

## RTKA223011DE0010BU

Evaluation Board

The RAA223011 evaluation board (RTKA223011DE0010BU) is a high voltage buck converter that is designed to demonstrate a low-cost high performance non-isolated AC/DC conversion from an universal input of 85V<sub>AC</sub> to 265V<sub>AC</sub>, to a 12V output with the output current up to 300mA.

The RTKA223011DE0010BU has built-in overcurrent, short-circuit, input brownout, and over-temperature protection. The board is designed on a single side PCB with a single diode half-wave input rectification. It is pre-compliant with conducted and radiated EMI requirements by EN55022/CISPR 22.

The RTKA223011DE0010BU comes with a RAA223011 in 8 Ld SOIC package.

### Key Features

- Universal input
- Single-side PCB with low cost external components
- EMI compliance for EN55022/CISPR22
- Standby power less than 10mW
- No audible noise

### Specifications

This board is optimized for the following operating conditions:

- Input voltage: 85V<sub>AC</sub> ~ 265V<sub>AC</sub>
- Output voltage: 12V<sub>DC</sub>
- Output current: 300mA max (at 230V<sub>AC</sub> or higher)
- Output power: 3.6W
- Efficiency: >73% at 100% load; 80% at 50% load
- No-load power: 7mW at 120V<sub>AC</sub>; 9.6mW at 230V<sub>AC</sub>
- Load regulation: -2.4%, load range 10% to 100%
- Operating temperature: -45°C~65°C
- Board dimension: 40mm x 60mm

# 1. Circuit Description

The RTKA223011DE0010BU is buck regulator implemented with a high-side float-switching topology, with switching frequency up to 33kHz. Its input has D1, D7 as a low-cost half-wave rectification (with an optional full-bridge rectifier foot-print). FR is a 1W fusible resistor providing input overcurrent protection and inrush current limiting. It also helps to absorb the input line surge energy together with DC buffer caps, C1 and C2.

C1, L1, and C2 consists of the input filter that provides the energy buffer after rectification and reduces conducted EMI noises to the input. L2, D2, and C<sub>OUT</sub> is the buck converter. RFB1, RFB2, CFB2, and CFB1 provide the output feedback signal to the IC. D4 and R2 provide V<sub>CC</sub> biasing current after startup, to increase the efficiency. They can be optional for low-cost, low-power applications. C<sub>VCC</sub> is the IC supply capacitor.

## 1.1 Recommended Equipment

- AC Power supply capable of generating AC voltage from 85V<sub>AC</sub> to 265V<sub>AC</sub> at 60Hz/50Hz, with at least 100mA output current capability.
- Load resistor box with adjustable value of 40Ω and up, or an electronics load than can emulate a resistor load or current load up to 300mA.
- Multimeters to measure the output voltage and current.
- Power meter to measure the AC input power.

## 1.2 Quick Start Guide

1. Program the AC power supply with a voltage between 85V<sub>AC</sub> and 265V<sub>AC</sub> at the corresponding frequency of 60Hz or 50Hz.
2. While the AC power supply is off, connect the output cables of the AC power supply to the L and N terminals of the RTKA223011DE0010BU. An optional power meter can be added in between the AC power supply output and input of the board.
3. Connect the load to the output terminals VOUT and GND.
4. Connect a voltage meter to VOUT and GND and connect a current meter between board outputs and the load.
5. Turn on AC power supply.
