Description

The AS025-HVPAK Motor Driver Pmod™ - Stepper Motor board combines a highly integrated HVPAK ™ IC, Current monitor, and protection function. The board can provide a quick configuration of Stepper motor. The board will be configured with one of the Quick connect boards on PMOD6A architecture. The motors like Stepper motor with direction and Step with Full steps/micro-steps are easily configurable. This will reduce the development and turnaround time of any customer.

Kit Contents

- AS025-HVPAK STM CONTROL BOARD

Features

- It will be suitable for a quick connect platform using the Pmod™ architecture.
- The same can be used as standalone development solution for HVPAK™ motor driver.
- The system solution can be extended for 1 Stepper motor driver.
- External current protection circuit provided using ISL28025 for additional system level hard reset and protection.
- I2C gives options for multiple dynamic configurations like Direction, Steps, Mode etc.

AS025-HVPAK Overview

The AS025-HVPAK Motor Driver Pmod™ - Stepper Motor board combines a highly integrated HVPAK ™ IC. This design can provide Quick configuration with Stepper motor. ISL28025 is used to provide external current and voltage protection for the circuit. Design has low idle current consumption in combination with a compact size. Speed, direction control options provided using I2C.

The block diagram below highlights the main parts of the system:

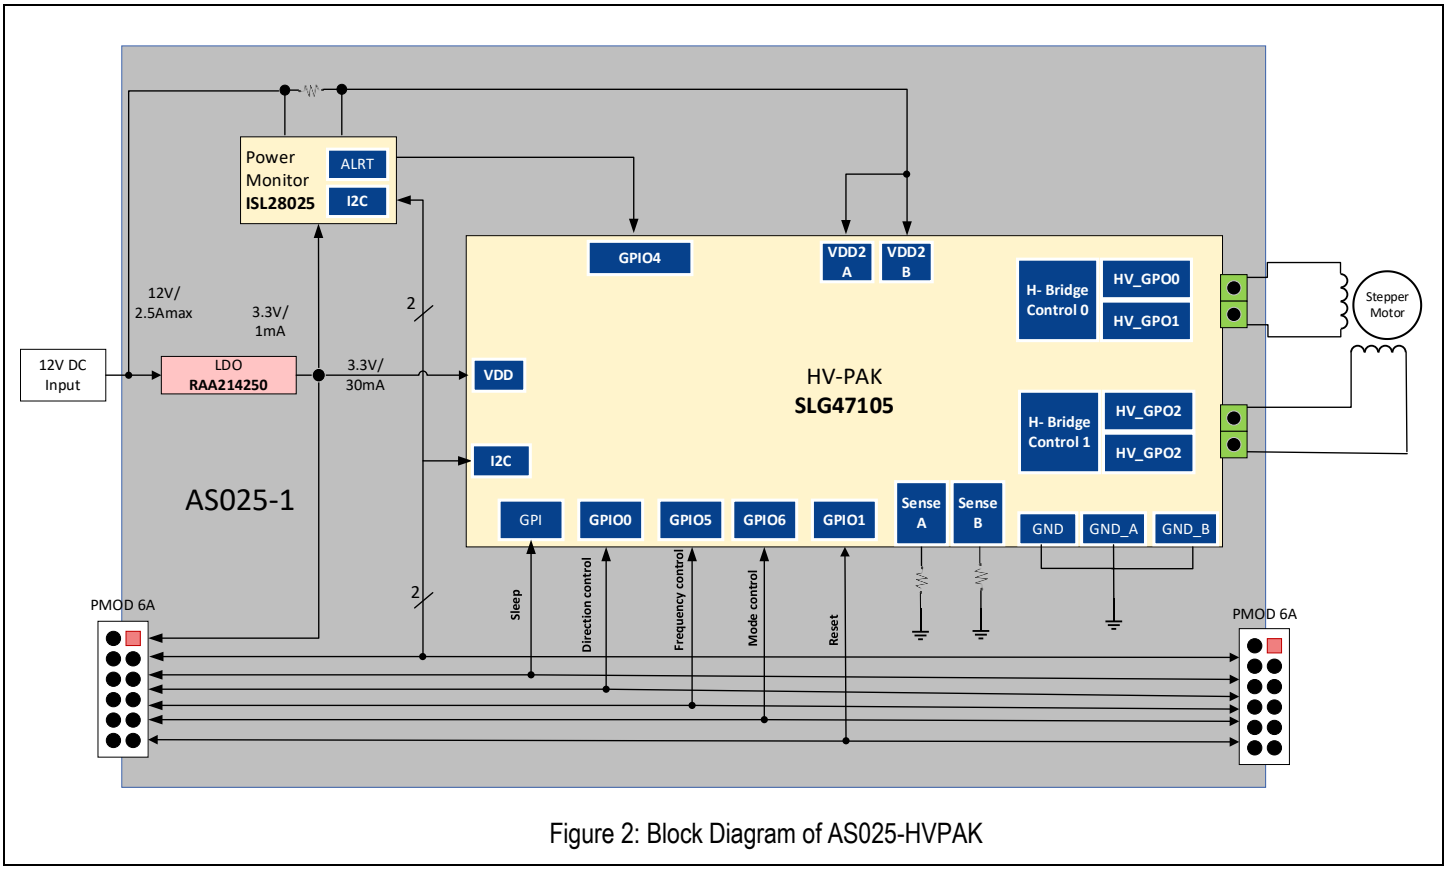

Figure 2: Block Diagram of AS025-HVPAK

The building blocks of the AS025-HVPAK and their functionality are listed below:

1. SLG47105: HVPAK™ Programmable Mixed-Signal Matrix with Four Outputs with Operating Voltage up to 13.2 V and up to 2 A Current per Output. SLG47105 has Full H-Bridge and Independent Half-Bridge Control.

2. RAA214250: The RAA214250 is a low-dropout linear voltage regulator that operates from 2.5V to 20V and provide up to 500mA of output current with a typical dropout of 269mV. The output voltage is adjustable with external feedback resistors anywhere from 1.224V to 18V.

3. ISL28025: Precision Digital Power Monitor with Real Time Alerts. The ISL28025 is a bidirectional high-side and low-side digital current sense and voltage monitor with a serial interface. The device monitors power supply current and voltage, which provides digital results along with calculated power.

Hardware Overview

The following block diagrams have specific applications explained below.

1. Power monitor Alert

The internal comparators of the ISL28025 can be configured to monitor the input supply voltage for undervoltage and overvoltage conditions. The comparator can signal the microcontroller to perform an action. A sense resistor, R1 & R2, is used to monitor the current delivered to the circuit load. The sense resistor is connected between the FB (feedback) and the VOUT pin of the ISL28025.

