

To our customers,

---

## Old Company Name in Catalogs and Other Documents

---

On April 1<sup>st</sup>, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

Send any inquiries to <http://www.renesas.com/inquiry>.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
  - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
  - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
  - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

## CHAPTER 1 OUTLINE

Most electric fans available in recent years employ microcomputers to provide various functions as value added, such as random blow simulating natural breeze, and employment of the Sleeping Timer that gradually reduce the air flow with time or gradually lengthens the intervals at which intermittent fan operation is carried out.

This Application Note introduces programs for the  $\mu$ PD17104 used to control the fan motor, head swing motor, and timers, for an electric fan.

The  $\mu$ PD17104 is a low-price "tiny microcontroller", which consists of 1K-byte ROM, 16-word RAM, and 16 I/O ports. The  $\mu$ PD17104 is suitable for electrical appliances, in which relatively simple control action is required, such as electric fans.

## CHAPTER 2 FUNCTIONS OF MICROCOMPUTER-CONTROLLED ELECTRIC FAN

### 2.1 FUNCTIONAL DESCRIPTION

This electric fan has the following functions:

- Wind speed selectable from Low, Medium, and High
- Random air flow changing wind velocity (Low random air flow, Medium random air flow, High random air flow)
- Electronics timer for 30 minute, 1 hour, or 2 hour operation
- Sleeping Timer for 1 hour, 2 hour, or 4 hour operation (Sleeping Timer: repeats ON → OFF → ON, and gradually lengthens intervals at which intermittent fan operation is carried out.)
- Motor specifically provided for head swing operation

### 2.2 INPUT KEYS AND OPERATION

- On/Air flow key . . . . . Air velocity changes from Low, to Medium, to High, then to Low by repeatedly pressing the key. Initially low is selected. The LED indication corresponds to the air velocity.
- Timer key . . . . . Timer length changes from 30 minutes to 1 hour, to 2 hours, to Timer-OFF, then to 30 minutes by repeatedly pressing the key. The LED indication corresponds to the timer length.
- Sleeping Timer key . . . . . Sleeping Timer length changes from 1 hour, to 2 hours, to 4 hours, to Sleeping Timer-OFF, then to 1 hour by repeatedly pressing the key. The LED indication corresponds to the Sleeping Timer length.  
ON → OFF → ON → is repeated in the pattern shown in the following page.

The air flow during ON time can be selected from Low, Medium, High, and random air flows.

- Random key . . . . . When this key is pressed, air flow randomly changes and the random LED illuminates. Normal operation can be resumed by pressing this key again (the random LED also goes OFF).  
By using this key, in conjunction with On/Air flow key, Low random air flow, Medium random air flow, or High random air flow can be selected.
- Head swing key . . . . . When this key is pressed, the fan head swings to left and right, and the head swing LED also illuminates. Head swing can be stopped by pressing this key again (the head swing LED also goes OFF).
- OFF key . . . . . When this key is pressed, all LEDs go off, and the operation of the fan stops.

**2.3 DISPLAY**

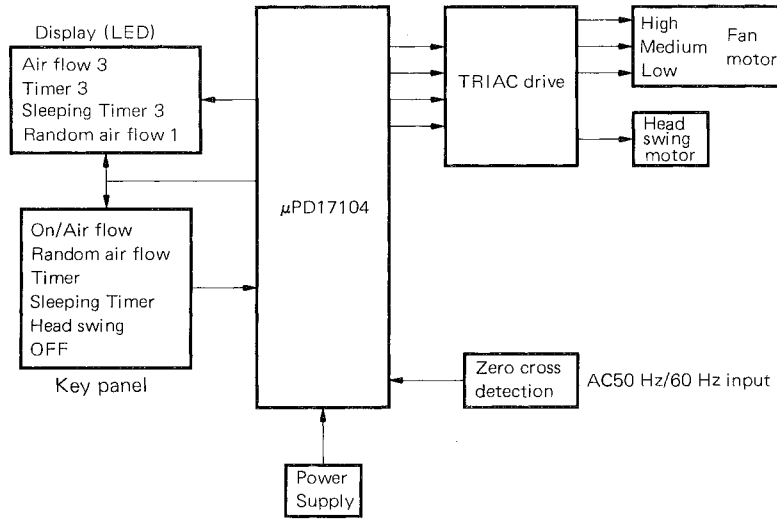

Ten LEDs are used, as shown in the figure below, to indicate such as the air flow's and time.

