RX130 Group, RX220 Group

Points of Difference Between RX130 Group and RX220 Group

Introduction

This application note is intended mainly as a reference for confirming the points of difference between the outlines of the peripheral functions, the I/O registers, and the pin functions of the RX130 Group and RX220 Group, and it also includes notes on migration between the two groups.

Unless otherwise indicated, the information listed in this application note applies to 100-pin product versions of RX220 Group MCUs and to 100-pin product versions of RX130 Group MCUs. For details of differences regarding electrical characteristics, important notes, setting procedures, etc., refer to the user's manual of the specific product.

Target Devices

RX220 Group and RX130 Group

Contents

1. Comparison of Functions of RX130 Group and RX220 Group

A comparison of the functions of the RX130 Group and RX220 Group is provided below. For details of the functions, see 2. Comparative Overview of Functions, and 5, Reference Documents.

Table 1.1 is a comparative listing of the functions of the RX130 and RX220.

Table 1.1 Comparison of Functions of RX130 and RX220

Function	RX220	RX130
CPU	○	○
Operating mode	△	△
Address Space	△	△
Reset	○	○
Option-setting memory	△	△
Voltage detection circuit (LVDAa): RX220, (LVDAb): RX130	△	△
Clock generation circuit	△	△
Clock frequency accuracy measurement circuit (CAC)	△	△
Low power consumption function	△	△
Register write protection function	△	△
Exception Handling	○	○
Interrupt controller (ICUb)	△	△
Buses	△	△
DMA controller (DMACA)	○	×
Data transfer controller (DTCa)	○	○
Event link controller (ELC)	△	△
I/O port	△	△
Multi-function pin controller (MPC)	△	△
Multi-function timer pulse unit 2 (MTU2a)	○	○
Port output enable 2 (POE2a)	○	○
8-bit timer (TMR)	○	○
Compare match timer (CMT)	△	△
Realtime clock (RTCc)	○	○
Low-power timer (LPT)	×	○
Independent watchdog timer (IWDTa)	△	△
Serial communications interface (SCIe, SCIf): RX220, (SCIg, SCIh): RX130	△	△
IrDA interface	○	×
I^2C bus interface (RIIC): RX220, (RIICa): RX130	△	△
Serial peripheral interface (RSPI): RX220, (RSPIa): RX130	△	△
CRC calculator (CRC)	○	○
Capacitive touch sensing unit (CTSUa)	×	○
12-bit A/D converter (S12ADb): RX220, (S12ADE): RX130	△	△
D/A converter (DA)	×	○
Temperature sensor (TEMPSA)	×	○
Comparator A(CMPA) :RX220, Comparator B (CMPBa):RX130	△	△
Data operation circuit (DOC)	○	○
RAM	△	△
Flash memory (ROM)	△	△
Flash memory (E2 Data Flash)	△	△
Package (LFQFP48/64/100 only)	△	△

Note: ○: Function implemented, ×: Function not implemented, △: Differences exist between implementation of function on RX220 and RX130.

2. Comparative Overview of Functions

This section lists points of difference between the peripheral functions of the RX130 and RX220 groups, comparing each function in overview and the registers of each function. Specifications implemented only on one group are shown in red, specifications that exist on both groups but with points of difference are shown in red, and specifications that exist on both groups are shown in black.

2.1 Operating Modes

Table 2.1 shows a comparative listing of the operating modes specifications, and Table 2.2 shows a comparative listing of the operating modes registers.

Table 2.1 Comparative Listing of Operating Modes Specifications

Item	RX220	RX130
Operating mode	Single-chip mode	Single-chip mode
	Boot mode (SCI interface)	Boot mode (SCI interface)
	User boot mode	—
Mode pins	MD, PC7	MD

2.5 Clock Generation Circuit

Table 2.7 shows a comparative listing of the clock generation circuit specifications, and Table 2.8 shows a comparative listing of the clock generation circuit registers.

Table 2.7 Comparative Listing of Clock Generation Circuit Specifications

Item	RX220	RX130
Uses	• Generates the system clock (ICLK) supplied to the CPU, DMAC, DTC, ROM, and RAM. • Generates the peripheral module clocks (PCLKB, PCLKD) supplied to the peripheral module clocks. Peripheral module clock PCLKD is used as the operating clock for S12AD, and peripheral module clock PCLKB is used as the operating clock for the modules other than S12AD. • Generates the FlashIF clock (FCLK) supplied to the FlashIF. • Generates the CAC clock (CACCLK) supplied to the CAC. • Generates the RTC-dedicated sub clock (RTCSCLK) supplied to the RTC. • Generates the IWDT-dedicated clock (IWDTCLK) supplied to the IWDT.	• Generates the system clock (ICLK) supplied to the CPU, DTC, and RAM. • Generates the peripheral module clocks (PCLKB, PCLKD) supplied to the peripheral module clocks. Peripheral module clock PCLKD is used as the operating clock for S12AD, and peripheral module clock PCLKB is used as the operating clock for the modules other than S12AD. • Generates the FlashIF clock (FCLK) supplied to the FlashIF. • Generates the CAC clock (CACCLK) supplied to the CAC. • Generates the RTC-dedicated sub clock (RTCSCLK) supplied to the RTC. • Generates the IWDT-dedicated clock (IWDTCLK) supplied to the IWDT. • Generates the LPT clock (LPTCLK) to be supplied to the LPT. • Generates the REMC clock (REMCLK) to be supplied to the REMC.
Operating frequencies	• ICLK: 32 MHz (max.) • PCLKB: 32 MHz (max.) • PCLKD: 32 MHz (max.) • FCLK: 4 MHz to 32 MHz (for programming and erasing the ROM and E2 data flash) 32 MHz (max.): (for reading from the E2 data flash) • CACCLK: Same frequency as each oscillator • RTCSCLK: 32.768 kHz • IWDTCLK: 125 kHz	• ICLK: 32 MHz (max.) • PCLKB: 32 MHz (max.) • PCLKD: 32 MHz (max.) • FCLK: 1 MHz to 32 MHz (for programming and erasing the ROM and E2 data flash) 32 MHz (max.): (for reading from the E2 data flash) • CACCLK: Same frequency as each oscillator • RTCSCLK: 32.768 kHz • IWDTCLK: 15 kHz • LPTCLK: The same frequency as that of the selected oscillator • REMCLK: Same frequency as each oscillator

Item	RX220	RX130
Main clock oscillator	• Resonator frequency: 1 MHz to 20 MHz • External clock input frequency: 20 MHz (max.) • Connectable resonator or additional circuit: Ceramic resonator, crystal resonator • Connection pins: EXTAL, XTAL • Oscillation stop detection function: When oscillation stop of the main clock is detected, the system clock source is switched to LOCO, and MTU output can be forcedly driven to high-impedance. • Drive capacity switching function	• Resonator frequency: 1 MHz to 20 MHz (VCC ≥ 2.4 V) 1 MHz to 8 MHz (VCC < 2.4 V) • External clock input frequency: 20 MHz (max.) • Connectable resonator or additional circuit: Ceramic resonator, crystal resonator • Connection pins: EXTAL, XTAL • Oscillation stop detection function: When oscillation stop of the main clock is detected, the system clock source is switched to LOCO, and MTU output can be forcedly driven to high-impedance. • Drive capacity switching function
Sub-clock oscillator	• Resonator frequency: 32.768 kHz • Connectable resonator or additional circuit: crystal resonator • Connection pins: XCIN, XCOUT • Drive capacity switching function	• Resonator frequency: 32.768 kHz • Connectable resonator or additional circuit: crystal resonator • Connection pins: XCIN, XCOUT • Drive capacity switching function
PLL	—	• Input clock source: Main clock • Input pulse frequency division ratio: Selectable from 1, 2, and 4 • Input frequency: 4 MHz to 8 MHz • Frequency multiplication ratio: Selectable within range from 4 to 8 (increments of 0.5) • Oscillation frequency: 24 MHz to 32 MHz (VCC ≥ 2.4 V)
High-speed on-chip oscillator (HOCO)	• Oscillation frequency: 32 MHz, 36.864 MHz, 40 MHz, 50 MHz • HOCO power supply control	• Oscillation frequency: 32 MHz
Low-speed on-chip oscillator (LOCO)	Oscillation frequency: 125 kHz	Oscillation frequency: 4 MHz
IWDT-dedicated on-chip oscillator	Oscillation frequency: 125 kHz	Oscillation frequency: 15 kHz

2.7 Low Power Consumption Functions

Table 2.11 shows a comparative listing of the low power consumption specifications, Table 2.12 to Table 2.15 shows a Comparative Listing of Entering and Exiting Low Power Consumption Modes and Operating States in Each Mode, and Table 2.16 shows a comparative listing of the low power consumption function registers.