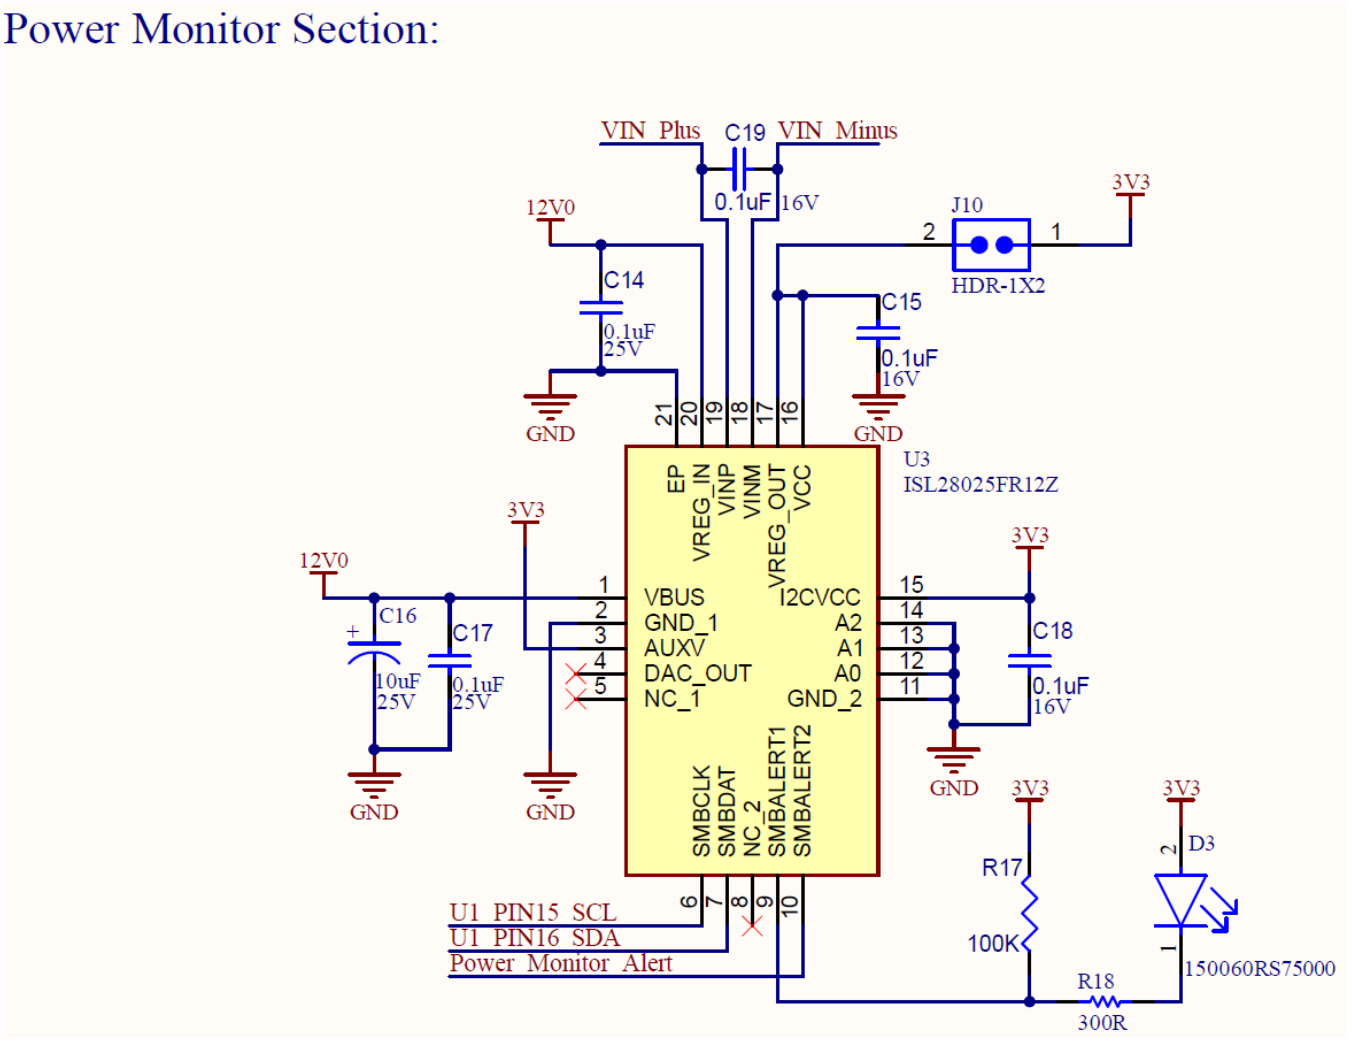

Figure 3: Power monitor section ISL28025FR12Z

2. LDO:

The RAA214250 output voltage (VOUT) used to programmed down to 3.3 V from12 v input using the feedback (FB) resistors, R4 and R5 and Low Dropout of 269mV at 500mA. RAA21450 has feature as short circuit current limit protection with fold-back at higher input voltage.

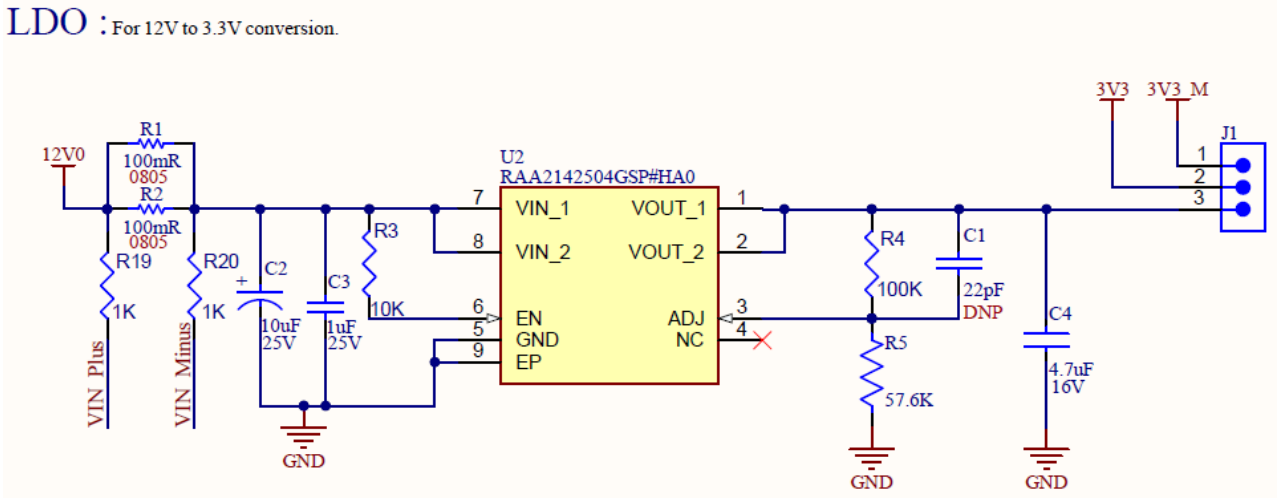

Figure 4: LDO Section

3. SLG47105V (HVPAK IC):

SLG47105 V provides Independent half-bridge control which allows dual bidirectional or four unidirectional motor operations. Build-in overcurrent and over-temperature protection reduces design complexity and enables higher system reliability, Flexible motor control with a programmable current sense comparator for current limiting or programmable overcurrent protection and R10, R13 used to limit the current. Low power consumption of Analog and Digital allows doing more in one IC. Smaller board space/smaller form factors; Constant motor speed with the variable Vin.