## CHAPTER 3 HARDWARE AND SOFTWARE SPECIFICATIONS

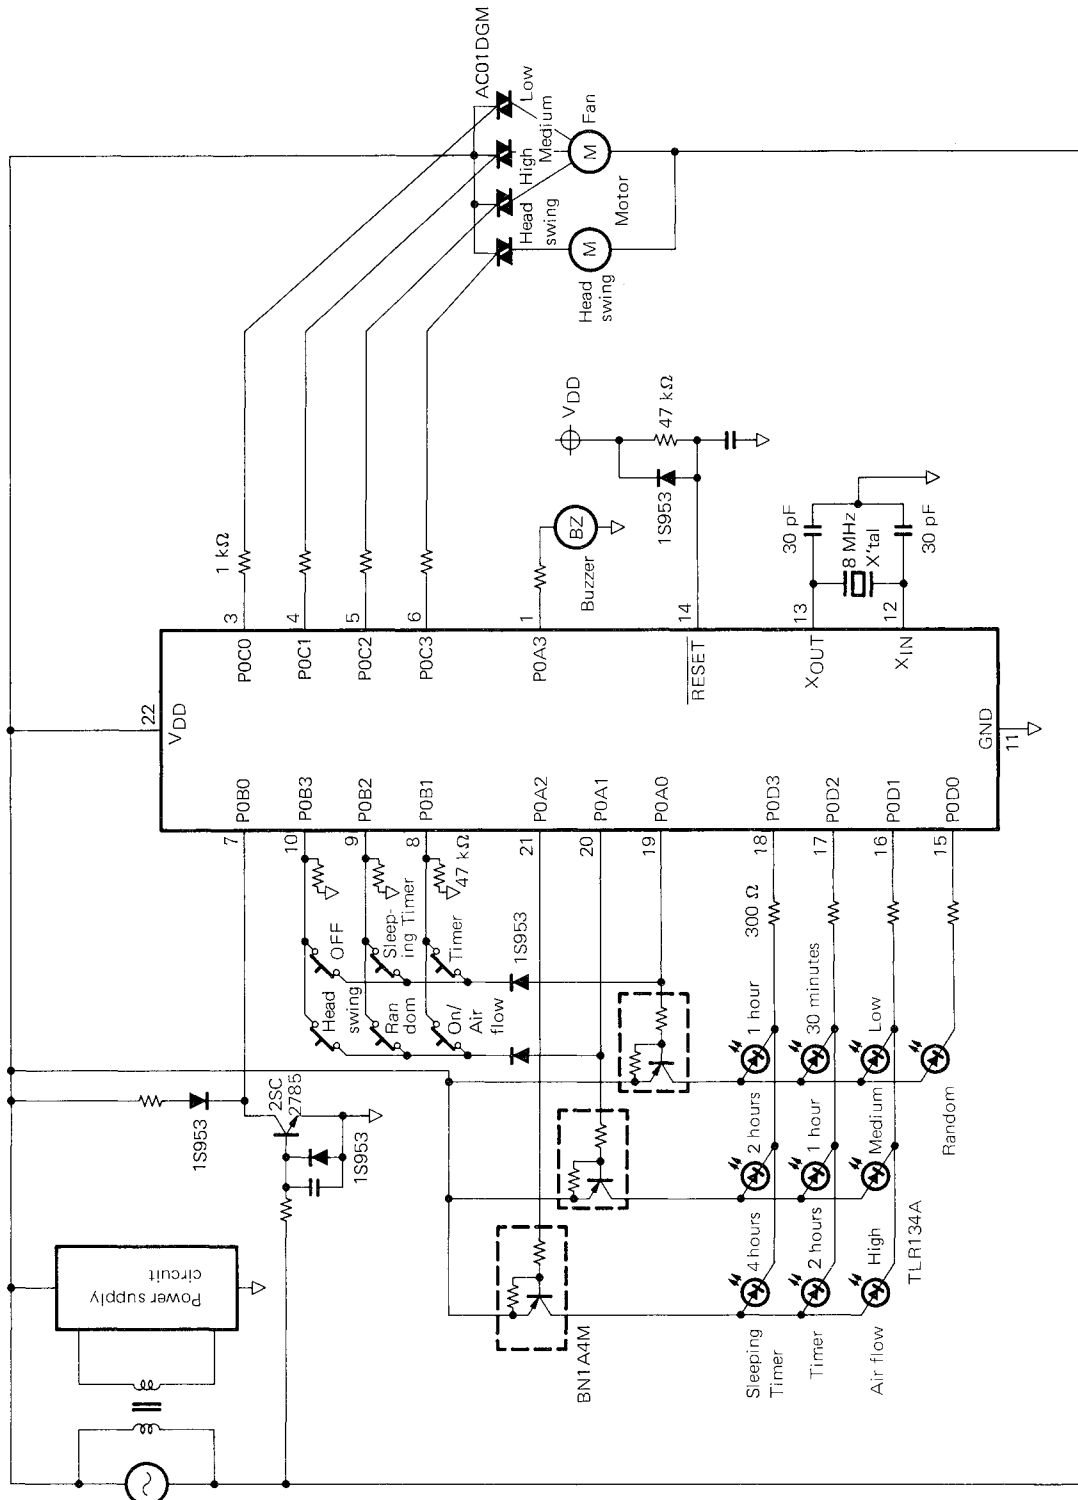

### 3.1 BLOCK DIAGRAM

The figure below shows a block diagram of this system.

3.2 CIRCUIT DIAGRAM

The figure below shows a circuit diagram for the electric fan used in this system (constants are for reference purposes only).

