in the top right of **Figure 9.9-50**, a value to be set in the table corresponds to a scale mark at an interval of 10h. The location of a point between two scale marks (for example, point X in **Figure 9.9-50**) is calculated through interpolation by the CLU (refer to **9.9.1.3.12 (1) CLU Control Register (VI6_CLU_CTRL)**). Accordingly, the lower four bits of table settings for each axis has no meaning; only the upper-order five bits of the desired coordinate for each component should be specified in VI6_CLU_ADDR (which should be shifted to the right by four bits) as shown in **Figure 9.9-50**.

Table 9.9-44 Address Spaces Used in Indirect Addressing to CLU Table

Address (Name)	Bit	Initial Value	R/W	Description
(offset address) + 7400h (VI6_CLU_ADDR)	31 to 24	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
	23 to 16	All 0	R/W	Coordinate Value of First Axis These bits set the coordinate value of the first axis on the three-dimensional space coordinates of the CLU table. A value from 0 to 16 can be specified.
	15 to 8	All 0	R/W	Coordinate Value of Second Axis These bits set the coordinate value of the second axis on the three-dimensional space coordinates of the CLU table. A value from 0 to 16 can be specified.
	7 to 0	All 0	R/W	Coordinate Value of Third Axis These bits set the coordinate value of the third axis on the three-dimensional space coordinates of the CLU table. A value from 0 to 16 can be specified when the CLU is in 3D mode. In 2D mode, these bits must be set to 0.
(offset address) + 7404h (VI6_CLU_DATA)	31 to 24	Undefined	R	Reserved These bits are always read as 0. The write value should always be 0.
	23 to 16	Undefined	R/W	Component Value of First Axis These bits set the component value of the first axis on the three-dimensional space coordinates of the CLU table, which is defined by the VI6_CLU_ADDR register. A value from 0 to 255 can be specified when the CLU is in 3D mode. In 2D mode, these bits must be set to 0.
	15 to 8	Undefined	R/W	Component Value of Second Axis These bits set the component value of the second axis on the three-dimensional space coordinates of the CLU table, which is defined by the VI6_CLU_ADDR register. A value from 0 to 255 can be specified.
	7 to 0	Undefined	R/W	Component Value of Third Axis These bits set the component value of the third axis on the three-dimensional space coordinates of the CLU table, which is defined by the VI6_CLU_ADDR register. A value from 0 to 255 can be specified when the CLU is in 3D mode. In 2D mode, these bits must be set to 0.

Accessing way of “Automatic Table Address Increment (VI6_CLU_CTRL.AAI = 1)” is shown below.

(1) Set 1 in VI6_CLU_CTRL.AAI

(2) Set 0000_0000h in VI6_CLU_ADDR (initial coordinate)

(3) Write the data in VI6_CLU_DATA by following order (pseudo-code).

```
for (ax3 = 0; ax3 < 17; ax3 ++) {
   for (ax2 = 0; ax2 < 17; ax2 ++) {
      for (ax1 = 0; ax1 < 17; ax1 ++) {
         Write the data in VI6_CLU_DATA
         for the coordinate of “VI6_CLU_ADDR = (ax1 << 16) + (ax2 << 8) + ax3”.
      }
   }
}
```

9.9.1.4.6 Image partition for VSPI processing

(1) Necessity of image partition

Because SRU, UDS and WPF/Rotation (VI6_WPF0_OUTFMT.ROT > 1) need to satisfy horizontal size restriction as shown in **Table 9.9-45**. Several executions of VSPI by partitioning one frame's image is needed to realize larger size in horizontal direction. In the chapter, the method is called as image partition. This section shows how to realize image partition for VSPI.

When either restriction shown in **Table 9.9-45** applies, image partition method is needed.

Table 9.9-45 Condition of Necessity to Take Image Partition

Location of Restriction	Max Horizontal Size	Condition of Necessity to Take the Restriction.
Input to UDS after clipping horizontal size by VI6_UDS_HSZCLIP register	304 pixels	UDS is used by up-scaling in horizontal direction.
Output from UDS after clipping horizontal size by VI6_UDS_CLIP_SIZE	304 Pixels	UDS is used by down-scaling or no scaling in horizontal direction.
Input to SRU	288 pixels	SRU is used.
Input to WPF after clipping horizontal size by VI6_WPF0_HSZCLIP	256 pixels	WPF/rotation (VI6_WPF0_OUTFMT.ROT > 1) is used.

To realize image partition, see seven items below.

a) Auto execution of VSPI by using automatic start of next frame processing (next_frame_auto_start) of DisplayList is recommended. See **9.9.1.4.6 (2) Auto execution by using display list** for more detail.

b) Start reservation is available to reduce overhead of interrupt response. See **9.9.1.4.6 (3)Start Reservation for VSPI** to use start reservation.

c) Discontinuous line is generated by VSPI end processing at partition boundary. So, reading overlapped pixels with neighbor partition and clipping discontinuous line at partition boundary is needed. **Figure 9.9-51** shows example of overlap pixel and clipping in case of 3 partition. See **9.9.1.4.6 (4) Reading overlapped pixels and clipping discontinuous line** for more detail.

d) The number of taps for each function's filter in horizontal direction is shown in **9.9.1.4.6 (5) The number of taps for each function's filter in horizontal direction for user to realize how many overlappe**d pixels to be read and how many pixels to be clipped.

e) Horizontal size clipping registers are explained in **9.9.1.4.6 (6) Horizontal size clipping registers for image partition**.

f) How to set HGO and HGT registers related to image partition is shown in **9.9.1.4.6 (7) Histogram of HGO/HGT**.

g) There are some restrictions when VSPI image partition is used. See **9.9.1.4.6 (8) Restriction when VSPI image partition is used**.

src_d_0: Input partition position 0
src_d_1: Input partition position 1

P_0 horizontal input size = $src_h_0 + m_0$
P_1 horizontal input size = $src_h_1 + m_1 + m_2$
P_2 horizontal input size = $src_h_2 + m_3$

$src_h_0 = src_d_0 + 1$
$src_h_1 = src_d_1 - src_d_0$
$src_h_2 = src_h - src_d_1 - 1$

Gray hatching is discontinuous region.

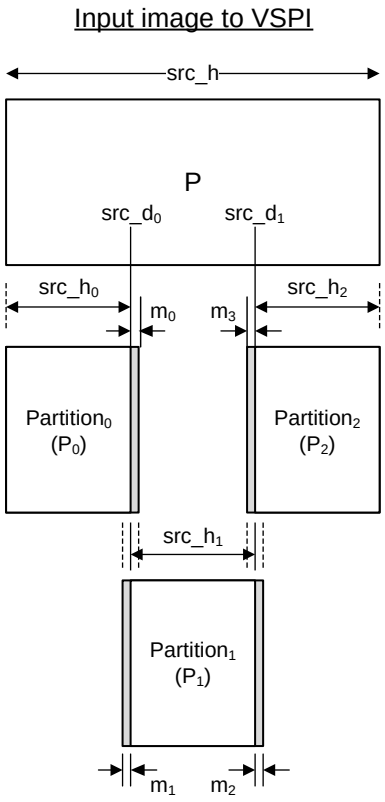

Figure 9.9-51 Example of Overlap Pixel and Clipping in Case of 3 Partitions

(2) Auto execution by using display list

Because partitioning one frame image into several partitioned images, several activations of VSPI for one frame processing are needed. So, using display list and auto execution by next frame auto start is recommended. Detail way is shown below.

a) Store all partitions' display list in SDRAM as shown in **Figure 9.9-52**.

b) In order to get better performance, don't set registers which are not updated per partition in display body from 2nd partition to last partition as shown in **Figure 9.9-52**. Registers which need to be updated per partition is listed in **Table 9.9-46**.

c) Set 1 to next_frame_auto_start in display list header from 1st partition to 2nd partition from the last. Then S/W has to activate VSPI only once for 1st partition.

d) Set 1 to current_frame_int_enable in display list header for only last partition. Set 0000_0002h to VI6_WPF0_IRQ_ENB to enable Display List Frame End (DFE) interrupt and to disable Frame End (FRE) interrupt. Then DFE interrupt occurs after all partitions' processing is finished by VSPI-H/W.

e) Set below to VI6_DL_CTRL

- VI6_DL_CTRL.DLE0 = 1 (Use display list)
- VI6_DL_CTRL.NH0 = 0 (Use Header Mode)
- VI6_DL_CTRL.RLM0 = 1 (Registers with two planes are not downloaded into H/W side at partition boundary)

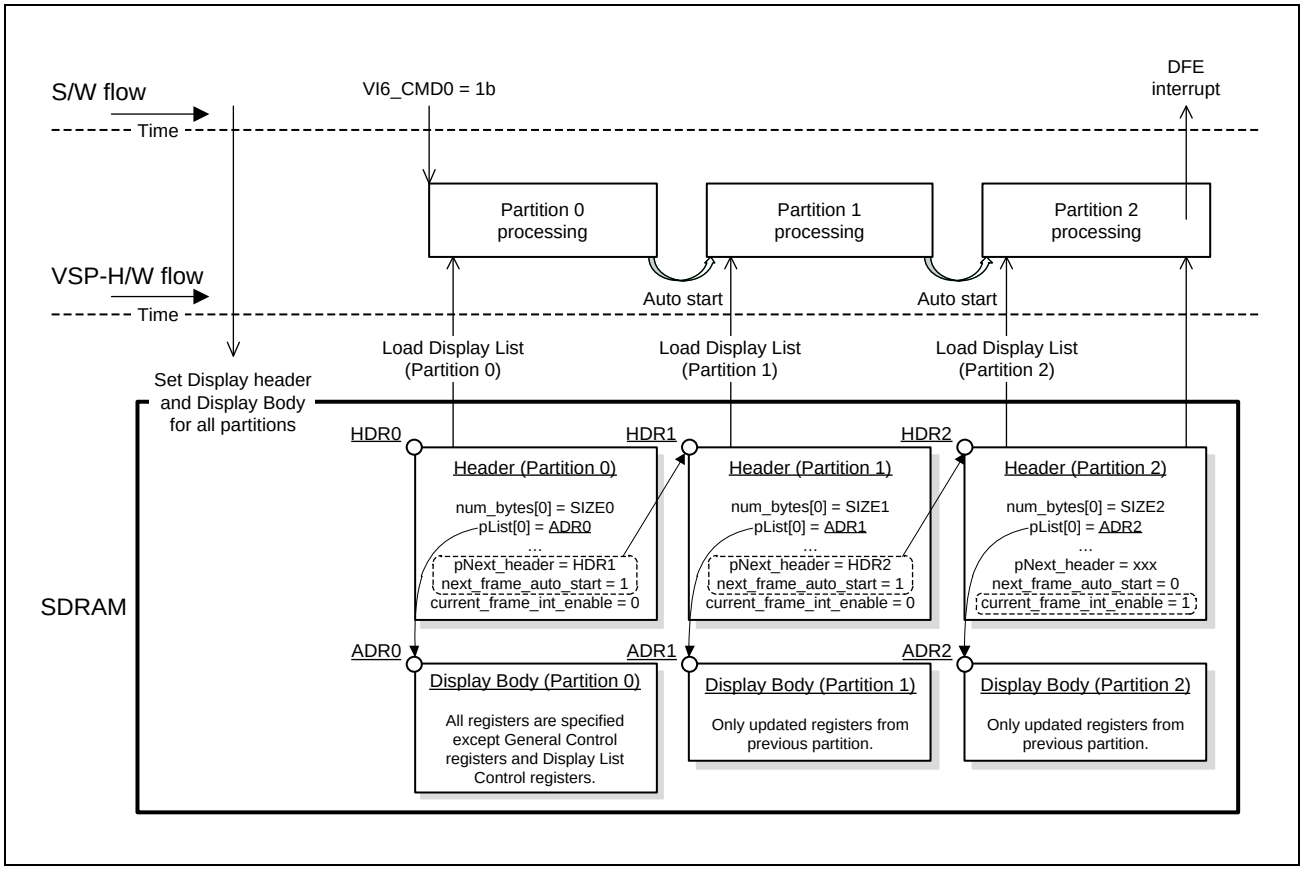

Figure 9.9-52 Flow of Image Partition Process (Example of 3 Partitions Case)

Table 9.9-46 Registers which Need to be Updated per Partition

1	VI6_RPF0_SRC_BSIZE
2	VI6_RPF0_SRC_ESIZE
3	VI6_RPF0_SRCM_ADDR_Y
4	VI6_RPF0_SRCM_ADDR_C0
5	VI6_RPF0_SRCM_ADDR_C1
6	VI6_RPF0_SRCM_ADDR_AI
7	VI6_WPF0_HSZCLIP
8	VI6_WPF0_DSTM_ADDR_Y
9	VI6_WPF0_DSTM_ADDR_C0
10	VI6_WPF0_DSTM_ADDR_C1

12	VI6_UDS_HSZCLIP
13	VI6_UDS_CLIP_SIZE
14	VI6_HGO_MODE
15	VI6_HGO_OFFSET
16	VI6_HGO_SIZE
17	VI6_HGO_REGRST
18	VI6_HGT_MODE
19	VI6_HGT_OFFSET
20	VI6_HGT_SIZE
21	VI6_HGT_REGRST
22	VI6_DPR_HGO_SMPPT
23	VI6_DPR_HGT_SMPPT

(3) Start Reservation for VSPI

This section shows sequence of software when start reservation is used. Software can reserve starting VSPI before VSPI processing of one frame is completed. Start reservation can remove interrupt response time and software overhead by reserving execution of VSPI before completion of previous frame.

a) Below shows software sequence of start reservation.

b) Below shows software sequence to manage the number of interrupt generation.

Remark Follow **9.9.1.4.6 (2) Auto execution by using display list** about the setting of display list and VI6_WPF0_IRQ_ENB.

(a) Software sequence of start reservation

[1] to [9] shown in **Figure 9.9-53** and **Figure 9.9-54** shows S/W flow to set registers for start reservation of VSPI.

[1] Wait until 0 is read from VI6_CMD0.STRCMD to confirm that starting WPF0 is not reserved.

[2] Wait until 0 is read from VI6_STATUS.SYS0_ACT to confirm WPF0 is IDLE.

[3] Set registers with two planes for frame 0 (1st frame) except DLH (Display List Header) address. Vi6_DL_HDR_ADDR0 has two planes.

[4] Set header address of display list for frame 0 to VI6_DL_HDR_ADDR0. Then VI6_CMD0.UPDHDR is asserted automatically by VSPI to indicate downloading registers with two planes is reserved.

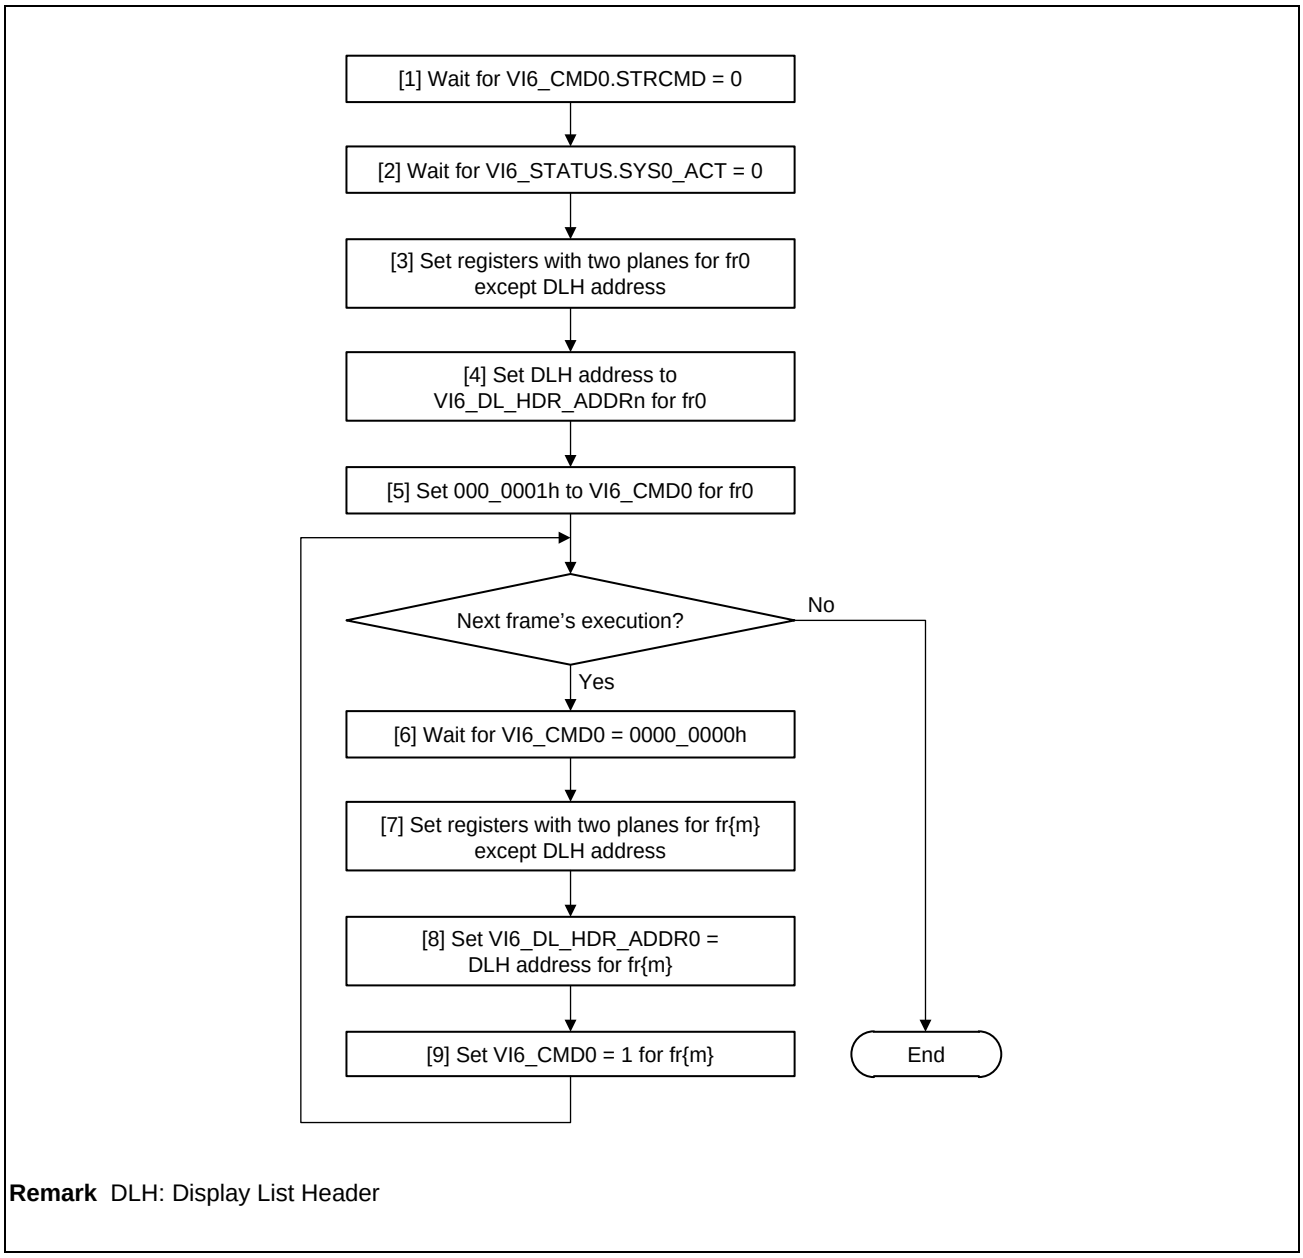
[5] Activate WPF0 for frame 0 (1st frame) by writing 0000_0001h to VI6_CMD0. If next frame's execution of VSPI is needed, go to step [6].

[6] Wait until start reservation is accepted and registers with two planes are downloaded into H/W side. If 0 is read from VI6_CMD0, it means that starting WPF0 is accepted and register with two planes are downloaded into internal registers H/W side refers.

[7] Set registers with two planes for next frame (fr{m}) except DLH (Display List Header) address.

[8] Set header address of display list for next frame (fr{m}) to VI6_DL_HDR_ADDR0. Then VI6_CMD0.UPDHDR is asserted automatically by VSPI to indicate downloading registers with two planes is reserved.

[9] Reserve activating WPF0 for next frame (fr{m}) by writing 0000_0001h to VI6_CMD0.
If next frame's execution of VSPI is needed, go to step [6].



Remark DLH: Display List Header

Figure 9.9-53 Flow Chart of Setting Registers by S/W in Case of VSPI Start Reservation

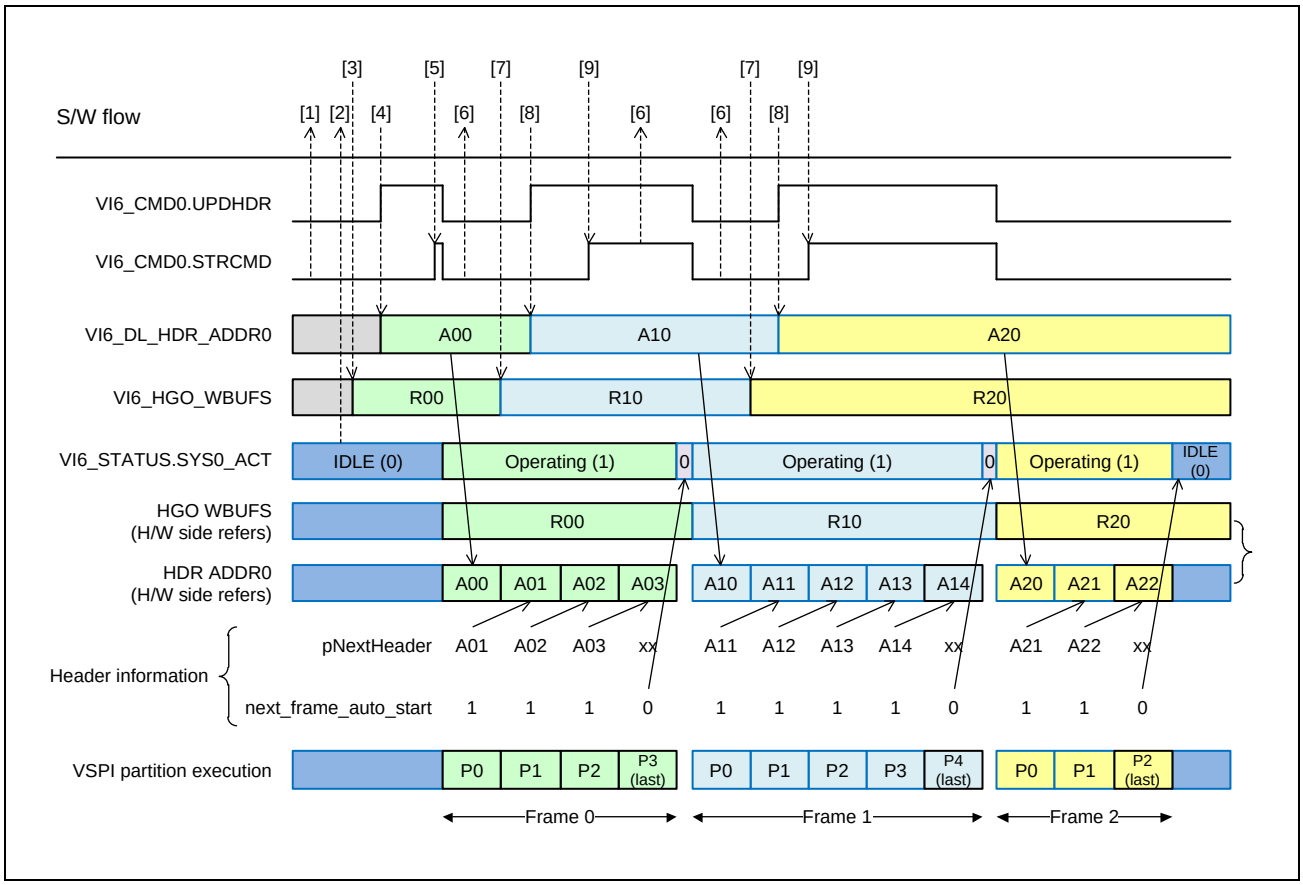


Figure 9.9-54 Timing of Setting Registers by S/W in Case of VSPI Start Reservation

(b) Software sequence to manage the number of interrupt generation.

The way of using interrupt is shown below.

[1] Set 1 to the VI6_WPF0_IRQ_ENB.DFEE to use frame end interrupt (VI6_WPF0_IRQ_STA.DFE)

[2] Write 0 to VI6_WPF0_IRQ_STA.DFE to clear status after interrupt processing as shown in **Figure 9.9-55**.

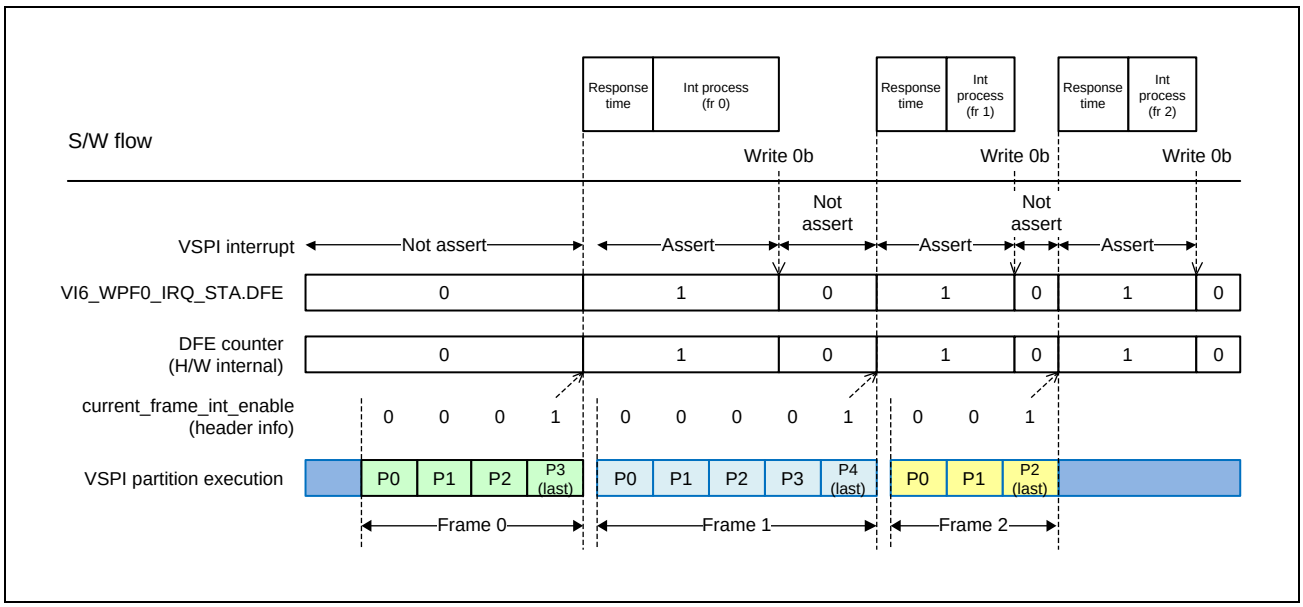

Figure 9.9-55 Timing of Interrupt Processing by S/W in Case of VSPI Start Reservation (Case1)

Be careful following points as shown in **Figure 9.9-56**.

[1] Set 0 to VI6_WPF0_IRQ_STA.DFE for the number of interrupt generation to clear VI6_WPF0_IRQ_STA.DFE.

[2] The VSPI H/W can count at most two of interrupt generation. If three times of interrupts occur before clearing the interrupt factor, interrupt counter overflows. Therefore, wait to reserve starting VSPI of frame {n+2} until interrupt factor of the frame {n} is cleared.

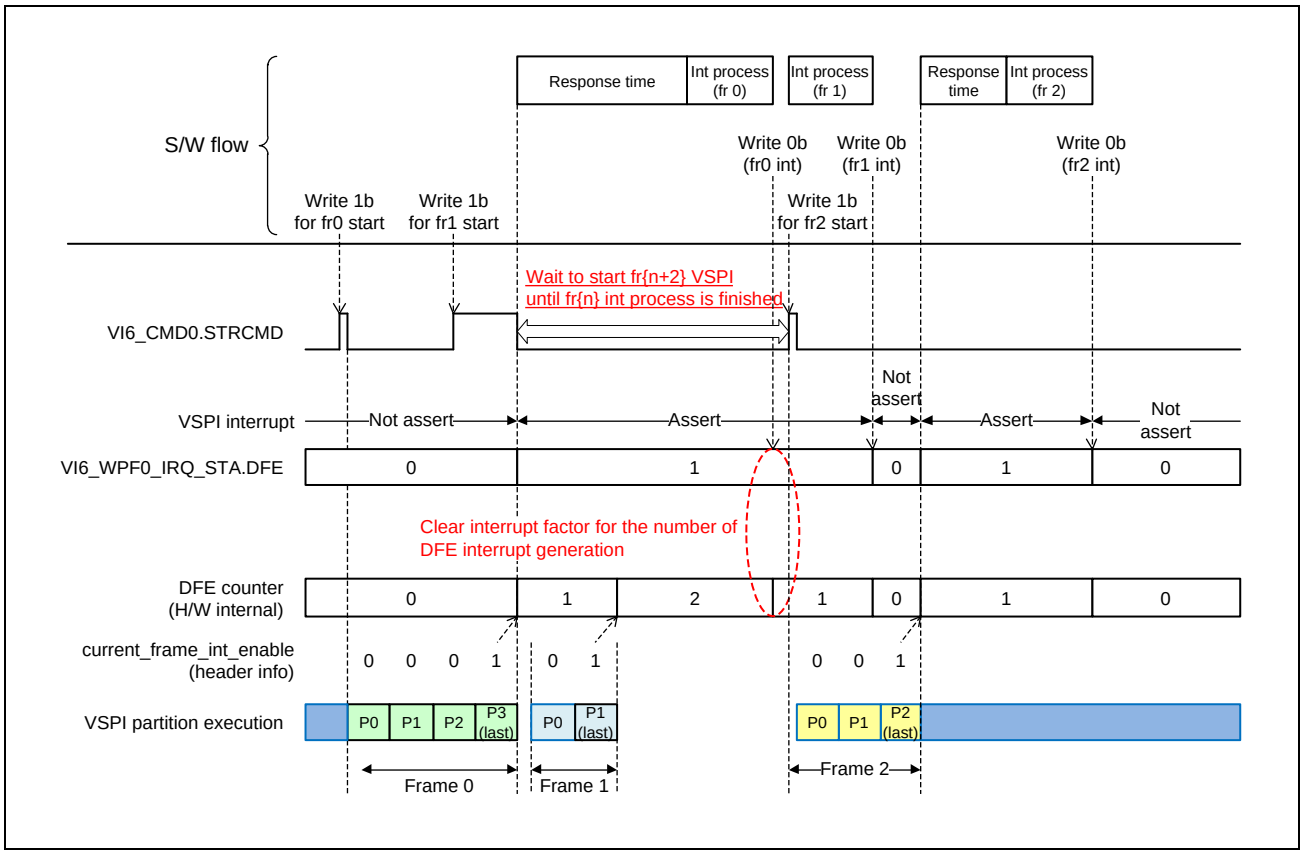

Figure 9.9-56 Timing of Interrupt Processing by S/W in Case of VSPI Start Reservation (Case2)

(4) Reading overlapped pixels and clipping discontinuous line

The VSPI processes partition boundary as end processing, and discontinuous line is generated at partition boundary. **Figure 9.9-57** shows why reading overlapped pixels and clipping discontinuous line are needed. As example that 3 tap filter is used inside VSPI, right neighbor pixel and left neighbor pixel are referred to generate output pixel. (*a*), (*b*) and (*c*) pixels are referred to generate (*b'*) in left partition. But if the VSPI doesn't read (*c*), right end pixel (*b*) is copied inside VSPI. And (*b*) is referred instead of (*c*) to generate (*b'*). And (*b'*) is recognized as discontinuous line. So reading overlapped pixels and clipping discontinuous line are needed.

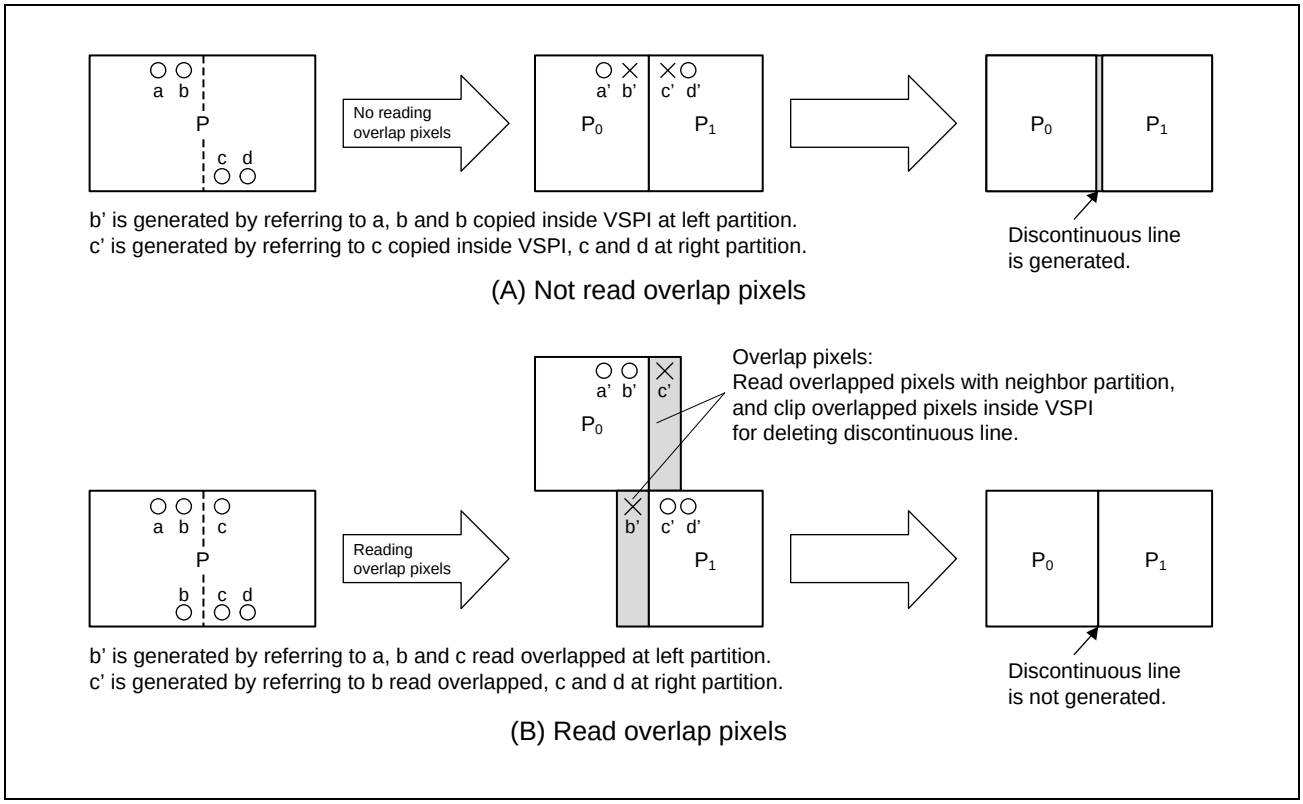

Figure 9.9-57 Discontinuous Line at Partition Boundary (The Example is 3 Tap Filter)

(5) The number of taps for each function's filter in horizontal direction

SRU, SHP, UDS and RPF have filter function which refer to not only current position's pixel but also several neighbor pixels to generate current position's output pixel. The number of taps for each function's filter are shown in this section to realize how many overlapped pixels to be read and how many pixels to be clipped.

(a) RPF (YCbCr42x -> YCbCr444 up sampling for Chroma)

Treatment of Cb and Cr is same as up sampling method. So C is used as Cb or Cr in the explanation.

(a-1) In case of VI6_RPF0_INFMT.CIPM = 0 for YCbCr42x input format

- Duplicate C component twice in horizontal direction.
- Horizontal size setting is restricted as 2-pixels units as shown in **Table 9.9-50**.

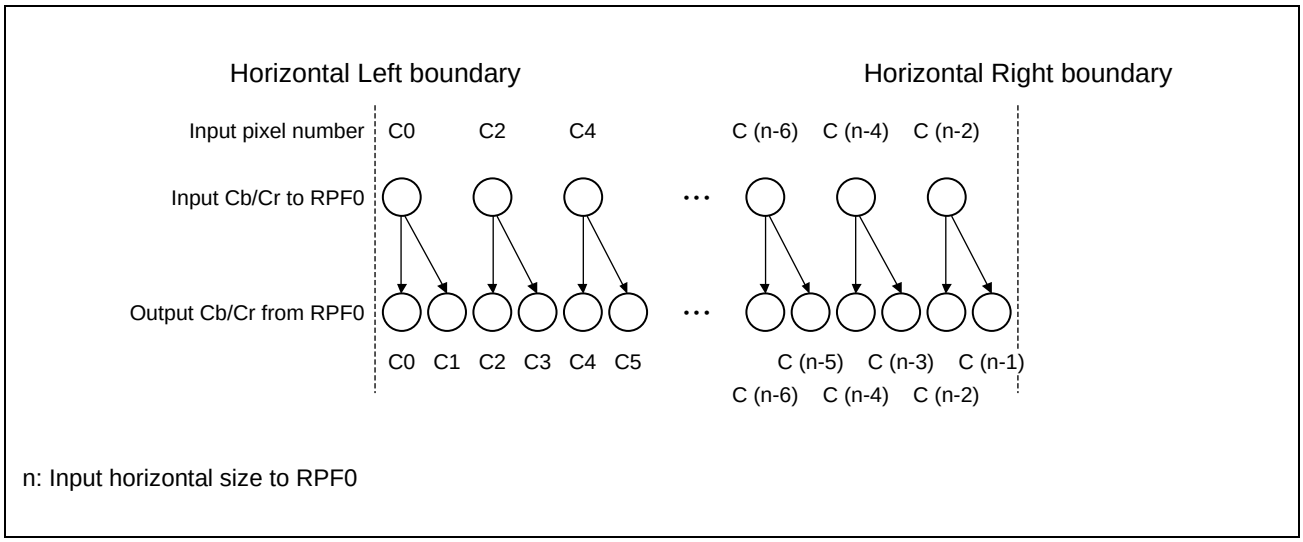

Figure 9.9-58 Chroma (Cb, Cr) Interpolation Way in RPF0 (VI6_RPF0_INFMT.CIPM = 0)

(a-2) In case of VI6_RPF0_INFMT.CIPM = 1 for YCbCr42x input format

- Even (0, 2, 4 …) output pixel of C is generated as copy of input pixel.
- Odd (1, 3, 5 …) output pixel of C is generated as 2 taps filter.
- Output pixel at right boundary is influenced by copied pixel C (n-2) of input pixel as shown in **Figure 9.9-59**. So it needs to clip C (n-1) output pixel for deleting discontinuous line when horizontal partition's right boundary is not frame boundary.
- Horizontal size setting is restricted as 2-pixels units as shown in **Table 9.9-50**.

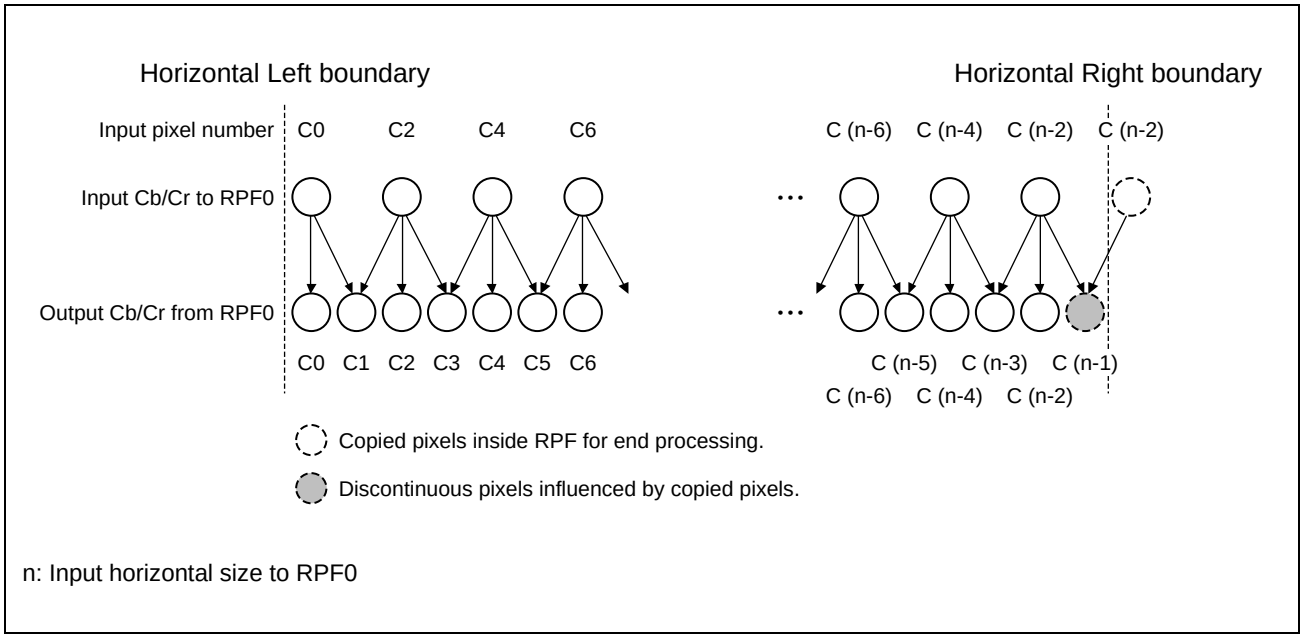

Figure 9.9-59 Chroma (Cb, Cr) Interpolation Way in RPF0 (VI6_RPF0_INFMT.CIPM = 1)

(b) SHP

- 9 taps filter
- From n-4 to n-1 output pixels are influenced by copied pixel of n-1 input pixel as shown in **Figure 9.9-60**. So it needs to clip from n-4 to n-1 output pixel for deleting discontinuous line when horizontal partition's right boundary is not frame boundary.
- From 0 to 3 output pixels are influenced by copied pixel of 0 input pixel as shown in **Figure 9.9-60**. So it needs to clip from 0 to 3 output pixels for deleting discontinuous line when horizontal partition's left boundary is not frame boundary.

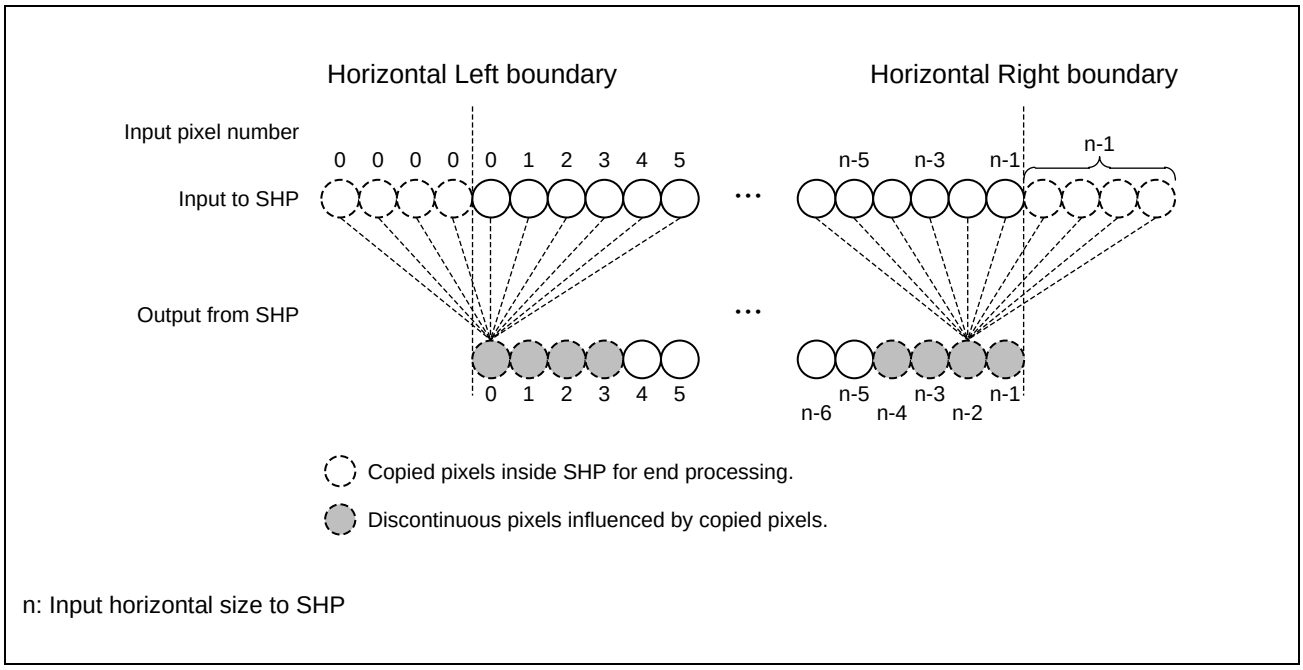

Figure 9.9-60 The Way of Applying Tap in SHP Filter

(c) SRU

SRU filter processing is composed of pre filter and post filter as shown in **Figure 9.9-61**.

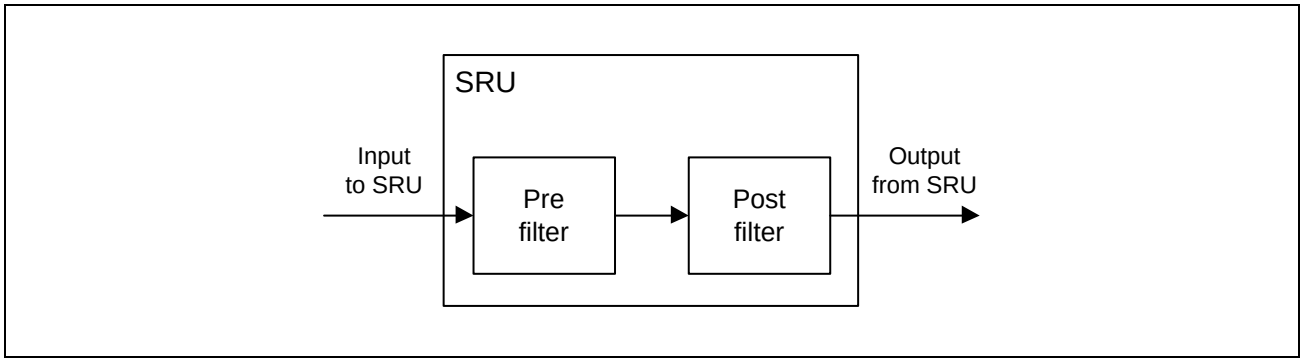

Figure 9.9-61 Structure of SRU Filter Processing

(c-1) In case of super resolution without scaling (VI6_SRU_CTRL0.SRU_MODE= 000b)

- Pre filter is 3 taps filter and go through post filter
- N-1 output pixel is influenced by copied pixel of n-1 input pixel as shown in **Figure 9.9-62**. So it needs to clip from n-1 output pixel for deleting discontinuous line when horizontal partition's right boundary is not frame boundary.
- 0 output pixel is influenced by copied pixel of 0 input pixel as shown in **Figure 9.9-62**. So it needs to clip 0 output pixel for deleting discontinuous line when horizontal partition's left boundary is not frame boundary.

