

MOS INTEGRATED CIRCUIT

μ PD784214, 784215, 784216

16/8-BIT SINGLE-CHIP MICROCONTROLLERS

The μ PD784216 is a member of the μ PD784216 Subseries of the 78K/IV Series. Besides a high-speed and high-performance CPU, it features various peripheral hardware such as ROM, RAM, I/O ports, 8-bit resolution A/D and D/A converters, timer, serial interface, real-time output port, interrupts, etc.

A flash memory version, the μ PD78F4216, which can operate in the same voltage range as the mask ROM version, and various development tools are under development.

Detailed function descriptions are provided in the following user's manuals. Be sure to read them before designing.

μ PD784216, 784216Y Subseries User's Manual Hardware: U12015E
78K/IV Series User's Manual Instructions: U10905E

FEATURES

- 78K/IV series
- Inherits peripheral functions of μ PD78078 subseries
- Pin-compatible with μ PD784216Y subseries
- Minimum instruction execution time
 - 160 ns
 - (@ $f_{xx} = 12.5$ -MHz operation with main system clock)
 - 61 μ s
 - (@ $f_{rx} = 32.768$ -kHz operation with subsystem clock)
- I/O port: 86 pins
- Timer/counter: 16-bit timer/counter \times 1 unit
8-bit timer/counter \times 6 units
- Serial interface: 3 channels
 - UART/IOE (3-wire serial I/O): 2 channels
 - CSI (3-wire serial I/O): 1 channel
- Standby function
 - HALT/STOP/IDLE mode
 - In power-saving mode: HALT/IDLE mode (with subsystem clock)
- Clock division function
- Watch timer: 1 channel
- Watchdog timer: 1 channel
- Clock output function
 - $f_{xx}, f_{xx}/2, f_{xx}/2^2, f_{xx}/2^3, f_{xx}/2^4, f_{xx}/2^5, f_{xx}/2^6, f_{xx}/2^7,$
 f_{xt} selectable
- Buzzer output function
 - $f_{xx}/2^{10}, f_{xx}/2^{11}, f_{xx}/2^{12}, f_{xx}/2^{13}$ selectable
- A/D converter: 8-bit resolution \times 8 channels
- D/A converter: 8-bit resolution \times 2 channels
- Supply voltage: $V_{DD} = 2.2$ to 5.5 V

★

APPLICATIONS

Cellular phones, PHS, cordless telephones, CD-ROM, AV equipment

Unless mentioned otherwise, references in this document to the μ PD784216 refer to the μ PD784214, μ PD784215, and μ PD784216.

The information in this document is subject to change without notice.

The mark ★ shows major revised points.

ORDERING INFORMATION

	Part Number	Package	Internal ROM (Bytes)	Internal RAM (Bytes)
★	μPD784214GC-xxx-8EU	100-pin plastic LQFP (fine pitch) (14 × 14 mm)	96 K	3584
	μPD784214GF-xxx-3BA	100-pin plastic QFP (14 × 20 mm)	96 K	3584
★	μPD784215GC-xxx-8EU	100-pin plastic LQFP (fine pitch) (14 × 14 mm)	128 K	5120
	μPD784215GF-xxx-3BA	100-pin plastic QFP (14 × 20 mm)	128 K	5120

1. DIFFERENCES AMONG MODELS IN μPD784216 SUBSERIES

The only difference among the μPD784214, 784215, and 784216 lies in the internal memory capacity.

The μPD78F4216 is provided with a 128-KByte flash memory instead of the mask ROM of the above models. These differences are summarized in Table 1-1.

★

Table 1-1. Differences among Models in μPD784216 Subseries

Part Number Item	μPD784214	μPD784215	μPD784216	μPD78F4216
Internal ROM	96 KBytes (mask ROM)	128 KBytes (mask ROM)		128 KBytes (Flash memory)
Internal RAM	3584 Bytes	5120 Bytes	8192 Bytes	
Internal memory size switching register (IMS)	None			Provided ^{Note}
Supply voltage	V _{DD} = 2.2 to 5.5 V			V _{DD} = 2.7 to 5.5 V
Electrical specifications	Refer to the Data Sheet for each device.			
Recommended soldering conditions				
TEST pin	Provided			None
V _{PP} pin	None			Provided

Note Internal flash memory capacity and internal RAM capacity can be changed using the internal memory size switching register (IMS).

Caution There are differences in noise immunity and noise radiation between the flash memory and mask ROM versions. When pre-producing an application set with the flash memory version and then mass-producing it with the mask ROM version, be sure to conduct sufficient evaluations on the commercial samples (not engineering samples) of the mask ROM version.

2. MAIN DIFFERENCES FROM μPD78078 SUBSERIES

Series Name		μPD784216 Subseries	μPD78078 Subseries
Item			
CPU		16-bit CPU	8-bit CPU
Minimum instruction execution time	With main system clock	160 ns (@ 12.5-MHz operation)	400 ns (@ 5.0-MHz operation)
	With subsystem clock	61 μs (@ 32.768-kHz operation)	122 μs (@ 32.768-kHz operation)
Memory space		1 Mbytes	64 Kbytes
I/O port	Total	86	88
	CMOS input	8	2
	CMOS I/O	72	78
	N-ch open drain I/O	6	8
Pins with ancillary functions Note	Pins with pull-up resistor	70	86
	LED direct drive output	22	16
	Middle-voltage pin	6	8
Timer/counter		<ul style="list-style-type: none"> • 16-bit timer/counter × 1 unit • 8-bit timer/counter × 6 units 	<ul style="list-style-type: none"> • 16-bit timer/counter × 1 unit • 8-bit timer/counter × 4 units
Serial interface		<ul style="list-style-type: none"> • UART/IOE (3-wire serial I/O) × 2 channels • CSI (3-wire serial I/O) × 1 channel 	<ul style="list-style-type: none"> • UART/IOE (3-wire serial I/O) × 1 channel • CSI (3-wire serial I/O, 2-wire serial I/O, SBI) × 1 channel • CSI (3-wire serial I/O, 3-wire serial I/O with automatic transmit/receive function) × 1 channel
Interrupt	NMI pin	Provided	None
	Macro service	Provided	None
	Context switching	Provided	None
	Programmable priority	4 levels	None
★ Standby function		HALT/STOP/IDLE modes In low-power consumption mode: HALT/IDLE	HALT/STOP modes
★ Package		<ul style="list-style-type: none"> • 100-pin plastic LQFP (fine pitch) (14 × 14 mm) • 100-pin plastic QFP (14 × 20 mm) 	<ul style="list-style-type: none"> • 100-pin plastic LQFP (fine pitch) (14 × 14 mm) • 100-pin plastic QFP (14 × 20 mm) • 100-pin ceramic WQFN (14 × 20 mm) (μPD78P078 only)

Note The pins with ancillary functions are included in the I/O pins.

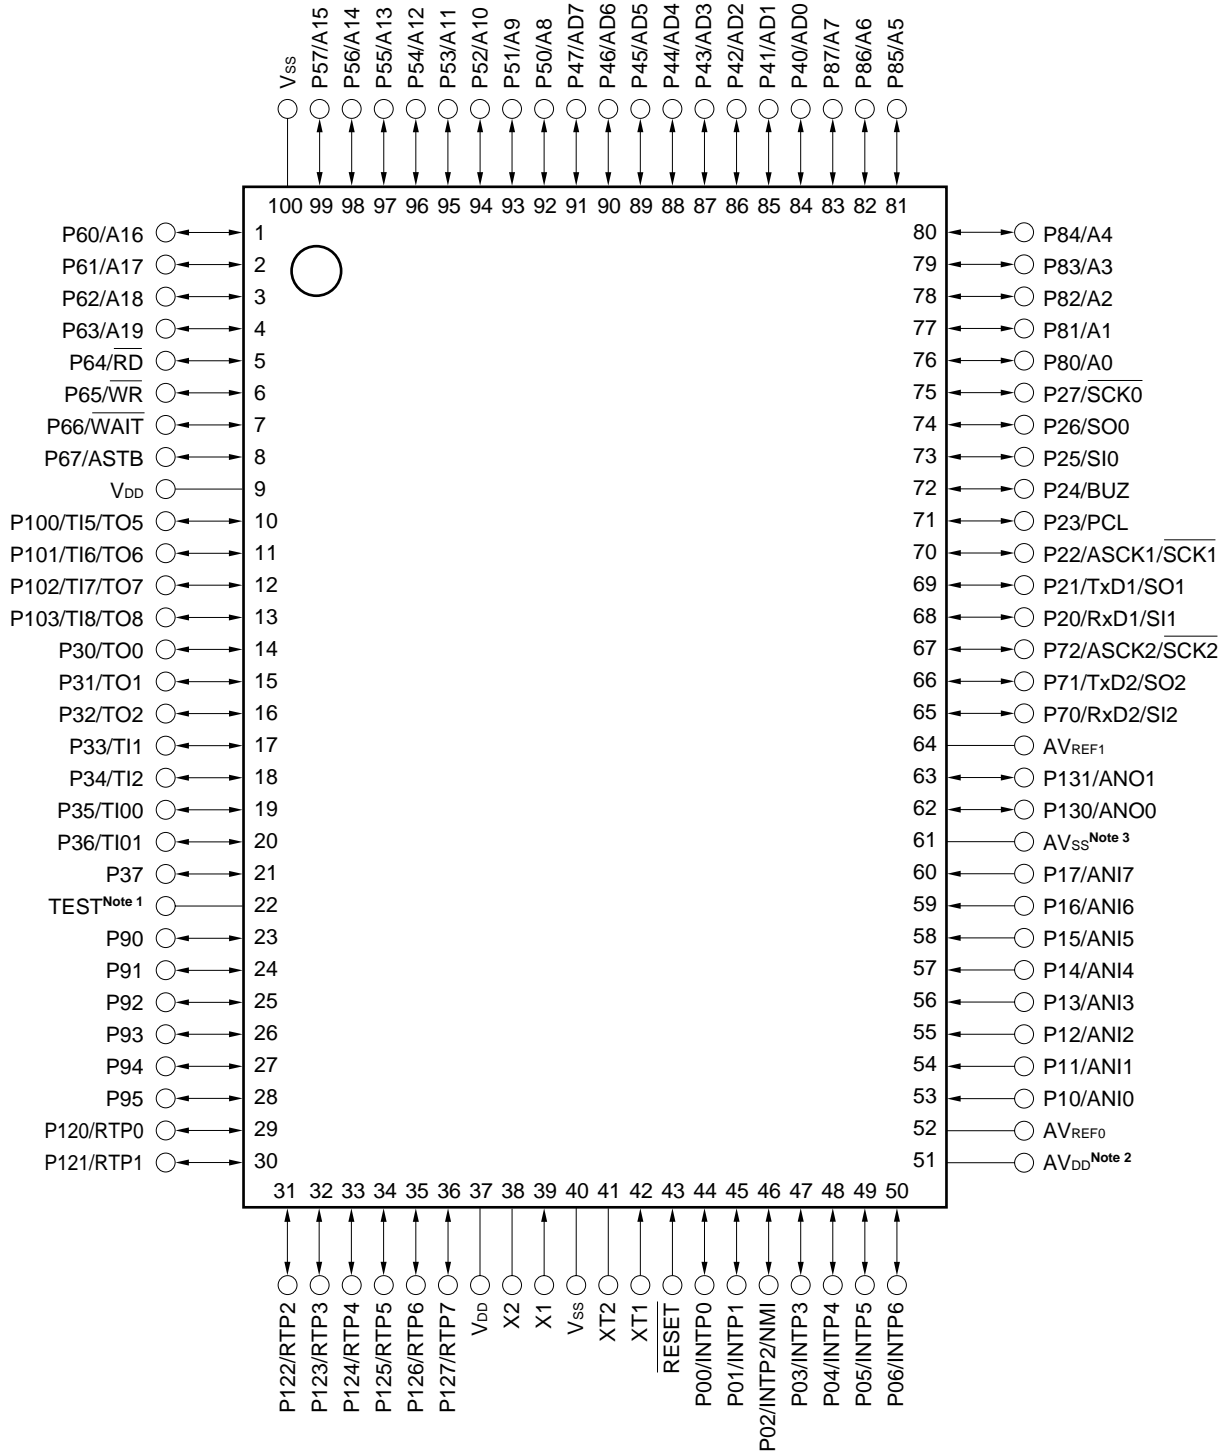

3. PIN CONFIGURATION (Top View)

- ★ • 100-pin plastic LQFP (fine pitch) (14 × 14 mm)
- μPD784214GC-xxx-8EU
- μPD784215GC-xxx-8EU
- μPD784216GC-xxx-8EU

- Notes**
1. Connect the TEST pin directly to Vss.
 2. Connect the AV_{DD} pin to V_{DD}.
 3. Connect the AV_{SS} pin to Vss.

