

GreenPAK

Programmable Mixed-signal Matrix with P-FET Power Switch w/o Discharge

General Description

The SLG46116 GreenPAK combines the functionality and versatility of a GreenPAK Programmable Mixed-signal Matrix with the capabilities of Renesas Electronics Corporation's CuFET technology. Capable of integrating a number common discrete ICs and passive components into a single device, the GreenPAK family's SLG46116V enables high power switching with a soft-start 1.25 A P-Ch MOSFET with slew rate control.

Features

- Logic & Mixed Signal Circuits
- Highly Versatile Macrocells
- Read Back Protection (Read Lock)
- 1.8 V ($\pm 5\%$) to 5 V ($\pm 10\%$) Supply
- Operating Temperature Range $-40\text{ }^{\circ}\text{C}$ to $85\text{ }^{\circ}\text{C}$
- Soft-Start 1.25 A ($@V_{IN} = 3.3\text{ V}$) P-FET Power Switch
- Package
 - 1.6 x 2.5 x 0.55 mm STQFN 14L package
 - Pb-Free / Halogen-Free / RoHS compliant

Pin Configuration

14-pin STQFN
(Top View)

Applications

- Power Sequencing with complex analog control
- Power Plane component size reduction project
- LED Driver
- Haptic Motor Driver
- System RESET with Power Switch

Block Diagram

1.0 Overview

The SLG46116 provides a small, low power component for commonly used mixed-signal functions. The user creates their circuit design by programming the one time Non-Volatile Memory (NVM) to configure the interconnect logic, the I/O Pins and the macrocells of the SLG46116. This highly versatile device allows a wide variety of mixed-signal functions to be designed within a very small, low power single integrated circuit. The SLG46116 includes the following:

- Two Analog Comparators (ACMP)
- Voltage References (Vref)
- Four Combinatorial Look Up Tables (LUTs)
 - Two 2-bit LUTs
 - Two 3-bit LUTs
- Seven Combination Function Macrocell
 - Two Selectable DFF/Latch or 2-bit LUTs
 - Two Selectable DFF/Latch or 3-bit LUTs
 - One Selectable Pipe Delay or 3-bit LUT
 - Pipe Delay – 8 stage / 2 output
 - One Selectable Counter/Delay or 4-bit LUT
 - One Programmable Delay/ Deglitch Filter
- Three Counter / Delay Generators (CNT/DLY)
 - Three 8-bit counter/delays with external clock/reset
- Four D Flip-Flop / Latches (DFF) (Part of Combination Function Macrocell)
- Pipe Delay – 8 stage/2 output (Part of Combination Function Macrocell)
- Trimmed RC Oscillator (RC OSC)
- Power On Reset (POR)
- One Bandgap
- Soft-Start P-FET Power Switch
 - Power Switch IDS: 1 A to 1.5 A
 - Slew Rate Control
 - V_{IN} : 1.5 V to 5.5 V
 - Low RDSON
 - 28.5 m Ω @ 5.5 V
 - 36.4 m Ω @ 3.3 V
 - 44.3 m Ω @ 2.5 V
 - 60.8 m Ω @ 1.8 V
 - 77.6 m Ω @ 1.5 V

2.0 Pin Description

2.1 Functional Pin Description

Pin #	Pin Name	Function
1	GPI	General Purpose Input
2	GPIO	General Purpose I/O or Analog Comparator 0 (+)
3	GPIO	General Purpose I/O or Analog Comparator 0 (-)
4	PWR_SW_ON	Input/Output
5	V _{IN}	P-FET Power Switch Input
6	NC	No Connect
7	V _{OUT}	P-FET Power Switch Output
8	AGND	Ground
9	GND	Ground
10	GPIO	General Purpose I/O
11	GPIO	General Purpose I/O or POR Output
12	GPIO	General Purpose I/O with OE and Vref output
13	GPIO	General Purpose I/O or External Clock Input
14	V _{DD}	Power Supply

3.0 User Programmability

Non-volatile memory (NVM) is used to configure the SLG46116's connection matrix routing and macrocells. The NVM is One-Time-Programmable (OTP). However, Renesas Electronics Corporation's GreenPAK development tools can be used to configure the connection matrix and macrocells, without programming the NVM, to allow on-chip emulation. This configuration will remain active on the device as long as it remains powered and can be re-written as needed to facilitate rapid design changes.

When a design is ready for in-circuit testing, the same GreenPAK development tools can be used to program the NVM and create samples for small quantity builds. Once the NVM is programmed, the device will retain this configuration for the duration of its lifetime.

Once the design is finalized, the design file can be forwarded to Renesas Electronics Corporation to integrate into the production process.

Figure 1. Steps to create a custom GreenPAK device

4.0 Ordering Information

Part Number	Type
SLG46116V	STQFN 14L
SLG46116VTR	STQFN 14L - Tape and Reel (3k units)

Note 1: Use SLG46116V to order. Shipments are automatically in Tape and Reel.

Note 2: "TR" suffix is no longer used. It is a legacy naming convention shown here only for informational purposes.

