

To our customers,

---

## Old Company Name in Catalogs and Other Documents

---

On April 1<sup>st</sup>, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1<sup>st</sup>, 2010  
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
  - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
  - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
  - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

### CMOS LSI FOR 12 lines × 24 columns CHARACTER DISPLAY ON SCREEN

The μPD6453 is a CMOS LSI device for on-screen character displays designed to display characters such as the time of day, channel numbers, and chapter numbers on a TV screen when used in a TV or video disk in combination with a microcomputer. By using this IC in a video camera or VCR, the time of day and date can also be recorded over video signals.

Each character is in a 12 x 18 dot pattern and by combining two or more characters, Chinese characters (Kanji) or graphics may be displayed. By using a character RAM for 16 characters, a character or graphic pattern can be changed while it is being displayed.

In addition, thanks to its Power ON Reset function, Video RAM All Reset command and other built-in functions, the μPD6453 helps lighten a burden on the microcomputer.

NEC offers two types of devices μPD6453CY-001 and μPD6453GT-101 as standard products. Both the μPD6453CY-001 and μPD6453GT-101 have the same character specifications, but the former is housed in a 20-pin plastic DIP (Dual In-line Package) and the latter in a 20-pin plastic SOP (Small Out-line Package).

#### FEATURES

- No. of Display Characters : 12 lines x 24 columns
- Types of Characters : 256 types (ROM: 240 types; RAM: 16 types.)
- Character Size : Any one of 1H, 2H, 3H, and 4H per dot can be selected.
- Character Colors : Any one of 8 different colors can be selectable for each character.
- Background : One of "No background", "Square background" and "Solid background" is selectable per screen, together with fringe ON/OFF function. Any of eight different colors is selectable as the background color and together with the fringe color (black or white) selectable per screen.
- Dot Matrix : 12 x 18 pattern without spacing between characters
- Smooth function : Two different interpolations are available for selection per line with characters two to four times the normal size.
- Blinking Control : Blinking ON/OFF can be specified per character. The ON/OFF time ratio of blinking is 1:1 with a blinking frequency selectable from among about 2 Hz, about 1 Hz, and about 0.5 Hz.
- Mask Pulse (Code Option) : To be output in vertical direction for each line.
- Adaptability to Progressive Scan TV : Vertical and horizontal directions can be specified independently of each other.
- Video RAM Data Clear : Video RAM data can be reset with either the Video RAM All Clear command or the Power ON Clear function.
- Interface with Microcomputer : Variable-length serial input format in units of 8 bits
- Power Supply : +5 V single power supply
- Construction : CMOS low power consumption

# ORDERING INFORMATION

PART NUMBER	PACKAGE	QUALITY GRADE
μPD6453CY-001	20-pin plastic DIP (400 mil)	Standard
μPD6453GT-101	20-pin plastic SOP (375 mil)	Standard

Please refer to "Quality grade on NEC Semiconductor Devices" (Document number IEI-1209) published by NEC Corporation to know the specification of quality grade on the devices and its recommended applications.

# CONNECTION DIAGRAM (Top View)

μPD6453CY, μPD6453GT

**Note:** Pin 10 (μPD6453CY/μPD6453GT) within parentheses is the mask code option to be used as the mask pulse. However, μPD6453CY-001/μPD6453GT-101 does not use the mask pulse, so pin 11 is used as monitor output V<sub>MON</sub>.

## PIN DESCRIPTION

SYMBOL	PIN NAME	FUNCTION
V <sub>DD</sub>	Power supply terminal	This terminal supplies +5 V power.
V <sub>SS</sub>	Grounding terminal	This is connected to the system GND.
DATA	Serial data input terminal	This terminal inputs control data. It reads data synchronizing with the clock input to the CLK terminal.
CLK	Clock input terminal	This terminal inputs the clock for reading data. At the rise of this clock, the data input to the DATA terminal is read.
$\overline{\text{CS}}$	Chip select terminal	Normal operation is performed when this is Low.
OSC <sub>IN</sub> OSC <sub>OUT</sub>	Oscillation terminals	These terminals are connected to the oscillation capacitor or coil.
$\overline{\text{H}}_{\text{SYNC}}$	Horizontal synchronous signal input terminal	This terminal inputs the horizontal synchronizing signal. The oscillator oscillates when this signal is high, synchronizing with the rise of the signal. Be sure to input the horizontal synchronizing signal when it is active low.
$\overline{\text{V}}_{\text{SYNC}}$	Vertical synchronizing signal input terminal	This terminal inputs the vertical synchronizing signal. Be sure to input this signal when it is active low.
V <sub>R</sub> V <sub>G</sub> V <sub>B</sub>	Character signal output terminals	These terminals output the character signal corresponding to R, G, and B.
V <sub>BLK</sub>	Blanking signal output terminal	This terminal outputs the blanking signal to cut the video signal.
R <sub>BLK</sub> G <sub>BLK</sub> B <sub>BLK</sub>	Blanking signal output terminal	These terminals output the blanking signal which correspond to character signal (V <sub>R</sub> , V <sub>G</sub> , V <sub>B</sub> ).
PCL	Power ON reset terminal	The state will be initialize by this terminal Low to High when Power is ON.
$\overline{\text{CK}}_{\text{OUT}}$	Clock output terminal	This is the inverted output of OSC <sub>OUT</sub> . To connect another type of on-screen IC in parallel, be sure to connect this terminal to OSC <sub>IN</sub> of the IC.
BUSY	Data input enable terminal	Output terminal to notify the microcomputer that data is enabled or disabled for input. Data can be input at a low level.
V <sub>MON</sub> <sup>Note</sup>	Character signal output monitor terminal	If any of character signal outputs V <sub>R</sub> , V <sub>G</sub> , and V <sub>B</sub> is High, the high-level signal is output.

**Note:** The mask code option enables this terminal to be used as the mask pulse output terminal.  
However,  $\mu$ PD6453CY-001/ $\mu$ PD6453GT-101 does not use the mask pulse, so pin 11 is used as monitor output V<sub>MON</sub>.

BLOCK DIAGRAM

**ABSOLUTE MAXIMUM RATINGS ( $T_a = 25\text{ }^{\circ}\text{C}$ )**

Supply Voltage	$V_{DD} - V_{SS}$	7.0	V
Input Voltage	$V_{IN}$	$V_{DD} + 0.3 > V_{IN} > V_{SS} - 0.3$	V
Output Voltage	$V_{OUT}$	$V_{DD} + 0.3 > V_{OUT} > V_{SS} - 0.3$	V
Output Current	$I_O$	$\pm 5$	mA
Operating Temperature	$T_{opt}$	-20 to +75	$^{\circ}\text{C}$
Storage Temperature	$T_{stg}$	-40 to +125	$^{\circ}\text{C}$

**RECOMMENDED OPERATING RANGE**

ITEM	SYMBOL	MIN.	TYP.	MAX.	UNIT
Supply Voltage	$V_{DD} - V_{SS}$	4.5	5.0	5.5	V
Oscillation Frequency	$f_{osc}$	4.0	7.0	12	MHz

**ELECTRICAL CHARACTERISTICS ( $T_a = 25\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 5.0\text{ V}$ ,  $V_{SS} = 0\text{ V}$ )**

CHARACTERISTIC	SYMBOL	MIN.	TYP.	MAX.	UNIT	TEST CONDITION
Supply Voltage	$V_{DD} - V_{SS}$	4.5	5.0	5.5	V	
Current Consumption	$I_{DD}$			15	mA	
Control Input High Level Voltage	$V_{CIH}$	2.4			V	
Control Input Low Level Voltage	$V_{CIL}$			0.8	V	
Synchronous Signal Input High Level Voltage	$V_{SIH}$	2.4			V	
Synchronous Signal Input Low Level Voltage	$V_{SIL}$			0.8	V	
Signal Output High Level Voltage	$V_{OH}$	4.5			V	$I_{OH} = -1.0\text{ mA}$
Signal Output Low Level Voltage	$V_{OL}$			0.5	V	$I_{OL} = 1.0\text{ mA}$
Clock Output High Level Voltage	$V_{CKH}$	4.5			V	$I_{CKH} = -0.5\text{ mA}$
Clock Output Low Level Voltage	$V_{CKL}$			0.5	V	$I_{CKL} = 0.5\text{ mA}$

**Note:** Control input . . . . . DATA, CLK,  $\overline{\text{CS}}$ , PCL  
Synchronous signal input . . . . .  $\overline{\text{HSYNC}}$ ,  $\overline{\text{VSYNC}}$   
Signal output . . . . .  $V_R$ ,  $V_G$ ,  $V_B$ ,  $V_{CBL}$ ,  $V_{MON}$  (MP), BUSY, RBLK, GBLK, BBLK.  
Clock output . . . . .  $\overline{\text{CKOUT}}$

## COMMAND FORMATS

All control commands are in a variable-length serial input format in units of eight bits. These commands are available in three types: 1-byte (8-bit) command consisting of an instruction part and data; 2-byte (16-bit) command consisting of an instruction part and data and 2nd byte continuous command which consists of two or more bytes and can be input in an abbreviated format.

