

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

IEEE1394 400Mbps PHY

The μ PD72850A is the 3-port physical layer LSI which complies with the P1394a draft 2.0 specifications.

The μ PD72850A works up to 400 Mbps. It is an upgrade of NEC's μ PD72850.

FEATURES

- The Three-port Physical Layer LSI complies to IEEE P1394a draft 2.0
- Connection debounce
- Arbitration enhancements
 - Arbitrated short bus reset
 - Ack-accelerated arbitration
 - Fly-by concatenation
 - Multiple-speed packet concatenation
 - Arbitration enhancements and cycle start (controlled by the Link layer)
- Performance optimization via PHY ping
- Priority arbitration (controlled by the Link layer)
- Data rate: 393.216 / 196.608 / 98.304 Mbps
- Compliant with Suspend/Resume function as defined in P1394a draft 2.1
- 3.3 V single power supply
- Electrical isolated Link interface
- 24.576 MHz crystal clock generation, 393.216 MHz PLL multiplying frequency
- System power management by signaling of node power class information
- Cable power monitor (CPS) is equipped
- Fully interoperable with IEEE1394 std 1394 Link (FireWire™, i.LINK™)
- Cable bias and terminal voltage driver supply function (for 3-port each)
- Separate digital power and analog GND
- Enable/Disable port control switch when power supply is powered on
- Support Suspend/Resume Off mode (Compliant with P1394a draft 1.3)
- Number of supported port are selectable
 - 1port, 2port, 3port. This selection is only under Suspend/Resume Off mode
- Compliant with MD8405E (FUJIFILM MICRODEVICES CO., LTD)

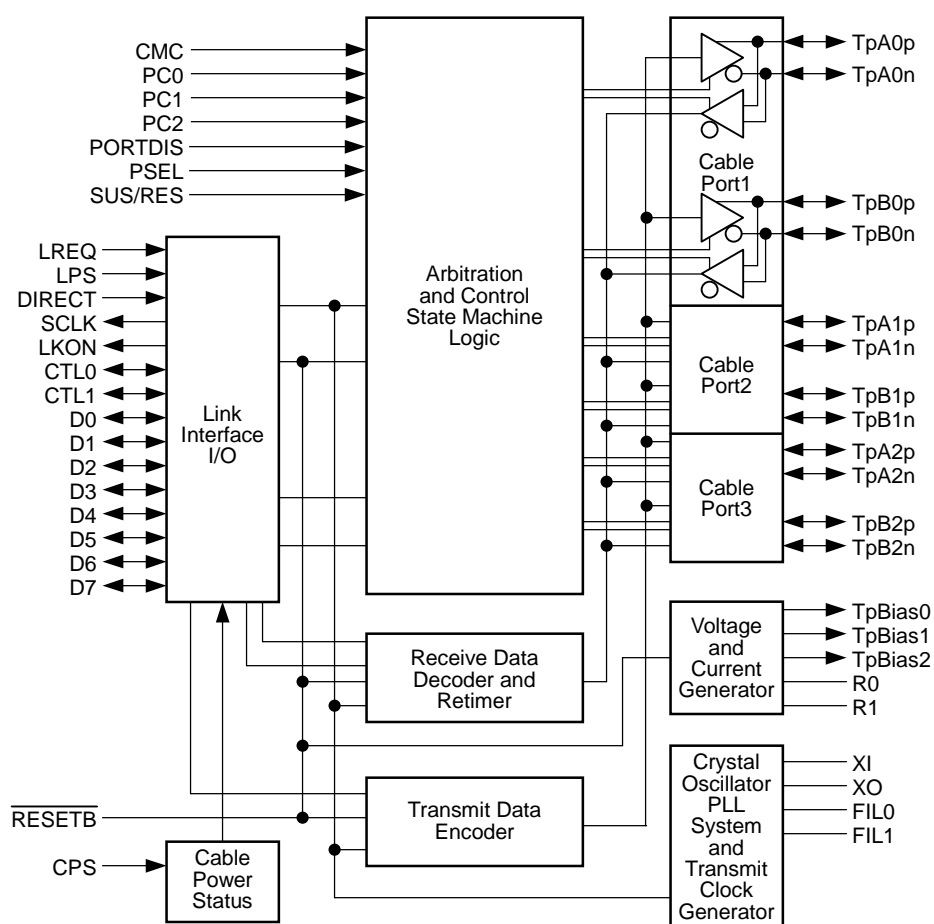

ORDERING INFORMATION

Part number	Package
μ PD72850AGK-9EU	80-pin plastic TQFP (Fine pitch) (12 x 12 mm)

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.

Not all devices/types available in every country. Please check with local NEC representative for availability and additional information.

BLOCK DIAGRAM

PIN CONFIGURATION (Top View)

- 80-pin plastic TQFP (Fine pitch) (12 x 12 mm)

PIN NAME

AGND	: Analog GND
AV _{DD}	: Analog Power
CMC	: Configuration Manager Capable
CPS	: Cable Power Status
CTL0	: Link Interface Control (bit 0)
CTL1	: Link Interface Control (bit 1)
D0-D7	: Data Input/Output
DGND	: Digital GND
Direct	: PHY/Link Isolation Barrier Control Input
DV _{DD}	: Digital V _{DD}
FIL0	: APLL Filter Ground
FIL1	: APLL Filter
IC(H)	: Internally Connected (High Clamped)
LKON	: Link-on Signal Output
LPS	: Link Power Status Input
LREQ	: Link Request Input
PC0-PC2	: Power Class Set Input
PORTDIS	: Port Disable
PSEL	: Support Number of Port Select
RESETB	: Power on Reset Input
RI0	: Reference Power Set, Connect Resistor 0
RI1	: Reference Power Set, Connect Resistor 1
SCLK	: Link Control Output Clock
SUS/RES	: Suspend/Resume Function Select
TpA0n	: First Port Twisted Pair Cable A Negative Phase I/O
TpA0p	: First Port Twisted Pair Cable A Positive Phase I/O
TpA1n	: Second Port Twisted Pair Cable A Negative Phase I/O
TpA1p	: Second Port Twisted Pair Cable A Positive Phase I/O
TpA2n	: Third Port Twisted Pair Cable A Negative Phase I/O
TpA2p	: Third Port Twisted Pair Cable A Positive Phase I/O
TpB0n	: First Port Twisted Pair Cable B Negative Phase I/O
TpB0p	: First Port Twisted Pair Cable B Positive Phase I/O
TpB1n	: Second Port Twisted Pair Cable B Negative Phase I/O
TpB1p	: Second Port Twisted Pair Cable B Positive Phase I/O
TpB2n	: Third Port Twisted Pair Cable B Negative Phase I/O
TpB2p	: Third Port Twisted Pair Cable B Positive Phase I/O
TpBias0	: First port Twisted Pair Output
TpBias1	: Second Port Twisted Pair Output
TpBias2	: Third Port Twisted Pair Output
XI	: Crystal Oscillator Connection XI
XO	: Crystal Oscillator Connection XO

1. PIN FUNCTIONS

1.1 Cable Interface Pins

Name	Pin No.	I/O	Function												
TpA0p	60	I/O	First port twisted pair cable A positive phase I/O												
TpA0n	59	I/O	First port twisted pair cable A negative phase I/O												
TpB0p	58	I/O	First port twisted pair cable B positive phase I/O												
TpB0n	57	I/O	First port twisted pair cable B negative phase I/O												
TpA1p	56	I/O	Second port twisted pair cable A positive phase I/O												
TpA1n	55	I/O	Second port twisted pair cable A negative phase I/O												
TpB1p	54	I/O	Second port twisted pair cable B positive phase I/O												
TpB1n	53	I/O	Second port twisted pair cable B negative phase I/O												
TpA2p	52	I/O	Third port twisted pair cable A positive phase I/O												
TpA2n	51	I/O	Third port twisted pair cable A negative phase I/O												
TpB2p	50	I/O	Third port twisted pair cable B positive phase I/O												
TpB2n	49	I/O	Third port twisted pair cable B negative phase I/O												
PORTDIS	64	I	Port disable. SUS/RES(71pin)="1" This selected state will be loaded to Disabled bit which allocated PHY register Port Status Page when power-on reset. The PORTDIS pin is ignored except power-on reset. 1: All 3 ports will be disabled. 0: All 3 ports will be enabled. SUS/RES(71pin)="0" Combination with PSEL(66pin) input the supported number of port will be selected. Please refer to PSEL.												
PSEL	66	I	Supported number of Port select (This function will be activated only under SUS/RES="0"). <table><tr><td></td><td>64pin</td><td>66pin</td></tr><tr><td>1Port(Port0)</td><td>0</td><td>1</td></tr><tr><td>2Port(Port0,1)</td><td>1</td><td>0</td></tr><tr><td>3Port(Port0-2)</td><td>0</td><td>0</td></tr></table> When SUS/RES="1", this pin should be connected to AGND.		64pin	66pin	1Port(Port0)	0	1	2Port(Port0,1)	1	0	3Port(Port0-2)	0	0
	64pin	66pin													
1Port(Port0)	0	1													
2Port(Port0,1)	1	0													
3Port(Port0-2)	0	0													
SUS/RES	71	I	Suspend/Resume function select 1: Suspend/Resume on (P1394a draft 2.1 compliant) 0: Suspend/Resume off (P1394a draft 1.3 compliant)												
CPS	43	I	Power cable status. Connect to the cable through a 390 kΩ resistor. 0: Cable power fail 1: Cable power on												

