

Description

The 5P49V6968 is a programmable clock generator that is intended for high-performance consumer, networking, industrial, computing, and data communications applications. This is Renesas' sixth generation of programmable clock technology (VersaClock 6E).

The 5P49V6968 generates the frequencies from a single reference clock, which can originate from one of the two redundant clock inputs. A glitchless manual switchover function allows one of the redundant clocks to be selected during normal operation.

Two select pins allow up to four different configurations to be programmed and can be used for different operating modes.

Typical Applications

- Ethernet switch/router
- PCI Express 1.0/2.0/3.0/4.0 spread spectrum on
- PCI Express 1.0/2.0/3.0/4.0/5.0 spread spectrum off
- Broadcast video/audio timing
- Multi-function printer
- Processor and FPGA clocking
- Any-frequency clock conversion
- MSAN/DSLAM/PON
- Fiber Channel, SAN
- Telecom line cards
- Datacenter

Features

- Flexible 1.8V, 2.5V, and 3.3V power rails
- High-performance, low phase noise PLL, < 0.5ps RMS typical phase jitter on outputs
- Four banks of internal OTP memory
 - In-system or factory programmable
- I²C serial programming interface
 - 0xD0 or 0xD4 I²C address options allow multiple devices to be configured in a same system
- Reference LVCMOS output clock
- Three universal configurable outputs (OUT1, 2, 4):
 - Differential (LVPECL, LVDS, or HCSL) 1kHz to 350MHz
 - Two single-ended (in-phase or 180 degrees out of phase)
 1kHz to 200MHz
 - I/O VDDs can be mixed and matched, supporting 1.8V (LVDS and LVCMOS), 2.5V, or 3.3V
 - Independent spread spectrum on each output pair
- Eight additional LPHCSL outputs (OUT 3, 5–11)
 - 1.8V low power supply
 - 1kHz to 200MHz
- Programmable output enable or power-down mode
- Redundant clock inputs with manual switchover
- Available in 6 × 6 mm 48-VFQFPN package
- -40° to +85°C industrial temperature operation

2. Pin Descriptions

Table 1. Pin Descriptions

| Pin | Name | Туре | | Description |
|-----|---------|--------|--|--|
| 1 | OUT10B | Output | | Complementary output clock 10. Low-power HCSL (LP-HCSL) output. |
| 2 | XOUT | Output | | Crystal oscillator interface output. |
| 3 | XIN/REF | Input | | Crystal oscillator interface input, or single-ended LVCMOS clock input. Input voltage needs to be below 1.2V. Refer to the <i>Output Drivers</i> section for more details. |
| 4 | VDDA | Power | | Analog functions power supply pin. Connect to 1.8V. |
| 5 | VDDO | Power | | Connect to 1.8V. Power pin for outputs 3, and 5–11. |

| Pin | Name | Туре | | Description |
|-----|----------|--------|------------------------|--|
| 6 | OUT9 | Output | | Output clock 9. Low-power HCSL (LP-HCSL) output. |
| 7 | OUT9B | Output | | Complementary output clock 9. Low-power HCSL (LP-HCSL) output. |
| 8 | OUT8 | Output | | Output clock 8. Low-power HCSL (LP-HCSL) output. |
| 9 | OUT8B | Output | | Complementary output clock 8. Low-power HCSL (LP-HCSL) output. |
| 10 | OUT7 | Output | | Output clock 7. Low-power HCSL (LP-HCSL) output. |
| 11 | OUT7B | Output | | Complementary output clock 7. Low-power HCSL (LP-HCSL) output. |
| 12 | SD/OE | Input | Internal Pull- down | Enables/disables the outputs (OE) or powers down the chip (SD). The SH bit controls the configuration of the SD/OE pin. The SH bit needs to be high for SD/OE pin to be configured as SD. The SP bit (0x02) controls the polarity of the signal to be either active HIGH or LOW only when the pin is configured as OE (Default is active LOW.) It has a weak internal pull-down resistor. When configured as SD, the device is shut down, differential outputs are driven high/low, and the single-ended LVCMOS outputs are driven low. When configured as OE, and outputs are disabled, the outputs can be selected to be tri-stated or driven high/low depending on the programming bits as discussed in "SD/OE Pin Function". |
| 13 | SEL1/SDA | Input | Internal Pull-down | Configuration select pin, or I ² C SDA input as selected by OUT0_SEL_I2CB. It has a weak internal pull-down resistor. |
| 14 | SEL0/SCL | Input | Internal Pull-down | Configuration select pin, or I ² C SCL input as selected by OUT0_SEL_I2CB. It has a weak internal pull-down resistor. |
| 15 | VDD | Power | | Connect to 1.8V. |
| 16 | VDDO | Power | | Connect to 1.8V. Power pin for outputs 3, and 5–11. |
| 17 | OUT6 | Output | | Output clock 6. Low-power HCSL (LP-HCSL) output. |
| 18 | OUT6B | Output | | Complementary output clock 6. Low-power HCSL (LP-HCSL) output. |
| 19 | OUT5 | Output | | Output clock 5. Low-power HCSL (LP-HCSL) output. |
| 20 | OUT5B | Output | | Complementary output clock 5. Low-power HCSL (LP-HCSL) output. |
| 21 | VDDO4 | Power | | Connect to 1.8V to 3.3V. VDD supply for OUT4. |
| 22 | OUT4 | Output | | Output clock 4. Refer to the Output Drivers section for more details. |
| 23 | OUT4B | Output | | Complementary output clock 4. Refer to the <i>Output Drivers</i> section for more details. |
| 24 | OEA | Input | Internal Pull-down | Active low output enable pin for outputs 3, 5, 6, and 11. 0 = Enable outputs, 1 = Disable outputs. This pin has an internal pull-down. |
| 25 | NC | _ | | Do not connect. |
| 26 | NC | _ | | Do not connect. |
| 27 | VDDO | Power | | Connect to 1.8V. This is a power pin for outputs 3, and 5–11. |
| 28 | OUT3B | Output | | Complementary output clock 3. Refer to the Output Drivers section for more details. |
| 29 | OUT3 | Output | | Output clock 3. Refer to the Output Drivers section for more details. |
| 30 | VDD_Core | Power | | Connect to 1.8V. |
| 31 | VDD | Power | | Connect to 1.8V. |