Each of these commands can be input while the  $\overline{CS}$  signal is in the Low (active) state and is followed by the BUSY signal on input of each 8-bit serial data. Please input datas from MSB.

### Command Input Methods

- To input one 1-byte command

- To input one 2-byte command

- To input one 2nd byte continuous command

The internal data processing is performed on input of every one byte (8 bits).  
(See the paragraph "Recommended Timing" on page 17 for  $\overline{CS}$  and BUSY.)

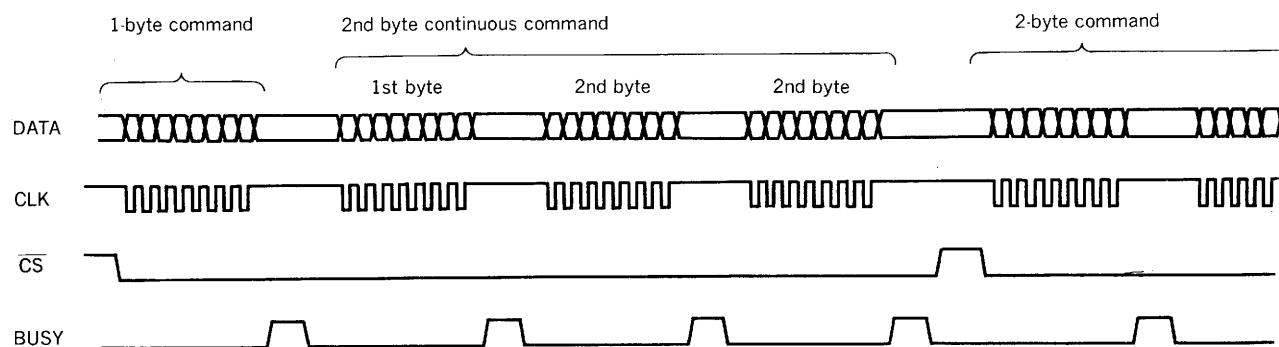

### Method of Continuous Command Input

A 1-byte command, a 2-byte command, or a 2nd byte continuous command can be input continuously either individually or in combination with the other commands while keeping the  $\overline{\text{CS}}$  signal in the Low state (without setting the signal to the High state for delimiting each command input) with the exception of the case indicated below.

### Restriction on Continuous Command Input

At the input of a 2nd byte continuous command, set the  $\overline{\text{CS}}$  signal to High (inactive) once and then to Low (active) and then enter the 1-byte or 2-byte command following the 2nd byte continuous command.

**Example:** Continuous input of 1-byte command, 2nd byte continuous command, and 2-byte command

$\mu$ PD6453CY-XXX/ $\mu$ PD6453GT-XXX Command List

## 1. 1-byte command

Content	(MSB)							(LSB)	
	D7	D6	D5	D4	D3	D2	D1	D0	
Display control	0	0	0	0	D0	LOSC	BL1	BL0	
Background control	0	1	0	0	0	BS1	BS0	Eg	
Background color control	0	0	0	1	Rb	Gb	Bb	Egc	
Progressive scan control	0	0	1	1	0	0	VC	HC	
Video RAM all reset	0	0	1	1	0	1	0	0	

## 2. 2-byte command

Content	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
Display position control	1	0	0	0	0	0	V4	V3	V2	V1	V0	H4	H3	H2	H1	H0
Character write address control	1	0	0	0	0	1	0	AR3	AR2	AR1	AR0	AC4	AC3	AC2	AC1	AC0
Character RAM write address control	1	0	0	0	0	1	1	RW3	RW2	RW1	RW0	RL4	RL3	RL2	RL1	RL0
Character size, smooth, mask pulse control	1	0	0	0	1	MP	S1	S0	0	0	SM1	SM0	AR3	AR2	AR1	AR0

## 3. 2nd byte continuous command

Content	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
Display character control	1	1	0	0	R	G	B	Blink	C7	C6	C5	C4	C3	C2	C1	C0

## POWER ON RESET

At the time of power on, the internal states of this IC are indefinite (unknown). For this reason, be sure to perform the Power ON Reset operation to set the IC to the initialized states by turning the voltage level of the PCL pin from Low to High. The commands to be set by this Power ON Reset operation are as follows:

- The contents of the character RAM are all Reseted to "0" (without dot).
- The word address and line address values of the character RAM are initialized to the first word and first line, respectively.
- The Progressive scan Control command is initialized to "Normal TV mode" (VC bit, HC bit = 0, 0).
- Test mode is released.

The time required for POWER ON RESET can be obtained from the following expression:

$$t = t_{PCLL} + \text{Video RAM Reset time} \\ = 10 (\mu s) + 12/f_{osc} (\text{MHz}) \times 288$$

- Video RAM related parameters are also initialized. For details, see the paragraph "Video RAM All Reset Command" below.

## Video RAM All Reset Command

When this command is executed, Display OFF, Losc Oscillation ON, and Video RAM Write mode are automatically set and these settings remain unchanged until execution of other commands even after the Video RAM All Reset command.

The commands to be set by the Video RAM All Reset command are as follows:

- All the character data of the video RAM are Reseted to "EFH" (namely, they become display OFF data).
- The line and column address values of the video RAM are set to "0".
- The character color and blinking control specifications are set to "Black" and "OFF" respectively.
- The character size specification is set to "1 H" (normal size) with respect to all lines.
- The smooth function specification is set to "OFF" with respect to all lines.
- The mask pulse data of all lines are reset, inhibiting any mask pulse from being output.

With respect to the character RAM, the data stored and the line address and word address values will remain unchanged.

## OSCILLATION CONTROL

With this IC, oscillation ON/OFF control can be effected with the Display Control command and thus power can be saved by stopping oscillation while characters are not being displayed on the screen. Even if oscillation is stopped by the oscillation OFF function, characters may or may not be output. So, be sure to use this function in conjunction with the Display OFF function.

Neither the video RAM nor the character RAM can be rewritten with oscillation being stopped.

**Note:** When display is ON, the oscillation synchronizes  $\overline{H_{sync}}$ , so the oscillation is stopping at the low level term of  $\overline{H_{sync}}$ .  
When display is OFF, the oscillation keeps on irrespective of  $\overline{H_{sync}}$ .

## CHARACTER BLINKING

With this IC, blinking can be effected for each character by executing the Display Control command.

The character to blink must be specified with the Display Character, Blinking, and Character Data Control commands.

The blinking ON/OFF ratio (the ratio of the blink ON time to the blink OFF time) is 1 : 1 and the blinking frequency is selectable from among about 2 Hz, about 1 Hz, and about 0.5 Hz.

### Display Control Command

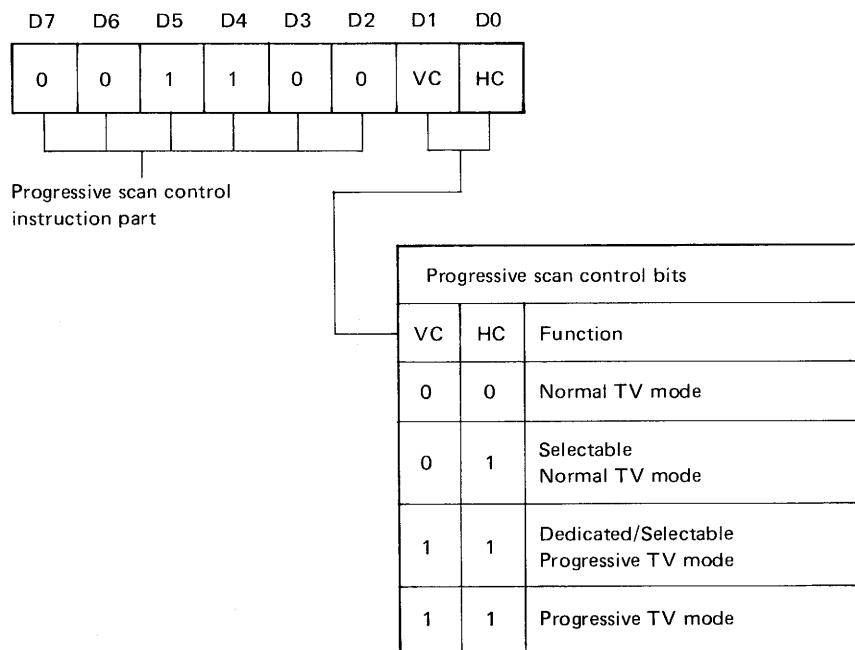

**Note:** The Display ON/OFF function is activated in synchronization with the Low-to-High transition of the  $\overline{H_{sync}}$  signal.