1.2 Link Interface Pins

Name	Pin No.	I/O	Function
D0	15	I/O	Data input/output (bit 0)
D1	16	I/O	Data input/output (bit 1)
D2	18	I/O	Data input/output (bit 2)
D3	19	I/O	Data input/output (bit 3)
D4	21	I/O	Data input/output (bit 4)
D5	22	I/O	Data input/output (bit 5)
D6	24	I/O	Data input/output (bit 6)
D7	25	I/O	Data input/output (bit 7)
CTL0	12	I/O	Link interface control (bit 0)
CTL1	13	I/O	Link interface control (bit 1)
LREQ	6	I	Link request input
SCLK	9	O	Link control output clock LPS 1: 49.152 MHz output LPS 0: Clamp to 0 (The clock signal will be output within 25 μsec after change to "0")
LPS	5	I	Link power status input 0: Link power off 1: Link power on (PHY/Link direct connection) Clock signal of about 300 kHz (if isolation)
LKON	78	O	Link-on signal output pin Link-on signal is 6.144 MHz clock output. Please refer to 4.2 Link-on Indication .
Direct	77	I	PHY/Link isolation barrier control input 0: Isolation barrier 1: PHY/Link direct connection

1.3 Control Pins

Name	Pin No.	I/O	Function
PC0	2	I	Power class set input
PC1	1	I	This pin status will be loaded to Pwr_class bit which allocated to PHY register 4H. IEEE1394-1995 chapter [4.3.4.1]
PC2	79	I	
CMC	3	I	Configuration manager capable setting. This pin status will be loaded to Contender bit which allocated to PHY register 4H. 0: Non contender 1: Contender
RESETB	30	I	Power on reset input. Connect to DGND through a 0.1 μF capacitor. 0: Reset 1: Normal

1.4 IC

Name	Pin No.	I/O	Function
IC	75, 76	I	Internally Connected (High Clamped)

1.5 Power Supply Pins

Name	Pin No.	I/O	Function
AV _{DD}	31, 36	-	Analog power 1 (APLL, OSC)
	40, 45	-	Analog power 2 (Bias)
	63, 67, 73	-	Analog power 3 (Cable Interface)
AGND	32, 33	-	Analog GND1 (PLL, OSC)
	39, 44	-	Analog GND2 (Bias)
	61	-	Analog GND3 (Common)
	62	-	Analog GND4 (Speed signal)
	65, 68-70, 72	-	Analog GND5 (Port)
DV _{DD}	7, 10, 14, 26-28, 80	-	Digital V _{DD}
DGND	4, 8, 11, 17, 20, 23, 29, 74	-	Digital GND

1.6 Other Pins

Name	Pin No.	I/O	Function
TpBias0	48	O	First port twisted pair output
TpBias1	47	O	Second port twisted pair output
TpBias2	46	O	Third port twisted pair output
RI0	41	-	Resistor connection pin0 for reference current generator. Please connect to RI1 pin via 9.1 kΩ resistor.
RI1	42	-	Resistor connection pin1 for reference current generator. Please connect to RI0 pin via 9.1 kΩ resistor.
FIL1	34	-	APLL filter (No need to assemble)
FIL0	35	-	APLL filter ground (No need to assemble)
XI	37	-	Crystal oscillator connection XI
XO	38	-	Crystal oscillator connection XO

2. PHY REGISTERS

2.1 Complete Structure for PHY Registers

Figure 2-1. Complete Structure of PHY Registers

	0	1	2	3	4	5	6	7
0000	Physical_ID						R	PS
0001	RHB	IBR	Gap_count					
0010	Extended (7)			Reserved	Total_ports			
0011	Max_speed			Reserved	Delay			
0100	Link_active	Contender	Jitter			Pwr_class		
0101	Resume_int	ISBR	Loop	Pwr_fail	Timeout	Port_event	Enab_accel	Enab_multi
0110	Reserved							
0111	Page_select			Reserved	Port_select

1110	Register6 (page_select)							
1111	Register7 (page_select)							

Table 2-1. Bit Field Description (1/2)

Field	Size	R/W	Reset value	Description
Physical_ID	6	R	000000	Physical_ID value selected from Self_ID period.
R	1	R	0	If this bit is 1, the node is root. 1: Root 0: Not root
PS	1	R		Cable power status. 1: Cable power on 0: Cable power off
RHB	1	R/W	0	Root Hold -off bit. If 1, becomes root at the bus reset.
IBR	1	R/W	0	Initiate bus reset. Setting to 1 begins a long bus reset. Long bus reset signal duration: 166 μsec. Returns to 0 at the beginning of bus reset.
Gap_count	6	R/W	111111	Gap count value. It is updated by the changes of transmitting and receiving the PHY configuration packet Tx/Rx. The value is maintained after first bus reset. After the second bus reset it returns to reset value.
Extended	3	R	111	Shows the extended register map.
Total_ports	4	R	0011	Supported port number. When SUS/RES(71pin)="1" 0011 : 3 ports When SUS/RES(71pin)="0" Combination with PSEL(66pin) input the supported number of port will be selected. Please refer to 1.1 Cable Interface Pins . 0001 : 1 port 0010 : 2 port 0011 : 3 port
Max_speed	3	R	010	Indicate the maximum speed that this node supports. 010: 98.304, 196.608 and 393.216 Mbps
Delay	4	R	0010	Indicate worst case repeating delay time. $144+(2 \times 20)=184$ nsec
Link_active	1	R/W	1	Link active. 1 : Enable 0 : Disable The logical AND status of this bit and LPS pin. State will be referred to "L bit" of Self-ID Packet#0.
Contender	1	R/W	See Description	Contender. "1" indicate this node support bus manager function. This bit will be referred to "C bit" of Self-ID Packet#0. The reset data is depending on CMC pin setting. CMC pin condition 1: Pull up (Contender) 0: Pull down (Non Contender)
Jitter	3	R	010	The difference of repeating time (Max.-Min.). $(2+1) \times 20=60$ nsec

Table 2-1. Bit Field Description (2/2)

Field	Size	R/W	Reset value	Description
Pwr_class	3	R/W	See Description	Power class. Please refer to IEEE1394 -1995 [4.3.4.1]. This bit will be referred to Pwr field of Self-ID Packet#0. The reset data will be determined by PC0-PC2 Pin status.
Resume_int	1	R/W	0	Resume interrupt enable. When set to 1, if any one port does resume, the Port_event bit becomes 1.
ISBR	1	R/W	0	Initiate short (arbitrated) bus reset. Setting to 1 acquires the bus and begins short bus reset. Short bus reset signal output : 1.3 μsec Returns to 0 at the beginning of the bus reset.
Loop	1	R/W	0	Loop detection output. 1: Detection Writing 1 to this bit clears it to 0. Writing 0 has no effect.
Pwr_fail	1	R/W	0	Power cable disconnect detect. It becomes 1 when there is a change from 1 to 0 in the CPS bit. Writing 1 to this bit clears it to 0. Writing 0 has no effect.
Timeout	1	R/W	0	Arbitration state machine time-out. Writing 1 to this bit clears it to 0. Writing 0 has no effect.
Port_event	1	R/W	0	Set to 1 when the Int_Enable bit in the register map of each port is 1 and there is a change in the ports connected, Bias, Disabled and Fault bits. Set to 1 when the Resume_int bit is 1 and any one port does resume. Writing 1 to this bit clears it to 0. Writing 0 has no effect.
Enab_accel	1	R/W	0	Enables arbitration acceleration. Ack-acceleration and Fly-by arbitration are enabled. 1: Enabled 0: Disabled If this bit changes while the bus request is pending, the operation is not guaranteed.
Enab_multi	1	R/W	0	Enable multi-speed packet concatenation. Setting this bit to 1 follows multi-speed transmission. When this bit is set to 0, the packet will be transmitted with the same speed as the first packet.
Page_select	3	R/W	000	Select page address between 1000 to 1111. 000: Port Status Page 001: Vendor Definition Page Others: Unused
Port_select	4	R/W	0000	Port Selection. Selecting 000 (Port Status Page) with the page selection selects the port. 0000: Port 0 0001: Port 1 0010: Port 2 Others: Unused
Reserved	-	R	000...	Reserved. Read as 0.

3. INTERNAL FUNCTION

3.1 Link Interface

3.1.1 Connection Method

Figure 3-1. PHY/Link Connection Method

Note Clamping to V_{DD} provides direct connection to Link.
Clamping to GND connects through isolation barrier to Link.
The isolation barrier connection circuit is described in **3.1.7 Isolation Barrier**.

3.1.2 LPS (Link Power Status)

LPS is a function to monitor the On/Off status of the Link power supply. After 1.2 μsec or more, LPS is Low, the PHY/Link is reset and D and CTL are output Low (when the isolation barrier is Hi-Z). After 2.5 μsec or more, LPS is Low, moreover, the PHY stops the supply of SCLK and SCLK outputs Low (when the isolation barrier is Hi-Z).

