To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: http://www.renesas.com

Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (http://www.renesas.com)

Send any inquiries to http://www.renesas.com/inquiry.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

   “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.

   “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.

   “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

RENESAS

MOS INTEGRATED CIRCUIT

Phase-out/Discontinued

μPD16681

LCD CONTROLLER/DRIVER FOR DOT MATRIX DISPLAY OF JIS LEVEL 1 AND JIS LEVEL 2 KANJI SETS

DESCRIPTION

The μPD16681 is a single-chip controller driver that can display Japanese text; including JIS Level 1 kanji, JIS Level 2 kanji, hiragana, and katakana. Each chip can display up to four lines containing up to eight full width characters (11 x 12 dots), or up to four lines containing up to 16 half width characters (5 x 12 dots), as well 96 pictographs.

FEATURES

- LCD controller/driver for dot matrix display of JIS Level 1 and JIS Level 2 kanji sets
- On-chip ROM for character generation
  - –JIS Level 1 + Level 2 kanji (11 x 12 dots) : 6,355 characters
  - –JIS non-kanji characters (11 x 12 dots) : 453 characters
  - –Other characters (symbols, etc.) (11 x 12 dots): 256 characters
  - –Half width alphanumeric characters (5 x 12 dots) : 192 characters
- On-chip RAM for character generation
  - –8 types (12 x 13 dots)
- On-chip boost circuit : switchable between 3x and 4x modes
- RAM for pictograph data displays : 96 bits
- Outputs : 96 segments, 52 commons
- Duty settings : 1/39 or 1/52
- Switchable data inputs : serial or 8-bit parallel
- On-chip divider resistor
- Selectable bias settings (1/8 bias, 1/7 bias, or 1/6 bias)
- On-chip oscillation circuit

ORDERING INFORMATION

Part number	Package	ROM code
μPD16681W-011	Wafer	Standard
μPD16681P-011	Chip (COG compliant)	Standard

3. PIN FUNCTIONS

3.1 Power Supply System Pins

Pin Symbol	Pin Name	Pad No.	I/O	Description
V_{DD}	Logic power supply pin Boost circuit power supply pin	50-54	–	Power supply pins for logic and boost circuit
V_{SS}	Logic ground Driver ground	55-59	–	Ground pins for logic and driver circuit
V_{LCD}	Driver power supply pins	29-31	–	Power supply pins for driver. Output pin for internal boost circuit. Connect a 1-μF capacitor between these pins and the V_{SS} pins for boosting. If not using the internal boost circuit, a direct driver power supply can be input.
V_{LC1} - V_{LC5}	Reference power supply pins for driver	14-28	–	These are reference power supply pins for the LCD driver. Leave these pins open if an internal bias has been selected. Connect a capacitor to ground.
V_{LCBS1} - V_{LCBS3}	Bias value setting pins	2-7	–	When selecting an internal bias, the bias value can be changed connecting these pins outside of the IC.
C_1^+, C_1^- C_2^+, C_2^- C_3^+, C_3^-	Capacitor connection pins	32-49	–	These are capacitor connection pins for the boost circuit. Connect a 1-μF capacitor.

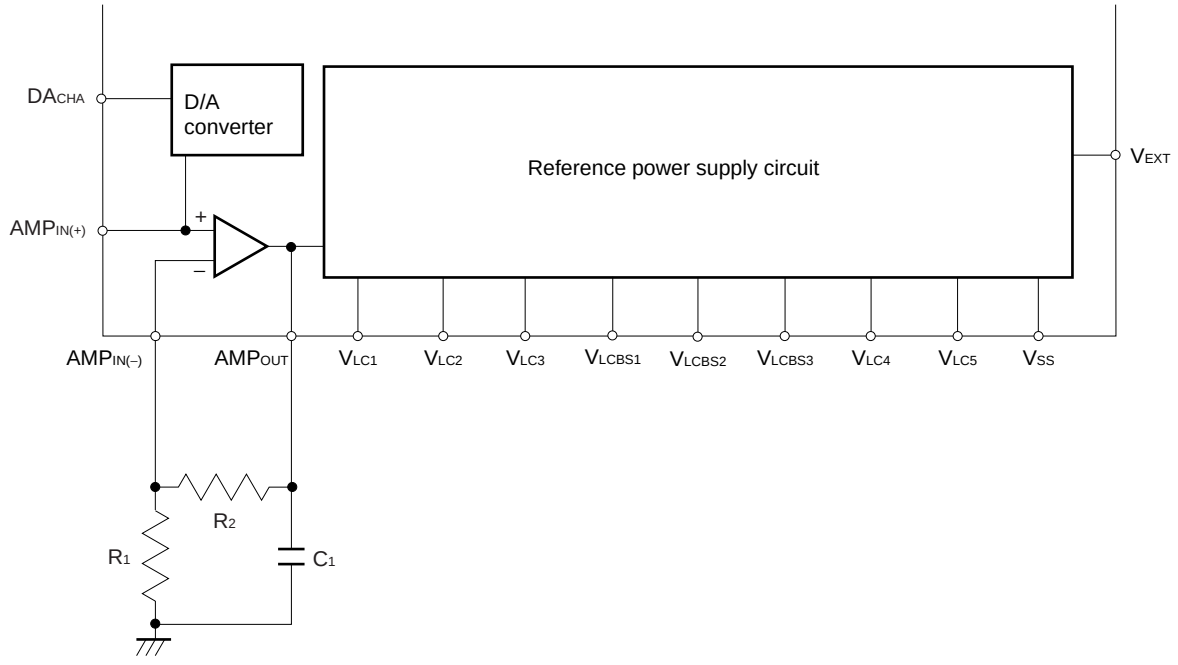
3.2 Logic System Pins

Pin Symbol	Pin Name	Pad No.	I/O	Description
WS	Select word length	76	I	Use this pin to select the word length. An 8-bit parallel interface is used for high level and a serial interface is used for low level. This setting cannot be changed after the power has been switched on.
DA_{CHA}	Select D/A converter	61	I	Use this pin to select whether or not to use the D/A converter for regulating the LCD driver voltage. Select high level to use the D/A converter or low level to not use it.
STB	Strobe	77	I	This is used for the device's select signal and strobe signal for communication. Communication is initialized at the rising edge or falling edge of STB. Command data receive standby status occurs at the falling edge of STB. Communication is enabled when STB is low. Also, enabled status or the shift clock is ignored when STB is high.
E/SCK	Enable/shift clock	78	I	This is an input enable pin for data when the parallel interface is used. During the read-in operation, data is captured in the interface buffer at the signal's rising edge. During a read-out operation, data is read-out from the interface buffer at the signal's falling edge. When using a serial interface, this pin is used for the data shift clock. During the read-in operation, data is captured in the shift register at the signal's rising edge. During a read-out operation, data is read from the shift register at the signal's falling edge.
D_0/DATA	Data bus/data	68	I/O	This pin is used for data bus bit D_0 when using the parallel interface. When using the serial interface, it is an I/O pin (tri-state) for commands and display data.
D_1-D_7	Data bus	69-75	I/O	These pins are used for data bus bits D_1 to D_7 when using the parallel interface. It should be fixed high or low when using the serial interface.
$TEST_{OUT}$	Test output	80	O	This is a test output pin. Leave this pin open when using the device.
/RESET	Reset	79	I	This pin is used for internal resets at low-level.
AMP_{CHA}	Op amp switch for LCD driver's power supply level	62	I	This pin is used to control the op amp that works with the LCD driver's power supply level. High-power mode is set when at low level and normal mode is set when at high level.
V_{EXT}	Reference power supply switch	60	I	This pin is used to select the reference power supply circuit's supply mode. High level sets external mode and low level sets internal mode.
SEG_{INV}	Segment direction switch	63	I	This pin is used to control the segment output direction. Low level sets forward direction and high level sets reverse direction.
COM_{INV}	Common scan direction switch	64	I	This pin is used to switch the common scan direction. Low level sets forward direction and high level sets reverse direction.
★ OSC_{IN}	Oscillator pins	65	I	These pins are connected to a 100-kΩ resistance. When using an external oscillator, input to OSC_{IN} and leave OSC_{OUT} unconnected.
OSC_{OUT}		66	O	
OSC_{BRI}	External clock for blink function	67	I	This is an input pin for the 2-Hz external clock. Internally, it is divided by half to generate a 1-Hz signal that is used as the synchronization signal for the blink function.

3.3 Driver System Pins

Pin Symbol	Pin Name	Pad No.	I/O	Description
SEG_1 - SEG_{96}	Segment	115-210	O	Segment output pins
COM_1 - COM_{51}	Common	85-105 109-112 211-216 220-239	O	Common output pins 1/52 duty : Use COM_1 to COM_{51}. 1/39 duty : Use COM_1 to COM_{19}, COM_{27} to COM_{45}, leave COM_{20} to COM_{26}, COM_{46} to COM_{51} open.
$PCOM_1$, $PCOM_2$	Pictograph common	240 114	O	Common output pins for pictographs The same signal is output from $PCOM_1$ and $PCOM_2$.
$AMP_{IN(+)}$	Op amp inputs	10-13	I	These are input pins for the op amp that regulates the LCD driver voltage. Leave the $AMP_{IN(+)}$ pin unconnected when using the on-chip D/A converter. When not using the D/A converter, a reference voltage must be input. Connect the $AMP_{IN(-)}$ pin to a resistor used to regulate the LCD voltage. (See diagram below.)
$AMP_{IN(-)}$				
AMP_{OUT}	Op amp outputs	8,9	O	These are output pins for the op amp that regulates the LCD driver voltage. Normally, they are connected to resistors that are used to regulate the LCD voltage. (See diagram below.) Since the AMP_{OUT} pins are used to stabilize the on-chip amp's output, we recommend connecting them to a capacitor that is rated between 0.1 and 1.0 μF.
DUMMY	DUMMY pins	1,81-84, 106-108, 113, 217-219, 241	–	DUMMY pins are not connected to the internal circuit. Leave open if they are not used.

Figure 3-1. Voltage Control Circuit



4. POWER SUPPLY CIRCUIT

A switchable (3x or 4x) boost circuit is included to generate a current for driving the LCD. A connection to a boost-related capacitor is used to switch the boost circuit's setting.

The V_{EXT} pin (H: external, L: internal) is used to switch between using an external LCD driver power supply or the on-chip boost circuit.

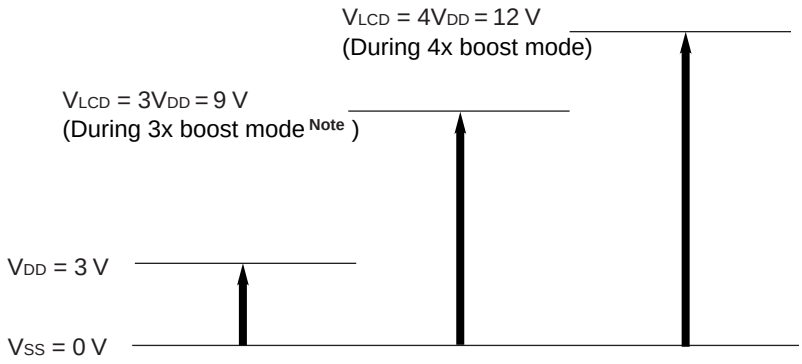
4.1 Boost Circuit

When using the internal power supply, connect the boost-related capacitor between C_1^+ and C_1^-, C_2^+ and C_2^-, and C_3^+ and C_3^-. Also, connect the capacitor for level stabilization between V_{LCD} and V_{SS}, and set V_{EXT} low to boost the potential between V_{DD} and V_{SS} from 3 to 4 times.

Since the boost circuit uses signals from the internal oscillation circuit, the oscillation circuit must be operating. The relation between the boosted voltage and the potential is described below.

The C_1^+, C_1^-, C_2^+, C_2^-, C_3^+, C_3^- and V_{DD} pins all relate to the boost circuit, so the wire impedance should be minimized.