3.3 PORT ASSIGNMENT

Pin No.	Port name	Input/Output	Signal name	Active level	Condition at Power on Reset (See <b>Note 1</b> )	Condition during standby mode		Function etc.
						STOP mode	HALT mode	
1	POA3	O	Buzzer output	H/L	L	L	—	
2	NC	—	Unused	—	—	—	—	
3	POC0	O	Low air flow TRIAC output	L	H	H	—	
4	POC1	O	Medium air flow TRIAC output	L	H	H	—	
5	POC2	O	High air flow TRIAC output	L	H	H	—	
6	POC3	O	Head swing TRIAC output	L	H	H	—	
7	POB0	I	Zero cross detection	H/L	—	—	—	
8	POB1	I	Key input	H	—	—	—	Standby mode release
9	POB2	I	Key input	H	—	—	—	
10	POB3	I	Key input	H	—	—	—	
11	GND	—	—	—	—	—	—	GND potential pin
12	X <sub>IN</sub>	—	System clock oscillator	—	—	—	—	8 MHz ceramic resonator
13	X <sub>OUT</sub>	—	System clock oscillator	—	—	—	—	8 MHz ceramic resonator

**Note 1:** Before initial setting

(continued)

Pin No.	Port name	Input/Output	Signal name	Active level	Condition at Power on Reset (See <b>Note 1</b> )	Condition during standby mode		Function etc.
						STOP mode	HALT mode	
14	$\overline{\text{RESET}}$	I	Reset	L	—	—	—	CPU reset pin
15	P0D0	O	LED segment signal output	L	H	H	—	
16	P0D1	O	LED segment signal output	L	H	H	—	
17	P0D2	O	LED segment signal output	L	H	H	—	
18	P0D3	O	LED segment signal output	L	H	H	—	
19	P0A0	O	LED digit signal output/key scan 1 signal output	<b>Note 2</b>	L	L	—	
20	P0A1	O	LED digit signal output/key scan 2 signal output	<b>Note 2</b>	L	H	—	
21	P0A2	O	LED digit signal output	L	H	H	—	
22	V <sub>DD</sub>	—	—	—	—	—	—	Positive power supply pin

