

## SLG46533-E

GreenPAK Programmable Mixed-Signal Matrix with Extended Temperature Range

The SLG46533-E provides a small, low power component for commonly used Mixed-Signal functions. The user creates their circuit design by programming the one time Non-Volatile Memory (NVM) to configure the interconnect logic, the IO Pins, and the macrocells of the SLG46533-E. This highly versatile device allows a wide variety of Mixed-Signal functions to be designed within a very small, low power single integrated circuit.

### Features

- Four Analog Comparators (ACMP)
- Two Voltage References ( $V_{REF}$ )
- Twenty-six Combination Function Macrocells
  - Three Selectable DFF/LATCH or 2-bit LUTs
  - Twelve Selectable DFF/LATCH or 3-bit LUTs
  - One Selectable Pipe Delay or 3-bit LUT
  - One Selectable Programmable Pattern Generator or 2-bit LUT
  - Five 8-bit delays/counters or 3-bit LUTs
  - Two 16-bit delays/counters or 4-bit LUTs
  - Two Deglitch Filters with Edge Detectors
- Combinatorial Logic
  - One 4-bit LUT
- Serial Communications
  - I<sup>2</sup>C Protocol Compliant
- 16x8 RAM Memory with Defined NVM OTP Initial State
- Pipe Delay – 16 Stage/3 Output (Part of Combination Function Macrocell)
- Programmable Delay
- Two Oscillators
  - Configurable 25 kHz or 2 MHz
  - 25 MHz Oscillator
- Power-On Reset (POR)
- Analog Temperature Sensor
- Logic and Mixed-Signal Circuits
- Highly Versatile Macrocells
- Read Back Protection (Read Lock)
- Power Supply
  - 1.8 V ( $\pm 5\%$ ) to 5.0 V ( $\pm 10\%$ )  $V_{DD}$
- Ambient Operating Temperature Range: -40 °C to +105 °C
- RoHS Compliant/Halogen-Free
- Available Package
  - 20-pin STQFN: 2.0 mm x 3.0 mm x 0.55 mm, 0.4 mm pitch

### Applications

- Outdoors Electronics
- Factory Automation
- Servers and Networking Equipment
- Chargers

<b>[1]</b> General Purpose IO's with OE can be used to implement bidirectional signals under user control via Connection Matrix to OE signal in IO structure.					

### 3. Specifications

#### 3.1 Absolute Maximum Ratings

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, so functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification are not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Parameter		Min	Max	Unit
Supply voltage on $V_{DD}$ relative to GND		-0.5	7.0	V
DC Input voltage	IOs 0, 6, 7	GND - 0.5	7.0	V
	IOs 1-5, 8, 10-17		$V_{DD} + 0.5$ , up to 7.0	
$V_{DD}$ DC Current	$T_J = +85\text{ }^\circ\text{C}$	--	45	mA
	$T_J = +110\text{ }^\circ\text{C}$	--	22	mA
GND DC Current	$T_J = +85\text{ }^\circ\text{C}$	--	86	mA
	$T_J = +110\text{ }^\circ\text{C}$	--	41	mA
GPIO DC Current (Through pin)	Push-Pull 1x	--	11	mA
	Push-Pull 2x	--	16	
	OD 1x	--	11	
	OD 2x	--	21	
	OD 4x	--	43	
Current at Input Pin		-1.0	1.0	mA
Storage Temperature Range		-65	+150	$^\circ\text{C}$
Junction Temperature		--	+150	$^\circ\text{C}$
Moisture Sensitivity Level		1		

## 3.2 Electrostatic Discharge Ratings

Parameter	Value	Unit
ESD Protection (Human Body Model)	2000	V
ESD Protection (Charged Device Model)	1300	V

## 3.3 Recommended Operating Conditions

Parameter	Condition	Min	Max	Unit
Supply Voltage ( $V_{DD}$ )		1.71	5.5	V
Operating Ambient Temperature Range		-40	+105	°C
Maximal Voltage Applied to any PIN in High Impedance State		--	$V_{DD}$	V
Capacitor Value at $V_{DD}$		0.1	--	$\mu$ F
Analog Input Common Mode Range	Allowable Input Voltage at Analog Pins	0	$V_{DD}$	V

## 3.4 Electrical Specifications

### 3.4.1 Logic IO Specifications

$T_A = -40\text{ }^{\circ}\text{C}$  to  $+105\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 1.71\text{ V}$  to  $5.5\text{ V}$ , unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Unit
ACMP Input Voltage Range	$V_{ACMP}$	Positive Input	0	--	$V_{DD}$	V
		Negative Input	0	--	1.2	V
HIGH-Level Input Voltage	$V_{IH}$	Logic Input [1]	$0.7 \times V_{DD}$	--	$V_{DD} + 0.3$	V
		Logic Input with Schmitt Trigger	$0.8 \times V_{DD}$	--	$V_{DD} + 0.3$	V
		Low-Level Logic Input [1]	1.25	--	$V_{DD} + 0.3$	V
LOW-Level Input Voltage	$V_{IL}$	Logic Input [1]	GND - 0.3	--	$0.3 \times V_{DD}$	V
		Logic Input with Schmitt Trigger	GND - 0.3	--	$0.2 \times V_{DD}$	V
		Low-Level Logic Input [1]	GND - 0.3	--	0.5	V
Schmitt Trigger Hysteresis Voltage	$V_{HYS}$	Logic Input with Schmitt Trigger, $V_{DD} = 1.8\text{ V} \pm 5\%$	$0.19 \times V_{DD}$	$0.26 \times V_{DD}$	$0.31 \times V_{DD}$	V
		Logic Input with Schmitt Trigger, $V_{DD} = 3.3\text{ V} \pm 10\%$	$0.16 \times V_{DD}$	$0.21 \times V_{DD}$	$0.26 \times V_{DD}$	V
		Logic Input with Schmitt Trigger, $V_{DD} = 5.0\text{ V} \pm 10\%$	$0.15 \times V_{DD}$	$0.18 \times V_{DD}$	$0.22 \times V_{DD}$	V
Input leakage (Absolute Value)	$I_{LKG}$		--	--	1000	nA

Parameter	Symbol	Condition	Min	Typ	Max	Unit
HIGH-Level Output Voltage	$V_{OH}$	Push-Pull, $I_{OH} = 100 \mu A$ , 1x Drive, $V_{DD} = 1.8 V \pm 5 \%$	$0.992 \times V_{DD}$	$0.994 \times V_{DD}$	--	V

[1] No hysteresis.

[2] DC or average current through any pin should not exceed value given in Absolute Maximum Conditions.

### 3.4.2 I<sup>2</sup>C Pins Electrical Specifications

$T_A = -40\text{ }^{\circ}\text{C}$  to  $105\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 1.71\text{ V}$  to  $5.5\text{ V}$  unless otherwise noted.

Parameter	Symbol	Condition	Fast-Mode		Unit
			Min	Max	
<b>IO Stage</b>					
LOW-level Input Voltage	$V_{IL}$		-0.5	$0.3 \times V_{DD}$	V
HIGH-level Input Voltage	$V_{IH}$		$0.7 \times V_{DD}$	$V_{DD} + 0.5$	V
Hysteresis of Schmitt Trigger Inputs	$V_{HYS}$		$0.05 \times V_{DD}$	--	V
LOW-Level Output Voltage 1	$V_{OL1}$	(Open-Drain) at 3 mA sink current, $V_{DD} > 2\text{ V}$	0	0.4	V
LOW-Level Output Voltage 2	$V_{OL2}$	(Open-Drain) at 2 mA sink current, $V_{DD} \leq 2\text{ V}$	0	$0.2 \times V_{DD}$	V
LOW-Level Output Current	$I_{OL}$	$V_{OL} = 0.4\text{ V}$	3	--	mA
		$V_{OL} = 0.6\text{ V}$	6	--	mA
Output Fall Time from $V_{IHmin}$ to $V_{ILmax}$ [1]	$t_{of}$		0.3	250	ns
Pulse Width of Spikes that must be suppressed by the Input Filter	$t_{SP}$	SDA line	0	50	ns
		SCL line	0	20 [1]	
Input Current Each IO Pin	$I_i$	$0.1 \times V_{DD} < V_i < 0.9 \times V_{DDmax}$	-10	+10	$\mu\text{A}$
Capacitance for Each IO Pin	$C_i$		--	10	pF
<b>Timing (see Figure 96 for Diagram)</b>					
Clock Frequency, SCL	$F_{SCL}$		--	400	kHz
Clock Pulse Width Low	$t_{LOW}$		1300	--	ns
Clock Pulse Width High	$t_{HIGH}$		600	--	ns
Data Valid Acknowledge Time	$t_{VD\_ACK}$		--	900	ns
Data Valid Time	$t_{VD\_DAT}$		--	900	ns
Bus Free Time between Stop and Start	$t_{BUF}$		1300	--	ns
Start Hold Time	$t_{HD\_STA}$		600	--	ns
Start Set-up Time	$t_{SU\_STA}$		600	--	ns
Data Hold Time	$t_{HD\_DAT}$		0	--	ns
Data Set-up Time	$t_{SU\_DAT}$		100	--	ns
Inputs Rise Time	$t_R$		--	300	ns
Inputs Fall Time	$t_F$		--	300	ns
Stop Set-up Time	$t_{SU\_STO}$		600	--	ns
Data Out Hold Time	$t_{DH}$		50	--	ns
<p>[1] Does not meet standard I<sup>2</sup>C specifications: <math>t_{of} = 20 \times (V_{DD}/5.5\text{ V})</math> (min), <math>t_{SP} = 50\text{ ns}</math> (max).            [2] The data is provided for the I<sup>2</sup>C mode in which IO6 and IO7 operate as Open-Drain 1x NMOS, which is the only output mode available for these pins when using I<sup>2</sup>C.</p>					

### 3.4.3 Macrocells Current Consumption

Typical values are at  $T_A = +25\text{ }^\circ\text{C}$ , unless otherwise specified.

Parameter	Symbol	Note	$V_{DD} = 1.8\text{ V}$	$V_{DD} = 3.3\text{ V}$	$V_{DD} = 5.0\text{ V}$	Unit
Current	$I_{DD}$	Chip Quiescent, $I_{DD}$	0.28	0.52	0.81	$\mu\text{A}$

### 3.4.5 Programmable Delay Typical Delays and Widths

Typical values are at  $T_A = +25\text{ }^\circ\text{C}$ , unless otherwise specified.

Parameter	Symbol	Note		$V_{DD} = 1.8\text{ V}$	$V_{DD} = 3.3\text{ V}$	$V_{DD} = 5.0\text{ V}$	Unit
Pulse Width	$t_w$	Mode: (any) Edge Detect, Edge Detect Output	1-Cell	309	139	103	ns
			2-Cell	621	280	209	
			3-Cell	934	422	314	
			4-Cell	1243	562	418	
Delay Time	$t_{DLY1}$	Mode: (any) Edge Detect, Edge Detect Output	1-Cell	55	22	15	ns
			2-Cell	55	22	15	
			3-Cell	55	22	15	
			4-Cell	55	22	15	
	$t_{DLY2}$	Mode: Both Edge Delay, Edge Detect Output	1-Cell	373	165	122	ns
			2-Cell	685	307	227	
			3-Cell	998	448	332	
			4-Cell	1307	588	437	

### 3.4.6 Typical Filter Rejection Pulse Width

Typical values are at  $T_A = +25\text{ }^\circ\text{C}$ , unless otherwise specified.

Parameter	$V_{DD} = 1.8\text{ V}$	$V_{DD} = 3.3\text{ V}$	$V_{DD} = 5.0\text{ V}$	Unit
Filtered Pulse Width for Filter 0	< 143	< 58	< 37	ns
Filtered Pulse Width for Filter 1	< 97	< 40	< 26	ns

### 3.4.7 Counter/Delay Specifications

Typical values are at  $T_A = +25\text{ }^\circ\text{C}$ , unless otherwise specified.

Parameter	OSC Freq	OSC Power	$V_{DD} = 1.8\text{ V}$	$V_{DD} = 3.3\text{ V}$	$V_{DD} = 5.0\text{ V}$	Unit
Power-On Delay Time	25 kHz	Auto	1.6	1.6	1.6	$\mu\text{s}$
Power-On Delay Time (Fast Start)	25 kHz	Auto	2.1	2.1	2.1	$\mu\text{s}$
Power-On Delay	2 MHz	Auto	0.4	0.2	0.2	$\mu\text{s}$
Power-On Delay Time (Fast Start)	2 MHz	Auto	0.7	0.5	0.4	$\mu\text{s}$
Power-On Delay Time	25 MHz	Auto	0.01	0.05	0.04	$\mu\text{s}$
Frequency settling time	25 kHz	Auto	19	14	12	$\mu\text{s}$
	2 MHz	Auto	14	14	14	$\mu\text{s}$
Variable (CLK period)	25 kHz	Forced	0-40	0-40	0-40	$\mu\text{s}$
	2 MHz	Forced	0-0.5	0-0.5	0-0.5	$\mu\text{s}$
	25 MHz	Forced	0-0.04	0-0.04	0-0.04	$\mu\text{s}$
Propagation Delay (Non-Delayed Edge)	25 kHz/ 2 MHz	Either	35	14	10	ns

### 3.4.8 25 kHz OSC0 Frequency Limits

Power Supply Range (V <sub>DD</sub> ), V	Temperature Range					
	+25 °C		0 °C to +105 °C		-40 °C to +105 °C	
	Minimum Value, kHz	Maximum Value, kHz	Minimum Value, kHz	Maximum Value, kHz	Minimum Value, kHz	Maximum Value, kHz
1.8 V ±5 %	24.317	25.726	23.576	26.116	23.576	27.219
3.3 V ±10 %	24.495	25.66	23.6	25.934	23.6	26.399
5.0 V ±10 %	24.443	25.698	23.517	25.978	23.517	26.567
2.5 V to 4.5 V	24.493	25.665	23.59	25.942	23.59	26.408
1.71 V to 5.5 V	24.224	25.698	23.484	26.257	23.484	27.225

### 3.4.9 25 kHz OSC0 Frequency Error

Power Supply Range (V <sub>DD</sub> ), V	Temperature Range					
	+25 °C		0 °C to +105 °C		-40 °C to +105 °C	
	Error (% at Minimum)	Error (% at Maximum)	Error (% at Minimum)	Error (% at Maximum)	Error (% at Minimum)	Error (% at Maximum)
1.8 V ±5 %	-2.732	2.904	-10.7	6.92	-10.7	16.832
3.3 V ±10 %	-2.02	2.64	-10.432	4.772	-10.432	9.66
5.0 V ±10 %	-2.228	2.792	-11.064	4.996	-11.064	10.22
2.5 V to 4.5 V	-2.028	2.66	-10.588	4.844	-10.588	9.848
1.71 V to 5.5 V	-3.104	3.872	-11.536	6.904	-11.536	16.728

### 3.4.10 2 MHz OSC0 Frequency Limits

Power Supply Range (V <sub>DD</sub> ), V	Temperature Range					
	+25 °C		0 °C to +105 °C		-40 °C to +105 °C	
	Minimum Value, MHz	Maximum Value, MHz	Minimum Value, MHz	Maximum Value, MHz	Minimum Value, MHz	Maximum Value, MHz
1.8 V ±5 %	1.903	2.098	1.856	2.104	1.856	2.115
3.3 V ±10 %	1.885	2.115	1.839	2.123	1.834	2.132
5.0 V ±10 %	1.858	2.220	1.821	2.230	1.803	2.252
2.5 V to 4.5 V	1.874	2.123	1.835	2.129	1.819	2.137
1.71 V to 5.5 V	1.811	2.249	1.779	2.260	1.623	2.283

### 3.4.11 2 MHz OSC0 Frequency Error

Power Supply Range (V <sub>DD</sub> ), V	Temperature Range					
	+25 °C		0 °C to +105 °C		-40 °C to +105 °C	
	Error (% at Minimum)	Error (% at Maximum)	Error (% at Minimum)	Error (% at Maximum)	Error (% at Minimum)	Error (% at Maximum)
1.8 V ±5 %	-4.85	4.9	-9.15	5.7	-10.35	6.95
3.3 V ±10 %	-5.75	5.75	-9.0	7.05	-11.4	7.65
5.0 V ±10 %	-7.1	11.0	-10.85	12.8	-13.1	14.4
2.5 V to 4.5 V	-6.3	6.15	-9.6	8.0	-13.75	8.2
1.71 V to 5.5 V	-9.45	12.45	-15.45	14.25	-30.5	16.0

### 3.4.12 25 MHz OSC1 Frequency Limits

Power Supply Range ( $V_{DD}$ ), V	Temperature Range					
	+25 °C		0 °C to +105 °C		-40 °C to +105 °C	
	Minimum Value, MHz	Maximum Value, MHz	Minimum Value, MHz	Maximum Value, MHz	Minimum Value, MHz	Maximum Value, MHz
2.5 V $\pm$ 10 %	22.964	26.443	21.759	26.828	21.759	27.327
3.3 V $\pm$ 10 %	24.056	25.824	22.655	26.081	22.655	26.350
5.0 V $\pm$ 10 %	23.860	25.894	22.832	26.215	22.832	26.714
2.5 V to 4.5 V	22.232	25.824	21.386	26.081	21.386	26.350
1.71 V to 5.5 V	14.130	25.824	13.718	26.081	13.028	26.350

### 3.4.13 25 MHz OSC1 Frequency Error

Power Supply Range ( $V_{DD}$ ), V	Temperature Range					
	+25 °C		0 °C to +105 °C		-40 °C to +105 °C	
	Error (% at Minimum)	Error (% at Maximum)	Error (% at Minimum)	Error (% at Maximum)	Error (% at Minimum)	Error (% at Maximum)
2.5 V $\pm$ 10 %	-8.144	5.772	-17.804	8.74	-17.804	13.04
3.3 V $\pm$ 10 %	-3.776	3.296	-14.96	5.904	-14.96	8.556
5.0 V $\pm$ 10 %	-4.56	3.576	-13.408	6.596	-13.408	10.36
2.5 V to 4.5 V	-11.072	3.296	-20.152	5.904	-20.152	8.768
1.71 V to 5.5 V	-43.48	3.296	-51.088	8.892	-53.848	9.988

**Note:** 25 MHz OSC1 performance is not guaranteed at  $V_{DD} < 2.5$  V.

### 3.4.14 OSC Power-On Delay (Normal Mode)

**Note:** DLY/CNT Counter Data = 100, OSC Power Setting: "Auto Power-On", OSC Clock to Matrix Input: "Enable".

Typical values are at  $T_A = +25\text{ }^\circ\text{C}$ , unless otherwise specified.

Power Supply Range ( $V_{DD}$ ) V	OSC0 2 MHz		OSC0 25 kHz		OSC1	
	Typical Value, ns	Maximum Value, ns	Typical Value, $\mu\text{s}$	Maximum Value, $\mu\text{s}$	Typical Value, ns	Maximum Value, ns
1.71	372.7	407.3	0.40	0.57	71.2	87.3
1.80	349.2	379.5	0.38	0.41	65.0	78.7
1.89	330.3	358.0	0.35	0.41	59.7	71.3
2.30	277.2	298.1	0.29	0.31	43.0	54.0
2.50	262.0	281.9	0.28	0.30	39.6	48.1
2.70	250.2	269.8	0.26	0.30	36.7	43.5
3.00	236.6	256.7	0.25	0.44	33.2	39.8
3.30	226.7	247.4	0.23	0.47	30.4	36.8

5.00	196.3	218.7	1.67	2.05	24.3	27.5
5.50	190.8	213.3	1.69	1.99	23.7	26.8

### 3.4.15 OSC Power-On Delay (Fast Start-Up Time Mode)

Typical values are at  $T_A = +25\text{ }^\circ\text{C}$ , unless otherwise specified.

Power Supply Range ( $V_{DD}$ ) V	OSC0 2 MHz		OSC0 25 kHz	
	Typical Value, ns	Maximum Value, ns	Typical Value, $\mu\text{s}$	Maximum Value, $\mu\text{s}$
1.71	327.9	360.0	0.68	0.76
1.80	309.9	338.3	0.64	0.64
1.89	295.5	323.1	0.61	0.70
2.30	254.9	278.1	0.53	21.93
2.50	243.1	266.1	3.23	21.88
2.70	234.1	257.1	16.68	21.94
3.00	223.7	246.8	19.25	21.90
3.30	215.7	239.1	19.22	21.77
3.60	209.4	232.9	19.21	21.74
4.20	199.5	223.4	19.17	21.78
4.50	195.5	219.8	19.15	21.69
5.00	189.8	214.6	19.12	21.71
5.50	184.9	209.8	19.05	21.75

### 3.4.16 ACMP Specifications

$T_A = -40\text{ }^\circ\text{C}$  to  $+105\text{ }^\circ\text{C}$ ,  $V_{DD} = 2.3\text{ V}$  to  $5.5\text{ V}$ , unless otherwise noted.

Parameter	Symbol	Note	Conditions	Min	Typ	Max	Unit
ACMP Input Voltage Range	$V_{ACMP}$	Positive Input	$V_{DD} = 1.8\text{ V} \pm 5\%$	0	--	$V_{DD}$	V
		Negative Input		0	--	1.2	V
		Positive Input	$V_{DD} = 3.3\text{ V} \pm 10\%$	0	--	$V_{DD}$	V
		Negative Input		0	--	1.2	V
		Positive Input	$V_{DD} = 5.0\text{ V} \pm 10\%$	0	--	$V_{DD}$	V
		Negative Input		0	--	1.2	V
ACMP Input Offset Voltage	$V_{offset}$	Low Bandwidth - Enable, $V_{phys} = 0\text{ mV}$ , Gain = 1, $V_{REF} = 50\text{ mV}$ to $1200\text{ mV}$ , $V_{DD} = 1.71\text{ V}$ to $5.5\text{ V}$	$T_A = +25\text{ }^\circ\text{C}$	-10.7	--	8.4	mV
			$T_A = -40\text{ }^\circ\text{C}$ to $+105\text{ }^\circ\text{C}$	-10.6	--	7.0	mV
		Low Bandwidth - Disable, $V_{phys} = 0\text{ mV}$ , Gain = 1, $V_{REF} = 50\text{ mV}$ to $1200\text{ mV}$ , $V_{DD} = 1.71\text{ V}$ to $5.5\text{ V}$	$T_A = +25\text{ }^\circ\text{C}$	-10.2	--	9.1	mV
			$T_A = -40\text{ }^\circ\text{C}$ to $+105\text{ }^\circ\text{C}$	-10.3	--	7.6	mV
ACMP Start Time	$t_{start}$	ACMP Power-On delay, Minimal required wake time for the "Wake and Sleep function", Regulator and Charge Pump set to automatic ON/OFF	BG = 550 $\mu\text{s}$ , $T_A = +25\text{ }^\circ\text{C}$ $V_{DD} = 1.71\text{ V}$ to $5.5\text{ V}$	--	672.6	909.0	$\mu\text{s}$
			BG = 550 $\mu\text{s}$ , $T_A = -40\text{ }^\circ\text{C}$ to $+105\text{ }^\circ\text{C}$ $V_{DD} = 1.71\text{ V}$ to $5.5\text{ V}$	--	676.5	1033.8	$\mu\text{s}$
			BG = 100 $\mu\text{s}$ , $T_A = +25\text{ }^\circ\text{C}$ $V_{DD} = 2.7\text{ V}$ to $5.5\text{ V}$	--	133.2	181.9	$\mu\text{s}$
			BG = 100 $\mu\text{s}$ , $T_A = -40\text{ }^\circ\text{C}$ to $+105\text{ }^\circ\text{C}$ $V_{DD} = 2.7\text{ V}$ to $5.5\text{ V}$	--	134.7	207.0	$\mu\text{s}$
		ACMP Power-On delay, Minimal required wake time for the "Wake and Sleep function", Regulator and Charge Pump always OFF	BG = 550 $\mu\text{s}$ , $T_A = +25\text{ }^\circ\text{C}$ $V_{DD} = 3.0\text{ V}$ to $5.5\text{ V}$	--	673.1	909.0	$\mu\text{s}$
			BG = 550 $\mu\text{s}$ , $T_A = -40\text{ }^\circ\text{C}$ to $+105\text{ }^\circ\text{C}$ $V_{DD} = 3.0\text{ V}$ to $5.5\text{ V}$	--	676.9	1033.8	$\mu\text{s}$

## 4. User Programmability

The SLG46533-E is a user programmable device with One-Time-Programmable (OTP) memory elements that are able to construct combinatorial logic elements. Three of the IO Pins provide a connection for the bit patterns into the OTP on board memory. A programming development kit allows the user the ability to create initial devices. Once the design is finalized, the programming code (.gpx file) is forwarded to Renesas Electronics Corporation to integrate into a production process.

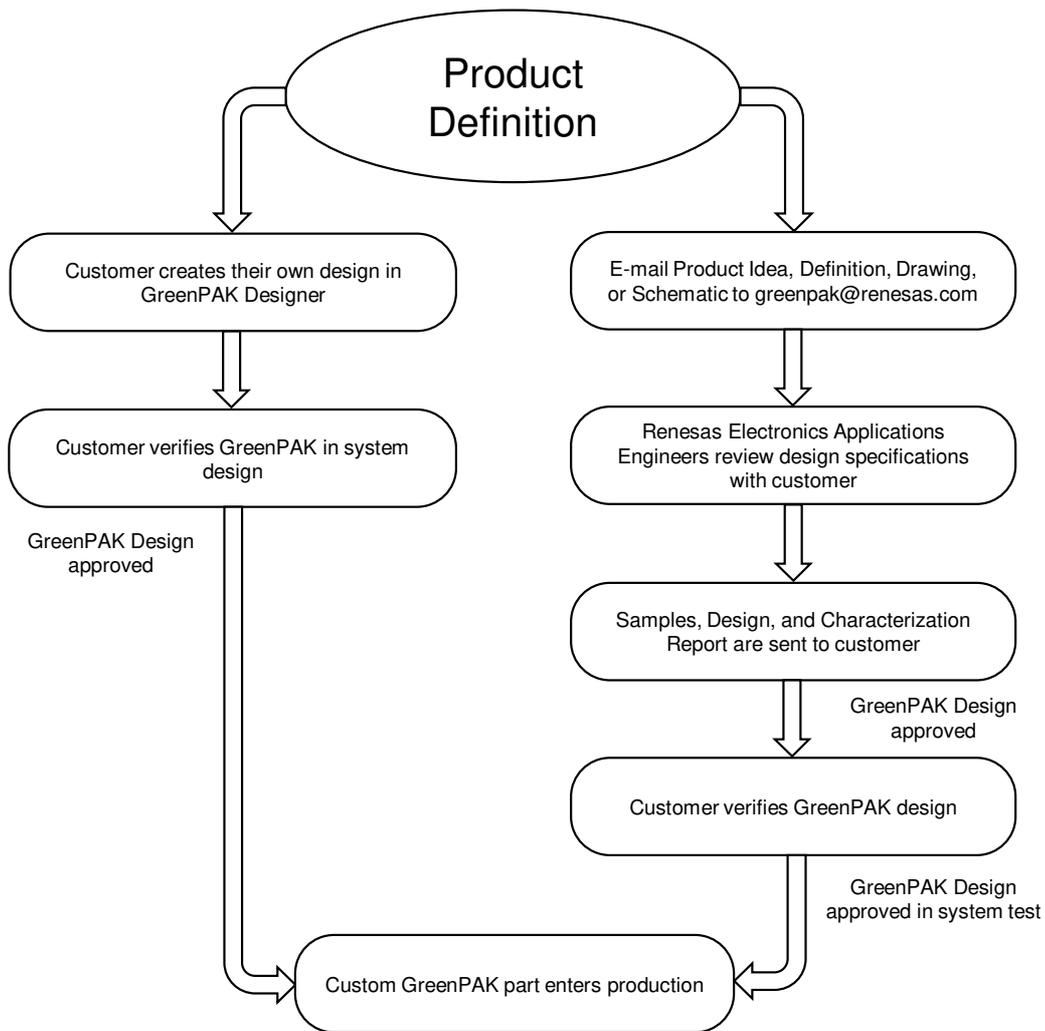

Figure 3. Steps to Create a Custom GreenPAK Device

## 5. Input/Output Pins

The SLG46533-E has a total of 18 multi-function IO pins which can function as either a user defined Input or Output, as well as serving as a special function (such as voltage reference output), or serving as a signal for programming of the on-chip Non Volatile Memory (NVM).

