DISCLAIMER

Integrated Device Technology, Inc. reserves the right to make changes to its products or specifications at any time, without notice, in order to improve design or performance and to supply the best possible product. IDT does not assume any responsibility for use of any circuitry described other than the circuitry embodied in an IDT product. The Company makes no representations that circuitry described herein is free from patent infringement or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent, patent rights or other rights, of Integrated Device Technology, Inc.

Boards that fail to function should be returned to IDT for replacement. Credit will not be given for the failed boards nor will a Failure Analysis be performed.

LIFE SUPPORT POLICY

Integrated Device Technology's products are not authorized for use as critical components in life support devices or systems unless a specific written agreement pertaining to such intended use is executed between the manufacturer and an officer of IDT.

1. Life support devices or systems are devices or systems which (a) are intended for surgical implant into the body or (b) support or sustain life and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any components of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

Description of the EB16NT2 Eval Board

Notes

Introduction

The 89HPES16NT2 switch (also referred to as PES16NT2 in this manual) is a member of IDT's PCI Express® standard (PCIe®) based line of products. It is a 16-lane, 2-port peripheral chip that provides high-performance switching and non-transparent bridging (NTB) function between an upstream port and an NTB downstream port.

The 89EBPES16NT2 Evaluation Board (also referred to as EB16NT2 in this manual) provides an evaluation platform for the PES16NT2 switch. It is designed to function as an add-on card to be plugged into a x8 PCIe slot available on a motherboard hosting an appropriate root complex, microprocessor(s), and an NTB downstream port to be connected to another root complex, microprocessor(s) via a PCI Express cable. The EB16NT2 is a vehicle to test and evaluate the functionality of the PES16NT2 chip. Customers can use this board to get a headstart on software development prior to the arrival of their own hardware. The EB16NT2 is also used by IDT to reproduce system-level hardware or software issues reported by customers. Figure 1.1 illustrates the functional block diagram representing the main parts of the EB16NT2 board.

Figure 1.1 Function Block Diagram of the EB16NT2 Eval Board

Notes

Board Features

Hardware

- ◆ PES16NT2 PCIe 2-port Non-Transparent switch
 - Two ports, 16 PCIe lanes
 - PCIe Base Specification Revision 1.0a compliant
 - 8 GBps (64Gbps) aggregate switching capacity
 - Up to 2048 byte maximum Payload Size
 - Automatic lane reversal and polarity inversion supported on all lanes
 - Automatic per port link width negotiation to x8, x4, x2, x1
 - Load configuration from an optional serial EEPROM via SMBUS
- ◆ Upstream, Transparent/Non-Transparent Port
 - One edge connector on the upstream port, to be plugged into a slot with x8 capable on a host motherboard
 - Transparent or Non-Transparent port via x8 PCI Express connector
- ◆ Numerous user selectable configurations set using onboard jumpers and DIP-switches
 - Source of clock - host clock or onboard clock generator
 - Two clock rates
 - Boot mode selection
- ◆ SMBUS Slave Interface (4 pin header)
- ◆ SMBUS Master Interface connected to the Serial EEPROMs through I/O expander
- ◆ Push button for Warm Reset
- ◆ Several LEDs to display status, reset, power, etc.
- ◆ One 10-pin JTAG connector (pitch 2.54 mm x 2.54 mm)

Software

There is no software or firmware executed on the board in transparent mode. However, useful software is provided along with the Evaluation Board to facilitate configuration and evaluation of the PES16NT2 within host systems running popular operating systems. In non-transparent mode, IDT provides Windows XP or a Linux device driver for PES16NT2 Non-Transparent Bridge endpoints. This driver includes two separate drivers, PCI endpoint driver and NDIS Ethernet miniport driver. Please contact ssdhelp@idt.com for additional information.

- ◆ Installation programs
 - Operating Systems Supported: Windows2000, WindowsXP, Linux
- ◆ GUI-based application for Windows and Linux
 - Allows users to view and modify registers in the PES16NT2
 - Binary file generator for programming the serial EEPROMs attached to the SMBUS.

Other

- ◆ A metal bracket is required to firmly hold in place the four endpoints plugged into the EB16NT2 board.
- ◆ SMBUS cable may be required for certain evaluation exercises.
- ◆ SMA connectors are provided on the EB16NT2 board for specific test points.

Revision History

November 13, 2007: Initial publication of board manual.

Installation of the EB16NT2 Eval Board

Notes

EB16NT2 Installation

This chapter discusses the steps required to configure and install the EB16NT2 evaluation board. All available DIP switches and jumper configurations are explained in detail.