3.1.3 LREQ, CTL0,CTL1, and D0-D7 Pins

- LREQ** : Indicates that a request is received from Link.
- CTL0,CTL1** : Bi-directional pin which controls the functions between the PHY/Link interface.
- D0-D7** : Bi-directional pin which controls the data Transfer/Receive status signal, and the speed code Transfer/Receive status signal.

3.1.4 SCLK

49.152 MHz clock supplied by PHY for the PHY/Link interface synchronization.

3.1.5 LKON

When the Link power is off, it outputs a clock of 6.144 MHz. LKON outputs under the following conditions: LPS is Low and the internal PHY register of the Link_active bit is 0.

- Link-on packet is received.
- Any bit of Loop, Pwr_fail, Timeout or Port_event is the PHY internal register becomes 1, and moreover either LPS or Link_active bit is 0.

When LPS is asserted, LKON returns to Low.

3.1.6 Direct

Set Direct to Low for using the isolation barrier.

3.1.7 Isolation Barrier

The IEEE1394 cable holds signals for Data/Strobe in addition to power and ground.

When the ground potential is different between connecting devices, the DC and AC current flows through the ground line in the cable and there is a possibility of malfunction due to ground difference between the two PHY.

The μPD72850A uses the isolation barrier to couple the AC between the PHY/Link interface to overcome the ground difference problem. Connecting the Direct pin to Low enables the digital differential circuit of the μPD72850A. The differential circuit propagates only the change in the signal; the interface will be driven only during transitions High → Low or Low → High. The interface will assume the high impedance state when there is no signal change. The μPD72850A uses Schmitt trigger input buffers for D, CTL, LREQ and LPS pins to prevent noise when the bus assumes a high impedance state.

The digital differential circuit and the Schmitt trigger input buffers are needed on the Link layer controller LSI to implement the isolation barrier.

Figure 3-2. Waveforms of the Isolation Barrier

3.2 Cable Interface

3.2.1 Connections

Figure 3-4. Cable Interface

3.2.2 Cable Interface Circuit

Each port is configured with two twisted-pairs of TpA and TpB.

TpA and TpB are used to monitor the state of the Transmit/Receive line, control signals, data and cables.

During transmission to the IEEE1394 bus, the Data/Strobe signal received from the Link layer controller is encoded, converted from parallel to serial and transmitted.

While receiving from the IEEE1394 bus, the Data/Strobe signal from TpA, TpB is converted from serial to parallel after synchronization by SCLK, then transmitted to the Link layer controller in 2/4/8 bits according to the data rate of 100/200/400 Mbps.

The bus arbitration for TpA and TpB and the state of the line are monitored by the built-in comparator. The state of the IEEE1394 bus is transmitted to the state machine in the LSI.

3.2.3 Unused Ports

TpAp, TpAn : Not connected

TpBp, TpBn : AGND

TpBias : Connected to AGND using a 1.0 μF load capacitor

3.2.4 CPS

An external resistance of 390 kΩ is connected in series to the power cable to monitor the power of the power cable. If the cable power falls under 7.5 V there is an indication to the Link layer controller that the power has failed.

3.3 Suspend/Resume

3.3.1 Suspend/Resume On Mode (SUS/RES = "H")

There are two ways of transition from the active status to the suspended status.

One is when the receipt of a remote command packet that sets the initiate suspend command. After that, the PHY transmits a remote confirmation packet with the ok bit set, subsequently signals TX_SUSPEND to the connected peer PHY with the port which specified by the port field in the remote command packet, and then the PHY port transitions to the suspended state.

The other is when the receipt of a RX_SUSPEND or RX_DISABLE_NOTIFY signal. When the port observes RX_SUSPEND, it transmits TX_SUSPEND to the active ports.

The TX_SUSPEND transmitted propagates until it reaches a leaf node. The PHY port transitions to the suspended state. The propagation of the suspended domain may be blocked by a PHY compliant with IEEE Std 1394-1995, a disabled or a suspended port.

Any one of a number of reasons may cause a suspended port to attempt to resume normal operations:

- Bias is detected and there is no fault condition;
- A resume packet is received or transmitted by the PHY;
- A remote command packet that sets the resume port command is received; or
- Either port of a node without active ports detects bias.

3.3.2 Suspend/Resume Off Mode (SUS/RES = "L")

- Remote command packet is ignored.
- Resume packet is ignored.
- Disabled, Int_enable and resume_int bits in PHY register are ignored.
- Responses to Remote access packet.
- Detects the connection of the port in TpBias.

3.4 PLL and Crystal Oscillation Circuit

3.4.1 Crystal Oscillation Circuit

To supply the clock of 24.576 MHz \pm 100 ppm, use an external capacitor of 10 pF and a crystal of 50 ppm.

3.4.2 PLL

The crystal oscillator multiplies the 24.576 MHz frequency by 16 (393.216 MHz).

3.5 PC0-PC2, CMC

CMC shows the bus manager function which corresponds to the c bit of the Self_ID packet and the Contender bit in the PHY register when the input is High.

The value of CMC can be changed with software through the Link layer; this pin sets the initial value during Power-on Reset. Use a pull-up or pull-down resistor of 10 k Ω , based on the device's specification.

The PC0-PC2 pin corresponds to the power field of the Self_ID packet and Pwr_class in the PHY register. Refer to Section 4.3.4.1 of the IEEE1394-1995 specification for information regarding the Pwr_class. The value of Pwr can be changed with software through the Link layer controller; this pin sets the initial value during Power-on Reset. Use a pull-up or pull-down resistor of 10 k Ω based on the application.

3.6 $\overline{\text{RESETB}}$

Connect an external capacitor of 0.1 μ F between the pins $\overline{\text{RESETB}}$ and GND. If the voltage drops below 0 V, a reset pulse is generated. All of the circuits are initialized, including the contents of the PHY register.

3.7 RI1, RI0

Connect an external resistor of 9.1 k Ω to limit the LSI's current.

4. PHY/LINK INTERFACE

4.1 Initialization of Link Power Status (LPS) and PHY/Link Interface

The LPS pin monitors the On/Off status of the Link power state. This pin is used during the PHY/Link interface Enable/Disable (initialization).

Reset

When the LPS input pin is Low for TLPS_RESET:

- CTL0,CTL1 and D0-D7 output Low (When the isolation barrier is Hi-Z).
- SCLK continuously supplies the clock signal to the Link.

Disable

When the LPS input pin is Low for TLPS_DISABLE:

- CTL0,CTL1, D0-D7 continue to output Low as TLPS_RESET has already occurred (When the isolation barrier is Hi-Z).
- SCLK to Link stops and it outputs Low (When the isolation barrier is Hi-Z).

Table 4-1. LPS Timing Parameters

Parameter	Symbol	MIN.	MAX.	Unit
LPS = Low propagation delay (with isolation barrier)	tLPSL	0.09	1.00	μs
LPS = High propagation delay (with isolation barrier)	tLPSH	0.09	1.00	μs
Reset active	tLPS_RESET	1.2	2.75	μs
Disable active	tLPS_DISABLE	25	30	μs
Setup time when using isolation barrier	tRESTORE	15	20	μs

Figure 4-1. LPS Waveform when Connected to Isolation Barrier

Figure 4-2. PHY/Link Interface Reset and Disable

4.2 Link-on Indication

When the power supply of Link is off (LPS is Low and the internal PHY register Link_active bit is 0), the pin LKON outputs High according to the following conditions: (With isolation barrier, it outputs a clock of 6.144 MHz)

- Link-on packet is received.
- When any bit of the μPD72850A PHY register's loop, Pwr fail, Timeout or Port_event becomes 1, and either LPS or the Link_active bit is 0.

Table 4-2. Link-on Timing

Parameter	MIN.	MAX.	Unit
Frequency	4	8	MHz
Duty Cycle	40	60	%
Propagation delay before the Link becomes active (LPS is asserted and the Link_active bit in the PHY register is 1).		500	ns

- If LPS or the Link_active bit is 0, the Link is considered inactive.
When the Link is inactive and any of Loop, PWR_fail, Timeout, Port_event becomes 1, then Link-on is asserted High.
- When the Link is active (both LPS and Link_active become 1) and Loop, Pwr_fail, Timeout and Port_event become 1, Status transfer is sent on the PHY/Link interface.

- The μPD72850A activates the PHY/Link interface when LPS is 1, regardless of the value of the Link active bit.

4.3 PHY/Link Interface Operation (CTL0, CTL1, LREQ, D0-D7)

The PHY/Link Interface consists of the following operations:

- Status transfer to the Link layer controller by CTL
- Transmit packet
- Receive packet
- Request from the Link layer controller by LREQ

4.3.1 CTL0,CTL1

CTL0,CTL1 controls the PHY/Link interface as shown in the Table 4-3.

Table 4-3. CTL Controls PHY

CTL0,CTL1	Type	Content
00	Idle	PHY is in idle function
01	Status	PHY transmitting status information to Link
10	Receive	PHY receiving data from the Link
11	Grant	PHY allows Link to transmit data

This is the operation by which, after Grant, the Link obtains the right to control the interface.