| Pin | Name | Ту | /pe | Description |
|------|-------------------|--------|------------------------|---|
| 32 | NC | Input | | Do not connect. |
| 33 | OEB7_10 | Input | | Active low output enable pin for outputs 7–10. 0 = Enable outputs; 1 = Disable outputs. This pin has an internal pull-down. |
| 34 | OUT2B | Output | | Complementary output clock 2. Refer to the <i>Output Drivers</i> section for more details. |
| 35 | OUT2 | Output | | Output clock 2. Refer to the Output Drivers section for more details. |
| 36 | VDDO2 | Power | | Connect to 1.8V to 3.3V. VDD supply for OUT2 |
| 37 | OUT1B | Output | | Complementary output clock 1. Refer to the <i>Output Drivers</i> section for more details. |
| 38 | OUT1 | Output | | Output clock 1. Refer to the Output Drivers section for more details. |
| 39 | VDDO1 | Power | | Connect to 1.8V to 3.3V. VDD supply for OUT1. |
| 40 | NC | _ | | Do not connect. |
| 41 | OUT11 | Output | | Output clock 11. Low-power HCSL (LP-HCSL) output. |
| 42 | OUT11B | Output | | Complementary output clock 11. Low-power HCSL (LP-HCSL) output. |
| 43 | VDDO | Power | | Connect to 1.8V. Power pin for outputs 3, and 5–11. |
| 44 | VDD | Power | | Connect to 1.8V. |
| 45 | OE_buffer | Input | Internal Pull- up | Active High Output enable for outputs 3, and 5–11. 0 = Disable outputs; 1 = Enable outputs. This pin has an internal pull-up. |
| 46 | VDD00 | Power | | Power supply pin for OUT0_SEL_I2CB and crystal oscillation. Connect to 1.8 to 3.3V. It sets the output voltage levels for OUT0. |
| 47 | OUT0_SEL_ I2CB | Output | Internal Pull- down | Latched input/LVCMOS Output. At power up, the voltage at the pin OUT0_SEL_I2CB is latched by the part and used to select the state of pins 13 and 14. If a weak pull-up (10Kohms) is placed on OUT0_SEL_I2CB, pins 13 and 14 will be configured as hardware select pins, SEL1 and SEL0. If a weak pull-down (10Kohms) is placed on OUT0_SEL_I2CB or it is left floating, pins 13 and 14 will act as the SDA and SCL pins of an I ² C interface. After power up, the pin acts as a LVCMOS reference output. |
| 48 | OUT10 | Output | | Output clock 10. Low-power HCSL (LP-HCSL) output. |
| ePAD | GND | GND | | Connect to ground pad. |

3. Absolute Maximum Ratings

The absolute maximum ratings are stress ratings only. Stresses greater than those listed below can cause permanent damage to the device. Functional operation of the device at absolute maximum ratings is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Table 2. Absolute Maximum Ratings

| Item | Rating |
|--|----------------|
| Supply Voltage, V _{DDA} , V _{DDD} , V _{DDO} | 3.6V |
| XIN/REF Input | 1.2V |
| I ² C Loading Current (SDA) | 10mA |
| Storage Temperature, TSTG | -65°C to 150°C |
| Junction Temperature | 125°C |
| ESD Human Body Model | 2000V |

4. Thermal Characteristics

Table 3. Thermal Characteristics

| Symbol | Parameter | Value | Unit |
|-------------------|--|-------|------|
| $\theta_{\sf JA}$ | Theta JA. Junction to air thermal impedance (0mps) | 41.05 | °C/W |
| θЈВ | Theta JB. Junction to board thermal impedance (0mps) | 13.6 | °C/W |
| θјς | Theta JC. Junction to case thermal impedance (0mps) | 36.41 | °C/W |

5. Recommended Operating Conditions

Table 4. Recommended Operating Conditions

| Symbol | Parameter | Minimum | Typical | Maximum | Unit |
|-----------------|--|---------|---------|---------|------|
| | Power supply voltage for supporting 1.8V outputs. | 1.71 | 1.8 | 1.89 | V |
| V_{DDOx} | Power supply voltage for supporting 2.5V outputs. | 2.375 | 2.5 | 2.625 | V |
| | Power supply voltage for supporting 3.3V outputs. | 3.135 | 3.3 | 3.465 | V |
| V_{DDD} | Power supply voltage for core logic functions. | 1.71 | - | 3.465 | V |
| V_{DDA} | Analog power supply voltage. Use filtered analog power supply. | 1.71 | - | 3.465 | V |
| T _{PU} | Power ramp time for all VDDs to reach 90% of VDD. | 0.05 | - | 50 | ms |
| T _A | Operating temperature, ambient. | -40 | - | 85 | °C |
| CL | Maximum load capacitance (3.3V LVCMOS only). | - | - | 15 | pF |