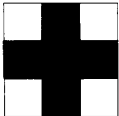

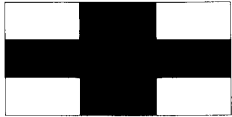

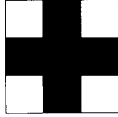

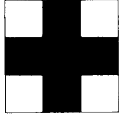

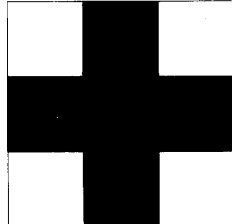

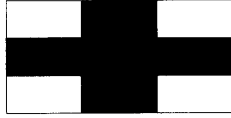

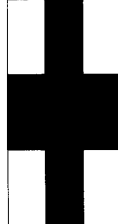

## PROGRESSIVE SCAN CONTROL

Progressive scan can be specified independently in the vertical and horizontal directions. By combining the Progressive scan Control command with oscillation frequency  $f_{osc}$ , character design may be changed. μPD6453 builds in 1/2 cycle dividers. So it is possible to indicate the same size characters on normal and progressive scan TV screen in according to switching by command.

### Progressive scan Control Command

Conceptual Diagram of Character Design (TV mode/ $f_{osc}$ / Command)

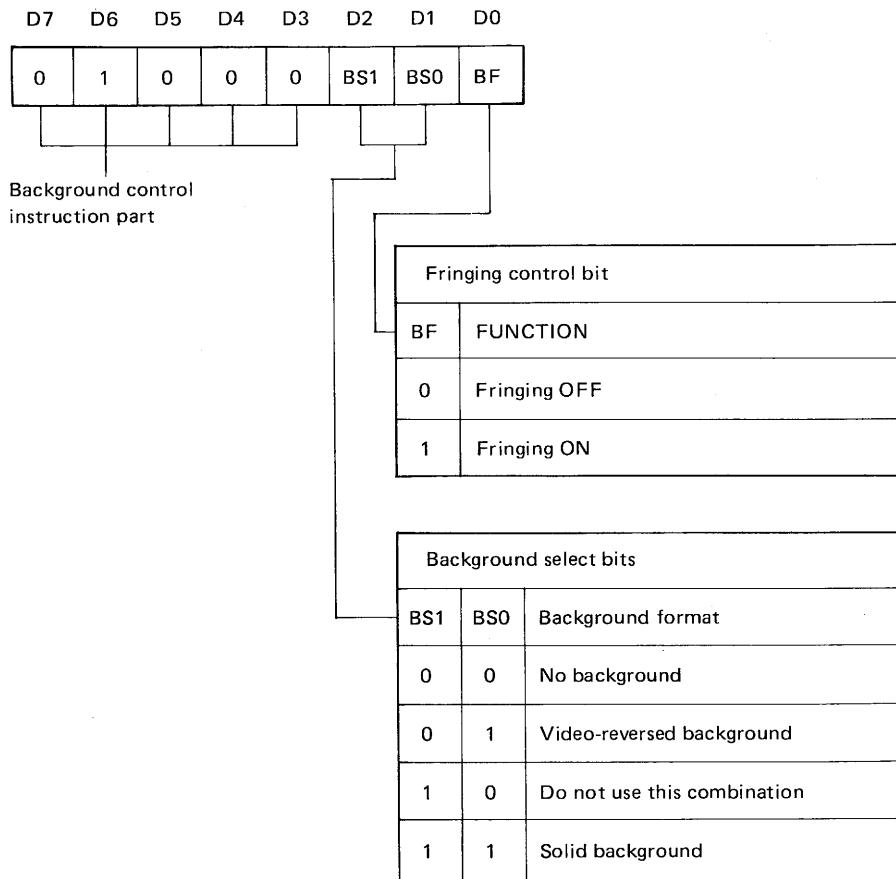

VC	HC	Normal TV mode $f_{osc} = f_x$	DS/Normal selectable TV mode	
			Double-speed TV mode $f_{osc} = 2 f_x$	Normal TV mode $f_{osc} = 2 f_x$
0	0			
0	1			
1	0			
1	1			

- When using this IC in Normal TV mode only, use  $f_{osc} = f_x$  with (VC, HC = 0, 0).
- When using this IC in Progressive scan TV mode only, use  $f_{osc} = 2 f_x$  with (VC, HC = 1, 0).
- When using this IC in Normal TV and Progressive scan TV modes selectively for EDTV system, use  
 $f_{osc} = 2 f_x$  with (VC, HC = 0, 1) in Normal TV mode  
 $f_{osc} = 2 f_x$  with (VC, HC = 0, 1) in Progressive scan mode  
 $f_x$  : oscillation frequency for normal scan TV.  
 $2f_x$  : oscillation frequency for progressive scan TV.

## BACKGROUND SPECIFICATION

The type of background (no background, Square background, or solid background) and the background fringing ON/OFF function can be specified for each screen with the Background Control command. Background fringing is carried out irrespective of the character size and is effective only for one dot which is the minimum size.

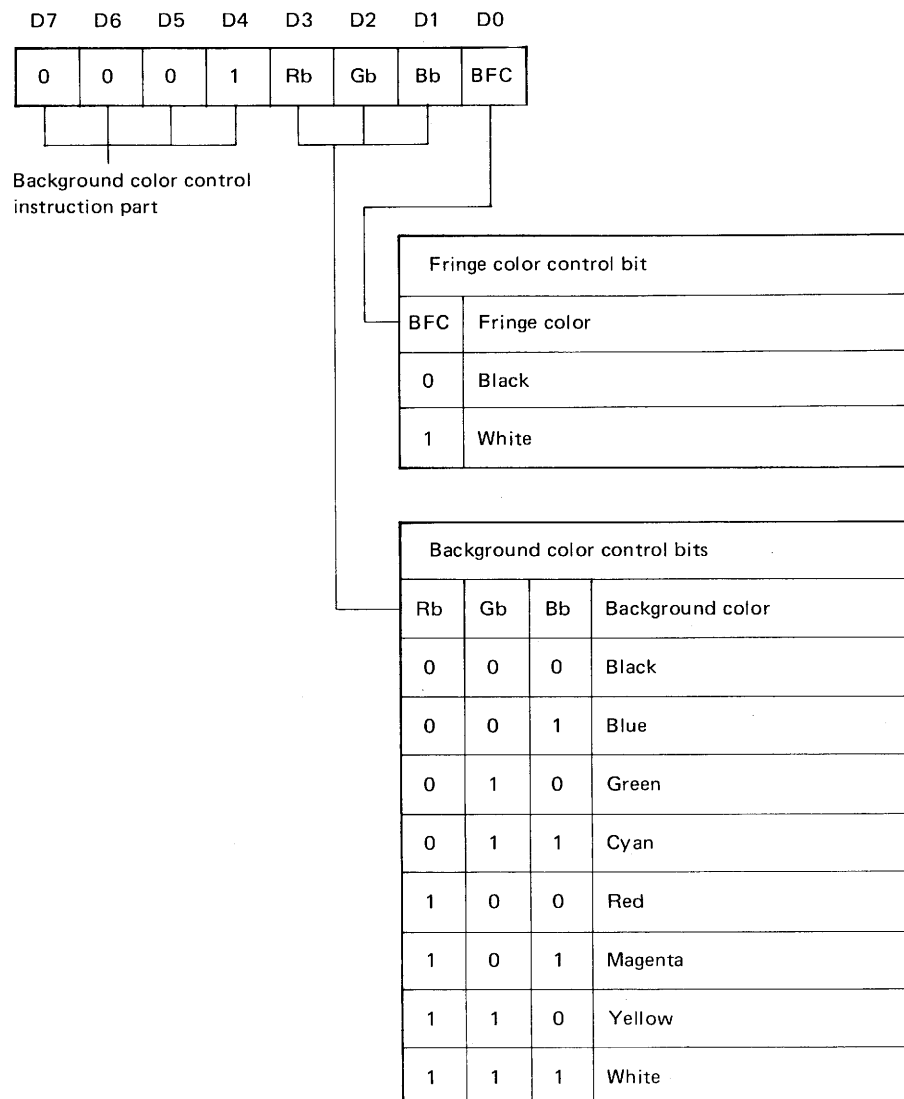

### Background Control Command

## BACKGROUND COLOR SPECIFICATION

The background color (black, blue, green, cyan, red, magenta, yellow, or white) can be specified for each character and the background fringe color (black or white) can be specified for each screen. Both colors can be set at the same time by using the Background Color Control command.