Refer to section 2. Pin Information for normal mode pin definitions.

Normal Mode pin definitions are as follows:

- $V_{DD}$ :  $V_{DD}$  power supply
- IO0: general purpose input
- IO1: general purpose input or output with OE
- IO2: general purpose input or output
- IO3: general purpose input or output with OE
- IO4: general purpose input or output or analog comparator 0(+)
- IO5: general purpose input or output with OE or analog comparator 0(-)
- IO6: general purpose input or OD output I<sup>2</sup>C SCL
- IO7: general purpose input or OD output I<sup>2</sup>C SDA
- IO8: general purpose input or output with OE or analog comparator 1(+)
- GND: ground
- IO9: general purpose input or output or analog comparator 1(-)
- IO10: general purpose input or output with OE or analog comparator 2(+)
- IO11: general purpose input or output with OE or analog comparator 2(-)
- IO12: general purpose input or output or analog comparator 3(+)
- IO13: general purpose input or output with OE
- IO14: general purpose input or output
- IO15: general purpose input or output with OE and  $V_{REF}$  output ( $V_{REF1}$ )
- IO16: general purpose input or output with OE and  $V_{REF}$  output ( $V_{REF0}$ )
- IO17: general purpose input or output or external clock input

Of the 18 user defined IO pins on the SLG46533-E, all but one of the pins (IO0) can serve as both digital input and digital output. IO0 can only serve as a digital input pin.

### 5.1 Input Modes

Each IO pin can be configured as a digital input pin with/without buffered Schmitt Trigger, or can also be configured as a low voltage digital input. IOs 4, 5, 8, 9, 10, 11, and 12 can also be configured to serve as analog inputs to the on-chip comparators. IOs 15 and 16 can also be configured as analog reference voltage inputs.

### 5.2 Output Modes

IOs 1, 2, 3, 4, 5, 6, 7, 8, 8, 10, 11, 12, 13, 14, 15, 16, and 17 can all be configured as digital output pins.

### 5.3 Pull-Up/Down Resistors

All IO pins have the option for user selectable resistors connected to the input structure. The selectable values on these resistors are 10 k $\Omega$ , 100 k $\Omega$ , and 1 M $\Omega$ . In the case of IO0, the resistors are fixed to a pull-down configuration. In the case of all other IO pins, the internal resistors can be configured as either pull-up or pull-downs.

## 5.4 GPI Structure

### 5.4.1 GPI Structure (for IO0)

Input Mode [1:0]  
 00: Digital In without Schmitt Trigger, wosmt\_en = 1, OE = 0  
 01: Digital In with Schmitt Trigger, smt\_en = 1, OE = 0  
 10: Low Voltage Digital In mode, lv\_en = 1, OE = 0  
 11: Reserved

Note 1: OE cannot be selected by user.  
 Note 2: OE is Matrix output, Digital In is Matrix input.

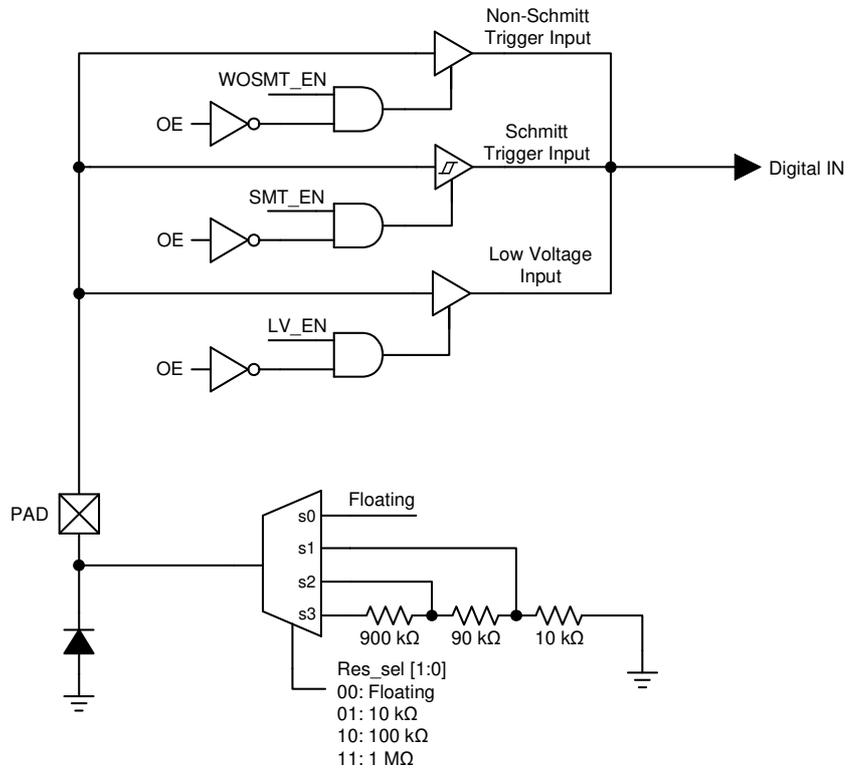

Figure 4. IO0 GPI Structure Diagram

## 5.5 Matrix OE IO Structure

### 5.5.1 Matrix OE IO Structure (for IOs 1, 3, 5, 10, 11, 13, 15, 16)

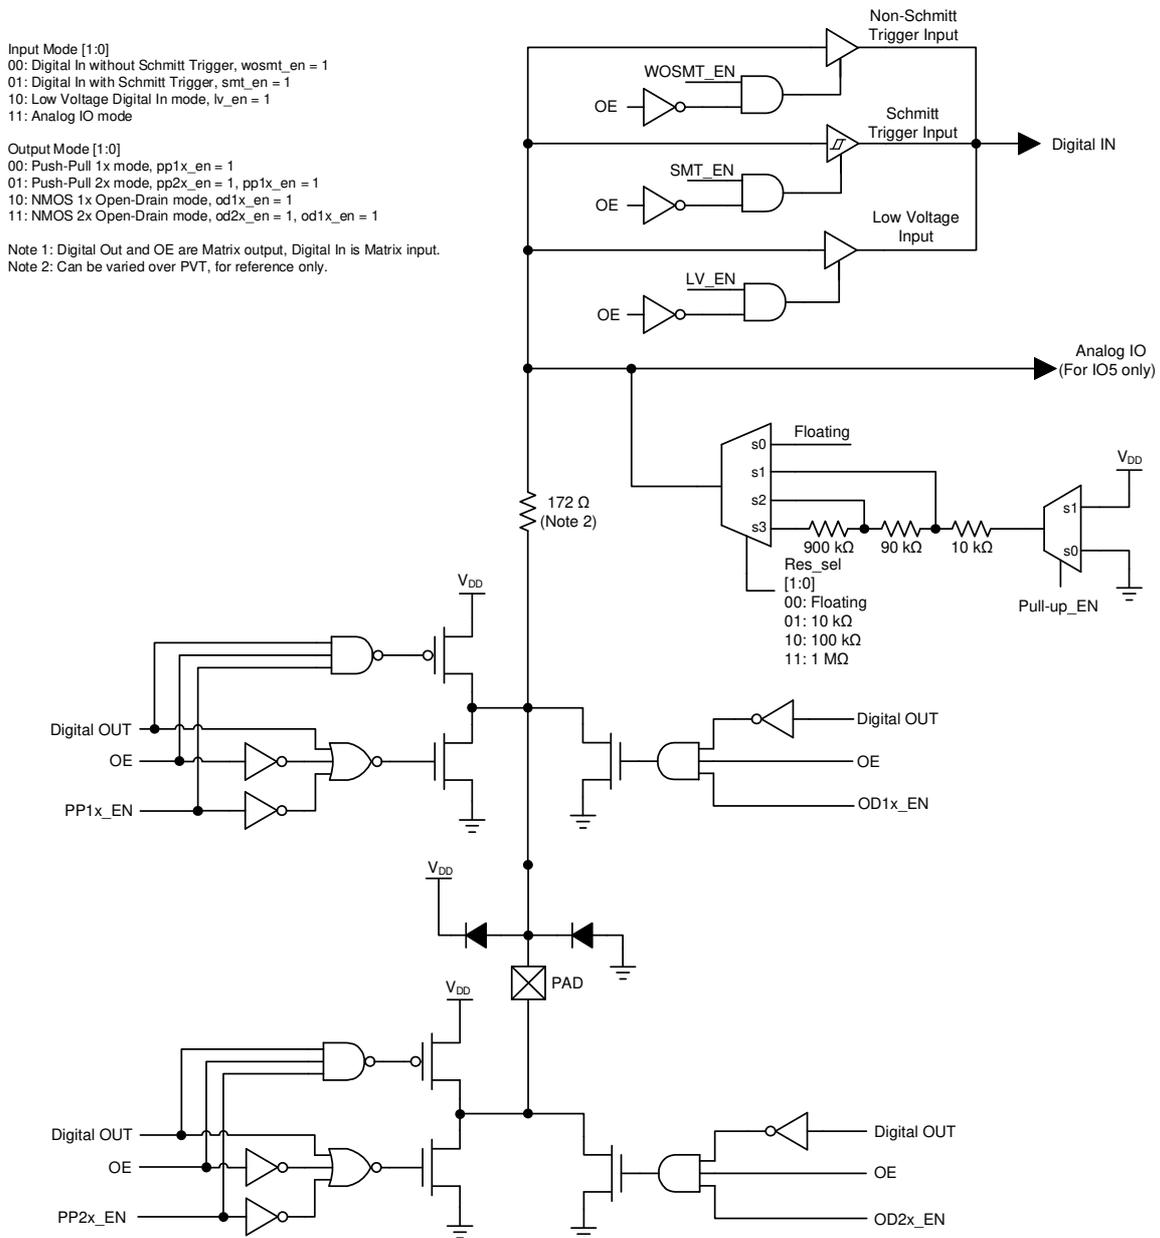

Figure 5. Matrix OE IO Structure Diagram

### 5.5.2 Matrix OE IO Structure (for IOs 6 and 7)

IO6, IO7 Mode [2:0]  
 000: Digital Input without Schmitt Trigger  
 001: Digital Input with Schmitt Trigger  
 010: Low Voltage Digital Input  
 011: Reserved  
 100: Reserved  
 101: Open Drain NMOS  
 110: Reserved  
 111: Reserved

Note1: Digital Out and OE are Matrix output, Digital In is Matrix input  
 Note2: When IO6 and IO7 are configured as I<sup>2</sup>C SCL and SDA output pins, they always operate in Open-Drain 1x NMOS mode

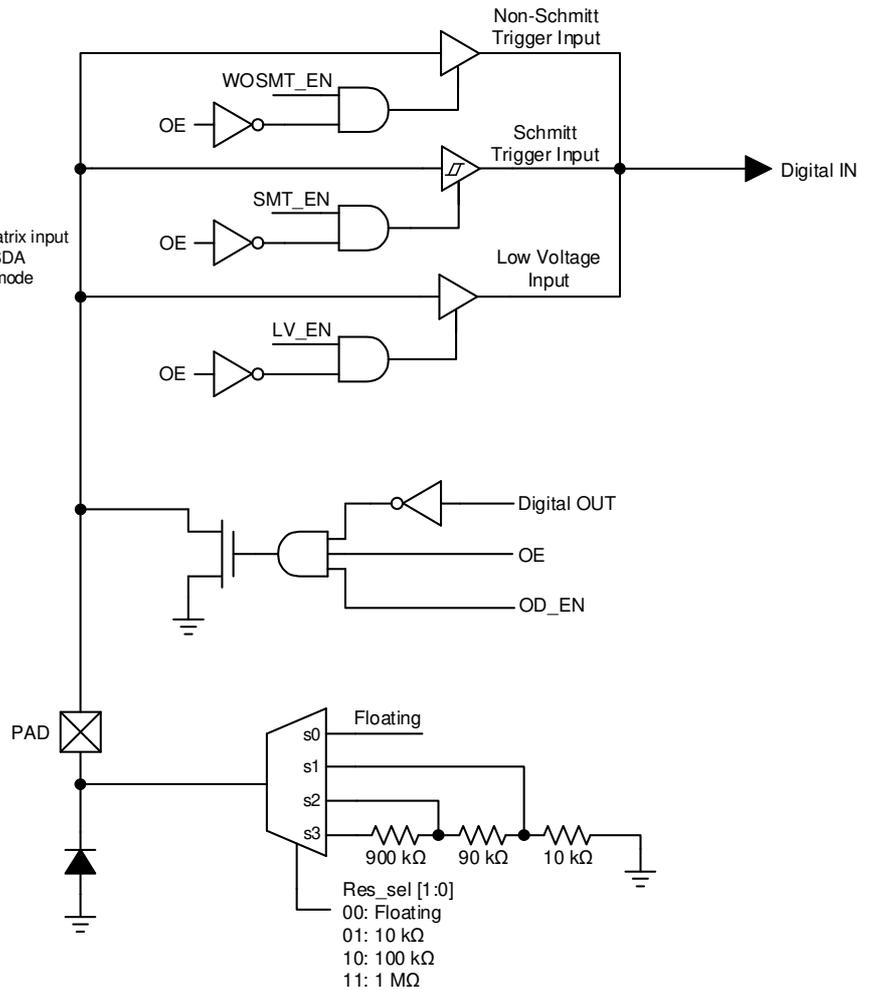

Figure 6. Matrix OE IO Structure Diagram

### 5.5.3 Matrix OE 4x Drive Structure (for IO8)

Input Mode [1:0]  
 00: Digital In without Schmitt Trigger, wosmt\_en = 1  
 01: Digital In with Schmitt Trigger, smt\_en = 1  
 10: Low Voltage Digital In mode, lv\_en = 1  
 11: Analog IO mode

Output Mode [1:0]  
 00: Push-Pull 1x mode, pp1x\_en = 1  
 01: Push-Pull 2x mode, pp2x\_en = 1, pp1x\_en = 1  
 10: NMOS Open-Drain 1x mode, od1x\_en = 1, odn\_en = 1  
 11: NMOS Open-Drain 2x mode, od2x\_en = 1, od1x\_en = 1, odn\_en = 1

Note 1: Digital Out and OE are Matrix output, Digital In is Matrix input.  
 Note 2: Can be varied over PVT, for reference only.

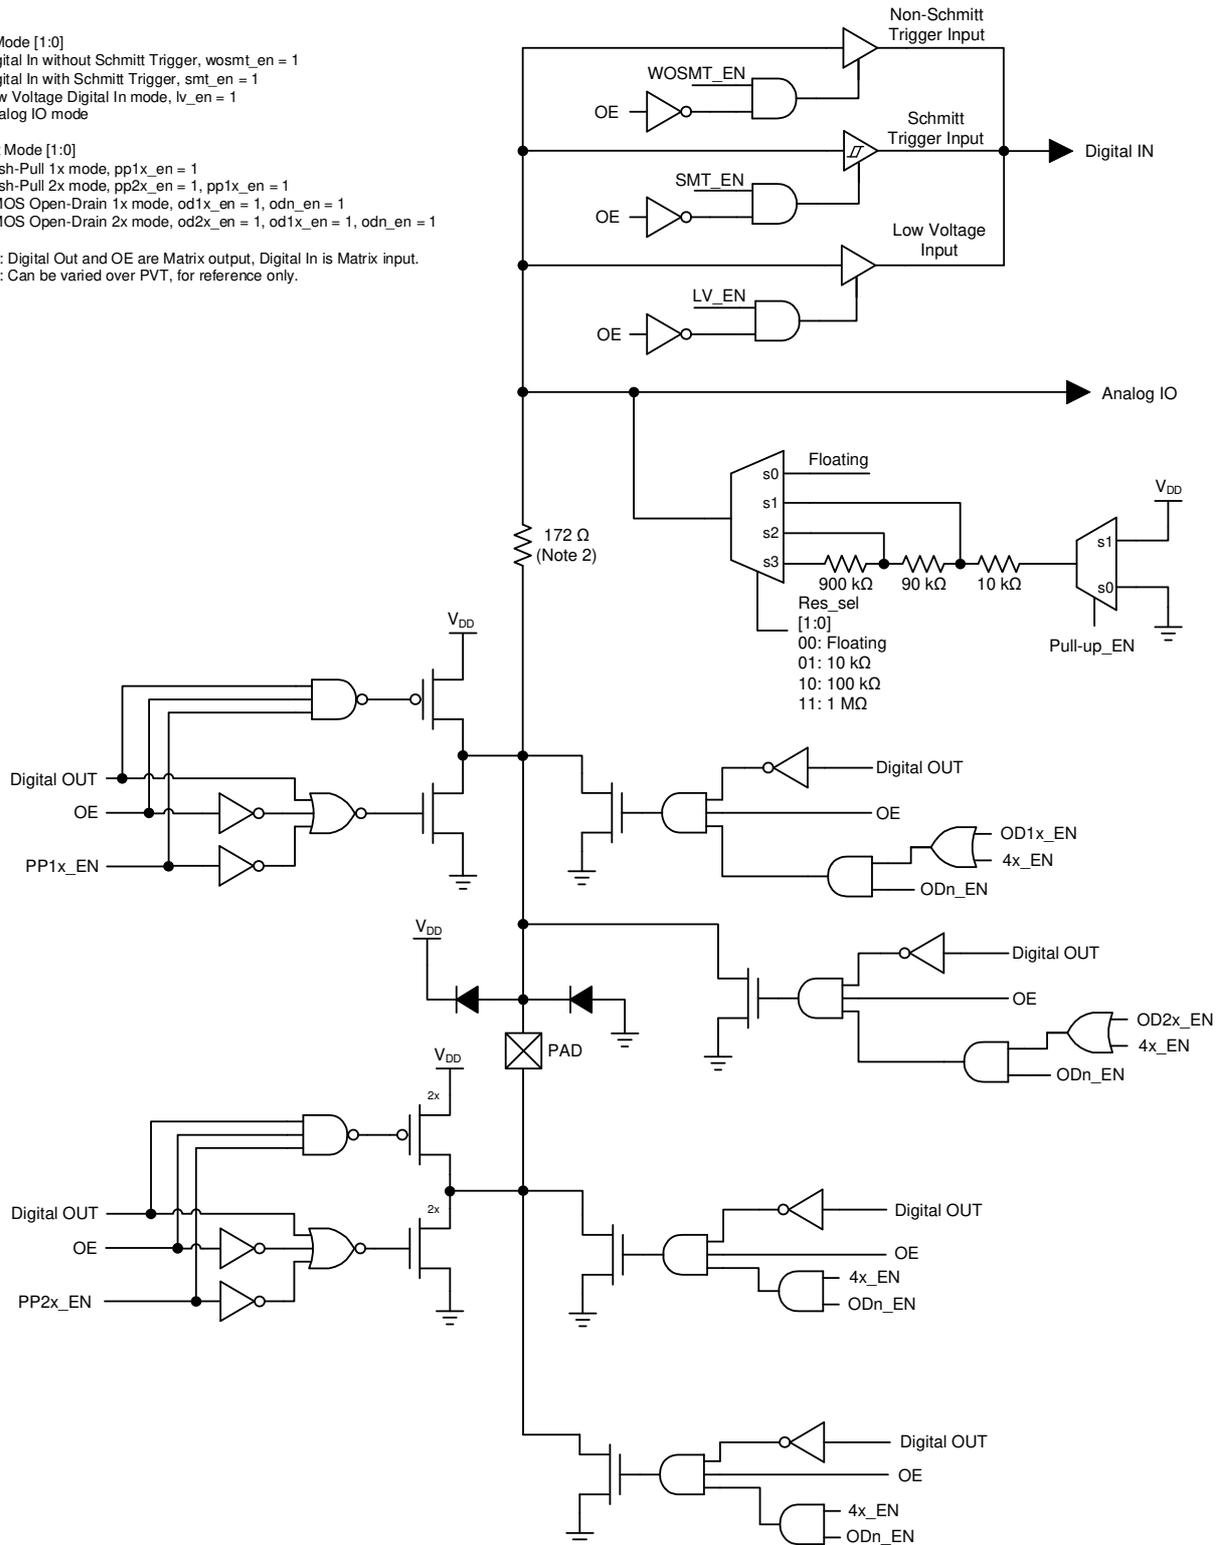

Figure 7. Matrix OE IO 4x Drive Structure Diagram

## 5.6 IO Structure

### 5.6.1 IO Structure (for IOs 2, 4, 12, 14, 17)

Mode [2:0]  
 000: Digital In without Schmitt Trigger, wosmt\_en = 1, OE = 0  
 001: Digital In with Schmitt Trigger, smt\_en = 1, OE = 0  
 010: Low Voltage Digital In mode, lv\_en = 1, OE = 0  
 011: Analog IO mode  
 100: Push-Pull mode, pp\_en = 1, OE = 1  
 101: NMOS Open-Drain mode, odn\_en = 1, OE = 1  
 110: PMOS Open-Drain mode, odp\_en = 1, OE = 1  
 111: Analog IO and NMOS Open-Drain mode, odn\_en = 1 and AIO\_en = 1

Note 1: OE cannot be selected by user and is controlled by register.  
 Note 2: Can be varied over PVT, for reference only.

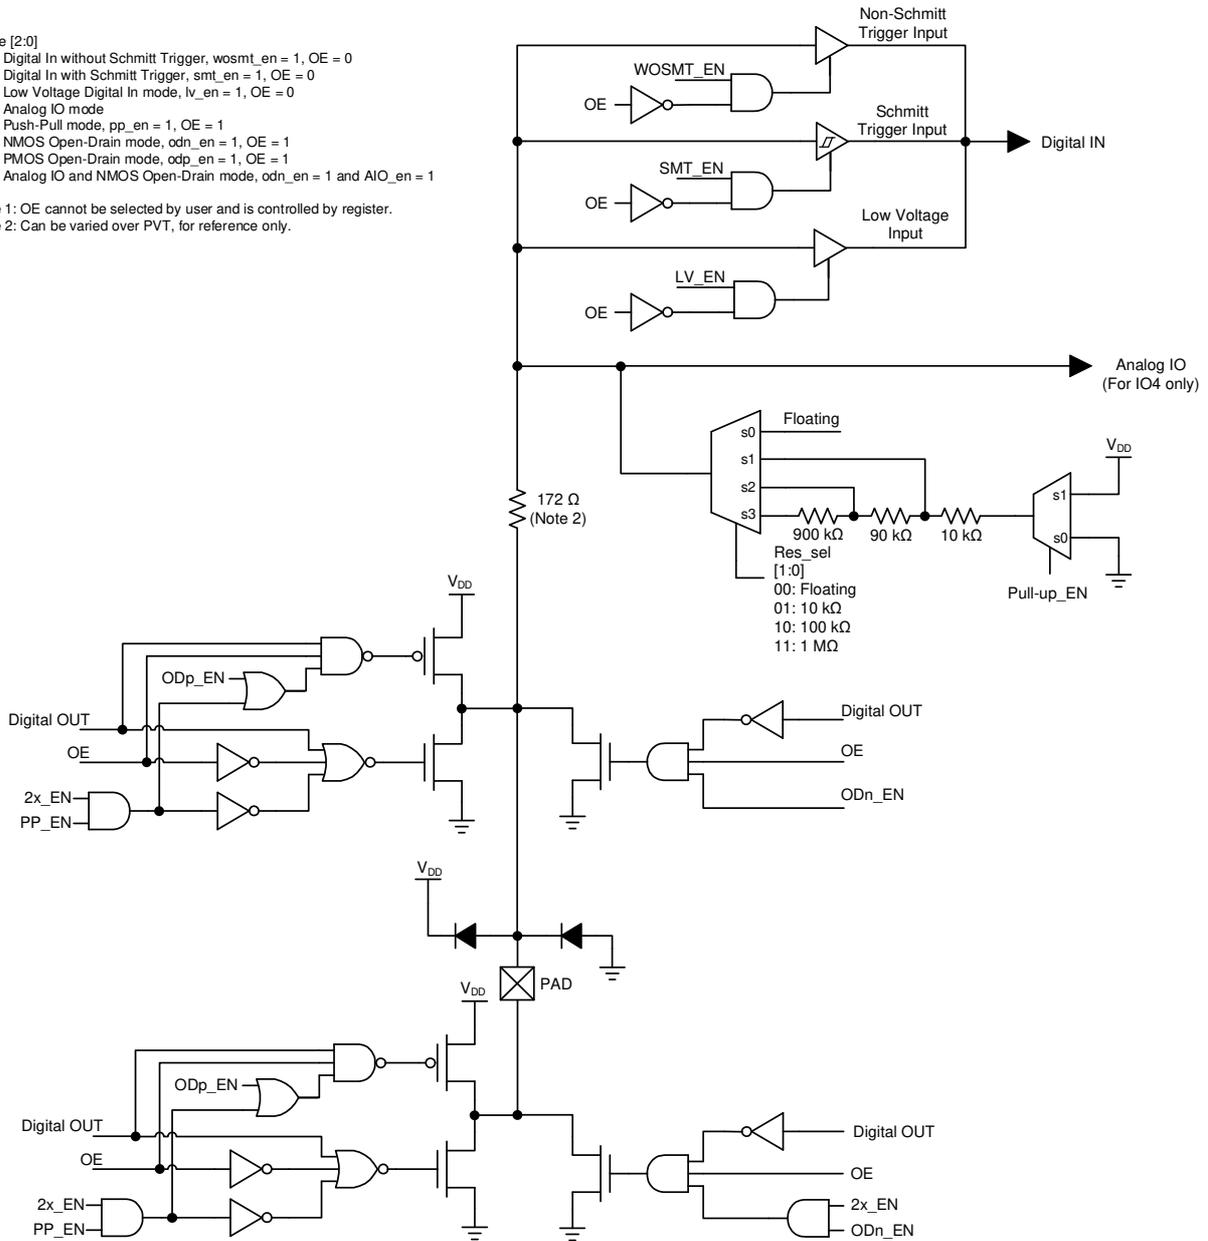

Figure 8. IO Structure Diagram

### 5.6.2 4x Drive Structure (for IO9)

Mode [2:0]  
 000: Digital In without Schmitt Trigger, wosmt\_en = 1, OE = 0  
 001: Digital In with Schmitt Trigger, smt\_en = 1, OE = 0  
 010: Low Voltage Digital In mode, lv\_en = 1, OE = 0  
 011: Analog IO mode  
 100: Push-Pull mode, pp\_en = 1, OE = 1  
 101: NMOS Open-Drain mode, odn\_en = 1, OE = 1  
 110: PMOS Open-Drain mode, odp\_en = 1, OE = 1  
 111: Analog IO and NMOS Open-Drain mode, odn\_en = 1 and AIO\_en = 1

Note 1: OE cannot be selected by user.  
 Note 2: Digital Out and OE are Matrix output, Digital In is Matrix input.  
 Note 3: Can be varied over PVT, for reference only.