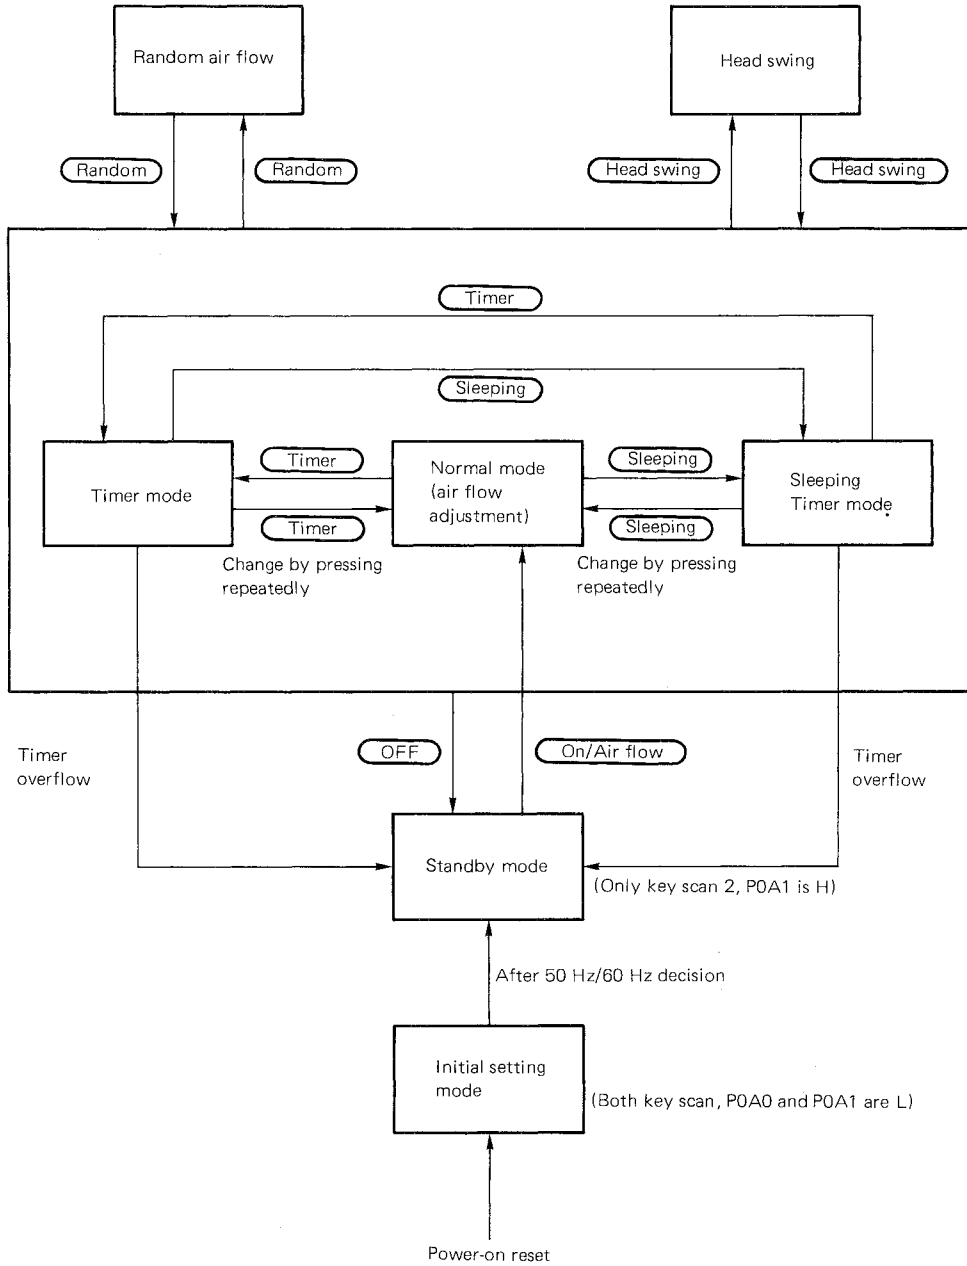

**Note 1:** Before initial setting

**2:** Pins 19 and 20 Active low for LED digit  
Active high for key scan

3.4 STATUS TRANSITION DIAGRAM AND STATUS TRANSITION TABLE

The figure below shows status transition of this system for key input.

(1) Status transition diagram

 : Key input

**(2) Status transition table**

Key input Status	On/Air flow	Timer	Sleeping timer	Random	Head swing	Off	Time overflow	After 60 Hz/ 50 Hz decision
Normal mode	○	Timer mode	Sleeping Timer mode	○	○	Standby mode	—	—
Timer mode	○	Timer length change. Moving to normal mode is possible	Sleeping Timer mode	○	○	Standby mode	Standby mode	—
Sleeping Timer mode	○	Timer mode	Timer length change. Moving to normal mode is possible	○	○	Standby mode	Standby mode	—
Standby mode	Normal mode	—	—	—	—	—	—	—
Initial setting		—	—	—	—	—	—	Standby mode

○: Mode is not changed, but processing is carried out in the respective mode.

—: Input is invalid.

**3.5 DESCRIPTION OF EACH MODE**

**(1) Initial setting mode**

After power-on reset, checks the frequency of the AC power supply pulse (reference pulse of various control timings) input to the POBO pin to determine whether the frequency is 50 Hz or 60 Hz, then enters the standby mode.

**(2) Standby mode**

All operations are stopped and the system enters the standby mode (STOP mode). The standby mode is released only when the On/Air flow key is pressed.