Table 2.11 Comparative Listing of Low Power Consumption Functions

Item	RX220	RX130
Reduction of power consumption by clock switching	The frequency division ratio can be set independently for the system clock (ICLK), peripheral module clock (PCLKB), S12AD clock (PCLKD), and FlashIF clock (FCLK).	The frequency division ratio can be set independently for the system clock (ICLK), peripheral module clock (PCLKB), S12AD clock (PCLKD), and FlashIF clock (FCLK).
Module stop function	Each peripheral module can be stopped independently.	Each peripheral module can be stopped independently.
Function for transition to low power consumption mode	It is possible to transition to a low power consumption mode in which the CPU, peripheral modules, or oscillators are stopped.	It is possible to transition to a low power consumption mode in which the CPU, peripheral modules, or oscillators are stopped.
Low power consumption modes	• Sleep mode • All-module clock stop mode • Software standby mode	• Sleep mode • Deep sleep mode • Software standby mode
Operating power reduction function	• Power consumption can be reduced in normal operation, sleep mode, and all-module clock stop mode by selecting an appropriate operating power consumption control mode according to the operating frequency and operating voltage. • Operating power control modes: 4 — Middle-speed operating mode 1A — Middle-speed operating mode 1B — Low-speed operating mode 1 — Low-speed operating mode 2	• Power consumption can be reduced in normal operation, sleep mode, and deep sleep mode by selecting an appropriate operating power consumption control mode according to the operating frequency and operating voltage. • Operating power control modes: 3 — High-speed operating mode — Middle-speed operating mode — Low-speed operating mode

Table 2.12 Comparative Listing of Entering and Exiting Low Power Consumption Modes and Operating States in Each Mode (Sleep Mode)

Entering and Exiting Low Power Consumption Modes and Operating States	RX220	RX130

RSTCKCR	RSTCKSEL [2:0]	Sleep mode return clock source select bits b2 b0 0 0 1: HOCO selected 0 1 0: Main clock oscillator selected Settings other than the above are prohibited while the RSTCKEN bit is set to 1.	Sleep mode return clock source select bits b2 b0 0 0 0: LOCO selected 0 0 1: HOCO selected 0 1 0: Main clock oscillator selected Settings other than the above are prohibited while the RSTCKEN bit is set to 1.
FHSSBYCR	—	Flash HOCO software standby control register	—

2.8 Register Write Protection Function

Table 2.17 shows a comparative overview of the register write protection function specifications, and Table 2.18 shows a comparative listing of the register write protection function registers.

Table 2.17 Comparative Overview of Register Write Protection Function

Item	RX220	RX130
PRC0 bit	Registers related to the clock generation circuit SCKCR, SCKCR3, MOSCCR, SOSCCR, LOCOCR, ILOCOCR, HOCOCR, OSTDCR, OSTDSR, HOCOCR2	Registers related to the clock generation circuit SCKCR, SCKCR3, PLLCR, PLLCR2, MOSCCR, SOSCCR, LOCOCR, ILOCOCR, HOCOCR, HOFCR, OSTDCR, OSTDSR, CKOCR, LOCOTRR, ILOCOTRR, HOCOTRR0
PRC1 bit	• Registers related to the operating modes SYSCR1 • Registers related to the low power consumption functions SBYCR, MSTPCRA, MSTPCRB, MSTPCRC, OPCCR, RSTCKCR, MOSCWTCR, SOSCWTCR, FHSSBYCR, HOCOWTCR2 • Registers related to the clock generation circuit MOFCR, HOCOPCR • Software reset register SWRR	• Registers related to the operating modes SYSCR1 • Registers related to the low power consumption functions SBYCR, MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD, OPCCR, RSTCKCR, SOPCCR • Registers related to the clock generation circuit MOFCR, MOSCWTCR • Software reset register SWRR
PRC2 bit	—	Registers related to the low power timer LPTCR1, LPTCR2, LPTCR3, LPTPRD, LPCMR0, LPWUCR
PRC3 bit	Registers related to the LVD LVCMPCR, LVDLVLR, LVD1CR0, LVD1CR1, LVD1SR, LVD2CR0, LVD2CR1, LVD2SR	Registers related to the LVD LVCMPCR, LVDLVLR, LVD1CR0, LVD1CR1, LVD1SR, LVD2CR0, LVD2CR1, LVD2SR

Table 2.18 Comparative Listing of Register Write Protection Function Registers

Register	Bit	RX220	RX130
PRCR	PRC1	Protect Bit 1 Enables writing to the registers related to operating modes, low power consumption, and software reset. 0: Write disabled 1: Write enabled	Protect Bit 1 Enables writing to the registers related to operating modes, low power consumption functions, the clock generation circuit, and software reset. 0: Write disabled 1: Write enabled
	PRC2	—	Protect bit 2

2.9 Interrupt Controller

Table 2.19 shows a comparative listing of the interrupt controller specifications, and Table 2.20 shows a comparative listing of the interrupt controller registers.

Table 2.19 Comparative Listing of Interrupt Controller Specifications

Item		RX220 (ICUb)	RX130 (ICUb)
Interrupt	Peripheral function interrupts	• Interrupts from peripheral modules • Interrupt detection: Edge detection/level detection Edge detection or level detection is determined independently for each source of the connected peripheral modules.	• Interrupts from peripheral modules • Interrupt detection: Edge detection/level detection Edge detection or level detection is determined independently for each source of the connected peripheral modules.
	External pin interrupts	• Interrupts from pins IRQ0 to IRQ7 • Sources: 8 • Interrupt detection: One detection method among low level, falling edge, rising edge, and rising and falling edges can be set for each source. • Digital filter function: Supported	• Interrupts from pins IRQ0 to IRQ7 • Sources: 8 • Interrupt detection: One detection method among low level, falling edge, rising edge, and rising and falling edges can be set for each source. • Digital filter function: Supported
	Software interrupt	• Interrupt generated by writing to a register. • Source: 1	• Interrupt generated by writing to a register. • Source: 1
	Event link interrupt	The ELSR18I interrupt is generated by an ELC event.	The ELSR8I or ELSR18I interrupt is generated by an ELC event.
	Interrupt priority level	Priority is specified by register settings.	Priority is specified by register settings.
	Fast interrupt function	Faster interrupt processing by the CPU can be specified only for a single interrupt source.	Faster interrupt processing by the CPU can be specified only for a single interrupt source.
	DTC control	Interrupt sources can be used to start the DTC and DMAC.	Interrupt sources can be used to start the DTC.
Non-maskable interrupts	NMI pin interrupt	• Interrupt from the NMI pin • Interrupt detection: Falling edge/rising edge • Digital filter function: Supported	• Interrupt from the NMI pin • Interrupt detection: Falling edge/rising edge • Digital filter function: Supported
	Oscillation stop detection interrupt	Interrupt at oscillation stop detection	Interrupt at oscillation stop detection
	IWDT underflow/refresh error	Interrupt at an underflow of the down counter or at the occurrence of a refresh error	Interrupt at an underflow of the down counter or at the occurrence of a refresh error
	Voltage monitoring 1 interrupt	Voltage monitoring interrupt of voltage monitoring circuit 1 (LVD1)	Voltage monitoring interrupt of voltage monitoring circuit 1 (LVD1)
	Voltage monitoring 2 interrupt	Voltage monitoring interrupt of voltage monitoring circuit 2 (LVD2)	Voltage monitoring interrupt of voltage monitoring circuit 2 (LVD2)

Item	RX220 (ICUb)	RX130 (ICUb)
Return from low power consumption modes	• Sleep mode: Return is initiated by a non-maskable interrupt or any other interrupt source. • All-module clock stop mode: Return is initiated by a non-maskable interrupts, interrupt IRQ0 to IRQ7, TMR interrupt or RTC alarm/period interrupt. • Software standby mode: Return is initiated by a non-maskable interrupt, interrupt IRQ0 to IRQ7, or RTC alarm/period interrupt.	• Sleep mode and deep sleep mode: Return is initiated by a non-maskable interrupt or any other interrupt source. • Software standby mode: Return is initiated by a non-maskable interrupt, interrupt IRQ0 to IRQ7, or RTC alarm/period interrupt.

Table 2.20 Comparative Listing of Interrupt Controller Registers

Register	Bit	RX220 (ICUb)	RX130 (ICUb)
DMRSRm	—	DMAC activation request select register m (m = DMAC channel number)	—
DTCERn	DTCE	DTC Activation Enable 0: DTC activation is disabled 1: DTC activation is enabled	DTC Transfer Request Enable 0: The corresponding interrupt source is not selected as the DTC trigger. 1: The corresponding interrupt source is selected as the DTC trigger.

2.10 Bus

Table 2.21 shows a comparative listing of the bus specifications, and Table 2.22 shows a comparative listing of the bus registers.

Table 2.21 Comparative Listing of Bus Specifications

Item		RX220	RX130
CPU bus	Instruction bus	• Connected to the CPU (for instructions). • Connected to the on-chip memory (RAM and ROM). • Operates in synchronization with the system clock (ICLK).	• Connected to the CPU (for instructions). • Connected to the on-chip memory (RAM and ROM). • Operates in synchronization with the system clock (ICLK).
	Operand bus	• Connected to the CPU (for operand). • Connected to the on-chip memory (RAM and ROM). • Operates in synchronization with the system clock (ICLK).	• Connected to the CPU (for operand). • Connected to the on-chip memory (RAM and ROM). • Operates in synchronization with the system clock (ICLK).
Memory buses	Memory bus 1	Connected to the RAM.	Connected to the RAM.
	Memory bus 2	Connected to the ROM.	Connected to the ROM.
Internal main buses	Internal main bus 1	• Connected to the CPU. • Operates in synchronization with the system clock (ICLK).	• Connected to the CPU. • Operates in synchronization with the system clock (ICLK).
	Internal main bus 2	• Connected to the DMAC and DTC. • Connected to the on-chip memory (RAM and ROM). • Operates in synchronization with the system clock (ICLK).	• Connected to the DTC. • Connected to the on-chip memory (RAM and ROM). • Operates in synchronization with the system clock (ICLK).
Internal peripheral buses	Internal peripheral bus 1	• Connected to peripheral modules (DTC, DMAC, interrupt controller, and bus error monitoring section). • Operates in synchronization with the system clock (ICLK).	• Connected to peripheral modules (DTC, interrupt controller, and bus error monitoring section). • Operates in synchronization with the system clock (ICLK).
	Internal peripheral bus 2	• Connected to peripheral modules (modules other than those connected to internal peripheral bus 1). • Operates in synchronization with the peripheral module clock (PCLKB, PCLKD).	• Connected to peripheral modules. • Operates in synchronization with the peripheral module clock (PCLKB, PCLKD).
	Internal peripheral bus 3	—	• Connected to peripheral modules (Touch). • Operates in synchronization with the peripheral module clock (PCLKB).
	Internal peripheral bus 6	• Connected to the on-chip ROM (P/E) and E2 data flash memory. • Operates in synchronization with the FlashIF clock (FCLK).	• Connected to the on-chip ROM (P/E) and E2 data flash memory. • Operates in synchronization with the FlashIF clock (FCLK).

