

## System Clock Chip for ATI RS400 P4™-based Systems

### Recommended Application:

ATI RS400 systems using Intel P4™ processors

### Output Features:

- 6 - Pairs of SRC/PCI-Express clocks
- 2 - Pairs of ATIG (SRC/PCI Express\*) clocks
- 3 - Pairs of Intel P4 clocks
- 3 - 14.318 MHz REF clocks
- 1 - 48MHz USB clock
- 1 - 33 MHz PCI clock seed

### Key Specifications:

- CPU outputs cycle-cycle jitter < 85ps
- SRC output cycle-cycle jitter <125ps
- PCI outputs cycle-cycle jitter < 250ps
- +/- 300ppm frequency accuracy on CPU & SRC clocks

### Features/Benefits:

- 2- Programmable Clock Request pins for SRC clocks
- Supports CK410 or CK409 frequency table mapping
- Spread Spectrum for EMI reduction
- Outputs may be disabled via SMBus
- External crystal load capacitors for maximum frequency accuracy

### Functionality - (CK410# = 0)

Pins preceded by \* have a 120 Kohm Internal Pull Up resistor

### 56-pin SSOP & TSSOP

## Pin Description

PIN #	PIN NAME	PIN TYPE	DESCRIPTION
1	X1	IN	Crystal input, Nominally 14.318MHz.
2	X2	OUT	Crystal output, Nominally 14.318MHz
3	VDD48	PWR	Power pin for the 48MHz output.3.3V
4	USB_48MHz	OUT	48.00MHz USB clock
5	GND	PWR	Ground pin.
6	VTT_PWRGD#/PD	IN	Vtt_PwrGd# is an active low input used to determine when latched inputs are ready to be sampled. PD is an asynchronous active high input pin used to put the device into a low power state. The internal clocks, PLLs and the crystal oscillator are stopped.
7	SCLK	IN	Clock pin of SMBus circuitry, 5V tolerant.
8	SDATA	I/O	Data pin for SMBus circuitry, 5V tolerant.
9	**FS_C	IN	Frequency select latch input pin
10	**CLKREQA#	IN	Output enable for PCI Express (SRC) outputs. SMBus selects which outputs are controlled. 0 = enabled, 1 = tri-stated
11	**CLKREQB#	IN	Output enable for PCI Express (SRC) outputs. SMBus selects which outputs are controlled. 0 = enabled, 1 = tri-stated
12	SRCCLKT7	OUT	True clock of differential SRC clock pair.
13	SRCCLKC7	OUT	Complement clock of differential SRC clock pair.
14	VDDSRC	PWR	Supply for SRC clocks, 3.3V nominal
15	GNDSRC	PWR	Ground pin for the SRC outputs
16	SRCCLKT6	OUT	True clock of differential SRC clock pair.
17	SRCCLKC6	OUT	Complement clock of differential SRC clock pair.
18	SRCCLKT5	OUT	True clock of differential SRC clock pair.
19	SRCCLKC5	OUT	Complement clock of differential SRC clock pair.
20	GNDSRC	PWR	Ground pin for the SRC outputs
21	VDDSRC	PWR	Supply for SRC clocks, 3.3V nominal
22	SRCCLKT4	OUT	True clock of differential SRC clock pair.
23	SRCCLKC4	OUT	Complement clock of differential SRC clock pair.
24	SRCCLKT3	OUT	True clock of differential SRC clock pair.
25	SRCCLKC3	OUT	Complement clock of differential SRC clock pair.
26	GNDSRC	PWR	Ground pin for the SRC outputs
27	ATIGCLKT1	OUT	True clock of differential SRC clock pair.
28	ATIGCLKC1	OUT	Complementary clock of differential SRC clock pair.

