

Photocouplers / Optocouplers

Insulation Distances

Abstract

Our photocouplers use a double structure consisting of an inner resin with high optical transmittance between the light-emitting diode (LED) and the photo-diode, and an outer resin with high light shading effect on the outside.

As a result, both stable operation not influenced by external light and high sensitivity (small minimum operating input current) are achieved.

1. Overview

No. / Name	Description
1. Creepage Distance	Shortest distance between the light emitting side pin and the light receiving side pin, along the package surface (green line in the figure above).
2. Isolation Distance	Shortest distance between the light emitting side and the light receiving side insulated with resin
3. Clearance (Air distance)	Space outside the resin that is the shortest distance between the light emitting side pin and the light receiving side pin. Depending on the pin shape, this distance may be the same as the creepage distance.