Table 2.22 Comparative Listing of Bus Registers

Register	Bit	RX220	RX130
BEREN	TOEN	—	Timeout detection enable bit
BERSR1	TO	—	Timeout bit
	MST[2:0]	Bus master code bits b6 b4 0 0 0: CPU 0 0 1: Reserved 0 1 0: Reserved 0 1 1: DTC/DMAC 1 0 0: Reserved 1 0 1: Reserved 1 1 0: Reserved 1 1 1: Reserved	Bus master code bits b6 b4 0 0 0: CPU 0 0 1: Reserved 0 1 0: Reserved 0 1 1: DTC 1 0 0: Reserved 1 0 1: Reserved 1 1 0: Reserved 1 1 1: Reserved
BUSPRI	BPGB[1:0]	Internal peripheral bus 2 priority control bits	Internal peripheral bus 2 and 3 priority control bits

2.11 Event Link Controller

Table 2.23 shows a comparative listing of the event link controller specifications, Table 2.24 shows a comparative listing of the event link controller registers, and Table 2.25 shows a comparative listing of ELSRn register setting values.

Table 2.23 Comparative Listing of Bus Specifications

Item	RX220 (ELC)	RX130 (ELC)
Event link function	• 46 event signals can be directly connected to modules. • It is possible to specify that timer modules operate when an event is input. • Event link operation is possible for port B. — Single-port: Event link operation can be enabled for a specified single bit in a port. — Port group: Event link operation can be enabled for a group of specified bits within an 8-bit port.	• 47 event signals can be directly connected to modules. • It is possible to specify that timer modules operate when an event is input. • Event link operation is possible for port B. — Single-port: Event link operation can be enabled for a specified single bit in a port. — Port group: Event link operation can be enabled for a group of specified bits within an 8-bit I/O port.
Low power consumption function	It is possible to specify the module stop state.	It is possible to specify the module stop state.

Table 2.24 Comparative Listing of Bus Registers

Register	Bit	RX220 (ELC)	RX130 (ELC)
ELSR7	ELS[7:0]	—	Event link setting register 7 [CMT1]
ELSR8	ELS[7:0]	—	Event link setting register 8 [ICU (dedicated LPT interrupt)]
ELSR14	ELS[7:0]	—	Event link setting register 14 [CTSU]
ELSR16	ELS[7:0]	—	Event link setting register 16 [DA0]
ELOPC	—	—	Event Link Option Setting Register C

Table 2.25 Comparative Listing of ELSRn Register Setting Values

Setting Value	RX220	RX130	Event
1Fh	—	○	CMT1, compare match 1
32h	—	○	LPT, compare match
34h	—	○	S12AD, compare condition met
35h	—	○	S12AD, compare condition unmet
52h	○	—	RSPI0 error (mode fault, overrun, or parity error)
53h	○	—	RSPI0 idle
54h	○	—	RSPI0 receive data full
55h	○	—	RSPI0 transmit data empty
56h	○	—	RSPI0 transmit end (except during clock synchronous operation in slave mode)
59h	—	○	Comparator B0, comparison result change
5Ah	—	○	Comparator B0 and B1, common comparison result change

2.12 I/O Ports

Table 2.26 to Table 2.28 shows a comparative listing of specifications of I/O ports, and Table 2.29 shows a comparative listing of I/O port functions, and Table 2.30 shows a comparative listing of the I/O port registers.

Table 2.26 Comparative Listing of Specifications of I/O Ports (100 Pins)

Notes: 1. On 80-pin (RX130 only) and 64-pin package products, pins PB6 and PC0, and PB7 and PC1 have multiplexed functions. These can be switched by making settings to the PSRA register. The pin functions conform to the settings of the selected port.

2. On 48-pin package products, pins PB0 and PC0, PB1 and PC1, PB3 and PC2, and PB5 and PC3 have multiplexed functions. These can be switched by making settings to the PSRB register. The pin functions conform to the settings of the selected port.

Table 2.30 Comparative Listing of I/O Port Registers

Register	Bit	RX220	RX130
ODR0	B2, B3	Pn1 output type select bit • PA1, PB1, PC1 b2 0: CMOS output 1: N-channel open-drain output b3 This bit is read as 0. The write value should be 0. • PE1 b3 b2 00: CMOS output 01: N-channel open-drain output 10: P-channel open-drain output 11: Hi-Z	Pm1 output type select bit • P31, PA1, PB1, PC1,PD1 b2 0: CMOS output 1: N-channel open-drain output b3 This bit is read as 0. The write value should be 0. • PE1 b3 b2 00: CMOS output 01: N-channel open-drain output 10: P-channel open-drain output 11: Hi-Z

2.13 Multi-Function Pin Controller

Table 2.31 shows a comparative listing of functions assigned to each multiplexed pin, and Table 2.32 shows a comparative listing of the multi-function pin controller port registers.

Blue characters exist only in the RX220, and orange characters exist only in the RX130. "√" indicates pin implemented, "×" indicates pin not implemented, "-" indicates no assignment pin for function, Grey hatching indicates pin function not implemented.

Table 2.31 Comparative Listing of Functions Assigned to Each Multiplexed Pin

2.14 8-Bit Timer

Table 2.33 shows a comparative overview of the 8-Bit Timer specification.

Table 2.33 Comparative Overview of 8-Bit Timer

Item	RX220 (CMT)	RX130 (CMT)
Count clock	• Internal clock: PCLK/1, PCLK/2, PCLK/8, PCLK/32, PCLK/64, PCLK/1024, PCLK/8192 • External clock: external count clock	• Internal clock: PCLK/1, PCLK/2, PCLK/8, PCLK/32, PCLK/64, PCLK/1024, PCLK/8192 • External clock: external count clock
Number of channels	(8 bits × 2 channels) × 2 units	(8 bits × 2 channels) × 2 units
Compare match	• 8-bit mode (compare match A, compare match B) • 16-bit mode (compare match A, compare match B)	• 8-bit mode (compare match A, compare match B) • 16-bit mode (compare match A, compare match B)
Counter clear	Selected by compare match A or B, or an external reset signal.	Selected by compare match A or B, or an external reset signal.
Timer output	Output pulses with a desired duty cycle or PWM output	Output pulses with a desired duty cycle or PWM output
Cascading of two channels	• 16-bit count mode 16-bit timer using TMR0 for the upper 8 bits and TMR1 for the lower 8 bits (TMR2 for the upper 8 bits and TMR3 for the lower 8 bits) • Compare match count mode TMR1 can be used to count TMR0 compare matches (TMR3 can be used to count TMR2 compare matches).	• 16-bit count mode 16-bit timer using TMR0 for the upper 8 bits and TMR1 for the lower 8 bits (TMR2 for the upper 8 bits and TMR3 for the lower 8 bits) • Compare match count mode TMR1 can be used to count TMR0 compare matches (TMR3 can be used to count TMR2 compare matches).
Interrupt sources	Compare match A, compare match B, and overflow	Compare match A, compare match B, and overflow
Event link function (Output)	Compare match A, compare match B, and overflow (TMR0, TMR2)	Compare match A, compare match B, and overflow (TMR0, TMR2)
Event link function (Input)	One of the following three operations proceeds in response to an event reception: (1) Counting start operation (TMR0, TMR2) (2) Event counting operation (TMR0, TMR2) (3) Counting restart operation (TMR0, TMR2)	One of the following three operations proceeds in response to an event reception: (1) Counting start operation (TMR0, TMR2) (2) Event counting operation (TMR0, TMR2) (3) Counting restart operation (TMR0, TMR2)
DTC activation	DTC can be activated by compare match A interrupts or compare match B interrupts.	DTC can be activated by compare match A interrupts or compare match B interrupts.
Capable of generating baud rate clock for SCI	Generates baud rate clock for SCI.	Generates baud rate clock for SCI.
Capable of generating receive clock for REMC	—	Generates operating clock for remote control signal receiver (REMC)
Low power consumption function	Each unit can be placed in a module stop state	Each unit can be placed in a module stop state

2.15 Compare Match Timer

Table 2.34 shows a comparative overview of the compare match timer specification, and Table 2.35 shows a comparative listing of the compare match timer registers.

Table 2.34 Comparative Overview of Compare Match Timer

Item	RX220 (CMT)	RX130 (CMT)
Number of units	2 units	1 unit
Number of channels	4 channels	2 channels
Count clocks	Four frequency-divided clocks One clock from PCLK/8, PCLK/32, PCLK/128, and PCLK/512 can be selected independently for each channel.	Four frequency-divided clocks One clock from PCLK/8, PCLK/32, PCLK/128, and PCLK/512 can be selected for each channel.
Interrupt	A compare match interrupt can be requested independently for each channel.	A compare match interrupt can be requested for each channel.
Event link function (output)	—	Event signal output at CMT1 compare match
Event link function (input)	—	• Support for linked operation of specified module • Support for CMT1 counter start, event counter, and count restart
Low power consumption function	It is possible to specify the module stop state.	It is possible to specify the module stop state.