5.0 Electrical Specifications

5.1 Absolute Maximum Conditions

Parameter	Condition	Min.	Max.	Unit
V_{IN}		-0.5	6	V
V_{DD}		-0.5	7	V
GPIO Voltage		GND - 0.5	$V_{DD} + 0.5$	V
GPIO Output Current (Through pin)	Push-Pull 1x	--	12	mA
	Push-Pull 2x	--	17	
	OD 1x	--	18	
	OD 2x	--	28	
GPIO Input Current		-1.0	1.0	mA
Storage Temperature Range		-65	150	°C
Junction Temperature		--	150	°C
ESD Protection (Human Body Model)		2000	--	V
ESD Protection (Charged Device Model)		1000	--	V
Moisture Sensitivity Level		1		
MOSFET IDS_{PEAK} (Peak Current from V_{IN} to V_{OUT})	For no more than 1 ms with 1 % duty cycle	--	1.5	A

5.2 Electrical Characteristics (1.8 V $\pm$ 5 % V_{DD})

Symbol	Parameter	Condition/Note	Min.	Typ.	Max.	Unit
V_{DD}	Supply Voltage		1.71	1.80	1.89	V
I_Q	Quiescent Current	Static Inputs and Outputs	--	0.5	--	μ A
T_A	Operating Temperature		-40	25	85	°C
V_{AIR}	Analog Input Voltage Range	Positive Input	0	--	V_{DD}	V
		Negative Input	0	--	1.1	V
V_{IH}	HIGH-Level Input Voltage	Logic Input	1.100	--	V_{DD}	V
		Logic Input with Schmitt Trigger	1.270	--	V_{DD}	V
		Low-Level Logic Input	0.980	--	V_{DD}	V
V_{IL}	LOW-Level Input Voltage	Logic Input	--	--	0.690	V
		Logic Input with Schmitt Trigger	--	--	0.440	V
		Low-Level Logic Input	--	--	0.520	V
I_{LKG}	Input Leakage (Absolute Value)		--	1	1000	nA
V_{OH}	HIGH-Level Output Voltage	Push-Pull 1X, Open Drain PMOS 1X, $I_{OH} = 100 \mu$ A	1.680	1.790	--	V
		Push-Pull 2X, Open Drain PMOS 2X, $I_{OH} = 100 \mu$ A	1.702	1.800	--	V

Symbol	Parameter	Condition/Note	Min.	Typ.	Max.	Unit
V_{OL}	LOW-Level Output Voltage	Push-Pull 1X, $I_{OL} = 100 \mu A$	--	0.020	0.030	V
		Push-Pull 2X, $I_{OL} = 100 \mu A$	--	0.010	0.020	V
		Open Drain NMOS 1X, $I_{OL} = 100 \mu A$	--	0.010	0.020	V
		Open Drain NMOS 2X, $I_{OL} = 100 \mu A$	--	0.010	0.010	V
I_{OH}	HIGH-Level Output Current (see Note 1)	Push-Pull 1X, Open Drain PMOS 1X, $V_{OH} = V_{DD} - 0.2$	1.040	1.400	--	mA
		Push-Pull 2X, Open Drain PMOS 2X, $V_{OH} = V_{DD} - 0.2$	2.150	2.710	--	mA
I_{OL}	LOW-Level Output Current (see Note 1)	Push-Pull 1X, $V_{OL} = 0.15 V$	0.760	1.340	--	mA
		Push-Pull 2X, $V_{OL} = 0.15 V$	1.520	2.660	--	mA
		Open Drain NMOS 1X, $V_{OL} = 0.15 V$	1.530	2.670	--	mA
		Open Drain NMOS 2X, $V_{OL} = 0.15 V$	3.060	5.130	--	mA
I_{VDD}	Maximum Average or DC Current Through V_{DD} Pin (Per chip side, see Note 2)	$T_J = 85^\circ C$	--	--	73	mA
		$T_J = 110^\circ C$	--	--	35	mA
I_{GND}	Maximum Average or DC Current Through GND Pin (Per chip side, see Note 2)	$T_J = 85^\circ C$	--	--	92	mA
		$T_J = 110^\circ C$	--	--	44	mA
V_O	Maximal Voltage Applied to any PIN in High-Impedance State		--	--	$V_{DD}+0.3$	V
T_{SU}	Startup Time	From V_{DD} rising past PON_{THR}	--	0.27	--	ms
PON_{THR}	Power On Threshold	V_{DD} Level Required to Start Up the Chip	1.182	1.346	1.505	V
$POFF_{THR}$	Power Off Threshold	V_{DD} Level Required to Switch Off the Chip	0.752	0.918	1.110	V
Power Switch Electrical Characteristics						
V_{IN}	Power Switch Input Voltage	$-40^\circ C$ to $85^\circ C$	1.5	--	5.5	V
I_{IN}	Power Switch Current (PIN 5)	when Off, $V_{IN} = 5.5 V$	--	0.02	0.1	μA
		when $PWR_SW_ON = V_{IN}$, No load	--	0.05	0.5	μA
I_{DS_LKG}	Leakage Measured from PIN 5 to PIN 7	when Off, $V_{IN} = 5.5 V$	--	0.05	1	μA
I_{ON_LKG}	PWR_SW_ON Pin Input Leakage		--	--	0.1	μA
R_{DS_ON}	Static Drain to Source ON Resistance @ $T_A 25^\circ C$	@ $V_{IN} = 5.5 V$	--	28.5	32.0	$m\Omega$
		@ $V_{IN} = 3.3 V$	--	36.4	40.0	$m\Omega$
		@ $V_{IN} = 2.5 V$	--	44.3	49.0	$m\Omega$
		@ $V_{IN} = 1.8 V$	--	60.8	65.0	$m\Omega$
		@ $V_{IN} = 1.5 V$	--	77.6	82.0	$m\Omega$