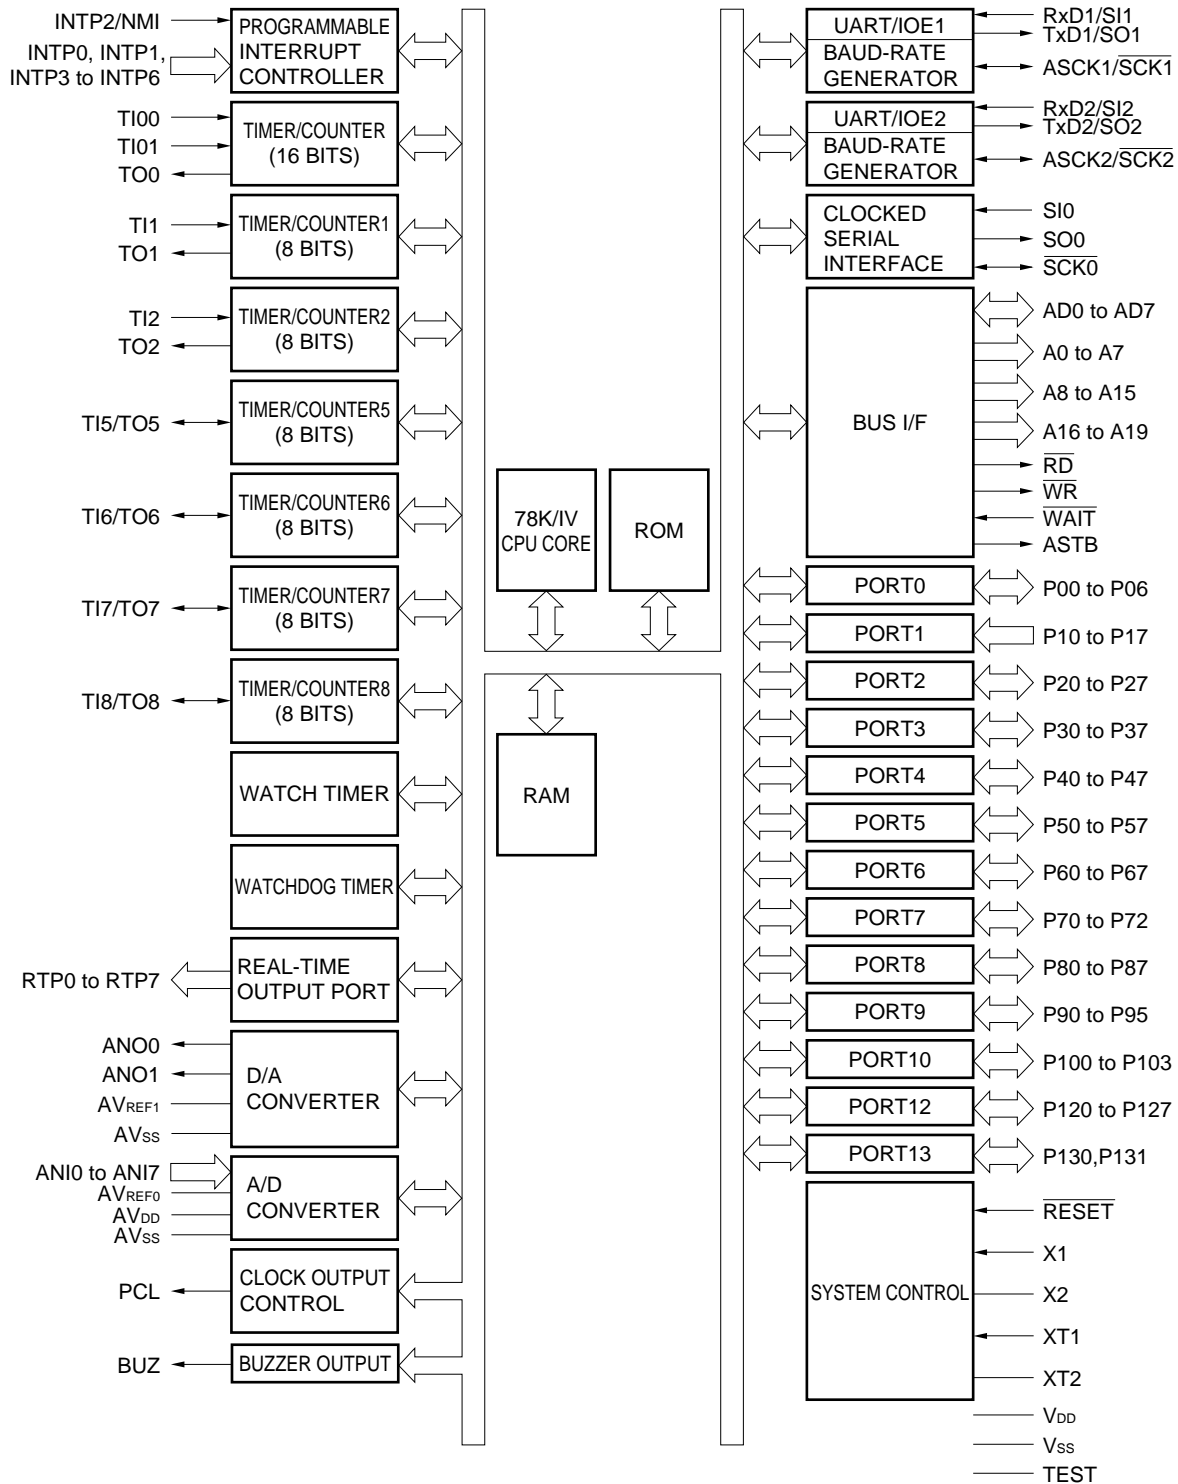

- 100-pin plastic QFP (14 × 20 mm)
 μPD784214GF-xxx-3BA
 μPD784215GF-xxx-3BA
 μPD784216GF-xxx-3BA

- Notes**
1. Connect the TEST pin directly to Vss.
 2. Connect the AVDD pin to VDD.
 3. Connect the AVSS pin to Vss.

5.2 Non-port Pins (2/2)

Pin Name	I/O	Alternate Function	Function
PCL	Output	P23	Clock output (for trimming main system clock and subsystem clock)
BUZ	Output	P24	Buzzer output
RTP0 to RTP7	Output	P120 to P127	Real-time output port that outputs data in synchronization with trigger
AD0 to AD7	I/O	P40 to P47	Lower address/data bus for expanding memory externally
A0 to A7	Output	P80 to P87	Lower address bus for expanding memory externally
A8 to A15		P50 to P57	Middle address bus for expanding memory externally
A16 to A19		P60 to P63	Higher address bus for expanding memory externally
\overline{RD}	Output	P64	Strobe signal output for read operation of external memory
\overline{WR}		P65	Strobe signal output for write operation of external memory
\overline{WAIT}	Input	P66	To insert wait state(s) when external memory is accessed
ASTB	Output	P67	Strobe output to externally latch address information output to ports 4 through 6 and port 8 to access external memory
\overline{RESET}	Input	—	System reset input
X1	Input	—	Crystal connection for main system clock oscillation
X2	—		
XT1	Input	—	Crystal connection for subsystem clock oscillation
XT2	—		
ANI0 to ANI7	Input	P10 to P17	Analog voltage input for A/D converter
ANO0, ANO1	Output	P130, P131	Analog voltage output for D/A converter
AV _{REF0}	—	—	To apply reference voltage for A/D converter
AV _{REF1}			To apply reference voltage for D/A converter
AV _{DD}			Positive power supply for A/D converter. Connect to V _{DD} .
AV _{SS}			GND for A/D converter and D/A converter. Connect to V _{SS} .
V _{DD}			Positive power supply
V _{SS}			GND
TEST			Connect directly to V _{SS} (this pin is for IC test).

5.3 Pin I/O Circuits and Recommended Connections of Unused Pins

Table 5-1 shows symbols indicating the I/O circuit types of the respective pins and the recommended connection of unused pins.

For the circuit diagram of each type of I/O circuit, refer to Figure 5-1.

Table 5-1. I/O Circuit Type of Respective Pins and Recommended Connections of Unused Pins (1/2)

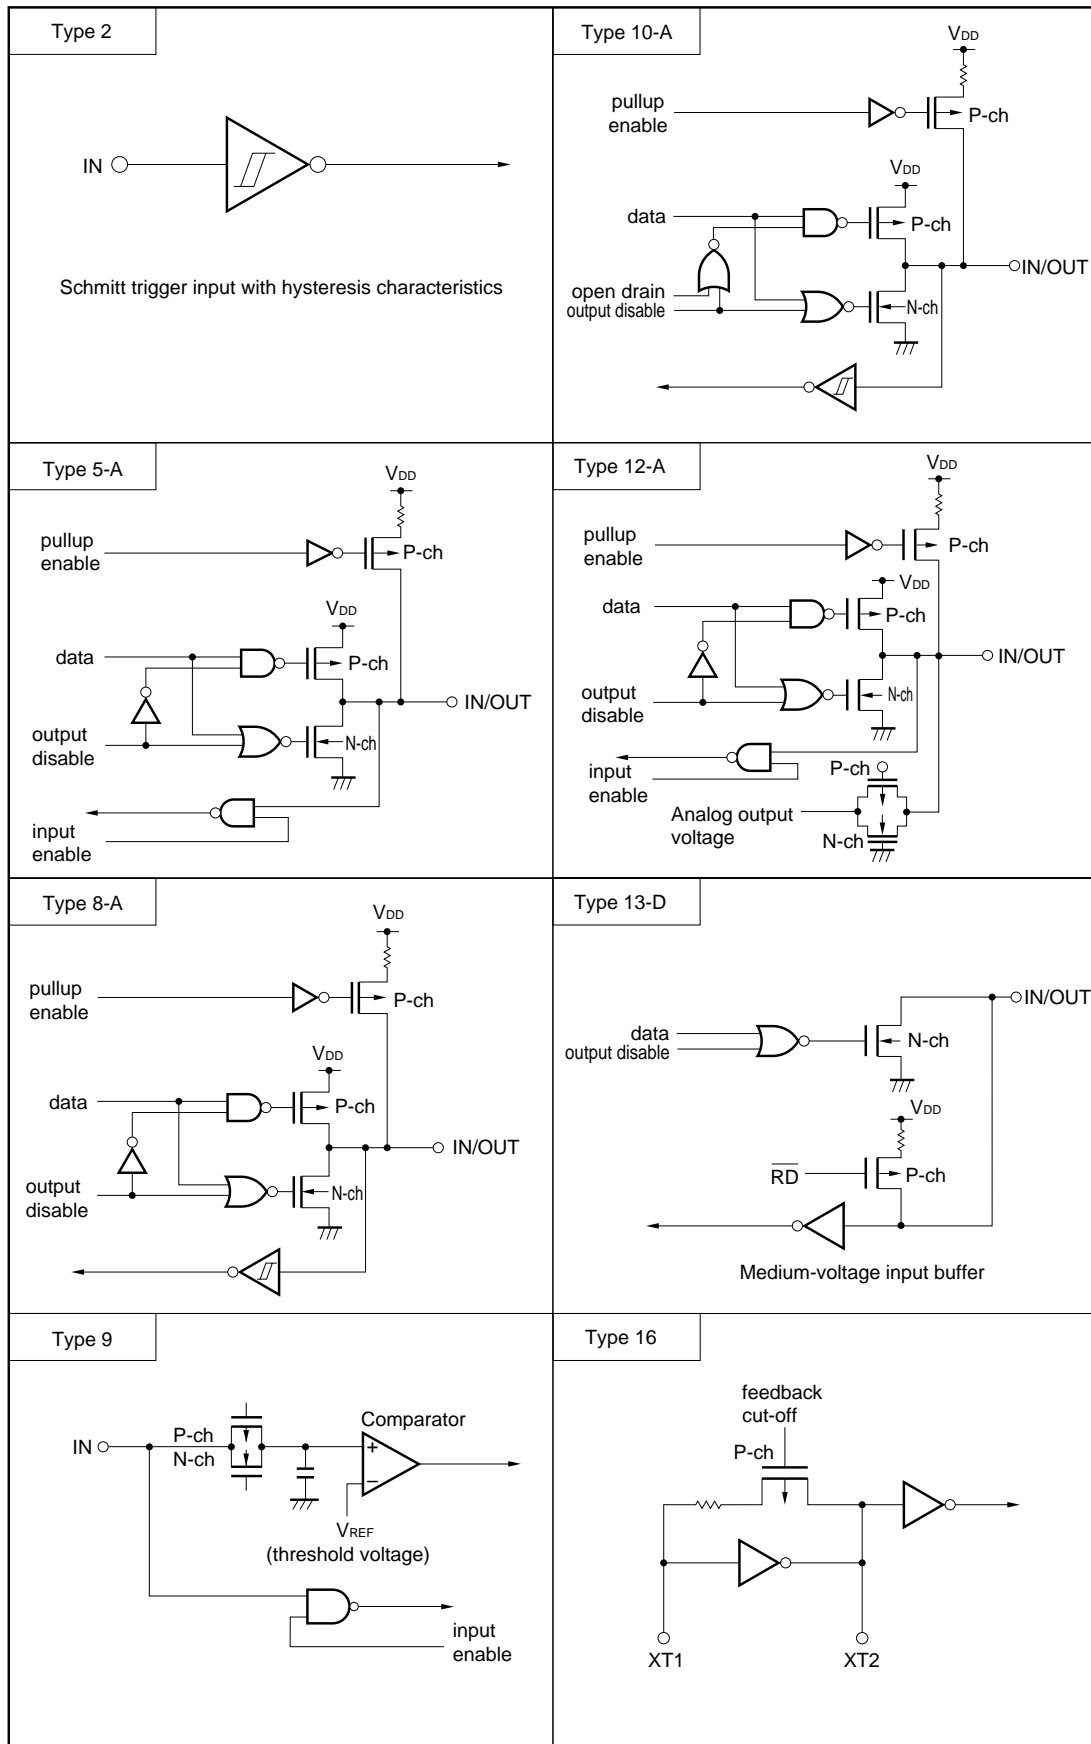

Pin Name	I/O Circuit Type	I/O	Recommended Connections of Unused Pins
P00/INTP0	8-A	I/O	Input: Independently connect to V _{SS} via a resistor Output: Leave open
P01/INTP1			
P02/INTP2/NMI

Table 5-1. I/O Circuit Type of Respective Pins and Recommended Connections of Unused Pins (2/2)

Pin Name	I/O Circuit Type	I/O	Recommended Connections of Unused Pins
RESET	2	Input	—
XT1	16	—	Connect to V _{SS}
XT2			Leave open
AV _{REF0}	—	—	Connect to V _{SS}
AV _{REF1}			Connect to V _{DD}
AV _{DD}			
AV _{SS}			Connect to V _{SS}
TEST			Connect directly to V _{SS}

Remark Because the circuit type numbers are standardized among the 78K Series products, they are not sequential in some models (i.e., some circuits are not provided).

Figure 5-1. Types of Pin I/O Circuits

6. CPU ARCHITECTURE

6.1 Memory Space

A memory space of 1 MByte can be accessed. Mapping of the internal data area (special function registers and internal RAM) can be specified by the LOCATION instruction. The LOCATION instruction must be always executed after RESET cancellation, and must not be used more than once.

(1) When LOCATION 0 instruction is executed

- **Internal memory**

The internal data area and internal ROM area are mapped as follows:

Part Number	Internal Data Area	Internal ROM Area
μPD784214	0F100H to 0FFFFH	00000H to 0F0FFH 10000H to 17FFFH
μPD784215	0EB00H to 0FFFFH	00000H to 0EAFH 10000H to 1FFFFH
μPD784216	0DF00H to 0FFFFH	00000H to 0DEFFH 10000H to 1FFFFH

Caution The following areas that overlap the internal data area of the internal ROM cannot be used when the LOCATION 0 instruction is executed.

Part Number	Unusable Area
μPD784214	0F100H to 0FFFFH (3840 Bytes)
μPD784215	0EB00H to 0FFFFH (5376 Bytes)
μPD784216	0DF00H to 0FFFFH (8448 Bytes)

- **External memory**

The external memory is accessed in external memory expansion mode.