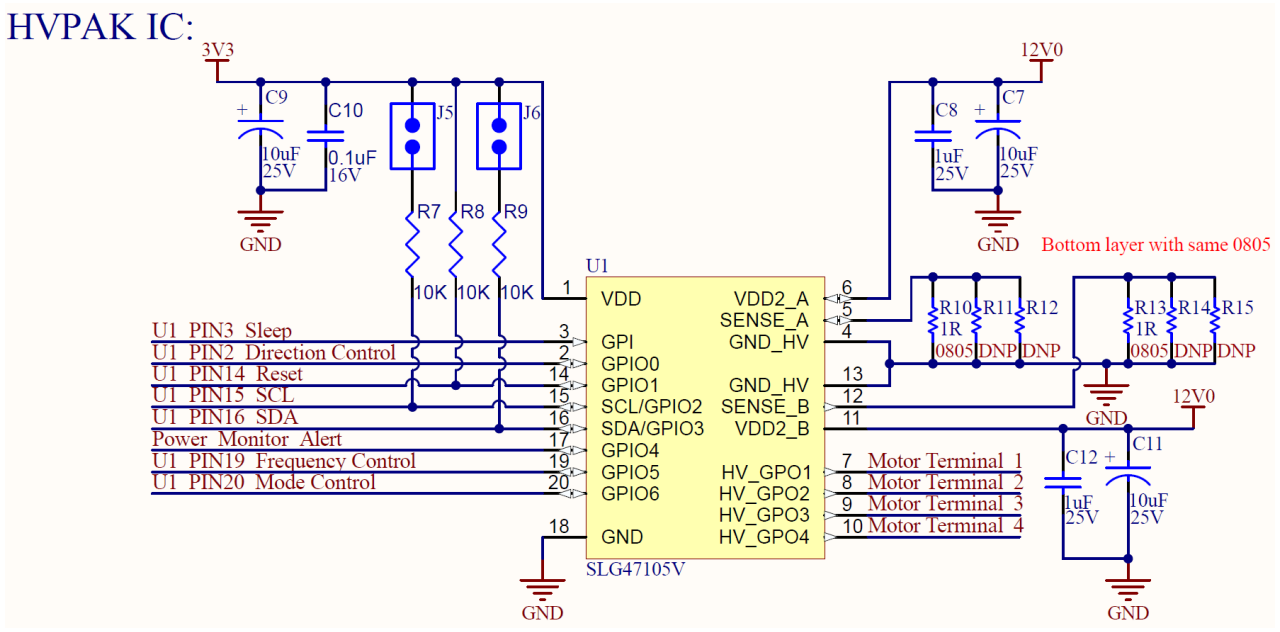

Figure 5: SLG47105 HVPAK

4. Pmod:

This interface conforms to the I2C specification, with an optional interrupt and reset pin plus some optional control signals. If these optional pins are not used, they will have no connection. The pull-up resistors used to provide the logic high level for SCL and SDA are provided on the modules and can be attached to or detached from the bus via onboard jumpers. Pull-ups on INT and RESET, if used, are also provided on the module, and can be attached or detached from the bus via onboard jumpers to enable daisy chaining.
An optional passthrough female Pmod connector may be added to the Pmod opposite to the side with the male connector. This connector may be a six-pin or 12-pin connector, though it should be considered that extra control signals, such as those on the lower row on a 12-pin connector, may not be appropriate for a pass-through connector due to the potential signal conflict if other modules in a daisy chain also used these control signal pins.

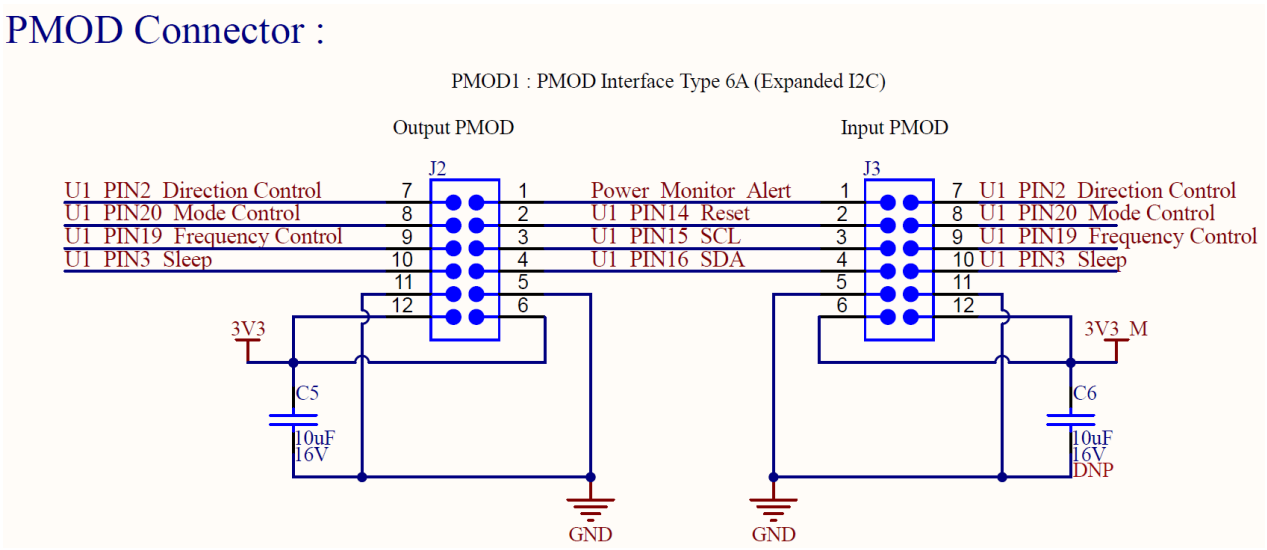

Figure 6: Pmod Interface Type 6A

5. LED: LEDs are used for power on indication and 3.3 v output indication.

Description of LEDs:

LED Color	Reference Designator	Function
Green	D1	Power up
Yellow	D2	3.3 v output indication

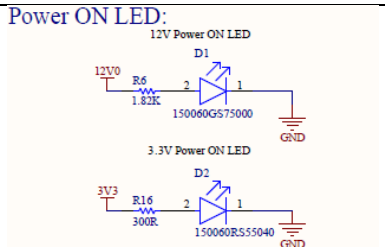

Figure 7: LED

6. Arduino connectors:

Near the center of the system control and ecosystem access is an Arduino uno R3 compatible connector interface.

Software Overview

Debugging using CS+

1. RL78/F14 can be programmed and debugged using CS+. Below are the steps to debug RL78/F14 using CS+. Open the RL78/F14 project in CS+ by double clicking the xxx.mtpj.

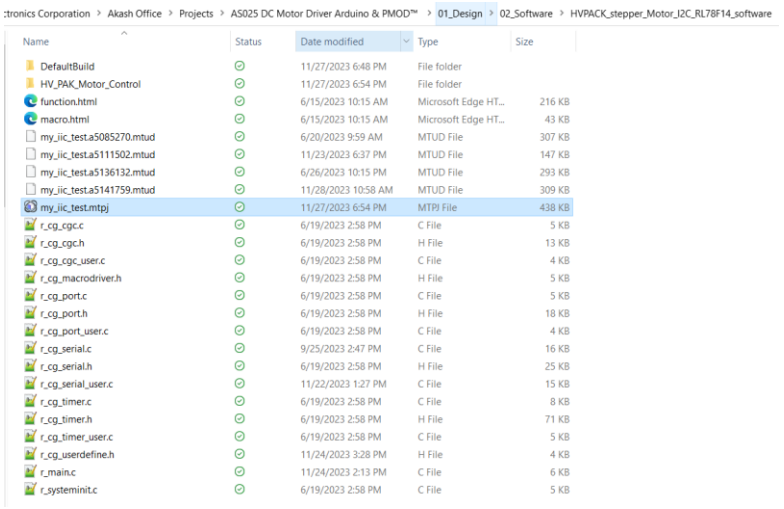

Figure 9: .mtpj file in the project

2. Once the project opens, click on build icon (marked as 1 in Figure: 10), or press F7 to build the project. Once build is successful, click on download icon (marked as 2 in Figure: 10), or press F6 to download the project.

