Rev.1.30 Apr 2026

# Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

# General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

# Preface

## 1. About this document

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microcontroller (MCU) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

## 2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas Microcontroller. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MCU.

## 3. Renesas Publications

Renesas provides the following documents. Before using any of these documents, visit www.renesas.com for the most up-to-date version of the document.

| Component | Document Type | Description |
|---|---|---|
| Microcontrollers | Data sheet | Features, overview, and electrical characteristics of the MCU |
| | User's Manual: Hardware | MCU specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions |
| | Application Notes | Technical notes, board design guidelines, and software migration information |
| | Technical Update (TU) | Preliminary reports on product specifications such as restriction and errata |
| Software | User's Manual: Software | API reference and programming information |
| | Application Notes | Project files, guidelines for software programming, and application examples to develop embedded software applications |
| Tools & Kits, Solutions | User's Manual: Development Tools | User's manual and quick start guide for developing embedded software applications with Development Kits (DK), Starter Kits (SK), Promotion Kits (PK), Product Examples (PE), and Application Examples (AE) |
| | User's Manual: Software | |
| | Quick Start Guide | |
| | Application Notes | Project files, guidelines for software programming, and application examples to develop embedded software applications |

# 4. Numbering Notation

The following numbering notation is used throughout this manual:

| Example | Description |
|---|---|
| 011b | Binary number. For example, the binary equivalent of the number 3 is 011b. |
| 0x1F | Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 0x1F. In some cases, a hexadecimal number is shown with the suffix "h". |
| 1234 | Decimal number. A decimal number is followed by this symbol only when the possibility of confusion exists. Decimal numbers are generally shown without a suffix. |

# 5. Typographic Notation

The following typographic notation is used throughout this manual:

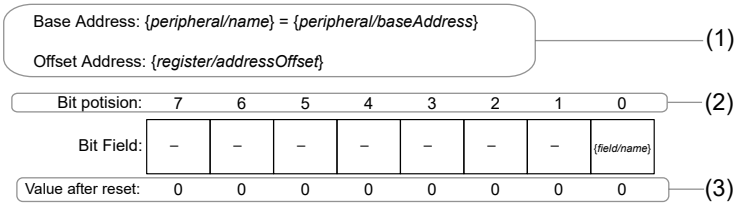
| Example | Description |
|---|---|
| AAA.BBB.CCC | Periods separated a function module symbol (AAA), register symbol (BBB), and bit field symbol (CCC). |
| AAA.BBB | A period separated a function module symbol (AAA) and register symbol (BBB). |
| BBB.DDD | A period separated a register symbol (BBB) and bit field symbol (DDD). |
| EEE[3:0] | Numbers in brackets expresses a bit number. For example, EEE[3:0] occupies bits 3 to 0. |

# 6. Unit and Unit Prefix

The following units and unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

| Symbol | Name | Description |
|---|---|---|
| b | Binary Digit | Single 0 or 1 |
| B | Byte | This unit is generally used for memory specification of the MCU and address space. |
| k | kilo- | 1000 = $10^3$. k is also used to denote 1024 ($2^{10}$) but this unit prefix is used to denote 1000 ($10^3$) throughout this manual. |
| K | Kilo- | 1024 = $2^{10}$. This unit prefix is used to denote 1024 ($2^{10}$) not 1000 ($10^3$) throughout this manual. |

# 7. Special Terms



The following terms have special meanings.

| Term | Description |
|---|---|
| NC | Not connected pin. This pin should be left floating unless specified otherwise. |
| Hi-Z | High impedance. |
| x | Don't care or undefined. |

# 8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

XX.X.X {*register/name*} : {*register/description*}

(4) (5) (6)

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | {*field/name*} | {*field/description*}<br>0: {*enumeratedValue/description*}<br>1: {*enumeratedValue/description*} | {*access*} |
| 7:1 | – | These bits are read as 0. The write value should be 0. | R/W |

### (1) Function module symbol, register symbol, and address assignment

Function module symbol, {*pheripheral/name*}, register symbol, {*register/name*}, and address assignment of this register are generally expressed. Base Address and Offset Address mean {*regiser/name*} : {*register/description*} of {*peripheral/name*} is assigned to address {*peripheral/baseAddress*} + {*register/addressOffset*}.

### (2) Bit number

This number indicates the bit number. This bits are shown in order from bits 31 to 0 for 32-bit register, from bits 15 to 0 for 16-bit register, and from bits 7 to 0 for 8-bit register.

### (3) Value after reset

This symbol or number indicate the value of each bit after a hard reset. The value is shown in binary unless specified otherwise.

- 0: Indicates that the value is 0 after a reset.
- 1: Indicates that the value is 1 after a reset.
- x: Indicates that the value is undefined after a reset.

### (4) Symbol

{*filed/name*} indicates the short name of bit field. Reserved bit is expressed with a —.

### (5) Function

Function indicates the full name of the bit field, {*field/description*}, and enumerated values.

### (6) R/W

The R/W column indicates access type whether the bit field is readable or writable.

- R/W: The bit field is readable and writable.
- R: The bit field is readable only. Writing to this bit field has no effect.
- W: The bit field is writable only. The read value is the same as after a reset unless specified otherwise.

# 9. Abbreviations

Abbreviations used in this document are shown in the following table.

| Abbreviation | Description |
|---|---|
| AES | Advanced Encryption Standard |
| AHB | Advanced High-performance Bus |
| AHB-AP | AHB Access Port |
| APB | Advanced Peripheral Bus |
| ARC | Alleged RC |
| ATB | Advanced Trace Bus |
| BCD | Binary Coded Decimal |
| BSDL | Boundary Scan Description Language |
| DES | Data Encryption Standard |
| DSA | Digital Signature Algorithm |
| ETB | Embedded Trace Buffer |
| ETM | Embedded Trace Macrocell |
| FLL | Frequency Locked Loop |
| FPU | Floating Point Unit |
| HMI | Human Machine Interface |
| IrDA | Infrared Data Association |
| LSB | Least Significant Bit |
| MSB | Most Significant Bit |
| NVIC | Nested Vector Interrupt Controller |
| PC | Program Counter |
| PFS | Port Function Select |
| PLL | Phase Locked Loop |
| POR | Power-on reset |
| PWM | Pulse Width Modulation |
| RSA | Rivest Shamir Adleman |
| SHA | Secure Hash Algorithm |
| S/H | Sample and Hold |
| SP | Stack Pointer |
| SWD | Serial Wire Debug |
| SW-DP | Serial Wire-Debug Port |
| TRNG | True Random Number Generator |
| UART | Universal Asynchronous Receiver/Transmitter |
| VCO | Voltage Controlled Oscillator |

# Contents

**Features** ..... **45**
**1. Overview** ..... **46**
1.1 Function Outline ..... 46
1.2 Block Diagram ..... 52
1.3 Part Numbering ..... 52
1.4 Function Comparison ..... 55
1.5 Pin Functions ..... 57
1.6 Pin Assignments ..... 61
1.7 Pin Lists ..... 66
**2. CPU** ..... **69**
2.1 Overview ..... 69
2.1.1 CPU ..... 69
2.1.2 Debug ..... 69
2.1.3 Operating Frequency ..... 70
2.1.4 Block Diagram ..... 70
2.2 Implementation Options ..... 70
2.3 SWD Interface ..... 71
2.4 Security Attribution for Memory ..... 71
2.5 Debug Function ..... 72
2.5.1 Debugger Connectivity ..... 72
2.5.2 Emulator Connection ..... 73
2.5.3 Self-Hosted Debug Function ..... 73
2.5.4 Effect of Debug Function ..... 73
2.6 Programmers Model ..... 74
2.6.1 Address Spaces ..... 74
2.6.2 Peripheral Address Map ..... 75
2.6.3 CoreSight ROM Table ..... 75
2.6.4 DBGREG Module ..... 76
2.6.5 OCDREG Module ..... 79
2.6.6 CPUDSAR : CPU Debug Security Attribution Register ..... 84
2.6.7 Processing on Error Response Generated by CPU Access ..... 84
2.7 CoreSight Cross Trigger Interface (CTI) ..... 86
2.8 CoreSight ATB Funnel ..... 87
2.9 Break Point Unit ..... 88
2.10 CoreSight Time Stamp Generator ..... 88
2.11 SysTick Timer ..... 88
2.12 OCD Emulator Connection ..... 88
2.12.1 DBGEN ..... 89
2.12.2 Restrictions on connecting an OCD emulator ..... 89
2.13 References ..... 90
**3. Operating Modes** ..... **91**
3.1 Overview ..... 91
3.2 Details of Operating Modes ..... 91
3.2.1 Single-Chip Mode ..... 91
3.2.2 SCI Boot Mode ..... 91
3.2.3 USB Boot Mode ..... 91
3.2.4 SWD Boot Mode ..... 91
3.3 Operating Modes Transitions ..... 91

3.3.1 Operating Mode Transitions as Determined by the Mode-Setting Pin ..... 91
**4. Address Space ..... 93**
4.1 Address Space ..... 93
**5. Resets ..... 94**
5.1 Overview ..... 94
5.2 Register Descriptions ..... 98
5.2.1 RSTSAR : Reset Security Attribution Register ..... 98
5.2.2 RSTSR0 : Reset Status Register 0 ..... 99
5.2.3 RSTSR1 : Reset Status Register 1 ..... 100
5.2.4 RSTSR2 : Reset Status Register 2 ..... 103
5.3 Operation ..... 103
5.3.1 RES Pin Reset ..... 103
5.3.2 Power-On Reset ..... 103
5.3.3 Voltage Monitor Reset ..... 104
5.3.4 Independent Watchdog Timer Reset ..... 105
5.3.5 Watchdog Timer Reset ..... 106
5.3.6 Software Reset ..... 106
5.3.7 Determination of Cold/Warm Start ..... 106
5.3.8 Determination of Reset Generation Source ..... 106
**6. Option-Setting Memory ..... 108**
6.1 Overview ..... 108
6.2 Register Descriptions ..... 109
6.2.1 OFS0 : Option Function Select Register 0 ..... 109
6.2.2 DUALSEL : Dual Mode Select Register ..... 112
6.2.3 SAS : Startup Area Setting Register ..... 112
6.2.4 OFS1, OFS1_SEC : Option Function Select Register 1 for Non-secure and Secure ..... 113
6.2.5 OFS1_SEL : Option Function Select Register 1 for Security Attribution ..... 114
6.2.6 BANKSEL, BANKSEL_SEC : Bank Select Register for Non-secure and Secure ..... 115
6.2.7 BANKSEL_SEL : Bank Select Register for Security Attribution ..... 116
6.2.8 BPS, BPS_SEC, BPS_SEL : Block Protect Setting Register ..... 117
6.2.9 PBPS, PBPS_SEC : Permanent Block Protect Setting Register ..... 119
6.3 Setting Option-Setting Memory ..... 119
6.3.1 Allocation of Data in Option-Setting Memory ..... 119
6.3.2 Setting Data for Programming Option-Setting Memory ..... 119
6.3.3 Security attribution of option-setting memory ..... 120
6.3.4 Timing of the Setting Value ..... 120
6.4 Usage Notes ..... 120
6.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory 120
**7. Low Voltage Detection (LVD) ..... 121**
7.1 Overview ..... 121
7.2 Register Descriptions ..... 123
7.2.1 LVDSAR : Low Voltage Detection Security Attribution Register ..... 123
7.2.2 LVD1CMPCR : Voltage Monitoring 1 Comparator Control Register ..... 123
7.2.3 LVD2CMPCR : Voltage Monitoring 2 Comparator Control Register ..... 124
7.2.4 LVD1CR0 : Voltage Monitor 1 Circuit Control Register 0 ..... 125
7.2.5 LVD2CR0 : Voltage Monitor 2 Circuit Control Register 0 ..... 126
7.2.6 LVD1CR1 : Voltage Monitor 1 Circuit Control Register ..... 127
7.2.7 LVD1SR : Voltage Monitor 1 Circuit Status Register ..... 127
7.2.8 LVD2CR1 : Voltage Monitor 2 Circuit Control Register 1 ..... 128
7.2.9 LVD2SR : Voltage Monitor 2 Circuit Status Register ..... 128

7.3 VCC Input Voltage Monitor ..... 129
7.3.1 Monitoring $V_{det0}$ ..... 129
7.3.2 Monitoring $V_{det1}$ ..... 129
7.3.3 Monitoring $V_{det2}$ ..... 129
7.4 Reset from Voltage Monitor 0 ..... 130
7.5 Interrupt and Reset from Voltage Monitor 1 ..... 131
7.6 Interrupt and Reset from Voltage Monitor 2 ..... 132
7.7 Event Link Controller (ELC) Output ..... 134
7.7.1 Interrupt Handling and Event Linking ..... 134
**8. Clock Generation Circuit ..... 135**
8.1 Overview ..... 135
8.2 Register Descriptions ..... 139
8.2.1 CGFSAR : Clock Generation Function Security Attribute Register ..... 139
8.2.2 SCKDIVCR : System Clock Division Control Register ..... 141
8.2.3 SCKSCR : System Clock Source Control Register ..... 143
8.2.4 MEMWAIT : Memory Wait Cycle Control Register for Code Flash ..... 144
8.2.5 FLDWAITR : Memory Wait Cycle Control Register for Data Flash ..... 145
8.2.6 PLLCCR : PLL Clock Control Register ..... 148
8.2.7 PLLCR : PLL Control Register ..... 149
8.2.8 MOSCCR : Main Clock Oscillator Control Register ..... 150
8.2.9 SOSCCR : Sub-Clock Oscillator Control Register ..... 151
8.2.10 LOCOCR : Low-Speed On-Chip Oscillator Control Register ..... 152
8.2.11 HOCOCR : High-Speed On-Chip Oscillator Control Register ..... 152
8.2.12 HOCOCR2 : High-Speed On-Chip Oscillator Control Register 2 ..... 153
8.2.13 MOCOCR : Middle-Speed On-Chip Oscillator Control Register ..... 154
8.2.14 OSCSF : Oscillation Stabilization Flag Register ..... 155
8.2.15 OSTDCR : Oscillation Stop Detection Control Register ..... 156
8.2.16 OSTDSR : Oscillation Stop Detection Status Register ..... 157
8.2.17 SOSTDCR : Sub-Clock Oscillation Stop Detection Control Register ..... 158
8.2.18 MOSCWTCR : Main Clock Oscillator Wait Control Register ..... 159
8.2.19 MOMCR : Main Clock Oscillator Mode Oscillation Control Register ..... 160
8.2.20 SOMCR : Sub-Clock Oscillator Mode Control Register ..... 160
8.2.21 SOMRG : Sub-Clock Oscillator Margin Check Register ..... 161
8.2.22 SLCDSCKCR : Segment LCD Source Clock Control Register ..... 161
8.2.23 CKOCR : Clock Out Control Register ..... 162
8.2.24 LOCOUTCR : LOCO User Trimming Control Register ..... 163
8.2.25 MOCOUTCR : MOCO User Trimming Control Register ..... 164
8.2.26 HOCOUTCR : HOCO User Trimming Control Register ..... 164
8.2.27 CANFDCKDIVCR : CANFD Clock Division Control Register ..... 165
8.2.28 I3CCKDIVCR : I3C Clock Division Control Register ..... 166
8.2.29 USBCKCR : USB Clock Control Register ..... 166
8.2.30 CANFDCKCR : CANFD Clock Control Register ..... 167
8.2.31 I3CCKCR : I3C Clock Control Register ..... 169
8.3 Main Clock Oscillator ..... 170
8.3.1 Connecting a Crystal Resonator ..... 170
8.3.2 External Clock Input ..... 170
8.3.3 Notes on External Clock Input ..... 171
8.4 Sub-Clock Oscillator ..... 171
8.4.1 Connecting a 32.768-kHz Crystal Resonator ..... 171
8.4.2 Pin Handling When the Sub-Clock Oscillator Is Not Used ..... 172

8.5 Oscillation Stop Detection Function ... 172
8.5.1 Oscillation Stop Detection and Operation after Detection ... 172
8.5.2 Oscillation Stop Detection Interrupts ... 174
8.5.3 Sub Clock Oscillation Stop Detection Function ... 175
8.5.4 Sub-clock Oscillation Stop Detection Interrupts ... 176
8.6 PLL Circuit ... 176
8.7 Internal Clock ... 177
8.7.1 System Clock (ICLK) ... 178
8.7.2 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD) ... 179
8.7.3 FlashIF Clock (FCLK) ... 179
8.7.4 USB Clock (USBCLK) ... 180
8.7.5 CANFD Clock (CANFDCLK) ... 180
8.7.6 CAN Clock (CANMCLK) ... 180
8.7.7 I3C Clock (I3CCLK) ... 180
8.7.8 CAC Clock (CACCLK) ... 180
8.7.9 RTC-Dedicated Clock (RTCSCLK, RTCS128CLK, RTCLCLK) ... 180
8.7.10 IWDT-Dedicated Clock (IWDTCLK) ... 180
8.7.11 AGT-Dedicated Clock (AGTSCLK, AGTLCLK) ... 181
8.7.12 SysTick Timer-Dedicated Clock (SYSTICCLK) ... 181
8.7.13 Segment LCD Source Clock (LCDSRCCLK) ... 181
8.7.14 UARTA Clock (UARTAMCLK, UARTASCLK, UARTALCLK, UARTAHCLK, UARTAMOCLK) ... 181
8.7.15 External Pin Output Clock (CLKOUT) ... 181
8.7.16 Serial Wire Debugger Clock (SWCLK) ... 181
8.8 Usage Notes ... 181
8.8.1 Notes on Clock Generation Circuit ... 181
8.8.2 Notes on Resonator ... 182
8.8.3 Notes on Board Design ... 182
8.8.4 Notes on Resonator Connect Pin ... 182
**9. Clock Frequency Accuracy Measurement Circuit (CAC) ... 183**
9.1 Overview ... 183
9.2 Register Descriptions ... 184
9.2.1 CACR0 : CAC Control Register 0 ... 184
9.2.2 CACR1 : CAC Control Register 1 ... 185
9.2.3 CACR2 : CAC Control Register 2 ... 185
9.2.4 CAICR : CAC Interrupt Control Register ... 186
9.2.5 CASTR : CAC Status Register ... 187
9.2.6 CAULVR : CAC Upper-Limit Value Setting Register ... 188
9.2.7 CALLVR : CAC Lower-Limit Value Setting Register ... 188
9.2.8 CACNTBR : CAC Counter Buffer Register ... 189
9.3 Operation ... 189
9.3.1 Measuring Clock Frequency ... 189
9.3.2 Digital Filtering of Signals on CACREF Pin ... 191
9.4 Interrupt Requests ... 191
9.5 Usage Notes ... 191
9.5.1 Settings for the Module-Stop Function ... 191
**10. Low Power Modes ... 192**
10.1 Overview ... 192
10.2 Register Descriptions ... 196
10.2.1 LPMSAR : Low Power Mode Security Attribution Register ... 196

10.2.2 SBYCR : Standby Control Register ..... 197
10.2.3 MSTPCRA : Module Stop Control Register A ..... 197
10.2.4 MSTPCRB : Module Stop Control Register B ..... 198
10.2.5 MSTPCRC : Module Stop Control Register C ..... 200
10.2.6 MSTPCRD : Module Stop Control Register D ..... 201
10.2.7 MSTPCRE : Module Stop Control Register E ..... 202
10.2.8 OPCCR : Operating Power Control Register ..... 203
10.2.9 SOPCCR : Sub Operating Power Control Register ..... 204
10.2.10 SNZCR : Snooze Control Register ..... 205
10.2.11 SNZEDCR0 : Snooze End Control Register 0 ..... 206
10.2.12 SNZEDCR1 : Snooze End Control Register 1 ..... 207
10.2.13 SNZREQCR0 : Snooze Request Control Register 0 ..... 208
10.2.14 PSMCR : Power Save Memory Control Register ..... 209
10.2.15 SYOCDCR : System Control OCD Control Register ..... 210
10.2.16 LDOCR : LDO Control Register ..... 211
10.3 Reducing Power Consumption by Switching Clock Signals ..... 211
10.4 Module-Stop Function ..... 211
10.5 Function for Lower Operating Power Consumption ..... 212
10.5.1 Operating Range ..... 212
10.5.2 Setting Operating Power Control Mode ..... 214
10.5.3 Operating Power Control Mode Change Procedure ..... 214
10.5.4 Specific Procedure for Low Power Mode Transition ..... 218
10.6 Sleep Mode ..... 219
10.6.1 Transitioning to Sleep Mode ..... 219
10.6.2 Canceling Sleep Mode ..... 219
10.7 Software Standby Mode ..... 220
10.7.1 Transitioning to Software Standby Mode ..... 220
10.7.2 Canceling Software Standby Mode ..... 221
10.7.3 Example of Software Standby Mode Application ..... 222
10.8 Snooze Mode ..... 223
10.8.1 Transition to Snooze Mode ..... 223
10.8.2 Canceling Snooze Mode ..... 223
10.8.3 Returning to Software Standby Mode from Snooze Mode ..... 224
10.8.4 Snooze Operation Example ..... 225
10.9 Usage Notes ..... 229
10.9.1 Register Access ..... 229
10.9.2 I/O Port Pin States ..... 230
10.9.3 Module-Stop State of DTC, DMAC ..... 230
10.9.4 Internal Interrupt Sources ..... 230
10.9.5 Transitioning to Low Power Modes ..... 230
10.9.6 Timing of WFI Instruction ..... 230
10.9.7 Writing to the WDT/IWDT Registers by DTC or DMAC in Sleep Mode or Snooze Mode ..... 231
10.9.8 Oscillators in Snooze Mode ..... 231
10.9.9 Snooze Mode Entry by RXD0 Falling Edge ..... 231
10.9.10 Using UART of SCI0 in Snooze Mode ..... 231
10.9.11 Conditions of A/D Conversion Start in Snooze Mode ..... 231
10.9.12 Conditions of CTSU in Snooze Mode ..... 231
10.9.13 ELC Events in Snooze Mode ..... 231
10.9.14 Module-Stop Function of A/D Converter ..... 232
10.9.15 Module-Stop Bit Write Timing ..... 232

10.9.16 Sleep-on-exit Function ..... 232
10.9.17 Interruption During the Transition to Low Power Modes ..... 232
**11. Register Write Protection ..... 235**
11.1 Overview ..... 235
11.2 Register Descriptions ..... 235
11.2.1 PRCR : Protect Register ..... 235
**12. Interrupt Controller Unit (ICU) ..... 237**
12.1 Overview ..... 237
12.2 Register Descriptions ..... 238
12.2.1 ICUSARA : Interrupt Controller Unit Security Attribution Register A ..... 239
12.2.2 ICUSARB : Interrupt Controller Unit Security Attribution Register B ..... 239
12.2.3 ICUSARC : Interrupt Controller Unit Security Attribution Register C ..... 240
12.2.4 ICUSARD : Interrupt Controller Unit Security Attribution Register D ..... 241
12.2.5 ICUSARE : Interrupt Controller Unit Security Attribution Register E ..... 241
12.2.6 ICUSARF : Interrupt Controller Unit Security Attribution Register F ..... 242
12.2.7 ICUSARG : Interrupt Controller Unit Security Attribution Register G ..... 243
12.2.8 ICUSARH : Interrupt Controller Unit Security Attribution Register H ..... 243
12.2.9 ICUSARM : Interrupt Controller Unit Security Attribution Register M ..... 244
12.2.10 IRQCRi : IRQ Control Register i (i = 0 to 15) ..... 244
12.2.11 NMISR : Non-Maskable Interrupt Status Register ..... 246
12.2.12 NMIER : Non-Maskable Interrupt Enable Register ..... 248
12.2.13 NMICLR : Non-Maskable Interrupt Status Clear Register ..... 250
12.2.14 NMICR : NMI Pin Interrupt Control Register ..... 252
12.2.15 IELSRn : ICU Event Link Setting Register n (n = 0 to 63) ..... 253
12.2.16 DELSRn : DMAC Event Link Setting Register n (n = 0 to 7) ..... 254
12.2.17 SELSR0 : SYS Event Link Setting Register ..... 255
12.2.18 WUPEN0 : Wake Up Interrupt Enable Register 0 ..... 256
12.2.19 WUPEN1 : Wake Up Interrupt Enable Register 1 ..... 257
12.2.20 WUPEN2 : Wake Up Interrupt Enable Register 2 ..... 258
12.3 Vector Table ..... 258
12.3.1 Interrupt Vector Table ..... 258
12.3.2 Event Number ..... 261
12.4 Interrupt Operation ..... 266
12.4.1 Detecting Interrupts ..... 266
12.5 Interrupt Setting Procedure ..... 267
12.5.1 Enabling Interrupt Requests ..... 267
12.5.2 Disabling Interrupt Requests ..... 267
12.5.3 Polling for Interrupts ..... 267
12.5.4 Selecting Interrupt Request Destinations ..... 268
12.5.5 Digital Filter ..... 269
12.5.6 External Pin Interrupts ..... 270
12.6 Non-Maskable Interrupt Operation ..... 270
12.6.1 Correspondence to TrustZone-M by NMI ..... 271
12.7 Return from Low Power Modes ..... 272
12.7.1 Return from Sleep Mode ..... 272
12.7.2 Return from Software Standby Mode ..... 273
12.7.3 Return from Snooze Mode ..... 273
12.8 Using the WFI Instruction with Non-Maskable Interrupts ..... 273
12.9 Reference ..... 273
**13. Buses ..... 274**

13.1 Overview ... 274
13.2 Description of Buses ... 275
13.2.1 Arbitration ... 275
13.2.2 Parallel Operation ... 275
13.2.3 Restrictions ... 276
13.3 Register Descriptions ... 276
13.3.1 BUSSARA : BUS Security Attribution Register A ... 276
13.3.2 BUSSARB : BUS Security Attribution Register B ... 277
13.3.3 BUSSCNT<slave> : Slave Bus Control Register (<slave> = FHBIU, FLBIU, S0BIU, EQBIU) ... 278
13.3.4 BUSSCNT<slave> : Slave Bus Control Register (<slave> = PSBIU, PLBIU, PHBIU) ... 278
13.3.5 BUSnERRADD : BUS Error Address Register (n = 1 to 3) ... 279
13.3.6 BUSnERRRW : BUS Error Read Write Register (n = 1 to 3) ... 279
13.3.7 BTZFnERRADD : BUS TZF Error Address Register (n = 1 to 3) ... 280
13.3.8 BTZFnERRRW : BUS TZF Error Read Write Register (n = 1 to 3) ... 281
13.3.9 BUSnERRSTAT : BUS Error Status Register n (n = 1 to 3) ... 281
13.3.10 DMACDTCERRSTAT : DMAC/DTC Error Status Register ... 283
13.3.11 BUSnERRCLR : BUS Error Clear Register n (n = 1 to 3) ... 283
13.3.12 DMACDTCERRCLR : DMAC/DTC Error Clear Register ... 284
13.4 Bus Error Monitoring Section ... 284
13.4.1 Bus Error Types ... 284
13.4.2 Operations When a Bus Error Occurs ... 284
13.4.3 Conditions Leading to Illegal Address Access Errors ... 286
13.4.4 Time-out ... 287
13.5 References ... 287
13.6 Cache ... 287
13.6.1 Overview ... 287
13.6.2 Register Description ... 289
13.6.3 Operation ... 294
13.6.4 Usage Notes ... 298
**14. Memory Protection Unit (MPU) ... 300**
14.1 Overview ... 300
14.2 Arm MPU ... 300
14.3 Bus Master MPU ... 300
14.3.1 Register Descriptions ... 301
14.3.2 Operation ... 309
14.4 References ... 312
**15. DMA Controller (DMAC) ... 313**
15.1 Overview ... 313
15.2 Register Descriptions ... 315
15.2.1 DMACSAR : DMAC Controller Security Attribution Register ... 315
15.2.2 DMSAR : DMA Source Address Register ... 315
15.2.3 DMSRR : DMA Source Reload Address Register ... 316
15.2.4 DMDAR : DMA Destination Address Register ... 316
15.2.5 DMDRR : DMA Destination Reload Address Register ... 316
15.2.6 DMCRA : DMA Transfer Count Register ... 317
15.2.7 DMCRB : DMA Block Transfer Count Register ... 318
15.2.8 DMTMD : DMA Transfer Mode Register ... 319
15.2.9 DMINT : DMA Interrupt Setting Register ... 320
15.2.10 DMAMD : DMA Address Mode Register ... 321

15.2.11 DMOFR : DMA Offset Register ..... 324
15.2.12 DMCNT : DMA Transfer Enable Register ..... 324
15.2.13 DMREQ : DMA Software Start Register ..... 325
15.2.14 DMSTS : DMA Status Register ..... 326
15.2.15 DMSBS : DMA Source Buffer Size Register ..... 327
15.2.16 DMDBS : DMA Destination Buffer Size Register ..... 328
15.2.17 DMAST : DMA Module Activation Register ..... 329
15.2.18 DMECHR : DMAC Error Channel Register ..... 330
15.3 Operation ..... 331
15.3.1 Transfer Mode ..... 331
15.3.2 Extended Repeat Area Function ..... 340
15.3.3 Free-running Function ..... 342
15.3.4 Address Update Function using Offset ..... 343
15.3.5 Address Update Function in Repeat-Block Transfer Mode ..... 348
15.3.6 Example of Using Repeat-Block Transfer Mode ..... 350
15.3.7 Activation Sources ..... 353
15.3.8 Operation Timing ..... 353
15.3.9 DMAC Execution Cycles ..... 354
15.3.10 Activating the DMAC ..... 355
15.3.11 Starting DMA Transfer ..... 357
15.3.12 Registers during DMA Transfer ..... 357
15.3.13 Channel Priority ..... 358
15.3.14 Channel Security ..... 358
15.3.15 Master TrustZone Filter in DMAC ..... 359
15.4 Ending DMA Transfer ..... 360
15.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations ..... 360
15.4.2 Transfer End by Repeat Size End Interrupt ..... 360
15.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow ..... 361
15.5 Processing on DMA Transfer Error ..... 361
15.5.1 Processing on NMI handler ..... 361
15.5.2 Processing on Error response detection interrupt request (DMA_TRANSERR) handler ..... 364
15.6 Interrupts ..... 370
15.6.1 Transfer End Interrupt ..... 370
15.6.2 Transfer Error Interrupt ..... 372
15.7 Event Link ..... 373
15.8 Low-Power Consumption Function ..... 373
15.9 Usage Notes ..... 373
15.9.1 Access to the Registers during DMA Transfer ..... 373
15.9.2 DMA Transfer to Reserved Areas ..... 374
15.9.3 Setting of DMAC Event Link Setting Register of the Interrupt Controller Unit (ICU.DELSRn n = 0 to 7) ..... 374
15.9.4 Suspending or Restarting DMAC Activation ..... 374
15.9.5 Precautions for Resuming DMA Transfer ..... 374
**16. Data Transfer Controller (DTC) ..... 376**
16.1 Overview ..... 376
16.2 Register Descriptions ..... 377
16.2.1 DTCSAR : DTC Controller Security Attribution Register ..... 378
16.2.2 MRA : DTC Mode Register A ..... 378
16.2.3 MRB : DTC Mode Register B ..... 379
16.2.4 SAR : DTC Transfer Source Register ..... 380

16.2.5 DAR : DTC Transfer Destination Register ..... 380
16.2.6 CRA : DTC Transfer Count Register A ..... 381
16.2.7 CRB : DTC Transfer Count Register B ..... 381
16.2.8 DTCCR : DTC Control Register ..... 382
16.2.9 DTCCR_SEC : DTC Control Register for Secure Region ..... 382
16.2.10 DTCVBR : DTC Vector Base Register ..... 383
16.2.11 DTCVBR_SEC : DTC Vector Base Register for Secure Region ..... 383
16.2.12 DTCST : DTC Module Start Register ..... 383
16.2.13 DTCSTS : DTC Status Register ..... 384
16.2.14 DTEVR : DTC Error Vector Register ..... 385
16.3 Activation Sources ..... 386
16.3.1 Allocating Transfer Information and DTC Vector Table ..... 386
16.4 Operation ..... 388
16.4.1 Transfer Information Read Skip Function ..... 390
16.4.2 Transfer Information Write-Back Skip Function ..... 390
16.4.3 Normal Transfer Mode ..... 391
16.4.4 Repeat Transfer Mode ..... 392
16.4.5 Block Transfer Mode ..... 393
16.4.6 Chain Transfer ..... 394
16.4.7 Operation Timing ..... 395
16.4.8 Execution Cycles of DTC ..... 397
16.4.9 DTC Bus Mastership Release Timing ..... 398
16.4.10 Vector Security ..... 398
16.4.11 Master TrustZone Filter in DTC ..... 398
16.5 DTC Setting Procedure ..... 398
16.6 Examples of DTC Usage ..... 399
16.6.1 Normal Transfer ..... 399
16.6.2 Chain Transfer ..... 400
16.6.3 Chain Transfer when Counter = 0 ..... 401
16.7 Processing on DTC Transfer Error ..... 403
16.7.1 Processing on NMI handler ..... 404
16.7.2 Processing on Error response detection interrupt request (DMA_TRANSERR) handler ..... 407
16.8 Interrupt ..... 413
16.8.1 Interrupt Request of Transfer End ..... 413
16.8.2 Interrupt Request of Transfer Error ..... 413
16.9 Event Link ..... 414
16.10 Low Power Consumption Function ..... 414
16.11 Usage Notes ..... 415
16.11.1 Transfer Information Start Address ..... 415
**17. Event Link Controller (ELC) ..... 416**
17.1 Overview ..... 416
17.2 Register Descriptions ..... 417
17.2.1 ELCR : Event Link Controller Register ..... 417
17.2.2 ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1) ..... 418
17.2.3 ELSRn : Event Link Setting Register n (n = 0 to 9, 12, 14 to 18) ..... 419
17.2.4 ELCSARA : Event Link Controller Security Attribution Register A ..... 424
17.2.5 ELCSARB : Event Link Controller Security Attribution Register B ..... 424
17.2.6 ELCSARC : Event Link Controller Security Attribution Register C ..... 425
17.3 Operation ..... 425
17.3.1 Relation between Interrupt Handling and Event Linking ..... 425

17.3.2 Linking Events ..... 425
17.3.3 Example of Procedure for Linking Events ..... 426
17.4 Usage Notes ..... 426
17.4.1 Linking DMAC/DTC Transfer End Signals as Events ..... 426
17.4.2 Setting Clocks ..... 426
17.4.3 Module-Stop Function Setting ..... 426
17.4.4 ELC Delay Time ..... 426
**18. I/O Ports ..... 428**
18.1 Overview ..... 428
18.2 Register Descriptions ..... 430
18.2.1 PCNTR1/PODR/PDR : Port Control Register 1 ..... 430
18.2.2 PCNTR2/EIDR/PIDR : Port Control Register 2 ..... 431
18.2.3 PCNTR3/PORR/POSR : Port Control Register 3 ..... 432
18.2.4 PCNTR4/EORR/EOSR : Port Control Register 4 ..... 433
18.2.5 PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 8, n = 00 to 15) ..... 434
18.2.6 PWPR : Write-Protect Register ..... 436
18.2.7 PWPRS : Write-Protect Register for Secure ..... 436
18.2.8 PRWCNTR : Set Wait Control Register ..... 437
18.2.9 PmSAR : Port Security Attribution Register (m = 0 to 8) ..... 437
18.2.10 PSAR : PORT Security Attribution Register ..... 438
18.3 Operation ..... 438
18.3.1 General I/O Ports ..... 438
18.3.2 Port Function Select ..... 438
18.3.3 Port Group Function for ELC ..... 439
18.3.4 Wait Function for Port Read ..... 440
18.4 Handling of Unused Pins ..... 441
18.5 Usage Notes ..... 441
18.5.1 Procedure for Specifying the Pin Functions ..... 441
18.5.2 Procedure for Using Port Group Input ..... 442
18.5.3 Port Output Data Register (PODR) Summary ..... 442
18.5.4 Notes on Using Analog Functions ..... 442
18.6 Peripheral Select Settings for Each Product ..... 442
**19. Port Output Enable for GPT (POEG) ..... 449**
19.1 Overview ..... 449
19.2 Register Descriptions ..... 451
19.2.1 POEGGn : POEG Group n Setting Register (n = A to D) ..... 451
19.3 Output-Disable Control Operation ..... 452
19.3.1 Pin Input Level Detection Operation ..... 452
19.3.2 Output-Disable Requests from the GPT ..... 453
19.3.3 Output-Disable Control Using Detection of Stopped Oscillation ..... 453
19.3.4 Output-Disable Control Using Registers ..... 453
19.3.5 Release from Output-Disable ..... 453
19.4 Interrupt Sources ..... 454
19.5 External Trigger Output to the GPT ..... 454
19.6 Usage Notes ..... 455
19.6.1 Transition to Software Standby Mode ..... 455
19.6.2 Specifying Pins Associated with the GPT ..... 455
**20. General PWM Timer (GPT) ..... 456**
20.1 Overview ..... 456

20.2 Register Descriptions ..... 459
20.2.1 GTWP : General PWM Timer Write-Protection Register ..... 459
20.2.2 GTSTR : General PWM Timer Software Start Register ..... 461
20.2.3 GTSTP : General PWM Timer Software Stop Register ..... 462
20.2.4 GTCLR : General PWM Timer Software Clear Register ..... 463
20.2.5 GTSSR : General PWM Timer Start Source Select Register ..... 463
20.2.6 GTPSR : General PWM Timer Stop Source Select Register ..... 467
20.2.7 GTCSR : General PWM Timer Clear Source Select Register ..... 470
20.2.8 GTUPSR : General PWM Timer Up Count Source Select Register ..... 473
20.2.9 GTDNSR : General PWM Timer Down Count Source Select Register ..... 476
20.2.10 GTICASR : General PWM Timer Input Capture Source Select Register A ..... 480
20.2.11 GTICBSR : General PWM Timer Input Capture Source Select Register B ..... 483
20.2.12 GTCR : General PWM Timer Control Register ..... 486
20.2.13 GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register ..... 488
20.2.14 GTIOR : General PWM Timer I/O Control Register ..... 490
20.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register ..... 494
20.2.16 GTST : General PWM Timer Status Register ..... 495
20.2.17 GTBER : General PWM Timer Buffer Enable Register ..... 499
20.2.18 GTCNT : General PWM Timer Counter ..... 500
20.2.19 GTCCRk : General PWM Timer Compare Capture Register k (k = A to F) ..... 501
20.2.20 GTPR : General PWM Timer Cycle Setting Register ..... 501
20.2.21 GTPBR : General PWM Timer Cycle Setting Buffer Register ..... 501
20.2.22 GTDTCR : General PWM Timer Dead Time Control Register ..... 502
20.2.23 GTDVU : General PWM Timer Dead Time Value Register U ..... 503
20.2.24 GTICLF : General PWM Timer Inter Channel Logical Operation Function Setting Register ..... 503
20.2.25 GTPC : General PWM Timer Period Count Register ..... 505
20.2.26 GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register ..... 506
20.2.27 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register ..... 507
20.2.28 OPSCR : Output Phase Switching Control Register ..... 508
20.3 Operation ..... 511
20.3.1 Basic Operation ..... 511
20.3.2 Buffer Operation ..... 519
20.3.3 PWM Output Operating Mode ..... 526
20.3.4 Automatic Dead Time Setting Function ..... 536
20.3.5 Count Direction Changing Function ..... 540
20.3.6 Function of Output Duty 0% and 100% ..... 541
20.3.7 Hardware Count Start/Count Stop and Clear Operation ..... 542
20.3.8 Synchronized Operation ..... 547
20.3.9 PWM Output Operation Examples ..... 552
20.3.10 Period Count Function ..... 558
20.3.11 Phase Counting Function ..... 559
20.3.12 Output Phase Switching (GPT_OPS) ..... 569
20.3.13 Inter Channel Logical Operation Function ..... 576
20.4 Interrupt Sources ..... 578
20.4.1 Interrupt Sources ..... 578
20.4.2 DMAC and DTC Activation ..... 580
20.5 Operations Linked by ELC ..... 580
20.5.1 Event Signal Output to ELC ..... 580

20.5.2 Event Signal Inputs from ELC ... 580
20.6 Noise Filter Function ... 580
20.7 Protection Function ... 581
20.7.1 Write-Protection for Registers ... 581
20.7.2 Disabling of Buffer Operation ... 581
20.7.3 GTIOCnm Pin Output Negate Control (n = 0 to 5, m = A, B) ... 583
20.8 Initialization Method of Output Pins ... 584
20.8.1 Pin Settings after Reset ... 584
20.8.2 Pin Initialization Due to Error during Operation ... 585
20.9 Usage Notes ... 585
20.9.1 Module-Stop Function Setting ... 585
20.9.2 GTCCRn Settings during Compare Match Operation (n = A to F) ... 585
20.9.3 Setting Range for GTCNT Counter ... 586
20.9.4 Starting and Stopping the GTCNT Counter ... 586
20.9.5 Priority Order of Each Event ... 586
**21. Low Power Asynchronous General Purpose Timer (AGTW) ... 588**
21.1 Overview ... 588
21.2 Register Descriptions ... 589
21.2.1 AGT : AGT Counter Register ... 589
21.2.2 AGTCMA : AGT Compare Match A Register ... 590
21.2.3 AGTCMB : AGT Compare Match B Register ... 590
21.2.4 AGTCR : AGT Control Register ... 591
21.2.5 AGTMR1 : AGT Mode Register 1 ... 592
21.2.6 AGTMR2 : AGT Mode Register 2 ... 593
21.2.7 AGTIOC : AGT I/O Control Register ... 594
21.2.8 AGTISR : AGT Event Pin Select Register ... 596
21.2.9 AGTCMSR : AGT Compare Match Function Select Register ... 596
21.2.10 AGTIOSEL : AGT Pin Select Register ... 597
21.3 Operation ... 597
21.3.1 Reload Register and Counter Rewrite Operation ... 597
21.3.2 Reload Register and AGT Compare Match A/B Register Rewrite Operation ... 599
21.3.3 Timer Mode ... 600
21.3.4 Pulse Output Mode ... 601
21.3.5 Event Counter Mode ... 602
21.3.6 Pulse Width Measurement Mode ... 603
21.3.7 Pulse Period Measurement Mode ... 604
21.3.8 Compare Match function ... 605
21.3.9 Output Settings for Each Mode ... 606
21.3.10 Standby Mode ... 608
21.3.11 Interrupt Sources ... 608
21.3.12 Event Signal Output to ELC ... 609
21.4 Usage Notes ... 609
21.4.1 Count Operation Start and Stop Control ... 609
21.4.2 Access to Counter Register ... 609
21.4.3 When Changing Mode ... 609
21.4.4 Output pin setting ... 610
21.4.5 Digital Filter ... 610
21.4.6 How to Calculate Event Number, Pulse Width, and Pulse Period ... 610
21.4.7 When Count is Forcibly Stopped by TSTOP Bit ... 610
21.4.8 When Selecting AGT0 Underflow as the Count Source ... 610

21.4.9 Module-stop function ..... 610
21.4.10 When Switching Source Clock ..... 611
**22. Realtime Clock (RTC) ..... 612**
22.1 Overview ..... 612
22.2 Register Descriptions ..... 613
22.2.1 R64CNT : 64-Hz Counter ..... 614
22.2.2 RSECCNT : Second Counter (in Calendar Count Mode) ..... 614
22.2.3 RMINCNT : Minute Counter (in Calendar Count Mode) ..... 615
22.2.4 RHRCNT : Hour Counter (in Calendar Count Mode) ..... 615
22.2.5 RWKCNT : Day-of-Week Counter (in Calendar Count Mode) ..... 616
22.2.6 BCNTn : Binary Counter n (n = 0 to 3) (in Binary Count Mode) ..... 616
22.2.7 RDAYCNT : Day Counter ..... 616
22.2.8 RMONCNT : Month Counter ..... 617
22.2.9 RYRCNT : Year Counter ..... 617
22.2.10 RSECAR : Second Alarm Register (in Calendar Count Mode) ..... 618
22.2.11 RMINAR : Minute Alarm Register (in Calendar Count Mode) ..... 619
22.2.12 RHRAR : Hour Alarm Register (in Calendar Count Mode) ..... 619
22.2.13 RWKAR : Day-of-Week Alarm Register (in Calendar Count Mode) ..... 620
22.2.14 BCNTnAR : Binary Counter n Alarm Register (n = 0 to 3) (in Binary Count Mode) ..... 621
22.2.15 RDAYAR : Date Alarm Register (in Calendar Count Mode) ..... 621
22.2.16 RMONAR : Month Alarm Register (in Calendar Count Mode) ..... 622
22.2.17 RYRAR : Year Alarm Register (in Calendar Count Mode) ..... 622
22.2.18 RYRAREN : Year Alarm Enable Register (in Calendar Count Mode) ..... 623
22.2.19 BCNTnAER : Binary Counter n Alarm Enable Register (n = 0, 1) (in Binary Count Mode) ..... 623
22.2.20 BCNT2AER : Binary Counter 2 Alarm Enable Register (in Binary Count Mode) ..... 624
22.2.21 BCNT3AER : Binary Counter 3 Alarm Enable Register (in Binary Count Mode) ..... 624
22.2.22 RCR1 : RTC Control Register 1 ..... 625
22.2.23 RCR2 : RTC Control Register 2 (in Calendar Count Mode) ..... 626
22.2.24 RCR2 : RTC Control Register 2 (in Binary Count Mode) ..... 628
22.2.25 RCR4 : RTC Control Register 4 ..... 629
22.2.26 RFRL : Frequency Register L ..... 630
22.2.27 RFRH : Frequency Register H ..... 630
22.2.28 RADJ : Time Error Adjustment Register ..... 631
22.2.29 RTCCRn : Time Capture Control Register n (n = 0 to 2) ..... 631
22.2.30 RSECCPn : Second Capture Register n (n = 0 to 2) (in Calendar Count Mode) ..... 633
22.2.31 RMINCPn : Minute Capture Register n (n = 0 to 2) (in Calendar Count Mode) ..... 633
22.2.32 RHRCPn : Hour Capture Register n (n = 0 to 2) (in Calendar Count Mode) ..... 633
22.2.33 RDAYCPn : Date Capture Register n (n = 0 to 2) (in Calendar Count Mode) ..... 634
22.2.34 RMONCPn : Month Capture Register n (n = 0 to 2) (in Calendar Count Mode) ..... 634
22.2.35 BCNTnCPm : BCNTn Capture Register m (n= 0 to 3, m = 0 to 2) (in Binary Count Mode) 635
22.3 Operation ..... 635
22.3.1 Outline of Initial Settings of Registers after Power On ..... 635
22.3.2 Operation mode, Clock and Count Mode Setting Procedure ..... 635
22.3.3 Setting the Time ..... 636
22.3.4 30-Second Adjustment ..... 637
22.3.5 Reading 64-Hz Counter and Time ..... 638
22.3.6 Alarm Function ..... 640
22.3.7 Procedure for Disabling Alarm Interrupt ..... 641
22.3.8 Time Error Adjustment Function ..... 641
22.3.9 Capturing the time ..... 644

22.4 Interrupt Sources ..... 644
22.5 Event Link Output ..... 646
22.5.1 Interrupt Handling and Event Linking ..... 646
22.6 Usage Notes ..... 646
22.6.1 Register Writing during Counting ..... 646
22.6.2 Use of Periodic Interrupts ..... 647
22.6.3 RTCOUT (1-Hz/64-Hz) Clock Output ..... 647
22.6.4 Transitions to Low Power Modes after Setting Registers ..... 648
22.6.5 Notes on Writing to and Reading from Registers ..... 648
22.6.6 Changing the Count Mode ..... 648
22.6.7 Time Capture Operation While Count Operation is Stopped ..... 648
22.6.8 Initialization Procedure When the RTC Is Not to Be Used ..... 648
**23. Watchdog Timer (WDT) ..... 650**
23.1 Overview ..... 650
23.2 Register Descriptions ..... 651
23.2.1 WDTRR : WDT Refresh Register ..... 651
23.2.2 WDTCR : WDT Control Register ..... 652
23.2.3 WDTSR : WDT Status Register ..... 654
23.2.4 WDTRCR : WDT Reset Control Register ..... 655
23.2.5 WDTCSTPR : WDT Count Stop Control Register ..... 656
23.2.6 Option Function Select Register 0 (OFS0) ..... 656
23.3 Operation ..... 656
23.3.1 Count Operation in each Start Mode ..... 656
23.3.2 Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers ..... 660
23.3.3 Refresh Operation ..... 660
23.3.4 Status Flags ..... 661
23.3.5 Reset Output ..... 661
23.3.6 Interrupt Sources ..... 661
23.3.7 Reading the Down-Counter Value ..... 662
23.3.8 Association between Option Function Select Register 0 (OFS0) and WDT Registers ..... 662
23.4 Output to the Event Link Controller (ELC) ..... 663
23.5 Usage Notes ..... 663
23.5.1 ICU Event Link Setting Register n (IELSRn) Setting ..... 663
**24. Independent Watchdog Timer (IWDT) ..... 664**
24.1 Overview ..... 664
24.2 Register Descriptions ..... 665
24.2.1 IWDTRR : IWDT Refresh Register ..... 665
24.2.2 IWDTSR : IWDT Status Register ..... 666
24.2.3 OFS0 : Option Function Select Register 0 ..... 667
24.3 Operation ..... 669
24.3.1 Auto Start Mode ..... 669
24.3.2 Refresh Operation ..... 670
24.3.3 Status Flags ..... 671
24.3.4 Reset Output ..... 672
24.3.5 Interrupt Sources ..... 672
24.3.6 Reading the Down-Counter Value ..... 672
24.4 Output to the Event Link Controller (ELC) ..... 672
24.5 Usage Notes ..... 673
24.5.1 Refresh Operations ..... 673
24.5.2 Clock Division Ratio Setting ..... 673

24.5.3 Constraints on the ICU Event Link Setting Register n (IELSRn) Setting ..... 673
**25. USB 2.0 Full-Speed Module (USBFS) ..... 674**
25.1 Overview ..... 674
25.2 Register Descriptions ..... 675
25.2.1 SYSCFG : System Configuration Control Register ..... 675
25.2.2 SYSSTS0 : System Configuration Status Register 0 ..... 677
25.2.3 DVSTCTR0 : Device State Control Register 0 ..... 678
25.2.4 CFIFO/CFIFOL : CFIFO Port Register ..... 680
25.2.5 DnFIFO/DnFIFOL : DnFIFO Port Register (n = 0, 1) ..... 682
25.2.6 CFIFOSEL : CFIFO Port Select Register ..... 683
25.2.7 DnFIFOSEL : DnFIFO Port Select Register (n = 0, 1) ..... 684
25.2.8 CFIFOCTR : CFIFO Port Control Register ..... 686
25.2.9 DnFIFOCTR : DnFIFO Port Control Register (n = 0, 1) ..... 688
25.2.10 INTENB0 : Interrupt Enable Register 0 ..... 689
25.2.11 INTENB1 : Interrupt Enable Register 1 ..... 690
25.2.12 BRDYENB : BRDY Interrupt Enable Register ..... 691
25.2.13 NRDYENB : NRDY Interrupt Enable Register ..... 692
25.2.14 BEMPENB : BEMP Interrupt Enable Register ..... 693
25.2.15 SOFCFG : SOF Output Configuration Register ..... 694
25.2.16 INTSTS0 : Interrupt Status Register 0 ..... 695
25.2.17 INTSTS1 : Interrupt Status Register 1 ..... 697
25.2.18 BRDYSTS : BRDY Interrupt Status Register ..... 700
25.2.19 NRDYSTS : NRDY Interrupt Status Register ..... 701
25.2.20 BEMPSTS : BEMP Interrupt Status Register ..... 702
25.2.21 FRMNUM : Frame Number Register ..... 703
25.2.22 USBREQ : USB Request Type Register ..... 704
25.2.23 USBVAL : USB Request Value Register ..... 704
25.2.24 USBINDX : USB Request Index Register ..... 705
25.2.25 USBLENG : USB Request Length Register ..... 706
25.2.26 DCPCFG : DCP Configuration Register ..... 706
25.2.27 DCPMAXP : DCP Maximum Packet Size Register ..... 707
25.2.28 DCPCTR : DCP Control Register ..... 708
25.2.29 PIPESEL : Pipe Window Select Register ..... 711
25.2.30 PIPECFG : Pipe Configuration Register ..... 711
25.2.31 PIPEMAXP : Pipe Maximum Packet Size Register ..... 713
25.2.32 PIPEPERI : Pipe Cycle Control Register ..... 714
25.2.33 PIPEnCTR : PIPEn Control Registers (n = 1 to 5) ..... 715
25.2.34 PIPEnCTR : PIPEn Control Registers (n = 6 to 9) ..... 719
25.2.35 PIPEnTRE : PIPEn Transaction Counter Enable Register (n = 1 to 5) ..... 721
25.2.36 PIPEnTRN : PIPEn Transaction Counter Register (n = 1 to 5) ..... 722
25.2.37 UCKSEL : USB Clock Selection Register ..... 723
25.2.38 DEVADDn : Device Address n Configuration Register (n = 0 to 5) ..... 723
25.3 Operation ..... 724
25.3.1 System Control ..... 724
25.3.2 Interrupts ..... 729
25.3.3 Interrupt Descriptions ..... 732
25.3.4 Pipe Control ..... 741
25.3.5 FIFO Buffer ..... 745
25.3.6 FIFO Buffer Clearing ..... 745
25.3.7 FIFO Port Functions ..... 746

25.3.8 DMA Transfers (D0FIFO and D1FIFO Ports) ... 747
25.3.9 Control Transfers Using the DCP ... 747
25.3.10 Bulk Transfers (Pipes 1 to 5) ... 749
25.3.11 Interrupt Transfers (Pipes 6 to 9) ... 749
25.3.12 Isochronous Transfers (Pipes 1 and 2) ... 750
25.3.13 SOF Interpolation Function ... 757
25.3.14 Pipe Schedule ... 757
25.4 Usage Notes ... 758
25.4.1 Settings for the Module-Stop State ... 758
25.4.2 Clearing the Interrupt Status Register on Canceling Software Standby Mode ... 759
25.4.3 Clearing the Interrupt Status Register after Setting Up the Port Function ... 759
25.4.4 Restrictions of P814 and P815 ... 759
**26. Serial Communications Interface (SCI) ... 760**
26.1 Overview ... 760
26.2 Register Descriptions ... 766
26.2.1 RSR : Receive Shift Register ... 766
26.2.2 RDR : Receive Data Register ... 766
26.2.3 RDRHL : Receive Data Register for Non-Manchester Mode (MMR.MANEN = 0) ... 766
26.2.4 RDRHL_MAN : Receive Data Register for Manchester Mode (MMR.MANEN = 1) ... 767
26.2.5 FRDRHL/FRDRH/FRDRL : Receive FIFO Data Register ... 768
26.2.6 TDR : Transmit Data Register ... 769
26.2.7 TDRHL : Transmit Data Register for Non-Manchester Mode (MMR.MANEN = 0) ... 769
26.2.8 TDRHL_MAN : Transmit Data Register for Manchester Mode (MMR.MANEN = 1) ... 770
26.2.9 FTDRHL/FTDRH/FTDRL : Transmit FIFO Data Register ... 771
26.2.10 TSR : Transmit Shift Register ... 771
26.2.11 SMR : Serial Mode Register for Non-Smart Card Interface Mode (SCMR.SMIF = 0) ... 772
26.2.12 SMR_SMCI : Serial Mode Register for Smart Card Interface Mode (SCMR.SMIF = 1) ... 773
26.2.13 SCR : Serial Control Register for Non-Smart Card Interface Mode (SCMR.SMIF = 0) ... 775
26.2.14 SCR_SMCI : Serial Control Register for Smart Card Interface Mode (SCMR.SMIF = 1) ... 777
26.2.15 SSR : Serial Status Register for Non-Smart Card Interface and Non-FIFO Mode (SCMR.SMIF = 0, FCR.FM = 0, and MMR.MANEN = 0) ... 778
26.2.16 SSR_FIFO : Serial Status Register for Non-Smart Card Interface and FIFO Mode (SCMR.SMIF = 0, FCR.FM = 1, and MMR.MANEN = 0) ... 780
26.2.17 SSR_SMCI : Serial Status Register for Smart Card Interface Mode (SCMR.SMIF = 1, and MMR.MANEN = 0) ... 783
26.2.18 SSR_MANC : Serial Status Register for Manchester Mode (SCMR.SMIF = 0, and MMR.MANEN = 1) ... 785
26.2.19 SCMR : Smart Card Mode Register ... 788
26.2.20 BRR : Bit Rate Register ... 789
26.2.21 MDDR : Modulation Duty Register ... 798
26.2.22 SEMR : Simple LIN Mode Register ... 801
26.2.23 SNFR : Noise Filter Setting Register ... 804
26.2.24 SIMR1 : IIC Mode Register 1 ... 805
26.2.25 SIMR2 : IIC Mode Register 2 ... 805
26.2.26 SIMR3 : IIC Mode Register 3 ... 806
26.2.27 SISR : IIC Status Register ... 808
26.2.28 SPMR : SPI Mode Register ... 809
26.2.29 FCR : FIFO Control Register ... 810
26.2.30 FDR : FIFO Data Count Register ... 811
26.2.31 LSR : Line Status Register ... 812
26.2.32 CDR : Compare Match Data Register ... 813

26.2.33 DCCR : Data Compare Match Control Register ..... 813
26.2.34 SPTR : Serial Port Register ..... 815
26.2.35 ACTR : Adjustment Communication Timing Register ..... 817
26.2.36 MMR : Manchester Mode Register ..... 818
26.2.37 TMPR : Transmit Manchester Preface Setting Register ..... 819
26.2.38 RMPR : Receive Manchester Preface Setting Register ..... 820
26.2.39 MESR : Manchester Extended Error Status Register ..... 821
26.2.40 MECR : Manchester Extended Error Control Register ..... 822
26.2.41 ESMER : Simple LIN Mode Enable Register ..... 823
26.2.42 CR0 : Control Register 0 ..... 824
26.2.43 CR1 : Control Register 1 ..... 824
26.2.44 CR2 : Control Register 2 ..... 825
26.2.45 CR3 : Control Register 3 ..... 826
26.2.46 PCR : Port Control Register ..... 826
26.2.47 ICR : Interrupt Control Register ..... 826
26.2.48 STR : Status Register ..... 827
26.2.49 STCR : Status Clear Register ..... 828
26.2.50 CF0DR : Control Field 0 Data Register ..... 828
26.2.51 CF0CR : Control Field 0 Compare Enable Register ..... 829
26.2.52 CF0RR : Control Field 0 Receive Data Register ..... 829
26.2.53 PCF1DR : Primary Control Field 1 Data Register ..... 830
26.2.54 SCF1DR : Secondary Control Field 1 Data Register ..... 830
26.2.55 CF1CR : Control Field 1 Compare Enable Register ..... 830
26.2.56 CF1RR : Control Field 1 Receive Data Register ..... 831
26.2.57 TCR : Timer Control Register ..... 831
26.2.58 TMR : Timer Mode Register ..... 831
26.2.59 TPRE : Timer Prescaler Register ..... 832
26.2.60 TCNT : Timer Count Register ..... 832
26.3 Operation in Asynchronous Mode ..... 832
26.3.1 Serial Data Transfer Format ..... 833
26.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode ..... 834
26.3.3 Clock ..... 835
26.3.4 Double-Speed Operation and Frequency of 6 Times the Bit Rate ..... 836
26.3.5 CTS and RTS Functions ..... 836
26.3.6 Address Match (Receive Data Match Detection) Function ..... 836
26.3.7 SCI Initialization in Asynchronous Mode ..... 839
26.3.8 Serial Data Transmission in Asynchronous Mode ..... 841
26.3.9 Serial Data Reception in Asynchronous Mode ..... 846
26.3.10 The function of adjust receive sampling timing (Asynchronous Mode) ..... 859
26.3.11 The function of adjust transmit timing (Asynchronous Mode) ..... 863
26.4 Multi-Processor Communication Function ..... 868
26.4.1 Multi-Processor Serial Data Transmission ..... 869
26.4.2 Multi-Processor Serial Data Reception ..... 872
26.5 Operation in Manchester mode ..... 877
26.5.1 Frame Format ..... 878
26.5.2 Clock ..... 882
26.5.3 Initialization of the SCI in Manchester Mode ..... 882
26.5.4 Double-speed operation ..... 883
26.5.5 CTS and RTS functions ..... 883
26.5.6 Serial data transmission in Manchester mode ..... 884

26.5.7 Serial Data Reception in Manchester Mode ... 887
26.5.8 Operation When Multi-Processor Bit Is Used ... 891
26.5.9 Receive Retiming ... 891
26.5.10 Polarity Setting for Manchester Code ... 892
26.5.11 Errors in Manchester Mode ... 893
26.6 Operation in Clock Synchronous Mode ... 898
26.6.1 Clock ... 898
26.6.2 CTS and RTS Functions ... 898
26.6.3 SCI Initialization in Clock Synchronous Mode ... 899
26.6.4 Serial Data Transmission in Clock Synchronous Mode ... 900
26.6.5 Serial Data Reception in Clock Synchronous Mode ... 904
26.6.6 Simultaneous Serial Data Transmission and Reception in Clock Synchronous Mode ... 909
26.7 Operation in Smart Card Interface Mode ... 912
26.7.1 Example Connection ... 912
26.7.2 Data Format (Except in Block Transfer Mode) ... 912
26.7.3 Block Transfer Mode ... 914
26.7.4 Receive Data Sampling Timing and Reception Margin ... 914
26.7.5 SCI Initialization (Smart Card Interface Mode) ... 915
26.7.6 Serial Data Transmission (Except in Block Transfer Mode) ... 916
26.7.7 Serial Data Reception (Except in Block Transfer Mode) ... 918
26.7.8 Clock Output Control ... 920
26.8 Operation in Simple IIC Mode ... 921
26.8.1 Generation of Start, Restart, and Stop Conditions ... 922
26.8.2 Clock Synchronization ... 923
26.8.3 SDAn Output Delay ... 924
26.8.4 SCI Initialization in Simple IIC Mode ... 924
26.8.5 Operation in Master Transmission in Simple IIC Mode ... 925
26.8.6 Master Reception in Simple IIC Mode ... 928
26.9 Operation in Simple SPI Mode ... 929
26.9.1 States of Pins in Master and Slave Modes ... 930
26.9.2 SS Function in Master Mode ... 931
26.9.3 SS Function in Slave Mode ... 931
26.9.4 Relationship between Clock and Transmit/Receive Data ... 931
26.9.5 SCI Initialization in Simple SPI Mode ... 932
26.9.6 Transmission and Reception of Serial Data in Simple SPI Mode ... 932
26.10 Bit Rate Modulation Function ... 932
26.11 Operation in Simple LIN Mode ... 933
26.11.1 Serial Transfer Protocol ... 933
26.11.2 Transmitting a Start Frame ... 934
26.11.3 Receiving a Start Frame ... 937
26.11.4 Detection of Bus Collisions ... 943
26.11.5 Digital Filter for Input on the RXDXn (n = 1) Pin ... 944
26.11.6 Bit Rate Measurement ... 945
26.11.7 Selectable Timing for Sampling Data Received through RXDXn (n = 1) ... 946
26.11.8 Timer ... 946
26.12 Interrupt Sources ... 948
26.12.1 Buffer Operation for SCIn_TXI and SCIn_RXI Interrupts (Non-FIFO Selected) ... 948
26.12.2 Buffer Operation for SCIn_TXI and SCIn_RXI Interrupts (FIFO Selected) ... 949
26.12.3 Interrupts in Asynchronous, Manchester, Clock Synchronous, and Simple SPI Modes ... 949
26.12.4 Interrupts in Smart Card Interface Mode ... 950

26.12.5 Interrupts in Simple IIC Mode ... 951
26.12.6 Interrupt Requests from the Simple LIN Mode Control Section ... 952
26.13 Event Linking ... 952
26.14 Address Non-match Event Output (SCI0_DCUF) ... 953
26.15 Noise Cancellation Function ... 953
26.16 Usage Notes ... 954
26.16.1 Settings for the Module-Stop Function ... 954
26.16.2 SCI Operation during Low Power State ... 954
26.16.3 Break Detection and Processing ... 959
26.16.4 Mark State and Production of Breaks ... 960
26.16.5 Receive Error Flags and Transmit Operation in Clock Synchronous Mode and Simple SPI Mode ... 960
26.16.6 Restrictions on Clock Synchronous Transmission in Clock Synchronous Mode and Simple SPI Mode ... 960
26.16.7 Restrictions on Using DTC or DMAC ... 961
26.16.8 Notes on Starting Transfer ... 962
26.16.9 External Clock Input in Clock Synchronous Mode and Simple SPI Mode ... 962
26.16.10 Limitations on Simple SPI Mode ... 962
26.16.11 Notes on Transmit Enable Bit (SCR.TE) ... 963
26.16.12 Limitation 1 on Usage of the Simple LIN Mode Control Section ... 963
26.16.13 Limitation 2 on Usage of the Simple LIN Mode Control Section ... 963
26.16.14 Note on Stopping Reception When Using the RTS Function in Asynchronous Mode ... 964
**27. IrDA Interface (IrDA) ... 965**
27.1 Overview ... 965
27.2 Register Descriptions ... 965
27.2.1 IRCR : IrDA Control Register ... 965
27.3 Operation ... 966
27.3.1 IrDA Interface Setup Procedure ... 966
27.3.2 Transmission ... 966
27.3.3 Reception ... 967
27.4 Usage Notes ... 967
27.4.1 Settings for the Module-Stop Function ... 967
27.4.2 Asynchronous Reference Clock for SCI5 ... 967
**28. $I^2C$ Bus Interface (IIC) ... 968**
28.1 Overview ... 968
28.2 Register Descriptions ... 970
28.2.1 ICCR1 : $I^2C$ Bus Control Register 1 ... 970
28.2.2 ICCR2 : $I^2C$ Bus Control Register 2 ... 972
28.2.3 ICMR1 : $I^2C$ Bus Mode Register 1 ... 975
28.2.4 ICMR2 : $I^2C$ Bus Mode Register 2 ... 976
28.2.5 ICMR3 : $I^2C$ Bus Mode Register 3 ... 977
28.2.6 ICFER : $I^2C$ Bus Function Enable Register ... 979
28.2.7 ICSER : $I^2C$ Bus Status Enable Register ... 980
28.2.8 ICIER : $I^2C$ Bus Interrupt Enable Register ... 982
28.2.9 ICSR1 : $I^2C$ Bus Status Register 1 ... 983
28.2.10 ICSR2 : $I^2C$ Bus Status Register 2 ... 985
28.2.11 ICWUR : $I^2C$ Bus Wakeup Unit Register ... 988
28.2.12 ICWUR2 : $I^2C$ Bus Wakeup Unit Register 2 ... 989
28.2.13 SARLy : Slave Address Register Ly (y = 0 to 2) ... 991

28.2.14 SARUy : Slave Address Register Uy (y = 0 to 2) ..... 991
28.2.15 ICBRL : I2C Bus Bit Rate Low-Level Register ..... 992
28.2.16 ICBRH : I2C Bus Bit Rate High-Level Register ..... 992
28.2.17 ICDRT : I2C Bus Transmit Data Register ..... 994
28.2.18 ICDRR : I2C Bus Receive Data Register ..... 994
28.2.19 ICDRS : I2C Bus Shift Register ..... 994
28.3 Operation ..... 994
28.3.1 Communication Data Format ..... 994
28.3.2 Initial Settings ..... 995
28.3.3 Master Transmit Operation ..... 996
28.3.4 Master Receive Operation ..... 1000
28.3.5 Slave Transmit Operation ..... 1005
28.3.6 Slave Receive Operation ..... 1007
28.4 SCL Synchronization Circuit ..... 1009
28.5 SDA Output Delay Function ..... 1010
28.6 Digital Noise Filter Circuits ..... 1011
28.7 Address Match Detection ..... 1012
28.7.1 Slave-Address Match Detection ..... 1012
28.7.2 Detection of General Call Address ..... 1015
28.7.3 Device-ID Address Detection ..... 1016
28.7.4 Host Address Detection ..... 1017
28.8 Wakeup Function ..... 1018
28.8.1 Normal Wakeup Mode 1 ..... 1019
28.8.2 Normal Wakeup Mode 2 ..... 1022
28.8.3 Command Recovery Mode and EEP Response Mode (Special Wakeup Modes) ..... 1024
28.9 Automatic Low-Hold Function for SCL ..... 1027
28.9.1 Function to Prevent Wrong Transmission of Transmit Data ..... 1027
28.9.2 NACK Reception Transfer Suspension Function ..... 1028
28.9.3 Function to Prevent Failure to Receive Data ..... 1029
28.10 Arbitration-Lost Detection Functions ..... 1030
28.10.1 Master Arbitration-Lost Detection (MALE Bit) ..... 1030
28.10.2 Function to Detect Loss of Arbitration During NACK Transmission (NALE Bit) ..... 1032
28.10.3 Slave Arbitration-Lost Detection (SALE Bit) ..... 1033
28.11 Start, Restart, and Stop Condition Issuing Function ..... 1034
28.11.1 Issuing a Start Condition ..... 1034
28.11.2 Issuing a Restart Condition ..... 1034
28.11.3 Issuing a Stop Condition ..... 1036
28.12 Bus Hanging ..... 1036
28.12.1 Timeout Function ..... 1036
28.12.2 Extra SCL Clock Cycle Output Function ..... 1037
28.12.3 IIC Reset and Internal Reset ..... 1038
28.13 SMBus Operation ..... 1038
28.13.1 SMBus Timeout Measurement ..... 1039
28.13.2 Packet Error Code (PEC) ..... 1040
28.13.3 SMBus Host Notification Protocol (Notify ARP Master Command) ..... 1040
28.14 Interrupt Sources ..... 1040
28.14.1 Buffer Operation for IIC0_TXI and IIC0_RXI Interrupts ..... 1041
28.15 State of Registers When Issuing Each Condition ..... 1041
28.16 Event Link Output ..... 1042
28.16.1 Interrupt Handling and Event Linking ..... 1042

28.17 Usage Notes ..... 1043
28.17.1 Settings for the Module-Stop Function ..... 1043
28.17.2 Notes on Starting Transfer ..... 1043
**29. I3C Bus Interface (I3C) ..... 1044**
29.1 Overview ..... 1044
29.1.1 Functional Overview ..... 1044
29.1.2 Block Diagram ..... 1046
29.2 Registers ..... 1047
29.2.1 PRTS : Protocol Selection Register ..... 1047
29.2.2 BCTL : Bus Control Register ..... 1048
29.2.3 MSDVAD : Master Device Address Register ..... 1049
29.2.4 RSTCTL : Reset Control Register ..... 1050
29.2.5 PRSST : Present State Register ..... 1052
29.2.6 INST : Internal Status Register ..... 1054
29.2.7 INSTE : Internal Status Enable Register ..... 1055
29.2.8 INIE : Internal Interrupt Enable Register ..... 1055
29.2.9 INSTFC : Internal Status Force Register ..... 1056
29.2.10 DVCT : Device Characteristic Table Register ..... 1057
29.2.11 IBINCTL : IBI Notify Control Register ..... 1057
29.2.12 BFCTL : Bus Function Control Register ..... 1058
29.2.13 SVCTL : Slave Control Register ..... 1060
29.2.14 REFCKCTL : Reference Clock Control Register ..... 1062
29.2.15 STDBR : Standard Bit Rate Register ..... 1062
29.2.16 EXTBR : Extended Bit Rate Register ..... 1065
29.2.17 BFRECDT : Bus Free Condition Detection Time Register ..... 1066
29.2.18 BAVLCDT : Bus Available Condition Detection Time Register ..... 1066
29.2.19 BIDLCDT : Bus Idle Condition Detection Time Register ..... 1067
29.2.20 OUTCTL : Output Control Register ..... 1067
29.2.21 INCTL : Input Control Register ..... 1069
29.2.22 TMOCTL : Timeout Control Register ..... 1070
29.2.23 WUCTL : Wake-up Unit Control Register ..... 1071
29.2.24 ACKCTL : Acknowledge Control Register ..... 1072
29.2.25 SCSTRCTL : SCL Stretch Control Register ..... 1073
29.2.26 SCSTLCTL : SCL Stalling Control Register ..... 1074
29.2.27 SVTDLG0 : Slave Transfer Data Length Register 0 ..... 1076
29.2.28 CNDCTL : Condition Control Register ..... 1076
29.2.29 NCMDQP : Normal Command Queue Port Register ..... 1078
29.2.30 NRSPQP : Normal Response Queue Port Register ..... 1078
29.2.31 NTDTBP0/NTDTBP0_BY : Normal Transfer Data Buffer Port Register 0 ..... 1079
29.2.32 NIBIQP : Normal IBI Queue Port Register ..... 1080
29.2.33 NRSQP : Normal Receive Status Queue Port Register ..... 1080
29.2.34 NQTHCTL : Normal Queue Threshold Control Register ..... 1081
29.2.35 NTBTHCTL0 : Normal Transfer Data Buffer Threshold Control Register 0 ..... 1082
29.2.36 NRQTHCTL : Normal Receive Status Queue Threshold Control Register ..... 1084
29.2.37 BST : Bus Status Register ..... 1084
29.2.38 BSTE : Bus Status Enable Register ..... 1088
29.2.39 BIE : Bus Interrupt Enable Register ..... 1089
29.2.40 BSTFC : Bus Status Force Register ..... 1091
29.2.41 NTST : Normal Transfer Status Register ..... 1092
29.2.42 NTSTE : Normal Transfer Status Enable Register ..... 1096

29.2.43 NTIE : Normal Transfer Interrupt Enable Register ..... 1098
29.2.44 NTSTFC : Normal Transfer Status Force Register ..... 1099
29.2.45 BCST : Bus Condition Status Register ..... 1101
29.2.46 SVST : Slave Status Register ..... 1102
29.2.47 WUST : Wake-up Unit Operating Status Register ..... 1105
29.2.48 DATBASm : Device Address Table Basic Register m (m = 0 to 3) ..... 1106
29.2.49 EXDATBAS : Extended Device Address Table Basic Register ..... 1108
29.2.50 SDATBAS0 : Slave Device Address Table Basic Register 0 ..... 1108
29.2.51 MSDCTm : Master Device Characteristic Table Register m (m = 0 to 3) ..... 1110
29.2.52 SVDCT : Slave Device Characteristic Table Register ..... 1111
29.2.53 SDCTPIDL : Slave Device Characteristic Table Provisional ID Low Register ..... 1112
29.2.54 SDCTPIDH : Slave Device Characteristic Table Provisional ID High Register ..... 1113
29.2.55 SVDVAD0 : Slave Device Address Register 0 ..... 1113
29.2.56 CSECMD : CCC Slave Events Command Register ..... 1115
29.2.57 CEACTST : CCC Enter Activity State Register ..... 1117
29.2.58 CMWLG : CCC Max Write Length Register ..... 1117
29.2.59 CMRLG : CCC Max Read Length Register ..... 1118
29.2.60 CETSTMD : CCC Enter Test Mode Register ..... 1119
29.2.61 CGDVST : CCC Get Device Status Register ..... 1120
29.2.62 CMDSPW : CCC Max Data Speed W (Write) Register ..... 1121
29.2.63 CMDSPR : CCC Max Data Speed R (Read) Register ..... 1121
29.2.64 CMDSPT : CCC Max Data Speed T (Turnaround) Register ..... 1122
29.2.65 CETSM : CCC Exchange Timing Support Information M (Mode) Register ..... 1123
29.2.66 CGHDRCAP : CCC Get HDR Capability Register ..... 1123
29.2.67 BITCNT : Bit Count Register ..... 1124
29.2.68 NQSTLV : Normal Queue Status Level Register ..... 1125
29.2.69 NDBSTLV0 : Normal Data Buffer Status Level Register 0 ..... 1126
29.2.70 NRSQSTLV : Normal Receive Status Queue Status Level Register ..... 1126
29.2.71 PRSTDBG : Present State Debug Register ..... 1127
29.2.72 MSERRCNT : Master Error Counters Register ..... 1127
29.3 Operation ..... 1128
29.3.1 Data Structures ..... 1128
29.3.2 Details of Function ..... 1145
29.3.3 Operation ..... 1237
29.4 Interrupt Sources ..... 1256
29.4.1 Overview ..... 1256
29.4.2 Buffer Operation for Buffer Full/Empty Interrupts ..... 1257
29.5 Event Link Output ..... 1258
29.5.1 Interrupt Handling and Event Linking ..... 1258
29.6 Reset Descriptions ..... 1258
29.7 Usage Notes ..... 1266
29.7.1 Settings for the Operating Clock ..... 1266
29.7.2 Settings for the SCL frequency Clock ..... 1266
29.7.3 Module-stop function ..... 1266
**30. Serial Interface UARTA (UARTA) ..... 1267**
30.1 Overview ..... 1267
30.2 Register Descriptions ..... 1269
30.2.1 TXBAn : Transmit Buffer Register n (n = 0, 1) ..... 1269
30.2.2 RXBAn : Receive Buffer Register n (n = 0, 1) ..... 1269
30.2.3 ASIMAn0 : Operation Mode Setting Register n0 (n = 0, 1) ..... 1270

30.2.4 ASIMAn1 : Operation Mode Setting Register n1 (n = 0, 1) ..... 1271
30.2.5 BRGCAn : Baud Rate Generator Control Register n (n = 0, 1) ..... 1272
30.2.6 ASISAn : Status Register n (n = 0, 1) ..... 1272
30.2.7 ASCTAn : Status Clear Trigger Register n (n = 0, 1) ..... 1274
30.2.8 UTA0CK : UARTA Clock Select Register 0 ..... 1274
30.2.9 UTA1CK : UARTA Clock Select Register 1 ..... 1275
30.3 Operation ..... 1276
30.3.1 Operation Stop Mode ..... 1276
30.3.2 UART Mode ..... 1276
30.3.3 Receive Data Noise Filter ..... 1285
30.3.4 Baud Rate Generator ..... 1285
30.4 Usage Notes ..... 1290
30.4.1 Port Setting for RxDAn Pin ..... 1290
30.4.2 Point for Caution when Selecting the UARTAn Operation Clock ($f_{UTAn}$) ..... 1290
**31. CAN with Flexible Data-rate (CANFD) ..... 1291**
31.1 Overview ..... 1291
31.1.1 CANFD Module ..... 1291
31.1.2 Clock restriction ..... 1293
31.2 Register Descriptions ..... 1293
31.2.1 Register Table ..... 1293
31.2.2 CFDC0NCFG : Nominal Baud Rate Configuration Register ..... 1294
31.2.3 CFDC0CTR : Control Register ..... 1295
31.2.4 CFDC0STS : Status Register ..... 1299
31.2.5 CFDC0ERFL : Error Flag Register ..... 1302
31.2.6 CFDC0DCFG : Data Baud Rate Configuration Register ..... 1307
31.2.7 CFDC0FDCFG : CANFD Configuration Register ..... 1309
31.2.8 CFDC0FDCTR : CANFD Control Register ..... 1311
31.2.9 CFDC0FDSTS : CANFD Status Register ..... 1312
31.2.10 CFDC0FDCRC : CANFD CRC Register ..... 1314
31.2.11 CFDGCFG : Global Configuration Register ..... 1315
31.2.12 CFDGCTR : Global Control Register ..... 1317
31.2.13 CFDGSTS : Global Status Register ..... 1318
31.2.14 CFDGERFL : Global Error Flag Register ..... 1319
31.2.15 CFDGTINTSTS : Global TX Interrupt Status Register ..... 1321
31.2.16 CFDGTSC : Global Timestamp Counter Register ..... 1322
31.2.17 CFDGAFLECTR : Global Acceptance Filter List Entry Control Register ..... 1323
31.2.18 CFDGAFLCFG : Global Acceptance Filter List Configuration Register ..... 1323
31.2.19 CFDGAFLIDr : Global Acceptance Filter List ID Registers (r = 1 to 16) ..... 1324
31.2.20 CFDGAFLMr : Global Acceptance Filter List Mask Registers (r = 1 to 16) ..... 1325
31.2.21 CFDGAFLP0r : Global Acceptance Filter List Pointer 0 Registers (r = 1 to 16) ..... 1326
31.2.22 CFDGAFLP1r : Global Acceptance Filter List Pointer 1 Registers (r = 1 to 16) ..... 1328
31.2.23 CFDRMNB : RX Message Buffer Number Register ..... 1329
31.2.24 CFDRMND : RX Message Buffer New Data Register ..... 1329
31.2.25 CFDRFCCa : RX FIFO Configuration/Control Registers a (a = 0 to 1) ..... 1330
31.2.26 CFDRFSTSa : RX FIFO Status Registers a (a = 0 to 1) ..... 1332
31.2.27 CFDRFPCTRa : RX FIFO Pointer Control Registers a (a = 0 to 1) ..... 1333
31.2.28 CFDCFCC : Common FIFO Configuration/Control Register ..... 1334
31.2.29 CFDCFSTS : Common FIFO Status Register ..... 1337
31.2.30 CFDCFPCTR : Common FIFO Pointer Control Register ..... 1339
31.2.31 CFDFESTS : FIFO Empty Status Register ..... 1340

31.2.32 CFDFFSTS : FIFO Full Status Register ..... 1340
31.2.33 CFDFMSTS : FIFO Message Lost Status Register ..... 1341
31.2.34 CFDRFISTS : RX FIFO Interrupt Flag Status Register ..... 1342
31.2.35 CFDCDTCT : DMA Transfer Control Register ..... 1342
31.2.36 CFDCDTSTS : DMA Transfer Status Register ..... 1343
31.2.37 CFDTMCi : TX Message Buffer Control Registers i (i = 0 to 3) ..... 1344
31.2.38 CFDTMSTSj : TX Message Buffer Status Registers j (j = 0 to 3) ..... 1345
31.2.39 CFDTMTRSTS : TX Message Buffer Transmission Request Status Register ..... 1347
31.2.40 CFDTMTARSTS : TX Message Buffer Transmission Abort Request Status Register ..... 1347
31.2.41 CFDTMTCSTS : TX Message Buffer Transmission Completion Status Register ..... 1348
31.2.42 CFDTMTASTS : TX Message Buffer Transmission Abort Status Register ..... 1349
31.2.43 CFDTMIEC : TX Message Buffer Interrupt Enable Configuration Register ..... 1349
31.2.44 CFDTXQCC : TX Queue Configuration/Control Register ..... 1350
31.2.45 CFDTXQSTS : TX Queue Status Register ..... 1351
31.2.46 CFDTXQPCTR : TX Queue Pointer Control Register ..... 1352
31.2.47 CFDTHLCC : TX History List Configuration/Control Register ..... 1353
31.2.48 CFDTHLSTS : TX History List Status Register ..... 1354
31.2.49 CFDTHLACC0 : TX History List Access Register 0 ..... 1355
31.2.50 CFDTHLACC1 : TX History List Access Register 1 ..... 1356
31.2.51 CFDTHLPCTR : TX History List Pointer Control Register ..... 1357
31.2.52 CFDGRSTC : Global SW reset Register ..... 1357
31.2.53 CFDGTSTCFG : Global Test Configuration Register ..... 1358
31.2.54 CFDGTSTCTR : Global Test Control Register ..... 1359
31.2.55 CFDGFDCFG : Global FD Configuration Register ..... 1359
31.2.56 CFDGLOCKK : Global Lock Key Register ..... 1360
31.2.57 CFDRPGACCk : RAM Test Page Access Registers k (k = 0 to 63) ..... 1361
31.2.58 CFDGAFLIGNENT : Global AFL Ignore Entry Register ..... 1361
31.2.59 CFDGAFLIGNCTR : Global AFL Ignore Control Register ..... 1361
31.2.60 CFDRMIEC : RX Message Buffer Interrupt Enable Configuration Register ..... 1362
31.2.61 Identifier Bits Alignment ..... 1362
31.2.62 Message Buffer Component Structure ..... 1363
31.3 Modes of Operation ..... 1383
31.3.1 Overview ..... 1383
31.3.2 Global Modes ..... 1383
31.3.3 Channel Modes ..... 1392
31.3.4 Global Mode and Channel Mode Transition Interactions ..... 1397
31.4 Initialization ..... 1399
31.4.1 Initialization of CAN Clock, Bit Timing and Baud Rate ..... 1399
31.4.2 CAN Module Configuration after Hardware Reset ..... 1406
31.5 Acceptance Filtering Function using Global Acceptance Filter List (AFL) ..... 1407
31.5.1 Overview ..... 1407
31.5.2 Allocation of AFL Entries ..... 1409
31.5.3 AFL Entry Description ..... 1409
31.5.4 Entering Entries in the AFL ..... 1411
31.5.5 Loopback Modes ..... 1413
31.5.6 IDE Masking ..... 1413
31.5.7 Updating AFL Entry during Communication ..... 1414
31.6 FIFO Buffers and Normal Message Buffer Configuration ..... 1416
31.6.1 Normal RX Message Buffers ..... 1417
31.6.2 FIFO Buffers ..... 1417

31.7 Interrupts and DMA ... 1422
31.7.1 Interrupts ... 1422
31.7.2 DMA Transfer ... 1425
31.8 Reception and Transmission ... 1428
31.8.1 Reception ... 1428
31.8.2 Transmission ... 1434
31.9 Test Mode ... 1448
31.9.1 Channel Specific Test Modes ... 1449
31.9.2 Global Test Modes ... 1451
31.10 Usage notes ... 1455
31.10.1 Module-stop function ... 1455
**32. CANFD ECC (CNECC) ... 1456**
32.1 Overview ... 1456
32.2 Register Descriptions ... 1456
32.2.1 EC710CTL : ECC Control Register ... 1456
32.2.2 EC710TMC : ECC Test Mode Control Register ... 1459
32.2.3 EC710TED : ECC Test Substitute Data Register ... 1460
32.2.4 EC710EAD0 : ECC Error Address Register ... 1461
32.3 Operation ... 1461
32.3.1 ECC Function Setting ... 1461
32.3.2 ECC Decoder Testing ... 1462
32.4 Interrupts ... 1463
**33. Serial Peripheral Interface (SPI) ... 1464**
33.1 Overview ... 1464
33.2 Register Descriptions ... 1466
33.2.1 SPCR : SPI Control Register ... 1466
33.2.2 SSLP : SPI Slave Select Polarity Register ... 1467
33.2.3 SPPCR : SPI Pin Control Register ... 1468
33.2.4 SPSR : SPI Status Register ... 1469
33.2.5 SPDR/SPDR_HA/SPDR_BY : SPI Data Register ... 1473
33.2.6 SPSCR : SPI Sequence Control Register ... 1475
33.2.7 SPSSR : SPI Sequence Status Register ... 1476
33.2.8 SPBR : SPI Bit Rate Register ... 1477
33.2.9 SPDCR : SPI Data Control Register ... 1478
33.2.10 SPCKD : SPI Clock Delay Register ... 1479
33.2.11 SSLND : SPI Slave Select Negation Delay Register ... 1480
33.2.12 SPND : SPI Next-Access Delay Register ... 1480
33.2.13 SPCR2 : SPI Control Register 2 ... 1481
33.2.14 SPCMDm : SPI Command Register m (m = 0 to 7) ... 1482
33.2.15 SPDCR2 : SPI Data Control Register 2 ... 1484
33.2.16 SPCR3 : SPI Control Register 3 ... 1485
33.3 Operation ... 1486
33.3.1 Overview of SPI Operation ... 1486
33.3.2 Controlling the SPI Pins ... 1487
33.3.3 SPI System Configuration Examples ... 1489
33.3.4 Data Formats ... 1494
33.3.5 Transfer Formats ... 1505
33.3.6 Data Transfer Modes ... 1507
33.3.7 Transmit Buffer Empty and Receive Buffer Full Interrupts ... 1509
33.3.8 Idle Interrupt ... 1511

33.3.9 Communication End Interrupt ..... 1512
33.3.10 Error Detection ..... 1518
33.3.11 Initializing the SPI ..... 1523
33.3.12 SPI Operation ..... 1524
33.3.13 Clock Synchronous Operation ..... 1538
33.3.14 Loopback Mode ..... 1544
33.3.15 Self-Diagnosis of Parity Bit Function ..... 1545
33.3.16 Interrupt Sources ..... 1546
33.4 Event Link Controller Event Output ..... 1547
33.4.1 Receive Buffer Full Event Output ..... 1547
33.4.2 Transmit Buffer Empty Event Output ..... 1547
33.4.3 Mode-Fault, Underrun, Overrun, or Parity Error Event Output ..... 1548
33.4.4 SPI Idle Event Output ..... 1548
33.4.5 Communication End Event Output ..... 1548
33.5 Usage Notes ..... 1550
33.5.1 Settings for the Module-stop State ..... 1550
33.5.2 Constraint on Low-power Functions ..... 1550
33.5.3 Constraints on Starting Transfer ..... 1550
33.5.4 Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output ..... 1550
33.5.5 Constraints on the SPSR.SPRF and SPSR.SPTEF Flags ..... 1550
**34. Quad Serial Peripheral Interface (QSPI) ..... 1551**
34.1 Overview ..... 1551
34.2 Register Descriptions ..... 1552
34.2.1 SFMSMD : Transfer Mode Control Register ..... 1552
34.2.2 SFMSSC : Chip Selection Control Register ..... 1553
34.2.3 SFMSKC : Clock Control Register ..... 1554
34.2.4 SFMSST : Status Register ..... 1555
34.2.5 SFMCOM : Communication Port Register ..... 1556
34.2.6 SFMCMD : Communication Mode Control Register ..... 1557
34.2.7 SFMCST : Communication Status Register ..... 1557
34.2.8 SFMSIC : Instruction Code Register ..... 1558
34.2.9 SFMSAC : Address Mode Control Register ..... 1558
34.2.10 SFMSDC : Dummy Cycle Control Register ..... 1559
34.2.11 SFMSPC : SPI Protocol Control Register ..... 1560
34.2.12 SFMPMD : Port Control Register ..... 1560
34.2.13 SFMCNT1 : External QSPI Address Register ..... 1561
34.3 Memory Map ..... 1561
34.3.1 External Bus Space ..... 1561
34.3.2 Address Width of the SPI Space and SPI Bus ..... 1562
34.4 SPI Bus ..... 1563
34.4.1 SPI Protocol ..... 1563
34.4.2 SPI Mode ..... 1566
34.5 SPI Bus Timing Adjustment ..... 1567
34.5.1 SPI Bus Reference Cycles ..... 1567
34.5.2 QSPCLK Signal Duty Ratio ..... 1568
34.5.3 Minimum High-Level Width for the QSSL Signal ..... 1568
34.5.4 QSSL Signal Setup Time ..... 1569
34.5.5 QSSL Signal Hold Time ..... 1569
34.5.6 Hold Time of the Serial Data Output Enable ..... 1569
34.5.7 Setup Time for Serial Data Output ..... 1570

34.5.8 Hold Time for Serial Data Output ..... 1571
34.5.9 Serial Data Receiving Latency ..... 1571
34.6 SPI Instruction Set Used for Serial Flash Memory Access ..... 1572
34.6.1 SPI Instructions That Are Automatically Generated ..... 1572
34.6.2 Standard Read Instruction ..... 1573
34.6.3 Fast Read Instruction ..... 1574
34.6.4 Fast Read Dual Output Instruction ..... 1575
34.6.5 Fast Read Dual I/O Instruction ..... 1576
34.6.6 Fast Read Quad Output Instruction ..... 1577
34.6.7 Fast Read Quad I/O Instruction ..... 1578
34.6.8 Enter 4-Byte Mode Instruction ..... 1580
34.6.9 Exit 4-Byte Mode Instruction ..... 1580
34.6.10 Write Enable Instruction ..... 1580
34.7 SPI Bus Cycle Arrangement ..... 1581
34.7.1 Serial Flash Memory Read Based on Individual Conversion ..... 1581
34.7.2 Serial Flash Memory Read Using the Prefetch Function ..... 1581
34.7.3 Halt of Prefetching ..... 1582
34.7.4 Direct Specification of Prefetch Destination ..... 1582
34.7.5 Prefetch State Polling ..... 1582
34.7.6 SPI Bus Cycle Extension Function ..... 1583
34.8 XIP Control ..... 1583
34.8.1 Setting XIP Mode ..... 1584
34.8.2 Releasing the XIP Mode ..... 1585
34.9 QIO2 and QIO3 Pin States ..... 1586
34.10 Direct Communication Mode ..... 1587
34.10.1 About Direct Communication ..... 1587
34.10.2 Using Direct Communication Mode ..... 1587
34.10.3 Generating the SPI Bus Cycle during Direct Communication ..... 1587
34.11 Interrupts ..... 1591
34.12 Usage Note ..... 1591
34.12.1 Settings for the Module-Stop Function ..... 1591
34.12.2 Procedure for Changing Settings in Multiple Control Registers ..... 1591
**35. Serial Sound Interface Enhanced (SSIE) ..... 1593**
35.1 Overview ..... 1593
35.2 Features ..... 1593
35.3 Block Diagram ..... 1594
35.4 Register Descriptions ..... 1596
35.4.1 SSICR : Control Register ..... 1596
35.4.2 SSISR : Status Register ..... 1606
35.4.3 SSIFCR : FIFO Control Register ..... 1617
35.4.4 SSIFSR : FIFO Status Register ..... 1623
35.4.5 SSIFTDR : Transmit FIFO Data Register ..... 1626
35.4.6 SSIFRDR : Receive FIFO Data Register ..... 1629
35.4.7 SSIOFR : Audio Format Register ..... 1631
35.4.8 SSISCR : Status Control Register ..... 1634
35.5 Communication Formats ..... 1635
35.5.1 $I^2S$ Format ..... 1636
35.5.2 Monaural Format ..... 1636
35.5.3 TDM Format ..... 1638
35.6 Communication Modes ..... 1639

35.6.1 Slave-mode Communication ..... 1639
35.6.2 Master-mode Communication ..... 1639
35.6.3 Transmission ..... 1640
35.6.4 Reception ..... 1640
35.6.5 Transmission and Reception ..... 1640
35.7 Operation ..... 1640
35.7.1 Idle State ..... 1640
35.7.2 Communication States ..... 1642
35.8 Communication Operation ..... 1646
35.8.1 Start Communication ..... 1646
35.8.2 Transmission ..... 1647
35.8.3 Reception ..... 1648
35.8.4 Transmission and Reception ..... 1649
35.8.5 Halt Communication ..... 1649
35.8.6 Error Handling ..... 1650
35.8.7 Resume Communication ..... 1651
35.9 Interrupts ..... 1652
35.9.1 SSIE0_SSIF Interrupt ..... 1653
35.9.2 SSIE0_SSITXI Interrupt ..... 1654
35.9.3 SSIE0_SSIRXI Interrupt ..... 1654
35.10 Software Resets ..... 1654
35.10.1 Software Reset Procedure ..... 1654
35.11 Notes ..... 1655
35.11.1 Notes for Slave-mode Communication ..... 1655
35.11.2 Notes for Master-mode Communication ..... 1656
35.11.3 Notes for Communication Flow ..... 1656
35.11.4 Write Access Restriction ..... 1657
**36. Cyclic Redundancy Check (CRC) ..... 1659**
36.1 Overview ..... 1659
36.2 Register Descriptions ..... 1660
36.2.1 CRCCR0 : CRC Control Register 0 ..... 1660
36.2.2 CRCDIR/CRCDIR_BY : CRC Data Input Register ..... 1660
36.2.3 CRCDOR/CRCDOR_HA/CRCDOR_BY : CRC Data Output Register ..... 1661
36.3 Operation ..... 1661
36.3.1 Basic Operation ..... 1661
36.4 Usage Notes ..... 1664
36.4.1 Settings for the Module-Stop State ..... 1664
36.4.2 Note on Transmission ..... 1664
**37. Renesas Secure IP (RSIP-E11A) ..... 1666**
37.1 Overview ..... 1666
37.2 Operation ..... 1667
37.2.1 Symmetric cryptography ..... 1667
37.2.2 Asymmetric Cryptography ..... 1668
37.2.3 Hash generator ..... 1669
37.2.4 Encryption and Decryption ..... 1669
37.3 Usage Notes ..... 1670
37.3.1 Software Standby Mode ..... 1670
37.3.2 Module-Stop Function Setting ..... 1670
37.3.3 SPA/DPA Protections ..... 1670
37.3.4 Restrictions on Open process ..... 1670

**38. 12-Bit A/D Converter (ADC12) ..... 1671**
38.1 Overview ..... 1671
38.2 Register Descriptions ..... 1674
38.2.1 ADDRn : A/D Data Registers n (n = 0 to 6, 17 to 25) ..... 1674
38.2.2 ADDBLDR : A/D Data Duplexing Register ..... 1676
38.2.3 ADDBLDRn : A/D Data Duplexing Register n (n = A, B) ..... 1677
38.2.4 ADTSDR : A/D Temperature Sensor Data Register ..... 1678
38.2.5 ADOCDR : A/D Internal Reference Voltage Data Register ..... 1680
38.2.6 ADCTDR : A/D CTSU TSCAP Voltage Data Register ..... 1681
38.2.7 ADRD : A/D Self-Diagnosis Data Register ..... 1682
38.2.8 ADCSR : A/D Control Register ..... 1683
38.2.9 ADANSA0 : A/D Channel Select Register A0 ..... 1687
38.2.10 ADANSA1 : A/D Channel Select Register A1 ..... 1687
38.2.11 ADANSB0 : A/D Channel Select Register B0 ..... 1688
38.2.12 ADANSB1 : A/D Channel Select Register B1 ..... 1688
38.2.13 ADADS0 : A/D-Converted Value Addition/Average Channel Select Register 0 ..... 1689
38.2.14 ADADS1 : A/D-Converted Value Addition/Average Channel Select Register 1 ..... 1690
38.2.15 ADADC : A/D-Converted Value Addition/Average Count Select Register ..... 1691
38.2.16 ADCER : A/D Control Extended Register ..... 1692
38.2.17 ADSTRGR : A/D Conversion Start Trigger Select Register ..... 1693
38.2.18 ADEXICR : A/D Conversion Extended Input Control Registers ..... 1694
38.2.19 ADSSTRn/ADSSTRL/ADSSTRT/ADSSTRO : A/D Sampling State Register (n = 0 to 6). 1696
38.2.20 ADDISCR : A/D Disconnection Detection Control Register ..... 1696
38.2.21 ADACSR : A/D Conversion Operation Mode Select Register ..... 1697
38.2.22 ADGSPCR : A/D Group Scan Priority Control Register ..... 1698
38.2.23 ADCMPCR : A/D Compare Function Control Register ..... 1699
38.2.24 ADCMPANSR0 : A/D Compare Function Window A Channel Select Register 0 ..... 1700
38.2.25 ADCMPANSR1 : A/D Compare Function Window A Channel Select Register 1 ..... 1701
38.2.26 ADCMPANSER : A/D Compare Function Window A Extended Input Select Register ..... 1701
38.2.27 ADCMPLR0 : A/D Compare Function Window A Comparison Condition Setting Register 0 ..... 1702
38.2.28 ADCMPLR1 : A/D Compare Function Window A Comparison Condition Setting Register 1 ..... 1703
38.2.29 ADCMPLER : A/D Compare Function Window A Extended Input Comparison Condition Setting Register ..... 1704
38.2.30 ADCMPDRn : A/D Compare Function Window A Lower-Side/Upper-Side Level Setting Register (n = 0, 1) ..... 1705
38.2.31 ADWINnLB : A/D Compare Function Window B Lower-Side/Upper-Side Level Setting Register (n = L, U) ..... 1706
38.2.32 ADCMPSR0 : A/D Compare Function Window A Channel Status Register 0 ..... 1707
38.2.33 ADCMPSR1 : A/D Compare Function Window A Channel Status Register1 ..... 1708
38.2.34 ADCMPSER : A/D Compare Function Window A Extended Input Channel Status Register ..... 1709
38.2.35 ADCMPBNSR : A/D Compare Function Window B Channel Select Register ..... 1710
38.2.36 ADCMPBSR : A/D Compare Function Window B Status Register ..... 1711
38.2.37 ADWINMON : A/D Compare Function Window A/B Status Monitor Register ..... 1712
38.2.38 ADHVREFCNT : A/D High-Potential/Low-Potential Reference Voltage Control Register. 1713
38.3 Operation ..... 1714
38.3.1 Scanning Operation ..... 1714
38.3.2 Single Scan Mode ..... 1715
38.3.3 Continuous Scan Mode ..... 1719

38.3.4 Group Scan Mode ... 1721
38.3.5 Compare Function for Windows A and B ... 1730
38.3.6 Analog Input Sampling and Scan Conversion Time ... 1734
38.3.7 Usage Example of A/D Data Register Automatic Clearing Function ... 1736
38.3.8 A/D-Converted Value Addition/Average Mode ... 1737
38.3.9 Disconnection Detection Assist Function ... 1737
38.3.10 Starting A/D Conversion with an Asynchronous Trigger ... 1739
38.3.11 Starting A/D Conversion with a Synchronous Trigger from a Peripheral Module ... 1740
38.4 Interrupt Sources and DTC Transfer Requests ... 1740
38.4.1 Interrupt Requests ... 1740
38.5 Event Link Function ... 1741
38.5.1 Event Output to the ELC ... 1741
38.5.2 ADC12 Operation through an Event from the ELC ... 1741
38.6 Selecting Reference Voltage ... 1742
38.7 A/D Conversion Procedure When Selecting Internal Reference Voltage as High-Potential Reference Voltage ... 1742
38.8 Usage Notes ... 1742
38.8.1 Constraints on Setting the Registers ... 1742
38.8.2 Constraints on Reading the Data Registers ... 1742
38.8.3 Constraints on Stopping A/D Conversion ... 1743
38.8.4 A/D Conversion Restart and Termination Timing ... 1745
38.8.5 Constraints on Scan End Interrupt Handling ... 1745
38.8.6 Settings for the Module-Stop Function ... 1745
38.8.7 Notes on Entering the Low-Power States ... 1745
38.8.8 Error in Absolute Accuracy When Disconnection Detection Assistance Is in Use ... 1745
38.8.9 ADHSC Bit Rewriting Procedure ... 1745
38.8.10 Constraints on Operating Modes and Status Bits ... 1746
38.8.11 Notes on Board Design ... 1746
38.8.12 Constraints on Noise Prevention ... 1746
38.8.13 Port Settings When Using the ADC12 Input ... 1747
38.8.14 Notes on Canceling Software Standby Mode ... 1747
**39. 12-Bit D/A Converter (DAC12) ... 1748**
39.1 Overview ... 1748
39.2 Register Descriptions ... 1749
39.2.1 DADR0 : D/A Data Register 0 ... 1749
39.2.2 DACR : D/A Control Register ... 1749
39.2.3 DADPR : DADR0 Format Select Register ... 1750
39.2.4 DAADSCR : D/A A/D Synchronous Start Control Register ... 1750
39.2.5 DAVREFCR : D/A VREF Control Register ... 1751
39.3 Operation ... 1751
39.3.1 Reducing Interference between D/A and A/D Conversion ... 1752
39.4 Event Link Operation Setting Procedure ... 1754
39.4.1 DA0 Event Link Operation Setting Procedure ... 1754
39.5 Usage Notes on Event Link Operation ... 1754
39.6 Usage Notes ... 1754
39.6.1 Settings for the Module-Stop Function ... 1754
39.6.2 DAC12 Operation in the Module-Stop State ... 1754
39.6.3 DAC12 Operation in Software Standby Mode ... 1754
39.6.4 Constraint on Usage When Interference Reduction between D/A and A/D Conversion Is Enabled ... 1754

**40. Temperature Sensor (TSN) ..... 1755**
40.1 Overview ..... 1755
40.2 Register Descriptions ..... 1755
40.2.1 TSCDR : Temperature Sensor Calibration Data Register ..... 1755
40.3 Using the Temperature Sensor ..... 1756
40.3.1 Preparation for Using the Temperature Sensor ..... 1756
40.3.2 Procedures for Using the Temperature Sensor ..... 1757
**41. Low Power Analog Comparator (ACMPLP) ..... 1758**
41.1 Overview ..... 1758
41.2 Register Descriptions ..... 1760
41.2.1 COMPMDR : ACMPLP Mode Setting Register ..... 1760
41.2.2 COMPFIR : ACMPLP Filter Control Register ..... 1761
41.2.3 COMPOCR : ACMPLP Output Control Register ..... 1761
41.3 Operation ..... 1762
41.4 Noise Filter ..... 1764
41.5 ACMPLP Interrupts ..... 1765
41.6 ELC Event Output ..... 1766
41.7 Interrupt Handling and ELC Linking ..... 1766
41.8 Comparator Pin Output ..... 1766
41.9 Usage Notes ..... 1766
41.9.1 Module-Stop Function Settings ..... 1766
**42. Capacitive Touch Sensing Unit (CTSU) ..... 1767**
42.1 Overview ..... 1767
42.2 Register Descriptions ..... 1770
42.2.1 CTSUCRA/CTSUCRAH/CTSUCRAL/CTSUCR3/CTSUCR2/CTSUCR1/CTSUCR0 : CTSU Control Register A ..... 1770
42.2.2 CTSUCRB/CTSUCRBH/CTSUCRBL/CTSUDCLKC/CTSUSST/CTSUSDPRS : CTSU Control Register B ..... 1774
42.2.3 CTSUMCH/CTSUMCHH/CTSUMCHL/CTSUMFAF/CTSUMCH1/CTSUMCH0 : CTSU Measurement Channel Register ..... 1776
42.2.4 CTSUCHACA/CTSUCHACAL/CTSUCHAC1/CTSUCHAC0 : CTSU Channel Enable Control Register A ..... 1778
42.2.5 CTSUCHTRCA/CTSUCHTRCAL/CTSUCHTRC1/CTSUCHTRC0 : CTSU Channel Transmit/Receive Control Register A ..... 1779
42.2.6 CTSUSR/CTSUSRH/CTSUSRL/CTSUSR2/CTSUST/CTSUSR0 : CTSU Status Register 1779
42.2.7 CTSUSO/CTSUSO1/CTSUSO0 : CTSU Sensor Offset Register ..... 1781
42.2.8 CTSUSCNT/CTSUSC : CTSU Sensor Counter Register ..... 1783
42.2.9 CTSUCALIB/CTSUDBGR1/CTSUDBGR0 : CTSU Calibration Register ..... 1783
42.2.10 CTSUSUCLKA/CTSUSUCLK1/CTSUSUCLK0 : CTSU Sensor Unit Clock Control Register A ..... 1786
42.2.11 CTSUSUCLKB/CTSUSUCLK3/CTSUSUCLK2 : CTSU Sensor Unit Clock Control Register B ..... 1787
42.2.12 CTSUTRIMA : CTSU Trimming Register A ..... 1788
42.2.13 CTSUTRIMB : CTSU Trimming Register B ..... 1788
42.2.14 CTSUOPT/CTSUOPTH/CTSUOPTL/AC/AJ/ACSB : CTSU Option Setting Register ..... 1789
42.2.15 CTSUSCNTACT/CTSUSCNTACTH/CTSUSCNTACTL : CTSU Sensor Counter Automatic Correction Table Access Register ..... 1790
42.2.16 CTSUMACT1/CTSUMACT1H/CTSUMACT1L/CTSUMACT2/CTSUMACT2H/CTSUMACT2L/CTSUMACT3/CTSUMACT3H/CTSUMACT3L : CTSU Multi-Clock Automatic Correction Table Access Register ..... 1791

42.2.17 CTSUAJCR/CTSUAJCRH/CTSUAJCRL/AJCR3/AJCR2/AJCR1/AJCR0 : CTSU Automatic Judgment Control Register ... 1792
42.2.18 CTSUAJTHR/CTSUAJTHRH/CTSUAJTHRL : CTSU Automatic Judgment Control Register ... 1793
42.2.19 CTSUAJMMAR/CTSUAJMMARH/CTSUAJMMARL : CTSU Threshold Register ... 1793
42.2.20 CTSUAJBLACT/CTSUAJBLACTH/CTSUAJBLACTL : CTSU Baseline Average Intermediate Result Register ... 1794
42.2.21 CTSUAJBLAR/CTSUAJBLARH/CTSUAJBLARL : CTSU Baseline Average Result Register ... 1795
42.2.22 CTSUAJRR/CTSUAJRRL/CTSUAJRR1/CTSUAJRR0 : CTSU Automatic Judgment Result Register ... 1795
**43. Data Operation Circuit (DOC) ... 1797**
43.1 Overview ... 1797
43.2 DOC Register Descriptions ... 1798
43.2.1 DOCR : DOC Control Register ... 1798
43.2.2 DOSR : DOC Flag Status Register ... 1799
43.2.3 DOSCR : DOC Flag Status Clear Register ... 1799
43.2.4 DODIR : DOC Data Input Register ... 1800
43.2.5 DODSR0 : DOC Data Setting Register 0 ... 1800
43.2.6 DODSR1 : DOC Data Setting Register 1 ... 1800
43.3 Operation ... 1801
43.3.1 Data Comparison Mode ... 1801
43.3.2 Data Addition Mode ... 1803
43.3.3 Data Subtraction Mode ... 1804
43.4 Interrupt Source ... 1804
43.5 Event Link Output ... 1805
43.6 Interrupt Handling and Event Linking ... 1805
43.7 Usage Notes ... 1805
43.7.1 Settings for the Module-Stop State ... 1805
**44. SRAM ... 1806**
44.1 Overview ... 1806
44.2 Register Descriptions ... 1806
44.2.1 SRAMSAR : SRAM Security Attribution Register ... 1806
44.2.2 PARIOAD : SRAM Parity Error Operation After Detection Register ... 1807
44.2.3 SRAMPRCR : SRAM Protection Register ... 1807
44.2.4 ECCMODE : ECC Operating Mode Control Register ... 1808
44.2.5 ECC2STS : ECC 2-Bit Error Status Register ... 1809
44.2.6 ECC1STSEN : ECC 1-Bit Error Information Update Enable Register ... 1809
44.2.7 ECC1STS : ECC 1-Bit Error Status Register ... 1810
44.2.8 ECCPRCR : ECC Protection Register ... 1810
44.2.9 ECCPRCR2 : ECC Protection Register 2 ... 1811
44.2.10 ECCETST : ECC Test Control Register ... 1811
44.2.11 ECCOAD : SRAM ECC Error Operation After Detection Register ... 1812
44.3 Operation ... 1812
44.3.1 Module Stop Function ... 1812
44.3.2 Correction of ECC Errors ... 1813
44.3.3 ECC Error Interrupt Function ... 1813
44.3.4 ECC Decoder Testing ... 1813
44.3.5 Parity Calculation Function ... 1814
44.3.6 TrustZone Filter Function ... 1816
44.3.7 Interrupt Source ... 1817

44.3.8 Number of Access Cycles to SRAM ... 1817
**45. Flash Memory ... 1819**
45.1 Overview ... 1819
45.2 Structure of Memory ... 1821
45.3 Address Space ... 1824
45.4 Register Descriptions ... 1824
45.4.1 DFLCTL : Data Flash Control Register ... 1824
45.4.2 PFBER : Prefetch Buffer Enable Register ... 1825
45.4.3 FSAR : Flash Security Attribution Register ... 1825
45.4.4 UIDRn : Unique ID Registers n (n = 0 to 3) ... 1826
45.4.5 PNRn : Part Numbering Register n (n = 0 to 3) ... 1826
45.4.6 MCUVER : MCU Version Register ... 1827
45.4.7 FASTAT : Flash Access Status Register ... 1827
45.4.8 FAEINT : Flash Access Error Interrupt Enable Register ... 1828
45.4.9 FRDYIE : Flash Ready Interrupt Enable Register ... 1829
45.4.10 FSADDR : FACI Command Start Address Register ... 1830
45.4.11 FEADDR : FACI Command End Address Register ... 1830
45.4.12 FMEPROT : Flash P/E Mode Entry Protection Register ... 1831
45.4.13 FBPROT0 : Flash Block Protection Register ... 1832
45.4.14 FBPROT1 : Flash Block Protection for Secure Register ... 1832
45.4.15 FSTATR : Flash Status Register ... 1833
45.4.16 FENTRYR : Flash P/E Mode Entry Register ... 1835
45.4.17 FSUINITR : Flash Sequencer Setup Initialization Register ... 1837
45.4.18 FCMDR : FACI Command Register ... 1837
45.4.19 FBCCNT : Blank Check Control Register ... 1838
45.4.20 FBCSTAT : Blank Check Status Register ... 1839
45.4.21 FBCADDR : Flash Blank Check Address Register ... 1839
45.4.22 FSUASMON : Flash Startup Area Select Monitor Register ... 1840
45.4.23 FPCKAR : Flash Sequencer Processing Clock Notification Register ... 1840
45.4.24 FSUACR : Flash Startup Area Control Register ... 1841
45.5 Prefetch Buffer ... 1842
45.6 Operating Modes Associated with Flash Memory ... 1842
45.7 Overview of Functions ... 1842
45.8 Operating Modes of the Flash Sequencer ... 1844
45.9 FACI Commands ... 1845
45.9.1 List of FACI Commands ... 1845
45.9.2 Relationship between the Flash Sequencer State and FACI Commands ... 1846
45.9.3 Usage of FACI Commands ... 1847
45.10 Suspend Operation ... 1861
45.11 Protection Function ... 1861
45.11.1 Software Protection ... 1861
45.11.2 Error Protection ... 1866
45.11.3 Startup Program Protection ... 1868
45.11.4 Dual Bank Function ... 1872
45.11.5 Block Swap Function ... 1874
45.12 Security Function ... 1875
45.12.1 Security Flag for Startup Area Select ... 1875
45.12.2 Permanent Block Protect Setting ... 1875
45.12.3 Flash Memory Protection for TrustZone ... 1877
45.13 Boot Mode ... 1883

45.13.1 Boot Mode (for the SCI Interface) ... 1884
45.13.2 Boot Mode (for the USB Interface) ... 1885
45.13.3 Boot Mode (for the SWD Interface) ... 1885
45.14 Using the Serial Programmer for Rewriting ... 1886
45.14.1 Environments for Serial Programming ... 1886
45.15 Programming through Self-Programming ... 1887
45.15.1 Overview ... 1887
45.15.2 Background Operation ... 1888
45.16 Reading Flash Memory ... 1889
45.16.1 Reading Code Flash Memory ... 1889
45.16.2 Reading Data Flash Memory ... 1889

The RA4L1 group features low power, 32-bit microcontrollers (MCUs) based on the Arm® Cortex®-M33 (CM33) core with TrustZone®, delivering an ideal balance of low voltage operation, low power consumption, and high performance. The RA4L1 offers operation down to 1.6V combined with a low power standby current of as little as 1.65µA and a multitude of low power features enabling the user to dynamically optimize power/performance to their application requirements.

# Features

## Arm® Cortex®-M33 Core

- Armv8-M architecture with the main extension
- Maximum operating frequency: 80 MHz
- Arm Memory Protection Unit (Arm MPU)
  - Protected Memory System Architecture (PMSAv8)
  - Secure MPU (MPU_S): 8 regions
  - Non-secure MPU (MPU_NS): 8 regions
- SysTick timer
  - Embeds two Systick timers: Secure and Non-secure instance
  - Driven by LOCO or system clock
- CoreSight™ ETM-M33

## Memory

- Up to 512-KB code flash memory
- 8-KB data flash memory (100,000 program/erase (P/E) cycles)
- 64-KB SRAM

## Connectivity

- Serial Communications Interface (SCI) × 6
  - Asynchronous interfaces
  - 8-bit clock synchronous interface
  - Smart card interface
  - Simple IIC
  - Simple SPI
  - Simple LIN (SCI1)
  - Manchester coding (SCI3, SCI4)
- IrDA interface (IrDA)
- $I^2C$ bus interface (IIC)
- I3C bus interface (I3C)
- Serial Interface UARTA (UARTA) × 2
- Serial Peripheral Interface (SPI)
- Quad Serial Peripheral Interface (QSPI)
- USB 2.0 Full-Speed Module (USBFS)
- CAN with Flexible Data-rate (CANFD)
- Serial Sound Interface Enhanced (SSIE)

## Analog

- 12-bit A/D Converter (ADC12)
- 12-bit D/A Converter (DAC12)
- Low-Power Analog Comparator (ACMPLP) × 2
- Temperature Sensor (TSN)

## Timers

- General PWM Timer 32-bit (GPT32) × 2
- General PWM Timer 16-bit (GPT16) × 4
- Low Power Asynchronous General Purpose Timer (AGT) × 2

## Security and Encryption

- Renesas Secure IP (RSIP-E11A)
  - Symmetric algorithms: AES
  - Asymmetric algorithms: ECC
  - Hash-value generation: SHA224, SHA256
  - 128-bit unique ID
- Arm® TrustZone®
  - Up to three or six regions for the code flash, depending on the bank mode
  - Up to two regions for the data flash
  - Up to three regions for the SRAM
  - Individual secure or non-secure security attribution for each peripheral
- Device lifecycle management
- Pin function
  - Up to three tamper pins
  - Secure pin multiplexing

## System and Power Management

- Low power modes
- Realtime Clock (RTC)
- Event Link Controller (ELC)
- Data Transfer Controller (DTC)
- DMA Controller (DMAC) × 8
- Power-on reset
- Low Voltage Detection (LVD) with voltage settings
- Watchdog Timer (WDT)
- Independent Watchdog Timer (IWDT)

## Human Machine Interface (HMI)

- Capacitive Touch Sensing Unit (CTSU)
- Segment LCD Controller (SLCDC)

## Multiple Clock Sources

- Main clock oscillator (MOSC) (1 to 20 MHz)
- Sub-clock oscillator (SOSC) (32.768 kHz)
- High-speed on-chip oscillator (HOCO) (48/64/80 MHz)
- Middle-speed on-chip oscillator (MOCO) (8 MHz)
- Low-speed on-chip oscillator (LOCO) (32.768 kHz)
- IWDT-dedicated on-chip oscillator (15 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- PLL
- Clock out support

## General-Purpose I/O Ports

- 5-V tolerance, open drain, input pull-up

## Operating Voltage

- VCC: 1.6 to 3.6 V

## Operating Temperature and Packages

- Ta = -40 °C to +125 °C
  - 100-pin LQFP (14 mm × 14 mm, 0.5 mm pitch)
  - 64-pin LQFP (10 mm × 10 mm, 0.5 mm pitch)
  - 48-pin LQFP (7 mm × 7 mm, 0.5 mm pitch)
  - 48-pin QFN (7 mm × 7 mm, 0.5 mm pitch)
  - 100-pin BGA (7 mm × 7 mm, 0.5 mm pitch)
  - 64-pin BGA (5.5 mm × 5.5 mm, 0.65 mm pitch)
  - 72-pin WLCSP (3.64 mm × 4.28 mm, 0.4 mm pitch)

# 1. Overview

The MCU integrates multiple series of software- and pin-compatible Arm®-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU in this series incorporates a high-performance Arm Cortex®-M33 core running up to 80 MHz with the following features:

- Up to 512 KB code flash memory
- 64 KB SRAM
- Quad Serial Peripheral Interface (QSPI)
- USBFS
- Capacitive Touch Sensing Unit (CTSU)
- Analog peripherals
- Security and safety features

## 1.1 Function Outline

**Table 1.1 Arm core**

| Feature | Functional description |
|---|---|
| Arm Cortex-M33 core | • Maximum operating frequency: up to 80 MHz<br>• Arm Cortex-M33 core:<br>– Armv8-M architecture with security extension<br>– Revision: r0p4-00rel1<br>• Arm Memory Protection Unit (Arm MPU)<br>– Protected Memory System Architecture (PMSAv8)<br>– Secure MPU (MPU_S): 8 regions<br>– Non-secure MPU (MPU_NS): 8 regions<br>• SysTick timer<br>– Embeds two Systick timers: Secure and Non-secure instance<br>– Driven by SysTick timer clock (SYSTICCLK) or system clock (ICLK)<br>• CoreSight™ ETM-M33 |

**Table 1.2 Memory**

| Feature | Functional description |
|---|---|
| Code flash memory | Maximum 512 KB of code flash memory.<br>See section 45, Flash Memory. |
| Data flash memory | 8 KB of data flash memory.<br>See section 45, Flash Memory. |
| Option-setting memory | The option-setting memory determines the state of the MCU after a reset.<br>See section 6, Option-Setting Memory. |
| SRAM | On-chip high-speed SRAM with either parity bit or Error Correction Code (ECC).<br>See section 44, SRAM. |

**Table 1.3 System (1 of 2)**

| Feature | Functional description |
|---|---|
| Operating modes | Two operating modes:<br>• Single-chip mode<br>• SCI/USB/SWD boot mode<br>See section 3, Operating Modes. |
| Resets | The MCU provides 13 resets.<br>See section 5, Resets. |

**Table 1.3 System (2 of 2)**

| Feature | Functional description |
|---|---|
| Low Voltage Detection (LVD) | The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC and EXLVD pins. The detection level can be selected by register settings. The LVD module consists of three separate voltage level detectors (LVD0, LVD1, LVD2). LVD0, LVD1, and LVD2 measure the voltage level input to the VCC and to the EXLVD pins for LVD2. LVD registers allow your application to configure detection of VCC changes at various voltage thresholds.<br>See section 7, Low Voltage Detection (LVD). |
| Clocks | • Main clock oscillator (MOSC)<br>• Sub-clock oscillator (SOSC)<br>• High-speed on-chip oscillator (HOCO)<br>• Middle-speed on-chip oscillator (MOCO)<br>• Low-speed on-chip oscillator (LOCO)<br>• IWDT-dedicated on-chip oscillator<br>• PLL<br>• Clock out support<br>See section 8, Clock Generation Circuit. |
| Clock Frequency Accuracy Measurement Circuit (CAC) | The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.<br>See section 9, Clock Frequency Accuracy Measurement Circuit (CAC). |
| Interrupt Controller Unit (ICU) | The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.<br>See section 12, Interrupt Controller Unit (ICU). |
| Low power modes | Power consumption can be reduced in multiple ways, including setting clock dividers, stopping modules, selecting power control mode in normal operation, and transitioning to low power modes.<br>See section 10, Low Power Modes. |
| Register write protection | The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR).<br>See section 11, Register Write Protection. |
| Memory Protection Unit (MPU) | The MCU has one Memory Protection Unit (MPU).<br>See section 14, Memory Protection Unit (MPU). |

**Table 1.4 Event link**

| Feature | Functional description |
|---|---|
| Event Link Controller (ELC) | The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.<br>See section 17, Event Link Controller (ELC). |

**Table 1.5 Direct memory access**

| Feature | Functional description |
|---|---|
| Data Transfer Controller (DTC) | A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request.<br>See section 16, Data Transfer Controller (DTC). |
| DMA Controller (DMAC) | The MCU includes an 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.<br>See section 15, DMA Controller (DMAC). |

**Table 1.6 External bus interface**

| Feature | Functional description |
|---|---|
| External bus | • QSPI area (EQBIU): Connected to the QSPI (external device interface) |

**Table 1.7 Timers**

| Feature | Functional description |
|---|---|
| General PWM Timer (GPT) | The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 2 channels and a 16-bit timer with GPT16 × 4 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer.<br>See section 20, General PWM Timer (GPT). |
| Port Output Enable for GPT (POEG) | The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state.<br>See section 19, Port Output Enable for GPT (POEG). |
| Low Power Asynchronous General Purpose Timer (AGT) | The low power Asynchronous General Purpose Timer (AGT) is a 32-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register.<br>See section 21, Low Power Asynchronous General Purpose Timer (AGTW). |
| Realtime Clock (RTC) | The Realtime Clock (RTC) has two operation modes, normal operation mode and low-consumption clock mode. In each of the operation mode, the RTC has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.<br>See section 22, Realtime Clock (RTC). |
| Watchdog Timer (WDT) | The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt.<br>See section 23, Watchdog Timer (WDT). |
| Independent Watchdog Timer (IWDT) | The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers.<br>See section 24, Independent Watchdog Timer (IWDT). |

**Table 1.8 Communication interfaces (1 of 2)**

| Feature | Functional description |
|---|---|
| Serial Communications Interface (SCI) | The Serial Communications Interface (SCI) × 6 channels have asynchronous and synchronous serial interfaces:<br>• Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA))<br>• 8-bit clock synchronous interface<br>• Simple IIC (master-only)<br>• Simple SPI<br>• Smart card interface<br>• Manchester interface<br>• Simple LIN<br>The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCIn (n = 0, 3 to 5, 9) has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator.<br>See section 26, Serial Communications Interface (SCI). |
| IrDA Interface | The IrDA interface sends and receives IrDA data communication waveforms in cooperation with the SCI5 based on the IrDA (Infrared Data Association) standard 1.0.<br>See section 27, IrDA Interface (IrDA). |
| $I^2C$ bus interface (IIC) | The $I^2C$ bus interface (IIC) has one channel. The IIC module conforms with and provides a subset of the NXP $I^2C$ (Inter-Integrated Circuit) bus interface functions.<br>See section 28, $I^2C$ Bus Interface (IIC). |

**Table 1.8 Communication interfaces (2 of 2)**

| Feature | Functional description |
|---|---|
| I3C bus interface (I3C) | The I3C bus interface (I3C) has one channel. The I3C module conforms with and provides a subset of the NXP $I^2C$ (Inter-Integrated Circuit) bus interface functions and a subset of the MIPI I3C.<br>See section 29, I3C Bus Interface (I3C). |
| Serial Interface UARTA (UARTA) | The serial interface UARTA (UARTA) has two channels. The UARTA supports the following modes:<br>● Operation stop mode<br>● UART mode<br>See section 30, Serial Interface UARTA (UARTA). |
| Serial Peripheral Interface (SPI) | The Serial Peripheral Interface (SPI) has one channel. The SPI provides high-speed full-duplex synchronous serial communications with multiple processors and peripheral devices.<br>See section 33, Serial Peripheral Interface (SPI). |
| Control Area Network with Flexible Data-Rate Module (CAN-FD) | The CAN with Flexible Data-Rate (CANFD) module can handle classical CAN frames and CANFD frames complied with ISO 11898-1 standard. The module supports 4 transmit buffers and 16 receive buffers.<br>See section 31, CAN with Flexible Data-rate (CANFD). |
| USB 2.0 Full-Speed module (USBFS) | The USB 2.0 Full-Speed module (USBFS) can operate as a host controller or device controller. The module supports full-speed and low-speed (host controller only) transfer as defined in Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 10 pipes. Pipes 1 to 9 can be assigned any endpoint number based on the peripheral devices used for communication or based on your system.<br>See section 25, USB 2.0 Full-Speed Module (USBFS). |
| Quad Serial Peripheral Interface (QSPI) | The Quad Serial Peripheral Interface (QSPI) is a memory controller for connecting a serial ROM (nonvolatile memory such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface.<br>See section 34, Quad Serial Peripheral Interface (QSPI). |
| Serial Sound Interface Enhanced (SSIE) | The Serial Sound Interface Enhanced (SSIE) peripheral provides functionality to interface with digital audio devices for transmitting $I^2S$/Monaural/TDM audio data over a serial bus. The SSIE supports an audio clock frequency of up to 40 MHz, and can be operated as a slave or master receiver, transmitter, or transceiver to suit various applications. The SSIE includes 32-stage FIFO buffers in the receiver and transmitter, and supports interrupts and DMA-driven data reception and transmission.<br>See section 35, Serial Sound Interface Enhanced (SSIE). |

**Table 1.9 Analog (1 of 2)**

| Feature | Functional description |
|---|---|
| 12-bit A/D Converter (ADC12) | A 12-bit successive approximation A/D converter (ADC12) is provided. Analog input channels are selectable up to 16. The temperature sensor output and an internal reference voltage are selectable for conversion.<br>See section 38, 12-Bit A/D Converter (ADC12). |
| 12-bit D/A Converter (DAC12) | A 12-bit D/A converter (DAC12) is provided.<br>See section 39, 12-Bit D/A Converter (DAC12). |
| Temperature Sensor (TSN) | The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC12 for conversion and can be further used by the end application.<br>See section 40, Temperature Sensor (TSN). |

**Table 1.9 Analog (2 of 2)**

| Feature | Functional description |
|---|---|
| Low-Power Analog Comparator (ACMPLP) | The Low-Power Analog Comparator (ACMPLP) compares a reference input voltage with an analog input voltage. Comparator channels ACMPLP0 and ACMPLP1 are independent of each other.<br>The comparison result of the reference input voltage and analog input voltage can be read by software. The comparison result can also be output externally. The reference input voltage can be selected from either an input to the CMPREFi (i = 0, 1) pin or from the internal reference voltage ($V_{REF}$) generated internally in the MCU.<br>The ACMPLP response speed can be set before starting an operation. Setting high-speed mode decreases the response delay time, but increases current consumption. Setting low-speed mode increases the response delay time, but decreases current consumption.<br>See section 41, Low Power Analog Comparator (ACMPLP). |

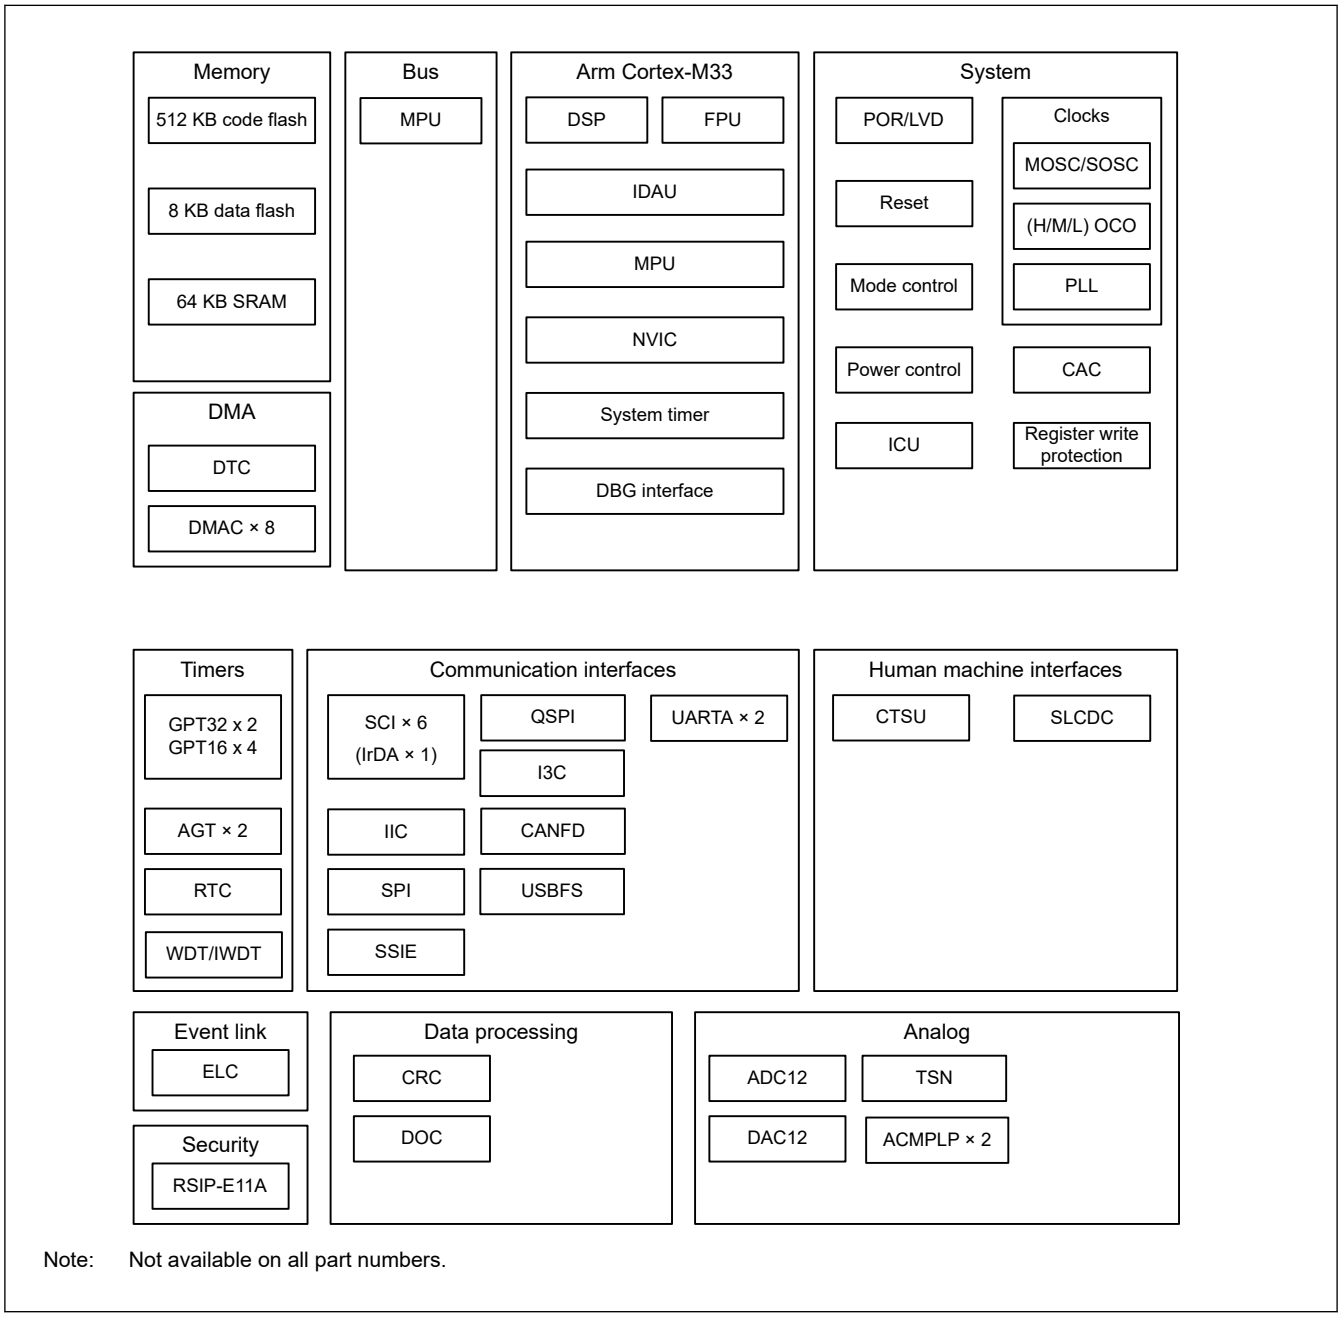
**Table 1.10 Human machine interfaces**

| Feature | Functional description |
|---|---|
| Capacitive Touch Sensing Unit (CTSU) | The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software that enables the CTSU to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical conductor so that a finger does not come into direct contact with the electrode.<br>See section 42, Capacitive Touch Sensing Unit (CTSU). |
| Segment LCD Controller (SLCDC) | The SLCDC provides the following functions:<br>• Internal voltage boosting method, capacitor split method, and external resistance division method are switchable<br>• VL1 or VL2 reference mode is selectable under internal voltage boosting method<br>• VCC or VL4 reference mode is selectable under capacitor split method<br>• Segment signal output: 52 (48)<br>• Common signal output: 4 (8)<br>• Waveform A or B selectable<br>• The LCD can be made to blink<br>Note: The values in parentheses are the number of signal outputs when 8 com is used.<br>See section 46, Segment LCD Controller (SLCDC). |

**Table 1.11 Data processing**

| Feature | Functional description |
|---|---|
| Cyclic Redundancy Check (CRC) calculator | The Cyclic Redundancy Check (CRC) generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available.<br>See section 36, Cyclic Redundancy Check (CRC). |
| Data Operation Circuit (DOC) | The Data Operation Circuit (DOC) compares, adds, and subtracts 32-bit data. When a selected condition applies, 32-bit data is compared and an interrupt can be generated.<br>See section 43, Data Operation Circuit (DOC). |

**Table 1.12 Security**



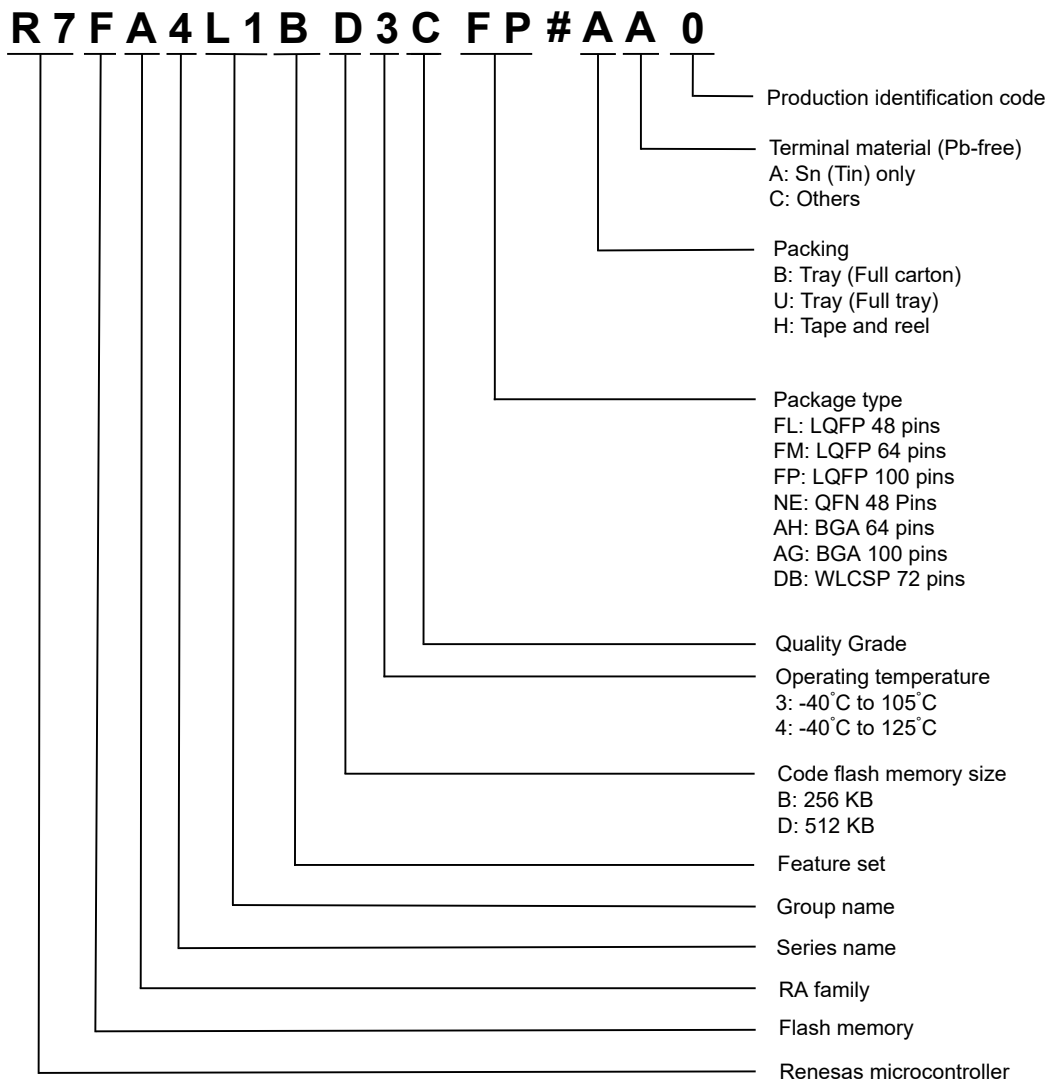
| Feature | Functional description |
|---|---|
| Security function | • ARMv8-M TrustZone security<br>• Device lifecycle management<br>• Debug access level<br>• Key injection<br>• Secure pin multiplexing |
| Renesas Secure IP (RSIP-E11A) | • Symmetric algorithms: AES<br>• Asymmetric algorithms: ECC<br>• Hash value generation: SHA224, SHA256<br>• True random number generator<br>• 128-bit unique ID.<br>See section 37, Renesas Secure IP (RSIP-E11A). |

**Table 1.13 I/O ports**

| Feature | Functional description |
|---|---|
| Programmable I/O ports | • I/O ports for the 100-pin LQFP, 100-pin BGA<br>– I/O pins: 82<br>– Input pins: 3<br>– Pull-up resistors: 82<br>– N-ch open-drain outputs: 75<br>– 5-V tolerance: 5<br>• I/O ports for the 72-pin WLCSP<br>– I/O pins: 53<br>– Input pins: 3<br>– Pull-up resistors: 53<br>– N-ch open-drain outputs: 46<br>– 5-V tolerance: 5<br>• I/O ports for the 64-pin LQFP<br>– I/O pins: 48<br>– Input pins: 3<br>– Pull-up resistors: 48<br>– N-ch open-drain outputs: 41<br>– 5-V tolerance: 5<br>• I/O ports for the 64-pin BGA<br>– I/O pins: 52<br>– Input pins: 3<br>– Pull-up resistors: 52<br>– N-ch open-drain outputs: 45<br>– 5-V tolerance: 5<br>• I/O ports for the 48-pin LQFP, 48-pin QFN<br>– I/O pins: 34<br>– Input pins: 3<br>– Pull-up resistors: 34<br>– N-ch open-drain outputs: 29<br>– 5-V tolerance: 5 |

## 1.2 Block Diagram

Figure 1.1 shows a block diagram of the MCU superset. Some individual devices within the group have a subset of the features.



Note: Not available on all part numbers.

**Figure 1.1 Block diagram**

## 1.3 Part Numbering

Figure 1.2 shows the product part number information, including memory capacity and package type. Table 1.14 shows a list of products.

Note: Check the order screen for each product on the Renesas website for valid symbols after the #.

**Figure 1.2 Part numbering scheme**

**Table 1.14 Product list (1 of 2)**

| Product part number | Package code | Code flash | Data flash | SRAM | Operating temperature |
|---|---|---|---|---|---|
| R7FA4L1BD4CFP | PLQP0100KB-B | 512 KB | 8 KB | 64 KB | -40 to +125 °C |

Note 1. Available pins depend on the pin count. For details, see section 1.7. Pin Lists.

## 1.5 Pin Functions

**Table 1.16 Pin functions (1 of 4)**

| Function | Signal | I/O | Description |
|---|---|---|---|
| Power supply | VCC | Input | Power supply pin. Connect it to the system power supply. Connect this pin to VSS by a 0.1-μF capacitor. The capacitor should be placed close to the pin. |
| | VCL/VCL0 | I/O | Connect this pin to the VSS pin by the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin. |
| | VSS | Input | Ground pin. Connect it to the system power supply (0 V). |
| Voltage detector | EXLVD | Input | Low voltage detector for external pin. |
| Clock | XTAL | Output | Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin. |
| | EXTAL | Input | |
| | XCIN | Input | Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOUT and XCIN. |
| | XCOUT | Output | |
| | CLKOUT | Output | Clock output pin |
| Operating mode control | MD | Input | Pin for setting the operating mode. The signal level on this pin must not be changed during operation mode transition on release from the reset state. |
| System control | RES | Input | Reset signal input pin. The MCU enters the reset state when this signal goes low. |
| CAC | CACREF | Input | Measurement reference clock input pin |
| On-chip emulator | SWDIO | I/O | Serial wire debug data input/output pin |
| | SWCLK | Input | Serial wire clock pin |
| Interrupt | NMI | Input | Non-maskable interrupt request pin |
| | IRQn | Input | Maskable interrupt request pins |
| GPT | GTETRGA, GTETRGB, GTETRGC, GTETRGD | Input | External trigger input pins |
| | GTIOCnA, GTIOCnB | I/O | Input capture, output compare, or PWM output pins |
| | GTIU | Input | Hall sensor input pin U |
| | GTIV | Input | Hall sensor input pin V |
| | GTIW | Input | Hall sensor input pin W |
| | GTOUUP | Output | 3-phase PWM output for BLDC motor control (positive U phase) |
| | GTOULO | Output | 3-phase PWM output for BLDC motor control (negative U phase) |
| | GTOVUP | Output | 3-phase PWM output for BLDC motor control (positive V phase) |
| | GTOVLO | Output | 3-phase PWM output for BLDC motor control (negative V phase) |
| | GTOWUP | Output | 3-phase PWM output for BLDC motor control (positive W phase) |
| | GTOWLO | Output | 3-phase PWM output for BLDC motor control (negative W phase) |
| AGT | AGTEEn | Input | External event input enable signals |
| | AGTIOn | I/O | External event input and pulse output pins |
| | AGTOn | Output | Pulse output pins |
| | AGTOAn | Output | Output compare match A output pins |
| | AGTOBn | Output | Output compare match B output pins |
| RTC | RTCOUT | Output | Output pin for 1-Hz or 64-Hz clock |
| | RTCICn | Input | Time capture event input pins |

**Table 1.16 Pin functions (2 of 4)**

| Function | Signal | I/O | Description |
|---|---|---|---|
| SCI | SCKn | I/O | Input/output pins for the clock (clock synchronous mode) |
| | RXDn | Input | Input pins for received data (asynchronous mode/clock synchronous mode) |
| | TXDn | Output | Output pins for transmitted data (asynchronous mode/clock synchronous mode) |
| | CTSn_RTSn | I/O | Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low. |
| | CTSn | Input | Input for the start of transmission. |
| | SCLn | I/O | Input/output pins for the IIC clock (simple IIC mode) |
| | SDAn | I/O | Input/output pins for the IIC data (simple IIC mode) |
| | SCKn | I/O | Input/output pins for the clock (simple SPI mode) |
| | MISOn | I/O | Input/output pins for slave transmission of data (simple SPI mode) |
| | MOSIn | I/O | Input/output pins for master transmission of data (simple SPI mode) |
| | RXDXn | Input | Input pins for received data (Simple LIN Mode) |
| | TXDXn | Output | Output pins for transmitted data (Simple LIN Mode) |
| | SIOXn | I/O | Input/output pins for received or transmitted data (Simple LIN Mode) |
| | SSn | Input | Chip-select input pins (simple SPI mode), active-low |
| IIC | SCLn | I/O | Input/output pins for the clock |
| | SDAn | I/O | Input/output pins for data |
| I3C | I3C_SCL0 | I/O | Input/output pin for clock |
| | I3C_SDA0 | I/O | Input/output pin for data |
| UARTA | RxDAn | Input | Serial data input signal |
| | TxDAn | Output | Serial data output signal |
| | CLKAn | Output | Serial clock output signal |
| SPI | RSPCKA | I/O | Clock input/output pin |
| | MOSIA | I/O | Input or output pin for data output from the master |
| | MISOA | I/O | Input or output pin for data output from the slave |
| | SSLA0 | I/O | Input or output pin for slave selection |
| | SSLA1 to SSLA3 | Output | Output pins for slave selection |
| CANFD | CRXn | Input | Receive data |
| | CTXn | Output | Transmit data |

**Table 1.16 Pin functions (3 of 4)**

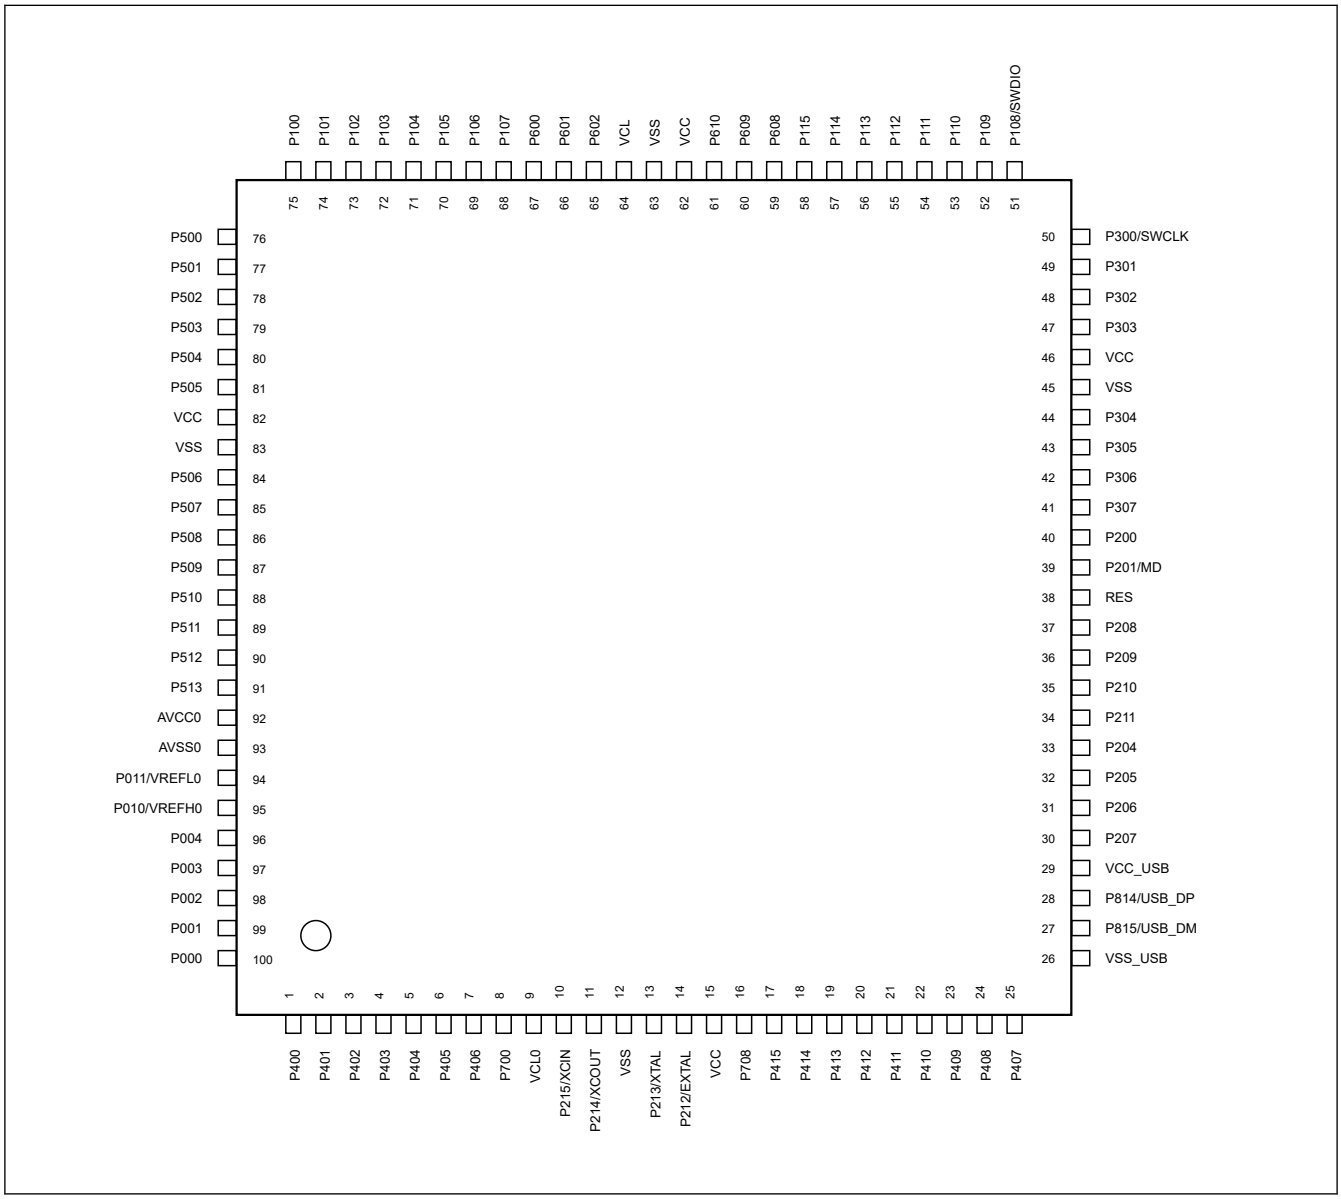
| Function | Signal | I/O | Description |
|---|---|---|---|
| USBFS | VCC_USB | Input | Power supply pin |
| | VSS_USB | Input | Ground pin |
| | USB_DP | I/O | D+ pin of the USB on-chip transceiver. Connect this pin to the D+ pin of the USB bus. |
| | USB_DM | I/O | D- pin of the USB on-chip transceiver. Connect this pin to the D- pin of the USB bus. |
| | USB_VBUS | Input | USB cable connection monitor pin. Connect this pin to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller. |
| | USB_EXICEN | Output | Low-power control signal for external power supply (OTG) chip |
| | USB_VBUSEN | Output | VBUS (5 V) supply enable signal for external power supply chip |
| | USB_OVRCURA, USB_OVRCURB | Input | Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected. |
| | USB_ID | Input | Connect the MicroAB connector ID input signal to this pin during operation in OTG mode |
| QSPI | QSPCLK | Output | QSPI clock output pin |
| | QSSL | Output | QSPI slave output pin |
| | QIO0 to QIO3 | I/O | Data0 to Data3 |
| SSIE | SSIBCK0 | I/O | SSIE serial bit clock pin |
| | SSILRCK0/SSIFS0 | I/O | LR clock/frame synchronization pin |
| | SSITXD0 | Output | Serial data output pin |
| | SSIRXD0 | Input | Serial data input pin |
| | AUDIO_CLK | Input | External clock pin for audio (input oversampling clock) |
| Analog power supply | AVCC0 | Input | Analog voltage supply pin. This is used as the analog power supply for the respective modules. Supply this pin with the same voltage as the VCC pin. |
| | AVSS0 | Input | Analog ground pin. This is used as the analog ground for the respective modules. Supply this pin with the same voltage as the VSS pin. |
| | VREFH0 | Input | Analog reference voltage supply pin for the ADC12. Connect this pin to AVCC0 when not using the ADC12. |
| | VREFL0 | Input | Analog reference ground pin for the ADC12. Connect this pin to AVSS0 when not using the ADC12. |
| ADC12 | AN0n | Input | Input pins for the analog signals to be processed by the A/D converter. |
| | ADTRG0 | Input | Input pins for the external trigger signals that start the A/D conversion, active-low. |
| DAC12 | DA0 | Output | Output pin for the analog signals processed by the D/A converter. |
| ACMPLP | VCOUT | Output | Comparator output pin |
| | CMPREF0, CMPREF1 | Input | Reference voltage input pins |
| | CMPIN0, CMPIN1 | Input | Analog voltage input pins |
| SLCDC | VL1, VL2, VL3, VL4 | I/O | Voltage pin for driving the LCD |
| | CAPH, CAPL | I/O | Capacitor connection for the LCD controller/driver |
| | COM0 to COM7 | Output | Common signal output pins for the LCD controller/driver |
| | SEG0 to SEG51 | Output | Segment signal output pins for the LCD controller/driver |

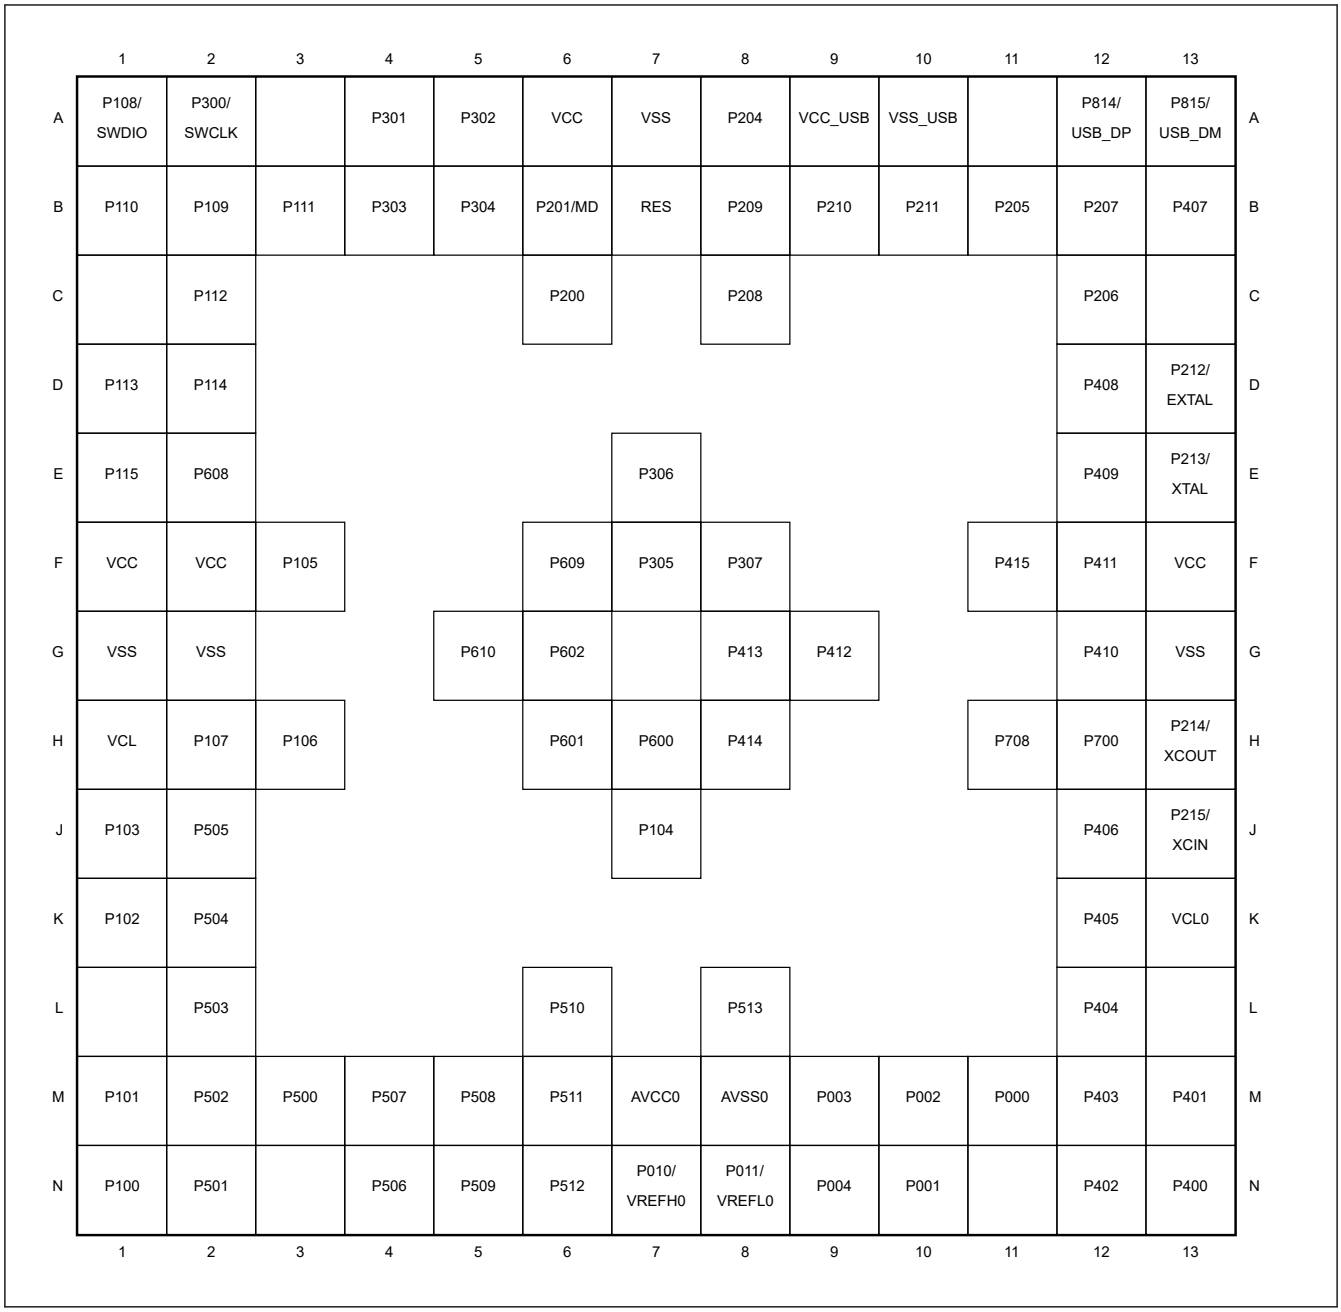
**Table 1.16 Pin functions (4 of 4)**

| Function | Signal | I/O | Description |
|---|---|---|---|
| CTSU | TSn | Input | Capacitive touch detection pins (touch pins) |
| | TSCAP | I/O | Secondary power supply pin for the touch driver |
| I/O ports | Pmn | I/O | General-purpose input/output pins<br>(m: port number, n: pin number) |
| | P200 | Input | General-purpose input pin |

## 1.6 Pin Assignments

The following figures show the pin assignments from the top view.





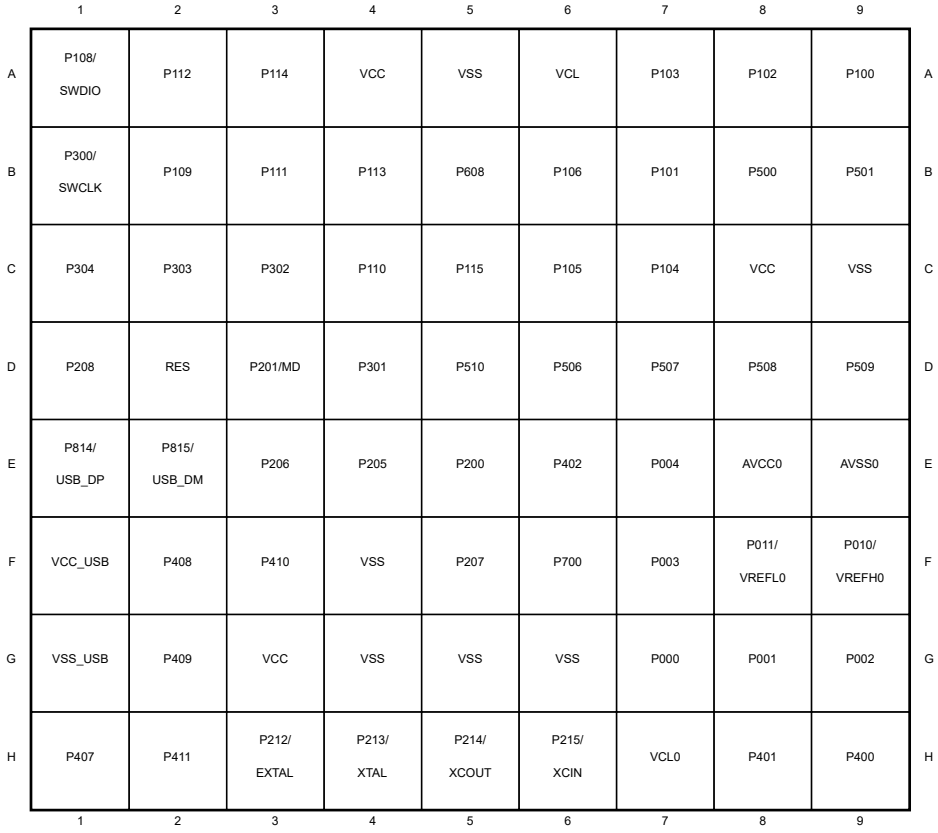


**Figure 1.3 Pin assignment for LQFP 100-pin**

# 2. CPU

The MCU is based on the Arm® Cortex®-M33 core.

## 2.1 Overview

### 2.1.1 CPU

- Arm Cortex-M33
  - Revision: r0p4-00rel1
  - Armv8-M architecture profile
  - Single Precision Floating-Point Unit compliant with the ANSI/IEEE Std 754-2008
- SAU (Security Attribution Unit): 0 region
- IDAU (Implementation Defined Attribution Unit): 8 regions
  - Code flash (secure/non-secure callable/non-secure)
  - Data Flash (secure/non-secure)
  - SRAM0 (secure/non-secure callable/non-secure)
- Memory Protection Unit (MPU)
  - Armv8 Protected Memory System Architecture (PMSAv8)
  - Secure MPU (MPU_S): 8 regions
  - Non-secure MPU (MPU_NS): 8 regions
- SysTick timer
  - Two SysTick timers: Secure and Non-secure instance
  - Driven by SysTick timer clock (SYSTICCLK) or system clock (ICLK)

See reference 1. and reference 2. in section 2.13. References for details.

### 2.1.2 Debug

- Arm® CoreSight™ ETM-M33
  - Revision: r0p2-00rel0
  - ARM ETM Architecture version 4.2
- Instrumentation Trace Macrocell (ITM)
- Data Watchpoint and Trace Unit (DWT)
  - 4 comparators for watchpoints and triggers
- Breakpoint Unit (BPU)
  - Breakpoint function is available.
    - 8 instruction comparators
    - 0 literal comparators
- Time Stamp Generator (TSG)
  - Time stamp for ETM and ITM
  - Driven by CPU clock
- Debug Register Module (DBGREG)
  - Reset control
  - Halt control
- Debug Access Port (DAP)

  - Serial Wire Debug Port (SW-DP)
- Cross Trigger Interface (CTI)
- Embedded Trace Buffer (ETB)
  - CoreSight Trace Memory Controller with ETB configuration
  - Buffer size: 2 KB

See reference 1. and reference 2. in section 2.13. References for details.

### 2.1.3 Operating Frequency

The operating frequencies for the MCU are as follows:

- CPU: maximum 80 MHz
- Serial Wire Debug (SWD) interface: maximum 12.5 MHz

### 2.1.4 Block Diagram

Figure 2.1 shows a block diagram of the Cortex-M33 core.

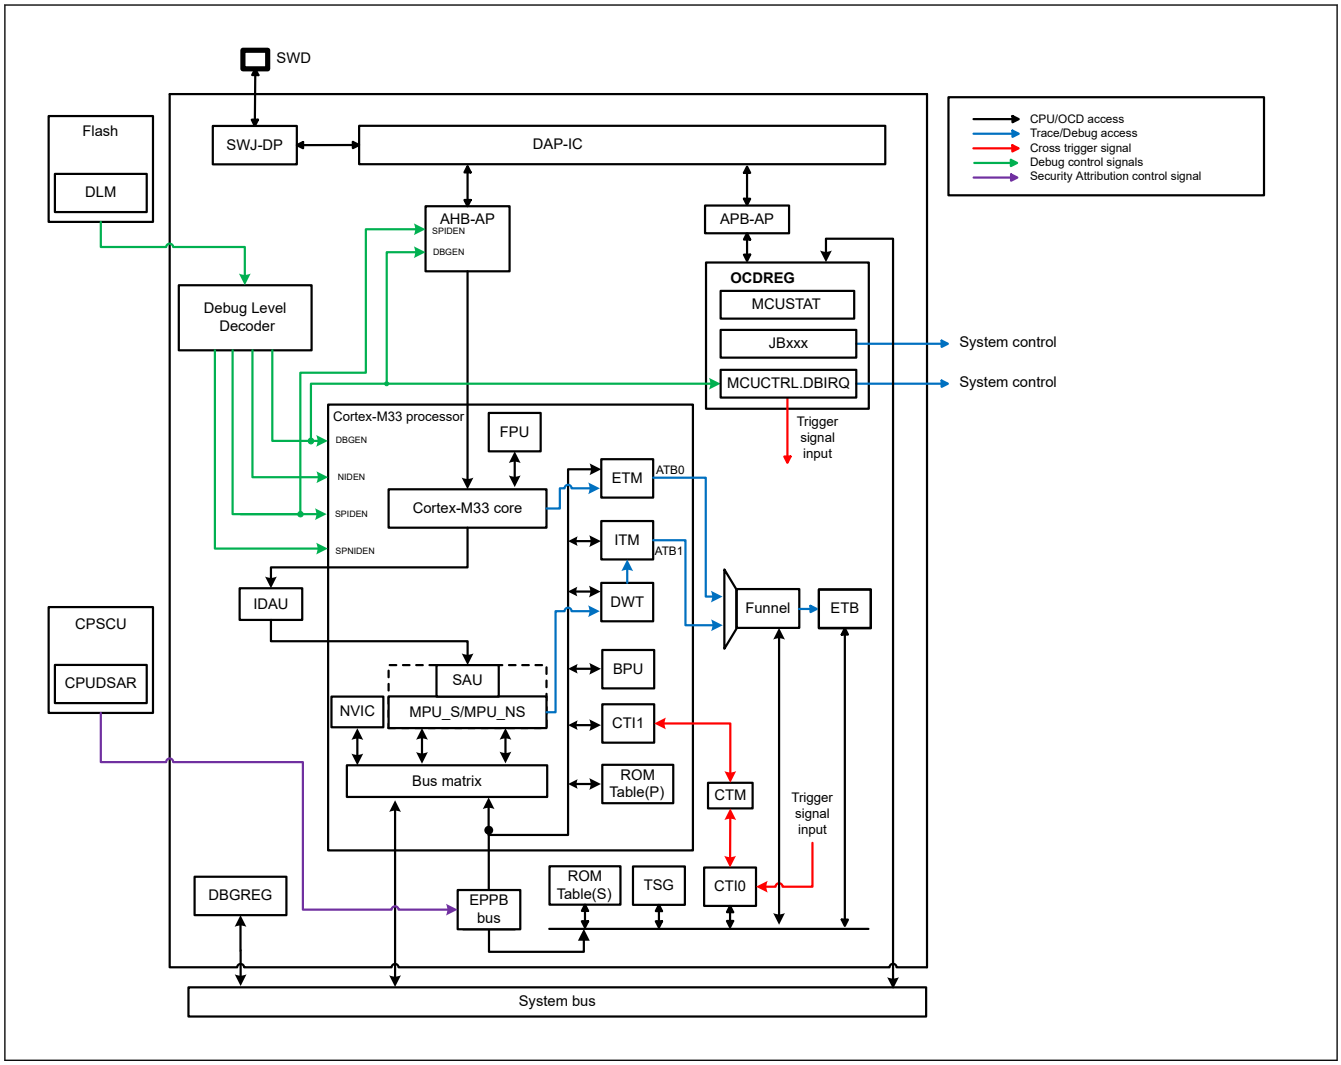

**Figure 2.1 Cortex-M33 block diagram**

## 2.2 Implementation Options

Table 2.1 shows the implementation options of the MCU.

**Table 2.1 Implementation options**

| Option | Implementation |
|---|---|
| SAU | Not included |
| IDAU | Included, 8 regions |
| MPU | Included, 8 regions for Secure and 8 regions for Non-secure |
| BPU | Included |
| Cross Trigger Interface (CTI) | Included |
| DWT | Included |
| Number of Wakeup Interrupt Controllers (WIC) | Not included<br>ICU can wake up CPU instead of WIC. See section 12, Interrupt Controller Unit (ICU) for details. |
| TPIU | Not included |
| FPU | Included |
| DSP | Included |
| Embedded Trace Macrocell (ETM) | Included |
| Sleep mode power saving | Sleep mode and other low power modes are supported. For more details, see section 10, Low Power Modes.<br>Note: SCB.SCR.SLEEPDEEP is ignored. |
| Interrupts | 66 |
| Priority bits | 4 bits (16 levels) |
| Endianness | Little-endian |
| SysTick | Included |
| SYST_CALIB register (0x4000_0147) | Bit [31] = 0 Reference clock provided<br>Bit [30] = 1 TERMS value is inexact<br>Bits [29:24] = 0x00 Reserved<br>Bits [23:0] = 0x000147 TERM: (32768 × 10 ms) - 1/32.768 kHz<br>= 326.66 decimal<br>= 327 with skew<br>= 0x000147 |
| Event input/output | Not implemented |
| Global exclusive monitor | Not implemented |
| System reset request output | The SYSRESETREQ bit in Application Interrupt and Reset Control Register causes a CPU reset |

## 2.3 SWD Interface

Table 2.2 shows the SWD pins.

**Table 2.2 SWD pins**

| Name | I/O | Function | When not in use |
|---|---|---|---|
| SWCLK | Input | Serial wire clock pin | Pull-up |
| SWDIO | I/O | Serial wire data I/O pin | Pull-up |

## 2.4 Security Attribution for Memory

In this MCU, SAU is not implemented and IDAU performs region definition for memory. IDAU divides the memory into 8 different areas as shown in Figure 2.2.

The code flash, the data flash, and the SRAM are divided into Secure (S), Non-secure (NS) and Non-secure callable (NSC) regions. These memory security attributions are set into the nonvolatile memory by the serial programming command when the device lifecycle is in SSD state. These memory security attributions are loaded into the IDAU and the memory controller before application execution. These memory security attributions cannot be updated by application but can read through the dedicated registers.

Note: When configuring, the memory regions should satisfy the setting condition of minimum address unit shown in Table 2.3.

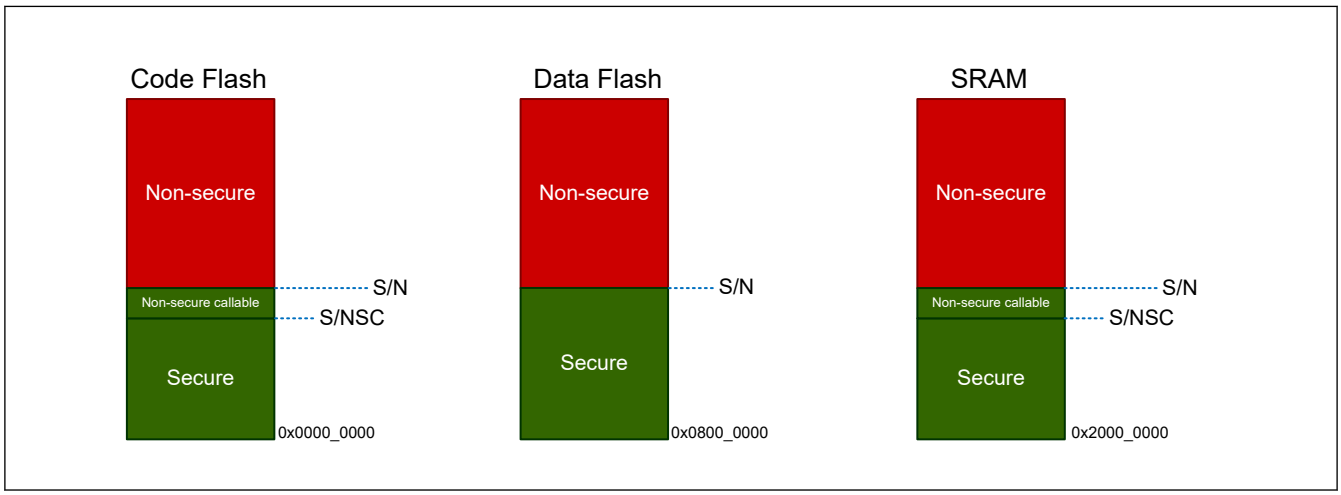

**Figure 2.2 Memory partitioning**

**Table 2.3 S/NS and S/NSC boundary list**

| Boundary | Code flash | Data flash | SRAM |
|---|---|---|---|
| S/NS | 32 KB | 1 KB | 8 KB |
| S/NSC | 1 KB | — | 1 KB |

Each region has its dedicated ID as follows. For more details, see section 2.13. References.

| IREGION (IDAU region number) | Description |
|---|---|
| 0x0D | Non-secure SRAM |
| 0x0E | Non-secure callable SRAM |
| 0x0F | Secure SRAM |
| 0x09 | Non-secure data flash |
| 0x0B | Secure data flash |
| 0x05 | Non-secure code flash |
| 0x06 | Non-secure callable code flash |
| 0x07 | Secure code flash |

## 2.5 Debug Function

### 2.5.1 Debugger Connectivity

In this MCU, debug function is considered in three levels, DBG0, DBG1, DBG2. At DBG0, no debug function is available. DBG1 level is defined as non-secure debug in ARMv-8 and the debugger can only access defined non-secure debug accessible regions. DBG2 level is defined as secure debug in ARMv-8 and at this level, nonsecure and secure debug function is enabled and can be accessible from the debugger.

Debug level is determined by the Device Lifecycle Management (DLM) state of the product.

See Figure 2.1 for debugger accessible regions.

Table 2.4 shows the CPU debug function and conditions.

**Table 2.4 CPU debug function and conditions**

| Condition | | | Permitted debug function |
|---|---|---|---|
| **OCD connect*1** | **DLM State** | **Debug level** | **Description** |
| Connected | SSD | DBG2 | All debug functions are available |
| Connected | NSECSD | DBG1 | Only Non-secure debug function is available |
| Connected | DPL | DBG0 | Debugger connection is not available |
| Connected | LCK_DBG | DBG0 | Debugger connection is not available |
| Connected | LCK_BOOT | DBG0 | Debugger connection is not available |
| Connected | RMA_REQ | DBG0 | Debugger connection is not available |
| Connected | RMA_ACK | DBG2 | All debug functions are available |

Note 1. OCD connect is determined by the CDBGPWRUPREQ bit output in the SWJ-DP register. The bit can only be written by the OCD. However, the level of the bit can be confirmed by reading the DBGSTR.CDBGPWRUPREQ bit.

## 2.5.2 Emulator Connection

Renesas provides the emulator which supports both debugging using SWD communication and serial programming using SCI or SWD communication.

Table 2.5 shows the pinout of 10 pin or 20 pin socket pinouts when using this emulator.

**Table 2.5 Pin assign for emulator**

| Pin No. | SWD | Serial programming using SCI |
|---|---|---|
| 1 | VCC | VCC |
| 2 | P108/SWDIO | NC |
| 4 | P300/SWCLK | P201/MD |
| 6 | NC | P109/TXD9 |
| 8 | NC | P110/RXD9 |
| 9 | GND detect | GND detect |
| 10 | nRESET | nRESET |
| 12 | NC | NC |
| 14 | NC | NC |
| 16 | NC | NC |
| 18 | NC | NC |
| 20 | NC | NC |
| 3, 5, 15, 17, 19 | GND | GND |
| 7 | NC | NC |
| 11, 13 | NC | NC |

## 2.5.3 Self-Hosted Debug Function

As described in section 2.6.6. CPUDSAR : CPU Debug Security Attribution Register, at the initial setting access from the CPU in non-secure state to CoreSight debug components is protected, that is, the non-secure access to CoreSight debug components from the self-hosted debugger is not allowed when the debug level is DBG2 at the initial setting. Therefore, the CPUDSAR.CPUDSA0 must be set to 1 to enable the self-hosted debug for CPU in non-secure state.

Note: There is no restriction for the self-hosted debug function while the CPU is in the secure state.

## 2.5.4 Effect of Debug Function

The debug function effects inside and outside of CPU.

### 2.5.4.1 Low power mode

All CoreSight debug components can store the register settings even when the CPU enters Software Standby or Snooze mode. However, AHB-AP cannot respond to On-Chip Debug (OCD) access in these low power modes. The OCD must wait for cancellation of the low power mode to access the CoreSight debug components. To request low power mode cancellation, the OCD can set the DBIRQ bit in the MCUCTRL register. For details, see section 2.6.5.2. MCUCTRL : MCU Control Register.

### 2.5.4.2 Reset

In OCD mode, some resets depend on the CPU status and the DBGSTOPCR register setting.

**Table 2.6 Reset or interrupt and mode setting**

| Reset or interrupt name | Control in On-Chip Debug (OCD) mode | |
|---|---|---|
| | OCD break mode | OCD run mode |
| RES pin reset | Same as user mode | |
| Power-on reset | Same as user mode | |
| Independent watchdog timer reset/interrupt | Does not occur*1 | Depends on DBGSTOPCR setting |
| Watchdog timer reset/interrupt | Does not occur*1 | Depends on DBGSTOPCR setting |
| Voltage monitor 0 reset | Depends on DBGSTOPCR setting | |
| Voltage monitor 1 reset/interrupt | Depends on DBGSTOPCR setting | |
| Voltage monitor 2 reset/interrupt | Depends on DBGSTOPCR setting | |
| SRAM parity error reset/interrupt | Depends on DBGSTOPCR setting | |
| SRAM ECC error reset/interrupt | Depends on DBGSTOPCR setting | |
| Cache Parity error reset/interrupt | Depends on DBGSTOPCR setting | |
| Bus master MPU error reset/interrupt | Same as user mode | |
| Software reset | Same as user mode | |

Note: In OCD break mode, the CPU is halted. In OCD run mode, the CPU is in OCD mode and the CPU is not halted.
Note 1. The IWDT and WDT always stop in this mode.

## 2.6 Programmers Model

### 2.6.1 Address Spaces

The MCU debug system includes two CoreSight Access Ports (AP):

- AHB-AP, which is connected to the CPU bus matrix and has the same access to the system address space as the CPU
- APB-AP, which has a dedicated address space (OCD address space) and is connected to the OCDREG registers.

Figure 2.3 shows a block diagram of the AP connection and address spaces.

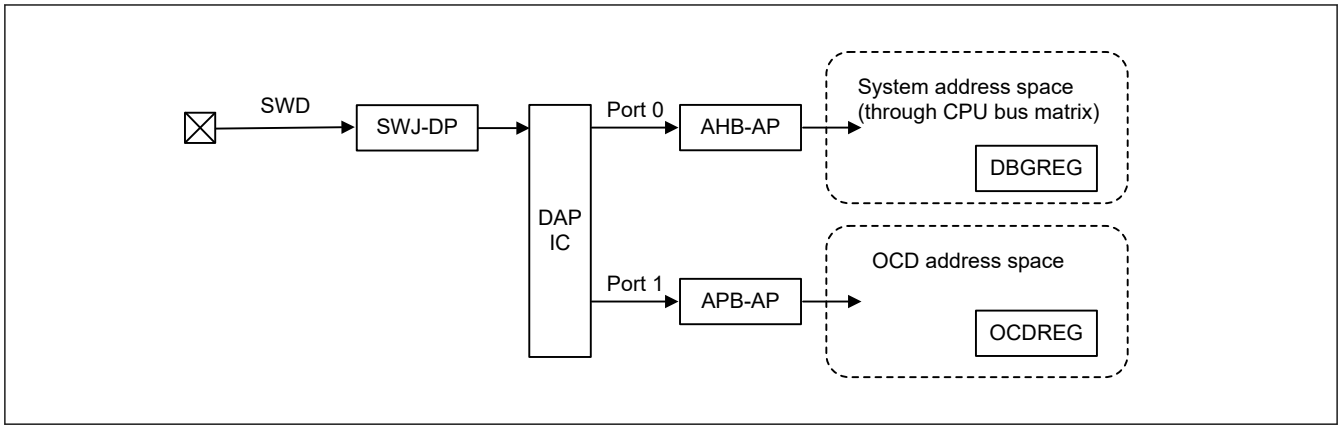

**Figure 2.3 SWD authentication block diagram**

For debugging purposes, there are two register modules, DBGREG and OCDREG. DBGREG is located in the system address space and can be accessed from the OCD emulator, the CPU, and other bus masters in the MCU. OCDREG is located in the OCD address space and can only be accessed from the OCD tool. The CPU and other bus masters cannot access OCDREG.

## 2.6.2 Peripheral Address Map

In system address space, the Cortex-M33 core has a Private Peripheral Bus (PPB) which can be accessed only from CPU and OCD emulator. The PPB is expanded from the original implementation of the Cortex-M33 core for this MCU. Table 2.7 shows the address map of the MCU.

**Table 2.7 Peripheral address map**

| Component name | Start address | End address | Note |
|---|---|---|---|

## 2.6.3 CoreSight ROM Table

The MCU contains two CoreSight ROM Tables, the processor and system ROM Tables. The Processor ROM Table contains entries which hold a list of debug components inside the processor. The System ROM Table contains entries of Processor ROM Table and others debug components outside the processor.

### 2.6.3.1 ROM Entries

ROM entries hold a list of components in the system. OCD emulator can use the ROM entries to determine which components are implemented in a system.

Table 2.8 and Table 2.9 show the System ROM entries and Processor ROM entries. See reference 5. in section 2.13. References for details.

**Table 2.8 System ROM entries**

| # | Address | Access size | R/W | Value | Target module pointer |
|---|---|---|---|---|---|
| 0 | 0xE00F_E000 | 32 bits | R | 0xFFF46003 | CTI0 |
| 1 | 0xE00F_E004 | 32 bits | R | 0xFFF49003 | Funnel |
| 2 | 0xE00F_E008 | 32 bits | R | 0xFFF4A003 | ETB |
| 3 | 0xE00F_E00C | 32 bits | R | 0xFFF4B003 | TSG |
| 4 | 0xE00F_E010 | 32 bits | R | 0xFFF42002 | Reserved |
| 5 | 0xE00F_E014 | 32 bits | R | 0x00001003 | Processor ROM table |
| 6 | 0xE00F_E018 | 32 bits | R | 0x00000000 | End of entries |

**Table 2.9 Processor ROM Entries**

| # | Address | Access size | R/W | Value | Target module pointer |
|---|---|---|---|---|---|
| 0 | 0xE00F_F000 | 32 bits | R | 0xFFF0F003 | SCS |
| 1 | 0xE00F_F004 | 32 bits | R | 0xFFF02003 | DWT |
| 2 | 0xE00F_F008 | 32 bits | R | 0xFFF03003 | BPU |
| 3 | 0xE00F_F00C | 32 bits | R | 0xFFF01003 | ITM |
| 4 | 0xE00F_F014 | 32 bits | R | 0xFFF42003 | ETM |
| 5 | 0xE00F_F018 | 32 bits | R | 0xFFF43003 | CTI1 |
| 6 | 0xE00F_F020 | 32 bits | R | 0x00000000 | End of entries |

### 2.6.3.2 CoreSight Component Registers

The CoreSight ROM Table lists the CoreSight component registers defined in the Arm CoreSight architecture.

Table 2.10 shows the registers. See reference 5. in section 2.13. References for details of each register.

**Table 2.10 CoreSight component registers in the CoreSight ROM Table**

| Name | Address | Access size | R/W | Initial value |
|---|---|---|---|---|
| PID4 | 0xE00F_EFD0 | 32 bits | R | 0x00000004 |
| PID5 | 0xE00F_EFD4 | 32 bits | R | 0x00000000 |
| PID6 | 0xE00F_EFD8 | 32 bits | R | 0x00000000 |
| PID7 | 0xE00F_EFDC | 32 bits | R | 0x00000000 |
| PID0 | 0xE00F_EFE0 | 32 bits | R | 0x00000061 |
| PID1 | 0xE00F_EFE4 | 32 bits | R | 0x00000030 |
| PID2 | 0xE00F_EFE8 | 32 bits | R | 0x0000000A |
| PID3 | 0xE00F_EFEC | 32 bits | R | 0x00000000 |
| CID0 | 0xE00F_EFF0 | 32 bits | R | 0x0000000D |
| CID1 | 0xE00F_EFF4 | 32 bits | R | 0x00000010 |
| CID2 | 0xE00F_EFF8 | 32 bits | R | 0x00000005 |
| CID3 | 0xE00F_EFFC | 32 bits | R | 0x000000B1 |

## 2.6.4 DBGREG Module

The DBGREG module controls the debug functionalities and is implemented as a CoreSight-compliant component.

Table 2.11 shows the DBGREG registers other than the CoreSight component registers.

**Table 2.11 Non-CoreSight DBGREG registers**

| Name | | DAP port | Address | Access size | R/W |
|---|---|---|---|---|---|
| Debug Status Register | DBGSTR | Port 0 | 0x4001_B000 | 32 bits | R |
| Debug Stop Control Register | DBGSTOPCR | Port 0 | 0x4001_B010 | 32 bits | R/W |

## 2.6.4.1 DBGSTR : Debug Status Register

Base address: DBG = 0x4001_B000

Offset address: 0x00

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | CDBGPWRUPACK | CDBGPWRUPREQ | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 27:0 | — | These bits are read as 0. | R |
| 28 | CDBGPWRUPREQ | Debug power-up request<br>0: OCD is not requesting debug power up<br>1: OCD is requesting debug power up | R |
| 29 | CDBGPWRUPACK | Debug power-up acknowledge<br>0: Debug power-up request is not acknowledged<br>1: Debug power-up request is acknowledged | R |
| 31:30 | — | These bits are read as 0. | R |

The DBGSTR register is a status register which indicates the state of the debug power-up request to the MCU from the emulator.

## 2.6.4.2 DBGSTOPCR : Debug Stop Control Register

Base address: DBG = 0x4001_B000

Offset address: 0x10

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DBGSTOP_CPER | — | — | — | — | — | DBGSTOP_RECCR | DBGSTOP_RPER | — | — | — | — | — | DBGSTOP_LVD2 | DBGSTOP_LVD1 | DBGSTOP_LVD0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DBGSTOP_WDT | DBGSTOP_IWDT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DBGSTOP_IWDT | Mask bit for IWDT reset/interrupt in the OCD run mode<br>In the OCD break mode, the reset/interrupt is masked and IWDT counter is stopped, regardless of this bit value.<br>0: Enable IWDT reset/interrupt<br>1: Mask IWDT reset/interrupt and stop IWDT counter | R/W |
| 1 | DBGSTOP_WDT | Mask bit for WDT reset/interrupt in the OCD run mode<br>In the OCD break mode, the reset/interrupt is masked and WDT counter is stopped, regardless of this bit value.<br>0: Enable WDT reset/interrupt<br>1: Mask WDT reset/interrupt and stop WDT counter | R/W |
| 15:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | DBGSTOP_LVD0 | Mask bit for LVD0 reset<br>0: Enable LVD0 reset<br>1: Mask LVD0 reset | R/W |
| 17 | DBGSTOP_LVD1 | Mask bit for LVD1 reset/interrupt<br>0: Enable LVD1 reset/interrupt<br>1: Mask LVD1 reset/interrupt | R/W |
| 18 | DBGSTOP_LVD2 | Mask bit for LVD2 reset/interrupt<br>0: Enable LVD2 reset/interrupt<br>1: Mask LVD2 reset/interrupt | R/W |
| 23:19 | — | These bits are read as 0. The write value should be 0. | R/W |
| 24 | DBGSTOP_RPER | Mask bit for SRAM parity error reset/interrupt<br>0: Enable SRAM parity error reset/interrupt<br>1: Mask SRAM parity error reset/interrupt | R/W |
| 25 | DBGSTOP_RECCR | Mask bit for SRAM ECC error reset/interrupt<br>0: Enable SRAM ECC error reset/interrupt<br>1: Mask SRAM ECC error reset/interrupt | R/W |
| 30:26 | — | These bits are read as 0. The write value should be 0. | R/W |
| 31 | DBGSTOP_CPER | Mask bit for Cache SRAM parity error reset/interrupt<br>0: Enable Cache SRAM parity error reset/interrupt<br>1: Mask Cache SRAM parity error reset/interrupt | R/W |

The Debug Stop Control Register (DBGSTOPCR) controls the functional stop in OCD mode. All bits in the register are regarded as 0 when the MCU is not in OCD mode.

### 2.6.4.3 DBGREG CoreSight Component Registers

The DBGREG module provides the CoreSight component registers defined in the Arm CoreSight architecture.

Table 2.12 shows the registers. See reference 4. in section 2.13. References for details of each register.

**Table 2.12 DBGREG CoreSight component registers (1 of 2)**

| Name | Address | Access size | R/W | Initial value |
|---|---|---|---|---|
| PIDR4 | 0x4001_BFD0 | 32 bits | R | 0x00000004 |
| PIDR5 | 0x4001_BFD4 | 32 bits | R | 0x00000000 |
| PIDR6 | 0x4001_BFD8 | 32 bits | R | 0x00000000 |
| PIDR7 | 0x4001_BFDC | 32 bits | R | 0x00000000 |
| PIDR0 | 0x4001_BFE0 | 32 bits | R | 0x00000005 |
| PIDR1 | 0x4001_BFE4 | 32 bits | R | 0x00000030 |
| PIDR2 | 0x4001_BFE8 | 32 bits | R | 0x0000000A |
| PIDR3 | 0x4001_BFEC | 32 bits | R | 0x00000000 |
| CIDR0 | 0x4001_BFF0 | 32 bits | R | 0x0000000D |
| CIDR1 | 0x4001_BFF4 | 32 bits | R | 0x000000F0 |

**Table 2.12 DBGREG CoreSight component registers (2 of 2)**

| Name | Address | Access size | R/W | Initial value |
|---|---|---|---|---|
| CIDR2 | 0x4001_BFF8 | 32 bits | R | 0x00000005 |
| CIDR3 | 0x4001_BFFC | 32 bits | R | 0x000000B1 |

## 2.6.5 OCDREG Module

The OCDREG module are only accessible by the On-Chip Debug (OCD) emulator. OCDREG is implemented as a CoreSight-compliant component.

Table 2.13 lists the OCDREG registers.

**Table 2.13 OCDREG registers**

| Name | | DAP port | Address | Access size | R/W |
|---|---|---|---|---|---|
| MCU Status Register | MCUSTAT | Port 1 | 0x8000_0400 | 32 bits | R |
| MCU Control Register | MCUCTRL | Port 1 | 0x8000_0410 | 32 bits | R/W |
| JTAG Boot Mode Entry Register*1 | JBMDR | Port 1 | 0x8001_1100<br>0x4001_b100*2 | 32 bits | R/W |
| JTAG Boot Receive Data Register*1 | JBRDR | Port 1 | 0x8001_1120<br>0x4001_b120*2 | 32 bits | R/W |
| JTAG Boot Transmit Data Register*1 | JBTDR | Port 1 | 0x8001_1130<br>0x4001_b130*2 | 32 bits | R/W |
| JTAG Boot Status Register*1 | JBSTR | Port 1 | 0x8001_1140<br>0x4001_b140*2 | 32 bits | R/W |
| JTAG Boot Interrupt Control Register*1 | JBICR | Port 1 | 0x8001_1150<br>0x4001_b150*2 | 32 bits | R/W |

Note: OCDREG is located in the dedicated OCD address space. This address map is independent from the system address map.
Note 1. Accessible from both DAP and CPU. Others are DAP only.
Note 2. Address when accessing from CPU

### 2.6.5.1 MCUSTAT : MCU Status Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x400

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | SECDBG | DBGFUNCEN | — | — | — | — | — | — | — | — | — | CPUSTOPCLK | CPUSLEEP | — |
| Value after reset: | 0 | 0 | 1/0*1 | 1/0*1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1/0*1 | 1/0*1 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | — | These bits are read as 0. | R |
| 1 | CPUSLEEP | Sleep mode status<br>This bit is unpredictable when the MCU is in Software Standby mode or Snooze mode.<br>0: CPU is not in Sleep mode<br>1: CPU in Sleep mode | R |
| 2 | CPUSTOPCLK | CPU clock status<br>0: CPU clock is not stopped<br>1: CPU clock is stopped | R |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:3 | — | These bits are read as 0. | R |
| 8 | — | These bits are read as 1. | R |
| 11:9 | — | These bits are read as 0. | R |
| 12 | DBGFUNCEN | Debugger status<br>0: Debugger connection is not available<br>1: Debugger function is enabled | R |
| 13 | SECDBG | Secure Debug status<br>0: Secure Debug is not available<br>1: Secure Debug is available | R |
| 31:14 | — | These bits are read as 0. | R |

Note 1. Depends on the MCU status.

### 2.6.5.2 MCUCTRL : MCU Control Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x410

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CPUWAIT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | DBIRQ | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | DBIRQ*2 | Debug Interrupt Request<br>Writing 1 to the bit wakes up the MCU from low power mode. The condition can be cleared by writing 0 to the DBIRQ bit.<br>0: Debug interrupt not requested<br>1: Debug interrupt requested | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | CPUWAIT*2 | CPU Wait Setting<br>Write 1 to assert CPUWAIT, write 0 to deassert CPUWAIT*1.<br>0: Clear CPUWAIT to low<br>1: Set CPUWAIT to high | R/W |
| 31:17 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. CPUWAIT is used to prevent the processor from executing code immediately after reset.
Note 2. Access (R/W) to bit is valid only when Debug Level is DBG1 or DBG2.

### 2.6.5.3 JBMDR : SWD Boot Mode Entry Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x1_1100

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | KEY[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | KEY[7:0] | Mode Entry Key<br>Pin reset releases after 0xA5 is set, then system enters the SWD boot mode.<br>MDSR.JBOTS = 1 when system transitions to SWD boot mode. | R/W |
| 31:8 | — | These bits are read as 0. The write value should be 0. | |

The JBMDR register sets command from the debugger.

This register is initialized by POR or debugger disconnection.

The MCU supports the SWD interface but not the JTAG interface.

### 2.6.5.4 JBRDR : SWD Boot Receive Data Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x1_1120

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | RDAT[31:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | RDAT[31:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | RDAT[31:0] | Received Data Register<br>R/W is possible for both the external host and CPU, but the following usage is recommended:<br>W: External host<br>R: CPU (Boot Firmware)<br>When JBSTR.RDF = 1, write is not possible and an error occurs. | R/W |

The JBRDR register is used for receiving data from the debugger.

This register is initialized by a system reset.

The MCU supports the SWD interface but not the JTAG interface.

### 2.6.5.5 JBTDR : SWD Boot Transmit Data Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x1_1130

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | TDAT[31:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | TDAT[31:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | TDAT[31:0] | Transmitted Data Register<br>R/W is possible for both the external host and CPU, but the following usage is recommended:<br>W: CPU (Boot Firmware)<br>R: External host<br>When JBSTR.TDE = 1, read is not possible and an error occurs. | R/W |

The JBTDR register is used for transmitting data to the debugger.

This register is initialized by a system reset.

The MCU supports the SWD interface but not the JTAG interface.

### 2.6.5.6 JBSTR : SWD Boot Status Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x1_1140

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TDE | RDF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RDF | Receive Buffer Full<br>[Set conditions]<br>● Write access to JBRDR<br>● Write 1 to JBSTR.RDF<br>[Clear conditions]<br>● Read access to JBRDR<br>● Write 0 to JBSTR.RDF<br>0: No receiving data<br>1: There is receiving data | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1 | TDE | Transmit Data Empty<br>[Set conditions]<br>● Read access to JBTDR<br>● Write 1 to JBSTR.TDE<br>[Clear conditions]<br>● Write access to JBTDR<br>● Write 0 to JBSTR.TDE<br>0: There is data transmission<br>1: No data transmission | R/W |
| 31:2 | — | These bits are read as 0. The write value should be 0. | R/W |

The JBSTR register is used for monitoring booting status.

This register is initialized by a system reset.

The MCU supports the SWD interface but not the JTAG interface.

### 2.6.5.7 JBICR : SWD Boot Interrupt Control Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x1_1150

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RDFIE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RDFIE | Receive Buffer Full Interrupt Enable<br>0: Interrupt request disabled by RDF = 1<br>1: Enable interrupt request by RDF = 1 | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R/W |

The JBICR register is used for controlling interrupt during SWD Boot.

This register is initialized by a system reset.

The MCU supports the SWD interface but not the JTAG interface.

### 2.6.5.8 OCDREG CoreSight Component Registers

The OCDREG module provides the CoreSight component registers defined in the Arm CoreSight architecture.

Table 2.14 shows the registers. See reference 4. in section 2.13. References for details of each register.

**Table 2.14 OCDREG CoreSight component registers (1 of 2)**

| Name | Address | Access size | R/W | Initial value |
|---|---|---|---|---|
| PIDR4 | 0x8000_0FD0 | 32 bits | R | 0x00000004 |
| PIDR5 | 0x8000_0FD4 | 32 bits | R | 0x00000000 |
| PIDR6 | 0x8000_0FD8 | 32 bits | R | 0x00000000 |
| PIDR7 | 0x8000_0FDC | 32 bits | R | 0x00000000 |
| PIDR0 | 0x8000_0FE0 | 32 bits | R | 0x00000004 |
| PIDR1 | 0x8000_0FE4 | 32 bits | R | 0x00000030 |

**Table 2.14 OCDREG CoreSight component registers (2 of 2)**

| Name | Address | Access size | R/W | Initial value |
|---|---|---|---|---|
| PIDR2 | 0x8000_0FE8 | 32 bits | R | 0x0000000A |
| PIDR3 | 0x8000_0FEC | 32 bits | R | 0x00000000 |
| CIDR0 | 0x8000_0FF0 | 32 bits | R | 0x0000000D |
| CIDR1 | 0x8000_0FF4 | 32 bits | R | 0x000000F0 |
| CIDR2 | 0x8000_0FF8 | 32 bits | R | 0x00000005 |
| CIDR3 | 0x8000_0FFC | 32 bits | R | 0x000000B1 |

## 2.6.6 CPUDSAR : CPU Debug Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x1B0

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CPUDSA0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | CPUDSA0 | CPU Debug Security Attribution 0<br>0: Secure<br>1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only secure access can write to this register. Both secure access and non-secure read access are allowed. Non-secure write access is denied, and no TrustZone access error is generated.

Note: This register is write-protected by PRCR register.

When Debug level of the MCU is DBG2, by guarding entire EPPB bus, the non-secure access from CPU to debug related components is completely controlled by the current value of the CPUDSA0 bit. Since this bit is modifiable only when CPU is in secure state, user must be aware of the CPUDSAR register before using CoreSight debug components.

### CPUDSA0 bit (CPU Debug Security Attribution 0)

Security attributes of register for accessing the debug component of the CPU.

0: Debug component can only be accessed with secure access.

1: There is no restriction on accessing the debug component.

## 2.6.7 Processing on Error Response Generated by CPU Access

In addition to the specific-error detection specification of the Arm Cortex-M33 processor, this MCU also provides additional error information which is described in section 13, Buses.

This section describes how to handle the additional error information with no conflict to that of the Arm Cortex-M33 processor.

Table 2.15 shows error detection modules, which are also described in section 13, Buses. These error detection modules not only provide error information on the bus module, but also notify the processor to trigger the exception handler.

**Table 2.15 Error detection modules**

| | NMI/RESET request | Interrupt | Bus error status register | Error address register Error RW register |
|---|---|---|---|---|
| Slave TZF | NMISR.TZFST | Bus Fault*1 (Hard Fault) | BUS.BUSnERRSTAT.STERRSTAT | BUS.BTZFnERRADD BUS.BTZFnERRRW |
| Slave bus error | — | Bus Fault*1 (Hard Fault) | BUS.BUSnERRSTAT.SLERRSTAT | BUS.BUSnERRADD BUS.BUSnERRRW |
| Illegal address access error | — | Bus Fault*1 (Hard Fault) | BUS.BUSnERRSTAT.ILERRSTAT | BUS.BUSnERRADD BUS.BUSnERRRW |

Note 1. A Bus Fault can be treated as HardFault. For details, see *ARM® Cortex®-M33 Device Generic User Guide* in the section 2.13. References.

To prevent unexpected operation, when handling the exception, additional operation should be added into exception routing.

BusFault when occurred by error detected as shown in Table 2.15:

- See section 13, Buses for the error information in the corresponding register
- Clear the data in cache for the error address
- Clear the Error Status register in the bus module
- Service exception handling with Arm-guided operation

For a Bus Fault that is not detected in the Renesas-specific error detection module (occurred inside the Arm Cortex-M33 core), see the *ARM® Cortex®-M33 Device Generic User Guide* to handle this case.

In the system bus specification, there is a specific case for Slave TrustZone Filter, that is, if an error is selected to generate an NMI, then before the processor handles the Bus Fault exception, NMI with higher priority takes the exception first. Therefore, use the BusFault handler and not NMI handler to handle this error. In other words, the NMI status should be cleared but the error status bit should not be cleared to ensure that BusFault captures all the error information.

Figure 2.4 and Figure 2.5 show the recommended flows for NMI handler and BusFault handler for the errors described in Table 2.15.

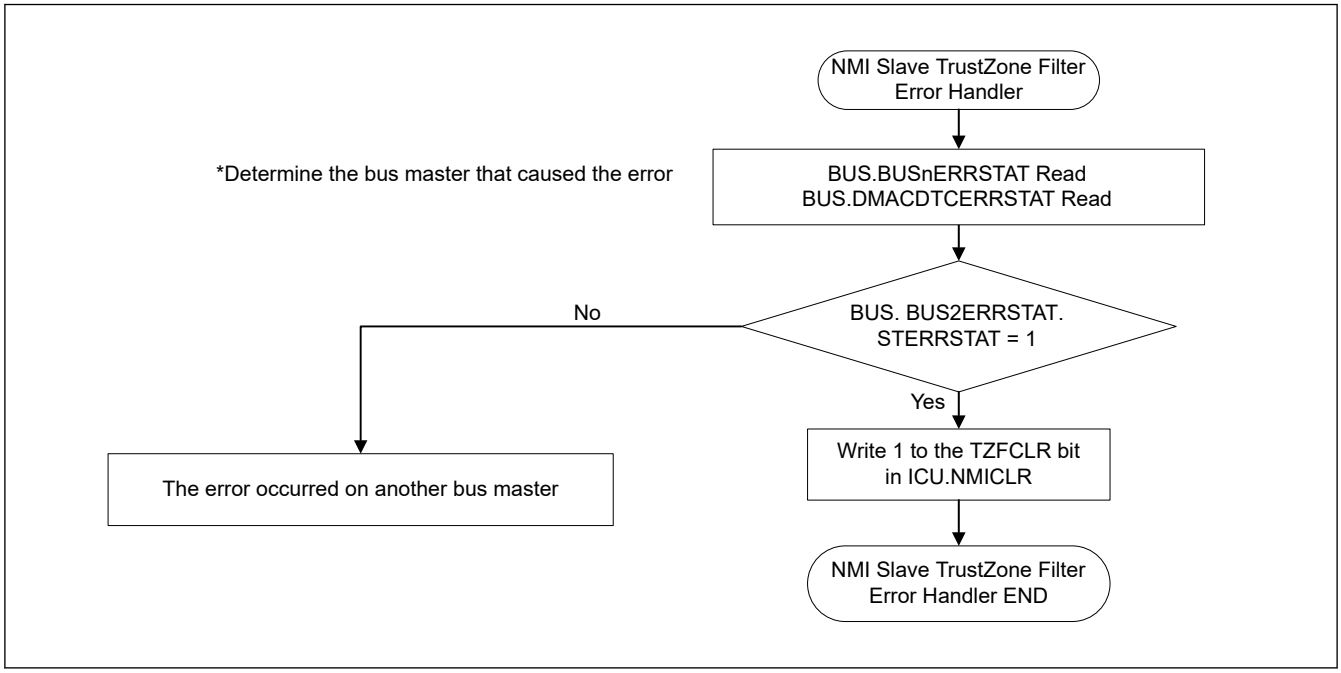

**Figure 2.4 NMI handling flowchart**

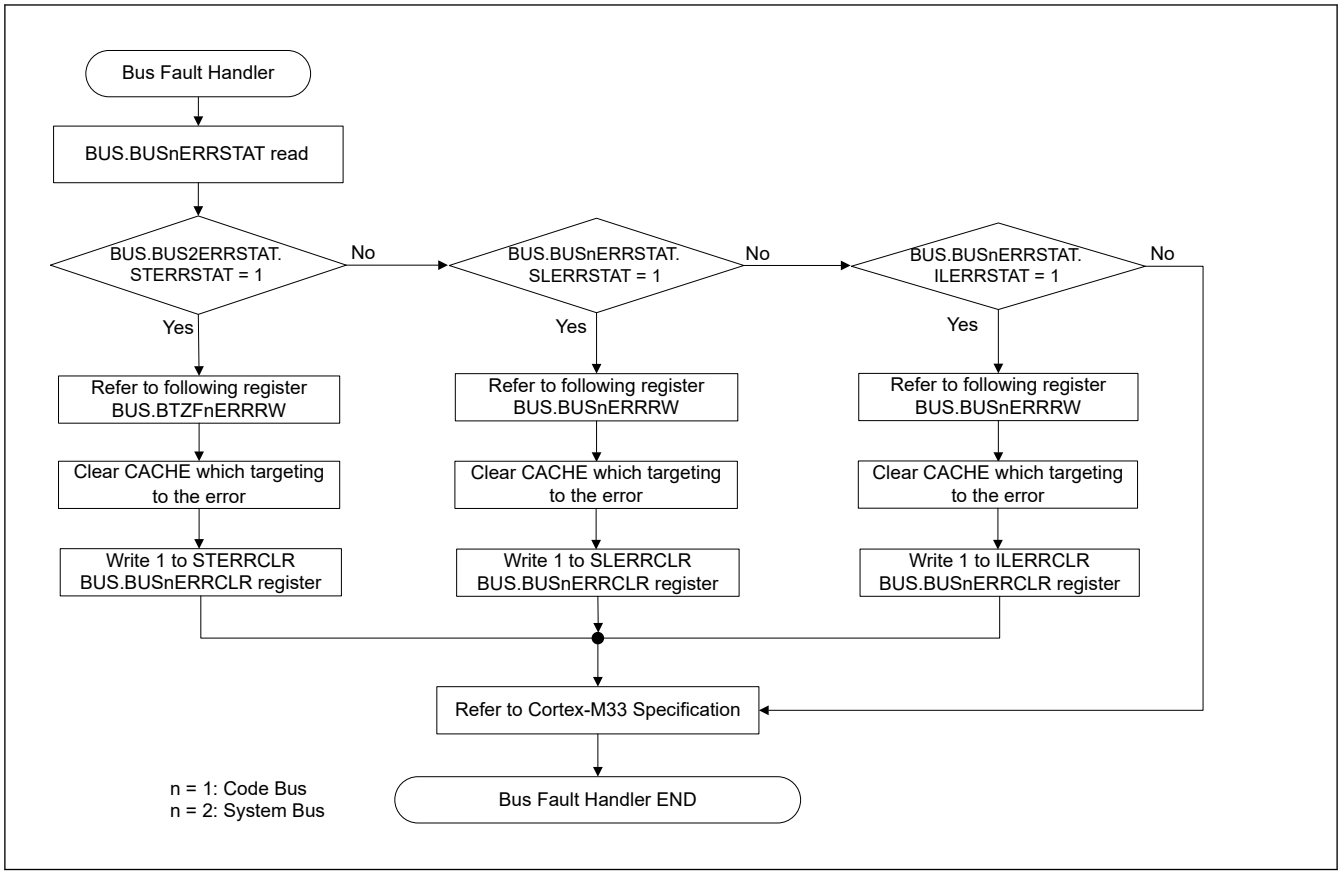

**Figure 2.5 BusFault interrupt handling flowchart**

## 2.7 CoreSight Cross Trigger Interface (CTI)

As shown in Figure 2.6, the input and output of a Cross Trigger Interface (CTI) interact with each other through four CTM channels. Input of a CTI can be used to trigger the output of another CTI using the four CTM channels.

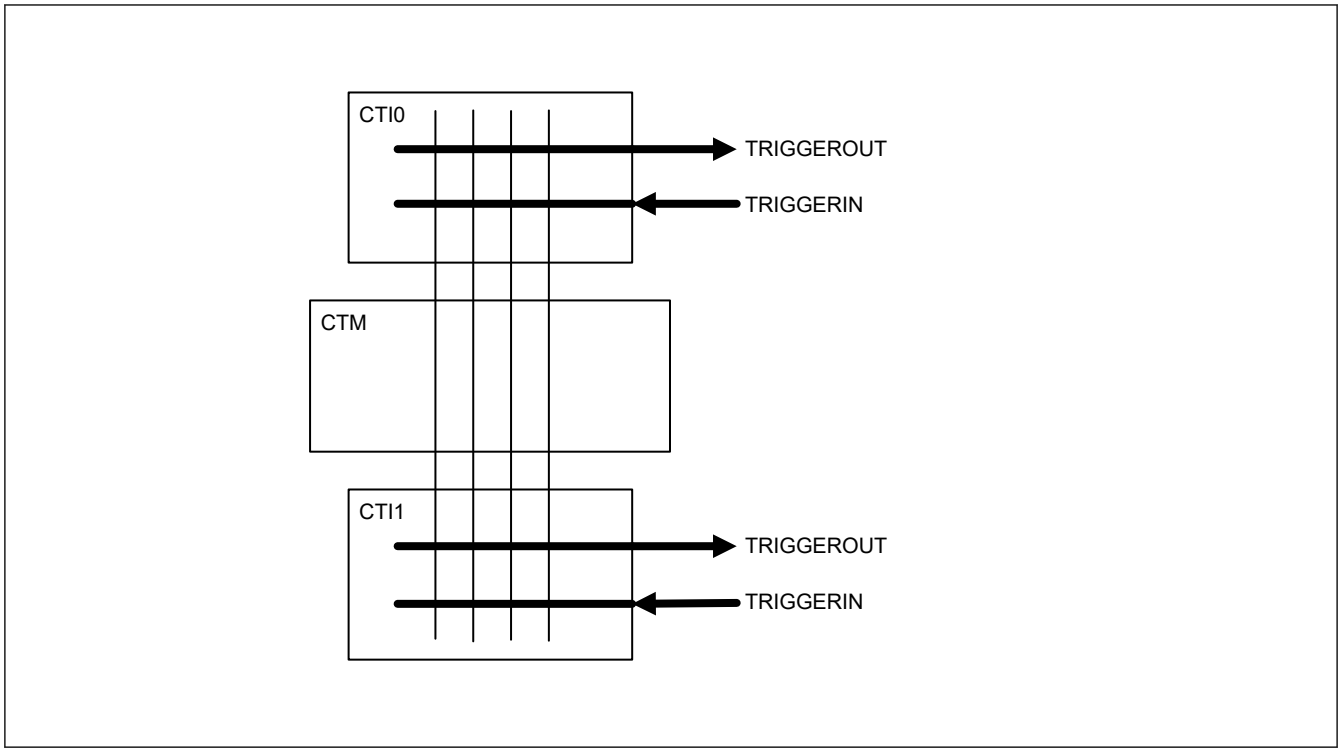

**Figure 2.6 CTI System**

Debug Interrupt Request (DBGIRQ) is controlled by MCUCTRL register in OCDREG module.

**Table 2.16 CTI Trigger signals**

| Number of CTI channel | CTITRIGIN | | CTITRIGOUT | |
|---|---|---|---|---|
| CTI0 (Debug common) | 0 | ACQCOMP | 0 | — |
| | 1 | FULL | 1 | — |
| | 2 | DBIRQ | 2 | ETB FLUSHIN |
| | 3 | — | 3 | ETB TRIGIN |
| | 4 | — | 4 | — |
| | 5 | — | 5 | — |
| | 6 | — | 6 | — |
| | 7 | — | 7 | — |
| CTI1 (CPU) | 0 | Processor Halted | 0 | Processor debug request |
| | 1 | DWT Comparator Output 0 | 1 | Processor Restart |
| | 2 | DWT Comparator Output 1 | 2 | CTIIRQ[0] (Connected to IRQ64) |
| | 3 | DWT Comparator Output 2 | 3 | CTIIRQ[1] (Connected to IRQ65) |
| | 4 | ETM Event Output 0 | 4 | ETM Event Input 0 |
| | 5 | ETM Event Output 1 | 5 | ETM Event Input 1 |
| | 6 | — | 6 | ETM Event Input 2 |
| | 7 | — | 7 | ETM Event Input 3 |

## 2.8 CoreSight ATB Funnel

There is one CoreSight ATB funnel in the MCU. The funnel has two ATB slaves and one ATB master, and it selects the debug trace source from ETM and ITM to ETB. Figure 2.7 shows the CoreSight ATB connection in the MCU.

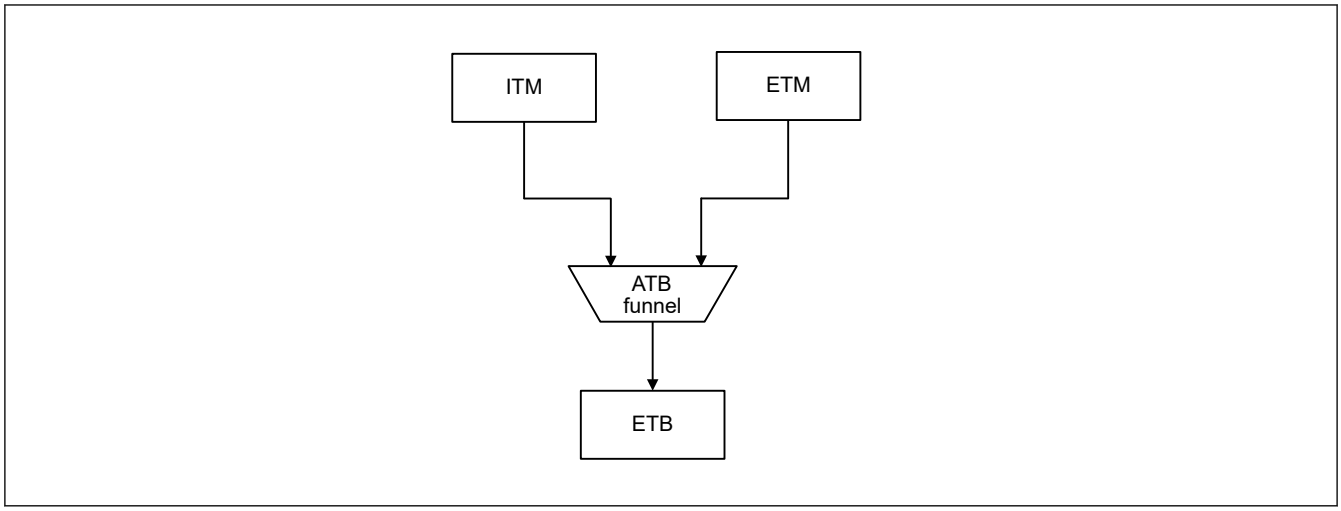

**Figure 2.7 CoreSight ATB connection**

Table 2.17 shows the ATB slave connection for the funnel.

**Table 2.17 ATB slave connection**

| ATB slave number | Connected trace source |
|---|---|
| #0 | ITM |
| #1 | ETM |

See reference 4. in section 2.13. References for details of the ATB and funnel.

## 2.9 Break Point Unit

The MCU has Break Point Unit. See Break Point Unit chapter of reference 1. in section 2.13. References for details about register description of this module.

## 2.10 CoreSight Time Stamp Generator

A CoreSight Time Stamp Generator provides a CPU clock-based timestamp to ITM and ETM. The timestamp is generated by a 64-bit counter. See reference 4. in section 2.13. References for details.

## 2.11 SysTick Timer

The MCU has SysTick timer that provides two 24-bit down counters, non-secure and secure counters. The timer can select SysTick timer clock (SYSTICCLK) or System clock (ICLK).

See section 8, Clock Generation Circuit and reference 1. in section 2.13. References for details.

Note: SysTick timer counter operation is enabled by signal synchronized with CPU clock. Therefore, the counter might not operate correctly if the CPU clock is slower than the SysTick timer clock. In other words, clock setting must satisfy the following: CPU clock ≥ SysTick timer clock (LOCO: 32.768 kHz).

## 2.12 OCD Emulator Connection

In this product, the MCU confirms the access permission for Non-secure debug and Non-secure chip resources by checking Debug level is DBG1 or higher. For full access permission for debug and chip resources, Secure debug level DBG2 is required.

Figure 2.8 shows a block diagram of SWD authentication mechanism.

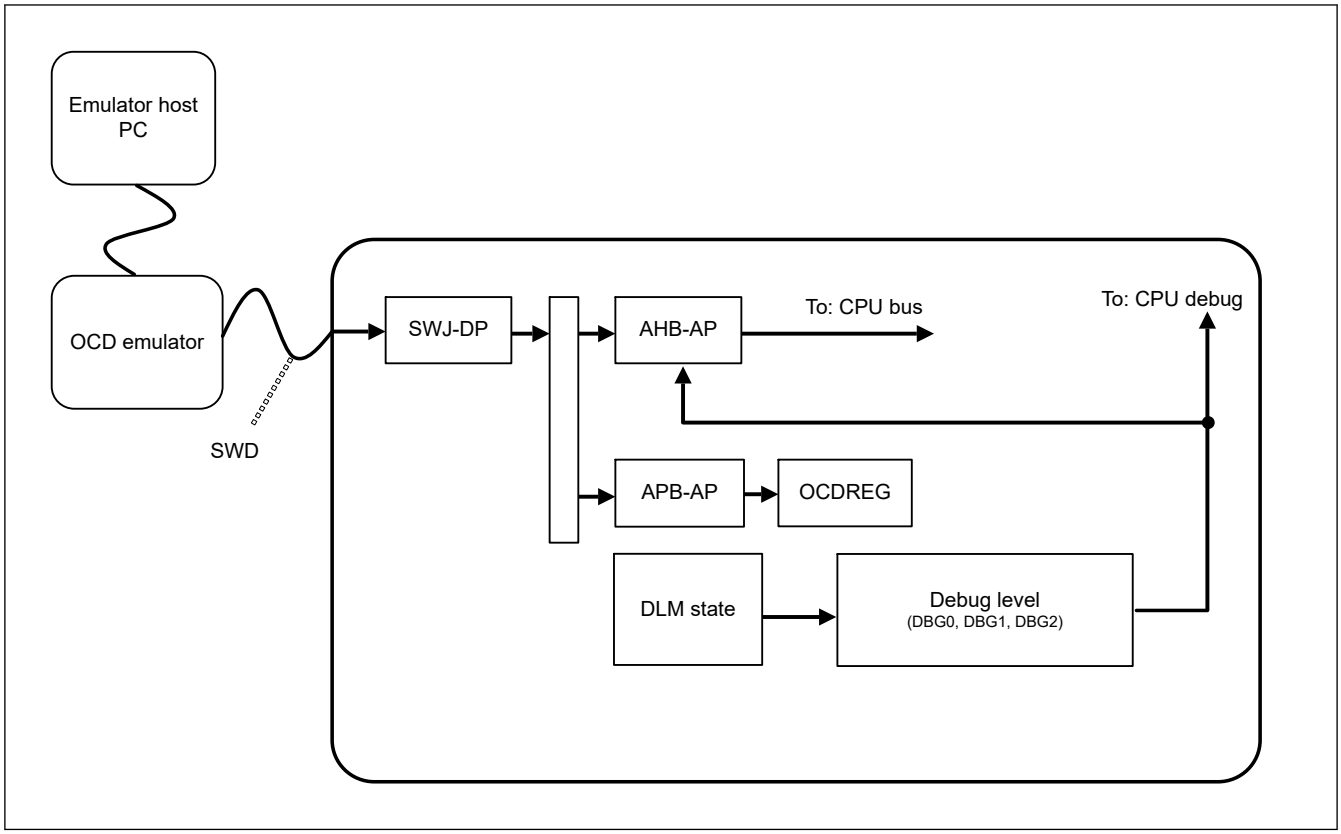

**Figure 2.8 SWD Authentication mechanism block diagram**

Three levels of debug capability are available, DBG0, DBG1, and DBG2, which correspond to the Device Level Management (DLM) states. When debug level is DBG0, access to debug components and system bus from OCD emulator is not permitted. When debug level is DBG1 or DBG2, the corresponding non-secure or secure debug components and system bus can be accessed from the OCD emulator. See Table 2.4 for more information about debug levels.

### 2.12.1 DBGEN

After the OCD emulator gets access permission, the OCD emulator must set the DBGEN bit in the System Control OCD Control Register (SYOCDCR). In addition, the OCD emulator must clear the DBGEN bit before disconnecting it. See section 10, Low Power Modes for details.

### 2.12.2 Restrictions on connecting an OCD emulator

This section describes the restrictions on emulator access.

#### 2.12.2.1 Starting connection while in low power mode

When starting a SWD connection from an OCD emulator, the MCU must be in Normal or Sleep mode. If the MCU is in Software Standby or Snooze mode, the OCD emulator can cause the MCU to hang.

#### 2.12.2.2 Changing low power mode while in OCD mode

When the MCU is in OCD mode, the low power mode can be changed. However, system bus access from AHB-AP is prohibited in Software Standby or Snooze mode. Only SWJ-DP, APB-AP, and OCDREG can be accessed from the OCD emulator in these modes. Table 2.18 shows the restrictions.

**Table 2.18 Restrictions by mode (1 of 2)**

| Active mode | Start OCD emulator connection | Change low power mode | Access AHB-AP and system bus | Access APB-AP and OCDREG |
|---|---|---|---|---|
| Normal | Yes | Yes | Yes | Yes |
| Sleep | Yes | Yes | Yes | Yes |

**Table 2.18 Restrictions by mode (2 of 2)**

| Active mode | Start OCD emulator connection | Change low power mode | Access AHB-AP and system bus | Access APB-AP and OCDREG |
|---|---|---|---|---|
| Software Standby | No | Yes | No | Yes |
| Snooze | No | Yes | No | Yes |

If system bus access is required in Software Standby or Snooze mode, set the MCUCTRL.DBIRQ bit in OCDREG to wake up the MCU from the low power modes. Simultaneously, by asserting the MCUCTRL.DBIRQ bit in OCDREG, the OCD emulator can wake up the MCU without starting CPU execution by using a CPU break.

#### 2.12.2.3 Connecting sequence and SWD authentication

1. Connect the OCD debugger to the MCU through the SWD interface.
2. Set up SWJ-DP to access DAP bus.
   In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJDP.
   Control Status Register, and then wait until CDBGPWRUPACK in the same register is asserted.
3. Set the APB-AP to access OCDREG. This APB-AP is connected to DAP bus port 1.
4. Set MCUCTRL.CPUWAIT = 1.
5. Confirm the debug capability of device by reading MCUSTAT:
   - If Debug function is prohibited, this device is not able to debug.
   - If Debug function is enabled and secure debug is not available, only non-secure debug is available.
   - If Debug function is enabled and secure debug is available, full debug functions are available.

   If Debug function is available, set debug-related register then clear MCUCTRL.CPUWAIT = 0.
6. Set up the AHB-AP to access the system address space. The AHB-AP is connected to DAP bus port 0.
7. Set SYOCDCR.DBGEN to 1.
8. Start accessing the CPU debug resources using the AHB-AP.

Note: Debug level is determined by the current DLM state of product.

# 3. Operating Modes

## 3.1 Overview

Table 3.1 shows the selection of operating modes by the mode-setting pin. For details, see section 3.2. Details of Operating Modes. Operation starts with the on-chip flash memory enabled, regardless of the mode in which operation started.

**Table 3.1 Selection of operating modes by the mode-setting pin**

| Mode-setting pin (MD) | Operating mode | On-chip Flash |
|---|---|---|
| 1 | Single chip mode/SWD boot mode | Enable |
| 0 | SCI/USB boot mode | Enable |

## 3.2 Details of Operating Modes

### 3.2.1 Single-Chip Mode

In single-chip mode, all I/O pins are available for use as input or output port, inputs or outputs for peripheral functions, or as interrupt inputs.

When a reset is released while the MD pin is high, the MCU starts in single-chip mode and the on-chip flash is enabled.

### 3.2.2 SCI Boot Mode

In this mode, the on-chip flash memory programming routine (SCI boot program), stored in the boot area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using a universal asynchronous receiver/transmitter (UART) SCI. For details, see section 45, Flash Memory. The MCU starts in SCI boot mode if the MD pin is held low on release from the reset state.

### 3.2.3 USB Boot Mode

In this mode, the on-chip flash memory programming routine (USB boot program), stored in the boot area within the MCU, is used. The on-chip flash, including the code flash memory and data flash memory, can be modified from outside the MCU by using the USB. For details, see section 45, Flash Memory. The MCU starts in USB boot mode if the MD pin is held low on release from the reset state.

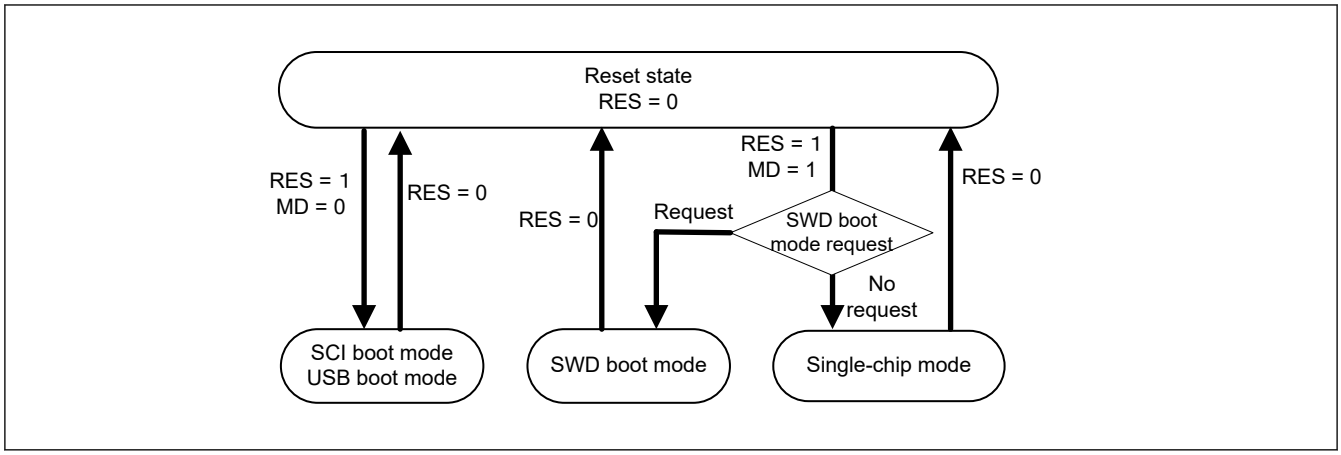
### 3.2.4 SWD Boot Mode

In this mode, the on-chip flash memory programming routine (SWD boot program), stored in the boot area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using the SWD interface. For details, see section 45, Flash Memory. To enter this mode, it is necessary to input the request from the SWD-I/F during RES pin reset.

## 3.3 Operating Modes Transitions

### 3.3.1 Operating Mode Transitions as Determined by the Mode-Setting Pin

Figure 3.1 shows operating mode transitions determined by the MD pin settings.



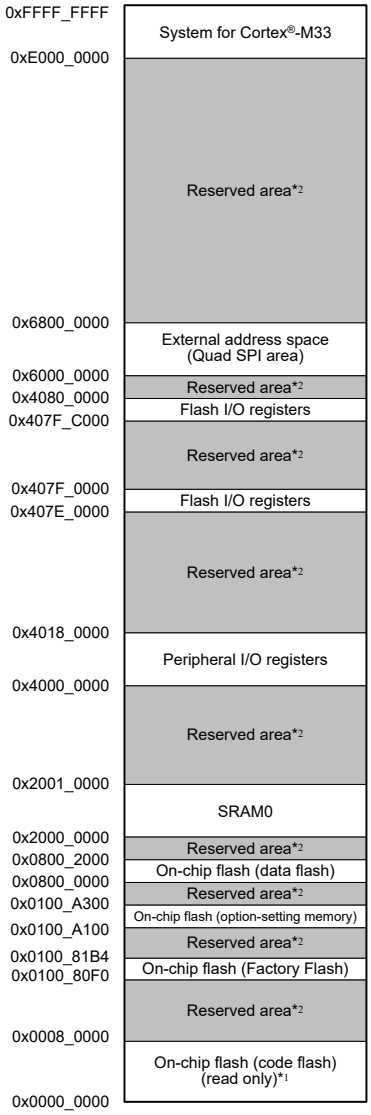


**Figure 3.1 Mode-setting pin level and operating mode**

# 4. Address Space

## 4.1 Address Space

The MCU supports a 4-GB linear address space ranging from 0x0000_0000 to 0xFFFF_FFFF that can contain both program and data. Figure 4.1 shows the memory map.

Note 1. See Table 4.1. The capacity of the flash differs depending on the product.
Note 2. Do not access reserved areas.

**Figure 4.1 Memory map**

**Table 4.1 Capacity of the code flash memory, data flash memory, and SRAM0**

| Code flash memory | | Data flash memory | | SRAM0 | |
|---|---|---|---|---|---|
| **Capacity** | **Address** | **Capacity** | **Address** | **Capacity** | **Address** |
| 512 KB | 0x0000_0000 - 0x0007_FFFF | 8 KB | 0x0800_0000 - 0x0800_1FFF | 64 KB | 0x2000_0000 - 0x2000_FFFF |
| 256 KB | 0x0000_0000 - 0x0003_FFFF | | | | |

# 5. Resets

## 5.1 Overview

The MCU provides 13 resets.

Table 5.1 lists the reset names and sources.

**Table 5.1 Reset names and sources**

| Reset name | Source |
|---|---|
| RES pin reset | Voltage input to the RES pin is driven low |
| Power-on reset | VCC fall (voltage detection $V_{POR}$)*1 |
| Independent watchdog timer reset | IWDT underflow or refresh error |
| Watchdog timer reset | WDT underflow or refresh error |
| Voltage monitor 0 reset | VCC fall (voltage detection $V_{det0}$)*1 |
| Voltage monitor 1 reset | VCC fall (voltage detection $V_{det1}$)*1 |
| Voltage monitor 2 reset | VCC or EXLVD fall (voltage detection $V_{det2}$)*1 |
| SRAM parity error reset | SRAM parity error detection |
| SRAM ECC error reset | SRAM ECC error detection |
| Bus master MPU error reset | Bus master MPU error detection |
| TrustZone error reset | TrustZone error detection |
| Cache Parity error reset | Cache Parity error detection |
| Software reset | Register setting (use the software reset bit AIRCR.SYSRESETREQ) |

Note 1. For details on the voltages to be monitored ($V_{POR}$, $V_{det0}$, $V_{det1}$, and $V_{det2}$), see section 7, Low Voltage Detection (LVD) and section 49, Electrical Characteristics.

The internal state and pins are initialized by a reset. Table 5.2 and Table 5.3 list the targets initialized by resets.

**Table 5.2 Reset detect flags initialized by each reset source (1 of 2)**

| Flag to be initialized | Reset source | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RES pin reset | Power-on reset | Voltage monitor 0 reset | Independent watchdog timer reset | Watchdog timer reset | Voltage monitor 1 reset | Voltage monitor 2 reset | Software reset | SRAM parity error reset | SRAM ECC error reset | Bus master MPU error reset | TrustZone reset error | Cache Parity error reset |
| Power-On Reset Detect Flag (RSTSR0.PORF) | ✓ | — | — | — | — | — | — | — | — | — | — | — | — |
| Voltage Monitor 0 Reset Detect Flag (RSTSR0.LVD0RF) | ✓ | ✓ | — | — | — | — | — | — | — | — | — | — | — |
| Independent Watchdog Timer Reset Detect Flag (RSTSR1.IWDTRF) | ✓ | ✓ | ✓ | — | — | — | — | — | — | — | — | — | — |
| Watchdog Timer Reset Detect Flag (RSTSR1.WDTRF) | ✓ | ✓ | ✓ | — | — | — | — | — | — | — | — | — | — |

**Table 5.2 Reset detect flags initialized by each reset source (2 of 2)**

| Flag to be initialized | Reset source | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RES pin reset | Power-on reset | Voltage monitor 0 reset | Independent watchdog timer reset | Watchdog timer reset | Voltage monitor 1 reset | Voltage monitor 2 reset | Software reset | SRAM parity error reset | SRAM ECC error reset | Bus master MPU error reset | TrustZone reset error | Cache Parity error reset |
| Voltage Monitor 1 Reset Detect Flag (RSTSR0.LVD1RF) | ✓ | ✓ | ✓ | — | — | — | — | — | — | — | — | — | — |

Note: ✓ : Initialized
— : Not initialized

Note 1. The RTC has a software reset. Some control bits are not initialized by all types of resets. For details on the target bits, see section 22, Realtime Clock (RTC).

Note 2. Some control bits are not initialized by all types of resets. For details on the target bits, see section 13, Buses

Note 3. Reset does not occur while the debugger is connected (DBGSTR.CDBGPWRUPREQ = 1) even if On-chip debugger is disabled (SYOCDCR.DBGEN = 0).

The RTC is not initialized by any reset source. SOSC and LOCO can be selected as the clock sources of the RTC.

Table 5.4 and Table 5.5 show the states of SOSC and LOCO when a reset occurs.

**Table 5.4 States of SOSC when a reset occurs**

| | | Reset source | |
|---|---|---|---|
| | | POR | Other |
| SOSC | Enable or disable | Initialized to disable | Continue with the state that was selected before the reset occurred |
| | Drive capability | Initialized to Nomal Mode | Continue with the state that was selected before the reset occurred |
| | XCIN/XCOUT | Initialized to Port Mode | Continue with the state that was selected before the reset occurred |

**Table 5.5 States of LOCO when a reset occurs**

| | | Reset source | |
|---|---|---|---|
| | | POR, LVD0, LVD1, LVD2 | Other |
| LOCO | Enable or disable | Initialized to enable | |
| | Oscillation accuracy*1 | Initialized to accuracy before trimming by power-on (accuracy: ± 10%) | Continue with the accuracy that was trimmed by LOCOUTCR |

Note 1. The LOCO User Trimming Control Register (LOCOUTCR) is reset by POR, LVD0, LVD1, and LVD2 resets returning the LOCO to the default oscillation accuracy. This can affect RTC accuracy if the RTC uses the LOCO (with a user trimming value in LOCOUTCR) as the RTC source clock. To restore the pre-reset LOCO oscillation accuracy, reload the required trimming value into LOCOUTCR after any of these resets.

When a reset is released, reset exception handling starts.

Table 5.6 lists the pin related to the reset function.

**Table 5.6 Pin related to reset**

| Pin name | I/O | Function |
|---|---|---|
| RES | Input | Reset pin |

## 5.2 Register Descriptions

### 5.2.1 RSTSAR : Reset Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3C4

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 2 | NONSEC2 | Non-secure Attribute bit 2<br>Target register: Reset Status Register 2<br>0: Secure<br>1: Non-secure | R/W |
| 31:3 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

### NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of RSTSR0.

### NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of RSTSR1.

### NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of RSTSR2.

## 5.2.2 RSTSR0 : Reset Status Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x410

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | LVD2RF | LVD1RF | LVD0RF | PORF |
| Value after reset: | 0 | 0 | 0 | 0 | x*1 | x*1 | x*1 | x*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PORF | Power-On Reset Detect Flag<br>0: Power-on reset not detected<br>1: Power-on reset detected | R/W*2 |
| 1 | LVD0RF | Voltage Monitor 0 Reset Detect Flag<br>0: Voltage monitor 0 reset not detected<br>1: Voltage monitor 0 reset detected | R/W*2 |
| 2 | LVD1RF | Voltage Monitor 1 Reset Detect Flag<br>0: Voltage monitor 1 reset not detected<br>1: Voltage monitor 1 reset detected | R/W*2 |
| 3 | LVD2RF | Voltage Monitor 2 Reset Detect Flag<br>0: Voltage monitor 2 reset not detected<br>1: Voltage monitor 2 reset detected | R/W*2 |
| 7:4 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. The value after reset depends on the reset source.
Note 2. The register is cleared when a reset source listed in Table 5.2 occurs or when 0 is written to clear a flag. Bits other than the flag that is cleared should be set to 1.

### PORF flag (Power-On Reset Detect Flag)

The PORF flag indicates that a power-on reset occurred.

[Setting condition]

- When a power-on reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When PORF is read as 1 and then 0 is written to PORF

### LVD0RF flag (Voltage Monitor 0 Reset Detect Flag)

The LVD0RF flag indicates that the VCC voltage fell below $V_{det0}$.

[Setting condition]

- When a voltage monitor 0 reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When LVD0RF is read as 1 and then 0 is written to LVD0RF.

### LVD1RF flag (Voltage Monitor 1 Reset Detect Flag)

The LVD1RF flag indicates that the VCC voltage fell below $V_{det1}$.

[Setting condition]

- When a voltage monitor 1 reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When LVD1RF is read as 1 and then 0 is written to LVD1RF

### LVD2RF flag (Voltage Monitor 2 Reset Detect Flag)

The LVD2RF flag indicates that the VCC or EXLVD voltage fell below $V_{det2}$.

[Setting condition]

- When a voltage monitor 2 reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When LVD2RF is read as 1 and then 0 is written to LVD2RF

## 5.2.3 RSTSR1 : Reset Status Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x0C0

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | CPERF | — | TZERF | — | BUSMRF | — | REERF | RPERF | — | — | — | — | — | SWRF | WDTRF | IWDTRF |
| Value after reset: | x*1 | 0 | x*1 | 0 | x*1 | 0 | x*1 | x*1 | 0 | 0 | 0 | 0 | 0 | x*1 | x*1 | x*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | IWDTRF | Independent Watchdog Timer Reset Detect Flag<br>0: Independent watchdog timer reset not detected<br>1: Independent watchdog timer reset detected | R/W*2 |
| 1 | WDTRF | Watchdog Timer Reset Detect Flag<br>0: Watchdog timer reset not detected<br>1: Watchdog timer reset detected | R/W*2 |
| 2 | SWRF | Software Reset Detect Flag<br>0: Software reset not detected<br>1: Software reset detected | R/W*2 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | RPERF | SRAM Parity Error Reset Detect Flag<br>0: SRAM parity error reset not detected<br>1: SRAM parity error reset detected | R/W*2 |
| 9 | REERF | SRAM ECC Error Reset Detect Flag<br>0: SRAM ECC error reset not detected<br>1: SRAM ECC error reset detected | R/W*2 |
| 10 | — | This bit is read as 0. The write value should be 0. | R/W |
| 11 | BUSMRF | Bus Master MPU Error Reset Detect Flag<br>0: Bus master MPU error reset not detected<br>1: Bus master MPU error reset detected | R/W*2 |
| 12 | — | This bit is read as 0. The write value should be 0. | R/W |
| 13 | TZERF | TrustZone Error Reset Detect Flag<br>0: TrustZone error reset not detected<br>1: TrustZone error reset detected | R/W*2 |
| 14 | — | This bit is read as 0. The write value should be 0. | R/W |
| 15 | CPERF | Cache Parity Error Reset Detect Flag<br>0: Cache Parity error reset not detected<br>1: Cache Parity error reset detected | R/W*2 |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. The value after reset depends on the reset source.
Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

### IWDTRF flag (Independent Watchdog Timer Reset Detect Flag)

The IWDTRF flag indicates that an independent watchdog timer reset occurs.

[Setting condition]

- When an independent watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 1 is read and then 0 is written to IWDTRF.

### WDTRF flag (Watchdog Timer Reset Detect Flag)

The WDTRF flag indicates that a watchdog timer reset occurs.

[Setting condition]

- When a watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 1 is read and then 0 is written WDTRF.

### SWRF flag (Software Reset Detect Flag)

The SWRF flag indicates that a software reset occurs.

[Setting condition]

- When a software reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs

- When 1 is read and then 0 is written to SWRF.

### RPERF flag (SRAM Parity Error Reset Detect Flag)

The RPERF flag indicates that an SRAM parity error reset occurs.

[Setting condition]

- When an SRAM parity error reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 1 is read as 1 and then 0 is written to RPERF.

### REERF flag (SRAM ECC Error Reset Detect Flag)

The REERF flag indicates that an SRAM ECC error reset occurs.

[Setting condition]

- When an SRAM ECC error reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 1 is read as 1 and then 0 is written to REERF.

### BUSMRF flag (Bus Master MPU Error Reset Detect Flag)

The BUSMRF flag indicates that a bus master MPU error reset occurs.

[Setting condition]

- When a bus master MPU error reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 1 is read and then 0 is written to BUSMRF.

### TZERF flag (TrustZone Error Reset Detect Flag)

The TZERF flag indicates that a TrustZone error reset has occurred.

[Setting condition]

- When a TrustZone error reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 1 is read then and 0 is written to TZERF.

### CPERF flag (Cache Parity Error Reset Detect Flag)

The CPERF flag indicates that a Cache Parity error reset has occurred.

[Setting condition]

- When a Cache Parity error reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs.
- When CPERF is read as 1 and then 0 is written to CPERF.

### 5.2.4 RSTSR2 : Reset Status Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x411

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | CWSF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | CWSF | Cold/Warm Start Determination Flag<br>0: Cold start<br>1: Warm start | R/W*2 |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. The value after reset depends on the reset source.
Note 2. Only 1 can be written to set the flag.

RSTSR2 determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

#### CWSF flag (Cold/Warm Start Determination Flag)

The CWSF flag indicates the type of reset processing, either cold start or warm start. The determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start). CWSF flag is initialized by a power-on reset. It is not initialized by a reset signal generated by the RES pin.

[Setting condition]

- When 1 is written by software.

[Clearing condition]

- When a reset listed in Table 5.2 occurs.

## 5.3 Operation

### 5.3.1 RES Pin Reset

The RES pin generates this reset. When the RES pin is driven low, all the processing in progress is aborted and the MCU enters a reset state. To successfully reset the MCU, the RES pin must be held low for the power supply stabilization time specified at power-on.

When the RES pin is driven high from low, the internal reset is canceled after the post-RES cancellation wait time ($t_{RESWT}$) elapses. The CPU then starts the reset exception handling.

For details, see section 49, Electrical Characteristics.

### 5.3.2 Power-On Reset

The power-on reset (POR) is an internal reset generated by the power-on reset circuit. A power-on reset is generated under the following conditions.

1. If the RES pin is in a high level state when power is supplied
2. If the RES pin is in a high level state when VCC is below $V_{POR}$

After VCC exceeds $V_{POR}$ and the specified power-on reset time ($t_{POR}$) elapses, the CPU starts the reset exception handling. The power-on reset time is a stabilization period of the external power supply and the MCU circuit.

After a power-on reset is generated, the PORF flag in the RSTSR0 is set to 1. The PORF flag is initialized by the RES pin reset. When VCC falls below $V_{POR}$, a power-on reset state is occurred.

Figure 5.1 shows example of operations during a power-on reset.

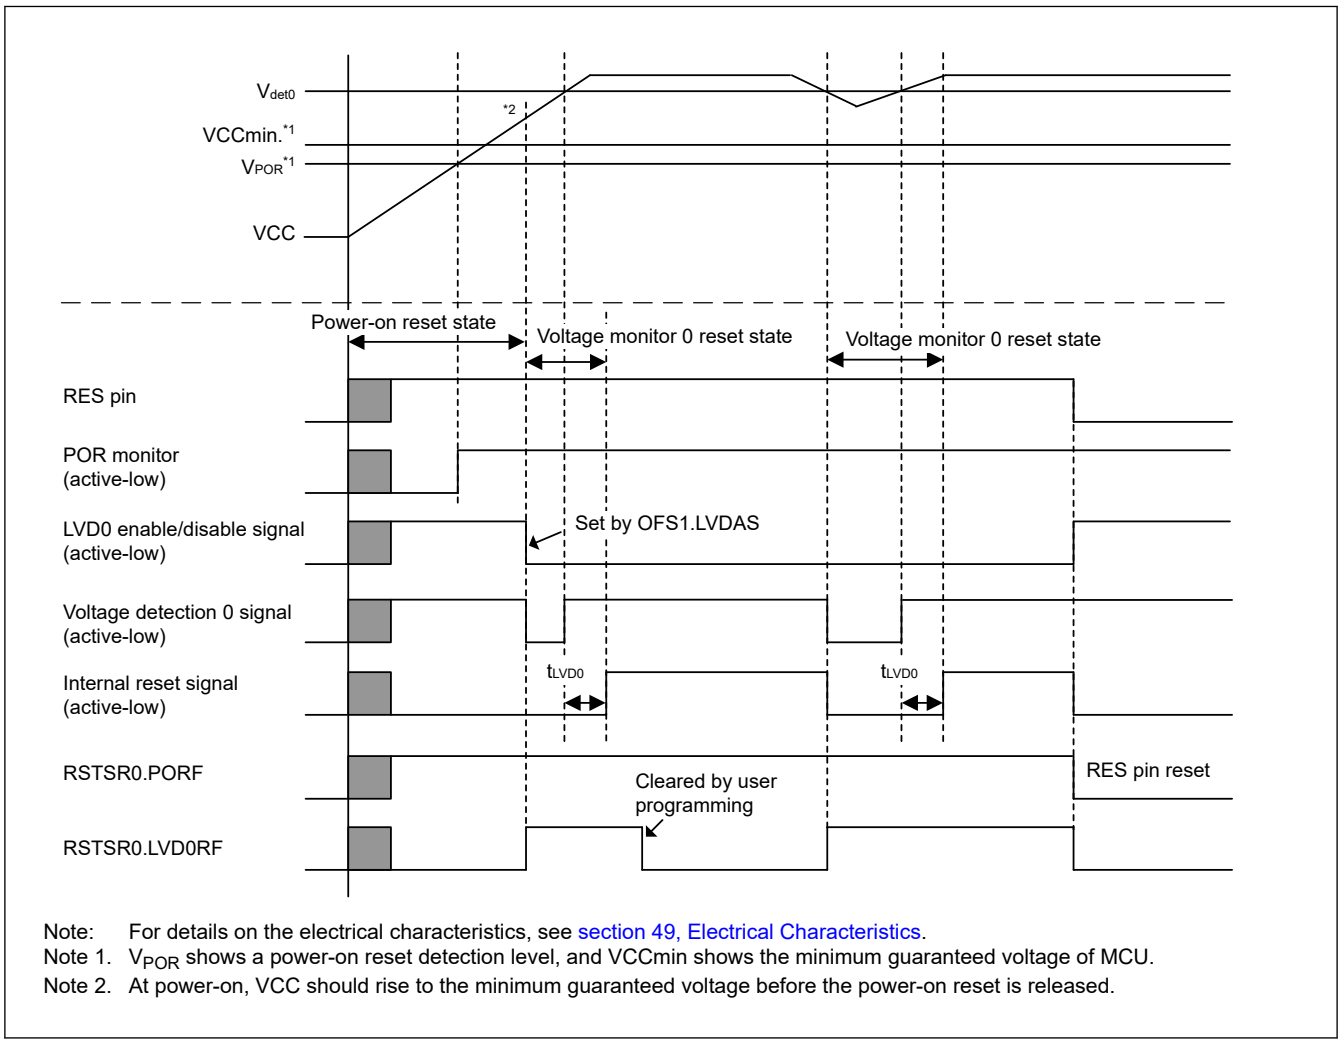

**Figure 5.1 Example of operations during a power-on reset**

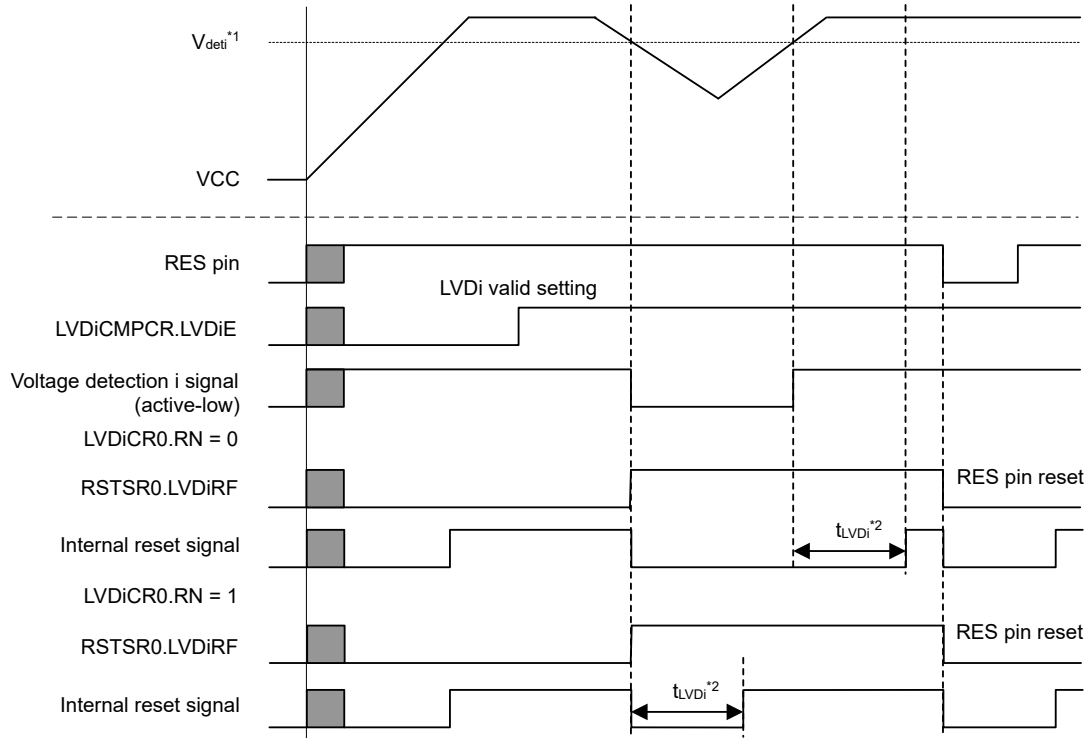
### 5.3.3 Voltage Monitor Reset

The voltage monitor i (i = 0, 1, 2) reset is an internal reset generated by the voltage monitor i circuit. If the Voltage Detection 0 Circuit Start (LVDAS) bit in the Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below $V_{det0}$, the RSTSR0.LVD0RF flag becomes 1 and the voltage detection circuit generates voltage monitor 0 reset. Clear the OFS1.LVDAS bit to 0 if the voltage monitor 0 reset is to be used. After VCC exceeds $V_{det0}$ and the voltage monitor 0 reset time ($t_{LVD0}$) elapses, the internal reset is canceled and the CPU starts the reset exception handling.

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (LVD1CR0), the RSTSR0.LVD1RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 1 reset if VCC falls to or below $V_{det1}$.



Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (LVD2CR0), the RSTSR0.LVD2RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 2 reset if VCC or EXLVD falls to or below $V_{det2}$.

Similarly, timing for release from the voltage monitor 1 reset state is selectable with the Voltage Monitor 1 Reset Negate Select bit (RN) in the LVD1CR0. When the LVD1CR0.RN bit is 0 and VCC falls to or below $V_{det1}$, the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time ($t_{LVD1}$) elapses after VCC rises above $V_{det1}$. When the LVD1CR0.RN bit is 1 and VCC falls to or below $V_{det1}$, the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time ($t_{LVD1}$) elapses.

Likewise, timing for release from the voltage monitor 2 reset state is selectable by setting the Voltage Monitor 2 Reset Negate Select bit (RN) in the LDV2CR0 register.

Detection levels $V_{det1}$ and $V_{det2}$ can be changed in the Voltage Monitoring Comparator Control Register (LVD1CMPCR/ LVD2CMPCR).

Figure 5.2 shows example of operations during voltage monitor 1 and 2 resets. For details on the voltage monitor 1 reset and voltage monitor 2 reset, see section 7, Low Voltage Detection (LVD).

Note: For details on the electrical characteristics, see section 49, Electrical Characteristics.
Note 1. $V_{deti}$ indicates the detection level of a voltage monitor 1 reset and a voltage monitor 2 reset (i = 1, 2).
Note 2. $t_{LVDi}$ indicates the time for a voltage monitor 1 reset and a voltage monitor 2 reset (i = 1, 2).

**Figure 5.2 Example of operations during voltage monitor 1 and voltage monitor 2 resets**

## 5.3.4 Independent Watchdog Timer Reset

The independent watchdog timer reset is an internal reset generated from the Independent Watchdog Timer (IWDT). Output of the reset from the IWDT can be selected in the Option Function Select Register 0 (OFS0).

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows, or if data is written when refresh operation is disabled. When the internal reset time ($t_{RESWT3}$) elapses after the independent watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the independent watchdog timer reset, see section 24, Independent Watchdog Timer (IWDT).

### 5.3.5 Watchdog Timer Reset

The watchdog timer reset is an internal reset generated from the Watchdog Timer (WDT). Output of the reset from the WDT can be selected in the WDT Reset Control Register (WDTRCR) or Option Function Select register 0 (OFS0).

When output of the watchdog timer reset is selected, a watchdog timer reset is generated if the WDT underflows, or if data is written when refresh operation is disabled. When the internal reset time ($t_{RESWT3}$) elapses after the watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the watchdog timer reset, see section 23, Watchdog Timer (WDT).

### 5.3.6 Software Reset

The software reset is an internal reset generated by a software setting of the SYSRESETREQ bit in the AIRCR register in the Arm core. When the SYSRESETREQ bit is set to 1, a software reset is generated. When the internal reset time ($t_{RESWT3}$) elapses after the software reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

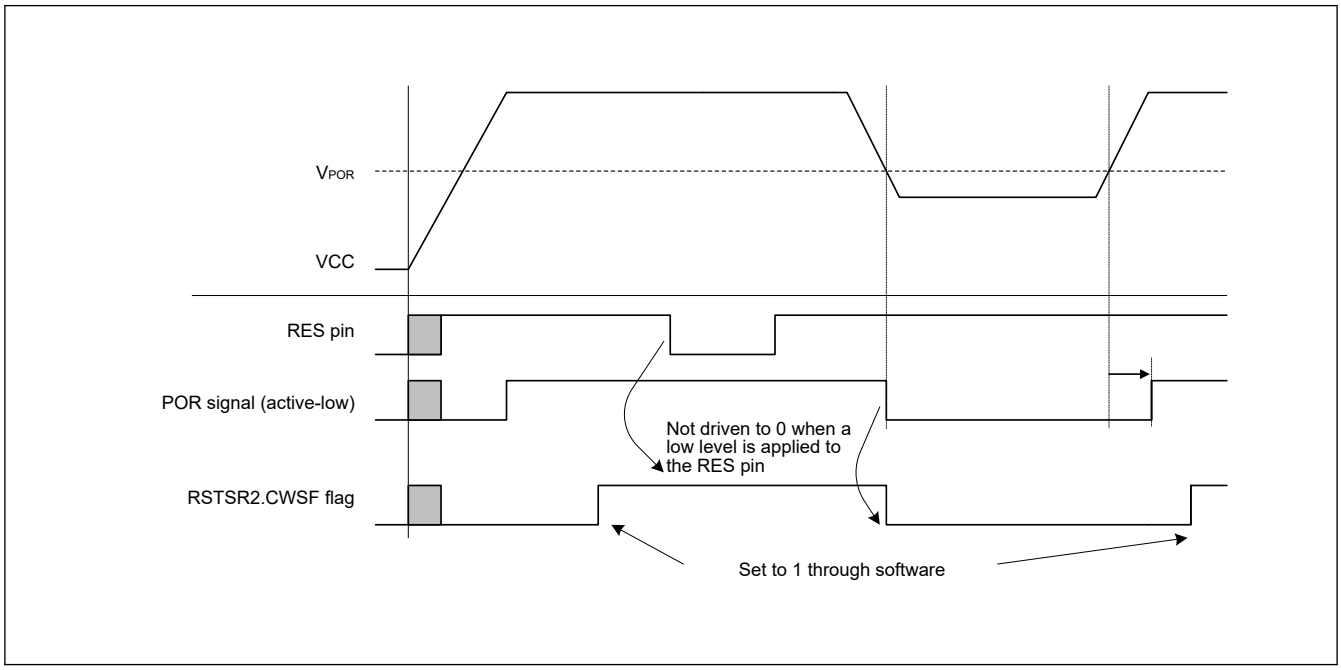
For details on the SYSRESETREQ bit, see the *ARM® Cortex®-M33 Technical Reference Manual*.

### 5.3.7 Determination of Cold/Warm Start

Read the CWSF flag in RSTSR2 to determine the cause of reset processing. This flag indicates whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

The CWSF flag is set to 0 when a power-on reset occurs (cold start), otherwise the flag is not set to 0. The flag is set to 1 when 1 is written to it through software. It is not set to 0 even on writing 0 to it.

Figure 5.3 shows an example of cold/warm start determination operation.