### Background Color Control Command

**Note:** The background color and background fringe color specifications are valid only when "Solid background" or "Square background" and "Fringe ON" have been specified with the Background Control command.

Display format in Each Background Mode

No background

Fringe

Square background + Fringe

Solid background + Fringe

**Note:** The solid character data means the data of character code 1 F<sub>H</sub> (Standard type of NEC).  
It is possible to establish the background and the fringe at the same time.

# 1. No background

Only characters are displayed.

# 2. Fringe

Characters with black fringe are displayed. Black fringe of a character which is used the edge of dot-matrix (right and left) is displayed in neighbor character area for 1 dot.

The fringe is the dot of the smallest character size and irrespective of character size.

# 3. Square background

The black square background is displayed in character display area.

In this case, the background is displayed in outside of character display area (right and left) for 1 dot.

In case of using "Display OFF data", the background is displayed in the inside edge of "Display OFF data" for 1 dot.

# 4. Solid background

The black solid background is displayed in the all area of screen.

In case of using "Display OFF data", the background is displayed in the inside edge of "Display OFF data" for 1 dot.

In case of using "Display OFF data".

## ○ Square background

## ○ Solid background

**Note:** The "1 dot" is the dot of the smallest character size and irrespective of character size.

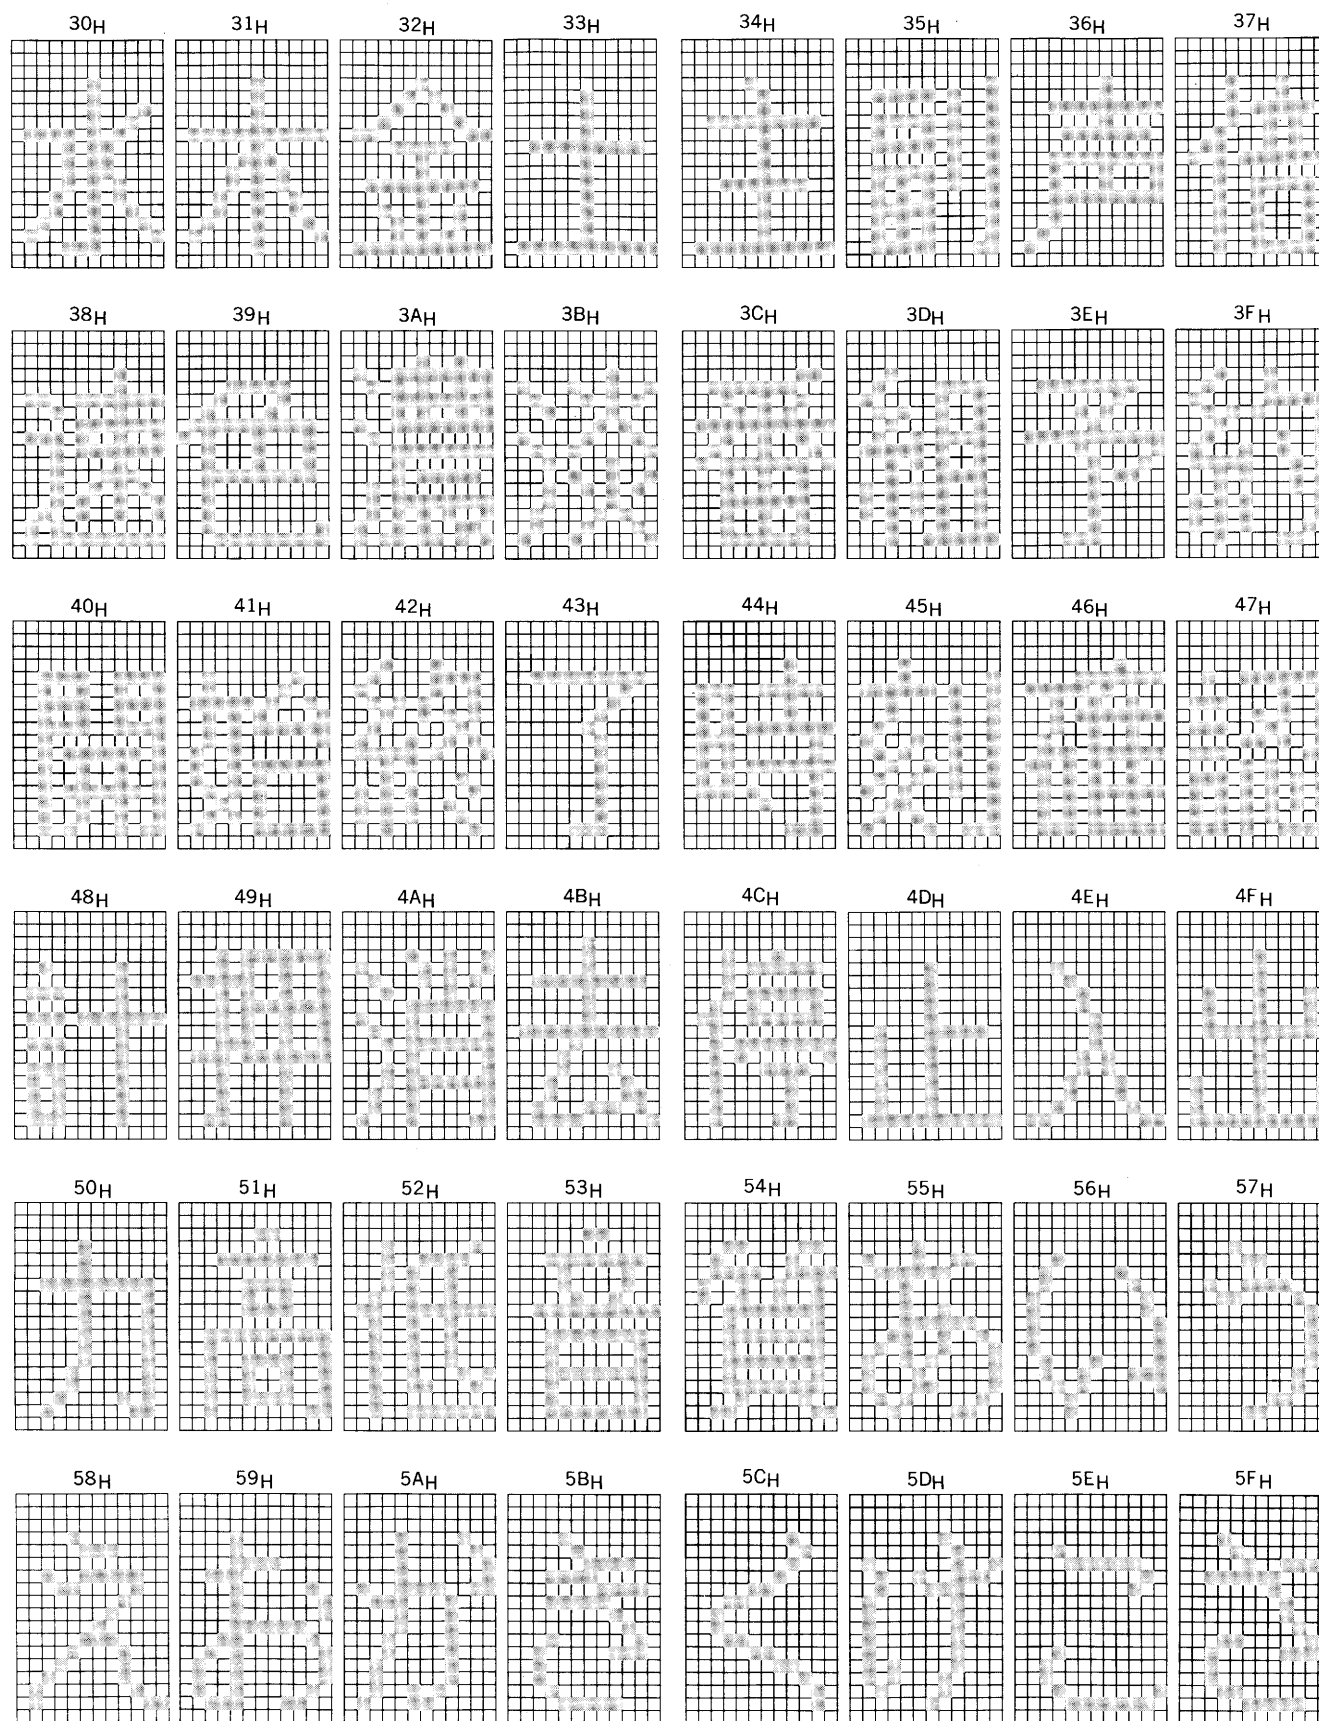

**$\mu$ PD6453CY-001/ $\mu$ PD6453GT-101 Character Pattern**

As shown in the following,  $\mu$ PD6453CY-001/ $\mu$ PD6453GT-101 enables display of 240 character generator ROM patterns and 16 patterns to be set in the character generator RAM by the CRAM write data command. The 240 character generator ROM patterns can be changed by the mask code option. However, character code "EFH" is fixed to the display OFF code so that no character pattern can be input to this code.