Table 2.35 Comparative Listing of Compare Match Timer Registers

Register	Bit	RX220 (CMT)	RX130 (CMT)
CMSTR1	—	Compare match timer start register 1	—

2.16 Independent Watchdog Timer

Table 2.36 shows a comparative overview of the independent watchdog timer specification, and Table 2.37 shows a comparative listing of the independent watchdog timer registers.

Table 2.36 Comparative Overview of Independent Watchdog Timer

Item	RX220 (IWDTa)	RX130 (IWDTa)
Count source	IWDTCLK (125 kHz)	IWDTCLK (15 kHz)

Table 2.37 Comparative Listing of Independent Watchdog Timer Registers

Register	Bit	RX220 (IWDTa)	RX130 (IWDTa)
IWDTCR	TOPS[1:0]	Timeout period select bits b1 b0 0 0: 1,024 cycles (03FFh) 0 1: 4,096 cycles (0FFFh) 1 0: 8,192 cycles (1FFFh) 1 1: 16,384 cycles (3FFFh)	Timeout period select bits b1 b0 0 0: 128 cycles (007Fh) 0 1: 512 cycles (01FFh) 1 0: 1,024 cycles (03FFh) 1 1: 2,048 cycles (07FFh)
IWDTCSTPR	SLCSTP	Sleep Mode Count Stop Control 0: Count stop is disabled 1: Count is stopped at a transition to sleep mode, software standby mode, or all-module clock stop mode	Sleep Mode Count Stop Control 0: Count stop is disabled. 1: Count is stopped at a transition to sleep mode, software standby mode, or deep sleep mode.

2.17 Serial Communication Interface

Table 2.38, Table 2.39 shows a comparative overview of the serial communication interface specifications, and Table 2.40 shows a comparative listing of the serial communications interface registers.

Table 2.38 Comparative Overview of Serial Communication Interface (SCIe: RX220, SCIg:RX130)

Item	RX220 (SCIe)	RX130 (SCIg)
Number of channels	4 channels (SCI1, SCI5, SCI6, SCI9)	6 channels (SCI0, SCI1, SCI5, SCI6, SCI8, SCI9)
Serial communication modes	• Asynchronous • Clock synchronous • Smart card interface • Simple I²C bus • Simple SPI bus	• Asynchronous • Clock synchronous • Smart card interface • Simple I²C bus • Simple SPI bus
Transfer speed	Bit rate specifiable by on-chip baud rate generator.	Bit rate specifiable by on-chip baud rate generator.
Full-duplex communication	• Transmitter: Continuous transmission possible using double-buffer configuration. • Receiver: Continuous reception possible using double-buffer configuration.	• Transmitter: Continuous transmission possible using double-buffer configuration. • Receiver: Continuous reception possible using double-buffer configuration.
I/O pins	• SCI I/O pins (asynchronous mode and clock synchronous mode) SCK1, RXD1, TXD1, CTS1#/RTS1# SCK5, RXD5, TXD5, CTS5#/RTS5# SCK6, RXD6, TXD6, CTS6#/RTS6# SCK9, RXD9, TXD9, CTS9#/RTS9# • SCI I/O pins (simple I²C mode) SSCL1, SSDA1, SSCL5, SSDA5, SSCL6, SSDA6, SSCL9, SSDA9, • SCI I/O pins (simple SPI mode) SCK1, SMISO1, SMOSI1, SS1#, SCK5, SMISO5, SMOSI5, SS5#, SCK6, SMISO6, SMOSI6, SS6#, SCK9, SMISO9, SMOSI9, SS9#,	• SCI I/O pins (asynchronous mode and clock synchronous mode) SCK0, RXD0, TXD0, CTS0#/RTS0# SCK1, RXD1, TXD1, CTS1#/RTS1# SCK5, RXD5, TXD5, CTS5#/RTS5# SCK6, RXD6, TXD6, CTS6#/RTS6# SCK8, RXD8, TXD8, CTS8#/RTS8# SCK9, RXD9, TXD9, CTS9#/RTS9# • SCI I/O pins (simple I²C mode) SSCL0, SSDA0, SSCL1, SSDA1, SSCL5, SSDA5, SSCL6, SSDA6, SSCL8, SSDA8, SSCL9, SSDA9, • SCI I/O pins (simple SPI mode) SCK0, SMISO0, SMOSI0, SS0#, SCK1, SMISO1, SMOSI1, SS1#, SCK5, SMISO5, SMOSI5, SS5#, SCK6, SMISO6, SMOSI6, SS6#, SCK8, SMISO8, SMOSI8, SS8#, SCK9, SMISO9, SMOSI9, SS9#,
Data transfer	Selectable between LSB-first or MSB-first transfer.	Selectable between LSB-first or MSB-first transfer.

Item		RX220 (SCIe)	RX130 (SCIg)
Interrupt sources		Transmit end, transmit data empty, receive data full, receive error, completion of generation of start condition, restart condition, or stop condition (simple I^2C mode)	Transmit end, transmit data empty, receive data full, receive error, completion of generation of start condition, restart condition, or stop condition (simple I^2C mode)
Low power consumption function		The module stop state can be specified for each channel.	The module stop state can be specified for each channel.
Asynchronous mode	Data length	7 or 8 bits	7, 8, or 9 bits
	Transmission stop bits	1 or 2 bits	1 or 2 bits
	Parity	Even parity, odd parity, or no parity	Even parity, odd parity, or no parity
	Receive error detection	Parity, overrun, and framing errors	Parity, overrun, and framing errors
	Hardware flow control	The CTSn# and RTSn# pins can be used to control transmission and reception.	The CTSn# and RTSn# pins can be used to control transmission and reception.
	Start bit detection	Selectable between low level and falling edge.	Selectable between low level and falling edge.
	Break detection	When a framing error occurs, a break can be detected by reading the RXDn pin level directly.	When a framing error occurs, a break can be detected by reading the RXDn pin level directly.
	Clock source	An internal or external clock can be selected. Transfer rate clock input from the TMR can be used (SCI5 and SCI6).	An internal or external clock can be selected. Transfer rate clock input from the TMR can be used (SCI5 and SCI6).
	Double-speed mode	—	Baud rate generator double-speed mode is selectable.
	Multi-processor communication function	Serial communication among multiple processors	Serial communication among multiple processors
	Noise cancellation	The signal paths from input on the RXDn pins incorporate on-chip digital noise filters.	The signal paths from input on the RXDn pins incorporate on-chip digital noise filters.
Clock synchronous mode	Data length	8 bits	8 bits
	Receive error detection	Overrun error	Overrun error
	Hardware flow control	The CTSn# and RTSn# pins can be used to control transmission and reception.	The CTSn# and RTSn# pins can be used to control transmission and reception.
Smart card interface mode	Error processing	An error signal can be transmitted automatically when a parity error is detected during reception.	An error signal can be transmitted automatically when a parity error is detected during reception.
		Data can be retransmitted automatically when an error signal is received during transmission.	Data can be retransmitted automatically when an error signal is received during transmission.
	Data type	Both direct convention and inverse convention are supported.	Both direct convention and inverse convention are supported.

Item		RX220 (SCIe)	RX130 (SCIg)
Simple I²C mode	Communication format	I²C bus format	I²C bus format
	Operating mode	Master (single-master operation only)	Master (single-master operation only)
	Transfer speed	Fast mode is supported.	Fast mode is supported.
	Noise canceler	The signal paths from input on the SSCLn and SSDAn pins incorporate on-chip digital noise filters, and the noise cancellation bandwidth is adjustable.	The signal paths from input on the SSCLn and SSDAn pins incorporate on-chip digital noise filters, and the noise cancellation bandwidth is adjustable.
Simple SPI mode	Data length	8 bits	8 bits
	Error detection	Overrun error	Overrun error
	SS input pin function	Applying a high-level signal to the SSn# pin causes the output pins to enter the high-impedance state.	Applying a high-level signal to the SSn# pin causes the output pins to enter the high-impedance state.
	Clock settings	Selectable among four clock phase and clock polarity settings.	Selectable among four clock phase and clock polarity settings.
Bit rate modulation function		—	On-chip baud rate generator output correction can reduce errors.
Event link function (supported by SCI5 only)		Error (receive error or error signal detection) event output	Error (receive error or error signal detection) event output
		Receive data full event output	Receive darta full event output
		Transmit data empty event output	Transmit data empty event output
		Transmit end event output	Transmit end event output

Table 2.39 Comparative Overview of Serial Communication Interface (SCIf: RX220, SCIg: SCIh)

Item	RX220 (SCIf)	RX130 (SCIh)
Number of channels	1 channels (SCI12)	1 channels (SCI12)
Serial communication modes	• Asynchronous • Clock synchronous • Smart card interface • Simple I²C bus • Simple SPI bus	• Asynchronous • Clock synchronous • Smart card interface • Simple I²C bus • Simple SPI bus
Transfer speed	Bit rate specifiable by on-chip baud rate generator.	Bit rate specifiable by on-chip baud rate generator.
Full-duplex communication	• Transmitter: Continuous transmission possible using double-buffer configuration. • Receiver: Continuous reception possible using double-buffer configuration.	• Transmitter: Continuous transmission possible using double-buffer configuration. • Receiver: Continuous reception possible using double-buffer configuration.