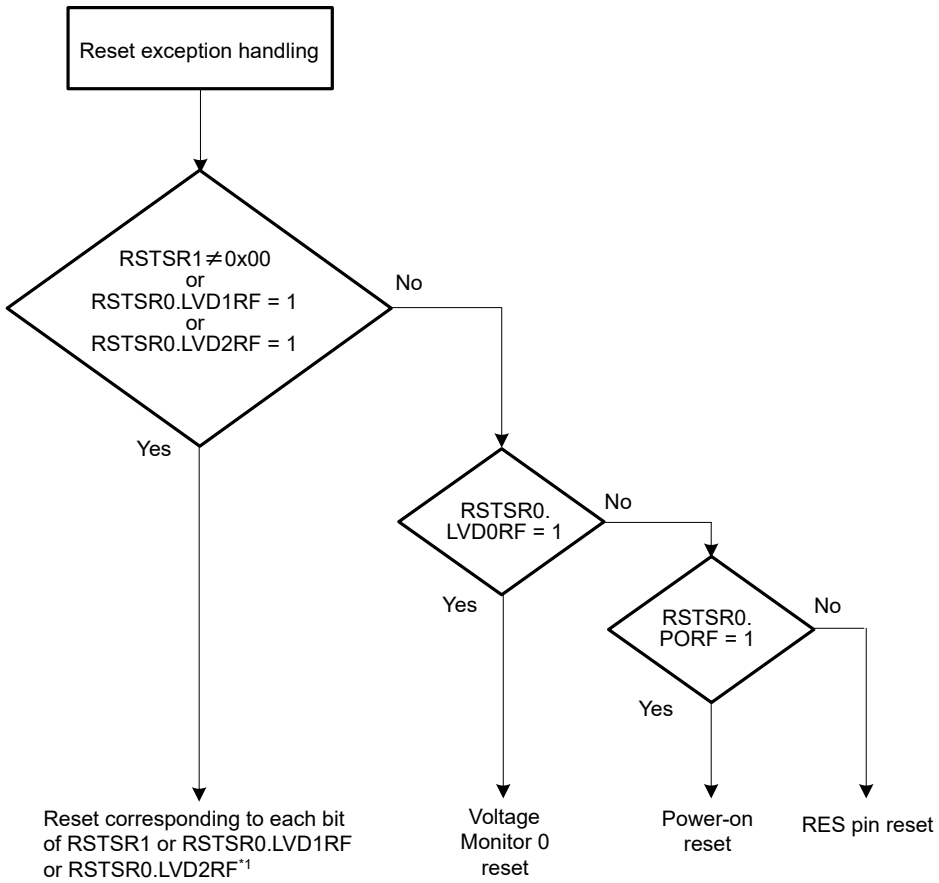


**Figure 5.3 Example of cold/warm start determination operation**

### 5.3.8 Determination of Reset Generation Source

Read RSTSR0 and RSTSR1 to determine which reset executes the reset exception handling.

Figure 5.4 shows an example of the flow to identify a reset generation source. The reset flag must be written with 0 after it is read as 1.

Note 1. When resets are generated simultaneously by two or more sources, the two or more corresponding reset flags will be set to 1.

**Figure 5.4 Example of reset generation source determination flow**

# 6. Option-Setting Memory

## 6.1 Overview

The option-setting memory determines the state of the MCU after a reset. The option-setting memory is allocated to the configuration setting area of the flash memory.

Figure 6.1 shows the option-setting memory area. The option-setting memory area has secure region. Table 6.1 shows the programming condition of the option-setting memory area.

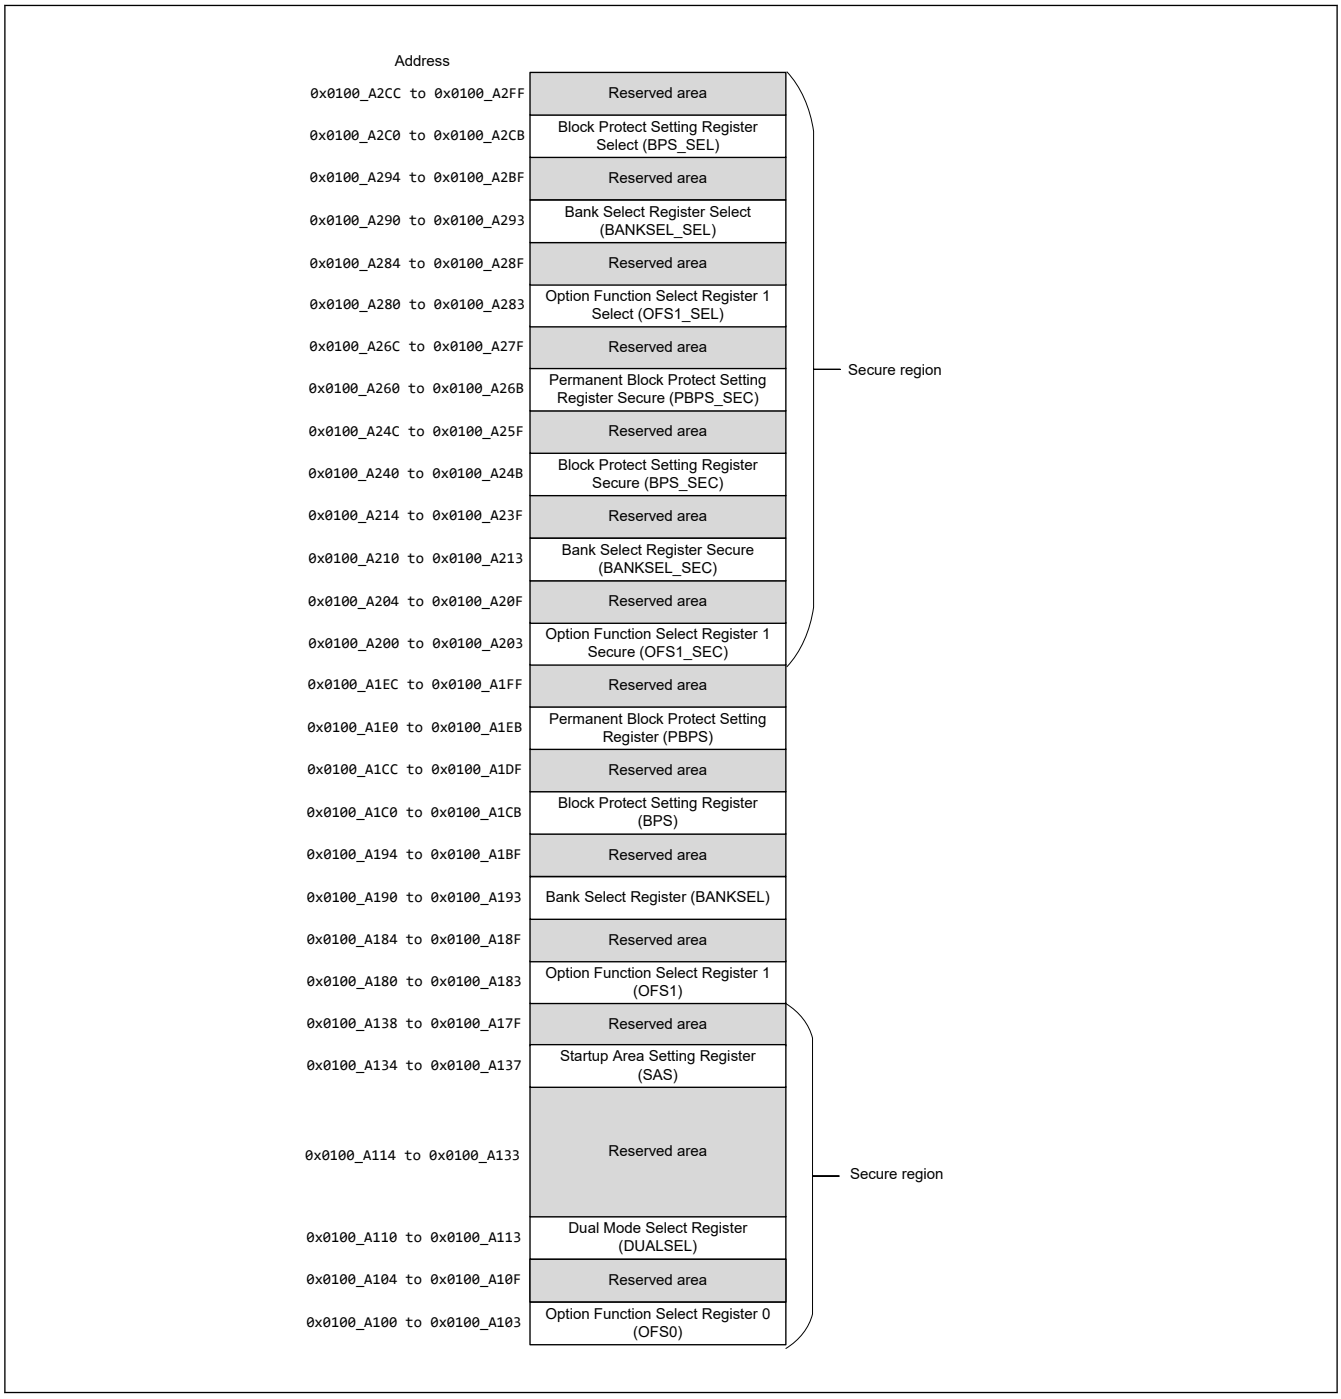

**Figure 6.1 Option-setting memory area**

**Table 6.1 The programming condition of the option-setting memory area**

| | Self programming | Serial programming | Programming by the on-chip debugger |
|---|---|---|---|
| Secure region | Programming commands issued by secure access. | Programming commands issued when the device life cycle is SSD. | Programming commands issued when the debug level is DBG2. |
| Other region | Programming commands issued by secure or non-secure access. | Programming commands issued when the devise life cycle is SSD or NSECSD. | Programming commands issued when the debug level is DBG2 or DBG1. |

## 6.2 Register Descriptions

### 6.2.1 OFS0 : Option Function Select Register 0

Address: 0x0100_A100

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 29 | — | When read, these bits return the written value. The write value should be 1. | R |
| 30 | WDTSTPCTL | WDT Stop Control<br>0: Continue counting<br>1: Stop counting when entering Sleep mode | R |
| 31 | — | When read, these bits return the written value. The write value should be 1. | R |

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

### IWDTSTRT bit (IWDT Start Mode Select)

The IWDTSTRT bit selects the mode in which the IWDT is activated after a reset (stopped state or activated state).

### IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow, as 128, 512, 1024, or 2048 cycles of the frequency-divided clock set in the IWDTCKS[3:0] bits. The time it takes for the counter to underflow after a refresh operation is determined by the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits.

For details, see section 24, Independent Watchdog Timer (IWDT).

### IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of the clock for the IWDT as 1/1, 1/16, 1/32, 1/64, 1/128, and 1/256. Using this setting combined with the IWDTTOPS[1:0] bits setting, the IWDT counting period can be set from 128 to 524288 IWDT clock cycles.

For details, see section 24, Independent Watchdog Timer (IWDT).

### IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the count value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the IWDTRPSS[1:0] and IWDTRPES[1:0] bits vary with the setting in the IWDTTOPS[1:0] bits.

For details, see section 24, Independent Watchdog Timer (IWDT).

### IWDTRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the window starts and ends positions becomes the period in which a refresh is possible. Refresh is not possible outside this period.

For details, see section 24, Independent Watchdog Timer (IWDT).

### IWDTRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDTRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The operation is selectable to an independent watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see section 24, Independent Watchdog Timer (IWDT).

### IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit specifies whether to stop counting when entering Sleep mode, Snooze mode, or Software Standby mode.

For details, see section 24, Independent Watchdog Timer (IWDT).

### WDTSTRT bit (WDT Start Mode Select)

The WDTSTRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated in auto start mode). When WDT is activated in auto start mode, the OFS0 register setting for the WDT is valid.

### WDTTOPS[1:0] bits (WDT Timeout Period Select)

The WDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDTCKS[3:0] bits. The number of PCLKB cycles that takes to underflow after a refresh operation is determined by a combination of the WDTCKS[3:0] and WDTTOPS[1:0] bits.

For details, see section 23, Watchdog Timer (WDT).

### WDTCKS[3:0] bits (WDT Clock Frequency Division Ratio Select)

The WDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of PCLKB as 1/4, 1/64, 1/128, 1/512, 1/2048, and 1/8192. Using this setting combined with the WDTTOPS[1:0] bits setting, the WDT counting period can be set from 4096 to 134217728 PCLKB cycles.

For details, see section 23, Watchdog Timer (WDT).

### WDTRPES[1:0] bits (WDT Window End Position Select)

The WDTRPES[1:0] bits specify the position where the window on the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the WDTRPSS[1:0] and WDTRPES[1:0] bits vary with the setting of the WDTTOPS[1:0] bits.

For details, see section 23, Watchdog Timer (WDT).

### WDTRPSS[1:0] bits (WDT Window Start Position Select)

The WDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the positions where the window starts and ends becomes the period in which a refresh is possible.

Refresh is not possible outside this period.

For details, see section 23, Watchdog Timer (WDT).

### WDTRSTIRQS bit (WDT Reset Interrupt Request Select)

The WDTRSTIRQS bit selects the operation on an underflow of the down-counter or generation of a refresh error. The operation is selectable to a watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see section 23, Watchdog Timer (WDT).

### WDTSTPCTL bit (WDT Stop Control)

The WDTSTPCTL bit specifies whether to stop counting when entering Sleep mode.

For details, see section 23, Watchdog Timer (WDT).

## 6.2.2 DUALSEL : Dual Mode Select Register

address: 0x0100_A110

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|
| 14:0 | — | When read, these bits return the written value. The write value should be 1. | R |
| 15 | FSPR | Protection of Startup Area Select Function<br>This bit controls the programming of the write/erase protection for the Startup Area Select flag (SAS.BTFLG), and the temporary boot swap control. When this bit is set to 0, it cannot be changed to 1.<br>0: Executing the configuration setting command for programming the Startup Area Select flag (SAS.BTFLG) is invalid.<br>1: Executing the configuration setting command for programming the Startup Area Select flag (SAS.BTFLG) is valid. | R |
| 30:16 | — | When read, these bits return the written value. The write value should be 1. | R |
| 31 | BTFLG | Startup Area Select Flag<br>This bit specifies whether the address of the startup area is exchanged for the boot swap function or not.<br>In dual mode (the DUALSEL.BANKMD[2:0] bits are 000b), set 1 to this bit.<br>0: First 8-KB area (0x0000_0000 to 0x0000_1FFF) and second 8-KB area (0x0000_2000 to 0x0000_3FFF) are exchanged.<br>1: First 8-KB area (0x0000_0000 to 0x0000_1FFF) and second 8-KB area (0x0000_2000 to 0x0000_3FFF) are not exchanged. | R |

## 6.2.4 OFS1, OFS1_SEC : Option Function Select Register 1 for Non-secure and Secure

Address: OFS1: 0x0100_A180
OFS1_SEC: 0x0100_A200

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | The value set by the user*1 | | | | | | | | | | | | | | | |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | HOCOFRQ0[2:0] | | | HOCOEN | — | — | — | — | — | LVDAS | VDSEL[1:0] | |
| Value after reset: | The value set by the user*1 | | | | | | | | | | | | | | | |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | VDSEL[1:0] | Voltage Detection 0 Level Select*2<br>0 0: Vdet0_0<br>0 1: Vdet0_1<br>1 0: Vdet0_2<br>1 1: Vdet0_3 | R |
| 2 | LVDAS | Voltage Detection 0 Circuit Start<br>0: Enable voltage monitor 0 reset after a reset<br>1: Disable voltage monitor 0 reset after a reset | R |
| 7:3 | — | When read, these bits return the written value. The write value should be 1. | R |
| 8 | HOCOEN | HOCO Oscillation Enable<br>0: Enable HOCO oscillation after a reset<br>1: Disable HOCO oscillation after a reset | R |
| 11:9 | HOCOFRQ0[2:0] | HOCO Frequency Setting 0<br>0 0 0: 48 MHz<br>0 0 1: 64 MHz<br>0 1 0: 80 MHz<br>1 0 0: 24 MHz<br>1 0 1: 32 MHz<br>1 1 0: 40 MHz<br>Others: Setting prohibited | R |
| 31:12 | — | When read, these bits return the written value. The write value should be 1. | R |

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. See section 49, Electrical Characteristics for the voltage levels to be detected.

OFS1 register is for Non-secure developer, and OFS1_SEC register is for Secure developer.

### VDSEL[1:0] bits (Voltage Detection 0 Level Select)

The VDSEL[1:0] bits select the voltage detection level of the voltage detection 0 circuit.

### LVDAS bits (Voltage Detection 0 Circuit Start)

The LVDAS bit selects whether the voltage monitor 0 reset is enabled or disabled after a reset.

### HOCOEN bit (HOCO Oscillation Enable)

The HOCOEN bit selects whether the HOCO oscillation is enabled or disabled after a reset. Setting this bit to 0 allows the HOCO oscillation to start before the CPU starts operation, which reduces the wait time for oscillation stabilization.

Note: When the HOCOEN bit is set to 0, the system clock source is not switched to HOCO. The system clock source is only switched to HOCO by setting the Clock Source Select bits (SCKSCR.CKSEL[2:0]). To use the HOCO clock, you must set the HOCO Frequency Setting 0 bits (OFS1.HOCOFRQ0[2:0]*1) to an optimum value.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL.

The value of OFS1.HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[1:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits when OFS1.HOCOEN = 1.

### HOCOFRQ0[2:0] bits (HOCO Frequency Setting 0)

The HOCOFRQ0[2:0] bits specify the HOCO frequency after a reset as 24, 32, 40, 48, 64, or 80 MHz.

## 6.2.5 OFS1_SEL : Option Function Select Register 1 for Security Attribution

Address: OFS1_SEL: 0x0100_A280

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | The value set by the user*1 | | | | | | | | | | | | | | | |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | HOCOFRQ0[2:0] | | | HOCOEN | — | — | — | — | — | LVDAS | VDSEL[1:0] | |
| Value after reset: | The value set by the user*1 | | | | | | | | | | | | | | | |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | VDSEL[1:0] | Security attributes of Voltage Detection 0 Level Select<br>0 0: Select OFS1_SEC.VDSEL[1:0]<br>1 1: Select OFS1.VDSEL[1:0]<br>Others: Setting prohibited | R |
| 2 | LVDAS | Security attributes of Voltage Detection 0 Circuit Start<br>0: Select OFS1_SEC.LVDAS<br>1: Select OFS1.LVDAS | R |
| 7:3 | — | When read, these bits return the written value. The write value should be 1. | R |
| 8 | HOCOEN | Security attributes of HOCO Oscillation Enable<br>0: Select OFS1_SEC.HOCOEN<br>1: Select OFS1.HOCOEN | R |
| 11:9 | HOCOFRQ0[2:0] | Security attributes of HOCO Frequency Setting 0<br>0 0 0: Select OFS1_SEC.HOCOFRQ0[2:0]<br>1 1 1: Select OFS1.HOCOFRQ0[2:0]<br>Others: Setting prohibited | R |
| 31:12 | — | When read, these bits return the written value. The write value should be 1. | R |

Note 1. The value of OFS1_SEL in a blank product is 0xFFFFFFFF. It is set to the value written by your application

The OFS1_SEL register selects the security attribute. Which security attribute is applied, OFS or OFS_SEC, is determined by the setting value of the corresponding bit in the OFS1_SEL register. For details, see section 6.3.3. Security attribution of option-setting memory.

## 6.2.6 BANKSEL, BANKSEL_SEC : Bank Select Register for Non-secure and Secure

Address: BANKSEL: 0x0100_A190
BANKSEL_SEC: 0x0100_A210

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | BLCKSWP[1:0] | |
| Value after reset: | User setting*1 | | | | | | | | | | | | | | | |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | BANKSWP[2:0] | | |
| Value after reset: | User setting*1 | | | | | | | | | | | | | | | |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | BANKSWP[2:0] | Startup Bank Switch<br>This setting is valid in dual mode.<br>0 0 0: Start address of Bank0 is 0x0020_0000 and Bnak1 is 0x0000_0000 in dual mode<br>1 1 1: Start address of Bank0 is 0x0000_0000 and Bnak1 is 0x0020_0000 in dual mode<br>Others: Setting prohibited | R |
| 15:3 | — | When read, these bits return the written value. The write value should be 1. | R |
| 17:16 | BLCKSWP[1:0] | Block Swap Select<br>When all bits are set to 1, the block swap is disabled. When at least one bit is set to 0, block swap is enabled and the corresponding blocks of code flash memory are swapped.<br>This setting is valid in linear mode. | R |
| 31:18 | — | When read, these bits return the written value. The write value should be 1. | R |

Note 1. The value in a blank product is 0xFFFF_FFFF. It is set to the value written by your application.

BANKSEL register is for Non-secure developer, and BANKSEL_SEC register is for Secure developer.

### BANKSWP[2:0] bits (Startup Bank Switch)

The BANKSWP[2:0] bits select the start address of the bank0 and bank1 of code flash memory in dual mode. For details of the startup bank selection, see section 45.11.4.2. Selecting the Startup Bank.

### BLCKSWP[1:0] bit (Block Swap Select)

The BLCKSWP[1:0] bits enable the block swap and select the valid blocks of the code flash memory in linear mode. Figure 6.2 shows the mapping of the flash memory in linear mode. Table 6.2 shows the specification of BLCKSWP bits for each product. Unused bits are reserved and should be set to 1. For details of block swap, see section 45.11.5. Block Swap Function.

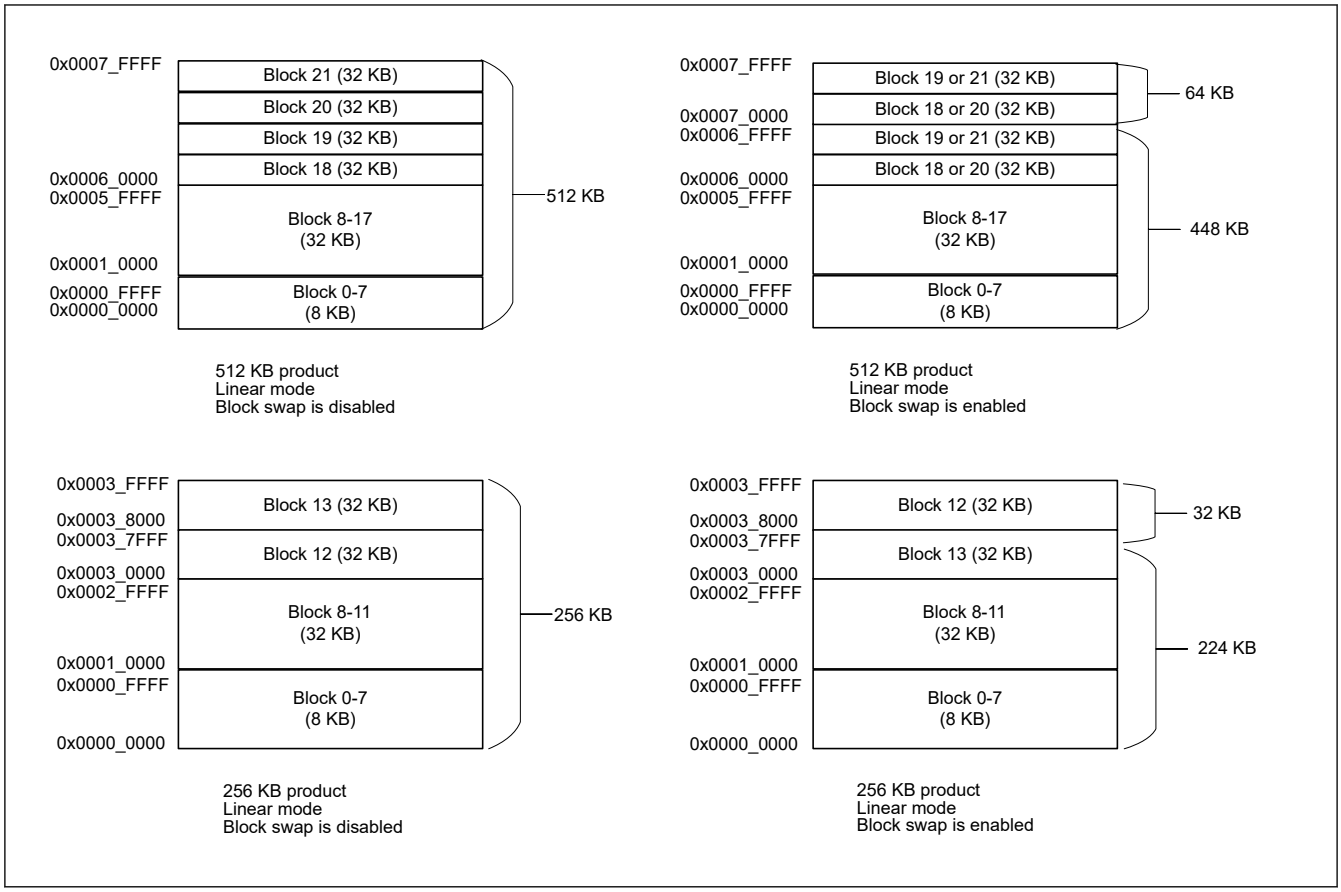

**Figure 6.2 Mapping of the flash memory in linear mode**

**Table 6.2 Specification of BLCKSWP bits for each product**

| | BLCKSWP bits | Select 0/1 |
|---|---|---|
| 512 KB product | BLCKSWP[0] | 1 : Block18 start address is 0x0006_0000. Block20 start address is 0x0007_0000.<br>0 : Block18 start address is 0x0007_0000. Block20 start address is 0x0006_0000. |
| | BLCKSWP[1] | 1 : Block19 start address is 0x0006_8000. Block21 start address is 0x0007_8000.<br>0 : Block19 start address is 0x0007_8000. Block21 start address is 0x0006_8000. |
| 256 KB product | BLCKSWP[0] | 1 : Block12 start address is 0x0003_0000. Block13 start address is 0x0003_8000.<br>0 : Block12 start address is 0x0003_8000. Block13 start address is 0x0003_0000. |

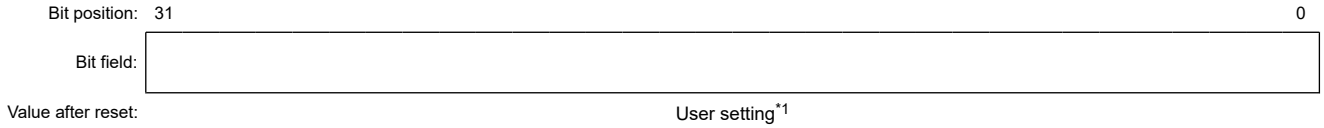
## 6.2.7 BANKSEL_SEL : Bank Select Register for Security Attribution

Address: BANKSEL_SEL: 0x0100_A290

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | BLCKSWP[1:0] | |
| Value after reset: | User setting*1 | | | | | | | | | | | | | | | |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | BANKSWP[2:0] | | |
| Value after reset: | User setting*1 | | | | | | | | | | | | | | | |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | BANKSWP[2:0] | Security Attributes of Startup Bank Switch<br>This setting is valid in dual mode.<br>0 0 0: Select BANKSEL_SEC.BANKSWP[2:0]<br>1 1 1: Select BANKSEL.BANKSWP[2:0]<br>Others: Reserved | R |
| 15:3 | — | When read, these bits return the written value. The write value should be 1. | R |
| 17:16 | BLCKSWP[1:0] | Security Attributes of Block Swap Select<br>BANKSEL_SEL.BLCKSWP[1:0] bits can select Secure or Non-secure access for each bit. The bit positions of BLCKSWP[1:0] in the BANKSEL_SEL register and the bit positions of BLCKSWP[1:0] in the BANKSEL and BANKSEL_SEC registers correspond to indicate the same block.<br>For example, when BANKSEL_SEL.BLCKSWP[0] = 0 and BANKSEL_SEL.BLCKSWP[1] = 1, then BANKSEL_SEC.BLCKSWP[0] and BANKSEL.BLCKSWP[1] are selected. | R |
| 31:18 | — | When read, these bits return the written value. The write value should be 1. | R |



Note 1. The value of BANKSEL_SEL in a blank product is 0xFFFF_FFFF. It is set to the value written by your application.

The BANKSEL_SEL register selects the security attribute. Which security attribute is applied, BANKSEL or BANKSEL_SEC, is determined by the setting value of corresponding bit in the BANKSEL_SEL register. For details, see section 6.3.3. Security attribution of option-setting memory.

## 6.2.8 BPS, BPS_SEC, BPS_SEL : Block Protect Setting Register

address:

BPS: 0x0100_A1C0, 0x0100_A1C8
BPS_SEC: 0x0100_A240, 0x0100_A248
BPS_SEL: 0x0100_A2C0, 0x0100_A2C8

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Only secure developer can program BPS_SEC and BPS_SEL registers. BPS_SEC register is for secure developer, and BPS register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in BPS_SEL register. For details, see section 6.3.3. Security attribution of option-setting memory.

The BPS and BPS_SEC registers invalidate the programming and erasure to the code flash memory. When the bit of this register is set to 0, the programming and erasure to the corresponding block are invalid. Figure 6.3 shows the code flash block structure of each product. Figure 6.4 shows the relationship between the bit of register and the block number. Unused bits are reserved and should be set to 1.

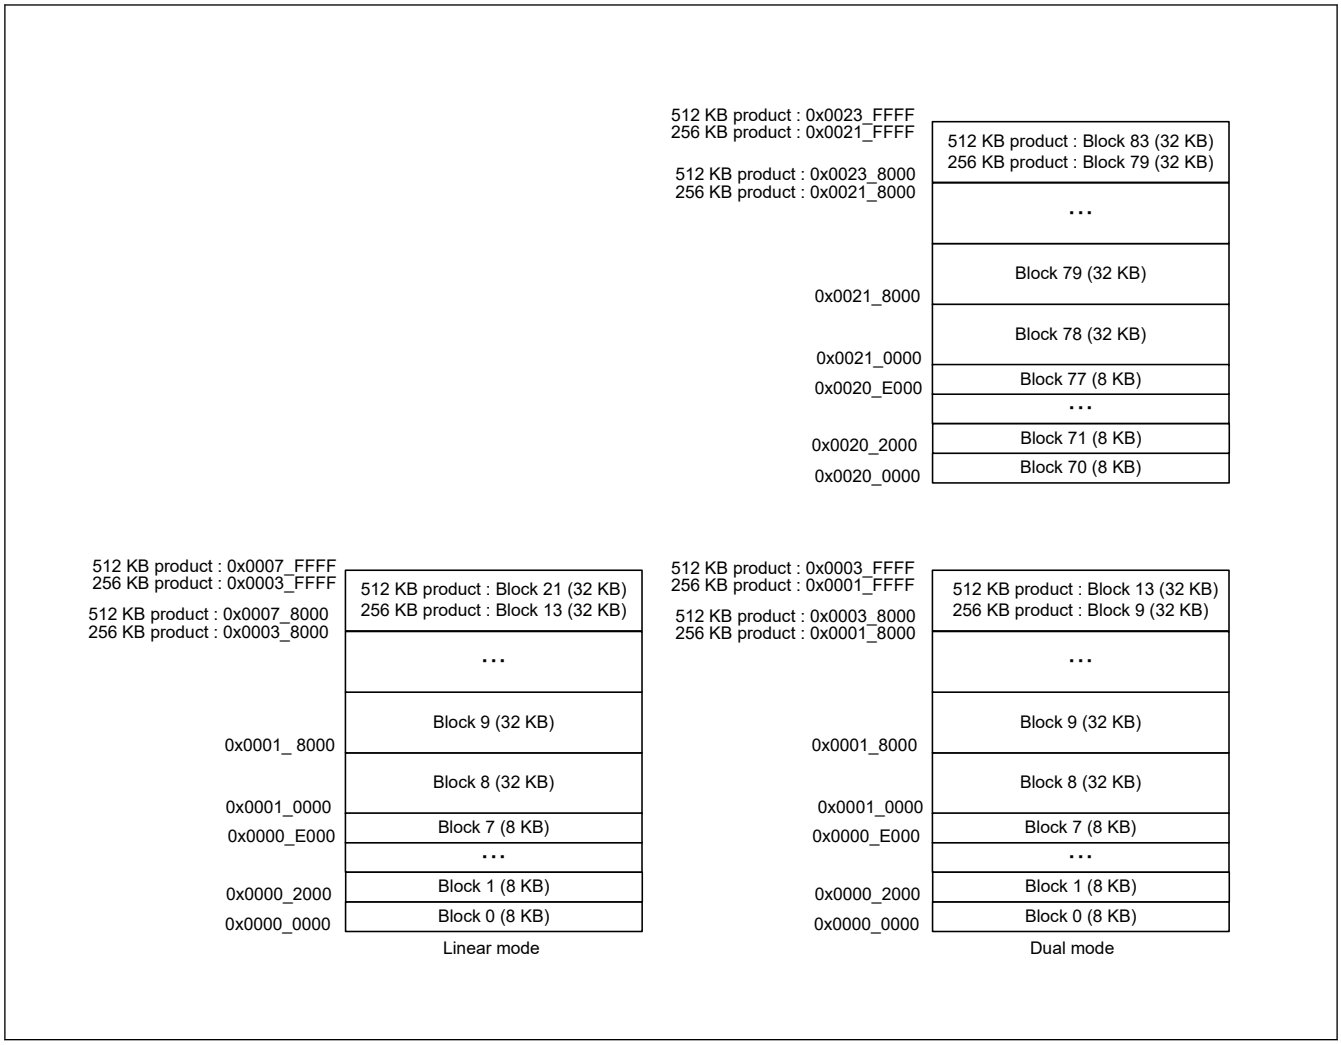


**Figure 6.3 Code flash block structure**

| Regiser | Address | +31 | +30 | +29 | +28 | +27 | +26 | +25 | +24 | +23 | +22 | +21 | +20 | +19 | +18 | +17 | +16 | +15 | +14 | +13 | +12 | +11 | +10 | + 9 | + 8 | + 7 | + 6 | + 5 | + 4 | + 3 | + 2 | + 1 | + 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| BPS_SEL | 0x0100_A2C8 | | | | | | | | | | | | | 83 | 82 | 81 | 80 | 79 | 78 | 77 | 76 | 75 | 74 | 73 | 72 | 71 | 70 | | | | | | |
| | 0x0100_A2C4 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 0x0100_A2C0 | | | | | | | | | | | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ⋮ | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| BPS_SEC | 0x0100_A248 | | | | | | | | | | | | | 83 | 82 | 81 | 80 | 79 | 78 | 77 | 76 | 75 | 74 | 73 | 72 | 71 | 70 | | | | | | |
| | 0x0100_A244 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 0x0100_A240 | | | | | | | | | | | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ⋮ | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| BPS | 0x0100_A1C8 | | | | | | | | | | | | | 83 | 82 | 81 | 80 | 79 | 78 | 77 | 76 | 75 | 74 | 73 | 72 | 71 | 70 | | | | | | |
| | 0x0100_A1C4 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 0x0100_A1C0 | | | | | | | | | | | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Figure 6.4 Relationship between the bit of register and the block number**

### 6.2.9 PBPS, PBPS_SEC : Permanent Block Protect Setting Register

Address: PBPS: 0x0100_A1E0, 0x0100_A1E8
PBPS_SEC: 0x0100_A260, 0x0100_A268

| Bit position: | 31 | 0 |
|---|---|---|
| Bit field: | | |
| Value after reset: | User setting*1 | |

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Only secure developer can program PBPS_SEC register. PBPS_SEC register is for secure developer, and PBPS register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in BPS_SEL register. For details, see section 6.3.3. Security attribution of option-setting memory. The security attribution register is same BPS_SEL register between the block protection and permanent block protection.

The PBPS and PBPS_SEC registers invalidate writes to bits of BPS and BPS_SEC. The bit of this register can be set to 0 when corresponding bit of BPS and BPS_SEC is set to 0. When the bit of this register is set to 0, writing the corresponding bit of BPS and BPS_SEC register is invalid. Once the bit of this register is set to 0, it is impossible to change the bit to 1. Table 6.3 shows the relationship between the bit of applied PBPS and bit of applied BPS.

The relationship between the bit of this register and the block number is same as BPS and BPS_SEC registers (section 6.2.8. BPS, BPS_SEC, BPS_SEL : Block Protect Setting Register). Unused bits are reserved and should be set to 1.

**Table 6.3 The relationship between the bit of PBPS, PBPS_SEC and bit of BPS, BPS_SEC**

| The bit of applied PBPS | The bit of applied BPS | Content |
|---|---|---|
| 1 | 1 | Programming and erasure to the corresponding block is valid. |
| 1 | 0 | Programming and erasure to the corresponding block is invalid. This protection can be canceled by FBPROT0 or FBPROT1 registers. |
| 0 | 1 | Cannot set this condition |
| 0 | 0 | Programming and erasure to the corresponding block is invalid permanently |

## 6.3 Setting Option-Setting Memory

### 6.3.1 Allocation of Data in Option-Setting Memory

Programming data is allocated to the addresses in the option-setting memory shown in Figure 6.1. The allocated data is used by tools such as a flash programming software or an on-chip debugger.

Note: Programming formats vary depending on the compiler. See the compiler manual for details.

### 6.3.2 Setting Data for Programming Option-Setting Memory

Allocating data according to the procedure described in section 6.3.1. Allocation of Data in Option-Setting Memory, alone does not actually write the data to the option-setting memory. You must also follow one of the actions described in this section.

#### (1) Changing the option-setting memory by self-programming

Use the configuration setting command to write data to the option-setting memory in the configuration setting area.

The option-setting memory does not support background operations (BGO). When writing the option-setting memory, jump to SRAM after copying writing software to SRAM.

For details of the configuration setting command, see section 45, Flash Memory.

#### (2) Debugging through an OCD or programming by a flash writer

This procedure depends on the tool in use, see the tool manual for details.

The MCU provides two setting procedures:

- Read the data allocated as described in section 6.3.1. Allocation of Data in Option-Setting Memory, from an object file or Motorola S-format file generated by the compiler, and write the data to the MCU
- Use the GUI interface of the tool to program the same data as allocated in section 6.3.1. Allocation of Data in Option-Setting Memory.

### 6.3.3 Security attribution of option-setting memory

Some functionality has 3 registers for non-secure (FUNC NAME), and secure (FUNC NAME_SEC), and security attribution (FUNC NAME_SEL). Only secure developer can set the registers for secure and security attribution. As shown in Figure 6.5, when the bit of security attribution register is set to 0, the corresponding bit of secure register is applied. When the bit of security attribution register is set to 1, the corresponding bit of non-secure register is applied.

For example, if the secure developer wants to configure LVD of OFS1 as secure, HOCO of OFS1 as non-secure, the secure developer needs to set OFS1_SEL as follows.

OFS1_SEL = 0xFFFF_FFF8

By this setting, LVDAS and VDSEL[1:0] values of OFS1_SEC and HOCOFRQ0[2:0] and HOCOEN values of OFS1 are applied to MCU. The reserved bits of the security attribution register (FUNC NAME_SEL) should be set to 1.

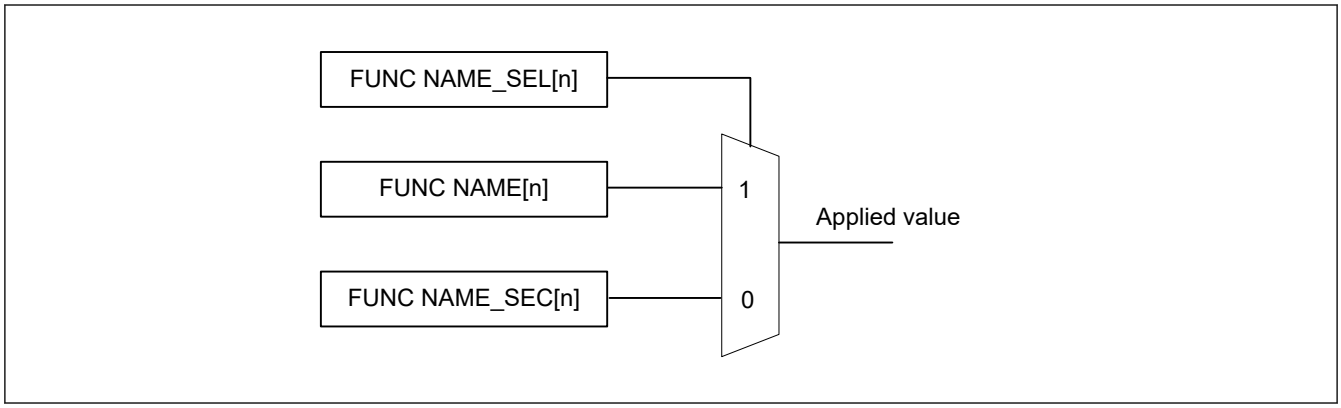

**Figure 6.5 Selection of applied value**

### 6.3.4 Timing of the Setting Value

For SAS, BPS, BPS_SEC, PBPS, and PBPS_SEC registers, the setting value of the related startup area and block protection is applied immediately after programming. For other registers, the setting value is applied after the MCU is reset.

In case the programming using the serial programming mode in customer’s factory, be careful that the block protection for secure user is applied after MCU is reset. Because initial value of the security attribution registers of block protection (BPS_SEL) is 1 (non-secure), the block protection setting for secure developer (BPS_SEC/PBPS_SEC) is not applied until MCU is reset even if the corresponding bit of BPS_SEL is programmed to 0 (secure).

## 6.4 Usage Notes

### 6.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory

When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 1 to all bits of reserved areas and all reserved bits. If 0 is written to these bits, normal operation cannot be guaranteed.

# 7. Low Voltage Detection (LVD)

## 7.1 Overview

The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC and EXLVD pins. The detection level can be selected by register settings. The LVD module consists of three separate voltage level detectors (LVD0, LVD1, LVD2). LVD0, LVD1, and LVD2 measure the voltage level input to the VCC and to the EXLVD pins for LVD2. LVD registers allow your application to configure detection of VCC changes at various voltage thresholds.

Voltage monitor registers are used to configure the LVD to trigger an interrupt, event link output, or reset when the thresholds are crossed.

Table 7.1 lists the LVD specifications. Figure 7.1 shows a block diagram of the voltage monitor 0 reset generation circuit. Figure 7.2 shows a block diagram of the voltage monitor 1 interrupt and reset circuit, Figure 7.3 shows a block diagram of the voltage monitor 2 interrupt and reset circuit, and Table 7.2 lists the I/O pins.

**Table 7.1 LVD specifications**

| Parameter | | Voltage monitor 0 | Voltage monitor 1 | Voltage monitor 2 |
|---|---|---|---|---|
| Means for setting up operation | | OFS1 register | Registers | Registers |
| Target for monitoring | | VCC pin input voltage | VCC pin input voltage | VCC or EXLVD pin input voltage |
| Monitored voltage | | $V_{det0}$ | $V_{det1}$ | $V_{det2}$ |
| Detected event | | Voltage falls past $V_{det0}$ | Voltage rises or falls past $V_{det1}$ | Voltage*1 rises or falls past $V_{det2}$ |
| Detection voltage | | Selectable from 4 different levels in the OFS1.VDSEL [1:0] bits | Selectable from 12 different levels in the LVD1CMPCR.LVD1LVL[3:0] bits | Selectable from 8 different levels in the LVD2CMPCR.LVD2LVL[2:0] bits |
| Monitoring flag | | None | LVD1SR.MON flag: Monitors whether voltage is higher or lower than $V_{det1}$ | LVD2SR.MON flag: Monitors whether voltage is higher or lower than $V_{det2}$ |
| | | | LVD1SR.DET flag: $V_{det1}$ passage detection | LVD2SR.DET flag: $V_{det2}$ passage detection |
| Process on voltage detection | Reset | Voltage monitor 0 reset | Voltage monitor 1 reset | Voltage monitor 2 reset |
| | | Reset when $V_{det0}$ > VCC<br>CPU restart after specified time with VCC > $V_{det0}$ | Reset when $V_{det1}$ > VCC<br>CPU restart timing selectable:<br>after specified time with VCC > $V_{det1}$ or $V_{det1}$ > VCC | Reset when $V_{det2}$ > VCC or the EXLVD pin<br>CPU restart timing selectable:<br>after specified time with either VCC or the EXLVD pin > $V_{det2}$ or $V_{det2}$ > VCC or the EXLVD pin |
| | Interrupt | No interrupt | Voltage monitor 1 interrupt | Voltage monitor 2 interrupt |
| | | | Non-maskable or maskable interrupt selectable | Non-maskable or maskable interrupt selectable |
| | | | Interrupt request issued when $V_{det1}$ > VCC and VCC > $V_{det1}$ or either | Interrupt request issued when $V_{det2}$ > VCC or the EXLVD pin and VCC or the EXLVD pin > $V_{det2}$ or either |
| Event link function | | None | Available<br>Output of event signals on detection of $V_{det1}$ crossings | Available<br>Output of event signals on detection of $V_{det2}$ crossings |
| TrustZone Filter | | — | Security attribution can be set for each registers | |

Note 1. Input voltages to VCC and EXLVD pin can be switched using LVD2CMPCR.EXVCCINP2 bit.

## 7.2 Register Descriptions

### 7.2.1 LVDSAR : Low Voltage Detection Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3CC

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | NONSEC1 | NONSEC0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | NONSEC0 | Non-secure Attribute bit 0<br>Target register: registers for LVD1<br>0: Secure<br>1: Non-secure | R/W |
| 1 | NONSEC1 | Non-secure Attribute bit 1<br>Target register: registers for LVD2<br>0: Secure<br>1: Non-secure | R/W |
| 31:2 | — | These bits are read as 1. The write value must be 1 when it is possible to write. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

The LVDSAR register controls the secure attribute of LVD registers.

**NONSEC0 bit (Non-secure Attribute bit 0)**

This bit controls the security attribute of LVD1CMPCR, LVD1CR0, LVD1CR1, LVD1SR.

**NONSEC1 bit (Non-secure Attribute bit 1)**

This bit controls the security attribute of LVD2CMPCR, LVD2CR0, LVD2CR1, LVD2SR.

### 7.2.2 LVD1CMPCR : Voltage Monitoring 1 Comparator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x417

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | LVD1E | — | — | — | LVD1LVL[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | LVD1LVL[3:0] | Voltage Detection 1 Level Select*1<br>0x00: Vdet1_0<br>0x01: Vdet1_1<br>0x02: Vdet1_2<br>0x03: Vdet1_3<br>0x04: Vdet1_4<br>0x05: Vdet1_5<br>0x06: Vdet1_6<br>0x07: Vdet1_7<br>0x08: Vdet1_8<br>0x09: Vdet1_9<br>0x0A: Vdet1_A<br>0x0B: Vdet1_B<br>Others: Setting prohibited | R/W |
| 6:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | LVD1E | Voltage Detection 1 Enable<br>0: Voltage detection 1 circuit disabled<br>1: Voltage detection 1 circuit enabled | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. See section 49, Electrical Characteristics for the voltage levels to be detected. Keep the initial value if LVD1 is not used. When using LVD0, set the detection voltage of LVD1 higher than the detection voltage of LVD0. The LVD1LVL[3:0] bits can be rewritten only once after reset.

The LVD1CMPCR.LVD1LVL can be changed only if the LVD1CMPCR.LVD1E and LVD2CMPCR.LVD2E bits are both 0. The voltage detection circuits 1 and 2 should not be set at the same voltage detection level.

Do not change LVD1CMPCR.LVD1LVL and LVD1CMPCR.LVD1E at the same time.

### LVD1E bit (Voltage Detection 1 Enable)

When using voltage detection 1 interrupt/reset or the LVD1SR.MON bit, set the LVD1E bit to 1. The voltage detection 1 circuit starts once $t_{d(E-A)}$ passes after the LVD1E bit value is changed from 0 to 1.

## 7.2.3 LVD2CMPCR : Voltage Monitoring 2 Comparator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x418

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | LVD2E | EXVC CINP2 | — | — | — | LVD2LVL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | LVD2LVL[2:0] | Voltage Detection 2 Level Select*1<br>0 0 0: Vdet2_0<br>0 0 1: Vdet2_1<br>0 1 0: Vdet2_2<br>0 1 1: Vdet2_3<br>1 0 0: Vdet2_4<br>1 0 1: Vdet2_5<br>1 1 0: Vdet2_6<br>1 1 1: Vdet2_7 | R/W |
| 5:3 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6 | EXVCCINP2 | Voltage Detection 2 Comparison (Voltage external input select)<br>0: Power supply voltage (VCC)<br>1: EXLVD pin input voltage | R/W |
| 7 | LVD2E | Voltage Detection 2 Enable<br>0: Voltage detection 2 circuit disabled<br>1: Voltage detection 2 circuit enabled | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. See section 49, Electrical Characteristics for the voltage levels to be detected. Keep the initial value if LVD2 is not used. When using LVD0, set the detection voltage of LVD2 higher than the detection voltage of LVD0. The LVD2LVL[2:0] bits can be rewritten only once after reset.

The LVD2CMPCR.LVD2LVL[2:0] and LVD2CMPCR.EXVCCINP2 can be changed only if the LVD1CMPCR.LVD1E and LVD2CMPCR.LVD2E bits are both 0. The voltage detection circuits 1 and 2 should not be set at the same voltage detection level.

Do not change LVD2CMPCR.LVD2LVL and LVD2CMPCR.LVD2E at the same time.

### LVD2E bit (Voltage Detection 2 Enable)

When using voltage detection 2 interrupt/reset or the LVD2SR.MON bit, set the LVD2E bit to 1. The voltage detection 2 circuit starts once $t_{d(E-A)}$ passes after the LVD2E bit value is changed from 0 to 1.

## 7.2.4 LVD1CR0 : Voltage Monitor 1 Circuit Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x41A

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | RN | RI | — | — | — | CMPE | — | RIE |
| Value after reset: | 1 | 0 | 0 | 0 | x | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RIE | Voltage Monitor 1 Interrupt/Reset Enable<br>0: Disable<br>1: Enable | R/W |
| 1 | — | This bit is read as 0. The write value should be 0. | R/W |
| 2 | CMPE | Voltage Monitor 1 Circuit Comparison Result Output Enable<br>0: Disable voltage monitor 1 circuit comparison result output<br>1: Enable voltage monitor 1 circuit comparison result output | R/W |
| 3 | — | The read value is undefined. The write value should be 1. | R/W |
| 5:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | RI | Voltage Monitor 1 Circuit Mode Select<br>0: Generate voltage monitor 1 interrupt on $V_{det1}$ crossing<br>1: Enable voltage monitor 1 reset when the voltage falls to and below $V_{det1}$ | R/W |
| 7 | RN | Voltage Monitor 1 Reset Negate Select<br>0: Negate after a stabilization time ($t_{LVD1}$) when VCC > $V_{det1}$ is detected<br>1: Negate after a stabilization time ($t_{LVD1}$) on assertion of the LVD1 reset | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

### RIE bit (Voltage Monitor 1 Interrupt/Reset Enable)

The RIE bit enables or disables voltage monitor 1 interrupt/reset. Ensure that neither a voltage monitor 1 interrupt nor a voltage monitor 1 reset is generated during programming or erasure of the flash memory.

### CMPE bit (Voltage Monitor 1 Circuit Comparison Result Output Enable)

The CMPE bit enables or disables voltage monitor 1 circuit comparison result output. Set the CMPE bit to 1 after the voltage detection 1 circuit enables and stabilization time ($t_{d(E-A)}$) elapses. When stopping the voltage detection 1 circuit, disable the voltage detection 1 circuit after setting the CMPE bit is 0.

### RN bit (Voltage Monitor 1 Reset Negate Select)

If the RN bit is set to 1 (negation follows a stabilization time on assertion of the LVD1 reset signal), set the MOCOCR.MCSTP bit to 0 (the MOCO operates). In addition, for a transition to Software Standby mode, the only possible value for the RN bit is 0 (negation follows stabilization time when VCC > $V_{det1}$ is detected). Do not set the RN bit to 1 when this is the case.

## 7.2.5 LVD2CR0 : Voltage Monitor 2 Circuit Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x41B

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | RN | RI | — | — | — | CMPE | — | RIE |
| Value after reset: | 1 | 0 | 0 | 0 | x | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RIE | Voltage Monitor 2 Interrupt/Reset Enable<br>0: Disable<br>1: Enable | R/W |
| 1 | — | This bit is read as 0. The write value should be 0. | R/W |
| 2 | CMPE | Voltage Monitor 2 Circuit Comparison Result Output Enable<br>0: Disable voltage monitor 2 circuit comparison result output<br>1: Enable voltage monitor 2 circuit comparison result output | R/W |
| 3 | — | The read value is undefined. The write value should be 1. | R/W |
| 5:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | RI | Voltage Monitor 2 Circuit Mode Select<br>0: Generate voltage monitor 2 interrupt on $V_{det2}$ crossing<br>1: Enable voltage monitor 2 reset when the voltage falls to and below $V_{det2}$ | R/W |
| 7 | RN | Voltage Monitor 2 Reset Negate Select<br>0: Negate after a stabilization time ($t_{LVD2}$) when VCC or the EXLVD pin > $V_{det2}$ is detected<br>1: Negate after a stabilization time ($t_{LVD2}$) on assertion of the LVD2 reset | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

### RIE bit (Voltage Monitor 2 Interrupt/Reset Enable)

The RIE bit enables or disables the voltage monitor 2 interrupt/reset. Ensure that neither a voltage monitor 2 interrupt nor a voltage monitor 2 reset is generated during programming or erasure of the flash memory.

### CMPE bit (Voltage Monitor 2 Circuit Comparison Result Output Enable)

The CMPE bit enables or disables voltage monitor 2 circuit comparison result output. Set the CMPE bit to 1 after the voltage detection 2 circuit enables and stabilization time ($t_{d(E-A)}$) elapses. When stopping the voltage detection 2 circuit, disable the voltage detection 2 circuit after setting the CMPE bit is 0.

### RN bit (Voltage Monitor 2 Reset Negate Select)

If the RN bit is set to 1 (negating LVD2 reset in a specified time after its assertion), set the MOCOCR.MCSTP bit to 0 (the MOCO operates). Additionally, for a transition to Software Standby mode, the only possible value for the RN bit is 0 (negation follows a stabilization time when VCC or the EXLVD pin > $V_{det2}$ is detected). Do not set the RN bit to 1 (negation follows a stabilization time after assertion of the LVD2 reset signal) when this is the case.

## 7.2.6 LVD1CR1 : Voltage Monitor 1 Circuit Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0E0

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | IRQSEL | IDTSEL[1:0] | |

|---|---|---|---|
| 1:0 | IDTSEL[1:0] | Voltage Monitor 1 Interrupt Generation Condition Select<br>0 0: When VCC ≥ $V_{det1}$ (rise) is detected<br>0 1: When VCC < $V_{det1}$ (fall) is detected<br>1 0: When fall and rise are detected<br>1 1: Settings prohibited | R/W |
| 2 | IRQSEL | Voltage Monitor 1 Interrupt Type Select<br>0: Non-maskable interrupt<br>1: Maskable interrupt*1 | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (writing enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the NMIER.LVD1EN bit value in the ICU from the reset state.

## 7.2.7 LVD1SR : Voltage Monitor 1 Circuit Status Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0E1

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | MON | DET |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DET | Voltage Monitor 1 Voltage Variation Detection Flag<br>0: Not detected<br>1: $V_{det1}$ crossing is detected | R/W*1 |
| 1 | MON | Voltage Monitor 1 Signal Monitor Flag<br>0: VCC < $V_{det1}$<br>1: VCC ≥ $V_{det1}$ or MON is disabled | R |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.
Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.

### DET flag (Voltage Monitor 1 Voltage Variation Detection Flag)

The DET flag is enabled when the LVD1CMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

When detecting $V_{det1}$, set the DET flag to 0 after setting LVD1CR0.RIE is 0 (disabled). When setting LVD1CR0.RIE bit to 1 (enabled) after setting it to 0, wait for 2 or more PCLKB cycles which have elapsed.

### MON flag (Voltage Monitor 1 Signal Monitor Flag)

The MON flag is enabled when the LVD1CMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

## 7.2.8 LVD2CR1 : Voltage Monitor 2 Circuit Control Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x0E2

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | IRQSEL | IDTSEL[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | IDTSEL[1:0] | Voltage Monitor 2 Interrupt Generation Condition Select<br>0 0: When VCC or the EXLVD pin ≥ $V_{det2}$ (rise) is detected<br>0 1: When VCC or the EXLVD pin < $V_{det2}$ (fall) is detected<br>1 0: When fall and rise are detected<br>1 1: Settings prohibited | R/W |
| 2 | IRQSEL | Voltage Monitor 2 Interrupt Type Select<br>0: Non-maskable interrupt<br>1: Maskable interrupt*1 | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (writing enabled) before rewriting this register.
Note 1. When enabling maskable interrupts, do not change the NMIER.LVD2EN bit value in the ICU from the reset state.

## 7.2.9 LVD2SR : Voltage Monitor 2 Circuit Status Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0E3

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | MON | DET |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DET | Voltage Monitor 2 Voltage Variation Detection Flag<br>0: Not detected<br>1: $V_{det2}$ crossing is detected | R/W*1 |
| 1 | MON | Voltage Monitor 2 Signal Monitor Flag<br>0: VCC or the EXLVD pin < $V_{det2}$<br>1: VCC or the EXLVD pin ≥ $V_{det2}$ or MON is disabled | R |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.
Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.

#### DET flag (Voltage Monitor 2 Voltage Variation Detection Flag)

The DET flag is enabled when the LVD2CMPCR.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

When detecting $V_{det2}$, set the DET flag to 0 after setting LVD2CR0.RIE is 0 (disabled). When setting LVD2CR0.RIE bit to 1 (enabled) after setting it to 0, wait for 2 or more PCLKB cycles which have elapsed.

#### MON flag (Voltage Monitor 2 Signal Monitor Flag)

The MON flag is enabled when the LVD2CMPCR.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

## 7.3 VCC Input Voltage Monitor

### 7.3.1 Monitoring $V_{det0}$

The comparison results from voltage monitor 0 are not available for reading.

### 7.3.2 Monitoring $V_{det1}$

Table 7.3 shows the procedures to set up monitoring against $V_{det1}$. After the settings are complete, the comparison results from voltage monitor 1 can be monitored with the LVD1SR.MON flag.

**Table 7.3 Procedures to set up monitoring against $V_{det1}$**

| Step | | Monitoring the comparison results from voltage monitor 1 |
|---|---|---|
| Setting up the voltage detection 1 circuit | 1 | Set LVD1CMPCR.LVD1E = 0 to disable voltage detection 1 before writing to the LVD1CMPCR.LVD1LVL [3:0] bits. |
| | 2 | Select the detection voltage in the LVD1CMPCR.LVD1LVL[3:0] bits. |
| | 3 | Set LVD1CMPCR.LVD1E = 1 to enable the voltage detection 1 circuit. |
| | 4 | Wait for at least $t_{d\ (E-A)}$ for the LVD1 operation stabilization time after LVD1 is enabled. |
| Enabling output | 5 | Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1. |

### 7.3.3 Monitoring $V_{det2}$

Table 7.4 shows the procedures to set up monitoring against $V_{det2}$. After the settings are complete, the comparison results from voltage monitor 2 can be monitored in the LVD2SR.MON flag.

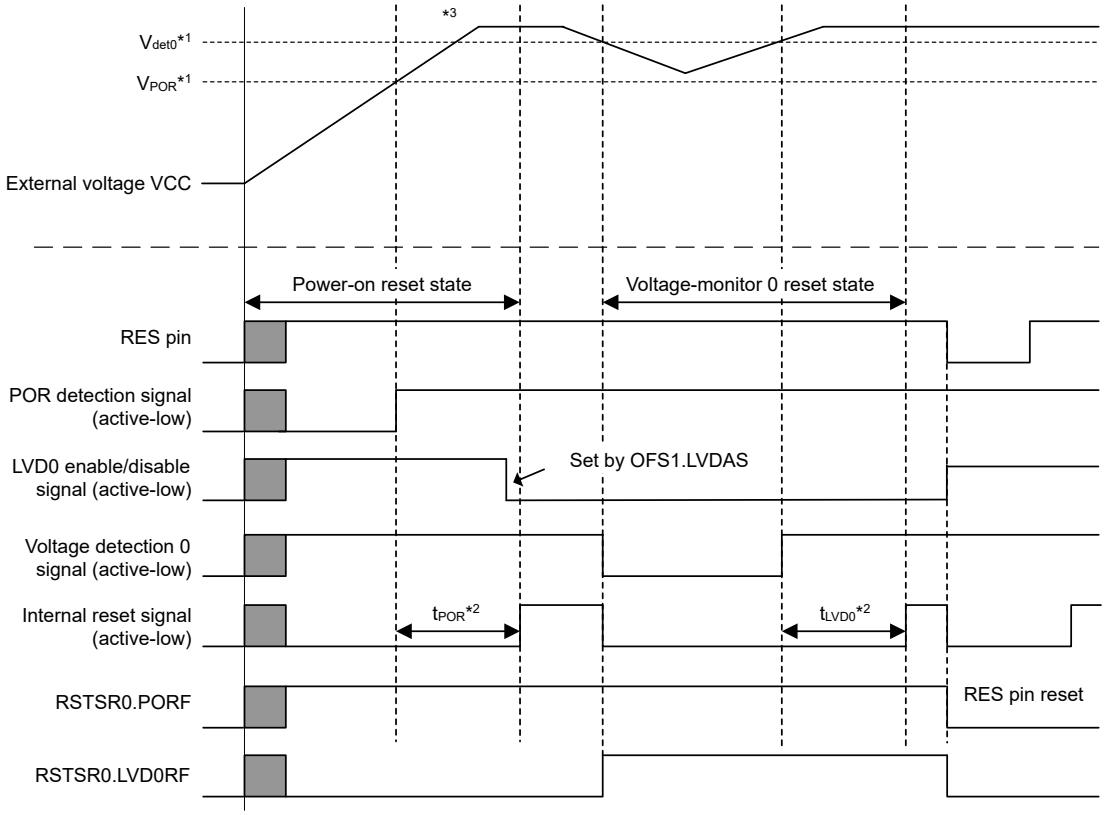

**Table 7.4 Procedures to set up monitoring against $V_{det2}$**

| Step | | Monitoring the results of comparison by voltage monitor 2 |
|---|---|---|
| Setting up the voltage detection 2 circuit | 1 | Set LVD2CMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVD2CMPCR.LVD2LVL [2:0] bits. |
| | 2 | Select the detection voltage in the LVD2CMPCR.LVD2LVL[2:0] bits. |
| | 3 | Set LVD2CMPCR.EXVCCINP2 = 0 (VCC voltage) or 1 (EXLVD pin input voltage) |
| | 4 | Set LVD2CMPCR.LVD2E = 1 to enable the voltage detection 2 circuit. |
| | 5 | Wait for at least $t_{d\ (E-A)}$ for the LVD2 operation stabilization time after LVD2 is enabled. |
| Enabling output | 6 | Set LVD2CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 2. |

## 7.4 Reset from Voltage Monitor 0

When using the reset from voltage monitor 0, clear the OFS1.LVDAS bit to 0 to enable the voltage monitor 0 reset after a reset. However, at boot mode, the reset from voltage monitor 0 is disabled regardless of the value of the OFS1.LVDAS bit.

Figure 7.4 shows an example of operations for a voltage monitor 0 reset.

Note: For details of the electrical characteristics, see section 49, Electrical Characteristics.
Note 1. $V_{POR}$ indicates the detection level for a power-on reset and $V_{det0}$ indicates the detection level for a voltage monitor 0 reset.
Note 2. $t_{POR}$: the period until the power-on reset is released.
$t_{LVD0}$: the period until the LVD0 reset is released.
Note 3. At power-on, the POR reset is released after VCC has reached the minimum guaranteed voltage.

**Figure 7.4 Example of voltage monitor 0 reset operation**

## 7.5 Interrupt and Reset from Voltage Monitor 1

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 1 circuit.

Table 7.5 shows the procedures for setting bits related to the voltage monitor 1 interrupt/reset so that voltage monitoring occurs. Table 7.6 shows the procedures for setting bits related to the voltage monitor 1 interrupt/reset so that voltage monitoring stops. Figure 7.5 shows an example of operations for a voltage monitor 1 interrupt. For the operation of the voltage monitor 1 reset, see Figure 5.2 in section 5, Resets.

When using the voltage monitor 1 circuit in Software Standby mode, set up the circuit using the procedures in this section.

### (1) Setting in Software Standby mode

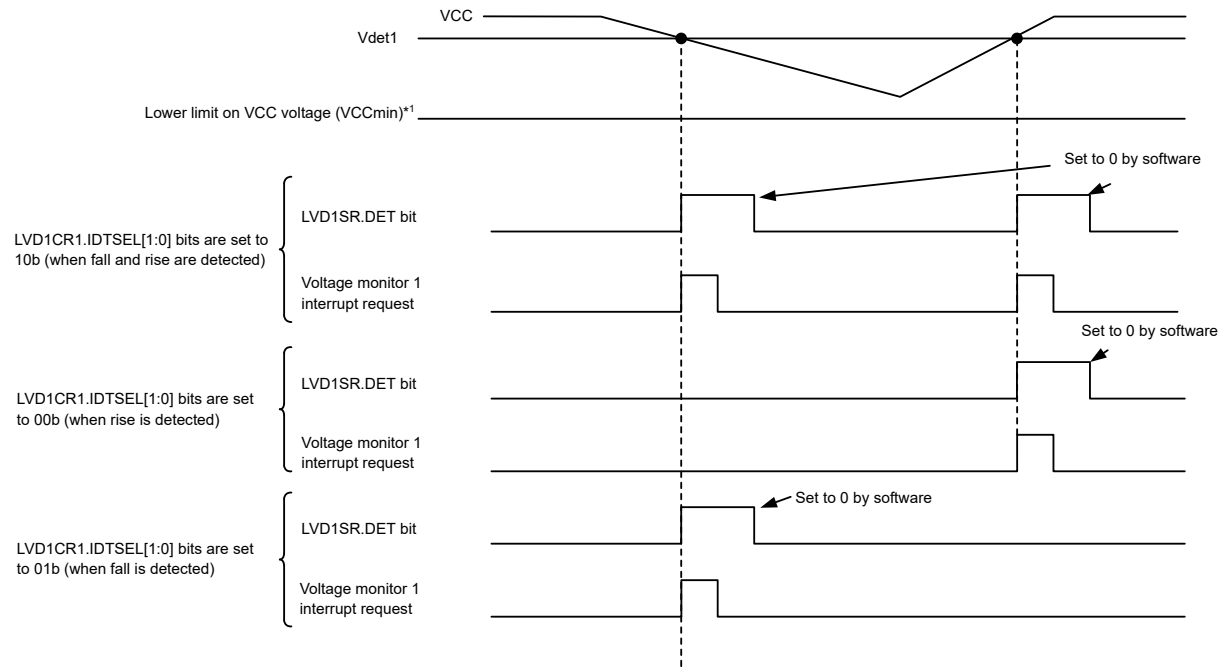
- When VCC > $V_{det1}$ is detected, negate the voltage monitor 1 reset signal (LVD1CR0.RN = 0) following a stabilization time.

**Table 7.5 Procedures for setting bits related to voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring occurs**

| Step | | Voltage monitor 1 interrupt (voltage monitor 1 ELC event output) | Voltage monitor 1 reset |
|---|---|---|---|
| Setting up the voltage detection 1 circuit | 1 | Set LVD1CMPCR.LVD1E = 0 to disable voltage detection 1 before writing to the LVD1CMPCR register. | |
| | 2 | Select the detection voltage in the LVD1CMPCR.LVD1LVL[3:0] bits. | |
| | 3 | Set LVD1CMPCR.LVD1E = 1 to enable the voltage detection 1 circuit. | |
| | 4 | Wait for at least $t_{d\ (E-A)}$ for the LVD1 operation stabilization time after LVD1 is enabled. | |
| Setting up the voltage monitor 1 interrupt or reset | 5 | Set LVD1CR0.RI = 0 to select the voltage monitor 1 interrupt. | • Set LVD1CR0.RI = 1 to select the voltage monitor 1 reset.<br>• Select the type of reset negation in the LVD1CR0.RN bit. |
| | 6 | • Select the interrupt request condition in the LVD1CR1.IDTSEL[1:0] bits.<br>• Select the interrupt type in the LVD1CR1.IRQSEL bit. | — |
| Enabling output | 7 | Set LVD1SR.DET = 0. | |
| | 8 | Set LVD1CR0.RIE = 1 to enable the voltage monitor 1 interrupt or reset.*1 | |
| | 9 | Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1. | |

Note: Steps 5 to 8 can be performed during the wait time in step 4. For details on $t_{d\ (E-A)}$, see section 49, Electrical Characteristics.
Note 1. Step 8 is not required if only the ELC event signal is to be output.

**Table 7.6 Procedures for setting bits related to voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring stops**



| Step | | Voltage monitor 1 interrupt (voltage monitor 1 ELC event output), voltage monitor 1 reset |
|---|---|---|
| Stopping the enabling output | 1 | Set LVD1CR0.CMPE = 0 to disable output of the comparison results from voltage monitor 1. |
| | 2 | Set LVD1CR0.RIE = 0 to disable the voltage monitor 1 interrupt or reset.*1 |
| Stopping the voltage detection 1 circuit | 3 | Set LVD1CMPCR.LVD1E = 0 to disable the voltage detection 1 circuit. |

Note 1. Step 2 is not required if only the ELC event signal is to be output.

If the voltage monitor 1 interrupt or reset setting is to be made again after it is used and stopped once, you can omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting the voltage detection 1 circuit is not required if the settings for the circuit do not change.
- Setting the voltage monitor 1 interrupt or reset is not required if the settings for the voltage monitor 1 interrupt or voltage monitor 1 reset do not change.

Figure 7.5 shows an example of the voltage monitor 1 interrupt operation.

Note 1. When the voltage monitor 0 reset is not in use, use at VCC ≥ VCCmin.

**Figure 7.5 Example of voltage monitor 1 interrupt operation**

## 7.6 Interrupt and Reset from Voltage Monitor 2

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 2 circuit.

Table 7.7 shows the procedures for setting bits related to the voltage monitor 2 interrupt/reset so that voltage monitoring occurs. Table 7.8 shows the procedures for setting bits related to the voltage monitor 2 interrupt/reset so that voltage monitoring stops. Figure 7.6 shows an example of operations for a voltage monitor 2 interrupt. For the operation of the voltage monitor 2 reset, see Figure 5.2 in section 5, Resets.

When using the voltage monitor 2 circuit in Software Standby mode, set up the circuit with the following procedures.

### (1) Setting in Software Standby mode

- When VCC or the EXLVD pin > $V_{det2}$ is detected, negate the voltage monitor 2 reset signal (LVD2CR0.RN = 0) following a LVD2 stabilization time.

**Table 7.7 Procedures for setting bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring occurs (1 of 2)**

| Step | | Voltage monitor 2 interrupt (voltage monitor 2 ELC event output) | Voltage monitor 2 reset |
|---|---|---|---|
| Setting up the voltage detection 2 circuit | 1 | Set LVD2CMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVD2CMPCR register. | |
| | 2 | Select the detection voltage in the LVD2CMPCR.LVD2LVL[2:0] bits. | |
| | 3 | Set LVD2CMPCR.EXVCCINP2 = 0 (VCC voltage) or 1 (EXLVD pin input voltage) | |
| | 4 | Set LVD2CMPCR.LVD2E = 1 to enable the voltage detection 2 circuit. | |
| | 5 | Wait for at least $t_{d\ (E\text{-}A)}$ for the LVD2 operation stabilization time after LVD2 is enabled.*1 | |

**Table 7.7 Procedures for setting bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring occurs (2 of 2)**

| Step | | Voltage monitor 2 interrupt (voltage monitor 2 ELC event output) | Voltage monitor 2 reset |
|---|---|---|---|
| Setting up the voltage monitor 2 interrupt or reset | 6 | Set LVD2CR0.RI = 0 to select the voltage monitor 2 interrupt. | • Set LVD2CR0.RI = 1 to select the voltage monitor 2 reset.<br>• Select the type of reset negation in the LVD2CR0.RN bit. |
| | 7 | • Select the interrupt request condition in the LVD2CR1.IDTSEL[1:0] bits.<br>• Select the interrupt type in the LVD2CR1.IRQSEL bit. | — |
| Enabling output | 8 | Set LVD2SR.DET = 0. | |
| | 9 | Set LVD2CR0.RIE = 1 to enable the voltage monitor 2 interrupt or reset.*2 | |
| | 10 | Set LVD2CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 2. | |

Note 1. Steps 6 to 9 can be performed during the wait time in step 5. For details on $t_{d(E-A)}$, see section 49, Electrical Characteristics.
Note 2. Step 9 is not required if only the ELC event signal is to be output.

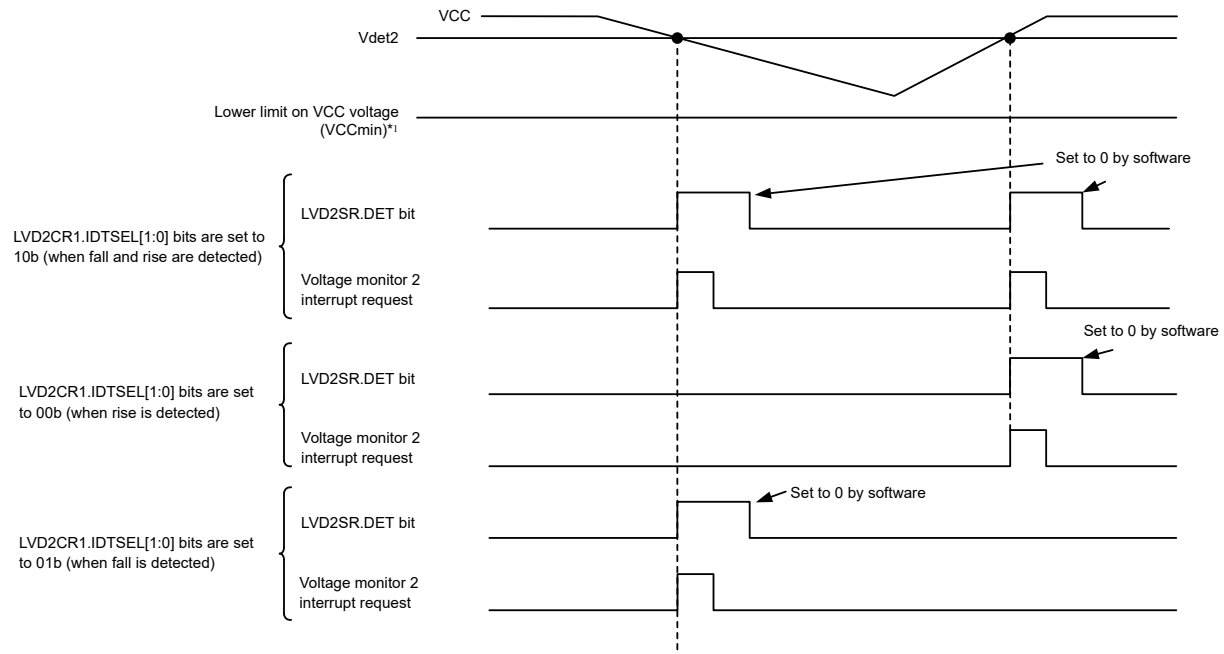


**Table 7.8 Procedures for setting bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring stops**

| Step | | Voltage monitor 2 interrupt (voltage monitor 2 ELC event output), voltage monitor 2 reset |
|---|---|---|
| Settings to stop enabling output | 1 | Set LVD2CR0.CMPE = 0 to disable output of the comparison results from voltage monitor 2. |
| | 2 | Set LVD2CR0.RIE = 0 to disable the voltage monitor 2 interrupt or reset.*1 |
| Stopping the voltage detection 2 circuit | 3 | Set LVD2CMPCR.LVD2E = 0 to disable the voltage detection 2 circuit. |

Note 1. Step 2 is not required if only the ELC event signal is to be output.

If the voltage monitor 2 interrupt or reset setting is to be made again after it is used and stopped once, you can omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting the voltage detection 2 is not required if the settings for the circuit do not change.
- Setting the voltage monitor 2 interrupt or reset is not required if the settings for the voltage monitor 2 interrupt or voltage monitor 2 reset do not change.

Note 1. When the voltage monitor 0 reset is not in use, use at VCC ≥ VCCmin.

**Figure 7.6 Example of voltage monitor 2 interrupt operation**

## 7.7 Event Link Controller (ELC) Output

The LVD can output the event signals to the Event Link Controller (ELC).

### (1) $V_{det1}$ Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the $V_{det1}$ voltage while both the voltage detection 1 circuit and the voltage monitor 1 circuit comparison result output are enabled.

### (2) $V_{det2}$ Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the $V_{det2}$ voltage while both the voltage detection 2 circuit and the voltage monitor 2 circuit comparison result output are enabled.

When enabling the event link output function of the LVD, you must enable the LVD before enabling the LVD event link function of the ELC. To stop the event link output function of the LVD, you must stop the LVD before disabling the LVD event link function of the ELC.

### 7.7.1 Interrupt Handling and Event Linking

The LVD provides bits to separately enable or disable the voltage monitor 1 and 2 interrupts. When an interrupt source is generated and the interrupt is enabled by the interrupt enable bit, the interrupt signal is output to the CPU.

In contrast, as soon as an interrupt source is generated, an event link signal is output as the event signal to the other module through the ELC, regardless of the state of the interrupt enable bit.

It is possible to output voltage monitor 1 and 2 interrupts in Software Standby mode. The event signals for the ELC in Software Standby mode are output as follows:

- When a $V_{det1}$ or $V_{det2}$ passage events is detected in Software Standby mode, event signals are not generated for the ELC because the clock is not supplied in Software Standby mode. Because the $V_{det1}$ and $V_{det2}$ passage detection flags are saved, when the clock supply resumes after returning from Software Standby mode, the event signals for the ELC are output based on the state of the $V_{det1}$ and $V_{det2}$ detection flags.

# 8. Clock Generation Circuit

## 8.1 Overview

The MCU provides a clock generation circuit. Table 8.1 and Table 8.2 list the clock generation circuit specifications. Figure 8.1 show a block diagram, and Table 8.3 lists the I/O pins.

**Table 8.1 Clock generation circuit specifications for the clock sources**

| Clock source | Description | Specification |
|---|---|---|
| Main clock oscillator (MOSC) | Resonator frequency | 1 MHz to 20 MHz |
| | External clock input frequency | Up to 20 MHz |
| | External resonator or additional circuit | Ceramic resonator, crystal |
| | Connection pins | EXTAL, XTAL |
| | Drive capability switching | Available |
| | Oscillation stop detection function | Available |
| Sub-clock oscillator (SOSC) | Resonator frequency | 32.768 kHz |
| | External resonator or additional circuit | Crystal resonator |
| | Connection pins | XCIN, XCOUT |
| | Drive capability switching | Available |
| | Oscillation stop detection function | Available |
| PLL circuit | Input clock source | MOSC, HOCO |
| | Input pulse frequency division ratio | Selectable from 1, 4, and 6 |
| | Input frequency | 4 MHz to 12.5 MHz |
| | Frequency multiplication ratio | Selectable from 4 to 15.5 (0.5 steps) |
| | Output pulse frequency division ratio | Unavailable |
| | PLL Output frequency | 24 MHz to 80 MHz |
| High-speed on-chip oscillator (HOCO) | Oscillation frequency | 24/32/40/48/64/80 MHz |
| | FLL function | Not available |
| | User trimming | Available |
| Middle-speed on-chip oscillator (MOCO) | Oscillation frequency | 8 MHz |
| | User trimming | Available |
| Low-speed on-chip oscillator (LOCO) | Oscillation frequency | 32.768 kHz |
| | User trimming | Available |
| IWDT-dedicated on-chip oscillator (IWDTLOCO) | Oscillation frequency | 15 kHz |
| | User trimming | Unavailable |
| External clock input for SWD (SWCLK) | Input clock frequency | Up to 12.5 MHz |

**Table 8.2 Clock generation circuit specifications for the internal clocks (1 of 3)**

| Item | Clock source | Clock supply | Specification |
|---|---|---|---|
| System clock (ICLK) | MOSC/SOSC/HOCO/MOCO/ LOCO/PLL | CPU, DTC, DMAC, Flash, RAM, I/O ports | Up to 80 MHz<br>Division ratio: 1/2/4/8/16/32/64 |
| Peripheral module clock A (PCLKA) | MOSC/SOSC/HOCO/MOCO/ LOCO/PLL | Peripheral modules (QSPI, SCI, SPI, CRC, DOC, ADC12, DAC12, GPT bus clock, CNECC, IrDA, I3C) | Up to 80 MHz<br>Division ratio: 1/2/4/8/16/32/64 |

**Table 8.2 Clock generation circuit specifications for the internal clocks (2 of 3)**

| Item | Clock source | Clock supply | Specification |
|---|---|---|---|
| Peripheral module clock B (PCLKB) | MOSC/SOSC/HOCO/MOCO/ LOCO/PLL | Peripheral modules (CAC, ELC, POEG, RTC, WDT, IWDT, AGT, IIC, CANFD, USBFS, SSIE, CTSU, SLCDC, ACMPLP, UARTA, RSIP-E11A) | Up to 40 MHz<br>Division ratio: 1/2/4/8/16/32/64 |
| Peripheral module clock C (PCLKC) | MOSC/SOSC/HOCO/MOCO/ LOCO/PLL | Peripheral module (ADC12 conversion clock) | Up to 48 MHz<br>Division ratio: 1/2/4/8/16/32/64 |
| Peripheral module clock D (PCLKD) | MOSC/SOSC/HOCO/MOCO/ LOCO/PLL | Peripheral module(GPT count clock) | Up to 80 MHz<br>Division ratio: 1/2/4/8/16/32/64 |
| FlashIF clock (FCLK) | MOSC/SOSC/HOCO/MOCO/ LOCO/PLL | FlashIF, TSN | 1 MHz to 48 MHz (P/E)<br>Up to 48 MHz (read)<br>Division ratio: 1/2/4/8/16/32/64 |
| USB clock (USBCLK) | HOCO*1/PLL | USBFS | 48 MHz |
| CANFD clock (CANFDCLK) | MOSC/SOSC/HOCO/MOCO/ LOCO/PLL | CANFD | Up to 40 MHz<br>Division ratio: 1/2/4/6/8 |
| I3C clock (I3CCLK) | MOSC/SOSC/HOCO/MOCO/ LOCO/PLL | I3C | Up to 80 MHz<br>Division ratio: 1/2/3/4/5/6/8 |
| CAN clock (CANMCLK) | MOSC | CANFD | 1 MHz to 20 MHz |
| Segment LCD source clock (LCDSRCCLK) | MOSC/SOSC/HOCO/LOCO | SLCDC | Up to 80 MHz |
| AGT sub-clock (AGTSCLK) | SOSC | AGT | 32.768 kHz |
| AGT LOCO clock (AGTLCLK) | LOCO | AGT | 32.768 kHz |
| CAC Main clock (CACMCLK) | MOSC | CAC | Up to 20 MHz |
| CAC Sub clock (CACSCLK) | SOSC | CAC | 32.768 kHz |
| CAC LOCO clock (CACLCLK) | LOCO | CAC | 32.768 kHz |
| CAC MOCO clock (CACMOCLK) | MOCO | CAC | 8 MHz |
| CAC HOCO clock (CACHCLK) | HOCO | CAC | 24/32/40/48/64/80 MHz |
| CAC IWDTLOCO clock (CACILCLK) | IWDTLOCO | CAC | 15 kHz |
| UARTA main clock (UARTAMCLK) | MOSC | UARTA | Up to 20 MHz |
| UARTA sub-clock (UARTASCLK) | SOSC | UARTA | 32.768 kHz |
| UARTA LOCO clock (UARTALCLK) | LOCO | UARTA | 32.768 kHz |
| UARTA MOCO clock (UARTAMOCLK) | MOCO | UARTA | 8 MHz |
| UARTA HOCO clock (UARTAHCLK) | HOCO | UARTA | 24/32/40/48/64/80 MHz |
| RTC sub-clock (RTCSCLK) | SOSC | RTC | 32.768 kHz |
| RTC 128 Hz clock (RTCS128CLK) | SOSC | RTC | 128 Hz |
| RTC LOCO clock (RTCLCLK) | LOCO | RTC | 32.768 kHz |
| IWDT clock (IWDTCLK) | IWDTLOCO | IWDT | 15 kHz |
| SysTick timer clock (SYSTICCLK) | LOCO | SysTick timer | 32.768 kHz |
| Serial wire clock (SWCLK) | SWCLK | OCD | Up to 12.5 MHz |

**Table 8.2 Clock generation circuit specifications for the internal clocks (3 of 3)**

| Item | Clock source | Clock supply | Specification |
|---|---|---|---|
| Clock/buzzer output (CLKOUT) | MOSC/SOSC/LOCO/MOCO/ HOCO | CLKOUT pin | Up to 40 MHz<br>Division ratios: 1/2/4/8/16/32/64/128 |

Note: Restrictions on setting clock frequency: ICLK ≥ PCLKA ≥ PCLKB, PCLKD ≥ PCLKA ≥ PCLKB
ICLK ≥ FCLK
Restrictions on clock frequency ratio: (N: integer, and up to 64)
ICLK : FCLK = 1:1 when ICLK ≤ 48 MHz, ICLK : FCLK = 2:1 when 48 MHz < ICLK ≤ 80 MHz
ICLK : PCLKA = N:1, ICLK : PCLKB = N:1, ICLK : PCLKC = N:1 or 1:N, ICLK : PCLKD = N:1 or 1:N
If the A/D converter is enabled, the clock frequency ratio is constrained as follows:
PCLKA : PCLKC = 1:1 or 2:1 or 4:1 or 8:1 or 1:2 or 1:4

Note: Restrictions on the minimum FCLK frequency 1 MHz when P/E.

Note: Clocks have a permissible frequency range (See Table 8.2).
Flash memory and SRAM also have a permissible operating frequency range in each wait cycle setting. (See section 44, SRAM, section 45, Flash Memory)
Those clock frequency ranges must be satisfied even if the HOCO has its maximum or minimum frequency. (See section 49, Electrical Characteristics).

Note 1. Only when USBFS is used as the device controller.

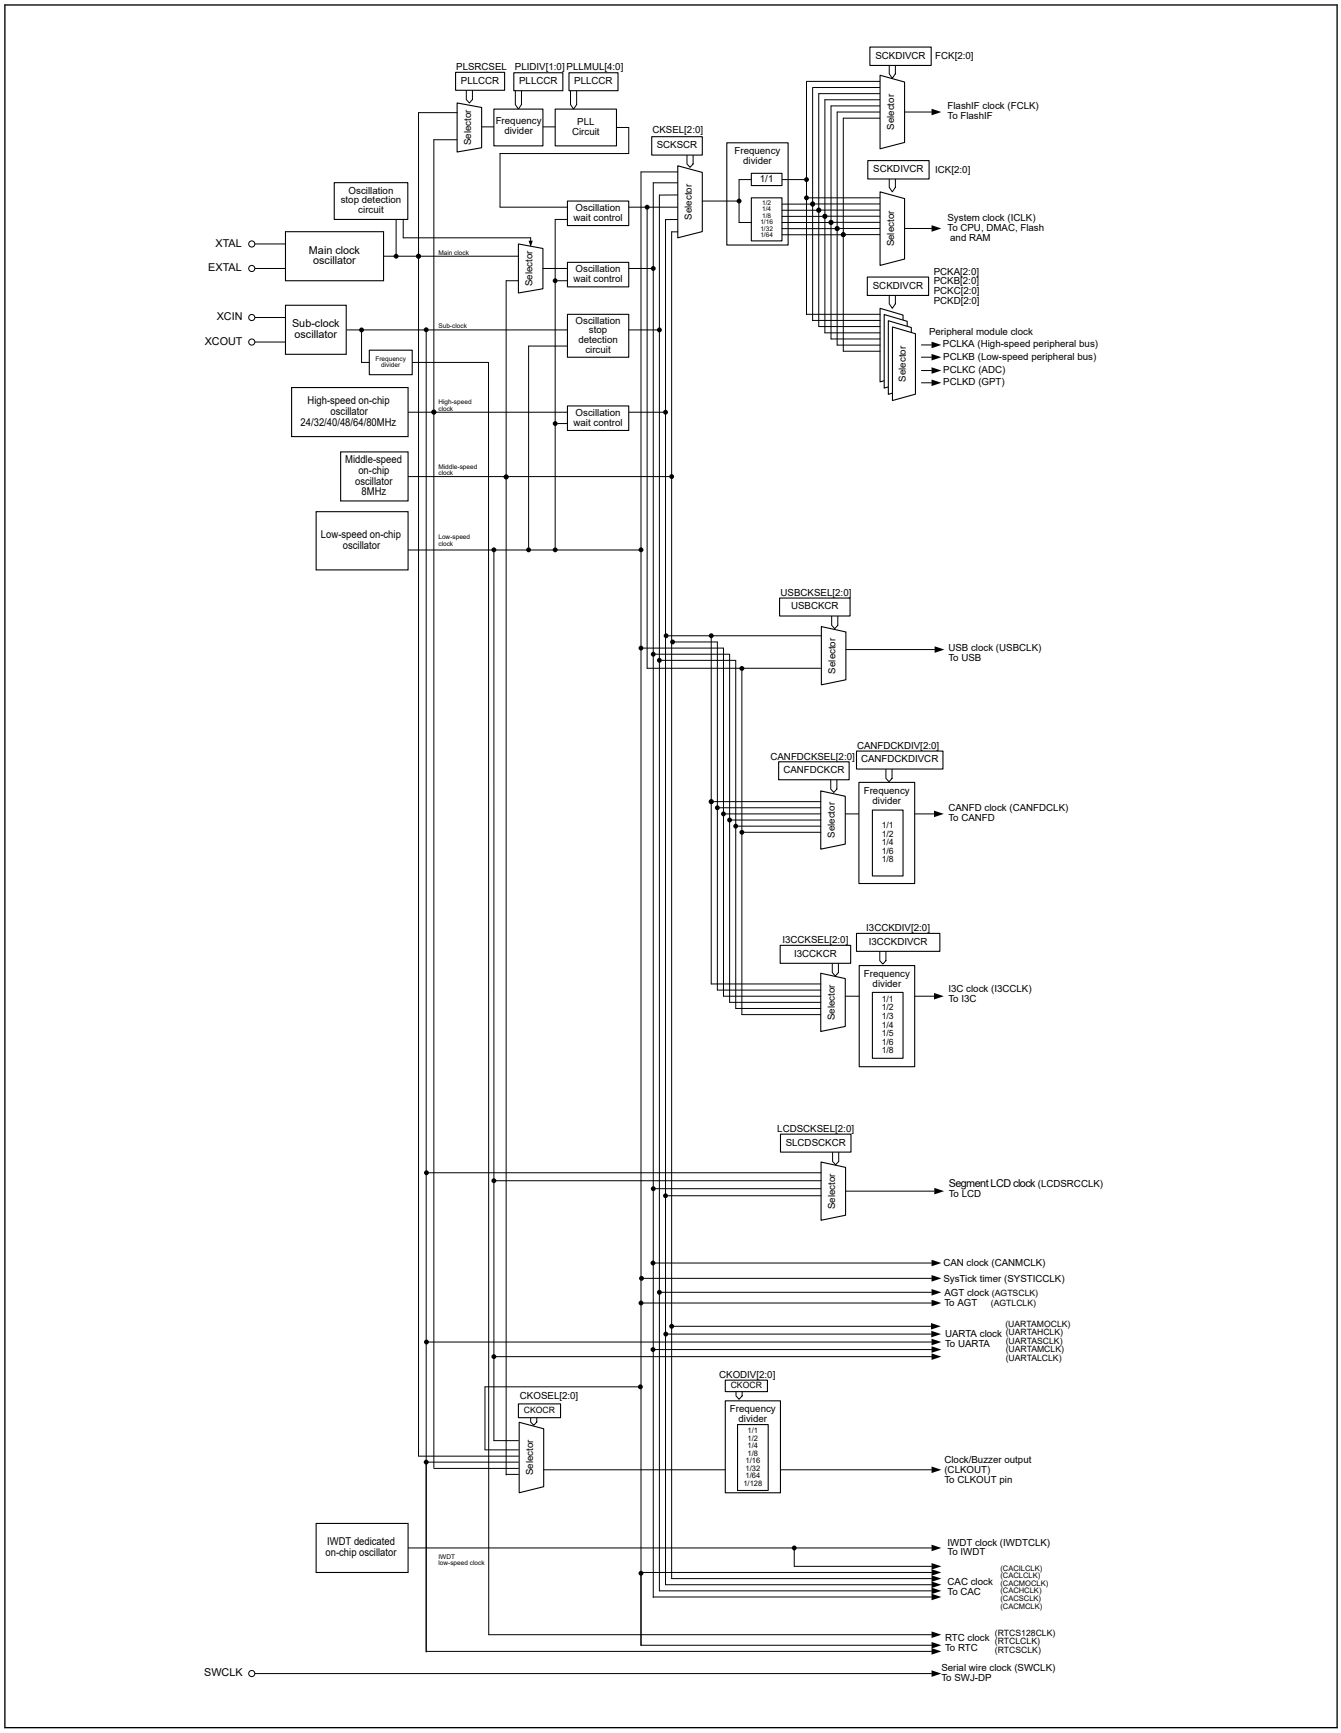

**Figure 8.1 Clock generation circuit block diagram**

Table 8.3 lists the input/output pins of the clock generation circuit.

**Table 8.3 Input/output pins of clock generation circuit**

| Pin name | I/O | Description |
|---|---|---|
| XTAL | Output | These pins are used to connect a ceramic resonator or crystal resonator. The EXTAL pin can also be used to input an external clock. For details, see section 8.3.2. External Clock Input. |
| EXTAL | Input | |
| XCIN | Input | These pins are used to connect a 32.768-kHz crystal resonator |
| XCOUT | Output | |
| SWCLK | Input | This pin is used to input the clock for the SWD |
| CLKOUT | Output | This pin is used to output the CLKOUT/BUZZER clock |

## 8.2 Register Descriptions

In this section, OFS1 represents the OFS1, OFS1_SEC, and OFS1_SEL registers. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL.

### 8.2.1 CGFSAR : Clock Generation Function Security Attribute Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3C0

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | NONSEC26 | — | — | — | — | — | NONSEC20 | — | NONSEC18 | — | NONSEC16 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | NONSEC11 | — | — | NONSEC08 | NONSEC07 | NONSEC06 | NONSEC05 | NONSEC04 | NONSEC03 | NONSEC02 | — | NONSEC00 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | NONSEC00*1 | Non-secure Attribute bit 00<br>Target register: SCKDIVCR, SCKSCR<br>Target factor: system clock control<br>0: Secure<br>1: Non-secure | R/W |

| 17 | — | This bit is read as 1. The write value should be 1. | R/W |
| 18 | NONSEC18 | Non-secure Attribute bit 18<br>Target register: CANFDCKDIVCR, CANFDCKCR<br>Target factor: CANFDCLK<br>0: Secure<br>1: Non-secure | R/W |
| 19 | — | This bit is read as 1. The write value should be 1. | R/W |
| 20 | NONSEC20 | Non-secure Attribute bit 20<br>Target register: I3CCKDIVCR, I3CCKCR<br>Target factor: I3CCLK<br>0: Secure<br>1: Non-secure | R/W |
| 25:21 | — | These bits are read as 1. The write value should be 1. | R/W |
| 26 | NONSEC26 | Non-secure Attribute bit 26<br>Target register: SLCDSCKCR<br>Target factor: LCDSRCCLK<br>0: Secure<br>1: Non-secure | R/W |
| 31:27 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.
Note 1. It is recommended that these bits are configured as Non-secure when the device life cycle is NSECSD (DLMMON.DLMMON[3:0] = 0011b). See section 48.8.1. Restrictions on setting the security attribution for the details.

CGFSAR register controls the secure attribute of Clock Generation Function registers.

### NONSEC00 bit (Non-secure Attribute bit 00)

This bit controls the security attribute of SCKDIVCR, SCKSCR.

### NONSEC02 bit (Non-secure Attribute bit 02)

This bit controls the security attribute of HOCOCR, HOCOCR2, HOCOUTCR.

**NONSEC03 bit (Non-secure Attribute bit 03)**

This bit controls the security attribute of MOCOCR, MOCOUTCR.

**NONSEC04 bit (Non-secure Attribute bit 04)**

This bit controls the security attribute of LOCOCR, LOCOUTCR.

**NONSEC05 bit (Non-secure Attribute bit 05)**

This bit controls the security attribute of MOSCCR, MOSCWTCR, MOMCR.

**NONSEC06 bit (Non-secure Attribute bit 06)**

This bit controls the security attribute of OSTDCR, OSTDSR, SOSTDCR.

**NONSEC07 bit (Non-secure Attribute bit 07)**

This bit controls the security attribute of SOSCCR, SOMCR, SOMRG.

**NONSEC08 bit (Non-secure Attribute bit 08)**

This bit controls the security attribute of PLLCCR, PLLCR.

**NONSEC11 bit (Non-secure Attribute bit 11)**

This bit controls the security attribute of CKOCR.

**NONSEC16 bit (Non-secure Attribute bit 16)**

This bit controls the security attribute of USBCKCR.

**NONSEC18 bit (Non-secure Attribute bit 18)**

This bit controls the security attribute of CANFDCKDIVCR, CANFDCKCR.

**NONSEC20 bit (Non-secure Attribute bit 20)**

This bit controls the security attribute of I3CCKDIVCR, I3CCKCR.

**NONSEC26 bit (Non-secure Attribute bit 26)**

This bit controls the security attribute of SLCDSCKCR.

## 8.2.2 SCKDIVCR : System Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x020

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | FCK[2:0] | | | — | ICK[2:0] | | | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | PCKA[2:0] | | | — | PCKB[2:0] | | | — | PCKC[2:0] | | | — | PCKD[2:0] | | |
| Value after reset: | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | PCKD[2:0]*3 | Peripheral Module Clock D (PCLKD) Select<br>0 0 0: × 1/1<br>0 0 1: × 1/2<br>0 1 0: × 1/4<br>0 1 1: × 1/8<br>1 0 0: × 1/16<br>1 0 1: × 1/32<br>1 1 0: × 1/64<br>Others: Setting prohibited. | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 6:4 | PCKC[2:0]*3 | Peripheral Module Clock C (PCLKC) Select<br>0 0 0: × 1/1<br>0 0 1: × 1/2<br>0 1 0: × 1/4<br>0 1 1: × 1/8<br>1 0 0: × 1/16<br>1 0 1: × 1/32<br>1 1 0: × 1/64<br>Others: Setting prohibited. | R/W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |
| 10:8 | PCKB[2:0]*2 | Peripheral Module Clock B (PCLKB) Select<br>0 0 0: × 1/1<br>0 0 1: × 1/2<br>0 1 0: × 1/4<br>0 1 1: × 1/8<br>1 0 0: × 1/16<br>1 0 1: × 1/32<br>1 1 0: × 1/64<br>Others: Setting prohibited. | R/W |
| 11 | — | This bit is read as 0. The write value should be 0. | R/W |
| 14:12 | PCKA[2:0]*2 | Peripheral Module Clock A (PCLKA) Select<br>0 0 0: × 1/1<br>0 0 1: × 1/2<br>0 1 0: × 1/4<br>0 1 1: × 1/8<br>1 0 0: × 1/16<br>1 0 1: × 1/32<br>1 1 0: × 1/64<br>Others: Setting prohibited. | R/W |
| 23:15 | — | These bits are read as 0. The write value should be 0. | R/W |
| 26:24 | ICK[2:0]*1 *2 *3 *4 | System Clock (ICLK) Select<br>0 0 0: × 1/1<br>0 0 1: × 1/2<br>0 1 0: × 1/4<br>0 1 1: × 1/8<br>1 0 0: × 1/16<br>1 0 1: × 1/32<br>1 1 0: × 1/64<br>Others: Setting prohibited. | R/W |
| 27 | — | This bit is read as 0. The write value should be 0. | R/W |
| 30:28 | FCK[2:0]*1 | FlashIF Clock (FCLK) Select<br>0 0 0: × 1/1<br>0 0 1: × 1/2<br>0 1 0: × 1/4<br>0 1 1: × 1/8<br>1 0 0: × 1/16<br>1 0 1: × 1/32<br>1 1 0: × 1/64<br>Others: Setting prohibited. | R/W |
| 31 | — | This bit is read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. The following relation is required between the frequencies of the system clock (ICLK) and the FlashIF clock (FCLK).
ICLK : FCLK = 1:1 when ICLK ≦ 48 MHz, ICLK : FCLK = 2:1 when 48 MHz < ICLK ≦ 80 MHz
Note 2. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKA, PCLKB)
ICLK:PCLKA = N:1, ICLK:PCLKB = N:1 (N: integer)
Note 3. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKC, PCLKD):
ICLK:PCLKC, PCLKD = N:1 or 1:N (N: integer)
Note 4. The frequency of the system clock (ICLK) is limited to the Memory Wait Cycle Control register (MEMWAIT). See section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash.

SCKDIVCR selects the frequencies of the system clock (ICLK), peripheral module clock (PCLKA, PCLKB, PCLKC, PCLKD), FlashIF clock (FCLK).

## 8.2.3 SCKSCR : System Clock Source Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x026

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | CKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | CKSEL[2:0] | Clock Source Select<br>0 0 0: HOCO<br>0 0 1: MOCO<br>0 1 0: LOCO<br>0 1 1: Main clock oscillator (MOSC)<br>1 0 0: Sub-clock oscillator (SOSC)<br>1 0 1: PLL<br>1 1 0: Setting prohibited<br>1 1 1: Setting prohibited | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The SCKSCR register selects the clock source for the system clock.

### CKSEL[2:0] bits (Clock Source Select)

The CKSEL[2:0] bits select the source for the following modules:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)
- FlashIF clock (FCLK)

The bits select from one of the following sources:

- Low-speed on-chip oscillator (LOCO)
- Middle-speed on-chip oscillator (MOCO)
- High-speed on-chip oscillator (HOCO)
- Main clock oscillator (MOSC)

- Sub-clock oscillator (SOSC)
- PLL

The operating state of each clock source is controlled not only by the clock oscillation enable settings but also by the operating modes of the product. Some clock sources might be forcibly stopped depending on the product operating mode being used.

Check the operation state of clock sources in each product operating mode, and do not select the clock source to be stopped in SCKSCR. The clock sources should be switched when there are no occurring internal asynchronous interrupt. For details, see section 10, Low Power Modes.

## 8.2.4 MEMWAIT : Memory Wait Cycle Control Register for Code Flash

Base address: SYSC = 0x4001_E000

Offset address: 0x031

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | MEMWAIT[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | MEMWAIT[1:0] | Memory Wait Cycle Select for Code Flash<br>0 0: No wait<br>0 1: One wait<br>1 0: Two waits<br>Others: Setting prohibited | R/W |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: Writing 0 to the MEMWAIT[1:0] bits is prohibited when SCKDIVCR.ICK bit selects division by 1 and SCKSCR.CKSEL[2:0] bits select the system clock source that is faster than 32 MHz (ICLK > 32 MHz).
Note: The security attribute of MEMWAIT[1:0] is controlled by FSAR.FLWTSA.

The MEMWAIT[1:0] register controls the wait cycle of code flash read access.

### MEMWAIT[1:0] bits (Memory Wait Cycle Select for Code Flash)

The MEMWAIT[1:0] bits select the wait cycle of code flash read access. The wait cycle of code flash access is set to no wait (MEMWAIT[1:0] = 00) after a reset is released.

Before writing to the MEMWAIT[1:0] bits, check the ICLK frequency and operating power control mode. The following restrictions apply when setting the ICLK and operating power control mode, including the MEMWAIT[1:0] bits. Use the following steps to switch the frequency.

Increasing the frequency

Use the following procedure when transitioning from Range 1 to Range 2, Range 3 or from Range 2 to Range 3. See Table 8.4 for an explanation of each range.

1. Check and set the FCLK division ratio if required.
2. Confirm and set the MEMWAIT[1:0] bits if required.
3. Change the frequency of the source clock.

Depending on the frequency to be changed, it is necessary to change the mode of the power supply. For details, see section 10, Low Power Modes.

Lowering the frequency

Use the following procedure when transitioning from Range 3 to Range 2, Range 1 or from Range 2 to Range 1. See Table 8.4 for an explanation of each range.

1. Change the frequency of the source clock.
2. Confirm and set the MEMWAIT[1:0] bits if required.

3. Check and set the FCLK division ratio if required.

Depending on the frequency to be changed, it is necessary to change the mode of the power supply. For details, see section 10, Low Power Modes.

**Table 8.4 Case by frequency ranges and related conditions**

| | Range 1 | Range 2 | Range 3 |
|---|---|---|---|
| Frequency of ICLK | ICLK ≤ 32 MHz | 32 MHz < ICLK ≤ 48 MHz | 48 MHz < ICLK ≤ 80 MHz |
| Division ratio of FCLK | 1 (recommended)<br>2*1 | 1 (recommended)<br>2*1 | 2 |
| MEMWAIT[1:0] | 00 (0 wait, recommended)<br>01*1 (1 wait)<br>10*1 (2 waits) | 01 (1 wait, recommended)<br>10*1 (2 waits) | 10 (2 waits) |

Note 1. Allowed during the frequency range change process.

**Table 8.5 MEMWAIT[1:0] bit setting**

| MEMWAIT[1:0] bits | MCU operation power control | | | |
|---|---|---|---|---|
| | Mode: except High-speed mode | High-speed mode | | |
| | | ICLK ≤ 32 MHz | 32 MHz < ICLK ≤ 48 MHz | 48 MHz < ICLK ≤ 80 MHz |
| 00 | ✓ | ✓ | — | — |
| 01 | — | ✓ | ✓ | — |
| 10 | — | ✓ | ✓ | ✓ |

Note: ✓ : Setting is possible.
— : Setting is not possible.

## 8.2.5 FLDWAITR : Memory Wait Cycle Control Register for Data Flash

Base address: FLCN = 0x407E_C000

Offset address: 0x3FC4

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | FLDWAIT1 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | FLDWAIT1 | Memory Wait Cycle Select for Data Flash<br>0: One wait access (default)<br>1: Two wait accesses | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Writing 0 to the FLDWAIT1 bit is prohibited when SCKDIVCR.ICK bit selects division by 1 and SCKSCR.CKSEL[2:0] bits select the system clock source that is faster than 32 MHz (ICLK > 32 MHz).

The FLDWAITR register controls the wait cycle of data flash read access.

### FLDWAIT1 bit (Memory Wait Cycle Select for Data Flash)

This bit selects the wait cycle of data flash read access. The wait cycle of data flash access is set to 1 wait (FLDWAIT1 = 0) after a reset is released.

The FLDWAIT1 settings for the data flash read access wait cycle are as follows:

- FLDWAIT1 = 0: 1 wait cycle
- FLDWAIT1 = 1: 2 wait cycles

Before writing to the FLDWAIT1 bit, check the ICLK frequency and operating power control mode. The following restrictions apply when setting the ICLK and operating power control mode, including the FLDWAIT1 bit:

- When setting the ICLK faster than 32 MHz (ICLK > 32 MHz), set FLDWAIT1 to 1 while ICLK is 32 MHz or less (ICLK ≤ 32 MHz) and the operating power control mode is High-speed mode (OPCCR.OPCM[1:0] = 00b). Setting FLDWAIT1 to 1 is prohibited in operation modes other than High-speed mode. Setting the ICLK faster than 32 MHz is prohibited while FLDWAIT1 = 0.
- When setting the ICLK from 32 MHz or faster (ICLK > 32 MHz) to 32 MHz or less (ICLK ≤ 32 MHz), the ICLK frequency must be set to 32 MHz or less while FLDWAIT1 = 1. Setting FLDWAIT1 to 0 is prohibited while ICLK is faster than 32 MHz. Setting FLDWAIT1 to 1 is prohibited in operation modes other than High-speed mode. FLDWAIT1 can be set to 0 while the ICLK frequency is 32 MHz or less and operating power control mode is High-speed mode (OPCCR.OPCM[1:0] = 00b).

**Table 8.6 FLDWAIT1 bit setting**

| FLDWAIT1 bit | MCU operation power control | | |
|---|---|---|---|
| | Mode: except High-speed mode | High-speed mode | |
| | | ICLK ≤ 32 MHz | ICLK > 32 MHz |
| 0 | ✓ | ✓ | — |
| 1 | — | ✓ | ✓ |

Note: ✓ : Setting is possible.
— : Setting is not possible.

Figure 8.2 shows an example flow when setting ICLK faster than 32 MHz.

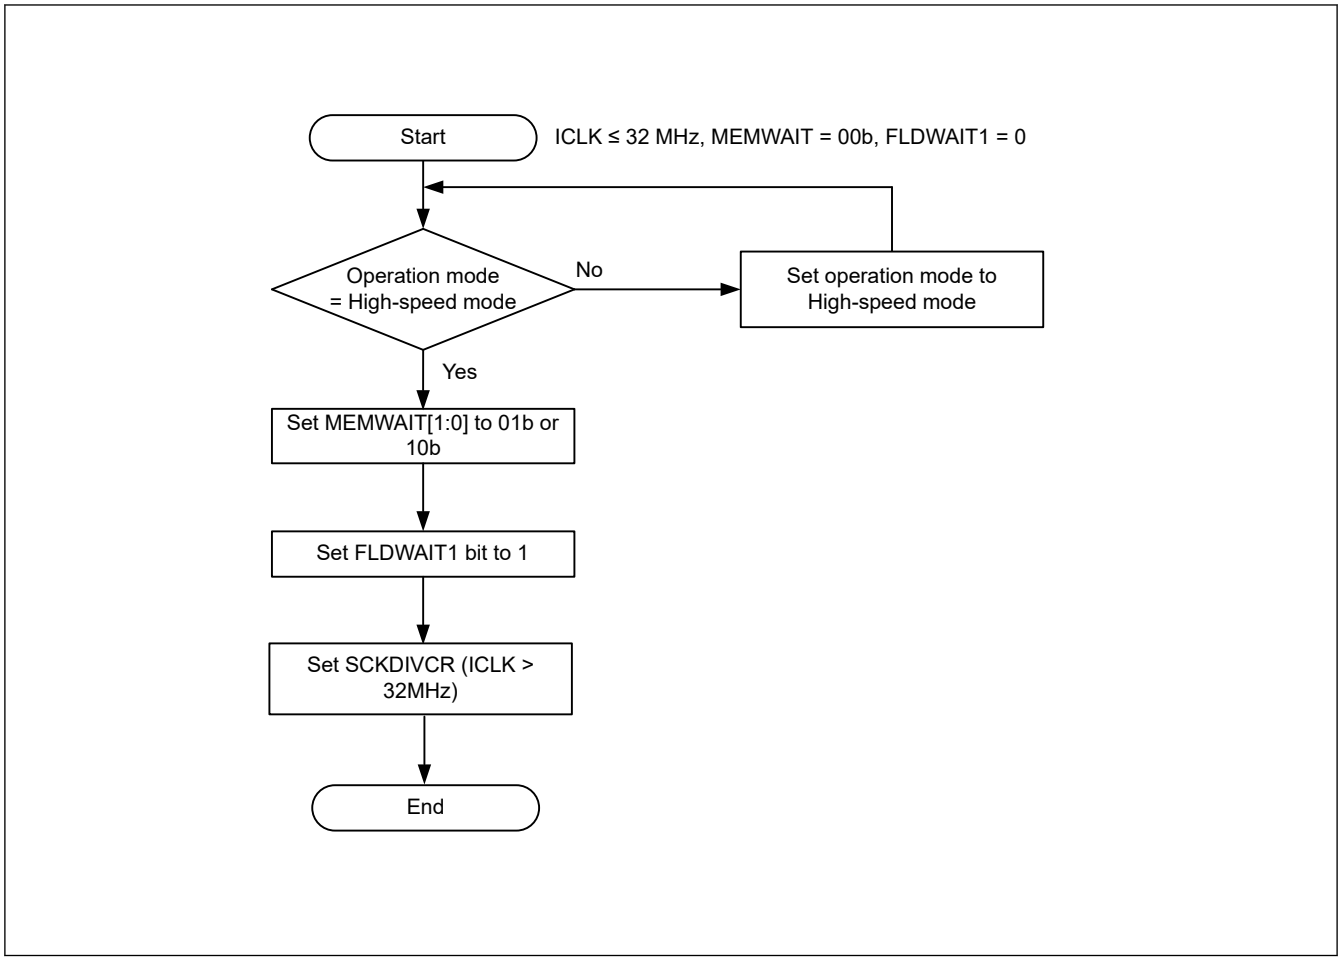

**Figure 8.2 When setting ICLK > 32 MHz**

Figure 8.3 shows an example flow when setting ICLK less than or equal to 32 MHz when ICLK is greater than 32 MHz.

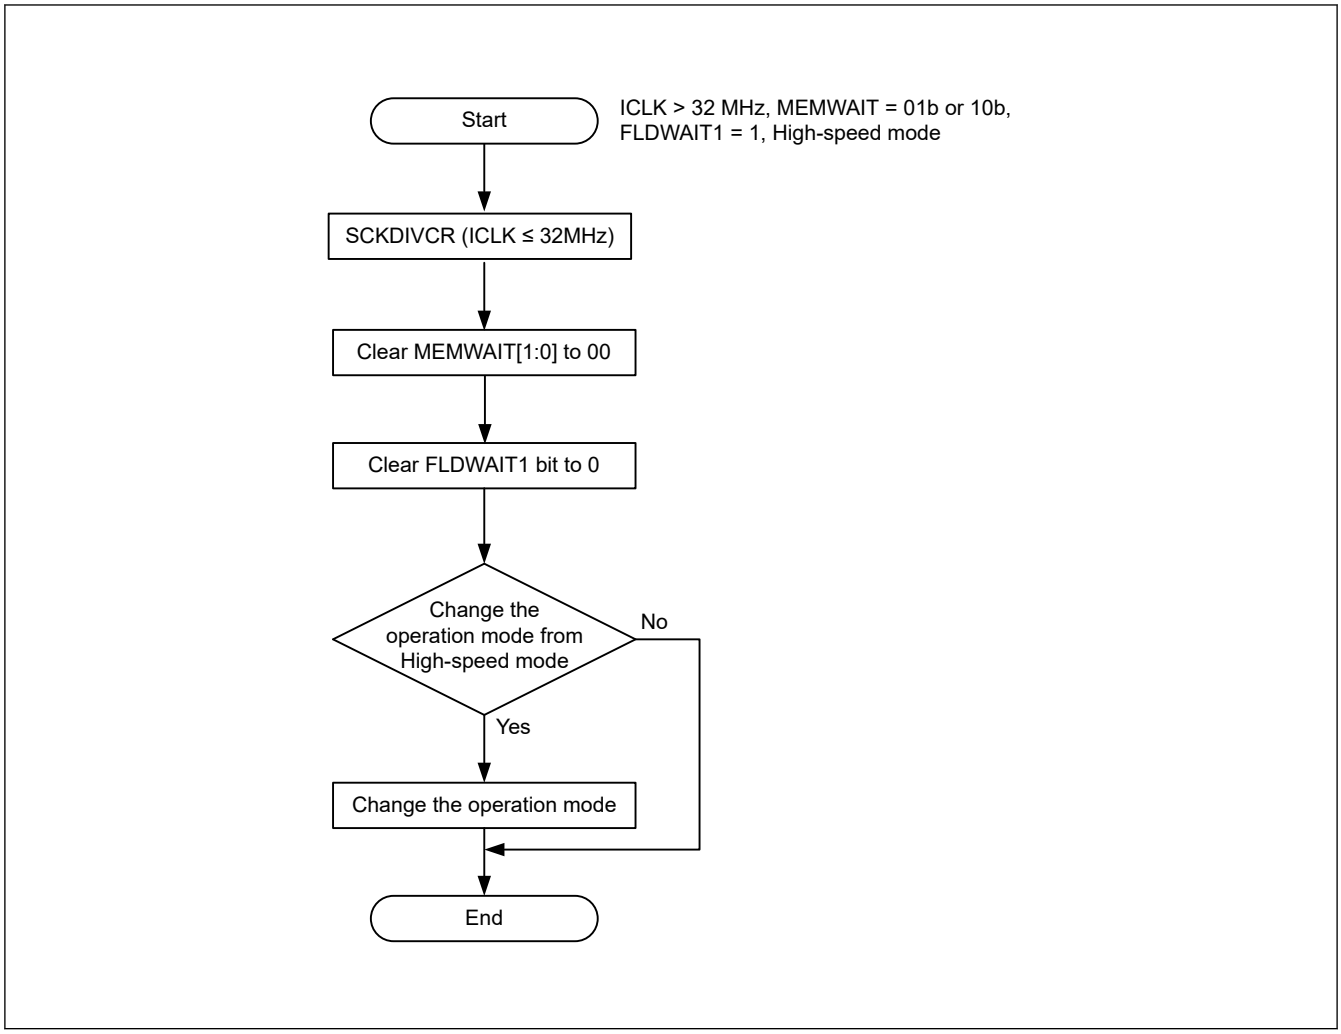

**Figure 8.3 When setting ICLK ≤ 32 MHz from ICLK > 32 MHz**

## 8.2.6 PLLCCR : PLL Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x028

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | PLLMUL[4:0] | | | | | — | — | — | PLSR CSEL | — | — | PLIDIV[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | PLIDIV[1:0]*1 | PLL Input Frequency Division Ratio Select<br>0 0: /1<br>0 1: /4<br>1 0: /6<br>Others: Setting prohibited | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | PLSRCSEL | PLL Clock Source Select<br>0: Main clock oscillator<br>1: HOCO | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 12:8 | PLLMUL[4:0]*2 | PLL Frequency Multiplication Factor Select<br>0x07: × 4 (value after reset)<br>0x08: × 4.5<br>0x09: × 5<br>⋮<br>0x1C: × 14.5<br>0x1D: × 15<br>0x1E: × 15.5<br>Others: Setting prohibited | R/W |
| 15:13 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. PLIDIV[1:0] should be set so that the frequency of PLL input signal is within the range of section 8.1. Overview.
Note 2. PLLMUL[4:0] should be set so that the frequency of PLL output signal is within the range of section 8.1. Overview.

The PLLCCR register sets the operation of the PLL circuit.

Writing to the PLLCCR is prohibited when the PLLCR.PLLSTP bit is 0 (the PLL operates).

### PLIDIV[1:0] bits (PLL Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL clock source.

### PLSRCSEL bit (PLL Clock Source Select)

This bit selects the clock source for the PLL.

### PLLMUL[4:0] bits (PLL Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL circuit.

## 8.2.7 PLLCR : PLL Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x02A

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | PLLSTP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PLLSTP | PLL Stop Control<br>0: PLL is operating<br>1: PLL is stopped | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLLCR register controls the operation of the PLL circuit.

### PLLSTP bit (PLL Stop Control)

This bit runs or stops the PLL circuit.

If the main clock oscillator is to be selected as the clock source for the PLL by the PLLCCR.PLSRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLLSTP bit setting is changed to run the PLL, only use the PLL clock after confirming that the OSCSF.PLLSF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL operation. A fixed time is also required for oscillation to stop after stopping the PLL operation. Additionally, apply the following limitations when starting and stopping the PLL operation by the PLLSTP bit:

- After stopping the PLL, confirm that the OSCSF.PLLSF bit is 0 before restarting the PLL.
- Confirm that the PLL is operating and that the OSCSF.PLLSF bit is 1 before stopping the PLL.
- Regardless of whether the PLL clock is selected as the system clock, confirm that the OSCSF.PLLSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby mode after operating the PLL.
- When transitioning to Software Standby mode after stopping the PLL, confirm that the OSCSF.PLLSF bit is cleared to 0 before executing a WFI instruction.

Writing 1 to the PLLSTP bit is prohibited when SCKSCR.CKSEL[2:0] = 101 (system clock source = PLL).

Confirm the following conditions before writing 0 to PLLSTP:

- When PLL source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When PLL source clock = HOCO: HOCOCR.HCSTP = 0 (HOCO is enabled).

## 8.2.8 MOSCCR : Main Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x032

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | MOSTP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MOSTP | Main Clock Oscillator Stop<br>0: Operate the main clock oscillator*1<br>1: Stop the main clock oscillator | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. MOMCR register must be set before setting MOSTP to 0.

The MOSCCR register controls the main clock oscillator.

### MOSTP bit (Main Clock Oscillator Stop)

The MOSTP bit starts or stops the main clock oscillator.

When changing the value of the MOSTP bit, execute subsequent instructions only after reading the bit to check that the value is updated.

When using the main clock, the Main Clock Oscillator Mode Oscillation Control Register (MOMCR) and the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set before setting MOSTP to 0. After setting the MOSTP bit to 0, confirm that the OSCSF.MOSCSF bit is set to 1 before using the main clock oscillator.

A fixed stabilization wait time is required after setting the main clock oscillator to start operation. A fixed wait time is also required for oscillation to stop after stopping the main clock oscillator.

The following restrictions apply when starting and stopping operation:

- After stopping the main clock oscillator, confirm that the OSCSF.MOSCSF bit is 0 before restarting the main clock oscillator

- Confirm that the main clock oscillator operates and that the OSCSF.MOSCSF bit is 1 before stopping the main clock oscillator
- Regardless of whether the main clock oscillator is selected as the system clock, confirm that the OSCSF.MOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby mode after operating the main clock oscillator
- When a transition to Software Standby mode is to follow the setting to stop the main clock oscillator, confirm that the OSCSF.MOSCSF bit is set to 0 before executing the WFI instruction

Writing 1 to MOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and PLLCR.PLLSTP = 0 (PLL is operating)

## 8.2.9 SOSCCR : Sub-Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x480

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | SOSTP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SOSTP | Sub Clock Oscillator Stop<br>0: Operate the sub-clock oscillator*1<br>1: Stop the sub-clock oscillator | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. The SOMCR register must be set before setting SOSTP to 0.

The SOSCCR register controls the sub-clock oscillator.

### SOSTP bit (Sub Clock Oscillator Stop)

The SOSTP bit starts or stops the sub-clock oscillator. When changing the value of the SOSTP bit, only execute subsequent instructions after reading the bit to check that the value is updated. Use the SOSTP bit when using the sub-clock oscillator as the source for a peripheral module, for example the RTC. When using the sub-clock oscillator, set the Sub-Clock Oscillator Mode Control Register (SOMCR) before setting SOSTP to 0.

The following restrictions apply when starting and stopping the operation:

- After stopping the sub-clock oscillator, allow a stop interval of at least 5 SOSC clock cycles before restarting it
- After setting the SOSTP bit to 0, use the sub-clock only after the sub-clock oscillation stabilization time ($t_{SUBOSCWT}$) has elapsed
- Regardless of whether the sub-clock oscillator is selected as the system clock, confirm that the sub-clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby mode
- When a transition to Software Standby mode is to follow the setting to stop the sub-clock oscillator, wait for at least 3 SOSC clock cycles before executing the WFI instruction.

Writing 1 to SOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 100b (system clock source = SOSC).

## 8.2.10 LOCOCR : Low-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x490

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | LCSTP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | LCSTP | LOCO Stop<br>0: Operate the LOCO clock<br>1: Stop the LOCO clock | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The LOCOCR register controls the LOCO clock.

### LCSTP bit (LOCO Stop)

The LCSTP bit starts or stops the LOCO clock.

After setting the LCSTP bit to 0 to start the LOCO clock, only use the clock after the LOCO clock-oscillation stabilization wait time ($t_{LOCOWT}$) elapses. A fixed stabilization wait time is required after setting the LOCO clock to start operation. A fixed wait time is also required after setting the LOCO clock to stop.

The following restrictions apply when starting and stopping operation:

- After stopping the LOCO clock, allow a stop interval of at least 5 LOCO clock cycles before restarting it
- Confirm that LOCO oscillation is stable before stopping the LOCO clock
- Regardless of whether the LOCO is selected as the system clock, confirm that LOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby mode
- When a transition to Software Standby mode is to follow the setting to stop the LOCO clock, wait for at least 3 LOCO cycles before executing the WFI instruction.

Writing 1 to LCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 010b (system clock source = LOCO).

## 8.2.11 HOCOCR : High-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x036

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | HCSTP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0/1*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | HCSTP | HOCO Stop<br>0: Operate the HOCO clock *2 *3 *4 *5<br>1: Stop the HOCO clock | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. The HCSTP bit value after a reset is 0 when the OFS1.HOCOEN bit is 0. It is 1 when the OFS1.HOCOEN bit is 1.
Note 2. If you are using the HOCO (HCSTP = 0), set the OFS1. HOCOFRQ0[2:0] bit to an optimum value.
Note 3. Writing to OPCCR.OPCM[1:0] is prohibited while HOCOCR.HCSTP = 0 and OSCSF.HOCOSF = 0 (HOCO is in stabilization wait counting).
Note 4. Writing HCSTP is prohibited while OPCCR.OPCMTSF = 1 or SOPCCR.SOPCMTSF = 1 (during transition of operating power control mode).
Note 5. To use self-programming, it is necessary to start the HOCO (HCSTP = 0) and ensure that the oscillation is in a stable state (OSCSF.HOCOSF = 0) before executing the self-programming.

The HOCOCR register controls the HOCO clock.

### HCSTP bit (HOCO Stop)

The HCSTP bit starts or stops the HOCO clock.

After setting the HCSTP bit to 0 to start the HOCO clock, confirm that the OSCSF.HOCOSF is set to 1 before using the clock. When OFS1.HOCOEN is set to 0, confirm that OSCSF.HOCOSF is also set to 1 before using the HOCO clock. A fixed stabilization wait time is required after setting the HOCO clock to start operation. A fixed wait time is also required after setting the HOCO clock to stop.

The following limitations apply when starting and stopping operation:

- After stopping the HOCO clock, confirm that the OSCSF.HOCOSF is 0 before restarting the HOCO clock
- Confirm that the HOCO clock operates and that the OSCSF.HOCOSF is 1 before stopping the HOCO clock
- Regardless of whether the HOCO clock is selected as the system clock, confirm that the OSCSF.HOCOSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby mode after setting HOCO operation with the HCSTP bit
- When a transition to Software Standby mode is to follow the setting of the HOCO clock to stop, confirm that the OSCSF.HOCOSF is set to 0 after setting the HOCO clock and before executing the WFI instruction.

Writing 1 to HCSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 000b (system clock source = HOCO)
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and PLLCR.PLLSTP = 0 (PLL is operating)

## 8.2.12 HOCOCR2 : High-Speed On-Chip Oscillator Control Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x037

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | HCFRQ0[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0/1*1 | 0/1*1 | 0/1*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | HCFRQ0[2:0] | HOCO Frequency Setting 0 *2<br>0 0 0: 48 MHz<br>0 0 1: 64 MHz<br>0 1 0: 80 MHz<br>1 0 0: 24 MHz<br>1 0 1: 32 MHz<br>1 1 0: 40 MHz<br>Others: Setting prohibited | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Value after reset of the HCFRQ0[2:0] bits depend on OFS1.HOCOFRQ0[2:0] bits.
Note 2. The value of OFS1.HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

The HOCOCR2 register controls the HOCO clock. Writing to the HOCOCR2 is prohibited when the HOCOCR.HCSTP bit is 0 (the HOCO operates). Writing to the HOCOCR2 is prohibited when the debugger is connected.

## 8.2.13 MOCOCR : Middle-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x038

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | MCSTP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MCSTP | MOCO Stop<br>0: MOCO clock is operating<br>1: MOCO clock is stopped | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The MOCOCR register controls the MOCO clock.

### MCSTP bit (MOCO Stop)

The MCSTP bit starts or stops the MOCO clock.

After setting MCSTP to 0, use the MOCO clock only after the MOCO clock oscillation stabilization time ($t_{MOCOWT}$) elapses. A fixed stabilization wait time is required after setting the MOCO clock to start operation. A fixed wait time is also required for oscillation to stop after setting the MOCO clock to stop operation.

The following restrictions apply when starting and stopping the oscillator:

- After stopping the MOCO clock, allow a stop interval of at least 5 MOCO clock cycles before restarting it
- Confirm that MOCO clock oscillation is stable before stopping the MOCO clock
- Regardless of whether the MOCO clock is selected as the system clock, confirm that MOCO clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby mode

- When a transition to Software Standby mode is to follow the setting to stop the MOCO clock, wait for at least 3 MOCO clock cycles before executing the WFI instruction.

Writing 1 to MCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 001b (system clock source = MOCO).

Writing 1 to the MCSTP bit (stopping the MOCO) is prohibited if oscillation stop detection is enabled in the Oscillation Stop Detection Control Register (OSTDCR.OSTDE).

Because the MOCO clock measures the wait time for other oscillators, it continues to oscillate while measuring this time, regardless of the setting in MOCOCR.MCSTP. As a result, the MOCO clock might be unintentionally supplied even when the MCSTP is set to stop.

## 8.2.14 OSCSF : Oscillation Stabilization Flag Register

Base address: SYSC = 0x4001_E000

Offset address: 0x03C

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | PLLSF | — | MOSCSF | — | — | HOCOSF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0/1*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | HOCOSF | HOCO Clock Oscillation Stabilization Flag<br>0: The HOCO clock is stopped or is not yet stable<br>1: The HOCO clock is stable, so is available for use as the system clock | R |
| 2:1 | — | These bits are read as 0. | R |
| 3 | MOSCSF | Main Clock Oscillation Stabilization Flag<br>0: The main clock oscillator is stopped (MOSTP = 1) or is not yet stable*2<br>1: The main clock oscillator is stable, so is available for use as the system clock | R |
| 4 | — | This bit is read as 0. | R |
| 5 | PLLSF | PLL Clock Oscillation Stabilization Flag<br>0: The PLL clock is stopped, or oscillation of the PLL clock is not stable yet<br>1: The PLL clock is stable, so is available for use as the system clock | R |
| 7:6 | — | These bits are read as 0. | R |

Note 1. The value after reset depends on the OFS1.HOCOEN setting.
When OFS1.HOCOEN = 1 (disable HOCO), the value after reset of HOCOSF is 0.
When OFS1.HOCOEN = 0 (enable HOCO), the HOCOSF value is set to 0 immediately after reset is released, and the HOCOSF value is set to 1 after the HOCO oscillation stabilization wait time elapses.

Note 2. This is true when an appropriate value is set in the Wait Control register for the main clock oscillator. If the wait time value is not sufficient, the oscillation stabilization flag is set to 1 and supply of the clock signal to the internal circuits starts before oscillation is stable.

This register is not controlled by CGFSAR register.

The OSCSF register contains flags to indicate the operating status of the counters in the oscillation stabilization wait circuits for the individual oscillators. After oscillation starts, these counters measure the wait time until each oscillator output clock is supplied to the internal circuits. An overflow of a counter indicates that the clock supply is stable and available for the associated circuit.

### HOCOSF flag (HOCO Clock Oscillation Stabilization Flag)

The HOCOSF flag indicates the operating status of the counter that measures the wait time for the high-speed clock oscillator (HOCO). When OFS1.HOCOEN is set to 0, confirm that OSCSF.HOCOSF is set to 1 before using the HOCO clock.

[Setting condition]

- When the HOCO clock is stopped and the HOCOCR.HCSTP bit is set to 0, and then the HOCO oscillation stabilization time is counted by the MOCO clock and supply of the HOCO clock within the MCU is started. For the HOCO oscillation stabilization time, see section 49, Electrical Characteristics.

[Clearing condition]

- When the HOCO clock is operating and then is deactivated because the HOCOCR.HCSTP bit is set to 1.

#### MOSCSF flag (Main Clock Oscillation Stabilization Flag)

The MOSCSF flag indicates the operating status of the counter that measures the wait time for the main clock oscillator.

[Setting condition]

- When the main clock oscillator is stopped and the MOSCCR.MOSTP bit is set to 0, and then the number of MOCO clock cycles corresponding to the setting of the MOSCWTCR register is counted and supply of the main clock within the MCU is started.

[Clearing condition]

- When the main clock oscillator is operating and then is deactivated because the MOSCCR.MOSTP bit is set to 1.

#### PLLSF flag (PLL Clock Oscillation Stabilization Flag)

The PLLSF flag indicates the operating state of the counter that measures the wait time of the PLL.

[Setting condition]

- When the PLL is stopped and the PLLCR.PLLSTP bit is set to 0, and then the PLL oscillation stabilization time is counted by the MOCO clock and supply of the PLL clock within the MCU is started. If oscillation by the PLL clock source is not stable when the PLLCR.PLLSTP bit is set to 0, counting of the MOCO cycles continues even after the PLL clock source oscillation is stabilized. For the PLL oscillation stabilization time, see section 49, Electrical Characteristics.

[Clearing condition]

- When the PLL is operating and then is deactivated because the PLLCR.PLLSTP bit is set to 1.

### 8.2.15 OSTDCR : Oscillation Stop Detection Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x040

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | OSTDE | — | — | — | — | — | — | OSTDIE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | OSTDIE | Oscillation Stop Detection Interrupt Enable<br>0: Disable oscillation stop detection interrupt (do not notify the POEG)<br>1: Enable oscillation stop detection interrupt (notify the POEG) | R/W |
| 6:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | OSTDE | Oscillation Stop Detection Function Enable<br>0: Disable oscillation stop detection function<br>1: Enable oscillation stop detection function | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The OSTDCR register controls the oscillation stop detection function.

### OSTDIE bit (Oscillation Stop Detection Interrupt Enable)

The OSTDIE bit enables the oscillation stop detection function interrupt. It also controls whether oscillation stop detection is reported to the POEG.

If the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) requires clearing, set the OSTDIE bit to 0 before clearing OSTDF. Wait for at least 2 PCLKB cycles before setting the OSTDIE bit to 1. By reading the I/O register whose access cycle number is defined by PCLKB, it is possible to secure waiting time of 2 or more cycles of PCLKB.

### OSTDE bit (Oscillation Stop Detection Function Enable)

The OSTDE bit enables the oscillation stop detection function.

When the OSTDE bit is 1 (enabled), the MOCO stop bit (MOCOCR.MCSTP) is set to 0 and the MOCO operation starts. The MOCO clock cannot be stopped while the oscillation stop detection function is enabled. Writing 1 to the MOCOCR.MCSTP bit (MOCO stopped) is invalid.

When the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) is 1 (main clock oscillation stop detected), writing 0 to the OSTDE bit is invalid.

The OSTDE bit must be set to 0 before transitioning to Software Standby mode. To transition to Software Standby mode, first set the OSTDE bit to 0, then execute the WFI instruction.

The following restrictions apply when using the oscillation stop detection function:

In low-speed mode, selecting division by 1, 2, 4, 8 for ICLK, FCLK, PCLKA, PCLKB, PCLKC, and PCLKD is prohibited.

## 8.2.16 OSTDSR : Oscillation Stop Detection Status Register

Base address: SYSC = 0x4001_E000

Offset address: 0x041

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | OSTDF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | OSTDF | Oscillation Stop Detection Flag<br>0: Main clock oscillation stop not detected<br>1: Main clock oscillation stop detected | R/W*1 |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. This bit can only be set to 0. This bit is cleared to 0 by writing 0 after reading it as 1.

The OSTDSR register indicates the stop detection status of the main clock oscillator.

### OSTDF flag (Oscillation Stop Detection Flag)

The OSTDF flag indicates the main clock oscillator status. When this flag is 1, it indicates that the main clock oscillation stop was detected. After this stop is detected, the OSTDF flag is not set to 0 even when the main clock oscillation is restarted. The OSTDF bit is cleared to 0 by writing 0 after reading it as 1.

At least 3 ICLK cycles of wait time are required between writing 0 to OSTDF and reading it as 0. If the OSTDF flag is set to 0 when the main clock oscillation is stopped, the OSTDF flag becomes 0 then returns to 1.

The OSTDF flag cannot be set to 0 under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC)

- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL)

The OSTDF flag must be set to 0 after switching the clock source to sources other than the main clock oscillator and PLL.

[Setting condition]

- The main clock oscillator is stopped when OSTDCR.OSTDE = 1 (oscillation stop detection function enabled).

[Clearing condition]

When writing 0 after reading 1. However, it is not 0 under the following conditions.

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source =PLL).

## 8.2.17 SOSTDCR : Sub-Clock Oscillation Stop Detection Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x042

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 11:0 | SOSDCCMP[11:0] | Sub-Clock Oscillation Stop Detection Time<br>0x004: Detection time = 5 cycles<br>⋮<br>0xFFF: Detection time = 4096 cycles<br>Others: Setting prohibited | R/W |
| 12 | SOSTDIE | Sub-Clock Oscillation Stop Detection Interrupt Enable<br>0: Disable sub-clock oscillation stop detection interrupt<br>1: Enable sub-clock oscillation stop detection interrupt | R/W |
| 13 | SOSTDF | Sub-Clock Oscillation Stop Detection Flag<br>0: Sub-clock oscillation stop not detected<br>1: Sub-clock oscillation stop detected | R |
| 14 | SOSDCF | Status of Sub-Clock Oscillation Stop Detector Operation<br>0: Stop operation of the sub-clock oscillation stop detector<br>1: Run operation of the sub-clock oscillation stop detector | R |
| 15 | SOSDCE | Control of Sub-Clock Oscillation Stop Detector Operation<br>0: Stop operation of the sub-clock oscillation stop detector<br>1: Start operation of the sub-clock oscillation stop detector | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: Sub-clock oscillation stop detection function is disabled when low power consumption clock mode (RCR4.ROPSEL = 1) and Software Standby mode.

Note: SOSTDCR register supports only 16-bit access.

### SOSDCCMP[11:0] bits (Sub-Clock Oscillation Stop Detection Time)

The SOSDCCMP[11:0] bits specify the oscillation stop detection time. It is detected that oscillation has stopped when oscillation has been stopped for (A - 2) to (A + 1) clock cycles, where A refers to the time specified by these bits. Oscillation stop detection time = Low-speed on-chip oscillator clock (LOCO) cycle × ((value of SOSDCCMP11 to SOSDCCMP0) + 1).

### SOSTDIE bit (Sub-Clock Oscillation Stop Detection Interrupt Enable)

The SOSTDIE bit enables or disables the sub-clock oscillation stop detection function interrupt.

### SOSTDF bit (Sub-Clock Oscillation Stop Detection Flag)

The SOSTDF bit is a flag to indicate the sub-clock status. When the SOSTDF flag is 1, it indicates that the sub-clock oscillation stop has been detected. When the MSTPCRA.MSTPA16 is set to 1, the SOSTDF flag is cleared.

### SOSDCF bit (Status of Sub-Clock Oscillation Stop Detector Operation)

The SOSDCF bit indicates the operation status of the sub-clock oscillation stop detection function. After writing 1 to the SOSDCE bit, it becomes 1 synchronously with LOCO. If the SOSDCE bit is written to 0, it goes to 0 asynchronously to LOCO.

### SOSDCE bit (Control of Sub-Clock Oscillation Stop Detector Operation)

The SOSDCE bit enables the sub-clock oscillation stop detection function.

When the SOSDCE bit is 1 (enabled) the LOCO stop bit is set to 0 and the LOCO operation starts.

The LOCO clock cannot be stopped while the sub-clock oscillation stop detection function is enabled. Writing 1 to the LOCOCR.LCSTP bit (LOCO stopped) is invalid. If the sub-clock oscillation stop detection function is enabled, it operates even during Software Standby mode.

## 8.2.18 MOSCWTCR : Main Clock Oscillator Wait Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0A2

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | MSTS[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | MSTS[3:0] | Main Clock Oscillator Wait Time Setting<br>0x0: Wait time = 2 cycles (0.25 µs)<br>0x1: Wait time = 1024 cycles (128 µs)<br>0x2: Wait time = 2048 cycles (256 µs)<br>0x3: Wait time = 4096 cycles (512 µs)<br>0x4: Wait time = 8192 cycles (1024 µs)<br>0x5: Wait time = 16384 cycles (2048 µs)<br>0x6: Wait time = 32768 cycles (4096 µs)<br>0x7: Wait time = 65536 cycles (8192 µs)<br>0x8: Wait time = 131072 cycles (16384 µs)<br>0x9: Wait time = 262144 cycles (32768 µs)<br>Others: Setting prohibited | R/W |
| 7:4 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### MSTS[3:0] bits (Main Clock Oscillator Wait Time Setting)

The MSTS[3:0] bits specify the oscillation stabilization wait time for the main clock oscillator.

Set the main clock oscillation stabilization time to a period longer than or equal to the stabilization time recommended by the oscillator manufacturer. When the main clock is input externally, set these bits to 0x0 because the oscillation stabilization time is not required.

The wait time set in these bits is counted using: 1 cycle (µs) = 1 / (fMOCO [MHz]) = 1/8 = 0.125 (µs) (typ.) The MOCO clock automatically oscillates when necessary, regardless of the value of the MOCOCR.MCSTP bit. After the specified

wait time elapses, supply of the main clock starts internally in the MCU, and the OSCSF.MOSCSF flag is set to 1. If the specified wait time is short, supply of the main clock starts before oscillation of the clock becomes stable.

Only rewrite the MOSCWTCR register when the MOSCCR.MOSTP bit is 1 and the OSCSF.MOSCSF flag is 0. Do not rewrite this register under any other conditions.

## 8.2.19 MOMCR : Main Clock Oscillator Mode Oscillation Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x413

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | MOSEL | — | — | MODRV1 | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 3 | MODRV1 | Main Clock Oscillator Drive Capability 1 Switching<br>0: 10 MHz to 20 MHz<br>1: 1 MHz to 10 MHz | R/W |
| 5:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | MOSEL | Main Clock Oscillator Switching<br>0: Resonator<br>1: External clock input | R/W |
| 7 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: The EXTAL/XTAL pins are also used as ports. In the initial state, the pin is set as a port.
Note: The MOSCCR.MOSTP bit must be 1 (MOSC is stopped) before changing this register.
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

### MODRV1 bit (Main Clock Oscillator Drive Capability 1 Switching)

The MODRV1 bit switches the drive capability of the main clock oscillator.

### MOSEL bit (Main Clock Oscillator Switching)

The MOSEL bit switches the source for the main clock oscillator.

## 8.2.20 SOMCR : Sub-Clock Oscillator Mode Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x481

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | SODRV[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | SODRV[1:0] | Sub-Clock Oscillator Drive Capability Switching<br>0 0: Normal mode<br>0 1: Low power mode 1<br>1 0: Low power mode 2<br>1 1: Low power mode 3 | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: The SOSCCR.SOSTP bit must be 1 (SOSC is stopped) before changing this register.

### SODRV[1:0] bits (Sub-Clock Oscillator Drive Capability Switching)

The SODRV[1:0] bits switch the drive capability of the sub-clock oscillator. The relationship between the drive capability and the setting value is as follows:

Normal mode > Low power mode 1 > Low power mode 2 > Low power mode 3.

## 8.2.21 SOMRG : Sub-Clock Oscillator Margin Check Register

Base address: SYSC = 0x4001_E000

Offset address: 0x482

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | SOSCMRG[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | SOSCMRG[1:0] | Sub Clock Oscillator Margin check Switching<br>0 0: Normal current<br>0 1: Lower margin check<br>1 0: Upper margin check<br>1 1: Setting prohibited | R/W |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |

### SOSCMRG[1:0] bits (Sub Clock Oscillator Margin check Switching)

The SOSCMRG[1:0] bits control the amp current in the SOSC for oscillation margin check.

## 8.2.22 SLCDSCKCR : Segment LCD Source Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x050

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | LCDSCKEN | — | — | — | — | LCDSCKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | LCDSCKSEL[2:0] | Segment LCD Source Clock (LCDSRCCLK) Select<br>0 0 0: LOCO<br>0 0 1: SOSC<br>0 1 0: MOSC<br>1 0 0: HOCO<br>Others: Setting prohibited | R/W |
| 6:3 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7 | LCDSCKEN | Segment LCD Source Clock (LCDSRCCLK) Out Enable<br>0: Segment LCD source clock out is disabled<br>1: Segment LCD source clock out is enabled | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Setting the LCDSCKEN bit and LCDSCKSEL[2:0] bits at the same time is prohibited.
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

### LCDSCKSEL[2:0] bits (Segment LCD Source Clock (LCDSRCCLK) Select)

The LCDSCKSEL[2:0] bits select the LOCO, SOSC, MOSC, or HOCO clock as the segment LCD source clock. Clear the LCDSCKEN bit to 0 when changing the segment LCD source clock.

When changing these bits, use the following steps:

1. Set LCDSCKEN to 0 (segment LCD source clock out is disabled).
2. Wait for 3 segment LCD source clock cycles and 2 ICLK cycles before the change.
3. Write the changed value to LCDSCKSEL[2:0] bits.
4. Read LCDSCKSEL[2:0] bits to confirm that the LCDSCKSEL[2:0] bits are changed.

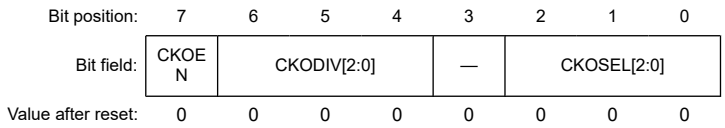
### LCDSCKEN bit (Segment LCD Source Clock (LCDSRCCLK) Out Enable)

The LCDSCKEN bit enables output of the segment LCD source clock to segment LCD module.

When this bit is set to 1, the selected clock is output. When changing this bit, confirm that the segment LCD source clock selected by the LCDSCLKSEL[2:0] bits is stable.

When transitioning to Software Standby mode after changing this bit, use the following steps:

1. Change this bit.
2. Wait for at least 2 cycles of the source clock selected in the LCDSCKSEL[2:0] bits.
3. Execute the WFI instruction.



When stopping the source clock selected in the LCDSCKSEL[2:0] bits after clearing this bit to 0, use the following steps:

1. Clear this bit to 0 (LCD source clock output is disabled).
2. Wait for at least 2 cycles of the source clock selected by the LCDSCKSEL[2:0] bits.
3. Stop the source clock selected by the LCDSCKSEL[2:0] bits.

## 8.2.23 CKOCR : Clock Out Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x03E

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | CKOSEL[2:0] | Clock Out Source Select<br>0 0 0: HOCO (value after reset)<br>0 0 1: MOCO<br>0 1 0: LOCO<br>0 1 1: MOSC<br>1 0 0: SOSC<br>Others: Setting prohibited | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 6:4 | CKODIV[2:0] | Clock Output Frequency Division Ratio<br>0 0 0: × 1/1<br>0 0 1: × 1/2<br>0 1 0: × 1/4<br>0 1 1: × 1/8<br>1 0 0: × 1/16<br>1 0 1: × 1/32<br>1 1 0: × 1/64<br>1 1 1: × 1/128 | R/W |
| 7 | CKOEN | Clock Out Enable<br>0: Disable clock out<br>1: Enable clock out | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### CKOSEL[2:0] bits (Clock Out Source Select)

The CKOSEL[2:0] bits select the source of the clock to be output from the CLKOUT pin. When changing the clock source, set the CKOEN bit to 0.

### CKODIV[2:0] bits (Clock Output Frequency Division Ratio)

The CKODIV[2:0] bits specify the clock division ratio. Set the CKOEN bit to 0 when changing the division ratio.

### CKOEN bit (Clock Out Enable)

The CKOEN bit enables output from the CLKOUT pin.

When this bit is set to 1, the selected clock is output. When this bit is set to 0, low is output. When changing this bit, confirm that the clock out source clock selected in the CKOSEL[2:0] bits is stable. When changing this bit, a glitch may be generated in the output.

Clear this bit before entering Software Standby mode if the selecting clock out source clock is stopped in that mode.

## 8.2.24 LOCOUTCR : LOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x492

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | LOCOUTRM[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | LOCOUTRM[7:0] | LOCO User Trimming<br>0x80: -128<br>0x81: -127<br>⋮<br>0xFF: -1<br>0x00: Center Code<br>0x01: +1<br>⋮<br>0x7E: +126<br>0x7F: +127 | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The LOCOUTCR register is added to the original LOCO trimming data.

MCU operation is not guaranteed when LOCOUTCR is set to a value that causes the LOCO frequency to be outside of the specification range. When LOCOUTCR is modified, the frequency stabilization time corresponds to the frequency stabilization time at the start of MCU operation.

Changing LOCOUTCR during RTC operation is prohibited.

## 8.2.25 MOCOUTCR : MOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x061

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | MOCOUTRM[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | MOCOUTRM[7:0] | MOCO User Trimming<br>0x80: -128<br>0x81: -127<br>⋮<br>0xFF: -1<br>0x00: Center Code<br>0x01: +1<br>⋮<br>0x7E: +126<br>0x7F: +127 | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The MOCOUTCR register is added to the original MOCO trimming data.

MCU operation is not guaranteed when MOCOUTCR is set to a value that causes the MOCO frequency to be outside of the specification range. When MOCOUTCR is modified, the frequency stabilization wait time corresponds to the frequency stabilization wait time at the start of the MCU operation.

## 8.2.26 HOCOUTCR : HOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x062

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | HOCOUTRM[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | HOCOUTRM[7:0] | HOCO User Trimming<br>0x80: -128<br>0x81: -127<br>⋮<br>0xFF: -1<br>0x00: Center Code<br>0x01: +1<br>⋮<br>0x7E: +126<br>0x7F: +127 | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The HOCOUTCR register is added to the original HOCO trimming data.

MCU operation is not guaranteed when HOCOUTCR is set to a value that causes the HOCO frequency to be outside of the specification range. When HOCOUTCR is modified, the frequency stabilization wait time corresponds to the frequency stabilization wait time at the start of the MCU operation.

When UCKSEL.UCKSELC = 1, writing any other value except 0x00 to HOCOUTCR is prohibited. For UCKSEL register, see section section 25, USB 2.0 Full-Speed Module (USBFS).

## 8.2.27 CANFDCKDIVCR : CANFD Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x06E

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | CANFDCKDIV[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | CANFDCKDIV[2:0] | CANFD clock (CANFDCLK) Division Select<br>0 0 0: /1 (value after reset)<br>0 0 1: /2<br>0 1 0: /4<br>0 1 1: /6<br>1 0 0: /8<br>Others: Setting prohibited | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

CANFDCKDIVCR controls the CANFD clock (CANFDCLK).

### CANFDCKDIV[2:0] bits (CANFD clock (CANFDCLK) Division Select)

The CANFDCKDIV[2:0] bits select the frequency of the CANFD clock (CANFDCLK). These bits must be modified when CANFDCKCR.CANFDCKSRDY = 1.

When switching the division ratio setting from n (n ≠ 1), set MSTPCRC.MSTPC27 = 1 before setting CANFDCKCR.CANFDCKSREQ = 1.

## 8.2.28 I3CCKDIVCR : I3C Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x071

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | I3CCKDIV[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | I3CCKDIV[2:0] | I3C Clock (I3CCLK) Division Select<br>0 0 0: /1 (value after reset)<br>0 0 1: /2<br>0 1 0: /4<br>0 1 1: /6<br>1 0 0: /8<br>1 0 1: /3<br>1 1 0: /5<br>Others: Setting prohibited | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The I3CCKDIVCR register controls the I3C clock.

### I3CCKDIV[2:0] bits (I3C Clock (I3CCLK) Division Select)

The I3CCKDIV[2:0] bits select the frequency of the I3C clock (I3CCLK). These bits must be modified when I3CCKCR.I3CCKSRDY = 1.

When switching the division ratio setting from n (n ≠ 1), set MSTPCRB.MSTPB4 = 1 before setting I3CCKCR.I3CCKSREQ = 1.

## 8.2.29 USBCKCR : USB Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x074

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | USBCKSRDY | USBCKSREQ | — | — | — | USBCKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | USBCKSEL[2:0] | USB Clock (USBCLK) Source Select<br>0 0 0: HOCO<br>1 0 1: PLL<br>Others: Setting prohibited. | R/W |
| 5:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | USBCKSREQ | USB Clock (USBCLK) Switching Request<br>0: No request<br>1: Request switching. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7 | USBCKSRDY | USB Clock (USBCLK) Switching Ready state flag<br>0: Impossible to Switch<br>1: Possible to Switch | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USBCKCR register controls the USB clock.

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of USBCKSEL[2:0], use the following procedure:

1. Write 1 to USBCKSREQ.
2. Poll until USBCKSRDY is read as 1. While USBCKSRDY = 1, no clock is output to USBCLK.
3. Write to USBCKSEL[2:0].
4. Write 0 to USBCKSREQ.
5. Poll until USBCKSRDY is read as 0.
6. When USBCKSRDY becomes 0, USBCLK starts to output. Clock switching is complete.

When transitioning to Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when USBCKSREQ = 1 and USBCKSRDY = 0, or when USBCKSREQ = 0 and USBCKSRDY = 1.

#### USBCKSEL[2:0] bits (USB Clock (USBCLK) Source Select)

These bits select the clock source of the USB clock (USBCLK) and must be modified when USBCKCR.USBCKSRDY = 1.

The USBCKCR.USBCKSEL[2:0] bits can only be set to 000 when USBFS is used as the device controller. Set the USBCKCR.USBCKSEL[2:0] bits to 101 to use the host controller and the On-The-Go (OTG) function.

The user trimming function cannot be used when the USBCKCR.USBCKSEL[2:0] bits is 000. To use the HOCO user trimming function, set the bits HOCOUTCR.HOCOUTRM[7:0] to 0x00.

#### USBCKSREQ bit (USB Clock (USBCLK) Switching Request)

This bit selects the USBCLK switching request.

#### USBCKSRDY flag (USB Clock (USBCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the USBCLK. When USBCKSRDY = 1, no clock is output to USBCLK.

## 8.2.30 CANFDCKCR : CANFD Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x076

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | CANFDCKSRDY | CANFDCKSREQ | — | — | — | CANFDCKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | CANFDCKSEL[2:0] | CANFD clock (CANFDCLK) Source Select<br>0 0 0: HOCO<br>0 0 1: MOCO (value after reset)<br>0 1 0: LOCO<br>0 1 1: Main clock oscillator<br>1 0 0: Sub-clock oscillator<br>1 0 1: PLL<br>Others: Setting prohibited | R/W |
| 5:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | CANFDCKSREQ | CANFD clock (CANFDCLK) Switching Request<br>0: No request<br>1: Request switching | R/W |
| 7 | CANFDCKSRDY | CANFD clock (CANFDCLK) Switching Ready State Flag<br>0: Switching not possible<br>1: Switching possible | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The CANFDCKCR register controls the CANFD clock (CANFDCLK).

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of CANFDCKDIVCR.CANFDCKDIV[2:0] and CANFDCKSEL[2:0], use the following procedure:

1. Write 1 to MSTPCRC.MSTPC27 (only when switching the division ratio setting from n (n ≠ 1)).
2. Wait for two CANFDCLK (only when switching the division ratio setting from n (n ≠ 1)).
3. Write 1 to CANFDCKSREQ.
4. Poll until CANFDCKSRDY is read as 1. While CANFDCKSRDY = 1, no clock is output to CANFDCLK.
5. Write to CANFDCKDIVCR.CANFDCKDIV[2:0] and CANFDCKSEL[2:0].
6. Write 0 to CANFDCKSREQ.
7. Poll until CANFDCKSRDY is read as 0.
8. When CANFDCKSRDY becomes 0, CANFDCLK starts to output. Clock switching is complete.

When transitioning to Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when CANFDCKSREQ = 1 and CANFDCKSRDY = 0, or when CANFDCKSREQ = 0 and CANFDCKSRDY = 1.

### CANFDCKSEL[2:0] bits (CANFD clock (CANFDCLK) Source Select)

The CANFDCKSEL[2:0] bits select the clock source of the CANFD clock (CANFDCLK) and must be modified when CANFDCKCR.CANFDCKSRDY = 1.

### CANFDCKSREQ bit (CANFD clock (CANFDCLK) Switching Request)

The CANFDCKSREQ bit selects the CANFDCLK switching request.

### CANFDCKSRDY flag (CANFD clock (CANFDCLK) Switching Ready State Flag)

The CANFDCKSRDY flag indicates the state of switching ready for the CANFDCLK. When CANFDCKSRDY = 1, no clock is output to CANFDCLK.

## 8.2.31 I3CCKCR : I3C Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x079

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | I3CCKSRDY | I3CCKSREQ | — | — | — | I3CCKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | I3CCKSEL[2:0] | I3C clock (I3CCLK) Source Select<br>0 0 0: HOCO<br>0 0 1: MOCO (value after reset)<br>0 1 0: LOCO<br>0 1 1: Main clock oscillator<br>1 0 0: Sub-clock oscillator<br>1 0 1: PLL<br>Others: Setting prohibited | R/W |
| 5:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | I3CCKSREQ | I3C clock (I3CCLK) Switching Request<br>0: No request<br>1: Request switching | R/W |
| 7 | I3CCKSRDY | I3C clock (I3CCLK) Switching Ready State Flag<br>0: Impossible to switch<br>1: Possible to switch | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The I3CCKCR controls the I3C clock (I3CCLK).

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of I3CCKDIVCR.I3CCKDIV[2:0] and I3CCKSEL[2:0], use the following procedure:

1. Write 1 to MSTPCRB.MSTPB4 (only when switching the division ratio setting from n (n ≠ 1)).
2. Wait for two I3CCLK (only when switching the division ratio setting from n (n ≠ 1)).
3. Write 1 to I3CCKSREQ.
4. Polling until I3CCKSRDY is read as 1. While I3CCKSRDY = 1, no clock is output to I3CCLK.
5. Write to I3CCKDIVCR.I3CCKDIV[2:0] and I3CCKSEL[2:0].
6. Write 0 to I3CCKSREQ.
7. Poll until I3CCKSRDY is read as 0.
8. When I3CCKSRDY becomes 0, I3CCLK starts to output. Clock switching complete.

When transitioning to Software Standby mode, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction when I3CCKSREQ = 1 and I3CCKSRDY = 0, or I3CCKSREQ = 0 and I3CCKSRDY = 1.

### I3CCKSEL[2:0] bits (I3C clock (I3CCLK) Source Select)

These bits select the clock source of the I3C clock (I3CCLK) and must be modified when I3CCKCR.I3CCKSRDY = 1.

### I3CCKSREQ bit (I3C clock (I3CCLK) Switching Request)

This bit selects the I3CCLK switching request.

**I3CCKSRDY bit (I3C clock (I3CCLK) Switching Ready State Flag)**

This flag indicates the state of switching ready for the I3CCLK.

While I3CCKSRDY = 1, no clock is output to I3CCLK.

## 8.3 Main Clock Oscillator

To supply the clock signal to the main clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

### 8.3.1 Connecting a Crystal Resonator

Figure 8.4 shows an example of connecting a crystal resonator. A damping resistor (Rd) can be added, if required.

Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor (Rf), insert an Rf between EXTAL and XTAL by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the main clock oscillator as described in Table 8.1.

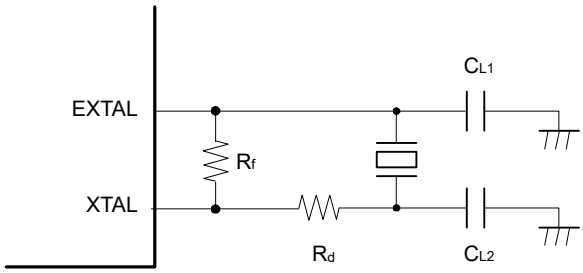


**Figure 8.4 Example of crystal resonator connection**

Figure 8.5 shows an equivalent circuit of the crystal resonator.

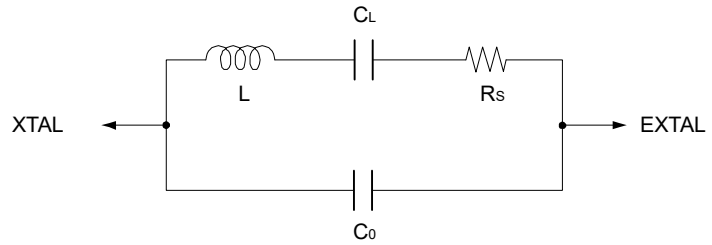

**Figure 8.5 Equivalent circuit of the crystal resonator**

### 8.3.2 External Clock Input

Figure 8.6 shows an example of connecting an external clock input. To operate the oscillator with an external clock signal, set the MOMCR.MOSEL bit to 1. The XTAL pin becomes high impedance.

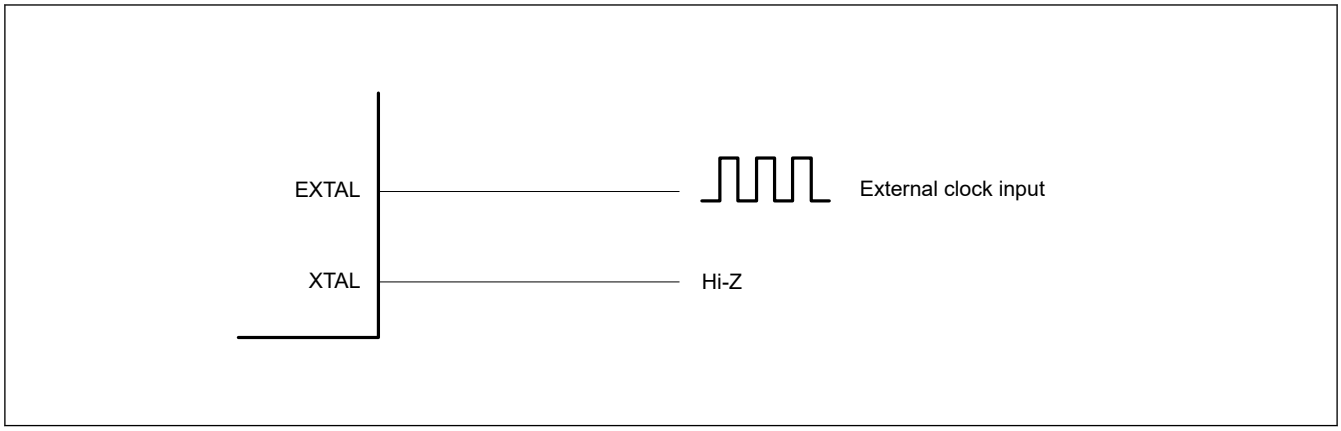

**Figure 8.6 Equivalent circuit for external clock**

### 8.3.3 Notes on External Clock Input

The frequency of the external clock input can only be changed when the main clock oscillator is stopped. Do not change the frequency of the external clock input when the setting of the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is 0.

## 8.4 Sub-Clock Oscillator

The only way of supplying a clock signal to the sub-clock oscillator is by connecting a crystal oscillator.

### 8.4.1 Connecting a 32.768-kHz Crystal Resonator

To supply a clock to the sub-clock oscillator, connect a 32.768-kHz crystal resonator as shown in Figure 8.7. A damping resistor (Rd) can be added, if necessary. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the resonator manufacturer recommends the use of an external feedback resistor (Rf), insert an Rf between XCIN and XCOUT by following the instructions. When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the sub-clock oscillator as described in Table 8.1.

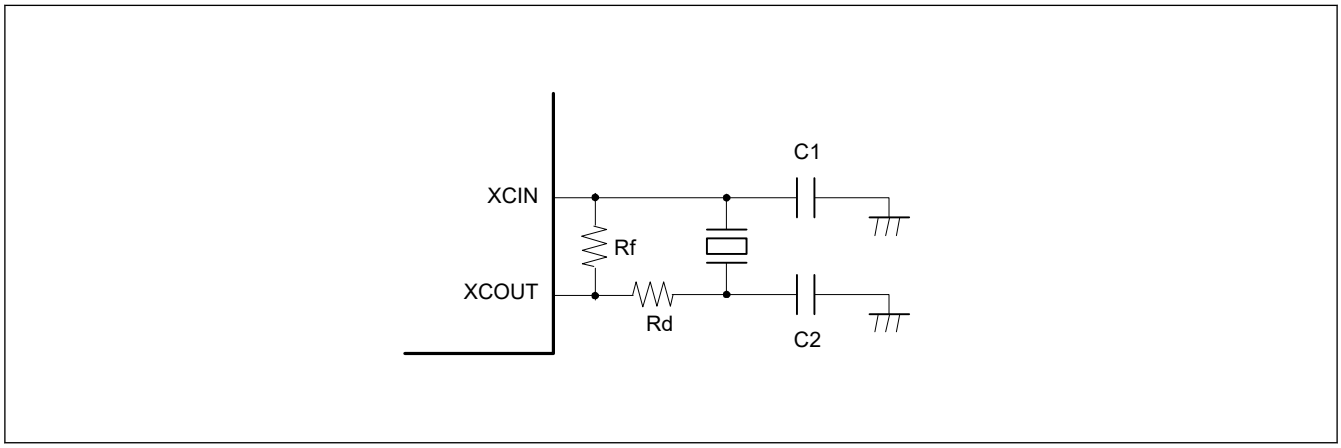

**Figure 8.7 Connection example of 32.768-kHz crystal resonator**

Figure 8.8 shows an equivalent circuit for the 32.768-kHz crystal resonator.

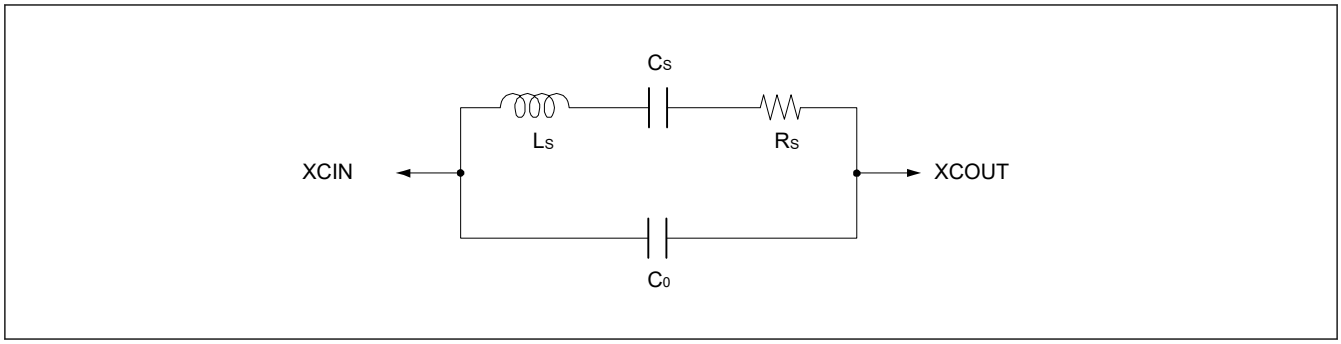

**Figure 8.8 Equivalent circuit for the 32.768-kHz crystal resonator**

### 8.4.2 Pin Handling When the Sub-Clock Oscillator Is Not Used

When the sub-clock oscillator is not in use, connect the XCIN pin to VSS through a resistor (to pull VSS down) and leave the XCOUT pin open as shown in Figure 8.9. In addition, if an oscillator is not connected, set the Sub-Clock Oscillator Stop bit (SOSCCR.SOSTP) to 1 to stop the oscillator.

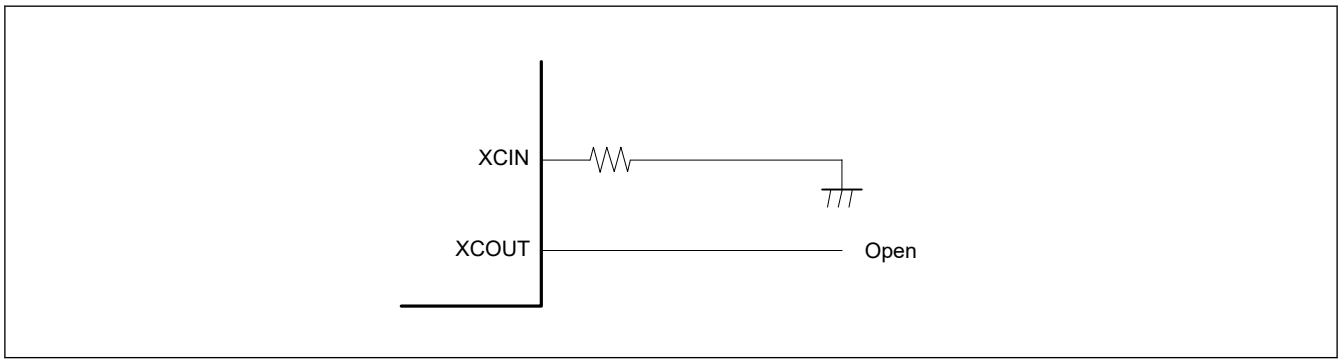

**Figure 8.9 Pin handling when the sub-clock oscillator is not used**

## 8.5 Oscillation Stop Detection Function

### 8.5.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop. When oscillation stop is detected, the system clock switches as follows:

- If an oscillation stop is detected with SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC), the system clock source switches to the MOCO clock.
- If an oscillation stop is detected with PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL), PLL clock remains the system clock source. However, the frequency becomes a free-running oscillation frequency.

An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the General PWM Timer (GPT) output can be forced to a high-impedance state on detection.

The main clock oscillation stop is detected when the input clock remains at 0 or 1 for a certain period, for example, when a malfunction occurs in the main clock oscillator. See section 49, Electrical Characteristics.

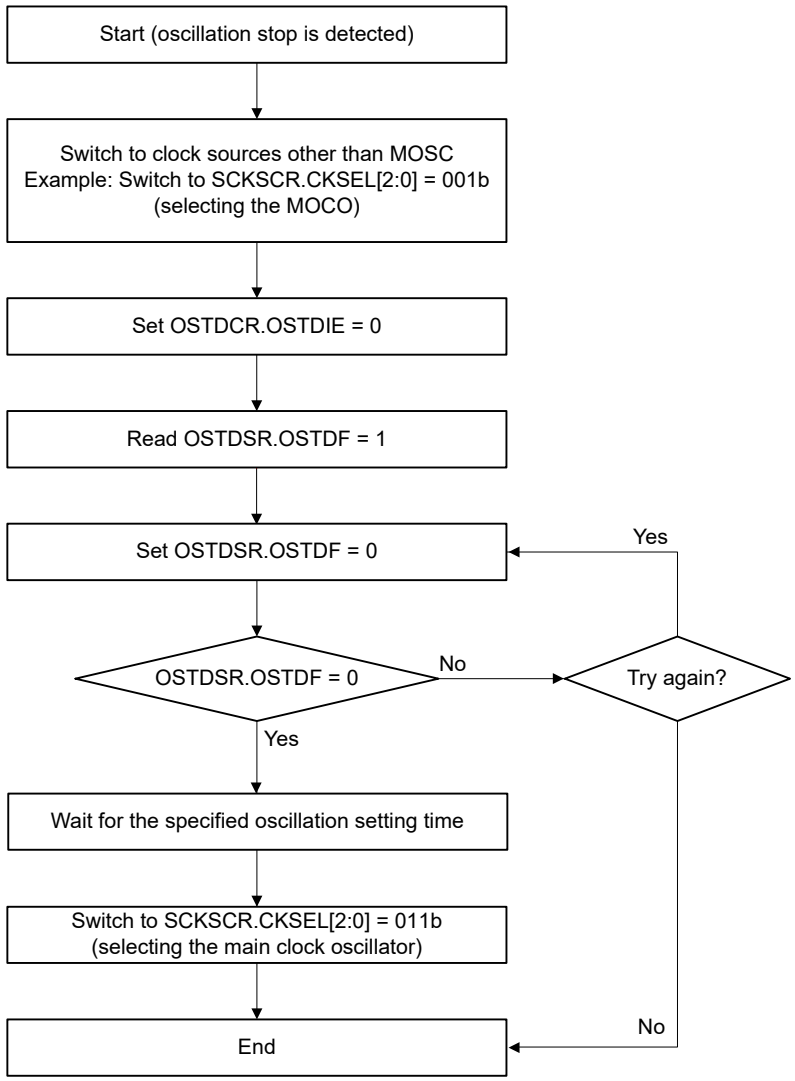
Switching between the main clock oscillator and the MOCO clock or between the PLL clock and PLL free-running clock is controlled by the Oscillation Stop Detection Flag (OSTDSR.OSTDF).

OSTDF controls the switched clock as follows:

- When SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC):
  - When OSTDF changes from 0 to 1, the clock source switches to the MOCO clock.
  - When OSTDF changes from 1 to 0, the clock source switches back to MOSC.

- When PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL):
  - When OSTDF changes 0 to 1, the clock source switches to the PLL free-running oscillation clock.
  - When OSTDF changes 1 to 0, the clock source switches back to PLL.

To switch the clock source to the main clock or PLL clock again after the oscillation stop detection, set the CKSEL[2:0] bits to a clock source other than the main clock or PLL clock and clear the OSTDF flag to 0. Also, check that the OSTDF flag is not 1, then set the CKSEL[2:0] bits to the main clock or PLL clock after the specified oscillation stabilization time elapses.



After a reset release, the main clock oscillator is stopped and the oscillation stop detection function is disabled. To enable the oscillation stop detection function, activate the main clock oscillator and write 1 to the oscillation stop detection function enable bit (OSTDCR.OSTDE) after a specified oscillation stabilization time elapses.

The oscillation stop detection function detects when the main clock is stopped by an external cause. Therefore, the oscillation stop detection function must be disabled before the main clock oscillator is stopped by software or a transition is made to Software Standby mode.

The oscillation stop detection function switches all clocks that can be selected as the MOSC clock except CLKOUT to the MOCO (when system clock is MOSC) or PLL free-running (when system clock is PLL).

The system clock (ICLK) frequency during the MOCO (when system clock is MOSC) or PLL free-running (when system clock is PLL) operation is specified by the MOCO oscillation frequency and the division ratio set by the system clock select bits (SCKDIVCR.ICK[2:0])

Example of returning when CKSEL[2:0] = 011b (selecting the main clock oscillator) after an oscillation stop is detected

Note: On return from the oscillation-stopped state, the factor responsible for stopping the main clock oscillation circuit must be removed from the system to allow oscillation to resume.

**Figure 8.10 Flow of recovery on detection of oscillator stop**

## 8.5.2 Oscillation Stop Detection Interrupts

An oscillation stop detection interrupt (MOSC_STOP) is generated when the Oscillation Stop Detection Flag (OSTDSR.OSTDF) is 1 and the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE) is 1 (enabled). The Port Output Enable for GPT (POEG) is notified of the main clock oscillator stop. On receiving the notification, the POEG sets the Oscillation Stop Detection Flag in the POEG Group n Setting Register (POEGGn.OSTPF) to 1 (n = A, B, C, D).

After the oscillation stop is detected, wait at least 10 PCLKB clock cycles before writing to the POEGGn.OSTPF flag. When the OSTDSR.OSTDF flag requires clearing, do so after clearing the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE). Wait at least 2 PCLKB clock cycles before setting the OSTDCR.OSTDIE bit to 1 again. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

The oscillation stop detection interrupt is a non-maskable interrupt. Because non-maskable interrupts are disabled in the initial state after a reset release, enable non-maskable interrupts through software before using oscillation stop detection interrupts. For details, see section 12, Interrupt Controller Unit (ICU).

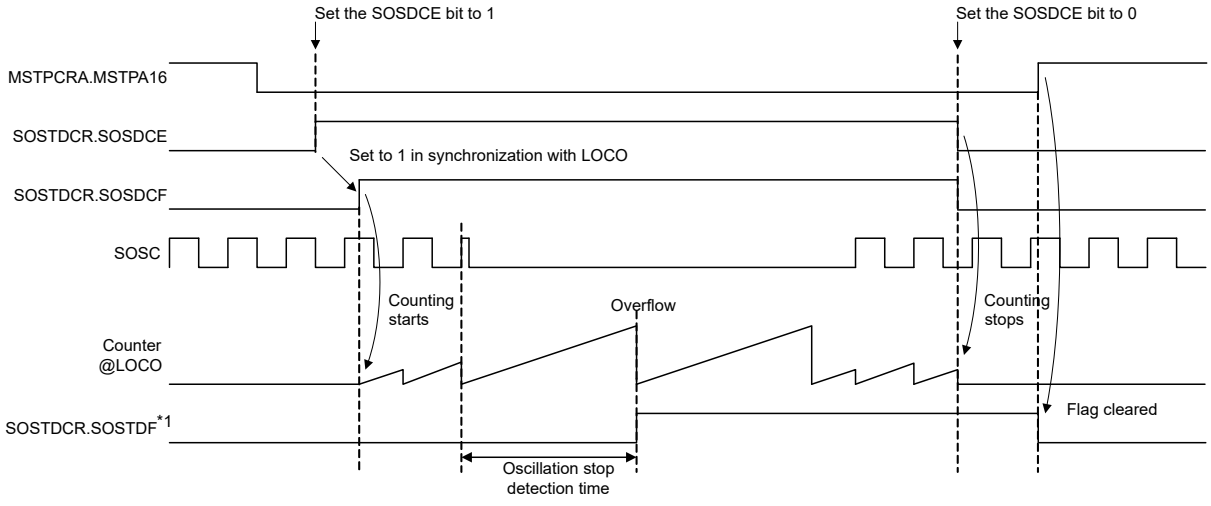
### 8.5.3 Sub Clock Oscillation Stop Detection Function

The oscillation stop detection circuit monitors the sub-clock (SOSC) operating status with a low-speed on-chip oscillator clock (LOCO). If it detects that the sub-clock oscillation is stopped longer than a predefined interval, it assumes that a sub-clock oscillator circuit error has occurred and outputs the oscillation stop interrupt signal.

When oscillation stop is detected, the system clock is switched as follows:

- If an oscillation stop is detected with SCKSCR.CKSEL[2:0] = 100 (system clock source = SOSC), the system clock source is switched to the LOCO clock.

When the system is reset, operation of the oscillation stop detector must be enabled by software after the reset period ends.



Operation of the oscillation stop detector is stopped by software, or the oscillation stop detector operation is stopped by reset from the RES pin, or internal reset due to execution of an invalid instruction. Additionally, after a reset, enable the oscillation stop detection operation with software.

The period used by the oscillation stop detector to detect that the sub-clock oscillation is stopped (oscillation stop detection time) can be set by using the SOSTDCR.SOSDCCMP [11:0] bits.

Oscillation stop detection time = Low-speed on-chip oscillator clock (LOCO) cycle × ((value of SOSTDCR.SOSDCCMP [11:0]) + 1)

- SOSTDCR.SOSDCCMP [11:0] = 0x004: 133 µs (Min.), 153 µs (Typ.), 180 µs (Max.)
- SOSTDCR.SOSDCCMP [11:0] = 0xFFF: 108 ms (Min.), 125 ms (Typ.), 147 ms (Max.)

Sub-clock oscillation stop detection function is disabled when in Low-consumption clock mode (RCR4.ROPSEL = 1) and Software Standby mode.

Note 1. When SOSTDCR.SOSTDIE is set to 1, SOSC_STOP is also output at the same timing.

**Figure 8.11 Timing of oscillation stop detection by sub clock oscillation stop detector**

**Table 8.7 Example flow when SCKSCR.CKSEL[2:0] = 100b (selecting the sub-clock oscillator) and sub-clock oscillation stop is detected (1 of 2)**

| No. | Step name | Description |
|---|---|---|
| 1 | Start | Sub-clock oscillation stop is detected and the system clock source is switched to the LOCO clock. |

**Table 8.7 Example flow when SCKSCR.CKSEL[2:0] = 100b (selecting the sub-clock oscillator) and sub-clock oscillation stop is detected (2 of 2)**

| No. | Step name | Description |
|---|---|---|
| 2 | Setting the clock source | Set the SCKSCR.CKSEL other than 100b (system clock sources other than SOSC). |
| 3 | Stop the sub-clock oscillator | Set the SOSCCR.SOSTP to 1. |
| 4 | Stop operation of the sub-clock oscillation stop detector and interrupt | Set SOSTDCR.SOSTDCE to 0 and SOSTDCR.SOSTDIE to 0. |
| 5 | Check the sub-clock oscillation stop detection flag | Check that SOSTDCR.SOSTDF = 1. (sub-clock oscillation stop has been detected.) |
| 6 | Enter the SOSTD module-stop state | Set MSPTCRA.MSTPA16 to 1. |
| 7 | Wait for the sub-clock oscillation stop detection flag to clear | Wait until SOSTDCR.SOSTDF = 0 (sub-clock oscillation stop has not been detected.) |
| 8 | End | Operation for the sub-clock oscillation stop detector is completed. Reconfigure the sub-clock oscillator, the system clock source, and the sub-clock oscillation stop detector as required. |

Note: On return from the oscillation-stopped state, the factor responsible for stopping the sub-clock oscillation circuit must be removed from the system to allow sub-clock oscillation to resume.

### 8.5.4 Sub-clock Oscillation Stop Detection Interrupts

A sub-clock oscillation stop detection interrupt (SOSTD) is generated when the Sub-clock Oscillation Stop Detection flag (SOSTDCR.SOSTDF) is 1 and the Sub-clock Oscillation Stop Detection Interrupt Enable bit in the Sub-clock Oscillation Stop Detection Control Register (SOSTDCR.SOSTDIE) is 1 (enabled).

When the SOSTDCR.SOSTDF flag requires clearing, do so after clearing the Sub-clock Oscillation Stop Detection Interrupt Enable bit in the Sub-clock Oscillation Stop Detection Control Register (SOSTDCR.SOSTDIE). Make sure SOSTDF is cleared before setting the SOSTDIE bit to 1 again.

## 8.6 PLL Circuit

The PLL circuit has a function to multiply the frequency from the oscillator.

Figure 8.12 shows the block diagram of PLL circuit.

The input clock source selection circuit selects the clock source input to the PLL.

The input clock divider circuit divides the input clock and generates the PLL reference clock.

The frequency control circuit controls the VCO clock to be generated from the PLL reference clock according to the frequency multiplier setting. The frequency multiplication ratio is determined by the PLLMUL bits.

The PLL input clock frequency, the PLL reference clock frequency, and PLL output clock frequency must be within the values specified in section 49, Electrical Characteristics.

The PLL frequency setting can only be changed when the PLL circuit is stopped. Do not change the PLL frequency setting when the PLL Stop Control bit (PLLSTP) is 0.

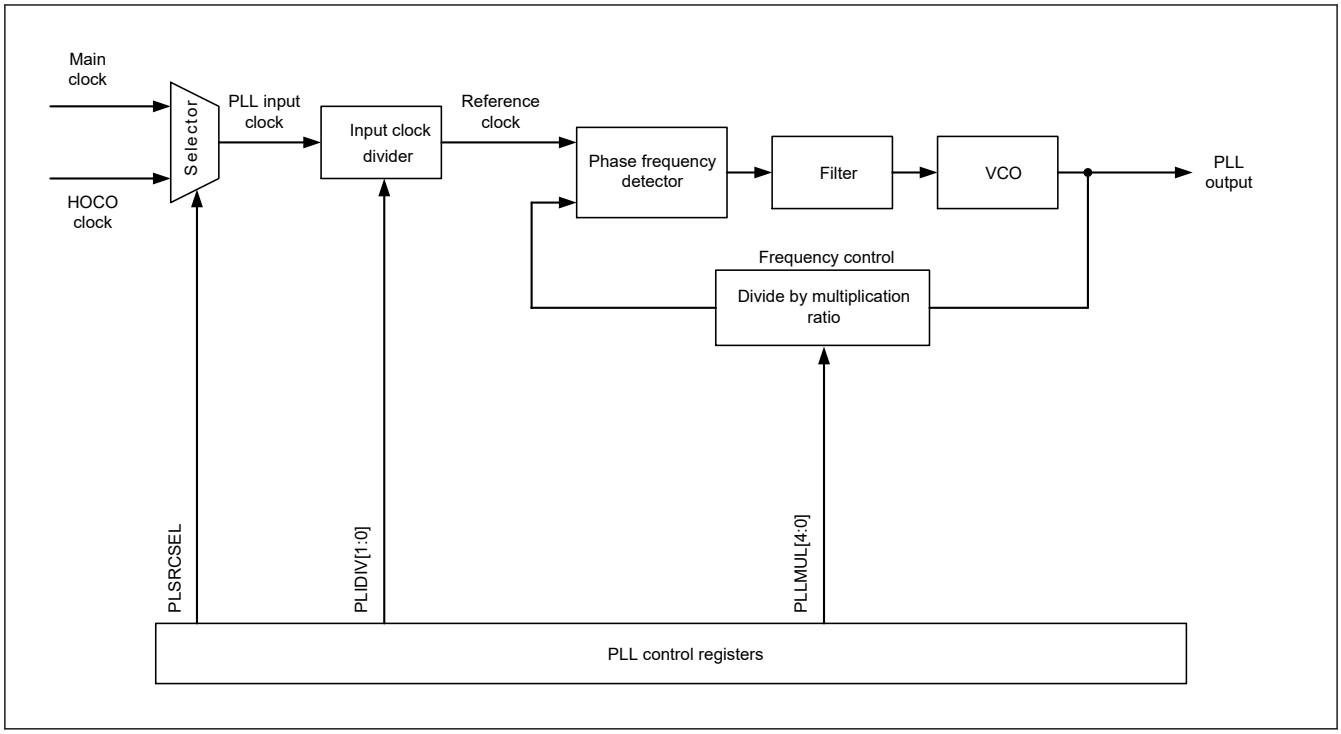


**Figure 8.12 PLL block diagram**

## 8.7 Internal Clock

Clock sources for the internal clock signals include:

- Main clock
- Sub-clock
- HOCO clock
- MOCO clock
- LOCO clock
- PLL clock
- IWDT-dedicated clock
- External clock for SWCLK

The following internal clocks are produced from these sources.

- Operating clock of the CPU, DMAC, DTC, Flash, and SRAM: System clock (ICLK)
- Operating clocks of peripheral modules: Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD)
- Operating clock of the FlashIF: FlashIF clock (FCLK)
- Operating clock for the USBFS clock (USBCLK)
- Operating clock for the CANFD: CANFD clock (CANFDCLK)
- Operating clock for the CAN: CAN clock (CANMCLK)
- Operating clock for the I3C: I3C clock (I3CCLK)
- Operating clocks for the CAC: CAC clock (CACCLK)
- Operating clocks for the RTC: RTC-dedicated clock (RTCSCLK, RTCS128CLK, RTCLCLK)
- Operating clock for the IWDT: IWDT-dedicated clock (IWDTCLK)
- Operating clock for the AGT: AGT-dedicated clock (AGTSCLK, AGTLCLK)
- Operating clock for the Systick Timer: Systick Timer-dedicated clock (SYSTICCLK)

- Operating clock for the Segment LCD : Segment LCD source clock (LCDSRCCLK)
- Operating clocks for the UARTA : UARTA clock (UARTAMCLK, UARTASCLK, UARTALCLK, UARTAHCLK, UARTAMOCLK)
- Clock for external pin output: Clock/Buzzer output clock(CLKOUT)
- Operating clock for the OCD: Serial wire clock (SWCLK)

For details on the registers used to set the frequencies of the internal clocks, see section 8.7.1. System Clock (ICLK) to section 8.7.16. Serial Wire Debugger Clock (SWCLK).

If the value of any of these bits is changed, subsequent operation is at the frequency determined by the new value.

## 8.7.1 System Clock (ICLK)

The system clock (ICLK) is the operating clock of the CPU, DMAC, DTC, Flash, and SRAM.

The ICLK frequency is specified by the ICK[2:0] bits in SCKDIVCR, the CKSEL[2:0] bits in SCKSCR, the PLLMUL[4:0] bits and PLIDIV[1:0] bits in PLLCCR, and the HOCOFRQ0[2:0] bits in OFS1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL.

The value of OFS1.HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

When the ICLK clock source is switched, the duration of the ICLK clock cycle becomes longer during the clock source transition period. See Figure 8.13 and Figure 8.14.

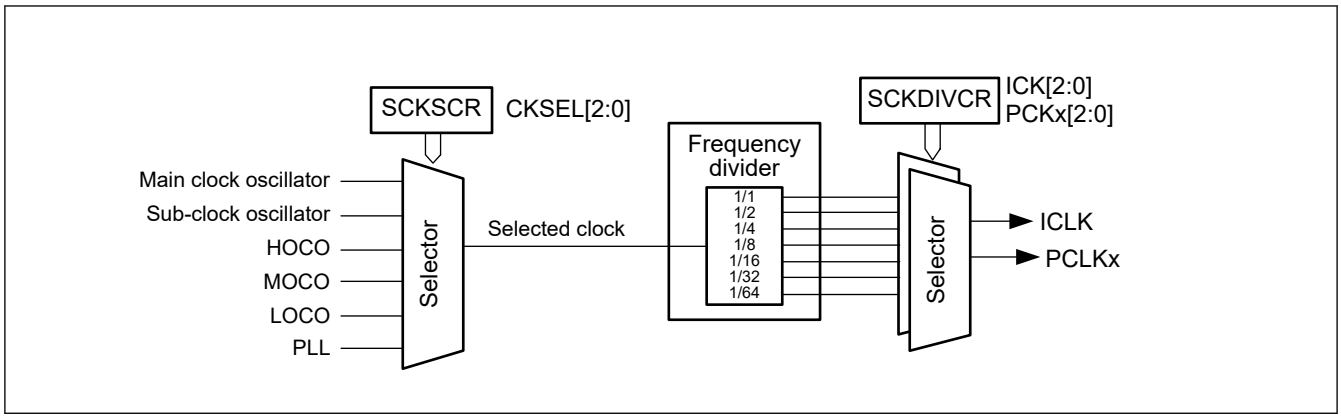

**Figure 8.13 Block diagram of clock source selector**

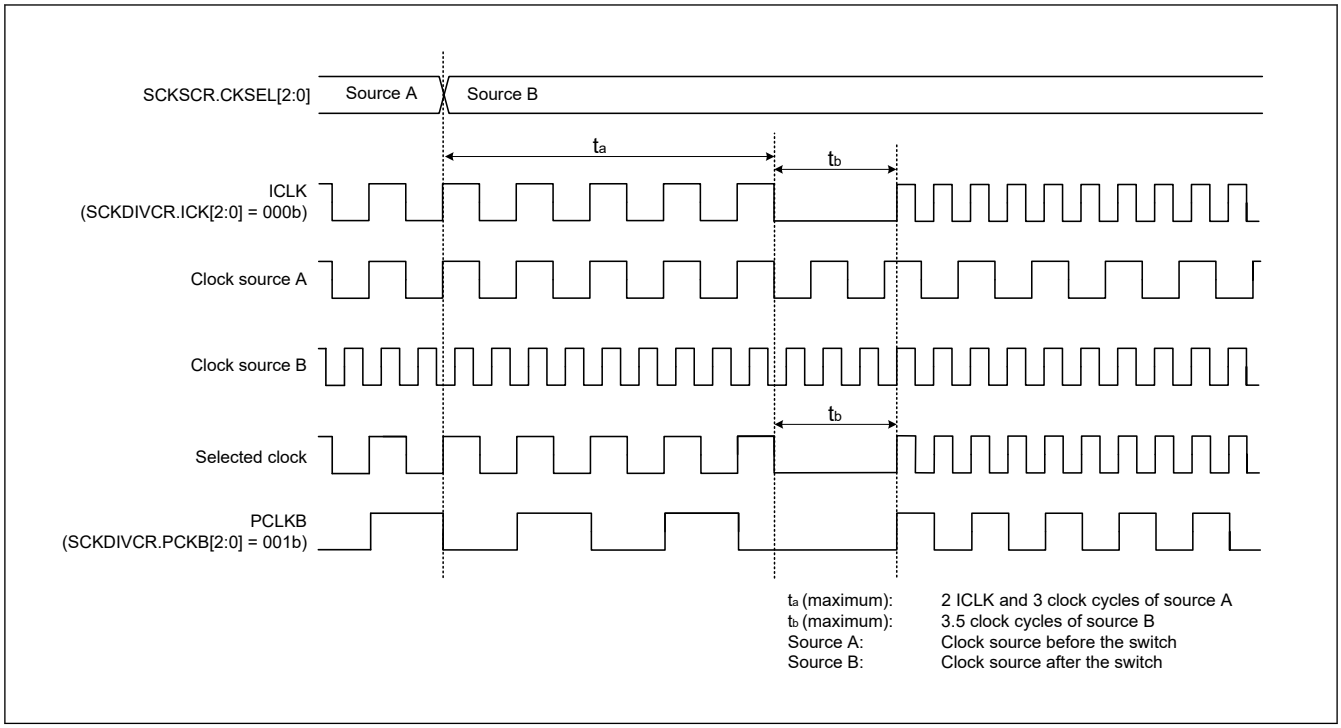

**Figure 8.14 Timing of clock source switching**

## 8.7.2 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD)

The peripheral module clocks (PCLKA, PCLKB, PCLKC and PCLKD) are the operating clocks for the peripheral modules.

The frequency of the given clock is specified in the following bits:

- PCKA[2:0], PCKB[2:0], PCKC[2:0] and PCKD[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[4:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ0[2:0] bits in OFS1*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

When the clock source of the peripheral module clock is switched, the duration of the peripheral module clock cycle becomes longer during the clock source transition period. See Figure 8.13 and Figure 8.14.

## 8.7.3 FlashIF Clock (FCLK)

The flash interface clock (FCLK) is the operating clock for the flash memory interface. In addition to reading from the data flash, FCLK is used for the programming and erasure of the code flash and data flash.

The FCLK frequency is specified in the following bits:

- FCK[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[4:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ0[2:0] bits in OFS1*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

### 8.7.4 USB Clock (USBCLK)

The USB clock (USBCLK) is the operating clock for the USBFS module.

A 48-MHz clock must be supplied to the USB module. When the USB module is used, setting must be made so that USBCLK is 48 MHz.

The USBCLK frequency is specified in the following bits:

- USBCKSEL[2:0] bits in USBCKCR
- PLLMUL[4:0] and PLIDIV[1:0] bits in PLLCCR

### 8.7.5 CANFD Clock (CANFDCLK)

The CANFD clock (CANFDCLK) is the operating clock for the CANFD module.

The CANFDCLK frequency is specified in the following bits:

- CANFDCKDIV[2:0] bits in CANFDCKDIVCR
- CANFDCKSEL[2:0] bits in CANFDCKCR
- PLLMUL[4:0] and PLIDIV[1:0] bits in PLLCCR

### 8.7.6 CAN Clock (CANMCLK)

The CAN clock, CANMCLK, is the operating clock for the CAN module. CANMCLK is generated by the main clock oscillator.

### 8.7.7 I3C Clock (I3CCLK)

The I3C clock (I3CCLK) is the operating clock for the I3C module.

Specify the frequency in the following bits:

- I3CCKDIV[2:0] bits in I3CCKDIVCR
- I3CCKSEL[2:0] bits in I3CCKCR
- PLLMUL[4:0] and PLIDIV[1:0] bits in PLLCCR

### 8.7.8 CAC Clock (CACCLK)

The CAC clock, CACCLK, is the operating clock for the CAC. CACCLK is generated by the following oscillators:

- Main clock oscillator
- Sub-clock oscillator
- High-speed clock oscillator (HOCO)
- Middle-speed clock oscillator (MOCO)
- Low-speed on-chip oscillator (LOCO)
- IWDT-dedicated on-chip oscillator. (IWDTLOCO)

### 8.7.9 RTC-Dedicated Clock (RTCSCLK, RTCS128CLK, RTCLCLK)

The RTC-dedicated clock (RTCSCLK, RTCS128CLK, RTCLCLK) is the operating clock for the RTC.

RTCSCLK and RTCS128CLK are generated by the sub-clock oscillator, and RTCLCLK is generated by the LOCO clock.

### 8.7.10 IWDT-Dedicated Clock (IWDTCLK)

The IWDT-dedicated clock (IWDTCLK) is the operating clock for the IWDT. IWDTCLK is internally generated by the IWDT-dedicated on-chip oscillator.

### 8.7.11 AGT-Dedicated Clock (AGTSCLK, AGTLCLK)

The AGT-dedicated clocks (AGTSCLK and AGTLCLK) are the operating clocks for the AGT. AGTSCLK is generated by the sub-clock oscillator, and AGTLCLK is generated by the LOCO clock.

### 8.7.12 SysTick Timer-Dedicated Clock (SYSTICCLK)

The SysTick timer-dedicated clock, SYSTICCLK, is the operating clock for the SysTick timer. SYSTICCLK is generated by the LOCO clock.

### 8.7.13 Segment LCD Source Clock (LCDSRCCLK)

The Segment LCD source clock (LCDSRCCLK) is the operating clock for the SLCDC module.

Specify the frequency in the following bits:

- LCDSCKSEL[2:0] bits in SLCDSCKCR

LCDSRCCLK is output when SLCDSCKCR.LCDSCKEN is set to 1. When changing the value of SLCDSCKCR.LCDSCKSEL[2:0], make sure that the value of SLCDSCKCR.LCDSCKEN is 0.

### 8.7.14 UARTA Clock (UARTAMCLK, UARTASCLK, UARTALCLK, UARTAHCLK, UARTAMOCLK)

The UARTA clock (UARTAMCLK, UARTASCLK, UARTALCLK, UARTAHCLK, UARTAMOCLK) is the operating clock for the UARTA module.

UARTAMCLK is generated by the main clock oscillator. UARTASCLK is generated by the sub-clock oscillator. UARTALCLK is generated by the LOCO clock. UARTAHCLK is generated by the HOCO clock. UARTAMOCLK is generated by the MOCO clock.

### 8.7.15 External Pin Output Clock (CLKOUT)

The CLKOUT is output externally from the CLKOUT pin for the clock or buzzer output. The CLKOUT is output to the CLKOUT pin when the CKOCR.CKOEN bit is set to 1. Only change the value in the CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR when the CKOCR.CKOEN bit is 0.

The CLKOUT clock frequency is specified in the following bits:

- CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR
- HOCOFRQ0[2:0] bits in OFS1*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

### 8.7.16 Serial Wire Debugger Clock (SWCLK)

The serial wire debugger clock (SWCLK) is the operating clock for the serial wire debugger.

SWCLK is generated by the external clock for Serial Wire Debugger (SWCLK pin).

## 8.8 Usage Notes

### 8.8.1 Notes on Clock Generation Circuit

The frequency of the following clocks supplied to each module changes according to the setting of the SCKDIVCR register:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)
- FlashIF clock (FCLK)

Each frequency must meet the following conditions:

- Each frequency must be selected within the operation-guaranteed range of the operating frequency (f) specified in the AC characteristics. See section 49, Electrical Characteristics.
- The system clock, peripheral module clock must be set according to Table 8.2.

To ensure correct processing after the clock frequency changes, first write to the relevant Clock Control register to change the frequency, then read the value from the register, and finally perform the subsequent processing.

### 8.8.2 Notes on Resonator

Because various resonator characteristics relate closely to your board design, adequate evaluation is required before use. See the resonator connection example in Figure 8.7. The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Therefore, consult the resonator manufacturer when determining the circuit constants. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

### 8.8.3 Notes on Board Design

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in Figure 8.15 to prevent electromagnetic induction from interfering with correct oscillation. Figure 8.15 shows the case which the main clock oscillator is used. For sub-clock oscillator, it is also the same as Figure 8.15.

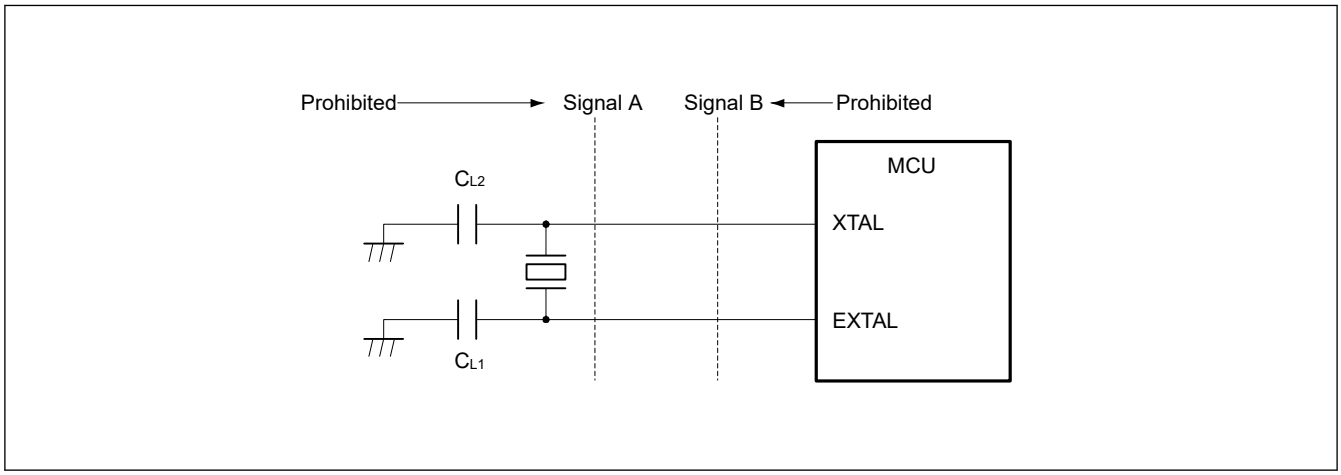

**Figure 8.15 Signal routing in board design for oscillation circuit**

### 8.8.4 Notes on Resonator Connect Pin

When the main clock is not used, the EXTAL and XTAL pins can be used as general ports. When these pins are used as general ports, the main clock must be stopped (MOSCCR.MOSTP bit should be set to 1).

# 9. Clock Frequency Accuracy Measurement Circuit (CAC)

## 9.1 Overview

The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.

Table 9.1 lists the CAC specifications, Figure 9.1 shows the CAC block diagram, and Table 9.2 lists the CAC I/O pin.

**Table 9.1 CAC specifications**

| Parameter | Specifications |
|---|---|
| Measurement target clocks | Frequency can be measured for:<br>• Main clock oscillator<br>• Sub-clock oscillator<br>• HOCO clock<br>• MOCO clock<br>• LOCO clock<br>• Peripheral module clock B (PCLKB)<br>• IWDT-dedicated clock |
| Measurement reference clocks | Frequency can be referenced to:<br>• External clock input to the CACREF pin<br>• Main clock oscillator<br>• Sub-clock oscillator<br>• HOCO clock<br>• MOCO clock<br>• LOCO clock<br>• Peripheral module clock B (PCLKB)<br>• IWDT-dedicated clock |
| Selectable function | Digital filter |
| Interrupt sources | • Measurement end<br>• Frequency error<br>• Overflow |
| Module-stop function | Module-stop state can be set to reduce power consumption |
| TrustZone Filter | Security attribution can be set |

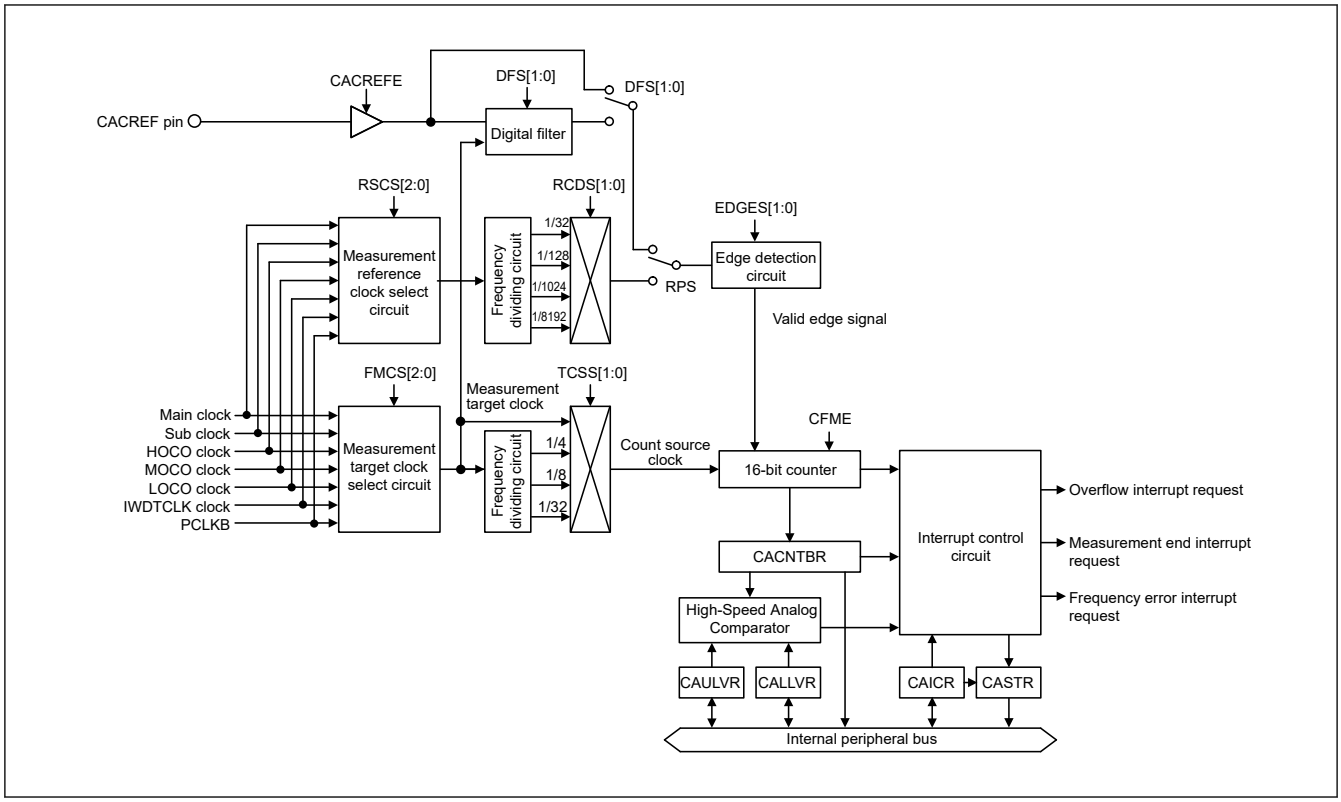

**Figure 9.1 CAC block diagram**

**Table 9.2 CAC I/O pin**

| Function | Pin name | I/O | Description |
|---|---|---|---|
| CAC | CACREF | Input | Measurement reference clock input pin |

## 9.2 Register Descriptions

### 9.2.1 CACR0 : CAC Control Register 0

Base address: CAC = 0x4008_3600

Offset address: 0x00

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | CFME |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | CFME | Clock Frequency Measurement Enable<br>0: Disable<br>1: Enable | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

**CFME bit (Clock Frequency Measurement Enable)**

The CFME bit enables clock frequency measurement. Changes made to this bit are not immediately reflected to the internal circuit. Read the bit to confirm that the change has been reflected.

## 9.2.2 CACR1 : CAC Control Register 1

Base address: CAC = 0x4008_3600

Offset address: 0x01

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | EDGES[1:0] | | TCSS[1:0] | | FMCS[2:0] | | | CACREFE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | CACREFE | CACREF Pin Input Enable<br>0: Disable<br>1: Enable | R/W |
| 3:1 | FMCS[2:0] | Measurement Target Clock Select<br>0 0 0: Main clock oscillator<br>0 0 1: Sub-clock oscillator<br>0 1 0: HOCO clock<br>0 1 1: MOCO clock<br>1 0 0: LOCO clock<br>1 0 1: Peripheral module clock B (PCLKB)<br>1 1 0: IWDT-dedicated clock<br>1 1 1: Setting prohibited | R/W |
| 5:4 | TCSS[1:0] | Timer Count Clock Source Select<br>0 0: No division<br>0 1: × 1/4 clock<br>1 0: × 1/8 clock<br>1 1: × 1/32 clock | R/W |
| 7:6 | EDGES[1:0] | Valid Edge Select<br>0 0: Rising edge<br>0 1: Falling edge<br>1 0: Both rising and falling edges<br>1 1: Setting prohibited | R/W |

Note: Set the CACR1 register when the CACR0.CFME bit is 0.

### CACREFE bit (CACREF Pin Input Enable)

The CACREFE bit enables the CACREF pin input.

### FMCS[2:0] bits (Measurement Target Clock Select)

The FMCS[2:0] bits select the measurement target clock whose frequency is to be measured.

### TCSS[1:0] bits (Timer Count Clock Source Select)

The TCSS[1:0] bits select the division ratio of the measurement target clock.

### EDGES[1:0] bits (Valid Edge Select)

The EDGES[1:0] bits select the valid edge for the reference signal.

## 9.2.3 CACR2 : CAC Control Register 2

Base address: CAC = 0x4008_3600

Offset address: 0x02

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | DFS[1:0] | | RCDS[1:0] | | RSCS[2:0] | | | RPS |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RPS | Reference Signal Select<br>0: CACREF pin input<br>1: Internal clock (internally generated signal) | R/W |
| 3:1 | RSCS[2:0] | Measurement Reference Clock Select<br>0 0 0: Main clock oscillator<br>0 0 1: Sub-clock oscillator<br>0 1 0: HOCO clock<br>0 1 1: MOCO clock<br>1 0 0: LOCO clock<br>1 0 1: Peripheral module clock B (PCLKB)<br>1 1 0: IWDT-dedicated clock<br>1 1 1: Setting prohibited | R/W |
| 5:4 | RCDS[1:0] | Measurement Reference Clock Frequency Division Ratio Select<br>0 0: × 1/32 clock<br>0 1: × 1/128 clock<br>1 0: × 1/1024 clock<br>1 1: × 1/8192 clock | R/W |
| 7:6 | DFS[1:0] | Digital Filter Select<br>0 0: Disable digital filtering<br>0 1: Use sampling clock for the digital filter as the frequency measuring clock<br>1 0: Use sampling clock for the digital filter as the frequency measuring clock divided by 4<br>1 1: Use sampling clock for the digital filter as the frequency measuring clock divided by 16. | R/W |

Note: Set the CACR2 register when the CACR0.CFME bit is 0.

### RPS bit (Reference Signal Select)

The RPS bit selects whether to use the CACREF pin input or an internal clock (internally generated signal) as the reference signal.

### RSCS[2:0] bits (Measurement Reference Clock Select)

The RSCS[2:0] bits select the reference clock for measurement.

### RCDS[1:0] bits (Measurement Reference Clock Frequency Division Ratio Select)

The RCDS[1:0] bits select the frequency-divisor of the reference clock for measurement when an internal reference clock is selected. When RPS = 0 (CACREF pin is used as the reference clock source), the reference clock is not divided.

### DFS[1:0] bits (Digital Filter Select)

The DFS[1:0] bits enable or disable the digital filter and selects its sampling clock.

## 9.2.4 CAICR : CAC Interrupt Control Register

Base address: CAC = 0x4008_3600

Offset address: 0x03

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | OVFFCL | MENDFCL | FERRFCL | — | OVFIE | MENDIE | FERRIE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | FERRIE | Frequency Error Interrupt Request Enable<br>0: Disable<br>1: Enable | R/W |
| 1 | MENDIE | Measurement End Interrupt Request Enable<br>0: Disable<br>1: Enable | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2 | OVFIE | Overflow Interrupt Request Enable<br>0: Disable<br>1: Enable | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 4 | FERRFCL | FERRF Clear<br>0: No effect<br>1: The CASTR.FERRF flag is cleared | W |
| 5 | MENDFCL | MENDF Clear<br>0: No effect<br>1: The CASTR.MENDF flag is cleared | W |
| 6 | OVFFCL | OVFF Clear<br>0: No effect<br>1: The CASTR.OVFF flag is cleared. | W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |

### FERRIE bit (Frequency Error Interrupt Request Enable)

The FERRIE bit enables or disables the frequency error interrupt request.

### MENDIE bit (Measurement End Interrupt Request Enable)

The MENDIE bit enables or disables the measurement end interrupt request.

### OVFIE bit (Overflow Interrupt Request Enable)

The OVFIE bit enables or disables the overflow interrupt request.

### FERRFCL bit (FERRF Clear)

Setting the FERRFCL bit to 1 clears the CASTR.FERRF flag.

### MENDFCL bit (MENDF Clear)

Setting the MENDFCL bit to 1 clears the CASTR.MENDF flag.

### OVFFCL bit (OVFF Clear)

Setting the OVFFCL bit to 1 clears the CASTR.OVFF flag.

## 9.2.5 CASTR : CAC Status Register

Base address: CAC = 0x4008_3600

Offset address: 0x04

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | OVFF | MENDF | FERRF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | FERRF | Frequency Error Flag<br>0: Clock frequency is within the allowable range<br>1: Clock frequency has deviated beyond the allowable range (frequency error). | R |
| 1 | MENDF | Measurement End Flag<br>0: Measurement is in progress<br>1: Measurement ended | R |
| 2 | OVFF | Overflow Flag<br>0: Counter has not overflowed<br>1: Counter overflowed | R |
| 7:3 | — | These bits are read as 0. | R |

### FERRF flag (Frequency Error Flag)

The FERRF flag indicates a deviation of the clock frequency from the set value (frequency error).

[Setting condition]

- The clock frequency is outside the allowable range defined in the CAULVR and CALLVR registers.

[Clearing condition]

- 1 is written to the FERRFCL bit.

### MENDF flag (Measurement End Flag)

The MENDF flag indicates the end of measurement.

[Setting condition]

- Measurement ends.

[Clearing condition]

- 1 is written to the MENDFCL bit.

### OVFF flag (Overflow Flag)

The OVFF flag indicates that the counter overflowed.

[Setting condition]

- The counter overflows.

[Clearing condition]

- 1 is written to the CAICR.OVFFCL bit.

## 9.2.6 CAULVR : CAC Upper-Limit Value Setting Register

Base address: CAC = 0x4008_3600

Offset address: 0x06

| Bit position: | 15 | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | n/a | The Upper Value of the Allowable Range<br>The CAULVR register is a 16-bit read/write register that specifies the upper value of the allowable range. When the counter value exceeds the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0.<br>The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin. | R/W |

## 9.2.7 CALLVR : CAC Lower-Limit Value Setting Register

Base address: CAC = 0x4008_3600

Offset address: 0x08

| Bit position: | 15 | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | n/a | The Lower Value of the Allowable Range<br>The CALLVR register is a 16-bit read/write register that specifies the lower value of the allowable range. When the counter value falls below the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0.<br>The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin. | R/W |

### 9.2.8 CACNTBR : CAC Counter Buffer Register

Base address: CAC = 0x4008_3600

Offset address: 0x0A

| Bit position: | 15 | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | n/a | The Measurement Result<br>The CACNTBR register is a 16-bit read-only register that stores the measurement result. | R |

## 9.3 Operation

### 9.3.1 Measuring Clock Frequency

The CAC measures the clock frequency using the CACREF pin input or an internal clock as a reference. Figure 9.2 shows an operating example of the CAC.

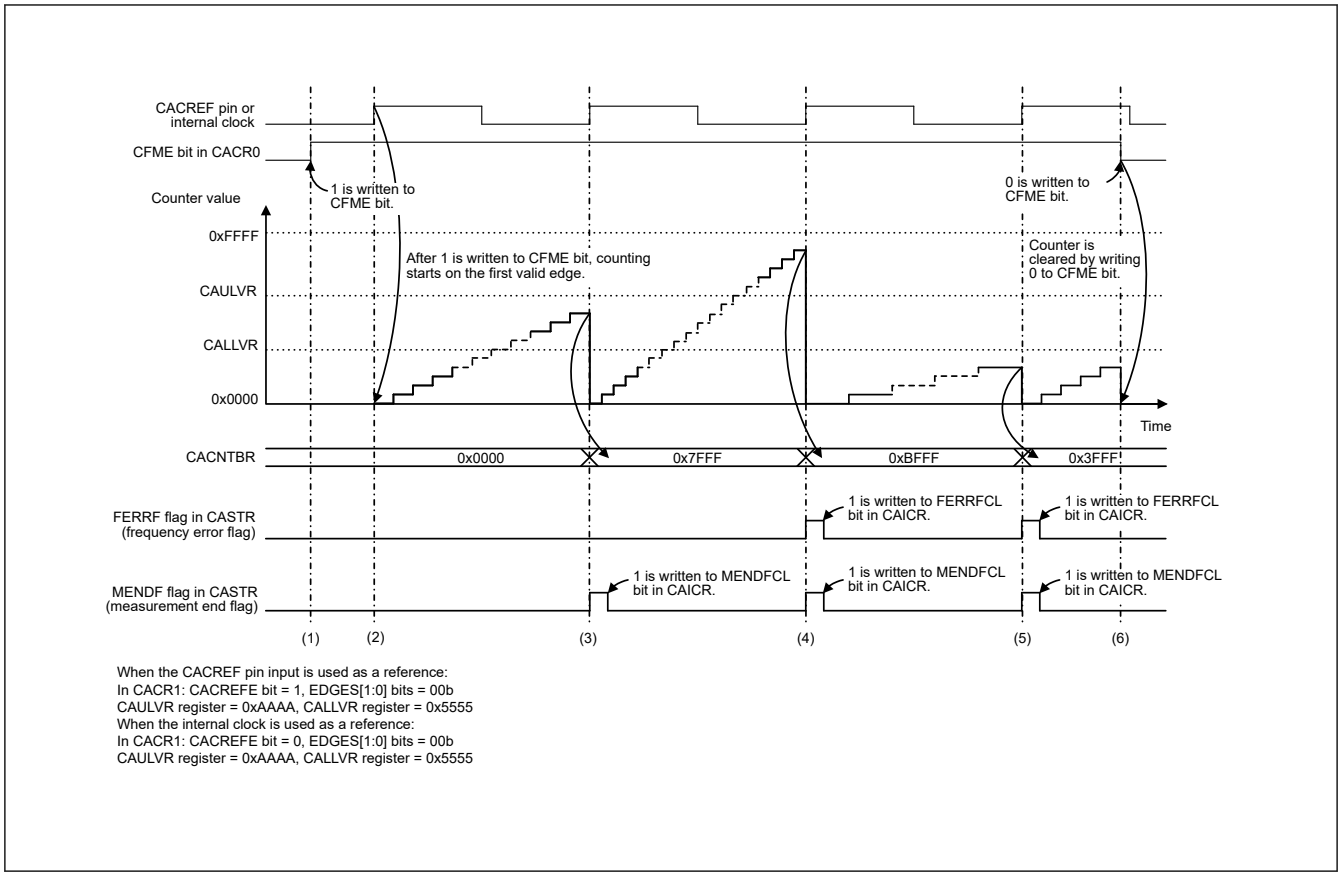

**Figure 9.2 CAC operating example**

The events in Figure 9.2 are:

1. When the CACREF pin input is used as reference (CACR1.CACREFE = 1), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 0 and the CACR1.CACREFE bit is set to 1. When the internal clock is used as reference (CACR1.CACREFE = 0), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 1.
2. When the CACREF pin input is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input from the CACREF pin. When the internal clock is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input based on the clock source selected by the CACR2.RSCS[2:0] bits.
3. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If both CACNTBR ≤ CAULVR and CACNTBR ≥ CALLVR are true, only the MENDF flag in CASTR is set to 1, because the clock frequency is correct. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
4. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If CACNTBR > CAULVR, the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
5. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If CACNTBR < CALLVR, the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
6. When the CFME bit in CACR0 is 1, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR every time a valid edge is input. Writing 0 to the CFME bit in CACR0 clears the counter and stops up-counting.

### 9.3.2 Digital Filtering of Signals on CACREF Pin

The CACREF pin has a digital filter, and levels on the CACREF pin are transmitted to the internal circuitry after three consecutive matches in the selected sampling interval. The same level continues to be transmitted internally until the level on the pin has three consecutive matches again. Enabling or disabling of the digital filter and its sampling clock are selectable.

The counter value transferred to CACNTBR might be in error by up to 1 cycle of the sampling clock because of the difference between the phases of the digital filter and the signal input to the CACREF pin. When a frequency dividing clock is selected as a count source clock, the counter value error is obtained using the following formula:

$$\text{Counter value error} = (1 \text{ cycle of the count source clock}) / (1 \text{ cycle of the sampling clock})$$

## 9.4 Interrupt Requests

The CAC generates three types of interrupt requests:

- Frequency error interrupt
- Measurement end interrupt
- Overflow interrupt

When an interrupt source is generated, the associated status flag is set to 1. Table 9.3 provides information on the CAC interrupt requests.

**Table 9.3 CAC interrupt requests**

| Interrupt request | Interrupt enable bit | Status flag | Interrupt sources |
|---|---|---|---|
| Frequency error interrupt | CAICR.FERRIE | CASTR.FERRF | The result of comparing CACNTBR with CAULVR and CALLVR is either CACNTBR > CAULVR or CACNTBR < CALLVR |
| Measurement end interrupt | CAICR.MENDIE | CASTR.MENDF | • Valid edge is input from the CACREF pin or internal clock<br>• Measurement end interrupt does not occur at the first valid edge after writing 1 to the CACR0.CFME bit |
| Overflow interrupt | CAICR.OVFIE | CASTR.OVFF | Counter overflows |

## 9.5 Usage Notes

### 9.5.1 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable CAC operation. The CAC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

# 10. Low Power Modes

## 10.1 Overview

The MCU has several functions for reducing power consumption, such as setting clock dividers, stopping modules, selecting power control mode in Normal mode, and transitioning to low power modes.

Table 10.1 lists the specifications of the low power mode functions. Table 10.2 lists the conditions to transition to low power modes, the states of the CPU and peripheral modules, and the method for canceling each mode. After a reset, the MCU enters the program execution state, but only the DTC, DMAC and SRAM operate.

**Table 10.1 Specifications of the low power mode functions**

| Item | Specification |
|---|---|
| Reducing power consumption by switching clock signals | The frequency division ratio can be selected independently for the system clock (ICLK), peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD), and flash interface clock (FCLK). *1 |
| Module stop | Functions can be stopped independently for each peripheral module |
| Low-power modes | • Sleep mode<br>• Software Standby mode<br>• Snooze mode |
| Power control modes | • Power consumption can be reduced in Normal, Sleep and Snooze modes by selecting an appropriate operating power control mode according to the operating frequency.<br>• The following operating power control modes are available:<br>– High-speed mode<br>– Middle-speed mode<br>– Low-speed mode<br>– Subosc-speed mode |
| TrustZone Filter | Security attribution can be set for each registers |

Note 1. For details, see section 8, Clock Generation Circuit

**Table 10.2 Operating conditions of each low power mode (1 of 3)**

| Item | Sleep mode | Software Standby mode | Snooze mode |
|---|---|---|---|
| Transition condition | When [Condition 1] or [Condition 2] while SBYCR.SSBY = 0<br>[Condition 1]<br>• WFI instruction<br>• A valid interrupt request*1 cannot be accepted to CPU.<br>(including a transition from the time WFI instruction is executed to the time the transition to Sleep mode is completed)<br>[Condition 2]<br>• SCR.SLEEPONEXIT = 1<br>• Complete execution of all exception handlers<br>• A valid interrupt request*1 cannot be accepted to CPU.<br>(including a transition from the time WFI instruction is executed to the time the transition to Sleep mode is completed) | When [Condition 1] or [Condition 2] while SBYCR.SSBY = 1<br>[Condition 1]<br>• WFI instruction<br>• A valid interrupt request*1 cannot be accepted to CPU.<br>(including a transition from the time WFI instruction is executed to the time the transition to Software Standby mode is completed)<br>[Condition 2]<br>• SCR.SLEEPONEXIT = 1<br>• Complete execution of all exception handlers<br>• A valid interrupt request*1 cannot be accepted to CPU.<br>(including a transition from the time WFI instruction is executed to the time the transition to Software Standby mode is completed) | Snooze request trigger in Software Standby mode.<br>SNZCR.SNZE=1. |
| Canceling method | All interrupts.<br>Any reset available in the mode. | Interrupts shown in Table 10.3.<br>Any reset available in the mode. | Interrupts shown in Table 10.3.<br>Any reset available in the mode. |
| State after cancellation by an interrupt | Program execution state | Program execution state | Program execution state |
| State after cancellation by a reset | Reset state | Reset state | Reset state |
| Main clock oscillator | Selectable | Stop | Selectable*6 |
| Sub-clock oscillator | Selectable | Selectable | Selectable |
| High-speed on-chip oscillator | Selectable | Stop | Selectable |
| Middle-speed on-chip oscillator | Selectable | Stop | Selectable |

**Table 10.2 Operating conditions of each low power mode (2 of 3)**

| Item | Sleep mode | Software Standby mode | Snooze mode |
|---|---|---|---|
| Low-speed on-chip oscillator | Selectable | Selectable | Selectable |
| IWDT-dedicated on-chip oscillator | Selectable*2 | Selectable*2 | Selectable*2 |

| NMI pin interrupt | Selectable | Selectable | Selectable |
| Low voltage detection (LVD) | Selectable | Selectable | Selectable |
| Power-on reset circuit | Operating | Operating | Operating |
| Other peripheral modules | Selectable | Stop (Retained) | Operation prohibited |

**Table 10.2 Operating conditions of each low power mode (3 of 3)**

| Item | Sleep mode | Software Standby mode | Snooze mode |
|---|---|---|---|
| I/O Ports | Operating | Retained | Operating |

Note: Selectable means that operating or not operating can be selected by the control registers.
Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.
Operation prohibited means that the function must be stopped before entering Software Standby mode.
All modules whose module-stop bits are 0 start as soon as PCLKs are supplied after entering Snooze mode. In order to avoid increase in power consumption in Snooze mode, module-stop bit of modules which are unnecessary in Snooze mode must be set to 1 before entering Software Standby mode.
Note 1. Valid interrupt requests are any interrupt/exception that are not masked by the priority level of current exception and the priority level set by BASEPRI. In addition, if the interrupt request is based on IELSRn, the interrupt must be enabled by NVIC_ISERn.
Note 2. In IWDT-dedicated on-chip oscillator and IWDT, operating or stopping is selected by setting the IWDT Stop Control bit (IWDTSTPCTL) in Option Function Select register 0 (OFS0) in IWDT auto start mode. In WDT, operating or stopping is selected by setting the WDT Stop Control bit (WDTSTPCTL) in Option Function Select Register 0 (OFS0) in WDT auto start mode. Power consumption can be reduced in Normal and Sleep modes by selecting an appropriate operating power control mode according to the operating frequency.
Note 3. Stopped when the clock output source select bits (CKOCR.CKOSEL[2:0]) are set to a value other than 010b (LOCO) and 100b (SOSC).
Note 4. AGT0 operation is possible when 100b (AGTLCLK) or 110b (AGTSCLK) is selected by the AGT0.AGTMR1.TCK[2:0] bits.
AGT1 operation is possible when 100b (AGTLCLK), 110b (AGTSCLK) or 101b (underflow event signal from AGT0) is selected by the AGT1.AGTMR1.TCK[2:0] bits.
Note 5. IIC0 wakeup interrupt is available.
Note 6. When using SCI0 in Snooze mode, MOSCCR.MOSTP and PLLCR.PLLSTP bits must be 1.
Note 7. Serial communication modes of SCI0 is only in asynchronous mode.
Note 8. Event lists the restrictions described in section 10.9.13. ELC Events in Snooze Mode.
Note 9. When using the 12-bit A/D Converter in Snooze mode, the ADCMPCR.CMPAE and ADCMPCR.CMPBE bits must be 1.
Note 10. I3C wakeup interrupt is available.
Note 11. Only VCOUT function is permitted. The VCOUT pin operates when ACMPLP uses no digital filter.
Note 12. Operation is possible when 000b (LOCO) or 001b (SOSC) is selected in the SLCDSCKCR.LCDSCKSEL[2:0] bits.
Note 13. Whether or not to retain some SRAM area in Software Standby mode can be selected by the PSMCR register. For detail, see section 10.2.14. PSMCR : Power Save Memory Control Register.
Note 14. UARTAn operation is possible when 1000b (UARTALCLK) or 1001b (UARTASCLK) is selected by the UARTA.UTAnCK.UTAnCK[3:0] bits.

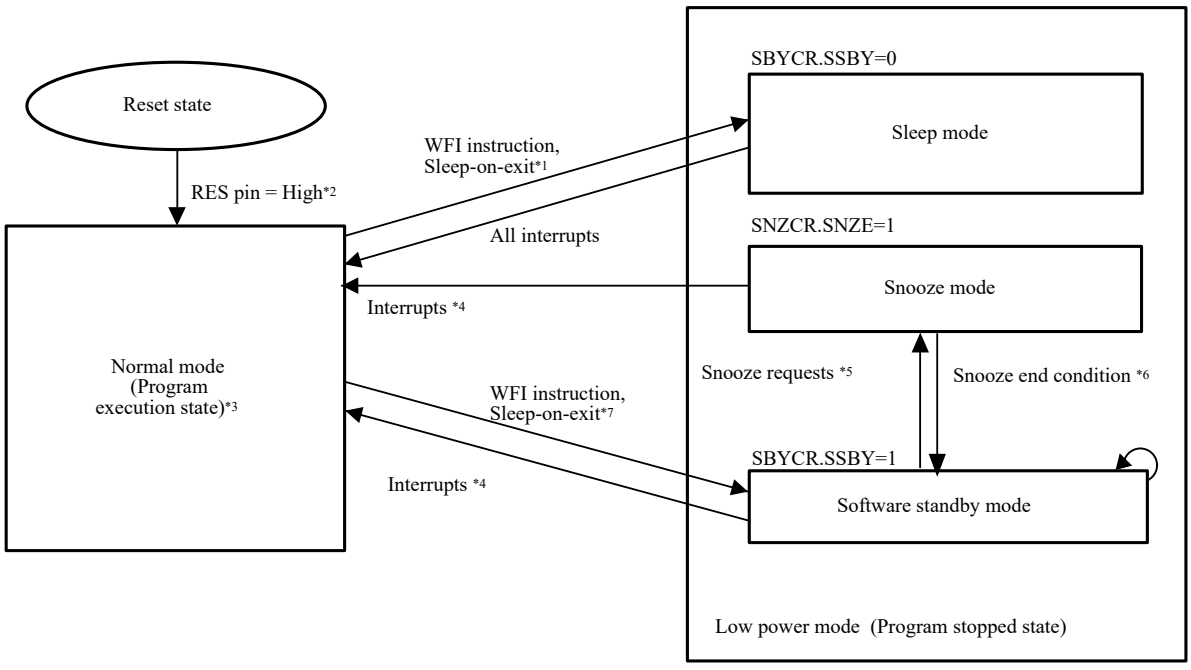

**Table 10.3 Interrupt source for canceling Snooze and Software Standby modes (1 of 2)**

| Interrupt source | Name | Software Standby mode | Snooze mode |
|---|---|---|---|
| NMI | | Yes | Yes |
| Port | PORT_IRQn (n = 0 to 15) | Yes | Yes |
| LVD | LVD_LVD1 | Yes | Yes |
| | LVD_LVD2 | Yes | Yes |
| IWDT | IWDT_NMIUNDF | Yes | Yes |
| USBFS | USBFS0_USBR | Yes | Yes |
| RTC | RTC_ALM | Yes | Yes |
| | RTC_PRD | Yes | Yes |
| UARTA | UARTA0_INTUR | Yes | Yes |
| | UARTA0_INTURE | Yes | Yes |
| | UARTA1_INTUR | Yes | Yes |
| | UARTA1_INTURE | Yes | Yes |
| SOSC | SOSC_STOP | Yes | Yes |
| I3C | I3C_WU | Yes | Yes |
| AGT1 | AGT1_AGTI | Yes | Yes*3 |
| | AGT1_AGTCMAI | Yes | Yes |
| | AGT1_AGTCMBI | Yes | Yes |
| ACMPLP | ACMP_LP0 | Yes | Yes |
| IIC0 | IIC0_WUI | Yes | Yes |

**Table 10.3 Interrupt source for canceling Snooze and Software Standby modes (2 of 2)**

| Interrupt source | Name | Software Standby mode | Snooze mode |
|---|---|---|---|
| ADC12n (n = 0) | ADC12n_WCMPM | No | Yes with SELSR0*1 *3 |
| | ADC12n_WCMPUM | No | Yes with SELSR0*1 *3 |
| SCI0 | SCI0_AM | No | Yes with SELSR0*1 *2 |
| | SCI0_RXI_OR_ERI | No | Yes with SELSR0*1 *2 |
| DTC | DTC_COMPLETE | No | Yes with SELSR0*1 *3 |
| DOC | DOC_DOPCI | No | Yes with SELSR0 *1 |
| CTSU | CTSU_CTSUFN | No | Yes with SELSR0*1 |
| DMAC/DTC | DMA_TRANSERR | No | Yes |
| ICU | ICU_SNZCANCEL | No | Yes |

Note 1. To use the interrupt request as a trigger for exiting the Snooze mode, the request must be selected in SELSR0. See section 12, Interrupt Controller Unit (ICU) for the setting of SELSR0. When a trigger selected in SELSR0 occurs after executing WFI instruction and during the transition from Normal mode to Software Standby mode, the request might or might not be accepted, depending on the timing of the occurrence.
Note 2. Only one of either SCI0_AM or SCI0_RXI_OR_ERI can be set.
Note 3. The event which is enabled by the SNZEDCRn must not be used.

Note 1. When an interrupt that acts as a trigger for cancel is received during a transition to the program-stopped state after the execution of a WFI instruction, the MCU executes interrupt exception handling instead of transitioning to low power mode.
Note 2. The MOCO clock is the source of the operating clock following a transition from the reset state to Normal mode.
Note 3. The transition to Normal mode is made because of an interrupt from Sleep mode, Snooze mode, or Software Standby mode. The clock source is the same as before entering the low power mode.
Note 4. See Table 10.3.
Note 5. See Table 10.8.
Note 6. See Table 10.10.

**Figure 10.1 Mode transitions**

## 10.2 Register Descriptions

### 10.2.1 LPMSAR : Low Power Mode Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3C8

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | NONSEC4 | — | NONSEC2 | — | NONSEC0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | NONSEC0*1 | Non-secure Attribute bit 0<br>Target register: OPCCR, SOPCCR, LDOCR<br>0: Secure<br>1: Non-secure | R/W |
| 1 | — | This bit is read as 1. The write value should be 1. | R/W |
| 2 | NONSEC2 | Non-secure Attribute bit 2<br>Target register: SBYCR, PSMCR<br>0: Secure<br>1: Non-secure | R/W |
| 3 | — | This bit is read as 1. The write value should be 1. | R/W |
| 4 | NONSEC4 | Non-secure Attribute bit 4<br>Target register: SNZCR, SNZEDCRn, SNZREQCR0<br>0: Secure<br>1: Non-secure | R/W |
| 31:5 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. It is recommended that these bits are configured as Non-secure when the device life cycle is NSECSD (DLMMON.DLMMON[3:0] = 0011b). See section 48.8.1. Restrictions on setting the security attribution for details.

The LPMSAR register controls the secure attribute of Low Power Mode registers.

**NONSEC0 bit (Non-secure Attribute bit 0)**

This bit controls the security attribute of OPCCR, SOPCCR, LDOCR.

**NONSEC2 bit (Non-secure Attribute bit 2)**

This bit controls the security attribute of SBYCR, PSMCR.

**NONSEC4 bit (Non-secure Attribute bit 4)**

This bit controls the security attribute of SNZCR, SNZEDCRn, SNZREQCR0.

## 10.2.2 SBYCR : Standby Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x00C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | SSBY | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 14:0 | — | These bits are read as reset value. The write value should be reset value | R/W |
| 15 | SSBY | Software Standby Mode Select<br>0: Sleep mode<br>1: Software Standby mode | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

### SSBY bit (Software Standby Mode Select)

The SSBY bit specifies the transition destination after a WFI instruction is executed.

When the SSBY bit is set to 1, the MCU enters Software Standby mode after execution of a WFI instruction. When the MCU returns to Normal mode from Software Standby mode by an interrupt, the SSBY bit remains 1. The SSBY bit can be cleared by writing 0 to it.

While the OSTDCR.OSTDE bit is 1, setting of the SSBY bit is ignored. Even if SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

While the FENTRYR.FENTRYC bit or FENTRYR.FENTRYD bit is 1 setting of the SSBY bit is ignored. Even if SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

## 10.2.3 MSTPCRA : Module Stop Control Register A

Base address: MSTP = 0x4008_4000

Offset address: 0x000

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | MSTPA22 | — | — | — | — | — | MSTPA16 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MSTPA0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MSTPA0 | SRAM0 Module Stop<br>Target module: SRAM0<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 15:1 | — | These bits are read as 1. The write value should be 1. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 16 | MSTPA16 | Sub Oscillation Stop Detection Module Stop<br>Target module: SOSTD<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 21:17 | — | These bits are read as 1. The write value should be 1. | R/W |
| 22 | MSTPA22 | DMA Controller/Data Transfer Controller Module Stop*1<br>Target module: DTC, DMAC<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 31:23 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. When rewriting the MSTPA22 bit from 0 to 1, disable the DMAC and DTC before setting the MSTPA22 bit.

## 10.2.4 MSTPCRB : Module Stop Control Register B

Base address: MSTP = 0x4008_4000

Offset address: 0x004

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | MSTPB31 | MSTPB30 | — | MSTPB28 | MSTPB27 | MSTPB26 | — | — | — | MSTPB22 | — | — | MSTPB19 | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | MSTPB11 | — | MSTPB9 | — | — | MSTPB6 | MSTPB5 | MSTPB4 | — | — | — | MSTPB0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MSTPB0 | Serial Interface UARTA Module Stop<br>Target module: UARTA<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 3:1 | — | These bits are read as 1. The write value should be 1. | R/W |
| 4 | MSTPB4 | I3C Bus Interface Module Stop<br>Target module: I3C<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 5 | MSTPB5 | IrDA Interface Module Stop<br>Target module: IrDA<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 6 | MSTPB6 | Quad Serial Peripheral Interface Module Stop<br>Target module: QSPI<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 8:7 | — | These bits are read as 1. The write value should be 1. | R/W |
| 9 | MSTPB9 | $I^2C$ Bus Interface 0 Module Stop<br>Target module: IIC0<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 10 | — | This bit is read as 1. The write value should be 1. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 11 | MSTPB11 | Universal Serial Bus 2.0 FS Interface Module Stop[*1]<br>Target module: USBFS<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 12 | — | This bit is read as 1. The write value should be 1. | R/W |
| 15:13 | — | These bits are read as 1. The write value should be 1. | R/W |
| 17:16 | — | These bits are read as 1. The write value should be 1. | R/W |
| 18 | — | This bit is read as 1. The write value should be 1. | R/W |
| 19 | MSTPB19 | Serial Peripheral Interface 0 Module Stop<br>Target module: SPI0<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 21:20 | — | These bits are read as 1. The write value should be 1. | R/W |
| 22 | MSTPB22 | Serial Communication Interface 9 Module Stop<br>Target module: SCI9<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 25:23 | — | These bits are read as 1. The write value should be 1. | R/W |
| 26 | MSTPB26 | Serial Communication Interface 5 Module Stop<br>Target module: SCI5<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 27 | MSTPB27 | Serial Communication Interface 4 Module Stop<br>Target module: SCI4<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 28 | MSTPB28 | Serial Communication Interface 3 Module Stop<br>Target module: SCI3<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 29 | — | This bit is read as 1. The write value should be 1. | R/W |
| 30 | MSTPB30 | Serial Communication Interface 1 Module Stop<br>Target module: SCI1<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 31 | MSTPB31 | Serial Communication Interface 0 Module Stop<br>Target module: SCI0<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. The MSTPC11 bit should be written after the USB clock (USBCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of USBCLK following the change of MSTPC11.

## 10.2.5 MSTPCRC : Module Stop Control Register C

Base address: MSTP = 0x4008_4000

Offset address: 0x008

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | MSTPC31 | — | — | — | MSTPC27 | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | MSTPC14 | MSTPC13 | — | — | — | — | MSTPC8 | — | — | — | MSTPC4 | MSTPC3 | — | MSTPC1 | MSTPC0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MSTPC0 | Clock Frequency Accuracy Measurement Circuit Module Stop[*1]<br>Target module: CAC<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 1 | MSTPC1 | Cyclic Redundancy Check Calculator Module Stop<br>Target module: CRC<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 2 | — | This bit is read as 1. The write value should be 1. | R/W |
| 3 | MSTPC3 | Capacitive Touch Sensing Unit Module Stop<br>Target module: CTSU<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 4 | MSTPC4 | Segment LCD Controller Module Stop[*2]<br>Target module: SLCDC<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 7:5 | — | These bits are read as 1. The write value should be 1. | R/W |
| 8 | MSTPC8 | Serial Sound Interface Enhanced Module Stop<br>Target module: SSIE<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 12:9 | — | These bits are read as 1. The write value should be 1. | R/W |
| 13 | MSTPC13 | Data Operation Circuit Module Stop<br>Target module: DOC<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 14 | MSTPC14 | Event Link Controller Module Stop<br>Target module: ELC<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 26:15 | — | These bits are read as 1. The write value should be 1. | R/W |
| 27 | MSTPC27 | Controller Area Network with Flexible Data-Rate Module Stop[*3]<br>Target module: CANFD<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 30:28 | — | These bits are read as 1. The write value should be 1. | R/W |
| 31 | MSTPC31 | RSIP-E11A Module Stop<br>Target module: RSIP-E11A<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. The MSTPC0 bit should be written after the CAC clock (CACMCLK/CACSCLK/CACLCLK/CACMOCLK/CACHCLK/CACILCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of CACMCLK/CACSCLK/CACLCLK/CACMOCLK/CACHCLK/CACILCLK following the change of MSTPC0.

Note 2. The MSTPC4 bit should be written after the Segment LCD clock (LCDSRCCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of LCDSRCCLK following the change of MSTPC4.

Note 3. The MSTPC27 bit should be written after the CANFD clock (CANFDCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of CANFDCLK following the change of MSTPC27.

## 10.2.6 MSTPCRD : Module Stop Control Register D

Base address: MSTP = 0x4008_4000

Offset address: 0x00C

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | MSTPD29 | — | — | — | — | — | — | — | — | MSTPD20 | — | — | — | MSTPD16 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | MSTPD14 | MSTPD13 | MSTPD12 | MSTPD11 | — | — | — | — | — | — | — | MSTPD3 | MSTPD2 | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | — | These bits are read as 1. The write value should be 1. | R/W |
| 2 | MSTPD2 | Low Power Asynchronous General Purpose Timer 1 Module Stop[*1]<br>Target module: AGT1<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 3 | MSTPD3 | Low Power Asynchronous General Purpose Timer 0 Module Stop[*2]<br>Target module: AGT0<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 10:4 | — | These bits are read as 1. The write value should be 1. | R/W |
| 11 | MSTPD11 | Port Output Enable for GPT Group D Module Stop<br>Target module: POEGGD<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 12 | MSTPD12 | Port Output Enable for GPT Group C Module Stop<br>Target module: POEGGC<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 13 | MSTPD13 | Port Output Enable for GPT Group B Module Stop<br>Target module: POEGGB<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 14 | MSTPD14 | Port Output Enable for GPT Group A Module Stop<br>Target module: POEGGA<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 15 | — | This bit is read as 1. The write value should be 1. | R/W |
| 16 | MSTPD16 | 12-bit A/D Converter 0 Module Stop<br>Target module: ADC120<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 19:17 | — | These bits are read as 1. The write value should be 1. | R/W |
| 20 | MSTPD20 | 12-bit D/A Converter Module Stop<br>Target module: DAC12<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 28:21 | — | These bits are read as 1. The write value should be 1. | R/W |
| 29 | MSTPD29 | Low-Power Analog Comparator Module Stop<br>Target module: ACMPLP<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |
| 31:30 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. When the count source is sub-clock oscillator or LOCO, AGT1 counting does not stop even if MSTPD2 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT1 registers.

Note 2. When the count source is sub-clock oscillator or LOCO, AGT0 counting does not stop even if MSTPD3 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT0 registers.

## 10.2.7 MSTPCRE : Module Stop Control Register E

Base address: MSTP = 0x4008_4000

Offset address: 0x010

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | MSTPE31 | MSTPE30 | MSTPE29 | MSTPE28 | MSTPE27 | MSTPE26 | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| 31 | MSTPE31 | GPT0 Module Stop<br>Target module: GPT0<br>0: Cancel the module-stop state<br>1: Enter the module-stop state | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

## 10.2.8 OPCCR : Operating Power Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0A0

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | OPCMTSF | — | — | OPCM[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | OPCM[1:0] | Operating Power Control Mode Select<br>0 0: High-speed mode<br>0 1: Middle-speed mode<br>1 0: Setting prohibited<br>1 1: Low-speed mode | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | OPCMTSF | Operating Power Control Mode Transition Status Flag<br>0: Transition completed<br>1: During transition | R |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The OPCCR register is used to reduce power consumption in Normal and Sleep modes by specifying a lower operating frequency.

### OPCM[1:0] bits (Operating Power Control Mode Select)

The OPCM[1:0] bits select the operating power control mode in Normal mode, Sleep mode, and Snooze mode. Table 10.4 shows the relationship between the operating power control modes and the OPCM[1:0] and SOPCM settings.

Writing to OPCCR.OPCM[1:0] is prohibited while the MCU is under the following conditions:

- The MCU is in Sleep or Snooze mode, the MCU transitions to Normal mode from Sleep or Snooze mode, the MCU transitions to Sleep, Snooze, or Software Standby mode from Normal mode, or the MCU is in transfer state when in operating power control mode.
- Flash is in programming mode.
- The MCU is in Subosc-speed mode (SOPCCR.SOPCM bit is 1).
- The data flash is disabled (DFLCTL.DFLEN bit is 0).
- HOCOCR.HCSTP and OSCSF.HOCOSF bits are 0 (HOCO is in stabilization wait counting).

### OPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The OPCMTSF flag indicates the switching control state when the operating power control mode is switched. This flag becomes 1 when the OPCM bit is written, and 0 when mode transition completes. Read this flag and confirm that it is 0 before proceeding.

## 10.2.9 SOPCCR : Sub Operating Power Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0AA

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | SOPCMTSF | — | — | — | SOPCM |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SOPCM | Sub Operating Power Control Mode Select<br>0: Other than Subosc-speed mode<br>1: Subosc-speed mode | R/W |
| 3:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | SOPCMTSF | Operating Power Control Mode Transition Status Flag<br>0: Transition completed<br>1: During transition | R |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SOPCCR register is used to reduce power consumption in Normal mode, Sleep mode, and Snooze mode. Setting this register initiates entry to and exit from Subosc-speed mode. Subosc-speed mode is available only when using the sub-clock oscillator or LOCO without dividing the frequency.

For the procedure to change operating power control modes, see section 10.5. Function for Lower Operating Power Consumption.

### SOPCM bit (Sub Operating Power Control Mode Select)

The SOPCM bit selects the operating power control mode in Normal mode, Sleep mode, and Snooze mode. Setting this bit to 1 allows transition to Subosc-speed mode. Setting this bit to 0 allows a return to the operating mode (set in OPCCR.OPCM[1:0]) before the transition to Subosc-speed mode.

Table 10.4 shows the relationship between the operating power control modes, the OPCM[1:0], and SOPCM bits settings.

Writing to SOPCCR.SOPCM is prohibited while the MCU is under the following conditions:

- The MCU is in Sleep or Snooze mode, the MCU transitions to Normal mode from Sleep, Snooze, or Software Standby mode, the MCU transitions to Sleep, Snooze, or Software Standby mode from Normal mode, or the MCU is in transfer state when in operating power mode.
- Flash is in programming mode.
- MOSC is operating (MOSCCR.MOSTP bit is 0), HOCO is operating (HOCOCR.HCSTP bit is 0), or MOCO is operating (MOCOCR.MCSTP bit is 0).
- PLL is operating (PLLCR.PLLSTP bit is 0).
- The value of SCKDIVCR.ICK[2:0] register is not equal to 000b.
- The data flash is disabled (DFLCTL.DFLEN bit is 0).

### SOPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The SOPCMTSF flag indicates the switching control state when the operating power control mode is switched to or from Subosc-speed mode. This flag becomes 1 when the SOPCM bit is written, and 0 when mode transition completes. Read this flag and confirm that it is 0 before proceeding.

Table 10.4 shows each operating power control mode.

**Table 10.4 Operating power control mode**

| Operating power control mode | OPCM[1:0] bits | SOPCM bit | Power consumption |
|---|---|---|---|
| High-speed mode | 00b | 0 | High |
| Middle-speed mode | 01b | 0 | ↓ |
| Low-speed mode | 11b | 0 | ↓ |
| Subosc-speed mode | xxb | 1 | Low |

## 10.2.10 SNZCR : Snooze Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x092

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | SNZE | — | — | — | — | — | SNZDTCEN | RXDREQEN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RXDREQEN | RXD0 Snooze Request Enable<br>0: Ignore RXD0 falling edge in Software Standby mode<br>1: Detect RXD0 falling edge in Software Standby mode | R/W |
| 1 | SNZDTCEN | DTC Enable in Snooze mode<br>0: Disable DTC operation<br>1: Enable DTC operation | R/W |
| 6:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | SNZE | Snooze mode Enable<br>0: Disable Snooze mode<br>1: Enable Snooze mode | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

### RXDREQEN bit (RXD0 Snooze Request Enable)

The RXDREQEN bit specifies whether to detect a falling edge of the RXD0 pin in Software Standby mode. This bit can be used only when SCI0 is operating in asynchronous mode. To detect a falling edge of the RXD0 pin, set this bit before entering Software Standby mode. When this bit is set to 1, a falling edge of the RXD0 pin in Software Standby mode causes the MCU to enter Snooze mode.

### SNZDTCEN bit (DTC Enable in Snooze mode)

The SNZDTCEN bit specifies whether to use the DTC and SRAM in Snooze mode. To use the DTC and SRAM in Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, the DTC can be activated by setting IELSRn register.

### SNZE bit (Snooze mode Enable)

The SNZE bit specifies whether to enable a transition from Software Standby mode to Snooze mode. To use Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, a trigger as shown in Table 10.8 in

Software Standby mode causes the MCU to enter Snooze mode. After the MCU transitions from Software Standby mode or Snooze mode to Normal mode, set 0 to the SNZE bit once then set it before re-entering Software Standby mode. For details, see section 10.8. Snooze Mode.

## 10.2.11 SNZEDCR0 : Snooze End Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x094

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | SCI0UMTED | — | — | AD0UMTED | AD0MATED | DTCNZRED | DTCZRED | AGTUNFED |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | AGTUNFED | AGT1 Underflow Snooze End Enable<br>0: Disable the snooze end request<br>1: Enable the snooze end request | R/W |
| 1 | DTCZRED | Last DTC Transmission Completion Snooze End Enable<br>0: Disable the snooze end request<br>1: Enable the snooze end request | R/W |
| 2 | DTCNZRED | Not Last DTC Transmission Completion Snooze End Enable<br>0: Disable the snooze end request<br>1: Enable the snooze end request | R/W |
| 3 | AD0MATED | ADC12 Compare Match Snooze End Enable<br>0: Disable the snooze end request<br>1: Enable the snooze end request | R/W |
| 4 | AD0UMTED | ADC12 Compare Mismatch Snooze End Enable<br>0: Disable the snooze end request<br>1: Enable the snooze end request | R/W |
| 6:5 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | SCI0UMTED | SCI0 Address Mismatch Snooze End Enable<br>0: Disable the snooze end request<br>1: Enable the snooze end request | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SNZEDCR0 register controls the condition of switching from Snooze mode to Software Standby mode. In order to use a trigger shown in Table 10.9 as a condition to switch from Snooze mode to Software Standby mode, the corresponding bit in the SNZEDCR0 register must be set to 1.

The event that is used to return from snooze mode to normal mode as shown in Table 10.3 must not be enabled in the SNZEDCR0 register.

### AGTUNFED bit (AGT1 Underflow Snooze End Enable)

The AGTUNFED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an AGT1 underflow. For details on the trigger conditions, see section 21, Low Power Asynchronous General Purpose Timer (AGTW).

### DTCZRED bit (Last DTC Transmission Completion Snooze End Enable)

The DTCZRED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on completion of the last DTC transmission, that is, when CRA or CRB registers in the DTC is 0. For details on the trigger conditions, see section 16, Data Transfer Controller (DTC).

### DTCNZRED bit (Not Last DTC Transmission Completion Snooze End Enable)

The DTCNZRED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on completion of each DTC transmission, that is, when CRA or CRB registers in the DTC is not 0. For details on the trigger conditions, see section 16, Data Transfer Controller (DTC).

### AD0MATED bit (ADC12 Compare Match Snooze End Enable)

The AD0MATED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an ADC120 event when a conversion result matches the expected data. For details on the trigger conditions, see section 38, 12-Bit A/D Converter (ADC12).

### AD0UMTED bit ()

The AD0UMTED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an ADC120 event when the conversion result does not match the expected data. For details on the trigger conditions, see section 38, 12-Bit A/D Converter (ADC12).

### SCI0UMTED bit (SCI0 Address Mismatch Snooze End Enable)

The SCI0UMTED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an SCI0 event when an address received in Software Standby mode does not match the expected data. For details on the trigger conditions, see section 26, Serial Communications Interface (SCI). Only set this bit to 1 when SCI0 operates in asynchronous mode.

## 10.2.12 SNZEDCR1 : Snooze End Control Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x095

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | CTSUNAJED | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | — | This bit is read as 0. The write value should be 0. | R/W |
| 1 | CTSUNAJED | CTSU non-touch automatic judgment Snooze End Enable<br>0: Disable the Snooze End request<br>1: Enable the Snooze End request | R/W |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SNZEDCR1 register controls the condition of switching from Snooze mode to Software Standby mode. In order to use a trigger shown in Table 10.9 as a condition to switch from Snooze mode to Software Standby mode, the corresponding bit in the SNZEDCR1 register must be set to 1.

The event that is used to return from Snooze mode to normal operating mode as shown in Table 10.3 must not be enabled in the SNZEDCR1 register.

### CTSUNAJED bit (CTSU non-touch automatic judgment Snooze End Enable)

The CTSUNAJED bit specifies whether to enable a transition from Snooze mode to Software Standby mode by an underflow of the CTSU. For detail of the condition of the trigger, see section 42, Capacitive Touch Sensing Unit (CTSU).

## 10.2.13 SNZREQCR0 : Snooze Request Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x098

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | SNZREQEN30 | SNZREQEN29 | SNZREQEN28 | — | — | SNZREQEN25 | SNZREQEN24 | SNZREQEN23 | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | SNZREQEN15 | SNZREQEN14 | SNZREQEN13 | SNZREQEN12 | SNZREQEN11 | SNZREQEN10 | SNZREQEN9 | SNZREQEN8 | SNZREQEN7 | SNZREQEN6 | SNZREQEN5 | SNZREQEN4 | SNZREQEN3 | SNZREQEN2 | SNZREQEN1 | SNZREQEN0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SNZREQEN0 | Enable IRQ0 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 1 | SNZREQEN1 | Enable IRQ1 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 2 | SNZREQEN2 | Enable IRQ2 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 3 | SNZREQEN3 | Enable IRQ3 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 4 | SNZREQEN4 | Enable IRQ4 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 5 | SNZREQEN5 | Enable IRQ5 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 6 | SNZREQEN6 | Enable IRQ6 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 7 | SNZREQEN7 | Enable IRQ7 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 8 | SNZREQEN8 | Enable IRQ8 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 9 | SNZREQEN9 | Enable IRQ9 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 10 | SNZREQEN10 | Enable IRQ10 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 11 | SNZREQEN11 | Enable IRQ11 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 12 | SNZREQEN12 | Enable IRQ12 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 13 | SNZREQEN13 | Enable IRQ13 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 14 | SNZREQEN14 | Enable IRQ14 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 15 | SNZREQEN15 | Enable IRQ15 pin snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 22:16 | — | These bits are read as 0. The write value should be 0. | R/W |
| 23 | SNZREQEN23 | Enable ACMP_LP0 snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 24 | SNZREQEN24 | Enable RTC alarm snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 25 | SNZREQEN25 | Enable RTC period snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 27:26 | — | These bits are read as 0. The write value should be 0. | R/W |
| 28 | SNZREQEN28 | Enable AGT1 underflow snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 29 | SNZREQEN29 | Enable AGT1 compare match A snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 30 | SNZREQEN30 | Enable AGT1 compare match B snooze request<br>0: Disable the snooze request<br>1: Enable the snooze request | R/W |
| 31 | — | This bit is read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SNZREQCR0 register controls which trigger causes the MCU to switch from Software Standby mode to Snooze mode. If a trigger is selected as a request to cancel Software Standby mode by setting the WUPENn register, see section 12, Interrupt Controller Unit (ICU), the MCU enters Normal mode when the trigger is generated while the associated bit of the SNZREQCR0 is 1. The setting of the WUPENn register always has higher priority than the setting of the SNZREQCR0 register. For details, see section 10.8. Snooze Mode and section 12, Interrupt Controller Unit (ICU).

## 10.2.14 PSMCR : Power Save Memory Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x09F

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | PSMC3 | PSMC2 | PSMC1 | PSMC0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PSMC0 | Power Save Memory Control bit 0<br>0: The SRAM data of 0x2000_0000 to 0x2000_3FFF area is retained in Software Standby mode.<br>1: The SRAM data of 0x2000_0000 to 0x2000_3FFF area is not retained in Software Standby mode. | R/W |
| 1 | PSMC1 | Power Save Memory Control bit 1<br>0: The SRAM data of 0x2000_4000 to 0x2000_7FFF area is retained in Software Standby mode.<br>1: The SRAM data of 0x2000_4000 to 0x2000_7FFF area is not retained in Software Standby mode. | R/W |
| 2 | PSMC2 | Power Save Memory Control bit 2<br>0: The SRAM data of 0x2000_8000 to 0x2000_BFFF area is retained in Software Standby mode.<br>1: The SRAM data of 0x2000_8000 to 0x2000_BFFF area is not retained in Software Standby mode. | R/W |
| 3 | PSMC3 | Power Save Memory Control bit 3<br>0: The SRAM data of 0x2000_C000 to 0x2000_FFFF area is retained in Software Standby mode.<br>1: The SRAM data of 0x2000_C000 to 0x2000_FFFF area is not retained in Software Standby mode. | R/W |
| 7:4 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

**PSMC[3:0] bits (Power Save Memory Control bits)**

The SRAM area with this bit set to 1 is powered off when the MCU transitions to Software Standby mode, and the data of the SRAM area is not retained, but the consumption current is reduced in Software Standby mode.

On the other hand, the SRAM area with this bit set to 0 is not powered off even if the MCU transitions to Software Standby mode, and the SRAM data is retained.

Set the PSMCR register before executing a WFI instruction.

## 10.2.15 SYOCDCR : System Control OCD Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x040E

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | DBGEN | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | DBGEN | Debugger Enable bit<br>Set to 1 first in on-chip debug mode.<br>0: On-chip debugger is disabled<br>1: On-chip debugger is enabled | R/W |

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

This register is not controlled by any security attribute register (such as LPMSAR).

SYOCDCR can be written when DBGSTR.CDBGPWRUPREQ = 1 (the debugger is connected).

**DBGEN bit (Debugger Enable bit)**

The DBGEN bit enables the on-chip debug mode. This bit must be set to 1 first in the on-chip debugger mode.

[Setting condition]

- Writing 1 to the bit when the debugger is connected.

[Clearing condition]

- Power-on reset is generated
- Writing 0 to the bit.

Note: Certain restrictions apply in terms of the MCU states in which the DBGEN bit can be set to 1. For details, see section 2.12.2. Restrictions on connecting an OCD emulator.