$\mu$ PD6453CY-001 and  $\mu$ PD6453GT-101 have the same character patterns in the character generator ROM though their packages are different.

## μPD6453CY-001, μPD6453GT-101 Character Pattern

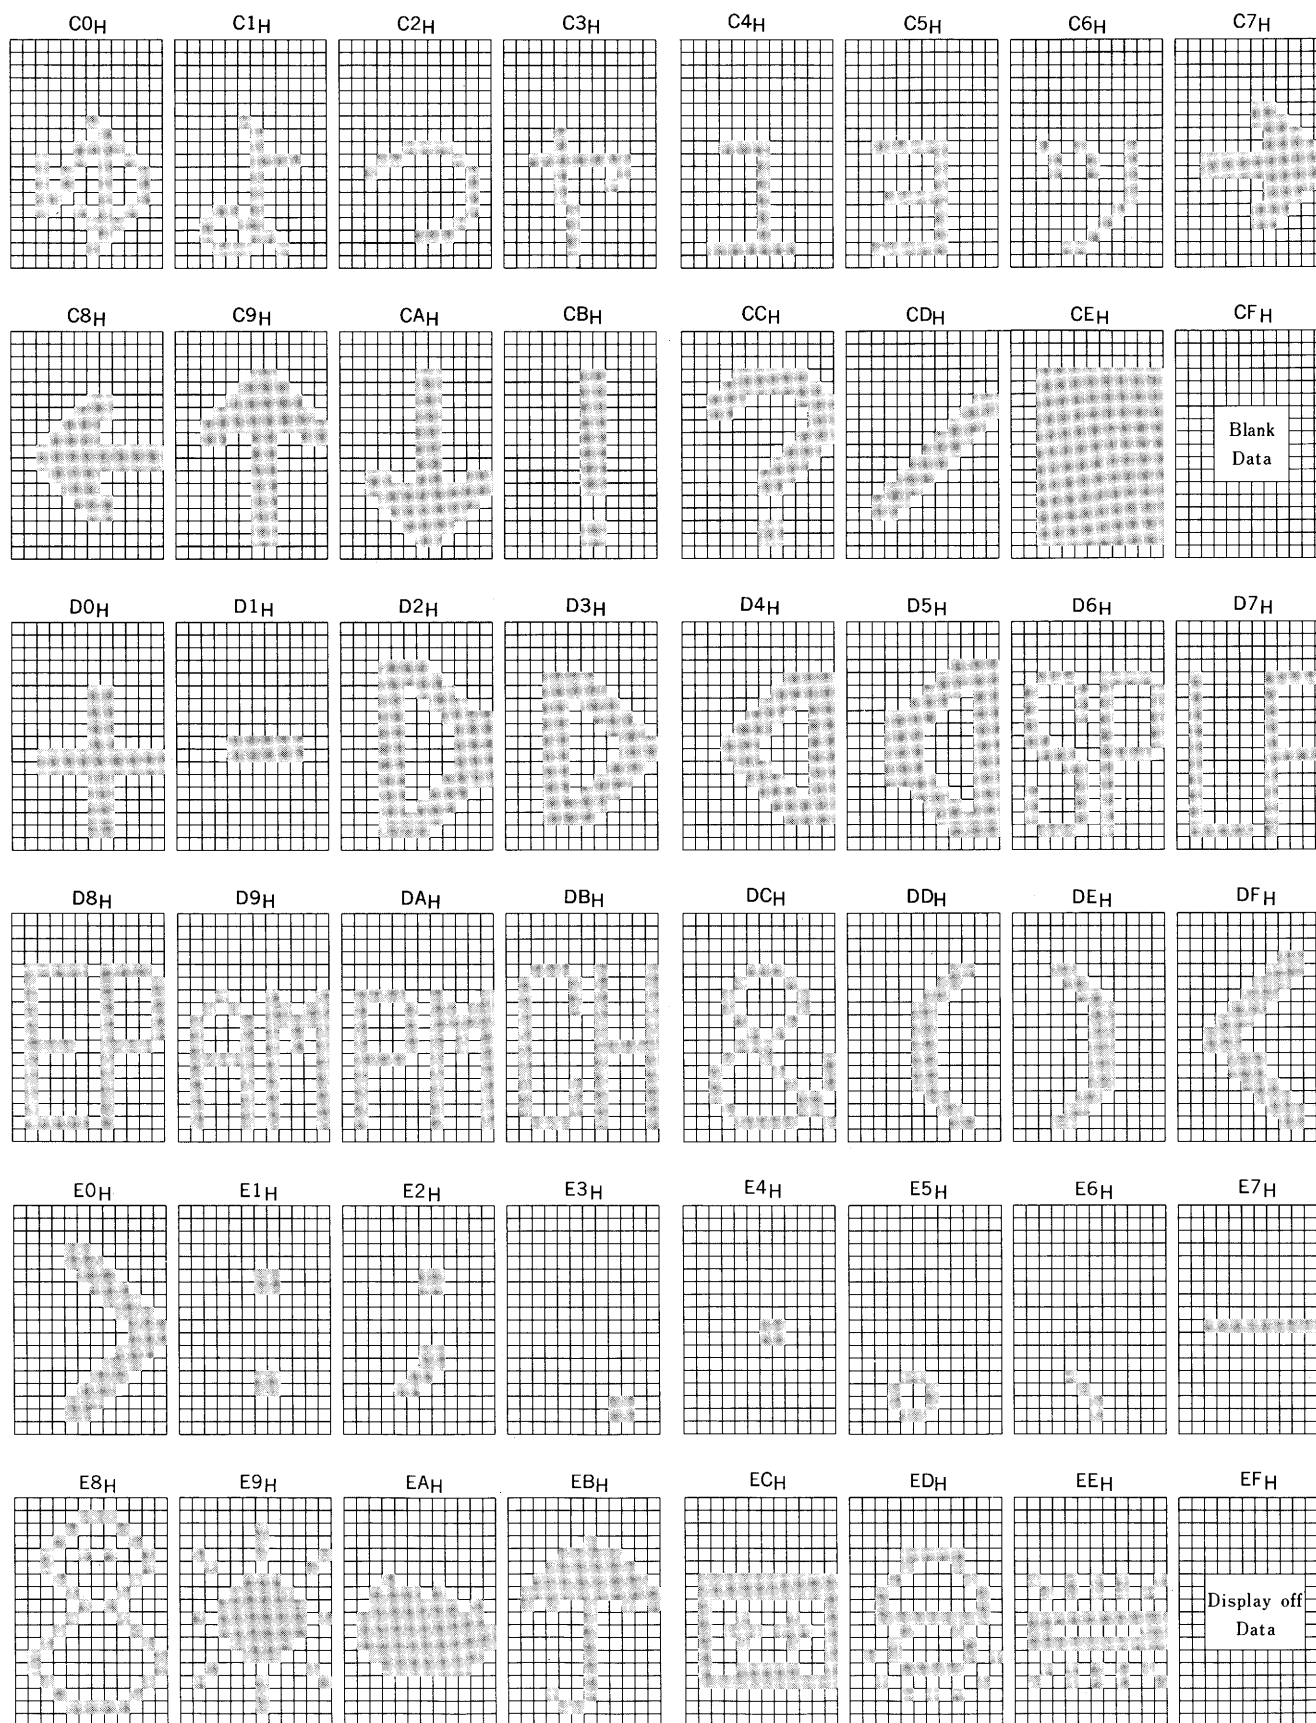

Figure 1 displays a 2x8 grid of 16 empty 10x10 grids, each labeled with a symbol from  $F0_H^{**}$  to  $FF_H^{**}$ . The labels are arranged in two rows of eight. The top row contains  $F0_H^{**}$ ,  $F1_H^{**}$ ,  $F2_H^{**}$ ,  $F3_H^{**}$ ,  $F4_H^{**}$ ,  $F5_H^{**}$ ,  $F6_H^{**}$ , and  $F7_H^{**}$ . The bottom row contains  $F8_H^{**}$ ,  $F9_H^{**}$ ,  $FA_H^{**}$ ,  $FB_H^{**}$ ,  $FC_H^{**}$ ,  $FD_H^{**}$ ,  $FE_H^{**}$ , and  $FF_H^{**}$ . Each grid is a 10x10 square with a grid of lines, and the labels are centered above each grid.