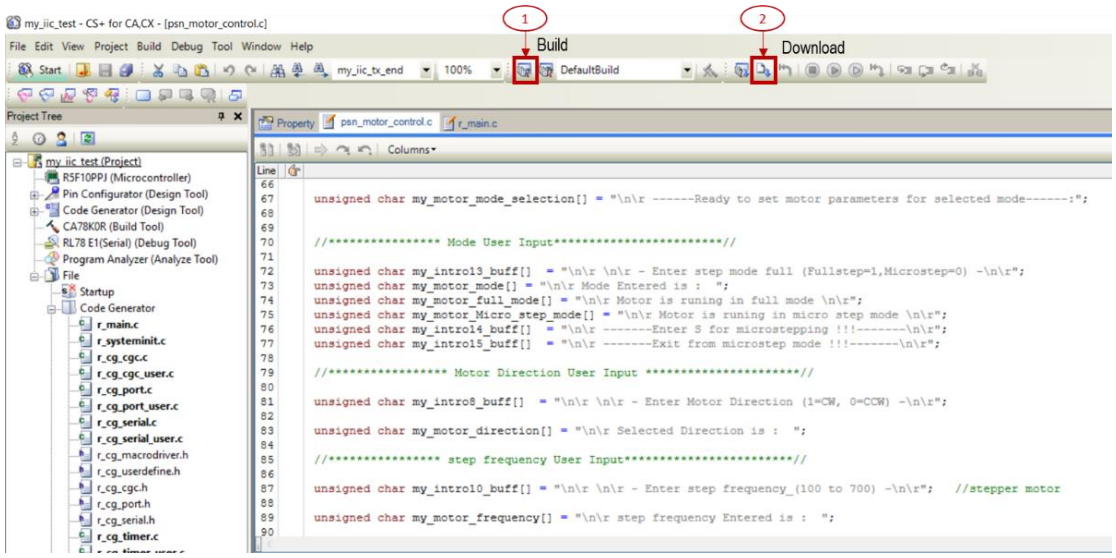

Figure 10: Build and Download the project

3. Once download is successful CS+ will open debug window as below:

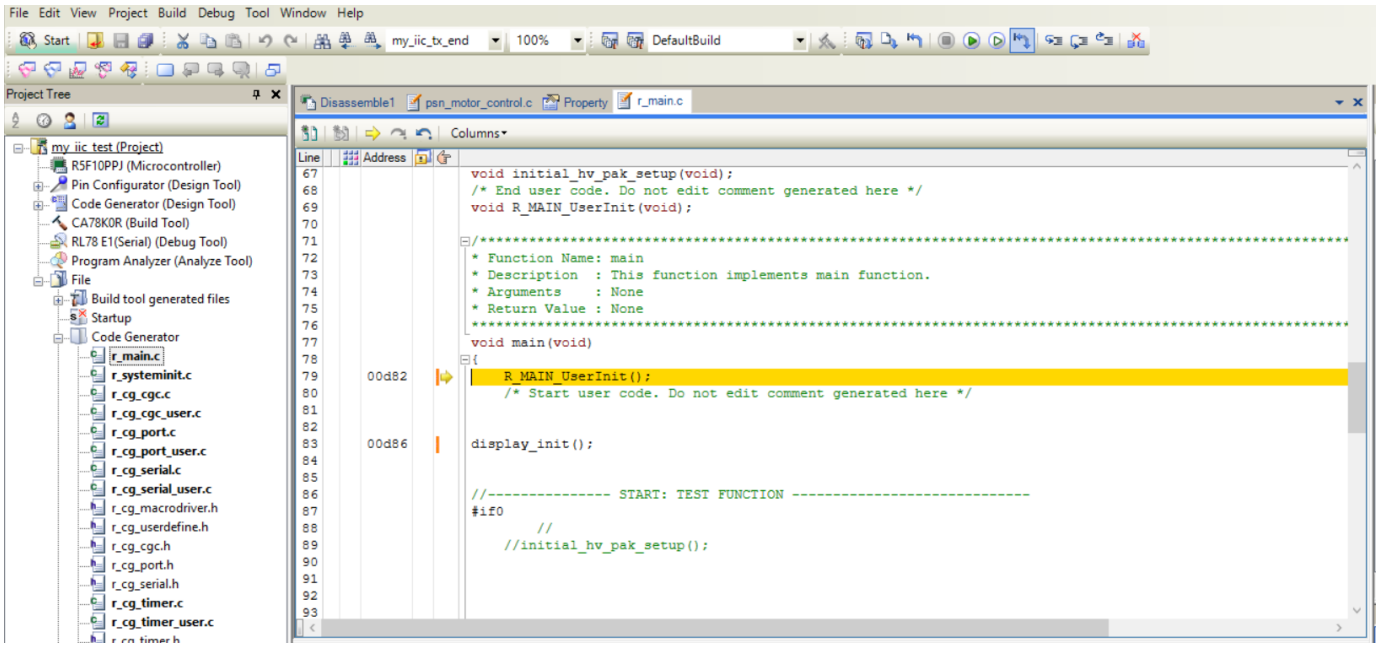

Figure 11: Debug window

4. Once the download is completed click on Execute command as highlighted in Figure:12.

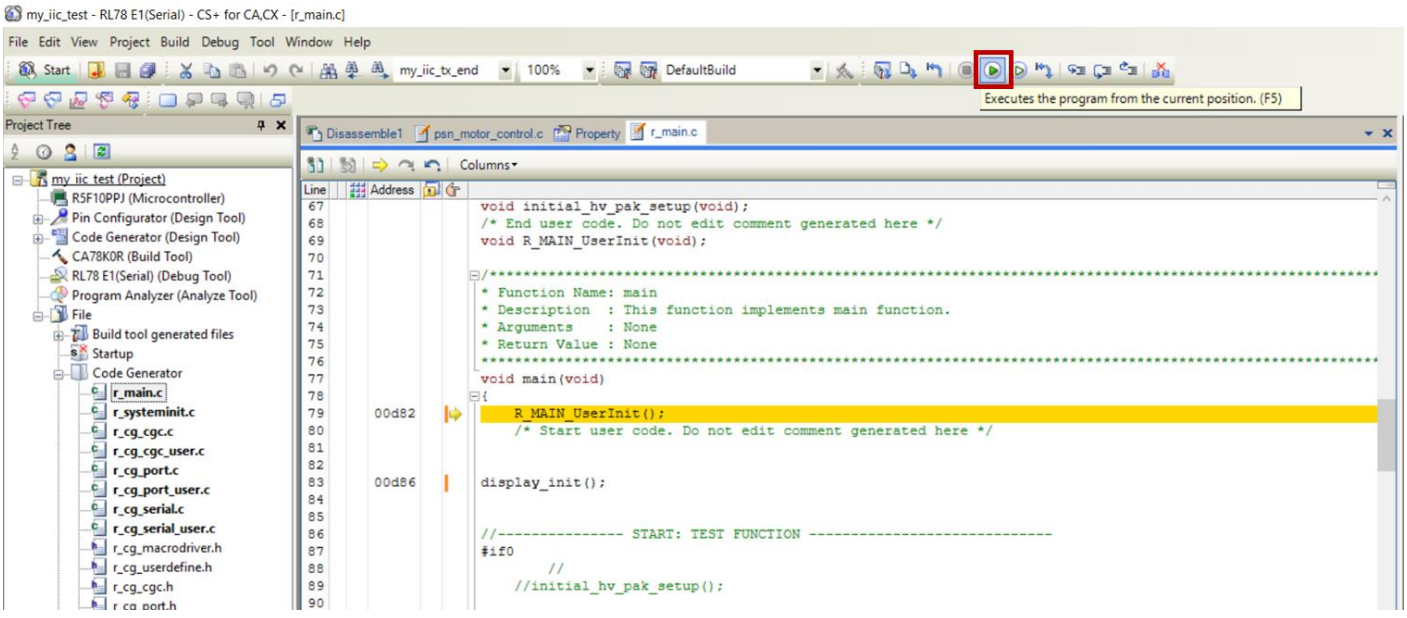

Figure 12: Execute the Program

5. After Execute Command, use TTL to USB Adapter and Tera-term terminal software to give serial commands to the device. Select the Serial Port and navigate to Serial Port and specify the baud rate setting as 19200.