(2) When LOCATION 0FH instruction is executed

- **Internal memory**

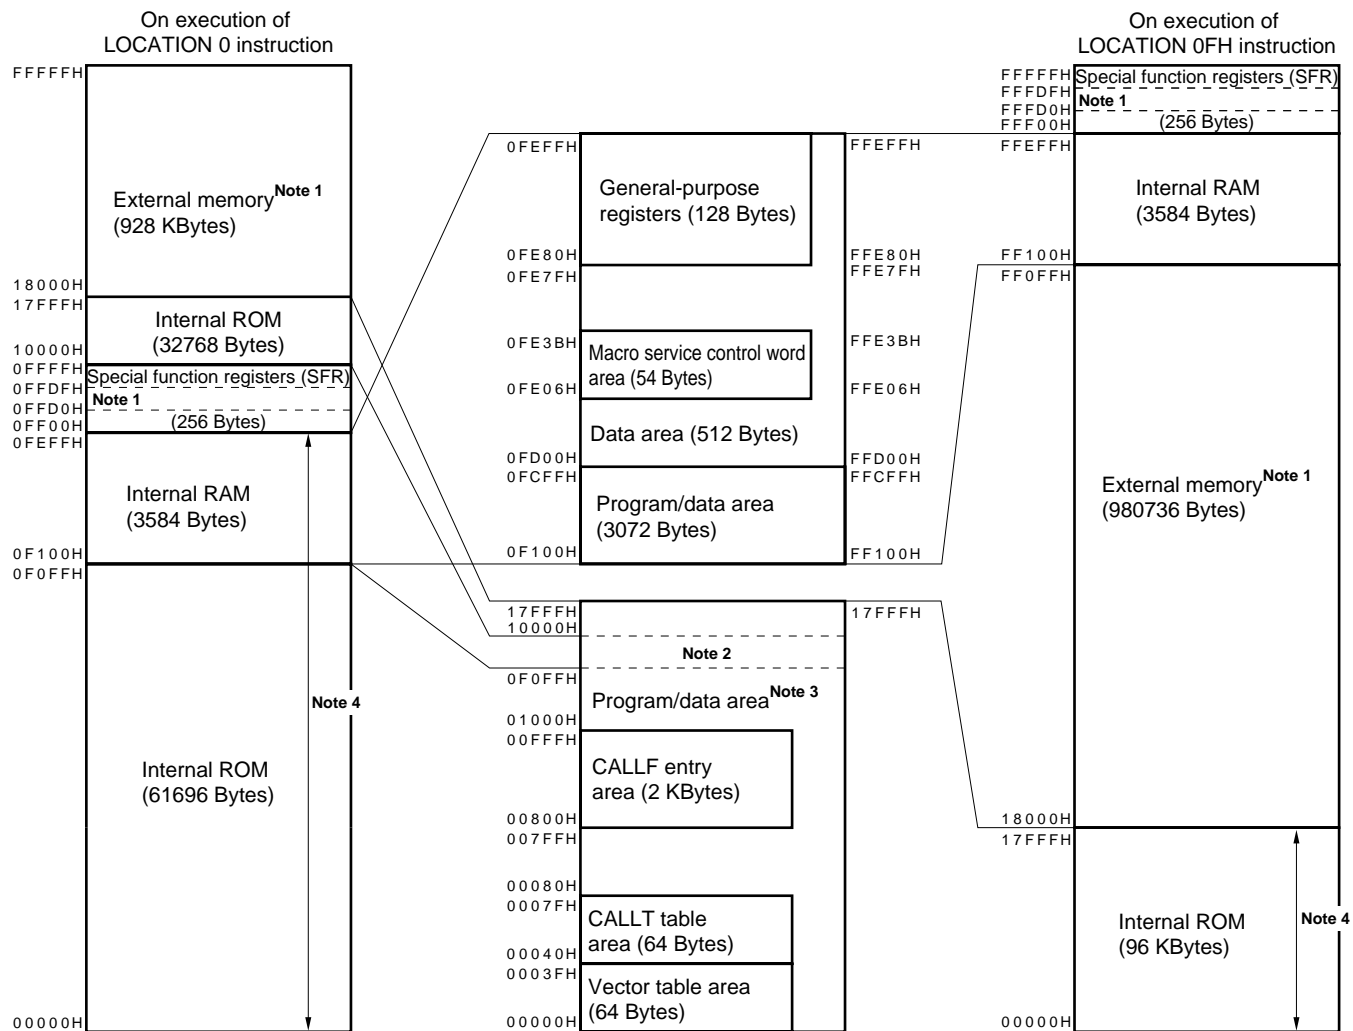

The internal data area and internal ROM area are mapped as follows:

Part Number	Internal Data Area	Internal ROM Area
μPD784214	FF100H to FFFFFH	00000H to 17FFFH
μPD784215	FEB00H to FFFFFH	00000H to 1FFFFH
μPD784216	FDF00H to FFFFFH	00000H to 1FFFFH

- **External memory**

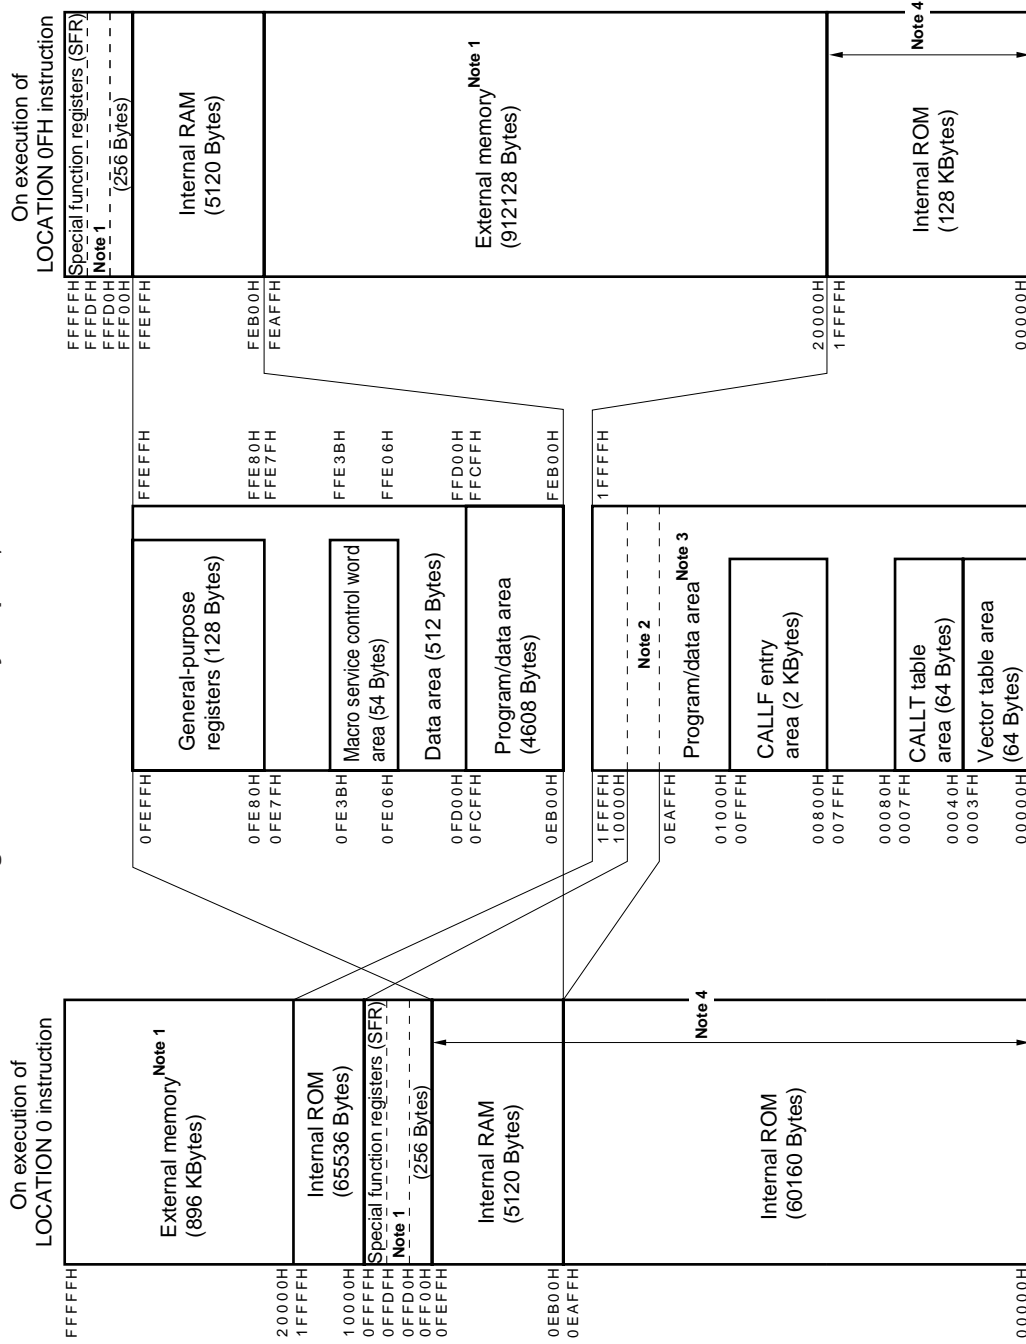

The external memory is accessed in external memory expansion mode.

Figure 6-1. Memory Map of μPD784214

- Notes**
1. Accessed in external memory expansion mode.
 2. This 3840-Byte area can be used as an internal ROM only when the LOCATION 0FH instruction is executed.
 3. On execution of LOCATION 0 instruction: 94464 Bytes, on execution of LOCATION 0FH instruction: 98304 Bytes
 4. Base area and entry area for reset or interrupt. However, the internal RAM area is not used as a reset entry area.

Figure 6-2. Memory Map of μPD784215

Notes

1. Accessed in external memory expansion mode.
2. This 5376-Byte area can be used as an internal ROM only when the LOCATION 0FH instruction is executed.
3. On execution of LOCATION 0 instruction: 125696 Bytes, on execution of LOCATION 0FH instruction: 131072 Bytes
4. Base area and entry area for reset or interrupt. However, the internal RAM area is not used as a reset entry area.

Figure 6-3. Memory Map of μPD784216

- Notes**
1. Accessed in external memory expansion mode.
 2. This 8448-Byte area can be used as an internal ROM only when the LOCATION 0FH instruction is executed.
 3. On execution of LOCATION 0 instruction: 122624 Bytes, on execution of LOCATION 0FH instruction: 131072 Bytes
 4. Base area and entry area for reset or interrupt. However, the internal RAM area is not used as a reset entry area.

6.2 CPU Registers

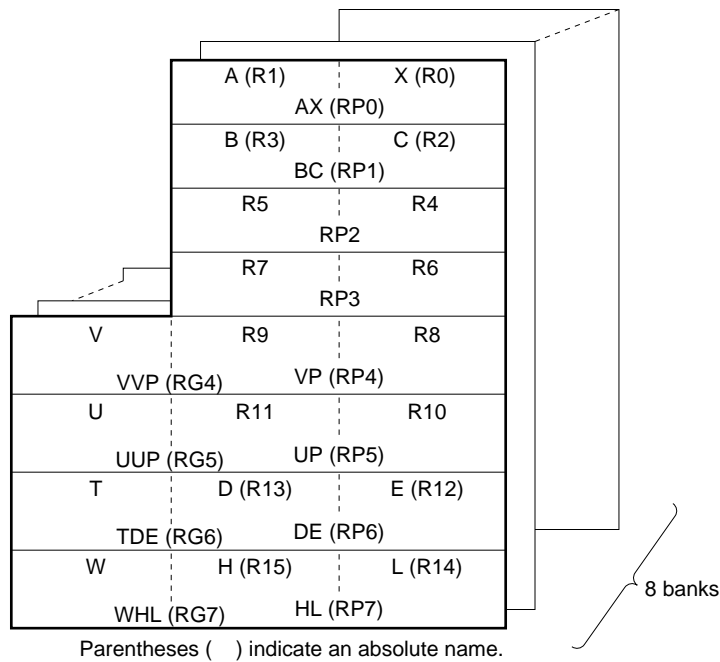

6.2.1 General-purpose registers

Sixteen 8-bit general-purpose registers are available. Two 8-bit registers can be also used in pairs as a 16-bit register. Of the 16-bit registers, four can be used in combination with an 8-bit register for address expansion as 24-bit address specification registers.

Eight banks of these register sets are available which can be selected by using software or the context switching function.

The general-purpose registers except V, U, T, and W registers for address expansion are mapped to the internal RAM.

Figure 6-4. General-Purpose Register Format

Caution Registers R4, R5, R6, R7, RP2, and RP3 can be used as X, A, C, B, AX, and BC registers, respectively, by setting the RSS bit of the PSW to 1. However, use this function only for recycling the program of the 78K/III Series.

6.2.2 Control registers

(1) Program counter (PC)

The program counter is a 20-bit register whose contents are automatically updated when the program is executed.

Figure 6-5. Program Counter (PC) Format

(2) Program status word (PSW)

This register holds the statuses of the CPU. Its contents are automatically updated when the program is executed.

Figure 6-6. Program Status Word (PSW) Format

Note This flag is provided to maintain compatibility with the 78K/III Series. Be sure to clear this flag to 0, except when the software for the 78K/III Series is used.

(3) Stack pointer (SP)

This is a 24-bit pointer that holds the first address of the stack. Be sure to write 0 to the higher 4 bits of this pointer.

Figure 6-7. Stack Pointer (SP) Format

6.2.3 Special function registers (SFRs)

The special function registers, such as the mode registers and control registers of the internal peripheral hardware, are registers to which special functions are allocated. These registers are mapped to a 256-Byte space of addresses 0FF00H through 0FFFFH **Note**.

Note On execution of the LOCATION 0 instruction. FFF00H through FFFFFH on execution of the LOCATION 0FH instruction.

Caution Do not access an address in this area to which no SFR is allocated. If such an address is accessed by mistake, the μPD784216 may be in the deadlock status. This deadlock status can be cleared only by inputting the RESET signal.

Table 6-1 lists the special function registers (SFRs). The meanings of the symbols in this table are as follows:

- Symbol Symbol indicating an SFR. This symbol is reserved for NEC's assembler (RA78K4). It can be used as sfr variable by the #pragma sfr command with the C compiler (CC78K4).
- R/W Indicates whether the SFR is read-only, write-only, or read/write.
 R/W: Read/write
 R: Read-only
 W: Write-only
- Bit units for manipulation.. Bit units in which the value of the SFR can be manipulated.
 SFRs that can be manipulated in 16-bit units can be described as the operand sfrp of an instruction. To specify the address of this SFR, describe an even address.
 SFRs that can be manipulated in 1-bit units can be described as the operand of a bit manipulation instruction.
- At reset Indicates the status of the register when the $\overline{\text{RESET}}$ signal has been input.

Table 6-1. Special Function Register (SFR) List (1/4)

Address ^{Note 1}	Special Function Register (SFR) Name	Symbol	R/W	Bit Units for Manipulation			At Reset
				1 bit	8 bits	16 bits

★

- Notes**
1. When the LOCATION 0 instruction is executed. Add "F0000H" to this value when the LOCATION 0FH instruction is executed.
 2. Because each port is initialized to input mode at reset, "00H" is not actually read. The output latch is initialized to "0".

7. PERIPHERAL HARDWARE FUNCTIONS

7.1 Ports

The ports shown in Figure 7-1 are provided to make various control operations possible. Table 7-1 shows the function of each port. Ports 0, 2 through 8, 10, 12 can be connected to internal pull-up resistors by software when inputting.