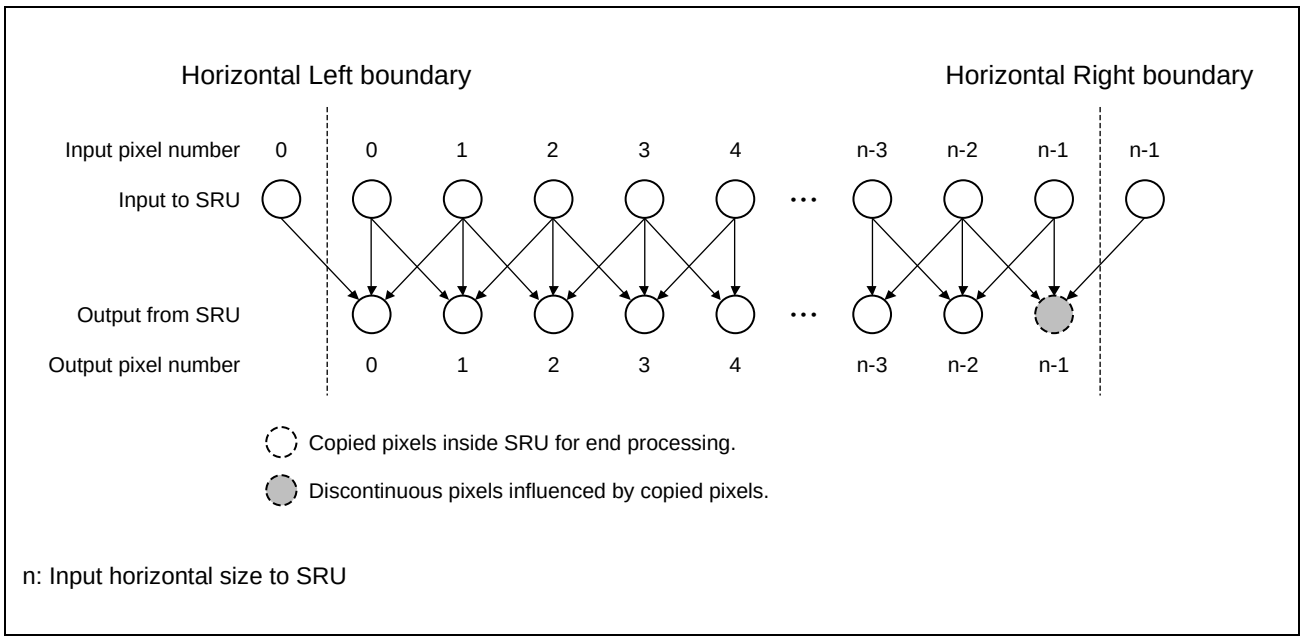

Figure 9.9-62 The Way of Applying Tap in SRU Filter (VI6_SRU_CTRL0.SRU_MODE = 000b)

(c-2) In case of super resolution with double scale-up (VI6_SRU_CTRL0.SRU_MODE = 100b)

- Pre filter is 3 taps filter and post filter is 2 taps filter.
- Even (0, 2, 4 …) output pixel is generated by 3 pixels (3 taps).
- Odd (1, 3, 5 …) output pixel is generated by 4 pixels (4 taps).
- From m-3 to m-1 output pixels are influenced by copied pixel of n-1 input pixel as shown in **Figure 9.9-63**. So it needs to clip from m-3 to m-1 output pixels for deleting discontinuous line when horizontal partition's right boundary is not frame boundary.
- From 0 to 1 output pixels are influenced by copied pixel of 0 input pixel as shown in **Figure 9.9-63**. So it needs to clip from 0 to 1 output pixels for deleting discontinuous line when horizontal partition's left boundary is not frame boundary.

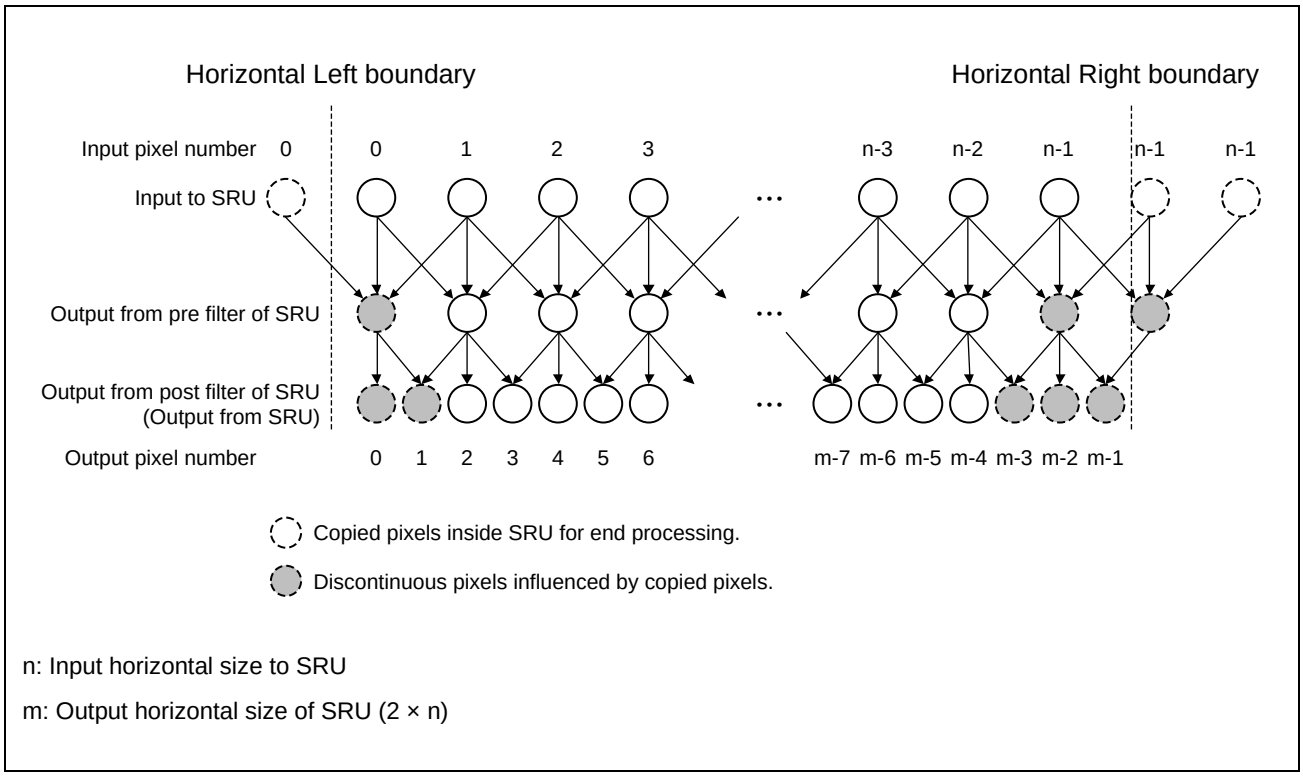

Figure 9.9-63 The Way of Applying Tap in SRU Filter (VI6_SRU_CTRL0.SRU_MODE = 100b)

(d) UDS

This section shows the way to calculate necessary input pixels of UDS (from src_pos0 position to src_pos1 position shown in **Figure 9.9-64**), discontinuous pixels generated by UDS (left position of discontinuous pixels is dst_pos0_pb as shown in **Figure 9.9-64**), necessary setting of horizontal start phase (hstp) and necessary setting of horizontal end phase (hedp) for UDS in order to generate valid output pixels from dst_pos0 position to dst_pos1 position as shown in **Figure 9.9-64**. Each parameter's definition is shown in (d-1) and (d-2) below. The way to calculate each parameter is shown in (d-3) below.

(d-1) Input parameters decided by user

- dst_pos0: Left position of desired valid pixels output from UDS.
- dst_pos1: Right position of desired valid pixels output from UDS.

(d-2) Parameters calculated in this section

- dst_pos0_pb: Left position of discontinuous pixels output from UDS.
- src_pos0: Left position of input pixels to UDS to generate valid pixels from dst_pos0 position.
- src_pos1: Right position of input pixels to UDS to generate valid pixels to dst_pos1 position.
- hstp: Horizontal start phase corresponding to dst_pos0_pb position.
- hedp: Horizontal end phase.

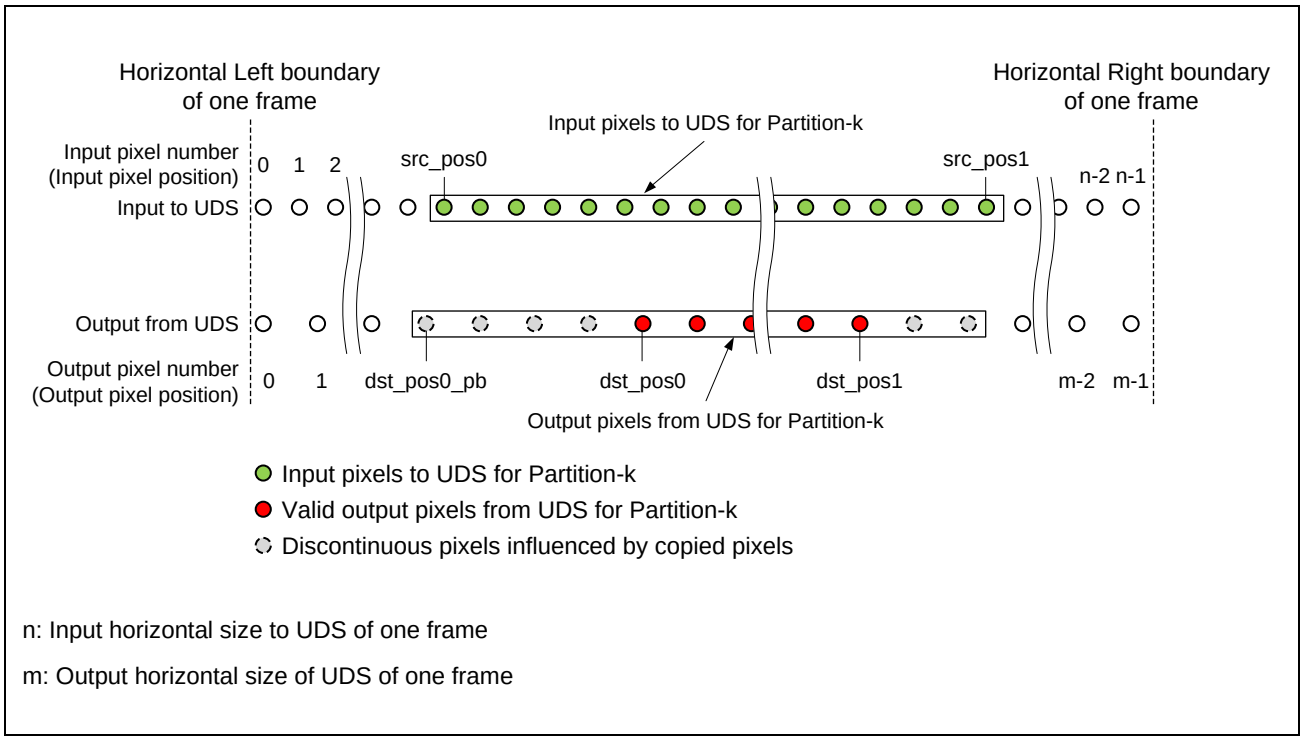

Figure 9.9-64 Relation between Valid Output Pixels' Position and Necessary Input Pixels' Position of UDS

(d-3) The way to calculate each parameter

[PROCEDURE 1] Calculate temporary src_pos0 position

For 1st partition (left end partition of source image)

$$src_pos0\ (temporal) = 0$$

For from 2nd partition to last partition (except left end partition of source image)

$$src_pos0\ (temporal) = \left(rdown \frac{dst_pos0 \times alpha - phase_edge \times {m_h}'}{4096 \times {m_h}'} - sub_src \right) \times {m_h}'$$

mh is the value of VI6_UDS_SCALE.HMANT, and f_h is the value of VI6_UDS_SCALE.HFRAC. mh' is defined in **Table 9.9-28**. phase_edge is defined in **Table 9.9-47**. rdown is defined in **9.9.1.5.6 Legend of Terms**. sub_src is 1 in case of mh' = 1, sub_src is 2 in case of mh' = 2 or 4. alpha can be expressed as below.

$$alpha = 4096 \times {m_h}' + f_h$$

Table 9.9-47 Value of phase_edge referenced in above calculation

VI6_UDS_SCALE.HMANT	VI6_UDS_CTRL.AMD	phase_edge
0	0	0
	1	rdown ((4096-VI6_UDS_SCALE.HFRAC)/2)
1 to 15	0 to 1	0

[PROCEDURE 2] Calculate temporary dst_pos0_pb position

For 1st partition (left end partition of source image)

$$dst_pos0_pb\ (temporal) = 0$$

For from 2nd partition to last partition (except left end partition of source image)

$$dst_pos0_pb\ (temporal) = rdown\frac{src_pos0\ (temporal) \times 4096 + \ phase_edge \times m_h'}{alpha}$$

[PROCEDURE 3] Decide dst_pos0_pb position from temporal dst_pos0_pb

There is a restriction about the left position which UDS outputs including discontinuous pixels. So it's necessary to shift the position of dst_pos0_pb (temporal) to the left so that the restrictions may be satisfied. dst_pos0_pb can be expressed as below.

$$dst_pos0_pb = dst_pos0_pb\ (temporal) - dst_pos0_pb_shift$$

Here, dst_pos0_pb_shift means the number of pixels by which dst_pos0_pb (temporal) is shifted to the left. Decide dst_pos0_pb_shift as satisfying restriction of [$(dst_pos0_pb \times alpha)$ should be multiple of mh']. The restriction can be expressed as below in other word.

There is no restriction in case of $mh' = 1$

- $(dst_pos0_pb \times alpha)$ must be multiple of 2 in case of $mh' = 2$
- $(dst_pos0_pb \times alpha)$ must be multiple of 4 in case of $mh' = 4$

Because clip register of UDS output (VI6_UDS_CLIP_SIZE) doesn't have clip offset setting, set the number of pixels of sum of valid output pixels and left discontinuous pixels to VI6_UDS_CLIP_SIZE.CL_HSIZE as shown in **Figure 9.9-65**. The number of sum of valid output pixels and left discontinuous pixels is $(dst_pos1 - dst_pos0_pb + 1)$ in the case. Left discontinuous pixels output from UDS should be clipped by offset register of WPF input clip (VI6_WPF0_HSZCLIP.HCL_OFST) as shown in **Figure 9.9-65**. The number of left discontinuous pixels is $(dst_pos0 - dst_pos0_pb)$ in the case. When modules which output discontinuous pixels such as SRU and/or SHP are connected after UDS as shown in **Figure 9.9-66**, discontinuous pixels are generated by also those modules. Add the number of pixels to the offset setting in the case.

The number of valid pixels from UDS should be set in size setting of WPF input clip register (VI6_WPF0_HSZCLIP.HCL_SIZE) as shown in **Figure 9.9-65**. The number of valid pixels is $(dst_pos1 - dst_pos0 + 1)$ in the case. When modules which output discontinuous pixels such as SRU and/or SHP is connected after UDS as shown in **Figure 9.9-66**, subtract the number of the discontinuous pixels from the size setting.

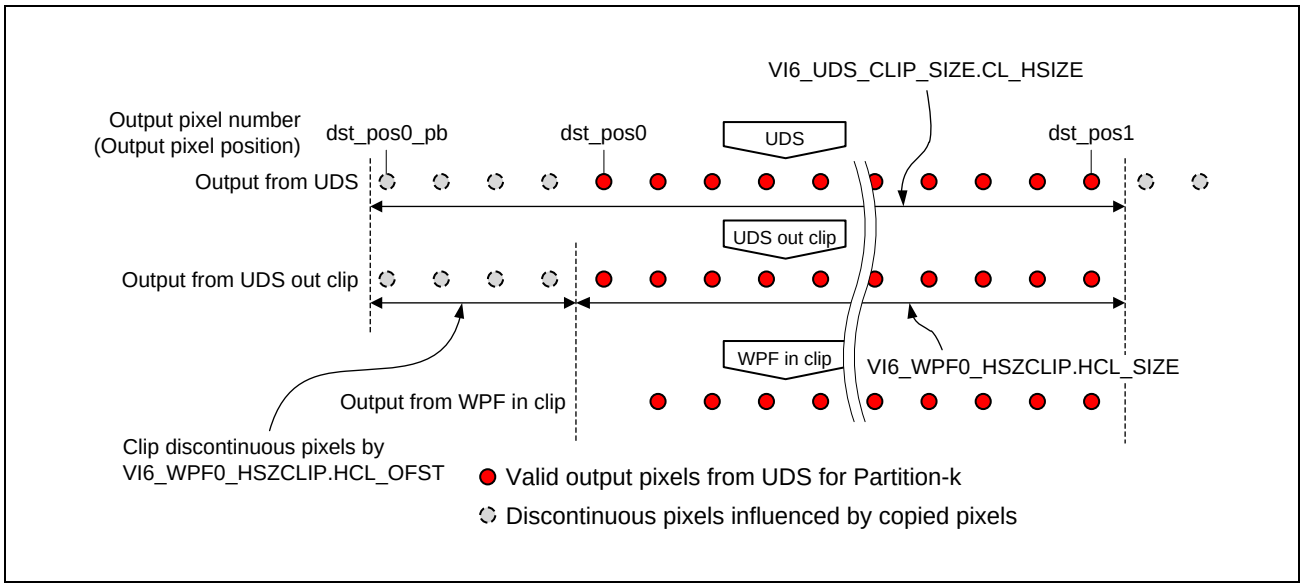

Figure 9.9-65 UDS Output Pixels and Clip Register's Setting (Case 1)

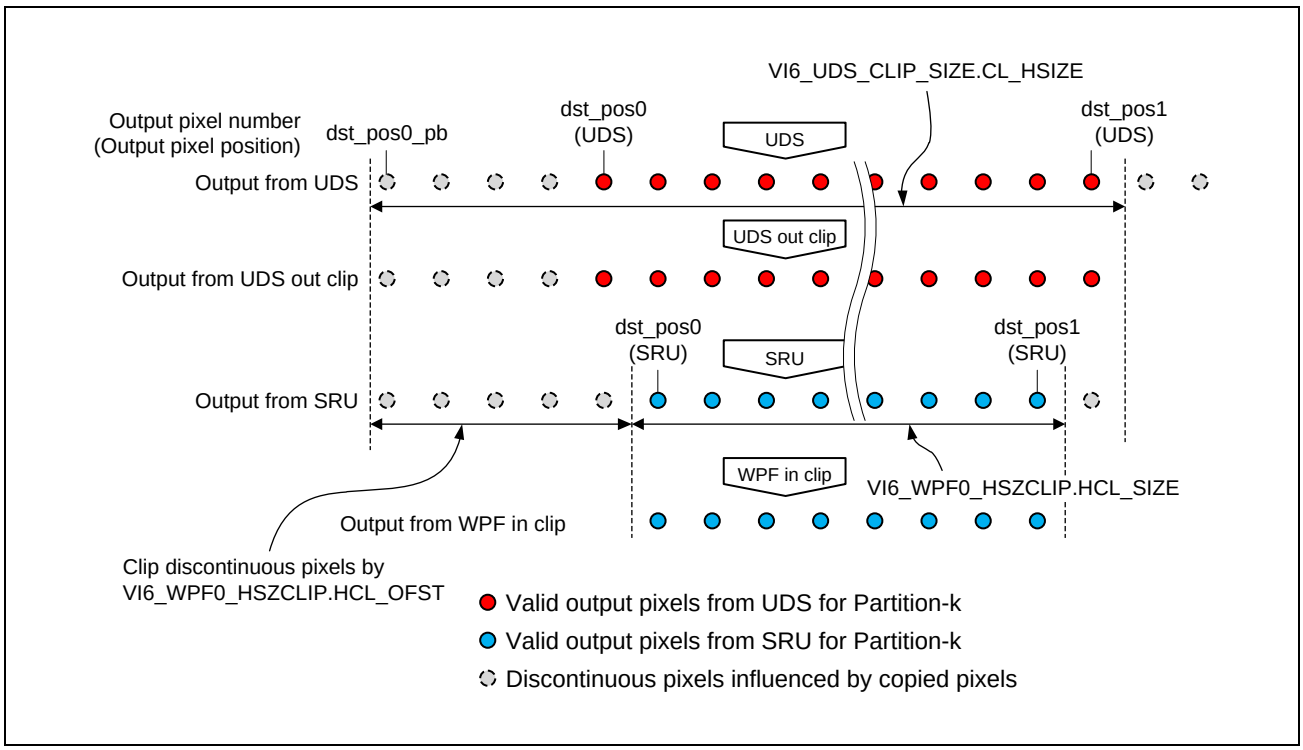

Figure 9.9-66 UDS Output Pixels and Clip Register'S Setting (Case 2)

[PROCEDURE 4] Calculate src_pos0 position from dst_pos0_pb

For 1st partition (left end partition of source image)

$$src_pos0 = 0$$

For from 2nd partition to last partition (except left end partition of source image)

$$src_pos0 = rdown\left(\frac{dst_pos0_pb \times alpha - phase_edge \times {m_h}'}{4096 \times {m_h}'} + add_src\right) \times {m_h}'$$

add_src is 0 in case that phase_residual expressed below is 0, add_src is 1 in case that phase_residual expressed below is not 0. phase_residual can be expressed as below.

$$phase_residual = rdown\left(\frac{alpha \times -dst_pos0_pb - phase_edge \times {m_h}'}{4096 \times {m_h}'}\right)$$

[PROCEDURE 5] Calculate src_pos1 position from dst_pos1

For from 1st partition to 2nd last partition (except right end partition of source image)

$$src_pos1 = rdown\left(\frac{dst_pos1 \times alpha - phase_edge \times {m_h}'}{4096 \times {m_h}'} + 2\right) \times {m_h}' + rdown\left(\frac{{m_h}'}{2}\right)$$

For last partition (right end partition of source image)

$$src_pos1 = n - 1$$

n is horizontal input size of UDS of one frame as shown in **Figure 9.9-64**.

[PROCEDURE 6] Calculate hstp

For 1st partition (left end partition of source image)

$$hstp = phase_edge$$

For from 2nd partition to last partition (except left end partition of source image)

$hstp = 4096 - rdown(phase_residual/mh')$ in case that phase_residual is not 0

$hstp = 0$ in case that phase_residual is 0

Set the value of hstp to VI6_UDS_HPHASE.HSTP. To enable VI6_UDS_HPHASE, set 1 to VI6_UDS_CTRL.AMDSLH.

[PROCEDURE 7] Calculate hedp

For from 1st partition to 2nd last partition (except right end partition of source image)

$$hedp = 0$$

For last partition (right end partition of source image)

$$hedp = phase_edge$$

Set the value of hedp to VI6_UDS_HPHASE.HEDP. To enable VI6_UDS_HPHASE, set 1 to VI6_UDS_CTRL.AMDSLH.

(6) Horizontal size clipping registers for image partition

As explained in **9.9.1.4.6 (1) Necessity of image partition** and **9.9.1.4.6 (4) Reading overlapped pixels and clipping discontinuous line**, discontinuous line is generated at partition boundary. So clipping discontinuous line is needed at boundary of image partition.

Horizontal input size clipping can be realized at input point of UDS module, input point of WPF0 module, input point of HGO module, input point of HGT module and output point of UDS module as shown in **Figure 9.9-67**. **Table 9.9-48** shows horizontal size clipping registers of each modules.

Other than an output point of UDS, arbitrary horizontal size can be specified from arbitrary horizontal offset position.

For an output point of UDS, arbitrary horizontal size can be specified from the left edge.

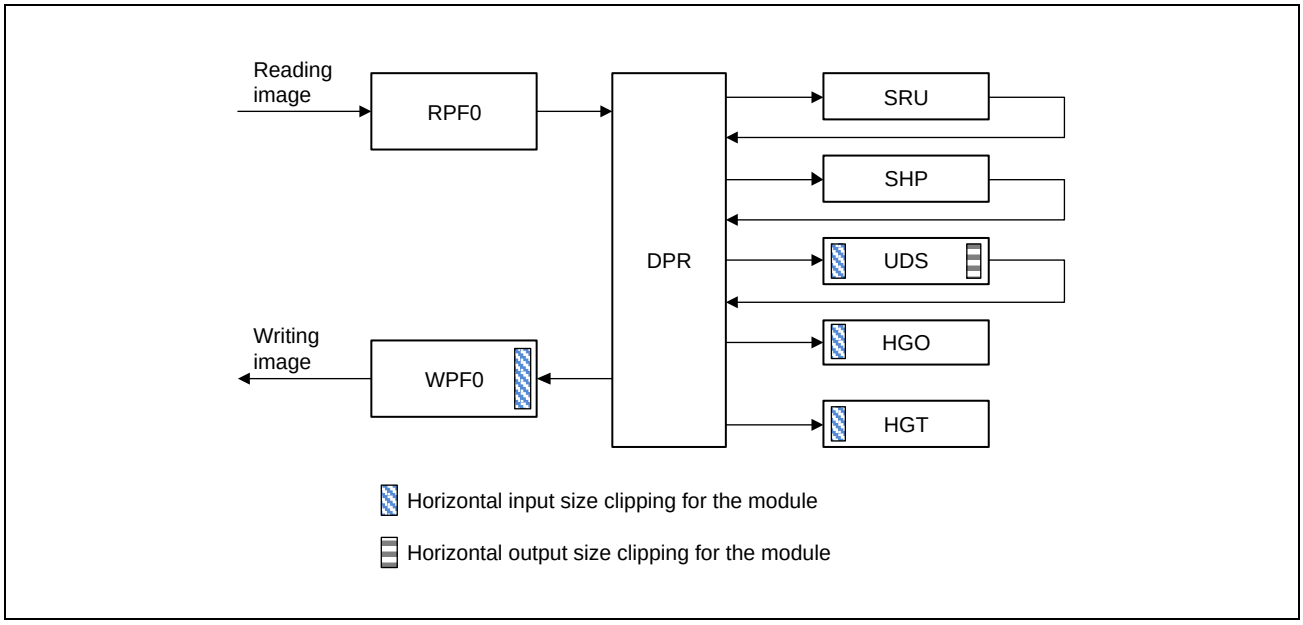

Figure 9.9-67 Horizontal Input Size Clipping in VSPI

Table 9.9-48 Horizontal Size Clipping Registers of Each Modules

Point	Size or Offset	Registers
UDS input*1	Horizontal offset	VI6_UDS_HSZCLIP.HCL_OFST [7:0]
	Horizontal size	VI6_UDS_HSZCLIP.HCL_SIZE [12:0]
UDS output*2	Horizontal size	VI6_UDS_CLIP_SIZE.CL_HSIZE [12:0]
WPF input*3	Horizontal offset	VI6_WPF0_HSZCLIP.HCL_OFST [7:0]
	Horizontal size	VI6_WPF0_HSZCLIP.HCL_SIZE [12:0]
HGO input	Horizontal offset	VI6_HGO_OFFSET.HOFFSET [13:0]
	Horizontal size	VI6_HGO_SIZE.HSIZE [13:0]
HGT input	Horizontal offset	VI6_HGT_OFFSET.HOFFSET [13:0]
	Horizontal size	VI6_HGT_SIZE.HSIZE [13:0]

Note 1. Set 1 to VI6_UDS_HSZCLIP.HCEN to enable clipping horizontal size at input to UDS.

Note 2. Horizontal offset at the UDS output point cannot be specified.

Note 3. Set 1 to VI6_WPF0_HSZCLIP.HCEN to enable clipping horizontal size at input to WPF0.

(7) Histogram of HGO/HGT

This section shows the setting value of registers about histogram detection of HGO and HGT. **Figure 9.9-68** shows the example of getting HGO histogram for UDS output. Those registers shown in **Figure 9.9-68** can be set by display list.

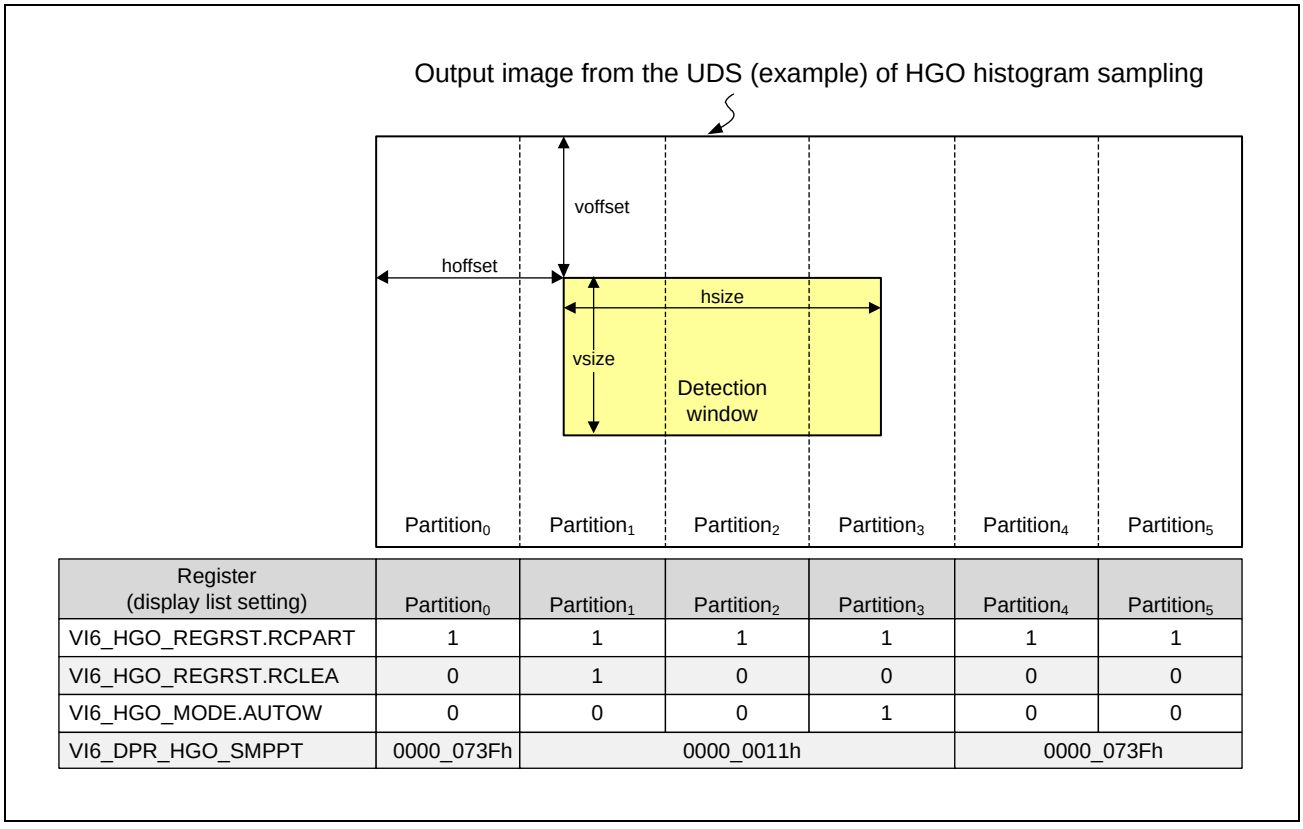
If user wants to get histogram for partial window (like **Figure 9.9-68**), set 0000_073Fh to VI6_DPR_HGO_SMPPT/VI6_DPR_HGT_SMPPT for partitions without detection window of histogram.

Set 1 to VI6_HGO_REGRST.RCLEA (VI6_HGT_REGRST.RCLEA) to initialize histogram counter for 1st partition including detection window of histogram (Partition1 in case of **Figure 9.9-68**). Then histogram counter is initialized before starting processing of the partition. To accumulate counting histogram for all partitions to get one frame's histogram, don't set 1 to VI6_HGO_REGRST.RCLEA (VI6_HGT_REGRST.RCLEA) after the partition.

Set 1 to VI6_HGO_REGRST.RCPART (VI6_HGT_REGRST.RCPART) for all partitions to initialize HGO (HGT) except histogram counter.

If user wants to dump histogram to external memory automatically set 1 to VI6_HGO_MODE.AUTOW (VI6_HGT_MODE.AUTOW) for last partition with detection window (partition3 in case of **Figure 9.9-68**). Then histogram is dumped to external memory after processing the partition with VI6_HGO_MODE.AUTOW =1 (VI6_HGT_MODE.AUTOW =1).

hsize and hoffset in **Figure 9.9-68** means horizontal size and horizontal offset as one frame. Set hsize and hoffset as each partition to VI6_HGO_SIZE.HSIZE, VI6_HGT_SIZE.HSIZE, VI6_HGO_OFFSET.HOFFSET and VI6_HGT_OFFSET.HOFFSET. If target node of histogram sampling generates discontinuous pixels, consider the number of discontinuous pixels and set offset register (VI6_HGO_OFFSET.HOFFSET, VI6_HGT_OFFSET.HOFFSET) as clipping also discontinuous pixels.



Register (display list setting)	$Partition_0$	$Partition_1$	$Partition_2$	$Partition_3$	$Partition_4$	$Partition_5$
VI6_HGO_REGRST.RCPART	1	1	1	1	1	1
VI6_HGO_REGRST.RCLEA	0	1	0	0	0	0
VI6_HGO_MODE.AUTOW	0	0	0	1	0	0
VI6_DPR_HGO_SMPPT	0000_073Fh	0000_0011h			0000_073Fh	

Figure 9.9-68 Example of Histogram Detection for Image Partition

(8) Restriction when VSPI image partition is used

When VSPI image partition is used, there are some restrictions below.

Remark SRU (×1) means SRU without scaling. SRU (×2) means SRU with double scale-up.

RPF

- Tiling (VI6_RPF0_SRC_BSIZE.BHSIZE != VI6_RPF0_SRC_ESIZE.EHSIZE) is prohibited.
- Reading 1bit/pixel alpha plane is prohibited.

SRU and UDS

- There are restriction when SRU and UDS are used in a VSPI execution. The restriction depends on SRU resolution mode, UDS horizontal scaling factor, the order of UDS and SRU and usage of SHP. The restriction is shown in **Table 9.9-49**.

  Example 1: RPF0 → UDS → LUT → SRU (×2) → WPF0 is prohibited.

  Example 2: RPF0 → SRU (×2) → LUT → UDS (hscale = 2) → WPF0 can be used.

  Example 3: RPF0 → SRU (×1) → LUT → UDS (hscale = 4) → WPF0 can be used.

  Example 4: RPF0 → SRU (×1) → UDS (hscale = 1/2) → WPF0 is prohibited.

Table 9.9-49 Restriction in Case of Connecting SRU and UDS

Order	SRU	UDS*1	VSPI supports	Note
UDS → SRU (×1)	×1	1/16 < hscale ≤ 16	✓	—
SRU (×1) → UDS	×1	hscale < 1	N/A	—
		1 ≤ hscale	✓	—
UDS → SRU (×2)	×2	1/16 < hscale ≤ 16	N/A	—
SRU (×2) → UDS	×2	hscale ≤ 1/4	N/A	—
		1/4 < hscale	✓	SHP cannot be used in this case

HGO/HGT

- HGO/HGT sampling points should not be specified at modules before UDS or SRU (×2).

  Example: In case of RPF0 → SHP → UDS → SRU (×1) → CLU → LUT → WPF0 connection
  UDS, SRU, CLU or LUT can be specified as HGO/HGT sampling points
  RPF0 or SHP cannot be specified as HGO/HGT sampling points.

  Example: In case of RPF0 → SHP → SRU (×2) → CLU → LUT → WPF0 connection
  SRU, CLU or LUT can be specified as HGO/HGT sampling points
  RPF0 or SHP cannot be specified as HGO/HGT sampling points.

- Letter box detection (VI6_HGO_m_LB_DET: m = R, G, B and VI6_HGT_LB_DET) cannot be available.
- Horizontal Pixel Skipping Mode cannot be used. Fix 0 to VI6_HGO_MODE.HRATIO [1:0], Fix 0 to VI6_HGT_MODE.HRATIO [1:0].

WPF

- Mode B dither cannot be used.

9.9.1.4.7 The step to read HGO histogram registers of 256 step mode by indirect addressing

When HGO is used as 256 step mode (VI6_HGO_MODE.STEP = 1) and HGO histogram is not automatically dumped to external memory (VI6_HGO_MODE.AUTOW = 0), read HGO histogram registers by indirect addressing. The step is shown below.

1. Set value-m in VI6_HGO_EXT_HIST_ADDR (**9.9.1.3.15 (11) HGO Y/MaxRGB Extended Histogram Address Register (VI6_HGO_EXT_HIST_ADDR)**). m is frequency of Y or MaxRGB pixel with value-m.
2. Read VI6_HGO_EXT_HIST_DATA (**9.9.1.3.15 (12) HGO Y/MaxRGB Extended Histogram Data Register (VI6_HGO_EXT_HIST_DATA)**) to get frequency of Y or MaxRGB pixel with value-m.

Repeat step 1 and step 2 256 times from m = 0 to m = 255.

9.9.1.5 Usage Notes

9.9.1.5.1 Assignment in Memory Space

Make sure that VSPI register space shall be mapped to Non-Cache region.

9.9.1.5.2 Input Image Size

Table 9.9-50 is a list of input size specifications.

Table 9.9-50 List of Input Size Specifications

Module	Min. Input Size (horizontal × vertical)	Max. Input Size (horizontal × vertical)	Restrictions on Setting Unit
RPF	1 × 1 pixel	8190 × 8190 pixels	• YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. • YCbCr420: 2-pixel units both horizontally and vertically. • Other formats: 1-pixel units both horizontally and vertically. *Note*: When the 1-bpp alpha plane*1 is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format. *Note*: These restrictions including note 1 are applied to the following. VI6_RPF0_SRC_BSIZE VI6_RPF0_SRC_ESIZE
SRU*2	4 × 4 pixels	• Without scaling (same size): 288 × 8190 pixels • With double scale-up: 288 × 4095 pixels	1-pixel units both horizontally and vertically.
UDS*2	4 × 4 pixels	304*3 × 8190 pixels	1-pixel units both horizontally and vertically.
SHP	4 × 4 pixels	8190 × 8190 pixels	1-pixel units both horizontally and vertically.
LUT	1 × 1 pixel	8190 × 8190 pixels	1-pixel units both horizontally and vertically.
CLU	1 × 1 pixel	8190 × 8190 pixels	1-pixel units both horizontally and vertically.
HST	1 × 1 pixel	8190 × 8190 pixels	1-pixel units both horizontally and vertically.
HSI	1 × 1 pixel	8190 × 8190 pixels	1-pixel units both horizontally and vertically.
HGO	1 × 1 pixel	8190 × 8190 pixels	1-pixel units both horizontally and vertically.
HGT	1 × 1 pixel	8190 × 8190 pixels	1-pixel units both horizontally and vertically.
WPF*2	1 × 1 pixel	• When VI6_WPF0_OUTFMT.ROT is smaller than 2, 8190 × 8190 pixels • When VI6_WPF0_OUTFMT.ROT is bigger than 1, 256 × 8190 pixels	• YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. • YCbCr420: 2-pixel units both horizontally and vertically. • Other formats: 1-pixel units both horizontally and vertically. *Note*: This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units. *Note*: In case of image rotation and flipping, other restrictions are applied. Refer to **9.9.1.3.7 (7) WPF0 Rotation Control Registers (VI6_WPF0_ROT_CTRL)**, which explains LMEM_WD.

Note 1. When VI6_RPF0_ALPH_SEL.ASEL is set to 011b.

Note 2. To support horizontal input size is larger than 256 pixels about SRU, UDS and/or WPF/ROT (VI6_WPF0_OUTFMT.ROT>1), the way of image partition is needed. Refer to **9.9.1.4.6 Image partition for VSPI processing** for realizing the way of image partition.

Note 3. The restriction of horizontal size is applied to input size of UDS in case of up-scaling in horizontal direction. The restriction of horizontal size is applied to output size of UDS in case of down-scaling or no-scaling in horizontal direction.

The most important restriction shown in **Table 9.9-50** is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in **Table 9.9-50**. Especially for the register settings of SRU and UDS, where the size can be changed within the modules, be careful not to exceed the input size limit for the module connected behind each of them.

9.9.1.5.3 Output Image Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in **Figure 9.9-2**, the data input to the VSPI is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. **Table 9.9-51** is a list of the processing that changes image size.

Table 9.9-51 Image Processing that Changes Image Size

Module	Function*1	Related Register	Size of Output from Module
SRU	Super resolution with double scale-up	VI6_SRU_CTRL0	• Super resolution without scaling (same size): Input size • Super resolution with double scale-up: Input size × 2
UDS	Output size clipping	VI6_UDS_CLIP_SIZE	• Horizontal output size: VI6_UDS_CLIP_SIZE.CL_HSIZE setting • Vertical output size: VI6_UDS_CLIP_SIZE.CL_VSIZE setting
WPF	Input size clipping	VI6_WPF0_HSZCLIP VI6_WPF0_VSZCLIP	When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size. • Horizontal output size: VI6_WPF0_HSZCLIP.HCL_SIZE*2 setting • Vertical output size: VI6_WPF0_VSZCLIP.VCL_SIZE*2 setting

Note 1. For details of each function, refer to the descriptions of the related registers.

Note 2. Refer to **9.9.1.3.1 Notational Conventions for Registers and Bit Fields** for explanation of register bit field.

The input image size can be changed only with the modules and functions shown in **Table 9.9-51**. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSPI output size can also be determined through the following steps.

1. The image size (VI6_RPF0_SRC_ESIZE) read from the external memory and sent to the DPR by the RPF0 is the initial value.
2. When the module connected with the DPR is not a module (function) shown in **Table 9.9-51**, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in **Table 9.9-51**, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPF0 is determined, this size is the VSPI output size for that WPF0 path.

Figure 9.9-69 shows how to determine the image size in a sample DPR connection through the above steps. The related conditions that determine the image size are also shown.

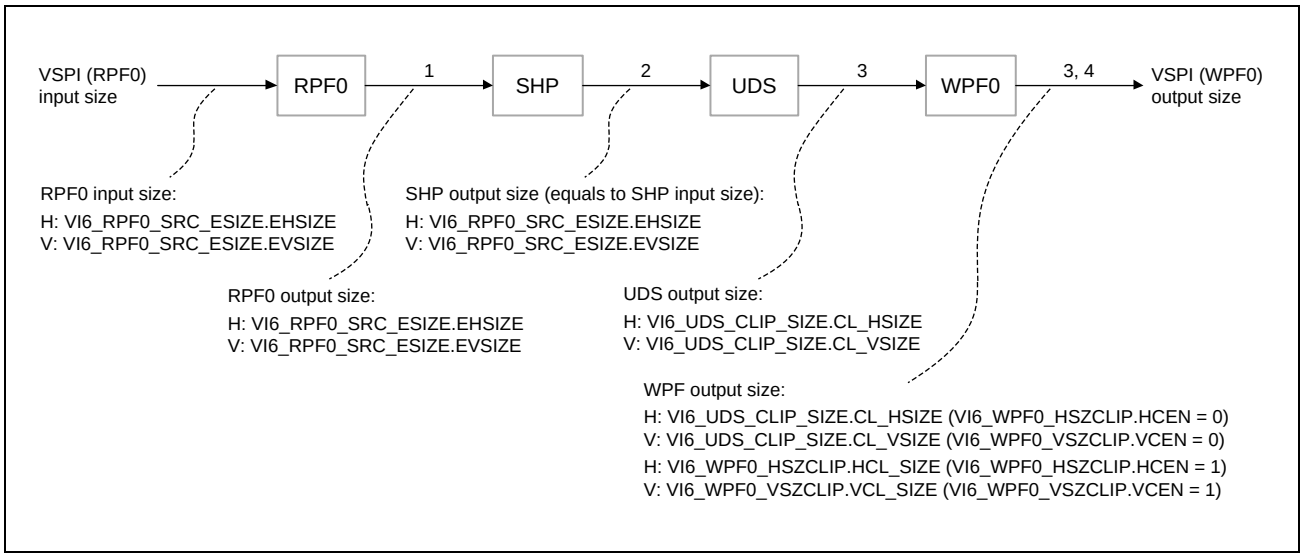


Figure 9.9-69 Input/Output Size for Each Module in a Sample DPR Connection

Make appropriate register settings in each module so that the VSPI output image size determined as shown in the figure does not violate the restrictions shown in **Table 9.9-51**.

9.9.1.5.4 Configuration of VSPI

Table 9.9-52 show the configuration of each type of VSPI unit on this LSI.

All the registers and functions listed in [Module] category of **Table 9.9-52** should be treated as un-implemented functions in each VSPI unit. Do not set any registers related to the un-implemented function without any statement.

Table 9.9-52 VSPI Configuration

Category	Configuration	Restricted contents
Restriction	WPF/format	See **9.9.2 FCPVI** for more detail. Related registers: VI6_WPF0_OUTFMT.ROT, VI6_WPF0_OUTFMT.WRFMT
	WPF/Addr, Stride	See **9.9.2 FCPVI** for more detail. Related registers: VI6_WPF0_STRIDE_Y. VI6_WPF0_STRIDE_C VI6_WPF0_DSTM_ADDR_Y VI6_WPF0_DSTM_ADDR_C0 VI6_WPF0_DSTM_ADDR_C1

9.9.1.5.5 Performance of VSPI

VSPI performance is shown in this section. VSPI performance shown in below is based on evaluation under the condition that only one IP is operated.

(1) Performance of VSPI

500 Mpix/s process rate per 1 set of VSPI except following cases. When one of following conditions is true, performance of VSPI is lower than 500 Mpix/s process rate. The execution of the VSPI is up to at most 480 frames per second.

(1) 90 degree or 270 degree rotation (VI6_WPF0_OUTFMT.ROT > 3) is enabled

(2) Horizontal scaling ratio is larger than ×4 times and SRU (×1) is used at same time.

(3) At least one RPF has all following conditions.

- RGB32bpp or YCbCr planar or YCbCr444 semi-planar
- Reading alpha plane

9.9.1.5.6 Legend of Terms

This section describes the configurations of VSPI on this LSI. Descriptions in this section show the full-function specifications of the VSPI IP. Some of the functions described in this section are not available on VSPI with restrictions written here.

(1) Terminology

This section explains the terminology for VSPI.