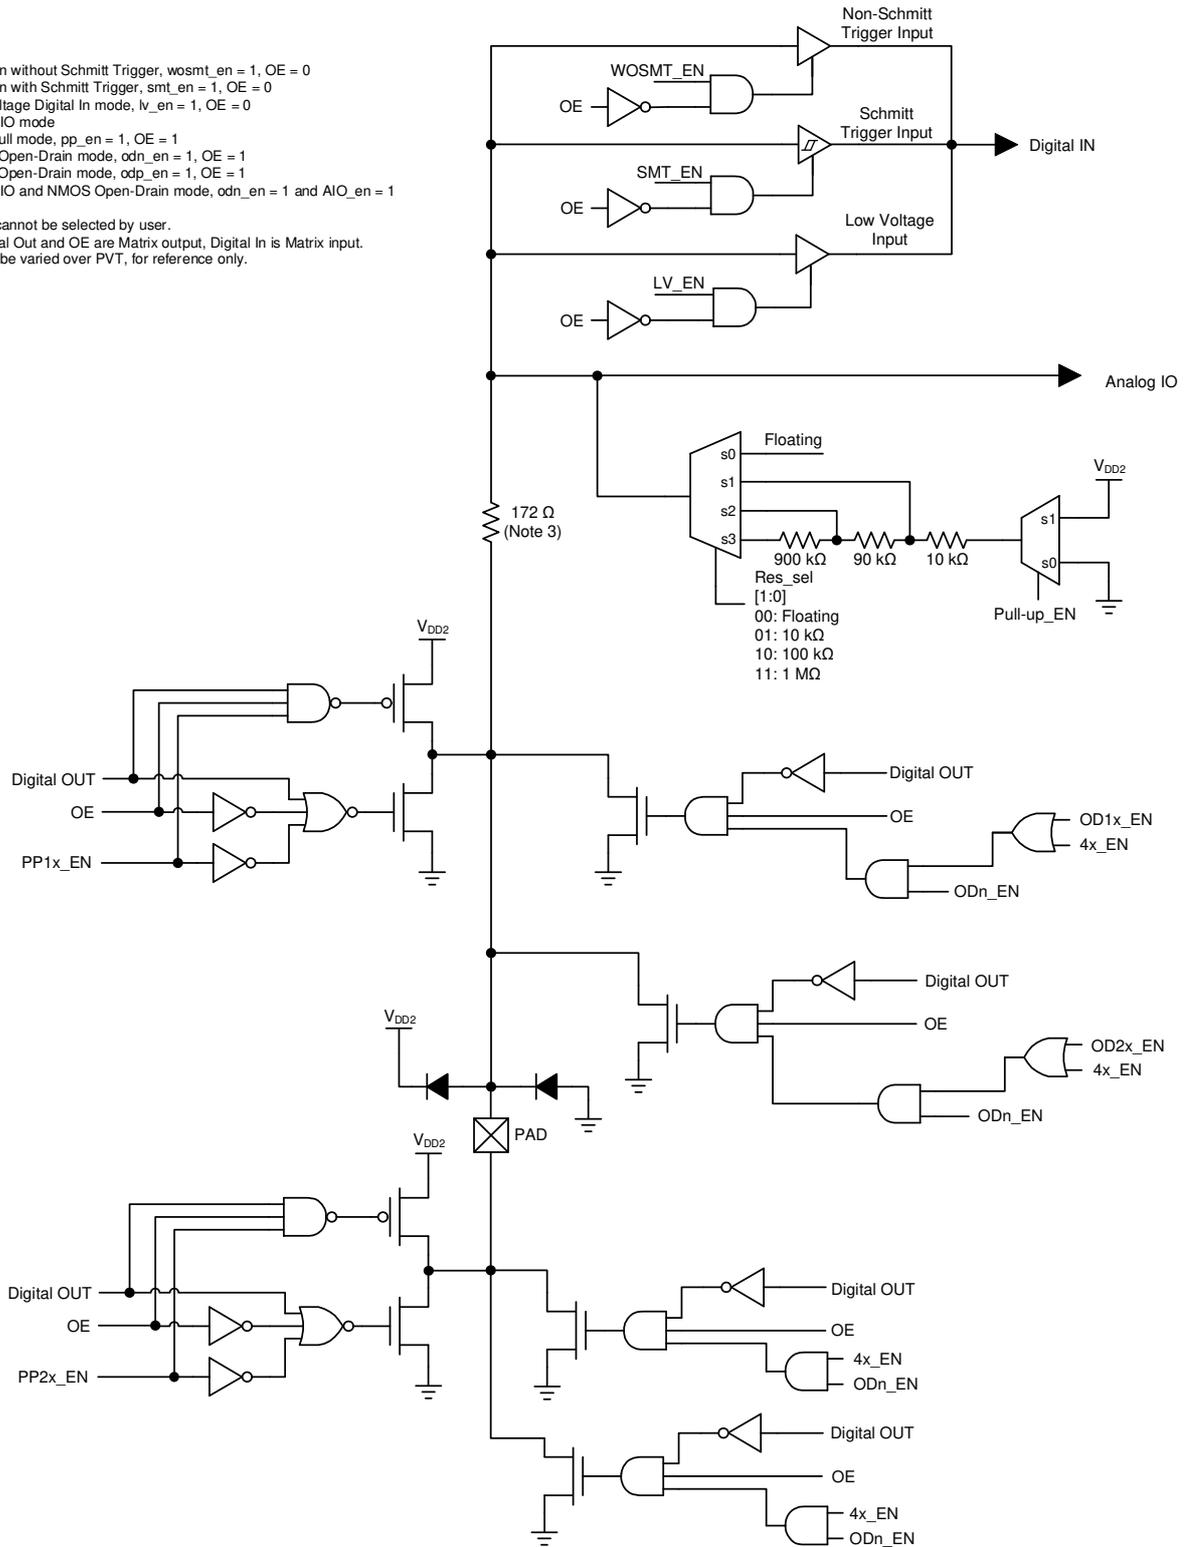

Figure 9. IO 4x Drive Structure Diagram

## 6. Connection Matrix

The Connection Matrix in the SLG46533-E is used to create the internal routing for internal functional macrocells of the device once it is programmed. The registers are programmed from the one-time NVM cell during Test Mode Operation. The output of each functional macrocell within the SLG46533-E has a specific digital bit code assigned to it that is either set to active “High” or inactive “Low” based on the design that is created. Once the 2048 register bits within the SLG46533-E are programmed a fully custom circuit will be created.

The Connection Matrix has 64 inputs and 110 outputs. Each of the 64 inputs to the Connection Matrix is hard-wired to the digital output of a particular source macrocell, including IO pins, LUTs, analog comparators, other digital resources, such as V<sub>DD</sub> and GND. The input to a digital macrocell uses a 6-bit register to select one of these 64 input lines.

For a complete list of the SLG46533-E’s register table, see section 17. Register Definitions.

### 6.3 Connection Matrix Virtual Inputs

As mentioned previously, the Connection Matrix inputs come from the outputs of various digital macrocells on the device. Eight of the Connection Matrix inputs have the special characteristic that the state of these signal lines comes from a corresponding data bit written as a register value via I<sup>2</sup>C. This gives the user the ability to write data via the serial channel, and have this information translated into signals that can be driven into the Connection Matrix and from the Connection Matrix to the digital inputs of other macrocells on the device. The I<sup>2</sup>C address for reading and writing these register values is at byte 0244.

Six of the eight Connection Matrix Virtual Inputs are dedicated to this virtual input function. An I<sup>2</sup>C write command to these register bits will set the signal values going into the Connection Matrix to the desired state. A read command to these register bits will read either the original data values coming from the NVM memory bits (that were loaded during the initial device startup), or the values from a previous write command (if that has happened).

Two of the eight Connection Matrix Virtual Inputs are shared with Pin digital inputs, (IO6 Digital or I<sup>2</sup>C\_virtual\_0 Input) and (IO7 Digital or I<sup>2</sup>C\_virtual\_1 Input). If the virtual input mode is selected, an I<sup>2</sup>C write command to these register bits will set the signal values going into the Connection Matrix to the desired state. Two register bits select whether the Connection Matrix input comes from the pin input or from the virtual register:

- register [1074] Select SCL and Virtual Input 0 or IO6
- register [1082] Select SDA and Virtual Input 1 or IO7.

See [Table 6](#) for Connection Matrix Virtual Inputs.

Table 6. Connection Matrix Virtual Inputs

Matrix Input Number	Matrix Input Signal Function	Register Bit Addresses (d)
32	I <sup>2</sup> C_virtual_0 Input	[1952]
33	I <sup>2</sup> C_virtual_1 Input	[1953]
34	I <sup>2</sup> C_virtual_2 Input	[1954]
35	I <sup>2</sup> C_virtual_3 Input	[1955]
36	I <sup>2</sup> C_virtual_4 Input	[1956]
37	I <sup>2</sup> C_virtual_5 Input	[1957]
38	I <sup>2</sup> C_virtual_6 Input	[1958]
39	I <sup>2</sup> C_virtual_7 Input	[1959]

## 6.4 Connection Matrix Virtual Outputs

The digital outputs of the various macrocells are routed to the Connection Matrix to enable interconnections to the inputs of other macrocells in the device. At the same time, it is possible to read the state of each of the macrocell outputs as a register value via I<sup>2</sup>C. This option, called Connection Matrix Virtual Outputs, allows the user to remotely read the values of each macrocell output. The I<sup>2</sup>C addresses for reading these register values are at bytes 0240 to 0247. Write commands to these same register values will be ignored (with the exception of the Virtual Input register bits at byte 0244).

## 7. Combination Function Macrocells

The SLG46533-E has twenty-four combination function macrocells that can serve more than one logic or timing function. In each case, they can serve as a Look Up Table (LUT), or as another logic or timing function. See the list below for the functions that can be implemented in these macrocells:

- Three macrocells that can serve as either 2-bit LUTs or as D Flip-Flops.
- Twelve macrocells that can serve as either 3-bit LUTs or as D Flip-Flops with Set/Reset Input.
- One macrocell that can serve as either 3-bit LUT or as Pipe Delay.
- One macrocell that can serve as either 2-bit LUT or as Programmable Pattern Generator (PGen).
- Five macrocells that can serve as either 3-bit LUTs or as 8-Bit Counter/Delays.
- Two macrocells that can serve as either 4-bit LUTs or as 16-Bit Counter/Delays.

Inputs/Outputs for the 24 combination function macrocells are configured from the connection matrix with specific logic functions being defined by the state of NVM bits.

When used as a LUT to implement combinatorial logic functions, the outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices - AND, NAND, OR, NOR, XOR, XNOR.

### 7.1 2-Bit LUT or D Flip-Flop Macrocells

There are three macrocells that can serve as either 2-bit LUTs or as D Flip-Flops. When used to implement LUT functions, the 2-bit LUTs each take in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip-Flop function, the two input signals from the connection matrix go to the data (D) and clock (CLK) inputs for the Flip-Flop, with the output going back to the connection matrix.

The operation of the D Flip-Flop and LATCH will follow the functional descriptions below:

- DFF: CLK is rising edge triggered, then Q = D; otherwise Q will not change.
- LATCH: when CLK is Low, then Q = D; otherwise Q remains its previous value (input D has no effect on the output, when CLK is High).

0	0	register [1200]	LSB
0	1	register [1201]	
1	0	register [1202]	
1	1	register [1203]	MSB

Each macrocell, when programmed for a LUT function, uses a 4-bit register to define their output function:

- 2-bit LUT0 is defined by registers [1207:1204]
- 2-bit LUT1 is defined by registers [1203:1200]
- 2-bit LUT2 is defined by registers [1215:1212].

Table 10 shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the 2-bit LUT logic cells.

Table 10. 2-bit LUT Standard Digital Functions

Function	MSB			LSB
AND-2	1	0	0	0
NAND-2	0	1	1	1
OR-2	1	1	1	0
NOR-2	0	0	0	1
XOR-2	0	1	1	0
XNOR-2	1	0	0	1

### 7.2 3-Bit LUT or D Flip-Flop with Set/Reset Macrocells

There are twelve macrocells that can serve as either 3-bit LUTs or as D Flip-Flops with Set/Reset inputs. When used to implement LUT functions, the 3-bit LUTs each take in three input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip-Flop function, the three input signals from the connection matrix go to the data (D) and clock (CLK), and Reset/Set (rRST/nSET) inputs for the Flip-Flop, with the output going back to the connection matrix.

1	0	1	register [1421]	
1	1	0	register [1422]	
1	1	1	register [1423]	MSB

Each macrocell, when programmed for a LUT function, uses a 8-bit register to define their output function:

- 3-bit LUT0 is defined by registers [1223:1216]
- 3-bit LUT1 is defined by registers [1231:1224]
- 3-bit LUT2 is defined by registers [1239:1232]
- 3-bit LUT3 is defined by registers [1247:1240]
- 3-bit LUT4 is defined by registers [1255:1248]
- 3-bit LUT11 is defined by registers [1375:1368]

- 3-bit LUT12 is defined by registers [1383:1376]
- 3-bit LUT13 is defined by registers [1391:1384]
- 3-bit LUT14 is defined by registers [1399:1392]
- 3-bit LUT15 is defined by registers [1407:1400]
- 3-bit LUT16 is defined by registers [1415:1408]
- 3-bit LUT17 is defined by registers [1423:1416].

Table 23 shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the six 3-bit LUT logic cells.

**Table 23. 3-bit LUT Standard Digital Functions**

Function	MSB							LSB
AND-3	1	0	0	0	0	0	0	0
NAND-3	0	1	1	1	1	1	1	1
OR-3	1	1	1	1	1	1	1	0
NOR-3	0	0	0	0	0	0	0	1
XOR-3	1	0	0	1	0	1	1	0
XNOR-3	0	1	1	0	1	0	0	1

## 7.2.2 Initial Polarity Operations

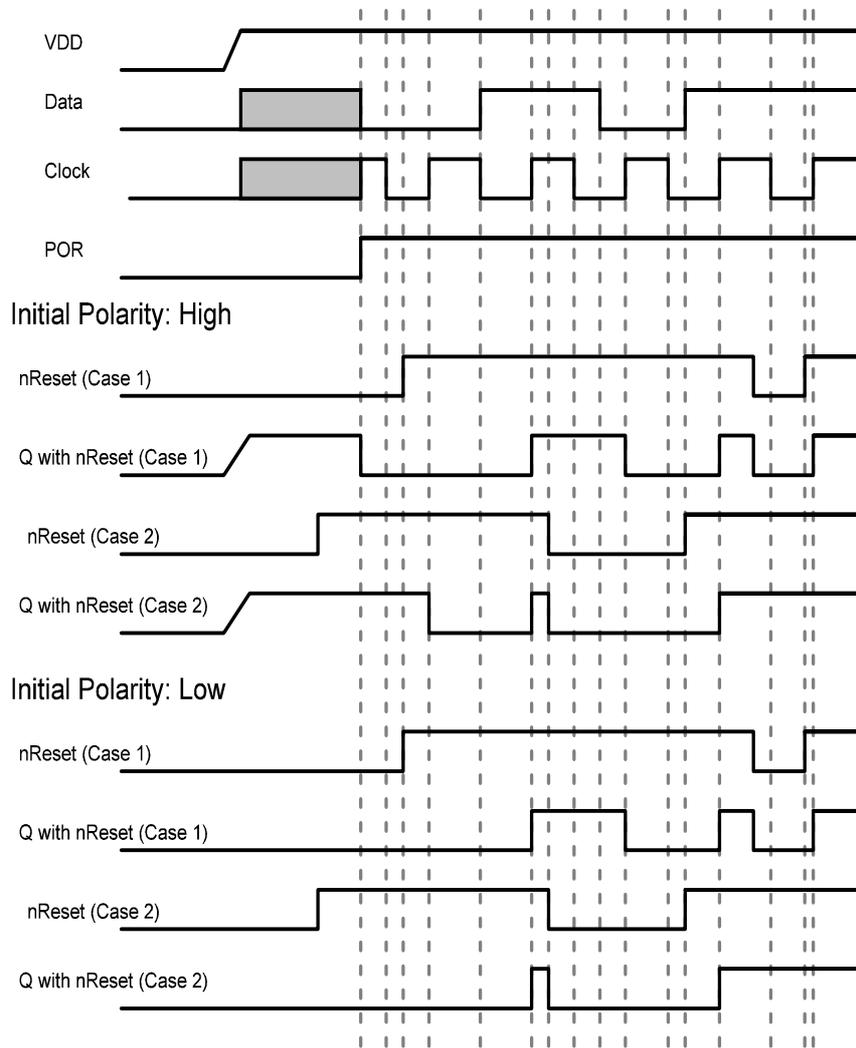

Figure 28. DFF Polarity Operations with nReset

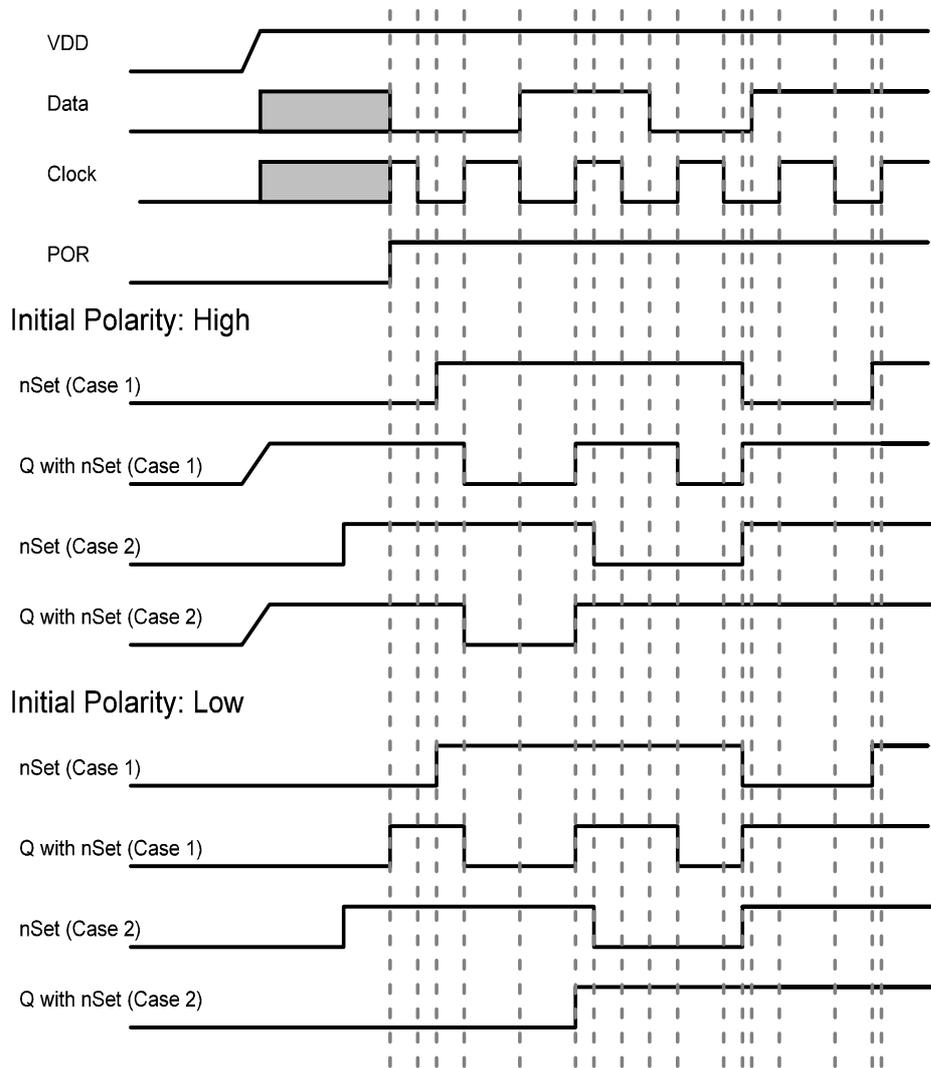

Figure 29. DFF Polarity Operations with nSet

### 7.3 3-Bit LUT or Pipe Delay Macrocell

There is one macrocell that can serve as either a 3-bit LUT or as a Pipe Delay.

When used to implement LUT functions, the 3-bit LUT takes in three input signals from the connection matrix and produces a single output, which goes back into the connection matrix.

When used as a Pipe Delay, there are three inputs signals from the matrix: Input (IN), Clock (CLK), and Reset (nRST). The Pipe Delay cell is built from 16 D Flip-Flop logic cells that provide the three delay options, two of which are user selectable. The DFF cells are tied in series where the output (Q) of each delay cell goes to the next DFF cell. The first delay option (OUT2) is fixed at the output of the first Flip-Flop stage. The other two outputs (OUT0 and OUT1) provide user selectable options for 1 to 16 stages of delay. There are delay output points for each set of the OUT0 and OUT1 outputs to a 16-input mux that is controlled by registers [1259:1256] for OUT0 and registers [1263:1260] for OUT1. The 16-input mux is used to select the amount of delay.

The overall time of the delay is based on the clock used in the SLG46533-E design. Each DFF cell has a time delay of the inverse of the clock time (either external clock or the Oscillator within the SLG46533-E). The sum of the number of DFF cells used will be the total time delay of the Pipe Delay logic cell.

**Note:** CLK is rising edge triggered.

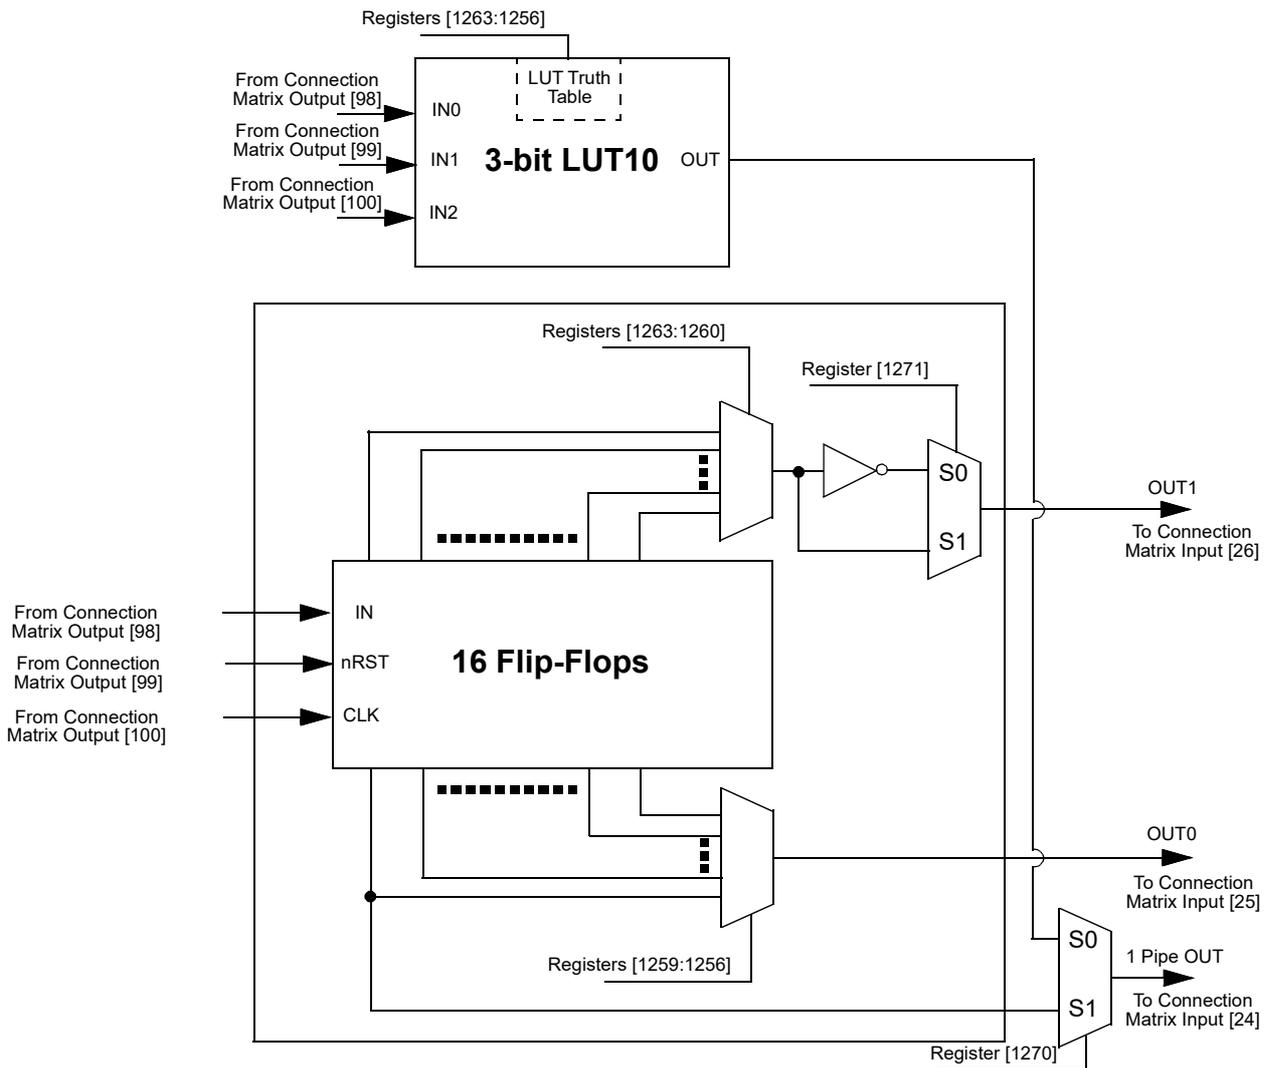

Figure 30. 3-bit LUT10 or Pipe Delay

### 7.3.1 3-Bit LUT or Pipe Delay Macrocells Used as 3-Bit LUTs

Table 24. 3-bit LUT10 Truth Table

IN2	IN1	IN0	OUT	
0	0	0	register [1256]	LSB
0	0	1	register [1257]	
0	1	0	register [1258]	
0	1	1	register [1259]	
1	0	0	register [1260]	
1	0	1	register [1261]	
1	1	0	register [1262]	
1	1	1	register [1263]	MSB

Each macrocell, when programmed for a LUT function, uses a 8-bit register to define their output function:

- 3-bit LUT10 is defined by registers [1263:1256].