6. Electrical Characteristics

Table 5. Current Consumption Characteristics

 V_{DDA} , V_{DDD} , V_{DD00} = 3.3V ±5%, 2.5V ±5%, 1.8V ±5%, T_A = -40°C to +85°C.

| Symbol | Parameter | Conditions | Minimum | Typical | Maximum | Unit |
|-------------------------|------------------------|---|---------|---------|---------|------|
| I _{DDCORE} [a] | Core Supply Current | 100MHz on all outputs | - | 30 | - | mA |
| | Output Buffer | LVPECL, 350MHz, 3.3V V _{DDOx} | - | 42 | - | mA |
| | Supply Current | LVPECL, 350MHz, 2.5V V _{DDOx} | - | 37 | - | mA |
| | | LVDS, 350MHz, 3.3V V _{DDOx} | - | 18 | - | mA |
| | | LVDS, 350MHz, 2.5V V _{DDOx} | - | 17 | - | mA |
| | | LVDS, 350MHz, 1.8V V _{DDOx} | - | 16 | - | mA |
| | | HCSL, 250MHz, 3.3V V _{DDOx} ^[b] | - | 29 | - | mA |
| | | HCSL, 250MHz, 2.5V V _{DDOx} ^[b] | - | 28 | - | mA |
| IDDOX | | LP-HCSL, 100MHz, 1.8V V _{DDO} | - | 4 | - | mA |
| | | LVCMOS, 50MHz, 3.3V, V _{DDOx} [b],[c] | - | 16 | - | mA |
| | | LVCMOS, 50MHz, 2.5V, V _{DDOx} [b],[c] | - | 14 | - | mA |
| | | LVCMOS, 50MHz, 1.8V, V _{DDOx} [b],[c] | - | 12 | - | mA |
| | | LVCMOS, 200MHz, 3.3V V _{DDOx} [b],[c] | - | 36 | - | mA |
| | | LVCMOS, 200MHz, 2.5V V _{DDOx} [b],[c] | - | 27 | - | mA |
| | | LVCMOS, 200MHz, 1.8V V _{DDOx} [b],[c] | - | 16 | - | mA |
| I _{DDPD} | Power Down Current | SD asserted, I ² C programming. | - | 10 | - | mA |

[[]a] IDDCORE = IDDA + IDDD, no loads.

[[]b] Measured into a 5" 50Ω trace with a 2pF load.

[[]c] Single CMOS driver active.

Table 6. AC Timing Characteristics

 V_{DDA} , V_{DDD} , $V_{DDO0} = 3.3V \pm 5\%$, $2.5V \pm 5\%$, $1.8V \pm 5\%$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$, unless stated otherwise.

| Symbol | Parameter | Conditions | Minimum | Typical | Maximum | Unit |
|------------------------------|----------------------------------|--|---------|---------|---------|------|
| F _{IN} [a] | Input Frequency | Input frequency limit (Crystal) | 8 | - | 40 | MHz |
| | | Input frequency limit (Single-ended over XIN) | 1 | - | 200 | |
| | | Single-ended clock output limit (LVCMOS), individual FOD mode. | 1 | - | 200 | |
| | | Differential clock output (LVPECL/LVDS/HCSL), individual FOD mode. | 0.001 | - | 350 | |
| F _{OUT} [b] | Output Frequency | Single-ended clock output limit (LVCMOS), cascaded FOD mode, output 2, 4. | 0.001 | - | 200 | MHz |
| | | Differential clock output limit (LVPECL/LVDS/HCSL), cascaded FOD mode, output 2, 4. | 0.001 | - | 350 | |
| | | Differential clock output (LP-HCSL output 3, 5–11) | 0.001 | - | 200 | |
| fvco | VCO Operating Frequency Range | | 2500 | - | 2900 | MHz |
| | Output Duty Cycle | Measured at $V_{DD}/2$, all outputs except reference output, $V_{DDOX} = 2.5V$ or $3.3V$. | 45 | 50 | 55 | % |
| - | | Measured at $V_{DD}/2$, all outputs except reference output, $V_{DDOX} = 1.8V$ | 40 | 50 | 60 | % |
| T _{DC} [c] | | Measured at V _{DD} /2, reference output OUT0 (5–150.1MHz) with 50% duty cycle input. | 40 | 50 | 60 | % |
| | | Measured at V _{DD} /2, reference output OUT0 (150.1–200MHz) with 50% duty cycle input. | 30 | 50 | 70 | % |
| T _{SKEW} | Output Skew | Skew between the same frequencies, with outputs using the same driver format and phase delay set to 0ns. | - | 75 | - | ps |
| T _{STARTUP} [d] [e] | Startup Time | Measured after all $V_{DD}s$ have raised above 90% of their target value. $\ensuremath{^{[f]}}$ | - | - | 30 | ms |
| | | PLL lock time from shutdown mode. | - | 3 | 4 | ms |

- [a] Practical lower frequency is determined by loop filter settings.
- [b] A slew rate of 2.75V/ns or greater should be selected for output frequencies of 100MHz or higher.
- [c] Duty cycle is only guaranteed at maximum slew rate settings.
- [d] Actual PLL lock time depends on the loop configuration.
- [e] Includes loading the configuration bits from EPROM to PLL registers. It does not include EPROM programming/write time.
- [f] Power-up with temperature calibration enabled, please contact Renesas if shorter lock-time is required in system.