Figure 4-1. 3x and 4x Boost Mode



Note When set for 3x boost, connect boost-related capacitors between C_2^- and C_3^+ and C_1^+ and C_1^-.

4.2 Regulation of LCD Driver Voltage

4.2.1 When not using internal power supply select or D/A converter (V_{EXT} = L, DA_{CHA} = L)

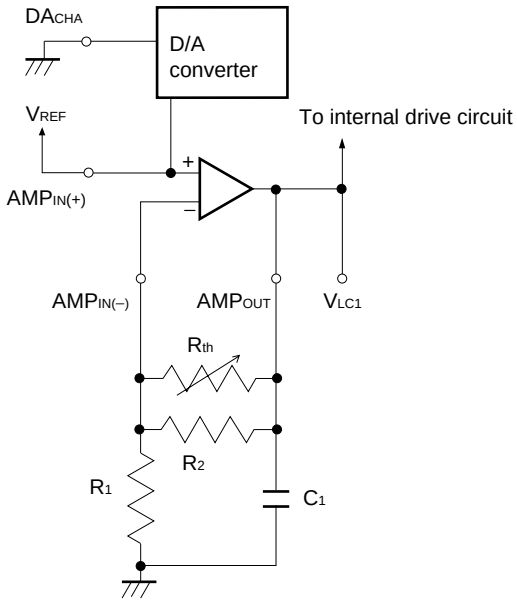
When using the internal power supply, the boosted voltage is used as the power supply for the op amp incorporated in the IC for the LCD driver's voltage. A common mode amplifier circuit can be configured by connecting external resistors R1 and R2 and inputting the reference voltage V_{REF} to $AMP_{IN(+)}$, and this configuration can be used to regulate the potential of the LCD driver voltage V_{LC1}. If using a thermistor to regulate the LCD driver voltage to suit the liquid crystals' temperature characteristics, we recommend connecting in parallel to R2.

The LCD driver voltage V_{LC1} can be determined using the following formula.

$$V_{LC1} = AMP_{OUT} = \left(1 + \frac{R2'}{R1}\right) V_{REF}$$

$$R2' = \frac{R2 \cdot Rth}{R2 + Rth}$$

Figure 4-2. When Not Using Internal Power Supply Select or D/A Converter



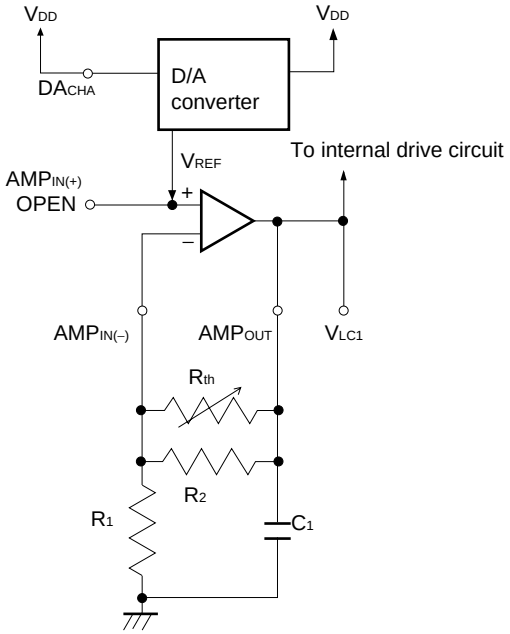
4.2.2 When using internal power supply select and D/A converter (V_{EXT} = L, DA_{CHA} = H)

Using the D/A converter enables commands to be entered to control the reference voltage V_{REF} that is input to the + input of the op amp for the LCD driver voltage.

The D/A converter function sets 6-bit data to the D/A converter set register to set one of the 64 modes for the reference voltage V_{REF} between V_{DD} and 1/2 V_{DD}.

The formula for V_{LC1} is the same as in **4.2.1 When not using internal power supply select or D/A converter (V_{EXT} = L, DA_{CHA} = L) above.**

Figure 4-3. Using Internal Power Supply Select and D/A Converter



4.2.3 When using an external power supply (V_{EXT} = H)

When an external power supply is used for the LCD driver voltage, the op amp incorporate in the μPD16681 (used for the LCD driver voltage) is in OFF mode. Consequently, the LCD driver's op amp and D/A converter function cannot be used when using an external power supply. Instead, regulate the LCD driver voltage by inputting directly to the V_{LCD} and V_{LC1} pins.

Cautions 1. Maintain the following relation for the voltage input to the V_{LCD} and V_{LC1} pins : $V_{LCD} > V_{LC1}$

2. Since the DA_{CHA}, $AMP_{IN(+)}$, and $AMP_{IN(–)}$ pins are CMOS inputs, they should be fixed either high or low.

3. The AMP_{OUT} pin should be left unconnected.

4.3 Reference Voltage

4.3.1 When using internal power supply (V_{EXT} = L)

When using the internal power supply, the μPD16681's on-chip divider resistor is used to create the six-level potential (V_{LC1}, V_{LC2}, V_{LC3}, V_{LC4}, V_{LC5}, and V_{SS}) required for the LCD driver.

4.3.2 When using an external power supply (V_{EXT} = H)

When use of an external power supply has been selected, the op amp incorporated in the μPD16681 for the LCD driver level power supply is in OFF mode, so a reference potential must be directly input to V_{LC1}, V_{LC2}, V_{LC3}, V_{LC4}, and V_{LC5}.

Ordinarily, these levels are generated by dividing the resistance. Since large resistance values result in poorer LCD display quality, be sure to select a resistance value that suits the type of LCD panel to be used.

The display quality can be improved by connecting capacitors between the level pins and ground pins. As with the resistance values described above, the capacitance values of the capacitors should be selected to suit the divided resistance values and the type of LCD panel to be used.

4.4 Control of Op Amp for Level Power Supply

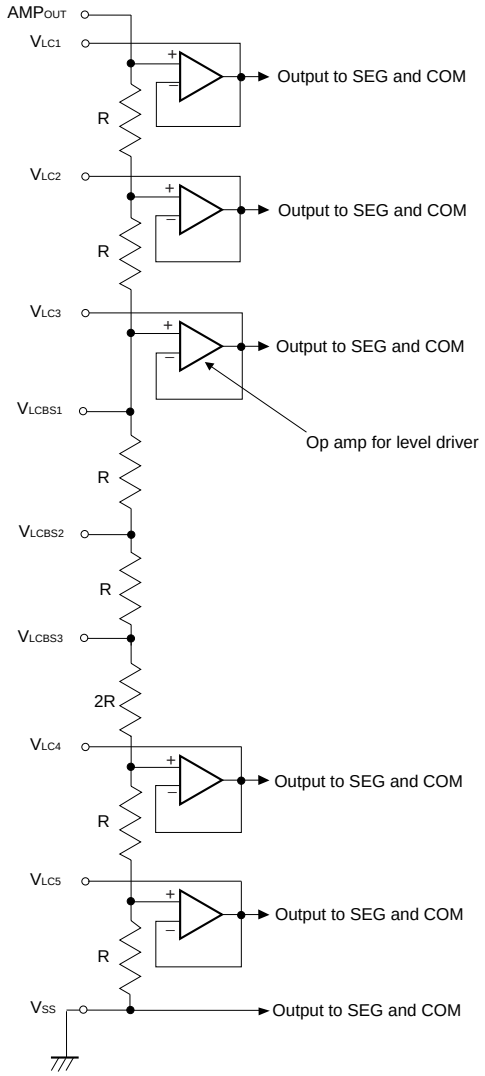
Input to the AMP_{CHA} pin is used to control the op amp for the LCD driver level power supply.

- High power mode (AMP_{CHA} = L)
  This mode maximizes the LCD drive current supply capacity in the op amp for the LCD driver level power supply.

- Normal mode (AMP_{CHA} = H)
  This mode uses a lower LCD drive current supply capacity in the op amp for the LCD driver level power supply, which is suitable for charging the capacitor used to stabilize the external level.

Caution For either mode, be sure to connect a level stabilization capacitor (rated from about 0.1 to 1.0 μF) for the V_{LC1} to V_{LC5} pins. Poorer display quality results when these capacitors are not connected.

Figure 4-4. Reference Voltage Circuit



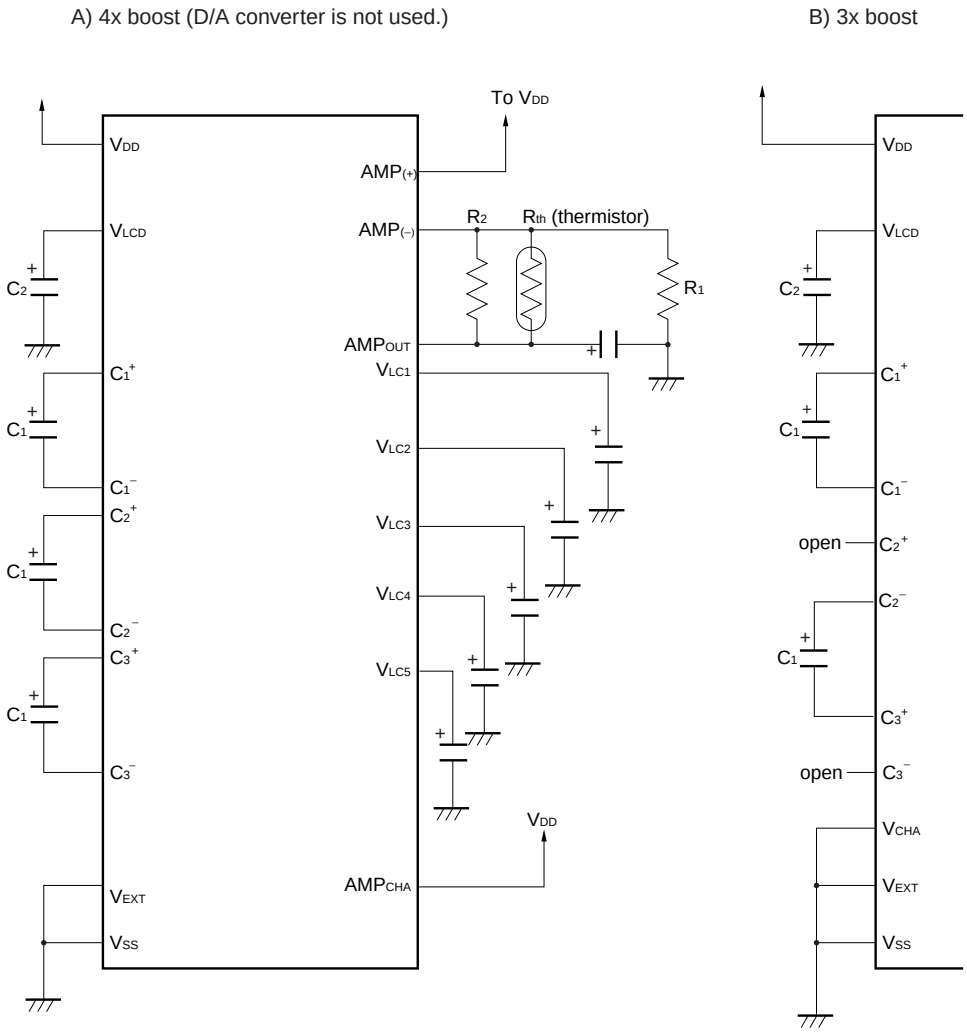
4.5 Bias Value Settings

The bias value can be set as 1/6 bias, 1/7 bias, or 1/8 bias by selecting an internal bias for the (μPD16681 and by connecting externally from the IC among V_{LCBS1}, V_{LCBS2}, and V_{LCBS3} pins.