## 7.4 3-Bit LUT or 8-Bit Counter/Delay Macrocells

There are five macrocells that can serve as either 3-bit LUTs or as Counter/Delays. When used to implement LUT function, the 3-bit LUT takes in three input signals from the connection matrix and produces a single output, which goes back into the connection matrix. When used to implement 8-Bit Counter/Delay function, two of the three input signals from the connection matrix go to the external clock (EXT\_CLK) and reset (DLY\_IN/CNT Reset) for the Counter/Delay, with the output going back to the connection matrix.

These macrocells can also operate in a one-shot mode, which will generate an output pulse of user-defined width.

These macrocells can also operate in a frequency detection or edge detection mode.

For timing diagrams refer to section [7.6 CNT/DLY/FSM Timing Diagrams](#)

**Note:** Counters initialize with counter data after POR.

Two of the five macrocells can have their active count value read via I<sup>2</sup>C (CNT4 and CNT6). See section [15.6.1 Reading Counter Data via I2C](#) for further details.

Each macrocell, when programmed for a LUT function, uses a 8-bit register to define their output function:

- 3-bit LUT5 is defined by registers [1543:1536]
- 3-bit LUT6 is defined by registers [1551:1544]
- 3-bit LUT7 is defined by registers [1559:1552]
- 3-bit LUT8 is defined by registers [1567:1560]
- 3-bit LUT9 is defined by registers [1575:1568].

Table 30 shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the six 3-bit LUT logic cells.

**Table 30. 3-bit LUT Standard Digital Functions**

Function	MSB							LSB
AND-3	1	0	0	0	0	0	0	0

## 7.5 4-Bit LUT or 16-Bit Counter/Delay Macrocells

There are two macrocells that can serve as either 4-bit LUTs or as 16-bit Counter/Delays. When used to implement LUT function, the 4-bit LUT takes in four input signals from the Connection Matrix and produces a single output, which goes back into the Connection Matrix. When used to implement 16-Bit Counter/Delay function, four input signals from the connection matrix go to the external clock (EXT\_CLK) and reset (DLY\_IN/CNT\_Reset), Keep and Up for the Counter/Delay, with the output going back to the connection matrix.

These two macrocells have an optional Finite State Machine (FSM) function. There are two matrix inputs for Up and Keep to support FSM functionality. Any counter within GreenPAK is counting down by default. In FSM mode (CNT/DLY0 and CNT/DLY1) it is possible to reverse counting by applying High level to Up input. Also, there is a possibility to pause counting by applying High level to Keep input, after the level goes Low, the counter will proceed counting.

These macrocells can also operate in a one-shot mode, which will generate an output pulse of user-defined width.

These macrocells can also operate in a frequency detection.

Delay time and Output Period can be calculated using the following formulas:

- Delay time:  $[(\text{Counter data} + 2)/\text{CLK input frequency} - \text{Offset}^*]$
- Output Period:  $[(\text{Counter data} + 1)/\text{CLK input frequency} - \text{Offset}^*]$ .

One Shot pulse width can be calculated using formula:

- Pulse width =  $[(\text{Counter Data} + 2)/\text{CLK input frequency} - \text{Offset}^*]$ .

\*Offset is the asynchronous time offset between the input signal and the first clock pulse.

**Note:** Counters initialize with counter data after POR

For timing diagrams refer to section [7.6 CNT/DLY/FSM Timing Diagrams](#).

Both of these macrocells can have their active count value read via I<sup>2</sup>C. See section [15.6.1 Reading Counter Data via I2C](#) for further details.

## 7.6 CNT/DLY/FSM Timing Diagrams

### 7.6.1 Delay Mode (Edge Select: Both, Counter Data: 3) CNT/DLY2 to CNT/DLY6

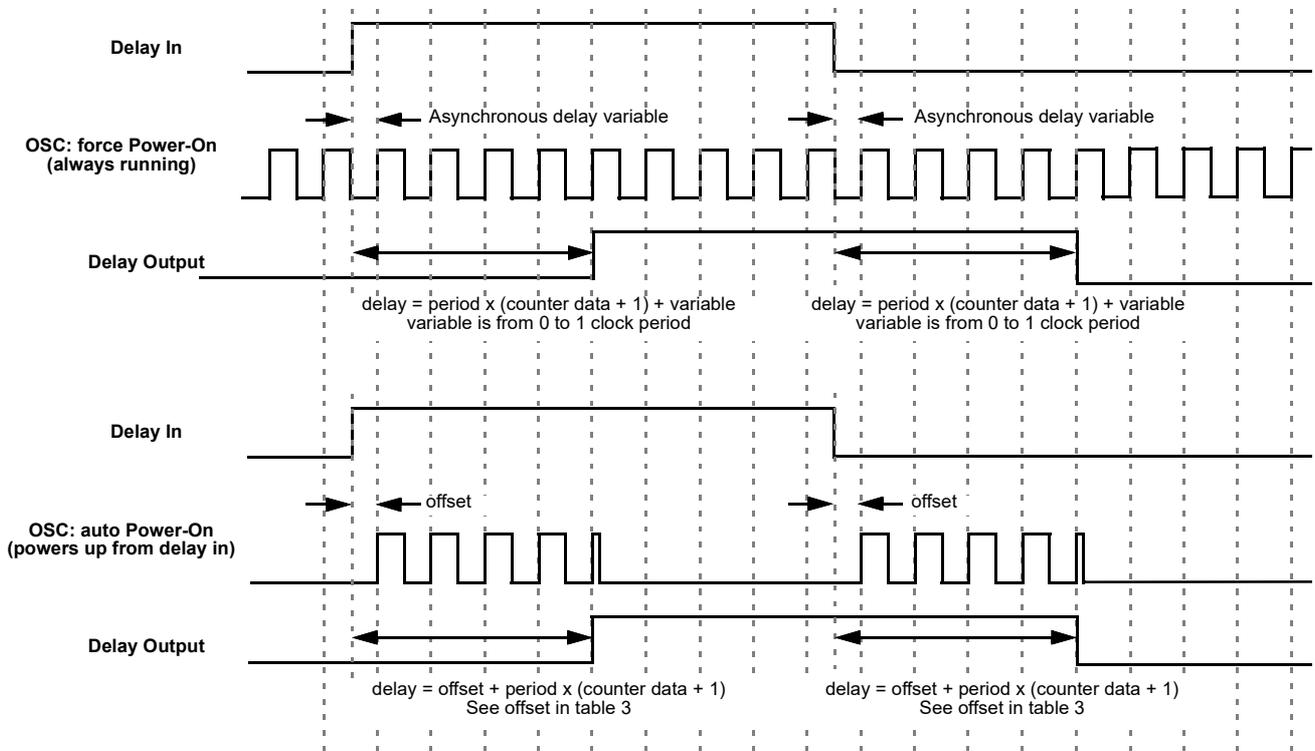

Figure 38. Delay Mode Timing Diagram

### 7.6.2 Count Mode (Count Data: 3), Counter Reset (Rising Edge Detect) CNT/DLY2 to CNT/DLY6

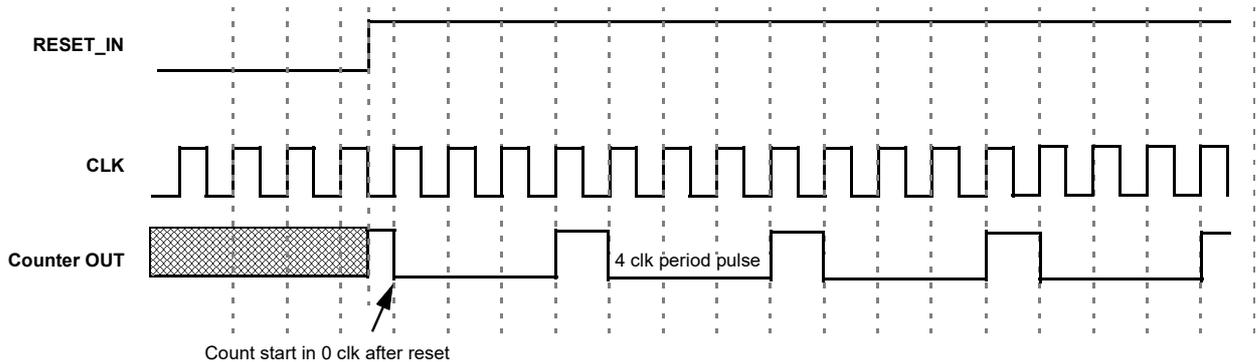

Figure 39. Counter Mode Timing Diagram

### 7.6.3 One-Shot Mode CNT/DLY0 to CNT/DLY6

This macrocell will generate a pulse whenever a selected edge is detected on its input. Register bits set the edge selection. The pulse width determines by counter data and clock selection properties. The output pulse polarity (non-inverted or inverted) is selected by register bit. Any incoming edges will be ignored during the pulse width generation. The following diagram shows one-shot function for non-inverted output.

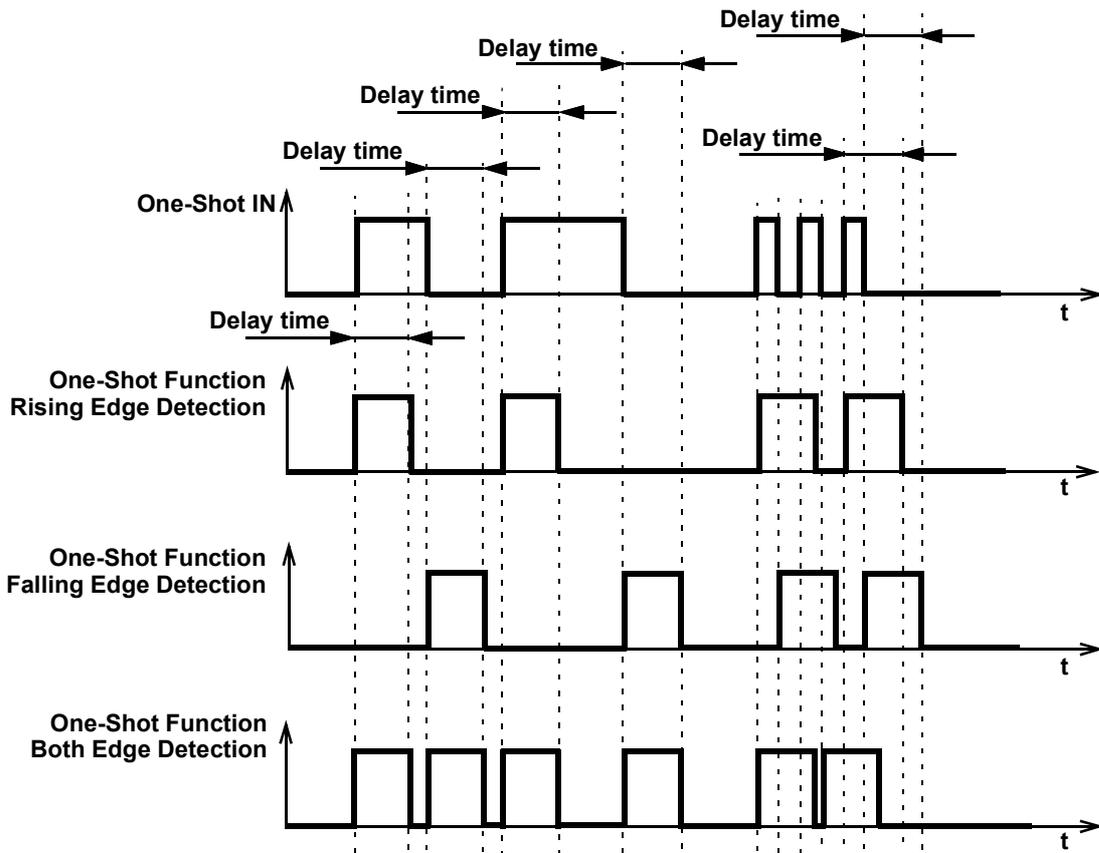

Figure 40. One-Shot Function Timing Diagram

This macrocell generates a high level pulse with a set width (defined by counter data) when detecting the respective edge. It does not restart while pulse is high.

#### 7.6.4 Frequency Detection Mode CNT/DLY0 to CNT/DLY6

**Rising Edge:** The output goes high if the time between two successive edges is less than the delay. The output goes low if the second rising edge has not come after the last rising edge in specified time.

**Falling Edge:** The output goes high if the time between two falling edges is less than the set time. The output goes low if the second falling edge has not come after the last falling edge in specified time.

**Both Edge:** The output goes high if the time between the rising and falling edges is less than the set time, which is equivalent to the length of the pulse. The output goes low if after the last rising/falling edge and specified time, the second edge has not come.

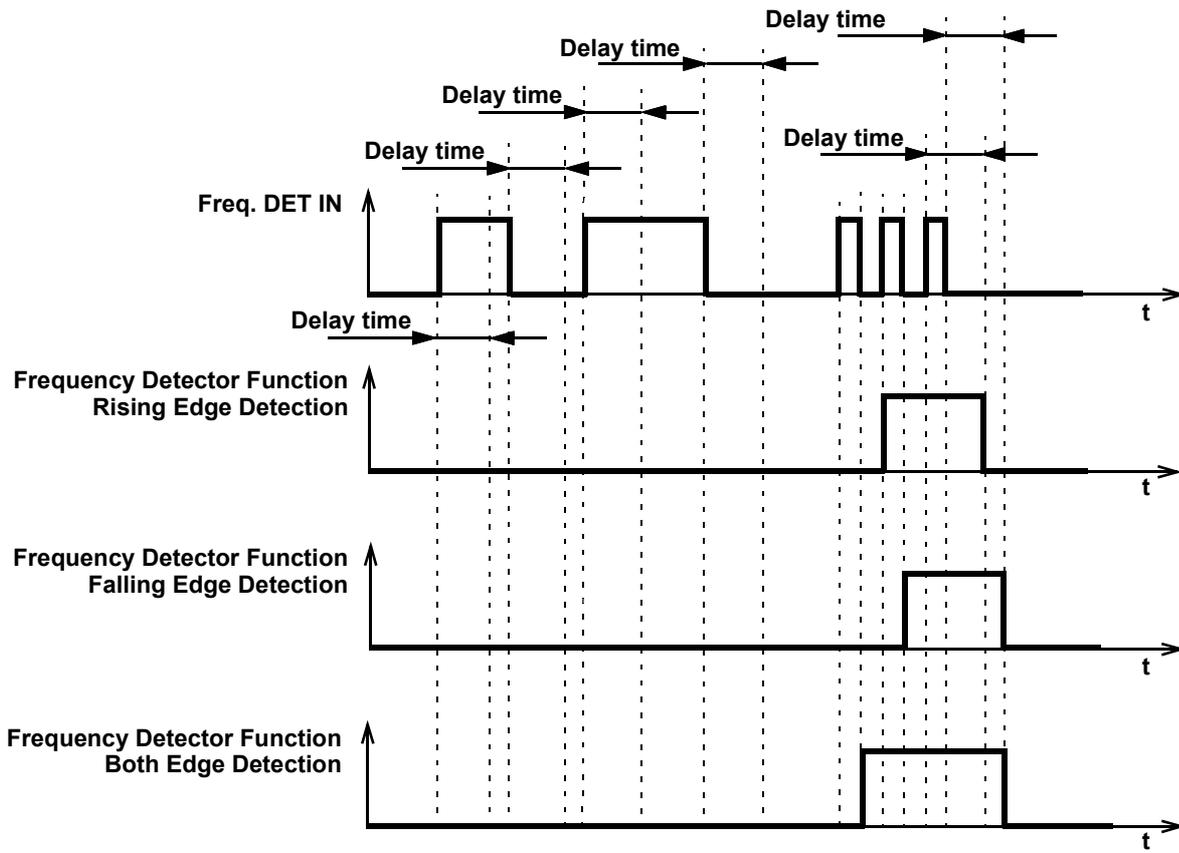

Figure 41. Frequency Detection Mode Timing Diagram

### 7.6.5 Edge Detection Mode CNT/DLY2 to CNT/DLY6

The macrocell generates high level short pulse when detecting the respective edge.

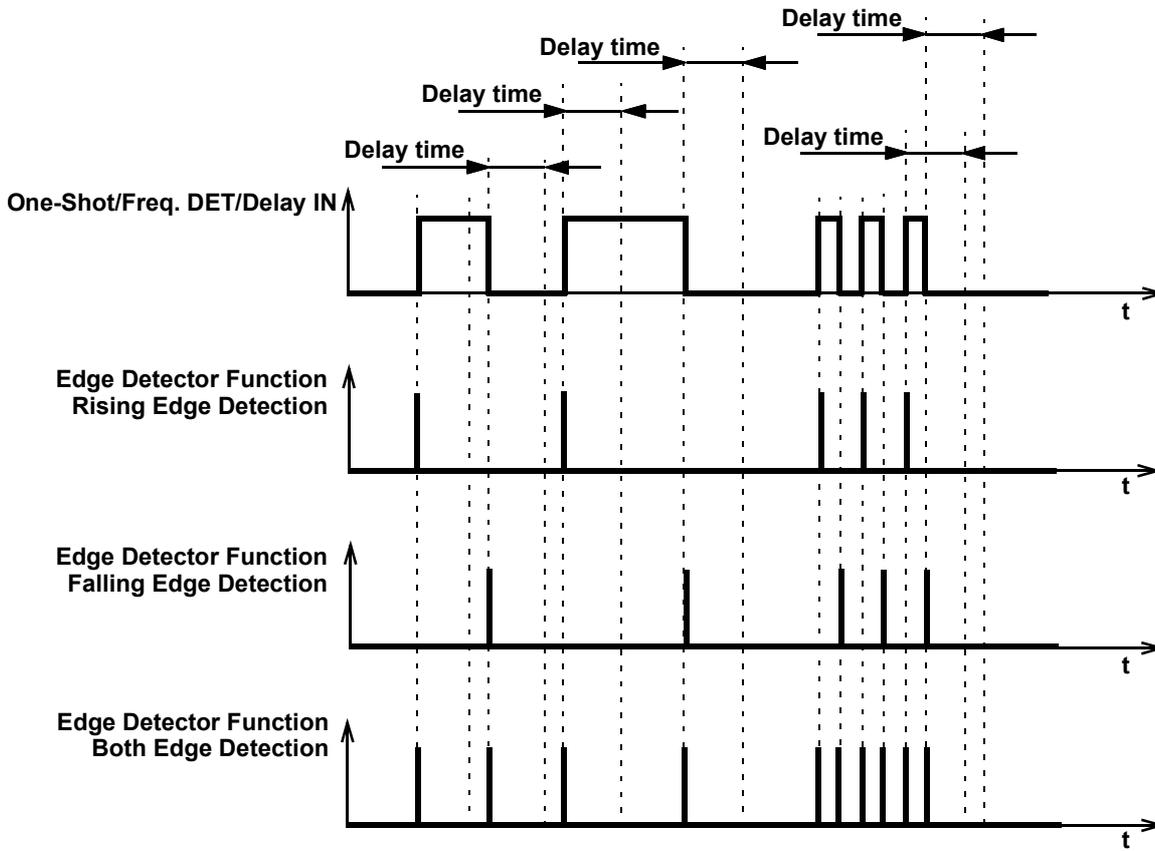

Figure 42. Edge Detection Mode Timing Diagram

### 7.6.6 Delay Mode CNT/DLY0 to CNT/DLY6

The macrocell shifts the respective edge to a set time and restarts by appropriate edge. It works as a filter if the input signal is shorter than the delay time.

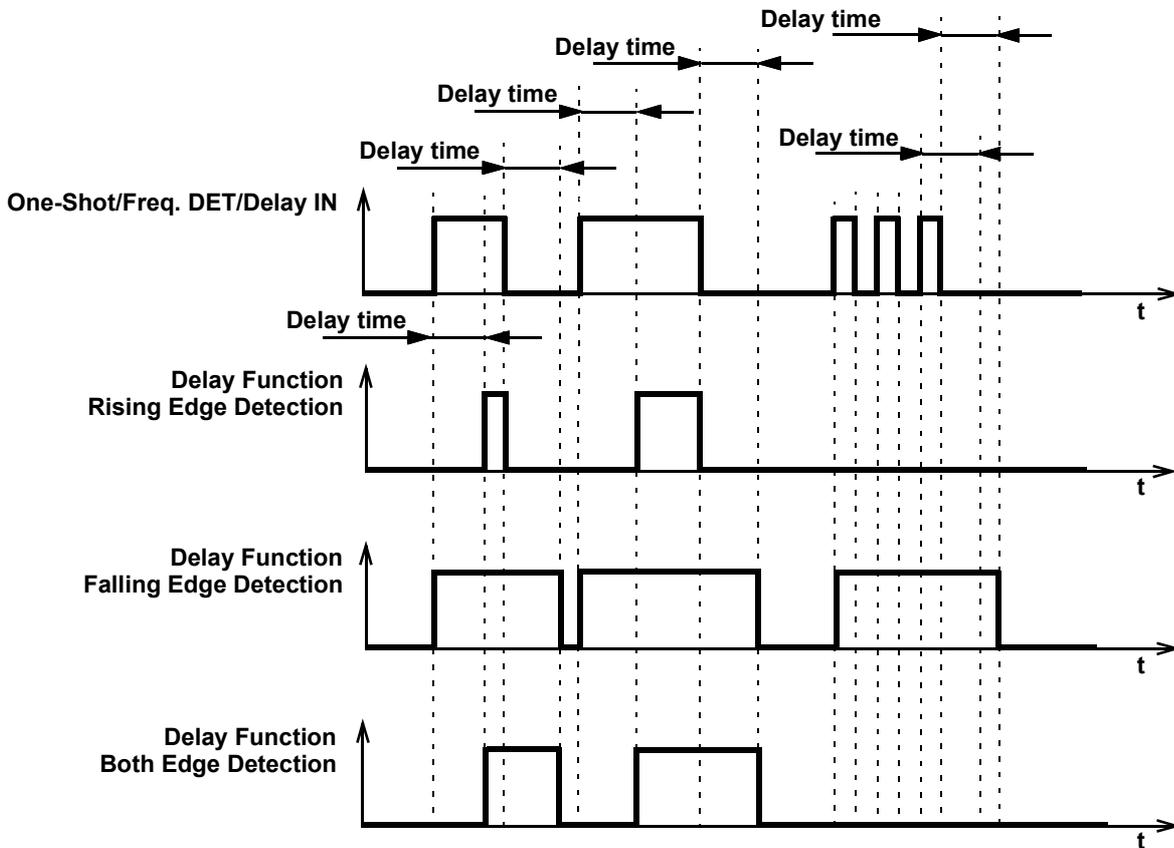

Figure 43. Delay Mode Timing Diagram

### 7.6.7 CNT/FSM Mode CNT/DLY0, CNT/DLY1

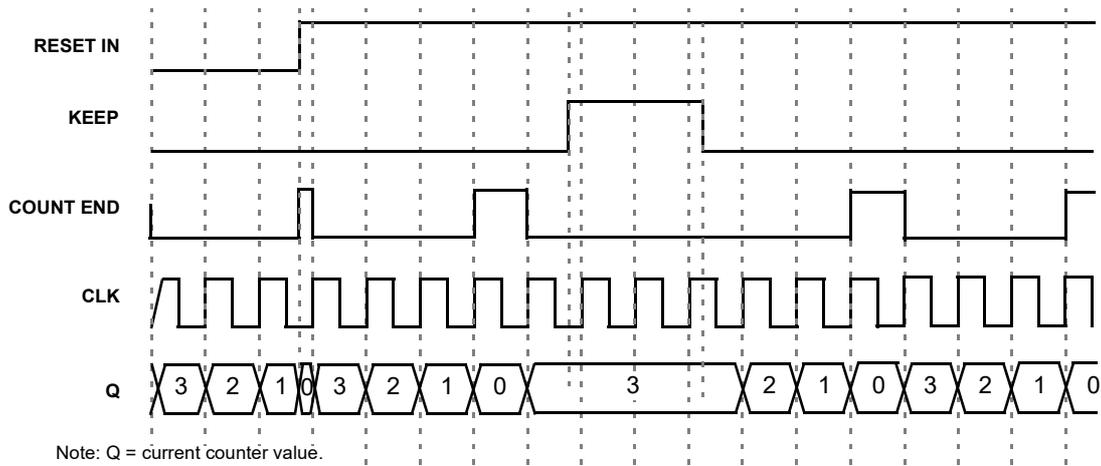

Figure 44. CNT/FSM Timing Diagram (Reset Rising Edge Mode, Oscillator is Forced On, UP = 0) for Counter Data = 3

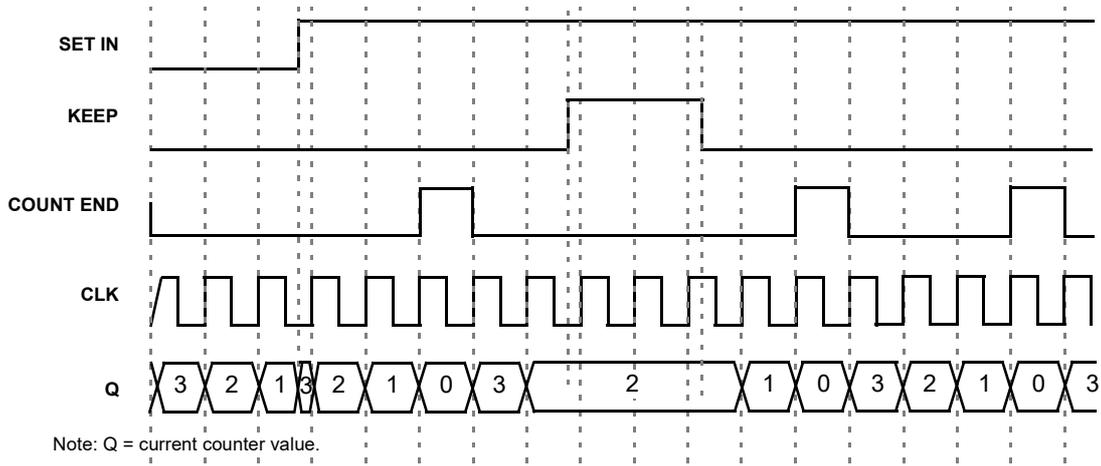

Figure 45. CNT/FSM Timing Diagram (Set Rising Edge Mode, Oscillator is Forced On, UP = 0) for Counter Data = 3