The primary installation steps are:

1. Configure jumper/switch options suitable for the evaluation or application requirements.
2. Insert the evaluation board into the host system (motherboard with root complex chipset).
3. Connect the NTB port to a remote system via a PCI Express® cable. An PCI Express adapter card to PCI Express Cable connector can be used on a remote system.
4. Apply power to the host system.

The EB16NT2 board is shipped with all jumpers and switches configured to their default settings. In most cases, the board does not require further modification or setup.

PCI Express Adapter Card

The PCI Express adapter card is an x8 link PCI Express card. It can be installed in a remote system. A (x8 lane) PCIe® cable is used to connect a remote system to EB16NT2 NTB port. See Figure 2.1 for the graphical presentation of this connection.

Figure 2.1 PCIe Adapter Card

Hardware Description

The 89HPES16NT2 is a member of the IDT PRECISE™ family of PCI Express switching solutions offering the next-generation I/O interconnect standard. The PES16NT2 is a 16-lane, 2-port peripheral chip that provides high-performance switching and non-transparent bridging (NTB) functions between a PCIe upstream

Notes

port and an NTB downstream port. The PES16NT2 is a part of the IDT PCIe System Interconnect Products family and is intended to be used with IDT PCIe System Interconnect Switches. Together, the chipset targets multi-host and intelligent I/O applications such as communications, storage, and blade servers, where inter-domain communication is required.

The EB16NT2 non-transparent port is accessible through x8 PCI Express cable connectors.

Basic requirements for the board to run are:

- Host system with a PCI Express root complex supporting x8 configuration through a PCI Express x8 slot.
- A secondary remote system with a PCI Express root complex supporting x8 configuration through a PCI Express x8 slot.

Reference Clocks

The PES16NT2 requires a pair of differential reference clocks. The EB16NT2 derives these clocks from a common source which is user-selectable. The common source can be either the host system's reference clock or the onboard clock generator. Selection is made by stuffing resistors described in Table 2.1. Typical usage model for the EB16NT2 in non-transparent mode includes two root complexes: one connects to the upstream port and the other connects to a NTB port. Each root complex most likely will have its own clock source. SSC (Spread Spectrum Clock) must be disabled in this configuration.

Clock Configuration Stuffing Option	
W7 and W8	Clock Source
Pins 2 and 3	Onboard Reference Clock – Use onboard clock generator
Pins 1 and 2	Upstream Reference Clock – Host system provides clock (Default)

Table 2.1 Clock Source Selection

The source for the onboard clock is the ICS557-03 clock generator device (U8) connected to a 25MHz oscillator (Y1). When using the onboard clock generator, the EB16NT2 allows selection between multiple clock rates via DIP switches as described in Table 2.2.

Clock Frequency Switch - S2[2:1]		
S2[2]	S2[1]	Clock Frequency
OFF	OFF	Reserved
OFF	ON	125 MHz
ON	OFF	100 MHz (Default)
ON	ON	<Reserved>

Table 2.2 Clock Frequency Selection

The output of the onboard clock generator is accessible through two SMA connectors located on the Evaluation Board. See Table 2.3. This can be used to connect a scope for probing or capturing purposes and cannot be used to drive the clock from an external source.

Onboard Reference Clock Output (Differential) – J2, J3	
J2	Positive Reference Clock
J3	Negative Reference Clock

Table 2.3 SMA Connectors - Onboard Reference Clock

Notes

Power Sources

The EB16NT2 is powered from the upstream port slot power.

PCI Express Serial Data Transmit Termination Voltage Converter

A DC-DC converter (U6) provides a 1.5V PCI Express serial data transmit termination voltage (shown as VPETVTT) to the PES16NT2.

PCI Express Digital Power Voltage Converter

A separate DC-DC converter (U3) provides a 1.0V PCI Express digital power voltage (VDDPE) to the PES16NT2.

PCI Express Analog Power Voltage Converter

A separate DC-DC converter (7) provides a 1.0V PCI Express analog power voltage (shown as VDDPEA) to the PES16NT2.

Core Logic Voltage Converter

A separate DC-DC converter (U1) provides the 1.0V core voltage (VDDCORE) to the PES16NT2.

3.3V I/O Power Module

A 12V to 3.3V power module (U26) provides the 3.3V I/O voltage (VDD_3V3) to the PES16NT2.

Power-up Sequence

The power-up sequence must be as following:

1. VDDIO - 3.3V
2. VDDCORE, VDDPEA, VDDPE - 1.0V
3. VTTPE - 1.5V

When powering up, each voltage level must ramp up and stabilize prior to applying the next voltage in the sequence to ensure internal latch-up issues are avoided. There are no maximum time limitations between sequential valid power level requirements. To insure that the sequencing requirements are met, a 0.015UF is used at the SOFTSTART cap on the VTTPE and VTTPEA voltage converter (U3 and U7 pin 36) in the EB16NT2.