Table 7. General Input Characteristics

 V_{DDA} , V_{DDD} , V_{DDO0} = 3.3V ±5%, 2.5V ±5%, 1.8V ±5%, T_A = -40°C to +85°C, unless stated otherwise.

| Symbol | Parameter | Pins | Minimum | Typical | Maximum | Unit |

| V_{MAX} | Maximum Voltage | Measurement on single-ended signal using | - | - | 1150 | mV |
| V _{MIN} | Minimum Voltage | absolute value (scope averaging off) | -300 | - | - | mV |
| V _{SWING} | Voltage Swing | Scope averaging off [b] [f] | 300 | - | | mV |
| V _{CROSS} | Crossing Voltage Value | Scope averaging off [d] [f] | 250 | - | 550 | mV |
| ΔV_{CROSS} | Crossing Voltage Variation | Scope averaging off [e] | • | - | 140 | mV |

- [a] Guaranteed by design and characterization. Not 100% tested in production.
- [b] Measured from differential waveform.
- [c] Slew rate is measured through the VSWING voltage range centered on differential 0V. This results in a ±150mV window around differential 0V.
- [d] V_{CROSS} is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e., Clock rising and Clock# falling).
- [e] The total variation of all V_{CROSS} measurements in any particular system. Note that this is a subset of V_{CROSS} min/max (V_{CROSS} absolute) allowed. The intent is to limit V_{CROSS} induced modulation by setting Δ V_{CROSS} to be smaller than V_{CROSS} absolute.
- [f] Measured from single-ended waveform.

Table 12. Electrical Characteristics - Low Power HCSL Outputs

| Symbol | Parameter | Conditions | | Тур. | Max. | Unit |
|---------------------|-------------------------------|---|------|------|------|------|
| Trf | Slew Rate | Slew Rate T [a][b][c] | 1 | 2.5 | 4 | v/ns |
| ΔTrf | Slew Rate Matching | Slew rate matching (scope averaging on) [a][b][d] | ı | 8.7 | 20 | % |
| V _{HIGH} | Voltage High | Statistical measurement on single-ended signal using | 660 | - | 850 | mV |
| V_{LOW} | Voltage Low | oscilloscope math function (scope averaging on) [a][g] | -150 | - | 150 | IIIV |
| V_{MAX} | Maximum Voltage | Measurement on single ended signal using absolute value (scope average off) [a] | | - | 1150 | mV |
| V _{MIN} | Minimum Voltage | | | - | - | IIIV |
| V _{SWING} | Voltage Swing | Scope averaging off [a][b][g] | 300 | - | - | mV |
| V _{CROSS} | Crossing Voltage Value | Scope averaging off [a][e][g] | 250 | - | 550 | mV |
| ΔV _{CROSS} | Crossing Voltage Variation | Scope averaging off [a][f] | - | - | 140 | mV |
| T _{DC} | Duty Cycle | Scope averaging off | 47 | - | 53 | % |

[[]a] Guaranteed by design and characterization, not 100% tested in production.

[[]b] Measured from differential waveform.

[[]c] Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a ±150mV window around differential 0V.

- [d] Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a ±75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.
- [e] Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e., Clock rising and Clock# falling).
- [f] The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting Δ-Vcross to be smaller than Vcross absolute.
- [g] At default SMBus settings.

Table 13. Spread-Spectrum Generation Specifications

| Symbol | Parameter | Conditions | Minimum | Typical | Maximum | Unit |
|------------------|------------------|--|----------------|---------|-------------------|--------|
| fssout | Spread Frequency | Output frequency range for spread spectrum | | - | 300 | MHz |
| f _{MOD} | Mod Frequency | Modulation frequency. | 30 to 63 | | | kHz |
| £ | Spread Value | Amount of spread value (programmable)-center spread. | ±0.1% to ±2.5% | | %f _{OUT} | |
| f SPREAD | Spreau value | Amount of spread value (programmable)-down spread. | -0.2% to -5% | | | /º¹OUT |

Table 14. I²C Bus (SCL/SDA) DC Characteristics

| Symbol | Parameter | Conditions | Minimum | Typical | Maximum | Unit |
|------------------|-----------------------|------------------------------------|-------------------------|---------|------------------------|------|
| V_{IH} | Input High Level | For SEL1/SDA pin and SEL0/SCL pin. | 0.7 x V _{DDD} | - | - | V |
| V _{IL} | Input Low Level | For SEL1/SDA pin and SEL0/SCL pin. | - | - | 0.3 x V _{DDD} | V |

¹ The Refclk jitter is measured after applying the filter functions found in PCI Express Base Specification 5.0, Revision 1.0. See the Test Loads section of the data sheet for the exact measurement setup. The worst case results for each data rate are summarized in this table.

- 3 SSC spurs from the fundamental and harmonics are removed up to a cutoff frequency of 2MHz taking care to minimize removal of any non-SSC content.
- ⁴ Note that 0.7ps RMS is to be used in channel simulations to account for additional noise in a real system.
- ⁵ Note that 0.25ps RMS is to be used in channel simulations to account for additional noise in a real system.
- While the PCI Express Base Specification 5.0, Revision 1.0 provides the filters necessary to calculate SRIS jitter values, it does not provide specification limits, hence the n/a in the Limit column. SRIS values are informative only. In general, a clock operating in an SRIS system must be twice as good as a clock operating in a Common Clock system. For RMS values, twice as good is equivalent to dividing the CC value by Ö2.