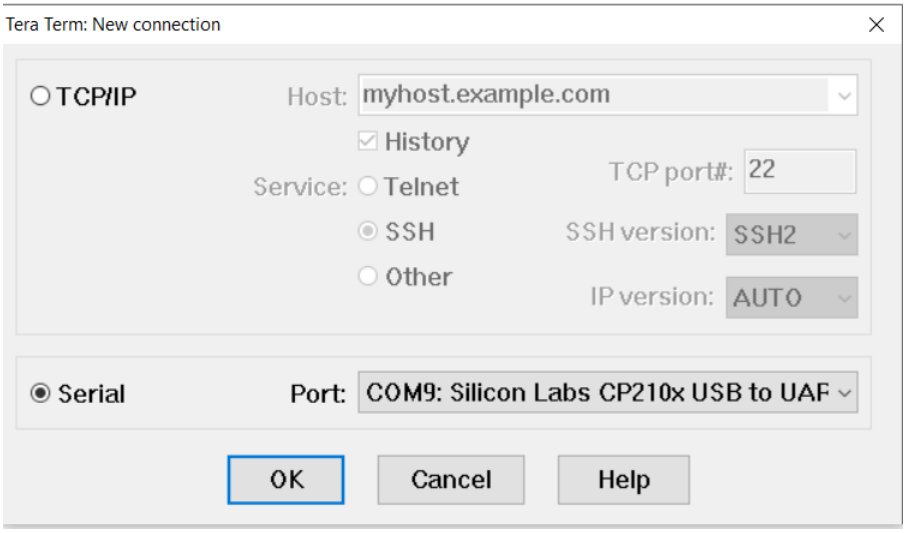

Figure 13: Serial Port Setting

Go Configuration Block Design and Firmware Flashing Steps

Connect SLG47105 chip using socket to programming board and design block using go configure GUI and flash firmware to us as Stepper motor controller.

1. Design block for Stepper motor –
    1. Open GO configure GUI to design block.
    2. Add PWM block for duty control.
    3. Add Enable disable function block for reset functionality.
    4. Add Step Control Block for Full/Micro Step Control of Stepper Motor.