Bias Value	Connected Pin
1/8 bias	V_{LCBS1}, V_{LCBS2}, and V_{LCBS3} leave open
1/7 bias	Between V_{LCBS1} and V_{LCBS2} or between V_{LCBS2} and V_{LCBS3}
1/6 bias	Between V_{LCBS1} and V_{LCBS3} and V_{LCBS2} leave open

4.6 Power Supply Circuit Use Example

Figure 4-5. Using Internal Power Supply and Normal Mode



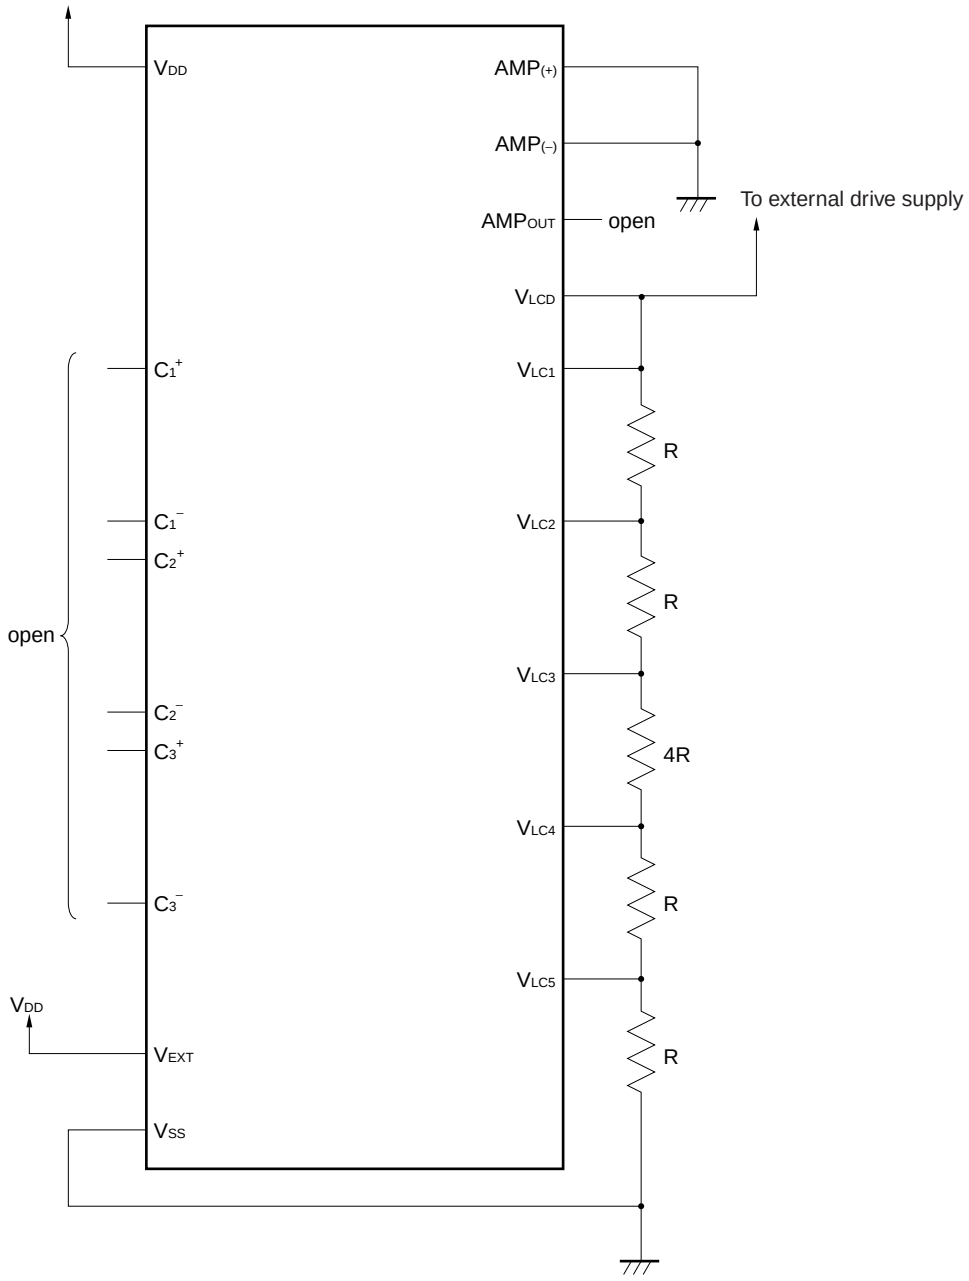
Remarks 1. C_1 = 1.0 μF,C_2 = 1.0 μF

2. Leave C_2^+ and C_3^- pins open during 3x boost.

3. Leave AMP(+) open when using the D/A converter.

Figure 4-6. Using External Power Supply Circuit

A) Use 1/8 bias



Remark Fix all open input pins high or low.

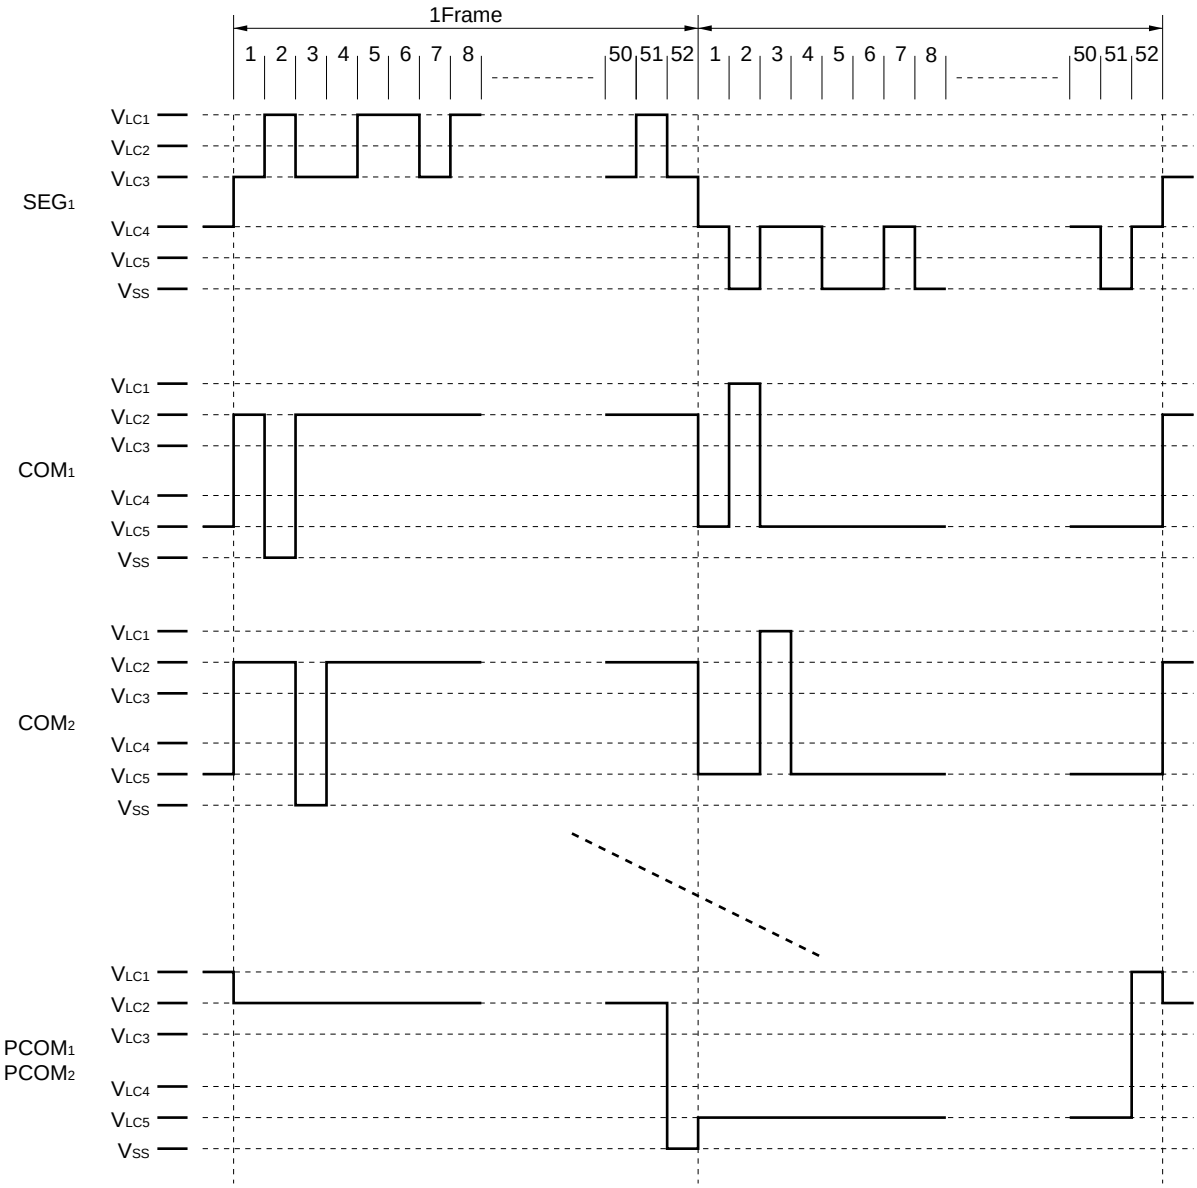
5. LCD DISPLAY DRIVER

Either a 1/52 duty driver or a 1/39 duty driver can be selected for the μPD16681. Both drivers output a drive waveform using the two-frame AC drive method.

5.1 1/52 Duty Driver

When the 1/52 duty driver is selected for the μPD16681, a select signal is output once per frame from the dot block's common outputs (COM_1 to COM_{51}) and from the pictograph block's common outputs (same signal output from $PCOM_1$ and $PCOM_2$).