Symbol	Parameter	Condition/Note	Min.	Typ.	Max.	Unit
RDS _{ON}	Static Drain to Source ON Resistance @ T _A 85 °C	@ V _{IN} = 5.5 V	--	34.0	36.0	mΩ
		@ V _{IN} = 3.3 V	--	43.8	46.0	mΩ
		@ V _{IN} = 2.5 V	--	53.3	56.0	mΩ
		@ V _{IN} = 1.8 V	--	72.2	76.0	mΩ
		@ V _{IN} = 1.5 V	--	90.7	94.0	mΩ
IDS	Operating Current	V _{IN} = 1.5 V	--	--	1.0	A
T _{On_Delay}	PWR_SW_ON pin Delay Time	50 % PWR_SW_ON to Ramp Begin, V _{IN} = 5 V, V _{OUT_Cap} = 0.1 μF, R _L = 10 Ω	12.0	15.0	18.5	μs
		50 % PWR_SW_ON to Ramp Begin, V _{IN} = 3.3 V, V _{OUT_Cap} = 0.1 μF, R _L = 10 Ω	17.0	22.0	30.0	μs

Filtered Pulse Width	< 150	< 55	< 35	ns

5.10 V_{IN} vs. Max IDS, Safe Operation Area

5.11 T_{Total_On} , T_{On_Delay} and Slew Rate Measurement

6.0 Summary of Macrocell Function

6.1 I/O Pins

- Digital Input (low voltage or normal voltage, with or without Schmitt Trigger)
- Open Drain Outputs
- Push Pull Outputs
- Analog I/O
- 10 k Ω /100 k Ω /1 M Ω pull-up/pull-down resistors

6.2 Connection Matrix

- Digital matrix for circuit connections based on user design

6.3 Analog Comparators (2 total)

- Selectable hysteresis 0 mV/25 mV/50 mV/200 mV

6.4 Voltage Reference

- Used for references on Analog Comparators
- Can also be driven to external pins

6.5 Combinational Logic Look Up Tables (LUTs – 4 total)

- Two 2-bit Lookup Tables
- Two 3-bit Lookup Tables

6.6 Combination Function Macrocells (7 total)

- Two Selectable DFF/Latch or 2-bit LUTs
- Two Selectable DFF/Latch or 3-bit LUTs
- One Selectable Pipe Delay or 3-bit LUT
- One Selectable CNT/DLY or 4-bit LUT
- One Programmable Delay/ Deglitch Filter

6.7 Delays/Counters (3 total)

- Three 8-bit delays/counters with external clock/reset: Range 1-255 clock cycles

6.8 Pipe Delay (Part of Combination Function Macrocell)

- 8 stage / 2 output
- Two 1-8 stage selectable outputs.

6.9 Programmable Delay

- 125 ns/250 ns/375 ns/500 ns @ 3.3 V
- Includes Edge Detection function

6.10 RC Oscillator

- 25 kHz and 2 MHz selectable frequency
- First stage divider (4): OSC/1, OSC/2, OSC/4, and OSC/8
- Second stage divider (8): selectable (OSC/1, OSC/2, OSC/3, OSC/4, OSC/8, OSC/12, OSC/24, or OSC/64)

6.11 Power On Reset (POR)

7.0 I/O Pins

The SLG46116 has a total of 7 multi-function I/O pins which can function as either a user defined Input or Output, as well as serving as a special function (such as outputting the voltage reference). Refer to Section 2.0 Pin Description for pin definitions.

Of the 7 user defined I/O pins on the SLG46116, all but one of the pins (Pin 1) can serve as both digital input and digital output. Pin 1 can only serve as a digital input pin.

7.1 Input Modes

Each I/O pin can be configured as a digital input pin with/without buffered Schmitt trigger, or can also be configured as a low voltage digital input. Pins 2 and 3 can also be configured to serve as analog inputs to the on-chip comparators.

7.2 Output Modes

Pins 2, 3, 10, 11, 12, and 13 can all be configured as digital output pins.