## 10.2.16 LDOCR : LDO Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0AC

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | CHG0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | CHG0 | Charge up 0<br>0: LDO normal operating mode<br>1: LDO high performance mode | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

It is prohibited to change this register except in High-speed mode with ICLK = 8 MHz.

LDOCR.CHG0 = 1 is allowed only in High-speed mode with ICLK ≥ 8 MHz.

See section 10.5.2. Setting Operating Power Control Mode for the detailed usage of this register.

**CHG0 bit (Charge up 0)**

Setting this bit to 1 increases the current capability of the LDO.

MOCOCR.MCSTP must be set to 0 before transitioning to Software Standby mode when using Snooze mode (CHG0 = 1).

## 10.3 Reducing Power Consumption by Switching Clock Signals

The clock frequency changes when the SCKDIVCR register is set.

For information on module and clock associations, see section 8.2.2. SCKDIVCR : System Clock Division Control Register.

## 10.4 Module-Stop Function

The module stop function can stop the clock supply set for each peripheral module.

When the MSTPmi bit (m = A to E, i = 31 to 0) in MSTPCRn (n = A to E) is set to 1, the specified module stops operating and enters the module-stop state, but the CPU continues to operate independently. Setting the MSTPmi bit to 0 cancels the module-stop state, allowing the module to resume operation at the end of the bus cycle.

After a reset is canceled, all modules other than the DMAC, DTC and SRAMn modules are placed in the module-stop state. Do not access the module while the corresponding MSTPmi bit is 1. Additionally, do not set 1 to the MSTPmi bit while the corresponding module is accessed.

## 10.5 Function for Lower Operating Power Consumption

By selecting an appropriate operating power consumption control mode according to the operating frequency, power consumption can be reduced in Normal mode, Sleep mode, and Snooze mode.

### 10.5.1 Operating Range

Figure 10.2 to Figure 10.5 show the ICLK operating voltages and frequencies. Other clock frequencies such as FCLK, PCLKA, PCLKB, PCLKC, and PCLKD are limited in relation to ICLK frequency. For details, see section 8, Clock Generation Circuit.

#### High-speed mode

When LDOCR.CHG0 = 0, the maximum operating frequency of ICLK is 8 MHz. When LDOCR.CHG0 = 1, the maximum operating frequency of ICLK is 80 MHz and the minimum operating frequency of ICLK is 8 MHz.

The operating voltage range is from 1.6 V to 3.6 V when ICLK is lower than 4 MHz. The operating voltage range is from 1.8 V to 3.6 V when ICLK is higher than or equal to 4 MHz.

During FLASH programming or erasure, the operating frequency range is from 1 MHz to 80 MHz when the operating voltage range is from 1.8 V to 3.6 V. During FLASH programming or erasure, the maximum operating frequency of ICLK is 4 MHz when the operating voltage range is from 1.6 V to 1.8 V.

Figure 10.2 shows the operating voltages and frequencies in High-speed mode.

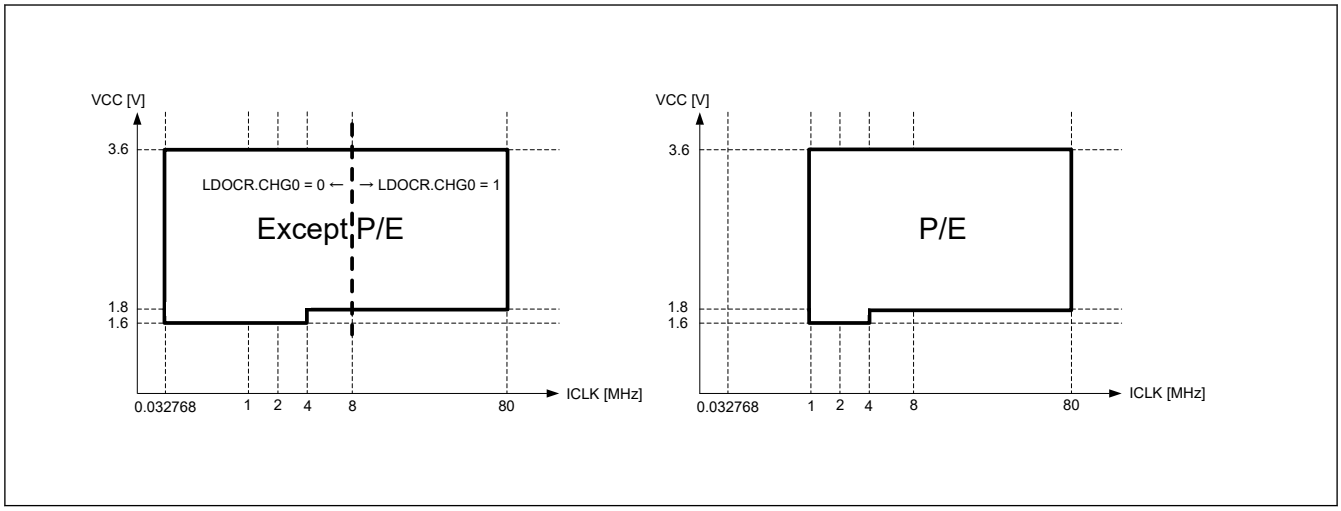

**Figure 10.2 Operating voltages and frequencies in High-speed mode**

#### Middle-speed mode

The power consumption in this mode is lower than that in High-speed mode under the same condition. The maximum operating frequency of ICLK is 8 MHz. The operating voltage range is from 1.6 V to 3.6 V when ICLK is lower than 4 MHz. The operating voltage range is from 1.8 V to 3.6 V when ICLK is higher than or equal to 4 MHz.

During FLASH programming or erasure, the operating frequency range is from 1 MHz to 8 MHz when the operating voltage range is from 1.8 V to 3.6V. During FLASH programming or erasure, the maximum operating frequency of ICLK is 4 MHz when the operating voltage range is from 1.6 V to 1.8 V.

Figure 10.3 shows the operating voltages and frequencies in Middle-speed mode.

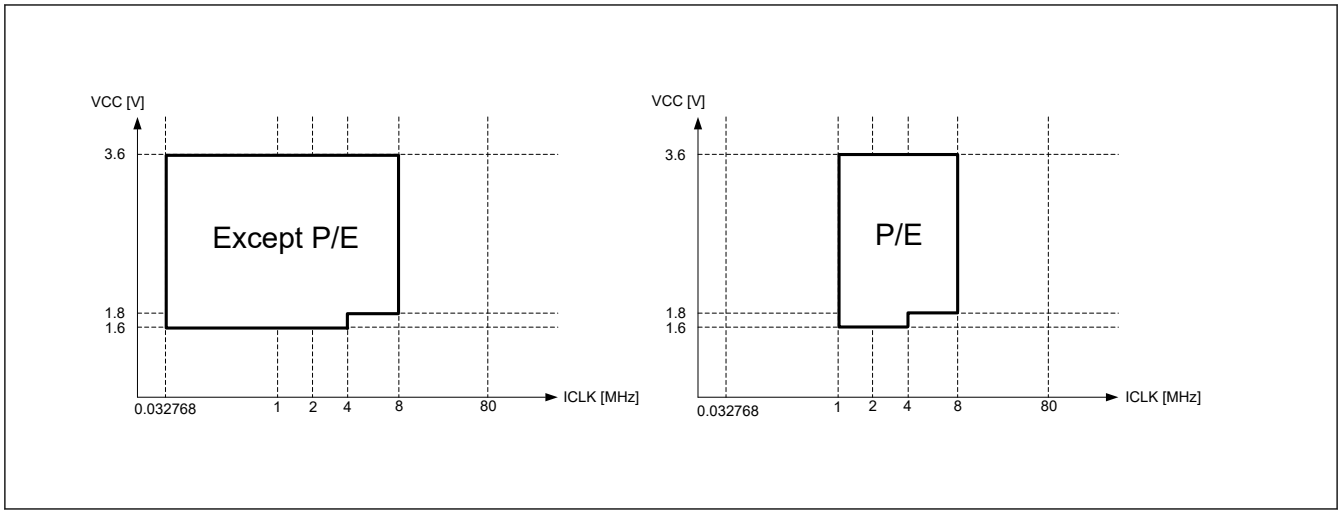

**Figure 10.3 Operating voltages and frequencies in Middle-speed mode**

### Low-speed mode

The maximum operating frequency of ICLK is 1 MHz. The operating voltage range is from 1.6 V to 3.6 V. During FLASH programming or erasure, the operating frequency is 1 MHz and the operating voltage range is from 1.6 V to 3.6 V.

Figure 10.4 shows the operating voltages and frequencies in Low-speed mode.

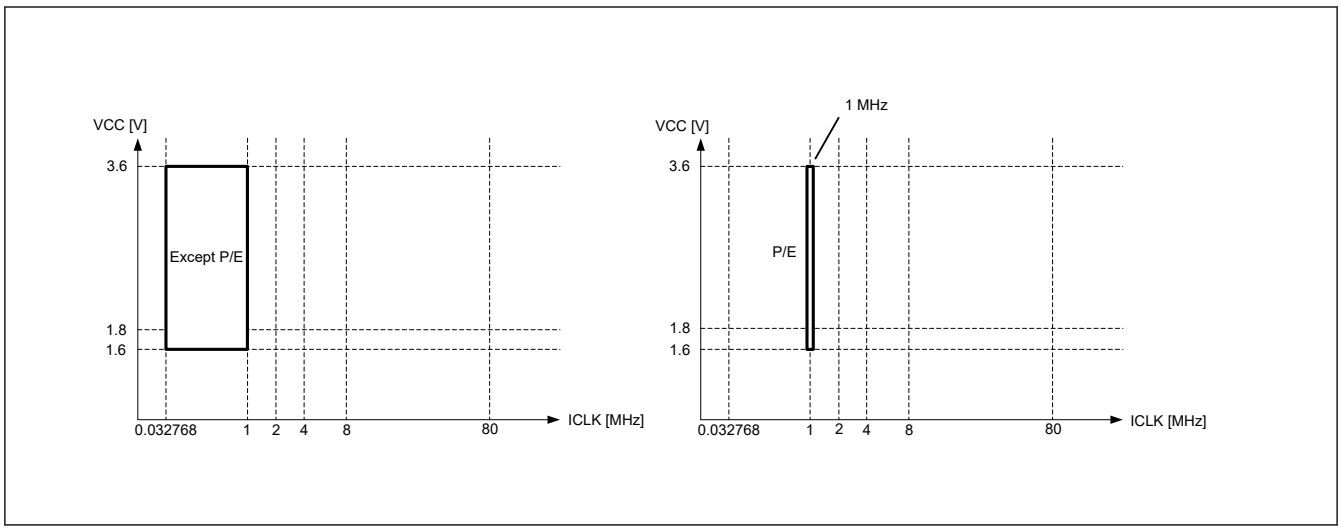

**Figure 10.4 Operating voltages and frequencies in Low-speed mode**

### Subosc-speed mode

The maximum operating frequency of ICLK is 37.6832 kHz. The operating voltage range is from 1.6 V to 3.6 V. P/E operations for flash memory are prohibited. Using the oscillators other than Sub-clock oscillator or Low-speed on-chip oscillator is prohibited.

Figure 10.5 shows the operating voltages and frequencies in Subosc-speed mode.

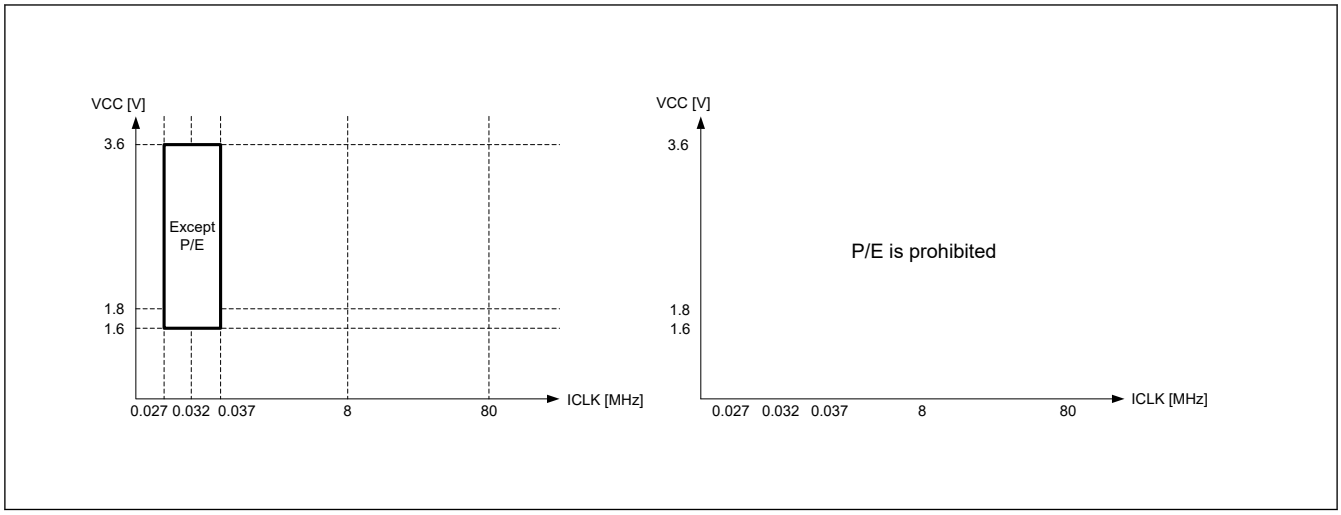

**Figure 10.5 Operating voltages and frequencies in Subosc-speed mode**

## 10.5.2 Setting Operating Power Control Mode

Make sure that the operating condition (the frequency range) is always within the specified range before and after switching the operating power control modes. Also, Table 10.5 shows the oscillators that can be used in each mode.

**Table 10.5 Available oscillators in each mode**

| Mode | Oscillator | | | | | | |
|---|---|---|---|---|---|---|---|
| | PLL | High-speed on-chip oscillator | Middle-speed on-chip oscillator | Low-speed on-chip oscillator | Main clock oscillator | Sub-clock oscillator | IWDT-dedicated on-chip oscillator |
| High-speed | Available | Available | Available | Available | Available | Available | Available |
| Middle-speed | Available | Available | Available | Available | Available | Available | Available |
| Low-speed | N/A | Available | Available | Available | Available | Available | Available |
| Subosc-speed | N/A | N/A | N/A | Available | N/A | Available | Available |

## 10.5.3 Operating Power Control Mode Change Procedure

The following descriptions are procedures for switching operating power control mode:

Note:
- It is prohibited to change LDOCR.CHG0 except High-speed mode with ICLK = 8 MHz.
- LDOCR.CHG0 = 1 is allowed only in High-speed mode with ICLK ≥ 8 MHz.
- Transition to other operating power control mode is allowed only when LDOCR.CHG0 = 0.

**Table 10.6 Operating power control mode transition overview**

| | | | | | | Next state | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ICLK frequency | | | | | 32 kHz | 32 kHz to 1 MHz | 32 kHz to 8 MHz | 8 MHz*1 | f1 MHz (8 < f1 ≤ 32) | f2 MHz (32 < f2 ≤ 48) | f3 MHz (48 < f3 ≤ 80) |
| | | OPCCR register | | | | Sosc-speed | Low-speed | Middle-speed | High-speed | High-speed | | |
| | | | LDOCR register | | | LDO normal operating mode | | | | LDO high performance mode | | |
| | | | | MEMWAIT register | | No wait | | | | No wait | 1 wait | 2 wait |
| | | | | | FCLK max freq. | ICLK × 1/1 | | | | ICLK × 1/1 | | ICLK × 1/2 |
| Current state | 32 kHz | Subosc-speed | LDO normal operating mode | No wait | ICLK × 1/1 | — | (1-1) | | | Not allowed | | |
| | 32 kHz to 1 MHz | Low-speed | | | | (1-4) | — | (1-2) | | | | |
| | 32 kHz to 8 MHz | Middle-speed | | | | | (1-5) | — | (1-3) | | | |
| | 8 MHz*1 | High-speed | | | | | | (1-6) | — | (2-1) | | (2-2) |
| | f1 MHz (8 < f1 ≤ 32) | High-speed | LDO high performance mode | No wait | ICLK × 1/1 | Not allowed | | | (2-5) | — | (2-3) | (2-4) |
| | f2 MHz (32 < f2 ≤ 48) | | | 1 wait | | | | | | (2-6) | — | |
| | f3 MHz (48 < f3 ≤ 80) | | | 2 wait | ICLK × 1/2 | | | | | | (2-7) | — |

Note 1. The “8 MHz” is described as the frequency assumed to be mainly used in High-speed mode. But in fact the switching procedure of (1-x) allows the selection of frequency below 8 MHz shown in Figure 10.2 (x = 1, 2, 3, 4, 5, and 6).

## (1) Operating power control mode transition within ICLK = 8 MHz or slower

### (1-1) Switching from Subosc-speed mode to High-speed, Middle-speed, or Low speed mode

1. (Operation in Subosc-speed mode)
2. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicating not during transition).
3. Set SOPCCR.SOPCM bit to 0 (High-speed, Middle-speed, or Low speed mode (MCU returns to the operating mode (operating mode set by OPCCR.OPCM[1:0]) before the transition to Subosc-speed mode).
4. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicating not during transition).
5. Turn on the oscillator needed in High-speed, Middle-speed, or Low-speed mode.
   Set the frequency of each clock to the maximum or less operating frequency for High-speed, Middle-speed, or Low speed mode.
6. (Operation in High-speed, Middle-speed, or Low-speed mode)

### (1-2) Switching from Low-speed mode to High-speed or Middle-speed mode

1. (Operation in Low-speed mode)
2. Confirm that the OPCCR.OPCMTSF flag is 0 (not indicated during transition).
3. Set the OPCCR.OPCM bit to 00b (High-speed mode) or 01b (Middle-speed mode).
4. Confirm that the OPCCR.OPCMTSF flag is 0 (not indicated during transition).
5. Turn on any oscillator needed in High-speed or Middle-speed mode.
6. Set the frequency of each clock to the maximum or less operating frequency for High-speed or Middle-speed mode.
7. (Operation in High-speed mode or Middle-speed mode)

### (1-3) Switching from Middle-speed to High-speed mode

1. (Operation in Middle-speed mode)
2. Confirm that the OPCCR.OPCMTSF flag is 0 (not indicating during transition).

3. Set the OPCCR.OPCM bit to 00b (High-speed mode).
4. Confirm that the OPCCR.OPCMTSF flag is 0 (not indicated during transition).
5. Turn on any oscillator needed in High-speed mode.
6. Set the frequency of each clock to the maximum or less operating frequency for High-speed mode.
7. (Operation in High-speed mode)

#### (1-4) Switching from High-speed, Middle-speed, or Low-speed mode to Subosc-speed mode

1. (Operation begins in High-speed, Middle-speed, or Low-speed mode)
2. Set or Confirm that LDOCR.CHG0 is 0.
3. Switch the clock source to sub-clock oscillator. Turn off HOCO, MOCO, LOCO main oscillator and PLL.
4. Confirm that all clock sources other than the sub-clock oscillator are stopped.
5. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicating not during transition).
6. Set the SOPCCR.SOPCM bit to 1 (Subosc-speed mode).
7. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicating not during transition).
8. (Operation in Subosc-speed mode)

#### (1-5) Switching from High-speed or Middle-speed mode to Low-speed mode

1. (Operation begins in High-speed or Middle-speed mode)
2. Set or confirm that LDOCR.CHG0 is 0.
3. Change the oscillator to what is used in Low-speed mode. Set the frequency of clock to the maximum or less operating frequency in Low-speed mode.
4. Turn off the oscillator that is not required in Low-speed mode.
5. Confirm that the OPCCR.OPCMTSF flag is 0 (indicating not during transition).
6. Set the OPCCR.OPCM bit to 11b (Low-speed mode).
7. Confirm that OPCCR.OPCMTSF flag is 0 (indicating not during transition).
8. (Operation is in Low-speed mode)

#### (1-6) Switching from a High-speed mode to Middle-speed

1. (Operation begins in High-speed mode)
2. Set or confirm that LDOCR.CHG0 is 0.
3. Change the oscillator to what is used in Middle-speed mode. Set the frequency of the clock to the maximum or less operating frequency in Middle-speed mode.
4. Turn off the oscillator that is not required in Middle-speed mode.
5. Confirm that the OPCCR.OPCMTSF flag is 0 (indicating not during transition).
6. Set the OPCCR.OPCM bit to 01b (Middle-speed mode).
7. Confirm that the OPCCR.OPCMTSF flag is 0 (indicating not during transition).
8. (Operation is in Middle-speed mode)

### (2) Operating power control mode transition within ICLK = 8 MHz or faster

#### (2-1) Procedure of switching ICLK frequency from 8 MHz to f1 or f2 MHz (8 < f1 ≤ 32, 32 < f2 ≤ 48)

1. (Operation begins in High-speed mode with LDOCR.CHG0 = 0)
2. Set the frequency of ICLK to 8 MHz.
   At this time, set the clock source to MOCO, and set SCKDIVCR.ICLK[2:0] to 000b.
3. Turn on the oscillator needed for f1 or f2 MHz.

4. Depending on the desired transition destination frequency (f1 or f2 MHz), set the clock division except of ICLK and the memory wait cycle as needed. For details, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash.
5. Set LDOCR.CHG0 to 1.
6. Wait at least 5 µs for stabilization of LDO.
7. Set the SCKSCR to change the clock source from MOCO to the oscillator for f1 or f2 MHz.
(Make sure ICLK frequency does not exceed 48MHz.)
8. Set SCKDIVCR.ICLK[2:0]
9. (Operation in High-speed mode with f1 or f2 MHz.)

**(2-2) Procedure of switching ICLK frequency from 8 MHz to f3 MHz (48 < f3 ≤ 80)**

1. (Operation begins in High-speed mode with LDOCR.CHG0 = 0)
2. Set the frequency of ICLK to 8 MHz.
At this time, set the clock source to MOCO, and set SCKDIVCR.ICLK[2:0] to 000b.
3. Turn on the oscillator needed for f3 MHz.
4. Depending on the desired transition destination frequency (f3 MHz), set the clock division except of ICLK and the memory wait cycle as needed. For details, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash.
5. Set SCKDIVCR.ICLK[2:0] to 001b.
(The ICLK frequency changes to 4 MHz.)
6. Set LDOCR.CHG0 to 1.
(At this time, the prohibited state that LDOCR.CHG0 is 1 and ICLK is less than 8 MHz appears, but it is a state in the middle of transition. So, it is specially permitted.)
7. Wait at least 5 µs for stabilization of LDO.
8. Set the SCKSCR to change the clock source from MOCO to the oscillator for f3 MHz.
(ICLK changes from 4 MHz to the frequency of half of f3 MHz.)
9. Wait more than 30 µs for stabilization of LDO.
10. Set SCKDIVCR.ICLK[2:0] to 000b.
11. (Operation in High-speed mode with f3 MHz.)

**(2-3) Procedure of switching ICLK frequency from f1 MHz to f2 MHz (8 < f1 ≤ 32, 32 < f2 ≤ 48)**

1. (Operation begins in High-speed mode with f1 MHz and LDOCR.CHG0 = 1)
2. Turn on the oscillator needed for f2 MHz.
3. Depending on the desired transition destination frequency (f2 MHz), set the clock division and the memory wait cycle as needed. For details, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash.
4. Set the SCKSCR to change the clock source from MOCO to the oscillator for f2 MHz.
(Make sure ICLK frequency does not exceed 48MHz.)
5. Set SCKDIVCR.ICLK[2:0]
6. (Operation in High-speed mode with f2 MHz and LDOCR.CHG0 = 1.)

**(2-4) Procedure of switching ICLK frequency from f1 or f2 MHz to f3 MHz (8 < f1 ≤ 32, 32 < f2 ≤ 48, 48 < f3 ≤ 80)**

1. (Operation begins in High-speed mode with f1 or f2 MHz and LDOCR.CHG0 = 1. At this time, set SCKDIVCR.ICLK[2:0] to 000b.)
2. Turn on the oscillator needed for f3 MHz.
3. Depending on the desired transition destination frequency (f3 MHz), set the clock division except of ICLK and the memory wait cycle as needed. For details, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash.

4. Set SCKDIVCR.ICLK[2:0] to 001b.
   (ICLK frequency changes to the frequency of the half of f1 or f2 MHz.)
   (At this time, the prohibited state that LDOCR.CHG0 is 1 and ICLK may be less than 8 MHz appears, but it is a state in the middle of transition. So, it is specially permitted.)
5. Set the SCKSCR to change the clock source to the oscillator for f3 MHz.
   (ICLK changes from the frequency of the half of f1 or f2 MHz to the frequency of the half of f3 MHz.)
6. Wait more than 30 µs for stabilization of LDO.
7. Set SCKDIVCR.ICLK[2:0] to 000b.
8. (Operation in High-speed mode with f3 MHz and LDOCR.CHG0 = 1.)

#### (2-5) Procedure of switching ICLK frequency from f1 or f2 or f3 MHz to 8 MHz

1. (Operation begins in High-speed mode with f1 or f2 or f3 MHz and LDOCR.CHG0 = 1)
2. Change the frequency of ICLK to 8 MHz.
3. Depending on the desired transition destination frequency (8 MHz), set the clock division and the memory wait cycle as needed. For details, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash.
4. Set LDOCR.CHG0 to 0.
5. (Operation begins in High-speed mode with 8 MHz and LDOCR.CHG0 = 0)

#### (2-6) Procedure of switching ICLK frequency from f2 or f3 MHz to f1 MHz

1. (Operation begins in High-speed mode with f2 or f3 MHz and LDOCR.CHG0 = 1)
2. Change the frequency of ICLK to f1 MHz.
3. Depending on the desired transition destination frequency (f1 MHz), set the clock division and the memory wait cycle as needed. For details, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash.
4. (Operation in High-speed mode with f1 MHz and LDOCR.CHG0 = 1)

#### (2-7) Procedure of switching ICLK frequency from f3 MHz to f2 MHz

1. (Operation begins in High-speed mode with f3 MHz and LDOCR.CHG0 = 1)
2. Change the frequency of ICLK to f2 MHz.
3. Depending on the desired transition destination frequency (f2 MHz), set the clock division and the memory wait cycle as needed. For details, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash.
4. (Operation in High-speed mode with f2 MHz and LDOCR.CHG0 = 1)

### 10.5.4 Specific Procedure for Low Power Mode Transition

For low power mode transition between normal mode with f3 MHz and Software Standby or Snooze mode, the following procedures are required.

Note: For the transition between normal mode except with f3 MHz and Software Standby and Snooze mode, the following special procedures are not required.

#### (3-1) Procedure of transition to Software Standby mode from the normal mode with f3 MHz

1. (Operation begins in High-speed mode with f3 MHz and LDOCR.CHG0 = 1)
2. Change SCKDIVCR.ICLK[2:0] to 001b from 000b.
   (Change the frequency of ICLK to half of f3 MHz from f3 MHz.)
   (It is prohibited to transition to Software Standby mode from the operation with f3 MHz.)
3. For the half of f3 MHz as ICLK frequency, set the clock division except for ICLK and the memory wait cycle as needed. For details, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash of section 8, Clock Generation Circuit.

4. Transition to Software Standby mode.
   (State in Software Standby mode.)

   Note: MOCOCR.MCSTP must be set to 0 before transitioning to Software Standby mode when using Snooze mode at LDOCR.CHG0 = 1.

**(3-2) Procedure of transition to normal mode with f3 MHz from Software Standby mode or Snooze mode (continuation of (3-1))**

1. (State begins in Software Standby mode or Snooze mode)
2. Occurrence of canceling factor
   (Transition is automatically executed to normal mode with half of f3 MHz and LDOCR.CHG0 = 1.)
3. Depending on the frequency (f3 MHz) of the target transition destination, set the clock division except for ICLK and the memory wait cycle as needed after the CPU starts to operate. For details, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.4. MEMWAIT : Memory Wait Cycle Control Register for Code Flash of section 8, Clock Generation Circuit.
4. Wait more than 30 µs for the stabilization of LDO.
5. Set SCKDIVCR.ICLK[2:0] to 000b.
   (Operation in High-speed mode with f3 MHz and LDOCR.CHG0 = 1.)

## 10.6 Sleep Mode

### 10.6.1 Transitioning to Sleep Mode

When a WFI instruction is executed while SBYCR.SSBY bit is 0, the MCU enters Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. Available resets or interrupts in Sleep mode cause the MCU to cancel Sleep mode. All interrupt sources are available. If using an interrupt to cancel Sleep mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see section 12, Interrupt Controller Unit (ICU).

Counting by IWDT stops when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep mode, Software Standby mode, or Snooze mode).

Counting by IWDT continues when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep mode, Software Standby mode, or Snooze mode).

Counting by WDT stops when the MCU enters Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 1 (WDT stops in Sleep mode). Similarly, counting by WDT stops when the MCU enters Sleep mode while the WDT is in register start mode and the WDTCSTPR.SLCSTP bit is 1 (WDT stops in Sleep mode).

Counting by WDT continues when the MCU enters Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 0 (WDT does not stop in Sleep mode). Similarly, counting by WDT continues when the MCU enters Sleep mode while the WDT is in register start mode and the WDTCSTPR.SLCSTP bit is 0 (WDT does not stop in Sleep mode).

### 10.6.2 Canceling Sleep Mode

Sleep mode is canceled by:

- An interrupt
- A RES pin reset
- A power-on reset
- A voltage monitor reset
- An SRAM parity error reset
- An SRAM ECC error reset
- A bus master MPU error reset
- A TrustZone error reset
- A reset caused by an IWDT or a WDT underflow

The operations are as follows:

1. Canceling by an interrupt
   When an interrupt request is generated, Sleep mode is canceled and the MCU starts the interrupt handling.
2. Canceling by RES pin reset
   When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for the time period specified in section 49, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by IWDT reset
   Sleep mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in Sleep mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
   - OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.
4. Canceling by WDT reset
   Sleep mode is canceled by an internal reset generated by a WDT underflow and the MCU starts the reset exception handling. However, WDT stops in Sleep mode even when counting in Normal mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
   - OFS0.WDTSTRT = 0 (auto start mode) and OFS0.WDTSTPCTL = 1
   - OFS0.WDTSTRT = 1 (register start mode) and WDTCSTPR.SLCSTP = 1.
5. Canceling by other resets available in Sleep mode
   Sleep mode is canceled by other resets and the MCU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see section 12, Interrupt Controller Unit (ICU).

## 10.7 Software Standby Mode

### 10.7.1 Transitioning to Software Standby Mode

When a WFI instruction is executed while SBYCR.SSBY bit is 1, the MCU enters Software Standby mode. In this mode, the CPU, most of the on-chip peripheral functions and the oscillators stop. However, the contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions and the I/O ports are retained*1. Software Standby mode allows significant reduction in power consumption because most of the oscillators stops in this mode. Table 10.2 shows the status of each on-chip peripheral functions and oscillators. Available resets or interrupts in Software Standby mode make the MCU to cancel Software Standby mode. See Table 10.3 for available interrupt sources and section 12.2.18. WUPEN0 : Wake Up Interrupt Enable Register 0, section 12.2.19. WUPEN1 : Wake Up Interrupt Enable Register 1, section 12.2.20. WUPEN2 : Wake Up Interrupt Enable Register 2 for information on waking up the MCU from Software Standby mode. If using an interrupt to cancel an interrupt, you must set the associated IELSRn register before executing a WFI instruction. For details, see section 12, Interrupt Controller Unit (ICU).

Clear DMAST.DMST bit and DTCST.DTCST bit to 0 before executing WFI instruction except when using DTC in Snooze mode. If DTC is required in Snooze mode, set DTCST.DTCST bit to 1 before executing a WFI instruction.

Counting by the IWDT stops if the MCU enters Software Standby mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep, Software Standby or Snooze mode).

Counting by the IWDT continues if the MCU enters Software Standby mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep, Software Standby or Snooze mode).

WDT stops counting when the MCU enters Software Standby mode because the PCLKB stops.

Do not enter Software Standby mode while OSTDCR.OSTDE = 1 (oscillation stop detection function is enabled). To enter Software Standby mode, execute a WFI instruction after disabling the oscillation stop detection function (OSTDCR.OSTDE = 0). In case of executing WFI instruction while OSTDCR.OSTDE = 1, the MCU enters Sleep mode even if SBYCR.SSBY = 1.

Do not enter Software Standby mode while the flash memory is programming or erasing. To enter Software Standby mode, execute a WFI instruction after programming or erasing procedure completes.

Note 1. The retention of RAM area can be controlled by the PSMCR register.

Table 10.7 shows the setting of the related control bits and the modes to enter after executing WFI instruction.

**Table 10.7 Bit settings that affect modes when executing a WFI instruction**

| | | SBYCR.SSBY bit settings | |
|---|---|---|---|
| | | SSBY = 0 | SSBY = 1 |
| OSTDCR.OSTDE | 0 | Sleep | Software Standby |
| | 1 | | Sleep |
| FENTRYR.FENTRYC<br>FENTRYR.FENTRYD | 0 | Sleep | Software Standby |
| | 1 | | Sleep |
| OFS0.IWDTSTPCTL | 0 | Sleep | Software Standby |
| | 1 | | |
| LVD1CR0.RI | 0 | Sleep | Software Standby |
| | 1 | | |
| LVD2CR0.RI | 0 | Sleep | Software Standby |
| | 1 | | |

## 10.7.2 Canceling Software Standby Mode

Software Standby mode is canceled by:

- An available interrupt shown in Table 10.3
- A RES pin reset
- A power-on reset
- A voltage monitor reset
- A reset caused by an IWDT underflow.

On exiting Software Standby mode, the oscillators that operate before the transition to the mode restart. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode. See section 12.2.18. WUPEN0 : Wake Up Interrupt Enable Register 0, section 12.2.19. WUPEN1 : Wake Up Interrupt Enable Register 1, section 12.2.20. WUPEN2 : Wake Up Interrupt Enable Register 2 for information on how to wake up the MCU from Software Standby mode.

You can cancel Software Standby mode in any of the following ways:

1. Canceling by an interrupt
   When an available interrupt request (see Table 10.3) is generated, an oscillator that operates before the transition to Software Standby mode restarts. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode and starts the interrupt handling.
2. Canceling by a RES pin reset
   When the RES pin is driven low, the MCU enters the reset state, and the oscillators whose default status is operating, start the oscillation. Be sure to keep the RES pin low for the time period specified in section 49, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by a power-on reset
   Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.
4. Canceling by a voltage monitor reset
   Software Standby mode is canceled by a voltage monitor reset from the voltage detection circuit and the MCU starts the reset exception handling.
5. Canceling by IWDT reset
   Software Standby mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in Software Standby mode and an internal reset for canceling Software Standby mode is not generated in the following condition:
   - OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.

### 10.7.3 Example of Software Standby Mode Application

Figure 10.6 shows an example of entry to Software Standby mode on detection of a falling edge of the IRQn pin, and exit from Software Standby mode by a rising edge of the IRQn pin.

In this example, an IRQn pin interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 00b (falling edge) in Normal mode, and the IRQCRi.IRQMD[1:0] bits are set to 01b (rising edge). After that, the SBYCR.SSBY bit is set to 1 and a WFI instruction is executed. As a result, entry to Software Standby mode completes and exit from Software Standby mode is initiated by a rising edge of the IRQn pin.

Setting the ICU is also required to exit Software Standby mode. For details, see section 12, Interrupt Controller Unit (ICU). The oscillation stabilization time in Figure 10.6 is specified in section 49, Electrical Characteristics.

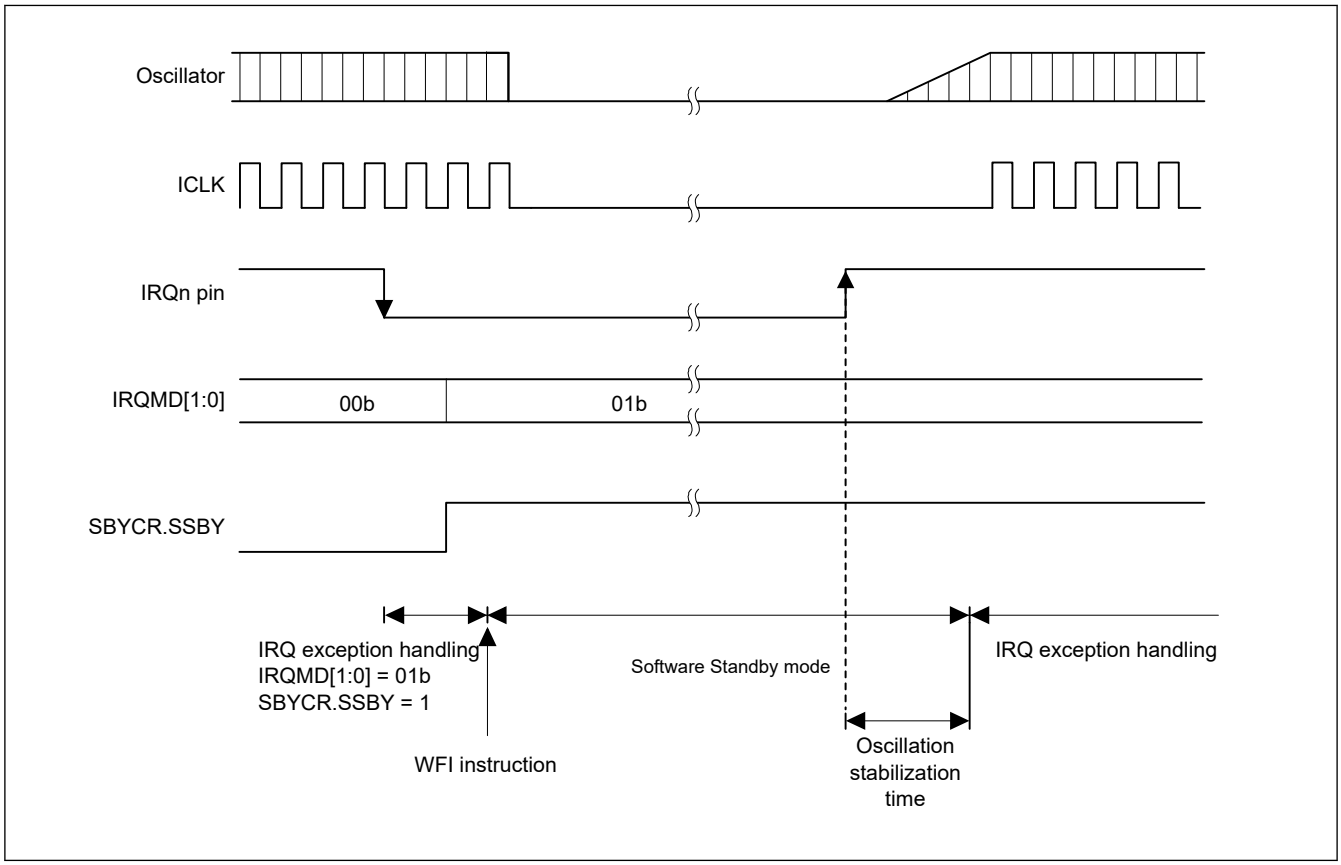

**Figure 10.6 Example of Software Standby mode application**

## 10.8 Snooze Mode

### 10.8.1 Transition to Snooze Mode

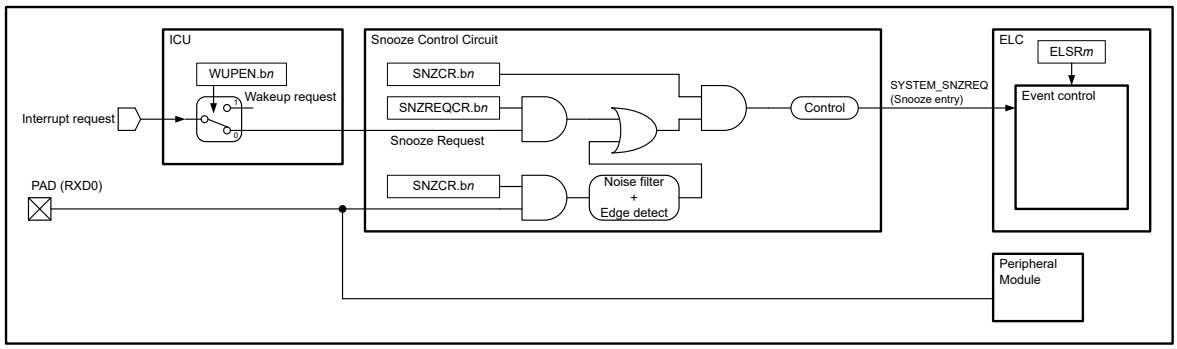

**Figure 10.7 Snooze mode entry configuration**

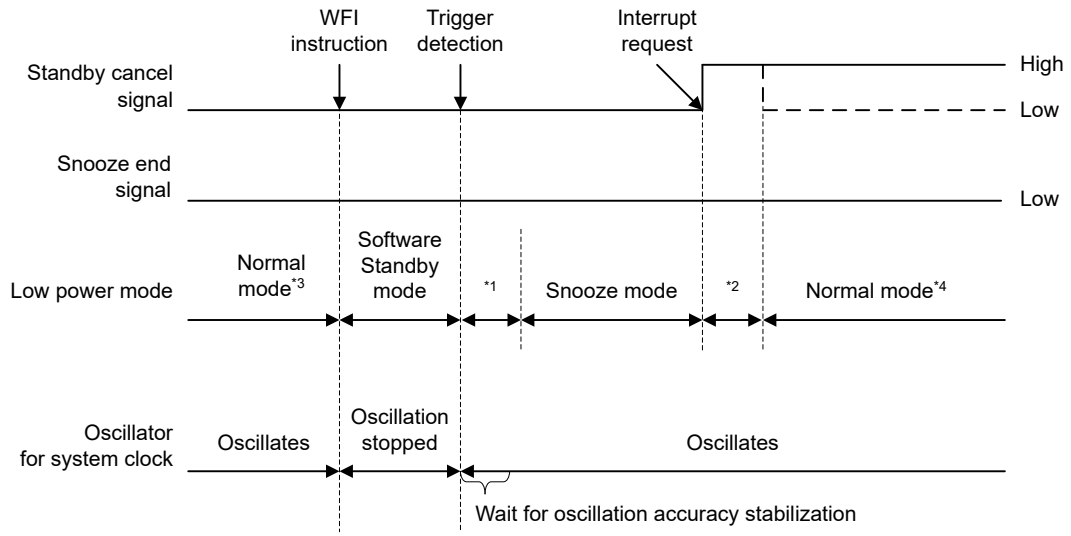
When the snooze control circuit accepts an available snooze request in Software Standby mode, the MCU transfers to Snooze mode. In this mode, some peripheral modules operates without waking the CPU. The peripheral modules that can operate in Snooze mode are shown in Table 10.2. Also, DTC operation in Snooze mode can be selected by the setting of SNZCR.SNZDTCEN bit.

Table 10.8 shows the Snooze requests that switch the MCU from Software Standby mode to Snooze mode. To use the listed Snooze requests as a trigger to switch to Snooze mode, the corresponding SNZREQENn bit of the SNZREQCR0 register or RXDREQEN bit of SNZCR register must be set before entering Software Standby mode.

**Table 10.8 Available snooze requests to switch to Snooze mode**



| Snooze request | Control Register | |
|---|---|---|
| | Register | Bit*1 |
| PORT_IRQn (n = 0 to 15) | SNZREQCR0 | SNZREQENn (n = 0 to 15) |
| ACMP_LP0 | SNZREQCR0 | SNZREQEN23 |
| RTC_ALM | SNZREQCR0 | SNZREQEN24 |
| RTC_PRD | SNZREQCR0 | SNZREQEN25 |
| AGT1_AGTI | SNZREQCR0 | SNZREQEN28 |
| AGT1_AGTCMAI | SNZREQCR0 | SNZREQEN29 |
| AGT1_AGTCMBI | SNZREQCR0 | SNZREQEN30 |
| RXD0 falling edge | SNZCR | RXDREQEN*2 |

Note 1. Do not enable multiple snooze requests at the same time.
Note 2. Do not set the RXDREQEN bit to 1 except in asynchronous mode.

Clear the DMAST.DMST and DTCST.DTCST bits to 0 before executing a WFI instruction, except when using the DTC in Snooze mode. If the DTC is required in Snooze mode, set the DTCST.DTCST bit to 1 before executing a WFI instruction.

### 10.8.2 Canceling Snooze Mode

Snooze mode is canceled by an interrupt request that is available in Software Standby mode or a reset. Table 10.3 shows the requests that can be used to exit each mode. After canceling the Snooze mode, the MCU enters Normal mode and proceeds with exception processing for the given interrupt or reset. The action triggered by the interrupt requests, selected in SELSR0, cancels Snooze mode. Interrupt canceling Snooze mode must be selected in IELSRn to link to the NVIC for the corresponding interrupt handling. See section 12, Interrupt Controller Unit (ICU) for information on SELSR0 and IELSRn registers.

Note 1. Transition time from Software Standby mode to Snooze mode.
Note 2. Transition time from Snooze mode to Normal mode.
Note 3. Enable Snooze mode (SNZCR.SNZE = 1) immediately before switching to Software Standby mode.
Note 4. Disable Snooze mode (SNZCR.SNZE = 0) immediately after returning to Normal mode.

**Figure 10.8 Canceling of Snooze mode when an interrupt request signal is generated**

## 10.8.3 Returning to Software Standby Mode from Snooze Mode

Table 10.9 shows the snooze end request that can be used as triggers to return to Software Standby mode. The snooze end requests are available only in Snooze mode. If the requests are generated when the MCU is not in Snooze mode, they are ignored. When multiple requests are selected, each of the requests invokes transition to Software Standby mode from Snooze mode.

Table 10.10 shows the snooze end conditions that consist of the snooze end requests and the conditions of the peripheral modules. The CTSU, SCI0, ADC12, and DTC modules can keep the MCU in Snooze mode until they complete the operation. However, an AGT1 underflow as a trigger to return to Software Standby mode cancels Snooze mode without waiting for the completion of SCI0 operation.

Figure 10.9 shows the timing diagram for the transition from Snooze mode to Software Standby mode. This mode transition occurs according to which snooze end requests are set in the SNZEDCR0 or SNZEDCR1 register. A snooze request is cleared automatically after returning to Software Standby mode.

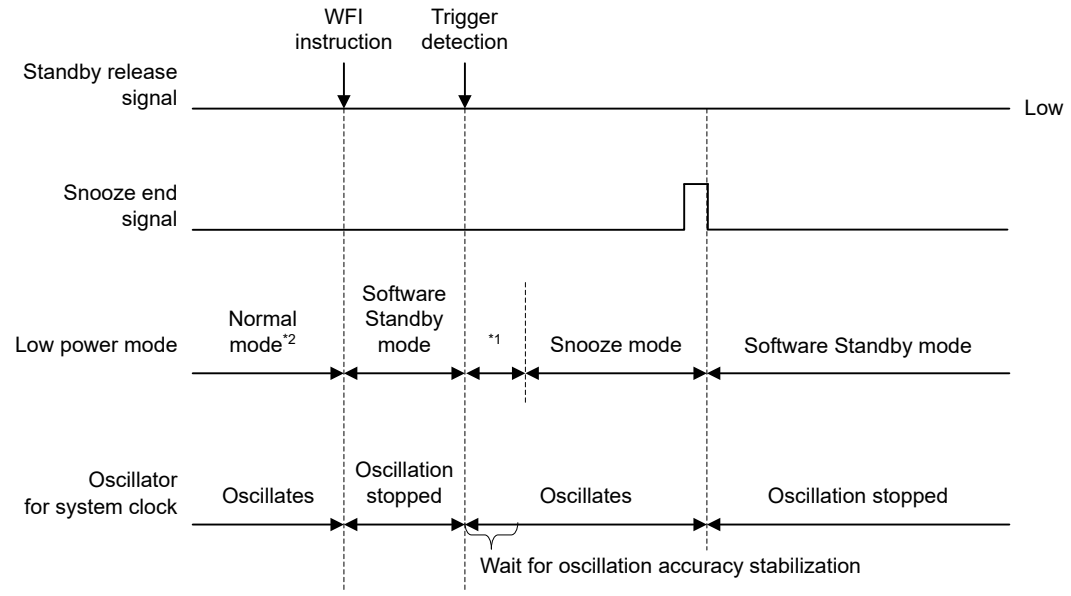


**Table 10.9 Available snooze end requests (triggers to return to Software Standby mode)**

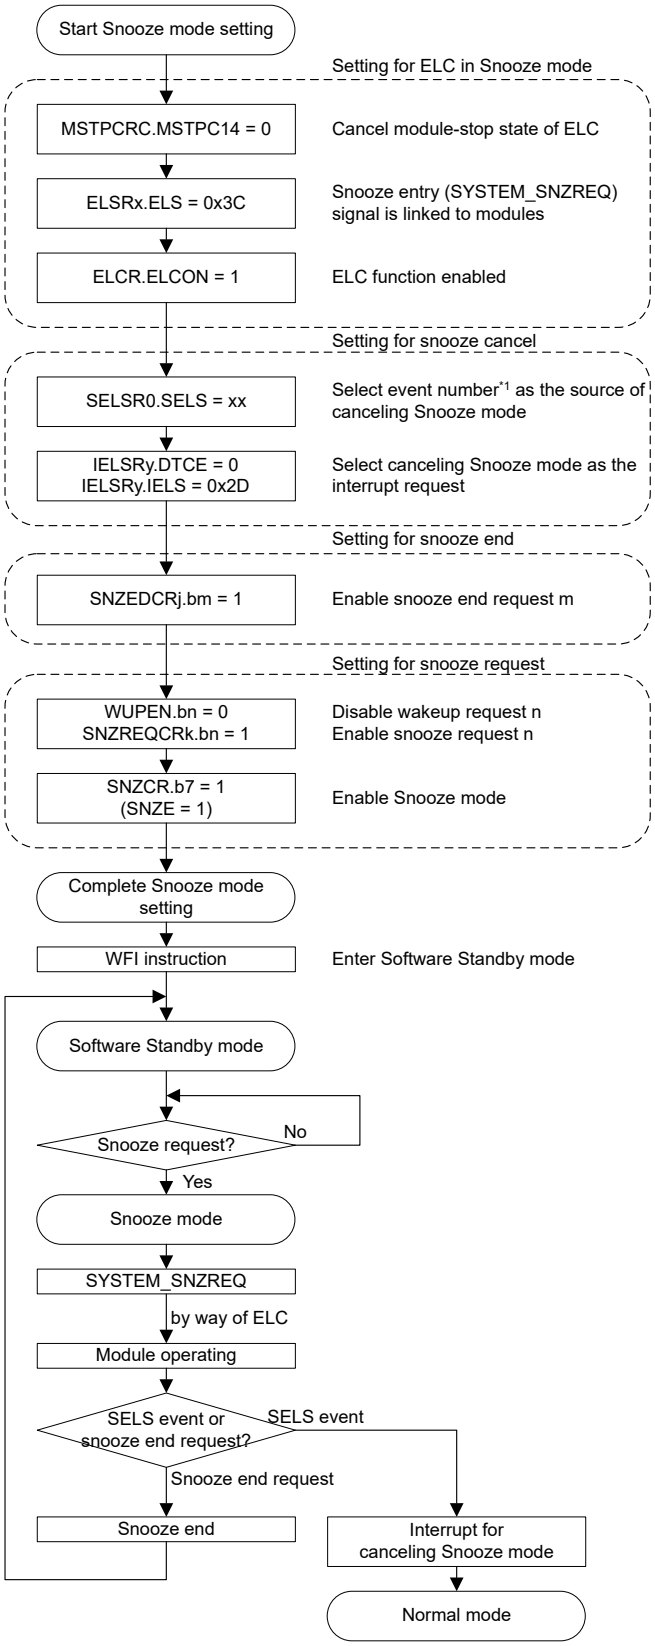
| | | Enable/Disable control | |
|---|---|---|---|
| **Peripheral module** | **Snooze end request** | **Register** | **Symbol** |
| AGT1 | AGT1 underflow (AGT1_AGTI) | SNZEDCR0 | AGTUNFED |
| DTC | Last DTC transmission completion (DTC_COMPLETE) | SNZEDCR0 | DTCZRED |
| DTC | Not Last DTC Transmission Completion (DTC_TRANSFER) | SNZEDCR0 | DTCNZRED |
| ADC120 | Window A/B compare match (ADC120_WCMPM) | SNZEDCR0 | AD0MATED |
| ADC120 | Window A/B compare mismatch (ADC120_WCMPUM) | SNZEDCR0 | AD0UMTED |
| SCI0 | SCI0 address mismatch (SCI0_DCUF) | SNZEDCR0 | SCI0UMTED |
| CTSU | CTSU non-touch automatic judgement (CTSU_NAJ) | SNZEDCR1 | CTSUNAJED |

**Table 10.10 Snooze end conditions**

| Operating module when a snooze end request occurs | Snooze end request | |
|---|---|---|
| | AGT1 underflow | Other than AGT1 underflow |
| DTC | The MCU transfers to the Software Standby mode after all of the modules listed in this table complete operation. | The MCU transfers to the Software Standby mode after all of the modules listed to the left of this column complete the operation. |
| ADC120 | | |
| CTSU | | |
| SCI0 | The MCU transfers to the Software Standby mode immediately after the snooze end request is generated. | |
| Other than specified | The MCU transfers to the Software Standby mode immediately after a snooze end request is generated. | |

Note: If the DTC is used to activate the ADC120, CTSU or SCI, the MCU transitions to Software Standby mode immediately after a snooze end request is generated.



Note 1. Transition time from Software Standby mode to Snooze mode.
Note 2. Enable Snooze mode (SNZCR.SNZE = 1) immediately before switching to Software Standby mode.

**Figure 10.9 Canceling of Snooze mode when an interrupt request signal is not generated**

## 10.8.4 Snooze Operation Example

Figure 10.10 shows an example setting for using ELC in Snooze mode.

Note 1. See Table 12.4

**Figure 10.10 Setting example of using ELC in Snooze mode**

The MCU can transmit and receive data in SCI0 asynchronous mode without CPU intervention. When using the SCI0 in Snooze mode, use High-speed mode, Middle-speed mode, or Low-speed mode.

Do not use Subosc-speed mode. Table 10.11 shows the maximum transfer rate of SCI0 in Snooze mode.

**Table 10.11 HOCO: ± 1% (Unit: bps)**

| Maximum division ratio of ICLK, PCLKB, and PCLKD | HOCO frequency | | | |
|---|---|---|---|---|
| | 24 MHz | 32 MHz | 48 MHz | 64 MHz |
| 1 | 9600*1 | 9600*4 | — | — |
| 2 | 9600*2 | 9600*5 | 4800 | 2400 |
| 4 | 9600*3 | 9600*6 | 4800 | 2400 |
| 8 | 4800 | 4800 | 4800 | 2400 |
| 16 | 4800 | 4800 | 4800 | 2400 |
| 32 | 2400 | 2400 | 2400 | 2400 |
| 64 | 2400 | 2400 | 2400 | 2400 |

Note 1. SCI0.SMR.CKS[1:0] = 00b, SCI0.SEMR.BRME = 1, SCI0.BRR = 0x3D, and SCI0.MDDR = 0xCE must be used for 9600 bps.
Note 2. SCI0.SMR.CKS[1:0] = 00b, SCI0.SEMR.BRME = 1, SCI0.BRR = 0x1E, and SCI0.MDDR = 0xCE must be used for 9600 bps.
Note 3. SCI0.SMR.CKS[1:0] = 00b, SCI0.SEMR.BRME = 1, SCI0.BRR = 0x0D, and SCI0.MDDR = 0xBA must be used for 9600 bps.
Note 4. SCI0.SMR.CKS[1:0] = 00b, SCI0.SEMR.BRME = 1, SCI0.BRR = 0x3E, and SCI0.MDDR = 0x9D must be used for 9600 bps.
Note 5. SCI0.SMR.CKS[1:0] = 00b, SCI0.SEMR.BRME = 1, SCI0.BRR = 0x32, and SCI0.MDDR = 0xFE must be used for 9600 bps.
Note 6. SCI0.SMR.CKS[1:0] = 00b, SCI0.SEMR.BRME = 1, SCI0.BRR = 0x18, and SCI0.MDDR = 0xF9 must be used for 9600 bps.

When using SCI0 in Snooze mode, use the following setting: BGDM = 0, ABCS = 0, ABCSE = 0. See section 26, Serial Communications Interface (SCI) for information on these bits.

Figure 10.11 shows a setting example for using SCI0 in Snooze mode entry.

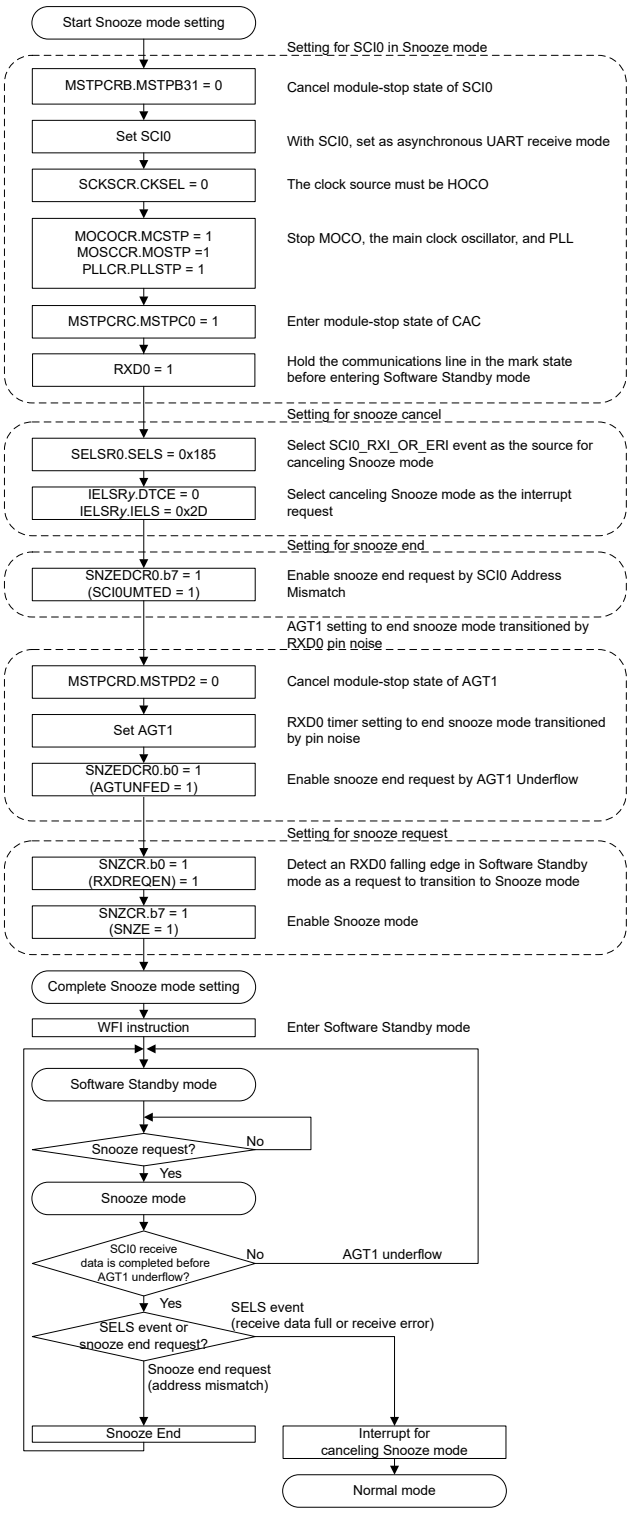


**Figure 10.11 Setting example of using SCI0 in Snooze mode entry**

## 10.9 Usage Notes

### 10.9.1 Register Access

#### (1) Invalid register write accesses during specific modes or transitions

Do not write to registers under any of the conditions listed in this section.

[Registers]

- All registers with a peripheral name of SYSTEM.

[Conditions]

- OPCCR.OPCMTSF = 1 or SOPCCR.SOPCMTSF = 1 (during transition of the operating power control mode)
- During the time period from executing a WFI instruction to returning to Normal mode
- FENTRYR.FENTRY0 = 1 or FENTRYR.FENTRYD = 1 (flash P/E mode, data flash P/E mode)

#### (2) Valid setting for the clock-related registers

Table 10.12 and Table 10.13 show the valid settings of the clock-related registers in each operating power control mode. Do not write any value other than the valid setting. Each register has certain prohibited settings under conditions other than those related to the operating power control modes. See section 8, Clock Generation Circuit for another condition of each register.

**Table 10.12 Valid settings for the clock-related registers (1)**

| Mode | Valid settings | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | SCKSCR.CKSEL[2:0] CKOCR.CKOSEL[2:0] | SCKDIVCR.FCK[2:0] ICK[2:0] | PLLCR.PLLSTP | HOCOCR.HCSTP | MOCOCR.MCSTP | LOCOCR.LCSTP | MOSCCR.MOSTP | SOSCCR.SOSTP |
| High-speed or Middle-speed | 000b (HOCO)<br>001b (MOCO)<br>010b (LOCO)<br>011b (Main clock)<br>100b (Sub clock)<br>101b (PLL) *1 | 000b (1/1)<br>001b (1/2)<br>010b (1/4)<br>011b (1/8)<br>100b (1/16)<br>101b (1/32)<br>110b (1/64) | 0 (operating)<br>1 (stop) | 0 (operating)<br>1 (stopped) | 0 (operating)<br>1 (stopped) | 0 (operating)<br>1 (stopped) | 0 (operating)<br>1 (stopped) | 0 (operating)<br>1 (stopped) |
| Low-speed | 000b (HOCO)<br>001b (MOCO)<br>010b (LOCO)<br>011b (Main clock)<br>100b (Sub clock) | | 1 (stop) | | | | | |
| Subosc-speed | 010b (LOCO)<br>100b (SOSC) | 000b (1/1) | 1 (stop) | 1 (stopped) | 1 (stopped) | 0 (operating)<br>1 (stopped) | 1 (stopped) | 0 (operating)<br>1 (stopped) |

Note 1. SCKSCR.CKSEL[2:0] only

**Table 10.13 Valid settings for the clock-related registers (2)**

| Operating oscillator | Valid settings | |
|---|---|---|
| | SOPCCR.SOPCM | OPCCR.OPCM[1:0] |
| PLL | 0 | 00b, 01b |
| High-speed on-chip oscillator | 0 | 00b, 01b, 11b |
| Middle-speed on-chip oscillator | | |
| Main clock oscillator | | |
| Low-speed on-chip oscillator | 0, 1 | 00b, 01b, 11b |
| Sub-clock oscillator | | |
| IWDT-dedicated on-chip oscillator | | |

#### (3) Invalid register write accesses in subosc-speed mode

Do not write to registers under the listed condition in this section.

[Registers]

- SCKSCR, OPCCR.

[Condition]

- SOPCCR.SOPCM = 1 (Subosc-speed mode).

#### (4) Invalid register write accesses by the DTC or DMAC

Do not write to registers listed in this section by the DTC or DMAC.

[Registers]

- MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD, MSTPCRE

#### (5) Invalid register write accesses in Snooze mode

Do not write to registers listed in this section in Snooze mode. They must be set before entering Software Standby mode.

[Registers]

- SNZCR, SNZEDCRn, SNZREQCR0.

#### (6) Invalid write access when PRCR.PRC1 is 0

Do not write to registers listed in this section when the PRCR.PRC1 bit is 0.

[Registers]

- SBYCR, SNZCR, SNZEDCRn, SNZREQCR0, PSMCR, OPCCR, SOPCCR, SYOCDCR, LDOCR

#### (7) Invalid write access when PRCR.PRC4 bit is 0

Do not write to registers listed in this section when the PRCR.PRC4 bit is 0.

[Registers]

- LPMSAR

### 10.9.2 I/O Port Pin States

The I/O port pin states in Software Standby mode and Snooze mode, unless modifying in Snooze mode, are the same before entering the modes. Therefore, power consumption is not reduced while the output signals are held high.

### 10.9.3 Module-Stop State of DTC, DMAC

Before writing 1 to MSTPCRA.MSTPA22, clear the DMAST.DMST bit of the DMAC and the DTCST.DTCST bit of the DTC to 0. For details, see section 15, DMA Controller (DMAC) and section 16, Data Transfer Controller (DTC).

### 10.9.4 Internal Interrupt Sources

Interrupts do not operate in the module-stop state. If setting the module-stop bit while an interrupt request is generated, a CPU interrupt source or a DTC or DMAC startup source cannot be cleared. Always disable the associated interrupts before setting the module-stop bits.

### 10.9.5 Transitioning to Low Power Modes

Because the MCU does not support wakeup by events, do not enter the low power modes such as Sleep mode or Software Standby mode by executing a WFI instruction. Also, do not set the SLEEPDEEP bit of the System Control Register in the Cortex-M33 core because the MCU does not support low power modes by SLEEPDEEP.

### 10.9.6 Timing of WFI Instruction

It is possible for the WFI instruction to be executed before I/O register write is completed, in which case operation might not be as intended. This can happen if the WFI is placed immediately after a write to an I/O register. To avoid this problem, read back the register that was written to confirm that the write completed.

### 10.9.7 Writing to the WDT/IWDT Registers by DTC or DMAC in Sleep Mode or Snooze Mode

Do not write to the WDT or IWDT registers by the DTC or DMAC while WDT or IWDT is stopped after entering Sleep mode or Snooze mode.

### 10.9.8 Oscillators in Snooze Mode

Oscillators that stop on entering Software Standby mode automatically restart when a trigger for switching to Snooze mode is generated. The MCU does not enter Snooze mode until all the oscillators stabilize. If in Snooze mode, you must disable oscillators that are not required in Snooze mode before entering Software Standby mode. Otherwise, the transition from Software Standby mode to Snooze mode takes longer.

### 10.9.9 Snooze Mode Entry by RXD0 Falling Edge

When the SNZCR.RXDREQEN bit is 1, the falling edge of RXD0 pin is used to switch MCU from Software Standby mode to Snooze mode when using UART of SCI0 in Snooze mode. In this case an interrupt such as SCI0_ERI, SCI0_RXI or an address mismatch event is used as the source for canceling Snooze mode. However, noise on the RXD0 pin might cause the MCU to transfer from Software Standby mode to Snooze mode unexpectedly. In this case if the MCU does not receive RXD0 data after the noise, an interrupt such as SCI0_ERI or SCI0_RXI, or an address mismatch event is not generated and the MCU stays in Snooze mode. This can be avoided by using AGT1 underflow interrupt to return to Software Standby mode or Normal mode unless otherwise UART receive data is completed before AGT1 underflow. However, do not use the AGT1 underflow as a source to return to Software Standby mode during an UART communication. This causes the UART to stop the operation in a half-finished state.

### 10.9.10 Using UART of SCI0 in Snooze Mode

When using UART in Snooze mode, ensure that the snooze request (RXD0 falling edge) does not conflict with the wakeup requests set by the WUPEN register, otherwise UART cannot be guaranteed.

When using UART in Snooze mode, the following conditions must be satisfied:

- The clock source must be HOCO
- MOCO, PLL, and the main clock oscillator must be stopped before entering Software Standby mode
- The RXD0 pin must be kept high before entering Software Standby mode
- A transition to Software Standby mode must not occur during an SCI0 communication
- The MSTPCRC.MSTPC0 bit must be 1 before entering Software Standby mode.

### 10.9.11 Conditions of A/D Conversion Start in Snooze Mode

ADC120 can only be triggered by the ELC in Snooze mode. Do not use software trigger or ADTRGn (n = 0, 1) pin.

### 10.9.12 Conditions of CTSU in Snooze Mode

The CTSU can only be started by the ELC in Snooze mode.

### 10.9.13 ELC Events in Snooze Mode

This section lists available ELC events in Snooze mode. Do not use any other events. If starting peripheral modules for the first time after entering Snooze mode, the Event Link Setting Register (ELSRn) must set a Snooze mode entry event (SYSTEM_SNZREQ) as the trigger.

- Snooze mode entry (SYSTEM_SNZREQ)
- DTC transfer end (DTC_DTCEND)
- ADC120 window A/B compare match (ADC120_WCMPM)
- ADC120 window A/B compare mismatch (ADC120_WCMPUM)
- Data operation circuit interrupt (DOC_DOPCI).

### 10.9.14 Module-Stop Function of A/D Converter

When entering Software Standby mode, it is recommended that you set the ADC120 module-stop state to reduce power consumption. In this case, the ADC120 is available in Snooze mode by releasing the ADC120 module-stop using the DTC. Similarly, set the module-stop state using the DTC before returning to Software Standby mode from Snooze mode.

### 10.9.15 Module-Stop Bit Write Timing

It is possible that access to I/O register may be executed before the corresponding module-stop bit write completed. In this case, access to I/O register may not proceed as intended. To avoid this issue, before accessing I/O register, read back the module-stop bit that was written to confirm that the write completed.

### 10.9.16 Sleep-on-exit Function

There are 2 ways to transition to low power modes. One is WFI instruction and the other is Sleep-on-exit. When Sleep-on-exit is used for transition to low power modes, WFI instruction comments written in User's Manual Hardware is applicable to Sleep-on-exit.

### 10.9.17 Interruption During the Transition to Low Power Modes

If the software meets the applicable condition listed in section 10.9.17.1. Applicable Condition and Notes, you may not be able to enter the intended low power mode and transit to unintended states described in section 10.9.17.1. Applicable Condition and Notes.

If the unintended states described in section 10.9.17.1. Applicable Condition and Notes notes cannot be tolerated, refer to section 10.9.17.2. Workaround.

#### 10.9.17.1 Applicable Condition and Notes

##### (1) Applicable Condition

Transition to Software Standby mode is started by a trigger (WFI instruction or SLEEPONEXIT) with SBYCR.SSBY = 1 set to use Software Standby mode or Snooze mode.

During the specified interval (ICLK 2 cycle) of transitioning to Software Standby mode, one of the following interrupt requests that is not an interrupt source to return from Software Standby mode is accepted by CPU.

1. SysTick interrupt (all of the following are applicable)
   - Exception number 15 of Interrupt vector table
   - Interrupt requests are not masked by Base Priority Mask Register (BASEPRI) (BASEPARI = 0 or BASEPRI > SHPR3.PRI_15)
2. Maskable interrupt requests that are not interrupt source to return from Software Standby mode (all of the following are applicable)
   - By WUPEN in exception numbers 16 to 79 in the interrupt vector table those not permitted to return from Software Standby mode
   - Interrupt requests are enabled by Interrupt Set-Enable Register (NVIC_ISERn)
   - Interrupt requests are not masked by Base Priority Mask Register (BASEPRI) (BASEPARI = 0 or BASEPRI > NVIC_IPRn.PRI_N)
3. Non-maskable interrupt request triggered by the following sources

   SRAM parity error

   SRAM ECC error

   Bus master MPU error

   TrustZone filtering error

### (2) Notes

If the above conditions are met, the MCU will transit to following unintended states. These unintended states can be resolved by a reset or returning to Normal mode with an interrupt request of an interrupt source to return from Software Standby mode.

1. When transitioning to Software Standby mode (SBYCR.SSBY = 1, SNZCR.SNZE = 0)
   Only CPU clock is stopped, and the remaining clocks continue to operate as they were prior to transitioning Software Standby mode.
   - As before the transition to Software Standby mode is started, depending on the setting, timer or other peripherals continue to operate, and an interrupt request related to the peripheral is generated.
   - Because the IWDT and WDT clock-stop function is disabled, a reset or an interrupt for the IWDT and WDT is generated depending on the settings before starting the transition to Software Standby mode.
   - Interrupt requests are held in IR flag (IELSRn, DELSRn).
2. When transitioning to Snooze mode (SBYCR.SSBY = 1, SNZCR.SNZE = 1)
   The transition to Snooze mode is not possible, and the states shown in “1) When transitioning to Software Standby mode” is continued.
   To return to Normal mode by an interrupt source (SELSR0) from Snooze mode depends on whether the interrupt request (SELSR0) to returning from Snooze mode can be generated while DTC operation is disabled.
   If DTC operation is disabled (SNZCR.SNZDTCEN = 0) in Snooze mode, Normal mode can be returned because an interrupt source for the interrupt source (SELSR0) to return from Snooze mode can be generated.
   If DTC operation is enabled (SNZCR.SNZDTCEN = 1) in Snooze mode, the Normal mode cannot be returned because an interrupt request for the interrupt source (SELSR0) to return from Snooze mode cannot be generated.

## 10.9.17.2 Workaround

### (1) Workaround

To avoid the unintended states described above, apply the following before the terms for transition to Software Standby mode or Snooze mode are met: (For the setting procedure, see "Setting Procedure for Transition to Software Standby or Snooze Mode")

1. Disable SysTick interrupt requests.
   Exception number 15 of Interrupt vector table
2. Disable maskable interrupt requests that are not interrupt sources to return from Software Standby mode.
   Exception number 16 to 79 of Interrupt vector table that WUPEN does not allow to return from Software Standby mode.
3. Stop access from the bus master other than the CPU so that the non-maskable interrupt is not triggered by the following sources.

   SRAM parity error

   SRAM ECC error

   Bus master MPU error

   TrustZone filtering error

### (2) Setting Procedure for Transition to Software Standby Mode or Snooze Mode

This section describes procedures for avoiding unintended states.

The handling of interrupt requests after returning from Software Standby mode or Snooze mode varies depending on the method used to disable the maskable interrupt request. Either one or the other should be applied.

- Procedure A: Disable maskable interrupt request acceptance.
  Any interrupt request that occurs while interrupt request acceptance is disabled is discarded.

**Table 10.14 Before transitioning to Software Standby mode or Snooze mode (1 of 2)**

| Step | Description |
|---|---|
| 1 | Stop the bus access from the bus master other than CPU.*1 |

**Table 10.14 Before transitioning to Software Standby mode or Snooze mode (2 of 2)**

| Step | Description |
|---|---|
| 2 | Disable the SysTick interrupt request.*2 |
| 3 | Clear IELSRn in ICU to disable acceptance of maskable interrupt requests that are not interrupt sources to return from Software Standby mode. |
| 4 | Read IELSRn in ICU to confirm that IELSRn in ICU has been cleared. |
| 5 | Transition to Software Standby mode (WFI instruction, SLEEPONEXIT). |

Note 1. SRAM parity error interrupt, SRAM ECC error interrupt, MPU bus master error interrupt, MPU bus slave error interrupt, or TrustZone filter error interrupt is enabled as a non-maskable interrupt.
Note 2. Disabling a SysTick interrupt request may cause SysTick interrupt request to be delayed by one cycle of SysTick timer without generating the latest SysTick interrupt request.

**Table 10.15 After returning from Software Standby mode or Snooze mode**

| Step | Description |
|---|---|
| 1 | Enable the SysTick interrupt request. |
| 2 | Set IELSRn in ICU to enable acceptance of maskable interrupt requests that are not interrupt sources to return from Software Standby mode. |
| 3 | Enable bus access from bus masters other than CPU. |

- Procedure B: Disable the maskable interrupt request
The interrupt request generated while the interrupt request is disabled is retained in IELSRn.IR flag. Therefore, after returning from Software Standby mode or Snooze mode and enabling the maskable interrupt, it is possible to process the interrupt.

**Table 10.16 Before transitioning to Software Standby mode or Snooze mode**

| Step | Description |
|---|---|
| 1 | Stop the bus access from the bus master other than CPU.*1 |
| 2 | Disable the SysTick interrupt request.*2 |
| 3 | Write 1 to the corresponding bit in NVIC_ICERn in CPU to disable maskable interrupt requests that are not interrupt sources to return from Software Standby mode. |
| 4 | Execute Data Synchronization Barrier (DSB) instruction. |
| 5 | Transition Software Standby mode (WFI instruction, SLEEPONEXIT) |

Note 1. SRAM parity error interrupt, SRAM ECC error interrupt, MPU bus master error interrupt, MPU bus slave error interrupt, or TrustZone filter error interrupt is enabled as a non-maskable interrupt.
Note 2. Disabling a SysTick interrupt request may cause SysTick interrupt request to be delayed by one cycle of SysTick timer without generating the latest SysTick interrupt request.

**Table 10.17 After returning from Software Standby mode or Snooze mode**

| Step | Description |
|---|---|
| 1 | Enable the SysTick interrupt request. |
| 2 | Write 1 to the corresponding bit in NVIC_ISERn in CPU to enable maskable interrupt requests that are not interrupt sources to return from Software Standby mode. |
| 3 | Enable bus access from bus masters other than CPU. |

# 11. Register Write Protection

## 11.1 Overview

The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR).

Table 11.1 lists the association between the bits in the PRCR register and the registers to be protected.

**Table 11.1 Association between the bits in the PRCR register and registers to be protected**

| PRCR bit | Register to be protected |
|---|---|
| PRC0 | • Registers related to the clock generation circuit:<br>SCKDIVCR, SCKSCR, MEMWAIT, PLLCCR, PLLCR, MOSCCR, HOCOCR, HOCOCR2, MOCOCR, SOMRG, SLCDSCKCR, CKOCR, OSTDCR, OSTDSR, SOSTDCR, MOCOUTCR, HOCOUTCR, CANFDCKDIVCR, I3CCKDIVCR, USBCKCR, CANFDCKCR, I3CCKCR, MOSCWTCR, MOMCR, SOSCCR, SOMCR, LOCOCR, LOCOUTCR |
| PRC1 | • Registers related to the low power modes:<br>SBYCR, SNZCR, SNZEDCR0, SNZEDCR1, PSMCR, SNZREQCR0, OPCCR, SOPCCR, SYOCDCR, LDOCR, FLSTOP |
| PRC3 | • Registers related to the LVD:<br>LVD1CR1, LVD1SR, LVD2CR1, LVD2SR, LVD1CMPCR, LVD2CMPCR, LVD1CR0, LVD2CR0 |
| PRC4 | • Registers related to the security function:<br>CPUDSAR, RSTSAR, LVDSAR, CGFSAR, LPMSAR, ICUSARx (x = A to H, M), BUSSARx (x = A, B), MMPUSARx (x = A, B), DMACSAR, DTCSAR, ELCSARx (x = A to C), PmSAR (m = 0 to 8), PSAR, SRAMSAR, FSAR, PSARx (x = B to E), MSSAR, TZFSAR |

## 11.2 Register Descriptions

### 11.2.1 PRCR : Protect Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3FE

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | PRKEY[7:0] | | | | | | | | — | — | — | PRC4 | PRC3 | — | PRC1 | PRC0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PRC0 | Enable writing to the registers related to the clock generation circuit<br>0: Disable writes<br>1: Enable writes | R/W |
| 1 | PRC1 | Enable writing to the registers related to the low power modes<br>0: Disable writes<br>1: Enable writes | R/W |
| 2 | — | This bit is read as 0. The write value should be 0. | R/W |
| 3 | PRC3 | Enable writing to the registers related to the LVD<br>0: Disable writes<br>1: Enable writes | R/W |
| 4 | PRC4 | Enables writing to the registers related to the security function<br>0: Disable writes<br>1: Enable writes | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | PRKEY[7:0] | PRC Key Code<br>These bits control the write access to the PRCR register. To modify the PRCR register, write 0xA5 to the upper 8 bits and the target value to the lower 8 bits as a 16-bit unit. | W |

### PRCn bits (Protect bit n) (n = 0, 1, 3, 4)

The PRCn bits enable or disable writing to the protected registers listed in Table 11.1. Setting the PRCn bits to 1 or 0 enables or disables writing, respectively.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR and its controlled registers are continuously written access. Avoid continuous write access or read the PRCR after PRC4 change, and then write access the PRC4-controlled register.

# 12. Interrupt Controller Unit (ICU)

## 12.1 Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.

Table 12.1 lists the ICU specifications, Figure 12.1 shows a block diagram, and Table 12.2 lists the I/O pins.

**Table 12.1 ICU specifications**

| Item | | Description |
|---|---|---|
| Maskable interrupts | Peripheral function interrupts | • Interrupts from peripheral modules<br>Number of sources: 196 (select factor within event list numbers 32 to 511) |
| | External pin interrupts | • Interrupt detection on low level*4, falling edge, rising edge, rising and falling edges. One of these detection methods can be set for each source<br>• Digital filter function supported<br>• 16 sources, with interrupts from IRQi (i = 0 to 15) pins. |
| | Interrupt requests to CPU (NVIC) | • 64 interrupt requests are output to NVIC. |
| | DMAC control | • The DMAC can be activated using interrupt sources*1<br>• The target interrupt source can be selected individually for every DMAC channels. |
| | DTC control | • The DTC can be activated using interrupt sources*1<br>• The method for selecting an interrupt source is the same as that of the interrupt request to NVIC. |
| Non-maskable interrupts*2 | NMI pin interrupt | • Interrupt from the NMI pin<br>• Interrupt detection on falling edge or rising edge<br>• Digital filter function supported |
| | WDT underflow/refresh error*3 | Interrupt on an underflow of the down-counter or occurrence of a refresh error |
| | IWDT underflow/refresh error*3 | Interrupt on an underflow of the down-counter or occurrence of a refresh error |
| | Low voltage detection 1*3 | Voltage monitor 1 interrupt of the voltage monitor 1 circuit (LVD_LVD1) |
| | Low voltage detection 2*3 | Voltage monitor 2 interrupt of the voltage monitor 2 circuit (LVD_LVD2) |
| | RPEST*5 | Interrupt on SRAM parity error |
| | RECCST*5 | Interrupt on SRAM ECC error |
| | TZFST*5 | Interrupt on TrustZone Filter error |
| | Oscillation stop detection interrupt*3 | Interrupt on detecting that the main oscillation has stopped |
| | Bus master MPU error*5 | Interrupt on bus master MPU error |
| | CPEST*5 | Cache RAM parity error |
| Low power modes | | • Sleep mode: return is initiated by non-maskable interrupts or any other interrupt source<br>• Software Standby mode: return is initiated by non-maskable interrupts. Interrupt can be selected in the WUPEN register.<br>• Snooze mode: return is initiated by non-maskable interrupts. Interrupt can be selected in the SELSR0 and WUPEN registers.<br>See section 12.2.17. SELSR0 : SYS Event Link Setting Register and section 12.2.18. WUPEN0 : Wake Up Interrupt Enable Register 0, section 12.2.19. WUPEN1 : Wake Up Interrupt Enable Register 1, section 12.2.20. WUPEN2 : Wake Up Interrupt Enable Register 2. |
| TrustZone Filter | | Available |

Note 1. For the DMAC and DTC activation sources, see Table 12.4.
Note 2. Non-maskable interrupts can be enabled only once after a reset release.
Note 3. These non-maskable interrupts can also be used as maskable interrupts. When used as maskable interrupts, do not change the value of the NMIER register from the reset state. To enable voltage monitor 1 and voltage monitor 2 interrupts, set the LVD1CR1.IRQSEL and LVD2CR1.IRQSEL bits to 1.
Note 4. Low level: interrupt detection is not canceled if you do not clear it after a detection.

Note 5. These non-maskable interrupt sources cannot be recovered if the request source clock is stopped during low power mode.

Figure 12.1 shows the ICU block diagram.

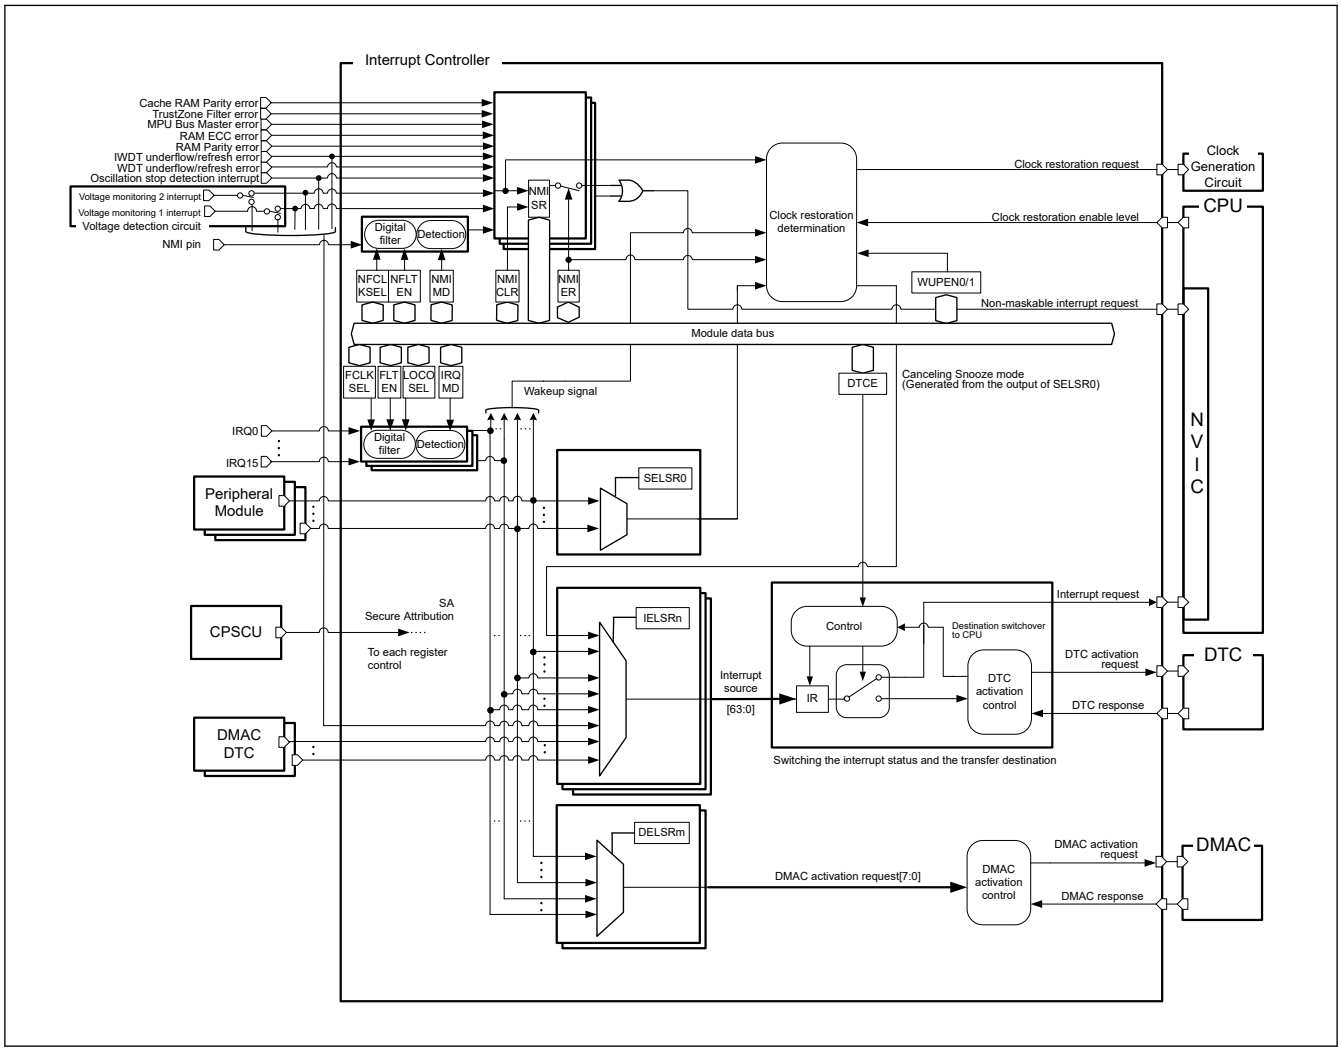

**Figure 12.1 ICU block diagram**

Table 12.2 lists the ICU input/output pins.

**Table 12.2 ICU I/O pins**

| Pin name | I/O | Description |
|---|---|---|
| NMI | Input | Non-maskable interrupt request pin |
| IRQi (i = 0 to 15) | Input | External interrupt request pins |

## 12.2 Register Descriptions

This chapter does not describe the Arm® NVIC internal registers. For information about these registers, see ARM Limited., ARM® Cortex®-M33 Processor Technical Reference Manual (ARM 100230).

## 12.2.1 ICUSARA : Interrupt Controller Unit Security Attribution Register A

Base address: CPSCU = 0x4000_8000

Offset address: 0x40

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | SAIRQ CR15 | SAIRQ CR14 | SAIRQ CR13 | SAIRQ CR12 | SAIRQ CR11 | SAIRQ CR10 | SAIRQ CR9 | SAIRQ CR8 | SAIRQ CR7 | SAIRQ CR6 | SAIRQ CR5 | SAIRQ CR4 | SAIRQ CR3 | SAIRQ CR2 | SAIRQ CR1 | SAIRQ CR0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | SAIRQCR15 to SAIRQCR0 | Security attributes of registers for the IRQCRn register<br>0: Secure<br>1: Non-secure | R/W |
| 31:16 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

### SAIRQCRn bits (Security attributes of registers for the IRQCRn register)

The target registers are as follows:

- IRQCR0 to IRQCR15 registers
- WUPEN0.IRQWUPEN[15:0] bits

## 12.2.2 ICUSARB : Interrupt Controller Unit Security Attribution Register B

Base address: CPSCU = 0x4000_8000

Offset address: 0x44

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SANMI |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SANMI | Security attributes of registers for nonmaskable interrupt<br>0: Secure<br>1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

### SANMI bit (Security attributes of registers for nonmaskable interrupt)

Security attributes of registers for non-maskable interrupt. The target registers are as follows:

- NMIER

- NMICLR
- NMICR

The value of AIRCR.BFHFNMINS bit [13] in Application Interrupt and Reset Control Register of ARM CPU should be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINS and the SANMI bits are different. AIRCR.BFHFNMINS is secure and SANMI is non-secure. Polarity has the same meaning so program these to match.

Note: Only one of Secure and Non-secure can set security attribution for non-maskable interrupt-related registers. If you program the Secure attribute as secure, it always goes to the Secure interrupt handler. To release any of the non-maskable interrupt sources to the non-secure user, write a function to execute a nonsecure program from the interrupt handler for Secure.

## 12.2.3 ICUSARC : Interrupt Controller Unit Security Attribution Register C

Base address: CPSCU = 0x4000_8000

Offset address: 0x48

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | SADMAC7 | SADMAC6 | SADMAC5 | SADMAC4 | SADMAC3 | SADMAC2 | SADMAC1 | SADMAC0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | SADMAC7 to SADMAC0 | Security attributes of registers for DMAC channel<br>0: Secure<br>1: Non-secure | R/W |
| 31:8 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

### SADMACn bits (Security attributes of registers for DMAC channel)

Security attributes of registers for DMAC channel. This register is referred to as the security attribute of the ICU and DMAC registers.

The controlled ICU register is:

- DELSRn

The controlled DMAC registers are:

- DMACn.DMSAR
- DMACn.DMSRR
- DMACn.DMDAR
- DMACn.DMDRR
- DMACn.DMCRA
- DMACn.DMCRB
- DMACn.DMTMD
- DMACn.DMINT
- DMACn.DMAMD
- DMACn.DMOFR

- DMACn.DMCNT
- DMACn.DMREQ
- DMACn.DMSTS
- DMACn.DMSBS
- DMACn.DMDBS
- DMACn.DMBWR

For details on DMAC registers, see section 15, DMA Controller (DMAC).

## 12.2.4 ICUSARD : Interrupt Controller Unit Security Attribution Register D

Base address: CPSCU = 0x4000_8000

Offset address: 0x4C

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SASELSR0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SASELSR0 | Security attributes of registers for SELSR0<br>0: Secure<br>1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

## 12.2.5 ICUSARE : Interrupt Controller Unit Security Attribution Register E

Base address: CPSCU = 0x4000_8000

Offset address: 0x50

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | SAIIC0WUP | SAAGT1CBWUP | SAAGT1CAWUP | SAAGT1UDWUP | SAUSBFS0WUP | — | SARTCPRDWUP | SARTCALMWUP | SAACMPLP0WUP | — | — | — | SALVD2WUP | SALVD1WUP | — | SAIWDTWUP |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | — | These bits are read as 1. The write value should be 1. | R/W |
| 16 | SAIWDTWUP | Security attributes of registers for WUPEN0.b16<br>0: Secure<br>1: Non-secure | R/W |
| 17 | — | This bit is read as 1. The write value should be 1. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 18 | SALVD1WUP | Security attributes of registers for WUPEN0.b18<br>0: Secure<br>1: Non-secure | R/W |
| 19 | SALVD2WUP | Security attributes of registers for WUPEN0.b19<br>0: Secure<br>1: Non-secure | R/W |
| 22:20 | — | These bits are read as 1. The write value should be 1. | R/W |
| 23 | SAACMPLP0WUP | Security attributes of registers for WUPEN0.b23<br>0: Secure<br>1: Non-secure | R/W |
| 24 | SARTCALMWUP | Security attributes of registers for WUPEN0.b24<br>0: Secure<br>1: Non-secure | R/W |
| 25 | SARTCPRDWUP | Security attributes of registers for WUPEN0.b25<br>0: Secure<br>1: Non-secure | R/W |
| 26 | — | This bit is read as 1. The write value should be 1. | R/W |
| 27 | SAUSBFS0WUP | Security attributes of registers for WUPEN0.b27<br>0: Secure<br>1: Non-secure | R/W |
| 28 | SAAGT1UDWUP | Security attributes of registers for WUPEN0.b28<br>0: Secure<br>1: Non-secure | R/W |
| 29 | SAAGT1CAWUP | Security attributes of registers for WUPEN0.b29<br>0: Secure<br>1: Non-secure | R/W |
| 30 | SAAGT1CBWUP | Security attributes of registers for WUPEN0.b30<br>0: Secure<br>1: Non-secure | R/W |
| 31 | SAIIC0WUP | Security attributes of registers for WUPEN0.b31<br>0: Secure<br>1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

## 12.2.6 ICUSARF : Interrupt Controller Unit Security Attribution Register F

Base address: CPSCU = 0x4000_8000

Offset address: 0x54

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | SAI3CWUP | — | — | — | SASOSCWUP | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6:0 | — | These bits are read as 1. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7 | SASOSCWUP | Security attributes of registers for WUPEN1.b7<br>0: Secure<br>1: Non-secure | R/W |
| 10:8 | — | These bits are read as 1. | R/W |
| 11 | SAI3CWUP | Security attributes of registers for WUPEN1.b11<br>0: Secure<br>1: Non-secure | R/W |
| 31:12 | — | These bits are read as 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

## 12.2.7 ICUSARG : Interrupt Controller Unit Security Attribution Register G

Base address: CPSCU = 0x4000_8000

Offset address: 0x70

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | SAIELSR31 | SAIELSR30 | SAIELSR29 | SAIELSR28 | SAIELSR27 | SAIELSR26 | SAIELSR25 | SAIELSR24 | SAIELSR23 | SAIELSR22 | SAIELSR21 | SAIELSR20 | SAIELSR19 | SAIELSR18 | SAIELSR17 | SAIELSR16 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | SAIELSR15 | SAIELSR14 | SAIELSR13 | SAIELSR12 | SAIELSR11 | SAIELSR10 | SAIELSR9 | SAIELSR8 | SAIELSR7 | SAIELSR6 | SAIELSR5 | SAIELSR4 | SAIELSR3 | SAIELSR2 | SAIELSR1 | SAIELSR0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | SAIELSR31 to SAIELSR0 | Security attributes of registers for IELSR31 to IELSR0<br>0: Secure<br>1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

### SAIELSRn bits (Security attributes of registers for IELSR31 to IELSR0)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn (n = 0 to 31). NVIC internal registers are in NVIC_ITNS0[31:0]. The initial values of NVIC_ITNS0 and ICUSARG are different. NVIC_ITNS0 is secure and ICUSARG is non-secure. Polarity has the same meaning so program these to match.

## 12.2.8 ICUSARH : Interrupt Controller Unit Security Attribution Register H

Base address: CPSCU = 0x4000_8000

Offset address: 0x74

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | SAIELSR63 | SAIELSR62 | SAIELSR61 | SAIELSR60 | SAIELSR59 | SAIELSR58 | SAIELSR57 | SAIELSR56 | SAIELSR55 | SAIELSR54 | SAIELSR53 | SAIELSR52 | SAIELSR51 | SAIELSR50 | SAIELSR49 | SAIELSR48 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | SAIELSR47 | SAIELSR46 | SAIELSR45 | SAIELSR44 | SAIELSR43 | SAIELSR42 | SAIELSR41 | SAIELSR40 | SAIELSR39 | SAIELSR38 | SAIELSR37 | SAIELSR36 | SAIELSR35 | SAIELSR34 | SAIELSR33 | SAIELSR32 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | SAIELSR63 to SAIELSR32 | Security attributes of registers for IELSR63 to IELSR32<br>0: Secure<br>1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

**SAIELSRn bits (Security attributes of registers for IELSR63 to IELSR32)**

The Secure Attribute managed within the ARM CPU NVIC must match the security attribution of IELSEn (n = 32 to 63). NVIC internal registers are in NVIC_ITNS1[31:0]. The initial values of NVIC_ITNS1 and ICUSARH are different. NVIC_ITNS1 is secure and ICUSARH is non-secure. Polarity has the same meaning so program these to match.

## 12.2.9 ICUSARM : Interrupt Controller Unit Security Attribution Register M

Base address: CPSCU = 0x4000_8000

Offset address: 0x58

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 1 | SAINTURE0WUP | Security attributes of registers for WUPEN2.b1<br>0: Secure<br>1: Non-secure | R/W |
| 2 | SAINTUR1WUP | Security attributes of registers for WUPEN2.b2<br>0: Secure<br>1: Non-secure | R/W |
| 3 | SAINTURE1WUP | Security attributes of registers for WUPEN2.b3<br>0: Secure<br>1: Non-secure | R/W |
| 31:4 | — | These bits are read as 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

## 12.2.10 IRQCRi : IRQ Control Register i (i = 0 to 15)

Base address: ICU = 0x4000_6000

Offset address: 0x000 + 0x1 × i

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | FLTEN | — | FCLKSEL[1:0] | | LOCOSEL | — | IRQMD[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | IRQMD[1:0] | IRQi Detection Sense Select<br>0 0: Falling edge<br>0 1: Rising edge<br>1 0: Rising and falling edges<br>1 1: Low level | R/W |
| 2 | — | This bit is read as 0. The write value should be 0. | R/W |
| 3 | LOCOSEL | IRQi Digital Filter Sampling LOCO Clock Select<br>0: LOCO not selected<br>1: LOCO selected | R/W |
| 5:4 | FCLKSEL[1:0] | IRQi Digital Filter Sampling Clock Select<br>0 0: PCLKB<br>0 1: PCLKB/8<br>1 0: PCLKB/32<br>1 1: PCLKB/64 | R/W |
| 6 | — | This bit is read as 0. The write value should be 0. | R/W |
| 7 | FLTEN | IRQi Digital Filter Enable<br>0: Digital filter disabled<br>1: Digital filter enabled | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The IRQCRi register changes must satisfy the following conditions:

- For a CPU interrupt or DTC trigger:
  Change the IRQCRi register value before setting the target IELSRn register (n = 0 to 63).
  The register value should be changed only when the value of the target IELSRn register is 0x0000.
- For a DMAC trigger:
  Change the IRQCRi register value before setting the target DELSRn register (n = 0 to 7).
  The register value should be changed only when the value of the target DELSRn register is 0x0000.
- For a wakeup enable signal:
  Change the IRQCRi register setting before setting the target WUPEN0.IRQWUPEN[n] (n = 0 to 15). The register value should be changed when the target WUPEN0.IRQWUPEN[n] is 0.

### IRQMD[1:0] bits (IRQi Detection Sense Select)

The IRQMD[1:0] bits set the detection sensing method for the IRQi external pin interrupt sources. For setting method when using external pin interrupt, see section 12.5.6. External Pin Interrupts.

### LOCOSEL bit (IRQi Digital Filter Sampling LOCO Clock Select)

The LOCOSEL bit selects the digital filter sampling clock for the IRQi external pin interrupt request pins, selectable to LOCO (LOCO cycle).

When LOCO is selected for the digital filter sampling clock, the setting of FCLKSEL[1:0] bits is invalid.

### FCLKSEL[1:0] bits (IRQi Digital Filter Sampling Clock Select)

The FCLKSEL[1:0] bits select the digital filter sampling clock for the IRQi external pin interrupt request pins, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see section 12.5.5. Digital Filter.

### FLTEN bit (IRQi Digital Filter Enable)

The FLTEN bit enables the digital filter used for the IRQi external pin interrupt sources. The digital filter is enabled when the IRQCRi.FLTEN bit is 1 and disabled when the IRQCRi.FLTEN bit is 0. The IRQi pin level is sampled at the clock cycle specified in the IRQCRi.FCLKSEL[1:0] bits and IRQCRi.LOCOSEL bit. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see section 12.5.5. Digital Filter.

## 12.2.11 NMISR : Non-Maskable Interrupt Status Register

Base address: ICU = 0x4000_6000

Offset address: 0x140

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | CPEST | — | TZFST | — | BUSMST | — | RECCST | RPEST | NMIST | OSTST | — | — | LVD2ST | LVD1ST | WDTST | IWDTST |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | IWDTST | IWDT Underflow/Refresh Error Interrupt Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |
| 1 | WDTST | WDT Underflow/Refresh Error Interrupt Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |
| 2 | LVD1ST | Voltage Monitor 1 Interrupt Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |
| 3 | LVD2ST | Voltage Monitor 2 Interrupt Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |
| 5:4 | — | These bits are read as 0. | R |
| 6 | OSTST | Main Clock Oscillation Stop Detection Interrupt Status Flag<br>0: Interrupt not requested for main clock oscillation stop<br>1: Interrupt requested for main clock oscillation stop | R |
| 7 | NMIST | NMI Pin Interrupt Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |
| 8 | RPEST | SRAM Parity Error Interrupt Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |
| 9 | RECCST | SRAM ECC Error Interrupt Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |
| 10 | — | This bit is read as 0. | R |
| 11 | BUSMST | Bus Master MPU Error Interrupt Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |
| 12 | — | This bit is read as 0. | R |
| 13 | TZFST | TrustZone Filter Error Interrupt Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |
| 14 | — | This bit is read as 0. | R |
| 15 | CPEST | Cache RAM Parity Error Status Flag<br>0: Interrupt not requested<br>1: Interrupt requested | R |

The NMISR register monitors the status of non-maskable interrupt sources. Writes to the NMISR register are ignored. The setting in the Non-Maskable Interrupt Enable Register (NMIER) does not affect the status flags in this register. Before the end of the non-maskable interrupt handler, check that all of the bits in this register are set to 0 to confirm that no other NMI requests are generated during handler processing.

#### IWDTST flag (IWDT Underflow/Refresh Error Interrupt Status Flag)

The IWDTST flag indicates an IWDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.IWDTCLR bit.

[Setting condition]

When the IWDT underflow/refresh error interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.IWDTCLR bit.

#### WDTST flag (WDT Underflow/Refresh Error Interrupt Status Flag)

The WDTST flag indicates a WDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.WDTCLR bit.

[Setting condition]

When the WDT underflow/refresh error interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.WDTCLR bit.

#### LVD1ST flag (Voltage Monitor 1 Interrupt Status Flag)

The LVD1ST flag indicates a request for voltage monitor 1 interrupt. It is read-only and cleared by the NMICLR.LVD1CLR bit.

[Setting condition]

When the voltage monitor 1 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.LVD1CLR bit.

#### LVD2ST flag (Voltage Monitor 2 Interrupt Status Flag)

The LVD2ST flag indicates a request for voltage monitor 2 interrupt. It is read-only and cleared by the NMICLR.LVD2CLR bit.

[Setting condition]

When the voltage monitor 2 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.LVD2CLR bit.

#### OSTST flag (Main Clock Oscillation Stop Detection Interrupt Status Flag)

The OSTST flag indicates a main clock oscillation stop detection interrupt request. It is read-only and cleared by the NMICLR.OSTCLR bit.

[Setting condition]

When the main clock oscillation stop detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.OSTCLR bit.

#### NMIST flag (NMI Pin Interrupt Status Flag)

The NMIST flag indicates an NMI pin interrupt request. It is read-only and cleared by the NMICLR.NMICLR bit.

[Setting condition]

When an edge specified by the NMICR.NMIMD bit is input to the NMI pin.

[Clearing condition]

When 1 is written to the NMICLR.NMICLR bit.

**RPEST flag (SRAM Parity Error Interrupt Status Flag)**

The RPEST flag indicates an SRAM parity error interrupt request.

[Setting condition]

When an interrupt is generated in response to an SRAM parity error.

[Clearing condition]

When 1 is written to the NMICLR.RPECLR bit.

**RECCST flag (SRAM ECC Error Interrupt Status Flag)**

The RECCST flag indicates an SRAM ECC error interrupt request.

[Setting condition]

When an interrupt is generated in response to an SRAM ECC error.

[Clearing condition]

When 1 is written to the NMICLR.RECCCLR bit.

**BUSMST flag (Bus Master MPU Error Interrupt Status Flag)**

The BUSMST flag indicates a bus master error interrupt request.

[Setting condition]

When an interrupt is generated in response to a bus master error.

[Clearing condition]

When 1 is written to the NMICLR.BUSMCLR bit.

**TZFST flag (TrustZone Filter Error Interrupt Status Flag)**

This flag indicates the TrustZone Filter error interrupt request.

[Setting condition]

When an interrupt is generated in response to a TrustZone Filter error.

[Clearing condition]

When 1 is written to the NMICLR.TZFCLR bit.

**CPEST flag (Cache RAM Parity Error Status Flag)**

This flag indicates the cache RAM parity error interrupt request.

[Setting condition]

When an interrupt is generated in response to a cache RAM parity error.

[Clearing condition]

When 1 is written to the NMICLR.CPECLR bit.

## 12.2.12 NMIER : Non-Maskable Interrupt Enable Register

Base address: ICU = 0x4000_6000

Offset address: 0x120

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | CPEEN | — | TZFEN | — | BUSMEN | — | RECCEN | RPEEN | NMIEN | OSTEN | — | — | LVD2EN | LVD1EN | WDTEN | IWDTEN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | IWDTEN | IWDT Underflow/Refresh Error Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 *2 |
| 1 | WDTEN | WDT Underflow/Refresh Error Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 *2 |
| 2 | LVD1EN | Voltage monitor 1 Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 *2 |
| 3 | LVD2EN | Voltage monitor 2 Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 *2 |
| 5:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | OSTEN | Main Clock Oscillation Stop Detection Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 *2 |
| 7 | NMIEN | NMI Pin Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 |
| 8 | RPEEN | SRAM Parity Error Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 |
| 9 | RECCEN | SRAM ECC Error Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 |
| 10 | — | This bit is read as 0. The write value should be 0. | R/W |
| 11 | BUSMEN | Bus Master MPU Error Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 |
| 12 | — | This bit is read as 0. The write value should be 0. | R/W |
| 13 | TZFEN | TrustZone Filter Error Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W*1 |
| 14 | — | This bit is read as 0. The write value should be 0. | R/W |
| 15 | CPEEN | Cache RAM Parity Error Interrupt Enable<br>0: Disabled<br>1: Enabled | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. You can write 1 to this bit only once after reset. Subsequent write accesses are invalid. Writing 0 to this bit is invalid.
Note 2. Do not write 1 to this bit when the source is used as an event signal.

### IWDTEN bit (IWDT Underflow/Refresh Error Interrupt Enable)

The IWDTEN bit enables IWDT underflow/refresh error interrupt as an NMI trigger.

### WDTEN bit (WDT Underflow/Refresh Error Interrupt Enable)

The WDTEN bit enables WDT underflow/refresh error interrupt as an NMI trigger.

### LVD1EN bit (Voltage monitor 1 Interrupt Enable)

The LVD1EN bit enables voltage monitor 1 interrupt as an NMI trigger.

### LVD2EN bit (Voltage monitor 2 Interrupt Enable)

The LVD2EN bit enables voltage monitor 2 interrupt as an NMI trigger.

### OSTEN bit (Main Clock Oscillation Stop Detection Interrupt Enable)

The OSTEN bit enables main clock oscillation stop detection interrupt as an NMI trigger.

### NMIEN bit (NMI Pin Interrupt Enable)

The NMIEN bit enables NMI pin interrupt as an NMI trigger.

### RPEEN bit (SRAM Parity Error Interrupt Enable)

The RPEEN bit enables SRAM parity error interrupt as an NMI trigger.

### RECCEN bit (SRAM ECC Error Interrupt Enable)

The RECCEN bit enables SRAM ECC error interrupt as an NMI trigger.

### BUSMEN bit (Bus Master MPU Error Interrupt Enable)

The BUSMEN bit enables bus master error interrupt as an NMI trigger.

### TZFEN bit (TrustZone Filter Error Interrupt Enable)

TZFEN bit enables the TrustZone Filter error interrupt as an NMI trigger.

### CPEEN bit (Cache RAM Parity Error Interrupt Enable)

CPEEN bit enables the Cache RAM parity error interrupt as an NMI trigger.

## 12.2.13 NMICLR : Non-Maskable Interrupt Status Clear Register

Base address: ICU = 0x4000_6000

Offset address: 0x130

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | CPECLR | — | TZFCLR | — | BUSMCLR | — | RECCCLR | RPECLR | NMICLR | OSTCLR | — | — | LVD2CLR | LVD1CLR | WDTCLR | IWDTCLR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | IWDTCLR | IWDT Underflow/Refresh Error Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.IWDTST flag | R/W*1 |
| 1 | WDTCLR | WDT Underflow/Refresh Error Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.WDTST flag | R/W*1 |
| 2 | LVD1CLR | Voltage Monitor 1 Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.LVD1ST flag | R/W*1 |
| 3 | LVD2CLR | Voltage Monitor 2 Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.LVD2ST flag. | R/W*1 |
| 5:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | OSTCLR | Oscillation Stop Detection Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.OSTST flag | R/W*1 |
| 7 | NMICLR | NMI Pin Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.NMIST flag | R/W*1 |
| 8 | RPECLR | SRAM Parity Error Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.RPEST flag | R/W*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 9 | RECCCLR | SRAM ECC Error Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.RECCST flag | R/W*1 |
| 10 | — | This bit is read as 0. The write value should be 0. | R/W |
| 11 | BUSMCLR | Bus Master MPU Error Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.BUSMST flag | R/W*1 |
| 12 | — | This bit is read as 0. The write value should be 0. | R/W |
| 13 | TZFCLR | TrustZone Filter Error Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.TZFST flag | R/W*1 |
| 14 | — | This bit is read as 0. The write value should be 0. | R/W |
| 15 | CPECLR | Cache RAM Parity Error Interrupt Status Flag Clear<br>0: No effect<br>1: Clear the NMISR.CPEST flag | R/W*1 |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only write 1 to this bit.

**IWDTCLR bit (IWDT Underflow/Refresh Error Interrupt Status Flag Clear)**

Writing 1 to the IWDTCLR bit clears the NMISR.IWDTST flag. This bit is read as 0.

**WDTCLR bit (WDT Underflow/Refresh Error Interrupt Status Flag Clear)**

Writing 1 to the WDTCLR bit clears the NMISR.WDTST flag. This bit is read as 0.

**LVD1CLR bit (Voltage Monitor 1 Interrupt Status Flag Clear)**

Writing 1 to the LVD1CLR bit clears the NMISR.LVD1ST flag. This bit is read as 0.

**LVD2CLR bit (Voltage Monitor 2 Interrupt Status Flag Clear)**

Writing 1 to the LVD2CLR bit clears the NMISR.LVD2ST flag. This bit is read as 0.

**OSTCLR bit (Oscillation Stop Detection Interrupt Status Flag Clear)**

Writing 1 to the OSTCLR bit clears the NMISR.OSTST flag. This bit is read as 0.

**NMICLR bit (NMI Pin Interrupt Status Flag Clear)**

Writing 1 to the NMICLR bit clears the NMISR.NMIST flag. This bit is read as 0.

**RPECLR bit (SRAM Parity Error Interrupt Status Flag Clear)**

Writing 1 to the RPECLR bit clears the NMISR.RPEST flag. This bit is read as 0.

**RECCCLR bit (SRAM ECC Error Interrupt Status Flag Clear)**

Writing 1 to the RECCCLR bit clears the NMISR.RECCST flag. This bit is read as 0.

**BUSMCLR bit (Bus Master MPU Error Interrupt Status Flag Clear)**

Writing 1 to the BUSMCLR bit clears the NMISR.BUSMST flag. This bit is read as 0.

**TZFCLR bit (TrustZone Filter Error Interrupt Status Flag Clear)**

Writing 1 to the TZFCLR bit clears the NMISR.TZFST flag. This bit is read as 0.

**CPECLR bit (Cache RAM Parity Error Interrupt Status Flag Clear)**

Writing 1 to the CPECLR bit clears the NMISR.CPEST flag. This bit is read as 0.

## 12.2.14 NMICR : NMI Pin Interrupt Control Register

Base address: ICU = 0x4000_6000

Offset address: 0x100

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | NFLTEN | — | NFCLKSEL[1:0] | | — | — | — | NMIMD |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | NMIMD | NMI Detection Set<br>0: Falling edge<br>1: Rising edge | R/W |
| 3:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 5:4 | NFCLKSEL[1:0] | NMI Digital Filter Sampling Clock Select<br>0 0: PCLKB<br>0 1: PCLKB/8<br>1 0: PCLKB/32<br>1 1: PCLKB/64 | R/W |
| 6 | — | This bit is read as 0. The write value should be 0. | R/W |
| 7 | NFLTEN | NMI Digital Filter Enable<br>0: Disabled<br>1: Enabled | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Change the NMICR register settings before enabling NMI pin interrupts, that is, before setting NMIER.NMIEN to 1.

### NMIMD bit (NMI Detection Set)

The NMIMD bit selects the detection sensing method for the NMI pin interrupts.

### NFCLKSEL[1:0] bits (NMI Digital Filter Sampling Clock Select)

The NFCLKSEL[1:0] bits select the digital filter sampling clock for the NMI pin interrupts, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see section 12.5.5. Digital Filter.

### NFLTEN bit (NMI Digital Filter Enable)

The NFLTEN bit enables the digital filter used for NMI pin interrupts. The filter is enabled when NFLTEN is 1, and disabled when NFLTEN is 0. The NMI pin level is sampled at the clock cycle specified in NFCLKSEL[1:0]. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see section 12.5.5. Digital Filter.

## 12.2.15 IELSRn : ICU Event Link Setting Register n (n = 0 to 63)

Base address: ICU = 0x4000_6000

Offset address: 0x300 + 0x4 × n

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | IELS[8:0] | ICU Event Link Select<br>0x00: Disable interrupts to the associated NVIC or DTC module<br>Others: Event signal number to be linked. For details, see section 12.3.2. Event Number. | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | IR | Interrupt Status Flag<br>0: No interrupt request generated.<br>1: An interrupt request is generated. | R/W*1 |
| 23:17 | — | These bits are read as 0. The write value should be 0. | R/W |
| 24 | DTCE | DTC Activation Enable<br>0: DTC activation is disabled.<br>1: DTC activation is enabled. | R/W |
| 31:25 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: This register requires halfword or word access.

Note 1. Writing 1 to the IR flag is prohibited.

The IELSRn register selects the IRQi source used by the NVIC. For details, see Table 12.3. IELSRn corresponds to the NVIC IRQ input source number, where n = 0 to 63.

### IELS[8:0] bits (ICU Event Link Select)

The IELS[8:0] bits link an event signal to the associated NVIC or DTC module. Event options are classified into 8 groups (groups 0 to 7). For details, see Table 12.3 and Table 12.4.

### IR flag (Interrupt Status Flag)

The IR status flag indicates an individual interrupt request from the event specified in IELS[8:0].

[Setting condition]

When an interrupt request is received from the associated peripheral module or IRQi pin.

[Clearing condition]

- The IR flag is cleared to 0 by writing 0.
- When DTC.DISEL = 0, at the time other than the final transfer end in DTC transfer while DTCE = 1, the IR flag is again set and cleared by Hardware.
- When DTC.DISEL = 1, for DTC transfers while DTCE = 1, the hardware does not clear the IR flag. The flag is cleared by the CPU writing 0.

When DTC transfer except the last transfer is completed (DTCE bit is changed from 1 to 0).

During DTCE = 1, write 0 to IR register is prohibited.

For level detection, clearing of the IR flag should follow the steps below.

1. Negate the input interrupt signal.
2. Read access the peripheral once and wait for 2 clock cycles of the target module clock.
3. Clear the IR flag by writing 0.

### DTCE bit (DTC Activation Enable)

When the DTCE bit is set to 1, the associated event is selected as the source for DTC activation.

[Setting condition]

- When 1 is written to the DTCE bit.

[Clearing condition]

- When the specified number of transfers is complete. For chain transfers, when the specified number of transfers for the last chain transfer is complete.
- When 0 is written to the DTCE bit.

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 63). IELSRn that is not the target is not cleared.

Note: DTC transfer error in Snooze mode

When an error occurs in DTC transfer in Snooze mode, ICU issues a wakeup request. However, interrupt requests are not issued automatically. See section 16, Data Transfer Controller (DTC) for how to set the interrupt when a DTC error occurs.

## 12.2.16 DELSRn : DMAC Event Link Setting Register n (n = 0 to 7)

Base address: ICU = 0x4000_6000

Offset address: 0x280 + 0x4 × n

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | IR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | DELS[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | DELS[8:0] | DMAC Event Link Select<br>0x00: Disable interrupts to the associated DMAC module.<br>Others: Event signal number to be linked. For details, see Table 12.4. | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | IR | DMAC Activation Request Status Flag<br>0: No DMAC activation request occurred.<br>1: DMAC activation request occurred. | R/W*1 |
| 31:17 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: This register requires halfword or word access.

Note 1. Writing 1 to the IR flag is prohibited.

### DELS[8:0] bit (DMAC Event Link Select)

The DELS[8:0] bits link an event signal to the associated DMAC module. Do not set the same event number in multiple DELSRn registers.

### IR flag (DMAC Activation Request Status Flag)

The IR flag is the status flag of a DMAC activation request. This flag is associated with the DELS[8:0] bits of this register.

[Setting condition]

- The flag is set to 1 when a DMAC activation request is generated from the associated peripheral module or IRQi pin.

[Clearing conditions]

- When 0 is written to the IR flag.
- At the start of a DMA transfer after the DMAC activation request is issued.

Note: The IR flag is automatically cleared after completion of a DMA transfer. Therefore, do not write 0 unless an abort occurs. When 0 is written, DMA transfer operation cannot be guaranteed.

Note: Error during DMAC transfer

If an error response occurs during a DMAC transfer, the DMAC notifies the ICU that an error has occurred.

The ICU clears all bits of the target channel of DELSRn (n = 0 to 7). DELSRn that is not the target channel is not cleared.

## 12.2.17 SELSR0 : SYS Event Link Setting Register

Base address: ICU = 0x4000_6000

Offset address: 0x200

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | SELS[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | SELS[8:0] | SYS Event Link Select<br>0x00: Disable event output to the associated low-power mode module<br>Others: Event signal number to be linked. For details, see Table 12.4. | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The SELSR0 register selects the events that wake up the CPU from Snooze mode. You can use only the events listed in Table 12.4 checked as “Canceling Snooze mode”. When ICU_SNZCANCEL is selected in the IELSRn.IELS[8:0] bits, an interrupt is generated that cancels snooze mode.

**Caution: For security attribution added to parts related to a series of actions, make sure to match all security attribution so that security holes cannot be created.**

**About security attribution to be matched**

- **Event source to be set to SELSR0.**
- **SELSR0**
- **IELSRn (n = 0 to 63) to receive event No. 45 (ICU_SNZCANCEL)**
- **NVIC internal registers in the CPU of the interrupt specified in the previous item**
- **Interrupt Handler.**

## 12.2.18 WUPEN0 : Wake Up Interrupt Enable Register 0

Base address: ICU = 0x4000_6000

Offset address: 0x1A0

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 29 | AGT1CAWUPEN | AGT1 Compare Match A Interrupt Software Standby/Snooze Mode Returns Enable Bit<br>0: Software Standby/Snooze Mode returns by AGT1 compare match A interrupt disabled<br>1: Software Standby/Snooze Mode returns by AGT1 compare match A interrupt enabled | R/W |
| 30 | AGT1CBWUPEN | AGT1 Compare Match B Interrupt Software Standby/Snooze Mode Returns Enable Bit<br>0: Software Standby/Snooze Mode returns by AGT1 compare match B interrupt disabled<br>1: Software Standby/Snooze Mode returns by AGT1 compare match B interrupt enabled | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31 | IIC0WUPEN | IIC0 Address Match Interrupt Software Standby/Snooze Mode Returns Enable Bit<br>0: Software Standby/Snooze Mode returns by IIC0 address match interrupt disabled<br>1: Software Standby/Snooze Mode returns by IIC0 address match interrupt enabled | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: The security attribution of this register is set for each wakeup event.
To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

## 12.2.19 WUPEN1 : Wake Up Interrupt Enable Register 1

Base address: ICU = 0x4000_6000

Offset address: 0x1A4

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31:4 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed.
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

## 12.3 Vector Table

The ICU detects maskable and non-maskable interrupts. Interrupt priorities are set up in the Arm NVIC. For information about these registers, see section 12.9. Reference.

### 12.3.1 Interrupt Vector Table

Table 12.3 describes the interrupt vector table. The interrupt vector addresses conform to the NVIC specifications.

**Table 12.3 Interrupt vector table (1 of 2)**

| Exception number | IRQ number | Vector offset | Source | Description |
|---|---|---|---|---|
| 0 | — | 0x000 | Arm | Initial stack pointer |
| 1 | — | 0x004 | Arm | Initial program counter (reset vector) |
| 2 | — | 0x008 | Arm | Non-Maskable Interrupt (NMI) |
| 3 | — | 0x00C | Arm | Hard Fault |
| 4 | — | 0x010 | Arm | MemManage fault |
| 5 | — | 0x014 | Arm | BusFault |
| 6 | — | 0x018 | Arm | UsageFault |
| 7 | — | 0x01C | Arm | SecureFault |
| 8 | — | 0x020 | Arm | Reserved |
| 9 | — | 0x024 | Arm | Reserved |
| 10 | — | 0x028 | Arm | Reserved |
| 11 | — | 0x02C | Arm | Supervisor Call (SVCall) |
| 12 | — | 0x030 | Arm | DebugMonitor |
| 13 | — | 0x034 | Arm | Reserved |
| 14 | — | 0x038 | Arm | Pendable request for system service (PendableSrvReq) |
| 15 | — | 0x03C | Arm | System Tick Timer (SysTick) |
| 16 | 0 | 0x040 | ICU.IELSR0 | Event selected in the ICU.IELSR0 register |
| 17 | 1 | 0x044 | ICU.IELSR1 | Event selected in the ICU.IELSR1 register |
| 18 | 2 | 0x048 | ICU.IELSR2 | Event selected in the ICU.IELSR2 register |
| 19 | 3 | 0x04C | ICU.IELSR3 | Event selected in the ICU.IELSR3 register |
| 20 | 4 | 0x050 | ICU.IELSR4 | Event selected in the ICU.IELSR4 register |
| 21 | 5 | 0x054 | ICU.IELSR5 | Event selected in the ICU.IELSR5 register |
| 22 | 6 | 0x058 | ICU.IELSR6 | Event selected in the ICU.IELSR6 register |
| 23 | 7 | 0x05C | ICU.IELSR7 | Event selected in the ICU.IELSR7 register |

### 12.3.2 Event Number

The following table lists heading details for Table 12.4, which describes each event number.

| Heading | Description |
|---|---|
| Interrupt request source | Name of the source generating the interrupt request |
| Name | Name of the interrupt |
| Connect to NVIC | " ✓" indicates the interrupt can be used as a CPU interrupt |
| Invoke DTC | " ✓" indicates the interrupt can be used to request DTC activation |
| Invoke DMAC | "✓" indicates the interrupt can be used to request DMAC activation |
| Canceling Snooze | " ✓" indicates the interrupt can be used to request a return from Snooze mode |
| Canceling Software Standby | " ✓" indicates the interrupt can be used to request a return from Software Standby mode |

**Table 12.4 Event table (1 of 6)**

| Event number | Interrupt request source | Name | IELSRn | | DELSRn | Canceling Snooze | Canceling Software Standby |

Note 1. Only the first edge detection is valid.
Note 2. Only interrupts after DTC transfer are supported.
Note 3. Using SELSR0.
Note 4. SCIX0_SCIXn (n = 0 to 3) links to Simple LIN interface of SCI1.

## 12.4 Interrupt Operation

The ICU performs the following functions:

- Detecting interrupts
- Enabling and disabling interrupts
- Selecting interrupt request destinations such as CPU interrupt, DTC activation, or DMAC activation.

### 12.4.1 Detecting Interrupts

The ICU selects an event source input from a peripheral function interrupt or an external pin interrupt with IELSRn.IELS [8:0].

The accepted interrupt source sets the IELSRn.IR to 1 and sends an interrupt request to the NVIC.

External pin interrupt requests are detected by either:

- Edges (falling edge, rising edge, or rising and falling edges)
- Level (low level) of the interrupt signal.

Set the IRQCRi.IRQMD[1:0] bits to select the detection mode for the IRQi pins. For interrupt sources associated with peripheral modules, see Table 12.3 and Table 12.4. Events must be accepted by the NVIC before an interrupt occurs and is accepted by the CPU.

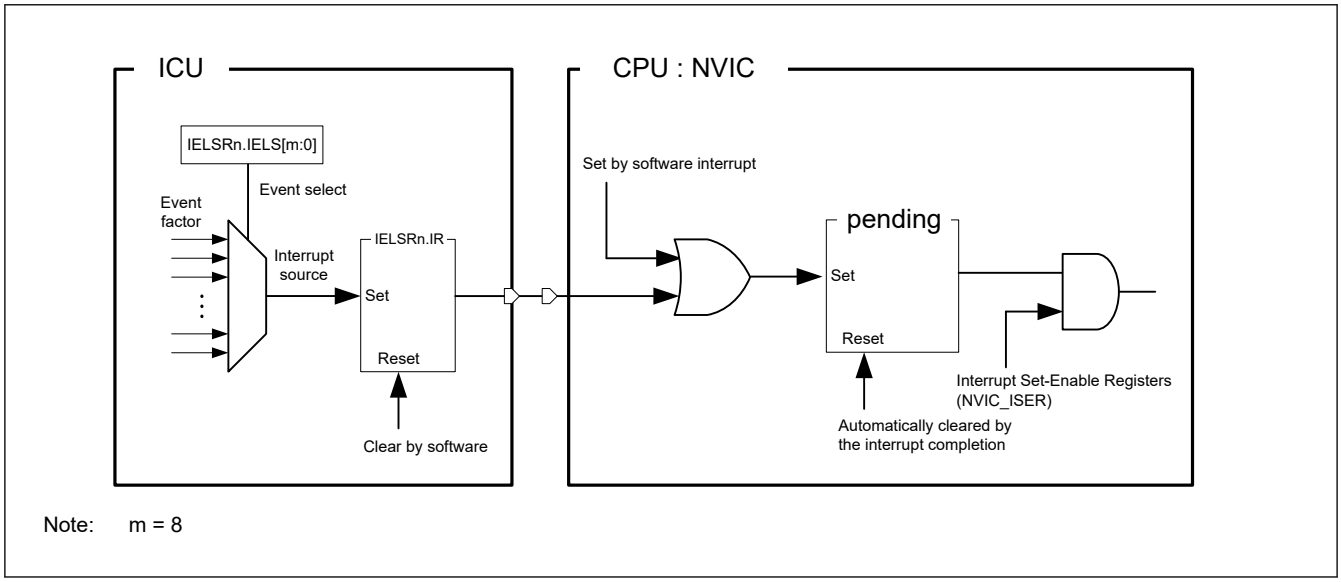

**Figure 12.2 Interrupt path of the ICU and CPU (NVIC)**

## 12.5 Interrupt Setting Procedure

### 12.5.1 Enabling Interrupt Requests

The procedure for enabling an interrupt request is as follows:

1. Set the Interrupt Set-Enable register (NVIC_ISER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN register setting).

### 12.5.2 Disabling Interrupt Requests

The procedure to disable the interrupt request is as follows:

1. Disable the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN register setting).
2. Clear the interrupt source setting (IELSRn.IELS[8:0] = 0x00).
3. Clear the interrupt status flag (IELSRn.IR = 0).
4. Clear the interrupt Clear-Enable register (NVIC_ICER) and interrupt Clear-Pending register (NVIC_ICPR).

### 12.5.3 Polling for Interrupts

The procedure for polling for interrupt requests is as follows:

1. Set the Interrupt Clear-Enable register (NVIC_ICER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN register setting).

4. Poll the interrupt Set-Pending register (NVIC_ISPR).

### 12.5.4 Selecting Interrupt Request Destinations

The available destinations are fixed for each interrupt, as described in Table 12.3, Table 12.4.

The interrupt output destination, CPU, DMAC, or DTC can be independently selected for each interrupt source.

Use an interrupt request destination setting that is indicated by a "✓" in the event list (see section 12.3.2. Event Number).

Note: Setting the same interrupt source for IELSRn and DELSRn is prohibited.

If the DMAC or DTC is selected as the destination for requests from an IRQi pin, set the IRQCRi.IRQMD[1:0] bits for that interrupt to select edge detection.

#### 12.5.4.1 CPU Interrupt Request

When IELSRn.DTCE = 0, the event specified in the IELSRn register is output to the NVIC. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 0.

#### 12.5.4.2 DTC Activation

When IELSRn.DTCE = 1, the event specified in the IELSRn register is output to the DTC. Use the following procedure:

1. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 1.
2. Set the DTC Module Start bit (DTCST.DTCST) to 1.

Table 12.5 shows operation when the DTC is the interrupt request destination.

**Table 12.5 Operation when DTC becomes interrupt request destination**

| Interrupt request destination | DISEL*1 | Remaining transfer operations | Operation per request | IR*2 | Interrupt request destination after transfer |
|---|---|---|---|---|---|
| DTC*3 | 1 | ≠ 0 | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU | DTC |
| | | = 0 | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU | CPU (IELSRn.DTCE bit is automatically cleared) |
| | 0 | ≠ 0 | DTC transfer | Cleared at the start of DTC data transfer after reading DTC transfer data | DTC |
| | | = 0 | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU | CPU (IELSRn.DTCE bit is automatically cleared) |

Note 1. DTC.MRB.DISEL bit controls the interrupt generates timing from DTC to CPU.
Note 2. When the IELSRn.IR flag is 1, an interrupt request (DTC activation request) that occurs again is ignored.
Note 3. For chain transfers, DTC transfer continues until the last chain transfer ends. The DISEL bit state and the remaining transfer count determine whether a CPU interrupt occurs, the IELSRn.IR flag clear timing, and the interrupt request destination after transfer. See Table 16.2 in section 16, Data Transfer Controller (DTC).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 63). IELSRn that is not the target is not cleared.

Note: DTC transfer error in Snooze mode

When an error occurs in DTC transfer in Snooze mode, the ICU issues a wakeup request. However, interrupt requests are not issued automatically. See section 16, Data Transfer Controller (DTC) for information on how to set the interrupt when a DTC error occurs.

#### 12.5.4.3 DMAC Activation

Events specified in the DELSRn registers are output to the DMAC.

To set the interrupt source for DMAC, use the following procedure:

1. Set the DELSRn.DELS[8:0] bits to the event to activate the DMAC.

2. When using interrupts to CPU, set the IELSRn.IELS bit to factor of DMAC interrupt and IELSRn.DTCE bit to 0.
3. Set the activation source for the target DMAC channel (DMACm.DMTMD.DCTG[1:0]) to 01b (interrupt module detection).
4. Set the DMAC transfer enable bit for the target DMAC channel (DMACm.DMCNT.DTE) to 1.
5. Set the DMAC operation enable bit (DMAST.DMST) to 1.

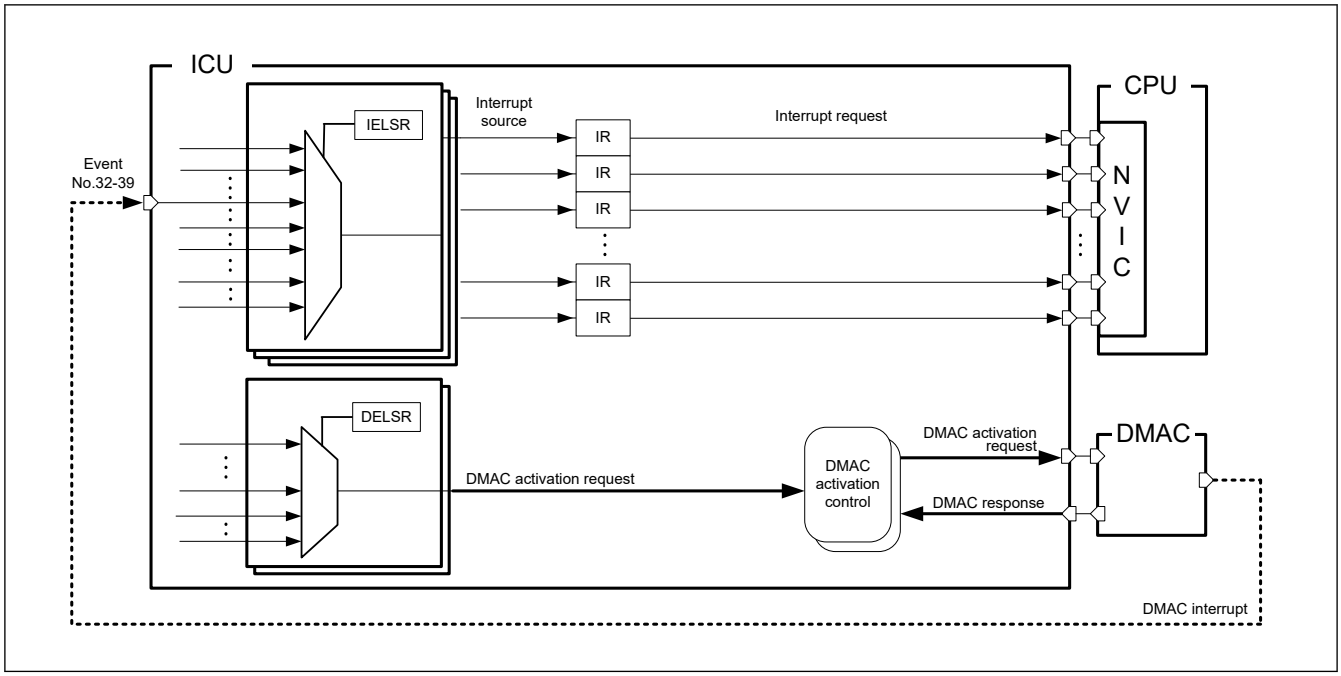

**Figure 12.3 DMAC request trigger and interrupt path**

Note: Error during DMAC transfer

If an error response occurs during DMAC transfer, the DMAC notifies the ICU that an error has occurred.

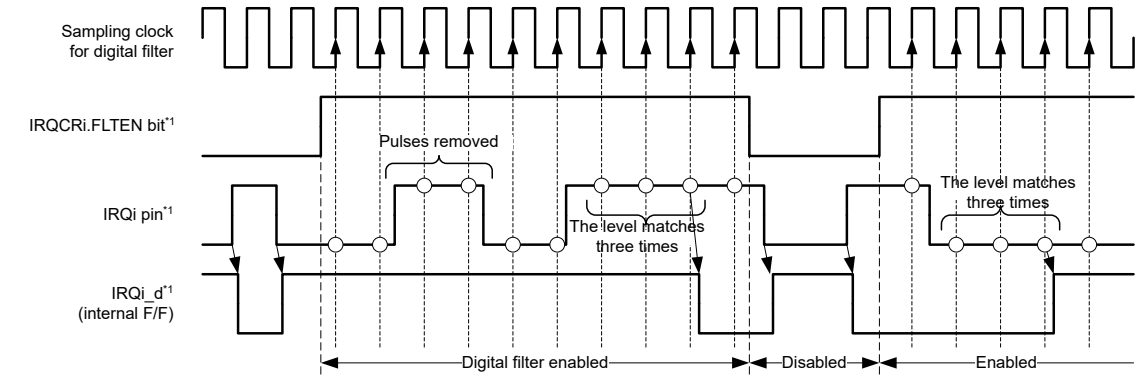
The ICU clears all bits of the target channel of DELSRn (n = 0 to 7). DELSRn that is not the target channel is not cleared.

## 12.5.5 Digital Filter

A digital filter function is provided for the external interrupt request pins IRQi, (i = 0 to 15) and the NMI pin interrupt. It samples input signals on the filter PCLKB sampling clock and removes any signal with a pulse width less than 3 sampling cycles.

To use the digital filter for an IRQi pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, PCLKB/64 or LOCO in the IRQCRi.FCLKSEL[1:0] bits and IRQCRi.LOCOSEL bit (i = 0 to 15).
2. Set the IRQCRi.FLTEN bit (i = 0 to 15) to 1 (digital filter enabled).



If LOCO is selected as the sampling clock for the digital filter, note the following:

- Once the IRQ pin is set, the IELSR register should be set to 4 cycles after the LOCO clock
- IRQMD[1:0] bits should not be set to 11b
- The digital filter settings (IRQCRi.FLTEN = 1 and IRQCRi.LOCOSEL = 1) should not be changed
- LOCO should not be stopped.

To use the digital filter for an NMI pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the NMICR.NFCLKSEL[1:0] bits.
2. Set the NMICR.NFLTEN bit to 1 (digital filter enabled).

Figure 12.4 shows an example of digital filter operation.

Note 1. i = 0 to 7

**Figure 12.4 Digital filter operation example**

Before entering Software Standby mode, disable the digital filters by clearing the IRQCRi.FLTEN if the sampling clock is not LOCO. NMI does not select LOCO, so be sure to clear the NMICR.NFLTEN bit to disable the digital filter. The ICU clock stops in Software Standby mode.

On exiting Software Standby mode, the circuit detects the edge by comparing the state before standby to the state after standby release. If the input changes during Software Standby mode, an incorrect edge might be detected. The digital filters can be enabled again after exiting Software Standby mode.

### 12.5.6 External Pin Interrupts

To use external pin interrupts:

1. Configure I/O ports settings.
2. Clear the IRQCRi.FLTEN bit (i = 0 to 15) to 0 (digital filter disabled).
3. Set the IRQMD[1:0] bits and the LOCOSEL bit of the given IRQCRi register (i = 0 to 15) to select the senses of detection.
4. Set the FCLKSEL[1:0] bits, and the FLTEN bit of the IRQCRi register.
5. Select the IRQ pin as follows:
   - If the IRQ pin is to be used for CPU interrupt requests, set the IELSRn.IELS[8:0] bits and the IELSRn.DTCE bit to 0.
   - If the IRQ pin is to be used for DTC activation, set the IELSRn.IELS[8:0] bits and the IELSRn.DTCE bit to 1.
   - If the IRQ pin is to be used for DMAC activation, set the DELSRn.DELS[8:0] bits.

## 12.6 Non-Maskable Interrupt Operation

The following sources can trigger a non-maskable interrupt:

- NMI pin interrupt
- Oscillation stop detection interrupt
- WDT underflow/refresh error interrupt
- IWDT underflow/refresh error interrupt
- Voltage monitor 1 interrupt

- Voltage monitor 2 interrupt
- SRAM parity error interrupt
- SRAM ECC error interrupt
- Bus master MPU error interrupt
- TrustZone filter error interrupt
- Cache RAM parity error interrupt

Non-maskable interrupts can only be used with the CPU, not to activate the DTC or DMAC. Non-maskable interrupts take precedence over all other interrupts. The non-maskable interrupt states can be verified in the Non-Maskable Interrupt Status Register (NMISR). Confirm that all bits in the NMISR are 0 before returning from the NMI handler.

Non-maskable interrupts are disabled by default. To use non-maskable interrupts:

1. Clear the NMICR.NFLTEN bit to 0 (digital filter disabled).
2. Set the NMIMD bit, NFCLKSEL[1:0] bits, and NFLTEN bit of NMICR register.
3. Write 1 to the NMICLR.NMICLR bit to clear the NMISR.NMIST flag to 0.
4. Enable the non-maskable interrupt by writing 1 to the associated bit in the Non-Maskable Interrupt Enable Register (NMIER).

After 1 is written to the NMIER register, subsequent write access to the NMIEN bit in NMIER is ignored. An NMI cannot be disabled when enabled, except by a reset.

The secure attribution managed within the Application Interrupt and Reset Control Register (AIRCR) of the Arm CPU must match the security attribution of NMI.

The NMI secure of the CPU is changed by AIRCR.BFHFNMINS. It is managed by software developers who manage secure program.

### 12.6.1 Correspondence to TrustZone-M by NMI

The NMI security is set by AIRCR.BFHFNMINS. Although there is only one NMI per CPU, multiple factors can be set. This section describes the procedure for mixing secure and non-secure programs of NMI. When doing so, the NMI-related registers of the ICU are set to secure.

NMI-related registers:

- NMIER
- NMICLR
- NMICR

Set the ICUSARB.SANMI bit to 0.

The value of AIRCR.BFHFNMINS[13] in the Application Interrupt and Reset Control Register of the ARM CPU must be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINS and ICUSARB.SANMI are different.

AIRCR.BFHFNMINS is for secure and ICUSARB.SANMI is for non-secure. Polarity has the same meaning so program these to match.

If NMI is issued, jump to the NMI handler. When mixing secure and non-secure program, the NMI handler must branch according to the TrustZone-M rule. Figure 12.5 shows the flow.

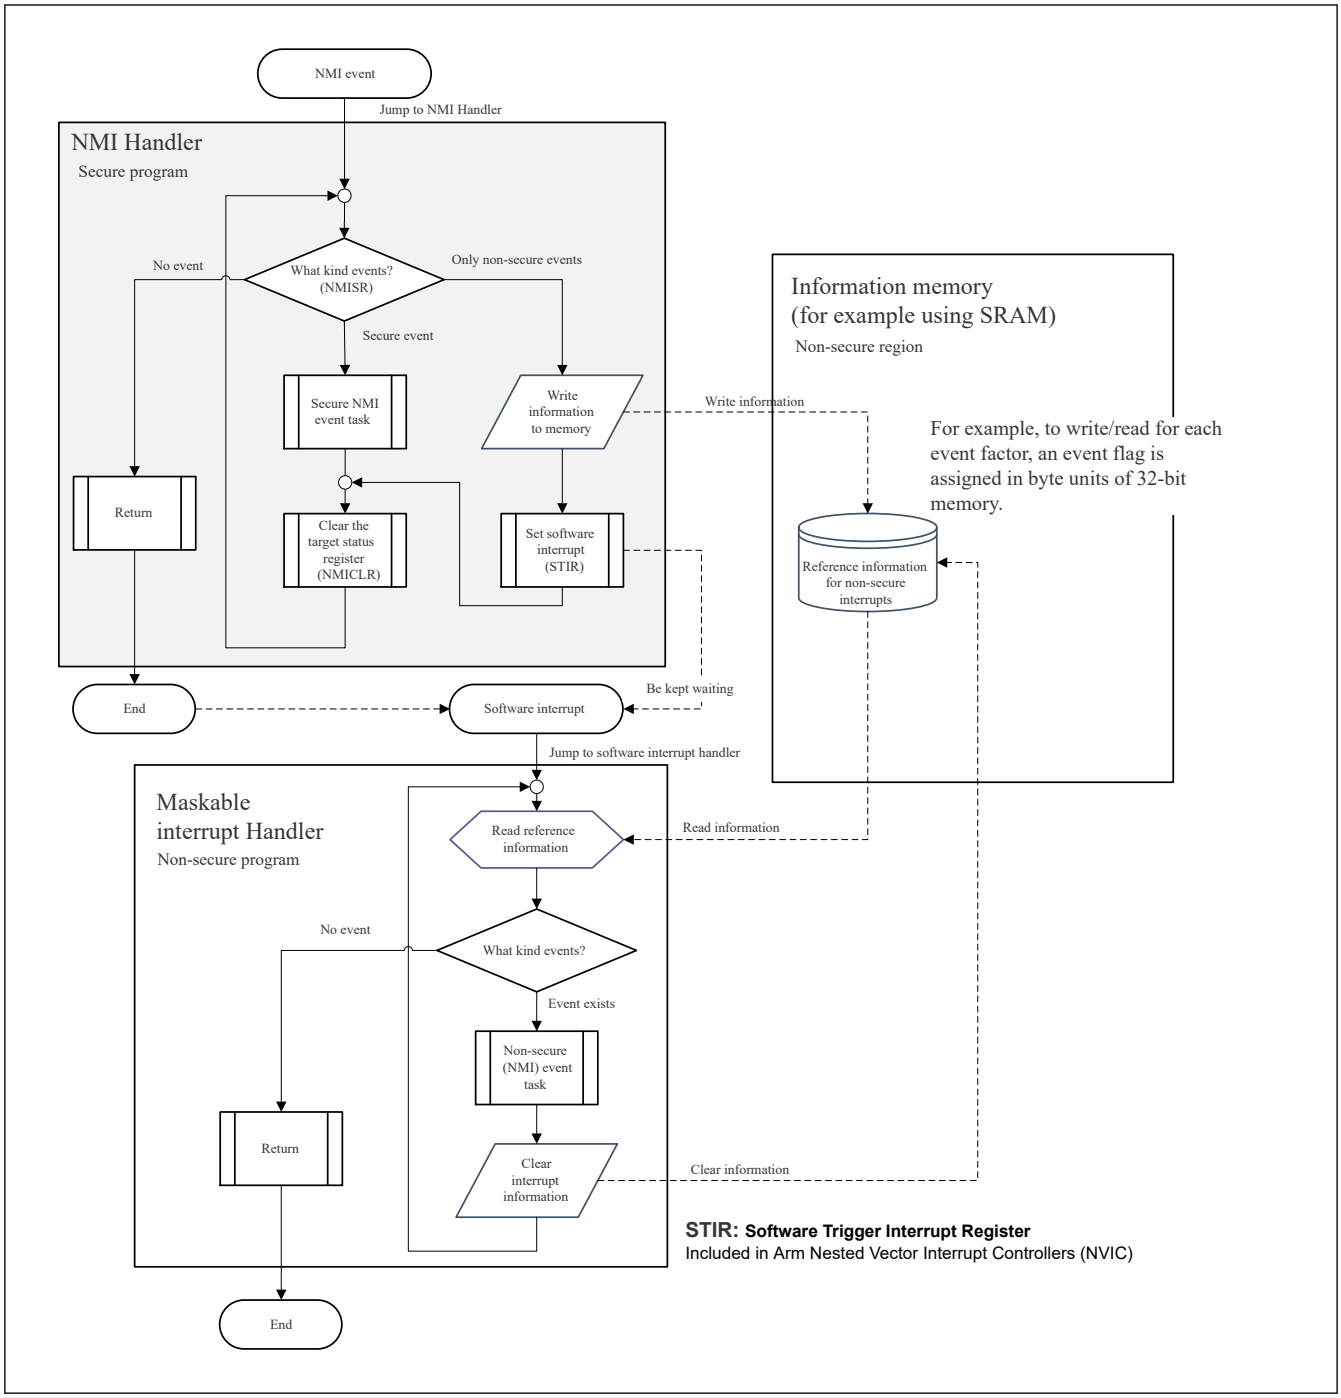


**Figure 12.5 Correspondence to TrustZone-M by NMI**

See the Arm documentation for details on how to move between secure and non-secure programs.

## 12.7 Return from Low Power Modes

Table 12.4 lists the interrupt sources that can be used to exit Sleep, Snooze, or Software Standby mode. For more information, see section 10, Low Power Modes.

### 12.7.1 Return from Sleep Mode

To return from Sleep mode in response to an interrupt:

**non-maskable interrupt**

- Use the NMIER register to enable the target interrupt request.

**maskable interrupt**

- Select the CPU as the interrupt request destination.
- Enable the interrupt in the NVIC.

### 12.7.2 Return from Software Standby Mode

The ICU returns from Software Standby mode using a non-maskable interrupt or a maskable interrupt. For maskable interrupt of canceling source, see Table 12.4.

To return from Software Standby mode:

1. Select the interrupt source that enables return from Software Standby:
   - For non-maskable interrupts, use the NMIER register to enable the target interrupt request
   - For maskable interrupts, use the WUPEN register to enable the target interrupt request.
2. Select the CPU as the interrupt request destination
3. Enable the interrupt in the NVIC.

Interrupt requests through the IRQn pins that do not satisfy these conditions are not detected while the clock is stopped in Software Standby mode.

Similarly, request for a non-maskable interrupt from a request source whose clock is stopped in Software Standby mode cannot be detected.

**Transition to/from Software Standby mode**

1. Before Software Standby mode is entered, disable the digital filter for the interrupt source as a return target (IRQCRi.FLTEN = 0, NMICR.NFLTEN = 0).
2. To use the digital filter again after returning from Software Standby mode, enable the digital filter (IRQCRi.FLTEN = 1, NMICR.NFLTEN = 1).

### 12.7.3 Return from Snooze Mode

The ICU can return to Normal mode from Snooze mode using the interrupts provided for this mode.

To return to Normal mode from Snooze mode:

1. Set the number of the required interrupt request in SELSR0.SELS[8:0]
2. Set the value 0x02D (ICU_SNZCANCEL) in IELSRn.IELS[8:0] (n = 0 to 63).
3. Select the CPU as the interrupt request destination.
4. Enable the interrupt in the NVIC.

Interrupt requests through the non-maskable that do not satisfy the above conditions are not detected while the clock is stopped in Snooze mode.

Note: In Snooze mode, a clock is supplied to the ICU. If an event selected in IELSRn is detected, the CPU acknowledges the interrupt after returning to Normal mode from Software Standby mode. If an event selected in DELSRn is detected, the DMAC can acknowledge the interrupt after returning to Normal mode from Software Standby mode.

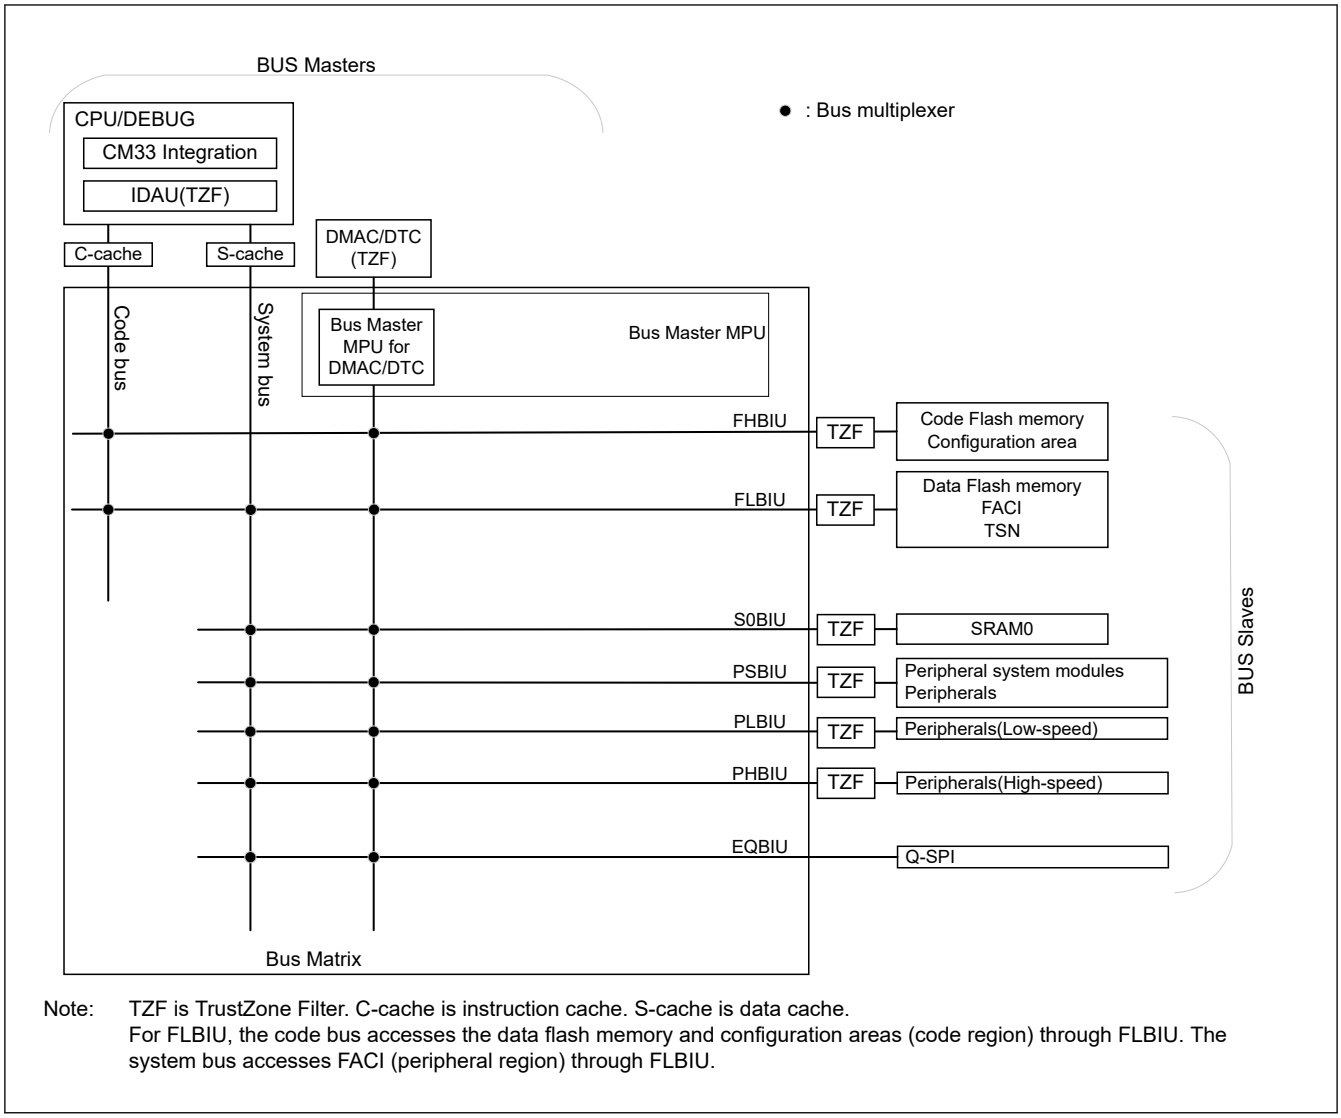
## 12.8 Using the WFI Instruction with Non-Maskable Interrupts

Whenever a WFI instruction is executed, confirm that all status flags in the NMISR register are 0.

## 12.9 Reference

- ARM Limited., ARM® Cortex®-M33 Processor Technical Reference Manual (ARM 100230).

# 13. Buses



## 13.1 Overview

The buses consists of 32 bits AHB bus matrix. Table 13.1 lists the bus masters and bus slaves and Figure 13.1 shows the bus configuration.

**Table 13.1 Bus specifications**

| Classification | Bus Master/Slave name | Sync Clock | Specifications |
|---|---|---|---|
| Bus Masters | Code bus (Cortex-M33) | ICLK | Connected to the CPU Instruction Cache for instructions and operands |
| | System bus (Cortex-M33) | ICLK | Connected to the CPU Data Cache for system |
| | DMAC / DTC | ICLK | Connected to the DMAC/DTC |
| Bus Slaves | FHBIU | ICLK | Connected to Code Flash memory and Configuration area |
| | FLBIU | FCLK | Connected to Data Flash memory, FACI, and TSN |
| | S0BIU | ICLK | Connected to SRAM0 |
| | PSBIU | ICLK | Connected to peripheral system modules (DTC, DMAC, ICU, Flash, MPU, SRAM, Debug/Trace module, System controller and BUS controller)<br>Connected to peripheral modules (I/O ports) |
| | PLBIU | PCLKB | Connected to peripheral modules (CAC, ELC, POEG, RTC, WDT, IWDT, AGT, IIC, CANFD, USBFS, SSIE, CTSU, SLCDC, ACMPLP, UARTA, and RSHIP-E11A) |
| | PHBIU | PCLKA | Connected to peripheral modules (GPT, SCI, SPI, CRC, DOC, ADC12, DAC12, CNECC, IrDA, and I3C) |
| | EQBIU (QSPI area) | PCLKA | Connected to the QSPI (External Memory Interface) |

Note: FHBIU: Flash High speed Bus Interface Unit.
FLBIU: Flash Low speed Bus Interface Unit.
S0BIU: SRAM0 Bus Interface Unit.
PSBIU: Peripheral System Bus Interface Unit.
PLBIU: Peripheral Low speed Bus Interface Unit.
PHBIU: Peripheral High speed Bus Interface Unit.
EQBIU: External memory interface QSPI Bus Interface Unit.

Note: TZF is TrustZone Filter. C-cache is instruction cache. S-cache is data cache.
For FLBIU, the code bus accesses the data flash memory and configuration areas (code region) through FLBIU. The system bus accesses FACI (peripheral region) through FLBIU.

**Figure 13.1 Bus connection**

## 13.2 Description of Buses

### 13.2.1 Arbitration

For arbitration between masters in each slave, fixed-priority and round-robin methods can be selected for each master. For details, see section 13.3.3. BUSSCNT<slave> : Slave Bus Control Register (<slave> = FHBIU, FLBIU, S0BIU, EQBIU), section 13.3.4. BUSSCNT<slave> : Slave Bus Control Register (<slave> = PSBIU, PLBIU, PHBIU).

### 13.2.2 Parallel Operation

Parallel operation is possible when different bus-master modules are requesting access to different slave modules. For example, if the CPU is fetching an instruction from Code Flash and an operand from SRAM0, the DMAC can handle transfer between a peripheral module at the same time.

Figure 13.2 shows an example of parallel operations. In this example, the CPU uses code bus and system bus for simultaneous access to FHBIU and S0BIU, respectively. Furthermore, the DMAC/DTC simultaneously accesses the peripheral bus during access to FHBIU and S0BIU by the CPU.

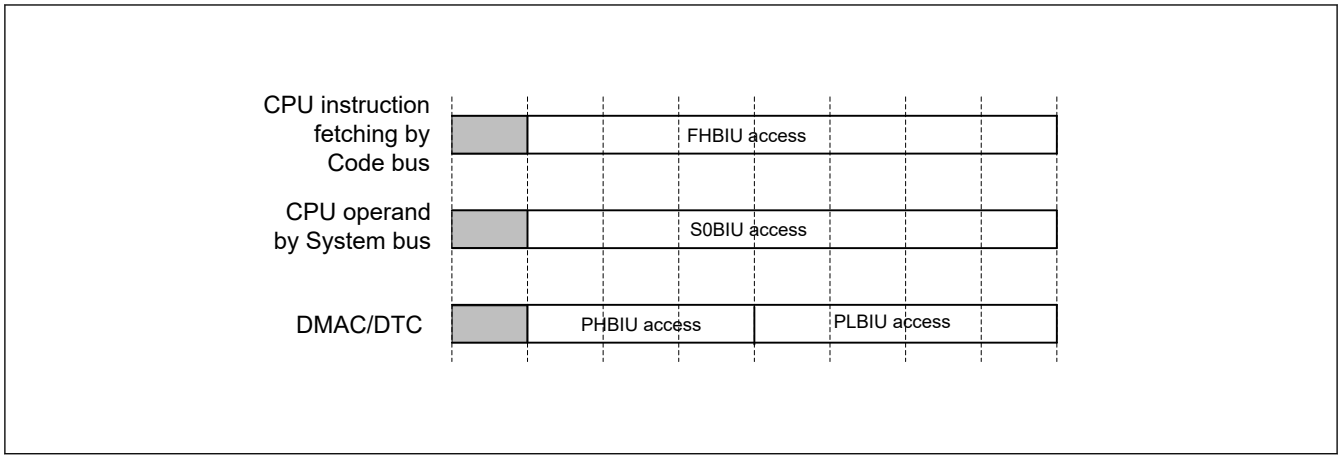


**Figure 13.2 Example of parallel operations**

## 13.2.3 Restrictions

### (1) Restriction on endian

Memory space must be little-endian in order to execute Cortex® code.

### (2) Bufferable write access

When CPU perform bufferable write access to PLBIU or PHBIU, if an STZF error occurs then the error response is invalidated. Therefore, no error flag is set and no NMI/RESET request is generated.

When CPU performs bufferable write access to PHBIU, if a Slave bus error occurs then the error response becomes invalid and the error flag is not set.

If error response is required, set the bus master to non-bufferable access.

### (3) Access to reserved area of FLBIU and S0BIU

Access to the reserved area of FLBIU and S0BIU is prohibited. Operation is not guaranteed if accessed.

## 13.3 Register Descriptions

## 13.3.1 BUSSARA : BUS Security Attribution Register A

Base address: CPSCU = 0x4000_8000

Offset address: 0x0100

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | BUSSA0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | BUSSA0 | BUS Security Attribution A0<br>0: Secure<br>1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. | R |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

### BUSSA0 bit (BUS Security Attribution A0)

The correspondence between register and BIU name is as follows:

Connection (BUSSCNT<slave> = FHBIU/FLBIU/S0BIU/PSBIU/PLBIU/PHBIU/EQBIU)

See to Figure 13.1 for connection between BIU and BUS.

- BUSSCNTFHBIU
- BUSSCNTFLBIU
- BUSSCNTS0BIU
- BUSSCNTPSBIU
- BUSSCNTPLBIU
- BUSSCNTPHBIU
- BUSSCNTEQBIU

## 13.3.2 BUSSARB : BUS Security Attribution Register B

Base address: CPSCU = 0x4000_8000

Offset address: 0x0104

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | BUSSB0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

|---|---|---|---|
| 0 | BUSSB0 | BUS Security Attribution B0<br>0: Secure<br>1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. | R |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

### BUSSB0 bit (BUS Security Attribution B0)

The BUSSB0 bit specifies the security attributes of registers for Bus Error Clear registers and DMAC/DTC Error Clear register.

BUS1ERRCLR: Code bus

BUS2ERRCLR: System bus

BUS3ERRCLR: DMAC/DTC

DMACDTCERRCLR: DMAC/DTC (Master-TZF)

See Figure 13.1 for connection of each bus.

## 13.3.3 BUSSCNT<slave> : Slave Bus Control Register (<slave> = FHBIU, FLBIU, S0BIU, EQBIU)

Base address: BUS = 0x4000_3000

Offset address: 0x1100 (BUSSCNTFHBIU)
0x1104 (BUSSCNTFLBIU)
0x1110 (BUSSCNTS0BIU)
0x1140 (BUSSCNTEQBIU)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ARBS[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | ARBS[1:0] | Arbitration Select for two masters<br>Specify the priority between bus master.<br>> : Fixed Priority<br>↔: Round-Robin<br>0 0: DMAC/DTC > CPU<br>0 1: DMAC/DTC ↔ CPU<br>1 0: Setting prohibited<br>1 1: Setting prohibited | R/W |
| 15:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note:
- BUSSCNT<slave> : <slave> is bus interface unit name for Slave
- The change is prohibited from initial value (0) to reserved bit. Operation when changing is not guaranteed.

### ARBS[1:0] bits (Arbitration Select for two masters)

The ARBS bits sets the arbitration method of each master.

## 13.3.4 BUSSCNT<slave> : Slave Bus Control Register (<slave> = PSBIU, PLBIU, PHBIU)

Base address: BUS = 0x4000_3000

Offset address: 0x1120 (BUSSCNTPSBIU)
0x1130 (BUSSCNTPLBIU)
0x1134 (BUSSCNTPHBIU)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ARBS |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | ARBS | Arbitration Select for two masters<br>Specify the priority between bus master.<br>> : Fixed Priority<br>↔: Round-Robin<br>0: DMAC/DTC > CPU<br>1: DMAC/DTC ↔ CPU | R/W |
| 15:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note:
- BUSSCNT<slave> : <slave> is bus interface unit name for Slave

- The change is prohibited from initial value (0) to reserved bit. Operation when changing is not guaranteed.

### ARBS bit (Arbitration Select for two masters)

The ARBS bits sets the arbitration method of each master.

## 13.3.5 BUSnERRADD : BUS Error Address Register (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: 0x1800 + 0x10 × (n - 1)

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | BERAD[31:0] | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | BERAD[31:0] | Bus Error Address<br>When a bus error occurs, these bits store the error address | R |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see section 5, Resets, section 14, Memory Protection Unit (MPU) and section 48.2. Arm TrustZone Security .

The following bus errors correspond to the master bus:

BUS1ERRADD : Code bus

BUS2ERRADD : System bus

BUS3ERRADD : DMAC/DTC

### BERAD[31:0] bits (Bus Error Address)

The BERAD[31:0] bits indicate the address when an error occurs on the associated bus. For detail of error that occurs by bus, see section 13.3.9. BUSnERRSTAT : BUS Error Status Register n (n = 1 to 3) and section 13.4. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of ILERRSTAT, MMERRSTAT, SLERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the BERAD[31:0] bits store the address of the bus error access.

BERAD[31:0] bits are only valid when ILERRSTAT, MMERRSTAT, and SLERRSTAT in BUSnERRSTAT (n = 1 to 3) are set to 1.

## 13.3.6 BUSnERRRW : BUS Error Read Write Register (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: 0x1804 + 0x10 × (n - 1)

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | RWSTAT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RWSTAT | Error Access Read/Write Status<br>The status at the time of the error.<br>0: Read access<br>1: Write access | R |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU related reset, see section 5, Resets and section 14, Memory Protection Unit (MPU).

The following bus errors correspond to the master bus:

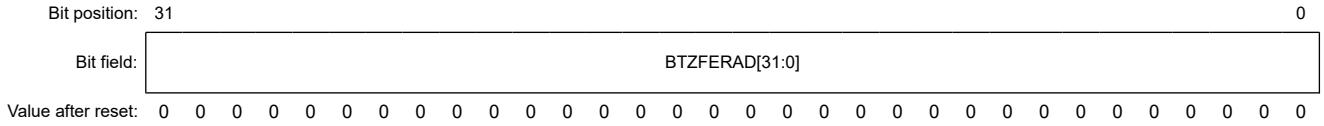
BUS1ERRRW : Code bus

BUS2ERRRW : System bus

BUS3ERRRW : DMAC/DTC

#### RWSTAT bit (Error Access Read/Write Status)

The RWSTAT bit indicates the access status, (write access or read access) when an error occurs on the associated bus. For detail of error that occurs by bus, see section 13.3.9. BUSnERRSTAT : BUS Error Status Register n (n = 1 to 3) and section 13.4. Bus Error Monitoring Section.



When an error occurs on the bus, the corresponding bit of ILERRSTAT, MMERRSTAT, SLERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the RWSTAT bits store the read/write status of the bus error access.

RWSTAT bit is only valid when ILERRSTAT, MMERRSTAT, and SLERRSTAT in BUSnERRSTAT (n = 1 to 3) are set to 1.

### 13.3.7 BTZFnERRADD : BUS TZF Error Address Register (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: 0x1900 + 0x10 × (n - 1)

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | BTZFERAD[31:0] | Bus TrustZone Filter Error Address<br>When a bus error occurs, these bits store the error address | R |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see section 5, Resets, section 14, Memory Protection Unit (MPU) and section 48.2. Arm TrustZone Security .

The following bus errors correspond to the master bus:

BTZF1ERRADD : Code bus

BTZF2ERRADD : System bus

BTZF3ERRADD : DMAC/DTC

See Figure 13.1 for connection of each BUS.

#### BTZFERAD[31:0] bits (Bus TrustZone Filter Error Address)

The BTZFERAD[31:0] bits indicate the address, when an error occurs on the associated bus. For detail of error that occurs by bus, see section 13.3.9. BUSnERRSTAT : BUS Error Status Register n (n = 1 to 3) and section 13.4. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the BTZFERAD[31:0] bits store the address of the bus error access.

BTZFERAD[31:0] bits are only valid when STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1.

## 13.3.8 BTZFnERRRW : BUS TZF Error Read Write Register (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: 0x1904 + 0x10 × (n - 1)

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | TRWSTAT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | TRWSTAT | TrustZone Filter Error Access Read/Write Status<br>The status at the time of the error.<br>0: Read access<br>1: Write access | R |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see section 5, Resets, section 14, Memory Protection Unit (MPU) and section 48.2. Arm TrustZone Security .

The following bus errors correspond to the master bus:

BTZF1ERRRW : Code bus

BTZF2ERRRW : System bus

BTZF3ERRRW : DMAC/DTC

See Figure 13.1 for connection of each bus.

### TRWSTAT bit (TrustZone Filter Error Access Read/Write Status)

The TRWSTAT bit indicates the access status, (write access or read access), when an error occurs on the associated bus. For detail of error that occurs by bus, see section 13.3.9. BUSnERRSTAT : BUS Error Status Register n (n = 1 to 3) and section 13.4. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the TRWSTAT bits store the read/write status of the bus error access. The TRWSTAT bit is only valid when STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1.

## 13.3.9 BUSnERRSTAT : BUS Error Status Register n (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: 0x1A00 + 0x10 × (n - 1)

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | ILERRSTAT | MMERRSTAT | — | STERRSTAT | SLERRSTAT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SLERRSTAT | Slave Bus Error Status<br>0: No error occurred<br>1: Error occurred | R |
| 1 | STERRSTAT | Slave TrustZone Filter Error Status<br>0: No error occurred<br>1: Error occurred | R |
| 2 | — | This bit is read as 0. | R |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3 | MMERRSTAT | Master MPU Error Status<br>0: No error occurred<br>1: Error occurred | R |
| 4 | ILERRSTAT | Illegal Address Access Error Status<br>0: No error occurred<br>1: Error occurred | R |
| 7:5 | — | These bits are read as 0. | R |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see section 5, Resets, section 14, Memory Protection Unit (MPU) and section 48.2. Arm TrustZone Security .

The following bus errors correspond to the master bus:

BUS1ERRSTAT : Code bus

BUS2ERRSTAT : System bus

BUS3ERRSTAT : DMAC/DTC

See Figure 13.1 for connection of each BUS

When an illegal access error, master MPU error, and slave bus error all occurred at the same time, the STAT bit is only valid in the following order of priority. The left side has higher priority.

Master MPU Error > Illegal access error, slave bus error

Note: Illegal access error and slave bus error do not occur at the same time.

If one of ILERRSTAT, MMERRSTAT or SLERRSTAT is set, these bits are not renewed until it is cleared.

### SLERRSTAT bit (Slave Bus Error Status)

When slave error occurs by bus, BUSnERRSTAT.SLERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.SLERRCLR (n = 1 to 3) to 1. Slave error is an error that occurs on a slave such as a timeout. For detail of slave error that occurs by bus, see section 13.4. Bus Error Monitoring Section.

### STERRSTAT bit (Slave TrustZone Filter Error Status)

When slave TrustZone filter error occurs by bus, BUSnERRSTAT.STERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.STERRCLR (n = 1 to 3) to 1. The STERRSTAT bit is not set when the debugger accesses the security area. For detail of slave TrustZone filter error that occurs by bus, see section 48, Security Features .

### MMERRSTAT bit (Master MPU Error Status)

When master MPU error occurs by bus, BUSnERRSTAT.MMERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.MMERRCLR (n = 1 to 3) to 1. For detail of master MPU error that occurs by bus, see section 14, Memory Protection Unit (MPU).

Note: At master MPU error is occur in DMAC or DTC access, if error address value is not as master MPU area, Illegal address access error or slave error is occurring before DMAC or DTC access. Decide the what error was happened by referring the error address value.

### ILERRSTAT bit (Illegal Address Access Error Status)

When illegal address access error occurs by bus, BUSnERRSTAT.ILERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.ILERRCLR (n = 1 to 3) to 1. For detail of illegal address access error that occurs by bus, see section 13.4. Bus Error Monitoring Section.

## 13.3.10 DMACDTCERRSTAT : DMAC/DTC Error Status Register

Base address: BUS = 0x4000_3000

Offset address: 0x1A24

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | MTERRSTAT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MTERRSTAT | Master TrustZone Filter Error Status<br>0: No error occurred<br>1: Error occurred | R |
| 7:1 | — | These bits are read as 0. | R |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see section 5, Resets, section 14, Memory Protection Unit (MPU) and section 48.2. Arm TrustZone Security .

### MTERRSTAT bit (Master TrustZone Filter Error Status)

When a master TrustZone filter error occurs by DMAC or DTC, DMACDTCERRSTAT.MTERRSTAT is set to 1. Clear condition is reset or set DMACDTCERRCLR.MTERRCLR to 1.

For detail of master TrustZone filter error that occurs by DMAC or DTC, see section 15, DMA Controller (DMAC) and section 16, Data Transfer Controller (DTC)

## 13.3.11 BUSnERRCLR : BUS Error Clear Register n (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: 0x1A08 + 0x10 × (n - 1)

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | ILERRCLR | MMERRCLR | — | STERRCLR | SLERRCLR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SLERRCLR | Slave Bus Error Clear<br>Writing 1 to the SLERRCLR bit clears the BUSnERRSTAT.SLERRSTAT (n = 1 to 3) | R/W*1 |
| 1 | STERRCLR | Slave TrustZone Filter Error Clear<br>Writing 1 to the STERRCLR bit clears the BUSnERRSTAT.STERRSTAT (n = 1 to 3) | R/W*1 |
| 2 | — | This bit is read as 0. The write value should be 0. | R/W |
| 3 | MMERRCLR | Master MPU Error Clear<br>Writing 1 to the MMERRCLR bit clears the BUSnERRSTAT.MMERRSTAT (n = 1 to 3) | R/W*1 |
| 4 | ILERRCLR | Illegal Address Access Error Clear<br>Writing 1 to the ILERRCLR bit clears the BUSnERRSTAT.ILERRSTAT (n = 1 to 3) | R/W*1 |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only 1 can be written to this bit. This bit is read as 0. Writing 0 to this bit has no effect.

The following bus errors correspond to the master bus:

BUS1ERRCLR : Code bus

BUS2ERRCLR : System bus

BUS3ERRCLR : DMAC/DTC

When writing 1 to BUSnERRCLR (n = 1 to 3), stop the bus access that causes an error in the corresponding bus master.

### 13.3.12 DMACDTCERRCLR : DMAC/DTC Error Clear Register

Base address: BUS = 0x4000_3000

Offset address: 0x1A2C

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | MTERRCLR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MTERRCLR | Master TrustZone filter Error Clear<br>Writing 1 to this bit clears the DMACDTCERRSTAT.MTERRSTAT flag. | R/W*1 |
| 7:1 | — | This bit is read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only 1 can be written to this bit. This bit is read as 0. Writing 0 to this bit has no effect.

When writing 1 to DMACDTCERRCLR, stop the bus access that causes an error in DMAC/DTC.

## 13.4 Bus Error Monitoring Section

The bus error monitoring system monitors each individual area, and when an error is detected, an error is returned to the requesting master IP using the AHB-Lite error response protocol.

### 13.4.1 Bus Error Types

The following types of errors can occur on each bus:

- Illegal address access
- Bus master MPU error
- TrustZone Filter error
- Bus error transmitted from each slave IP

Table 13.2 lists the address ranges where access leads to illegal address access errors. The reserved area in the slave does not trigger an illegal address access error. For more information on the bus master MPU, see section 14, Memory Protection Unit (MPU).

### 13.4.2 Operations When a Bus Error Occurs

When a bus error occurs, operation is not guaranteed and the error is returned to the requesting master IP.

Figure 13.3 shows operation from each error detection to user notification on the bus.

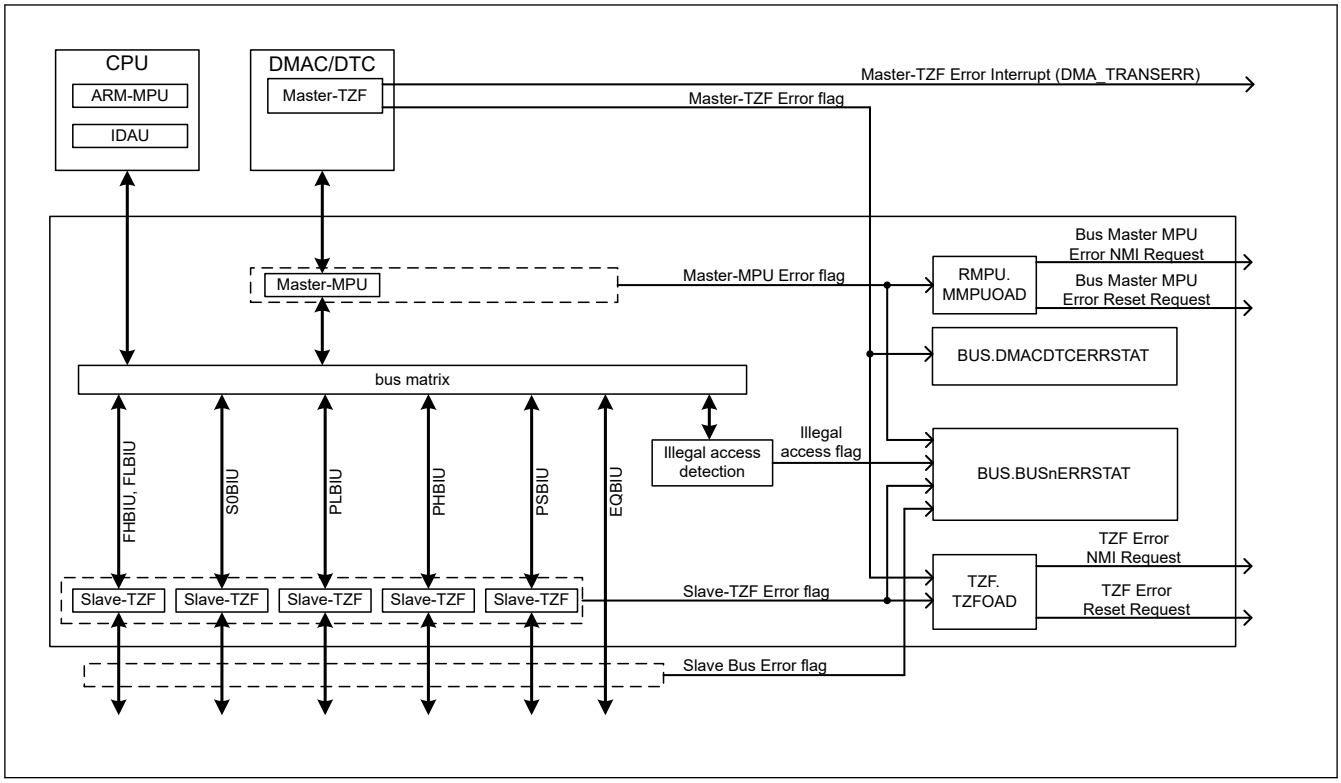


**Figure 13.3 The operation from each error detection to user notification on the bus**

## (1) Bus Master MPU Error

The bus master of DMAC/DTC has a master MPU for access control of the set address area. The CPU does not have a master MPU because it has an Arm MPU. When a bus master MPU error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 3).
2. Store the read/write information of the error in BUSnERRRW (n = 3).
3. Set 1 to MMERRSTAT bit of BUSnERRSTAT (n = 3).

An NMI request or a reset request is generated according to the MMPUOAD.OAD setting (see section 14, Memory Protection Unit (MPU)). Since BUSnERRADD (n = 3), BUSnERRRW (n = 3), and BUSnERRSTAT (n = 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 3), they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first bus master MPU error after a reset or clearing of BUSnERRSTAT.MMERRSTAT (n = 3) bit by BUSnERRCLR (n = 3).

## (2) Illegal Access Error

section 13.4.3. Conditions Leading to Illegal Address Access Errors, describes illegal access errors. When an illegal access error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 1 to 3).
2. Store the read/write information of the error in BUSnERRRW (n = 1 to 3).
3. Set 1 to ILERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

NMI request and reset request are not generated. Since BUSnERRADD (n = 1 to 3), BUSnERRRW (n = 1 to 3), BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be confirmed in the Bus Fault handler or the interrupt handler.

### (3) Master-TZF Error

As described in section 48, Security Features , DMAC/DTC has Master-TZF errors. When a Master-TZF error is detected, 1 is set to MTERRSTAT bit of DMACDTCERRSTAT, and because the DMAC/DTC does not perform bus access, no bus error information is stored in BTZF3ERRADD and BTZF3ERRRW.

An NMI request or reset request is generated according to the setting of TZFOAD.OAD. See section 15, DMA Controller (DMAC), section 16, Data Transfer Controller (DTC) for details on Master-TZF errors. Because DMACDTCERRSTAT is held until reset other than MPU- and TZF-related resets or cleared by DMACDTCERRCLR, they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first Master-TZF error after reset or clearing of the DMACDTCERRSTAT.MTERRSTAT bit by DMACDTCERRCLR.

### (4) Slave-TZF Error

As described in section 48, Security Features , FHBIU (code flash), FLBIU (data flash), S0BIU (SRAM), PHBIU, PLBIU and PSBIU have Slave-TZF errors. When a Slave-TZF error is detected, perform the following steps:

1. Store the address of the error in BTZFnERRADD (n = 1 to 3).
2. Store the read/write information of the error in BTZFnERRRW (n = 1 to 3).
3. Set 1 to STERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

NMI request or reset request is generated according to the setting in TZFOAD.OAD. Since BTZFnERRADD (n = 1 to 3), BTZFnERRRW (n = 1 to 3), and BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first Slave-TZF error after a reset or clearing of the BUSnERRSTAT.STERRSTAT (n = 1 to 3) bit by BUSnERRCLR (n = 1 to 3).

### (5) Slave Bus Error

Slave Bus Error occurs in the slave. When Slave Bus Error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 1 to 3)
2. Store the read/write information of the error in BUSnERRRW (n = 1 to 3)
3. Set 1 to SLERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

An NMI request and reset request are not generated. Since BUSnERRADD (n = 1 to 3), BUSnERRRW (n = 1 to 3), and BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be verified in the Bus Fault handler or interrupt handler. When a bus slave MPU error occurs, the error is returned to the requesting master IP and operation is not guaranteed.

## 13.4.3 Conditions Leading to Illegal Address Access Errors

Table 13.2 lists the address spaces for each bus that trigger illegal address access errors.

**Table 13.2 Conditions leading to illegal address access errors (1 of 2)**

| Address | Slave bus | Master bus | | |
|---|---|---|---|---|
| | | CPU | | DMA |
| | | Code | System | |
| 0x0000_0000 to 0x01FF_FFFF | FHBIU | — | | — |
| 0x0200_0000 to 0x07FF_FFFF | Reserved | E | | E |
| 0x0800_0000 to 0x0803_FFFF | FLBIU | — | | — |
| 0x0804_0000 to 0x0FFF_FFFF | Reserved | E | | E |
| 0x1000_0000 to 0x100F_FFFF | Reserved | — | | E |
| 0x1010_0000 to 0x1FFF_FFFF | Reserved | E | | E |

**Table 13.2 Conditions leading to illegal address access errors (2 of 2)**

| Address | Slave bus | Master bus | | |
|---|---|---|---|---|
| | | CPU | | DMA |
| | | Code | System | |
| 0x2000_0000 to 0x2800_FFFF | S0BIU | | — | — |
| 0x2801_0000 to 0x3FFF_FFFF | Reserved | | E | E |
| 0x4000_0000 to 0x4000_0FFF | PSBIU | | — | — |
| 0x4000_1000 to 0x4000_1FFF | Reserved | | E | E |
| 0x4000_2000 to 0x4000_2FFF | PSBIU | | — | — |
| 0x4000_3000 to 0x4000_3FFF | Reserved | | E | E |
| 0x4000_4000 to 0x4000_8FFF | PSBIU | | — | — |
| 0x4000_9000 to 0x4001_AFFF | Reserved | | E | E |
| 0x4001_B000 to 0x4001_CFFF | PSBIU | | — | — |
| 0x4001_D000 to 0x4001_DFFF | Reserved | | E | E |
| 0x4001_E000 to 0x4002_1FFF | PSBIU | | — | — |
| 0x4002_2000 to 0x4007_FFFF | Reserved | | E | E |
| 0x4008_0000 to 0x400F_FFFF | PLBIU | | — | — |
| 0x4010_0000 to 0x4017_FFFF | PHBIU | | — | — |
| 0x4018_0000 to 0x407D_FFFF | Reserved | | E | E |
| 0x407E_0000 to 0x407F_FFFF | FLBIU | | — | — |
| 0x4080_0000 to 0x5FFF_FFFF | Reserved | | E | E |
| 0x6000_0000 to 0x67FF_FFFF | EQBIU | | — | — |
| 0x6800_0000 to 0x87FF_FFFF | Reserved | | E | E |
| 0x8800_0000 to 0xDFFF_FFFF | Reserved | | E | E |
| 0xE000_0000 to 0xFFFF_FFFF | System for Cortex®-M33 | | | E |

Note: "E" : A bus error occurs.
" " : Transfer does not occur.
"—" : A bus error has not occurred. Even if there has reserved area, a bus error has not occurred.
Do not access reserved area in FLBIU and S0BIU. If accessed, a slave TZF error might occur.

### 13.4.4 Time-out

For some peripheral modules, a timeout error occurs with the module-stop function. When there is no response from the slave for a certain period of time, a timeout error is detected. A timeout error is returned to the requesting master IP using the AHB-Lite error response protocol.

## 13.6 Cache

### 13.6.1 Overview

There are two types of caches:

- C-cache on code bus
- S-cache on system bus.

Table 13.3 lists the specifications of the cache, Figure 13.4 shows a block diagram of the cache, and Figure 13.5 shows the cache structure.

**Table 13.3 Cache specifications**

| Parameter | C-cache | S-cache |
|---|---|---|
| Capacity | 2 KB | 2 KB |
| Way | 2-way set associative | 2-way set associative |
| Line size | 32/64 bytes | 32/64 bytes |
| Number of entry | 32/16 entry/way | 32/16 entry/way |
| Write way | No write | Write-through, non-write allocate |
| Replace way | 2-way: LRU (least recently used) | 2-way: LRU (least recently used) |
| Cache support area | 0x0000_0000 to 0x1FFF_FFFF | 0x2000_0000 – 0xDFFF_FFFF*1 |

Note 1. Peripheral area 0x4000_0000 to 0x5FFF_FFFF and QSPI I/O register area 0x6400_0000 to 0x67FF_FFFF must not have the cacheable attribution in the Arm MPU.

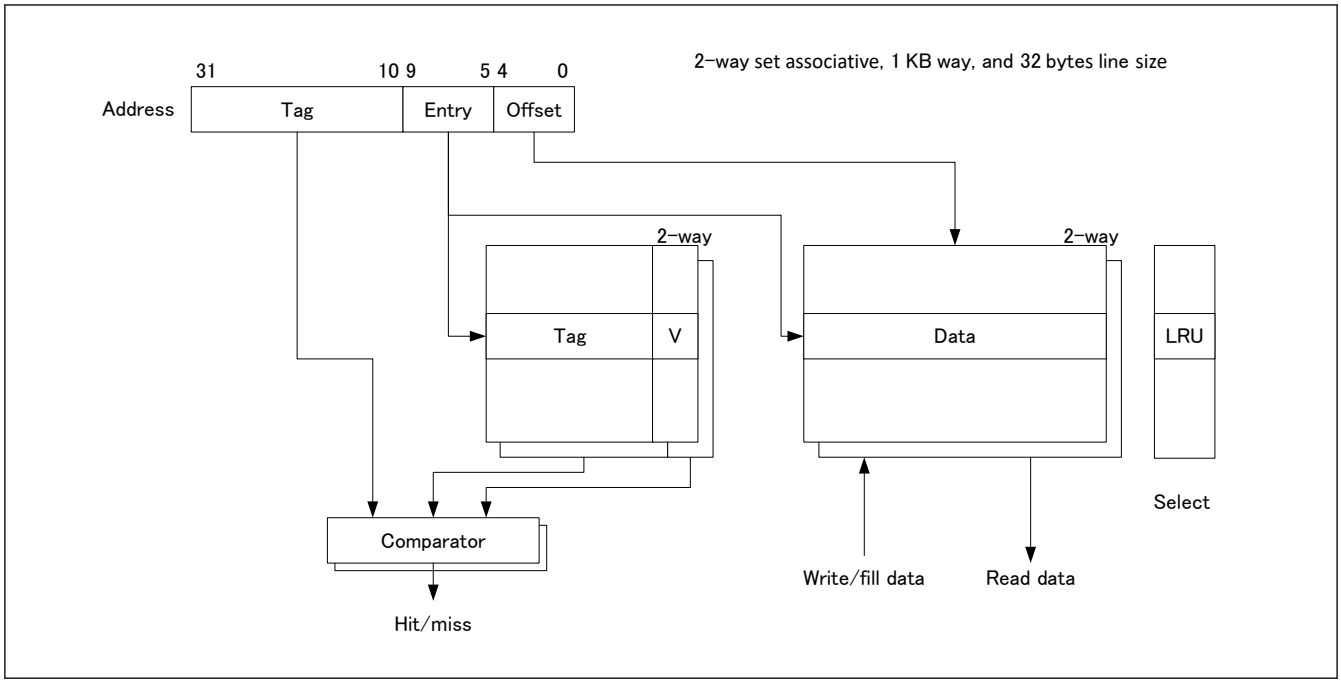

**Figure 13.5 Cache structure for 2-way set associative of 2 KB capacity and 32 bytes line size**

## 13.6.2 Register Description

### 13.6.2.1 CSAR : Cache Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x000

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | CACHEESA | CACHELSA | CACHESA |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | CACHESA | Security Attributes of Registers for Cache Control<br>0: Secure<br>1: Non-secure | R/W |
| 1 | CACHELSA | Security Attributes of Registers for Cache Line Configuration<br>0: Secure<br>1: Non-secure | R/W |
| 2 | CACHEESA | Security Attributes of Registers for Cache Error<br>0: Secure<br>1: Non-secure | R/W |
| 31:3 | — | These bits are read as 1. | R |

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

**CACHESA bit (Security Attributes of Registers for Cache Control)**

The CACHESA bit indicates the security attributes of registers for cache control. The target registers are:

- CCACTL
- SCACTL.

### CACHELSA bit (Security Attributes of Registers for Cache Line Configuration)

The CACHELSA bit indicates the security attributes of registers for cache line configuration. The target registers are:
- CCALCF
- SCALCF.

### CACHEESA bit (Security Attributes of Registers for Cache Error)

The CACHEESA bit indicates the security attributes of registers for cache error.
- CAPOAD
- CAPRCR.

## 13.6.2.2 CCACTL : C-Cache Control Register

Base address: CACHE = 0x4000_7000

Offset address: 0x000

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ENC |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | ENC | C-Cache Enable<br>Set the C-cache enable:<br>0: Disable C-cache<br>1: Enable C-cache | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### ENC bit (C-Cache Enable)

The ENC bit controls the cache enable of C-cache. When the ENC bit changes from 0 to 1, the Valid bit of C-cache is cleared.

## 13.6.2.3 CCAFCT : C-Cache Flush Control Register

Base address: CACHE = 0x4000_7000

Offset address: 0x004

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FC |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | FC | C-Cache Flush<br>Set the C-cache line flush:<br>0: No action<br>1: C-cache line flush (all lines invalidated) | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R |

### FC bit (C-Cache Flush)

The FC bit controls the cache flush of C-cache.

[Setting condition]

- When writing 1 to this bit.
- When setting CCACTL.ENC bit from 0 to 1.

[Clearing condition]

- This bit is cleared automatically when cache flush is performed.

## 13.6.2.4 CCALCF : C-Cache Line Configuration Register

Base address: CACHE = 0x4000_7000

Offset address: 0x008

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CC [1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | CC[1:0] | C-Cache Line Size<br>Set the C-cache line size:<br>0 0: Prohibited<br>0 1: Cache line size 32 bytes<br>1 0: Cache line size 64 bytes<br>1 1: Prohibited | R/W |
| 31:2 | — | These bits are read as 0. The write value should be 0. | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### CC[1:0] bits (C-Cache Line Size)

The CC[1:0] bits control the cache line size of C-cache. This bit can be written when the CCACTL.ENC bit is 0. Otherwise, this bit cannot be written.

## 13.6.2.5 SCACTL : S-Cache Control Register

Base address: CACHE = 0x4000_7000

Offset address: 0x040

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ENS |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | ENS | S-Cache Enable<br>Set the S-cache enable:<br>0: Disable S-cache<br>1: Enable S-cache | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### ENS bit (S-Cache Enable)

The ENS bit controls the cache enable of S-cache. When the ENS bit changes from 0 to 1, the Valid bit of S-cache is cleared.

## 13.6.2.6 SCAFCT : S-Cache Flush Control Register

Base address: CACHE = 0x4000_7000

Offset address: 0x044

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FS |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | FS | S-Cache Flush<br>Set the S-cache line flush:<br>0: No action<br>1: S-cache line flush (all lines invalidated) | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R |

### FS bit (S-Cache Flush)

The FS bit controls the cache flush of S-cache.

[Setting condition]

When writing 1 to this bit.

When setting SCACTL.ENS bit from 0 to 1.

[Clearing condition]

This bit is cleared automatically when cache flush is performed.

## 13.6.2.7 SCALCF : S-Cache Line Configuration Register

Base address: CACHE = 0x4000_7000

Offset address: 0x048

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CS [1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | CS[1:0] | S-Cache Line Size<br>Set the S-cache line size:<br>0 0: Prohibited<br>0 1: Cache line size 32 bytes<br>1 0: Cache line size 64 bytes<br>1 1: Prohibited | R/W |
| 31:2 | — | These bits are read as 0. The write value should be 0. | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### CS[1:0] bits (S-Cache Line Size)

The CS[1:0] bits control the cache line size of S-cache. This bit can be written when the SCACTL.ENS bit is 0. Otherwise, this bit cannot be written.

[Setting condition]

This bit can be written when the SCACTL.ENS bit is 0. Otherwise, this bit cannot be written.

## 13.6.2.8 CAPOAD : Cache Parity Error Operation After Detection Register

Base address: CACHE = 0x4000_7000

Offset address: 0x200

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | OAD |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | OAD | Operation after Detection<br>Select the operation after detection.<br>0: Non-maskable interrupt<br>1: Reset | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### OAD bit (Operation after Detection)

The OAD bit generates either a reset or a non-maskable interrupt when parity error is detected.

The protection register (CAPRCR) protects this register against writes. Modify the valid bit in the protection register (CAPRCR) to enable before writing to this bit. Do not write to CAPOAD while access to cache is in progress.

## 13.6.2.9 CAPRCR : Cache Protection Register

Base address: CACHE = 0x4000_7000

Offset address: 0x204

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | KW[6:0] | | | | | | | PRCR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PRCR | Register Write Control<br>Set the register write control:<br>0: Disable writes to protected registers<br>1: Enable writes to protected registers | R/W |
| 7:1 | KW[6:0] | Write key code<br>These bits enable or disable writes to the PRCR bit. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:8 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### PRCR bit (Register Write Control)

The PRCR bit controls the write mode of the CAPOAD register. When this bit is set to 1, writing to the CAPOAD register is enabled. When writing to this bit, write 0x78 to the KW[6:0] bits simultaneously.

### KW[6:0] bits (Write key code)

The KW[6:0] bits enable or disable writes to the PRCR bit. When writing to the PRCR bit, write 0x78 to the KW[6:0] bits simultaneously. When a value other than 0x78 is written to KW[6:0] bits, the PRCR bit is not updated. The KW[6:0] bits are always read as 0x00.

## 13.6.3 Operation

### 13.6.3.1 S-Cache

Figure 13.6 shows the access flow from CPU to S-cache.

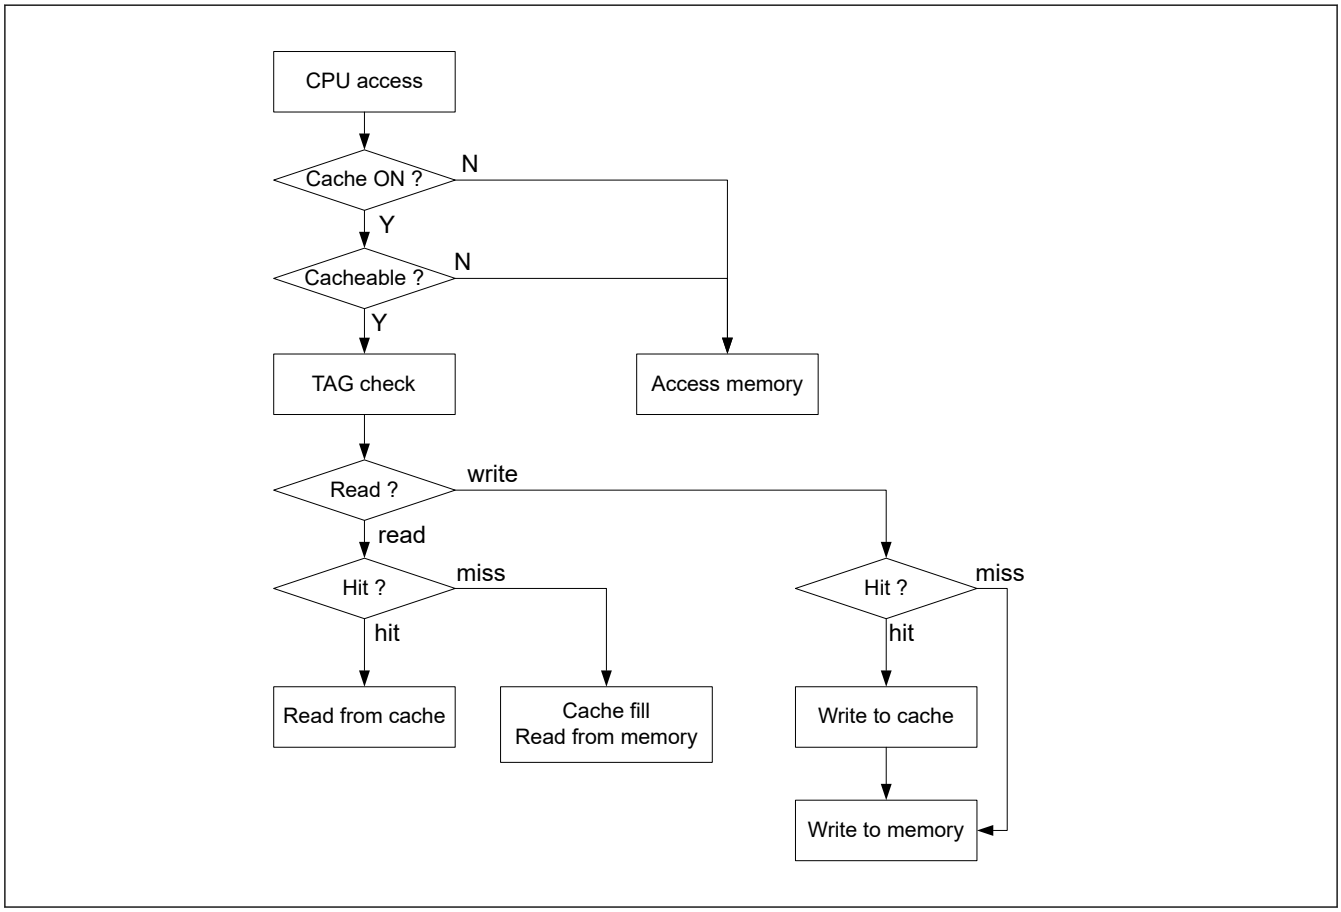

**Figure 13.6 Access flow from CPU to S-cache**

The cache function works when cache is enabled (SCACTL.ENS = 1) and cacheable access is from CPU. The cache checks the address of CPU access request and request in cache tag, then determines whether the CPU access is a hit or a miss-hit.

#### Read miss

The cache reads one cache line data from memory and stores it into the cache data. The cache then returns the required data to CPU.

#### Read hit

The cache reads required data from the cache data and returns it to CPU. Access cycle then determines it is a hit because of the 0 wait cycle.

#### Write miss

The cache processes only a write cycle to memory. No affect to cache data.

#### Write hit

The cache processes both a write cycle to cache data and a write cycle to memory.

### 13.6.3.2 C-Cache

Figure 13.7 shows the access flow from CPU to C-cache.

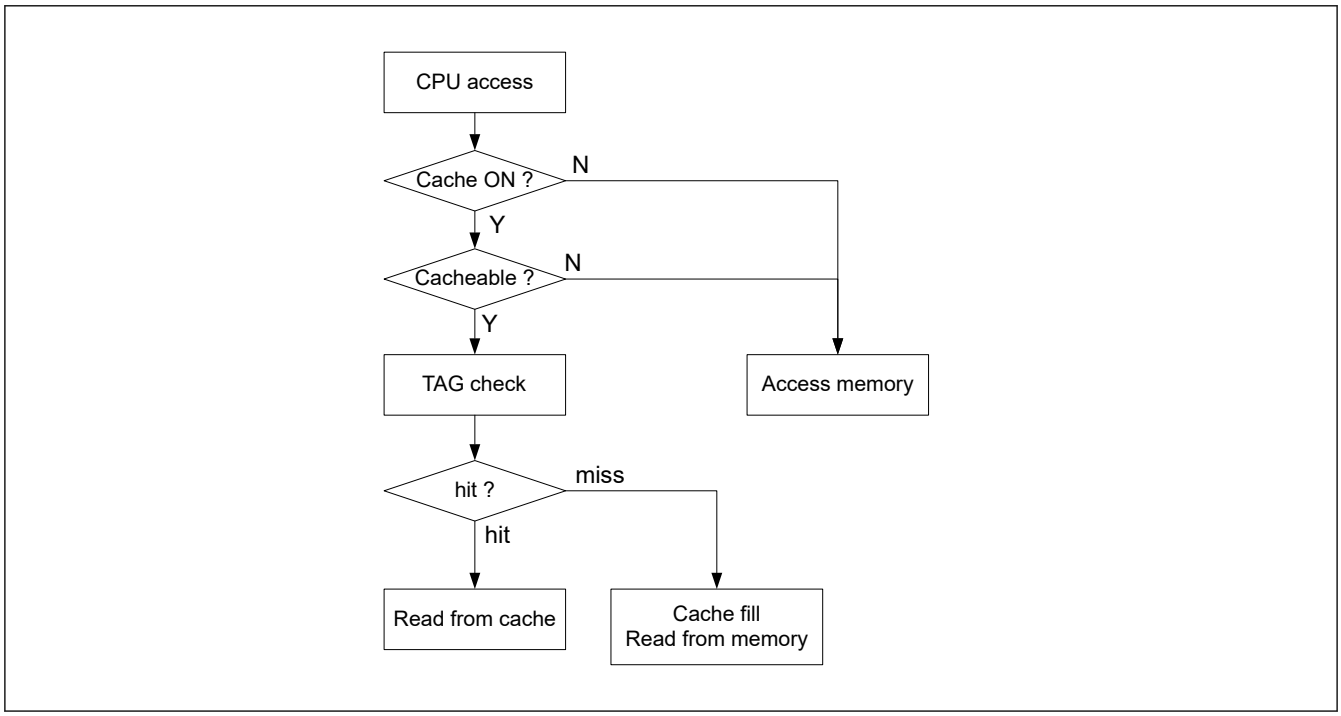

**Figure 13.7 Access flow from CPU to C-cache**

The cache function works when cache is enabled (CCACTL.ENC = 1) and cacheable access is from CPU. The cache checks the address of CPU access request and request in cache tag, then determines whether the CPU access is a hit or a miss-hit.

#### Read miss

The cache reads one cache line data from memory and stores it into the cache data. The cache then returns the required data to CPU.

#### Read hit

The cache reads required data from the cache data and returns it to CPU. Access cycle then determines it is a hit because of the 0 wait cycle.

Because C-cache does not function in the ROM area of C-cache, therefore it operates in read-only access.

### 13.6.3.3 Cache Flush

The Valid bit is cleared with the CAFCT register. However, tag and cache data are not affected by the CAFCT register.

The valid bit is also cleared when CACTL is set from 0 to 1.

Note: After changing the cacheable attribute by the Arm MPU, clear the valid bit using the CAFCT register.

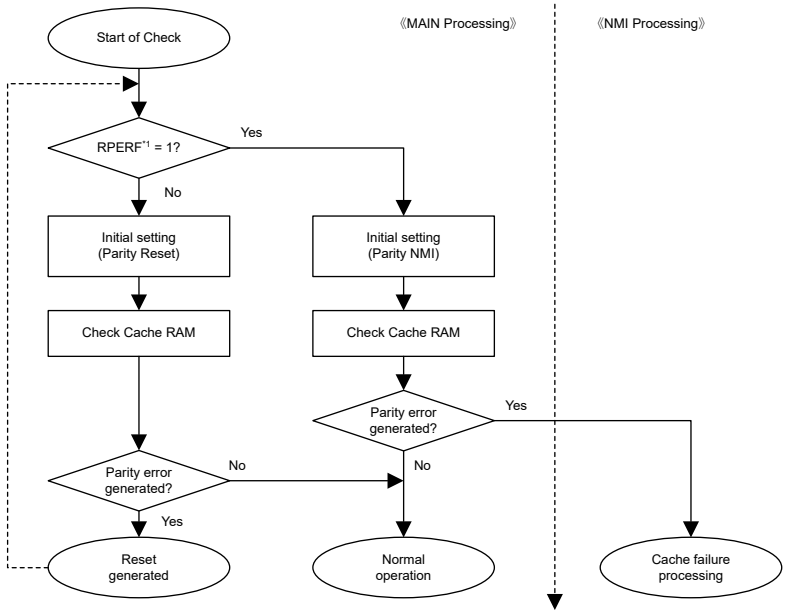
### 13.6.3.4 LRU and Replace

The cache uses LRU (Least Recently Used) mechanism as the cache replacement algorithm. If a CPU access is determined as a hit or a miss-hit, the cache replaces cache data that is not the last restored. Additionally, the cache is tagged as the latest data in LRU of the cache data. Therefore even when the cache line in cache ways are full, the cache can replace cache data using LRU which shows older data.

The algorithm for a 2-way LRU shows which way, for example way 0 or way 1, is the latest stored.

### 13.6.3.5 Parity Check

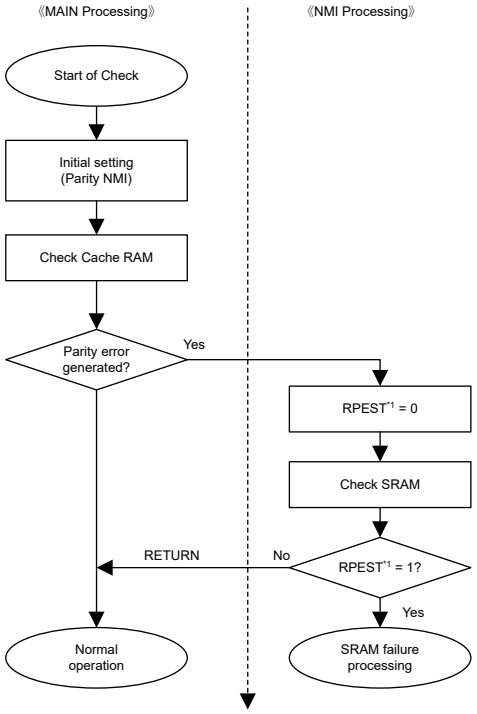
The cache has a parity check function for cache RAM that is stored as cache fill data. The cache has 4-bit parities for 32-bit data, that is when data is read, a parity bit is added to every 8-bit data of 32-bit data width. When the cache reads data with a hit status, it checks for parity errors. When a parity error occurs, a parity error notification is generated.



The cache reads 32-bit data even when the CPU requests a byte read or half-word read.

Note: A parity error might occur even though it is caused by a non validated-data byte of which the CPU does not request.

Parity error notification can be specified as a non-maskable interrupt or a reset request in the CAPOAD register. However, if the debug mode requests to suppress the parity error notification, then notification is not generated.



When a parity error occurs, the cache does not perform a cache flush and does not respond to the CPU with a bus error.

Parity errors often occur due to noise. To confirm whether the cause of the parity error is noise or corruption, see the flows for cache parity check in Figure 13.8 and Figure 13.9.

Note 1. RPERF: Cache Parity Error Reset Detect Flag (RSTSR1.RPERF)

**Figure 13.8 Flow of cache parity check when parity reset is enabled**

Note 1. RPEST: Cache Parity Error Interrupt Detect Flag (NMISR.RPEST)

**Figure 13.9 Flow of cache parity check when parity interrupt is enabled**

### 13.6.3.5.1 Cache RAM Check

Parity error of cache RAM occurs at a read access by CPU with a cache status of read-hit. With a read-hit status, some conditions are required before performing a cache RAM check. For S-cache check, execute the check program in flash memory. For C-cache check, execute the check program in SRAM.

#### (1) Cache RAM check flow

1. Flush all valid bits in cache to clear the cache enable bit.
2. Reserve a 2-KB work memory such as SRAM for S-cache. Because each cache in the MCU is a 2-way set associative with 1 KB RAM per way, a total of 2 KB is required for S-cache. The target address should not be used as reserved area.
3. Set the cache enable to 1.
4. Read data from the target word address of 2 KB using the CPU. The status of cache should be a read-miss with the result stored as cache fill data.
5. Read data in another cache way whose address is calculated by adding the address in step 4. with 1 KB address. The status of cache should be a read-miss with the result stored as cache fill data in another way. Cache RAM check for a write/read-hit status is now complete.
6. Write test data to the target word address in steps 4. and 5.. The status of cache in steps 4. and 5. should be a write-hit with the results written to the cache RAM.
7. Read from the target word address in steps 4. and 5. again. The status of cache in steps 4. and 5. should be a read-hit. Parity check for a word data is now complete.
8. Go to step 1. to continue parity check for different target addresses.

### 13.6.3.6 Bus Error

The association from a bus slave to a bus error is described in the sections that follow.

**In cache off**

The cache returns a bus error to the CPU.

#### For non-cacheable access

The cache returns a bus error to the CPU.

#### During read accesses for cache fill

For the first data that corresponds to a CPU access request, the cache returns a bus error to the CPU. For other read data while filling the cache line, the cache cannot return a bus error to the CPU except for read data with early forwarding. The cache enable bit clears the cache line if the cache accepts a bus error response from the slave.

#### For write-hit status

The cache cannot return a bus error to the CPU because the cache enable bit does not clear the cache line.

#### For write-miss status

The cache cannot return a bus error to the CPU.

### 13.6.3.7 Early Forwarding Function

While filling data in the cache, if the address of the CPU read request and the address of the cache fill request are the same, the cache returns the data to CPU. Table 13.4 shows an example.

**Table 13.4 Example of early forwarding**

| Operation | Access sequence | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Address of CPU read request | 0x04 | 0x08 | 0x0C | 0x14 | → | 0x10 | → | → | → |
| Address of cache fill | 0x04 | 0x08 | 0x0C | 0x10 | 0x14 | 0x18 | 0x1C | 0x00 | — |
| CPU access status | Read (0x04) | Read (0x08) | Read (0x0C) | — | Read (0x14) | — | — | — | Read (0x10) |

When the CPU requests read accesses and the addresses are 0x04, 0x08, 0x0C, 0x14 and 0x10 sequentially, the first read access to address 0x04 is of a miss-hit status and the cache starts to fill data into cache. The early forwarding function allows a return of read data to CPU when accesses are to addresses 0x08, 0x0C and 0x14 while the cache is filling the cache line. On the other hand, access to address 0x10 must wait for the completion of filling the cache line. The cache then returns data for address 0x10 when it finished filling the cache line.

## 13.6.4 Usage Notes

### 13.6.4.1 Cache Line Configuration Register

Writes to the Cache Line Configuration Register are allowed when the status is cache off (SCACTL.ENS = 0 for S-cache, CCACTL.ENC = 0 for C-cache).

### 13.6.4.2 Coherency

The coherency between the cache and internal SRAM must be guaranteed by software.

When allocating shared memory between the CPU and a bus master such as DMAC in the cache support area, invalidate the cache data as necessary.

### 13.6.4.3 Cacheability

When the cache is enabled, the cacheability attribute is determined from the default system address map of the Cortex-M or by using an Arm MPU that excludes 0x2800_0000 to 0x2FFF_FFFF area which is always treated as non-cacheable regardless of the default system address map or Arm MPU setting.

When using the default system address map, the cacheable attribution is determined as follows:

- 0x0000_0000 to 0x27FF_FFFF : Cacheable
- 0x2800_0000 to 0x2FFF_FFFF : Non-cacheable
- 0x3000_0000 to 0x3FFF_FFFF : Cacheable
- 0x4000_0000 to 0x5FFF_FFFF : Non-cacheable

- 0x6000_0000 to 0x9FFF_FFFF : Cacheable
- 0xA000_0000 to 0xFFFF_FFFF : Non-cacheable

Note: If you use QSPI, it is recommended that you use the MAIR_ATTR method to determine the I/O register area of the QSPI.

When not using the default system address map, MAIR_ATTR used for each MPU region determines the cacheable attribution as follows:

- MAIR_ATTR[7:4] = 0000b : Non-cacheable (device memory)
- MAIR_ATTR[7:4] = 0100b : Non-cacheable (normal memory)
- MAIR_ATTR[7:4] = 1010b : Cacheable
- Other settings are not supported in the MCU.

Note: In case of accessing the following areas, the area must be set to non-cacheable:

- Peripheral I/O register area (0x4000_0000 to 0x5FFF_FFFF)
- I/O register area of QSPI (0x6400_0000 to 0x67FF_FFFF)

See the ARM Limited, *ARM v8-M Architecture Reference Manual*.

# 14. Memory Protection Unit (MPU)

## 14.1 Overview

The MCU has one Memory Protection Unit (MPU).

Table 14.1 lists the MPU specifications, and Table 14.2 shows the behavior on detection of each MPU error.

**Table 14.1 MPU specifications**

| Classification | Module/Function | Specifications |
|---|---|---|
| Illegal memory access | Arm® Cortex®-M33 CPU | • Arm CPU has a default memory map. If the CPU makes an illegal access, an exception interrupt occurs<br>• The MPU can change a default memory map. |
| Memory protection | Arm MPU | Memory protection function for the CPU:<br>• (8+8) region MPU with sub regions and background region for secure and non-secure. |
| | Bus master MPU | Memory protection function for each bus master except for the CPU:<br>• DMAC/DTC: 8 regions |

**Table 14.2 Behavior on MPU error detection**

| MPU type | Notification type | Error Response by HRESP signal of AHB I/F | Bus Access on error detection | Storing of error access information |
|---|---|---|---|---|
| Arm MPU | • Hard fault | Not supported | • Does not correctly write access<br>• Does not correctly read access | Stored in the Cortex-M33 processor |
| Bus Master MPU | • Reset or Non-maskable interrupts<br>• Hard fault | Supported | • Write access ignore<br>• Read access is read as 0 | Stored |

For information on error access for the Arm MPU, see section 14.4. References. For information on error access for other MPUs, see section 13.3. Register Descriptions and section 13.4. Bus Error Monitoring Section in section 13, Buses.

## 14.2 Arm MPU

The Arm MPU monitors the addresses accessed by the CPU across the entire address space (0x0000_0000 to 0xFFFF_FFFF) and provides support for:

- (8 + 8) protected regions
- When memory regions overlap, the processor generates a fault if a core access hits the overlapping regions
- Setting access permissions to protected region (read, write, execution)
- Export of memory attributes to the system.

Arm MPU mismatches and permission violations invoke the programmable-priority MemManage fault (Hard Fault) handler. For details, see section 14.4. References.

## 14.3 Bus Master MPU

The bus master MPU monitors the addresses accessed by the bus masters in the entire address space (0x0000_0000 to 0xFFFF_FFFF). Access-control information can be set up to 8 regions in DMAC/DTC and monitor for access to each region is in accord with this information.

If access to a protected region is detected, the bus master MPU generates an internal reset or a non-maskable interrupt. For information on error access, see section 13.3. Register Descriptions and section 13.4. Bus Error Monitoring Section in section 13, Buses.

The access control information for each area consists of protected/not-protected to read or write.

Table 14.3 lists the specifications of the bus master MPU.

**Table 14.3 Bus master MPU specifications**

| Parameter | Description |
|---|---|
| Protected master groups | • DMAC, DTC |
| Protected regions | 0x0000_0000 to 0xFFFF_FFFF |
| Number of regions | • DMAC/DTC: 8 regions |
| Address specification for individual regions | • Specifying start and end address for individual regions |
| Enable or disable setting for memory protection in individual regions | • Enabling or disabling setting for the associated region |
| Access-control settings for individual regions | • Permission for read and write |
| Operation on error detection | • Reset or non-maskable interrupts |
| Register protection | • Protecting registers from illegal writes |
| TrustZone Filter | • DMAC: Security attribution can be set for each regions |

## 14.3.1 Register Descriptions

Bus access must be stopped before writing to MPU registers.

### 14.3.1.1 MMPUSARA : Master Memory Protection Unit Security Attribution Register A

Base address: CPSCU = 0x4000_8000

Offset address: 0x130

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | MMPUASA7 | MMPUASA6 | MMPUASA5 | MMPUASA4 | MMPUASA3 | MMPUASA2 | MMPUASA1 | MMPUASA0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | MMPUASA7 to MMPUASA0 | MMPUA Security Attribution (n = 0 to 7)<br>0: Secure<br>1: Non-secure | R/W |
| 31:8 | — | These bits are read as 1. | R*1 |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. This bit is read only.

#### MMPUASAn bits (MMPUA Security Attribution (n = 0 to 7))

The MMPUASAn bits specify the security attributes of registers for the Bus Master MPU Region Setting register. The target registers are:

- MMPUSDMACn (n = 0 to 7)
- MMPUEDMACn (n = 0 to 7)
- MMPUACDMACn (n = 0 to 7)

### 14.3.1.2 MMPUSARB : Master Memory Protection Unit Security Attribution Register B

Base address: CPSCU = 0x4000_8000

Offset address: 0x134

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MMPUBSA0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MMPUBSA0 | MMPUB Security Attribution<br>0: Secure<br>1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. | R*1 |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. This bit is read-only.

#### MMPUBSA0 bit (MMPUB Security Attribution)

The MMPUBSA0 bit specifies the security attributes of registers for the Bus Master MPU Region Setting register, Protect register, and OAD register. The target registers are:

- MMPUENDMAC
- MMPUENPTDMAC
- MMPURPTDMAC
- MMPURPTDMAC_SEC
- MMPUOAD
- MMPUOADPT

The Secure user provides a Secure API to Non-secure user for the modification of the MMPURPTDMAC value when MMPUBSA0 bit is set to 0 (Secure).

### 14.3.1.3 MMPUSDMACn : MMPU Start Address Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000

Offset address: 0x0204 + 0x010 × n

| Bit position: | 31 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|
| Bit field: | MMPUS[31:5] | — | — | — | — | — | — |
| Value after reset: | x x x x x x x x x x x x x x x x x x x x x x x x x x x | 0 | 0 | 0 | 0 | 0 | |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 4:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 31:5 | MMPUS[31:5] | Region start address register<br>Address where the region starts, for use in region determination | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The MMPUSDMACn (n = 0 to 7) register specifies the start address where the region starts.

This register requires word access. Byte access and half word access is prohibited. When byte access and half word access is executed, operation is not guaranteed.

Regions set by MMPUSDMACn (n = 0 to 7), MMPUEDMACn (n = 0 to 7) and MMPUACDMACn (n = 0 to 7) registers, can be set for a secure access or a non-secure access with the MMPUSARA register. If the corresponding MMPUSARA.MMPUASAn (n = 0 to 7) bit is set to 1, only non-secure access is permitted for that region. On the other hand, if the corresponding MMPUSARA.MMPUASAn (n = 0 to 7) bit is set to 0, only secure access is permitted for that region.

### 14.3.1.4 MMPUEDMACn : MMPU End Address Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000

Offset address: 0x0208 + 0x010 × n

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | 5 | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | MMPUE[31:5] | | | | | | | | | | | | | | | | | | | | | | | — | — | — | — | — | |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | 1 | 1 | 1 | 1 | 1 | |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 4:0 | — | These bits are read as 1. The write value should be 1. | R/W |
| 31:5 | MMPUE[31:5] | Region end address register<br>Address where the region end, for use in region determination | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The MMPUEDMAC (n = 0 to 7) register specifies the end address where the region ends.

This register requires word access. Byte access and half word access is prohibited. When byte access and half word access is executed, operation is not guaranteed.

### 14.3.1.5 MMPUACDMACn : MMPU Access Control Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000

Offset address: 0x0200 + 0x010 × n

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | WP | RP | ENABLE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | ENABLE | Region Enable<br>0: DMAC region n unit is disabled<br>1: DMAC region n unit is enabled | R/W |
| 1 | RP | Read Protection<br>0: Read permission<br>1: Read protection | R/W |
| 2 | WP | Write Protection<br>0: Write permission<br>1: Write protection | R/W |
| 15:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Region n unit sets the ENABLE bit, the RP bit, and the WP bit each.

### ENABLE bit (Region Enable)

The ENABLE bit controls the enable or disable of DMAC/DTC region n (n = 0 to 7) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit control access permission for read and write protection to MMPUSDMACn (n = 0 to 7) and MMPUEDMACn (n = 0 to 7).

When the ENABLE bit is set to 0, access to DMAC region n (n = 0 to 7) is the outside region.

### RP bit (Read Protection)

The RP bit enables or disables read protection of DMAC/DTC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the RP bit is available.

### WP bit (Write Protection)

The WP bit enables or disables write protection of DMAC/DTC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the WP bit is available.

**Table 14.4 Function of Region Control Circuit for DMAC**

| MMPUACDMACn (n = 0 to 7) | | | Access | Region | Output of DMAC region n unit (n = 0 to 7) |
|---|---|---|---|---|---|
| ENABLE | RP | WP | | | |
| 0 | — | — | Read | — | Outside region |
| | | | Write | | Outside region |
| 1 | 0 | 0 | Read | Inside | Permitted region |
| | | | | Outside | Outside region |
| | | | Write | Inside | Permitted region |
| | | | | Outside | Outside region |
| | 0 | 1 | Read | Inside | Permitted region |
| | | | | Outside | Outside region |
| | | | Write | Inside | Protection region |
| | | | | Outside | Outside region |
| | 1 | 0 | Read | Inside | Protection region |
| | | | | Outside | Outside region |
| | | | Write | Inside | Permitted region |
| | | | | Outside | Outside region |
| | 1 | 1 | Read | Inside | Protection region |
| | | | | Outside | Outside region |
| | | | Write | Inside | Protection region |
| | | | | Outside | Outside region |

Note: Each region of DMAC/DTC are set for secure access and non-secure access by MMPUSARA register. In this case, non-secure regions in secure access and secure regions in non-secure access are outside regions.

**Table 14.5 Function of Master Control Circuit for DMAC**

| MMPUENDMAC ENABLE | Output of DMAC region 0 unit | Output of DMAC region 1 unit | Output of DMAC region 2-7 unit | Function of DMAC |
|---|---|---|---|---|
| 1 | Protected region | Don't care | Don't care | Generate error |
| | Don't care | Protected region | Don't care | Generate error |
| | Don't care | Don't care | Protected region | Generate error |
| | Outside region | Outside region | Outside region | Generate error |
| Other cases | | | | No error |

A master MPU error occurs on the following conditions:

1. MMPUENDMAC.ENABLE = 1, and output of one or more region n unit is protected region.
2. MMPUENDMAC.ENABLE = 1, and output of all region n unit are outside region.

Other cases are handled as permitted region.

### 14.3.1.6 MMPUENDMAC : MMPU Enable Register for DMAC

Base address: RMPU = 0x4000_0000

Offset address: 0x0100

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | ENABLE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | ENABLE | Bus Master MPU of DMAC enable<br>0: Bus Master MPU of DMAC is disabled<br>1: Bus Master MPU of DMAC is enabled | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code<br>These bits enable or disable writes to the ENABLE bit. | W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

#### ENABLE bit (Bus Master MPU of DMAC enable)

The ENABLE bit controls enable or disable of the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACDMACn (n = 0 to 7) is valid. When the ENABLE bit is set to 0, MMPUACDMACn (n = 0 to 7) is invalid for all regions. The bus master MPU function sets the ENABLE bit of each master group. When the ENABLE bit is set, write 0xA5 in KEY[7:0] at the same time.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the ENABLE bit. When writing to the ENABLE bit, write 0xA5 in KEY[7:0] bits at the same time. When values other than 0xA5 are written to KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

### 14.3.1.7 MMPUENPTDMAC : MMPU Enable Protect Register for DMAC

Base address: RMPU = 0x4000_0000

Offset address: 0x0104

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | PROTECT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PROTECT | Protection of register<br>0: MMPUENDMAC register writes are possible<br>1: MMPUENDMAC register writes are protected. Read is possible | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code<br>These bits enable or disable writes to the PROTECT bit. | W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

#### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the MMPUENDMAC register.

When writing to the PROTECT bit, write 0xA5 in KEY[7:0] at the same time.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 in KEY[7:0] at the same time. When values other than 0xA5 are written in KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

### 14.3.1.8 MMPURPTDMAC : MMPU Regions Protect Register for DMAC

Base address: RMPU = 0x4000_0000

Offset address: 0x0108

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | PROTECT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PROTECT | Protection of register<br>0: Bus Master MPU register for DMAC writing is possible<br>1: Bus Master MPU register for DMAC writing is protected. Read is possible | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code<br>These bits enable or disable writes to the PROTECT bit. | W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC.PROTECT controls the following registers:

- MMPUSDMACn (n = 0 to 7) of non-secure program
- MMPUEDMACn (n = 0 to 7) of non-secure program
- MMPUACDMACn (n = 0 to 7) of non-secure program

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the PROTECT bit is not updated.

The KEY[7:0] bits always read as 0x00.

## 14.3.1.9 MMPURPTDMAC_SEC : MMPU Regions Protect Register for DMAC Secure

Base address: RMPU = 0x4000_0000

Offset address: 0x010C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | PROTECT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PROTECT | Protection of register<br>0: Bus master MPU register for DMAC secure writes are possible<br>1: Bus master MPU register for DMAC secure writes are protected. Read is possible | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code<br>These bits enable or disable writes to the PROTECT bit. | W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC_SEC.PROTECT controls the following registers:

- MMPUSDMACn (n = 0 to 7) of Secure program
- MMPUEDMACn (n = 0 to 7) of Secure program
- MMPUACDMACn (n = 0 to 7) of Secure program

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the PROTECT bit is not updated.

The KEY[7:0] bits are always read as 0x00.

### 14.3.1.10 MMPUOAD : MMPU Operation After Detection Register

Base address: RMPU = 0x4000_0000

Offset address: 0x0000

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | OAD |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | OAD | Operation After Detection<br>0: Non-maskable interrupt<br>1: Reset | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code<br>This bit enables or disables writes to the OAD bit. | W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

#### OAD bit (Operation After Detection)

The OAD bit is specified to generate either reset or non-maskable interrupt when the access to the protect region is detected by the BUS Master MPU.

When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the OAD bit. When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the OAD bit is not updated.

The KEY[7:0] bits always read as 0x00.

### 14.3.1.11 MMPUOADPT : MMPU Operation After Detection Protect Register

Base address: RMPU = 0x4000_0000

Offset address: 0x0004

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | PROTECT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PROTECT | Protection of register<br>0: MMPUOAD register writes are possible<br>1: MMPUOAD register writes are protected. Read is possible | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key code<br>These bits enable or disable writes to the PROTECT bit. | W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

**PROTECT bit (Protection of register)**

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPUOADPT.PROTECT controls the following register:

- MMPUOAD

When the PROTECT bit is set simultaneously, write 0xA5 to the KEY[7:0] bits using half word access.

**KEY[7:0] bits (Key code)**

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit simultaneously, write 0xA5 to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

## 14.3.2 Operation

### 14.3.2.1 Memory protection

The bus master MPU monitors memory access using control settings made individually for the access control regions. If access to a protected region is detected, the bus master MPU generates a memory protection error.

Bus Master MPU can be set for up to 8 protection regions. It is protection region when set up of permission region and protection region overlaps. It is protection region when set up of two protection region overlaps.

Bus Master MPU has master groups of DMAC/DTC.

Memory protection checks the address of the bus which the master group unified. Therefore, all the access of a master group is detected by memory protection.

The region setting registers of the Bus Master MPU for DMAC/DTC can be set for secure access and non-secure access using the MMPUSARA register. Make secure access and non-secure access settings the same for each DMAC/DTC channel and the corresponding region setting registers of the Bus Master MPU.

Bus Master MPU is permission of all regions after reset. All region is protected by setting MMPUENDMAC.ENABLE = 1.

Each region sets up a permission region on the protection region. If access to the protected region is detected, Bus Master MPU will generate an error.

Figure 14.1 shows the use case of a bus master MPU.

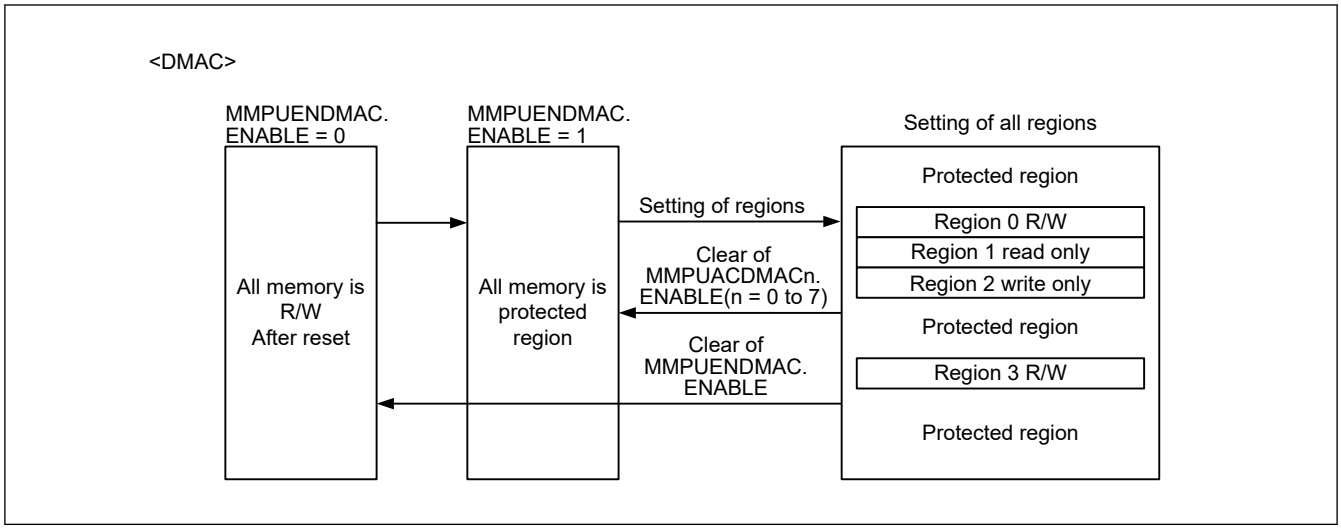


**Figure 14.1 Use case of bus master MPU**

Figure 14.2 shows the access permission or protection by the overlapping bus master MPU regions.

Access control for the overlapping regions is as follows:

- The region is handled as a protected region when output of one or more region units is a protected region
- The region is handled as a protected region when output of all region units is outside of the regions
- Other cases are handled as permitted regions.

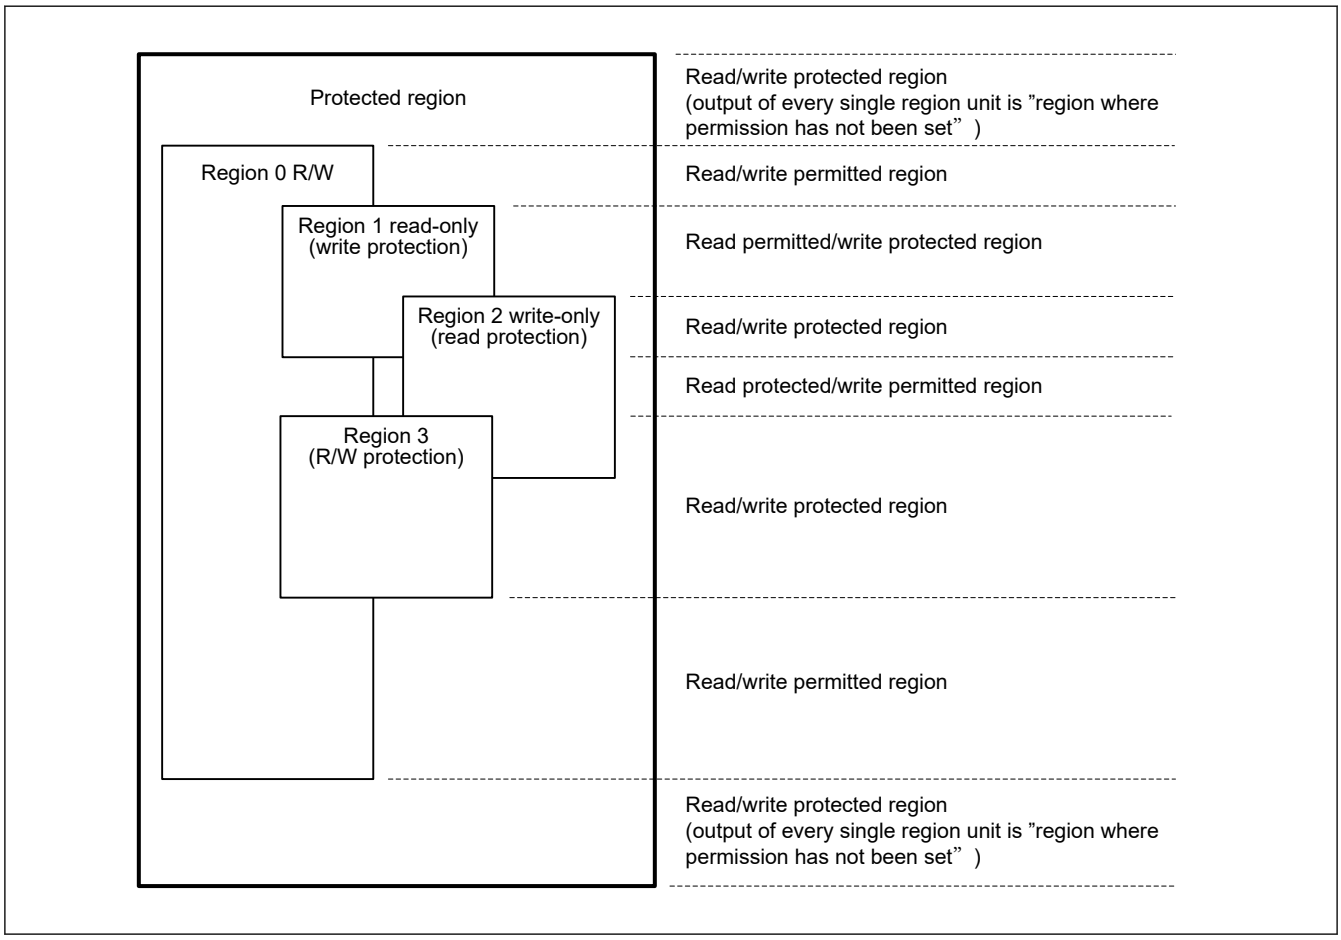

**Figure 14.2 Access permission or protection by overlap of the bus master MPU regions**

Figure 14.3 shows the register setting flow after reset. During this register setting, stop all bus masters except the CPU.

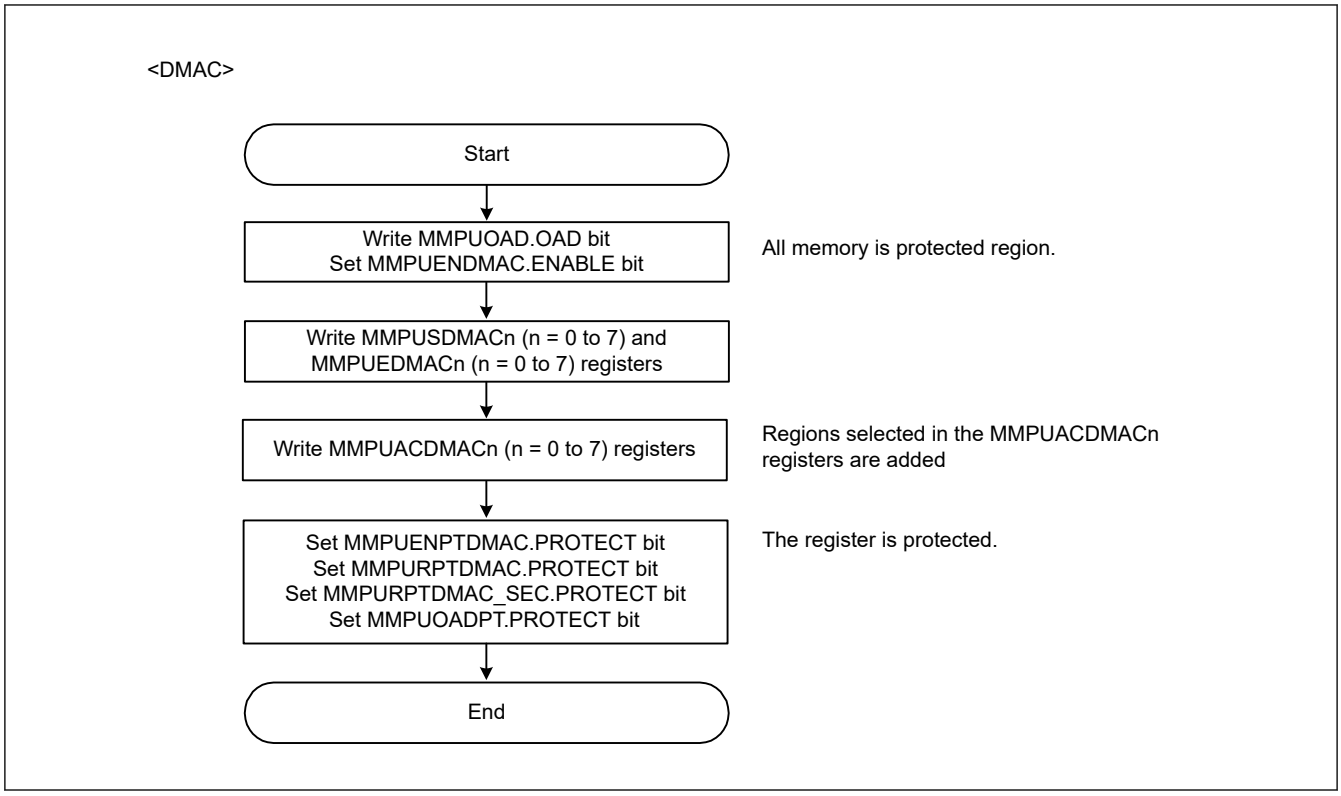

**Figure 14.3 Register setting flow of bus master MPU after reset**

Figure 14.4 shows the register setting flow for adding regions. During this register setting, stop all masters except the CPU.

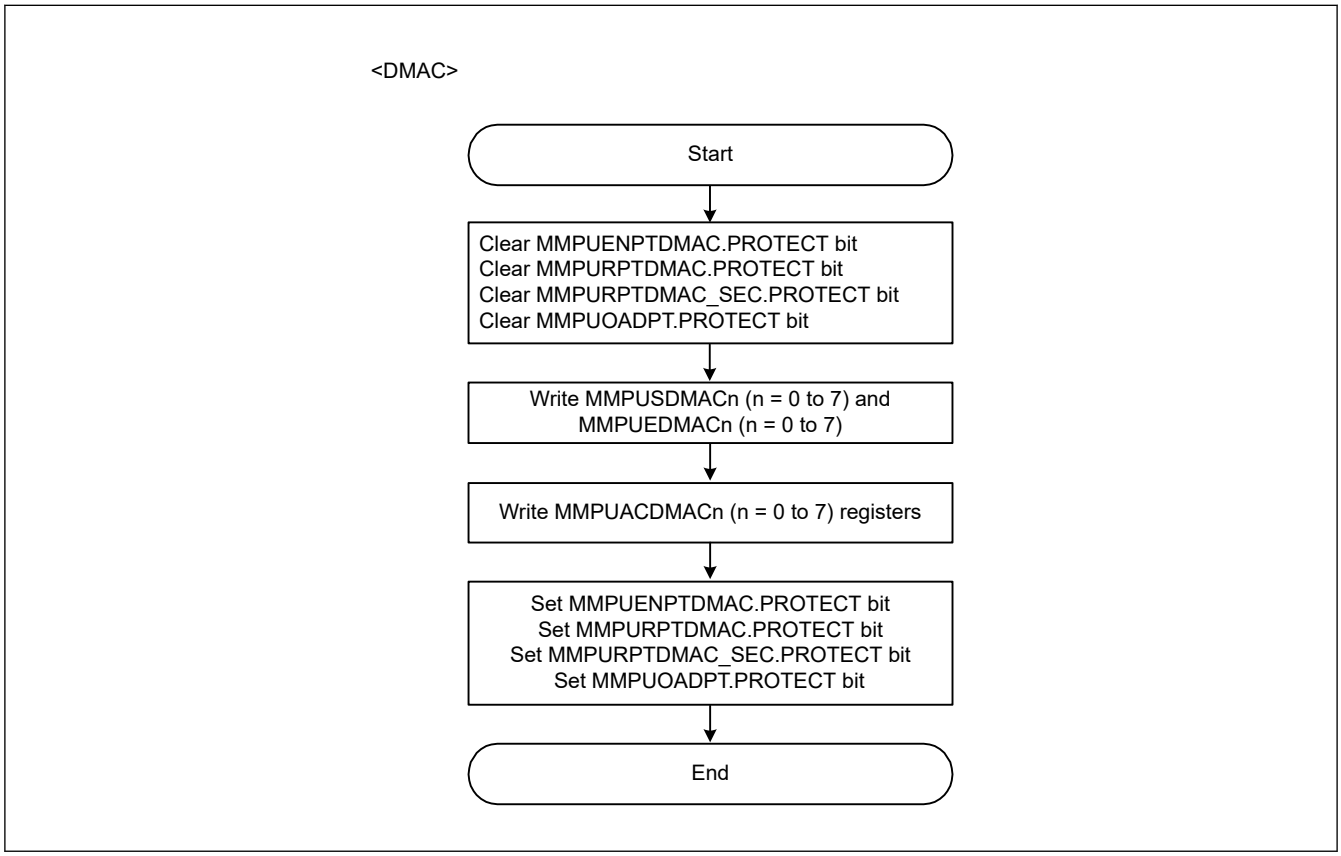

**Figure 14.4 Register setting flow for region addition**

#### 14.3.2.2 Protecting the registers

Registers related to the Bus Master MPU can be protected with the PROTECT bit in the MMPUENPTDMA, MMPURPTDMAC, MMPURPTDMAC_SEC and MMPUOADPT registers.

**Table 14.6 PROTECT bit and Protected target registers**

| PROTECT bit | Protect target registers |
|---|---|
| MMPUENPTDMAC.PROTECT | MMPUENDMAC |
| MMPURPTDMAC.PROTECT | The following registers set to Non-secure by MMPUSARA.MMPUASAn (n = 0 to 7).<br>MMPUSDMACn (n = 0 to 7)<br>MMPUEDMACn (n = 0 to 7)<br>MMPUACDMACn (n = 0 to 7) |
| MMPURPTDMAC_SEC.PROTECT | The following registers set to Secure by MMPUSARA.MMPUASAn (n = 0 to 7).<br>MMPUSDMACn (n = 0 to 7)<br>MMPUEDMACn (n = 0 to 7)<br>MMPUACDMACn (n = 0 to 7) |
| MMPUOADPT.PROTECT | MMPUOAD |

#### 14.3.2.3 Memory protection error

If access to a protected region is detected, the bus master MPU generates an error. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or a reset.

The non-maskable interrupt status is indicated in ICU.NMISR.BUSMST. For details, see section 12, Interrupt Controller Unit (ICU). The reset status is indicated in SYSTEM.RSTSR1.BUSMRF. For details, see section 5, Resets.

# 15. DMA Controller (DMAC)

## 15.1 Overview

The MCU includes an 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

Table 15.1 lists the DMAC specifications, and Figure 15.1 shows a block diagram of the DMAC.

**Table 15.1 DMAC specifications (1 of 2)**

| Item | | Description |
|---|---|---|
| Number of channels | | 8 channels (DMACn (n = 0 to 7)) |
| Transfer space | | 4 GB<br>(0x00000000 to 0xFFFFFFFF excluding reserved areas) |
| Maximum transfer volume | | 64 M data<br>(Maximum number of transfers in block transfer mode: 1,024 data/block × 65,536 blocks) |
| DMAC activation source | | Selectable for each channel:<br>• Software trigger<br>• Interrupt requests from peripheral modules or trigger from external interrupt input pins.*1 |
| Channel priority | | Channel 0 > Channel 1 > Channel 2 > Channel 3… > Channel 7 (Channel 0: Highest) |
| Transfer data | Single data | Bit length: 8, 16, 32 bits |
| | Block size | Number of data: 1 to 1,024 |
| Transfer mode | Normal transfer mode | • One data transfer by one DMA transfer request<br>• Free-running function (setting in which total number of data transfers is not specified) settable |
| | Repeat transfer mode | • One data transfer by one DMA transfer request<br>• Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination.<br>• Maximum settable repeat size: 1,024<br>• Selectable free-running function |
| | Repeat-block transfer mode | • One block data transfer by one DMA transfer request<br>• Maximum settable block size: 1,024<br>• Block transfer can be repeated<br>• Maximum settable repeat size: 64K<br>• Selectable free-running function |
| | Block transfer mode | • One block data transfer by one DMA transfer request<br>• Maximum settable block size: 1,024 data<br>• Selectable free-running function |
| Selective functions | Extended repeat area function | • Function in which data can be transferred by repeating the address values in the specified range with the upper bit values in the transfer address register fixed<br>• Area of 2 bytes to 128 Mbytes separately settable as extended repeat area for transfer source and destination |
| Processing on DMAC transfer error | | • When a DMAC transfer error occurs, the transfer on the channel that caused the error is stopped<br>• A request to clear the register for activation request of DMAC error channel is sent to ICU |
| Interrupt (DMACn_INT) | Transfer end interrupt | Generated on completion of transferring data volume specified by the transfer counter |
| | Transfer escape end interrupt | • Generated when the repeat size of data transfer is completed<br>• Generated when the source address extended repeat area overflows<br>• Generated when the destination address extended repeat area overflows |
| Interrupt (DMA_TRANSERR) | Error response detection interrupt | Generated when the DMAC transfer error occurs |
| Event link activation (DMACn_INT) | | An event link request is generated after each data transfer (for block transfer, after each block is transferred) |

**Table 15.1 DMAC specifications (2 of 2)**

| Item | Description |
|---|---|
| Master TrustZone Filter | TrustZone violation area of Flash and SRAM is detected before a non-secure channel access the bus |
| Power consumption reduction function | Module-stop state can be set |
| TrustZone Filter | Security attribution can be set for each channels |

Note: Security attribution Register of DMAC channel is described in ICU.ICUSARC.
Note 1. For details on DMAC activation sources, see Table 12.4 in section 12, Interrupt Controller Unit (ICU).

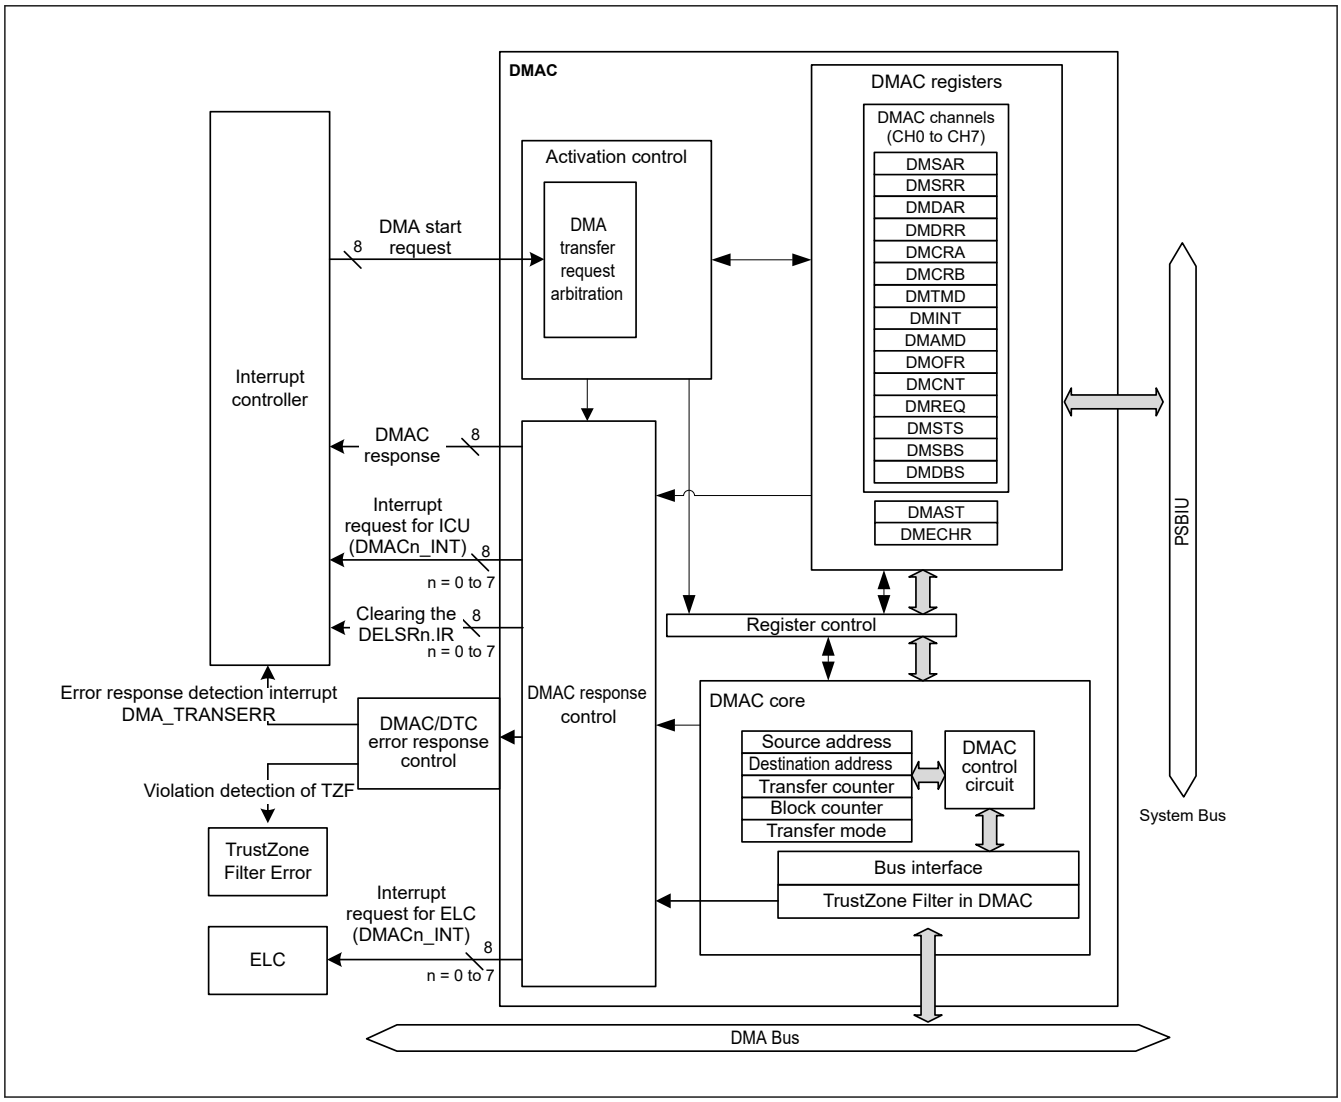

**Figure 15.1 Block diagram of DMAC**

## 15.2 Register Descriptions

### 15.2.1 DMACSAR : DMAC Controller Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x34

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DMASTSA |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DMASTSA | DMAST Security Attribution<br>0: Secure<br>1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

For DMAC, security attribution is set for each channel. However, this register only sets the DMAST register security attribute. The security attribution setting of each channel is described in the section 12.2.3. ICUSARC : Interrupt Controller Unit Security Attribution Register C.

#### DMASTSA bit (DMAST Security Attribution)

Security attributes of registers for DMAST. Do not write to DMASTSA bit while DMA transfer is enabled or a bus master is writing to the DMA registers.

### 15.2.2 DMSAR : DMA Source Address Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

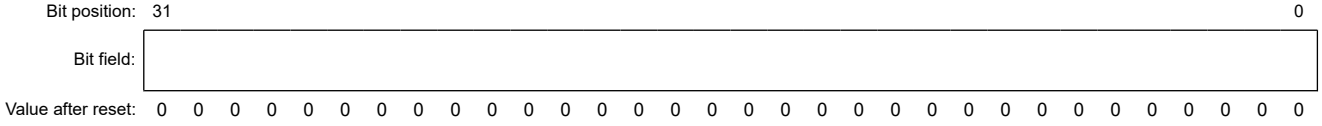
Offset address: 0x00

| Bit position: | 31 | 0 |
|---|---|---|
| Bit field: | | |
| Value after reset: | 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 | |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | Specifies the transfer source start address<br>Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 Gbytes). | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.



Set DMSAR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

## 15.2.3 DMSRR : DMA Source Reload Address Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x20

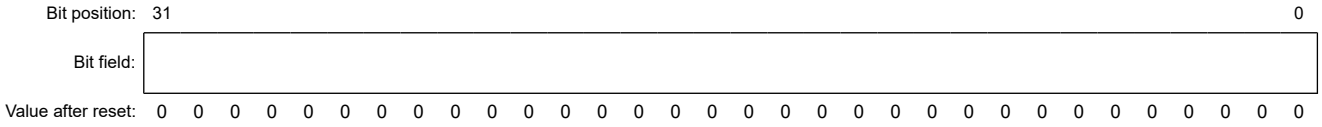
| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | Specifies the transfer source reload address<br>Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 GB). | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Set DMSRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

DMSRR is the initial value of DMSAR. In repeat-block transfer mode, DMSAR reloads the value of DMSRR after the specified transfer is finished.



In normal transfer mode, repeat transfer mode, and block transfer mode DMSRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

## 15.2.4 DMDAR : DMA Destination Address Register

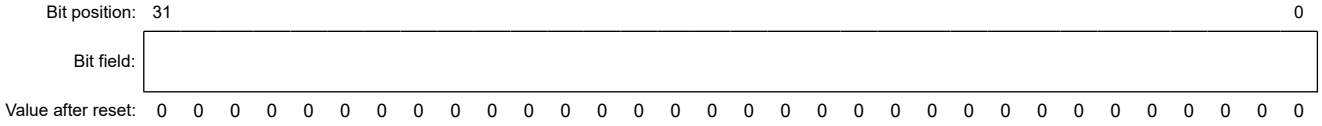
Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x04

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | Specifies the transfer destination start address<br>Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 Gbytes). | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.



Set DMDAR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

## 15.2.5 DMDRR : DMA Destination Reload Address Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x24

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | Specifies the transfer destination reload address<br>Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 Gbytes). | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Set DMDRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

DMDRR is the initial value of DMDAR. In repeat-block transfer mode, DMDAR reloads the value of DMDRR after the specified transfer is finished.

In normal transfer mode, repeat transfer mode and block transfer mode, DMDRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

## 15.2.6 DMCRA : DMA Transfer Count Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x08

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | DMCRAH[9:0] | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DMCRAL[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | DMCRAL[15:0] | Lower bits of transfer count<br>Specifies the number of transfer operations. | R/W |
| 25:16 | DMCRAH[9:0] | Upper bits of transfer count<br>Specifies the number of transfer operations. | R/W |
| 31:26 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Set the same value for DMCRAH and DMCRAL in repeat transfer mode, block transfer mode, and repeat-block transfer mode. Bits [15:10] are fixed to 0 in repeat transfer mode, block transfer mode, and repeat-block transfer mode.

### (1) Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

DMCRAL functions as a 16-bit transfer counter.

The number of transfer operations is one when the setting is 0x0001, and 65,535 when it is 0xFFFF. The value is decremented by one each time data is transferred.

When the setting is 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function).

Free running function is not selected by DMTMD.TKP bit in normal transfer mode.

DMCRAH is not used in normal transfer mode. Write 0x0000 to DMCRAH.

### (2) Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter.

The number of transfer operations is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat transfer mode, a value in the range of 0x000 to 0x3FF (1 to 1024) can be set for DMCRAH and DMCRAL.

Setting bits [15:10] in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

### (3) Block Transfer Mode (DMTMD.MD[1:0] = 10b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits [15:10] in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

### (4) Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat-block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits [15:10] in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

## 15.2.7 DMCRB : DMA Block Transfer Count Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x0C

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DMCRBH[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DMCRBL[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | DMCRBL[15:0] | Functions as a number of block, repeat or repeat-block transfer counter.<br>0x0001 to 0xFFFF (1 to 65535)<br>0x0000 (65536) | R/W |
| 31:16 | DMCRBH[15:0] | Specifies the number of block, repeat or repeat-block transfer operations.<br>0x0001 to 0xFFFF (1 to 65535)<br>0x0000 (65536) | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Set the same value for DMCRBH[15:0] and DMCRBL[15:0] in repeat transfer mode, block transfer mode and repeat-block transfer mode.

DMCRBH[15:0] specifies the number of block, repeat and repeat-block transfer operations, and DMCRBL[15:0] functions as a 16-bit the number of block counter in block, repeat, and repeat-block transfer mode, respectively.

The number of transfer operations is one when the setting is 0x0001, 65535 when it is 0xFFFF, and 65536 when it is 0x0000.

In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred.

In block transfer mode and repeat-block transfer mode, the value is decremented by one when the final data of one block size is transferred.

In normal transfer mode, DMCRB is not used. The setting is invalid.

When DMTMD.TKP is 1 and the final data of one repeat size or one block size is transferred, DMCRBL[15:0] reloads the value of DMCRBH[15:0] automatically.

## 15.2.8 DMTMD : DMA Transfer Mode Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x10

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | MD[1:0] | | DTS[1:0] | | — | TKP | SZ[1:0] | | — | — | — | — | — | — | DCTG[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | DCTG[1:0] | Transfer Request Source Select<br>0 0: Software request<br>0 1: Hardware request*1<br>1 0: Setting prohibited<br>1 1: Setting prohibited | R/W |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 9:8 | SZ[1:0] | Transfer Data Size Select<br>0 0: 8 bits<br>0 1: 16 bits<br>1 0: 32 bits<br>1 1: Setting prohibited | R/W |
| 10 | TKP | Transfer Keeping<br>0: Transfer is stopped by completion of specified total number of transfer operations<br>1: Transfer is not stopped by completion of specified total number of transfer operations (free-running) | R/W |
| 11 | — | This bit is read as 0. The write value should be 0. | R/W |
| 13:12 | DTS[1:0] | Repeat Area Select<br>0 0: The destination is specified as the repeat area or block area<br>0 1: The source is specified as the repeat area or block area<br>1 0: The repeat area or block area is not specified<br>1 1: Setting prohibited | R/W |
| 15:14 | MD[1:0] | Transfer Mode Select<br>0 0: Normal transfer<br>0 1: Repeat transfer<br>1 0: Block transfer<br>1 1: Repeat-block transfer | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. To select the DMAC activation source, use the DELSRn registers of the ICU. For details on DMAC activation sources, see Table 12.4 in section 12, Interrupt Controller Unit (ICU).