Figure 7-1. Port Configuration

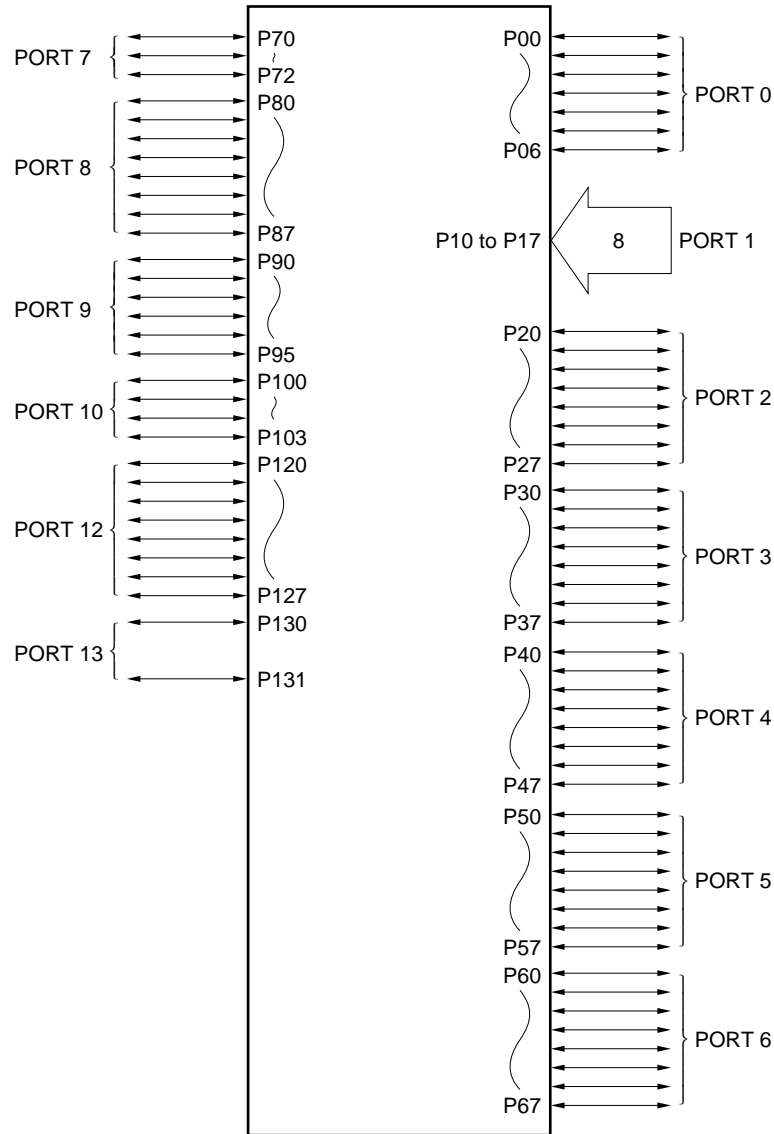

Table 7-1. Port Functions

Port Name	Pin Name	Function	Specification of Pull-up Resistor Connection by Software
Port 0	P00 to P06	• Can be set in input or output mode in 1-bit units	Can be specified in 1-bit units
Port 1	P10 to P17	• Input port	—
Port 2	P20 to P27	• Can be set in input or output mode in 1-bit units	Can be specified in 1-bit units
Port 3	P30 to P37	• Can be set in input or output mode in 1-bit units	Can be specified in 1-bit units
Port 4	P40 to P47	• Can be set in input or output mode in 1-bit units • Can directly drive LEDs	Can be specified in 1-port units
Port 5	P50 to P57	• Can be set in input or output mode in 1-bit units • Can directly drive LEDs	Can be specified in 1-port units
Port 6	P60 to P67	• Can be set in input or output mode in 1-bit units	Can be specified in 1-port units
Port 7	P70 to P72	• Can be set in input or output mode in 1-bit units	Can be specified in 1-bit units
Port 8	P80 to P87	• Can be set in input or output mode in 1-bit units	Can be specified in 1-bit units
Port 9	P90 to P95	• N-ch open drain I/O port • Can be set in input or output mode in 1-bit units • Can directly drive LEDs	—
Port 10	P100 to P103	• Can be set in input or output mode in 1-bit units	Can be specified in 1-bit units
Port 12	P120 to P127	• Can be set in input or output mode in 1-bit units	Can be specified in 1-bit units
Port 13	P130, P131	• Can be set in input or output mode in 1-bit units	—

7.2 Clock Generation Circuit

An on-chip clock generation circuit necessary for operation is provided. This clock generation circuit has a divider circuit. If high-speed operation is not necessary, the internal operating frequency can be lowered by the divider circuit to reduce the current consumption.

Figure 7-2. Block Diagram of Clock Generation Circuit

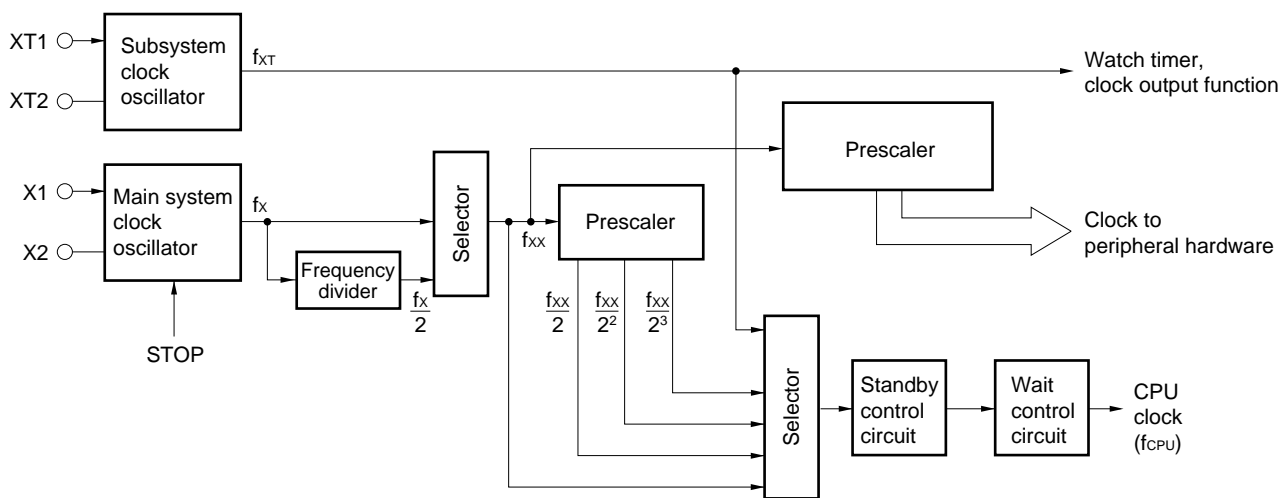

Figure 7-3. Example of Using Main System Clock Oscillator

Figure 7-4. Example of Using Subsystem Clock Oscillator

Caution When using the main system clock and subsystem clock oscillator, wire the dotted portions in Figures 7-3 and 7-4 as follows to avoid adverse influence from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always keep the ground point of the oscillator capacitor to the same potential as Vss. Do not ground the capacitor to a ground pattern in which a high current flows.
- Do not fetch signals from the oscillator.

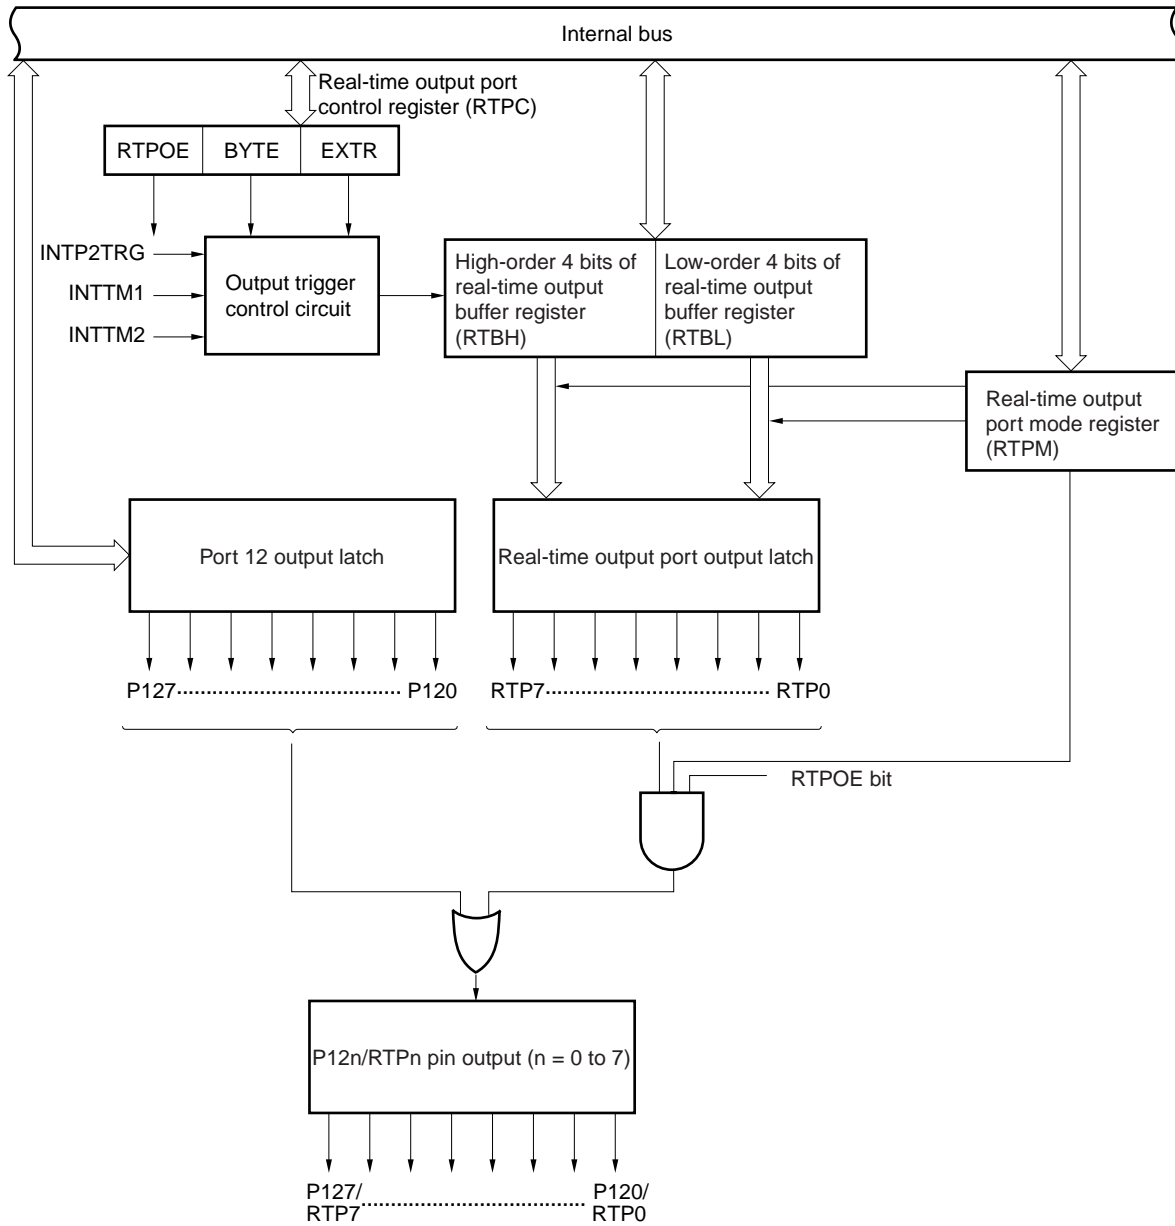

Note that the subsystem clock oscillator has a low amplification factor to reduce the current consumption.

7.3 Real-Time Output Port

The real-time output function is to transfer data set in advance to the real-time output buffer register to the output latch as soon as the timer interrupt or external interrupt has occurred in order to output the data to an external device. The pins that output the data to the external device constitute a port called a real-time output port.

Because the real-time output port can output signals without jitter, it is ideal for controlling a stepping motor.

★ Figure 7-5. Block Diagram of Real-Time Output Port

7.4 Timer/Counter

One unit of 16-bit timers/counters and six units of 8-bit timers/counters are provided.

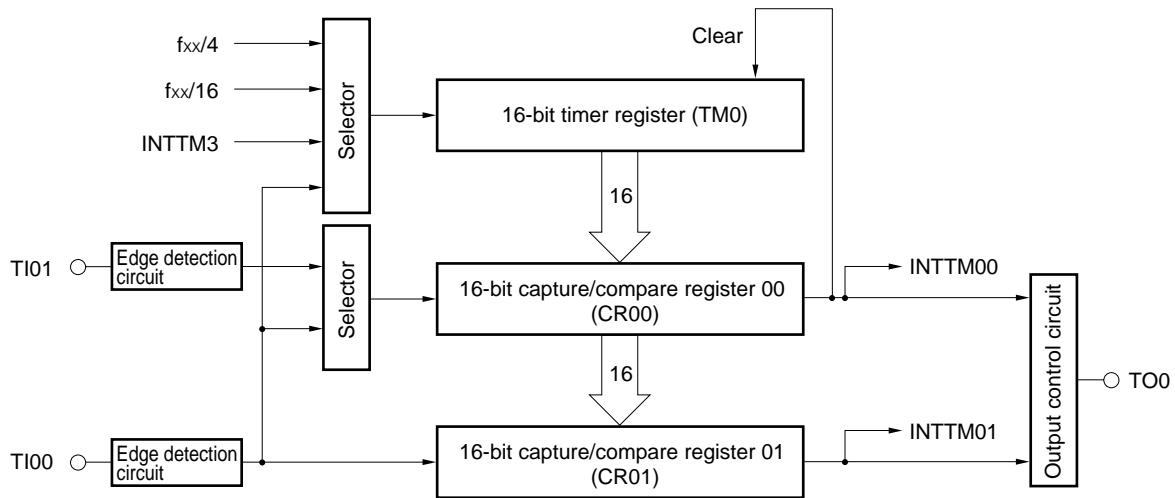

Because a total of eight interrupt requests are supported, these timers/counters can be used as eight units of timers/counters.

Table 7-2. Operations of Timers/Counters

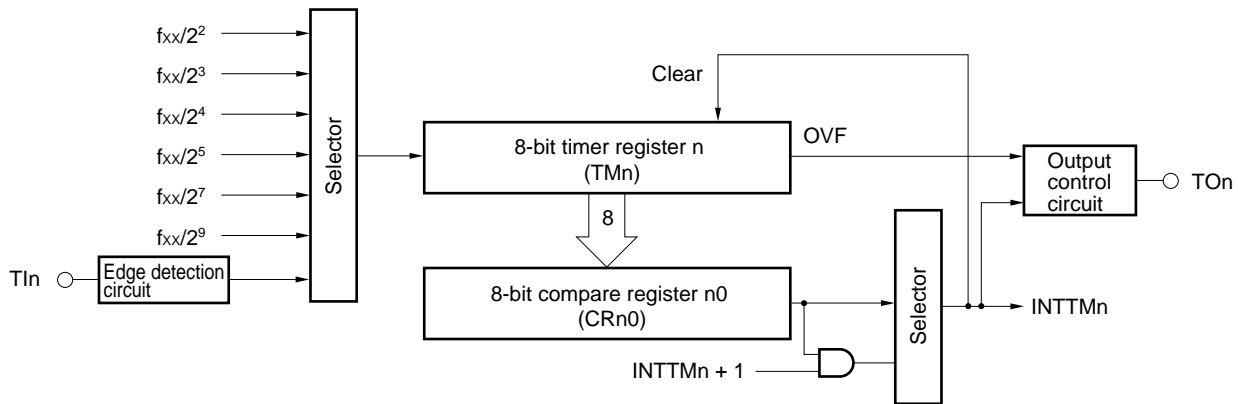

Item		Name		16-Bit	8-Bit	8-Bit	8-Bit	8-Bit	8-Bit	8-Bit
		Timer/Counter	Timer/Counter 1	Timer/Counter 2	Timer/Counter 5	Timer/Counter 6	Timer/Counter 7	Timer/Counter 8

8-bit timer/counter 2, 6, 8

- Remarks 1. $n = 2, 6, 8$
- 2. OVF: overflow flag

7.5 A/D Converter

An A/D converter converts an analog input variable into a digital signal. This microcontroller is provided with an A/D converter with a resolution of 8 bits and 8 channels (ANI0 through ANI7).