7.3 Pull Up/Down Resistors

All I/O pins have the option for user selectable resistors connected to the input structure. The selectable values on these resistors are 10 k Ω , 100 k Ω and 1 M Ω . In the case of Pin 1, the resistors are fixed to a pull-down configuration. In the case of all other I/O pins, the internal resistors can be configured as either pull-up or pull-downs.

7.4 3-State Output

Pin 12 of the SLG46116 can be configured to build separate 3-state output using other components from this pin.

Table 6. 3-State Output Mode Settings (for Pin 12)

Output Enable	Input Mode	Output Mode
0	Analog Input/Output	--
1	--	Push-Pull

8.0 Connection Matrix

The Connection Matrix in the SLG46116 is used to create the internal routing for internal functions of the device once it is programmed. The registers are programmed from the one-time NVM cell during Test Mode Operation. All of the connection point for each logic cell within the SLG46116 has a specific digital bit code assigned to it that is either set to active “High” or inactive “Low” based on the design that is created. Once the 1024 register bits within the SLG46116 are programmed a fully custom circuit will be created.

The Connection Matrix has 32 inputs and 44 outputs. Each of the 32 inputs to the Connection Matrix is hard-wired to a particular source macrocell, including I/O pins, LUTs, analog comparators, other digital resources and V_{DD} and V_{SS} . The input to a digital macrocell uses a 5-bit register to select one of these 32 input lines.

For a complete list of the SLG46116’s register table, see Section 19.0 Appendix A - SLG46116 Register Definition.

Matrix Input Signal Functions	N						
VSS	0						
PIN 1 Digital In	1

9.0 Combinatorial Logic

Combinatorial logic is supported via four Lookup Tables (LUTs) within the SLG46116. There are two 2-bit LUTs and two 3-bit LUTs. The device also includes six Combination Function Macrocells that can be used as LUTs. For more details, please see Section 10.0 Combination Function Macrocells.

Inputs/Outputs for the four LUTs are configured from the connection matrix with specific logic functions being defined by the state of NVM bits. The outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR).

9.1 2-Bit LUT

The two 2-bit LUTs each take in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix. ...

Figure 7. 2-bit LUTs

Table 16. 2-bit LUT2 Truth Table.

IN1	IN0	OUT
0	0	reg <232>
0	1	reg <233>

0	1	reg <237>
1	0	reg <238>
1	1	reg <239>

Each 2-bit LUT uses a 4-bit register signal to define their output functions;

2-Bit LUT2 is defined by reg <235:232>

2-Bit LUT3 is defined by reg <239:236>

The table below shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the two 2-bit LUT logic cells.

Table 18. 2-bit LUT2/LUT3 Standard Digital Functions.

Function	MSB			LSB
AND-2	1	0	0	0
NAND-2	0	1	1	1
OR-2	1	1	1	0
NOR-2	0	0	0	1
XOR-2	0	1	1	0
XNOR-2	1	0	0	1

9.2 3-Bit LUT

The two 3-bit LUTs each take in three input signals from the connection matrix and produce a single output, which goes back into the connection matrix.

Figure 8. 3-bit LUTs

Table 19. 3-bit LUT2 Truth Table.

IN2	IN1	IN0	OUT

1	0	1	reg <271>
1	1	0	reg <272>
1	1	1	reg <273>

Each 3-bit LUT uses a 8-bit register signal to define their output functions;

3-Bit LUT2 is defined by reg <265:258>

3-Bit LUT3 is defined by reg <273:266>

The table below shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the two 3-bit LUT logic cells.

Table 21. 3-bit LUT2/LUT3 Standard Digital Functions.

AND-3	1	0	0	0	0	0	0	0
NAND-3	0	1	1	1	1	1	1	1
OR-3	1	1	1	1	1	1	1	0
NOR-3	0	0	0	0	0	0	0	1
XOR-3	0	1	1	1	1	1	1	0
XNOR-3	1	0	0	0	0	0	0	1

10.0 Combination Function Macrocells

The SLG46116 has six combination function macrocells that can serve more than one logic or timing function. In each case, they can serve as a Look Up Table (LUT), or as another logic or timing function. See the list below for the functions that can be implemented in these macrocells;

- Two macrocells that can serve as either 2-bit LUTs or as D Flip-Flops.
- Two macrocells that can serve as either 3-bit LUTs or as D Flip-Flops.
- One macrocell that can serve as either 3-bit LUT or as Pipe Delay
- One macrocells that can serve as either 4-bit LUTs or as 8-Bit Counter / Delays

Inputs/Outputs for the six combination function macrocells are configured from the connection matrix with specific logic functions being defined by the state of NVM bits.

When used as a LUT to implement combinatorial logic functions, the outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR).

When used as a D Flip-Flop / Latch, the source and destination of the inputs and outputs for the DFF/Latches are configured from the connection matrix. All DFF/Latch macrocells have user selection for initial state, and all have the option to connect both the Q and Q Bar outputs to the connection matrix. The macrocells DFF2, DFF3 have an additional input from the matrix that can serve as a nSet or nReset function to the macrocell.