Required Jumpers

To deliver power to the PES16NT2 switch, the following jumpers must be shunted: W10, W22-W25. These jumpers were implemented so that the power consumption of the PES16NT2 can be measured.

Reset

The PES16NT2 supports two types of reset mechanisms as described in the PCI Express specification:

- Fundamental Reset: This is a system-generated reset that propagates along the PCI Express tree through a single side-band signal PERST# which is connected to the Root Complex, the PES16NT2, and the endpoints.
- Hot Reset: This is an In-band Reset, communicated downstream via a link from one device to another. Hot Reset may be initiated by software. This is further discussed in the 89HPES16NT2 User Manual. The EB16NT2 evaluation board provides seamless support for Hot Reset.

Notes

Fundamental Reset

There are two types of Fundamental Resets which may occur on the EB16NT2 evaluation board:

- Cold Reset: During initial power-on, the onboard voltage monitor (TLC7733D) will assert the PCI Express Reset (PERSTN) input pin of the PES16NT2.
- Warm Reset: This is triggered by hardware while the device is powered on. Warm Reset can be initiated by two methods:
 - Pressing a push-button switch (S1) located on EB16NT2 board
 - The host system board IO Controller Hub asserting PERST# signal, which propagates through the PCIe upstream edge connector of the EB16NT2. Note that one can bypass the onboard voltage monitor (TLC7733D) by moving the resistor from pin 1-2 to pin 2-3 on W27.

Both events cause the onboard voltage monitor (TLC7733D) to assert the PCI Express Reset (PERSTN) input of the PES16NT2 while power is on.

An external side fundamental reset is initiated when the switch is configured to operate in non-transparent mode and the PCI Express Non-Transparent Bridge Reset (PENTBRST#) signal is asserted. This results in the resetting of the transaction, data link, and PHY layers associated with the external side of the non-transparent bridge. The initialization of all registers associated with the external side of the non-transparent bridge are set to their initial values except those with a read and write when unlocked attribute and those associated with the non-transparent bridge configuration capability structure.

Boot Configuration Vector

A boot configuration vector consisting of the signals listed in Table 2.4 is sampled by the PES16NT2 during a fundamental reset (while PERSTN is active). The boot configuration vector defines the essential parameters for switch operation and is set using DIP switches S5 and S6 as defined in Table 2.5.

Signal	Description
CCLKDS	Common Clock Downstream. The assertion of this pin indicates that all downstream ports are using the same clock source as that provided to downstream devices. This pin is used as the initial value of the Slot Clock Configuration bit in all of the Link Status Registers for downstream ports. The value may be overridden by modifying the SCLK bit in the downstream port's PCIELSTS register. Default: 0x1
CCLKUS	Common Clock Upstream. The assertion of this pin indicates that the upstream port is using the same clock source as the upstream device. This pin is used as the initial value of the Slot Clock Configuration bit in the Link Status Register for the upstream port. The value may be overridden by modifying the SCLK bit in the P0_PCIELSTS register. Default: 0x1
MSMBSMODE	Master SMBus Slow Mode. The assertion of this pin indicates that the master SMBus should operate at 100 KHz instead of 400 kHz. Default: 0x0
RSTHALT	Reset Halt. When this signal is asserted during a PCI Express fundamental reset, the PES16NT2 executes the reset procedure and remains in a reset state with the Master and Slave SMBuses active. This allows software to read and write registers internal to the device before normal device operation begins. The device exits the reset state when the RSTHALT bit is cleared in the P0_SWCTL register through the SMBus. The value may be overridden by modifying the RSTHALT bit in the P0_SWCTL register. Default: 0x0

Table 2.4 Boot Configuration Vector Signals (Part 1 of 2)

Notes

Signal	Description
SWMODE[2:0]	Switch Mode. These configuration pins determine the PES16NT2 switch operating mode. Default: 0x1 0x0 - Normal switch mode 0x1 - Normal switch mode with Serial EEPROM-based initialization 0x2 - Non-transparent mode 0x3 - Non-transparent mode with serial EEPROM initialization 0x4 - Non-transparent failover mode 0x5 - Non-transparent failover mode serial EEPROM initialization 0x7 - 0xF Reserved Default: 0x0
REFCLKM	PCI Express Reference Clock Mode Select. This signal selects the frequency of the reference clock input. Default: 0x0 0x0 - 100 MHz 0x1 - 125 MHz
MSMBADDR[2:0]	Master SMBus Address. These pins determine the SMBus address of the serial EEPROM from which configuration information is loaded. Default: 0x0

Table 2.4 Boot Configuration Vector Signals (Part 2 of 2)

Signal	Description	Default
S6[1]	CCLKDS	OFF
S6[2]	CCLKUS	OFF
S6[3]	SWMODE[3]	ON
S6[4]	SWMODE[2]	ON
S6[5]	SWMODE[1]	ON

S6[7]	MSMBSMODE	ON
S5[8]	Not Used	ON

Table 2.5 Boot Configuration Vector Switches S7 & S8 (ON=0, OFF=1)

SMBus Interfaces

The System Management Bus (SMBus) is a two-wire interface through which various system component chips can communicate. It is based on the principles of operation of I²C. Implementation of the SMBus signals in the PCI Express connector is optional and may not be present on the host system. The SMBus interface consists of an SMBus clock pin, an SMBus data pin, and 4 SMBus address pins.