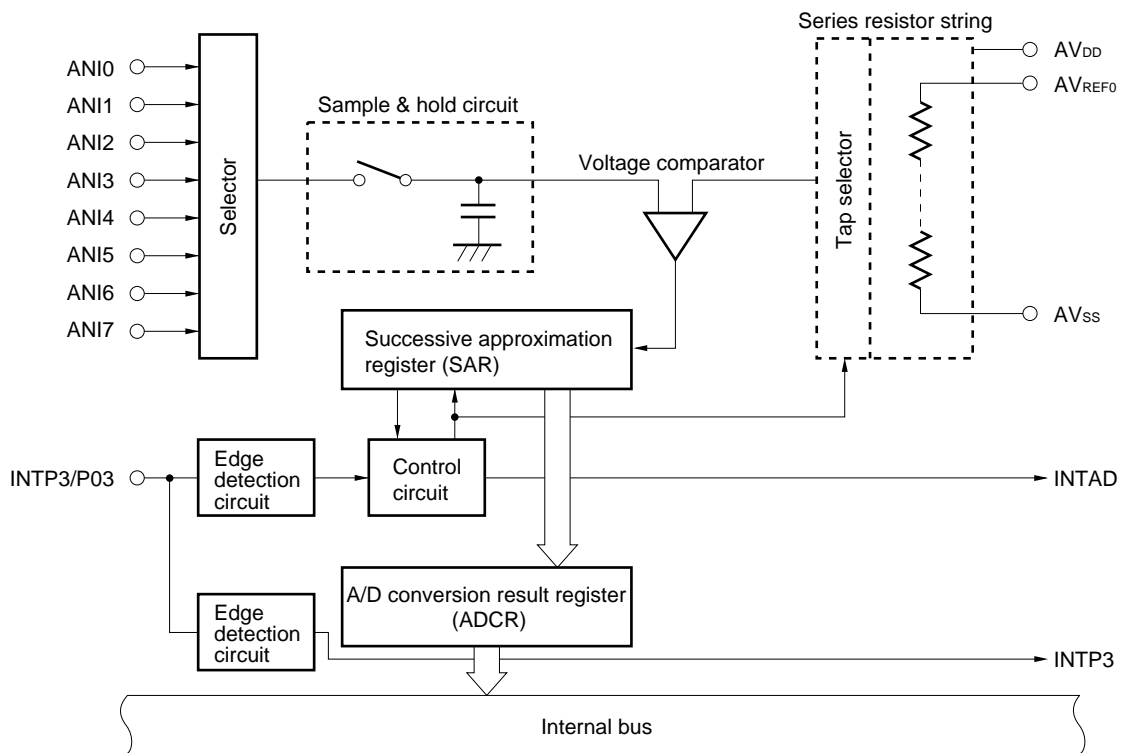

This A/D converter is of successive approximation type and the result of conversion is stored to an 8-bit A/D conversion result register (ADCR).

The A/D converter can be started in the following two ways:

- Hardware start
Conversion is started by trigger input (P03).
- Software start
Conversion is started by setting the A/D converter mode register (ADM).

One analog input channel is selected from ANI0 through ANI7 for A/D conversion. When A/D conversion is started by means of hardware start, conversion is stopped after it has been completed. When conversion is started by means of software start, A/D conversion is repeatedly executed, and each time conversion has been completed, an interrupt request (INTAD) is generated.

Figure 7-7. Block Diagram of A/D Converter

7.6 D/A Converter

A D/A converter converts an input digital signal into an analog voltage. This microcontroller is provided with a voltage output type D/A converter with a resolution of 8 bits and two channels.

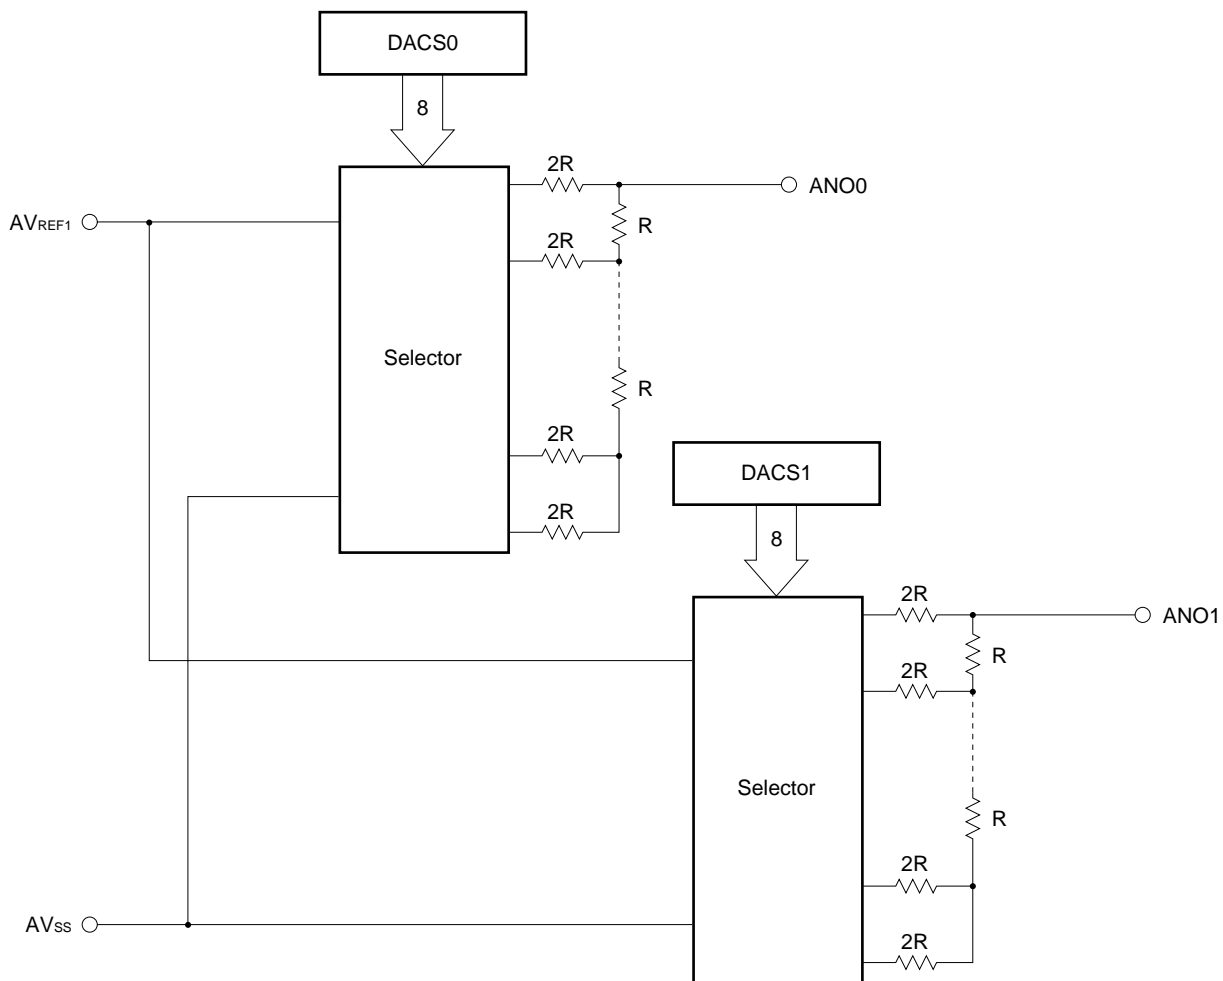

The conversion method is of R-2R resistor ladder type.

D/A conversion is started by setting DACE0 of the D/A converter mode register 0 (DAM0) and DACE1 of the D/A converter mode register 1 (DAM1).

The D/A converter operates in the following two modes:

- Normal mode
The converter outputs an analog voltage immediately after it has completed D/A conversion.
- Real-time output mode
The converter outputs an analog voltage in synchronization with an output trigger after it has completed D/A conversion.

Figure 7-8. Block Diagram of D/A Converter

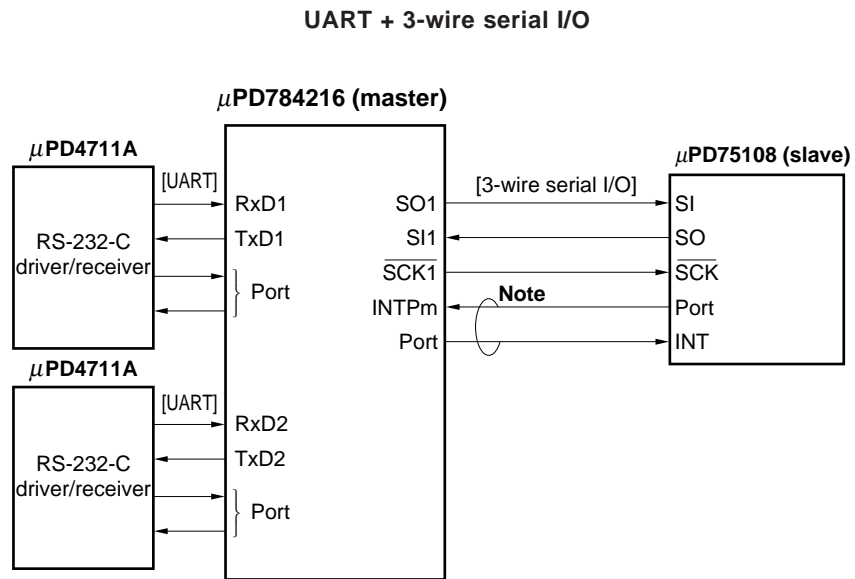

7.7 Serial Interface

Three independent serial interface channels are provided.

- Asynchronous serial interface (UART)/3-wire serial I/O (IOE) × 2
- Clocked serial interface (CSI) × 1
- 3-wire serial I/O (IOE)

Therefore, communication with an external system and local communication within the system can be simultaneously executed (refer to Figure 7-9).

Figure 7-9. Example of Serial Interface

Note Handshake line

7.7.1 Asynchronous serial interface/3-wire serial I/O (UART/IOE)

Two channels of serial interfaces that can select an asynchronous serial interface mode and 3-wire serial I/O mode are provided.

(1) Asynchronous serial interface mode

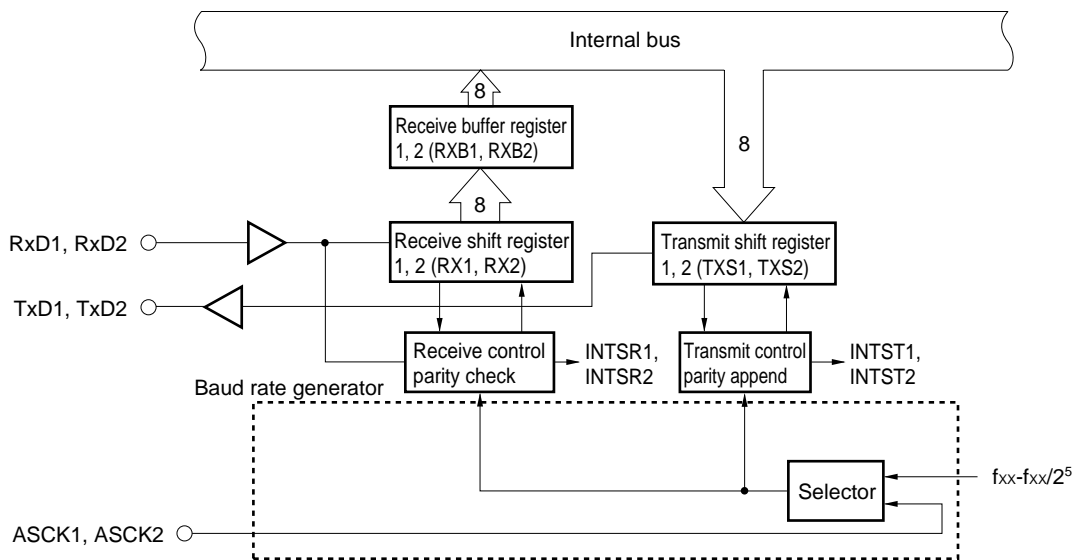

In this mode, data of 1 byte following the start bit is transmitted or received.

Because an on-chip baud rate generator is provided, a wide range of baud rates can be set.

Moreover, the clock input to the ASCK pin can be divided to define a baud rate.

When the baud rate generator is used, a baud rate conforming to the MIDI standard (31.25 kbps) can be also obtained.

Figure 7-10. Block Diagram in Asynchronous Serial Interface Mode

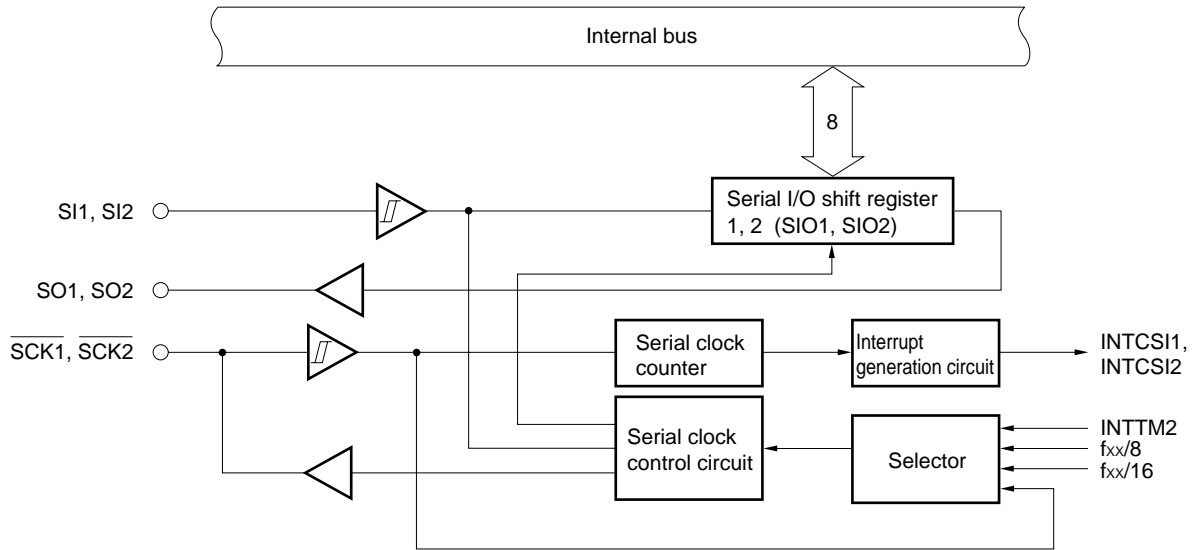

(2) 3-wire serial I/O mode

In this mode, the master device starts transfer by making the serial clock active and transfers 1-byte data in synchronization with this clock.

This mode is used to communicate with a device having the conventional clocked serial interface. Basically, communication is established by using three lines: serial clocks ($\overline{SCK1}$ and $\overline{SCK2}$), serial data inputs (SI1 and SI2), and serial data outputs (SO1 and SO2). To connect two or more devices, a handshake line is necessary.