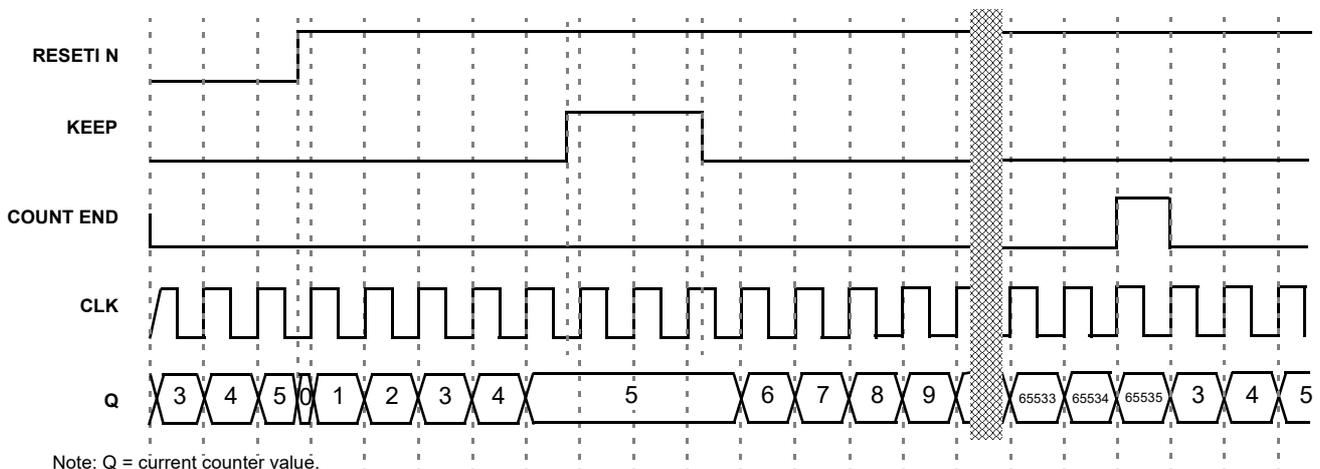

Figure 46. CNT/FSM Timing Diagram (Reset Rising Edge Mode, Oscillator is Forced On, UP = 1) for Counter Data = 3

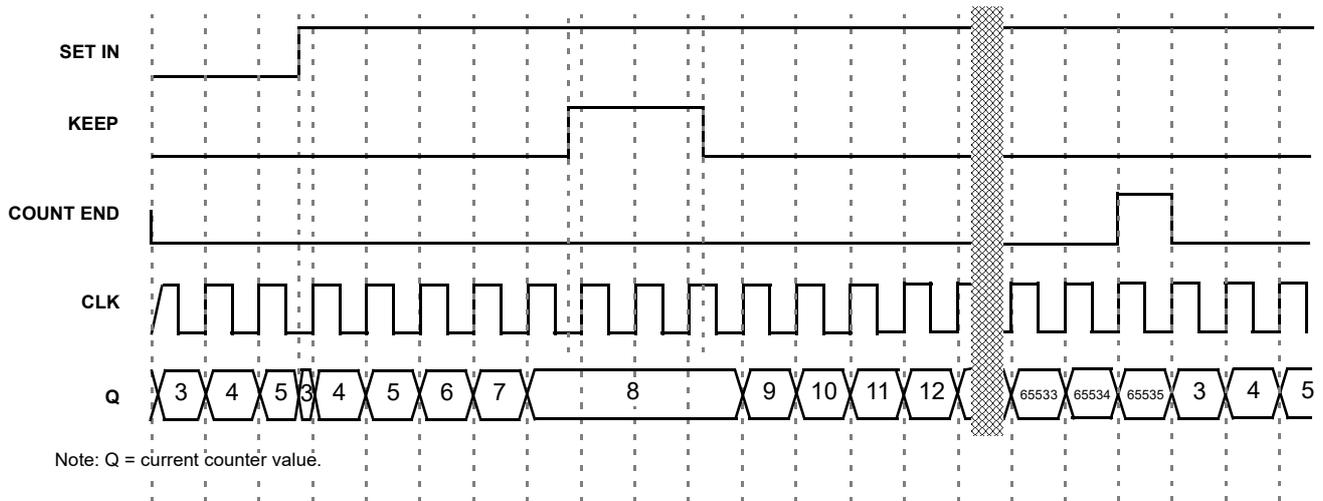

Figure 47. CNT/FSM Timing Diagram (Set Rising Edge Mode, Oscillator is Forced On, UP = 1) for Counter Data = 3

### 7.6.8 Difference in Counter Value for Counter, Delay, One-Shot, and Frequency Detect Modes

There is a difference in counter value for Counter and Delay/One-Shot/Frequency Detect modes. The counter value is shifted for two rising edges of the clock signal in Delay/One-Shot/Frequency Detect modes compared to Counter mode. See [Figure 48](#).

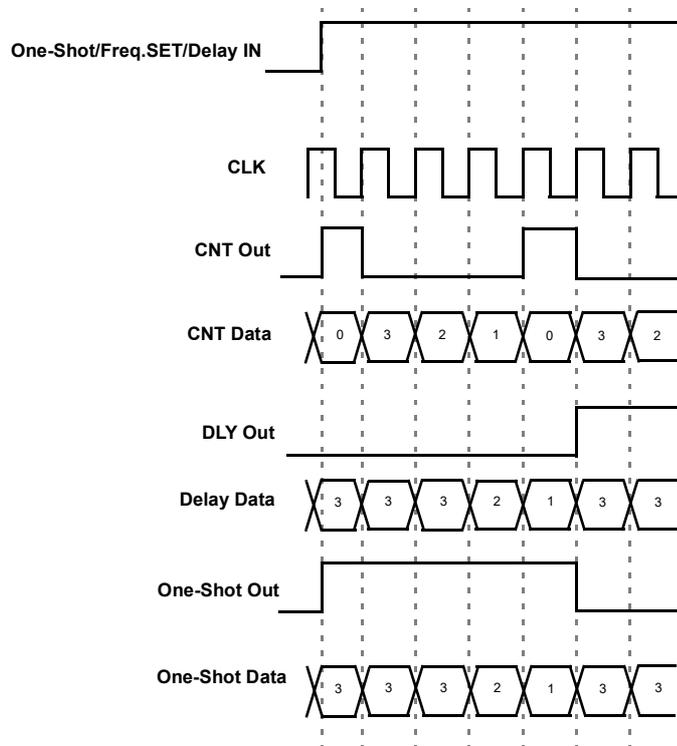

Figure 48. Counter Value, Counter Data = 3

## 7.7 2-bit LUT or Programmable Pattern Generator

The SLG46533-E has one combination function macrocell that can serve as a logic or timing function. This macrocell can serve as a Look Up Table (LUT), or Programmable Pattern Generator (PGen).

When used to implement LUT functions, the 2-bit LUT takes in four input signals from the connection matrix and produces a single output, which goes back into the connection matrix. When used as a LUT to implement combinatorial logic functions, the outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices - AND, NAND, OR, NOR, XOR, XNOR. The user can also define the combinatorial relationship between inputs and outputs to be any selectable function.

When operating as a Programmable Pattern Generator, the output of the macrocell with clock out a sequence of two to sixteen bits that are user selectable in their bit values, and user selectable in the number of bits (up to sixteen) that are output before the pattern repeats. See [Figure 50](#).

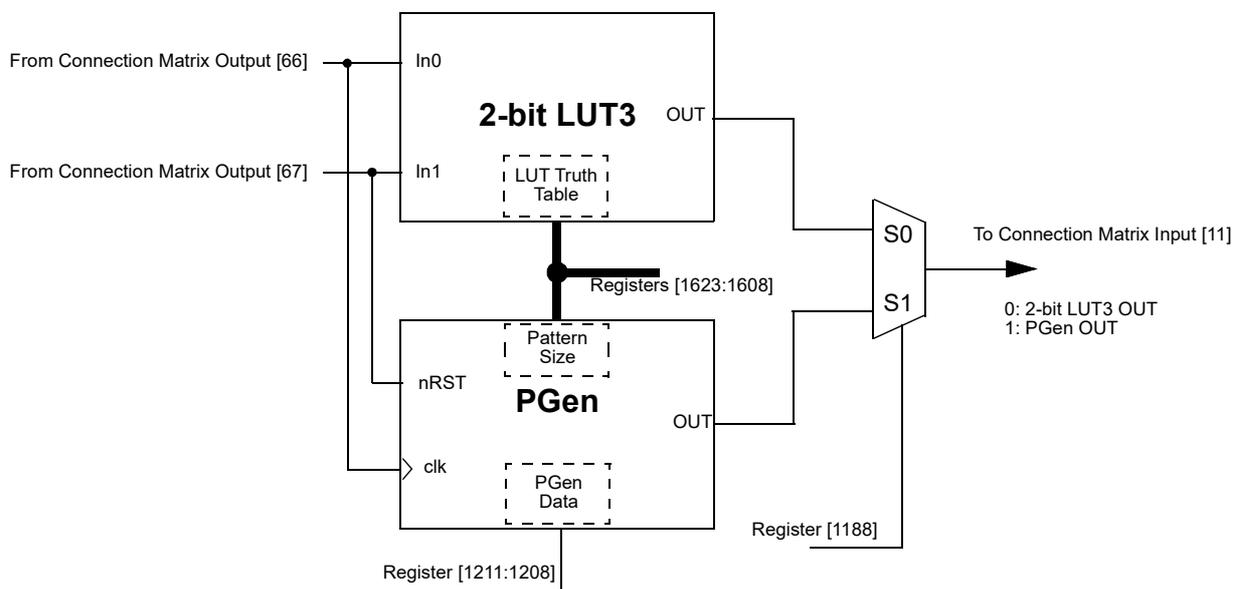

Figure 49. 2-bit LUT3 or PGen

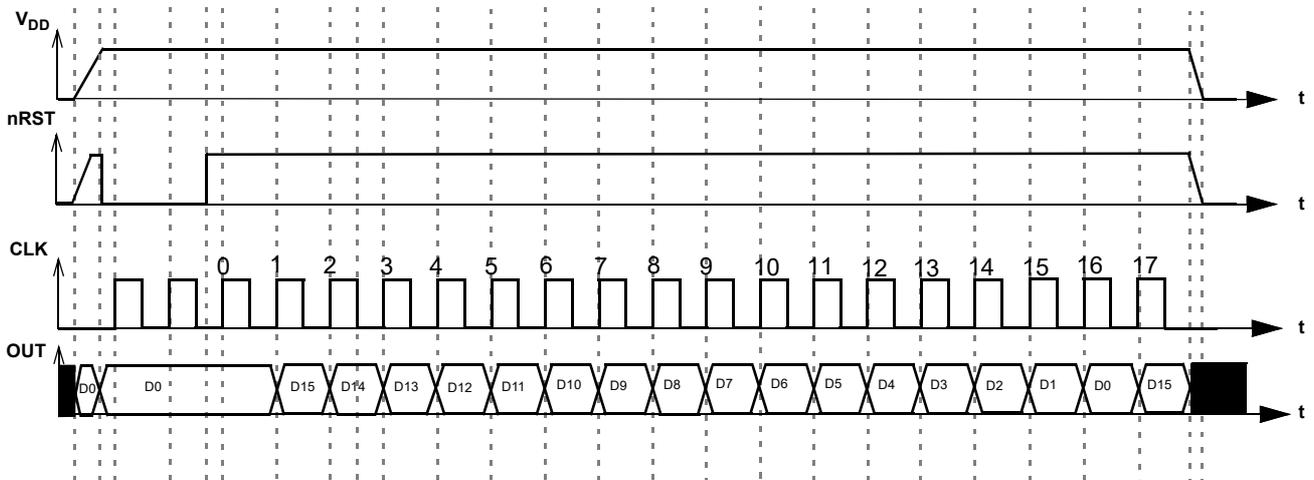

Figure 50. PGen Timing Diagram

## 7.8 Wake and Sleep Controller

The SLG46533-E has a Wake and Sleep (WS) function for all ACMPs. The macrocell CNT/DLY0 can be reconfigured for this purpose registers [1319:1318] = 11 and registers [1495] = 1. The WS serves for power saving, it allows to switch on and off selected ACMPs on selected bit of 16-bit counter.

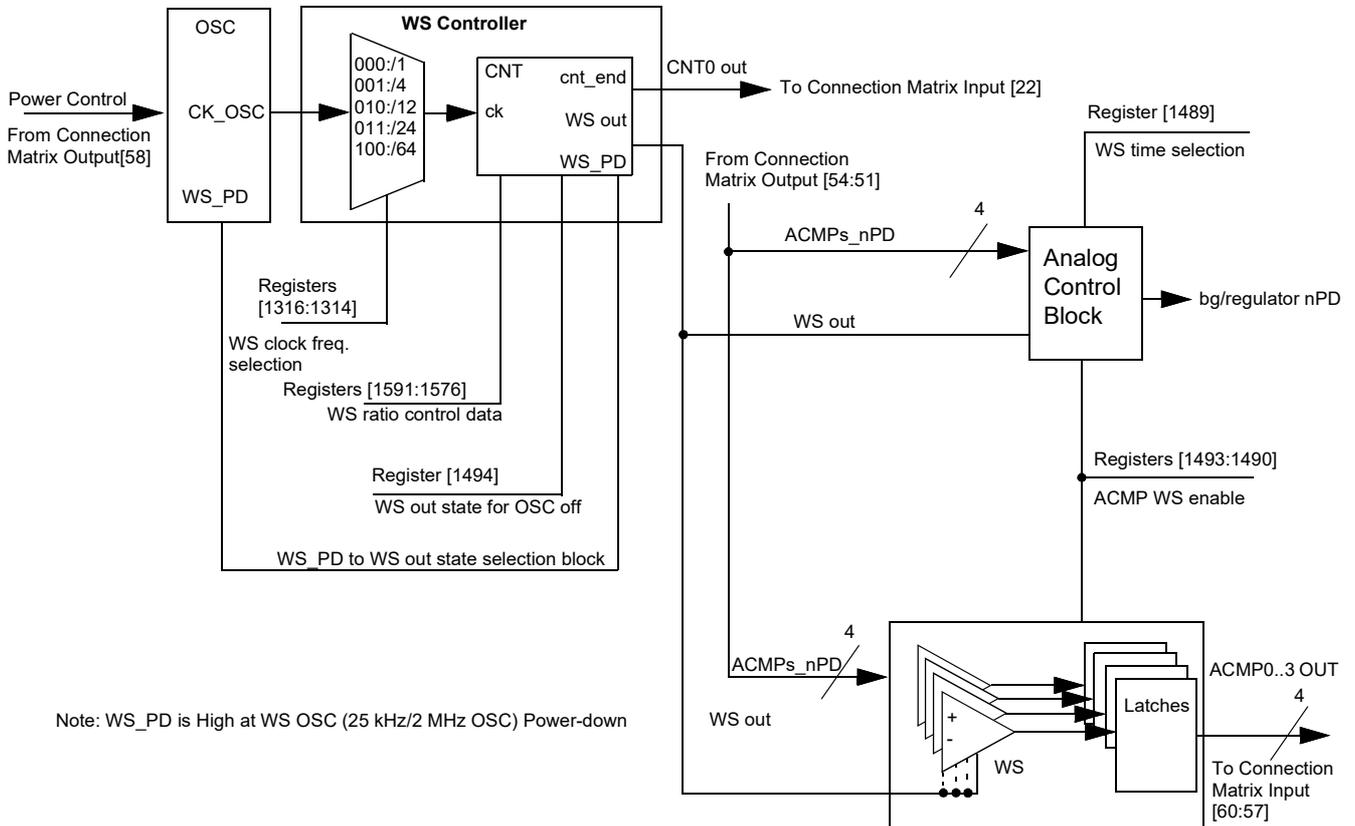

Figure 51. Wake/Sleep Controller

To use any ACMP under WS controller the following settings must be done:

- ACMP Power Up Input from matrix = 1 (for each ACMP separately)
- CNT/DLY0 must be set to Wake and Sleep Controller function (for all ACMPs)
- Register WS => enable (for each ACMP separately)
- CNT/DLY0 set/reset input = 0 (for all ACMPs)
- In case of using OSC1 (25 MHz), OSC0 must be set to Force Power-On.

As the OSC any oscillator with any pre-divider can be used. The user can select a period of time while the ACMPs are sleeping in a range of 1 - 65535 clock cycles. Before they are sent to sleep their outputs are latched, so the ACMPs remain their state (High or Low) while sleeping.

WS controller has the following settings:

- Wake and Sleep Output State (High/Low)

If OSC is powered off (Power-Down option is selected; power-down input = 1) and Wake and Sleep Output State = High, the ACMP is continuously on.

If OSC is powered off (Power-Down option is selected; power-down input = 1) and Wake and Sleep Output State = Low, the ACMP is continuously off.

Both cases WS function is turned off.

- Counter Data (Range: 1 - 65535)  
User can select wake and sleep ratio of the ACMP; counter data = sleep time, one clock = wake time.
- Q mode - defines the state of WS counter data when Set/Reset signal appears  
Reset - when active signal appears, the WS counter will reset to zero and High level signal on its output will turn the ACMPs on. When Reset signal goes out, the WS counter will go Low and turn the ACMPs off until the counter counts up to the end.  
  
Set - when active signal appears, the WS counter will stop and Low level signal on its output will turn the ACMPs off. When Set signal goes out, the WS counter will go on counting and High level signal will turn the ACMPs on while counter is counting up to the end.
- Edge Select defines the edge for Q mode  
High level Set/Reset - switches mode Set/Reset when level is High.  
**Note:** Q mode operates only in case of "High Level Set/Reset".
- Wake time selection - time required for wake signal to turn the ACMPs on  
Normal Wake Time - when WS signal is High, it takes a BG time (100/550  $\mu$ s) to turn the ACMPs on. They will stay on until WS signal is Low again. Wake time is one clock period. It should be longer than BG turn on time and minimal required comparing time of the ACMP.  
  
Short Wake Time - when WS signal is High, it takes a BG time (100/550  $\mu$ s) to turn the ACMPs on. They will stay on for 1  $\mu$ s and turn off regardless of WS signal. The WS signal width does not matter.
- Keep - pauses counting while Keep = 1
- Up - reverses counting  
If Up = 1, CNT is counting up from user selected value to 65535.  
If Up = 0, CNT is counting down from user selected value to 1.

## 8. Analog Comparators

There are four Analog Comparator (ACMP) macrocells in the SLG46533-E. In order for the ACMP cells to be used in a GreenPAK design, the power up signals (ACMPx\_nPD) need to be active. By connecting to signals coming from the Connection Matrix, it is possible to have each ACMP be always on, always off, or power cycled based on a digital signal coming from the Connection Matrix. Also, all ACMPs have Wake and Sleep function (WS), see section [7.8 Wake and Sleep Controller](#). When ACMP is powered down, output is low.

PWR UP = 1 – ACMP is powered up.

PWR UP = 0 – ACMP is powered down.

During ACMP power up, its output will remain low, and then becomes valid 1 ms (max) after ACMP power up signal goes high, see [Figure 56](#). The ACMP cells have an input "Low bandwidth" signal selection, which can be used to save power and reduce noise impact when lower bandwidth signals are being compared. To ensure proper chip startup operation, it is recommended to enable the ACMPs with the POR signal, and not the  $V_{DD}$  signal.

**Note:** Regulator and Charge Pump set to automatic ON/OFF.

Each of the ACMP cells has a positive input signal that can be provided by a variety of external sources. There is also a selectable gain stage (1x, 0.5x, 0.33x, 0.25x) before connection to the analog comparator. The Gain divider is unbuffered and consists of 250 k $\Omega$  (typ) resistors. IN- voltage range: 0 - 1.2 V. Can use  $V_{REF}$  selection  $V_{DD}/4$  and  $V_{DD}/3$  to maintain this input range.

Input bias current < 1 nA (typ).

Each cell also has a hysteresis selection, to offer hysteresis of 0 mV, 25 mV, 50 mV, 200 mV. The 50 mV and 200 mV hysteresis options can be used with internal voltage reference only, while 25 mV hysteresis option can be used with both internal and external voltage reference. The 50 mV and 200 mV hysteresis options are one way hysteresis. It means that the actual thresholds will be  $V_{REF}$  (high threshold) and  $V_{REF}$  - hysteresis (low threshold). The ACMP output will retain its previous value, if the input voltage is within threshold window (between  $V_{REF}$  and  $V_{REF}$  - hysteresis). Please note: for the 25 mV hysteresis option threshold levels will be  $V_{REF}$  + hysteresis/2 (high threshold) and  $V_{REF}$  - hysteresis/2 (low threshold).

**Note:** Any ACMP powered on enables the BandGap internal circuit as well. An analog voltage will appear on  $V_{REF}$  even when the Force BandGap option is set as Disabled.

For high input impedance when using the gain divider (x0.25, x0.33, x0.5), it is possible to use the input buffer. However, this will add some offset, see [Figure 57](#) and [Figure 58](#). It is not recommended to use ACMP buffer when  $V_{DD} < 2.5$  V.

## 8.1 ACMP0 Block Diagram

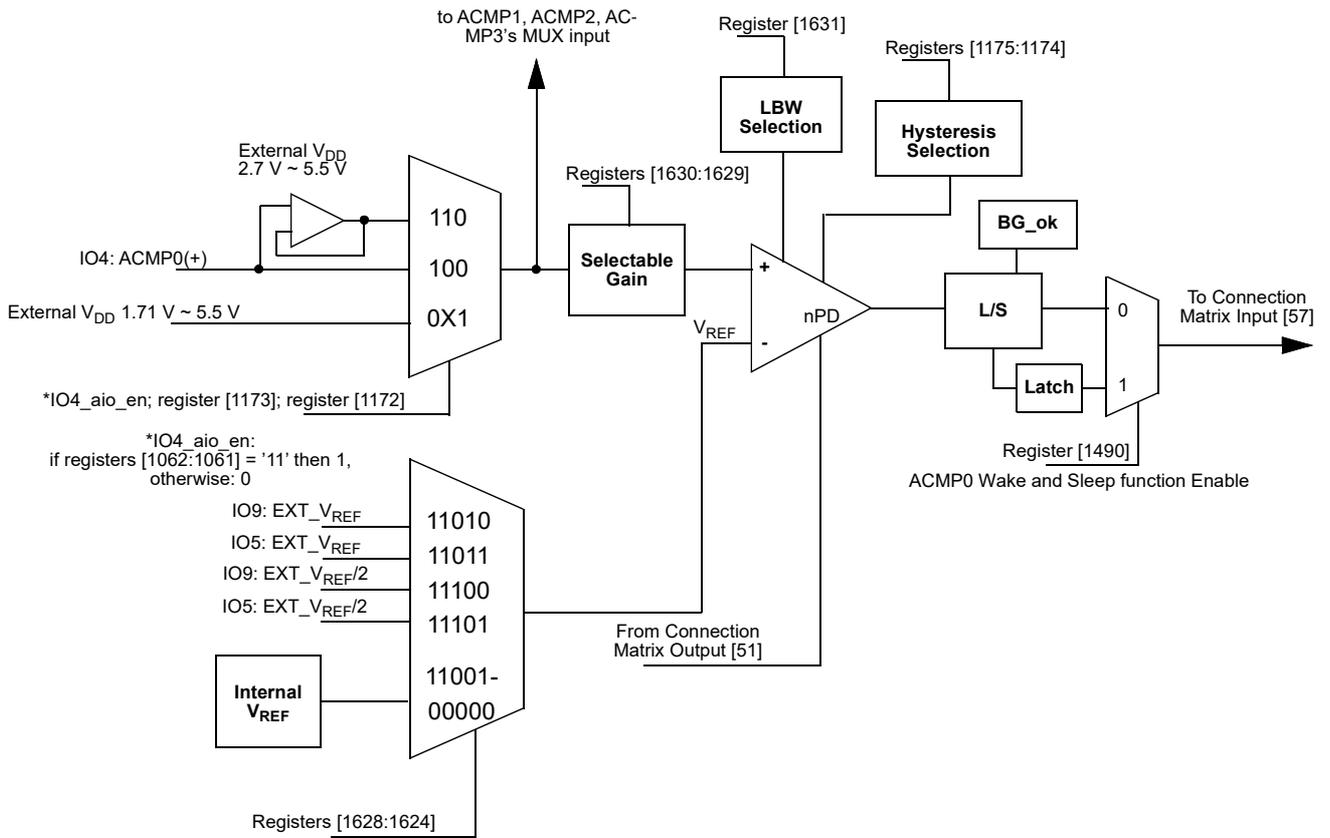

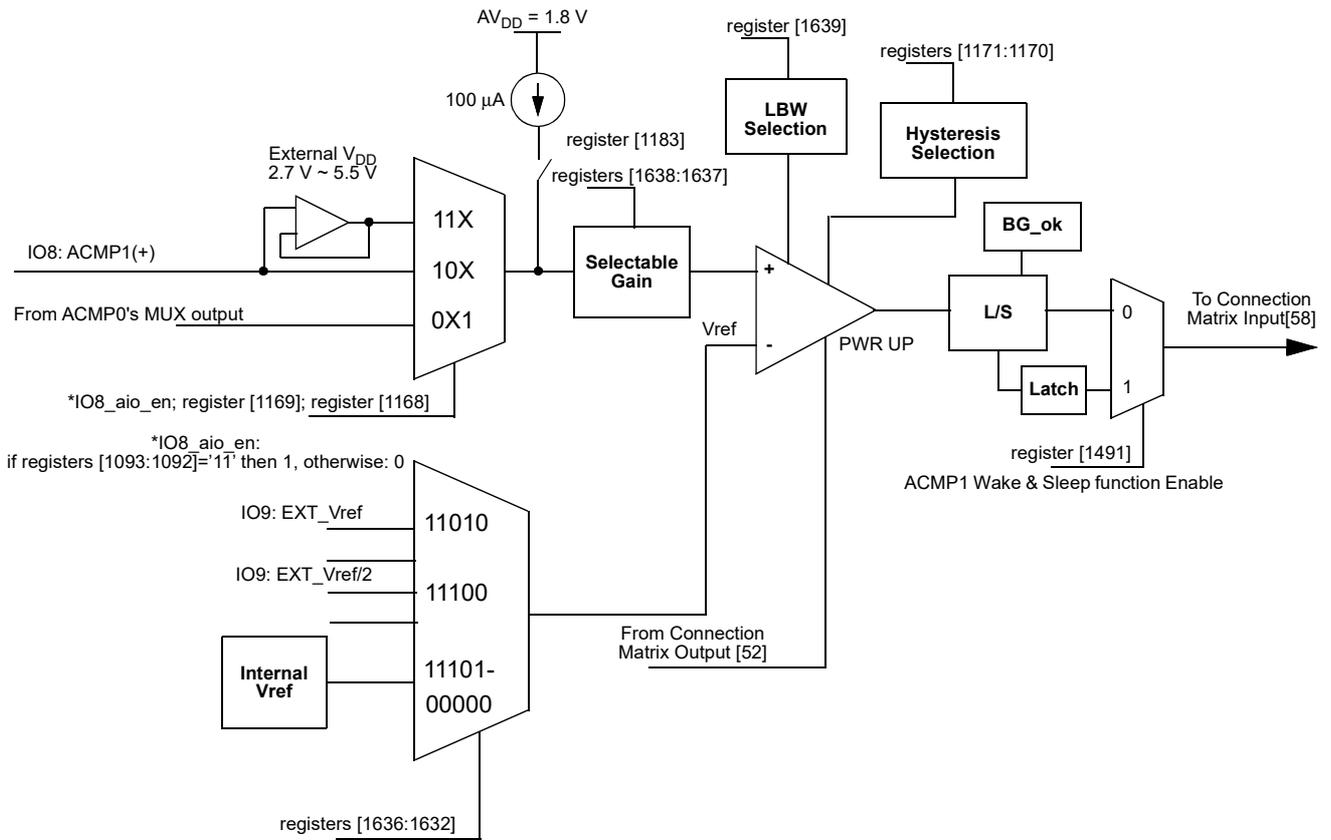

Figure 52. ACMP0 Block Diagram

## 8.2 ACMP1 Block Diagram

Note: when 100 μA Current Source is enabled input voltage on IO8 should not exceed 1.8 V.