### DTS[1:0] bits (Repeat Area Select)

DTS[1:0] select either the source or destination as the repeat area in repeat or block transfer mode. In normal or repeat-block transfer mode, setting these bits is invalid.

### TKP bit (Transfer Keeping)

TKP selects either stopping transfer or keeping transfer by completion of specified total number of transfer operations in repeat, block or repeat-block transfer mode. In normal transfer mode, setting this bit is invalid.

## 15.2.9 DMINT : DMA Interrupt Setting Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x13

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | DTIE | ESIE | RPTIE | SARIE | DARIE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DARIE | Destination Address Extended Repeat Area Overflow Interrupt Enable<br>0: Disables an interrupt request for an extended repeat area overflow on the destination address<br>1: Enables an interrupt request for an extended repeat area overflow on the destination address | R/W |
| 1 | SARIE | Source Address Extended Repeat Area Overflow Interrupt Enable<br>0: Disables an interrupt request for an extended repeat area overflow on the source address<br>1: Enables an interrupt request for an extended repeat area overflow on the source address | R/W |
| 2 | RPTIE | Repeat Size End Interrupt Enable<br>0: Disables the repeat size end interrupt request<br>1: Enables the repeat size end interrupt request | R/W |
| 3 | ESIE | Transfer Escape End Interrupt Enable<br>0: Disables the transfer escape end interrupt request<br>1: Enables the transfer escape end interrupt request | R/W |
| 4 | DTIE | Transfer End Interrupt Enable<br>0: Disables the transfer end interrupt request<br>1: Enables the transfer end interrupt request | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### DARIE bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while DARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the destination address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the destination address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

### SARIE bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while SARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the source address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the source address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

### RPTIE bit (Repeat Size End Interrupt Enable)

When RPTIE bit is set to 1 in repeat transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-repeat size data transfer. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When this bit is set to 1 in block transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-block data transfer in the same way as repeat transfer mode. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When set to repeat-block transfer mode, do not use this bit.

### ESIE bit (Transfer Escape End Interrupt Enable)

ESIE bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that are generated during DMA transfer.

The transfer escape end interrupt is generated when the DMSTS.ESIF flag is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by clearing this bit or the DMSTS.ESIF flag to 0.

### DTIE bit (Transfer End Interrupt Enable)

DTIE bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers.

The transfer end interrupt is generated when the DMSTS.DTIF flag is set to 1 with this bit set to 1. The transfer end interrupt is cleared by clearing this bit or the DMSTS.DTIF flag to 0.

## 15.2.10 DMAMD : DMA Address Mode Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x14

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | SM[1:0] | | SADR | SARA[4:0] | | | | | DM[1:0] | | DADR | DARA[4:0] | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 4:0 | DARA[4:0] | Destination Address Extended Repeat Area<br>Specifies the extended repeat area on the destination address. For details on the settings, see Table 15.2. | R/W |
| 5 | DADR | Destination Address Update Select After Reload<br>0: Only reloading<br>1: Add index after reloading | R/W |
| 7:6 | DM[1:0] | Destination Address Update Mode<br>0 0: Destination address is fixed<br>0 1: Offset addition<br>1 0: Destination address is incremented<br>1 1: Destination address is decremented | R/W |
| 12:8 | SARA[4:0] | Source Address Extended Repeat Area<br>Specifies the extended repeat area on the source address. For details on the settings, see Table 15.2. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 13 | SADR | Source Address Update Select After Reload<br>0: Only reloading<br>1: Add index after reloading | R/W |
| 15:14 | SM[1:0] | Source Address Update Mode<br>0 0: Source address is fixed<br>0 1: Offset addition<br>1 0: Source address is incremented<br>1 1: Source address is decremented | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### DARA[4:0] bits (Destination Address Extended Repeat Area)

DARA[4:0] bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the DARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.DARIE bit set to 1. Table 15.2 lists the settings and the corresponding extended repeat areas.

### DADR bits (Destination Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMDAR after reloading DMDRR.

When this bit is set to 1, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after reloading DMDRR.

When this bit is set to 0, DMDAR only reloads DMDRR. This behavior is described in Table 15.13.

In normal, repeat or block transfer mode, this bit is ignored.

### DM[1:0] bits (Destination Address Update Mode)

DM[1:0] bits select the mode of updating the destination address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

### SARA[4:0] bits (Source Address Extended Repeat Area)

SARA[4:0] bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the SARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.SARIE bit set to 1. Table 15.2 lists the settings and the corresponding extended repeat areas.

### SADR bits (Source Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMSAR after reloading DMSRR.

When this bit is set to 1, an index value ((DMSBSH-DMSBSL) × DataSize) is added to DMSAR after reloading DMSRR.

When this bit is set to 0, DMSAR only reloads DMSRR. This behavior is described in Table 15.12.

In normal, repeat or block transfer mode, this bit is ignored.

### SM[1:0] bits (Source Address Update Mode)

SM[1:0] bits select the mode of updating the source address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

**Table 15.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (1 of 2)**

| SARA[4:0] or DARA[4:0] settings | Extended repeat area |
|---|---|
| 00000b | Not specified |
| 00001b | 2 bytes specified as extended repeat area by the lower 1 bit of the address |
| 00010b | 4 bytes specified as extended repeat area by the lower 2 bits of the address |
| 00011b | 8 bytes specified as extended repeat area by the lower 3 bits of the address |
| 00100b | 16 bytes specified as extended repeat area by the lower 4 bits of the address |
| 00101b | 32 bytes specified as extended repeat area by the lower 5 bits of the address |
| 00110b | 64 bytes specified as extended repeat area by the lower 6 bits of the address |
| 00111b | 128 bytes specified as extended repeat area by the lower 7 bits of the address |
| 01000b | 256 bytes specified as extended repeat area by the lower 8 bits of the address |
| 01001b | 512 bytes specified as extended repeat area by the lower 9 bits of the address |
| 01010b | 1 Kbyte specified as extended repeat area by the lower 10 bits of the address |
| 01011b | 2 Kbytes specified as extended repeat area by the lower 11 bits of the address |
| 01100b | 4 Kbytes specified as extended repeat area by the lower 12 bits of the address |
| 01101b | 8 Kbytes specified as extended repeat area by the lower 13 bits of the address |
| 01110b | 16 Kbytes specified as extended repeat area by the lower 14 bits of the address |
| 01111b | 32 Kbytes specified as extended repeat area by the lower 15 bits of the address |
| 10000b | 64 Kbytes specified as extended repeat area by the lower 16 bits of the address |
| 10001b | 128 Kbytes specified as extended repeat area by the lower 17 bits of the address |
| 10010b | 256 Kbytes specified as extended repeat area by the lower 18 bits of the address |
| 10011b | 512 Kbytes specified as extended repeat area by the lower 19 bits of the address |
| 10100b | 1 Mbyte specified as extended repeat area by the lower 20 bits of the address |
| 10101b | 2 Mbytes specified as extended repeat area by the lower 21 bits of the address |
| 10110b | 4 Mbytes specified as extended repeat area by the lower 22 bits of the address |
| 10111b | 8 Mbytes specified as extended repeat area by the lower 23 bits of the address |
| 11000b | 16 Mbytes specified as extended repeat area by the lower 24 bits of the address |
| 11001b | 32 Mbytes specified as extended repeat area by the lower 25 bits of the address |

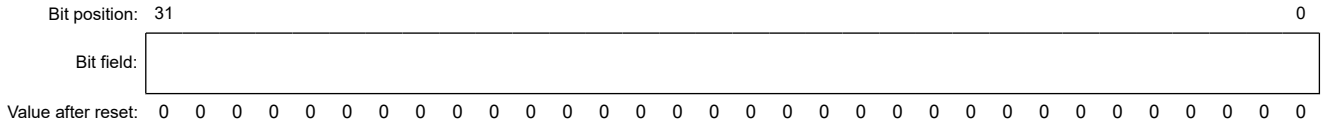


**Table 15.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (2 of 2)**

| SARA[4:0] or DARA[4:0] settings | Extended repeat area |
|---|---|
| 11010b | 64 Mbytes specified as extended repeat area by the lower 26 bits of the address |
| 11011b | 128 Mbytes specified as extended repeat area by the lower 27 bits of the address |
| 11100b to 11111b | Setting prohibited. |

## 15.2.11 DMOFR : DMA Offset Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

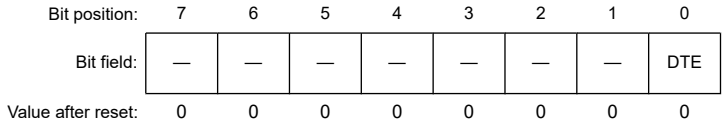
Offset address: 0x18

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | Specifies the offset when offset addition is selected as the address update mode for transfer source or destination.<br>0x00000000 to 0x00FFFFFF (0 bytes to (16 M – 1) bytes)<br>0xFF000000 to 0xFFFFFFFF (–16 Mbytes to –1 byte) | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Write to this register while the DMAC operation is stopped or DMA transfer is disabled (not during data transfer).



Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading DMOFR returns the extended value.

In repeat-block transfer mode, the offset is not specified by DMOFR when offset addition is selected, write 0 to DMOFR.

## 15.2.12 DMCNT : DMA Transfer Enable Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1C

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DTE | DMA Transfer Enable<br>0: Disables DMA transfer<br>1: Enables DMA transfer | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### DTE bit (DMA Transfer Enable)

When the DMAST.DMST bit is set to 1 (DMAC activation is enabled) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit
- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt
- When DMA transfer is stopped by the access error occurs. See section 15.5. Processing on DMA Transfer Error.

## 15.2.13 DMREQ : DMA Software Start Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1D

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | CLRS | — | — | — | SWREQ |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SWREQ | DMA Software Start<br>0: DMA transfer is not requested<br>1: DMA transfer is requested | R/W |
| 3:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | CLRS | DMA Software Start Bit Auto Clear Select<br>0: SWREQ bit is cleared after DMA transfer is started by software<br>1: SWREQ bit is not cleared after DMA transfer is started by software | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### SWREQ bit (DMA Software Start)

When 1 is written to SWREQ bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is cleared to 0 if the CLRS bit is set to 0. This bit is not cleared to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer.

Note: Setting this bit is valid and DMA transfer by software is enabled only when the DMTMD.DCTG[1:0] bits are set to 00b (DMAC activation source is software).

Setting this bit is invalid when the DMTMD.DCTG[1:0] bits are set to a value other than 00b.

To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When 0 is written to this bit.

### CLRS bit (DMA Software Start Bit Auto Clear Select)

CLRS bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is cleared to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not cleared to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

## 15.2.14 DMSTS : DMA Status Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1E

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ACT | — | — | DTIF | — | — | — | ESIF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | ESIF | Transfer Escape End Interrupt Flag<br>0: A transfer escape end interrupt has not been generated<br>1: A transfer escape end interrupt has been generated | R/W*1 |
| 3:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | DTIF | Transfer End Interrupt Flag<br>0: A transfer end interrupt has not been generated<br>1: A transfer end interrupt has been generated | R/W*1 |
| 6:5 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | ACT | DMAC Active Flag<br>0: DMAC is in the idle state<br>1: DMAC is operating | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only 0 can be written to clear the flag.

### ESIF flag (Transfer Escape End Interrupt Flag)

This flag indicates that the transfer escape end interrupt has been generated.

[Setting conditions]

- When 1-repeat size data transfer is completed in repeat transfer mode with the DMINT.RPTIE bit set to 1.
- When 1-block data transfer is completed in block transfer mode with the DMINT.RPTIE bit set to 1.
- When an extended repeat area overflow on the source address occurs while the DMINT.SARIE bit is set to 1 and the DMAMD.SARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer source address).
- When an extended repeat area overflow on the destination address occurs while the DMINT.DARIE bit is set to 1 and the DMAMD.DARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer destination address).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

### DTIF flag (Transfer End Interrupt Flag)

This flag indicates that the transfer end interrupt has been generated.

[Setting conditions]

- When the specified number of unit-transfers are completed in normal transfer mode (the value of DMCRAL becoming 0 on completion of transfer).
- When the specified number of repeat transfer operations are completed in repeat transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).
- When the specified number of blocks have been transferred in block transfer mode and repeat-block transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

### ACT flag (DMAC Active Flag)

This flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- When the DMAC starts data transfer operation.

[Clearing condition]

- When data transfer in response to one transfer request is completed.

## 15.2.15 DMSBS : DMA Source Buffer Size Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x28

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DMSBSH[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DMSBSL[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | DMSBSL[15:0] | Functions as data transfer counter in repeat-block transfer mode<br>See Table 15.3 for available settings. | R/W |
| 31:16 | DMSBSH[15:0] | Specifies the repeat-area size in repeat-block transfer mode<br>See Table 15.3 for available settings. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Set the same value for DMSBSH[15:0] and DMSBSL[15:0] in repeat-block transfer mode. Write 0x00000000 to DMSBS in normal, repeat and block transfer mode.

DMSBSH[15:0] specifies buffer size and DMSBSL[15:0] functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by DMSBSH[15:0].

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMSBSH[15:0] and DMSBSL[15:0] to 0x0000 is prohibited. When final data of one buffer size is transferred, DMSBSL[15:0] reloads value of DMSBSH[15:0]. When address update mode is fixed address, this register

is ignored. Table 15.3 shows the setting values of DMA Source Buffer Size Register corresponding to Transfer Data Size in Source Address Update Mode.

**Table 15.3 Available setting for DMSBS register in repeat-block transfer mode**

| Source address update mode (DMAMD.SM) | Transfer data size (DMTMD.SZ) | Available setting for DMSBSH and DMSBSL bits |
|---|---|---|
| Source address is fixed (SM = 00b) | Don't care | 0x0000 (DMSBS is not used) |
| Offset addition (SM = 01b) | 8 bits (SZ = 00b) | 0x0001 to 0xFFFF (1 to 65535) |
| | 16 bits (SZ = 01b) | 0x0001 to 0x7FFF (1 to 32767) |
| | 32 bits (SZ = 10b) | 0x0001 to 0x3FFF (1 to 16383) |
| Source address is incremented or decremented (SM = 1xb) | Don't care | 0x0000 (infinite)<br>0x0001 to 0xFFFF (1 to 65535) |

In normal, repeat and block transfer mode, DMSBS is not used. The setting is invalid.

## 15.2.16 DMDBS : DMA Destination Buffer Size Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x2C

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DMDBSH[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DMDBSL[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | DMDBSL[15:0] | Functions as data transfer counter in repeat-block transfer mode.<br>See Table 15.4 for available settings. | R/W |
| 31:16 | DMDBSH[15:0] | Specifies the repeat-area size in repeat-block transfer mode.<br>See Table 15.4 for available settings. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Set the same value for DMDBSH[15:0] and DMDBSL[15:0] in repeat-block transfer mode. Write 0x00000000 to DMDBS in normal, repeat and block transfer mode.

DMDBSH[15:0] specifies buffer size and DMDBSL[15:0] functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, destination repeat area is specified by DMDBSH[15:0].

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMDBSH[15:0] and DMDBSL[15:0] to 0x0000 is prohibited. When final data of one buffer size is transferred, DMDBSL[15:0] reloads value of DMDBSH[15:0]. When address update mode is fixed address, this register is ignored. Table 15.4 shows the setting values of Destination Buffer Size Register corresponding to Transfer Data Size in Destination Address Update Mode.

**Table 15.4 Available setting for DMDBS register in repeat-block transfer mode (1 of 2)**

| Destination address update mode (DMAMD.DM) | Transfer data size (DMTMD.SZ) | Available setting for DMDBSH and DMDBSL bits |
|---|---|---|
| Destination address is fixed (DM = 00b) | Don't care | 0x0000 (DMDBS is not used) |

**Table 15.4 Available setting for DMDBS register in repeat-block transfer mode (2 of 2)**

| Destination address update mode (DMAMD.DM) | Transfer data size (DMTMD.SZ) | Available setting for DMDBSH and DMDBSL bits |
|---|---|---|
| Offset addition (DM = 01b) | 8 bits (SZ = 00b) | 0x0001 to 0xFFFF (1 to 65535) |
| | 16 bits (SZ = 01b) | 0x0001 to 0x7FFF (1 to 32767) |
| | 32 bits (SZ = 10b) | 0x0001 to 0x3FFF (1 to 16383) |
| Destination address is incremented or decremented (DM = 1xb) | Don't care | 0x0000 (infinite)<br>0x0001 to 0xFFFF (1 to 65535) |

In normal, repeat and block transfer mode, DMDBS is not used. The setting is invalid.

## 15.2.17 DMAST : DMA Module Activation Register

Base address: DMA = 0x4000_5200

Offset address: 0x00

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | DMST |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DMST | DMAC Operation Enable<br>0: DMAC activation is disabled<br>1: DMAC activation is enabled | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### DMST bit (DMAC Operation Enable)

Setting the DMAST.DMST to 1 enables DMAC activation for all channels. When the DMST bit is set to 1 (DMAC activation is enabled), and 1 is written to the DMCNT.DTE bit (DMA transfer is enabled) for multiple channels, all associated channels can be placed in the transfer request ready state at the same time.

When the DMST bit clears to 0 during DMA transfer, DMA transfer is suspended after the current data transfer associated with a single transfer request completes. To resume DMA transfer, set the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit.

[Clearing condition]

- When 0 is written to this bit.

## 15.2.18 DMECHR : DMAC Error Channel Register

Base address: DMA = 0x4000_5200

Offset address: 0x40

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DMESTA |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | DMECHSAM | — | — | — | — | — | DMECH | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | DMECH | DMAC Error channel<br>Indicates the channel number causing the error<br>0 0 0: Error occurred on Channel 0<br>0 0 1: Error occurred on Channel 1<br>0 1 0: Error occurred on Channel 2<br>⋮ ⋮<br>1 1 1: Error occurred on Channel 7 | R |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R |
| 8 | DMECHSAM | DMAC Error channel Security Attribution Monitor<br>Indicates the security attribution of a channel causing the error<br>0: Secure channel<br>1: Non-secure channel | R |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R |
| 16 | DMESTA | DMAC Error Status<br>0: No DMA transfer error occurred<br>1: DMA transfer error occurred | R/W*1 |
| 31:17 | — | These bits are read as 0. The write value should be 0. | R |

Note 1. Writing to DMESTA depends on the value of DMECHSAM

### DMECH[2:0] bits (DMAC Error channel)

When a transfer error due to DMA transfer occurs, the DMECH[2:0] bits store the violating DMAC channel.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

### DMECHSAM bit (DMAC Error channel Security Attribution Monitor)

When a transfer error due to DMA transfer occurs, the DMECHSAM bit indicates the security attribution of the violating DMAC channel.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

**DMESTA bit (DMAC Error Status)**

The DMESTA bit indicates whether or not a DMA transfer error occurred.

DMECH, DMECHSAM, DMESTA are cleared by writing 1 to DMESTA. Writing 0 to DMESTA is ignored.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs.

[Clearing condition]

- When 1 is written to DMESTA.

Note: When DMECHSAM = 1, it can be cleared in the Secure state and Non-secure state. DMECHSAM = 0, it cannot be cleared in the Non-secure state.

## 15.3 Operation

### 15.3.1 Transfer Mode

#### 15.3.1.1 Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the DMCRAL register. When these bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free-running function). Setting DMCRB register is invalid in normal transfer mode. Except in free-running function, a transfer end interrupt request can be generated after completion of the specified number of transfer operations.

Table 15.5 summarizes the register update operation in normal transfer mode, and Figure 15.2 shows the operation in normal transfer mode.

**Table 15.5 Register update operation in normal transfer mode**

| Register | Function | Update operation after completion of a transfer by one transfer request |
|---|---|---|
| DMSAR | Transfer source address | Increment/decrement/fixed/offset addition |
| DMDAR | Transfer destination address | Increment/decrement/fixed/offset addition |
| DMCRAL | Transfer count | Decremented by one/not updated (in free running function) |
| DMCRAH | — | Not updated (Not used in normal transfer mode) |
| DMCRB | — | Not updated (Not used in normal transfer mode) |

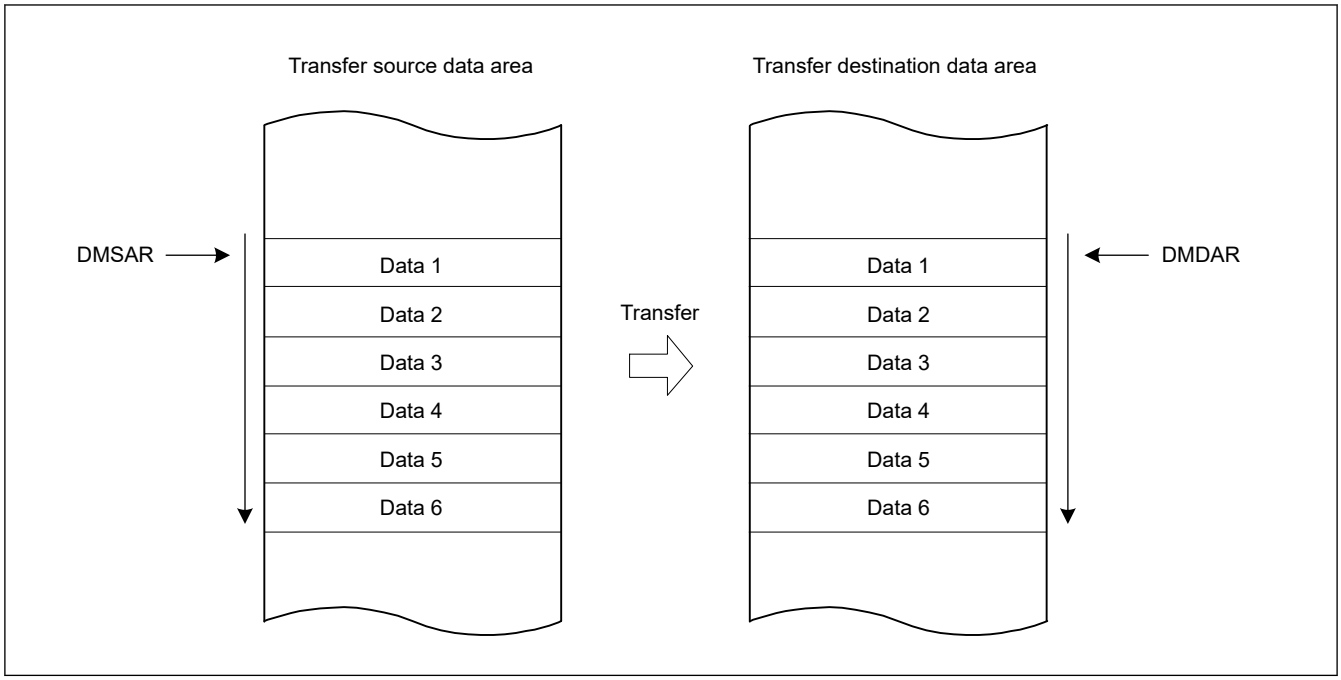


**Figure 15.2 Operation in normal transfer mode**

### 15.3.1.2 Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request.

A maximum of 1K data can be set as a total repeat transfer size using DMCRA register.

A maximum of 64K can be set as the number of repeat transfer operations using DMCRB register. Therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (DMSAR or DMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations.

Table 15.6 summarizes the register update operation in repeat transfer mode, and Figure 15.3 shows the operation in repeat transfer mode.

**Table 15.6 Register update operation in repeat transfer mode (1 of 2)**

| Register | Function | Update operation after completion of a transfer by one transfer request | |
|---|---|---|---|
| | | When DMCRAL register is not 1 | When DMCRAL register is 1 (Transfer of the last data in repeat size) |
| DMSAR | Transfer source address | Increment/decrement/fixed/offset addition | • DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition<br>• DMTMD.DTS[1:0] = 01b Initial value of DMSAR<br>• DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition |
| DMDAR | Transfer destination address | Increment/decrement/fixed/offset addition | • DMTMD.DTS[1:0] = 00b Initial value of DMDAR<br>• DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition<br>• DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition |
| DMCRAH | Repeat size | Not updated | Not updated |
| DMCRAL | Transfer count | Decremented by one | DMCRAH |

**Table 15.6 Register update operation in repeat transfer mode (2 of 2)**

| Register | Function | Update operation after completion of a transfer by one transfer request | |
|---|---|---|---|
| | | When DMCRAL register is not 1 | When DMCRAL register is 1 (Transfer of the last data in repeat size) |
| DMCRBH | Number of repeat transfer operations | Not updated | Not updated |
| DMCRBL | Count of repeat transfer operations | Not updated | Decremented by one |

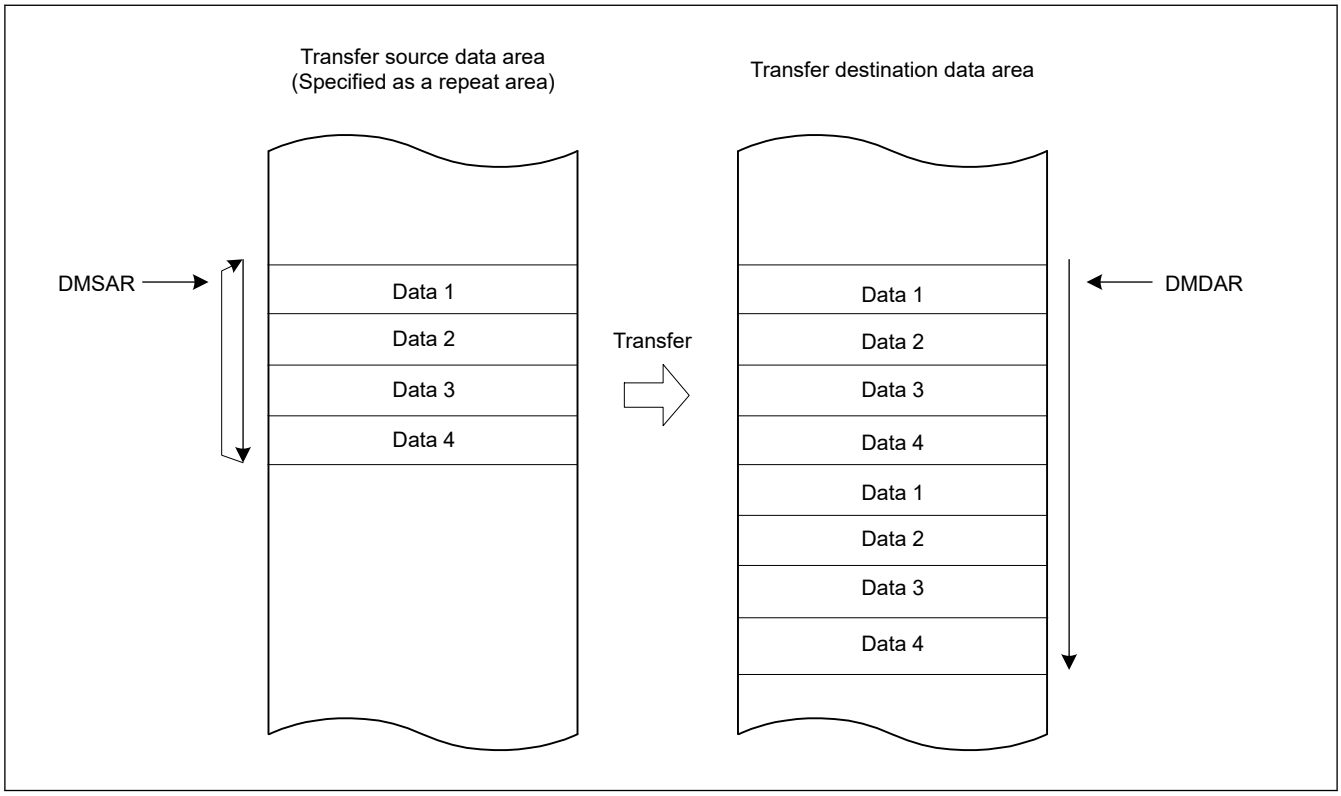

**Figure 15.3 Operation in repeat transfer mode**

### 15.3.1.3 Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA register.

A maximum of 64K can be set as the number of block transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (DMSAR or DMDAR) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

Transfer end interrupt request can be generated after completion of the specified number of block transfer operations.

Table 15.7 summarizes the register update operation in block transfer mode, and Figure 15.4 shows the operation in block transfer mode.

**Table 15.7 Register update operation in block transfer mode**

| Register | Function | Update operation after completion of single-block transfer by one transfer request |
|---|---|---|
| DMSAR | Transfer source address | • DMTMD.DTS[1:0] = 00b<br>Increment/decrement/fixed/offset addition<br>• DMTMD.DTS[1:0] = 01b<br>Initial value of DMSAR<br>• DMTMD.DTS[1:0] = 10b<br>Increment/decrement/fixed/offset addition |
| DMDAR | Transfer destination address | • DMTMD.DTS[1:0] = 00b<br>Initial value of DMDAR<br>• DMTMD.DTS[1:0] = 01b<br>Increment/decrement/fixed/offset addition<br>• DMTMD.DTS[1:0] = 10b<br>Increment/decrement/fixed/offset addition |
| DMCRAH | Block size | Not updated |
| DMCRAL | Transfer count | DMCRAH |
| DMCRBH | Number of block transfer operations | Not updated |
| DMCRBL | Count of block transfer operations | Decremented by one |

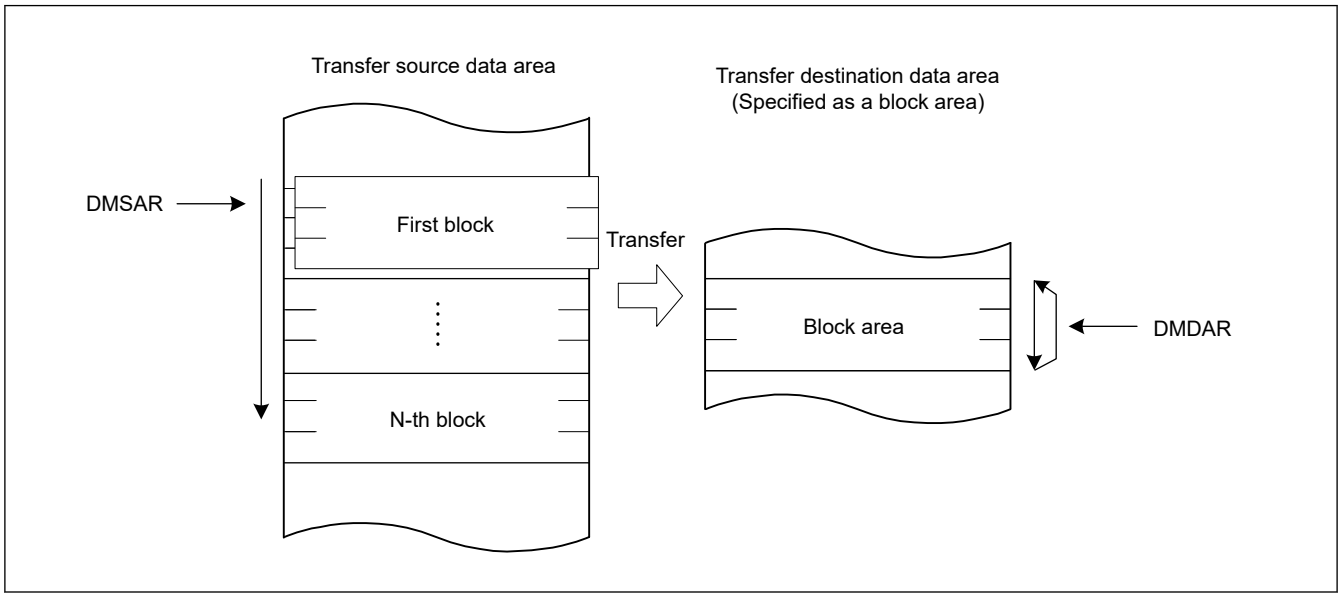

**Figure 15.4 Operation in block transfer mode**

### 15.3.1.4 Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.

Repeat function: Added function (ring buffer) to repeat specified address area.

Offset function: Multiple areas with offset can be specified within one block transfer.

The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer.

Figure 15.5 shows an example of adding a repeat function to the transfer destination.

Figure 15.6 shows repeat-block transfer with an offset to the transfer destination.

In repeat-block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA of the DMACn.

A maximum of 64K can be set as the number of block transfer operations using DMCRB of the DMACn; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

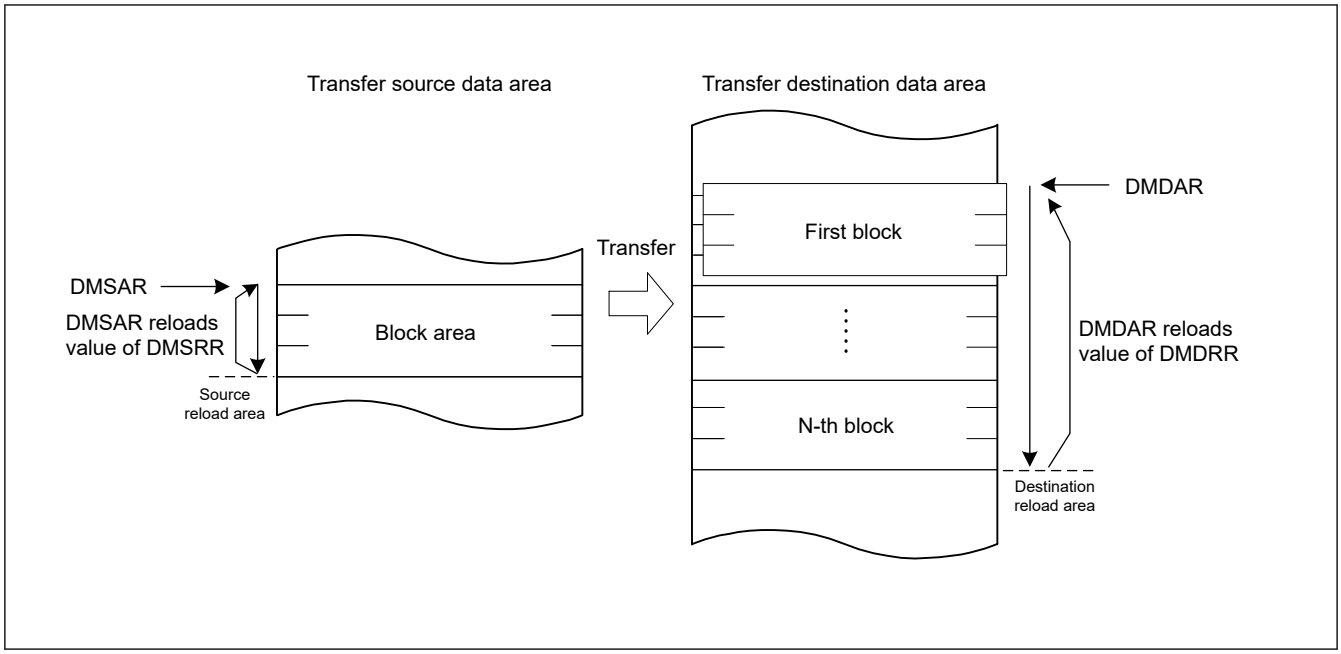

**Figure 15.5 Operation in repeat block transfer mode**

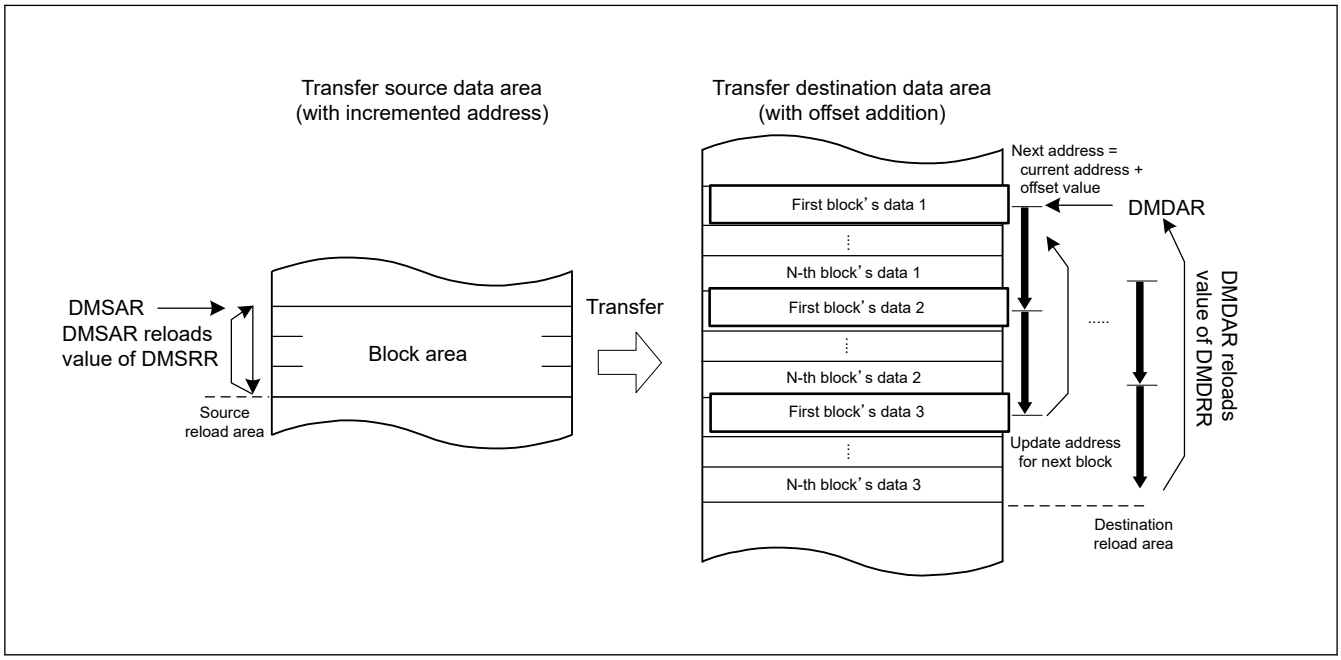

**Figure 15.6 Operation in repeat-block transfer mode with offset addition**

Table 15.8 to Table 15.13 summarize the register update operations in repeat-block transfer mode.

**Table 15.8 Register update operation associated with source area in repeat-block transfer mode (fixed address DMAMD.SM[1:0] = 00b) (1 of 2)**

| Register | Function | Update operation after single data is transferred | | |
|---|---|---|---|---|
| | | DMCRAL[15:0] is not 1 | DMCRAL[15:0] is 1 (single block is transferred) | |

## 15.3.2 Extended Repeat Area Function

The DMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas.

The extended repeat areas can be specified separately to the transfer source address register (DMSAR) and transfer destination address register (DMDAR).

The extended repeat area on the source address is specified by the DMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the DMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides.

However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt by an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the DMINT.SARIE bit is set to 1, the DMSTS.ESIF flag is set to 1 and the DMCNT.DTE bit is cleared to 0 to stop DMA transfer. At this time, if the DMINT.ESIE bit is set to 1, an interrupt by an extended repeat area overflow is requested. When the DMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the interrupt handling.

Figure 15.7 shows an example of the extended repeat area operation.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b). The data size is eight bits (DMTMD.SZ[1:0] = 00b).

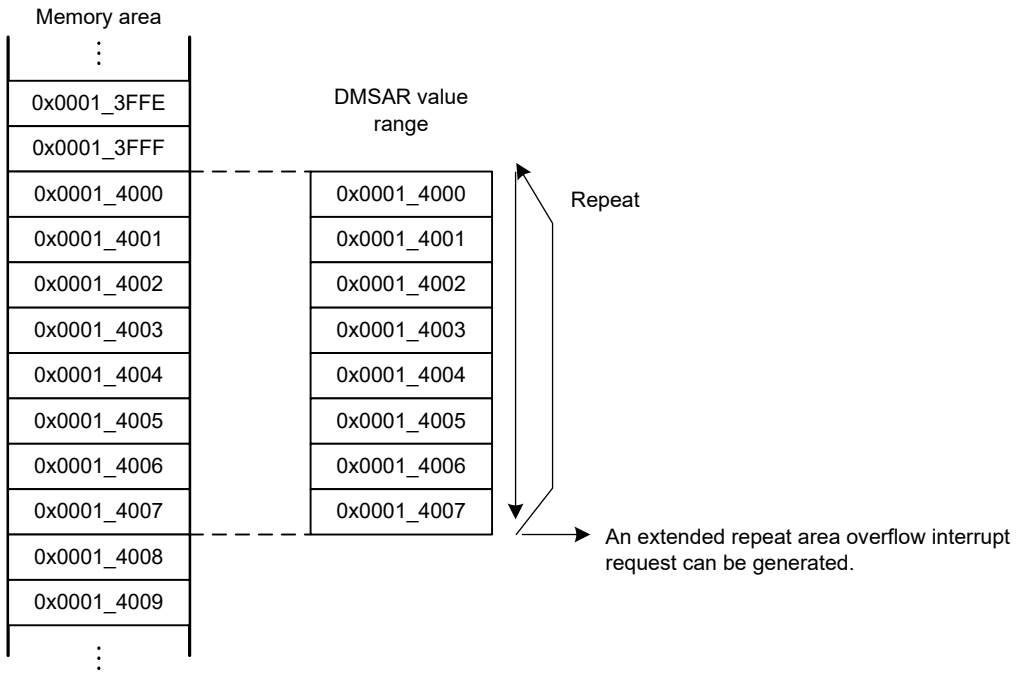

**Figure 15.7 Example of extended repeat area operation**

When an interrupt by an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration.

When a transfer is stopped by an interrupt by an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt by the overflow is suspended until transfer of the block is completed, and the transfer overruns.

Figure 15.8 shows an example when the extended repeat area function is used in block transfer mode.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b), block transfer mode with block size 5 is set (DMCRA = 0x0005_0005), and transfer source address is not specified as a block area. Data size is eight bits (DMTMD.SZ[1:0] bits = 00b).

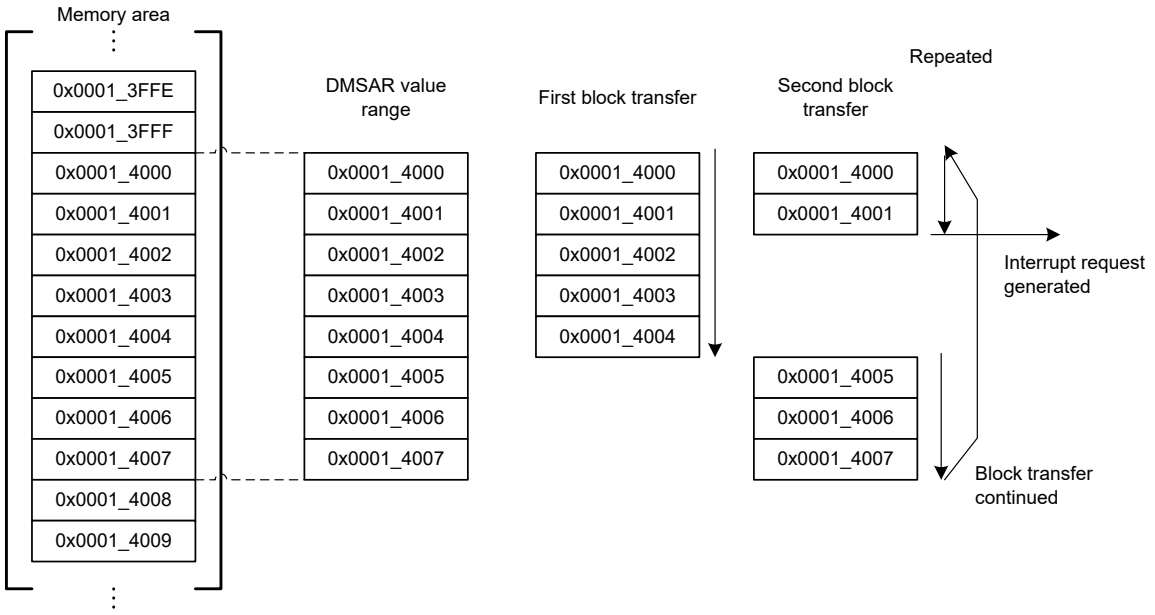

**Figure 15.8 Example of extended repeat area function in block transfer mode**

## 15.3.3 Free-running Function

The DMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

### 15.3.3.1 In Normal Transfer Mode

In normal transfer mode, when DMCRA.DMCRAL bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped.

For more information, see section 15.3.1.1. Normal Transfer Mode.

### 15.3.3.2 In Other Transfer Modes

In repeat, block and repeat-block transfer mode, the DMAC supports free-running function using the DMTMD.TKP bit. If the DMTMD.TKP bit is to be set to 1, the transfer is not stopped by completion of specified total number of transfer operations and reloads DMCRBH repeatedly.

Figure 15.9 show an example of block transfer operation without free-running function.

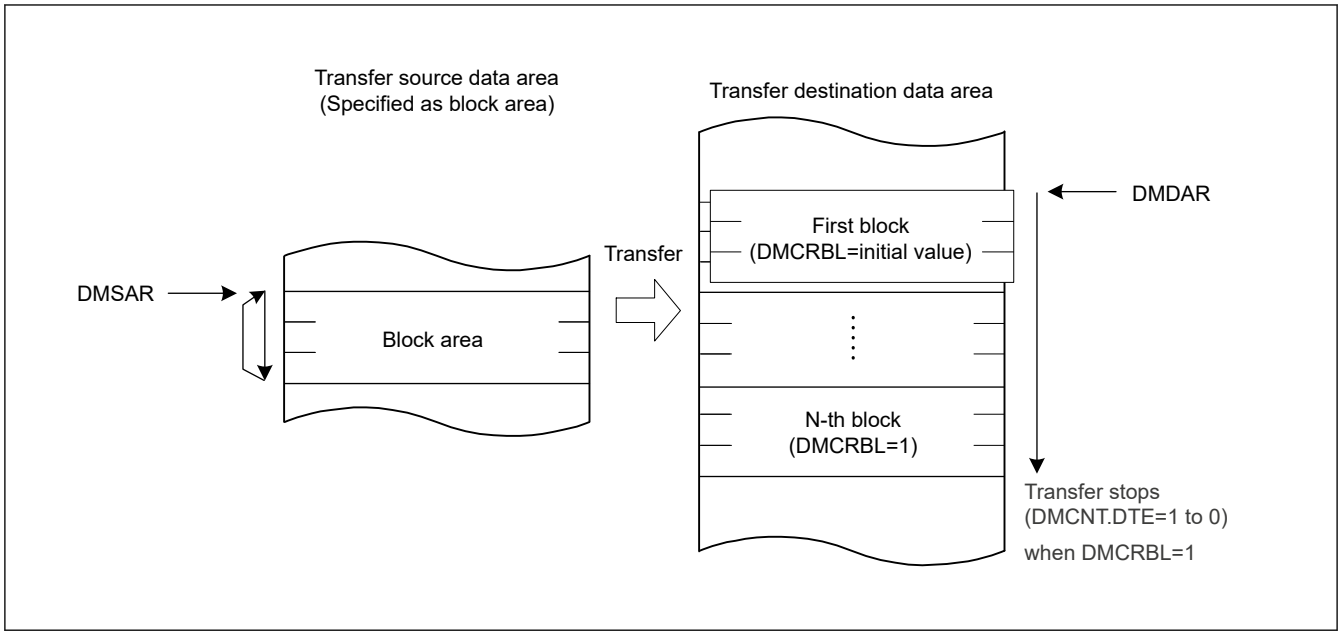

**Figure 15.9 Operation in block transfer mode when DMTMD.TKP bit is set to 0**

Figure 15.10 show an example of block transfer operation with free-running function.

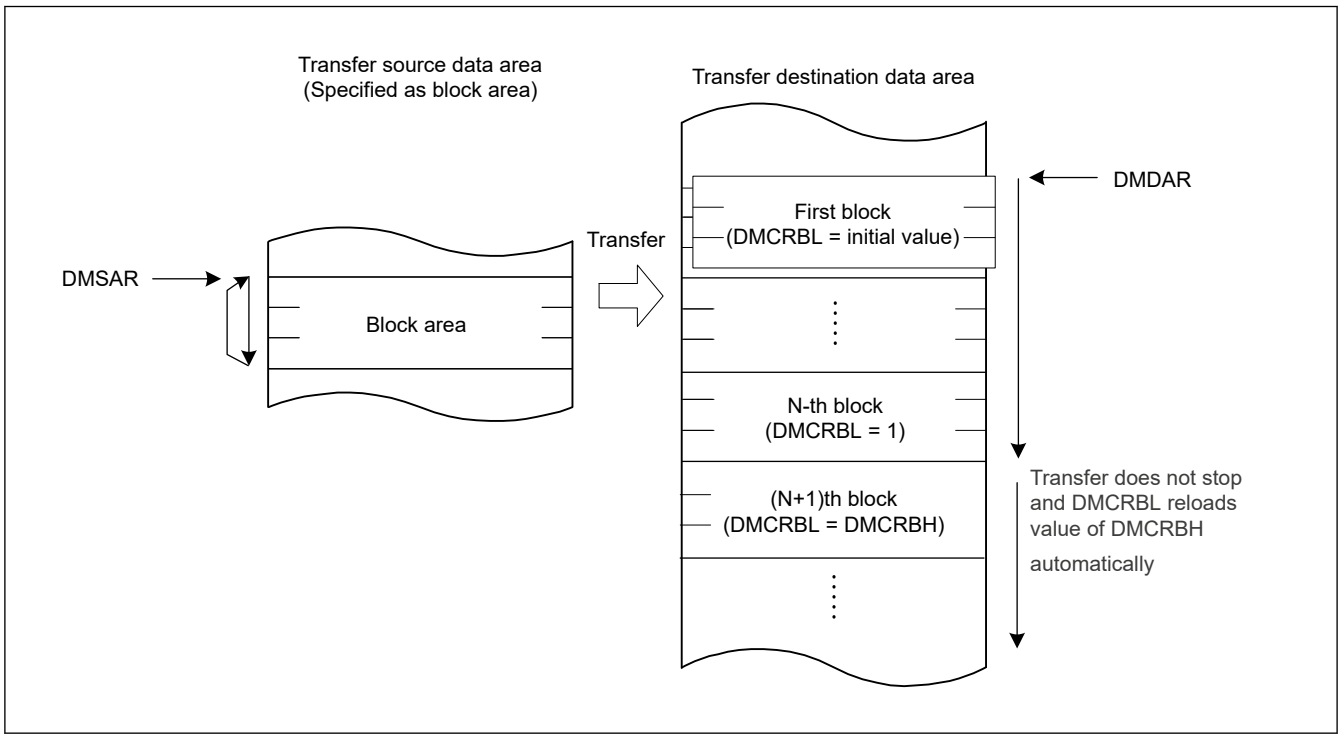

**Figure 15.10 Operation in block transfer mode when DMTMD.TKP bit is set to 1**

### 15.3.4 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (DMOFR) is added to the address every time the DMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas.

Offset subtraction can also be realized by setting a negative value in DMOFR. In this case, the negative value must be 2's complement.

DMSBS or DMDBS are used instead of DMOFR in repeat-block transfer mode. For more information section 15.3.1.4. Repeat-Block Transfer Mode

Table 15.14 shows the address update method in each address update mode.

**Table 15.14 Address update method in each address update mode**

| Address update mode | Settings of DMAMD.SM[1:0] and DMAMD.DM[1:0] for address update modes | Address update method (for different SZ[1:0] settings in DMTMD) | | |
|---|---|---|---|---|
| | | SZ[1:0] = 00b | SZ[1:0] = 01b | SZ[1:0] = 10b |
| Address fixed | 00b | Fixed | | |
| Offset addition | 01b | +DMOFR*1 | | |
| Increment | 10b | +1 | +2 | +4 |
| Decrement | 11b | –1 | –2 | –4 |

Note 1. When setting a negative value in the DMA Offset Register, the value must be in two's complement, obtained by the following formula:
two's complement of a negative offset value = ~ (offset) + 1 (~ = bit inversion)

### 15.3.4.1 Basic Transfer Using Offset Addition

Figure 15.11 shows an example of address updating using offset addition.

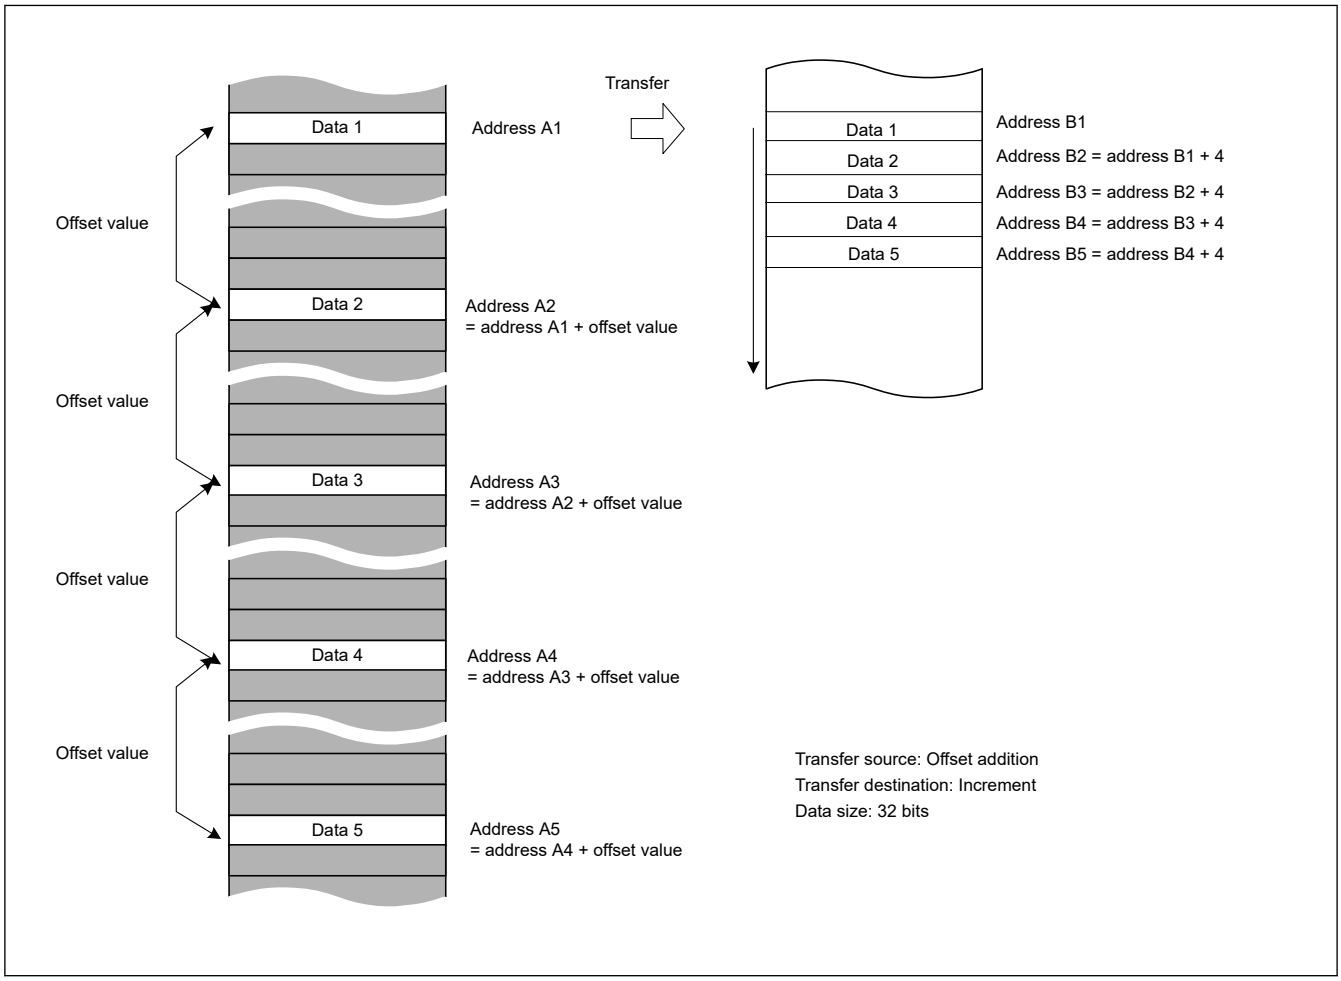

**Figure 15.11 Example of address updating by offset addition**

Figure 15.11 shows the setting of the following.

- The transfer data is 32 bits long.
- Offset addition is set as the transfer source address update mode.

- Increment is set as the transfer destination address update mode.

The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

### 15.3.4.2 Example of XY Conversion Using Offset Addition

Figure 15.12 shows the XY conversion using offset addition in repeat transfer mode.

Settings are as follows:

- DMAMD.SM — Transfer source address update mode: Offset addition.
- DMAMD.DM — Transfer destination address update mode: Destination address is incremented.
- DMTMD.SZ — Transfer data size select: 32 bits.
- DMTMD.MD — Transfer mode select: Repeat transfer.
- DMTMD.DTS — Repeat area select: The source is specified as the repeat area.
- DMOFR — Offset address: 0x10.
- DMCRA — Repeat size: 0x4.
- DMINT.RPTIE — The repeat size end interrupt is enabled.

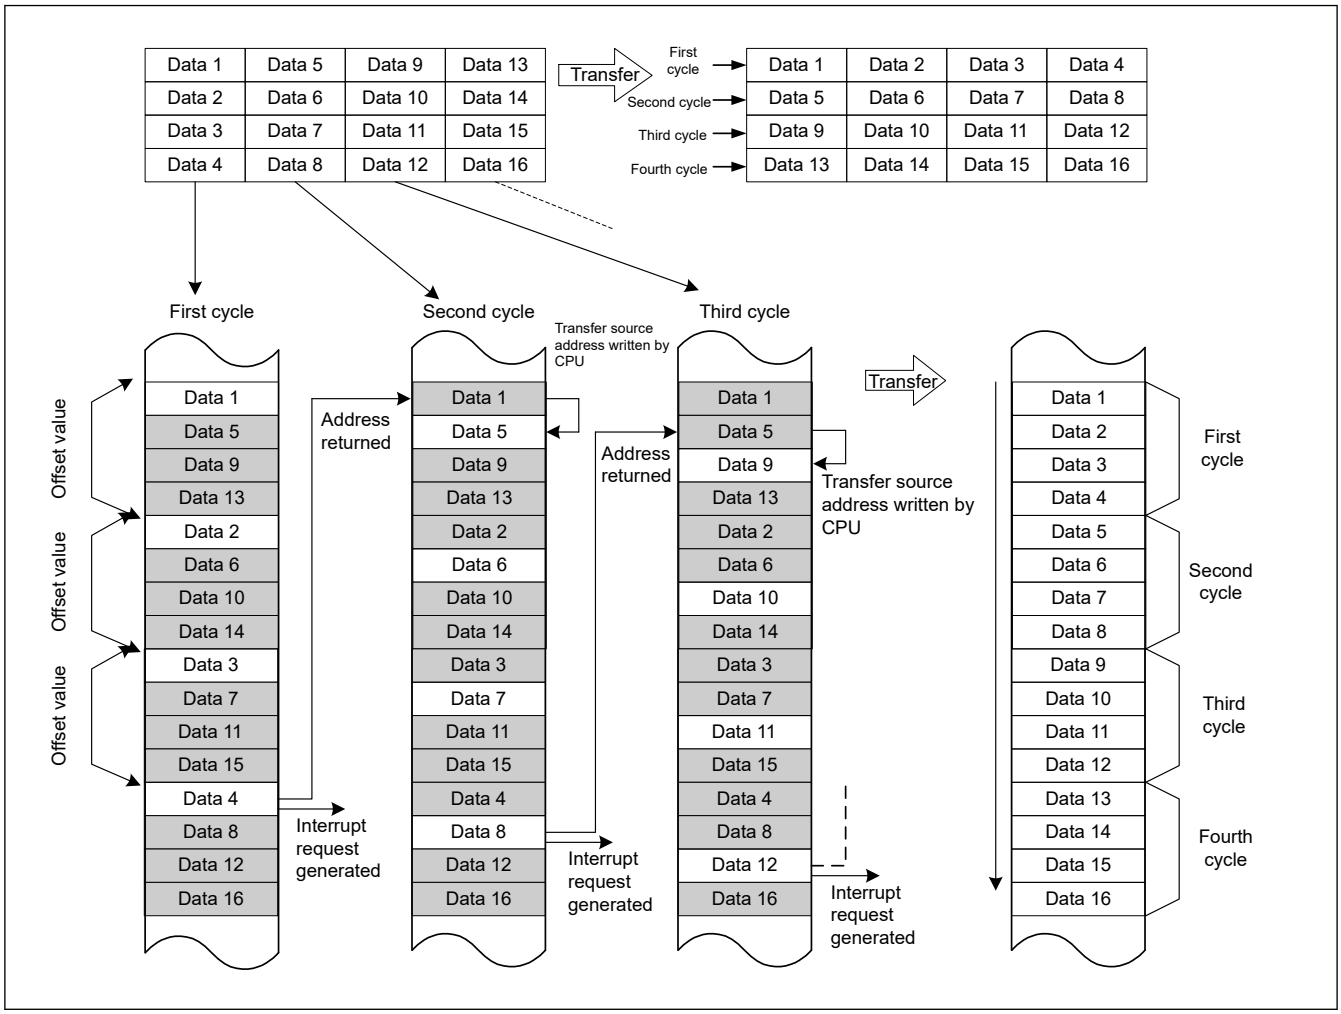

**Figure 15.12 XY conversion operation using offset addition in repeat transfer mode**

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to continuous transfer destination addresses. When data 4 is transferred:

- The repeat size of data transfer is complete.
- The transfer source address returns to the transfer start address (the address of data 1 on the transfer source).
- A repeat size end interrupt is requested.

During the time this interrupt pauses the transfer, the following operations are performed.

- DMSAR — Rewrite the DMA transfer source address to the address of data 5 (with the above example, the data 1 address + 4).
- DMCNT — Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 15.13 shows a flowchart of the XY conversion.

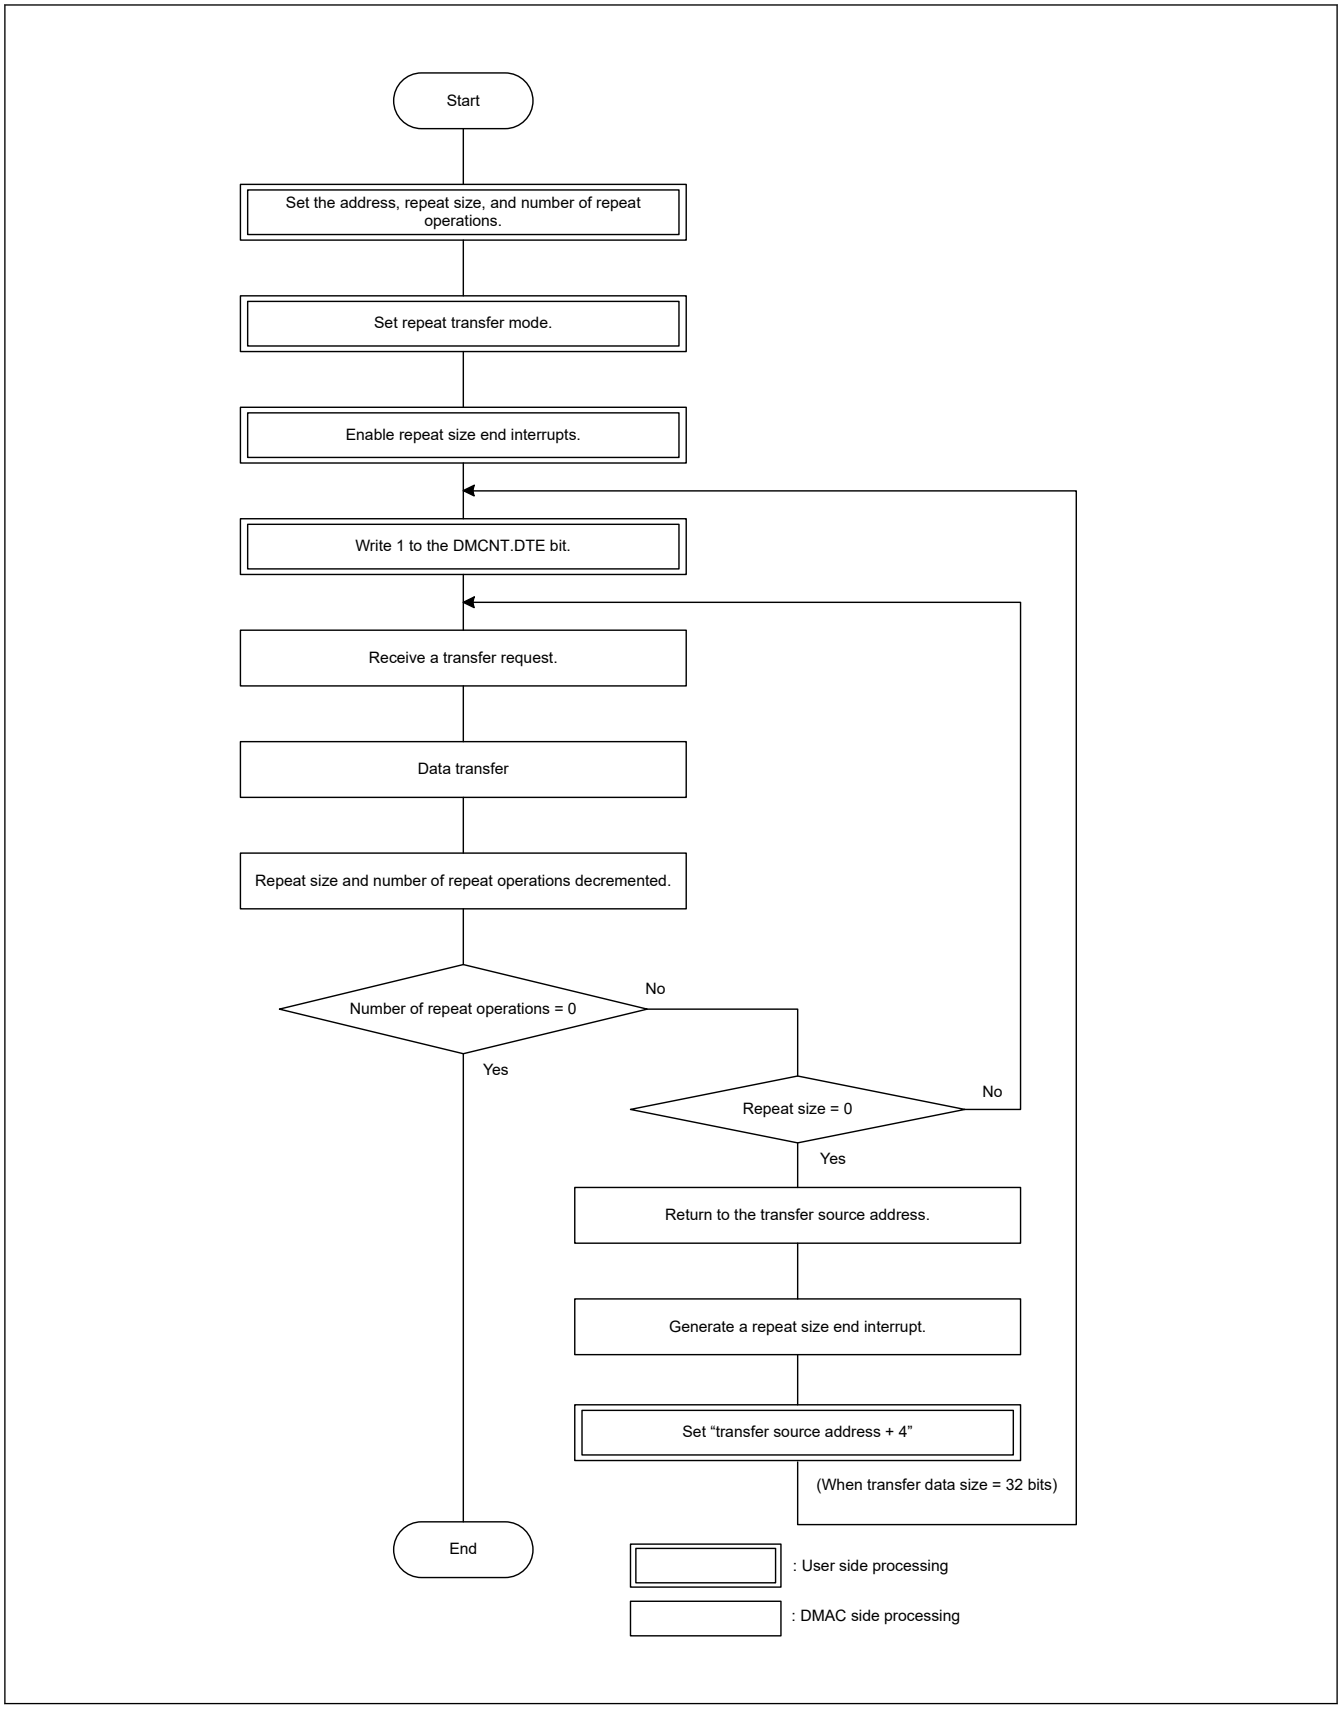

**Figure 15.13 XY conversion flowchart using offset addition in repeat transfer mode**

### 15.3.5 Address Update Function in Repeat-Block Transfer Mode

Repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior of the address update is different from these two modes. Here are the details of the address update function in repeat-block transfer mode.

#### 15.3.5.1 Fixed Address Mode

When DMAMD.SM[1:0] is set to 00b, the address update mode of the source is fixed address. And when DMAMD.DM[1:0] is set to 00b, the address update mode of the destination is fixed address.

In fixed address, the address is not updated from the initial value of DMSAR and DMDAR. If the block size (DMCRA) is larger than 1, the same data will be transferred multiple times for one request.

Figure 15.14 shows address update in fixed address.

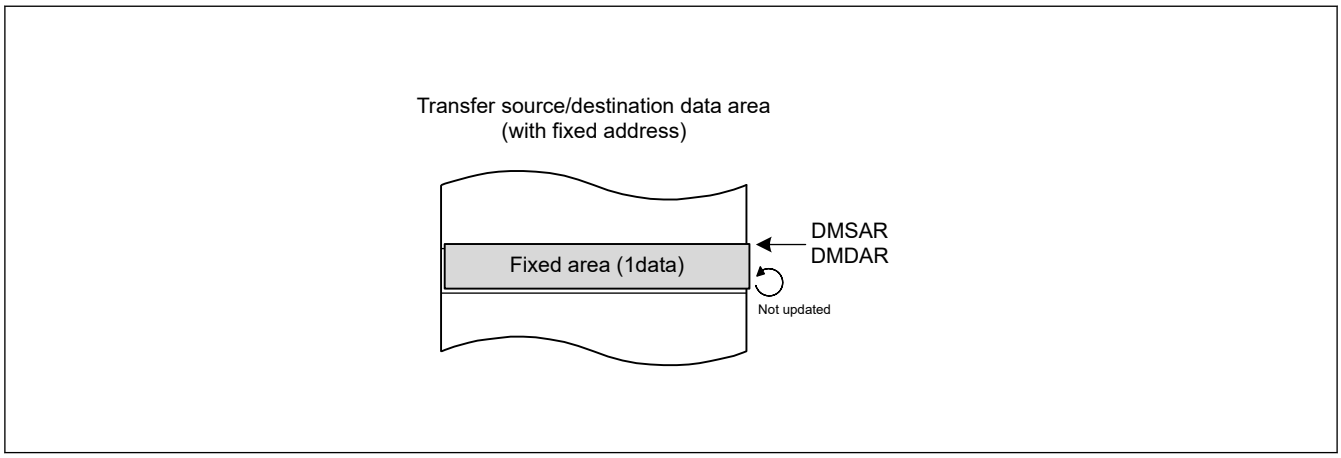

**Figure 15.14 Address update in fixed address**

#### 15.3.5.2 Incremental and Decremental Address Mode

When DMAMD.SM[1:0] is set to 10b, the address update mode of the source is incremental address. And when DMAMD.DM[1:0] is set to 10b, the address update mode of the destination is incremental address. When DMAMD.SM[1:0] is set to 11b, the address update mode of the source is decremental address. And when DMAMD.DM[1:0] is set to 11b, the address update mode of the destination is decremental address.

In these update modes, the address is incremented or decremented according to the setting of DMTMD.SZ[1:0].

In these update modes DMSBS and DMDBS indicates a reload area. The unit of DMSBS and DMDBS is "number of data". At the start of transfer, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

Figure 15.15 shows address update in incremental address.

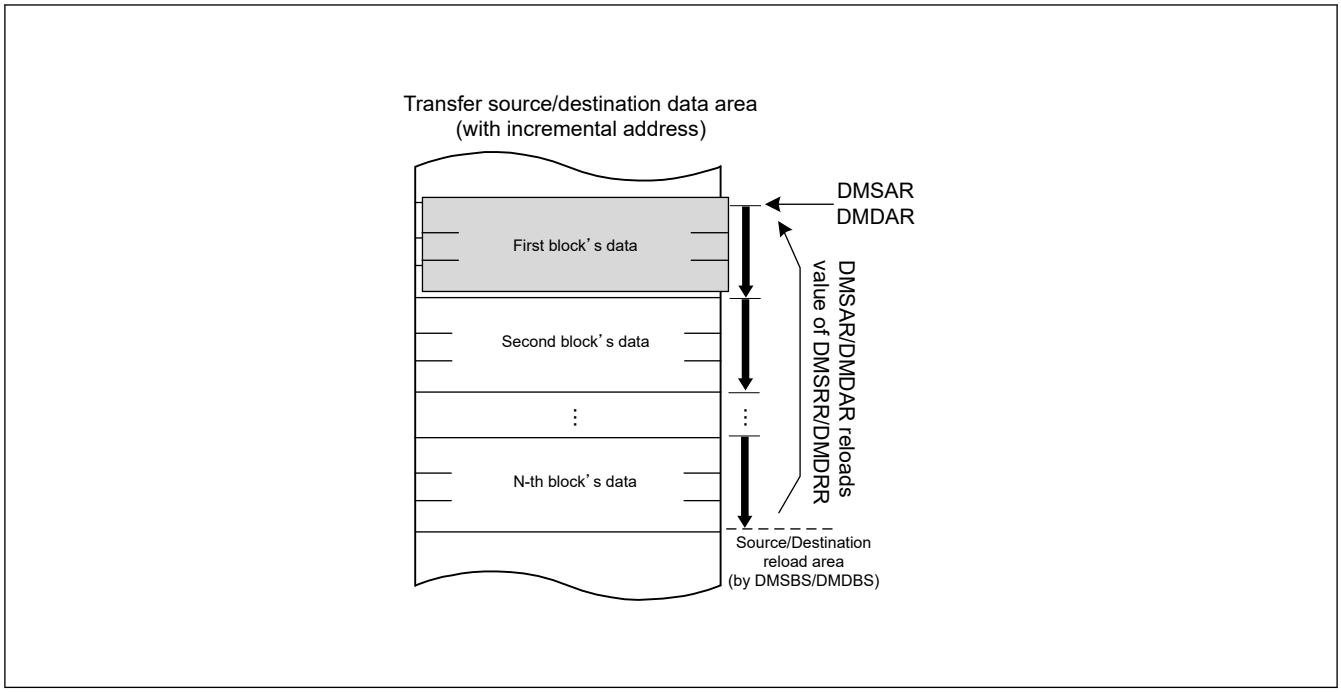

**Figure 15.15 Address update in incremental address**

### 15.3.5.3 Offset Addition Mode

When DMAMD.SM[1:0] is set to 01b, the address update mode of the source is offset addition. And when DMAMD.DM[1:0] is set to 01b, the address update mode of the destination is offset addition.

In offset addition, DMSBS and DMDBS indicates reload area and also works as an access offset value. Unlike other transfer modes, DMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of DMSBS and DMDBS is the number of blocks. When the transfer starts, DMCRAL operates as a down counter, DMSAR and DMDAR reloads the value of DMSRR and DMDRR every time one block is transferred. In addition, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, also operates as a down counter and decrements every time one block is transferred. When the DMSBS and DMDBS value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

When DMAMD.SADR and DMAMD.DADR is set to 0, offset addition operation of the same area is repeated. DMDAR only reloads DMDRR. Figure 15.16 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=0.

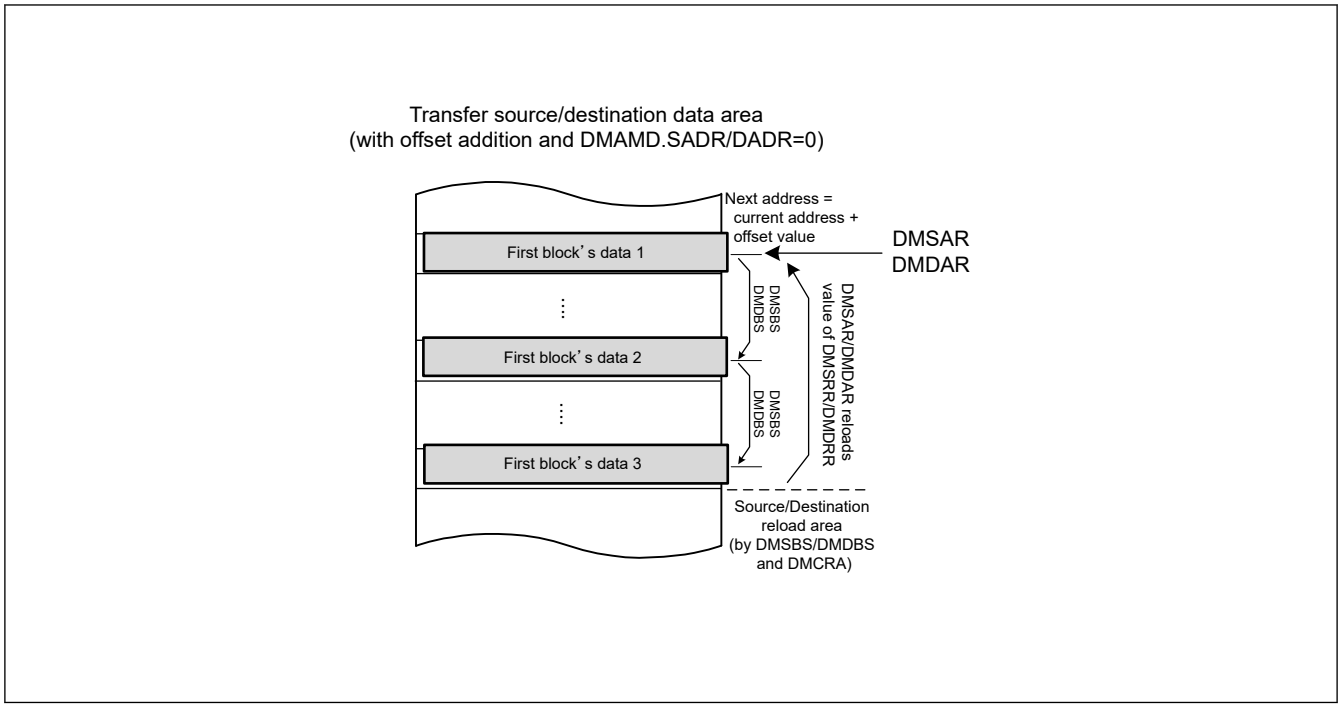

**Figure 15.16 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 0**

When DMAMD.SADR and DMAMD.DADR is set to 1, the address is incremented by one data unit after DMSRR and DMDRR is reloaded by DMCRAL=1. In other words, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after DMDRR is reloaded. This behavior is used to implement multiple ring buffers. Figure 15.17 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=1.

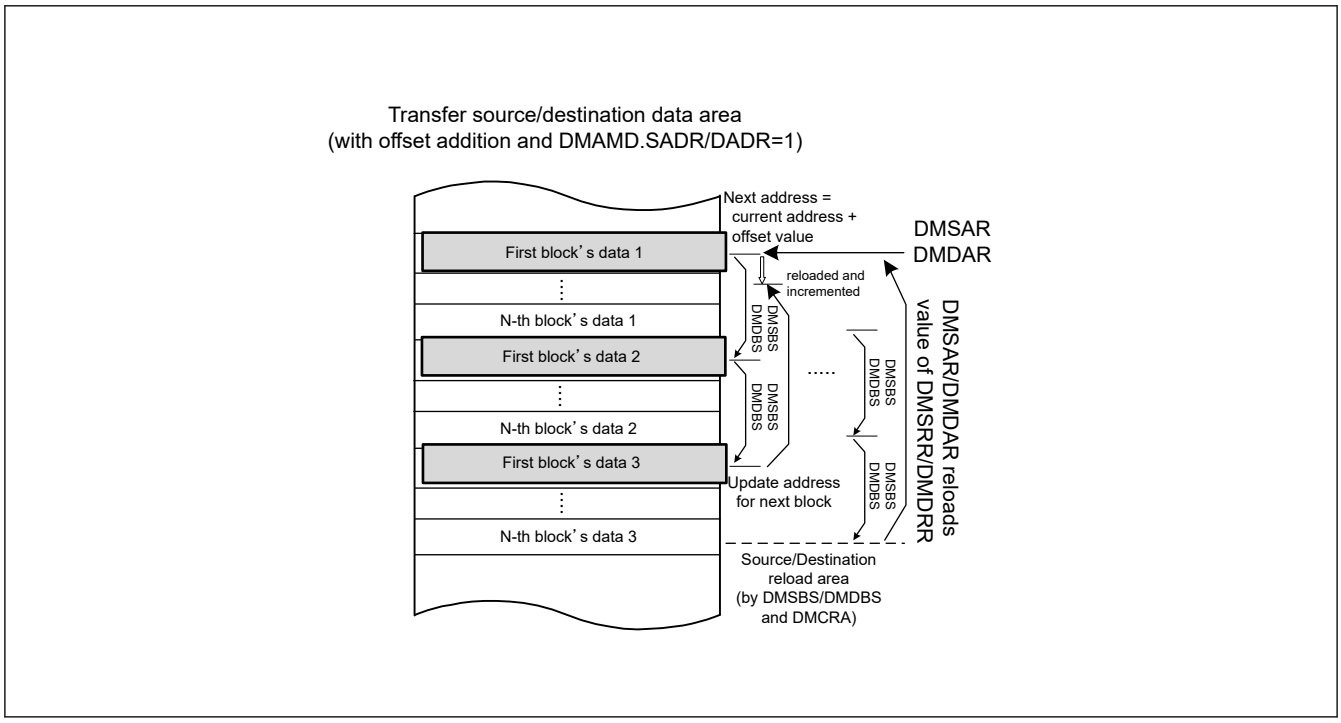

**Figure 15.17 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 1**

## 15.3.6 Example of Using Repeat-Block Transfer Mode

In repeat-block transfer mode, it is possible to realize repeated access to interval data and single or multiple ring buffers by combining the above address update modes. Following sections shows some usage examples.

### 15.3.6.1 Interval Address to Single Ring Buffer

Figure 15.18 shows an example of reading interval ADDRn registers (data register) of ADC12 module and storing it in single ring buffer. It transfers 2 data every 4 halfwords per 1 request. DMSAR is incremented by one data every one request. This can be achieved by setting the transfer source to offset addition and DMAMD.SADR=1, the block size (DMCRA) to 2, and the transfer source offset (DMSBS) to 4. Table 15.15 shows setting of this example.

**Table 15.15 Setting of use case: from interval address to single ring buffer**

| Register | Value | Description |
|---|---|---|
| DMSAR, DMSRR | 0x4017_0020 | Initial source address |
| DMDAR, DMDRR | 0x2000_0000 | Initial destination address |
| DMTMD.SZ[1:0] | 01b | Data size is halfword |
| DMAMD.SADR | 1 | Incremental source address after reloading |
| DMAMD.SM[1:0] | 01b | Source update mode is offset addition |
| DMAMD.DM[1:0] | 10b | Destination update mode is incremental address |
| DMCRAH, DMCRAL | 2 | Transfer block size |
| DMSBSH, DMSBSL | 4 | Source whole buffer size (unit is 'blocks') and Source access offset (unit is 'data') |
| DMDBSH, DMDBSL | N × 2 (DMCRA) | Destination buffer size (unit is 'data') |

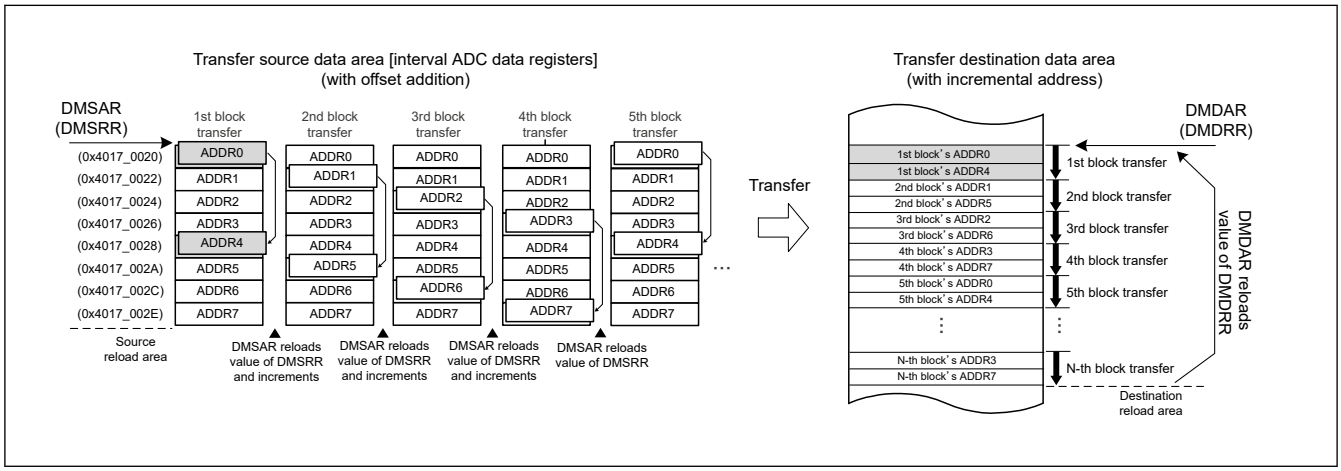

**Figure 15.18 Example of use case: from interval address to single ring buffer**

### 15.3.6.2 Unaligned Ring Buffer to Single Ring Buffer

Figure 15.19 shows an example of reading ADBUFn registers of ADC12 module (conversion result storage ring buffer) incrementally and storing it in single ring buffer. In this example, wrapping occurs because ADBUFn overflows in the fourth scan, but transfer source address of DMAC is also updated accordingly. This can be realized by setting the transfer source to incremental address and setting the DMSBS register to 16 which is the length of ADBUFn. This makes it possible to continue transfer without performing CPU processing using interrupts. Table 15.16 shows setting of this example.

**Table 15.16 Setting of use case: from unaligned ring buffer to single ring buffer (1 of 2)**

| Register | Value | Description |
|---|---|---|
| DMSAR, DMSRR | 0x4017_00B0 | Initial source address |
| DMDAR, DMDRR | 0x2000_0000 | Initial destination address |
| DMTMD.SZ[1:0] | 01b | Data size is halfword |
| DMAMD.SM[1:0] | 10b | Source update mode is incremental address |
| DMAMD.DM[1:0] | 10b | Destination update mode is incremental address |

**Table 15.16 Setting of use case: from unaligned ring buffer to single ring buffer (2 of 2)**

| Register | Value | Description |
|---|---|---|
| DMCRAH, DMCRAL | 5 | Transfer block size |
| DMSBSH, DMSBSL | 16 | Source buffer size (unit is ‘data’) |
| DMDBSH, DMDBSL | N × 5(DMCRA) | Destination buffer size (unit is ‘data’) |

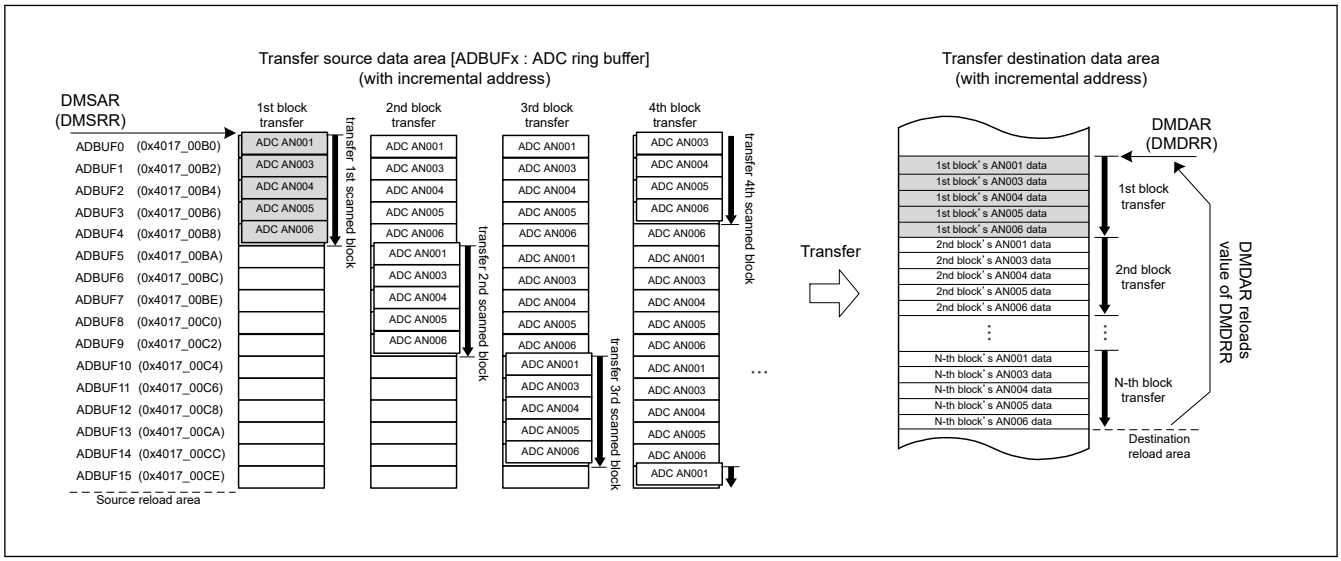

**Figure 15.19 Example of use case: from unaligned ring buffer to single ring buffer**

### 15.3.6.3 Single Block to Multi Ring Buffer

Figure 15.20 shows an example of storing the continuous ADDRn registers (data register) of ADC12 module individually in multiple ring buffers. In this example, a ring buffer in which only the first element (ADDR0) in a single block is arranged in transfer order is created at the destination. Also, in the next area, create a ring buffer in which only the second element (ADDR1) is arranged in transfer order. In the following case, create a ring buffer of length N, which is defined by DMDBS. And the number of data elements in the block is 3, which is defined by DMCRA. Table 15.17 shows setting of this example.

**Table 15.17 Setting of use case: from single block to multi ring buffer**

| Register | Value | Description |
|---|---|---|
| DMSAR, DMSRR | 0x4017_0020 | Initial source address |
| DMDAR, DMDRR | 0x2000_0000 | Initial destination address |
| DMTMD.SZ[1:0] | 01b | Data size is halfword |
| DMAMD.DADR | 1 | Incremental destination address after reloading |
| DMAMD.SM[1:0] | 10b | Source update mode is incremental address |
| DMAMD.DM[1:0] | 01b | Destination update mode is offset addition |
| DMCRAH, DMCRAL | 3 | Transfer block size |
| DMSBSH, DMSBSL | 3 | Source buffer size (unit is ‘data’) |
| DMDBSH, DMDBSL | N | Destination whole buffer size (unit is ‘blocks’) and Destination access offset (unit is ‘data’) |

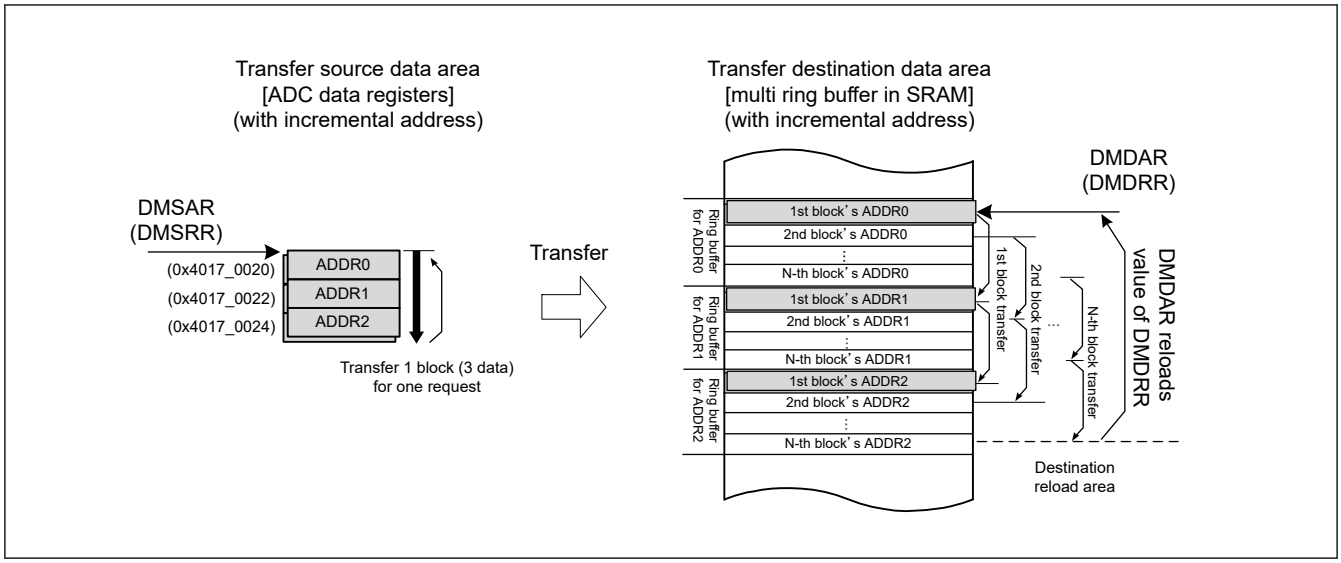

**Figure 15.20 Example of use case: from single block to multi ring buffer**

## 15.3.7 Activation Sources

Software, interrupt requests from the peripheral modules, and external interrupt requests can all be specified as DMAC activation sources. Set the DMTMD.DCTG[1:0] bits to select the activation source.

### 15.3.7.1 DMAC Activation by Software

When DMA transfer is started by software, follow below procedure.

1. Set the DMTMD.DCTG[1:0] bits to 00b.
2. Set the DMCNT.DTE bit to 1 (DMA transfer is enabled).
3. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).
4. Set the DMREQ.SWREQ bit to 1 (DMA requested).

When the DMAC is activated by software while the DMREQ.CLRS bit is 0, the DMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request.

When the DMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

### 15.3.7.2 DMAC Activation through Interrupt Requests from On-Chip Peripheral Modules or External Interrupt Requests

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC activation sources. The activation sources can be selected individually for each channel in ICU.DELSRn.DELS[8:0] (n = 0 to 7).

To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set ICU.DELSRn.DELS[8:0] (n = 0 to 7) to the event number (select the DMAC event link).
2. Set the DMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
3. Set the DMCNT.DTE bit to 1 (enable DMA transfer).
4. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).

For interrupt requests specified as DMAC activation sources, see Table 12.3, in section 12, Interrupt Controller Unit (ICU).

## 15.3.8 Operation Timing

The following timing charts show the minimum number of execution cycles.

Figure 15.21 and Figure 15.22 show DMAC operation timing examples.

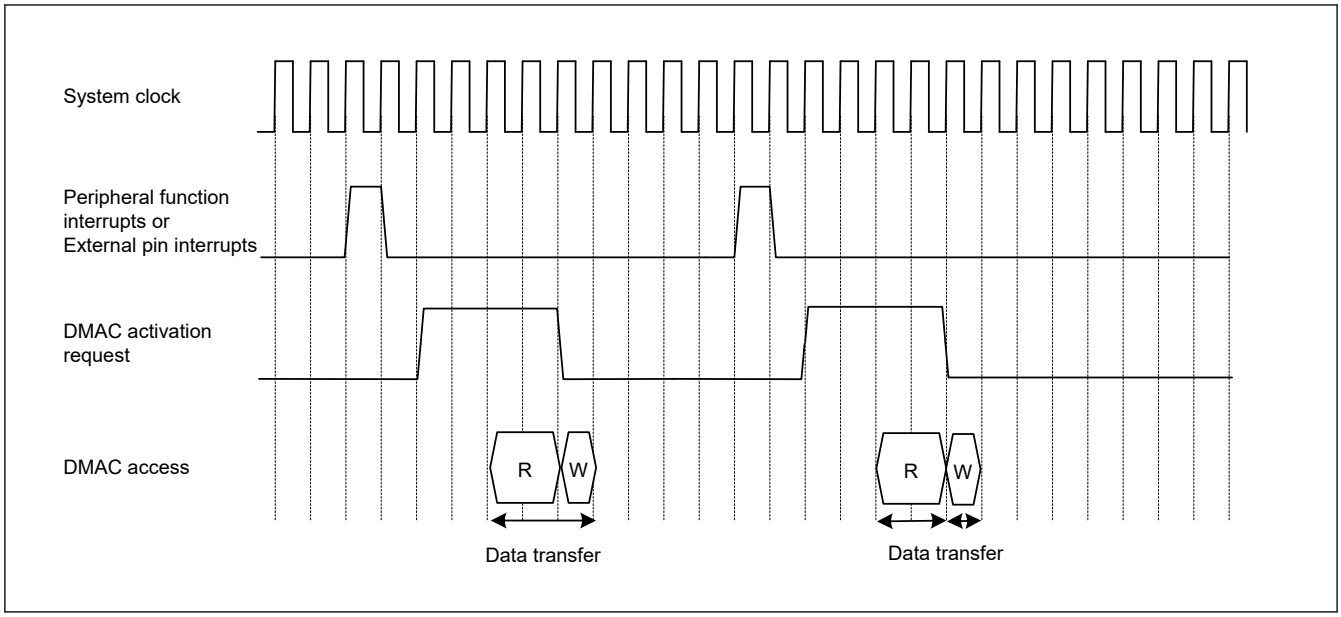

**Figure 15.21 DMAC operation timing example 1 with DMAC activation by Interrupt from peripheral module or external interrupt input pin, in normal transfer mode or repeat transfer mode**

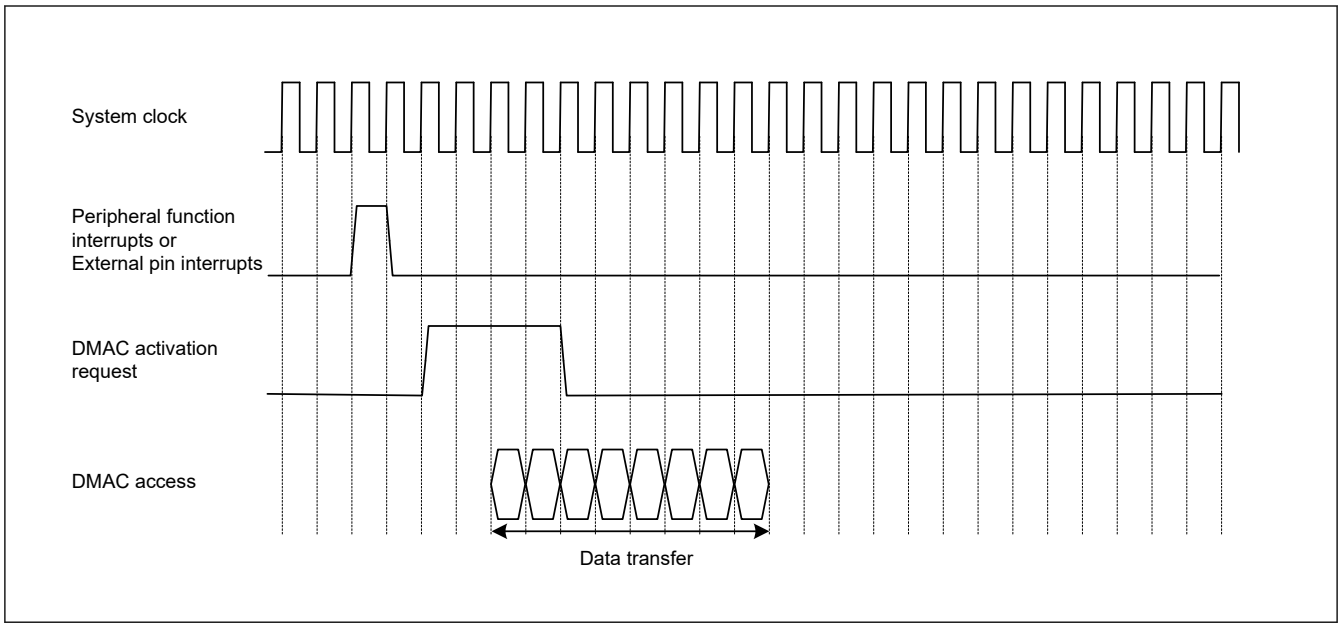

**Figure 15.22 DMAC operation timing example 2 with DMAC activation by interrupt from peripheral module or external interrupt input pin, in block transfer mode with block size = 4**

## 15.3.9 DMAC Execution Cycles

Table 15.18 lists execution cycles in one DMAC data transfer operation.

**Table 15.18 DMAC execution cycles**

| Transfer mode | Data transfer (read) | Data transfer (write) |
|---|---|---|
| Normal | Cr+1 | Cw |
| Repeat | Cr+1 | Cw |
| Block*1 | P × Cr | P × Cw |

Note: P: Block size (DMCRAH register setting)
Cr: Data read destination access cycle
Cw: Data write destination access cycle

Note 1. This is the case when the block size is 2 or more. When the block size is 1, normal transfer cycle is applied.

Cr and Cw depend on the access destination. For the number of cycles for each access destination, see section 44, SRAM, section 45, Flash Memory, and section 13, Buses. The frequency ratio of the system clock and the peripheral clock is also taken into consideration.

The unit for +1 in “Data Transfer (Read)” column is one system clock cycle (ICLK). For the operation example, see section 15.3.8. Operation Timing.

### 15.3.10 Activating the DMAC

Table 15.19 shows the register setting procedure of normal, repeat and block transfer mode and Table 15.20 shows register setting procedure of repeat-block transfer mode.

**Table 15.19 Register setting procedure of normal transfer mode, repeat transfer mode and block transfer mode (1 of 2)**

| No. | Step Name | Description |
|---|---|---|
| 1 | Disable the peripheral function as the DMACn request source. | To use peripheral function interrupts as DMAC activation sources.<br>Disable the control register for the peripheral function. |
| 2 | Disable the IRQn pin as the DMACn request source. | To use external pin interrupts as DMAC activation sources. |
| 3 | Set the DMACn Event Link select (ICU.DELSRn.DELS[8:0]) to 0x000. | Disable the DMACn request. |
| 4 | Clear the DMCNT.DTE bit to 0. | Disable DMA transfer. |
| 5 | Set the interrupt request as a DMACn request source in the DMAC Event Link Setting Register (ICU.DELSRn) by using the ICU. | To use internal peripheral interrupts or external pin interrupts as DMAC activation sources.<br>Enable the interrupt bit for the activation source. Set the DMACn activation source. |

| 14 | Set the DMAST.DMST bit to 1. | Enable DMAC operation. *1 |
| 15 | Start the peripheral function as a DMACn request source. | To use peripheral function interrupt as a DMA activation source. |
| 16 | Enable the IRQ pin as a DMACn request source. | To use external pin interrupt as a DMA activation source. |

**Table 15.20 Register setting procedure of repeat-block transfer mode (2 of 2)**

| No. | Step name | Description |
|---|---|---|
| 17 | End of initial settings. | For activation by software.<br>On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer. |

Note: n: DMAC channel (n = 0 to 7)
Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

## 15.3.11 Starting DMA Transfer

To enable the DMA transfer, set the DMCNT.DTE bit to 1 (enable the DMA transfer), and then set the DMAST.DMST bit to 1 (enable the DMAC activation).

New activation requests are not accepted during the transfer of another DMAC channel or DTC. When the preceding transfer is complete, channel arbitration selects the DMA transfer request of the highest priority channel, and the DMA transfer of that channel starts. When the DMA transfer starts, the DMSTS.ACT flag is set to 1 (the DMAC is in the active state).

## 15.3.12 Registers during DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMSBS, DMDBS, DMCNT, and DMSTS.

### DMA Source Address Register (DMSAR)

When data has been transferred in response to one transfer request, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see Table 15.5 to Table 15.13.

### DMA Destination Address Register (DMDAR)

When data has been transferred in response to one transfer request, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see Table 15.5 to Table 15.13.

### DMA Transfer Count Register (DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 15.5 to Table 15.13.

### DMA Block Transfer Count Register (DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 15.5 to Table 15.13.

### DMA Source Buffer Size Register (DMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 15.8 to Table 15.13.

### DMA Destination Buffer Size Register (DMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 15.8 to Table 15.13.

#### DMA Transfer Enable Bit (DMCNT.DTE)

Although the DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically cleared to 0 by the DMAC according to the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt
- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding DMCNT.DTE bit is set to 1 is prohibited (except for DMCNT). In this case, writing must be performed after the bit is cleared to 0.

#### DMAC Active Flag (DMSTS.ACT)

The DMSTS.ACT flag indicates whether the DMACn is in the idle or active state.

This flag is set to 1 when the DMAC starts data transfer, and is cleared to 0 when data transfer in response to one transfer request is completed.

Even when DMA transfer is stopped by writing 0 to the DMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

#### Transfer End Interrupt Flag (DMSTS.DTIF)

The DMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed.

When both this flag and the DMINT.DTIE bit are set to 1, a transfer end interrupt is requested.

This flag is set to 1 when the DMA transfer bus cycle is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during the interrupt handling.

#### Transfer Escape End Interrupt Flag (DMSTS.ESIF)

The DMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When this bit and the DMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested.

This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during an interrupt handling.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see section 12, Interrupt Controller Unit (ICU).

### 15.3.13 Channel Priority

When multiple DMA transfer requests are present, the DMAC determines the priority of channels that have DMA transfer requests.

- The channel priority is fixed as follows: Channel 0 > Channel 1 > Channel 2 > Channel 3… > Channel 7 (Channel 0: Highest).

When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

### 15.3.14 Channel Security

The security attribute of transfer access of DMACn, security attribute of access to register of DMACn, security attribute of access to the ICU.DELSRn register are controlled by ICUSARC.SADMACn bit. For details on the ICUSARC register, see section 12, Interrupt Controller Unit (ICU).

When the ICUSARC.SADMACn bit is 0, transfer of DMACn is Secure access for both read and write. At the same time, the registers of channel n and the DELSRn register are protected from a Non-secure access.

When the ICUSARC.SADMACn bit is 1, transfer of DMACn is Non-secure access for both read and write. At the same time, the registers of channel n and the DELSRn register are Non-secure attributes.

Do not write to the ICUSARC.SADMACn bit while DMA transfer of same channel is enabled or a bus master is writing to the DMA registers of same channel.

Figure 15.23 shows security attribute about each DMAC channels.

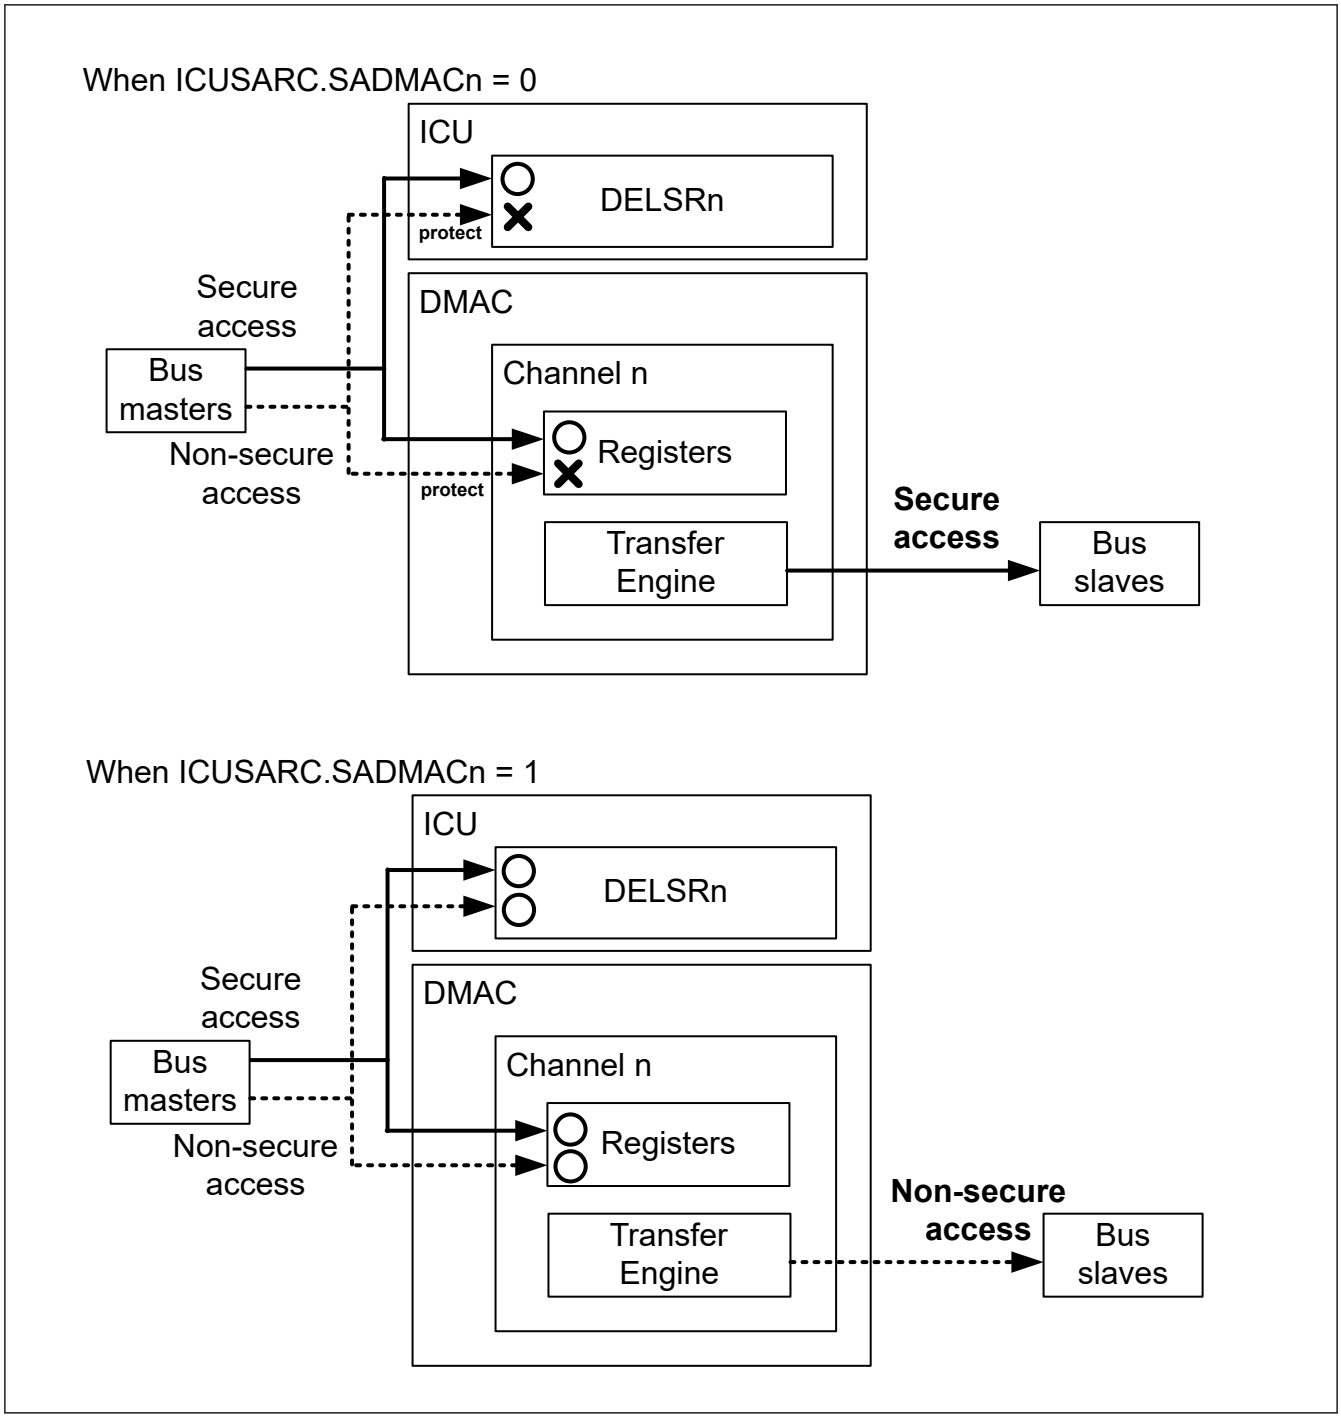

**Figure 15.23 Security attribute about each DMAC channels**

## 15.3.15 Master TrustZone Filter in DMAC

DMAC has the Master TrustZone Filter. The MasterTrustZone Filter in DMAC can detect security areas of Flash area (code flash and data flash) and SRAM area (ECC/Parity RAM) defined by IDAU. When setting non-secure channel to access

those addresses, it can detect security violation. Access of violation address is not performed. Detected error is handled as Master TrustZone Filter error.

## 15.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DMCNT.DTE bit and the DMSTS.ACT flag are changed from 1 to 0, indicating that DMA transfer has ended.

### 15.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

#### (1) In Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

When the value of DMCRAL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

#### (2) In Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

#### (3) In Block Transfer Mode (DMTMD.MD[1:0] = 10b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see section 12, Interrupt Controller Unit (ICU).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

#### (4) In Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 12, Interrupt Controller Unit (ICU).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

### 15.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of a 1-repeat size of data is completed while the DMINT.RPTIE bit is set to 1. When the interrupt is requested to complete DMA transfer, the DMCNT.DTE bit is cleared to 0 and the DMSTS.ESIF flag is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function). If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DMCNT.DTE bit.

A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of a 1-block size data is completed.

Repeat size end interrupt cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 12, Interrupt Controller Unit (ICU).

### 15.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the DMINT.SARIE or DMINT.DARIE bit is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function), an interrupt by an extended repeat area overflow is requested. When the interrupt is requested, the DMA transfer is terminated, the DMCNT.DTE bit is cleared to 0, and the ESIF flag in DMSTS is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Even if an interrupt by an extended repeat area overflow is requested during a read cycle, the following write cycle is performed.

In block transfer mode, even if an interrupt by an extended repeat area overflow is requested during a 1-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer.

An interrupt by an extended repeat area overflow cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 12, Interrupt Controller Unit (ICU).

## 15.5 Processing on DMA Transfer Error

DMA transfer error occurs with the Master TrustZone Filter error in DMAC, the Slave TrustZone Filter error, the Master MPU error, the Slave Bus Error or the Illegal Access Error. If the access error occurs during the DMA transfer, the DMAC immediately stops the transfer of error occurred channel. At this time, the ICU setting of the corresponding channel is also cleared. If there is a request other than the channel which caused the error, it will be re-arbitration as it is.

When the transfer error occurs, DMCNT.DTE of the error causing channel is set to 0. Also, the error response is informed to the ICU.DELSRn of the corresponding channel is cleared. Write back to each register is not performed. Furthermore, it generates the error response detection interrupt request (DMA_TRANSERR) to notify that an error has occurred by DMAC/DTC transfer.

When the Master TrustZone Filter error occurs, the Slave TrustZone error occurs or the Master MPU error occurs, it is possible to confirm the error information of DMAC by selecting NMI. The DMAC error channel register is cleared by selecting reset. Under the conditions where NMI is generated due to transfer error in DMAC, two interrupts(NMI and DMA_TRANSERR) are generated. In this case, NMI always responds first.

The error response detection interrupt request (DMA_TRANSERR) occurs when the Slave Bus error or the Illegal Access error occurs. Furthermore, it occurs after NMI when the error response detection interrupt request (DMA_TRANSERR) is not cleared in NMI handler.

section 15.5.1. Processing on NMI handler describes how to confirm the error information of the DMAC in the NMI handler.

section 15.5.2. Processing on Error response detection interrupt request (DMA_TRANSERR) handler describes how to confirm the error information of the DMAC in the DMA_TRANSERR handler.

Interrupts and the error information generated due to transfer errors are shown in section 15.6.2. Transfer Error Interrupt.

### 15.5.1 Processing on NMI handler

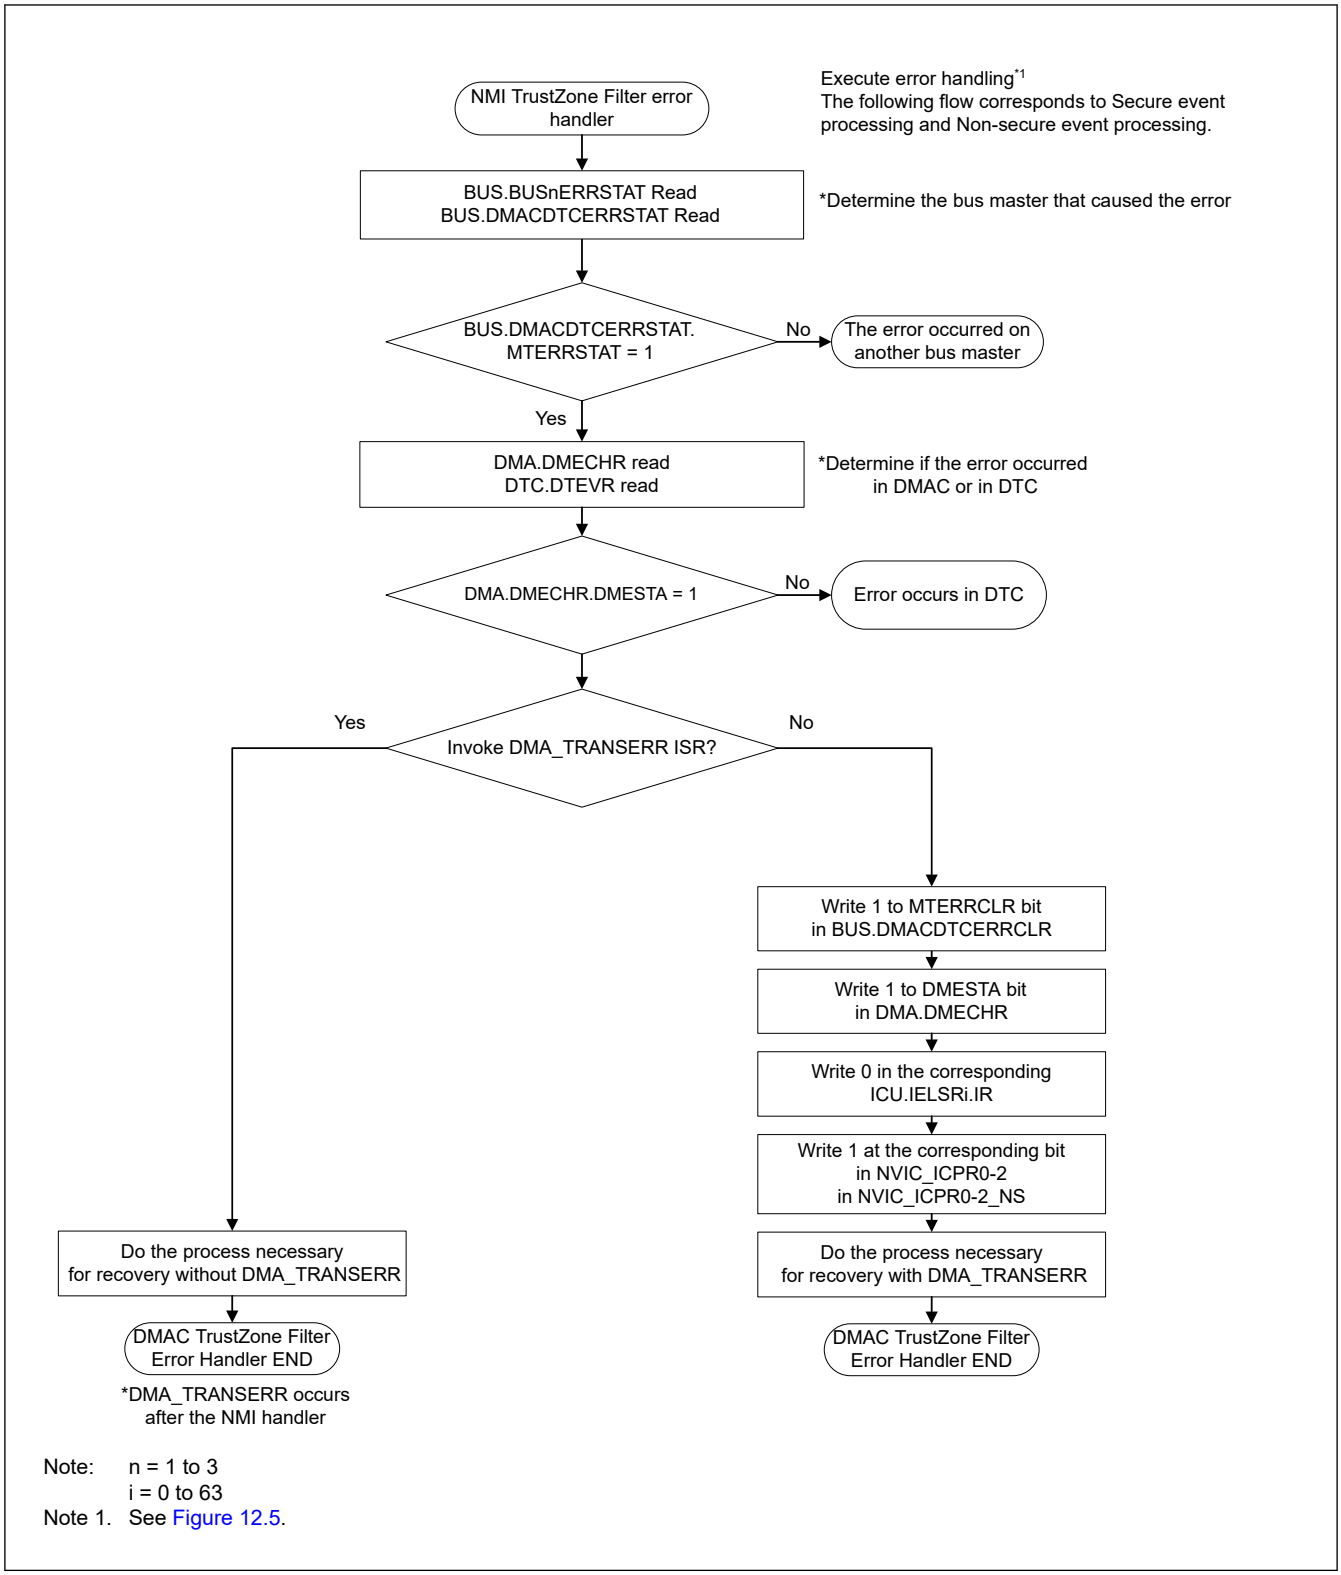
The cause of NMI due to the DMA transfer error is the Master TrustZone Filter error, the Slave TrustZone Filter error or the Master MPU error. When NMI occurs due to the DMAC transfer error, the error response detection interrupt request (DMA_TRANSERR) occurs after the end of NMI handler. It is possible to confirm the cause of the error and the DMAC channel in which the error occurred. When NMI occurs, perform the necessary processing according to the flow described in section 12, Interrupt Controller Unit (ICU).

Figure 15.24 shows the flow to confirm the channel that caused the Master TrustZone Filter error in DMAC.

Figure 15.25 shows the flow to confirm the channel that caused the Slave TrustZone Filter error in DMAC.

Figure 15.26 shows the flow to confirm the channel and Security Attribute that caused the Master MPU error in DMAC.

If completing all processing in NMI handler, it is possible to clear the error response detection interrupt request (DMA_TRANSERR) that occurs subsequently.



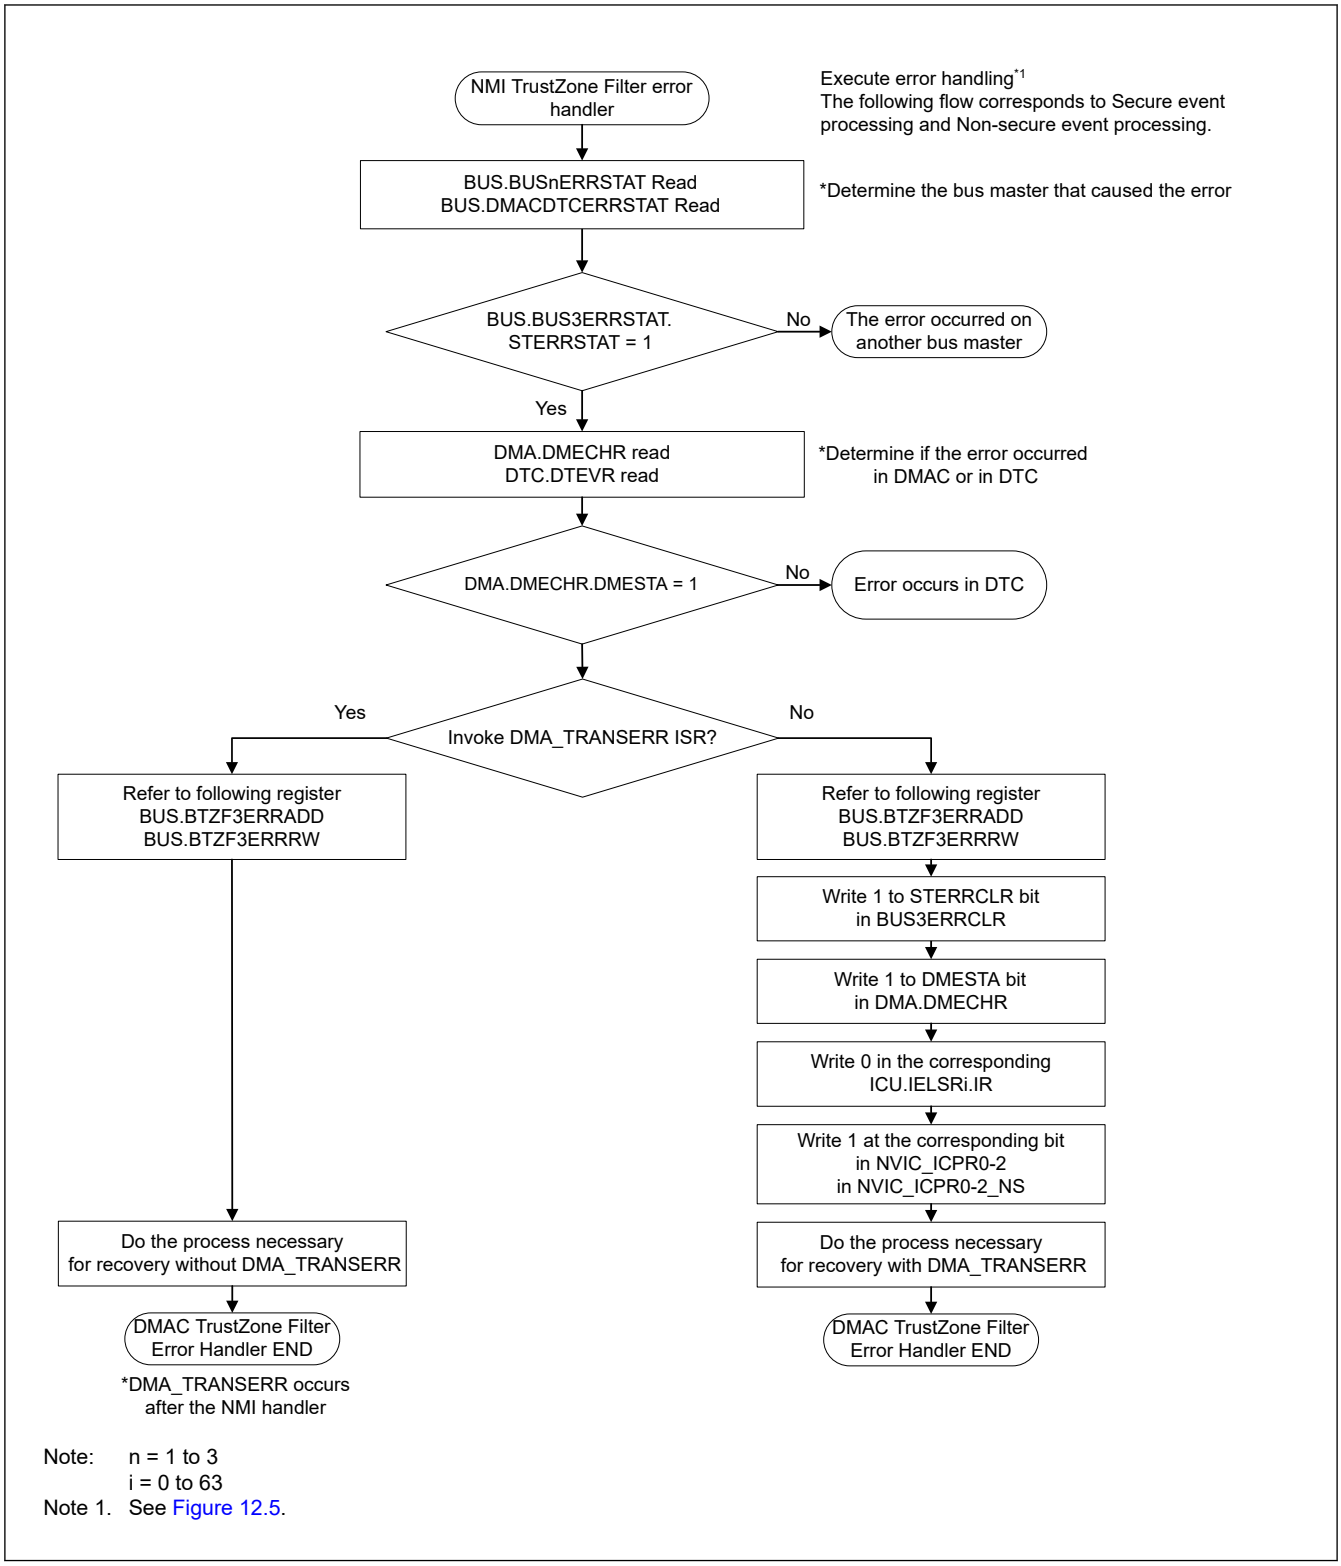


**Figure 15.24 Processing in NMI handler by Master TrustZone Filter error**

Note: n = 1 to 3
i = 0 to 63
Note 1. See Figure 12.5.

**Figure 15.25 Processing in NMI handler by Slave TrustZone Filter error**

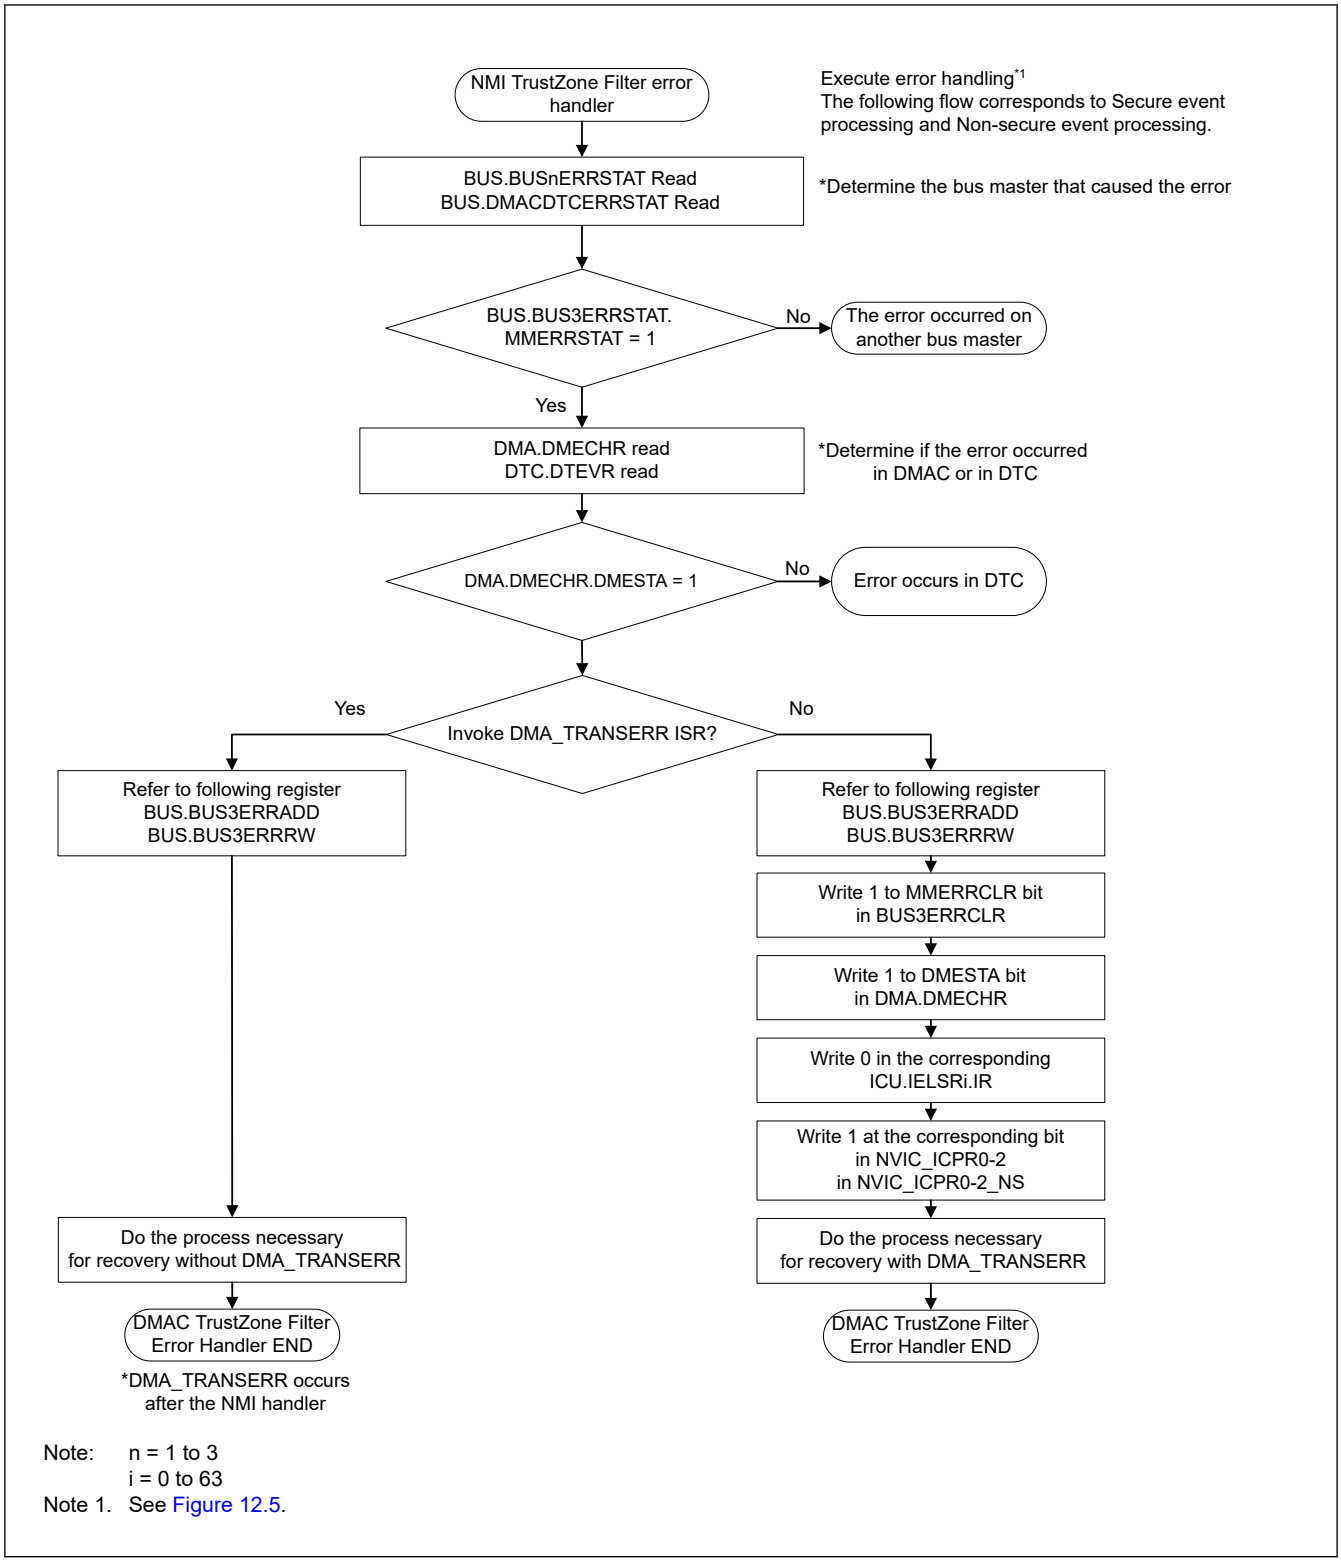

**Figure 15.26 Processing in NMI handler by Master MPU error**

## 15.5.2 Processing on Error response detection interrupt request (DMA_TRANSERR) handler

The cause of error response detection interrupt request (DMA_TRANSERR) due to DMA transfer error is the Slave Bus Error or Illegal Access Error. Also, it occurs after the NMI handler error response detection interrupt request (DMA_TRANSERR) is not cleared by the NMI handler.

It is possible to confirm the cause of the error and the DMAC channel in which the error occurred.

Error cause confirmation procedure is shown Figure 15.27.

Figure 15.28 shows the flow for confirm the channel that caused the Master TrustZone Filter Error in DMAC

Figure 15.29 shows the flow for confirm the channel that caused the Slave TrustZone Filter Error in DMAC

Figure 15.30 shows the flow for confirm the channel and Security Attribute that caused the Master MPU Error in DMAC

Figure 15.31 shows the flow for confirm the channel and Security Attribute that caused the Slave Bus Error in DMAC

Figure 15.32 shows the flow for confirm the channel and Security Attribute that caused the Illegal Access Error in DMAC

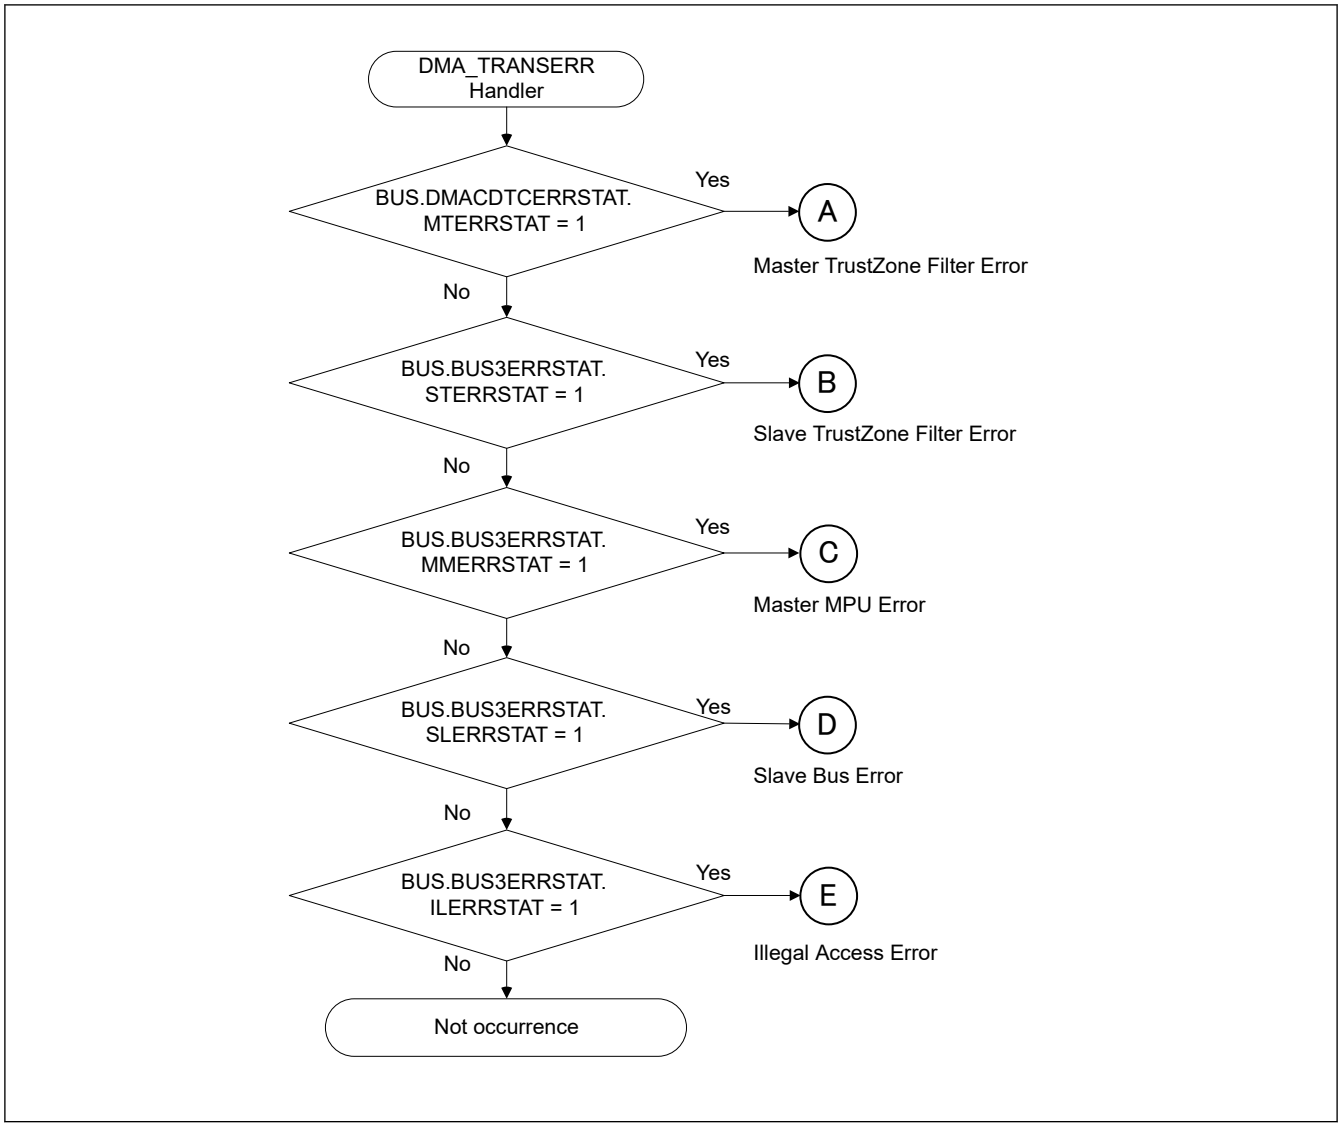

**Figure 15.27 Transfer error factor judgment when the error response detection interrupt (DMA_TRANSERR) occurs**

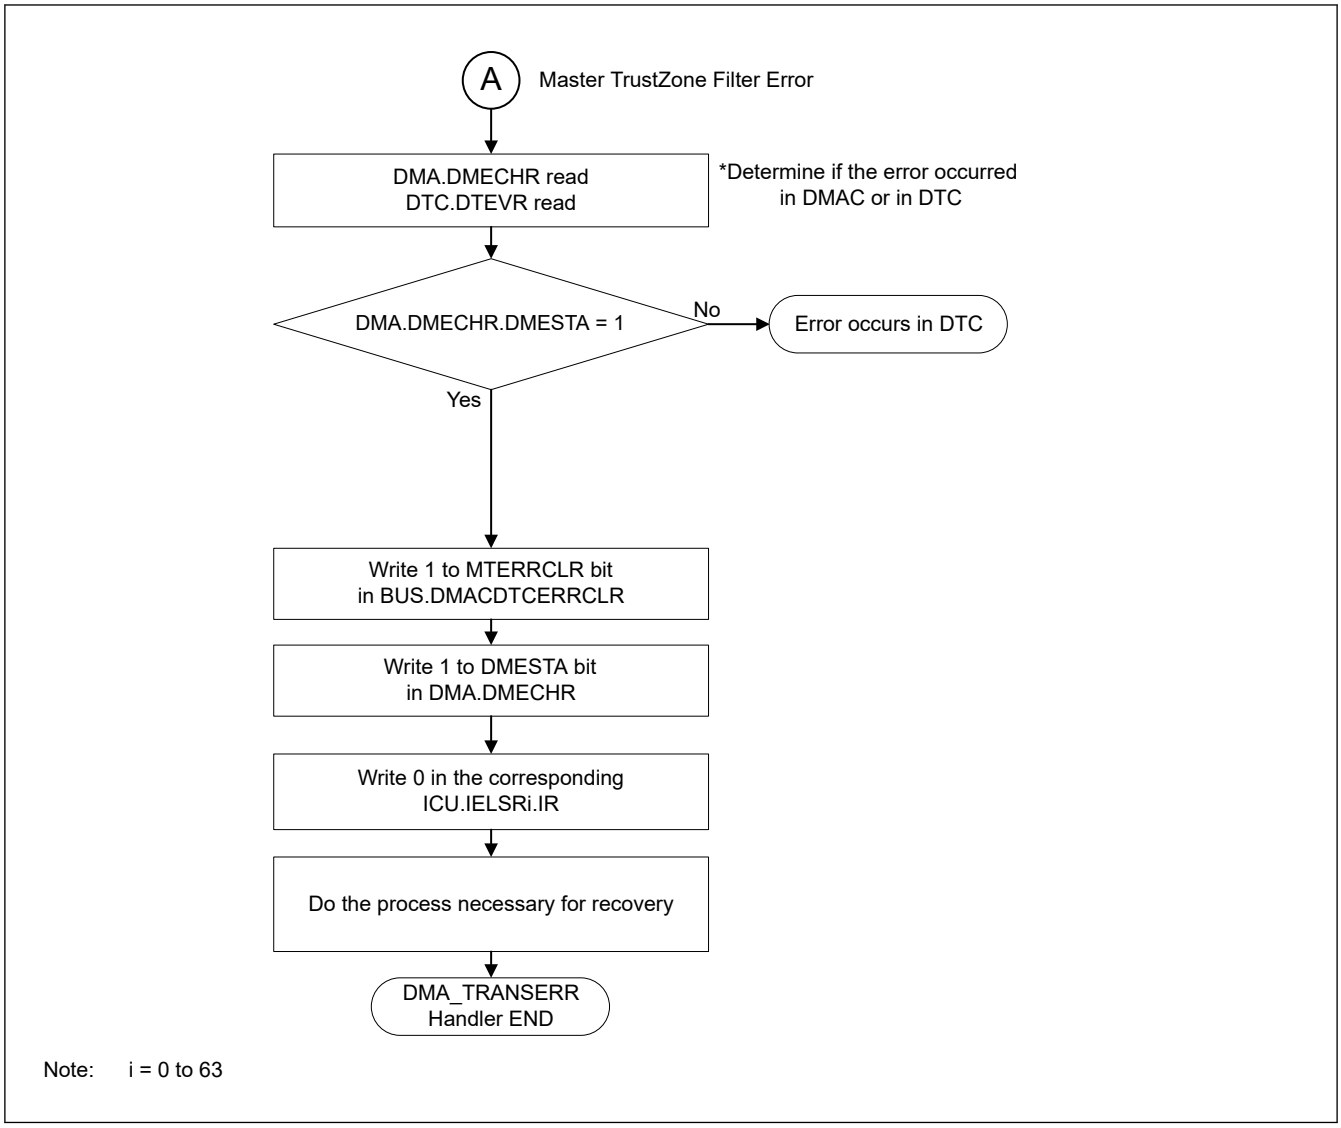

**Figure 15.28 Processing in DMA_TRANSERR handler by Master TrustZone Filter Error**

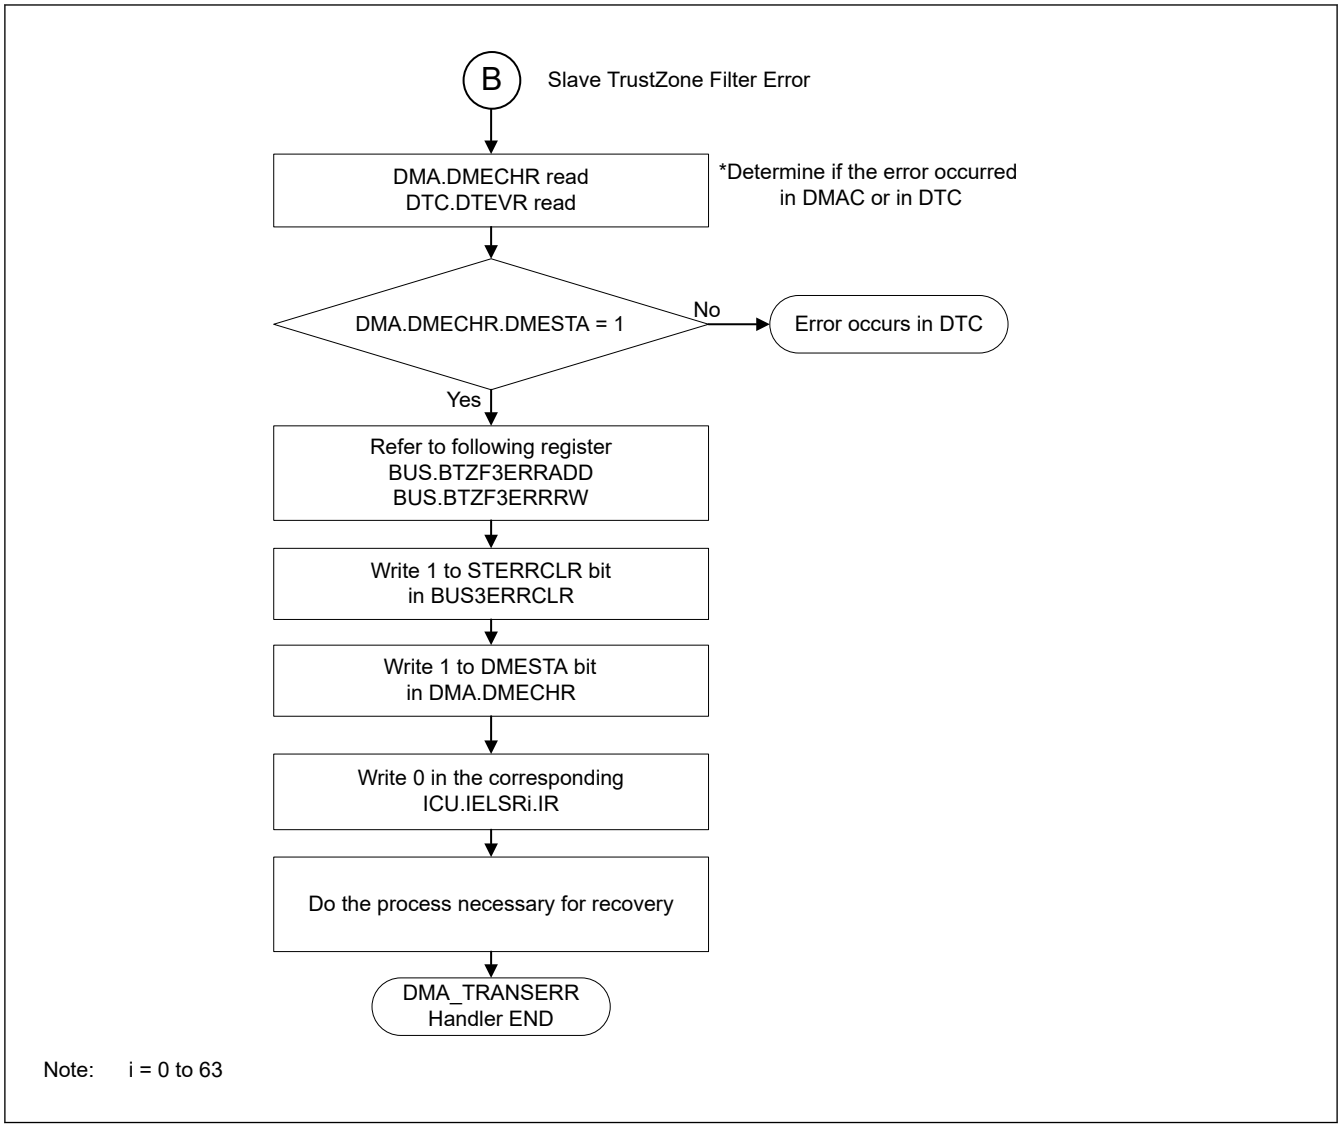

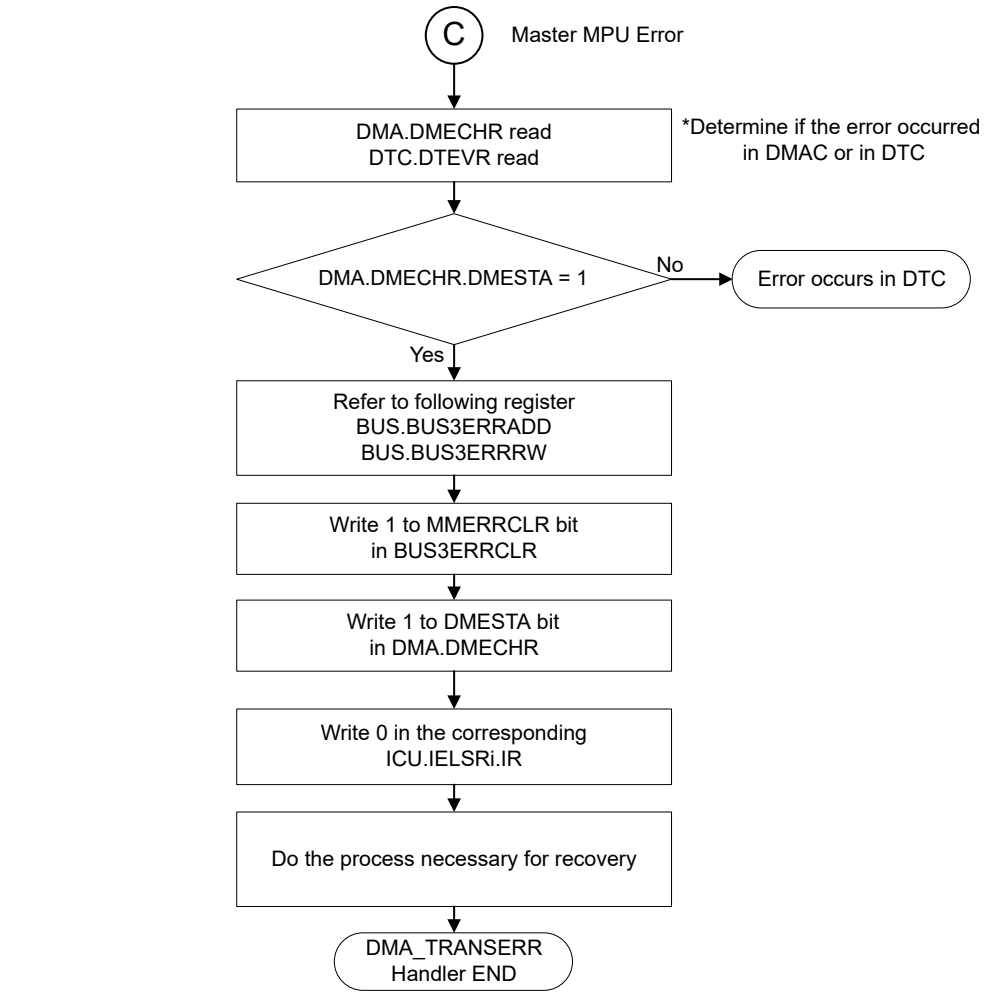

**Figure 15.29 Processing in DMA_TRANSERR handler by Slave TrustZone Filter Error**

Note: i = 0 to 63

**Figure 15.30 Processing in DMA_TRANSERR handler by Master MPU Error**

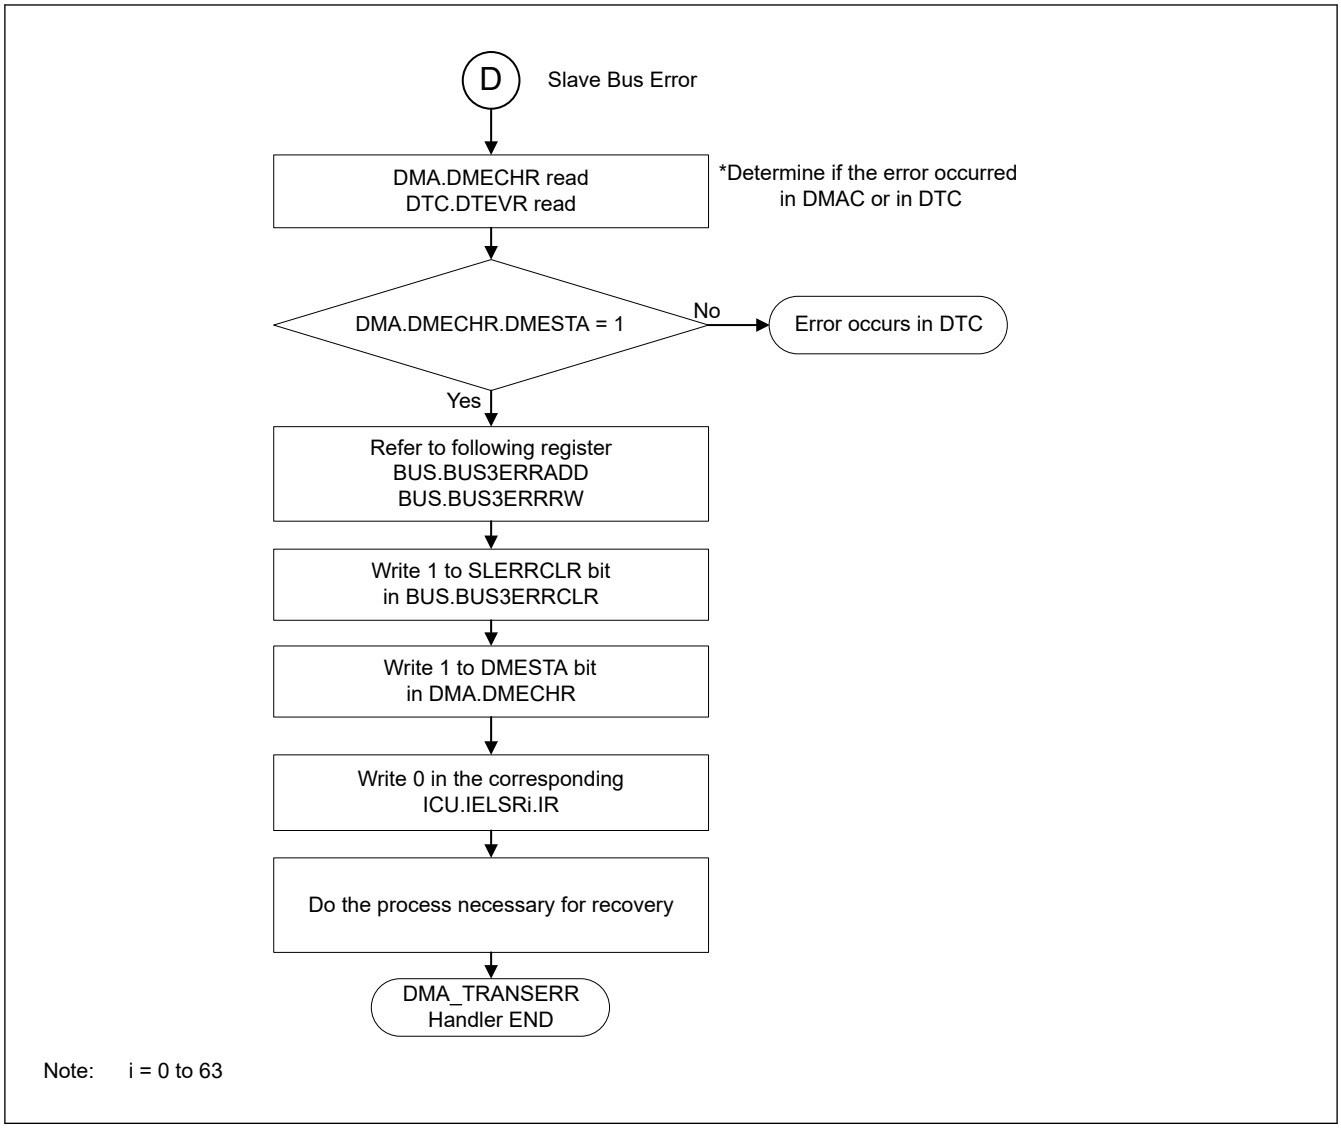

**Figure 15.31 Processing in DMA_TRANSERR handler by Slave Bus Error**

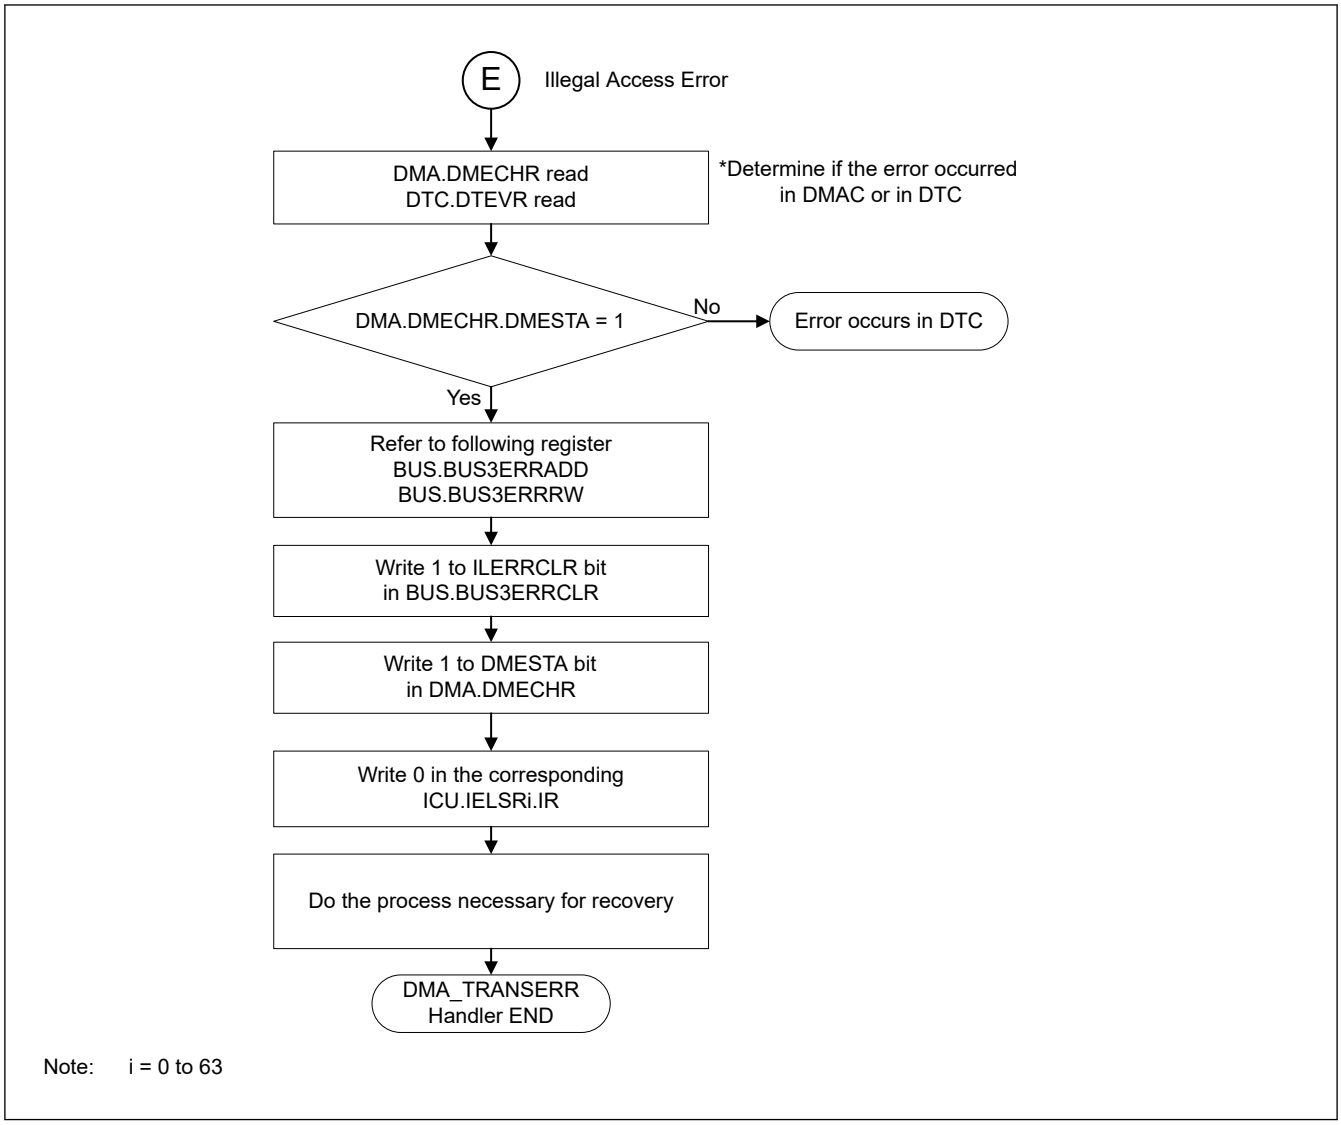

**Figure 15.32 Processing in DMA_TRANSERR handler by Illegal Access Error**

## 15.6 Interrupts

### 15.6.1 Transfer End Interrupt

Each DMAC channel can output an interrupt request (DMACn_INT) to the CPU or the DTC after transfer in response to one request is completed.

In repeat-block transfer mode, do not enable escape transfer end interrupt.

Table 15.21 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 15.33 shows the schematic logic diagram of interrupt outputs (DMACn (n = 0 to 7)). Figure 15.34 shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

**Table 15.21 Relation among interrupt sources, interrupt status flags, and interrupt enable bits (1 of 2)**

| Interrupt sources | Interrupt enable bits | Interrupt status flags | Request output enable bits |
|---|---|---|---|
| Transfer end | — | DMSTS.DTIF | DMINT.DTIE |

**Table 15.21 Relation among interrupt sources, interrupt status flags, and interrupt enable bits (2 of 2)**

| Interrupt sources | | Interrupt enable bits | Interrupt status flags | Request output enable bits |
|---|---|---|---|---|
| Escape transfer end | Repeat size end | DMINT.RPTIE | DMSTS.ESIF | DMINT.ESIE |
| | Source address extended repeat area overflow | DMINT.SARIE | | |
| | Destination address extended repeat area overflow | DMINT.DARIE | | |

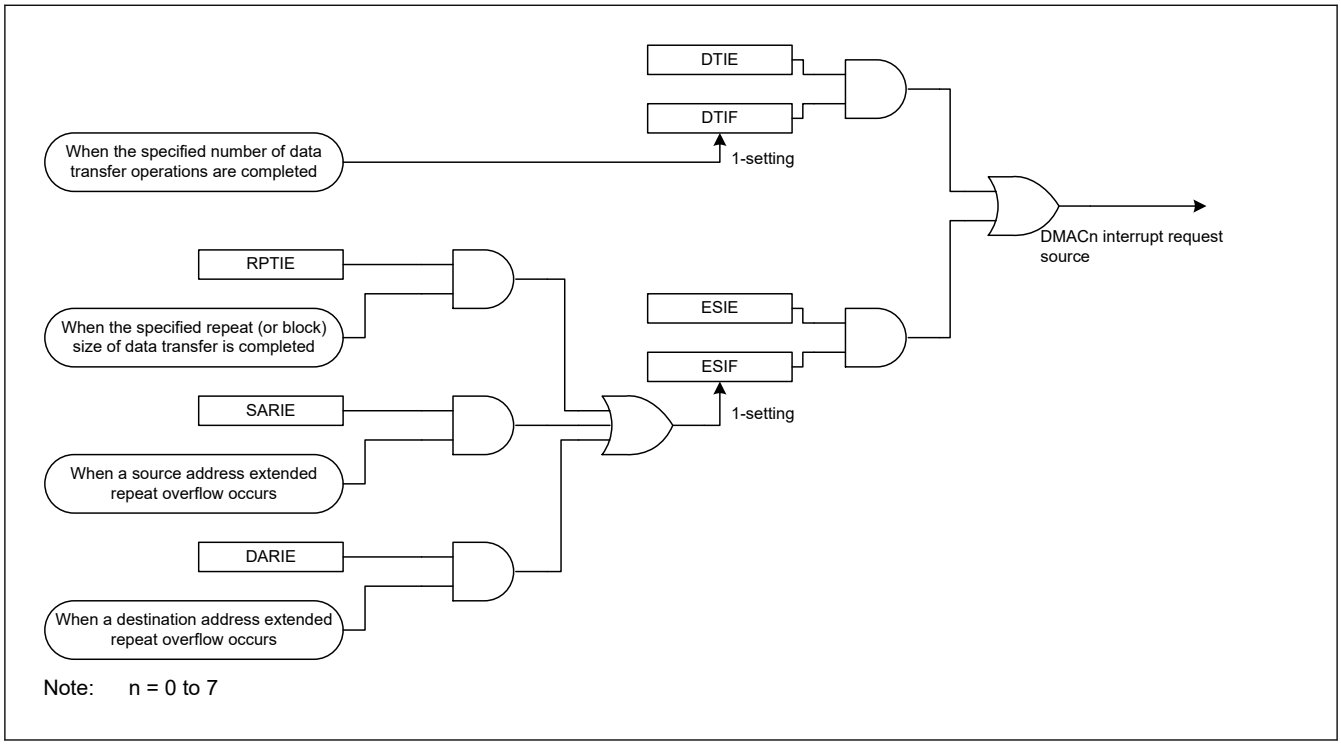

**Figure 15.33 Schematic logic diagram of interrupt output source (DMACn)**

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases:

- When terminating a DMA transfer
- When continuing a DMA transfer

### 15.6.1.1 When Terminating a DMA Transfer

Write 0 to the DMSTS.DTIF flag to clear a transfer end interrupt, and to the DMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The DMACn remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DMCNT.DTE bit to 1 (DMA transfer enabled).

### 15.6.1.2 When Continuing a DMA Transfer

Write 1 to the DMCNT.DTE bit. The DMSTS.ESIF flag is automatically cleared to 0 (interrupt source cleared), and DMA transfer is resumed.

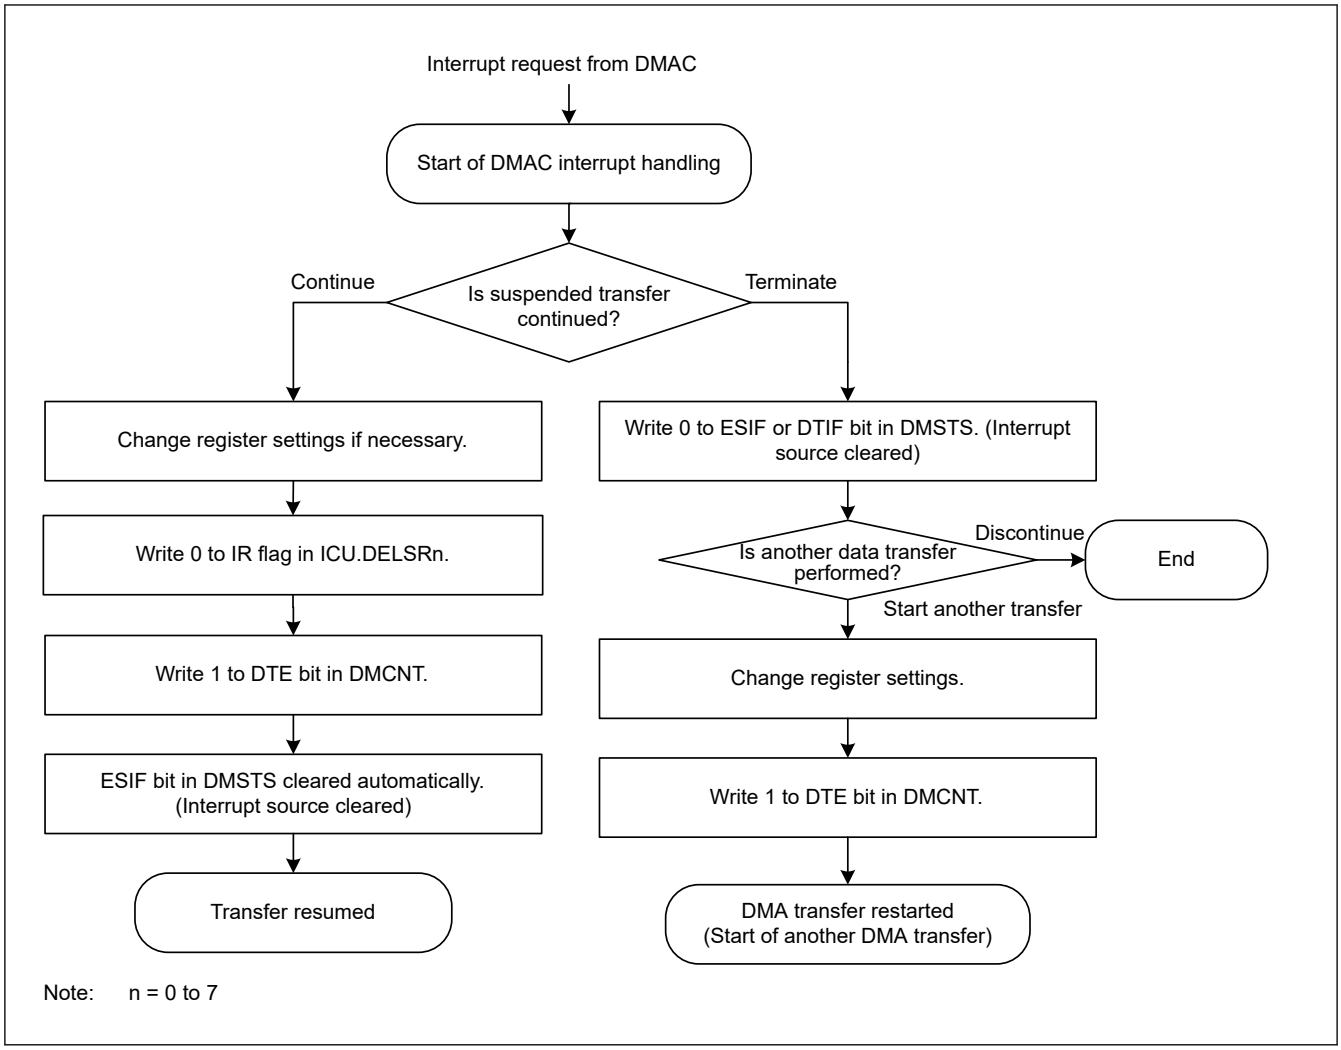

**Figure 15.34 DMAC interrupt handling routine to resume/terminate DMA transfer**

## 15.6.2 Transfer Error Interrupt

Error response detection interrupt request (DMA_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DMAC transfer. The types of interrupts that occur when a DMAC transfer error occurs are listed in the Table 15.22. The Table 15.22 also shows error information stored when a transfer error occurs.

**Table 15.22 Interrupt and error information due to DMAC transfer error cause**

| Transfer error factor | NMI/RESET*1 Request | Interrupt Request | Bus Error Status | Error Address Error R/W | Error Channel Information |
|---|---|---|---|---|---|
| Master TrustZone Filter (in DMAC/DTC) | ICU.NMISR.TZFST*1 | DMA_TRANSERR | BUS.DMACDTCERRSTAT.MTERRSTAT*1 | — | DMA.DMECHR |
| Slave TrustZone Filter | ICU.NMISR.TZFST*1 | DMA_TRANSERR | BUS.BUS3ERRSTAT.STERRSTAT*1 | BUS.BTZF3ERRADD BUS.BTZF3ERRRW | DMA.DMECHR |
| Master MPU | ICU.NMISR.BUSMST | DMA_TRANSERR | BUS.BUS3ERRSTAT.MMERRSTAT | BUS.BUS3ERRADD BUS.BUS3ERRRW | DMA.DMECHR |
| Slave Bus Error | —*2 | DMA_TRANSERR | BUS.BUS3ERRSTAT.SLERRSTAT*2 | BUS.BUS3ERRADD BUS.BUS3ERRRW | DMA.DMECHR |
| Illegal Access Error | —*2 | DMA_TRANSERR | BUS.BUS3ERRSTAT.ILERRSTAT*2 | BUS.BUS3ERRADD BUS.BUS3ERRRW | DMA.DMECHR |

Note 1. Interrupt is generated when NMI request is selected as the operation after detection of the Master MPU error and the TrustZone Filter error. By confirming BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT, judge whether it is the Master or the Slave.

Note 2. If the error response detection interrupt (DMA_TRANSERR) occurs and NMI of the Master MPU or NMI of the TrustZone Filter has not occurred, treat it as the Illegal address access error or the Slave Bus Error. It can also be determined by BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT.

Note that if the bus error occurs when writing the last data of transfer, the transfer end event and the error response detection interrupt (DMA_TRANSERR) occurs.

## 15.7 Event Link

Each DMAC channel outputs an event link request signal (DMACn_INT) every time it completes a data transfer, or a block transfer in block transfer mode.

For details, see section 17, Event Link Controller (ELC).

If a bus error occurs when writing the last data of transfer, a transfer end event and error response detection interrupt (DMA_TRANSERR) occurs.

## 15.8 Low-Power Consumption Function

Before entering the module-stop state or Software Standby mode, you must first set the DMAST.DMST bit to 0 (the DMAC module suspended) and use the settings in the sections that follow.

### (1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DMAC. If a DMA transfer is in progress when 1 is written to the MSTPA22 bit, the transition to the module-stop state proceeds after the DMA transfer ends. Access to the DMAC registers is prohibited while the MSTPA22 bit is 1. Writing 0 to the MSTPA22 bit releases the DMAC from the module-stop state.

### (2) Software Standby mode

Use the settings described in section 10.7.1. Transitioning to Software Standby Mode.

If DMA transfer operations are in progress when the WFI instruction is executed, the DMA transfer completes before the transition to Software Standby mode.

### (3) Notes on low power consumption function

For information on the WFI instruction and register settings, see section 10.9.6. Timing of WFI Instruction.

To perform a DMA transfer after returning from a low power mode, set the DMAST.DMST bit to 1 again. To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination, as described in section 12.4.1. Detecting Interrupts, and then execute the WFI instruction.

## 15.9 Usage Notes

### 15.9.1 Access to the Registers during DMA Transfer

Do not write to the following registers while the DMSTS.ACT flag of the same channel is set to 1 (DMAC active state) or the DMCNT.DTE bit of the same channel is set to 1 (DMA transfer enabled):

- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR
- DMREQ
- DMSBS

- DMDBS
- DMSRR
- DMDRR
- ICUSARC
- DMACSAR

### 15.9.2 DMA Transfer to Reserved Areas

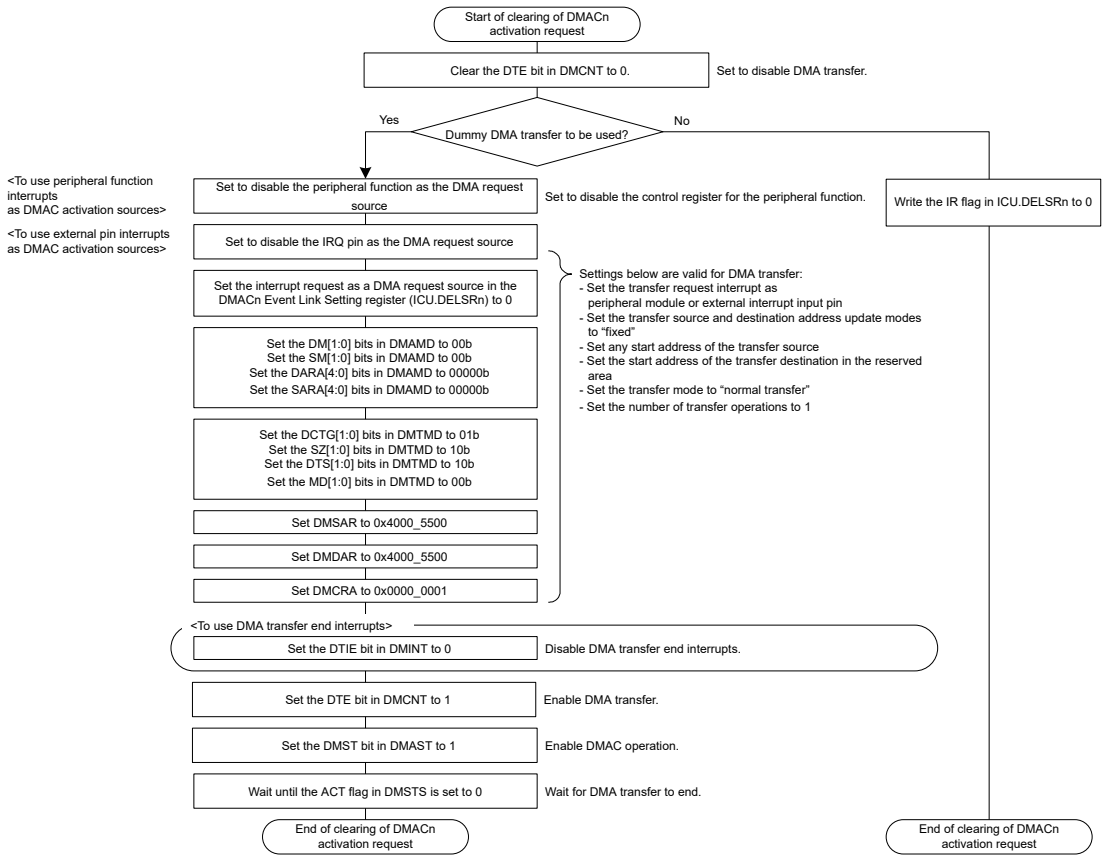
DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see section 4, Address Space.

### 15.9.3 Setting of DMAC Event Link Setting Register of the Interrupt Controller Unit (ICU.DELSRn n = 0 to 7)

The DMAC event link setting register (ICU.DELSRn) should be set while the DMA transfer enable bit (DMCNT.DTE) is cleared to 0 (DMA transfer is disabled). Moreover, the DTC activation enable register (ICU.IELSRn.DTCE (n = 0 to 63)) that corresponds to the same event number that has been set by the ICU.DELSRn register should not be set to 1. For details on the ICU.IELSRn.DTCE and ICU.DELSRn, see section 12, Interrupt Controller Unit (ICU).

### 15.9.4 Suspending or Restarting DMAC Activation

To suspend a DMAC activation request, write 0x00 to the DMAC Event Link select bits (ICU.DELSRn.DELS[8:0]). To restart the DMA transfer, write the event number to the ICU.DELSRn.DELS[8:0] bits following the settings shown in section 15.3.10. Activating the DMAC.



### 15.9.5 Precautions for Resuming DMA Transfer

A DMAC activation request might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMAC activation request is held in the DMAC. To prevent this, stop the DMAC activation requests by setting the DELSRn.DELS[8:0] bits in the ICU to 0.

When a DMAC activation request occurs after the last round of the DMA transfer is generated, clear the DMAC activation request with either of the following approaches.

- Clear the DMAC activation request with a DMA dummy transfer.
- Set the DMCNT.DTE bit to 0 and then set the ICU.DELSRn.IR flag to 0.

See Figure 15.35.

Note: n: 0 to 7

**Figure 15.35 Example of register setting procedure to clear the DMAC activation interrupt**

# 16. Data Transfer Controller (DTC)

## 16.1 Overview

A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request.

Table 16.1 lists the DTC specifications and Figure 16.1 shows DTC block diagram.

**Table 16.1 DTC specifications**

| Parameter | Description |
|---|---|
| Transfer modes | • Normal transfer mode<br>A single activation leads to a single data transfer.<br>• Repeat transfer mode<br>A single activation leads to a single data transfer.<br>The transfer address returns to the start address after the number of data transfers reaches the specified repeat size.<br>The maximum number of repeat transfers is 256 and the maximum data transfer size is 256 × 32 bits (1024 bytes)<br>• Block transfer mode<br>A single activation leads to a transfer of a single block.<br>The maximum block size is 256 × 32 bits = 1024 bytes. |
| Transfer channel | • Channel transfer can be associated with the interrupt source (transferred by a DTC activation request from the ICU)<br>• Multiple data units can be transferred on a single activation source (chain transfer)<br>• Chain transfers are selectable to either execute when the counter is 0, or always execute. |
| Transfer space | • 4 GB area from 0x0000_0000 to 0xFFFF_FFFF, excluding reserved areas |
| Data transfer units | • Single data unit: 1 byte (8 bits), 1 halfword (16 bits), 1 word (32 bits)<br>• Single block size: 1 to 256 data units. |
| CPU interrupt source | • An interrupt request can be generated to the CPU on a DTC activation interrupt<br>• An interrupt request can be generated to the CPU after a single data transfer<br>• An interrupt request can be generated to the CPU after a data transfer of a specified volume. |
| Processing on DTC transfer error | • When the DTC transfer error occurs, it stops the transfer that caused the error<br>• Request to clear the register for activation request of DTC error number to ICU |
| Error response detection interrupt | Generated when the DTC transfer error occurs |
| Event link function | An event link request is generated after one data transfer (for block, after one block transfer) |
| Read skip | Read of transfer information can be skipped |
| Write-back skip | When the transfer source or destination address is specified as fixed, a write-back of transfer information can be skipped |
| TrustZone | TrustZone violation area of Flash and SRAM is detected in advance before access the bus. |
| Module-stop function | Module-stop state can be set to reduce power consumption |
| TrustZone Filter | Security attribution can be set for each activation source |

Note: Security attribution register of DTC is described in ICU.ICUSARG, ICU.ICUSARH and ICU.ICUSARI.

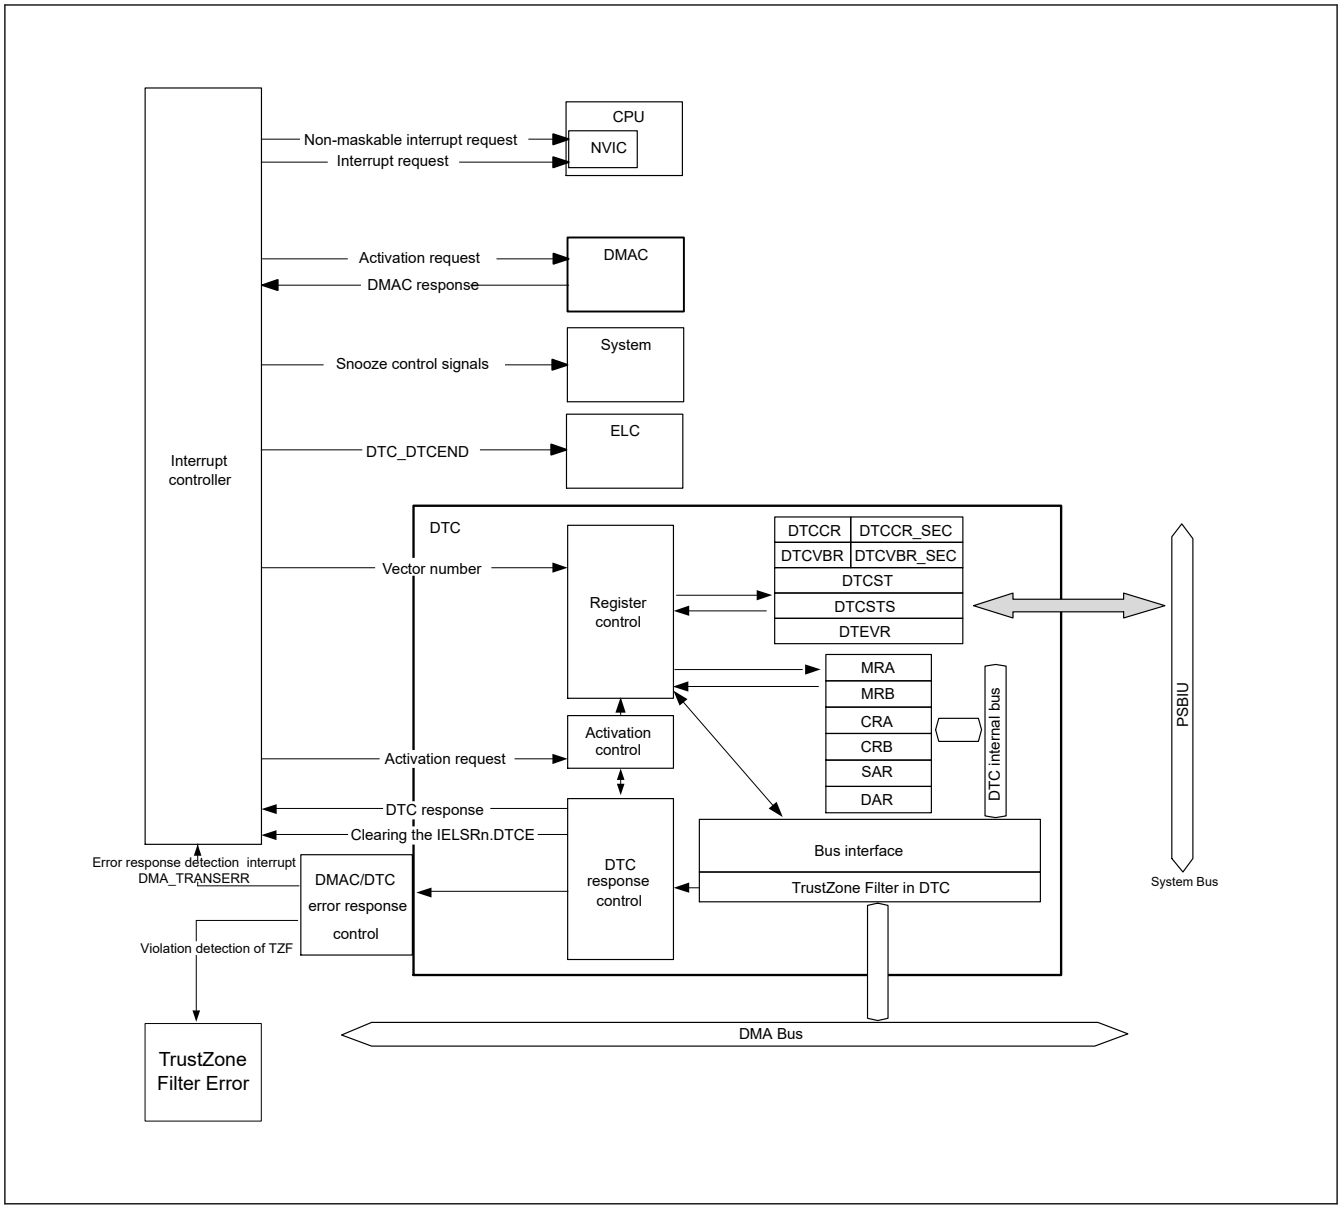


**Figure 16.1 DTC block diagram**

See section 12.1. Overview in section 12, Interrupt Controller Unit (ICU) for the connections between the DTC and NVIC in the CPU.

## 16.2 Register Descriptions

MRA, MRB, SAR, DAR, CRA, and CRB are all DTC internal registers that cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the SRAM area as transfer information. When an activation request is generated, the DTC reads the transfer information from the SRAM area and sets it in its internal registers. After the data transfer ends, the internal register contents are written back to the SRAM area as transfer information.

## 16.2.1 DTCSAR : DTC Controller Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x30

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DTCSTSA |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DTCSTSA | DTC Security Attribution<br>0: Secure.<br>1: Non-secure. | R/W |
| 31:1 | — | This bit is read as 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

This register only sets the DTCST security attribute.

**DTCSTSA bit (DTC Security Attribution)**

Security attributes of registers for DTCST.

Do not write to the DTCSTSA bit while DTC transfer is enabled or a bus master is writing to the DTC registers.

## 16.2.2 MRA : DTC Mode Register A

Base address: DTCVBR

Offset address: 0x03 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 16.3.1. Allocating Transfer Information and DTC Vector Table)

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | MD[1:0] | | SZ[1:0] | | SM[1:0] | | — | — |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | — | The read values are undefined. The write value should be 0. | — |
| 3:2 | SM[1:0] | Transfer Source Address Addressing Mode<br>0 0: Address in the SAR register is fixed (write-back to SAR is skipped.)<br>0 1: Address in the SAR register is fixed (write-back to SAR is skipped.)<br>1 0: SAR value is incremented after data transfer:<br>+1 when SZ[1:0] = 00b<br>+2 when SZ[1:0] = 01b<br>+4 when SZ[1:0] = 10b<br>1 1: SAR value is decremented after data transfer:<br>-1 when SZ[1:0] = 00b<br>-2 when SZ[1:0] = 01b<br>-4 when SZ[1:0] = 10b | — |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5:4 | SZ[1:0] | DTC Data Transfer Size<br>0 0: Byte (8-bit) transfer<br>0 1: Halfword (16-bit) transfer<br>1 0: Word (32-bit) transfer<br>1 1: Setting prohibited | — |
| 7:6 | MD[1:0] | DTC Transfer Mode Select<br>0 0: Normal transfer mode<br>0 1: Repeat transfer mode<br>1 0: Block transfer mode<br>1 1: Setting prohibited | — |

The MRA register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x03) and DTC transfers it automatically to and from the MRA register. See section 16.3.1. Allocating Transfer Information and DTC Vector Table.

## 16.2.3 MRB : DTC Mode Register B

Base address: DTCVBR

Offset address: 0x02 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 16.3.1. Allocating Transfer Information and DTC Vector Table)

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | CHNE | CHNS | DISEL | DTS | DM[1:0] | | — | — |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | — | The read values are undefined. The write value should be 0. | — |
| 3:2 | DM[1:0] | Transfer Destination Address Addressing Mode<br>0 0: Address in the DAR register is fixed (write-back to DAR is skipped)<br>0 1: Address in the DAR register is fixed (write-back to DAR is skipped)<br>1 0: DAR value is incremented after data transfer:<br>+1 when MRA.SZ[1:0] = 00b<br>+2 when MRA.SZ[1:0] = 01b<br>+4 when MRA.SZ[1:0] = 10b<br>1 1: DAR value is decremented after data transfer:<br>-1 when MRA.SZ[1:0] = 00b<br>-2 when MRA.SZ[1:0] = 01b<br>-4 when MRA.SZ[1:0] = 10b | — |
| 4 | DTS | DTC Transfer Mode Select<br>0: Select transfer destination as repeat or block area.<br>1: Select transfer source as repeat or block area. | — |
| 5 | DISEL | DTC Interrupt Select<br>0: Generate an interrupt request to the CPU when specified data transfer is complete.<br>1: Generate an interrupt request to the CPU each time DTC data transfer is performed. | — |
| 6 | CHNS | DTC Chain Transfer Select<br>0: Chain transfer is continuous.<br>1: Chain transfer occurs only when the transfer counter changes from 1 to 0 or 1 to CRAH. | — |
| 7 | CHNE | DTC Chain Transfer Enable<br>0: Chain transfer is disabled.<br>1: Chain transfer is enabled. | — |

The MRB register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x02) and DTC transfers it automatically to and from the MRB register. See section 16.3.1. Allocating Transfer Information and DTC Vector Table.

### DM[1:0] bits (Transfer Destination Address Addressing Mode)

The DM[1:0] bits are to fix the address of the DAR register or specify increment / decrement of the DAR register after transfer.

### DTS bit (DTC Transfer Mode Select)

The DTS bit specifies whether the transfer source or destination is the repeat or block area in repeat or block transfer mode.

### DISEL bit (DTC Interrupt Select)

The DISEL bit specifies the condition for generating an interrupt request to the CPU.

### CHNS bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition. When CHNE is 0, the CHNS setting is ignored. For details on the conditions for chain transfer, see Table 16.3.

When the next transfer is chain transfer, completion of the specified number of transfers is not determined, the activation source flag is not cleared, and an interrupt request to the CPU is not generated.

### CHNE bit (DTC Chain Transfer Enable)

The CHNE bit enables chain transfer. The chain transfer condition is selected by the CHNS bit. For details on chain transfer, see section 16.4.6. Chain Transfer.

## 16.2.4 SAR : DTC Transfer Source Register

Base address: DTCVBR

Offset address: 0x04 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 16.3.1. Allocating Transfer Information and DTC Vector Table)

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x |

The SAR sets the transfer source start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x04) and DTC transfers it automatically to and from the SAR register. See section 16.3.1. Allocating Transfer Information and DTC Vector Table.

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b.

## 16.2.5 DAR : DTC Transfer Destination Register

Base address: DTCVBR

Offset address: 0x08 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 16.3.1. Allocating Transfer Information and DTC Vector Table)

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x |

The DAR sets the transfer destination start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x08) and DTC transfers it automatically to and from the DAR register. See section 16.3.1. Allocating Transfer Information and DTC Vector Table.

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b.

## 16.2.6 CRA : DTC Transfer Count Register A

Base address: DTCVBR

Offset address: 0x0E + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 16.3.1. Allocating Transfer Information and DTC Vector Table)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | CRAL | Transfer Counter A Lower Register<br>Specify the transfer count. | — |
| 15:8 | CRAH | Transfer Counter A Upper Register<br>Specify the transfer count. | — |

Note: The function depends on the transfer mode.
Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

The CRA register consists of 16 bits. CRAL is the lower 8 bits and CRAH is the upper 8 bits. CRA is used in normal mode.

CRAL and CRAH are used in repeat transfer mode and block transfer mode.

The CRA register cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0E) and DTC transfers it automatically to and from the CRA register. See section 16.3.1. Allocating Transfer Information and DTC Vector Table.

### (1) Normal transfer mode (MRA.MD[1:0] = 00b)

In normal transfer mode, CRA functions as a 16-bit transfer counter. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRA value is decremented (-1) on each data transfer.

### (2) Repeat transfer mode (MRA.MD[1:0] = 01b)

In repeat transfer mode, the CRAH register holds the transfer count and the CRAL register functions as an 8-bit transfer counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

### (3) Block transfer mode (MRA.MD[1:0] = 10b)

In block transfer mode, the CRAH register holds the block size and the CRAL register functions as an 8-bit block size counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

## 16.2.7 CRB : DTC Transfer Count Register B

Base address: DTCVBR

Offset address: 0x0C + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 16.3.1. Allocating Transfer Information and DTC Vector Table)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x |

The CRB sets the block transfer count for block transfer mode. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRB value is decremented (-1) when the final data of a single block size is transferred. When normal transfer mode or repeat transfer mode is selected, this register is not used, and the set value is ignored.

The CRB cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0C) and DTC transfers it automatically to and from the CRB register. See section 16.3.1. Allocating Transfer Information and DTC Vector Table.

## 16.2.8 DTCCR : DTC Control Register

Base address: DTC = 0x4000_5400

Offset address: 0x00

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | RRS | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 3 | — | This bit is read as 1. The write value should be 1. | R/W |
| 4 | RRS | DTC Transfer Information Read Skip Enable<br>0: Transfer information read is not skipped<br>1: Transfer information read is skipped when vector numbers match | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

### RRS bit (DTC Transfer Information Read Skip Enable)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

## 16.2.9 DTCCR_SEC : DTC Control Register for Secure Region

Base address: DTC = 0x4000_5400

Offset address: 0x10

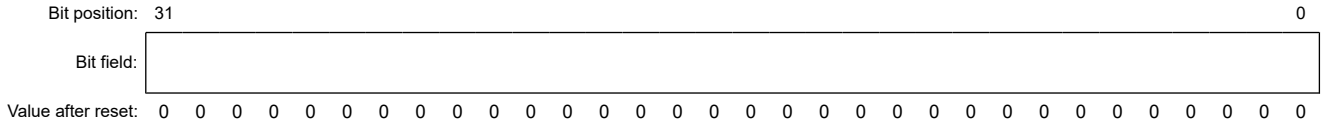
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | RRS | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 3 | — | This bit is read as 1. The write value should be 1. | R/W |
| 4 | RRS | DTC Transfer Information Read Skip Enable for Secure<br>0: Transfer information read is not skipped.<br>1: Transfer information read is skipped when vector numbers match. | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Secure access is allowed. Non-secure access is read-only.

### RRS bit (DTC Transfer Information Read Skip Enable for Secure)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is



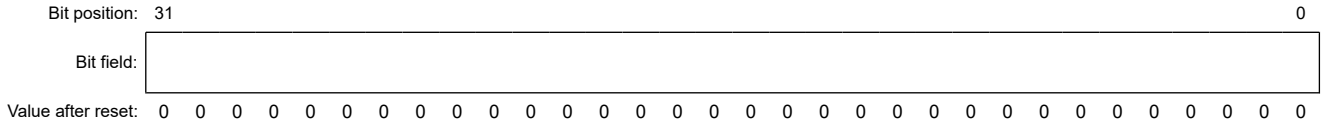
set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

## 16.2.10 DTCVBR : DTC Vector Base Register

Base address: DTC = 0x4000_5400

Offset address: 0x04



| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | DTC Vector Base Address<br>Set the DTC vector base address. The lower 10 bits should be 0. | R/W |

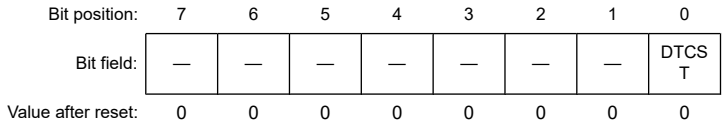
The DTCVBR sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1-KB units.

## 16.2.11 DTCVBR_SEC : DTC Vector Base Register for Secure Region

Base address: DTC = 0x4000_5400

Offset address: 0x14

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | DTC Vector Base Address for Secure Region<br>Set DTC Vector Base Address for Secure region. The lower 10 bits should be 0. | R/W |



Note: Secure access is allowed. Non-secure access is read-only.

The DTCVBR_SEC sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1-KB units.

## 16.2.12 DTCST : DTC Module Start Register

Base address: DTC = 0x4000_5400

Offset address: 0x0C

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DTCST | DTC Module Start<br>0: DTC module stopped.<br>1: DTC module started. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### DTCST bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted. If this bit is set to 0 during a data transfer, the accepted transfer request is active until processing completes.

DTCST must be set to 0 before transitioning to one of the following state or mode:

- Module-stop state
- Software Standby mode without Snooze mode transition

For details on these transitions, see section 16.10. Low Power Consumption Function and section 10, Low Power Modes.

## 16.2.13 DTCSTS : DTC Status Register

Base address: DTC = 0x4000_5400

Offset address: 0x0E

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | ACT | — | — | — | — | — | — | — | VECN[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | VECN[7:0] | DTC-Activating Vector Number Monitoring<br>These bits indicate the vector number for the activation source when a DTC transfer is in progress.<br>The value is only valid if a DTC transfer is in progress (ACT flag is 1). | R |
| 14:8 | — | These bits are read as 0. | R |
| 15 | ACT | DTC Active Flag<br>0: DTC transfer operation is not in progress.<br>1: DTC transfer operation is in progress. | R |

### VECN[7:0] bits (DTC-Activating Vector Number Monitoring)

While transfer by the DTC is in progress, the VECN[7:0] bits indicate the vector number associated with the activation source for the transfer. The value read from the VECN[7:0] bits is valid if the ACT flag is 1, indicating a DTC transfer in progress, and invalid if the ACT flag is 0, indicating no DTC transfer is in progress.

### ACT flag (DTC Active Flag)

The ACT flag indicates the state of the DTC transfer operation.

[Setting condition]

- When the DTC is activated by a transfer request.

[Clearing condition]

- When transfer by the DTC, in response to a transfer request, is complete.

## 16.2.14 DTEVR : DTC Error Vector Register

Base address: DTC = 0x4000_5400

Offset address: 0x20

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DTESTA |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | DTEVSAM | DTEV[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | DTEV[7:0] | DTC Error Vector Number<br>These bits represent error vector of the DTC. | R |
| 8 | DTEVSAM | DTC Error Vector Number SA Monitor<br>Indicates the SA of vector number causing the error.<br>0: Secure vector number<br>1: Non-secure vector number | R |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R |
| 16 | DTESTA | DTC Error Status Flag<br>0: No DTC transfer error occurred<br>1: DTC transfer error occurred | R/W |
| 31:17 | — | These bits are read as 0. The write value should be 0. | R |

Note: Writing to DTESTA depends on the value of DTEVSAM

### DTEV[7:0] bits (DTC Error Vector Number)

When a transfer error due to DTC transfer occurs, the DTEV[7:0] bits store the violating DTC channel.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

### DTEVSAM bit (DTC Error Vector Number SA Monitor)

When a transfer error due to DTC transfer occurs, the DTEVSAM bit indicates the SA of the violating DTC vector number.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition].

- When 1 is written to DTEVR.DTESTA.

### DTESTA bit (DTC Error Status Flag)

The DTESTA bit indicates whether or not a DTC transfer error occurred.

DTEV, DTEVSAM, DTESTA are cleared by writing 1 to DTESTA.

Writing 0 to DTESTA is ignored.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DTC transfer error occurs.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

Note: When DTEVSAM = 1, it can be cleared in the Secure state and Non-secure state. DTEVSAM = 0, it cannot be cleared in the Non-secure state.

## 16.3 Activation Sources

The DTC is activated by an interrupt request. Setting the ICU.IELSRn.DTCE bit to 1 enables activation of the DTC by the associated interrupt. The selector output *n* number set in ICU.IELSRn is defined as the interrupt vector number, where n = 0 to 63. For an enabled interrupt, the specific DTC interrupt source associated with each interrupt vector number *n* is selected in ICU.IELSRn.IELS[8:0] where n = 0 to 63, as listed in section 12.3.2. Event Number in section 12, Interrupt Controller Unit (ICU). For activation by software, see section 17.2.2. ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1).

The interrupt vector number is equivalent to the DTC vector table number. After the DTC accepted an activation request, it does not accept another activation request until the transfer for that single request is complete, regardless of the priority of the requests. When multiple activation requests are generated during a DTC transfer, the highest priority request is accepted on completion of the transfer. When multiple activation requests are generated while the DTC Module Start bit (DTCST.DTCST) is 0, the DTC accepts the highest priority request when DTCST.DTCST is subsequently set to 1. The smaller interrupt vector number has higher priority.

The DTC performs the following operations at the start of a single data transfer or for a chain transfer, after the last of the consecutive transfers:

- On completion of a specified round of data transfer, the ICU.IELSRn.DTCE bit is set to 0, and an interrupt request is sent to the CPU.
- If the MRB.DISEL bit is 1, an interrupt request is sent to the CPU on completion of a data transfer.
- For other transfers, the ICU.IELSRn.IR flag of the activation source is set to 0 at the start of the data transfer.

### 16.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information associated with each activation source from the vector table and reads the transfer information starting at that address.

DTC has two vector tables, Non-secure side or Secure side. Because the interrupt vector number that serves as a trigger for DTC is divided into Non-secure or Secure. Place the vector table of the interrupt vector number of SA = 1 in DTCVBR which is the Non-secure side. Place the vector table of interrupt number SA = 0 in DTCVBR_SEC which is the Secure side.

The vector table must be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC Vector Base Register (DTCVBR) to set the base address of the DTC vector table. Transfer information is allocated in the SRAM area. In the SRAM area, the start address of the transfer information *n* with vector number *n* must be 4n added to the base address in the vector table.

Figure 16.2 shows the relationship between the DTC vector table and transfer information. Figure 16.3 shows the allocation of transfer information in the SRAM area.

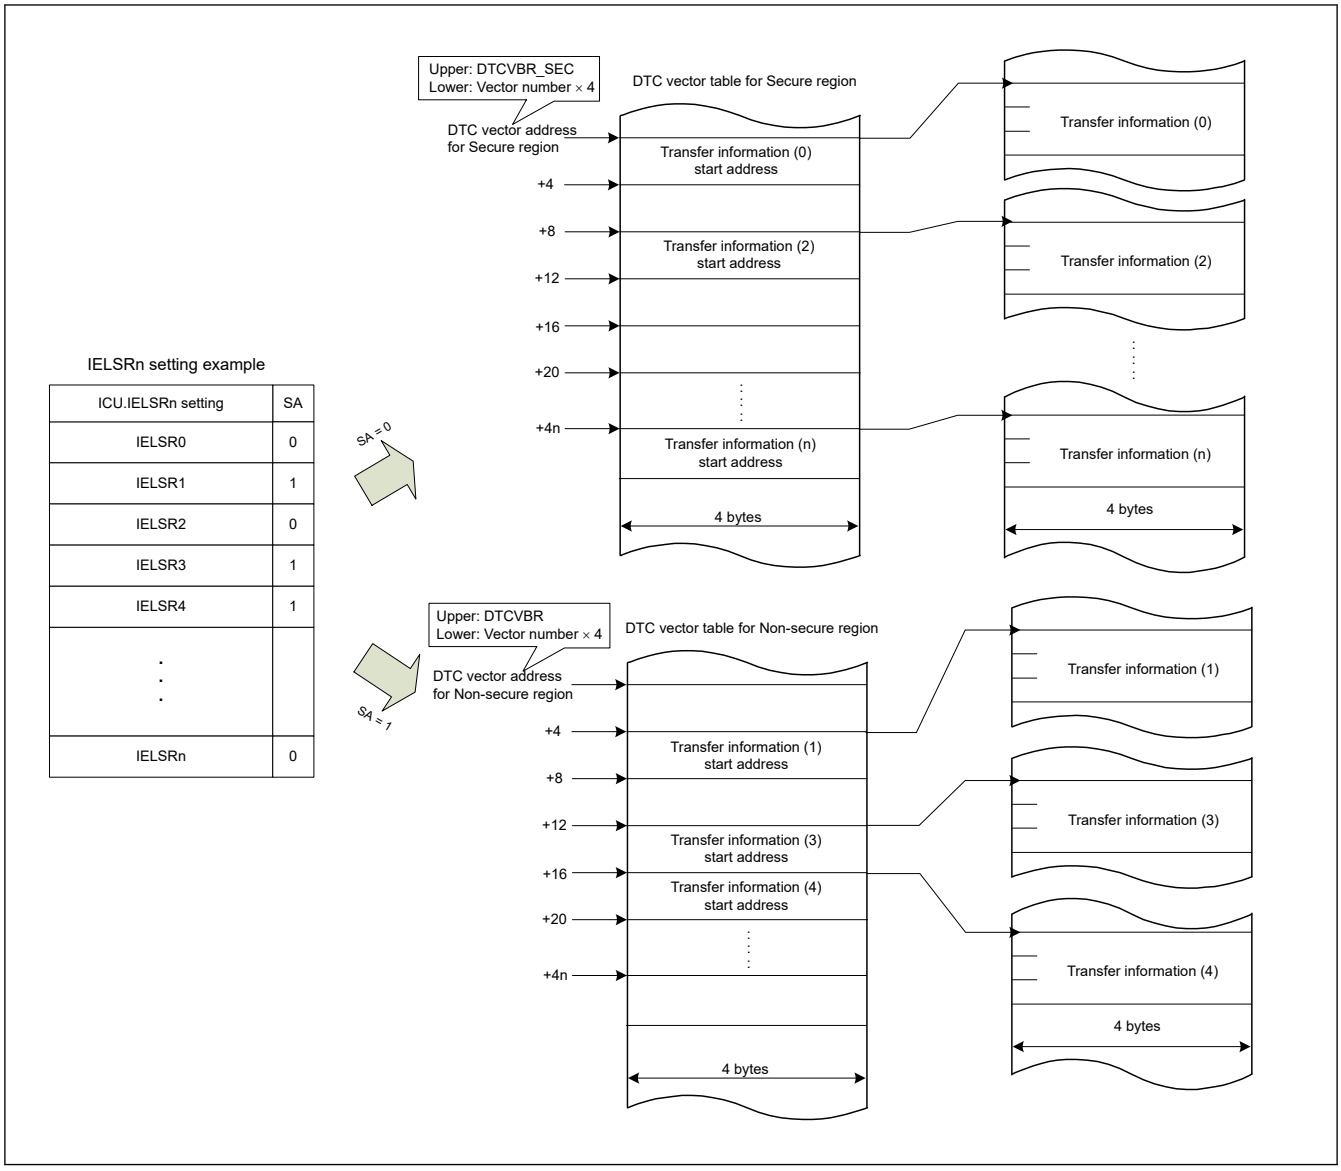


**Figure 16.2 DTC vector table and transfer information**

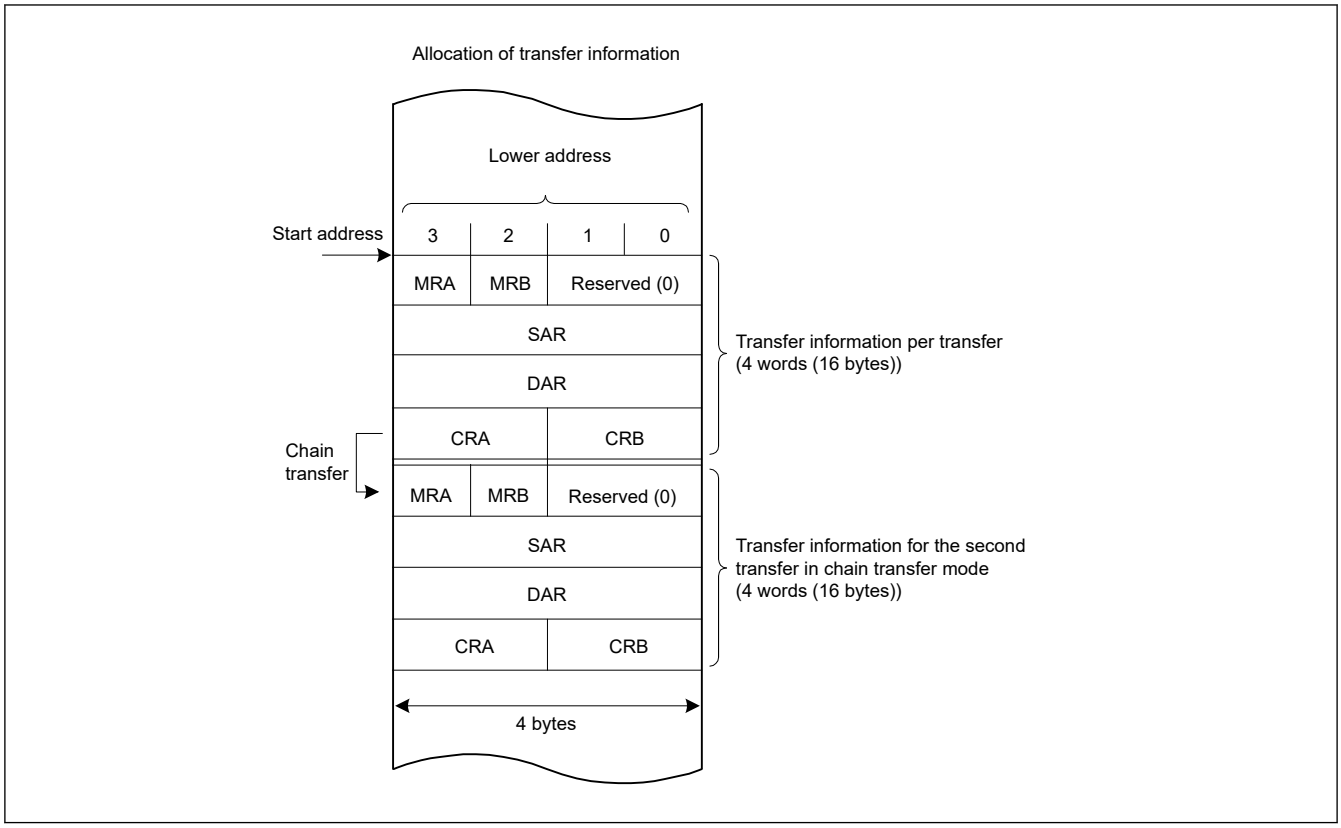

**Figure 16.3 Allocation of transfer information in the SRAM area**

## 16.4 Operation

The DTC transfers data according to the transfer information. Storage of the transfer information in the SRAM area is required before a DTC operation. When the DTC is activated, it reads the DTC vector associated with the vector number. The DTC reads the transfer information from the transfer information store address referenced by the DTC vector and transfers the data. After the data transfer, the DTC writes back the transfer information. Storing the transfer information in the SRAM area allows data transfer of any number of channels.

The transfer modes include:

- Normal transfer mode
- Repeat transfer mode
- Block transfer mode.

The DTC specifies a transfer source address in the SAR register and a transfer destination address in the DAR register. The values of these registers are incremented, decremented, or address-fixed independently after the data transfer.

Table 16.2 describes the DTC transfer modes.

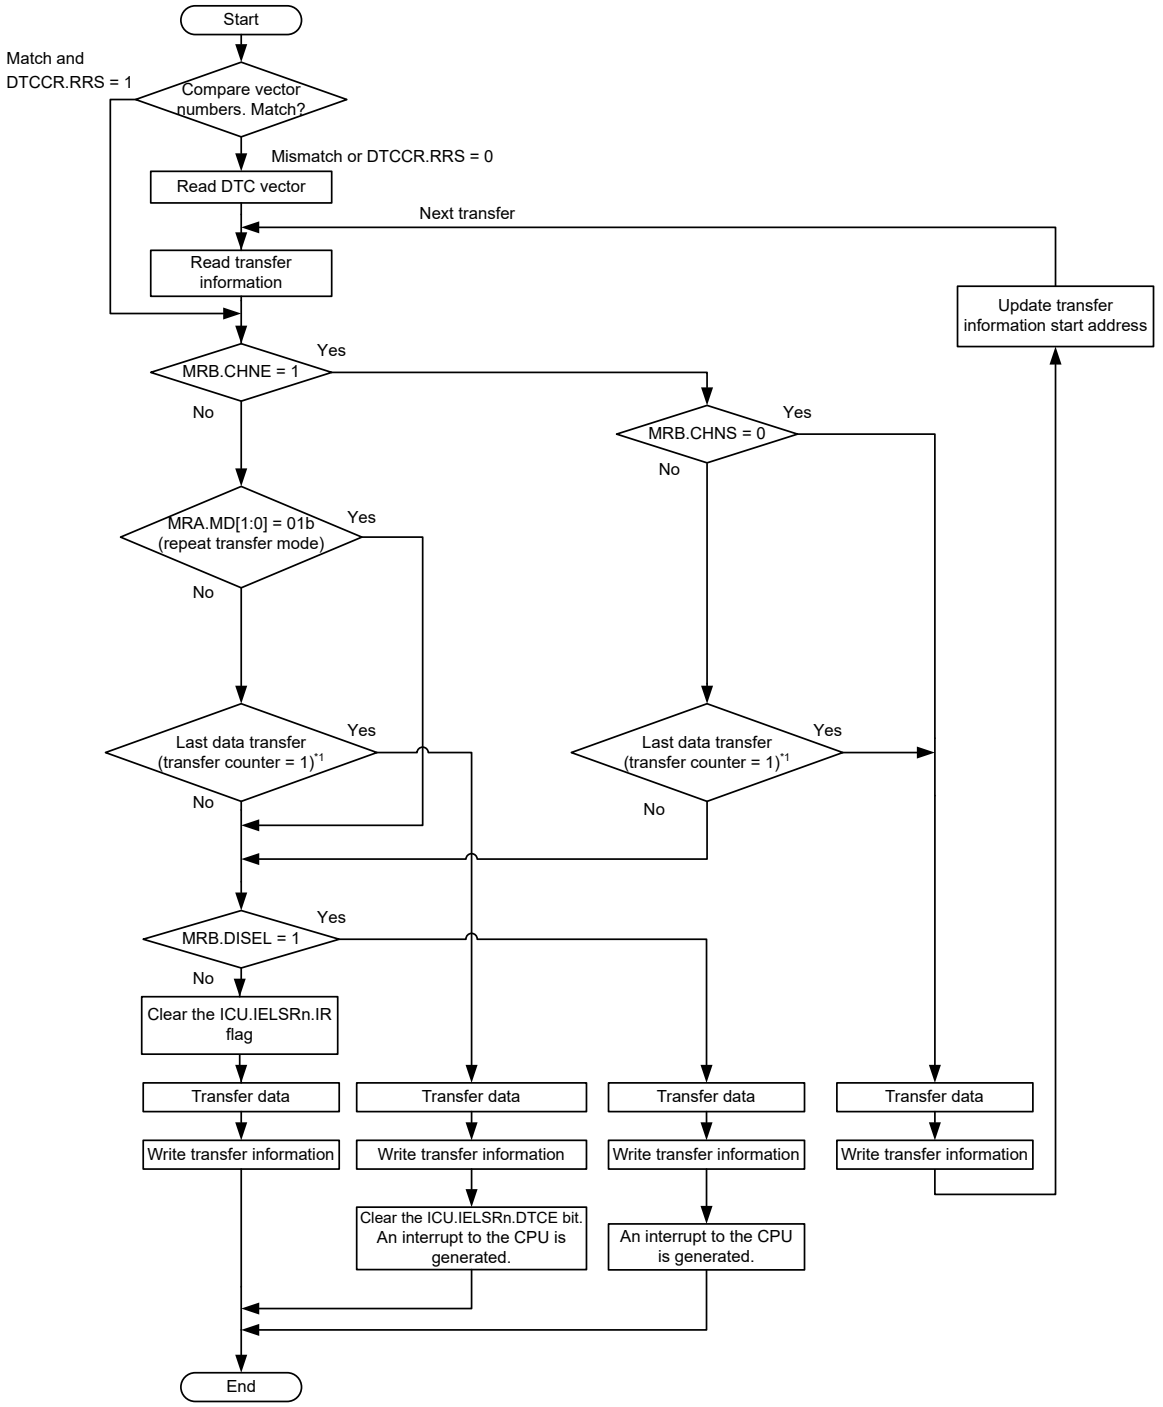

**Table 16.2 DTC transfer modes**

| Transfer mode | Data size transferred on single transfer request | Increment or decrement of memory address | Settable transfer count |
|---|---|---|---|
| Normal transfer mode | 1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit) | Incremented or decremented by 1, 2, or 4 or address-fixed | 1 to 65536 |
| Repeat transfer mode*1 | 1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit) | Incremented or decremented by 1, 2, or 4 or address-fixed | 1 to 256*3 |
| Block transfer mode*2 | Block size specified in CRAH (1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes)) | Incremented or decremented by 1, 2, or 4 or address-fixed | 1 to 65536 |

Note 1. Set the transfer source or transfer destination as the repeat area.
Note 2. Set the transfer source or transfer destination as the block area.
Note 3. After a data transfer of the specified count, the initial state is restored and operation restarts.

Setting the MRB.CHNE bit to 1 allows multiple transfers or chain transfer on a single activation source. It also enables a chain transfer when the specified data transfer is complete.

Figure 16.4 shows the operation flow of the DTC. Table 16.3 lists the chain transfer conditions. The combination of control information for the second and subsequent transfers are omitted in this table.

Note 1. Counter value before starting data transfer.

**Figure 16.4 DTC operation flow**

**Table 16.3 Chain transfer conditions**

| First transfer | | | | Second transfer*3 | | | | |
|---|---|---|---|---|---|---|---|---|
| CHNE bit | CHNS bit | DISEL bit | Transfer counter*1 *2 | CHNE bit | CHNS bit | DISEL bit | Transfer counter*1 *2 | DTC transfer |
| 0 | — | 0 | Other than (1 → 0) | — | — | — | — | Ends after the first transfer |
| 0 | — | 0 | (1 → 0) | — | — | — | — | Ends after the first transfer with an interrupt request to the CPU |
| 0 | — | 1 | — | — | — | — | — | |
| 1 | 0 | — | — | 0 | — | 0 | Other than (1 → 0) | Ends after the second transfer |
| | | | | 0 | — | 0 | (1 → 0) | Ends after the second transfer with an interrupt request to the CPU |
| | | | | 0 | — | 1 | — | |
| 1 | 1 | 0 | Other than (1 → *) | — | — | — | — | Ends after the first transfer |
| 1 | 1 | — | (1 → *) | 0 | — | 0 | Other than (1 → 0) | Ends after the second transfer |
| | | | | 0 | — | 0 | (1 → 0) | Ends after the second transfer with an interrupt request to the CPU |
| | | | | 0 | — | 1 | — | |
| 1 | 1 | 1 | Other than (1 → *) | — | — | — | — | Ends after the first transfer with an interrupt request to the CPU |

Note 1. The transfer counter used depends on the transfer modes as follows:
Normal transfer mode — CRA register
Repeat transfer mode — CRAL register
Block transfer mode — CRB register

Note 2. On completion of a data transfer, the counters operate as follows:
1 → 0 in normal and block transfer modes
1 → CRAH in repeat transfer mode
(1 → *) in the table indicates both of these two operations, depending on the mode.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The conditions for the combination of the second transfer and CHNE = 1 is omitted.

### 16.4.1 Transfer Information Read Skip Function

Reading of vector addresses and transfer information can be skipped by setting the DTCCR.RRS bit. When a DTC activation request is generated, the current DTC vector number is compared with the DTC vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, the DTC data transfer is performed without reading the vector address and transfer information. However, when the previous transfer is a chain transfer, the vector address and transfer information are read. Additionally, when the transfer counter (CRA register) becomes 0 during the previous normal transfer, and when the transfer counter (CRB register) becomes 0 during the previous block transfer, transfer information is read regardless of the RRS bit. Figure 16.12 shows an example when reading the transfer information is skipped.

To update the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, then set the RRS bit to 1. The stored vector number is discarded by setting the RRS bit to 0. The updated DTC vector table and transfer information are read in the next activation process.

### 16.4.2 Transfer Information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to address fixed, a part of the transfer information is not written back. Table 16.4 lists the transfer information write-back skip conditions and the associated registers. The CRA and CRB registers are written back, and the write-back of the MRA and MRB registers is skipped.

**Table 16.4 Transfer information write-back skip conditions and applicable registers**

| MRA.SM[1:0] bits | | MRB.DM[1:0] bits | | | |
|---|---|---|---|---|---|
| b3 | b2 | b3 | b2 | SAR register | DAR register |
| 0 | 0 | 0 | 0 | Skip | Skip |
| 0 | 0 | 0 | 1 | | |
| 0 | 1 | 0 | 0 | | |
| 0 | 1 | 0 | 1 | | |
| 0 | 0 | 1 | 0 | Skip | Write-back |
| 0 | 0 | 1 | 1 | | |
| 0 | 1 | 1 | 0 | | |
| 0 | 1 | 1 | 1 | | |
| 1 | 0 | 0 | 0 | Write-back | Skip |
| 1 | 0 | 0 | 1 | | |
| 1 | 1 | 0 | 0 | | |
| 1 | 1 | 0 | 1 | | |
| 1 | 0 | 1 | 0 | Write-back | Write-back |
| 1 | 0 | 1 | 1 | | |
| 1 | 1 | 1 | 0 | | |
| 1 | 1 | 1 | 1 | | |

### 16.4.3 Normal Transfer Mode

The normal transfer mode allows a 1-byte (8 bit), 1-halfword (16 bit), 1-word (32 bit) data transfer on a single activation source. The transfer count can be set from 1 to 65536. Transfer source and destination addresses can be independently set to increment, decrement, or fixed. This mode enables an interrupt request to the CPU to be generated at the end of a specified-count transfer.

Table 16.5 lists register functions in normal transfer mode, and Figure 16.5 shows the memory map of normal transfer mode.

**Table 16.5 Register functions in normal transfer mode**

| Register | Description | Value written back by writing transfer information |
|---|---|---|
| SAR | Transfer source address | Increment, decrement, or fixed*1 |
| DAR | Transfer destination address | Increment, decrement, fixed*1 |
| CRA | Transfer counter A | CRA - 1 |
| CRB | Transfer counter B | Not updated |

Note 1. Write-back operation is skipped in address-fixed mode.

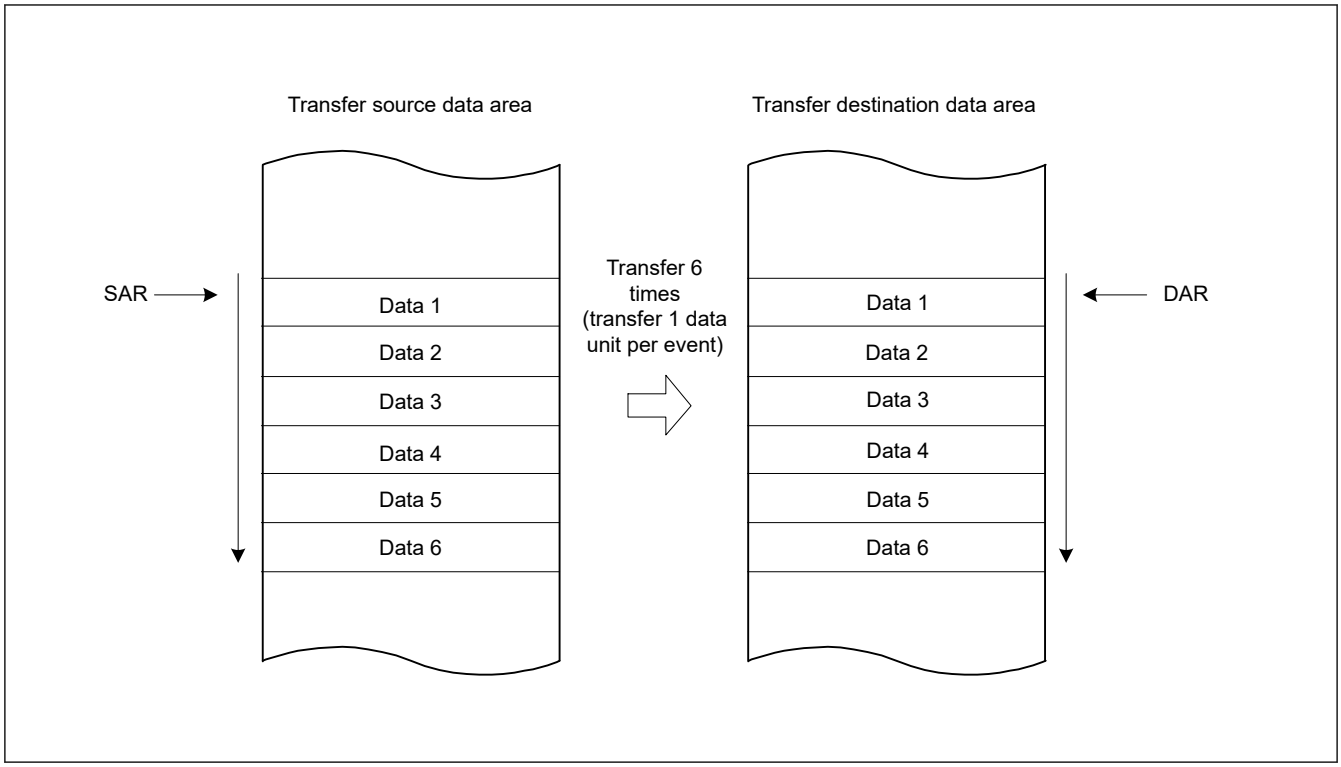

**Figure 16.5 Memory map of normal transfer mode (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRA = 0x0006)**

## 16.4.4 Repeat Transfer Mode

The repeat transfer mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. Transfer source or transfer destination for the repeat area must be specified in the MRB.DTS bit. The transfer count can be set from 1 to 256. When the specified transfer count is complete, the initial value of the address register specified in the repeat area is restored, the initial value of the transfer counter is restored, and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL decrements to 0x00 in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. As a result, the transfer counter does not clear to 0x00, which disables interrupt requests to the CPU when the MRB.DISEL bit is set to 0. An interrupt request to the CPU is generated when the specified data transfer completes.

Table 16.6 lists the register functions in repeat transfer mode, and Figure 16.6 shows the memory map of repeat transfer mode.

**Table 16.6 Register functions in repeat transfer mode**

| Register | Description | Value written back by writing transfer information | |
|---|---|---|---|
| | | When CRAL is not 1 | When CRAL is 1 |
| SAR | Transfer source address | Increment, decrement, fixed*1 | • When the MRB.DTS bit is 0<br>Increment, decrement, or fixed*1<br>• When the MRB.DTS bit is 1<br>SAR register initial value |
| DAR | Transfer destination address | Increment, decrement, or fixed*1 | • When the MRB.DTS bit is 0<br>DAR register initial value<br>• When the MRB.DTS bit is 1<br>Increment, decrement, or fixed*1 |
| CRAH | Retains transfer counter | CRAH | CRAH |
| CRAL | Transfer counter A | CRAL - 1 | CRAH |
| CRB | Transfer counter B | Not updated | Not updated |

Note 1. Write-back is skipped in address-fixed mode.

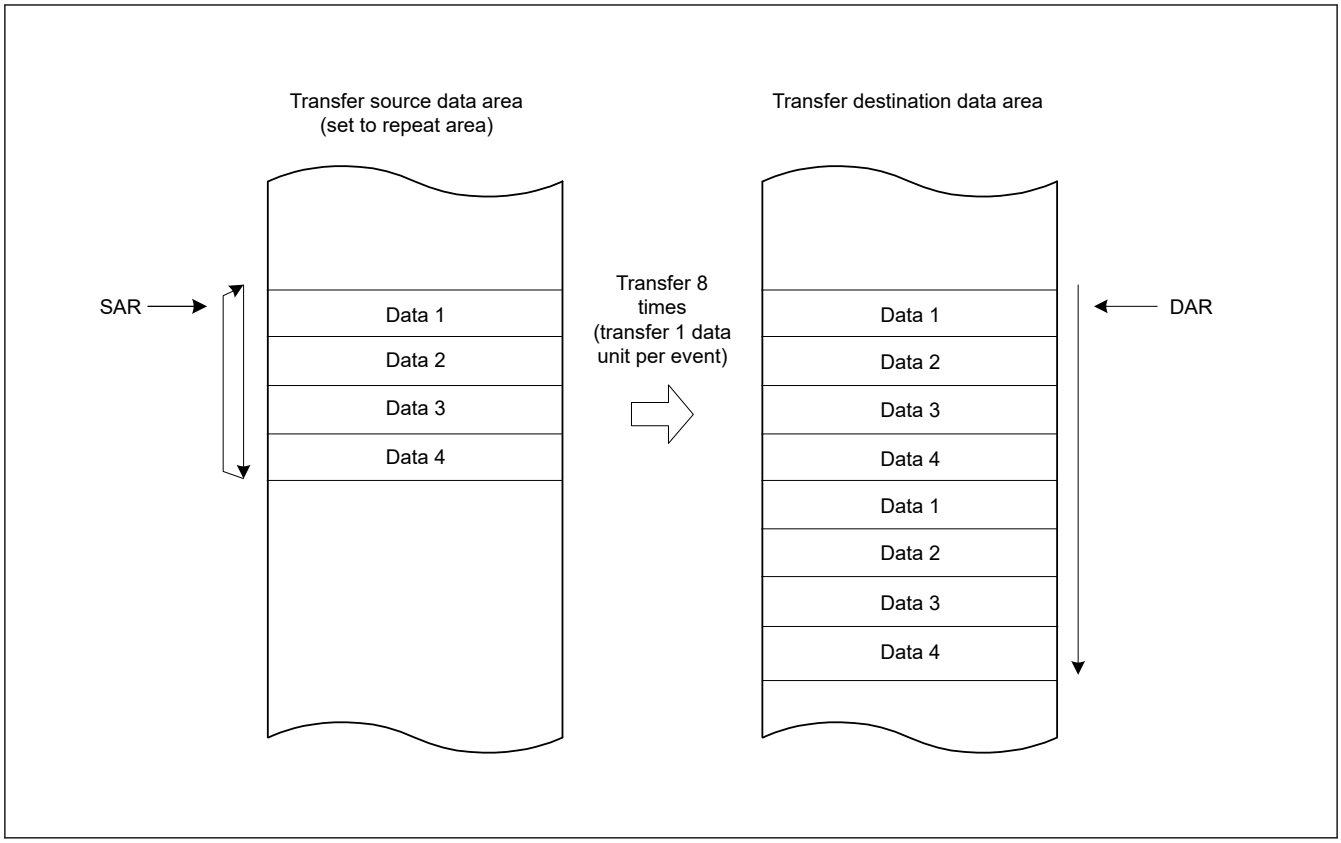

**Figure 16.6 Memory map of repeat transfer mode when transfer source is a repeat area (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRAH = 0x04)**

## 16.4.5 Block Transfer Mode

The block transfer mode allows single-block data transfer on a single activation source. Transfer source or transfer destination for the block area must be specified in the MRB.DTS bit. The block size can be set from 1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes). When transfer of the specified block completes, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS = 1 or the DAR register when the DTS = 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set from 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of the specified-count block transfer.

Table 16.7 lists the register functions in block transfer mode, and Figure 16.7 shows the memory map for block transfer mode.

**Table 16.7 Register functions in block transfer mode**

| Register | Description | Value written back by writing transfer information |
|---|---|---|
| SAR | Transfer source address | • When MRB.DTS bit is 0<br>Increment, decrement, or fixed*1<br>• When MRB.DTS bit is 1<br>SAR register initial value. |
| DAR | Transfer destination address | • When MRB.DTS bit is 0<br>DAR register initial value<br>• When MRB.DTS bit is 1<br>Increment, decrement, or fixed*1. |
| CRAH | Holds block size | CRAH |
| CRAL | Block size counter | CRAH |
| CRB | Block transfer counter | CRB - 1 |

Note 1. Write-back is skipped in address-fixed mode.

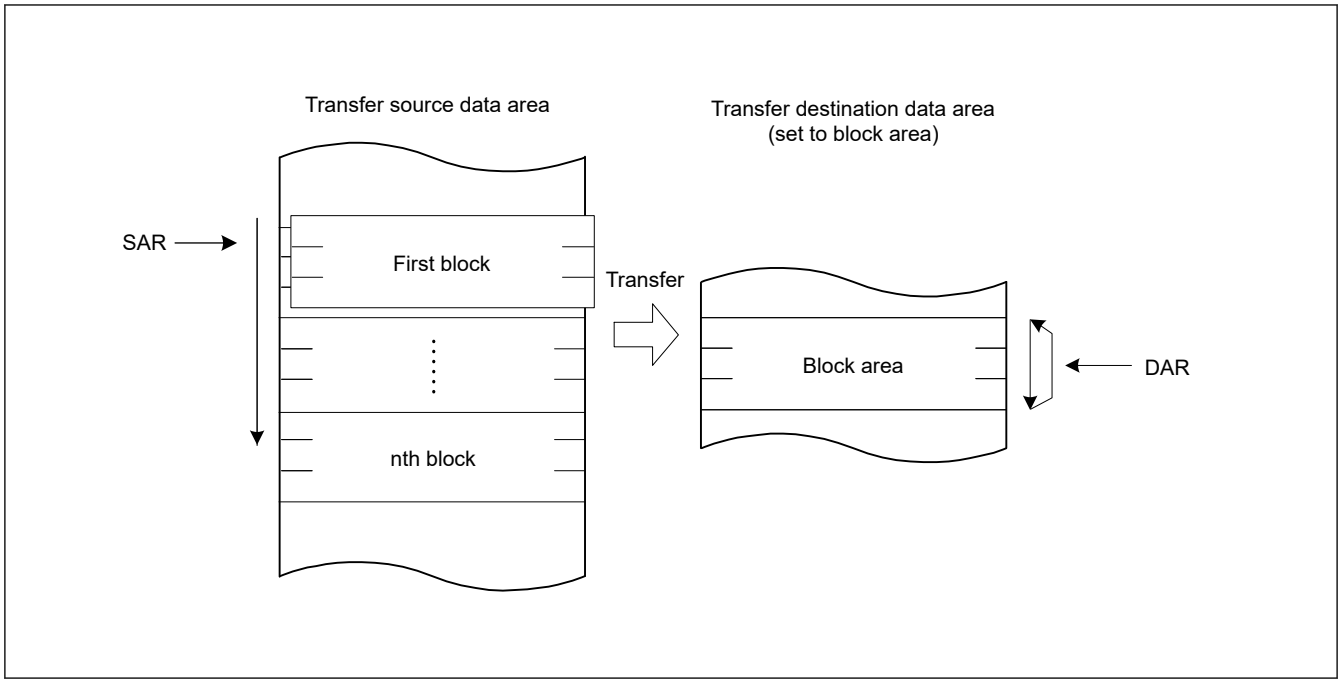

**Figure 16.7 Memory map of block transfer mode**

## 16.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single activation source. If the MRB.CHNE is set to 1 and CHNS to 0, an interrupt request to the CPU is not generated on completion of the specified number of rounds of transfer or by setting the MRB.DISEL bit to 1. An interrupt request is sent to the CPU each time DTC data transfer is performed. Data transfer has no effect on the ICU.IELSRn.IR flag of the activation source.

The SAR, DAR, CRA, CRB, MRA, and MRB registers can be set independently of each other to define the data transfer. Figure 16.8 shows a chain transfer operation.

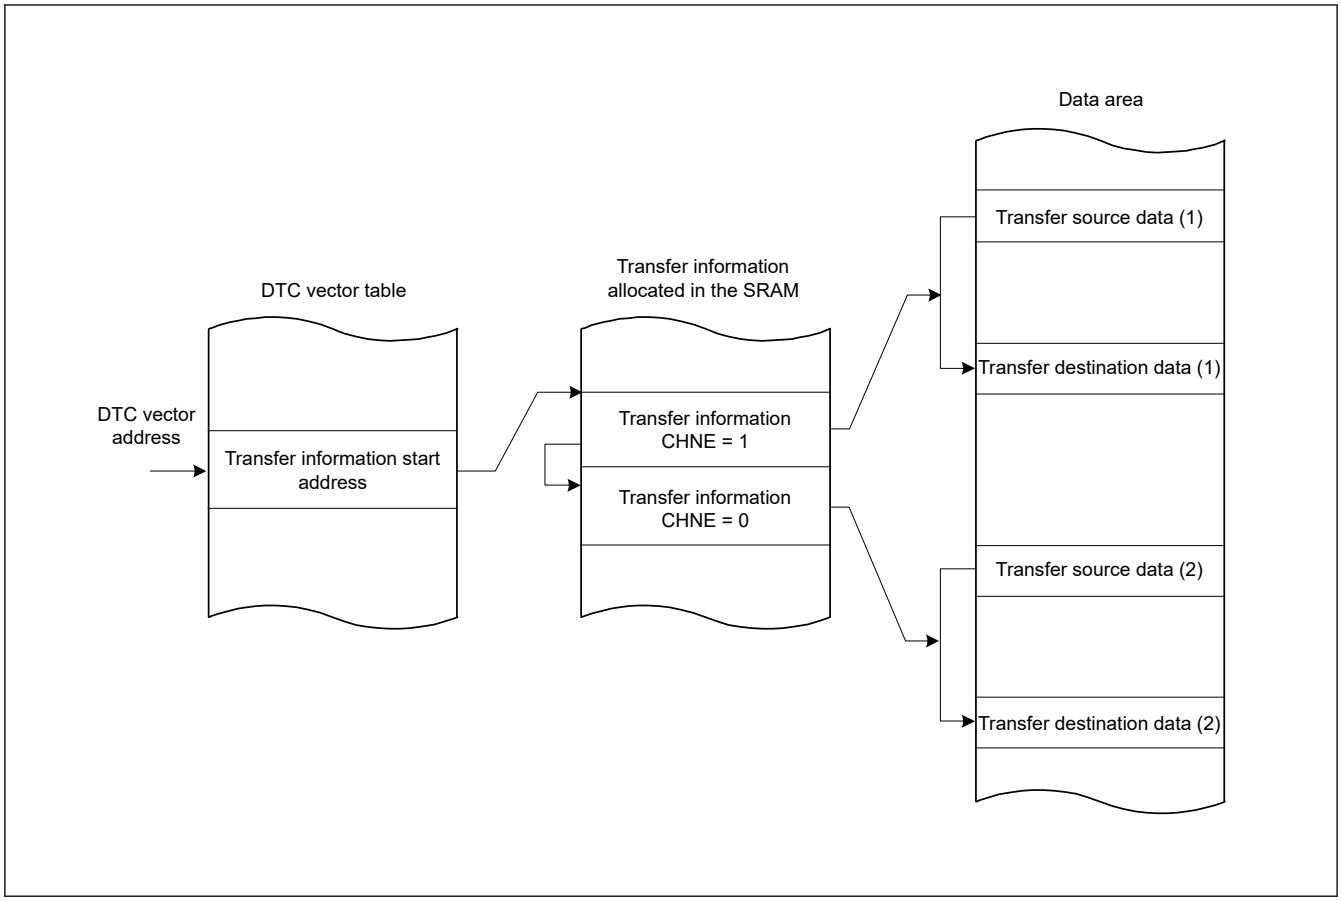

**Figure 16.8 Chain transfer operation**

Writing 1 to the MRB.CHNE and CHNS bits enables chain transfer to be performed only after completion of the specified data transfer. In repeat transfer mode, chain transfer is performed after completion of the specified data transfer. For details on chain transfer conditions, see Table 16.3.

## 16.4.7 Operation Timing

Figure 16.9 to Figure 16.12 are timing diagrams that show the minimum number of execution cycles.

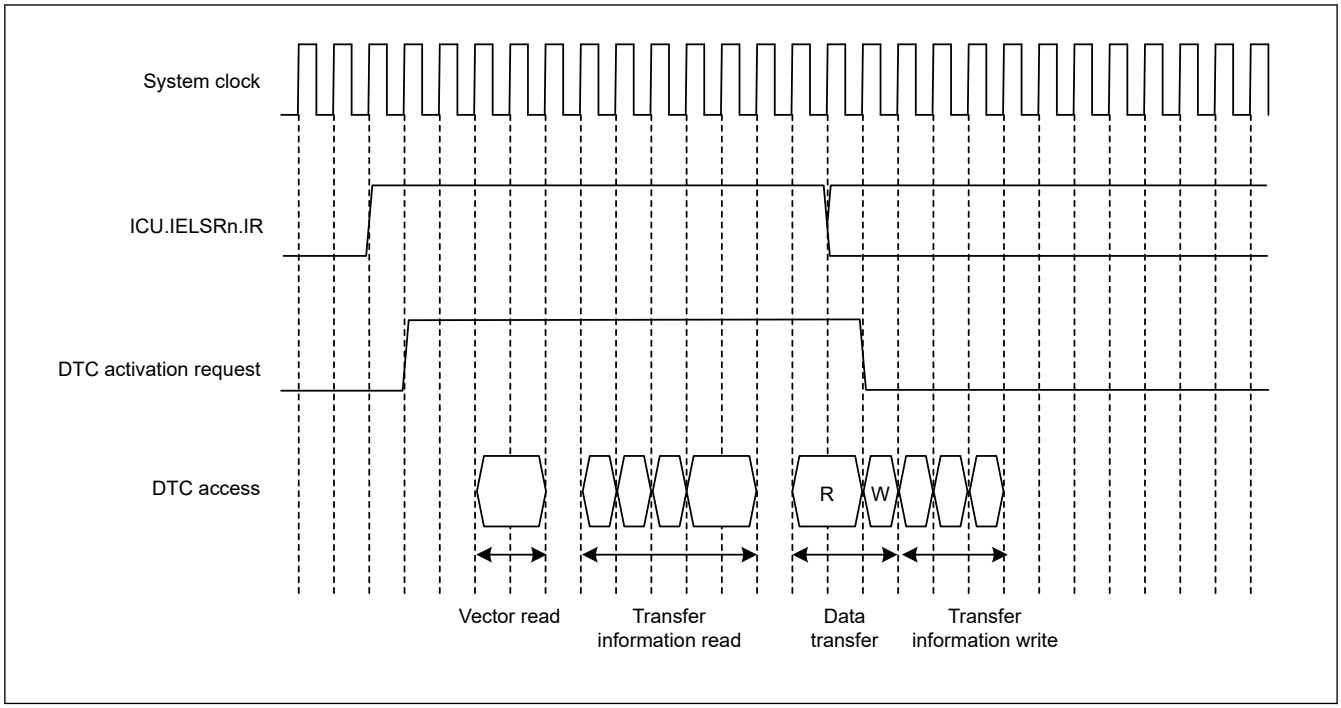

**Figure 16.9 Example 1 of DTC operation timing in normal transfer and repeat transfer modes**

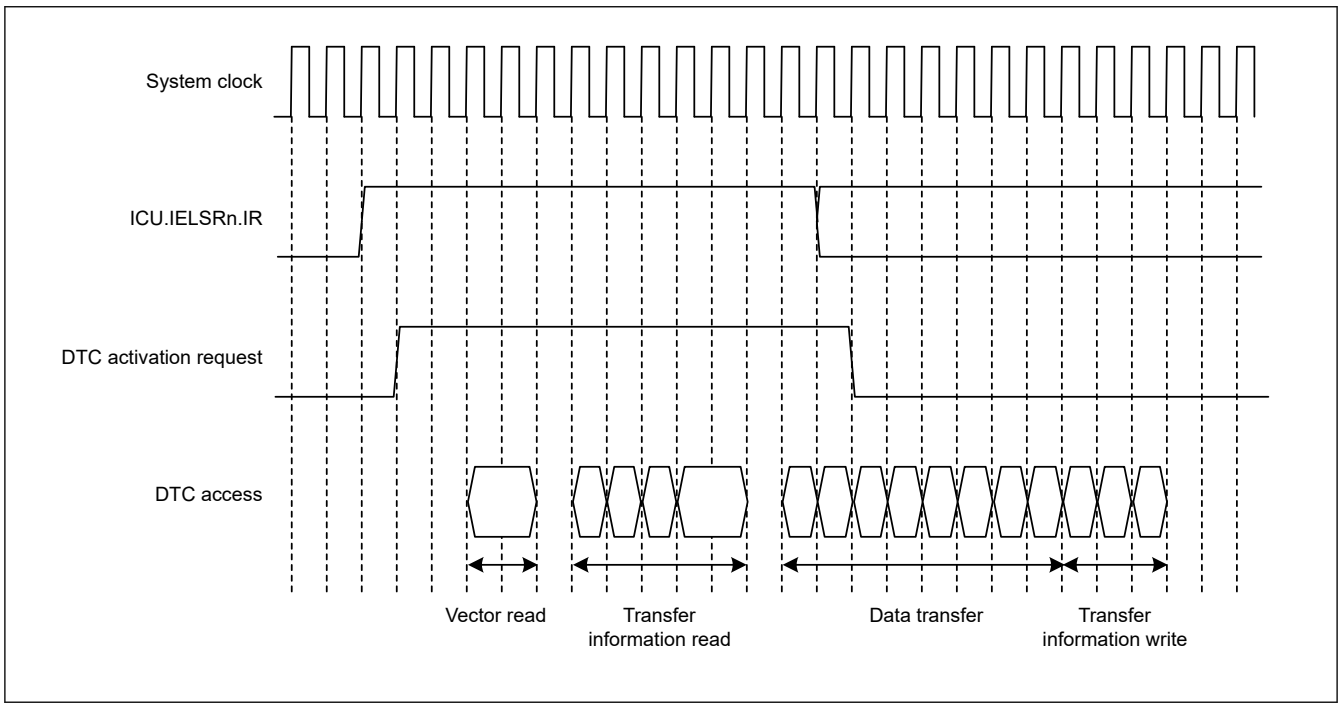

**Figure 16.10 Example 2 of DTC operation timing in block transfer mode when the block size = 4**

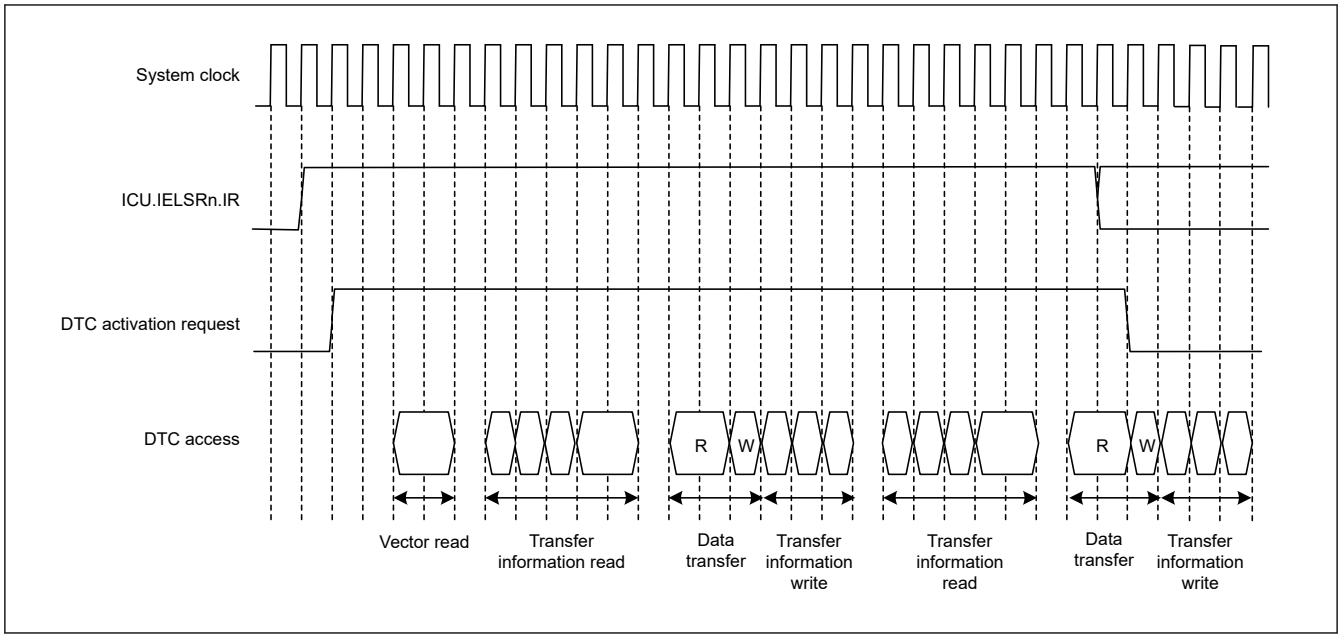

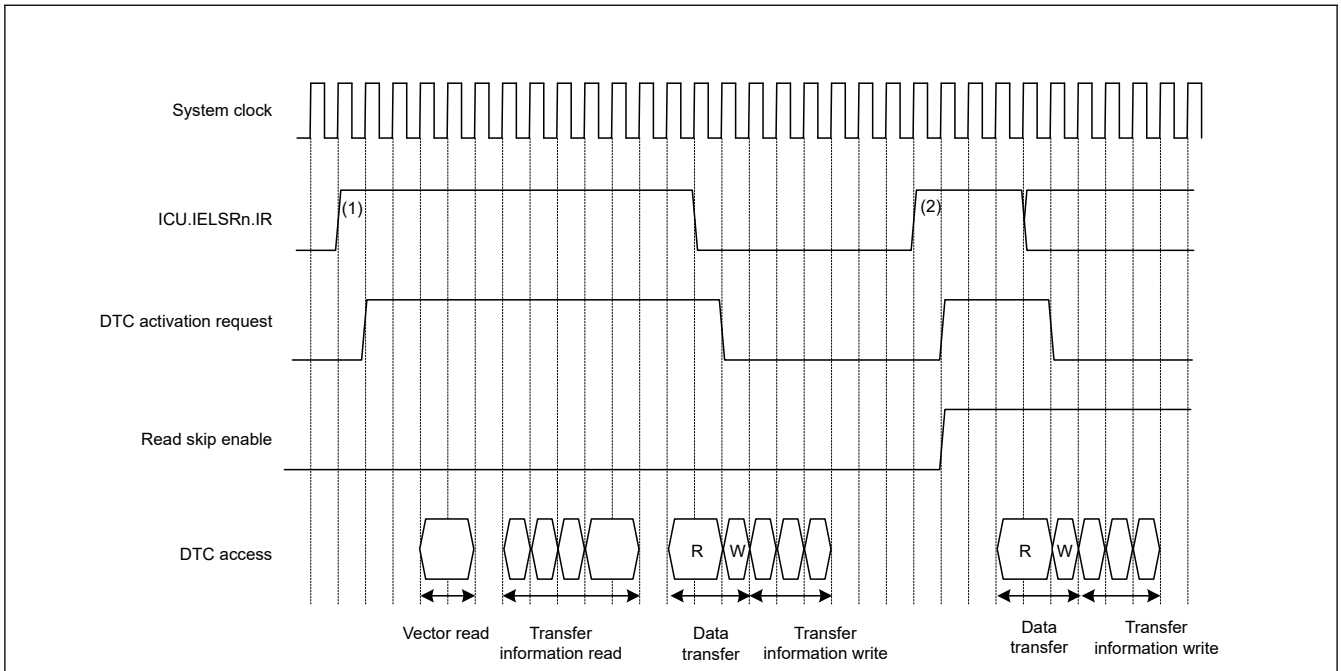

**Figure 16.11 Example 3 of DTC operation timing for chain transfer**

Note: When activation sources (vector numbers) of (1) and (2) are the same and the RRS = 1, the transfer information read for request (2) is skipped.

**Figure 16.12 Example of operation when a transfer information read is skipped with the vector, transfer information, and transfer destination data on the SRAM, and the transfer source data on the peripheral module**

## 16.4.8 Execution Cycles of DTC

Table 16.8 lists the execution cycles of single data transfer of the DTC. For the order of the execution states, see section 16.4.7. Operation Timing.

**Table 16.8 Execution cycles of DTC**

P: Block size (initial settings of CRAH and CRAL)
Cv: Cycles for access to vector transfer information storage destination
Ci: Cycles for access to transfer information storage destination address
Cr: Cycles for access to data read destination
Cw: Cycles for access to data write destination
The unit is for system clocks (ICLK) + 1 in the Vector read, Transfer information read, and Data transfer read columns and 2 in the Internal operation column.
Cv, Ci, Cr, and Cw vary depending on the corresponding access destination. For the number of cycles for respective access destinations, see section 44, SRAM, section 45, Flash Memory, and section 13, Buses.
The frequency ratio of the system clock and peripheral clock is also taken into consideration.
The DTC response time is the time from when the DTC activation source is detected until DTC transfer starts.
Table 16.8 does not include the time until DTC data transfer starts after the DTC activation source becomes active.

| Transfer mode | Vector read | | Transfer information read | | Transfer information write | | | Data transfer | | Internal operation | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | Read | Write | | |
| Normal | Cv + 1 | 0*1 | 4 × Ci + 1 | 0*1 | 3 × Ci + 1*2 | 2 × Ci + 1*3 | Ci*4 | Cr + 1 | Cw + 1 | 2 | 0*1 |
| Repeat | | | | | | | | Cr + 1 | Cw + 1 | | |
| Block*5 | | | | | | | | P × Cr | P × Cw | | |

Note 1. When transfer information read is skipped.
Note 2. When neither SAR nor DAR is set to address-fixed mode.
Note 3. When SAR or DAR is set to address-fixed mode.
Note 4. When SAR and DAR are set to address-fixed mode.
Note 5. When the block size is 2 or more. If the block size is 1, the cycle number for normal transfer applies.

