

Description

This 25-bit 1:1 or 14-bit 1:2 configurable registered buffer is designed for 1.7-V to 1.9-V VDD operation.

All clock and data inputs are compatible with the JEDEC standard for SSTL_18. The control inputs are LVCMOS. All outputs are 1.8-V CMOS drivers that have been optimized to drive the DDR-II DIMM load. IDT74SSTUBF32866B operates from a differential clock (CLK and $\overline{\text{CLK}}$). Data are registered at the crossing of CLK going high, and $\overline{\text{CLK}}$ going low.

The C0 input controls the pinout configuration of the 1:2 pinout from A configuration (when low) to B configuration (when high). The C1 input controls the pinout configuration from 25-bit 1:1 (when low) to 14-bit 1:2 (when high).

A - Pair Configuration (C01 = 0, C11 = 1 and C02 = 0, C12 = 1)

Parity that arrives one cycle after the data input to which it applies is checked on the PAR_IN of the first register. The second register produces PPO and QERR signals. The QERR of the first register is left floating. The valid error information is latched on the QERR output of the second register. If an error occurs QERR is latched low for two cycles or until RESET is low.

B - Single Configuration (C0 = 0, C1 = 0)

The device supports low-power standby operation. When the RESET input ($\overline{\text{RESET}}$) is low, the differential input receivers are disabled, and undriven (floating) data, clock and reference voltage (VREF) inputs are allowed. In addition, when $\overline{\text{RESET}}$ is low all registers are reset, and all outputs are forced low. The LVCMOS $\overline{\text{RESET}}$ and Cn inputs must always be held at a valid logic high or low level. To ensure defined outputs from the register before a stable clock has been supplied, $\overline{\text{RESET}}$ must be held in the low state during power up.

In the DDR-II RDIMM application, $\overline{\text{RESET}}$ is specified to be completely asynchronous with respect to CLK and $\overline{\text{CLK}}$. Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the outputs will be driven low quickly, relative to the time to disable the differential input receivers. However, when coming out of reset, the register will become active quickly, relative to the time to enable the differential input receivers. As long as the data inputs are low, and the clock is stable during the time from the low-to-high transition of $\overline{\text{RESET}}$ until the input receivers are fully enabled, the

design of the IDT74SSTUBF32866B must ensure that the outputs will remain low, thus ensuring no glitches on the output.

The device monitors both $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ inputs and will gate the Qn outputs from changing states when both $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ inputs are high. If either $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ input is low, the Qn outputs will function normally. The $\overline{\text{RESET}}$ input has priority over the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ control and will force the outputs low. If the $\overline{\text{DCS}}$ -control functionality is not desired, then the $\overline{\text{CSR}}$ input can be hardwired to ground, in which case, the setup-time requirement for $\overline{\text{DCS}}$ would be the same as for the other D data inputs. Package options include 96-ball LFBGA (MO-205CC).

Features

- 25-bit 1:1 or 14-bit 1:2 registered buffer with parity check functionality
- Supports SSTL_18 JEDEC specification on data inputs and outputs
- Supports LVCMOS switching levels on C0, C1, and RESET inputs
- Low voltage operation: VDD = 1.7V to 1.9V
- Available in 96-ball LFBGA package