Notes

The PES16NT2 contains two SMBus interfaces: a slave SMBus interface and a master SMBus interface. The slave SMBus interface allows a SMBus Master device (such as the Intel E7520) full access to all software-visible registers. The Master SMBus interface provides connection to the external serial EEPROMs used for initialization.

SMBus Slave Interface

On the PES16NT2 board, the slave SMBus interface is accessible through the PCI Express edge connector as well as a 4-pin header as described in Table 2.6.

Note: The SMBus signals to the PCI Express edge connector is disabled by default. To enable them, place 0-ohm resistors at locations R74 and R75.

Slave SMBus Interface Connector J10	
Pin	Signal
1	N/C
2	SCL
3	GND
4	SDA

Table 2.6 Slave SMBus Interface Connector

A fixed slave SMBus address (0b1110_111) specified by the SSMBADDR[5,3:1] pins is used.

Slave Interface Address Configuration	
Address Bit	Signal
1	SSMBUSADDR[1]
2	SSMBUSADDR[2]
3	SSMBUSADDR[3]
4	0
5	SSMBUSADDR[5]
6	1
7	1

Table 2.7 SMBus Slave Interface Address Configuration

The slave SMBus interface responds to the following SMBus transactions initiated by an SMBus master. Initiation of any SMBus transaction other than those listed above produces undefined results. See the SMBus 2.0 specification for a detailed description of the following transactions:

- Byte and Word Write/Read
- Block Write/Read

SMBus Master Interface

The seven bits address for the selected EEPROM device is **0b1010_000** by default.

Notes

JTAG Header

The PES16NT2 provides a JTAG connector J4 for access to the PES16NT2 JTAG interface. The connector is a 2.54 x 2.54 mm pitch male 10-pin connector. Refer to Table 2.8 for the JTAG Connector J4 pin out.

JTAG Connector J5					
Pin	Signal	Direction	Pin	Signal	Direction
1	/TRST - Test reset	Input	2	GND	—
3	TDI - Test data	Input	4	GND	—
5	TDO - Test data	Output	6	GND	—
7	TMS - Test mode select	Input	8	GND	—
9	TCK - Test clock	Input	10	GND	—

EB16NT2 Eval Board Figure

Notes

Software for the EB16NT2 Eval Board

Notes

Introduction

This chapter discusses some of the main features of the available software to give users a better understanding of what can be achieved with the EB16NT2 evaluation board using the device management software.

Device management software and related user documentation are available on a CD which is included in the Evaluation Board Kit. This information is also available on IDT's FTP site. For more information, contact IDT at ssdhelp@idt.com.

Device Management Software

The primary use of the Device Management Software package is to enable users of the evaluation board to access all the registers in the PES16NT2 device. This access can be achieved using the PCI Express in-band configuration cycles through the upstream port on the PES16NT2.

This software also enables users to save a snapshot of the current register set into a dump file which can be used for debugging purposes. An export/import facility is also available to create and use "Configuration" files which can be used to initialize the switch device with specific values in specific registers.

A conversion utility is also provided to translate a configuration file into an EEPROM programmable data structure. This enables the user to program an appropriate serial EEPROM with desirable register settings for the PES16NT2, and then to populate that EEPROM onto the Evaluation Board. It is also possible to program the EEPROM directly on the Evaluation Board using a feature provided by the software package.

The front end of the Device Management Software is a user-friendly Graphical User Interface which allows the user to quickly read or write the registers of interest. The GUI also permits the user to run the software in "simulation" mode with no real hardware attached, allowing the creation of configuration files for the PES16NT2 in the absence of the actual device.

Much of the Device Management Software is written with device-independent and OS-independent code. The software will be guaranteed to work on Linux (/sys interface) and MS Windows XP. It may function flawlessly on various flavors of MS Windows, but may not be validated on all. The fact that the software is device-independent assures its scalability to future PCIe parts from IDT. Once users are familiar with the GUI, they will be able to use the same GUI on all PCIe parts from IDT. This software is customized for each device through an XML device description file which includes information on the number of ports, registers, types of registers, information on bit-fields within each register, etc.