### 16.4.9 DTC Bus Mastership Release Timing

The DTC does not release the bus mastership during transfer information reads. Before the transfer information is read or written, the bus is arbitrated according to the priority determined by the bus master arbitrator. For bus arbitration, see section 13, Buses.

### 16.4.10 Vector Security

The security attribute of transfer access of DTC vector n and security attribute of access to the IELSRn (n = 0 to 63) register of ICU are controlled by SAIELSRn bit of ICUSARx (x = G, H or I) registers in CPSCU. For details on the CPSCU.ICUSARx registers, see section 12, Interrupt Controller Unit (ICU).

When the CPSCU.ICUSARx.SAIELSRn bit is 0, transfer of DTC vector n is Secure access for both read and write. At the same time, the IELSRn register are protected from a Non-secure access.

When the CPSCU.ICUSARx.SAIELSRn bit is 1, transfer of DTC vector n is Non-secure access for both read and write. At the same time, the IELSRn register are Non-secure attributes.

Do not write to the CPSCU.ICUSARx.SAIELSRn bit while DTC transfer is enabled or a bus master is writing to the DTC registers of same channel.

section 16.3.1. Allocating Transfer Information and DTC Vector Table shows security attribute about each DTC vectors.

### 16.4.11 Master TrustZone Filter in DTC

DTC has Master TrustZone Filter. The Master TrustZone Filter in DTC can detect the security areas of Flash area (code flash and data flash) and SRAM area (ECC/Parity RAM) defined by IDAU. When non-secure program accesses those addresses, it detects the security violation. Access of violation address is not performed. Detected error is handled as Master TrustZone Filter error.

## 16.5 DTC Setting Procedure

Before using the DTC, set the DTC Vector Base Register (DTCVBR). Set the ICU.IELSRn.IELS[8:0] bits to 0 to disable the interrupt in the NVIC and follow the procedure in Table 16.9 to set the DTC.

**Table 16.9 DTC setting procedure**

| No. | Step Name | Description |
|---|---|---|
| 1 | Set the DTCCR*1.RRS bit to 0 | Set the DTCCR*1.RRS bit to 0 to reset the transfer information read skip flag. After that, the transfer information read is not skipped while the DTC is activated. Be sure to specify this setting when the transfer information is updated. |
| 2 | Set transfer information (MRA, MRB, SAR, DAR, CRA, and CRB) | Allocate transfer information (MRA, MRB, SAR, DAR, CRA, and CRB) in the data area. To set transfer information, see section 16.2. Register Descriptions. To allocate transfer information, see section 16.3.1. Allocating Transfer Information and DTC Vector Table. |
| 3 | Set transfer information start addresses in the DTC vector table | Set the transfer information start addresses in the DTC vector table. To set the DTC vector table, see section 16.3.1. Allocating Transfer Information and DTC Vector Table. |
| 4 | Set the DTCCR*1.RRS bit to 1 | Set the DTCCR*1.RRS bit to 1 to enable skipping of the second and subsequent transfer information read cycles for continuous DTC activation from the same interrupt source. The RRS bit can be set to 1, but if this is set during DTC transfer, it becomes valid from the next transfer. |
| 5 | Set the ICU.IELSRn.DTCE bit to 1.<br>Set the ICU.IELSRn.IELS[8:0] as interrupt source. The interrupt should be enabled in the NVIC. | Set the ICU.IELSRn.DTCE bit to 1. Set ICU.IELSRn.IELS[8:0] as interrupt sources that trigger DTC. The interrupt must be enabled in the NVIC. See section 12.3.2. Event Number in section 12, Interrupt Controller Unit (ICU). |
| 6 | Set the enable bit for an activation source interrupt | Set the enable bit for the activation source interrupts to 1. When a source interrupt is generated, the DTC is activated. To set the interrupt source enable bit, see the settings for the modules that are to be the activation sources. |
| 7 | Set the DTCST.DTCST bit to 1 | Set the DTC Module Start bit (DTCST.DTCST) to 1. |

Note: The DTCST.DTCST bit can be set even if the setting for each activation source is not completed.
Note: When used in Non-secure state, DTCSAR.DTCSTSA = 1 or DTCST.DTCST = 1 must be set.
Note 1. When used in Secure state, access DTCCR_SEC instead of DTCCR.

## 16.6 Examples of DTC Usage

### 16.6.1 Normal Transfer

This section provides an example of DTC usage and its application when receiving 128 bytes of data from an SCI.

#### (1) Transfer information settings

In the MRA register, select a fixed source address (MRA.SM[1:0] = 00b), normal transfer mode (MRA.MD[1:0] = 00b), and byte-sized transfer (MRA.SZ[1:0] = 00b). In the MRB register, specify incrementation of the destination address (MRB.DM[1:0] = 10b) and single data transfer by a single interrupt (MRB.CHNE = 0 and MRB.DISEL = 0). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the SRAM area for data storage in the DAR register, and 128 (0x0080) in the CRA register. The CRB register can be set to any value.

#### (2) DTC vector table settings

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

#### (3) ICU settings and DTC module activation

Set the ICU.IELSRn.DTCE bit to 1 and set ICU.IELSRn.IELS[8:0] as the SCI interrupt. The interrupt must be enabled in the NVIC. Set the DTCST.DTCST bit to 1.

#### (4) SCI settings

Enable the SCIn_RXI (n = 0, 1, 3 to 5, 9) interrupt by setting the SCR.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, reception stops. To manage this, use settings that allow the CPU to accept receive error interrupts.

#### (5) DTC transfer

Each time a reception of 1 byte by the SCI is complete, an SCIn_RXI interrupt is generated to activate the DTC. The DTC transfers the received byte from the RDR of the SCI to the SRAM, after which the DAR register is incremented and the CRA register is decremented.

#### (6) Interrupt handling

After 128 rounds of data transfer are complete and the value in the CRA register becomes 0, an SCIn_RXI interrupt request is generated for the CPU. Complete the process in the handling routine for this interrupt.

### 16.6.2 Chain Transfer

This section provides an example of chain transfer by the DTC and describes its use in the output of pulses by the General PWM Timer (GPT). You can use chain transfer to transfer PWM timer compare data and change the period of the PWM timer for the GPT.

For the first of the chain transfers, normal transfer mode is specified for transfer to the GPTm.GTCCRC register (m = 320, 321, 162 to 165). For the second transfer, normal transfer mode is specified for transfer to the GPTm.GTCCRE register (m = 320, 321, 162 to 165). For the third transfer of the chained transfer, normal transfer mode for transfer to the GPTm.GTPBR register (m = 320, 321, 162 to 165) is specified. This is because clearing of the activation source and generation of an interrupt on completion of the specified number of transfers are restricted to the third of the chain transfers, that is, transfer while MRB.CHNE = 0.

The following example shows how to use the counter overflow interrupt with the GPT320.GTPR register as an activating source for the DTC.

#### (1) First transfer information setting

Set up transfer to the GPT320.GTCCRC register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRC register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

#### (2) Second transfer information setting

Set up for transfer to the GPT320.GTCCRE register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1, MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRE register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

#### (3) Third transfer information set

Set up transfer to the GPT320.GTPBR register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up single data transfer per interrupt (MRB.CHNE = 0, MRB.DISEL = 0). The MRB.DTS bit can be set to any value.

4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTPBR register.
6. Set the CRA register to the size of the data table. The CRB register can be set to any value.

#### (4) Transfer information assignment

Place the transfer information for use in the transfer to the GPT320.GTPBR immediately after the transfer control information for use in the GPT320.GTCCRC and GPT320.GTCCRE registers.

#### (5) DTC vector table

In the DTC vector table, set the address where the transfer control information for use in transfer to the GPT320.GTCCRC and GPT320.GTCCRE registers starts.

#### (6) ICU setting and DTC module activation

1. Set the ICU.IELSRn.DTCE bit associated with the GPT320 counter overflow interrupt.
2. Set the ICU.IELSRn.IELS[8:0] bits and specify the GPT320 counter overflow.
3. Set the DTCST.DTCST bit to 1.

#### (7) GPT settings

1. Set the GPT320.GTIOR register so that the GTCCRA and GTCCRB registers operate as output compare registers.
2. Set the default PWM timer compare values in the GPT320.GTCCRA and GPT320.GTCCRB registers and the next PWM timer compare values in the GPT320.GTCCRC and GPT320.GTCCRE registers.
3. Set the default PWM timer period values in the GPT320.GTPR register and the next PWM timer period values in the GPT320.GTPBR register.
4. Set 1 to the output bit in PmnPFS.PDR, and set 00011b to the Peripheral Select bits in PmnPFS.PSEL[4:0].

#### (8) GPT activation

Set the GPT320.GTSTR.CSTRT bits to 1 to start the GPT320.GTCNT counter.

#### (9) DTC transfer

Each time a GPT320 counter overflow is generated with the GPT320.GTPR register, the next PWM timer compare values are transferred to the GPT320.GTCCRC and GPT320.GTCCRE registers. The setting for the next PWM timer period is transferred to the GPT320.GTPBR register.

#### (10) Interrupt handling

After the specified rounds of data transfer are complete, for example when the value in the CRA register for GPT transfer becomes 0, a GPT320 counter overflow interrupt request is issued for the CPU. Complete the process for this interrupt in the handling routine.

### 16.6.3 Chain Transfer when Counter = 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second transfer. Chain transfer enables transfers to be repeated 256 times or more.

The following procedure shows an example of configuring a 1-KB input buffer, where the input buffer is set so that its lower address starts with 0x00. Figure 16.13 shows a chain transfer when the counter = 0.

1. Set the normal transfer mode to input data for the first data transfer. Set the following:
   (a) Transfer source address = fixed.
   (b) CRA register = 0x0200 (512) times.
   (c) MRB.CHNE bit = 1 (chain transfer is enabled).
   (d) MRB.CHNS bit = 1 (chain transfer is performed only when the transfer counter is 0).

(e) MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).

2. Prepare the upper 8-bit address of the start address at every 512 times of the transfer destination address for the first data transfer in different area such as the flash. For example, when setting the input buffer to 0x8000 to 0x83FF, prepare 0x82 and 0x80.
3. For the second data transfer:
   (a) Set the repeat transfer mode (with transfer source and destination address = fixed.) to reset the transfer counter of the first data transfer.
   (b) Specify the CRA register in the first transfer information area for the transfer destination.
   (c) Set the MRB.CHNE bit = 1 (chain transfer is enabled).
   (d) Set the MRB.CHNS bit = 0 (select continuous chain transfer).
   (e) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
   (f) CRA register = 0x0101 (The transfer count is 1).
4. For the third data transfer:
   (a) Set the repeat transfer mode (with the source as the repeat area) to reset the transfer destination address of the first data transfer.
   (b) Specify the upper 8 bits of the DAR register in the first transfer information area for the transfer destination.
   (c) Set the MRB.CHNE bit = 0 (chain transfer is disabled).
   (d) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
   (e) When setting the input buffer to 0x8000 to 0x83FF, also set the transfer counter to 2.
5. The first data transfer is performed by an interrupt 512 times. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
6. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x82. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
7. In succession, the first data transfer is performed by an interrupt 512 times as specified for the first data transfer. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
8. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x80. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
9. Steps 5 to 8 are repeated indefinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

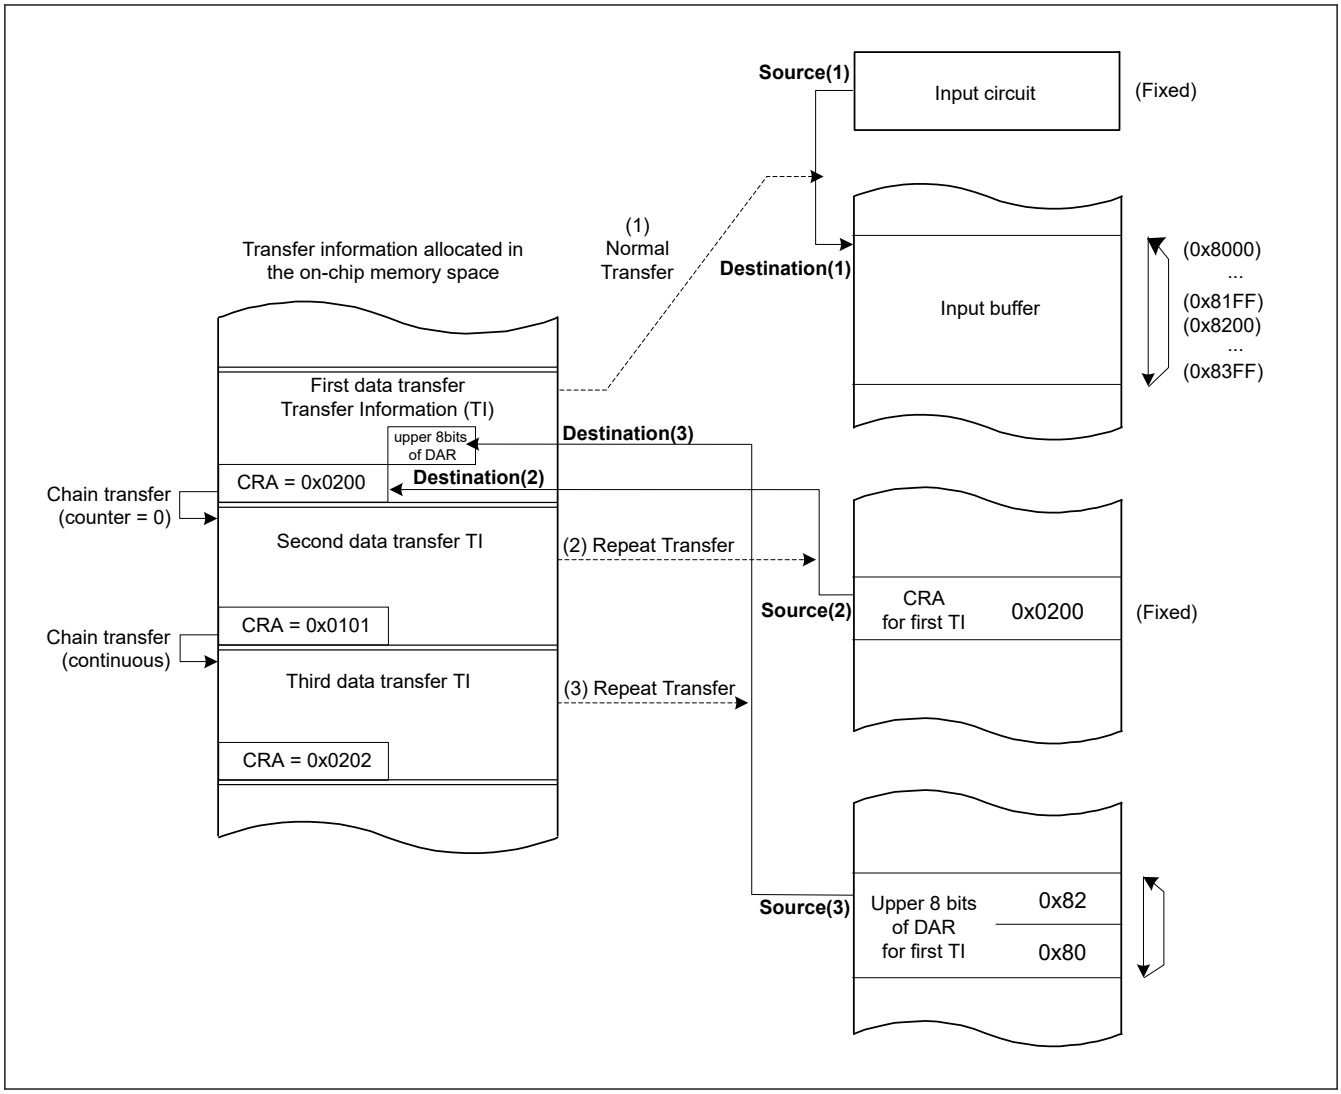

**Figure 16.13 Chain transfer when counter = 0**

## 16.7 Processing on DTC Transfer Error

If the access error occurs during DTC transfer, the DTC immediately stops access during transfer. To stop only the vector number that caused the error, inform the vector number that caused the error to the ICU and clear the corresponding ICU setting. After that, if there is a request other than the vector number which caused the error, it will be re-arbitration as it is. The condition under which the transfer error occurs is indicated when TrustZone Filter in DTC detects a violation.

The error response is informed to ICU when the transfer error occurs. ICU clears the ICU.IELSRn of the corresponding vector number which caused the transfer error. Furthermore, it generates an error response detection interrupt to notify that an error has occurred by DMAC/DTC transfer. (section 16.8.2. Interrupt Request of Transfer Error). Write back to SRAM is not performed.

When the Master TrustZone Filter error occurs, the Slave TrustZone error occurs or the Master MPU error occurs, it is possible to confirm the error information of DTC by selecting NMI. The DTC error vector register is cleared by selecting reset. Under the conditions where NMI is generated due to transfer error in DTC, two interrupts(NMI and DMA_TRANSERR) are generated. In this case, NMI always responds first.

The error response detection interrupt request (DMA_TRANSERR) occurs when the Slave Bus error or the Illegal Access error occurs. Furthermore, it occurs after NMI when the error response detection interrupt request (DMA_TRANSERR) is not cleared in NMI handler.

section 16.7.1. Processing on NMI handler describes how to confirm the error information of the DTC in the NMI handler. section 16.7.2. Processing on Error response detection interrupt request (DMA_TRANSERR) handler describes how to confirm the error information of the DTC in the DMA_TRANSERR handler.

Interrupts and the error information generated due to transfer errors are shown in section 16.8.2. Interrupt Request of Transfer Error.

### 16.7.1 Processing on NMI handler

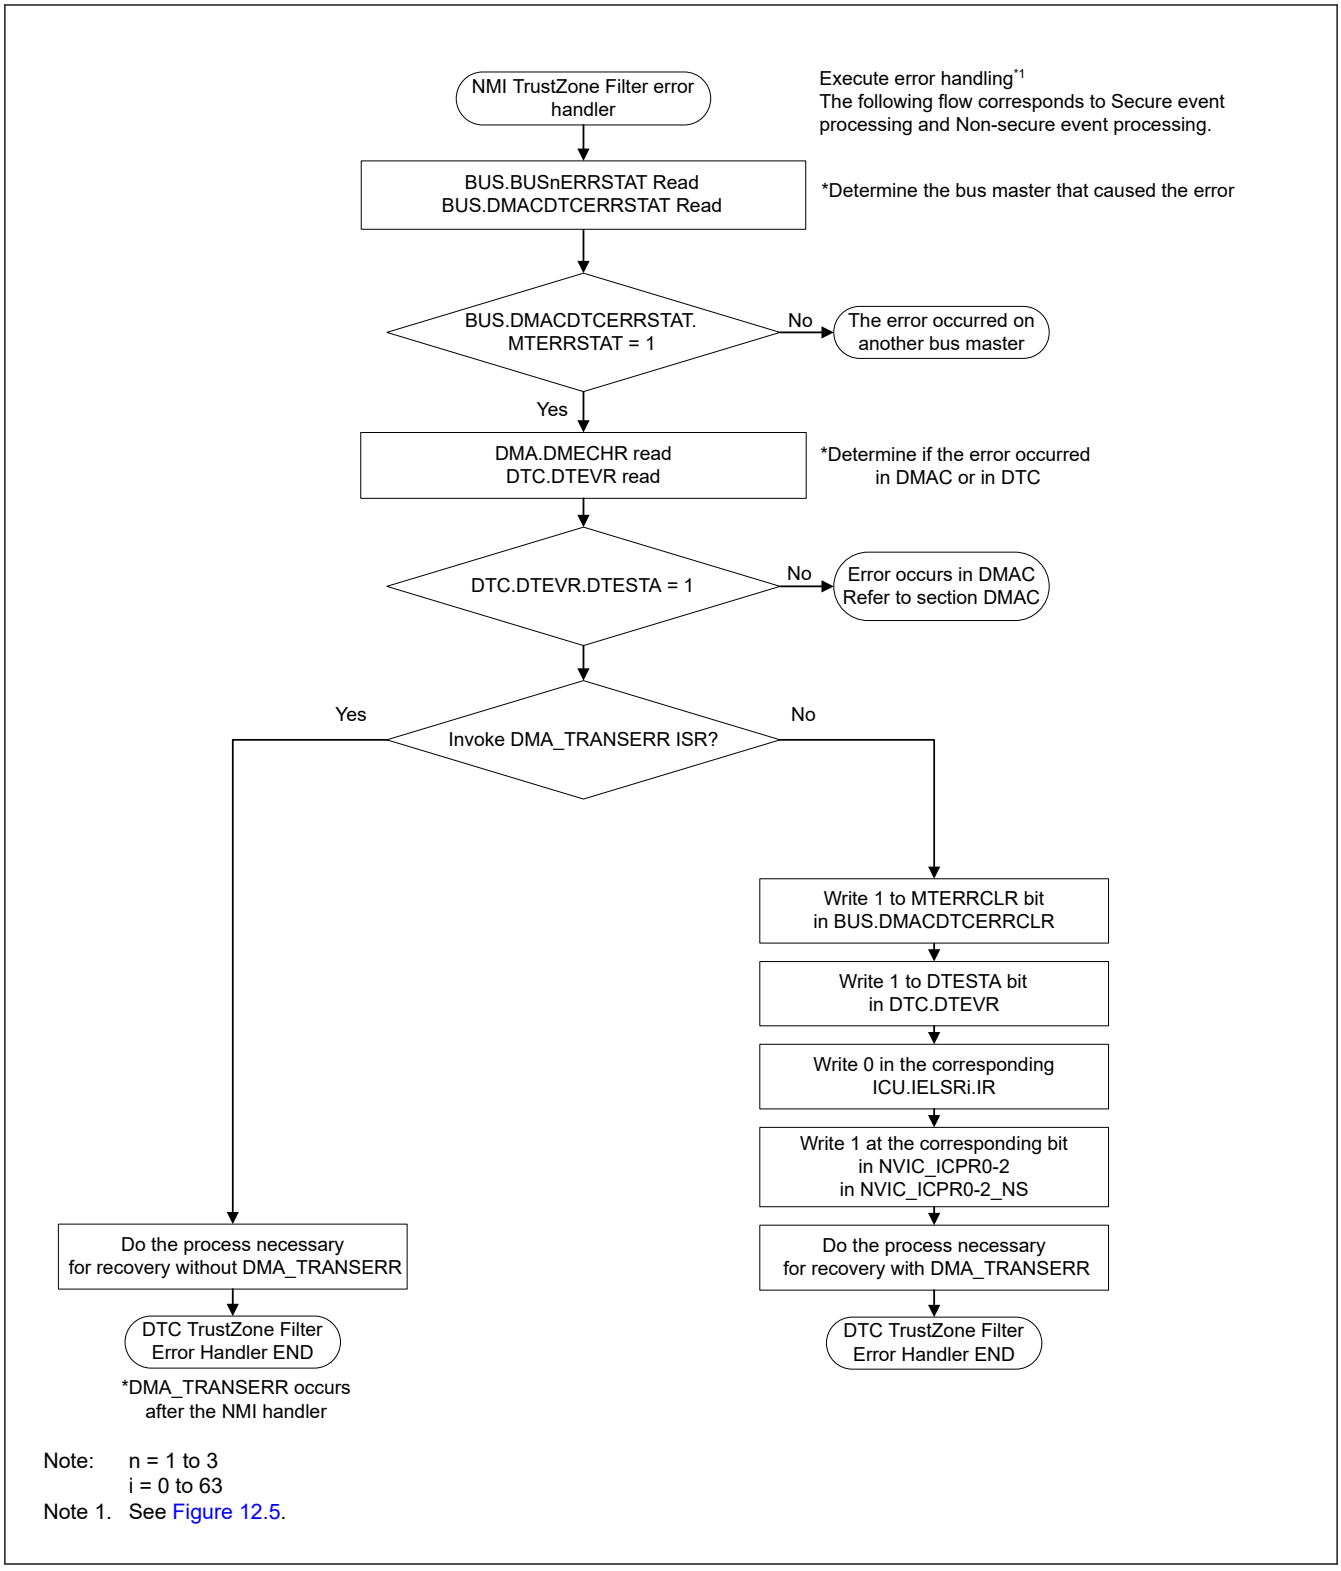
The cause of NMI due to the DMA transfer error is the Master TrustZone Filter error, the Slave TrustZone Filter error or the Master MPU error. When NMI occurs due to the DTC transfer error, the error response detection interrupt request (DMA_TRANSERR) occurs after the end of NMI handler. It is possible to confirm the cause of the error and the DTC vector number in which the error occurred. When NMI occurs, perform the necessary processing according to the flow described in section 12, Interrupt Controller Unit (ICU).

Figure 16.14 shows the flow to confirm the vector number that caused the Master TrustZone Filter error in DTC.

Figure 16.15 shows the flow to confirm the vector number that caused the Slave TrustZone Filter error in DTC.

Figure 16.16 shows the flow to confirm the vector number and Security Attribute that caused the Master MPU error in DTC.

If completing all processing in NMI handler, it is possible to clear the error response detection interrupt request (DMA_TRANSERR) that occurs subsequently.



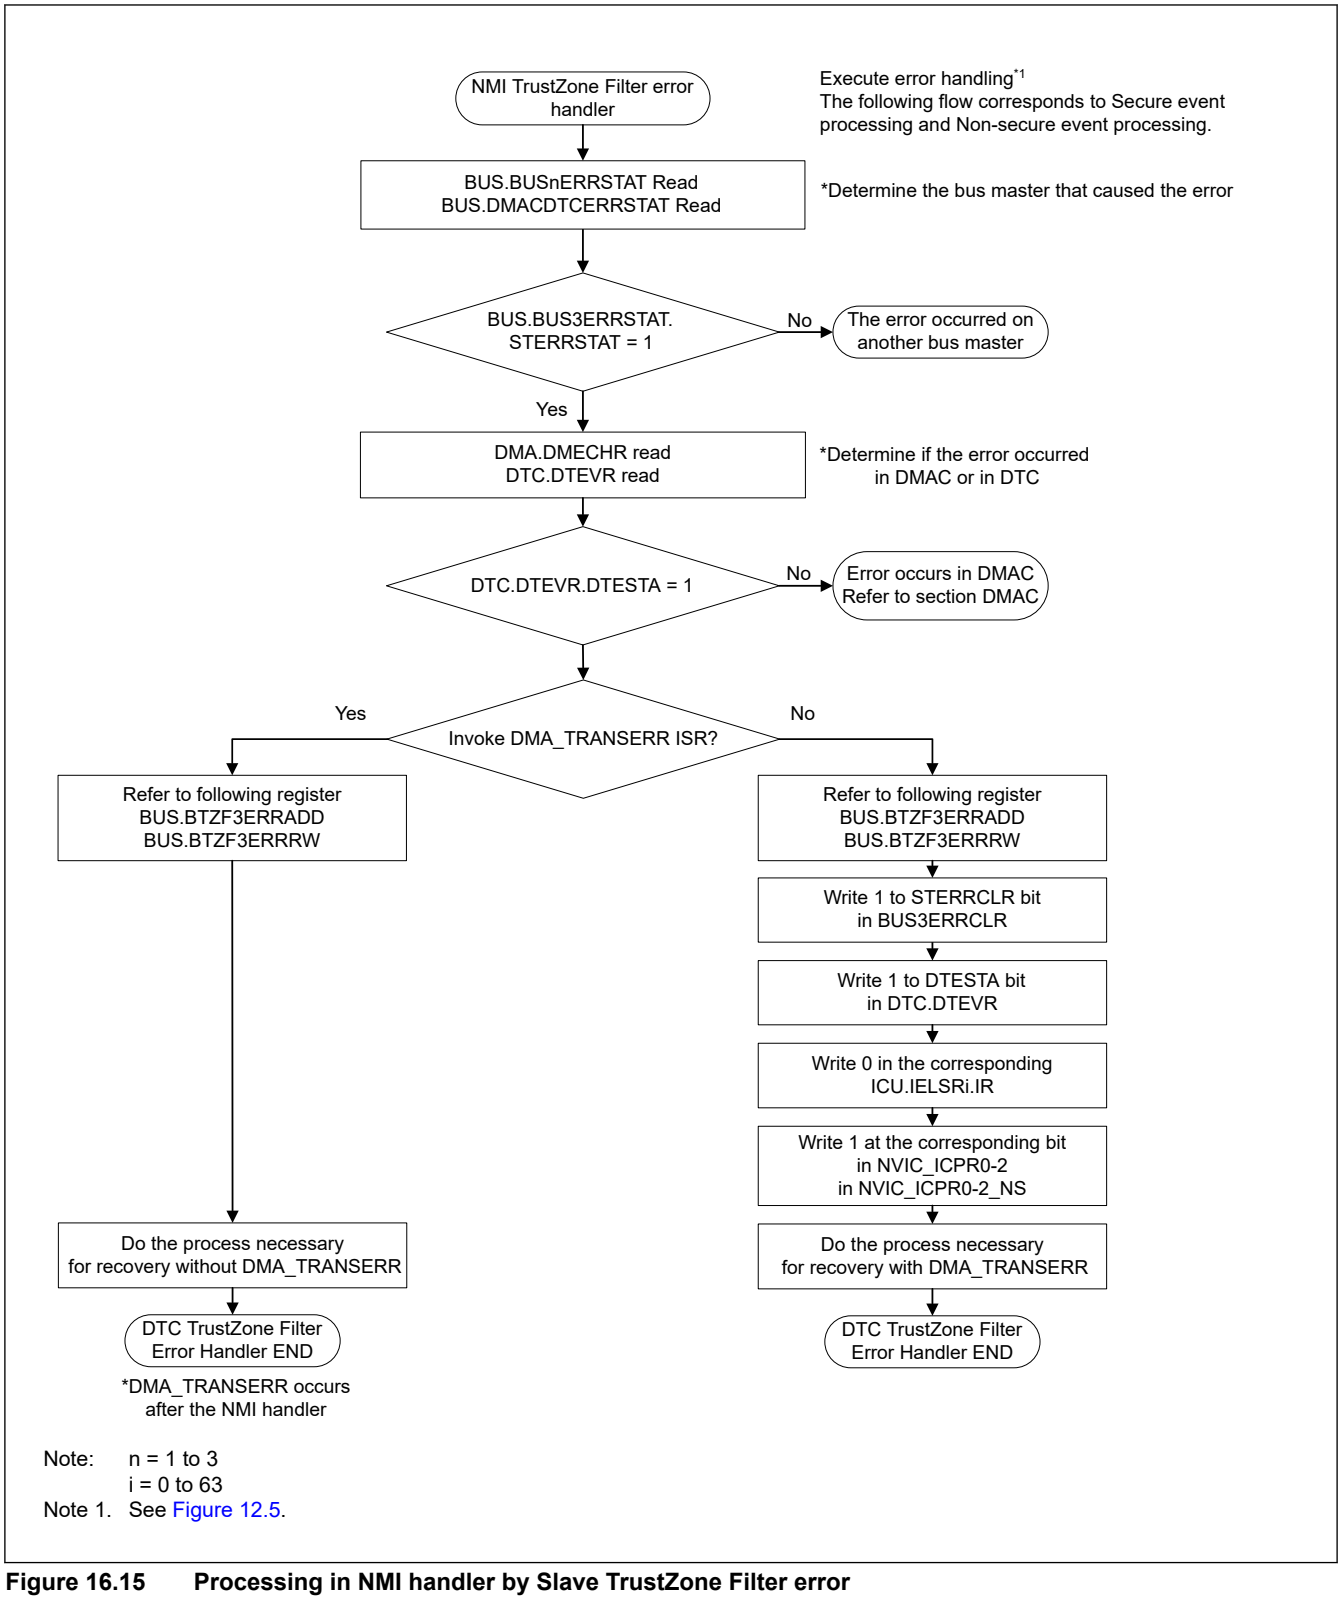


**Figure 16.14 Processing in NMI handler by Master TrustZone Filter error**

Note: n = 1 to 3
i = 0 to 63
Note 1. See Figure 12.5.

**Figure 16.15 Processing in NMI handler by Slave TrustZone Filter error**

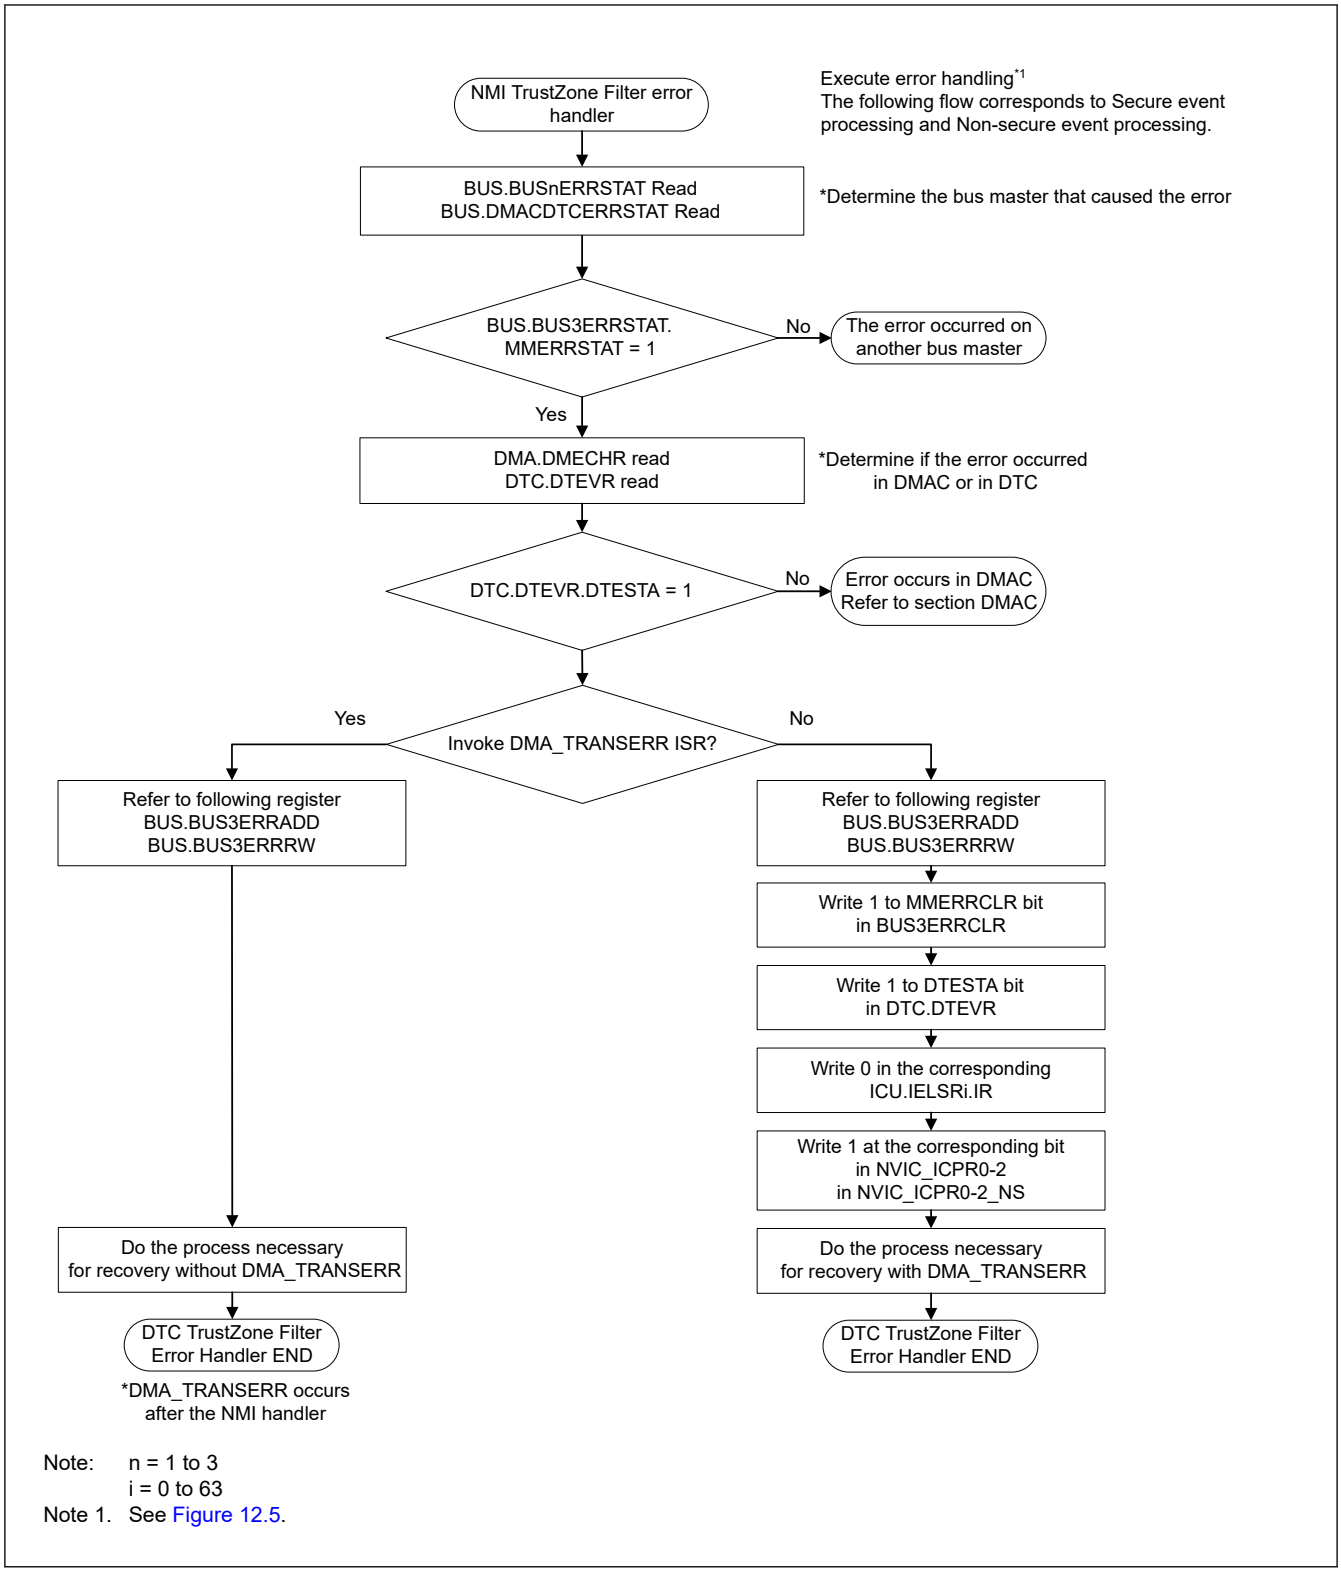

**Figure 16.16 Processing in NMI handler by Master MPU error**

## 16.7.2 Processing on Error response detection interrupt request (DMA_TRANSERR) handler

The cause of error response detection interrupt request (DMA_TRANSERR) due to DMA transfer error is the Slave Bus Error or Illegal Access Error. Also, it occurs after the NMI handler error response detection interrupt request (DMA_TRANSERR) is not cleared by the NMI handler.

It is possible to confirm the cause of the error and the vector number of DTC in which the error occurred.

Error cause confirmation procedure is shown Figure 16.17.

Figure 16.18 shows the flow for confirm the vector number that caused the Master TrustZone Filter Error in DTC

Figure 16.19 shows the flow for confirm the vector number that caused the Slave TrustZone Filter Error in DTC

Figure 16.20 shows the flow for confirm the vector number and Security Attribute that caused the Master MPU Error in DTC

Figure 16.21 shows the flow for confirm the vector number and Security Attribute that caused the Slave Bus Error in DTC

Figure 16.22 shows the flow for confirm the vector number and Security Attribute that caused the Illegal Access Error in DTC

## 16.8 Interrupt

### 16.8.1 Interrupt Request of Transfer End

When the DTC completes data transfer of the specified count or when data transfer with MRB.DISEL set to 1 is complete, a DTC activation source generates an interrupt to the CPU. Two types of interrupt are available: interrupts triggered by a DTC activation (per channel) and an interrupt triggered by the event signal DTC_COMPLETE (common to all channels). Interrupts to the CPU are controlled according to the settings in the NVIC and the ICU.IELSRn.IELS[8:0] bits. See section 12, Interrupt Controller Unit (ICU). The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

### 16.8.2 Interrupt Request of Transfer Error

The error response detection interrupt request (DMA_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DTC transfer. The types of interrupts that occur when the DTC transfer error occurs are listed in the Table 16.10. The Table 16.10 also shows error information stored when a transfer error occurs.

**Table 16.10 Interrupt and error information due to DTC transfer error cause**

| Transfer error factor | NMI/RESET*1 Request | Interrupt Request | Bus Error Status | Error Address Error R/W | Error Channel Information |
|---|---|---|---|---|---|
| Master TrustZone Filter (in DMAC/DTC) | ICU.NMISR.TZFST*1 | DMA_TRANSERR | BUS.DMACDTCERRSTAT.MTERRSTAT*1 | — | DTC.DTEVR |
| Slave TrustZone Filter | ICU.NMISR.TZFST*1 | DMA_TRANSERR | BUS.BUS3ERRSTAT.STERRSTAT*1 | BUS.BTZF3ERRADD BUS.BTZF3ERRRW | DTC.DTEVR |
| Master MPU | ICU.NMISR. BUSMST | DMA_TRANSERR | BUS.BUS3ERRSTAT.MMERRSTAT | BUS.BUS3ERRADD BUS.BUS3ERRRW | DTC.DTEVR |
| Slave Bus Error | —*2 | DMA_TRANSERR | BUS.BUS3ERRSTAT.SLERRSTAT*2 | BUS.BUS3ERRADD BUS.BUS3ERRRW | DTC.DTEVR |
| Illegal Access Error | —*2 | DMA_TRANSERR | BUS.BUS3ERRSTAT.ILERRSTAT*2 | BUS.BUS3ERRADD BUS.BUS3ERRRW | DTC.DTEVR |

Note 1. Interrupt generated, when NMI request selected as the operation after detection of the Master MPU error and The TrustZone Filter error. By confirming BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT, judge whether it is the Master or the Slave.
Note 2. If the error response detection interrupt (DMA_TRANSERR) occurs and NMI of the Master MPU or NMI of the TrustZone Filter has not occurred, treat it as the Illegal address access error or the Slave Bus Error. It can be judged also by BUS.BUS3ERRSTAT and BUS. DMACDTCERRSTAT.

Note that if the bus error occurs when writing the last data of transfer, the transfer end event and the error response detection interrupt (DMA_TRANSERR) occurs.

## 16.9 Event Link

The DTC can produce an event link request on completion of one transfer request.

## 16.10 Low Power Consumption Function

Before transitioning to the module-stop state, Software Standby mode without Snooze mode transition, set the DTCST.DTCST bit to 0, and then perform the operations described in the following sections. The DTC is available in Snooze mode by setting the SYSTEM.SNZCR.SNZDTCEN bit to 1. See section 10, Low Power Modes.

### (1) Module-Stop Function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DTC. If a DTC transfer is in progress when 1 is written to the MSTPCRA.MSTPA22 bit, the transition to the module-stop state proceeds after the DTC transfer ends. While the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited. Writing 0 to the MSTPCRA.MSTPA22 bit releases the DTC from the module-stop state.

### (2) Software Standby Mode

Use the settings described in section 10.7.1. Transitioning to Software Standby Mode.

If DTC transfer operations are in progress when the WFI instruction is executed, the transition to Software Standby mode is executed after the completion of the DTC transfer.

### (3) Snooze Mode

When the snooze control circuit receives a snooze request in Software Standby mode, the MCU transitions to Snooze mode. See section 10.8.1. Transition to Snooze Mode. DTC operation in Snooze mode can be selected in the SYSTEM.SNZCR.SNZDTCEN bit. If DTC operation is enabled in Snooze mode, before transitioning to Software Standby mode, set the DTCST.DTCST bit to 1. To return to Software Standby mode through DTC, set SYSTEM.SNZEDCR0.DTCZRED or SYSTEM.SNZEDCR0.DTCNZRED to 1. See section 10.8.3. Returning to Software Standby Mode from Snooze Mode. SYSTEM.SNZEDCR0.DTCZRED enables or disables a snooze end request on completion of the last DTC transmission, detected on DTC transmission completion when CRA and CRB are 0. SYSTEM.SNZEDCR0.DTCNZRED enables or disables a snooze end request on a not last DTC transmission completion (CRA and CRB are not 0), detected on DTC transmission completion when CRA and CRB are not 0. The DTC activation request from the ICU is stopped during Software Standby mode but not stopped during Snooze mode.

### (4) Notes on Low Power Consumption Function

For the WFI instruction and the register setting procedure, see section 10, Low Power Modes.

To perform a DTC transfer after returning from a low power mode without a Snooze mode transition, set the DTCST.DTCST bit to 1 again.

To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DTC activation request, specify the CPU as the interrupt request destination as described in section 12.4.1. Detecting Interrupts, then execute the WFI instruction. If DTC operation is enabled in Snooze mode, do not use the module-stop function of the DTC.

## 16.11 Usage Notes

### 16.11.1 Transfer Information Start Address

You must set multiples of 4 for the transfer information start addresses in the vector table. Otherwise, such addresses are accessed with their lowest 2 bits regarded as 00b.

# 17. Event Link Controller (ELC)

## 17.1 Overview

The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.

Table 17.1 lists the ELC specifications, and Figure 17.1 shows a block diagram.

**Table 17.1 ELC specifications**

| Item | Description |
|---|---|
| Event link function | 157 types of event signals can be directly connected to modules. The ELC generates the ELC event signal, and events that activate the DTC. |
| Module-stop function | Module-stop state can be set |
| TrustZone Filter | Security attribution can be set for each registers |

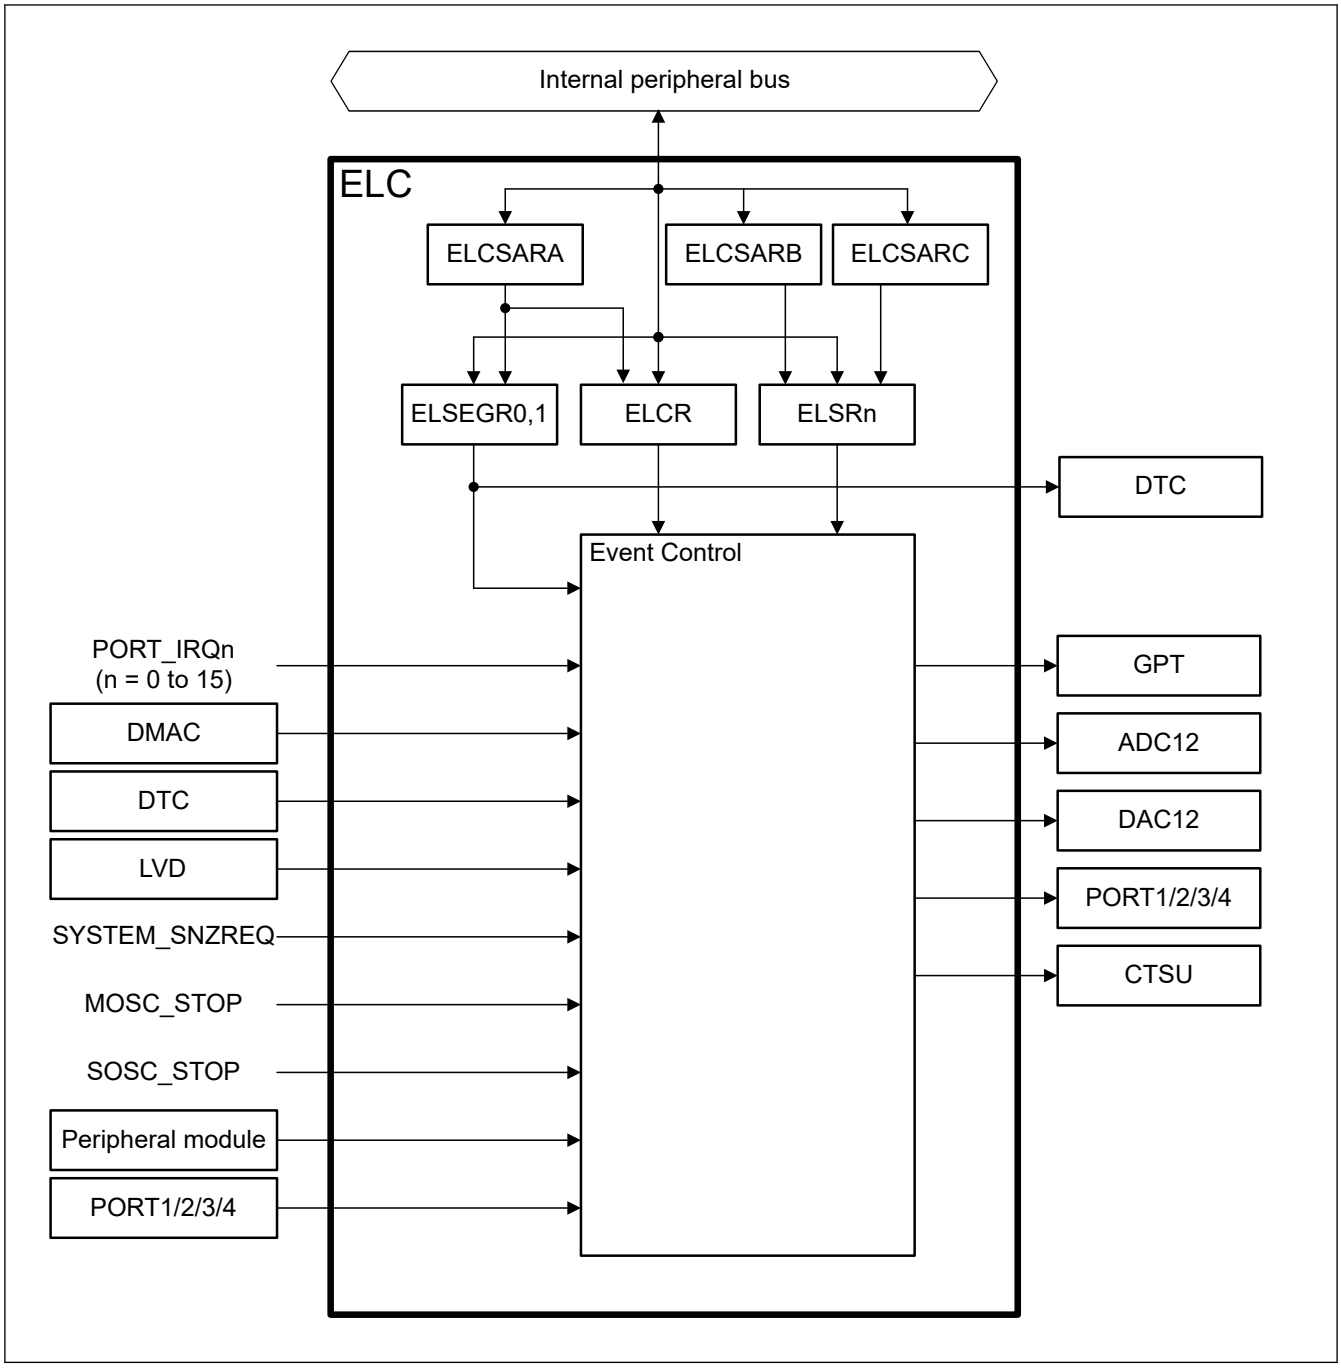

**Figure 17.1 ELC block diagram**

## 17.2 Register Descriptions

### 17.2.1 ELCR : Event Link Controller Register

Base address: ELC = 0x4008_2000

Offset address: 0x00

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ELCON | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | ELCON | All Event Link Enable<br>0: ELC function is disabled<br>1: ELC function is enabled | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The ELCR register controls the ELC operation.

## 17.2.2 ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1)

Base address: ELC = 0x4008_2000

Offset address: 0x02 + 0x02 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | WI | WE | — | — | — | — | — | SEG |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SEG | Software Event Generation<br>0: Normal operation<br>1: Software event is generated | W |
| 5:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | WE | SEG Bit Write Enable<br>0: Write to SEG bit disabled<br>1: Write to SEG bit enabled | R/W |
| 7 | WI | ELSEGR Register Write Disable<br>0: Write to ELSEGR register enabled<br>1: Write to ELSEGR register disabled | W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### SEG bit (Software Event Generation)

When 1 is written to the SEG bit while the WE bit is 1, a software event is generated. This bit is read as 0. Even when 1 is written to this bit, data is not stored. The WE bit must be set to 1 before writing to this bit.

A software event can trigger a linked DTC event.

### WE bit (SEG Bit Write Enable)

The SEG bit can only be written to when the WE bit is 1. Clear the WI bit to 0 before writing to this bit.

[Setting condition]

- If 1 is written to this bit while the WI bit is 0, this bit becomes 1.

[Clearing condition]

- If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

### WI bit (ELSEGR Register Write Disable)

The ELSEGR register can only be written to when the write value to the WI bit is 0. This bit is read as 1. Before setting the WE or SEG bit, the WI bit must be set to 0.

### 17.2.3 ELSRn : Event Link Setting Register n (n = 0 to 9, 12, 14 to 18)

Base address: ELC = 0x4008_2000

Offset address: 0x10 + 0x04 × n

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | ELS[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | ELS[8:0] | Event Link Select<br>0x000: Event output disabled for the associated peripheral module<br>0x001: Number setting for the event signal to be linked<br>⋮<br>0x1E7: Number setting for the event signal to be linked<br>Others: Settings prohibited | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The ELSRn register specifies an event signal to be linked to each peripheral module. Table 17.2 shows the association between the ELSRn register and the peripheral modules. Table 17.3 shows the association between the event signal names set in the ELSRn register and the signal numbers.

**Table 17.2 Association between the ELSRn registers and peripheral functions**

| Register name | Peripheral function (module) | Event name |
|---|---|---|
| ELSR0 | GPT (A) | ELC_GPTA |
| ELSR1 | GPT (B) | ELC_GPTB |
| ELSR2 | GPT (C) | ELC_GPTC |
| ELSR3 | GPT (D) | ELC_GPTD |
| ELSR4 | GPT (E) | ELC_GPTE |
| ELSR5 | GPT (F) | ELC_GPTF |
| ELSR6 | GPT (G) | ELC_GPTG |
| ELSR7 | GPT (H) | ELC_GPTH |
| ELSR8 | ADC12A0 | ELC_AD00 |
| ELSR9 | ADC12B0 | ELC_AD01 |
| ELSR12 | DAC12 | ELC_DA0 |
| ELSR14 | PORT1 | ELC_PORT1 |
| ELSR15 | PORT2 | ELC_PORT2 |
| ELSR16 | PORT3 | ELC_PORT3 |
| ELSR17 | PORT4 | ELC_PORT4 |
| ELSR18 | CTSU | ELC_CTSU |

**Table 17.3 Association between event signal names set in ELSRn.ELS[8:0] bits and signal numbers (1 of 5)**

| Event number | Interrupt request source | Name | Description |
|---|---|---|---|
| 0x001 | Port | PORT_IRQ0*1 | External pin interrupt 0 |
| 0x002 | | PORT_IRQ1*1 | External pin interrupt 1 |
| 0x003 | | PORT_IRQ2*1 | External pin interrupt 2 |
| 0x004 | | PORT_IRQ3*1 | External pin interrupt 3 |
| 0x005 | | PORT_IRQ4*1 | External pin interrupt 4 |
| 0x006 | | PORT_IRQ5*1 | External pin interrupt 5 |
| 0x007 | | PORT_IRQ6*1 | External pin interrupt 6 |
| 0x008 | | PORT_IRQ7*1 | External pin interrupt 7 |
| 0x009 | | PORT_IRQ8*1 | External pin interrupt 8 |
| 0x00A | | PORT_IRQ9*1 | External pin interrupt 9 |
| 0x00B | | PORT_IRQ10*1 | External pin interrupt 10 |
| 0x00C | | PORT_IRQ11*1 | External pin interrupt 11 |
| 0x00D | | PORT_IRQ12*1 | External pin interrupt 12 |
| 0x00E | | PORT_IRQ13*1 | External pin interrupt 13 |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

This register specifies the security attribution for the Register ELSRn (n = 0 to 9, 12, 14, 15).

### 17.2.6 ELCSARC : Event Link Controller Security Attribution Register C

Base address: ELC = 0x4008_2000

Offset address: 0x7C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | ELSR[18:16] | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | ELSR[18:16] | Event Link Setting Register n Security Attribution (n = 16 to 18)<br>Target register: ELSRn (n = 16 to 18)<br>0: Secure<br>1: Non-secure | R/W |
| 15:3 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

This register specifies the security attribution for the Register ELSRn (n = 16 to 18)

## 17.3 Operation

### 17.3.1 Relation between Interrupt Handling and Event Linking

Event number for an event link is the same as that for the associated interrupt source. For information on generating event signals, see the explanation in the chapter for each event source module.

### 17.3.2 Linking Events

When an event occurs and that event is already set as a trigger in the Event Link Setting Register (ELSRn), the associated module is activated. The operation of the module must be set up in advance. Table 17.4 lists the operations of modules when an event occurs.

**Table 17.4 Module operations when event occurs (1 of 2)**

| Module | Operations When Event is Input |
|---|---|
| GPT | • Start counting<br>• Stop counting<br>• Clear counting<br>• Up counting<br>• Down counting<br>• Input capture |
| DAC12 | Start D/A conversion |

**Table 17.4 Module operations when event occurs (2 of 2)**

| Module | Operations When Event is Input |
|---|---|
| I/O Ports | • Change pin output based on the EORR (reset) or EOSR (set)<br>• Latch pin state to EIDR<br>• The following ports can be used for the ELC:<br>Port 1<br>Port 2<br>Port 3<br>Port 4 |
| CTSU | Start measurement operation |
| ADC12 | Start A/D conversion |
| DTC | Start DTC data transfer |

### 17.3.3 Example of Procedure for Linking Events

To link events:

1. Set the operation of the module for which an event is to be linked.
2. Set the appropriate ELSRn.ELS[8:0] bits for the module to be linked.
3. Set the ELCR.ELCON bit to 1 to enable linkage of all events.
4. Configure the module from which an event is output and activate the module. The link between the two modules is now active.
5. To stop event linkage of modules individually, set 0 to the ELSRn.ELS[8:0] bit associated with the modules. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

If event link output from the RTC is to be used, set the ELC after the RTC settings, for example, for initialization and time setting. Unintended events may be generated if RTC settings are made after the ELC settings.

If event link output from the LVD is to be used, set the ELC after setting the LVD. To disable the LVD, do so after setting 0x00 to the associated ELSRn register.

## 17.4 Usage Notes

### 17.4.1 Linking DMAC/DTC Transfer End Signals as Events

When linking the DMAC/DTC transfer end signals as events, do not set the same peripheral module as the DMAC/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMAC/DTC transfer to the peripheral module is complete.

### 17.4.2 Setting Clocks

To link events, you must enable the ELC and the related modules. The modules cannot operate if the related modules are in the module-stop state or in low power mode in which the module is stopped (Software Standby mode).

Some modules can perform in Snooze mode. For more information, see Table 17.3 and section 10, Low Power Modes.

### 17.4.3 Module-Stop Function Setting

The Module Stop Control Register C (MSTPCRC) can enable or disable ELC operation. The ELC is initially stopped after reset. Releasing the module-stop state enables access to the registers. The ELCON bit must be set to 0 before disabling ELC operation using the Module Stop Control Register. For more information, see Table 17.3 and section 10, Low Power Modes.

### 17.4.4 ELC Delay Time

In Figure 17.2, module A accesses module B through the ELC. There is a delay time in the ELC between module A and module B. Table 17.5 shows the ELC delay time.

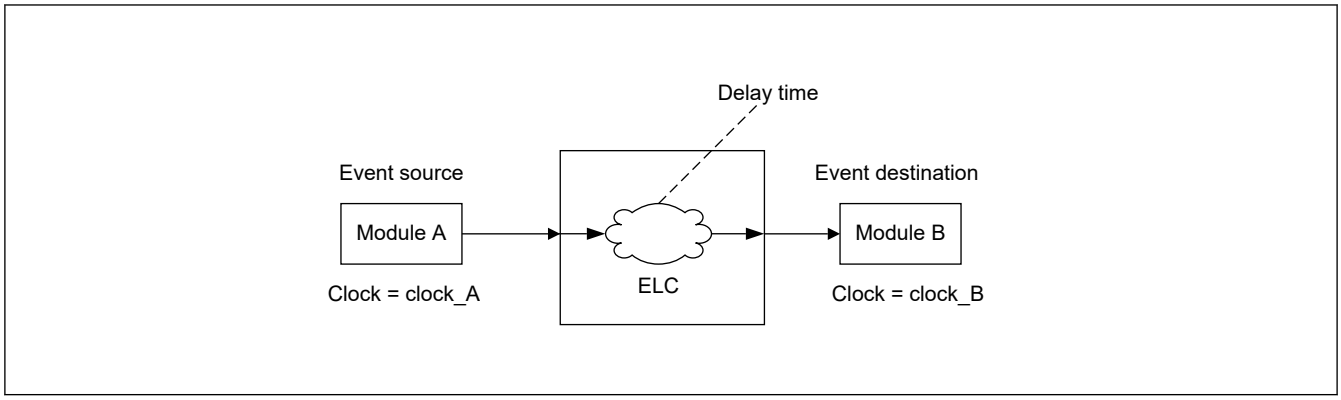

**Figure 17.2 ELC delay time**

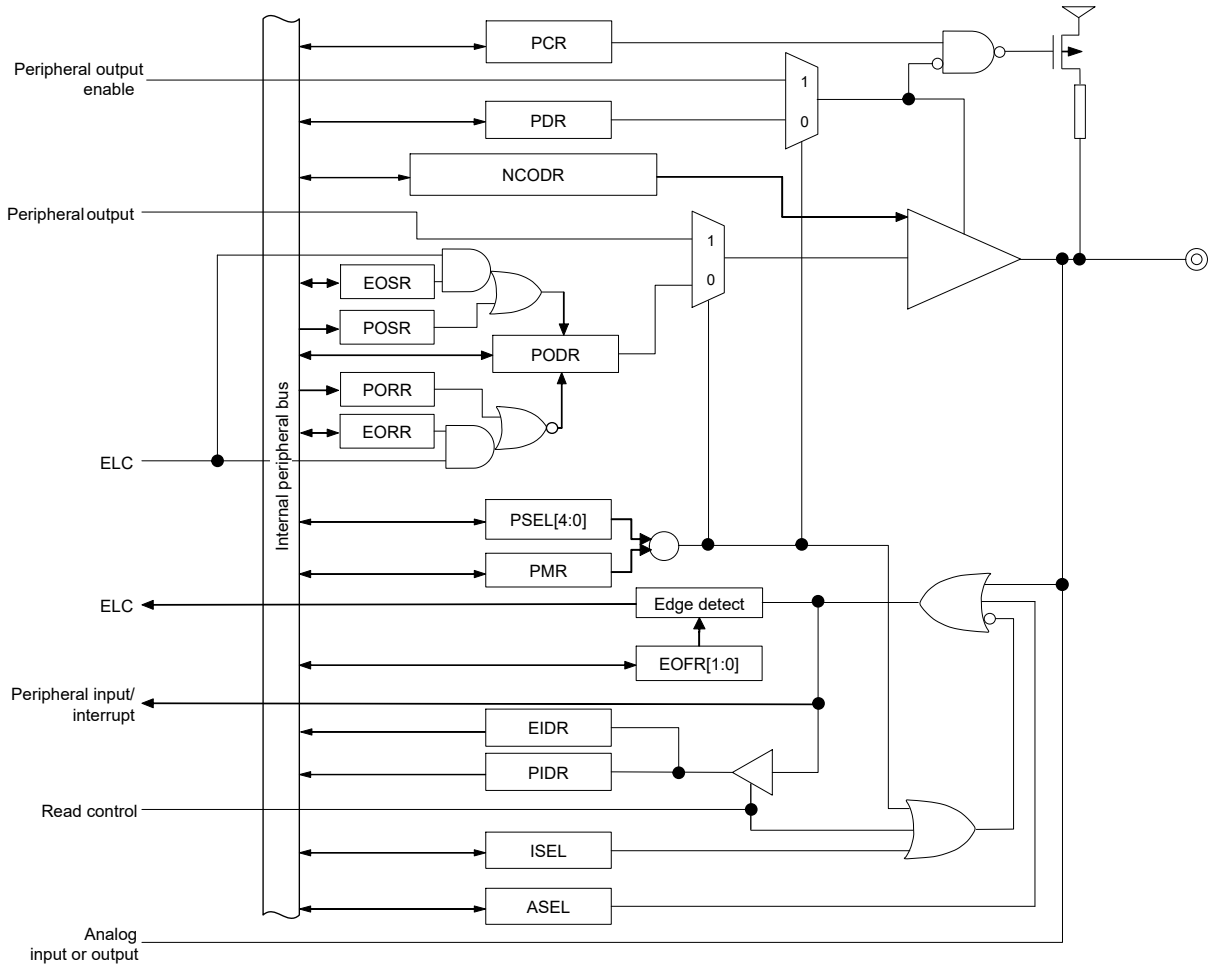
**Table 17.5 ELC delay time**

| Clock domain | Clock frequency | ELC delay time |
|---|---|---|
| clock_A = clock_B | clock_A = clock_B | 0 cycle |
| clock_A ≠ clock_B | clock_A = clock_B | 1 cycle to 2 cycles |
| | clock_A > clock_B | 1 cycle to 2 cycles of clock_B |
| | clock_A < clock_B | 1 cycle to 2 cycles of clock_A |



# 18. I/O Ports

## 18.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC.

All pins operate as input pins immediately after a reset, and pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

Figure 18.1 shows a connection diagram for the I/O port registers. The configuration of the I/O ports differs for different packages. Table 18.1 lists the I/O port specifications by package, and Table 18.2 lists the port functions.

Note: This figure shows a basic port configuration. The configuration differs depending on the ports.

**Figure 18.1 Connection diagram for I/O port registers**

**Table 18.1 I/O port specifications (1 of 2)**

| Port | Package 100 pins | Number of pins | Package 72 pins | Number of pins | Package 64 pin LQFP | Number of pins | Package 64 pin BGA | Number of pins | Package 48 pins | Number of pins |
|---|---|---|---|---|---|---|---|---|---|---|
| Port0 | P000 to P004, P010, P011 | 7 | P000 to P004, P010, P011 | 7 | P000 to P004, P010, P011 | 7 | P000 to P004, P010, P011 | 7 | P002 to P004, P010, P011 | 5 |

**Table 18.1 I/O port specifications (2 of 2)**

| Port | Package 100 pins | Number of pins | Package 72 pins | Number of pins | Package 64 pin LQFP | Number of pins | Package 64 pin BGA | Number of pins | Package 48 pins | Number of pins |

## 18.2 Register Descriptions

### 18.2.1 PCNTR1/PODR/PDR : Port Control Register 1

Base address: PORTm = 0x4001_F000 + 0x0020 × m (m = 0 to 8)

Offset address: 0x000 (PCNTR1/PODR)
0x002 (PDR)

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | PODR15 | PODR14 | PODR13 | PODR12 | PODR11 | PODR10 | PODR09 | PODR08 | PODR07 | PODR06 | PODR05 | PODR04 | PODR03 | PODR02 | PODR01 | PODR00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | PDR15 | PDR14 | PDR13 | PDR12 | PDR11 | PDR10 | PDR09 | PDR08 | PDR07 | PDR06 | PDR05 | PDR04 | PDR03 | PDR02 | PDR01 | PDR00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | PDR15 to PDR00 | Pmn Direction<br>0: Input (functions as an input pin)<br>1: Output (functions as an output pin) | R/W*1 |
| 31:16 | PODR15 to PODR00 | Pmn Output Data<br>0: Low output<br>1: High output | R/W*2 |

Note: m = 0 to 8, n = 00 to 15

Note 1. If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 2. If the security attribution is configured as Secure:
- Secure access is allowed
- Non-secure read value is 0 and TrustZone access error is not generated
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The Port Control Register 1 (PCNTR1/PODR/PDR) is a 32-bit or 16-bit read/write register that controls port direction and port output data. The PCNTR1 specifies the port direction and output data, and is accessed in 32-bit units. The PDRn (bits [15:0] in PCNTR1) and PODRn (bits [31:16] in PCNTR1) respectively, are accessed in 16-bit units.

#### PDRn bits (Pmn Direction)

The PDRn bits select the input or output direction for individual pins on the associated port when the pins are configured as general I/O pins. Each pin on port m is associated with a PORTm.PCNTR1.PDRn bit. The I/O direction can be specified in 1-bit unit. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PDRn bits are reserved. See Table 18.2. The PDRn bit in the PORTm.PCNTR1 register serves the same function as the PDR bit in the PFS.PmnPFS register.

#### PODRn bits (Pmn Output Data)

The PODRn bits hold data to be output from the general I/O pins. Bits of non-existent port m are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PODRn bits are reserved. See Table 18.2. The PODRn bit in the PORTm.PCNTR1 register serves the same function as the PODR bit in the PFS.PmnPFS register.

## 18.2.2 PCNTR2/EIDR/PIDR : Port Control Register 2

Base address: PORTm = 0x4001_F000 + 0x0020 × m (m = 0 to 8)

Offset address: 0x004 (PCNTR2/EIDR)
0x006 (PIDR)

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | EIDR15 | EIDR14 | EIDR13 | EIDR12 | EIDR11 | EIDR10 | EIDR09 | EIDR08 | EIDR07 | EIDR06 | EIDR05 | EIDR04 | EIDR03 | EIDR02 | EIDR01 | EIDR00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | PIDR15 | PIDR14 | PIDR13 | PIDR12 | PIDR11 | PIDR10 | PIDR09 | PIDR08 | PIDR07 | PIDR06 | PIDR05 | PIDR04 | PIDR03 | PIDR02 | PIDR01 | PIDR00 |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | PIDR15 to PIDR00 | Pmn State<br>0: Low level<br>1: High level | R |
| 31:16 | EIDR15 to EIDR00 *2 | Port Event Input Data*1<br>When an ELC_PORTx signal occurs<br>0: Low input<br>1: High input | R |

Note: If the security attribution is configured as Secure:
- Secure read access is allowed
- Non-secure read value is 0 and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure read access are allowed.

Note: m = 0 to 8, n = 00 to 15
Note 1. x = 1, 2, 3 or 4 for EIDR only
Note 2. Supported by ports 1, 2, 3 or 4.

The Port Control Register 2 (PCNTR2/EIDR/PIDR) allows read access to the Pmn state and the port event input data using 32-bit or 16-bit access.

The PCNTR2 represents the Pmn state and the port event input data, and is accessed in 32-bit units.

The PIDRn (bits [15:0] in PCNTR2) and EIDRn (bits [31:16] in PCNTR2) respectively, are accessed in 16-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as undefined.

### PIDRn bits (Pmn State)

The PIDRn bits reflect the individual pin states of the port, regardless of the values set in PmnPFS.PMR and PORTm.PCNTR1.PDRn. The PIDRn bit in the PORTm.PCNTR2 register serves the same function as the PIDR bit in the PFS.PmnPFS register.

A pin state cannot be reflected in PIDRn when one of the following functions is enabled:

- Main clock oscillator (MOSC)
- Sub-clock oscillator (SOSC)
- Analog function (ASEL = 1)
- Capacitive Touch sensing Unit (CTSU)
- Segment LCD Controller (SLCDC)
- USB 2.0 Full-Speed Module (USB_DP, USB_DM)

### EIDRn bits (Port Event Input Data)

The EIDRn bits latch a pin state when an ELC_PORTx signal occurs. Pin states can only be input to EIDRn when PmnPFS.PMR and PORTm.PCNTR1.PDRn are 0. When the PmnPFS.ASEL bit is set to 1, the associated pin state is not reflected in EIDRn.

## 18.2.3 PCNTR3/PORR/POSR : Port Control Register 3

Base address: PORTm = 0x4001_F000 + 0x0020 × m (m = 0 to 8)

Offset address: 0x008 (PCNTR3/PORR)
0x00A (POSR)

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | PORR 15 | PORR 14 | PORR 13 | PORR 12 | PORR 11 | PORR 10 | PORR 09 | PORR 08 | PORR 07 | PORR 06 | PORR 05 | PORR 04 | PORR 03 | PORR 02 | PORR 01 | PORR 00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | POSR 15 | POSR 14 | POSR 13 | POSR 12 | POSR 11 | POSR 10 | POSR 09 | POSR 08 | POSR 07 | POSR 06 | POSR 05 | POSR 04 | POSR 03 | POSR 02 | POSR 01 | POSR 00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | POSR15 to POSR00 | Pmn Output Set<br>0: No effect on output<br>1: High output | W |
| 31:16 | PORR15 to PORR00 | Pmn Output Reset<br>0: No effect on output<br>1: Low output | W |

Note: If the security attribution is configured as Secure:
- Secure write access is allowed
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure write access are allowed.

Note: m = 0 to 8, n = 00 to 15

The Port Control Register 3 (PCNTR3/PORR/POSR) is a 32-bit or 16-bit write register that controls the setting or resetting of the port output data.

The PCNTR3 controls the setting or resetting of the port output data, and is accessed in 32-bit units.

The POSRn (bits [15:0] in PCNTR3) and the PORRn (bits [31:16] in PCNTR3) respectively, are accessed in 16-bit units.

### POSRn bits (Pmn Output Set)

POSR changes PODR when set by a software write. For example, for P100, when PORT1.PCNTR3.POSR00 = 1, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, POSRn bits are reserved. See Table 18.2.

### PORRn bits (Pmn Output Reset)

PORR changes PODR when reset by a software write. For example, for P100, when PORT1.PCNTR3.PORR00 = 1, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, PORRn bits are reserved. See Table 18.2.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.
Note: PORRn and POSRn should not be set at the same time.

## 18.2.4 PCNTR4/EORR/EOSR : Port Control Register 4

Base address: PORTm = 0x4001_F000 + 0x0020 × m (m = 1 to 4)

Offset address: 0x00C (PCNTR4/EORR)
0x00E (EOSR)

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | EORR 15 | EORR 14 | EORR 13 | EORR 12 | EORR 11 | EORR 10 | EORR 09 | EORR 08 | EORR 07 | EORR 06 | EORR 05 | EORR 04 | EORR 03 | EORR 02 | EORR 01 | EORR 00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | EOSR 15 | EOSR 14 | EOSR 13 | EOSR 12 | EOSR 11 | EOSR 10 | EOSR 09 | EOSR 08 | EOSR 07 | EOSR 06 | EOSR 05 | EOSR 04 | EOSR 03 | EOSR 02 | EOSR 01 | EOSR 00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | EOSR15 to EOSR00 | Pmn Event Output Set<br>When an ELC_PORTx signal occurs<br>0: No effect on output<br>1: High output | R/W |
| 31:16 | EORR15 to EORR0 | Pmn Event Output Reset<br>When an ELC_PORTx signal occurs<br>0: No effect on output<br>1: Low output | R/W |

Note: If the security attribution is configured as Secure:
- Secure access is allowed
- Non-secure read value is 0 and TrustZone access error is not generated
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: m = 1 to 4, n = 00 to 15, x = 1 to 4

The Port Control Register 4 (PCNTR4/EORR/EOSR) is a 32-bit or 16-bit read/write register that controls the setting or resetting of the port output data by an event input from the ELC.

The PCNTR4 controls the setting or resetting of the port output data by an event input from the ELC, and is accessed in 32-bit units.

The EOSRn (bits [15:0] in PCNTR4) and EORRn (bits [31:16] in PCNTR4) respectively, are accessed in 16-bit units.

### EOSRn bits (Pmn Event Output Set)

EOSR changes PODR when set because an ELC_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EOSR00 is set to 1 when the ELC_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EOSRn bits are reserved. See Table 18.2.

### EORRn bits (Pmn Event Output Reset)

EORR changes PODR when reset because an ELC_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EORR00 = 1 when the ELC_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EORRn bits are reserved. See Table 18.2.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: EORRn and EOSRn should not be set at the same time.

## 18.2.5 PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 8, n = 00 to 15)

Base address: PFS = 0x4001_F800

Offset address: 0x000 + 0x040 × m + 0x004 × n (PmnPFS)
0x002 + 0x040 × m + 0x004 × n (PmnPFS_HA)

Note 1. The initial value of P108, P201 and P300 is not 0x0000_0000. P108 is 0x0001_0010, P201 is 0x0000_0010, and P300 is 0x0001_0010.
Note 2. Supported by PORTn (n = 1 to 4).
Note 3. If the security attribution is configured as Secure:
- Secure access is allowed
- Non-secure read value is 0 and TrustZone access error is not generated
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 4. If the security attribution is configured as Secure:
- Secure read access is allowed
- Non-secure read value is 0 and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure read access are allowed.

Note 5. If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Port mn Pin Function Select Register (PmnPFS/PmnPFS_HA/PmnPFS_BY) is a 32-bit, 16-bit, or 8-bit read/write control register that selects the port mn pin function, and is accessed in 32-bit units. PmnPFS_HA (PmnPFS [15:0] bits) is accessed in 16-bit units. PmnPFS_BY (PmnPFS[7:0] bits) is accessed in 8-bit units.

The available Port mn pin depends on the product. For details, see Table 18.1

### PODR bit (Port Output Data), PIDR bit (Port State), PDR bit (Port Direction)

The PDR, PIDR, and PODR bits serve the same function as the PCNTR. When these bits are read, the PCNTR value is read.

### PCR bit (Pull-up Control)

The PCR bit enables or disables an input pull-up resistor on the individual port pins. When a pin is in the input state with the associated bit in PmnPFS.PCR set to 1, the pull-up resistor connected to the pin is enabled. When a pin is set as a general port output pin, or a peripheral function output pin, the pull-up resistor for the pin is disabled regardless of the PCR setting. The pull-up resistor is also disabled in the reset state. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

### NCODR bit (N-Channel Open-Drain Control)

The NCODR bit specifies the output type for the port pins. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

### EOFR[1:0] bits (Event on Falling/Event on Rising)

The EOFR[1:0] bits select the edge detection method for the port group input signal. These bits support rising, falling, or both edge detections. When the EOFR[1:0] bits are set to 01b, 10b, or 11b, the input enable of the I/O cell is asserted. Following that, the event pulse is input from the external pin, and the GPIO outputs the event pulse to the ELC. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

### ISEL bit (IRQ Input Enable)

The ISEL bit specifies IRQ input pins. This setting can be used in combination with the peripheral functions, although an IRQn (external pin interrupt) of the same number must only be enabled for one pin. The ISEL bit for an unspecified IRQn is reserved.

### ASEL bit (Analog Input Enable)

The ASEL bit specifies analog pins. When a pin is set as an analog pin by this bit:

1. Specify it as a general I/O port in the Port Mode Control bit (PmnPFS.PMR).
2. Disable the pull-up resistor in the Pull-up Control bit (PmnPFS.PCR).
3. Specify the input in the Port Direction bit (PmnPFS.PDR). The pin state cannot be read at this point. The PmnPFS register is protected by the Write-Protect Register (PWPR). Release write-protect before modifying the register.

The ASEL bit for an unspecified analog I/O pin is reserved.

### PMR bit (Port Mode Control)

The PMR bit specifies the port pin function. Bits associated with non-existent pins are reserved. The write value should be 0.

### PSEL[4:0] bits (Peripheral Select)

The PSEL[4:0] bits assign the peripheral function.

## 18.2.6 PWPR : Write-Protect Register

Base address: PFS = 0x4001_F800

Offset address: 0x503

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | B0WI | PFSWE | — | — | — | — | — | — |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | PFSWE | PmnPFS Register Write Enable<br>0: Writing to the PmnPFS register is disabled<br>1: Writing to the PmnPFS register is enabled | R/W |
| 7 | B0WI | PFSWE Bit Write Disable<br>0: Writing to the PFSWE bit is enabled<br>1: Writing to the PFSWE bit is disabled | R/W |

### PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

### B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

## 18.2.7 PWPRS : Write-Protect Register for Secure

Base address: PFS = 0x4001_F800

Offset address: 0x505

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | B0WI | PFSWE | — | — | — | — | — | — |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | PFSWE | PmnPFS Register Write Enable<br>0: Disable writes to the PmnPFS register<br>1: Enable writes to the PmnPFS register | R/W |
| 7 | B0WI | PFSWE Bit Write Disable<br>0: Enable writes the PFSWE bit<br>1: Disable writes to the PFSWE bit | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

### PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register of the IO port pin set as secure by the PmSAR register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

### B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

## 18.2.8 PRWCNTR : Set Wait Control Register

Base address: PFS = 0x4001_F800

Offset address: 0x50C

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | WAIT[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | WAIT[3:0] | Wait Cycle Control Bit<br>The WAIT bits specify the number of wait cycles for accessing the PRCNT2 and PFS registers, and reading the port pin state by ELC event.<br>0x0: Setting prohibited<br>0x1: insert wait cycle 1<br>0x2: insert wait cycle 2<br>0x3: insert wait cycle 3<br>0x4: insert wait cycle 4<br>0x5: insert wait cycle 5<br>0x6: insert wait cycle 6<br>0x7: insert wait cycle 7<br>0x8: insert wait cycle 8<br>0x9: insert wait cycle 9<br>0xA: insert wait cycle 10<br>0xB: insert wait cycle 11<br>0xC: insert wait cycle 12<br>0xD: insert wait cycle 13<br>0xE: insert wait cycle 14<br>0xF: insert wait cycle 15 | R/W |
| 7:4 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: This register is write-protected by PSAR register.

## 18.2.9 PmSAR : Port Security Attribution Register (m = 0 to 8)

Base address: PFS = 0x4001_F800

Offset address: 0x510 + 0x002 × m

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | PMNSA[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | PMNSA[15:0] | Pmn Security Attribution<br>Target I/O port pin : Pmn<br>0: Secure<br>1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note: m = 0 to 8, n = 00 to 15

Port Security Attribution Register is a 16-bit register that setting the Security Attribution of the each port, the registers are accessed only in 16-bit units.

**PMNSA[15:0] bits (Pmn Security Attribution)**

The PmnSA bit specifies the Security Attribution of Pmn.

## 18.2.10 PSAR : PORT Security Attribution Register

Base address: PFS = 0x4001_F800

Offset address: 0x540

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PORTSA0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PORTSA0 | PRWCNTR Security Attribution<br>0: Secure<br>1: NonSecure | R/W |
| 15:1 | — | These bits are read as 0. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Port Security Attribution Register is a 16-bit register that setting the Security Attribution of the PRWCNTR, the registers are accessed only in 16-bit units.

## 18.3 Operation

### 18.3.1 General I/O Ports

All pins except P108 and P300 operate as general I/O ports after reset. General I/O ports are organized as 16 bits per port and can be accessed by port with the Port Control Registers (PCNTRn, where n = 1 to 4), or by individual pins with the Port mn Pin Function Select register. For details on these registers, see section 18.2. Register Descriptions.

Each port has the following bits:

- Port Security Attribution register (PmSAR)(m = 0 to 8), which indicates the security attribution.
- Port Direction bit (PDRn), which selects input or output direction
- Port Output Data bit (PODRn), which holds data for output
- Port Input Data bit (PIDRn), which indicates the pin states
- Event Input Data bit (EIDRn), which indicates the pin state when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs
- Port Output Set bit (POSRn), which indicates the output value when a software write occurs
- Port Output Reset bit (PORRn), which indicates the output value when a software write occurs
- Event Output Set bit (EOSRn), which indicates the output value when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs
- Event Output Reset bit (EORRn), which indicates the output value when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.

### 18.3.2 Port Function Select

The following port functions are available for configuring each pin:

- Security function: Security attribution for each pins
- I/O configuration: CMOS output or NMOS open-drain output, and pull-up control
- General I/O port: Port direction, output data setting, and read input data

- Alternate function: Configured function mapping to the pin.

Each pin is associated with a Port mn Pin Function Select register (PmnPFS), which includes the associated PODR, PIDR, and PDR bits. In addition, the PmnPFS register includes the following:

- PCR: Pull-up resistor control bit that turns the input pull-up MOS on or off
- NCODR: N-channel open-drain control bit that selects the output type for each pin
- EOFR[1:0]: For selecting the edge of the event that input from the port group
- ISEL: IRQ input enable bit to specify an IRQ input pin
- ASEL: Analog input enable bit to specify an analog pin
- PMR: Port mode bit to specify the pin function of each port
- PSEL[4:0]: Port function select bits to select the associated peripheral function.

These configurations can be made by a single-register access to the Port mn Pin Function Select register. For details, see section 18.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 8, n = 00 to 15).

### 18.3.3 Port Group Function for ELC

In the MCU, Port 1 to Port 4 are assigned for the ELC port group function.

#### 18.3.3.1 Behavior When ELC_PORTn (n = 1, 2, 3 or 4) is Input from ELC

The MCU supports the two functions described in this section when an ELC_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC.

##### (1) Input to EIDR

For the GPI function (PDR = 0 and PMR = 0 in the PmnPFS register), when an ELC_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC, the input enable of the I/O cell is asserted, and data from the external pins is read into the EIDR bit. See Figure 18.2

For the GPO function (PDR = 1) or the peripheral mode (PMR = 1), 0 is input into the EIDR bit from the external pins.

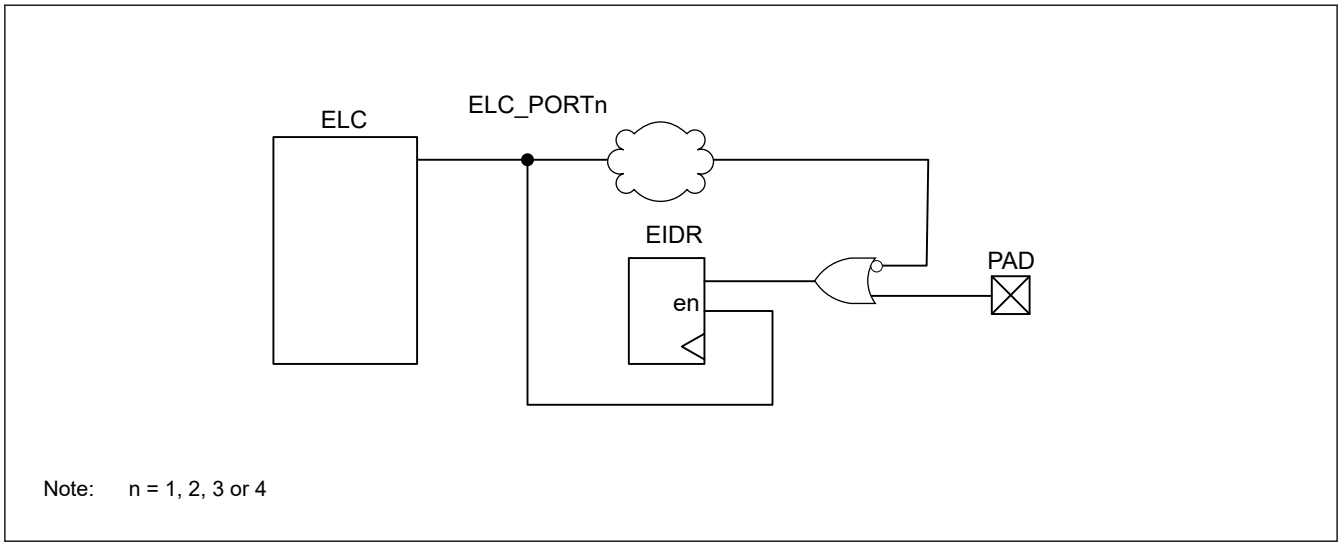

**Figure 18.2 Event ports input data**

##### (2) Output from PODR by EOSR and EORR

When an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the data is output from the PODR to the external pin based on the settings in the EOSR and EORR registers.

- If EOSR is set to 1, when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 1 to the external pin. Otherwise, when EOSR = 0, the PODR value is retained.

- If EORR is set to 1, when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 0 to the external pin. Otherwise, when EORR = 0, the PODR value is retained.

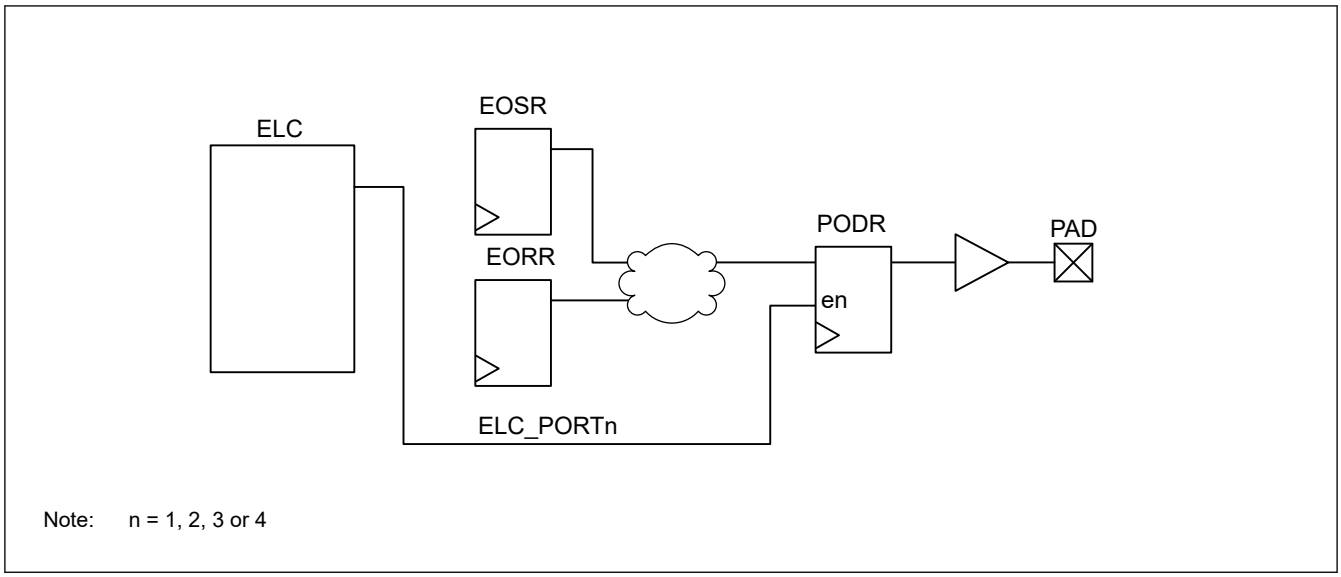

**Figure 18.3 Event ports output data**

### 18.3.3.2 Behavior When an Event Pulse is Output to ELC

To output the event pulse from the external pins to the ELC, set the EOFR[1:0] bits in the PmnPFS register. For details, see section 18.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 8, n = 00 to 15). When the EOFR[1:0] bits are set, the input enable of the I/O cell is asserted.

Data from the external pin is the input. For example, for Port 1, when the data is input from P100 to P115, the data of those 16 pins is organized by OR logic. This data is formed into a one-shot pulse that goes to the ELC. The operation of Port n (n = 2 to 4) is also the same as Port 1. See Figure 18.4.

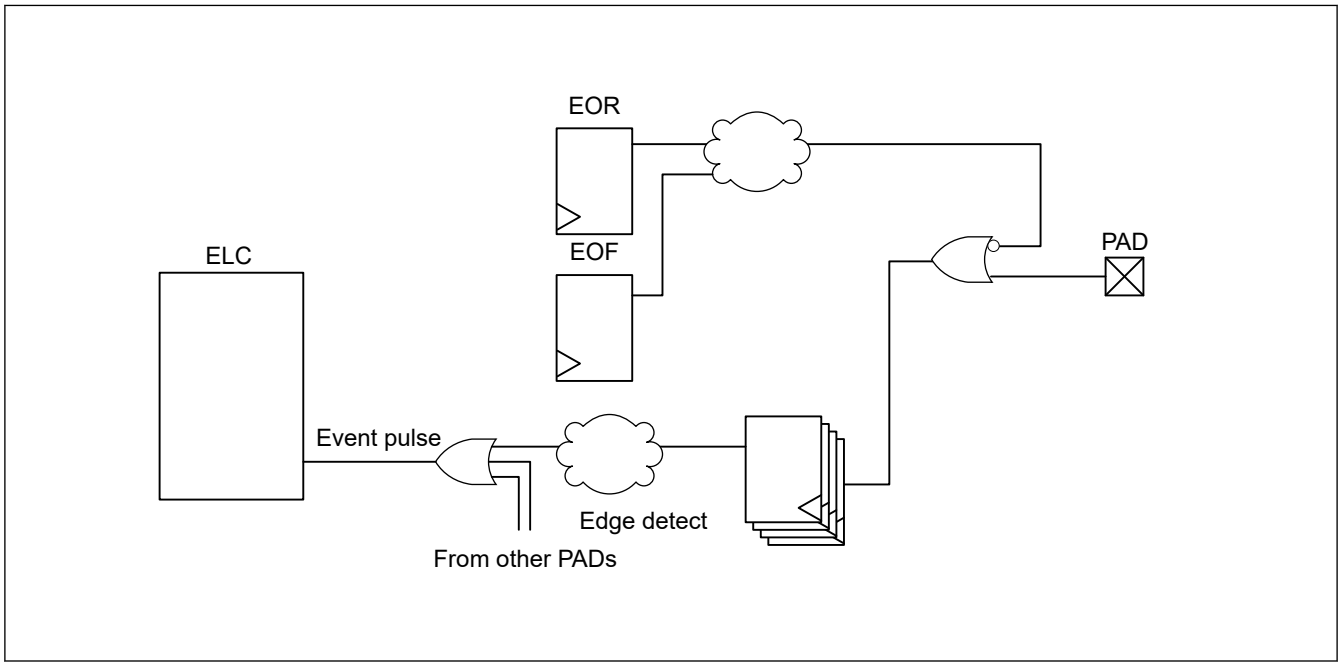

**Figure 18.4 Generation of event pulse**

## 18.3.4 Wait Function for Port Read

Wait cycles for reading the port input data can be set in the PRWCNTR.WAIT[3:0] bits as follows:

- Read port input data (PIDR) by reading the PRCNT2 or PFS register.
- Latch port pin state to Event Input Data Register (EIDR) when an ELC_PORT1 to 4 signal occurs.

The number of access cycles is the value in PRWCNTR.WAIT[3:0] plus 1. For example, if PRWCNTR.WAIT[3:0] is set as 0010b, then the wait is 2 cycles, and access is 3 clock cycles.

Table 18.3 shows the relationship of voltage, frequency, and wait cycles.

**Table 18.3 Relationship between voltage, frequency, and wait cycles**

| VCC = AVCC0 | Access cycles*1 | Wait cycles*2 |
|---|---|---|
| More than 2.7 V | 4 to 16 | 3 to 15 |
| 2.4 to 2.7 V | 5 to 16 | 4 to 15 |
| 1.8 to 2.4 V | 8 to 16 | 7 to 15 |
| 1.6 to 1.8 V | 2 to 16 | 1 to 15 |

Note 1. Bus latency is not included
Note 2. Number of wait cycles to set in Set Wait Control Register (PRWCNTR).

## 18.4 Handling of Unused Pins

Table 18.4 shows how to handle unused pins.

**Table 18.4 Handling of unused pins**

| Pin name | Description |
|---|---|
| P201/MD | Use as a mode selection pin |
| RES | Connect to VCC through a resistor (pulling up) |
| P200/NMI | Connect to VCC through a resistor (pulling up) |
| P212/EXTAL | When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P212). When this pin is not used as port P212, configure it in the same way as ports 1 to 8. |
| P213/XTAL | When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P213). When the external clock is input to the EXTAL pin, the XTAL pin functions as P213. When this pin is not used as port P213, configure it in the same way as ports 1 to 8. |
| P215/XCIN | When the sub-clock oscillator is not used, set the SOSCCR.SOSTP bit to 1 (general port P215). When this pin is not used as port P215, configure it in the same way as ports 1 to 8. |
| P214/XCOUT | When the sub-clock oscillator is not used, set the SOSCCR.SOSTP bit to 1 (general port P214). When this pin is not used as port P214, configure it in the same way as ports 1 to 8. |
| P0xx | • If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to AVCC0 (pulled up) through a resistor or to AVSS0 (pulled down) through a resistor.*1<br>• If the direction is set to output (PCNTR1.PDRn = 1), keep pin open.*1 |
| P1x to P8x | • If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC (pulled up) through a resistor or to VSS (pulled down) through a resistor.*1*2<br>• If the direction is set to output (PCNTR1.PDRn = 1), keep pin open.*1 |
| VREFH0 | Connect to AVCC0 |
| VREFL0 | Connect to AVSS0 |

Note 1. Clear the PmnPFS.PMR, PmnPFS.ISEL, PmnPFS.PCR, and PmnPFS.ASEL bits to 0.
Note 2. P108, P201, and P300 should be enabled for input pull-up from the initial value (PmnPFS.PCR = 1).

## 18.5 Usage Notes

### 18.5.1 Procedure for Specifying the Pin Functions

To specify the I/O pin functions:

1. Clear the B0WI bit in the PWPR register. This enables writing to the PFSWE bit in the PWPR register.*1
2. Set 1 to the PFSWE bit in the PWPR register. This enables writing to the PmnPFS register.*1
3. Clear the Port Mode Control bit in the PMR to 0 for the target pin to select the general I/O port.

4. Specify the I/O function for the pin through the PSEL[4:0] bits settings in the PmnPFS register.
5. Set the PMR bit to 1 as required to switch to the selected I/O function for the pin.
6. Clear the PFSWE bit in the PWPR register. This disables writing to the PmnPFS register.*1
7. Set 1 to the B0WI bit in the PWPR register. This disables writing to the PFSWE bit in the PWPR register.*1

Note 1. When the security attribution of Pmn is set to 0, set the PWPRS register to write to the PmnPFS register.

### 18.5.2 Procedure for Using Port Group Input

To use the port group input (port n (n = 1 to 4)):

1. Set the ELSRx.ELS[8:0] bits to all 0 to ignore unexpected pulses. For more information, see section 17, Event Link Controller (ELC).
2. Set the EOFR[1:0] bits of the PmnPFS register to specify the rising, falling, or both edge detections.
3. Execute a dummy read or wait for a short time, for example 100 ns. Ignoring of unexpected pulses depends on the initial value of the external pin.
4. Set the ELSRx.ELS[8:0] bits to enable the event signals.

### 18.5.3 Port Output Data Register (PODR) Summary

This register outputs data as follows:

1. Outputs 0 if PCNTR4.EORR is set to 1 when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.
2. Outputs 1 if PCNTR4.EOSR is set to 1 when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.
3. Outputs 0 if PCNTR3.PORR is set to 1.
4. Outputs 1 if PCNTR3.POSR is set to 1.
5. Outputs 0 or 1 because PCNTR1.PODRn is set.
6. Outputs 0 or 1 because PmnPFS.PODRn is set.

Numbers in this list correspond to the priority for writing to the PODRn. For example, if 1. and 3. from the list occur at the same time, the higher priority event 1. is executed.

### 18.5.4 Notes on Using Analog Functions

To use an analog function, set the Port Mode Control bit (PMR) and the Port Direction bit (PDRn) to 0 so that the pin acts as a general input port. Next, set the Analog Input Enable bit (ASEL) in the Port mn Pin Function Select Register (PmnPFS.ASEL) to 1.

## 18.6 Peripheral Select Settings for Each Product

This section describes the pin function select configuration using the PmnPFS register. Some pin names have added _A, _B, _C, or _D suffixes. When assigning IIC, SPI and SSIE functionality, select the functional pins having the same suffix. The other pins can be selected regardless of the suffix. Assigning the same function to two or more pins simultaneously is prohibited.

1. In Pmn pin function select register(PmnPFS), the PSEL bits have to be set when the PMR bit of the target pin is 0. If the PSEL bits are set when the PMR bit is 1, the unexpected edges may be input at the input function or the unexpected pulses may be output to the external pin at the output function.
2. Only the allowed values (functions) should be specified in the PSEL bits of PmnPFS register. If a value which is not allowed for the register is specified, the correct operation is not guaranteed.
3. The single function should not be assigned to the multiple pins by PmnPFS register. When the GPT1, GPT5, SCI3, IIC0, and SPI0 are configured as secure and these pin function is being assigned to the pin which security attribution is set as secure by the PmSAR register, the write access to the PSEL bits for setting same function as secure pin in other pins is ignored when the security attribution of that pin is non-secure. For example, if the PSARE.PSARE30 bit is 0 (GPT1 is secure) and the P109PFS.PSEL bits is 00011b (pin function is GTIOC1A) and the P1SAR.109SA bit is 0 (P109 is secure), the write 00011b to the P405PFS.PSEL bits is ignored when the P4SAR.P405SA bit is 1 (P405 is non-secure).

4. The PORT0 and 5 have the analog functions such as A/D converter. When these pins are used as an analog function, for avoiding the loss of resolution, the PMR bit should be set to 0 and PDR bit should be set to 0. After that, ASEL bit should be set to 1

**Table 18.5 Register settings for input/output pin function (PORT0)**

| PSEL[4:0] Settings | Function | Pin | | | | | | |
|---|---|---|---|---|---|---|---|---|

# 19. Port Output Enable for GPT (POEG)

## 19.1 Overview

The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state in one of the following ways:

- Input level detection of the GTETRGn (n = A to D) pins
- Output-disable request from the GPT
- Oscillation stop detection of the clock generation circuit
- Register settings

The GTETRGn (n = A to D) pins can be used as GPT external trigger input pins.

Table 19.1 lists the POEG specifications, Figure 19.1 shows a block diagram, and Table 19.2 lists the input pins.

**Table 19.1 POEG specifications**

| Parameter | Specifications |
|---|---|
| Output-disable control through input level detection | • The GPT output pins can be disabled when a GTETRGn rising edge or high level is sampled after polarity and filter selection. |
| Output-disable request from the GPT | • When the GTIOCxA pin and the GTIOCxB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCxA and GTIOCxB pins are output-disabled. |
| Output-disable control through oscillation stop detection | • The GPT output pins can be disabled when oscillation of the clock generation circuit stops. |
| Output-disable control by software (registers) | • The GPT output pins can be disabled by modifying the register settings. |
| Interrupt | • Interrupts can be generated by detecting the input level of external trigger input pins (GTETRGn pins).<br>• Interrupts can be generated when all GPT output pins are driven to an active level simultaneously. |
| External trigger output to the GPT | • The GTETRGn signals can be output to the GPT after polarity and filter selection. (count start, count stop, count clear, up-count, down-count, or input capture function). |
| Noise filtering | • For input from the GTETRGn pins, PCLKB/1, PCLKB/8, PCLKB/32, or PCLKB/128 can be selected as the noise filtering clock. (Filtering is performed by sampling the input signals three times using the selected clock.)<br>• Positive or negative polarity can be selected for any of the GTETRGn input pins.<br>• Signal state after polarity and filter selection can be monitored. |
| TrustZone Filter | • Security attribution can be set for each group. |

Note: n = A to D, x = 0 to 5

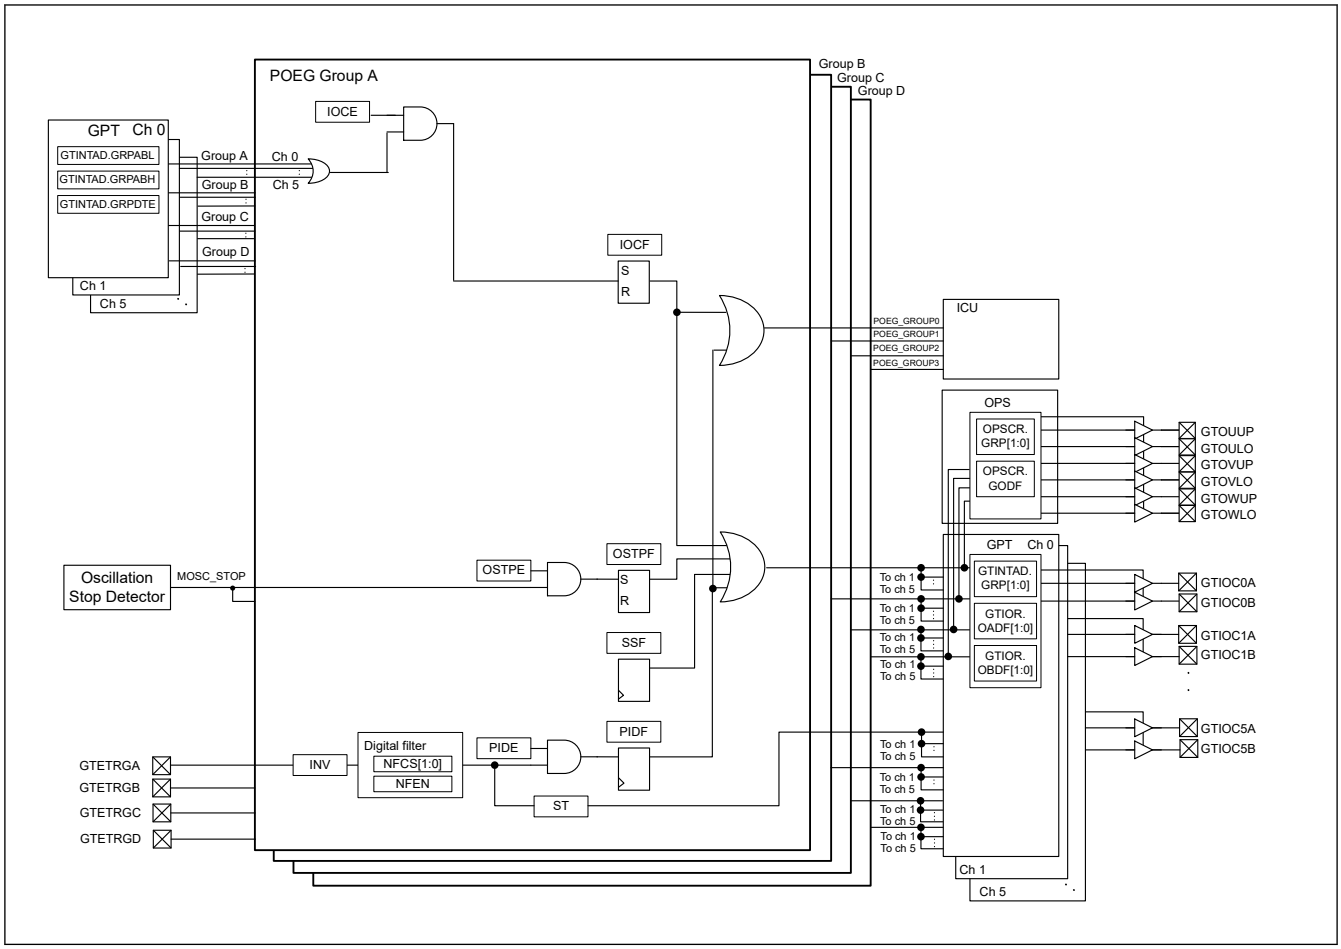

**Figure 19.1 POEG block diagram**

**Table 19.2 POEG input pins**

| Pin name | I/O | Description |
|---|---|---|
| GTETRGA | Input | GPT output pin output-disable request signal or GPT external trigger input pin A |
| GTETRGB | Input | GPT output pin output-disable request signal or GPT external trigger input pin B |
| GTETRGC | Input | GPT output pin output-disable request signal or GPT external trigger input pin C |
| GTETRGD | Input | GPT output pin output-disable request signal or GPT external trigger input pin D |

## 19.2 Register Descriptions

### 19.2.1 POEGGn : POEG Group n Setting Register (n = A to D)

Base address: POEG = 0x4008_A000

Offset address: 0x000 (POEGGA)
0x100 (POEGGB)
0x200 (POEGGC)
0x300 (POEGGD)

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | NFCS[1:0] | | NFEN | INV | — | — | — | — | — | — | — | — | — | — | — | ST |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PIDF | Port Input Detection Flag<br>0: No output-disable request from the GTETRGn pin occurred<br>1: Output-disable request from the GTETRGn pin occurred | R/W*1 |
| 1 | IOCF | Detection Flag for GPT Output-Disable Request<br>0: No output-disable request from GPT occurred<br>1: Output-disable request from GPT occurred | R/W*1 |
| 2 | OSTPF | Oscillation Stop Detection Flag<br>0: No output-disable request from oscillation stop detection occurred<br>1: Output-disable request from oscillation stop detection occurred | R/W*1 |
| 3 | SSF | Software Stop Flag<br>0: No output-disable request from software occurred<br>1: Output-disable request from software occurred | R/W |
| 4 | PIDE | Port Input Detection Enable<br>0: Disable output-disable requests from the GTETRGn pins<br>1: Enable output-disable requests from the GTETRGn pins | R/W*2 |
| 5 | IOCE | Enable for GPT Output-Disable Request<br>0: Disable output-disable requests from GPT<br>1: Enable output-disable requests from GPT | R/W*2 |
| 6 | OSTPE | Oscillation Stop Detection Enable<br>0: Disable output-disable requests from oscillation stop detection<br>1: Enable output-disable requests from oscillation stop detection | R/W*2 |
| 15:7 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | ST | GTETRGn Input Status Flag<br>0: GTETRGn input after filtering is 0<br>1: GTETRGn input after filtering is 1 | R |
| 27:17 | — | These bits are read as 0. The write value should be 0. | R/W |
| 28 | INV | GTETRGn Input Reverse<br>0: Input GTETRGn as-is<br>1: Input GTETRGn in reverse | R/W |
| 29 | NFEN | Noise Filter Enable<br>0: Disable noise filtering<br>1: Enable noise filtering | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:30 | NFCS[1:0] | Noise Filter Clock Select<br>0 0: Sample GTETRGn pin input level three times every PCLKB<br>0 1: Sample GTETRGn pin input level three times every PCLKB/8<br>1 0: Sample GTETRGn pin input level three times every PCLKB/32<br>1 1: Sample GTETRGn pin input level three times every PCLKB/128 | R/W |

Note 1. Only 0 can be written to clear the flag.
Note 2. Can be modified only once after a reset.

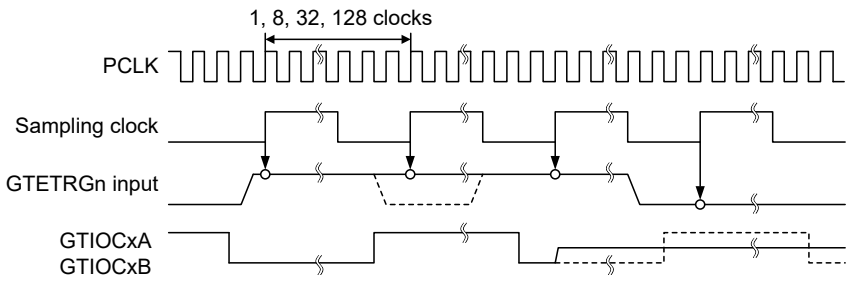
The POEGGn (n = A to D) registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT.

In the descriptions, POEGGn represents the POEGGn (n = A to D) registers.

## 19.3 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOCxA, GTIOCxB, and the 3-phase PWM output for BLDC motor control pins can be set to output-disable:

- Input level or edge detection of the GTETRGn pins
  When POEGGn.PIDE is 1, the POEGGn.PIDF flag is set to 1.
- Output-disable request from the GPT
  When POEGGn.IOCE is 1, the POEGGn.IOCF flag is set to 1 if the disable request is enabled by GTINTAD. The GTINTAD.GRPABH and GTINTAD.GRPABL settings apply to the group selected by the GPT register GTINTAD.GRP[1:0] or OPSCR.GRP[1:0].
- Oscillation stop detection for the clock generation circuit
  While POEGGn.OSTPE is 1, the halt status of the main clock oscillator is detected and the POEGGn. OSTPF flag is set to 1.
- SSF bit setting
  When POEGGn.SSF is set to 1, the GPT and PWM output are disabled.



The output-disable state is controlled in the GPT module. The output-disable of the GTIOCxA and GTIOCxB pins is set in the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits in GPTx. The output-disable of the 3-phase PWM output for BLDC motor control pins is set in the OPSCR.GRP[1:0] bits and OPSCR.GODF bit in GPT_OPS.

### 19.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGGn.PIDE, POEGGn.NFCS[1:0], POEGGn.NFEN, and POEGGn.INV occur on the GTETRGn pins, the GPT output pins are output-disabled.

#### 19.3.1.1 Digital Filter

Figure 19.2 shows high-level detection by the digital filter. When a high level associated with the POEGGn.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not output, changes of the levels on the GTETRGn pins are ignored.

| | | | | |
|---|---|---|---|---|
| When high level is sampled at all points | [1] | [2] | [3] | Flag set (GTETRGn received) |
| When low level is sampled at least once | [1] | [0] | [1] | Flag not set |

Note: PCLK = PCLKB
Note: Each channel output can be set in the GPT setting. Low level sampling can be set in the POEGGn.INV setting.

**Figure 19.2 Example of digital filter operation**

### 19.3.2 Output-Disable Requests from the GPT

For details on the operation, see the description for GTIOC Pin Output Negate Control in section 20, General PWM Timer (GPT).

### 19.3.3 Output-Disable Control Using Detection of Stopped Oscillation

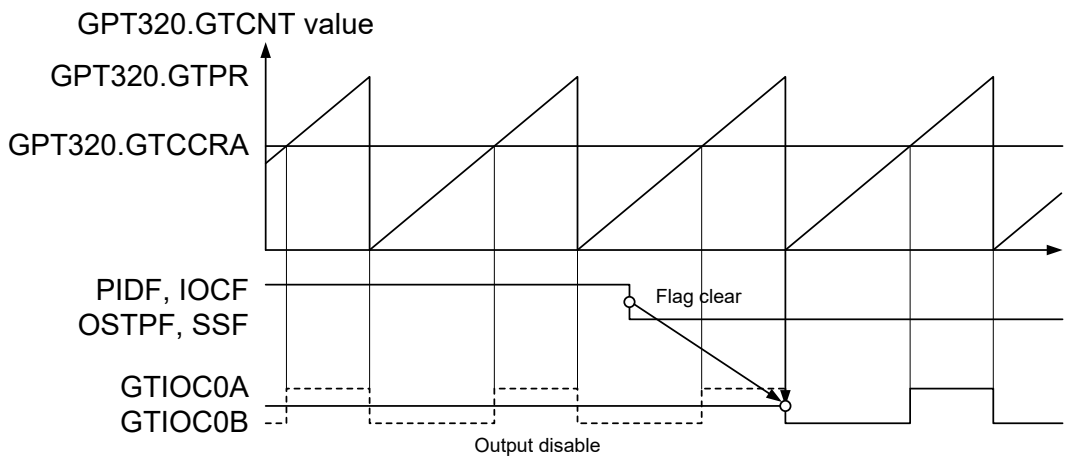
When the oscillation stop detection function in the clock generation circuit detects stopped oscillation while POEGGn.OSTPE is 1, the GPT output pins are output-disabled for each group.

### 19.3.4 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing 1 to the Software Stop flag, POEGGn.SSF.

### 19.3.5 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all the following flags:



- POEGGn.PIDF
- POEGGn.IOCF
- POEGGn.OSTPF
- POEGGn.SSF

Writing 0 to the POEGGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRGn are not disabled and the POEGGn.ST bit is not set to 0.

Writing 0 to the POEGGn.IOCF flag is valid (the flag is cleared) only if all the GTST.OABHF and GTST.OABLF flags in the GPT are set to 0.

Writing 0 to the POEGGn.OSTPF flag is ignored (the flag is not cleared) if the OSTDSR.OSTDF flag in the clock generation circuit is not set to 0. In addition, when the flag set and release occur at the same time, the flag set takes precedence.

Figure 19.3 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

Note: The base address of the registers are the same.

**Figure 19.3 Output-disable release timing for GPT pin outputs**

## 19.4 Interrupt Sources

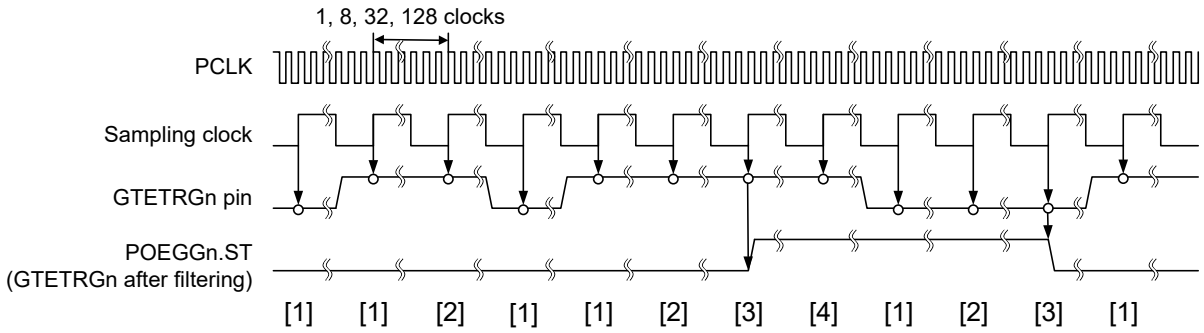
The POEG generates an interrupt request for the following factors:

- Output-disable control by the input level detection
- Output-disable request from the GPT

Table 19.3 lists the conditions for interrupt requests.

**Table 19.3 Interrupt sources and conditions**

| Interrupt source | Symbol | Associated flag | Trigger conditions |
|---|---|---|---|
| POEG group A interrupt | POEG_GROUPA | POEGGA.IOCF | An output-disable request from a GPT disable request occurred |
| | | POEGGA.PIDF | An output-disable request from the GTETRGA pin occurred |
| POEG group B interrupt | POEG_GROUPB | POEGGB.IOCF | An output-disable request from a GPT disable request occurred |
| | | POEGGB.PIDF | An output-disable request from the GTETRGB pin occurred |
| POEG group C interrupt | POEG_GROUPC | POEGGC.IOCF | An output-disable request from a GPT disable request occurred |
| | | POEGGC.PIDF | An output-disable request from the GTETRGC pin occurred |
| POEG group D interrupt | POEG_GROUPD | POEGGD.IOCF | An output-disable request from a GPT disable request occurred |
| | | POEGGD.PIDF | An output-disable request from the GTETRGD pin occurred |



## 19.5 External Trigger Output to the GPT

The POEG outputs signals generated by filtering and level detection of GTETRGn pins input signals as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture

For the POEGGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in section 19.3.1. Pin Input Level Detection Operation. The state after filtering can be monitored in POEGGn.ST.

Figure 19.4 shows the output timing of an external trigger to the GPT.

Note: PCLK = PCLKB
Note: Each channel output can be set in the GPT settings. Polarity can be reversed in POEGGn.INV.

**Figure 19.4 Output timing of external trigger to the GPT**

## 19.6 Usage Notes

### 19.6.1 Transition to Software Standby Mode

When using the POEG, do not invoke Software Standby mode. In this mode, the POEG stops and therefore output disable of the pins cannot be controlled.

### 19.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PmnPFS.PMR and PmnPFS.PSEL settings. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

# 20. General PWM Timer (GPT)

## 20.1 Overview

The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 2 channels and a 16-bit timer with GPT16 × 4 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer.

Table 20.1 lists the GPT specifications, Table 20.2 shows the GPT functions, and Figure 20.1 shows a block diagram.

**Table 20.1 GPT specifications**

| Item | Description |
|---|---|
| Functions | • 32 bits × 2 channels (GPT32n (n = 0, 1))<br>• 16 bits × 4 channels (GPT16m (m = 2 to 5))<br>• Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter<br>• Clock sources independently selectable for each channel<br>• Two input/output pins per channel<br>• Two output compare/input capture registers per channel<br>• For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use<br>• In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms<br>• Registers for setting up frame cycles in each channel with capability for generating interrupts at overflow or underflow<br>• Generation of dead times in PWM operation<br>• Synchronous starting, stopping and clearing counters for arbitrary channels<br>• Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 8 ELC events<br>• Count start, count stop, count clear, up-count, down-count, or input capture operation in response to the status of two input pins<br>• Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 4 external triggers<br>• Output pin disable function by detected short-circuits between output pins<br>• PWM waveform for controlling brushless DC motors can be generated<br>• Compare match A to F event, overflow/underflow event, and input UVW edge event can be output to the ELC<br>• Enables the noise filter for input capture and input UVW<br>• Period count function<br>• Logical operation between the channel output<br>• Bus clock: PCLKA, Core clock: PCLKD<br>• Frequency ratio: PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64) |

| 15:8 | PRKEY[7:0] | GTWP Key Code<br>When 0xA5 is written to these bits, writing to the WP, STRWP, STPWP, CLRWP, and CMNWP bits are permitted. These bits are read as 0. | W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:16 | — | These bits are read as 0. The write value should be 0. | R/W |

GTWP enables or disables writing to registers to prevent accidental modification. Protection by the GTWP register is only for the writes by the CPU. GTWP does not protect registers from updates that occur in association with CPU writes.

#### WP bit (Register Write Disable)

The following is a list of write enabled or disabled registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTDTCR, GTDVU, GTICLF, GTPC.

#### STRWP bit (GTSTR.CSTRT Bit Write Disable)

The STRWP bit enables or disables starting the updating of counter values by writing to the CSTRTn bit (n = 0 to 5) corresponding to a channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR register is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1 (disabling writing), the CSTRT bit for the given channel is not updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter starts to run. When the setting of the GPT320.GTWP.STRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter does not run.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1.

#### STPWP bit (GTSTP.CSTOP Bit Write Disable)

The STPWP bit enables or disables starting the updating of counter values by writing to the CSTOPn bit (n = 0 to 5) corresponding to a channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and the writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1 (disabling writing), the CSTOP bit for the given channel is not updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STPWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is stopped. When the setting of the GPT320.GTWP.STPWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1.

#### CLRWP bit (GTCLR.CCLR Bit Write Disable)

CLRWP bit enables or disables starting the updating of counter values by writing to the CCLRn bit (n = 0 to 5) corresponding to a channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and the writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1 (disabling writing), the CCLR bit for the given channel is not updated, but the CCLR bits corresponding to channel for which the setting

of the CLRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.CLRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is cleared. When the setting of the GPT320.GTWP.CLRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not cleared.

If you want to protect all bits in the GTCLR register from being updated, set the CLRWP bits of all channels to 1.

#### CMNWP bit (Common Register Write Disabled)

CMNWP bit enables or disables starting the updating of counter values by writing to the SECSELn bit (n = 0 to 5) corresponding to a channel number in the GTSECSR register or to the GTSECR register.

The bit position of each SECSEL bit in the GTSECSR registers is allocated to the channel with the corresponding number, and the writing to the GTSECSR register for any channel results in writing to the registers of all channels. Writing to the GTSECR register of any channel leads to writing to the registers of all channels. The CMNWP bit for each channel does not control writing but only controls updating of the SECSEL bit and the GTSECR register value for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the SECSEL bit and the GTSECR register value of a channel for which the setting of the CMNWP bit is 1 (disabling writing), the SECSEL bit and the GTSECR register value for the given channel is not updated, but the SECSEL bit and the GTSECR register value corresponding to channel for which the setting of the CMNWP bit is 0 (enabling writing) are updated.

For example, when the setting of the GPT320.GTWP.CMNWP bit is 0 (enabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit causes the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register updates the value of the GPT320.GTSECR register. When the setting of the GPT320.GTWP.CMNWP bit is 1 (disabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit does not cause the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register does not update the value of the GPT320.GTSECR register.

If you want to protect all bits in the GTSECSR and GTSECR registers from being updated, set the CMNWP bits of all channels to 1.

#### PRKEY[7:0] bit (GTWP Key Code)

This bit controls whether the WP, STRWP, STPWP, CLRWP, and CMNWP bits can be overwritten.

### 20.2.2 GTSTR : General PWM Timer Software Start Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0 to 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x04

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | CSTRT5 | CSTRT4 | CSTRT3 | CSTRT2 | CSTRT1 | CSTRT0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5:0 | CSTRT0 to CSTRT5[*1] | Channel n GTCNT Count Start (n : the same as bit position value)<br>0: GTCNT counter not start<br>1: GTCNT counter start | R/W |
| 31:6 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. The bits that can be used vary depending on the product. The n in CSTRTn is the same as the GPT channel number. For this product, n is 0 to 5.

The GTSTR starts the GTCNT counter operation for each channel n, where n = 0 to 5.

The GTSTR bit number represents the channel number. The GTSTR register of each channel is shared by all the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTR register.

The bit corresponding to channel which security attribution is configured as secure can be read by non-secure access but cannot be written by non-secure access. For example, if GPT channel 0 is configured as secure and other GPTs are configured as non-secure, the CSTRT0 bit cannot be written by non-secure access to GPT321.GTSTR register, and the GTCNT counter operation status of GPT channel 0 is not changed. When the GTSTR register in GPT channel 1 is read by non-secure access in the same security configuration as the previous example, the GTCNT counter operation status of GPT channel 0 (CSTRT0 bit) can be read.

For the association between module names and channel numbers, see Figure 20.2.

### CSTRTn bits (Channel n GTCNT Count Start (n = 0 to 5))

The CSTRTn bits start channel n of the GTCNT counter operation. Writing to the GTSTR.CSTRTn bit (n = 0 to 5) has no effect unless the GTSSR.CSTRT bit is set to 1.

The read data shows the counter status of each channel (GTCR.CST bit). A value of 0 means the counter is stopped and 1 means the counter is running.

## 20.2.3 GTSTP : General PWM Timer Software Stop Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x08

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | CSTOP5 | CSTOP4 | CSTOP3 | CSTOP2 | CSTOP1 | CSTOP0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5:0 | CSTOP0 to CSTOP5 | Channel n GTCNT Count Stop (n : the same as bit position value)<br>0: GTCNT counter not stop<br>1: GTCNT counter stop | R/W |
| 31:6 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTSTP stops the GTCNT counter operation for each channel n, where n = 0 to 5.

The GTSTP bit number represents the channel number. The GTSTP register of each channel is shared by all the channels. The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTP register.

The bit corresponding to channel which security attribution is configured as secure can be read by non-secure access but cannot be written by non-secure access. For example, if GPT channel 0 is configured as secure and other GPTs are configured as non-secure, the CSTOP0 bit cannot be written by non-secure access to GTSTP register in GPT channel 1, and the GTCNT counter operation status of GPT channel 0 is not changed. When the GTSTP register in GPT channel 1 is read by non-secure access in the same security configuration as the previous example, the GTCNT counter operation status of GPT channel 0 (CSTOP0 bit) can be read.

For the association between module names and channel numbers, see Figure 20.2.

### CSTOPn bits (Channel n GTCNT Count Stop (n = 0 to 5))

The CSTOPn bits stop channel n of the GTCNT counter operation. Writing to the GTSTP.CSTOPn bit (n = 0 to 5) has no effect unless the GTPSR.CSTOP bit is set to 1. The read data shows the counter status of each channel (invert of GTCR.CST bit). A value of 0 means the counter is running and 1 means the counter is stopped.

## 20.2.4 GTCLR : General PWM Timer Software Clear Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x0C

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | CCLR5 | CCLR4 | CCLR3 | CCLR2 | CCLR1 | CCLR0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5:0 | CCLR0 to CCLR5 | Channel n GTCNT Count Clear (n : the same as bit position value)<br>0: GTCNT counter is not cleared<br>1: GTCNT counter is cleared | W |
| 31:6 | — | The write value should be 0. | W |

The GTCLR is a write-only register that clears the GTCNT counter operation for each channel n, where n = 0 to 5.

The GTCLR bit number represents the channel number. The GTCLR register of each channel is shared by all the channels. The GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter.

The bit corresponding to channel which security attribution is configured as secure can not be written by non-secure access. For example, if GPT channel 0 is configured as secure and other GPTs are configured as non-secure, the CCLR0 bit cannot be written by non-secure access to GTCLR register in GPT channel 1, and the GTCNT counter of GPT channel 0 is not cleared.

For the association between module names and channel numbers, see Figure 20.2.

### CCLRn bits (Channel n GTCNT Count Clear (n = 0 to 5))

When the counting direction flag is set for decrement (GTST.TUCF flag = 0) with saw-wave mode selected in the GTCR.MD[2:0] bits, the value of the GTCNT counter becomes that of the corresponding GTPR register in response to writing 1 to the CCLRn bit. The value of the counter becomes 0x0000 0000 with other settings. These bits are read as 0.

## 20.2.5 GTSSR : General PWM Timer Start Source Select Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x10

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 | CSTRT | Software Source Counter Start Enable<br>0: Counter start disabled by the GTSTR register<br>1: Counter start enabled by the GTSTR register | R/W |

The GTSSR sets the source to start the GTCNT counter.

Input from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

### SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGA pin input.

### SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGA pin input.

### SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGB pin input.

### SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGB pin input.

**SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)**

The SSGTRGCR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGC pin input.

**SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)**

The SSGTRGCF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGC pin input.

**SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)**

The SSGTRGDR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGD pin input.

**SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)**

The SSGTRGDF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGD pin input.

**SSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Start Enable)**

The SSCARBL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**SSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Start Enable)**

The SSCARBH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**SSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Start Enable)**

The SSCAFBL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**SSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Start Enable)**

The SSCAFBH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**SSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Start Enable)**

The SSCBRAL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**SSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Start Enable)**

The SSCBRAH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**SSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Start Enable)**

The SSCBFAL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**SSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Start Enable)**

The SSCBFAH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**SSELCm bit (ELC_GPTm Event Source Counter Start Enable) (m = A to H)**

The SSELCm bit enables or disables the GTCNT counter start at the ELC_GPTm event input.

**CSTRT bit (Software Source Counter Start Enable)**

The CSTRT bit enables or disables the GTCNT counter start by GTSTR register.

## 20.2.6 GTPSR : General PWM Timer Stop Source Select Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)

| 31 | CSTOP | Software Source Counter Stop Enable<br>0: Counter stop disabled by the GTSTP register<br>1: Counter stop enabled by the GTSTP register | R/W |

The GTPSR sets the source to stop the GTCNT counter.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

**PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)**

The PSGTRGAR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGA pin input.

**PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)**

The PSGTRGAF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGA pin input.

**PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)**

PSGTRGBR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGB pin input.

**PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)**

The PSGTRGBF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGB pin input.

**PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)**

PSGTRGCR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGC pin input.

**PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)**

The PSGTRGCF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGC pin input.

**PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)**

PSGTRGDR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGD pin input.

**PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)**

The PSGTRGDF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGD pin input.

**PSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Stop Enable)**

The PSCARBL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**PSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Stop Enable)**

The PSCARBH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**PSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Stop Enable)**

The PSCAFBL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**PSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Stop Enable)**

The PSCAFBH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**PSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Stop Enable)**

The PSCBRAL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**PSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Stop Enable)**

The PSCBRAH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**PSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Stop Enable)**

The PSCBFAL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**PSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Stop Enable)**

The PSCBFAH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

### PSELCm bit (ELCm Event Source Counter Stop Enable) (m = A to H)

The PSELCm bit enables or disables the GTCNT counter stop at the ELC_GPTm event input.

### CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables the GTCNT counter stop by the GTSTP register.

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31 | CCLR | Software Source Counter Clear Enable<br>0: Counter clear disabled by the GTCLR register<br>1: Counter clear enabled by the GTCLR register | R/W |

The GTCSR sets the source to clear the GTCNT counter.

Counter clearing can be executed whether the counter is running (GTCR.CST=1) or stopped (GTCR.CST=0).

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

#### CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGA pin input.

#### CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGA pin input.

#### CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGB pin input.

#### CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGB pin input.

#### CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGC pin input.

#### CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGC pin input.

#### CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGD pin input.

#### CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGD pin input.

#### CSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCARBL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

#### CSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCARBH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

#### CSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCAFBL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

#### CSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCAFBH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

#### CSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBRAL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

### CSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBRAH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

### CSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBFAL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

### CSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBFAH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

### CSELCm bit (ELCm Event Source Counter Clear Enable) (m = A to H)

The CSELCm bit enables or disables the GTCNT counter clear at the ELC_GPTm event input.

### CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables the GTCNT counter clear by the GTCLR register.

The GTUPSR sets the source to count up the GTCNT counter.

When at least one bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of increment in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

#### USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGA pin input.

#### USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGA pin input.

#### USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGB pin input.

#### USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGB pin input.

#### USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGC pin input.

#### USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGC pin input.

#### USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGD pin input.

#### USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGD pin input.

#### USCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCnA pin input, when GTIOCnB input is 0.

#### USCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Up Enable)

The USCARBH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

#### USCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCAFBL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

### USCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Up Enable)

The USCAFBH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

### USCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBRAL bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

### USCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBRAH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

### USCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBFAL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

### USCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBFAH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

### USELCm bit (ELC_GPTm Event Source Counter Count Up Enable) (m = A to H)

The USELCm bit enables or disables the GTCNT counter count up at the ELC_GPTm event input.

## 20.2.9 GTDNSR : General PWM Timer Down Count Source Select Register

The GTDNSR sets the source to count down the GTCNT counter.

When at least one bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of decrement in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

#### DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGA pin input.

#### DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGA pin input.

#### DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGB pin input.

#### DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGB pin input.

#### DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGC pin input.

#### DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGC pin input.

#### DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGD pin input.

#### DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGD pin input.

**DSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Down Enable)**

The DSCARBL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

**DSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Down Enable)**

The DSCARBH bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**DSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Down Enable)**

The DSCAFBL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**DSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Down Enable)**

The DSCAFBH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**DSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Down Enable)**

The DSCBRAL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**DSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Down Enable)**

The DSCBRAH bit enables or disables the GTCNT counter count down on the rising edge of GTIOCnB pin input, when GTIOCnA input is 1.

**DSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Down Enable)**

The DSCBFAL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**DSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Down Enable)**

The DSCBFAH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**DSELCm bit (ELC_GPTm Event Source Counter Count Down Enable) (m = A to H)**

The DSELCm bit enables or disables the GTCNT counter count down at the ELC_GPTm event input.

| 31:24 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTICASR sets the source of input capture for GTCCRA.

When at least one bit among bits in the GTICASR register is set to 1, input capture operation making the GTCCRA register as an input capture register is performed.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

**ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGAR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGA pin input.

**ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGAF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGA pin input.

**ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGBR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGB pin input.

**ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGBF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGB pin input.

**ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGCR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGC pin input.

**ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGCF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGC pin input.

**ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGDR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGD pin input.

**ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGDF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGD pin input.

**ASCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)**

The ASCARBL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**ASCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)**

The ASCARBH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**ASCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)**

The ASCAFBL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**ASCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)**

The ASCAFBH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when the GTIOCnB input is 1.

**ASCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)**

The ASCBRAL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

**ASCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)**

The ASCBRAH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

### ASCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBFAL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

### ASCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)

The ASCBFAH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

### ASELCm bit (ELC_GPTm Event Source Counter GTCCRA Input Capture Enable) (m = A to H)

The ASELCm bit enables or disables the input capture for GTCCRA at the ELC_GPTm event input.

| 31:24 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTICBSR sets the source of input capture for GTCCRB.

When at least one bit among bits in the GTICBSR register is set to 1, input capture operation making the GTCCRB register as an input capture register is performed.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

#### BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables the input capture for GTCCRB on the rising edge of the GTETRGA pin input.

#### BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGA pin input.

#### BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGB pin input.

#### BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGB pin input.

#### BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGC pin input.

#### BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGC pin input.

#### BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGD pin input.

#### BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGD pin input.

#### BSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)

The BSCARBL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

#### BSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)

The BSCARBH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**BSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)**

The BSCAFBL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**BSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)**

The BSCAFBH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**BSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)**

The BSCBRAL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**BSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)**

The BSCBRAH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**BSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)**

The BSCBFAL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**BSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)**

The BSCBFAH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**BSELCm bit (ELC_GPTm Event Source Counter GTCCRB Input Capture Enable) (m = A to H)**

The BSELCm bit enables or disables the input capture for GTCCRB at the ELC_GPTm event input.

| 31:27 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTCR controls GTCNT.

### CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- The GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input that are enabled by GTSSR for the starting counter source, occurs (n = 0 to 5)
- 1 is written by software directly.

[Clearing conditions]

- The GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input enabled by GTPSR as the counter stop source, occurs (n = 0 to 5)
- 0 is written by software directly.
- When the period count function is finished while the GTPC.ASTP bit is 1.

### MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode. Only the MD[2] bit is valid at input capture. Counting in saw-wave mode is performed by setting 0 to the MD[2] bit, and counting in triangle-wave mode is performed by setting 1 to the MD[2] bit. The MD bits must be set while the GTCNT operation is stopped. During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), setting of the MD bits is ignored, where counting in saw-wave or triangle-wave modes is not performed.

Instead, up-counting or down-counting by a source set by the GTUPSR and GTDNSR registers is performed.

### TPCS[3:0] bits (Timer Prescaler Select)

The TPCS[3:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[3:0] bits must be set while the GTCNT operation is stopped.

When the GTETRGA, GTETRGB, GTETRGC, or GTETRGD is selected, output for the POEG at rising becomes a clock source. Set the polarity of these signals with the POEG.

## 20.2.13 GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:28 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: n = 0 to 5

The GTUDDTYC sets the direction in which the GTCNT counts (up-counting or down-counting), and sets the duty of the GTIOCnA/GTIOCnB pin output.

The setting is invalid during the event count operation.

Count Direction:

- In saw-wave mode.
  When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
  When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting stops, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
  When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.
- In triangle-wave mode.
  When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.
  When the UDF bit is set to 1 while counting is stopped, the UD value is reflected in the count direction when counting starts.

### UD bit (Count Direction Setting)

The UD bit sets the count direction (up-counting or down-counting) for GTCNT.

### UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only 0 should be written to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

Output duty

- In saw-wave mode.
  When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR).
  When the OADTY/OBDTY value is changed during down-counting, the duty is reflected at an underflow (GTCNT = 0).
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops the output duty is not reflected at the starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0).
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.
- In triangle-wave mode.
  When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow.
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation. The output duty is reflected at an underflow.
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

In both saw-wave mode and triangle-wave mode, when the OADTYF/OBDTYF bit is set back to 0 and the OADTY[1:0]/OBDTY[1:0] bits are set after setting the OADTYF/OBDTYF bit to 1 and setting the OADTY[1:0]/OBDTY[1:0] bits for the duty of first cycle while count operation is stopped, these duty-cycle set during stopping count operation are reflected in the first cycle and the second cycle after starting count operation.

### OmDTY[1:0] bits (GTIOCnm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCnm pin.

### OmDTYF bit (Forcible GTIOCnm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation.

### OmDTYR bit (GTIOCnm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmDTYR bit selects the value that is the object of output retained or toggled at cycle end, when the control changes from 0% or 100% duty setting to compare match for the GTIOCnm pin and GTIOR.GTIOm[3:2] bits are set to 00b (output retained at cycle end) or the GTIOR.GTIOm[3:2] bits are set to 11b (output toggled at cycle end).

The GPT internally continues to perform compare match operation during duty-cycle 0% or 100% operation. When the OmDTYR bit is 1, the value after the period has elapsed due this compare match operation is target for the GTIOm[3:2] bits.

## 20.2.14 GTIOR : General PWM Timer I/O Control Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x34

Note: n = 0 to 5

The GTIOR sets the functions of the GTIOCnA and GTIOCnB pins. (n = 0 to 5)

### GTIOA[4:0] bits (GTIOCnA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCnA pin function. For details, see Table 20.4.

### OADFLT bit (GTIOCnA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCnA pin outputs high or low when counting stops.

### OAHLD bit (GTIOCnA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCnA pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OAHLD bit is set to 0:

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OAHLD bit is set to 1:

- The output is retained when counting starts or stops.

### OAE bit (GTIOCnA Pin Output Enable)

The OAE bit disables or enables the GTIOCnA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCnA pin does not output regardless of the OAE bit value.

#### OADF[1:0] bits (GTIOCnA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of the GTIOCnA pin in response to a request to disable output from the POEG.

#### NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCnA pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

#### NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCnA pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

#### GTIOB[4:0] bits (GTIOCnB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCnB pin function. For details, see Table 20.4.

#### OBDFLT bit (GTIOCnB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCnB pin outputs high or low when counting stops.

#### OBHLD bit (GTIOCnB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether the GTIOCnB pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OBHLD bit is set to 0:

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OBHLD bit is set to 1:

- The output is retained when counting starts or stops.

#### OBE bit (GTIOCnB Pin Output Enable)

The OBE bit disables or enables the GTIOCnB pin output.

When GTCCRB register is used as the input capture register (at least one bit in the GTICBSR register is set to 1), the GTIOCnB pin does not output regardless of the OBE bit value.

#### OBDF[1:0] bits (GTIOCnB Pin Disable Value Setting)

The OBDF[1:0] bits select the output value of the GTIOCnB pin in response to a request to disable output from the POEG.

#### NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCnB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

#### NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCnB pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

**Table 20.4 Settings of GTIOA[4:0] and GTIOB[4:0] bits**

| GTIOA/GTIOB[4:0] bits | | | | | Function | | |
|---|---|---|---|---|---|---|---|
| b4 | b3 | b2 | b1 | b0 | b4 | b3, b2*1 *2 *3 | b1, b0*2 |
| 0 | 0 | 0 | 0 | 0 | Initial output is low | Output retained at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 0 | 0 | 0 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 0 | 0 | 0 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 0 | 0 | 0 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |
| 0 | 0 | 1 | 0 | 0 | | Low output at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 0 | 0 | 1 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 0 | 0 | 1 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 0 | 0 | 1 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |
| 0 | 1 | 0 | 0 | 0 | | High output at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 0 | 1 | 0 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 0 | 1 | 0 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 0 | 1 | 0 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |
| 0 | 1 | 1 | 0 | 0 | | Output toggled at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 0 | 1 | 1 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 0 | 1 | 1 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 0 | 1 | 1 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |
| 1 | 0 | 0 | 0 | 0 | Initial output is high | Output retained at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 1 | 0 | 0 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 1 | 0 | 0 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 1 | 0 | 0 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |
| 1 | 0 | 1 | 0 | 0 | | Low output at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 1 | 0 | 1 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 1 | 0 | 1 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 1 | 0 | 1 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |
| 1 | 1 | 0 | 0 | 0 | | High output at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 1 | 1 | 0 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 1 | 1 | 0 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 1 | 1 | 0 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |
| 1 | 1 | 1 | 0 | 0 | | Output toggled at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 1 | 1 | 1 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 1 | 1 | 1 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 1 | 1 | 1 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |

Note 1. The cycle end means an overflow (GTCNT changes from GTPR to 0 in up-counting), an underflow (GTCNT changes from 0 to GTPR in down-counting), or counter clearing for saw-wave mode, and means a trough (GTCNT changes from 0 to 1) for triangle-wave mode.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least one bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

## 20.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x38

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 | — | This bit is read as 0. The write value should be 0. | R/W |

The GTINTAD enables or disables interrupt requests and output disable requests.

### GRP[1:0] bits (Output Disable Source Select)

These bits select the group of output disable request from GPT to POEG and the group of output disable for GTIOCnA pin and GTIOCnB pin from POEG to GPT.

The output disable request to POEG is output to the group selected in the GRP[1:0] bit, with dead-time errors, simultaneous high output, and simultaneous low output factors following their respective disable request enable bits.

GTST.ODF shows the request of the output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when both GTIOR.OAE and GTIOR.OBE bits are 0.

If the POEG other than the group connected to GPT is selected in the GRP[1:0] bits, the ODF flag is always 0, and the status never changes to the output disable state.

### GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

### GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 0 at the same time.

## 20.2.16 GTST : General PWM Timer Status Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

| 28:25 | — | These bits are read as 0. The write value should be 0. | R/W |
| 29 | OABHF | Same Time Output Level High Flag<br>0: No simultaneous generation of 1 both for the GTIOCA and GTIOCB pins has occurred.<br>1: A simultaneous generation of 1 both for the GTIOCA and GTIOCB pins has occurred. | R |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 30 | OABLF | Same Time Output Level Low Flag<br>0: No simultaneous generation of 0 both for the GTIOCA and GTIOCB pins has occurred.<br>1: A simultaneous generation of 0 both for the GTIOCA and GTIOCB pins has occurred. | R |
| 31 | PCF*2 | Period Count Function Finish Flag<br>0: No period count function finish has occurred<br>1: A period count function finish has occurred | R/W*1 |

Note 1. Only 0 can be written to this bit. Do not write 1.
Note 2. This bit is only available in GPT320, GPT321, GPT162 to GPT164. In GPT165, this bit is read as 0. The write value should be 0.

The GTST indicates the status of the GPT.

### TCFA flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

### TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

### TCFC flag (Input Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

When GTCCRC performs buffer operation, GTCCRC does not perform compare match.

[Setting condition]

- GTCNT = GTCCRC.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

### TCFD flag (Input Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

When GTCCRD performs buffer operation, GTCCRD does not perform compare match.

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

#### TCFE flag (Input Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

When GTCCRE performs buffer operation, GTCCRE does not perform compare match.

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

#### TCFF flag (Input Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

When GTCCRF performs buffer operation, GTCCRF does not perform compare match.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

#### TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR - 1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

### TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a trough (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this bit.

### TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and to 0 in down-counting.

### ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group that is selected in the GRP[1:0] bits.

When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

### OABHF flag (Same Time Output Level High Flag)

The OABHF flag indicates that the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

When the GTIOCnA or GTIOCnB pin outputs 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the high level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or OBE bit is set to 0.

### OABLF flag (Same Time Output Level Low Flag)

The OABLF flag indicates that the GTIOCnA and GTIOCnB pins output 0 at the same time.

When the GTIOCnA pin or GTIOCnB pin outputs 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the low level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or the OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before they are masked by the output disable function. Even during the output disable condition, compare match operation continues internally, where the OABHF or OABLF flag is updated based on the operation results.

### PCF*2 flag (Period Count Function Finish Flag)

This bit is status flag of period count function finish.

[Setting condition]

- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1 at the end of cycle.
- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 0 at the count clock.

[Clearing condition]

- 0 is written to this bit.

## 20.2.17 GTBER : General PWM Timer Buffer Enable Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x40

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 21:20 | PR[1:0] | GTPR Buffer Operation<br>0 0: No buffer operation<br>0 1: Single buffer operation (GTPBR → GTPR)<br>Others: Setting prohibited | R/W |
| 22 | CCRSWT | GTCCRA and GTCCRB Forcible Buffer Operation<br>Writing 1 to this bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after 1 is written. This bit is read as 0. | W |
| 31:23 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTBER register provides settings for the buffer operation. Set the GTBER register while the GTCNT counter is stopped.

#### BD0 bit (GTCCR Buffer Operation Disable)

The BD0 bit disables the buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF combined.

When GTDTCR.TDE is 1 and when BD0 is set to 0, GTCCRB does not perform buffer operation. The GTCCRB register is automatically set to a compare match value for negative-phase waveform with dead time.

A value for the BD0 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDCE or GTSECR.SBDCD.

#### BD1 bit (GTPR Buffer Operation Disable)

The BD1 bit disables the buffer operation using GTPR and GTPBR combined.

A value for the BD1 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDPE or GTSECR.SBDPD.

#### CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set the buffer operation with GTCCRA, GTCCRC, and GTCCRD combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

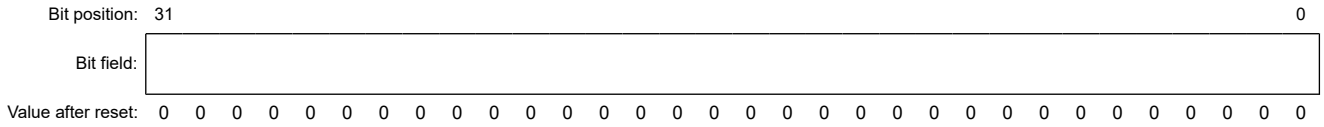
#### CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set the buffer operation using GTCCRB, GTCCRE, and GTCCRF combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

#### PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set the buffer operation with GTPR and GTPBR combined.



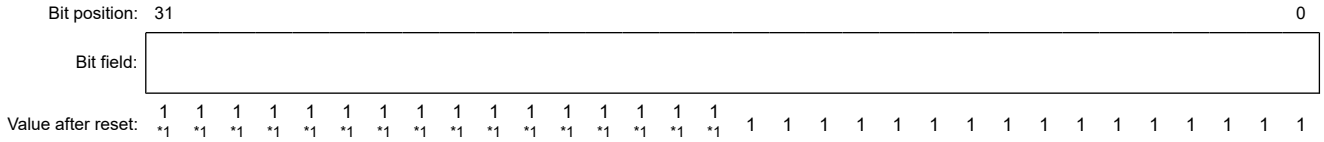
#### CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after the 1 is written. This bit is read as 0, and is valid only when counting is stopped with a compare match operation specified.

### 20.2.18 GTCNT : General PWM Timer Counter

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x48

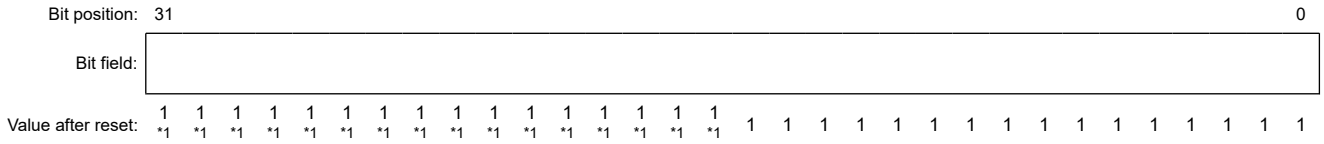


| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | GTCNT is a 32-bit read/write counter for GPT32n (n = 0, 1). For GPT16m (m = 2 to 5), GTCNT is a 16-bit register. GTCNT can only be written to after counting stops.<br>For GPT16m, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored.<br>GTCNT must be set within the range of 0 ≤ GTCNT ≤ GTPR. | R/W |

## 20.2.19 GTCCRk : General PWM Timer Compare Capture Register k (k = A to F)

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x4C (GTCCRA)
0x50 (GTCCRB)
0x54 (GTCCRC)
0x58 (GTCCRE)
0x5C (GTCCRD)
0x60 (GTCCRF)



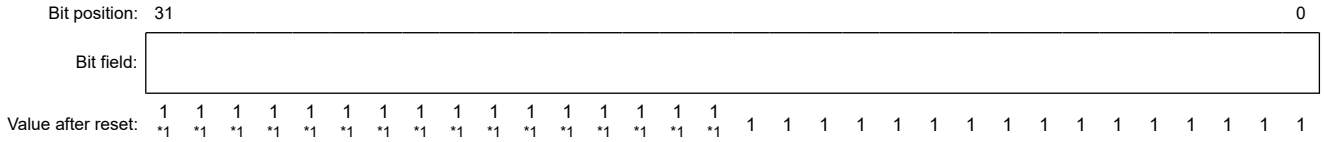
| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | GTCCRk registers are read/write registers. The effective size of GTCCRk is the same as GTCNT (16- or 32-bit). If the effective size of GTCCRk is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored.<br>GTCCRA and GTCCRB are registers used for both output compare and input capture.<br>GTCCRC and GTCCRE are compare match registers, and can also function as buffer registers for GTCCRA and GTCCRB.<br>GTCCRD and GTCCRF are compare match registers, and can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB). | R/W |

Note 1. For GPT16m (m = 2 to 5), the value of the upper 16 bits after reset is 0x0000.

## 20.2.20 GTPR : General PWM Timer Cycle Setting Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x64



| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | GTPR is a read/write register that sets the maximum count value of GTCNT. The effective size of GTPR is the same as GTCNT (16- or 32-bit). If the effective size of GTPR is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored.<br>For saw waves, the value of (GTPR + 1) is the cycle. For triangle waves, the value of (GTPR value × 2) is the cycle. | R/W |

Note 1. For GPT16m (m = 2 to 5), the value of the upper 16 bits after reset is 0x0000.

## 20.2.21 GTPBR : General PWM Timer Cycle Setting Buffer Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x68

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | GTPBR is a read/write register that functions as a buffer register for GTPR. The effective size of GTPBR is the same as GTCNT (16- or 32-bit). If the effective size of GTPBR is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. | R/W |

Note 1. For GPT16m (m = 2 to 5), the value of the upper 16 bits after reset is 0x0000.

## 20.2.22 GTDTCR : General PWM Timer Dead Time Control Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x88

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TDE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | TDE | Negative-Phase Waveform Setting<br>0: GTCCRB is set without using GTDVU<br>1: GTDVU is used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R/W |

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time. GPT has a dead time control function and the GTDVU register is used for setting dead time value.

### TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU. When GTDVU is used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU) is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and the GTCCRB is not automatic setting.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB.

- Triangle waves:
  Upper limit value: GTPR − 1
  Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode:
  Upper limit value: GTPR
  Lower limit value: 0

## 20.2.23 GTDVU : General PWM Timer Dead Time Value Register U

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0x8C

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Value after reset: | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 *1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | GTDVU is a read/write register that sets the dead time for generating PWM waveforms with dead time. The effective size of GTDVU is the same as GTCNT (16 or 32 bits). If the effective size of GTDVU is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored.<br>For saw-waves, the GTDVU register controls the front dead time and the GTDVD register controls the rear dead time, regardless of whether the count is up or down.<br>Setting a GTDVU value greater than or equal to GTPR is prohibited. When using the automatic dead time setting function, do not set a value that makes a change point of the waveform exceeding the count period. The set value can be confirmed by reading from GTCCRB. When GTDVU is used, writing to GTCCRB is prohibited. When this register is set to 0, waveforms without dead time are output.<br>While GPT is running, changing the GTDVU values is prohibited. To change GTDVU to a new value, stop the GPT with the CST bit in the GTCR register. | R/W |

Note 1. For GPT16m (m = 2 to 5), the value of the upper 16 bits after reset is 0x0000.

## 20.2.24 GTICLF : General PWM Timer Inter Channel Logical Operation Function Setting Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0xB8

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 9:4 | ICLFSELC[5:0] | Inter Channel Signal C Select[*1*2]<br>0x00: GTIOC0A<br>0x01: GTIOC0B<br>0x02: GTIOC1A<br>0x03: GTIOC1B<br>⋮ ⋮<br>0x0A: GTIOC5A<br>0x0B: GTIOC5B<br>Others: Setting prohibited | R/W |
| 15:10 | — | These bits are read as 0. The write value should be 0. | R/W |
| 18:16 | ICLFB[2:0] | GTIOCnB Output Logical Operation Function Select<br>0 0 0: B (no delay)<br>0 0 1: NOT B (no delay)<br>0 1 0: D (1 PCLKD delay)<br>0 1 1: NOT D (1 PCLKD delay)<br>1 0 0: B AND D (1 PCLKD delay)[*3]<br>1 0 1: B OR D (1 PCLKD delay)[*3]<br>1 1 0: B EXOR D (1 PCLKD delay)[*3]<br>1 1 1: B NOR D (1 PCLKD delay)[*3] | R/W |
| 19 | — | This bit is read as 0. The write value should be 0. | R/W |
| 25:20 | ICLFSELD[5:0] | Inter Channel Signal D Select[*1*3]<br>0x00: GTIOC0A<br>0x01: GTIOC0B<br>0x02: GTIOC1A<br>0x03: GTIOC1B<br>⋮ ⋮<br>0x0A: GTIOC5A<br>0x0B: GTIOC5B<br>Others: Setting prohibited | R/W |
| 31:26 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. The signal before performing output disable control is selected.
Note 2. When channel's own GTIOCnA is selected, C is treated as "1".
Note 3. When channel's own GTIOCnB is selected, D is treated as "1".

The GTICLF register sets the logical operation function between compare match outputs. The logical operation is performed with the signals that the duty 0%/100% control is performed after compare match control. (The output disable control is performed with the signal after logical operation.)

Access in 8-bit units to GTICLF is prohibited.

### ICLFm[2:0] bit (GTIOCnm Output Logical Operation Function Select) (m = A, B)

These bits select the logical operation function between signals before performing output disable control for GTIOCnm. To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed. When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as 1.

### ICLFSELk[5:0] bit (Inter Channel Signal k Select) (k = C, D)

These bits select the signal k that the logical operation is performed with the signal before performing output disable control for GTIOCnm.

## 20.2.25 GTPC : General PWM Timer Period Count Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 4)

Offset address: 0xBC

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | PCNT[11:0] | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | ASTP | — | — | — | — | — | — | — | PCEN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PCEN | Period Count Function Enable<br>0: Period count function is disabled<br>1: Period count function is enabled | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | ASTP | Automatic Stop Function Enable<br>0: Automatic stop function is disabled<br>1: Automatic stop function is enabled | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 27:16 | PCNT[11:0] | Period Counter<br>Counter for the number of period | R/W |
| 31:28 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTPC register counts the number of period.

### PCEN bit (Period Count Function Enable)

This bit enables or disables period count function.

Writing is available when counting is both in progress and stopped.

When 1 is written to either the GTSECR.SPCE bit or the GTSECR.SPCD bit, the value is simultaneously set to the PCEN bit in the channels set to 1 by the GTSECSR register.

### ASTP bit (Automatic Stop Function Enable)

This bit enables or disables the GTCNT counter automatic stopping after finishing counting the number of period.

When the PCEN bis is 0, writing is available.

When the PCEN bit is 1, writing is disabled.

When the PCEN bit is 1, the ASTP bit is 1, and the PCNT counter is stopped at PCNT = 0, the GTCNT counter is also stopped. When the ASTP bit is 0, the GTCNT counter continues to count.

### PCNT[11:0] bit (Period Counter)

This counter counts the number of period.

When the PCEN bis is 0, writing the number of period is available.

When the PCEN bit is 1, writing is disabled, and down-counting is performed at the end of period. In saw-wave mode, the end of period refers to overflow, underflow, or counter clearing. In triangle-wave mode, it refers to trough.

When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

## 20.2.26 GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)

| 2 | SECSEL2 | Channel 2 Operation Enable Bit Simultaneous Control Channel Select<br>0: Disable simultaneous control<br>1: Enable simultaneous control | R/W |
| 3 | SECSEL3 | Channel 3 Operation Enable Bit Simultaneous Control Channel Select<br>0: Disable simultaneous control<br>1: Enable simultaneous control | R/W |
| 4 | SECSEL4 | Channel 4 Operation Enable Bit Simultaneous Control Channel Select<br>0: Disable simultaneous control<br>1: Enable simultaneous control | R/W |
| 5 | SECSEL5 | Channel 5 Operation Enable Bit Simultaneous Control Channel Select<br>0: Disable simultaneous control<br>1: Enable simultaneous control | R/W |
| 31:6 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTSECSR register selects an intended channel n (n = 0 to 5) for updating an operation enable bit by the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

The bit corresponding to channel which security attribution is configured as secure can be read by non-secure access but cannot be written by non-secure access. For example, if GPT channel 0 is configured as secure and other GPTs are configured as non-secure, the SECSEL0 bit cannot be written by non-secure access to GPT321.GTSECSR register, and the simultaneous control status of GPT channel 0 is not changed. When the GPT321.GTSECSR register is read by non-secure access in the same security configuration as the previous example, the simultaneous control status of GPT channel (SECSEL0 bit) can be read.

Access in 8-bit or 16-bit units to GTSECSR is prohibited, and it should be accessed in 32-bit units.

**SECSELn bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 0 to 5)**

This bit enables or disables the simultaneous control of operation enable in channel n.

When the bit is set to 1, the simultaneous control is enabled, and disabled when the bit is 0.

## 20.2.27 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0, 1)
GPT16m = 0x4016_9000 + 0x0100 × m (m = 2 to 5)

Offset address: 0xD4

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | SPCD | — | — | — | — | — | — | — | SPCE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | SBDPD | SBDCD | — | — | — | — | — | — | SBDPE | SBDCE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SBDCE | GTCCR Register Buffer Operation Simultaneous Enable<br>0: Disable simultaneous enabling GTCCR buffer operations<br>1: Enable GTCCR register buffer operations simultaneously | R/W |
| 1 | SBDPE | GTPR Register Buffer Operation Simultaneous Enable<br>0: Disable simultaneous enabling GTPR buffer operations<br>1: Enable GTPR register buffer operations simultaneously | R/W |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | SBDCD | GTCCR Register Buffer Operation Simultaneous Disable<br>0: Disable simultaneous disabling GTCCR buffer operations<br>1: Disable GTCCR register buffer operations simultaneously | R/W |
| 9 | SBDPD | GTPR Register Buffer Operation Simultaneous Disable<br>0: Disable simultaneous disabling GTPR buffer operations<br>1: Disable GTPR register buffer operations simultaneously | R/W |
| 15:10 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | SPCE | Period Count Function Simultaneous Enable*1<br>0: Disable simultaneous enabling period count function<br>1: Enable period count function simultaneously | R/W |
| 23:17 | — | These bits are read as 0. The write value should be 0. | R/W |
| 24 | SPCD | Period Count Function Simultaneous Disable*1<br>0: Disable simultaneous disabling period count function<br>1: Disable period count function simultaneously | R/W |
| 31:25 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. This bit is only available in GPT320, GPT321, GPT162 to GPT164. In GPT165, this bit is read as 0. The write value should be 0.

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers.

The GTSECR register of channel which security attribution is configured as secure can not be written by non-secure access. For example, if GPTn is configured as secure and other GPTs are configured as non-secure, the GPTn.GTSECR register cannot be written by non-secure access to GPTn+1.GTSECR register even if the simultaneous control of GPTn is enabled, and the simultaneous control status of GPTn is not changed.

Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.

A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.

Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

### SBDCE bit (GTCCR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

### SBDPE bit (GTPR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are enabled.

Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

### SBDCD bit (GTCCR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

### SBDPD bit (GTPR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are disabled.

Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

### SPCE bit (Period Count Function Simultaneous Enable[*1])

When 1 is written to this bit, 1 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is enabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

### SPCD bit (Period Count Function Simultaneous Disable[*1])

When 1 is written to this bit, 0 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is disabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

## 20.2.28 OPSCR : Output Phase Switching Control Register

Base address: GPT_OPS = 0x4016_9A00

Offset address: 0x00

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 28:27 | — | These bits are read as 0. The write value should be 0. | R/W |
| 29 | NFEN | External Input Noise Filter Enable<br>0: Do not use a noise filter on the external input<br>1: Use a noise filter on the external input | R/W |
| 31:30 | NFCS[1:0] | External Input Noise Filter Clock Selection<br>Noise filter sampling clock setting of the external input.<br>0 0: PCLKD/1<br>0 1: PCLKD/4<br>1 0: PCLKD/16<br>1 1: PCLKD/64 | R/W |

Note 1. When OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

The OPSCR register sets the output of the signal waveform required for brushless DC motor control.

### UF , VF , WF bits (Input Phase Soft Setting)

The UF , VF , WF bits set the input phase from the software settings. When OPSCR.FB bit is 1, these bits are valid. The set value of the UF /VF /WF takes the place of the U/V/W external input.

### U, V, W bits (Input Phase Monitor)

When the OPSCR.FB bit is 0, external inputs that are synchronized by PCLKD are monitored by these bits. When the OPSCR.FB bit is 1, the OPSCR.U, OPSCR.V, and OPSCR.W bits can read the OPSCR.UF , OPSCR.VF , and OPSCR.WF bits.

### EN bit (Output Phase Enable)

The EN bit controls the output enable signal of output phase (positive phase/negative phase).

When the OPSCR.EN bit is 1, the signal waveform is output.

When the OPSCR.EN bit is 0, first set OPSCR.FB, OPSCR.UF /VF /WF (software setting is selected), OPSCR.P/N, OPSCR.INV, OPSCR.RV, OPSCR.ALIGN, OPSCR.GRP[1:0], OPSCR.GODF, OPSCR.NFEN, OPSCR.NFCS. Then, set the EN bit to 1. The EN bit should be set when output disable request does not occur from POEG. Also when OPSCR.GODF is 1 and the signal value selected in the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0. Even if 1 is written by software, the EN bit remains at 0.

For the return, after clearing the Output Disable Request by software, set the EN bit to 1.

Priority order of the EN bit is as follows (when the conflict occurs).

When writing 1 by software and clearing to 0 by the Output Disable Request conflict for the EN bit, clearing to 0 by the Output Disable Request is enabled.

### FB bit (External Feedback Signal Enable)

The FB bit selects the input phase from the software settings (OPSCR.UF, VF, WF) and external input such as a Hall element.

### P bit (Positive-Phase Output (P) Control)

The P bit selects one of the level signal output or PWM signal output for the positive-phase output (GTOUUP, GTOVUP and GTOWUP pins).

### N bit (Negative-Phase Output (N) Control)

The N bit selects one of the level signal output or PWM signal output for the negative-phase output (GTOULO, GTOVLO and GTOWLO pins).

### INV bit (Output Phase Invert Control)

The INV bit selects one of the positive logic (active-high) output or negative logic (active-low) output for the output phase.

### RV bit (Output Phase Rotation Direction Reversal Control)

The RV bit reverses the direction of rotation of the motor by inverting the input phase.

### ALIGN bit (Input Phase Alignment)

The ALIGN bit selects the PCLKD or PWM for the sampling of the input phase (input phase is specified in the OPSCR.FB bit).

When OPSCR.ALIGN bit is 0, input phase is aligned to PCLKD.

Note: When the chopping is performed, there are cases where the PWM width of output is shorter than the width of the PWM used to chop just before or after switching of output phase, depending on the phase difference between the phase output switch timing and the phase of PWM.

When OPSCR.ALIGN bit is 1, input phase is aligned with the falling edge of PWM.

### GRP[1:0] bit (Output Disabled Source Selection)

The GRP[1:0] bit selects the output disable source.

The GRP bits should be set when GODF bit is 0. If GRP bits select a POEG except for the connected groups, the status of output pin never change to disable.

**GODF bit (Group Output Disable Function)**

When OPSCR.GODF is 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

When OPSCR.GODF bit is 0, this bit is ignored.

The GODF bit should be set when output disable request does not occur from POEG.

**NFEN bit (External Input Noise Filter Enable)**

The NFEN bit selects the noise filter for external input. When OPSCR.NFEN bit is 0, a noise filter for the external input is not used.

Note: Set this bit during the EN bit is 0 to avoid generation of unintentional internal edge caused by switching this bit.

**NFCS[1:0] bits (External Input Noise Filter Clock Selection)**

The NFCS[1:0] bits select the clock for the external input noise filter. When the OPSCR.NFEN bit is 1, noise filter sampling clock setting of the external input is enabled.

1. Set the NFCS[1:0].
2. Wait for 2 cycles.
3. Set the OPSCR.EN bit to 1.

## 20.3 Operation

### 20.3.1 Basic Operation

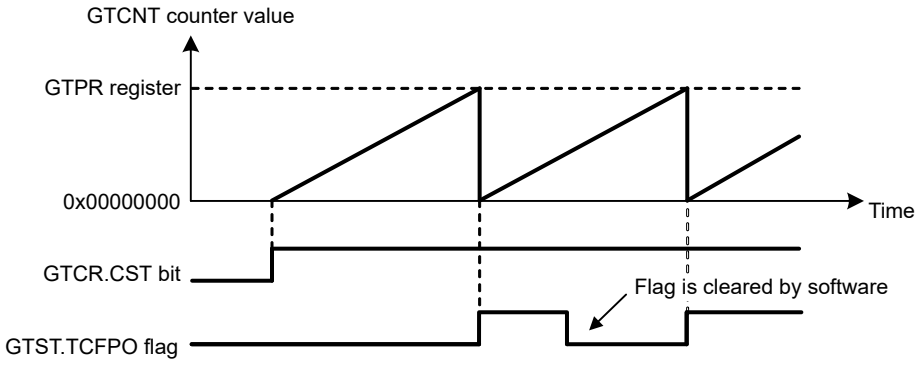
Each channel has a 32-bit and 16-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle.

When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated GTIOCnA or GTIOCnB can be changed (n = 0 to 5). GTCCRA or GTCCRB can be used as an input capture register with hardware resources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

#### 20.3.1.1 Counter operation

##### (1) Counter start and stop



The counter of each channel starts the count operation when GTCR.CST is set to 1, and stops counting when the bit is set to 0. The GTCR.CST bit value is changed by the following sources:

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register
- Completion of the period count function while the GTPC.ASTP bit is 1

##### (2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to 0x00000000. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1, and the overflow interrupt(GPTn_OVF) is also generated. After GTCNT overflows, up-counting resumes from 0x00000000.

Figure 20.3 shows an example of a periodic count operation in up-counting by the count clock.

Note: The base address of registers are the same.

**Figure 20.3 Example of periodic count operation in up-counting by the count clock**

Table 20.5 shows an example for setting periodic count operation in up-counting by the count clock.

**Table 20.5 Example for setting a periodic count operation in up-counting by the count clock**

| No. | Step Name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.3, 000b (saw-wave PWM mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.3, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 20.3, 0x00000000 is set. |
| 6 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

### (3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 0x00000000. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1, and the underflow interrupt(GPTn_UDF) is also generated. After the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 20.4 shows an example of periodic count operation in down-counting by the count clock.

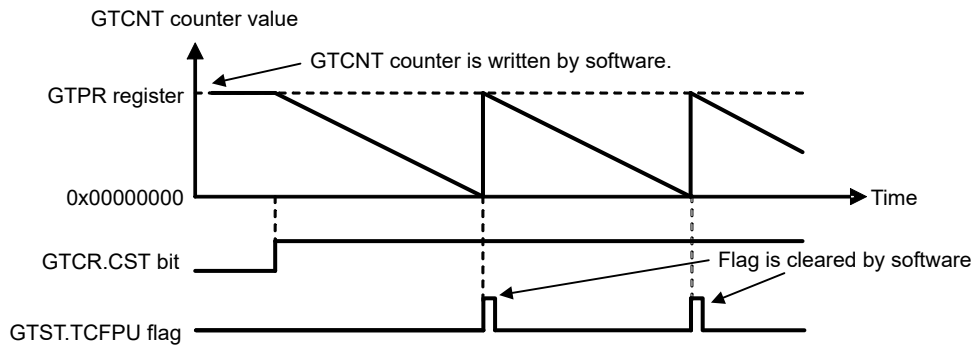


**Figure 20.4 Example of periodic count operation in down-counting by the count clock**

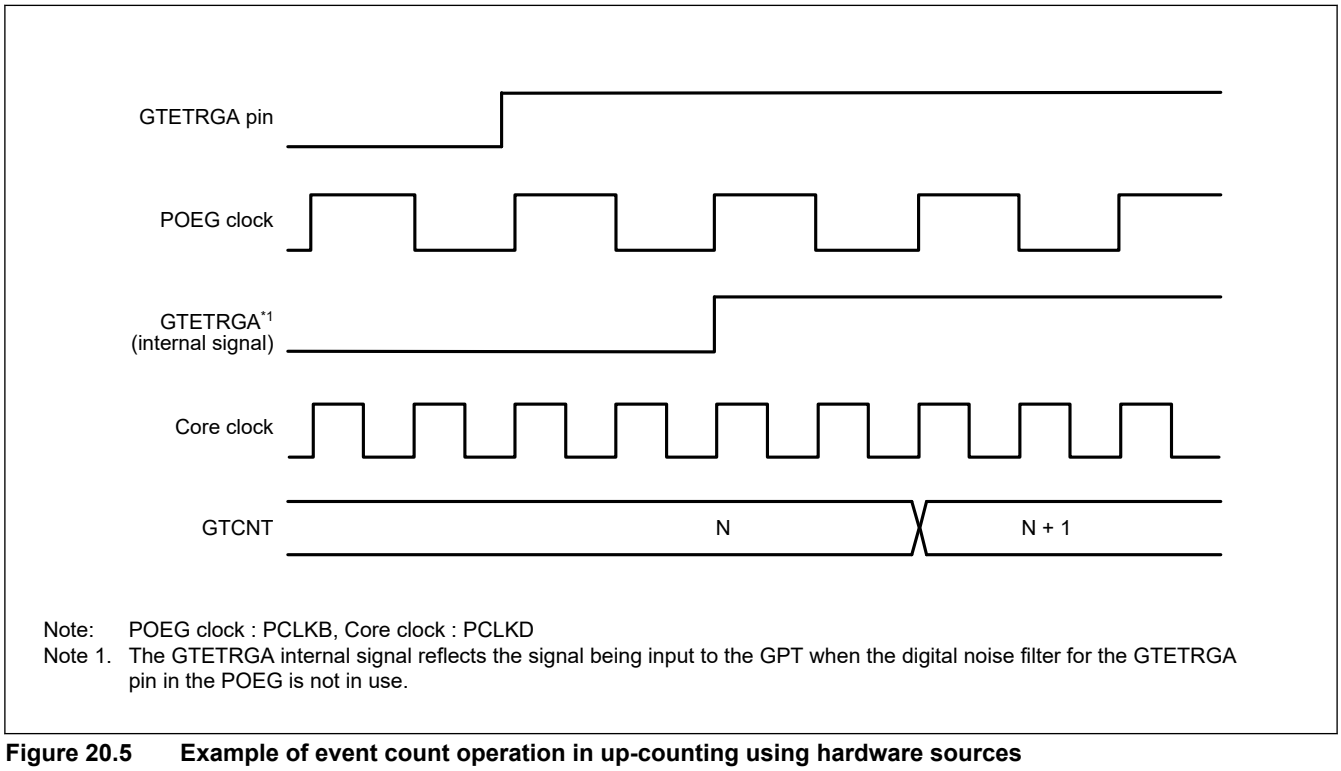
Table 20.6 shows an example for setting periodic count operation in down-counting by the count clock.

**Table 20.6 Example for setting periodic count operation in down-counting by count clock**

| No. | Step Name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.4, 000b (saw-wave PWM mode) is set. |
| 2 | Set count direction | Select the count direction with the GTUDDTYC register.<br>In Figure 20.4, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 20.4, the GTPR register value is set. |
| 6 | Start count operation | Set the GTCR.CST bit to 1 to start count operation.<br>In Figure 20.4, 1 is set in the CST bit. |



### (4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior when up-counting using hardware sources is the same as when up-counting by the count clock.

If you are using a hardware source to count up, set the GTCR.CST bit to 1 to enable the counting operation. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized by the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count up with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 20.5 shows an example of an event count operation in up-counting by a hardware resource (the rising edge of GTETRGA pin input).

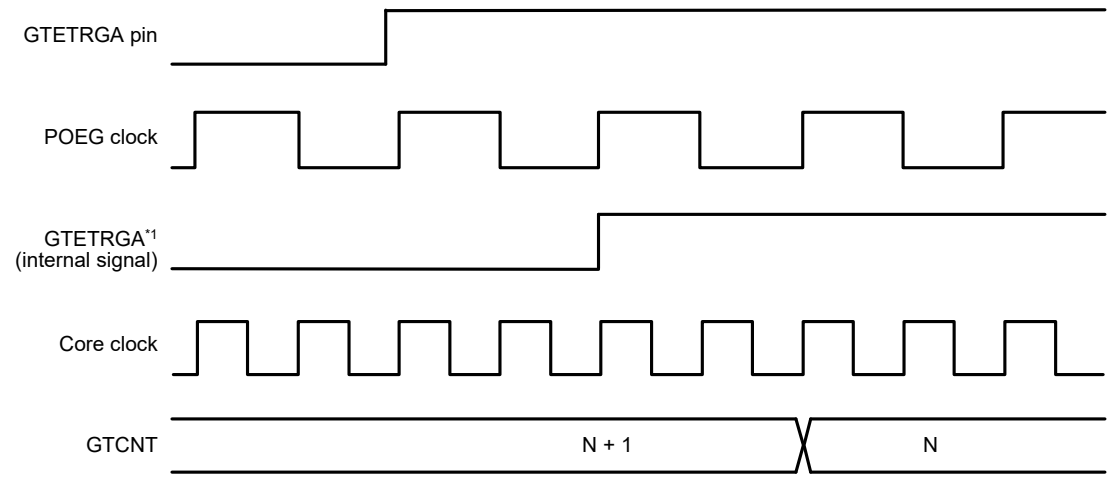
Note: POEG clock : PCLKB, Core clock : PCLKD
Note 1. The GTETRGA internal signal reflects the signal being input to the GPT when the digital noise filter for the GTETRGA pin in the POEG is not in use.

**Figure 20.5 Example of event count operation in up-counting using hardware sources**

Table 20.7 shows an example for setting event count operation in up-counting by a hardware source.

**Table 20.7 Example for setting an event count operation in up-counting using hardware sources**

| No. | Step name | Description |
|---|---|---|
| 1 | Set count source | Select the counting-up hardware source with the GTUPSR register. |
| 2 | Set cycle | Set the cycle in the GTPR register. |
| 3 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 4 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |



### (5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The underflow behavior when down-counting using hardware sources is the same as when down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized with the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count down with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 20.6 shows an example of a event count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).

Note: POEG clock: PCLKB, Core clock: PCLKD
Note 1. The GTETRGA internal signal reflects the signal being input to the GPT when the digital noise filter for the GTETRGA pin in the POEG is not in use.

**Figure 20.6 Example of event count operation in down-counting using hardware sources**

Table 20.8 shows an example for setting a periodic count operation in down-counting using a hardware resource.

**Table 20.8 Example for setting an event count operation in down-counting using hardware sources (1 of 2)**

| No. | Step name | Description |
|---|---|---|
| 1 | Set count source | Select the counting-down hardware source with the GTDNSR register. |
| 2 | Set cycle | Set the cycle in the GTPR register. |

**Table 20.8 Example for setting an event count operation in down-counting using hardware sources (2 of 2)**

| No. | Step name | Description |
|---|---|---|
| 3 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 4 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

### (6) Counter clear operation

The counter of each channel is cleared by following sources:

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST is 1) or not (GTCR.CST is 0).

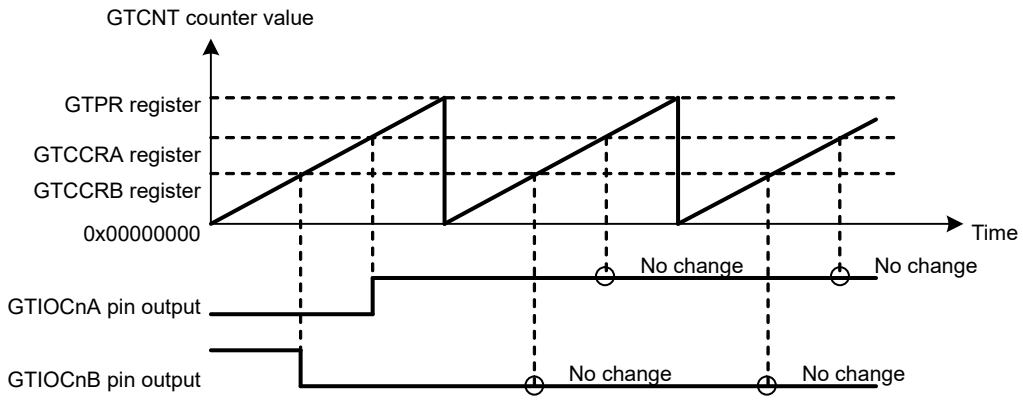
When the count direction flag is set as decrement (GTST.TCUF flag = 0) in saw-wave mode selected with GTCR.MD[2:0] bits, the GTCNT register is set to the value of the GTPR register when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

When not in saw-waves mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in the GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with PCLKD. If other settings are used, clear is synchronized with the counter clock selected in GTCR.TPCS[3:0].

## 20.3.1.2 Waveform output by compare match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock, including the event count. At the same time, the GPT can output low, high, or toggled output from the associated GTIOCnA or GTIOCnB output pin (n = 0 to 5). In addition, the GTIOCnA or GTIOCnB pin output can be low, high, or toggled at the cycle end which is determined by GTPR.



The cycle end is:

- For saw waves in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw waves – when the GTCNT counter is cleared
- For triangle waves – when the GTCNT changes from 0 to 1 (trough).

### (1) Low output and high output

Figure 20.7 shows an example of low output and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOCnA pin by a GTCCRA compare match, and low is output from the GTIOCnB pin by a GTCCRB compare match. The pin level does not change when the specified level and pin level match.

[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is low, high output at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is high, low output at compare match, output retained at cycle end

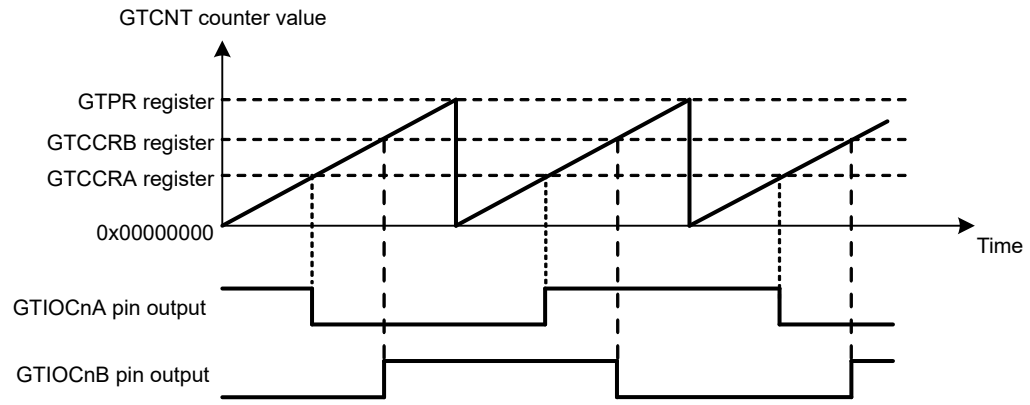
Note: The base address of registers are the same.

**Figure 20.7 Example of low output and high output operation**

Table 20.9 shows an example for setting low output and high output operation.

**Table 20.9 Example for setting low output and high output operation**

| No. | Step Name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.7, 000b (saw-wave PWM mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.7, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.<br>In Figure 20.7, GTIOA[4:0] = 00010b, GTIOB[4:0] = 10001b. |
| 7 | Enable GTIOCnm pin output | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set compare match value | Set compare match values in the GTCCRA and GTCCRB registers. |
| 9 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

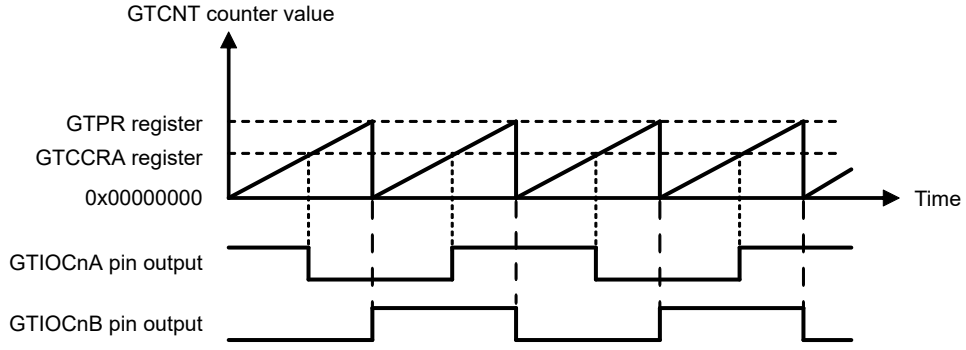


Note: n: 0 to 5
m: A, B

## (2) Toggled output

Figure 20.8 and Figure 20.9 show examples of toggled output operation by compare matches of GTCCRA and GTCCRB.

In Figure 20.8, the GTCNT counter performs up-counting, and settings are made so that the GTIOCnA pin output by a GTCCRA compare match and GTIOCnB pin output by a GTCCRB compare match are toggled.



In Figure 20.9, the GTCNT counter performs up-counting, and settings are made so that a GTCCRA compare match toggles the GTIOCnA pin output level and a cycle end toggles the GTIOCnB pin output level.

[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is low, output toggled at compare match, output retained at cycle end

Note: The base address of registers are the same.

**Figure 20.8 Example of toggled output operation (1)**

[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is low, output retained at compare match, output toggled at cycle end

Note: The base address of registers are the same.

**Figure 20.9 Example of toggled output operation (2)**

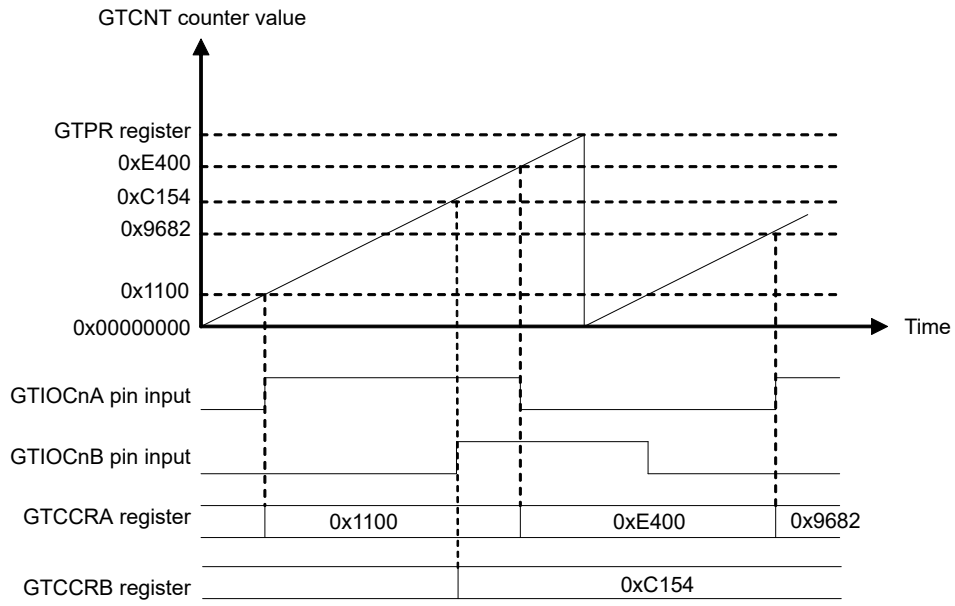
Table 20.10 shows an example for setting toggled output operation.

**Table 20.10 Example for setting toggled output operation (1 of 2)**

| No. | Step Name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.8 and Figure 20.9, 000b (saw-wave PWM mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 20.8 and Figure 20.9, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |

**Table 20.10 Example for setting toggled output operation (2 of 2)**

| No. | Step Name | Description |
|---|---|---|
| 6 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 20.8, GTIOA[4:0] = 10011b, GTIOB[4:0] = 00011b, and in Figure 20.9, GTIOA[4:0] = 10011b, GTIOB[4:0] = 01100b. |
| 7 | Enable GTIOCnm pin output | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set compare match value | Set compare match values in the GTCCRA and GTCCRB registers. |
| 9 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |



Note: n: 0 to 5
m: A, B

### 20.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 20.10 shows an example of the input capture function.

In this example, the GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTCCRA at both edges of the GTIOCnA input pin and to GTCCRB on the rising edge of the GTIOCnB input pin.

Note: The base address of registers are the same.
Note: [Setting examples]
GTICASR setting: input capture at both edges
GTICBSR setting: input capture at the rising edge

**Figure 20.10 Example of input capture operation**

Table 20.11 and Table 20.14 show the example for setting an input capture operation with count operation by the count clock.

**Table 20.11 Example for setting input capture operation (1 of 2)**

| No. | Step name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits. In Figure 20.10, 000b (saw-wave PWM mode) is set. |

**Table 20.11 Example for setting input capture operation (2 of 2)**

| No. | Step name | Description |
|---|---|---|
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.10, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Select input capture source | Select the input capture source in the GTICASR and GTICBSR registers.<br>In Figure 20.10, GTICASR = 0x00000F00, GTICBSR = 0x00003000. |
| 7 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

## 20.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR and GTPBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF

### 20.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR.

The buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR register)
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR.CCLRn bit is set to 1, n = 0 to 5).

To set GTPR to function as a buffer, set the GTBER.PR bit to 1. To set GTPR not to function as a buffer, set the GTBER.PR bit to 0.

Figure 20.11 to Figure 20.13 show examples of GTPR buffer operation and Table 20.12 shows an example for setting GTPR buffer operation.

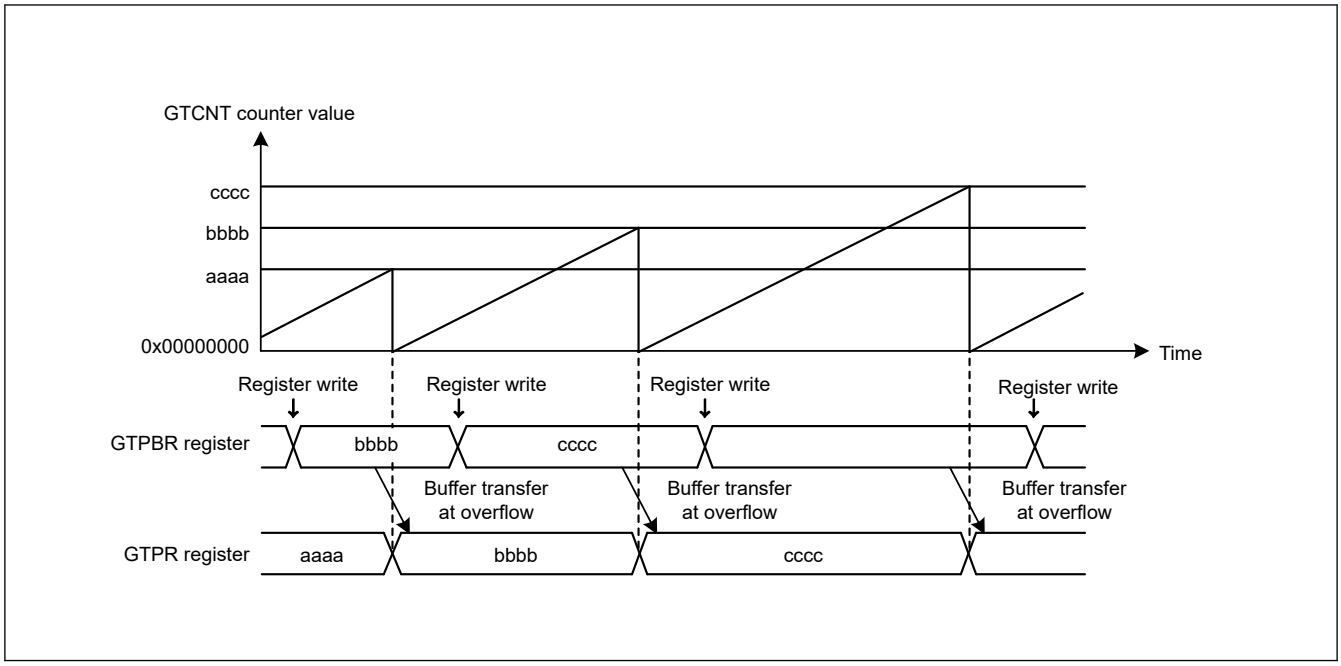


**Figure 20.11 Example of GTPR buffer operation with saw waves in up-counting**

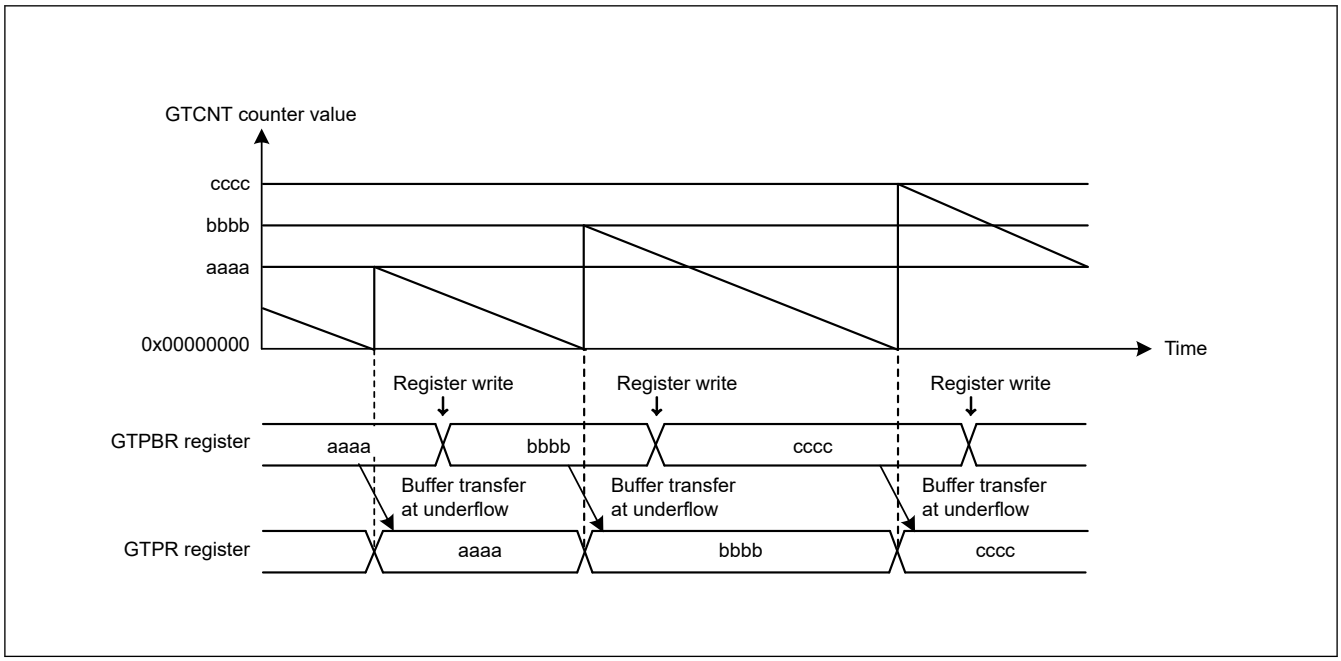

**Figure 20.12 Example of GTPR buffer operation with saw waves in down-counting**

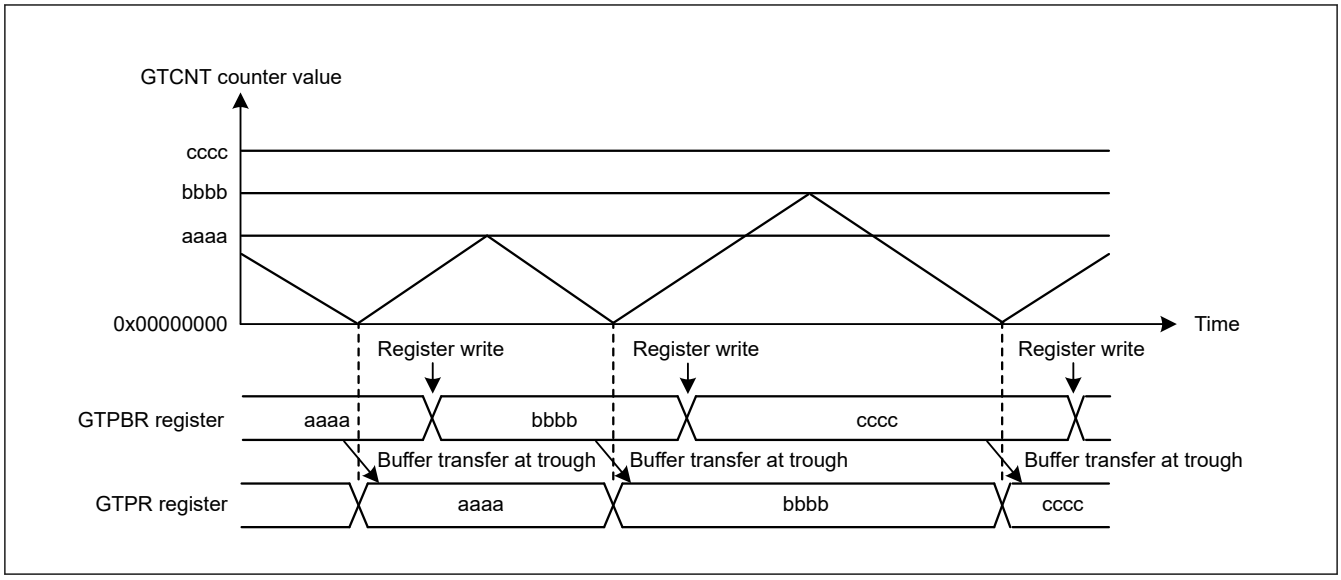

**Figure 20.13 Example of GTPR buffer operation with triangle waves**

**Table 20.12 Example for setting GTPR register buffer operation**

| No. | Step Name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.11 and Figure 20.12, 000b (saw-wave PWM mode) is set, and in Figure 20.13, 100b (triangle-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.11, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In Figure 20.12, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set buffer operation | Set buffer operation with the GTBER.PR[1:0] bits. In Figure 20.11, Figure 20.12, and Figure 20.13, PR[1:0] = 01b. |
| 7 | Set buffer value | For buffer operation, set a value in one cycle after the current cycle in the GTPBR register. |
| 8 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 9 | Set buffer value for each cycle | For buffer operation, set a value in one cycle after the current cycle in the GTPBR register. |

### 20.3.2.2 Buffer Operation for GTCCRA and GTCCRB Registers

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set 01b. To set GTCCRA or GTCCRB to not function as a buffer, set 00b.

In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, the buffer operations that specify each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits.

#### (1) When GTCCRA or GTCCRB Functions as Output Compare Register

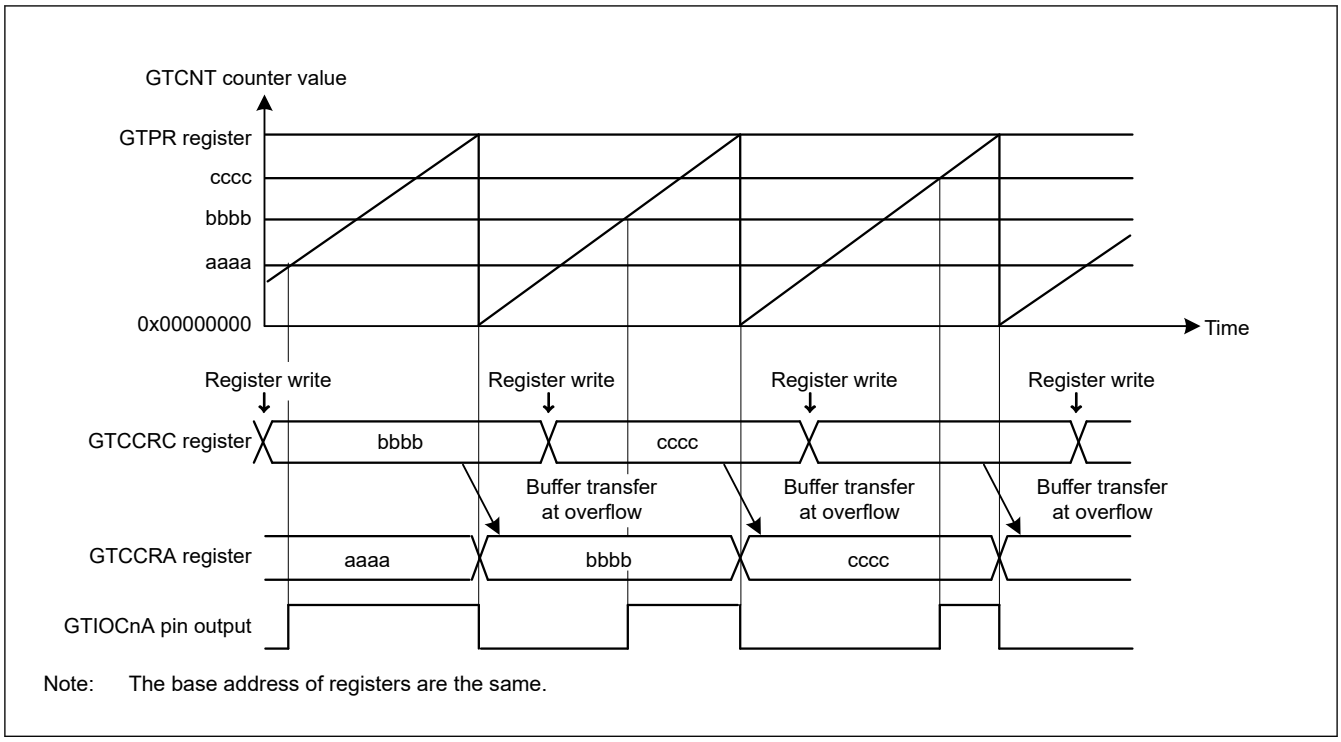
In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, the buffer operations that specify each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits. For details, see section 1.3.3. PWM Output Operating Mode. Other than the above PWM output operation mode, buffer transfer occurs in the following situations:

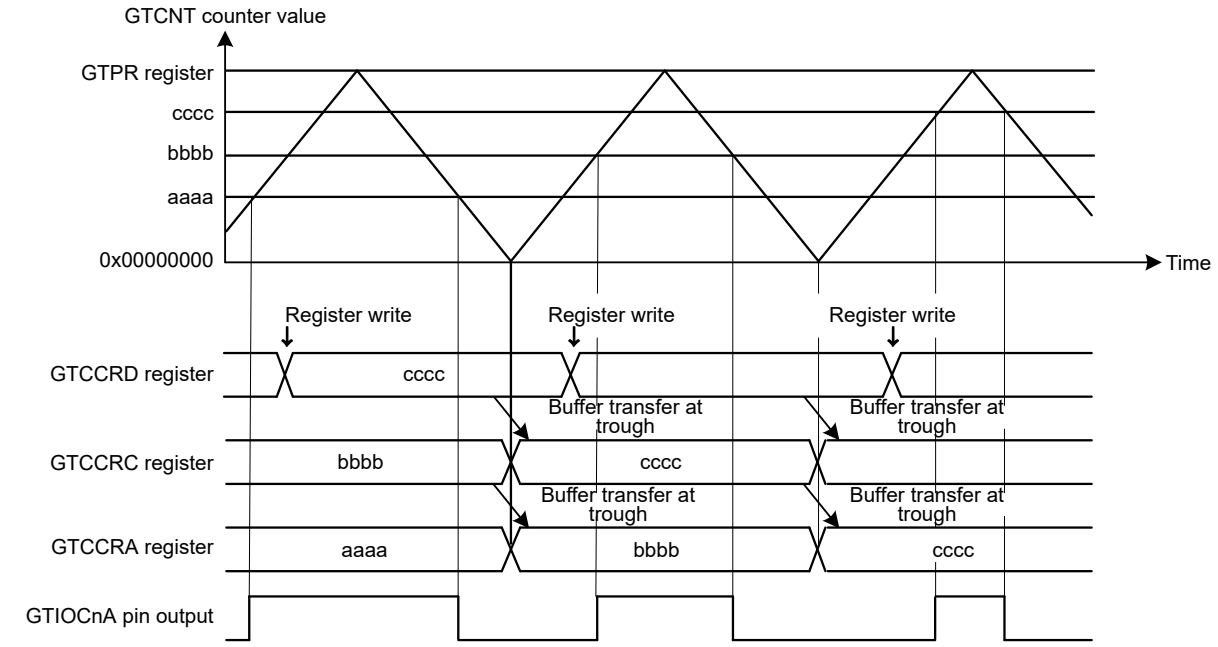
- Buffer transfer by overflow or underflow

Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).

- Buffer transfer by counter clear
  In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources similar to the case shown in section 20.3.2.1. GTPR Register Buffer Operation.
  In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Forcible buffer transfer
  When GTBER.CCRSWT bit is set to 1 while the count operation is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3.

Figure 20.14 to Figure 20.16 show examples of GTCCRA and GTCCRB buffer operation and Table 20.13 shows an example for setting GTCCRA and GTCCRB buffer operation.





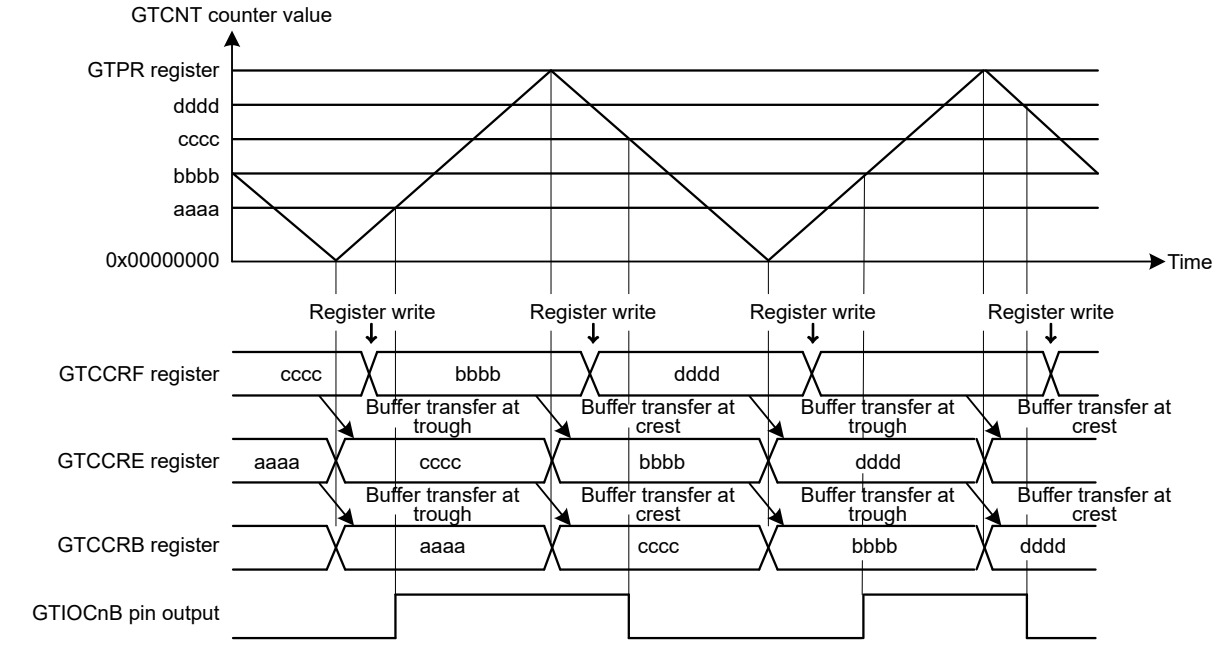


**Figure 20.14 Example of GTCCRA and GTCCRB buffer operation with output compare, saw waves in up-counting, high output at GTCCRA compare match, and low output at cycle end**

Note: The base address of registers are the same.

**Figure 20.15 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end**

Note: The base address of registers are the same.

**Figure 20.16 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end**

**Table 20.13 Example for setting GTCCRA and GTCCRB buffer operation for output compare**

| No. | Step name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.14, 000b (saw-wave PWM mode) is set, in Figure 20.15, 100b (triangle-wave PWM mode 1) is set, and in Figure 20.16, 101b (triangle-wave PWM mode 2) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.14, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.<br>In Figure 20.14, GTIOA[4:0] = 00110b, in Figure 20.15, GTIOA[4:0] = 00011b, and in Figure 20.16, GTIOB[4:0] = 00011b. |
| 7 | Enable GTIOCnm pin output | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set buffer operation | Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register.<br>In Figure 20.14, CCRA[1:0] = 01b, in Figure 20.15, CCRA[1:0] = 1xb, and in Figure 20.16, CCRB [1:0] = 1xb. |
| 9 | Set compare match value | Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register. |
| 10 | Set buffer value | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively.<br>For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively. |
| 11 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 12 | Set buffer value for each cycle | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively.<br>For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively. |

Note: n: 0 to 5
m: A, B

### (2) When GTCCRA or GTCCRB Functions as Input Capture Register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

Figure 20.17 and Figure 20.18 show examples of GTCCRA and GTCCRB buffer operation and Table 20.14 shows an example for setting GTCCRA and GTCCRB buffer operation.

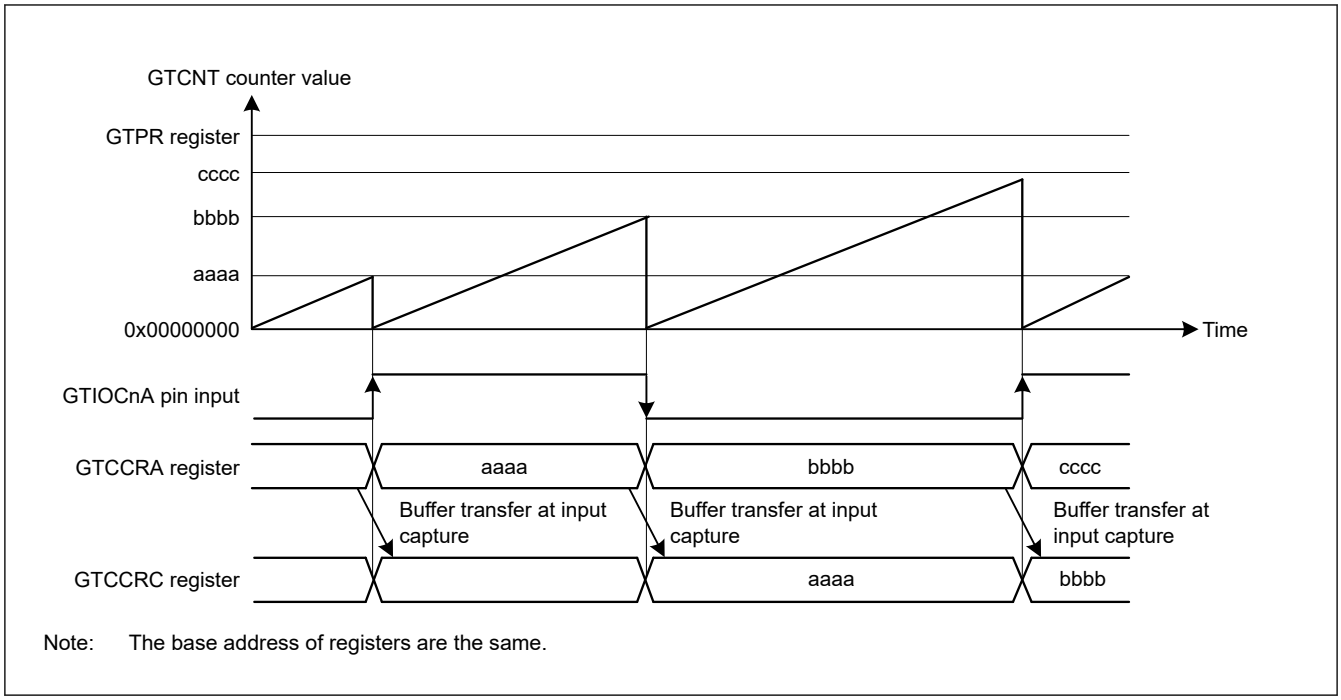

**Figure 20.17 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOCnA input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnA input**

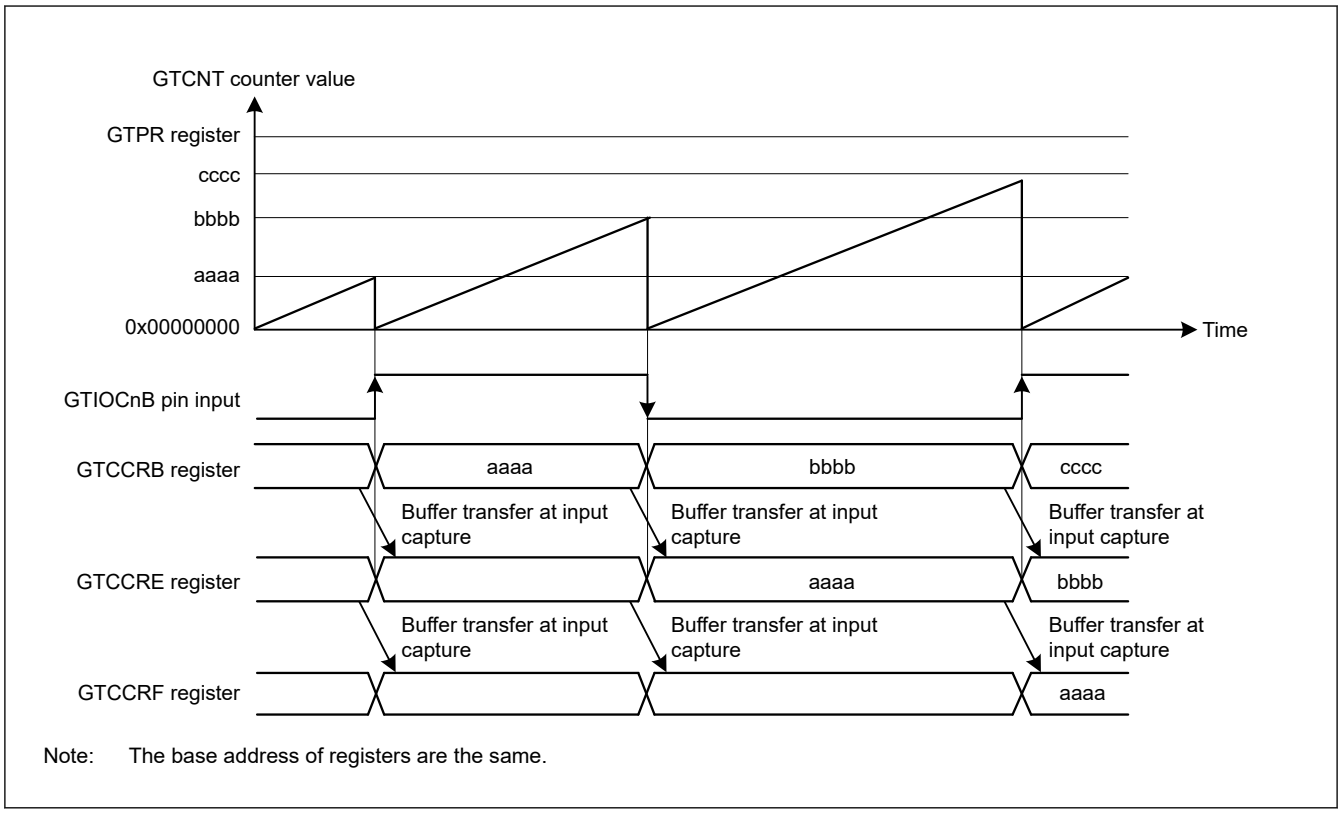

**Figure 20.18 Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOCnB input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnB input**

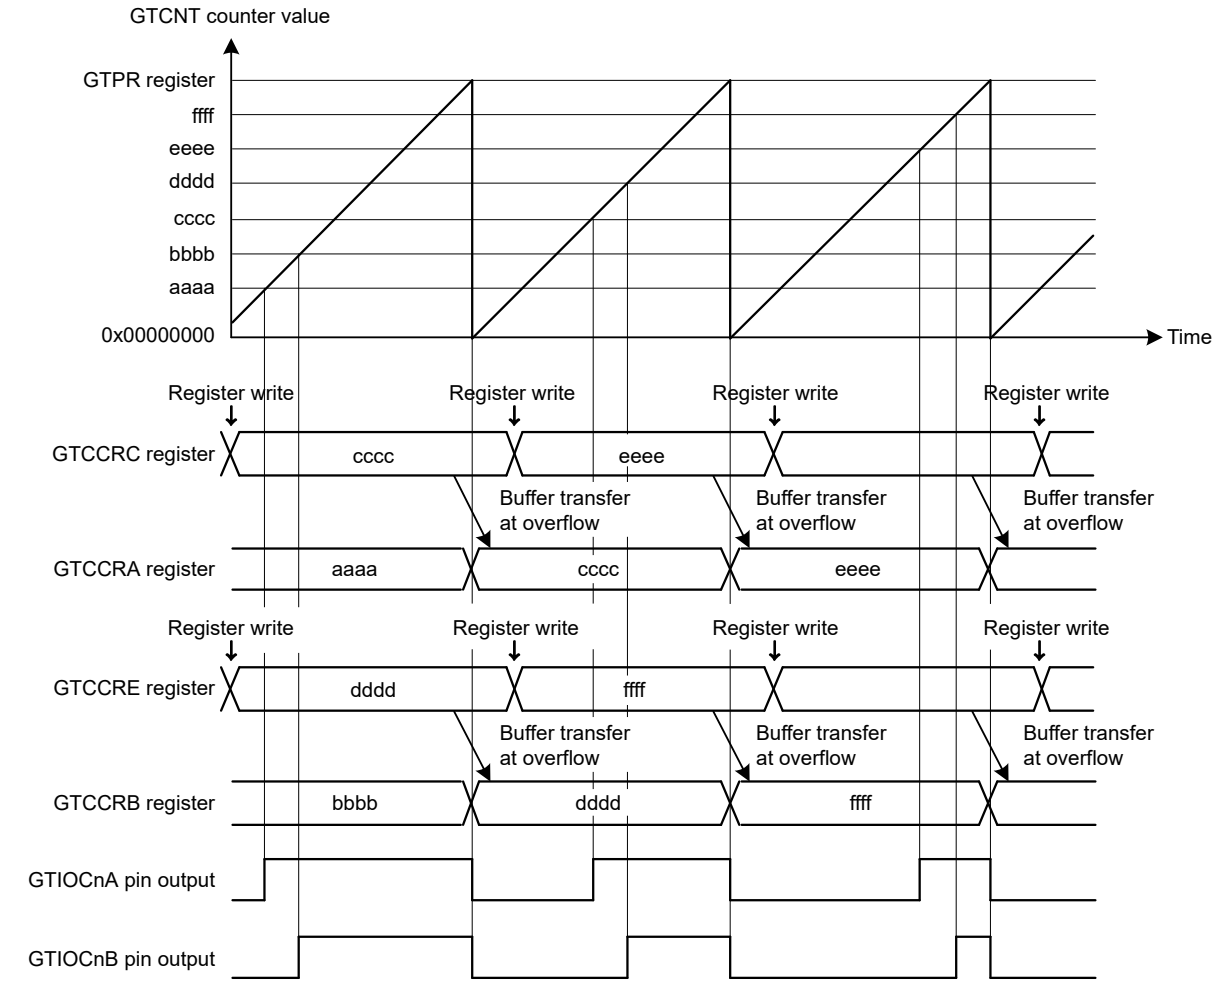
**Table 20.14 Example for setting GTCCRA and GTCCRB buffer operation for input capture**

| No. | Step name | Description |
|---|---|---|
| 1 | Set operating mode and counter clear sources | Set the operating mode with the GTCR.MD[2:0] bits and count clear source with the GTCSR register.<br>In Figure 20.17, MD[2:0] = 000b (saw-wave PWM mode) and GTCSR = 0x00000F00, and in Figure 20.18, MD[2:0] = 000b (saw-wave PWM mode) and GTCSR = 0x0000F000. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.17, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Select input capture source | Select input capture source in the GTICASR register and GTICBSR register.<br>In Figure 20.17, GTICASR = 0x00000F00, and in Figure 20.18, GTICBSR = 0x0000F000. |
| 7 | Set buffer operation | Set buffer operation with the CCRA and CCRB bits in the GTBER register.<br>In Figure 20.17, CCRA[1:0] = 01b, and in Figure 20.18, CCRB[1:0] = 1xb. |
| 8 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

## 20.3.3 PWM Output Operating Mode



The GPT can output PWM waveforms to the GTIOCnA or GTIOCnB pin (n = 0 to 5) by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR and GTDVU, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

### 20.3.3.1 Saw-Wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 5) when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

Figure 20.19 shows an example of saw-wave PWM mode operation, and Table 20.15 shows an example for setting saw-wave PWM mode.

Note: The base address of registers are the same.

**Figure 20.19 Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end**

**Table 20.15 Example for setting saw-wave PWM mode (1 of 2)**

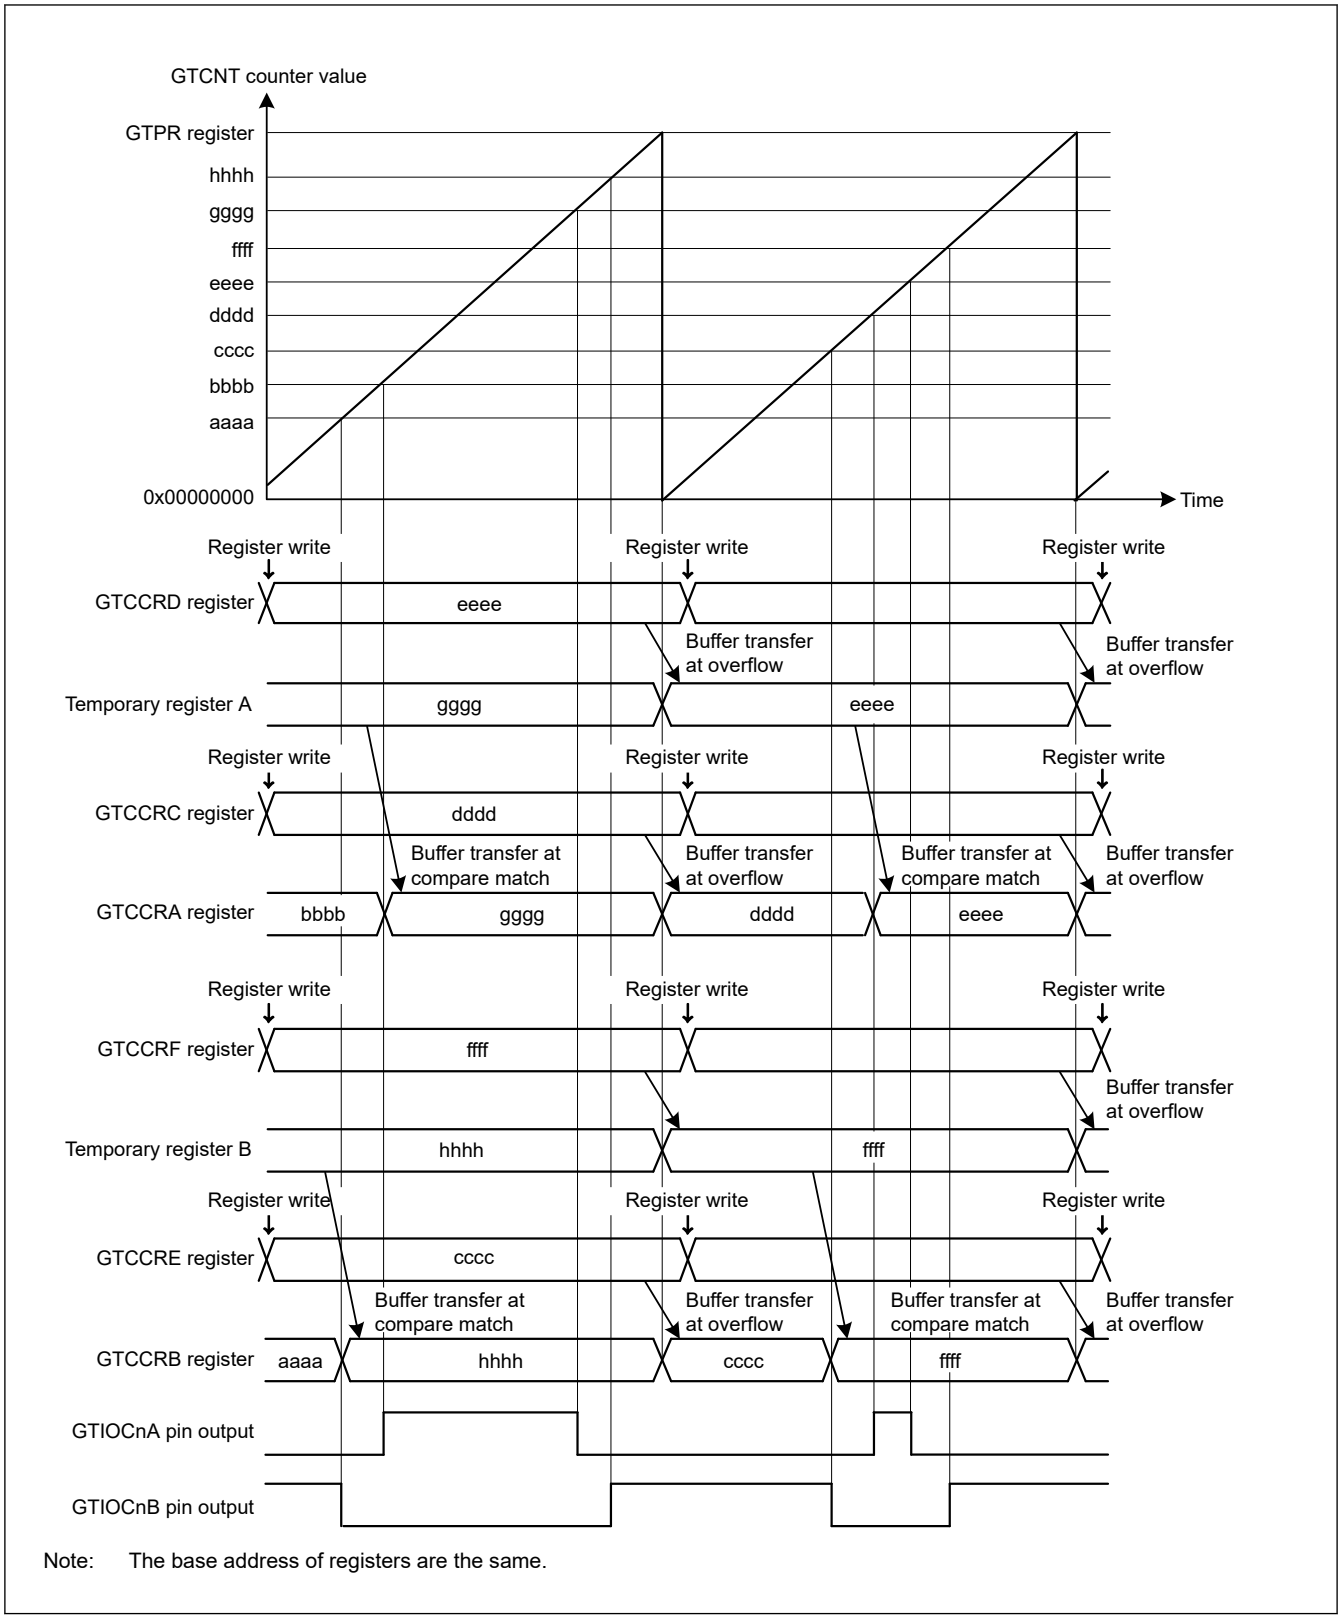
| No. | Step name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits. In Figure 20.19, 000b (saw-wave PWM mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.19, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.<br>In Figure 20.19, GTIOA[4:0] = 00110b and GTIOB[4:0] = 00110b. |
| 7 | Enable GTIOCnm pin output | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set buffer operation | Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 20.19, CCRA[1:0] = 01b and CCRB[1:0] = 01b. |
| 9 | Set compare match value | Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register. |

**Table 20.15 Example for setting saw-wave PWM mode (2 of 2)**

| No. | Step name | Description |
|---|---|---|
| 10 | Set buffer value | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.<br>For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively. |
| 11 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 12 | Set buffer value for each cycle | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.<br>For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively. |

Note: n: 0 to 5
m: A, B

### 20.3.3.2 Saw-Wave One-Shot Pulse Mode



The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR, the GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 5) at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and the cycle end according to the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while count operation is stopped, the buffer is transferred forcibly from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B. By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

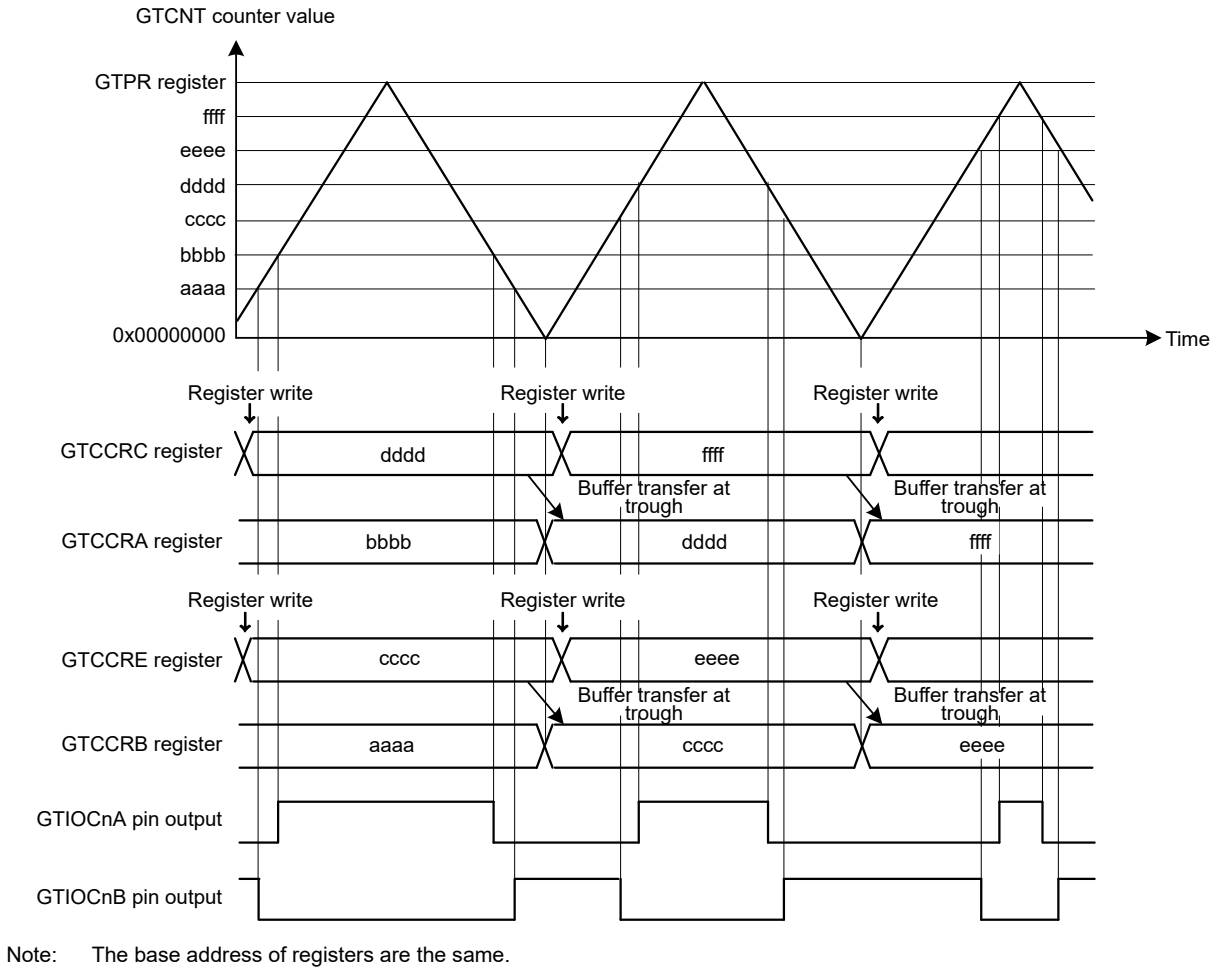
Figure 20.20 shows an example of saw-wave one-shot pulse mode operation, and Table 20.16 shows an example for setting saw-wave one-shot pulse mode.

Note: The base address of registers are the same.

**Figure 20.20 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, and output retained at cycle end**

**Table 20.16 Example setting for saw-wave one-shot pulse mode**

| No. | Step name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.20, 001b (saw-wave one-shot pulse mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.20, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.<br>In Figure 20.20, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b. |
| 7 | Enable GTIOCnm pin output | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set compare match value | Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers. |
| 9 | Set forcible buffer transfer | Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly. |
| 10 | Set buffer value | For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers. |
| 11 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 12 | Set buffer value for each cycle | For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers. |



Note: n: 0 to 5
m: A, B

### 20.3.3.3 Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 5) when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 20.21 shows an example of a triangle-wave PWM mode 1 operation, and Table 20.17 shows an example for setting a triangle-wave PWM mode 1.

Note: The base address of registers are the same.

**Figure 20.21 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB register compare match, and output retained at cycle end**

**Table 20.17 Example setting for triangle-wave PWM mode 1 (1 of 2)**

| No. | Step name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.21, 100b (triangle-wave PWM mode 1) is set. |
| 2 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 3 | Set cycle | Set the cycle in the GTPR register. |
| 4 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 5 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.<br>In Figure 20.21, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b. |
| 6 | Enable GTIOCnm pin output | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 7 | Set buffer operation | Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register.<br>In Figure 20.21, CCRA[1:0] = 01b and CCRB[1:0] = 01b. |
| 8 | Set compare match value | Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively. |
| 9 | Set buffer value | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.<br>For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively. |

### 20.3.3.4 Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 5) when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 20.22 shows an example of triangle-wave PWM mode 2 operation, and Table 20.18 shows an example for setting triangle-wave PWM mode 2.

Note: The base address of registers are the same.

**Figure 20.22 Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, and output retained at cycle end**

**Table 20.18 Example for setting triangle-wave PWM mode 2 (1 of 2)**

| No. | Step name | Description |
|---|---|---|

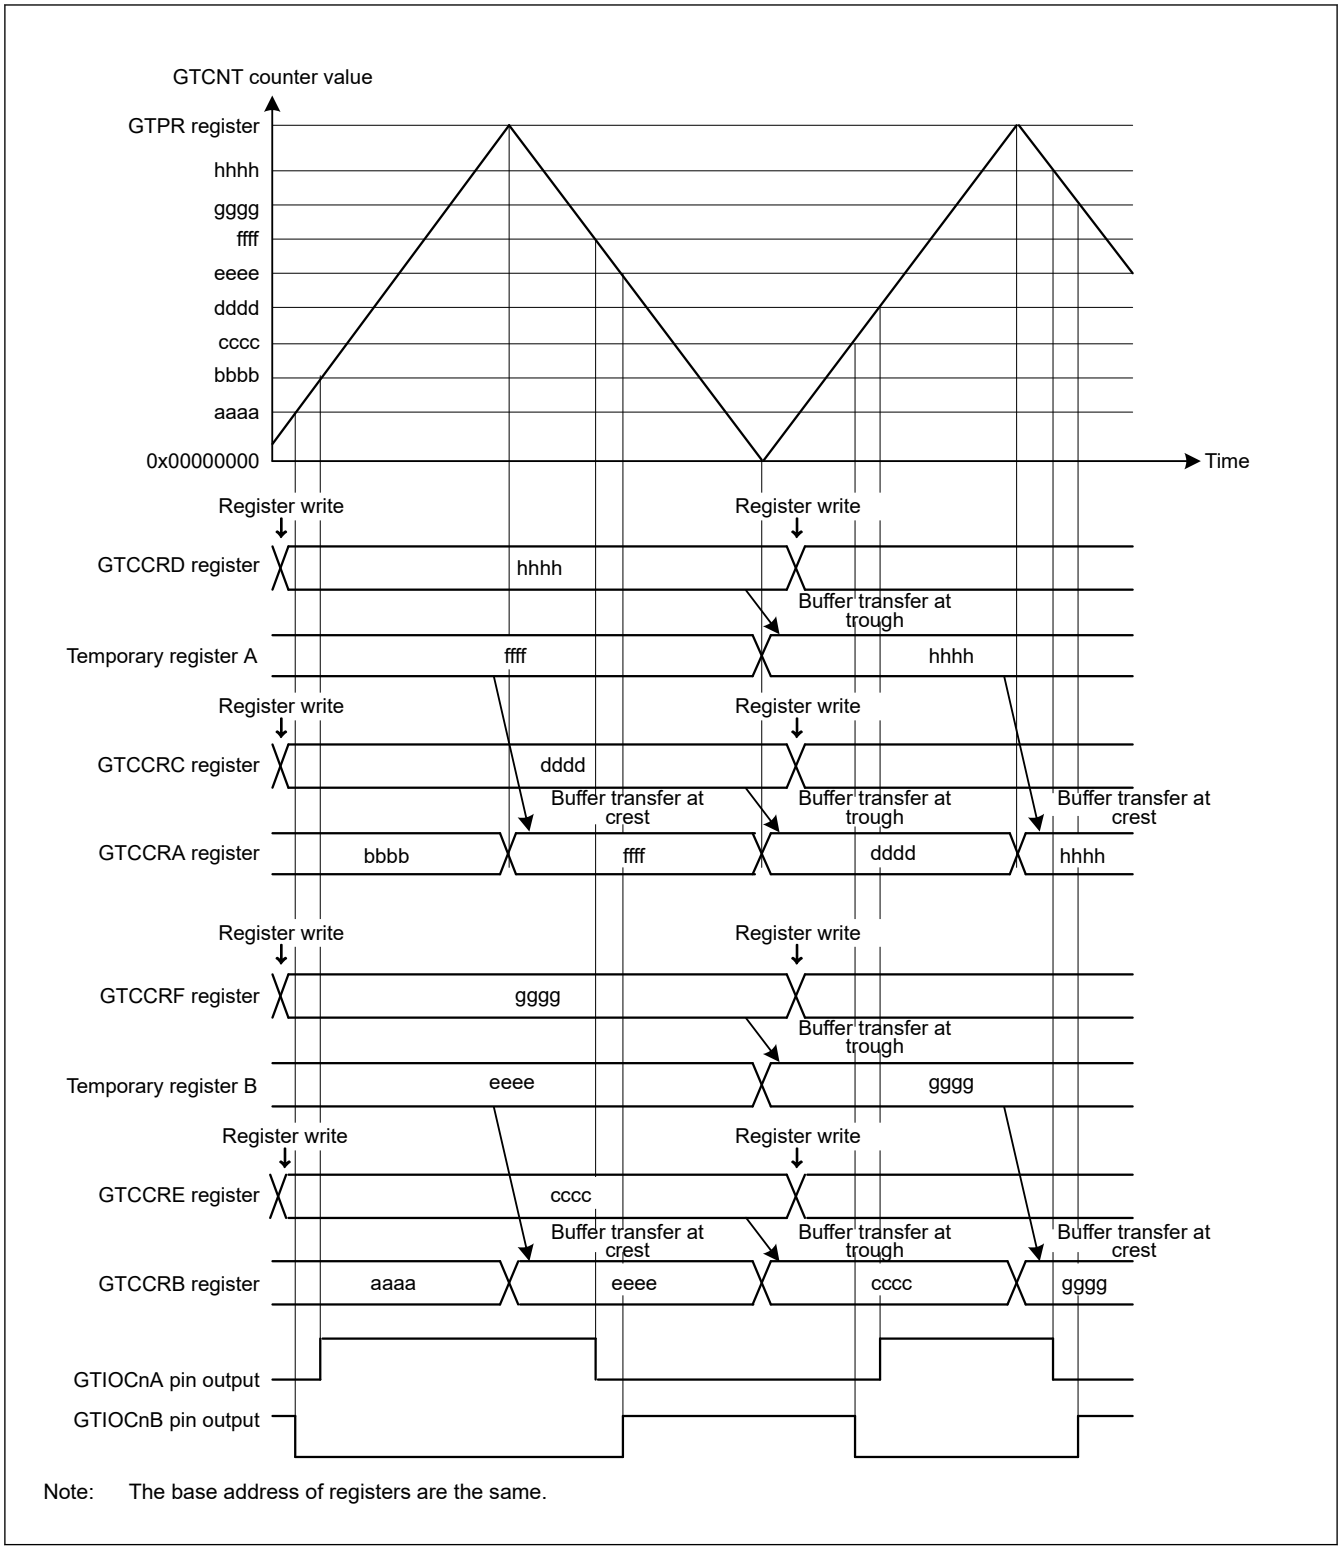
| 10 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 11 | Set buffer value for each half cycle | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.<br>For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in GTCCRD and GTCCRF registers, respectively. |

Note: n: 0 to 5
m: A, B

### 20.3.3.5 Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)



The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 5) at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 20.23 shows an example of triangle-wave PWM mode 3 operation, and Table 20.19 shows an example for setting triangle-wave PWM mode 3.

Note: The base address of registers are the same.

**Figure 20.23 Example of triangle-wave PWM mode 3 operation with low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end**

**Table 20.19 Example setting for triangle-wave PWM mode 3 (1 of 2)**

| No. | Step name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.23, 110b (triangle-wave PWM mode 3) is set. |
| 2 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |

| 3 | Set cycle | Set the cycle in the GTPR register. |
| 4 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 5 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 20.23, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b. |
| 6 | Enable GTIOCnm pin output | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 7 | Set compare match value | Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers. |
| 8 | Set forcible buffer transfer | Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly. |
| 9 | Set buffer value | Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers. |
| 10 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 11 | Set buffer value for each cycle | Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers. |

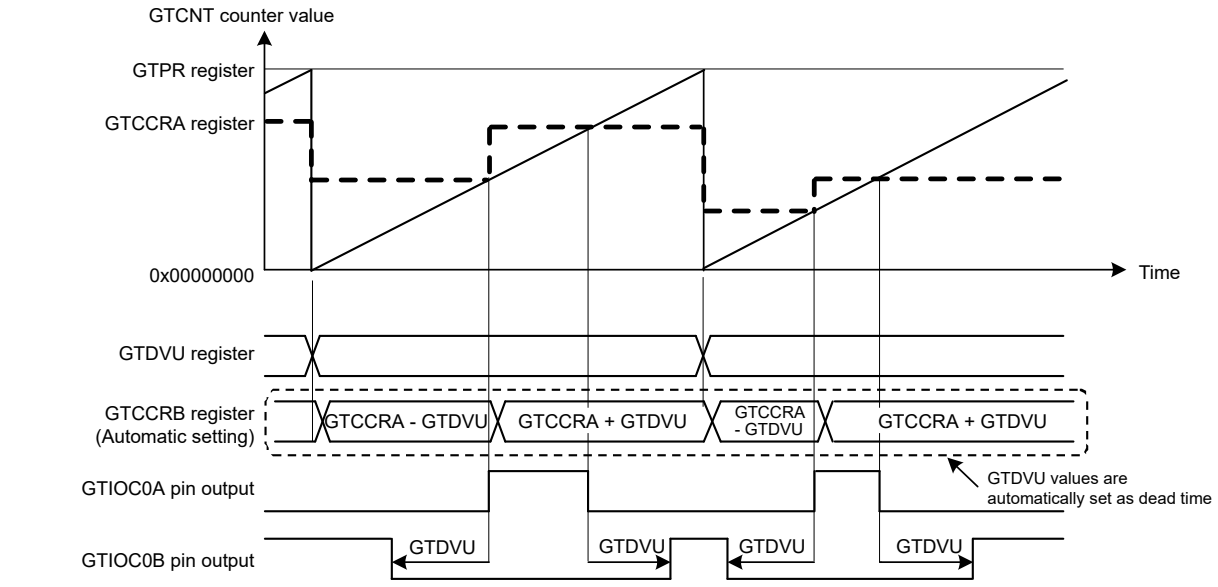
Note: n: 0 to 5
m: A, B

## 20.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time value (GTDVU value) can automatically be set to GTCCRB. The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Writing to GTCCRB is prohibited when the automatic dead time setting function is used. Dead time setting beyond the cycle is also prohibited. Values for automatic dead time setting can be read from GTCCRB. In triangle-wave mode, when the dead time is beyond the cycle by setting the value GTCCRA = 0 or GTCCRA ≥ GTPR for GTCCRA, the output protection function keeps the level of output. For details, see section 20.7.3. GTIOCnm Pin Output Negate Control (n = 0 to 5, m = A, B). The automatic dead time value setting to GTCCRB is performed at the next clock cycle count when registers that are used for calculating the automatic dead time value are updated.

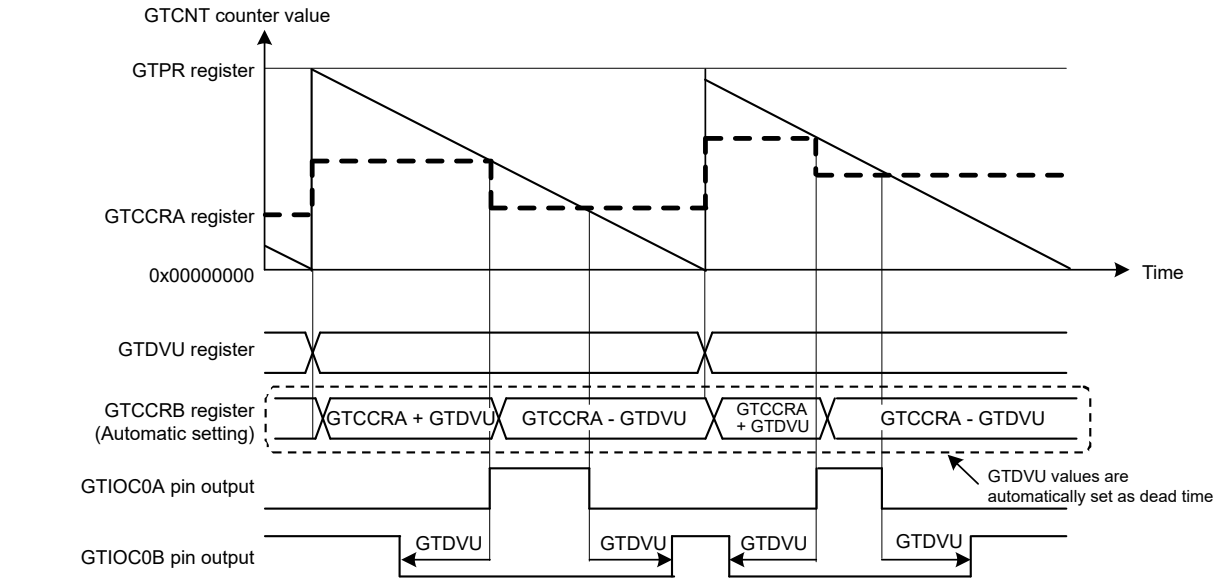
When a dead time error occurs, the compare match values for positive and negative waveforms are adjusted to generate the waveforms with the dead time as shown in Table 20.20.



The adjusted value for the negative waveform is set for GTCCRB automatically.

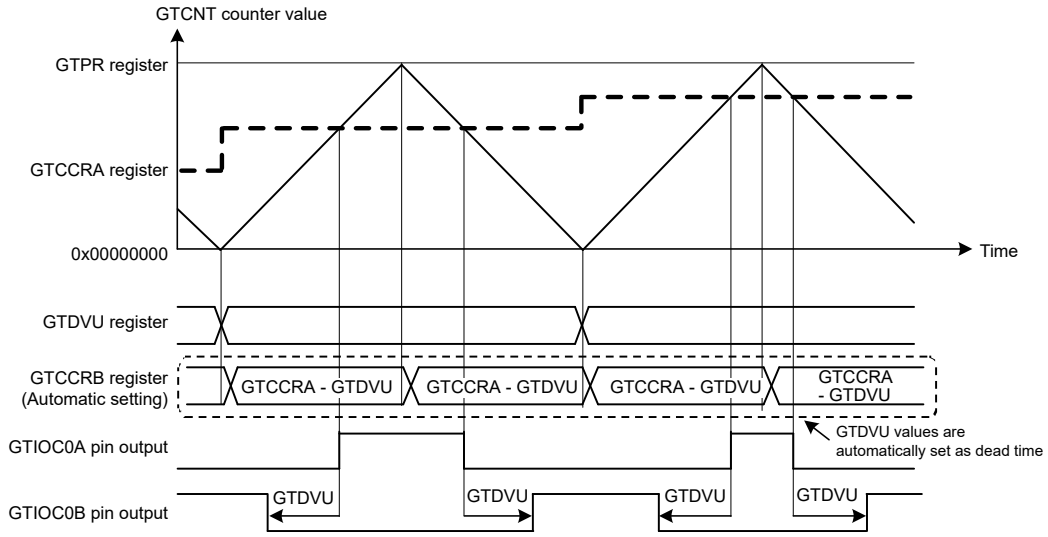
The adjusted value for the positive waveform is used as internal signal and not set for GTCCRA.

**Table 20.20 Adjustment of the waveform change point when a dead-time error occurs**



| Mode | Count direction | Period | Condition for dead time error | Change point of the positive-phase waveform after adjustment | Change point of the negative-phase waveform after adjustment |
|---|---|---|---|---|---|
| Sawtooth-wave one-shot pulse mode | Up-counting | First half | GTCCRA - GTDVU < 0 | GTDVU | 0 |
| | | Second half | GTCCRA + GTDVU > GTPR | GTPR - GTDVU | GTPR |
| | Down-counting | First half | GTCCRA + GTDVU > GTPR | GTPR - GTDVU | GTPR |
| | | Second half | GTCCRA - GTDVU < 0 | GTDVU | 0 |
| Triangle-wave PWM mode 1/2/3 | Up-counting | (First half) | GTCCRA - GTDVU ≤ 0 | GTDVU + 1 | 1 |
| | Down-counting | (Second half) | GTCCRA - GTDVU < 0 | GTDVU | 0 |

Figure 20.24 to Figure 20.27 show examples of automatic dead time setting function operation. Table 20.21 and Table 20.22 show the setting examples.



Note: The base address of registers are the same.

**Figure 20.24 Example of automatic dead time setting function operation in saw-wave one-shot pulse mode, up-counting, and active-high**

Note: n: 0 to 5
m: A, B

## 20.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected in the count cycle during up-counting and the GTPR value after the start of down-counting is reflected in the count cycle during down-counting.

Figure 20.28 shows an example of count direction changing function operation.

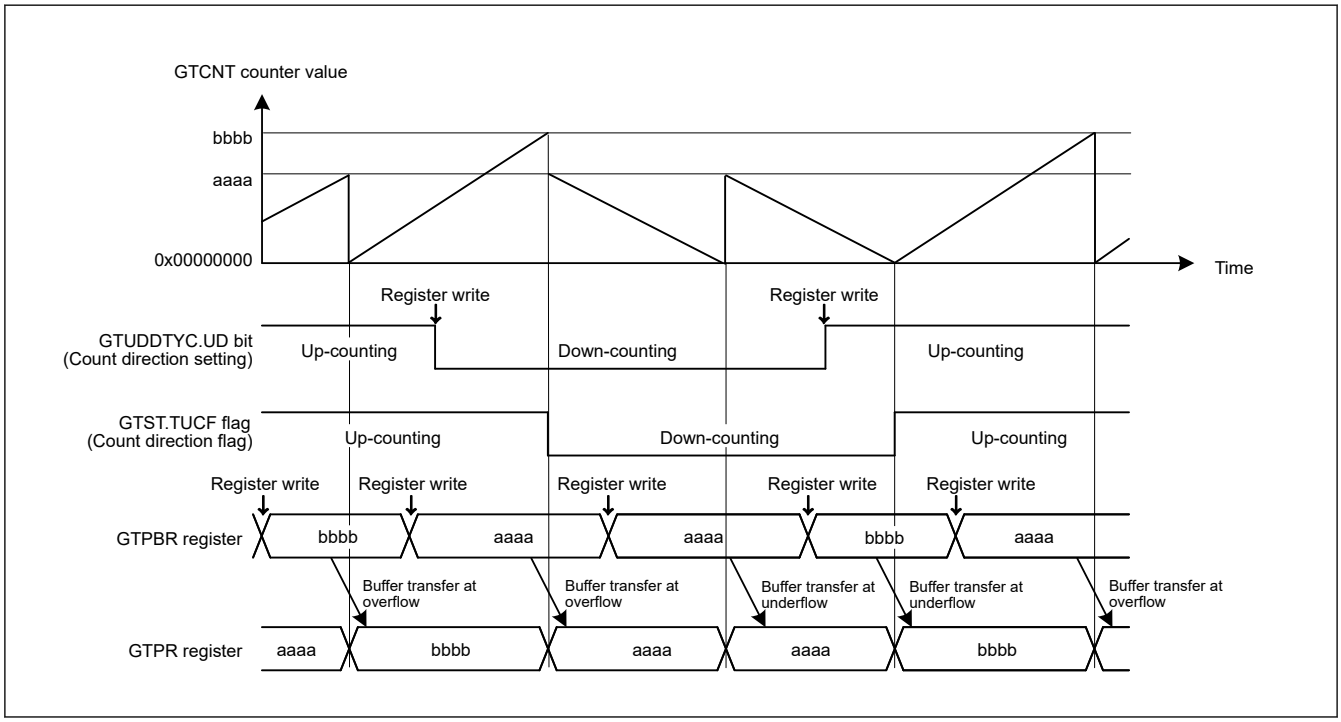

**Figure 20.28 Example of a count direction changing function operation during buffer operation**

### 20.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCnA pin and the GTIOCnB pin (n = 0 to 5) are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

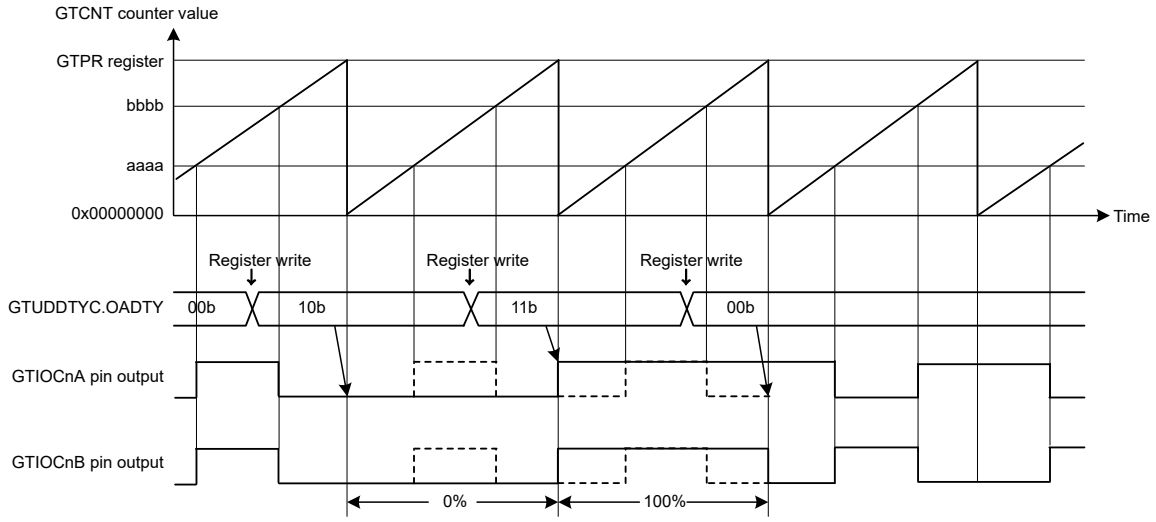
In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0% or 100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCnA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCnB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.



When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). Table 20.23 shows the values of GTIOCnA and GTIOCnB pin output at cycle end.

**Table 20.23 Output values after releasing 0% or 100% duty setting (m = A, B)**

| GTIOR.GTIOm[3:2] | Compare match value at cycle end masked by 0% or 100% duty setting | GTUDDTYC.OmDTYR in duty 0% setting | | GTUDDTYC.OmDTYR in duty 100% setting | |
|---|---|---|---|---|---|
| | | 0 | 1 | 0 | 1 |
| 00 (output retained at cycle end) | 0 | 0 | 0 | 1 | 0 |
| | 1 | 0 | 1 | 1 | 1 |
| 01 (low output at cycle end) | — | 0 | 0 | 0 | 0 |
| 10 (high output at cycle end) | — | 1 | 1 | 1 | 1 |
| 11 (output toggled at cycle end) | 0 | 1 | 1 | 0 | 1 |
| | 1 | 1 | 0 | 0 | 0 |

Figure 20.29 shows an example of output duty 0% and 100% function.

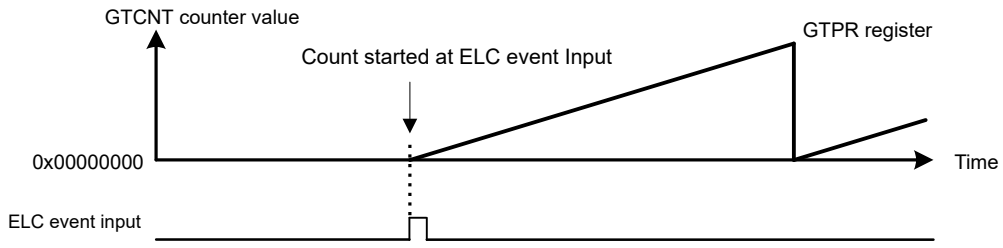
Note: The base address of registers are the same.

Note: [Setting examples]

| | |
|---|---|
| GTIOR.GTIOA[4:0] bits: | 00011b<br>initial low output, output toggled at compare match, output retained at cycle end |
| GTUDDTYC.OADTYR bit: | 0b<br>The function selected by GTIOA[3:2] is applied to the output value when the duty cycle is set after release from 0 or 100% duty-cycle setting. |
| GTIOR.GTIOB[4:0] bits: | 00011b<br>initial low output, output toggled at compare match, output retained at cycle end |
| GTUDDTYC.OBDTYR bit: | 1<br>The function of GTIOB[3:2] is applied to the compare match output value which is masked after 0 or 100% duty setting release. |

**Figure 20.29 Example of output duty 0% and 100% function**

## 20.3.7 Hardware Count Start/Count Stop and Clear Operation



The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- ELC event input
- GTIOCnA and GTIOCnB pin input (n = 0 to 5).

### 20.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 20.30 shows an example of a count start operation by a hardware source. Table 20.24 shows the setting example.

Note: ELC event input: ELC_GPTA event input

**Figure 20.30 Example of count start operation by a hardware source started at the input of the signal from the ELC_GPTA event**

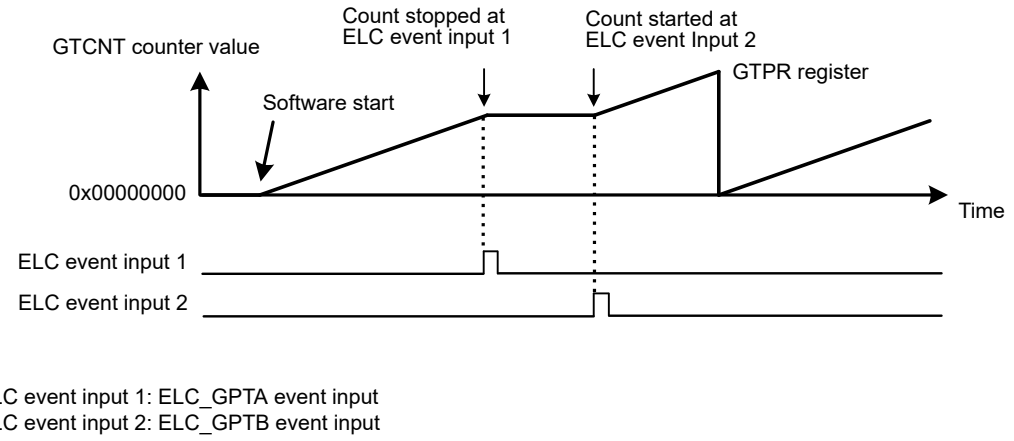


**Table 20.24 Example setting for count start operation by a hardware source**

| No. | Step Name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.30, 000b (saw-wave PWM mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.30, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 20.30, 0x00000000 is set. |
| 6 | Set hardware count start | Select a hardware source for starting count operation in the GTSSR register.<br>In Figure 20.30, GTSSR.SSELCA = 1 |
| 7 | Set hardware source operation | Set operation of the hardware source selected by the GTSSR register and start counting.<br>In Figure 20.30, the ELC_GPTA event input operation is set. |

### 20.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR.

Figure 20.31 shows an example of a count stop operation by a hardware source. Table 20.25 shows the setting example. In this example, the count operation stops at the ELC_GPTA event input and restarts at the ELC_GPTB event input.