Item		RX220 (SCIf)	RX130 (SCIh)
I/O pins		• SCI I/O pins (asynchronous mode and clock synchronous mode) SCK12, RXD12, TXD12, CTS12#/RTS12# • SCI I/O pins (simple I²C mode) SSCL12, SSDA12 • SCI I/O pins (simple SPI mode) SCK12, SMISO12, SMOSI12, SS12# • SCI I/O pins (extended serial mode) RXDX12, TXDX12, SIOX12	• SCI I/O pins (asynchronous mode and clock synchronous mode) SCK12, RXD12, TXD12, CTS12#/RTS12# • SCI I/O pins (simple I²C mode) SSCL12, SSDA12 • SCI I/O pins (simple SPI mode) SCK12, SMISO12, SMOSI12, SS12# • SCI I/O pins (extended serial mode) RXDX12, TXDX12, SIOX12
Data transfer		Selectable between LSB-first or MSB-first transfer.	Selectable between LSB-first or MSB-first transfer.
Interrupt sources		Transmit end, transmit data empty, receive data full, receive error, completion of generation of start condition, restart condition, or stop condition (simple I²C mode)	Transmit end, transmit data empty, receive data full, receive error, completion of generation of start condition, restart condition, or stop condition (simple I²C mode)
Low power consumption function		The module stop state can be specified for each channel.	The module stop state can be specified for each channel.
Asynchronous mode	Data length	7 or 8 bits	7, 8, or 9 bits
	Transmission stop bits	1 or 2 bits	1 or 2 bits
	Parity	Even parity, odd parity, or no parity	Even parity, odd parity, or no parity
	Receive error detection	Parity, overrun, and framing errors	Parity, overrun, and framing errors
	Hardware flow control	The CTSn# and RTSn# pins can be used to control transmission and reception.	The CTSn# and RTSn# pins can be used to control transmission and reception.
	Start bit detection	Selectable between low level and falling edge.	Selectable between low level and falling edge.
	Break detection	When a framing error occurs, a break can be detected by reading the RXDn pin level directly.	When a framing error occurs, a break can be detected by reading the RXDn pin level directly.
	Clock source	An internal or external clock can be selected. Transfer rate clock input from the TMR can be used (SCI5 and SCI6).	An internal or external clock can be selected. Transfer rate clock input from the TMR can be used (SCI5 and SCI6).
	Double-speed mode	—	Baud rate generator double-speed mode is selectable.
	Multi-processor communication function	Serial communication among multiple processors	Serial communication among multiple processors
	Noise cancellation	The signal paths from input on the RXDn pins incorporate on-chip digital noise filters.	The signal paths from input on the RXDn pins incorporate on-chip digital noise filters.
Clock synchronous mode	Data length	8 bits	8 bits
	Receive error detection	Overrun error	Overrun error

Item		RX220 (SCIf)	RX130 (SCIh)
	Hardware flow control	The CTSn# and RTSn# pins can be used to control transmission and reception.	The CTSn# and RTSn# pins can be used to control transmission and reception.
Smart card interface mode	Error processing	An error signal can be transmitted automatically when a parity error is detected during reception.	An error signal can be transmitted automatically when a parity error is detected during reception.
		Data can be retransmitted automatically when an error signal is received during transmission.	Data can be retransmitted automatically when an error signal is received during transmission.
	Data type	Both direct convention and inverse convention are supported.	Both direct convention and inverse convention are supported.
Simple I^2C mode	Communication format	I^2C bus format	I^2C bus format
	Operating mode	Master (single-master operation only)	Master (single-master operation only)
	Transfer speed	Fast mode is supported.	Fast mode is supported.
	Noise canceler	The signal paths from input on the SSCLn and SSDAn pins incorporate on-chip digital noise filters, and the noise cancellation bandwidth is adjustable.	The signal paths from input on the SSCLn and SSDAn pins incorporate on-chip digital noise filters, and the noise cancellation bandwidth is adjustable.
Simple SPI mode	Data length	8 bits	8 bits
	Error detection	Overrun error	Overrun error
	SS input pin function	Applying a high-level signal to the SSn# pin causes the output pins to enter the high-impedance state.	Applying a high-level signal to the SSn# pin causes the output pins to enter the high-impedance state.
	Clock settings	Selectable among four clock phase and clock polarity settings.	Selectable among four clock phase and clock polarity settings.
Extended serial mode	Start frame transmission	• Output of the break field low width and generation of an interrupt on detection • Detection of bus collisions and the generation of interrupts on detection	• Output of the break field low width and generation of an interrupt on detection • Detection of bus collisions and the generation of interrupts on detection
	Start frame reception	• Detection of the break field low width and generation of an interrupt on detection • Comparison of data in control fields 0 and 1 and generation of an interrupt when the two match • Two kinds of data for comparison (primary and secondary) can be set in control field 1. • A priority interrupt bit can be set in control field 1. • Support for handling of start frames that do not include a break field • Support for handling of start frames that do not include control field 0 • Function for measuring bit rates	• Detection of the break field low width and generation of an interrupt on detection • Comparison of data in control fields 0 and 1 and generation of an interrupt when the two match • Two kinds of data for comparison (primary and secondary) can be set in control field 1. • A priority interrupt bit can be set in control field 1. • Support for handling of start frames that do not include a break field • Support for handling of start frames that do not include control field 0 • Function for measuring bit rates

Item		RX220 (SCIf)	RX130 (SCIh)
Extended serial mode	I/O control functions	• Selectable polarity for TXDX12 and RXDX12 signals • Ability to enable digital filter function for RXDX12 • Half-duplex operation employing RXDX12 and TXDX12 signals multiplexed on the same pin • Selectable timing for the sampling of data received through RXDX12 • Signals received on RXDX12 can be passed through to SCIg when the extended serial mode control section is off.	• Selectable polarity for TXDX12 and RXDX12 signals • Ability to enable digital filter function for RXDX12 • Half-duplex operation employing RXDX12 and TXDX12 signals multiplexed on the same pin • Selectable timing for the sampling of data received through RXDX12 • Signals received on RXDX12 can be passed through to SCIg when the extended serial mode control section is off.
	Timer function	Usable as a reloading timer	Usable as a reloading timer
Bit rate modulation function		—	On-chip baud rate generator output correction can reduce errors.

2.19 Serial Peripheral Interface

Table 2.42 shows a comparative overview of the serial peripheral interface specifications, and Table 2.43 shows a comparative listing of the serial peripheral interface registers.

Table 2.42 Comparative Overview of Serial Peripheral Interface

Item	RX220 (RSPI)	RX130 (RSPIa)
Number of channels	1 channel	1 channel
RSPI transfer functions	• Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (RSPI clock) signals allows serial communication through SPI operation (4-wire method) or clock synchronous operation (3-wire method). • Transmit-only operation is available. • Serial communication is available in master and slave mode. • Switching of the polarity of RSPCK is supported. • Switching of the phase of RSPCK is supported.	• Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (RSPI clock) signals allows serial communication through SPI operation (4-wire method) or clock synchronous operation (3-wire method). • Transmit-only operation is available. • Communication mode: Full-duplex or transmit-only can be selected. • Switching of the polarity of RSPCK is supported. • Switching of the phase of RSPCK is supported.
Data format	• Selectable between MSB-first and LSB-first. • Transfer bit length is selectable among 8, 9, 10, 11, 12, 13, 14, 15, 16, 20, 24, or 32 bits. • 128-bit transmit/receive buffers • Up to four frames can be transferred in one round of transmission/reception (with each frame consisting of up to 32 bits).	• Selectable between MSB-first and LSB-first. • Transfer bit length is selectable among 8, 9, 10, 11, 12, 13, 14, 15, 16, 20, 24, or 32 bits. • 128-bit transmit/receive buffers • Up to four frames can be transferred in one round of transmission/reception (with each frame consisting of up to 32 bits).

Item	RX220 (RSPI)	RX130 (RSPIa)
Bit rate	• In master mode, the on-chip baud rate generator generates RSPCK by frequency-dividing PCLK (the maximum division ratio is 4,096). • In slave mode, the externally input clock is used as the serial clock (the maximum frequency is PCLK divided by 8). Width at high level: 4 cycles of PCLK; width at low level: 4 cycles of PCLK	• In master mode, the on-chip baud rate generator generates RSPCK by frequency-dividing PCLK (the division ratio ranges from 2 to 4096). • In slave mode, the minimum PCLK clock divided by 8 can be input as RSPCK (the maximum frequency of RSPCK is PCLK divided by 8). Width at high level: 4 cycles of PCLK; width at low level: 4 cycles of PCLK
Buffer configuration	• The transmit and receive buffers have a double buffer configuration. • The transmit and receive buffers are each 128 bits in size.	• The transmit and receive buffers have a double buffer configuration. • The transmit and receive buffers are each 128 bits in size.
Error detection	• Mode fault error detection • Overrun error detection • Parity error detection	• Mode fault error detection • Overrun error detection • Parity error detection
SSL control function	• Four SSL pins (SSLA0 to SSLA3) for each channel • In single-master mode, SSLA0 to SSLA3 pins are output. • In multi-master mode: SSLA0 pin is input, and SSLA1 to SSLA3 pins are either output or unused. • In slave mode: SSLA0 pin is input, and SSLA1 to SSLA3 pins are unused. • Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay) Setting range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable delay from RSPCK stop to SSL output negation (SSL negation delay) Setting range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable wait for next-access SSL output assertion (next-access delay) Setting range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • SSL polarity-change function	• Four SSL pins (SSLA0 to SSLA3) for each channel • In single-master mode, SSLA0 to SSLA3 pins are output. • In multi-master mode: SSLA0 pin is input, and SSLA1 to SSLA3 pins are either output or unused. • In slave mode: SSLA0 pin is input, and SSLA1 to SSLA3 pins are unused. • Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay) Setting range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable delay from RSPCK stop to SSL output negation (SSL negation delay) Setting range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable wait for next-access SSL output assertion (next-access delay) Setting range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • SSL polarity-change function