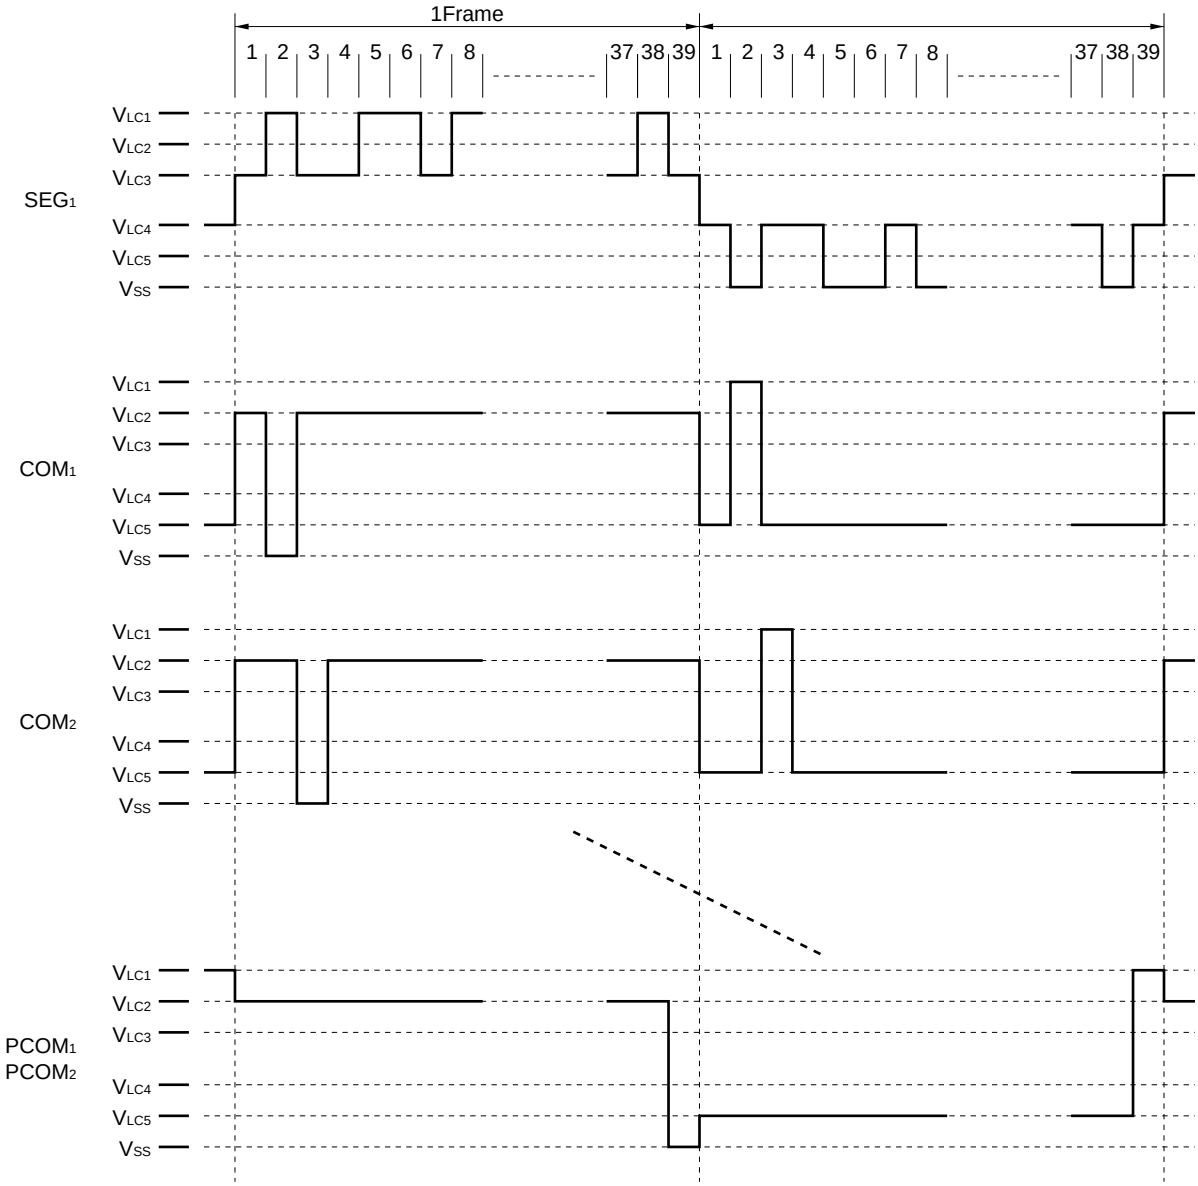
Figure 5-1. 1/52 Duty Driver



5.2 1/39 Duty Driver

When the 1/39 duty driver is selected for the μPD16681, a select signal is output once per frame from the dot block's common outputs (COM_1 to COM_{19}, COM_{27} to COM_{45}) and from the pictograph block's common outputs (same signal output from $PCOM_1$ and $PCOM_2$).

Figure 5-2 1/39 Duty Driver



6. DESCRIPTION OF BLOCKS

6.1 Display Data RAM (DDRAM)

DDRAM is RAM that contains display data consisting of a 16-bit character code plus a character attribute code. The RAM capacity is 16 x 72 bits, which means that up to 72 characters can be stored in RAM.

The following table shows correspondences between DDRAM addresses and LCD display positions. For further description of these correspondences, see the section **7.1 LCD display and DDRAM addresses.**

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
1st line	00H	01H	02H	03H	04H	05H	06H	07H	08H	09H	0AH	0BH	0CH	0DH	0EH	0FH	10H	11H

6.2 Full Width (11x12 dots) Character Generator ROM (FCGROM)

FCGROM generates a total of 7,064 full width character patterns, of which 6,355 are JIS Level 1 + Level 2 kanji, 453 are non-kanji characters and 256 other symbols. These character patterns are displayed in 11 x12 dot font patterns based on 12-bit character codes. The section entitled **7.2.2 Full Width(11 x 12 dots) Character Code Setting Examples** describes the correspondence between the character codes set to DDRAM and this full width font pattern.

Also, see the section entitled **7.2 Character Codes** for a description of the correspondence between the JIS code and the character code set to DDRAM.

6.3 Half Width(5 x 12 dots) Character Generator ROM (HCGROM)

FCGROM generates a total of 192 half width (5 x 12 dots) character patterns, displayed in 5 x 12 dot font patterns. The section entitled **7.2 Character Codes** describes the correspondence between the character code set to DDRAM and the half width font patterns.

6.4 Character Generator RAM (CGRAM)

CGRAM is RAM to which the user can freely set character patterns. Eight types of 12 x 13 dot character patterns can be defined. To display a character pattern that has been stored in CGRAM, the user specifies a value ranging from “000H” to “007H”.

The relation between character codes and CGRAM addresses used to access CGRAM is shown below.

Figure 6-1. The Relation between Character Codes and CGRAM Addresses

Character code															CGRAM Address								CGRAM Data																			
																							A0 ="0"												A0 ="1"

																	0	0	1	1	A	A							A	A						
																	0	1	0	0	A	A							A	A						
																	0	1	0	1	A	A							A	A						
																	0	1	1	0	A	A							A	A						
																	0	1	1	1	A	A							A	A						
																	1	0	0	0	A	A							A	A						
																	1	0	0	1	A	A							A	A						
																	1	0	1	0	A	A							A	A						
																	1	0	1	1	A	A							A	A						
																	1	1	0	0	A	A							A	A						

Remarks 1. CGRAM is selected when the high-order nine bits (C11 to C3) of a character code are all zeros. At that time, the low-order three bits (C2 to C0) corresponds to CGRAM addresses 7 to 5 (A7 to A5). (Three bits: eight types.)

2. Display ON is selected when the CGRAM data value is “1”. Display OFF is selected when this data value is “0”.

3. The CGRAM address 0 (A0) corresponds to the left and right sides of the character pattern.

4. The high-order two bits of CGRAM are used to control the display attributes of the pattern corresponding to the low-order six bits. In such cases, any display attribute specification made for DDRAM is ignored. When the value of the high-order two bits is “00”, CGRAM’s pattern is displayed.

5. CGRAM addresses 4 to 1 (A4 to A1) corresponds to the line position of the character pattern. (Four bits : 13 lines) The ORed result with the cursor is taken and displayed on the 12th line.

6.5 Pictograph Display RAM (PDRAM)

PDRAM is the RAM that contains pictograph display data that has been assigned to $PCOM_1$ and $PCOM_2$. The data display function is ON when the data value is “1” and OFF when the data value is “0”.

After data is written, the address counter is automatically incremented (by one), and the value after 0FH is 00H.

The correspondence between output from various segments and PDRAM addresses is shown below.

$PCOM_1$,$PCOM_2$

Address	Segment Output No.							
	b7	b6	b5	b4	b3	b2	b1	b0
00H	X	X	6	5	4	3	2	1
01H	X	X	12	11	10	9	8	7
02H	X	X	18	17	16	15	14	13
03H	X	X	24	23	22	21	20	19
04H	X	X	30	29	28	27	26	25
05H	X	X	36	35	34	33	32	31
06H	X	X	42	41	40	39	38	37
07H	X	X	48	47	46	45	44	43
08H	X	X	54	53	52	51	50	49
09H	X	X	60	59	58	57	56	55
0AH	X	X	66	65	64	63	62	61
0BH	X	X	72	71	70	69	68	67
0CH	X	X	78	77	76	75	74	73
0DH	X	X	84	83	82	81	80	79
0EH	X	X	90	89	88	87	86	85
0FH	X	X	96	95	94	93	92	91

Remark X : Don’t care

6.6 Pictograph Blink Data RAM (PBRAM)

PBRAM is the RAM that contains pictograph blink data that has been assigned to $PCOM_1$ and $PCOM_2$. A data value of "1" is written to the address of the pictograph to be set for a blink display.

After data is written, the address counter is automatically incremented (by one), and the value after 0FH is 00H.

The correspondence between output from various segments and PBRAM addresses is shown below.

$PCOM_1$,$PCOM_2$

Address	Segment Output No.							
	b7	b6	b5	b4	b3	b2	b1	b0
00H	X	X	6	5	4	3	2	1
01H	X	X	12	11	10	9	8	7
02H	X	X	18	17	16	15	14	13
03H	X	X	24	23	22	21	20	19
04H	X	X	30	29	28	27	26	25
05H	X	X	36	35	34	33	32	31
06H	X	X	42	41	40	39	38	37
07H	X	X	48	47	46	45	44	43
08H	X	X	54	53	52	51	50	49
09H	X	X	60	59	58	57	56	55
0AH	X	X	66	65	64	63	62	61
0BH	X	X	72	71	70	69	68	67
0CH	X	X	78	77	76	75	74	73
0DH	X	X	84	83	82	81	80	79
0EH	X	X	90	89	88	87	86	85
0FH	X	X	96	95	94	93	92	91

Remark X : Don't care

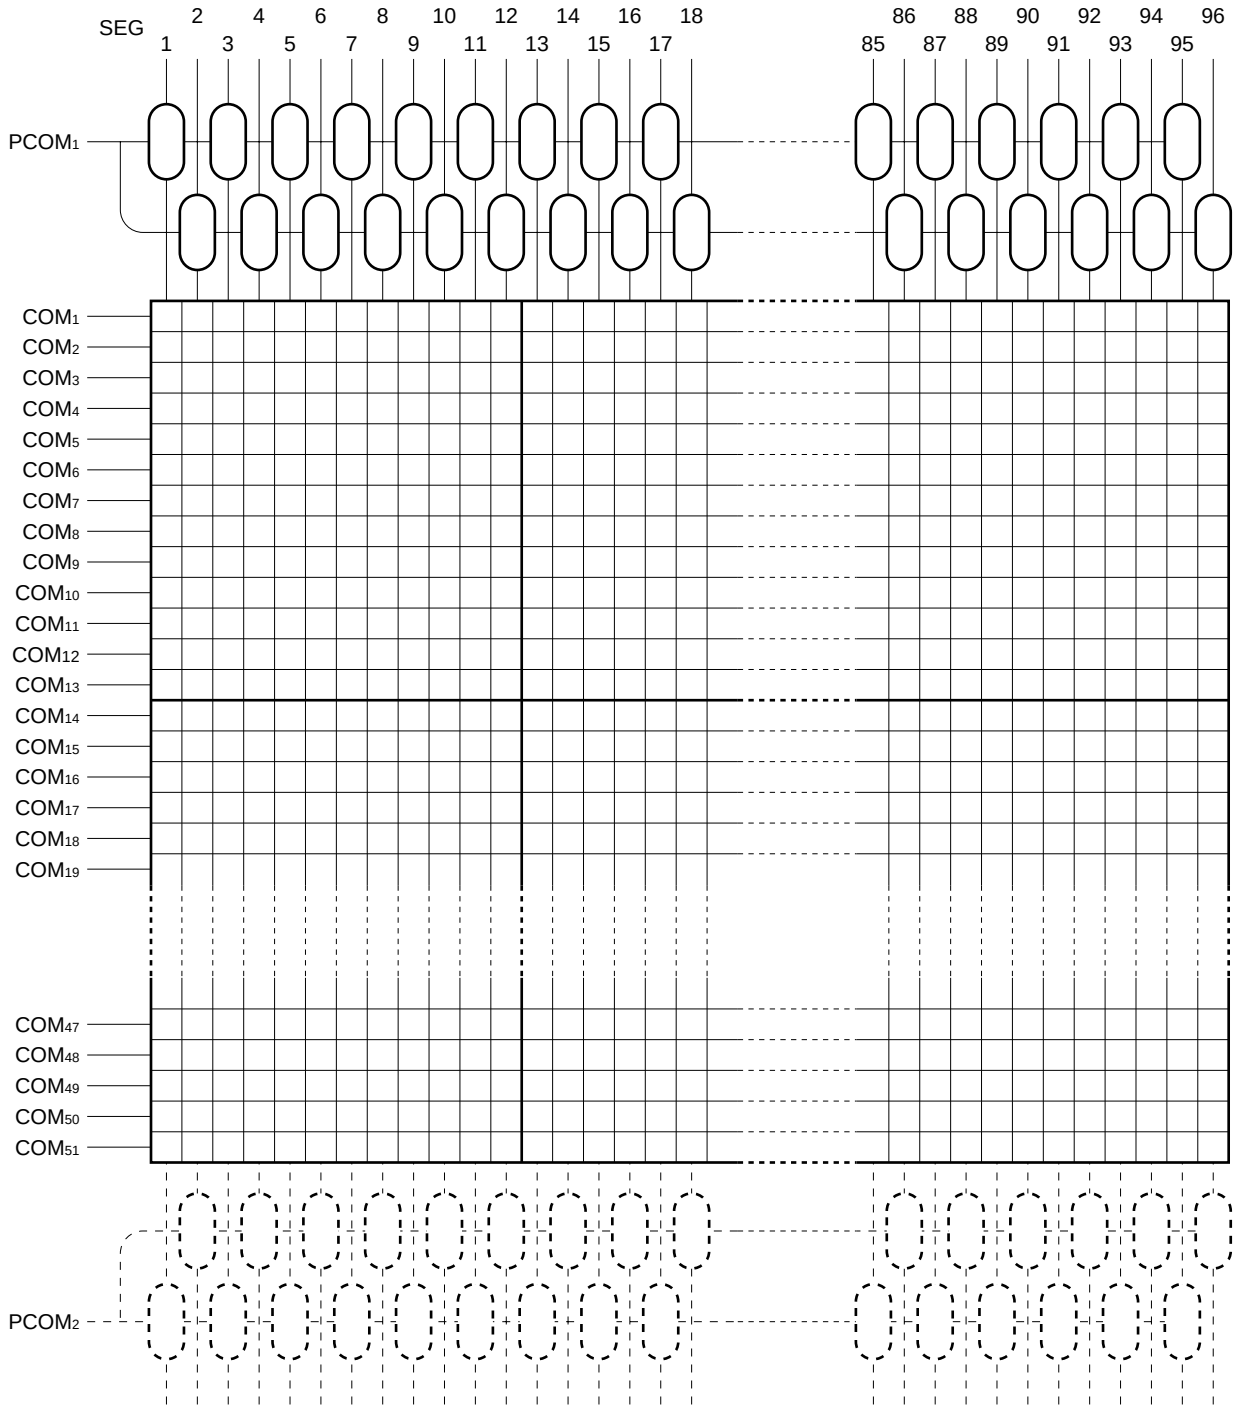
6.7 Relation between Addresses and Various ROM and RAM Devices