★

Figure 7-11. Block Diagram in 3-wire Serial I/O Mode

7.7.2 Clocked serial interface (CSI)

In this mode, the master device starts transfer by making the serial clock active and communicates 1-byte data in synchronization with this clock.

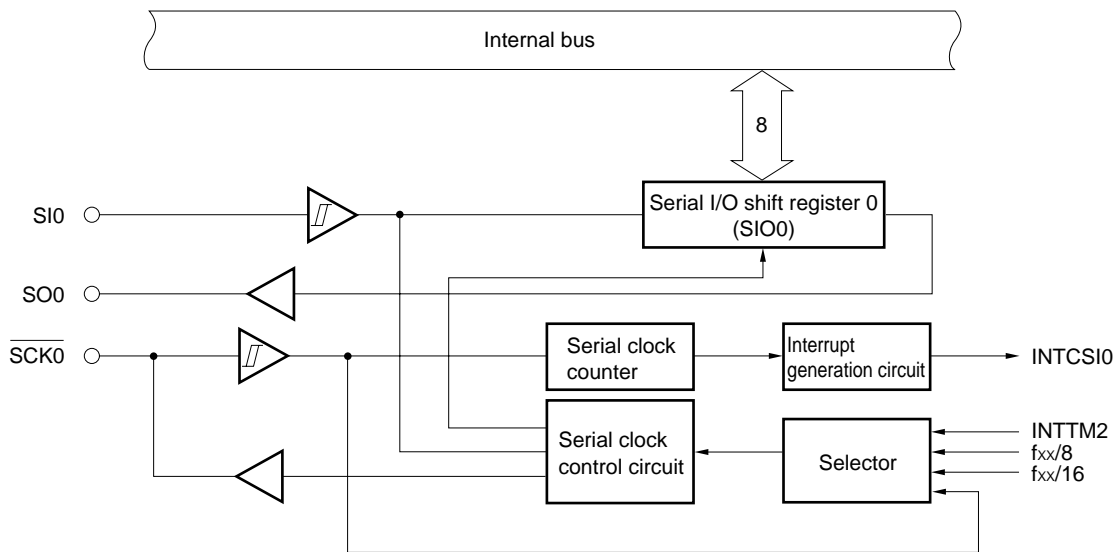

• **3-wire serial I/O mode**

This mode is to communicate with devices having the conventional clocked serial interface.

Basically, communication is established in this mode with three lines: one serial clock ($\overline{\text{SCK0}}$) and two serial data (SI0 and SO0) lines.

Generally, a handshake line is necessary to check the reception status.

★ **Figure 7-12. Block Diagram in 3-wire Serial I/O Mode**

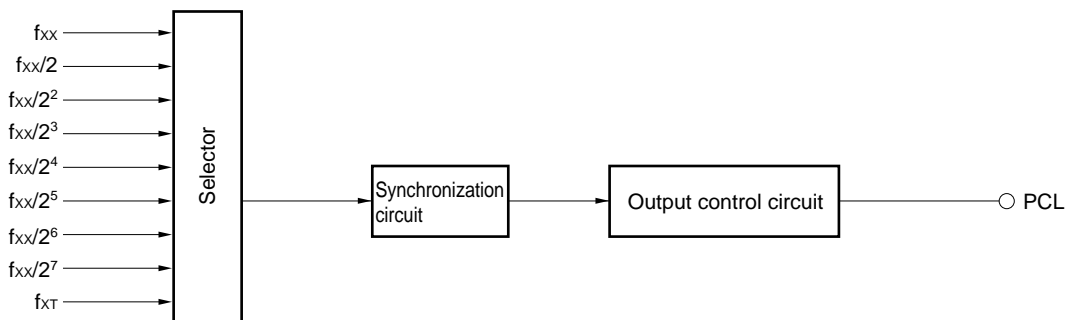

7.8 Clock Output Function

Clocks of the following frequencies can be output as clock output.

- 97.7 kHz/195 kHz/391 kHz/781 kHz/1.56 MHz/3.13 MHz/6.25 MHz/12.5 MHz (@ 12.5-MHz operation with main system clock)
- 32.768 kHz (@ 32.768-kHz operation with subsystem clock)

Figure 7-13. Block Diagram of Clock Output Function

7.9 Buzzer Output Function

Clocks of the following frequencies can be output as buzzer output.

- 1.5 kHz/3.1 kHz/6.1 kHz/12.2 kHz (@ 12.5-MHz operation with main system clock)

Figure 7-14. Block Diagram of Buzzer Output Function

7.10 Edge Detection Function

The interrupt input pins (INTP0, INTP1, NMI/INTP2, INTP3 through INTP6) are used not only to input interrupt requests but also to input trigger signals to the internal hardware units. Because these pins operate at an edge of the input signal, they have a function to detect an edge. Moreover, a noise reduction function is also provided to prevent erroneous detection due to noise.

Pin Name	Detectable Edge	Noise Reduction
NMI	Either or both of rising and falling edges	By analog delay
INTP0 through INTP6		

7.11 Watch Timer

The watch timer has the following functions:

- Watch timer
- Interval timer

The watch timer and interval timer functions can be used at the same time.

(1) Watch timer

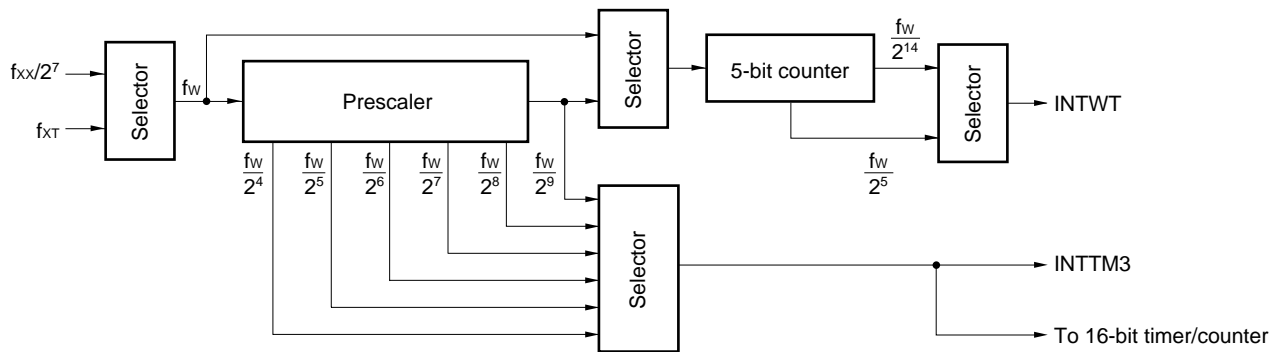

The watch timer sets the WTIF flag of the interrupt control register (WTIC) at time intervals of 0.5 seconds by using the 32.768-kHz subsystem clock.

(2) Interval timer

The interval timer generates an interrupt request (INTTM3) at predetermined time intervals.

★

Figure 7-15. Block Diagram of Watch Timer

7.12 Watchdog Timer

A watchdog timer is provided to detect a hang up of the CPU. This watchdog timer generates a non-maskable or maskable interrupt unless it is cleared by software within a specified interval time. Once enabled to operate, the watchdog timer cannot be stopped by software. Whether the interrupt by the watchdog timer or the interrupt input from the NMI pin takes precedence can be specified.

Figure 7-16. Block Diagram of Watchdog Timer

Remark f_{CLK} : Internal system clock (f_{xx} to $f_{xx}/8$)

8. INTERRUPT FUNCTION

As the servicing in response to an interrupt request, the three types shown in Table 8-1 can be selected by program.

Table 8-1. Servicing of Interrupt Request

Servicing Mode	Entity of Servicing	Servicing	Contents of PC and PSW
Vectored interrupt	Software	Branches and executes servicing routine (servicing is arbitrary)	Saves to and restores from stack
Context switching		Automatically switches register bank, branches and executes servicing routine (servicing is arbitrary)	Saves to or restores from fixed area in register bank
Macro service	Firmware	Executes data transfer between memory and I/O (servicing is fixed)	Retained

8.1 Interrupt Sources

Table 8-2 shows the interrupt sources available. As shown, interrupts are generated by 29 types of sources, execution of the BRK instruction, BRKCS instruction, or an operand error.

The priority of interrupt servicing can be set to four levels, so that nesting can be controlled during interrupt servicing and that which of the two or more interrupts that simultaneously occur should be serviced first. When the macro service function is used, however, nesting always proceeds.

The default priority is the priority (fixed) of the service that is performed if two or more interrupt requests, having the same priority, simultaneously generate (refer to Table 8-2).

Table 8-2. Interrupt Sources

Type	Default Priority	Source		Internal/ External	Macro Service
		Name	Trigger		
Software	—	BRK instruction	Instruction execution	—	—
		BRKCS instruction	Instruction execution		
		Operand error	If result of exclusive OR between operands byte and byte is not FFH when MOV STBC, #byte instruction, MOV WDM, #byte instruction, or LOCATION instruction is executed		
Non-maskable	—	NMI	Pin input edge detection	External	—
		INTWDT	Overflow of watchdog timer	Internal	
Maskable	0 (highest)	INTWDTM	Overflow of watchdog timer	Internal	√
	1	INTP0	Pin input edge detection	External	
	2	INTP1			
	3	INTP2			
	4	INTP3			
	5	INTP4			
	6	INTP5			
	7	INTP6			
	8	INTCSI0	End of 3-wire transfer by CSI0	Internal	
	9	INTSER1	Occurrence of UART reception error in ASI1		
	10	INTSR1	End of UART reception by ASI1		
		INTCSI1	End of 3-wire transfer by CSI1		
	11	INTST1	End of UART transmission by ASI1		
	12	INTSER2	Occurrence of UART reception error in ASI2		
	13	INTSR2	End of UART reception by ASI2		
		INTCSI2	End of 3-wire transfer by CSI2		
	14	INTST2	End of UART transmission by ASI2		
	15	INTTM3	Reference time interval signal from watch timer		
	16	INTTM00	Signal indicating coincidence between 16-bit timer register and capture/compare register (CR00)		
	17	INTTM01	Signal indicating coincidence between 16-bit timer register and capture/compare register (CR01)		
	18	INTTM1	Occurrence of coincidence signal of 8-bit timer/counter 1		
	19	INTTM2	Occurrence of coincidence signal of 8-bit timer/counter 2		
	20	INTAD	End of conversion by A/D converter		
	21	INTTM5	Occurrence of coincidence signal of 8-bit timer/counter 5		
	22	INTTM6	Occurrence of coincidence signal of 8-bit timer/counter 6		
	23	INTTM7	Occurrence of coincidence signal of 8-bit timer/counter 7		
	24	INTTM8	Occurrence of coincidence signal of 8-bit timer/counter 8		
25	INTWT	Overflow of watch timer			
26 (lowest)	INTKR	Detection of falling edge of port 8	External		

Remark ASI: Asynchronous Serial Interface
 CSI: Clocked Serial Interface

8.2 Vectored Interrupt

Execution branches to a servicing routine by using the memory contents of a vector table address corresponding to the interrupt source as the address of the branch destination.

So that the CPU performs interrupt servicing, the following operations are performed:

- On branching: Saves the status of the CPU (contents of PC and PSW) to stack
- On returning: Restores the status of the CPU (contents of PC and PSW) from stack

To return to the main routine from an interrupt service routine, the RETI instruction is used. The branch destination address is in a range of 0 to FFFFH.

Table 8-3. Vector Table Address

Interrupt Source	Vector Table Address	Interrupt Source	Vector Table Address
BRK instruction	003EH	INTSER2	001EH
TRAP0 (operand error)	003CH	INSR2	0020H
NMI	0002H	INTCSI2	
INTWDT (non-maskable)	0004H	INTST2	0022H
INTWDTM (maskable)	0006H	INTTM3	0024H
INTP0	0008H	INTTM00	0026H
INTP1	000AH	INTTM01	0028H
INTP2	000CH	INTTM1	002AH
INTP3	000EH	INTTM2	002CH
INTP4	0010H	INTAD	002EH
INTP5	0012H	INTTM5	0030H
INTP6	0014H	INTTM6	0032H
INTCSI0	0016H	INTTM7	0034H
INTSER1	0018H	INTTM8	0036H
INTSR1	001AH	INTWT	0038H
INTCSI1		INTKR	003AH
INTST1	001CH	X	

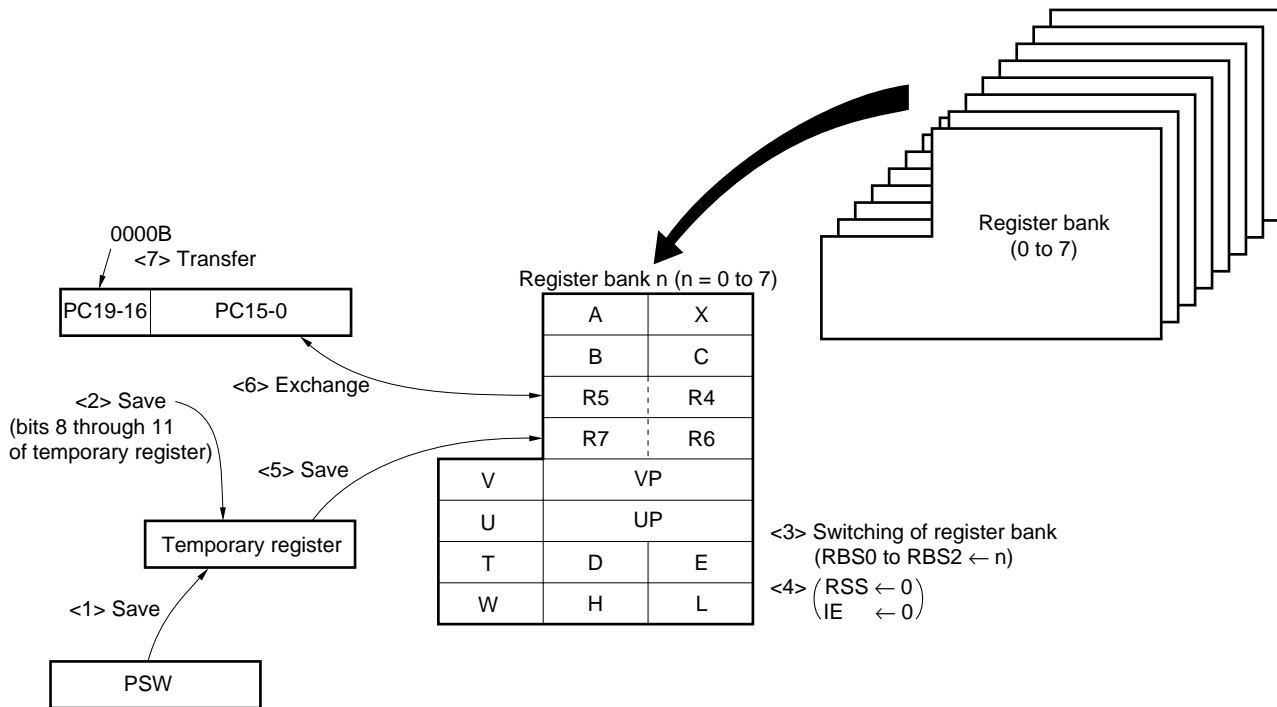

★

8.3 Context Switching

When an interrupt request is generated or when the BRKCS instruction is executed, a predetermined register bank is selected by hardware. Context switching is a function that branches execution to a vector address stored in advance in the register bank, and to stack the current contents of the program counter (PC) and program status word (PSW) to the register bank.