Table 4-4. CTL Controls Link

CTL0,CTL1	Type	Content
00	Idle	Link completes the packet transmission and releases the PHY/Link interface.
01	Hold	1) Link transmits Hold until the data is ready for transmission. 2) Link transmits the interface connect packet.
10	Transmit	Link transmits the data to PHY.
11	-	Not used.

4.3.2 LREQ

Access to the PHY register and the bus is controlled from the Link layer controller through the LREQ pin of PHY.

Figure 4-3. LREQ and CTL Timing

(1) LREQ format

• Bus Request

Table 4-5. Bus Request Format

Bit	Type	Content
0	start	Signal that starts a request : 1
1-3	request	Bus request type: 000: ImmReq acknowledge packet transmit 001: IsoReq isochronous packet transmit 010: PriReq cycle start packet transmit 011: FairReq asynchronous packet transmit
4-6	speed	Transmit speed: 000: 100 Mbps 010: 200 Mbps 100: 400 Mbps other: reserved
7	stop	End request signal : 0 (optional)

• PHY Register Read Request

Table 4-6. Read Request Register Format

Bit	Type	Content
0	start	Signal that starts a request : 1
1-3	request	Read Request. 100 : ReadReq
4-7	access address	PHY register address.
8	stop	End request signal : 0

• PHY Register Write Request

Table 4-7. Write Request Register Format

Bit	Type	Content
0	start	Signal that starts a request : 1
1-3	request	Write Request. 101 : WriteReq
4-7	access address	PHY register address.
8-15	write data	Write data.
16	stop	End request signal : 0

• Acceleration Controller

Table 4-8. Acceleration Controller Request Format

Bit	Type	Content
0	start	Signal that starts a request : 1
1-3	request	110 : Acc Ctrl accelerate controller
4	access address	0: Accelerate disable 1: Accelerate enable
5	stop	End request signal : 0

Table 4-9. Request Type List

Bit	Type	Content
000	ImmReq	Used to acknowledge packet transmit. When Idle is detected, PHY immediately controls the bus.
001	IsoReq	Used to transmit isochronous packet. PHY does arbitration after isochronous gap is detected and acquires the bus.
010	PriReq	Used for Cycle master request.
011	FairReq	Fair request.
100	RdReg	PHY register read request.
101	WrReg	PHY register write request.
110	AccCtrl	Disable/enable of arbitration acceleration.
111	-	Unused.

For the Link to execute Priority request and Fair, start the request using LREQ when CTL0,CTL1 becomes idle, after one clock. When request is acknowledged, the μPD72850A outputs Grant to CTL0,CTL1.

The Link of cycle master uses PriReq to transmit the cycle start packet. IsoReq transmits the isochronous packet.

IsoReq becomes effective only as follows:

- The transmission of the cycle start packet is performed on the same isochronous period as Receive. (The period until the subaction gap is detected.)
- During isochronous packet Transmit or Receive.

The μPD72850A cancels IsoReq with the subaction gap detection or bus reset. To meet the timing, do not issue the IsoReq to PHY when CRC operation is performed.

The Link cancel method is described later.

After the packet is received, Link issues ImmReq as the acknowledge packet transmission. The purpose is to prevent another node from detecting subaction gap as ACK_RESPONSE_TIME. The μPD72850A acquires the bus after packet receive and returns Grant to CTL0,CTL1. When CRC fails, before Link detects Grant, assert 3 Idle cycles to CTL0,CTL1.

When the bus reset is generated, the unprocessed requests are canceled.

The μPD72850A updates the data of the Write request register and the contents of the Read register are changed. The contents of the register of the specified address are output to the Link as a status transfer in the Read request register, When the status transmission is interrupted by transmitting/receiving packets, the status transmission will re-start from the first bit after completing the transmit/receive of the packets.

The bus request (ImmReq, IsoReq, PriReq, FairReq) is completed (in case of ImmReq, IsoReq, when the subaction gap is detected) when the packet is transmitted or canceled by canceling the bus request.

(2) LREQ rules

The Link request and the status of the serial bus are asynchronous; the bus request can be canceled by the status of the serial bus.

The following rules apply to a request by LREQ:

- Link cannot issue a bus request (ImmReq, IsoReq, PriReq, FairReq) if Grant is given to an LREQ request or until the Link's request is canceled. The request can be canceled by the μPD72850A if it detects subaction gap at ImmReq, IsoReq.
- Do not issue a RdReg or WrReg request when the status transmission is not completed by the Read request register.
- All of the bus requests (ImmReq, IsoReq, PriReq, FairReq) are canceled by a bus reset.

In addition, there is a limitation in the request of LREQ according to the state of CTL as shown in Table 4-10.

Table 4-10. Rules for Other Requests

Request	State of CTL in CA to which LREQ is allowed when PHY drives CTL	LREQ issues permission when Link drives CTL	Note
Fair, Priority	Idle, Status	wrong	Fair, Priority request cannot be issued until the unprocessed bus request is completed.
Immediate	Receive, Idle	wrong	Link issues the request after completing the decoding of Destination_ID, when the acknowledge packet is ready. After the packet is received, it is necessary to transmit the first bit of the request within four cycles.
Isochronous	any	correct	If the isochronous packet transmission is prepared for the isochronous period, it is issued. Do not issue the request to transmit the isochronous packet appending to the currently transmitted isochronous packet (Using Hold).
Register Read Register Write	any	correct	Do not issue this request if the unprocessed Read request has not been completed.
AccCtrl	any	correct	To set acceleration bit 0: When the isochronous period starts, if the Enab_accel bit is one, Cycle slave should adjust accelerate bit to 0. To set acceleration bit 1: Do not set the cycle master. It is issued when the isochronous period ends.

Table 4-11. PHY Operation Before LREQ Request to the CTL Function Changes

Request	State of CTL in C B after LREQ was issued	Operation of the PHY (μPD72850A)
Fair, Priority	Receive	<ul style="list-style-type: none"> Hold the request if the acceleration of arbitration packet transmitted with enable is 8 bits (ACK). Except for 8 bits, the requests are ignored. Ignore the request when the acceleration of arbitration is disabled.
	Grant	Arbitration Won.
	Idle, Status	Excluding when the bus reset is generated, Hold the requests.
Immediate	Grant	
	Receive	The packet is being transmitted to Link. Request Hold.
	Idle, Status	Excluding when the bus reset is generated, hold the request.
Isochronous	Transmit Idle (driven by Link)	Request Hold.
	Grant	Arbitration Won.
	Receive	Request Hold.
	Status	Request is ignored when sub-action gap is detected.
	Idle	
Register Read	Any (driven by Link)	
	Grant	Request Hold.
	Receive	Request Hold.
	Status	Hold the request until the corresponding register value is returned.
	Idle	
Register Write, Acceleration control	Any	Request is completed.

4.3.3 PHY/Link Interface Timing

(1) SCLK timing

Table 4-12. SCLK Timing

Timing Constant	Comment	MIN.	MAX.	Unit
BUS_TO_LINK_DELAY	Period from receiving RX_DATA_PREFIX until Receive to CTL is output.	2	9	SCLK cycle
DATA_PREFIX_TO_GRANT	Period when the Grant is output to CTL after TX_DATA_PREFIX is output to a port.		25	SCLK cycle
LINK_TO_BUS_DELAY	Period when TX_DATA_END is output to all ports after transmitting the packet by Link after idle was asserted to CTL.	2	5	SCLK cycle
MAX_HOLD	Maximum period when Hold can be asserted by Link to confirm Grant.		47	SCLK cycle

(2) AC timing

Table 4-13. PHY/Link Interface Timing

Parameter	Symbol	MIN.	MAX.	Unit
D, CTL propagation delay	t_{pd}	0.5	13.5	ns
D, CTL, LREQ setup time	t_{su}	6		ns
D, CTL, LREQ Hold time	t_h	0		ns

Figure 4-4. PHY/Link Interface AC Timing

4.4 Acceleration Control

Enable of ack-acceleration and fly-by on the same isochronous period may create a problem. The isochronous cycle may extend unintentionally when transmitting the asynchronous packet by a node using ack-acceleration and fly-by.

To avoid this problem, Link should control Disable/Enable of these enhancements (ack-Acceleration, fly-by), by Acceleration Control requests. Cycle master cannot issue the Acceleration Control request.

The enhancements should not be used from the generation of the local cycle synchronization event to the confirmation of cycle start. In this period, all Links except for Cycle Master use Acceleration Control as follows:

- Do not issue Fair nor Priority request to Link after generating local cycle synchronization, if the Acceleration Control request's Accelerate bit is not set to 0.
- Link must not use Hold when transmitting continuous primary asynchronous packet after the Acknowledge packet, except after ack_pending to complete the split transaction.
- Ending the Link during the isochronous period issues the acceleration control request to set the Accelerate bit to 1, enabling these enhancements.

The μPD72850A does not require setting the Acceleration Control during isochronous transmit to enable the isochronous request fly-by acceleration.

It is not necessary to issue Acceleration Control request when the cycle master is absent from the serial bus. These enhancements are enabled if the Enab_accel bit in the PHY register is set. The μPD72850A supports Variable Acceleration controlled by the Acceleration Control during power-on reset.