The operation of the D Flip-Flop and Latch will follow the functional descriptions below:

DFF: CLK is rising edge triggered, then $Q = D$; otherwise Q will not change

Latch: if CLK = 0, then $Q = D$

10.1 2-Bit LUT or D Flip-Flop Macrocells

There are two macrocells that can serve as either 2-bit LUTs or as D Flip-Flops. When used to implement LUT functions, the 2-bit LUTs each take in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip-Flop function, the two input signals from the connection matrix go to the data (d) and clock (clk) inputs for the Flip-Flop, with the output going back to the connection matrix.

Figure 9. 2-bit LUT0 or DFF0

Table 25. DFF1 Register Settings

Signal Function	Register Bit Address	Register Definition
DFF1 or Latch select	reg <228>	0: DFF function 1: Latch function
DFF1 output select	reg <229>	0: Q output 1: nQ output
DFF1 initial polarity select	reg <230>	0: Low 1: High
2-bit LUT1 data	reg <239:236>	2-bit LUT1 data
2-bit LUT1 or DFF1 select	reg <241>	0: 2-bit LUT1 1: DFF1

10.2 3-Bit LUT or D Flip-Flop with Set/Reset Macrocells

There are two macrocells that can serve as either 3-bit LUTs or as D Flip-Flops. When used to implement LUT functions, the 3-bit LUTs each take in three input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip-Flop function, the three input signals from the connection matrix go to the data (d) and clock (clk) and Set/Reset (nRST/nSET) inputs for the Flip-Flop, with the output going back to the connection matrix.

Figure 11. 3-bit LUT0 or DFF2

1	0	1	reg <279>
1	1	0	reg <280>
1	1	1	reg <281>

Each Macrocell, when programmed for a LUT function, uses a 8-bit register to define their output function:

3-Bit LUT4 is defined by reg <281:274>

10.3.2 3-Bit LUT or Pipe Delay Macrocells Used as Pipe Delay Register Settings

Table 31. Pipe Delay Register Settings

Signal Function	Register Bit Address	Register Definition
OUT0 select	reg <276:274>	data (pipe number)
OUT1 select	reg <279:277>	data (pipe number)
3-bit LUT4 or pipe delay output select	reg <284>	0: 3-bit LUT4 1: pipe delay

10.4 4-Bit LUT or 8- Bit Counter / Delay Macrocells

There is one macrocell that can serve as either a 4-bit LUT or as a Counter / Delay. When used to implement LUT functions, the 4-bit LUT takes in four input signals from the connection matrix and produces a single output, which goes back into the connection matrix. When used to implement 8-Bit Counter / Delay function, two of the four input signals from the connection matrix go to the external clock (ext_clk) and reset (DLY_n/CNT_Reset) for the counter/delay, with the output going back to the connection matrix.

Note: Counters initialize with counter data=0 after POR.

Figure 14. 4-bit LUT0 or CNT/DLY2

4-bit LUT0 or Counter2 select	reg <301>	0: 4-bit LUT0 1: Counter2

11.0 Analog Comparators (ACMP)

There are two Analog Comparator (ACMP) macrocells in the SLG46116. In order for the ACMP cells to be used in a GreenPAK design, the power up signals (ACMP0_pdb and ACMP1_pdb) need to be active. By connecting to signals coming from the Connection Matrix, it is possible to have each ACMP be on continuously, off continuously, or switched on periodically based on a digital signal coming from the Connection Matrix. When ACMP is powered down, output is low.

Each of the ACMP cells has a positive input signal that can be provided by a variety of external sources, and can also have a selectable gain stage before connection to the analog comparator. Each of the ACMP cells has a negative input signal that is either created from an internal VREF or provided by way of the external sources.

Each of the ACMP cells has a selection for the bandwidth of the input signal, which can be used to save power when low bandwidth signals are input into the analog comparator. And if input frequency > 200 kHz, the output will retain its previous value. Each cell also has a hysteresis selection, to offer hysteresis of 0 mV, 25 mV, 50 mV or 200 mV.

During powerup, the ACMP output will remain low, and then become valid 110 μ s (max) after POR signal goes high, see *Figure 15*.

Note: Regulator and Charge Pump set to automatic ON/OFF.

Figure 15. Maximum Power On Delay vs. V_{DD} .

Each of the ACMP cells has a positive input signal that can be provided by a variety of external sources, and can also have a selectable gain stage (1X, 0.5X, 0.33X, 0.25X) before connection to the analog comparator. The Gain divider is unbuffered and consists of 250 K Ω (typ.) resistors, see *Table 34*. IN- voltage range: 0 - 1.2 V. Can use Vref selection $V_{DD}/4$ and $V_{DD}/3$ to maintain this input range.

Table 34. Gain Divider Input Resistance (typ).

Gain	1X	0.5X	0.33X	0.25X
Input Resistance	100M	1M	0.75M	1M

Each of the ACMP cells has a negative input signal that is either created from an internal VREF or provided by the external reference/source. Internal Vref accuracy is optimized near 1000 mV selection.

Note: Power supply control options have influence on the ACMP operation.