The μPD16681 assigned FCGROM addresses as shown below to HCGROM, CGRAM, and user-defined ROM.

Type	No. of Characters	Address Range
JIS kanji	6355	Same as kanji ROM IC
Non-JIS kanji	453	Same as kanji ROM IC
Half width alphanumeric characters	192	Uses addresses 0080H to 039FH in the kanji ROM IC
User defined	256	Uses addresses 1000H to 101FH in the kanji ROM IC
CGRAM	8	Uses addresses 0000H to 0007H in the kanji ROM IC

7. LCD DISPLAY

The μPD16681's LCD display can display four lines containing up to 8 characters (11 x 12 dots) or 16 characters (5 x 12 dots) and 96 pictographs.



Remark The same select signal is output from $PCOM_1$ and $PCOM_2$.

7.1 LCD Display and DDRAM Addresses

The character code used in the μPD16681 contains 16 bits (character code + character attribute code). When data is stored to an address in DDRAM, a combination of full width (11 x 12 dots) and half width (5 x 12 dots) characters can be displayed on the LCD.

The relation between the DDRAM's character area and the actual LCD display when displaying a combination of full width and half width characters is shown below.

Figure 7-1. The Relation between The DDRAM's Character Area and The Actual LCD Display

LCD display:

日		本		電		気		株		式		会		社	
神		奈		川		県		川		崎		市		幸	
区		塚		越		三		丁		目		4	8	4	" "
T	E	L	:	0	4	4	−	5	4	8	−	8	8	8	2

"" : Half width(5 x 12 dots) space

DDRAM:

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
1st line	00H	01H	02H	03H	04H	05H	06H	07H	08H	09H	0AH	0BH	0CH	0DH	0EH	0FH	10H	11H
2nd line	12H	13H	14H	15H	16H	17H	18H	19H	1AH	1BH	1CH	1DH	1EH	1FH	20H	21H	22H	23H
3rd line	24H	25H	26H	27H	28H	29H	2AH	2BH	2CH	2DH	2EH	2FH	30H	31H	32H	33H	34H	35H
4th line	36H	37H	38H	39H	3AH	3BH	3CH	3DH	3EH	3FH	40H	41H	42H	43H	44H	45H	46H	47H

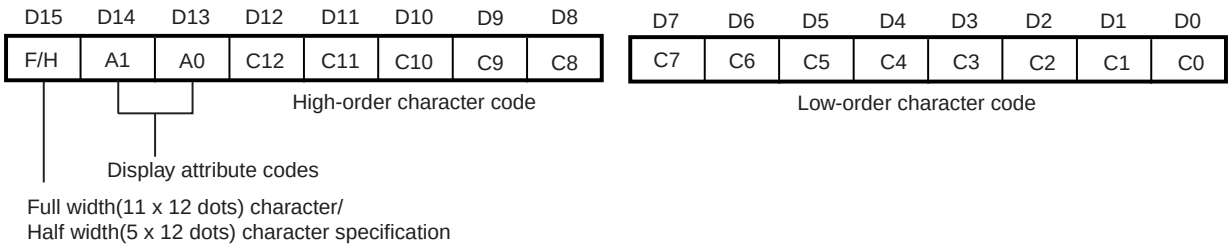
Remark Shaded areas indicate addresses.
Address characters that are not displayed are used as data for character scrolling.

7.2 Character Codes

The μPD16681 is able to combine full width characters (11 x 12 dots) and half width characters (5 x 12 dots) in the same display. The character data that is stored in DDRAM is displayed starting from the top left corner of the LCD screen. A one-dot character interval is added to the left of each character font.

Both full width (11 x 12 dots) and half width (5 x 12 dots) characters are handled using 16-bit code lengths and are stored in DDRAM. The 16-bit code format uses the low-order 13 bits as the character code. The remaining 3 bits are the high-order 3 bits, which specify the character width (full or half) and the display attribute. The MSB is the select bit indicating full width or half width character code: "0" specifies full width characters and "1" specifies half width characters. The character attribute code is assigned to the next two bits, and can specify attributes such as blinking for individual characters. (See the section **7.3 Display Attributes**.)

7.2.1 Code format



7.2.2 Full width (11 x 12 dots) character code setting examples

The following shows the correspondence between 16-bit JIS code and the μPD16681's 13-bit character code. This correspondence varies according to the values of the high-order 3 bits (b17, b16, and b15) in the first byte of the JIS code.

Convert JIS code as shown below to generate character code for the μPD16681.

(1) JIS level 1 kanji and non-kanji characters

Table 7-1. When (b17, b16, b15) = (0, 1, 0)

JIS C 6226	First byte							Second byte						
	b17	b16	b15	b14	b13	b12	b11	b27	b26	b25	b24	b23	b22	b21
Character code					C9	C8	C7	C6	C5	C4	C3	C2	C1	C0

Remark C12 = C6 = C5 = 0

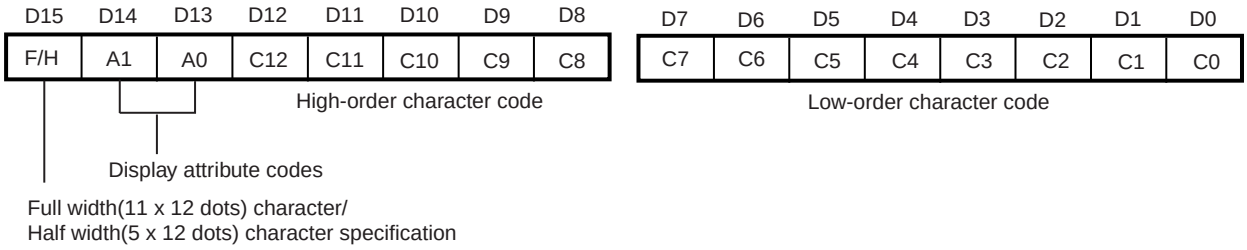
Remark CGRAM addresses for user font: u2 to u0

7.3 Display Attributes

In the μPD16681, the character code is assigned to 12 bits of the 16-bit data that is specified as full width (11 x 12 dots) characters or half width (5 x 12 dots) characters and the display attribute code is assigned to two of the remaining four bits. Normal display or blink display mode can be specified for each character unit.

The blink cycle for blink display mode is 64 frames, so that display blinks on or off once every 32 frames.

7.3.1 Character code format

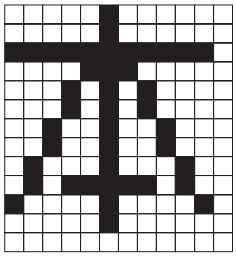


7.3.2 Display attribute specifications

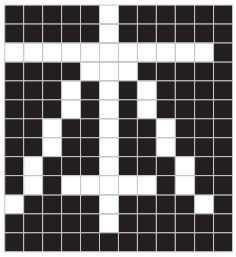
A1	A0	Display Mode
0	0	Normal display
0	1	Reverse display
1	0	Character blink
1	1	Reverse character blink

7.3.3 Display examples

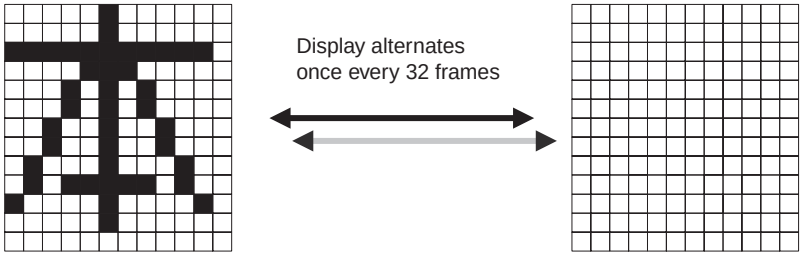
(1) Normal display



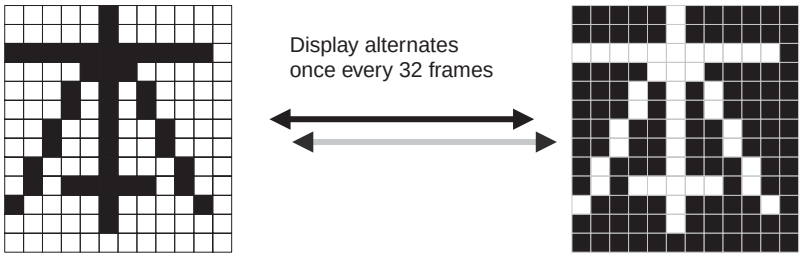
(2) Reverse display



(3) Blink display

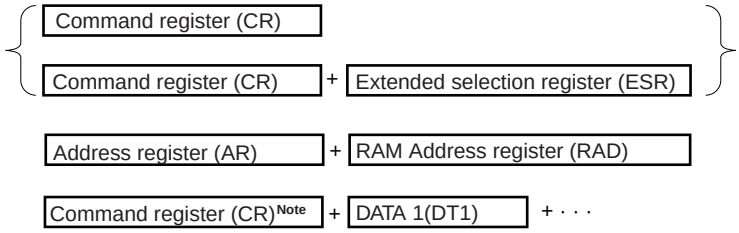


(4) Reverse blink display



8. COMMANDS

8.1 Basic format



Note The command (1 or 2 bytes) immediately follows the falling edge of the STB signal, and whatever is sent after that is recognized as data.

Table 8-1. Command List

Command	Register Contents								Description
	b7	b6	b5	b4	b3	b2	b1	b0	
Reset	0	0	1	0	0	0	1	1	
Display ON/OFF	0	0	0	0	1	b2	b1	b0	
Standby	0	0	0	1	0	b2	b1	b0	
Duty setting	0	0	0	1	1	0	b1	b0	
Cursor control	0	0	0	1	1	1	b1	b0	
D/A converter setting	0	0	1	0	1	0	0	0	
Scroll control	0	0	1	1	b3	b2	b1	b0	
Blink setting	0	1	0	0	0	0	b1	b0	
Address register	0	1	0	0	1	0	b1	b0	
Data R/W mode	1	0	1	1	0	b2	b1	b0	
Test mode	1	0	1	0	b3	b2	b1	b0	

8.1.1 Reset

This command resets all of the commands in the μPD16681.