4.5 Transmit Status

Pin D0,D1 of the μPD72850A transmits status information to the Link. Status is asserted to CTL while transmitting Status. The status transmission is interrupted if the serial bus receives a packet which contains states other than status to CTL. Between two status transmissions, assert Idle to CTL for at least one SCLK cycle.

The μPD72850A transmits status in 16 bits as follows:

- In response to the register request
- After deciding the new Physical_ID for the Self_ID period resetting the bus (after a Self_ID packet is transmitted)

The event indication is the only 4-bit transmission of the μPD72850A.

Figure 4-5. Status Timing

Table 4-14. Status Data Format

Bit(s)	Name	Description
0	ARB_RESET_GAP	Arbitration Reset gap detect
1	SUBACTION_GAP	Subaction gap detect
2	BUS_RESET_START	Bus reset detect
3	Phy_interrupt	Either of the following states is detected: <ul style="list-style-type: none"> • The topology of the bus is a loop • Voltage drop on the power cable • Arbitration state machine timeout • Port Event
4-7	Address	PHY register address
8-15	Data	Register data

The bits already transmitted are set to 0.

Example If the status transmission is interrupted after S0,S1 bit was transmitted, then in the next status transfer, S0,S1 becomes 0.

Therefore one of the following situations will occur when the μPD72850A re-transmits status after an interruption of the status transmission:

- At least one bit of S0-S3 is 1
- The PHY register data contains the interrupt status information

The status transmission always begins with S0,S1.

If the Link executes read request, and Subaction gap and arbitration reset gap are detected, priority is given to the transmission of gap status, postponing the response to the register read request.

4.6 Transmit

The μPD72850A arbitrates the serial bus using Link's LREQ.

- When the μPD72850A acquires the bus, a Grant period of 1 SCLK is executed to CTL0,CTL1. After that, an Idle period of 1 SCLK cycle is executed.
- Link controls the interface executing Idle, Hold of Transmit to CTL0,CTL1 after 1 SCLK cycle when Grant from PHY is detected.
- Before asserting Hold and Transmit, assert 1 Idle cycle. Do not execute Idle for 2 or more cycles.
- If the packet transmit is not ready, the Hold period can be extended up to MAX_HOLD.
- The μPD72850A outputs DATA_PREFIX to the serial bus while Hold is being asserted to CTL.
- When the packet transmit is ready, Link outputs the first bit of the packet and Transmit is asserted to CTL at the same time.
- After transmitting the last bit of the packet, Link outputs for Idle or Hold to CTL for 1 cycle. After that, it outputs Idle for 1 cycle.

When PHY/Link releases the bus, output Low to CTL and D0-D7 within 1 cycle.

Figure 4-6. Transmit Timing

(a) Single Packet

(b) Concatenated Packet

Note In case of packet transmission after Grant, before actual transmission, Hold does not need to be asserted.

Link can transmit continuous packets without releasing the bus.

- Hold is asserted to CTL. This function is used when the Link transmits continuous packets after acknowledge and isochronous packets. Link outputs the transfer rate signal of the following packet to D0-D7 and asserts Hold simultaneously.
- After Hold is detected by MIN_PACKET_SEPARATION, the μPD72850A outputs Grant to CTL.

- Link controls the interface by generating Idle, Hold or Transmit to CTL0,CTL1, after 1 SCLK cycle when Grant from PHY is detected.
- Assert 1 Idle cycle before asserting Hold and Transmit (do not output 2 or more Idle cycles). When the packet transmission is not ready, assert Hold. The Hold output period after Grant is detected should not exceed the period provided by MAX_HOLD.

The following limitations exist though Link can transmit the concatenated packet with a different transfer rate. Link cannot transmit other than S100 connecting packets after S100 (concatenated) packets have been transmitted. A new request to transmit must be issued in order to transmit S100 packets at a transfer rate of S200 or more.

If the En_Multi bit in the PHY register is 0, the μPD72850A assumes the same speed as the first packet, for all of the concatenated packets.

At the end of packet transmission, Link asserts Idle to CTL for a period of 2 cycles.

After sampling Idle from Link, the μPD72850A asserts Idle to CTL for a period of 1 cycle.

4.7 Cancel

This section describes how Link operates, when after the bus has been acquired by the request of LREQ, there is no data transmission. In this case, a Null packet with no data is transmitted to the serial bus (DATA_PREFIX → DATA_END).

Following are two method for canceling the Link:

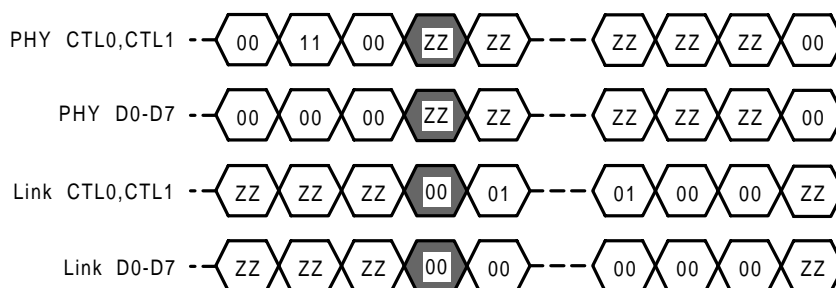

1. As explained in Section 4.6, the Link outputs Idle or Hold, then outputs Transmit to CTL after confirming Grant. Here, the Link asserts Idle for two cycles to CTL, then switches to high impedance. The μPD72850A confirms Cancel at the second Idle cycle. To prevent the bus from switching to high impedance, a third Idle cycle is needed.

Figure 4-7. Link Cancel Timing (After Grant)

2. To cancel after asserting Hold, assert Idle between two cycles; it switches to high impedance. This method cancels the packet transmission connection (concatenated) after Grant is received. The μPD72850A cancels with the next Idle cycle of Hold. To prevent CTL from switching to high impedance, assert a second Idle cycle.

Figure 4-8. Link Cancel Timing (After Hold)

4.8 Receive

This section shows the operation when the packet is received from the serial bus.

- When the μPD72850A detects DATA_PREFIX on the serial bus, it asserts receive to CTL and all of the D pins assume the logic value of 1.
- The μPD72850A shows the speed code of the transfer rate ahead of the packet using bits D0-D7. Transmitting the speed code with the speed signal is the protocol of the PHY/Link interface. The speed code is not included in the CRC calculation.
- The μPD72850A continues to assert Receive to CTL until the packet is finally transmitted.
- Idle is asserted to CTL, indicating completion of the packet transmission.

Figure 4-9. Receive Timing

The packet transfer rate of the serial bus depends on the topology of the bus. The μPD72850A checks if the node can receive at the faster transfer rate. At this time, DATA_PREFIX → DATA_END is transmitted to the μPD72850A. After DATA_PREFIX is transmitted to the Link, Receive from the serial bus is completed, asserting Idle.

Table 4-15 shows the speed code encoding.

Table 4-15. Speed Encoding

D0-D7		Data rate
Transmitted	Observed	
00000000	00xxxxxx	S100
01000000	0100xxxx	S200
01010000	01010000	S400
11111111	11xxxxxxxx	Data Prefix

5. CABLE PHY PACKET

The node on the serial bus transmits and receives the PHY packet to control the bus.

The PHY packet is composed of 2 quadlets (64-bit); the second quadlet (32-bit) contains the inverse value of the first quadlet.

The PHY packet is transmitted at a transfer rate of S100. All of the PHY packets received from the serial bus are transmitted to the Link.

Though the PHY packet from the μPD72850A is transmitted to the Link, the PHY packet which was transmitted from the Link of the node is not transmitted to the Link.

There are four types of PHY packets, as follows:

- Self_ID packet
- Link-on packet
- PHY configuration packet
- Extended PHY packet

The Self_ID packet transmitted automatically by the μPD72850A is also transmitted to the Link of a local node.

The μPD72850A PHY packet Receive from the serial bus operates similar to the PHY packet transmitted by the Link (when the packet transmission to the Link is executed).

5.1 Self_ID Packet

During the Self_ID phase of the initialization or when the Ping packet responds, the μPD72850A transmits the Self_ID packet.

Figure 5-1. Self_ID Packet Format

Table 5-1. Self_ID Packet

Field	Description
phy_ID	Physical ID of the node.
L	Logical product of Link_active and LPS in the PHY register.
gap_cnt	Gap_count value in the PHY register.
sp	Physpeed 10 (corresponds to 98.304, 196.608, 393.216 Mbps).
c	C bit values in the PHY register.
pwr	<p>pwr value in the PHY register.</p> <p>000: The node does not need the power supply. No power repeat.</p> <p>001: Obtains power supply for the node. Can supply 15W or more.</p> <p>010: Obtains power supply for the node. Can supply 30W or more.</p> <p>011: Obtains power supply for the node. Can supply 45W or more.</p> <p>100: The node consumes 3W maximum power.</p> <p>110: The node consumes 3W maximum power. At least 3W are necessary to enable Link.</p> <p>111: The node consumes 3W maximum power. At least 7W are necessary to enable Link.</p>
i	It shows that the node issued Bus Reset and the bus was reset.
m	Read as 0.
rsv	Read as 00.

5.2 Link-on Packet

The μPD72850A outputs the Link-on signal of 6.144 MHz from the pin LKON when receiving the Link-on packet.