The branch address is in a range of 0 to FFFFH.

Figure 8-1. Context Switching Operation When Interrupt Request Is Generated

8.4 Macro Service

This function is to transfer data between memory and a special function register (SFR) without intervention by the CPU. A macro service controller accesses the memory and SFR in the same transfer cycle and directly transfers data without loading it.

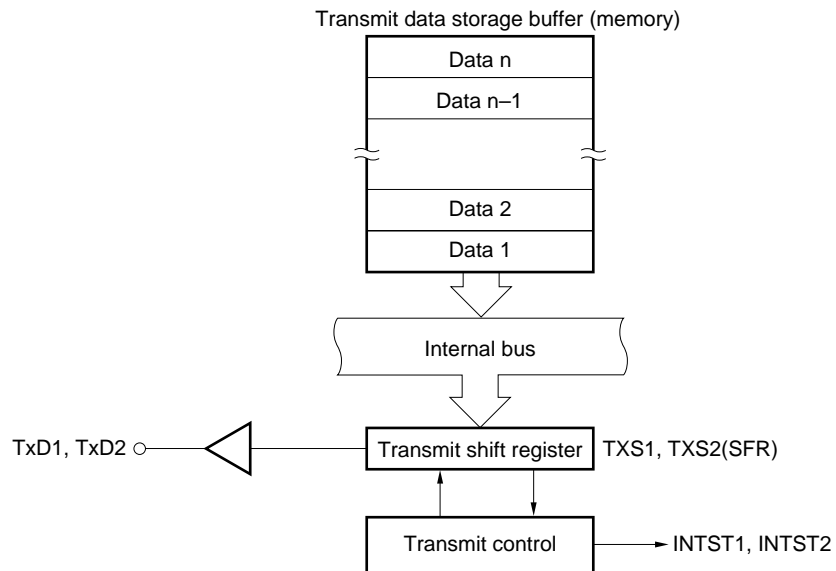

Because this function does not save or restore the status of the CPU, or load data, data can be transferred at high speeds.

Figure 8-2. Macro Service

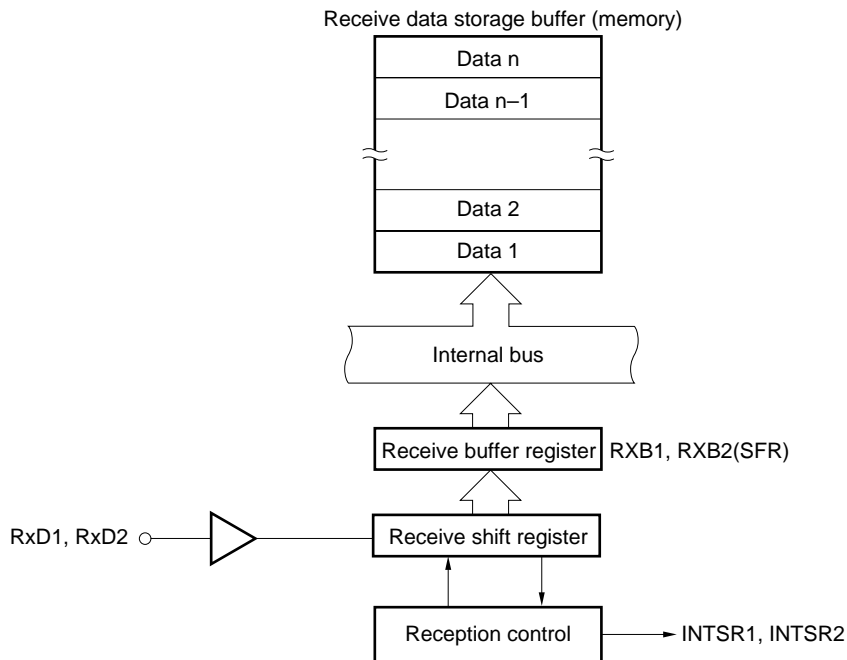

8.5 Application Example of Macro Service

(1) Transmission of serial interface

Each time macro service requests INTST1 and INTST2 are generated, the next transmit data is transferred from memory to TXS1 and TXS2. When data n (last byte) has been transferred to TXS1 and TXS2 (when the transmit data storage buffer has become empty), vectored interrupt requests INTST1 and INTST2 are generated.

(2) Reception of serial interface

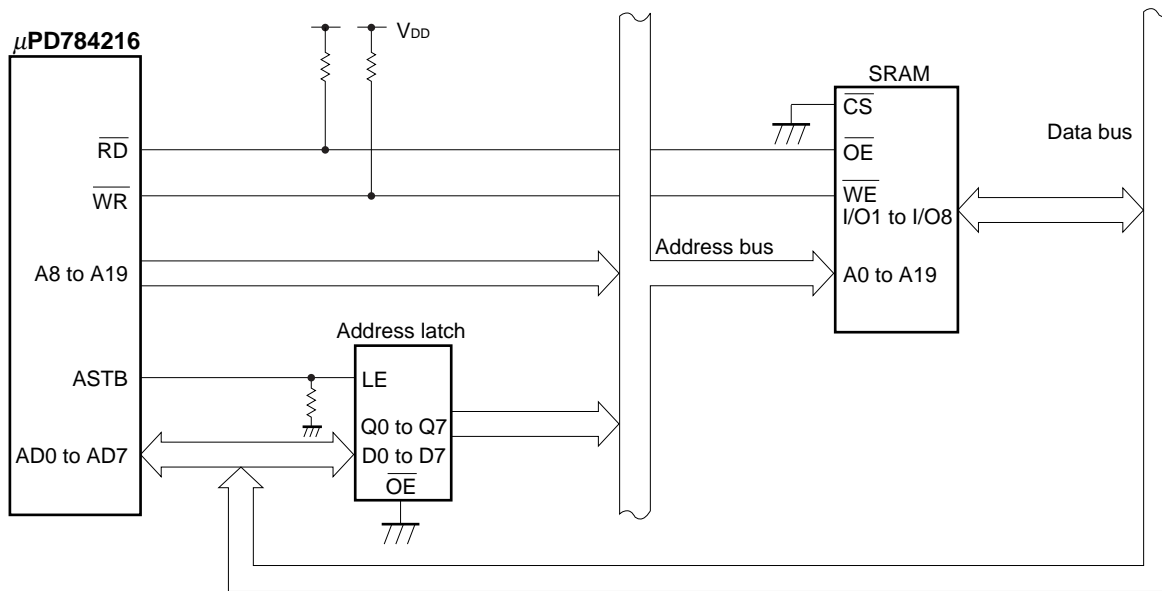

Each time macro service requests INTSR1 and INTSR2 are generated, the receive data is transferred from RXB1 and RXB2 to memory. When data n (last byte) has been transferred to memory (when the receive data storage buffer has become full), vectored interrupt requests INTSR1 and INTSR2 are generated.

9. LOCAL BUS INTERFACE

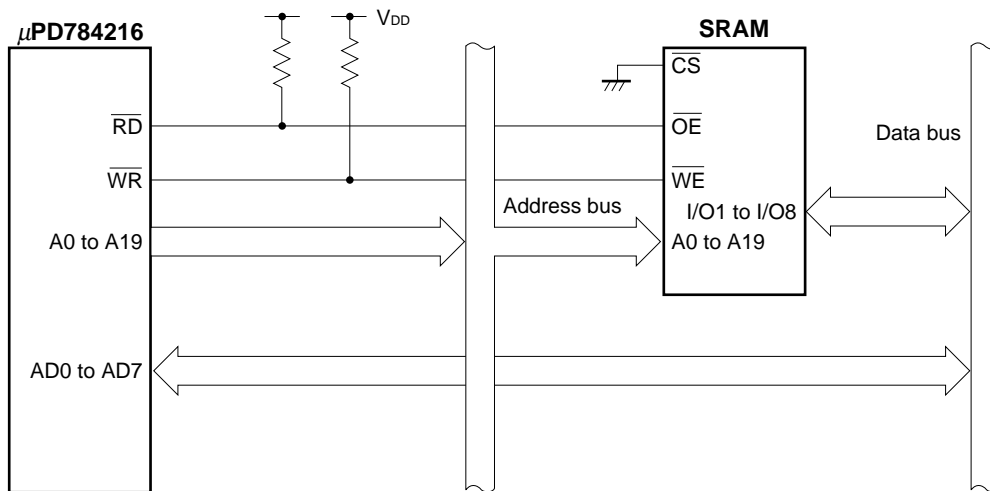

The local bus interface can connect an external memory or I/O (memory mapped I/O) and support a memory space of 1 MByte (refer to Figure 9-1).

Figure 9-1. Example of Local Bus Interface

(1) Multiplexed bus mode

(2) Separate bus mode

9.1 Memory Expansion

External program memory and data memory can be connected in two stages: 256 Kbytes and 1 Mbytes.

To connect the external memory, ports 4 through 6 and port 8 are used.

The external memory can be connected in the following two modes:

- Multiplexed bus mode: The external memory is connected by using a time-division address/data bus. The number of ports used when the external memory is connected can be reduced in this mode.
- Separate bus mode: The external memory is connected by using an address bus and data bus independent of each other. Because an external latch circuit is not necessary, this mode is useful for reducing the number of components and mounting area on the printed wiring board.

9.2 Programmable Wait

Wait state(s) can be inserted to the memory space (00000H through FFFFFH) while the \overline{RD} and \overline{WR} signals are active.

In addition, there is an address wait function that extends the active period of the ASTB signal to gain the address decode time.

10. STANDBY FUNCTION

This function is to reduce the power consumption of the chip, and can be used in the following modes:

- HALT mode: Stops supply of the operating clock to the CPU. This mode is used in combination with the normal operation mode for intermittent operation to reduce the average power consumption.
- IDLE mode: Stops the entire system with the oscillator continuing operation. The power consumption in this mode is close to that in the STOP mode. However, the time required to restore the normal program operation from this mode is almost the same as that from the HALT mode.
- STOP mode: Stops the main system clock and thereby to stop all the internal operations of the chip. Consequently, the power consumption is minimized with only leakage current flowing.
- Low power consumption mode: The main system clock is stopped with the subsystem clock used as the system clock. The CPU can operate on the subsystem clock to reduce the current consumption.
- Low power consumption HALT mode: This is a standby function in the low-power consumption mode and stops the operation clock of the CPU, to reduce the power consumption of the entire system.
- Low power consumption IDLE mode: This is a standby function in the low-power consumption mode and stops the entire system except the oscillator, to reduce the power consumption of the entire system.

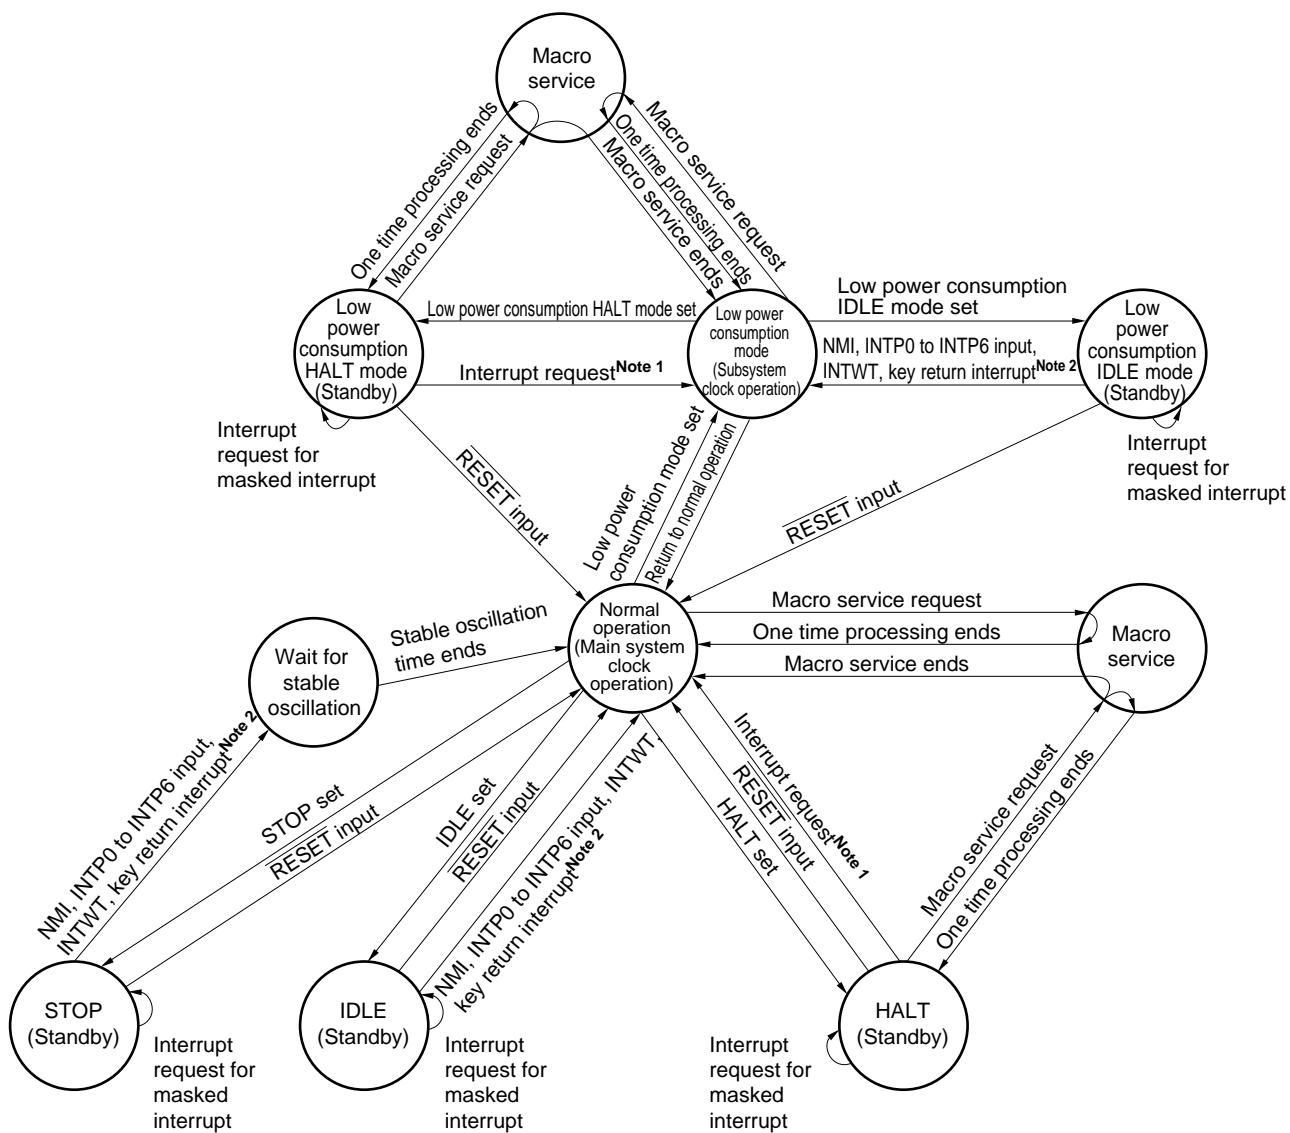

These modes are programmable.