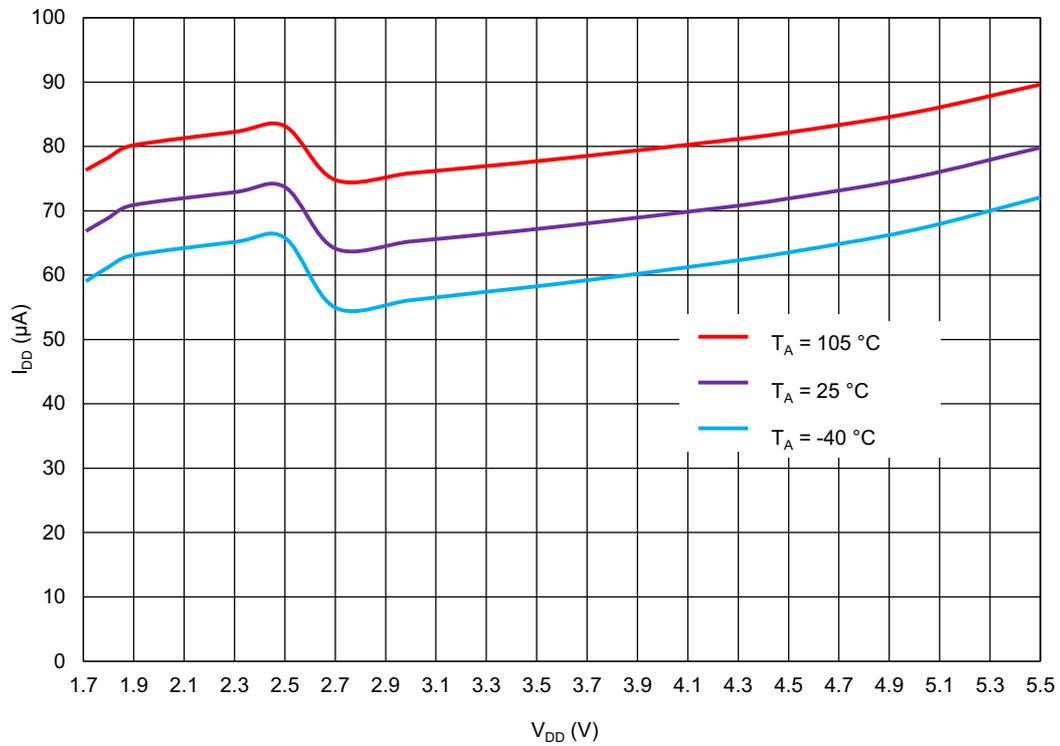

Figure 62. Buffered ACMPx Current Consumption vs. V<sub>DD</sub> at V<sub>IN+</sub> Connected to V<sub>DD</sub>, Internal V<sub>REF</sub> = 50 mV

## 9. Pipe Delay

The SLG46533-E has a pipe delay logic cell that is shared with the 3-bit LUT10 in one of the Combination Function macrocells. The user can select one of these functions to use in a design, but not both. Please see section [7.3 3-Bit LUT or Pipe Delay Macrocell](#) for the description of this Combination Function macrocell.

## 10. Programmable Delay/Edge Detector

The SLG46533-E has a programmable time delay logic cell available, that can generate a delay, that is selectable from one of four timings configured in the GreenPAK Designer. The programmable time delay cell can generate one of four different delay patterns, rising edge detection, falling edge detection, both edge detection, and both edge delay. See [Figure 63](#) and [Figure 64](#) for further information.

**Note:** The input signal must be longer than the delay, otherwise it will be filtered out.

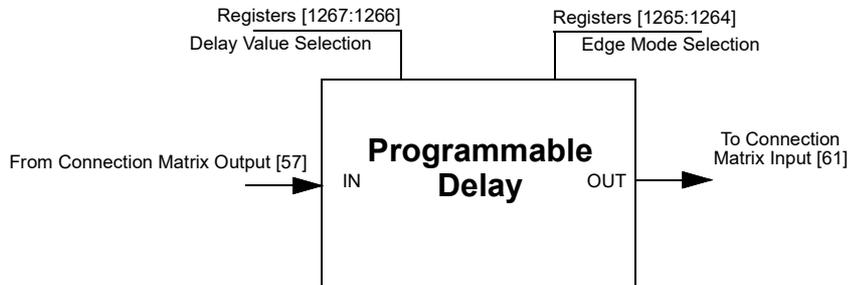

Figure 63. Programmable Delay

### 10.1 Programmable Delay Timing Diagram - Edge Detector Output

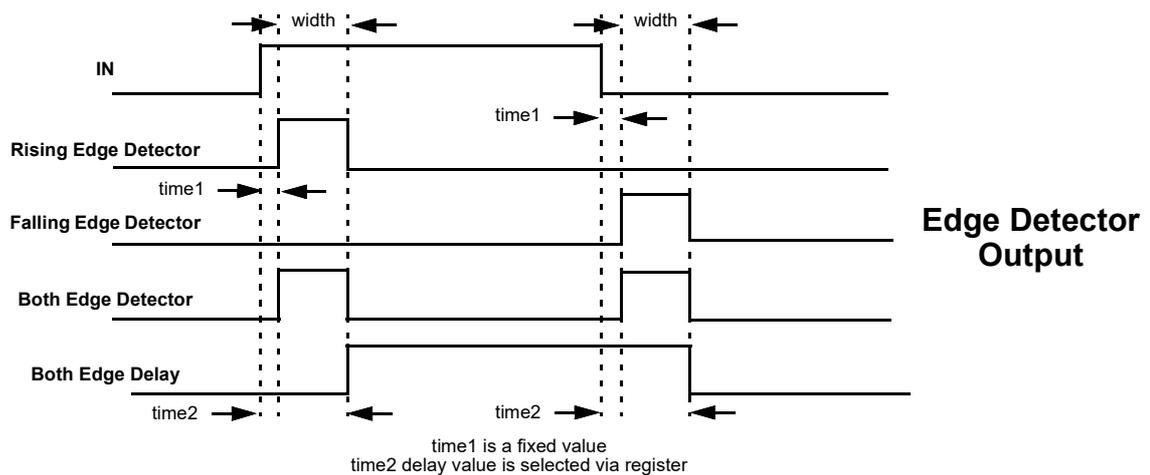

Figure 64. Edge Detector Output

Please refer to section [3.4.4 Estimated Typical Delay of Each Macrocell](#).

## 11. Additional Logic Function. Deglitch Filter

The SLG46533-E has two additional logic functions that are connected directly to the Connection Matrix inputs and outputs. There are two deglitch filters, each with edge detector functions. See section 3.4.4 Estimated Typical Delay of Each Macrocell.

### 11.1 Deglitch Filter/Edge Detector

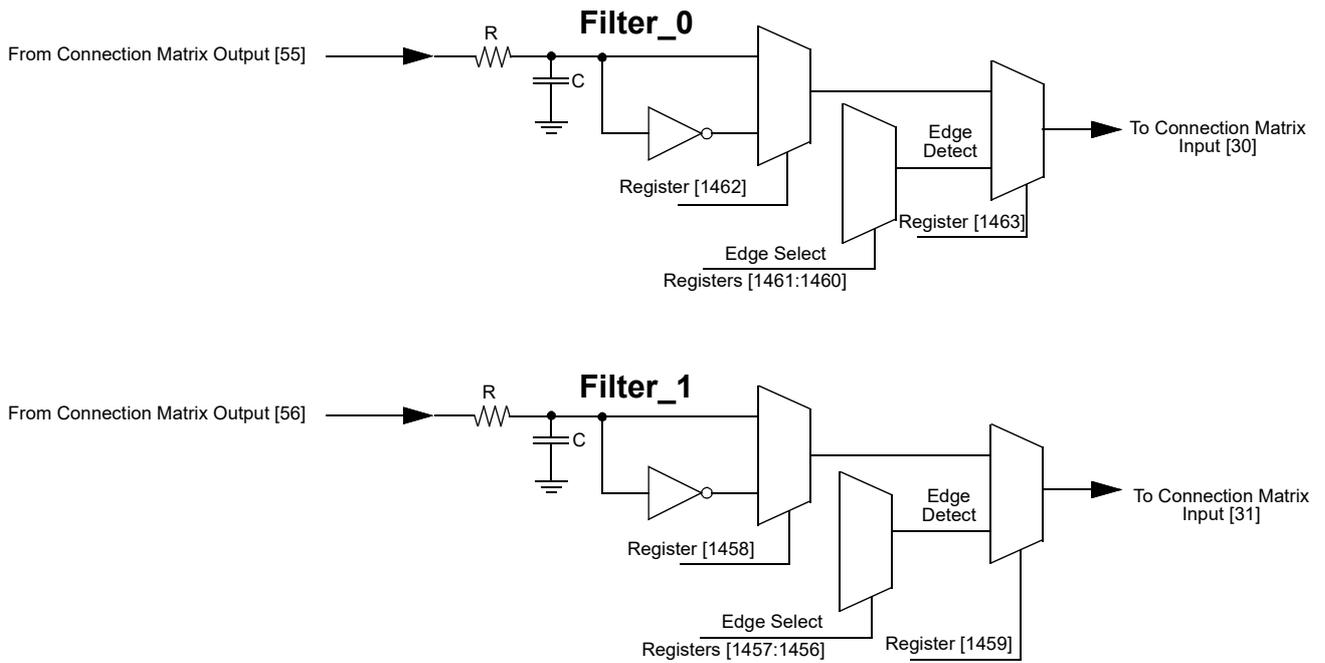

Figure 65. Deglitch Filter/Edge Detector

## 12. Voltage Reference

### 12.1 Voltage Reference Overview

The SLG46533-E has a Voltage Reference ( $V_{REF}$ ) Macrocell to provide references to the four analog comparators. This macrocell can supply a user selection of fixed voltage references,  $/3$  and  $/4$  reference off of the  $V_{DD}$  power supply to the device, and externally supplied voltage references from IOs 5, 9, and 11. The macrocell also has an option to output reference voltages on IOs 15 and 16. See [Table 34](#) for the available selections for each analog comparator. Also, see [Figure 66](#), which shows the reference output structure.

## 13. Clocking

### 13.1 OSC General Description

The SLG46533-E has two internal oscillators. Oscillator that runs at 25 kHz/2 MHz (OSC0) and Oscillator that runs at 25 MHz (OSC1). It is possible to use OSC0 and OSC1 simultaneously. The fundamental frequency can also come from clock input (IO15 or IO17 for 25 kHz/2 MHz and IO14 for 25 MHz), see section [13.3 External Clocking](#).

### 13.2 25 kHz/2 MHz and 25 MHz Oscillators

There are two divider stages that allow the user flexibility for introducing clock signals on various Connection Matrix Input lines. The pre-divider allows the selection of /1, /2, /4, or /8 divide down frequency from the fundamental. The second stage divider (only for 25 kHz/2 MHz Oscillator) has an input of frequency from the pre-divider, and outputs one of seven different frequencies on Connection Matrix Input lines [27] (OUT0) and [28] (OUT1). See [Figure 70](#) and [Figure 71](#) for details.

There are two modes of the POWER CONTROL pin, (register [1658] for 25 kHz/2 MHz OSC and register [1657] for 25 MHz OSC):

- **POWER-DOWN [0]**. If PWR CONTROL input of oscillator is LOW, the oscillator will be turned on. If PWR CONTROL input of oscillator is HIGH the oscillator will be turned off and OSC divider will reset.
- **FORCE ON [1]**. If PWR CONTROL input of oscillator is HIGH, the oscillator will be turned on. If PWR CONTROL input of oscillator is LOW the oscillator will be turned off.

The PWR CONTROL signal has the highest priority.

The SLG46533-E has a 25 kHz/2 MHz OSC FAST START-UP function register [1338] (1 – on, 0 – off). It allows the OSC to run immediately after power-up this decreases the settling time. Note that when OSC FAST START-UP is on, the current consumption will rise.

The user can select two OSC POWER MODEs (register [1343] for 25 kHz/2 MHz OSC and register [1341] for 25 MHz OSC):

- If **AUTO POWER-ON [0]** is selected, the OSC will run when any macrocell that uses OSC is powered on.
- If **FORCE POWER-ON [1]** is selected, the OSC will run when the SLG46533-E is powered on.

OSC can be turned on by:

- Register control (force Power-On)
- Delay mode, when delay requires OSC
- CNT/FSM.

The Power-Down Mode is paired with temperature sensor, section [16. Analog Temperature Sensor](#).

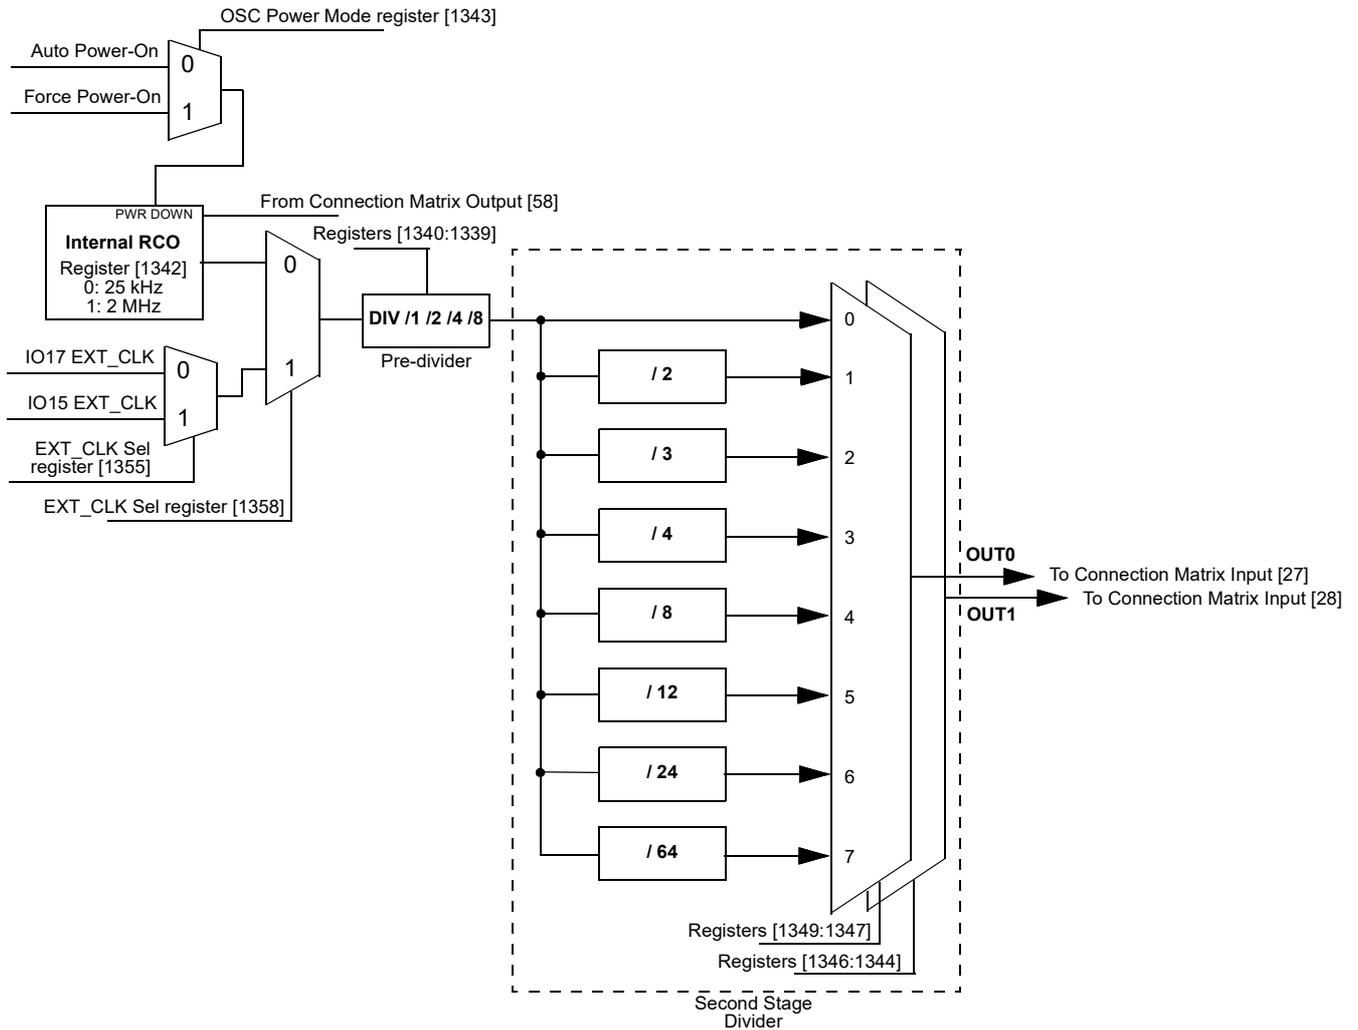

Figure 70. 25 kHz/2 MHz OSC Block Diagram

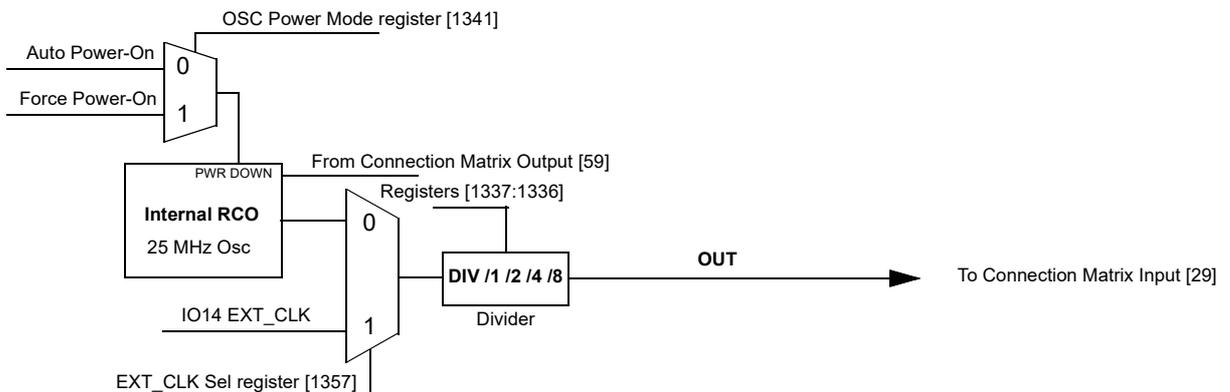

Figure 71. 25 MHz OSC Block Diagram

### 13.3 External Clocking

The SLG46533-E supports several ways to use an external, higher accuracy clock as a reference source for internal operations.

### 13.3.1 IO17 or IO15 Source for 25 kHz/2 MHz Clock

When register [1358] is set to 1, an external clocking signal on IOs 15 or 17 will be routed in place of the internal oscillator derived 25 kHz/2 MHz clock source. When register [1355] is set to 0, IO17 is in use, when set to 1, IO15 is in use. See Figure 70. The high and low limits for external frequency that can be selected are 0 MHz and 77 MHz.

### 13.3.2 IO14 Source for 25 MHz Clock

When register [1357] is set to 1, an external clocking signal on IO14 will be routed in place of the internal oscillator derived 25 MHz clock source. See Figure 71. The high and low limits for external frequency that can be selected are 0 MHz and 84 MHz.

## 13.4 Oscillators Power-On Delay

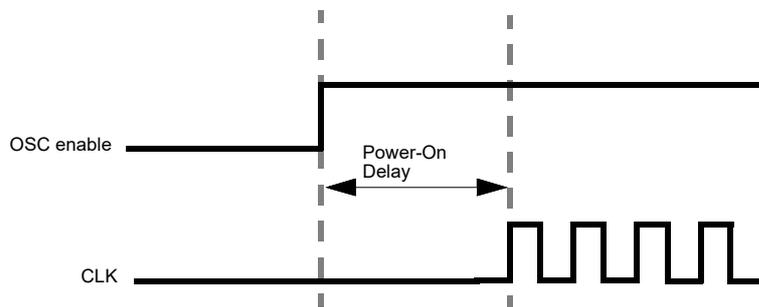

Figure 72. Oscillator Startup Diagram

**Note 1:** OSC power mode: “Auto Power-On”.

**Note 2:** “OSC enable” signal appears when any macrocell that uses OSC is powered on.

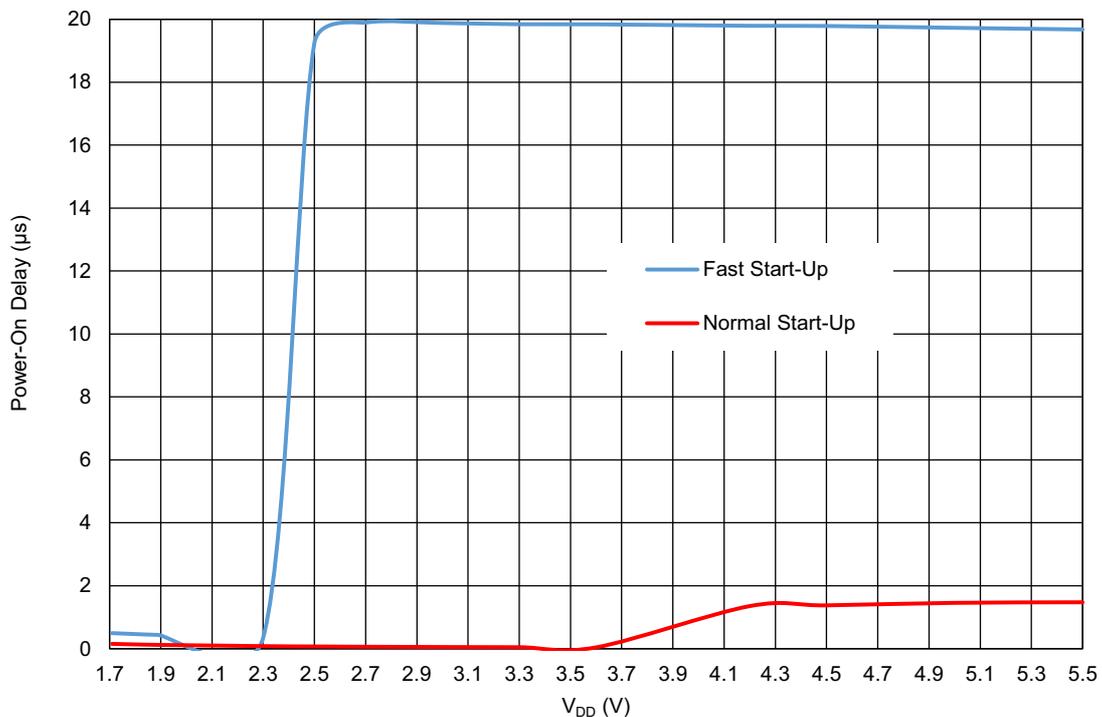

Figure 73. Oscillator Maximum Power-On Delay vs. V<sub>DD</sub> at T<sub>A</sub> = +25 °C, OSC0 = 25 kHz

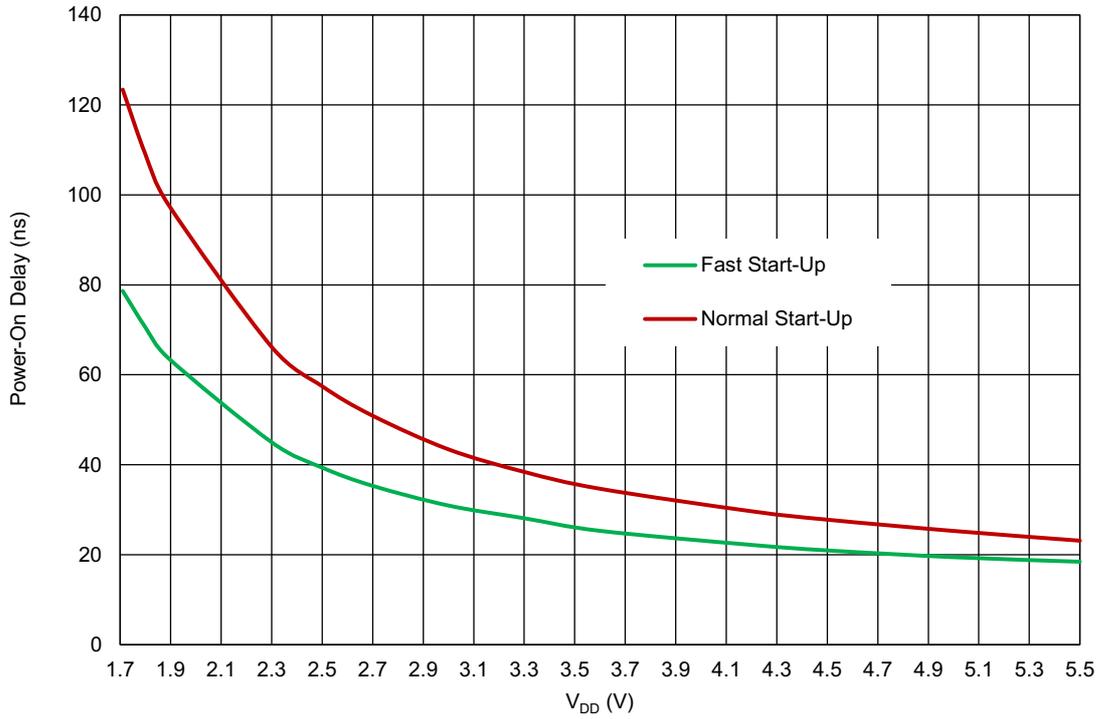

Figure 74. Oscillator Maximum Power-On Delay vs. V<sub>DD</sub> at T<sub>A</sub> = +25 °C, OSC0 = 2 MHz

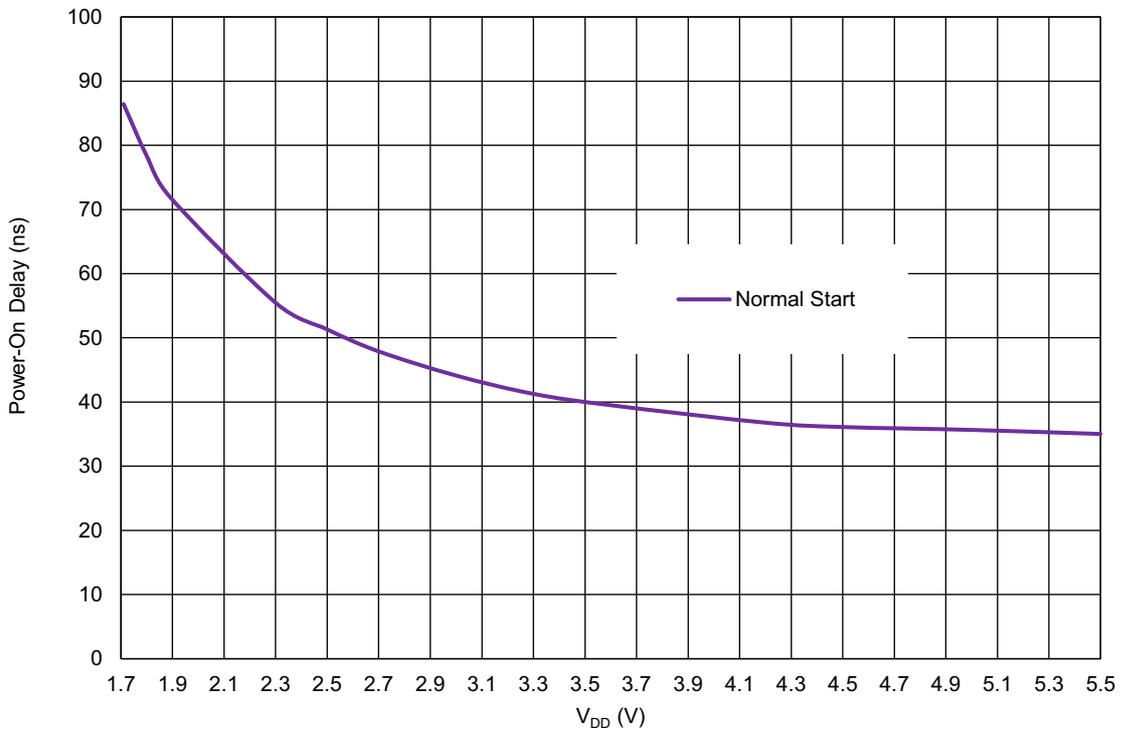

Figure 75. Oscillator Maximum Power-On Delay vs. V<sub>DD</sub> at T<sub>A</sub> = +25 °C, OSC1 = 25 MHz

### 13.5 Oscillators Accuracy

**Note 1:** OSC power setting: Force Power-On; Clock to matrix input - enable; Bandgap: turn on by register - enable.

**Note 2:** For more information see sections [3.4.8 25 kHz OSC0 Frequency Limits](#), [3.4.10 2 MHz OSC0 Frequency Limits](#), [3.4.12 25 MHz OSC1 Frequency Limits](#).