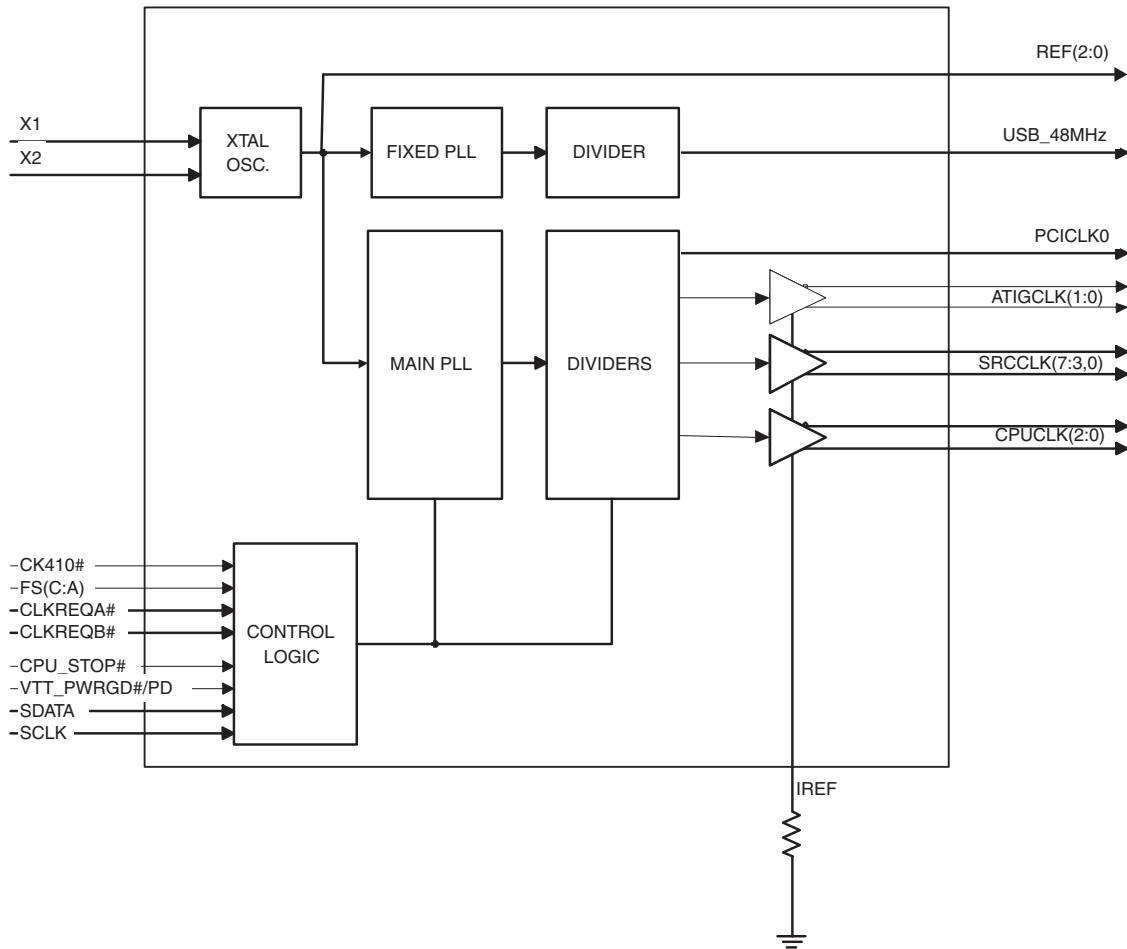

### Pin Description (Continued)

PIN #	PIN NAME	PIN TYPE	DESCRIPTION
29	ATIGCLKC0	OUT	Complementary clock of differential SRC clock pair.
30	ATIGCLKT0	OUT	True clock of differential SRC clock pair.
31	GNDATI	PWR	Ground for ATI Gclocks, nominal 3.3V
32	VDDATI	PWR	Power supply ATI Gclocks, nominal 3.3V
33	SRCCLKC0	OUT	Complement clock of differential SRC clock pair.
34	SRCCLKT0	OUT	True clock of differential SRC clock pair.
35	VDDSRC	PWR	Supply for SRC clocks, 3.3V nominal
36	GNDSRC	PWR	Ground pin for the SRC outputs
37	IREF	OUT	This pin establishes the reference current for the differential current-mode output pairs. This pin requires a fixed precision resistor tied to ground in order to establish the appropriate current. 475 ohms is the standard value.
38	GND A	PWR	Ground pin for the PLL core.
39	VDD A	PWR	3.3V power for the PLL core.
40	CPUCLKC2_ITP	OUT	Complementary clock of differential pair CPU outputs. These are current mode outputs. External resistors are required for voltage bias.
41	CPUCLKT2_ITP	OUT	True clock of differential pair CPU outputs. These are current mode outputs. External resistors are required for voltage bias.
42	CPUCLKC1	OUT	Complementary clock of differential pair CPU outputs. These are current mode outputs. External resistors are required for voltage bias.
43	CPUCLKT1	OUT	True clock of differential pair CPU outputs. These are current mode outputs. External resistors are required for voltage bias.
44	GND CPU	PWR	Ground pin for the CPU outputs
45	VDD CPU	PWR	Supply for CPU clocks, 3.3V nominal
46	CPUCLKC0	OUT	Complementary clock of differential pair CPU outputs. These are current mode outputs. External resistors are required for voltage bias.
47	CPUCLKT0	OUT	True clock of differential pair CPU outputs. These are current mode outputs. External resistors are required for voltage bias.
48	*CPU_STOP#	IN	Stops all CPUCLK, except those set to be free running clocks
49	GND PCI	PWR	Ground pin for the PCI outputs
50	**CK410#/PCICLK0	I/O	FS Table select latch input pin / 3.3V PCI clock output. 0 = CK410 FS Table, 1 = CK409 FS Table
51	VDD PCI	PWR	Power supply for PCI clocks, nominal 3.3V
52	**TEST_SEL/REF2	I/O	TEST_SEL: latched input to select TEST MODE / 14.318 MHz reference clock. 1 = All outputs are CK410 REF/N test mode 0 = All outputs behave normally.
53	**FS_B/REF1	I/O	Frequency select latch input pin / 14.318 MHz reference clock.
54	**FS_A/REF0	I/O	Frequency select latch input pin / 14.318 MHz reference clock.
55	GND	PWR	Ground pin.
56	VDD REF	PWR	Ref, XTAL power supply, nominal 3.3V

## General Description

ICS951411 provides a single-chip clocking solution for the ATI RS400-based systems using the latest Intel P4 processors. ICS951411 is driven with a 14.318MHz crystal. It generates CPU outputs up to 400MHz and also provides highly accurate SRC clocks for PCI Express support. Two Clock Request pins are provided for Express-Card™ support.