Figure 5-2. Link-on Packet Format

Table 5-2. Link-on Packet

Field	Description
phy_ID	Physical_ID of the destination of the Link-on packet

5.3 PHY Configuration Packet

Use the PHY configuration packet to set the gap count for the bus.

Figure 5-3. PHY Configuration Packet Format

Table 5-3. PHY Configuration Packet

Field	Description
root_ID	Sets the Physical_ID node as root contender (for the next reset).
R	When this bit is set to 1 and the Physical_ID of the node corresponds to the rootID of this packet, the μPD72850A sets the force_root bit. The force_root bit is cleared if there is discrepancy.
T	If this bit is 1, the gap_cnt value of this packet is used as the gap_count value. The gap_count value must not be cleared by the following bus reset, set the gap_count_reset_disable flag in the μPD72850A to TRUE.
gap_cnt	When this packet is received, the gap count is set to this value. While it remains effective for the next bus reset, it will be cleared by the second bus reset to 3FH.

Remark Applying 0 to both R,T, regards the following packets as extended PHY packets, the PHY configuration is not recognized.

5.4 Extended PHY Packet

An extended PHY packet is defined when both the R (in the PHY configuration packet) and T bits are transmitted as 0. The extended PHY packet does not influence the force_root_bit and the gap_count bit on any node.

Following are the types of extended PHY packets:

- Ping packet
- Remote access packet
- Remote reply packet
- Remote command packet
- Remote confirmation packet
- Resume packet

5.4.1 Ping Packet

When the μPD72850A receives the Ping packet, it will transmit the Self_ID packet within the RESPONSE_TIME.

Figure 5-4. Ping Packet Format

Table 5-4. Ping Packet

Field	Description
phy_ID	Physical ID of the destination node of the Ping packet
type	Indicates that there is a Ping packet with a value of 0

5.4.2 Remote Access Packet

The Remote access packet reads information in the PHY register of another node. The PHY specified by the Remote access packet transmits the value in the register using the Remote Reply packet.

Figure 5-5. Remote Access Packet Format

Table 5-5. Remote Access Packet

Field	Description
phy_ID	Physical ID of the destination node of the Remote access packet
type	1 = read register (base register), 5 = read register (page register)
page	Specifies the page of the PHY register
port	Specifies the register of each port in the PHY register
reg	Specifies the address when reading the base register. In case of the Page and port registers, specifies the address with 1000+reg.

5.4.3 Remote Reply Packet

The μPD72850A transmits the value in the register by using the Remote reply packet as a response to the Remote access packet.

Figure 5-6. Remote Reply Packet Format

Table 5-6. Remote Reply Packet

Field	Description
phy_ID	Physical ID of the node (Node's original packet transmit)
type	3 = register read (base register), 7 = read register (page register)
page	Used when specifying the page of the PHY register
port	Used to specify the register of each port in the PHY register
reg	Specifies the address when reading the base register. In case of the Page and port registers, specify the address with 1000+reg.
data	Contents of the specified register

5.4.4 Remote Command Packet

Use the Remote command packet to operate the function of the port of the PHY of another node.

Figure 5-7. Remote Command Packet Format

Table 5-7. Remote Command Packet

Field	Description
phy_ID	Physical ID of the destination packet
type	Extended PHY packet type; set to 8 for Remote command packet
port	Port of the PHY of the operating node
cmnd	Command <ul style="list-style-type: none"> 0: NOP 1: Disables the port after transmission of the TX_DISABLE_NOTIFY 2: Suspend initiator 4: Clears to 0 the Fault bit of the port 5: Enables the port 6: Resumes the port

5.4.5 Remote Confirmation Packet

The μPD72850A transmits the Remote confirmation when the Remote command packet is received, responding whether Cmnd can be executed.

Figure 5-8. Remote Confirmation Packet Format

Table 5-8. Remote Confirmation Packet

Field	Description
phy_ID	Physical ID of the node (node's original packet transmit)
type	Extended PHY packet type; set to A16 for Remote confirmation packet
port	Port set from the Remote command packet
f	Fault bit value of the PHY register of this port
c	Connected bit value of the PHY register of this port
b	Bias bit value of the PHY register of this port
d	Disable bit value of the PHY register of this port
ok	1 indicates executing; otherwise it is 0
cmnd	Specifies the command value with the Remote command packet

5.4.6 Resume Packet

When the μPD72850A receives the Resume packet, all of the ports that were suspended resume the connection. The Resume packet does the broadcast.

Figure 5-9. Resume Packet Format

Table 5-9. Resume Packet

Field	Description
phy_ID	Physical ID of the original packet transmit
type	Extended PHY packet type; set to F16 for Resume packet

6. ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings

Parameter	Symbol	Condition	Rating	Unit
Power supply voltage	V_{DDm}		−0.5 to +4.6	V
Input voltage	V_{IN}		−0.5 to $V_{DD}+0.5$	V
Output voltage	V_{OUT}		−0.5 to $V_{DD}+0.5$	V
Storage temperature	T_{stg}		−40 to +125	°C

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Recommended Operating Ranges

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Power supply voltage	V_{DD}		3.0	3.3	3.6	V
Operating temperature	T_A		0.0		70.0	°C
Power dissipation	P_D				0.9	W

DC Characteristics

Common

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Supply current	I _{DD}	3-port, S400, V _{DD} = 3.6 V			240	mA
		1-port transmit or receive, S400, V _{DD} = 3.3 V		135		mA

PHY/Link Interface

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
High-level output voltage (Undifferentiated)	V _{OH}	I _{OH} = -4 mA	2.8			V
High-level output voltage (Differentiated)	V _{OHD}	I _{OH} = -9 mA	V _{DD} -0.4			V
Low-level output voltage (Undifferentiated)	V _{OL}	I _{OH} = 4 mA			0.4	V
Low-level output voltage (Differentiated)	V _{OLD}	I _{OH} = 9 mA			0.4	V
High-level input voltage (Undifferentiated)	V _{IH}		2.6		V _{DD} +10%	V
Low-level input voltage (Undifferentiated)	V _{IL}				0.7	V
Input rising threshold voltage (LPS)	V _{LIT+}				V _{LREF} +1	V
Input falling threshold voltage (LPS)	V _{LIT-}		V _{LREF} +0.2			V
Hysteresis input rising threshold voltage(Differentiated)	V _{IT+}		V _{REF} +0.3		V _{REF} +0.9	V
Hysteresis input falling threshold voltage(Differentiated)	V _{IT-}		V _{REF} -0.9		V _{REF} -0.3	V
Reference voltage	V _{REF}		V _{DD} /2±1%			V
Reference voltage (LPS)	V _{LREF}		0.5		1.6	V
Input capacitance	C _{IN}				7.5	pF

Cable Interface

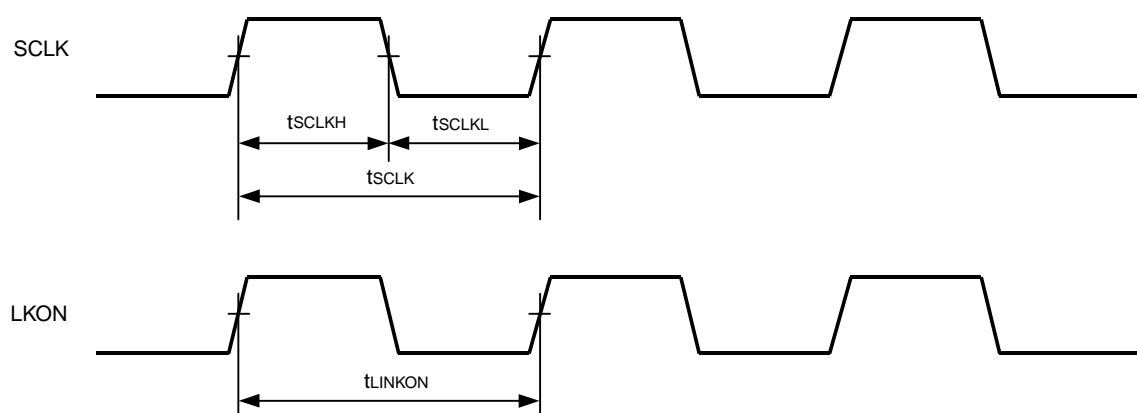

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Differential input voltage	V _{ID}	Cable input, 100 Mbps operation	142		260	mV
		Cable input, 200 Mbps operation	132		260	mV
		Cable input, 400 Mbps operation	118		260	mV
TpB common mode input voltage	V _{ICM}	100 Mbps speed signaling off	1.165		2.515	V
		200 Mbps speed signaling	0.935		2.515	V
		400 Mbps speed signaling	0.523		2.515	V
Differential output voltage	V _{OD}	Cable output (Test load 55Ω)	172.0		265.0	mV
TpA common mode output voltage	V _{OCM}	100 Mbps speed signaling off	1.665		2.015	V
		200 Mbps speed signaling	1.438		2.015	V
		400 Mbps speed signaling	1.030		2.015	V
TpA common mode output current	I _{CM}	100 Mbps speed signaling off	-0.81		+0.44	mA
		200 Mbps speed signaling	-4.84		-2.53	mA
		400 Mbps speed signaling	-12.40		-8.10	mA
Power status threshold voltage	V _{TH}	CPS			7.5	V
TpBias output voltage	V _{TPBIAS}		1.665		2.015	V