## 14. Power-On Reset

The SLG46533-E has a Power-On Reset (POR) macrocell to ensure correct device initialization and operation of all macrocells in the device. The purpose of the POR circuit is to have consistent behavior and predictable results when the  $V_{DD}$  power is first ramping to the device, and also while the  $V_{DD}$  is falling during power-down. To accomplish this goal, the POR drives a defined sequence of internal events that trigger changes to the states of different macrocells inside the device, and finally to the state of the IO pins.

### 14.1 General Operation

To start the POR sequence in the SLG46533-E, the voltage applied on the  $V_{DD}$  should be higher than the Power-On Threshold (**Note 1**). The full operational  $V_{DD}$  range for the SLG46533-E is 1.71 V to 5.5 V (1.8 V  $\pm 5\%$  to 5.0 V  $\pm 10\%$ ). This means that the  $V_{DD}$  voltage must ramp up to the operational voltage value, but the POR sequence will start earlier, as soon as the  $V_{DD}$  voltage rises to the Power-On Threshold. After the POR sequence has started, the SLG46533-E will have a typical period of time to go through all the steps in the sequence (noted in the datasheet for that device), and will be ready and completely operational after the POR sequence is complete.

The SLG46533-E is guaranteed to be powered down and nonoperational when the  $V_{DD}$  voltage (voltage on  $V_{DD}$ ) is less than Power-Off Threshold (see in Electrical Specifications table), but not less than -0.6 V. Another essential condition for the chip to be powered down is that no voltage higher than the  $V_{DD}$  voltage is applied to any other PIN (**Note 2**). For example, if  $V_{DD}$  voltage is 0.3 V, applying a voltage higher than 0.3 V to any other PIN is incorrect, and can lead to incorrect or unexpected device behavior.

**Note 1:** The Power-On Threshold is defined in Electrical Specifications table.

**Note 2:** There is a 0.6V margin due to forward drop voltage of the ESD protection diodes.

To power down the chip the  $V_{DD}$  voltage should be lower than the operational and to guarantee that chip is powered down it should be less than Power-Off Threshold.

All PINs are in high impedance state when the chip is powered down and while the POR sequence is taking place. The last step in the POR sequence releases the IO structures from the high impedance state, at which time the device is operational. The pin configuration at this point in time is defined by the design programmed into the chip. Also, as it was mentioned before the voltage on PINs can't be bigger than the  $V_{DD}$ , this rule also applies to the case when the chip is powered on.

## 14.2 POR Sequence

The POR system generates a sequence of signals that enable certain macrocells. The sequence is shown in Figure 92.

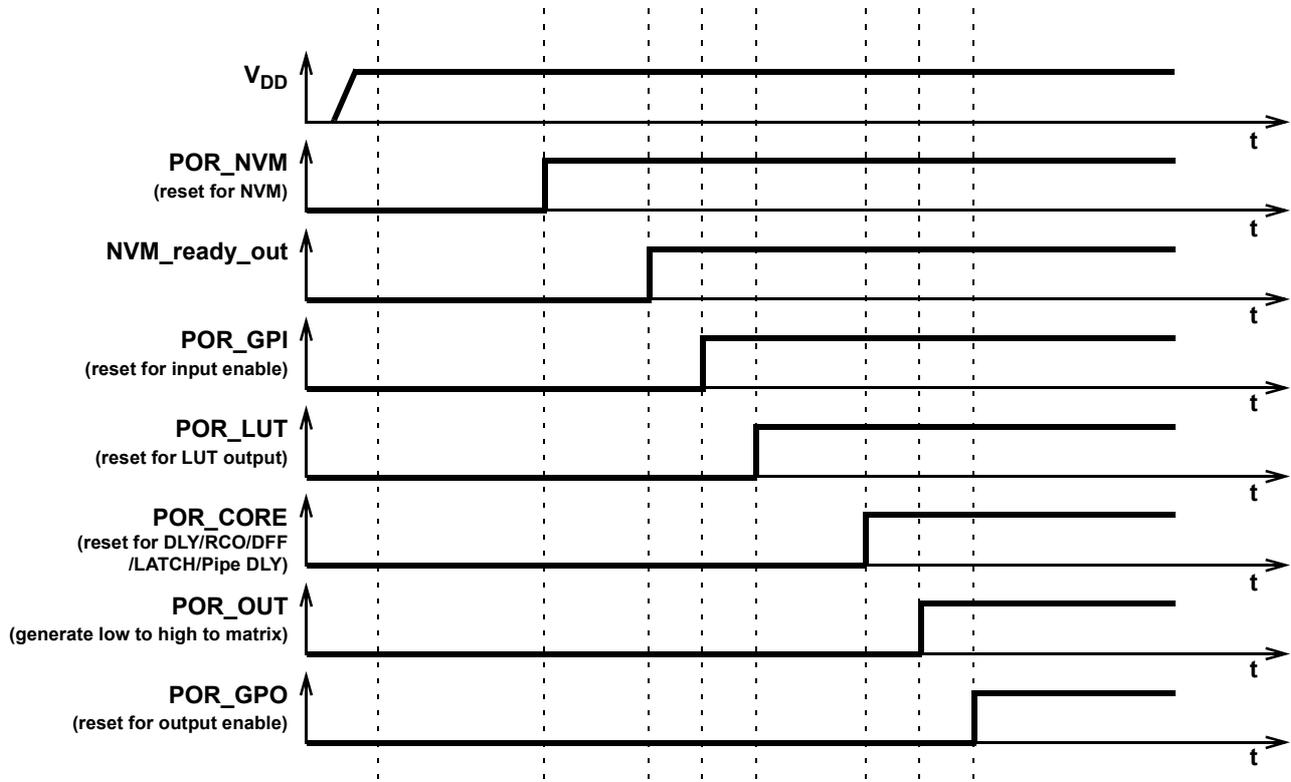

Figure 92. POR Sequence

As can be seen from Figure 92 after the  $V_{DD}$  has start ramping up and crosses the Power-On threshold, first, the on-chip NVM memory is reset. Next, the chip reads the data from NVM, and transfers this information to SRAM registers that serve to configure each macrocell, and the Connection Matrix which routes signals between macrocells. The third stage causes the reset of the input pins, and then to enable them. After that, the LUTs are reset and become active. After LUTs, the Delay cells, OSC, DFFs, LATCHES, and Pipe Delay are initialized. Only after all macrocells are initialized internal POR signal (POR macrocell output) goes from LOW to HIGH. The last portion of the device to be initialized are the output PINs, which transition from high impedance to active at this point.

The typical time that takes to complete the POR sequence varies by device type in the GreenPAK family. It also depends on many environmental factors, such as: slew rate,  $V_{DD}$  value, temperature, and even will vary from chip to chip (process influence).

## 14.3 Macrocells Output States During POR Sequence

To have a full picture of SLG46533-E operation during powering and POR sequence, review the overview the macrocell output states during the POR sequence (Figure 93 describes the output signals states).

First, before the NVM has been reset, all macrocells have their output set to logic LOW (except the output PINs which are in high impedance state). Before the NVM is ready, all macrocell outputs are unpredictable (except the output PINs). On the next step, some of the macrocells start initialization: input pins output state becomes LOW; LUTs also output LOW. Only P DLY macrocell configured as edge detector becomes active at this time. After that input PINs are enabled. Next, only LUTs are configured. Next, all other macrocells are initialized. After macrocells are initialized, internal POR matrix signal switches from LOW to HIGH. The last are output PINs that become active and determined by the input signals.

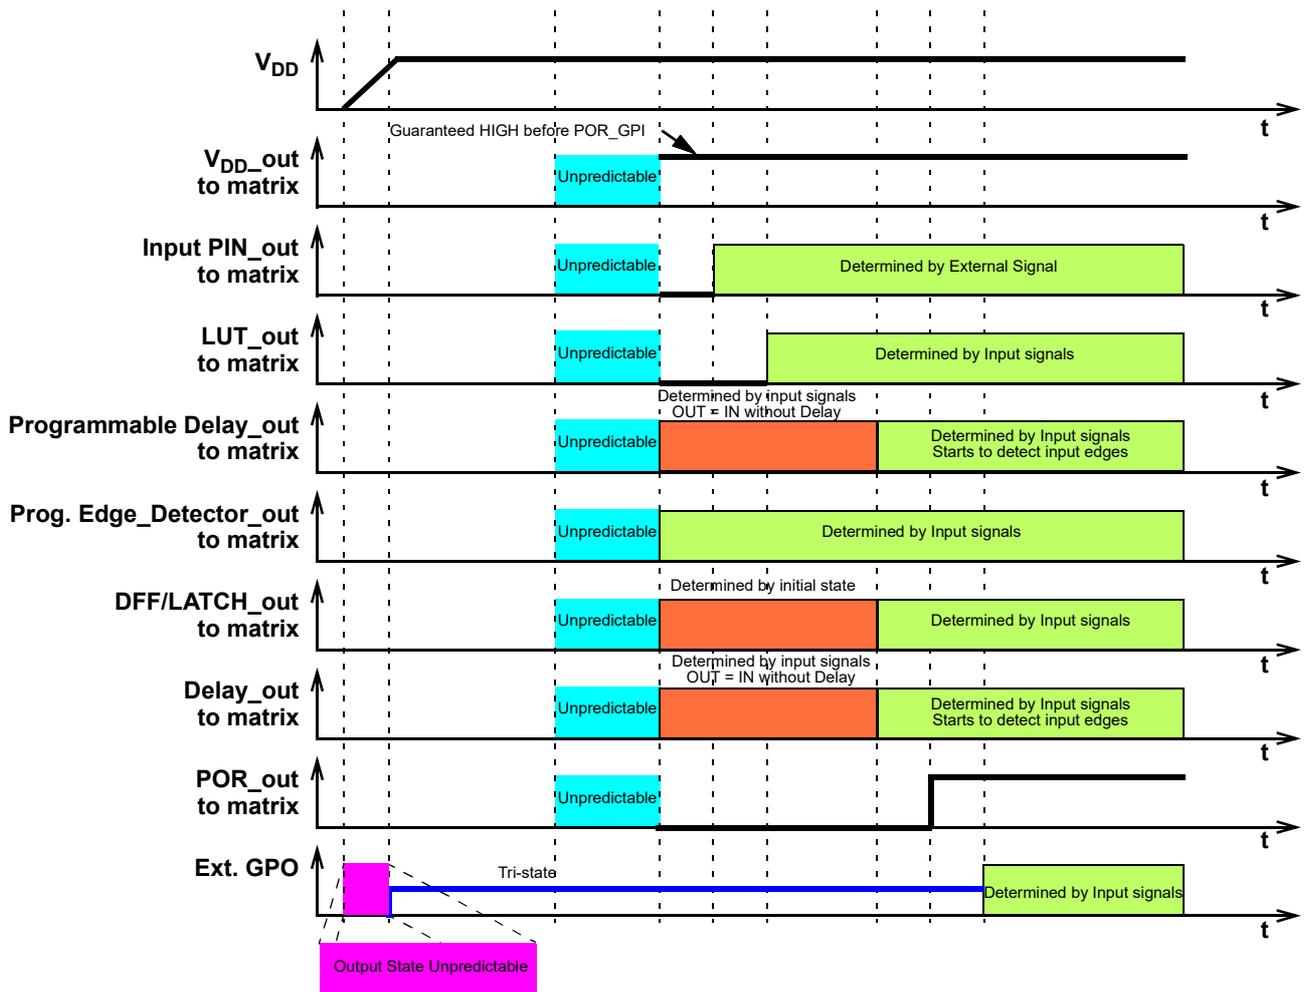

Figure 93. Internal Macrocell States during POR Sequence

### 14.3.1 Initialization

All internal macrocells by default have initial LOW level. Starting from indicated power-up time of 1.15 V to 1.6 V, macrocells in GPAK are powered on while forced to the reset state. All outputs are in Hi-Z and chip starts loading data from NVM. Then the reset signal is released for internal macrocells and they start to initialize according to the following sequence:

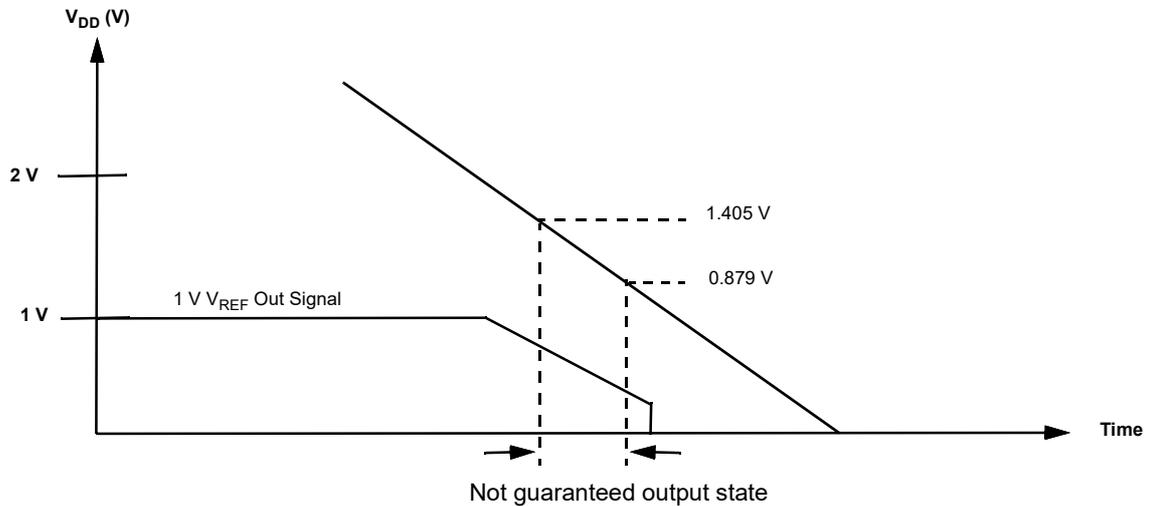

1. I<sup>2</sup>C.
2. Input PINs, ACMP, Pull-up/down.
3. LUTs.
4. DFFs, Delays/Counters, Pipe Delay.
5. POR output to matrix.
6. Output PIN corresponds to the internal logic.

The V<sub>REF</sub> output pin driving signal can precede POR output signal going high by 3 μs - 5 μs. The POR signal going high indicates the mentioned power-up sequence is complete.

**Note:** The maximum voltage applied to any PIN should not be higher than the V<sub>DD</sub> level. There are ESD Diodes between PIN → V<sub>DD</sub> and PIN → GND on each PIN. So, if the input signal applied to PIN is higher than V<sub>DD</sub>, then current will sink through the diode to V<sub>DD</sub>. Exceeding V<sub>DD</sub> results in leakage current on the input PIN, and V<sub>DD</sub> will

be pulled up, following the voltage on the input PIN. There is no effect from input pin when input voltage is applied at the same time as  $V_{DD}$ .

### 14.3.2 Power-Down

**Figure 94. Power-Down**

During power-down, macrocells in SLG46533-E are powered off after  $V_{DD}$  falling down below Power-Off Threshold. Please note that during a slow rampdown, outputs can possibly switch state during this time.

## 15. I<sup>2</sup>C Serial Communications Macrocell

### 15.1 I<sup>2</sup>C Serial Communications Macrocell Overview

In the standard use case for the GreenPAK devices, the configuration choices made by the user are stored as bit settings in the Non-Volatile Memory (NVM), and this information is transferred at startup time to volatile RAM registers that enable the configuration of the macrocells. Other RAM registers in the device are responsible for setting the connections in the Connection Matrix to route signals in the manner most appropriate for the user's application.

The I<sup>2</sup>C Serial Communications Macrocell in this device allows an I<sup>2</sup>C bus Controller to read and write this information via a serial channel directly to the RAM registers, allowing the remote re-configuration of macrocells, and remote changes to signal chains within the device.

An I<sup>2</sup>C bus Controller is also able read and write other register bits that are not associated with NVM memory. As an example, the input lines to the Connection Matrix can be read as digital register bits. These are the signal outputs of each of the macrocells in the device, giving an I<sup>2</sup>C bus Controller the capability to remotely read the current value of any macrocell.

The user has the flexibility to control read access and write access via registers bits register [1832], register [1870], and register [1871]. See section [15.5 I<sup>2</sup>C Serial Command Register Protection](#) for more details on I<sup>2</sup>C read/write memory protection.

**Note:** GreenPAK I<sup>2</sup>C is fully compatible with standard I<sup>2</sup>C protocol.

### 15.2 I<sup>2</sup>C Serial Communications Device Addressing

Each command to the I<sup>2</sup>C Serial Communications macrocell begins with a Control Byte. The bits inside this Control Byte are shown in [Figure 95](#). After the Start bit, the first four bits are a control code, which can be set by the user in registers [1867:1864]. This gives the user flexibility on the chip level addressing of this device and other devices on the same I<sup>2</sup>C bus. The Block Address is the next three bits (A10, A9, A8), which will define the most significant bits in the addressing of the data to be read or written by the command. The last bit in the Control Byte is the R/W bit, which selects whether a read command or write command is requested, with a "1" selecting for a Read command, and a "0" selecting for a Write command. This Control Byte will be followed by an Acknowledge bit (ACK), which is sent by this device to indicate successful communication of the Control Byte data.

In the I<sup>2</sup>C-bus specification and user manual, there are two groups of eight addresses (0000 xxx and 1111 xxx) that are reserved for the special functions, such as a system General Call address. If the user of this device chooses to set the Control Code to either "1111" or "0000" in a system with other target device, please consult the I<sup>2</sup>C-bus specification and user manual to understand the addressing and implementation of these special functions, to ensure reliable operation.

In the read and write command address structure, there are a total of 11 bits of addressing, each pointing to a unique byte of information, resulting in a total address space of 2K bytes. Of this 2K byte address space, the valid addresses accessible to the I<sup>2</sup>C Macrocell on the SLG46533-E are in the range from 0 (0x00) to 255 (0xFF). The MSB address bits (A10, A9, and A8) will be "0" for all commands to the SLG46533-E.

With the exception of the Current Address Read command, all commands will have the Control Byte followed by the Word Address. [Figure 95](#) shows this basic command structure.

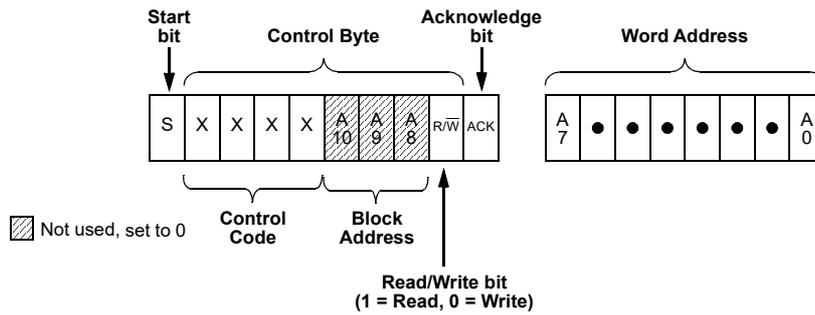

Figure 95. Basic Command Structure

### 15.3 I<sup>2</sup>C Serial General Timing

General timing characteristics for the I<sup>2</sup>C Serial Communications macrocell are shown in Figure 96. Timing specifications can be found in section 3.4 Electrical Specifications.

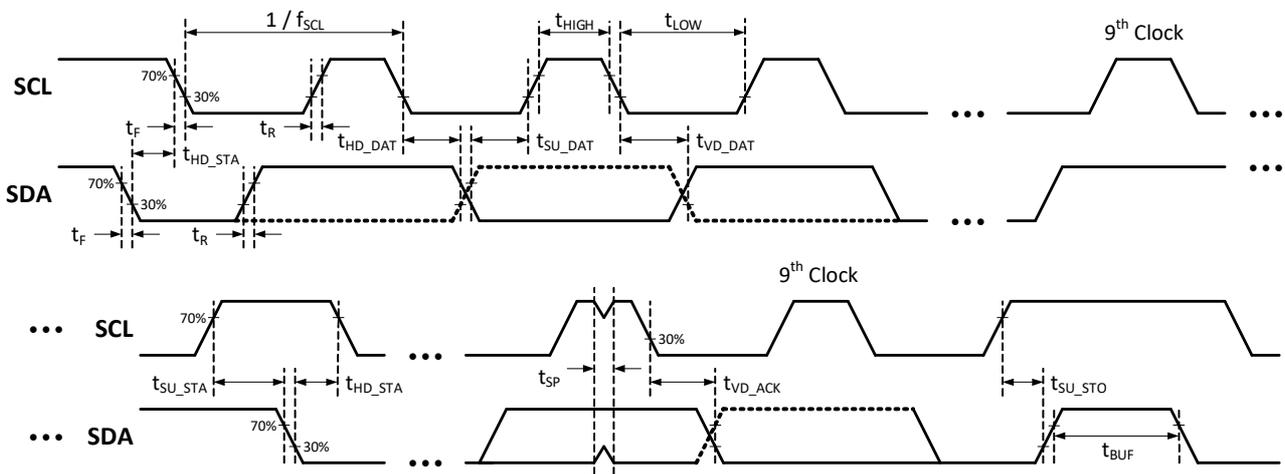

Figure 96. I<sup>2</sup>C General Timing Characteristics

### 15.4 I<sup>2</sup>C Serial Communications Commands

#### 15.4.1 Byte Write Command

Following the Start condition from the Controller, the Control Code [4 bits], the Block Address [3 bits], and the R/W bit (set to “0”), are placed onto the I<sup>2</sup>C bus by the Controller. After the SLG46533-E sends an Acknowledge bit (ACK), the next byte transmitted by the Controller is the Word Address. The Block Address (A10, A9, A8), combined with the Word Address (A7 through A0), together set the internal address pointer in the SLG46533-E, where the data byte is to be written. After the SLG46533-E sends another Acknowledge bit, the Controller will transmit the data byte to be written into the addressed memory location. The SLG46533-E again provides an Acknowledge bit and then the Controller generates a Stop condition. The internal write cycle for the data will take place at the time that the SLG46533-E generates the Acknowledge bit.

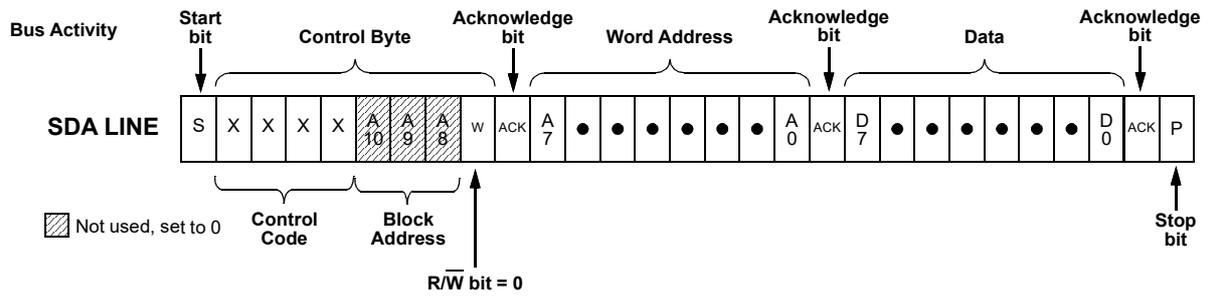

Figure 97. Byte Write Command,  $\overline{R/W} = 0$

### 15.4.2 Sequential Write Command

The write Control Byte, Word Address, and the first data byte are transmitted to the SLG46533-E in the same way as in a Byte Write command. However, instead of generating a Stop condition, the Bus Controller continues to transmit data bytes to the SLG46533-E. Each subsequent data byte will increment the internal address counter, and will be written into the next higher byte in the command addressing. As in the case of the Byte Write command, the internal write cycle will take place at the time that the SLG46533-E generates the Acknowledge bit.