MSB							LSB
0	0	1	0	0	0	1	1

8.1.2 Display ON/OFF

This command controls the display's ON/OFF status.

MSB							LSB
0	0	0	0	1	b2	b1	b0

Selection

000 : LCD OFF (SEG_n, COM_n, $PCOM_n = V_{SS}$)

001 : LCD OFF (SEG_n, COM_n, $PCOM_n$ = non-select waveform)

111 : LCD ON

8.1.3 Standby

This command stops the DC/DC converter, which reduces the supply current. The display is set to OFF mode (SEG_n, $COM_n = V_{SS}$).

MSB							LSB
0	0	0	1	0	b2	b1	b0

Selection

000 : Normal operation

001 : Standby (stop DC/DC converter, fulll display off [Note],stop OSC)

Note SEG_n, COM_n, $PCOM_n = V_{EE}$

8.1.4 Duty setting

This command specifies the duty setting.

MSB							LSB
0	0	0	1	1	0	b1	b0

Selection

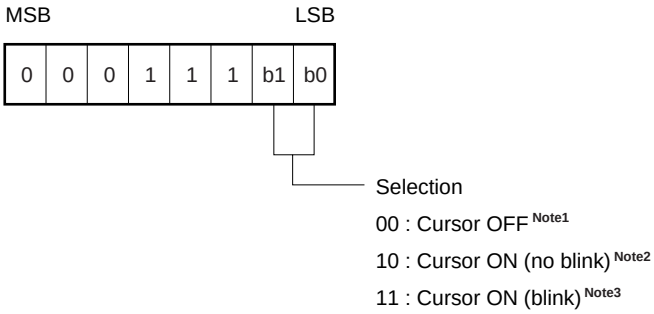
00 : 1/52 duty

01 : 1/39 duty[Note]

Note Use COM_1 to COM_{19} and COM_{27} to COM_{45}, leave COM_{20} to COM_{26} and COM_{46} to COM_{51} open when setting 1/39 duty.

8.1.5 Cursor control

This command controls the cursor's ON/OFF status.



Notes 1. 00 : Sets cursor to OFF mode.

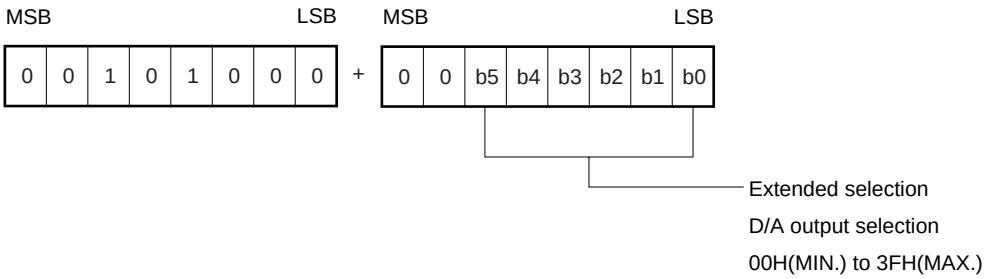
2. 10 : Sets cursor to ON mode (cursor is displayed). The cursor is displayed at the character which occupies the display position of the currently specified DDRAM address. The "address register" + "data R/W command" combination is used to set data to DDRAM addresses. When accessing RAM, the address counter in RAM is automatically incremented (+1) or decremented (–1), and the cursor is moved accordingly.

3. 11 : This sets the cursor to ON mode and causes the cursor to blink. The blink cycle is 64 frames. The correspondence between the cursor and the RAM address is the same as when the cursor is blinking.

Remark The cursor display function is valid only when the display attribute specifies "normal display" (A0 = 0, A1 = 0).

8.1.6 D/A converter set 1

The D/A converter's output for the LCD driver is set in 64 steps from V_{DD} to 1/2 V_{DD}.

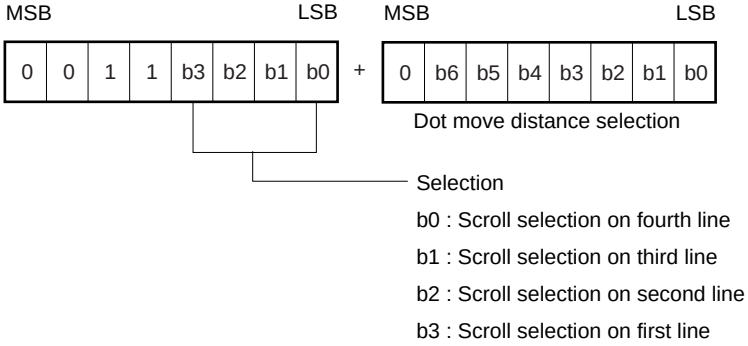


Remark This value is set to 20H after a reset.

8.1.7 Scroll control

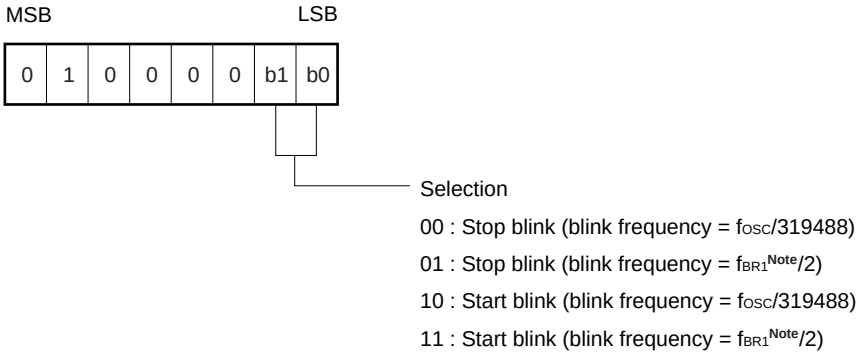
This controls scrolling of displayed characters.

The individual bits in the selection are allocated to their respective display lines. When the data value is “1”, scrolling is enabled for that line. The distance of the dots’ leftward (horizontal) motion is selected via the extended selection register that is input after the command. The dot move distance varies depending on the current LCD display status and the contents of DDRAM. For details, see the section **8.4 Scrolling**.



8.1.8 Pictograph blink setting

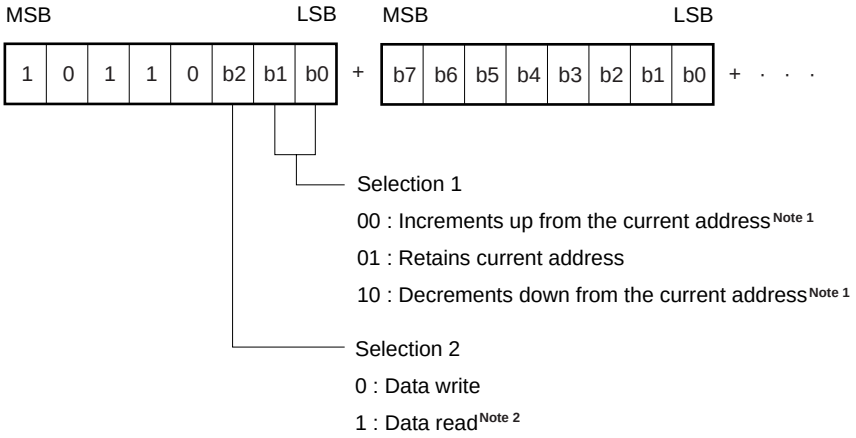
This command performs blink control for the pictograph at addresses where the blink (PBRAM) data value is “1”.



Note This refers to the frequency of the external clock that is input from the OSC_{BR1} pin.

8.1.9 Data R/W command

This command performs data read/write operations.



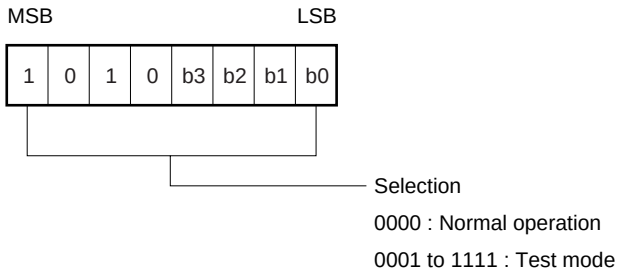
Notes 1. During increment mode, when the current address is the last address the next address becomes 00H. During decrement mode, when the current address is 00H, the next address becomes the last address.

2. Data read mode is cancelled at the rising edge of the STB signal (mode is switched to command/data write mode).

Caution During a serial data transfer, write data in 8-bit or 16-bit segments. If the rising edge of STB occurs during the data transfer operation, the operation is not guaranteed.

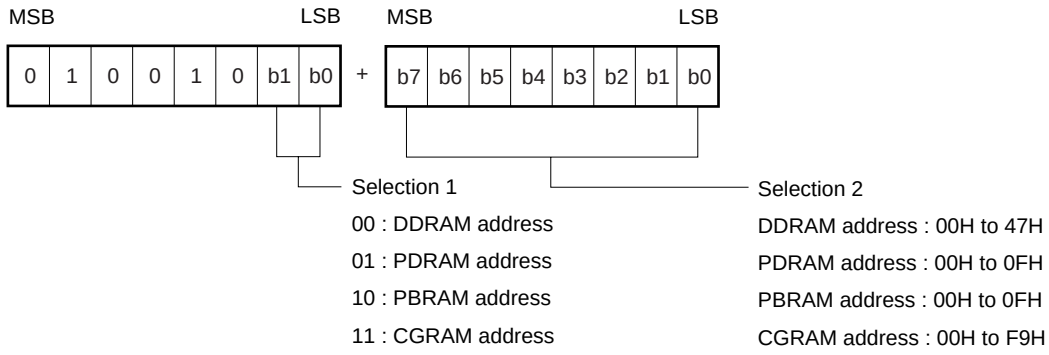
8.1.10 Test mode

This command sets the test mode. The test mode is only for confirming the IC's operation. Regular or continuous use while in test mode is not guaranteed.



8.2 Address Register

This command selects the address type and specifies addresses.



Caution Operation is not guaranteed if an invalid address is set.

8.3 Reset

The contents of the various registers appear as shown below after a reset (command reset or hardware [pin] reset).

Command	Register Contents								Description
	b7	b6	b5	b4	b3	b2	b1	b0	
Display ON/OFF	0	0	0	0	1	0	0	0	LCD OFF (SEG_n, COM_n, $PCOM_n$, = V_{SS})
Standby	0	0	0	1	0	0	0	0	Normal operation
Duty setting	0	0	0	1	1	0	0	0	1/52 duty
Cursor control	0	0	0	1	1	1	0	0	Cursor OFF
D/A converter setting	0	0	1	0	1	0	0	0	Set to 20H
Scroll control	0	0	1	1	0	0	0	0	No specified scroll line
Blink setting	0	1	0	0	0	0	0	0	Blink stop
Address register	0	1	0	0	1	0	0	0	DDRAM is specified
Data R/W mode	1	0	1	1	0	0	0	0	Data write/increment (+1)
Test mode	1	0	1	0	0	0	0	0	Normal operation

8.4 Scrolling

Character scrolling is controlled by inputting scroll control commands (8 bits) plus scroll dot count data (8 bits). The line to be scrolled is specified by the scroll control command and the scroll dot count data sets the number of dots to be scrolled. When this command is input, the characters on the specified line are shifted leftward by the specified number of dots.

The number of dots that can be scrolled differs according to the contents of the data stored in DDRAM (see **8.4.1 Scrollable number of dots** and **8.4.2 Display and scroll amounts**). Consequently, if scrolling is specified for an amount of data that exceeds the scrollable data, the character data, only the scrollable data is shifted and overwritten, and scrolling must be performed again.

Cautions 1. For character scrolling, be sure to input a scroll control command (8 bits) plus the amount of scrolled data (8 bits).

2. If the characters on a scrolled line have various character attributes (normal/blink/reverse/ reverse/blink), the character display may become garbled after scrolling. This problem does not occur when all of the characters on the line have the same character attribute.