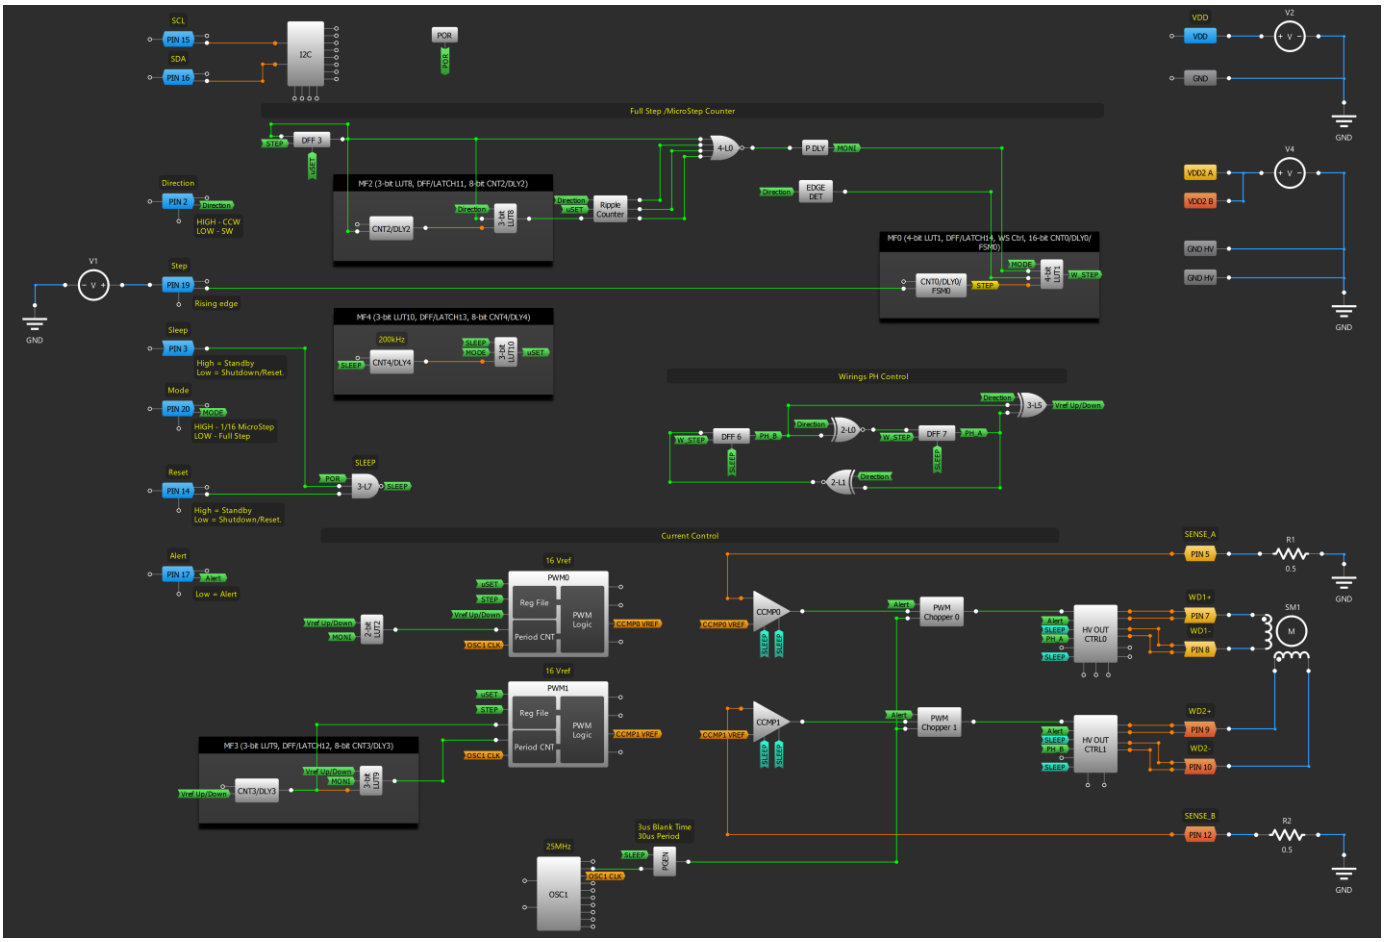

Figure 15: Design block for Stepper motor

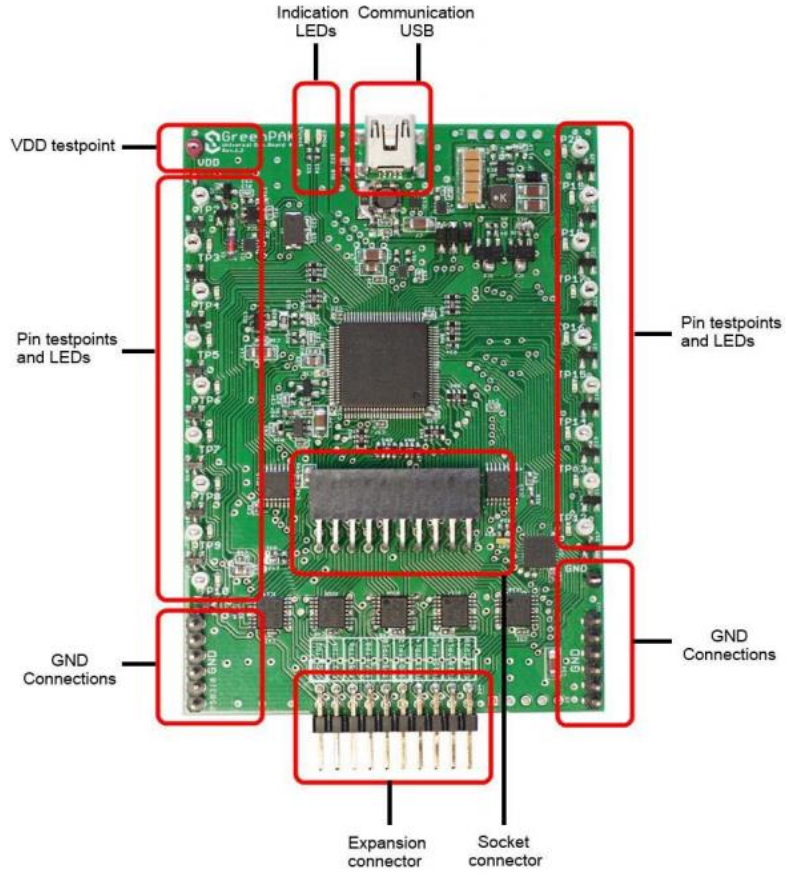
2. Follow below settings for configure HVPAK (SLG47105) as Stepper Motor controller.
    1. Place Unprogrammed SLG47105 chip into socket.
    2. Connect Board and socket using USB & power up the board.
    3. Design blocks using go configure GUI.
    4. Press debug button to run program.
    5. Press program from debugging control panel.
    6. Confirm Configuration.



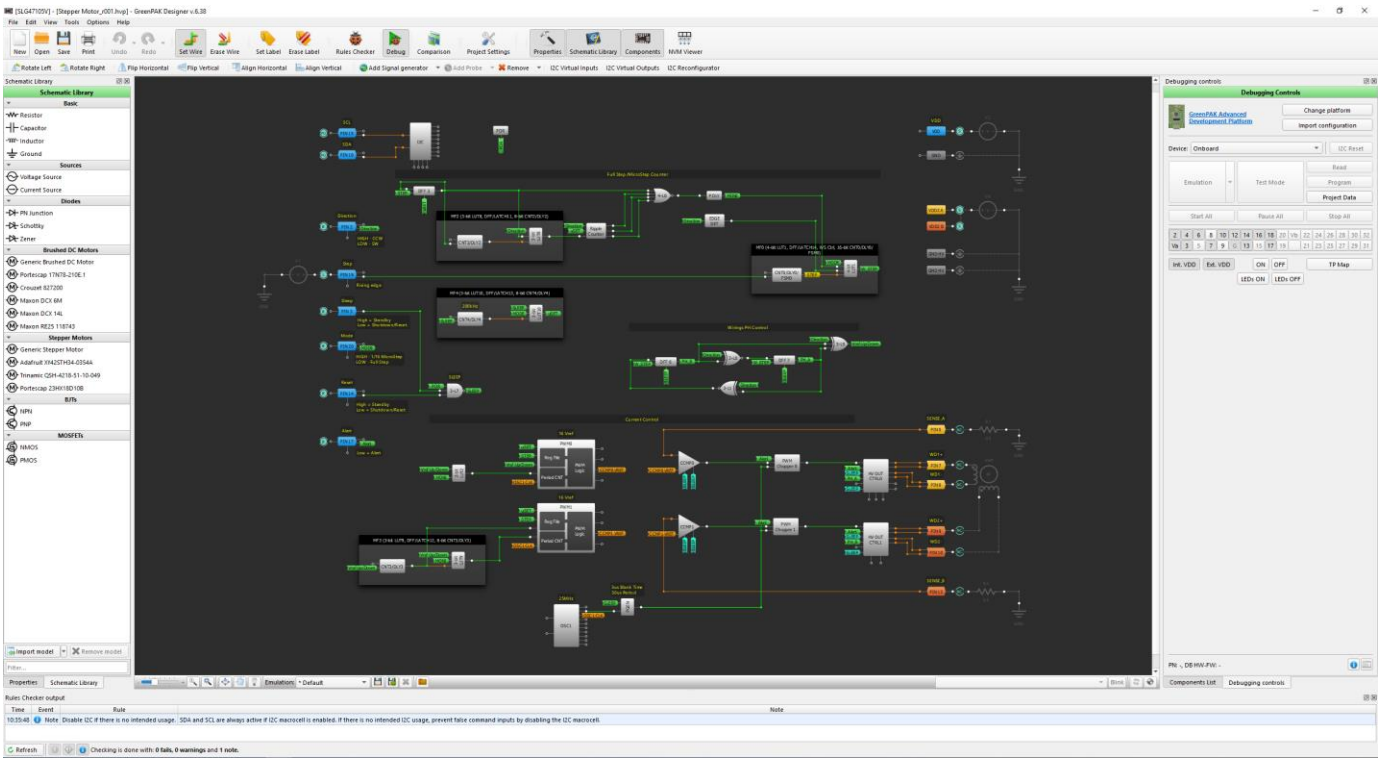


Figure 16: HVPAK Configuration Setup

Test Setup

Method 1: I2C Configuration (In this method the board is fully functional using software mode.)

Follow these procedures to set up the kit as shown in Figure 13

1. Connect AS025-HVPAK board with the RL78/F14 EVK board. The RL78/F14 and AS025-HVPAK board are communicated by I2C communication.
2. Connect 12V DC supply to jumper J4 of AS025-HVPAK board.
3. Connect the E1 emulator to build and debug the project.
4. Connect the USB to TTL converter to give the user commands.
5. Open the Tera term software and give the commands for Stepper Motor Run Mode either Full Step/Micro Step as 0 0r 1, Motor Direction, Stepper Motor Step Frequency, and to Enable the Motor.
6. After the user specifies the commands, the motor runs with the specified commands given to it.
7. The serial commands are shown in Figure: 14 and Figure: 15.