Note: Any ACMP powered on enables the BandGap internal circuit as well. An analog voltage will appear on Vref (even when the Force BandGap option is set as Disabled).

Analog comparators have the following configurable options:

- Hysteresis: Input signal hysteresis options are Disable, 25 mV, 50 mV, 200 mV.
- Low Bandwidth: Enable, Disable;
- IN+ Gain: 1X, 0.5X, 0.33X, 0.25X;
- IN+ source:
 - ACMP0 IN+ options are PIN 3, V_{DD} ;
 - ACMP1 IN+ options are PIN 6, ACMP0 IN+;
- IN- source:
 - ACMP0 IN- options are 24 internal reference sources (50 mV – 1200 mV) and $V_{DD}/3$, $V_{DD}/4$, PIN 4;
 - PWR UP=0 – ACMP is powered down; PWR UP=1 – ACMP is powered up.

All ACMPs can have a common negative input. This can be achieved by configuring ACMP0 PIN 4 analog I/O connection.

12.0 Counters/Delay Generators (CNT/DLY)

There are three configurable counters/delay generators in the SLG46116. The three counters/delay generators (CNT/DLY 0, 1, 3) are 8-bit. For flexibility, each of these macrocells has a large selection of internal and external clock sources, as well as the option to chain from the output of the previous (N-1) CNT/DLY macrocell, to implement longer count / delay circuits.

Two of the counter/delay generator macrocells (CNT/DLY0 and CNT/DLY1) have two inputs from the connection matrix, one for Delay Input/Reset Input (Delay_In/Reset_In), and one for an external counter/clock source. One of the counter/delay generator macrocells (CNT/DLY3) has one input from the connection matrix, which has a shared function of either a Delay Input or an external clock input.

Note that there is also one Combination Function Macrocells that can implement either 4-bit LUTs or 8-bit counter / delays, For more information please see Section 10.4 4-Bit LUT or 8- Bit Counter / Delay Macrocells.

Note: Counters initialize with counter data=0 after POR.

13.0 Programmable Delay / Edge Detector

The SLG46116 has a programmable time delay logic cell available that can generate a delay that is selectable from one of four timings (time1) configured in the GreenPAK Designer. The programmable time delay cell can generate one of four different delay patterns, rising edge detection, falling edge detection, both edge detection and both edge delay. These four patterns can be further modified with the addition of delayed edge detection, which adds an extra unit of delay as well as glitch rejection during the delay period. See the timing diagrams below for further information.

Note: The input signal must be longer than the delay, otherwise it will be filtered out.

Figure 35. Programmable Delay

14.0 Additional Logic Functions

The SLG46116 has an additional logic function that is connected directly to the Connection Matrix inputs and outputs. There is one deglitch filter.

14.1 Deglitch Filter

Figure 38. Deglitch Filter

15.0 Voltage Reference (VREF)

15.1 Voltage Reference Overview

The SLG46116 has a Voltage Reference Macrocell to provide references to the four analog comparators. This macrocell can supply a user selection of fixed voltage references, $/3$ and $/4$ reference off of the V_{DD} power supply to the device, and externally supplied voltage references from PIN 3. The macrocell also has the option to output reference voltages on PIN 12. See table below for the available selections for each analog comparator. Also see *Figure 39.* below, which shows the reference output structure.

15.2 VREF Selection Table

Table 42. VREF Selection Table.

SEL<4:0>	CMP0_VREF	CMP1_VREF
11010	ext. Vref (PIN 3)	ext. Vref (PIN 3)
11001	$V_{DD} / 4$	$V_{DD} / 4$
11000	$V_{DD} / 3$	$V_{DD} / 3$
10111	1.20	1.20
10110	1.15	1.15
10101	1.10	1.10

00000	0.05	0.05

V_{DD}	Practical VREF Range	Note
2.0 V - 5.5 V	50 mV ~1.2 V	
1.7 V - 2.0 V	50 mV ~1.1 V	Higher than 1.1 V negative input, the comparator may show wrong result

15.3 VREF Block Diagram

Figure 39. Voltage Reference Block Diagram

16.0 RC Oscillator (RC Osc)

16.1 RC Oscillator Overview

The SLG46116 has two internal RC oscillators, one that runs at 25 kHz and one that runs at 2 MHz. When using the chip internal RC OSC, a choice is available to “Force Power On”, meaning that the RC OSC will always run, or “Auto Power On”, meaning that the RC OSC will have an associated startup and settling time associated with it (offset). *Figure 40.* and *Figure 41.* show maximum power on delay vs. V_{DD} .

Note: RC OSC power setting: “Auto Power On”.

Figure 40. Maximum Power On Delay vs. V_{DD} , RC OSC = 2 MHz.

Figure 41. Maximum Power On Delay vs. V_{DD} , RC OSC = 25 kHz.