Item	RX220 (RSPI)	RX130 (RSPIa)
Control in master transfer	• Transfers of up to eight commands can be performed sequentially in looped execution. • For each command, the following can be set: SSL signal value, bit rate, RSPCK polarity/phase, transfer data length, LSB/MSB-first, burst, RSPCK delay, SSL negation delay, and next-access delay • A transfer can be initiated by writing to the transmit buffer. • The MOSI signal value when SSL is negated can be specified.	• Transfers of up to eight commands can be performed sequentially in looped execution. • For each command, the following can be set: SSL signal value, bit rate, RSPCK polarity/phase, transfer data length, LSB/MSB-first, burst, RSPCK delay, SSL negation delay, and next-access delay • A transfer can be initiated by writing to the transmit buffer. • The MOSI signal value when SSL is negated can be specified. • RSPCK auto-stop function
Interrupt sources	maskable interrupt sources: • RSPI receive interrupt (receive buffer full) • RSPI transmit interrupt (transmit buffer empty) • RSPI error interrupt (mode fault, overrun, parity error) • RSPI idle interrupt (RSPI idle)	Interrupt sources: • Receive buffer full interrupt • transmit buffer empty interrupt • RSPI error interrupt (mode fault, overrun, parity error) • RSPI idle interrupt (RSPI idle)
Event link function (output)	The five events can be output to the event link controller: • Receive buffer run event output • Transmit buffer empty event output • Mode fault, overrun, or parity error event output • RSPI idle event output • Transmit end event output	—
Other functions	• Function for switching between CMOS output and open-drain output • Function for initializing the RSPI • Loopback mode function	• Function for switching between CMOS output and open-drain output • Function for initializing the RSPI • Loopback mode function
Low power consumption function	It is possible to specify the module stop state.	It is possible to specify the module stop state.

Table 2.43 Comparative Listing of Serial Peripheral Interface Registers

Register	Bit	RX220 (RSPI)	RX130 (RSPIa)
SPCR2	SCKASE	—	RSPCK auto-stop function enable bit

	SPRF	—	Receive Buffer Full Flag

2.20 12-Bit A/D Converter

Table 2.44 shows a comparative overview of the 12-bit A/D converter specifications, and Table 2.45 shows a comparative listing of the 12-bit A/D converter registers.

Table 2.44 Comparative Overview of 12-Bit A/D Converter

Item	RX220 (S12ADb)	RX130 (S12ADE)
Number of units	1 unit	1 unit
Input channels	16 channels	24 channels
Extended analog function	Internal reference voltage	Temperature sensor output, internal reference voltage
A/D conversion method	Successive approximation method	Successive approximation method
Resolution	12 bits	12 bits
Conversion time	1.56 µs per channel (when operating with A/D conversion clock ADCLK = 32 MHz)	1.4 µs per channel (when operating with A/D conversion clock ADCLK = 32 MHz)
A/D conversion clock	Peripheral module clock PCLK and A/D conversion clock ADCLK can be set so that the division ratio is one of the following: PCLK: ADCLK division ratio = 1:1, 1:2, 1:4, 1:8, 2:1, 4:1 ADCLK is set using the clock generation circuit.	Peripheral module clock PCLK and A/D conversion clock ADCLK can be set so that the frequency ratio is one of the following: PCLK: ADCLK frequency ratio = 1:1, 1:2, 2:1, 4:1, 8:1 ADCLK is set using the clock generation circuit.
Data register	• For analog input: 16 data registers • One data register for each unit for A/D conversion data multiplexing in double trigger mode • For internal reference voltage: One data register • 1 register per unit for self-diagnostics • The results of A/D conversion are stored in 12-bit A/D data registers. • In addition mode, A/D conversion results are added and stored in A/D data registers as 14-bit data. Duplication of A/D conversion data • A/D conversion data of one selected analog input channel is stored in A/D data register y when conversion is started by the first trigger and into the duplication register when started by the second trigger.	• For analog input: 24 data registers • One data register for each unit for A/D conversion data multiplexing in double trigger mode • For temperature sensor: One data register • For internal reference voltage: One data register • 1 register per unit for self-diagnostics • The results of A/D conversion are stored in 12-bit A/D data registers. • Output of A/D conversion results at 12-bit precision • The value obtained by adding up A/D-converted results is stored as a value (number of conversion accuracy bits + 2 bits/4 bits) in the A/D data registers in A/D-converted value addition mode. • Double trigger mode (selectable in single scan and group scan modes) • The first piece of A/D-converted analog-input data on one selected channel is stored in the data register for the channel, and the second piece is stored in the duplication register.

Item	RX220 (S12ADb)	RX130 (S12ADE)
Data register	• Duplication is available only in double trigger mode in single scan mode or group scan mode.	
Operating mode	• Single scan mode: — A/D conversion is performed only once on the analog inputs of up To 16 user-selected channels. — A/D conversion is performed only once on the internal reference voltage. • Continuous scan mode: — A/D conversion is performed repeatedly on the analog inputs of up to 16 user-selected channels. • Group scan mode: — Up to 16 channels of analog input are divided between group A and group B, and A/D conversion is performed only once on all the channels in the selected group. — The scanning start conditions can be selected independently for group A and group B allowing conversion to start at a different time for each group.	• Single scan mode: — A/D conversion is performed only once on the analog inputs of up to 24 user-selected channels. — A/D conversion is performed only once on the temperature sensor output. — A/D conversion is performed only once on the internal reference voltage. • Continuous scan mode: — A/D conversion is performed repeatedly on the analog inputs of up to 24 user-selected channels. • Group scan mode: — Up to 24 channels of analog input are divided between group A and group B, and A/D conversion is performed only once on all the channels in the selected group. — The scanning start conditions (synchronous triggers) can be selected independently for group A and group B allowing conversion to start at a different time for each group. • Group scan mode (with group A priority control selected): — If a group A trigger is input when A/D conversion on group B is in progress, scanning of group B is stopped and scanning of group A starts. — Restart of A/D conversion on group B (rescan) after completion of A/D conversion on group A can be enabled.
A/D conversion start conditions	• Software trigger • Synchronous trigger Conversion start is triggered by the MTU and ELC. • Asynchronous trigger A/D conversion can be triggered by the ADTRG0# pin.	• Software trigger • Synchronous trigger Conversion start is triggered by the multi-function timer pulse unit (MTU) and event link controller (ELC). • Asynchronous trigger A/D conversion can be started by the external trigger ADTRG0# pin.

Item	RX220 (S12ADb)	RX130 (S12ADE)
Functions	• Sample-and-hold function • Variable sampling state count • Self-diagnostic function for 12-bit A/D converter • Selectable A/D-converted value adding mode • Analog input disconnection detection function • Double trigger mode (duplication of A/D conversion data)	• Sample-and-hold function • Variable sampling state count • Self-diagnostic function for 12-bit A/D converter • Selectable A/D-converted value adding mode or averaging mode • Analog input disconnection detection function (discharge function/precharge function) • Double trigger mode (duplication of A/D conversion data) • A/D data register auto-clear function • Compare function (window A, window B) • Ring buffers (16) for compare function
Interrupt sources	• In modes other than double trigger mode and group scan mode, an A/D scan end interrupt request (S12ADI0) can be generated on completion of a single scan. • In double trigger mode, an A/D scan end interrupt request (S12ADI0) can be generated on completion of a double scan. • In group scan mode, a scan end interrupt request (S12ADI0) can be generated on completion of a group A scan. On completion of a group B scan a dedicated group B scan end interrupt request (GBADI) can be generated. • When double trigger mode is selected in group scan mode, a scan end interrupt request (S12ADI0) can be generated on completion of two scans of group A. On completion of a group B scan a dedicated scan end interrupt request (GBADI) can be generated. • The DMA controller (DMAC) or data transfer controller (DTC) can be activated by the S12ADI0 or GBADI interrupt.	• In modes other than double trigger mode and group scan mode, an A/D scan end interrupt request (S12ADI0) can be generated on completion of a single scan. • In double trigger mode, an A/D scan end interrupt request (S12ADI0) can be generated on completion of a double scan. • In group scan mode, a scan end interrupt request (S12ADI0) can be generated on completion of a group A scan. On completion of a group B scan a dedicated group B scan end interrupt request (GBADI) can be generated. • When double trigger mode is selected in group scan mode, a scan end interrupt request (S12ADI0) can be generated on completion of two scans of group A. On completion of a group B scan a dedicated scan end interrupt request (GBADI) can be generated. • The data transfer controller (DTC) can be activated by the S12ADI0 or GBADI interrupt.

Item	RX220 (S12ADb)	RX130 (S12ADE)
Event link function	• In group scan mode an ELC event can be generated on completion of scans other than group B scan. • Scanning can be started by a trigger from the ELC.	• In group scan mode an ELC event can be generated on completion of scans other than group B scan. • An ELC event can be generated on completion of group B scan in group scan mode. • An ELC event can be generated at end of all scans. • Scanning can be started by a trigger from the ELC. • An ELC event can be generated according to the window compare function event conditions in single scan mode.
Low power consumption function	It is possible to specify the module stop state.	It is possible to specify the module stop state.