8.4.1 Scrollable number of dots

Scroll amount = (12 dots x number of non-displayed full width characters that are stored in DDRAM)
+ (6 dots x number of non-displayed half width characters that are stored in DDRAM)

8.4.2 Display and scroll amounts

LCD display:

日		本		電		気		株		式		会		社	
神		奈		川		県		川		崎		市		幸	
T	E	L	:	0	4	4	−	5	4	8	−	8	8	8	2
F	A	X	:	0	4	4	−	5	4	8	−	7	9	1	0

DDRAM status :

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
1st line	00H	01H	02H	03H	04H	05H	06H	07H	08H	09H	0AH	0BH	0CH	0DH	0EH	0FH	10H	11H
2nd line	12H	13H	14H	15H	16H	17H	18H	19H	1AH	1BH	1CH	1DH	1EH	1FH	20H	21H	22H	23H
3rd line	24H	25H	26H	27H	28H	29H	2AH	2BH	2CH	2DH	2EH	2FH	30H	31H	32H	33H	34H	35H
4th line	36H	37H	38H	39H	3AH	3BH	3CH	3DH	3EH	3FH	40H	41H	42H	43H	44H	45H	46H	47H

Remark Shaded areas indicate addresses.

Address characters that are not displayed are used as data for character scrolling.

Character memory contents :

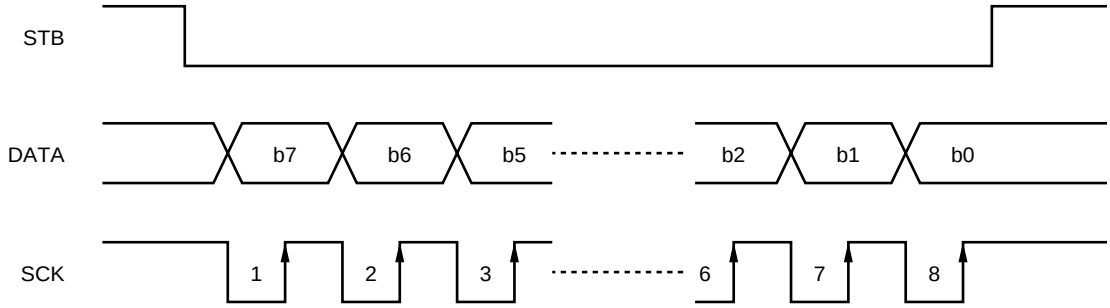
1st line	日	本	電	気	株	式	会	社	半	導	体	ソ	リ	ュ	ー	シ	ョ	ン
2nd line	神	奈	川	県	川	崎	市	幸	区	塚	越	三	丁	目	4	8	4	□
3rd line	T	E	L	:	0	4	4	-	5	4	8	-	3	8	8	2	P	B
4th line	F	A	X	:	0	4	4	-	5	4	8	-	7	9	1	0	夜	間

Remarks 1. Shaded areas indicate addresses.

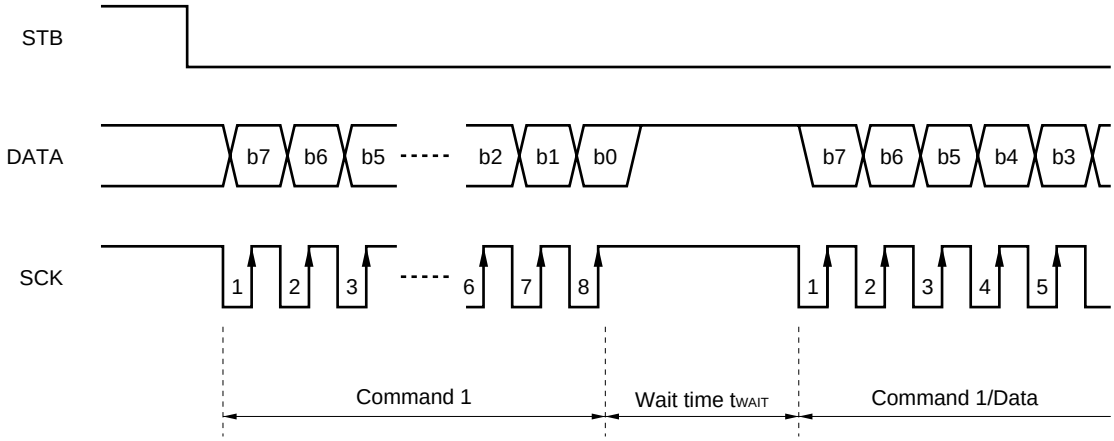
2. First line : "半導体ソリューション"(10 full width (11 x 12 dots) characters)
Second line : "区塚越三丁目"(6 full width (11 x 12 dots) characters),
"484"□(4 half width (5 x 12 dots) characters)
Third line : "PB"(2 half width (5 x 12 dots) characters)
Fourth line : "夜間"(2 full width (5 x 12 dots) characters)
Scrollable dot counts;
First line : (12 dots x 10 characters) + (6 dots x 0 characters) = 120 dots
Second line : (12 dots x 6 characters) + (6 dots x 4 characters) = 96 dots
Third line : (12 dots x 0 characters) + (6 dots x 2 characters) = 12 dots
Fourth line : (12 dots x 2 characters) + (6 dots x 0 characters) = 24 dots
If scroll count data that exceeds the scrollable number of dots is entered using the scroll control command, all dots that are in the area that goes beyond the DDRAM addresses are output as OFF data.

8.5 Serial Communication Format

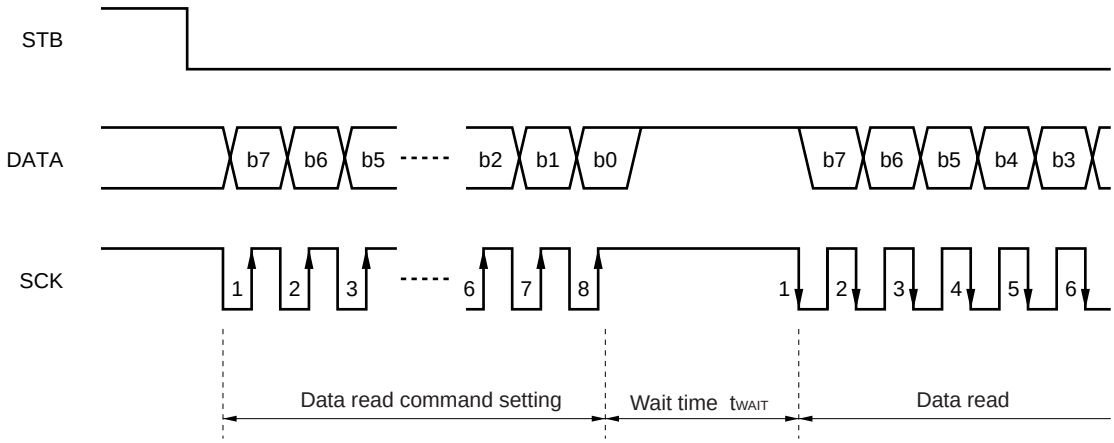
(1) Reception 1 (command write, 1 byte)



(2) Reception 2 (command/data write, 2 bytes or more)



(3) Transmission (command/data read)



8.6 Parallel Communication Format

(1) 8-bit parallel interface

10. ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings (T_A = 25 °C, V_{SS} = 0 V)

Parameter	Symbol	Rating	Unit
Supply voltage (4x boost)	V_{DD}	–0.3 to +3.75	V
Supply voltage (3x boost)	V_{DD}	–0.3 to +5.0	V
Driver supply voltage	V_{LCD}	–0.3 to +15.0, $V_{DD} \leq V_{LCD}$	V
Driver reference supply input voltage	V_{LC1}-V_{LC5}	–0.3 to V_{LCD}+0.3	V
Logic system input voltage	V_{IN1}	–0.3 to V_{DD}+0.3	V
Logic system output voltage	V_{OUT1}	–0.3 to V_{DD}+0.3	V
Logic system input/output voltage	$V_{I/O1}$	–0.3 to V_{DD}+0.3	V
Driver system input voltage	V_{IN2}	–0.3 to V_{LCD}+0.3	V
Driver system output voltage	V_{OUT2}	–0.3 to V_{LCD}+0.3	V
Operating ambient temperature	T_A	–40 to +85	°C
Storage temperature	T_{stg}	–55 to +150	°C

Caution If the absolute maximum rating of even one of the above parameters is exceeded even momentarily, the quality of the product may be degraded. Absolute maximum ratings, therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the range of the absolute maximum ratings.

Recommended Operating Range

Parameter	Symbol	MIN.	TYP.	MAX.	Unit
Supply voltage (4x boost)	V_{DD}	2.45		3.0	V
Supply voltage (3x boost)	V_{DD}	2.45		4.0	V
Driver supply voltage	V_{LCD}	5.0	10	12	V
Logic system input voltage	V_{IN}	0		V_{DD}	V
Driver system input voltage	V_{LC1}-V_{LC5}	0		V_{LCD}	V

Remarks 1. When using an external power supply, be sure to maintain these relations:
$V_{SS} < V_{LC5} < V_{LC4} < V_{LC3} < V_{LC2} < V_{LC1} \leq V_{LCD}$

2. Maintain $V_{DD} \leq V_{LCD}$ when turning the power on or off.

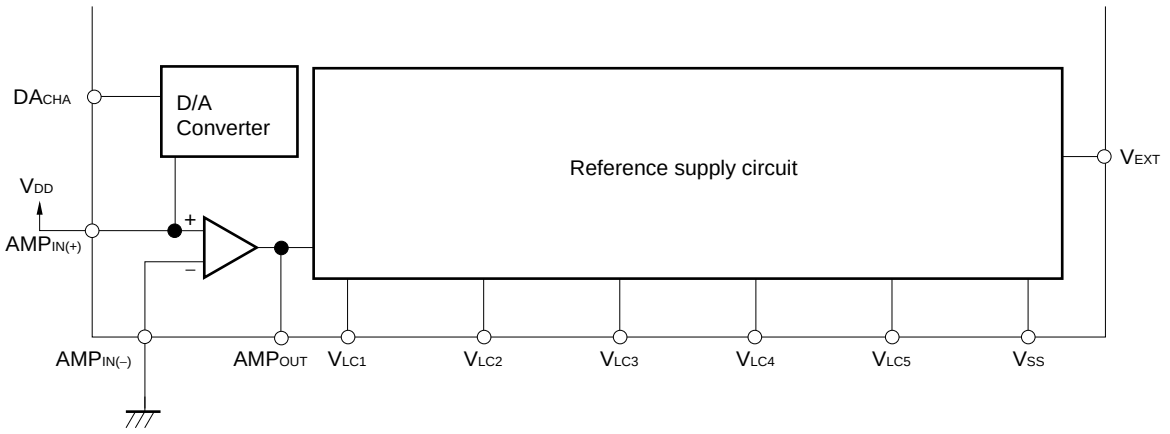
3. Keep voltage input to the $AMP_{IN(+)}$ pin between 1.0 V and V_{DD} when using an internal power supply but not using the D/A converter.