Note: ELC event input 1: ELC_GPTA event input
ELC event input 2: ELC_GPTB event input

**Figure 20.31 Example of count stop operation by hardware source started by software, stopped at ELC_GPTA input, and restarted at ELC_GPTB input**

**Table 20.25 Example setting for count stop operation by a hardware source**

| No. | Step Name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with GTCR.MD[2:0] bits.<br>In Figure 20.31, 000b (saw-wave PWM mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.31, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting). |
| 3 | Select count clock | Select the count clock with GTCR.TPCS[3:0]. |
| 4 | Set cycle | Set the cycle in GTPR. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 20.31, 0x00000000 is set. |
| 6 | Set hardware count start | Select a hardware source for starting count operation in GTSSR register, and wait for count start by the hardware source. In Figure 20.31, GTSSR.SSELCB = 1. |
| 7 | Set hardware count stop | Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. In Figure 20.31, GTPSR.PSELCA = 1. |
| 8 | Set hardware source operation | Set operation of the hardware source selected in GTSSR register or GTPSR register, and start or stop counting. In Figure 20.31, ELC_GPTA input operation and ELC_GPTB input operation are set. |

Figure 20.32 shows an example of a count start/stop operation by a hardware source. Table 20.26 shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

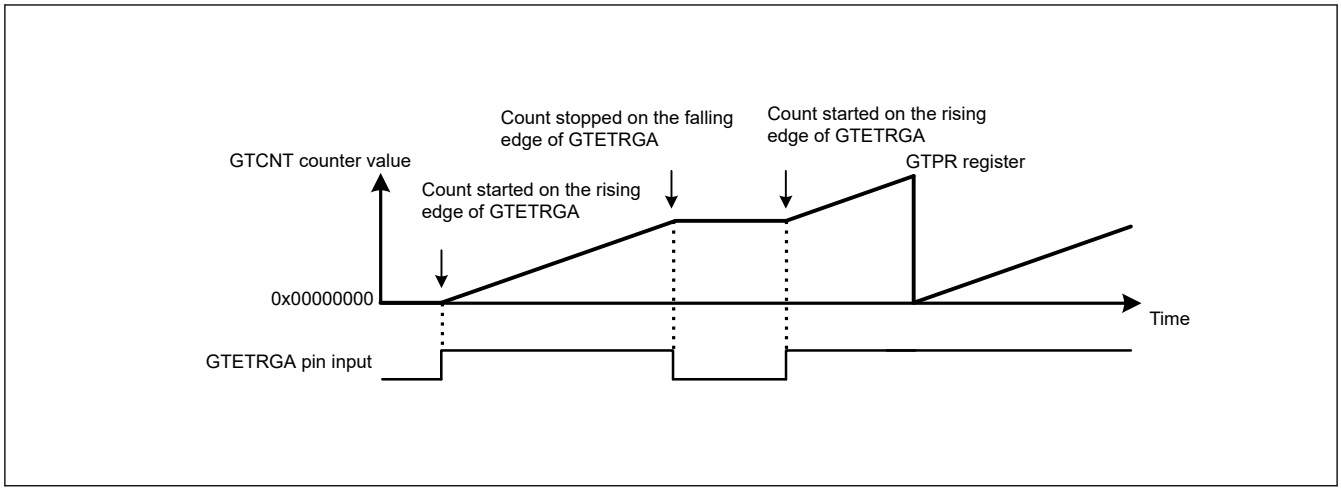

**Figure 20.32 Example of count start/stop operation by a hardware source started on the rising edge of GTETRGA pin input, and stopped on the falling edge of GTETRGA pin input**

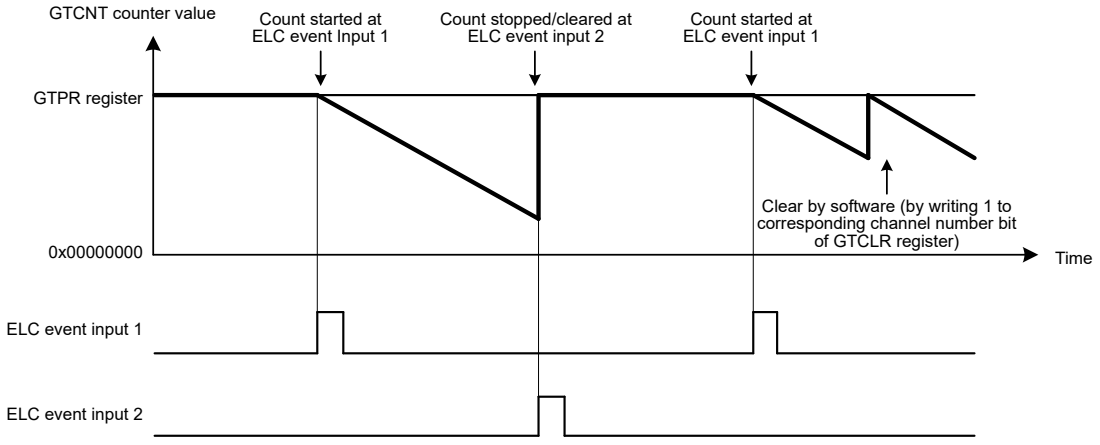
| 8 | Set hardware source operation | Set operation of the hardware source selected in the GTSSR register or GTPSR register and start or stop counting.<br>In Figure 20.32, the GTETRGA pin operation is set. |

### 20.3.7.3 Hardware Clear Operation



The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The GPTn_OVF/GPTn_UDF (n = 0 to 5) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 20.33 and Figure 20.34 show examples of the GTCNT counter clearing operation by a hardware source. Table 20.27 shows the setting example. In this example, the GTCNT counter starts at the ELC_GPTA input, and the counter stops and clears at the ELC_GPTB input.

Note: ELC event input 1: ELC_GPTA event input
ELC event input 2: ELC_GPTB event input

**Figure 20.33 Examples of count clearing operation by hardware source in saw wave up-counting, started at ELC_GPTA input, and stopped/cleared at ELC_GPTB input**

Note: ELC event input 1: ELC_GPTA event input
ELC event input 2: ELC_GPTB event input

**Figure 20.34 Examples of count clearing operation by hardware source in saw wave down-counting, started at ELC_GPTA input, and stopped/cleared at ELC_GPTB input**

**Table 20.27 Example setting for count clearing operation by a hardware source (1 of 2)**

| No. | Step name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.33 and Figure 20.34, 000b (saw-wave PWM mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.33, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).<br>In Figure 20.34, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting). |

**Table 20.27 Example setting for count clearing operation by a hardware source (2 of 2)**

| No. | Step name | Description |
|---|---|---|
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 20.33, 0x00000000 is set. In Figure 20.34, the GTPR register value is set. |
| 6 | Set hardware count start | Select a hardware source for starting count operation in the GTSSR register, and wait for count start by the hardware source. In Figure 20.33 and Figure 20.34, GTSSR.SSELCA = 1. |
| 7 | Set hardware count stop | Select a hardware source for stopping count operation in the GTPSR register, and wait for count stop by the hardware source. In Figure 20.33 and Figure 20.34, GTPSR.PSELCB = 1. |
| 8 | Set hardware count clear | Select a hardware source for clearing count operation in the GTCSR register, and wait for count clear by the hardware source. In Figure 20.33 and Figure 20.34, GTCSR.CSELCB = 1. |
| 9 | Set hardware source operation | Set operation of the hardware source selected in the GTSSR register, GTPSR register or GTCSR register and start, stop or clear counting.<br>In Figure 20.33 and Figure 20.34, the ELC_GPTA input and ELC_GPTB input are set. |

The GPTn_OVF/GPTn_UDF (n = 0 to 5) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 20.35 shows the relationship between the counter clearing by a hardware source and the GPTn_OVF (n = 0 to 5) interrupt.

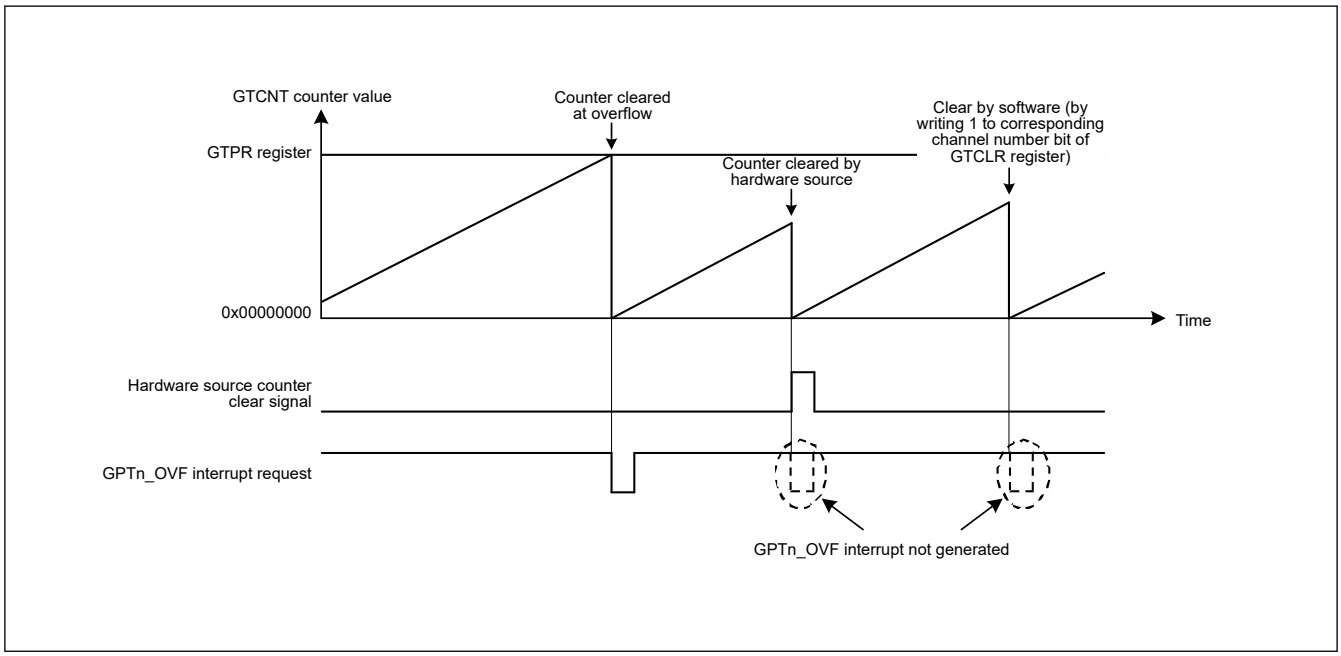


**Figure 20.35 Relationship between counter clearing by hardware source and GPTn_OVF (n = 0 to 5) interrupt**

## 20.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop, and clear operation can be performed.

### 20.3.8.1 Synchronized Operation by Software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP, or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

Because the clock of count operation is selected by GTCR.TPCS[3:0] bits in respective channels, if the clock period of each channel that performs synchronous operation (count start/stop/clear) is different from the others, the synchronous operation timings of each channel are not exactly the same.

Figure 20.36 shows an example of a simultaneous start, stop, and clear by software. Figure 20.37 shows an example of phase start operation by software. Figure 20.38, Figure 20.39, Figure 20.40 show an example of simultaneous start/stop/clearing with different count period.

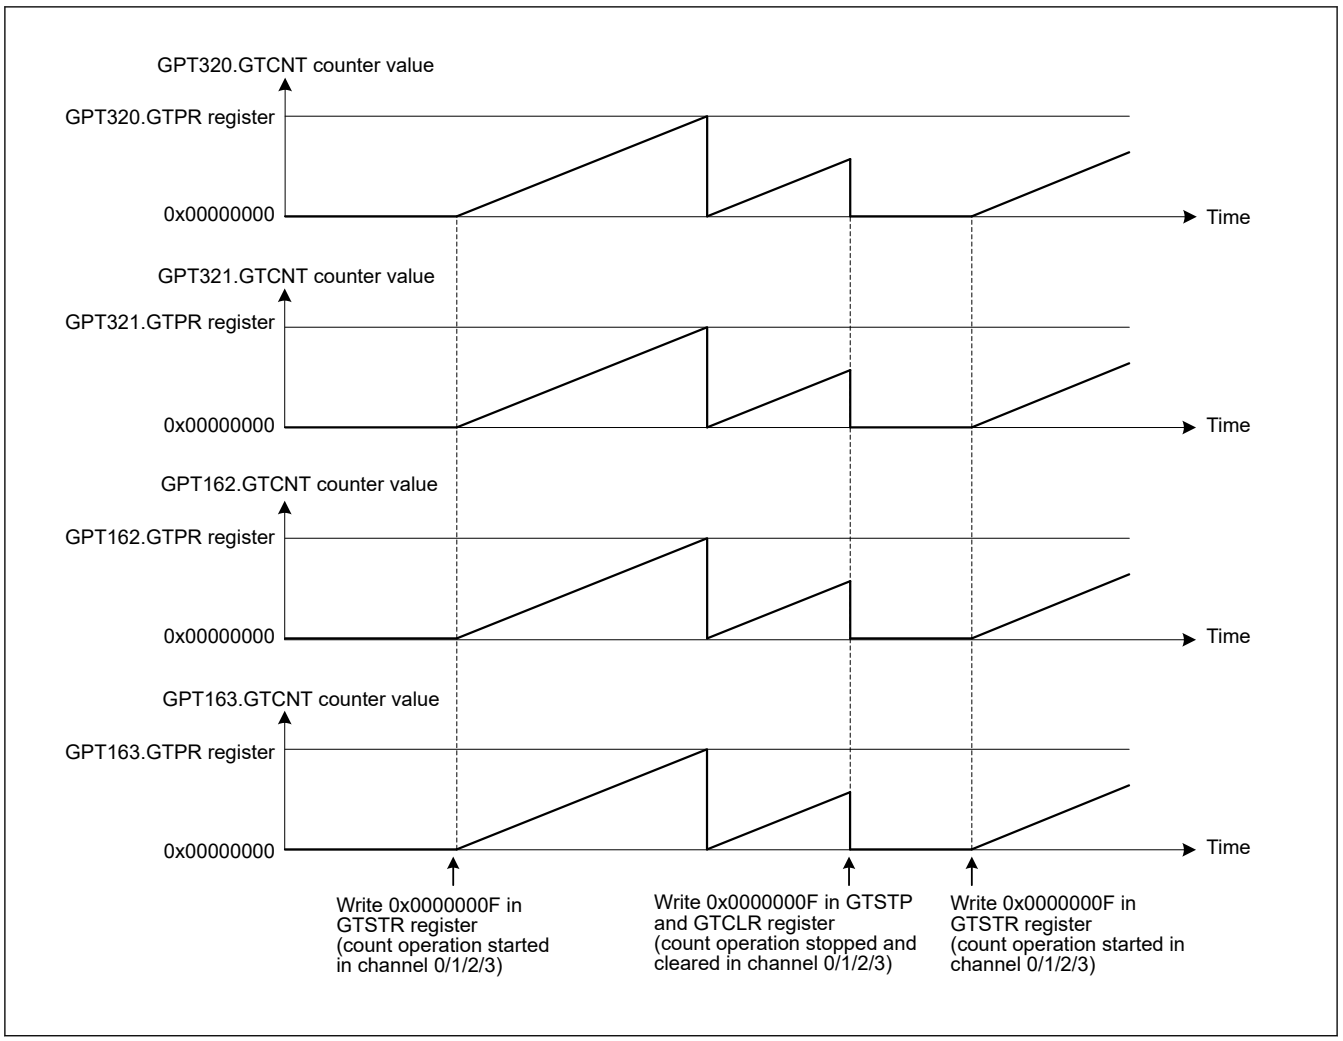

**Figure 20.36 Example of a simultaneous start, stop, and clear by software with the same count cycle (GTPR register value)**

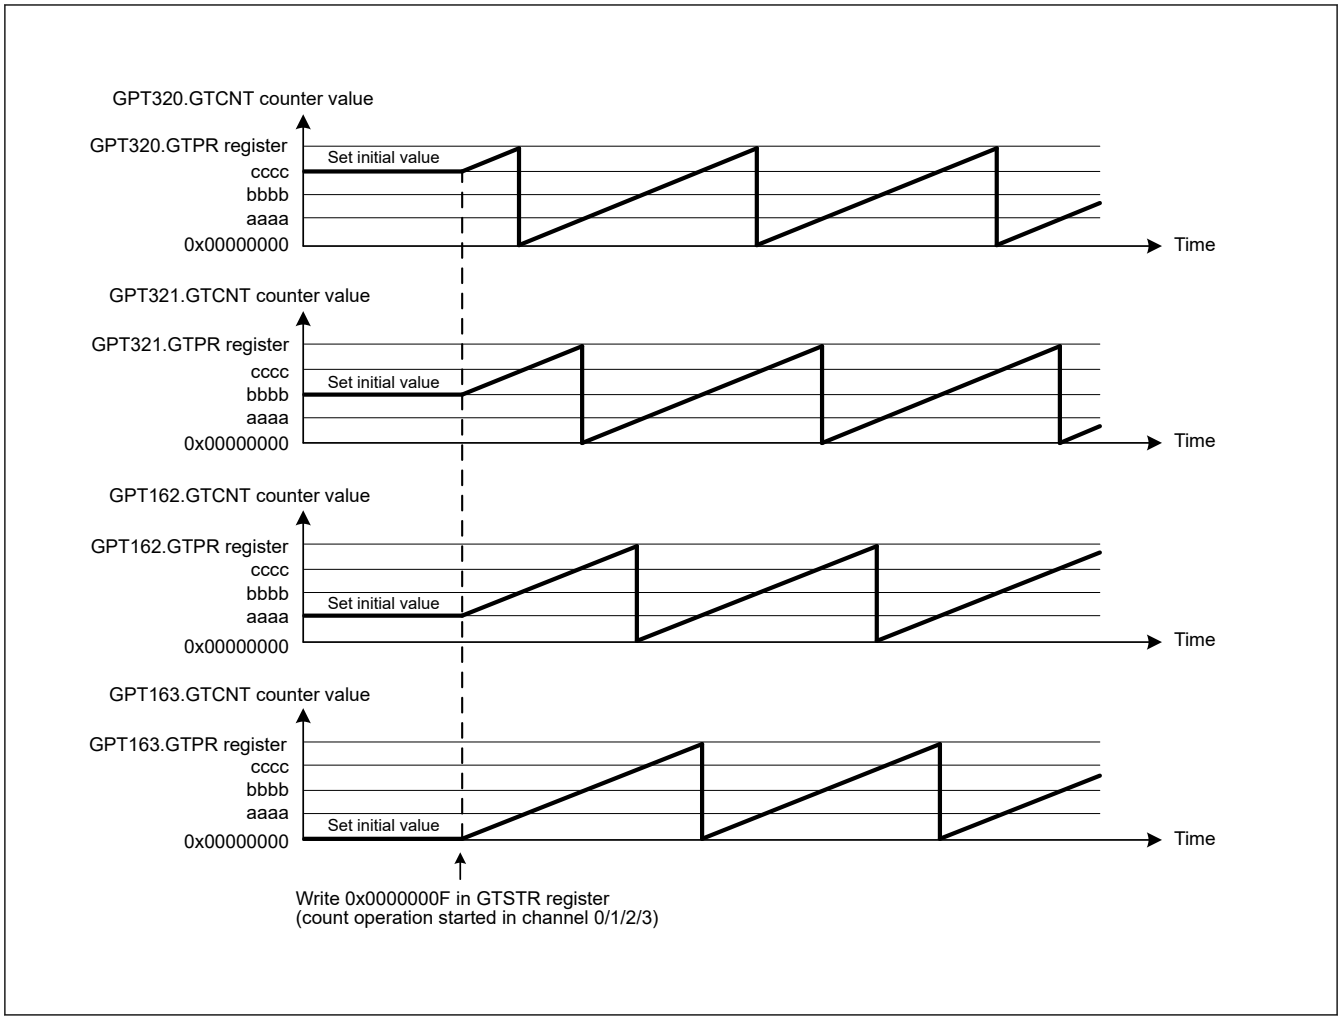

**Figure 20.37 Example of software phase start with the same count cycle (GTPR register value)**

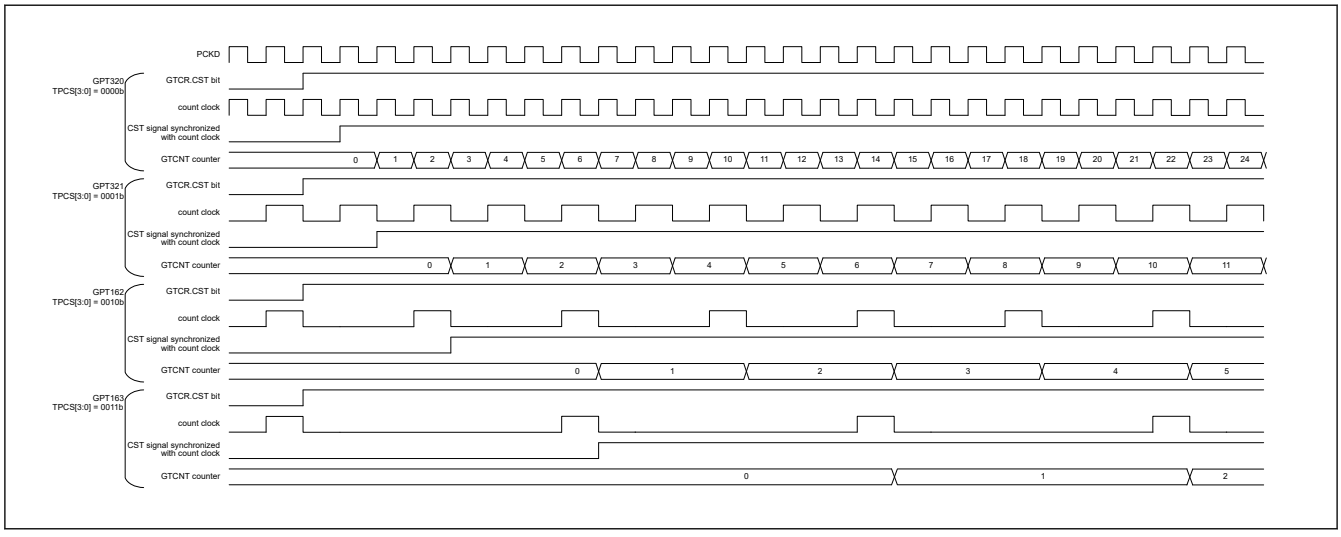

**Figure 20.38 Example of Simultaneous Start Operation by Software (with Different Count Period)**

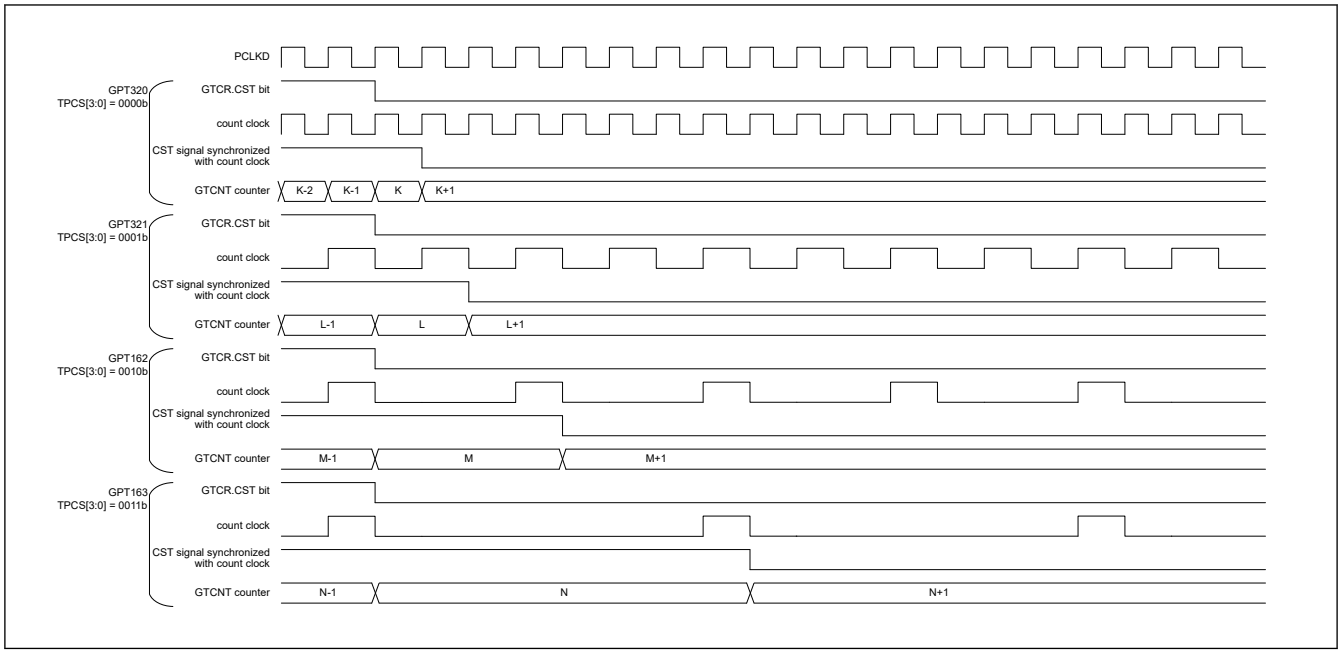

**Figure 20.39 Example of Simultaneous Stop Operation by Software (with Different Count Period)**

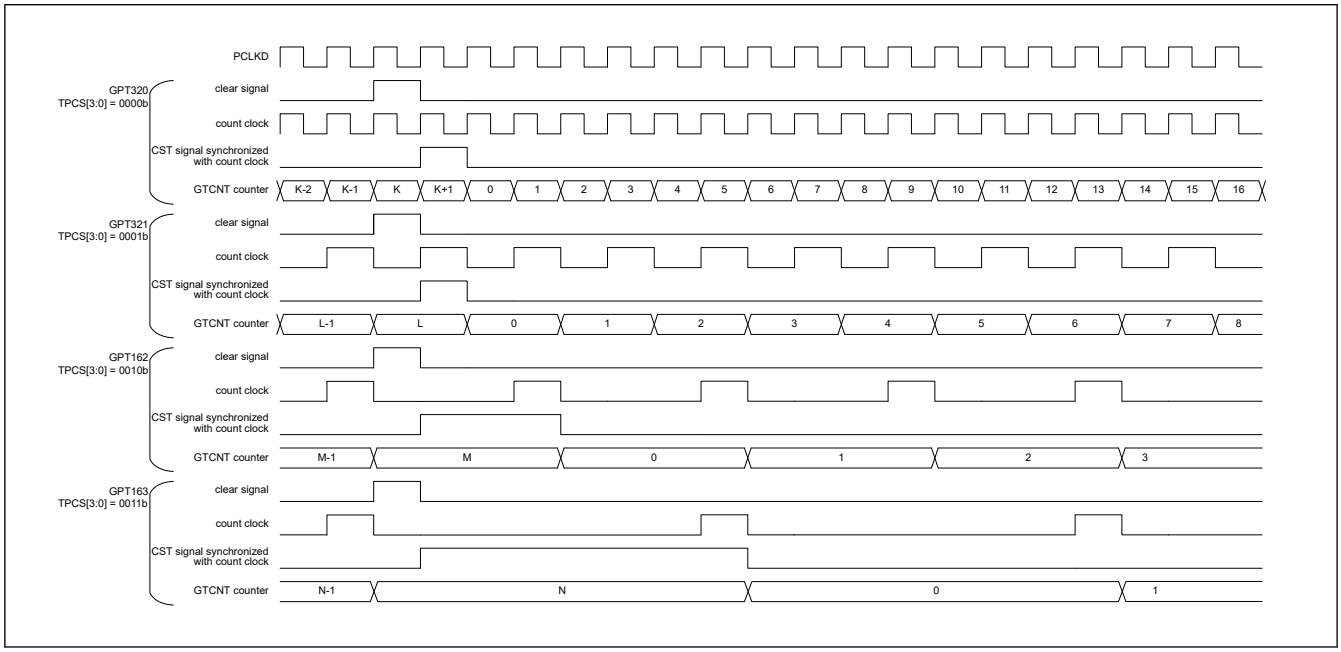

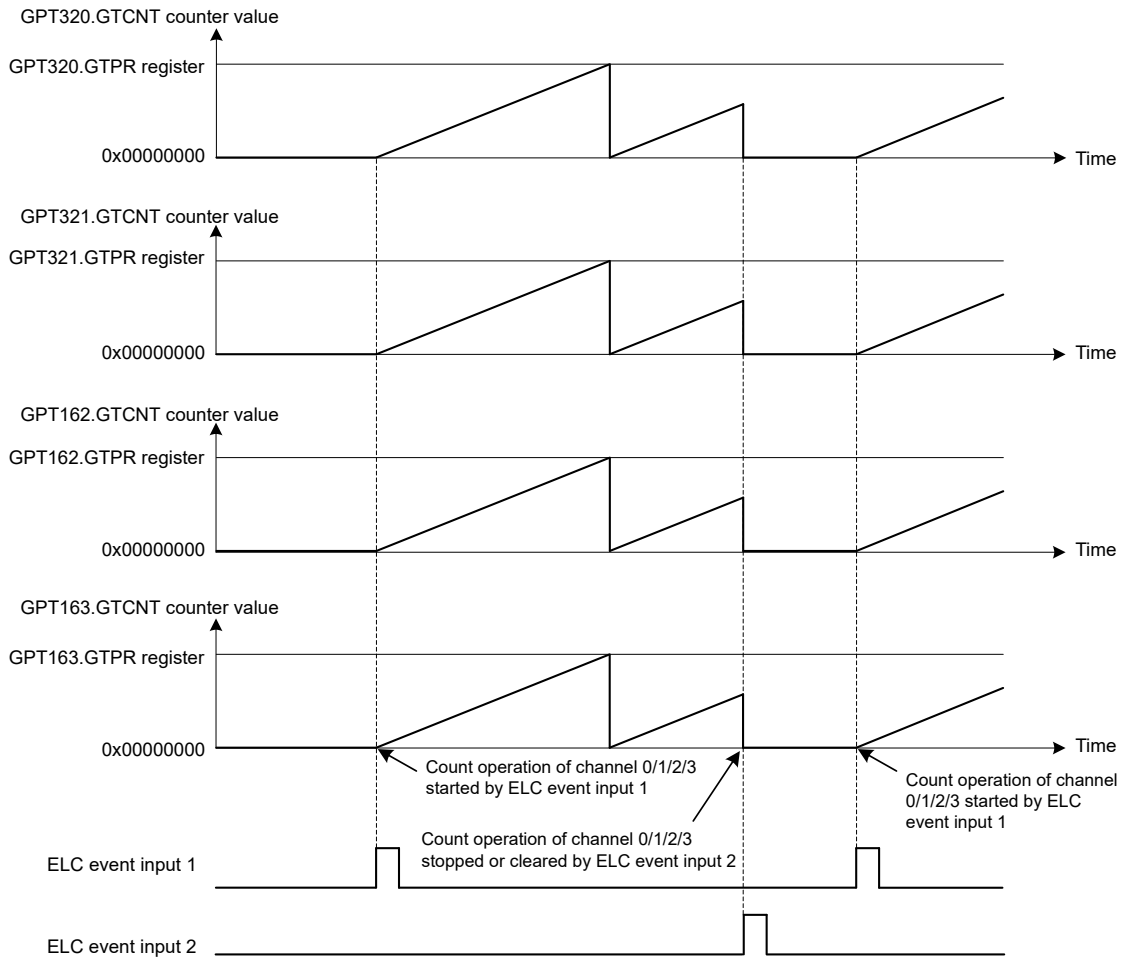

**Figure 20.40 Example of Simultaneous Clearing Operation by Software (with Different Count Period)**

### 20.3.8.2 Synchronized Operation by Hardware

The counters for multiple channels can be started, stopped, and cleared simultaneously by the following hardware sources. Hardware sources that can cause a synchronized operation are external trigger input and ELC event input. Synchronized operation through the GTIOCnA and GTIOCnB pin inputs is possible by setting an ELC event due to input capture as a hardware source (n = 0 to 5).

Figure 20.41 shows an example of a simultaneous start, stop, and clear operation by a hardware source. Table 20.28 shows the setting example.

Note: ELC event input 1: ELC_GPTA event input
ELC event input 2: ELC_GPTB event input

**Figure 20.41 Example of a simultaneous start, stop, and clear by a hardware source with the same count cycle (GTPR register value)**

**Table 20.28 Example setting for simultaneous start by a hardware source (1 of 2)**

| No. | Step name | Description |
|---|---|---|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 20.41, 000b (saw-wave PWM mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 20.41, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 20.41, 0x00000000 is set. |
| 6 | Set hardware count start | Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source.<br>In Figure 20.41, GTSSR.SSELCA = 1. |

| 8 | Set hardware count clear | Select a hardware source for clearing count operation with the GTCSR register, and wait for count clear by the hardware source.<br>In Figure 20.41, GTCSR.CSELCB = 1. |
| 9 | Set hardware source operation | Set operation of the hardware source selected in the GTSSR, GTPSR, or GTCSR registers, and start, stop, or clear counting.<br>In Figure 20.41, ELC_GPTA input and ELC_GPTB input are set. |

## 20.3.9 PWM Output Operation Examples

### (1) Synchronized PWM output

The GPT outputs 8 × 2 phases of linked PWM waveforms for a maximum of GPT × 8 channels.

Figure 20.42 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

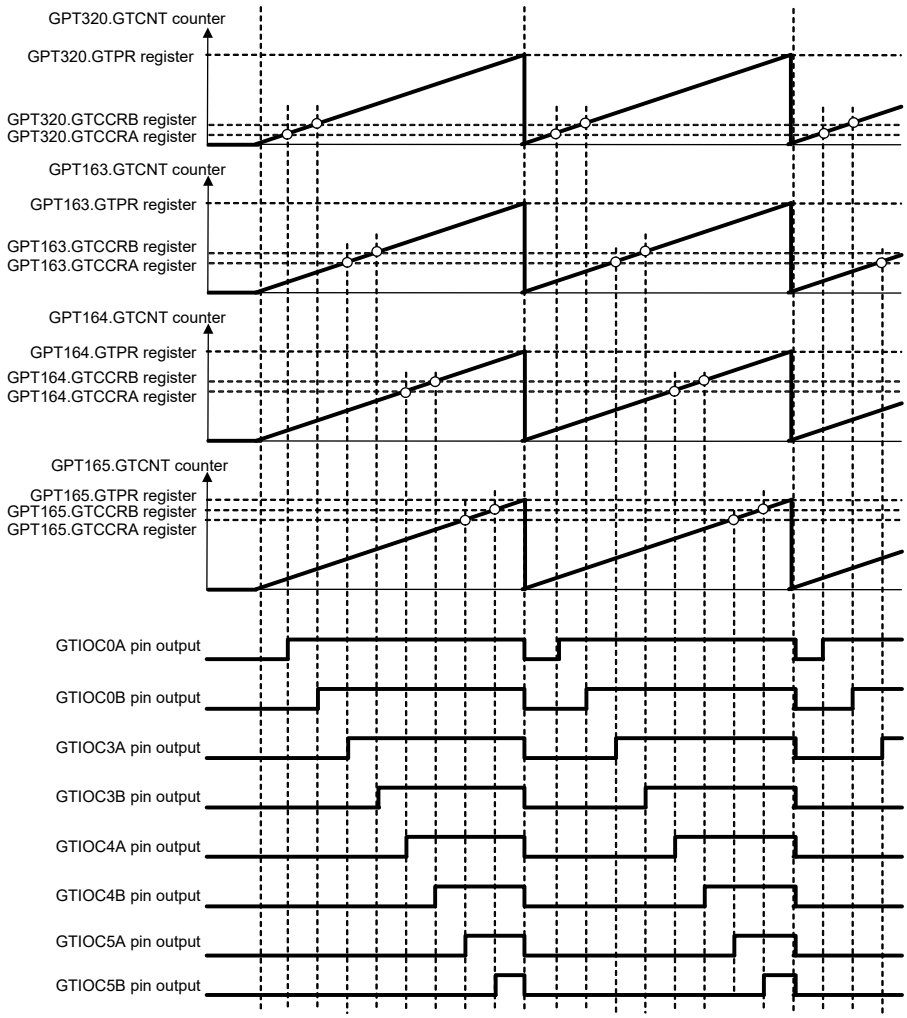

**Figure 20.42 Example of synchronized PWM output**

## (2) 3-phase saw-wave complementary PWM output

Figure 20.43 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

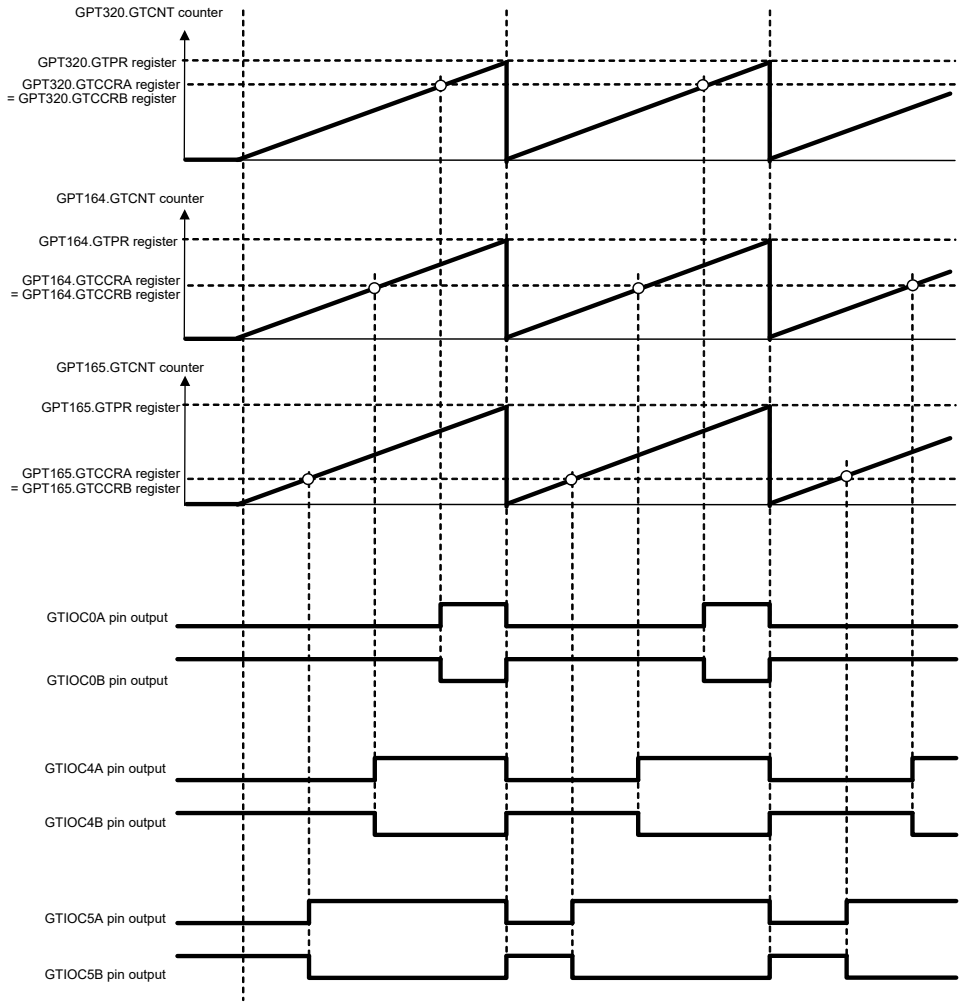

**Figure 20.43 Example of 3-phase saw-wave complementary PWM output**

### (3) 3-phase saw-wave complementary PWM output with automatic dead time setting

Figure 20.44 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTIOCnB compare match, and retains the output at the cycle end.

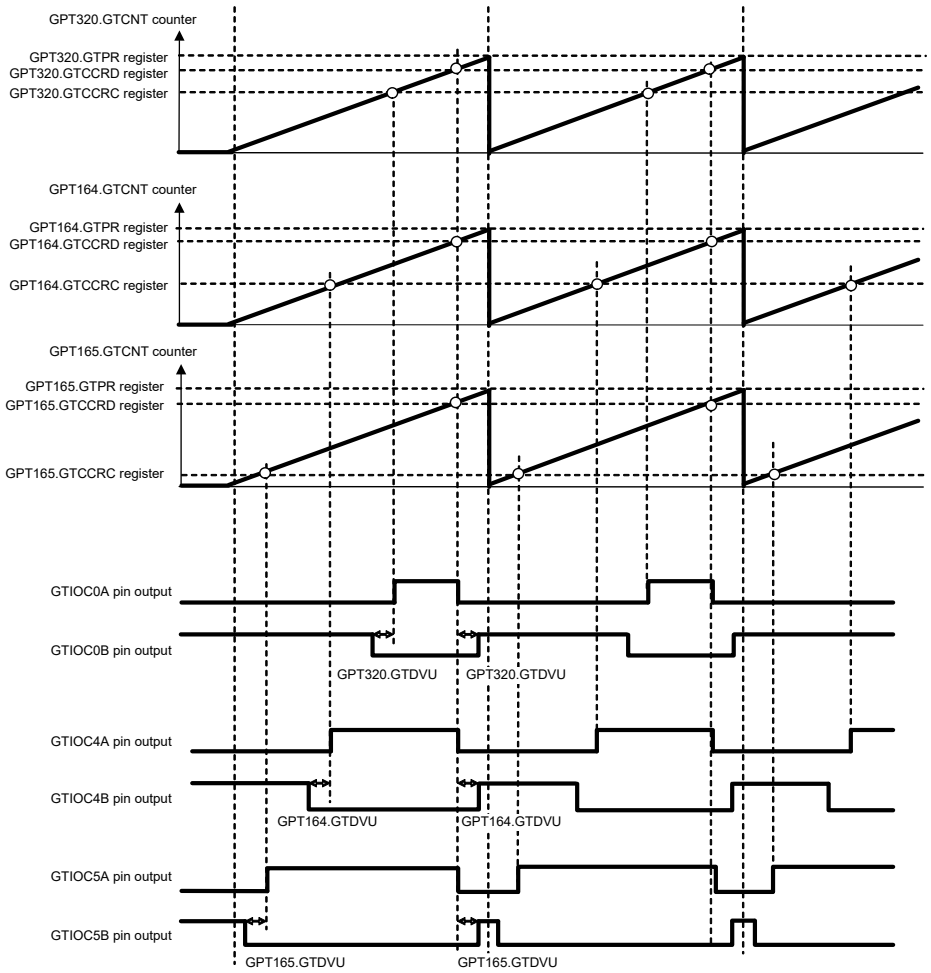

**Figure 20.44 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting**

## (4) 3-phase triangle-wave complementary PWM output

Figure 20.45 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

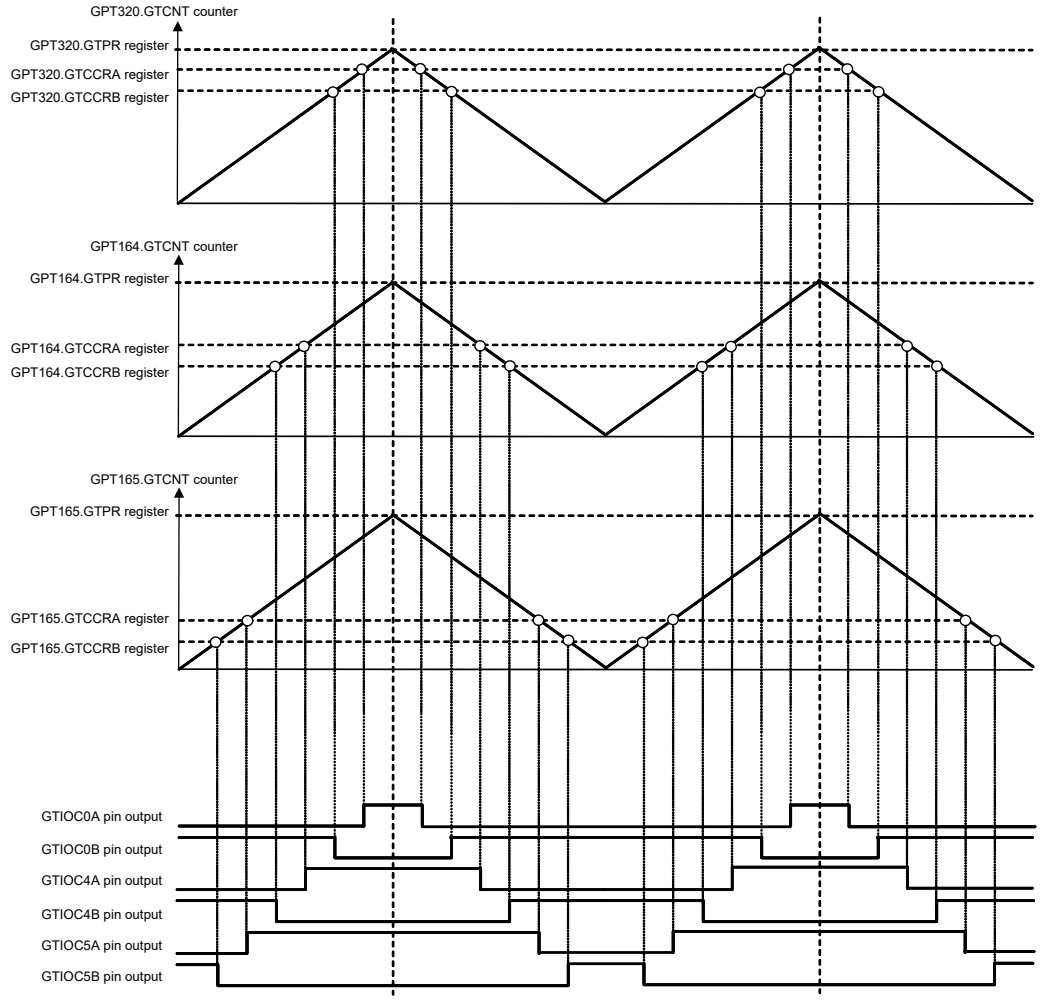

**Figure 20.45 Example of 3-phase triangle-wave complementary PWM output**

## (5) 3-phase triangle-wave complementary PWM output with automatic dead time setting

Figure 20.46 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

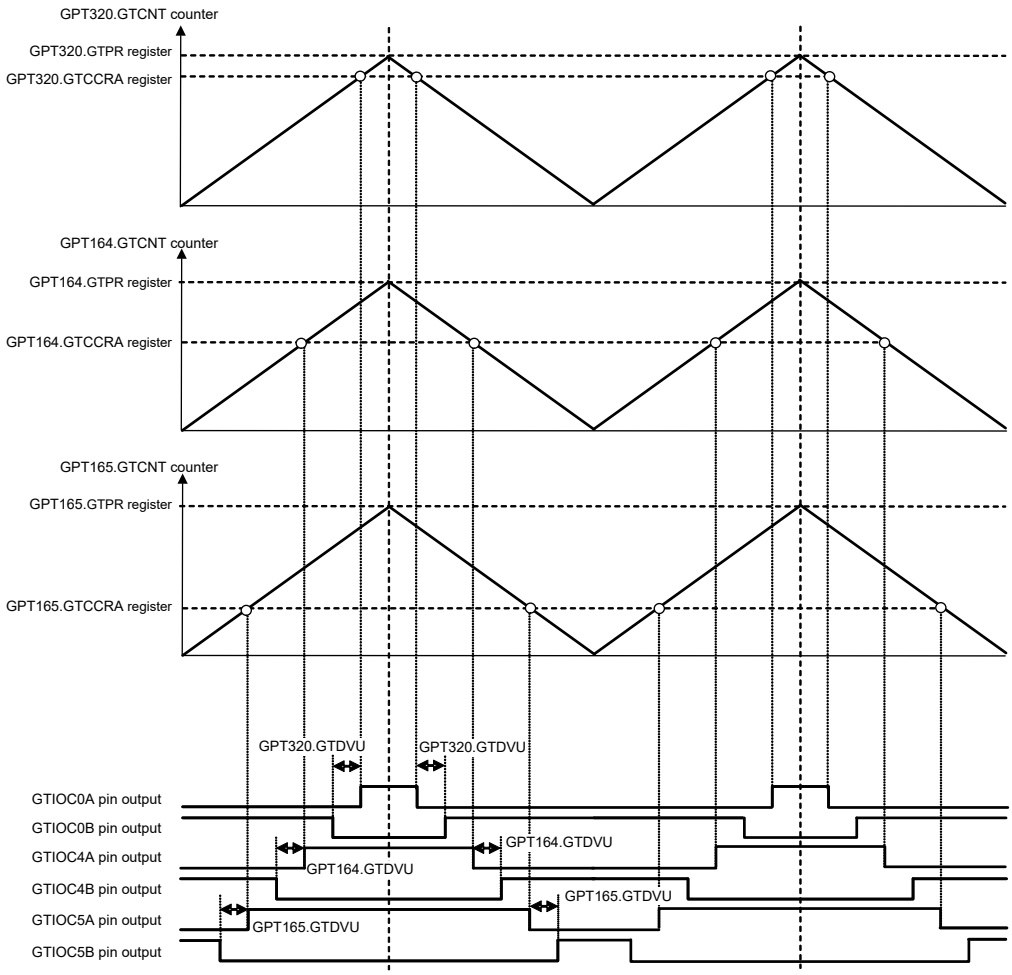

**Figure 20.46 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting**

## (6) 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

Figure 20.47 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

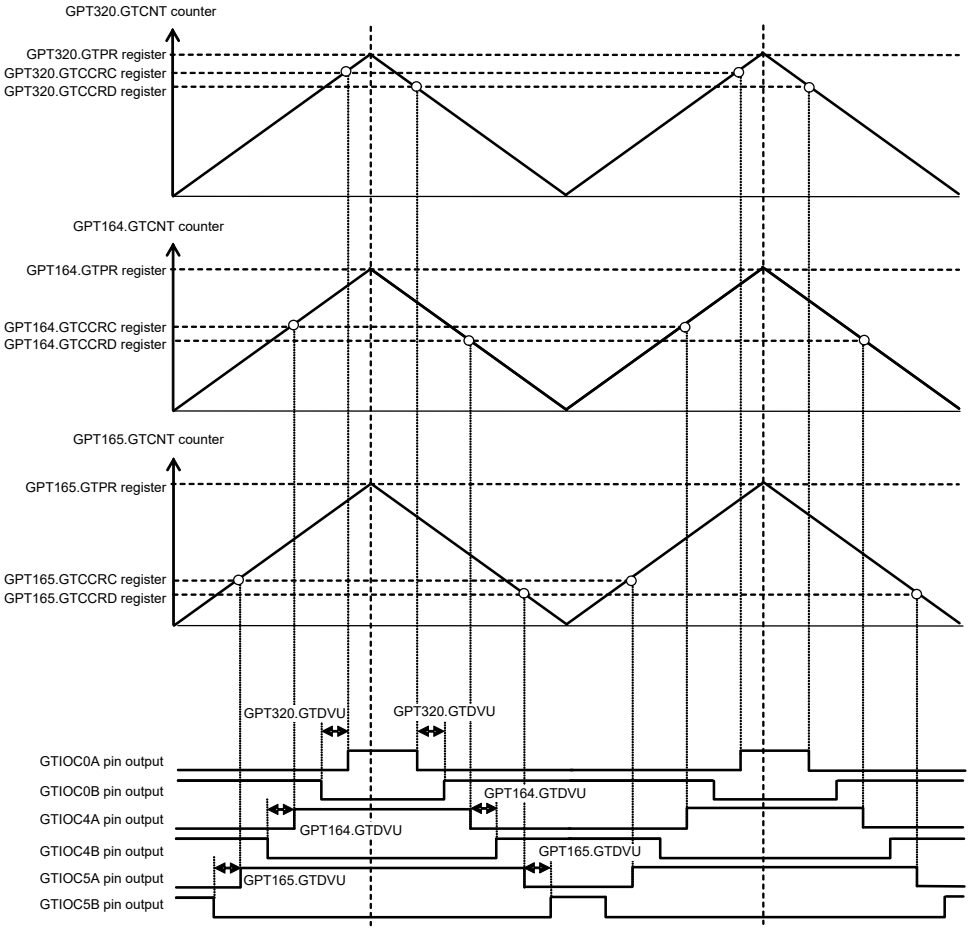

**Figure 20.47 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting**

## 20.3.10 Period Count Function

By setting the GTPC register, the end of period can be counted.

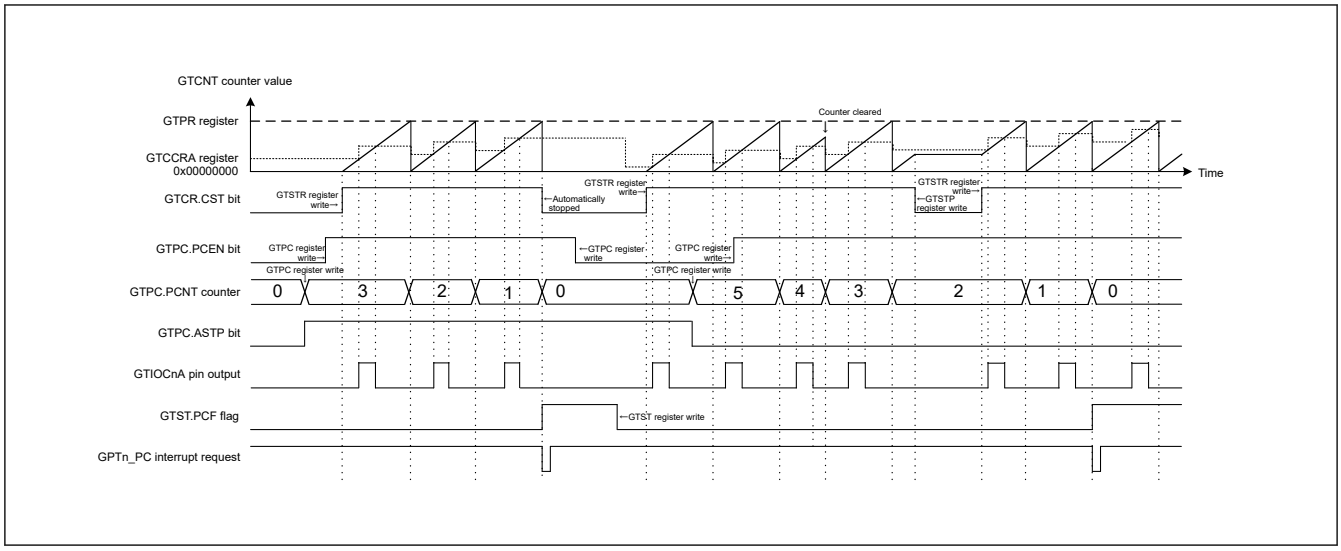
The number of period to be counted should be set into the GTPC.PCNT counter when the GTPC.PCEN bit is 0. When the PCEN bit is 1, the PCNT counter can be read, but writing is disabled. When the PCEN bit is 1, down-counting is performed at the end of period. When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped to finish the period count function. At that time, the GTST.PCF flag is set, and the period count function finish interrupt request GPTn_PC is generated. When the GTPC.ASTP bit is 1, the GTCNT counter is also stopped at the same time that the period count function is finished.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

When either GTSECR.SPCE bit or GTSECR.SPCD bit is set to 1, the PCEN bit in the channels set to 1 by the GTSECSR register is simultaneously set the value to enable or disable the period count function for multiple channels.

Figure 20.48 and Figure 20.49 show examples of PWM cycle count function.



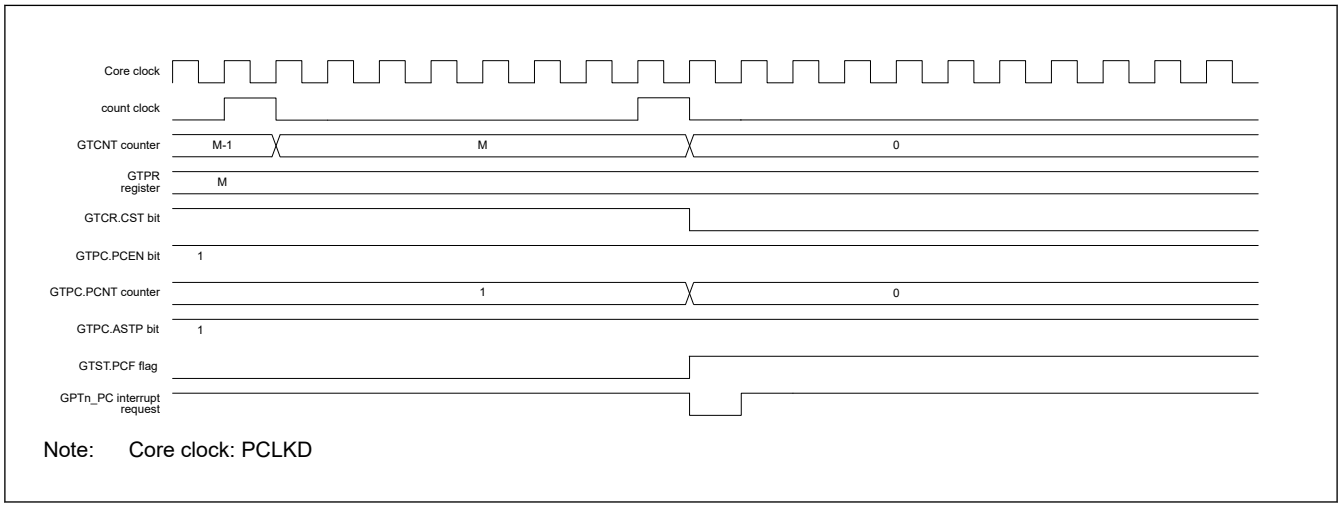


**Figure 20.48 Example of PWM cycle count function (saw-wave one-shot pulse mode)**

Note: Core clock: PCLKD

**Figure 20.49 Example of the timing of operations for PWM cycle count function (saw-wave one-shot pulse mode, up-counting)**

## 20.3.11 Phase Counting Function

The phase difference between the GTIOCnA and GTIOCnB pin (n = 0 to 5) inputs is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOCnA and GTIOCnB pin inputs being set in the GTUPSR and GTDNSR registers. For details on count operation, see section 20.3.1.1. Counter operation.

Figure 20.50 to Figure 20.59 show an example of phase counting modes 1 to 5 operation when the GTIOCnA, GTIOCnB pins are used. Table 20.29 to Table 20.38 show conditions of up-counting or down-counting and list settings for the GTUPSR and GTDNSR registers which is corresponding to Figure 20.50 to Figure 20.59.

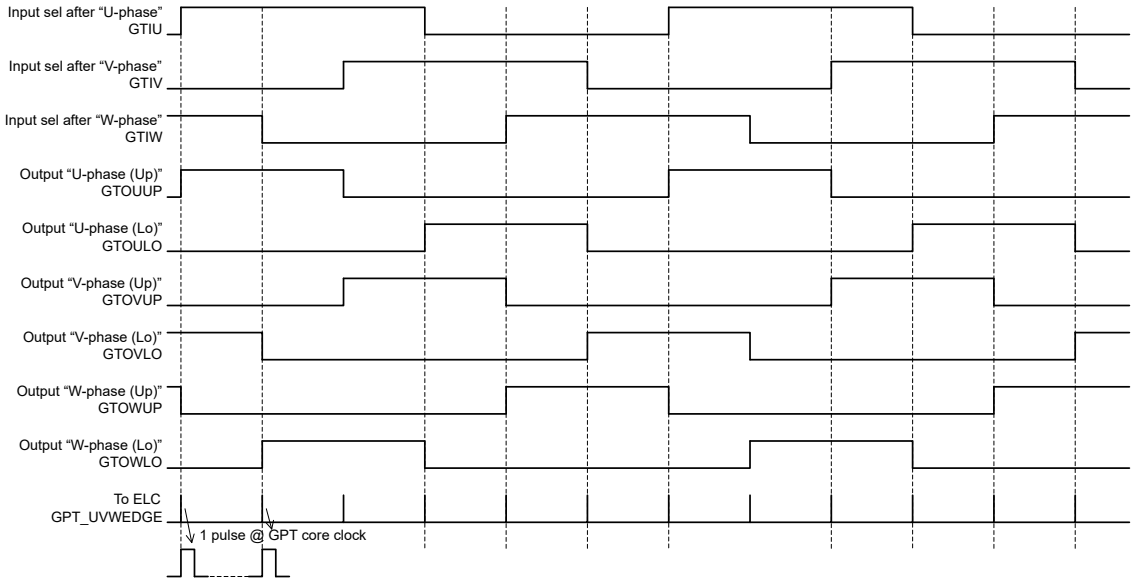
## 20.3.12 Output Phase Switching (GPT_OPS)

GPT_OPS provides a function for easy control of brushless DC motor operation using the Output Phase Switching Control Register (OPSCR).

GPT_OPS outputs a PWM signal to be used for chopper control or level signal for each phase (U-positive phase/negative phase, V-positive phase/negative phase, W-positive phase/negative phase) of the 6-phase motor control. This function uses a soft setting value (OPSCR.UF, VF, WF) set by software or external signals detected by the Hall element, a PWM waveform of GPT320.GTIOC0A.

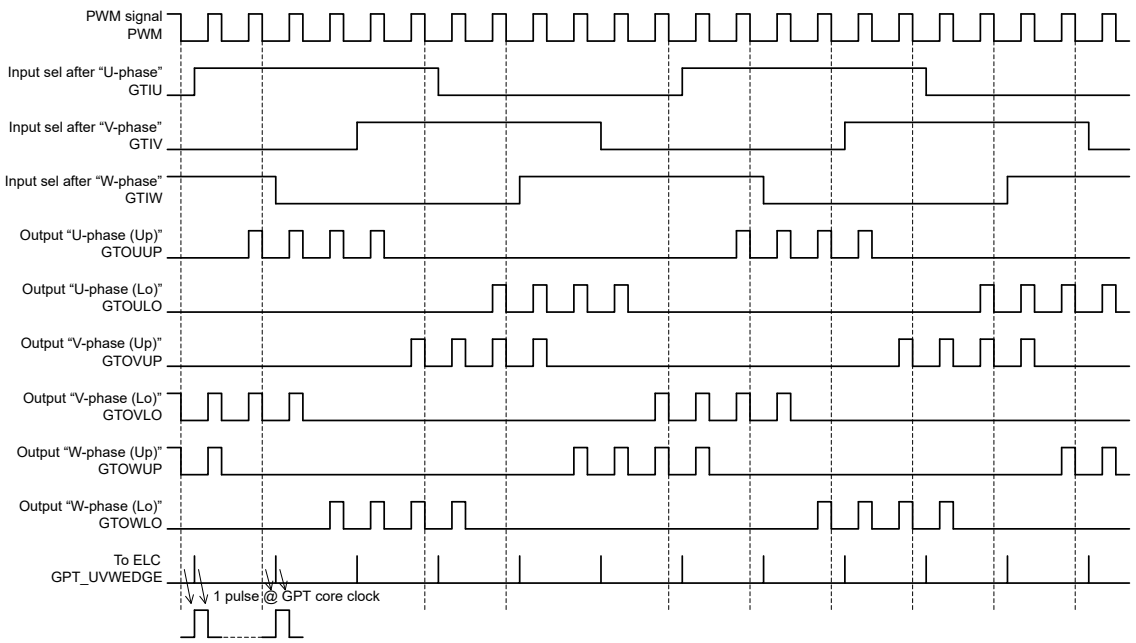
Figure 20.60 shows the conceptual diagram of GPT_OPS control flow.



Note: GPT core clock: PCLKD
PWM signal: PWM signal from GPT320.GTIOC0A

**Figure 20.60 Conceptual diagram of GPT_OPS control flow**

Figure 20.61 shows a 6-phase level signals output example of a GPT_OPS operation.



The GPT_UVWEDGE signal in Figure 20.61 is the Hall sensor input edge that outputs to the ELC.

Note: Register settings : OPSCR.ALIGN = 0, OPSCR.EN = 1, OPSCR.P = 0, OPSCR.N = 0, OPSCR.INV = 0, OPSCR.RV = 0
Note: GPT core clock: PCLKD

**Figure 20.61 Example of 6-phase level output operation**

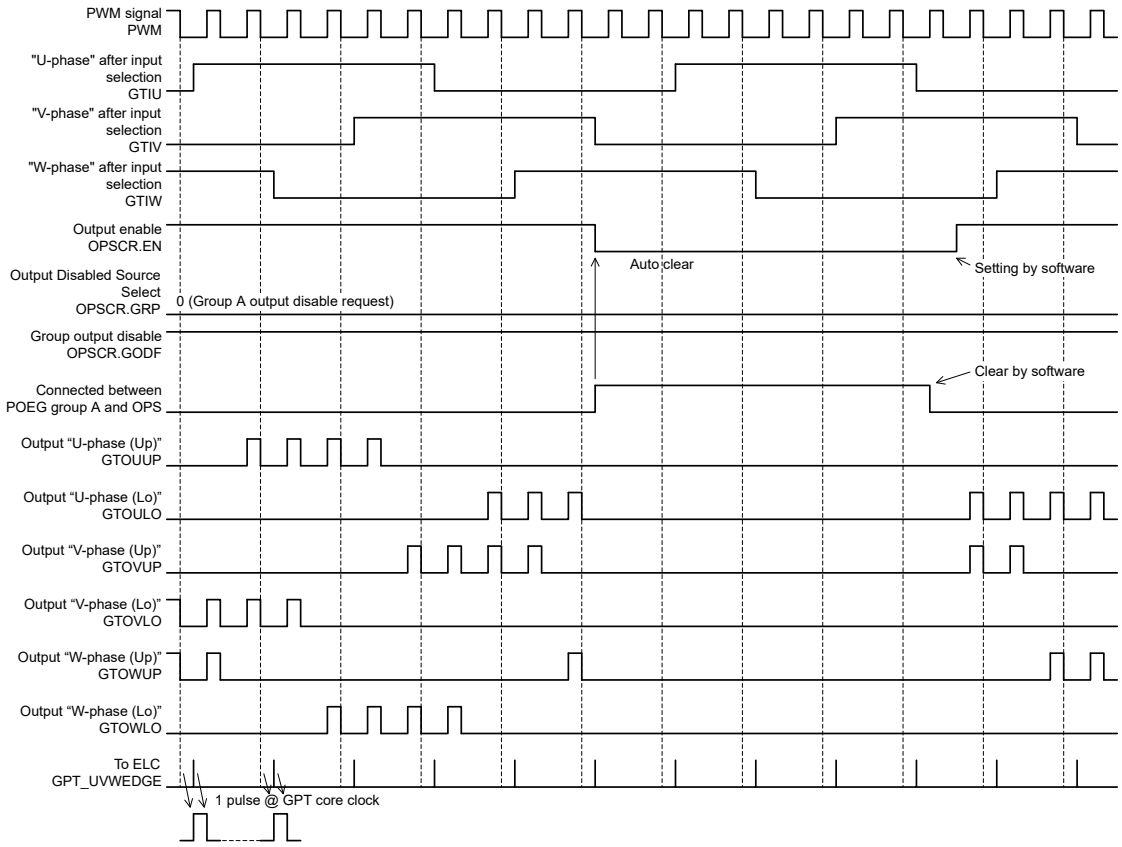


Figure 20.62 shows a 6-phase PWM output example of a GPT_OPS operation with chopper control.

Note: Register settings : OPSCR.ALIGN = 1, OPSCR.EN = 1, OPSCR.P = 1, OPSCR.N = 1, OPSCR.INV = 0, OPSCR.RV = 0
Note: GPT core clock: PCLKD
PWM signal: PWM signal from GPT320.GTIOC0A

**Figure 20.62 Example of 6-phase PWM output operation with chopper control**

Figure 20.63 shows a 6-phase PWM output example of an output disable control operation.

Note: Register settings : OPSCR.P = 1, OPSCR.N = 1, OPSCR.INV = 0, OPSCR.RV = 0
Note: GPT core clock: PCLKD
PWM signal: PWM signal from GPT320.GTIOC0A

**Figure 20.63 Example of group output disable control operation**

### 20.3.12.1 Input Selection and Synchronization of External Input Signal

In the GPT_OPS control flow conceptual diagram shown in Figure 20.60, (1) is a selection of input phase from the software settings and external input by the OPSCR.FB bit.

When OPSCR.FB bit is 0, select the external input. Enable the input signal after synchronization with the GPT core clock (PCLKD). After carrying out noise filtering (optional), set the external input to the input phase of PWM (PWM of GPT320.GTIOC0A) using falling edge sampling with OPSCR.ALIGN bit set to 1.

When OPSCR.FB bit is 1, select the soft setting (OPSCR.UF, VF, WF) with the value of the input phase of PWM (PWM of GPT320.GTIOC0A) using falling edge sampling with OPSCR.ALIGN bit set to 1.

When OPSCR.ALIGN bit is 0, GPT_OPS operates with the input phase of PCLKD synchronization with either OPSCR.FB bit set to 0 or OPSCR.FB bit set to 1. However, there are cases where the PWM pulse width of the output U/V/W phases (PWM output mode) of switch timing (just before/just after) is shortened.

Table 20.39 shows the input selection process and setting of associated OPSCR bits.

**Table 20.39 Input selection processing method**

| Register OPSCR | | Selection of input phase sampling method (U/V/W-phase) | Synchronization input/output selection process (GPT_OPS internal node name) |
|---|---|---|---|
| FB bit | ALIGN bit | | |
| 0 | 1 | External Input at PWM Falling Edge Sampling (PCLKD synchronization + falling edge sample) | Input Phase<br>Input U-Phase (gtu_sync)<br>Input V-Phase (gtv_sync)<br>Input W-Phase (gtw_sync) |
| | 0 | External Input at PCLKD Synchronization Output (PCLKD synchronization + through mode) | |
| 1 | 1 | Software Settings at PWM Falling Edge Sampling (OPSCR.UF, VF, WF of falling edge sample) | |
| | 0 | Software Setting Value Selection (= OPSCR.UF/VF/WF value) (= PCLKD synchronization) | |

### 20.3.12.2 Input Sampling

The OPSCR.U, V, W bits indicate the PCLKD sampling results of the input selected in the OPSCR.FB bit.

When OPSCR.FB bit is 0 and after synchronization with the GPT core clock (PCLKD) and noise filtering (optional), OPSCR.U, V, W bits indicate the sampling results of the external input. When OPSCR.FB bit is 1, OPSCR.U, V, W bits are the value (OPSCR.UF, VF, WF) of the soft setting.

### 20.3.12.3 Input Phase Decode

In the GPT_OPS control flow conceptual diagram shown in Figure 20.60, (3) enables the 6-phase signals by decoding the input phase selected in the OPSCR.FB bit.

Table 20.40 shows the decode table of input phase when OPSCR.RV bit is 0.

**Table 20.40 Decode table of input phase (OPSCR.RV = 0)**

| Input phase (U/V/W) (GPT_OPS internal node name) | | | 6-phase enable {U/V/W (Up/Lo)} by decoding input phase (GPT_OPS internal node name) | | | | | |
|---|---|---|---|---|---|---|---|---|
| Input U-Phase | Input V-Phase | Input W-Phase | U-phase (Up) | U-phase (Lo) | V-phase (Up) | V-phase (Lo) | W-phase (Up) | W-phase (Lo) |

### 20.3.12.4 Rotation Direction Control

In the GPT_OPS control flow conceptual diagram shown in Figure 20.60, (2) controls the direction of rotation of a 3-phase motor using the OPSCR.RV bit.

When the rotation direction is reverse (RV bit = 1), the input phase is inverted.

Table 20.42 shows the assigned output phases based on the OPSCR.RV bit setting (before and after rotation direction control).

**Table 20.42 Rotation Direction Control Method**

| Reversal of Direction of Rotation Using Output Phases as Specified in OPSCR Register | Output of Rotation Direction Control [U/V/W (Positive/Negative)] (GPT_OPS Internal Node Name after Control) | | | | | |
|---|---|---|---|---|---|---|
| OPSCR.RV bit | (gtuup_ren) | (gtulo_ren) | (gtvup_ren) | (gtvlo_ren) | (gtwup_ren) | (gtwlo_ren) |
| 0 | U-phase (Up) (gtuup_en) | U-phase (Lo) (gtulo_en) | V-phase (Up) (gtvup_en) | V-phase (Lo) (gtvlo_en) | W-phase (Up) (gtwup_en) | W-phase (Lo) (gtwlo_en) |
| 1 | U-phase (Up) (gtuup_en) | U-phase (Lo) (gtulo_en) | W-phase (Up) (gtwup_en) | W-phase (Lo) (gtwlo_en) | V-phase (Up) (gtvup_en) | V-phase (Lo) (gtvlo_en) |

### 20.3.12.5 Output Selection Control

In the GPT_OPS control flow conceptual diagram in Figure 20.60, (4) represents the selection of the output waveform by setting the OPSCR register bit.

For output selection, the following bits are relevant:

- The OPSCR.EN bit controls whether to output the 6-phase output, or to stop
- The OPSCR.P and OPSCR.N bits can select from the level signal or PWM signal (chopper output) for the output phase
- The polarity of the output phase can be set to a positive logic or negative logic by the OPSCR. INV bit.

Table 20.43 and Table 20.44 show the output selection control method using the OPSCR register bit.

**Table 20.43 Output selection control method (positive phase) (1 of 2)**

| Enable-phase output control | Positive-phase output (P) control | Invert-phase output control | Output port name (positive phase = up) (output selection internal node allocation) | |
|---|---|---|---|---|
| OPSCR.EN | OPSCR.P | OPSCR.INV | GTOUUP GTOVUP GTOWUP | Mode |
| 0 | x | x | 0 | Output Stop (External pin: Hi-Z) GPT_OPS → 0 output |

**Table 20.43 Output selection control method (positive phase) (2 of 2)**

| Enable-phase output control | Positive-phase output (P) control | Invert-phase output control | Output port name (positive phase = up) (output selection internal node allocation) | |
|---|---|---|---|---|
| OPSCR.EN | OPSCR.P | OPSCR.INV | GTOUUP<br>GTOVUP<br>GTOWUP | Mode |
| 1 | 0 | 0 | Level signal<br>(gtuup_ren)<br>(gtvup_ren)<br>(gtwup_ren) | Level Output Mode<br>(Positive phase)<br>(Positive logic) |
| 1 | 0 | 1 | Level signal<br>(~gtuup_ren)<br>(~gtvup_ren)<br>(~gtwup_ren) | Level Output Mode<br>(Positive phase)<br>(Negative logic) |

### 20.3.12.6 Output Selection Control (Group Output Disable Function)

When OPSCR.GODF is 1 and the signal value selected by the OPSCR.GRP bit is high (output disable request), the group output-disable function asynchronously sets the output to Hi-Z. When an output-disable request is generated, the OPSCR.EN bit is cleared to 0. For the return, set the OPSCR.EN bit to 1 after clearing the output disable request by software.

To ensure output-disable control, use the POEG_GROUPn (n = A to D) interrupt to clear the flag in the POE or check that the OPSCR.EN bit is 0 and then clear the flag. For an example of the operation for group output disable control, see Figure 20.63.

### 20.3.12.7 Event Link Controller (ELC) Output

In the GPT_OPS control flow conceptual diagram shown in Figure 20.60, (5) outputs the Hall sensor input signal edge to the ELC.

The Hall sensor input edge signal is the logical OR of the rising and falling edge signals of each U-phase/V-phase/W-phase input sampled at PCLKD. That is, if the high period of each of the U-phase/V-phase/W-phase of the input phase is short in duration, the Hall sensor edge input signal is not output at that time.

When the OPSCR.FB bit is 0, the Hall sensor input edge signal is the logical OR of the edge signals of the external input phase sampled at PCLKD.

When OPSCR.FB bit is 1, the Hall sensor input edge signal is the logical OR of the edge of the soft setting (OPSCR.UF, VF, WF) sampled at PCLKD.

See Figure 20.61 to Figure 20.63 for examples of the output signal to the ELC.

### 20.3.12.8 GPT_OPS Start Operation Setting Flow

**Table 20.45 Example setting of GPT_OPS start operation**

| No. | Step Name | Description |
|---|---|---|
| 1 | GPT320 operation mode setting | GPT320.GTIOC0A set the PWM output operation mode of the saw-wave or triangle-wave.<br>For details, see section 20.3.3. PWM Output Operating Mode. |
| 2 | Counting of GPT320 | Start the count operation of GPT320, and outputs a PWM waveform. |
| 3 | GPT_OPS input data set (only software setting is selected) | Set software setting to OPSCR.UF, VF, and WF bits. |
| 4 | Noise filter settings of GPT_OPS external input (only external input is selected) | When using a noise filter, set the sampling clock of the noise filter by OPSCR.NFCS[1:0] bits.<br>Then the noise filter is enabled if OPSCR.NFEN = 1. |
| 5 | GPT_OPS input phase selection setting/input phase alignment setting | Select the input phase from the external input or software setting by OPSCR.FB bit.<br>Select the alignment of the input phase by OPSCR.ALIGN bit. |
| 6 | Setting the GPT_OPS output phase | Set the level output/PWM output of the positive/negative phase output by OPSCR.P/OPSCR.N bit.<br>Set the positive logic/negative logic of the output phase by OPSCR.INV bit. Set the rotation direction by OPSCR.RV bit |
| 7 | GPT_OPS setting the group output disable function | Set the selection of output disable source by OPSCR.GRP bit.<br>Perform the setting of on/off of the group output disable function by OPSCR.GODF bit. |
| 8 | GPT_OPS Working | Setting the OPSCR.EN = 1 outputs the 6-phase output to drive the brushless DC motor from the GPT_OPS. |

## 20.3.13 Inter Channel Logical Operation Function

The logical operation function between compare match outputs can be performed.

Figure 20.64 shows the block diagram of inter channel logical operation.

To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed.

When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal (C = A or D = B) to operate logical function AND, OR, EXOR and NOR is selected, C or D is treated as 1. In the case of GTIOCnA pin output, when A of same channel is selected for C, the result of AND is A, the result of OR is 1, the result of EXOR is NOT A, and the result of NOR is 0.

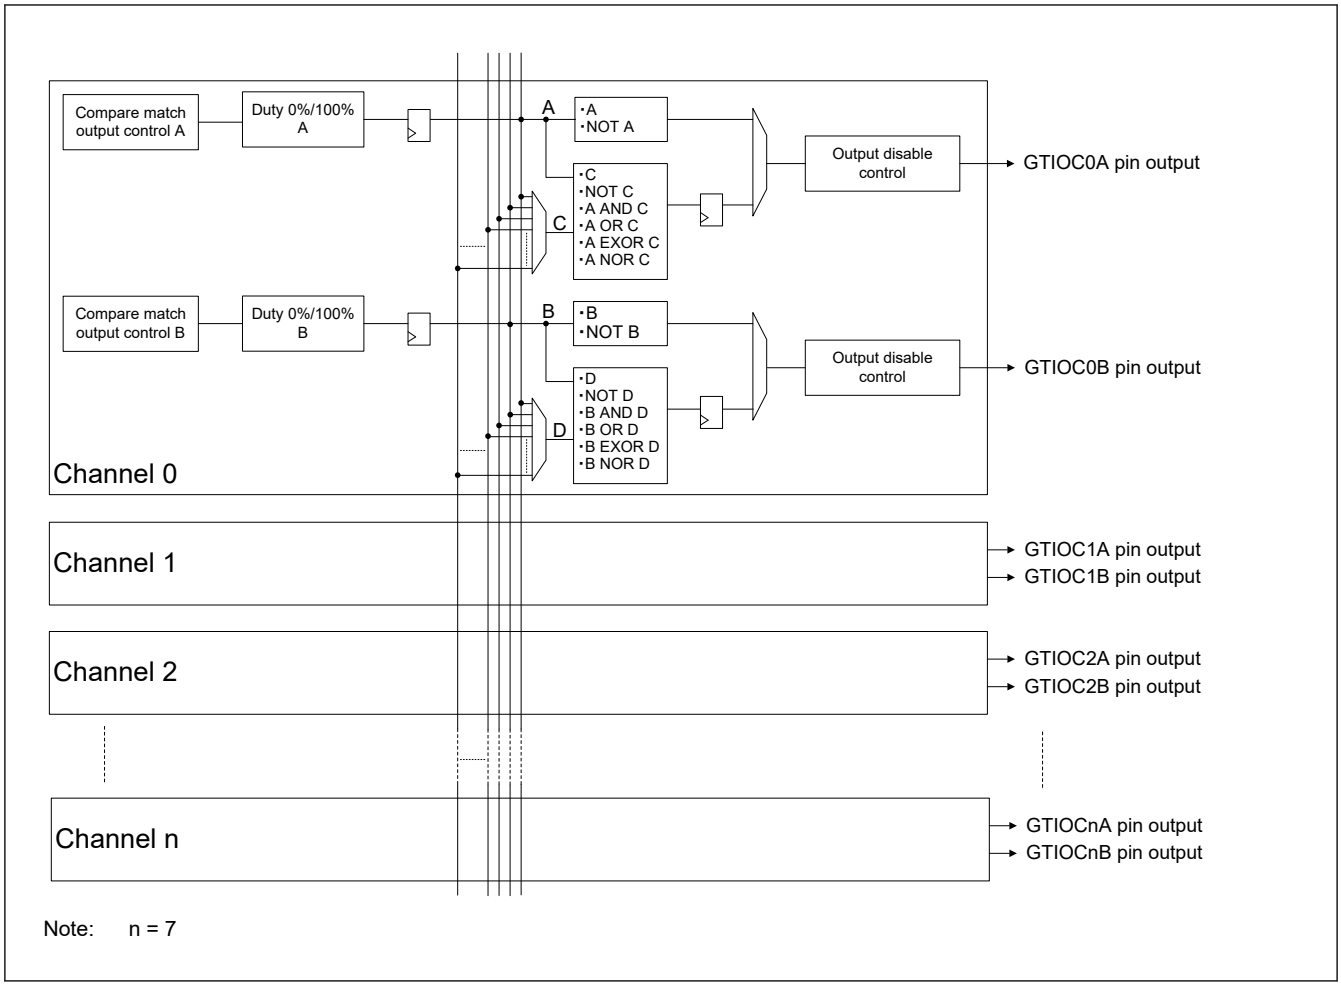

**Figure 20.64 Block diagram of inter channel logical operation**

Figure 20.65 shows an example of inter channel logical operation.

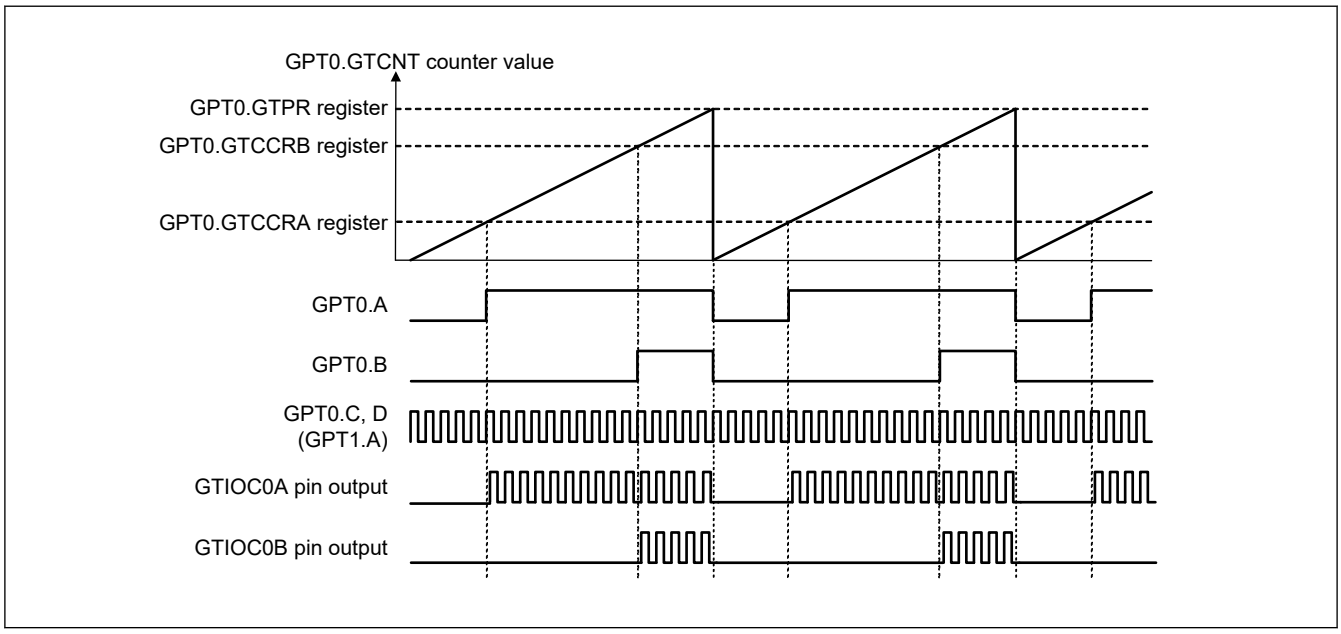

**Figure 20.65 Example of inter channel logical operation**

## 20.4 Interrupt Sources

### 20.4.1 Interrupt Sources

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTCNT counter overflow (GTPR compare match)/underflow
- Period count function finish

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear occur at the same time, flag clear takes priority over flag set. These flags are automatically updated by the internal state. The Interrupt Controller Unit can change the relative channel priorities. However, the priority within a channel is fixed. For details, see section 12, Interrupt Controller Unit (ICU).

Table 20.46 lists the GPT interrupt sources.

**Table 20.46 Interrupt sources**

| Channel | Name | Interrupt source | Interrupt flag | DTC activation |
|---|---|---|---|---|
| n = 0, 1 | GPTn_CCMPA | GPT32n.GTCCRA input capture/compare match | GTST[0] (TCFA) | Possible |
| | GPTn_CCMPB | GPT32n.GTCCRB input capture/compare match | GTST[1] (TCFB) | Possible |
| | GPTn_CMPC | GPT32n.GTCCRC compare match | GTST[2] (TCFC) | Possible |
| | GPTn_CMPD | GPT32n.GTCCRD compare match | GTST[3] (TCFD) | Possible |
| | GPTn_CMPE | GPT32n.GTCCRE compare match | GTST[4] (TCFE) | Possible |
| | GPTn_CMPF | GPT32n.GTCCRF compare match | GTST[5] (TCFF) | Possible |
| | GPTn_OVF | GPT32n.GTCNT overflow (GPT32n.GTPR compare match) | GTST[6] (TCFPO) | Possible |
| | GPTn_UDF | GPT32n.GTCNT underflow | GTST[7] (TCFPU) | Possible |
| | GPTn_PC | Period count function finish (n = 0, 1) | GTST[31] (PCF) | Possible |
| n = 2 to 5 | GPTn_CCMPA | GPT16n.GTCCRA input capture/compare match | GTST[0] (TCFA) | Possible |
| | GPTn_CCMPB | GPT16n.GTCCRB input capture/compare match | GTST[1] (TCFB) | Possible |
| | GPTn_CMPC | GPT16n.GTCCRC compare match | GTST[2] (TCFC) | Possible |
| | GPTn_CMPD | GPT16n.GTCCRD compare match | GTST[3] (TCFD) | Possible |
| | GPTn_CMPE | GPT16n.GTCCRE compare match | GTST[4] (TCFE) | Possible |
| | GPTn_CMPF | GPT16n.GTCCRF compare match | GTST[5] (TCFF) | Possible |
| | GPTn_OVF | GPT16n.GTCNT overflow (GPT16n.GTPR compare match) | GTST[6] (TCFPO) | Possible |
| | GPTn_UDF | GPT16n.GTCNT underflow | GTST[7] (TCFPU) | Possible |
| | GPTn_PC | Period count function finish (n = 2 to 4) | GTST[31] (PCF) | Possible |

#### (1) GPTn_CCMPA interrupt (n = 0 to 5)

An interrupt request is generated under the following conditions:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register
- When the GTCCRA register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRA register.

#### (2) GPTn_CCMPB interrupt (n = 0 to 5)

An interrupt request is generated under the following conditions:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register

- When the GTCCRB register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRB register.

### (3) GPTn_CMPC interrupt (n = 0 to 5)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

### (4) GPTn_CMPD interrupt (n = 0 to 5)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

### (5) GPTn_CMPE interrupt (n = 0 to 5)

An interrupt request is generated under the following condition:

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register).

### (6) GPTn_CMPF interrupt (n = 0 to 5)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

### (7) GPTn_OVF interrupt (n = 0 to 5)

An interrupt request is generated in the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (the GTCNT changes from GTPR to GTPR-1)

- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

#### (8) GPTn_UDF interrupt (n = 0 to 5)

An interrupt request is generated in the following conditions.

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting)
- In triangle-wave mode, interrupt requests are enabled at troughs (the GTCNT changes from 0 to 1)
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

About Interrupt signals and interrupt status flags, see section 20.2.16. GTST : General PWM Timer Status Register.

#### (9) GPTn_PC Interrupt (n = 0 to 4)

When the GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1, an interrupt request is generated at the end of cycle.

### 20.4.2 DMAC and DTC Activation

The DMAC and DTC can be activated by the interrupt in each channel. For details, see section 12, Interrupt Controller Unit (ICU), section 15, DMA Controller (DMAC), and section 16, Data Transfer Controller (DTC).

## 20.5 Operations Linked by ELC

### 20.5.1 Event Signal Output to ELC

The GPT can perform operation linked with another module set in advance when its interrupt request signal is used as an event signal by the Event Link Controller (ELC).

The GPT has the following ELC event signals:

- Generation of compare match and input capture A interrupt (GPTn_CCMPA)
- Generation of compare match and input capture B interrupt (GPTn_CCMPB)
- Generation of compare match C interrupt (GPTn_CMPC)
- Generation of compare match D interrupt (GPTn_CMPD)
- Generation of compare match E interrupt (GPTn_CMPE)
- Generation of compare match F interrupt (GPTn_CMPF)
- Generation of overflow interrupt (GPTn_OVF)
- Generation of underflow interrupt (GPTn_UDF)
- Finish of period count function (GPTm_PC)

Note: n = 0 to 5
m = 0 to 4

### 20.5.2 Event Signal Inputs from ELC

The GPT can perform the following operations in response to a maximum of 8 events from the ELC:

- Start counting, stop counting, clear counting
- Up-counting, down-counting
- Input capture.

See section 17, Event Link Controller (ELC) for the connection between the ELC and the event signal input.

## 20.6 Noise Filter Function

Each pin for use in input capture and Hall sensor input to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than 3 sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

Figure 20.66 shows the timing of noise filtering.

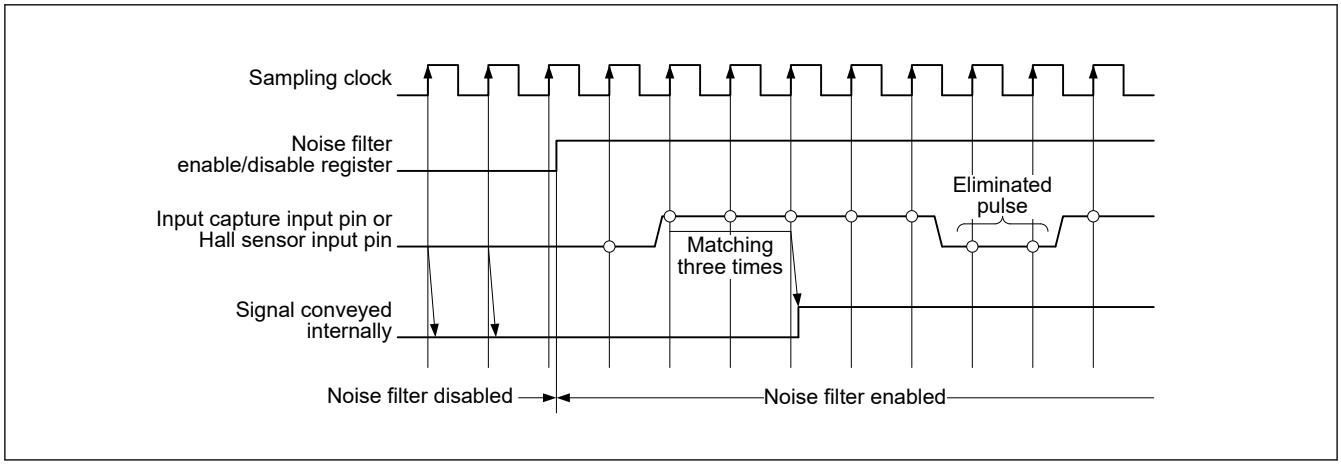

**Figure 20.66 Timing of noise filtering**

If noise filtering is enabled, the input capture operation or hall sensor input operation is performed on the edges of the noise filtered signal after a delay of (sampling interval × 2 + PCLKD) at the shortest. This is due to the noise filtering for the input capture input or hall sensor input.

## 20.7 Protection Function

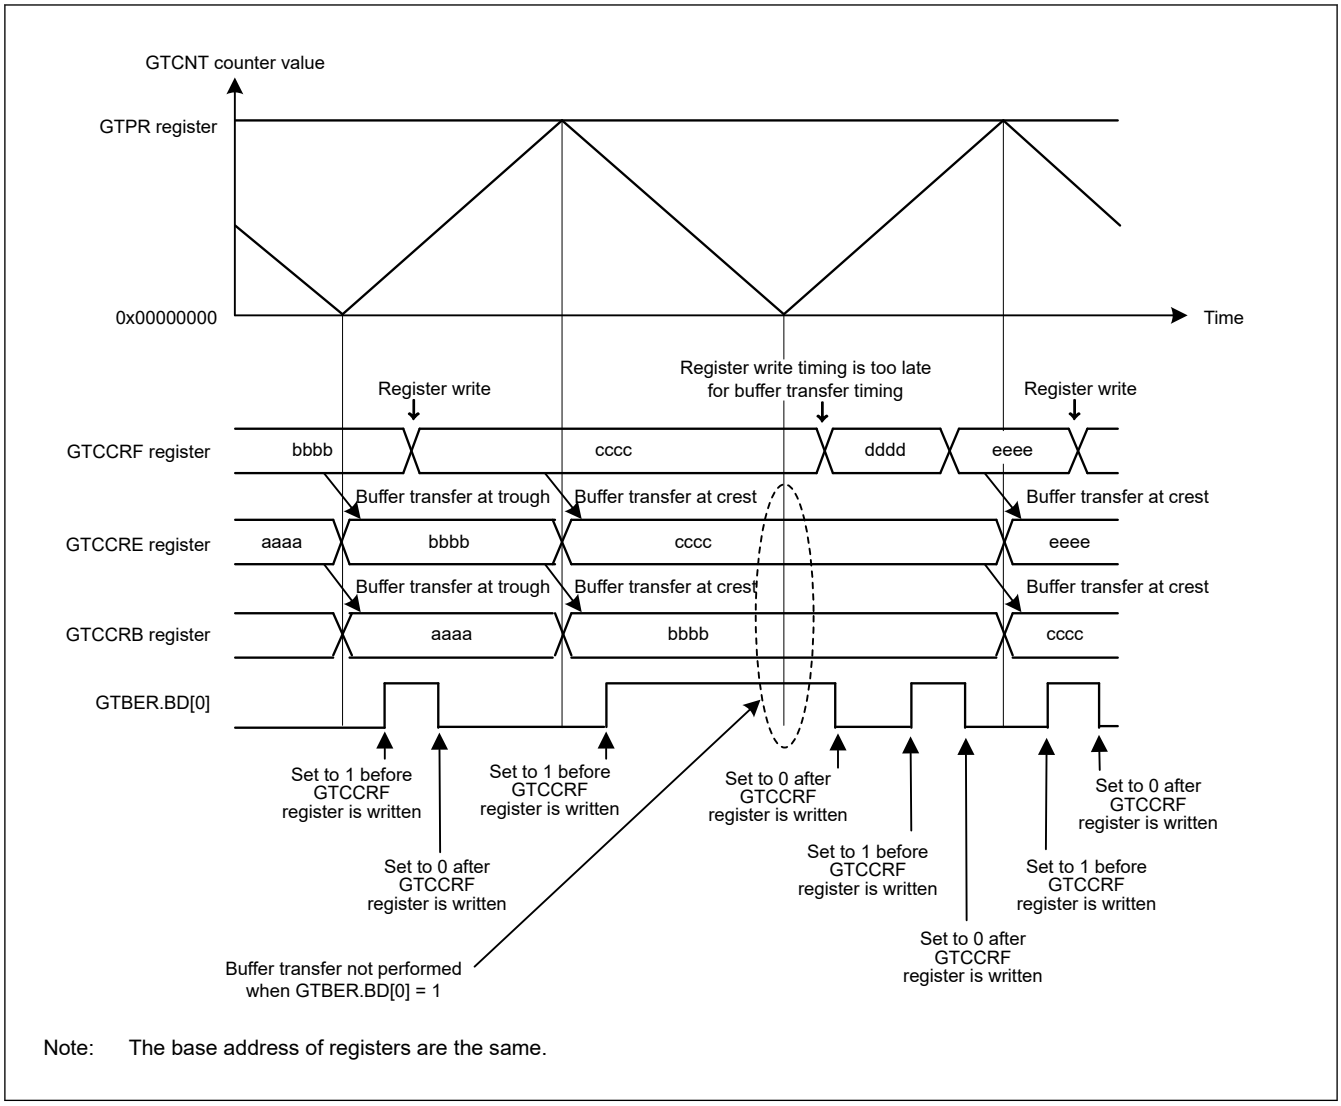
### 20.7.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTDTCR, GTDVU, GTICLF, GTPC.

Every bit in registers GTSTR, GTSTP and GTCLR which can update the corresponding registers in other channels and can be updated by any of the corresponding registers in other channels conversely, can be protected by setting the GTWP.STRWP, STPWP, and CLRWP bits, respectively, per channel.

Likewise, writing to the GTSECSR and GTSECR registers, which can control all channels by writing to the GTSECSR and GTSECR registers of a given channel, can be enabled or disabled by the setting of the GTWP.CMNWP bit.



Protection using the GTWP register is only for write operations by the CPU. This protection does not cover updates to registers that occur in association with CPU writes.

### 20.7.2 Disabling of Buffer Operation

If the timing of the buffer register write is delayed relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD[1] and BD[0] bits settings. Specifically, buffer transfer can be temporarily disabled even though a buffer transfer condition is generated during buffer register write, by setting the BD[1] and BD[0] bits to 1 (buffer operation disabled) before buffer register write, and setting the bits to 0 (buffer operation enabled) after completion of writing to all the buffer registers.

The BD[1] and BD[0] bits can be set on channel basis by writing directly to the GTBER register, or it can be set to 0 simultaneously by setting the GTSECR register for multiple channels which were set by the GTSECSR register.

Figure 20.67 shows an example of operation for disabling buffer operation by writing to the GTBER register.

Note: The base address of registers are the same.

**Figure 20.67 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests**

### 20.7.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BD bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that have already set in the GTSECSR register.

Follow the procedure below to simultaneously set the GTBER.BD bits of multiple channels.

1. Select the channels for simultaneously setting by the GTSECSR register
   Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BD bits become 1. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.
2. Simultaneously set the GTBER.BD bits by updating the GTSECR register
   In the GTSECR register, set the operation of the GTBER.BD bits (enabling or disabling of buffer operation) which are to be simultaneously set. Writing to a GTSECR register from any channel updates the GTBER.BD bits in all channels corresponding to the bits set as 1 in the GTSECSR register, in accordance with the value of the GTSECR register.

Figure 20.68 show examples of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

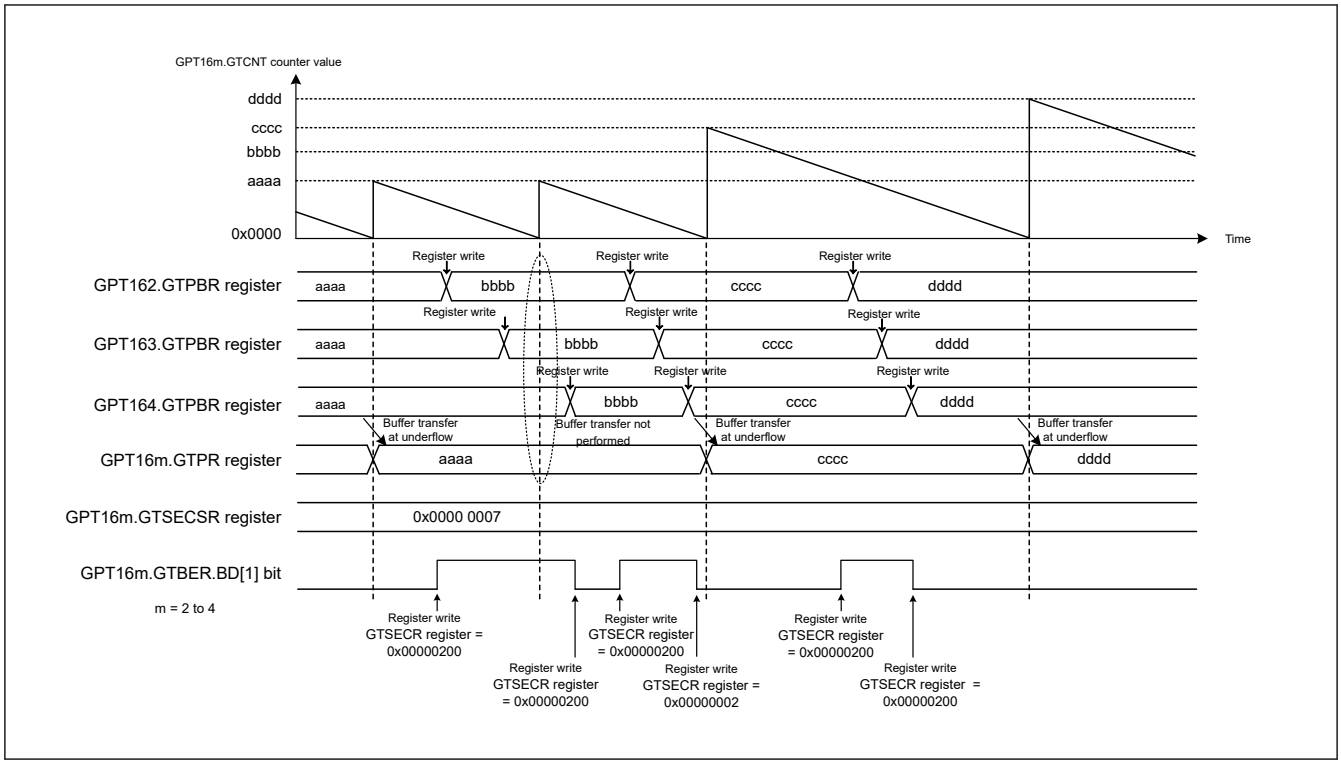


**Figure 20.68 Example of multiple channel operation for disabling buffer operation (saw waves, single buffer operation)**

## 20.7.3 GTIOCnm Pin Output Negate Control (n = 0 to 5, m = A, B)

For protection from system failure, the output disable control that changes the GTIOCnm pin output value forcibly is provided for GTIOCnm pin output by the request of output disable from POEG. Output protection is required when the same output level being on the GTIOCnA and GTIOCnB pins is detected. GPT detects this condition and generates output disable requests to POEG according to the setting of the output disable request permission bits, such as GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG performs the logical OR of the output disable request from each channel and the output disable request from the external input, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCnA pin and the GTIOCnB pin) out of 4 output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disable output request is monitored by reading the GTST.ODF bit. The output level during output disable is set based on the GTIOR.OADF[1:0] bits for the GTIOCnA pin and the GTIOR.OBDF[1:0] setting for the GTIOCnB pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. It is after 3 PCLKD at shortest when the output disable condition is released after the output disable request becomes no longer satisfied. To reliably control output disabling, clear the flag of POEG for which the condition for the request to disable the output is no longer satisfied after 4 cycles of PCLKD.

When event count is performed or when the output disable state should be released immediately without waiting for end of cycle, GTIOR.OADF[1:0] should be set to 00b (for GTIOCnA pin) or GTIOR.OBDF[1:0] should be set to 00b (for the GTIOCnB pin).

Figure 20.69 shows an example of the GTIOCnm pin output disable control operation. (n = 0 to 5, m = A, B)

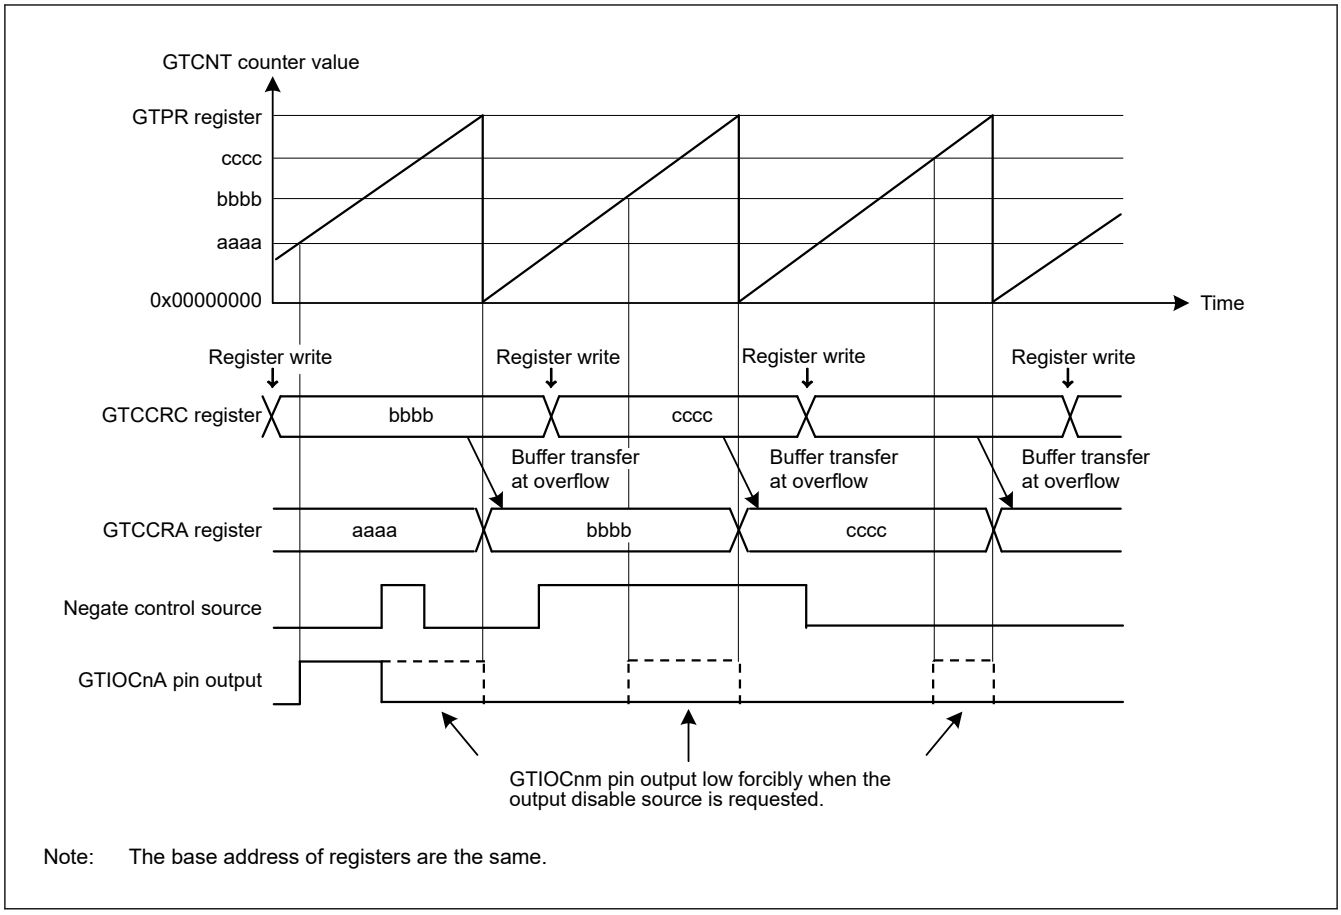

**Figure 20.69 Example of GTIOCnm pin output disable control operation in saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable (n = 0 to 5, m = A, B)**

## 20.8 Initialization Method of Output Pins

### 20.8.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port pin function with the PmnPFS register, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.

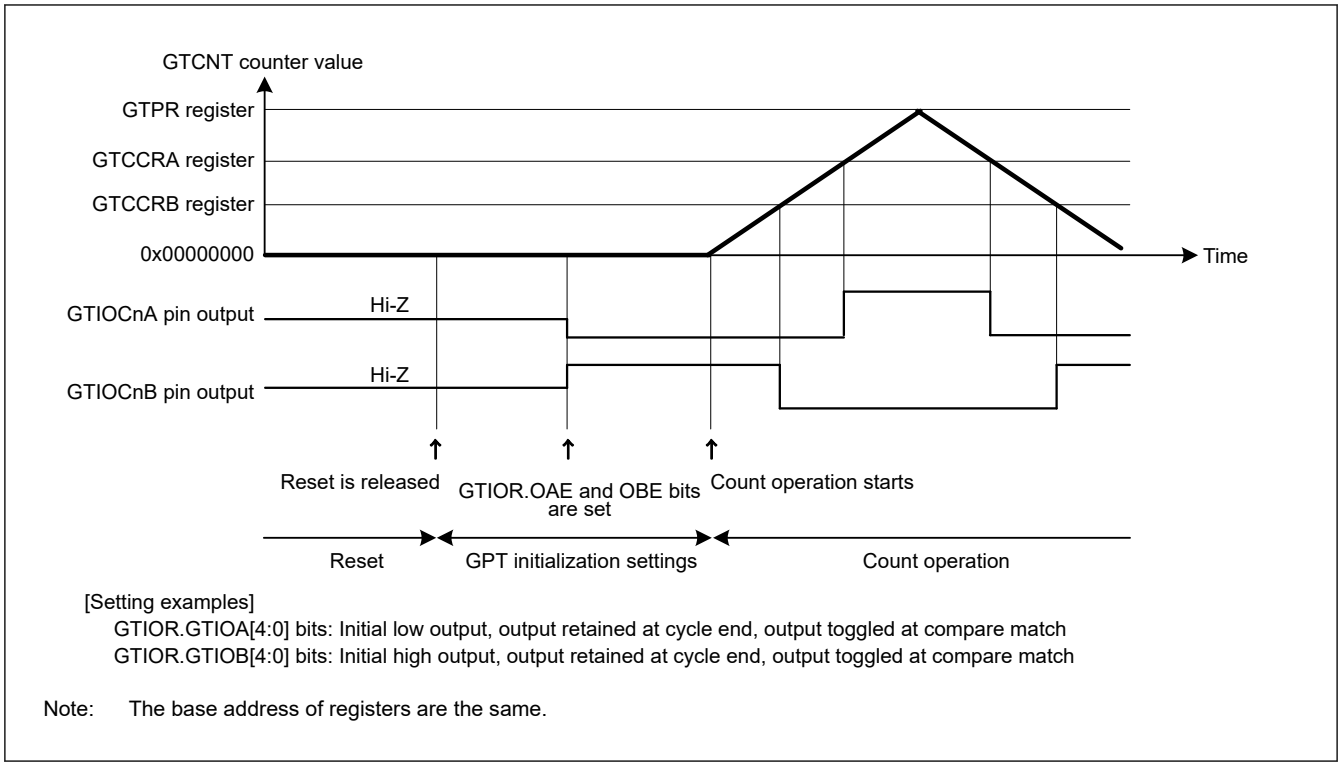

**Figure 20.70 Example of pin settings after reset**

### 20.8.2 Pin Initialization Due to Error during Operation

If an error occurs during GPT operation, the following four types of pin control can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values at OADFLT and OBDFLT in GTIOR, and output the arbitrary values at count stop
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR registers and PmnPFS.PMR bit of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0, and the control bit associated with the pin in the PMR to 0 to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

If the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting is resumed, operation continues from where it stopped. If counting is stopped, the registers must be initialized before counting starts.

## 20.9 Usage Notes

### 20.9.1 Module-Stop Function Setting

The Module Stop Control Register can enable or disable GPT operation. The GPT is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

### 20.9.2 GTCCRn Settings during Compare Match Operation (n = A to F)

#### (1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy all the following conditions:

- GTDVU < GTCCRA
- 0 < GTCCRA < GTPR

#### (2) When automatic dead time setting is not made in triangle-wave PWM mode

The GTCCRA register must be set within the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. When GTCCRA > GTPR, no compare match occurs.

Similarly, GTCCRB must be set within the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a compare match occurs within the cycle only when GTCCRB is 0 or GTCCRB = GTPR is satisfied. When GTCCRB > GTPR, no compare match occurs.

#### (3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, the correct output waveforms with secured dead time may not be obtained.

- In up-counting: GTCCRC < GTCCRD, GTCCRC > GTDVU, GTCCRD < GTPR - GTDVU
- In down-counting: GTCCRC > GTCCRD, GTCCRC < GTPR - GTDVU, GTCCRD > GTDVU

#### (4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC < GTCCRD < GTPR
- In down-counting: GTPR > GTCCRC > GTCCRD > 0

Similarly, GTCCRE and GTCCRF must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE < GTCCRF < GTPR
- In down-counting: GTPR > GTCCRE > GTCCRF > 0.

#### (5) In saw-wave PWM mode

The GTCCRA register must be set with the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. If GTCCRA > GTPR is set, no compare match occurs.

Similarly, GTCCRB must be set with the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. If GTCCRB > GTPR is set, no compare match occurs.

### 20.9.3 Setting Range for GTCNT Counter

The GTCNT counter register must be set with the range of 0 ≤ GTCNT ≤ GTPR.

### 20.9.4 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[3:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[3:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored, resulting in situations in which an event is accepted or an interrupt occurs after GTCR.CST is set to 0.

### 20.9.5 Priority Order of Each Event

#### (1) GTCNT register

Table 20.47 shows a priority order of events updating the GTCNT register.

**Table 20.47 Priority order of sources updating GTCNT**

| Source updating GTCNT | Priority order |
|---|---|
| Writing by CPU (writing to GTCNT/GTCLR) | High |
| Clear by hardware sources set in GTCSR | ↑ |
| Count up or down by hardware sources set in GTUPSR/GTDNSR | ↑ |
| Count operation | Low |

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

### (2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), the writing by CPU has priority over the starting/stopping by hardware sources.

In case that stop by the period count function conflicts with start by the CPU writing (GTCR register writing/GTSTR register writing), the period count function is finished with setting the GTST.PCF flag. The CST bit is not changed and the GTCNT continues to count.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. When there is a conflict between updating the GTCR.CST bit and reading by the CPU (reading from GTCR/GTSTR/GTSTP registers), pre-update data is read.

### (3) GTCCRm registers (m = A to F)

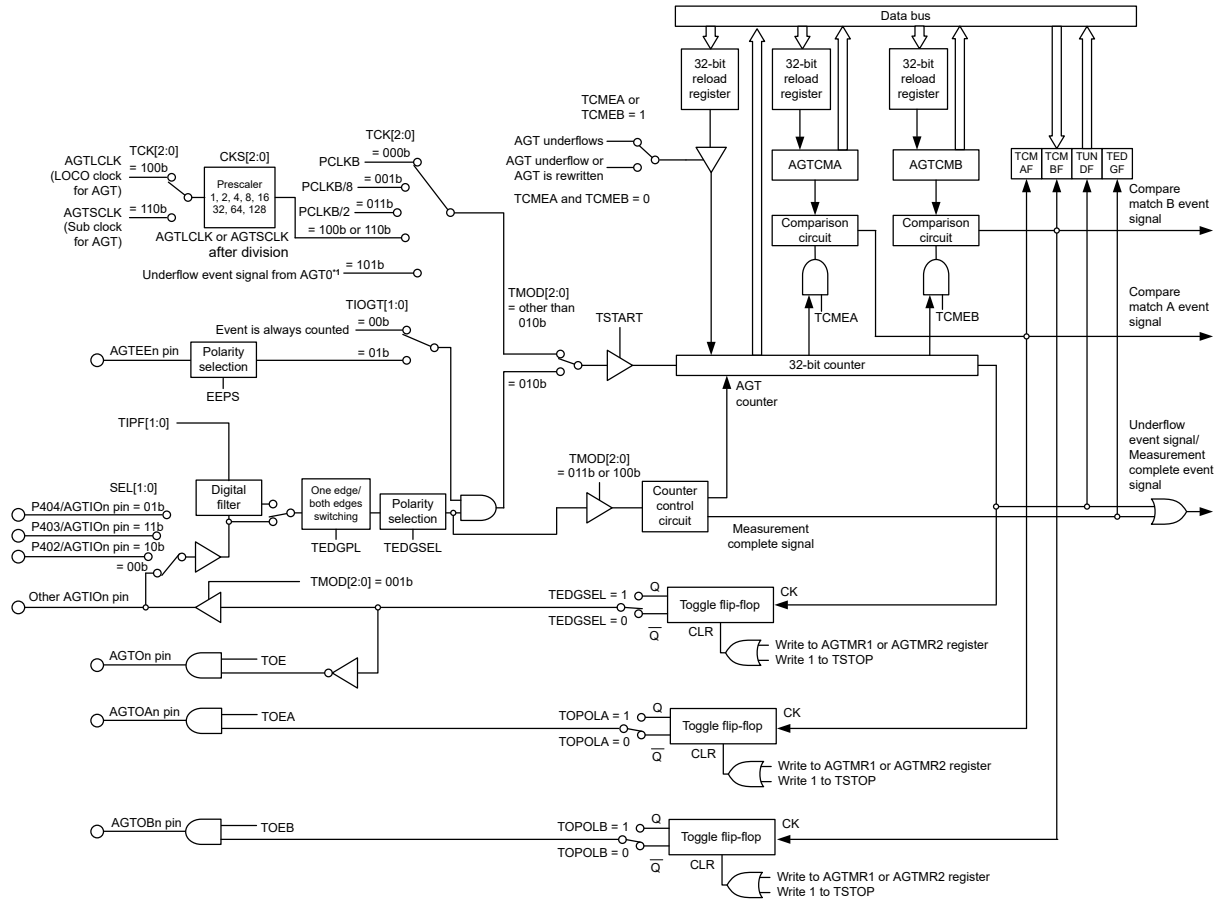
When there is a conflict between input capture/buffer transfer operation and writing to the GTCCRm registers, the writing to GTCCRm registers has priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. When there is a conflict between updating the GTCCRm registers and reading by the CPU, pre-update data is read.

### (4) GTPR register

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

# 21. Low Power Asynchronous General Purpose Timer (AGTW)

## 21.1 Overview



The low power Asynchronous General Purpose Timer (AGT) is a 32-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register.

Table 21.1 lists the AGT specifications, Figure 21.1 shows a block diagram, and Table 21.2 lists the I/O pins.

**Table 21.1 AGT specifications**

| Parameter | | Description |
|---|---|---|
| Operating modes | Timer mode | The count source is counted |
| | Pulse output mode | The count source is counted, and the output is inverted at each timer underflow |
| | Event counter mode | An external event is counted |
| | Pulse width measurement mode | An external pulse width is measured |
| | Pulse period measurement mode | An external pulse period is measured |
| Number of Channels | | 32 bits × 2 channels (AGTn (n = 0, 1)) |
| Count source (operating clock)*2 | Timer mode | PCLKB, PCLKB/2, PCLKB/8, AGTLCLK/d, AGTSCLK/d (d = 1, 2, 4, 8, 16, 32, 64, or 128), or underflow signal of AGT0 selectable.*1 |
| | Pulse output mode | |
| | Pulse width measurement mode | |
| | Pulse period measurement mode | |
| | Event counting mode | External event input |
| Interrupt and Event Link function | | • Underflow event signal or measurement complete event signal<br>– When the counter underflows<br>– When the measurement of the active width of the external input pin (AGTIOn) completes in pulse width measurement mode<br>– When the set edge of the external input pin (AGTIOn) is input in pulse period measurement mode.<br>• Compare match A event signal<br>– When the values of AGT register and AGTCMA register matched (compare match A function enabled).<br>• Compare match B event signal<br>– When the values of AGT and AGTCMB registers matched (compare match B function enabled).<br>• Return from Snooze mode or Software Standby mode can be performed with AGT1_AGTI, AGT1_AGTCMAI, or AGT1_AGTCMBI*3 |
| Selectable functions | | • Compare match function<br>One or two of the AGT Compare Match A register and AGT Compare Match B register is selectable. |
| TrustZone Filter | | Security attribution can be set for each channels |

Note 1. AGT0 cannot use underflow signal. AGT1 connects directly with the underflow event signal from the AGT0 timer.
Note 2. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock. When selecting AGTLCLK/d or AGTSCLK/d as the count source clock, the frequency of PCLKB should be at least twice that of the count source clock.
Note 3. For details, see section 10, Low Power Modes.

Note 1. AGT0 cannot use AGT0 underflow event. AGT1 uses the underflow of AGT0.

**Figure 21.1 AGT block diagram**

**Table 21.2 AGT I/O pins**

| Pin name | I/O | Function |
|---|---|---|
| AGTEEn | Input | External event input enable for AGT |
| AGTIOn | Input/output | External event input and pulse output for AGT |
| AGTOn | Output | Pulse output for AGT |
| AGTOAn | Output | Compare match A output for AGT |
| AGTOBn | Output | Compare match B output for AGT |

Note: Channel number: n = 0, 1
Note: P402 to P404 can only be used as input.

## 21.2 Register Descriptions

### 21.2.1 AGT : AGT Counter Register

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x00

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | 32-bit counter and reload register<br>Setting range : 0x00000000 to 0xFFFFFFFF | R/W |

AGTn.AGT is a 32-bit register. The write value is written to the reload register and the read value is read from the counter.

The states of the reload register and the counter change according to the TSTART bit in the AGTCR register and TCMEA/TCMEB bit in the AGTCMSR register. For details, see section 21.3.1. Reload Register and Counter Rewrite Operation.

When 1 is written to the TSTOP bit in the AGTCR register, AGT counter is forcibly stopped and set to 0xFFFFFFFF.

When the TCK[2:0] bits setting in the AGTMR1 register are a value other than 001b (PCLKB/8) or 011b (PCLKB/2), if the AGT register is set to 0x00000000, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts. The AGTOn and AGTIOn pin output are toggled.

When the AGT register is set to 0x00000000 in event counter mode, regardless of the value of TCK[2:0] bits, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts.

In addition, the AGTOn pin output is toggled even during a period other than the specified count period. When the AGT register is set to 0x00000001 or more, a request signal is generated each time AGT underflows.

## 21.2.2 AGTCMA : AGT Compare Match A Register

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x04

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | 32-bit compare match A data is stored.*1<br>Setting range : 0x00000000 to 0xFFFFFFFF | R/W |

Note 1. Set the AGTCMA register to 0xFFFFFFFF when compare match A is not used.

The AGTCMA register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register A change according to the TSTART bit in the AGTCR register. For details, see section 21.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation.

## 21.2.3 AGTCMB : AGT Compare Match B Register

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x08

| Bit position: | 31 | | | | | | | | | | | | | | | | | | | | | | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 31:0 | n/a | 32-bit compare match B data is stored.*1<br>Setting range : 0x00000000 to 0xFFFFFFFF | R/W |

Note 1. Set the AGTCMB register to 0xFFFFFFFF when compare match B is not used.

The AGTCMB register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register B change according to the TSTART bit in the AGTCR register. For details, see section 21.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation.

## 21.2.4 AGTCR : AGT Control Register

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0C

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | TCMBF | TCMAF | TUNDF | TEDGF | — | TSTOP | TCSTF | TSTART |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | TSTART | AGT Count Start*2<br>0: Count stops<br>1: Count starts | R/W |
| 1 | TCSTF | AGT Count Status Flag*2<br>0: Count stopped<br>1: Count in progress | R |
| 2 | TSTOP | AGT Count Forced Stop*1<br>0: Writing is invalid<br>1: The count is forcibly stopped | W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 4 | TEDGF | Active Edge Judgment Flag<br>0: No active edge received<br>1: Active edge received | R/(W)*3 |
| 5 | TUNDF | Underflow Flag<br>0: No underflow<br>1: Underflow | R/(W)*3 |
| 6 | TCMAF | Compare Match A Flag<br>0: No match<br>1: Match | R/(W)*3 |
| 7 | TCMBF | Compare Match B Flag<br>0: No match<br>1: Match | R/(W)*3 |

Note 1. When 1 (count is forcibly stopped) is written to the TSTOP bit, the TSTART bit and TCSTF flag are initialized at the same time. The pulse output level is also initialized. The read value is 0.
Note 2. For information on using the TSTART bit and TCSTF flag, see section 21.4.1. Count Operation Start and Stop Control.
Note 3. Only 0 can be written to clear the flag.

### TSTART bit (AGT Count Start)

The count operation is started by writing 1 to the TSTART bit and stopped by writing 0. When the TSTART bit is set to 1 (count starts), the TCSTF flag is set to 1 (count in progress) in synchronization with the count source. Also, after 0 is written to the TSTART bit, the TCSTF flag is set to 0 (count stops) in synchronization with the count source. For details, see section 21.4.1. Count Operation Start and Stop Control.

### TCSTF flag (AGT Count Status Flag)

The TCSTF flag indicates the AGT count status.

[Setting condition]

- When 1 is written to the TSTART bit (the TCSTF flag is set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (the TCSTF flag is set to 0 in synchronization with the count source)
- When 1 is written to the TSTOP bit.

### TSTOP bit (AGT Count Forced Stop)

When 1 is written to the TSTOP bit, the count is forcibly stopped. The read value is 0.

### TEDGF flag (Active Edge Judgment Flag)

The TEDGF flag indicates that an active edge was detected.

[Setting condition]

- When the measurement of the active width of the external input pin (AGTIOn) is complete in pulse width measurement mode
- When the set edge of the external input pin (AGTIOn) is input in pulse period measurement mode.

[Clearing condition]

- When 0 is written to this flag by software.

### TUNDF flag (Underflow Flag)

The TUNDF flag indicates that the counter underflowed.

[Setting condition]

- When the counter underflows.

[Clearing condition]

- When 0 is written to this flag by software.

### TCMAF flag (Compare Match A Flag)

The TCMAF flag indicates that compare match A was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMA register.

[Clearing condition]

- When 0 is written to this flag by software.

### TCMBF flag (Compare Match B Flag)

The TCMBF flag indicates that compare match B was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMB register.

[Clearing condition]

- When 0 is written to this flag by software.

## 21.2.5 AGTMR1 : AGT Mode Register 1

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0D

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | TCK[2:0] | | | TEDGPL | TMOD[2:0] | | |
| Value after reset: | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | TMOD[2:0] | Operating Mode*3<br>0 0 0: Timer mode<br>0 0 1: Pulse output mode<br>0 1 0: Event counter mode<br>0 1 1: Pulse width measurement mode<br>1 0 0: Pulse period measurement mode<br>Others: Setting prohibited | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3 | TEDGPL | Edge Polarity*4<br>0: Single-edge<br>1: Both-edge | R/W |
| 6:4 | TCK[2:0] | Count Source*1 *2 *5 *7<br>0 0 0: PCLKB<br>0 0 1: PCLKB/8<br>0 1 1: PCLKB/2<br>1 0 0: Divided clock AGTLCLK specified by CKS[2:0] bits in the AGTMR2 register<br>1 0 1: Underflow event signal from AGT0*6<br>1 1 0: Divided clock AGTSCLK specified by CKS[2:0] bits in the AGTMR2 register<br>Others: Setting prohibited | R/W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |

Note: Write access to the AGTMR1 register initializes the output from the AGTOn, AGTIOn, AGTOAn, and AGTOBn pins. For details on the output level at initialization, see section 21.2.7. AGTIOC : AGT I/O Control Register.
Note 1. When event counter mode is selected, the external input pin (AGTIOn) is selected as the count source regardless of the setting of TCK[2:0] bits.
Note 2. Do not switch count sources during count operation. Only switch count sources when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).
Note 3. The operating mode can only be changed when the count is stopped while both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count is stopped). Do not change the operating mode during count operation.
Note 4. The TEDGPL bit is enabled only in event counter mode.
Note 5. To run AGT in Software Standby mode or Snooze mode, select AGTLCLK or AGTSCLK (TCK[2:0] = 100b, 110b).
Note 6. AGT0 cannot use AGT0 underflow (setting prohibited). AGT1 uses the AGT0 underflow.
Note 7. Do not change the TCK[2:0] bits when the CKS[2:0] bits in the AGTMR2 register is not 000b. First, change the CKS[2:0] bits in the AGTMR2 register to 000b. Then change the TCK[2:0] bits and wait for one cycle of the count source.

## 21.2.6 AGTMR2 : AGT Mode Register 2

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0E

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | LPM | — | — | — | — | CKS[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | CKS[2:0] | AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio*1 *2 *3<br>0 0 0: 1/1<br>0 0 1: 1/2<br>0 1 0: 1/4<br>0 1 1: 1/8<br>1 0 0: 1/16<br>1 0 1: 1/32<br>1 1 0: 1/64<br>1 1 1: 1/128 | R/W |
| 6:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | LPM | Low Power Mode<br>0: Normal mode<br>1: Low power mode | R/W |

Note 1. Do not rewrite the CKS[2:0] bits during count operation. Only rewrite the CKS[2:0] bits when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).
Note 2. When count source is AGTLCLK or AGTSCLK, the switch of CKS[2:0] bits is valid.
Note 3. Do not switch the TCK[2:0] bits in the AGTMR1 register when CKS[2:0] bits are not 000b. Switch the TCK[2:0] bits in the AGTMR1 register after CKS[2:0] bits are set to 000b, and wait for 1 cycle of the count source.

### CKS[2:0] bit (AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio)

CKS[2:0] bits select the Count Source Clock Frequency Division Ratio for AGTLCLK or AGTSCLK.

### LPM bit (Low Power Mode)

The LPM bit sets the low power operation, which impacts access to certain AGT registers. Set this bit to 1 to operate in low power.

When this bit is 1, access to the following registers is prohibited:

- AGT/AGTCMA/AGTCMB/AGTCR.

After this bit is switched from 1 to 0, the first access to the register is constrained as follows:

- When reading from the AGT register, read AGT register twice. Only the second reading of data is valid.
- When writing to the AGT, AGTCMA, AGTCMB, and AGTCR register, allow at least 2 cycles of the count source clock when writing to the register.
- When confirm the value written to the AGT, AGTCMA, AGTCMB, and AGTCR registers.
  - When the count operation is stopped, the written data can be read in the next cycle.
  - When the count operation is operating, the written data can be read after four cycles of the count source clock.

Figure 21.2 shows the flow of how to write LPM bit

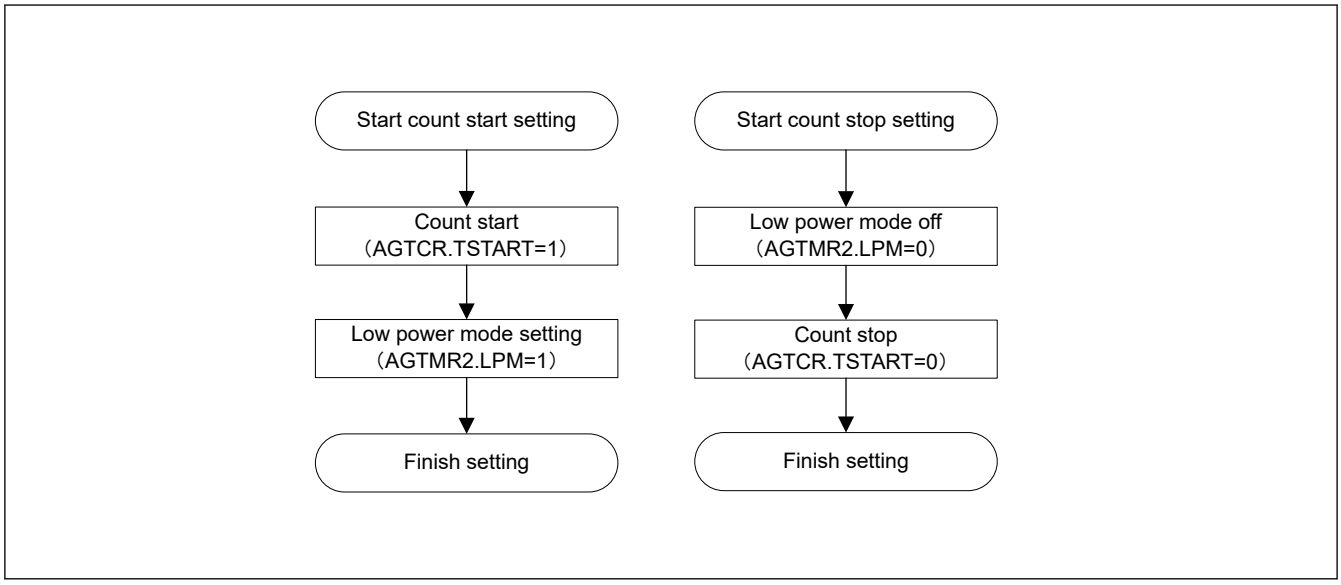


**Figure 21.2 LPM how to write flow chart**

## 21.2.7 AGTIOC : AGT I/O Control Register

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x10

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | TIOGT[1:0] | | TIPF[1:0] | | — | TOE | — | TEDG SEL |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | TEDGSEL | I/O Polarity Switch<br>Function varies depending on the operating mode (see Table 21.3 and Table 21.4). | R/W |
| 1 | — | This bit is read as 0. The write value should be 0. | R/W |
| 2 | TOE | AGTOn pin Output Enable<br>0: AGTOn pin output disabled<br>1: AGTOn pin output enabled | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 5:4 | TIPF[1:0] | Input Filter*3<br>These bits specify the sampling frequency of the filter for the AGTIOn input. If the input to the AGTIOn pin is sampled and the value matches three successive times, that value is taken as the input value.<br>0 0: No filter<br>0 1: Filter sampled at PCLKB<br>1 0: Filter sampled at PCLKB/8<br>1 1: Filter sampled at PCLKB/32 | R/W |
| 7:6 | TIOGT[1:0] | Count Control*1 *2<br>0 0: Event is always counted<br>0 1: Event is counted during polarity period specified for AGTEEn pin<br>Others: Setting prohibited | R/W |

Note 1. When AGTEEn pin is used, the polarity to count an event can be selected with the EEPS bit in the AGTISR register.
Note 2. TIOGT[1:0] bits are enabled only in event counter mode.
Note 3. When event counter mode operation is performed during Software Standby mode, the digital filter function cannot be used.

### TEDGSEL bit (I/O Polarity Switch)

The TEDGSEL bit switches the AGTOn pin output polarity and the AGTIOn pin input/output edge and polarity.

In pulse output mode, it only controls polarity of the AGTOn pin output and AGTIOn pin output. AGTOn pin output and AGTIOn pin output are initialized when the AGTMR1 register is written or the TSTOP bit in the AGTCR register is written with 1.

### TOE bit (AGTOn pin Output Enable)

The TOE bit selects whether the AGTOn pin output is disabled or enabled.

### TIPF[1:0] bits (Input Filter)

The TIPF[1:0] bits specify the sampling frequency of the AGTIOn pin input filter. When the input to the AGTIOn pin is sampled and the values match three times in succession, the value is regarded as the input value.

### TIOGT[1:0] bits (Count Control)

The TIOGT[1:0] bits control the event count.

**Table 21.3 AGTIOn pin I/O edge and polarity switching**

| Operating mode | Function |
|---|---|
| Timer mode | Not used |
| Pulse output mode | 0: Output is started at high (initialization level: high), for example, inverted output<br>1: Output is started at low (initialization level: low), for example, normal output |
| Event counter mode | 0: Count on rising edge<br>1: Count on falling edge |
| Pulse width measurement mode | 0: Low-level width is measured<br>1: High-level width is measured |
| Pulse period measurement mode | 0: Measure from one rising edge to the next rising edge<br>1: Measure from one falling edge to the next falling edge |

Note: When the TOE bit is 0, the pin state is Hi-Z.

**Table 21.4 AGTOn pin output polarity switching**

| Operating mode | Function |
|---|---|
| All modes | 0: Output is started at low (initial level: low): normal output<br>1: Output is started at high (initial level: high): inverted output |

Note: When the TOE bit is 0, a value according to the set value of the TEDGSEL bit in the pulse output mode is output.

## 21.2.8 AGTISR : AGT Event Pin Select Register

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x11

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | EEPS | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 2 | EEPS | AGTEEn Polarity Selection<br>0: An event is counted during the low-level period<br>1: An event is counted during the high-level period | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

**EEPS bit (AGTEEn Polarity Selection)**

The EEPS bit selects the polarity of events to be counted.

## 21.2.9 AGTCMSR : AGT Compare Match Function Select Register

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x12

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | TOPOLB | TOEB | TCMEB | — | TOPOLA | TOEA | TCMEA |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | TCMEA | AGT Compare Match A Register Enable*1 *2 *3<br>0: AGT Compare match A register disabled<br>1: AGT Compare match A register enabled | R/W |
| 1 | TOEA | AGTOAn Pin Output Enable*1 *2<br>0: AGTOAn pin output disabled<br>1: AGTOAn pin output enabled | R/W |
| 2 | TOPOLA | AGTOAn Pin Polarity Select*1 *2<br>0: AGTOAn pin output is started on low. i.e. normal output<br>1: AGTOAn pin output is started on high. i.e. inverted output | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 4 | TCMEB | AGT Compare Match B Register Enable*1 *2 *3<br>0: Compare match B register disabled<br>1: Compare match B register enabled | R/W |
| 5 | TOEB | AGTOBn Pin Output Enable*1 *2<br>0: AGTOBn pin output disabled<br>1: AGTOBn pin output enabled | R/W |
| 6 | TOPOLB | AGTOBn Pin Polarity Select*1 *2<br>0: AGTOBn pin output is started on low. i.e. normal output<br>1: AGTOBn pin output is started on high. i.e. inverted output | R/W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |

Note 1. Do not rewrite the AGTCMSR register during a count operation. Only rewrite the AGTCMSR register when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 2. Do not set 1 when in pulse width measurement mode or pulse period measurement mode.

Note 3. When 1 is written to the TSTOP bit in the AGTCR register, TCMEA and TCMEB is forcibly stopped and set to 0.

## 21.2.10 AGTIOSEL : AGT Pin Select Register

Base address: AGTWn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x13

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | TIES | — | — | SEL[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | SEL[1:0] | AGTIOn Pin Select*1<br>0 0: Select the AGTIOn except for the following pins<br>0 1: Select the P404/AGTIOn P404/AGTIOn as input only. It cannot be used for output.<br>1 0: Select the P402/AGTIOn P402/AGTIOn as input only. It cannot be used for output.<br>1 1: Select the P403/AGTIOn P403/AGTIOn as input only. It cannot be used for output. | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | TIES | AGTIOn Pin Input Enable<br>0: External event input is disabled during Software Standby mode<br>1: External event input is enabled during Software Standby mode | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. You must set the Pin Function Select Register. See section 18, I/O Ports.

The AGTIOSEL register sets the AGTIOn pin when using the AGTIOn pin in Software Standby mode.

### SEL[1:0] bits (AGTIOn Pin Select)

The SEL[1:0] bits select the AGTIOn pin function.

### TIES bit (AGTIOn Pin Input Enable)

The TIES bit enables or disables an external event input.

## 21.3 Operation

### 21.3.1 Reload Register and Counter Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and the counter differs depending on the value of the TSTART bit in the AGTCR register and of the TCMEA or TCMEB bit in the AGTCMSR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and the counter. When the TSTART bit is 1 (count starts) and the TCMEA bit and TCMEB bit are 0 (AGT compare match A/B register are invalid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the next count source. When the TSTART bit is 1 (count starts) and the TCMEA bit or the TCMEB bit is 1 (AGT compare match A register or compare match B register is valid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the underflow of the counter.

Figure 21.3 and Figure 21.4 show the timing of rewrite operation with TSTART bit value and TCMEA/TCMEB bit value.

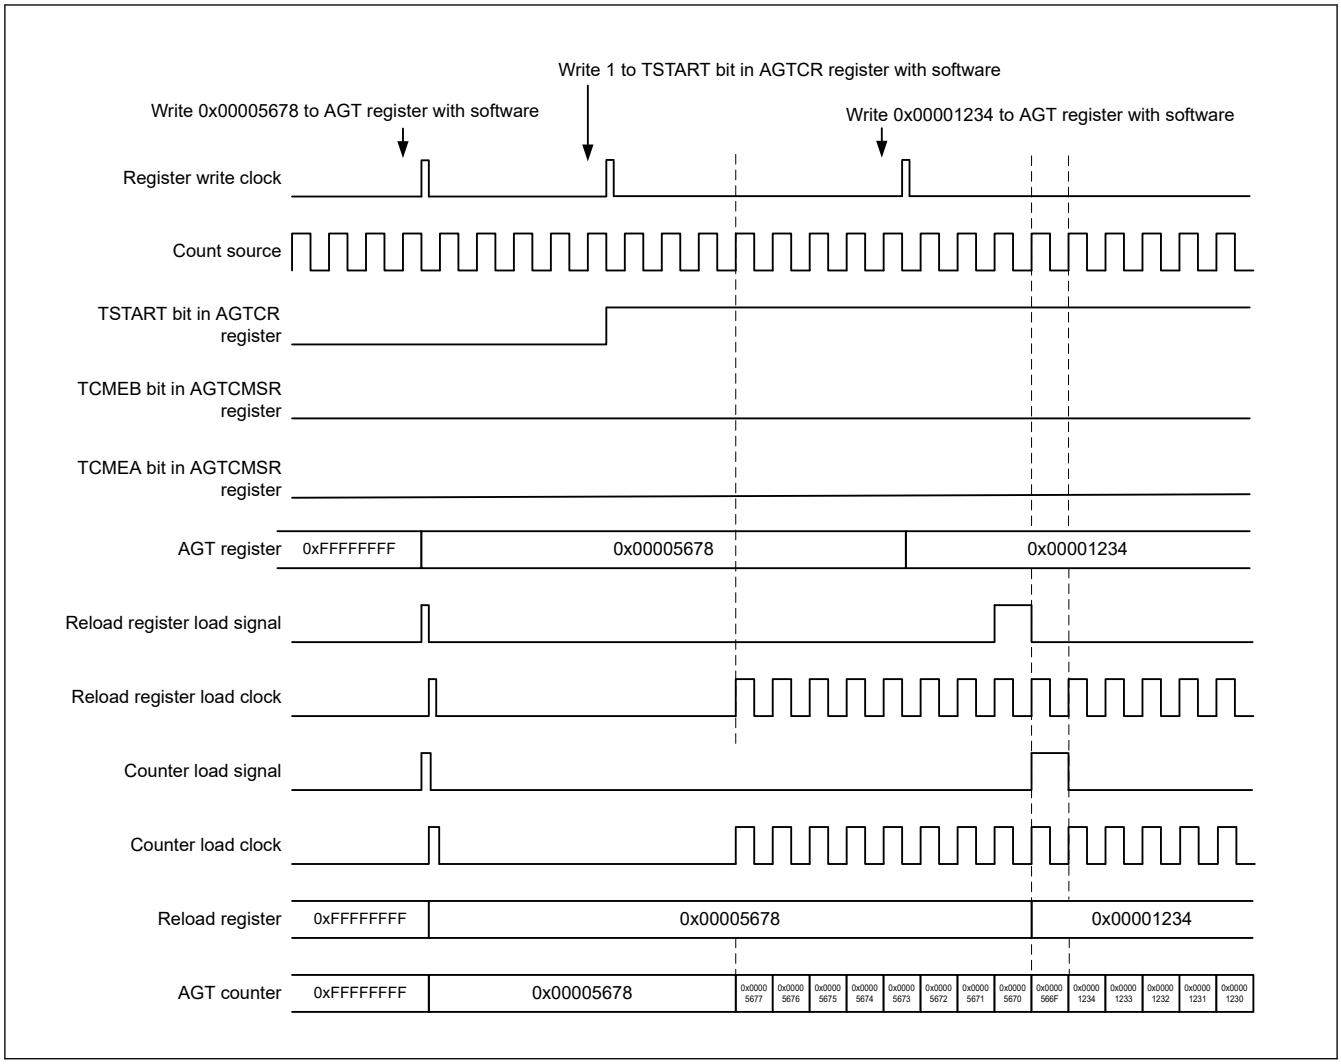

**Figure 21.3 Timing of rewrite operation with TSTART, TCMEA, and TCMEB bit value when AGT compare match A register and AGT compare match B register is invalid**

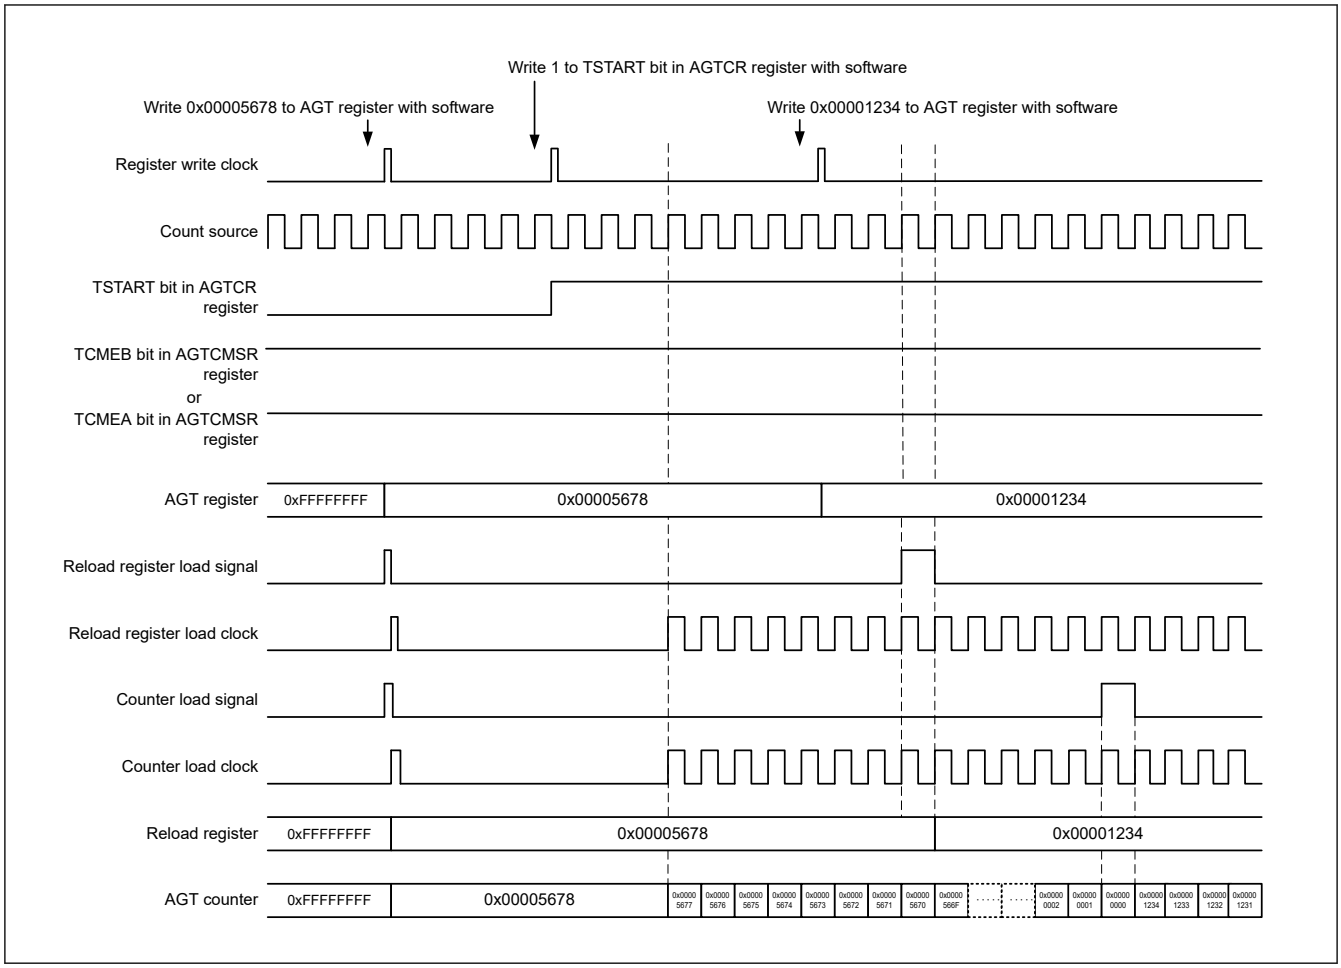

**Figure 21.4 Timing of rewrite operation with TSTART bit value and TCMEA or TCMEB bit value when AGT compare match A register or AGT compare match B register is valid**

## 21.3.2 Reload Register and AGT Compare Match A/B Register Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and AGT compare register A/B depends on the value of the TSTART bit in the AGTCR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and AGT compare register A/B. When the TSTART bit is 1 (count starts), the value is written to the reload register in synchronization with the count source, and then to the compare register in synchronization with the underflow of the counter.

Figure 21.5 shows the timing of rewrite operation with TSTART bit value for compare register A. AGT Compare register B is of the same timing as AGT compare register A.

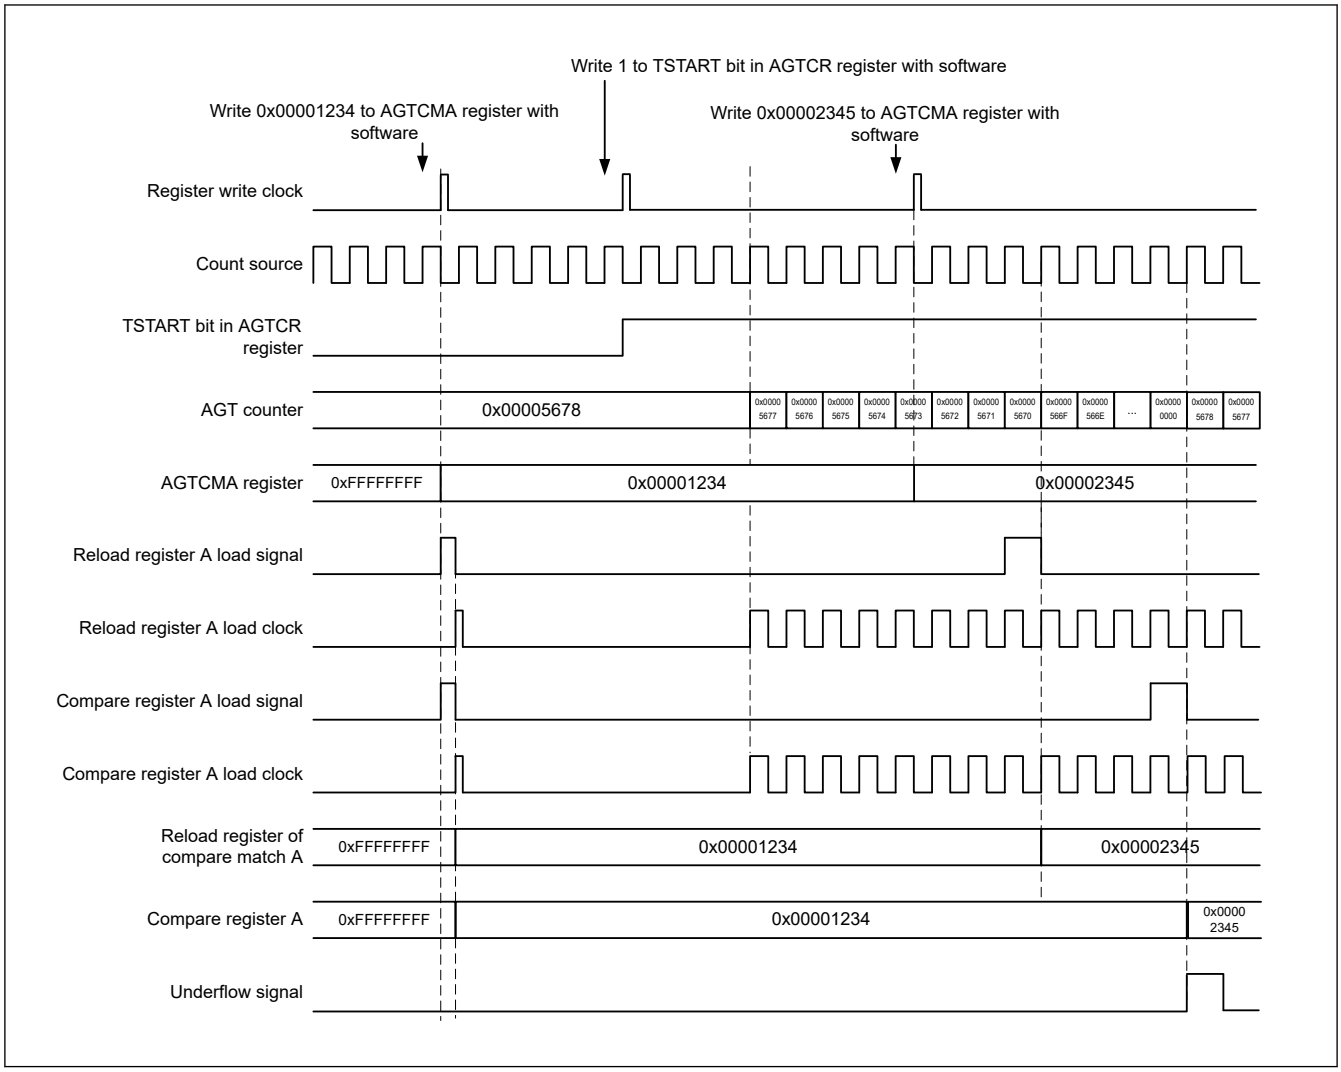

**Figure 21.5 Timing of rewrite operation with the TSTART bit value for AGT compare register A**

## 21.3.3 Timer Mode

In this mode, the AGT counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register. In timer mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x00000000 and the next count source is input, an underflow occurs, and an interrupt request is generated.

Figure 21.6 shows the operation example in timer mode.

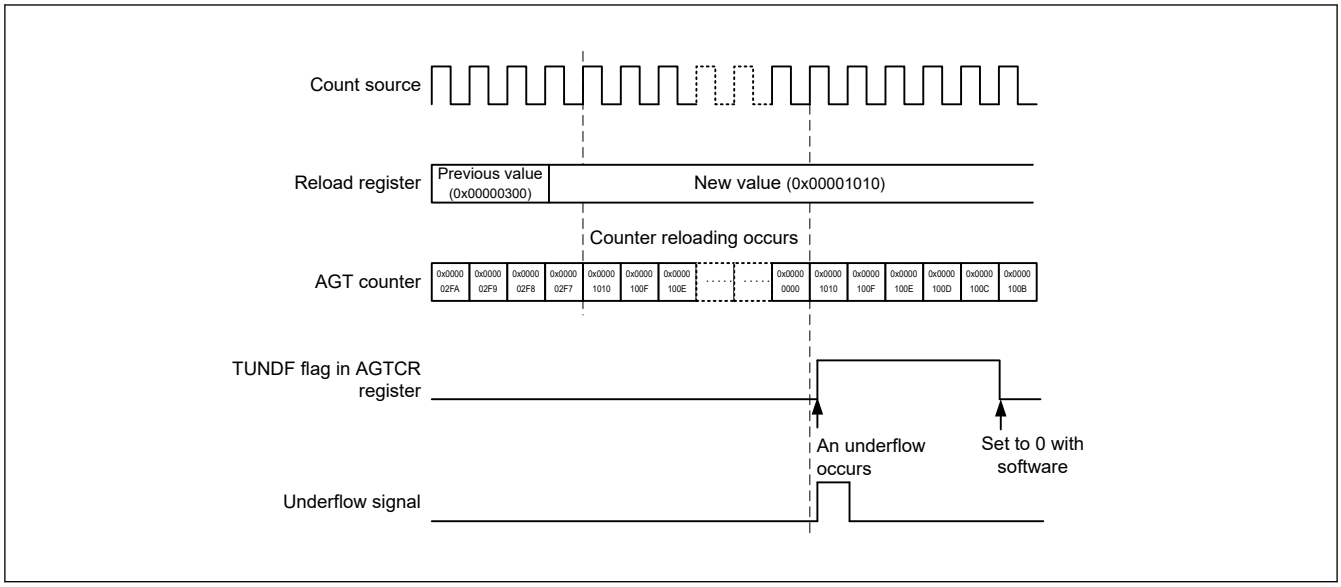

**Figure 21.6 Operation example in timer mode**

## 21.3.4 Pulse Output Mode

In pulse output mode, the counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and the output level of the AGTIOn and AGTOn pins inverted each time an underflow occurs.

In pulse output mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x00000000 and the next count source is input, an underflow occurs, and an interrupt request is generated. In addition, a pulse can be output from the AGTIOn and AGTOn pins. The output level is inverted each time an underflow occurs. The pulse output from the AGTOn pin can be stopped with the TOE bit in the AGTIOC register. The output level can be selected with the TEDGSEL bit in the AGTIOC register.

Figure 21.7 shows the operation example in pulse output mode.

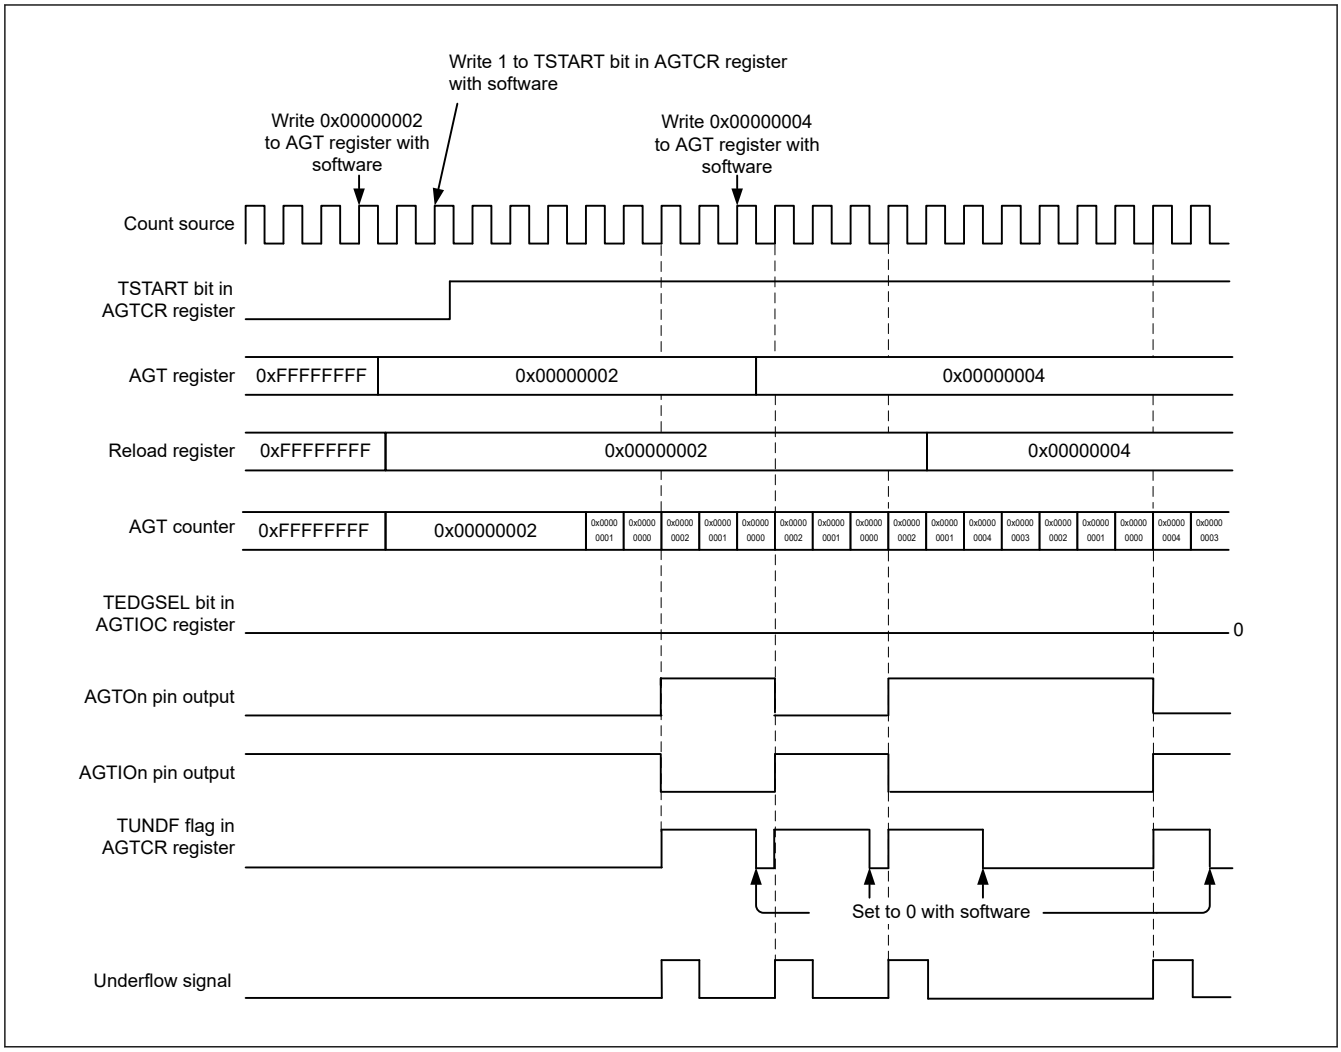

**Figure 21.7 Operation example in pulse output mode**

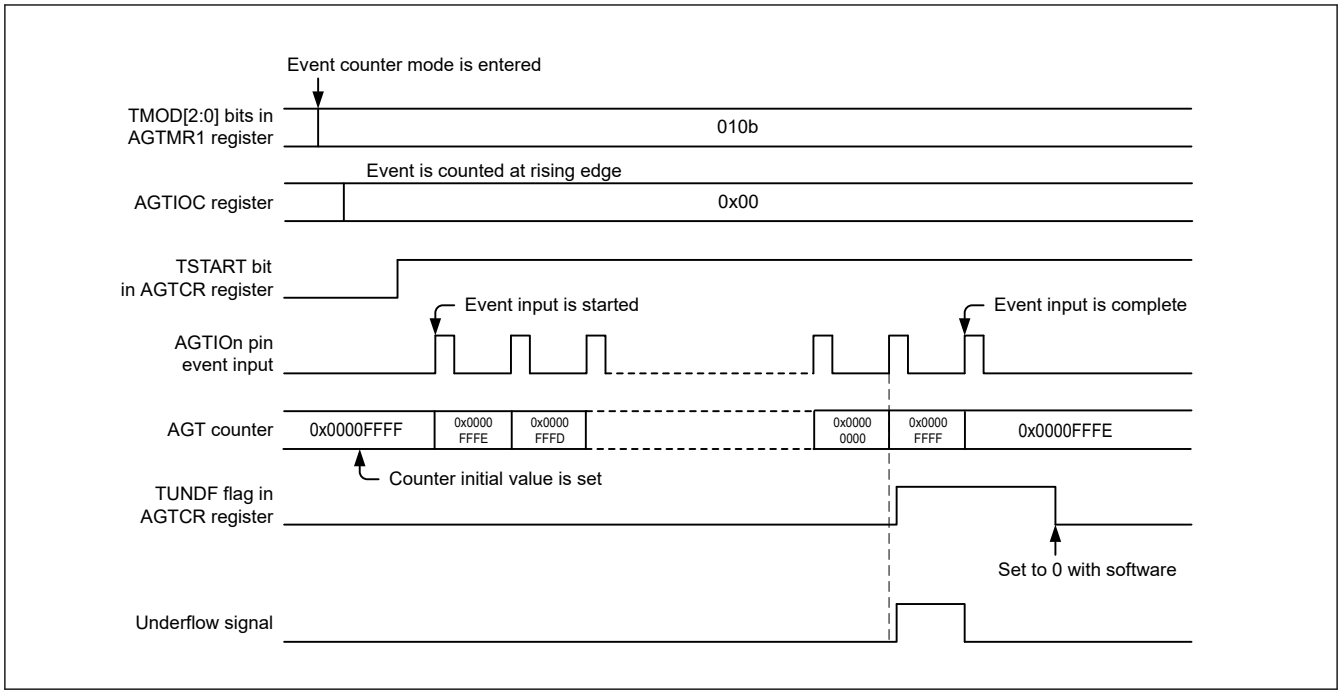
## 21.3.5 Event Counter Mode

In event counter mode, the counter is decremented by an external event signal (count source) input to the AGTIOn pin. Various periods for counting events can be set with the TIOGT[1:0] bits in the AGTIOC register and AGTISR registers. In addition, the filter function for the AGTIOn pin input can be specified with bits TIPF[1:0] in the AGTIOC register. The output from the AGTOn pin can be toggled even in event counter mode.

Figure 21.8 shows the operation example in event counter mode.



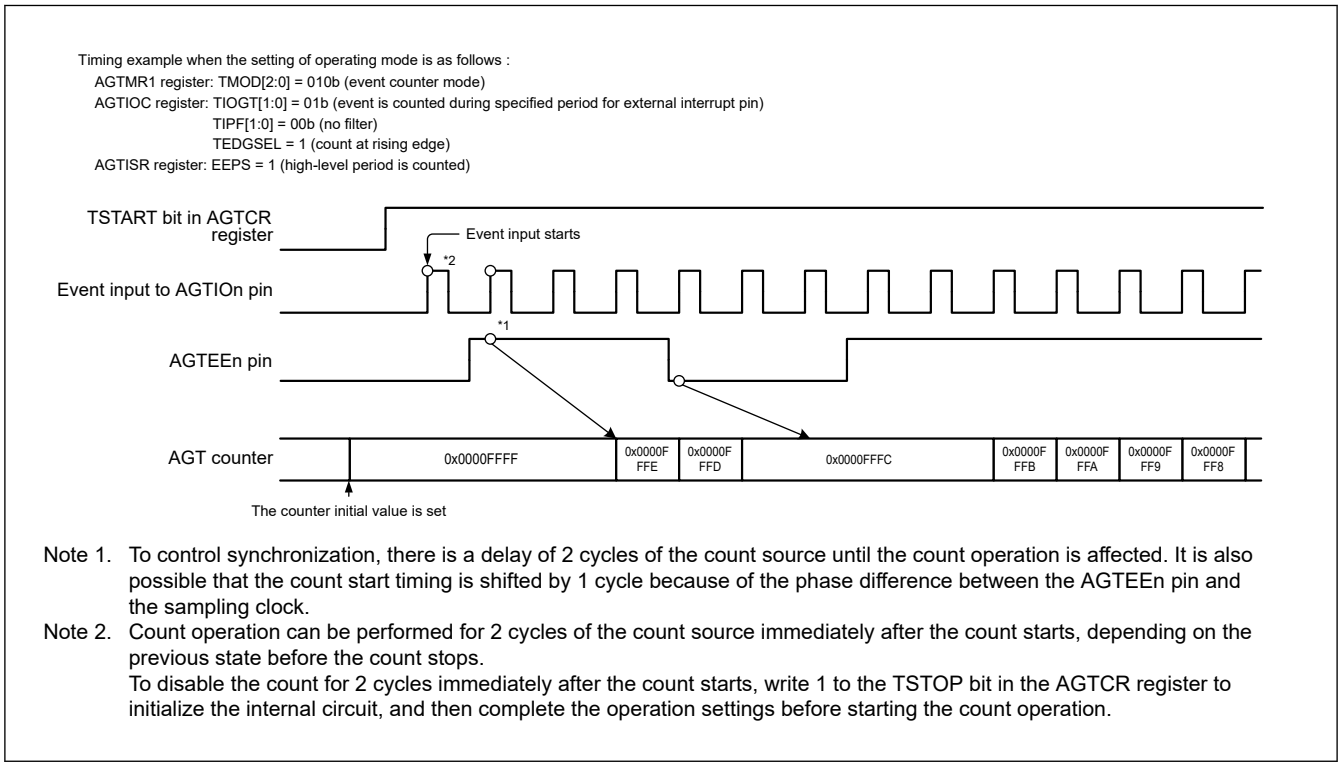


**Figure 21.8 Operation example 1 in event counter mode**

Figure 21.9 shows an operation example for counting during the specified period in event counter mode (TIOGT[1:0] bits in the AGTIOC register are set to 01b).

Note 1. To control synchronization, there is a delay of 2 cycles of the count source until the count operation is affected. It is also possible that the count start timing is shifted by 1 cycle because of the phase difference between the AGTEEn pin and the sampling clock.

Note 2. Count operation can be performed for 2 cycles of the count source immediately after the count starts, depending on the previous state before the count stops.
To disable the count for 2 cycles immediately after the count starts, write 1 to the TSTOP bit in the AGTCR register to initialize the internal circuit, and then complete the operation settings before starting the count operation.

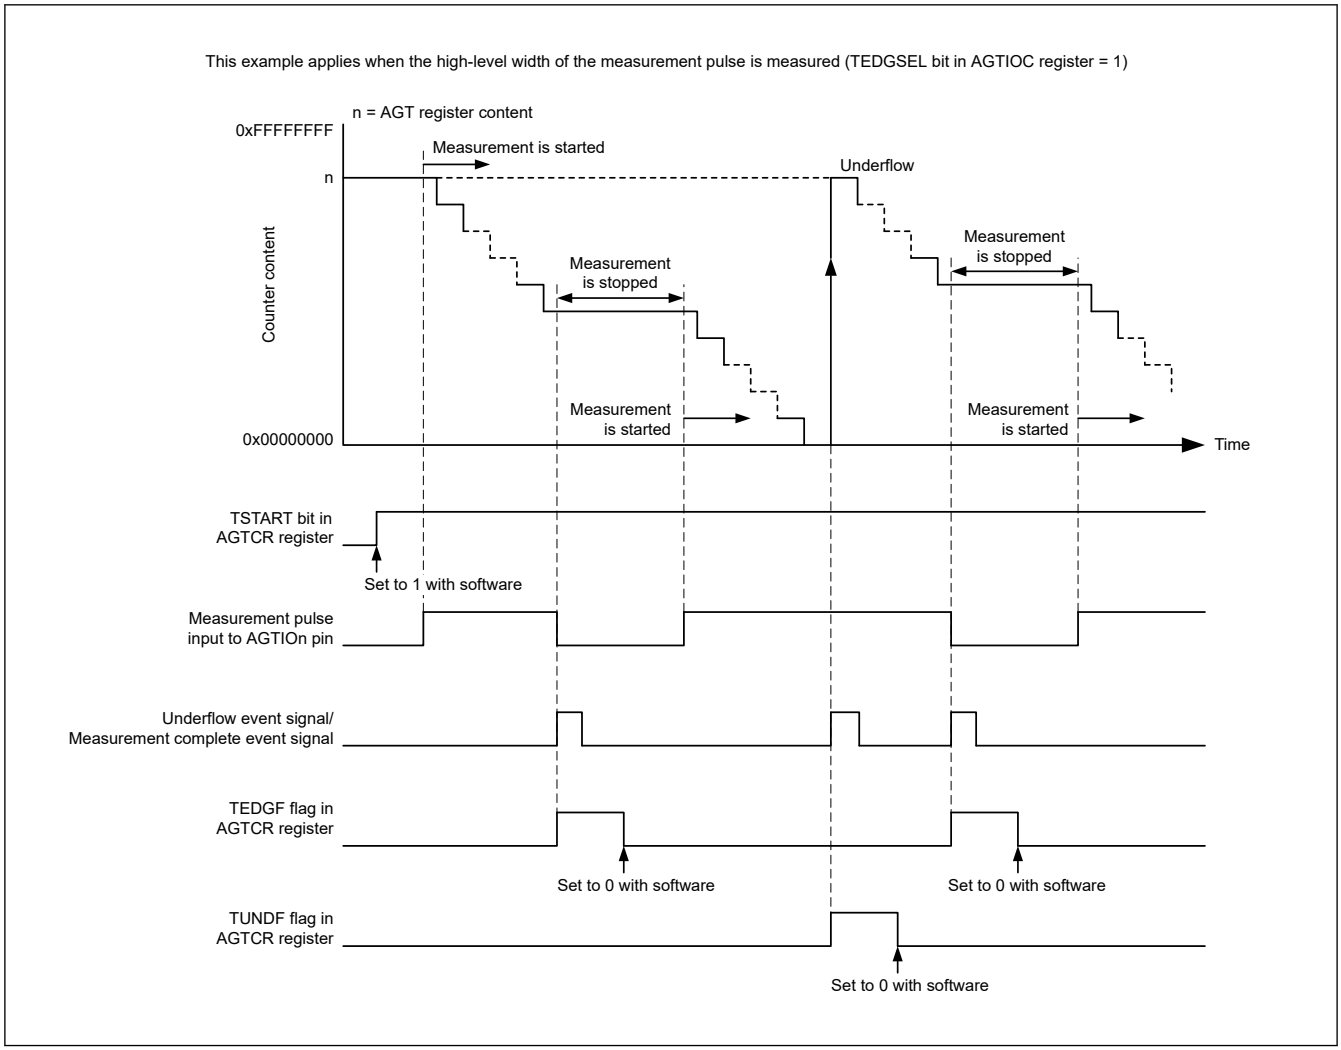
**Figure 21.9 Operation example 2 in event counter mode**

## 21.3.6 Pulse Width Measurement Mode

In pulse width measurement mode, the pulse width of an external signal input to the AGTIOn pin is measured. When the level specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIOn pin, the counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register. When the specified level on the AGTIOn pin ends, the counter is stopped, the TEDGF flag in the AGTCR register is set to 1 (active edge received), and an interrupt request

is generated. The measurement of pulse width data is performed by reading the count value while the counter is stopped. Also, when the counter underflows during measurement, the TUNDF flag in the AGTCR register is set to 1 and an interrupt request is generated.

Figure 21.10 shows the operation example in pulse width measurement mode.



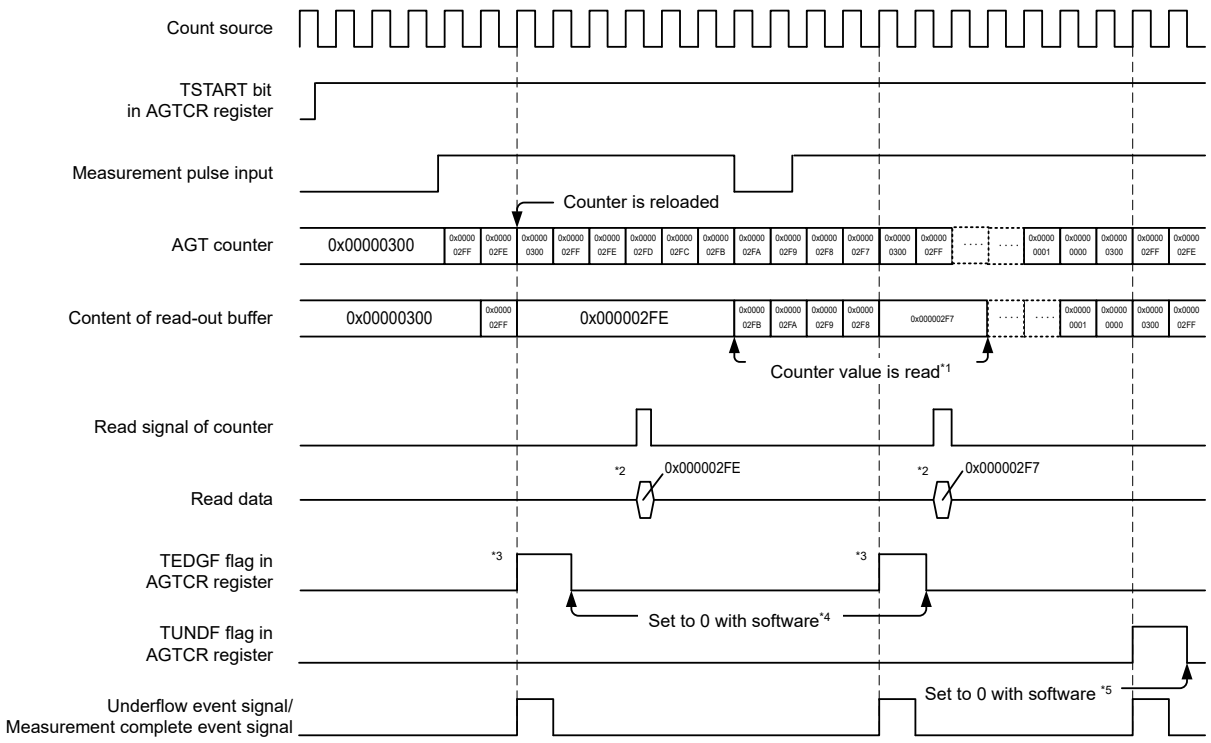


**Figure 21.10 Operation example in pulse width measurement mode**

## 21.3.7 Pulse Period Measurement Mode

In pulse period measurement mode, the pulse period of an external signal input to the AGTIOn pin is measured. The counter is decremented by the count source selected with TCK[2:0] bits in the AGTMR1 register. When a pulse with the period specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIOn pin, the count value is transferred to the read-out buffer on the rising edge of the count source. The value in the reload register is loaded to the counter at the next rising edge. Simultaneously, the TEDGF flag in the AGTCR register is set to 1 (active edge received) and an interrupt request is generated. The read-out buffer (AGT register) is read at this time and the difference from the reload value (see section 21.4.6. How to Calculate Event Number, Pulse Width, and Pulse Period) is the period data of the input pulse. The period data is retained until the read-out buffer is read. When the counter underflows, the TUNDF flag in the AGTCR register is set to 1 (underflow) and an interrupt request is generated.

Figure 21.11 shows the operation example in pulse period measurement mode.

Only input pulses with a period longer than twice the period of the count source are measured. Also, the low-level and high-level widths must both be longer than the period of the count source. If a pulse period shorter than these conditions is input, the input might be ignored.

This example applies when the initial value of the AGT register is set to A, the TEDGSEL bit in the AGTIOC register is set to 0, and the period from one rising edge to the next edge of the measurement pulse is measured.

Note 1. Reading from the AGT register must be performed during the period from when the TEDGF flag is set to 1 (active edge received) until the next active edge is input. The content of the read-out buffer is retained until the AGT register is read. If it is not read before the active edge is input, the measurement result of the previous period is retained.
Note 2. When the AGT register is read in pulse period measurement mode, the content of the read-out buffer is read.
Note 3. When the active edge of the measurement pulse is input and then the set edge of an external pulse is input, the TEDGF flag in the AGTCR register is set to 1 (active edge received).
Note 4. To set to 0 with software, write 0 to the TEDGF flag in the AGTCR register with an 8-bit memory manipulation instruction.
Note 5. To set to 0 with software, write 0 to the TUNDF flag in the AGTCR register with an 8-bit memory manipulation instruction.

**Figure 21.11 Operation example in pulse period measurement mode**

## 21.3.8 Compare Match function

The compare match function detects matches (compare match) between the content of the AGTCMA or AGTCMB register and the content of the AGT register. This function is enabled when the TCMEA or TCMEB bit in the AGTCMSR register is 1 (compare match A register or compare match B register is valid). The counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and when the values of AGT and AGTCMA or AGTCMB match, the TCMAF/TCMBF flag in the AGTCR register is set to 1 (match), and an interrupt request is generated.

When the compare match function is enabled, the timing of the rewrite operation to the reload register and the counter differs. See section 21.3.1. Reload Register and Counter Rewrite Operation for details. In addition, the output level of the AGTOAn, AGTOBn pins is inverted by the match and by the underflow. The output level can be selected with the TOPOLA or TOPOLB bit in the AGTCMSR register.

Figure 21.12 shows the operation example in compare match function.

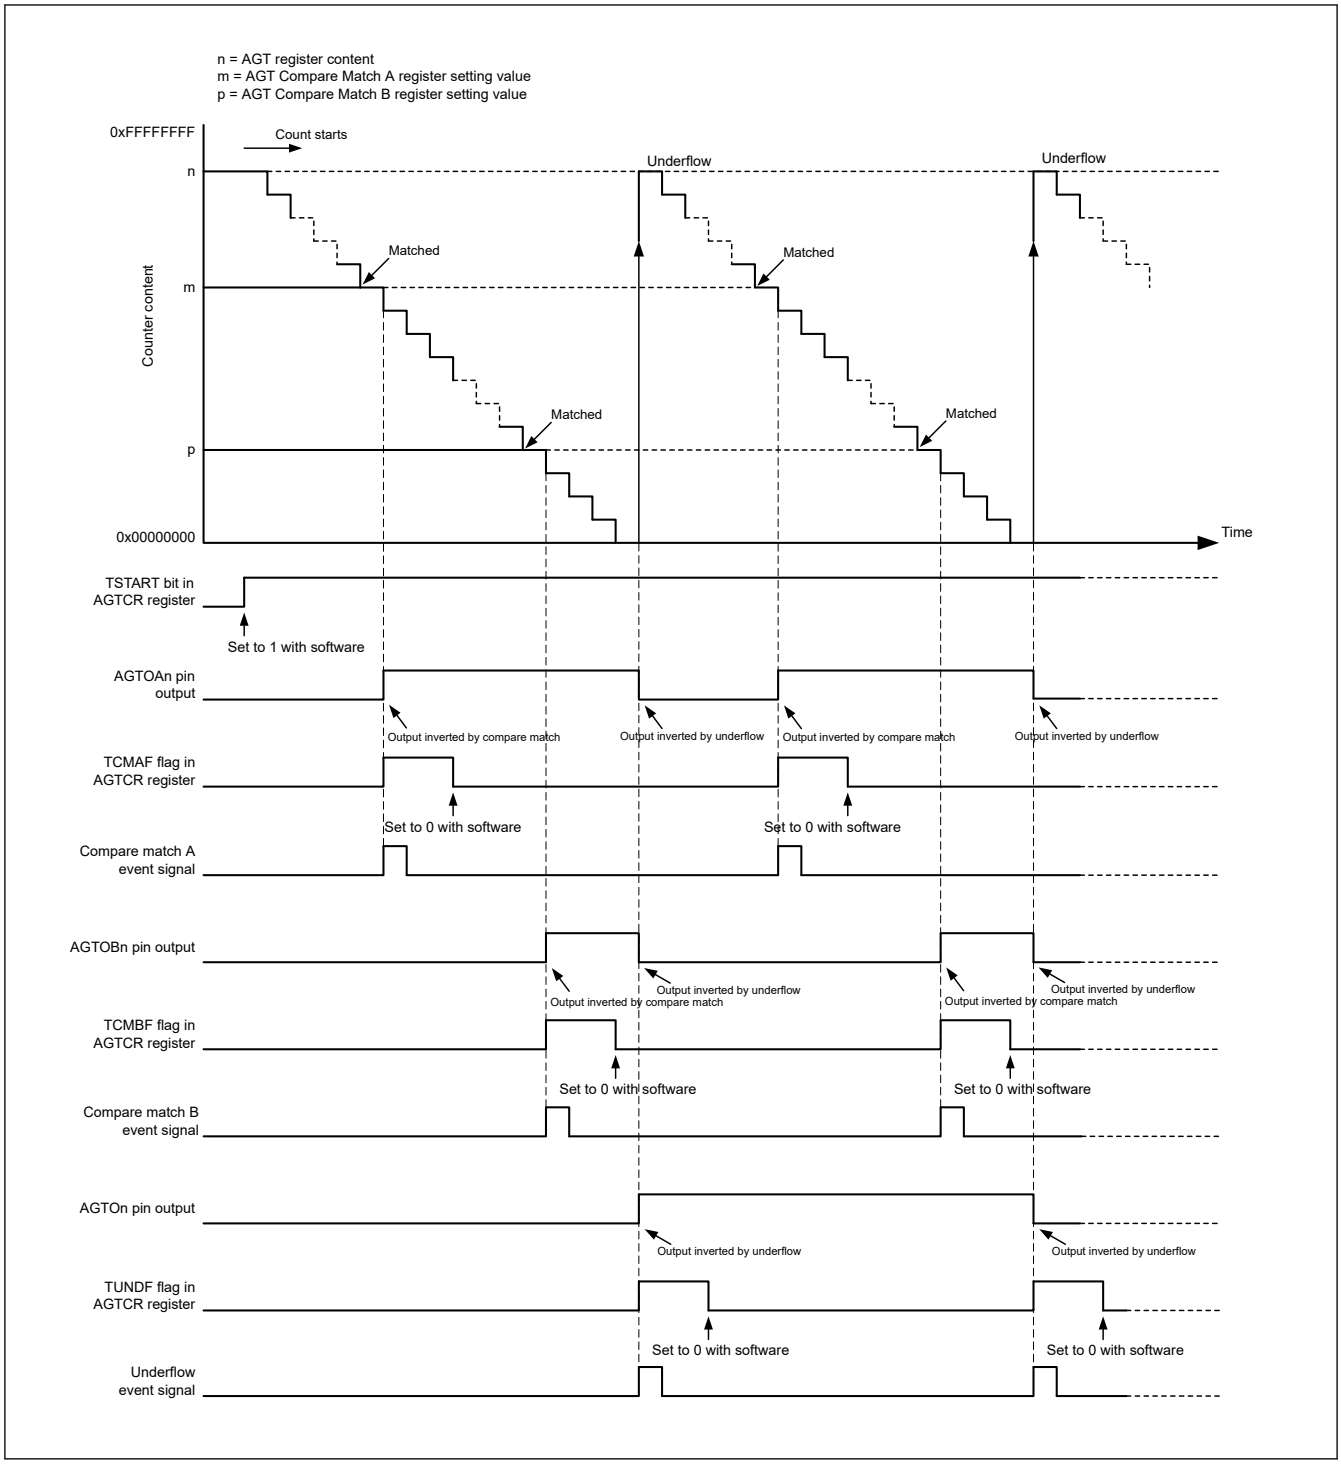

**Figure 21.12 Operation example in compare match function (TOPOLA = 0, TOPOLB = 0)**

## 21.3.9 Output Settings for Each Mode

Table 21.5 to Table 21.8 list the states of AGTOn, AGTIOn, AGTOAn, and AGTOBn pins in each mode.

**Table 21.5 AGTOn pin setting**

| Operating mode | AGTIOC register | | AGTOn pin output |
|---|---|---|---|
| | TOE bit | TEDGSEL bit | |
| All modes | 1 | 1 | Inverted output |
| | | 0 | Normal output |
| | 0 | 0 or 1 | Output disabled |

**Table 21.6 AGTIOn pin setting**

| Operating mode | AGTIOC register | AGTIOn pin I/O |
|---|---|---|
| | TEDGSEL bit | |
| Timer mode | 0 or 1 | Input (not used) |
| Pulse output mode | 1 | Normal output |
| | 0 | Inverted output |
| Event counter mode | 0 or 1 | Input |
| Pulse width measurement mode | | |
| Pulse period measurement mode | | |

**Table 21.7 AGTOAn pin setting**

| Operating mode | AGTCMSR register | | AGTOAn pin output |
|---|---|---|---|
| | TOEA bit | TOPOLA bit | |
| Timer mode | 1 | 1 | Inverted output |
| | | 0 | Normal output |
| | 0 | 0 or 1 | Output disabled (not used) |
| Pulse output mode | 1 | 1 | Inverted output |
| | | 0 | Normal output |
| | 0 | 0 or 1 | Output disabled (not used) |
| Event counter mode | 1 | 1 | Inverted output |
| | | 0 | Normal output |
| | 0 | 0 or 1 | Output disabled (not used) |
| Pulse width measurement mode | 0 | 0 | Prohibited |
| Pulse period measurement mode | | | |

**Table 21.8 AGTOBn pin setting (1 of 2)**

| Operating mode | AGTCMSR register | | AGTOBn pin output |
|---|---|---|---|
| | TOEB bit | TOPOLB bit | |
| Timer mode | 1 | 1 | Inverted output |
| | | 0 | Normal output |
| | 0 | 0 or 1 | Output disabled (not used) |
| Pulse output mode | 1 | 1 | Inverted output |
| | | 0 | Normal output |
| | 0 | 0 or 1 | Output disabled (not used) |
| Event counter mode | 1 | 1 | Inverted output |
| | | 0 | Normal output |
| | 0 | 0 or 1 | Output disabled (not used) |

**Table 21.8 AGTOBn pin setting (2 of 2)**

| Operating mode | AGTCMSR register | | AGTOBn pin output |
|---|---|---|---|
| | TOEB bit | TOPOLB bit | |
| Pulse width measurement mode | 0 | 0 | Prohibited |
| Pulse period measurement mode | | | |

## 21.3.10 Standby Mode

The AGT can operate in Software Standby mode. Set it to Software Standby mode with count operation start (TSTART = 1, TCSTF = 1).

Table 21.9 and Table 21.10 show the setting that can be used in Software Standby mode.

**Table 21.9 Usable settings in Software Standby mode (AGT0)**

| Operating mode | AGTMR1.TCK[2:0] | Operating clock | Resurgence factor of CPU |
|---|---|---|---|
| Timer mode | 100b or 110b | AGTLCLK or AGTSCLK | — |
| Pulse output mode | 100b or 110b | AGTLCLK or AGTSCLK | — |
| Event counter mode*2*3 | — | AGTIOn*1 | — |
| Pulse width measurement mode | 100b or 110b | AGTLCLK or AGTSCLK | — |
| Pulse period measurement mode | 100b or 110b | AGTLCLK or AGTSCLK | — |

Note: —: invalid
Note 1. When using the AGTIOn pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.
Note 2. The AGTEE pin is not available during Software Standby mode. External events are always enabled.
Note 3. When AGTIOSEL.TIES = 0 and the external event input signal is disabled during Software Standby mode, stop the count operation before entering Software Standby mode. After returning from Software Standby mode, restart the count operation if necessary.

**Table 21.10 Usable settings in Software Standby mode (AGT1)**

| Operating mode | AGTMR1.TCK[2:0] | Operating clock | Resurgence factor of CPU |
|---|---|---|---|
| Timer mode | 100b or 110b or 101b*1 | AGTLCLK or AGTSCLK or AGT0 underflow | • Underflow<br>• Compare match A/B |
| Pulse output mode | 100b or 110b or 101b*1 | AGTLCLK or AGTSCLK or AGT0 underflow | • Underflow<br>• Compare match A/B |
| Event counter mode*3*4 | — | AGTIOn*2 | • Underflow<br>• Compare match A/B |
| Pulse width measurement mode | 100b or 110b or 101b*1 | AGTLCLK or AGTSCLK or AGT0 underflow | • Underflow<br>• Active edge |
| Pulse period measurement mode | 100b or 110b or 101b*1 | AGTLCLK or AGTSCLK or AGT0 underflow | • Underflow<br>• Active edge |

Note: —: invalid
Note: Release of Software Standby mode is only AGT1.
Note: Compare match A/B is resurgence factor of CPU from Software Standby mode.
Note 1. Only when AGT0 operates in Table 21.9
Note 2. When using the AGTIOn pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.
Note 3. The AGTEE pin is not available during Software Standby mode. External events are always enabled.
Note 4. When AGTIOSEL.TIES = 0 and the external event input signal is disabled during Software Standby mode, stop the count operation before entering Software Standby mode. After returning from Software Standby mode, restart the count operation if necessary.

## 21.3.11 Interrupt Sources

The AGTn has three interrupt sources as listed in Table 21.11.

**Table 21.11 AGT interrupt sources**

| Name | Interrupt source | DMAC/DTC activation |
|---|---|---|
| AGTn_AGTI | • When the counter underflows<br>• When measurement of the active width of the external input pin (AGTIOn) is complete in pulse width measurement mode<br>• When the set edge of the external input pin (AGTIOn) is input in pulse period measurement mode. | Possible |
| AGTn_AGTCMAI | • When the values of AGT register and AGTCMA register match | Possible |
| AGTn_AGTCMBI | • When the values of AGT register and AGTCMB register match | Possible |

Note: Channel number (n = 0, 1)

### 21.3.12 Event Signal Output to ELC

The AGTn (n = 0, 1) uses the Event Link Controller (ELC) to perform a link operation to a specified module using the interrupt request signal as the event signal. The AGTn (n = 0, 1) outputs compare match A, compare match B, and underflow/measurement complete signals as event signals. For details, see section 17, Event Link Controller (ELC).

## 21.4 Usage Notes

### 21.4.1 Count Operation Start and Stop Control

- When the operating mode (see Table 21.1) is set to other than the event counter mode, or the count source is set to other than AGTn underflow event signal (TCK[2:0] = 101b):
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 3 cycles of the count source. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 3 cycles of the count source. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 0.
- When the operating mode (see Table 21.1) is set to event counter mode, or the count source is set to AGT1 underflow event signal (TCK[2:0] = 101b):
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 2 PCLKB cycles. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 2 PCLKB cycles. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 0.

### 21.4.2 Access to Counter Register

When the TSTART bit and TCSTF flag in the AGTCR register are both 1 (count starts), allow at least 3 cycles of the count source clock between writes when writing to the AGT register successively.

### 21.4.3 When Changing Mode

The registers associated with AGT operating mode (AGTMR1, AGTMR2, AGTIOC, AGTISR, and AGTCMSR) can be changed only when the count is stopped with both the TSTART bit and TCSTF flag set to 0 (count stops). Do not change these registers during count operation.

When the registers associated with AGT operating mode are changed, the values of TEDGF, TUNDF, TCMAF, and TCMBF flags are undefined. Before starting the count, write 0 to the following flags:

- TEDGF (no active edge received)
- TUNDF (no underflow)
- TCMAF (no match)
- TCMBF (no match).

### 21.4.4 Output pin setting

When using the AGTOn, AGTIOn, AGTOAn, or AGTOBn as an output pin, set up the Operation and determine the initial output values. Then set an output mode in the port register.

When using the AGTIOn as an input pin in pulse width measurement mode or pulse period measurement mode, set up the Operation and start count operation. Then start to enter external events from the AGTIOn pin. Invalidate the first measurement and validate the second and later completed measurements.

### 21.4.5 Digital Filter

When using the digital filter, do not start the timer operation for 5 cycles of the digital filter clock after setting TIPF[1:0] bits and when the TEDGSEL bit in the AGTIOC register changes.

### 21.4.6 How to Calculate Event Number, Pulse Width, and Pulse Period

- In event counter mode, event number is expressed mathematically as follows:
  Event number = initial value of counter [AGT register] - counter value of active event end
- In pulse width measurement mode, pulse width is expressed mathematically as follows:
  Pulse width = counter value of stopping measurement - counter value of next stopping measurement
- In pulse period measurement mode, input pulse period is expressed mathematically as follows:
  Period of input pulse = (initial value of counter [AGT register] - reading value of the read-out buffer) + 1.

### 21.4.7 When Count is Forcibly Stopped by TSTOP Bit

After the counter is forcibly stopped by the TSTOP bit in the AGTCR register, do not access the following I/O registers for 1 cycle of the count source:

- AGT
- AGTCMA
- AGTCMB
- AGTCR
- AGTMR1
- AGTMR2.

### 21.4.8 When Selecting AGT0 Underflow as the Count Source

Operate according to the following procedures described in this section when selecting the underflow event signal as the count source.

#### (1) Procedure for starting operation

1. Set AGT.
2. Start the count operation of AGT1.
3. Start the count operation of AGT0.

#### (2) Procedure for stopping operation

1. Stop the count operation of AGT0.
2. Stop the count operation of AGT1.
3. Stop the count source clock of AGT1 (write 000b in the AGTMR1.TCK[2:0] bits).

### 21.4.9 Module-stop function

AGT operation can be disabled or enabled using Module Stop Control Register D (MSTPCRD). The AGT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes

### 21.4.10 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. Therefore, when using the AGTIOn, AGTEEn, or both input as external event input, the clock source should not be switched. If switching the clock source while using the external event input, extend the input pulse width by 4 clock cycles of the switched source clock cycles.

# 22. Realtime Clock (RTC)

## 22.1 Overview

The RTC has two operation modes, normal operation mode and low-consumption clock mode. In each of the operation mode, the RTC has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.

Differences exist in the RTC functions between the two operation modes.

In normal operation mode, the sub-clock oscillator or LOCO can be selected as the count source of the time counters. The RTC uses a 128-Hz clock acquired by dividing the count source by a prescaler. Year, month, date, day-of-week, a.m. /p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted by 1/128 second.

In low-consumption clock mode, a 128-Hz clock from the sub-clock acts as the count source of the time counters. Year, month, date, day-of-week, a.m. /p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted by 1/128 second.

Table 22.1 lists the RTC specifications, Figure 22.1 shows a block diagram, and Table 22.2 lists the I/O pins.

**Table 22.1 RTC specifications**

| Parameter | Specifications |
|---|---|
| Count mode | Calendar count mode/binary count mode |
| Count source*1 | • Sub-clock (XCIN) or LOCO (normal operation mode)<br>• 128-Hz from sub-clock (XCIN) (low-consumption clock mode) |
| Clock and calendar functions | • Calendar count mode<br>– Year, month, date, day of week, hour, minute, second are counted, BCD display<br>– 12 hours/24 hours mode switching function<br>– 30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to 1 minute)<br>– Automatic adjustment function for leap years<br>• Binary count mode<br>– Count seconds in 32 bits, binary display<br>• Shared by both modes<br>– Start/stop function<br>– The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz)<br>– Clock error correction function<br>– Clock (1-Hz/64-Hz) output |
| Interrupts | • Alarm interrupt (RTC_ALM)<br>– As an alarm interrupt condition, selectable for comparison with the following:<br>– Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected<br>– Binary count mode: Each bit of the 32-bit binary counter<br>• Periodic interrupt (RTC_PRD)<br>– 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second*2, 1/128 second*2, or 1/256 second*2 can be selected as an interrupt period.<br>• Carry interrupt (RTC_CUP)<br>– An interrupt is generated at either of the following conditions:<br>• When a carry from the 64-Hz counter to the second counter is generated.<br>• When the 64-Hz counter is changed and the R64CNT register is read at the same time. (32-KHz count mode is only for 64-Hz counter reading)<br>• Return from Software Standby mode can be performed by the alarm interrupt or periodic interrupt |
| Time capture function | • Times can be captured when the edge of the time capture event input pin is detected. For every event input, month, date, hour, minute, and second are captured or the 32-bit binary counter value is captured.<br>• Interrupt can be generated when the edge of the time capture event input is detected. The time capture event input pin and IRQ are shared. |
| Event link function | Periodic event output (RTC_PRD)*2 |
| TrustZone filter | Security attribution can be set |

Note 1. The frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source should be satisfied.
Note 2. Not supported in low-consumption clock mode.

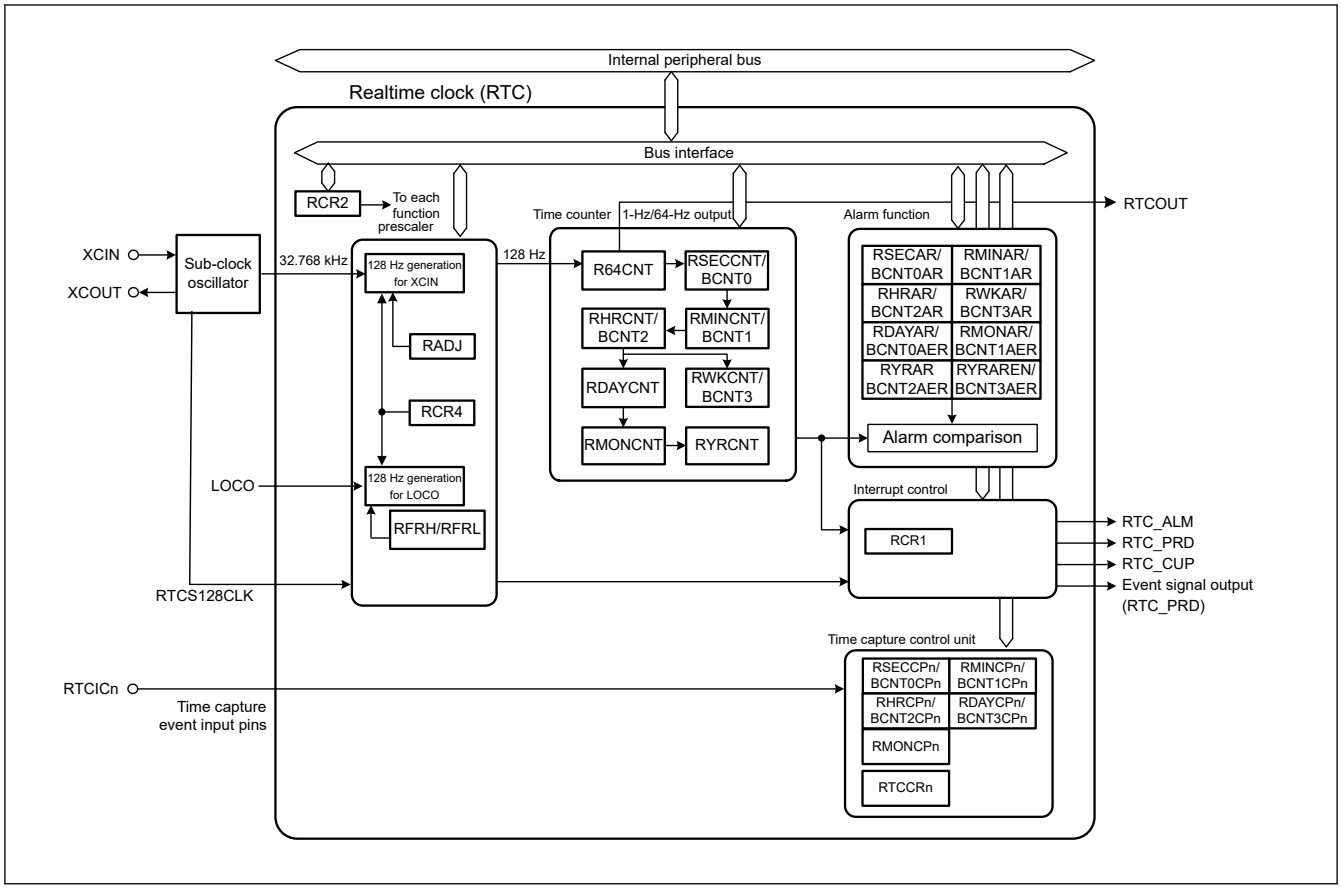

**Figure 22.1 RTC block diagram**

**Table 22.2 RTC I/O pins**

| Pin name | I/O | Description |
|---|---|---|
| XCIN | Input | Connect a 32.768-kHz crystal to these pins |
| XCOUT | Output | |
| RTCOUT | Output | This pin is used to output a 1-Hz/64-Hz waveform |
| RTCICn (n = 0 to 2) | Input | Time capture event input pins |

## 22.2 Register Descriptions

Write or read from the RTC registers as described in section 22.6.5. Notes on Writing to and Reading from Registers.

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power state during counting operations, for example, while the RCR2.START bit is 1, the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate.

Note: A reset generated while writing to a register might destroy the register value. In addition, do not allow the MCU to enter Software Standby mode immediately after setting any of these registers. For details, see section 22.6.4. Transitions to Low Power Modes after Setting Registers.

### 22.2.1 R64CNT : 64-Hz Counter

Base address: RTC = 0x4008_3000

Offset address: 0x00

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | R64OVF | F1HZ | F2HZ | F4HZ | F8HZ | F16HZ | F32HZ | F64HZ |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | F64HZ | 64-Hz Flag<br>This bit indicates the 64-Hz state of the sub-second digit. | R |
| 1 | F32HZ | 32-Hz Flag<br>This bit indicates the 32-Hz state of the sub-second digit. | R |
| 2 | F16HZ | 16-Hz Flag<br>This bit indicates the 16-Hz state of the sub-second digit. | R |
| 3 | F8HZ | 8-Hz Flag<br>This bit indicates the 8-Hz state of the sub-second digit. | R |
| 4 | F4HZ | 4-Hz Flag<br>This bit indicates the 4-Hz state of the sub-second digit. | R |
| 5 | F2HZ | 2-Hz Flag<br>This bit indicates the 2-Hz state of the sub-second digit. | R |
| 6 | F1HZ | 1-Hz Flag<br>This bit indicates the 1-Hz state of the sub-second digit. | R |
| 7 | R64OVF | This bit indicates the overflow of F1HZ only when using time error adjustment function in low-consumption clock mode. | R |

The R64CNT counter is used in both calendar count mode and binary count mode, under two operation modes. The 64-Hz counter (R64CNT) generates the period for a second by counting up periods of the 128-Hz clock. The state in the sub-second range can be confirmed by reading this counter.

This counter is set to 0x00 by an RTC software reset or an execution of a 30-second adjustment. To read this counter, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.

### 22.2.2 RSECCNT : Second Counter (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x02

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | SEC10[2:0] | | | SEC1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | SEC1[3:0] | 1-Second Count<br>Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place. | R/W |
| 6:4 | SEC10[2:0] | 10-Second Count<br>Counts from 0 to 5 for 60-second counting. | R/W |
| 7 | — | The read value is undefined. The write value should be 0. | R/W |

The RSECCNT counter sets and counts the BCD-coded second value. It counts the carries generated once per second in the 64-Hz counter.

The setting range is decimal 00 to 59. The RTC does not operate normally if any other value is set. Before writing to this register, you must stop the count operation using the START bit in RCR2.

To read this counter, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.

### 22.2.3 RMINCNT : Minute Counter (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x04

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | MIN10[2:0] | | | MIN1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | MIN1[3:0] | 1-Minute Count<br>Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place. | R/W |
| 6:4 | MIN10[2:0] | 10-Minute Count<br>Counts from 0 to 5 for 60-minute counting. | R/W |
| 7 | — | The read value is undefined. The write value should be 0. | R/W |

The RMINCNT counter sets and counts the BCD-coded minute value. It counts the carries generated once every minute in the second counter.

A value from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.

### 22.2.4 RHRCNT : Hour Counter (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x06

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | PM | HR10[1:0] | | HR1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | HR1[3:0] | 1-Hour Count<br>Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place. | R/W |
| 5:4 | HR10[1:0] | 10-Hour Count<br>Counts from 0 to 2 once per carry from the ones place. | R/W |
| 6 | PM | AM/PM select for time counter setting.<br>0: AM<br>1: PM | R/W |
| 7 | — | The read value is undefined. The write value should be 0. | R/W |

The RHRCNT counter sets and counts the BCD-coded hour value. It counts the carries generated once per hour in the minute counter. The specifiable time differs based on the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – from 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – from 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. The PM bit is only enabled when the RCR2.HR24 bit is 0.

Otherwise, the setting in the PM bit has no effect. To read this counter, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.

### 22.2.5 RWKCNT : Day-of-Week Counter (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x08

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | DAYW[2:0] | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | DAYW[2:0] | Day-of-Week Counting<br>0 0 0: Sunday<br>0 0 1: Monday<br>0 1 0: Tuesday<br>0 1 1: Wednesday<br>1 0 0: Thursday<br>1 0 1: Friday<br>1 1 0: Saturday<br>1 1 1: Setting prohibited | R/W |
| 7:3 | — | The read values are undefined. The write value should be 0. | R/W |

The RWKCNT counter sets and counts in the coded day-of-week value. It counts the carries generated once per day in the hour counter. A value from 0 through 6 can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.

### 22.2.6 BCNTn : Binary Counter n (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x02 + 0x02 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | BCNT[7:0] | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | BCNT[7:0] | Binary Counter | R/W |

BCNTn is a read/write 8-bit register to access BCNT[31:0] that is a 32-bit binary counter. BCNT3 is assigned to the BCNT[31:24] bits, BCNT2 is assigned to the BCNT[23:16] bits, BCNT1 is assigned to the BCNT[15:8] bits, and BCNT0 is assigned to the BCNT[7:0] bits. BCNTn performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.

### 22.2.7 RDAYCNT : Day Counter

Base address: RTC = 0x4008_3000

Offset address: 0x0A

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | DATE10[1:0] | | DATE1[3:0] | | | |
| Value after reset: | 0 | 0 | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | DATE1[3:0] | 1-Day Count<br>Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place. | R/W |
| 5:4 | DATE10[1:0] | 10-Day Count<br>Counts from 0 to 3 once per carry from the ones place. | R/W |
| 7:6 | — | These bits are read as 0. The write value should be 0. | R/W |

The RDAYCNT counter is used in calendar count mode to set and count the BCD-coded date value. It counts the carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year. Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. When specifying a value, the range of specifiable days depends on the month and whether the year is a leap year. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.

## 22.2.8 RMONCNT : Month Counter

Base address: RTC = 0x4008_3000

Offset address: 0x0C

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | MON10 | MON1[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | MON1[3:0] | 1-Month Count<br>Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place. | R/W |
| 4 | MON10 | 10-Month Count<br>Counts from 0 to 1 once per carry from the ones place. | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

The RMONCNT counter is used in calendar count mode to set and count the BCD-coded month value. It counts the carries generated once per month in the date counter.

A value from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.

## 22.2.9 RYRCNT : Year Counter

Base address: RTC = 0x4008_3000

Offset address: 0x0E

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | YR10[3:0] | | | | YR1[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | YR1[3:0] | 1-Year Count<br>Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:4 | YR10[3:0] | 10-Year Count<br>Counts from 0 to 9 once per carry from ones place. When a carry is generated in the tens place, 1 is added to the hundreds place. | R/W |
| 15:8 | — | These bits are read as 0. The write value should be 0. | R/W |

The RYRCNT counter is used in calendar count mode to set and count the BCD-coded year value. It counts the carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.

## 22.2.10 RSECAR : Second Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x10

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ENB | SEC10[2:0] | | | SEC1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | SEC1[3:0] | 1 Second<br>Value for the ones place of seconds. | R/W |
| 6:4 | SEC10[2:0] | 10 Seconds<br>Value for the tens place of seconds. | R/W |
| 7 | ENB | ENB<br>0: Do not compare register value with RSECCNT counter value<br>1: Compare register value with RSECCNT counter value | R/W |

RSECAR is an alarm register associated with the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. RSECAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

## 22.2.11 RMINAR : Minute Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x12

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ENB | MIN10[2:0] | | | MIN1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | MIN1[3:0] | 1 Minute<br>Value for the ones place of minutes. | R/W |
| 6:4 | MIN10[2:0] | 10 Minutes<br>Value for the tens place of minutes. | R/W |
| 7 | ENB | ENB<br>0: Do not compare register value with RMINCNT counter value<br>1: Compare register value with RMINCNT counter value | R/W |

RMINAR is an alarm register associated with the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. RMINAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

## 22.2.12 RHRAR : Hour Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x14

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ENB | PM | HR10[1:0] | | HR1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | HR1[3:0] | 1 Hour<br>Value for the ones place of hours. | R/W |
| 5:4 | HR10[1:0] | 10 Hours<br>Value for the tens place of hours. | R/W |
| 6 | PM | AM/PM select for alarm setting.<br>0: AM<br>1: PM | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7 | ENB | ENB<br>0: Do not compare register value with RHRCNT counter value<br>1: Compare register value with RHRCNT counter value | R/W |

RHRAR is an alarm register associated with the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – From 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – From 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. When the RCR2.HR24 bit is 0, you must set the PM bit. When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect. This register is set to 0x00 by an RTC software reset.

## 22.2.13 RWKAR : Day-of-Week Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x16

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ENB | — | — | — | — | DAYW[2:0] | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | DAYW[2:0] | Day-of-Week Setting<br>0 0 0: Sunday<br>0 0 1: Monday<br>0 1 0: Tuesday<br>0 1 1: Wednesday<br>1 0 0: Thursday<br>1 0 1: Friday<br>1 1 0: Saturday<br>1 1 1: Setting prohibited | R/W |
| 6:3 | — | The read values are undefined. The write value should be 0. | R/W |
| 7 | ENB | ENB<br>0: Do not compare register value with RWKCNT counter value<br>1: Compare register value with RWKCNT counter value | R/W |

RWKAR is an alarm register associated with the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR

- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. RWKAR values from 0 through 6 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

## 22.2.14 BCNTnAR : Binary Counter n Alarm Register (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x10 + 0x02 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | BCNTAR | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | BCNTAR | Alarm register associated with the 32-bit binary counter | R/W |

BCNTnAR is a read/write alarm register associated with the 32-bit binary counter. BCNT3AR is assigned to the BCNTAR[31:24] bits, BCNT2AR is assigned to the BCNTAR[23:16] bits, BCNT1AR is assigned to the BCNTAR[15:8] bits, and BCNT0AR is assigned to the BCNTAR[7:0]. This register is set to 0x00 by an RTC software reset.

## 22.2.15 RDAYAR : Date Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x18

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ENB | — | DATE10[1:0] | | DATE1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | DATE1[3:0] | 1 Day<br>Value for the ones place of days. | R/W |
| 5:4 | DATE10[1:0] | 10 Days<br>Value for the tens place of days. | R/W |
| 6 | — | The read value is undefined. The write value should be 0. | R/W |
| 7 | ENB | ENB<br>0: Do not compare register value with RDAYCNT counter value<br>1: Compare register value with RDAYCNT counter value | R/W |

RDAYAR is an alarm register associated with the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR

- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RDAYAR values from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

## 22.2.16 RMONAR : Month Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x1A

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ENB | — | — | MON10 | MON1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | MON1[3:0] | 1 Month<br>Value for the ones place of months. | R/W |
| 4 | MON10 | 10 Months<br>Value for the tens place of months. | R/W |
| 6:5 | — | The read values are undefined. The write value should be 0. | R/W |
| 7 | ENB | ENB<br>0: Do not compare register value with RMONCNT counter value<br>1: Compare register value with RMONCNT counter value | R/W |

RMONAR is an alarm register associated with the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RMONAR values from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

## 22.2.17 RYRAR : Year Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x1C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | YR10[3:0] | | | | YR1[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | YR1[3:0] | 1 Year<br>Value for the ones place of years. | R/W |
| 7:4 | YR10[3:0] | 10 Years<br>Value for the tens place of years. | R/W |
| 15:8 | — | These bits are read as 0. The write value should be 0. | R/W |

RYRAR is an alarm register associated with the BCD-coded year counter RYRCNT. The RYRAR values from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x0000 by an RTC software reset.

## 22.2.18 RYRAREN : Year Alarm Enable Register (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x1E

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ENB | — | — | — | — | — | — | — |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6:0 | — | The read values are undefined. The write value should be 0. | R/W |
| 7 | ENB | ENB<br>0: Do not compare register value with the RYRCNT counter value<br>1: Compare register value with the RYRCNT counter value | R/W |

When the ENB bit in the RYRAREN register is set to 1, the RYRAR value is compared with the RYRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

## 22.2.19 BCNTnAER : Binary Counter n Alarm Enable Register (n = 0, 1) (in Binary Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x18 + 0x02 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ENB[7:0] | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | ENB[7:0] | Setting the alarm enable associated with the 32-bit binary counter | R/W |

BCNTnAER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

## 22.2.20 BCNT2AER : Binary Counter 2 Alarm Enable Register (in Binary Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x1C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | ENB[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | ENB[7:0] | Setting the alarm enable associated with the 32-bit binary counter | R/W |
| 15:8 | — | These bits are read as 0. The write value should be 0. | R/W |

BCNT2AER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

## 22.2.21 BCNT3AER : Binary Counter 3 Alarm Enable Register (in Binary Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x1E

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ENB[7:0] | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | ENB[7:0] | Setting the alarm enable associated with the 32-bit binary counter | R/W |

BCNT3AER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

## 22.2.22 RCR1 : RTC Control Register 1

Base address: RTC = 0x4008_3000

Offset address: 0x22

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | PES[3:0] | | | | RTCOS | PIE | CIE | AIE |
| Value after reset: | x | x | x | x | 0 | x | 0 | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | AIE | Alarm Interrupt Enable<br>0: Disable alarm interrupt requests<br>1: Enable alarm interrupt requests | R/W |
| 1 | CIE | Carry Interrupt Enable<br>0: Disable carry interrupt requests<br>1: Enable carry interrupt requests | R/W |
| 2 | PIE | Periodic Interrupt Enable<br>0: Disable periodic interrupt requests<br>1: Enable periodic interrupt requests | R/W |
| 3 | RTCOS | RTCOUT Output Select<br>0: Outputs 1 Hz on RTCOUT<br>1: Outputs 64 Hz RTCOUT | R/W |
| 7:4 | PES[3:0] | Periodic Interrupt Select<br>0x6: Generate periodic interrupt every 1/256 second*1*2<br>0x7: Generate periodic interrupt every 1/128 second*2<br>0x8: Generate periodic interrupt every 1/64 second*2<br>0x9: Generate periodic interrupt every 1/32 second<br>0xA: Generate periodic interrupt every 1/16 second<br>0xB: Generate periodic interrupt every 1/8 second<br>0xC: Generate periodic interrupt every 1/4 second<br>0xD: Generate periodic interrupt every 1/2 second<br>0xE: Generate periodic interrupt every 1 second<br>0xF: Generate periodic interrupt every 2 seconds<br>Others: Do not generate periodic interrupts | R/W |

Note 1. When LOCO is selected (RCR4.RCKSEL = 1) while PES[3:0] = 0x6, a periodic interrupt is generated every 1/128 second.
Note 2. Not supported when RTC is in low-consumption clock mode. No periodic interrupts are generated if RTC is in this setting.

The RCR1 register is used in both calendar count mode and binary count mode, under two operation modes. Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits are updated before proceeding.

### AIE bit (Alarm Interrupt Enable)

The AIE bit enables or disables alarm interrupt requests.

### CIE bit (Carry Interrupt Enable)

The CIE bit enables or disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

### PIE bit (Periodic Interrupt Enable)

The PIE bit enables or disabled a periodic interrupt.

### RTCOS bit (RTCOUT Output Select)

The RTCOS bit selects the RTCOUT output period. The RTCOS bit must be rewritten while the count operation is stopped (RCR2.START = 0) and the RTCOUT output is disabled (RCR2.RTCOE = 0). When RTCOUT is output to an external pin, the RCR2.RTCOE bit must be enabled.

**PES[3:0] bits (Periodic Interrupt Select)**

The PES[3:0] bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified in these bits.

## 22.2.23 RCR2 : RTC Control Register 2 (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x24

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | CNTMD | HR24 | AADJP | AADJE | RTCOE | ADJ30 | RESET | START |
| Value after reset: | x | x | x | x | 0 | 0 | 0 | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | START*3 | Start<br>0: Stop prescaler and time counter<br>1: Operate prescaler and time counter normally | R/W |
| 1 | RESET | RTC Software Reset<br>0: In writing: Invalid (writing 0 has no effect).<br>In reading: Normal time operation in progress, or an RTC software reset has completed.<br>1: In writing: Initialize the prescaler and target registers for RTC software reset*1.<br>In reading: RTC software reset in progress. | R/W |
| 2 | ADJ30 | 30-Second Adjustment<br>0: In writing: Invalid (writing 0 has no effect).<br>In reading: Normal time operation in progress, or 30-second adjustment has completed.<br>1: In writing: Execute 30-second adjustment.<br>In reading: 30-second adjustment in progress. | R/W |
| 3 | RTCOE | RTCOUT Output Enable<br>0: Disable RTCOUT output<br>1: Enable RTCOUT output | R/W |
| 4 | AADJE | Automatic Adjustment Enable*2*4<br>0: Disable automatic adjustment<br>1: Enable automatic adjustment | R/W |
| 5 | AADJP | Automatic Adjustment Period Select*2*4<br>0: In normal operation mode, adjust RADJ.ADJ[5:0] setting from the count value of the prescaler every minute. In low-consumption clock mode, adjust RADJ.ADJ [5:0] setting from the count value of the 64-Hz counter every day.<br>1: In normal operation mode, adjust RADJ.ADJ[5:0] setting from the count value of the prescaler every 10 seconds. In low-consumption clock mode, adjust RADJ.ADJ[5:0] setting from the count value of the 64-Hz counter every hour. | R/W |
| 6 | HR24 | Hours Mode*4<br>0: Operate RTC in 12-hour mode<br>1: Operate RTC in 24-hour mode | R/W |
| 7 | CNTMD | Count Mode Select*5<br>0: Calendar count mode<br>1: Binary count mode | R/W |

Note 1. R64CNT, RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAR, RYRAREN, RADJ, RTCCRn, RSECCPn, RMINCPn, RHRCPn, RDAYCPn, RMONCPn, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

Note 3. The prescaler operates only in normal operation mode, and no prescaler operates in low-consumption clock mode.

Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See section 22.6.5. Notes on Writing to and Reading from Registers for notes on register writing/reading.

Note 5. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

The RCR2 register is related to hours mode, automatic adjustment function, enabling RTCOUT output, 30-second adjustment, RTC software reset, and controlling count operation.

#### START bit (Start)

The START bit stops or restarts the prescaler or time counter operation. This bit is updated in synchronization with the next cycle of the count source. When the START bit is modified, check that the bit is updated before proceeding.

#### RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. Check that this bit is 0 before proceeding.

#### ADJ30 bit (30-Second Adjustment)

The ADJ30 bit is for 30-second adjustment.

When 1 is written to the ADJ30 bit, the RSECCNT value of less than 30 seconds is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.

The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment completes. If 1 is written to the ADJ30 bit, check that the bit is 0 before proceeding. When the 30-second adjustment is performed, the prescaler and R64CNT are also reset. The ADJ30 bit is set to 0 by an RTC software reset.

#### RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time.

When RTCOUT is to be output from an external pin, enable the RTCOE bit and set up the port control for the pin.

#### AADJE bit (Automatic Adjustment Enable)

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.

The AADJE bit is set to 0 by an RTC software reset.

#### AADJP bit (Automatic Adjustment Period Select)

The AADJP bit selects the automatic-adjustment period.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.

The AADJP bit is set to 0 by an RTC software reset.

#### HR24 bit (Hours Mode)

The HR24 bit specifies whether the RTC operates in 12- or 24-hour mode.

Use the START bit to stop counting before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.

#### CNTMD bit (Count Mode Select)

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode in the two operation modes.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see section 22.3.1. Outline of Initial Settings of Registers after Power On.

## 22.2.24 RCR2 : RTC Control Register 2 (in Binary Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x24

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | CNTMD | — | AADJP | AADJE | RTCOE | — | RESET | START |
| Value after reset: | x | x | x | x | 0 | 0 | 0 | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | START*3 | Start<br>0: Stop the 32-bit binary counter, 64-Hz counter, and prescaler<br>1: Operate the 32-bit binary counter, 64-Hz counter, and prescaler normally | R/W |
| 1 | RESET | RTC Software Reset<br>0: In writing: Invalid (writing 0 has no effect).<br>In reading: Normal time operation in progress, or an RTC software reset has completed.<br>1: In writing: Initialize the prescaler and target registers for RTC software reset*1.<br>In reading: RTC software reset in progress. | R/W |
| 2 | — | This bit is read as 0. The write value should be 0. | R/W |
| 3 | RTCOE | RTCOUT Output Enable<br>0: Disable RTCOUT output<br>1: Enable RTCOUT output | R/W |
| 4 | AADJE | Automatic Adjustment Enable*2*4<br>0: Disable automatic adjustment<br>1: Enable automatic adjustment | R/W |
| 5 | AADJP | Automatic Adjustment Period Select*2*4<br>0: In normal operation mode, add or subtract the RADJ.ADJ[5:0] bits from the prescaler count value every 32 seconds. In low-consumption clock mode, add or subtract the RADJ.ADJ[5:0] bits from the 64-Hz counter count value every 8192 seconds.<br>1: In normal operation mode, add or subtract the RADJ.ADJ[5:0] bits from the prescaler count value every 8 seconds. In low-consumption clock mode, add or subtract the RADJ.ADJ[5:0] bits from the 64-Hz counter count value every 2048 seconds. | R/W |
| 6 | — | The read value is undefined. The write value should be 0. | R/W |
| 7 | CNTMD | Count Mode Select*5<br>0: Calendar count mode<br>1: Binary count mode | R/W |

Note 1. R64CNT, BCNTnAR, BCNTnAER, RADJ, RTCCRn, BCNTnCPm, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.
Note 2. When LOCO is selected, the setting of this bit is disabled.
Note 3. The prescaler operates only in normal operation mode, and no prescaler operates in low-consumption clock mode.
Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See section 22.6.5. Notes on Writing to and Reading from Registers for notes on register writing/reading.
Note 5. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

RCR2 in the binary count mode is a register related to the automatic correction function, RTCOUT output enable, RTC software reset, and count mode control.

### START bit (Start)

The START bit stops or restarts the prescaler or counter (clock) operation. This bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding.

### RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. When 1 is written to the RESET bit, check that the bit is 0 before proceeding.

### RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time. When an RTCOUT signal is to be output from an external pin, enable the port control in addition to setting this bit.

### AADJE bit (Automatic Adjustment Enable)

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit. The AADJE bit is set to 0 by an RTC software reset.

### AADJP bit (Automatic Adjustment Period Select)

The AADJP bit selects the automatic-adjustment period.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit. The AADJP bit is set to 0 by an RTC software reset.

### CNTMD bit (Count Mode Select)

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode in the two operation modes.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see section 22.3.1. Outline of Initial Settings of Registers after Power On.

## 22.2.25 RCR4 : RTC Control Register 4

Base address: RTC = 0x4008_3000

Offset address: 0x28

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ROPSEL | — | — | — | — | — | — | RCKSEL |
| Value after reset: | x | 0 | 0 | 0 | 0 | 0 | 0 | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RCKSEL | Count Source Select in normal operation mode<br>0: Sub-clock oscillator is selected<br>1: LOCO is selected | R/W |
| 6:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | ROPSEL | RTC Operation Mode Select<br>0: Normal operation mode is selected.<br>1: Low-consumption clock mode is selected. | R/W |

The RCR4 is used for selecting the RTC operation mode and the count source. The RCR4 register is used in both calendar count mode and binary count mode.

For details on count source setting, see section 22.3.1. Outline of Initial Settings of Registers after Power On and section 22.3.2. Operation mode, Clock and Count Mode Setting Procedure. The count source must be selected only once before specifying the initial settings of the RTC registers at power on.

### RCKSEL bit (Count Source Select in normal operation mode)

The RCKSEL bit selects the count source from the sub-clock oscillator and LOCO.

The RCKSEL bit is only used in normal operation mode. When the RCKSEL bit is set to 0, the time is counted with the sub-clock oscillator. When the bit is set to 1, the time is counted with LOCO.

**ROPSEL bit (RTC Operation Mode Select)**

When the ROPSEL bit is set to 0, the RTC operation mode is set to normal operation mode. When this bit is set to 1, the RTC operation mode is set to low-consumption clock mode.

## 22.2.26 RFRL : Frequency Register L

Base address: RTC = 0x4008_3000

Offset address: 0x2C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | RFC[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | RFC[15:0] | Frequency Comparison Value<br>Write 0x00FF to this register when using the LOCO. | R/W |

RFRL is a register for controlling the prescaler when LOCO is selected in normal operation mode.

The RTC time counter operates on a 128-Hz clock signal as the base clock. Therefore, when LOCO is selected, LOCO is divided by the prescaler to generate a 128-Hz clock signal. Set the frequency comparison value in the RFC[15:0] bits to generate a 128-Hz clock from the LOCO frequency. Before writing to RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

A value from 0x0007 through 0x01FF can be specified as the frequency comparison value. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2. The operating frequency of the peripheral module clock and the LOCO should be such that the peripheral module clock is ≥ LOCO.

Calculation method of frequency comparison value:

RFC[15:0] = (LOCO clock frequency) / 128 - 1

When the LOCO frequency is 32.768 kHz, the RFRL register should be set to 0x00FF.

## 22.2.27 RFRH : Frequency Register H

Base address: RTC = 0x4008_3000

Offset address: 0x2A

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RFC16 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RFC16 | Write 0 before writing to the RFRL register after a cold start. | R/W |
| 15:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Before writing to RFRHL.RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

## 22.2.28 RADJ : Time Error Adjustment Register

Base address: RTC = 0x4008_3000

Offset address: 0x2E

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | PMADJ[1:0] | | ADJ[5:0] | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5:0 | ADJ[5:0] | Adjustment Value<br>In normal operation mode, these bits specify the adjustment value from the prescaler.<br>In low-consumption clock mode, these bits specify the adjustment value from the 64-Hz counter. | R/W |
| 7:6 | PMADJ[1:0] | Plus-Minus<br>0 0: Do not perform adjustment.<br>0 1: In normal operation mode, adjustment is performed by the addition to the prescaler.<br>In low-consumption clock mode, adjustment is performed by the addition to the 64-Hz counter.<br>1 0: In normal operation mode, adjustment is performed by the subtraction from the prescaler.<br>In low-consumption clock mode, adjustment is performed by the subtraction from the 64-Hz counter.<br>1 1: Setting prohibited. | R/W |

The RADJ register is used in both calendar count mode and binary count mode. Adjustment is performed by the addition to or subtraction from the prescaler or 64-Hz counter. If the Automatic Adjustment Enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ. If the RCR2.AADJE bit is 1, adjustment is performed in the interval specified in the Automatic Adjustment Period Select (RCR2.AADJP) bit.

The current adjustment by software (disabling automatic adjustment) may be invalid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting, then specify the next adjustment value.

RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits are updated before continuing with more processing. This register is set to 0x00 by an RTC software reset. The setting of this register is enabled only when the sub-clock oscillator is selected. When LOCO is selected, adjustment is not performed.

### ADJ[5:0] bits (Adjustment Value)

The ADJ[5:0] bits specify the adjustment value.

### PMADJ[1:0] bits (Plus-Minus)

The PMADJ[1:0] bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

## 22.2.29 RTCCRn : Time Capture Control Register n (n = 0 to 2)

Base address: RTC = 0x4008_3000

Offset address: 0x40 + 0x02 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | TCEN | — | TCNF[1:0] | | — | TCST | TCCT[1:0] | |
| Value after reset: | x | 0 | x | x | 0 | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | TCCT[1:0] | Time Capture Control<br>0 0: Do not detect events<br>0 1: Detect rising edge<br>1 0: Detect falling edge<br>1 1: Detect both edges | R/W |
| 2 | TCST | Time Capture Status<br>0: No event detected<br>1: Event detected*1 | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 5:4 | TCNF[1:0] | Time Capture Noise Filter Control<br>0 0: Turn noise filter off<br>0 1: Setting prohibited<br>1 0: Turn noise filter on (count source)<br>1 1: Turn noise filter on (count source by divided by 32) | R/W |
| 6 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | TCEN | Time Capture Event Input Pin Enable<br>0: Disable the RTCICn pin as the time capture event input pin<br>1: Enable the RTCICn pin as the time capture event input pin | R/W |

Note 1. Indicates that an event is detected. Writing 1 to this bit has no effect. Writing 0 sets this bit to 0.

The RTCCRn register is used both in calendar count mode and in binary count mode. RTCCR0, RTCCR1, and RTCCR2 control the RTCIC0, RTCIC1, and RTCIC2 pins respectively.RTCCRn is updated in synchronization with the count source. When RTCCRn is modified, check that all the bits except the TCST bit are updated before continuing with additional processing. This register is cleared to 0x00 by an RTC software reset.

### TCCT[1:0] bits (Time Capture Control)

The TCCT[1:0] bits control the edge detection of the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2. The detection edge is selectable. The TCCT[1:0] bits must be set while the TCEN bit is 1.

### TCST bit (Time Capture Status)

The TCST bit indicates that an event on the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2, was detected. When the TCST bit is 0, no event is detected. When the TCST bit is 1, this bit indicates that an event was detected on the associated pin and the capture register is valid. When multiple events are detected, the capture time for the first event is retained.

The event is detected only during count operation (RCR2.START bit = 1). Before reading the capture register, make sure that this bit is set to 1.

Set the TCST bit while the TCCT[1:0] bits are 00b (no event is detected). The TCST bit is set to 0 in synchronization with the count source. When the TCST bit is set to 0, check that the bit is updated before continuing with additional processing.

### TCNF[1:0] bits (Time Capture Noise Filter Control)

The TCNF[1:0] bits control the noise filter of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).

When the noise filter is on, the count source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined.

Set the TCNF[1:0] bits while the TCCT[1:0] bits are 00b (no event is detected). When the noise filter is used, set the TCNF[1:0] bits, wait for 3 cycles of the specified sampling period, then set the TCCT[1:0] bits.

### TCEN bit (Time Capture Event Input Pin Enable)

The TCEN bit enables or disables the time capture event input pins RTCIC0, RTCIC1, and RTCIC2. When the 32 kHz clock is selected (RCR4.RCKSEL bit = 0) and the 32 kHz clock oscillator is stopped, the time capture event input pins (RTCTC0, RTCTC1, RTCTC2) is invalid. If the TCEN bit is set to 0, also set the TCCT[1:0] bits to 00b.

## 22.2.30 RSECCPn : Second Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x52 + 0x10 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | SEC10[2:0] | | | SEC1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | SEC1[3:0] | 1-Second Capture<br>Capture value for the ones place of seconds. | R |
| 6:4 | SEC10[2:0] | 10-Second Capture<br>Capture value for the tens place of seconds. | R |
| 7 | — | The read value is undefined. | R |

RSECCPn is a read-only register that captures the RSECCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins ares stored in the RSECCP0, RSECCP1, and RSECCP2 registers, respectively. This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

## 22.2.31 RMINCPn : Minute Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x54 + 0x10 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | MIN10[2:0] | | | MIN1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | MIN1[3:0] | 1-Minute Capture<br>Capture value for the ones place of minutes. | R |
| 6:4 | MIN10[2:0] | 10-Minute Capture<br>Capture value for the tens place of minutes. | R |
| 7 | — | The read value is undefined. | R |

RMINCPn is a read-only register that captures the RMINCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMINCP0, RMINCP1, and RMINCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

## 22.2.32 RHRCPn : Hour Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x56 + 0x10 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | PM | HR10[1:0] | | HR1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | HR1[3:0] | 1-Hour Capture<br>Capture value for the ones place of hours | R |
| 5:4 | HR10[1:0] | 10-Hour Capture<br>Capture value for the tens place of hours | R |
| 6 | PM | PM<br>0: AM<br>1: PM | R |
| 7 | — | The read value is undefined. | R |

RHRCPn is a read-only register that captures the RHRCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RHRCP0, RHRCP1, and RHRCP2 registers, respectively.

The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

## 22.2.33 RDAYCPn : Date Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x5A + 0x10 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | DATE10[1:0] | | DATE1[3:0] | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | DATE1[3:0] | 1-Day Capture<br>Capture value for the ones place of days. | R |
| 5:4 | DATE10[1:0] | 10-Day Capture<br>Capture value for the tens place of days. | R |
| 7:6 | — | The read value is undefined. | R |

RDAYCPn is a read-only register that captures the RDAYCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RDAYCP0, RDAYCP1, and RDAYCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

## 22.2.34 RMONCPn : Month Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x5C + 0x10 × n

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | MON10 | MON1[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | MON1[3:0] | 1-Month Capture<br>Capture value for the ones place of months. | R |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 4 | MON10 | 10-Month Capture<br>Capture value for the tens place of months. | R |
| 7:5 | — | These bits are read as 0. | R |

RMONCPn is a read-only register that captures the RMONCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMONCP0, RMONCP1, and RMONCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

## 22.2.35 BCNTnCPm : BCNTn Capture Register m (n= 0 to 3, m = 0 to 2) (in Binary Count Mode)

Base address: RTC = 0x4008_3000

Offset address: 0x52 + 0x10 × m (BCNT0CPm)
0x54 + 0x10 × m (BCNT1CPm)
0x56 + 0x10 × m (BCNT2CPm)
0x5A + 0x10 × m (BCNT3CPm)

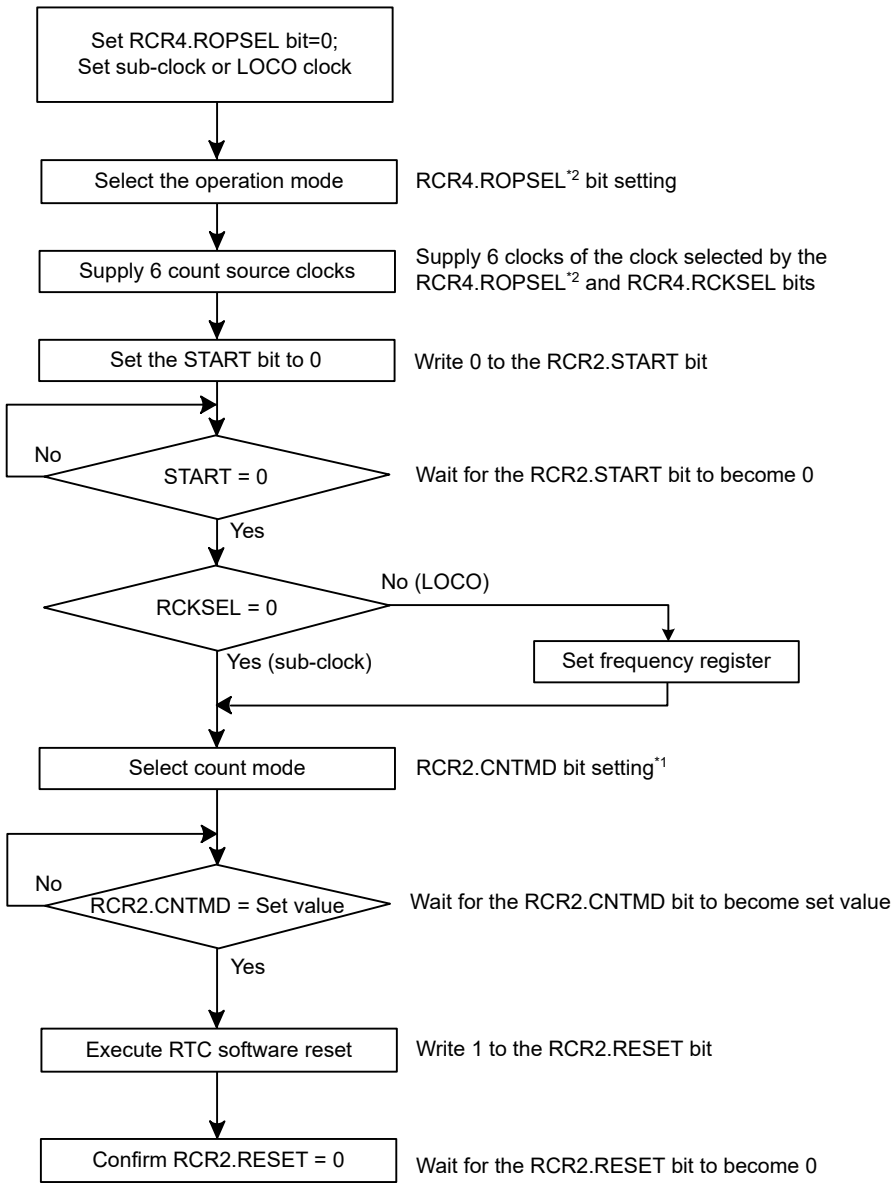
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x |

BCNTnCPm is a read-only register that captures the BCNTn value when a time capture event is detected. BCNT3CPm is assigned to the BCNTCPm[31:24] bits, BCNT2CPm is assigned to the BCNTCPm[23:16] bits, BCNT1CPm is assigned to the BCNTCPm[15:8] bits and BCNT0CPm is assigned to the BCNTCPm[7:0] bits. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNTnCP0, BCNTnCP1, and BCNTnCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

# 22.3 Operation

## 22.3.1 Outline of Initial Settings of Registers after Power On



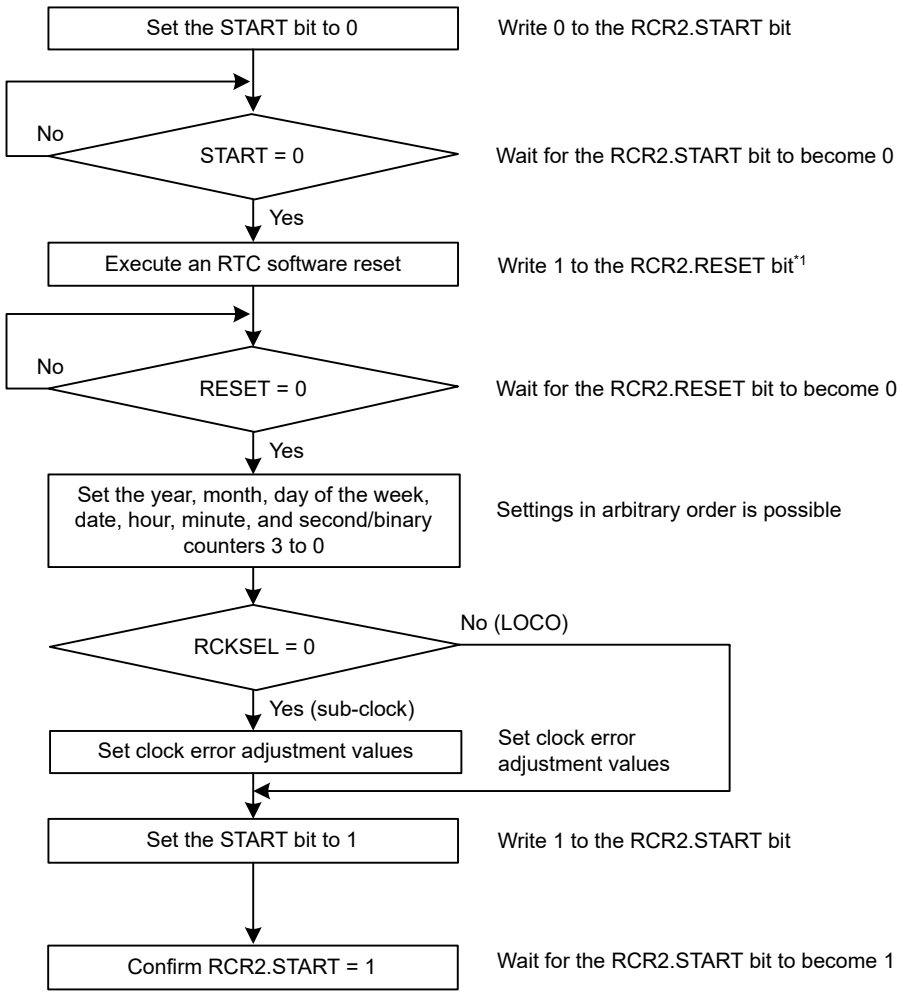
After the power is turned on, perform the initial settings for the operation mode, clock, count mode, time error adjustment, time, alarm, and interrupts.

**Table 22.3 Initial settings after a power on**

| No. | Step Name | Description |
|---|---|---|
| 1 | Clock supply, operation mode and count mode settings | Initial setting for clock supply, operation mode and count mode |
| 2 | Set the time | Time setting in the clock counter and initial setting of the time error adjustment register |
| 3 | Set the alarm | Initial setting of the alarm registers |
| 4 | Set the interrupt | Initial setting of the interrupt control register |
| 5 | Set the time capture control register n | Initial setting of the time capture control register n |

## 22.3.2 Operation mode, Clock and Count Mode Setting Procedure

Figure 22.2 shows how to set the operation mode, clock and the count mode.



Note 1. This step is not required if the count mode is concurrently set by setting the START bit to 0. A value associated with the count mode setting must be written to the RCR2.CNTMD bit.
Note 2. RCR4.RCKSEL bit setting is not required if the low-consumption clock mode is set.

**Figure 22.2 Clock and count mode setting procedure**

## 22.3.3 Setting the Time

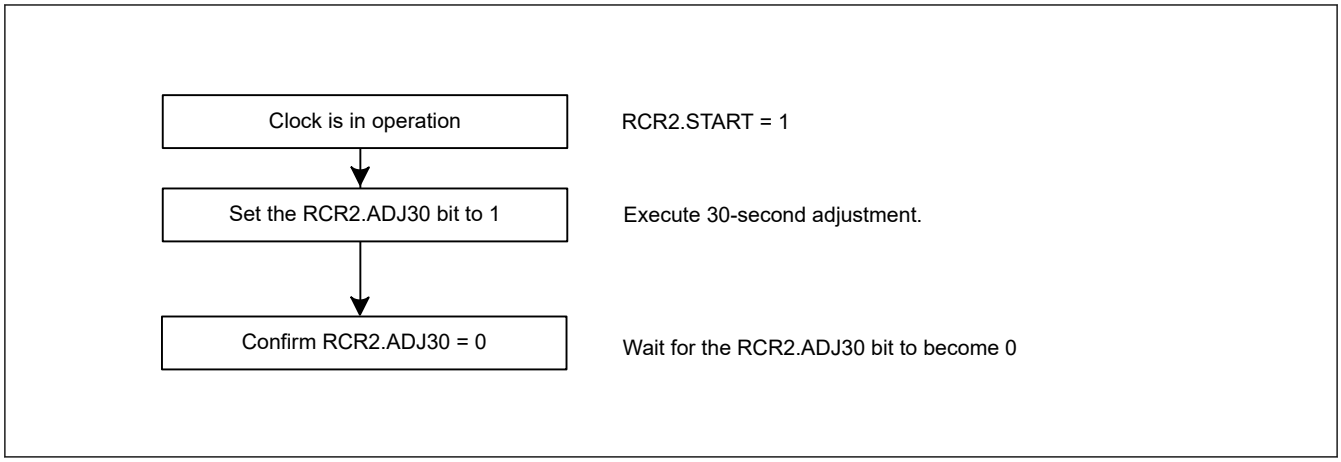
Figure 22.3 shows how to set the time.

Note 1. This step can be omitted in initial settings after power-on because an RTC software reset is executed in the clock setting procedure that is performed during initial settings at power-on.
Note 2. Set in any order.

**Figure 22.3 Setting the time**

### 22.3.4 30-Second Adjustment

Figure 22.4 shows how to execute a 30-second adjustment.



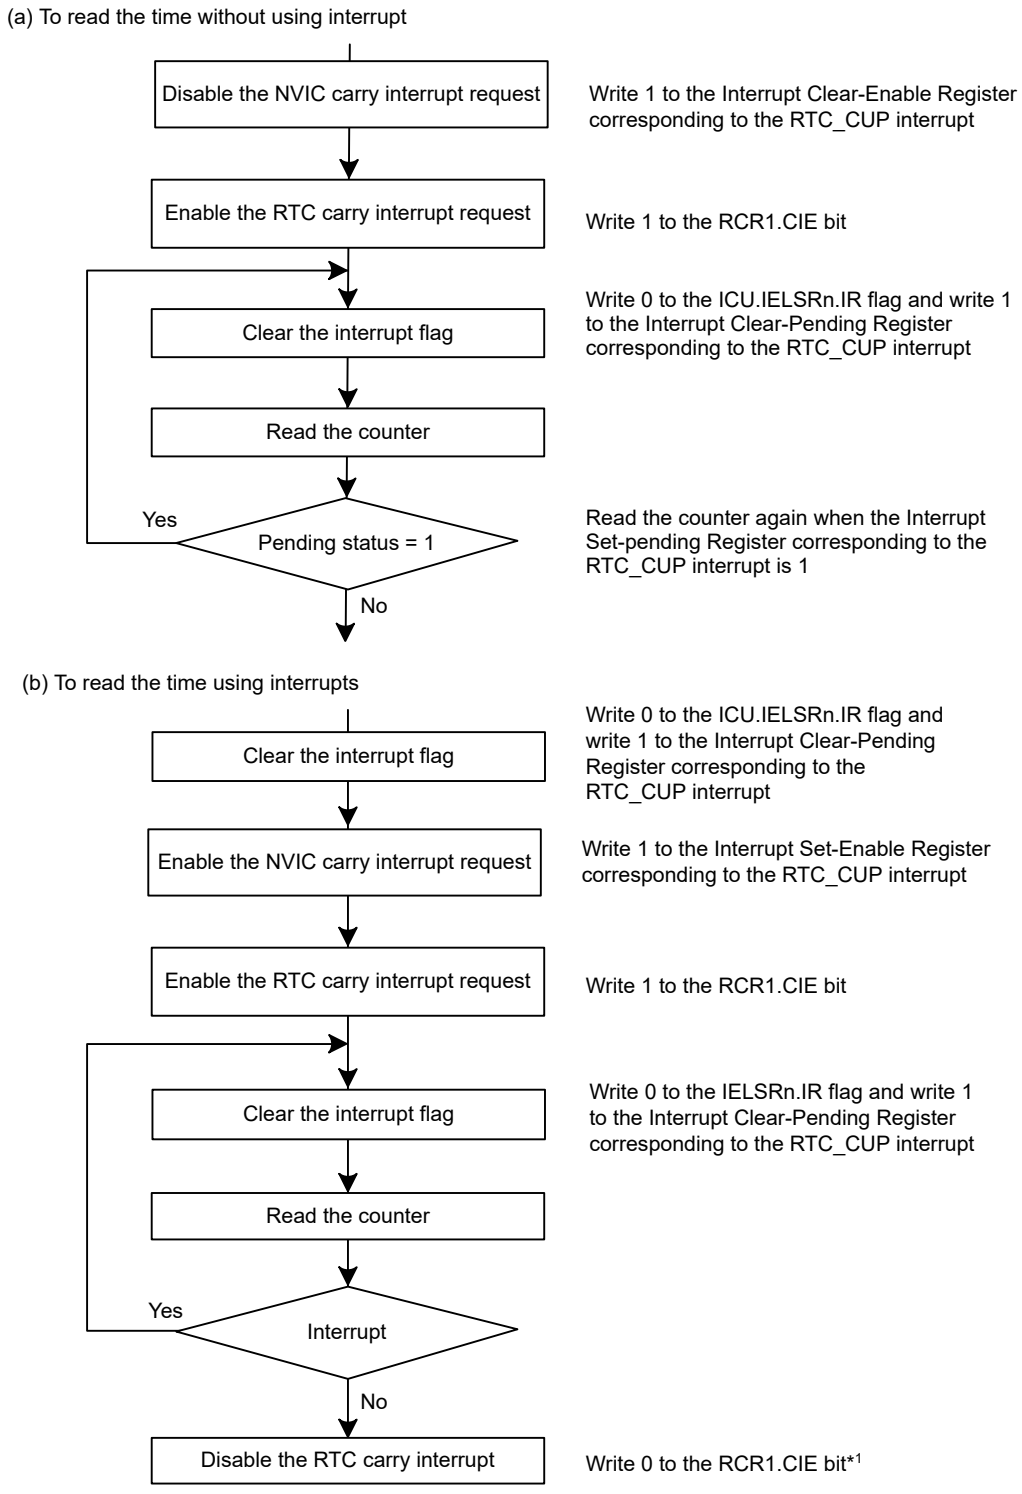


**Figure 22.4 30-second adjustment**

### 22.3.5 Reading 64-Hz Counter and Time

Figure 22.5 shows how to read a 64-Hz counter and time.

Note 1. Disable interrupts if required.

**Figure 22.5 Reading time**

If a carry occurs while the 64-Hz counter and time are read, the correct time is not obtained, therefore they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 22.5, and the procedure using carry interrupts is shown in (b). To keep the program simple, method (a) should be used in most cases.

Only method (a) could be used in low-consumption mode.

### 22.3.6 Alarm Function

Figure 22.6 shows how to use the alarm function.

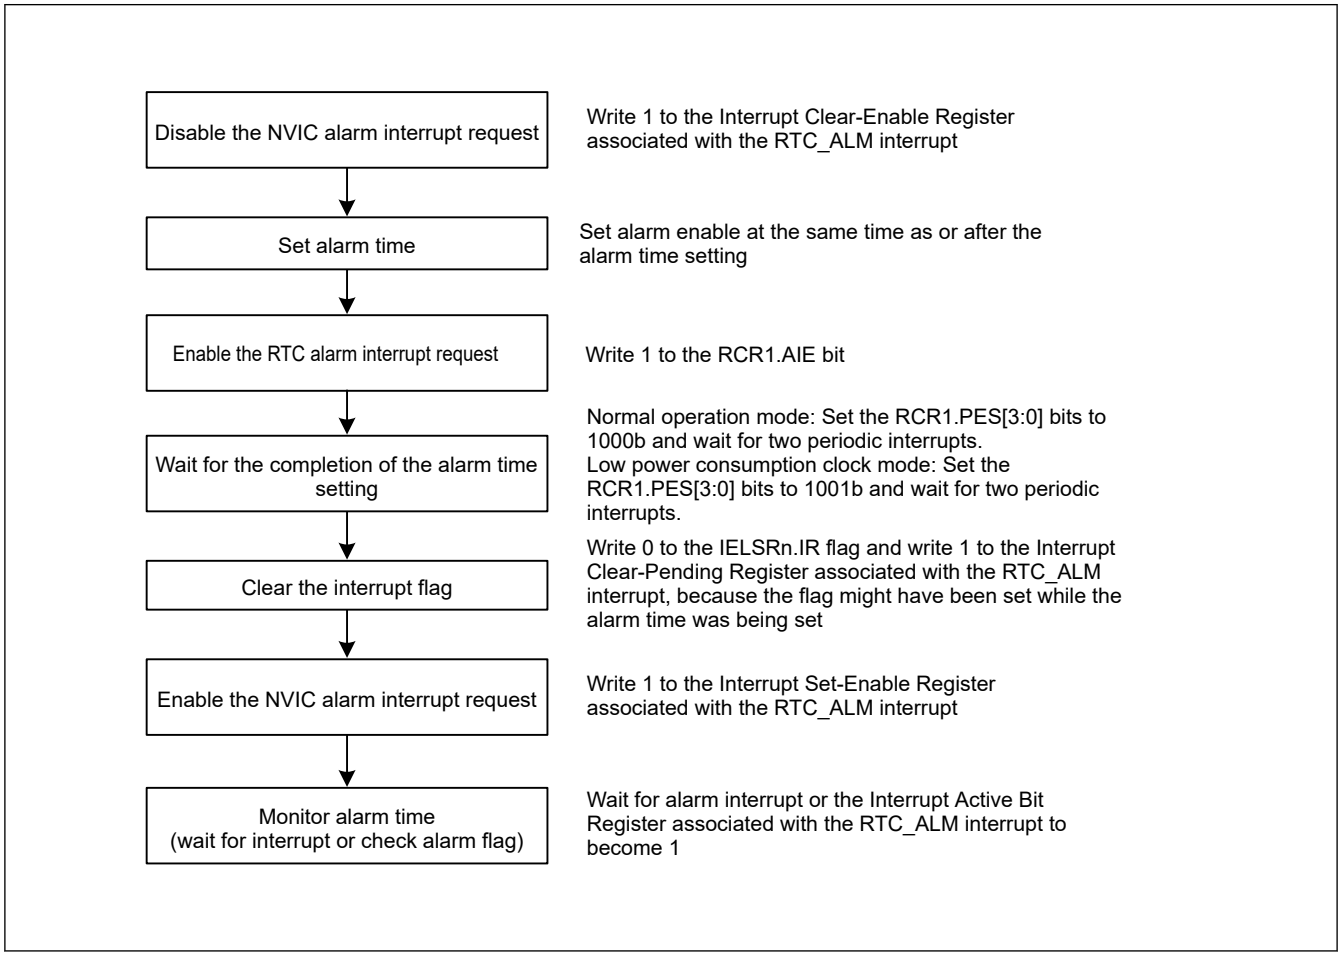

**Figure 22.6 Using the alarm function**

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the Alarm Enable register associated with the target bit of the alarm, and set the alarm time in the alarm register. For bits that are not the target of the alarm, write 0 to the ENB bit of the Alarm Enable register.[*1]

For any of the ENB[31:0] bits that are set to 1, the bits in the corresponding positions in the binary counter (BCNT[31:0]) are compared with the values of the corresponding bits in the binary alarm registers[*1]. When all such bits match, the IR flag associated with the RTC_ALM interrupt is set to 1 and the corresponding bits in the Interrupt Set-Pending/Clear-Pending Registers are set to 1. Alarm detection can be confirmed by reading the Interrupt Set-Pending Register associated with the RTC_ALM interrupt, but an interrupt should be used in most cases. If 1 is set in the Interrupt Set-Enable Register associated with the RTC_ALM interrupt, an alarm interrupt is generated in the event of the alarm, enabling the alarm to be detected.

Writing 0 sets the IELSRn.IR flag associated with the RTC_ALM interrupt to 0. If interrupt is enabled, the Interrupt Set-Pending/Clear-Pending Register associated with the RTC_ALM interrupt is cleared automatically after exiting the interrupt handler. Otherwise, write 1 to the Interrupt Clear-Pending Register associated with the RTC_ALM interrupt to clear it.

When the counter and the alarm time match in a low power state, the MCU returns from the low power state.

Note 1. For any bits in the ENB bits that are set to 1, the values in the corresponding positions in the alarm registers from the following registers are compared with the corresponding bits of the counted values.

Counter registers: RSECCNT, RMINCNT, RHRCNT, RWKCNT, RDAYCNT, RMONCNT, RYRCNT

Alarm registers: RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAREN

### 22.3.7 Procedure for Disabling Alarm Interrupt

Figure 22.7 shows the procedure for disabling the enabled alarm interrupt request.

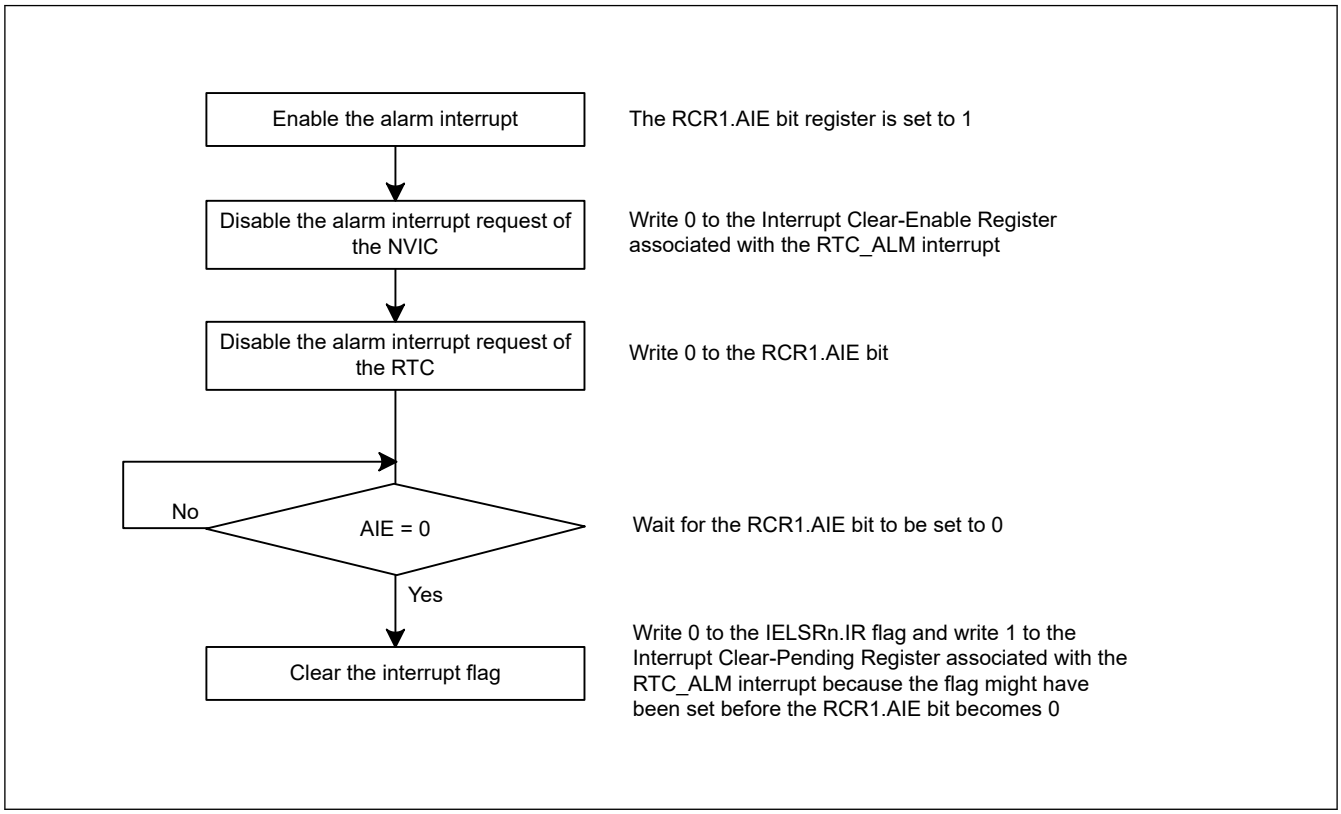

**Figure 22.7 Procedure for disabling alarm interrupt request**

### 22.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. In normal operation mode, because 32768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low. In low-consumption clock mode, because 128 cycles of the 128-Hz clock constitute 1 second of operation, the clock runs fast if the 128-Hz clock frequency is high and slow if the 128-Hz clock frequency is low.