The macro service can be started from the HALT mode or low-power consumption HALT mode.

- ★ After macro service processing is executed, the system returns to the HALT mode again.
The transition of the standby status is shown in Figure 10-1.

★

Figure 10-1. Standby Function State Transitions

- Notes**
1. Only unmasked interrupt requests
 2. Only unmasked INTP0 to INTP6, INTWT, key return interrupt (P80 to P87)

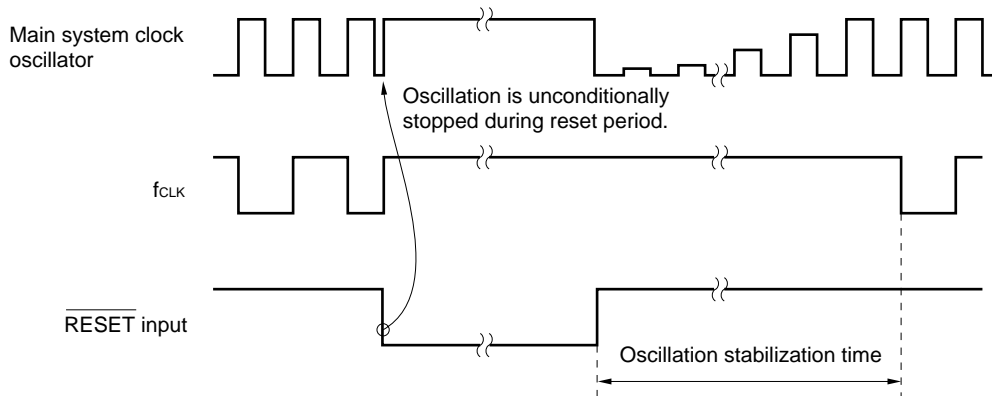

Remark NMI is valid only for an external input.
The watchdog timer cannot be used for the release of standby (HALT mode/STOP mode/IDLE mode).

11. RESET FUNCTION

When a low-level signal is input to the $\overline{\text{RESET}}$ pin, the system is reset, and each hardware unit is initialized (reset). During the reset period, oscillation of the main system clock is unconditionally stopped. Consequently, the current consumption of the entire system can be reduced.

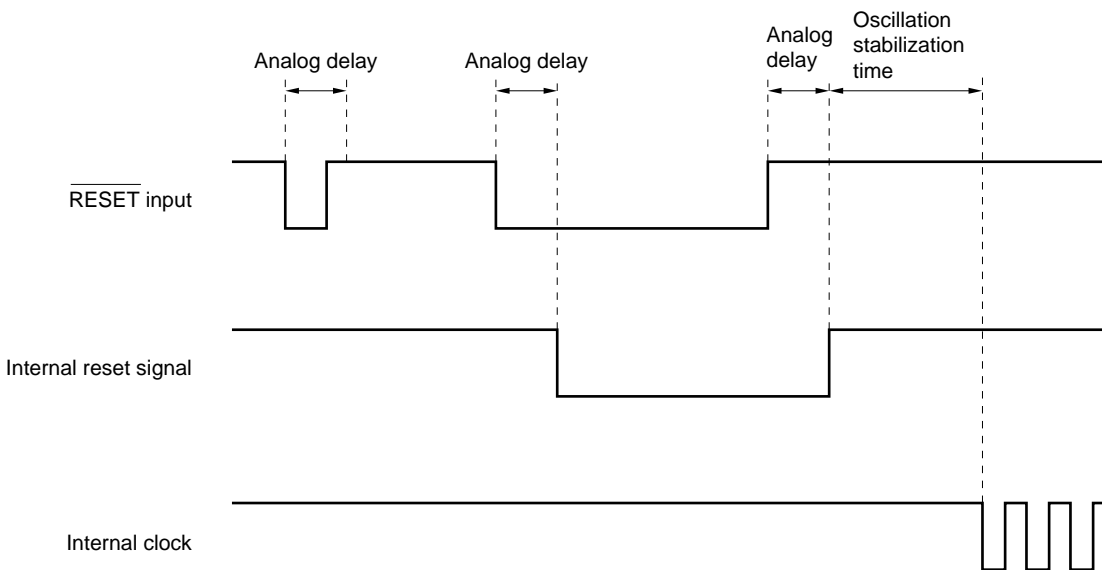

- ★ When the $\overline{\text{RESET}}$ signal goes high, the reset status is cleared, oscillation stabilization time (84.0 ms at 12.5-MHz operation) elapses, the contents of the reset vector table are set to the program counter (PC), execution branches to an address set to the PC, and program execution is started from that branch address. Therefore, the program can be reset and started from any address.

Figure 11-1. Oscillation of Main System Clock during Reset Period

The $\overline{\text{RESET}}$ input pin has an analog delay noise rejection circuit to prevent malfunctioning due to noise.

Figure 11-2. Acknowledgement of Reset Signal

12. INSTRUCTION SET

- (1) 8-bit instructions (The instructions in parentheses are combinations realized by describing A as r)
 MOV, XCH, ADD, ADDC, SUB, SUBC, AND, OR, XOR, CMP, MULU, DIVUW, INC, DEC, ROR, ROL, RORC, ROLC, SHR, SHL, ROR4, ROL4, DBNZ, PUSH, POP, MOV_M, XCH_M, CMP_ME, CMP_MN_E, CMP_MN_C, CMP_MC, MOV_{BK}, XCH_{BK}, CMP_{BK}E, CMP_{BK}N_E, CMP_{BK}N_C, CMP_{BK}C

Table 12-1. Instruction List by 8-Bit Addressing

Second Operand First Operand	#byte	A	r r'	saddr saddr'	sfr	!addr16 !!addr24	mem [saddrp] [%saddrg]	r3 PSWL PSWH	[WHL+] [WHL-]	n	None ^{Note 2}

			2.7 V ≤ V _{DD} < 4.5 V	0		10	
2.2 V ≤ V _{DD} < 2.7 V	0			20			

Cautions 1. When using the main system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as V_{SS}.
- Do not ground the capacitor in a ground pattern in which a high current flows.
- Do not fetch signals from the oscillator.

2. When the main system clock is stopped and the system is operated by the subsystem clock, the subsystem clock should be switched back to the main system clock after the oscillation stabilization time is secured by the program.

Subsystem Clock Oscillator Characteristics (T_A = -40 to +85°C)

Resonator	Recommended Circuit	Parameter	Test Conditions	MIN.	TYP.	MAX.	Unit
Crystal resonator		Oscillation frequency (f _{XT})		32	32.768	35	kHz
		Oscillation stabilization time ^{Note}	4.5 V ≤ V _{DD} ≤ 5.5 V		1.2	2	s
			2.2 V ≤ V _{DD} < 4.5 V			10	
External clock		XT1 input frequency (f _{XT})		32		35	kHz
		XT1 input high/low-level width (t _{XTH} , t _{XTL})		5		15	μs

Note Time required to stabilize oscillation after V_{DD} reaches oscillator voltage MIN.

Cautions 1. When using the subsystem clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as V_{SS}.
- Do not ground the capacitor to a ground pattern in which a high current flows.
- Do not fetch signals from the oscillator.

2. When the main system clock is stopped and the system is operated by the subsystem clock, the subsystem clock should be switched back to the main system clock after the oscillation stabilization time is secured by the program.

DC Characteristics (T_A = -40 to +85°C, V_{DD} = AV_{DD} = 2.2 to 5.5 V, AV_{SS} = V_{SS} = 0 V) (1/2)

★ 15. RECOMMENDED SOLDERING CONDITIONS

The μPD784216 should be soldered and mounted under the following recommended conditions. For the details of the recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**. For soldering methods and conditions other than those recommended below, contact your NEC sales representative.

Table 15-1. Soldering Conditions for Surface Mount Type

- (1) μPD784214GC-xxx-8EU: 100-pin plastic LQFP (Fine pitch) (14 × 14 mm)
- μPD784215GC-xxx-8EU: 100-pin plastic LQFP (Fine pitch) (14 × 14 mm)
- μPD784216GC-xxx-8EU: 100-pin plastic LQFP (Fine pitch) (14 × 14 mm)

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 235°C, Time: 30 sec. Max. (at 210°C or higher), Count: two times or less	IR35-00-2
VPS	Package peak temperature: 215°C, Time: 40 sec. Max. (at 200°C or higher), Count: two times or less	VP-15-00-2
Partial heating	Pin temperature: 300°C Max., Time: 3 sec. Max. (per pin row)	—

Caution Do not use different soldering methods together (except for partial heating).

- (2) μPD784214GF-xxx-3BA: 100-pin plastic QFP (Fine pitch) (14 × 20 mm)
- μPD784215GF-xxx-3BA: 100-pin plastic QFP (Fine pitch) (14 × 20 mm)
- μPD784216GF-xxx-3BA: 100-pin plastic QFP (Fine pitch) (14 × 20 mm)

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 235°C, Time: 30 sec. Max. (at 210°C or higher), Count: two times or less	IR35-00-2
VPS	Package peak temperature: 215°C, Time: 40 sec. Max. (at 200°C or higher), Count: two times or less	VP15-00-2
Wave soldering	Solder bath temperature: 260°C Max., Time: 10 sec. Max., Count: once, Preheating temperature: 120°C Max. (package surface temperature)	WS60-00-1
Partial heating	Pin temperature: 300°C Max., Time: 3 sec. Max. (per pin row)	—

Caution Do not use different soldering methods together (except for partial heating).

★ APPENDIX A DEVELOPMENT TOOLS

The following development tools are available for system development using the μPD784216Y. Also refer to (5) **Cautions on Using Development Tools.**

(1) Language Processing Software

RA78K4	Assembler package common to 78K/IV Series
CC78K4	C compiler package common to 78K/IV Series
DF784218	Device file common to μPD784216 Subseries
CC78K4-L	C compiler library source file common to 78K/IV Series

(2) Flash Memory Writing Tools

Flashpro II (Model number: FL-PR2), Flashpro III (Model number: FL-PR3, PG-FP3)	Dedicated flash programmer for microcontrollers incorporating flash memory
FA-100GF	Adapter for writing 100-pin plastic QFP (GF-3BA type) flash memory. Connection must be performed depending on the target product.
FA-100GC	Adapter for writing 100-pin plastic LQFP (GC-8EU type) flash memory. Connection must be performed depending on the target product.
Flashpro II controller, Flashpro III controller	Control program that runs on a personal computer and is attached to Flashpro II, Flashpro III. Operates on Windows™95, etc.

(3) Debugging Tools

- When IE-78K4-NS in-circuit emulator is used

IE-78K4-NS	In-circuit emulator common to 78K/IV Series
IE-70000-MC-PS-B	Power supply unit for IE-78K4-NS
IE-70000-98-IF-C	Interface adapter used when PC-9800 series PC (except notebook type) is used as host machine (C bus supported)
IE-70000-CD-IF-A ^{Note}	PC card and cable when PC-9800 series notebook PC is used as host machine (PCMCIA socket supported)
IE-70000-PC-IF-C	Interface adapter when using IBM PC/AT™ compatible as host machine (ISA bus supported)
IE-70000-PCI-IF ^{Note}	Interface adapter when using PC that incorporates PCI bus as host machine
IE-784225-NS-EM1	Emulation board to emulate μPD784216Y Subseries
NP-100GF	Emulation probe for 100-pin plastic QFP (GF-3BA type)
NP-100GC	Emulation probe for 100-pin plastic LQFP (GC-8EU type)
EV-9200GF-100	Socket to be mounted on a target system board made for 100-pin plastic QFP (GF-3BA type)
TGC-100SDW	Conversion adapter to connect the NP-100GC and a target system board on which a 100-pin plastic LQFP (GC-8EU type) can be mounted
ID78K4-NS	Integrated debugger for IE-78K4-NS
SM78K4	System simulator common to 78K/IV Series
DF784218	Device file common to μPD784216Y Subseries

Note Under development

• When IE-784000-R in-circuit emulator is used

IE-784000-R	In-circuit emulator common to 78K/IV Series
IE-70000-98-IF-C	Interface adapter used when PC-9800 series PC (except notebook type) is used as host machine (C bus supported)
IE-70000-98N-IF	Interface adapter and cable used when PC-9800 series notebook type PC is used as host machine
IE-70000-PC-IF-C	Interface adapter when using IBM PC/AT compatible as host machine (ISA bus supported)
IE-70000-PCI-IF ^{Note}	Interface adapter when using PC that incorporates PCI bus as host machine
IE-78000-R-SV3	Interface adapter and cable used when EWS is used as host machine
IE-784225-NS-EM1 IE-784216-R-EM1	Emulation board to emulate μPD784216 Subseries
IE-784000-R-EM	Emulation board common to 78K/IV Series
IE-78K4-R-EX3	Emulation probe conversion board necessary when using IE-784225-NS-EM1 on IE-784000-R. Not necessary when IE-784216-R-EM1 is used.
EP-78064GF-R	Emulation probe for 100-pin plastic QFP (GF-3BA type)
EP-78064GC-R	Emulation probe for 100-pin plastic LQFP (GC-8EU type)
EV-9200GF-100	Socket to be mounted on a target system board made for 100-pin plastic QFP (GF-3BA type)
TGC-100SDW	Conversion adapter to connect the NP-100GC and a target system board on which a 100-pin plastic LQFP (GC-8EU type) can be mounted
ID78K4	Integrated debugger for IE-784000-R
SM78K4	System simulator common to 78K/IV Series
DF784218	Device file common to μPD784216 Subseries

Note Under development

(4) Real-time OS

RX78K/IV	Real-time OS for 78K/IV Series
MX78K4	OS for 78K/IV Series

(5) Cautions on Using Development Tools

- The ID78K4-NS, ID78K4, and SM78K4 are used in combination with the DF784218.
- The CC78K4 and RX78K/IV are used in combination with the RA78K4 and DF784218.
- The FL-PR2, FL-PR3, FA-100GF, FA-100GC, NP-100GF, and NP-100GC are products made by Naitou Densei Machidaseisakusho Co., Ltd. (TEL: +81-44-822-3813). Contact an NEC distributor regarding the purchase of these products.
- The TGC-100SDW is a product made by TOKYO ELETECH CORPORATION.
- For further information, contact to: Daimaru Kogyo, Ltd.
 Electronics Dept. (Tokyo) (TEL: +81-3-3820-7112)
 Electronics Dept. (Osaka) (TEL: +81-6-244-6672)
- For third party development tools, see the **78K/IV Series Selection Guide (U13355E)**.
- The host machine and OS suitable for each software are as follows:

Host Machine [OS] Software	PC	EWS
	PC-9800 series [Windows] IBM PC/AT compatibles [Japanese/English Windows]	HP9000 Series 700™ [HP-UX™] SPARCstation™ [SunOS™, Solaris™] NEWS™ (RISC) [NEWS-OS™]
RA78K4	√ Note	√
CC78K4	√ Note	√
ID78K4-NS	√	—
ID78K4	√	√
SM78K4	√	—
RX78K/IV	√ Note	√
MX78K4	√ Note	√

Note DOS-based software

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

The related documents indicated in this publication may include preliminary versions. However, preliminary versions are not marked as such.

The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