ADBUFn (n = 0 to 15)	—	—	A/D data storage buffer register n
ADBUFEN	—	—	A/D data storage buffer enable register
ADBUFPTR	—	—	A/D data storage buffer pointer register

2.21 Comparator

Table 2.46 shows a comparative overview of the comparator, and Table 2.47 shows a comparative listing of comparator registers.

Table 2.46 Comparative Overview of Comparator

Item	RX220(CMPA)	RX130(CMPBa)
Analog input voltage	Input voltage to the CMPAn pin (n = 1, 2)	Input voltage to the CMPBn pin (n = 0, 1)
Reference input voltage	Input voltage to the CVREFA pin	Input voltage to the CVREFBn pin (n = 0, 1) or internal reference voltage
Comparison result monitor	LVDnMON bit in the LVDnSR register (n = 1, 2)	Read from the CPBFLG.CPBnOUT flag (n = 0, 1)
Comparison result output	Comparison result can be output from a port by going through the event link controller (ELC).	The comparison result can be output to the CMPOBn pin (n = 0, 1).
Interrupt request generation timing	Input voltage to the CMPA1 pin has risen above or fallen below the CVREFA pin reference input voltage, or either of the two.	When comparator B0 comparison result changes When comparator B1 comparison result changes
Event generation timing to ELC	Input voltage to the CMPA1 pin has risen above or fallen below the CVREFA pin reference input voltage, or either of the two.	When comparator B0 comparison result changes When comparator B0 or comparator B1 comparison result changes
Selectable function	• Digital filter function Whether the digital filter is applied or not, and the sampling frequency can be selected.	• Digital filter function Whether the digital filter is applied or not, and the sampling frequency can be selected. • Window function Whether the window function is enabled or disabled (low-side reference (VRFL)) < CMPBn (n = 0, 1) < high-side reference (VRFH)) can be selected. • Reference input voltage CVREFBn pin input or internal reference voltage (generated internally) can be selected (n = 0, 1). • Comparator B response speed High-speed mode/low-speed mode can be selected.
Low power consumption function	—	Module stop state can be set.

Register	Bit	RX220	RX130
FWEPROR	—	Flash write erase protection register	—
FMODR	—	Flash mode register	—
FASTAT	—	Flash access status register	—
FAEINT	—	Flash access error interrupt enable register	—
FSTATR0	PRGSPD	Programming suspend status bit	—
	ERSSPD	Erasure suspend status bit	—
	SUSRDY	Suspend ready bit	—
	ERSERR	Erasure error bit	—
	FRDY	Flash ready bit	—
	ERERR	—	Erase error flag
	BCERR	—	Blank check error flag
	EILGLERR	—	Extra area illegal command error flag
FSTATR1	FLOCKST	Lock bit status bit	—
	FCUERR	FCU error bit	—
	DRRDY	—	Data read ready flag
	FRDY	—	Flash ready flag
	EXRDY	—	Extra area ready flag
FRDYIE	—	Flash ready interrupt enable register	—
FPROTR	—	Flash protection register	—
FRESETR	FRESET	Flash reset bit 0: FCU is not reset. 1: FCU is reset.	Flash reset bit 0: Reset of flash control circuit is canceled. 1: Reset of flash control circuit is reset.
	FRKEY[7:0]	Key code	—
FCMDR	—	FCU command register	—
FCPSR	—	FCU processing switching register	—
FPESTAT	—	Flash P/E status register	—
PCKAR	—	Peripheral clock notification register	—
DFLRE0	—	E2 data flash read enable register 0	—
DFLWE0	—	E2 data flash programming/erasure enable register 0	—
DFLBCCNT	—	E2 data flash blank check control register	—
DFLBCSTAT	—	E2 data flash blank check status register	—
DFLCTL	—	—	E2 data flash control register
FPR	—	—	Protection unlock register
FPSR	—	—	Protection unlock status register
FPMCR	—	—	Flash P/E mode control register
FISR	—	—	Flash initial settings register
FASR	—	—	Flash area select register
FCR	—	—	Flash control register
FEXCR	—	—	Flash extra area control register
FSARH	—	—	Flash processing start address register H

Register	Bit	RX220	RX130
FSARL	—	—	Flash processing start address register L
FEARH	—	—	Flash processing end address register H
FEARL	—	—	Flash processing end address register L
FRBH	—	—	Flash read buffer register H
FRBL	—	—	Flash read buffer register L
FWBH	—	—	Flash write buffer register H
FWBL	—	—	Flash write buffer register L
FEAMH	—	—	Flash error address monitor register H
FEAML	—	—	Flash error address monitor register L
FSCMR	—	—	Flash start-up setting monitor register
FAWSMR	—	—	Flash access window start address monitor register
FAWEMR	—	—	Flash access window end address monitor register
UIDRn (n = 0 to 31)	—	—	Unique ID register n

2.24 Flash Memory (E2 Data Flash)

Table 2.51 shows a comparative overview of the flash memory (E2 Data flash) specifications.

Table 2.51 Comparative Overview of Flash Memory (E2 Data Flash) Specifications

Item	RX220	RX130
Memory capacity	8 Kbytes	8 Kbytes
Value after erasure	Undefined	FFh
Block configuration	Block: 128 bytes	Block: 1 Kbytes
Number of blocks	64	8

2.25 Package (LFQFP48/64/100 only)

There are some differences in the outline drawing of the LFQFP48, LFQFP64, LFQFP100 package, so please be careful when designing the board.

For details, refer to Design Guide for Migration between RX Family: Differences in Package External form (R01AN4591EJ).

Table 2.52 Comparison of package codes

Item	RX220	RX130
48 pin LFQFP	PLQP0048KB-A	PLQP0048KB-B
64 pin LFQFP	PLQP0064KB-A	PLQP0064KB-C
100 pin LFQFP	PLQP0100KB-A	PLQP0100KB-B

3. Comparison of Pin Functions

The pin functions are compared below, and a comparative listing of power supply, clock, and system control pins is provided. Items present on only one group are shown in blue. Items with identical specifications on both groups are shown in **black**.

3.1 100-Pin Package

Table 3.1lists the pin functions on products with the 100-pin package.

Table 3.1 Comparison of Pin Functions on 100-Pin Package Products

Pin No.	I/O Port	RX220	RX130
1	P06*1	(Non-Connection)	P06
2	P03	P03	DA0
3	P04*1	(Non-Connection)	P04
4	PJ3	MTIOC3C,CTS6#,RTS6#,SS6#	MTIOC3C,CTS6#,RTS6#,SS6#
5	—	VCL	VCL
6	PJ1	MTIOC3A	MTIOC3A
7	—	MD,FINED	MD,FINED
8	—	XCIN	XCIN
9	—	XCOUT	XCOUT
10	—	RES#	RES#
11	P37	XTAL	XTAL
12	—	VSS	VSS
13	P36	EXTAL	EXTAL
14	—	VCC	VCC
15	P35	NMI	NMI
16	P34	MTIOC0A,TMCI3,POE2#,SCK6,IRQ4	MTIOC0A,TMCI3,POE2#,SCK6,IRQ4
17	P33	MTIOC0D,TMRI3,POE3#,RXD6,SMISO6,SSCL6,IRQ3	MTIOC0D,TMRI3,POE3#,RXD6,SMISO6,SSCL6,IRQ3
18	P32	MTIOC0C,TMO3,TXD6,SMOSI6,SSDA6,IRQ2,RTCOUT	MTIOC0C,TMO3,TXD6,SMOSI6,SSDA6,TS0,IRQ2,RTCOUT
19	P31	MTIOC4D,TMCI2,CTS1#,RTS1#,SS1#,IRQ1	MTIOC4D,TMCI2,CTS1#,RTS1#,SS1#,TS1,IRQ1
20	P30	MTIOC4B,TMRI3,POE8#,RXD1,SMISO1,SSCL1,IRQ0	MTIOC4B,POE8#,TMRI3,RXD1,SMISO1,SSCL1,TS2,IRQ0
21	P27	MTIOC2B,TMCI3,SCK1	MTIOC2B,TMCI3,SCK1,TS3
22	P26	MTIOC2A,TMO1,TXD1,SMOSI1,SSDA1	MTIOC2A,TMO1,TXD1,SMOSI1,SSDA1,TS4
23	P25	MTIOC4C,MTCLKB,ADTRG0#	MTIOC4C,MTCLKB,ADTRG0#
24	P24	MTIOC4A,MTCLKA,TMRI1	MTIOC4A,MTCLKA,TMRI1
25	P23	MTIOC3D,MTCLKD	MTIOC3D,MTCLKD,CTS0#,RTS0#,SS0#
26	P22	MTIOC3B,MTCLKC,TMO0	MTIOC3B,MTCLKC,TMO0,SCK0
27	P21	MTIOC1B,TMCI0	MTIOC1B,TMCI0,RXD0,SMISO0,SSCL0
28	P20	MTIOC1A,TMRI0	MTIOC1A,TMRI0,TXD0,SMOSI0,SSDA0
29	P17	MTIOC3A,MTIOC3B,TMO1,POE8#,SCK1,MISOA,SDA,IRQ7, (5V tolerant)	MTIOC3A,MTIOC3B,TMO1,POE8#,SCK1,MISOA,SDA0,IRQ7, (5V tolerant)
30	P16	MTIOC3C,MTIOC3D,TMO2,TXD1,SMOSI1,SSDA1,MOSIA,SCL,IRQ6,RTCOUT,ADTRG0#, (5V tolerant)	MTIOC3C,MTIOC3D,TMO2,TXD1,SMOSI1,SSDA1,MOSIA,SCL0,IRQ6,RTCOUT,ADTRG0#, (5V tolerant)
31	P15	MTIOC0B,MTCLKB,TMCI2,RXD1,SMISO1,SSCL1,IRQ5	MTIOC0B,MTCLKB,TMCI2,RXD1,SMISO1,SSCL1,TS5,IRQ5