**(3) Normal mode**

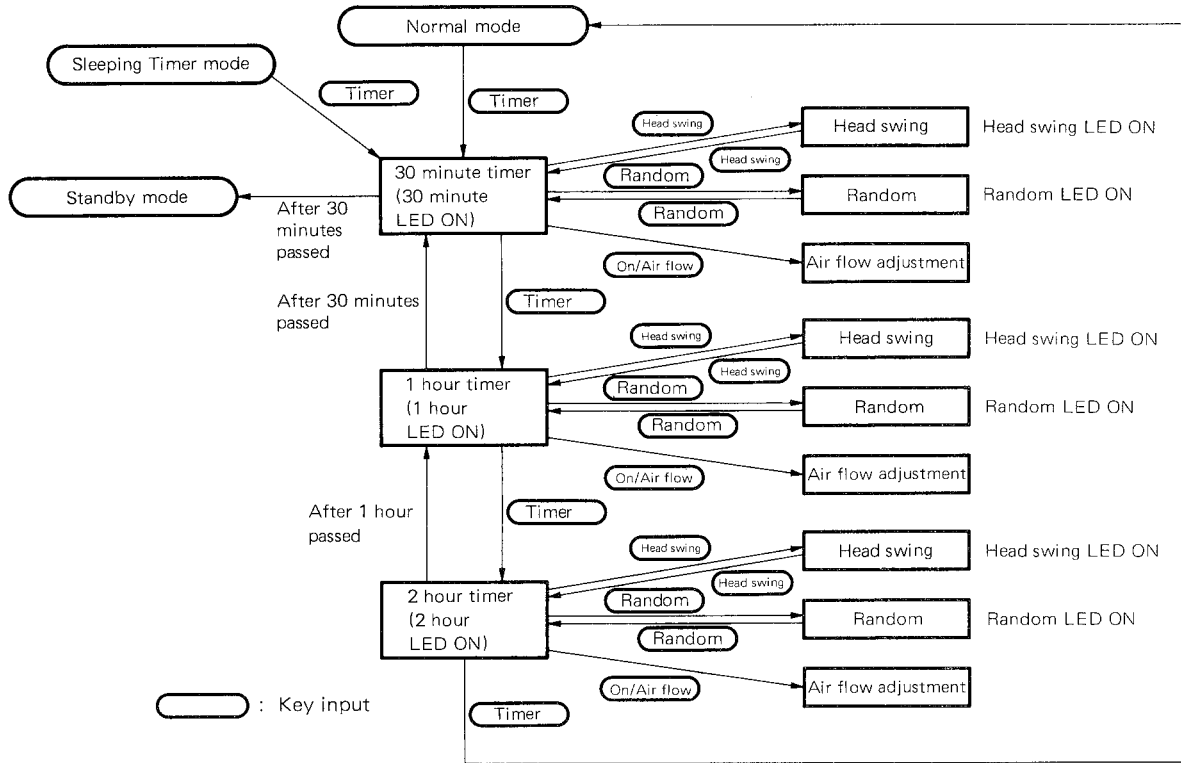

When the On/Air flow key is pressed in the standby mode, the system enters the Normal mode, and the fan starts to operate at Low speed without head swing. Then, status change, as shown in the figure below, becomes possible. Air flow, head swing, and random air flow can be independently set.

\* Air flow indication LED is always ON  
 ○ : Key input

(4) Timer mode

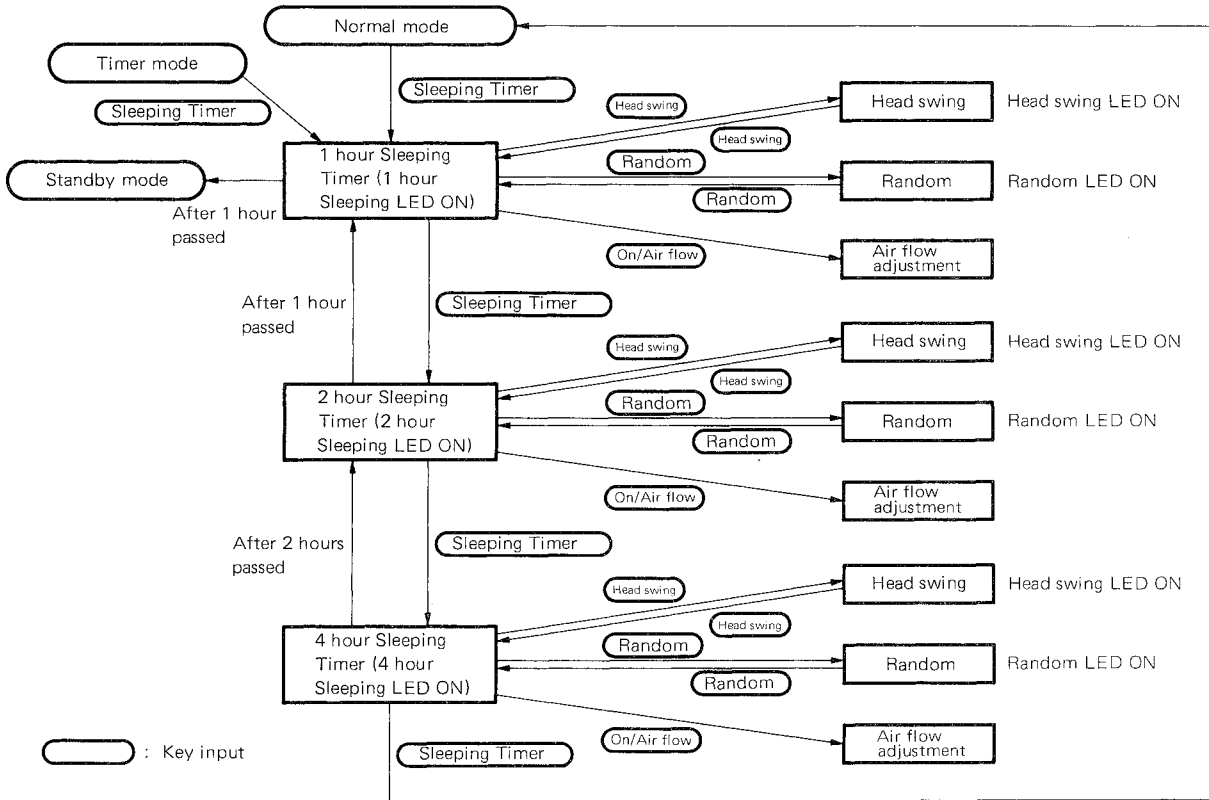

When the timer key is pressed in the Normal mode or the Sleeping Timer mode, the system enters this mode, and the 30 minutes timer is set. Then, status change, as shown in the figure below, becomes possible. LED indication changes as time passes, and the system enters the standby mode after the specified time passed (timer overflow).

**(5) Sleeping Timer mode**

When the Sleeping Timer key is pressed in the Normal mode or the Timer mode, the system enters this mode, and the 1 hour sleeping timer is set. Then, status change, as shown in the figure below, becomes possible. The Sleeping Timer length, air flow, head swing, and random air flow can be independently set.

LED indication changes as time passes, and the system enters the standby mode after the specified time passed.

**3.6 KEYS**

**(1) Key and port assignment diagram**

POA0	POA1	
Timer	On/ Air flow	P0B1/RLS <sub>STOP</sub>
Sleeping Timer	Random	P0B2
OFF	Head swing	P0B3

When a key is pressed, 4 kHz buzzer sounds for 50 ms.

