## Notes for CMOS Devices

### 1. Precaution against ESD for semiconductors

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

### 2. Handling of unused input pins for CMOS

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to VDD or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

### 3. Status before initialization of MOS devices

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

- The information in this document is current as of January 2007. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.
- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.
- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such NEC Electronics products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.
- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".

The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.

- "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.
- "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).
- "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact NEC Electronics sales representative in advance to determine NEC Electronics 's willingness to support a given application.

- Notes:**
1. "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.
  2. "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).
  3. SuperFlash<sup>®</sup> is a registered trademark of Silicon Storage Technology, Inc. in several countries including the United States and Japan. This product uses SuperFlash<sup>®</sup> technology licensed from Silicon Storage Technology, Inc.

## Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

## 1. Pin Group Information

### 1.1 Device package information

The V850ES/Fx3 device series comprises several members. An overview with the pin and package information is given in the following table:

Series Member	# Pins	Device package information
μPD70F3370A μPD70F3371	64	FE3
μPD70F3372 μPD70F3373	80	FF3
μPD70F3374 μPD70F3375 μPD70F3376A μPD70F3377A	100	FG3
μPD70F3378 μPD70F3379 μPD70F3380 μPD70F3381 μPD70F3382	144	FJ3
μPD70F3383 μPD70F3384 μPD70F3385	176	FK3

This document describes the specification for the V850ES/FF3.

- Notes:**
1. Indicates only oscillation circuit characteristics. Refer to "AC Characteristic" for cpu operation clock.
  2. Time required to stabilize oscillation after VDD reaches oscillator voltage range min. 3.3V
  3. In order to avoid the influence of wiring capacity, shorten wiring as much as possible.
  4. RC Oscillation frequency is typ. 40kHz. This clock is divided by 2 internally. In case of RC Oscillator, internal system clock frequency (fxt) is min. 12.5kHz, typ. 20kHz, max. 27.5kHz.

2.5.3 Internal-OSC Characteristics

(Ta = -40 to +85°C, C=4.7uF, VDD = EVDD = 3.3 to 5.5V, AVREF0 = 3.3 to 5.5V, VSS = EVSS = AVSS = 0V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit

Output period jitter Note2	tpj	Peak to peak			2.0	ns

- Notes:**
- The input of the PLL (f<sub>PLLI</sub>) can be set to f<sub>x</sub>, f<sub>x</sub>/2, or f<sub>x</sub>/4. The divider is set through an option byte in the code flash memory.
  - Not tested in production.

## 2.5.5 SSCG Characteristics

(Ta = -40 to +85°C, C=4.7uF, VDD = EVDD = 3.3 to 5.5V, AVREF0 = 3.3 to 5.5V, VSS = EVSS = AVSS = 0V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit

- Notes:**
- VDD and EVDD total current. (Ports are stopped).  
AVREF0 current, port buffer current (including a current flowing in the on-chip pull-up/pull-down resistor) are not included.
  - The code flash and the data flash are in read mode.  
When the device is in programming mode (Self-programming mode or data flash programming mode), the current value (MAX. value) adds by the following value:
    - Self-programming mode:
      - + In case of PLL OFF: 7-(0.33·f<sub>xx</sub>+0.1) [mA]
      - + In case of PLL ON: 7-(0.18·f<sub>xx</sub>+3.0) [mA]
    - Data flash programming mode:

Pulse width with spike suppressed by input filter	tSP			0	50	ns
Capacitance load of each bus line	Cb		400		400	pF

- Notes:**
- At the start condition, the first clock pulse is generated after the hold time
  - The system requires a minimum of 300ns hold time Internally for the SDA signal ( at VIH-min. of SCL00 signal )  
In order to occupy the undefined area at the falling edge of SCL00.
  - If the system does not extend the SCL00 signal low hold time ( tLOW ), only the maximum data hold time (tHD:DAT ) needs to be satisfied.
  - The high-speed-mode IIC bus can be used In a normal-mode IIC bus system.  
In this case, set the high-speed-mode IIC bus so that It meets the following conditions.  
- If the system does not extend the SCL00 signal's low state hold time:  
SU:DAT?250ns  
- If the system extends the SCL00 signal's low state hold time:  
Transmit the following data bit to the SDA00 line prior to releasing the SCL00 line  
(tRmax.+tSU:DAT=1000+250=1250ns: Normal mode IIC bus specification ).
  - Cb: Total capacitance of one bus line (unit: pF)

## 2.13 Flash Memory Programming Characteristics

### (a) Basic Characteristics

(C=4.7uF, VDD = EVDD, AVREF0 = 3.5 to 5.5V, VSS = EVSS = AVSS = 0V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Operation frequency	fCPU		4		32	MHz
Supply voltage	VDD		3.3		5.5	V
Number of rewrites	CWRT1	Code Flash	1000			count
	CWRT2	Data Flash				
High level input voltage	VIH	FLMD0	0.8EVDD		EVDD	V
Low level input voltage	VIL	FLMD0	EVSS		0.2EVDD	V
Programming temperature	tPRG		-40		+85	°C
Data retention		Code Flash			15 <sup>Note1</sup>	year
		Data Flash			5 <sup>Note2</sup>	

- Notes:**
- Under the condition of CWRT1
  - Under the condition of CWRT2

**Remark:** The initial write when the product is shipped, any erase → write set of operations, or any programming operation is counted as one rewrite.