² Jitter measurements shall be made with a capture of at least 100,000 clock cycles captured by a real-time oscilloscope (RTO) with a sample rate of 20GS/s or greater. Broadband oscilloscope noise must be minimized in the measurement. The measured PP jitter is used (no extrapolation) for RTO measurements. Alternately, jitter measurements may be used with a Phase Noise Analyzer (PNA) extending (flat) and integrating and folding the frequency content up to an offset from the carrier frequency of at least 200MHz (at 300MHz absolute frequency) below the Nyquist frequency. For PNA measurements for the 2.5GT/s data rate, the RMS jitter is converted to peak to peak jitter using a multiplication factor of 8.83. In the case where real-time oscilloscope and PNA measurements have both been done and produce different results the RTO result must be used.

Table 18. PCI Express Jitter Performance (Spread Spectrum = ON)

| Parameter | Symbol Conditions | | Minimum | Typical | Maximum | Limit | Unit | Notes |
|-----------------------------------|-------------------|---|---------|---------|---------|-------|-------------|-------|
| | tjphPCleG1-CC | PCIe Gen1 (2.5 GT/s) SSC = -0.5% | - | 16 | - | 86 | ps (p-p) | 1, 2 |
| PCIe Phase Jitter | | PCIe Gen2 Lo Band (5.0 GT/s) SSC = -0.5% | - | 0.02 | - | 3 | ps (RMS) | 1, 2 |
| (Common Clocked Architectures) | tjphPCleG2-CC | PCle Gen2 Hi Band (5.0 GT/s) SSC = -0.5% | - | 0.92 | - | 3.1 | ps (RMS) | 1, 2 |
| | tjphPCleG3-CC | PCIe Gen3 (8.0 GT/s) SSC = -0.5% | - | 0.37 | - | 1 | ps (RMS) | 1, 2 |

¹ The Refclk jitter is measured after applying the filter functions found in PCI Express Base Specification 5.0, Revision 1.0. See the Test Loads section of the data sheet for the exact measurement setup. The worst case results for each data rate are summarized in this table.

² Jitter measurements shall be made with a capture of at least 100,000 clock cycles captured by a real-time oscilloscope (RTO) with a sample rate of 20GS/s or greater. Broadband oscilloscope noise must be minimized in the measurement. The measured PP jitter is used (no extrapolation) for RTO measurements. Alternately, jitter measurements may be used with a Phase Noise Analyzer (PNA) extending (flat) and integrating and folding the frequency content up to an offset from the carrier frequency of at least 200MHz (at 300MHz absolute frequency) below the Nyquist frequency. In the case where real-time oscilloscope and PNA measurements have both been done and produce different results the RTO result must be used.

10. Features and Functional Blocks

10.1 Device Startup and Power-on-Reset

The 5P49V6968 has an internal power-up reset (POR) circuit. All VDDs must be connected to the desired supply voltage to trigger a POR.

The user can define specific default configurations through internal One-Time-Programmable (OTP) memory -- either the user or factory can program the default configuration. Contact Renesas if a specific factory-programmed default configuration is required or refer to the VersaClock 6E Programming Guide.

The device will identity which of the two modes to operate in by the state of the OUT0_SEL_I2CB pin at POR. Both modes' default configurations can be programmed as follows:

- 1. **Software Mode (I²C):** OUT0_SEL_I2CB is low at POR.
 - The I²C interface will be open to users for in-system programming, overriding device default configurations at any time.
- 2. Hardware Select Mode: OUT0 SEL I2CB is high at POR.

The device has been programmed to load OTP at power-up (REG0[7] = 1). The device will load internal registers according to *Table 19. Power-Up Behavior*.

Internal OTP memory can support up to four configurations, which selectable by the SEL0/SEL1 pins.

At POR, logic levels at SEL0 and SEL1 pins must be settled, which results in the selected configuration to be loaded at power up.

After the first 10ms of operation, the levels of the SELx pins can be changed, either to low or to the same level as VDDD/VDDA. The SELx pins must be driven with a digital signal of < 300ns rise/fall time and only a single pin can be changed at a time. After a pin level change, the device must not be interrupted for at least 1ms so that the new values have time to load and take effect.

| Table | 19. | Power-Up | Behavior |
|-------|-----|----------|-----------------|
| Iabic | 13. | FOWEI-OP | Deliavioi |

| OUT0_SEL_I2CB at POR | SEL1 | SEL0 | I ² C Access | REG0:7 | Config |
|-------------------------|------|------|----------------------------|--------|------------------------------|
| 1 | 0 | 0 | No | 0 | 0 |
| 1 | 0 | 1 | No | 0 | 1 |
| 1 | 1 | 0 | No | 0 | 2 |
| 1 | 1 | 1 | No | 0 | 3 |
| 0 | Х | X | Yes | 1 | I ² C defaults |
| 0 | Х | Х | Yes | 0 | 0 |

10.2 Clock Inputs

There is one differential clock input that support LVDS, HCSL, LVPECL logic levels without external terminations. The CLKIN pin can accept CMOS signals up to 1.2V. For more information on driving CLKIN with a CMOS signal, see section Driving XIN/REF with a CMOS Driver. The two clock inputs can be left floating when unused.

When using the CLKIN pins the en_clkin register must be set. For more details, see the Register Descriptions and Programming Guide.

The crystal oscillator is enabled by default but can be disabled when unused. For more details, see the <u>Register Descriptions and Programming Guide</u>.

10.3 Internal Crystal Oscillator (XIN/REF)

10.3.1 Choosing Crystals

A crystal manufacturer will calibrate its crystals to the nominal frequency with a certain load capacitance value. When the oscillator load capacitance matches the crystal load capacitance, the oscillation frequency will be accurate. When the oscillator load capacitance is lower than the crystal load capacitance, the oscillation frequency will be higher than nominal and vice versa. Therefore, for an accurate oscillation frequency you must match the oscillator load capacitance with the crystal load capacitance.