- Alpha
  The VSPI can execute both color data and its transparent data. The alpha is 8-bit data and expresses the transparency of pixel. The value FFh represents opaque pixel, and the value 00h represents transparent pixel.
- Plane
  One layer consists of color components such as R/G/B or Y/Cb/Cr, and alpha data representing its transparency of the pixel. The frame which is one of color components and alpha data is called as a plane.
- Picture Plane
  The picture plane represents color data in one layer.
- Alpha Plane
  The alpha plane represents transparent data in one layer.

(2) Definition of operators and functions

The following operators, notations are defined for explaining the functions of VSPI.

- $\langle x \rangle$
  Discard decimal places of value x
- $rdown\ (x)$
  Discard decimal places of value x: Ex, $rdown(3.81) = 3$
- $clip0\ (x)$
  Clip to 0 value if x is less than 0. $[x = (x < 0)?\ 0 : x]$

- $clip3\ (min, max, x)$
  The value x shall be clipped so that x shall be min < x < max. $\left[x = (x < min)?\ min: \left((x > max)?\ max: x\right)\right]$

(3) Unit

The unit is defined here for explaining VSPI's functions.

- [bpp]: bits per pixel

VSPI can handle a number of image formats. Each image format has different number of data bits. The unit [bpp] shows a number of data bits for one pixel. For example, RGB 8bpp means that its format is RGB and the pixel consists of 8 data bits.

9.9.2 FCPVI

The FCPVI conducts the bus accesses with 256-bit AXI bus for VSPI. This module is under control of software for the VSPI with the control function of the FCPVI executed on the host CPU.

9.9.2.1 Features

The FCPVI has the following features.

- Support out-of-order for the whole outstanding transactions

Table 9.9-53 Main Function of the FCPVI

Item	Description
Picture size supported	• Minimum: 1 pixel × 1 line • Maximum: 8190 pixels × 8190 lines The picture sizes must follow the restriction specified in **9.9 Video Signal Processor (VSP)** (sections “Usage Notes”, “Input Image Size” and “Output Image Size”).
Color format supported	Support all formats specified in **9.9 Video Signal Processor (VSP)** (sections “Register Descriptions”, “RPF0 Input Format Registers (VI6_RPF0_INFMT)” and “WPF0 Output Format Registers (VI6_WPF0_OUTFMT)”).

AXI transactions	• Read access:
	  • Access at 256 bytes boundary
	  • Support out-of-order for the whole outstanding transactions
	  • Support data interleaving
	• Write access:
	  • Access at 256 bytes boundary
	  • Support out-of-order for the whole outstanding transactions

CTRL	FCPVI controller
WIIF	VSPI write channel interface
WSIF	System AXI write channel interface

Abbr.	Description
RIIF	VSPI read channel interface
RSIF	System AXI read channel interface

9.9.2.3 IP Set and Bus Access Functions

FCPVI does not work alone but in companion with other IPs (VSPI) in an IP set. For each IP set the bus access function conducted by FCPVI is different.

Table 9.9-55 Bus Access Function for Each IP Set

IP Set	Bus Access
VSPI + FCPVI	Following functions are conducted by FCPVI • Read linear addressing image data • Read display list data • Write image data • Write histogram data*1

Note 1. This function is active when FCPVI is connected to VSPI.

9.9.2.4 Register Configuration

The FCPVI contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits) in the registers. Therefore, read-modify-write is needed to change partial bits in 32bits register.

The grayed portions represent reserved areas for debugging or future functional expansion. Do not access the reserved areas. Never access the registers when the FCPVI is in the module standby mode (with the operation clock placed in hold status).

The following are the base addresses of the FCPVI channels.

<FCPVI0_base>: 00_1606_0000h (5606_0000h*1, 4606_0000h*2)

Note 1. CM33 address space (non-secure)
Note 2. CM33 address space (secure)

Table 9.9-56 List of FCPVI Register

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
FCP version control register	FCPV0_FCP_VCR	0000_0104h	0000h	32
FCPV configuration register 0	FCPV0_FCP_CFG0	0000_0000h	0004h	32

31 to 16	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
15 to 8	CATEGORY [7:0]	1h	R	FCPVI use case category. 01h: This LSI
7 to 0	REVISION[7:0]	4h	R	Version of LSI product 04h: FCPVI revision is this LSI

(2) FCPVI Configuration Register 0 (FCP_CFG0)

FCP_CFG0 specifies the configuration of the FCPVI.

Access Size : 32 bits
Address : <FCPV0_base> + 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	FCPSEL	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
1	FCPSEL	0h	RW	This bit must be set to 1b in the FCPVI initialization
0	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

(3) FCP Reset Register (FCP_RST)

FCP_RST controls the FCPVI reset operation. The reset operation of the FCPVI highly depends on the reset sequence of the connected VSPI. For detailed information, refer to **9.9.2.6 Operation**.

Access Size : 32 bits
Address : <FCPV0_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	MODRST	-	-	-	SOFTRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
4	MODRST	0h	RW	FCPV MODule ReSeT This reset stops the FCPVI module immediately regardless of the bus transaction state. To operate the FCPVI after this reset, reconfigure all FCPVI registers. After the active period of MODRST is finished, it is switched back to 0 automatically. 0: NOP 1: Forcibly terminate the FCPVI operation. Note: Do not set both MODRST and SOFTRST bit to 1.
3 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	SOFTRST	0h	RW	FCPV SOFT ReSeT This reset stops the FCPVI module after finishing active bus transaction. To operate the FCPVI after this reset, reconfigure all FCPVI registers. After the active period of SOFTRST is finished, it is switched back to 0 automatically. 0: NOP 1: Terminates the FCPVI operation. Note: Do not set both MODRST and SOFTRST bit to 1.

(4) FCP Status Register (FCP_STA)

FCP_STA indicates the FCPVI status.

Access Size : 32 bits
Address : <FCPV0_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ACT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	ACT	0h	R	FCPVI Active Flag 0: Indicates the FCPVI is not active. 1: Indicates the FCPVI is active.

9.9.2.6 Operation

FCPVI is not invoked directly by register setting. It works if there are bus accesses from the connected IP VSPI. This section explains how to control operation for FCPVI connected with VSPI.

9.9.2.6.1 Operation Control Setting IP set VSPI + FCPVI

(1) FCPVI initialization

FCPVI must be initialized with following settings. This initialization must be conducted before starting image process. After initialization, those settings are kept no change until power-off or hardware reset, therefore, they don't need to be set for every image process.

1. Set 1 to FCP_CFG0.FCPVSEL to enable configuration of FCPVI.

(2) To start image process of VSPI + FCPVI

FCPVI registers do not need to be set when starting an image process. Therefore, refer to **9.9.1 VSPI** for the guidance of starting an image process.

(3) To stop image process of VSPI+FCPVI immediately

Do following steps to stop immediately an image process of VSPI + FCPVI

1. Set value 1 to VSPI register VI6_WPF0_IRQ_ENB.FREE so that frame end interruption can be issued.
2. Set value 1 to VSPI register VI6_SRESET.SRST0. VSPI will invoke termination process immediately.
3. Wait frame end interruption from VSPI or until the register bit VI6_WPF0_IRQ_STA.FRE is set to 1. After it occurs, VSPI has finished its processing.
4. Set value 1 to FCPVI register FCP_RST.SOFTRST. FCPVI will invoke termination process immediately.
5. Wait until ACT bit of the FCP_STA register and become 0. After it occurs, FCPVI has finished its processing.

With this procedure, VSPI can stop its process quickly, but the output frame of the last frame is corrupted.

9.9.2.6.2 Reset Operation

FCPVI reset can be conducted by software reset and power on reset. The software reset which is controlled by software, is used to stop the FCPVI operation. The software reset operation is not executed immediately; it is executed on completion of the bus transaction. The other is power on reset which initialize the whole FCPVI logic immediately.

(1) Software Reset

1. Activate software reset sequence:
   Set FCP_RST.SOFTRST to the value 1.
2. Confirm software reset sequence finished:
   FCP_STA.ACT becomes 0. All remain transactions with the bus system finished.

The procedure to stop operation of FCPVI and connected IP is descripted at **9.9.2.6.1 Operation Control Setting IP set VSPI + FCPVI**.

(2) Power-on Reset, Hardware reset

The power-on reset is controlled by an externally input signal called hardware reset. This reset initializes the whole internal logic of FCPVI.

9.9.2.6.3 Register Settings and Restrictions on Connected VSPI

The connected IP VSPI have to follow the setting and restrictions in following tables.

Table 9.9-57 Setting Restriction about Output Color Formats

	Format setting (VI6_WPF0_OUTFMT)	Restrictions
Register	ROT[2:0]	Register Value (Explanation)
VI6_WPF0_ROT_CTRL.LN16	4-7	1 (always output in 16 lines mode)

9.9.2.7 Usage Notes

9.9.2.7.1 Manipulating FCPVI, VSPI with CPG module stop, software reset

The following notes 1. and 2. are to prevent FCPVI and VSPI from the unstable status which may cause hang or wrong operation.

NOTES

1. In the case of stopping FCPVI and VSPI using the corresponding register, do following steps. Note that it is needed to stop both FCPVI and VSPI.
   [Step 1] Stop FCPVI and VSPI with the software reset sequence following to the guidance in **9.9.2.6.2 Reset Operation**.
   [Step 2] Stop VSPI and FCPVI using the corresponding register with following **9.9.3.2 Procedure for Stopping VSP**.
2. In the case of re-starting FCPVI and VSPI after stopping those modules, be sure to run start process as defined in **9.9.3.1 Procedure for Starting VSP** and **9.9 Video Signal Processor (VSP)**.

9.9.3 Procedure for Starting and Stopping VSP

Follow the steps below.

For the clocks used in the VSP are provided by the CPG. For activating and stopping the clocks to VSP, access to the CPG module. Besides that, VPS have a clock divider to generate clocks used in the VSP. This clock divider is controlled by the reset signal and the module stop (mstp) signal for the VSP.

For controlling and observing the signals in the following steps, access to the SYS module or CPG modules.

Clock On/Off control register, Reset control register and Low power control registers are used for VSP (VSPI, FCPVI). Detail descriptions refer to **4.3 System Controller (SYS)** and **4.4 Clock Pulse Generator (CPG)**.

9.9.3.1 Procedure for Starting VSP

Table 9.9-58 is the Procedure for starting for VSP.

Table 9.9-58 Procedure for Starting VSP

Step	Description	Register Operation
1	Activate clocks for VSP from CPG. *Note*: This step can be omitted if clocks are already provided from CPG.	• Set 1b to CPG_CLKON_26.CLK5_ON (bit-5: CGC_VSPI_clk_m). • Set 1b to CPG_CLKON_26.CLK6_ON (bit-6: CGC_VSPI_clk_a_as). • Set 1b to CPG_CLKON_26.CLK7_ON (bit-7: CGC_VSPI_clk_p_as).
2	De-assert the reset signal for clock divider from CPG.	Set 1b to CPG_RST_17.RSTB11 (bit-11: VSPI_x_smreset_vspiss_n).
3	De-assert module stop signal for clock divider from SYS.	Set 1b to SYS_VSPI_CLK.x_mstp_vsp_clk_n (bit-1).
4	Confirm that clock divider is activated.	Read SYS_VSPI_CLK. • Confirm o_vspi_clk_mon (bit-0) is 1b.
5	De-assert reset signals for VSPI and FCPVI.	• Set 0b to CPG_RST_17.RSTB13 (bit-13: VSPI_x_spreset_fcpvi0). • Set 0b to CPG_RST_17.RSTB12 (bit-12: VSPI_x_sreset_vsp1z).
6	Release the low-power state of ADB400.	• Set 1b to CPG_LP_VSPI_CTL1.fvi_axi_clkqreqnm (bit-4). • Set 1b to CPG_LP_VSPI_CTL1.fvi_axi_clkqreqns (bit-0).
7	Confirm that ADB400 have leaved from the low-power state.	Read CPG_LP_VSPI_CTL1. • Confirm fvo_axi_clkqacceptnm (bit-5) is 1b. • Confirm fvo_axi_clkqacceptns (bit-1) is 1b.
8	Release the low-power state of the APB-IF	• Set 1b to CPG_LP_VSPI_CTL1.fvi_apb_pwr_qreq_n (bit-16). • Set 1b to CPG_LP_VSPI_CTL2.vsi_apb_pwr_qreq_n (bit-0).
9	Confirm that APB-IF have leaved from the low-power state.	Read CPG_LP_VSPI_CTL1. • Confirm fvo_apb_pwr_qaccept_n (bit-17) is 1b. Read CPG_LP_VSPI_CTL2. • Confirm vso_apb_pwr_qaccept_n (bit-1) is 1b

9.9.3.2 Procedure for Stopping VSP

Table 9.9-59 is the Procedure for stopping for VSP.

Table 9.9-59 Procedure for Stopping VSP

Step	Description	Register Operation
1	Make the APB-IF to the low-power state.	• Set 0b to CPG_LP_VSPI_CTL1.fvi_apb_pwr_qreq_n (bit-16). • Set 0b to CPG_LP_VSPI_CTL2.vsi_apb_pwr_qreq_n (bit-0).
2	Confirm that APB-IF have been in the low-power state.	Read CPG_LP_VSPI_CTL1. • Confirm fvo_apb_pwr_qaccept_n (bit-17) is 0b. Read CPG_LP_VSPI_CTL2. • Confirm vso_apb_pwr_qaccept_n (bit-1) is 0b
3	Make the ADB400 to the low-power state.	• Set 0b to CPG_LP_VSPI_CTL1.fvi_axi_clkqreqnm (bit-4). • Set 0b to CPG_LP_VSPI_CTL1.fvi_axi_clkqreqns (bit-0).
4	Confirm that ADB400 have been in the low-power state.	Read CPG_LP_VSPI_CTL1. • Confirm fvo_axi_clkqacceptnm (bit-5) is 0b. • Confirm fvo_axi_clkqacceptns (bit-1) is 0b.
5	Assert reset signals for VSPI and FCPVI.	• Set 1b to CPG_RST_17.RSTB13 (bit-13: VSPI_x_spreset_fcpvi0). • Set 1b to CPG_RST_17.RSTB12 (bit-12: VSPI_x_sreset_vsp1z).
6	Assert module stop signal for clock divider from SYS.	Set 0b to SYS_VSPI_CLK_x_mstp_vsp_clk_n (bit 1).
7	Confirm that clock divider have stopped.	Read SYS_VSPI_CLK. • Confirm o_vspi_clk_mon (bit-0) is 0b.
8	Assert the reset signal for clock divider from CPG.	Set 0b to CPG_RST_17.RSTB11 (bit-11: VSPI_x_smreset_vspiss_n).
9	Stop clocks for VSP from CPG. *Note*: This step can be omitted if clock stopping is not required.	• Set 0b to CPG_CLKON_26.CLK5_ON (bit-5: CGC_VSPI_clk_m). • Set 0b to CPG_CLKON_26.CLK6_ON (bit-6: CGC_VSPI_clk_a_as). • Set 0b to CPG_CLKON_26.CLK7_ON (bit-7: CGC_VSPI_clk_p_as).

SECTION 9 IMAGE

9.10 Frame Data Processor (FDP)

FDP consist of FDP1B and FCPF modules. Refer the detail for **9.10.1 FDP1B** and **9.10.2 FCPF**.

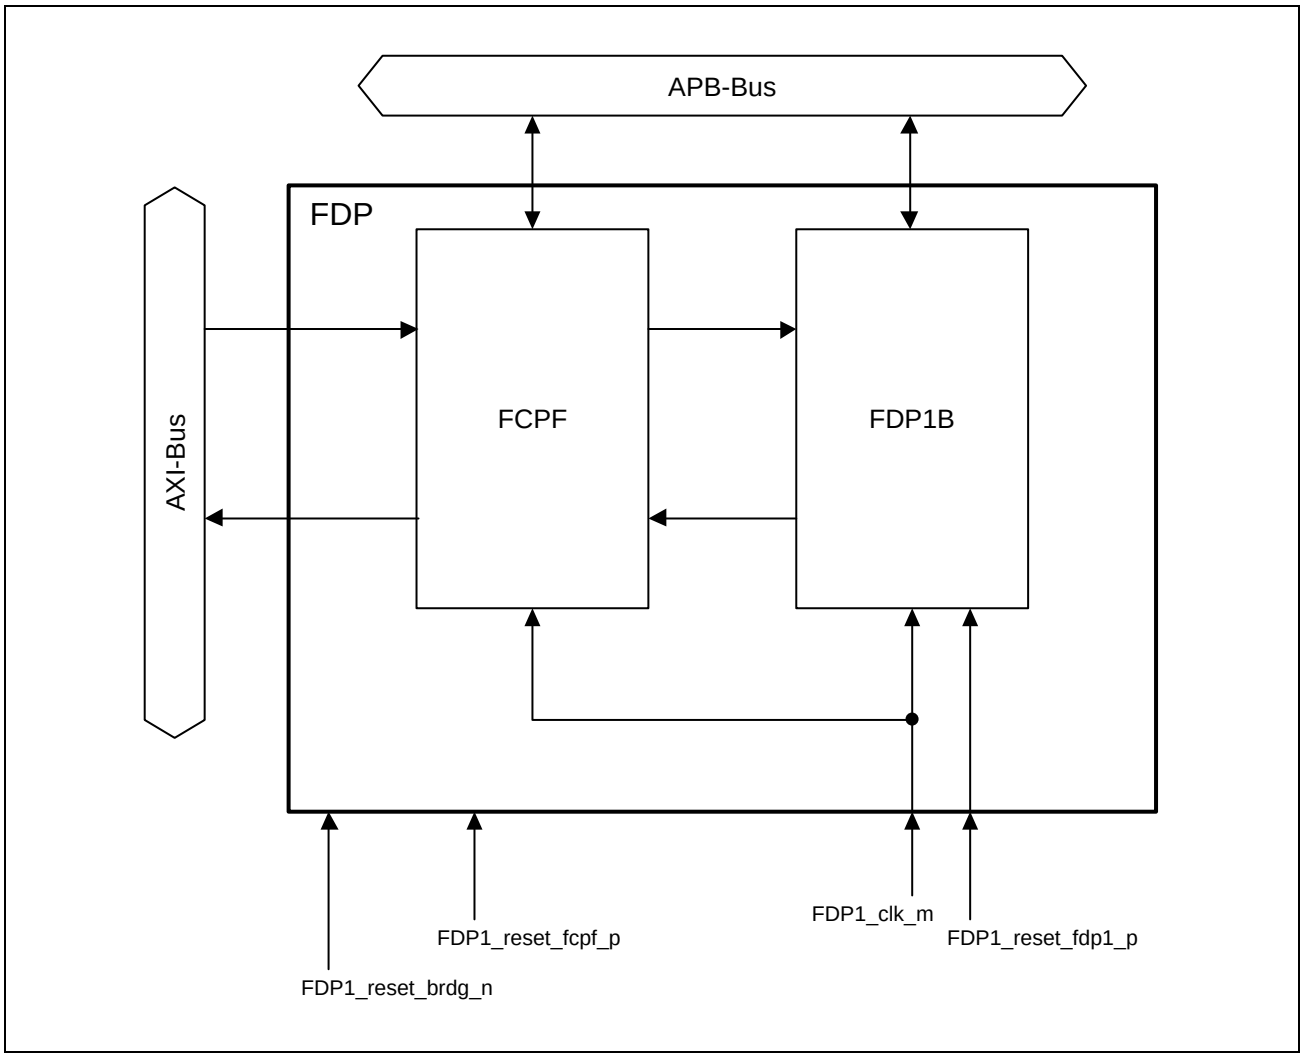

Figure 9.10-1 FDP Block Diagram

9.10.1 FDP1B

The FDP1B is the module which converts the tile video data to linear video. Require software or the library to RENESAS for operating this module.

This LSI provides one channel.

9.10.1.1 Features

This module has the following features.

- Support 8190 × 8190 resolution
- Performance of FDP1B is as following:
  - Output performance is 500 Mpixs/s. Input performance (progressive mode) is equal to output performance.

Table 9.10-1 Main Function of the FDP1B

• Read Pixel Formatter (RPF)			
Number of Channels			One Channel (RPF1)
Image Format	Input	YCbCr	• YCbCr444-PL, SP, ILV*1 • YCbCr422-PL, SP, ILV*1 • YCbCr420-PL, SP*1
		Maximum size	H8190 × V8190 pixels
		Minimum size	H32 × V32 pixels
		Size setting unit	• YCbCr420: 2-pixel units both horizontally and vertically. • YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
• Write Pixel Formatter (WPF)			
Number of Channels			One Channel (WPF)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555 α value is fixed.
		YCbCr	• YCbCr444-PL, SP, ILV*1 • YCbCr422-PL, SP, ILV*1 • YCbCr420-PL, SP*1
		Maximum size	H8190 × V8190 pixels
		Minimum size	H32 × V32 pixel
		Size setting unit	• YCbCr420: 2-pixel units both horizontally and vertically. • YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	YCbCr to RGB	Conversion expression	• BT.601 (16, 235/240) to RGB (0, 255) • BT.709 (16, 235/240) to RGB (0, 255) • BT.601 (0, 255) to RGB (0, 255) • BT.709 (16, 235/240) to RGB (16, 235)
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping

Note 1. PL: Planar, SP: Semi-planar, ILV: Interleaved

9.10.1.2 Block Diagram

Figure 9.10-2 shows the block diagram of FDP1B.

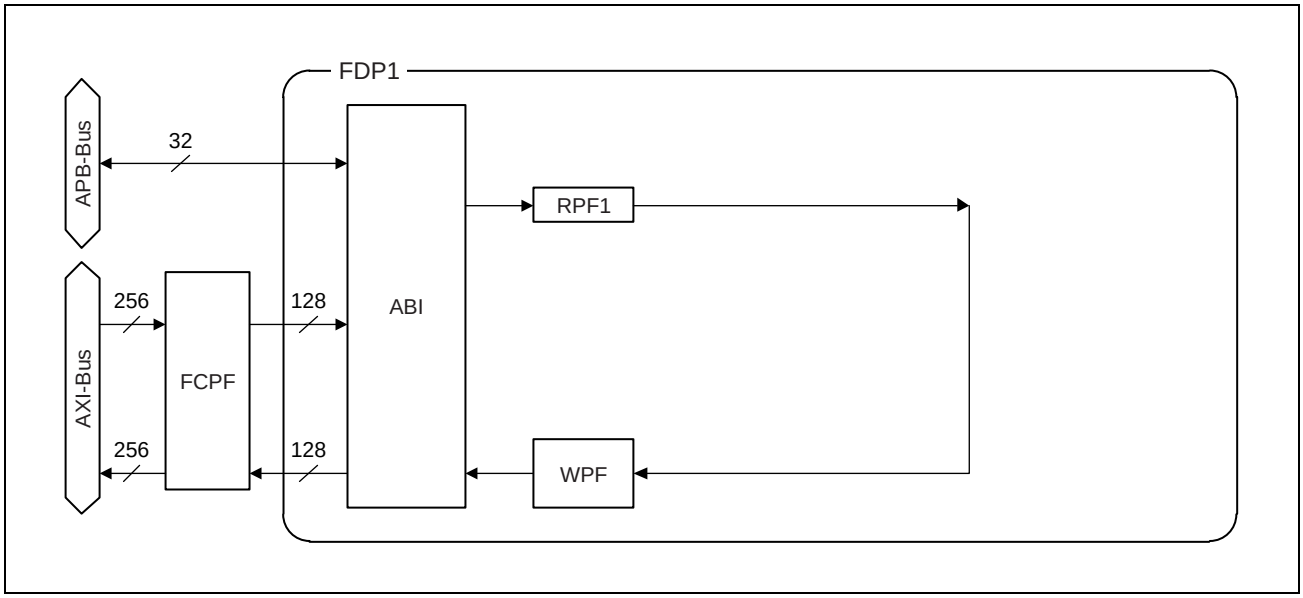

Figure 9.10-2 FDP1B Block Diagram

The following gives an overview of each block function shown in **Figure 9.10-2**.

The operation of these functions is determined by the register setting explained in **9.10.1.4 Register Description**. See **9.10.1.4 Register Description** for the relationship between the register setting and the functional behavior.

9.10.1.2.1 ABI (AXI Bus Interface)

The FDP1B applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and FDP1B necessary for this operation is done by the ABI, which works as the bus master, according to the register settings. The ABI executes this data transfer between the external memory and FDP1B through FCPF.

9.10.1.2.2 RPF (Read Pixel Formatter)

The RPF reads image data from the external memory through the ABI, unpacks data according to the specified format, and outputs the resultant data to the WPF. The input format unpacking unit expands the image data input from the ABI into the image format for internal processing.

The FDP1B provides RPF1 module.

9.10.1.2.3 WPF (Write Pixel Formatter)

The WPF is an output module that receives image data from the RPF1, converts the color space, number of colors, and format of the data, and outputs the results of FDP1B image processing to external memory through the ABI. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The FDP1B provides one WPF.

9.10.1.2.4 Input/Output Data Format

The FDP1B input/output data should be stored in a format where the address is incremented in the direction from the MSB to the LSB as in big endian. For example, the FDP1B reads and writes data to and from the external memory through the dedicated bus interface with a 128-bit width, and the data that should come first should be stored in the MSB side regardless of the unit data size as shown in **Figure 9.10-3**.

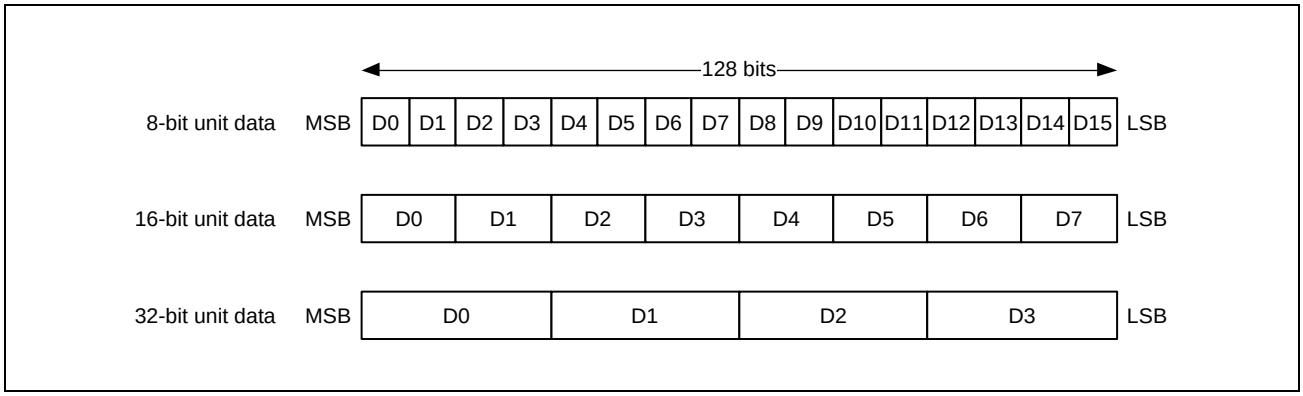

Figure 9.10-3 FDP1B Input/output Data Format

However, data may be arranged in a way unexpected by the FDP1B depending on the address handling method (such as little endian) of the FDP1B access destination in some cases as in the external memory format shown in **Figure 9.10-4**. In such a case, use the data swapping function (Refer to **9.10.1.4.7 (5) RPF Data Swap Register (FD1_RPF1_SWAP)** and **9.10.1.4.8 (4) Destination Component-m Address Register (FD1_WPF_ADDR_m) (m = Y, C0, C1)**) in the FDP1B to convert the data format to be suitable for the FDP1B.

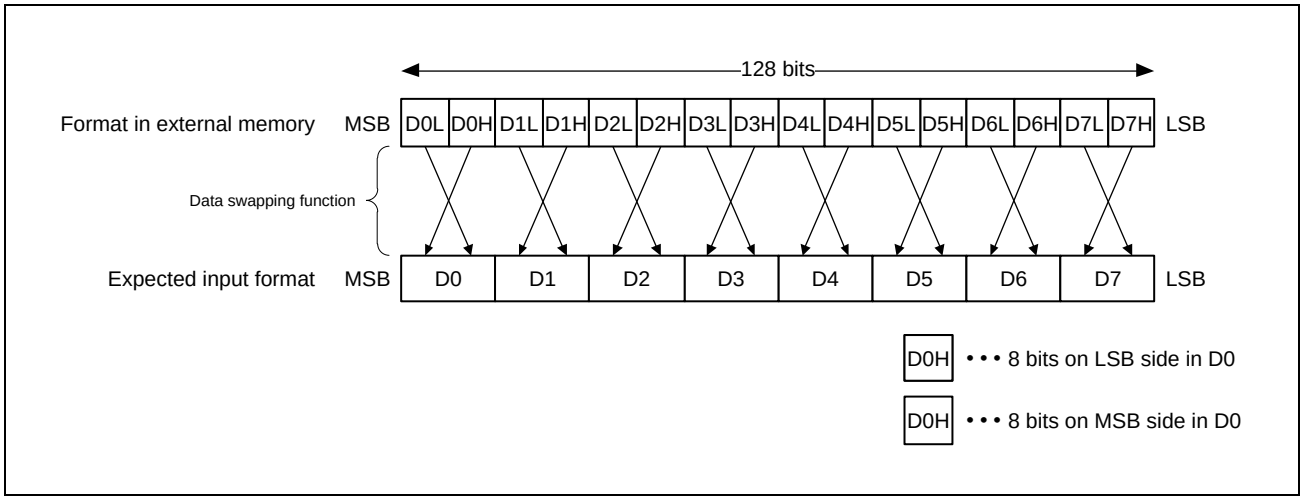

Figure 9.10-4 Input Data Alignment by Data Swapping Function

9.10.1.3 Register Configuration

Table 9.10-2 shows the FDP1B memory map. Immediate registers are specified as “Imm”, the V-update registers are indicated as “Vupdt” and the V-update status registers are indicated as “VupdtSt” in register type column in **Table 9.10-2**.

Base address of FDP1B:

Ch0: 0_1630_0000h (5630_0000h*[1], 4630_0000h*[2])

Note 1. CM33 address space (non-secure)
Note 2. CM33 address space (secure)

Table 9.10-2 List of FDP1B Registers

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
FDP1 Start Register	FD1_CTL_CMD	0000_0000h	0000h	32
Sync Generator Register	FD1_CTL_SGCMD	0000_0000h	0004h	32

IP Internal Data	FD1_IP_INTDATA	0202_0202h	0800h	32

9.10.1.4 Register Description

9.10.1.4.1 Access Restrictions

FDP1B supports only 32-bit access to read or write all addresses in FDP1B area. Do not access any of otherwise access units. Therefore, read-modify-write is needed to change partial bits in 32bits register.

9.10.1.4.2 Register Type Definitions

There are 3 types of registers in FDP1B: immediate register, V-update Register and V-update Status Register. The values of immediate registers are reflected to H/W behavior immediately after the changing its values. Hence, do not change these immediate registers while FDP1B is processing unless this manual allows it explicitly. The values of V-update registers are reflected to H/W behavior at the timing of V-interruption (at the timing of FD1_CTL_IRQSTA.VINT is set to 1). Users can change these V-update registers while FDP1B is processing. To reflect V-update registers to the H/W, users have to set FD1_CTL_REGEND.REGEND to 1 after the all V-update registers which are intended to be changed are completely set. The values of V-update Status Registers are updated at the timing of V-interruption. Therefore, the status (FD1_CTL_STATUS) of frame process which is conducted before a V-interruption must be referred after that V-interruption.

To confirm the types of registers, refer to **Table 9.10-2**.

9.10.1.4.3 Notational Conventions for Registers and Bit Fields

This document uses the following notational conventions for the FDP1B registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the FD1_CTL_CMD register is indicated as FD1_CTL_CMD.STRCMD.
3. In each subsection for register description in **9.10.1.4 Register Description**, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.

9.10.1.4.4 Register Classification

The FDP1B registers are arranged in the following order; the general control registers control the operation of the entire FDP1B, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from **9.10.1.4.6 General Control Registers**.

1. General control registers (FD1_CTL_*)
2. RPF control registers (FD1_RPF_*)
3. WPF control registers (FD1_WPF_*)

9.10.1.4.5 Restrictions on Access to Registers and Lookup Tables

The FDP1B has control registers. When accessing the addresses where these registers are allocated, the following restrictions should be satisfied. If any restriction is violated, the FDP1B will not operate correctly.

1. For the read-only bits and reserved bits in all FDP1B registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in **9.10.1.3 Register Configuration** are reserved areas and write access is prohibited in these areas.
3. For all immediate registers, except FD1_CTL_SGCMD, FD1_CTL_SRESET and FD1_CTL_IRQ*, modifying register values during operation of the module is prohibited. Modify registers while the FDP1B is stopped. For the operating status of the FDP1B, refer to **9.10.1.4.6 (9) Operating Status Register (FD1_CTL_STATUS)**.

9.10.1.4.6 General Control Registers

(1) FDP1B Start Register (FD1_CTL_CMD)

Access Size : 32 bits

Address : <FDP1_base> + 0000h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STRCMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	STRCMD	0h	RW	Start Command FDP1 starts the FD1 process if this bit is set to 1. Set this bit after all relevant registers are surely set except for FD1_CTL_REGEND and FD1_CTL_SGCMD. Set this bit to 1 before the FD1_CTL_REGEND.REGEND and FD1_CTL_SGCMD if FDP1 has to execute process. This bit will keep the value 1 after the set. To clear this bit, write the value 0 to this bit. 0: NOP or stops process at the next timing of V-Interruption. 1: Start FDP1 process at the next timing of V-Interruption. Note that setting of this register is valid if the register FD1_CTL_REGEND.REGEND is set to the value 1 at the timing of next V-Interruption.

(2) Sync Generator Register (FD1_CTL_SGCMD)

Access Size : 32 bits
Address : <FDP1_base> + 0004h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SGEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SGEN	0h	RW	V-Interruption Generator Enable This bit controls V-Interruption. This bit should be set to the value 1 after other all registers are set, and only at the first field of the sequence. Set this bit to the value 1 to execute process in all V-Interruption modes described in **9.10.1.4.6 (5)**. 0: Disable V-Interruption 1: Enable V-Interruption [Important] In case of software reset (FD1_CTL_SRESET.SRST), set this SGEN bit to the value 0. If this bit is cleared during process V-interruption will not occur after FDP1 finished current frame. As a result, FDP1 will not start the next frame because STRCMD is not captured and V-update status registers will not be updated about process information of current frame.

(3) Register Set End Register (FD1_CTL_REGEND)

Access Size : 32 bits
Address : <FDP1_base> + 0008h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	REGEND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	REGEND	0h	RW	Register Setting Ready Flag Set the value 1 to this bit after completing the setting of parameter registers. Do not write the value 0 to this bit. This bit will be cleared by FDP1 automatically. 0: Writing 0 is prohibited except for after the completion of S/W reset sequence. 1: Registers which are set by SW is ready to be reflected for Hardware reference. The V-update status registers is ready to be reflected for Software reference. The second or later V-interruption in the case No interrupt mode can be generated.

(4) Channel Activation Register (FD1_CTL_CHACT)

Access Size : 32 bits
Address : <FDP1_base> + 000Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	SMW	WR	-	-	-	-	SMR	RD[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0
9	SMW	0h	RW	Refer to **Table 9.10-3** for setting this bit.
8	WR	0h	RW	Refer to **Table 9.10-3** for setting this bit.
7 to 4	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0
3	SMR	0h	RW	Refer to **Table 9.10-3** for setting this bit.
2 to 0	RD[2:0]	0h	RW	Refer to **Table 9.10-3** for setting these bits.

Table 9.10-3 FD1_CTL_CHACT Setting for DIM Parameter

Use Case	PRG*1	DIM [2:0]*2	FD1_CTL_CHACT						
			SMW	WR	SMR	RD2	RD1	RD0	Word Expression
Progressive Mode	1	1	0	1	0	0	1	0	0000_0102h

Note 1. FD1_CTL_OPMODE.PRG

Note 2. FD1_IPC_MODE.DIM [2:0]

(5) Operation Mode Register (FD1_CTL_OPMODE)

Access Size : 32 bits
Address : <FDP1_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	PRG	-	-	VIMD[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PRG	0h	RW	Progressive Mode Set the value 1 to this bit as default.
3, 2	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	VIMD[1:0]	0h	RW	V-Interruption Mode This register field sets V-Sync interrupt mode of FDP1. Refer to **Table 9.10.1-4** for detail. 0: Interrupt mode 1: Best Effort mode 2: No interrupt mode

Table 9.10-4 V-Interrupt Mode

VIMD[1:0]	V-Interruption Timing		
	First Time	Second Time or Later	STRCMD Captured Timing
0 (Interrupt mode)	V-Interruption occurs when changes FD1_CTL_SGCMD.SGEN from 0 to 1 and FDP1B is not doing frame process.	Fixed period interrupt specified by FD1_CTL_VPERIOD in spite of the frame processing.	Captured at V-Interruption
1 (Best effort)		Fixed period interrupt specified by FD1_CTL_VPERIOD. If the frame processing is not completed at the timing specified by FD1_CTL_VPERIOD, V-Interruption is deferred to the end of the processing.	
2 (No interrupt)		• If FD1_CTL_REGEND is set 1 before the end of the processing (frame end interruption FD1_CTL_IRQSTA .FRE is set as 1) V-Interruption occurs right after the end of the processing. • If FD1_CTL_REGEND is set 1 after the end of processing (frame end interruption FD1_CTL_IRQSTA .FRE is set as 1) V-Interruption occurs right after FD1_CTL_REGEND is set. • If FD1_CTL_REGEND is not set 1 V-Interruption does not occur.

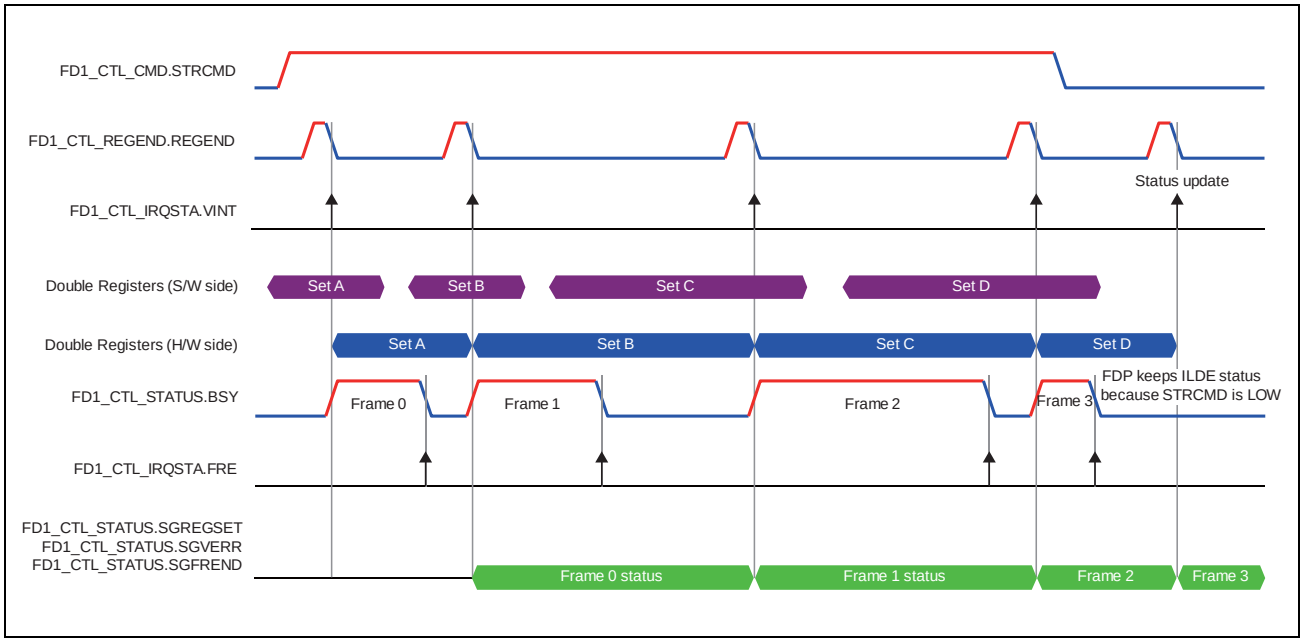

Figure 9.10-8 Timing Chart of No Interrupt Mode (VIMD = 2)

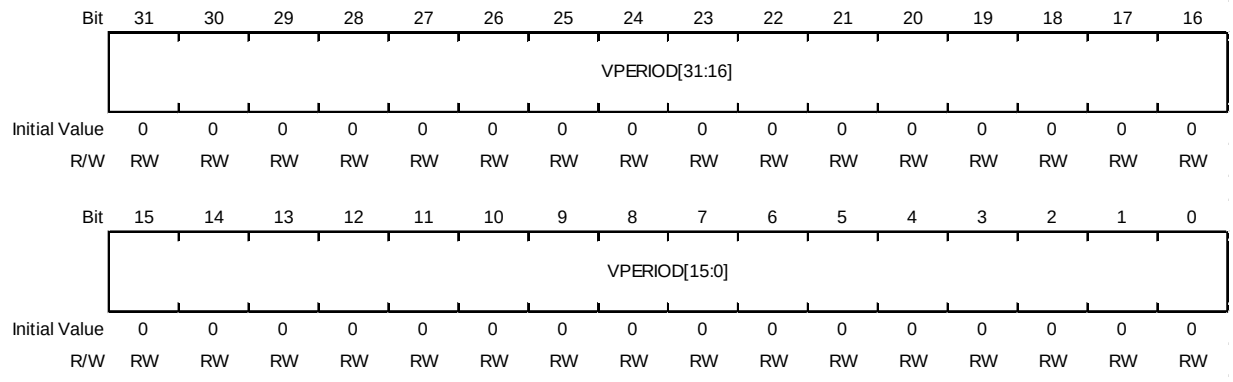
(6) V-Period Register (FD1_CTL_VPERIOD)

Access Size : 32 bits
Address : <FDP1_base> + 0014h
Initial Value : 0000_0000h



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VPERIOD [31:0]	00000000h	RW	V-Sync Period Set the period from the V-Sync to the next V-Sync in the unit of FDP1 clock frequency (800MHz) cycles.

(7) Clock Control Register (FD1_CTL_CLKCTRL)

Access Size : 32 bits

Address : <FDP1_base> + 0018h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CSTP_N
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CSTP_N	0h	RW	Set the value 1 to this bit.

(8) Software Reset Register (FD1_CTL_SRESET)

Access Size : 32 bits
Address : <FDP1_base> + 001Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRST	0h	RW	FDP1 Software Reset FDP1 stops it operation after this bit is set to 1. FDP1 aborts all processing and quit bus/ memory accesses. Do not start next process by FD1_CTL_CMD until the software processing is completed. When this processing is completed, the FD1_ CTL_IRQSTA.FRE interrupt source bit is set to 1, when the FRE interrupt is enabled. This interrupt notifies the end of the reset processing. The end of software reset processing is notified through the FRE bit, but the software reset issued while FDP1 is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the FDP1 may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the FDP1 completes operation. But even through in this case, not that the output image may be destroyed due to software reset process. This bit is always read as 0. 0: NOP 1: Software Reset [Important] Set FD1_CTL_SGCMD.SGEN to the value 0 before write 1 to this SRST bit.

(9) Operating Status Register (FD1_CTL_STATUS)

Access Size : 32 bits
Address : <FDP1_base> + 0024h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VINT_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	SGREGSET	SGVERR	SGFREND	-	-	-	-	-	-	-	BSY
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	VINT_CNT[15:0]	0000h	R	V-Sync Interrupt Counter Status This bit field shows the number of interruption times of V-Sync interrupt. Hence, the value of this bit indicates the number of progressive output frames which is generated by FDP1. This counter value is reset to 0 when FD1_CTL_SGCMD.SGEN is set to 1.
15 to 11	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10	SGREGSET	0h	R	Register Set End Status This bit represents the register set status updated at V-Sync. The status is controlled by FD1_CTL_REGEND.REGEND bit and the internal timing. 0: Registers are not set for the operation 1: Registers are set for the operation
9	SGVERR	0h	R	V-Sync End Error Status This bit represents the V-Sync end error status updated at V-Sync. 0: No error 1: V-Sync end error (Fram processor cannot be finished by the timing of V-Sync)
8	SGFREND	0h	R	Frame End Status This bit represents the frame end status updated at V-Sync. 0: The frame processor is not finished 1: Frame end (The frame processor is finished)
7 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BSY	0h	R	FDP1 Operating Status This bit indicates the operating or stopped state of control FDP1. 0: FDP1 is stopped. 1: FDP1 is operating.

(10) V-Cycles Status Register (FD1_CTL_VCYCLE_STAT)

Access Size : 32 bits
Address : <FDP1_base> + 0028h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VCYC[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VCYC[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VCYC[31:0]	00000000h	R	Number of Cycles of the Previous Frame Processing This status register shows the number of cycles of previous frame processing. FDP1 updates this register at the timing of V-Sync interrupt.

(11) Interrupt Enable Register (FD1_CTL_IRQENB)

Access Size : 32 bits
Address : <FDP1_base> + 0038h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VERE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	VINTE	-	-	-	FREE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VERE	0h	RW	Interrupt Enable for V-Sync End Error The interrupt of V-Sync end error is asserted at the timing that FDP1 does not complete the frame processing at the V-Sync.
15 to 5	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VINTE	0h	RW	Interrupt Enable for V-Sync The interrupt of V-Sync is asserted at the timing of V-Sync specified by FD1_CTL_OPMODE.VIMD register field. If VIMD is set to 2, this interrupt is not asserted.
3 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FREE	0h	RW	Interrupt Enable for Frame End The interrupt of frame end is asserted at the timing that FDP1 completes the frame processing.

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt Disabled

1: Interrupt Enabled

Each bit in FD1_CTL_IRQSTA is set to 1 when the corresponding interrupt source is generated. FD1_CTL_IRQENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in FD1_CTL_IRQSTA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in FD1_CTL_IRQSTA is set to 1.

(12) Interrupt Status Register (FD1_CTL_IRQSTA)

Access Size : 32 bits
Address : <FDP1_base> + 003Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	VER
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	VINT	-	-	-	FRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VER	0h	RW	Interrupt Status and Clear for V-Sync End Error
15 to 5	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VINT	0h	RW	Interrupt Status and Clear for V-Sync
3 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FRE	0h	RW	Interrupt Status and Clear for Frame End

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt

1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0

1: Hold the interrupt status value

FD1_CTL_IRQSTA indicates the state of the interrupt sources generated in the FDP1B. Whether to output a FDP1B interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in FD1_CTL_IRQENB.

While an interrupt is disabled in FD1_CTL_IRQENB, the FDP1B does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

(13) Interrupt Control Register (FD1_CTL_IRQFSET)

Access Size : 32 bits
Address : <FDP1_base> + 0040h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	FRES
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FRES	0h	RW	This bit is used to issue the dummy frame end interruption. [Read Access] Always 0 value is read. [Write Access] 0: Hold the current interrupt status value 1: The interrupt status of frame end (bit FRE of register FD1_CTL_IRQSTA) is forced to 1. After being forced to 1, the status value 1 of interrupt status bit FRE is hold until it is cleared by being written 0. The bit FRES turns to 0 automatically after being written 1.