**(2) Key scan**

The LED display digit signal output pins also serve as key scan signal output pins. Their interval is 6 ms.

The display digit signals are active low, and the key scan signals are active high.

**(3) Key valid/invalid table**

○: Valid  
 -: Invalid

Key name / Mode	ON/ Air flow	Timer	Sleeping Timer	Random	Head swing	OFF
Normal mode	○	○	○	○	○	○
Timer mode	○	○	○	○	○	○
Sleeping Timer mode	○	○	○	○	○	○
Standby mode	○	-	-	-	-	-

**3.7 ZERO-CROSS PULSE DETECTION**

50 Hz/60 Hz AC signal used as the reference pulse for time control for Timer, Sleeping Timer, and random air flow, is detected by software. The duty ratio for the input pulse must be at least 40 %.

**3.8 DISPLAY**

Display is 1/3 duty dynamic drive LED. Timing is as shown in (3) in 3.6. The table shown below describes the port assignment.

**(1) Port assignment table**

Segment Digit	P0D0	P0D1	P0D2	P0D3
POA0	Random	Air flow (High)	Timer 2 hours	Sleeping Timer 4 hours
POA1		Air flow (Medium)	Timer 1 hour	Sleeping Timer 2 hours
POA2		Air flow (Low)	Timer 30 minutes	Sleeping Timer 1 hour

Both segments and digits are active low.

(2) Key processing

Key name	Condition	Processing		
		When pressed once	When held down	Multiple pressing
On/Air flow	During standby	Enters the Normal mode, and operates with Low air flow.	No change unless Key is released.	Invalid
	During Normal mode	Air flow can be changed from Low to Medium, to High, then to Low by pressing repeatedly.		
Random	Other than standby mode	When pressed once, random operation, in which the air flow is randomly changed, is carried out. When pressed again, the random operation is stopped and the normal operation will be resumed.	Same as above	Invalid
Head swing	Same as above	Swings the head to left and right. When pressed again, head swing operation will be stopped.	Same as above	Invalid
Timer	Same as above	When pressed once, the timer is set to 30 minutes. When repeatedly pressed, setting will be changed to 1 hour, to 2 hours, to timer off, then to 30 minutes.	Same as above	Invalid
Sleeping Timer	Same as above	ON → OFF → ON will be repeated. The OFF period will be gradually increased. Initially, the total time is set to 1 hour. When repeatedly pressed, setting can be changed to 2 hours, to 4 hours, then to OFF.	Same as above	Invalid
OFF	Same as above	Stops all operations, and enters the standby mode	Same as above	Invalid

Chattering is protected up to 30 ms for both ON and OFF.