10.3.2 Tuning the Crystal Load Capacitor

Cs1 and Cs2 are stray capacitances at each crystal pin and typical values are between 1pF and 3pF (see Figure 7).

Ce1 and Ce2 are additional external capacitors. Increasing the load capacitance reduces the oscillator gain, so it is recommended to consult the manufacturer when adding Ce1 and/or Ce2 to avoid crystal startup issues.

Ci1 and Ci2 are integrated programmable load capacitors, one at XIN and one at XOUT.

Figure 7. Tuning the Crystal Load Capacitor

The value of each capacitor is composed of a fixed capacitance amount plus a variable capacitance amount set with the XTAL[5:0] register. Ci1 and Ci2 are commonly programmed to be the same value. Adjustment of the crystal tuning capacitors allows maximum flexibility to accommodate crystals from various manufacturers. The range of tuning capacitor values available are in accordance with the following table. Ci1/Ci2 starts at 0pF with the setting 000000 and can be increased up to 13.83pF with the setting 111111b. The step per bit is 0.43pF.

Table 20. XTAL[5:0] Tuning Capacitor

| Parameter | Bits | Step (pF) | Min (pF) | Max (pF) |
|-----------|------|-----------|----------|----------|
| XTAL | 6 | 0.43 | 0 | 13.83 |

You can write the following equation for this capacitance:

$$C_{XIN} = Ci1 + Cs1 + Ce1$$

The final load capacitance of the crystal:

$$C_L = C_{XIN} \times C_{XOUT} / (C_{XIN} + C_{XOUT})$$

It is recommended to set the same value at each crystal pin meaning:

$$C_{XIN} = C_{XOUT}$$

Example: The crystal load capacitance is specified as 8pF, the stray capacitance at each crystal pin is Cs = 1.5pF, and package stray capacitance is Ce = 7pF. Assuming equal capacitance values at XIN and XOUT = 6.92pF, the equation is as follows:

8pF = (6.92pF + 7.5pF + 1.5pF) / 2 = 7.9pF XTAL[5:0] = "10000"

Table 21. Recommended Crystal Characteristics

| Parameter | Minimum | Typical | Maximum | Unit |
|---|---------|-------------|---------|------|
| Mode of Oscillation | | Fundamental | | |
| Frequency | 8 | 25 | 40 | MHz |
| Equivalent Series Resistance (ESR) | - | 10 | 100 | Ω |
| Shunt Capacitance | - | - | 7 | pF |
| Load Capacitance (C _L) at < = 25MHz | 6 | 8 | 12 | pF |
| Load Capacitance (C _L) > 25MHz to 40MHz | 6 | - | 8 | pF |
| Maximum Crystal Drive Level | - | - | 100 | μW |

10.4 Programmable Loop Filter

The device PLL loop bandwidth operating range depends on the input reference frequency (Fref).

Table 22. Loop Filter Settings

| Input Reference Frequency (MHz) | Loop Bandwidth Minimum (kHz) | Loop Bandwidth Maximum (kHz) |
|------------------------------------|---------------------------------|---------------------------------|
| 1 | 40 | 126 |
| 350 | 300 | 1000 |

10.5 Fractional Output Dividers (FOD)

The 5P49V6968 has four fractional output dividers (FOD). Each FOD is comprised of a 12-bit integer counter and a 24-bit fractional counter. The output divider can operate in integer divide only mode for improved performance or use the fractional counters to generate a clock frequency accurate to 50ppb.

FODs support the following features.

10.5.1 Individual Spread Spectrum Modulation

The output clock frequencies can be modulated to spread energy across a broader range of frequencies, thereby lowering system EMI. Each divider has individual spread ability. Spread modulation independent of output frequency, a triangle wave modulation between 30 and 63kHz.

Spread spectrum can be applied to any output clock, clock frequency, or spread amount from $\pm 0.25\%$ to $\pm 2.5\%$ center-spread and -0.5% to -5% down-spread.

10.5.2 Bypass Mode

Bypass mode (divide by 1) allows the output to behave as a buffered copy from the input or another FOD.

10.5.3 Cascaded Mode

As shown in the block diagram on page 1, FODs can be cascaded for lower output frequency.

For example, if OUT1 is configured to run at 12.288MHz and needs another 48kHz output, the user can cascade FOD2 by taking input from OUT1, with a divide ratio of 256. As a result, OUT 2 runs at 48kHz while in alignment with 12.288MHz on OUT1.

10.5.4 Dividers Alignment

Each output divider block has a synchronizing pulse to provide startup alignment between outputs dividers. This allows alignment of outputs for low skew performance.

When the 5P49V6968 is in hardware select mode, outputs are automatically aligned at POR. The same synchronization reset is also triggered when switching between configurations with the SEL0/1 pins. This ensures that the outputs remain aligned in every configuration.

When the 5P49V6968 is using software mode, I²C is used to reprogram an output divider during operation, and therefore, alignment can be lost. Alignment can be restored by manually triggering a reset through I²C.

The outputs are aligned on the falling edges of each output by default. Rising edge alignment can also be achieved by using the programmable skew feature to delay the faster clock by 180 degrees. The programmable skew feature also allows for fine tuning of the alignment.