9.10.1.4.7 RPF Control Registers

(1) Source Picture Size Register (FD1_RPF1_SIZE)

Access Size : 32 bits
Address : <FDP1_base> + 0060h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	HSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
28 to 16	HSIZE[12:0]	0000h	RW	Horizontal Source Picture Size Specify the horizontal picture size of input frame in unit of pixels.
15 to 13	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
12 to 0	VSIZE[12:0]	0000h	RW	Vertical Source Picture Size Specify the vertical picture size of input frame in unit of pixels.

(2) Source Picture Format Register (FD1_RPF1_FORMAT)

Access Size : 32 bits
Address : <FDP1_base> + 0064h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CIPM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	RSPYCS	RSPUVS	-	-	-	-	-	RDFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
16	CIPM	0h	RW	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside RPF in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is up-sampled as shown in **Figure 9.10-9**. This bit specifies the method of up-sampling for this purpose. 0: The nearest-neighbor method is used for horizontal chrominance interpolation. 1: The bilinear method is used for horizontal chrominance interpolation. In the case all following conditions are true set 0 to this bit in order to prevent the image difference between input and output. If set 1 to this bit in this case the output image may be different from the input image, but it is not broken. 1) Input format is either YCbCr4:2:2 or YCbCr4:2:0 2) Output format is either YCbCr4:2:2 or YCbCr4:2:0
15, 14	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
13	RSPYCS	0h	RW	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1 and set the RDFM T bits to 71 (47h). When the input format is YVYU, set this bit and the RSPUVS bit to 1 and set the RDFM T bits to 71 (47h). In other cases, set this bit to 0.
12	RSPUVS	0h	RW	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1 and set the RDFM T bits to 65 (41h). When the input format is NV21, set this bit to 1 and set the RDFM T bits to 66 (42h). When the input format is YVYU, set this bit and the RSPYCS bit to 1 and set the RDFM T bits to 71 (47h). In other cases, set this bit to 0.
11 to 9	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
8	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.
7	-	0h	R	Reserved These bits are read as 0b. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	RDFMT[6:0]	00h	RW	RPF Input Image Format Setting These bits select the format of the image input from the external SDRAM to the RPF1. Select a value corresponding to the desired format from those shown in **Table 9.10-5**. [Note 1] Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. [Note 2] Input chroma horizontal up-sampling When the input format is YCbCr4:2:2 or YCbCr4:2:0 the chroma component is up-sampled horizontally to YCbCr4:4:4 (the format used for image process) with the method specified by the CIPM bit. [Note 3] Input chroma vertical up-sampling When the input format is YCbCr4:2:0 the chroma component is up-sampled vertically to YCbCr4:4:4 (the format used for image process) by copying the neighbor upper input line.

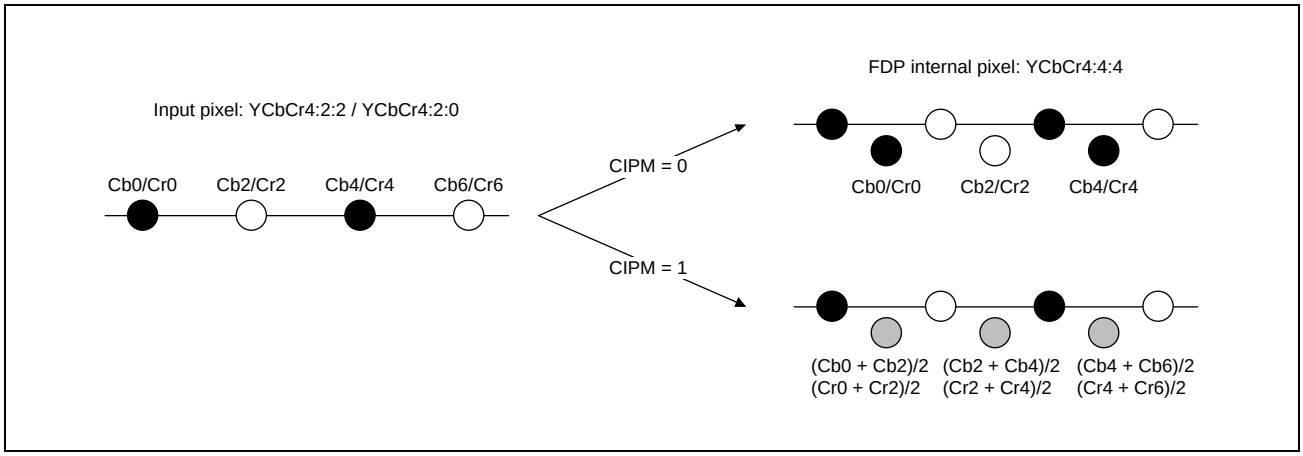


Figure 9.10-9 Chrominance Interpolation Methods Selectable through CIPM Setting

Table 9.10-5 YCbCr Formats for RPF Input and WPF Output

RDFMT [6:0], WRFMT[6:0]	Packed YcbCr input/output Format	Reference
00h to 3Fh	Reserved	—
40h	YcbCr4:4:4 semi-planar	**Figure 9.10-10**
41h	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
42h	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
43h to 45h	Reserved	—
46h	YcbCr4:4:4 interleaved	**Figure 9.10-11**
47h	YcbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
48h	YcbCr4:2:2 interleaved type 1	
49h	Reserved	
4Ah	YcbCr4:4:4 planar	**Figure 9.10-12**
4Bh	YcbCr4:2:2 planar (YV16)	
4Ch	YcbCr4:2:0 planar (YV12, I420)	
4Dh to 7Fh	Reserved	—

Note 1. When the input format is NV61 or NV21, set the RSPUVS bit to 1.

Note 2. When the input format is YUY2, set the RSPYCS bit to 1.

Note 3. When the input format is YVYU, set the RSPUVS bit to 1 and RSPYCS bit to 1.

In write format case shown in **9.10.1.4.8 (1) Destination Picture Format Register (FD1_WPF_FORMAT)**, FD1_WPF_FORMAT.WSPYCS, WSPUVS are corresponds to RSPYCS and RSPUVS, respectively.

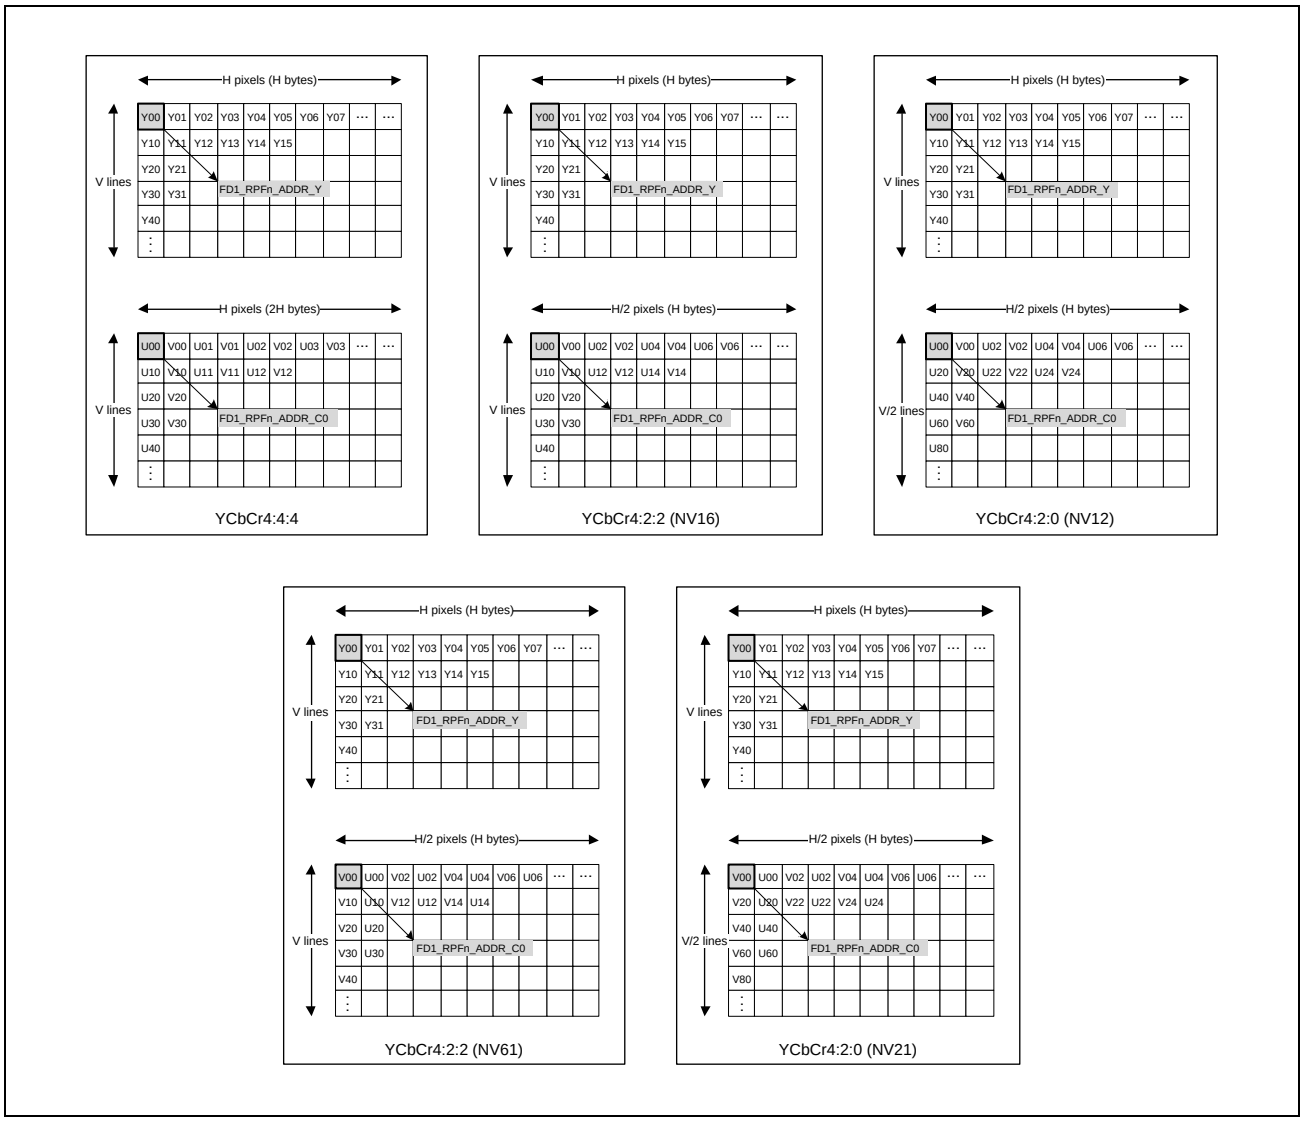

Figure 9.10-10 YcbCr Semi-Planar Formats

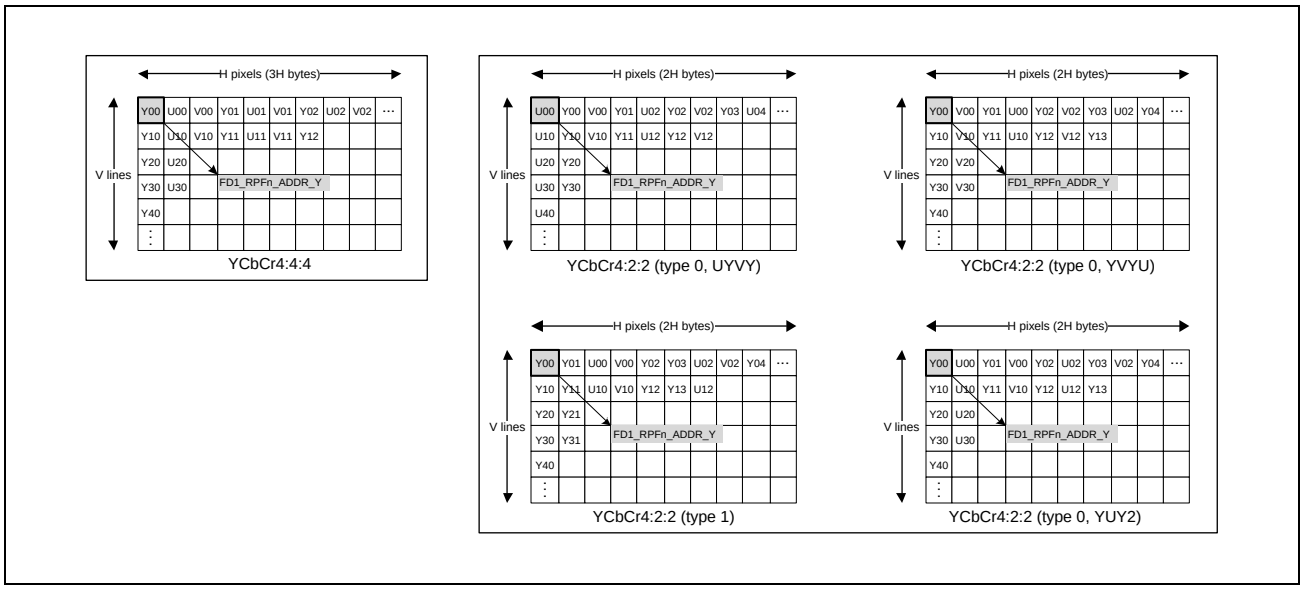

Figure 9.10-11 YcbCr Interleaved Formats

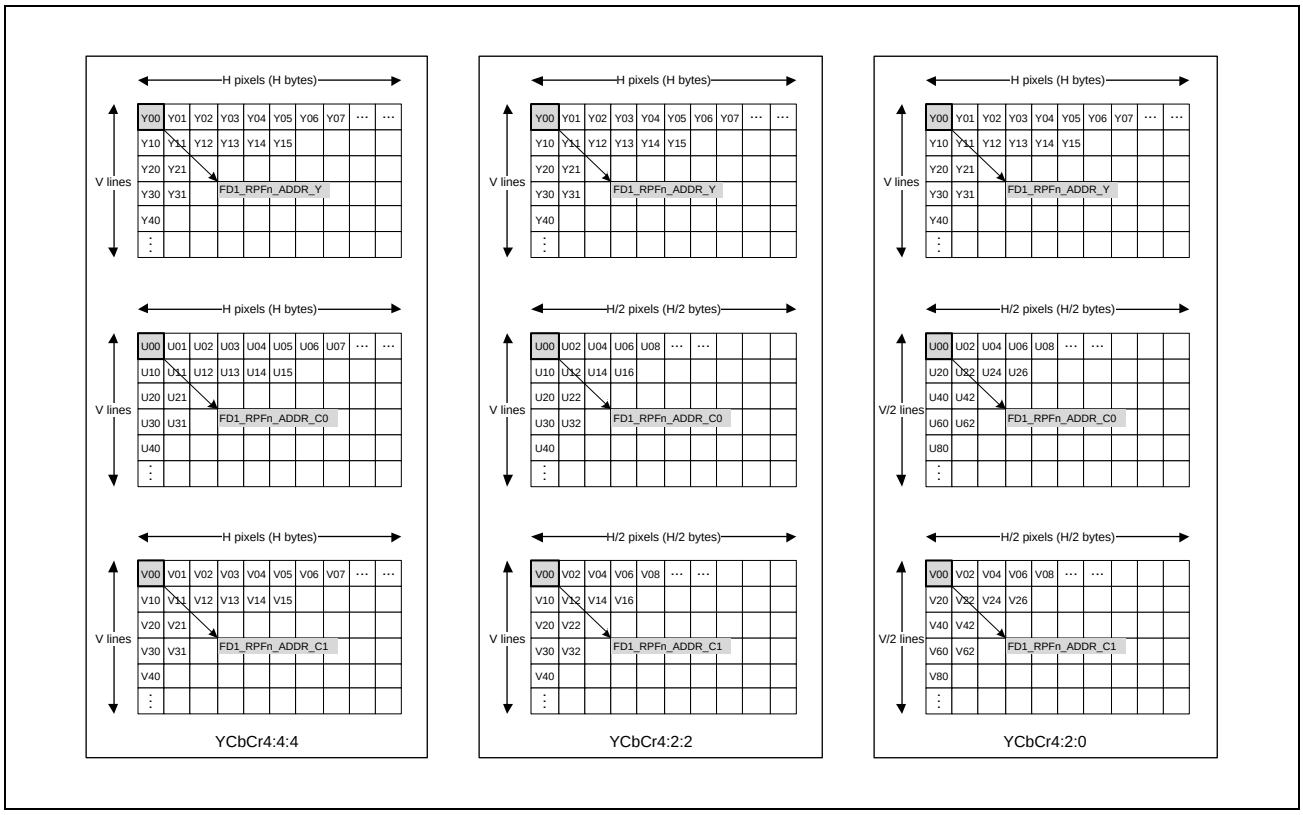

Figure 9.10-12 YcbCr Planar Formats

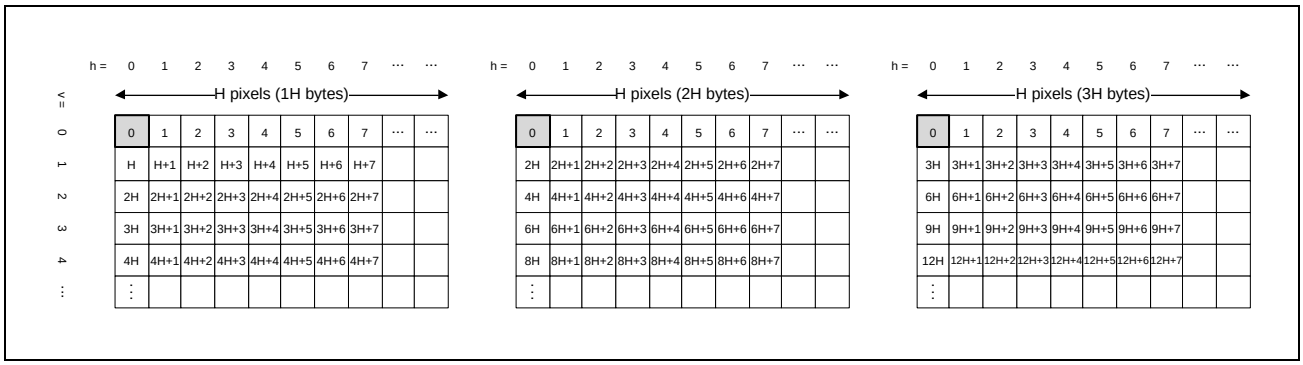

Figure 9.10-13 Memory Address for the Corresponding Pixel's Position

Legend of **Figure 9.10-13**, H is horizontal image size in pixel unit. 1H, 2H and 3H is corresponding to the case 1 pixel has 1 byte, 2 bytes, 3 bytes of data respectively.

(3) Source Picture Stride Register (FD1_RPF1_PSTRIDE)

Access Size : 32 bits
Address : <FDP1_base> + 0068h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRC_STRD_Y[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRC_STRD_C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SRC_STRD_Y [15:0]	0000h	RW	Memory Stride of Source Picture Y Plane These bits specify in 1-byte units the memory stride of the source picture Y plane read by the RPF1). A value from 0020h to 1FFEh can be specified.
15 to 0	SRC_STRD_C [15:0]	0000h	RW	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPF1. A value from 0020h to 1FFEh can be specified. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

(4) RPF1 Source Component-m Address Register (FD1_RPF1_ADDR_m) (m = Y, C0, C1)

Access Size : 32 bits

Address : <FDP1_base> + 0078h / 007Ch / 0080h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSRC_ADDR_m[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSRC_ADDR_m[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PSRC_ADDR_m[31:0]	00000000h	RW	RPF1 Source Field Address for Component-m (m = Y,C0, C1) These bits specify in 1-byte units the start address of the source component-m plane read by the RPF1. A value from 0000_0000h to FFFF_FFFFh can be specified. Set same value with LSB 4bit of RPF1 source field address of component C0 to LSB 4bit of RPF1 source field address of component C1, when input image format is Planar(FD1_RPF_FORMAT.RDFMT = 74,75,76).

(5) RPF Data Swap Register (FD1_RPF1_SWAP)

Access Size : 32 bits
Address : <FDP1_base> + 0094h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	ISWAP[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	ISWAP[3:0]	0h	RW	Input Swap Setting for Image Data This bit field specifies the data swapping function. Each bit corresponds to the following data swapping. Bit[3]: Double Word (64-bit) Swap Bit[2]: Word (32-bit) Swap Bit[1]: Half Word (16-bit) Swap Bit[0]: Byte (8-bit) Swap

When data order in memory for each format is defined as same as **Figure 9.10-10** to **Figure 9.10-12** set 1111b to ISWAP[3:0]. If data order in memory is different from definitions of these figures, it can be adjusted to definitions of these figures in 16 bytes unit as shown in **Table 9.10-6**.

NOTE

Follow **9.10.2 FCPF** about setting this swap register.

Table 9.10-6 Changing Data Order According to Swap Register

Data Order in Memory																	ISWAP[3:0]/OSWAP[3:0]			
Byte Address	16n+0	16n+1	16n+2	16n+3	16n+4	16n+5	16n+6	16n+7	16n+8	16n+9	16n+10	16n+11	16n+12	16n+13	16n+14	16n+15	BIT3	BIT2	BIT1	BIT0

9.10.1.4.8 WPF Control Registers

(1) Destination Picture Format Register (FD1_WPF_FORMAT)

Access Size : 32 bits
Address : <FDP1_base> + 00C0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDV[7:0]								-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	RW	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WSPYCS	WSPUVS	DITH[1:0]		WRTM[2:0]			CSC	-	WRFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV[7:0]	00h	RW	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in **Table 9.10-7**. A value from 0 to 255 can be specified. Note: Case that PAD data size less than 8-bit, fill the most significant bit for the empty higher of bits. When the PAD is 1 bit: Output the MSB bit (PDV[7]) When the PAD is 4 bits: Output the upper 4 bits (PDV[7:4]) When the PAD is 8 bits: Output 8 bits (PDV[7:0])
23 to 21	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	-	0h	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
19 to 16	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	WSPYCS	0h	RW	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (47h). When the output format is YVYU, set this bit and the WSPUVS bit to 1 and set the WRFMT bits to 71 (47h). In other cases, set this bit to 0.
14	WSPUVS	0h	RW	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (41h). When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (42h). When the output format is YVYU, set this bit and the WSPYCS bit to 1 and set the WRFMT bits to 71 (47h). In other cases, set this bit to 0.
13, 12	DITH[1:0]	0h	RW	Dithering Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (262144 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. 0: Dithering is disabled 3: Dithering is enabled 1, 2: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
11 to 9	WRTM[2:0]	0h	RW	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr. 0: BT.601 YCbCr [16,235/240] → RGB [0,255] 1: BT.601 YCbCr [0,255] → RGB [0,255] 2: BT.709 YCbCr [16,235/240] → RGB [0,255] 3: BT.709 YCbCr [16,235/240] → RGB [16,235] 4 to 7: Setting prohibited
8	CSC	0h	RW	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPF. The characteristics of color space conversion are determined by the WRTM setting. 0: Color space is not converted. 1: Color space is converted.
7	-	0h	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	WRFMT[6:0]	00h	RW	WPF Output Image Format Setting These bits select the format of the image output from the WPF to the external memory from among those listed in **Table 9.10-7** and **Table 9.10-5**. [Note 1] Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. [Note 2] Output chroma horizontal down-sampling When the output format is YCbCr4:2:2 or YCbCr4:2:0 the chroma component is down-sampled horizontally from YCbCr4:4:4 (the format of image process result) by averaging the values of neighbor two pixels. [Note 3] Output chroma vertical down-sampling When the output format is YCbCr4:2:0 the chroma component is down-sampled vertically from YCbCr4:4:4 (the format of image process result) by outputting only the even number line (line 0, 2, etc).

Table 9.10-7 Packed RGB Formats for WPF Output (1/2)

WRFMT[6:0]	Bit per Pixel	Phase	Upper Row - Address / Bottom Row - Bit Field																													
			n								n+1								n+2								n+3							
			7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

Refer to **Table 9.10-5** for YCbCr formats.

(2) Destination Picture Rounding Control Register (FD1_WPF_RNDCTL)

Access Size : 32 bits
Address : <FDP1_base> + 00C4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	CBRM	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	CLMD[1:0]		-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	CBRM	0h	RW	Bit Count Reduction Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in **Table 9.10-7** and the target bit fields are not eight bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
27 to 14	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	CLMD[1:0]	0h	RW	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. 00b: Output value is not clipped (0-255) 01b: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) 10b: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) 11b: Setting prohibited
11 to 0	-	0h	R	Reserved These bits are always read as 0. The write value should always be 0.

(3) Destination Picture Stride Register (FD1_WPF_PSTRIDE)

Access Size : 32 bits
Address : <FDP1_base> + 00C8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DST_STRD_Y[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DST_STRD_C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DST_STRD_Y [15:0]	0000h	RW	Memory Stride of Destination Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPF. A value from 0020h to 1FFEh can be specified.
15 to 0	DST_STRD_C [15:0]	0000h	RW	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPF. When the WPF outputs images in an RGB format, this setting is not used. When the WPF outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from 0020h to 1FFEh can be specified.

(4) Destination Component-m Address Register (FD1_WPF_ADDR_m) (m = Y, C0, C1)

Access Size : 32 bits

Address : <FDP1_base> + 00CCh / 00D0h / 00D4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DST_ADDR_m[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DST_ADDR_m[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DST_ADDR_m [31:0]	00000000h	RW	Destination Address for Component-m (m = Y, C0, C1) These bits specify in 1-byte units the address for storing the destination component-m plane to be written to the external memory by the WPF. A value from 0000_0000h to FFFF_FFFFh can be specified.

(5) WPF Data Swap Register (FD1_WPF_SWAP)

Access Size : 32 bits
Address : <FDP1_base> + 00D8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	SSWAP[3:0]				OSWAP[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	SSWAP[3:0]	0h	RW	Set the same value with FD1_RPF_SWAP.ISWAP.
3 to 0	OSWAP[3:0]	0h	RW	Output Swap Setting for Image Data This bit field specifies the data swapping function. Each bit corresponds to the following data swapping. Bit[3]: Double Word (64-bit) Swap Bit[2]: Word (32-bit) Swap Bit[1]: Half Word (16-bit) Swap Bit[0]: Byte (8-bit) Swap

When data order in memory for each format is defined as same as **Table 9.10-7** for RGB format and **Figure 9.10-10** to **Figure 9.10-12** for YCbCr format set 1111b to OSWAP[3:0]. If data order in memory is different from definitions of these table and figures, it can be adjusted to definitions of these table and figures in 16 bytes unit as shown in **Table 9.10-6**.

NOTE

Follow **9.10.2 FCPF** about setting this swap register.

9.10.1.4.9 Other Control Registers

(1) IPC Mode Register (FD1_IPC_MODE)

Access Size : 32 bits
Address : <FDP1_base> + 0100h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DLI	-	-	-	-	-	DIM[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DLI	0h	RW	Set the value 1 to this bit.
7 to 3	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	DIM[2:0]	0h	RW	001b: Set the value 001b to this bit as default.

(2) Line Memory Pixel Number Register (FD1_IPC_LMEM)

Access Size : 32 bits
Address : <FDP1_base> + 01E0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	PNUM[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	PNUM[11:0]	000h	RW	Specify 1024 in case of linear addressing access. In case of tile addressing access, set 960 to this bit. Refer to **9.10.2.5 Operation**.

(3) IP Internal Data (FD1_IP_INTDATA)

Access Size : 32 bits
Address : <FDP1_base> + 0800h
Initial Value : 0202_0202h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IP_INTERNAL_DATA[31:16]															
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IP_INTERNAL_DATA[15:0]															
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	IP_INTERNAL_DATA[31:0]	02020202h	R	Internal data specifies version of FDP 0202_0202h: FDP1 version of this LSI.

9.10.1.5 Operation

Procedure of FDP1B Start and Stop operations are described for Register usage and Register settings.

9.10.1.5.1 Register Usages for FDP1B Start and Stop

Registers FD1_CTL_CMD, FD1_CTL_SGCMD, and FD1_CTL_REGEND must be used correctly in the procedures of FDP1B start and stop as specified in **Table 9.10-8** and **Table 9.10-8**.

Table 9.10-8 Register Usages for Starting FDP1B

Register	Start the First Frame (FR[0])	Start the Second or Later Frame (FR[f], f = 1, 2, 3…)
FD1_CTL_SGCMD.SGEN	After all registers have been set completely, it must be set as 1 to generate V-Interruption.	It must be kept as 1 from the previous frame FR [f-1].
FD1_CTL_REGEND.REGEND	After all registers except FD1_CTL_SGCMD.SGEN have been set completely, it must be set 1. As the results, at the first V-interruption, all V-update registers are reflected for hardware reference, FD1_CTL_CMD.STRCMD is referred to start the first frame.	After V-interruption of starting the previous frame FR [f-1], it must be set 1 after all registers about FR[f] have been set completely. As the results, at the V-interruption of the end of frame FR [f-1], the V-update registers will be reflected to hardware reference, FD1_CTL_CMD.STRCMD is referred to start the frame FR[f].
FD1_CTL_CMD.STRCMD	It must be set 1 when all registers except FD1_CTL_SGCMD.SGEN, FD1_CTL_REGEND.REGEND are set. At the first V-Interruption it is referred by hardware to start the frame.	It must be set 1 when all registers except FD1_CTL_REGEND.REGEND are set at the next V-Interruption (boundary between FR [t-1] and FR[t]) it is referred by hardware to start the frame.

Table 9.10-9 Register Usages for Stopping FDP1B

Register	Stopping Immediately by Software Reset	Stopping after Current Process Finished
FD1_CTL_SGCMD.SGEN	It must be cleared before setting the value of FD1_CTL_SRESET.SRST as 1 so that no more V-Interruption after FDP1B stopped.	After V-interruption at the final frame end (FD1_CTL_IRQSTA.FRE is set as 1) occurred, it must be cleared so that no more V-Interruption is generated after FDP1B stopped.
FD1_CTL_REGEND.REGEND	—	1) No Interrupt Mode After V-interruption of starting the final frame, it must be set 1 right after clearing FD1_CTL_CMD.STRCMD so that the final V-interruption occurs and operation status of the final frame is updated to V-update status registers for Software reference. 2) Other modes Right after V-interruption at starting the final frame, it must be set 1 right after clearing FD1_CTL_CMD.STRCMD so that operation status of the final frame is updated to V-update status registers for Software reference.
FD1_CTL_CMD.STRCMD	After FDP1B stopped successfully (FD1_CTL_IRQSTA.FRE is set as 1), it must be cleared to prevent wrong operation when restart FDP1B.	After V-interruption of starting the final frame, it must be cleared to prevent wrong operation when restart FDP1B.

9.10.1.5.2 Register Setting Order for FDP1B Start and Stop

(1) Interrupt mode or best effort mode

(1a) To start the first frame, set registers in following order.

1. Set 1 to FD1_CTL_CLKCTRL.CSTP_N
2. Set registers other than FD1_CTL_CMD, FD1_CTL_SGCMD, and FD1_CTL_REGEND.
3. Set FD1_CTL_CMD.STRCMD to the value 1. Set FD1_CTL_REGEND.REGEND to the value 1.
4. Set FD1_CTL_SGCMD.SGEN to the value 1, then FDP1 starts its process. FD1_CTL_SGCMD.SGEN must be not cleared if continue to the second or later frames.

(1b) To start the second or later frame, set registers in following order.

1. After V-interruption of the previous frame start timing occurred, set registers other than FD1_CTL_CMD and FD1_CTL_REGEND.
2. Set FD1_CTL_CMD.STRCMD to the value 1.
3. Set FD1_CTL_REGEND.REGEND to the value 1.
4. At the V-interruption of the previous frame end timing, FDP1B starts the target frame. The V-interruption of the previous frame end timing and the one of the target frame start timing are the same.

(1c) To stop FDP1B operation after current frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0.
2. Set FD1_CTL_REGEND.REGEND to the value 1. If this register was completed before the V-Interruption of frame end timing, FDP1B stops its operation and current frame becomes the last frame of the image sequence. If these register setting could not be completed before the V-Interruption of frame end timing, FDP1B stops its operation in the next V-interruption. In the latter case, V-update status registers are not updated at V-interruption of frame end but at the next V-interruption at which FD1_CTL_REGEND.REGEND is set as 1.
3. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP1B will stop generating V-interruption.

(1d) To stop FDP1B operation immediately, set registers as the following.

1. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP1B will stop generating V-interruption.
2. Set FD1_CTL_SRESET.SRST to the value 1. FDP1B will invoke termination process immediately.
3. Wait frame end interrupt from FDP1B or until the register bit FD1_CTL_IRQSTA.FRE is set to 1. After it occurs, FDP1B have finished its processing. With this operation, FDP1B can stop its process quickly, but the output frame of the last frame is corrupted.

(2) No interrupt mode

(2a) To start the first frame, set registers in following order.

Same as (1a).

(2b) To start the second or later frame, set registers in following order.

Same as (1b).

(2c) To stop FDP1B operation after current frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0.
2. Set FD1_CTL_REGEND.REGEND to the value 1. At the V-Interruption of frame end timing, FDP1B stops its operation and current frame becomes the last frame of the image sequence.
3. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP1B will stop generating V-interruption.

(2d) To stop FDP1B operation immediately, set registers as the following.

Same as (1d).

9.10.1.6 Usage Notes

9.10.1.6.1 Assignment in Memory Space

Make sure that FDP1B memory space shall be mapped to Non-Cache region.

9.10.1.6.2 FCPF Connection

Bus access of FDP is carried out through FCPF module in this LSI. So, refer to also **9.10.2 FCPF** in this manual.

There are some notices in FCPF connection system below.

(1) FDP1B must be started, stopped in companion with FCPF as guided in **9.10.2.5 Operation**.

(2) There are some restrictions about register setting in FCPF connection system. Refer to **9.10.2 FCPF** about restrictions of register setting.

9.10.1.6.3 Manipulate FDP with Software Reset of CPG

Please refer to Usage Notes of **9.10.2.6.1 Manipulating FDP with CPG Software Reset** about manipulating FDP with CPG software reset.

9.10.1.6.4 Terminology

(1) Definition of operators and functions

The following operators, notations are defined for explaining the functions of FDP1B.

clip0 (*x*)

Clip to 0 value if x is less than 0. [$x = (x < 0)? 0: x$]

clip3 (min, max, *x*)

The value *x* shall be clipped so that *x* shall be min < *x* < max. [$x = (x < \text{min})? \text{min}: ((x > \text{max})? \text{max}:)$]

(2) Unit

The unit is defined here for explaining FDP1B's functions.

[bpp]: Bits per pixel

FDP1B can handle a number of image formats. Each image format has different number of data bits. The unit [bpp] shows number of data bits for one pixel. For example, RGB 8 bpp means that its format is RGB and the pixel consists of 8 data bits.

9.10.2 FCPF

The FCP is a companion module of a video processing module in this LSI. It provides data caching, and converting of AXI transaction in order to reduce the memory bandwidth.

The FCPF is a module that reads tile addressing image data or linear addressing image data from external memory, converts it to linear addressing image data, and transfers the data to FDP1B. The FCPF also outputs images processed by FDP1B in linear addressing image data to external memory. FCPF access with 256 bits AXI bus for the FDP1B. This module is under control of software for the FDP with the control function of the FCPF executed on the host CPU.

9.10.2.1 Features

The FCPF has the following features.

- Support 3840 × 3840 resolution
- Support converting linear addressing access from FDP to tile addressing image
- Support out-of-order for the whole outstanding transactions

Table 9.10-10 Main Function of the FCPF

Item	Description
Picture size supported	Tile addressing image: Min.: 32 pixels × 32 lines Max.: Horizontal 3840 pixels × vertical 3840 lines Others: Support all picture sizes specified in **9.10.1 FDP1B** (**9.10.1.1 Features**)
Color format	Tile addressing image: YCbCr420 semi-planar Support all formats specified I in **9.10.1 FDP1B** (**9.10.1.4.7 (2) Source Picture Format Register (FD1_RPF1_FORMAT)** and **9.10.1.4.8 (1) Destination Picture Format Register (FD1_WPF_FORMAT)**)
AXI transaction	• Read access: Support out-of-order for all outstanding transactions Support data interleaving Tile/linear address conversion (format YCbCr420 semi-planar only) • Write access: Support out-of-order for all outstanding transactions

9.10.2.2 Block Diagram

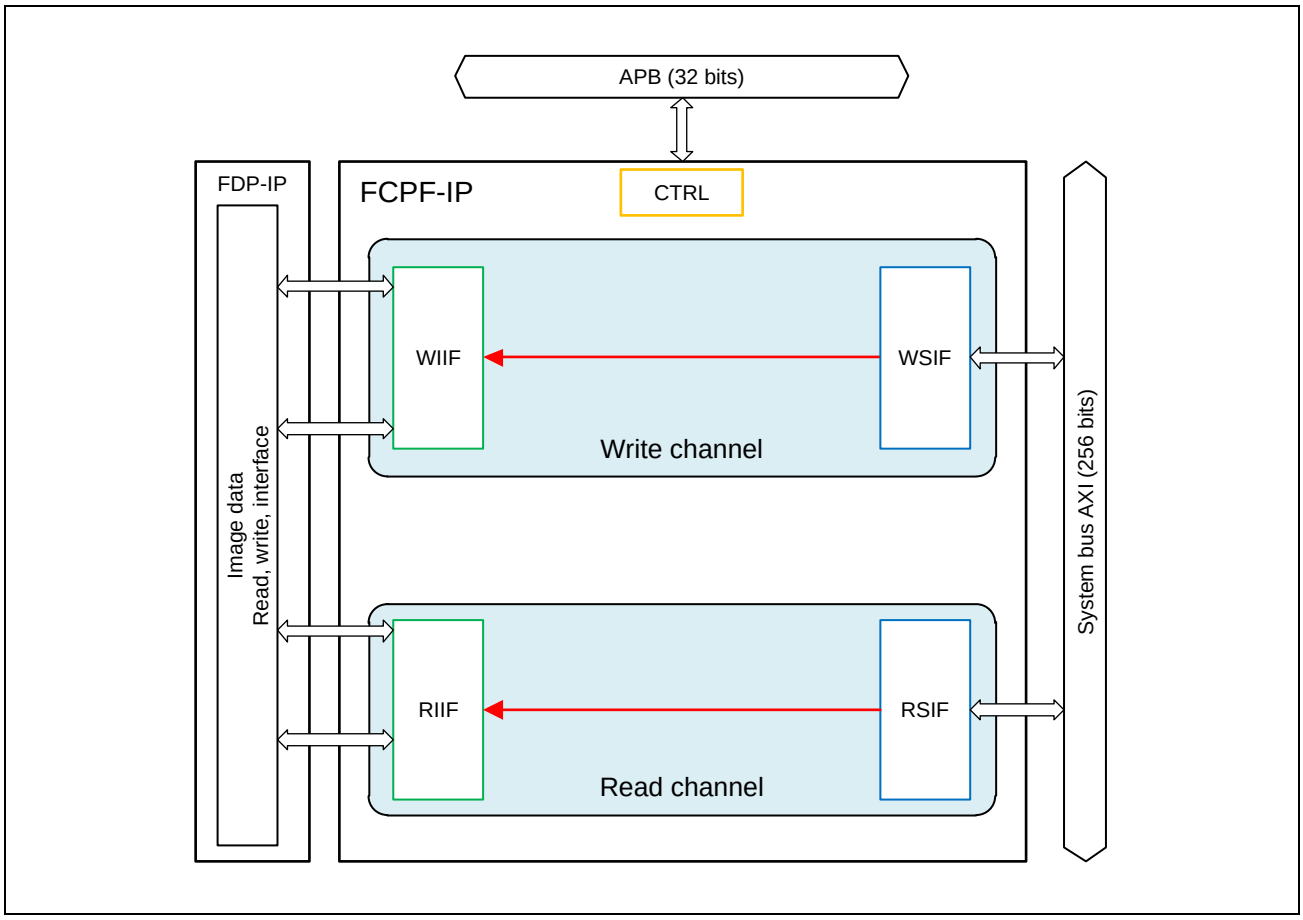

Figure 9.10-14 Overall Configuration of the FCPF

Table 9.10-11 Sub-module Description

Abbr.	Description
WIIF	Connected IP write channel interface
WSIF	System AXI write channel interface
CTRL	FCPF controller

Abbr.	Description
RIIF	Connected IP read channel interface
RSIF	System AXI read channel interface

9.10.2.2.1 IP Set and Bus Access Functions

FCPF works in companion with other IPs (FDP) in an IP set. As shown in **Table 9.10-12** the bus access function conducted by FCPF is different according to each IP set.

Table 9.10-12 Bus Access Function for Each IP Set

IP Set	Bus Access
FDP + FCPF	Following functions are conducted by FCPF • Read linear addressing image data • Read tile addressing image data • Write image data

9.10.2.3 Register Configuration

The FCPF contains the registers which can directly be read and written to by the host CPU. The host can access any word (32 bits) in the registers. Therefore, read-modify-write is needed to change partial bits in 32 bits register.

There are 2 types of registers in FCPF: Immediate register, V-update Register. The values of immediate registers are reflected to H/W behavior immediately after changing its values. Hence, do not change these immediate registers while FCPF is processing (FCP_STA.ACT is set to 1) unless this manual allows it explicitly. The values of V-update registers are reflected to H/W behavior at the next V-interruption of FDP. For FDP connection case users can set V-update registers of the next frame/field while FDP + FCPF is processing the current frame/field.

Refer to **9.10.2.5.1 Operation Control Setting for the IP Set FDP** to grasp the flow of setting registers of FCPF and connected IP.

The grayed portions represent reserved areas for debugging or future functional expansion. Do not access the reserved areas. Never access the registers when the FCPF is in the operation clock placed in hold status.

The following are the base addresses of the FCPF channel.

FCPF: 0_1631_0000h (5631_0000h*1, 4631_0000h*2)

Note 1. CM33 address space (non-secure)
Note 2. CM33 address space (secure)

Table 9.10-13 FCPF Registers

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
FCP version control register	FCPF0_FCP_VCR	0000_0202h	0000h	32
Reserve	-	-	0004h to 0017h	-
FCP status register	FCPF0_FCP_STA	0000_0000h	0018h	32
Reserve	-	-	001Ch to 006Fh	-
FCP Tile/Linear address conversion control	FCPF0_FCP_TL_CTRL	0000_0000h	0070h	32
Reserve	-	-	0074h to 00C3h	-
FCP picture information register 1	FCPF0_FCP_PICINFO1	0000_0000h	00C4h	32
Reserve	-	-	00C8h to 0113h	-
FCP base address of reference picture of plane Y	FCPF0_FCP_BA_REF_Y	0000_0000h	0114h	32
Reserve	-	-	0118h to 011Bh	-
FCP base address of reference picture of plane C	FCPF0_FCP_BA_REF_C	0000_0000h	011Ch	32

Remarks Immediate register: FCPF0_FCP_VCR, FCPF0_FCP_STA
V-update register: FCPF0_FCP_TL_CTRL, FCPF0_FCP_PICINFO1, FCPF0_FCP_BA_REF_Y, FCPF0_FCP_BA_REF_C

9.10.2.4 Register Descriptions

9.10.2.4.1 FCP Version Control Register (FCP_VCR)

FCP_VCR is a version control register of the FCPF. The value read is fixed.

Access Size : 32 bits
Address : <FCPF0_base> + 0000h
Initial Value : 0000_0202h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CATEGORY[7:0]								REVISION[7:0]							
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
15 to 8	CATEGORY [7:0]	2h	R	FCP use case category. 02h: This LSI
7 to 0	REVISION[7:0]	2h	R	Version of LSI product 02h: FCP revision of this LSI

9.10.2.4.2 FCP Status Register (FCP_STA)

FCP_STA indicates the FCPF status.

Access Size : 32 bits
Address : <FCPF0_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ACT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are always read as 0 or 1. Do not care about this value. The write value should always be 0.
0	ACT	0h	R	FCPF Active Flag 0: Indicates the FCPF is not active. 1: Indicates the FCPF is active.

9.10.2.4.3 FCP Tile/Linear Control Register (FCP_TL_CTRL)

FCP_TL_CTRL specifies the control of Tile/Linear address conversion on FCPF. Refer to **9.10.2.5.4 (2) Tile/linear addressing conversion** to grasp how to set registers when reading a tile addressing image.

Access Size : 32 bits
Address : <FCPF0_base> + 0070h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TLEN	-	-	VPOS_C[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VPOS_Y[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	TLEN	0h	RW	Tile Linear Enable 0: Disable Tile/Linear address conversion 1: Enable Tile/Linear address conversion
30, 29	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	VPOS_C[12:0]	0h	RW	Vertical POSition of Chroma Vertical position of tile address chroma plane which FDP start to read. This register must be set value from 0 to FFEh.
15 to 13	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	VPOS_Y[12:0]	0h	RW	Vertical POSition of Y plane Vertical position of tile address luma plane which FDP start to read. This register must be set value from 0 to 1FFDh.

NOTE

This register is only effective for the Tile data. VPOS_C value should be set the half of the VPOS_Y value.

9.10.2.4.4 FCP Picture Information 1 (FCP_PICINFO1)

FCP_PICINFO1 specifies the picture information of the tile address image. Refer to **9.10.2.5.4 (2) Tile/linear addressing conversion** to grasp how to set registers when reading a tile addressing image.

Access Size : 32 bits
Address : <FCPF0_base> + 00C4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	STRIDE_DIV16[10:0]										
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	STRIDE_DIV16 [10:0]	0h	RW	STRIDE DIVided by 16 Memory stride of the tile addressing image. Common for all luma and chroma planes Y and C. It must be specified so that STRIDE_DIV16*16 is exponent of 2 and larger than or equal to 128. STRIDE_DIV16*16 must be the same with memory stride of Y plane, C plane set by FDP registers. This bit must get value from 8h to 200h.

9.10.2.4.5 FCP Base Address Reference picture of plane m (FCP_BA_REF_m) (m = Y, C)

FCP_BA_REF_m specifies the base address of the reference picture of the plane Y, C which is located in tile addressing. Those registers are different from the source address registers set in FDP. Refer to **9.10.2.5.4 (1) Tile addressing image data** to grasp the way of setting address registers.

Access Size : 32 bits
Address : <FCPF0_base> + 0114h / 011Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BA[31:0]	0h	RW	Base Address of reference picture The base address of the tile addressing image of the plane Y, C. It must be specified in 16384 bytes unit. In case of FDP connection Y are corresponding to the luma plane of previous, current, next field (frame in case of progressive input) respectively. C is corresponding to the chroma plane of the current field (frame). This bit must be set value from 0 to FFFF_4000h

9.10.2.5 Operation

This section explains how to control operation of an IP set which includes FCPF.