The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

Adjustment by software is not supported in low-consumption clock mode.

#### 22.3.8.1 Automatic adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1.

In normal operation mode, automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJP bit elapses.

### (1) Example 1: Sub-clock oscillator running at 32.769 kHz (normal operation mode)

**Adjustment procedure**

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

**Register settings when RCR2.CNTMD = 0:**

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 60 (0x3C)

### (2) Example 2: Sub-clock oscillator running at 32.766 kHz (normal operation mode)

**Adjustment procedure**

When the sub-clock oscillator is running at 32.766 kHz, 1 second elapses every 32766 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs slow by 2 clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

**Register settings when RCR2.CNTMD = 0:**

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 20 (0x14)

### (3) Example 3: Sub-clock oscillator running at 32.764 kHz (normal operation mode)

**Adjustment procedure**

When the sub-clock oscillator is running at 32.764 kHz, 1 second elapses on 32764 clock cycles. Because the RTC operates for 32768 clock cycles as 1 second, the clock is delayed for 4 clock cycles per second. In 8 seconds, the delay is 32 clock cycles, therefore correction can be made by advancing the clock 32 clock cycles every 8 seconds.

**Register settings when RCR2.CNTMD = 1:**

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 32 (0x20)

In low-consumption clock mode, automatic adjustment is the addition or subtraction of the value counted by the 64-Hz counter to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJE bit elapses.

### (4) Example 4 : Sub-clock oscillator running at 32.769 kHz (low-consumption clock mode)

**Adjustment procedure**

The 128-Hz clock is generated from the sub-clock with 256 dividing ratio. When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses in every 32769 sub-clock cycles, thus 32769/256 count source cycles. The RTC is meant to run at 32768/256 clock cycles, so the clock runs fast by 1/256 clock cycle every second. The time on the clock is fast by (1/256) × 3600 clock cycles per hour, so adjustment can take the form of setting the clock back by (1/256) × 3600 = 14 cycles every hour.

**Register settings when RCR2.CNTMD = 0:**

- RCR2.AADJP = 1 (adjustment every hour)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the 64-Hz counter)

- RADJ.ADJ[5:0] = 14 (0x0E)

#### (5) Example 5: Sub-clock oscillator running at 32.764 kHz (low-consumption clock mode)

**Adjustment procedure**

The 128-Hz clock is generated from the sub-clock with 256 dividing ratio. When the sub-clock oscillator runs at 32.764 kHz, 1 second elapses in every 32764 sub-clock cycles, thus 32764/256 count source cycles. Because the RTC operates for 32768/256 clock cycles as 1 second, the clock is delayed for 4/256 clock cycles per second. In 2048 seconds, the delay is 4/256 × 2048 = 32 clock cycles, therefore correction can be made by setting the clock for 32 clock cycles every 2048 seconds.

**Register settings when RCR2.CNTMD = 1:**

- RCR2.AADJP = 1 (adjustment every 2048 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the 64-Hz counter)
- RADJ.ADJ[5:0] = 32 (0x20)

### 22.3.8.2 Adjustment by software

Enable adjustment by software by setting the RCR2.AADJE bit to 0. Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register on execution of a write instruction to the RADJ register. Adjustment by software is not supported in low-consumption clock mode.

#### (1) Example 1: Sub-clock oscillator running at 32.769 kHz

**Adjustment procedure**

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 1 clock cycle per second, so adjustment can take the form of setting the clock back by 1 cycle every second.

**Register settings**

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 1 (0x01)
  This is written to the RADJ register once per 1-second interrupt.

### 22.3.8.3 Procedure to Change the Mode of Adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

To change adjustment by software to automatic adjustment:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).
3. Use the RCR2.AADJP bit to select the period of adjustment.
4. In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

To change automatic adjustment to adjustment by software:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
3. Proceed with the adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the wanted time. After that, the time is adjusted every time a value is written to the RADJ register.

### 22.3.8.4 Procedure to Stop Adjustment

Stop the adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

### 22.3.9 Capturing the time

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin in calendar count mode or binary count mode.

A noise filter can also be used on a time capture event input pin. If the noise filter is enabled, the RTCCRn.TCST bit is set to 1 when the input level on the pin matches three times.

The noise filter can be switched on or off for each of the time capture event input pins. Operation when the noise filter is off is shown in Figure 22.8 and operation when the noise filter is on is shown in Figure 22.9.

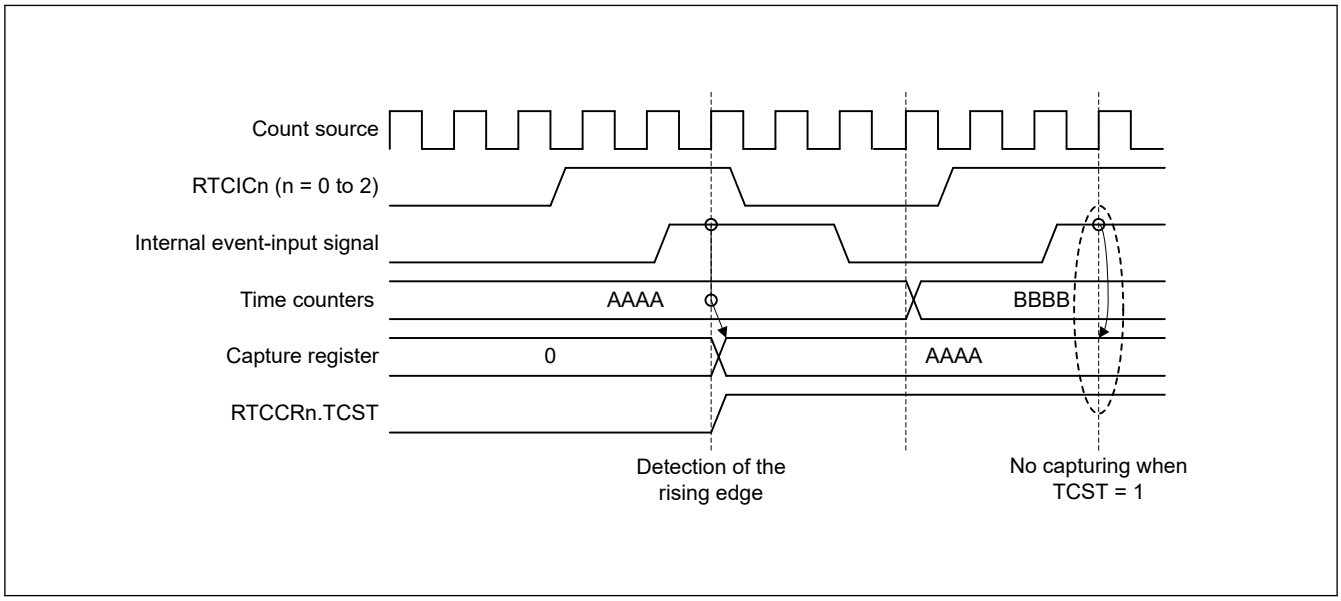

**Figure 22.8 Timing of a time capture operation with the noise filter off**

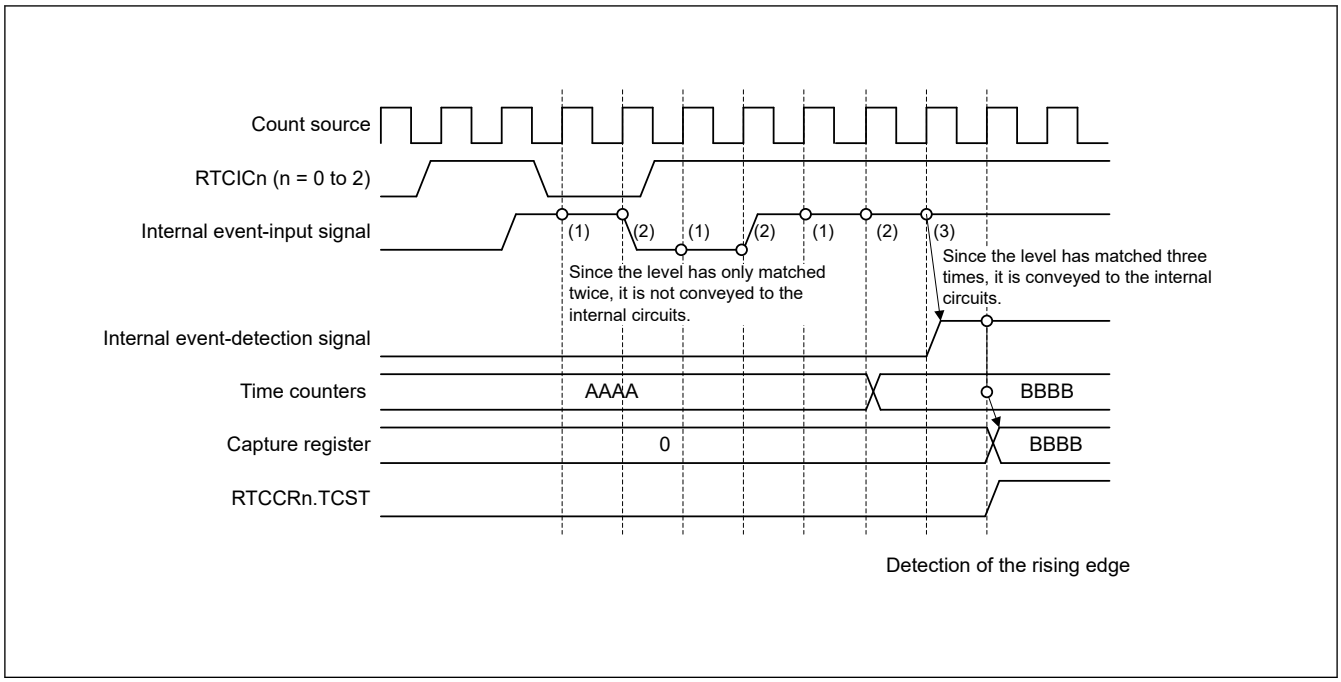

**Figure 22.9 Timing of a time capture operation with the noise filter on**

## 22.4 Interrupt Sources

The RTC has three interrupt sources, as listed in Table 22.4.

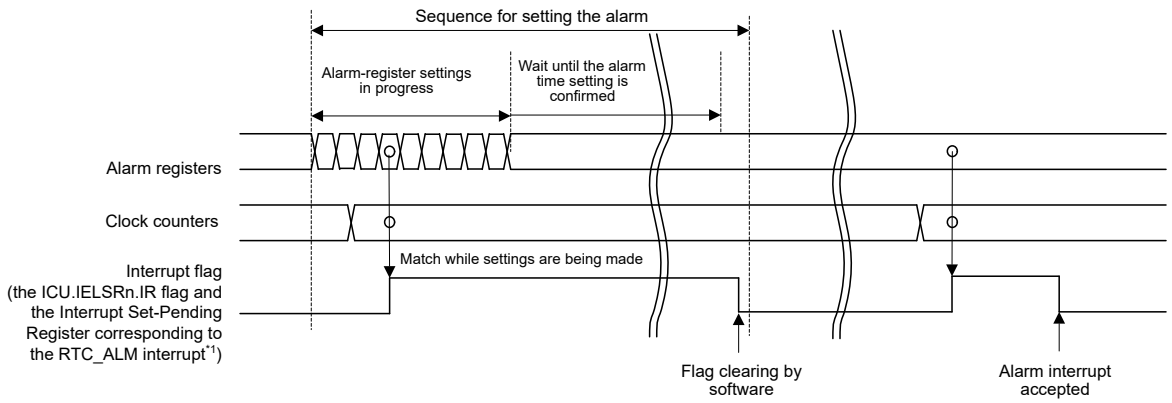

**Table 22.4 RTC interrupt sources**

| Name | Interrupt source |
|---|---|
| RTC_ALM | Alarm interrupt |
| RTC_PRD | Periodic interrupt |
| RTC_CUP | Carry interrupt |

### (1) Alarm interrupt (RTC_ALM)

This interrupt is generated based on the comparison result between the alarm registers and RTC counters. For details, see section 22.3.6. Alarm Function.

Because there is a possibility that the interrupt flag might be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and clear the IELSRn.IR flag and the interrupt Set-Pending Register associated with the RTC_ALM interrupt to 0 again after modifying values of the alarm registers. After the interrupt flag for the alarm interrupt is set to 1 and the state is returned to mismatching of the alarm registers and clock counters, the flag is not 1 again until there is another match or the values of the alarm registers are modified again.

Note 1. See section 12, Interrupt Controller Unit (ICU) for details on the associated interrupt vector number.

**Figure 22.10 Timing for the alarm interrupt (RTC_ALM)**

### (2) Periodic interrupt (RTC_PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected in the RCR1.PES[3:0] bits.

Note: The interrupt generated at intervals of 1/64 second, 1/128 second, or 1/256 second is not supported in low-consumption clock mode.

### (3) Carry interrupt (RTC_CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

Note: Carry interrupt (RTC_CUP) does not support interrupts generated in software standby mode. Before entering software standby mode, be sure to set the carry interrupt enable bit (RCR1.CIE bit) to 0 before entering standby mode. After entering RUN mode, set the carry interrupt enable bit (RCR1.CIE bit) to 1 before using the carry interrupt.

Figure 22.11 shows the timing of the carry interrupt (RTC_CUP).

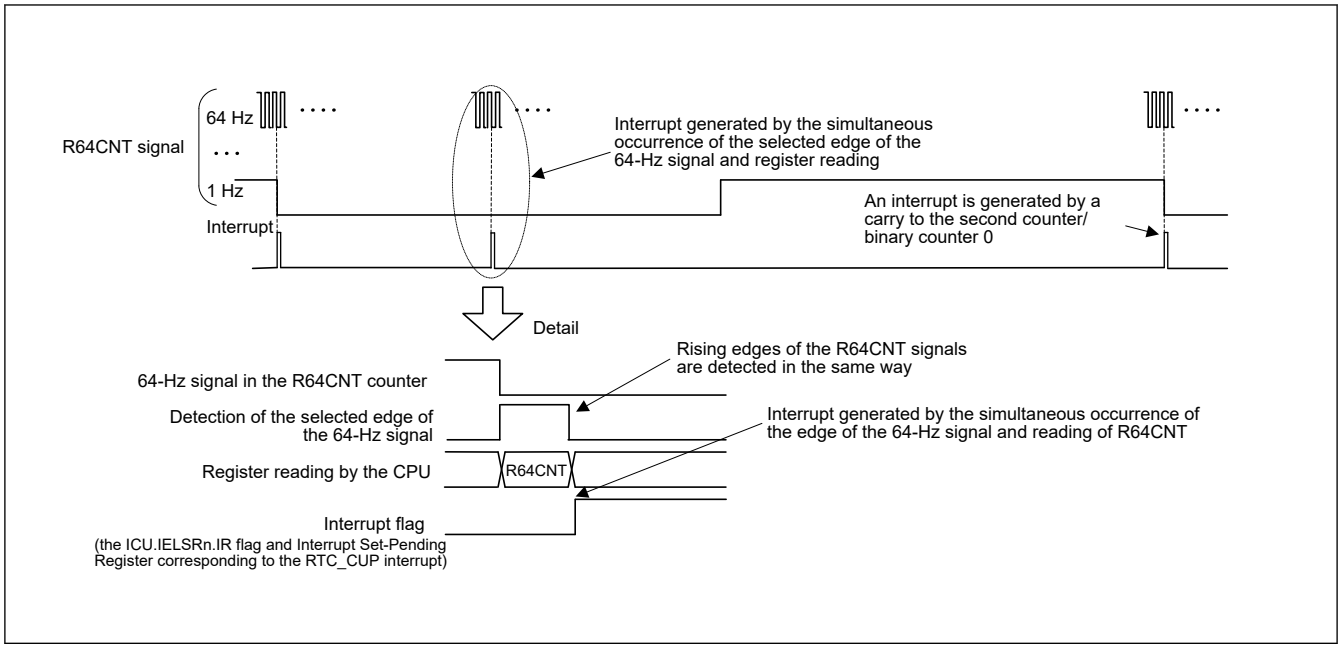

**Figure 22.11 Timing for the carry interrupt (RTC_CUP)**

## 22.5 Event Link Output

The RTC generates periodic event output (RTC_PRD) event signal for the ELC that can be used to initiate operations by other modules selected in advance.

Note: The event link output function is not supported in low-consumption clock mode. Therefore, you must disable the ELC link function of the RTC in low-consumption clock mode.

The periodic event signal is output at the interval selected from 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by setting the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

Note: If event linking from the RTC is used, only set the ELC after setting the RTC, for example initialization and time settings. Setting the RTC after the ELC can lead to output of unexpected event signals.

### 22.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output to the CPU when an interrupt source is generated while the associated enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal through the ELC when an interrupt source is generated, regardless of the setting of the associated interrupt enable bit.

Note: Although alarm and periodic interrupts can still be output during Software Standby mode, the periodic event signals for the ELC are not output.

## 22.6 Usage Notes

### 22.6.1 Register Writing during Counting

The following registers should not be written to during counting, that is, while the RCR2.START bit is 1:

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3

- RMONCNT
- RYRCNT
- RCR1.RTCOS
- RCR2.RTCOE
- RCR2.HR24
- RFRH/RFRL

The counter should be stopped before writing to any of these registers.

### 22.6.2 Use of Periodic Interrupts

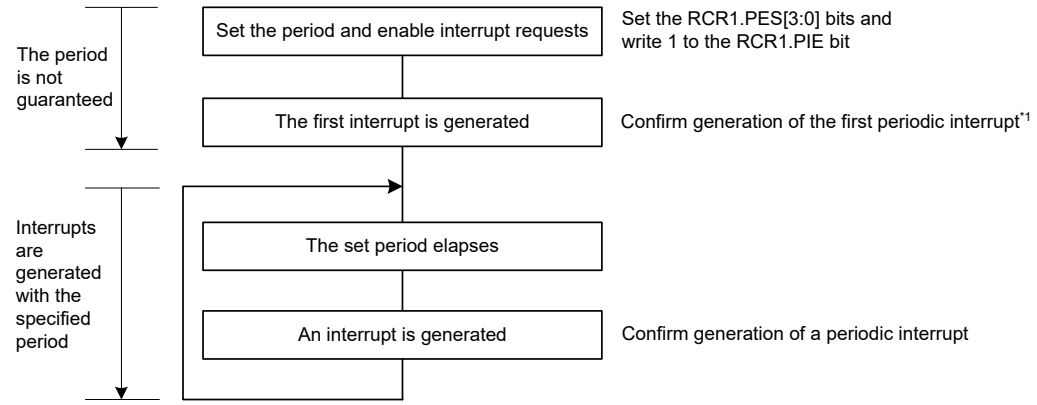

Figure 22.12 shows the procedure for using periodic interrupts.

The generation and period of the periodic interrupt can be changed by setting the RCR1.PES[3:0] bits. However, because the prescaler R64CNT and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting the RCR1.PES[3:0] bits.

In addition, any of the following operation can affect the interrupt period:

- Stopping/restarting or resetting counter operation
- Reset by RTC software
- 30-second adjustment by changing the RCR2 value

When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted based on the adjustment value.

Note 1. When an interrupt generation period changes while the periodic interrupt is used, an interrupt might be generated at the completion of the setting. If the interrupt is generated immediately after the setting, the period is not guaranteed for two interrupts including the current interrupt.

**Figure 22.12 Using the periodic interrupt function**

### 22.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted based on the adjustment value.

### 22.6.4 Transitions to Low Power Modes after Setting Registers

A transition to a low power state (Software Standby mode) during a write to an RTC register might corrupt the value of the register. After setting the register, confirm that the setting is in place before initiating a transition to a low power state.

### 22.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter after writing to the counter register, follow the procedure in section 22.3.5. Reading 64-Hz Counter and Time.
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4 register, or frequency register is reflected when fourth read operations are performed after writing.
- The values written to the RCR1.CIE, RCR1.RTCOS, and RCR2.RTCOE bits can be read immediately after writing.
- To read the value from the timer counter after returning from a reset or a period in Software Standby mode, wait for 1/128 second while the clock is operating (RCR2.START bit = 1).
- After a reset is generated, write to the RTC register after 6 cycles of the count source clock have elapsed.

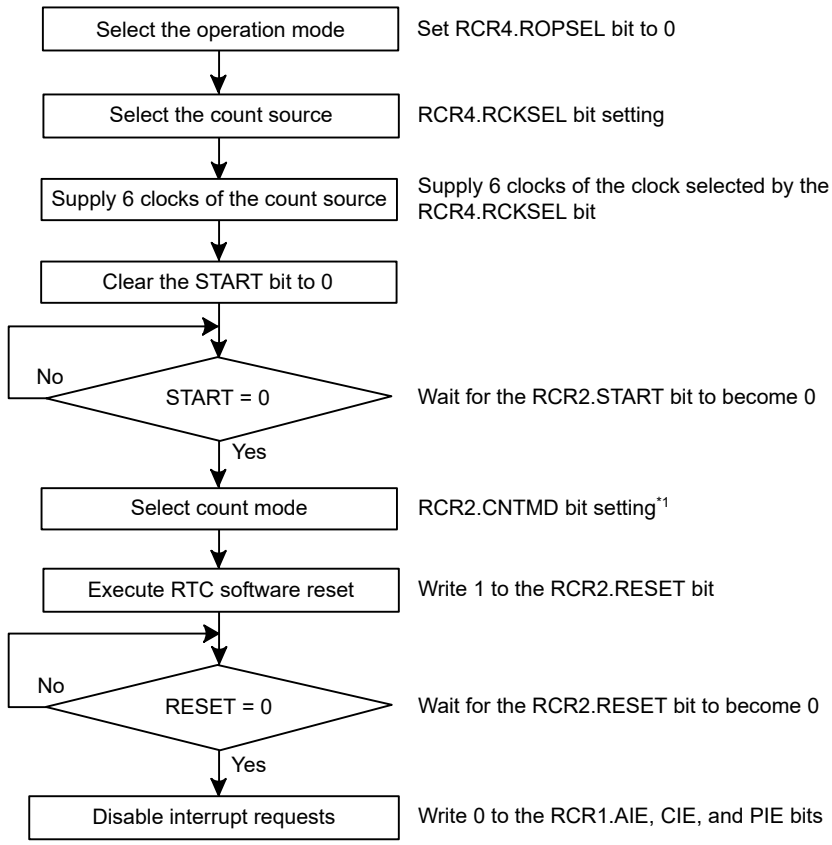
### 22.6.6 Changing the Count Mode

When changing the count mode (calendar count mode/binary count mode), set the RCR2.START bit to 0, stop the counting operation, then start it again from the initial setting. For details on the initial setting, see section 22.3.1. Outline of Initial Settings of Registers after Power On.

### 22.6.7 Time Capture Operation While Count Operation is Stopped

If the count operation is stopped while the edge detection setting of the time capture event is enabled, the value captured after the count operation starts cannot be guaranteed.

To avoid this, set the time capture control bits (RTCCRn.TCCT[1:0] bits) to 00b (no event detection) before stopping the count operation (RCR2.START bit is 1).



### 22.6.8 Initialization Procedure When the RTC Is Not to Be Used

Registers in the RTC are not initialized by a reset. Depending on the initial state, the generation of an unintentional interrupt request or operation of the counter might lead to increased power consumption.

For applications that do not require a realtime clock, initialize the registers by following the initialization procedure shown in Figure 22.13.

Alternatively, when the sub-clock oscillator is not used as the system clock or realtime clock, the counter can be stopped by writing 0 (sub-clock oscillator is selected) to the RCR4.RCKSEL bit and stopping the sub-clock oscillator. To stop the sub-clock oscillator, write 1 to the SOSCCR.SOSTP bit.

For details on the setting of the SOSCCR.SOSTP bit, see section 8, Clock Generation Circuit.

Note 1. This step is not necessary if the count mode is concurrently set by setting the START bit to 0.

**Figure 22.13 Initialization procedure**

# 23. Watchdog Timer (WDT)

## 23.1 Overview

The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt.

Table 23.1 lists the WDT specifications and Figure 23.1 shows a block diagram.

**Table 23.1 WDT specifications**

| Parameter | Specifications |
|---|---|
| Count source*1 | Peripheral clock (PCLKB) |
| Clock division ratio | Division by 4, 64, 128, 512, 2048, or 8192 |
| Counter operation | Counting down using a 14-bit down-counter |
| Condition for starting the counter | • Auto start mode: Counting automatically starts after a reset or after an underflow or refresh error occurs<br>• Register start mode: Counting is started with a refresh by writing to the WDTRR register<br>• Only secure developer can select Auto-start mode or Register-start mode |
| Conditions for stopping the counter | • Reset (the down-counter and other registers return to their initial values)<br>• A counter underflows or a refresh error is generated |
| Window function | Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods) |
| Watchdog timer reset sources | • Down-counter underflows<br>• Refreshing outside the refresh-permitted period (refresh error) |
| Non-maskable interrupt/interrupt sources | • Down-counter underflows<br>• Refreshing outside the refresh-permitted period (refresh error) |
| Reading of the counter value | The down-counter value can be read by the WDTSR register |
| Event link function (output) | • Down-counter underflow event output<br>• Refresh error event output |
| Output signal (internal signal) | • Reset output<br>• Interrupt request output<br>• Sleep-mode count stop control output |
| TrustZone Filter | Security attribution can be set |

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ 4 × (the frequency of the count clock source after division).

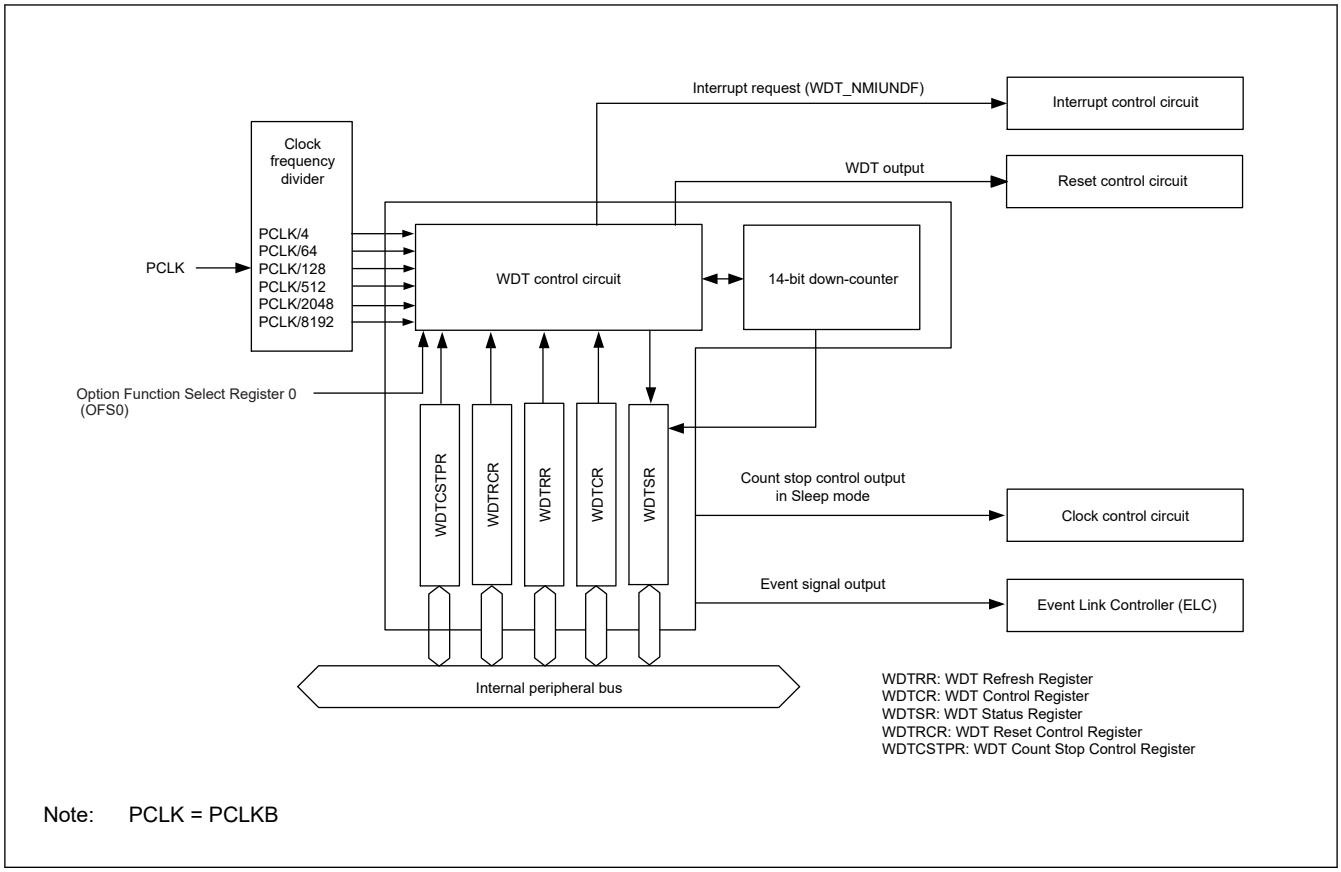


**Figure 23.1 WDT block diagram**

## 23.2 Register Descriptions

### 23.2.1 WDTRR : WDT Refresh Register

Base address: WDT = 0x4008_3400

Offset address: 0x00

| Bit position: | 7 | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | n/a | The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register. | R/W |

The WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 0x00 and then writing 0xFF to WDTRR register (refresh operation) within the refresh-permitted period.

After the down-counter is refreshed, it starts counting down from the value selected by setting the WDT Timeout Period Select bits (OFS0.WDTTOPS[1:0]) in the Option Function Select Register 0 in auto start mode. In register start mode, counting down starts from the value selected by setting the Timeout Period Select bits (WDTCR.TOPS[1:0]) in the WDT Control Register.

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see section 23.3.3. Refresh Operation.

## 23.2.2 WDTCR : WDT Control Register

Base address: WDT = 0x4008_3400

Offset address: 0x02

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | RPSS[1:0] | | — | — | RPES[1:0] | | CKS[3:0] | | | | — | — | TOPS[1:0] | |
| Value after reset: | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | TOPS[1:0] | Timeout Period Select<br>0 0: 1024 cycles (0x03FF)<br>0 1: 4096 cycles (0x0FFF)<br>1 0: 8192 cycles (0x1FFF)<br>1 1: 16384 cycles (0x3FFF) | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7:4 | CKS[3:0] | Clock Division Ratio Select<br>0x1: PCLKB/4<br>0x4: PCLKB/64<br>0xF: PCLKB/128<br>0x6: PCLKB/512<br>0x7: PCLKB/2048<br>0x8: PCLKB/8192<br>Others: Setting prohibited | R/W |
| 9:8 | RPES[1:0] | Window End Position Select<br>0 0: 75%<br>0 1: 50%<br>1 0: 25%<br>1 1: 0% (do not specify window end position). | R/W |
| 11:10 | — | These bits are read as 0. The write value should be 0. | R/W |
| 13:12 | RPSS[1:0] | Window Start Position Select<br>0 0: 25%<br>0 1: 50%<br>1 0: 75%<br>1 1: 100% (do not specify window start position). | R/W |
| 15:14 | — | These bits are read as 0. The write value should be 0. | R/W |

The WDTCR register is used to set the clock division ratio, and window start and end positions for refresh, and the timeout period until the down-counter underflows in register start mode.

Some constraints apply when writing to the WDTCR register. For details, see section 23.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto start mode, the settings in the WDTCR register are disabled, and the settings in the Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made in the OFS0 register. For details, see section 23.3.8. Association between Option Function Select Register 0 (OFS0) and WDT Registers.

### TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1024, 4096, 8192, and 16384 cycles, taking the divided clock specified in the CKS[3:0] bits as 1 cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of PCLKB cycles until the counter underflows.

Table 23.2 lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles.

**Table 23.2 Timeout period settings**

| CKS[3:0] bits | TOPS[1:0] bits | Clock division ratio | Timeout period (number of cycles) | PCLKB clock cycles |
|---|---|---|---|---|
| 0x1 | 00b | PCLKB/4 | 1024 | 4096 |
| | 01b | | 4096 | 16384 |
| | 10b | | 8192 | 32768 |
| | 11b | | 16384 | 65536 |
| 0x4 | 00b | PCLKB/64 | 1024 | 65536 |
| | 01b | | 4096 | 262144 |
| | 10b | | 8192 | 524288 |
| | 11b | | 16384 | 1048576 |
| 0xF | 00b | PCLKB/128 | 1024 | 131072 |
| | 01b | | 4096 | 524288 |
| | 10b | | 8192 | 1048576 |
| | 11b | | 16384 | 2097152 |
| 0x6 | 00b | PCLKB/512 | 1024 | 524288 |
| | 01b | | 4096 | 2097152 |
| | 10b | | 8192 | 4194304 |
| | 11b | | 16384 | 8388608 |
| 0x7 | 00b | PCLKB/2048 | 1024 | 2097152 |
| | 01b | | 4096 | 8388608 |
| | 10b | | 8192 | 16777216 |
| | 11b | | 16384 | 33554432 |
| 0x8 | 00b | PCLKB/8192 | 1024 | 8388608 |
| | 01b | | 4096 | 33554432 |
| | 10b | | 8192 | 67108864 |
| | 11b | | 16384 | 134217728 |

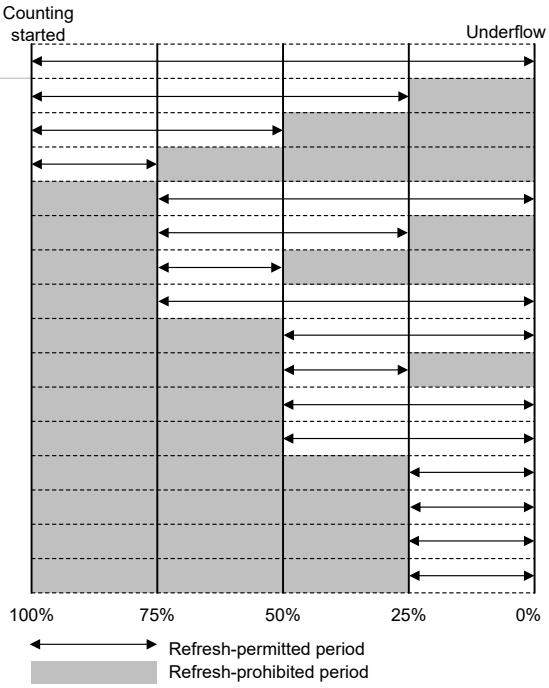
### CKS[3:0] bits (Clock Division Ratio Select)

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the PCLKB divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, this allows the WDT to be configured to a count period between 4096 and 134217728 PCLKB clock cycles.

### RPES[1:0] bits (Window End Position Select)

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the value for the window start position (window start position > window end position). If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled, and the window end position is set to 0%.

### RPSS[1:0] bits (Window Start Position Select)



The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled, and the window end position is set to 0%.

Table 23.3 lists the counter values for the window start and end positions, and Figure 23.2 shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

**Table 23.3 Relationship between the timeout period and window start and end counter values**

| TOPS[1:0] | Timeout period | | Window start and end counter value | | | |
|---|---|---|---|---|---|---|
| | Cycles | Counter value | 100% | 75% | 50% | 25% |
| 00b | 1024 | 0x03FF | 0x03FF | 0x02FF | 0x01FF | 0x00FF |
| 01b | 4096 | 0x0FFF | 0x0FFF | 0x0BFF | 0x07FF | 0x03FF |
| 10b | 8192 | 0x1FFF | 0x1FFF | 0x17FF | 0x0FFF | 0x07FF |
| 11b | 16384 | 0x3FFF | 0x3FFF | 0x2FFF | 0x1FFF | 0x0FFF |

| RPSS[1:0] bits | | RPES[1:0] bits | | Window | |
|---|---|---|---|---|---|
| b13 | b12 | b9 | b8 | Start (%) | End (%) |
| 1 | 1 | 1 | 1 | 100 | 0 |
| | | 1 | 0 | | 25 |
| | | 0 | 1 | | 50 |
| | | 0 | 0 | | 75 |
| 1 | 0 | 1 | 1 | 75 | 0 |
| | | 1 | 0 | | 25 |
| | | 0 | 1 | | 50 |
| | | 0 | 0 | | 75 |
| 0 | 1 | 1 | 1 | 50 | 0 |
| | | 1 | 0 | | 25 |
| | | 0 | 1 | | 50 |
| | | 0 | 0 | | 75 |
| 0 | 0 | 1 | 1 | 25 | 0 |
| | | 1 | 0 | | 25 |
| | | 0 | 1 | | 50 |
| | | 0 | 0 | | 75 |

Note: If window end position setting ≥ window start position setting, the window end position setting is set to 0%.

**Figure 23.2 RPSS[1:0] and RPES[1:0] bits setting and refresh-permitted period**

## 23.2.3 WDTSR : WDT Status Register

Base address: WDT = 0x4008_3400

Offset address: 0x04

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | REFEF | UNDF | CNTVAL[13:0] | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 13:0 | CNTVAL[13:0] | Down-Counter Value<br>Value counted by the down-counter | R |
| 14 | UNDFF | Underflow Flag<br>0: No underflow occurred<br>1: Underflow occurred | R/W*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15 | REFEF | Refresh Error Flag<br>0: No refresh error occurred<br>1: Refresh error occurred | R/W*1 |

Note 1. Only 0 can be written to clear the flag.

The WDTSR register indicates the counter value of the down-counter and the status of whether an underflow or refresh error occurred in the down-counter.

### CNTVAL[13:0] bits (Down-Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

### UNDFF flag (Underflow Flag)

Read the UNDFF flag to confirm whether an underflow occurred in the counter. A value of 1 indicates that the down counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after an underflow. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

### REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after a refresh error. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

## 23.2.4 WDTRCR : WDT Reset Control Register

Base address: WDT = 0x4008_3400

Offset address: 0x06

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | RSTIRQS | — | — | — | — | — | — | — |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6:0 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7 | RSTIRQS | WDT Behavior Selection<br>0: Interrupt<br>1: Reset | R/W |

The WDTRCR register controls reset output by a WDT down-counter underflow or interrupt request output.

Some constraints apply when writing to the WDTRCR register. For details, see section 23.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto start mode, the WDTRCR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTRCR register can also be made for the OFS0 register. For details, see section 23.3.8. Association between Option Function Select Register 0 (OFS0) and WDT Registers.

### 23.2.5 WDTCSTPR : WDT Count Stop Control Register

Base address: WDT = 0x4008_3400

Offset address: 0x08

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | SLCSTP | — | — | — | — | — | — | — |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | SLCSTP | Sleep-Mode Count Stop Control Register<br>0: Disable count stop<br>1: Stop count on transition to Sleep mode | R/W |

The WDTCSTPR register controls whether to stop the WDT counter in Sleep mode. Some constraints apply when writing to the WDTCSTPR register. For details, see section 23.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto start mode, the WDTCSTPR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTCSTPR register can also be made for the OFS0 register. For details, see section 23.3.8. Association between Option Function Select Register 0 (OFS0) and WDT Registers.

#### SLCSTP bit (Sleep-Mode Count Stop Control Register)

The SLCSTP bit selects whether to stop counting on transition to Sleep mode.

### 23.2.6 Option Function Select Register 0 (OFS0)

For information on the OFS0 register, see section 23.3.8. Association between Option Function Select Register 0 (OFS0) and WDT Registers.

## 23.3 Operation

### 23.3.1 Count Operation in each Start Mode

The WDT has two start modes:

- Auto start mode, in which counting automatically starts after a release from the reset state
- Register start mode, in which counting starts with a refresh by writing to the register.

In auto start mode, counting automatically starts after a release from the reset state according to the settings in the Option Function Select register 0 (OFS0) in the flash.

In register start mode, counting starts with a refresh by writing to the WDTRR register after the respective registers are set after a release from the reset state.

Select auto start mode or register start mode by setting the WDT Start Mode Select bit (OFS0.WDTSTRT) in the OFS0 register.

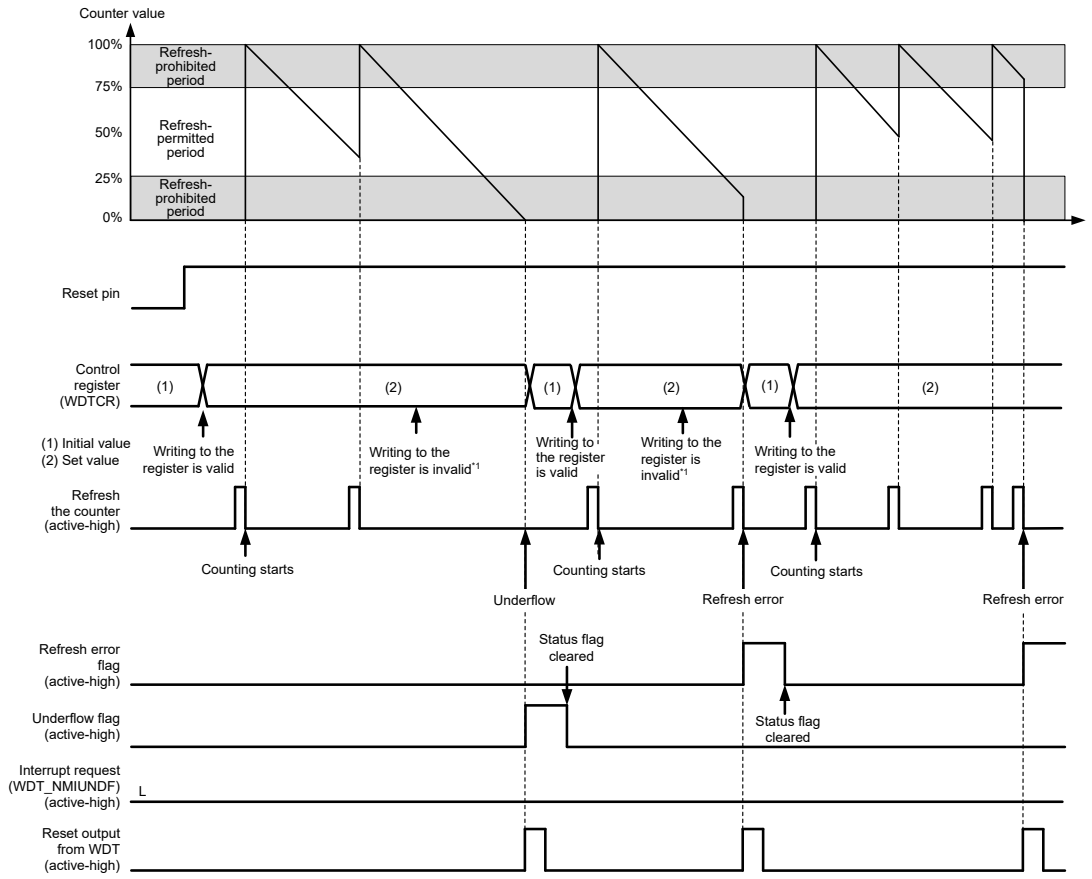
When the auto start mode is selected, the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are disabled while the settings in the OFS0 register are enabled.

When the register start mode is selected, the setting for the OFS0 register is disabled while the settings for the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are enabled.

#### 23.3.1.1 Register start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) is 1, register start mode is selected, the OFS0 register setting is invalid, and the WDT control register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are enabled.

After the reset state is released, set the following:



- Clock division ratio in the WDTCR register
- Window start and end positions in the WDTCR register
- Timeout period in the WDTCR register
- Reset output or interrupt request output in the WDTRCR register
- Counter stop control during transitions to Sleep mode in the WDTCSTPR register

The WDT refresh register (WDTRR) refreshes the down counter. As a result, the downcount starts at the value set by the timeout period selection bit (WDTCR.TOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt request/interrupt request as long as counting continues. However, if the down-counter underflows because the down-counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs the reset signal or a non-maskable interrupt request/interrupt request (WDT_NMIUNDF). Reset output or interrupt request output can be selected in the WDT Reset Interrupt Request Select bit (WDTRCR.RSTIRQS). The interrupt enabled for operating the NMI can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 23.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.WDTSTRT = 1)
- WDT reset interrupt request selection (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b)

Note: Refreshing the counter requires up to 4 count signal cycles from refresh request to execution.
Note 1. See section 23.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.
Reset pin = RES

**Figure 23.3 Operation example in register start mode**

### 23.3.1.2 Auto start mode

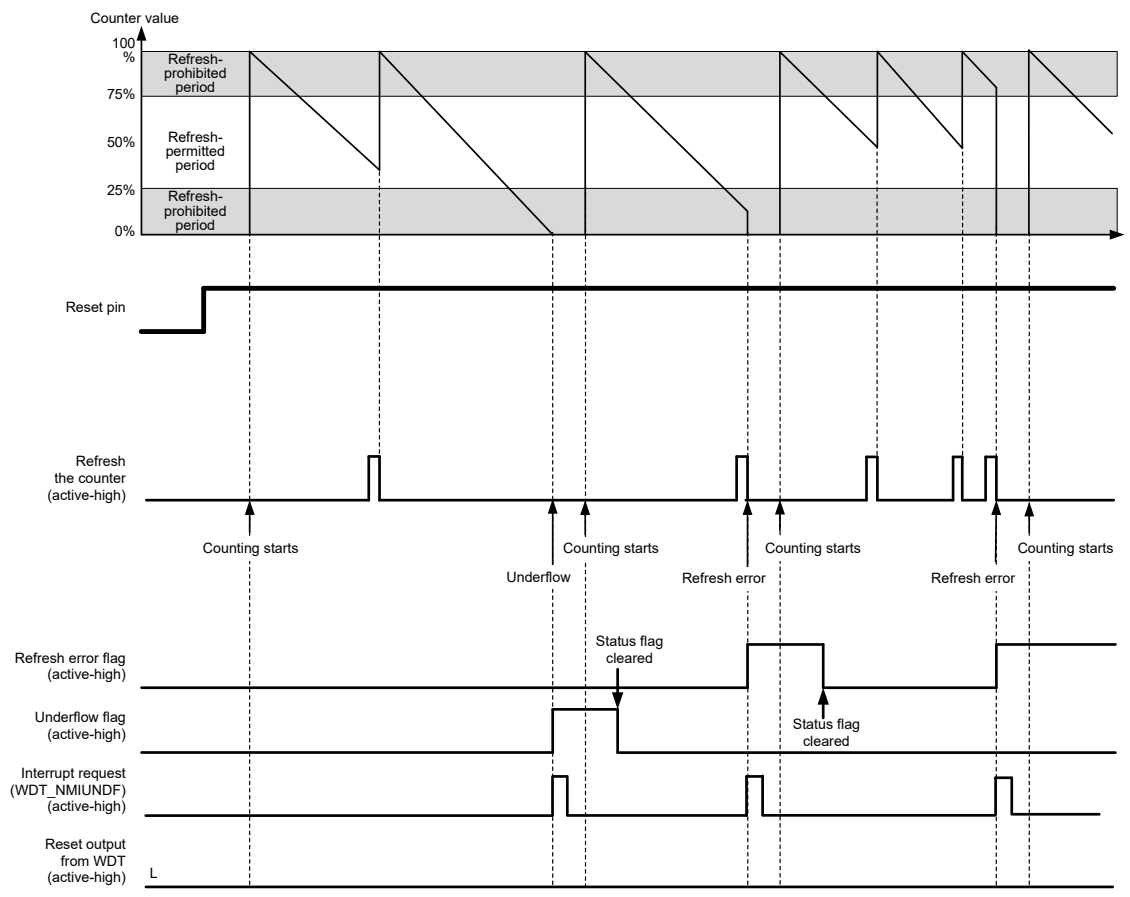
When the WDT Start Mode Select bit (OFS0.WDTSTRT) in the Option Function Select Register 0 (OFS0) is 0, auto start mode is selected, the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are disabled, and the settings in the OFS0 register are enabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the WDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control during transition to Sleep mode

When the reset state is released, the down-counter automatically starts counting down from the value set in the WDT Timeout Period Select bits (OFS0.WDTTOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt



request/interrupt request (WDT_NMIUNDF) as long as the counting continues. However, if the down-counter underflows because refreshing of the down-counter is not possible due to a runaway program or if a refresh error occurs due to refreshing outside the refresh-permitted period, the WDT outputs the reset signal or non-maskable interrupt request/interrupt request (WDT_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle. The value of the timeout period is set in the down-counter and counting restarts.

Reset output or interrupt request output can be selected by setting the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT Underflow/ Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 23.4 shows an example of operation (non-maskable interrupt) under the following conditions:

- Auto start mode (OFS0.WDTSTRT = 0)
- WDT behavior selection: interrupt (OFS0.WDTRSTIRQS = 0)
- Non-maskable Interrupt: WDT Underflow/Refresh Error Interrupt Enabled (NMIER.WDTEN = 1)
- The window start position is 75% (OFS0.WDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.WDTRPES[1:0] = 10b)

Note: Refreshing the counter requires up to 4 count signal cycles from refresh request to execution.
Note: Reset pin = RES

**Figure 23.4 Operation example in auto start mode**

### 23.3.2 Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers

Writing to the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), or WDT Count Stop Control Register (WDTCSTPR) is possible once each between the release from the reset state and the first refresh operation.

After a refresh (counting starts) or a write to WDTCR, WDTRCR or WDTCSTPR register, the protection signal in the WDT becomes 1 to protect WDTCR, WDTRCR and WDTCSTPR register against subsequent write attempts. This protection is released by the reset source of the WDT. With other reset sources, the protection is not released.

Figure 23.5 shows control waveforms produced in response to writing to the WDTCR.

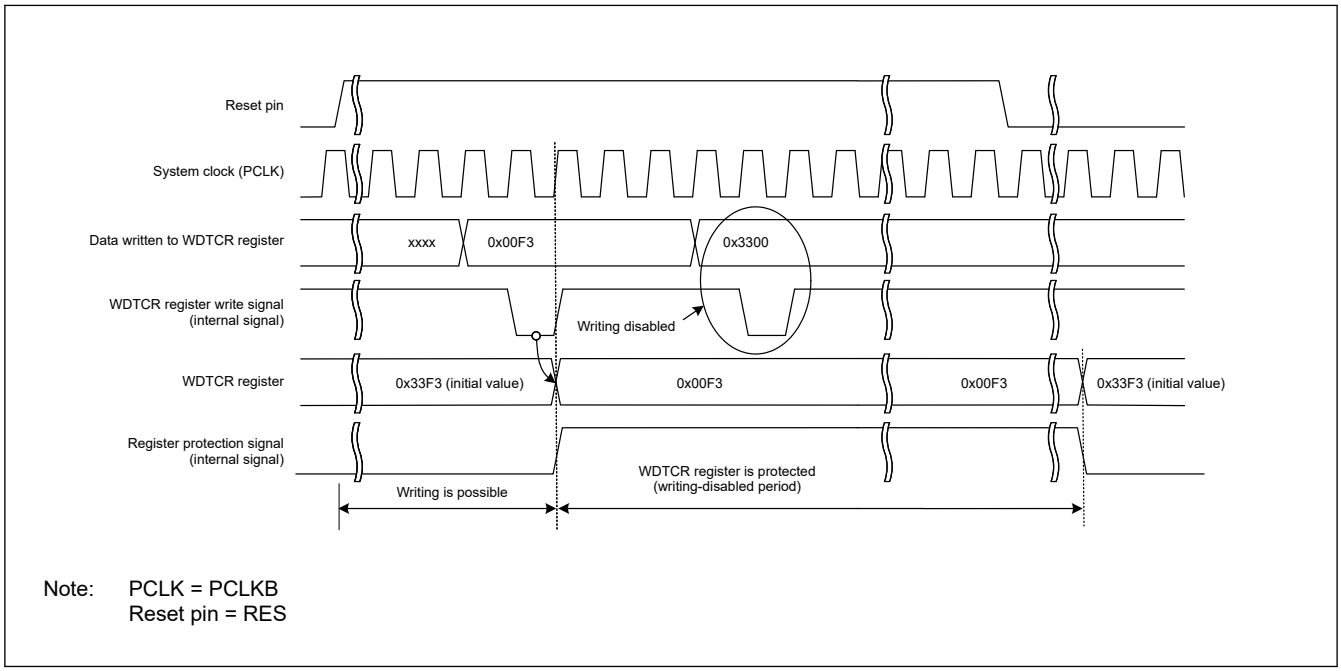


**Figure 23.5 Control waveforms produced in response to writes to the WDTCR register**

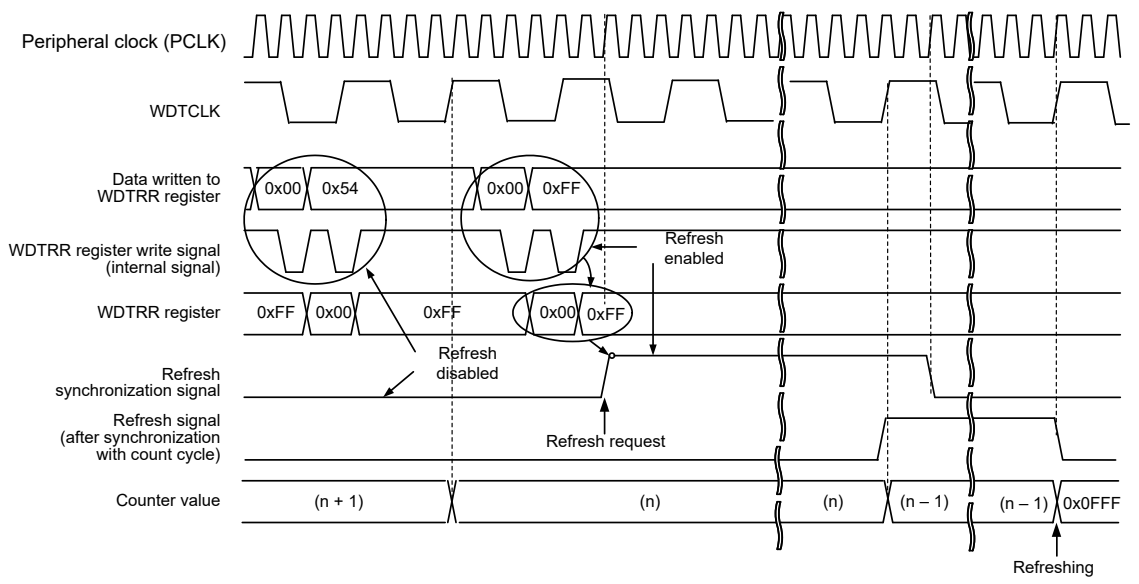
### 23.3.3 Refresh Operation

To refresh the down counter and start the counting operation, write to the WDT Refresh Register (WDTRR) in the order of values from 0x00 to 0xFF. If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. If an invalid value is written, refreshing is performed normally by writing to the WDTRR register in the order of values from 0x00 to 0xFF.

Correct refreshing is also performed when a register other than WDTRR is accessed or WDTRR is read between writing 0x00 and writing 0xFF to WDTRR. Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by the 0xFF write. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid for refreshing the counter]



- 0x00 → 0xFF
- 0x00 ((n–1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from WDTRR → 0xFF

[Example write sequences that are invalid for refreshing the counter]

- 0x23 (a value other than 0x00) → 0xFF
- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF

After 0xFF is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to 4 cycles of the signal for counting. To meet this requirement, complete writing 0xFF to WDTRR 4 count cycles before the down-counter underflows.

Figure 23.6 shows the WDT refresh-operation waveforms when the clock division ratio is PCLKB/64.

Note: PCLK = PCLKB

**Figure 23.6 WDT refresh operation waveforms when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOPS[1:0] = 01b**

Note: When setting the refresh time, consider the oscillation accuracy of the clock sources of the PCLKB and WDTCLK. Set values which ensure that refreshing is possible even when the frequency varies in the range of error of the oscillation accuracy.

### 23.3.4 Status Flags

The refresh error (WDTSR.REFEF) and underflow (WDTSR.UNDFF) flags retain the source of the interrupt request from the WDT. After a release from the interrupt request generation, read the WDTSR.REFEF and WDTSR.UNDFF flags to check for the interrupt source. For each flag, writing 0 clears the bit. Writing 1 has no effect. Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the next interrupt request from the WDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see section 23.2.3. WDTSR : WDT Status Register.

### 23.3.5 Reset Output

When the Reset Interrupt Select bit (WDTRCR.RSTIRQS) is set to 1 in register start mode, or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1 in auto start mode, a reset signal is output for 1 cycle count when an underflow in the down-counter or a refresh error occurs.

In register start mode, the down-counter is initialized (all bits set to 0) and stopped in that state after output of a reset signal. After the reset state is released and the program is restarted, the counter is set up again and counting down starts again with a refresh. In auto start mode, counting down starts automatically after the reset state is released.

### 23.3.6 Interrupt Sources

When the Reset Interrupt Select bit (WDTRCR.RSTIRQS) is set to 0 in register start mode or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0 in auto start mode, an interrupt (WDT_NMIUNDF) signal is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see section 12, Interrupt Controller Unit (ICU).

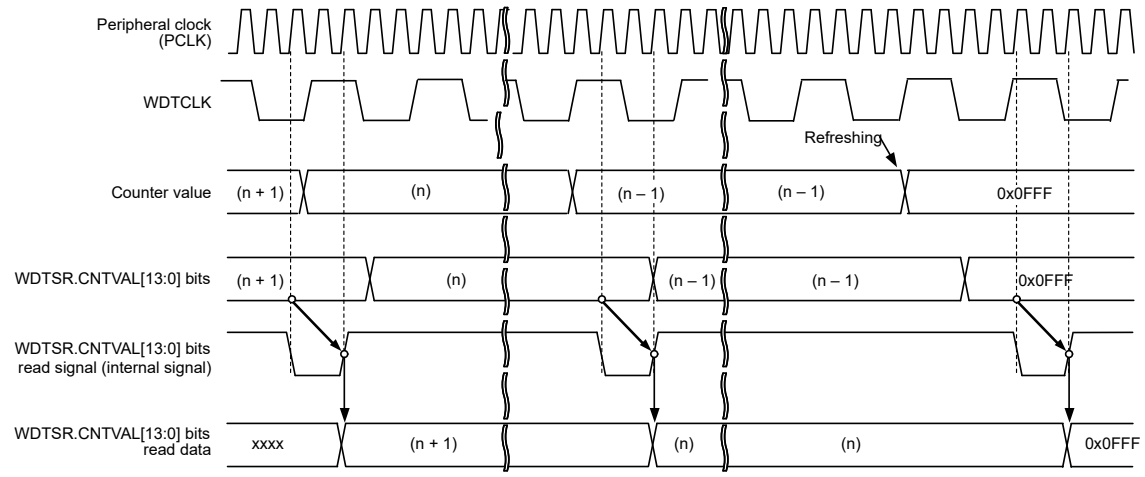


**Table 23.4 WDT interrupt source**

| Name | Interrupt source | Interrupt to CPU | Start DMAC or DTC |
|---|---|---|---|
| WDT_NMIUNDF | • Down-counter underflow<br>• Refresh error | Possible | Not possible |

## 23.3.7 Reading the Down-Counter Value

The WDT stores the counter value in the down-counter value bits (WDTSR.CNTVAL[13:0]) of the WDT Status Register. Check these bits to obtain the counter value. The read value of the down-counter might differ from the actual count by one.

Figure 23.7 shows the processing for reading the WDT down-counter value when the clock division ratio is PCLKB/64.

Note: PCLK = PCLKB

**Figure 23.7 Processing for reading WDT down-counter value when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOPS[1:0] = 01b**

## 23.3.8 Association between Option Function Select Register 0 (OFS0) and WDT Registers

Table 23.5 lists the association between the Option Function Select Register 0 (OFS0) used in auto start mode, and the registers used in register start mode. For details on the Option Function Select Register 0 (OFS0), see section 6.2.1. OFS0 : Option Function Select Register 0.

**Table 23.5 Association between Option Function Select Register 0 (OFS0) and the WDT registers**

| Control target | Function | OFS0 register (enabled in auto start mode) OFS0.WDTSTRT = 0 | WDT registers (enabled in register start mode) OFS0.WDTSTRT = 1 |
|---|---|---|---|
| Down-counter | Timeout period selection | OFS0.WDTTOPS[1:0] | WDTCR.TOPS[1:0] |
| | Clock division ratio selection | OFS0.WDTCKS[3:0] | WDTCR.CKS[3:0] |
| | Window start position selection | OFS0.WDTRPSS[1:0] | WDTCR.RPSS[1:0] |
| | Window end position selection | OFS0.WDTRPES[1:0] | WDTCR.RPES[1:0] |
| Reset output or interrupt request output | Select a reset interrupt request | OFS0.WDTRSTIRQS | WDTRCR.RSTIRQS |
| Count stop | Sleep mode count stop control | OFS0.WDTSTPCTL | WDTCSTPR.SLCSTP |

## 23.4 Output to the Event Link Controller (ELC)

The WDT is capable of a link operation for the previously specified module when interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow and refresh error. An event signal is output regardless of the setting of the Reset Interrupt Request Select bit (WDTRCR.RSTIRQS) in register start mode or auto start mode. An event signal can also be output when the next interrupt source is generated while the Refresh Error flag (WDTSR.REFEF) or Underflow flag (WDTSR.UNDFF) is 1. For details, see section 17, Event Link Controller (ELC).

## 23.5 Usage Notes

### 23.5.1 ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x53 to ICU Event Link Setting Register n (ICU.IELSRn) is prohibited when WDT reset interrupt request selection resets (OFS0.WDTRSTIRQS = 0 or WDTRCR.RSTIRQS = 0) or when enabling event link operation (ELSRn.ELS[8:0] = 0x53).

# 24. Independent Watchdog Timer (IWDT)

## 24.1 Overview

The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers.

The IWDT functions differ from those of the WDT in the following respects:

- The divided IWDT-dedicated clock (IWDTCLK) is used as the count source (not affected by PCLKB)
- IWDT does not support register start mode

Table 24.1 lists the IWDT specifications and Figure 24.1 shows a block diagram.

**Table 24.1 IWDT specifications**

| Parameter | Description |
|---|---|
| Count source*1 | IWDT-dedicated clock (IWDTCLK) |
| Clock division ratio | Division by 1, 16, 32, 64, 128, or 256 |
| Counter operation | Counting down using a 14-bit down-counter |
| Condition for starting the counter | • Counting automatically starts after a reset<br>• Only secure developer can start the IWDT |
| Conditions for stopping the counter | • Reset (the down-counter and other registers return to their initial values)<br>• A counter underflows or a refresh error is generated (counting restarts automatically). |
| Window function | Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods) |
| Reset output sources | • Down-counter underflows<br>• Refreshing outside the refresh-permitted period (refresh error). |
| Non-maskable interrupt/interrupt sources | • Down-counter underflows<br>• Refreshing outside the refresh-permitted period (refresh error). |
| Reading the counter value | The down-counter value can be read by the IWDTSR register |
| Event link function | • Down-counter underflow event output<br>• Refresh error event output. |
| Output signal (internal signal) | • Reset output<br>• Interrupt request output<br>• Sleep-mode count stop control output. |
| Auto start mode | Configurable to the following triggers:<br>• Clock frequency division ratio after a reset (OFS0.IWDTCKS[3:0] bits)<br>• Timeout period of the Independent Watchdog Timer (OFS0.IWDTTOPS[1:0] bits)<br>• Window start position in the Independent Watchdog Timer (OFS0.IWDTRPSS[1:0] bits)<br>• Window end position in the Independent Watchdog Timer (OFS0.IWDTRPES[1:0] bits)<br>• Reset output or interrupt request output (OFS0.IWDTRSTIRQS bit)<br>• Down-count stop function at transition to Sleep, Snooze, or Software Standby mode (OFS0.IWDTSTPCTL bit). |
| TrustZone Filter | Security attribution can be set |

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ 4 × (the frequency of the count clock source after division).

The bus interface and registers operate with PCLKB, and the 14-bit counter and control circuits operate with IWDTCLK.

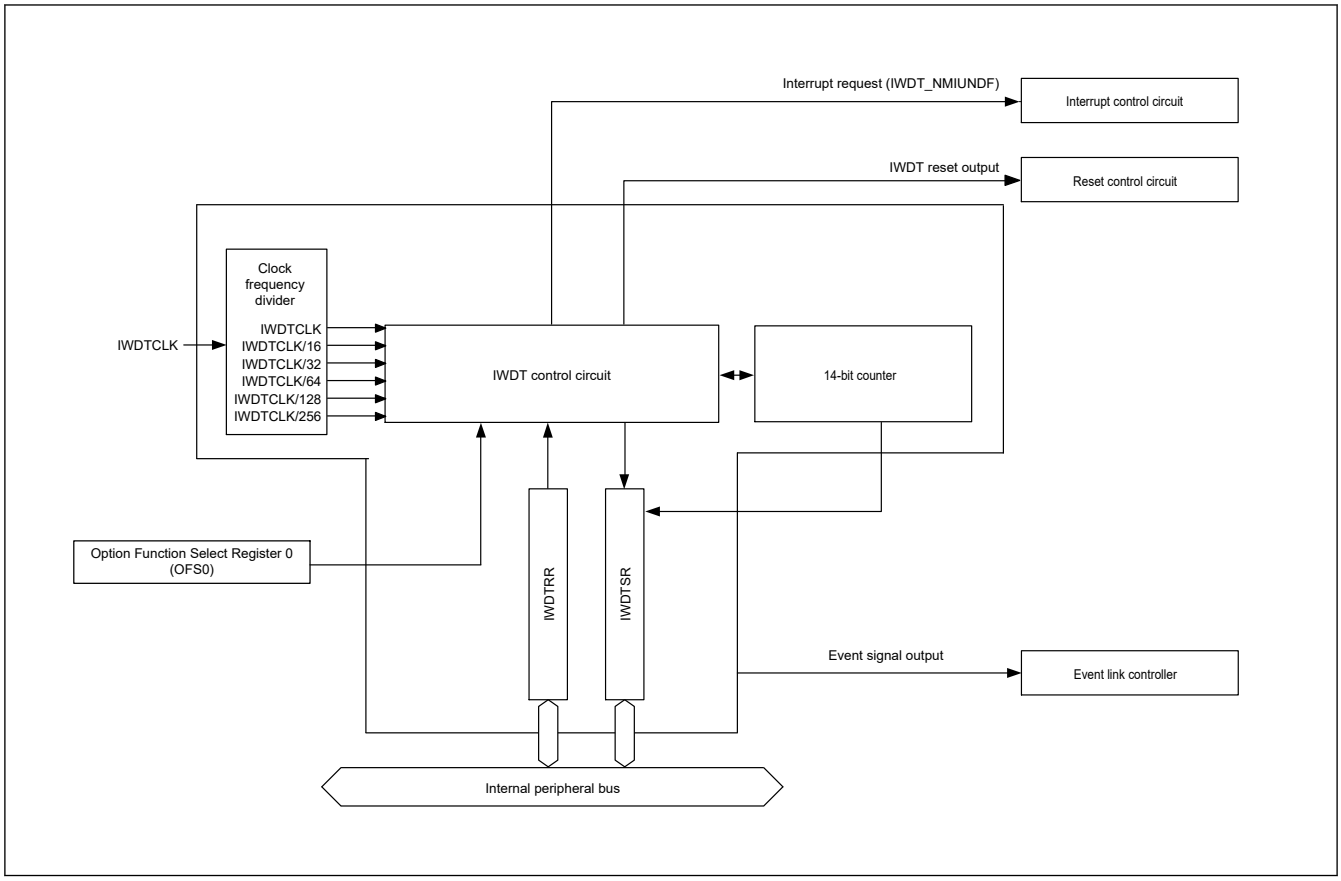

**Figure 24.1 IWDT block diagram**

## 24.2 Register Descriptions

### 24.2.1 IWDTRR : IWDT Refresh Register

Base address: IWDT = 0x4008_3200

Offset address: 0x00

| Bit position: | 7 | | | | | | | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | n/a | The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register | R/W |

The IWDTRR register refreshes the down-counter of the IWDT. The down-counter of the IWDT is refreshed by writing 0x00 and then writing 0xFF to IWDTRR (refresh operation) within the refresh-permitted period. After the down-counter is refreshed, it starts counting down from the value selected in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]) in the Option Function Select Register 0 (OFS0).

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see section 24.3.2. Refresh Operation.

## 24.2.2 IWDTSR : IWDT Status Register

Base address: IWDT = 0x4008_3200

Offset address: 0x04

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | REFEF | UNDFF | CNTVAL[13:0] | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 13:0 | CNTVAL[13:0] | Down-counter Value<br>Value counted by the down-counter | R |
| 14 | UNDFF | Underflow Flag<br>0: No underflow occurred<br>1: Underflow occurred | R/W*1 |
| 15 | REFEF | Refresh Error Flag<br>0: No refresh error occurred<br>1: Refresh error occurred | R/W*1 |

Note 1. Only 0 can be written to clear the flag.

The IWDTSR register indicates the counter value of the down-counter and whether an underflow or refresh error occurred in the down-counter.

### CNTVAL[13:0] bits (Down-counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

### UNDFF flag (Underflow Flag)

Read the UNDFF flag to confirm whether an underflow occurred in the down-counter. The value 1 indicates that the down-counter underflowed. Write 0 to the UNDFF flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFF flag takes (N + 2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of this flag is ignored for (N + 2) IWDTCLK cycles after an underflow. N is specified in the IWDTCKS[3:0] bits as follows:

- When OFS0.IWDTCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCKS[3:0] = 0xF, N = 128
- When OFS0.IWDTCKS[3:0] = 0x5, N = 256.

### REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred. This indicates that a refresh operation was performed during a prohibited period. The value 1 indicates that a refresh error occurred. Write 0 to the REFEF flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N + 2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of this flag is ignored for (N + 2) IWDTCLK cycles following a refresh error. N is specified in the IWDTCKS[3:0] bits as follows:

- When OFS0.IWDTCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCKS[3:0] = 0xF, N = 128
- When OFS0.IWDTCKS[3:0] = 0x5, N = 256.

### 24.2.3 OFS0 : Option Function Select Register 0

For information on the Option Function Select Register 0 (OFS0), see section 6.2.1. OFS0 : Option Function Select Register 0.

#### IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits select the timeout period, that is, the period until the down-counter underflows, from 128, 512, 1024, or 2048 cycles, taking the divided clock specified in the IWDTCKS[3:0] bits as 1 cycle.

After the down-counter is refreshed, the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits determines the number of IWDTCLK cycles until the counter underflows.

Table 24.2 lists the relationship between the IWDTCKS[3:0] and IWDTTOPS[1:0] bit settings, the timeout period, and the number of IWDTCLK cycles.

**Table 24.2 Timeout period settings**

| IWDTCKS[3:0] bits | | | | IWDTTOPS [1:0] bits | | Clock division ratio | Timeout period (number of cycles) | IWDTCLK cycles |
|---|---|---|---|---|---|---|---|---|
| b7 | b6 | b5 | b4 | b3 | b2 | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | IWDTCLK | 128 | 128 |
| | | | | 0 | 1 | | 512 | 512 |
| | | | | 1 | 0 | | 1024 | 1024 |
| | | | | 1 | 1 | | 2048 | 2048 |
| 0 | 0 | 1 | 0 | 0 | 0 | IWDTCLK/16 | 128 | 2048 |
| | | | | 0 | 1 | | 512 | 8192 |
| | | | | 1 | 0 | | 1024 | 16384 |
| | | | | 1 | 1 | | 2048 | 32768 |
| 0 | 0 | 1 | 1 | 0 | 0 | IWDTCLK/32 | 128 | 4096 |
| | | | | 0 | 1 | | 512 | 16384 |
| | | | | 1 | 0 | | 1024 | 32768 |
| | | | | 1 | 1 | | 2048 | 65536 |
| 0 | 1 | 0 | 0 | 0 | 0 | IWDTCLK/64 | 128 | 8192 |
| | | | | 0 | 1 | | 512 | 32768 |
| | | | | 1 | 0 | | 1024 | 65536 |
| | | | | 1 | 1 | | 2048 | 131072 |
| 1 | 1 | 1 | 1 | 0 | 0 | IWDTCLK/128 | 128 | 16384 |
| | | | | 0 | 1 | | 512 | 65536 |
| | | | | 1 | 0 | | 1024 | 131072 |
| | | | | 1 | 1 | | 2048 | 262144 |
| 0 | 1 | 0 | 1 | 0 | 0 | IWDTCLK/256 | 128 | 32768 |
| | | | | 0 | 1 | | 512 | 131072 |
| | | | | 1 | 0 | | 1024 | 262144 |
| | | | | 1 | 1 | | 2048 | 524288 |

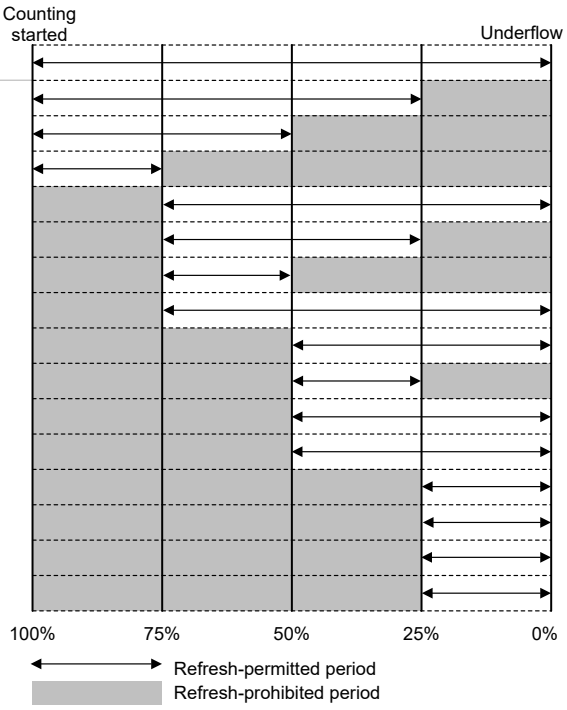
#### IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the IWDT-dedicated clock (IWDTCLK) divided by 1, 16, 32, 64, 128, and 256. Combined with the IWDTTOPS[1:0] bit setting, the IWDT can be configured to a count period between 128 and 524,288 IWDTCLK cycles.

### IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the window start position (window start position > window end position). If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled, and the window end position is set to 0%.

### IWDTRPSS[1:0] bits (IWDT Window Start Position Select)



The IWDTRPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the window end position. If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled, and the window end position is set to 0%.

Table 24.3 lists the counter values for the window start and end positions, and Figure 24.2 shows the refresh-permitted period set in the IWDTRPSS[1:0], IWDTRPES[1:0], and IWDTTOPS[1:0] bits.

**Table 24.3 Relationship between the timeout period and window start and end counter values**

| IWDTTOPS[1:0] bits | | Timeout period | | Window start and end counter value | | | |
|---|---|---|---|---|---|---|---|
| b3 | b2 | Cycles | Counter value | 100% | 75% | 50% | 25% |
| 0 | 0 | 128 | 0x007F | 0x007F | 0x005F | 0x003F | 0x001F |
| 0 | 1 | 512 | 0x01FF | 0x01FF | 0x017F | 0x00FF | 0x007F |
| 1 | 0 | 1024 | 0x03FF | 0x03FF | 0x02FF | 0x01FF | 0x00FF |
| 1 | 1 | 2048 | 0x07FF | 0x07FF | 0x05FF | 0x03FF | 0x01FF |

| IWDTRPSS[1:0] bits | | IWDTRPES[1:0] bits | | Window | |
|---|---|---|---|---|---|
| b11 | b10 | b9 | b8 | Start (%) | End (%) |
| 1 | 1 | 1 | 1 | 100 | 0 |

| | | 1 | 0 | | 25 |
| | | 0 | 1 | | 50 |
| | | 0 | 0 | | 75 |

Note: If window end position setting ≥ window start position setting, the window end position setting is set to 0%.

**Figure 24.2 IWDTRPSS[1:0] and IWDTRPES[1:0] bit settings and refresh-permitted period**

### IWDTRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDTRSTIRQS bit specifies the behavior when an underflow or a refresh error occurs. Setting 1 selects reset output. Setting 0 selects interrupt.

**IWDTSTPCTL bit (IWDT Stop Control)**

The IWDTSTPCTL bit selects whether to stop counting on transition to Sleep, Snooze, or Software Standby mode.

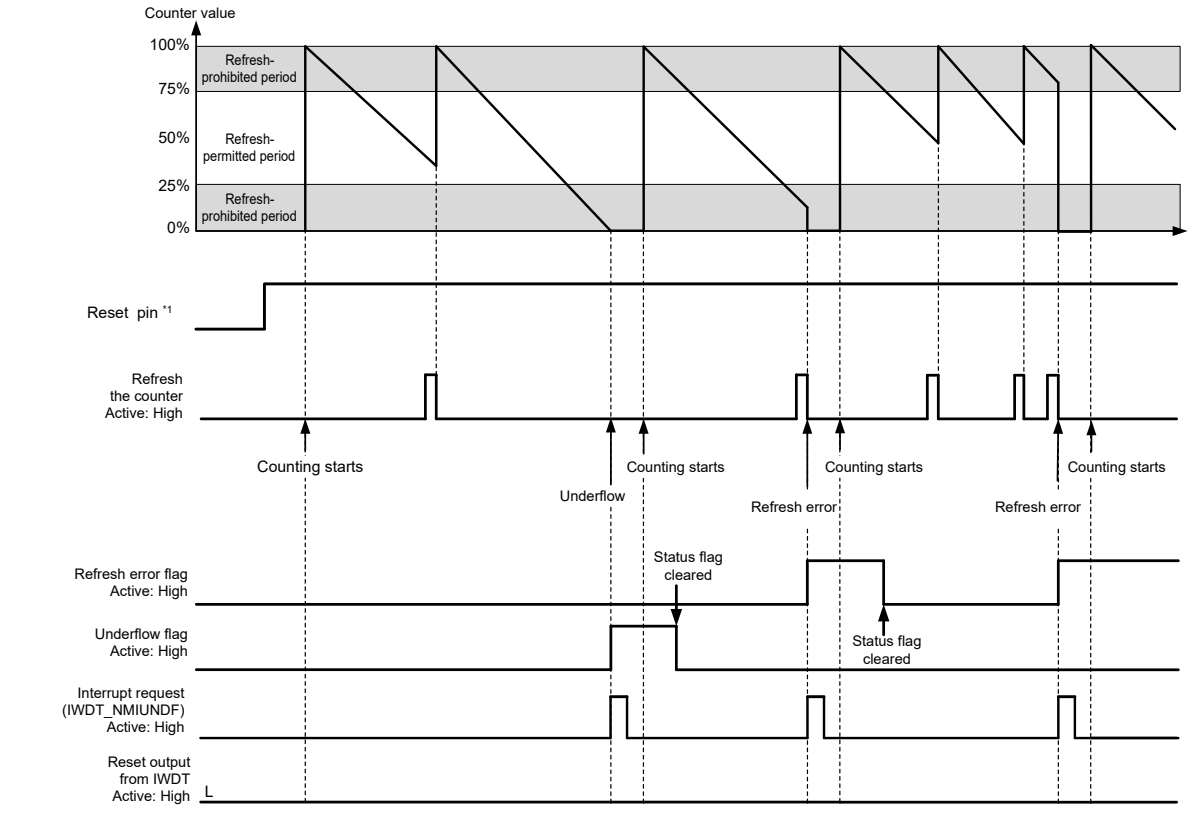
## 24.3 Operation

### 24.3.1 Auto Start Mode

When the IWDT Start Mode Select bit (OFS0.IWDTSTRT) in the Option Function Select Register 0 is 0, auto start mode is selected, otherwise the IWDT is disabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the IWDT registers:

- Clock division ratio (OFS0.IWDTCKS[3:0])
- Window start and end positions (OFS0.IWDTRPSS[1:0], OFS0.IWDTRPES[1:0])
- Timeout period (OFS0.IWDTTOPS[1:0])
- Reset output or interrupt request (OFS0.IWDTRSTIRQS)



When the reset state is released, the counter automatically starts counting down from the value selected in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]).

After that, as long as the program continues normal operation and the counter is refreshed within the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The IWDT does not output the reset signal as long as this procedure continues. However, if the counter underflows because the program crashed or because a refresh error occurred when an attempt is made to refresh outside the refresh-permitted period, the IWDT asserts the reset signal or non-maskable interrupt request/interrupt request (IWDT_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle, the value of the timeout period is set in the down-counter and counting starts. The reset output or interrupt request output can be selected with the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS). The interrupt enabled for operating the NMI can be selected with the IWDT Underflow/Refresh Error Interrupt Enable bit (NMIER.IWDTEN).

Figure 24.3 shows an example of operation under the following conditions:

- Auto start mode (OFS0.IWDTSTRT = 0)
- IWDT behavior selection: interrupt (OFS0.IWDTRSTIRQS = 0)
- Non-maskable Interrupt: IWDT Underflow/Refresh Error Interrupt Enabled (NMIER.IWDTEN = 1)
- The window start position is 75% (OFS0.IWDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDTRPES[1:0] = 10b).

Note 1. Reset pin = RES

**Figure 24.3 Operation example in auto start mode**

## 24.3.2 Refresh Operation

To refresh the down counter and start the counting operation, write to the IWDT Refresh Register (IWDTRR) in the order of values from 0x00 to 0xFF. If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. If an invalid value is written, refreshing is performed normally by writing to the IWDTRR register in the order of values from 0x00 to 0xFF.

When writes are made in the order of 0x00 (first time) → 0x00 (second time), and if 0xFF is written after that, the writing order 0x00 → 0xFF is satisfied. Writing 0x00 ((n - 1)th time) →0x00 (nth time) → 0xFF is valid, and the refresh is performed correctly. Even when the first value written before 0x00 is not 0x00, correct refreshing is performed as long as the operation contains the write sequence of 0x00 → 0xFF.

Correct refreshing is also performed regardless of whether a register other than IWDTRR is accessed or IWDTRR is read between writing 0x00 and writing 0xFF to IWDTRR. Writes to refresh the counter must be made within the refresh-permitted period. Whether writing is done within the refresh-permitted period is determined when 0xFF is written. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid to refresh the counter]

- 0x00 → 0xFF
- 0x00 ((n - 1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from IWDTRR → 0xFF.

[Example write sequences that are not valid to refresh the counter]

- 0x23 (a value other than 0x00) → 0xFF

- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF.

After 0xFF is written to the IWDTRR register, refreshing the counter requires up to 4 cycles of the signal for counting the IWDT-Dedicated Clock Frequency Division Ratio Select bits (OFS0.IWDTCKS[3:0]) to determine how many cycles of the IWDT-dedicated clock (IWDTCLK) make up 1 cycle for counting. To meet this requirement, writing 0xFF to the IWDTRR must be completed 4 count cycles before the end of the refresh-permitted period or a down-counter underflow. The value of the counter can be checked with the counter bits (IWDTSR.CNTVAL[13:0]).

[Example refreshing timings]

- When the window start position is set to 0x03FF (50% of 0x07FF), even if 0x00 is written to IWDTRR before 0x03FF is reached at (0x0402, for example), refreshing occurs if 0xFF is written to IWDTRR after the value of the IWDTSR.CNTVAL[13:0] bits reaches 0x03FF
- When the window end position is set to 0x01FF (25% of 0x07FF), refreshing occurs if 0x0203 (4 count cycles before 0x01FF) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to IWDTRR
- When the refresh-permitted period continues until count 0x0000, refreshing can be performed immediately before an underflow. In this case, if 0x0003 (4 count cycles before an underflow) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to IWDTRR, no underflow occurs and refreshing is performed.

Figure 24.4 shows the IWDT refresh-operation waveforms when PCLKB > IWDTCLK and the clock division ratio is IWDTCLK.

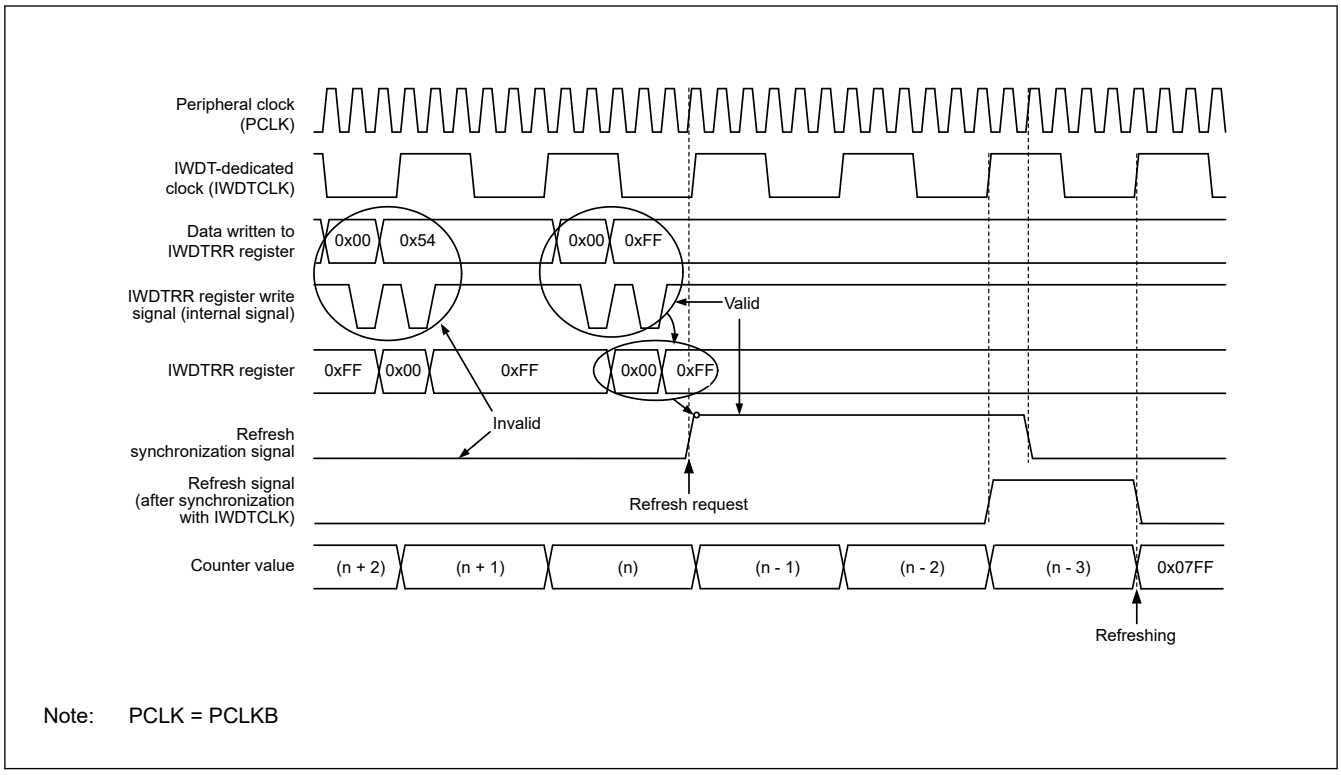


**Figure 24.4 IWDT refresh operation waveforms when OFS0.IWDTCKS[3:0] = 0000b, OFS0.IWDTTOPS[1:0] = 11b**

## 24.3.3 Status Flags

The refresh error (IWDTSR.REFEF) and underflow (IWDTSR.UNDFF) flags retain the source of the interrupt request from the IWDT. Therefore, after a release from the interrupt request generation, read the IWDTSR.REFEF and UNDFF flags to check for the interrupt source. For each flag, writing 0 clears the bit and writing 1 has no effect.

Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the time of the next interrupt request from the IWDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see section 24.2.2. IWDTSR : IWDT Status Register.

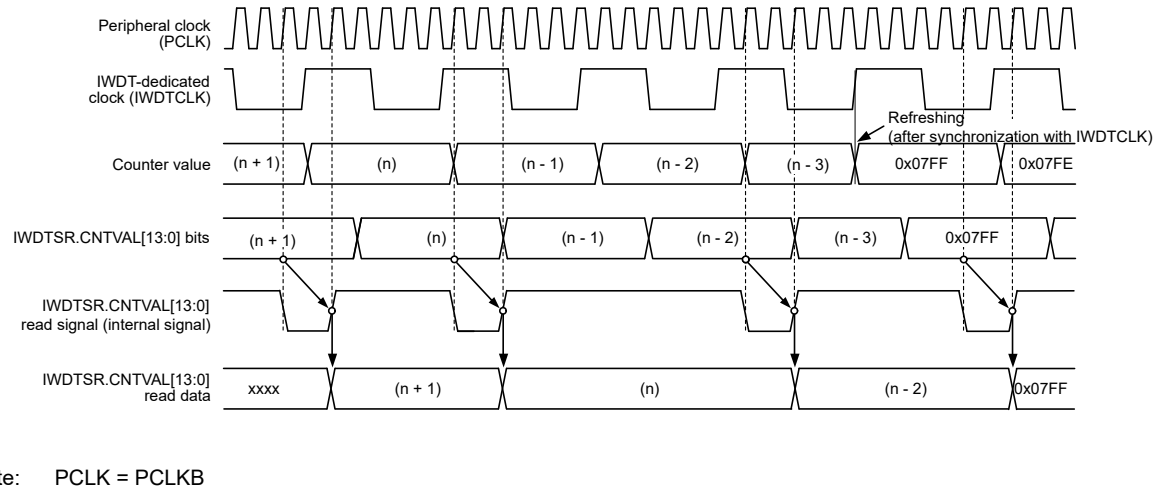
### 24.3.4 Reset Output

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1, a reset signal is output when an underflow in the counter or a refresh error occurs. Counting down automatically starts after the reset output.

### 24.3.5 Interrupt Sources

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0, an interrupt (IWDT_NMIUNDF) signal occurs when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see section 12, Interrupt Controller Unit (ICU).

**Table 24.4 IWDT interrupt source**



| Name | Interrupt source | Interrupt to CPU | Start DMAC or DTC |
|---|---|---|---|
| IWDT_NMIUNDF | • Down-counter underflow<br>• Refresh error | Possible | Not possible |

### 24.3.6 Reading the Down-Counter Value

As the counter is a IWDT-dedicated clock (IWDTCLK), the counter value cannot be read directly. The IWDT synchronizes the counter value with the peripheral clock (PCLKB) and stores it in the down-counter value bits (IWDTSR.CNTVAL[13:0]) of the IWDT Status Register. Check these bits to obtain the counter value indirectly.

Reading the counter value requires multiple PCLKB clock cycles (up to 4 clock cycles), and the read counter value might differ from the actual counter value by a value of one count.

Figure 24.5 shows the processing for reading the IWDT counter value when PCLKB > IWDTCLK and the clock division ratio is IWDTCLK.

Note: PCLK = PCLKB

**Figure 24.5 Processing for reading IWDT counter value when OFS0.IWDTCKS[3:0] = 0000b, OFS0.IWDTTOPS[1:0] = 11b**

## 24.4 Output to the Event Link Controller (ELC)

The IWDT is capable of link operation for a specified module when the interrupt request signal is used as an event signal by the event link controller (ELC). The event signal is output by the counter underflow or refresh error.

An event signal is output regardless of the setting of the OFS0.IWDTRSTIRQS bit. An event signal can also be output at generation of the next interrupt source while the Refresh Error flag (IWDTSR.REFEF) or Underflow flag (IWDTSR.UNDFF) is 1. For details, see section 17, Event Link Controller (ELC).

## 24.5 Usage Notes

### 24.5.1 Refresh Operations

While configuring the refresh time, consider variations in the range of errors given the accuracy of PCLKB and IWDTCLK. Set values that ensure refreshing is possible.

### 24.5.2 Clock Division Ratio Setting

Satisfy the frequency of the peripheral module clock (PCLKB) ≥ 4 × (the frequency of the count clock source after division).

### 24.5.3 Constraints on the ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x52 to ICU Event Link Setting Register n (IELSRn.IELS[8:0]) is prohibited when enabling the IWDT reset assertion (OFS0.IWDTRSTIRQS = 0) or when enabling event link operation (ELSRn.ELS[8:0] = 0x52).

# 25. USB 2.0 Full-Speed Module (USBFS)

## 25.1 Overview

The USB 2.0 Full-Speed module (USBFS) operates as a host or device controller compliant with the Universal Serial Bus (USB) specification revision 2.0. The host controller supports USB 2.0 full-speed and low-speed transfers, and the device controller supports USB 2.0 full-speed transfers. The USBFS has an internal USB transceiver and supports all the transfer types defined in the USB 2.0 specification

The USBFS has FIFO buffer for data transfers, providing a maximum of 10 pipes. Any endpoint number can be assigned to pipes 1 to 9, based on the peripheral devices or the communication requirements for your system.

Table 25.1 lists the USBFS specifications, Figure 25.1 shows a block diagram, and Table 25.2 lists the I/O pins.

**Table 25.1 USBFS specifications**

| Parameter | Specifications |
|---|---|
| Features | ● USB Device Controller (UDC) and USB 2.0 transceiver supporting host controller, and device controller, and On-The-Go (OTG) functions<br>● Host and device controller can be switched by software<br>● Self-power or bus power mode selectable |
| | Host controller features:<br>● Full-speed transfer (12 Mbps) and low-speed transfer (1.5 Mbps)<br>● Automatic scheduling for SOF and packet transmissions<br>● Programmable intervals for isochronous and interrupt transfers<br>● Communications with multiple peripheral devices connected through a single hub |
| | Device controller features:<br>● Full-speed transfer (12 Mbps)*1<br>● Control transfer stage control function<br>● Device state control function<br>● Auto response function for SET_ADDRESS request<br>● SOF interpolation |
| Supported transfer types | ● Control transfer<br>● Bulk transfer<br>● Interrupt transfer<br>● Isochronous transfer |
| Pipe configuration | ● FIFO buffer for USB communication<br>● Up to 10 pipes selectable, including the Default Control Pipe (DCP)<br>● Pipes 1 to 9 assignable to any endpoint number |
| | Transfer conditions specifiable for each pipe:<br>● Pipe 0: Control transfer with 64-byte single buffer<br>● Pipes 1 and 2: Selectable to bulk transfer with 64-byte double buffer or isochronous transfer with 256-byte double buffer<br>● Pipes 3 to 5: Bulk transfer with 64-byte double buffer<br>● Pipes 6 to 9: Interrupt transfer with 64-byte single buffer |
| Other features | ● Reception end function using transaction count<br>● Function that changes the BRDY interrupt event notification timing (BFRE)<br>● Automatic clearing of the FIFO buffer after the data for the pipe specified in the DnFIFO port (n = 0, 1) is read (DCLRM)<br>● NAK setting function for response PID generated on transfer end (SHTNAK)<br>● On-chip pull-up and pull-down resistors for D+ and D– |
| Module-stop function | Module-stop state can be set to reduce power consumption |
| TrustZone Filter | Security attribution can be set |

Note 1. Low-speed transfer (1.5 Mbps) is not supported.

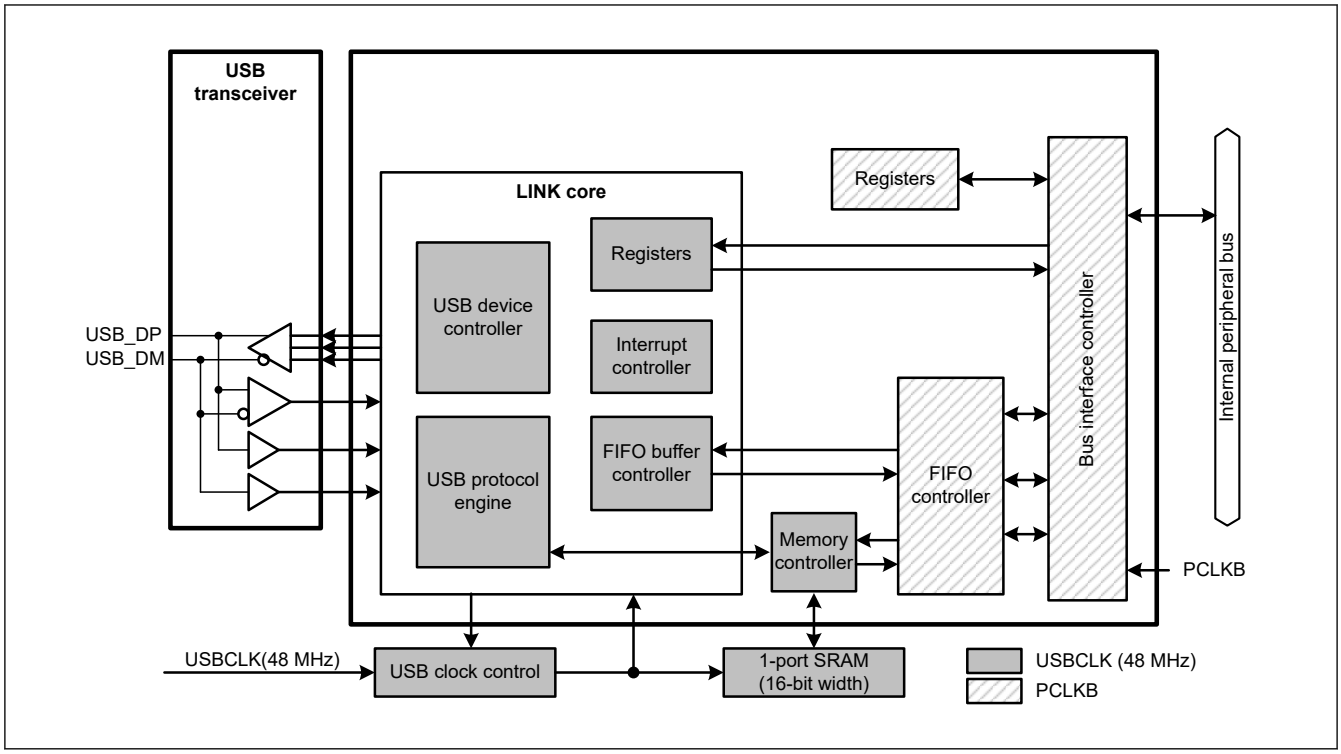


**Figure 25.1 USBFS block diagram**

**Table 25.2 USBFS pin configuration**

| Function | Pin name | I/O | Description |
|---|---|---|---|
| USBFS | USB_DP | I/O | D+ I/O pin of the USB on-chip transceiver. This pin should be connected to the D+ pin of the USB bus. |
| | USB_DM | I/O | D– I/O pin of the USB on-chip transceiver. This pin should be connected to the D– pin of the USB bus. |
| | USB_VBUS | Input | USB cable connection monitor pin. This pin should be connected to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller. |
| | USB_EXICEN | Output | Low-power control signal for external power supply (OTG) chip. |
| | USB_VBUSEN | Output | VBUS (5 V) supply enable signal for external power supply chip. |
| | USB_OVRCURA, USB_OVRCURB | Input | External overcurrent detection signals should be connected to these pins. VBUS comparator signals should be connected to these pins when the OTG power supply chip is connected. |
| | USB_ID | Input | MicroAB connector ID input signal should be connected to this pin during operation in OTG mode. |
| | VCC_USB | Input | Power supply pins. |
| | VSS_USB | Input | Ground pins. |

## 25.2 Register Descriptions

### 25.2.1 SYSCFG : System Configuration Control Register

Base address: USBFS = 0x4009_0000

Offset address: 0x000

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | SCKE | — | — | — | DCFM | DRPD | DPRPU | — | — | — | USBE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | USBE | USBFS Operation Enable<br>0: Disable<br>1: Enable | R/W |
| 2:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 4 | DPRPU | D+ Line Resistor Control<br>0: Disable line pull-up<br>1: Enable line pull-up | R/W |
| 5 | DRPD | D+/D– Line Resistor Control<br>0: Disable line pull-down<br>1: Enable line pull-down | R/W |
| 6 | DCFM | Controller Function Select<br>0: Select device controller<br>1: Select host controller | R/W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |
| 9:8 | — | These bits are read as 0. The write value should be 0. | R/W |
| 10 | SCKE | USB Clock Enable<br>0: Stop clock supply to the USBFS<br>1: Enable clock supply to the USBFS | R/W |
| 15:11 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: After writing 1 to the SCKE bit, read it to confirm that it is set to 1.

### USBE bit (USBFS Operation Enable)

The USBE bit enables or disables operation of the USBFS.

Changing the USBE bit from 1 to 0 initializes the bits listed in Table 25.3. Only change this bit while the SCKE bit is 1. In host controller mode, this bit must be set to 1 after setting the DRPD bit to 1, eliminating SYSSTS0.LNST[1:0] flags chattering, and confirming that the USB bus state is stable.

**Table 25.3 Registers initialized by writing 0 to the SYSCFG.USBE bit**

| Selected function | Register | Bit | Remarks |
|---|---|---|---|
| Device controller | SYSSTS0 | LNST[1:0] | Value is saved in host controller mode |
| | DVSTCTR0 | RHST[2:0] | — |
| | INTSTS0 | DVSQ[2:0] | Value is saved in host controller mode |
| | USBREQ | BREQUEST[7:0], BMREQUESTTYPE[7:0] | Value is saved in host controller mode |
| | USBVAL | WVALUE[15:0] | Value is saved in host controller mode |
| | USBINDX | WINDEX[15:0] | Value is saved in host controller mode |
| | USBLENG | WLENTUH[15:0] | Value is saved in host controller mode |
| Host controller | DVSTCTR0 | RHST[2:0] | — |
| | FRMNUM | FRNM[10:0] | Value is saved in device controller mode |

### DPRPU bit (D+ Line Resistor Control)

The DPRPU bit enables or disables pulling up the D+ line in device controller mode.

When the DPRPU bit is set to 1 in device controller mode, the USBFS pulls up the D+ line to notify the USB host that it attached. Changing the DPRPU bit from 1 to 0 releases the pull-up, thereby notifying the USB host that it detached.

Set this bit to 1 in device controller mode and to 0 in host controller mode.

### DRPD bit (D+/D– Line Resistor Control)

TheDRPD bit enables or disables pulling down D+ and D– lines in host controller mode.

Set this bit to 1 in host controller mode and to 0 in device controller mode.

### DCFM bit (Controller Function Select)

The DCFM bit selects the host or device function of the USBFS.

Only change this bit when the DPRPU and DRPD bits are both 0.

### SCKE bit (USB Clock Enable)

The SCKE bit stops or enables the 48-MHz clock supply to the USBFS.

When this bit is 0, only SYSCFG is permitted to be read from and written to; the other registers related to the USB should not be read from or written to.

## 25.2.2 SYSSTS0 : System Configuration Status Register 0

Base address: USBFS = 0x4009_0000

Offset address: 0x004

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | OVCMON[1:0] | | — | — | — | — | — | — | — | HTACT | SOFEA | — | — | IDMON | LNST[1:0] | |
| Value after reset: | x | x | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | LNST[1:0] | USB Data Line Status Monitor<br>Indicates the status of the USB data lines, see Table 25.4 | R |
| 2 | IDMON | External ID0 Input Pin Monitor<br>0: USB_ID pin is low<br>1: USB_ID pin is high | R |
| 4:3 | — | These bits are read as 0. | R |
| 5 | SOFEA | Active Monitor When the Host Controller Is Selected<br>0: SOF output stopped<br>1: SOF output operating | R |
| 6 | HTACT | USB Host Sequencer Status Monitor<br>0: Host sequencer completely stopped<br>1: Host sequencer not completely stopped | R |
| 13:7 | — | These bits are read as 0. | R |
| 15:14 | OVCMON[1:0] | External USB_OVRCURA/USB_OVRCURB Input Pin Monitor<br>OVCMON[1] indicates the USB_OVRCURA pin status.<br>OVCMON[0] indicates the USB_OVRCURB pin status. | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: The values of the OVCMON[1:0] and IDMON bits depend on the status of the USB_OVRCURA, USB_OVRCURB and USB_ID pins.

### LNST[1:0] bits (USB Data Line Status Monitor)

The LNST[1:0] bits indicate the state of the USB data lines, D+ and D–. For details, see Table 25.4.

In device controller mode, read the LNST[1:0] bits after connection processing (SYSCFG.DPRPU bit = 1). In host controller mode, read them after enabling pull-down of the lines (SYSCFG.DRPD bit = 1).

**Table 25.4 Status of the USB data bus lines (D+ and D–)**

| LNST[1:0] bits | During full-speed operation | During low-speed operation |
|---|---|---|
| 00b | SE0 | SE0 |
| 01b | J-State | K-State |
| 10b | K-State | J-State |
| 11b | SE1 | SE1 |

### SOFEA bit (Active Monitor When the Host Controller Is Selected)

The SOFEA bit is used in host controller mode to check whether the output of the last SOF is complete when the USBFS is suspended because of a 0 setting to the DVSTCTR0.UACT bit.

In host controller mode, check that both the HTACT and SOFEA bits are 0 before setting the SYSCFG.USBE bit to 0 to stop the USBFS or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

### HTACT bit (USB Host Sequencer Status Monitor)

The HTACT bit is set to 0 when the host sequencer of the USBFS is completely stopped.

In host controller mode, check that the HTACT bit is 0 before setting the DVSTCTR0.UACT bit to 0 to place the USBFS in the suspended state or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

### OVCMON[1:0] bits (External USB_OVRCURA/USB_OVRCURB Input Pin Monitor)

The OVCMON[1:0] bits indicate the status of the overcurrent signals from an external power supply IC.

## 25.2.3 DVSTCTR0 : Device State Control Register 0

Base address: USBFS = 0x4009_0000

Offset address: 0x008

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | HNPBTOA | EXICEN | VBUSEN | WKUP | RWUPE | USBRST | RESUME | UACT | — | RHST[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | RHST[2:0] | USB Bus Reset Status<br>0 0 0: In host controller mode: Communication speed indeterminate (powered state or no connection)<br>In device controller mode: Communication speed indeterminate<br>0 0 1: In host controller mode: Low-speed connection<br>In device controller mode: USB bus reset in progress<br>0 1 0: In host controller mode: Full-speed connection<br>In device controller mode: USB bus reset in progress or full-speed connection<br>0 1 1: Setting prohibited<br>Others: In host controller mode: USB bus reset in progress<br>In device controller mode: Setting prohibited | R |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 4 | UACT | USB Bus Enable<br>0: Disable downstream port (disable SOF transmission)<br>1: Enable downstream port (enable SOF transmission) | R/W |
| 5 | RESUME | Resume Output<br>0: Do not output resume signal<br>1: Output resume signal | R/W |
| 6 | USBRST | USB Bus Reset Output<br>0: Do not output USB bus reset signal<br>1: Output USB bus reset signal | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7 | RWUPE | Wakeup Detection Enable<br>0: Disable downstream port remote wakeup<br>1: Enable downstream port remote wakeup | R/W |
| 8 | WKUP | Wakeup Output<br>0: Do not output remote wakeup signal<br>1: Output remote wakeup signal | R/W |
| 9 | VBUSEN | USB_VBUSEN Output Pin Control<br>0: Output low on external USB_VBUSEN pin<br>1: Output high on external USB_VBUSEN pin | R/W |
| 10 | EXICEN | USB_EXICEN Output Pin Control<br>0: Output low on external USB_EXICEN pin<br>1: Output high on external USB_EXICEN pin | R/W |
| 11 | HNPBTOA | Host Negotiation Protocol (HNP) Control<br>Use this bit when switching from device B to device A in OTG mode. If the HNPBTOA bit is 1, the internal function control remains in the Suspend state until the HNP processing ends even if SYSCFG.DPRPU = 0 or SYSCFG.DCFM = 1. | R/W |
| 15:12 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The USBFS controller does not support low-speed connections in device controller mode. When this value is read, abnormal connection processing must be executed in higher level application software.

### RHST[2:0] bits (USB Bus Reset Status)

RHST[2:0] bits indicate the status of the USB bus reset.

In host controller mode, writing 1 to the USBRST bit causes the RHST[2:0] bits to set to 100b. When 0 is written to the USBRST bit and the USBFS ends the SE0 state, the RHST[2:0]bits update to a new value.

In device controller mode, if the USBFS detects a USB bus reset, the RHST[2:0] bits indicate 010b if the DPRPU bit is 1, and a DVST interrupt is generated.

### UACT bit (USB Bus Enable)

When set to 1 in host controller mode, the UACT bit enables USB bus operation by controlling SOF packet transmission to the USB bus in addition to data and reception. The USBFS starts SOF packet output within one frame period after the UACT bit is set to 1. When UACT is set to 0, the USBFS enters the idle state after the SOF packet output.

The USBFS sets the UACT bit to 0 on any of the following conditions:

- A DTCH interrupt is detected during communication (when UACT = 1)
- An EOFERR interrupt is detected during communication (when UACT = 1)

Always write 1 to the UACT bit at the end of the USB bus reset processing (writing 0 to the USBRST bit) or at the end of resume processing from the suspended state (writing 0 to the RESUME bit).

In device controller mode, always set this bit to 0.

### RESUME bit (Resume Output)

The RESUME bit controls the resume signal output in host controller mode.

When this bit is set to 1, the USBFS drives the USB port to the K-state and outputs the resume signal. The USBFS sets the bit to 1 on detection of a remote wakeup signal while the RWUPE bit is 1 and in the USB Suspend state.

The USBFS continues outputting the K-state while the RESUME bit is 1, until the bit is cleared to 0 by software. The RESUME bit must be 1 (resume period) for the time defined in the USB 2.0 specification. Only set this bit to 1 while the interface is in the Suspend state. Write 1 to the UACT bit simultaneously with the end of the resume processing (writing 0 to the RESUME bit).

Always set this bit to 0 in device controller mode.

### USBRST bit (USB Bus Reset Output)

The USBRST bit controls the output of the USB bus signal in host controller mode. When this bit set to 1, the USBFS drives the USB port to the SE0 state to reset the USB bus. The USBFS continues outputting SE0 while the USBRST bit is 1, until the bit is cleared to 0 by software. The USBRST bit must be 1 (USB bus reset period) for the time defined in the USB 2.0 specification. Writing 1 to the USBRST bit during communication (UACT = 1) or during resume processing (RESUME = 1) prevents the USBFS from starting USB bus reset processing until both the UACT and RESUME bits become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset processing (writing 0 to the USBRST bit).

Always set this bit to 0 in device controller mode.

### RWUPE bit (Wakeup Detection Enable)

The RWUPE bit enables or disables remote wakeup signals (resume signals) from downstream peripheral devices in host controller mode. When this bit is set to 1, the USBFS detects a remote wakeup signal (K-state for 2.5 µs) from a downstream peripheral device, and performs resume processing, driving the K-state. When the RWUPE bit is set to 0, the USBFS ignores remote wakeup signals (K-states) from peripheral devices connected to the USB port.

Do not stop the internal clock when the RWUPE bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in device controller mode.

### WKUP bit (Wakeup Output)

The WKUP bit enables or disables remote wakeup signals (resume signals) to the USB bus in device controller mode.

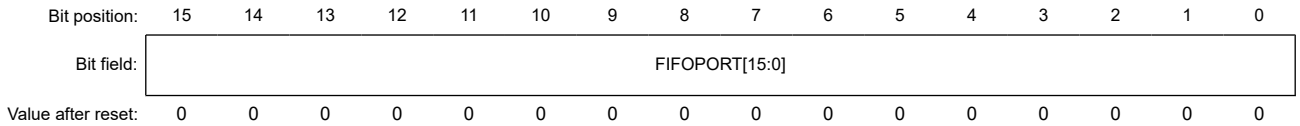
The USBFS controls the output timing of the remote wakeup signals. When this bit is set to 1, the USBFS clears it to 0 after outputting the K-state for 10 ms. The USB 2.0 specification specifies that the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is sent. If the USBFS writes 1 to the WKUP bit immediately after detecting the Suspend state, the K-state is output after 2 ms.

Only write 1 to the WKUP bit when the device is in the Suspend state (INTSTS0.DVSQ[2:0] = 1xxb) and the USB host enables the remote wakeup signal. Do not stop the internal clock while this bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in host controller mode.

### HNPBTOA bit (Host Negotiation Protocol (HNP) Control)

TheHNPBTOA bit is used when switching from device B to device A while in OTG mode.



If the HNPBTOA bit is 1, the internal function control maintains the Suspend state until HNP processing ends, even if the SYSCFG.DPRPU bit is set to 0 or the SYSCFG.DCFM bit is set to 1. Resume interrupts (RESM) are not generated even if a falling edge of D+ is detected.

After this bit is set to 1, the HNP processing ends when a host attach event is detected, because of a pull-up by the initiating party, or the HNPBTOA bit is cleared to 0 by software because the HNP processing times out.

## 25.2.4 CFIFO/CFIFOL : CFIFO Port Register

Base address: USBFS = 0x4009_0000

Offset address: 0x014

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | FIFOPORT[15:0]*1 | FIFO Port<br>Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND) in the associated port selection register. See Table 25.5 and Table 25.6.

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

### FIFOPORT[15:0] bits (FIFO Port)

When the FIFOPORT[15:0] bits are accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See Table 25.5 and Table 25.6.

**Table 25.5 Endian operation in 16-bit access**

| CFIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---|---|---|
| 0 | N + 1 data | N + 0 data |
| 1 | N + 0 data | N + 1 data |

**Table 25.6 Endian operation in 8-bit access**

| CFIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---|---|---|
| 0 | Access prohibited*1 | N + 0 data |
| 1 | Access prohibited*1 | N + 0 data |

Note 1. Writing to or reading from these areas is not allowed.

## 25.2.5 DnFIFO/DnFIFOL : DnFIFO Port Register (n = 0, 1)

Base address: USBFS = 0x4009_0000

Offset address: 0x018 + 0x4 × n

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | FIFOPORT[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | FIFOPORT[15:0]*1 | FIFO Port<br>Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW, D0FIFOSEL.MBW, and D1FIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND, D0FIFOSEL.BIGEND, and D1FIFOSEL.BIGEND) in the associated port selection register. See Table 25.7 and Table 25.8.

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

### FIFOPORT[15:0] bits (FIFO Port)

When the FIFOPORT bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See Table 25.7 and Table 25.8.

**Table 25.7 Endian operation in 16-bit access**

| CFIFOSEL.BIGEND bit<br>D0FIFOSEL.BIGEND bit<br>D1FIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---|---|---|
| 0 | N + 1 data | N + 0 data |
| 1 | N + 0 data | N + 1 data |

**Table 25.8 Endian operation in 8-bit access**

| CFIFOSEL.BIGEND bit<br>D0FIFOSEL.BIGEND bit<br>D1FIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---|---|---|
| 0 | Access prohibited*1 | N + 0 data |
| 1 | Access prohibited*1 | N + 0 data |

Note 1. Writing to or reading from these areas is not allowed.

## 25.2.6 CFIFOSEL : CFIFO Port Select Register

Base address: USBFS = 0x4009_0000

Offset address: 0x020

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | RCNT | REW | — | — | — | MBW | — | BIGEND | — | — | ISEL | — | CURPIPE[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | CURPIPE[3:0] | CFIFO Port Access Pipe Specification<br>0x0: Default Control Pipe<br>0x1: Pipe 1<br>0x2: Pipe 2<br>0x3: Pipe 3<br>0x4: Pipe 4<br>0x5: Pipe 5<br>0x6: Pipe 6<br>0x7: Pipe 7<br>0x8: Pipe 8<br>0x9: Pipe 9<br>Others: Setting prohibited | R/W |
| 4 | — | This bit is read as 0. The write value should be 0. | R/W |
| 5 | ISEL | CFIFO Port Access Direction When DCP Is Selected<br>0: Select reading from the FIFO buffer<br>1: Select writing to the FIFO buffer | R/W |
| 7:6 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | BIGEND | CFIFO Port Endian Control<br>0: Little endian<br>1: Big endian | R/W |
| 9 | — | This bit is read as 0. The write value should be 0. | R/W |
| 10 | MBW | CFIFO Port Access Bit Width<br>0: 8-bit width<br>1: 16-bit width | R/W |
| 13:11 | — | These bits are read as 0. The write value should be 0. | R/W |
| 14 | REW | Buffer Pointer Rewind<br>0: Do not rewind buffer pointer<br>1: Rewind buffer pointer | W*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15 | RCNT | Read Count Mode<br>0: The DTLN[8:0] bits (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) are cleared when all receive data is read from the CFIFO. In double buffer mode, the DTLN[8:0] value is cleared when all data is read from only a single plane.<br>1: The DTLN[8:0] bits are decremented each time the receive data is read from the CFIFO. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only 0 can be read.

Do not specify the same pipe number in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected.

Do not change the pipe number while DMA or DTC transfer is enabled.

### CURPIPE[3:0] bits (CFIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the CFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

### ISEL bit (CFIFO Port Access Direction When DCP Is Selected)

After writing a new value to the ISEL bit with the DCP as the selected pipe, read the ISEL bit to check that the written value agrees with the read value before proceeding to the next process. Set the ISEL and CURPIPE[3:0] bits simultaneously.

### MBW bit (CFIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the CFIFO port.

When the selected pipe is receiving, set the CURPIPE[3:0] and MBW bits simultaneously. After a write to these bits starts a data read from the FIFO buffer, do not change the MBW bit until all the data is read.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

### REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the REW bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

## 25.2.7 DnFIFOSEL : DnFIFO Port Select Register (n = 0, 1)

Base address: USBFS = 0x4009_0000

Offset address: 0x028 + 0x4 × n

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | RCNT | REW | DCLRM | DREQE | — | MBW | — | BIGEND | — | — | — | — | CURPIPE[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | CURPIPE[3:0] | FIFO Port Access Pipe Specification<br>0x0: Default Control Pipe<br>0x1: Pipe 1<br>0x2: Pipe 2<br>0x3: Pipe 3<br>0x4: Pipe 4<br>0x5: Pipe 5<br>0x6: Pipe 6<br>0x7: Pipe 7<br>0x8: Pipe 8<br>0x9: Pipe 9<br>Others: Setting prohibited | R/W |
| 7:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | BIGEND | FIFO Port Endian Control<br>0: Little endian<br>1: Big endian | R/W |
| 9 | — | This bit is read as 0. The write value should be 0. | R/W |
| 10 | MBW | FIFO Port Access Bit Width<br>0: 8-bit width<br>1: 16-bit width | R/W |
| 11 | — | This bit is read as 0. The write value should be 0. | R/W |
| 12 | DREQE | DMA/DTC Transfer Request Enable<br>0: Disable DMA/DTC transfer request<br>1: Enable DMA/DTC transfer request | R/W |
| 13 | DCLRM | Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read<br>0: Disable auto buffer clear mode<br>1: Enable auto buffer clear mode | R/W |
| 14 | REW | Buffer Pointer Rewind<br>0: Do not rewind buffer pointer<br>1: Rewind buffer pointer | W |
| 15 | RCNT | Read Count Mode<br>0: Clear DTLN[8:0] bits in (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) when all receive data is read from DnFIFO (after read of a single plane in double buffer mode)<br>1: Decrement DTLN[8:0] bits each time receive data is read from DnFIFO | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The same pipe must not be specified in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected. The pipe number must not be changed while DMA or DTC transfer is enabled.

### CURPIPE[3:0] bits (FIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the DnFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

### MBW bit (FIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the DnFIFO port.

When the selected pipe is receiving, after a write to these bits starts a data read from the FIFO buffer, do not change the MBW bit until all the data is read. Set the CURPIPE[3:0] and MBW bits simultaneously.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

#### DREQE bit (DMA/DTC Transfer Request Enable)

The DREQE bit enables or disables issuing of DMA or DTC transfer requests. To enable DMA or DTC transfer requests, set this bit to 1 after setting the CURPIPE[3:0] bits. To change the CURPIPE[3:0] setting, first set this bit to 0.

#### DCLRM bit (Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read)

The DCLRM bit enables or disables automatic FIFO buffer clearing after data in the selected pipe is read.

When this bit is set to 1, on receiving a zero-length packet while the FIFO buffer assigned to the selected pipe is empty, or when reading of a received short packet is complete while the PIPECFG.BFRE bit is 1, the USBFS sets the BCLR bit in the FIFO port control register to 1.

When using the USBFS with the SOFCFG.BRDYM bit set to 1, set this bit to 0.

#### REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the bit to 1, be sure to check that the FRDY bit is 1.

To rewrite the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

#### RCNT bit (Read Count Mode)

The RCNT bit specifies the read mode for the value in the D0FIFOCTL.DTLN bit and D1FIFOCTL.DTLN bit. When accessing DnFIFO with the PIPECFG.BFRE bit set to 1, set the RCNT bit to 0.

### 25.2.8 CFIFOCTR : CFIFO Port Control Register

Base address: USBFS = 0x4009_0000

Offset address: 0x022

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | BVAL | BCLR | FRDY | — | — | — | — | DTLN[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | DTLN[8:0] | Receive Data Length<br>Indicates the receive data length.<br>The meaning of the values differs depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits. | R |
| 12:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 13 | FRDY | FIFO Port Ready<br>0: FIFO port access disabled<br>1: FIFO port access enabled | R |
| 14 | BCLR | CPU Buffer Clear<br>0: No operation<br>1: Clear FIFO buffer on the CPU side | W |
| 15 | BVAL | Buffer Memory Valid Flag<br>0: Invalid (writing 0 has no effect)<br>1: Writing ended | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed

- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

### DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0

  The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.

  While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

  The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

  The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

### FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

### BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO port control register is 1 (set by the USBFS).

### BVAL flag (Buffer Memory Valid Flag)

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

## 25.2.9 DnFIFOCTR : DnFIFO Port Control Register (n = 0, 1)

Base address: USBFS = 0x4009_0000

Offset address: 0x02A + 0x4 × n

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | BVAL | BCLR | FRDY | — | — | — | — | DTLN[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | DTLN[8:0] | Receive Data Length<br>Indicates the receive data length.<br>The meaning of the values differs depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits. | R |
| 12:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 13 | FRDY | FIFO Port Ready<br>0: FIFO port access disabled<br>1: FIFO port access enabled | R |
| 14 | BCLR | CPU Buffer Clear<br>0: No operation<br>1: Clear FIFO buffer on the CPU side | R/W*1 |
| 15 | BVAL | Buffer Memory Valid Flag<br>0: Invalid (writing 0 has no effect)<br>1: Writing ended | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only 0 can be read.

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

### DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0

  The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all the received data from a single FIFO buffer plane.

  While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

  The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

  The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all the data is read from the latter plane.

### FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

### BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO port control register is 1 (set by the USBFS).

### BVAL flag (Buffer Memory Valid Flag)

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

## 25.2.10 INTENB0 : Interrupt Enable Register 0

Base address: USBFS = 0x4009_0000

Offset address: 0x030

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | VBSE | RSME | SOFE | DVSE | CTRE | BEMPE | NRDYE | BRDYE | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | BRDYE | Buffer Ready Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 9 | NRDYE | Buffer Not Ready Response Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 10 | BEMPE | Buffer Empty Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 11 | CTRE | Control Transfer Stage Transition Interrupt Enable *1<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 12 | DVSE | Device State Transition Interrupt Enable *1<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 13 | SOFE | Frame Number Update Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 14 | RSME | Resume Interrupt Enable*1<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 15 | VBSE | VBUS Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. The RSME, DVSE, and CTRE bits can only be set to 1 in device controller mode. Do not set these bits to 1 in host controller mode.

When a status flag in the INTSTS0 register sets to 1 and the associated interrupt request enable bit setting in theINTENB0 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB0 register setting, the status flag in the INTSTS0 register sets to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB0 register is switched from 0 to 1 while the associated status flag in the INTSTS0 register is set to 1, a USBFS interrupt is requested.

## 25.2.11 INTENB1 : Interrupt Enable Register 1

Base address: USBFS = 0x4009_0000

Offset address: 0x032

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | OVRCRE | BCHGE | — | DTCHE | ATTCHE | — | — | — | — | EOFERRE | SIGNE | SACKE | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | SACKE | Setup Transaction Normal Response Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 5 | SIGNE | Setup Transaction Error Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 6 | EOFERRE | EOF Error Detection Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 10:7 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 11 | ATTCHE | Connection Detection Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 12 | DTCHE | Disconnection Detection Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 13 | — | This bit is read as 0. The write value should be 0. | R/W |
| 14 | BCHGE | USB Bus Change Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 15 | OVRCRE | Overcurrent Input Change Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: The bits in INTENB1 can only be set to 1 in host controller mode. Do not set these bits to 1 in device controller mode.

INTENB1 specifies the interrupt masks in host controller mode and for the setup transaction.

When a status flag in the INTSTS1 register sets to 1 and the associated interrupt request enable bit setting in theINTENB1 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB1 register setting, the status flag in the INTSTS1 register sets to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB1 register is switched from 0 to 1 while the associated status flag in the INTSTS1 register is set to 1, a USBFS interrupt is requested.

Do not enable interrupts in device controller mode.

## 25.2.12 BRDYENB : BRDY Interrupt Enable Register

Base address: USBFS = 0x4009_0000

Offset address: 0x036

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | PIPE9BRDYE | PIPE8BRDYE | PIPE7BRDYE | PIPE6BRDYE | PIPE5BRDYE | PIPE4BRDYE | PIPE3BRDYE | PIPE2BRDYE | PIPE1BRDYE | PIPE0BRDYE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PIPE0BRDYE | BRDY Interrupt Enable for Pipe 0<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 1 | PIPE1BRDYE | BRDY Interrupt Enable for Pipe 1<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 2 | PIPE2BRDYE | BRDY Interrupt Enable for Pipe 2<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 3 | PIPE3BRDYE | BRDY Interrupt Enable for Pipe 3<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 4 | PIPE4BRDYE | BRDY Interrupt Enable for Pipe 4<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5 | PIPE5BRDYE | BRDY Interrupt Enable for Pipe 5<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 6 | PIPE6BRDYE | BRDY Interrupt Enable for Pipe 6<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 7 | PIPE7BRDYE | BRDY Interrupt Enable for Pipe 7<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 8 | PIPE8BRDYE | BRDY Interrupt Enable for Pipe 8<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 9 | PIPE9BRDYE | BRDY Interrupt Enable for Pipe 9<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 15:10 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The BRDYENB register enables or disables the INTSTS0.BRDY bit to be set to 1 when a BRDY interrupt is detected for each pipe.

When a status flag in the BRDYSTS register sets to 1 and the associated PIPEnBRDYE bit (n = 0 to 9) setting in theBRDYENB register is 1, the INTSTS0.BRDY flag sets to 1. In this case, if the BRDYE bit in INTENB0 is 1, the USBFS generates a BRDY interrupt request. While at least one PIPEnBRDY bit indicates 1, the USB generates the BRDY interrupt request when the associated interrupt request enable bit in the BRDYENB register is changed from 0 to 1 by software.

## 25.2.13 NRDYENB : NRDY Interrupt Enable Register

Base address: USBFS = 0x4009_0000

Offset address: 0x038

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | PIPE9NRDYE | PIPE8NRDYE | PIPE7NRDYE | PIPE6NRDYE | PIPE5NRDYE | PIPE4NRDYE | PIPE3NRDYE | PIPE2NRDYE | PIPE1NRDYE | PIPE0NRDYE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PIPE0NRDYE | NRDY Interrupt Enable for Pipe 0<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 1 | PIPE1NRDYE | NRDY Interrupt Enable for Pipe 1<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 2 | PIPE2NRDYE | NRDY Interrupt Enable for Pipe 2<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 3 | PIPE3NRDYE | NRDY Interrupt Enable for Pipe 3<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 4 | PIPE4NRDYE | NRDY Interrupt Enable for Pipe 4<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5 | PIPE5NRDYE | NRDY Interrupt Enable for Pipe 5<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 6 | PIPE6NRDYE | NRDY Interrupt Enable for Pipe 6<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 7 | PIPE7NRDYE | NRDY Interrupt Enable for Pipe 7<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 8 | PIPE8NRDYE | NRDY Interrupt Enable for Pipe 8<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 9 | PIPE9NRDYE | NRDY Interrupt Enable for Pipe 9<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 15:10 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The NRDYENB register enables or disables the INTSTS0.NRDY bit to be set to 1 when a NRDY interrupt is detected for each pipe.

When a status flag in the NRDYSTS register sets to 1 and the associated PIPEnNRDYE (n = 0 to 9) bit setting in theNRDYENB register is 1, the INTSTS0.NRDY flag sets to 1. In this case, if the NRDYE bit in INTENB0 is 1, the USBFS generates a NRDY interrupt request. While at least one PIPEnNRDY bit indicates 1, the USBFS generates the NRDY interrupt request when the associated interrupt request enable bit in the NRDYENB register is changed from 0 to 1 by software.

## 25.2.14 BEMPENB : BEMP Interrupt Enable Register

Base address: USBFS = 0x4009_0000

Offset address: 0x03A

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | PIPE9BEMPE | PIPE8BEMPE | PIPE7BEMPE | PIPE6BEMPE | PIPE5BEMPE | PIPE4BEMPE | PIPE3BEMPE | PIPE2BEMPE | PIPE1BEMPE | PIPE0BEMPE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PIPE0BEMPE | BEMP Interrupt Enable for Pipe 0<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 1 | PIPE1BEMPE | BEMP Interrupt Enable for Pipe 1<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 2 | PIPE2BEMPE | BEMP Interrupt Enable for Pipe 2<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 3 | PIPE3BEMPE | BEMP Interrupt Enable for Pipe 3<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 4 | PIPE4BEMPE | BEMP Interrupt Enable for Pipe 4<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5 | PIPE5BEMPE | BEMP Interrupt Enable for Pipe 5<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 6 | PIPE6BEMPE | BEMP Interrupt Enable for Pipe 6<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 7 | PIPE7BEMPE | BEMP Interrupt Enable for Pipe 7<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 8 | PIPE8BEMPE | BEMP Interrupt Enable for Pipe 8<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 9 | PIPE9BEMPE | BEMP Interrupt Enable for Pipe 9<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 15:10 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The BEMPENB register enables or disables the INTSTS0.BEMP bit to be set to 1 when a BEMP interrupt is detected for each pipe.

When a status flag in the BEMPSTS register sets to 1 and the associated PIPEnBEMPE (n = 0 to 9) bit setting in the BEMPENB register is 1, the INTSTS0.BEMP flag sets to 1. In this case, if the BEMPE bit in INTENB0 is 1, the USBFS generates a BEMP interrupt request. While at least one PIPEnBEMP bit indicates 1, the USBFS generates the BEMP interrupt request when the associated interrupt request enable bit in the BEMPENB register is changed from 0 to 1 by software.

## 25.2.15 SOFCFG : SOF Output Configuration Register

Base address: USBFS = 0x4009_0000

Offset address: 0x03C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | TRNENSEL | — | BRDYM | — | EDGESTS | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | EDGESTS | Edge Interrupt Output Status Monitor*1<br>Indicates 1 during the edge processing of an edge interrupt output signal. | R |
| 5 | — | This bit is read as 0. The write value should be 0. | R/W |
| 6 | BRDYM | BRDY Interrupt Status Clear Timing<br>0: Clear BRDY flag by software<br>1: Clear BRDY flag by the USBFS through a data read from the FIFO buffer or data write to the FIFO buffer | R/W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |
| 8 | TRNENSEL | Transaction-Enabled Time Select*1<br>0: Not low-speed communication<br>1: Low-speed communication | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Confirm that the EDGESTS flag is 0 before stopping the clock supply to the USBFS.

### EDGESTS bit (Edge Interrupt Output Status Monitor)

The EDGESTS bit indicates 1 during the edge processing of an edge interrupt output signal. Confirm that this bit is 0 before stopping the clock supply to the USBFS.

### BRDYM bit (BRDY Interrupt Status Clear Timing)

The BRDYM bit specifies how the BRDY interrupt status flags for the pipes are cleared.

### TRNENSEL bit (Transaction-Enabled Time Select)

When the USB port is in use for full- or low-speed communications, the TRNENSEL bit specifies the timing with which the USBFS issues tokens in a frame (transaction-enabled time).

Set this bit to 1 when a low-speed device is connected. The bit is only valid in host controller mode. Set this bit to 0 in device controller mode.

## 25.2.16 INTSTS0 : Interrupt Status Register 0

Base address: USBFS = 0x4009_0000

Offset address: 0x040

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | VBINT | RESM | SOFR | DVST | CTRT | BEMP | NRDY | BRDY | VBSTS | DVSQ[2:0] | | | VALID | CTSQ[2:0] | | |
| Value after reset: | 0 | 0 | 0 | x | 0 | 0 | 0 | 0 | x | 0 | 0 | x | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | CTSQ[2:0] | Control Transfer Stage<br>0 0 0: Idle or setup stage<br>0 0 1: Control read data stage<br>0 1 0: Control read status stage<br>0 1 1: Control write data stage<br>1 0 0: Control write status stage<br>1 0 1: Control write (no data) status stage<br>1 1 0: Control transfer sequence error | R |
| 3 | VALID | USB Request Reception<br>0: Setup packet not received<br>1: Setup packet received | R/W |
| 6:4 | DVSQ[2:0] | Device State<br>Indicates the device state.<br>0 0 0: Powered state<br>0 0 1: Default state<br>0 1 0: Address state<br>0 1 1: Configured state<br>Others: Suspend state | R |
| 7 | VBSTS | VBUS Input Status<br>0: USB_VBUS pin is low<br>1: USB_VBUS pin is high | R |
| 8 | BRDY | Buffer Ready Interrupt Status<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R |
| 9 | NRDY | Buffer Not Ready Interrupt Status<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 10 | BEMP | Buffer Empty Interrupt Status<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R |
| 11 | CTRT | Control Transfer Stage Transition Interrupt Status*2<br>0: No control transfer stage transition interrupt occurred<br>1: Control transfer stage transition interrupt occurred | R/W*1 |
| 12 | DVST | Device State Transition Interrupt Status*2<br>0: No device state transition interrupt occurred<br>1: Device state transition interrupt occurred | R/W*1 |
| 13 | SOFR | Frame Number Refresh Interrupt Status<br>0: No SOF interrupt occurred<br>1: SOF interrupt occurred | R/W*1 |
| 14 | RESM | Resume Interrupt Status*2 *3<br>0: No resume interrupt occurred<br>1: Resume interrupt occurred | R/W*1 |
| 15 | VBINT | VBUS Interrupt Status*3<br>0: No VBUS interrupt occurred<br>1: VBUS interrupt occurred | R/W*1 |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: The value of the DVST bit is 0 when the MCU is reset and 1 after a USB bus reset.
Note: The value of the VBSTS bit is 1 when the USB_VBUS pin is high and 0 when the USB_VBUS pin is low.
Note: The value of the DVSQ[2:0] bits is 000b when the MCU is reset and 001b after a USB bus reset.
Note 1. To clear the VBINT, RESM, SOFR, DVST, CTRT, or VALID bits, write 0 only to the bits to be cleared. Write 1 to the other bits. Do not write 0 to the status bits indicating 0.
Note 2. The status of the RESM, DVST, and CTRT bits are changed only in device controller mode. Set the associated interrupt enable bits to 0 (disabled) in host controller mode.
Note 3. The USBFS detects a change in the status indicated in the VBINT andRESM bits even while the clock supply is stopped (SYSCFG.SCKE bit = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply before clearing the status by software.

### CTSQ[2:0] bits (Control Transfer Stage)

In host controller mode, the read value of the CTSQ[2:0] bits is invalid.

### VALID bit (USB Request Reception)

In host controller mode, the read value of the VALID bit is invalid.

### DVSQ[2:0] bits (Device State)

The DVSQ[2:0] bits are initialized by a USB bus reset. In host controller mode, the read value is invalid.

### BRDY flag (Buffer Ready Interrupt Status)

The BRDY flag indicates the BRDY interrupt status.

The USBFS sets the BRDY bit to 1 when it detects a BRDY interrupt status (PIPEnBRDY = 1, n = 0 to 9) on at least one pipe for which BRDY interrupts are enabled (BRDYENB.PIPEnBRDYE = 1).

For the conditions that cause the PIPEnBRDY status to be asserted, see section 25.3.3.1. BRDY Interrupt.

The USBFS sets the BRDY bit to 0 when the software writes 0 to all the PIPEnBRDY bits associated with the PIPEnBRDYE bits that are set to 1. Writing 0 to the BRDY flag in the software does not clear the flag.

### NRDY flag (Buffer Not Ready Interrupt Status)

The NRDY flag indicates the NRDY interrupt status.

The USBFS sets the NRDY bit to 1 when it detects a NRDY interrupt status (PIPEnNRDY = 1, n = 0 to 9) on at least one pipe for which NRDY interrupts are enabled (NRDYENB.PIPEnNRDYE = 1).

For the conditions that cause the PIPEnNRDY status to be asserted, see section 25.3.3.2. NRDY Interrupt.

The USBFS sets the NRDY bit to 0 when the software writes 0 to all the PIPEnNRDY bits associated with the PIPEnNRDYE bits that are set to 1. Writing 0 to the NRDY flag in the software does not clear the flag.

#### BEMP flag (Buffer Empty Interrupt Status)

The BEMP flag indicates the BEMP interrupt status.

The USBFS sets the BEMP bit to 1 when it detects a BEMP interrupt status (PIPEnBEMP = 1, n = 0 to 9) on at least one pipe for which BEMP interrupts are enabled (BEMPENB.PIPEnBEMPE = 1).

For the conditions that cause the PIPEnBEMP status to be asserted, see section 25.3.3.3. BEMP Interrupt.

The USBFS sets the BEMP bit to 0 when the software writes 0 to all the PIPEnBEMP bits associated with the PIPEnBEMPE bits that are set to 1. Writing 0 to the BEMP flag in the software does not clear the flag.

#### CTRT flag (Control Transfer Stage Transition Interrupt Status)

In device controller mode, the USBFS updates the value of the CTSQ[2:0] bits and sets the CTRT flag to 1 on detecting a transition in the control transfer stage. When a control transfer stage transition interrupt occurs, clear the CTRT flag before the USBFS detects the next control transfer stage transition.

Values read from the CTRT flag in host controller mode are invalid.

#### DVST flag (Device State Transition Interrupt Status)

In device controller mode, the USBFS updates the value of the DVSQ[2:0] bits and sets the DVST flag to 1 on detecting a change in the device state. When a device state transition interrupt occurs, clear theDVST flag before the USBFS detects the next device state transition.

Values read from the DVST flag in host controller mode are invalid.

#### SOFR flag (Frame Number Refresh Interrupt Status)

In host controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number when the DVSTCTR0.UACT bit is set to 1 by software. A SOFR interrupt is detected every 1 ms.

In device controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number. A frame number refresh interrupt is detected every 1 ms.

The USBFS can detect an SOFR interrupt through the internal interpolation function even when a corrupted SOF packet is received from the USB host.

#### RESM flag (Resume Interrupt Status)

In device controller mode, the USBFS sets the RESM flag to 1 on detecting the falling edge of the signal on the USB_DP pin in the Suspend state (DVSQ[2:0] = 1xxb). Values read from the RESM flag in host controller mode are invalid.

#### VBINT flag (VBUS Interrupt Status)

The USBFS sets the VBINT flag to 1 on detecting a level change (high to low or low to high) in the USB_VBUS pin input value. The USBFS sets the VBSTS flag to indicate the USB_VBUS pin input value. When a VBUS interrupt occurs, eliminate transient elements by reading the VBSTS flag at least three times through software processing and check that the values read are the same.

### 25.2.17 INTSTS1 : Interrupt Status Register 1

Base address: USBFS = 0x4009_0000

Offset address: 0x042

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | OVRCR | BCHG | — | DTCH | ATTCH | — | — | — | — | EOFERR | SIGN | SACK | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 4 | SACK | Setup Transaction Normal Response Interrupt Status<br>0: No SACK interrupt occurred<br>1: SACK interrupt occurred | R/W*1 |
| 5 | SIGN | Setup Transaction Error Interrupt Status<br>0: No SIGN interrupt occurred<br>1: SIGN interrupt occurred | R/W*1 |
| 6 | EOFERR | EOF Error Detection Interrupt Status<br>0: No EOFERR interrupt occurred<br>1: EOFERR interrupt occurred | R/W*1 |
| 10:7 | — | These bits are read as 0. The write value should be 0. | R/W |
| 11 | ATTCH | ATTCH Interrupt Status<br>0: No ATTCH interrupt occurred<br>1: ATTCH interrupt occurred | R/W*1 |
| 12 | DTCH | USB Disconnection Detection Interrupt Status<br>0: No DTCH interrupt occurred<br>1: DTCH interrupt occurred | R/W*1 |
| 13 | — | This bit is read as 0. The write value should be 0. | R/W |
| 14 | BCHG | USB Bus Change Interrupt Status*2<br>0: No BCHG interrupt occurred<br>1: BCHG interrupt occurred | R/W*1 |
| 15 | OVRCR | Overcurrent Input Change Interrupt Status*2<br>0: No OVRCR interrupt occurred<br>1: OVRCR interrupt occurred | R/W*1 |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. To clear the bits in INTSTS1, write 0 only to the bits to be cleared. Write 1 to the other bits.

Note 2. The USBFS detects a change in the status in the OVRCR or BCHG bit even when the clock supply is stopped (SYSCFG.SCKE = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply (SYSCFG.SCKE = 1) before clearing the status through the software. No other interrupts can be detected while the clock supply is stopped (SYSCFG.SCKE bit = 0).

INTSTS1 is used to confirm the status of each interrupt in host controller mode. Only enable the status change interrupts indicated in the bits in INTSTS1 in host controller mode.

### SACK flag (Setup Transaction Normal Response Interrupt Status)

The SACK flag indicates the status of the setup transaction normal response interrupt in host controller mode.

The USBFS detects the SACK interrupt and sets this flag to 1 when an ACK response is returned from a peripheral device during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

Values read from the SACK flag in device controller mode are invalid.

### SIGN flag (Setup Transaction Error Interrupt Status)

The SIGN flag indicates the status of setup transaction error interrupts in host controller mode.

The USBFS detects the SIGN interrupt and sets this flag to 1 when an ACK response is not returned from a peripheral device three consecutive times during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions:

- Timeout is detected by the USBFS when the peripheral device has returned no response
- A corrupted ACK packet is received
- A handshake other than ACK (NAK, NYET, or STALL) is received

Values read from the SIGN flag in device controller mode are invalid.

#### EOFERR flag (EOF Error Detection Interrupt Status)

The EOFERR flag indicates the status of EOF error detection interrupts in host controller mode.

The USBFS detects the EOFERR interrupt and sets this flag to 1 on detecting that communication did not complete at the EOF2 timing defined in the USB 2.0 specification. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

After detecting the EOFERR interrupt, the USBFS controls the hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt was detected to 0
- Puts the port in which the EOFERR interrupt occurred into the idle state

The software must terminate all pipes in which communications are being carried out and re-enumerate the USB port.

Values read from the EOFERR flag in device controller mode are invalid.

#### ATTCH flag (ATTCH Interrupt Status)

The ATTCH flag indicates the status of USB attach detection interrupts in host controller mode.

The USBFS detects the ATTCH interrupt and sets this flag to 1 on detecting a J- or K-state on the full- or low-speed signal level for 2.5 µs. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the ATTCH interrupt on any of the following conditions.

- K-state, SE0, or SE1 changes to J-state, and J-state continues for 2.5 µs
- J-state, SE0, or SE1 changes to K-state, and K-state continues for 2.5 µs

Values read from the ATTCH flag in device controller mode are invalid.

#### DTCH flag (USB Disconnection Detection Interrupt Status)

The DTCH flag indicates the status of USB disconnection detection interrupts in host controller mode.

The USBFS detects the DTCH interrupt and sets this flag to 1 on detecting a USB bus detach event. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects bus detach events based on the USB 2.0 specification.

After detecting the DTCH interrupt, the USBFS controls hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt was detected to 0
- Puts the port in which the DTCH interrupt occurred into the idle state

The software must terminate all pipes in which communications are being carried out and transition to a wait state for connecting to the USB port (waiting for ATTCH interrupt generation).

Values read from the DTCH flag in device controller mode are invalid.

#### BCHG flag (USB Bus Change Interrupt Status)

The BCHG flag indicates the status of USB bus change interrupts in host controller mode.

The USBFS detects the BCHG interrupt and sets this flag to 1 when a change in the full- or low-speed signal level occurs on the USB port. This includes any change from J-state, K-state, or SE0 to J-state, K-state, or SE0. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS sets the LNST[1:0] flags to indicate the input state of the USB port. When a BCHG interrupt occurs, eliminate transient elements by repeat reading the LNST[1:0] flags by software until the same value is read at least three times.

Change in the USB bus state can be detected while the internal clock is stopped.

Values read from the BCHG flag in device controller mode are invalid.

#### OVRCR flag (Overcurrent Input Change Interrupt Status)

The OVRCR flag indicates the status of USB_OVRCURA or USB_OVRCURB input pin change interrupts.

The USBFS detects the OVRCR interrupt and sets this flag to 1 when a change (high to low or low to high) occurs in at least one of the input values to the USB_OVRCURA or USB_OVRCURB pins. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

## 25.2.18 BRDYSTS : BRDY Interrupt Status Register

Base address: USBFS = 0x4009_0000

Offset address: 0x046

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | PIPE9 BRDY | PIPE8 BRDY | PIPE7 BRDY | PIPE6 BRDY | PIPE5 BRDY | PIPE4 BRDY | PIPE3 BRDY | PIPE2 BRDY | PIPE1 BRDY | PIPE0 BRDY |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PIPE0BRDY | BRDY Interrupt Status for Pipe 0 *2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 1 | PIPE1BRDY | BRDY Interrupt Status for Pipe 1 *2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 2 | PIPE2BRDY | BRDY Interrupt Status for Pipe 2*2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 3 | PIPE3BRDY | BRDY Interrupt Status for Pipe 3*2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 4 | PIPE4BRDY | BRDY Interrupt Status for Pipe 4 *2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 5 | PIPE5BRDY | BRDY Interrupt Status for Pipe 5 *2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 6 | PIPE6BRDY | BRDY Interrupt Status for Pipe 6*2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 7 | PIPE7BRDY | BRDY Interrupt Status for Pipe 7 *2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 8 | PIPE8BRDY | BRDY Interrupt Status for Pipe 8 *2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 9 | PIPE9BRDY | BRDY Interrupt Status for Pipe 9 *2<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred | R/W*1 |
| 15:10 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. When the SOFCFG.BRDYM bit is set to 0, to clear the status indicated in the bits in BRDYSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

Note 2. When the SOFCFG.BRDYM bit is set to 0, clear BRDY interrupts before accessing the FIFO.

## 25.2.19 NRDYSTS : NRDY Interrupt Status Register

Base address: USBFS = 0x4009_0000

Offset address: 0x048

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | PIPE9 NRDY | PIPE8 NRDY | PIPE7 NRDY | PIPE6 NRDY | PIPE5 NRDY | PIPE4 NRDY | PIPE3 NRDY | PIPE2 NRDY | PIPE1 NRDY | PIPE0 NRDY |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PIPE0NRDY | NRDY Interrupt Status for Pipe 0<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 1 | PIPE1NRDY | NRDY Interrupt Status for Pipe 1<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 2 | PIPE2NRDY | NRDY Interrupt Status for Pipe 2<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 3 | PIPE3NRDY | NRDY Interrupt Status for Pipe 3<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 4 | PIPE4NRDY | NRDY Interrupt Status for Pipe 4<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 5 | PIPE5NRDY | NRDY Interrupt Status for Pipe 5<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 6 | PIPE6NRDY | NRDY Interrupt Status for Pipe 6<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 7 | PIPE7NRDY | NRDY Interrupt Status for Pipe 7<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 8 | PIPE8NRDY | NRDY Interrupt Status for Pipe 8<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 9 | PIPE9NRDY | NRDY Interrupt Status for Pipe 9<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred | R/W*1 |
| 15:10 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. To clear the status indicated in the bits in NRDYSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

## 25.2.20 BEMPSTS : BEMP Interrupt Status Register

Base address: USBFS = 0x4009_0000

Offset address: 0x04A

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | PIPE9 BEMP | PIPE8 BEMP | PIPE7 BEMP | PIPE6 BEMP | PIPE5 BEMP | PIPE4 BEMP | PIPE3 BEMP | PIPE2 BEMP | PIPE1 BEMP | PIPE0 BEMP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PIPE0BEMP | BEMP Interrupt Status for Pipe 0<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 1 | PIPE1BEMP | BEMP Interrupt Status for Pipe 1<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 2 | PIPE2BEMP | BEMP Interrupt Status for Pipe 2<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 3 | PIPE3BEMP | BEMP Interrupt Status for Pipe 3<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 4 | PIPE4BEMP | BEMP Interrupt Status for Pipe 4<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 5 | PIPE5BEMP | BEMP Interrupt Status for Pipe 5<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 6 | PIPE6BEMP | BEMP Interrupt Status for Pipe 6<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 7 | PIPE7BEMP | BEMP Interrupt Status for Pipe 7<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 8 | PIPE8BEMP | BEMP Interrupt Status for Pipe 8<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 9 | PIPE9BEMP | BEMP Interrupt Status for Pipe 9<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W*1 |
| 15:10 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. To clear the status indicated in the bits in BEMPSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

## 25.2.21 FRMNUM : Frame Number Register

Base address: USBFS = 0x4009_0000

Offset address: 0x04C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | OVRN | CRCE | — | — | — | FRNM[10:0] | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 10:0 | FRNM[10:0] | Frame Number<br>Latest frame number. | R |
| 13:11 | — | These bits are read as 0. The write value should be 0. | R/W |
| 14 | CRCE | Receive Data Error<br>0: No error occurred<br>1: Error occurred | R/W*1 |
| 15 | OVRN | Overrun/Underrun Detection Status<br>0: No error occurred<br>1: Error occurred | R/W*1 |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. To clear the status, write 0 only to the bits to be cleared. Write 1 to the other bits.

### FRNM[10:0] flags (Frame Number)

The USBFS sets the FRNM[10:0] flags to indicate the latest frame number, which is updated every 1 ms, when an SOF packet is issued or received.

### CRCE flag (Receive Data Error)

The CRCE flag sets to 1 when a CRC error or bit stuffing error occurs during isochronous transfer. On detecting a CRC error in host controller mode, the USBFS generates an internal NRDY interrupt.

To clear the CRCE flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

### OVRN flag (Overrun/Underrun Detection Status)

The OVRN flag sets to 1 when an overrun or underrun error occurs during isochronous transfer. To clear the flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

In host controller mode, the OVRN flag sets to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the time to issue an OUT token comes before all the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the time to issue an IN token comes when no FIFO buffer planes are empty

In device controller mode, the OVRN flag sets to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the IN token is received before all the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the OUT token is received when no FIFO buffer planes are empty

## 25.2.22 USBREQ : USB Request Type Register

Base address: USBFS = 0x4009_0000

Offset address: 0x054

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | BREQUEST[7:0] | | | | | | | | BMREQUESTTYPE[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | BMREQUESTTYPE [7:0] | Request Type<br>USB request bmRequestType value | R/W*1 |
| 15:8 | BREQUEST[7:0] | Request<br>USB request bRequest value | R/W*1 |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBREQ stores setup requests for control transfers.

In device controller mode, the USBREQ stores the received bRequest and bmRequestType values. In host controller mode, it sets to the bRequest and bmRequestType values to be transmitted.

USBREQ is initialized by a USB bus reset.

### BMREQUESTTYPE[7:0] bits (Request Type)

The BMREQUESTTYPE[7:0] bits hold the bmRequestType value of USB requests.

- In host controller mode:

  Set these bits to the value of the USB request data in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.

- In device controller mode:

  These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

### BREQUEST[7:0] bits (Request)

The BREQUEST[7:0] bits store bRequest value of the USB request.

- In host controller mode:

  Set these bits to the value of the USB request data in setup transmission transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.

- In device controller mode:

  These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

## 25.2.23 USBVAL : USB Request Value Register

Base address: USBFS = 0x4009_0000

Offset address: 0x056

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | WVALUE[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | WVALUE[15:0] | Value<br>USB request wValue value | R/W*1 |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

In device controller mode, USBVAL stores the received wValue value. In host controller mode, it sets to the wValue value to be transmitted is set.

USBVAL is initialized by a USB bus reset.

#### WVALUE[15:0] bits (Value)

The WVALUE[15:0] bits store wValue value of the USB request.

- In host controller mode:

  Set these bits to the value of the wValue field in USB requests of transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.

- In device controller mode:

  These bits indicate the wValue value of USB requests in reception setup transactions. Writing to the bits has no effect.

### 25.2.24 USBINDX : USB Request Index Register

Base address: USBFS = 0x4009_0000

Offset address: 0x058

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | WINDEX[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | WINDEX[15:0] | Index<br>USB request wIndex value | R/W*1 |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBINDX stores setup requests for control transfers.

In device controller mode, it stores the received wIndex value. In host controller mode, it sets to the wIndex value to be transmitted.

USBINDX is initialized by a USB bus reset.

#### WINDEX[15:0] bits (Index)

The WINDEX[15:0] bits hold the wIndex value of a USB request.

- In host controller mode:

  Set these bits to the wIndex value in USB requests in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.

- In device controller mode:

These bits indicate the wIndex value in USB requests received in reception setup transactions. Writing to the bits has no effect.

## 25.2.25 USBLENG : USB Request Length Register

Base address: USBFS = 0x4009_0000

Offset address: 0x05A

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | WLENTUH[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | WLENTUH[15:0] | Length<br>USB request wLength value | R/W*1 |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

The USBLENG register stores setup requests for control transfers.

In device controller mode, the value of wLength that is received is stored. In host controller mode, the value of wLength to be transmitted is set.

USBLENG is initialized by a USB bus reset.

### WLENTUH[15:0] bits (Length)

The WLENTUH[15:0] bits hold the wLength value of a USB request.

- In host controller mode:

  Set these bits to the wLength value in USB requests in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.

- In device controller mode:

  These bits indicate the wLength value in USB requests received in reception setup transactions. Writing to the bits has no effect.

## 25.2.26 DCPCFG : DCP Configuration Register

Base address: USBFS = 0x4009_0000

Offset address: 0x05C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | SHTNAK | — | — | DIR | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | DIR | Transfer Direction*1<br>0: Data receiving direction<br>1: Data transmitting direction | R/W |
| 6:5 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7 | SHTNAK | Pipe Disabled at End of Transfer*1<br>0: Keep pipe open after transfer ends<br>1: Disable pipe after transfer ends | R/W |
| 15:8 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only set this bit while the PID is NAK. Before setting this bit, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

### DIR bit (Transfer Direction)

In host controller mode, the DIR bit sets the transfer direction of the data stage and status stage for control transfers. In device controller mode, set the DIR bit to 0.

### SHTNAK bit (Pipe Disabled at End of Transfer)

The SHTNAK bit specifies whether to change PID to NAK on transfer end when the selected pipe is receiving. It is only valid when the selected pipe is receiving.

When the SHTNAK bit is 1, the USBFS changes the DCPCTR.PID[1:0] bits for the DCP to NAK on determining that a transfer has ended. The USBFS determines transfer end on the following condition:

- A short packet, including a zero-length packet, is successfully received.

## 25.2.27 DCPMAXP : DCP Maximum Packet Size Register

Base address: USBFS = 0x4009_0000

Offset address: 0x05E

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DEVSEL[3:0] | | | | — | — | — | — | — | MXPS[6:0] | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6:0 | MXPS[6:0] | Maximum Packet Size*1<br>Maximum data payload specification (maximum packet size) for the DCP | R/W |
| 11:7 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:12 | DEVSEL[3:0] | Device Select*2<br>0x0: Address 0000b<br>0x1: Address 0001b<br>0x2: Address 0010b<br>0x3: Address 0011b<br>0x4: Address 0100b<br>0x5: Address 0101b<br>Others: Setting prohibited | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only set the MXPS[6:0] bits while PID is NAK. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary. After the MXPS[6:0] bits are set and the DCP is set to the CURPIPE[3:0] bits in a port select register, clear the buffer by setting the BCLR bit in the port control register to 1.

Note 2. Only set the DEVSEL[3:0] bits while PID is NAK and the DCPCTR.SUREQ bit is 0. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

### MXPS[6:0] bits (Maximum Packet Size)

The MXPS[6:0] bits specify the maximum data payload (maximum packet size) for the DCP. The initial value is 0x40 (64 bytes). Set the bits to a USB 2.0-compliant value. Do not write to the FIFO buffer or set PID = BUF whileMXPS[6:0] is set to 0.

### DEVSEL[3:0] bits (Device Select)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target peripheral device for a control transfer. Set up the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0010b, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0000b.

## 25.2.28 DCPCTR : DCP Control Register

Base address: USBFS = 0x4009_0000

Offset address: 0x060

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | BSTS | SUREQ | — | — | SUREQCLR | — | — | SQCLR | SQSET | SQMON | PBUSY | — | — | CCPL | PID[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | PID[1:0] | Response PID<br>0 0: NAK response<br>0 1: BUF response (depends on the buffer state)<br>1 0: STALL response<br>1 1: STALL response | R/W |
| 2 | CCPL | Control Transfer End Enable<br>0: Disable control transfer completion<br>1: Enable control transfer completion | R/W |
| 4:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 5 | PBUSY | Pipe Busy<br>0: DCP not used for the USB bus<br>1: DCP in use for the USB bus | R |
| 6 | SQMON | Sequence Toggle Bit Monitor<br>0: DATA0<br>1: ATA1 | R |
| 7 | SQSET | Sequence Toggle Bit Set*2<br>Sets the sequence toggle bit in DCP transfers.<br>0: Invalid (writing 0 has no effect)<br>1: Set the expected value for the next transaction to DATA1 | R/W*1 |
| 8 | SQCLR | Sequence Toggle Bit Clear*2<br>Clears the sequence toggle bit in DCP transfers.<br>0: Invalid (writing 0 has no effect)<br>1: Clear the expected value for the next transaction to DATA0 | R/W*1 |
| 10:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 11 | SUREQCLR | SUREQ Bit Clear<br>Clears the SUREQ bit in host controller mode.<br>0: Invalid (writing 0 has no effect)<br>1: Clear SUREQ to 0 | R/W*1 |
| 13:12 | — | These bits are read as 0. The write value should be 0. | R/W |
| 14 | SUREQ | Setup Token Transmission<br>Sets up token transmission in host controller mode.<br>0: Invalid (writing 0 has no effect)<br>1: Transmit setup packet | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15 | BSTS | Buffer Status<br>0: Buffer access disabled<br>1: Buffer access enabled | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. This bit is read as 0.

Note 2. Only set the SQSET and SQCLR bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

### PID[1:0] bits (Response PID)

The PID[1:0] bits control the USB response type during control transfers.

In host controller mode, to change the PID[1:0] setting from NAK to BUF:

- When the transmitting direction is set:
  a. Write all the transmit data to the FIFO buffer while the DVSTCTR0.UACT bit is 1 and PID is NAK.
  b. Set PID[1:0] bits to 01b (BUF).
     The USBFS then executes the OUT transaction.
- When the receiving direction is set:
  a. Check that the FIFO buffer is empty (or empty the buffer) while the DVSTCTR0.UACT bit is 1 and PID is NAK.
  b. Set PID[1:0] bits to 01b (BUF).
     The USBFS then executes the IN transaction.

The USBFS changes the PID[1:0] setting as follows:

- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets the PID[1:0] to STALL (11b)
- When a reception error, such as a CRC error, is detected three times consecutively, the USBFS sets the PID[1:0] bits to NAK (00b)
- On receiving the STALL handshake, the USBFS sets PID[1:0] to STALL (11b)

In device controller mode, the USBFS changes the PID[1:0] setting as follows:

- On receiving a setup packet, the USBFS sets PID[1:0] to NAK (00b). The USBFS then sets the INTSTS0.VALID flag to 1, and the PID[1:0] setting cannot be changed until the software clears the VALID flag to 0.
- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets PID[1:0] to STALL (11b)
- On detecting a control transfer sequence error, the USBFS sets PID[1:0] to STALL (1xb)
- On detecting a USB bus reset, the USBFS sets PID[1:0] to NAK

The USBFS does not check the PID[1:0] setting while processing a SET_ADDRESS request.

The PID[1:0] bits are initialized by a USB bus reset.

### CCPL bit (Control Transfer End Enable)

In device controller mode, setting the CCPL bit to 1 enables the status stage of the control transfer to be completed. When the bit is set to 1 by software while the associated PID[1:0] bits are set to BUF, the USBFS completes the control transfer status stage.

During control read transfers, the USBFS transmits the ACK handshake in response to the OUT transaction from the USB host. During a control write or no-data control transfers, it transmits the zero-length packet in response to the IN transaction from the USB host. On detecting a SET_ADDRESS request, the USBFS operates in auto response mode from the setup stage up to status stage completion regardless of the CCPL bit setting.

The USBFS changes the CCPL bit from 1 to 0 on receiving a new setup packet. The software cannot write 1 to the bit while the INTSTS0.VALID bit is 1. The bit is initialized by a USB bus reset.

In host controller mode, always write 0 to the CCPL bit.

#### PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether DCP is used for the transaction when USBFS changes the PID[1:0] bits from BUF to NAK. The USBFS changes the PBUSY bit from 0 to 1 on start of a USB transaction for the selected pipe. It changes the PBUSY bit from 1 to 0 on completion of one transaction.

After PID is set to NAK by software, the value in the PBUSY bit indicates whether changes to pipe settings can proceed.

For details, see section 25.3.4.1. Pipe Control Register Switching Procedures.

#### SQMON bit (Sequence Toggle Bit Monitor)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

The USBFS toggles the bit on normal completion of the transaction. It does not toggle the bit, however, when a DATAPID mismatch occurs during a transfer in the receiving direction.

In device controller mode, the USBFS sets the SQMON bit to 1 (specifies DATA1 as the expected value) on successful reception of the setup packet.

In device controller mode, the USBFS does not reference this bit during IN or OUT transactions at the status stage, and it does not toggle the bit on normal completion.

#### SQSET bit (Sequence Toggle Bit Set)

The SQSET bit specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

#### SQCLR bit (Sequence Toggle Bit Clear)

The SQCLR bit specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer. It is read as 0.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

#### SUREQCLR bit (SUREQ Bit Clear)

In host controller mode, setting the SUREQCLR bit to 1 clears the SUREQ bit to 0. The bit is read as 0.

If transfer stops while the SUREQ bit is set to 1 in a setup transaction, set the SUREQCLR bit to 1 by software. This is not necessary at the end of a normal setup transaction, because the USBFS automatically clears the SUREQ bit to 0.

Only control the SUREQ bit through the SUREQCLR bit while the DVSTCTR0.UACT bit is 0. When UACT is 0, communication is halted or no transfer is occurring because a bus disconnection was detected.

In device controller mode, always write 0 to this bit.

#### SUREQ bit (Setup Token Transmission)

In host controller mode, setting the SUREQ bit to 1 triggers the USBFS to transmit the setup packet. After completing the setup transaction process, the USBFS generates either the SACK or SIGN interrupt and clears the SUREQ bit to 0. The USBFS also clears the SUREQ bit to 0 when the software sets the SUREQCLR bit to 1.

Before setting the SUREQ bit to 1, set the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, and USBLENG appropriately to transmit the target USB request in the setup transaction. Also check that the PID[1:0] bits for the DCP are set to NAK. After setting the SUREQ bit to 1, do not change the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, or USBLENG until the setup transaction is complete (SUREQ bit = 1). Write 1 to the SUREQ bit only when transmitting the setup token. Otherwise, write 0.

In device controller mode, always write 0 to this bit.

#### BSTS flag (Buffer Status)

The BSTS flag indicates the status of access to the DCP FIFO buffer. The meaning of this flag varies as follows depending on the CFIFOSEL.ISEL setting:

- When ISEL = 0, the bit indicates whether receive data can be read from the buffer
- When ISEL = 1, the bit indicates whether transmit data can be written to the buffer

## 25.2.29 PIPESEL : Pipe Window Select Register

Base address: USBFS = 0x4009_0000

Offset address: 0x064

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | PIPESEL[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | PIPESEL[3:0] | Pipe Window Select<br>0x0: No pipe selected<br>0x1: Pipe 1<br>0x2: Pipe 2<br>0x3: Pipe 3<br>0x4: Pipe 4<br>0x5: Pipe 5<br>0x6: Pipe 6<br>0x7: Pipe 7<br>0x8: Pipe 8<br>0x9: Pipe 9<br>Others: Setting prohibited | R/W |
| 15:4 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Set pipes 1 to 9 using the PIPESEL, PIPECFG, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN registers (n = 0 to 9).

After selecting the pipe in the PIPESEL register, pipe functions must be set in the associated PIPECFG, PIPEMAXP, and PIPEPERI registers. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set independently of the pipe selection in this register.

### PIPESEL[3:0] bits (Pipe Window Select)

The PIPESEL[3:0] bits select the pipe number associated with the PIPECFG, PIPEMAXP, and PIPEPERI registers used for data writing and reading. Selecting a pipe number in the PIPESEL[3:0] bits allows writing to and reading from PIPECFG, PIPEMAXP, and PIPEPERI associated with the selected pipe number.

When PIPESEL[3:0] = 0000b, 0 is read from all of the bits in PIPECFG, PIPEMAXP, and PIPEPERI. Writing to these bits has no effect.

## 25.2.30 PIPECFG : Pipe Configuration Register

Base address: USBFS = 0x4009_0000

Offset address: 0x068

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | TYPE[1:0] | | — | — | — | BFRE | DBLB | — | SHTNAK | — | — | DIR | EPNUM[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | EPNUM[3:0] | Endpoint Number[*1]<br>Specifies the endpoint number for the selected pipe. Setting 0000b indicates that the pipe is not used. | R/W |
| 4 | DIR | Transfer Direction[*2 *3]<br>0: Receiving direction<br>1: Transmitting direction | R/W |
| 6:5 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | SHTNAK | Pipe Disabled at End of Transfer[*1]<br>0: Continue pipe operation after transfer ends<br>1: Disable pipe after transfer ends | R/W |
| 8 | — | This bit is read as 0. The write value should be 0. | R/W |
| 9 | DBLB | Double Buffer Mode[*2 *3]<br>0: Single buffer<br>1: Double buffer | R/W |
| 10 | BFRE | BRDY Interrupt Operation Specification[*2 *3]<br>0: Generate BRDY interrupt on transmitting or receiving data<br>1: Generate BRDY interrupt on completion of reading data | R/W |
| 13:11 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:14 | TYPE[1:0] | Transfer Type[*1]<br>0 0: Pipe not used<br>0 1: Pipes 1 and 2: Bulk transfer<br>Pipes 3 to 5: Bulk transfer<br>Pipes 6 to 9: Setting prohibited<br>1 0: Pipes 1 and 2: Setting prohibited<br>Pipes 3 to 5: Setting prohibited<br>Pipes 6 to 9: Interrupt transfer<br>1 1: Pipes 1 and 2: Isochronous transfer<br>Pipes 3 to 5: Setting prohibited<br>Pipes 6 to 9: Setting prohibited | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only set the TYPE[1:0], SHTNAK, and EPNUM[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the BFRE, DBLB, and DIR bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 3. To change the BFRE, DBLB, or DIR bits after completing USB communication on the selected pipe, in addition to the constraints described in Note 2, write 1 and 0 to the PIPEnCTR.ACLRM bit continuously through the software and clear the FIFO buffer assigned to the pipe.

PIPECFG specifies the transfer type, FIFO buffer access direction, and endpoint numbers for pipes 1 to 9. It also selects single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.

### EPNUM[3:0] bits (Endpoint Number)

The EPNUM[3:0] bits specify the endpoint number for the selected pipe. Setting 0000b indicates the pipe not used.

Set these bits so that the combination of the DIR and EPNUM[3:0] settings is different from those for other pipes. The EPNUM[3:0] bits can be set to 0000b for all pipes.

### DIR bit (Transfer Direction)

The DIR bit specifies the transfer direction for the selected pipe.

When the software sets this bit to 0, the USBFS uses the selected pipe for receiving. When the software sets this bit to 1, the USBFS uses the selected pipe for transmitting.

### SHTNAK bit (Pipe Disabled at End of Transfer)

The SHTNAK bit specifies whether to change the PIPEnCTR.PID[1:0] bits to 00b (NAK) at the end of transfer when the selected pipe is set in the receiving direction. The bit is valid for pipes 1 to 5 in the receiving direction.

When the software sets this bit to 1 for a receiving pipe, the USBFS changes the associated PIPEnCTR.PID[1:0] bits to 00b (NAK) on determining the transfer end. The USBFS determines that the transfer has ended on the following conditions:

- A short packet data (including a zero-length packet) was successfully received
- The transaction counter is used and the number of packets specified for the transaction counter are successfully received

### DBLB bit (Double Buffer Mode)

The DBLB bit selects either single or double buffer mode for the FIFO buffer used by the selected pipe. The bit is valid for pipes 1 to 5.

### BFRE bit (BRDY Interrupt Operation Specification)

The BFRE bit specifies the BRDY interrupt generation timing from the USBFS to the CPU for the selected pipe.

When the software sets the BFRE bit to 1 and the selected pipe is in the receiving direction, the USBFS detects the transfer completion and generates the BRDY interrupt on reading the packet.

When a BRDY interrupt is generated with this setting, the software must write 1 to the BCLR bit in the port control register. The FIFO buffer assigned to the selected pipe is not enabled for reception until 1 is written to the BCLR bit.

When the BFRE bit is set to 1 by software and the selected pipe is in the transmitting direction, the USBFS does not generate the BRDY interrupt. For details, see section 25.3.3.1. BRDY Interrupt.

### TYPE[1:0] bits (Transfer Type)

The TYPE[1:0] bits specify the transfer type for the pipe selected in the PIPESEL.PIPESEL[3:0] bits. Before setting PID to BUF and starting USB communication on the selected pipe, set the TYPE[1:0] bits to a value other than 00b.

## 25.2.31 PIPEMAXP : Pipe Maximum Packet Size Register

Base address: USBFS = 0x4009_0000

Offset address: 0x06C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | DEVSEL[3:0] | | | | — | — | — | MXPS[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | MXPS[8:0] | Maximum Packet Size*1<br>● Pipes 1 and 2<br>1 byte (0x001) to 256 bytes (0x100) (bit [9] not supported.)<br>● Pipes 3 to 5<br>8 bytes (0x008), 16 bytes (0x010), 32 bytes (0x020), 64 bytes (0x040) (bits [9:7] and [2:0] not supported.)<br>● Pipes 6 to 9<br>1 byte (0x001) to 64 bytes (0x040) (bits [9:7] not supported.) | R/W |
| 11:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:12 | DEVSEL[3:0] | Device Select*2<br>0x0: Address 0000b<br>0x1: Address 0001b<br>0x2: Address 0010b<br>0x3: Address 0011b<br>0x4: Address 0100b<br>0x5: Address 0101b<br>Others: Setting prohibited | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed

- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: The value of the MXPS[8:0] bits is 0x000 when no pipe is selected in the PIPESEL.PIPESEL[3:0] bits and 0x040 when a pipe is selected.

Note 1. Only set the MXPS[8:0] bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the DEVSEL[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

The PIPEMAXP register specifies the maximum packet size for pipes 1 to 9.

### MXPS[8:0] bits (Maximum Packet Size)

The MXPS[8:0] bits specify the maximum data payload (maximum packet size) for the selected pipe.

Set these bits to the appropriate value for each transfer type based on the USB 2.0 specification. When MXPS[8:0] = 0, do not write to the FIFO buffer or set PID to BUF. These writes have no effect.

### DEVSEL[3:0] bits (Device Select)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target device for USB communication. Set up the device address in the associated DEVADDn (n = 0 to 5) register first, then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0x2, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0x0.

## 25.2.32 PIPEPERI : Pipe Cycle Control Register

Base address: USBFS = 0x4009_0000

Offset address: 0x06E

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | IFIS | — | — | — | — | — | — | — | — | — | IITV[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | IITV[2:0]*1 | Interval Error Detection Interval<br>Specifies the interval error detection timing for the selected pipe as the n-th power of 2 of the frame timing | R/W |
| 11:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 12 | IFIS | Isochronous IN Buffer Flush<br>0: Do not flush buffer<br>1: Flush buffer | R/W |
| 15:13 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only set the IITV[2:0] bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEPERI selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfers, and sets the interval error detection interval for pipes 1 to 9.

### IITV[2:0] bits (Interval Error Detection Interval)

To change the IITV[2:0] bits to another value after they are set and USB communication is performed, set the PIPEnCTR.PID[1:0] bits to 00b (NAK) and then set the PIPEnCTR.ACLRM bit to 1 to initialize the interval timer.

The IITV[2:0] bits are not provided for pipes 3 to 5. Write 000b to bit positions of the IITV[2:0] bits associated with pipes 3 to 5.

#### IFIS bit (Isochronous IN Buffer Flush)

The IFIS bit specifies whether to flush the buffer when the pipe selected in the PIPESEL.PIPESEL[3:0] bits is used for isochronous IN transfers.

In device controller mode when the selected pipe is for isochronous IN transfers, the USBFS automatically clears the FIFO buffer if the USBFS fails to receive the IN token from the USB host within the interval set in theIITV[2:0] bits in terms of frames.

When double buffering is specified (PIPECFG.DBLB = 1), the USBFS only clears the data in the previously used plane.

The USBFS clears the FIFO buffer on receiving the SOF packet immediately after the frame in which the USBFS expected to receive the IN token. Even if the SOF packet is corrupted, the FIFO buffer is cleared at the time the SOF packet is expected to be received by using the internal interpolation function.

In host controller mode, set the IITV[2:0] bits to 000b.

Set the IITV[2:0] bits to 000b when the selected pipe is not used for isochronous transfers.

## 25.2.33 PIPEnCTR : PIPEn Control Registers (n = 1 to 5)

Base address: USBFS = 0x4009_0000

Offset address: 0x070 + 0x2 × (n - 1)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | BSTS | INBUFM | — | — | — | ATREPM | ACLRM | SQCLR | SQSET | SQMON | PBUSY | — | — | — | PID[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | PID[1:0] | Response PID<br>0 0: NAK response<br>0 1: BUF response (depends buffer state)<br>1 0: STALL response<br>1 1: STALL response | R/W |
| 4:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 5 | PBUSY | Pipe Busy<br>0: Pipe n not in use for the transaction<br>1: Pipe n in use for the transaction | R |
| 6 | SQMON | Sequence Toggle Bit Confirmation<br>0: DATA0<br>1: DATA1 | R |
| 7 | SQSET | Sequence Toggle Bit Set*2<br>Sets the sequence toggle bit for pipe n.<br>0: Invalid (writing 0 has no effect)<br>1: Set the expected value for the next transaction to DATA1 | R/W*1 |
| 8 | SQCLR | Sequence Toggle Bit Clear*2<br>Clears the sequence toggle bit for pipe n.<br>0: Invalid (writing 0 has no effect)<br>1: Clear the expected value for the next transaction to DATA0 | R/W*1 |
| 9 | ACLRM | Auto Buffer Clear Mode*3<br>0: Disable<br>1: Enable (initialize all buffers) | R/W |
| 10 | ATREPM | Auto Response Mode*2<br>0: Disable auto response mode<br>1: Enable auto response mode | R/W |
| 13:11 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 14 | INBUFM | Transmit Buffer Monitor<br>0: No data to be transmitted is in the FIFO buffer<br>1: Data to be transmitted is in the FIFO buffer | R |
| 15 | BSTS | Buffer Status<br>0: Buffer access by the CPU disabled<br>1: Buffer access by the CPU enabled | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. This bit is read as 0.

Note 2. Only set the ATREPM bit or write 1 to the SQCLR or SQSETbit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSYbit through the software is not necessary.

Note 3. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting this bit, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEnCTR can be set for any pipe selection in the PIPESEL register.

### PID[1:0] bits (Response PID)

The PID[1:0]bits specify the response type for the next transaction on the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. Table 25.9 and Table 25.10 show the basic operations of the USBFS (when there are no errors in the communication packets) based on the PID[1:0] bit setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected pipe, check that the PBUSY bit is 1 to see if USB transfer on the pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to NAK on recognizing completion of the transfer when the selected pipe is in the receiving direction and the PIPECFG.SHTNAK bit for the selected pipe is set to 1 by software
- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode

To specify the response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, set 00b (NAK) and then 01b (BUF)

**Table 25.9 Operation of the USBFS based on the PID[1:0] setting in host controller mode (1 of 2)**

| PID[1:0] value | Transfer type | Transfer direction (DIR bit) | USBFS operation |
|---|---|---|---|
| 00b (NAK) | Does not depend on the setting | Does not depend on the setting | Does not issue tokens |

**Table 25.9 Operation of the USBFS based on the PID[1:0] setting in host controller mode (2 of 2)**

| PID[1:0] value | Transfer type | Transfer direction (DIR bit) | USBFS operation |
|---|---|---|---|
| 01b (BUF) | Bulk or interrupt | Does not depend on the setting | Issues tokens when the DVSTCTR0.UACT bit is 1 and the FIFO buffer associated with the selected pipe is ready for transmission and reception.<br>Does not issue tokens when the DVSTCTR0.UACT bit is 0 or the FIFO buffer associated with the selected pipe is not ready for transmission or reception. |
| | Isochronous | Does not depend on the setting | Issues tokens regardless of the status of the FIFO buffer associated with the selected pipe. |
| 10b (STALL) or 11b (STALL) | Does not depend on the setting | Does not depend on the setting | Does not issue tokens. |

**Table 25.10 Operation of the USBFS based on the PID[1:0] setting in device controller mode**

| PID[1:0] value | Transfer type | Transfer direction (DIR bit) | USBFS operation |
|---|---|---|---|
| 00b (NAK) | Bulk or interrupt | Does not depend on the setting | Returns NAK in response to the token from the USB host |
| | Isochronous | Does not depend on the setting | Returns nothing in response to the token from the USB host |
| 01b (BUF) | Bulk | Receiving direction (DIR = 0) | Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception |
| | Interrupt | Receiving direction (DIR = 0) | Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception |
| | Bulk or interrupt | Transmitting direction (DIR = 1) | Transmits data in response to the token from the USB host if the FIFO buffer associated with the selected pipe is ready for transmission. Otherwise, returns NAK. |
| | Isochronous | Receiving direction (DIR = 0) | Receives data in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception. Otherwise, discards the data. |
| | Isochronous | Transmitting direction (DIR = 1) | Transmits data in response to the token from the USB host if the associated FIFO buffer is ready for transmission. Otherwise, transmits a zero-length packet. |
| 10b (STALL) or 11b (STALL) | Bulk or interrupt | Does not depend on the setting | Returns STALL in response to the token from the USB host |
| | Isochronous | Does not depend on the setting | Returns nothing in response to the token from the USB host |

### PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by software after PID is set to NAK allows you to check whether changing the pipe setting is possible. For details, see section 25.3.4.1. Pipe Control Register Switching Procedures.

### SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

When the selected pipe is not the isochronous transfer type, the USBFS toggles the SQMON flag on successful completion of the transaction. However, the USBFS does not toggle the SQMON flag when a DATA-PID mismatch occurs during transfer in the receiving direction.

### SQSET bit (Sequence Toggle Bit Set)

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS clears the SQSET bit to 0.

### SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS clears the SQCLR bit to 0.

### ACLRM bit (Auto Buffer Clear Mode)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

Table 25.11 shows the data cleared by writing 1 and 0 to the ACLRM bit continuously and the cases in which this processing is required.

**Table 25.11 Data cleared by the USBFS when ACLRM = 1**

| Number | Data cleared by setting the ACLRM bit | Situations requiring data clear |
|---|---|---|
| 1 | All data in the FIFO buffer allocated to the selected pipe (two FIFO buffers in double buffer mode) | When initializing the selected pipe |
| 2 | Interval count value when the selected pipe is the isochronous transfer type | When resetting the interval count value |
| 3 | Internal flags related to the PIPECFG.BFRE bit | When changing the PIPECFG.BFRE setting |
| 4 | FIFO buffer toggle control | When changing the PIPECFG.DBLB setting |
| 5 | Internal flags related to the transaction count | When forcing the transaction count function to terminate |

### ATREPM bit (Auto Response Mode)

The ATREPM bit enables or disables auto response mode for the selected pipe.

This bit can be set to 1 in device controller mode when the selected pipe is the bulk transfer type. When the bit is set to 1, the USBFS responds to the token from the USB host as follows:

- When the selected pipe is set for bulk IN transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 1):
  a. When the ATREPM bit = 1 and PID = BUF, the USBFS transmits a zero-length packet in response to the IN token.
  b. The USBFS updates the sequence toggle bit (DATA-PID) each time the USBFS receives ACK from the USB host. In a single transaction, the IN token is received, a zero-length packet is transmitted, and then ACK is received. The USBFS does not generate the BRDY or BEMP interrupt.
- When the selected pipe is set for bulk OUT transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 0):
  When the ATREPM bit = 1 and PID = BUF, the USBFS returns NAK in response to the OUT token and generates an NRDY interrupt.

For USB communication in auto response mode, set the ATREPM bit to 1 while the FIFO buffer is empty. Do not write to the FIFO buffer during USB communication in auto response mode. When the selected pipe uses isochronous transfer, always set this bit to 0.

In host controller mode, always set the ATREPM bit to 0.

### INBUFM bit (Transmit Buffer Monitor)

The INBUFM bit indicates the FIFO buffer status for the selected pipe in the transmitting direction.

When the selected pipe is set in the transmitting direction (PIPECFG.DIR = 1), the USBFS sets this bit to 1 when the CPU or DMA/DTC completes writing data to at least one FIFO buffer plane.

The USBFS sets this bit to 0 when the USBFS completes transmission of the data from the FIFO buffer plane to which all the data is written. In double buffer mode (PIPECFG.DBLB = 1), the USBFS sets the INBUFM bit to 0 when the USBFS completes transmission of the data from the two FIFO buffer planes before the CPU or DMA/DTC completes writing data to one FIFO buffer plane.

The INBUFM bit indicates the same value as the BSTS bit when the selected pipe is in the receiving direction (PIPECFG.DIR = 0).

### BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 25.12.

**Table 25.12 BSTS bit operation**

| DIR value | BFRE value | DCLRM value | BSTS bit function |
|---|---|---|---|
| 0 | 0 | 0 | Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 on completion of data read |
| | | 1 | Setting prohibited |
| | 1 | 0 | Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 when the software sets the BCLR bit in the port control register to 1 after the data read is complete |
| | | 1 | Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 on completion of data read |
| 1 | 0 | 0 | Sets to 1 when transmit data can be written to the FIFO buffer, and clears to 0 on completion of data write |
| | | 1 | Setting prohibited |
| | 1 | 0 | Setting prohibited |
| | | 1 | Setting prohibited |

## 25.2.34 PIPEnCTR : PIPEn Control Registers (n = 6 to 9)

Base address: USBFS = 0x4009_0000

Offset address: 0x07A + 0x2 × (n - 6)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | BSTS | — | — | — | — | — | ACLRM | SQCLR | SQSET | SQMON | PBUSY | — | — | — | PID[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | PID[1:0] | Response PID<br>0 0: NAK response<br>0 1: BUF response (depends on buffer state)<br>1 0: STALL response<br>1 1: STALL response | R/W |
| 4:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 5 | PBUSY | Pipe Busy<br>0: Pipe n not in use for the transaction<br>1: Pipe n in use for the transaction | R |
| 6 | SQMON | Sequence Toggle Bit Confirmation<br>0: DATA0<br>1: DATA1 | R |
| 7 | SQSET | Sequence Toggle Bit Set*1<br>Sets the sequence toggle bit for pipe n.<br>0: Invalid (writing 0 has no effect)<br>1: Set the expected value for the next transaction to DATA0 | W |
| 8 | SQCLR | Sequence Toggle Bit Clear*1<br>Clears the sequence toggle bit for pipe n.<br>0: Invalid (writing 0 has no effect)<br>1: Clear the expected value for the next transaction to DATA0 | W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 9 | ACLRM | Auto Buffer Clear Mode*2<br>0: Disable<br>1: Enable (all buffers initialized) | R/W |
| 14:10 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15 | BSTS | Buffer Status<br>0: Buffer access disabled<br>1: Buffer access enabled | R |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only write 1 to the SQCLR or SQSET bit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting this bit, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

### PID[1:0] bits (Response PID)

The PID[1:0]bits specify the response type for the next transaction of the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. Table 25.9 and Table 25.10 show the basic operation (when there are no errors in the transmitted and received packets) of the USBFS depending on the PID[1:0] setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected pipe, check that the PBUSY bit is 1 to see if USB transfer on the selected pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode

To specify each response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, set 00b (NAK) and then 01b (BUF)

### PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by software after PID is set to NAK allows you to check whether changing the pipe setting is possible.

### SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

The USBFS toggles the SQMON bit on successful completion of the transaction. However, the USBFS does not toggle the SQMON bit when a DATA-PID mismatch occurs during transfer in the receiving direction.

### SQSET bit (Sequence Toggle Bit Set)

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS sets the SQSET bit to 0.

### SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS sets the SQCLR bit to 0.

### ACLRM bit (Auto Buffer Clear Mode)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

Table 25.13 shows the data cleared by writing 1 and 0 continuously to the ACLRM bit and the cases in which this processing is required.

**Table 25.13 Data cleared by the USBFS when ACLRM = 1**

| Number | Data cleared by setting the ACLRM bit | Situations requiring data clear |
|---|---|---|
| 1 | All data in the FIFO buffer allocated to the selected pipe | When initializing the selected pipe |
| 2 | Interval count value when the selected pipe is the isochronous transfer type | When resetting the interval count value |
| 3 | Internal flags related to the PIPECFG.BFRE bit | When changing the PIPECFG.BFRE setting |
| 4 | Internal flags related to the transaction count | When forcing the transaction count function to terminate |

### BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 25.12.

## 25.2.35 PIPEnTRE : PIPEn Transaction Counter Enable Register (n = 1 to 5)

Base address: USBFS = 0x4009_0000

Offset address: 0x090 + 0x4 × (n - 1)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | TRENB | TRCLR | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | TRCLR | Transaction Counter Clear<br>0: Invalid (writing 0 has no effect)<br>1: Clear counter value | R/W |
| 9 | TRENB | Transaction Counter Enable<br>0: Disable transaction counter<br>1: Enable transaction counter | R/W |
| 15:10 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set each bit in PIPEnTRE while PID is NAK. Before setting these bits after changing the PIPEnCTR.PID[1:0] bits for the selected pipe from BUF to NAK, check that the PIPEnCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

### TRCLR bit (Transaction Counter Clear)

When the TRCLR bit sets to 1, the USBFS clears the value of the transaction counter associated with the selected pipe and then sets the TRCLR bit to 0.

### TRENB bit (Transaction Counter Enable)

The TRENB bit enables or disables the transaction counter.

For receiving pipes, setting the TRENB bit to 1 after setting the total number of the packets to be received in the PIPEnTRN.TRNCNT[15:0] bits through the software allows the USBFS to control hardware on having received the number of packets equal to the TRNCNT[15:0] setting, as follows:

- When the PIPECFG.SHTNAK bit is 1, the USBFS changes the PID bits to NAK for the associated pipe on having received the number of packets equal to the TRNCNT[15:0] setting
- When the PIPECFG.BFRE bit is 1, the USBFS asserts the BRDY interrupt on having received the number of packets equal to the TRNCNT[15:0] setting and then reading the last received data

For transmitting pipes, set the TRENB bit to 0.

When the transaction counter is not used, set this bit to 0. When the transaction counter is used, set the TRNCNT[15:0] bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.

## 25.2.36 PIPEnTRN : PIPEn Transaction Counter Register (n = 1 to 5)

Base address: USBFS = 0x4009_0000

Offset address: 0x092 + 0x4 × (n - 1)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | TRNCNT[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 15:0 | TRNCNT[15:0] | Transaction Counter<br>When written to, this bit specifies the total packets (number of transactions) to be received by the selected pipe.<br>When read from, when PIPEnTRE.TRENB is 0, this bit indicates the specified number of transactions.<br>When PIPEnTRE.TRENB is 1, this bit indicates the current transaction count. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The PIPEnTRN registers retain their settings during a USB bus reset.

### TRNCNT[15:0] bits (Transaction Counter)

The USBFS increments the value of the TRNCNT[15:0] bits by 1 when all the following conditions are satisfied on receiving the packet:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value ≠ current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[9:0] setting

The USBFS clears the value of the TRNCNT[15:0] bits to 0 when any of the following conditions are satisfied:

All the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value = current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[9:0] setting

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The USBFS received a short packet

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The PIPEnTRE.TRCLR bit was set to 1 by software

For transmitting pipes, set the TRNCNT[15:0] bits to 0. When the transaction counter is not used, set the TRNCNT[15:0] bits to 0.

Setting the number of transactions to be transferred to the TRNCNT[15:0] bits is only enabled when the PIPEnTRE.TRENB bit is 0. To set the number of transactions to be transferred, set the TRCLR bit to 1 to clear the current counter value before setting the PIPEnTRE.TRENB bit to 1.

## 25.2.37 UCKSEL : USB Clock Selection Register

Base address: USBFS = 0x4009_0000

Offset address: 0x0C4

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UCKSELC |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | UCKSELC | USB Clock Selection*1*2<br>0: High-speed on-chip oscillator clock (HOCO) not selected as USB clock.<br>1: High-speed on-chip oscillator clock (HOCO) selected as USB clock. | R/W |
| 15:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. Set UCKSELC bit to 0 when selecting the host controller function.
Note 2. When UCKSELC = 1, writing any other value except 0x00 to HOCOUTCR is prohibited. For HOCOUTCR register, see section 8, Clock Generation Circuit.

## 25.2.38 DEVADDn : Device Address n Configuration Register (n = 0 to 5)

Base address: USBFS = 0x4009_0000

Offset address: 0x0D0 + 0x2 × n

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | — | USBSPD[1:0] | | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7:6 | USBSPD[1:0] | Transfer Speed of Communication Target Device<br>0 0: Do not use DEVADDn<br>0 1: Low-speed<br>1 0: Full-speed<br>1 1: Setting prohibited | R/W |
| 15:8 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The DEVADDn register specifies the transfer speed of the peripheral device that is the communication target for pipes 0 to 9.

In host controller mode, set all DEVADDn bits before starting communication to any pipes. Only change the bits in DEVADDn when no valid pipes are using the bit settings. A valid pipe is defined as one that satisfies both of the following conditions:

- The target device of the DEVADDn register is selected in the DEVSEL[3:0] bits
- The PID[1:0] bits are set to BUF for the selected pipe, or the selected pipe is the DCP with the DCPCTR.SUREQ bit set to 1

In device controller mode, set all bits in this register to 0.

**USBSPD[1:0] bits (Transfer Speed of Communication Target Device)**

TheUSBSPD[1:0] bits specify the USB transfer speed of the target peripheral device. Set these bits to 10b when a full-speed device is connected through the hub. In host controller mode, the USBFS generates packets based on the USBSPD[1:0] setting. In device controller mode, set these bits to 00b.

## 25.3 Operation

### 25.3.1 System Control

This section describes register settings required for initializing the USBFS and controlling power consumption.

#### 25.3.1.1 Setting Data to the USBFS Registers

Setting the SYSCFG.USBE bit to 1 after starting the clock supply (SYSCFG.SCKE bit = 1) enables and starts USBFS operation.

#### 25.3.1.2 Selecting the Controller Function

The USBFS can operate as either a host or device controller.

Use the SYSCFG.DCFM bit to select one of these USBFS functions. The DCFM bit must be changed in the initial settings immediately after a reset or in the D+ pull-up-disabled state (SYSCFG.DPRPU bit = 0) and D+ and D– pull-down-disabled state (SYSCFG.DRPD bit = 0).

#### 25.3.1.3 Controlling the USB Data Bus Using Resistors

The USBFS provides pull-up and pull-down resistors for the D+ and D– lines. Pull these lines up or down by setting the SYSCFG.DPRPU and DRPD bits.

In device controller mode, confirm that connection to the USB host is made, and then set the SYSCFG.DPRPU bit to 1 and pull up the D+ line (in full-speed communication).

When the SYSCFG.DPRPU bit is set to 0 during communication with a PC, the USBFS disables the pull-up resistor of the USB data line, thereby notifying the USB host of disconnection.

In host controller mode, set the SYSCFG.DRPD bit to 1 to pull down the D+ and D– lines.

**Table 25.14 USB data bus resistor control**

| SYSCFG register settings | | USB data bus control | | |
|---|---|---|---|---|
| DRPD bit | DPRPU bit | D– | D+ | Function |
| 0 | 0 | Open | Open | When resistors are not used |
| 0 | 1 | Open | Pull-up | When operating as a device controller at full-speed |
| 1 | 0 | Pull-down | Pull-down | When operating as a host controller |
| 1 | 1 | — | — | Setting prohibited |

#### 25.3.1.4 Example External Connection Circuits

Figure 25.2 shows an example OTG connection in the self-powered system. The USBFS controls the pull-up resistor of the D+ line and the pull-down resistor of D+ and D- lines. Select pull-up and pull-down for the lines in the SYSCFG.DPRPU and SYSCFG.DRPD bits. In device controller mode, the pull-up resistor of the USB data line is disabled if SYSCFG.DPRPU bit is set to 0 while communicating with the USB host. The USBFS can use this to notify the USB host of a device disconnect.

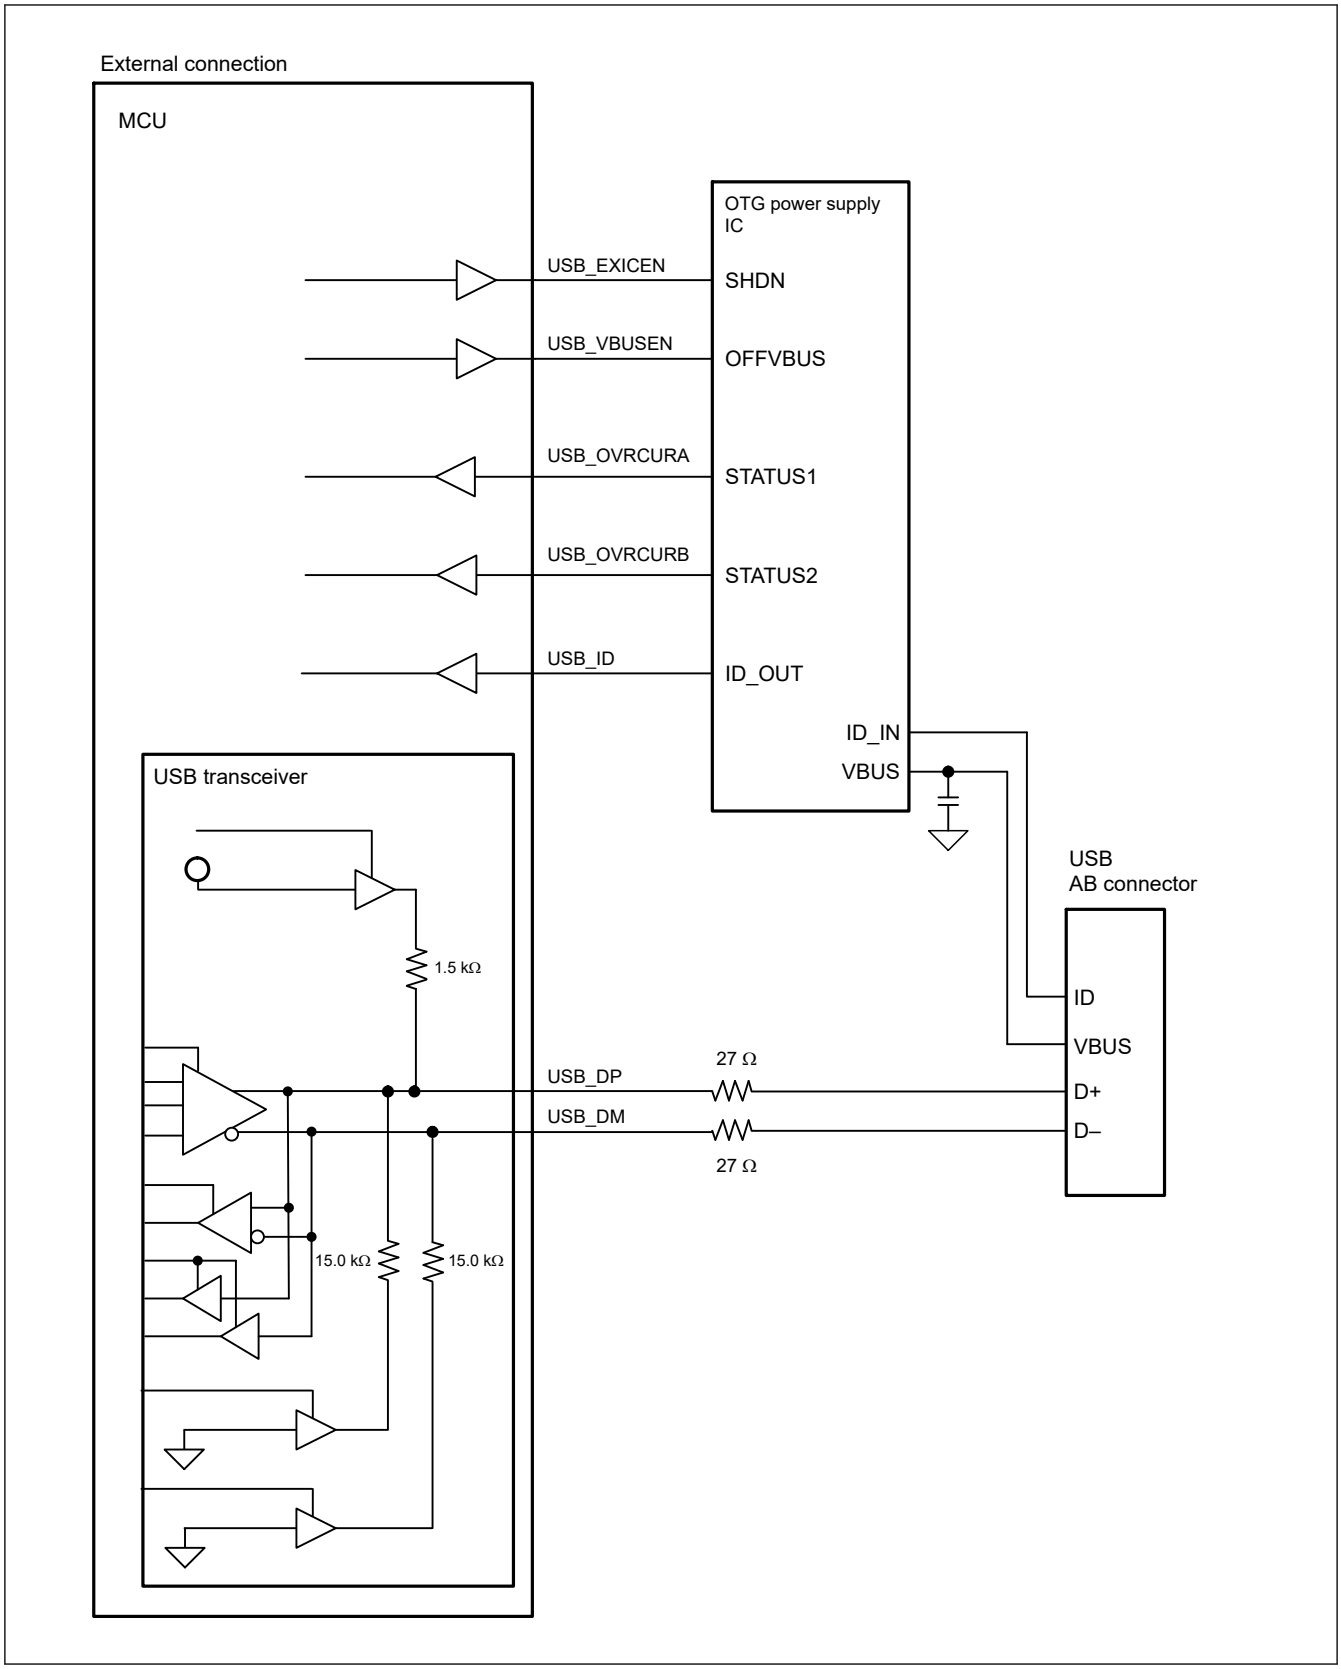


**Figure 25.2 Example OTG connection in a self-powered system**

Figure 25.3 shows an example device connection in a self-powered system.

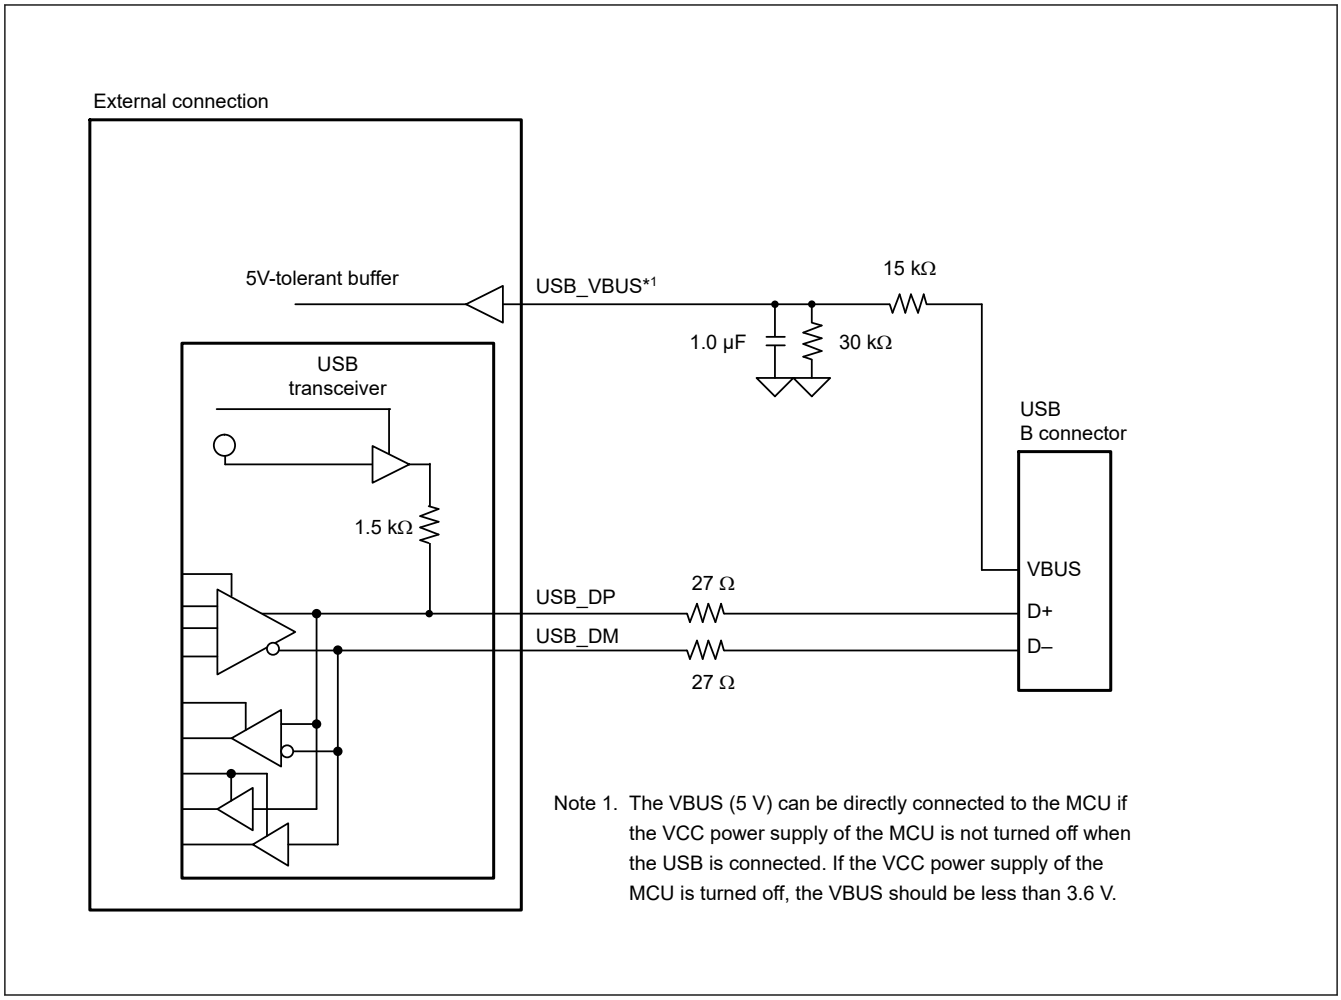

**Figure 25.3 Example device connection in a self-powered system**

Figure 25.4 shows an example host connection.

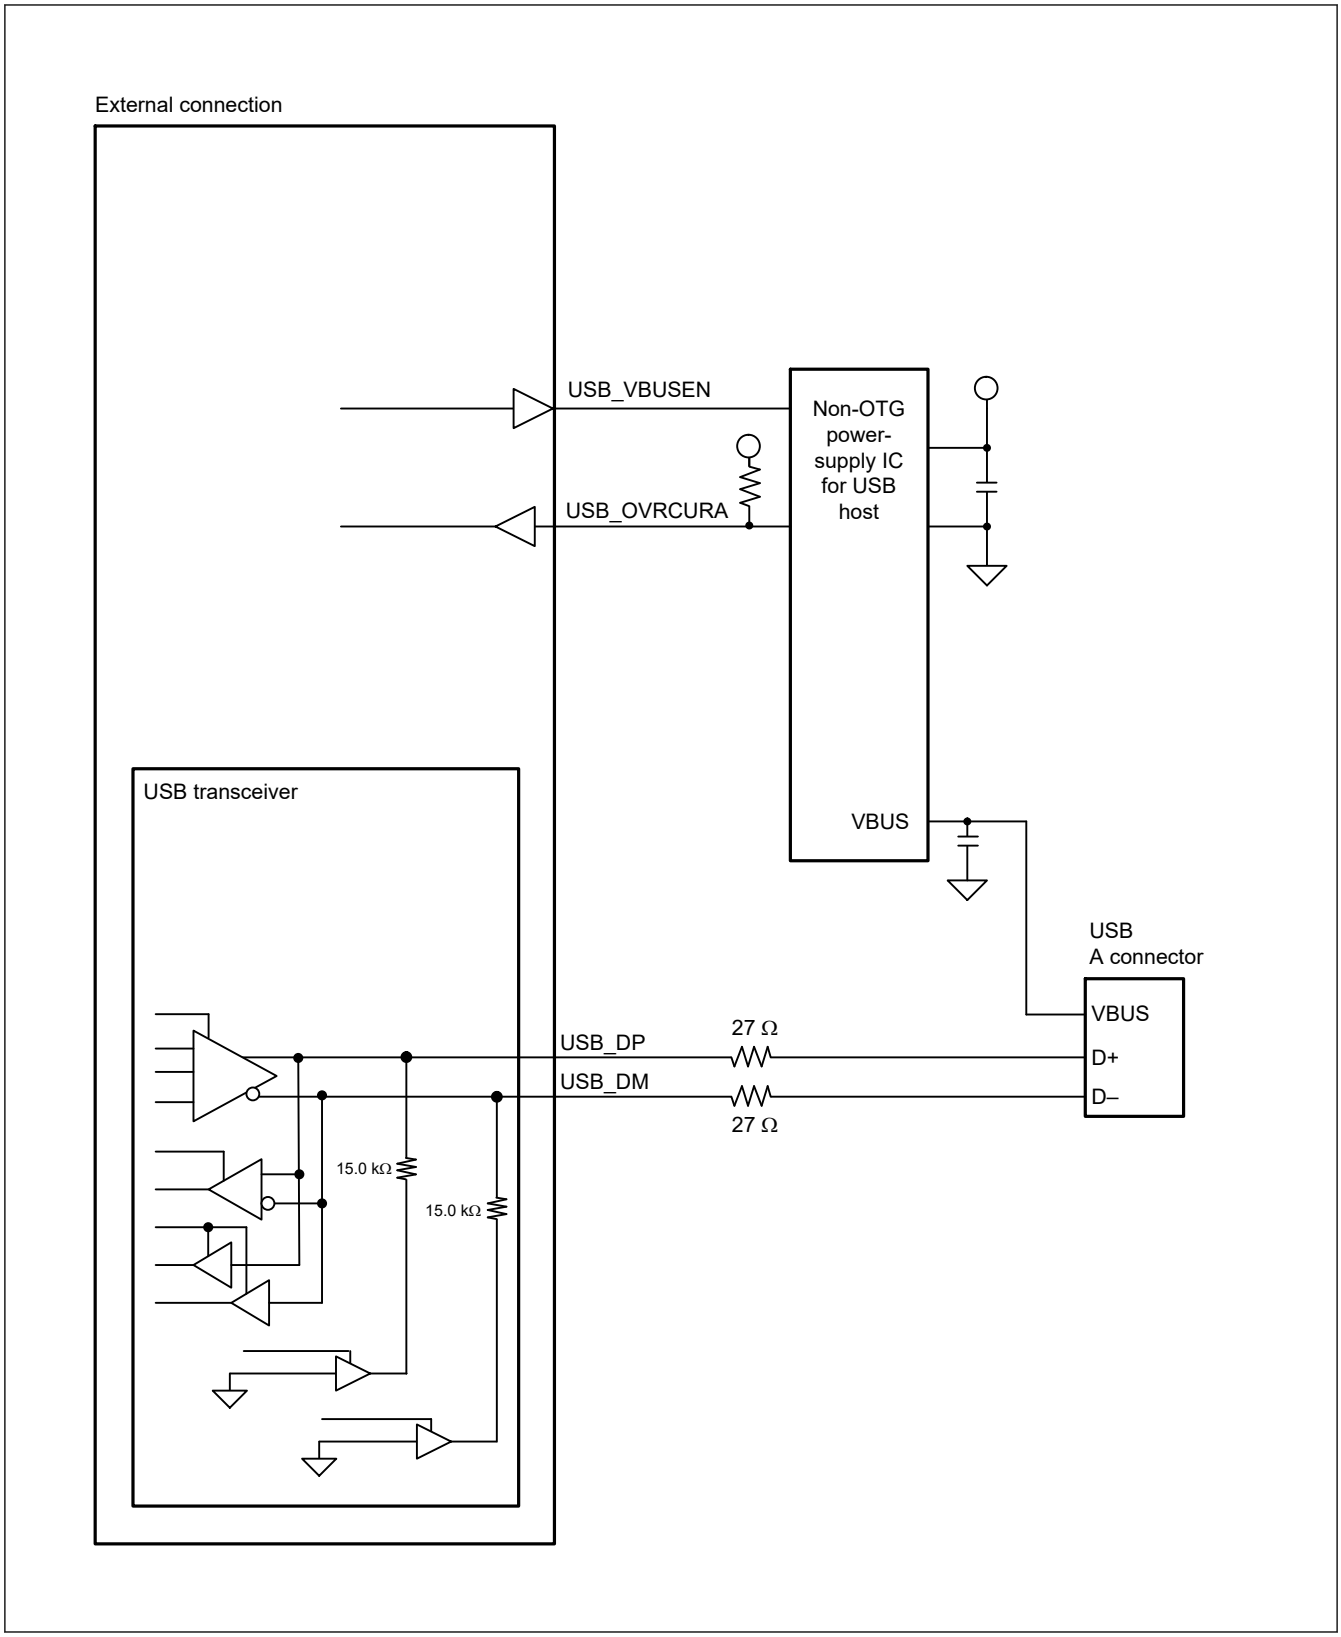

**Figure 25.4 Example host connection**

Figure 25.5 shows an example device connection in a bus-powered system.

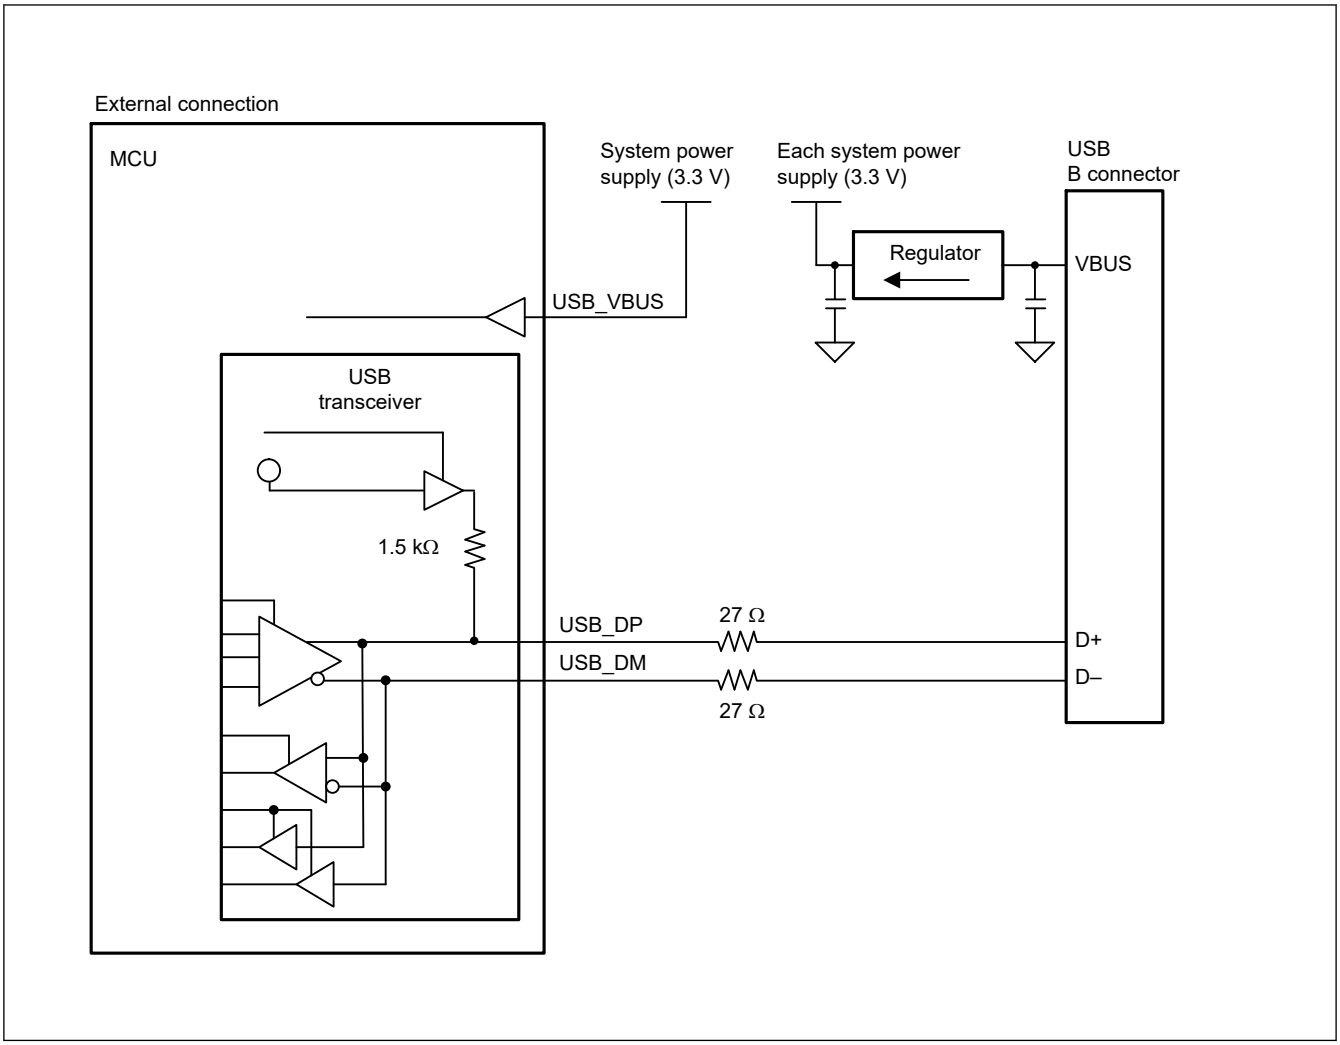

**Figure 25.5 Example device connection in a bus-powered state**

The examples of external circuits given in this section are simplified circuits, and their operation in every system is not guaranteed.

## 25.3.2 Interrupts

Table 25.15 lists the interrupt sources in the USBFS. When an interrupt generation condition is satisfied and the interrupt output is enabled using the associated interrupt enable register, a USBFS interrupt request is issued to the Interrupt Controller Unit (ICU) and an USBFS interrupt is generated.

**Table 25.15 Interrupt sources (1 of 2)**

| Bit to be set to 1 | Name | Interrupt source | Applicable controller function | Status flag |
|---|---|---|---|---|
| VBINT | VBUS interrupt | • A change in the state of the USB_VBUS input pin was detected (low to high or high to low) | Host or device*1 | INTSTS0.VBSTS |
| RESM | Resume interrupt | • A change in the state of the USB bus was detected in the Suspend state (J-state to K-state or J-state to SE0) | Device | — |
| SOFR | Frame number update interrupt | In host controller mode:<br>• An SOF packet with a different frame number was transmitted<br>In device controller mode:<br>• An SOF packet with a different frame number was received | Host or device | — |

**Table 25.15 Interrupt sources (2 of 2)**

| Bit to be set to 1 | Name | Interrupt source | Applicable controller function | Status flag |
|---|---|---|---|---|
| DVST | Device state transition interrupt | • One of the following device state transitions was detected:<br>– USB bus reset was detected<br>– Suspend state was detected<br>– SET_ADDRESS request was received<br>– SET_CONFIGURATION request was received | Device | INTSTS0.DVSQ[2:0] |
| CTRT | Control transfer stage transition interrupt | • A control transfer stage transition was detected because of one of the following:<br>– Setup stage completed<br>– Control write transfer status stage transition occurred<br>– Control read transfer status stage transition occurred<br>– Control transfer completed<br>– Control transfer sequence error occurred | Device | INTSTS0.CTSQ[2:0] |
| BEMP | Buffer empty interrupt | • The buffer is empty after all FIFO buffer data was transmitted<br>• A packet larger than the maximum packet size was received | Host or device | BEMPSTS.PIPEnBEMP |
| NRDY | Buffer not ready interrupt | In host controller mode<br>• A STALL response was received from the peripheral device in response to the issued token<br>• The response from the peripheral device in response to the issued token was not received successfully (no response three times consecutively or packet reception error three times consecutively)<br>• An overrun or underrun error occurred during isochronous transfer<br>In device controller mode<br>• NAK was returned for an IN or OUT token while the PID [1:0] bits were set to 01b (BUF)<br>• A CRC error or bit stuffing error occurred during data reception in isochronous transfer<br>• An overrun or underrun occurred during data reception in isochronous transfer | Host or device | NRDYSTS.PIPEnNRDY |
| BRDY | Buffer ready interrupt | • The buffer is ready (readable or writable state) | Host or device | BRDYSTS.PIPEnBRDY |
| OVRCR | Overcurrent input change interrupt | • USB_OVRCURA or USB_OVRCURB input pin state change was detected (low to high or high to low) | Host | INTSTS1.OVRCR |
| BCHG | Bus change interrupt | • USB bus state change was detected | Host or device | SYSSTS0.LNST[1:0] |
| DTCH | Disconnect detection during full-speed operation | Peripheral device disconnect was detected in full-speed operation | Host | DVSTCTR0.RHST[2:0] |
| ATTCH | Device connect detection interrupt | • J-state or K-state was detected on the USB bus for 2.5 µs continuously<br>This interrupt can be used to check whether peripheral devices are connected | Host | — |
| EOFERR | EOF error detection interrupt | • An EOF error was detected for a peripheral device | Host | — |
| SACK | Setup normal interrupt | • A setup transaction normal response (ACK) was received | Host | — |
| SIGN | Setup error interrupt | • A setup transaction error (no response or ACK packet corruption) was detected three consecutive times | Host | — |

Note 1. Although this interrupt can be generated in host controller mode, it is not usually used in this mode.

Figure 25.6 shows the circuits related to the USBFS interrupts.

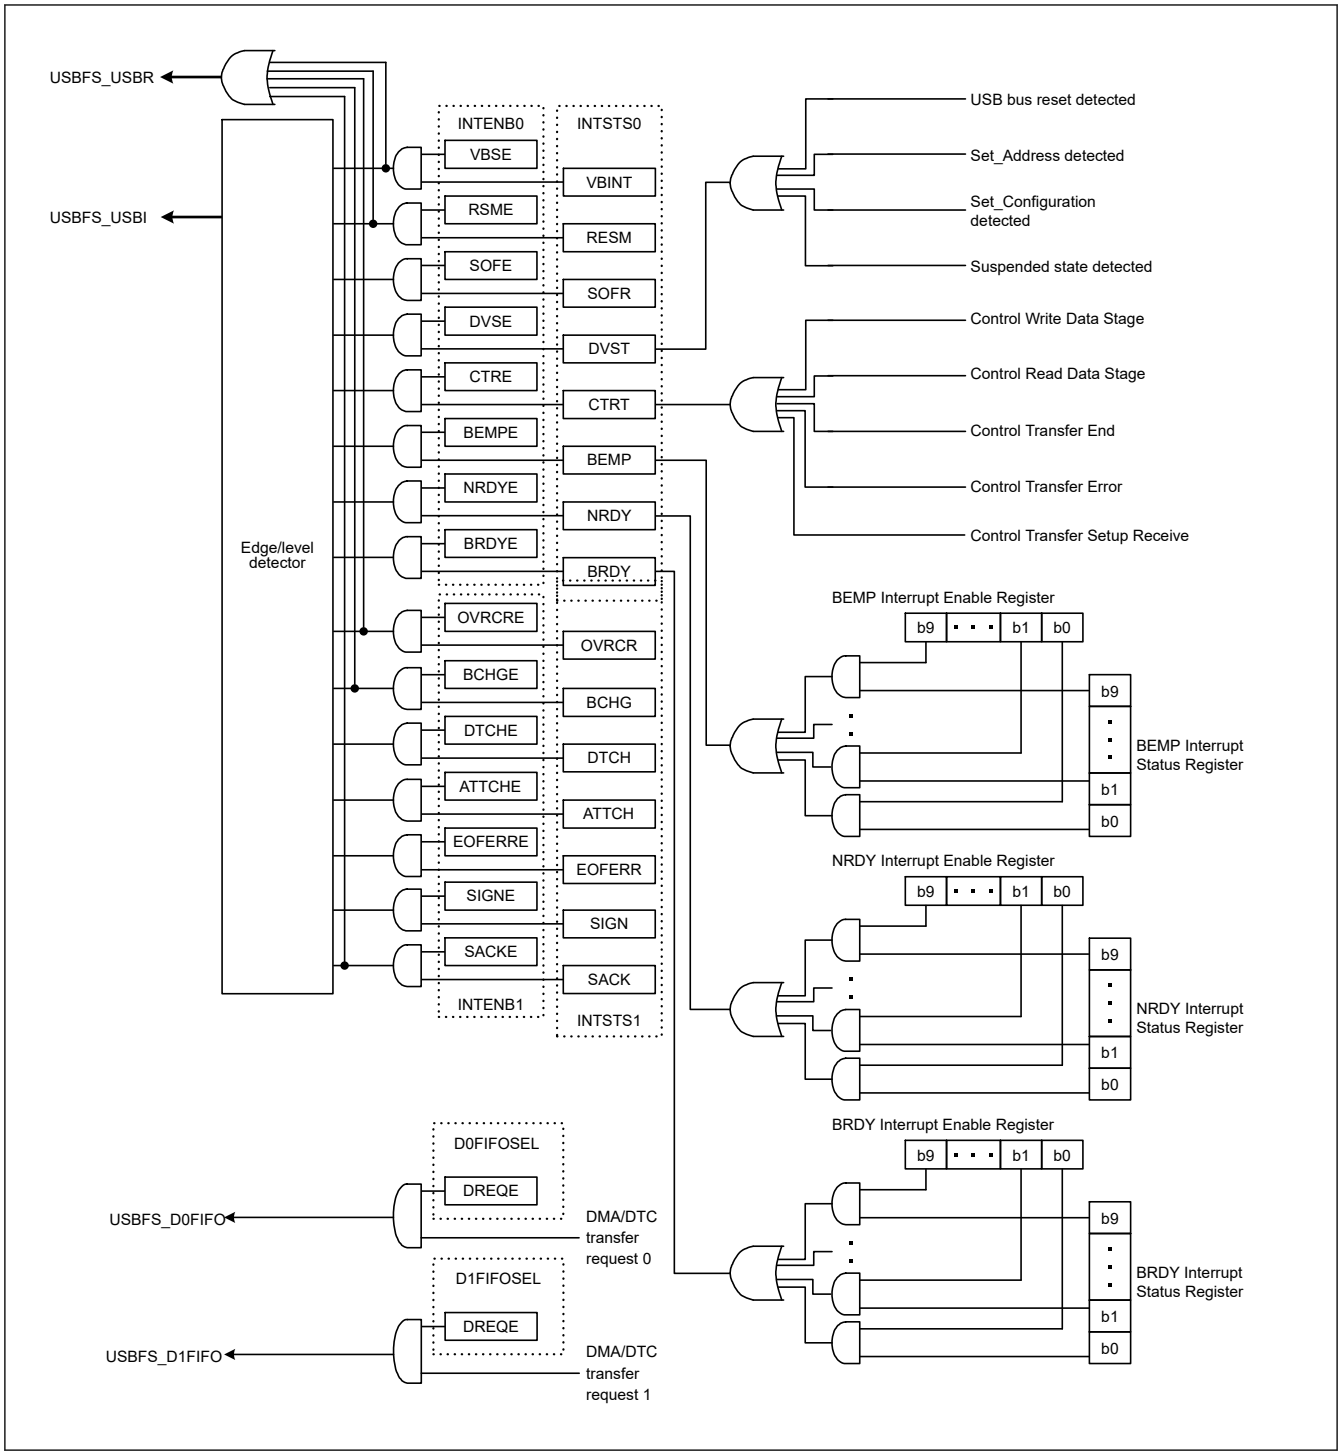

**Figure 25.6 USBFS interrupt-related circuits**

Table 25.16 shows the interrupts generated by the USBFS.

**Table 25.16 USBFS interrupts**

| Interrupt name | Interrupt status flag | DTC activation | DMAC activation | Priority |
|---|---|---|---|---|
| USBFS_D0FIFO | DMA transfer request 0 | Possible | Possible | High |
| USBFS_D1FIFO | DMA transfer request 1 | Possible | Possible | ↑ |
| USBFS_USBI | VBUS interrupt, resume interrupt, frame number update interrupt, device state transition interrupt, control transfer stage transition interrupt, buffer empty interrupt, buffer not ready interrupt, buffer ready interrupt, overcurrent input change interrupt, bus change interrupt, disconnect detection interrupt during full-speed operation, device connect detection interrupt, EOF error detection interrupt, normal setup operation interrupt, and setup error interrupt | Not possible | Not possible | Low |
| USBFS_USBR | VBUS interrupt, resume interrupt, overcurrent input change interrupt and setup error interrupt | Not possible | Not possible | — |

## 25.3.3 Interrupt Descriptions

### 25.3.3.1 BRDY Interrupt

The BRDY interrupt is generated in both host and device controller modes. This section describes the conditions in which the USBFS sets the associated bit in BRDYSTS to 1. Under these conditions, the USBFS generates a BRDY interrupt if the software has set the bit in BRDYENB associated with the given pipe to 1 and the INTENB0.BRDYE bit to 1.

The conditions for generating and clearing the BRDY interrupt depend on the SOFCFG.BRDYM and PIPECFG.BFRE settings for each pipe as follows:

#### (1) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.

On any of the following conditions, the USBFS generates an internal BRDY interrupt request trigger and sets the BRDYSTS.PIPEnBRDY bit associated with the selected pipe to 1.

**For transmitting pipes**

- When the DIR bit is changed from 0 to 1 by software
- When packet transmission is complete for a pipe while write-access from the CPU to the FIFO buffer for the pipe is disabled (when the BSTS bit is read as 0)
- When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode
- No request trigger is generated until completion of writing data to the currently-written FIFO buffer even if transmission to the other FIFO buffer is complete
- When the hardware flushes the buffer of the pipe for isochronous transfers
- When 1 is written to the PIPEnCTR.ACLRM bit, which causes the FIFO buffer to transition from the write-disabled to write-enabled state

No request trigger is generated for the DCP, that is, during data transmission for control transfers.

**For receiving pipes**

- When packet reception is successfully complete, enabling the FIFO buffer to be read while read-access from the CPU to the FIFO buffer for the given pipe is disabled (when the BSTS bit is read as 0). No request trigger is generated for transactions in which a DATA-PID mismatch has occurred.
- When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode. No request trigger is generated until completion of reading data from the currently-read FIFO buffer, even if reception by the other FIFO buffer is complete.

In device controller mode, the BRDY interrupt is not generated in the status stage of control transfers. The PIPEBRDY interrupt status of the selected pipe can be set to 0 by writing 0 to the associated PIPEnBRDY bit through software. In this case, the other PIPEBRDY bit should be set to 1.

Clear the BRDY status before accessing the FIFO buffer.

### (2) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 1

With these settings, the USBFS generates a BRDY interrupt on completion of reading all data for a single transfer using the receiving pipe, and sets the bit in BRDYSTS associated with the pipe to 1.

On any of the following conditions, the USBFS determines that the last data for a single transfer was received.

- When a short packet including a zero-length packet is received
- When the PIPEn transaction counter register (PIPEnTRN) is used and the number of packets specified in the PIPEnTRN.TRNCNT[15:0] bits are completely received

When the data is completely read after any of these conditions is satisfied, the USBFS determines that all data for a single transfer is completely read.

When a zero-length packet is received while the FIFO buffer is empty, the USBFS determines that all data for a single transfer is completely read when the FRDY bit in the FIFO port control register is 1 and the DTLN[8:0] bits are 0. In this case, to start the next transfer, write 1 to the BCLR bit in the associated port control register through the software. With these settings, the USBFS does not detect a BRDY interrupt for the transmitting pipe.

The PIPEBRDY interrupt status of a pipe can be set to 0 by writing 0 to the associated BRDYSTS.PIPEnBRDY bit through the software. In this case, 1s must be written to the PIPEBRDY bits for the other pipes.

In this mode, do not change the PIPECFG.BFRE bit setting until all data for a single transfer is processed. When it is necessary to change the PIPECFG.BFRE bit before completion of processing, all FIFO buffers for the pipe must be cleared using the PIPEnCTR.ACLRM bit.

### (3) When SOFCFG.BRDYM = 1 and PIPECFG.BFRE = 0

With these settings, the BRDYSTS.PIPEnBRDY values are linked to the BSTS bit setting for each pipe. In other words, the BRDY interrupt status bits (PIPEBRDY) are set to 1 or 0 by the USB depending on the FIFO buffer status.

#### For transmitting pipes

The BRDY interrupt status bits are set to 1 when the FIFO buffer is ready for write access, and are set to 0 when it is not ready. The BRDY interrupt is not generated for the DCP in the transmitting direction even when it is ready for write access.

#### For receiving pipes

The BRDY interrupt status bits set to 1 when the FIFO buffer is ready for read access, and set to 0 when all data is read (not ready for read access).

When a zero-length packet is received while the FIFO buffer is empty, the associated bit is set to 1 and the BRDY interrupt is continuously generated until the software writes 1 to BCLR. With this setting, the PIPEnBRDY bit cannot be set to 0 by software.

When the SOFCFG.BRDYM bit is set to 1, set the PIPECFG.BFRE bit for all pipes to 0.

Figure 25.7 shows the timing of BRDY interrupt generation.

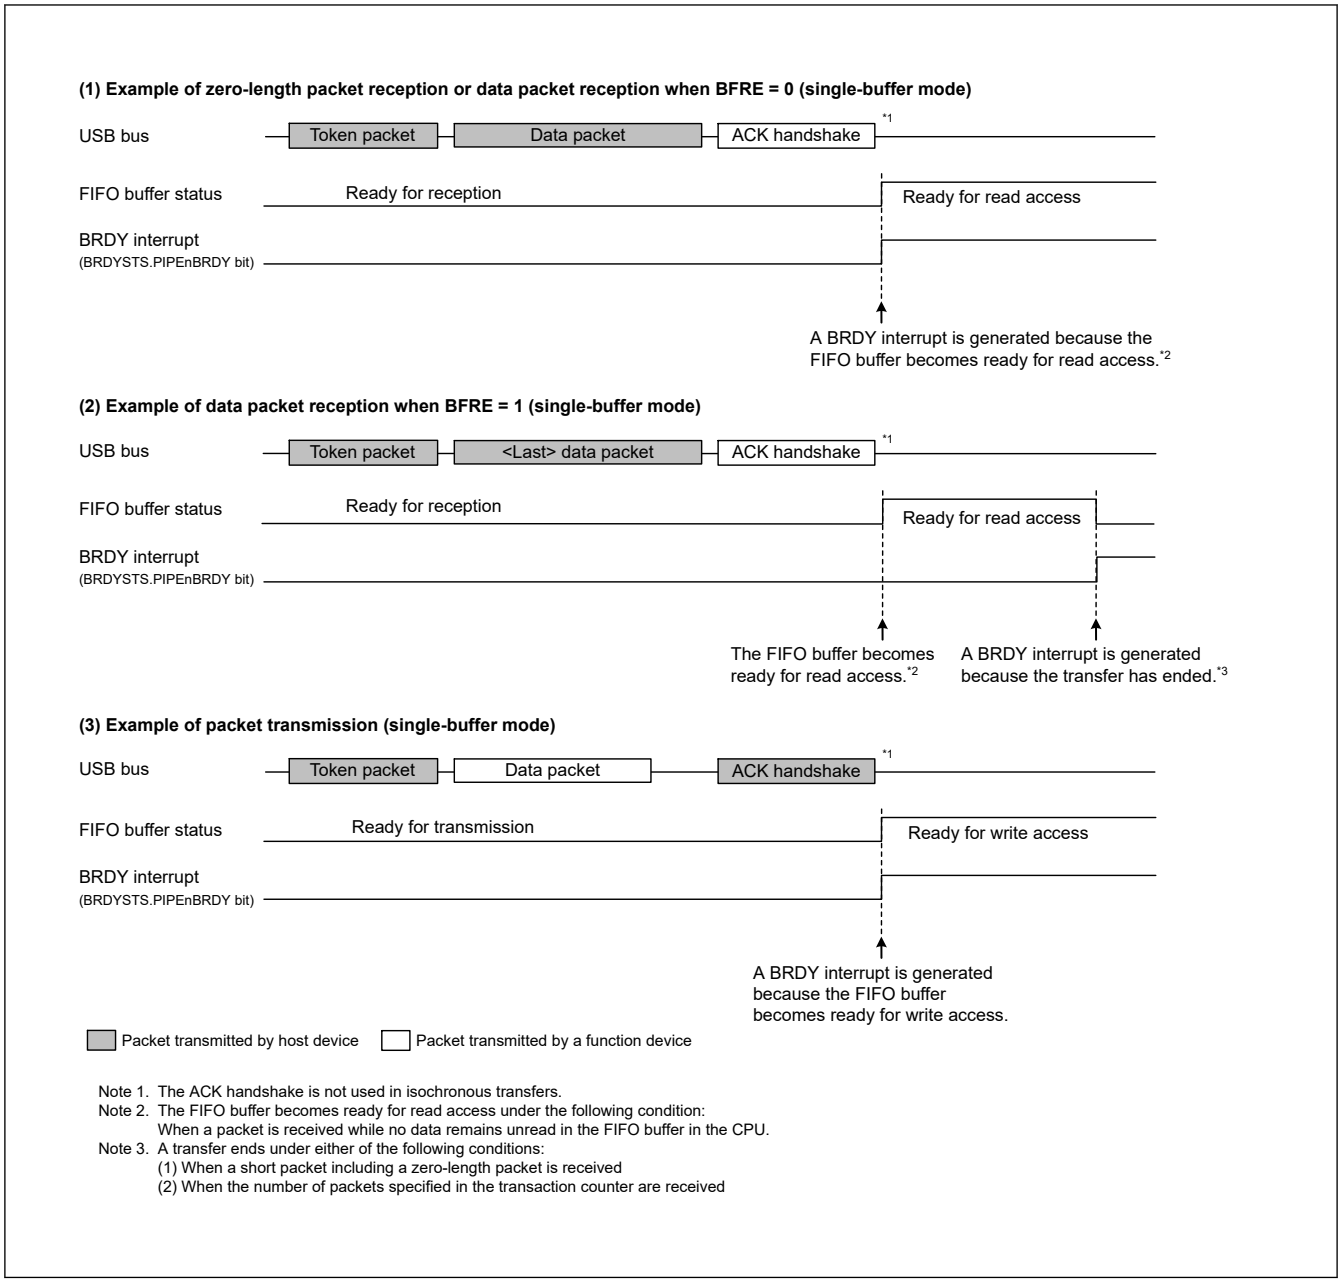

**Figure 25.7 Timing of BRDY interrupt generation**

The condition for clearing the INTSTS0.BRDY bit depends on the SOFCFG.BRDYM bit setting, as shown in Table 25.17.

**Table 25.17 Conditions for clearing the BRDY bit**

| BRDYM bit | Condition for clearing BRDY bit |
|---|---|
| 0 | The USBFS clears the BRDY bit to 0 when all bits in BRDYSTS are set to 0 by software. |
| 1 | The USBFS clears the BRDY bit to 0 when the BSTS bits for all pipes have cleared to 0. |

### 25.3.3.2 NRDY Interrupt

On generating an internal NRDY interrupt request for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated PIPEnNRDY bit in NRDYSTS to 1. If the associated bit in NRDYENB is set to 1 by software, the USBFS sets the INTSTS0.NRDY bit to 1 and generates a USBFS interrupt.

This section describes the conditions in which the USBFS generates the internal NRDY interrupt request for a given pipe.

The internal NRDY interrupt request is not generated during setup transaction execution in host controller mode. During setup transactions in host controller mode, the SACK or SIGN interrupt is detected.

The internal NRDY interrupt request is not generated during status stage execution of the control transfer in device controller mode.

### (1) In host controller mode

#### For transmitting pipes

On any of the following conditions, the USBFS detects an NRDY interrupt:

- For isochronous transfer pipes, when the time to issue an OUT token comes while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS transmits a zero-length packet following the OUT token and sets the associated NRDYSTS.PIPEnNRDY bit and the FRMNUM.OVRN bit to 1.
- During communications other than setup transactions on pipes not used for isochronous transfers, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK
- During communications other than setup transactions, when the STALL handshake is received from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the PID[1:0] setting for the associated pipe to STALL (11b).

#### For receiving pipes

- For isochronous transfer pipes, when the time to issue an IN token comes but there is no space available in the FIFO buffer. In this case, the USBFS discards the received data for the IN token and sets the PIPEnNRDY bit associated with the pipe and the OVRN bit to 1. When a packet error is detected in the received data for the IN token, the USBFS also sets the FRMNUM.CRCE bit to 1.
- For non-isochronous transfer pipes, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device for the IN token issued by the USBFS (when timeout is detected before detection of the DATA packet from the peripheral device)
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK
- For isochronous transfer pipes, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe to 1. The PID[1:0] setting for the pipe is not changed.
- For isochronous transfer pipes, when a CRC error or a bit stuffing error is detected in the received data packet. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe and the CRCE bit to 1.
- When the STALL handshake is received. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe to 1 and changes the PID[1:0] setting for the associated pipe to STALL.

### (2) In device controller mode

#### For transmitting pipes

- When an IN token is received while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS generates a NRDY interrupt request on reception of the IN token and sets the NRDYSTS.PIPEnNRDY bit to 1. For an isochronous transfer pipe in which an interrupt is generated, the USBFS transmits a zero-length packet and sets the FRMNUM.OVRN bit to 1.

#### For receiving pipes

- When an OUT token is received but there is no space available in the FIFO buffer. For an isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request on reception of the OUT token and sets the PIPEnNRDY bit to 1 and OVRN bit to 1. For a non-isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request when a NAK handshake is transferred after the data following the OUT token is received, and sets the PIPEnNRDY bit to 1. The NRDY interrupt request is not generated during retransmission

because of a DATA-PID mismatch. In addition, the NRDY interrupt request is not generated if an error occurs in the DATA packet.

- For isochronous transfer pipes, when a token is not received successfully within an interval frame. In this case, the USBFS generates an NRDY interrupt request when the SOF is received, and sets the PIPEnNRDY bit to 1.

Figure 25.8 shows the timing of NRDY interrupt generation in device controller mode.

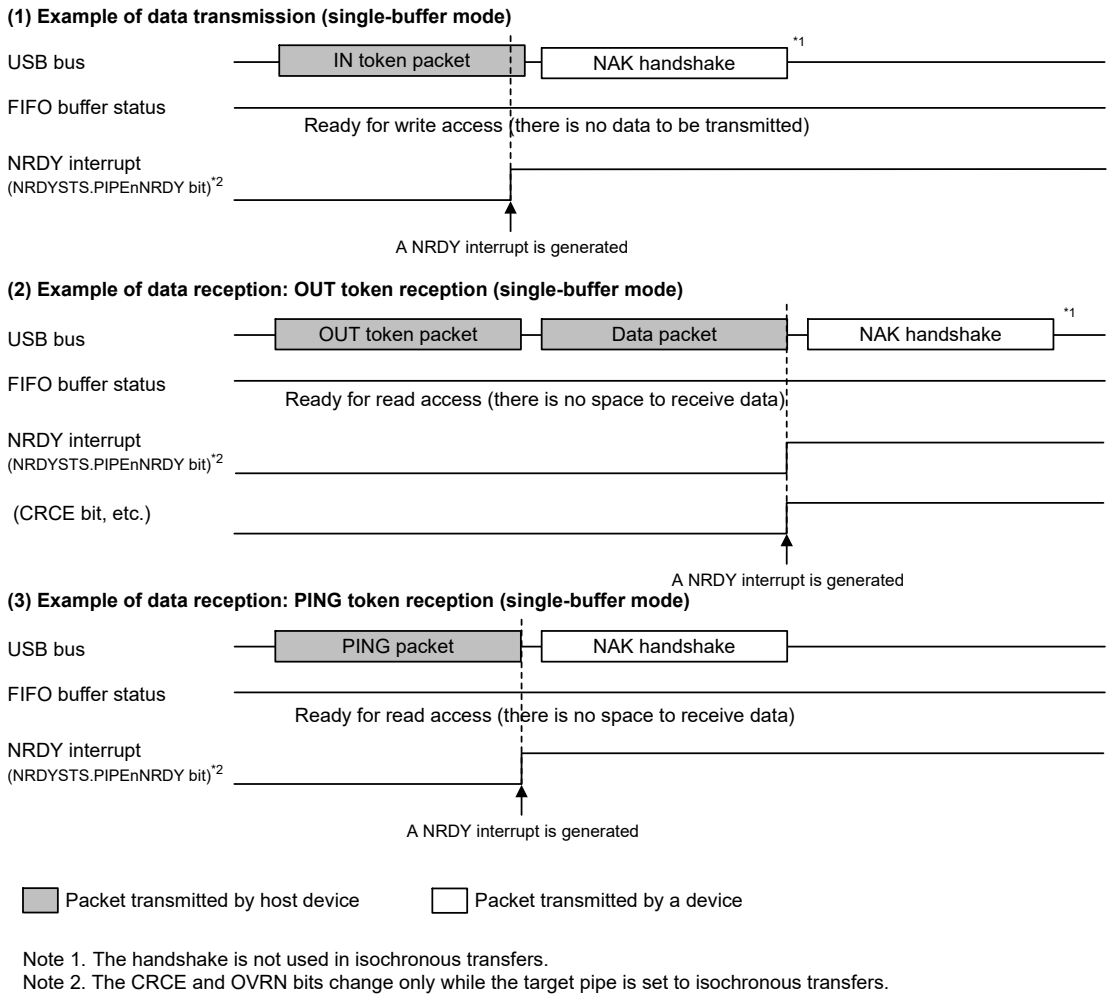

**Figure 25.8 Timing of NRDY interrupt generation in device controller mode**

### 25.3.3.3 BEMP Interrupt

On detecting a BEMP interrupt for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated BEMPSTS.PIPEnBEMP bit to 1. If the associated bit in BEMPENB is set to 1 by software, the USBFS sets the INTSTS0.BEMP bit to 1 and generates a USBFS interrupt. This section describes the conditions in which the USBFS generates an internal BEMP interrupt request.

#### (1) For transmitting pipes

When the FIFO buffer of the associated pipe is empty on completion of transmission, including zero-length packet transmission, and in single buffer mode, an internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for a non-DCP pipe. The internal BEMP interrupt request is not generated in any of the following conditions:

- When the CPU or DMA/DTC has already started writing data to the FIFO buffer of the CPU on completion of transmitting data from one FIFO buffer in double buffer mode
- When the buffer is cleared (emptied) by setting the PIPEnCTR.ACLRM or the BCLR bit to 1 in the port control register
- When an IN transfer (zero-length packet transmission) is performed during the control transfer status stage in device controller mode

### (2) For receiving pipes

When a successfully-received data packet size exceeds the specified maximum packet size. In this case, the USBFS generates a BEMP interrupt request, sets the associated BEMPSTS.PIPEnBEMP bit to 1, discards the received data, and changes the associated PID[1:0] setting for the pipe to STALL (11b). The USBFS returns no response in host controller mode, and returns STALL response in device controller mode.

The internal BEMP interrupt request is not generated in any of the following conditions:

- When a CRC error or a bit stuffing error is detected in the received data
- When a setup transaction is being performed:
  - Writing 0 to the BEMPSTS.PIPEnBEMP bit clears the status
  - Writing 1 to the BEMPSTS.PIPEnBEMP bit has no effect

Figure 25.9 shows the timing of BEMP interrupt generation in device controller mode.

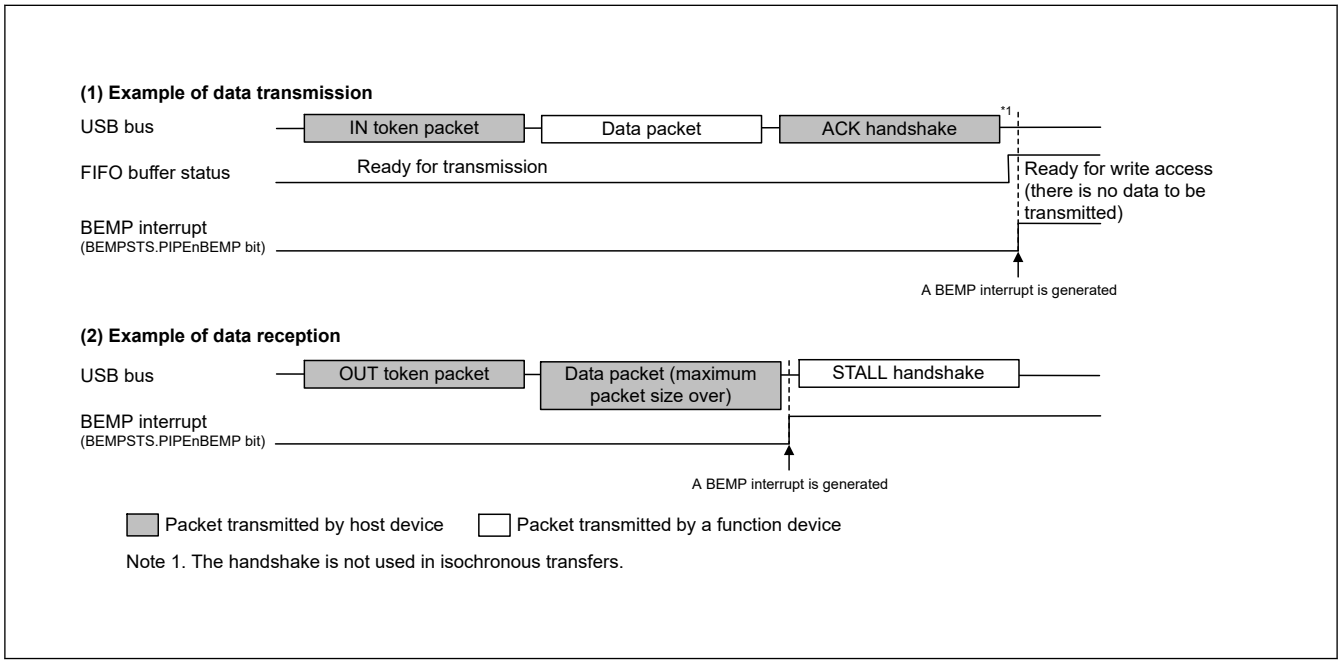

**Figure 25.9 Timing of BEMP interrupt generation in device controller mode**

## 25.3.3.4 Device State Transition Interrupt (Device Controller Mode)

Figure 25.10 shows a diagram of the USBFS device state transitions. The USBFS controls device states and generates device state transition interrupts. However, recovery from the Suspend state (resume signal detection) is detected by means of the resume interrupt. Device state transition interrupts can be enabled or disabled independently in INTENB0. Devices whose states have changed can be checked in the INTSTS0.DVSQ[2:0] bits.

When a transition is made to the default state, a device state transition interrupt is generated after a USB bus reset is detected.

The USBFS controls device states, and device state transition interrupts can be generated, only in device controller mode.

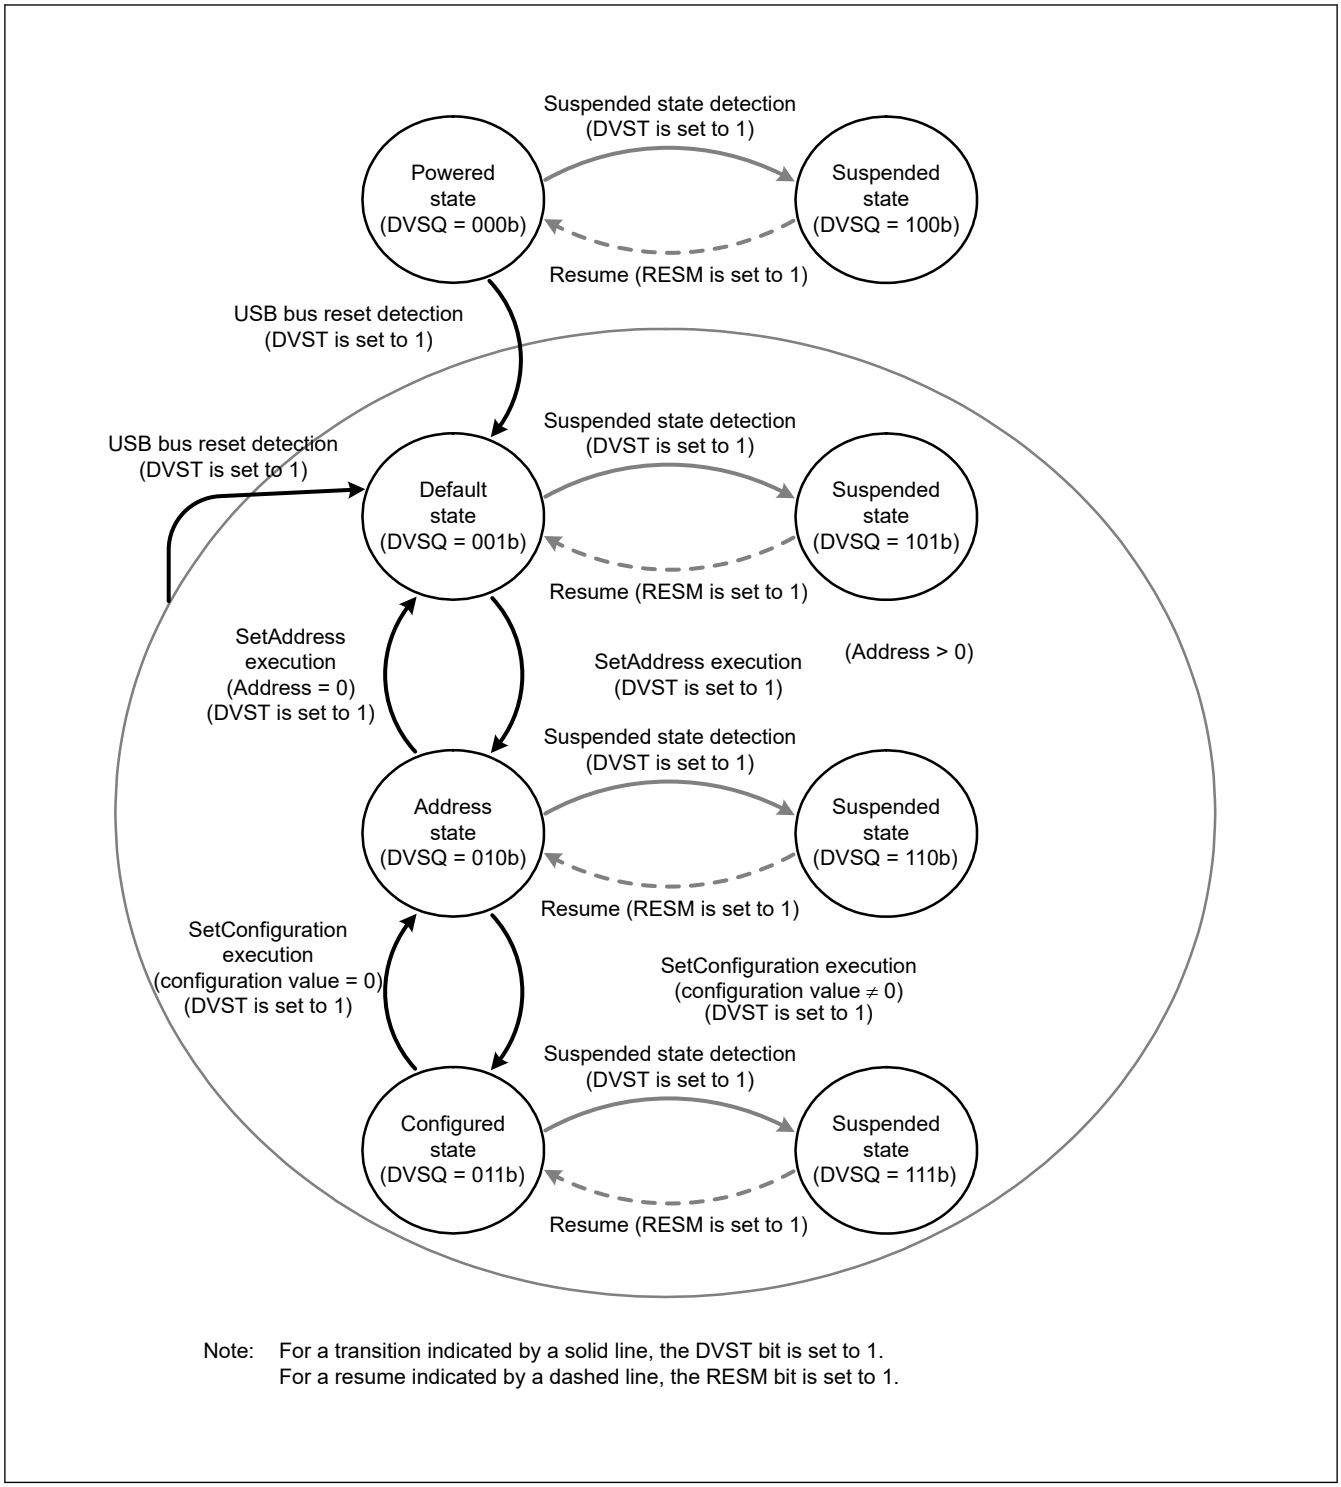

**Figure 25.10 Device state transitions**

### 25.3.3.5 Control Transfer Stage Transition Interrupt (Device Controller Mode)

Figure 25.11 shows a diagram of the control transfer stage transitions of the USBFS. The USBFS controls the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled independently in INTENB0. Transfer stages that have transitioned can be checked in the INTSTS0.CTSQ[2:0] bits.

Control transfer stage transition interrupts are generated only in device controller mode. This section describes control transfer sequence errors. If an error occurs, the DCPCTR.PID[1:0] bits are set to 1xb (STALL response).

### (1) Control read transfer errors

- An OUT token is received but no data is transferred in response to the IN token at the data stage
- An IN token is received at the status stage
- A data packet with DATAPID = DATA0 is received at the status stage

### (2) Control write transfer errors

- An IN token is received but no ACK is returned in response to the OUT token at the data stage
- A data packet with DATAPID = DATA0 is received as the first data packet at the data stage
- An OUT token is received at the status stage

### (3) Control write no data transfer errors

- An OUT token is received at the status stage

At the control write transfer data stage, if the receive data length exceeds the wLength value of the USB request, it is not recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (INTSTS0.CTRT = 1), the CTSQ[2:0] = 110b value is saved until the CTRT bit is set to 0, clearing the interrupt status. While CTSQ[2:0] = 110b is being saved, no CTRT interrupt for ending the setup stage is generated, even if a new USB request is received. The USBFS saves the setup stage completion status, and it generates a CTRT interrupt after the interrupt status is cleared by software.

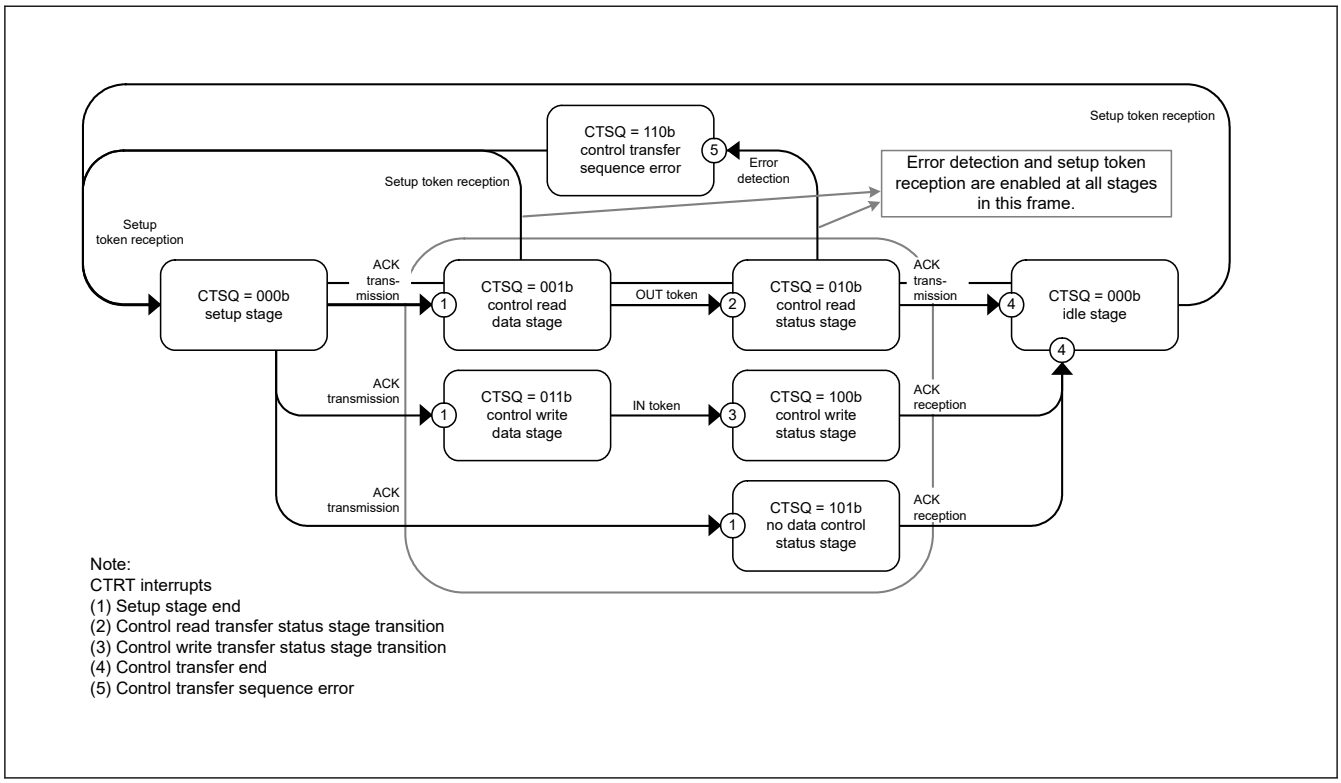

**Figure 25.11 Control transfer stage transitions**

## 25.3.3.6 Frame Update Interrupt

In host controller mode, an interrupt is generated when the frame number is updated.