AC Characteristics

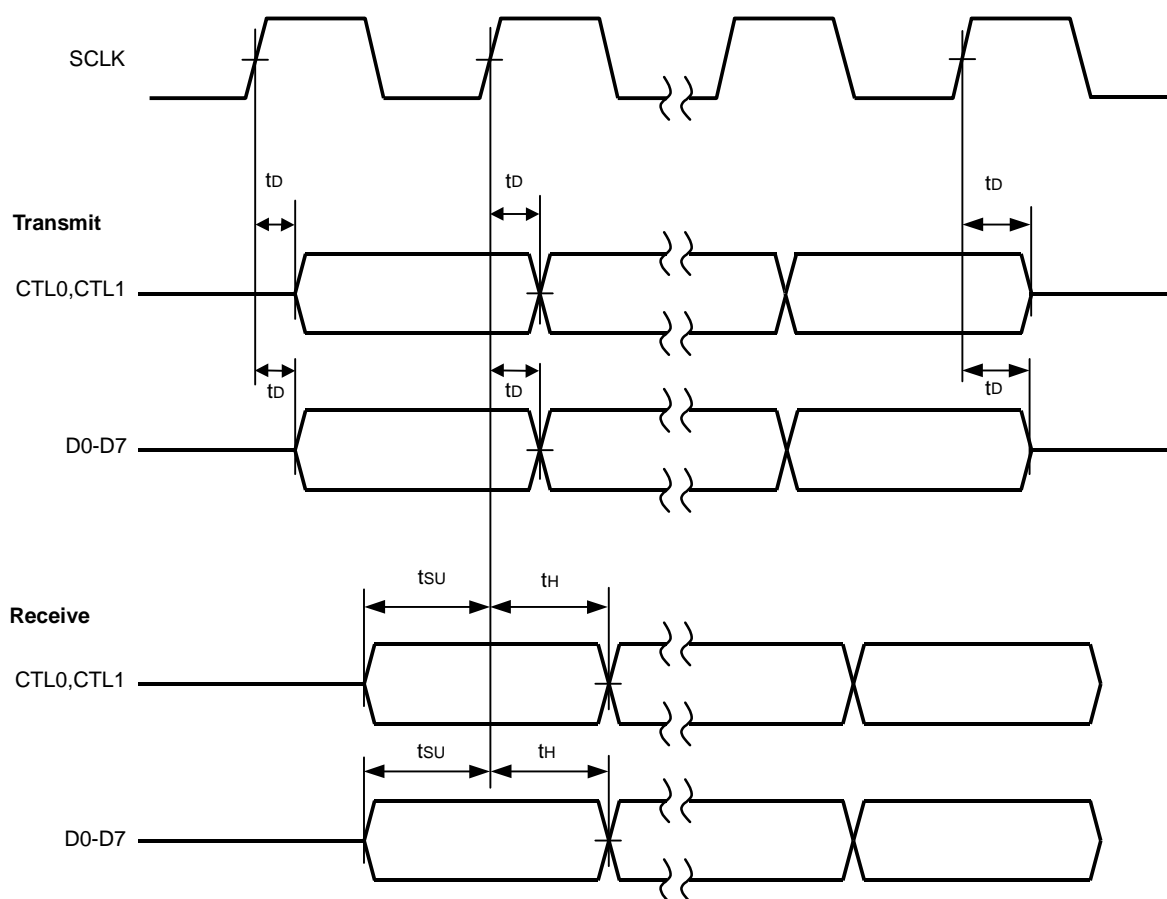

PHY/Link Interface

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
D, CTL, LREQ setup time	t_{su}		6			ns
D, CTL, LREQ hold time	t_{hd}		0			ns
D, CTL output timing	t_d		2		12	ns
SCLK cycle time	t_{SCLK}		20			ns
SCLK high level time	t_{SCLKH}		9		11	ns
SCLK low level time	t_{SCLKL}		9		11	ns
LKON cycle time	t_{LINKON}		160			ns

Link Interface Timing (SCLK, LKON)

Link Interface Timing (CTL, D)

Link Interface Timing (LREQ)