Applications

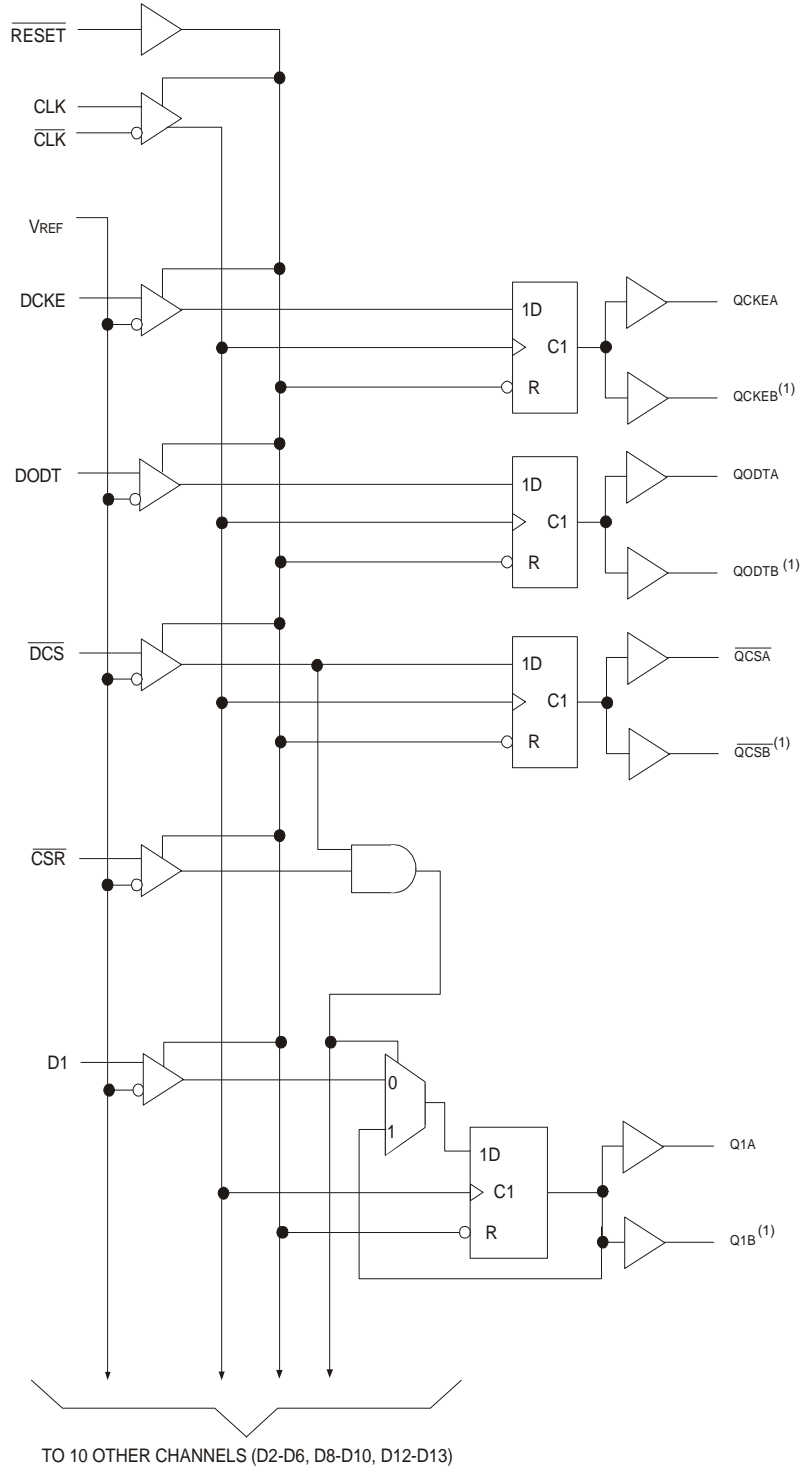

- DDR2 Memory Modules
- Provides complete DDR DIMM solution with ICS98ULPA877A or IDTCSPUA877A
- Ideal for DDR2 667 and 800

↑ = LOW to HIGH

↓ = HIGH to LOW

Data Inputs = D2, D3, D5, D6, D8 - D25 when C0 = 0 and C1 = 0.

Data Inputs = D2, D3, D5, D6, D8 - D14 when C0 = 0 and C1 = 1.

Data Inputs = D1 - D6, D8 - D10, D12, D13 when C0 = 1 and C1 = 1.

2 PAR_IN arrives one clock cycle after the data to which it applies when C0 = 0, and two clock cycles when C0 = 1.

3 This transition assumes $\overline{\text{QERR}}$ is HIGH at the crossing of CLK going HIGH and $\overline{\text{CLK}}$ going LOW. If $\overline{\text{QERR}}$ is LOW, it stays latched LOW for two clock cycles or until $\overline{\text{RESET}}$ is driven LOW.