In device controller mode, an SOFR interrupt is generated when the frame number is updated. The USBFS updates the frame number and generates an SOFR interrupt if it detects a new SOF packet during full-speed operation.

#### 25.3.3.7 VBUS Interrupt

When the USB_VBUS pin level changes, a VBUS interrupt is generated. The level of the USB_VBUS pin can be checked with the INTSTS0.VBSTS bit. Whether the host controller is connected or disconnected can be confirmed using the VBUS interrupt. If the system is activated with the host controller connected, the first VBUS interrupt is not generated, because there is no change in the USB_VBUS pin level.

#### 25.3.3.8 Resume Interrupt

In device controller mode, a resume interrupt is generated when the device state is the Suspend state and the USB bus state has changed (from J-state to K-state, or from J-state to SE0). Recovery from the Suspend state is detected by means of the resume interrupt.

In host controller mode, no resume interrupt is generated. Use the BCHG interrupt to detect a change in the USB bus state.

#### 25.3.3.9 OVRCR Interrupt

An OVRCR interrupt is generated when the USB_OVRCURA or USB_OVRCURB pin level has changed. The levels of the USB_OVRCURA and USB_OVRCURB pins can be checked in the SYSSTS0.OVCMON[1:0] flags. The external power supply IC can check whether overcurrent is detected using the OVRCR interrupt.

For OTG connections, the OVRCR interrupt allows you to check whether a change is detected in the VBUS comparator.

#### 25.3.3.10 BCHG Interrupt

A BCHG interrupt is generated when the USB bus state has changed. The BCHG interrupt can be used to detect whether a peripheral device is connected and can also be used to detect a remote wakeup in host controller mode. The BCHG interrupt is generated in both host and device controller modes.

#### 25.3.3.11 DTCH Interrupt

A DTCH interrupt occurs when a USB bus disconnect is detected in host controller mode. The USBFS detects bus disconnects in compliance with the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by software. The pipes enter the wait state for a bus connection to the port, waiting for an ATTCH interrupt to occur. Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt is detected to 0
- Puts the port in which the DTCH interrupt occurred into the idle state

#### 25.3.3.12 SACK Interrupt

A SACK interrupt is generated when an ACK response for the transmitted setup packet is received from the peripheral device in host controller mode. The SACK interrupt can be used to confirm that the setup transaction is successfully complete.

#### 25.3.3.13 SIGN Interrupt

A SIGN interrupt is generated when an ACK response for the transmitted setup packet is not correctly received from the peripheral device three consecutive times in host controller mode. The SIGN interrupt can be used to detect no ACK response transmitted from the peripheral device or corruption of an ACK packet.

#### 25.3.3.14 ATTCH Interrupt

An ATTCH interrupt is generated when J-state or K-state of the full-speed signal level is detected on the USB port for 2.5 µs in host controller mode. To be more specific, an ATTCH interrupt is detected on any of the following conditions:

- When K-state, SE0, or SE1 changes to J-state, and J-state continues 2.5 µs
- When J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 µs

#### 25.3.3.15 EOFERR Interrupt

An EOFERR interrupt occurs when the USBFS detects that communication is not complete at the EOF2 timing defined in the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by software, and the port must be re-enumerated. Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt is detected to 0
- Puts the port in which the EOFERR interrupt is generated into the idle state

### 25.3.4 Pipe Control

Table 25.18 lists the pipe settings for the USBFS. USB data transfer is performed through logical pipes that the software associates with endpoints. The USBFS provides 10 pipes that are used for data transfer. Set up the pipes based on your system specifications.

**Table 25.18 Pipe settings**

| Register name | Bit name | Setting | Notes |
|---|---|---|---|
| DCPCFG<br>PIPECFG | TYPE | Transfer type | Pipes 1 to 9: Settable |
| | BFRE | BRDY interrupt mode | Pipes 1 to 5: Settable |
| | DBLB | Double buffer select | Pipes 1 to 5: Settable |
| | DIR | Transfer direction select | IN or OUT settable |
| | EPNUM | Endpoint number | Pipes 1 to 9: Settable<br>A value other than 0000b must be set when the pipe is used. |
| | SHTNAK | Selects disabled state for pipe when transfer ends | Pipes 1 and 2: Settable only for bulk transfers<br>Pipes 3 to 5: Settable |
| DCPMAXP<br>PIPEMAXP | DEVSEL | Device select | Referenced only in host controller mode. |
| | MXPS | Maximum packet size | Compliant with the USB 2.0 specification. |
| PIPEPERI | IFIS | Buffer flush | Pipes 1 and 2: Settable only for isochronous transfers<br>Pipes 3 to 9: Setting disabled |
| | IITV | Interval counter | Pipes 1 and 2: Settable only for isochronous transfers<br>Pipes 3 to 5: Setting disabled<br>Pipes 6 to 9: Settable only in host controller mode |
| DCPCTR<br>PIPEnCTR | BSTS | Buffer status | For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit. |
| | INBUFM | IN buffer monitor | Available only for pipes 1 to 5. |
| | SUREQ | Setup request | Settable only for the DCP and controlled in host controller mode |
| | SUREQCLR | SUREQ clear | Settable only for the DCP and controlled in host controller mode |
| | ATREPM | Auto response mode | Pipes 1 to 5: Settable only in device controller mode |
| | ACLRM | Auto buffer clear | Pipes 1 to 9: Settable |
| | SQCLR | Sequence clear | Clears the data toggle bit |
| | SQSET | Sequence set | Sets the data toggle bit |
| | SQMON | Sequence monitor | Monitors the data toggle bit |
| | PBUSY | Pipe busy status | — |
| | PID | Response PID | See section 25.3.4.6. Response PID. |
| PIPEnTRE | TRENB | Transaction counter enable | Pipes 1 to 5: Settable |
| | TRCLR | Current transaction counter clear | Pipes 1 to 5: Settable |
| PIPEnTRN | TRNCNT | Transaction counter | Pipes 1 to 5: Settable |

#### 25.3.4.1 Pipe Control Register Switching Procedures

The following bits in the pipe control registers can be changed only when USB communication is prohibited (PID = NAK).

Do not change the following registers and bits when USB communication is enabled (PID = BUF):

- Bits in DCPCFG and DCPMAXP
- SQCLR and SQSET bits in DCPCTR
- Bits in PIPECFG, PIPEMAXP, and PIPEPERI
- ATREPM, ACLRM, SQCLR, and SQSET bits in PIPEnCTR
- Bits in PIPEnTRE and PIPEnTRN

To set these bits when USB communication is enabled (PID = BUF):

1. A request to change the bits in the pipe control register occurs.
2. Set the PID[1:0] bits associated with the pipe to NAK.
3. Wait until the associated PBUSY bit clears to 0.
4. Set the bits in the pipe control register.

The following bits in the pipe control registers can be changed only when the selected pipe information is not set in the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

Do not set the following registers when the CURPIPE[3:0] bits are set:

- Bits in DCPCFG and DCPMAXP
- Bits in PIPECFG, PIPEMAXP and PIPEPERI

To change pipe information, you must set the CURPIPE[3:0] bits in the port select registers to a pipe other than the one to be changed. For the DCP, the buffer must be cleared using the BCLR bit in the Port Control Register after the pipe information is changed.

#### 25.3.4.2 Transfer Types

The PIPECFG.TYPE[1:0] bits specify the following transfer types for each pipe:

- DCP: No setting is necessary (fixed at control transfer)
- Pipes 1 and 2: Set to bulk or isochronous transfer
- Pipes 3 to 5: Set to bulk transfer
- Pipes 6 to 9: Set to interrupt transfer

#### 25.3.4.3 Endpoint Number

The PIPECFG.EPNUM[3:0] bits are used to set the endpoint number for each pipe. The DCP is fixed at endpoint 0. The other pipes can be set from endpoint 1 to 15.

- DCP: No setting is necessary (fixed at endpoint 0)
- Pipes 1 to 9: Select and set the endpoint numbers from 1 to 15 so that the combination of the PIPECFG.DIR and EPNUM[3:0] bits is unique

#### 25.3.4.4 Maximum Packet Size Setting

Specify the maximum packet size for each pipe in the DCPMAXP.MXPS[6:0] and PIPEMAXP.MXPS[9:0] bits. The DCP and pipes 1 to 5 can be set to any of the maximum pipe sizes defined in the USB 2.0 specification. For pipes 6 to 9, the maximum packet size is 64 bytes. Set the maximum packet size as follows before starting a transfer (PID = BUF):

- DCP: Set to 8, 16, 32, or 64
- Pipes 1 to 5: Set to 8, 16, 32, or 64 for bulk transfers
- Pipes 1 and 2: Set between 1 and 256 for isochronous transfers
- Pipes 6 to 9: Set between 1 and 64

### 25.3.4.5 Transaction Counter for Pipes 1 to 5 in the Receiving Direction

When the specified number of transactions is complete in the data packet receiving direction, the USBFS recognizes that the transfer ended. Two transaction counters are provided: one is the PIPEnTRN register, which specifies the number of transactions to be executed, and the other is the current counter, which internally counts the number of executed transactions. If the PIPECFG.SHTNAK bit is set to 1, when the current counter value matches the specified number of transactions, the associated PIPEnCTR.PID[1:0] bits are set to NAK and the subsequent transfer is disabled. The transactions can be counted again from the beginning by initializing the current counter of the transaction counter function through the PIPEnTRE.TRCLR bit. The data read from PIPEnTRN differs depending on the PIPEnTRE.TRENB setting as follows:

- The TRENB bit = 0: Specified transaction counter value can be read
- The TRENB bit = 1: Current counter value indicating the internally counted number of executed transactions can be read

The following constraints apply when working with the TRCLR bit:

- If the transactions are being counted and PID = BUF, the current counter cannot be cleared
- If there is any data left in the buffer, the current counter cannot be cleared

### 25.3.4.6 Response PID

Specify the response PID for each pipe in the PID[1:0] bits in DCPCTR and PIPEnCTR. This section describes the USBFS operation with different response PID settings.

#### (1) Software response PID settings in host controller mode

Select the response PID to specify the execution of transactions as follows:

- NAK setting: Using pipes is disabled and no transactions are executed
- BUF setting: Transactions are executed based on the FIFO buffer state:
  - OUT direction: An OUT token is issued if the FIFO buffer contains transmit data.
  - IN direction: An IN token is issued if the FIFO buffer is not full and can receive data.
- STALL setting: Using pipes is disabled and no transactions are executed

Note: Use the DCPCTR.SUREQ bit to execute setup transactions for the DCP.

#### (2) Software response PID settings in device controller mode

Select the response PID to respond as follows to transactions from the host:

- NAK setting: A NAK response is returned to all generated transactions
- BUF setting: A response is returned to transactions based on the FIFO buffer
- STALL setting: A STALL response is returned to all generated transactions

Note: For setup transactions, an ACK response is always returned, regardless of the PID[1:0] bits setting, and the USB request is stored in the register.

(3) Hardware response PID settings in host controller mode and (4) Hardware response PID settings in device controller mode describe situations in which the USBFS writes to the PID[1:0] bits because of specific transaction results.

#### (3) Hardware response PID settings in host controller mode

- NAK setting: PID = NAK is set in the following cases, and issuing of tokens is automatically stopped:
  - When a non-isochronous transfer is performed and an NRDY interrupt is generated

    (For details, see section 25.3.3.2. NRDY Interrupt.)
  - If a short packet is received when the PIPECFG.SHTNAK bit is set to 1 for bulk transfers
  - If transaction counting ends when the SHTNAK bit is set to 1 for bulk transfers
- BUF setting: The USBFS does not write this setting.

- STALL setting: PID = STALL is set in the following cases, and issuing of tokens is automatically stopped:
  - When STALL is received in response to a transmitted token
  - When a received data packet exceeds the maximum packet size

#### (4) Hardware response PID settings in device controller mode

- NAK setting: PID = NAK is set in the following cases, and a NAK response is returned to transactions:
  - When the setup token is received normally (DCP only)
  - If transaction counting ends or a short packet is received when the PIPECFG.SHTNAK bit is set to 1 for bulk transfers
- BUF setting: There is no BUF writing by the USBFS.
- STALL setting: PID = STALL is set in the following cases, and a STALL response is returned to transactions:
  - When a received data packet exceeds the maximum packet size
  - When a control transfer sequence error is detected (DCP only)

### 25.3.4.7 Data PID Sequence Bit

The USBFS automatically toggles the sequence bit in the data PID when data is transferred successfully in the control transfer data stage, bulk transfer, and interrupt transfer. The sequence bit of the next data PID to be transmitted can be confirmed with the SQMON bit in DCPCTR and PIPEnCTR. When data is transmitted, the sequence bit toggles on ACK handshake reception. When data is received, the sequence bit toggles on ACK handshake transmission. The SQCLR bit in DCPCTR and the SQSET bit in PIPEnCTR can be used to change the data PID sequence bit.

In device controller mode when control transfers are used, the USBFS automatically sets the sequence bit for stage transitions. DATA1 is returned when the setup stage ends. The sequence bit is not referenced and PID = DATA1 is returned in the status stage. Therefore, no software settings are required. However, in host controller mode when control transfers are used, the sequence bit must be set by software for the stage transitions.

For ClearFeature requests for transmission or reception, the data PID sequence bit must be set by software in both host and device controller modes.

### 25.3.4.8 Response PID = NAK Function

The USBFS provides a function for disabling pipe operation (PID response = NAK) when the final data packet of a transaction is received. The USBFS automatically distinguishes this based on reception of a short packet or the transaction counter. Enable this function by setting the PIPECFG.SHTNAK bit to 1.

When the double buffer mode is being used for the FIFO buffer, using this function enables reception of data packets in transfer units. If pipe operation is disabled, the software must enable the pipe again (PID response = BUF).

The response PID = NAK function can be used only for bulk transfers.

### 25.3.4.9 Auto Response Mode

For bulk transfer pipes (1 to 5), when the PIPEnCTR.ATREPM bit is set to 1, a transition is made to auto response mode. During an OUT transfer (PIPECFG.DIR = 0), OUT-NAK mode is invoked, and during an IN transfer (DIR = 1), null auto response mode is invoked.

### 25.3.4.10 OUT-NAK Mode

For bulk OUT transfer pipes, NAK is returned in response to an OUT token, and an NRDY interrupt is output when the PIPEnCTR.ATREPM bit is set to 1. To transition from normal mode to OUT-NAK mode, specify OUT-NAK mode while pipe operation is disabled (PID[1:0] = 00b for NAK response). Next enable pipe operation (PID[1:0] = 01b for BUF response), on which OUT-NAK mode becomes valid. If an OUT token is received immediately before pipe operation is disabled, the token data is normally received, and an ACK is returned to the host.

To transition from OUT-NAK mode to normal mode, cancel OUT-NAK mode while pipe operation is disabled (NAK). Next enable pipe operation (BUF). In normal mode, reception of OUT data is enabled.

#### 25.3.4.11 Null Auto Response Mode

For bulk IN transfer pipes, zero-length packets are continuously transmitted when the PIPEnCTR.ATREPM bit is set to 1.

To transition from normal mode to null auto response mode, specify null auto response mode while pipe operation is disabled (response PID = NAK). Next enable pipe operation (response PID = BUF) on which null auto response mode becomes valid. Before setting null auto response mode, check that PIPEnCTR.INBUFM = 0, because the mode can be set only when the buffer is empty. If the INBUFM bit is 1, empty the buffer using the PIPEnCTR.ACLRM bit. Do not write data from the FIFO port while a transition to null auto response mode is being made.

To transition from null auto response mode to normal mode, keep pipe operation disabled (response PID = NAK) for the period of the zero-length packet transmission (about 10 µs) before canceling the null auto response mode. In normal mode, data can be written from the FIFO port, so packet transmission to the host is enabled by enabling pipe operation (response PID = BUF).

### 25.3.5 FIFO Buffer

The USBFS provides a FIFO buffer for data transfers, and it manages the memory area used for each pipe. The FIFO buffer has two states depending on whether the access right is assigned to the system (CPU side) or the USBFS (SIE side).

#### (1) Buffer status

Table 25.19 and Table 25.20 show the buffer status in the USBFS. The FIFO buffer status can be confirmed using the DCPCTR.BSTS and PIPEnCTR.INBUFM bits. The transfer direction for the FIFO buffer can be specified in either the PIPECFG.DIR or CFIFOSEL.ISEL bit (when DCP is selected).

The INBUFM bit is valid for pipes 0 to 5 in the transmitting direction.

When a transmitting pipe uses double buffering, the software can read the BSTS bit to monitor the FIFO buffer status on the CPU side and the INBUFM bit to monitor the FIFO buffer status on the SIE side. When write access to the FIFO port by the CPU or DMA/DTC is slow and the buffer empty status cannot be determined using the BEMP interrupt, the software can use the INBUFM bit to confirm the end of transmission.

**Table 25.19 Buffer status indicated in the BSTS bit**

| ISEL or DIR | BSTS | FIFO buffer status |
|---|---|---|
| 0 (receiving direction) | 0 | There is no received data, or data is being received.<br>Reading from the FIFO port is disabled. |
| 0 (receiving direction) | 1 | There is received data, or a zero-length packet is received.<br>Reading from the FIFO port is allowed.<br>When a zero-length packet is received, reading is not possible and the buffer must be cleared. |
| 1 (transmitting direction) | 0 | Transmission has not completed.<br>Writing to the FIFO port is disabled. |
| 1 (transmitting direction) | 1 | Transmission is complete.<br>CPU write is allowed. |

**Table 25.20 Buffer status indicated in the INBUFM bit**

| DIR | INBUFM | FIFO buffer status |
|---|---|---|
| 0 (receiving direction) | Invalid | Invalid |
| 1 (transmitting direction) | 0 | Transmission is complete.<br>There is no data waiting to be transmitted. |
| 1 (transmitting direction) | 1 | The FIFO port has written data to the buffer.<br>There is data to be transmitted. |

### 25.3.6 FIFO Buffer Clearing

Table 25.21 shows the methods for clearing the FIFO buffer. The FIFO buffer can be cleared using BCLR bit in the port control register, DnFIFOSEL.DCLRM, or the PIPEnCTR.ACLRM bit.

Single or double buffering can be selected for pipes 1 to 5 in the PIPECFG.DBLB bit.

**Table 25.21 Buffer clearing methods**

| FIFO buffer clearing mode | Clearing FIFO buffer on the CPU side | Mode for automatically clearing the FIFO buffer after reading the specified pipe data | Auto buffer clear mode for discarding all received packets |
|---|---|---|---|
| Register used | CFIFOCTR<br>DnFIFOCTR | DnFIFOSEL | PIPEnCTR |
| Bit used | BCLR | DCLRM | ACLRM |
| Clearing condition | Cleared by writing 1 | 1: Mode valid<br>0: Mode invalid | 1: Mode valid<br>0: Mode invalid |

### (1) Auto buffer clear mode function

The USBFS discards all received data packets if the PIPEnCTR.ACLRM bit is set to 1. If a correct data packet is received, the ACK response is returned to the host controller. The auto buffer clear mode function can only be set in the FIFO buffer reading direction.

Setting the ACLRM bit to 1 and then to 0 clears the FIFO buffer of the selected pipe regardless of the access direction. An access cycle of at least 100 ns is required for the internal hardware sequence processing between ACLRM = 1 and ACLRM = 0.

## 25.3.7 FIFO Port Functions

Table 25.22 shows the settings for the FIFO port functions. In write access, writing data until the maximum packet size is reached automatically enables transmission of the data. To enable transmission before the maximum packet size is reached, set the BVAL flag in the port control register to end writing. To send a zero-length packet, use the BCLR bit to clear the buffer, and then set the BVAL flag to end writing.

In reading, reception of new packets is automatically enabled when all data is read. Data cannot be read when a zero-length packet is received (DTLN[8:0] = 0), so the buffer must be cleared with the BCLR bit. The length of the receive data can be confirmed in the DTLN[8:0] bits in the port control register.

**Table 25.22 FIFO port function settings**

| Register name | Bit name | Description |
|---|---|---|
| CFIFOSEL,<br>DnFIFOSEL<br>(n = 0, 1) | RCNT | Selects DTLN[11:0] read mode |
| | REW | FIFO buffer rewind (re-read, rewrite) |
| | DCLRM | Automatically clears receive data for a specified pipe after the data is read (only for DnFIFO) |
| | DREQE | Enables DMA/DTC transfers (only for DnFIFO) |
| | MBW | FIFO port access bit width |
| | BIGEND | Selects FIFO port endian |
| | ISEL | FIFO port access direction (only for DCP) |
| | CURPIPE | Selects the current pipe |
| CFIFOCTR,<br>DnFIFOCTR<br>(n = 0, 1) | BVAL | Ends writing to the FIFO buffer |
| | BCLR | Clears the FIFO buffer on the CPU side |
| | DTLN | Checks the length of receive data |

### (1) FIFO port selection

Table 25.23 shows the pipes that can be selected with the different FIFO ports. The pipe to be accessed must be selected in the CURPIPE[3:0] bits in the port select register. After the pipe is selected, the software must check whether the written value can be read correctly from the CURPIPE[3:0] bits. (If the previous pipe number is read, it indicates that the USBFS is modifying the pipe.) Next, the software checks that the FRDY bit in the port control register is 1.

In addition, the software must specify the bus width to be accessed in the MBW bit in the port select register. The FIFO buffer access direction conforms to the PIPECFG.DIR setting. For the DCP only, the ISEL bit in the port select register determines the direction.

**Table 25.23 FIFO port access by pipe**

| Pipe | Access method | Ports that can be used |
|---|---|---|
| DCP | CPU access | CFIFO port register |
| Pipes 1 to 9 | CPU access | • CFIFO port register<br>• D0FIFO/D1FIFO port register |
| | DMA/DTC access | D0FIFO/D1FIFO port register |

### (2) REW bit

It is possible to temporarily stop access to a pipe currently being accessed, access a different pipe, and then continue processing for the first pipe again. The REW bit in the port select register is used for this processing.

If a pipe is selected in the CURPIPE[3:0] bits in the port select register with the REW bit set to 1, the pointer used for reading from and writing to the FIFO buffer is reset, and reading or writing can be carried out from the first byte. If a pipe is selected with 0 set for the REW bit, data can be read and written in continuation from the previous selection, without the pointer being reset.

To access the FIFO port, the software must check that the FRDY bit in the port control register is 1 after selecting a pipe.

## 25.3.8 DMA Transfers (D0FIFO and D1FIFO Ports)

### (1) Overview of DMA transfers

For pipes 1 to 9, the FIFO port can be accessed using the DMAC. When buffer access for a pipe targeted for DMA transfer is enabled, a DMA transfer request is issued.

Select the unit of transfer to the FIFO port in the DnFIFOSEL.MBW bit, and select the pipe targeted for the DMA transfer in the DnFIFOSEL.CURPIPE[3:0] bits. Do not change the selected pipe during the DMA transfer.

### (2) DnFIFO auto clear mode (D0FIFO and D1FIFO port reading direction)

If 1 is set in the DnFIFOSEL.DCLRM bit, the USBFS automatically clears the FIFO buffer of the selected pipe when reading of data from the FIFO buffer is complete.

Table 25.24 shows the packet reception and FIFO buffer clearing processing by software for each of the settings.
As shown in the table, the buffer clearing conditions depend on the value set in the PIPECFG.BFRE bit. Using the DnFIFOSEL.DCLRM bit eliminates the need for the buffer to be cleared by software in any situation that requires buffer clearing. This enables DMA transfers without involving software.

The DnFIFO auto clear mode can only be set in the FIFO buffer reading direction.

**Table 25.24 Packet reception and FIFO buffer clearing processing by software**

| Buffer status when packet is received | Register setting | | | |
|---|---|---|---|---|
| | DCLRM = 0 | | DCLRM = 1 | |
| | BFRE = 0 | BFRE = 1 | BFRE = 0 | BFRE = 1 |
| Buffer full | No clearing required | No clearing required | No clearing required | No clearing required |
| Zero-length packet reception | Clearing required | Clearing required | No clearing required | No clearing required |
| Normal short packet reception | No clearing required | Clearing required | No clearing required | No clearing required |
| Transaction count end | No clearing required | Clearing required | No clearing required | No clearing required |

## 25.3.9 Control Transfers Using the DCP

The DCP is used for data transfers in the control transfer data stage. The FIFO buffer of the DCP is a 64-byte single buffer with a fixed area for both control reads and control writes. The FIFO buffer can be accessed only through the CFIFO port.

#### 25.3.9.1 Control Transfers in Host Controller Mode

##### (1) Setup stage

The USQREQ, USBVAL, USBINDX, and USBLENG registers are used to transmit USB requests for setup transactions. Writing the setup packet data to the registers and then writing 1 to the DCPCTR.SUREQ bit transmits the specified data for the setup transaction. On completion of the transaction, the SUREQ bit clears to 0. Do not change these USB request registers while SUREQ = 1.

When an attached function device is detected, the software must issue the first setup transaction for the device using this sequence with the DCPMAXP.DEVSEL[3:0] bits cleared to 0 and the DEVADD0.USBSPD[1:0] bits set appropriately.

When an attached function device is shifted to the Address state, the software must issue setup transactions using this sequence with the assigned USB address set in the DEVSEL[3:0] bits and the bits in DEVADDn corresponding to the specified USB address set appropriately. For example, when PIPEMAXP.DEVSEL[3:0] = 0010b, make appropriate settings in DEVADD2. When PIPEMAXP.DEVSEL[3:0] = 0101b, make appropriate settings in DEVADD5.

When the setup transaction data is sent, an interrupt request is generated based on the response from the peripheral device (SIGN or SACK bit in INTSTS1). This interrupt request allows the software to check the setup transaction result.

A DATA0 data packet (USB request) for the setup transaction is always transmitted regardless of the status of the DCPCTR.SQMON bit.

##### (2) Data stage

The data stage is used to transfer data using the DCP FIFO buffer.

Before accessing the DCP FIFO buffer, specify the access direction in the CFIFOSEL.ISEL bit. Specify the transfer direction in the DCPCFG.DIR bit.

For the first data packet of the data stage, the data PID must be transferred as DATA1. Set data PID = DATA1 in the DCPCTR.SQSET bit and set the PID bits = BUF. Completion of data transfer is detected using the BRDY or BEMP interrupt.

For control write transfers, when the number of data bytes to be sent is an integer multiple of the maximum packet size, the software must send a zero-length packet at the end.

##### (3) Status stage

The status stage is used for zero-length packet data transfers in the reverse direction of the data stage. As in the data stage, data is transferred using the DCP FIFO buffer. Transactions are executed using the same procedure as the data stage.

Data packets in the status stage must be transmitted and received with the data PID set to DATA1 using the DCPCTR.SQSET bit.

When a zero-length packet is received, check the receive-data length in the CFIFOCTR.DTLN[8:0] bits after a BRDY interrupt is generated, and then clear the FIFO buffer using the BCLR bit.

#### 25.3.9.2 Control Transfers in Device Controller Mode

##### (1) Setup stage

The USBFS sends an ACK response to a normal setup packet for the USBFS. The USBFS operates in the setup stage as follows:

On receiving a new setup packet, the USBFS sets the following bits:

- Sets the INTSTS0.VALID bit to 1
- Sets the DCPCTR.PID[1:0] bits to NAK
- Sets the DCPCTR.CCPL bit to 0

When the USBFS receives a data packet following a setup packet, it stores the USB request parameters in USBREQ, USBVAL, USBINDX, and USBLENG.

Before performing the response processing for a control transfer, set the VALID flag to 0. When the VALID bit = 1, PID = BUF cannot be set, and the data stage cannot be terminated.

Using the VALID bit function, the USBFS can suspend a request being processed when it receives a new USB request during a control transfer and return a response to the latest request.

In addition, the USBFS automatically detects the direction bit (bmRequestType bit [8]) and the request data length (wLength) in the received USB request. It distinguishes between control read transfers, control write transfers, and no-data control transfers, and it controls stage transitions. For an incorrect sequence, a sequence error occurs in the control transfer stage transition interrupt, and the interrupt is reported to the software. For a diagram of the stage control by the USBFS, see Figure 25.11.

#### (2) Data stage

The DCP must be used to execute data transfers for received USB requests. Before accessing the DCP FIFO buffer, specify the access direction in the CFIFOSEL.ISEL bit.

If the transfer data is larger than the size of the DCP FIFO buffer, execute the data transfer using the BRDY interrupt for control write transfers and the BEMP interrupt for control read transfers.

#### (3) Status stage

Control transfers are terminated by setting the DCPCTR.CCPL bit to 1 while the DCPCTR.PID[1:0] bits are set to BUF.

After this setting is made, the USBFS automatically executes the status stage based on the data transfer direction determined at the setup stage. The procedure is as follows:

- For control read transfers

  The USBFS receives a zero-length packet from the USB host and transmits an ACK response.
- For control write transfers and no-data control transfers

  The USBFS transmits a zero-length packet and receives an ACK response from the USB host.

#### (4) Control transfer auto response function

The USBFS automatically responds to a correct SET_ADDRESS request. If any of the following errors occurs in the SET_ADDRESS request, a response from the software is necessary.

- bmRequestType is not 0x00: Any transfer other than a control write transfer
- wIndex is not 0x00: Request error
- wLength is not 0x00: Any transfer other than a no-data control transfer
- wValue is larger than 0x7F: Request error
- INTSTS0.DVSQ[2:0] are 011b (configured state): Control transfer of a device state error

For all requests other than the SET_ADDRESS request, a response is required from the corresponding software.

### 25.3.10 Bulk Transfers (Pipes 1 to 5)

The FIFO buffer usage (single/double buffer setting) is configurable for bulk transfers. The USBFS provides the following functions for bulk transfers:

- BRDY interrupt function (PIPECFG.BFRE bit), see section 25.3.3.1. BRDY Interrupt
- Transaction count function (PIPEnTRE.TRENB, TRCLR, and PIPEnTRN.TRNCNT[15:0] bits), see section 25.3.4.5. Transaction Counter for Pipes 1 to 5 in the Receiving Direction
- Response PID = NAK function (PIPECFG.SHTNAK bit), see section 25.3.4.8. Response PID = NAK Function
- Auto response mode (PIPEnCTR.ATREPM bit), see section 25.3.4.9. Auto Response Mode

### 25.3.11 Interrupt Transfers (Pipes 6 to 9)

In device controller mode, the USBFS performs interrupt transfers based on the timing dictated by the host controller.

In host controller mode, the software can set the timing for issuing tokens using the interval counter.

#### 25.3.11.1 Interval Counter for Interrupt Transfers in Host Controller Mode

Specify the transaction interval for interrupt transfers in the PIPEPERI.IITV[2:0] bits. The USBFS issues interrupt transfer tokens based on this interval.

##### (1) Counter initialization

The USBFS initializes the interval counter under the following conditions:

- Power-on reset

  This initializes the IITV[2:0] bits.
- FIFO buffer initialization using the PIPEnCTR.ACLRM bit:

  This does not initialize the IITV[2:0] bits, but does initialize the count value. Setting the PIPEnCTR.ACLRM bit to 0 starts counting from the value set in IITV[2:0].

The interval counter is not initialized in the following case:

- USB bus reset or USB suspended

  The IITV[2:0] bits are not initialized. Setting 1 to the DVSTCTR0.UACT bit starts counting from the value saved before entering the USB bus reset state or USB suspend state.

##### (2) Operation when tokens cannot be transmitted or received even on token generation

No token is generated in the following cases even at token generation time. In these cases, the USBFS tries to execute the transaction in the next interval.

- When the PID is set to NAK or STALL
- When the FIFO buffer is full at token transmit time in the receiving (IN) direction
- When there is no data to be transmitted in the FIFO buffer at token transmit time in the transmitting (OUT) direction

### 25.3.12 Isochronous Transfers (Pipes 1 and 2)

The USBFS provides the following functions for isochronous transfers:

- Notification of isochronous transfer error
- Interval counter specified in the PIPEPERI.IITV[2:0] bits
- Isochronous IN transfer data setup control (IDLY function)
- Isochronous IN transfer buffer flush function specified in the PIPEPERI.IFIS bit

#### 25.3.12.1 Error Detection in Isochronous Transfers

The USBFS provides a function for detecting the errors described in this section, so that when errors occur in isochronous transfers, they can be controlled by software. Table 25.25 and Table 25.26 show the priority order for errors detected by the USBFS and the associated interrupts.

**PID errors**

- The PID value of the received packet is invalid.

**CRC errors and bit stuffing errors**

- A CRC error is found in a received packet or the bit stuffing is illegal.

**Maximum packet size exceeded**

- The data size of the received packet exceeds the specified maximum packet size.

**Overrun and underrun errors**

In host controller mode:

- The FIFO buffer is full at token transmit time in the IN (receiving) direction
- There is no data to be sent in the FIFO buffer at token transmit time in the OUT (transmitting) direction

In device controller mode:

- There is no data to be sent in the FIFO buffer at token receive time in the IN (transmitting) direction
- The FIFO buffer is full at token receive time in the OUT (receiving) direction

#### Interval errors

In device controller mode, the following cases are treated as an interval error:

- Failure to receive an IN token in the interval frame during an isochronous IN transfer
- Failure to receive an OUT token in the interval frame during an isochronous OUT transfer

**Table 25.25 Error detection for token transmission and reception**

| Detection priority | Error | Generated interrupt and status |
|---|---|---|
| 1 | PID error | No interrupts are generated in either host or device controller mode (ignored as a corrupted packet) |
| 2 | CRC or bit stuffing error | No interrupts are generated in either host or device controller mode (ignored as a corrupted packet) |
| 3 | Overrun or underrun error | An NRDY interrupt is generated to set the FRMNUM.OVRN bit to 1 in both host and device controller modes.<br>In device controller mode, a zero-length packet is transmitted in response to an IN token. No data packets are received in response to OUT token. |
| 4 | Interval error | An NRDY interrupt is generated in device controller mode. No interrupt is generated in host controller mode. |

**Table 25.26 Error detection for data packet reception**

| Detection priority | Error | Generated interrupt and status |
|---|---|---|
| 1 | PID error | No interrupts are generated (ignored as a corrupted packet) |
| 2 | CRC or bit stuffing error | An NRDY interrupt is generated and the FRMNUM.CRCE bit sets to 1 in both host and device controller modes |
| 3 | Maximum packet size exceeded error | A BEMP interrupt is generated and the PID[1:0] bits set to STALL in both host and device controller modes |

### 25.3.12.2 DATA-PID

In device controller mode, the USBFS responds to a received PID as follows:

#### (1) IN direction

- DATA0: Transmitted as data packet PID
- DATA1: Not transmitted
- DATA2: Not transmitted
- mDATA: Not transmitted

#### (2) OUT direction

- DATA0: Received normally as data packet PID
- DATA1: Received normally as data packet PID
- DATA2: Packets ignored
- mDATA: Packets ignored

### 25.3.12.3 Interval Counter

The isochronous transfer interval can be set in the PIPEPERI.IITV[2:0] bits. In device controller mode, the interval counter enables the functions as shown in Table 25.27. In host controller mode, the USBFS generates the token issuance timing, and the interval counter operation is the same as that for interrupt transfers.

**Table 25.27 Interval counter functions in device controller mode**

| Transfer direction | Function | Conditions for detection |
|---|---|---|
| IN | Transmit buffer flush | Failure to receive an IN token successfully in the interval frame during an isochronous IN transfer. |
| OUT | Notification of no reception of token | Failure to receive an OUT token successfully in the interval frame during an isochronous OUT transfer. |

The interval count is performed when an SOF is received or for interpolated SOFs, so the isochronism can be maintained even if an SOF is corrupt. The frame interval can be set to $2^{IITV}$ frames.

### (1) Counter initialization in device controller mode

The USBFS initializes the interval counter under the following conditions:

- Power-on reset

  This initializes the PIPEPERI.IITV[2:0] bits.
- FIFO buffer initialization using the ACLRM bit

  This does not initialize the IITV[2:0] bits, but does initialize the count value.

After the interval counter is initialized, the interval count starts under one of the following conditions when a packet is transferred successfully:

- An SOF is received after data is transmitted in response to an IN token when PID = BUF
- An SOF is received after data is received in response to an OUT token when PID = BUF

The interval counter is not initialized in the following conditions:

- When the PID[1:0] bits are set to NAK or STALL

  This does not stop the interval timer. The USBFS attempts the transaction in the next interval.
- When the USB bus is reset or USBFS is suspended

  This does not initialize the IITV[2:0] bits. When an SOF is received, the interval counter starts counting from the value set before SOF was received.

### (2) Interval counting and transfer control in host controller mode

The USBFS controls the interval between token issuance operations based on the PIPEPERI.IITV[2:0] bits settings. Specifically, the USBFS issues a token for a selected pipe once every $2^{IITV}$ frames.

The USBFS starts counting the token issuance interval at the frame following the frame in which the PID[1:0] bits are set to BUF by software.

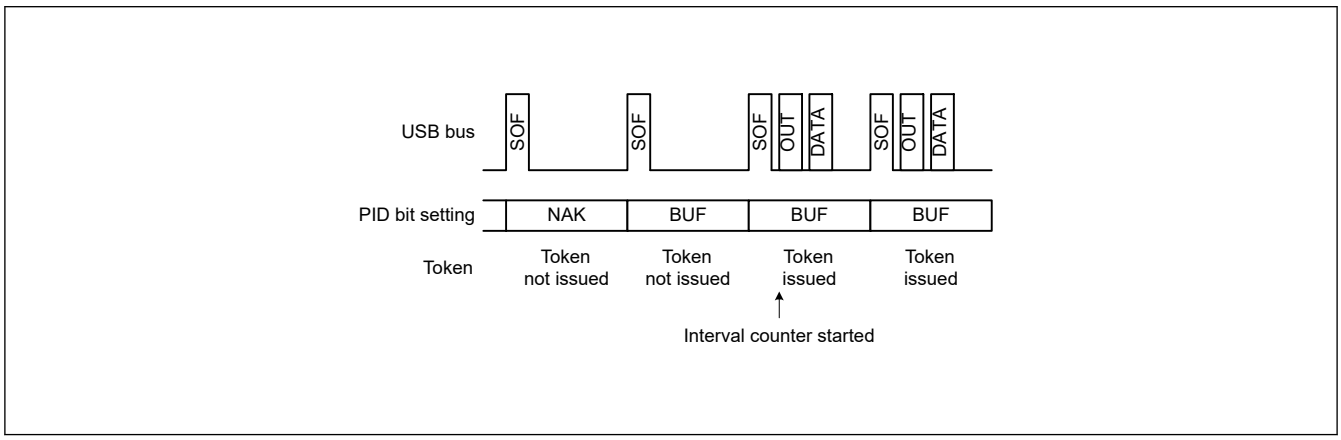

**Figure 25.12 Token issuance when IITV = 0**

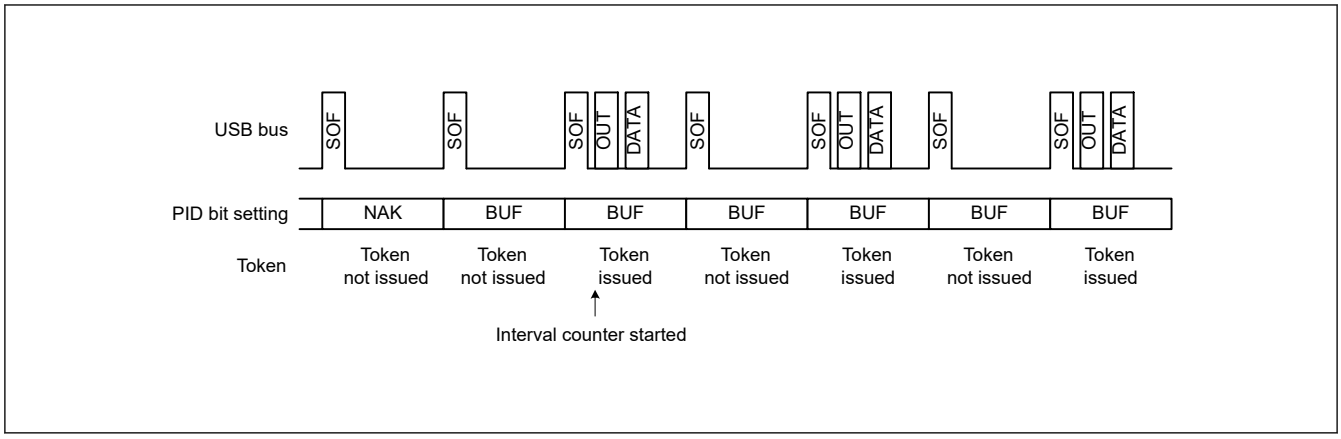

**Figure 25.13 Token issuance when IITV = 1**

When the selected pipe is set for isochronous transfers, the USBFS performs the following operation in addition to controlling the token issuance interval. The USBFS issues a token even when the NRDY interrupt generation condition is satisfied.

#### When the selected pipe is for isochronous IN transfers

The USBFS generates an NRDY interrupt when the USBFS issues an IN token but does not successfully receive a packet from a peripheral device (no response or packet error).

The USBFS sets the FRMNUM.OVRN bit to 1, generating an NRDY interrupt, when the time to issue an IN token occurs while the USBFS cannot receive data because the FIFO buffer is full, because the CPU or DMAC/DTC is too slow in reading data from the FIFO buffer.

#### When the selected pipe is for isochronous OUT transfers

The USBFS sets the OVRN bit to 1, generating an NRDY interrupt and transmitting a zero-length packet, when the time to issue an OUT token comes while there is no data to be transmitted in the FIFO buffer, or because the CPU or DMAC/DTC is too slow in writing data to the FIFO buffer.

The token issuance interval is reset on any of the following conditions:

- When the USBFS is reset through a reset pin

  This initializes the IITV[2:0] bits.
- When the PIPEnCTR.ACLRM bit is set to 1 by software

### (3) Interval counting and transfer control in device controller mode

#### When the selected pipe is for isochronous OUT transfers

The USBFS generates an NRDY interrupt when it fails to receive a data packet within the interval set in the PIPEPERI.IITV[2:0] bits.

The USBFS also generates an NRDY interrupt when it fails to receive data because of a CRC error or other errors contained in the data packet or because the FIFO buffer is full.

The NRDY interrupt is generated on SOF packet reception. Even if the SOF packet is corrupted, internal interpolation allows the interrupt to be generated when the SOF packet is received. However, when the IITV bits are set to a value other than 0, the USBFS generates an NRDY interrupt on receiving an SOF packet for every interval after interval counting starts.

When the PID[1:0] bits are set to NAK by software after starting the interval timer, the USBFS does not generate an NRDY interrupt on receiving an SOF packet.

The timing for starting interval counting depend on the IITV[2:0] setting as follows:

- When the IITV[2:0] bits = 0:

  Interval counting starts at the next frame after the software changes the PID[1:0] bits of the selected pipe to BUF.
- When the IITV[2:0] bits ≠ 0:

  Interval counting starts on completion of successful reception of the first data packet after the PID[1:0] bits for the selected pipe are changed to BUF.

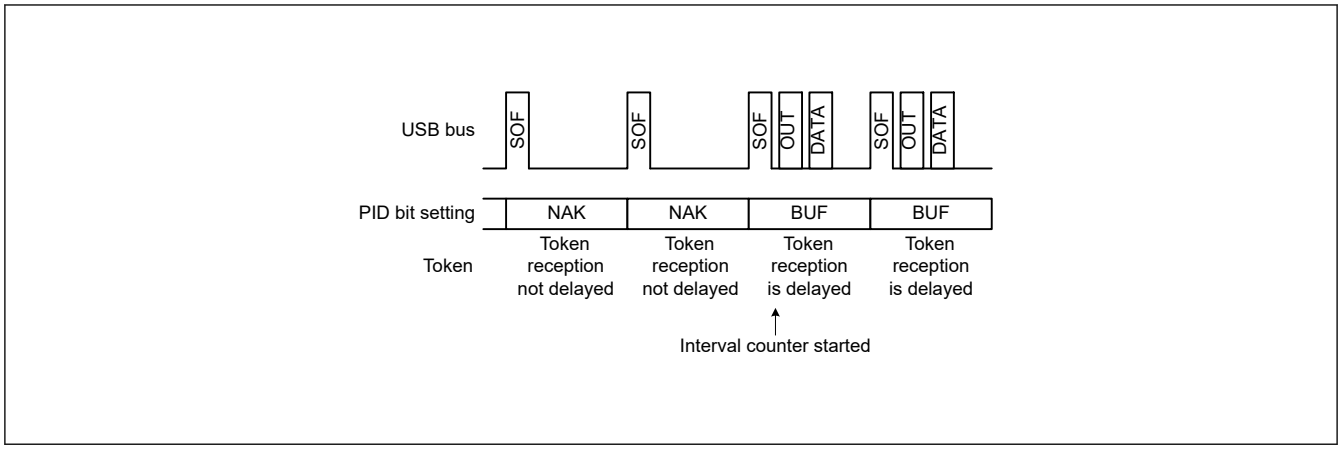

**Figure 25.14 Relationship between frames and expected token reception when IITV[2:0] = 0**

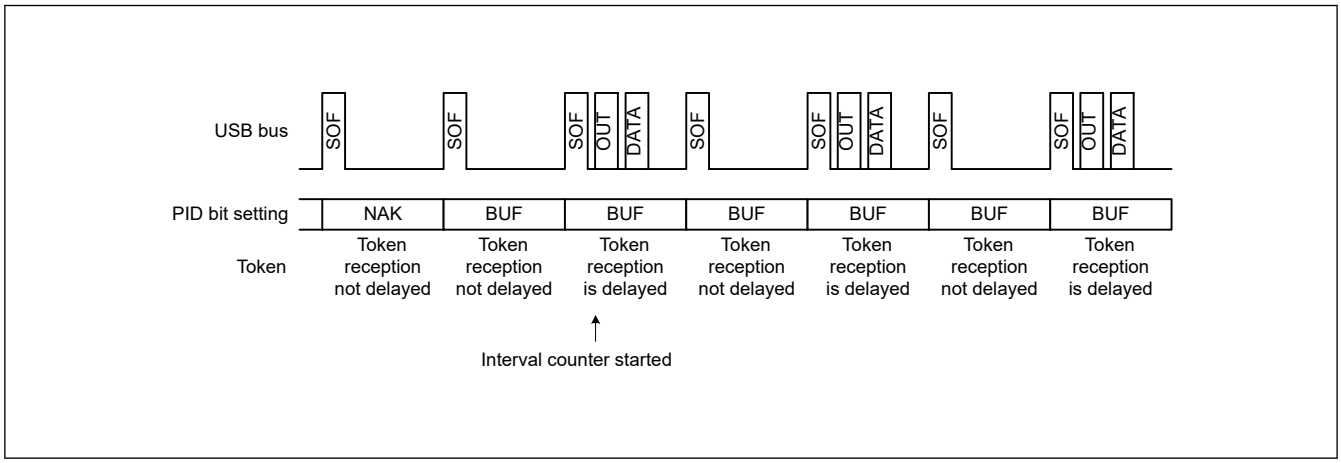

**Figure 25.15 Relationship between frames and expected token reception when IITV[2:0] ≠ 0**

### When the selected pipe is for isochronous IN transfers

The PIPEPERI.IFIS bit must be 1 for this use case. When IFIS = 0, the USBFS transmits a data packet in response to a received IN token regardless of the PIPEPERI.IITV[2:0] setting.

When IFIS is 1 and there is data to be transmitted in the FIFO buffer, the USBFS clears the FIFO buffer when it fails to receive an IN token in the frame at the interval set in the IITV[2:0] bits.

The USBFS also clears the FIFO buffer when it fails to receive an IN token successfully because of a bus error, such as a CRC error, contained in the IN token.

The FIFO buffer is cleared on SOF packet reception. Even if the SOF packet is corrupted, the internal interpolation allows the FIFO buffer to be cleared when the SOF packet is received.

The timing to start interval counting depends on the IITV[2:0] setting, as with OUT transfers.

The interval is counted on any of the following conditions in device controller mode:

- When a hardware reset is applied to the USBFS (which also sets the IITV[2:0] bits to 000b)
- When the PIPEnCTR.ACLRM bit is set to 1 by software
- When the USBFS detects a USB bus reset

## (4) Transmit data setup for isochronous transfers in device controller mode

With isochronous data transmission using the USBFS in device controller mode, after data is written to the FIFO buffer, a data packet can be transmitted in the first frame after the SOF packet is detected. This isochronous transfer transmit data setup function can identify the frame that started transmission.

When the double buffering is used, transmission is only enabled for the buffer where data writing was completed first, even after the data write to both buffers is complete. Accordingly, even if multiple IN tokens are received, only the one packet of FIFO buffer data is transmitted.

When the FIFO buffer is ready to transmit data when an IN token is received, the data is transferred and a normal response is returned. However, if the FIFO buffer cannot transmit data, a zero-length packet is transmitted and an underrun error occurs.

Figure 25.16 shows an example transmission using the isochronous transfer transmission data setup function when IITV = 0 (every frame) is set.

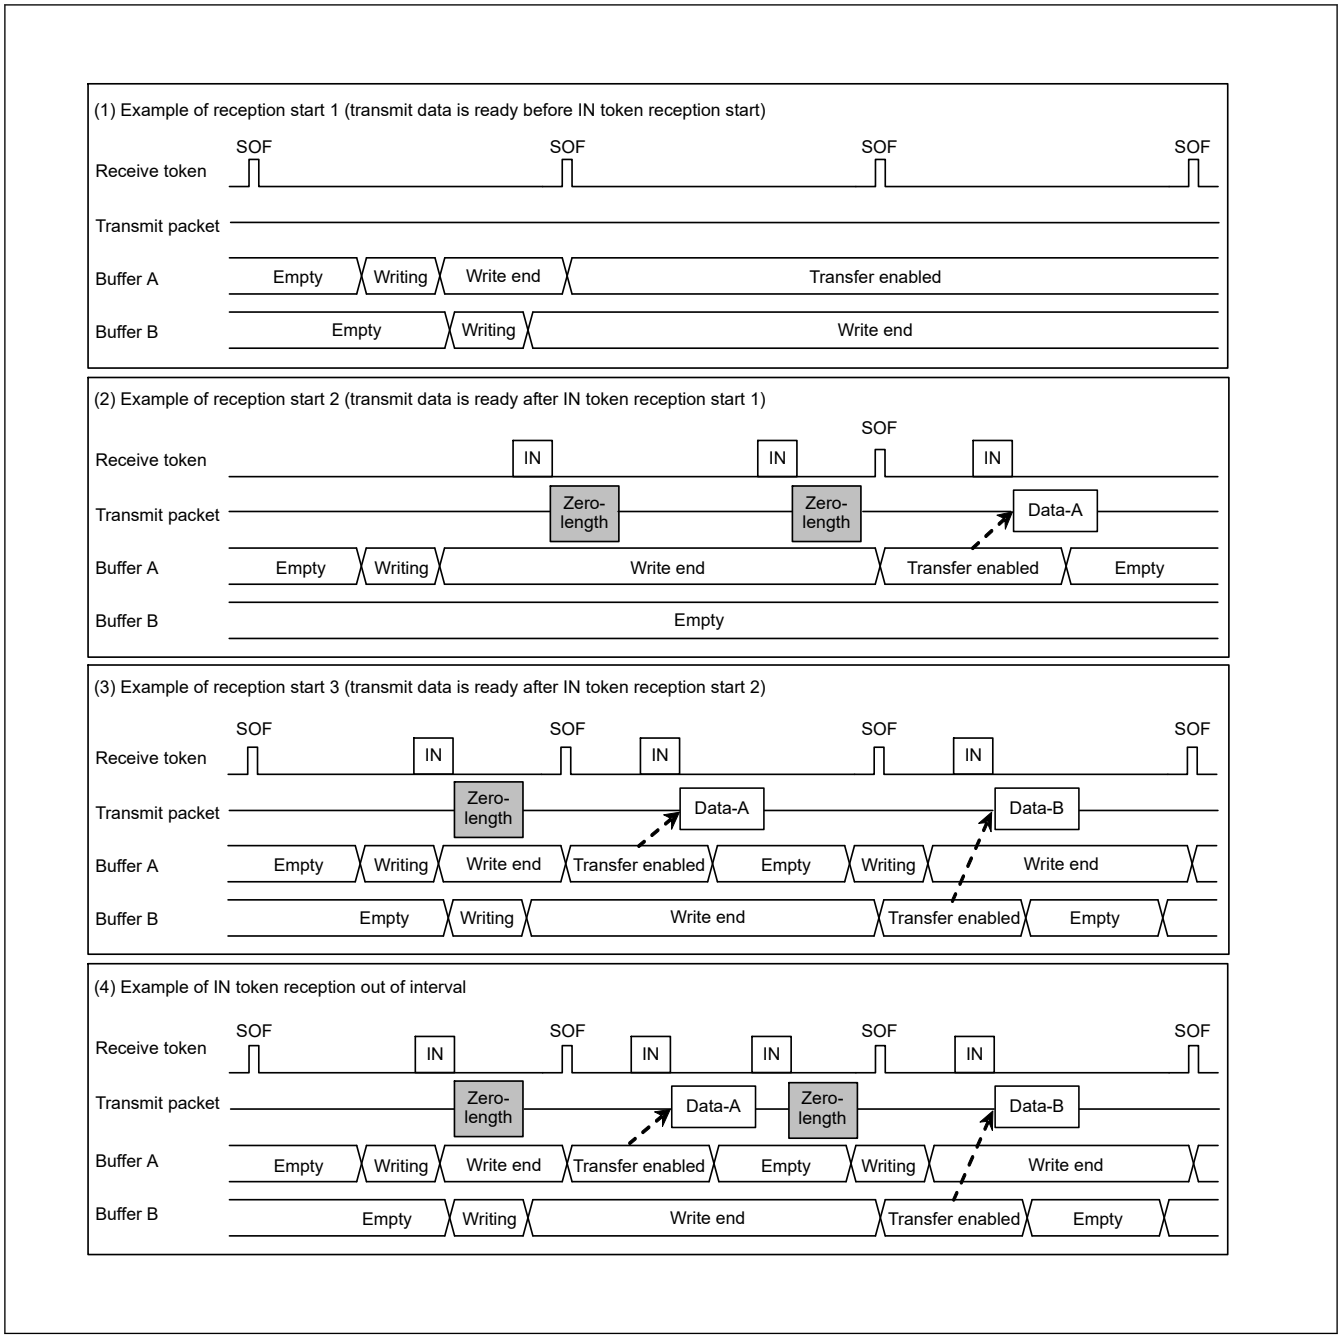

**Figure 25.16 Example data setup operation**

## (5) Transmit buffer flush for isochronous transfers in device controller mode

In device controller mode during isochronous data transmission, if the USBFS receives an SOF packet for the next frame without receiving an IN token in the interval frame, it operates as if the IN token is corrupt and clears the buffer that is enabled for transmission, putting that buffer in the writing enabled state.

When double buffering is used and writing to both buffers is complete, the cleared FIFO buffer is assumed to be the one where the data was transmitted in the interval frame, and transmission is enabled for the FIFO buffer that was not cleared on SOF packet reception.

The timing of the buffer flush function depends on the PIPEPERI.IITV[2:0] setting as follows:

- When IITV = 0:

  The buffer flush operation starts from the first frame after the pipe is enabled.

- When IITV ≠ 0:

  The buffer flush operation starts after the first normal transaction.

Figure 25.17 shows an example buffer flush. When an unanticipated token is received before the interval frame, the USBFS sends the write data or a zero-length packet as an underrun error, depending on the data setup status.

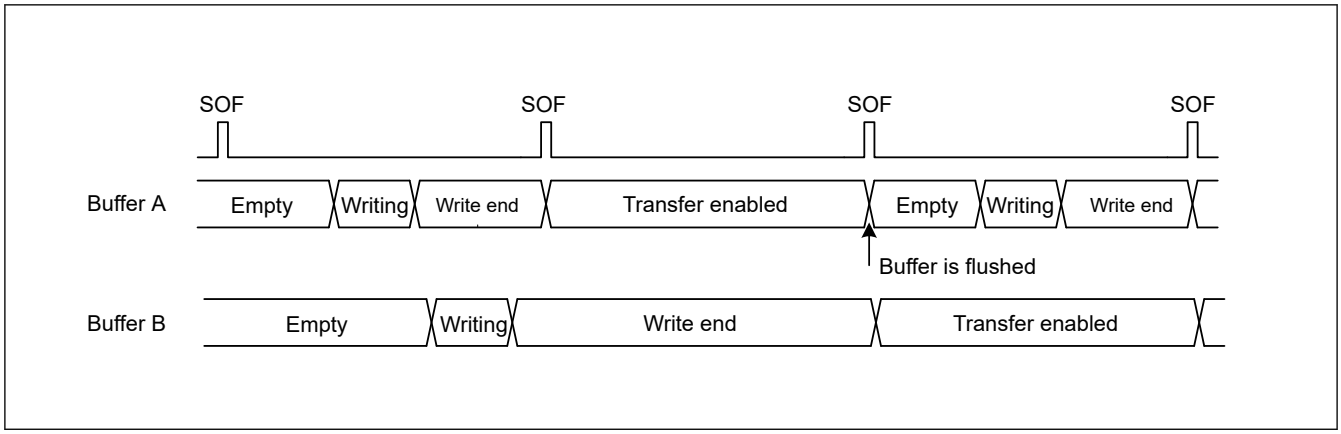

**Figure 25.17 Example buffer flush operation**

Figure 25.18 shows an example interval error occurrence. There are five types of interval errors, as shown in the figure. An interval error occurs at timing (A), and the buffer flush function is activated.

If an interval error occurs during an IN transfer, the buffer flush function is activated. If it occurs during an OUT transfer, an NRDY interrupt is generated. Use the FRMNUM.OVRN bit to distinguish between this and NRDY interrupts triggered by received packet errors and overrun errors.

For tokens that are shaded in the figure, responses are returned based on the FIFO buffer status.

- IN direction:
  - If the buffer is ready to transfer data, the data is transferred and a normal response is returned
  - If the buffer is not ready to transfer data, a zero-length packet is transmitted and an underrun error occurs
- OUT direction:
  - If the buffer is ready to receive data, the data is received and a normal response is returned
  - If the buffer is not ready to receive data, the received data is discarded and an overrun error occurs

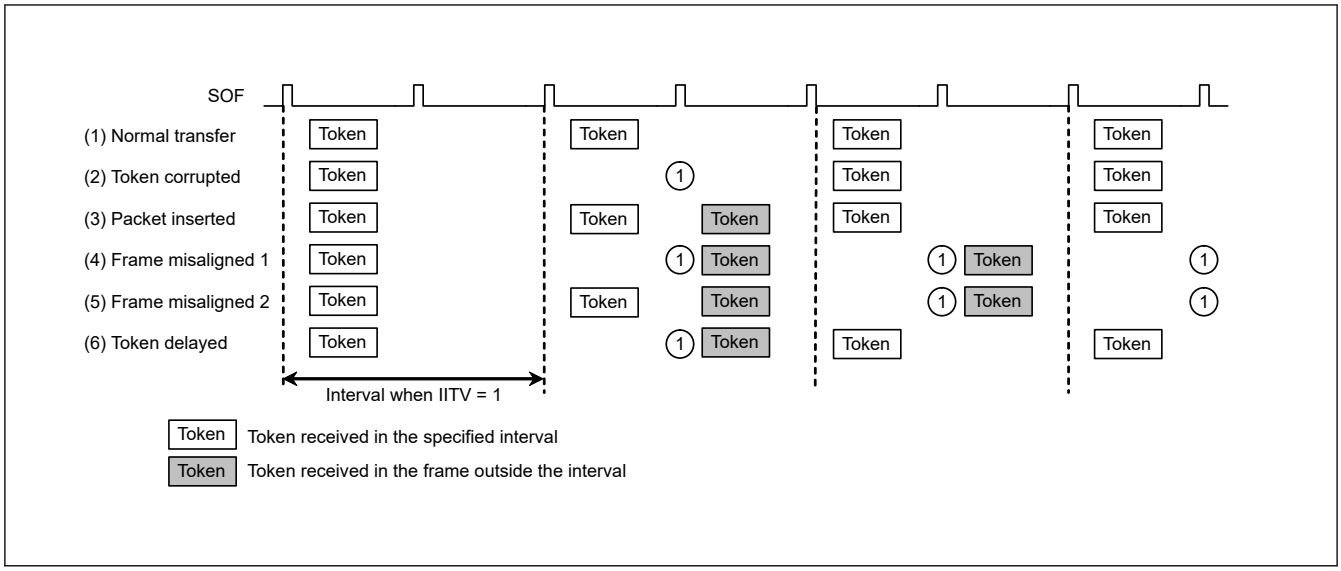

**Figure 25.18 Example interval error occurrence when IITV = 1**

## 25.3.13 SOF Interpolation Function

In device controller mode, if packet reception is disabled at intervals of 1 ms because the SOF packet is corrupted or missing, the USBFS interpolates the SOF. SOF interpolation begins when the USBE and SCKE bits in SYSCFG are set to 1 and an SOF packet is received.

The interpolation function is initialized under the following conditions:

- MCU reset
- USB bus reset
- Suspend state detection

The SOF interpolation operates as follows:

- The interpolation function is not activated until an SOF packet is received
- When the first SOF packet is received, interpolation is performed by counting 1 ms on the 48-MHz internal clock
- When the second and subsequent SOF packets are received, interpolation is performed at the previous reception interval
- Interpolation is not performed in the Suspend state or on reception of a USB bus reset

The USBFS supports the following functions controlled by SOF packet reception. These functions operate normally with SOF interpolation if the SOF packet is missing:

- Updating of the frame number
- SOFR interrupt timing
- Isochronous transfer interval count

If an SOF packet is missing during full-speed operation, the FRMNUM.FRNM[10:0] bits are not updated.

## 25.3.14 Pipe Schedule

### 25.3.14.1 Conditions for Generating Transactions

In host controller mode and when the DVSTCTR0.UACT bit is set to 1, the USBFS generates transactions under the conditions shown in Table 25.28.

**Table 25.28 Conditions for generating transactions**

| Transaction | Conditions for generation | | | | |
|---|---|---|---|---|---|
| | DIR | PID | IITV0 | Buffer state | SUREQ |
| Setup | —*1 | —*1 | —*1 | —*1 | 1 setting |
| Control transfer data stage, status stage, bulk transfer | IN | BUF | Invalid | Receive area exists | —*1 |
| | OUT | BUF | Invalid | Transmit data exists | —*1 |
| Interrupt transfer | IN | BUF | Valid | Receive area exists | —*1 |
| | OUT | BUF | Valid | Transmit data exists | —*1 |
| Isochronous transfer | IN | BUF | Valid | *2 | —*1 |
| | OUT | BUF | Valid | *3 | —*1 |

Note 1. An em dash (—) in the table indicates that the condition is unrelated to the generating of tokens. “Valid” indicates that, for interrupt transfers and isochronous transfers, a transaction is generated only in transfer frames that are based on the interval counter. “Invalid” indicates that a transaction is generated regardless of the interval counter.

Note 2. This indicates that a transaction is generated regardless of whether there is a receive area. If there is no receive area, however, the received data is discarded.

Note 3. This indicates that a transaction is generated regardless of whether there is any data to be transmitted. If there is no data to be transmitted, however, a zero-length packet is transmitted.

### 25.3.14.2 Transfer Schedule

This section describes the transfer scheduling within a frame of the USBFS. After the USBFS sends an SOF, the transfer is carried out in the following sequence:

1. Execution of periodic transfers:

   A pipe is searched for in the order of pipe 1 → pipe 2 → pipe 6 → pipe 7 → pipe 8 → pipe 9, and then if there is a pipe for which an isochronous or interrupt transfer transaction can be generated, the transaction is generated.

2. Setup transactions for control transfers:

   The DCP is checked, and if a setup transaction is possible, it is sent.

3. Execution of bulk transfers, control transfer data stages, and control transfer status stages:

   A pipe is searched for in the order of DCP → pipe 1 → pipe 2 → pipe 3 → pipe 4 → pipe 5, and then if there is a pipe for which a transaction for a bulk transfer, a control transfer data stage, or a control transfer status stage can be generated, the transaction is generated.

   When a transaction is generated, processing moves to the next pipe transaction regardless of whether the response from the peripheral device is ACK or NAK. If there is time for transfer within the frame, step 3 is repeated.

### 25.3.14.3 Enabling USB Communication

Setting the DVSTCTR0.UACT bit to 1 initiates an SOF transmission, and transaction generation is enabled. Setting the UACT bit to 0 stops SOF transmission and the Suspend state is invoked. If the UACT setting is changed from 1 to 0, processing stops after the next SOF is sent.

## 25.4 Usage Notes

### 25.4.1 Settings for the Module-Stop State

USBFS operation can be disabled or enabled using Module Stop Control Register B (MSTPCRB). The USBFS is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

### 25.4.2 Clearing the Interrupt Status Register on Canceling Software Standby Mode

Because the input buffer is always enabled in Software Standby mode, an unexpected interrupt might occur under the following conditions:

- When the interrupt is enabled in Normal mode
- When the interrupt is disabled in Software Standby mode
- When the input level of the pin that cancels software standby mode is changed in Software Standby mode

These conditions might cause the associated interrupt flag in the Interrupt Status Register to set unexpectedly. After the MCU cancels the Software Standby mode, the unexpected interrupt might be sent to the interrupt controller. To avoid this, always clear the INTSTS0 and INTSTS1 registers in the canceling sequence.

### 25.4.3 Clearing the Interrupt Status Register after Setting Up the Port Function

The input buffer is disabled before the PmnPFS.PSEL and PmnPFS.PMR port is set up, so the internal signal is fixed high or low. The input buffer is enabled after the port is set so that the external pin state is propagated to the MCU. An unexpected interrupt might occur at this time, causing the VBINT and OVRCR bits in INTSTS0 and INTSTS1, or other interrupt status flags to set to 1. To avoid a malfunction, always clear the INTSTS0 and INTSTS1 registers after setting up the port.

### 25.4.4 Restrictions of P814 and P815

When using USBFS, It should not be changed the following registers of P814 and P815 from initial values.

- PORT8.PCNTR1/PORT8.PODR/PORT8.PDR
- PORT8.PCNTR2/PORT8.EIDR/PORT8.PIDR
- PORT8.PCNTR3/PORT8.PORR/PORT8.POSR
- PFS.P814PFS/PFS.P814PFS_HA/PFS.P814PFS_BY
- PFS.P815PFS/PFS.P815PFS_HA/PFS.P815PFS_BY

When P814 and P815 are used as general-purpose I/O ports, setting MSTPCRB.MSTPB11 to 0 is prohibited.

# 26. Serial Communications Interface (SCI)

## 26.1 Overview

The Serial Communications Interface (SCI) × 6 channels have asynchronous and synchronous serial interfaces:

- Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA))
- 8-bit clock synchronous interface
- Simple IIC (master-only)
- Simple SPI
- Smart card interface
- Manchester interface
- Simple LIN

The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCIn (n = 0, 3 to 5, 9) has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator.

In this section, PCLK refers to PCLKA.

Table 26.1 lists the SCI specifications, Figure 26.1 shows a block diagram of SCI, and Table 26.3 lists the I/O pins.

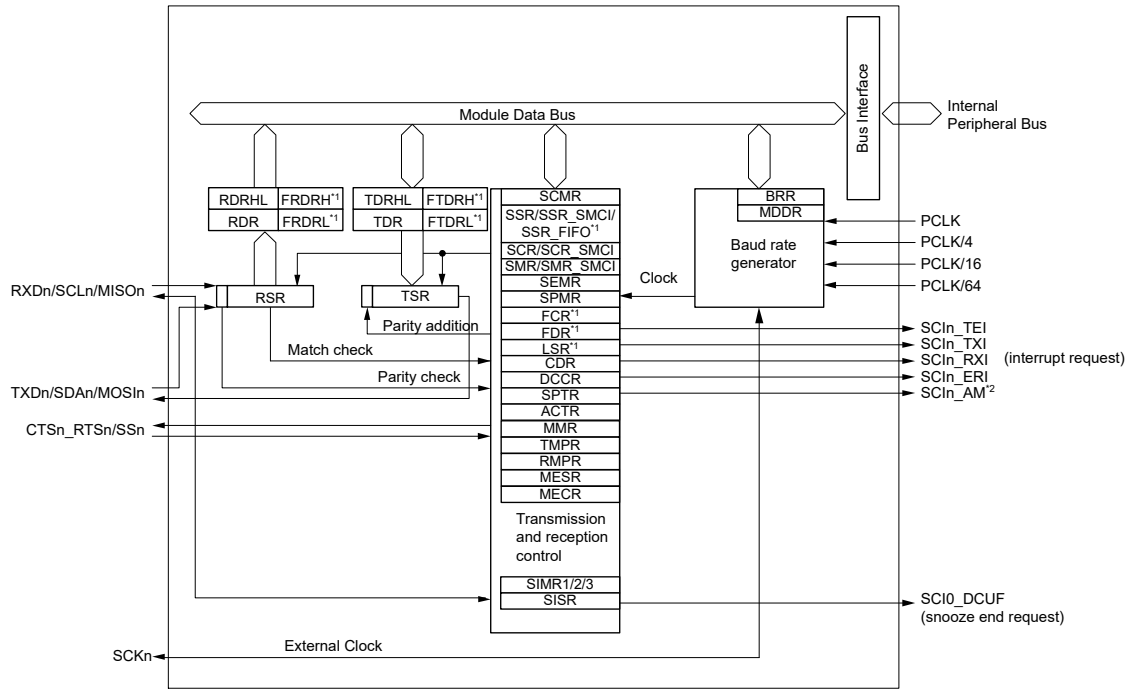
**Table 26.1 SCI specifications (1 of 4)**

| Parameter | | Specifications |
|---|---|---|
| Number of modules | | 6 (SCIn (n = 0, 1, 3 to 5, 9)) |
| Serial communication modes | | • Asynchronous<br>• Clock synchronous<br>• Simple IIC<br>• Simple SPI<br>• Smart card interface<br>• Manchester interface (SCIn (n = 3, 4))<br>• Simple LIN (SCIn (n = 1)) |
| Transfer speed | | Bit rate specifiable with the on-chip baud rate generator |
| Full-duplex communications | | • Transmitter: Continuous transmission possible using double-buffering<br>• Receiver: Continuous reception possible using double-buffering |
| Data transfer | | Selectable as LSB-first or MSB-first transfer |
| Inverter for communication terminals (RXDn, TXDn) | | Selectable inverter for each terminals (RXDn, TXDn) (SCIn (n = 0, 1, 3 to 5, 9)) |
| Interrupt sources | | • Transmit end, transmit data empty, receive data full, and receive error.<br>• Receive data ready and address match (support by all channels except SCI1)<br>• Completion of generation of a start condition, restart condition, or stop condition for simple IIC mode. |
| Module-stop function | | Module-stop state can be set for each channel |
| Snooze end request | | SCI0 address mismatch (SCI0_DCUF) |
| Clock synchronous mode | Data length | 8 bits |
| | Receive error detection | Overrun error |
| | Clock source | Selectable to internal clock (master mode) or external clock (slave mode) |
| | Hardware flow control | Transmission and reception controllable with CTSn_RTSn pins |
| | Transmission and reception | Selectable to 1-stage register or 16-stage FIFO (only SCIn (n = 0, 3 to 5, 9) supports FIFO) |

**Table 26.1 SCI specifications (2 of 4)**

| Parameter | | Specifications |
|---|---|---|
| Asynchronous mode | Data length | 7, 8, or 9 bits |
| | Transmission stop bit | 1 or 2 bits |
| | Adjustment of receive sampling timing | Adjustable receive sampling timing before/after the default timing |
| | Adjustment of transmit timing | Adjustable edge timing of transmit waveform controlled by the setting value of registers. |
| | Parity | Even parity, odd parity, or no parity |
| | Receive error detection | • Parity error<br>• Overrun error<br>• Framing error |
| | Hardware flow control | Transmission and reception controllable with CTSn_RTSn pins |
| | Transmission and reception | Selectable to 1-stage register or 16-stage FIFO (SCIn (n = 0, 3 to 5, 9) supports FIFO) |
| | Address match | Interrupt request/event output can be issued upon detecting a match between received data and the value in the compare match register (SCIn (n = 0, 3 to 5, 9) support) |
| | Address mismatch (SCI0 only) receive data | Snooze end request can be issued when detecting a mismatch between the received data and the value in the compare match register |
| | Start-bit detection | Selectable to low level or falling edge detection |
| | Break detection | Breaks from framing errors detectable by read from SPTR register |
| | Clock source | Selectable to internal or external clock.<br>Transfer rate clock input from the GPT can be used. (SCIn (n = 1)). |
| | Double-speed mode | Baud rate generator double-speed mode is selectable |
| | Multi-processor communications function | Serial communication enabled among multiple processors |
| | Noise cancellation | Digital noise filters included on signal paths from the RXDn pin inputs |
| Smart card interface mode | Error processing | Error signal can be automatically transmitted upon detecting a parity error during reception |
| | | Data can be automatically retransmitted upon receiving an error signal during transmission |
| | Data type | Both direct and inverse convention supported |

**Table 26.1 SCI specifications (3 of 4)**



| Parameter | | Specifications |
|---|---|---|
| Manchester mode | Communication format | Manchester code with the preface and the Start Bit added |
| | Data length | 7, 8, or 9 bits |
| | Transmission stop bit | 1 or 2 bits |
| | Parity function | Even parity, odd parity, or no parity |
| | Receive error detection | Parity, overrun, framing, Manchester errors |
| | Hardware flow control | CTSn and RTSn pins can be used in controlling transmission |
| | Clock source | Only internal clock can be used. |
| | Double-speed mode | Baud rate generator double-speed mode is selectable |
| | Multi-processor communication function | Serial communication among multiple processors |
| | Noise cancellation | The signal paths from input on the RXDn pins incorporate digital noise filters |
| | Preface setting/detection function | The function outputs the configured the preface pattern and detects it. |
| | Start Bit setting/detection function | The function outputs the configured the Start Bit pattern and detects it. |
| | Reception retiming function | Timing correction is performed for each bit of the received signal |
| Simple IIC mode | Transfer format | $I^2C$ bus format (MSB-first only) |
| | Operating mode | Master (single-master operation only) |
| | Transfer rate | Up to 400 kbps |
| | Noise cancellation | The signal paths from input on the SCLn and SDAn pins incorporate digital noise filters and provide an adjustable interval for noise cancellation |
| Simple SPI mode | Data length | 8 bits |
| | Error detection | Overrun error |
| | Clock source | Selectable to internal clock (master mode) or external clock (slave mode) |
| | SSn input pin function | High impedance state can be invoked on the output pins by driving the SSn pin high. |
| | Clock settings | Configurable among four clock phase and clock polarity settings |
| Simple LIN mode | Start Frame transmission | • Output of a low level as the Break Field over a specified width and generation of interrupts on completion<br>• Detection of bus collisions and the generation of interrupts on detection |
| | Start Frame reception | • Detection of the Break Field low width and generation of an interrupt on detection<br>• Comparison of Control Fields 0 and 1 and generation of an interrupt when the two match<br>• Two kinds of data for comparison (primary and secondary) can be set in Control Field 1.<br>• A priority interrupt bit can be set in Control Field 1.<br>• Handling of Start Frames that do not include a Break Field<br>• Handling of Start Frames that do not include a Control Field 0<br>• Function for measuring bit rates |
| | I/O control function | • Selectable polarity for TXDXn and RXDXn signals<br>• Selection of a digital filter for the RXDXn signal<br>• Half-duplex operation employing RXDXn and TXDXn signals multiplexed on the same pin<br>• Selectable timing for the sampling of data received through RXDXn<br>• Signals received on RXDXn can be passed though to SCIn (n = 1) when the Simple LIN mode control section is off. |
| | Timer function | • Usable as a reloading timer |
| Bit rate modulation function | | Error reduction through correction of outputs from the on-chip baud rate generator |

**Table 26.1 SCI specifications (4 of 4)**

| Parameter | Specifications |
|---|---|
| Event link function | Error event output for receive error or error signal detection (SCIn_ERI) (n = 0, 1, 3 to 5, 9) |
| | Receive data full event output (SCIn_RXI) (n = 0, 1, 3 to 5, 9) |
| | Transmit data empty event output (SCIn_TXI) (n = 0, 1, 3 to 5, 9) |
| | Address match event output (SCIn_AM) (n = 0, 3 to 5, 9) |
| | Transmit end event output (SCIn_TEI) (n = 0, 1, 3 to 5, 9) |
| TrustZone Filter | Security attribution can be set for each channels |

## 26.2 Register Descriptions

### 26.2.1 RSR : Receive Shift Register

RSR is a shift register that receives serial data input from the RXDn pin and converts it into parallel data. When one frame of data is received, the data is automatically transferred to the RDR, RDRHL, or the receive FIFO register. The RSR register cannot be directly accessed by the CPU.

### 26.2.2 RDR : Receive Data Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x05

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

RDR is an 8-bit register that stores received data. When one frame of serial data is received, it is transferred from RSR to RDR, and the RSR register can receive more data. Because RSR and RDR function as a double buffer, continuous received operations can be performed.

Read the RDR only once after a receive data full interrupt (SCIn_RXI) occurs.

Note: If the next frame of data is received before reading the received data from RDR, an overrun error occurs. The CPU cannot write to the RDR.

### 26.2.3 RDRHL : Receive Data Register for Non-Manchester Mode (MMR.MANEN = 0)

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x10

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | RDAT[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | RDAT[8:0] | Serial Receive Data | R |
| 15:9 | — | These bits are read as 0. | R |

RDRHL is a 16-bit register that stores received data. Use this register when asynchronous mode and 9-bit data length are selected.

The lower 8 bits of RDRHL are the shadow register of RDR, so access to RDRHL affects the RDR register. Access to the RDRHL register is prohibited if 7-bit or 8-bit data length is selected.

After one frame of data is received, the received data is transferred from the RSR register to the RDR/RDRHL registers, allowing the RSR register to receive more data.

The RSR and RDRHL registers form a double-buffered structure to enable continuous reception. RDRHL should be read only when a receive data full interrupt (SCIn_RXI) request is issued. An overrun error occurs when the next frame of data is received before the received data is read from RDRHL. The CPU cannot write to the RDRHL register.

## 26.2.4 RDRHL_MAN : Receive Data Register for Manchester Mode (MMR.MANEN = 1)

Base address: SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x10

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | RSYNC | — | — | MPB | RDAT[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | RDAT[8:0] | Serial Receive Data<br>These bits can read serial receive data | R |
| 9 | MPB | Multi-processor Bit<br>This bit can read multi-processor bit corresponded to serial receive data (RDATA[8:0])<br>0: Data transmission cycles<br>1: ID transmission cycles | R |
| 11:10 | — | These bits are read as 0. The write value should be 0. | R |
| 12 | RSYNC | Receive SYNC Data Bit<br>This bit is valid when MMR.SBSEL = 1 in Manchester mode, 0 is read otherwise.<br>0: The received Start bit is DATA SYNC<br>1: The received Start bit is COMMAND SYNC | R |
| 15:13 | — | These bits are read as 0. The write value should be 0. | R |

RDRHL_MAN is a 16-bit register that stores received data. Use this register when asynchronous mode and 9-bit data length are selected. The lower 8 bits of RDRHL_MAN are the shadow register of RDR, so access to RDRHL_MAN affects the RDR register. Access to the RDRHL_MAN register is prohibited if 7-bit or 8-bit data length is selected.

After one frame of data is received, the received data is transferred from the RSR register to the RDR/RDRHL_MAN registers, allowing the RSR register to receive more data.

The RSR and RDRHL_MAN registers form a double-buffered structure to enable continuous reception.

RDRHL_MAN should be read only when a receive data full interrupt (SCIn_RXI) request is issued. An overrun error occurs when the next frame of data is received before the received data is read from RDRHL_MAN.

The CPU cannot write to the RDRHL_MAN register.

### RDAT[8:0] bits (Serial Receive Data)

The RDAT[8:0] bits can read serial receive data.

### MPB bit (Multi-processor Bit)

The MPB bit holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

### RSYNC bit (Receive SYNC Data Bit)

When Manchester mode and MMR.SBSEL = 1, this bit indicates the type of SYNC of the received Start bit. For other settings, it is fixed to 0.

## 26.2.5 FRDRHL/FRDRH/FRDRL : Receive FIFO Data Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x10 (FRDRHL/FRDRH)
0x11 (FRDRL)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | RDF | ORER | FER | PER | DR | MPB | RDAT[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

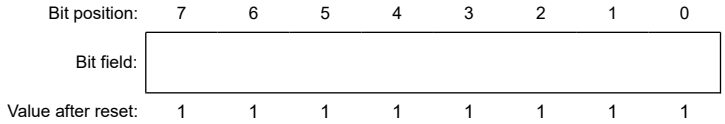
| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | RDAT[8:0] | Serial receive data<br>Stores the serial receive data.<br>Valid only in asynchronous mode, including multi-processor mode, and clock synchronous mode, and with FIFO selected. | R |
| 9 | MPB | Multi-Processor Bit Flag<br>Stores the value of the multi-processor bit in the serial receive data, RDAT[8:0]. Valid only in asynchronous mode with SMR.MP = 1, and with FIFO selected.<br>0: Data transmission cycle<br>1: ID transmission cycle | R |
| 10 | DR | Receive Data Ready Flag<br>This flag is the same as SSR_FIFO.DR.<br>0: Receiving is in progress, or no received data remains in the FRDRH and FRDRL registers after successfully completed reception<br>1: Next receive data is not received for a period after successfully completed reception | R*1 |
| 11 | PER | Parity Error Flag<br>0: No parity error occurred in the first data of FRDRH and FRDRL<br>1: Parity error occurred in the first data of FRDRH and FRDRL | R |
| 12 | FER | Framing Error Flag<br>0: No framing error occurred in the first data of FRDRH and FRDRL<br>1: Framing error occurred in the first data of FRDRH and FRDRL | R |
| 13 | ORER | Overrun Error Flag<br>This flag is the same as SSR_FIFO.ORER.<br>0: No overrun error occurred<br>1: Overrun error occurred | R*1 |
| 14 | RDF | Receive FIFO Data Full Flag<br>This flag is the same as SSR_FIFO.RDF.<br>0: The amount of receive data written in FRDRH and FRDRL is less than the specified receive triggering number<br>1: The amount of receive data written in FRDRH and FRDRL is equal to or greater than the specified receive triggering number | R*1 |
| 15 | — | This bit is read as 0. | R |

Note 1. If this flag is read, it indicates the same value as that read from the SSR_FIFO register. Write 0 to the SSR_FIFO register to clear the flag.

FRDRHL is a 16-bit register that consists of the 8-bit FRDRH and FRDRL registers. FRDRH is assigned to the FRDRHL[15:8] bits, and allocated to the same address as FRDRHL. FRDRL is assigned to the FRDRHL[7:0] bits, and allocated to (the address of FRDRHL + 1) address.

FRDRH and FRDRL constitute a 16-stage FIFO register that stores serial receive data and related status information readable by software. This register is only valid in asynchronous mode, including multi-processor mode, or clock synchronous mode.

The SCI completes reception of one frame of serial data by transferring the received data from the Receive Shift Register (RSR) into FRDRH and FRDRL for storage. Continuous reception is executed until 16 stages are stored. If data is read when there is no received data in FRDRH and FRDRL, the value is undefined. When FRDRH and FRDRL are full, subsequent serial receive data is lost. The CPU can read from the FRDRH and FRDRL registers but cannot write to them.



Reading 1 from the RDF, ORER, or DR flags of the FRDRH register is the same as reading from those bits in the SSR_FIFO register. When writing 0 to clear a flag in the SSR_FIFO register after reading the FRDRH register, write 0 only to the flag that is to be cleared and write 1 to the other flags.

When reading both the FRDRH and FRDRL registers, read in order from FRDRH to FRDRL. The FRDRHL register can be accessed in 16-bit units.

## 26.2.6 TDR : Transmit Data Register

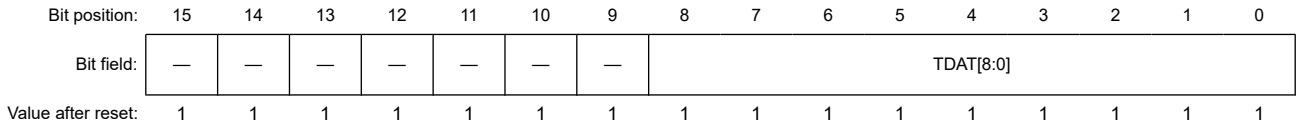
Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x03

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7:0 | n/a | Serial Transmit Data | R/W |

TDR is an 8-bit register that stores transmit data.

When the SCI detects that the TSR register is empty, it transfers the transmit data written in the TDR register to the TSR register and starts transmission.



The double-buffered structure of the TDR and TSR registers enables continuous serial transmission. If the next transmit data is already written to TDR when one frame of data is transmitted, the SCI transfers the written data to the TSR register to continue transmission.

The CPU can read from or write to TDR at any time. Only write transmit data to TDR once after each instance of the transmit data empty interrupt (SCIn_TXI).

## 26.2.7 TDRHL : Transmit Data Register for Non-Manchester Mode (MMR.MANEN = 0)

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x0E

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | TDAT[8:0] | Serial Transmit Data | R/W |
| 15:9 | — | This bit is read as 1. The write value should be 1. | R/W |

TDRHL is a 16-bit register that stores transmit data. Use this register when asynchronous mode and 9-bit data length are selected.

The lower 8 bits of TDRHL are the shadow register of TDR, so access to TDRHL affects the TDR register. Access to the TDRHL register is prohibited if 7-bit or 8-bit data length is selected.

When empty space is detected in the TSR register, the transmit data stored in the TDRHL registers is transferred to TSR and transmission starts.

The TSR and TDRHL registers have a double-buffered structure to support continuous transmission. When the next data to be transmitted is stored in TDRHL after one frame of data is transmitted, the transmitting operation continues by transferring the data to the TSR register.

The CPU can read and write to the TDRHL register. Bits [15:9] in TDRHL are fixed to 1. These bits are read as 1. The write value should be 1.

Write transmit data to the TDRHL register only once when a transmit data empty interrupt (SCIn_TXI) request is issued.

## 26.2.8 TDRHL_MAN : Transmit Data Register for Manchester Mode (MMR.MANEN = 1)

Base address: SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x0E

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | TSYNC | — | — | MPBT | TDAT[8:0] | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | TDAT[8:0] | Serial Transmit Data<br>These bits can set serial transmit data | R/W |
| 9 | MPBT | Multi-processor Transfer Bit Flag<br>Value of the multi-processor bit in the transmission frame<br>0: Data transmission cycles<br>1: ID transmission cycles | R/W |
| 11:10 | — | The write value should be 1. | R |
| 12 | TSYNC | Transmit SYNC data bit<br>This bit is valid when MMR.SBSEL = 1 and MMR.SYNSEL = 1 in Manchester mode.<br>0: The Start bit is transmitted as DATA SYNC<br>1: The Start bit is transmitted as COMMAND SYNC | R/W |
| 15:13 | — | The write value should be 1. | R |

TDRHL_MAN is a 16-bit register that stores transmit data. Use this register when asynchronous mode and 9-bit data length are selected.

The lower 8 bits of TDRHL_MAN are the shadow register of TDR, so access to TDRHL_MAN affects the TDR register. Access to the TDRHL_MAN register is prohibited if 7-bit or 8-bit data length is selected.

When empty space is detected in the TSR register, the transmit data stored in the TDRHL_MAN registers is transferred to TSR and transmission starts.

The TSR and TDRHL_MAN registers have a double-buffered structure to support continuous transmission. When the next data to be transmitted is stored in TDRHL_MAN after one frame of data is transmitted, the transmitting operation continues by transferring the data to the TSR register.

Write transmit data to the TDRHL_MAN register only once when a transmit data empty interrupt (SCIn_TXI) request is issued.

### TDAT[8:0] bits (Serial Transmit Data)

The TDAT[8:0] bits set the serial transmission data.

### MPBT bit (Multi-processor Transfer Bit Flag)

The MPBT bit selects the multi processor bit of transmit frame.

### TSYNC bit (Transmit SYNC data bit)

When Manchester mode and MMR.SBSEL = 1 and MMR.SYNSEL = 1, the type of SYNC selected according to this bit becomes the Star bit of the transmission frame.

## 26.2.9 FTDRHL/FTDRH/FTDRL : Transmit FIFO Data Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x0E (FTDRHL/FTDRH)
0x0F (FTDRL)

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | MPBT | TDAT[8:0] | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | TDAT[8:0] | Serial Transmit Data<br>Specifies the serial transmit data.<br>Valid only in asynchronous mode, including multi-processor mode, and clock synchronous mode, and with FIFO selected. | W |
| 9 | MPBT | Multi-Processor Transfer Bit Flag<br>Specifies the multi-processor bit in the transmission frame. Valid only in asynchronous mode and SMR.MP = 1, and with FIFO selected. Valid only in asynchronous mode, including multi-processor mode, and clock synchronous mode, and with FIFO selected.<br>0: Data transmission cycle<br>1: ID transmission cycle | W |
| 15:10 | — | The write value should be 1. | W |

FTDRHL is a 16-bit register that consists of the 8-bit FTDRH and FTDRL registers. FTDRH is assigned to the FTDRHL[15:8] bits, and allocated to the same address as FTDRHL. FTDRL is assigned to the FTDRHL[7:0] bits, and allocated to (the address of FTDRHL + 1) address.

FTDRH and FTDRL constitute a 16-stage FIFO register that stores data for serial transmission and a multi-processor transfer bit. This register is only valid in asynchronous mode, including multi-processor mode, or clock synchronous mode.

When the SCI detects that the Transmit Shift Register (TSR) is empty, it transfers data written in the FTDRH and FTDRL registers to the TSR register and starts serial transmission. Continuous serial transmission is executed until no transmit data is left in FTDRH and FTDRL. When FTDRHL is full of transmit data, no more data can be written. If writing new data is attempted, the data is ignored. The CPU can write to the FTDRH and FTDRL registers but cannot read them.

When writing to both the FTDRH and FTDRL registers, write in order from FTDRH to FTDRL.

### TDAT[8:0] bits (Serial Transmit Data)

The TDAT[8:0] bits set the serial transmission data. This is valid only when FIFO is selected in asynchronous mode (including multiprocessor) or clock synchronous mode.

### MPBT flag (Multi-Processor Transfer Bit Flag)

The MPBT flag specifies the value of the multi-processor bit of the transmit frame. When FCR.FM = 1, SSR.MPBT is invalid.

## 26.2.10 TSR : Transmit Shift Register

TSR is a shift register that transmits serial data. To perform serial data transmission, the SCI first automatically transfers transmit data from TDR, TDRHL, or transmit FIFO to TSR, then sends the data to the TXDn pin. The CPU cannot directly access the TSR.

## 26.2.11 SMR : Serial Mode Register for Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x00

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | CM | CHR | PE | PM | STOP | MP | CKS[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| 4 | PM | Parity Mode<br>Valid only when the PE bit is 1.<br>0: Even parity<br>1: Odd parity | R/W*4 |
| 5 | PE | Parity Enable<br>Valid only in asynchronous mode.<br>0: When transmitting: Do not add parity bit<br>When receiving: Do not check parity bit<br>1: When transmitting: Add parity bit<br>When receiving: Check parity bit | R/W*4 |
| 6 | CHR | Character Length<br>Valid only in asynchronous mode.*2<br>Selects the transmit/receive character length in combination with the SCMR.CHR1 bit.<br>0: SCMR.CHR1 = 0: Transmit/receive in 9-bit data length<br>SCMR.CHR1 = 1: Transmit/receive in 8-bit data length (initial value)<br>1: SCMR.CHR1 = 0: Transmit/receive in 9-bit data length<br>SCMR.CHR1 = 1: Transmit/receive in 7-bit data length*3 | R/W*4 |
| 7 | CM | Communication Mode<br>0: Asynchronous mode or simple IIC mode<br>1: Clock synchronous mode or simple SPI mode | R/W*4 |

Note 1. n is the decimal notation of the value of n in the BRR register. See section 26.2.20. BRR : Bit Rate Register.
Note 2. In any mode other than asynchronous mode, this bit setting is invalid and a fixed data length of 8 bits is used.
Note 3. LSB-first is fixed and the MSB (bit [7]) in the TDR register is not transmitted in transmit mode.
Note 4. Writable only when SCR.TE = 0 and SCR.RE = 0 (both serial transmission and reception are disabled).

The SMR register sets the communication format and clock source for the on-chip baud rate generator.

### CKS[1:0] bits (Clock Select)

The CKS[1:0] bits select the clock source for the on-chip baud rate generator. For the relationship between the settings of these bits and the baud rate, see section 26.2.20. BRR : Bit Rate Register.

### MP bit (Multi-Processor Mode)

The MP bit disables or enables the multi-processor communications function. The PE and PM bit settings are invalid in multi-processor mode.

### STOP bit (Stop Bit Length)

The STOP bit selects the stop bit length in transmission.

In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit frame.

### PM bit (Parity Mode)

The PM bit selects the parity mode (even or odd) for transmission and reception. The PM bit setting is invalid in multiprocessor mode.

### PE bit (Parity Enable)

When the PE bit is set to 1, the parity bit is added to transmit data, and the parity bit is checked in reception. Regardless of the PE bit setting, the parity bit is not added or checked in multi-processor format.

### CHR bit (Character Length)

The CHR bit selects the data length for transmission and reception in combination with the SCMR.CHR1 bit. In modes other than asynchronous, a fixed data length of 8 bits is used.

### CM bit (Communication Mode)

The CM bit selects the communication mode:

- Asynchronous mode or simple IIC mode
- Clock synchronous mode or simple SPI mode

## 26.2.12 SMR_SMCI : Serial Mode Register for Smart Card Interface Mode (SCMR.SMIF = 1)

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x00

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | GM | BLK | PE | PM | BCP[1:0] | | CKS[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | CKS[1:0] | Clock Select<br>0 0: PCLK clock (n = 0)*1<br>0 1: PCLK/4 clock (n = 1)*1<br>1 0: PCLK/16 clock (n = 2)*1<br>1 1: PCLK/64 clock (n = 3)*1 | R/W*2 |
| 3:2 | BCP[1:0] | Base Clock Pulse<br>Selects the number of base clock cycles in combination with the SCMR.BCP2 bit. Table 26.4 lists the combinations of the SCMR.BCP2 and SMR.BCP[1:0] bits. | R/W*2 |
| 4 | PM | Parity Mode<br>Valid only when the PE bit is 1.<br>0: Even parity<br>1: Odd parity | R/W*2 |
| 5 | PE | Parity Enable<br>When this bit is set to 1, a parity bit is added to transmit data, and the parity of received data is checked. Set this bit to 1 in smart card interface mode. | R/W*2 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6 | BLK | Block Transfer Mode<br>0: Normal mode operation<br>1: Block transfer mode operation | R/W*2 |
| 7 | GM | GSM Mode<br>0: Normal mode operation<br>1: GSM mode operation | R/W*2 |

Note 1. n is the decimal notation of the value of n in the BRR register. See section 26.2.20. BRR : Bit Rate Register.
Note 2. Writable only when SCR_SMCI.TE = 0 and SCR_SMCI.RE = 0 (both serial transmission and reception are disabled).

The SMR_SMCI register sets the communication format and clock source for the on-chip baud rate generator.

### CKS[1:0] bits (Clock Select)

The CKS[1:0] bits select the clock source for the on-chip baud rate generator. For the relationship between the settings of these bits and the baud rate, see section 26.2.20. BRR : Bit Rate Register.

### BCP[1:0] bits (Base Clock Pulse)

The BCP[1:0] bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set these bits in combination with the SCMR.BCP2 bit.

For details, see section 26.7.4. Receive Data Sampling Timing and Reception Margin.

**Table 26.4 Combinations of SCMR.BCP2 and SMR_SMCI.BCP[1:0] bits**

| SCMR.BCP2 bit | SMR_SMCI.BCP[1:0] bits | Number of base clock cycles for 1-bit transfer period*1 |
|---|---|---|
| 0 | 00b | 93 clock cycles (S = 93) |
| 0 | 01b | 128 clock cycles (S = 128) |
| 0 | 10b | 186 clock cycles (S = 186) |
| 0 | 11b | 512 clock cycles (S = 512) |
| 1 | 00b | 32 clock cycles (S = 32) (initial value) |
| 1 | 01b | 64 clock cycles (S = 64) |
| 1 | 10b | 372 clock cycles (S = 372) |
| 1 | 11b | 256 clock cycles (S = 256) |

Note 1. S is the value of S in BRR (see section 26.2.20. BRR : Bit Rate Register).

### PM bit (Parity Mode)

The PM bit selects the parity mode for transmission and reception (even or odd). For details on the usage of this bit in smart card interface mode, see section 26.7.2. Data Format (Except in Block Transfer Mode).

### PE bit (Parity Enable)

Set the PE bit to 1. The parity bit is added to transmit data before transmission, and the parity bit is checked in reception.

### BLK bit (Block Transfer Mode)

Setting the BLK bit to 1 enables block transfer mode operation. For details, see section 26.7.3. Block Transfer Mode.

### GM bit (GSM Mode)

Setting the GM bit to 1 enables GSM mode operation. In GSM mode, the SSR_SMCI.TEND flag set timing is moved forward to 11.0 etus (elementary time unit = 1-bit transfer time) from the start bit, and clock output control is added. For details, see section 26.7.6. Serial Data Transmission (Except in Block Transfer Mode) and section 26.7.8. Clock Output Control.

## 26.2.13 SCR : Serial Control Register for Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x02

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | TIE | RIE | TE | RE | MPIE | TEIE | CKE[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | CKE[1:0] | Clock Enable<br>0 0: In asynchronous mode, the SCKn pin is available for use as an I/O port based on the I/O port settings.<br>In clock synchronous mode, the SCKn pin functions as the clock output pin.<br>0 1: In asynchronous mode, a clock with the same frequency as the bit rate is output from the SCKn pin.<br>In clock synchronous mode, the SCKn pin functions as the clock output pin.<br>Others: In asynchronous mode, input a clock with a frequency 16 times the bit rate from the SCKn pin when the SEMR.ABCS bit is 0. Input a clock signal with a frequency eight times the bit rate when the SEMR.ABCS bit is 1. The SCKn pin is available for use as an I/O port based on the I/O port settings when the GPT clock*4 is used.<br>In clock synchronous mode, the SCKn pin functions as the clock input pin. | R/W*1 |
| 2 | TEIE | Transmit End Interrupt Enable<br>0: Disable SCIn_TEI interrupt requests<br>1: Enable SCIn_TEI interrupt requests | R/W |
| 3 | MPIE | Multi-Processor Interrupt Enable<br>Valid in asynchronous mode when SMR.MP = 1.<br>0: Normal reception<br>1: When data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags RDRF, ORER, and FER in SSR to 1 and the status flags SYER, PFER, and SBER in MESR are disabled.<br>When data with the multi-processor bit set to 1 is received, the MPIE bit is automatically set to 0, and normal reception is resumed. | R/W*3 |
| 4 | RE | Receive Enable<br>0: Disable serial reception<br>1: Enable serial reception | R/W*2 |
| 5 | TE | Transmit Enable<br>0: Disable serial transmission<br>1: Enable serial transmission | R/W*2 |
| 6 | RIE | Receive Interrupt Enable<br>0: Disable SCIn_RXI and SCIn_ERI interrupt requests<br>1: Enable SCIn_RXI and SCIn_ERI interrupt requests | R/W |
| 7 | TIE | Transmit Interrupt Enable<br>0: Disable SCIn_TXI interrupt requests<br>1: Enable SCIn_TXI interrupt requests | R/W |

Note 1. Writable only when TE = 0 and RE = 0.
Note 2. 1 can be written only when TE = 0 and RE = 0, when the SMR.CM bit is 1. After setting TE or RE to 1, only 0 can be written to TE and RE. When the SMR.CM bit is 0 and the SIMR1.IICM bit is 0, writing is enabled under any condition.
Note 3. When writing a new value to a bit other than the MPIE bit of this register in multi-processor mode (SMR.MP bit = 1), write 0 to the MPIE bit using the store instruction to avoid accidentally setting the MPIE bit to 1 by a read-modify-write operation when using a bit manipulation instruction.
Note 4. GPT clock is selectable for SCI1.

The SCR register controls operation and clock source selection for transmission and reception.

**CKE[1:0] bits (Clock Enable)**

The CKE[1:0] bits select the clock source and the SCKn pin function.

### TEIE bit (Transmit End Interrupt Enable)

The TEIE bit enables or disables SCIn_TEI interrupt requests. Set TEIE to 0 to disable an SCIn_TEI interrupt request.

In simple IIC mode, SCIn_TEI is allocated to the interrupt on completion of issuing a start, restart, or stop condition (STIn). In this case, the TEIE bit can be used to enable or disable the STI.

### MPIE bit (Multi-Processor Interrupt Enable)

When the MPIE bit is set to 1 and data with the multi-processor bit set to 0 is received, the data is not read and setting the status flags RDRF, ORER, FER, RDF, and DR in SSR/SSR_FIFO to 1 is disabled. When data with the multi-processor bit set to 1 is received, the MPIE bit is automatically set to 0, and normal reception resumes. For details, see section 26.4. Multi-Processor Communication Function.

When the MPB bit in the SSR register is 0, the receive data is not transferred from the RSR register to the RDR register, a receive error is not detected, and setting the flags ORER and FER to 1 is disabled.

When the MPB bit is set to 1, the MPIE bit is automatically set to 0, SCIn_RXI and SCIn_ERI interrupt requests are enabled (if the RIE bit in SCR is set to 1), and setting of the ORER and FER flags to 1 is enabled.

Set MPIE to 0 if the multi-processor communications function is not used.

### RE bit (Receive Enable)

The RE bit enables or disables serial reception. When the RE bit is set to 1, serial reception starts by detecting the start bit in asynchronous mode or the synchronous clock input in clock synchronous mode. Set the reception format in the SMR register before setting the RE bit to 1.

In non-FIFO operation, when reception is halted by setting the RE bit to 0, the RDRF, ORER, FER, and PER flags in the SSR register are not affected, and the previous values are retained.

When FIFO operation is selected and reception is halted by setting the RE bit to 0, the RDF, ORER, FER, PER, and DR flags in SSR_FIFO are not affected and the previous values are retained.

### TE bit (Transmit Enable)

The TE bit enables or disables serial transmission.

When the TE bit is set to 1, serial transmission is started by writing transmit data to the TDR register. Set the transmission format in the SMR register before setting the TE bit to 1.

### RIE bit (Receive Interrupt Enable)

The RIE bit enables or disables SCIn_RXI and SCIn_ERI interrupt requests.

SCIn_RXI and SCIn_ERI interrupt requests are disabled by setting the RIE bit to 0.

An SCIn_ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR/SSR_FIFO then setting the flag to 0, or by setting the RIE bit to 0.

### TIE bit (Transmit Interrupt Enable)

The TIE bit enables or disables SCIn_TXI interrupt requests. SCIn_TXI interrupt requests are disabled by setting the TIE bit to 0.

Note: To switch the TIE bit value from 0 to 1 in FIFO mode, set the TIE and TE bits to 1 simultaneously or set the TIE bit to 1 when TE = 1. When TE = 0 in FIFO mode, setting the TIE bit to 1 is prohibited.

## 26.2.14 SCR_SMCI : Serial Control Register for Smart Card Interface Mode (SCMR.SMIF = 1)

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x02

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | TIE | RIE | TE | RE | MPIE | TEIE | CKE[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | CKE[1:0] | Clock Enable<br>0 0: When SMR_SMCI.GM = 0: Disable output<br>The SCKn pin is available for use as an I/O port if set up in the I/O port settings<br>When SMR_SMCI.GM = 1: Fix output low<br>0 1: When SMR_SMCI.GM = 0: Output clock<br>When SMR_SMCI.GM = 1: Output clock<br>1 0: When SMR_SMCI.GM = 0: Setting prohibited<br>When SMR_SMCI.GM = 1: Fix output high<br>1 1: When SMR_SMCI.GM = 0: Setting prohibited<br>When SMR_SMCI.GM = 1: Output clock | R/W*1 |
| 2 | TEIE | Transmit End Interrupt Enable<br>Set this bit to 0 in smart card interface mode | R/W |
| 3 | MPIE | Multi-Processor Interrupt Enable<br>Set this bit to 0 in smart card interface mode | R/W |
| 4 | RE | Receive Enable<br>0: Disable serial reception<br>1: Enable serial reception | R/W*2 |
| 5 | TE | Transmit Enable<br>0: Disable serial transmission<br>1: Enable serial transmission | R/W*2 |
| 6 | RIE | Receive Interrupt Enable<br>0: Disable SCIn_RXI and SCIn_ERI interrupt requests<br>1: Enable SCIn_RXI and SCIn_ERI interrupt requests | R/W |
| 7 | TIE | Transmit Interrupt Enable<br>0: Disable SCIn_TXI interrupt requests<br>1: Enable SCIn_TXI interrupt requests | R/W |

Note 1. Writable only when TE = 0 and RE = 0.
Note 2. Can only be written as 1 when TE = 0 and RE = 0. After setting TE or RE to 1, only 0 can be written to TE and RE.

The SCR_SMCI register sets transmission and reception control, interrupt control, and clock source selection for transmission and reception.

For details on interrupt requests, see section 26.12. Interrupt Sources.

### CKE[1:0] bits (Clock Enable)

The CKE[1:0] bits control the clock output from the SCKn pin. In GSM mode, clock output can be dynamically switched. For details, see section 26.7.8. Clock Output Control.

### TEIE bit (Transmit End Interrupt Enable)

Set the TEIE bit to 0 in smart card interface mode.

### MPIE bit (Multi-Processor Interrupt Enable)

Set the MPIE bit to 0 in smart card interface mode.

### RE bit (Receive Enable)

The RE bit enables or disables serial reception. When the RE bit is set to 1, serial reception starts by detecting the start bit. Set the reception format in the SMR_SMCI register before setting the RE bit to 1.

If reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR_SMCI are not affected and the previous values are retained.

### TE bit (Transmit Enable)

The TE bit enables or disables serial transmission. When the TE bit is set to 1, serial transmission is started by writing transmit data to TDR. Set the transmission format in the SMR_SMCI register before setting the TE bit to 1.

### RIE bit (Receive Interrupt Enable)

The RIE bit enables or disables SCIn_RXI and SCIn_ERI interrupt requests.

SCIn_RXI and SCIn_ERI interrupt requests are disabled by setting the RIE bit to 0.

An SCIn_ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in the SSR_SMCI register, and then setting the flag to 0, or by setting the RIE bit to 0.

### TIE bit (Transmit Interrupt Enable)

The TIE bit enables or disables SCIn_TXI interrupt requests. SCIn_TXI interrupt requests are disabled by setting the TIE bit to 0.

## 26.2.15 SSR : Serial Status Register for Non-Smart Card Interface and Non-FIFO Mode (SCMR.SMIF = 0, FCR.FM = 0, and MMR.MANEN = 0)

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x04

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | TDRE | RDRF | ORER | FER | PER | TEND | MPB | MPBT |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MPBT | Multi-Processor Bit Transfer<br>Sets the value of the multi-processor bit in the transmission frame.<br>0: Data transmission cycle<br>1: ID transmission cycle | R/W |
| 1 | MPB | Multi-Processor<br>Value of the multi-processor bit in the reception frame.<br>0: Data transmission cycle<br>1: ID transmission cycle | R |
| 2 | TEND | Transmit End Flag<br>0: A character is being transmitted<br>1: Character transfer is complete | R |
| 3 | PER | Parity Error Flag<br>0: No parity error occurred<br>1: Parity error occurred | R/(W)*1 |
| 4 | FER | Framing Error Flag<br>0: No framing error occurred<br>1: Framing error occurred | R/(W)*1 |
| 5 | ORER | Overrun Error Flag<br>0: No overrun error occurred<br>1: Overrun error occurred | R/(W)*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6 | RDRF | Receive Data Full Flag<br>0: No received data in RDR register<br>1: Received data in RDR register | R/(W)*1 |
| 7 | TDRE | Transmit Data Empty Flag<br>0: Transmit data in TDR register<br>1: No transmit data in TDR register | R/(W)*1 |

Note 1. Only 0 can be written to clear the flag after reading 1.

The SSR register provides SCI status flags and transmission and reception multi-processor bits.

### MPBT bit (Multi-Processor Bit Transfer)

The MPBT bit sets the value of the multi-processor bit in the transmit frame.

### MPB bit (Multi-Processor)

The MPB bit holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

### TEND flag (Transmit End Flag)

The TEND flag indicates completion of transmission.

[Setting conditions]

- When the SCR.TE bit is set to 0 (serial transmission is disabled) and the FCR.FM bit is set to 0 (non-FIFO selected). When the SCR.TE bit is set to 1, the TEND flag is not affected and retains the value 1.
- When the TDR register is not updated on transmission of the tail-end bit of a character being transmitted.

[Clearing conditions]

- When transmit data is written to the TDR register while the SCR.TE bit is 1
- When 0 is written to TDRE after reading TDRE = 1 while the SCR.TE bit is 1

### PER flag (Parity Error Flag)

The PER flag indicates that a parity error occurred during reception in asynchronous mode and the reception ended abnormally.

[Setting condition]

- When a parity error is detected during reception in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).

  Although receive data is transferred to the RDR register when the parity error occurs, no SCIn_RXI interrupt request occurs. When the PER flag is set to 1, the subsequent receive data is not transferred to the RDR register.

[Clearing condition]

- When 0 is written to PER after reading PER = 1. After writing 0 to the PER flag, read the PER flag to check that it is actually set to 0.

When the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

### FER flag (Framing Error Flag)

The FER flag indicates that a framing error occurred during reception in asynchronous mode and the reception ended abnormally.

[Setting condition]

- When 0 is sampled as the stop bit during reception in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).

  In 2-stop-bit mode, only the first stop bit is checked. The second stop bit is not checked. Although receive data is transferred to the RDR register when the framing error occurs, no SCIn_RXI interrupt request occurs. When the FER flag is to 1, the subsequent receive data is not transferred to the RDR register.

[Clearing condition]

- When 0 is written to FER after reading FER = 1. After writing 0 to the FER flag, read the FER flag to check that it is actually set to 0.

When the SCR.RE bit is set to 0 (serial reception is disabled), the FER flag is not affected and retains its previous value.

#### ORER flag (Overrun Error Flag)

The ORER flag indicates that an overrun error occurred during reception and the reception ended abnormally.

[Setting condition]

- When the next data is received before receive data that does not have a parity error and a framing error is read from the RDR register.

  The data received before an overrun error occurred is saved in the RDR register, but data received after the error is lost. When the ORER flag is set to 1, receive data is not forwarded to the RDR register. In clock synchronous mode, serial transmission and reception are stopped.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1. After writing 0 to the ORER flag, read the ORER flag to check that it is actually set to 0.

When the SCR.RE bit is set to 0 (serial reception is disabled), the ORER flag is not affected and retains its previous value.

#### RDRF flag (Receive Data Full Flag)

The RDRF flag indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register.

[Clearing conditions]

- When 0 is written to RDRF after reading RDRF = 1
- When data is forwarded from the RDR register

#### TDRE flag (Transmit Data Empty Flag)

The TDRE flag indicates the presence of transmit data in the TDR register.

[Setting conditions]

- When the SCR.TE bit is 0
- When data is transmitted from the TDR register to the TSR register

[Clearing conditions]

- When 0 is written to TDRE after reading TDRE = 1
- When the SCR.TE bit is 1 and data is written to the TDR register

### 26.2.16 SSR_FIFO : Serial Status Register for Non-Smart Card Interface and FIFO Mode (SCMR.SMIF = 0, FCR.FM = 1, and MMR.MANEN = 0)

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x04

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | TDFE | RDF | ORER | FER | PER | TEND | — | DR |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | x | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DR | Receive Data Ready Flag<br>0: Receiving is in progress, or no received data remains in FRDRHL after successfully completed reception (receive FIFO empty)<br>1: Next receive data is not received for a period after normal receiving is complete, when the amount of data stored in the FIFO is equal to or less than the receive triggering number | R/W*1 |
| 1 | — | The read value is undefined. The write value should be 1. | R/W |
| 2 | TEND | Transmit End Flag<br>0: A character is being transmitted<br>1: Character transfer is complete | R/W*1 |
| 3 | PER | Parity Error Flag<br>0: No parity error occurred<br>1: Parity error occurred | R/W*1 |
| 4 | FER | Framing Error Flag<br>0: No framing error occurred<br>1: Framing error occurred | R/W*1 |
| 5 | ORER | Overrun Error Flag<br>0: No overrun error occurred<br>1: Overrun error occurred | R/W*1 |
| 6 | RDF | Receive FIFO Data Full Flag<br>0: The amount of receive data written in FRDRHL is less than the specified receive triggering number<br>1: The amount of receive data written in FRDRHL is equal to or greater than the specified receive triggering number | R/W*1 |
| 7 | TDFE | Transmit FIFO Data Empty Flag<br>0: The amount of transmit data written in FTDRHL exceeds the specified transmit triggering number<br>1: The amount of transmit data written in FTDRHL is equal to or less than the specified transmit triggering number | R/W*1 |

Note 1. Only 0 can be written, to clear the flag after reading 1.

The SSR_FIFO register provides the SCI with FIFO mode status flags.

### DR flag (Receive Data Ready Flag)

The DR flag indicates that the amount of data stored in the Receive FIFO Data Register (FRDRHL) falls below the specified receive triggering number, and that no next data is received after 15 etus (elementary time units) from the last stop bit in asynchronous mode. This flag is valid only in asynchronous mode, including multi-processor mode, when FIFO operation is selected.

In clock synchronous mode, the DR flag is not set to 1.

[Setting condition]

- When FRDRHL contains less data than the specified receive triggering number, and no next data is received after 15 etus*1 from the last stop bit, and the SSR_FIFO.FER and SSR_FIFO.PER flags are 0.

[Clearing conditions]

- When 1 is read from DR, after all received data is read
- When the FCR.FM bit is changed from 0 to 1

Note 1. This is equivalent to 1.5 frames in the 8-bit format with one stop bit.

The DR flag is only set to 1 when FIFO is selected in asynchronous mode, including multi-processor mode. It is not set to 1 in other operation modes.

### TEND flag (Transmit End Flag)

The TEND flag indicates that FTDRHL does not contain valid data when transmitting the last bit of a serial character, so the transmission is halted.

[Setting condition]

- When FTDRHL does not contain transmit data when the last bit of a 1-byte serial character is transmitted.

[Clearing conditions]

- When transmit data is written to FTDRHL[*1] while the SCR.TE bit is 1
- When 0 is written to TEND after 1 is read from TEND, when the SCR.TE bit is 1
- When the FCR.FM bit is changed from 0 to 1

Note 1. Do not use the TEND bit as a transmit end flag when the DTC writes data to FTDRHL in response to an SCIn_TXI interrupt request.

#### PER flag (Parity Error Flag)

The PER flag indicates whether there is a parity error in the data read from the FRDRHL register in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).

[Setting condition]

- When data is received and a parity error is detected, when the address match function is disabled (DCCR.DCME = 0).

[Clearing condition]

- When 0 is written to PER after reading PER = 1.

The reception operation is continuous, and the receive data is stored in the FRDRHL register, even when a parity error occurs during reception.

When the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

#### FER flag (Framing Error Flag)

The FER flag indicates whether there is a framing error in the data read from the FRDRHL register in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).

[Setting condition]

- When 0 is sampled as the stop bit during reception when the address match function is disabled (DCCR.DCME = 0).

[Clearing condition]

- When 0 is written to FER after reading FER = 1.

The reception operation is continuous, and the receive data is stored in the FRDRHL register, even when a framing error occurs during reception.

When the SCR.RE bit is set to 0 (serial reception is disabled), the FER flag is not affected and retains its previous value.

#### ORER flag (Overrun Error Flag)

The ORER flag indicates that the receive operation stopped abnormally because an overrun error occurred.

[Setting condition]

- When the next serial reception completes while the receive FIFO is full with 16-byte receive data.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1.

When the SCR.RE bit is set to 0 (serial reception is disabled), the ORER flag is not affected and retains its previous value.

#### RDF flag (Receive FIFO Data Full Flag)

The RDF flag indicates that receive data was transferred to the FRDRHL register, and the amount of data in FRDRHL is equal to or exceeds the specified receive triggering number. When RTRG is set to 0, the RDF flag is not set even when the amount of data in the receive FIFO is equal to 0.

[Setting condition]

- When the amount of receive data equal to or greater than the specified receive triggering number is stored in FRDRHL,[*1] and the FIFO is not empty.

[Clearing conditions]

- When 0 is written to RDF after reading RDF = 1
- When FRDRHL is read by the DTC, but only when the block transfer is the last transmission
- When the setting and clearing conditions occur at the same time, the RDF bit is set to 0. After that, when the amount of data stored in the FRDRHL register is the same as or greater than the RTRG value, RDF is set to 1 after 1 PCLK.

Note 1. Because FRDRHL is a 16-stage FIFO register, the maximum amount of data that can be read when RDF is 1 is equivalent to the specified receive triggering number. If an attempt is made to read after all the data in FRDRHL is read, the data is undefined.

**TDFE flag (Transmit FIFO Data Empty Flag)**

The TDFE flag indicates that data is transferred from the FTDRHL register into the TSR register, the amount of data in FTDRHL is below the specified transmit triggering number, and writing of transmit data to FTDRHL is enabled.

[Setting conditions]

- When the TE bit in SCR is 0
- When the amount of transmit data written in FTDRHL is equal to or less than the specified transmit triggering number*1

[Clearing conditions]

- When writing to FTDRHL is executed on the last transmission while the DTC is activated
- When 0 is written to the TDFE flag after reading TDFE = 1.*2
  The setting conditions are given priority when TE = 0. When the setting condition and clearing condition occur at the same time, the TDFE flag is set to 0. After that, when the amount of data stored in the FTDRHL register is equal to or less than the TTRG value, TDFE is set to 1 after 1 PCLK.

Note 1. Because the FTDRHL register is a 16-stage FIFO register, when the TDFE flag is 1, the maximum amount of data that can be written to the FTDRHL register is 16 minus FDR.T[4:0] bytes. If more data is written, data is discarded.
Note 2. Do not clear the TDFE flag during block transfer processing by the DTC.

## 26.2.17 SSR_SMCI : Serial Status Register for Smart Card Interface Mode (SCMR.SMIF = 1, and MMR.MANEN = 0)

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x04

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | TDRE | RDRF | ORER | ERS | PER | TEND | MPB | MPBT |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MPBT | Multi-Processor Bit Transfer<br>Set this bit to 0 in smart card interface mode | R/W |
| 1 | MPB | Multi-Processor<br>Set this bit to 0 in smart card interface mode | R |
| 2 | TEND | Transmit End Flag<br>0: A character is being transmitted<br>1: Character transfer is complete | R |
| 3 | PER | Parity Error Flag<br>0: No parity error occurred<br>1: Parity error occurred | R/W*1 |
| 4 | ERS | Error Signal Status Flag<br>0: No low error signal response<br>1: Low error signal response occurred | R/W*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5 | ORER | Overrun Error Flag<br>0: No overrun error occurred<br>1: Overrun error occurred | R/W*1 |
| 6 | RDRF | Receive Data Full Flag<br>0: No received data in RDR register<br>1: Received data in RDR register | R/W*1 |
| 7 | TDRE | Transmit Data Empty Flag<br>0: Transmit data in TDR register<br>1: No transmit data in TDR register | R/W*1 |

Note 1. Only 0 can be written, to clear the flag after reading 1.

The SSR_SMCI register provides the SCI with smart card interface mode status flags.

### TEND flag (Transmit End Flag)

When there is no error signal from the receiving side, the TEND flag is set to 1 when more data for transfer is ready to be transferred to the TDR register.

[Setting conditions]

- When the SCR_SMCI.TE bit = 0 (serial transmission is disabled).
  When the SCR_SMCI.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When a specified period elapses after the latest transmission of 1 byte, the ERS flag is 0, and the TDR register is not updated.

  The set timing is determined by the following register settings:
  - When SMR_SMCI.GM = 0 and SMR_SMCI.BLK = 0, 12.5 etus after the start of transmission
  - When SMR_SMCI.GM = 0 and SMR_SMCI.BLK = 1, 11.5 etus after the start of transmission
  - When SMR_SMCI.GM = 1 and SMR_SMCI.BLK = 0, 11.0 etus after the start of transmission
  - When SMR_SMCI.GM = 1 and SMR_SMCI.BLK = 1, 11.0 etus after the start of transmission

[Clearing conditions]

- When transmit data is written to the TDR register while the SCR_SMCI.TE bit is 1
- When 0 is written to TDRE after reading TDRE = 1 while the SCR_SMCI.TE bit is 1

### PER flag (Parity Error Flag)

The PER flag indicates that a parity error occurred during reception in asynchronous mode and the reception ended abnormally.

[Setting condition]

- When a parity error is detected during reception. Although receive data is transferred to RDR when a parity error occurs, no SCIn_RXI interrupt request occurs. After the PER flag is set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1. After writing 0 to the PER flag, read the flag to check that it is actually set to 0.

When the RE bit in SCR_SMCI is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

### ERS flag (Error Signal Status Flag)

[Setting condition]

- When a low error signal is sampled.

[Clearing condition]

- When 0 is written to ERS after reading ERS = 1.

### ORER flag (Overrun Error Flag)

The ORER flag indicates that an overrun error occurred during reception and the reception ended abnormally.

[Setting condition]

- When the next data is received before receive data that does not have a parity error is read from the RDR register. The data received before an overrun error occurred is saved in the RDR, but data received after the error is lost. When the ORER flag is set to 1, receive data is not forwarded to the RDR register.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1. After writing 0 to the ORER flag, read the flag to check that it is actually set to 0.

When the RE bit in SCR_SMCI is set to 0, the ORER flag is not affected and retains its previous value.

### RDRF flag (Receive Data Full Flag)

The RDRF flag indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register.

[Clearing conditions]

- When 0 is written to RDRF after reading RDRF = 1
- When data is forwarded from the RDR register

### TDRE flag (Transmit Data Empty Flag)

The TDRE flag indicates the presence of transmit data in the TDR register.

[Setting conditions]

- When the SCR_SMCI.TE bit is 0
- When data is transmitted from the TDR register to the TSR register

[Clearing conditions]

- When 0 is written to TDRE after reading TDRE = 1
- When the SCR_SMCI.TE bit is 1 and data is written to the TDR register

## 26.2.18 SSR_MANC : Serial Status Register for Manchester Mode (SCMR.SMIF = 0, and MMR.MANEN = 1)

Base address: SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x04

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | TDRE | RDRF | ORER | FER | PER | TEND | MPB | MER |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | MER | Manchester Error Flag<br>Valid for Manchester mode only<br>0: No Manchester error occurred<br>1: Manchester error has occurred | R/(W)*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1 | MPB | Multi-Processor<br>Value of the multi-processor bit in the reception frame<br>0: Data transmission cycles<br>1: ID transmission cycles | R |
| 2 | TEND | Transmit End Flag<br>0: A character is being transmitted<br>1: Character transfer has been completed | R |
| 3 | PER | Parity Error Flag<br>0: No parity error occurred<br>1: A parity error has occurred | R/(W)*1 |
| 4 | FER | Framing Error Flag<br>0: No framing error occurred<br>1: A framing error has occurred | R/(W)*1 |
| 5 | ORER | Overrun Error Flag<br>0: No overrun error occurred<br>1: An overrun error has occurred | R/(W)*1 |
| 6 | RDRF | Receive Data Full Flag<br>0: No received data is in RDR register<br>1: Received data is in RDR register | R/(W)*1 |
| 7 | TDRE | Transmit Data Empty Flag<br>0: Transmit data is in TDR register<br>1: No transmit data is in TDR register | R/(W)*1 |

Note 1. Only 0 can be written to this bit, to clear the flag after confirmed (read) the flag is set to 1.

SSR is constructed in the status flag of SCI and reception multi processor bits.

### MER flag (Manchester Error Flag)

When data is received in Manchester mode, Manchester error is detected and it is displayed.

[Setting conditions]

- When receiving in Manchester mode and detecting Manchester code error in data area of received frame.
  Received data when an error occurs is transferred to the RDR register, but the RXI interrupt request is not generated and the ERI interrupt request is generated.
  When the Manchester error flag is set to “1”, subsequent receive data is not transferred to the RDR register.
  For details on Manchester error, see section 26.5.11. Errors in Manchester Mode.

[Clearing conditions]

- When 0 is written to MER after 1 is read (after writing 0 to it, read the MER bit to check that it is actually set to 0.)
  Even when the RE bit in SCR is set to 0 (serial reception is disabled), the MER flag is not affected and retains its previous value.

### MPB flag (Multi-Processor)

Holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

### TEND flag (Transmit End Flag)

Indicates completion of transmission.

[Setting conditions]

- When the SCR.TE bit is set to 0 (serial transmission is disabled) and FCR.FM bit is set to 0 (non-FIFO selected).
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When the TDR register is not updated at the time of transmission of the tail-end bit of a character being transmitted

[Clearing conditions]

- When transmit data are written to the TDR register while the SCR.TE bit is 1.
- When 0 is written to TDRE after 1 is read while the SCR.TE bit is 1.

#### PER flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception in Asynchronous Mode and the state of Address Match function invalidity (DCCR.DCME = 0).
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after 1 is read (after writing 0 to it, read the PER bit to check that it is actually set to 0.)

Even when the RE bit in SCR is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

#### FER flag (Framing Error Flag)

Indicates that a framing error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When 0 is sampled as the stop bit during reception in Asynchronous Mode and the state of Address Match function invalidity (DCCR.DCME = 0).
  In 2-stop-bit mode, only the first stop bit is checked whether it is 1 but the second stop bit is not checked. Note that although receive data when the framing error occurs is transferred to RDR, no RXI interrupt request occurs. In addition, when the FER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to FER after 1 is read (after writing 0 to it, read the FER bit to check that it is actually set to 0.)

Even when the RE bit in SCR is set to 0, the FER flag is not affected and retains its previous value.

#### ORER flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR which don’t have any valid reception error.
  In RDR, receive data prior to an overrun error occurrence is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, reception data isn’t forwarded to RDR register. Note that, in clock synchronous mode, serial transmission and reception are stopped.

[Clearing condition]

- When 0 is written to ORER after 1 is read (after writing 0 to it, read the ORER bit to check that it is actually set to 0.)

Even when the RE bit in SCR is set to 0, the ORER flag is not affected and retains its previous value.

#### RDRF flag (Receive Data Full Flag)

Indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register

[Clearing conditions]

- When 0 is written to RDRF after 1 is read
- When it reads the data from the RDR register

#### TDRE flag (Transmit Data Empty Flag)

Indicates the presence of transmit data in the TDR register.

[Setting conditions]

- When the SCR.TE bit is 0
- When data is transmitted from the TDR register to the TSR register

[Clearing conditions]

- When 0 is written to TDRE after 1 is read
- When the SCR.TE bit is 1, it is written to the TDR register

Note: RDRF and TDRE should not be cleared by SSR register access unless communication is interrupted.

## 26.2.19 SCMR : Smart Card Mode Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x06

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | BCP2 | — | — | CHR1 | SDIR | SINV | — | SMIF |
| Value after reset: | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SMIF | Smart Card Interface Mode Select<br>0: Non-smart card interface mode (asynchronous mode, clock synchronous mode, simple SPI mode, or simple IIC mode)<br>1: Smart card interface mode | R/W*1 |
| 1 | — | This bit is read as 1. The write value should be 1. | R/W |
| 2 | SINV | Transmitted/Received Data Invert<br>Set the SINV bit to 0 for operation in simple IIC mode.<br>The level of communication terminals (RXD, TXD) are controlled by combination of this bit and SPTR.TINV/RINV. For details, see Figure 26.5.<br>The SINV bit can be used in the following modes:<br>● Smart card interface mode<br>● Asynchronous mode (including multi-processor mode)<br>● Clock synchronous mode<br>● Simple SPI mode<br>0: TDR contents are transmitted as they are. Received data is stored as received in the RDR register.<br>1: TDR register contents are inverted before transmission. Receive data is stored in inverted form in the RDR register. | R/W*1 |
| 3 | SDIR | Transmitted/Received Data Transfer Direction<br>Set the SDIR bit to 1 for operation in simple IIC mode.<br>The SDIR bit can be used in the following modes:<br>● Smart card interface mode<br>● Asynchronous mode (including multi-processor mode)<br>● Clock synchronous mode<br>● Simple SPI mode<br>0: Transfer LSB-first<br>1: Transfer MSB-first | R/W*1 |
| 4 | CHR1 | Character Length 1<br>Valid only in asynchronous mode.*2<br>Selects the transmit/receive character length in combination with the SMR.CHR bit.<br>0: SMR.CHR = 0: Transmit/receive in 9-bit data length<br>SMR.CHR = 1: Transmit/receive in 9-bit data length<br>1: SMR.CHR = 0: Transmit/receive in 8-bit data length (initial value)<br>SMR.CHR = 1: Transmit/receive in 7-bit data length*3 | R/W*1 |
| 6:5 | — | These bits are read as 1. The write value should be 1. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7 | BCP2 | Base Clock Pulse 2<br>Selects the number of base clock cycles in combination with the SMR_SMCI.BCP[1:0] bits.<br>Table 26.5 lists the combinations of the SCMR.BCP2 and SMR_SMCI.BCP[1:0] bits. | R/W*1 |

Note 1. Writable only when the TE and RE bits in SCR/SCR_SMCI are 0 (both serial transmission and reception are disabled).
Note 2. The setting is invalid and a fixed data length of 8 bits is used in modes other than asynchronous mode.
Note 3. LSB-first must be selected and the value of the MSB (bit [7]) in TDR cannot be transmitted.

The SCMR register selects the smart card interface and communication format.

### SMIF bit (Smart Card Interface Mode Select)

Setting the SMIF bit to 1 selects smart card interface mode. Setting it to 0 selects all other modes:

- Asynchronous mode, including multi-processor mode
- Clock synchronous mode
- Simple SPI mode
- Simple IIC mode

### SINV bit (Transmitted/Received Data Invert)

The SINV bit inverts the transmit and receive data logic level. It does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SMR or SMR_SMCI.

### CHR1 bit (Character Length 1)

The CHR1 bit selects the data length of transmit and receive data in combination with the CHR bit in the SMR register. A fixed data length of 8 bits is used in modes other than asynchronous mode.

### BCP2 bit (Base Clock Pulse 2)

The BCP2 bit selects the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set this bit in combination with the SMR_SMCI.BCP[1:0] bits.

**Table 26.5 Combinations of the SCMR.BCP2 and SMR_SMCI.BCP[1:0] bits**

| SCMR.BCP2 bit | SMR_SMCI.BCP[1:0] bits | Number of base clock cycles for 1-bit transfer period |
|---|---|---|
| 0 | 00b | 93 clock cycles (S = 93)*1 |
| 0 | 01b | 128 clock cycles (S = 128)*1 |
| 0 | 10b | 186 clock cycles (S = 186)*1 |
| 0 | 11b | 512 clock cycles (S = 512)*1 |
| 1 | 00b | 32 clock cycles (S = 32) (Initial Value)*1 |
| 1 | 01b | 64 clock cycles (S = 64)*1 |
| 1 | 10b | 372 clock cycles (S = 372)*1 |
| 1 | 11b | 256 clock cycles (S = 256)*1 |

Note 1. S is the value of S in section 26.2.20. BRR : Bit Rate Register.

## 26.2.20 BRR : Bit Rate Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x01

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

BRR is an 8-bit register that adjusts the bit rate.

As each SCI channel has independent baud rate generator control, different bit rates can be set for each channel. Table 26.6 shows the relationship between the setting (N) in the BRR and the bit rate (B) for normal asynchronous mode, multi-processor transfer, clock synchronous mode, smart card interface mode, simple SPI mode, and simple IIC mode.

The initial value of the BRR register is 0xFF. The BRR register can be read by the CPU, but it can be written to only when the TE and RE bits in SCR/SCR_SMCI are 0.

**Table 26.6 Relationship between N setting in BRR and bit rate B**

| Mode | SEMR settings | | | BRR setting | Error |
|---|---|---|---|---|---|
| | BGDM bit | ABCS bit | ABCS E bit | | |
| Asynchronous, multi-processor transfer | 0 | 0 | 0 | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | $Error\ (\%) = \left\{\frac{PCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$ |
| | 1 | 0 | 0 | $N = \frac{PCLK \times 10^6}{32 \times 2^{2n-1} \times B} - 1$ | $Error\ (\%) = \left\{\frac{PCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$ |
| | 0 | 1 | 0 | | |
| | 1 | 1 | 0 | $N = \frac{PCLK \times 10^6}{16 \times 2^{2n-1} \times B} - 1$ | $Error\ (\%) = \left\{\frac{PCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$ |
| | Don't care | Don't care | 1 | $N = \frac{PCLK \times 10^6}{12 \times 2^{2n-1} \times B} - 1$ | $Error\ (\%) = \left\{\frac{PCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1\right\} \times 100$ |
| Clock synchronous, simple SPI | | | | $N = \frac{PCLK \times 10^6}{8 \times 2^{2n-1} \times B} - 1$ | — |
| Smart card interface | | | | $N = \frac{PCLK \times 10^6}{S \times 2^{2n+1} \times B} - 1$ | $Error\ (\%) = \left\{\frac{PCLK \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1\right\} \times 100$ |
| Simple IIC*1 | | | | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | — |

Note: B: Bit rate (bps)
N: BRR setting for on-chip baud rate generator (0 ≤ N ≤ 255)
PCLK: Operating frequency (MHz)
n and S: Determined by the SMR/SMR_SMCI and SCMR register settings as listed in Table 26.8 and Table 26.9.

Note 1. Adjust the bit rate so that the widths of high and low level of the SCLn output in simple IIC mode satisfy the $I^2C$ bus standard.

**Table 26.7 Calculating widths of SCLn high and low levels**

| Mode | SCLn | Formula (result in seconds) |
|---|---|---|
| IIC | Width at high level (minimum value) | $(N+1) \times 4 \times 2^{2n-1} \times 7 \times \frac{1}{PCLK \times 10^6}$ |
| | Width at low level (minimum value) | $(N+1) \times 4 \times 2^{2n-1} \times 8 \times \frac{1}{PCLK \times 10^6}$ |

**Table 26.8 Clock source settings**

| SMR or SMR_SMCI.CKS[1:0] bits setting | | |
|---|---|---|
| CKS[1:0] bits | Clock source | n |
| 00b | PCLK clock | 0 |
| 01b | PCLK/4 clock | 1 |
| 10b | PCLK/16 clock | 2 |
| 11b | PCLK/64 clock | 3 |

**Table 26.9 Base clock settings in smart card interface mode**

| SCMR.BCP2 bit setting | SMR_SMCI.BCP[1:0] bits setting | | |
|---|---|---|---|
| BCP2 bit | BCP[1:0] bits | Base clock cycles for 1-bit period | S |
| 0 | 00b | 93 clock cycles | 93 |
| 0 | 01b | 128 clock cycles | 128 |
| 0 | 10b | 186 clock cycles | 186 |
| 0 | 11b | 512 clock cycles | 512 |
| 1 | 00b | 32 clock cycles | 32 |
| 1 | 01b | 64 clock cycles | 64 |
| 1 | 10b | 372 clock cycles | 372 |
| 1 | 11b | 256 clock cycles | 256 |

Table 26.10 and Table 26.11 list examples of BRR (N) settings in normal asynchronous mode. Table 26.12 lists the maximum bit rate settable for each operating frequency. Table 26.16 lists examples of BRR (N) settings in smart card interface mode.

In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, see section 26.7.4. Receive Data Sampling Timing and Reception Margin. Table 26.13 and Table 26.15 list the maximum bit rates with external clock input.

When either the Asynchronous Mode Base Clock Select bit (ABCS) or the Baud Rate Generator Double-speed Mode Select bit (BGDM) in the Simple LIN Mode Register (SEMR) is set to 1 in asynchronous mode, the bit rate becomes twice the value listed in Table 26.17. When both of those registers are set to 1, the bit rate becomes four times the listed value.

**Table 26.10 Examples of BRR settings for different bit rates in asynchronous mode (1) (1 of 3)**

| Bit rate (bps) | Operating frequency PCLK (MHz) | | | | | | | | | | | | | | |

Note: Space: Setting prohibited.
—: Can be set, but an error occurs.

Note 1. Continuous transmission or reception is not possible. After transmitting or receiving one frame of data, a 1-bit period elapses before starting to transmit or receive the next frame of data. The output of the synchronization clock is stopped for a 1-bit period. Therefore, it takes 9 bits worth of time to transfer one frame (8 bits) of data, and the average transfer rate is 8/9 times the bit rate. When the FIFO is selected, this setting (BRR = 0x00 and SMR.CKS[1:0] = 00b) is not available.

**Table 26.15 Maximum bit rate with external clock input in clock synchronous and simple SPI modes**

## 26.2.21 MDDR : Modulation Duty Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x12

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

MDDR corrects the bit rate adjusted by the BRR register.

When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected using the settings in MDDR (M/256). Table 26.20 shows the relationship between the MDDR setting (M) and the bit rate (B).

The initial value of MDDR is 0xFF. Bit [7] in this register is fixed to 1.

The CPU can read the MDDR register, but this register is only writable when the TE and RE bits in SCR/SCR_SMCI are 0.

**Table 26.20 Relationship between MDDR setting (M) and bit rate (B) when bit rate modulation function is used**

B: Bit rate (bps)
M: MDDR setting (128 ≤ MDDR ≤ 256)
N: BRR setting for baud rate generator (0 ≤ N ≤ 255)
PCLK: Operating frequency (MHz)
n and S: Determined by the SMR/SMR_SMCI and SCMR register settings as listed in Table 26.8 and Table 26.9 in section 26.2.20. BRR : Bit Rate Register.

| Mode | SEMR settings | | | BRR setting | Error |
|---|---|---|---|---|---|
| | BGDM bit | ABCS bit | ABCSE bit | | |
| Asynchronous multiprocessor transfer | 0 | 0 | 0 | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times \left(256/M\right) \times B} - 1$ | $Error(\%) = \left\{\frac{PCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times \left(256/M\right) \times (N+1)} - 1\right\} \times 100$ |
| | 1 | 0 | 0 | $N = \frac{PCLK \times 10^6}{32 \times 2^{2n-1} \times \left(256/M\right) \times B} - 1$ | $Error(\%) = \left\{\frac{PCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times \left(256/M\right) \times (N+1)} - 1\right\} \times 100$ |
| | 0 | 1 | 0 | | |
| | 1 | 1 | 0 | $N = \frac{PCLK \times 10^6}{16 \times 2^{2n-1} \times \left(256/M\right) \times B} - 1$ | $Error(\%) = \left\{\frac{PCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times \left(256/M\right) \times (N+1)} - 1\right\} \times 100$ |
| | × | × | 1 | $N = \frac{PCLK \times 10^6}{12 \times 2^{2n-1} \times \left(256/M\right) \times B} - 1$ | $Error(\%) = \left\{\frac{PCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times \left(256/M\right) \times (N+1)} - 1\right\} \times 100$ |
| Clock synchronous, simple SPI*1 | | | | $N = \frac{PCLK \times 10^6}{8 \times 2^{2n-1} \times \left(256/M\right) \times B} - 1$ | — |
| Smart card interface | | | | $N = \frac{PCLK \times 10^6}{S \times 2^{2n+1} \times \left(256/M\right) \times B} - 1$ | $Error(\%) = \left\{\frac{PCLK \times 10^6}{B \times S \times 2^{2n+1} \times \left(256/M\right) \times (N+1)} - 1\right\} \times 100$ |
| Simple IIC*2 | | | | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times \left(256/M\right) \times B} - 1$ | — |

Note 1. Do not use this function in clock synchronous mode or in the highest speed settings in simple SPI mode (SMR.CKS[1:0] = 00b, SCR.CKE[1] = 0, and BRR = 0).
Note 2. Adjust the bit rate so that the widths at high and low level of the SCLn output in simple IIC mode satisfy the IIC standard.

Table 26.21 and Table 26.22 list examples of N settings in BRR and M settings in MDDR in normal asynchronous mode.

**Table 26.21 Examples of the BRR and MDDR settings for different bit rates in asynchronous mode (1) (1 of 4)**

| Bit rate (bps) | Operating frequency PCLK (MHz) | | | | | | | | | | | | | | |

| 6 | BGDM | Baud Rate Generator Double-Speed Mode Select<br>Valid only in asynchronous mode with SCR.CKE[1] = 0.<br>0: Output clock from baud rate generator with normal frequency<br>1: Output clock from baud rate generator with doubled frequency | R/W*1 |
| 7 | RXDESEL | Asynchronous Start Bit Edge Detection Select<br>Valid only in asynchronous mode.<br>0: Detect low level on RXDn pin as start bit<br>1: Detect falling edge of RXDn pin as start bit | R/W*1 |

Note 1. Writable only when the TE and RE bits in SCR/SCR_SMCI are 0 (both serial transmission and reception are disabled).

The SEMR register selects the clock source for the 1-bit period in asynchronous mode.

### ACS0 bit (Asynchronous Mode Clock Source Select)

Selects the clock source in the asynchronous mode.

The ACS0 bit is valid in asynchronous mode (SMR.CM bit = 0) and when an external clock input is selected (SCR.CKE[1:0] bits = 10b or 11b). This bit is used to select an external clock input or the logical AND of compare matches output from the internal GPT.

Set the ACS0 bit to 0 in other than asynchronous mode.

For SCI1, the GTIOCnA output (n = 3, 4) of GPT can be set as the serial transfer base clock. For details, see Table 26.23.

These bits for the other SCI channels than SCI1 are reserved. The write values to these bits for other than SCI1 should be 0.

**Table 26.23 Correspondence between SCI Channels and Compare Match Outputs**

| SCI | GPT | Compare Match Output |
|---|---|---|
| SCI1 | GPT3 | GTIOC3A |
| | GPT4 | GTIOC4A |

Figure 26.3, Figure 26.4 show a setting example of when GTIOC3A and GTIOC4A are selected for output.

This figure shows an example when GPT clock is input to SCI1.

When generating 187.5 kbps of GPT average transfer rate for PCLKD = 32 MHz:

1. Generate a frequency of 4 MHz using GTIOC3A as the base clock.
2. Generate 3/4 clock enable of base clock to set an average transfer rate of 3 MHz/16 = 187.5 kbps using GTIOC4A.

Setting examples of GPT and SCI

- GPT3.GTSSR = 0x80000000, GPT4.GTSSR = 0x80000000 (enable software counter start)
- GPT3.GTPR = 0x00000007, GPT4.GTPR = 0x0000001F (maximum count value of GTCNT)
- GPT3.GTCCRA = 0x00000003, GPT4.GTCCRA = 0x00000007 (compare match value)
- GPT3.GTCR = 0x00000000, GPT4.GTCR = 0x00000000 (saw-wave PWM mode, timer prescaler is PCLKD/1)
- GPT3.GTIOR = 0x00000306, GPT4.GTIOR = 0x00000306

(Initial output low, output high at GTCCRA compare match, output low at cycle end)

- SCR.SCK[1:0] = 10b (external clock input or GPT clock input is selected)

- SEMR = 0x01 (TMR clock input is selected with 16 base clock cycles for 1-bit period)
- GPT3.GTSTR = 0x00000018 (software start GTCNT counter)

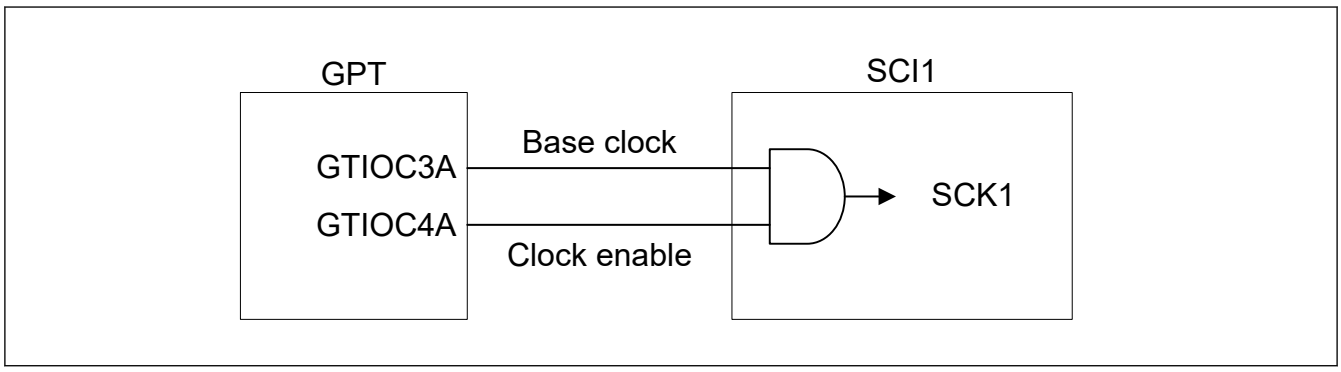

**Figure 26.3 Example of GPT and SCI connection**

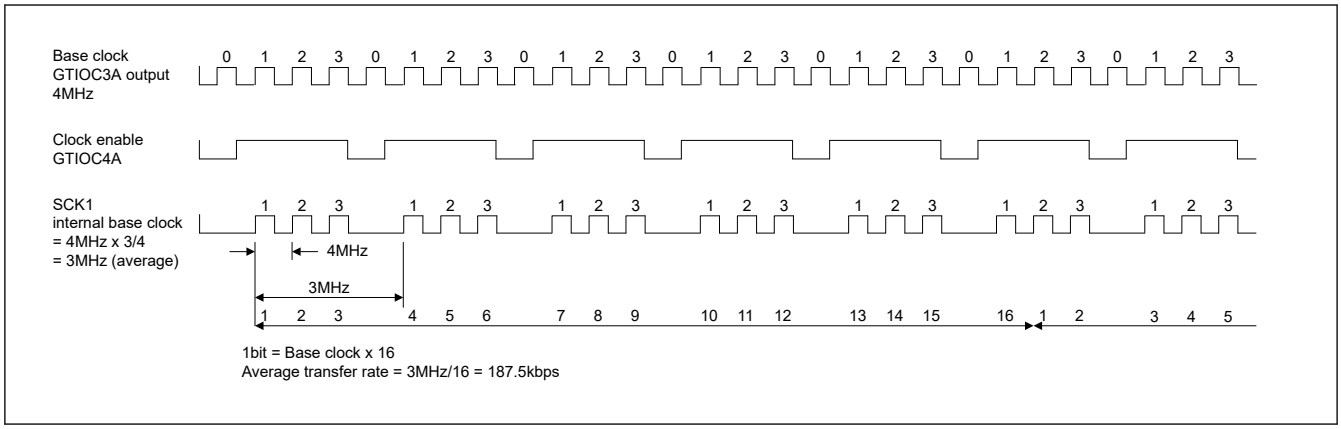

**Figure 26.4 Example of average transfer rate setting when GPT clock is input**

### PADIS bit (Preamble function Disable)

In asynchronous mode, select enable / disable of preamble function. In Manchester mode, preamble is not output regardless of this bit setting

### BRME bit (Bit Rate Modulation Enable)

The BRME bit enables or disables the bit rate modulation function. The bit rate generated by the on-chip baud rate generator is evenly corrected when this function is enabled. Set to 0 in Manchester mode.

### ABCSE bit (Asynchronous Mode Extended Base Clock Select 1)

The ABCSE bit sets the pulse number for the base clock in a 1-bit period to 6, and the double-frequency clock is output from the baud rate generator. When the bit rate is set to 6 while dividing the bus clock frequency, use this bit and set SMR.CKS[1:0] = 00b and BRR = 0.

Set it to 0 in modes other than asynchronous mode. Even in asynchronous mode, set it to 0 when using external clock.

### ABCS bit (Asynchronous Mode Base Clock Select)

The ABCS bit selects the number of clock cycles for a 1-bit period.

Set it to 0 in modes other than asynchronous mode and Manchester mode.

### NFEN bit (Digital Noise Filter Function Enable)

The NFEN bit enables or disables the digital noise filter function.

When the digital noise filter function is enabled:

- Noise cancellation is applied to the RXDn input signal in asynchronous mode
- Noise cancellation is applied to the SDAn and SCLn input signals in simple $I^2C$ mode

In all other modes, set the NFEN bit to 0 to disable the digital noise filter function. When the function is disabled, input signals are transferred as received.

### BGDM bit (Baud Rate Generator Double-Speed Mode Select)

The BGDM bit selects whether or not to double the base clock frequency output from the baud rate generator.

The BGDM bit is valid when the on-chip baud rate generator is selected as the clock source (SCR.CKE[1] = 0) in asynchronous mode (SMR.CM = 0) or Manchester mode (MMR.MANEN = 1). When external clock is selected (SCR.CKE[1] = 1), set it to 0. The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1, the base clock cycle is halved and the bit rate is doubled.

Set this bit to 0 in modes other than asynchronous mode or Manchester mode.

### RXDESEL bit (Asynchronous Start Bit Edge Detection Select)

The RXDESEL bit selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, data reception operation depends on the setting of this bit. Set this bit to 1 when reception must be stopped while a break occurs or when reception must be started without keeping the RXDn pin input at the high level for the period of one data frame or longer after completion of the break.

Set this bit to 0 in modes other than asynchronous mode.

## 26.2.23 SNFR : Noise Filter Setting Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x08

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | NFCS[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | NFCS[2:0] | Noise Filter Clock Select<br>In asynchronous mode, selects the standard setting for the base clock.<br>In simple I²C mode, selects the standard settings for the clock source of the on-chip baud rate generator selected in the SMR.CKS[1:0] bits.<br>0 0 0: In asynchronous mode: Use clock signal divided by 1 with noise filter<br>In simple I²C mode: Setting prohibited<br>0 0 1: In asynchronous mode: Setting prohibited<br>In simple I²C mode: Use clock signal divided by 1 with noise filter<br>0 1 0: In asynchronous mode: Setting prohibited<br>In simple I²C mode: Use clock signal divided by 2 with noise filter<br>0 1 1: In asynchronous mode: Setting prohibited<br>In simple I²C mode: Use clock signal divided by 4 with noise filter<br>1 0 0: In asynchronous mode: Setting prohibited<br>In simple I²C mode: Use clock signal divided by 8 with noise filter<br>Others: Setting prohibited | R/W*1 |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. Writing to these bits is only possible when the RE and TE bits in SCR/SCR_SMCI are 0 (serial reception and transmission disabled).

The SNFR register sets the digital noise filter clock.

### NFCS[2:0] bits (Noise Filter Clock Select)

The NFCS[2:0] bits select the sampling clock for the digital noise filter. To use the noise filter in asynchronous mode, set these bits to 000b. In simple I²C mode, when 32 clocks are selected as one bit period in the basic clock selection bits of the SEMR register, set the NFCS [2: 0] bits in the range from 001b to 100b. When any other value is selected for the basic clock selection bit, set the NFCS bit to 001b.

## 26.2.24 SIMR1 : IIC Mode Register 1

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x09

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | IICDL[4:0] | | | | | — | — | IICM |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | IICM | Simple IIC Mode Select<br>0: SCMR.SMIF = 0: Asynchronous mode (including multi-processor mode), clock synchronous mode, or simple SPI mode<br>SCMR.SMIF = 1: Smart card interface mode<br>1: SCMR.SMIF = 0: Simple IIC mode<br>SCMR.SMIF = 1: Setting prohibited | R/W*1 |
| 2:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7:3 | IICDL[4:0] | SDAn Delay Output Select<br>SDAn signal output delay in cycles of the clock signal from the on-chip baud rate generator.<br>0x00: No output delay<br>Others: (IICDL - 1) to (IICDL) cycles | R/W*1 |

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR register are 0 (both serial transmission and reception are disabled).

SIMR1 selects simple IIC mode and the number of delay stages for the SDAn output.

### IICM bit (Simple IIC Mode Select)

In combination with the SCMR.SMIF bit, the IICM bit selects the operating mode.

### IICDL[4:0] bits (SDAn Delay Output Select)

The IICDL[4:0] bits specify an output delay on the SDAn pin relative to the falling edge of the output on the SCLn pin.

The available delay settings range from no delay to 31 cycles, with the clock signal from the on-chip baud rate generator as the base. The signal obtained by frequency-dividing PCLK by the divisor set in SMR.CKS[1:0] is supplied as the clock signal from the on-chip baud rate generator. Set 00000b to IICDL[4:0] bits unless operation is in simple IIC mode. In simple IIC mode, set the bits to a value in the range from 00001b to 11111b.

**Table 26.24 Settable value of IICDL[4: 0] bits in each communication mode**

| Communication mode | ABCS | Settable value of IICDL[4:0] bits |
|---|---|---|
| Other than simple IIC mode | Don't care | 00000b |
| Simple IIC mode | 0 | 00001b to 11111b |
| | 1 | 00001b to 00100b |

## 26.2.25 SIMR2 : IIC Mode Register 2

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x0A

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | IICACKT | — | — | — | IICSCC | IICINTM |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | IICINTM | IIC Interrupt Mode Select<br>0: Use ACK/NACK interrupts<br>1: Use reception and transmission interrupts | R/W*1 |
| 1 | IICCSC | Clock Synchronization<br>0: Do not synchronize with clock signal<br>1: Synchronize with clock signal | R/W*1 |
| 4:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 5 | IICACKT | ACK Transmission Data<br>0: ACK transmission<br>1: NACK transmission and ACK/NACK reception | R/W |
| 7:6 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR register are 0 (serial reception and transmission disabled).

SIMR2 selects how reception and transmission are controlled in simple IIC mode.

### IICINTM bit (IIC Interrupt Mode Select)

The IICINTM bit selects the sources of interrupt requests in simple IIC mode.

### IICCSC bit (Clock Synchronization)

Set the IICCSC bit to 1 if the internally generated SCLn clock signal is to be synchronized when the SCLn pin is driven low because a wait was inserted by another other device.

The SCLn clock signal is not synchronized if the IICCSC bit is 0. The SCLn clock signal is generated according to the rate selected in the BRR register regardless of the level being input on the SCLn pin.

Set the IICCSC bit to 1 except during debugging.

### IICACKT bit (ACK Transmission Data)

Transmitted data contains ACK bits. Set the IICACKT bit to 1 when ACK and NACK bits are received.

## 26.2.26 SIMR3 : IIC Mode Register 3

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x0B

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | IICSCLS[1:0] | | IICSDAS[1:0] | | IICSTIF | IICSTPREQ | IICRSTAREQ | IICSTAREQ |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | IICSTAREQ | Start Condition Generation<br>0: Do not generate start condition<br>1: Generate start condition*1 *3 *5 *6 | R/W |
| 1 | IICRSTAREQ | Restart Condition Generation<br>0: Do not generate restart condition<br>1: Generate restart condition*2 *3 *5 *6 | R/W |
| 2 | IICSTPREQ | Stop Condition Generation<br>0: Do not generate stop condition<br>1: Generate stop condition*2 *3 *5 *6 | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3 | IICSTIF | Issuing of Start, Restart, or Stop Condition Completed Flag<br>0: No requests are being made for generating conditions, or a condition is being generated<br>1: Generation of start, restart, or stop condition is complete.<br>When 0 is written to IICSTIF, it is set to 0*4 | R/W*4 |
| 5:4 | IICSDAS[1:0] | SDAn Output Select<br>0 0: Output serial data<br>0 1: Generate start, restart, or stop condition<br>1 0: Output low on SDAn pin<br>1 1: Drive SDAn pin to high-impedance state | R/W |
| 7:6 | IICSCLS[1:0] | SCLn Output Select<br>0 0: Output serial clock<br>0 1: Generate start, restart, or stop condition<br>1 0: Output low on SCLn pin<br>1 1: Drive SCLn pin to high-impedance state | R/W |

Note 1. Only generate a start condition after checking the bus state and confirming that the bus is free.
Note 2. Generate a restart or stop condition after checking the bus state and confirming that the bus is busy.
Note 3. Do not set more than one of the IICSTAREQ, IICRSTAREQ, and IICSTPREQ bits to 1 at a given time.
Note 4. Write only 0. When 1 is written, the value is ignored.
Note 5. Execute the generation of a condition after the value of the IICSTIF flag is 0.
Note 6. Do not write 0 to this bit while it is 1. Generation of a condition is suspended by writing 0 to this bit while it is 1.

The SIMR3 register is used to control the start, restart, and stop conditions in the simple $I^2C$ mode, and to hold the SSDAn and SSCLn pins at fixed levels.

### IICSTAREQ bit (Start Condition Generation)

When a start condition is to be generated, set both IICSDAS[1:0] and IICSCLS[1:0] to 01b in addition to setting the IICSTAREQ bit to 1.

[Setting condition]

- On writing 1 to the bit.

[Clearing condition]

- On completion of start condition generation.

### IICRSTAREQ bit (Restart Condition Generation)

When a restart condition is to be generated, set both IICSDAS[1:0] and IICSCLS[1:0] to 01b in addition to setting the IICRSTAREQ bit to 1.

[Setting condition]

- On writing 1 to the bit.

[Clearing condition]

- On completion of restart condition generation.

### IICSTPREQ bit (Stop Condition Generation)

When a stop condition is to be generated, set both IICSDAS[1:0] and IICSCLS[1:0] to 01b in addition to setting the IICSTPREQ bit to 1.

[Setting condition]

- On writing 1 to the bit.

[Clearing condition]

- On completion of stop condition generation.

### IICSTIF flag (Issuing of Start, Restart, or Stop Condition Completed Flag)

After generating a condition, the IICSTIF flag indicates that the condition generation is complete. When using the IICSTAREQ, IICRSTAREQ, or IICSTPREQ bit to cause generation of a condition, do so after setting the IICSTIF flag to 0.

When the IICSTIF flag is 1 while an interrupt request is enabled by setting the SCR.TEIE bit, an STI request is output.

[Setting condition]

- On completion of a start, restart, or stop condition generation.

  If the setting condition conflicts with any of the clearing conditions for the flag, the clearing condition takes precedence.

[Clearing conditions]

- On writing 0 to the bit. After writing 0 to the IICSTIF bit, read the bit to check that it is actually set to 0.
- On writing 0 to the SIMR1.IICM bit when operation is not in simple IIC mode.
- On writing 0 to the SCR.TE bit.

### IICSDAS[1:0] bits (SDAn Output Select)

The IICSDAS[1:0] bits control output from the SDAn pin. Set IICSDAS[1:0] and IICSCLS[1:0]to the same value during normal operations.

### IICSCLS[1:0] bits (SCLn Output Select)

The IICSCLS[1:0] bits control output from the SCLn pin. Set IICSDAS[1:0] and IICSCLS[1:0] to the same value during normal operations.

## 26.2.27 SISR : IIC Status Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x0C

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | IICACKR |
| Value after reset: | 0 | 0 | x | x | 0 | x | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | IICACKR | ACK Reception Data Flag<br>0: ACK received<br>1: NACK received | R |
| 1 | — | This bit is read as 0. | R |
| 2 | — | The read value is undefined. | R |
| 3 | — | This bit is read as 0. | R |
| 5:4 | — | The read value is undefined. | R |
| 7:6 | — | These bits are read as 0. | R |

SISR monitors the state in simple IIC mode.

### IICACKR flag (ACK Reception Data Flag)

Received ACK and NACK bits can be read from the IICACKR flag. The IICACKR flag is updated on the rising edge of the SCLn clock for the received ACK/NACK bit.

## 26.2.28 SPMR : SPI Mode Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)
SCI1 = 0x4011_8100

Offset address: 0x0D

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | CKPH | CKPOL | — | MFF | CTSPEN | MSS | CTSE | SSE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SSE | SSn Pin Function Enable<br>0: Disable SSn pin function<br>1: Enable SSn pin function | R/W*1 |
| 1 | CTSE | CTS Enable<br>0: Disable CTS function (enable RTS output function)<br>1: Enable CTS function | R/W*1 |
| 2 | MSS | Master Slave Select<br>0: Transmit through TXDn pin and receive through RXDn pin (master mode)<br>1: Receive through TXDn pin and transmit through RXDn pin (slave mode) | R/W*1 |
| 3 | CTSPEN | CTS External Pin Enable<br>0: Alternate setting to use CTS and RTS functions as either one terminal<br>1: Dedicated setting for separately using CTS and RTS functions with 2 terminals<br>These bits for the other SCI channels than SCIn (n = 0, 3 to 5, 9) are reserved. | R/W |
| 4 | MFF | Mode Fault Flag<br>0: No mode fault error<br>1: Mode fault error | R/W*2 |
| 5 | — | This bit is read as 0. The write value should be 0. | R/W |
| 6 | CKPOL | Clock Polarity Select<br>0: Do not invert clock polarity<br>1: Invert clock polarity | R/W*1 |
| 7 | CKPH | Clock Phase Select<br>0: Do not delay clock<br>1: Delay clock | R/W*1 |

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR register are 0 (both serial transmission and reception are disabled).
Note 2. Only 0 can be written to this bit, to clear the flag.

SPMR selects the extension settings in asynchronous and clock synchronous modes.

### SSE bit (SSn Pin Function Enable)

Set the SSE bit to 1 to use the SSn pin to control transmission and reception in simple SPI mode. Set this bit to 0 in all other modes. In simple SPI mode, when master mode is selected (SCR.CKE[1:0] = 00b and SPMR.MSS = 0) and there is a single master, the SSn pin on the master side is not required to control reception and transmission. In such a case, set the SSE bit to 0. Do not set both the SSE and CTSE bits to 1. If this setting is made, operation is the same as that when these bits are set to 0.

### CTSE bit (CTS Enable)

Set the CTSE bit to 1 if the SSn pin is to be used for inputting the CTS control signal to control transmission and reception. The RTS signal is output when this bit is set to 0. Set this bit to 0 in smart card interface mode, simple SPI mode, and simple IIC mode. Do not set both the CTSE and SSE bits to 1. If this setting is made, operation is the same as that when these bits are set to 0.

### MSS bit (Master Slave Select)

The MSS bit selects master or slave operation in simple SPI mode. The functions of the TXDn and RXDn pins are reversed when this bit is set to 1, so that data is received through the TXDn pin and transmitted through the RXDn pin.

Set this bit to 0 in modes other than simple SPI mode.

### CTSPEN bit (CTS External Pin Enable)

Select the terminals usage method when using the CTS and RTS functions.

### MFF flag (Mode Fault Flag)

The MFF flag indicates mode fault errors. In a multi-master configuration, determine the mode fault error occurrence by reading this flag.

[Setting condition]

- When input on the SSn pin is low during master operation in simple SPI mode (SSE bit = 1 and MSS bit = 0).

[Clearing condition]

- On writing 0 to the bit after it is read as 1.

### CKPOL bit (Clock Polarity Select)

The CKPOL bit selects the polarity of the clock signal output through the SCKn pin. See Figure 26.99 for details. Set the CKPOL bit to 0 in all modes other than simple SPI mode and clock synchronous mode.

### CKPH bit (Clock Phase Select)

The CKPH bit selects the phase of the clock signal output through the SCKn pin. See Figure 26.99 for details. Set the CKPH bit to 0 in all modes other than simple SPI mode and clock synchronous mode.

## 26.2.29 FCR : FIFO Control Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x14

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | RSTRG[3:0] | | | | RTRG[3:0] | | | | TTRG[3:0] | | | | DRES | TFRST | RFRST | FM |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | FM | FIFO Mode Select<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode.<br>0: Non-FIFO mode.<br>Selects TDR/RDR or TDRHL/RDRHL for communication.<br>1: FIFO mode.<br>Selects FTDRHL/FRDRHL for communication. | R/W*1 |
| 1 | RFRST | Receive FIFO Data Register Reset<br>Valid only when FCR.FM = 1.<br>0: Do not reset FRDRHL<br>1: Reset FRDRHL | R/W |
| 2 | TFRST | Transmit FIFO Data Register Reset<br>Valid only when FCR.FM = 1.<br>0: Do not reset FTDRHL<br>1: Reset FTDRHL | R/W |
| 3 | DRES | Receive Data Ready Error Select<br>Selects the interrupt requested when detecting receive data ready.<br>0: Receive data full interrupt (SCIn_RXI)<br>1: Receive error interrupt (SCIn_ERI) | R/W |
| 7:4 | TTRG[3:0] | Transmit FIFO Data Trigger Number<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode.<br>The trigger number is specified in the TTRG[3:0] bits. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 11:8 | RTRG[3:0] | Receive FIFO Data Trigger Number<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode.<br>The trigger number is specified in the RTRG[3:0] bits. | R/W |
| 15:12 | RSTRG[3:0] | RTS Output Active Trigger Number Select<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, when FCR.FM = 1, SPMR.CTSE = 0, and SPMR.SSE = 0.<br>The trigger number is specified in the RSTRG[3:0] bits. | R/W |

Note 1. Writable only when TE = 0 and RE = 0.

FCR selects FIFO mode, resets FTDRHL and FRDRHL, selects the FIFO data trigger number for transmission or reception, and selects the RTS output active trigger number.

#### FM bit (FIFO Mode Select)

When the FM bit is set to 1, FTDRHL and FRDRHL are selected for communication. When the FM bit is set to 0, TDR and RDR, or TDRHL and RDRHL are selected for communication.

#### RFRST bit (Receive FIFO Data Register Reset)

When the RFRST bit is set to 1, the FRDRHL register is reset and the received data count resets to 0. When 1 is written to the RFRST bit, it clears to 0 after 1 PCLK.

#### TFRST bit (Transmit FIFO Data Register Reset)

When the TFRST bit is set to 1, the FTDRHL register is reset and the transmit data count resets to 0. When 1 is written to the TFRST bit, it clears to 0 after 1 PCLK.

#### DRES bit (Receive Data Ready Error Select)

When detecting a receive data ready error, the selection can be made from an SCIn_RXI interrupt request or an SCIn_ERI interrupt request.

#### TTRG[3:0] bits (Transmit FIFO Data Trigger Number)

The TDFE flag is set to 1 when the amount of transmit data in FTDRHL is equal to or less than the transmit triggering number specified in the TTRG[3:0] bits, and software can write data to FTDRHL. If SCR.TIE = 1, an SCIn_TXI interrupt request occurs.

#### RTRG[3:0] bits (Receive FIFO Data Trigger Number)

The RDF flag is set to 1 when the amount of receive data in FRDRHL is equal to or greater than the receive triggering number specified in the RTRG[3:0] bits, and software can read data from FRDRHL. If SCR.RIE = 1, an SCIn_RXI interrupt request occurs.

When RTRG[3:0] is 0, the RDF flag is not set even when the amount of data in the receive FIFO is equal to 0, and an SCIn_RXI interrupt does not occur.

#### RSTRG[3:0] bits (RTS Output Active Trigger Number Select)

When the amount of receive data stored in FRDRHL is equal to or greater than the receive triggering number specified in the RSTRG[3:0] bits, the RTS signal goes high.

When RSTRG[3:0] is 0, the RTS signal does not go high even when the amount of data in FRDRHL is equal to 0.

### 26.2.30 FDR : FIFO Data Count Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x16

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | T[4:0] | | | | | — | — | — | R[4:0] | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 4:0 | R[4:0] | Receive FIFO Data Count<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, when FCR.FM = 1.<br>Indicates the amount of receive data stored in FRDRHL. | R |
| 7:5 | — | These bits are read as 0. | R |
| 12:8 | T[4:0] | Transmit FIFO Data Count<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, when FCR.FM = 1.<br>Indicates the amount of non-transmitted data stored in FTDRHL. | R |
| 15:13 | — | These bits are read as 0. | R |

The FDR register indicates the amount of data stored in FRDRHL and FTDRHL.

### R[4:0] bits (Receive FIFO Data Count)

The R[4:0] bits indicate the amount of receive data stored in FRDRHL. 0x00 means no receive data, and 0x10 means that the maximum received data is stored in FRDRHL.

### T[4:0] bits (Transmit FIFO Data Count)

The T[4:0] bits indicate the amount of non-transmitted data stored in FTDRHL. 0x00 means no transmit data, and 0x10 means that all (maximum amount) of the data to be transmitted is stored in FTDRHL.

## 26.2.31 LSR : Line Status Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x18

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | PNUM[4:0] | | | | | — | FNUM[4:0] | | | | | — | ORER |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | ORER | Overrun Error Flag<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, and when FIFO is selected.<br>0: No overrun error occurred<br>1: Overrun error occurred | R*1 |
| 1 | — | This bit is read as 0. | R |
| 6:2 | FNUM[4:0] | Framing Error Count<br>Indicates the amount of data with a framing error in the receive data stored in FRDRHL. | R |
| 7 | — | This bit is read as 0. | R |
| 12:8 | PNUM[4:0] | Parity Error Count<br>Indicates the amount of data with a parity error in the receive data stored in FRDRHL. | R |
| 15:13 | — | These bits are read as 0. | R |

Note 1. Write 0 to SSR_FIFO.ORER to clear the flag.

The LSR register indicates the receive error status.

### ORER flag (Overrun Error Flag)

The ORER flag reflects the value in SSR_FIFO.ORER.

### FNUM[4:0] bits (Framing Error Count)

The FNUM[4:0] value indicates the amount of data with a framing error stored in the FRDRHL register.

### PNUM[4:0] bits (Parity Error Count)

The PNUM[4:0] value indicates the amount of data with a parity error stored in the FRDRHL register.

## 26.2.32 CDR : Compare Match Data Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x1A

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | CMPD[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 8:0 | CMPD[8:0] | Compare Match Data<br>Holds compare data pattern for address match wakeup function. | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |

The CDR register sets the compare data for the address match function.

### CMPD[8:0] bits (Compare Match Data)

The CMPD[8:0] bits set the data to be compared to receive data for the address match function, when the address match function is enabled (DCCR.DCME = 1).

Three bit lengths are available:

- CMPD[6:0] with 7-bit length
- CMPD[7:0] with 8-bit length
- CMPD[8:0] with 9-bit length

## 26.2.33 DCCR : Data Compare Match Control Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x13

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | DCME | IDSEL | — | DFER | DPER | — | — | DCMF |
| Value after reset: | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | DCMF | Data Compare Match Flag<br>0: Not matched<br>1: Matched | R/(W)*1 |
| 2:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 3 | DPER | Data Compare Match Parity Error Flag<br>0: No parity error occurred<br>1: Parity error occurred | R/(W)*1 |
| 4 | DFER | Data Compare Match Framing Error Flag<br>0: No framing error occurred<br>1: Framing error occurred | R/(W)*1 |
| 5 | — | This bit is read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6 | IDSEL | ID Frame Select<br>Valid only in asynchronous mode, including multi-processor mode.<br>0: Always compare data regardless of the MPB bit value<br>1: Only compare data when MPB bit = 1 (ID frame) | R/W |
| 7 | DCME | Data Compare Match Enable<br>Valid only in asynchronous mode, including multi-processor mode.<br>0: Disable address match function<br>1: Enable address match function | R/W |

Note 1. Only 0 can be written, to clear the flag after reading 1.

The DCCR register controls the address match function.

### DCMF flag (Data Compare Match Flag)

The DCMF flag indicates that the SCI detected a receive data match with the comparison data (CDR.CMPD).

[Setting condition]

- On match of the comparison data (CDR.CMPD) with the receive data when DCCR.DCME = 1.

[Clearing condition]

- When 0 is written after 1 is read from DCMF.

Clearing the SCR.RE bit to 0 does not affect the DCMF flag, which retains its previous value.

### DPER flag (Data Compare Match Parity Error Flag)

The DPER flag indicates that a parity error occurred on address match detection (receive data match detection).

[Setting condition]

- When a parity error is detected in a frame in which an address match is detected.

[Clearing conditions]

- When 0 is written after 1 is read from DPER.

When the SCR.RE bit is set to 0 (serial reception is disabled), the DPER flag is not affected and retains its previous value.

### DFER flag (Data Compare Match Framing Error Flag)

The DFER flag indicates that a framing error occurred on address match detection (receive data match detection).

[Setting conditions]

- When a stop bit of a frame in which an address match is detected is 0.

  When in 2-stop-bit mode, only the first bit of the stop bits is checked for a value of 1 (the second stop bit is not checked).

[Clearing conditions]

- When 0 is written after 1 is read from DFER.

When the SCR.RE bit is set to 0 (serial reception is disabled), the DFER flag is not affected and retains its previous value.

### IDSEL bit (ID Frame Select)

The IDSEL bit selects whether to compare data regardless of the MPB bit value or to compare data only when MPB = 1 (ID frame), when the address match function is enabled.

### DCME bit (Data Compare Match Enable)

The DCME bit enables or disables the address match function (data compare match function).

If the SCI detects a match to the comparison data (CDR.CMPD) with the receive data, the DCME bit clears automatically, after which SCI operation mode is in normal receive mode. See section 26.3.6. Address Match (Receive Data Match Detection) Function.

The write value must be 0 for all modes other than asynchronous mode.

## 26.2.34 SPTR : Serial Port Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x1C

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | ATEN | ASEN | TINV | RINV | — | SPB2IO | SPB2DT | RXDMON |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RXDMON | Serial Input Data Monitor<br>Indicates the state of the RXDn pin.<br>0: When RINV = 0, RXDn terminal is the low level.<br>When RINV = 1, RXDn terminal is the high level.<br>1: When RINV = 0, RXDn terminal is the high level.<br>When RINV = 1, RXDn terminal is the low level. | R |
| 1 | SPB2DT | Serial Port Break Data Select<br>Selects the output level of the TXDn pin when SCR.TE = 0.<br>0: When TINV = 0, low level is output in TXDn terminal.<br>When TINV = 1, high level is output in TXDn terminal.<br>1: When TINV = 0, high level is output in TXDn terminal.<br>When TINV = 1, low level is output in TXDn terminal. | R/W |
| 2 | SPB2IO | Serial Port Break I/O*1<br>Selects whether the value of SPB2DT is output to TXDn pin.<br>0: Do not output value of SPB2DT bit on TXDn pin<br>1: Output value of SPB2DT bit on TXDn pin | R/W |
| 3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | RINV | RXD Invert Bit<br>0: Received data from RXDn is not inverted and input*2<br>1: Received data from RXDn is inverted and input | R/W*3 |
| 5 | TINV | TXD Invert Bit<br>0: Transmit data is not inverted and output to TXDn*2<br>1: Transmit data is inverted and output to TXDn | R/W*3 |
| 6 | ASEN | Adjust Receive Sampling Timing Enable<br>This bit enables in asynchronous mode using internal clock.<br>This function can adjust the receive sampling timing.<br>In asynchronous mode using internal clock, see section 26.3.10. The function of adjust receive sampling timing (Asynchronous Mode) for details.<br>0: Adjust sampling timing disable<br>1: Adjust sampling timing enable | R/W*3 |
| 7 | ATEN | Adjust Transmit Timing Enable<br>This bit enables in asynchronous mode using internal clock.<br>This function can adjust the transmit edge of TXDn waveform. See section 26.3.11. The function of adjust transmit timing (Asynchronous Mode) for details.<br>0: Adjust transmit timing disable<br>1: Adjust transmit timing enable | R/W*3 |

Note 1. Please use this bit in asynchronous mode and manchester mode. Movement by other mode isn't guaranteed.
Note 2. RINV/TINV should be set to 0 in smart card interface mode and simple I2C mode.
Note 3. Change the value of these bits only at SCR.TE = SCR.RE = 0.

The SPTR register provides confirmation of the serial reception pin (RXDn pin) status and sets the transmission and receive pin status.

Additionally, the SPTR register has enable bits for adjusting functions of receive sampling timing and transmit timing.

The TXDn pin status is determined by the combination of SCR.TE, SPTR.SPB2IO, and SPTR.SPB2DT settings, as shown in Table 26.25.

The data of RDR is controlled by RINV and SCMR.SINV. The data from TXDn terminal is controlled by TINV and SCMR.SINV. The control by RINV/TINV are done to communication terminals (RXDn/TXDn), so they can control not only data-bits but also other bits (start bit, stop bit, parity bit). For details, see Figure 26.5.

**Table 26.25 TXDn pin status**

| Value of SCR.TE | Value of SPTR.SPB2IO | Value of SPTR.SPB2DT | TXDn pin status |
|---|---|---|---|
| 0 | 0 | — | Hi-Z (initial value) |
| 0 | 1 | 0 | Low level output |
| 0 | 1 | 1 | High level output |
| 1 | — | — | Serial transmit data is output |

Note: —: Don't care.
Note: Use the SPTR register in asynchronous mode only. Using this register in any other mode is not guaranteed.

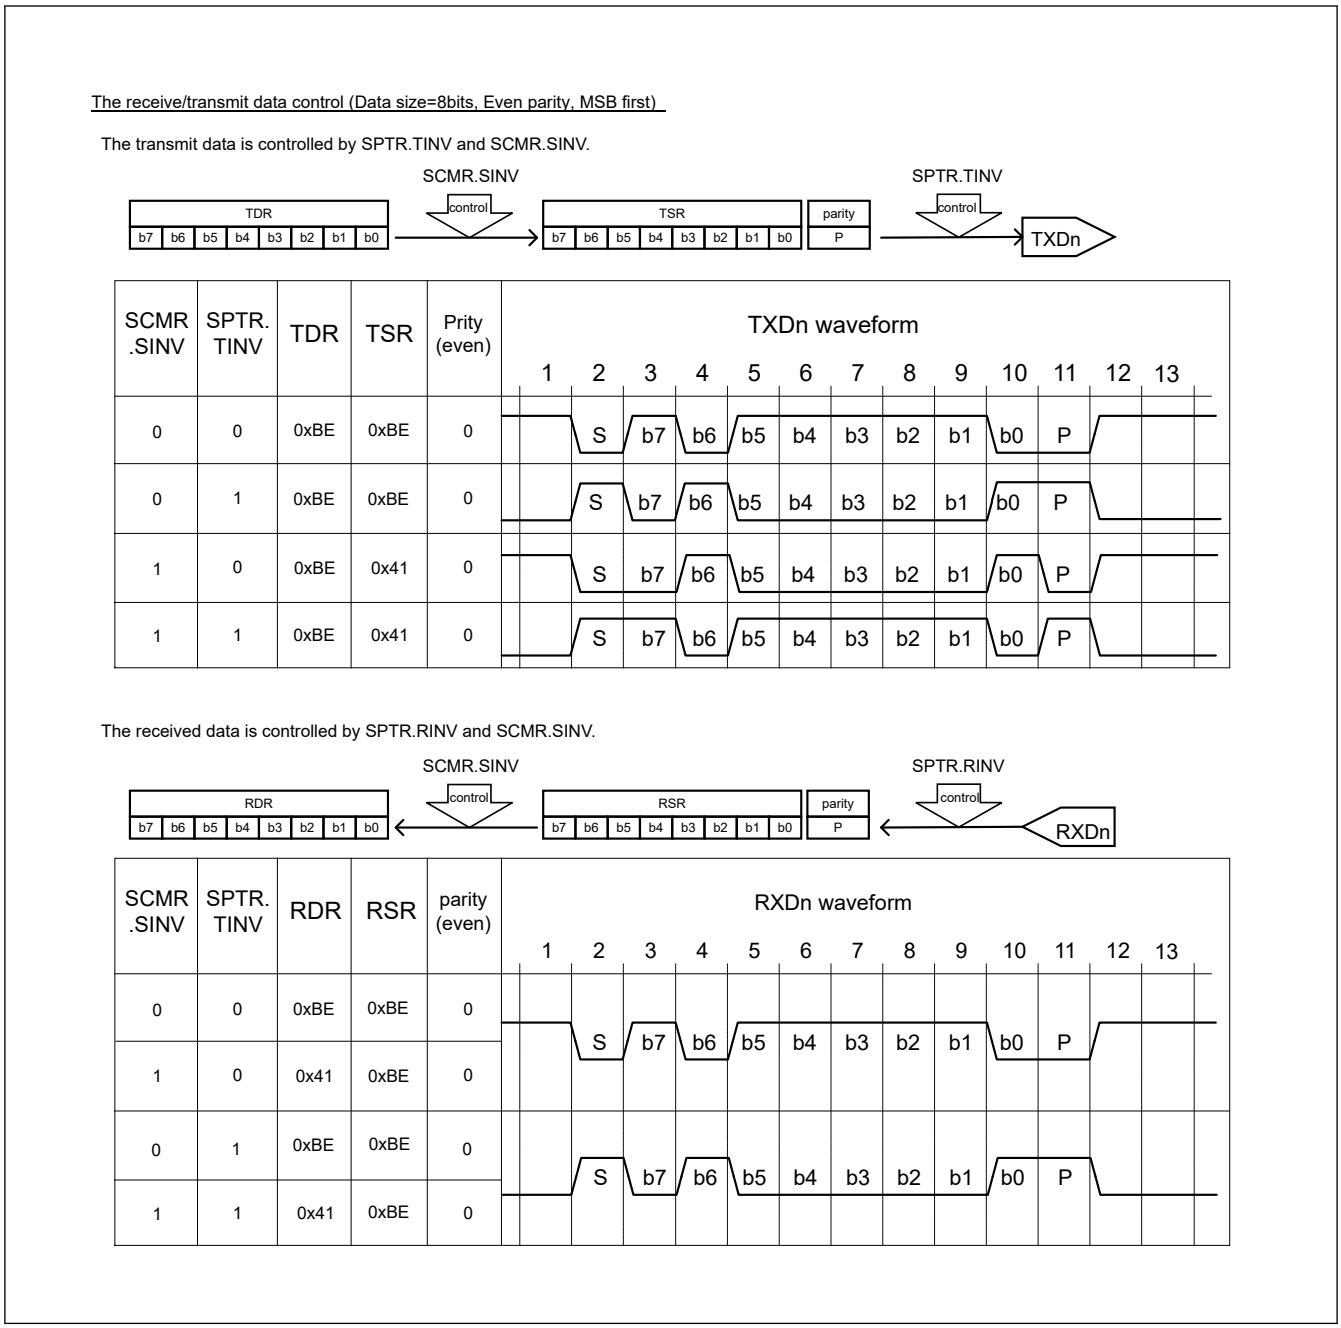

**Figure 26.5 Example of the receive/transmit data control**

## 26.2.35 ACTR : Adjustment Communication Timing Register

Base address: SCIn = 0x4011_8000 + 0x0100 × n (n = 0, 5, 9)
SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x1D

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | AET | ATT[2:0] | | | AJD | AST[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 2:0 | AST | Adjustment Value for Receive Sampling Timing<br>The sampling timing of RXD terminal is adjusted from the middle of bit by the following formula.<br>Adjustment sampling timing = base clock × the setting value of AST[2:0].<br>This bit is valid only at SPTR.ASEN = 1. This setting timing is limited by setting the base clock cycles. For details, see section 26.3.10. The function of adjust receive sampling timing (Asynchronous Mode). | R/W*1 |
| 3 | AJD | Adjustment Direction for Receive Sampling Timing<br>Adjustment direction for RXD receive sampling timing is determined by this bit.<br>0: The sampling timing is adjusted backward to the middle of bit.<br>1: The sampling timing is adjusted forward to the middle of bit.<br>This bit is valid only at SPTR.ASEN = 1. For details, see section 26.3.10. The function of adjust receive sampling timing (Asynchronous Mode). | R/W*1 |
| 6:4 | ATT | Adjustment Value for Transmit Timing<br>The selected edge timing of TXD is adjusted by the following formula.<br>Adjustment edge timing = base clock × the setting value of ATT[2:0].<br>This bit is valid only at SPTR.ATEN = 1. This setting timing is limited by setting the base clock cycles. For details, see section 26.3.11. The function of adjust transmit timing (Asynchronous Mode). | R/W*2 |
| 7 | AET | Adjustment Edge for Transmit Timing<br>The adjustable edge is set by this bit.<br>When SPTR.TINV is 0:<br>0: Adjust the rising edge timing<br>1: Adjust the falling edge timing<br>When SPTR.TINV is 1:<br>0: Adjust the falling edge timing<br>1: Adjust the rising edge timing<br>This bit is valid only at SPTR.ATEN = 1. For details, see section 26.3.11. The function of adjust transmit timing (Asynchronous Mode). | R/W*2 |

Note 1. Write this bit only when SPTR.ASEN = 0.
Note 2. Write this bit only when SPTR.ATEN = 0.

This register controls adjustment of receive sampling timing and transmit timing. This register is valid only when asynchronous mode using internal clock.

For details of adjustment of receive sampling timing by this register, see section 26.3.10. The function of adjust receive sampling timing (Asynchronous Mode).

For details of adjustment transmit timing by this register, see section 26.3.11. The function of adjust transmit timing (Asynchronous Mode).

Note: Details and a timing diagram of the IP operation (except section 26.1. Overview, section 26.2. Register Descriptions, section 26.3.10. The function of adjust receive sampling timing (Asynchronous Mode) and section 26.3.11. The function of adjust transmit timing (Asynchronous Mode)) are described by the condition that the receive sampling timing and transmit timing adjustments are disabled (SPTR.ASEN = 0, SPTR.ATEN = 0).

## 26.2.36 MMR : Manchester Mode Register

Base address: SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x20

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | MANEN | SBSEL | SYNSEL | SYNVAL | — | ERTEN | TMPOL | RMPOL |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | RMPOL | Polarity of Received Manchester Code<br>Sets the polarity of the received Manchester code<br>0: Logic 0 is coded as a zero-to-one transition in Manchester code<br>Logic 1 is coded as a one-to-zero transition in Manchester code<br>1: Logic 0 is coded as a one-to-zero transition in Manchester code<br>Logic 1 is coded as a zero-to-one transition in Manchester code | R/W*1 |
| 1 | TMPOL | Polarity of Transmit Manchester Code<br>Sets the polarity of the transmit Manchester code<br>0: Logic 0 is coded as a zero-to-one transition in Manchester code<br>Logic 1 is coded as a one-to-zero transition in Manchester code<br>1: Logic 0 is coded as a one-to-zero transition in Manchester code<br>Logic 1 is coded as a zero-to-one transition in Manchester code | R/W*1 |
| 2 | ERTEN | Manchester Edge Retiming Enable<br>Sets the receive retiming function<br>0: Disables the receive retiming function<br>1: Enables the receive retiming function | R/W*1 |
| 3 | — | This bit is read as 0. The write value should be 0. | R |
| 4 | SYNVAL | SYNC Value Setting<br>Sets the SYNC type of the start bit in the Manchester code<br>When the start bit area consists of one bit (SBSEL = 0)<br>● When transmitting<br>0: The start bit is added as a zero-to-one transition<br>1: The start bit is added as a one-to-zero transition<br>● When receiving<br>0: Only when the start bit is a zero-to-one transition, the data is received. The other cases are determined as an error.<br>1: Only when the start bit is a one-to-zero transition, the data is received. The other cases are determined as an error.<br>When the start bit area consists of three bits. (SBSEL = 1)<br>● When transmitting<br>0: The start bits are added as a zero-to-one transition (DATA SYNC)<br>1: The start bits are coded as a one-to-zero transition (COMMAND SYNC)<br>● When receiving<br>When the start bit area consists of three bits, data is received regardless of the value of this bit. | R/W*1 |
| 5 | SYNSEL | SYNC Select<br>0: The start bit pattern is set with the SYNVAL bit<br>1: The start bit pattern is set with the TSYNC bit | R/W*1 |
| 6 | SBSEL | Start Bit Select<br>0: The start bit area consists of one bit<br>1: The start bit area consists of three bits (COMMAND SYNC or DATA SYNC) | R/W*1 |
| 7 | MANEN | Manchester Mode Enable<br>Sets the Manchester mode<br>0: Disables the Manchester mode<br>1: Enables the Manchester mode | R/W*1 |

Note: Bits [6:0] in this register are valid only when the Manchester mode is enabled (MANEN = 1) in bit 7.

Note 1. Writing to these bits is only possible when the RE and TE bits in SCR are 0 (both serial transmission and reception are disabled).

This register is used to enable or disable the Manchester mode, set the start bit area, and set the logic polarity.

### RMPOL bit (Polarity of Received Manchester Code)

This bit sets the polarity of the received Manchester code. For details, see section 26.5.7. Serial Data Reception in Manchester Mode.

### TMPOL bit (Polarity of Transmit Manchester Code)

This bit sets the polarity of the transmit Manchester code. For details, see section 26.5.6. Serial data transmission in Manchester mode.

### ERTEN bit (Manchester Edge Retiming Enable)

This bit sets the receive retiming function in Manchester mode.

For information on the receive retiming function, see section 26.5.9. Receive Retiming.

### SYNVAL bit (SYNC Value Setting)

This bit is valid when the SYNSEL bit of this register is set to 0.

The SYNC type can be set by combining this bit and the SBSEL bit.

For the start bit area determined by the combination of this bit and the SBSEL bit, see Figure 26.52 and Figure 26.53.

### SYNSEL bit (SYNC Select)

This bit is valid when the SBSEL bit of this register is set to 1. This bit determines the destination to be referred to for setting the SYNC type of the start bit area added to Manchester frames.

When this bit is set to 0, the SYNVAL bit of this register is referred to.

When this bit is set to 1, the TSYNC bit in the TDRH register is referred to.

For detail, see the bit table in section 26.2.36. MMR : Manchester Mode Register.

### SBSEL bit (Start Bit Select)

This bit sets the start bit area in Manchester frames.

When this bit is set to 1, the start bit area added to each frame consists of three bits, and the SYNSEL and SYNVAL bits in this register are valid.

When this bit is set to 0, the start bit area added to each frame consists of one bit.

### MANEN bit (Manchester Mode Enable)

This bit sets the Manchester mode.

When this bit is set to 0, the Manchester mode is disabled.

When this bit is set to 1, the Manchester mode is enabled.

## 26.2.37 TMPR : Transmit Manchester Preface Setting Register

Base address: SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x22

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | TPPAT[1:0] | | TPLEN[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | TPLEN | Transmit Preface Length<br>Set the preface length of the transmit data in Manchester mode<br>0x0: Disables the transmit preface generation<br>Others: Transmit preface length (bit length) | R/W*1 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 5:4 | TPPAT | Transmit Preface Pattern<br>Set the preface pattern of the transmit data<br>0 0: All zeros<br>0 1: Zero one<br>1 0: One zero<br>1 1: All ones | R/W*1 |
| 7:6 | — | The read value is undefined. The write value should be 0. | R |

Note: This register is valid only when the Manchester mode is enabled (MMR.MANEN = 1).
Note 1. Writing to these bits is only possible when the RE and TE bits in SCR are 0 (both serial transmission and reception are disabled).

This register is used to set the preface length and preface pattern of the transmit data in Manchester mode.

### TPLEN bit (Transmit Preface Length)

These bits set the preface bit length of the transmit data in Manchester mode.

The settable range is 0x0 to 0xF (0 to 15). The setting of 0x0 disables the transmit preface, which is not added.

### TPPAT bit (Transmit Preface Pattern)

These bits set one of the four preface patterns in Manchester mode.

When these bits are set to 00b, the preface area is set to all zeros.

When these bits are set to 01b, the preface area is set to the zero-one-zero-one pattern.

When these bits are set to 10b, the preface area is set to the one-zero-one-zero pattern.

When these bits are set to 11b, the preface area is set to all ones.

Note: For the transmit and receive data when the TPPAT bits are set, see Figure 26.51.

## 26.2.38 RMPR : Receive Manchester Preface Setting Register

Base address: SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x23

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | RPPAT[1:0] | | RPLEN[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 3:0 | RPLEN | Receive Preface Length<br>Set the preface length in received frames when Manchester mode is enabled<br>0: Disables the receive preface generation<br>Others: Receive preface length (bit length) | R/W*1 |
| 5:4 | RPPAT | Receive Preface Pattern<br>Set the preface pattern of received frames<br>0 0: All zeros<br>0 1: Zero one<br>1 0: One zero<br>1 1: All ones | R/W*1 |
| 7:6 | — | These bits are read as 0. The write value should be 0. | R |

Note: This register is valid only when the Manchester mode is enabled (MMR.MANEN = 1).
Note 1. Writing to these bits is only possible when the RE and TE bits in SCR are 0 (both serial transmission and reception are disabled).

This register is used to set the preface length and preface pattern of the received frames in Manchester mode.

### RPLEN bit (Receive Preface Length)

These bits set the preface bit length of the received frames in Manchester mode.

The settable range is 0x0 to 0xF (0 to 15). The setting 0x0 disables the receive preface, which is not added. When 0x1 to 0xF is set, the set value is handled as the receive preface bit length.

### RPPAT bit (Receive Preface Pattern)

These bits set one of the four preface patterns in Manchester mode.

When these bits are set to 00b, the preface area is handled as all zeros.

When these bits are set to 01b, the preface area is handled as the zero-one-zero-one pattern.

When these bits are set to 10b, the preface area is handled as the one-zero-one-zero pattern.

When these bits are set to 11b, the preface area is handled as all ones.

Note: For the transmit and receive data when the RPPAT bits are set, see Figure 26.51.

## 26.2.39 MESR : Manchester Extended Error Status Register

Base address: SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x24

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | SBER | SYER | PFER |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PFER | Preface Error Flag<br>This bit is set when a preface error (pattern mismatch) is detected<br>0: No preface error detected<br>1: Preface error detected | R/(W)*1 |
| 1 | SYER | SYNC Error Flag<br>This bit is set when no edge is detected in the adjustable range during receive retiming<br>0: No receive SYNC error detected<br>1: Receive SYNC error detected | R/(W)*1 |
| 2 | SBER | Start Bit Error Flag<br>This bit is set when a pattern mismatch in the start bit area is detected<br>0: No start bit error detected<br>1: Start bit error detected | R/(W)*1 |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R |

Note: This register is valid only when the Manchester mode is enabled (MMR.MANEN = 1).
Note 1. Only 0 can be written to this bit, to clear the flag. To clear the flag, confirm that the flag is 1 before setting it to 0.

This register indicates an error status when receiving frames in Manchester mode.

A preface error, receive SYNC error or start bit error was detected.

### PFER bit (Preface Error Flag)

This bit indicates that a preface error was detected when receiving frames in Manchester mode.

[Setting condition]

- When detecting a preface error when receiving frames in Manchester mode
  The following operations are performed when a preface error occurs.
  When MECR.PFEREN = 1
  The received data is not transferred to the RDR register and no RXI interrupt request occurs. Instead, an ERI interrupt request occurs. Note that when the PFER flag is being set to 1, the subsequently received data is not transferred to the RDR register.
  When MECR.PFEREN = 0
  The received data is transferred to the RDR register and an RXI interrupt request occurs. An ERI interrupt request is not generated. The subsequent receive operations are not affected even with the PFER flag being set to 1.

[Clearing condition]

- When 0 is written to the bit after it was read as 1

Even if the SCR.RE bit is cleared, the PFER flag is not affected, and the previous state is retained.

**SYER bit (SYNC Error Flag)**

This bit indicates that a receive SYNC error was detected when receiving frames in Manchester mode with

MMR.ERTEN = 1 (Manchester edge retiming enabled).

[Setting condition]

- When detecting a receive SYNC error when receiving frames in Manchester mode
  The following operations are performed when a receive SYNC error occurs.
  When MECR.SYEREN = 1
  Although the received data is transferred to the RDR register, no RXI interrupt request occurs. Instead, an ERI interrupt request occurs. Note that when the SYER flag is being set to 1, the subsequently received data is not transferred to the RDR register.
  When MECR.SYEREN = 0
  The received data is transferred to the RDR register and an RXI interrupt request occurs. An ERI interrupt request is not generated. The subsequent receive operations are not affected even with the SYER flag being set to 1.

[Clearing condition]

- When 0 is written to the bit after it was read as 1

Even if the SCR.RE bit is cleared, the SYER flag is not affected, and the previous state is retained.

**SBER bit (Start Bit Error Flag)**

This bit indicates that a start bit error was detected when receiving frames in Manchester mode.

[Setting condition]

- When detecting a start bit error when receiving frames in Manchester mode
  The following operations are performed when a start bit error occurs.
  When MECR.SBEREN = 1
  The received data is not transferred to the RDR register and no RXI interrupt request occurs. Instead, an ERI interrupt request occurs. Note that when the SBER flag is being set to 1, the subsequently received data is not transferred to the RDR register.
  When MECR.SBEREN = 0
  The received data is transferred to the RDR register and an RXI interrupt request occurs. An ERI interrupt request is not generated. The subsequent receive operations are not affected even with the SBER flag being set to 1.

[Clearing condition]

- When 0 is written to the bit after it was read as 1

Even if the SCR.RE bit is cleared, the SBER flag is not affected, and the previous state is retained.

## 26.2.40 MECR : Manchester Extended Error Control Register

Base address: SCIk = 0x4011_8000 + 0x0100 × k (k = 3, 4)

Offset address: 0x25

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | SBEREN | SYEREN | PFEREN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | PFEREN | Preface Error Enable<br>Specifies whether to handle a preface error as an interrupt source<br>0: Does not handle a preface error as an interrupt source<br>1: Handles a preface error as an interrupt source | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1 | SYEREN | Receive SYNC Error Enable<br>Specifies whether to handle a receive SYNC error as an interrupt source<br>0: Does not handle a receive SYNC error as an interrupt source<br>1: Handles a receive SYNC error as an interrupt source | R/W |
| 2 | SBEREN | Start Bit Error Enable<br>Specifies whether to handle a start bit error as an interrupt source<br>0: Does not handle a start bit error as an interrupt source<br>1: Handles a start bit error as an interrupt source | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R |

Note: This register is valid only when the Manchester mode is enabled (MMR.MANEN = 1).

This register is used to specify whether to handle a preface error, receive SYNC error, or a start bit error as an interrupt source in Manchester mode. If those errors are handled as interrupt sources, interrupt requests and event requests are generated at the occurrence of each error, and the next reception is not performed until the corresponding error flag is cleared.

Set this register when MMR.MANEN = 0. However, do not change this register during communication.

### PFEREN bit (Preface Error Enable)

This bit specifies whether to handle a preface error as an interrupt source.

When it is set to 0, a preface error is not handled as an interrupt source. When it is set to 1, a preface error is handled as an interrupt source.

### SYEREN bit (Receive SYNC Error Enable)

This bit specifies whether to handle a receive SYNC error as an interrupt source.

When it is set to 0, a receive SYNC error is not handled as an interrupt source. When it is set to 1, a receive SYNC error is handled as an interrupt source.

### SBEREN bit (Start Bit Error Enable)

This bit specifies whether to handle a start bit error as an interrupt source.

When it is set to 0, a start bit error is not handled as an interrupt source. When it is set to 1, a start bit error is handled as an interrupt source.

## 26.2.41 ESMER : Simple LIN Mode Enable Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x20

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | ESME |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | ESME | Simple LIN Mode Enable<br>0: The Simple LIN mode is disabled<br>1: The Simple LIN mode is enabled | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

### ESME bit (Simple LIN Mode Enable)

When the ESME bit is 1, the facilities of the Simple LIN mode control section are enabled.

When the ESME bit is 0, the Simple LIN mode control section is initialized.

**Table 26.26 Settings of the ESME bit and timer operation mode**

| ESME bit | Timer mode | Break field low width determination mode | Break field low width output mode |
|---|---|---|---|
| 0 | Available*1 | Not available | Not available |
| 1 | Available | Available | Available |

Note 1. Operation is only possible with PCLK selected.

## 26.2.42 CR0 : Control Register 0

Base address: SCI1 = 0x4011_8100

Offset address: 0x21

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 2:0 | DFCS[2:0] | RXDXn Signal Digital Filter Clock Select<br>0 0 0: Filter is disabled<br>0 0 1: Filter clock is SCI base clock*1 *2<br>0 1 0: Filter clock is PCLK/8<br>0 1 1: Filter clock is PCLK/16<br>1 0 0: Filter clock is PCLK/32<br>1 0 1: Filter clock is PCLK/64<br>1 1 0: Filter clock is PCLK/128<br>1 1 1: Setting prohibited | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 5:4 | BCCS[1:0] | Bus Collision Detection Clock Select<br>● When SEMR.BGDM = 0, or SEMR.BGDM = 1 and SMR.CKS[1:0] = a value other than 00b<br>0 0: SCI base clock<br>0 1: SCI base clock frequency divided by 2<br>1 0: SCI base clock frequency divided by 4<br>1 1: Setting prohibited<br>● When SEMR.BGDM = 1 and SMR.CKS[1:0] = 00b<br>0 0: SCI base clock frequency divided by 2<br>0 1: SCI base clock frequency divided by 4<br>1 0: Setting prohibited<br>1 1: Setting prohibited | R/W |
| 7:6 | RTS[1:0] | RXDXn Reception Sampling Timing Select<br>● When SCIn.SEMR.ABCS = 0<br>0 0: Rising edge of the 8th cycle of SCI base clock<br>0 1: Rising edge of the 10th cycle of SCI base clock<br>1 0: Rising edge of the 12th cycle of SCI base clock<br>1 1: Rising edge of the 14th cycle of SCI base clock<br>● When SCIn.SEMR.ABCS = 1<br>0 0: Rising edge of the 4th cycle of SCI base clock<br>0 1: Rising edge of the 5th cycle of SCI base clock<br>1 0: Rising edge of the 6th cycle of SCI base clock<br>1 1: Rising edge of the 7th cycle of SCI base clock | R/W |

Note: The period of the SCI base clock is 1/16 of a single bit period when the SCIn.SEMR.ABCS is 0, and 1/8 of a single bit period when the SCIn.SEMR.ABCS is 1.

Note 1. To use the SCI base clock, set the SCIn.SCR.TE bit to 1.

Note 2. The SCI base clock divided by 2 is the filter clock when the SEMR.BGDM bit is 1 and the SMR.CKS[1:0] bits are 00b.

## 26.2.45 CR3 : Control Register 3

Base address: SCI1 = 0x4011_8100

Offset address: 0x24

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | SDST |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | SDST | Start Frame Detection Start<br>0: Detection of start frame is not performed<br>1: Detection of start frame is performed | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

**SDST bit (Start Frame Detection Start)**

Detection of a start frame begins when this bit is set to 1. The bit is read as 0.

## 26.2.46 PCR : Port Control Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x25

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | SHARPS | — | — | RXDXPS | TXDXPS |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | TXDXPS | TXDXn Signal Polarity Select<br>0: The polarity of TXDXn signal is not inverted for output<br>1: The polarity of TXDXn signal is inverted for output | R/W |
| 1 | RXDXPS | RXDXn Signal Polarity Select<br>0: The polarity of RXDXn signal is not inverted for input<br>1: The polarity of RXDXn signal is inverted for input | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | SHARPS | TXDXn/RXDXn Pin Multiplexing Select<br>0: The TXDXn and RXDXn pins are independent<br>1: The TXDXn and RXDXn signals are multiplexed on the same pin | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

**SHARPS bit (TXDXn/RXDXn Pin Multiplexing Select)**

When this bit is set to 1, the TXDXn and RXDXn signals are multiplexed on the same pin so that half-duplex communications become possible.

## 26.2.47 ICR : Interrupt Control Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x26

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | AEDIE | BCDIE | PIBDIE | CF1MIE | CF0MIE | BFDIE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | BFDIE | Break Field Low Width Detected Interrupt Enable<br>0: Interrupts on detection of the low width for a Break Field are disabled<br>1: Interrupts on detection of the low width for a Break Field are enabled | R/W |
| 1 | CF0MIE | Control Field 0 Match Detected Interrupt Enable<br>0: Interrupts on detection of a match with Control Field 0 are disabled<br>1: Interrupts on detection of a match with Control Field 0 are enabled | R/W |
| 2 | CF1MIE | Control Field 1 Match Detected Interrupt Enable<br>0: Interrupts on detection of a match with Control Field 1 are disabled<br>1: Interrupts on detection of a match with Control Field 1 are enabled | R/W |
| 3 | PIBDIE | Priority Interrupt Bit Detected Interrupt Enable<br>0: Interrupts on detection of the priority interrupt bit are disabled<br>1: Interrupts on detection of the priority interrupt bit are enabled | R/W |
| 4 | BCDIE | Bus Collision Detected Interrupt Enable<br>0: Interrupts on detection of a bus collision are disabled<br>1: Interrupts on detection of a bus collision are enabled | R/W |
| 5 | AEDIE | Valid Edge Detected Interrupt Enable<br>0: Interrupts on detection of a valid edge are disabled<br>1: Interrupts on detection of a valid edge are enabled | R/W |
| 7:6 | — | These bits are read as 0. The write value should be 0. | R/W |

## 26.2.48 STR : Status Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x27

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | AEDF | BCDF | PIBDF | CF1MF | CF0MF | BFDF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| 7:6 | — | These bits are read as 0. The write value should be 0. | R |

## 26.2.49 STCR : Status Clear Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x28

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | AEDCL | BCDCL | PIBDCL | CF1MCL | CF0MCL | BFDCL |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | BFDCL | BFDF Clear<br>Setting this bit to 1 clears the STR.BFDF flag. This bit is read as 0. | R/W |
| 1 | CF0MCL | CF0MF Clear<br>Setting this bit to 1 clears the STR.CF0MF flag. This bit is read as 0. | R/W |
| 2 | CF1MCL | CF1MF Clear<br>Setting this bit to 1 clears the STR.CF1MF flag. This bit is read as 0. | R/W |
| 3 | PIBDCL | PIBDF Clear<br>Setting this bit to 1 clears the STR.PIBDF flag. This bit is read as 0. | R/W |
| 4 | BCDCL | BCDF Clear<br>Setting this bit to 1 clears the STR.BCDF flag. This bit is read as 0. | R/W |
| 5 | AEDCL | AEDF Clear<br>Setting this bit to 1 clears the STR.AEDF flag. This bit is read as 0. | R/W |
| 7:6 | — | These bits are read as 0. The write value should be 0. | R/W |

## 26.2.50 CF0DR : Control Field 0 Data Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x29

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The CF0DR register is an 8-bit readable and writable register that holds a value for comparison with Control Field 0.

## 26.2.51 CF0CR : Control Field 0 Compare Enable Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x2A

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | CF0CE7 | CF0CE6 | CF0CE5 | CF0CE4 | CF0CE3 | CF0CE2 | CF0CE1 | CF0CE0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | CF0CE0 | Control Field 0 Bit 0 Compare Enable<br>0: Comparison with bit 0 of Control Field 0 disabled<br>1: Comparison with bit 0 of Control Field 0 enabled | R/W |
| 1 | CF0CE1 | Control Field 1 Bit 0 Compare Enable<br>0: Comparison with bit 1 of Control Field 0 disabled<br>1: Comparison with bit 1 of Control Field 0 enabled | R/W |
| 2 | CF0CE2 | Control Field 2 Bit 0 Compare Enable<br>0: Comparison with bit 2 of Control Field 0 disabled<br>1: Comparison with bit 2 of Control Field 0 enabled | R/W |
| 3 | CF0CE3 | Control Field 3 Bit 0 Compare Enable<br>0: Comparison with bit 3 of Control Field 0 disabled<br>1: Comparison with bit 3 of Control Field 0 enabled | R/W |
| 4 | CF0CE4 | Control Field 4 Bit 0 Compare Enable<br>0: Comparison with bit 4 of Control Field 0 disabled<br>1: Comparison with bit 4 of Control Field 0 enabled | R/W |
| 5 | CF0CE5 | Control Field 5 Bit 0 Compare Enable<br>0: Comparison with bit 5 of Control Field 0 disabled<br>1: Comparison with bit 5 of Control Field 0 enabled | R/W |
| 6 | CF0CE6 | Control Field 6 Bit 0 Compare Enable<br>0: Comparison with bit 6 of Control Field 0 disabled<br>1: Comparison with bit 6 of Control Field 0 enabled | R/W |
| 7 | CF0CE7 | Control Field 7 Bit 0 Compare Enable<br>0: Comparison with bit 7 of Control Field 0 is disabled.<br>1: Comparison with bit 7 of Control Field 0 enabled | R/W |

## 26.2.52 CF0RR : Control Field 0 Receive Data Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x2B

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

CF0RR is a readable register that holds the value received in Control Field 0.

## 26.2.53 PCF1DR : Primary Control Field 1 Data Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x2C

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

PCF1DR is an 8-bit readable and writable register that holds the 8-bit primary value for comparison with Control Field 1.

## 26.2.54 SCF1DR : Secondary Control Field 1 Data Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x2D

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

SCF1DR is an 8-bit readable and writable register that holds the 8-bit secondary value for comparison with Control Field 1.

## 26.2.55 CF1CR : Control Field 1 Compare Enable Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x2E

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | CF1CE7 | CF1CE6 | CF1CE5 | CF1CE4 | CF1CE3 | CF1CE2 | CF1CE1 | CF1CE0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | CF1CE0 | Control Field 1 Bit 0 Compare Enable<br>0: Comparison with bit 0 of Control Field 1 disabled<br>1: Comparison with bit 0 of Control Field 1 enabled | R/W |
| 1 | CF1CE1 | Control Field 1 Bit 1 Compare Enable<br>0: Comparison with bit 1 of Control Field 1 disabled<br>1: Comparison with bit 1 of Control Field 1 enabled | R/W |
| 2 | CF1CE2 | Control Field 1 Bit 2 Compare Enable<br>0: Comparison with bit 2 of Control Field 1 disabled<br>1: Comparison with bit 2 of Control Field 1 is enabled. | R/W |
| 3 | CF1CE3 | Control Field 1 Bit 3 Compare Enable<br>0: Comparison with bit 3 of Control Field 1 disabled<br>1: Comparison with bit 3 of Control Field 1 enabled | R/W |
| 4 | CF1CE4 | Control Field 1 Bit 4 Compare Enable<br>0: Comparison with bit 4 of Control Field 1 disabled<br>1: Comparison with bit 4 of Control Field 1 enabled | R/W |
| 5 | CF1CE5 | Control Field 1 Bit 5 Compare Enable<br>0: Comparison with bit 5 of Control Field 1 disabled<br>1: Comparison with bit 5 of Control Field 1 enabled | R/W |
| 6 | CF1CE6 | Control Field 1 Bit 6 Compare Enable<br>0: Comparison with bit 6 of Control Field 1 disabled<br>1: Comparison with bit 6 of Control Field 1 enabled | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 7 | CF1CE7 | Control Field 1 Bit 7 Compare Enable<br>0: Comparison with bit 7 of Control Field 1 disabled<br>1: Comparison with bit 7 of Control Field 1 enabled | R/W |

## 26.2.56 CF1RR : Control Field 1 Receive Data Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x2F

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

CF1RR is a readable register that holds the value received in Control Field 1.

## 26.2.57 TCR : Timer Control Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x30

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | — | — | — | — | — | — | TCST |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 0 | TCST | Timer Count Start<br>0: Stops the timer counting<br>1: Starts the timer counting | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

## 26.2.58 TMR : Timer Mode Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x31

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | — | TCSS[2:0] | | | TWRC | — | TOMS[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 1:0 | TOMS[1:0] | Timer Operating Mode Select*1<br>0 0: Timer mode<br>0 1: Break Field low width determination mode<br>1 0: Break Field low width output mode<br>1 1: Setting prohibited | R/W |
| 2 | — | This bit is read as 0. The write value should be 0. | R/W |
| 3 | TWRC | Counter Write Control<br>0: Data is written to the reload register and counter<br>1: Data is written to the reload register only | R/W |

| Bit | Symbol | Function | R/W |
|---|---|---|---|
| 6:4 | TCSS[2:0] | Timer Count Clock Source Select*1<br>0 0 0: PCLK<br>0 0 1: PCLK/2<br>0 1 0: PCLK/4<br>0 1 1: PCLK/8<br>1 0 0: PCLK/16<br>1 0 1: PCLK/32<br>1 1 0: PCLK/64<br>1 1 1: PCLK/128 | R/W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |

Note 1. Rewrite the TOMS[1:0] and TCSS[2:0] bits only when the timer is stopped (TCST = 0).

**TWRC bit (Counter Write Control)**

This bit determines whether a value written to TPRE or TCNT is written to the reload register only or is written to both the reload register and the counter.

## 26.2.59 TPRE : Timer Prescaler Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x32

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

TPRE consists of an 8-bit reload register, a read buffer, and a counter, each of which has 0xFF as its initial value. The counter counts down in synchronization with the counter clock selected by the TMR.TCSS[2:0] bits, and is reloaded with the value in the reload register when it underflows. Underflows of this register provide the clock source to drive counting by the TCNT register. The reload register and read buffer are allocated to the same address. Data is written to the reload register in writing, and the counter value that has been transferred to the read buffer is returned in reading.

It takes 1 PCLK cycle to load a value from the reload register to the counter.

## 26.2.60 TCNT : Timer Count Register

Base address: SCI1 = 0x4011_8100

Offset address: 0x33

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| Bit field: | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

TCNT consists of an 8-bit reload register, a read buffer, and a counter, each of which has 0xFF as its initial value. This down-counter counts underflows of the TPRE register until the TCNT register underflows, and is then reloaded with the value from the reload register. The reload register and read buffer are allocated to the same address. Data is written to the reload register in writing, and the counter value that has been transferred to the read buffer is returned in reading.

It takes 1 PCLK cycle to load a value from the reload register to the counter.

## 26.3 Operation in Asynchronous Mode

Figure 26.6 shows the general format for asynchronous serial communications. One frame consists of a start bit (low level), transmit or receive data, a parity bit, and stop bits (high level). In asynchronous serial communications, the communications line is usually held in the mark state (high level).

The SCI monitors the communications line. When the SCI detects a low, it regards that as a start bit and starts serial communication.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and receiver have a double-buffered structure in addition to FIFO mode, so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

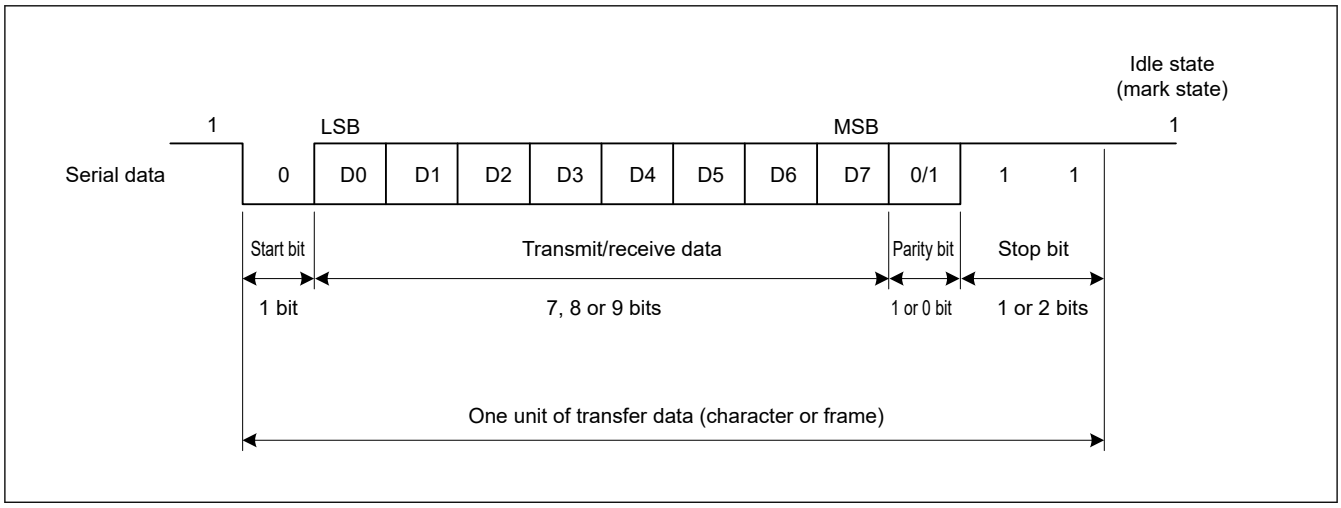

**Figure 26.6 Data format in asynchronous serial communications with 8-bit data, parity bit, and 2 stop bits**

## 26.3.1 Serial Data Transfer Format

Table 26.27 lists the serial data transfer formats that can be used in asynchronous mode. Any of 18 transfer formats can be selected with the SMR and SCMR settings. For details on the multi-processor function, see section 26.4. Multi-Processor Communication Function.

**Table 26.27 Serial transfer formats in asynchronous mode (1 of 2)**

| SCMR setting | SMR setting | | | | Serial transfer format and frame length |
|---|---|---|---|---|---|
| CHR1 | CHR | PE | MP | STOP | 1 2 3 4 5 6 7 8 9 10 11 12 13 |
| 0 | 0 | 0 | 0 | 0 | ST 9-bit data SP |
| 0 | 0 | 0 | 0 | 1 | ST 9-bit data SP SP |
| 0 | 0 | 1 | 0 | 0 | ST 9-bit data P SP |
| 0 | 0 | 1 | 0 | 1 | ST 9-bit data P SP SP |
| 1 | 0 | 0 | 0 | 0 | ST 8-bit data SP |
| 1 | 0 | 0 | 0 | 1 | ST 8-bit data SP SP |
| 1 | 0 | 1 | 0 | 0 | ST 8-bit data P SP |
| 1 | 0 | 1 | 0 | 1 | ST 8-bit data P SP SP |
| 1 | 1 | 0 | 0 | 0 | ST 7-bit data SP |
| 1 | 1 | 0 | 0 | 1 | ST 7-bit data SP SP |

**Table 26.27 Serial transfer formats in asynchronous mode (2 of 2)**

| SCMR setting | SMR setting | | | | Serial transfer format and frame length |
|---|---|---|---|---|---|
| CHR1 | CHR | PE | MP | STOP | 1 2 3 4 5 6 7 8 9 10 11 12 13 |
| 1 | 1 | 1 | 0 | 0 | ST \| 7-bit data \| P \| SP |
| 1 | 1 | 1 | 0 | 1 | ST \| 7-bit data \| P \| SP \| SP |
| 0 | 0 | — | 1 | 0 | ST \| 9-bit data \| MPB \| SP |
| 0 | 0 | — | 1 | 1 | ST \| 9-bit data \| MPB \| SP \| SP |
| 1 | 0 | — | 1 | 0 | ST \| 8-bit data \| MPB \| SP |
| 1 | 0 | — | 1 | 1 | ST \| 8-bit data \| MPB \| SP \| SP |
| 1 | 1 | — | 1 | 0 | ST \| 7-bit data \| MPB \| SP |
| 1 | 1 | — | 1 | 1 | ST \| 7-bit data \| MPB \| SP \| SP |

ST: Start bit
SP: Stop bit
P: Parity bit
MPB: Multi-processor bit

## 26.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times[*1] the bit rate.

In reception, the SCI samples the falling edge of the start bit using the base clock, and performs internal synchronization.[*2]

Because receive data is sampled on the rising edge of the 8th pulse[*1] of the base clock, data is latched at the middle of each bit (when sampling timing does not adjust (SPTR.ASEN = 0)), as shown in Figure 26.7 The reception margin in asynchronous mode is determined by the following formula (1):

$$M = \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\ [\%] \quad \ldots \quad \text{Formula (1)}$$

Note: M: Reception margin
N: Ratio of bit rate to clock
(N = 16 when SEMR.ABCSE = 0 and SEMR.ABCS = 0,
N = 8 when SEMR.ABCS = 1,
N = 6 when SEMR.ABCSE = 1)
D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 13)
F: Absolute value of clock frequency deviation

Assuming values of F = 0 and D = 0.5 in formula (1), the reception margin is determined using the following formula:
$M = \{0.5 - 1/(2 \times 16)\} \times 100\ (\%) = 46.875\ \%$

This represents the computed value. Renesas recommends a margin of 20% to 30% in system design.

Note 1. In this example, the SEMR.ABCS bit is 0 and the SEMR.ABCSE is 0. When the ABCS bit is 1 and the ABCSE bit is 0, a frequency of 8 times the bit rate is used as a base clock, and receive data is sampled on the rising edge of the 4th pulse of the base clock.

When the ABCSE bit is 1, a sextuple frequency of a bit rate is used as a base clock, and receive data is sampled on the rising edge of the 3rd pulse of the base clock.

Note 2. The determination condition of the start bit is as follows.

The function of adjust sampling timing is OFF (ASEN = 0):

The determination condition of a start bit is that Low beyond half bit length continues. It is same as the sampling timing. In Figure 26.7, Low period should be kept over 8-cycles to detect a start bit. If Low period does not keep over 8-cycles, the IP judges this as a noise. So, the IP does not start reception and wait start bit.

The function of adjust sampling timing is ON (ASEN = 1):

The determination condition of a start bit is that Low keeps up until the sampling timing. Adjusting the sampling timing forward (AJD = 1) increases the possibility of erroneously determining a noise as the start bit.

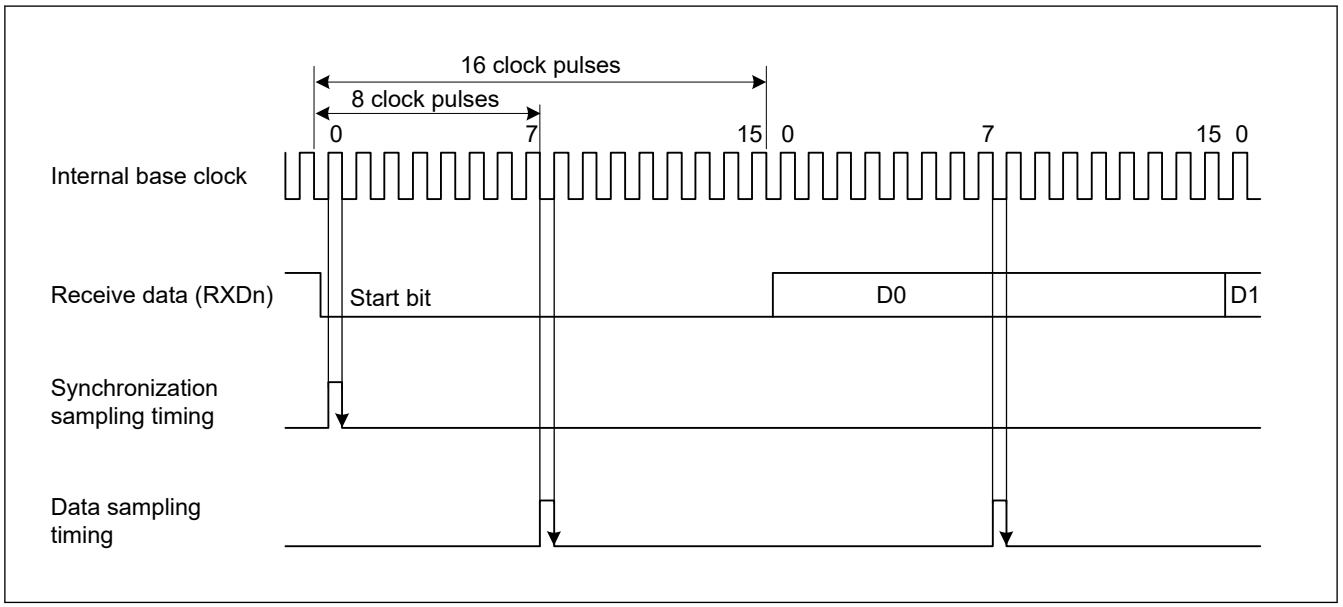

**Figure 26.7 Receive data sampling timing in asynchronous mode**

## 26.3.3 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input to the SCKn pin can be selected as the transfer clock of the SCI, based on the SMR.CM and SCR.CKE[1:0] settings.

When an external clock is input to the SCKn pin, the clock frequency must be 16 times the bit rate (when SEMR.ABCS = 0) or 8 times the bit rate (when SEMR.ABCS = 1).

When the SCI uses its internal clock, the clock can be output from the SCKn pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is configured so that the rising edge of the clock is in the middle of the transmit data, as shown in Figure 26.8.

When clock output is enabled, the clock is output after setting the SCR.TE or SCR.RE bit to 1.

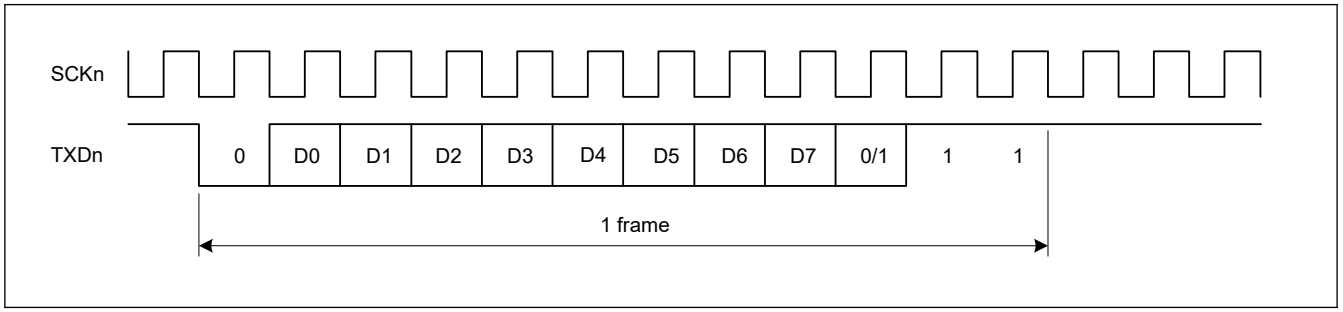

**Figure 26.8 Phase relationship between output clock and transmit data in asynchronous mode when SMR.CHR = 0, PE = 1, MP = 0, and STOP = 1**

### 26.3.4 Double-Speed Operation and Frequency of 6 Times the Bit Rate

When the SEMR.ABCS bit is set to 1 and eight pulses of the base clock for a 1-bit period is selected, the SCI operates on the bit rate twice that of when ABCS is set to 0. When the SEMR.BGDM bit is set to 1, the cycle of the base clock is half and the bit rate is double that of when BGDM is set to 0. When the SCR.CKE[1] bit is set to 0 and the on-chip baud rate generator is selected, setting the ABCS and BGDM bits to 1 allows the SCI to operate at a bit rate four times that when the ABCS and BGDM bits are set to 0.

When the SEMR.ABCSE bit is set to 1, the number of base clock pulses is 6 during a period of 1 bit, and the SCI operates at a bit rate 16/3 times that when SEMR.ABCS = 0, SEMR.BGDM = 0, and SEMR.ABCSE = 0.

As shown by Formula (1) in section 26.3.2. Receive Data Sampling Timing and Reception Margin in Asynchronous Mode, the reception margin decreases when the SEMR.ABCS or SEMR.ABCSE bit is set to 1. Therefore, if the target bit rate can be obtained with ABCS or ABCSE set to 0, it is recommended that you use the SCI with ABCS and ABCSE set to 0.

### 26.3.5 CTS and RTS Functions

The CTS function uses input on the CTSn_RTSn pin in transmission control. Setting the SPMR.CTSE bit to 1 enables the CTS function. For the functions of CTS and RTS, you can select the alternate setting that uses either function with one terminal and the dedicated setting that uses each function independently with two terminals. This setting is done with the SPMR.CTSPEN bit.

When the CTS function is enabled, placing a low level on the CTSn_RTSn pin causes transmission to start.

Driving the CTSn_RTSn pin high while transmission is in progress does not affect transmission of the current frame.

In the RTS function, which uses output on the CTSn_RTSn pin, a low level is output when reception becomes possible. Conditions for output of the low and high levels are shown in this section.

[Conditions for low level output]

Satisfaction of all conditions are listed in this section.

**Non-FIFO selected**

- The value of the SCR.RE bit is 1
- Reception is not in progress
- There is no received data yet to be read
- The ORER, FER, and PER flags in the SSR register are all 0

**FIFO selected**

- The value of the SCR.RE bit is 1
- The amount of receive data written in FRDRHL is equal to or less than the setting value of FCRH.RSTRG[3:0]
- The ORER flag in the SSR_FIFO register (ORER in FRDRH) is 0

[Condition for high level output]

- The conditions for low-level output are not satisfied

### 26.3.6 Address Match (Receive Data Match Detection) Function

The address match function can be used only in asynchronous mode.

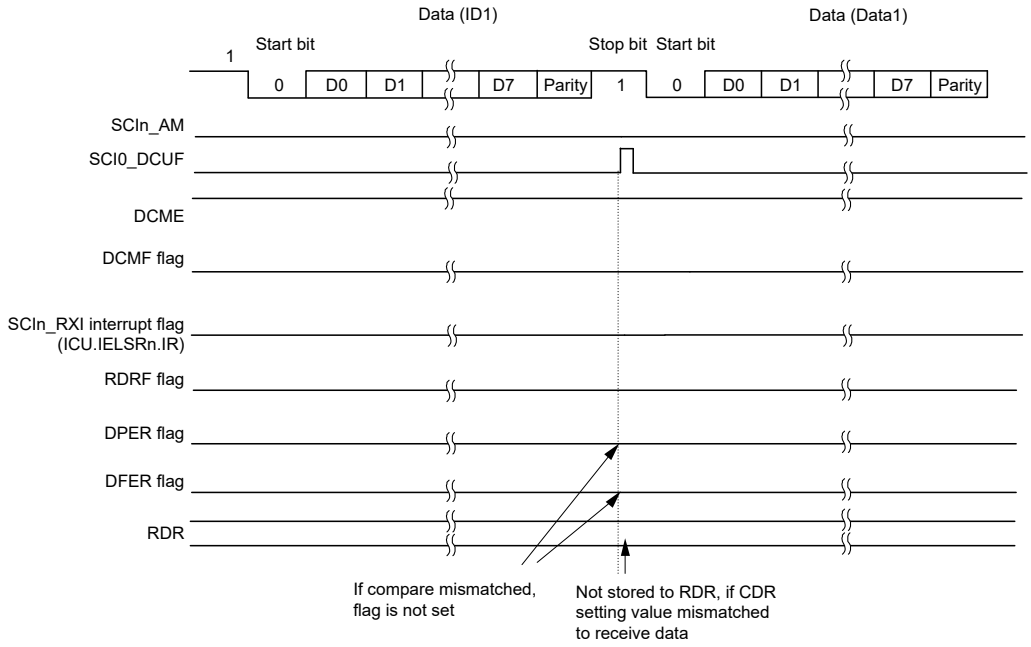
If the DCCR.DCME bit is set to 1, when one frame of data is received, the SCI compares that received data with the data set in CDR.CMPD. If the SCI detects a match to the comparison data (CDR.CMPD[*1]) with the received data, the SCI can issue the SCIn_RXI interrupt request.

If the SMR.MP bit is set to 0, comparison occurs only for valid data in receive format. In multi-processor mode (SMR.MP bit = 1), if the DCCR.IDSEL bit is set to 1, receive data where the MPB bit is 1 is subject to comparison for address match and receive data where the MPB bit is 0 is always treated as a non-match.

If the DCCR.IDSEL bit is set to 0, SCI performs address match detection regardless of the MPB bit value of the received data.

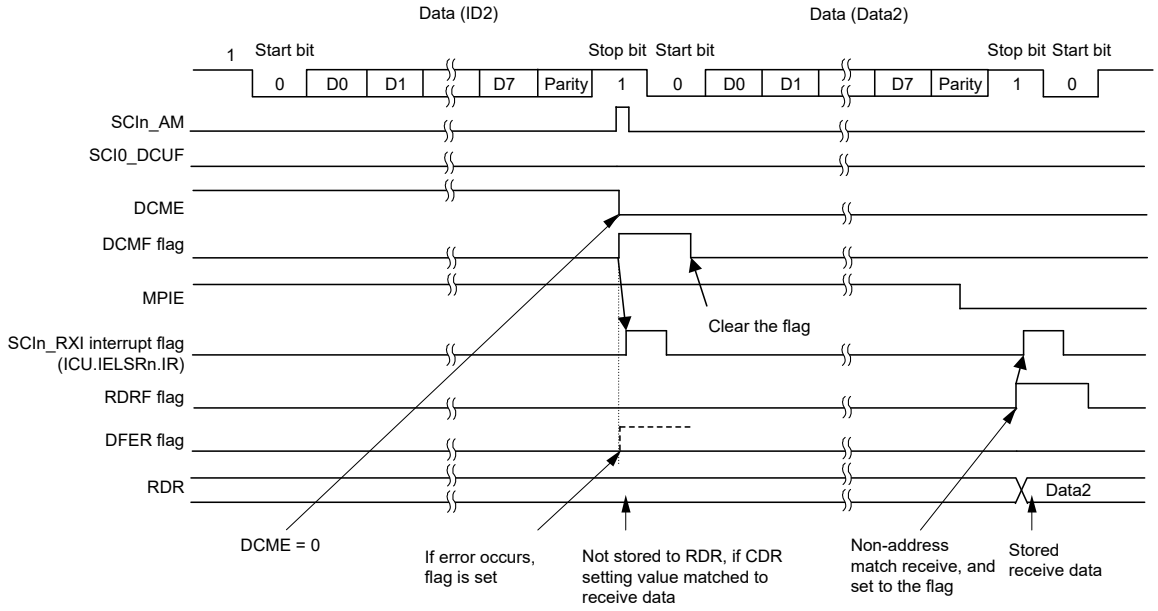
Until SCI detects a match to the comparison data (CDR.CMPD[*1]) with receive data, received data is skipped (discarded), and the SCI cannot detect a parity error or framing error.

When SCI detects a match, the DCCR.DCME bit is automatically cleared, and the DCCR.DCMF flag is set to 1. If the DCCR.IDSEL bit is set to 1, the SCR.MPIE bit is automatically cleared. If DCCR.IDSEL is set to 0, the value of the SCR.MPIE bit is retained. If the SCR.RIE bit is set to 1, the SCI issues an SCIn_RXI interrupt request.



If the SCI detects a framing error in the receive data for which a match is detected, the DCCR.DFER flag is set to 1, and if the SCI detects a parity error in that frame, the DCCR.DPER flag is set to 1. The compared receive data is not stored in the RDR register, and SSR.RDRF remains 0. When FCR.FM = 1, the RDR register indicates the FRDRHL register, and the SSR.RDRF flag indicates the SSR_FIFO.RDF flag.

After the SCI detects a match, and DCCR.DCME is automatically cleared, the SCI receives the next data continuously based on the current register setting.



When the DCCR.DFER or DCCR.DPER flag is set, the address match detection is not performed. Before enabling the address match function, set the DCCR.DFER and DCCR.DPER flags to 0.

Examples of the address match function are shown in Figure 26.9 and Figure 26.10.

Note 1. This comparative target can select one length of 3 types: CMPD[6:0] with 7-bit length, CMPD[7:0] with 8-bit length, and CMPD[8:0] with 9-bit length.

(a) Example of compare mismatched between receive data and CDR (8-bit length/IDSEL = 1/multi-processor mode)

(b) Example of compare matched between receive data and CDR (8-bit length/IDSEL = 1/multi-processor mode)

**Figure 26.10 Example of address match (2) multi-processor mode**

## 26.3.7 SCI Initialization in Asynchronous Mode

Before transmitting and receiving data, start by writing the initial value 0x00 to the SCR register, then continue through the SCI initialization procedure (select non-FIFO or FIFO) shown in Table 26.28 and Table 26.29. Whenever the operating mode or transfer format is to be changed, the SCR register must be initialized before the change is made.

When the external clock is used in asynchronous mode, ensure that the clock signal is supplied during initialization.

Note: Setting the SCR.RE bit to 0 initializes neither the ORER, FER, RDRF, RDF, PER, and DR flags in SSR/SSR_FIFO nor RDR and RDRHL. When the TE bit is set to 0, the TEND flag for the selected FIFO buffer is not initialized.

Note: In non-FIFO mode, switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of an SCIn_TXI interrupt request.

**Table 26.28 Example flow of SCI initialization in asynchronous mode with non-FIFO selected**

| No. | Step Name | Description |
|---|---|---|
| 1 | Start initialization | |
| 2 | Set the SCR.TIE, RIE, TE, RE, and TEIE bits to 0 | |
| 3 | Set the FCR.FM bit to 0 | Set the FCR.FM bit to 0. |
| 4 | Set the SCR.CKE[1:0] bits | Set the clock selection in SCR.<br>When the clock output is selected in asynchronous mode, the clock is output immediately after SCR settings are made. |
| 5 | Set the SIMR1.IICM bit to 0.<br>Set the SPMR.CKPH and CKPOL bits to 0. | Set the SIMR1.IICM bit to 0.<br>Set the SPMR.CKPH and CKPOL bits to 0.<br>Step 5 can be skipped if the values have not been changed from the initial values. |
| 6 | Set the data transmission/ reception format in SMR, SCMR, and SEMR | Set data transmission/reception format in SMR, SCMR, and SEMR. |
| 7 | Set a value in SPTR and ACTR | Set the communication terminals status in SPTR and adjustable sampling values in ACTR. |
| 8 | Set a value in BRR | Write a value corresponding to the bit rate to BRR.<br>This step is not necessary if an external clock is used. |
| 9 | Set a value in MDDR | Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the BRME bit in SEMR is set to 0 or an external clock is used. |
| 10 | Set the I/O port functions | Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins. |
| 11 | Set the SCR.TE or RE bit to 1, and set the SCR.TIE and RIE bits | Set the SCR.TE or RE bit to 1. Also set the SCR.TIE and RIE bits.<br>Setting the TE and RE bits allows TXDn and RXDn to be used. |
| 12 | Initialization completion | |

## 26.3.8 Serial Data Transmission in Asynchronous Mode

(1) Non-FIFO selected

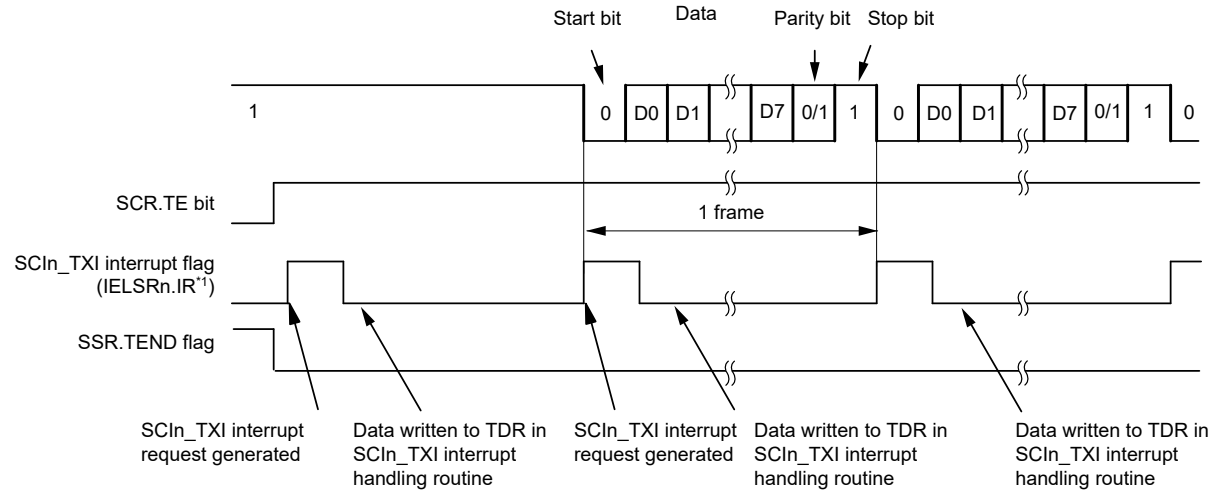

Figure 26.11, Figure 26.12, and Figure 26.13 show examples of serial transmission in asynchronous mode.

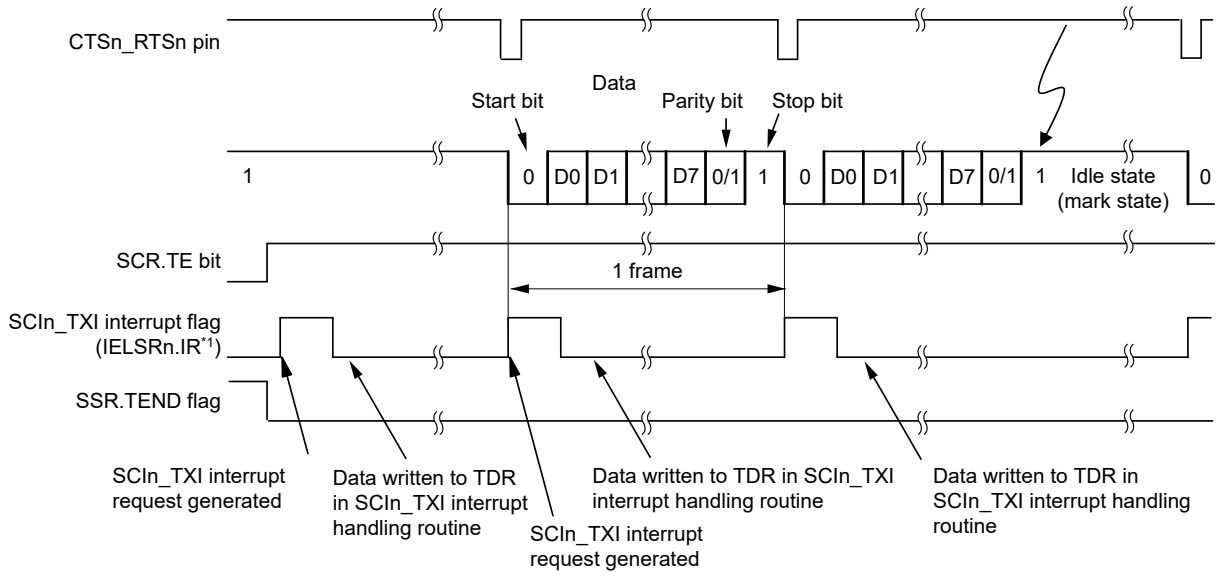
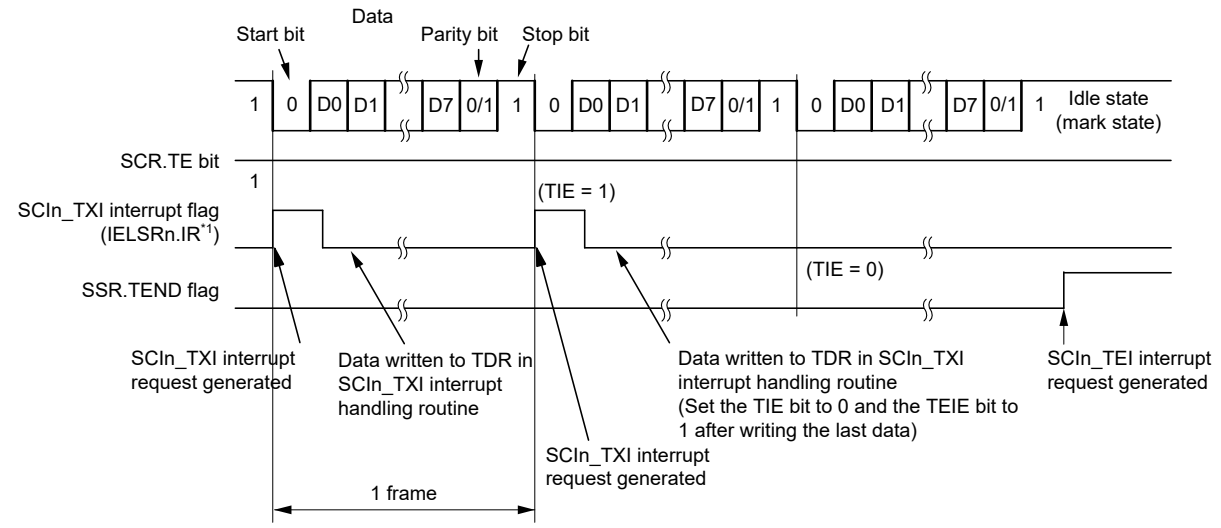
In serial transmission, the SCI operates as described in this section. When the SCR.TE bit is set to 1, the high level is output to TXDn for one frame. However, when SEMR.PADIS is set to 1, this preamble is not output. An example of operation when preamble is not output is shown in Figure 26.14.

1. The SCI transfers data from the TDR[*1] register to the TSR register when data is written to TDR[*1] in the SCIn_TXI interrupt handling routine.
   The SCIn_TXI interrupt request at the beginning of transmission is generated when the SCR.TE and SCR.TIE bits are set to 1 simultaneously by a single instruction.
2. Transmission starts after the SPMR.CTSE bit is set to 0 (CTS function is disabled) or a low level on the CTSn_RTSn pin causes data transfer from the TDR[*1] register to the TSR register. If the SCR.TIE bit is 1, an SCIn_TXI interrupt request is generated. Continuous transmission is possible by writing the next transmit data to the TDR[*1] register in the SCIn_TXI interrupt handling routine before transmission of the current transmit data is complete. When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 (SCIn_TXI interrupt requests are disabled) and the SCR.TEIE bit to 1 (an SCIn_TEI interrupt request is enabled) after the last of the data to be transmitted is written to the TDR[*1] register from the handling routine for SCIn_TXI requests.
3. Data is sent from the TXDn pin in the following order:
   - Start bit
   - Transmit data
   - Parity bit or multi-processor bit (can be omitted depending on the format)
   - Stop bit
4. The SCI checks for update of the TDR register on output of the stop bit.
5. When the TDR register is updated, setting the SPMR.CTSE bit to 0 (CTS function is disabled) or a low level input on the CTSn_RTSn pin causes transfer of the next transmit data from the TDR[*1] register to the TSR register and transmission of the stop bit, after which serial transmission of the next frame starts.
6. If the TDR register is not updated, the SSR.TEND flag is set to 1, the stop bit is sent, and the mark state is entered, in which 1 is output. If the SCR.TEIE bit is 1, the SSR.TEND flag is set to 1 and an SCIn_TEI interrupt request is generated.



Note 1. The TDRHL register when 9-bit data length is selected.

Figure 26.11, Figure 26.12, and Figure 26.13 show examples of serial transmission in asynchronous mode.



Note 1. See section 12, Interrupt Controller Unit (ICU) for information on the corresponding interrupt event number.

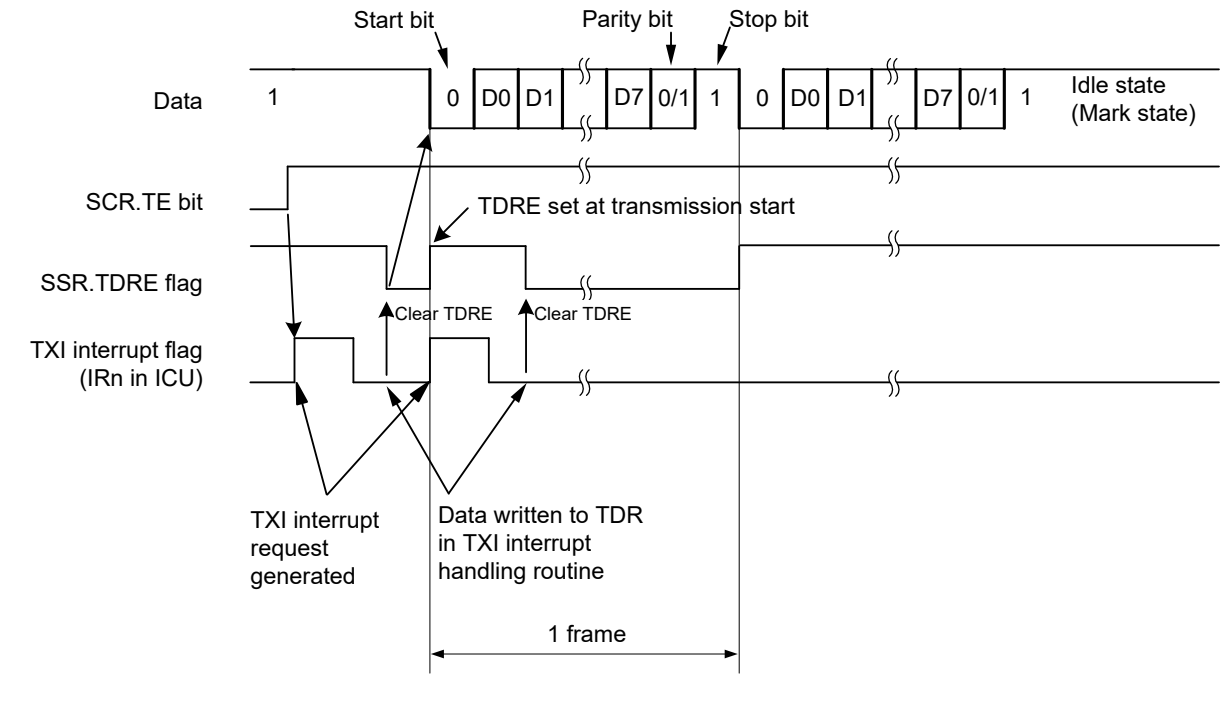
**Figure 26.11 Example operation for serial transmission in asynchronous mode (1) with 8-bit data, parity bit, 1 stop bit, CTS function not used, and at the beginning of transmission**

Note 1. See section 12, Interrupt Controller Unit (ICU) for information on the corresponding interrupt event number.

**Figure 26.12 Example operation for serial transmission in asynchronous mode (2) with 8-bit data, parity bit, one stop bit, CTS function used, and at the beginning of transmission**

Note 1. See section 12, Interrupt Controller Unit (ICU) for information on the corresponding interrupt event number.

**Figure 26.13 Example operation for serial transmission in asynchronous mode (3) with 8-bit data, parity bit, one stop bit, CTS function not used, and from the middle of transmission until transmission completion**



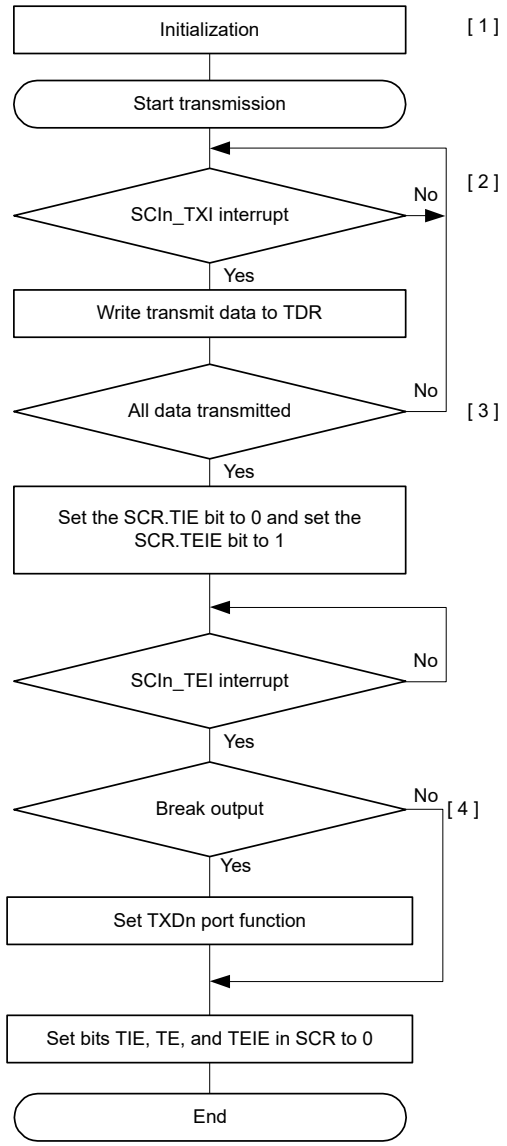


**Figure 26.14 Example of Operation for Serial Transmission in Asynchronous Mode (4)(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, from the Middle of Transmission until Transmission Completion, stop preamble)**

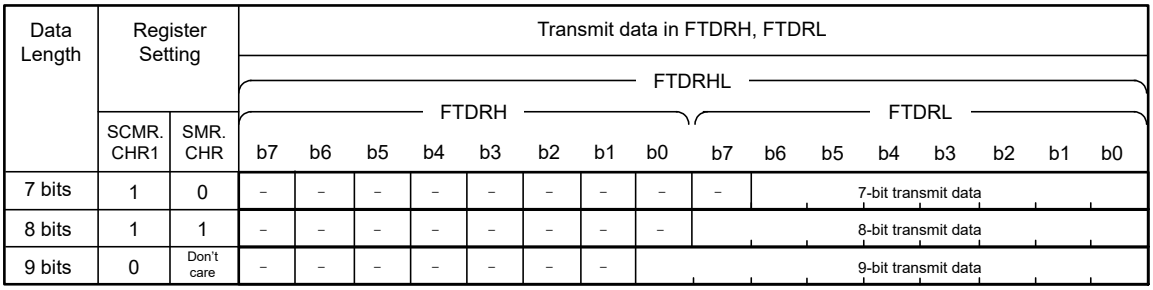
[1] SCI Initialization:
Set data transmission.
After the SCR.TE bit is set to 1, 1 is output for a frame, and transmission is enabled.

[2] Transmit data write to TDR by an SCIn_TXI interrupt request. When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (SCIn_TXI) request is generated. Write transmit data to TDR once in the SCIn_TXI interrupt processing routine.

[3] Serial transmission continuation procedure:
To continue serial transmission write transmit data to TDR once using an SCIn_TXI interrupt request. Transmit data can also be written to TDR by activating the DMAC or DTC.
When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to TDR.



[4] Break output at the end of serial transmission:
To output a break in serial transmission, after setting the output state (LOW level output) of TXDn pin by SPTR.SPB2IO and SPTR.SPB2DT bits, set the SCR.TE bit to 0.

**Figure 26.15 Example flow of serial transmission in asynchronous mode with non-FIFO selected**

(2) FIFO selected

Figure 26.16 shows an example of a data format that is written to FTDRH and FTDRL register in asynchronous mode.

Data corresponding to the data length is set to FTDRH and FTDRL. Write 0 for unused bits. Write in order from FTDRH to FTDRL.

Note: —: Invalid. The write value should be 0.

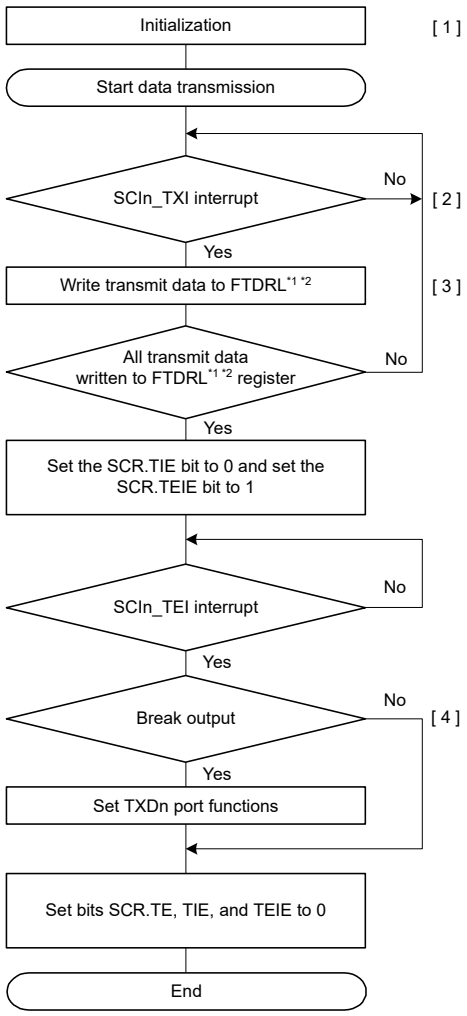


**Figure 26.16 Data format written to FTDRH and FTDRL with FIFO selected**

In serial transmission, the SCI operates as described in this section. When the TE bit is set to 1, the high level is output to TXDn for one frame (preamble).

1. The SCI transfers data from the FTDRL*1 register to the TSR register when data is written to FTDRL*1 in the SCIn_TXI interrupt handling routine. The amount of data that can be written to FTDRL is 16 minus FDR.T[4:0] bytes. The SCIn_TXI interrupt request at the beginning of transmission is generated when the SCR.TE and SCR.TIE bits are set to 1 simultaneously by a single instruction.
2. Transmission starts after the SPMR.CTSE bit is set to 0 (CTS function is disabled) or a low level on the CTSn_RTSn pin causes data transfer from the FTDRL*1 register to the TSR register. When the amount of transmit data written in FTDRL is equal to or less than the specified transmit triggering number, SSR_FIFO.TDFE is set to 1. If the SCR.TIE bit is 1, an SCIn_TXI interrupt request is generated. Continuous transmission is possible by writing the next transmit data to FTDRL*1 in the SCIn_TXI interrupt handling routine before transmission of the current transmit data is complete. When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 (SCIn_TXI interrupt requests are disabled) and the SCR.TEIE bit to 1 (an SCIn_TEI interrupt request is enabled) after the last of the data to be transmitted is written to the FTDRL*1*2 register from the handling routine for SCIn_TXI requests.
3. Data is sent from the TXDn pin in the following order:
   - Start bit
   - Transmit data
   - Parity bit or multi-processor bit (can be omitted depending on the format)
   - Stop bit
4. On output of the stop bit, the SCI checks whether non-transmitted data remains in the FTDRL*3 register.
5. When data is set to FTDRL*3, setting the SPMR.CTSE bit to 0 (CTS function is disabled) or a low level input on the CTSn_RTSn pin causes transfer of the next transmit data from FTDRL*1 to TSR and transmission of the stop bit, after which serial transmission of the next frame starts.
6. If data is not set in FTDRL*3, the TEND flag in SSR_FIFO is set to 1, the stop bit is sent, and the mark state is entered in which 1 is output. If the SCR.TEIE bit is 1, the SSR_FIFO.TEND flag is set to 1 and an SCIn_TEI interrupt request is generated.

Note 1. Write data not to FTDRL but to the FTDRH and FTDRL registers.
Note 2. Write data in order from FTDRH to FTDRL when 9-bit data length is selected.
Note 3. The SCI only checks for update to the FTDRL register and not the FTDRH register when 9-bit data length is selected.