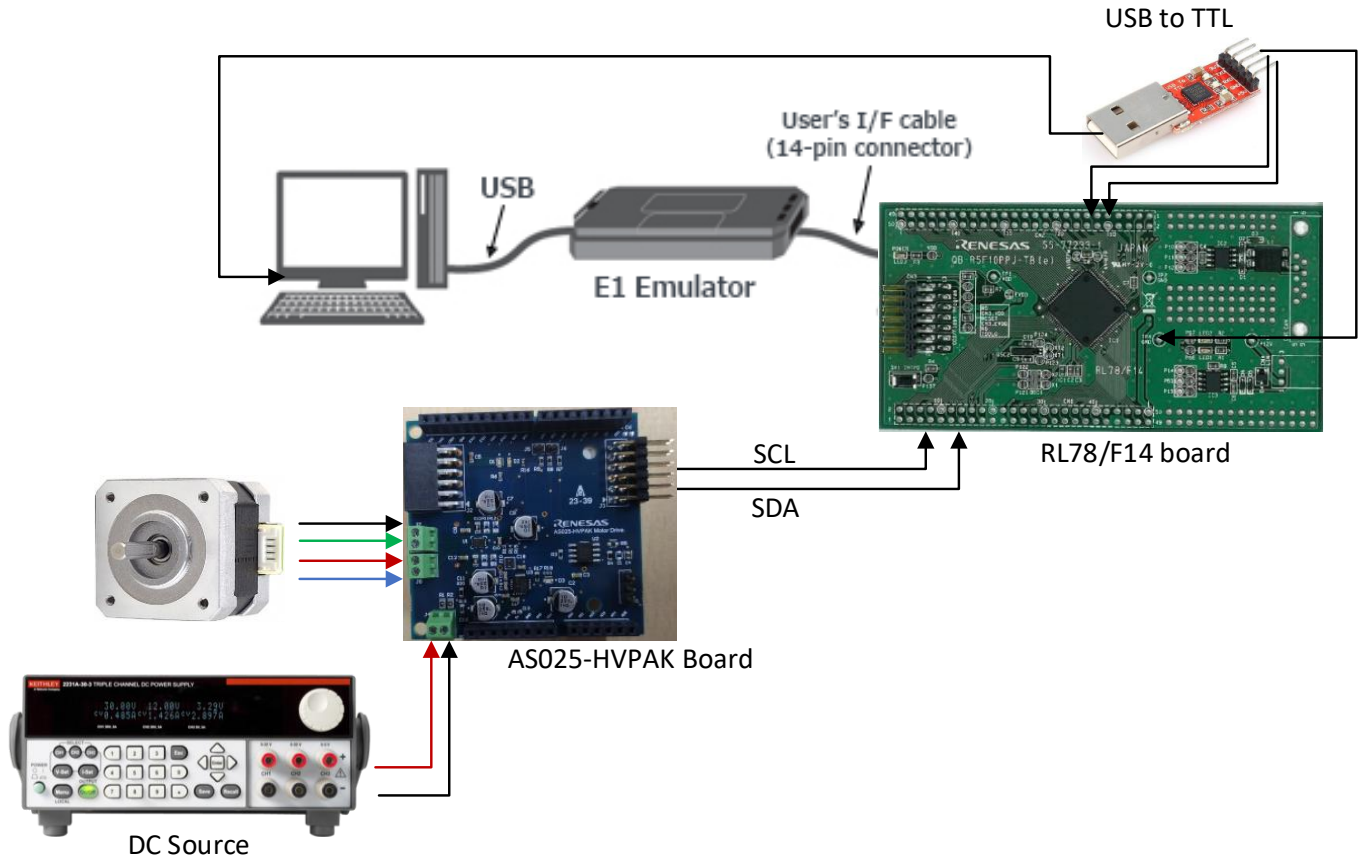

Figure 17: Design Setup

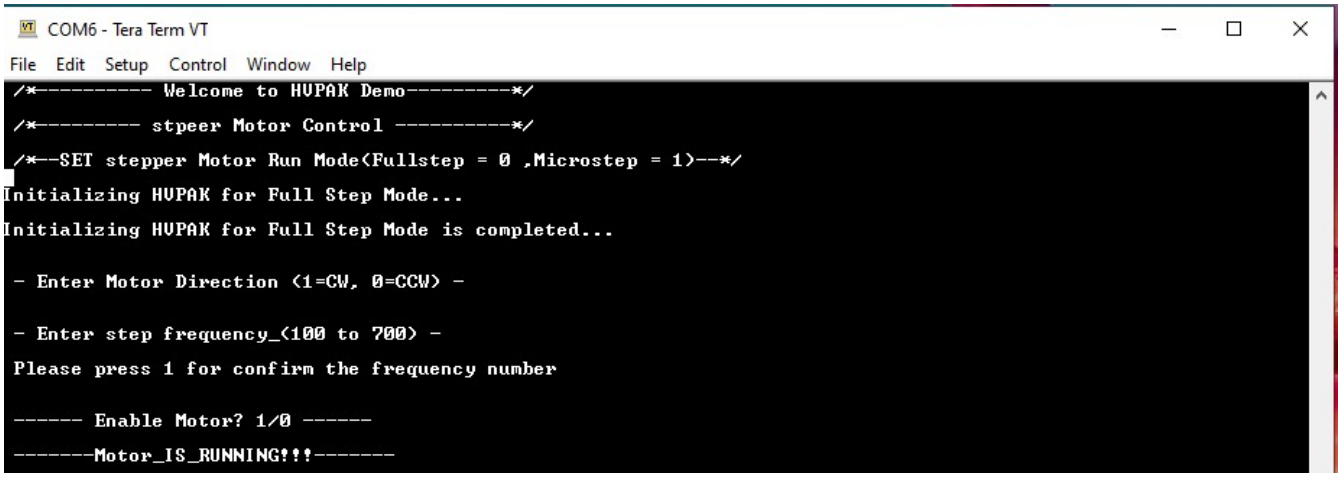

Figure 18: Stepper Motor Serial Data to Run Motor for Full Step

Steps to enter commands in Tera Term to Run the Stepper Motor in Full Step Mode.

1. Enter Stepper Motor Run Mode Full Step/Micro Step. Give command as 0 to run the Motor in Full Step Mode.
2. The HVPAK will initialize the Motor to Full Step Mode.
3. Enter Motor Direction as 1 to Clockwise and 0 for Counterclockwise.
4. Enter Motor Step Frequency from 100 to 700 Hz. (Note: Step Frequency range depends on the type of Stepper Motor. We are using 17PM-K210-10V Stepper Motor.)
5. Press 1 to confirm the Step frequency entered.
6. Press 1 to Enable the Motor.

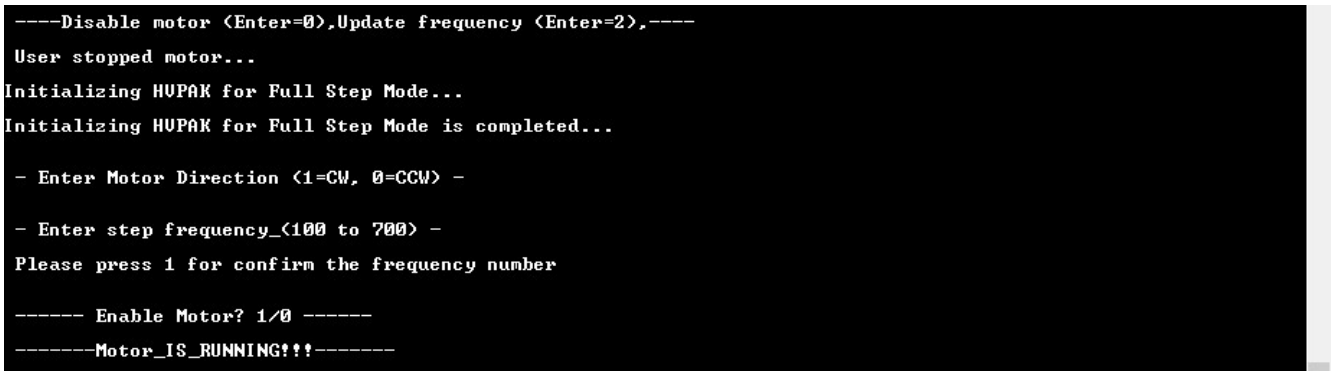

Figure 19: Stepper Motor Serial Data to Stop/Disable Motor

Steps to enter commands in Tera Term to Disable/Stop the Motor or to Update the Step Frequency.