Absolute Maximum Ratings

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Item		Rating
Supply Voltage, VDD		-0.5V to 2.5V
Input Voltage Range, Vi ¹		-0.5V to 2.5V
Output Voltage Range, Vo ^{1,2}		-0.5V to VDD + 0.5V
Input Clamp Current, IiK		±50mA
Output Clamp Current, IoK		±50mA
Continuous Output Clamp Current, Io		±50mA
Continuous Current through each VDD or GND		±100mA
Package Thermal Impedance (θ_{ja}) ³	0m/s Airflow	70.9° C/W
	1m/s Airflow	65° C/W
Storage Temperature, TSTG		-65 to +150° C

1 The input and output negative voltage ratings may be exceeded if the ratings of the I/P and O/P clamp current are observed.

2 This current will flow only when the output is in the high state level $V_O > V_{DDQ}$.

3 The package thermal impedance is calculated in accordance with JESD 51.

Terminal Functions

Terminal Name	Electrical Characteristics	Description
GND	Ground Input	Ground
VDD	1.8V nominal	Power Supply Voltage
VREF	0.9V nominal	Input Reference Clock
ZOH	Input	Reserved for future use
ZOL	Input	Reserved for future use
CLK	Differential Input	Positive Master Clock Input
$\overline{\text{CLK}}$	Differential Input	Negative Master Clock Input
C0, C1	LVC MOS Input	Configuration Control Inputs
$\overline{\text{RESET}}$	LVC MOS Input	Asynchronous Reset Input. Resets registers and disables VREF data and clock differential-input receivers.
$\overline{\text{CSR}}, \overline{\text{DCS}}$	SSTL_18 Input	Chip Select Inputs. Disables outputs D1 - D24 output switching when both inputs are HIGH.
D1 - D25	SSTL_18 Input	Data Input. Clocked in on the crossing of the rising edge of CLK and the falling edge of $\overline{\text{CLK}}$.
DODT	SSTL_18 Input	The outputs of this register bit will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
DCKE	SSTL_18 Input	The outputs of this register bit will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
Q1 - Q25	1.8V CMOS	Data Outputs that are suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
$\overline{\text{QCS}}$	1.8V CMOS	Data Output that will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
QODT	1.8V CMOS	Data Output that will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
QCKE	1.8V CMOS	Data Output that will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
PPO	1.8V CMOS	Partial Parity Output. Indicates off parity of D1 - D25
PAR_IN	SSTL_18 Input	Parity Input arrives one cycle after corresponding data input
$\overline{\text{QERR}}$	Open Drain Output	Output Error bit, generated one cycle after the corresponding data output

Operating Characteristics

The $\overline{\text{RESET}}$ and Cn inputs of the device must be held at valid levels (not floating) to ensure proper device operation. The differential inputs must not be floating unless $\overline{\text{RESET}}$ is LOW.

Symbol	Parameter		Min.	Typ.	Max.	Units
VDDQ	I/O Supply Voltage		1.7		1.9	V

Register Timing

Timing Diagram for SSTUBF32866B Used as a Single Device; C0 = 0, C1 = 0, RESET Switches from L to H

NOTES:

1. After RESET is switched from LOW to HIGH, all data and PAR_IN inputs signals must be set and held low for a minimum time of tACTMAX, to avoid false error.
2. If the data is clocked in on the n clock pulse, the QERR output signal will be generated on the n+2 clock pulse, and it will be valid on the n+3 clock pulse.

Register Timing

Timing Diagram for the First SSTUBF32866B Used as a Single Device; C0 = 0, C1 = 0, \overline{RESET} Held HIGH

NOTE:

1. If the data is clocked in on the n clock pulse, the \overline{QERR} output signal will be generated on the $n+2$ clock pulse, and it will be valid on the $n+3$ clock pulse. If an error occurs and the \overline{QERR} output is driven low, it stays latched low for a minimum of two clock cycles or until \overline{RESET} is driven low.