### 3.9 FAN MOTOR CONTROL

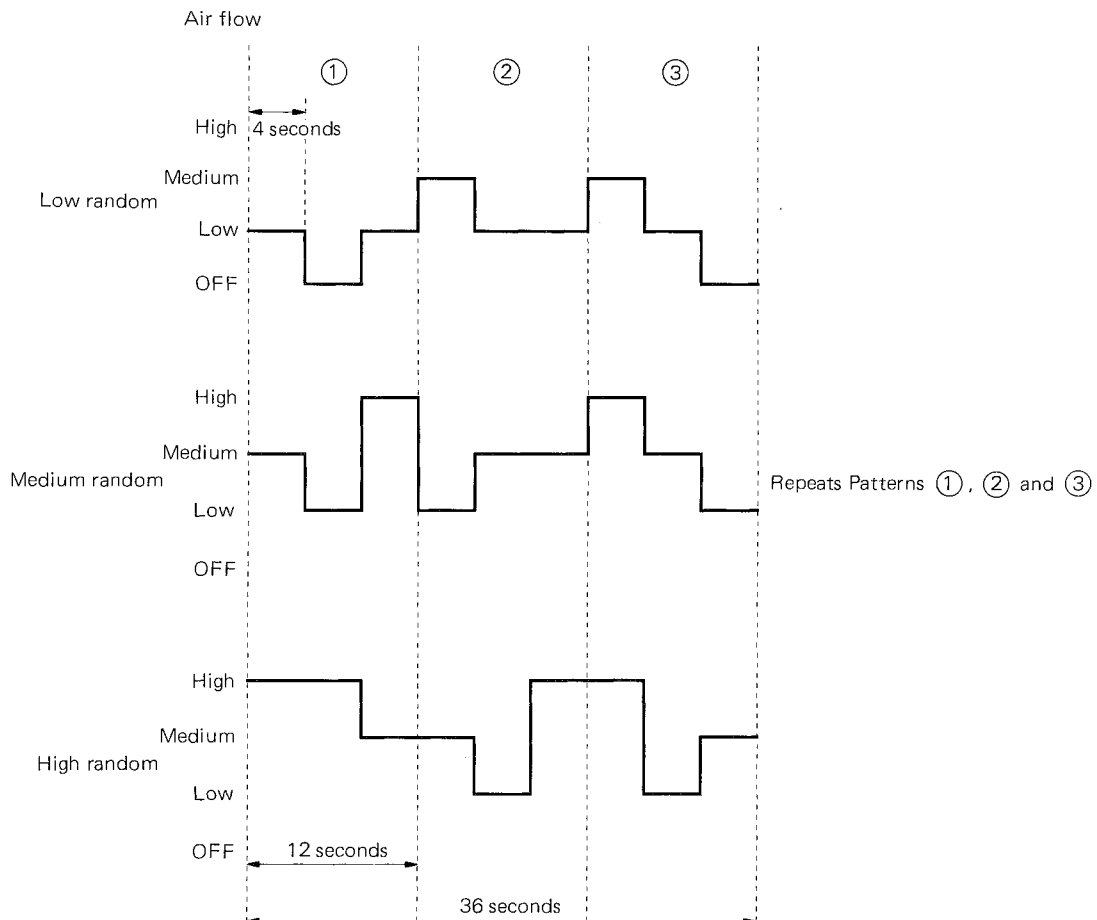

#### (1) Port output condition for each air flow

The following figure shows the output condition of each port in OFF, Low, Medium, and High air flow. TRIAC, which drives the motor, is turned ON at low level.

#### (2) Air flow variation pattern for random air flow

Random air flow has three modes; Low random air flow, Medium random air flow, and High random air flow. The figure below shows the variation pattern for the random air flow. The air flow changes in units of 4 seconds, and one cycle is 36 seconds.

**(3) Combining Sleeping Timer and random air flow**

When random air flow is used in conjunction with Sleeping Timer, stop period is periodically inserted into Patterns ①, ② and ③ described in (2). The timing becomes as follows:

Up to 30 minutes . . . . .

After two Patterns among ①, ②, and ③ have been activated, stops for 12 seconds.

① → ② → 12 sec stop → ③ → ① → 12 sec stop → ② → ③ → . . . . .

30 minutes to 1 hour . . . . .

After each of Patterns ①, ②, and ③ has been activated, stops for 12 seconds.

① → 12 sec stop → ② → 12 sec stop → ③ → 12 sec stop → ① → . . . . .

1 to 1.5 hours . . . . .

After each of Patterns ①, ②, and ③ has been activated, stops for 24 seconds.

① → 24 sec stop → ② → 24 sec stop → ③ → 24 sec stop → ① → . . . . .

1.5 to 2 hours . . . . .

After each of Patterns ①, ②, and ③ has been activated, stops for 36 seconds.

① → 36 sec stop → ② → 36 sec stop → ③ → 36 sec stop → ① → . . . . .

2 to 3 hours . . . . .

After each of Patterns ①, ②, and ③ has been activated, stops for 48 seconds.

① → 48 sec stop → ② → 48 sec stop → ③ → 48 sec stop → ① → . . . . .

3 to 4 hours . . . . .

After each of Patterns ①, ②, and ③ has been activated, stops for 60 seconds.

① → 60 sec stop → ② → 60 sec stop → ③ → 60 sec stop → ① → . . . . .

The following shows examples of air flow change, when random air flow is used in conjunction with the Sleeping Timer:

**Example 1:** Low random air flow up to 30 minutes

**Example 2:** High random air flow during 1.5 to 2 hours

## CHAPTER 4 CONTROL PROGRAM

### 4.1 ALGORITHM

The steps in this program are adjusted in such a manner that the main routine is repeated in 2 ms. In each cycle, key scan signal and LED digit signal outputs are switched.

Zero cross pulses from the POB0 pin are counted to generate the period of Timer, Sleeping Timer, and the random air flow patterns. If the line frequency is 50 Hz, 200 counts are equivalent to 4 seconds. 240 counts are required to generate 4 seconds, when the line frequency is 60 Hz.

50 Hz/60 Hz decision is made in the following manner during initial setting.

The POB0 pin level is checked every 2 ms after the zero cross pulse changes from "L" to "H". If the pin level is "L", when the 9th check is made (after 18 ms), the frequency is 50 Hz. If it is "H", the frequency is determined to be 60 Hz.

The TRIAC, which drives the motor, is not controlled in synchronization with the AC frequency, but is controlled with DC level.