Electrical characteristics (unless otherwise specified, T_A = –40 to +85 °C, V_{DD} = 2.45 to 3.0 V during 4x boost mode or 2.45 to 4.0 V during 3x boost mode)

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
High-level input voltage	V_{IH}		$0.8V_{DD}$			V
Low-level input voltage	V_{IL}				$0.2V_{DD}$	V
High-level input current	I_{IH1}	Except for D_0/DATA and D_1 to D_7			1	μA
Low-level input current	I_{IL1}	Except for D_0/DATA and D_1 to D_7			–1	μA
High-level output voltage	V_{OH}	I_{OUT} = –1.5 mA, except OSC_{OUT}	V_{DD}–0.5			V
Low-level output voltage	V_{OL}	I_{OUT} = 4 mA, except OSC_{OUT}			0.5	V
High-level leakage current	I_{LOH}	D_0/DATA and D_1 to D_7, $V_{IN/OUT} = V_{DD}$			10	μA
Low-level leakage current	I_{LOL}	D_0/DATA and D_1 to D_7, $V_{IN/OUT} = V_{SS}$			–10	μA
Common output ON resistance	R_{COM}	$V_{LCn} \rightarrow COM_n$, $V_{LCD} \geq 3V_{DD}$, I_{LOL} = 50 μA			2	kΩ
Segment output ON resistance	R_{SEG}	$V_{LCn} \rightarrow SEG_n$, $V_{LCD} \geq 3V_{DD}$, I_{LOL} = 50 μA			4	kΩ
Driver voltage (boost voltage)	V_{LCD}	During 3x boost	$2.7V_{DD}$		$3.0V_{DD}$	V
		During 4x boost	$3.6V_{DD}$		$4.0V_{DD}$	V
Current consumption (normal mode)	I_{DD11}	f_{OSC} = 375 kHz, all display OFF data output, V_{DD} = 3.0 V during 3x boost mode		100	180	μA
		f_{OSC} = 375 kHz, all display OFF data output, V_{DD} = 3.0 V during 4x boost mode		135	210	μA
Current consumption (high-power mode)	I_{DD12}	f_{OSC} = 375 kHz, all display OFF data output, V_{DD} = 3.0 V during 3x boost mode		150	280	μA
		f_{OSC} = 375 kHz, all display OFF data output, V_{DD} = 3.0 V during 4x boost mode		200	340	μA
Driver system current consumption (V_{DD}) (Standby)	I_{DD21}	V_{DD} = 3.0 V		1	10	μA

Remark The TYP. value is a reference value when T_A = 25 °C

Test Circuit



Switching characteristics (unless otherwise specified, T_A = –40 to +85 °C)

V_{DD} = 2.45 to 2.7 V

	Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
★	Oscillation frequency	f_{OSC}	Self-oscillation, oscillation resistance R = 100 kΩ	180		500	kHz
	Transfer delay time	t_{PHL}	SCK↓→DATA↓			60	ns
	Transfer delay time	t_{PLH}	SCK↓→DATA↑			60	ns

Remark The TYP. value is a reference value when T_A = 25 °C

V_{DD} = 2.7 to 3.3 V

	Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
★	Oscillation frequency	f_{OSC}	Self-oscillation, oscillation resistance R = 100 kΩ	240	378	560	kHz
	Transfer delay time	t_{PHL}	SCK↓→DATA↓			60	ns
	Transfer delay time	t_{PLH}	SCK↓→DATA↑			60	ns

Remark Use the following equation to determine the time per frame.

1 frame = 1/f_{OSC} x 96 x number of duty

f_{OSC} = 375 kHz, Given a 1/52 duty,

1 frame = 2.67 μs (96 x 52 = 13.1 ms ≅ 75 Hz)

Required timing conditions (unless otherwise specified, T_A = –40 to +85 ºC)

Common (1) (V_{DD} = 2.45 to 2.7 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Clock frequency	f_{OSC}	OSC_{IN} external clock	180		500	kHz
High-level clock pulse width	t_{WHC1}	OSC_{IN} external clock	600			ns

STB hold time	t_{HKSTB}	SCK↑→STB↑	260			ns
STB pulse width	t_{WSTB}		210			ns
Wait time	t_{WAIT}	8th CLK↑→1st CLK↓	260			ns

Remark The TYP. value is a reference value when T_A = 25 °C.

Serial interface (2) (V_{DD} = 2.7 to 3.3 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Shift clock cycle	t_{CYK}	SCK	500			ns
High-level shift clock pulse width	t_{WHK}	SCK	260			ns
Low-level shift clock pulse width	t_{WLK}	SCK	210			ns
Shift clock hold time	t_{HSTBK}	STB↓→SCK↓	260			ns
Data setup time	t_{DS1}	DATA→SCK↑	40			ns
Data hold time	t_{DH1}	SCK↑→DATA	40			ns
STB hold time	t_{HKSTB}	SCK↑→STB↑	260			ns
STB pulse width	t_{WSTB}		210			ns
Wait time	t_{WAIT}	8th CLK↑→1st CLK↓	260			ns

Remarks 1. The TYP. value is a reference value when T_A = 25 °C.

2. For details, see **8.5 Serial Communication Format** (3) Transmission (command/data read).

Parallel interface (1) (V_{DD} = 2.45 to 2.7 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Enable cycle time	t_{CYCE}	E↑→E↑	600			ns
High-level enable pulse width	t_{WHE}	E	300			ns
Low-level enable pulse width	t_{WLE}	E	210			ns
STB pulse width	t_{WSTB}		210			ns
STB hold time	t_{WKSTB}		260			ns
Enable hold time	t_{HSTBK}		260			ns
Data setup time	t_{DS2}	D_0 to D_7→E↑	40			ns
Data hold time	t_{DH2}	D_0 to D_7→E↓	40			ns

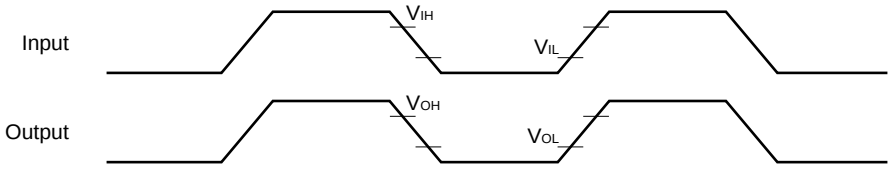
Remark The TYP. value is a reference value when T_A = 25 °C.

Parallel interface (2) (V_{DD} = 2.7 to 3.3 V)

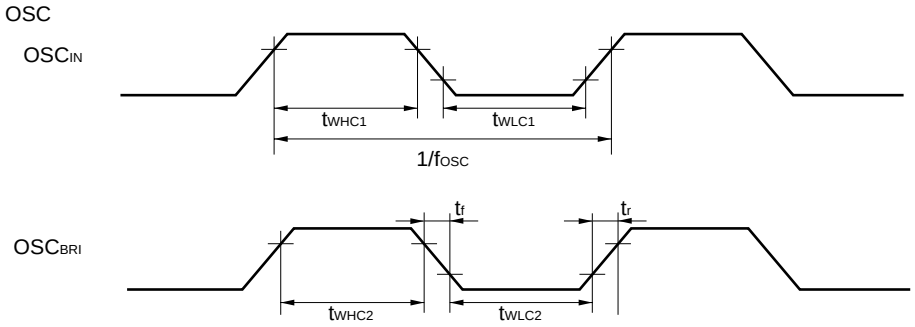
Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Enable cycle time	t_{CYCE}	E↑→E↑	500			ns
High-level enable pulse width	t_{WHE}	E	260			ns
Low-level enable pulse width	t_{WLE}	E	210			ns
STB pulse width	t_{WSTB}		210			ns
STB hold time	t_{WKSTB}		260			ns
Enable hold time	t_{HSTBK}		260			ns
Data setup time	t_{DS2}	D_0 to D_7→E↑	40			ns
Data hold time	t_{DH2}	D_0 to D_7→E↓	40			ns

Remark The TYP. value is a reference value when T_A = 25 °C.

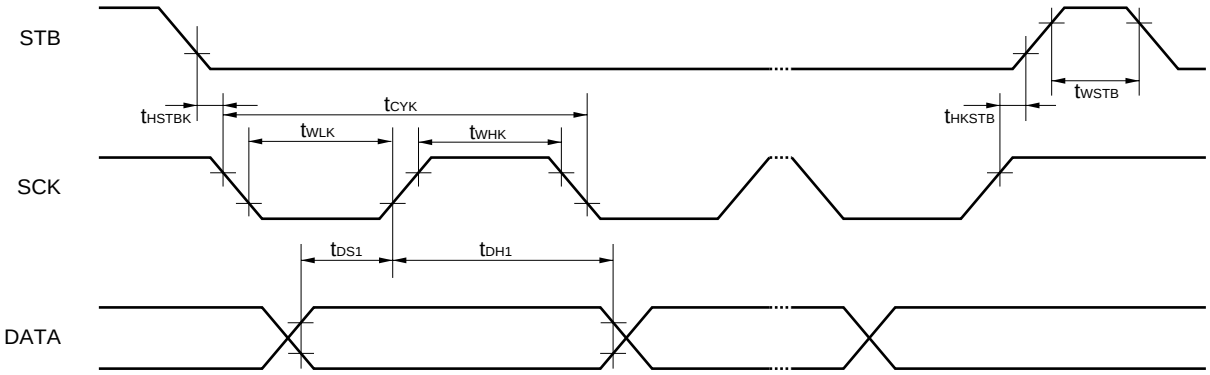
AC timing measurement voltages



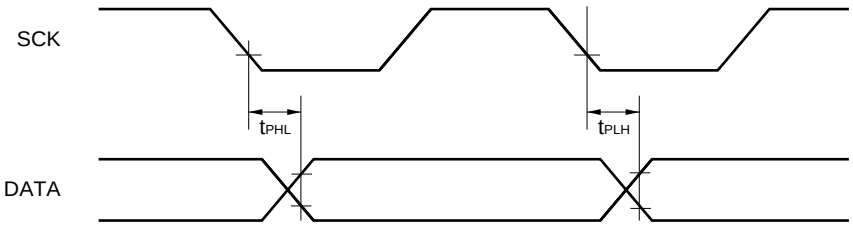
AC characteristics waveforms



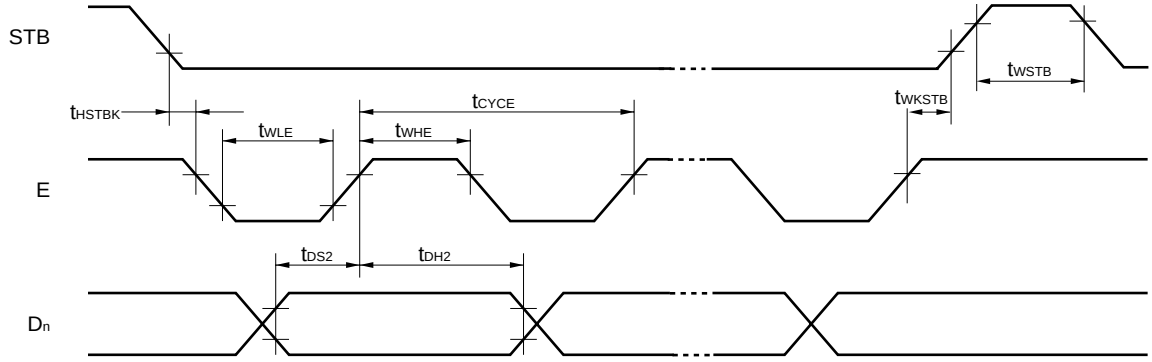
Serial interface (input)



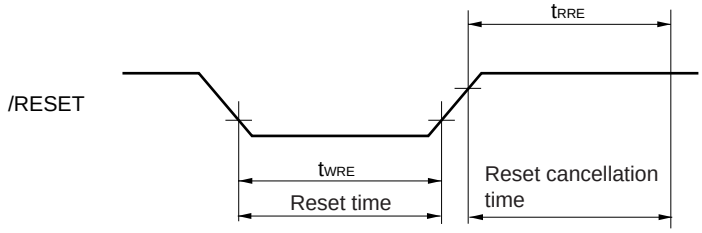
Serial interface (output)



8-bit parallel interface



Reset



11. CHARACTER CODE TABLES (standard ROM code, μPD16681W/P-011)

The following tables show the correspondences between character codes and characters. Character codes ranging from 0000H to 0007H are assigned to CGRAM and those ranging from 1000H to 1380H are assigned to an area that is defined by the user when establishing custom ROM codes.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

- **The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.**
- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.
- NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.
- Descriptions of circuits, software, and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software, and information in the design of the customer's equipment shall be done under the full responsibility of the customer. NEC Corporation assumes no responsibility for any losses incurred by the customer or third parties arising from the use of these circuits, software, and information.
- While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.
- NEC devices are classified into the following three quality grades:
  "Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.
  - Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
  - Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
  - Specific: Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

  The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.