Register Timing

Timing Diagram for SSTUBF32866B Used as a Single Device; C0 = 0, C1 = 0, $\overline{\text{RESET}}$ Switches from H to L

NOTE:

1. After $\overline{\text{RESET}}$ is switched from HIGH to LOW, all data and clock inputs signals must be set and held at valid logic levels (not floating) for a minimum time of t_{INACTMAX} .

Register Timing

Timing Diagram for the First SSTUBF32866B (1:2 Register-A Configuration) Device Used in a Pair; C0 = 0, C1 = 1, RESET Switches from L to H

NOTES:

1. After \overline{RESET} is switched from LOW to HIGH, all data and $\overline{PAR_IN}$ inputs signals must be set and held low for a minimum time of t_{ACTMAX} , to avoid false error.
2. If the data is clocked in on the n clock pulse, the \overline{QERR} output signal will be generated on the n+1 clock pulse, and it will be valid on the n+2 clock pulse.

Register Timing

Timing Diagram for the First SSTUBF32866B (1:2 Register-A Configuration) Device Used in a Pair; C0 = 0, C1 = 1, \overline{RESET} Held HIGH

NOTE:

1. If the data is clocked in on the n clock pulse, the \overline{QERR} output signal will be generated on the $n+1$ clock pulse, and it will be valid on the $n+2$ clock pulse. If an error occurs and the \overline{QERR} output is driven low, it stays latched low for a minimum of two clock cycles or until \overline{RESET} is driven low.

Register Timing

NOTES:

1. CL includes probe and jig capacitance.
2. IDD tested with clock and data inputs held at VDD or GND, and $I_o = 0mA$
3. All input pulses are supplied by generators having the following characteristics: PRR $\leq 10MHz$, $Z_o = 50\Omega$, input slew rate = $1 V/ns \pm 20\%$ (unless otherwise specified).
4. The outputs are measured one at a time with one transition per measurement.
5. $V_{TT} = V_{REF} = V_{DD}/2$
6. $V_{IH} = V_{REF} + 250mV$ (AC voltage levels) for differential inputs. $V_{IH} = V_{DD}$ for LVC MOS input.
7. $V_{IL} = V_{REF} - 250mV$ (AC voltage levels) for differential inputs. $V_{IL} = GND$ for LVC MOS input.
8. $V_{ID} = 600mV$.
9. tPLH and tPHL are the same as tPDM.

Test Circuits and Waveforms ($V_{DD} = 1.8V \pm 0.1V$)

Load Circuit: High-to-Low Slew-Rate Adjustment

Voltage Waveforms: High-to-Low Slew-Rate Adjustment

Load Circuit: Error Output Measurements

Voltage Waveforms: Open Drain Output Low-to-High Transition Time (with respect to RESET input)

Load Circuit: Low-to-High Slew-Rate Adjustment

Voltage Waveforms: Low-to-High Slew-Rate Adjustment

Voltage Waveforms: Open Drain Output High-to-Low Transition Time (with respect to clock inputs)

Voltage Waveforms: Open Drain Output Low-to-High Transition Time (with respect to clock inputs)

NOTES:

1. CL includes probe and jig capacitance.
2. All input pulses are supplied by generators having the following characteristics: PRR $\leq 10\text{MHz}$, $Z_o = 50\Omega$, input slew rate = $1 \text{ V/ns} \pm 20\%$ (unless otherwise specified).

Test Circuits and Waveforms ($V_{DD} = 1.8V \pm 0.1V$)

Load Circuit: Partial-Parity-Out Load Circuit

Load Circuit: Partial-Parity-Out Voltage Waveforms Propagation Delay Times (with respect to clock inputs)

Load Circuit: Partial-Parity-Out Voltage Waveforms Propagation Delay Times (with respect to $\overline{\text{RESET}}$ input)