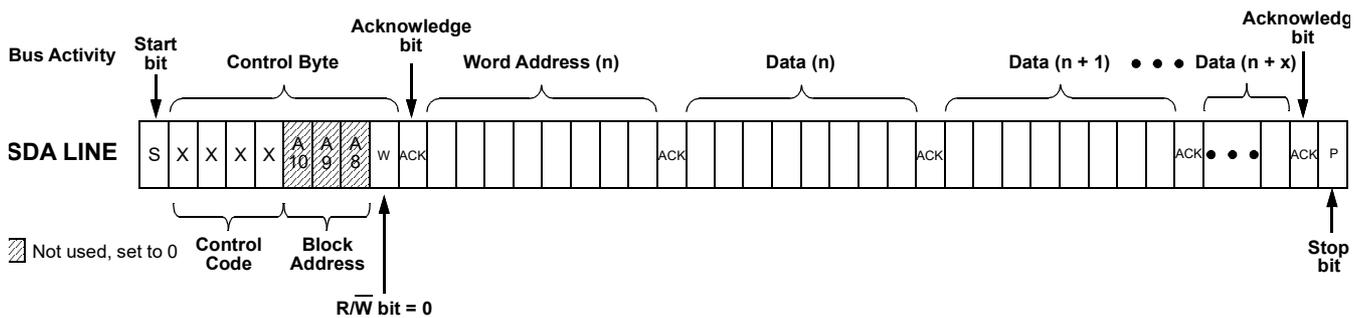

Figure 98. Sequential Write Command

### 15.4.3 Current Address Read Command

The Current Address Read Command reads from the current pointer address location. The address pointer is incremented at the first STOP bit following any write control byte. For example, if a Sequential Read command (which contains a write control byte) reads data up to address n, the address pointer would get incremented to n + 1 upon the STOP of that command. Subsequently, a Current Address Read that follows would start reading data at n + 1. The Current Address Read Command contains the Control Byte sent by the Controller, with the R/W bit = "1". The SLG46533-E will issue an Acknowledge bit, and then transmit eight data bits for the requested byte. The Controller will not issue an Acknowledge bit, and follow immediately with a Stop condition.

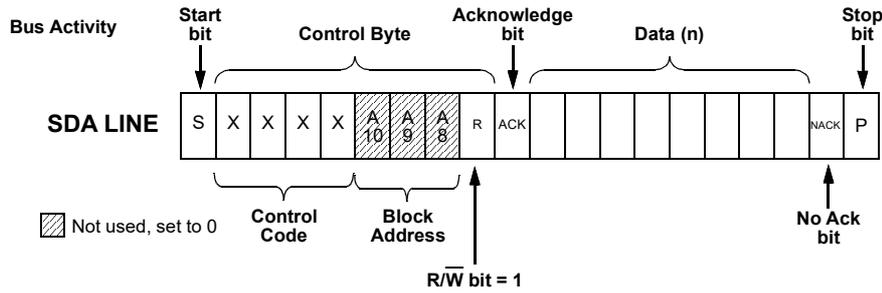

Figure 99. Current Address Read Command,  $\overline{R/W} = 1$

### 15.4.4 Random Read Command

The Random Read command starts with a Control Byte (with R/W bit set to “0”, indicating a write command) and Word Address to set the internal byte address, followed by a Start bit, and then the Control Byte for the read (exactly the same as the Byte Write command). The Start bit in the middle of the command will halt the decoding of a Write command, but will set the internal address counter in preparation for the second half of the command. After the Start bit, the Bus Controller issues a second control byte with the R/W bit set to “1”, after which the SLG46533-E issues an Acknowledge bit, followed by the requested eight data bits.

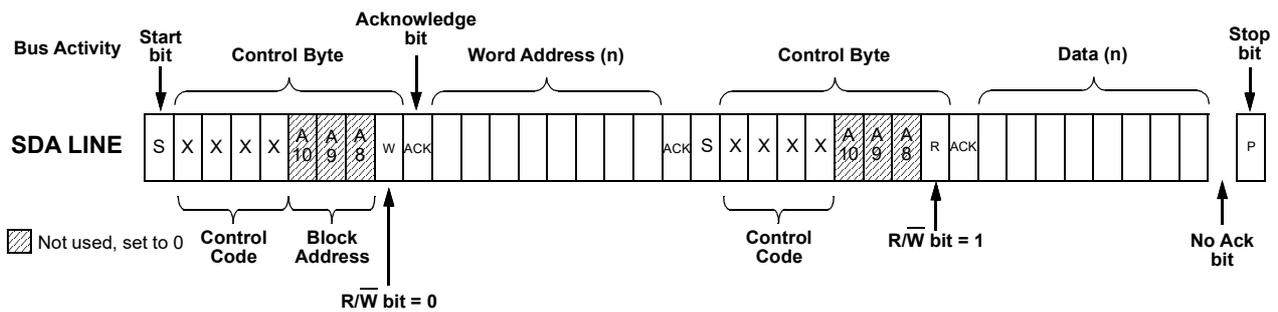

Figure 100. Random Read Command

### 15.4.5 Sequential Read Command

The Sequential Read command is initiated in the same way as a Current Address Read or Random Read command, except that once the SLG46533-E transmits the first data byte, the Controller issues an Acknowledge bit as opposed to a Stop condition in a random read. The Controller can continue reading sequential bytes of data, and will terminate the command with a Stop condition.

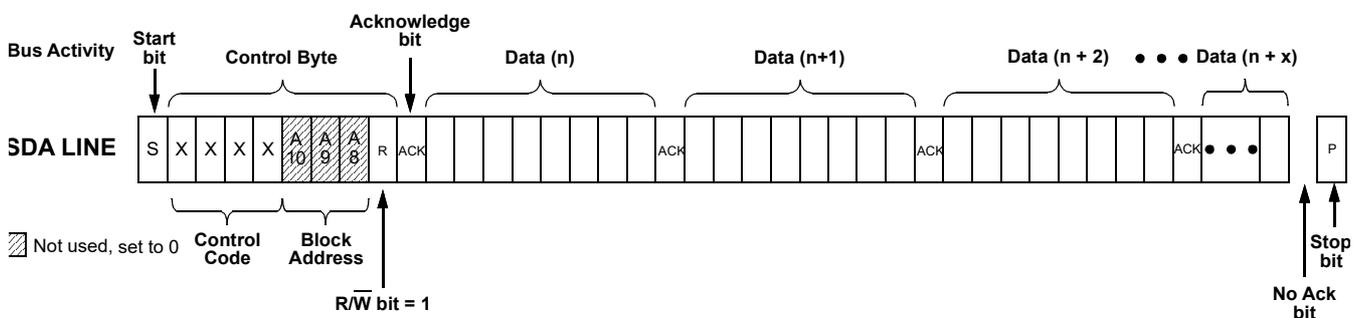

Figure 101. Sequential Read Command

### 15.4.6 I<sup>2</sup>C Serial Command Address Space

In the read and write command address structure, there are a total of 11 bits of addressing, each pointing to a unique byte of information, resulting in a total address space of 2K bytes. Of this 2K byte address space, the valid addresses accessible to the I<sup>2</sup>C Macrocell on the SLG46533-E are in the range from 0 (0x00) to 255 (0xFF). The MSB address bits (A10, A9, and A8) will be “0” for all commands to the SLG46533-E.

### 15.4.7 I<sup>2</sup>C Serial Command Register Map

These register addresses are broken down into four Banks to give the user greater control on access to reading and writing information in each bank. Each of the four banks is 512 bits (64 bytes) in length. Writing information to register bits in these Banks will change the configuration of the device, resulting in either a change in the interconnection options provided by the Connection Matrix, or by changing the configuration of individual macrocells. During device use, all register bits can be read or written via I<sup>2</sup>C, unless protection bits are set to prevent this.

See section [17. Register Definitions](#) for detailed information on all register bits.

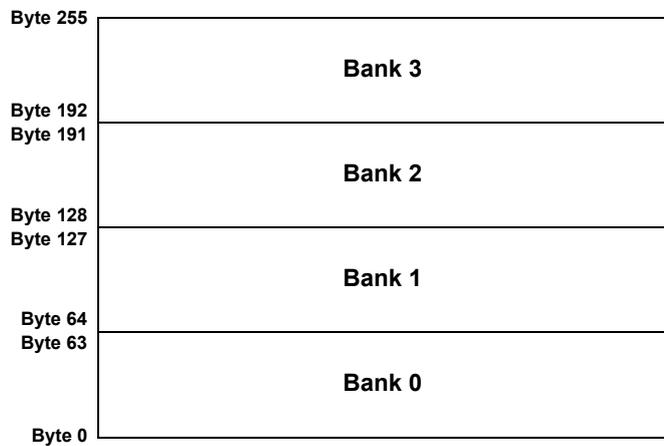

Figure 102. Register Bank Map

## 15.5 I<sup>2</sup>C Serial Command Register Protection

The memory space is divided into four banks, each of which has 512 bits (64 bytes). There are three bits that allow the user to define rules for reading and writing bits in each of these banks via I<sup>2</sup>C:

- register [1832] I<sup>2</sup>C lock for read bits [1535:0] (Bank 0/1/2). If the system provides any read commands to the addresses in these three banks, the device will respond with 'FFH' in data field.
- register [1871] I<sup>2</sup>C lock for write bits [1535:0] (Bank 0/1/2). If the system provides any write commands to the addresses in these three banks, the device will acknowledge these commands, but will not do internal writes to the register space.
- register [1870] I<sup>2</sup>C lock for write all bits (Bank 0/1/2/3). If the system provides any write commands to the addresses in these four banks, the device will acknowledge these commands, but will not do internal writes to the register space.

**Note 1:** register [1870] is higher priority than register [1871], and if register [1870] is set, than register [1871] does not have any effect.

**Note 2:** If the user sets IOs 6 and 7 function to a selection other than SDA and SCL, all access via I<sup>2</sup>C will be disabled.

If register [1870] is not set, register bits in Bank 3 are open to read and write commands via I<sup>2</sup>C with the following exceptions:

- register [1871] Bank 0/1/2 I<sup>2</sup>C-write protection bit is always protected from I<sup>2</sup>C write
- registers [1867:1864] I<sup>2</sup>C Control Code Bit [3:0] is always protected from I<sup>2</sup>C write.

**Note:** Any write commands that come to the device via I<sup>2</sup>C that are not blocked, based on the protection bits, will change the contents of the RAM register bits that mirror the NVM bits. These write commands will not change the NVM bits themselves, and a POR event will restore the register bits to original programmed contents of the NVM.

See section 17. Register Definitions for detailed information on all registers.

### 15.5.1 Register Read/Write Protection

There are six read/write protect modes for the design sequence from being corrupted or copied. See Table 36 for details.

Table 36. Read/Write Protection Options

Bank	Byte	Bits	Description	Lock Status					
				Unlocked	Locked for read bits [1535:0]	Locked for write bits [1535:0]	Locked for write all bits	Locked for read and write bits [1535:0]	Locked for read bits [1535:0] and write all bits
				register [1832] = 0, [1871] = 0, [1870] = 0	register [1832] = 1, [1871] = 0, [1870] = 0	register [1832] = 0, [1871] = 1, [1870] = 0	register [1832] = 0, [1871] = x, [1870] = 1	register [1832] = 1, [1871] = 1, [1870] = 0	register [1832] = 1, [1871] = x, [1870] = 1
0	0-63	511-0	Connection Matrix	R/W	W	R	R	-	-

### 15.5.2 I<sup>2</sup>C Serial Reset Command

If I<sup>2</sup>C serial communication is established with the device, it is possible to reset the device to initial power up conditions, including configuration of all macrocells, and all connections provided by the Connection Matrix. This is implemented by setting register [1662] I<sup>2</sup>C reset bit to “1”, which causes the device to re-enable the Power-On Reset (POR) sequence, including the reload of all register data from NVM. During the POR sequence, the outputs of the device will be in tri-state. After the reset has taken place, the contents of register [1662] will be set to “0” automatically. Figure 103 illustrates the sequence of events for this reset function.

**Note:** I<sup>2</sup>C Serial Reset Command is not available during emulation.

- 1) I<sup>2</sup>C write with register [1662] = 1 (I<sup>2</sup>C reset bit with reloading NVM into Data register).
- 2) POR go to LOW and reloading NVM into Data register start after “STOP” of I<sup>2</sup>C.
- 3) POR go to HIGH after reloading NVM into Data register.

Figure 103. Reset Command Timing

## 15.6 I<sup>2</sup>C Additional Options

### 15.6.1 Reading Counter Data via I<sup>2</sup>C

The current count value in four counters in the device can be read via I<sup>2</sup>C. The counters that have this additional functionality are 16-bit CNT0 and CNT1, and 8-bit counters CNT4 and CNT6.

### 15.6.2 User RAM and OTP Memory Array

There are eight bytes of RAM memory that can be read and written remotely by I<sup>2</sup>C commands. The initial contents of this memory space can be selected by the user, and this information will be transferred from OTP memory to the RAM memory space during the power-up sequence. The lowest order byte in this array (User Configurable RAM/OTP Byte 0) is located at I<sup>2</sup>C address 0xD8, and the highest order byte in this array is located at I<sup>2</sup>C address 0xDF.

Table 37. RAM Array Table

I <sup>2</sup> C Address (hex)	Highest Bit Address	Lowest Bit Address	Memory Byte
D0	1671	1664	User Configurable RAM/OTP Byte 8
D1	1679	1672	User Configurable RAM/OTP Byte 9
D2	1687	1680	User Configurable RAM/OTP Byte 10
D3	1695	1688	User Configurable RAM/OTP Byte 11
D4	1703	1696	User Configurable RAM/OTP Byte 12
D5	1711	1704	User Configurable RAM/OTP Byte 13
D6	1719	1712	User Configurable RAM/OTP Byte 14
D7	1727	1720	User Configurable RAM/OTP Byte 15
D8	1735	1728	User Configurable RAM/OTP Byte 0

## 16. Analog Temperature Sensor

The SLG46533-E has an Analog Temperature sensor (TS) with an output voltage linearly-proportional to the Centigrade temperature. The TS is rated to operate over a -40 °C to +105 °C temperature range. The error in the Output Range 1 does not exceed ±11.2 °C. The error in the Output Range 2 does not exceed ±11.7 °C. For more detail refer to section 3.4.17 Analog Temperature Sensor Specifications.

The equations below calculates the typical analog voltage ( $V_{TS\_OUT}$ ) passed from the TS to the ACMPs' IN+ source input. It is important to note that there will be a chip to chip variation of about ±2 °C.

$$V_{TS1\_OUT} = -0.0035 \times T_J + 1.0522$$

$$V_{TS2\_OUT} = -0.0029 \times T_J + 0.8670$$

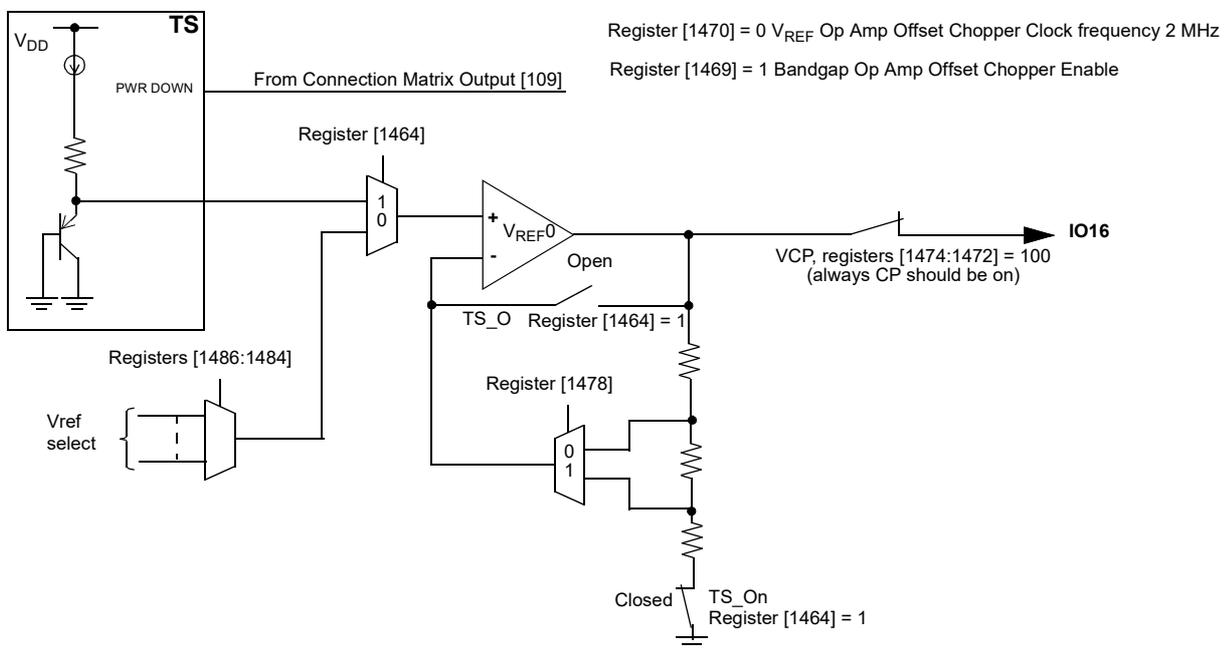

Figure 104. Analog Temperature Sensor Structure Diagram

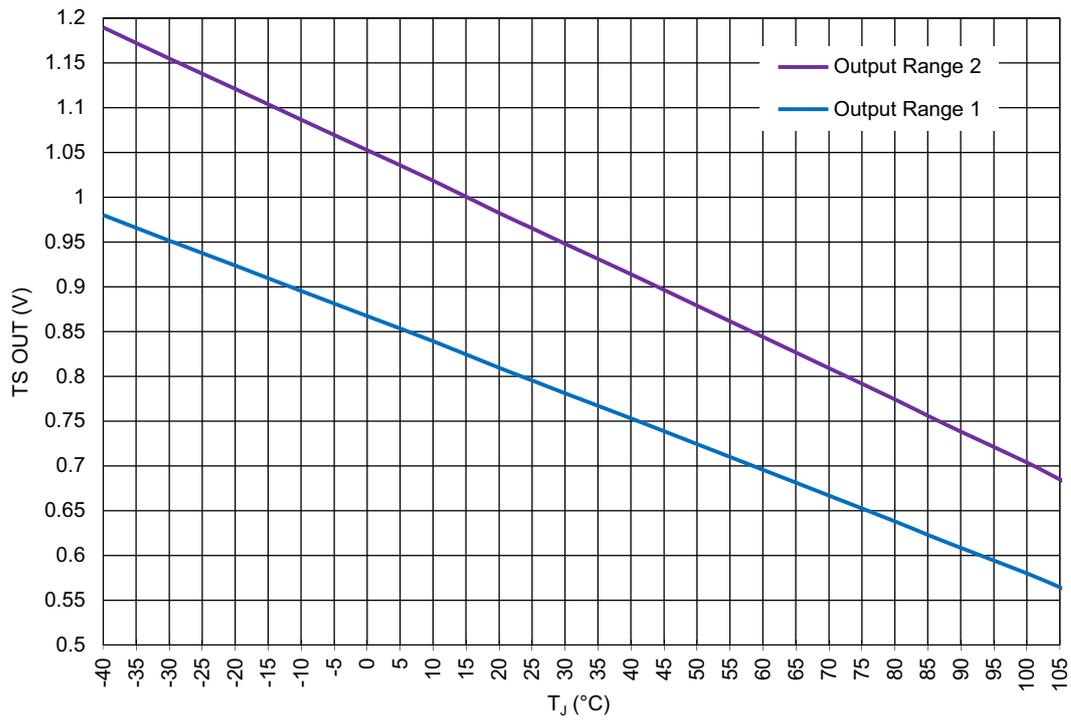

Figure 105. TS Output vs. Junction Temperature, V<sub>DD</sub> = 1.71 V to 5.5 V

## 18. Package Top Marking Definitions

### 18.1 STQFN 20L 2.0 mm x 3.0 mm 0.4P COL Package

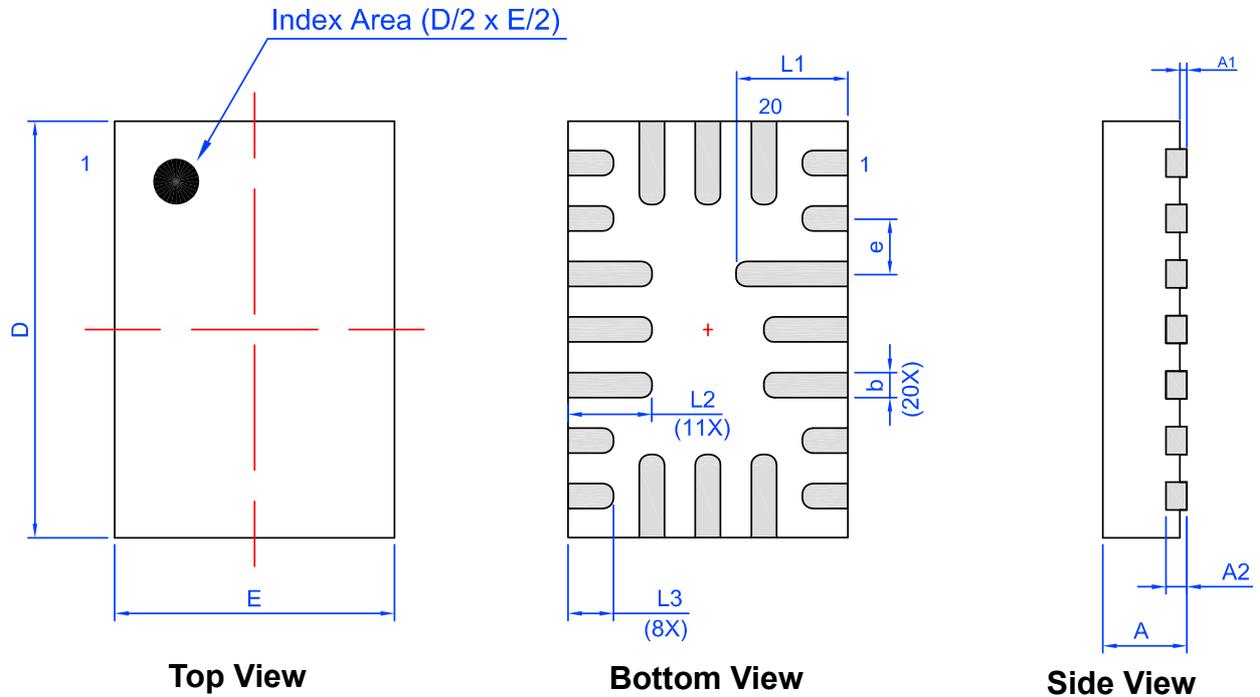

- XXXXXX – Part ID Field: identifies the specific device configuration
- DD – Date Code Field: Coded date of manufacture
- LLL – Lot Code: Designates Lot #
- C – Assembly Site/COO: Specifies Assembly Site/Country of Origin
- RR – Revision Code: Device Revision

## 19. Package Information

### 19.1 Package Outlines for STQFN 20L 2.0 mm x 3.0 mm 0.4P COL Package

JEDEC MO-220  
 IC Net Weight: 0.0090 g

Unit: mm

Symbol	Min	Nom.	Max	Symbol	Min	Nom.	Max
A	0.50	0.55	0.60	D	2.95	3.00	3.05
A1	0.005	-	0.050	E	1.95	2.00	2.05
A2	0.10	0.15	0.20	L1	0.75	0.80	0.85

e	0.40 BSC			L3	0.275	0.325	0.375

## 19.2 STQFN Handling

Be sure to handle STQFN package only in a clean, ESD-safe environment. Tweezers or vacuum pick-up tools are suitable for handling. Do not handle STQFN package with fingers as this can contaminate the package pins and interface with solder reflow.

## 19.3 Soldering Information

Please see IPC/JEDEC J-STD-020: latest revision for reflow profile based on package volume of 3.30 mm<sup>3</sup> (nominal) for STQFN 20L Package. More information can be found at <http://www.jedec.org>.

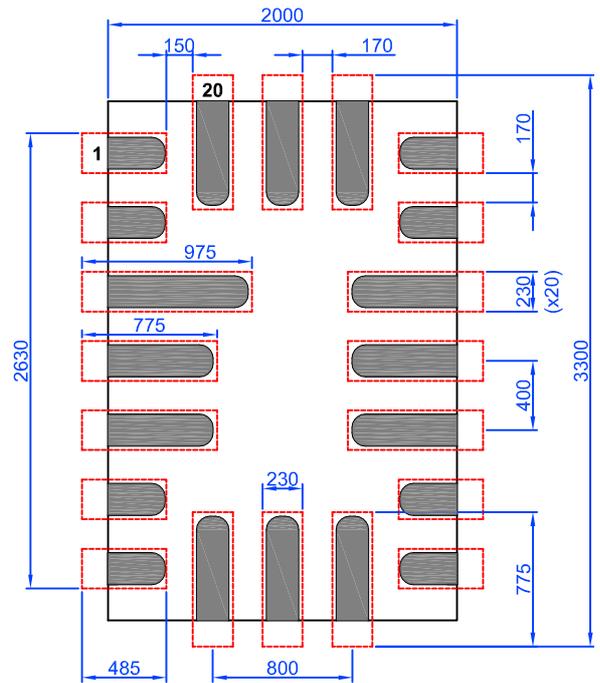

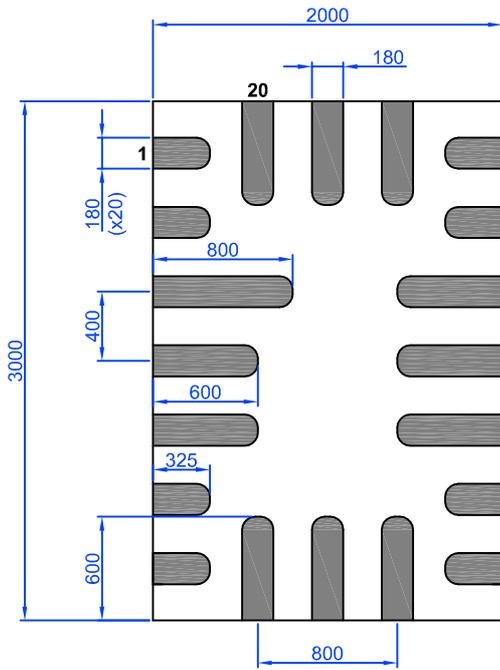

## 20. Layout Guidelines

### 20.1 STQFN-20L 2.0 mm x 3.0 mm 0.4P COL Package

**W**

WS	Wake and Sleep Controller
----	---------------------------

## Revision History

Revision	Date	Description
1.03	Jan 23, 2026	Updated Electrostatic Discharge Ratings table Corrected figure Internal Macrocell States during POR Sequence Changed the Current Source connection in ACMP1 Block Diagram Added note to Matrix OE IO Structure Diagram (for IOs 6 and 7) Added note to I <sup>2</sup> C Specifications table Fixed typos
1.02	Aug 20, 2025	Updated Ordering Information Corrected part number Fixed typos
1.01	Feb 14, 2025	Corrected cross-reference to figure 25 kHz/2 MHz OSC Block Diagram in subsections 25 kHz/2 MHz and 25 MHz Oscillators and IO17 or IO15 Source for 25 kHz/2 MHz Clock
1.00	Jan 30, 2025	Initial release