Example: P: Program(write) E: Erase

Product is shipped → P → E → P → E → P : Rewrite count: 3

Product is shipped → E → P → E → P → E → P : Rewrite count: 3

### (b) Serial Writing Operation Characteristics

(Ta = -40 to +85°C, C=4.7uF, VDD = EVDD, AVREF0 = 3.5 to 5.5V, VSS = EVSS = AVSS = 0V, CL=50pF)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
FLMD0 setup time (from VDD)	tDP		1			ms
RESET release (from FLMD0)	tPR		2			ms
FLMD0 pulse input start (from raise edge of _RESET)	tRP		800			μs

- Notes:**
1. Indicates only oscillation circuit characteristics. Refer to "AC Characteristic" for cpu operation clock.
  2. Time required to stabilize oscillation after VDD reaches oscillator voltage range min. 3.3V
  3. In order to avoid the influence of wiring capacity, shorten wiring as much as possible.
  4. RC Oscillation frequency is typ. 40kHz. This clock is divided by 2 internally. In case of RC Oscillator, internal system clock frequency(fxt) is min. 12.5kHz, typ. 20kHz, max. 27.5kHz.

**3.5.3 Internal-OSC Characteristics**

Specification is identical to that from (A)-Grade except Ta=-40 to +110°C.

**3.5.4 PLL Characteristics**

Specification is identical to that from (A)-Grade except Ta=-40 to +110°C.

**3.5.5 SSCG Characteristics**

Specification is identical to that from (A)-Grade except Ta=-40 to +110°C.

### 3.6 DC Characteristics

  2. Excluding quantization error (±1/2 LSB)
  3. Not tested in production.
  4. Does not include input/output capacitance CIO

## 4.9 POC

Specification is identical to that from (A)-Grade except Ta=-40 to +125°C.

## 4.10 LVI

Specification is identical to that from (A)-Grade except Ta=-40 to +125°C.

## 4.11 RAM Retention Flag

Specification is identical to that from (A)-Grade except Ta=-40 to +125°C.

## 4.12 Data Retention Characteristics

Specification is identical to that from (A)-Grade except Ta=-40 to +125°C.

### 4.13 Flash Memory Programming Characteristics

#### (a) Basic Characteristics

(C=4.7 $\mu$ F, VDD = EVDD, AVREF0 = 3.5 to 5.5V, VSS = EVSS = AVSS = 0V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Operation frequency	fCPU		4		32	MHz
Supply voltage	VDD		3.3		5.5	V
Number of rewrites	CWRT1	Code Flash	1000			count
	CWRT2	Data Flash	10000			
High level input voltage	VIH	FLMD0	0.8EVDD		EVDD	V
Low level input voltage	VIL	FLMD0	EVSS		0.2EVDD	V
Programming temperature	tPRG		-40		+125	°C
Data retention		Code Flash			15 <sup>Note1</sup>	year
		Data Flash			5 <sup>Note2</sup>	

- Notes:** 1. Under the condition of CWRT1  
2. Under the condition of CWRT2

**Remark:** The initial write when the product is shipped, any erase → write set of operations, or any programming operation is counted as one rewrite.

Example: P: Program(write) E: Erase

Product is shipped → P → E → P → E → P : Rewrite count: 3

Product is shipped → E → P → E → P → E → P : Rewrite count: 3

#### (b) Serial Writing Operation Characteristics

Specification is identical to that from (A)-Grade except Ta=-40 to +125°C.

## 5. Package

### 5.1 Package Dimension

80-PIN PLASTIC LQFP (FINE PITCH) (12x12)

NOTE  
Each lead centerline is located within 0.08 mm of its true position at maximum material condition.

## 5.2 Product Marking

### 5.2.1 Marking of pin 1 at a QFP (Quad Flat Package)

Example 1: The index mark for pin 1 is the beveled edge of the package

Example 2: The index mark for pin 1 is a round notch at one of the 4 edges. In this case, the shape of all edges is identical (usually beveled).

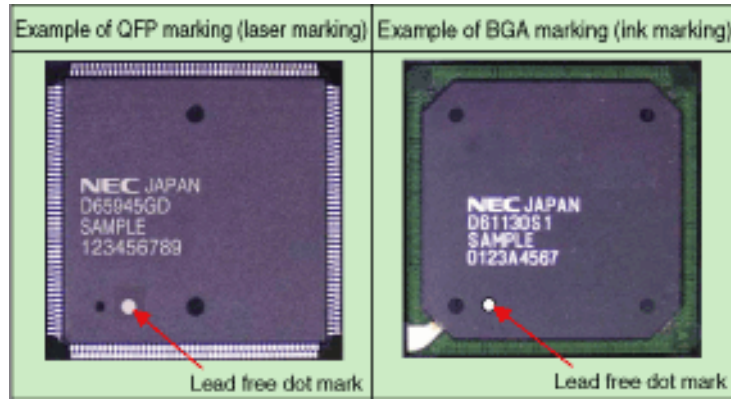

Example 3: For production reasons, two or more similar notches may be located at the top of the package. In such a case the index marker for pin 1 is a round notch with an additional mark in it.

**Note:** RoHS compliant devices have an additional dot at the top side. Do not mix it up with the marking for pin 1. For details see 5.2.2 "Identification of Lead-Free Products" on page 53.

## 5.2.2 Identification of Lead-Free Products

Lead-Free products are marked with a dot "•". The marking methods are the paint or the laser (It doesn't sink in). The shape of lead-free marks is a circle.

## 6. Change History

The following revision list shows all major changes of the different datasheet versions.

Version	Chapter	Comment
V1.0		Initial release
V1.1	2.13 3.13	Removed 'Target Specification' for (A)- and (A1)-Grade Devices in the Flash Programming specifications.
		Changed specification of 'Number of rewrites' from MAX. to MIN.
V1.2	2.8 4.8	Remove Caution (Described in User's Manual)
		Changed document status from 'Preliminary Datasheet' to 'Datasheet'.
	4.13	Removed 'Target Specification' for (A2)-Grade Devices in the Flash Programming specifications.