10.5.5 Programmable Skew

The 5P49V6968 can skew outputs by quadrature values. The skew on each output can be adjusted from 0 to 360 degrees. Skew is adjusted in units equal to 1/32 of the VCO period. As a result, for 100MHz output and a 2800MHz VCO, the user can select how many 11.161ps units to be added to the skew (resulting in units of 0.402 degrees). For example, 0, 0.402, 0.804, 1.206, 1.408, and so on. The granularity of the skew adjustment is always dependent on the VCO period and the output period.

10.6 Output Drivers

Device output drivers can individually support the following features:

- 2.5V or 3.3V voltage level for HCSL/LVPECL operation
- 1.8V, 2.5V, or 3.3V voltage levels for CMOS/LVDS operation
- CMOS supports four operating modes:
 - CMOSD: OUTx and OUTxB 180 degrees out of phase
 - CMOSX2: OUTx and OUTxB phase-aligned
 - CMOS1: only OUTx pin is on
 - CMOS2: only OUTxB pin is on

When a given output is configured to CMOSD or CMOSX2, then all previously described configuration and control apply equally to both pins.

Independent output enable/disabled by register bits. When disabled, an output can be either in a logic 1 state or Hi-Z.

The following options are used to disable outputs:

- Output turned off by I²C
- Output turned off by SD/OE pin
- Output unused, which means it is turned off regardless of OE pin status

10.7 SD/OE Pin Function

The SD/OE pin can be programmed as follows:

- OE output enable (low active)
- OE output enable (high active)
- Global shutdown (low active)
- Global shutdown (high active)

Output behavior when disabled is also programmable. The user can select the output driver behavior when it is off as follows:

- OUTx pin high, OUTxB pin low (controlled by SD/OE pin)
- OUTx/OUTxB Hi-Z (controlled by SD/OE pin)
- OUTx pin high, OUTxB pin low (configured through I²C)
- OUTx/OUTxB Hi-Z (configured by I²C)

The user can disable the output with either I2C or SD/OE pin. For more information, see the VersaClock 6E Programming Guide.

10.8 I²C Operation

The 5P49V6968 acts as a slave device on the I²C bus using one of the two I²C addresses (0xD0 or 0xD4) to allow multiple devices to be used in the system. The interface accepts byte-oriented block write and block read operations.

Address bytes (2 bytes) specify the register address of the byte position of the first register to write or read.

Data bytes (registers) are accessed in sequential order from the lowest to the highest byte (most significant bit first).

Read and write block transfers can be stopped after any complete byte transfer. During a write operation, data will not be moved into the registers until the STOP bit is received, at which point, all data received in the block write will be written simultaneously.

For full electrical I²C compliance, use external pull-up resistors for SDATA and SCLK.

Figure 8. I²C R/W Sequence

11. Typical Application Circuit

For more information on application and reference circuit designs, refer to the 5P49V6967 and 5P49V6968 Evaluation Board Manual.

11.1 Recommendations for Unused Input and Output Pins

11.1.1 XIN/REF and XOUT

If used as crystal inputs, each set of pins must be connected to a crystal. If using these pins as XIN/REF, see Driving XIN/REF with a CMOS Driver for important information.

11.1.2 LVCMOS Outputs

Any LVCMOS output can be left floating if unused. There should be no trace attached. The output buffer should be set to high-impedance state to avoid unnecessary noise generation.

11.1.3 Differential Outputs

All unused differential outputs can be left floating. Renesas recommends that no trace be attached and that the outputs be set to high impedance. Both sides of the differential output pair should be treated the same, either left floating or terminated

11.1.4 Driving XIN/REF with a CMOS Driver

In some instances, it is preferable to have XIN/REF driven by a clock input -- for reasons such as better SNR, multiple input select with device CLKIN, etc. The XIN/REF pin can take an input when its amplitude is between 500mV and 1.2V, and the slew rate more than 0.2V/ns. The XIN/REF input can be overdriven by an LVCMOS driver or by one side of a differential driver through an AC coupling capacitor. The XOUT pin can be left floating.

When driving the XIN with a CMOS or differential signal, set the load capacitor to 0.

Figure 9. Overdriving XIN with a CMOS Driver

Table 23. Nominal Voltage Divider Values for Overdriving CLKIN with Single-ended Driver

| LVCMOS Diver V _{DD} | Ro + Rs | R1 | R2 | V_XIN (peak) | Ro+Rs+R1+R2 |
|------------------------------|---------|-----|-----|--------------|-------------|
| 3.3 | 50.0 | 130 | 75 | 0.97 | 255 |
| 2.5 | 50.0 | 100 | 100 | 1.00 | 250 |
| 1.8 | 50.0 | 62 | 130 | 0.97 | 242 |

11.1.5 Driving XIN with a LVPECL Driver

Figure 11 shows an example of the interface diagram for a 3.3V LVPECL driver. This is a standard LVPECL termination with one side of the driver feeding the XIN/REF input. It is recommended that all components in the schematic be placed in the layout; though some components may not be used, they can be used for debugging purposes. The datasheet specifications are characterized and guaranteed using a quartz crystal as the input. If the driver is 2.5V LVPECL, the only required change is to use the appropriate R3 value.

Figure 10. Overdriving XIN with a LVPECL Driver

Table 24 shows resistor values that ensure the maximum drive level for the CLKIN port is not exceeded for all combinations of 5% tolerance on the driver V_{DD} , V_{DDO0} , and 5% resistor tolerances. The resistor values can be adjusted to reduce the loading for a slower and weaker LVCMOS driver by increasing the impedance of the R1–R2 divider. To better assist with this assessment, the total load (Ro+Rs+R1+R2) on the driver is included in the table.