The user can select one of these fundamental frequencies for the RC OSC Macrocell, or the fundamental frequency can also come from an external clock input (Pin 12). There are two divider stages that allow the user flexibility for introducing clock signals on various Connection Matrix Input lines. The first stage divider (also known as the clock pre-divider) allows the selection of /1, /2, /4 or /8 divide down frequency from the fundamental. There are two second stage divider controls (OUT0 and OUT1). Each has its own input of one frequency from the first stage divider, and outputs five different frequencies on Connection Matrix Input lines <45>, <46>, <47>, <48>, and <49>. See *Figure 42.* below for details of the frequencies for each of these five Connection Matrix Inputs.

If PWR DOWN input of oscillator is LOW, the oscillator will be turned on. If PWR DOWN input of oscillator is HIGH the oscillator will be turned off. The PWR DOWN signal has the highest priority.

16.2 RC OSC Block Diagram

Figure 42. RC OSC Block Diagram

17.0 Power On Rest (POR)

The SLG46116 has a power-on reset (POR) macrocell to ensure correct device initialization and operation of all macrocells in the device. The purpose of the POR circuit is to have consistent behavior and predictable results when the V_{DD} power is first ramping to the device, and also while the V_{DD} is falling during power-down. To accomplish this goal, the POR drives a defined sequence of internal events that trigger changes to the states of different macrocells inside the device, and finally to the state of the I/O pins. This application note is created to explain the whole process of POR operation and GreenPAK chip behavior during the time while it is powering up and powering down.

17.1 General Operation

The SLG46116 is guaranteed to be powered down and nonoperational when the V_{DD} voltage (on PIN14) is less than 0.6 V, but not less than -0.6 V. Another essential condition for the chip to be powered down is that no voltage higher (see Note 1) than the V_{DD} voltage is applied to any other PIN. For example, if V_{DD} voltage is 0.3 V, applying a voltage higher than 0.3 V to any other PIN is incorrect, and can lead to incorrect or unexpected device behavior.

Note 1. There is a 0.6 V margin due to forward drop voltage of the ESD protection diodes.

To start the POR sequence in the SLG46116, the voltage applied on the V_{DD} should be higher than the Power_ON threshold (see Note 2). The full operational V_{DD} range for the SLG46116 is 1.71 V – 5.5 V (1.8 V $\pm$ 5 % - 5 V $\pm$ 10 %). This means that the V_{DD} voltage must ramp up to the operational voltage value, but the POR sequence will start earlier, as soon as the V_{DD} voltage rises to the Power_ON threshold. After the POR sequence has started, the SLG46116 will have a typical period of time to go through all the steps in the sequence (noted in the datasheet for that device), and will be ready and completely operational after the POR sequence is complete.

Note 2. The Power_ON threshold can vary by PVT, but typically it is 1.6 V.

To power down the chip the V_{DD} voltage should be lower than the operational and to guarantee that chip is powered down it should be less than 0.6 V.

All PINs are in high impedance state when the chip is powered down and while the POR sequence is taking place. The last step in the POR sequence releases the I/O structures from the high impedance state, at which time the device is operational. The pin configuration at this point in time is defined by the design programmed into the chip. Also as it was mentioned before the voltage on PINs can't be bigger than the V_{DD} , this rule also applies to the case when the chip is powered on.

17.2 POR Sequence

The POR system generates a sequence of signals that enable certain macrocells. The sequence is shown in *Figure 43*.

Figure 43. POR sequence

As can be seen from *Figure 43*, after the V_{DD} has started ramping up and crosses the Power_ON threshold, first, the on-chip NVM memory is reset. Next the chip reads the data from NVM, and transfers this information to SRAM registers that serve to configure each macrocell, and the Connection Matrix which routes signals between macrocells. The third stage causes the reset of the input pins, and then to enable them. After that, the LUTs are reset and become active. After LUTs the Delay cells, RC OSC, DFFs, Latches and Pipe Delay are initialized. Only after all macrocells are initialized internal POR signal (POR macrocell output) goes from LOW to HIGH. The last portion of the device to be initialized are the output PINs, which transition from high impedance to active at this point.

The typical time that takes to complete the POR sequence varies by device type in the GreenPAK family. It also depends on many environmental factors, such as: slew rate, V_{DD} value, temperature and even will vary from chip to chip (process influence).

17.3 Macrocells Output States During POR Sequence

To have a full picture of SLG46116 operation during powering and POR sequence, review the overview the macrocell output states during the POR sequence (*Figure 44.* describes the output signals states).

First, before the NVM has been reset, all macrocells have their output set to logic LOW (except the output PINs which are in high impedance state). Before the NVM is ready, all macrocell outputs are unpredictable (except the output PINs). On the next step, some of the macrocells start initialization: input pins output state becomes LOW; LUTs also output LOW. Only P DLY macrocell configured as edge detector becomes active at this time. After that input PINs are enabled. Next, only LUTs are configured. Next, all other macrocells are initialized. After macrocells are initialized, internal POR matrix signal switches from LOW to HIGH. The last are output PINs that become active and determined by the input signals.