9.10.2.5.1 Operation Control Setting for the IP Set FDP

(1) The case FDP in interrupt mode or best effort mode

(1a) To start the first frame, set registers of FDP, FCPF as following order.

1. Set value 1 to register FD1_CTL_CLKCTRL.CSTP_N
2. Set FDP registers other than FD1_CTL_CMD, FD1_CTL_SGCMD, and FD1_CTL_REGEND. FDP registers must follow restriction at **9.10.2.5.3 Register Settings and Restrictions on Connected IP (FDP)**.
3. Set FCPF registers (V-update registers and other registers if necessary).
   In case of reading tile addressing image set 1 to FCP_TL_CTRL.TLEN.
4. Set FD1_CTL_CMD.STRCMD to the value 1. Set FD1_CTL_REGEND.REGEND to the value 1.
5. Set FD1_CTL_SGCMD.SGEN to the value 1, then FDP starts its process. FD1_CTL_SGCMD.SGEN must be not cleared if continue to the second or later frames.

(1b) To start the second or later frame, set registers in following order.

1. After V-interruption of the previous frame start timing occurred, set all FDP registers other than FD1_CTL_CMD and FD1_CTL_REGEND. FDP registers must follow restriction at **9.10.2.5.3 Register Settings and Restrictions on Connected IP (FDP)**.
2. Set FCPF V-update registers.
   In case of reading tile addressing image set 1 to FCP_TL_CTRL.TLEN.
3. Set FD1_CTL_CMD.STRCMD to the value 1.
4. Set FD1_CTL_REGEND.REGEND to the value 1.
5. At the V-interruption of the previous frame end timing, FDP starts the target frame. The V-interruption of the previous frame end timing and the one of the target frame start timing are the same.

(1c) to stop FDP, FCPF operation after current frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0.
2. Set FD1_CTL_REGEND.REGEND to the value 1. If this register was completed before the V-Interruption of frame end timing, FDP stops its operation and current frame becomes the last frame of the image sequence. If these register setting could not be completed before the V-Interruption of frame end timing, FDP stops its operation in the next V-interruption. In the latter case, V-update status registers are not updated at V-interruption of frame end but at the next V-interruption at which FD1_CTL_REGEND.REGEND is set as 1.
3. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP will stop generating V-interruption.

(1d) To stop FDP operation immediately, set registers as the following.

1. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP will stop generating V-interruption.
2. Set FD1_CTL_SRESET.SRST to the value 1. FDP will invoke termination process immediately.
3. Wait frame end interrupt from FDP or until the register bit FD1_CTL_IRQSTA.FRE is set to 1. After it occurs, both FDP and FCPF have finished its processing.
4. Set CPG_RST_18.{RSTB4, RSTB5, RSTB6} to the value 1. FCPF will invoke termination process immediately.

5. Wait until ACT bit of the FCP_STA register become 0. After it occurs, FCPF has finished its processing.

With this operation, FDP can stop its process quickly, but the output frame of the last frame is corrupted.

(2) The case FDP in no interrupt mode

(2a) To start the first frame, set registers in following order.

Same as (1a).

(2b) To start the second or later frame, set registers in following order.

Same as (1b).

(2c) To stop FDP operation after current frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0.
2. Set FD1_CTL_REGEND.REGEND to the value 1. At the V-Interruption of frame end timing, FDP stops its operation and current frame becomes the last frame of the image sequence.
3. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP will stop generating V-interruption.

(2d) To stop FDP operation immediately, set registers as the following.

Same as (1d).

9.10.2.5.2 Reset Operation

FCPF reset can be conducted by software reset and power on reset. The software reset which is controlled by software, is used to stop the FCPF operation. The software reset operation is not executed immediately; it is executed on completion of the bus transaction. The other is power on reset which initialize the whole FCPF logic immediately.

(1) Software reset

The procedure of software reset of the FCPF is as following:

1. Activate software reset sequence
   Set CPG_RST_18.{RSTB4, RSTB5, RSTB6} to the value 1.
2. Confirm software reset sequence finished:
   FCP_STA.ACT becomes 0. All remain transactions with the bus system finished.

The procedure to stop operation of an IP set including FCPF is descripted at **9.10.2.5.1 Operation Control Setting for the IP Set FDP**.

(2) Power-on reset

The power-on reset is controlled by an externally input signal called hardware reset. This reset initializes the whole internal logic of FCPF.

9.10.2.5.3 Register Settings and Restrictions on Connected IP (FDP)

The connected FDP has to follow the setting and restrictions in following tables.

(1) Restrictions on FDP read side

In case of reading tile addressing image (FCP_TL_CTRL.TLEN = 1), the setting of input data swap (FD1_RPF1_SWAP.ISWAP [3:0]), line memory pixel number (FD1_RPF1_LMEM.PNUM [11:0]), read color format (FD1_RPF1_FORMAT.RDFMT [6:0]), read memory stride (FD1_RPF1_PSTRIDE.SRC_STRD_Y [15:0], FD1_RPF1_PSTRIDE.SRC_STRD_C [15:0]) must follow the **Table 9.10-14**.

Table 9.10-14 Setting Restriction on FDP Read Side

Register	Value
FD1_RPF1_SWAP.ISWAP[3:0]	Fh
Max value of FD1_RPF1_LMEM.PNUM[11:0]	960
FD1_RPF1_FORMAT.RDFMT[6:0]	42h (YCbCr420 semi-planar)
FD1_RPF1_PSTRIDE.SRC_STRD_Y[15:0]	STRIDE*1
FD1_RPF1_PSTRIDE.SRC_STRD_C[15:0]	STRIDE*1

Note 1. STRIDE = FCP_PICINFO1.STRIDE_DIV16 [10:0] × 16

9.10.2.5.4 Decode Data

Decode data consists of tile addressing image data

(1) Tile addressing image data

Image data is located on memory in tile addressing as shown in **Figure 9.10-15**. Although the valid image data exists in the green area only, the tile addressing area is extended to horizontal and vertical direction. The tile size is 128 bytes × 32 lines. The stride of allocation memory area is exponent of 2.

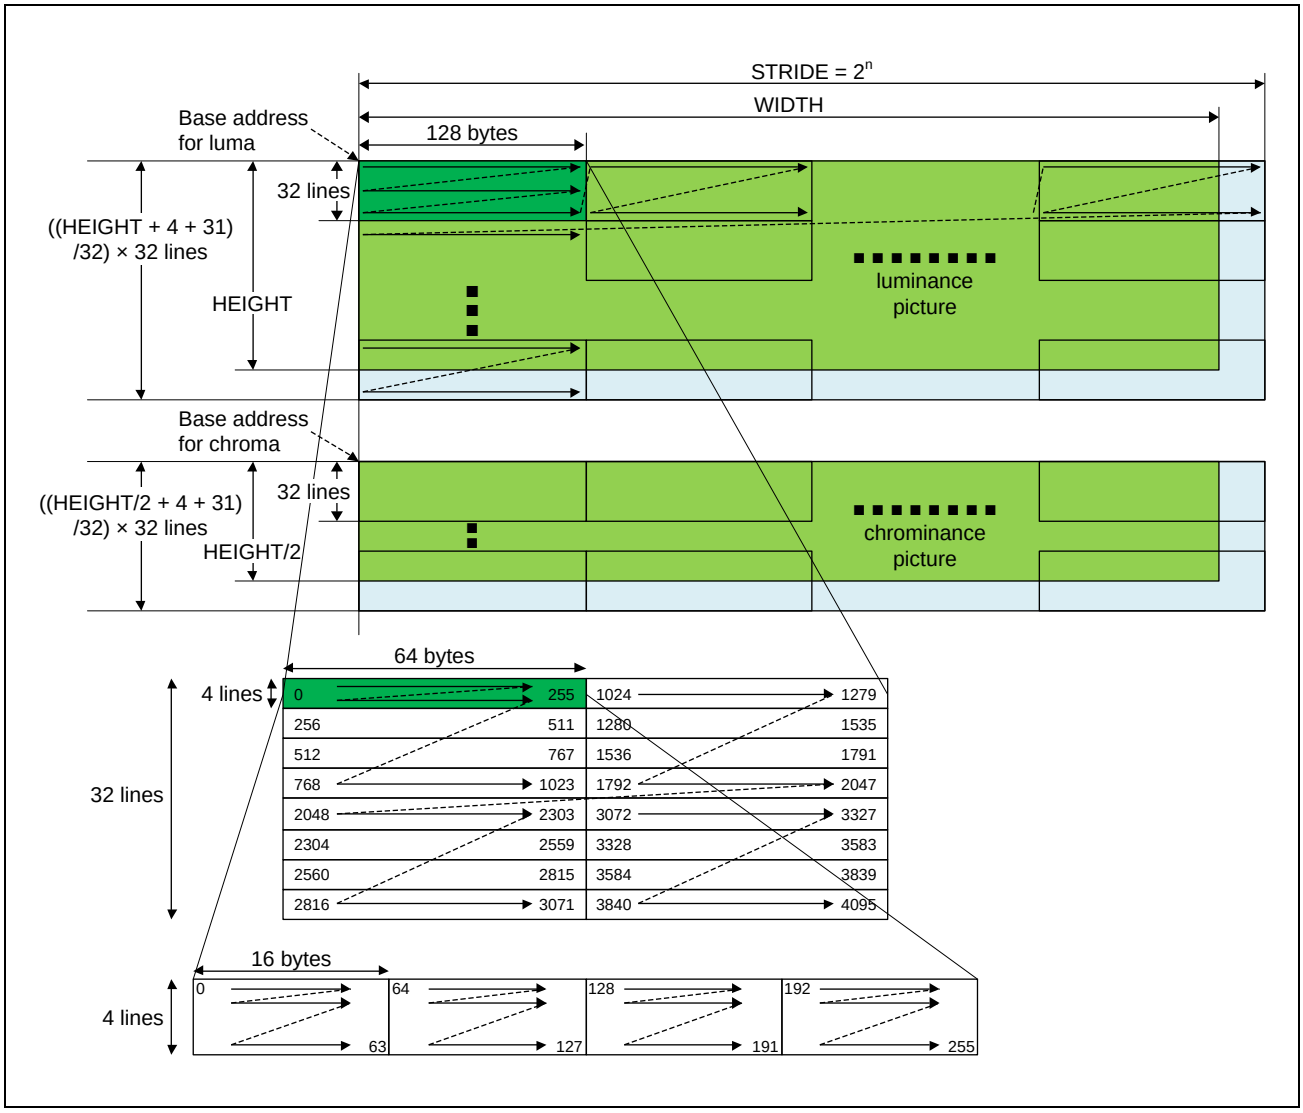

Figure 9.10-15 Memory Allocation of Tile Addressing Image

Parameters in **Figure 9.10-15**:

- STRIDE = FCP_PICINFO1. STRIDE_DIV16 × 16
- HEIGHT, WIDTH: The height and width of the tile addressing image
- Base address for luma: Value of register FCP_BA_REF_Y.BA[31:0]
- Base address for chroma: Value of register FCP_BA_REF_C.BA[31:0]

The buffer size needed for a tile addressing image is shown in **Table 9.10-15**.

Table 9.10-15 Data Size of a Tile Addressing Image

Number of Pic	Data Size per Picture
Maximum number of frames	Luminance: STRIDE × CEIL32 (BLOCK_HEIGHT + 4) bytes*1 Chrominance: STRIDE × CEIL32 (BLOCK_HEIGHT/2 + 4) bytes where STRIDE = FCP_PICINFO1. STRIDE_DIV16 × 16 BLOCK_HEIGHT = pixel height of picture in the size of MB or CTB boundary [pixel height of picture in the size of MB or CTB boundary] MB: CEIL16 (pixel height) CtbSizeY = 16: CEIL16 (pixel height) CtbSizeY = 32: CEIL32 (pixel height) CtbSizeY = 64: CEIL64 (pixel height)

Note 1. CEILn (a) = ((a + (n – 1)) / n) × n

(2) Tile/linear addressing conversion

In order to enable the FDP which supports only linear addressing to access the tile addressing image data, the software needs to set the registers following to **Figure 9.10-16**. Note that the value of VPOS_{Y/C} is set basing on base address regardless of 2 lines of line-shift because reading access to an address is converted to the address of 2 lines below.

In order to enable tile/linear addressing conversion, set 1 to the register FCP_TL_CTRL.TLEN.

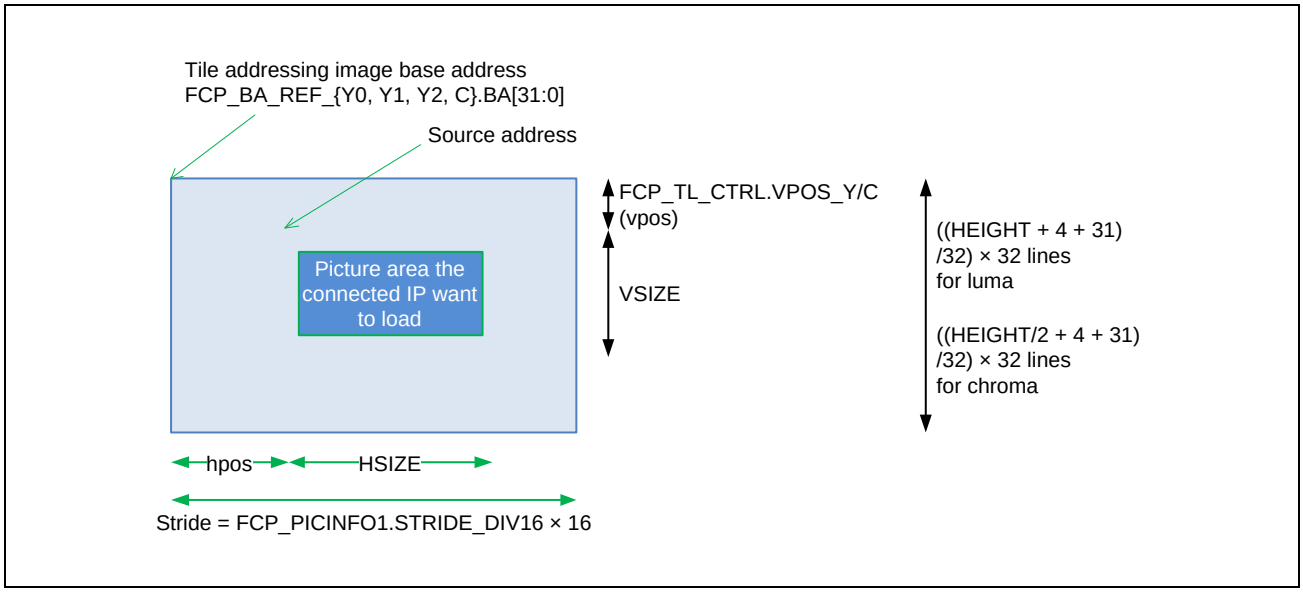

Figure 9.10-16 Reading Tile Addressing Image by Linear Access

Parameters in **Figure 9.10-16**:

- "Source address": FD1_RPF1_ADDR_m.PSRC_ADDR_m[31:0], m = Y,C0
  "Source address" = "Tile addressing image base address" + vpos × stride + hpos
- hpos: the start reading byte position for each line in linear addressing. This value is automatically calculated by FCP and not needed to be set as register.
- VSIZE: FD1_RPF_SIZE.VSIZE[12:0]
- HSIZE: FD1_RPF_SIZE.HSIZE[12:0]

9.10.2.5.5 Operation Status

Operation status of FDP, FCPF is defined for the whole IP set as follows.

(1) If both register bits FD1_CTL_STATUS.BSY and FCP_STA.ACT are 0, both of module FDP, FCPF are stopping.

(2) If either register bit FD1_CTL_STATUS.BSY or FCP_STA.ACT is 1, both of module FDP, FCPF are operating.

9.10.2.6 Usage Notes

9.10.2.6.1 Manipulating FDP with CPG Software Reset

The following notes 1. to 2. are to prevent FDP from the unstable status which may cause hang or wrong operation.

NOTES

1. In the case of stopping FDP using the corresponding register bit of software reset registers (CPG_RST_18) of the module CPG, do following steps.

   Step 1) Stop FDP with the software reset sequence following to the guidance in **9.10.2.5.1 Operation Control Setting for the IP Set FDP**.

   Step 2) Do the following power off sequence b1 to b6.

   b1) Write 0110_1111h to the CPG register (Offset address: CA4h). Transition the Q-ch for all power supply control to Q_STOPPED.

   b2) Read 0330_3333h from the CPG register (Offset address: CA4h). Confirm the Q-ch for all power supply control has transitioned to Q_STOPPED.

   b3) Write 0060_0000h to the CPG register (Offset address: 948h). Assert reset_fcpf_p and reset_fdp1_p.

   b4) Read 0000_006xh from the CPG register (Offset address: A24h). Confirm reset_fcpf_p and reset_fdp1_p asserted.

   b5) Write 0010_0000h to the CPG register (Offset address: 948h). Assert reset_brdg_n.

   b6) Read 0000_007xh from the CPG register (Offset address: A24h). Confirm reset_brdg_n already asserted.

   b7) Power off all the power depending on **10.1.3 Power-On/Off Sequence**.

2. In the case of re-starting FDP after stopping those modules with CPG software reset, do following steps.

   Step 1) Do the following power on sequence a2 to a8.

   a1) Power on all the power depending on **10.1.3 Power-On Sequence**.

   a2) Write 000E_000Eh to the CPG register (Offset address: 66Ch). Supply all clocks.

   a3) Read 0000_0380h from the CPG register (Offset address: 82Ch). Confirm all clocks to started.

   a4) Write 3333_3333h to the CPG register (Offset address: CA4h) Transition all Q-ch for all Q_RUN.

   a5) Write 0010_0010h to the CPG register (Offset address: 948h). Negate the reset_brdg_n.

   a6) Read 0000_006xh from the CPG register (Offset address: A24h). Confirm the reset_brdg_n was already negated.

   a7) Write 0060_0060h hto the CPG register (Offset address: 948h). Negate the reset_fcpf_p and reset_fdp1_p.

   a8) Read 0000_000xh from the CPG register (Offset address: A24h). Confirm the reset_fcpf_p and reset_fdp1_p already negated.

   Step2) Re-start FDP with the software reset sequence following to the guidance in **9.10.2.5.1 Operation Control Setting for the IP Set FDP**.

SECTION 9 IMAGE

9.11 Low Voltage Differential Signaling (LVDS)

9.11.1 Overview

This module is equipped with LVDS_CORE, APB IF section, and Renesas' PHY IP (PHY section), which are collectively provided as LVDS. This section describes the specifications of this LSI.

It complies with the following standards:

- FPD-link Standards Compliant (TIA/EIA-644)
- VESA Standards Compliant

9.11.1.1 Feature

Table 9.11-1 shows the main features of this module.

Table 9.11-1 Overview of Functions

Function	Description
Single-link Target	● RGB888 640 × 480 (VGA) ● RGB888 800 × 480 (QVGA) ● RGB888 1366 × 768 60 Hz (WXGA) ● RGB888 1280 × 800 60 Hz (WXGA)
Dual-link Target	● RGB888 1920 × 1200 60 fps (up to 3.32 Gbps) ● RGB888 1920 × 1080 60 fps (up to 2.99 Gbps)
Number of support lanes	● Single-link: 4 lanes (Data) + 1 lane (Clock) ● Single-link (2ch): 8 lanes (Data) + 2 lanes (Clock) ● Dual-link: 8 lanes (Data) + 2 lanes (Clock)
Link function	● Video mode supports RGB888 ● Output Mode Select of 8 Format ● Dual-Link Even/Odd Swap ● Lane Select (In a channel) ● Supports 8 lanes transfers. (4 lanes × 2ch)
PHY function	● Parallel-Serial Converter ● LVDS IO Buffer Control ● Clock Rate: 25 to 87 MHz (Up to 87 MHz even with SSC ON) ● Data Rate: 175 to 609 Mbps/Lane
Register interface	● AMBA® APB (v1.0) compliant Slave interface ● Data bus width 32 bits ● Two systems of LVDS_CORE register / PHY register
SSC	● Modulation Frequency: 30 to 150 kHz ● Center Spread: −1 to +1 [%] ● Down Spread: 0 to −2 [%]

9.11.1.2 Block Diagram

Figure 9.11-1 shows a block diagram of LVDS.

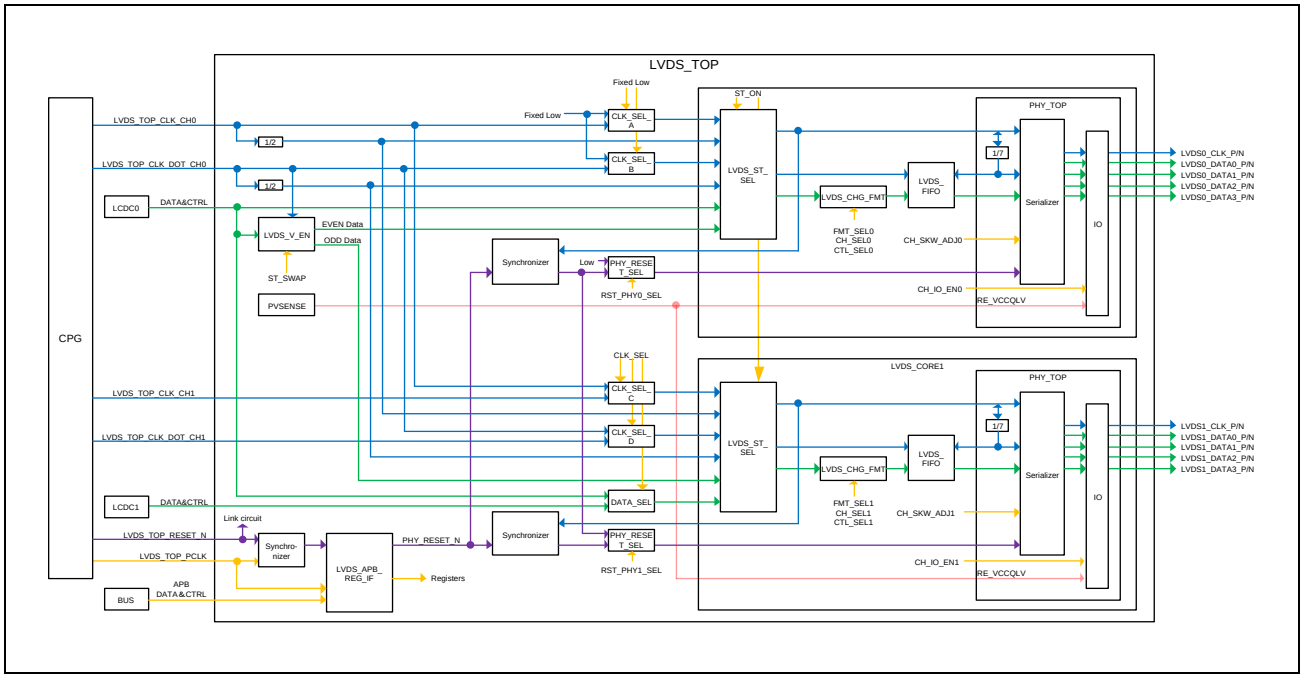

Figure 9.11-1 Block Diagram of LVDS

LVDS_TOP

This is the top circuit of LVDS consisting of the LVDS_CORE section for LVDS output control and the PHY section. This module is equipped with two core circuits for LVDS 2ch support, a Dual-link control circuit and an APB IF circuit. In addition, it is configured to implement multiple Dividers, Selectors, and Synchronizers to match the monitor specifications.

LVDS_CORE section

It implements functions such as single-link and dual-link switching, output format switching, and lane switching. The PHY section is mounted on the LVDS_CORE section.

PHY section

It consists of a Serializer and LVDS IO. Renesas IP is used.

APB IF section

The APB IF section implements registers for controlling the LVDS_CORE and PHY sections.

9.11.1.3 External Pins

Table 9.11-2 shows the pin configuration.

Table 9.11-2 Pin Configuration

Pin Name	I/O	Function	Pin State when not in Use
LVDS0_DATA0_P	Out	LVDS0 TX differential data lane 0 (positive)	Open
LVDS0_DATA0_N	Out	LVDS0 TX differential data lane 0 (negative)	Open
LVDS0_DATA 1_P	Out	LVDS0 TX differential data lane 1 (positive)	Open
LVDS0_DATA 1_N	Out	LVDS0 TX differential data lane 1 (negative)	Open
LVDS0_DATA 2_P	Out	LVDS0 TX differential data lane 2 (positive)	Open
LVDS0_DATA 2_N	Out	LVDS0 TX differential data lane 2 (negative)	Open
LVDS0_DATA 3_P	Out	LVDS0 TX differential data lane 3 (positive)	Open
LVDS0_DATA3_N	Out	LVDS0 TX differential data lane 4 (negative)	Open
LVDS0_CLK_P	Out	LVDS0 TX differential clock lane (positive)	Open
LVDS0_CLK_N	Out	LVDS0 TX differential clock lane (negative)	Open
LVDS1_DATA0_P	Out	LVDS1 TX differential data lane 0 (positive)	Open
LVDS1_DATA0_N	Out	LVDS1 TX differential data lane 0 (negative)	Open
LVDS1_DATA1_P	Out	LVDS1 TX differential data lane 1 (positive)	Open
LVDS1_DATA1_N	Out	LVDS1 TX differential data lane 1 (negative)	Open
LVDS1_DATA2_P	Out	LVDS1 TX differential data lane 2 (positive)	Open
LVDS1_DATA2_N	Out	LVDS1 TX differential data lane 2 (negative)	Open
LVDS1_DATA3_P	Out	LVDS1 TX differential data lane 3 (positive)	Open
LVDS1_DATA3_N	Out	LVDS1 TX differential data lane 4 (negative)	Open
LVDS1_CLK_P	Out	LVDS1 TX differential clock lane (positive)	Open
LVDS1_CLK_N	Out	LVDS1 TX differential clock lane (negative)	Open

Note: LVDS is a differential output interface. The channel supports 2 channels, TX0 = Ch0 and TX1 = Ch1. Each channel consists of 1 Clock Lane and 4 Data Lanes.

9.11.1.4 Connected Module

Table 9.11-3 shows modules connected to this module.

Table 9.11-3 Connected Module

Module Name	Connected Module Name	Function of Connected Module
LVDS	CPG	Clock Pulse Generator
	BUS	Interconnect BUS
	LCDC0	LCD Controller0
	LCDC1	LCD Controller1
	External pin	External pin

9.11.2 Registers

The LVDS register address is <LVDS_base> given as an offset from the base address. The register base addresses of LVDS are listed in the following table.

Table 9.11-4 Register Base Addresses

Base Address Name	Base Address	Function
<LVDS_base>	0_164C_0000h (564C_0000h*1, 464C_0000h*2)	

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

9.11.2.1 List of Registers

The LVDS registers and the memory addresses are listed in the following table.

For the actual addresses, the offset values indicated in this table are added to the base addresses.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
LVDS Common Register	LVDS_CMN	0000_0000h	0000h	32
Reserve	-	-	0004h to 000Fh	-
LVDS0 PHY Register	LVDS_0_PHY	0000_0000h	0010h	32
LVDS0 Control Register	LVDS_0_CTL	0000_0000h	0014h	32
LVDS1 PHY Register	LVDS_1_PHY	0000_0000h	0018h	32
LVDS1 Control Register	LVDS_1_CTL	0000_0000h	001Ch	32

Note: Addresses other than those listed above are Reserved. Access to the reserved area is prohibited. The operation when accessed is not guaranteed. Access is 32 bits. Byte access is not allowed.

9.11.2.2 LVDS Common Register (LVDS_CMN)

This is a common register for LVDS modules.

Registers are implemented to select the clock, reset, and data paths according to the operating mode.

Access Size : 32 bits
Address : <LVDS_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	RST_PHY1_SEL	RST_PHY0_SEL	-	-	-	-	-	-	-	CLK_SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	ST_SWAP	ST_ON	-	-	-	-	-	-	-	PHY_RESET_N
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	RST_PHY1_SEL	0h	RW	PHY1 Reset Signal Select 0: CH0 1: CH1
24	RST_PHY0_SEL	0h	RW	PHY0 Reset Signal Select 0: Low 1: CH0
23 to 17	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK_SEL	0h	RW	Clock Select (LVDS_TOP_CLK_CHx, LVDS_TOP_CLK_DOT_CHx): x = 0, 1 CLK_SEL_C 0: LVDS_TOP_CLK_CH0 1: LVDS_TOP_CLK_CH1 CLK_SEL_D 0: LVDS_TOP_CLK_DOT_CH0 1: LVDS_TOP_CLK_DOT_CH1
15 to 10	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	ST_SWAP	0h	RW	LVDS Dual-Link Even/Odd Data Stripe Swap 0: ch0 = Even, ch1 = Odd 1: ch0 = Odd, ch1 = Even
8	ST_ON	0h	RW	Dual-link Select (Stripe-ON) 0: Single-link 1: Dual-link
7 to 1	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	PHY_RESET_N	0h	RW	LVDS PHY0 & PHY1 Reset 0: Reset, 1: Normal

9.11.2.3 LVDS0 PHY Register (LVDS_0_PHY)

This is the PHY control register for LVDS0 (ch0).

Register is implemented to adjust the LVDS output clock and data skew and to enable the LVDS output IO.

Access Size : 32 bits
Address : <LVDS_base> + 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	CH_SKW_ADJ0[14:0]														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	CH_IO_EN0[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

15 to 5	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4 to 0	CH_IO_EN0 [4:0]	0h	RW	LVDS0 DRV Enable (Power Cut) 0: OutputBuffer, 1: Normal Operation [4]: Lane4, [3]: Lane3, [2]: Lane2, [1]: Lane1, [0]: Lane0

9.11.2.4 LVDS0 Control Register (LVDS_0_CTL)

This is the control register of the LVDS_CORE part of LVDS0 (ch0).

This is a register that controls the functions of the LVDS_CORE section (Control bit selection, output format selection, and output lane switching).

Access Size : 32 bits
Address : <LVDS_base> + 0014h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	CTL_SEL0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

9.11.2.5 LVDS1 PHY Register (LVDS_1_PHY)

This is the PHY control register for LVDS1 (ch1).

Register is implemented to adjust the LVDS output clock and data skew and to enable the LVDS output IO.

Access Size : 32 bits
Address : <LVDS_base> + 0018h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 16	CH_SKW_ADJ1 [14:0]	0h	RW	LVDS1 Skew Adjust 000: +0 ps, 100: -0 ps 001: +30 ps, 101: -30 ps 010: +60 ps, 110: -60 ps 011: +90 ps, 111: -90 ps [30:28]: Lane4, [27:15]: Lane3, [24:22]: Lane2, [21:19]: Lane1, [18:16]: Lane0
15 to 5	-	0h	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4 to 0	CH_IO_EN1[4:0]	0h	RW	LVDS1 DRV Enable (Power Cut) 0: OutputBuffer, 1: Normal Operation [4]: Lane4, [3]: Lane3, [2]: Lane2, [1]: Lane1, [0]: Lane0

9.11.2.6 LVDS1 Control Register (LVDS_1_CTL)

This is the control register of the LVDS_CORE part of LVDS1 (ch1).

This is a register that controls the functions of the LVDS_CORE section (Control bit selection, output format selection, and output lane switching).

Access Size : 32 bits
Address : <LVDS_base> + 001Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	CTL_SEL1[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

9.11.3 Operation

9.11.3.1 Power On Sequence

The initialization procedure for this module is shown in **Figure 9.11-2**.

The basic sequence is as follows.

All operating modes (Single-link, Dual-link) can be activated by following the steps below. For details on LVDS operating modes, refer to **9.11.3.3 LVDS Operating Modes**.

1. Power-on
2. Unreset LVDS (RESET_N)
3. Supplying the APB clock to LVDS (LVDS_TOP_PCLK)
4. LVDS_CORE Register Settings (Excludes PHY_RESET)
5. Provides LVDS PHY and DOT clocks (LVDS_TOP_CLK_CH0, LVDS_TOP_CLK_CH1, LVDS_TOP_CLK_DOT_CH0, LVDS_TOP_CLK_DOT_CH1)
6. PHY register setting
7. Unreset PHY

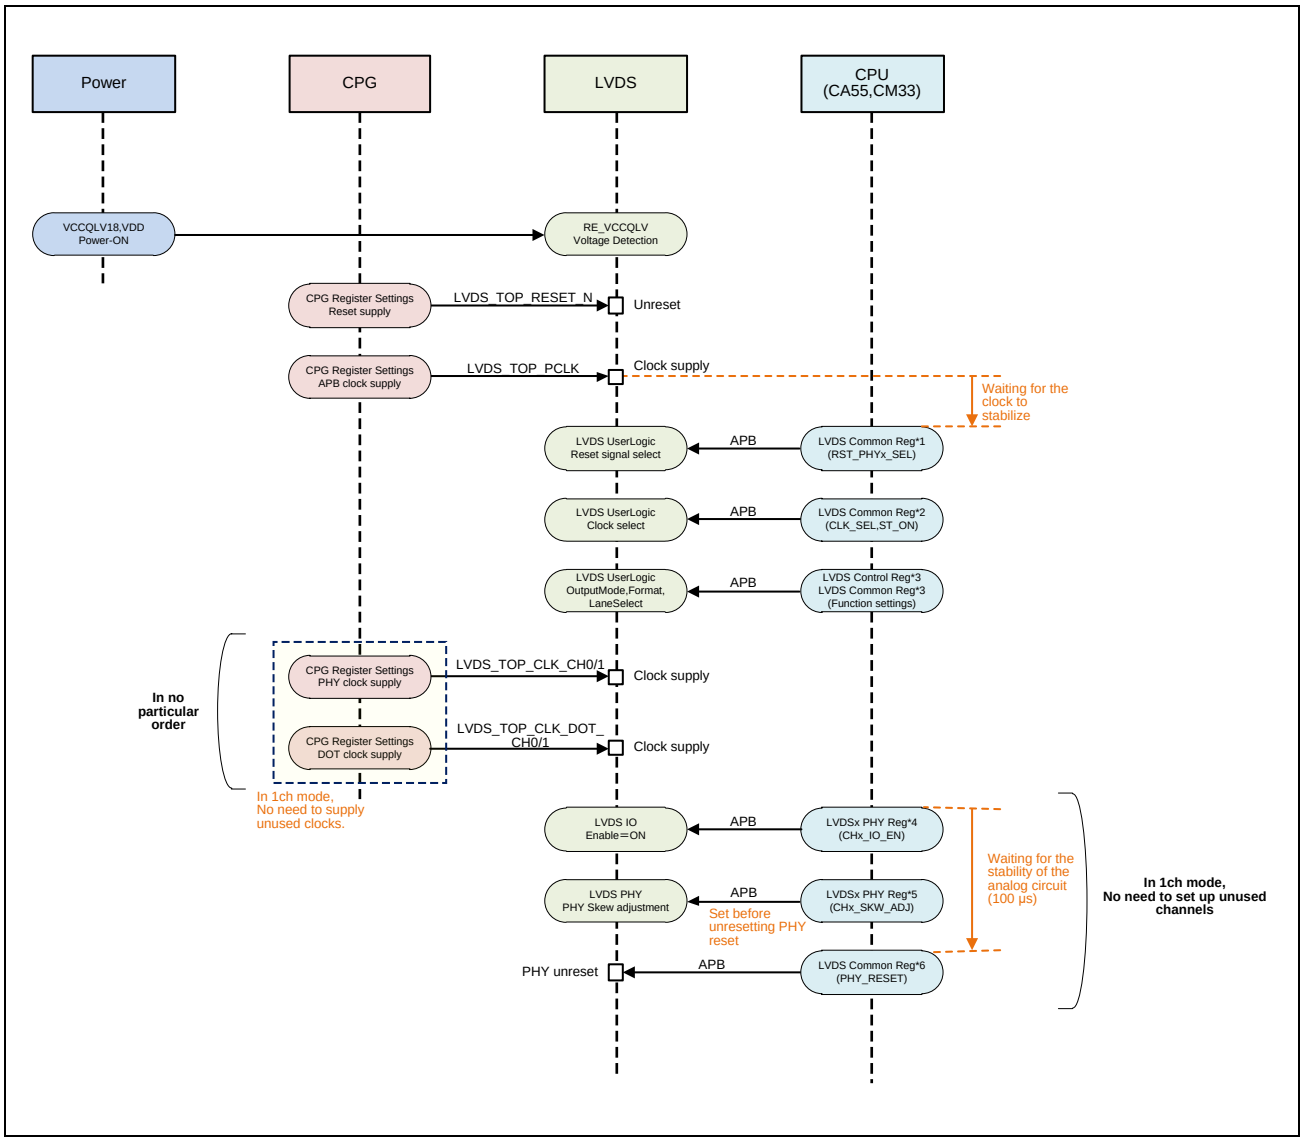

Figure 9.11-2 Power On Sequence

Remark Refer to **Table 9.11-5** for *1 to *6 in the figure.
For the relationship between each operation mode and the register settings, refer to **Table 9.11-6**.

(1) Power on, unreset

After the power is turned on (VCCQLV18, VDD), the reset (RESET_N) is canceled for LVDS startup. The LVDS is unreset by the CPG register control. For more information about the CPG registers, refer to CPG chapter.

(2) Clock supply

The clock input to the LVDS can be frequency-set, supplied, and deactivated by the CPG. For more information about the CPG registers, refer to CPG chapter.

Also refer to “3. Supplying the APB clock to LVDS (LVDS_TOP_PCLK)”, “4. LVDS_CORE Register Settings (Excludes PHY_RESET)”, and **9.11.3.7 Output Pattern**, as LVDS requires a reset and clock to be selected according to the mode of operation.

It is recommended that the following clock frequency settings be set before clocking the LVDS.

- LVDS_TOP_CLK_CH0/1 and LVDS_TOP_CLK_DOT_CH0/1 must be set to the required frequency based on the specifications of the panel to be connected.

(3) Register settings (Common, PHY, LVDS_CORE)

After the APB clock (LVDS_TOP_PCLK) is stabilized, the PHY and LVDS_CORE register settings are configured. Depending on the mode of operation, the initial settings of the registers must be made.

<Common Register Settings>

LVDS_CMN is the register of common settings. Depending on the channel to be used, it is necessary to set the LVDS0, 1 registers. There is no difference in the register settings depending on the channel.

For details on how to set it, refer to (1) of **9.11.3.7 Output Pattern**.

- Register function
  1) CLK_SEL
  2) RST_PHYx_SEL
  3) PHY_RESET
  4) ST_ON
  5) ST_SWAP

<PHY Register Settings>

LVDS_0_PHY and LVDS_1_PHY are the registers for the PHY configuration. Depending on the channel to be used, it is necessary to set the LVDS0, 1 registers. There is no difference in the register settings depending on the channel.

- Setup Procedure
  1) Set the CHx_IO_EN according to the lane to be used.
  2) If you want to adjust Skew for each channel, set the CHx_SKW_ADJ.
  3) After the stabilization time (100 µs) of the Analog circuit, including the PHY clock (LVDS_TOP_CLK_CH0,1) and “1)”, set the PHY_RESET register and release the PHY reset.

  Note: x = 0 or 1

<LVDS_CORE Register Settings>

LVDS_0_CTL and LVDS_1_CTL are the registers for LVDS_CORE configuration. Depending on the channel to be used, it is necessary to set the LVDS0, 1 registers. Make the appropriate settings according to the single-link and dual-link.

For details on how to do this, refer to **9.11.3.5 Output Format Selection** (FMT_SEL), **9.11.3.8 Control Bit Switching** (CTL_SEL), and **9.11.3.9 Output Lane Selection** (CH_SEL).

- Setting conditions

  Before configuring the PHY register, configure the LVDS_CORE register.
  The settings for the various LVDS_CORE registers are in no particular order.
  The registers that require initial settings are as follows. The registers used by default do not need to be initialized.

Table 9.11-5 List of Registers that Require Initial Setting

No.	Numbers in the figure	Register Name	Address	Bit	I/O	Function
1	*1	LVDS_CMN	000h	25	RST_PHY1_SEL	LVDS PHY1 Reset Signal Select
2	*1			24	RST_PHY0_SEL	LVDS PHY0 Reset Signal Select
3	*2			16	CLK_SEL	LVDS Clock Select
4	*3			9	ST_SWAP	LVDS Dual-Link Even/Odd Data Swap
5	*2			8	ST_ON	LVDS Dual-Link Clock and Data Select
6	*6			0	PHY_RESET	LVDS0,1 PHY Reset
7	*5	LVDS_0_PHY	010h	30-16	CH_SKW_ADJ0[14:0]	LVDS0 Skew Adjust
8	*4			4-0	CH_IO_EN0 [4:0]	LVDS0 DRV Enable (Power Cut)
9	*3	LVDS_0_CTL	014h	23-16	CTL_SEL0 [7:0]	LVDS0 Control bit Select
10	*3			11-8	FMT_SEL0 [3:0]	LVDS0 Output Format Variation
11	*3			7-0	CH_SEL [7:0]	LVDS0 Data Lane Select
12	*5	LVDS_1_PHY	018h	30-16	CH_SKW_ADJ1 [14:0]	LVDS1 Skew Adjust
13	*4			4-0	CH_IO_EN1 [4:0]	LVDS1 DRV Enable (Power Cut)
14	*3	LVDS_1_CTL	01Ch	23-16	CTL_SEL1 [7:0]	LVDS1 Control bit Select
15	*3			11-8	FMT_SEL1 [3:0]	LVDS1 Output Format Variation
16	*3			7-0	CH_SEL1 [7:0]	LVDS1 Data Lane Select

(4) Relationship between operating mode and register setting

The initial setting is performed according to the procedure in **Figure 9.11-2**, regardless of whether it is a single-link or a dual-link.

If only one channel is used, it is not necessary to set the CPG and LVDS registers for the unused channel.

Table 9.11-6 shows the relationship between the operating mode and the register settings.

Note 1. Refer to the CPG chapter for details on the clock settings (LVDS_TOP_CLK_CH0, LVDS_TOP_CLK_CH1, LVDS_TOP_CLK_DOT_CH 0, LVDS_TOP_CLK_DOT_CH 1) of CPG Reg.

Note 2. For LVDS Reg., refer to **9.11.2 Registers**.

Table 9.11-6 Relationship between Operating Mode and Register Setting

Operation Mode	CPG Reg.				LVDS Reg.	
	LVDS_TOP_CLK_CH0	LVDS_TOP_CLK_CH1	LVDS_TOP_CLK_DOT_CH0	LVDS_TOP_CLK_DOT_CH1	LVDS0	LVDS1
Single-link (ch1)	✓	—	✓	—	✓	—
Single-link (ch2)	—	✓	—	✓	—	✓
Single-link (2ch)	✓	✓	✓	✓	✓	✓
Single-link (Multi)	✓	—	✓	—	✓	—
Dual-link	✓	—	✓	—	✓	—

9.11.3.2 Power Off Sequence

The flow of the power off sequence in this module is shown in **Figure 9.11-3**. The Power off sequence is the reverse of the Power on sequence.

The basic sequence is as follows.

1) PHY Reset
2) LVDS IO Disable
3) LVDS reset, clock stop
4) Power OFF

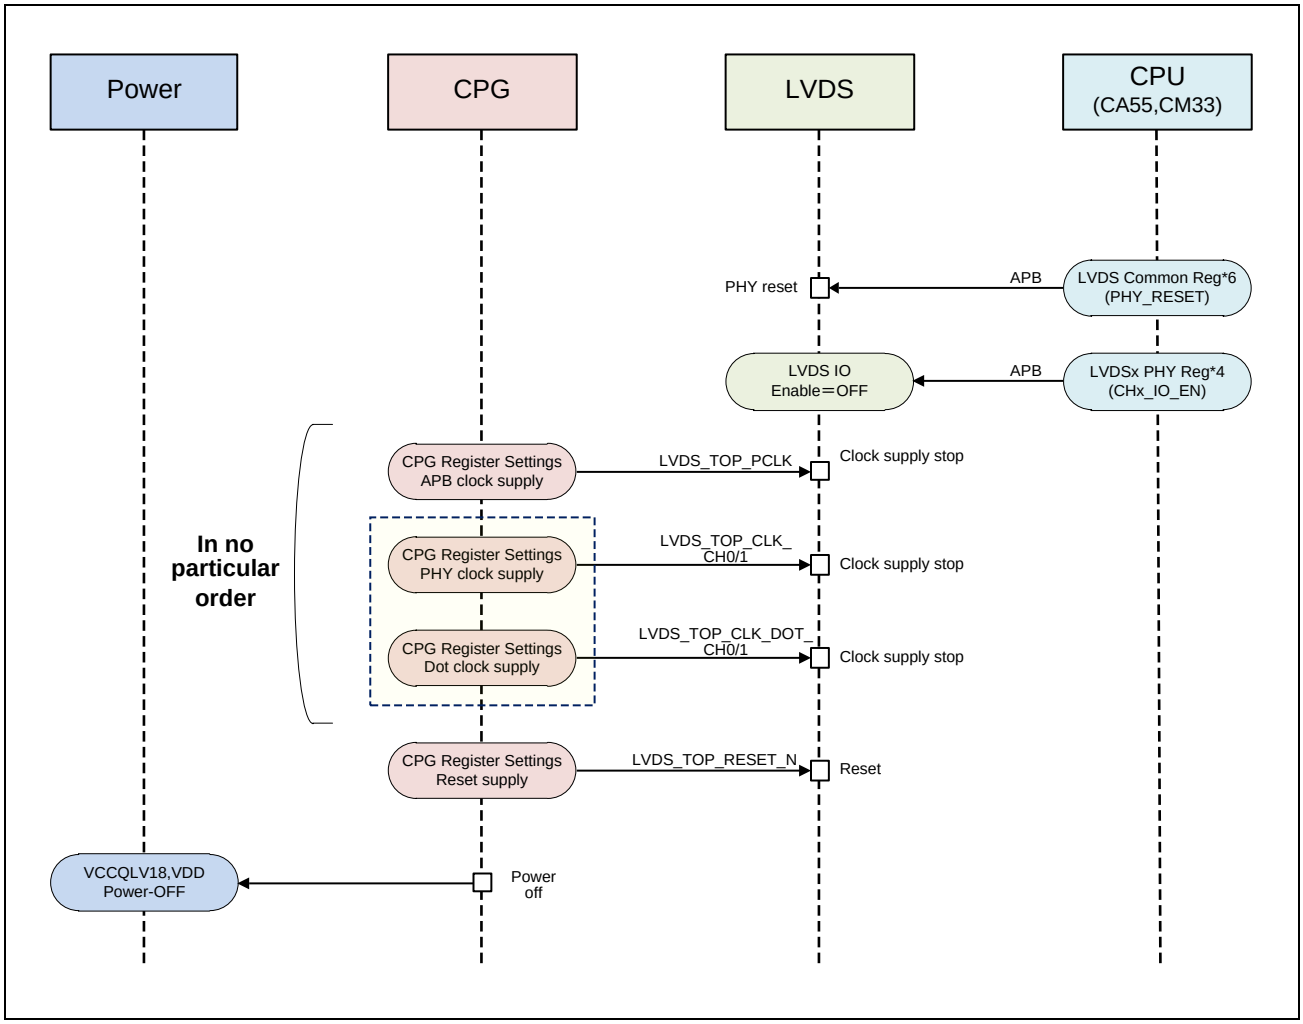

Figure 9.11-3 Power Off Sequence

Remark Refer to **Table 9.11-5** for *4 and *6 in the figure.