## Block Diagram

## Power Groups

Pin Number		Description
VDD	GND	
56	55	Xtal, REF
51	49	PCICLK output
45	44	CPUCLK Outputs
14, 21, 35	15, 20, 26, 36	SRCCLK outputs
32	31	ATIGCLK outputs
39	38	Analog, CPU PLL
3	5	USB_48MHz output

## General SMBus serial interface information for the ICS951411

### How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address  $D2_{(H)}$
- ICS clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- ICS clock will **acknowledge**
- Controller (host) sends the data byte count = X
- ICS clock will **acknowledge**
- Controller (host) starts sending **Byte N through Byte N + X - 1**  
(see Note 2)
- ICS clock will **acknowledge** each byte **one at a time**
- Controller (host) sends a Stop bit

### How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the write address  $D2_{(H)}$
- ICS clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- ICS clock will **acknowledge**
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address  $D3_{(H)}$
- ICS clock will **acknowledge**
- ICS clock will send the data byte count = X
- ICS clock sends **Byte N + X - 1**
- ICS clock sends **Byte 0 through byte X (if  $X_{(H)}$  was written to byte 8).**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

Index Block Write Operation

## Shared Pin Operation - Input/Output Pins

The I/O pins designated by (input/output) on the **ICS951416** serve as dual signal functions to the device. During initial power-up, they act as input pins. The logic level (voltage) that is present on these pins at this time is read and stored into a 5-bit internal data latch. At the end of Power-On reset, (see AC characteristics for timing values), the device changes the mode of operations for these pins to an output function. In this mode the pins produce the specified buffered clocks to external loads.

To program (load) the internal configuration register for these pins, a resistor is connected to either the VDD (logic 1) power supply or the GND (logic 0) voltage potential. A 10 Kiloohm (10K) resistor is used to provide both the solid CMOS programming voltage needed during the power-up programming period and to provide an insignificant load on the output clock during the subsequent operating period.

Figure 1 shows a means of implementing this function when a switch or 2 pin header is used. With no jumper is installed the pin will be pulled high. With the jumper in place the pin will be pulled low. If programmability is not necessary, than only a single resistor is necessary. The programming resistors should be located close to the series termination resistor to minimize the current loop area. It is more important to locate the series termination resistor close to the driver than the programming resistor.