**\*\* Character generator RAM area**

(The character patterns are set in this area with the data sent from the microcomputer.)

# Character Display

The number of characters displayed is 12 lines x 24 columns; that is, 288 as shown below:

AC4,AC3,AC2,AC1,AC0				00000	00001	00010	00011	00100	00101	00110	00111	01000	01001	01010	01011	01100	01101	01110	01111	10000	10001	10010	10011	10100	10101	10110	10111

	1011																										

The write address is incremented automatically after the display character data is input.

Column address counter AC<sub>4</sub>, AC<sub>3</sub>, AC<sub>2</sub>, AC<sub>1</sub>, AC<sub>0</sub>

Line address counters AR<sub>3</sub>, AR<sub>2</sub>, AR<sub>1</sub>, AR<sub>0</sub>

## CHARACTER RAM WRITE ADDRESS CONTROL

The write word address and write line address of the character RAM can be specified with the Character RAM Write Address Control command.

Each time data is input, both the line address and word address are automatically incremented by 1. For the method of writing data into the character RAM, see the paragraph "Character RAM Write Data Control" on the next page.

### Character RAM Write Address Control Command

(Because this command is a 2-byte command, 16 bits must be fully input for this command at the time of continuous command input.)

## CHARACTER RAM WRITE DATA CONTROL

Input data for writing into the character RAM can be specified with the Character RAM Write Data Control command. This command is valid only when the word address and line address of the character RAM have been specified with the Character RAM Write Address Control command. This command must be input with the Losc being set in the Oscillation ON state.

As long as the CS signal remains Low (active), both the line address and word address of the character RAM are automatically incremented by 1 each time the data for one command is input.

### Character RAM Write Data Control Command

(Because this command is a 2-byte command, 16 bits must be fully input for this command at the time of continuous command input.)

## CHARACTER SIZE, SMOOTH, & MASK PULSE CONTROL

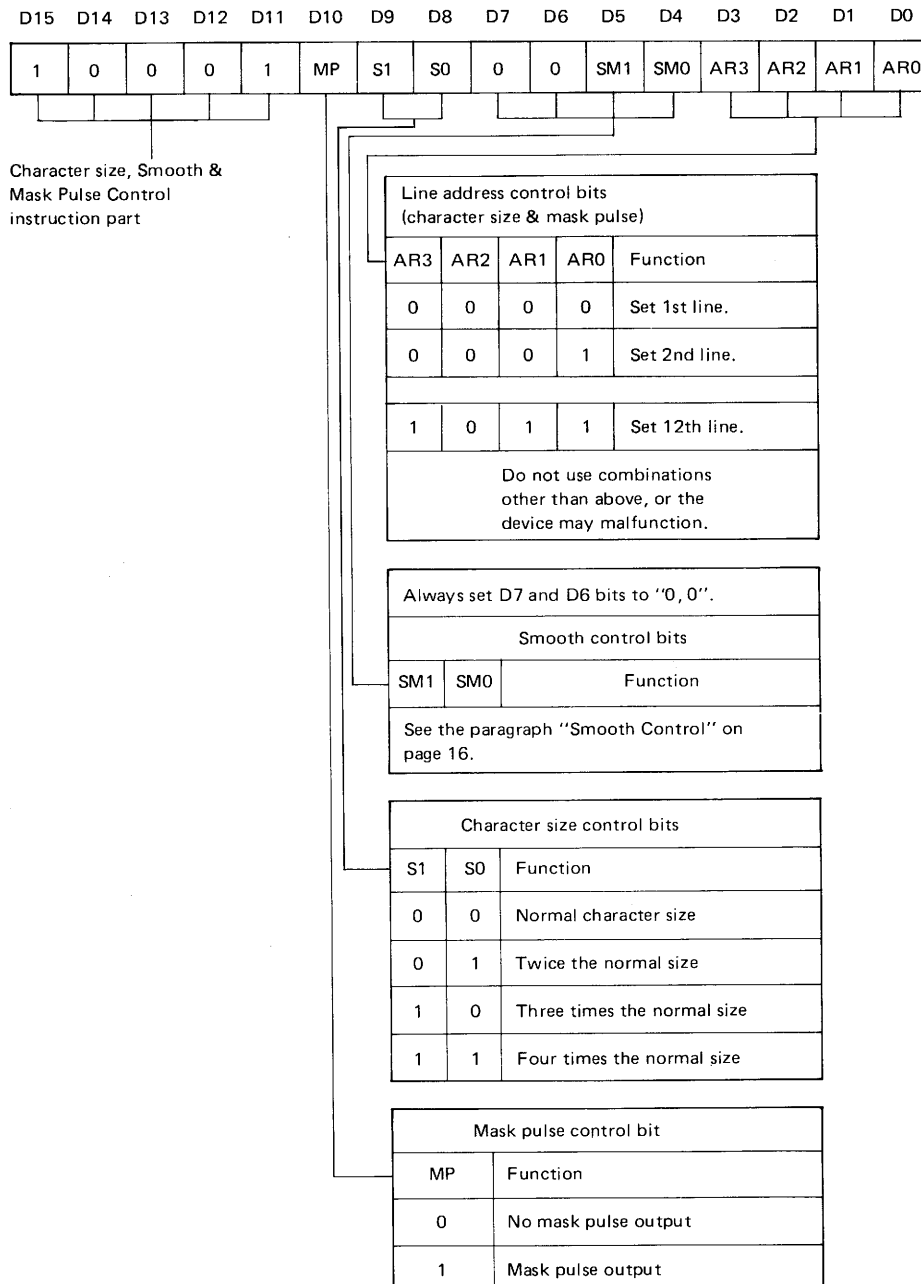

Character size, smooth function (in Character Enlarged mode), and mask pulse (Mask code option) can be specified with the Character Size, Smooth, and Mask Pulse Control command.

A character size common to both the vertical and horizontal directions is selectable in units of lines from among 1H (normal size) to 4H (four times the normal size).

For the method of writing character data, see the paragraph "Display Character Control" on page 33.

### Character Size, Smooth, & Mask Pulse Control Command

(Because this command is a 2-byte command, 16 bits must be fully input for this command at the time of continuous command input.)

**Note:** The MP (mask pulse) control bit is valid only when the mask pulse function has been selected with the Mask code option. If this function has not been selected, set the MP bit to "0".

The horizontal size of one character depends on the oscillation frequency ( $f_{OSC}$ ), and the vertical size of one character depends on the number of scanning lines. In case of the smallest character size, one horizontal dot size is  $1/f_{OSC}$ , and one vertical dot size is two scanning lines (in the frame).

## SMOOTH (INTERPOLATION) CONTROL

In the Character Enlarged mode (two to four times the normal size), the smooth function can be set in units of lines to smooth each displayed character.

### Smooth Control Command

(Because this command is a 2-byte command, 16 bits must be fully input for this command at the time of continuous command input.)

\* See page 12 for explanation of these bits.

Always set D7 and D6 bits to "0,0".		
Smooth control bits		
SM1	SM0	Function
0	X	No smooth function
1	0	Class 1 smooth
1	1	Class 2 smooth

X: Don't care.