Table 24. Nominal Voltage Divider Values for Overdriving CLKIN with Single-ended Driver

| LVCMOS Diver V _{DD} | Ro + Rs | R1 | R2 | Vrx (peak) | Ro+Rs+R1+R2 |
|------------------------------|---------|-----|-----|------------|-------------|
| 3.3 | 50.0 | 130 | 75 | 0.97 | 255 |
| 2.5 | 50.0 | 100 | 100 | 1.00 | 250 |
| 1.8 | 50.0 | 62 | 130 | 0.97 | 242 |

11.2 Output - Single-ended or Differential Clock Terminations

11.2.1 LVDS Termination

For a general LVDS interface, the recommended value for the termination impedance (ZT) is between 90Ω and 132Ω . The actual value should be selected to match the differential impedance (Zo) of your transmission line. A typical point-to-point LVDS design uses a 100Ω parallel resistor at the receiver and a 100Ω . Differential transmission-line environment. In order to avoid any transmission-line reflection issues, the components should be surface mounted and must be placed as close to the receiver as possible. The standard termination schematic as shown in figure *Standard Termination* or the termination of figure *Optional Termination* can be used, which uses a center tap capacitance to help filter common mode noise. The capacitor value should be approximately 50pF. In addition, since these outputs are LVDS compatible, the input receiver's amplitude and common-mode input range should be verified for compatibility with the Renesas LVDS output.

For example, the LVDS outputs can be AC coupled by placing capacitors between the LVDS outputs and the 100Ω shunt load. This is a common practice with receiver with internal self-bias circuitry. If using a non-standard termination, it is recommended to contact Renesas and confirm that the termination will function as intended.

Figure 11. Standard and Optional Terminations

11.2.2 LVPECL Termination

The clock layout topology shown below are typical terminations for LVPECL outputs. The differential outputs generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50 Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. For VDDO = 2.5V, the VDDO − 2V is very close to ground level. The R3 in 2.5V LVPECL Output Termination can be eliminated and the termination is shown in 2.5V LVPECL Output Termination (2).

11.2.4 LVCMOS Termination

Each output pair can be configured as a standalone CMOS or dual-CMOS output driver. An example of CMOSD driver termination is shown in the following figure:

- CMOS1 Single CMOS active on OUTx pin
- CMOS2 Single CMOS active on OUTxB pin
- CMOSD Dual CMOS outputs active on both OUTx and OUTxB pins, 180 degrees out of phase
- CMOSX2 Dual CMOS outputs active on both OUTx and OUTxB pins, in-phase

12. Package Outline Drawings

The package outline drawings are appended at the end of this document and are accessible from the link below. The package information is the most current data available.

www.idt.com/us/en/document/psc/48-vfqfpn-package-outline-drawing60-x-60-x-090-mm-body-epad-42-x-42-mm-040mm-pitchndg48p2

13. Marking Diagram

- Lines 1 and 2 indicate the part number.
- Line 3:
 - "YYWW" is the last digit of the year and week that the part was assembled.
 - # denotes the sequential lot number.
 - "\$" denotes the mark code.

14. Ordering Information

| Part Number [a][b] | Package | Carrier Type | Temperature Range |
|---------------------|---------------------------|---------------|-------------------|
| 5P49V6968AdddNDGI | 6 × 6 mm <u>48-VFQFPN</u> | Tray | -40° to +85°C |
| 5P49V6968AdddNDGI8 | 6 × 6 mm <u>48-VFQFPN</u> | Tape and Reel | -40° to +85°C |
| 5P49V6968A000NDGI | 6 × 6 mm <u>48-VFQFPN</u> | Tray | -40° to +85°C |
| 5P49V6968A000NDGI8 | 6 × 6 mm <u>48-VFQFPN</u> | Tape and Reel | -40° to +85°C |

[[]a] "ddd" denotes factory programmed configurations based on required settings. Please contact factory for factory programming.

[[]b] "000" denotes un-programmed parts for user customization.

15. Revision History

| Date | Description of Change |
|------------------|--|
| November 4, 2025 | Added Recommendations for Unused Input and Output Pins section. Added Clock Inputs section. Updated Typical Application Circuit section . |
| Jul 16, 2025 | Updated the block diagram on page 1 Added the LP-HCSL condition to Table 5 Added Table 12 Updated Table 18 Updated numerous parts of Internal Crystal Oscillator (XIN/REF) |
| Apr 17, 2024 | Updated 1.8V V _{OH} to 0.7 × V _{DDO} from 0.5 × V _{DDO} in Table 8. |
| Aug 20, 2020 | Updated slew rate terminology in section Driving XIN/REF with a CMOS Driver. |
| Oct 4, 2019 | Updated Absolute Maximum Ratings table. Updated PCI Express Jitter Performance tables (Table 17 and Table 18). Updated Electrical Characteristics tables (Table 8, Table 10, and Table 14). |
| Jun 19, 2019 | PCIe specification updated. Added recommended power ramp time. Expanded spread spectrum value range. I²C tolerant voltage footnote changed to 3.3V. LVDS Termination section allows AC-coupling for LVDS signals. |
| Aug 30, 2018 | Updated schematics for Driving XIN/REF with a CMOS Driver and Driving XIN with an LVPECL Driver sections. |
| Jul 5, 2018 | Removed all references to CLKIN and updated values in electrical tables. |
| Mar 16, 2018 | Updated Current Consumption, AC Timing, LVDS, and CMOS electrical tables. |
| Dec 12, 2017 | Initial release. |