9.11.3.3 LVDS Operating Modes

The module supports five different modes of operation. This chapter describes each mode of operation. For details on setting the operation mode, refer to **9.11.3.7 Output Pattern**.

(1) Single-link (ch0 only)

This mode outputs the image data of LCDC0 to LVDS (ch0) as shown below. In this mode, LVDS (ch1) is not used, so the ch1 side is used in the reset state and clock stop in consideration of power saving.

Figure 9.11-4 shows an image of the single-link (ch0 only) clock and data path.

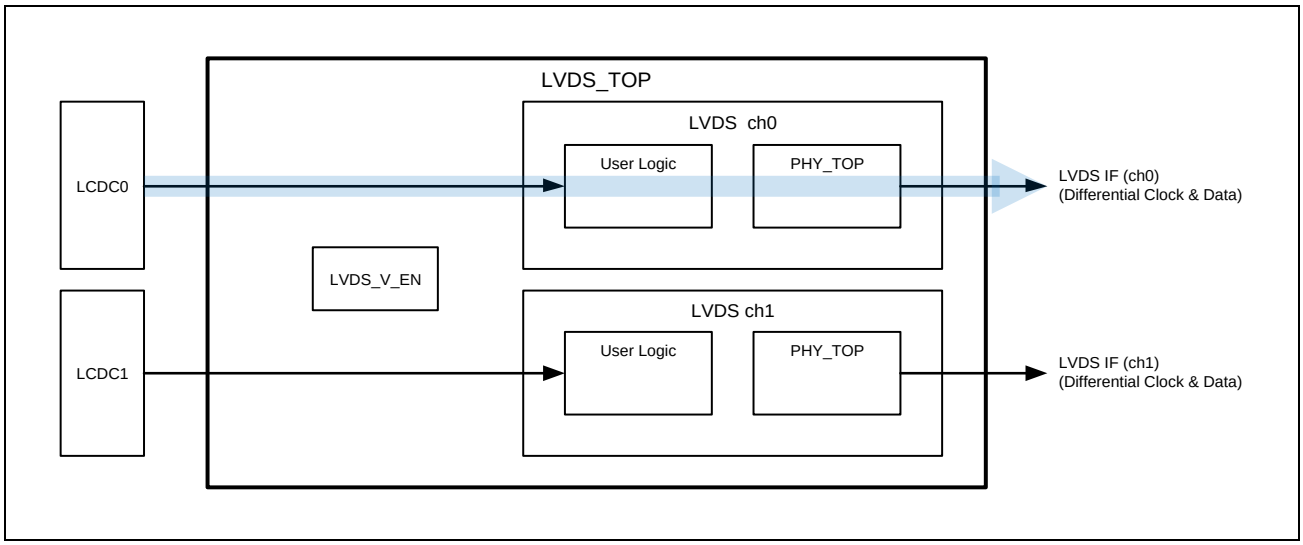

Figure 9.11-4 Single-link (Ch0 Only) Data Path Image

(2) Single-link (ch1 only)

This mode outputs the image data of LCDC1 to LVDS (ch1) as shown below. In this mode, LVDS (ch0) is not used, so the ch0 side is used in the reset state and clock stop in consideration of power saving.

Figure 9.11-5 shows an image of the single-link (ch1 only) clock and data path.

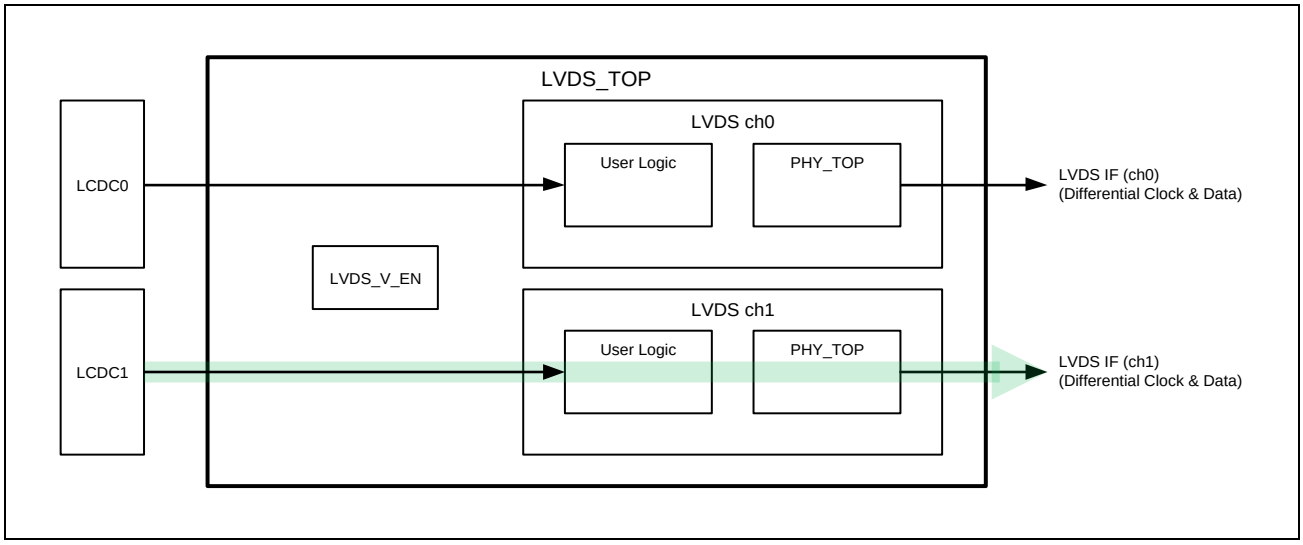

Figure 9.11-5 Single-link (Ch1 Only) Data Path Image

(3) Single-link (2ch)

In this mode, the image data of LCDC0 is output to LVDS (ch0) and the image data of LCDC1 is output to LVDS (ch1). Since LVDS (ch0) and LVDS (ch1) are not synchronously related, they can be output in different image formats and can be operated asynchronously. In this mode, two channels are used, so it is necessary to cancel the reset and supply the clock for each channel.

Figure 9.11-6 shows an image of the single-link (2ch) clock and data path.

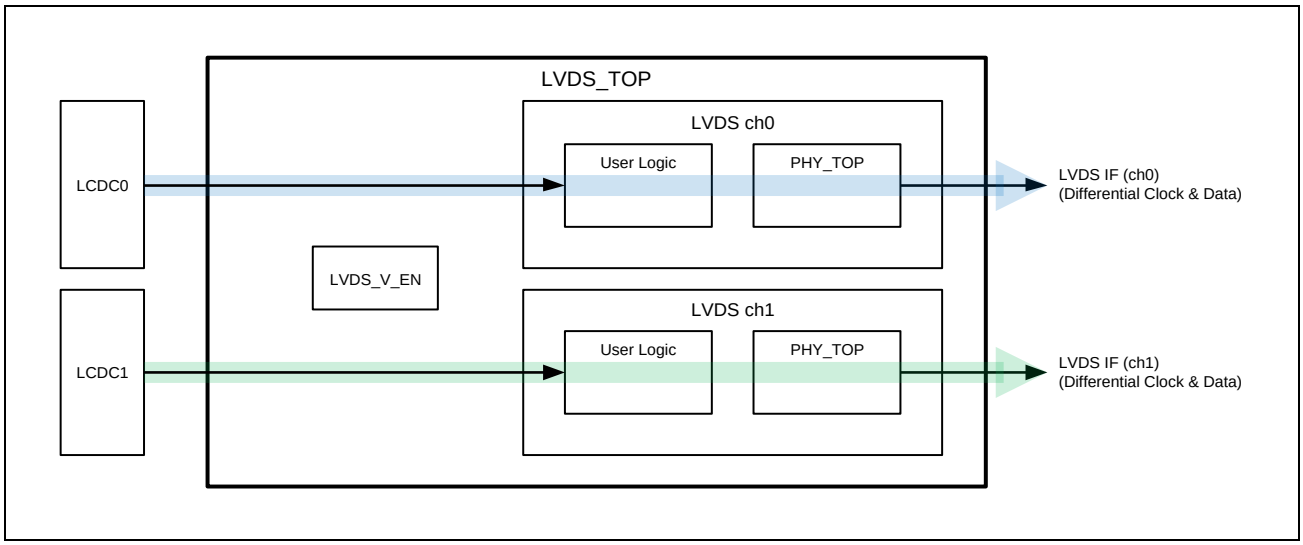

Figure 9.11-6 Single-link (2ch) Data Path Image

(4) Single-link (Multi)

In this mode, the image data of LCDC0 is output to both LVDS (ch0) and LVDS (ch1). LVDS (ch0) and LVDS (ch1) operate synchronously. In this mode, two channels are used, so it is necessary to cancel the reset and supply the clock for each channel.

Figure 9.11-7 shows an image of the single-link (Multi) clock and data path.

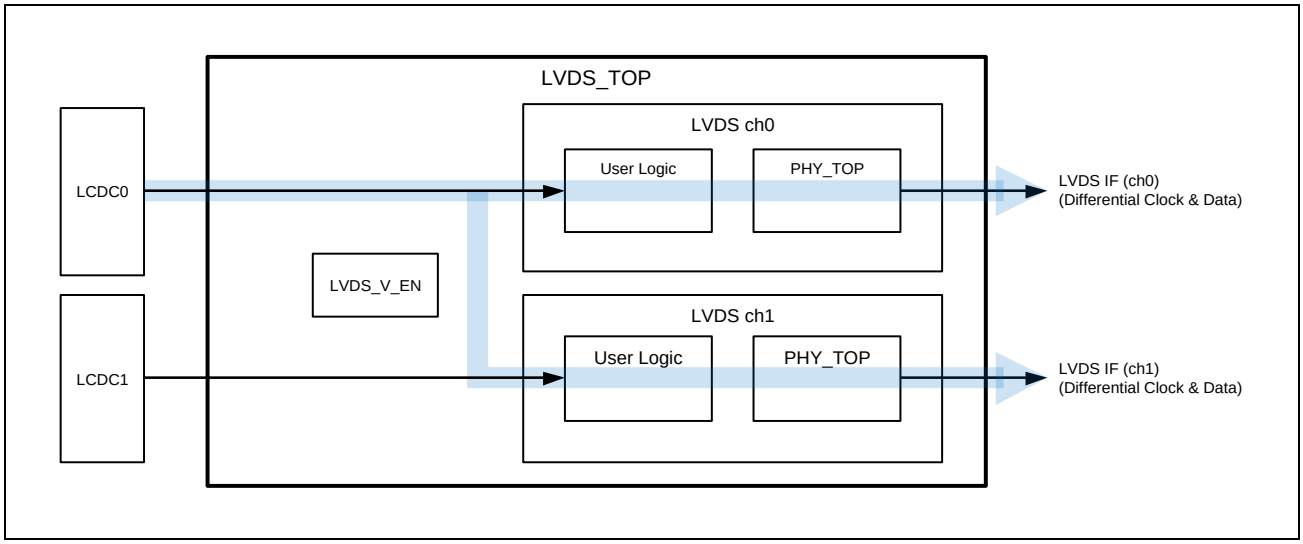

Figure 9.11-7 Single-link (Multi) Data Path Image

(5) Dual-link

In this mode, the input image data is separated into Even pixels and Odd pixels, and the output is distributed to LVDS ch0 and ch1. The destination channel of the Even pixel and Odd pixel can be changed by setting the LVDS registers. In this mode, two channels are used, so it is necessary to cancel the reset and supply the clock for each channel.

Figure 9.11-8 shows an image of the dual-link clock and data path.

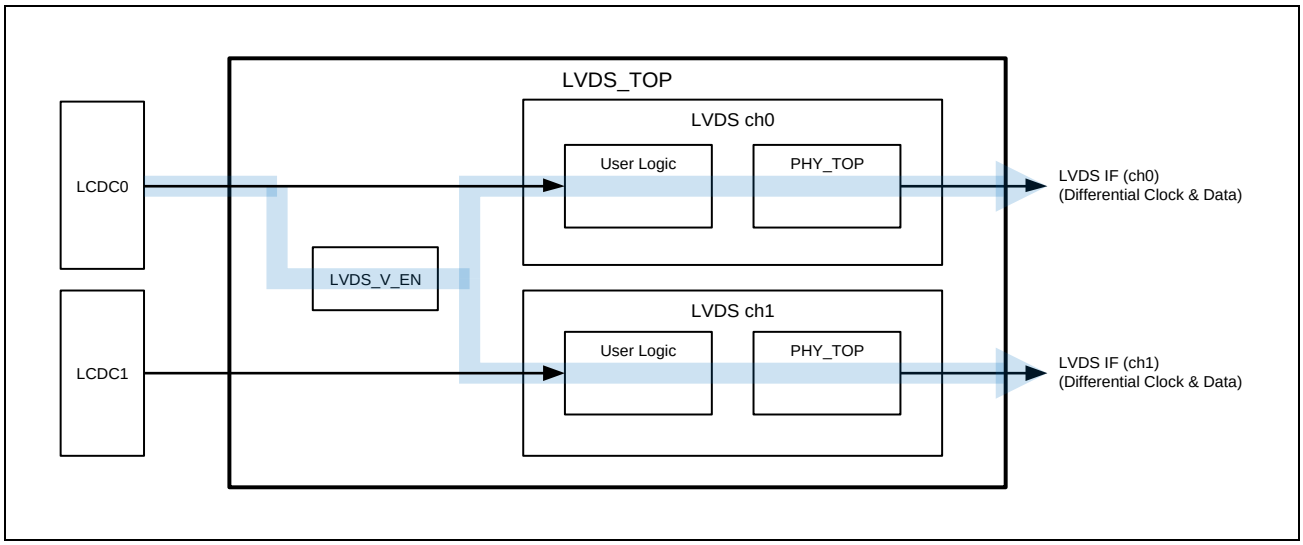

Figure 9.11-8 Dual-link Data Path Image

9.11.3.4 Input Format

For the input format to this module, please refer to **9.4 LCD Controller (LCDC)**.

9.11.3.5 Output Format Selection

This module supports 8 types of output formats (Modes). Switch the output format by setting the register (LVDS_0_CTL.FMT_SEL[3:0]/ LVDS_1_CTL.FMT_SEL[3:0]). The output image data is 24 bits for RGB (8 bits each) and 4 bits for Control bits. The control bits input from the LCDC consist of 4 bits: HSYNC, VSYNC, DE, and Low(fixed).

Refer to **Figure 9.11-13** for the data format conversion from LCDC to LVDS.

The output formats for each mode are shown in **Figure 9.11-9**, **Figure 9.11-10**, **Figure 9.11-11**, and **Figure 9.11-12**.

Remark R = Red Data, G = Green Data, B = Blue Data, CTL = Control bit

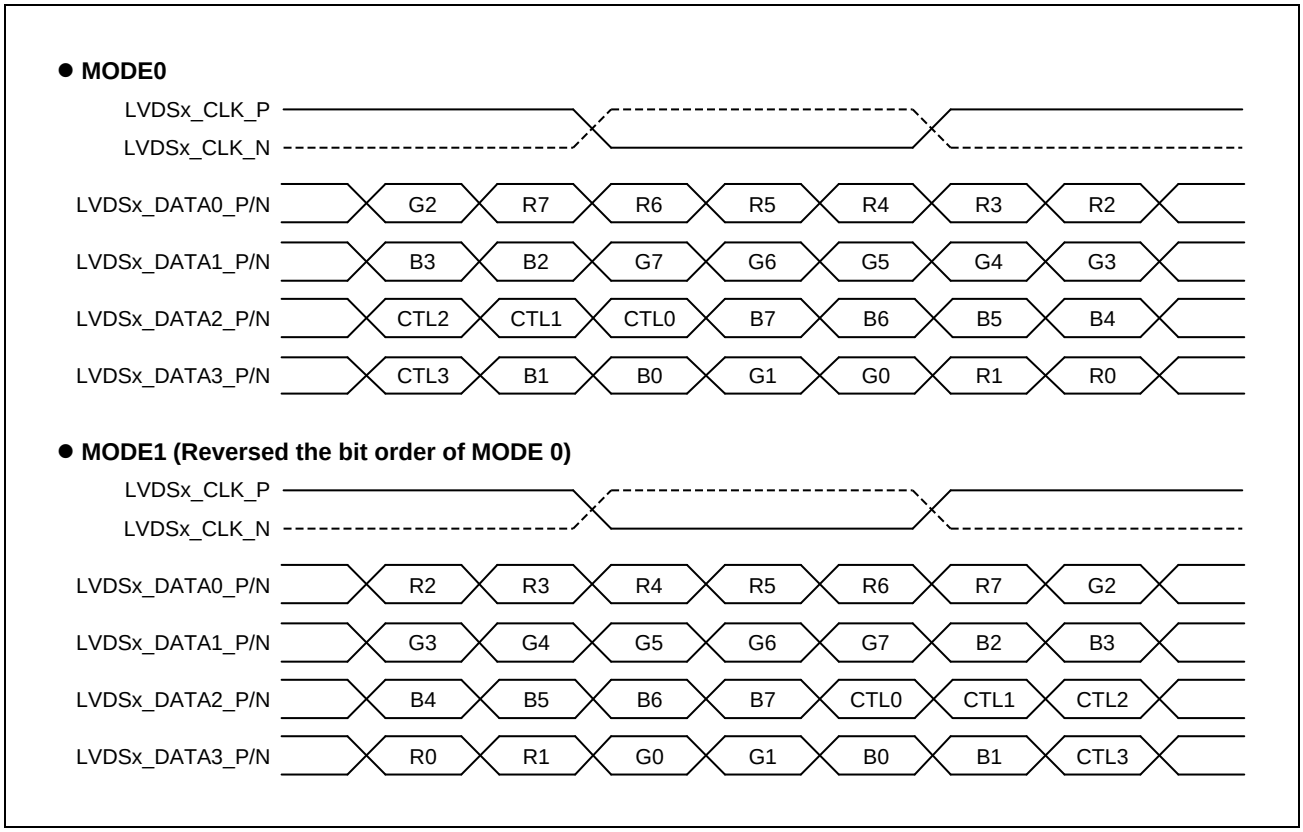

Figure 9.11-9 Mode0, Mode1 Output Format

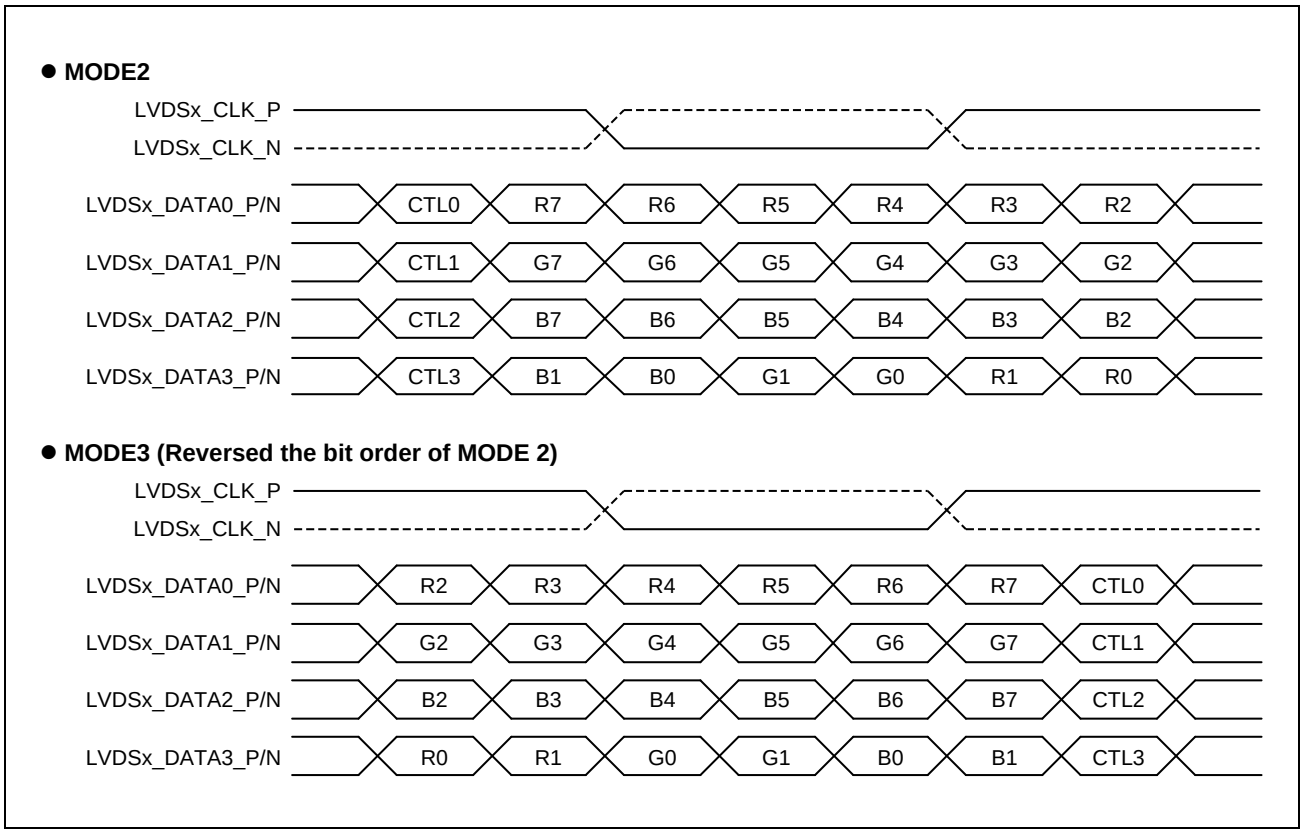

Figure 9.11-10 Mode2, Mode3 Output Format

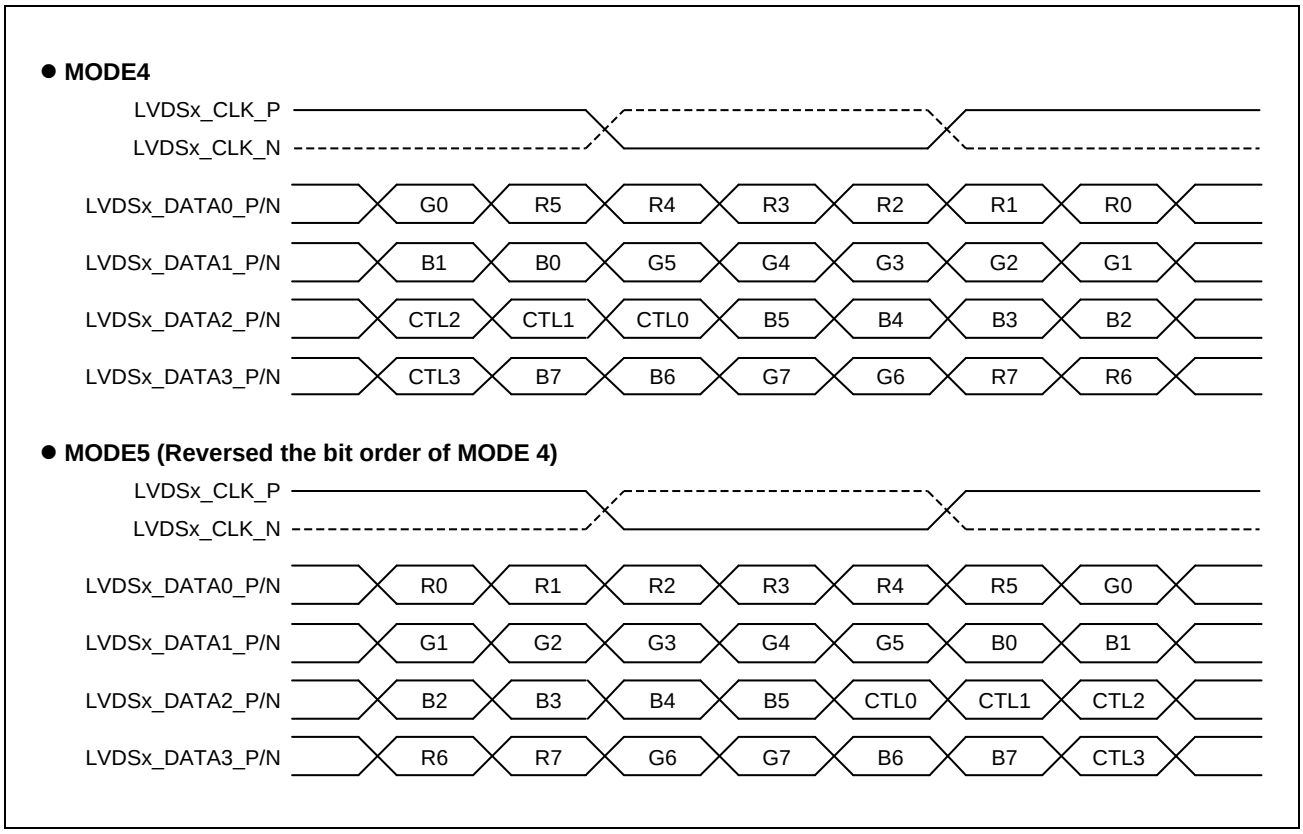

Figure 9.11-11 Mode4, Mode5 Output Format

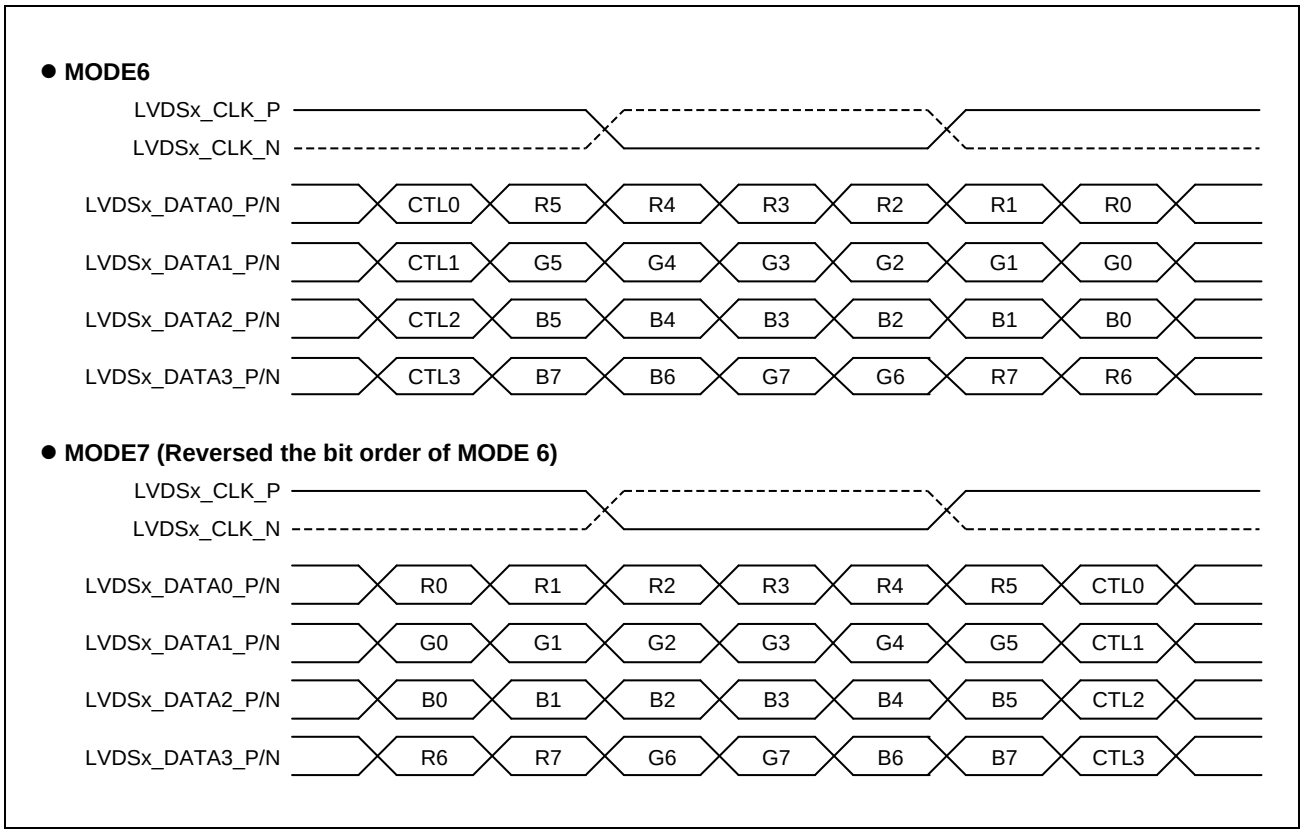

Figure 9.11-12 Mode6, Mode7 Output Format

9.11.3.6 Input/Output Data Description

This module converts the input data from the LCDC to the selected output format (refer to **9.11.3.5 Output Format Selection**) and outputs it. The clock must be output with a duty ratio of 4:3 (High:Low) according to the TIA/EIA-644 standard and is generated by the PHY. As for image data, the data equivalent to one clock of the LCDC is output by the Serializer at 7 times the speed. This section describes how to convert input data and control bits at the time of output (bit assignment).

(1) Data Conversion

Describes data transformation. The figure below is an example of conversion. The input data is converted into the selected data according to the output format (refer to **9.11.3.5 Output Format Selection**) and output. For details on the register settings for selecting the output format, refer to LVDS_0_CTL and LVDS_1_CTL.

The upper part of the figure below is the input data from the LCDC. 24 bits of data are input per clock.

As shown at the bottom of the figure below, the input parallel data is sorted into serial data and output.

The conversion of parallel data to serial data is done by the PHY's Serializer.

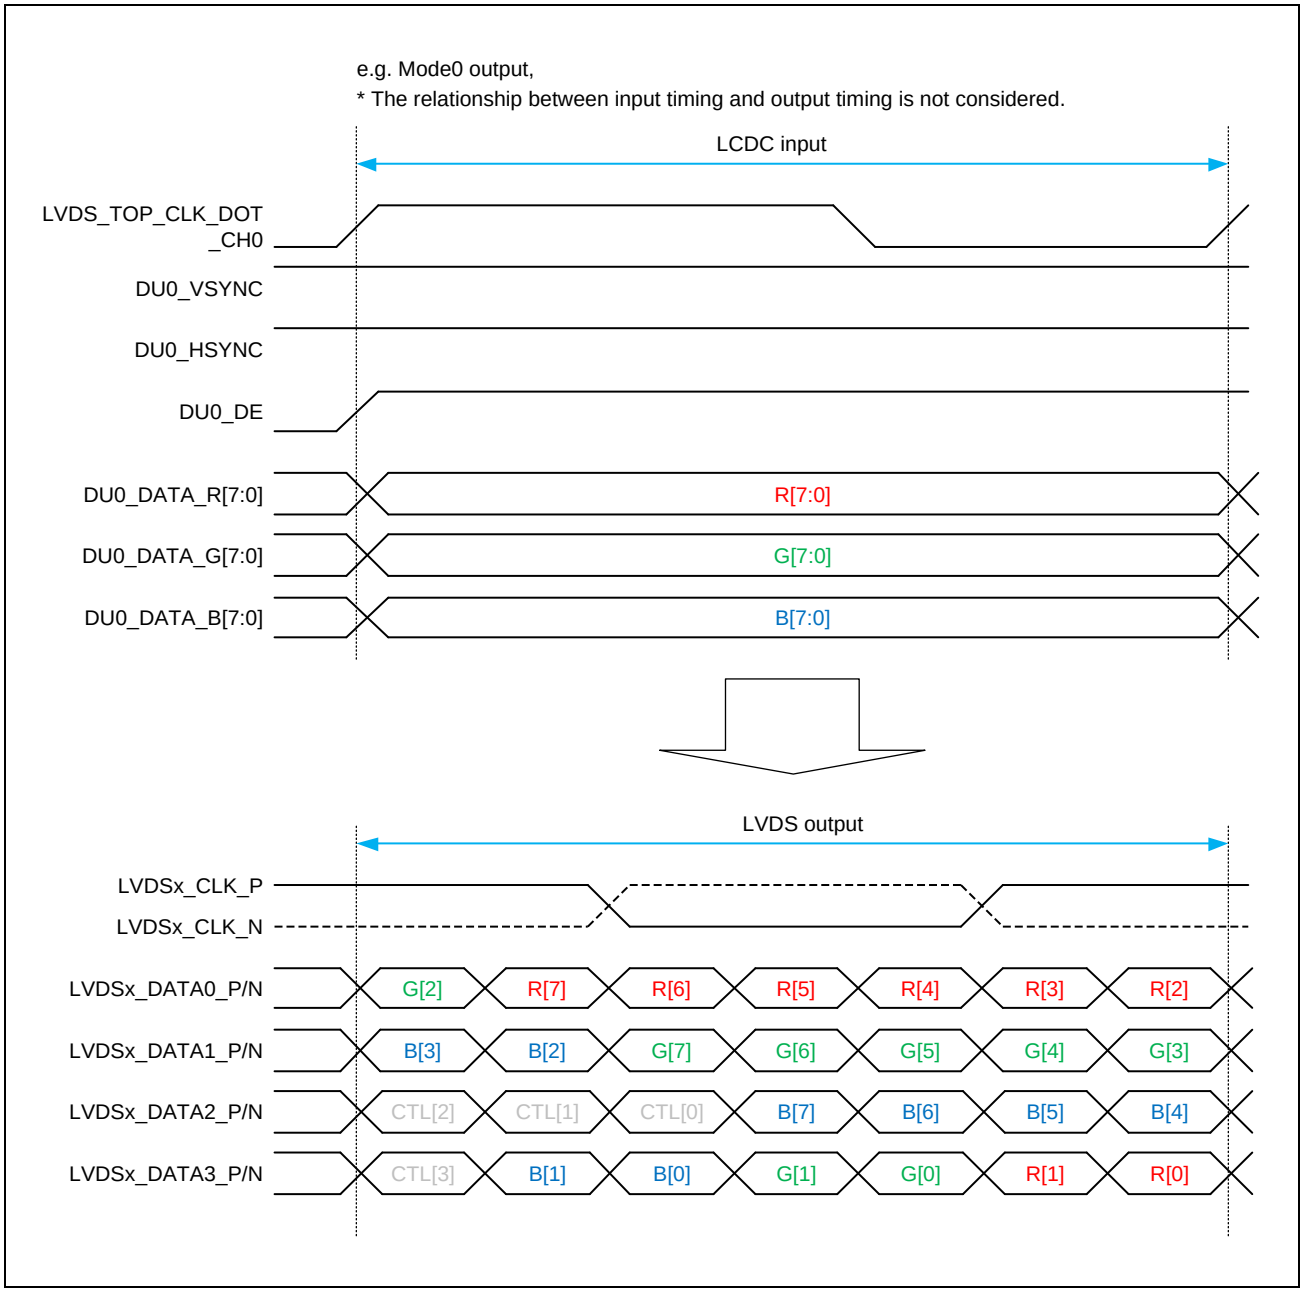

Figure 9.11-13 Data Conversion

(2) Control Bit Conversion

This section describes the Control bit transformation. The synchronization signal (DUx_HSYNC, DUx_VSYNC, DUx_DE) from the LCDC and the low(fixed) bit are reflected in the output data by the selected Control bit.

For the register settings for Control bit conversion, refer to LVDS_0_CTL and LVDS_1_CTL.

The upper part of the figure below shows the three types of synchronization signals input from the LCDC.

As shown in the lower part of the figure below, three types of synchronization signals and Low fixation are reflected in the Control bit.

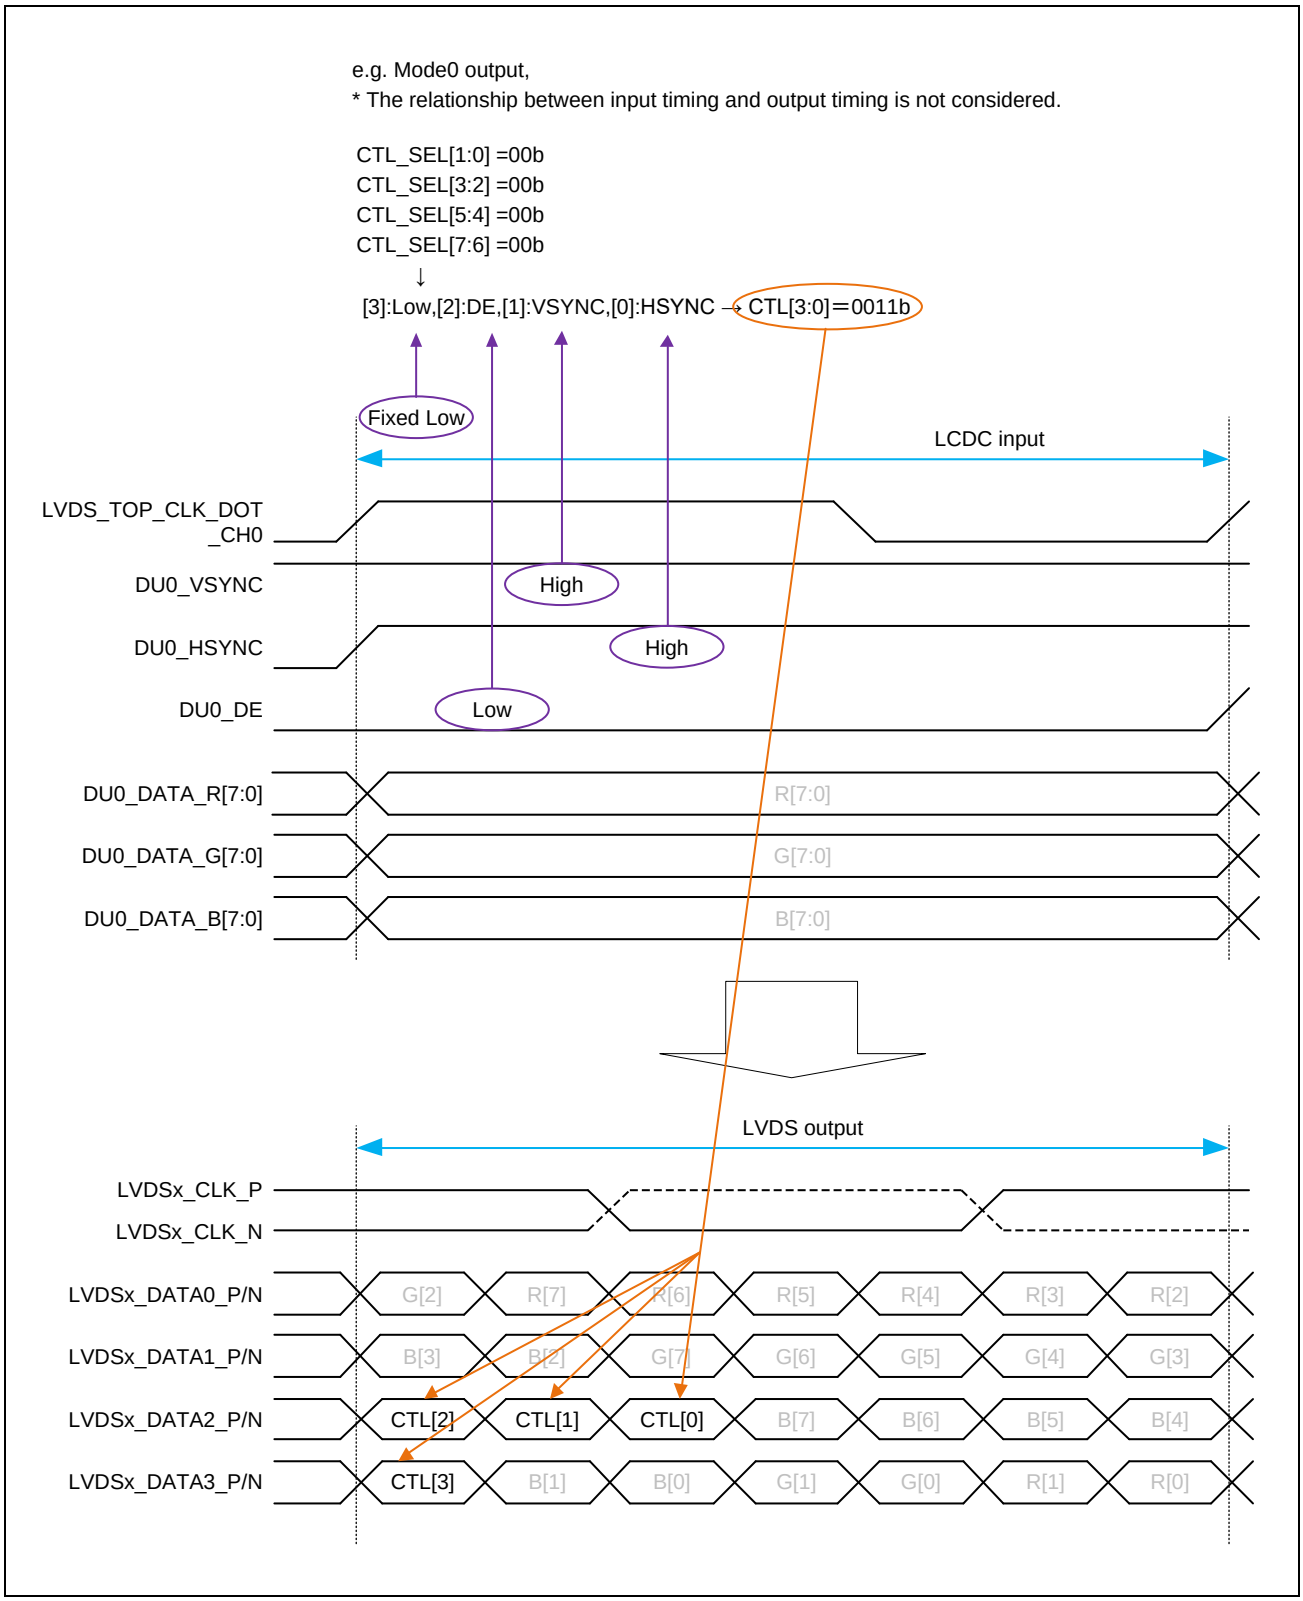

Figure 9.11-14 Control Bit Conversion

9.11.3.7 Output Pattern

Depending on your use case (output pattern), you need to set the LVDS operating mode. The output pattern is a combination of MIPI-DSI and Parallel output. **Table 9.11-7** shows the relationship between LCDC0,1 and LVDS0, 1 in the output pattern and LVDS operating mode, limited to LVDS.

For an image of the LVDS operating mode, refer to **9.11.3.3 LVDS Operating Modes**. Refer to (1) for the setting method.

The color coding of the operating modes is as follows:

- Grey: LVDS module unused
- Blue: Single-link (ch0 only)
- Orange: Single-link (ch1 only)
- Yellow: Single-link (2ch)
- Green: Single-link (Multi)
- Violet: Dual-link

Table 9.11-7 Relationship between Operating Modes and Output Variation Patterns

Output Pattern	1-0	1-1	1-2	1-3	1-4	1-5
LVDS0	LCDC0	—	—	—	—	LCDC0
LVDS1	—	LCDC1	—	—	—	LCDC0

Output Pattern	2-0	2-1	2-2	2-3	2-4	2-5	2-6
LVDS0	LCDC0	LCDC0	LCDC0	LCDC0	LCDC0	LCDC0	—
LVDS1	LCDC0	LCDC1	—	—	LCDC0	LCDC0	—

Output Pattern	3-0	3-1
LVDS0	LCDC0	LCDC0
LVDS1	LCDC0	LCDC0

(1) How to set up

Register settings (CLK_SEL, ST_ON, RST_PHY0_SEL, RST_PHY1_SEL, and PHY_RESET) must be made to determine the clock, reset, and data paths.

Table 9.11-8 shows the relationship between LVDS operating modes and register settings.

Table 9.11-8 List of LVDS Operation Mode Settings

Operation Mode	CLK_SEL	ST_ON	RST_PHY0_SEL	RST_PHY1_SEL	PHY_RESET
Unused	0	0	0	0	0
Single-link (ch0 only)	1	0	1	0	1
Single-link (ch1 only)	1	0	0	1	1
Single-link (2ch)	1	0	1	1	1
Single-link (Multi)	0	0	1	0	1
Dual-link	1	1	1	0	1

Note: If only one LVDS channel is used, turn off the CPG clock gating enable for unused clocks. The target clocks are LVDS_TOP_CLK_CH0, LVDS_TOP_CLK_DOT_CH0 and LVDS_TOP_CLK_CH1, LVDS_TOP_CLK_DOT_CH1. The data is switched along with the associated clock.

9.11.3.8 Control Bit Switching

Switching the Control bit by setting the register (LVDS_0_CTL.CTL_SEL0[7:0] / LVDS_1_CTL.CTL_SEL1[7:0]) of this module.

The output synchronization signal can be assigned to the 4 bits of the Control bit [3:0] included in the output format with a register. The target synchronization signal is VSYNC/HSYNC/DE/Low (Fixed).

The relationship between CTL_SELx[7:0] and the Control bit is as follows.

- CTL_SELx[1:0]: CTL[0]
- CTL_SELx[2:3]: CTL[1]
- CTL_SELx[4:5]: CTL[2]
- CTL_SELx[6:7]: CTL[3]

Table 9.11-9 shows a list of Control bit assignment selection.

Refer to **Figure 9.11-14** Control Bit Conversion for an image of the control bit switching.

Table 9.11-9 Control bit Assignment Selection List

Register Setting Value	CTL[3]	CTL[2]	CTL[1]	CTL[0]
00b	Low	DE	VSYNC	HSYNC
01b	HSYNC	Low	DE	VSYNC
10b	VSYNC	HSYNC	Low	DE
11b	DE	VSYNC	HSYNC	Low

Note: CTL_SEL When “00_00_00_00b” is set to [7:0], it is as follows.
CTL[3] = Low, CTL[2] = DE, CTL[1] = VSYNC, CTL[0] = HSYNC.

9.11.3.9 Output Lane Selection

This module is a function to swap the input and output DataLanes in the register (LVDS_0_CTL.CH_SEL0[7:0] / LVDS_1_CTL.CH_SEL1[7:0]) settings.

Clock Lanes are not swapped. In addition, DataLanes cannot be swapped across channels. Register settings can be set for 4 lanes at once (8 bits).

Table 9.11-10 shows the output lane selection list.