### Description of each smooth type

Class I smooth = Smooth A + Smooth B  
 Class II smooth = Smooth A + Smooth B + Smooth C + Smooth D

# An Example of Smooth

1H/dot

2H/dot

3H/dot

4H/dot

With dots

Smooth dots

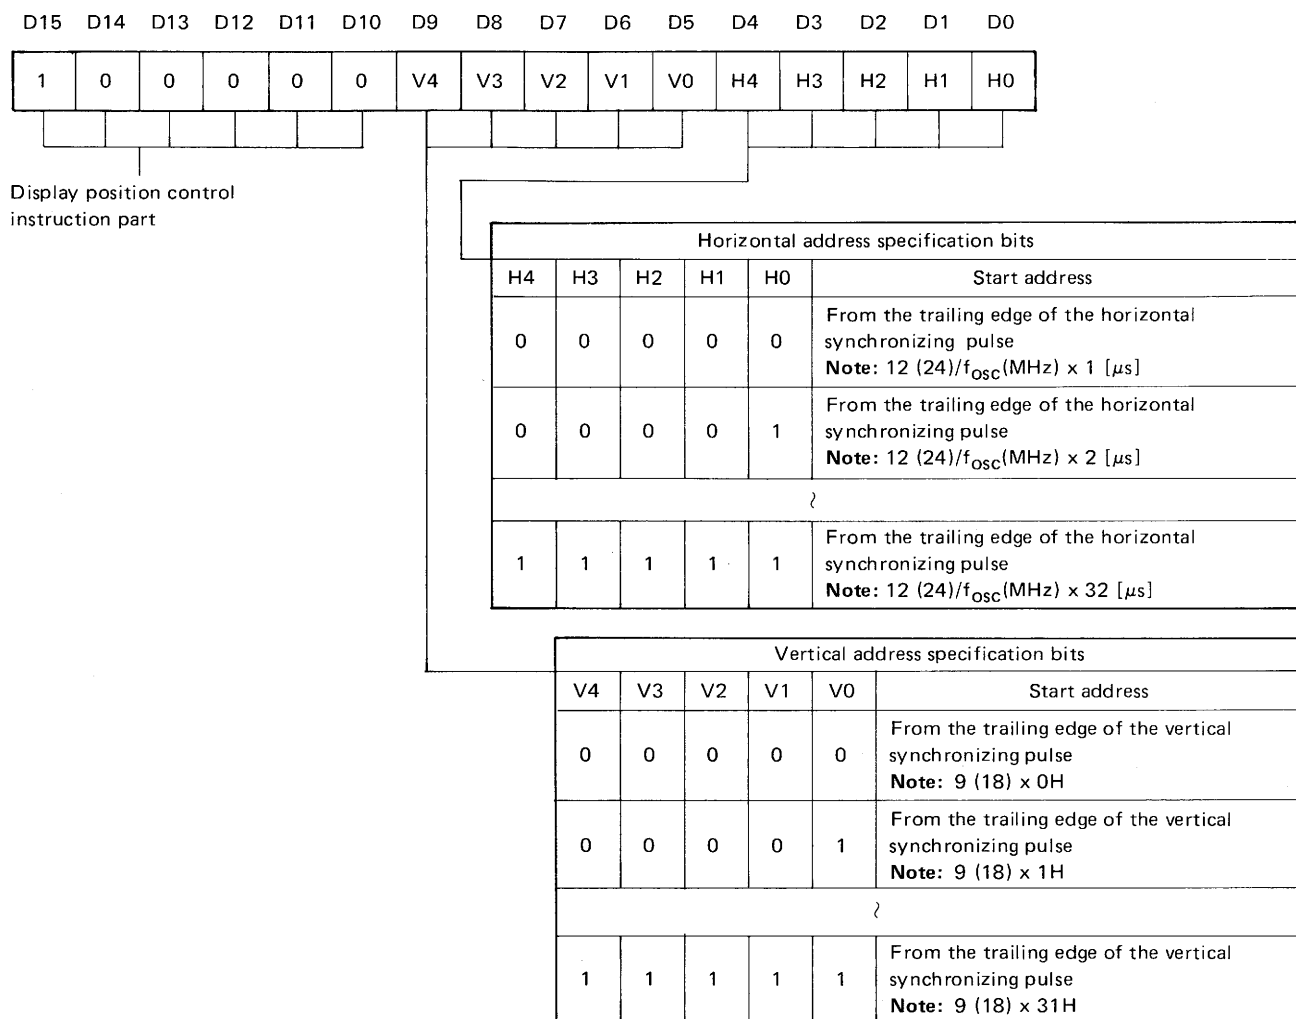

## DISPLAY POSITION CONTROL

It is possible to set 32 steps for vertical and horizontal direction.

### Display Position Control Command

(Because the command is a 2-byte command, 16 bits must be fully input for this command at the time of continuous command input.)

( ): Progressive TV

## Character Write Address Control

Line and column address of VRAM which is written the character data can be specified with the character write address control command.

Please refer to the section of Display Character Control command about writing the character data.

### Character Write Address Control Command

(Because this command is a 2-byte command, 16 bits must be fully input for this command at the time of continuous command input.)

Character write address  
control instruction part

Column addressing bits					Function
AC4	AC3	AC2	AC1	AC0	
0	0	0	0	0	Set the 1st line.
0	0	0	0	1	Set the 2nd line.
}					
1	0	1	1	1	Set the 24th line.
}					Do not set an address other than the addresses 0H through 17H.

Line addressing bits				Function
AR3	AR2	AR1	AR0	
0	0	0	0	Set the 1st line.
0	0	0	1	Set the 2nd line.
}				
1	0	1	1	Set the 12th line.
}				Do not set an address other than addresses 0H through BH.

## WRITING DISPLAY CHARACTER DATA, CHARACTER COLOR, AND BLINKING DATA

The write address of data can be set directly in the address counter by using the Character Write Address Control command.

After the write address has been set, the display character data must be entered. The character color and blinking data are written into the video RAM and at the same time retained in the internal registers. The display character data is written into the video RAM and the write address is automatically incremented by 1.

When character data is to be input without changing the character color and blinking data, the Display Character Control command can be input in an abbreviated format by entering only its low-order 8 bits (character address) while the CS signal is being held in the Low state. After the command input, the write address is automatically incremented by 1.

The character data, character color, and blinking data can be set with the Display Character Control command.

### Display Character Control Command

As mentioned above, the character data, character color, and blinking data to be written into the video RAM can be specified with the Display Character Control command. This command must be input with the Losc being set in the Oscillation ON state. When characters are to be input successively without changing the character color and blinking data, only the low-order 8 bits of this command need to be input for the second and subsequent characters, because this command is a 2nd byte continuous command.

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	0	R	G	B	Blink	C7	C6	C5	C4	C3	C2	C1	C0

Display Character Control instruction part

Character specification bits								Function
C7	C6	C5	C4	C3	C2	C1	C0	
0	0	0	0	0	0	0	0	Outputs the data for character code 00 <sub>H</sub> .
0	0	0	0	0	0	0	1	Outputs the data for character code 01 <sub>H</sub> .
}								
1	1	1	1	1	1	1	1	Outputs the data for character code 6E <sub>H</sub> .

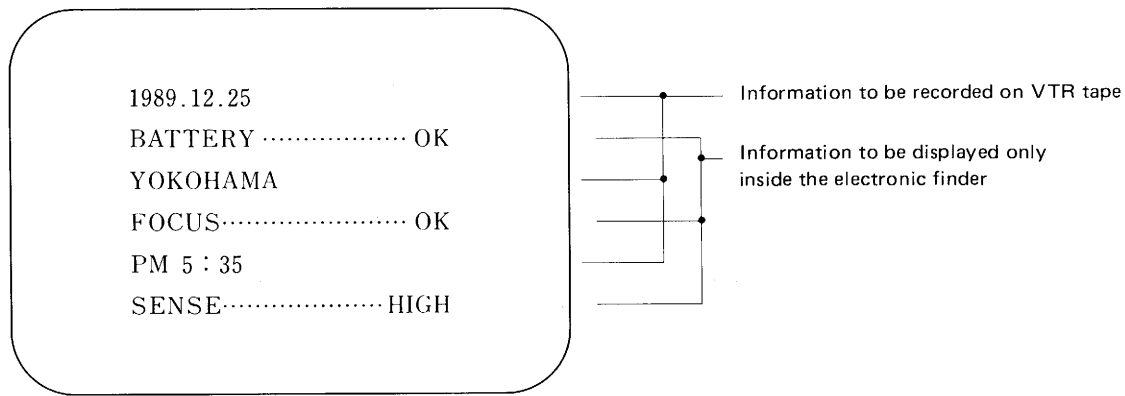

00<sub>H</sub> to EE<sub>H</sub>; CROM, F0<sub>H</sub> to FF<sub>H</sub>; CRAM, EF<sub>H</sub>; Display off data

Blink selecting bits	
Blink	Function
0	No blinking
1	Blinking

Character color selecting bits				Character color
R	G	B		
0	0	0		Black
0	0	1		Blue
0	1	0		Green
0	1	1		Cyan
1	0	0		Red
1	0	1		Magenta
1	1	0		Yellow
1	1	1		White

### Mask Pulse Function (Mask Code Option)

When used in a VCR camera, the on-screen ICs provide two types of information; information to be recorded on VCR tape, such as the date and title, and information to be displayed only inside the electronic view finder, such as the battery, focus, sensitivity, and mode. For proper use of these two types of information, the mask option allows the  $V_{MON}$  terminal to be used as the character-by-character signal output terminal.