Figure 44. Internal Macrocell States during POR Sequence

18.0 Soft-Start P-FET Power Switch with Fixed Slew Rate Control

The SLG46116 includes a Soft-Start P-FET Power Switch designed for load switching applications. The P-FET Power Switch contains a 28.5 mΩ RDSON, 1.25 A (at $V_{IN} = 3.3$ V) P-ch MOSFET with fixed slew rate control. The P-FET Power Switch can be controlled internally via the ON digital input of the P-FET Power Switch component in GreenPAK Designer, allowing the user to generate integrated mixed-signal control circuits, or externally via PWR_SW_ON (PIN 4).

When configured to be controlled internally, PWR_SW_ON (PIN 4) is configured as a Push-Pull output.

When configured for external control, PWR_SW_ON (PIN 4) is configured as a Low Voltage Digital Input (LVDI) and can be used as an input to other integrated components.

The P-FET Power Switch need not be used in the same voltage domain as V_{DD} . However, when V_{IN} is not tied to V_{DD} , using a large pull-down resistor on PWR_SW_ON (PIN 4) is recommended to prevent current from flowing through the P-FET Power Switch while the device is not powered.

Note: To prevent glitches at the output, it is recommended to connect at least 0.1 μF capacitor from V_{OUT} pin to the AGND.

Figure 45. P-FET Power Switch with Slew Rate Control

25.0 Recommended Reflow Soldering Profile

Please see IPC/JEDEC J-STD-020: latest revision for reflow profile based on package volume of 2.2 mm^3 (nominal). More information can be found at www.jedec.org.

26.0 Revision History

Date	Version	Change
7/29/2026	1.16	Removed table Gain Divider Accuracy Corrected figure Internal Macrocell States during POR Sequence Added subsection 3-State Output to I/O Pins section Updated LUT block names to match with Go Configure™ Software Hub Renamed Power Switch GND to AGND throughout the datasheet
8/14/2023	1.15	Updated section Soft-Start P-FET Power Switch with Fixed Slew Rate Control Updated table Absolute Maximum Conditions Updated tables Electrical Characteristics Fixed typos
3/10/2023	1.14	Added notes to section Ordering Information
3/4/2022	1.13	Added R_{PUP} and R_{PDWN} in section Electrical Specifications Renesas rebranding Fixed typos
10/21/2021	1.12	Updated tables CNT/DLY Register Settings Corrected registers [296:289], [325:318], [339:332], [353:346] in Appendix A - SLG46116 Register Definition Added V_{IN} to Abs Max table Updated Abs Max Table Parameters for clarity Updated IDS conditions and spec Updated SOA Graph accuracy
4/22/2021	1.11	Updated Package Drawing and Dimensions Added note for CNTs Corrected registers [353:343], [339:329], [325:315], [296:286]
10/29/2019	1.10	Updated last page with disclaimer and contacts Added pre front page
10/10/2017	1.09	Updated Electrical Spec Fixed typos Updated POR sequence
7/5/2017	1.08	Updated Electrical Spec
6/21/2017	1.07	Fixed typos Updated Silego Website & Support Updated Section Programmable Delay / Edge Detector Updated Recommended Landing Pattern
10/20/2016	1.06	Fixed typos Removed references to GPAK families
6/22/2016	1.05	Updated P-FET section
5/27/2016	1.04	Added PON_{THR} and $POFF_{THR}$ in Electrical Spec Updated Silego Website & Support Updated Programmable Delay information
12/1/2015	1.03	Corrected Appendix A
10/29/2015	1.02	Updated text for clarity Fixed typos Updated Absolute maximum conditions
6/17/2015	1.01	Increased to support 1.25 A
5/26/2016	1.0	Production Release
5/21/2015	0.62	Updated ACMP Diagrams and added Timing Characteristics Diagrams
4/28/2015	0.61	Updated RC Oscillator section
4/24/2015	0.60	Updated ACMP section
4/9/2015	0.59	Updated T_{su} condition and value
3/10/2015	0.58	Added Connection Matrix Example

Date	Version	Change
3/9/2015	0.57	Added POR section
2/10/2015	0.56	Updated General Description
1/14/2015	0.55	Added IDD Estimator, Timing Estimator, Expected Delays sections
12/3/2014	0.54	Updated Electrical Characteristics VIH/VIL/VOH/VOL values
10/14/2014	0.53	Updated ACMP1 Block to remove PIN 4 as analog input
9/3/2014	0.52	Updated Electrical Characteristics VIH/VIL/VOH/VOL values
7/29/2014	0.51	Fixed Programming Pin Descriptions and Pin 8 name
7/23/2014	0.5	Added ESD information Preliminary Release
7/18/2014	0.25	Added Soft-Start to describe P-FET
6/19/2014	0.24	Added Load to P-FET Power Switch diagram
6/2/2014	0.23	Updated P-FET Power Switch diagram
4/18/2014	0.22	Updated P-FET Power Switch section
4/15/2014	0.21	Added P-FET Power Switch section
4/7/2014	0.2	Updated Pinout Updated Diagrams Updated Register Table Added Tape and Reel Spec Corrected typos and formatting for clarity
2/3/2014	0.1	Initial release