Table 9.11-10 Output Lane Selection List

Each CH_SELx (2bit)	O_Lane3	O_Lane2	O_Lane1	O_Lane0
00b	I_Lane3	I_Lane2	I_Lane1	I_Lane0
01b	I_Lane0	I_Lane3	I_Lane2	I_Lane1
10b	I_Lane1	I_Lane0	I_Lane3	I_Lane2
11b	I_Lane2	I_Lane1	I_Lane0	I_Lane3

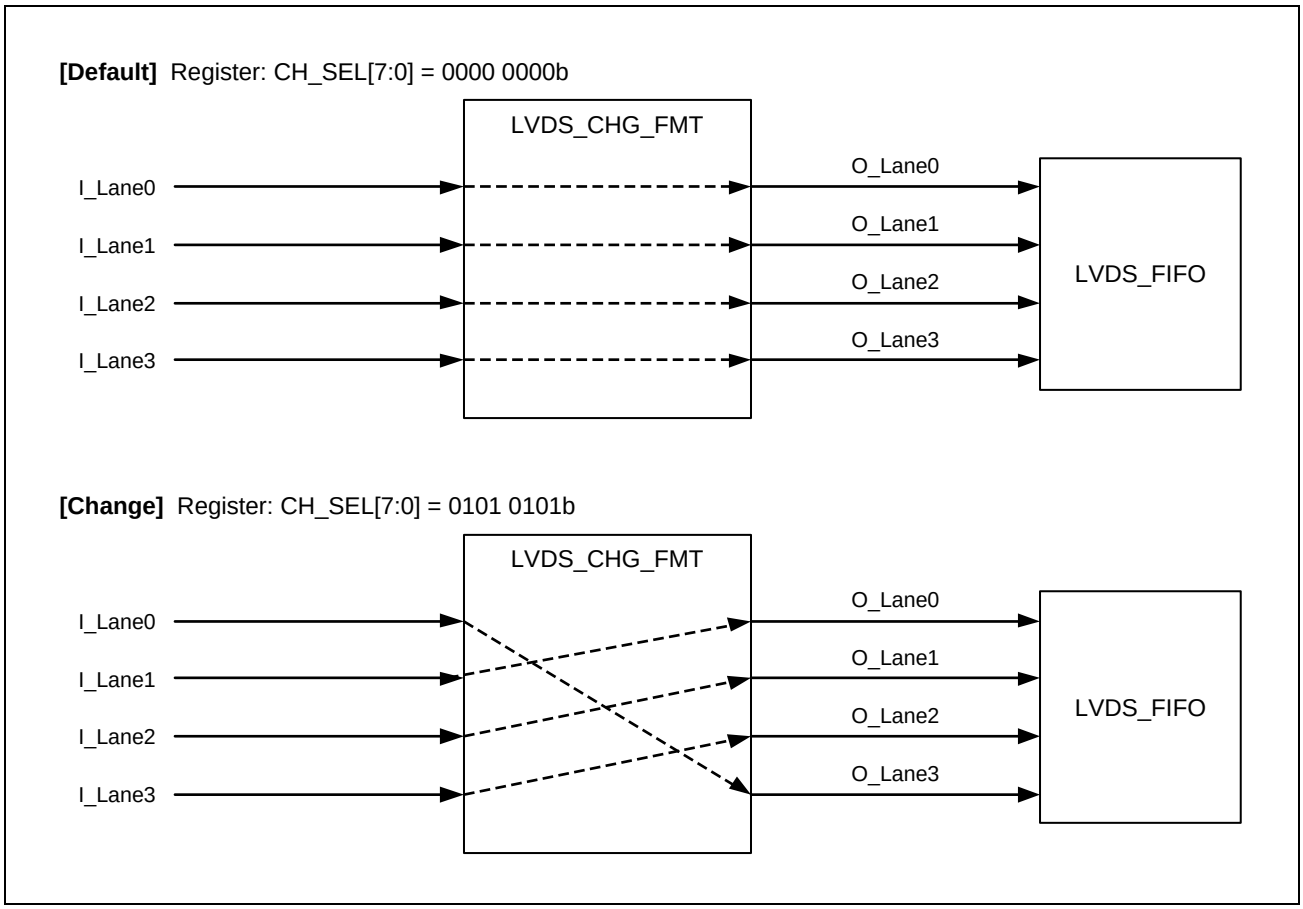

Figure 9.11-15 Image of Data Lane Swapped

9.11.3.10 Dual-link Output Data Swap

This function selects whether to output Even Data or Odd Data of image data to each of LVDS Ch0 and 1.

Even Data/Odd Data is judged and sorted based on the ODDP signal input from the LCDC.

In addition, the register (refer to LVDS_CMN.ST_SWAP) setting allows you to select the output destination of Even data and Odd data. Default outputs Even Data to Ch0 and Odd Data to Ch1.

Figure 9.11-16 shows the timing of Even/Odd Data distribution.

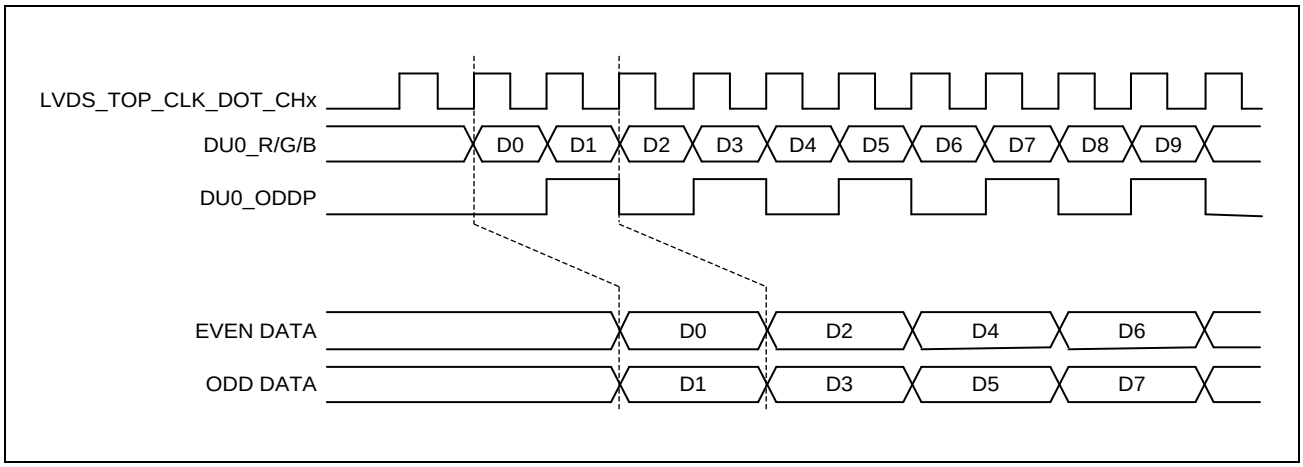

Figure 9.11-16 Timing of Even/Odd Data Distribution

9.11.3.11 Asynchronous FIFO

In this module, an asynchronous FIFO is implemented between the LVDS_CORE section and the PHY.

9.11.3.12 PHY Reset

The reset of the LVDS PHY can be controlled by setting the APB registers.

The PHY reset must be entered synchronously with the PHY clock.

For the control procedure, refer to Power on sequence (**9.11.3.1 Power On Sequence**).

9.11.3.13 PHY Skew Adjustment

This is a function to adjust the LVDS output data and the Skew for each lane of the clock.

Skew adjustment can be adjusted from ±30 ps per lane and can be set up to ±90 ps.

For register settings, refer to LVDS_0_PHY and LVDS_1_PHY.

9.11.3.14 PHY IO Buffer Enable

This function controls the LVDS IO buffer.

The output of the IO buffer of an unused lane can be controlled by setting it to Disable (CH_IO_EN is Normal Operation) in the register.

When Disable (CH_IO_EN is Normal Operation), Hi-Z is output.

For register settings, refer to LVDS_0_PHY and LVDS_1_PHY.

9.11.4 Interrupt

There are no interrupt signals in this module.

9.11.5 Usage Note

This module does not support dynamic register settings.

Set the appropriate register settings at the time of initial setup, and if you want to change the settings, perform the Power On sequence again after performing the Power Off sequence. (No need to turn the power on or off)

The clocks of the unused channels (LVDS_TOP_CLK_CH0, LVDS_TOP_CLK_DOT_CH0, LVDS_TOP_CLK_CH1, LVDS_TOP_CLK_DOT_CH1) should be stopped at the CPG register.

For more information, please refer to **4.4 Clock Pulse Generator (CPG)**.

SECTION 10 ELECTRICAL CHARACTERISTICS

10.1 Electrical Characteristics

This section describes the electrical characteristics of this LSI.

10.1.1 Absolute Maximum Ratings

Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

Table 10.1-1 Absolute Maximum Ratings (1/2)

Note 1. The voltage to be applied must be within the absolute maximum rating (1.5 V).

Note 2. The voltage to be applied must be within the absolute maximum rating (2.5 V). V_{12} indicates the power supply voltage for 1.2-V I/O pins.

Note 3. The voltage to be applied must be within the absolute maximum rating (2.5 V). V_{18} indicates the power supply voltage for 1.8-V I/O pins. When 1.8-V is used for the 3.3/1.8-V switching I/O, this specification is applied.

Note 4. PS0 to PS3, PJ0 to PJ4

Note 5. The voltage to be applied must be within the absolute maximum rating (3.8 V). V_{33} indicates the power supply voltage for 3.3-V I/O pins. When 3.3-V is used for the 3.3/1.8-V switching I/O, this specification is applied.

Note 1. OD: Over drive (up to 1.8-GHz operation frequency)
ND: Normal drive (up to 1.1-GHz operation frequency)

Note 2. To avoid the possibility of noise, separating this power supply from other power supply terminals is recommended.

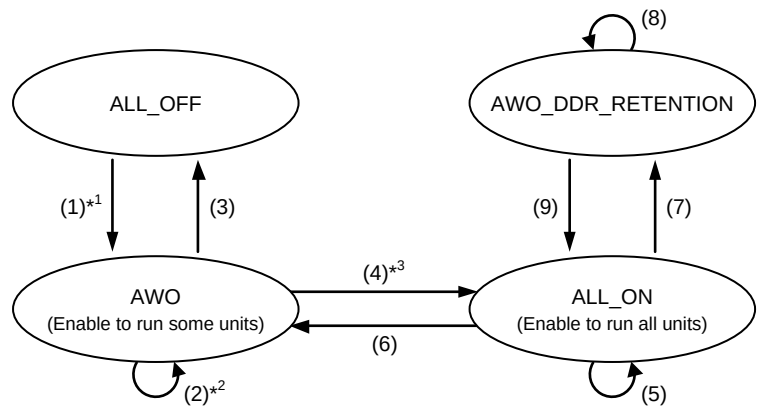
10.1.3 Power-On/Off Sequence

10.1.3.1 CM33 Boot Mode (State Diagram)

The state diagram of CM33 cold boot is shown in **Figure 10.1-1**. The boot mode states (1) to (9) refer to the sequence of (1) to (9) in **Figure 10.1-2** to **Figure 10.1-5**.

For the details of boot mode, refer to **4.4.7 Control of Booting**.

For the details of power mode, refer to **4.5.3 Power Domains**.



Note 1. CM33 cold boot sequence.

Note 2. CM33 operates the system managements.

Note 3. When the power mode switches from AWO to ALL_ON depending on the user system, CM33 sets the LSI registers and PMIC registers to supply power to the OTHERS domain.

Note 4. USB2_USDVDD: Max. 10 ms

Note 5. USB20_USVDD18, USB21_USVDD18, USB30_USVDD18, USB2_USVDD33: Max. 10 ms

Note: The clock stabilization time depends on the board design. Make the setting according to the results of evaluation.

Note: The rise time of each power supply must be compliant with the maximum 30 ms regulation.

Note 1. Only for the QRESN and QRESNSEL pin

Note 2. When the RIIC function is in use or the value of the PFC_SMT_mn register is 1

Note 3. Only for the P20 and P21 pins (when the value of the PFC_PUPD_mn register is 10b)

Note 4. Only for the P20 and P21 pins (when the value of the PFC_PUPD_mn register is 11b)

Note 5. Only for the QBYPASS, BSCANP, MD_BOOT0, MD_BOOT3, and BOOTSELCPU pins

Note 6. Only for the MD_BOOT1, MD_BOOT2 and MD_CLKS pins

Note 7. Only for the WDTUDFCA, WDTUDFCM, and SCIF_RXD, SCIF_TXD pins (when the value of the PFC_PUPD_mn register is 10b)

Note 8. Only for the WDTUDFCA, WDTUDFCM, and SCIF_RXD, SCIF_TXD pins (when the value of the PFC_PUPD_mn register is 11b)

Note 9. When the value of the PFC_PUPD_mn register is 10b

Note 10. When the value of the PFC_PUPD_mn register is 11b

Note 11. Only for the pins other than SD0CLK, SD0RSTN, SD0PWEN, and SD0IOVS (when the value of the PFC_PUPD_mn register is 10b)

Note 12. Only for the pins other than SD0CLK, SD0RSTN, SD0PWEN, and SD0IOVS (when the value of the PFC_PUPD_mn register is 11b)

Note 13. This type IO can be available both 3.3 V and 1.8 V buffers, but it is fixed at 1.8 V buffer.

Note 14. Only for the pins other than SD0CLK, SD0CMD, SD0DAT0-SD0DAT7, SD0PWEN, SD0IOVS, and SD0RSTN (when the RIIC function is in use or the value of the PFC_SMT_mn register is 1)

Table 10.1-5 DC Characteristics (LVDS)

V_{DD} = 1.71 V to 1.89 V (I/O type[LVDS])

Item	I/O Type	Symbol	Min.	Typ.	Max.	Unit	Condition
Output differential voltage	LVDS	|VOD|	250	—	450	mV	TIA-EIA-644 Termination load = 100Ω
Output offset voltage	LVDS	VOS	1.125	—	1.375	V	TIA-EIA-644 Termination load = 100Ω
Change in |VOD| between 0 and 1	LVDS	ΔVOD	—	—	50	mV	TIA-EIA-644 Termination load = 100Ω
Change in VOS between 0 and 1	LVDS	ΔVOS	—	—	50	mV	TIA-EIA-644 Termination load = 100Ω

10.1.5 AC Characteristics

Conditions:

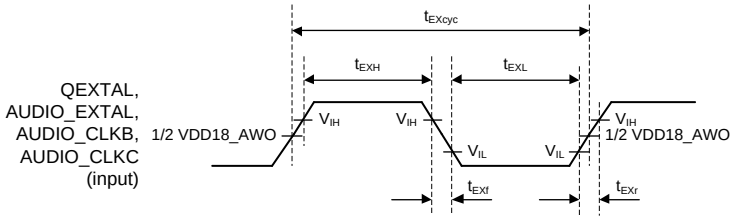
VDD18 = VDD18_AWO = ADAVDD18 = VDD1833_* (1.8 V mode)

VDD33 = VDD1833_* (3.3 V mode)

10.1.5.1 Clock Timing

Table 10.1-6 Clock Timing Table

Item	Symbol	Min.	Max.	Unit	Figures
QEXTAL clock input frequency	f_{EX}	24 −50 ppm	24 +50 ppm	MHz	**Figure 10.1-11**
QEXTAL clock input cycle time	t_{EXcyc}	41.67	41.67	ns	
AUDIO_EXTAL clock input frequency	f_{EX}	4	48	MHz	
AUDIO_EXTAL clock input cycle time	t_{EXcyc}	20.83	250	ns	
AUDIO_CLKB, AUDIO_CLKC clock input frequency (external clock is input)	f_{EX}	4	50	MHz	
AUDIO_CLKB, AUDIO_CLKC clock input cycle time (external clock is input)	t_{EXcyc}	20	250	ns	
QEXTAL clock input low-level pulse width	t_{EXL}	0.4	0.6	t_{EXcyc}	
QEXTAL clock input high-level pulse width	t_{EXH}	0.4	0.6	t_{EXcyc}	
AUDIO_XTAL, AUDIO_CLKB, AUDIO_CLKC clock input low-level pulse width	t_{EXL}	0.45	0.55	t_{EXcyc}	
AUDIO_EXTAL, AUDIO_CLKB, AUDIO_CLKC clock input high-level pulse width	t_{EXH}	0.45	0.55	t_{EXcyc}	
QEXTAL, AUDIO_EXTAL, AUDIO_CLKB, AUDIO_CLKC clock input rise time	t_{EXr}	—	4	ns	
QEXTAL, AUDIO_EXTAL, AUDIO_CLKB, AUDIO_CLKC clock input fall time	t_{EXf}	—	4	ns	
Mode hold time	t_{MDH}	—	100	ns	**Figure 10.1-12**
Mode setup time	t_{MDS}	—	100	ns	



Note: When the clock is input on the QEXTAL, AUDIO_EXTAL, AUDIO_CLKB, or AUDIO_CLKC

Note 1. Specification at 133 MHz / Specification at 100 MHz

Note 2. These are values when the OEN assertion is extended in the Output Enable Asserting extension bit (COMCFG.OEASTEX = 1b).

Note 3. These are the values when the CS assertion is extended in the CS asserting extension bit (LIOCFGCSn.CSASTEX = 1b).

Note 4. The standard value for xSPI266 is 0.8 ns.

Note 5. If the DS is high during the command & modifier phase when using JESD251 Profile 2.0 memory, the time from CS low to DS high must also meet this specification.

Note 6. When using JESD251 Profile 1.0 memory or JESD251 Profile 2.0 memory with LIOCFGCSn.LATEMD set to 0, this constraint does not apply if the internal pull-down resistor of the DS pin is enabled.

Note 7. These are the values when the t_{CKLDSL} constraint is satisfied.

Note 8. This constraint is necessary only to satisfy the t_{DSLCSH} requirement specified in JESD251, which specifies that t_{DSLCSH} must be at least 80% of t_{PERIOD}. Set LIOCFGCSn.CSNEGEX to the appropriate value to ensure the memory specification complies with this constraint.

Note 9. e: LIOCFGCSn.CSNEGEX (e = 0, 1)

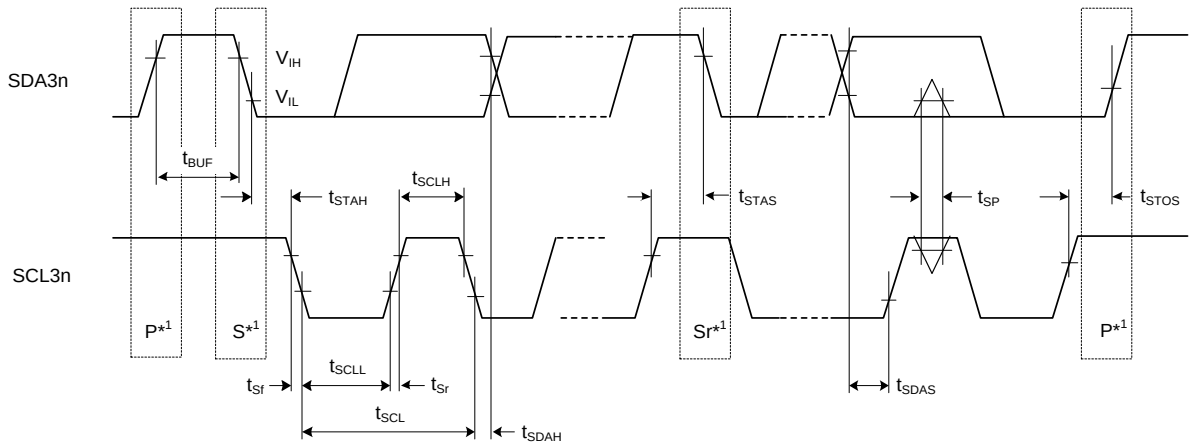
	Data hold time	t_{SDAH}	0	80	0	150	ns	
	SCL3n, SDA3n capacitive load	C_b	—	100	—	400	pF	

Note 1. t_{IICcyc}: I3C internal reference clock (I3Cϕ) cycle, t_{Pcyc}: I3C_0_TCLK cycle. Refer to **7.8.3.2.14 Reference Clock Control Register** for details. Values in parentheses apply when INCTL.DNFS[3:0] is set to 1111b while the digital filter is enabled with INCTL.DNFE set to 1b

Note 2. The maximum SCL clock frequency is 1.7 MHz.



Note: n = 0

Note 1. S, P, and Sr indicate the following conditions
S: Start condition
P: Stop condition
Sr: Restart condition

Figure 10.1-47 I3C Bus Interface Input/Output Timing

Table 10.1-25 I3C Timing (Open Drain Timing Parameters)

Parameter	Symbol	Min.*1	Max.	Unit	Figure	Notes
SCL3n clock Low period	t_{LOW_OD}	200	—	ns	**Figure 10.1-50**	1, 2
	$t_{DIG_OD_L}$	t_{LOW_ODmin} + t_{fDA_ODmin}	—	ns	**Figure 10.1-50**	—
SCL3n clock High period	t_{HIGH}	—	41	ns	**Figure 10.1-50**	3, 4
	t_{DIG_H}	36 (when 1.8 V) 40 (when 1.2 V)	t_{HIGH} + t_{CF}	ns	**Figure 10.1-50**	
SDA3n signal fall time	t_{fDA_OD}	t_{CF}	33	ns	**Figure 10.1-50**	—
SDA3n data setup time open drain mode V_{DD1218} = 1.8 V	t_{SU_OD}	12	—	ns	**Figure 10.1-49**, **Figure 10.1-50**	1
SDA3n data setup time open drain mode V_{DD1218} = 1.2 V		13.9	—	ns		
Clock after START (S) condition	t_{CAS}	38.4	For ENTAS0: 1 µ	seconds	**Figure 10.1-50**	5, 6
			For ENTAS1: 100 µ			
			For ENTAS2: 2 m			
			For ENTAS3: 50 m			
Clock before STOP (P) condition	t_{CBP}	t_{CASmin}/2	—	seconds	**Figure 10.1-51**	—
Current master to secondary master overlap time during handoff	$t_{MMOverlap}$	$t_{DIG_OD_Lmin}$	—	ns	**Figure 10.1-56**	—
Bus available condition	t_{AVAL}	1	—	µs	—	7
Bus idle condition	t_{IDLE}	1	—	ms	—	—
Time internal where new master not driving SDA3n low	t_{MMLock}	$t_{AVALmin}$	—	µs	**Figure 10.1-56**	—

Note 1. This is approximately equal to t_{LOWmin} + t_{DS_ODmin} + t_{rDA_ODtyp} + t_{SU_ODmin}.

Note 2. The Master may use a shorter Low period if it knows that this is safe, i.e., that SDA is already above VIH.

Note 3. This is based on t_{SPIKE}, rise and fall times, and interconnect.

Note 4. This maximum High period may be exceeded when the signals can be safely seen by Legacy I^2C Devices, and/or in consideration of the interconnect (e.g., a short bus).

Note 5. On a Legacy Bus where I^2C Devices need to see Start.

Note 6. Slaves that do not support the optional ENTASx CCCs shall use the t_{CAS} Max value shown for ENTAS3

Note 7. On a Mixed Bus with Fm Legacy I^2C Devices, t_{AVAL} is 300 ns shorter than the Fm Bus Free Condition time (t_{BUF})

Table 10.1-26 I3C Timing (Push-Pull Timing Parameters for SDR)

Parameter		Symbol	Min.*1	Max.	Unit	Figure	Notes
SCL3n clock frequency	V_{DD1218} = 1.8 V	t_{SCL}	0.01	12.5	MHz	—	1

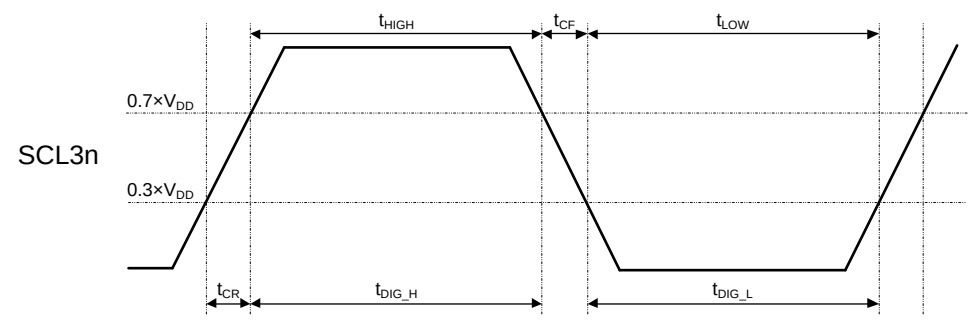
SCL3n clock Low period		t_{LOW}	24	—	ns	**Figure 10.1-48**	—
		t_{DIG_L}	32	—	ns	**Figure 10.1-48**	2, 4
SCL3n clock High period for Mixed Bus		t_{HIGH}	24	—	ns	**Figure 10.1-48**	—
		t_{DIG_H}	32	45	ns	**Figure 10.1-48**	2, 3
SCL3n clock High period		t_{HIGH}	24	—	ns	**Figure 10.1-48**	—
		t_{DIG_H}	32	45	ns	**Figure 10.1-48**	2
Clock in to data out for a slave	V_{DD1218} = 1.8 V	t_{SCO}	—	12	ns	**Figure 10.1-53**	—
	V_{DD1218} = 1.2 V		—	12.7	ns		
SCL3n clock rise time		t_{CR}	—	150 × 1/f_{SCL} (capped at 60)	ns	**Figure 10.1-48**	—
SCL3n clock fall time		t_{CF}	—	150 × 1/f_{SCL} (capped at 60)	ns	**Figure 10.1-48**	—
SDA3n signal data hold in push-pull mode	Master	t_{HD_PP}	t_{CR} + 3 and t_{CF} + 3	—	—	**Figure 10.1-52**	4
	Slave		0	—	—	**Figure 10.1-54**	—
SDA3n signal data setup in push-pull mode	V_{DD1218} = 1.8 V	t_{SU_PP}	12	N/A	ns	**Figure 10.1-52**, **Figure 10.1-53**, **Figure 10.1-54**	—
	V_{DD1218} = 1.2 V		13.9	N/A	ns		
Clock after repeated START (Sr)		t_{CASr}	t_{CASmin}	N/A	ns	**Figure 10.1-55**	—
Clock before repeated START (Sr)		t_{CBSr}	t_{CASmin}/2	N/A	ns	**Figure 10.1-55**	—
Capacitive load per bus line (SDA3n / SCL3n)		C_b	—	50	pF	—	—

Note 1. FSCL = 1/(t_{DIG_L} + t_{DIG_H})

Note 2. t_{DIG_L} and t_{DIG_H} are the clock Low and High periods as seen at the receiver end of the I3C Bus using VIL and VIH (see **Figure 10.1-48**)

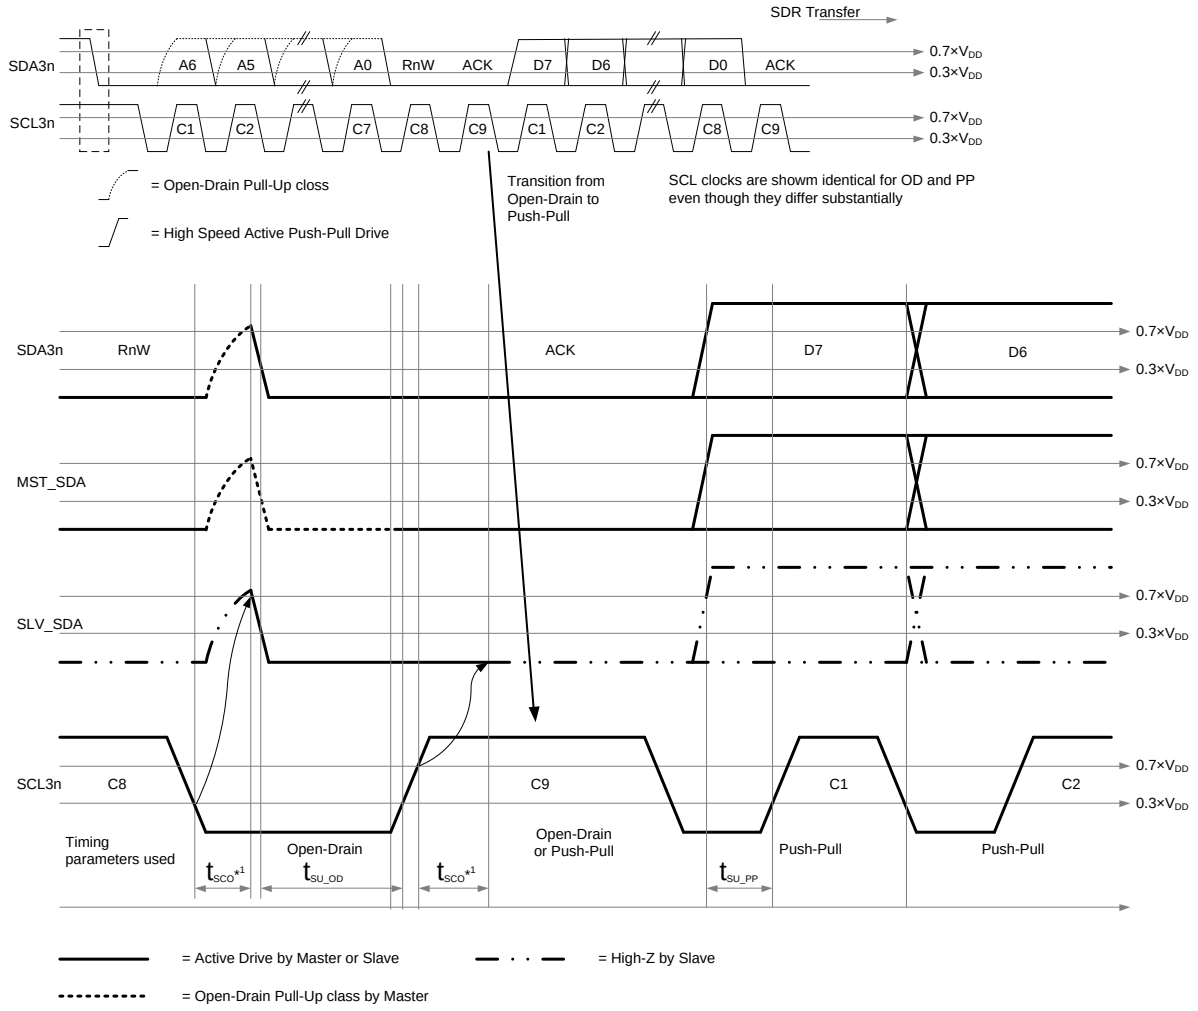
Note 3. When communicating with an I3C Device on a mixed bus, the $t_{DIG_H_MIXED}$ period must be constrained in order to make sure that I^2C Devices do not interpret I3C signaling as valid I^2C signaling.

Note 4. As both edges are used, the hold time must be satisfied for the respective edges, for example, t_{CF} + 3 for falling edge clocks, and t_{CR} + 3 for rising edge clocks.



Note: V_{DD}: VDD1218_I3C

Figure 10.1-48 t_{DIG_H} and t_{DIG_L}



Note: V_{DD}: VDD1218_I3C

Note: Open-Drain: Master releases SDA after a suitable delay from SCL edges
Push-Pull: Master drives SDA after a suitable delay from SCL edges

Note 1. t_{SCO} is depicted for informative purposes only

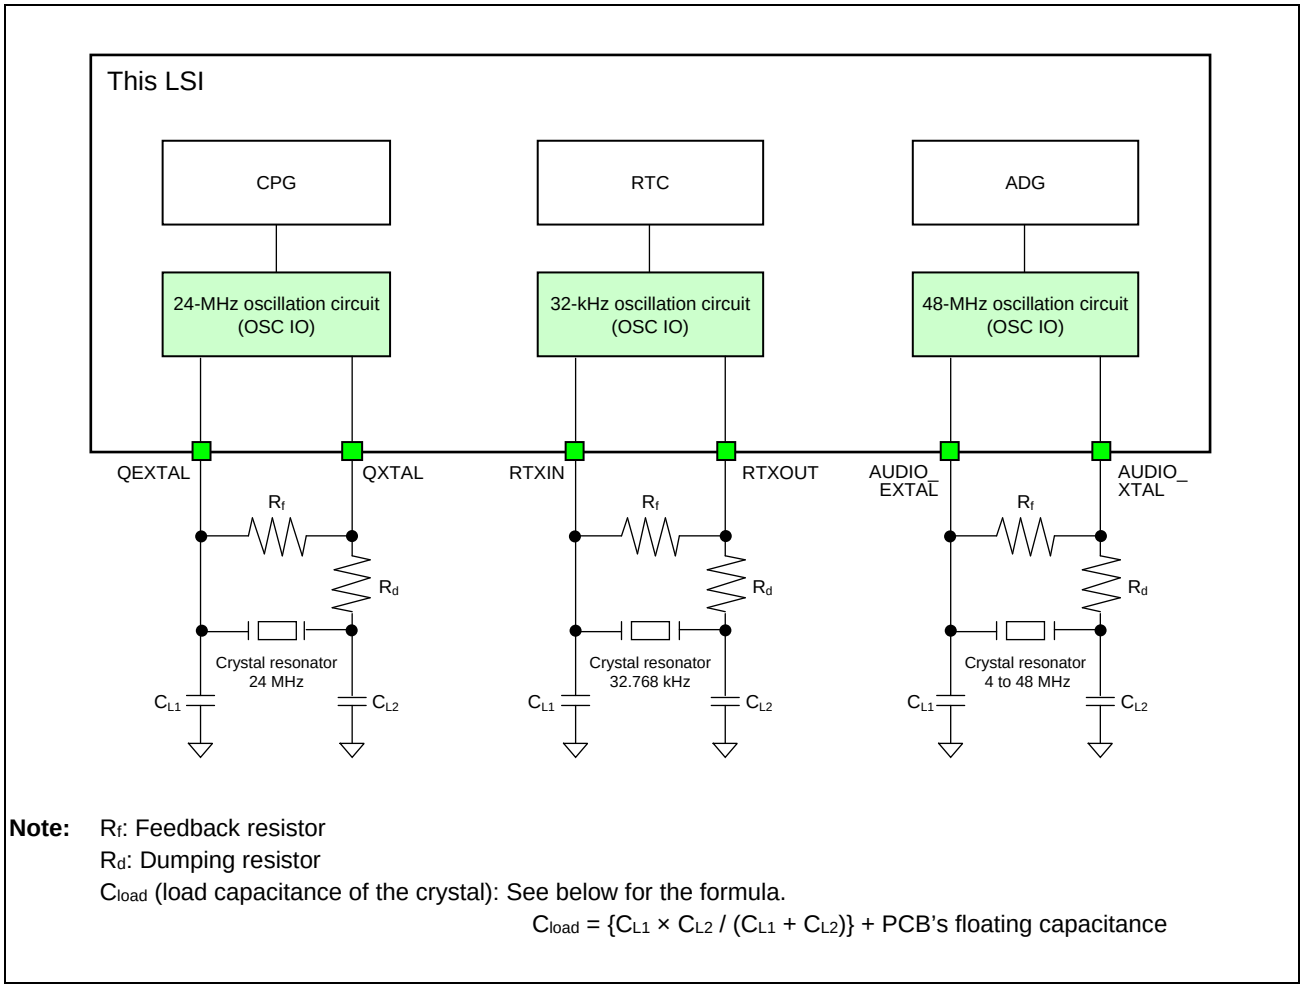
10.1.7 Oscillation Circuits for Connecting Crystal Resonators (OSC)

This LSI chip includes three oscillation circuits (OSC) for connection to crystal resonators, specifically a 24-MHz crystal resonator for the system clock, a frequency range between 4 and 48-MHz crystal resonator for the audio clocks and a 32.768-kHz crystal resonator for the real-time clock. **Table 10.1-38** lists the pins for connecting the crystal resonators and the clock frequencies. **Figure 10.1-75** shows an example of the connections with crystal resonators.

Table 10.1-38 Pins for Connecting Crystal Resonators and Clock Frequency

External Pin Name	I/O	Clock Frequency
For the system clock		
QEXTAL	Input	24 MHz (frequency deviation: ±50 ppm)
QXTAL	Output	24 MHz
For the real-time clock		
RTXIN	Input	32.768 kHz (frequency deviation: ±50 ppm)
RTXOUT	Output	32.768 kHz
For the audio clocks		
AUDIO_EXTAL	Input	4 to 48 MHz
AUDIO_XTAL	Output	4 to 48 MHz



Note: R_f: Feedback resistor
R_d: Dumping resistor
C_{load} (load capacitance of the crystal): See below for the formula.

$$C_{load} = \{C_{L1} \times C_{L2} / (C_{L1} + C_{L2})\} + \text{PCB's floating capacitance}$$

Figure 10.1-75 Example of Connections with Crystal Resonators

Place the crystal resonators and the capacitors C_{L1} and C_{L2} as close as possible to the pins to connect crystal resonators. To avoid interference and to ensure correct oscillation, the grounding points of the capacitors appended to the crystal resonators should be shared, and no wiring patterns should be placed near these components.

The characteristics of the crystal resonators are closely related to the design of the user board. Therefore, the user should sufficiently evaluate them with reference to the example of connection of crystal resonators in **Figure 10.1-75**.

The circuit rating of a crystal resonator depends on the crystal resonator and the stray capacitance of the mounting circuit. Therefore, contact the manufacturer of the crystal resonator before deciding upon the circuit rating. The user should thoroughly evaluate and then set the parameters (resistor and capacitor values).

Table 10.1-39 is a list of recommended values for the crystal resonators.

Table 10.1-39 Recommended Model Values for the Crystal Resonators

	Model Values for the Crystal Resonators			
Clock Frequency	Max. ESR*1	Max. C_L*2	Max. C_0*3	Max. Drive Level
32.768 kHz	70 kΩ	12.5 pF	1.4 pF	1 µW
24 MHz	60 Ω	12 pF	7 pF	100 µW
48 MHz	50 Ω	10 pF	7 pF	100 µW

Note 1. ESR means the equivalent series resistor of the crystal resonator.

Note 2. C_L is the load capacitance of the crystal resonator.

Note 3. C_0 is the parallel capacitance of the crystal resonator.

		97	Table 1.3-3 List of Pin Functions (2/2): The frequency of the RSPCKn pin, modified (100 MHz → 50 MHz)
		1.7 Internal Bus	
		110 to 112	Table 1.7-1 Accessible Areas (1/3) to Table 1.7-1 Accessible Areas (3/3) CRU (Video) and CRU (Statistics) were deleted, and CRU0 (Video, Statistics) was added in the "Master Unit" column
		1.8 Address Map	
		123	Table 1.8-1 Detailed Address Space (2/6): The "Space" column of 0_1600_0000h - 0_1600_FFFFh, modified (CRU → CRU0)
		130	Table 1.8-2 Detailed Address Space of CM33 (2/13): The "Space" column of 5600_0000h - 5600_FFFFh, modified (CRU (Non-Secure) → CRU0 (Non-Secure))
		131	Table 1.8-2 Detailed Address Space of CM33 (8/13): The "Space" column of 4600_0000h - 4600_FFFFh, modified (CRU (Secure) → CRU0 (Secure))
		SECTION 2 PROCESSORS	
		2.2 CPU	
		186	2.2.3 System CPU Cortex-M33 (CM33): The reference in the main text, modified (1.8.2 CM33 Address Space)
		SECTION 4 SYSTEM	
		4.1 System Overview	
		221	Trusted Secure IP → Renesas Secure IP (RSIP-E50B)
		4.2 Pin Function Controller (PFC)	
		222	4.2.1 Overview, modified ((P00 to PB4) → (P00 to PS3))
		247	Table 4.2-13 Drive Strength Setting Values on Respective Pins and Values after Reset (1/4) Table heading: IOLH_mn bits = 00b/01b/10b/11b → 00b/10b/01b/11b WDTUDF_CA → WDTUDFCA, WDTUDF_CM → WDTUDFCM The Value after Reset of WDTUDFCA, WDTUDFCM, SCIF_RXD, SCIF_TXD, and PS0 to PJ4, modified (×2 → ×4)

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	248	Table 4.2-13 Drive Strength Setting Values on Respective Pins and Values after Reset (2/4) Table heading: IOLH_mn bits = 00b/01b/10b/11b → 00b/10b/01b/11b The Value after Reset of PG0 to PD6, modified (×2 → ×4)
		249	Table 4.2-13 Drive Strength Setting Values on Respective Pins and Values after Reset (3/4) Table heading: IOLH_mn bits = 00b/01b/10b/11b → 00b/10b/01b/11b The Value after Reset of PD7 to P60, modified (×2 → ×4)
		250	Table 4.2-13 Drive Strength Setting Values on Respective Pins and Values after Reset (4/4) Table heading: IOLH_mn bits = 00b/01b/10b/11b → 00b/10b/01b/11b The Value after Reset of P61 to P37, modified (×2 → ×4)
		250	Note 2 to Note 4: Table heading, modified (00b 01b 10b 11b → 00b 10b 01b 11b)
		279	4.2.2.16 Schmitt Control Registers (PFC_SMT_mn): Note 1, deleted
		311	4.2.4.3 Multiplexed Pins (in Control Mode): Switching between Functions Multiplexed on the Pins and Control of the Pins, modified (the external P00, P30, P50, P70, P90, or PB1 pin → the external P13, P33, P81, PA5, PC0, PG7, PL0, or PS0 pin, P02, P03, or P15 → P44, PC1, or PJ3)
		317	Figure 4.2-10 Output Port Group Operation, modified (P6* → P1*)
		4.3 System Controller (SYS)	
		320	4.3.1.1 Functions, modified (Trust zone control → TrustZone control)
		367	4.3.3.2.33 Slave Access Control Register 21 (SYS_SLVACCCTL21): The main text, added
		387	4.3.3.2.53 Slave Access Control Register 57 (SYS_SLVACCCTL57): The main text, added
		4.4 Clock Pulse Generator (CPG)	
		560	Table 4.4-38 Target Units for Control by the CPG_BUS_m_MSTOP Registers (m = 1 to 4) The control target of the CPG_BUS_3_MSTOP register in Spec. MSTOP6_ON, modified (GPV_ACPU → Reserved)
		560	Table 4.4-39 Target Units for Control by the CPG_BUS_m_MSTOP Registers (m = 5 to 8) The control target of the CPG_BUS_8_MSTOP register in Spec. MSTOP7_ON, modified (GPV_COM → Reserved) The control target of the CPG_BUS_5_MSTOP register in Spec. MSTOP8_ON, modified (GPV_MCPU → Reserved) The control target of the CPG_BUS_8_MSTOP register in Spec. MSTOP11_ON, modified (NPU GPV → Reserved)
		561	Table 4.4-40 Target Units for Control by the CPG_BUS_m_MSTOP Registers (m = 9 to 13) The control target of the CPG_BUS_10_MSTOP register in Spec. MSTOP4_ON, modified (GPV_VIDEO1 → Reserved) The control target of the CPG_BUS_9_MSTOP register in Spec. MSTOP10_ON, modified (GPV_VIDEO0 → Reserved)
		4.5 Power Management Unit (PMU)	
		618	Table 4.5-3 Relationship between the Power Domain and the Respective Unit: The Power Domain of Unit: SRAM1, modified
		621	Table 4.5-4 Switching Procedure from AWO/AWO_DDR_RETENTION to ALL_ON: The Remarks in Step 2 in the Pre-process column, modified
		4.6 Interrupt Controller	
		627	Figure 4.6-1 Block Diagram of the ICU, modified
		668	(27) GPT Interrupt CA55 Status Register (ICU_GPTINTA55CTL) The main text, modified The description of bits 31 to 0, modified (GPT CH1 → GPT1), (GPT CH0 → GPT0)
		680	(35) DMAC TEND Selection Register k (ICU_DMTENDSELk) (k = 0, 1): The main text, modified (Table 4.6-14 → Table 4.6-12)
		691	(1) Input event normalization/synchronization and event output: The description on the Register access security control, added

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	715 to 770	Table 4.6-24 List of Input Events: The “Active” column, deleted
		782	4.6.3.1 Features The description of the Non-secure interrupt control register (Channels NS0-41), deleted The description of the interrupt control register (Channels S0-41), deleted
		807	4.6.3.4.2 Software interrupt, added
		810	4.6.3.5.3 Software interrupt sequence, added
		4.7 DMA Controller (DMAC)	
		831	4.7.5.2.10 Channel Status Register n (DMACm_CHSTAT_n) (m = 0 to 4, n = 0 to 15): The description of bits 31 to 17, and 15 to 12, modified
		844	4.7.5.2.18 DMA Status EN Register (DMACm_DST_EN) (m = 0 to 4): The description of bits 31 to 8, modified
		845	4.7.5.2.19 DMA Status ER Register (DMACm_DST_ER) (m = 0 to 4): The description of bits 31 to 8, modified
		846	4.7.5.2.20 DMA Status END Register (DMACm_DST_END) (m = 0 to 4): The description of bits 31 to 8, modified
		847	4.7.5.2.21 DMA Status TC Register (DMACm_DST_TC) (m = 0 to 4): The description of bits 31 to 8, modified
		848	4.7.5.2.22 DMA Status SUS Register (DMACm_DST_SUS) (m = 0 to 4): The description of bits 31 to 8, modified
		887	Figure 4.7-18 Level Detection Timing (HIEN = 1b, REQD = 0b, AM[2:0] = 001b), modified (HCLK → ACLK)
		4.9 Debug Interface	
		937	4.9.2.2.1 ID Register (CST_BSID) The Initial Value of bits 31 to 28, modified The description of bits 3 to 0, modified
		SECTION 5 TIMER	
		5.3 Realtime Clock (RTC)	
		957	5.3.2.2.2 Second Counter (RTC_RSECCNT)/Binary Counter 0 (RTC_BCNT0): RW and the description of bit 7, modified
		959	5.3.2.2.3 Minute Counter (RTC_RMINCNT)/Binary Counter 1 (RTC_BCNT1): RW and the description of bit 7, modified
		961	5.3.2.2.4 Hour Counter (RTC_RHRCNT)/Binary Counter 2 (RTC_BCNT2): RW and the description of bit 7, modified
		963	5.3.2.2.5 Day-of-Week Counter (RTC_RWKCNT)/Binary Counter 3 (RTC_BCNT3): RW and the description of bits 7 to 3, modified
		965	5.3.2.2.6 Date Counter (RTC_RDAYCNT): RW and the description of bits 7 and 6, modified
		966	5.3.2.2.7 Month Counter (RTC_RMONCNT): RW and the description of bits 7 to 5, modified
		967	5.3.2.2.8 Year Counter (RTC_RYRCNT): RW and the description of bits 15 to 8, modified
		974	5.3.2.2.12 Day-of-Week Alarm Register (RTC_RWKAR)/Binary Counter 3 Alarm Register (RTC_BCNT3AR): RW and the description of bits 6 to 3, modified
		976	5.3.2.2.13 Date Alarm Register (RTC_RDAYAR)/Binary Counter 0 Alarm Enable Register (RTC_BCNT0AER): RW and the description of bit 6, modified
		978	5.3.2.2.14 Month Alarm Register (RTC_RMONAR)/Binary Counter 1 Alarm Enable Register (RTC_BCNT1AER): RW and the description of bits 6 and 5, modified
		980	5.3.2.2.15 Year Alarm Register (RTC_RYRAR)/Binary Counter 2 Alarm Enable Register (RTC_BCNT2AER): RW and the description of bits 15 to 8, modified
		982	5.3.2.2.16 Year Alarm Enable Register (RTC_RYRAREN)/Binary Counter 3 Alarm Enable Register (RTC_BCNT3AER): RW and the description of bits 6 to 0, modified
		984	5.3.2.2.17 RTC Status Register (RTC_RSR): RW and the description of bits 7 to 3, modified
		985	5.3.2.2.18 RTC Control Register 1 (RTC_RCR1): RW and the description of bit 3, modified