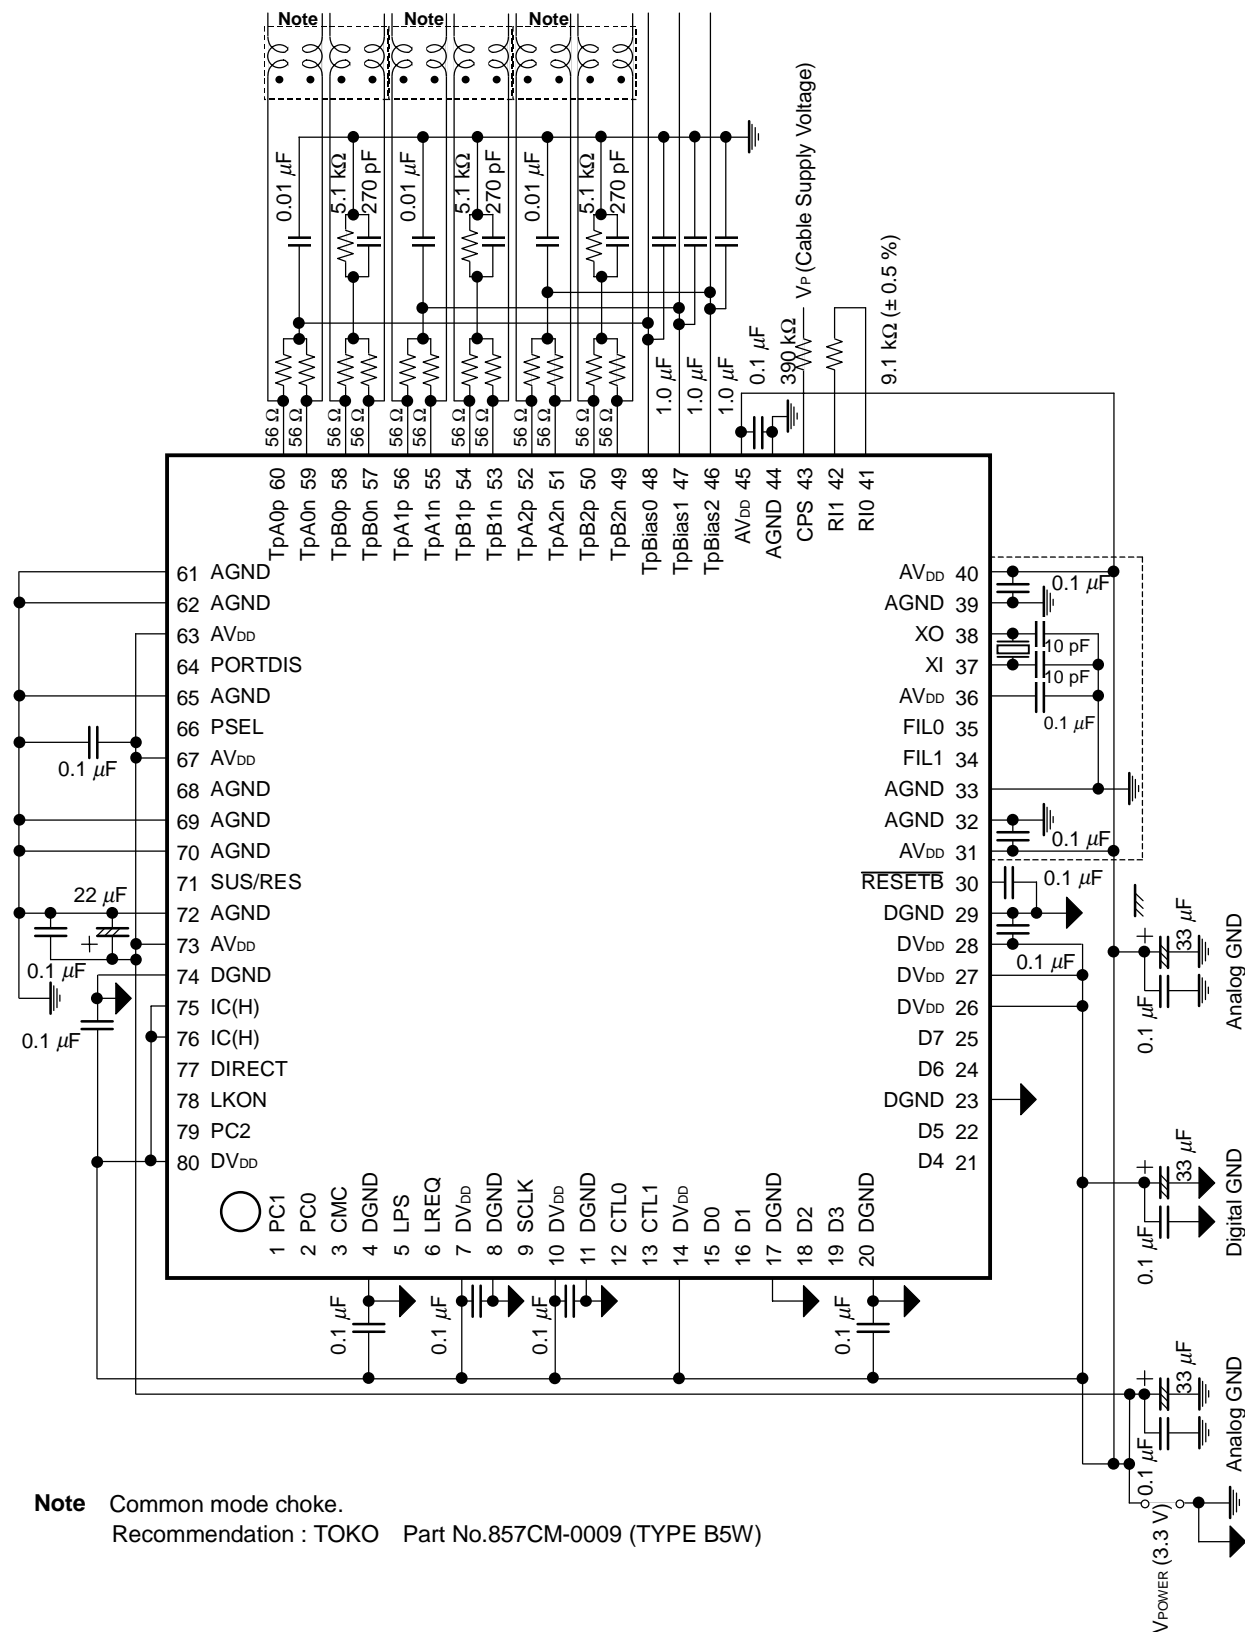

Cable Interface

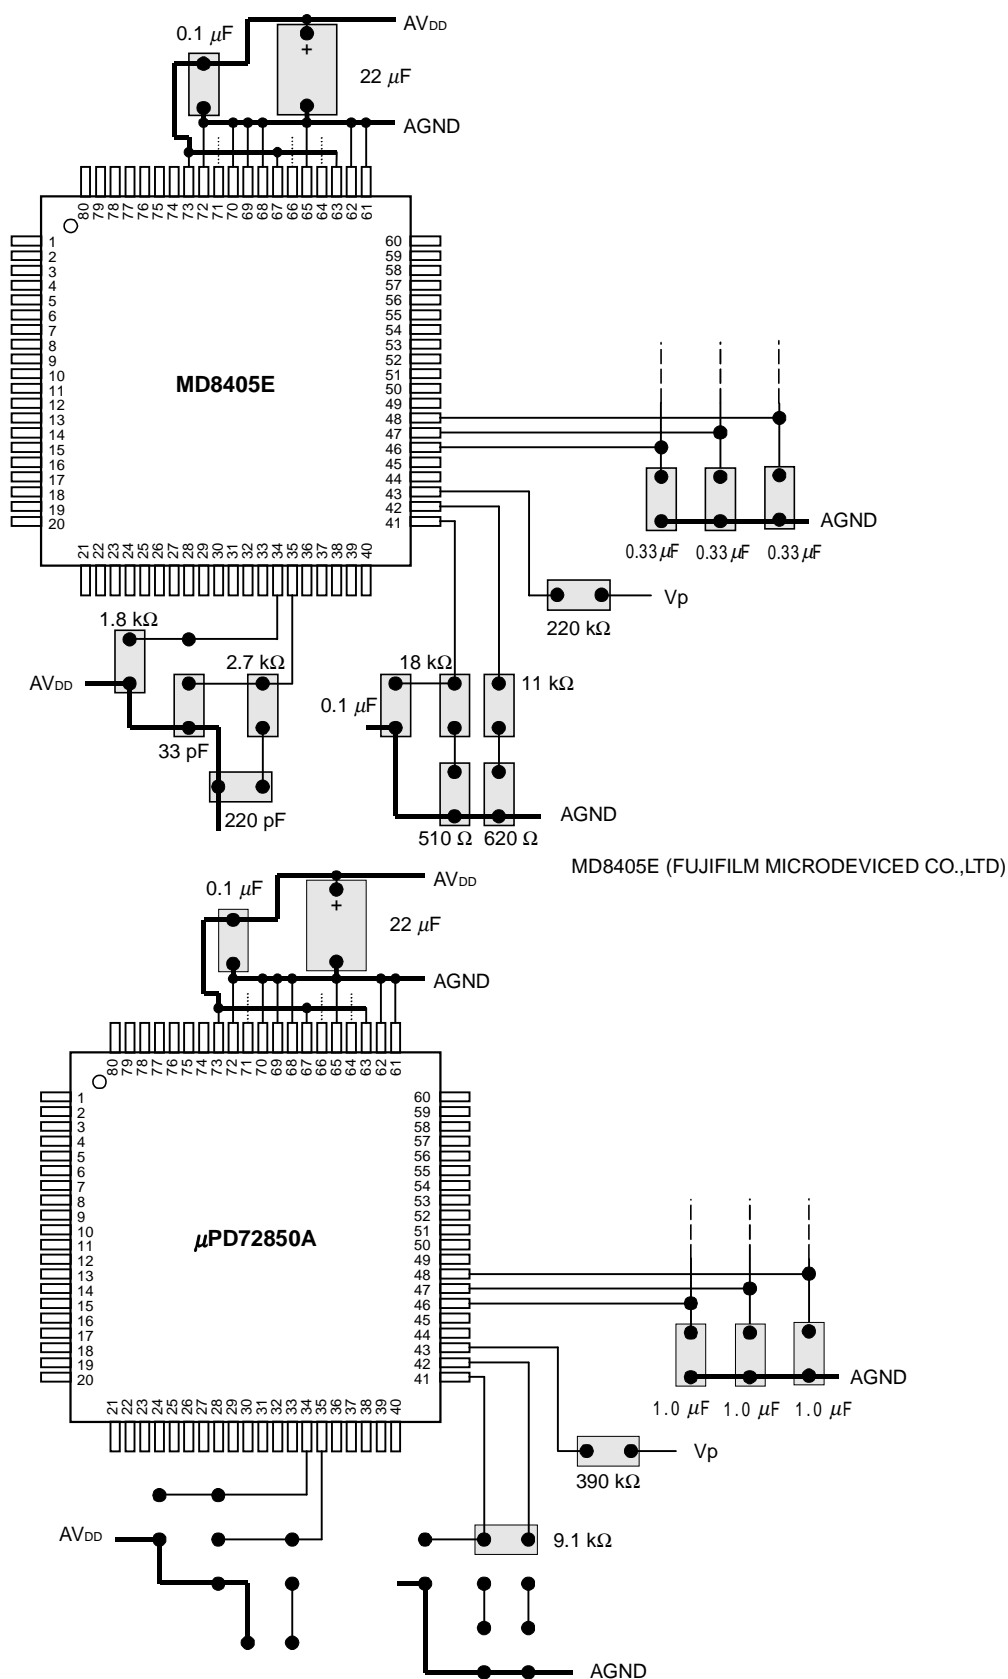

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
TpA, TpB transfer jitter	t _{JITTER}	Between TpA and TpB			±0.15	ns
TpA strobe, TpB data transfer	t _{SKEW}	Between TpA and TpB			±0.10	ns
TPA, TPB rise time/fall time	t _R /t _F	10% to 90%, via 55Ω and 10 pF			1.2	ns

7. APPLICATION CIRCUIT EXAMPLE

7.1 IEEE1394 Interface

7.2 NEC/FFM Board Sharing

8. PACKAGE DRAWING

80-PIN PLASTIC TQFP (FINE PITCH) (12x12)

NOTE

Each lead centerline is located within 0.10 mm of its true position (T.P.) at maximum material condition.

ITEM	MILLIMETERS
A	14.0±0.2
B	12.0±0.2
C	12.0±0.2
D	14.0±0.2
F	1.25
G	1.25
H	0.22±0.05
I	0.10
J	0.5 (T.P.)
K	1.0±0.2
L	0.5±0.2
M	0.145±0.05
N	0.10
P	1.0±0.05
Q	0.1±0.05
R	3° ^{+7°} _{-3°}
S	1.2 MAX.

S80GK-50-9EU-1

9. RECOMMENDED SOLDERING CONDITIONS

The μPD72850A should be soldered and mounted under the following recommended conditions.

For the details of the recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and conditions other than those recommended below, contact your NEC sales representative.

Table 9-1. Surface Mounting Type Soldering Conditions

μPD72850AGK-9EU : 80-pin plastic TQFP (Fine pitch) (12 x 12 mm)

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 235°C, Time: 30 sec. Max. (at 210°C or higher). Count: three times or less Exposure limit: 3 days ^{Note} (after that prebake at 125°C for 10 hours)	IR35-103-3
Partial heating	Pin temperature: 300°C Max., Time: 3 sec. Max. (per pin row)	—

Note After opening the dry pach, store it at 25°C or less and 65% RH or less for the allowable storage period.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

i.LINK is a trademark of Sony Corporation.

The export of this product from Japan is prohibited without governmental license. To export or re-export this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

- **The information in this document is current as of October, 1999. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.**
- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
- NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
- NEC semiconductor products are classified into the following three quality grades:
 "Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.
 "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
 "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
 "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.
 The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.
 (Note)
 (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
 (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