4.2 RAM MAP (Description of Symbols and Flags)

Address 0X

Address 7X

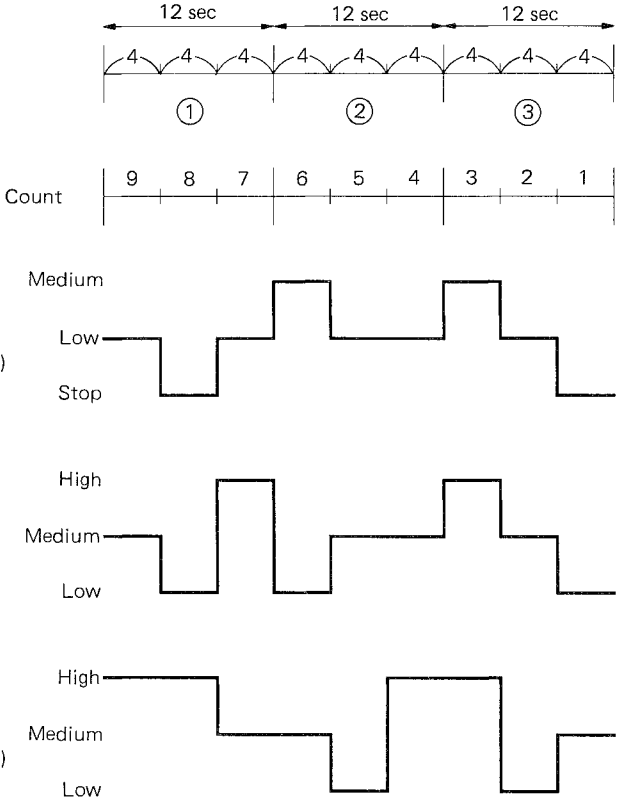

Description of symbols and flags

Symbol and flag	Name	Description																														
BUZF	Buzzer flag	The flag is set when initial setting is made or when a key input is determined to be valid. The flag is reset after 50 ms buzzer output.																														
LOCKF	Lock flag	The flag is set after 36 ms (chattering protect time) are counted or when multiple keys are depressed. The flag is reset when the key is released.																														
SWING_F	Head swing flag	This flag is set during head swing operation.																														
SASA_F	Sleeping Timer flag	This flag is set during the Sleeping Timer mode.																														
PULSE_F	Pulse flag	This flag is set when zero cross pulse is "H", and reset when it is "L".																														
HZF	HZ flag	This flag is set when zero cross pulse is 60 Hz.																														
ONF	ON/OFF flag	This flag is set during the Normal mode, Timer mode, or Sleeping Timer mode operation. This flag is reset during stop periods for the Sleeping Timer mode.																														
RANDOM_F	Random flag	This flag is set during the random air flow mode.																														
MSH	2 ms counter (upper)	These are used as a temporary counter, in order to adjust the main routine time to 2 ms, and to count 124 $\mu$ s of buzzer output. Additionally, these are used to count 30 ms before initiating determination of 50 Hz/60 Hz after power-on setting, and to count 18 ms to determine whether the line frequency is 50 Hz or 60 Hz. In this case, 1 count is made every 5 instruction executions (10 $\mu$ s).																														
MSL	2 ms counter (lower)																															
LEDPORT	LED signal output register	This is a temporary register, which temporarily stores the LED segment data.																														
FSH	4 sec. counter (upper)	This counter counts 4 seconds to control time for the Timer, Sleeping Timer, and random air flow. 1 count is made every zero cross pulse. Additionally, these are used to count 30 ms before initiating determination of 50 Hz/60 Hz after power-on setting, and to count 18 ms to determine whether the line frequency is 50 Hz or 60 Hz. In this case, 1 count is made every 2 ms (after counting MSH, MSL).																														
FSL	4 sec. counter (lower)																															
INM	Sleeping Timer set period register	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>3</td> <td>2</td> <td>x</td> <td>x</td> <td></td> </tr> <tr> <td>:</td> <td>:</td> <td>:</td> <td>:</td> <td></td> </tr> <tr> <td>0</td> <td>0</td> <td>x</td> <td>x</td> <td>Unused</td> </tr> <tr> <td>0</td> <td>1</td> <td>x</td> <td>x</td> <td>Sleeping Timer set to 1 hr</td> </tr> <tr> <td>1</td> <td>0</td> <td>x</td> <td>x</td> <td>Sleeping Timer set to 2 hrs</td> </tr> <tr> <td>1</td> <td>1</td> <td>x</td> <td>x</td> <td>Sleeping Timer set to 4 hrs</td> </tr> </table>	3	2	x	x		:	:	:	:		0	0	x	x	Unused	0	1	x	x	Sleeping Timer set to 1 hr	1	0	x	x	Sleeping Timer set to 2 hrs	1	1	x	x	Sleeping Timer set to 4 hrs

4.4 GENERAL FLOW CHART

The figure below shows the general flow for this program.

Time adjustment subroutines or NOP instructions are inserted for this program, in various locations of each branch destination, so that the execution time for the main routine becomes 2 ms.

4.5 DETAILED FLOW CHART

4.5.1 30 ms Delay

(1)

Input variable	Flow chart	Processing, remarks	Output variable
MSL MSH	<pre> graph TD     START([START]) --&gt; Init1[MSH ← 00H MSL ← 00H]     Init1 --&gt; Init2[FSH ← 00H FSL ← 00H]     Init2 --&gt; Dec1{MSH = 0CH?}     Dec1 -- Y --&gt; Dec2{HSL = 08H?}     Dec1 -- N --&gt; Dec2     Dec2 -- Y --&gt; Init1     Dec2 -- N --&gt; Inc["(MSH,MSL) ← (MSH,MSL)+1"]     Inc --&gt; Dec1     </pre>	<p>Clears 2 ms counter</p> <p>Clears 4 ms counter</p> <p>10 ms (5 instructions) x 200 = 2 ms count</p>	MSH MSL  FSH FSL  MSH MSL