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	986	5.3.2.2.19 RTC Control Register 2 (RTC_RCR2): RW and the description of bit 3, modified
		5.4 Watchdog Timer (WDT)	
		1003	Table 5.4-1 WDT Specifications: The Specifications of Parameter: Count source, modified (clk_loco → LOCO clock)
		1004	Figure 5.4-1 WDT Block Diagram, modified (clk_loco → LOCO clock)
		1007	5.4.2.2.2 WDT Control Register (WDTm_WDTCR) The description of bits 7 to 4, modified (clk_loco → LOCO clock) The description of the RPES[1:0] bits (Window End Position Select), modified The description of the RPSS[1:0] bits (Window Start Position Select), modified
		1010	5.4.2.2.3 WDT Status Register (WDTm_WDTSR) The description of the UNDFF flag (Underflow Flag), modified (bus clock → WDT_n_clkp (n = 0 to 3)) The description of the REFEF flag (Refresh Error Flag), modified (IWDTCLK → LOCO clock, clk_loco → WDT_n_clkp (n = 0 to 3))
		1013	5.4.3.1 Register Start Mode: The main text, modified
		1016	5.4.3.3 Refresh Operation: The main text, modified
		1017	Figure 5.4-5 WDT Refresh Operation Waveforms when WDTCR.CKS[3:0] = 4h and WDTCR.TOPS[1:0] = 01b, modified (clk_loco → LOCO clock, clkp → WDT_n_clkp)
		1019	5.4.3.6 Reading the Down-Counter Value: The main text, modified (clk_loco → LOCO clock)
		1019	Figure 5.4-6 Processing for Reading WDT Down-Counter Value when WDTCR.CKS[3:0] = 4h and WDTCR.TOPS[1:0] = 01b, modified (clk_loco → LOCO clock, clkp → WDT_n_clkp)
		1020	Table 5.4-6 WDT1 Setting Procedure for Error System Reset: The description of Step 6, modified (clk_loco → LOCO clock)
		5.6 Compare Match Timer W (CMTW)	
		1045	5.6.2.2.3 Timer I/O Control Register (CMTWm_CMWIOR): The description of bit 14, and 7 and 6, modified
		5.7 General-Purpose Timer (GPT)	
		1075	5.7.2.2.1 General-Purpose Timer Write-Protection Register (GPTm_n_GTWP): The description of bits 31 to 16 and 7 to 5, modified
		1083	5.7.2.2.5 General-Purpose Timer Start Source Select Register (GPTm_n_GTSSR): R/W and the description of bits 30 to 24, modified
		1087	5.7.2.2.6 General-Purpose Timer Stop Source Select Register (GPTm_n_GTPSR): R/W and the description of bits 30 to 24, modified
		1091	5.7.2.2.7 General-Purpose Timer Clear Source Select Register (GPTm_n_GTCSR): R/W and the description of bits 30 to 24, modified
		1095	5.7.2.2.8 General-Purpose Timer Up Count Source Select Register (GPTm_n_GTUPSR): R/W and the description of bits 31 to 24, modified
		1099	5.7.2.2.9 General-Purpose Timer Down Count Source Select Register (GPTm_n_GTDNSR): R/W and the description of bits 31 to 24, modified
		1103	5.7.2.2.10 General-Purpose Timer Input Capture Source Select Register A (GPTm_n_GTICASR): R/W and the description of bits 31 to 24, modified
		1107	5.7.2.2.11 General-Purpose Timer Input Capture Source Select Register B (GPTm_n_GTICBSR): R/W and the description of bits 31 to 24, modified
		1111	5.7.2.2.12 General-Purpose Timer Control Register (GPTm_n_GTCR): R/W and the description of bits 31 to 27, 22 to 19, and 15 to 1, modified
		1113	5.7.2.2.13 General-Purpose Timer Count Direction and Duty Setting Register (GPTm_n_GTUDDTYC): R/W and the description of bits 31 to 28, 23 to 20, and 15 to 2, modified
		1116	5.7.2.2.14 General-Purpose Timer I/O Control Register (GPTm_n_GTIOR): R/W and the description of bits 28, 27, 21, 12, 11, and 5, modified
		1120	5.7.2.2.15 General-Purpose Timer Interrupt Output Setting Register (GPTm_n_GTINTAD): R/W and the description of bits 31, 27, 26, 23 to 20, and 15 to 8, modified

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	1123	5.7.2.2.16 General-Purpose Timer Status Register (GPTm_n_GTST): R/W and the description of bits 27 to 25, 23 to 20, and 14 to 11, modified
		1130	5.7.2.2.17 General-Purpose Timer Buffer Enable Register (GPTm_n_GTBER): R/W and the description of bits 31, 27, 23, and 7 to 4, modified
		1135	5.7.2.2.18 General-Purpose Timer Interrupt and A/D Converter Start Request Setting Register (GPTm_n_GTITC): R/W and the description of bits 31 to 15, 13, and 11, modified
		1146	5.7.2.2.27 General-Purpose Timer Dead Time Control Register (GPTm_n_GTDTCR): R/W and the description of bits 31 to 9, 7, 6, and 3 to 1, modified
		1151	5.7.2.2.31 General-Purpose Timer Output Protection Function Temporary Release Register (GPTm_n_GTSOTR): R/W and the description of bits 31 to 1, modified
		1152	5.7.2.2.32 General-Purpose Timer Extended Interrupt Skipping Counter Control Register (GPTm_n_GTEITC): R/W and the description of bits 19, 18, 11 to 8, 3, and 2, modified
		1158	5.7.2.2.34 General-Purpose Timer Extended Interrupt Skipping Setting Register 2 (GPTm_n_GTEITLI2): R/W and the description of bits 31 to 8, modified
		1160	5.7.2.2.35 General-Purpose Timer Extended Buffer Transfer Skipping Setting Register (GPTm_n_GTEITLB): R/W and the description of bits 31, 27, 23, 19, 15 to 11, 7, and 3, modified
		1162	5.7.2.2.36 General-Purpose Timer Inter Channel Logical Operation Function Setting Register (GPTm_n_GTICLF): R/W and the description of bits 31 to 26, 19, 15 to 10, and 3, modified
		1167	5.7.2.2.38 General-Purpose Timer Operation Enable Bit Simultaneous Control Register (GPTm_n_GTSECR): R/W and the description of bits 31 to 25, 23 to 17, 15 to 10, and 7 to 2, modified
		1188	Table 5.7-22 Example for Setting GTCCRA and GTCCRB Buffer Operation for Output Compare: The description of item No. 6, modified (Figure 5.7-15 → Figure 5.7-16)
		5.8 Port Output Enable for GPT (POEG)	
		1292	5.8.2.2.1 POEG Group n Setting Register (POEG_POEGGn) (n = A to H) The description of bits 6 and 2, modified
		1296	5.8.3.4 Release from Output-Disable The main text, modified (GTST.DTEF, added)
		SECTION 6 HIGH-SPEED INTERFACE	
		6.1 High-Speed Interface Overview	
		1300	6.1 High-Speed Interface Overview: The description of PCI Express 3.0 Interface (PCIe) (See 6.6), modified
		6.2 SD/MMC Host Interface (SD)	
		1361	6.2.3.1.2 Bus signal voltage switch: The description of item No. 4, modified
		6.4 USB3.2 Gen2x1 Interface (USB3)	
		1422	Figure 6.4-1 USB Connection Configuration: The title, modified
		1431	6.4.4.3.2 Register List USB3m_HOST_U2HCSPC2: The register name, modified USB3m_HOST_DCDn: The register name and offset address, modified
		1454	(1) U3P1 Port Status and Control Register (USB3m_HOST_U3P1PORTSC) The description of bit 22, modified The description of bits 8 to 5, modified (the U0 state → the U3 state)
		1458	(3) U3P1 Port Link Info Register (USB3m_HOST_U3P1PORTLI): R/W and the description of bits 15 to 0, modified
		1463	(6) U2P1 Port Power Management Status and Control Register (USB3m_HOST_U2P1PORTPMSC): The description of bits 31 to 28, 16, 7 to 4, and 2 to 0, modified (xHCI 1.1 → xHCI 1.2)
		1466	(8) U2P1 Port Hardware LPM Power Control Register (USB3m_HOST_U2P1PORTHLPMC): The description of bits 13 to 10 and 9 to 2, modified (xHCI 1.1 → xHCI 1.2)

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	1471	(c) Offset 08h - xHCI Supported Protocol Capability Field Definitions (USB3.2) Register (USB3m_HOST_U3HCSPC3): The description of bits 27 to 25, modified (USB2 → USB3)
		1477	(c) Offset 08h - xHCI Supported Protocol Capability Field Definitions (USB2.0) Register (USB3m_HOST_U2HCSPC3): The description of bit 20, modified (xHCI 1.1 → xHCI 1.2)
		1494	(2) Device Context Doorbell Register (Slot #n) (USB3m_HOST_DCDn) (n = 1 to 32): The address, modified
		1496	(b) Configuration Status1 Register (USB3m_HOST_CFGSTS1): The initial value of bits 27 and 26, modified
		1510	(n) PHY Control Register (USB3m_HOST_PHYCTRL): The description of bits 19, 18, and 17, modified
		1517	(a) Battery Charging Control Register (USB3m_HOST_BCCTRL): The description of bits 7 to 2, modified
		1521	(4) PIPE Status and Control Register 3 (USB3m_HOST_U3P0PIPESC3): The description of bits 21 to 16, modified
		6.5 USB2.0 Interface	
		1541	Table 6.5-3 External Signal Pins: Name: The Input/Output column of USB20_DP, USB20_DM, USB21_DP, and USB21_DM, modified
		1547	(3) OTG function: The description of the OTG_PERI bit, modified
		1552	(1) HcRevision Register (USB2m_HOST_HcRevision): The description of bits 31 to 8, modified
		1553	(2) HcControl Register (USB2m_HOST_HcControl): The description of bits 31 to 10, and 8, modified
		1555	(3) HcCommandStatus Register (USB2m_HOST_HcCommandStatus): The description of bits 31 to 18, and 15 to 3, modified
		1556	(4) HcInterruptStatus Register (USB2m_HOST_HcInterruptStatus): The description of bits 31 to 7, modified
		1558	(5) HcInterruptEnable Register (USB2m_HOST_HcInterruptEnable): The description of bits 29 to 7, modified
		1560	(6) HcInterruptDisable Register (USB2m_HOST_HcInterruptDisable): The description of bits 29 to 7, modified
		1561	(7) HcHCCA Register (USB2m_HOST_HcHCCA): The description of bits t 7 to 0, modified
		1562	(8) HcPeriodicCurrentED Register (USB2m_HOST_HcPeriodCurrentED): The description of bits 3 to 0, modified
		1563	(9) HcControlHeadED Register (USB2m_HOST_HcControlHeadED): The description of bits 3 to 0, modified
		1564	(10) HcControlCurrentED Register (USB2m_HOST_HcControlCurrentED): The description of bits 3 to 0, modified
		1565	(11) HcBulkHeadED Register (USB2m_HOST_HcBulkHeadED): The description of bits 3 to 0, modified
		1566	(12) HcBulkCurrentED Register (USB2m_HOST_HcBulkCurrentED): The description of bits 3 to 0, modified
		1567	(13) HcDoneHead Register (USB2m_HOST_HcDoneHead): The description of bits 3 to 0, modified
		1569	(15) HcFmRemaining Register (USB2m_HOST_HcFmRemaining): The description of bits 30 to 14, modified
		1571	(17) HcPeriodicStart Register (USB2m_HOST_HcPeriodicStart): The description of bits 31 to 14, modified
		1572	(18) HcLSThreshold Register (USB2m_HOST_HcLSThreshold): The description of bits 31 to 12, modified
		1573	(19) HcRhDescriptorA Register (USB2m_HOST_HcRhDescriptorA): The description of bits 23 to 13, modified
		1574	(20) HcRhDescriptorB Register (USB2m_HOST_HcRhDescriptorB): The description of bits 31 to 18, 16 to 2, and 0, modified

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	1575	(21) HcRhStatus Register (USB2m_HOST_HcRhStatus): The description of bits 30 to 18, and 14 to 2, modified
		1577	(22) HcRhPortStatus[1:NDP] Register (USB2m_HOST_HcRhPortStatus1): The description of bits 31 to 21, 15 to 10, and 7 to 5, modified
		1580	(1) HCIVERSION/CAPLENGTH Register (USB2m_HOST_CAPL_VERSION): The description of bits 15 to 8, modified
		1581	(2) HCSPARAMS Register (USB2m_HOST_HCSPARAMS): The description of bits 31 to 24, 19 to 17, 6, and 5, modified
		1582	(3) HCCPARAMS Register (USB2m_HOST_HCCPARAMS): The description of bits 31 to 20, and 3, modified
		1585	(1) USBCMD Register (USB2m_HOST_USBCMD): The description of bits 31 to 28, 14 to 12, 10, and 7, modified
		1587	(2) USBSTS Register (USB2m_HOST_USBSTS): The description of bits 31 to 17, and 11 to 6, modified
		1589	(3) SBINTR Register (USB2m_HOST_USBINTR): The description of bits 31 to 17, and 15 to 6, modified
		1590	(4) FRINDEX Register (USB2m_HOST_FRINDEX): The description of bits 31 to 14, modified
		1592	(6) PERIODICLISTBASE Register (USB2m_HOST_PERIODICLISTBASE): The description of bits 11 to 0, modified
		1593	(7) ASYNCLISTADDR Register (USB2m_HOST_ASYNCLISTADDR): The description of bits 4 to 0, modified
		1594	(8) CONFIGFLAG Register (USB2m_HOST_CONFIGFLAG): The description of bits 31 to 1, modified
		1595	(9) PORTSC1Register (USB2m_HOST_PORTSC1): The description of bits 15 and 14, modified
		1599	(1) INT_ENABLE Register (USB2m_HOST_INT_ENABLE): The description of bits 31 to 5, modified
		1600	(2) INT_STATUS Register (USB2m_HOST_INT_STATUS): The description of bits 31 to 5, modified
		1601	(3) AHB_BUS_CTR Register (USB2m_HOST_AHB_BUS_CTR): The description of bits 31 to 16, 11 to 9, 7, 6, 3, and 2, modified
		1602	(4) USBCTR Register (USB2m_HOST_USBCTR): The description of bits 31 to 3, modified
		1603	(5) Register Enable/Clock Gating Control Register (USB2m_HOST_REGEN_CG_CTRL): The description of bits 30, and 27 to 1, modified
		1604	(6) Suspend Control Register (USB2m_HOST_SPD_CTRL): The description of bits 29 to 24, and 22 to 1, modified
		1607	(8) Overcurrent Detection/Sleep Timer Setting Register (USB2m_HOST_OC_SLP_TIMSET): The description of bits 31 to 29, modified
		1609	(10) UTMI+PHY Control Register (USB2m_HOST_UTMI_CTRL): The description of bits 30 to 9, modified
		1610	(11) PORT_LPM_CTR1 Register (USB2m_HOST_PORT_LPM_CTRL1): The description of bits 31 to 8, modified
		1611	(1) Common Control Register (USB2m_HOST_COMMCTRL): The description of bits 30 to 0, modified
		1612	(2) OTG-BC Interrupt Status Register (USB2m_HOST_OBINTSTA) The description of bits 31 to 18, 15 to 7, and 5, modified The bit name, R/W, and description of bits 3 and 2, modified
		1613	(3) OTG-BC Interrupt Enable Register (USB2m_HOST_OBINTEN) The description of bits 31 to 18, 15 to 7, and 5, modified The bit name, R/W, and description of bits 3 and 2, modified
		1614	(4) VBUS Control Register (USB2m_HOST_VBCTRL): The description of bits 31 to 5, and 3 to 1, modified

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	1615	(5) Line Control Port 1 Register (USB2m_HOST_LINECTRL1) The description of bits 31 to 26, 23, 22, 15 to 4, and 1, modified The bit name and description of bits 25 and 24, modified
		1616	(6) BC Control Port 1 Register (USB2m_HOST_BCCTRL1): The description of bits 31 to 26, 23 to 10, 7, and 6, modified
		1621	(3) U2H_EHCI_INT assertion source and control The description of “Interrupt enable control by register”, modified (bit[17:16] → bit[16]) The “Interrupt source” table, modified
		1623	(5) U2H_OBINT assertion source and control The description of “Interrupt enable control by register”, modified (bit[27:24], bit[18:16], bit[12:8], bit[3:0] → bit[17:16], bit[6], bit[4], bit[1:0]) The “Interrupt source” table, modified The description of “Clearing the interrupt”, modified (bit[27:24], bit[18:16], bit[12:8], bit[3:0] → bit[17:16], bit[6], bit[4], bit[1:0])
		1630	6.5.2.8.3 Port Power (VBUS) control specifications: The main text, modified
		1644	(1) System Configuration Control Register 0 (USB20_FUNC_SYSCFG0): The description of bits 15 to 9, 6, and 3 to 1, modified
		1646	(2) System Configuration Control Register 1 (USB20_FUNC_SYSCFG1): The description of bits t 15 to 12, 11 to 8, 7, and 6, modified
		1648	(1) Device State Control Register 0 (USB20_FUNC_DVSTCTR0): The description of bits 15 to 9, and 7 to 3, modified
		1650	(1) USB Test Mode Register (USB20_FUNC_TESTMODE): The description of bits 15 to 4, modified
		1653	(2) CFIFO Port Select Register (USB20_FUNC_CFIFOSEL): The description of bits 13, 12, 9, 7, 6, and 4, modified
		1655	(3) DnFIFO Port Select Register (USB20_FUNC_DnFIFOSEL) (n = 0, 1): The description of bits 9 to 4, modified
		1657	(4) CFIFO Port Control Register (USB20_FUNC_CFIFOCTR) D0FIFO Port Control Register (USB20_FUNC_D0FIFOCTR) D1FIFO Port Control Register (USB20_FUNC_D1FIFOCTR) The description of bit 12, modified
		1659	(1) Interrupt Enable Register 0 (USB20_FUNC_INTENB0): The description of bits 7 to 0, modified
		1663	(1) SOF Pin Configuration Register (USB20_FUNC_SOFCFG): The description of bits 15 to 7, 5, 4, 1, and 0, modified
		1673	(1) Frame Number Register (USB20_FUNC_FRMNUM): The description of bits 13 to 11, modified
		1675	(2) Micro Frame Number Register (USB20_FUNC_UFRMNUM): The description of bits 15 to 3, modified
		1676	(1) USB Address Register (USB20_FUNC_USBADDR): The description of bits 15 to 7, modified
		1681	(1) DCP Configuration Register (USB20_FUNC_DCPCFG): The description of bits 15 to 9, and 6 to 0, modified
		1682	(2) DCP Max. Packet Size Register (USB20_FUNC_DCPMAXP): The description of bits 15 to 7, modified
		1683	(3) DCP Control Register (USB20_FUNC_DCPCTR): The description of bits 14 to 9, 4, and 3, modified
		1686	(1) Pipe Window Select Register (USB20_FUNC_PIPESEL): The description of bits 15 to 4, modified
		1687	(2) Pipe Configuration Register (USB20_FUNC_PIPECFG): The description of bits 13 to 11, 6, and 5, modified
		1691	(3) Pipe Buffer Setting Register (USB20_FUNC_PIPEBUF): The description of bits 15, 9, and 8, modified

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	1693	(4) Pipe Maximum Packet Size Register (USB20_FUNC_PIPEMAXP): The description of bits 15 to 11, modified
		1694	(5) Pipe Cycle Control Register (USB20_FUNC_PIPEPERI): The description of bits 15 to 13, and 11 to 3, modified
		1697	(1) PIPEn Control Register (USB20_FUNC_PIPEnCTR) (n = 1 to 5): The description of bits 13 to 11, and 4 to 2, modified
		1702	(2) PIPEn Control Register (USB20_FUNC_PIPEnCTR) (n = 6 to 9): The description of bits 14 to 10, and 4 to 2, modified
		1704	(1) PIPEn Transaction Counter Enable Register (USB20_FUNC_PIPEnTRE) (n = 1 to 5): The description of bits 15 to 10, and 7 to 0, modified
		1707	(1) Low Power Control Register (USB20_FUNC_LPCTRL): The description of bits 15 to 8, and 6 to 0, modified
		1708	(1) Low Power Status Register (USB20_FUNC_LPSTS): The description of bits 15, and 13 to 0, modified
		1709	(1) PHY Function Control Register (USB20_FUNC_PHYFUNCTR): The description of bits 15, and 13 to 0, modified
		1710	(1) PHY_OTG Control Register (USB20_FUNC_PHYOTGCTR): The description of bits 15 to 11, and 8 to 0, modified
		1711	(1) Peripheral L1 Control Register 1 (USB20_FUNC_PL1CTRL1): The description of bits 15, 13, and 12, modified
		1713	(1) Peripheral L1 Control Register 2 (USB20_FUNC_PL1CTRL2): The description of bits 15 to 13, and 7 to 0, modified
		1720	(a) Channel Status Register ch n (USB20_FUNC_CHSTAT_n) (n = 0, 1): The description of bits 23 to 19, and 15 to 12, modified
		1724	(a) Channel Control Register ch n (USB20_FUNC_CHCTRL_n) (n = 0, 1): The description of bits 31 to 20, 15, 13, 11, and 10, modified
		1727	(a) Channel Configuration Register ch n (USB20_FUNC_CHCFG_n) (n = 0, 1): The description of bits 22, 10 to 4, 2, and 1, modified
		1730	(a) Channel Interval Register ch n (USB20_FUNC_CHITVL_n) (n = 0, 1): The description of bits 31 to 16, modified
		1731	(a) Channel Extension Register ch n (USB20_FUNC_CHEXT_n) (n = 0, 1) The description of bits 31 to 20, modified RW and the description of bits 7 to 4, modified
		1740	(a) DMA Control Register (USB20_FUNC_DCTRL): The description of bits 31 to 28, 23 to 20, and 15 to 2, modified
		1741	(a) Descriptor Interval Register (USB20_FUNC_DSCITVL): The description of bits 31 to 16, and 7 to 0, modified
		1742	(a) DMA Status EN Register (USB20_FUNC_DSTAT_EN): The description of bits 31 to 2, modified
		1743	(a) DMA Status ER Register (USB20_FUNC_DSTAT_ER): The description of bits 31 to 2, modified
		1744	(a) DMA Status END Register (USB20_FUNC_DSTAT_END): The description of bits 31 to 2, modified
		1745	(a) DMA Status TC Register (USB20_FUNC_DSTAT_TC): The description of bits 31 to 2, modified
		1746	(a) DMA Status SUS Register (USB20_FUNC_DSTAT_SUS): The description of bits 31 to 2, modified
		6.6 PCI Express 3.0 Interface (PCIe)	
		1810	6.6.1 Overview: PCI Express Specification (Compliant with the PCI Express Base Specification 4.0): The description, modified
		1812	Table 6.6-1 List of External Pins: PCIE0_RSTOUTB: The function, modified
		1819	Table 6.6-4 Register Base Addresses: Base Address Name: <PCI_PHY_base>, deleted

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	1820	6.6.4.1 Register Descriptions (Root Complex Mode): Registers with the HwInit attribute: The table, modified
		1871	(38) PCIe Core Control 1 Register (PCI_RC_PCCTRL1): The bit name and description of bit 11, modified
		1878	(42) PCIe Core Status 5 Register (PCI_RC_PCSTAT5): The description of bit 0, modified
		1885	(49) DMAC Control Register (PCI_RC_DMACTRL): The initial value of bits 2 to 0, modified
		1923	(1) Vendor and Device ID Register (PCI_RC_VID) The main text, modified The description of bits 31 to 16, and 15 to 0, modified
		1942	(18) PM Status/Control Register (PCI_RC_PMSC): R/W of bit 15, modified
		1945	(21) Device Control/Status Register (PCI_RC_DEVCS): The description of bits 11 to 8, modified
		1958	(29) Device Control 2/Status 2 Register (PCI_RC_DEVCS2): The description of bits 31 to 5, modified
		1977	Table 6.6-45 Valid Reset Signal, deleted
		1997	(63) Link Control 3 Register (PCI_RC_LINC3): The bit name and description of bits 15 to 9, modified
		2004	6.6.4.2 Register Descriptions (Endpoint Mode): The table, modified
		2053	(35) PCIe Core Control 1 Register (PCI_EP_PCCTRL1): The bit name and description of bit 11, modified
		2102	(1) Vendor and Device ID (Function #n) Register (PCI_EP_VID_Fn) (n = 0, 1) The main text, modified The description of bits 31 to 16, and 15 to 0, modified
		2186	(68) Link Control 3 Register (Function #0) (PCI_EP_LINC3_F0): The bit name and description of bits15 to 9, modified
		2188	(70) Lane Equalization Control Register Lane #n (Function #0) (PCI_EP_LEQCTL_F0): R/W(PCIe) and R/W(UDL) of bits 30 to 24, 22 to 16, 14 to 8, and 6 to 0, modified
		2231, 2232	Figure 6.6-4 Legacy Interrupt Issuing Flow, added Figure 6.6-5 MSI Issuing Flow, added
		2233	Table 6.6-127 External Interrupt Notification: Interrupt Notification Name: UI_EXTMSI_FUNC0/1/2/3/4 [2:0], modified
		2252	6.6.6.1 Setting Up: The main text, modified
		2253	6.6.6.1.1 Changing the Initial Values of the Registers (1) Setting the Initial Values of the Registers, deleted (3) Physical Layer Control/Monitor Registers, added (1), (2) Setting the initial values of the registers, added
		2271	Table 6.6-129 Initialization Procedure (RC) Step 8: The description, modified Note 3, added
		2273	Table 6.6-130 Initialization Procedure (EP) Step 8, 9: The description, modified Note 3, added
		SECTION 7 LOW-SPEED INTERFACE	
		7.2 Expanded Serial Peripheral Interface (xSPI)	
		2281	Table 7.2-1 xSPI Specifications xSPI function: The description, modified Note 1, added
		2284	7.2.2.1 List of Registers: The table, modified
		2321	(2) xSPI Common Status Register (XSPIm_COMSTT): The initial value of bits 22 to 20, modified
		2351	7.2.3.4.2 Reset pattern: The main text, modified

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	7.3 Serial Communications Interface (RSCI)	
		2409	7.3.2.2.15 Simple-LIN (SCIX) Control Register 0 (RSCIm_XCR0): The description of bits 25 and 24, modified (Note 2, deleted)
		7.4 Serial Communications Interface with FIFO (SCIF)	
		2604	Figure 7.4-12 Receive Data Sampling Timing, modified
		7.5 Serial Peripheral Interface (RSPI)	
		2607	Table 7.5-1 SPI Specifications (2/3): SSL control function: The description, modified
		2608	Table 7.5-1 SPI Specifications (3/3): Others: The description, modified
		2609	7.5.1.1 Features: The main text, modified
		2611	7.5.2.1 List of Registers RSPIm_SPSCR, RSPIm_SPDCR2: The access size, modified RSPIm_SPTFSR: The initial value, modified
		2626	7.5.2.2.6 SPI Control Register (RSPIm_SPCR): SPFRF bit (SPI Frame Format Select): The description, modified
		2629	7.5.2.2.9 SPI Pin Control Register (RSPIm_SPPCR) The bit name and description of bit 2, modified SPOM bit (SPI Output Pin Mode): The description, deleted
		2631	7.5.2.2.11 SPI Slave Select Polarity Register (RSPIm_SSLP): SSLnP bits (SSLn Signal Polarity Setting): The description, modified
		2633	7.5.2.2.13 SPI Sequence Control Register (RSPIm_SPSCR): The access size, modified
		2636	7.5.2.2.14 SPI Command Register n (RSPIm_SPCMDn) (n = 0 to 7): SSLA[1:0] bits (SSL Signal Assertion): The description, modified
		2637	7.5.2.2.15 SPI Data Control Register (RSPIm_SPDCR) The bit name and description of bits 2 and 1, modified SLSEL[1:0] bits (SSL Pin Output Select): The description, deleted
		2639	7.5.2.2.16 SPI Data Control Register 2 (RSPIm_SPDCR2): The access size, modified
		2643	7.5.2.2.18 SPI Status Register (RSPIm_SPSR): MODF bit (Mode Fault Error Flag): The description, modified (the description of [Multi-master mode], deleted)
		2647	7.5.2.2.19 SPI Transfer FIFO Status Register (RSPIm_SPTFSR): The initial value of bits 4 and 2, modified
		2652	7.5.3.1 Overview of SPI Operations: The main text, modified
		2652	Table 7.5-7 Relationship between SPI Modes and SPCR Settings and Description of Each Mode, modified (Single-Master → Master) (Multi-Master(SPI Operation), deleted) (Output pin mode, deleted)
		2653	7.5.3.2 SPI Pin Control: The main text, modified
		2653	Table 7.5-8 Relationship between Pin States and Set Control Bit Values, modified
		2655	7.5.3.3 SPI System Configuration Examples: The main text, modified
		2655	7.5.3.3.1 Master/single slave (this LSI = master): The title, modified The main text, modified
		2655	Figure 7.5-7 Master/Single-Slave Configuration Example (This LSI = Master): The title, modified
		2655	7.5.3.3.2 Master/single slave (this LSI = slave): The title, modified The main text, modified
		2656	Figure 7.5-8 Master/Single-Slave Configuration Example (This LSI = Slave, CPHA = 0b): The title, modified Figure 7.5-9 Master/Single-Slave Configuration Example (This LSI = Slave, CPHA = 1b): The title, modified
		2656	7.5.3.3.3 Master/multi-slave (this LSI = master): The title, modified The main text, modified

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	2657	Figure 7.5-10 Master/Multi-Slave Configuration Example (This LSI = Master): The title, modified
		2657	7.5.3.3.4 Master/multi-slave (with this LSI acting as slave): The title, modified The main text, modified
		2658	Figure 7.5-11 Master/Multi-Slave Configuration Example (This LSI = Slave): The title, modified SPI master, modified (RSPCK → SPCK)
		—	7.5.3.3.5 Multi-master/multi-slave (with this LSI acting as master), deleted
		2691	Table 7.5-10 Abnormal Transfer Occurrence Conditions and Error Detection Function of SPI, modified
		2697	7.5.3.10.3 Mode fault error The main text, modified (2) In the TI-SSP case: The description, modified
		2699	7.5.3.13.1 Master mode operation: The main text, modified
		2710	Figure 7.5-63 Example of Initialization Flowchart in Master Mode (SPI Operation), modified (“Sets output mode (CMOS/open-drain)”, deleted)
		2717	Figure 7.5-68 Example of Initialization Flow in Slave Mode, modified (“Set SPI pin control register (SPPCR)”, deleted)
		2725	Figure 7.5-76 Example of Initialization Flowchart in Master Mode (Clock Synchronous Operation), modified (“Sets output mode (CMOS/open-drain)”, deleted)
		2727	Figure 7.5-77 Example of Initialization Flow in Slave Mode, modified (“Set SPI pin control register (SPPCR)”, deleted)
		2732	Table 7.5-16 Communication End Event Generating Conditions (Receive Only Slave Mode): Bits SPOM and SLSEL[1:0], deleted
		7.7 I^2C Bus Interface (RIIC)	
		2754	7.7.2.2.1 I2C Bus Control Register 1 (RIICm_ICCR1) The description of bit 2, modified
		7.8 I3C Bus Interface (I3C)	
		3112	Figure 7.8-111 Example of I^2C Initialization Flowchart (Single Buffer Transfer), modified
		3113	Figure 7.8-112 Example of I3C initialization flowchart, modified
		7.9 CAN-FD Interface (CANFD)	
		3144	Table 7.9-1 CANFD Specifications (2/2): Interrupt source: The description, modified
		3155	7.9.2.1 List of Registers: Note 1, added
		3156	7.9.2.2.1 Channel n Nominal Bit Rate Configuration Register (CFDCnNCFG) (n = 0 to 5): The description of bits 16 to 10, modified
		3204	7.9.2.2.18 Global Acceptance Filter List Entry Control Register (CFDGAFLECTR): AFLPN[5:0] bits (Acceptance Filter List Page Number): The description, modified (0h and Fh → 0h and 2Fh)
		3255	7.9.2.2.48 TX Message Buffer Control Register n (CFDTMCn) (n = 0 to 383): The main text, modified
		3257	7.9.2.2.49 TX Message Buffer Status Register n (CFDTMSTSn) (n = 0 to 383): The main text, modified
		3259	Table 7.9-7 Alignment of TMTRSTS[15:0] Mirror Bits, modified
		3261	Table 7.9-8 Alignment of TMTARSTS[15:0] Mirror Bits, modified
		3263	Table 7.9-9 Alignment of TMTCSTS[15:0] Mirror Bits, modified
		3265	Table 7.9-10 Alignment of TMTASTS[15:0] Mirror Bits, modified
		3267	Table 7.9-11 Alignment of TMIE[15:0] bits, modified
		3269	7.9.2.2.55 TX Queue Configuration/Control Register 0n (CFDTXQCC0n) (n = 0 to 5) The main text, modified (TXMB31 → TXMB15) TXQDC[4:0] bits (TX Queue Depth Configuration): The description, modified

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	3272	7.9.2.2.56 TX Queue Configuration/Control Register 1n (CFDTXQCC1n) (n = 0 to 5) The main text, modified (TXMB31 → TXMB15) TXQDC[4:0] bits (TX Queue Depth Configuration): The description, modified
		3275	7.9.2.2.57 TX Queue Configuration/Control Register 2n (CFDTXQCC2n) (n = 0 to 5) The main text, modified (TXMB63 → TXMB47) TXQDC[4:0] bits (TX Queue Depth Configuration): The description, modified
		3278	7.9.2.2.58 TX Queue Configuration/Control Register 3n (CFDTXQCC3n) (n = 0 to 5) The main text, modified (TXMB63 → TXMB47) TXQDC[4:0] bits (TX Queue Depth Configuration): The description, modified
		3319	7.9.2.2.80 Global Flexible CAN Mode Configuration Register (CFDGFCMC) The bit name of bit 2, modified FLXC1 bit (Flexible CAN Mode between Channel 2 and Channel 3): The description, added FLXC2 bit (Flexible CAN Mode between Channel 4 and Channel 5): The description, added
		3322	7.9.2.2.82 Global Test Configuration Register (CFDGTSTCFG): RTMPS[9:0] bits (RAM Test Mode Page Select): The description, modified
		3393	Figure 7.9-28 Message Buffer Configuration, modified
		3394	7.9.6.1.1 Normal RX Message Buffer Configuration: The main text, modified
		3395	7.9.6.2.1 FIFO Buffers Configuration: The main text, modified
		3397	(2) FIFO TX Message Buffer Link Configuration: The main text, modified (1Fh: TX Message Buffer 63 → 0Fh: TX Message Buffer 47)
		3405	7.9.7.2 DMA Transfer: Reception DMA, Transmission DMA: The description, modified
		3415	7.9.8.2 Transmission: The main text, modified
		3416	Figure 7.9-39 Channel Transmission Message Buffer Configuration, modified
		3427, 3428	7.9.8.2.4 TX Queue: The main text, modified
		3432	7.9.8.2.4 TX Queue: The table, modified (Range Width, Direction, and Note, modified)
		3434	Table 7.9-29 TX History List Buffer Number Entry, modified
		3441	7.9.9.2.1 RAM Test Mode: The main text, modified
		3441	Figure 7.9-55 RAM Page Structure, modified
		3447	Figure 7.9-59 Diagram of the Flexible CAN for Channel 0 and Channel 1: The title, modified: The text, modified (CH1 → LSI)
		3448	7.9.12 Flexible Transmission Buffer Assignment: The main text, modified (64 transmit buffers → 32 transmit buffers)
		7.10 12-Bit A/D Converter (ADC)	
		3454	Figure 7.10-1 Block Diagram of 12-Bit A/D Converter (Unit0), modified (ADTRG# → ADTRG)
		3508	Figure 7.10-9 Example of Operation of Compare Function (Compare Target: ANI000-ANI003): The title, modified
		3510	Figure 7.10-11 Example of Operation for Event Output of Compare Function, modified (AN → ANI)
		SECTION 9 IMAGE	
		9.1 Image Overview	
		3736	9.1.1 Variation of Display Output, added
		9.2 Camera Data Receiver Unit (CRU)	
		3740	9.2.3.1.1 Features COMMON: 1) Data input range: The description of [Pixel size], modified Note 1, modified
		3742	9.2.3.1.1 Features: The description of item No. 6 in “LINK”, modified
		3757	(9) Receive Data Type Enable Low Register (CRUm_CSI2nDTEL) (m = 0): The description of bits 31 to 0, modified (ICnMC → ICnIPMC)

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	3758	Table 9.2-4 Receive Data Type Enable Low Register (CSI2nDTEL): The data type and description of bits 18 to 16, modified
		3762	(12) Receive Status Clear Register (CRUm_CSI2nRXSC) (m = 0): The description of bit 17, modified
		3784	(30) Slave D-PHY Control Register (MSB) (CRUm_S_DPHYCTL_MSB) (m = 0): The description of bit 0, modified
		3800	Figure 9.2-7 Block Diagram of Image Converter, modified Note 2, added
		3804	9.2.4.2.1 List of Registers (m = 0): Register Name: The AXI-VD Bus Master FIFO Setting Register and the AXI-VD Bus Master Transfer Resume Register, added
		3809	Figure 9.2-8 Bypass Setting for Each Function, modified
		3812	(4) CRU Interrupt Enable Register2 (CRUm_CRUnIE2) (m = 0): The bit name and description of bit 11, modified
		3814	(5) CRU Interrupt Status Register1 (CRUm_CRUnINTS1) (m = 0): R/W and the description of bits 31, 11, and 3, modified
		3816	(6) CRU Interrupt Status Register2 (CRUm_CRUnINTS2) (m = 0): R/W and the description of bits 31 and 30, modified
		3855	(44) AXI-VD Bus Master Transfer Setting Register (CRUm_AMnAXIATTR) (m = 0): The description of bits 3 to 0, modified
		3856	(45) AXI-VD Bus Master FIFO Setting Register (m = 0) (CRUm_AMnFIFO), added
		3857	(46) AXI-VD Bus Master Transfer Resume Register (m = 0) (CRUm_AMnFIFOTRST), added
		3935	(120) CRU Test Image Generation Control 1 Register (CRUm_ICnTICTRL1) (m = 0): The description of bits 20 to 16, modified
		3960	Figure 9.2-17 Image of Data Storage (Example of Division by VC), modified
		3961	Figure 9.2-18 Image of Data Storage (Example of Division by MB), modified
		3972	9.2.4.3.4 Pattern Generator (for Debugging): The main text, modified (Specify V → Specify Y, Specify Y → Specify V)
		3974	Figure 9.2-31 Data Generation Circuit (in the Case of Pattern Generation): The description in the square of YU, modified (V LSB 4-bit → U LSB 4-bit)
		3989	Figure 9.2-43 Example of VC Specification and Selection of Several Data Types for Non-Image Processing, modified
		3990	Figure 9.2-44 Example of Settings for Full Bypass, modified
		3998	Table 9.2-23 Interrupt Sources and Registers, and Interrupt Signals [n = 0] The “Interrupt Source Status/Clear” column of Internal Signal Name: axi_mst_err_int, modified The “Conditions for Occurrence” column of cru_vd_addr_wend, cru_sd_addr_wend, and cru_vsd_addr_wend, modified
		4004	Figure 9.2-53 Reception Start Flow for the MIPI CSI-2 Input, modified (CPG_RST_13 and CPG_RSTMON_6, deleted)
		4006	Figure 9.2-55 Initializing the AXI Master, modified
		4010	Figure 9.2-58 Initializing the LINK, modified (CSI2nDTEL = F778_FF0Fh → CSI2nDTEL = F77F_FF0Fh)
		4012	Figure 9.2-61 Stopping the D-PHY, modified (CPG_RST_13, deleted)
		4018	Figure 9.2-65 Reception Start Flow for the Pattern Generator Input (CPG_RSTMON_6, deleted)
		9.4 LCD Controller (LCDC)	
		4037	9.4.3.1 List of VSPD Registers: Register Name: Display List-0 Wake Up Counter Register, added
		4069	(7) Display List-0 Wake Up Counter Register (VI6_DL_WUPCNT0), added

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	4074	Figure 9.4-8 Chrominance Interpolation Methods Selectable through CIPM Setting, modified (VSP → VSPD)
		4147	(6) BRS Blend Control Register A (LCDC_VSPD_VI6_BRSA_BLD): The description of bit 23, modified ((m = A, B, C, D, E) → (m = A, B))
		4149	(7) BRS Control Register B (LCDC_VSPD_VI6_BRSB_CTRL): The bit name and description of bits 18 to 16, modified
		4150	(8) BRS Blend Control Register B (LCDC_VSPD_VI6_BRSB_BLD): The description of bit 23, modified ((m = A, B, C, D, E) → (m = A, B))
		4161	9.4.4.2.1 DU Module Control Register 0 (LCDC_DU_MCR0): The bit name and description of bit 0, modified
		9.5 MIPI DSI Interface (DSI)	
		4202	Table 9.5-2 Clocks and the Frequency Range: Clock Name: The description of “hsclk”, modified (1/16 for MIPI_DSI_PLLCLK → 1/8 for the PLL clock frequency (FFOUT))
		4269	9.5.2.2.55 Sequence Channel x Set 0 Register (DSI_LINK_SQCHxSET0R): R/W of bit 23, modified
		4284	9.5.2.3.3 DSI PLL Clock Setting 0 Register (DSI_DPHY_PLLCLKSET0R): The main text, modified (F_{FOUT}, deleted)
		9.10 Frame Data Processor (FDP)	
		4577	Table 9.10-2 List of FDP1B Registers: The initial value of Abbreviation: FD1_CTL_CHACT, modified
		4584	(4) Channel Activation Register (FD1_CTL_CHACT) The initial value of bits 8 and 1, modified The description of bits 9, 8, 3, and 2 to 0, modified
		4584	Table 9.10-3 FD1_CTL_CHACT Setting for DIM Parameter: Note, added
		SECTION 10 ELECTRICAL CHARACTERISTICS	
		10.1 Electrical Characteristics	
		4669	Table 10.1-1 Absolute Maximum Ratings The Max value of Item: USB30_USVDD18, modified Notes 3 and 5, modified
		4675	Figure 10.1-2 Power-On Sequence (CM33 Boot): Note, modified (The clock settling time → The clock stabilization time)
		4677	Figure 10.1-3 DDR Retention Enter Sequence (CM33 Boot Mode): Note, modified (The clock settling time → The clock stabilization time)
		4679	Figure 10.1-4 DDR Retention Exit Sequence (CM33 Boot Mode): Note, modified (The clock settling time → The clock stabilization time)
		4681	Figure 10.1-5 Power-Off Sequence (CM33 Boot Mode): Note, modified (The clock settling time → The clock stabilization time)
		4684	Figure 10.1-7 Power-On Sequence (CA55 Boot Mode): Note, modified (The clock settling time → The clock stabilization time)
		4688	Figure 10.1-9 DDR Retention Exit Sequence (CA55 Boot Mode): Note, modified (The clock settling time → The clock stabilization time)
		4690	Figure 10.1-10 Power-Off Sequence (CA55 Boot Mode): Note, modified (The clock settling time → The clock stabilization time)
		4701	10.1.5.5 DMAC Timing, added
		4707	10.1.5.9 Ethernet Interface Timing: Conditions, modified
		4707	Table 10.1-17 Ethernet Interface Timing (n = 0, 1) The Min value of ETn_TXD0 to ETn_TXD3, ETn_TXCTL_TXEN, and ETn_TXER output delay time in Parameter: Ethernet(MII), modified Note 1, added

Rev.	Date	Description	
		Page	Summary
1.10	Jun 30, 2025	4711	Table 10.1-18 xSPI Timing (2/2) The Min value in Parameter: DS low to CS high, modified The Max value in Parameter: CS low to DS low, modified Parameter: CK low to DS low, added Notes 5 to 9, added
		4713	Figure 10.1-29 DS to CS Signal Timing, modified
		4714	10.1.5.14 Serial Communications Interface (RSCI) Access Timing: Drive strength, modified
		4715	Table 10.1-19 RSCI Timing (2/2) Parameter: SCK clock rise/fall time, deleted Parameter: Input clock rise time, Input clock fall time, Output clock rise time, and Output clock fall time, added
		4716	Figure 10.1-33 RSCI Simple SPI Mode Clock Timing, modified
		4719	Table 10.1-20 RSPI Timing Parameter: SSL Activation to Data Output Delay, added Notes 1 to 4, modified
		4720	Figure 10.1-38 RSPI Clock Timing, modified
		4720	Figure 10.1-39 RSPI Timing (Master, Motorola RSPI, CPHA = 0), modified
		4726	Table 10.1-22 I3C Timing: Note 1, modified
		4727	Table 10.1-23 IIC Timing (Fast-mode+): Note 1, modified
		4728	Table 10.1-24 IIC Timing (HS mode) The Min value in Parameter: SCL3n cycle time, modified Note 1, modified
		4730	Table 10.1-25 I3C Timing (Open Drain Timing Parameters) The Min value and Notes in Parameter: SCL3n clock High period, modified Notes in Parameter: Clock after START (S) condition, modified The Min value in Parameter: Clock before STOP (P) condition, modified Notes in Parameter: Bus available condition, modified Notes 3 and 4, added
		4731	Table 10.1-26 I3C Timing (Push-Pull Timing Parameters for SDR) Notes in Parameter: SCL3n clock Low period, modified Parameter: SCL3n clock High period for Mixed Bus, added Notes in Parameter: SDA3n signal data hold in push-pull mode, modified Note 3, added
		4740	10.1.5.20 SSIU Timing: Condition, modified
		4740	Table 10.1-29 SSIU Signal Timing: Note 2, added
		4743	10.1.5.21 PDM Timing: Condition, modified
		4743	Table 10.1-30 PDM Interface Timing: Note 2, added
		4752	10.1.7 Oscillation Circuits for Connecting Crystal Resonators (OSC): The main text, modified
		4752	Table 10.1-38 Pins for Connecting Crystal Resonators and Clock Frequency: For the emergency clock, deleted
1.15	Nov 28, 2025	SECTION 1 OVERVIEW	
		1.1 Overview	
		75	1.1.1 Features: NOTE, modified
		76	Table 1.1-1 Product Lineup: Note 1, deleted
		SECTION 9 IMAGE	
		9.5 MIPI DSI Interface (DSI)	
		4318	9.5.3.5.9 Delay about Video-Input Operation: The description, added