Pin No.	I/O Port	RX220	RX130
32	P14	MTIOC3A,MTCLKA,TMRI2,CTS1#,RTS1#,SS1#,IRQ4	MTIOC3A,MTCLKA,TMRI2,CTS1#,RTS1#,SS1#,TS6,IRQ4
33	P13	MTIOC0B,TMO3,SDA,IRQ3, (5V tolerant)	MTIOC0B,TMO3,SDA0,IRQ3, (5V tolerant)
34	P12	TMCI1,SCL,IRQ2, (5V tolerant)	TMCI1,SCL0,IRQ2, (5V tolerant)
35	PH3	TMCI0	TMCI0,TS7
36	PH2	TMRI0,IRQ1	TMRI0,TS8,IRQ1

Note 1. I/O port implemented on the RX130 only. Not implemented on the RX220.

4. Notes on Migration

When migrating from the RX220 Group to the RX130 Group, a few points need to be considered with regard to hardware and software.

The points related to hardware are covered in 4.1, Important Points Regarding Pin Design, and the points related to software are covered in 4.2, Important Points Regarding Function Settings.

4.1 Important Points Regarding Pin Design

The RX220 Group and RX130 Group are pin compatible to enable easy migration, but some pins need to be handled differently because the product series are different.

4.1.1 Power Supply Pin

The upper limit of the operating frequency range differs between the RX220 Group and RX130 Group, depending on the voltage (Vcc) applied to the power supply pin. Make sure to use the power supply voltage that is appropriate for the operating frequency.

Table 4.1 Power Supply Voltage and Operating Frequency

MCU	Power Supply Voltage/Operating Frequency		
RX220	1.62 V to 2.7 V / 8 MHz		2.7 V to 5.5 V / 32 MHz
RX130	1.8 V to 2.4 V / 8 MHz	2.4 V to 2.7 V / 16 MHz	

4.1.2 Main Clock Oscillator

When VCC ≥ 2.4 V, the connectable main clock frequency range of the RX130 Group is the same as that for the RX220 Group (1 MHz to 20 MHz). However, when VCC < 2.4 V, the main clock frequency of the RX130 Group is limited to a range of 1 MHz to 8 MHz.

4.1.3 VCL Pin (External Capacitor)

To stabilize the internal power supply, connect a smoothing capacitor to the VCL pin. For the RX220 Group use a smoothing capacitor rated at 0.1 µF, and for the RX130 Group use a smoothing capacitor rated at 4.7 µF.

4.1.4 Mode Setting Pin

On the RX220 Group the MD pin and PC7 pin are used to specify the mode after a reset, but on the RX130 Group only the MD pin is used for this purpose.

4.1.5 General-Purpose I/O Ports

Care must be exercised on the RX220 Group with ports P40 to P47, and on the RX130 Group with ports P03 to P07, P40 to P47, PJ6, and PJ7, because these I/O ports are dependent on AVCC. When they will not be used, these pins should be set as inputs and individually connected to AVCC via a resistor (pull-up), or they should be individually connected to VSS via a resistor (pull-down). Alternatively, they can be set as outputs and left open.

A pin that is set as an output and left open will be set as an input immediately after a reset, and the pin's voltage level will be unstable for the period it is set as an input. This can cause in increase in the power supply current.

4.1.6 Analog Input Pins

It is necessary to change references to the eight channels assigned to pins AN008 to AN015 on the RX220 Group to channels among the nine assigned to pins AN016 to AN021 and AN024 to AN026 on the RX130 Group.

Refer to 4.2.5, 12-Bit A/D Converter, regarding software related to analog inputs.

4.1.7 Analog Pins for Comparator A1

The PE3/CMPA1 pin and comparator A function of the RX220 Group are not implemented on the RX130 Group. The PE4/CMPA2 pin can be used as a detection target for the voltage detection 2 voltage detection circuit, but the functionality of comparator A2 differs from that of comparator A.

Change references to the PE3/CMPA1 pin of comparator A1 on the RX220 Group to the PA3/CMPB1 pin of comparator B on the RX130 Group.

4.2 Important Points Regarding Function Settings

Software that runs on the RX220 Group is highly compatible with RX130 Group software. Nevertheless, careful evaluation is needed to accommodate differences in certain aspects, such as operation timing and electrical characteristics.

Some important points regarding function settings in software for the RX220 Group and RX130 Group are described below. See 2, Comparative Overview of Functions, for details of the points of difference between modules and functions. These points should be carefully evaluated when making use of this application note.

4.2.1 Option-Setting Memory

The settings details for the IWDT timeout period select bits (IWDTTOPS[1:0]) in option function select register 0 (OFS0) and the voltage detection 0 level select bits (VDSEL[1:0]) in option function select register 1 (OFS1) in the flash memory differ between the RX220 Group and RX130 Group. Make sure to change the settings to appropriate values.

See 2.3, Option-Setting Memory for the points of difference. For details, refer to User's Manual: Hardware in 5, Reference Documents.

4.2.2 User Boot Mode

The RX220 Group has a user boot mode, but UB code A, UB code B, and user boot mode are not implemented on the RX130 Group.

As a substitute for user boot mode, on the RX130 Group it is possible to use the startup program protection function to program and read the user and data areas of the flash memory via a user-defined interface. For details, refer to the Startup Program Protection Function section in User's Manual: Hardware, listed in 5, Reference Documents.

4.2.3 Clock Generator Circuit

The RX130 Group has a PLL circuit, but no PLL circuit is implemented on the RX220 Group. On the RX130 Group the PLL circuit supports selection of multiplication factors from 4× to 8× (in increments of 0.5×) to generate a PLL oscillation frequency of 24 MHz to 32 MHz (VCC ≥ 2.4V), without frequency division. To use the PLL circuit, change these settings as appropriate.

In addition, the on-chip oscillator generation frequencies of the RX130 Group differ from those of the RX220 Group. The different generation frequencies are listed below.

Table 4.2 On-Chip Oscillator and Operating Frequency

On-Chip Oscillator	RX220	RX130
High-speed on-chip oscillator (HOCO)	32 MHz, 36.864 MHz, 40 MHz, or 50 MHz	32 MHz
Low-speed on-chip oscillator (LOCO)	125 kHz	4 MHz
IWDT-dedicated on-chip oscillator	125 kHz	15 kHz

For points of difference, see 2.5, Clock Generation Circuit. For details, refer to User's Manual: Hardware in 5, Reference Documents.

4.2.4 Low Power Consumption Functions

Change references to the all-module clock stop mode of the RX220 Group to deep sleep mode on the RX130 Group. Deep sleep mode provides power consumption equivalent to all-module clock stop mode.

Change the references to the operating power control modes to the following three modes:

- High-speed operating mode
- Middle-speed operating mode
- Low-speed operating mode

For points of difference, see 2.7, Low Power Consumption Functions. For details, refer to User's Manual: Hardware in 5, Reference Documents.

4.2.5 12-Bit A/D Converter

The functions of the 12-bit A/D converter have been enhanced on the RX130 Group, and the number of I/O registers used has increased. Also, change references in software to the eight channels assigned to pins AN008 to AN015 on the RX220 Group to channels among the nine assigned to pins AN016 to AN021 and AN024 to AN026 on the RX130 Group.

For points of difference, see 2.20, 12-Bit A/D Converter. For details, refer to the 12-Bit A/D Converter (S12ADE) section in User's Manual: Hardware, listed in 5, Reference Documents.

4.2.6 Comparator A

Comparator A is not implemented on the RX130 Group. Change references to comparator A of the RX220 Group to comparator B (comparator B0 or B1) on the RX130 Group.

For details, refer to User's Manual: Hardware in 5, Reference Documents.

4.2.7 Flash Memory

The flash memory on the RX130 Group has shorter programming and read times, resulting in increased production efficiency, lower power consumption, and reduced production costs for products incorporating it. To realize these benefits, software used for self-programming in single-chip mode on the RX220 Group will require appropriate modifications.

For points of difference related to the flash memory, see 2.23, Flash Memory. For details, refer to User's Manual: Hardware in 5, Reference Documents.

(R20UT0399EJ)

Technical Update/Technical News
(The technical updates issued after each referenced user manual are not reflected in this application note, so obtain latest version from the Renesas Electronics website.)

Revision History

Rev.	Date	Description	
		Page	Summary
1.00	Dec. 9, 2015	-	First edition issued
1.10	May. 8, 2019	Whole	Correspondence for 512KB and 100pin of RX130 Confirmed the contents of the description again (Addition of description mistake etc.)
		5	Add memory map comparison of address space
		7	Add area comparison of option setting memory
		18	Add Comparative Listing of Entering and Exiting Low Power Consumption Modes and Operating States in Each Mode
		33	Add comparative listing of functions assigned to each multiplexed pin
		40	Added comparison of pin function control register
		68	Add differences in package external form

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on

   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state

   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins

   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals

   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin

   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses

   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products

   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.