1. Enter 0 to Disable the Motor.
2. Enter 2 to update the Step Frequency.

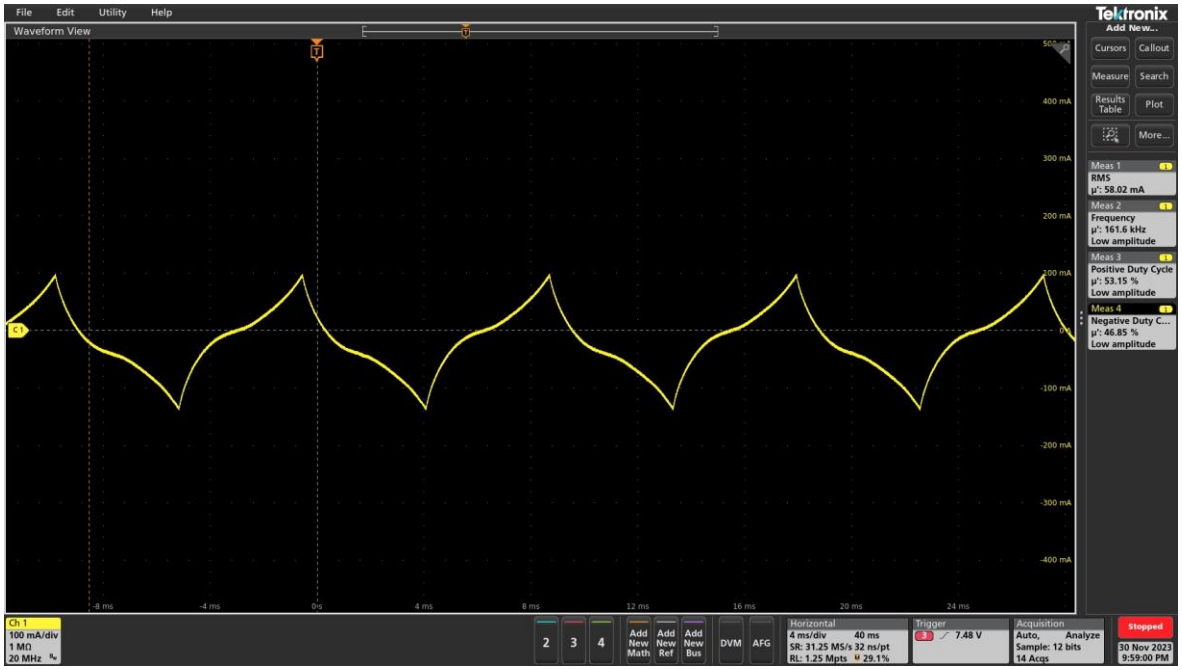

Figure 20: Current Waveform for Full Step Mode

Figure 21: Stepper Motor Serial Data to Run Motor for Micro Step

Steps to enter commands in Tera Term to Run the Motor in Micro step Mode.

1. Enter Stepper Motor Run Mode Full Step/Micro Step. Give command as 1 to run the Motor in Micro Step Mode.
2. The HVPAK will initialize the Motor to Micro Step Mode.
3. Enter Motor Direction as 1 to Clockwise and 0 for Counterclockwise.
4. Enter Motor Step Frequency from 100 to 700 Hz. (Note: Step Frequency range depends on the type of Stepper Motor. We are using 17PM-K210-10V Stepper Motor.)

5. Press 1 to confirm the Step frequency entered.
6. Press 1 to Enable the Motor.

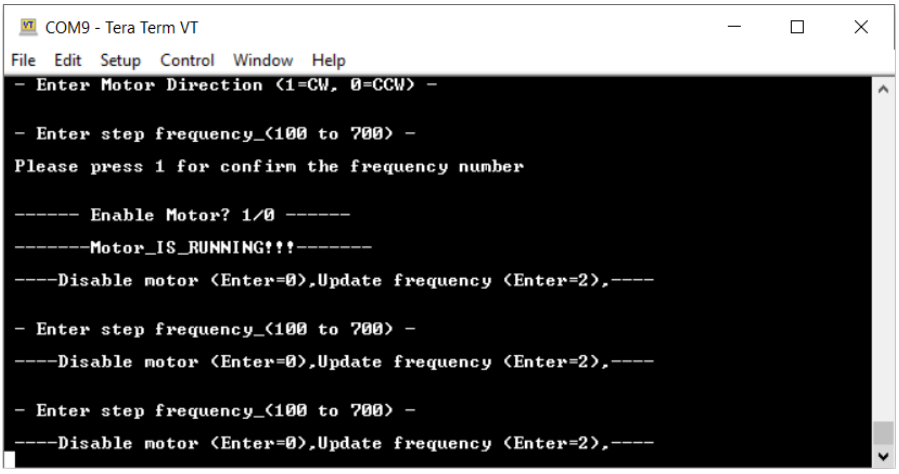

Figure 22: Stepper Motor Serial Data to Stop/Disable Motor

Steps to enter commands in Tera Term to Disable/Stop the Motor or to Update the Step Frequency.

1. Enter 0 to Disable the Motor.
2. Enter 2 to update the Step Frequency.

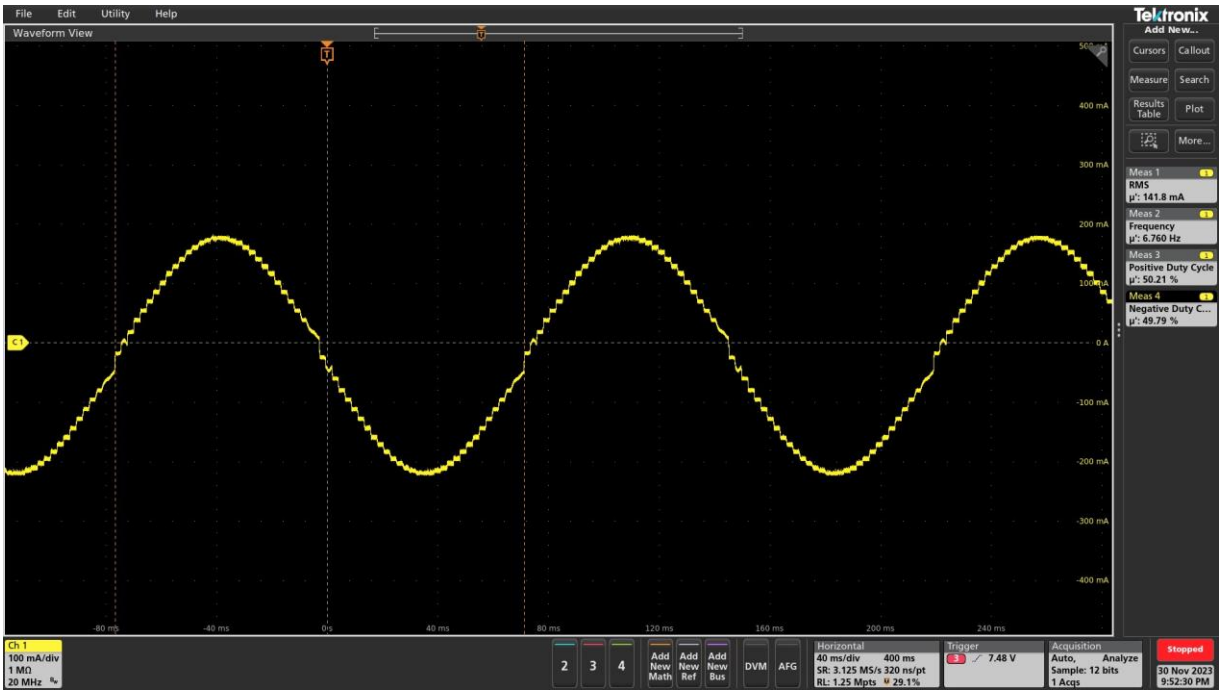

Figure 23: Current Waveform for Micro Step Mode

Method 2: Pin Configuration Method: (In this method the board is fully functional using external input without software. External Inputs: Function Generator and DC Source)

Follow these procedures to set up the kit as shown in Figure 16.

1. Connect 12V DC supply to jumper J4 of AS025-HVPAK board.
2. Connect Stepper motor to connectors J7 and J8.
3. Connect Waveform generator and provide the PWM signal to 9 of Pmod connector, i.e., J3 connector. Pin 9 of Pmod Interface are used for Frequency control of the motor.
4. Pin 8 of Pmod interface connector J3 are used for Mode Control of Stepper motor. The motor will run in Full Step Mode for Low Signal, and it will run in Micro Step Mode for High Signal. For Micro Step Control provide 3V supply from the DC Source.
5. Pin 7 of Pmod interface connector J3 are used for Direction Control of Stepper motor. To control the direction of Stepper Motor, provide 3V from the DC Source.