**Example:** The mask pulse is to be output to line addresses 1 H, 3 H, and 5 H with vertical address 0 H and a character size of 1 H/dot.

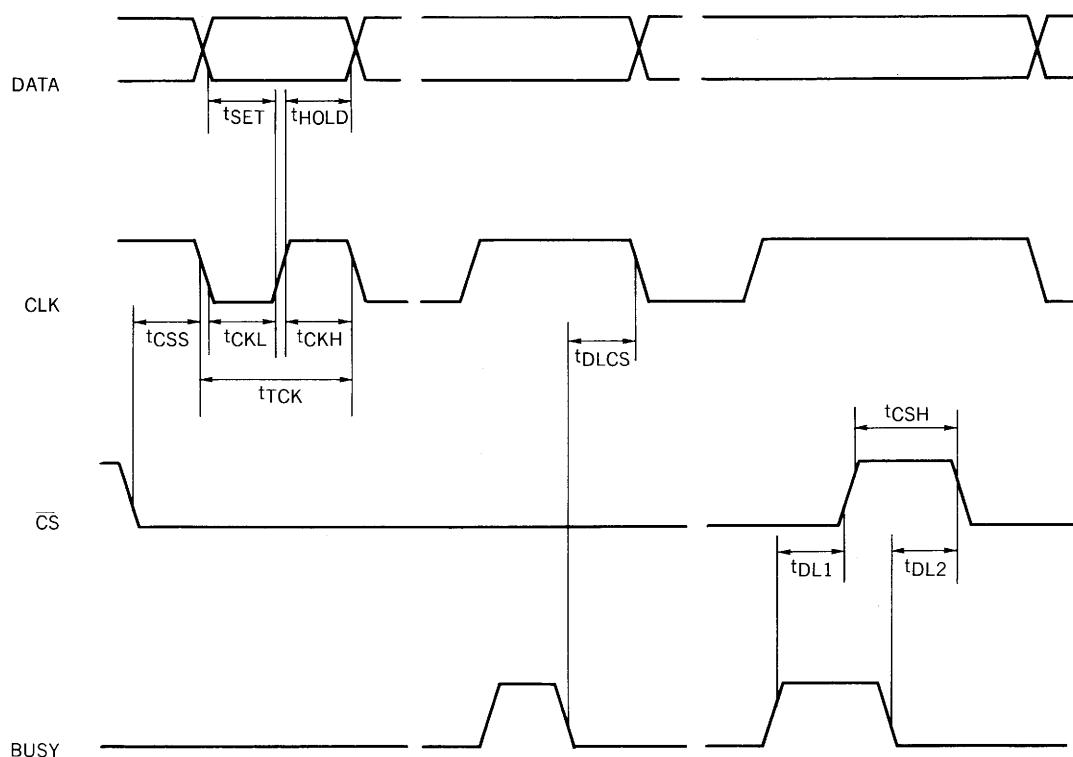

The leading and trailing edges of the mask pulse are synchronized with the trailing edge of  $H_{sync}$ .

## RECOMMENDED CONDITIONS FOR OPERATION TIMING

(T<sub>a</sub> = 25 °C, V<sub>DD</sub> – V<sub>SS</sub> = 5.0 V)

ITEM	SYMBOL	CONDITION	MIN.	TYP.	MAX.	UNIT
Minimum Setup Time	t <sub>SET</sub>		400			ns
Minimum Hold Time	t <sub>HOLD</sub>		400			ns
Minimum Clock Width at Low Level	t <sub>CKL</sub>		400			ns
Minimum Clock Width at High Level	t <sub>CKH</sub>		400			ns
Clock Cycle	t <sub>TCK</sub>		1.0			μs
$\overline{\text{CS}}$ Minimum Setup Time	t <sub>CSS</sub>		400			ns
$\overline{\text{CS}}$ Minimum Hold Time	t <sub>CSH</sub>		400			ns
Delay Time 1 (from BUSY rising)	t <sub>DL1</sub>		400			ns
Delay Time 2 (from BUSY falling)	t <sub>DL2</sub>		400			ns
Minimum Busy to CLK Time	t <sub>DLCS</sub>		400			ns
Minimum $\overline{\text{VSYNC}}$ Width at Low Level	t <sub>VWL</sub>		4			μs
Minimum $\overline{\text{Hsync}}$ Width at High Level	t <sub>HWL</sub>		4			μs

For format data, the BUSY signal goes low after the internal state is completely established. It also goes low when writing data into the VRAM is finished.

When writing data into the VRAM extends to the horizontal flyback time, the BUSY signal lasts longer than usual. (This is because oscillation is off and data cannot be written into the VRAM during the horizontal flyback time.)

Power ON Reset

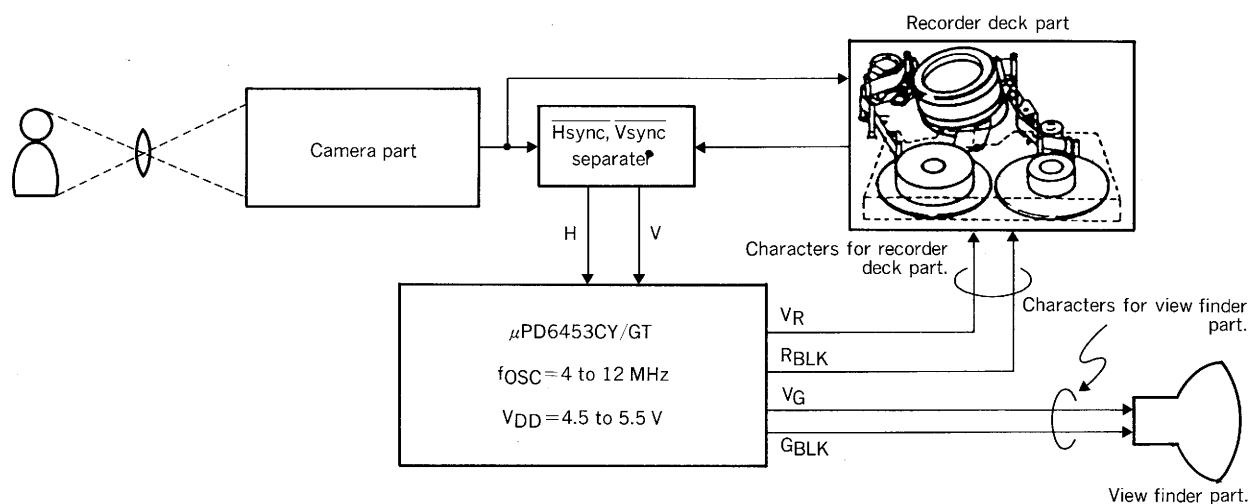

ITEM	SYMBOL	CONDITION	MIN.	TYP.	MAX.	UNIT
PCL terminal Minimum Low Hold Time	$t_{PCLL}$		10			$\mu s$

# Application of $\mu$ PD6453

$\mu$ PD6453 has 3 blanking signals output terminals. These terminals ( $R_{BLK}$ ,  $G_{BLK}$ ,  $B_{BLK}$ ) outputs the blanking signals which correspond to all character signals output ( $V_R$ ,  $V_G$ ,  $V_B$ ).

This diagram shows application of  $\mu$ PD6453 for camera recorder.

For example,  $V_G$  and  $G_{BLK}$  terminals are connected to the view finder part,  $V_R$  and  $R_{BLK}$  terminals are connected to the recorder deck part.

It is possible to indicate characters only on view finder part by specifying character color G, and it is possible to indicate characters on both parts (the view finder part and the recorder deck part) by specifying character color R + G.

NEC corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

The devices listed in this document are not suitable for use in the field where very high reliability is required including, but not limited to, aerospace equipment, submarine cables, nuclear reactor control systems and life support systems. If customers intend to use NEC devices for above applications or those intended to use "Standard", or "Special" quality grade NEC devices for the applications not intended by NEC, please contact our sales people in advance.

Application examples recommended by NEC Corporation

Standard: Data processing and office equipment, Communication equipment (terminal, mobile), Test and Measurement equipment, Audio and Video equipment, Other consumer products, etc.

Special: Automotive and Transportation equipment, Communication equipment (trunk line), Train and Traffic control devices, industrial robots, Burning control systems, antidisaster systems, anticrime systems etc.
