Rev.7.00 Sep. 2024

# Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

# General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

# Contents

1. Overview ..... 1-1
   1.1 Features of This LSI ..... 1-1
   1.2 Product Lineup ..... 1-10
   1.3 Block Diagram ..... 1-10
   1.4 Pin Assignment ..... 1-11
   1.5 Pin Functions ..... 1-14
   1.6 List of Pins ..... 1-22
2. CPU ..... 2-1
   2.1 Features ..... 2-1
   2.2 Configuration Signals ..... 2-2
3. Boot Mode ..... 3-1
   3.1 Features ..... 3-1
   3.2 Boot Mode and Pin Function Setting ..... 3-1
   3.3 Hardware Used in Each Boot Mode ..... 3-2
   3.4 Exception Vector Address at a Reset in Each Boot Mode ..... 3-3
   3.5 Operation ..... 3-4
      3.5.1 Boot Modes 0 and 1 ..... 3-4
      3.5.2 Boot Mode 3 ..... 3-4
      3.5.3 Boot Mode 4 ..... 3-5
      3.5.4 Boot Mode 5 ..... 3-7
   3.6 Notes ..... 3-9
      3.6.1 Boot Related Pins ..... 3-9
      3.6.2 Operation when an Exception Occurs with the Exception Vector Set to the High Vector Address ..... 3-9
      3.6.3 Notes on Serial Flash Booting (Boot Mode 3) after This LSI is Reset ..... 3-9
4. Secondary Cache ..... 4-1
   4.1 Features ..... 4-1
   4.2 Configuration Signals ..... 4-1
5. LSI Internal Bus ..... 5-1
   5.1 LSI Internal Bus ..... 5-1
      5.1.1 Configuration ..... 5-1
      5.1.2 Operation ..... 5-1
   5.2 North Main Bus ..... 5-2
      5.2.1 Configuration ..... 5-2
      5.2.2 Features ..... 5-2
      5.2.3 Peripheral Buses ..... 5-3
   5.3 South Main Bus ..... 5-5
      5.3.1 Configuration ..... 5-5
      5.3.2 Features ..... 5-5
      5.3.3 Connected Buses ..... 5-6

5.4 Address Map ..... 5-7
5.5 Address Remapping ..... 5-10
5.5.1 Overview ..... 5-10
5.5.2 Operation ..... 5-10
5.6 AXI Interconnect ..... 5-11
5.6.1 Configuration ..... 5-11
5.6.2 Operation ..... 5-11
5.7 Bus Bridges ..... 5-11
5.8 AXI Protocol Control Signals ..... 5-12
5.8.1 Bus Masters other than Cortex-A9, CoreSight, and the Direct Memory Access Controller ..... 5-12
5.8.2 Cortex-A9 ..... 5-12
5.8.3 CoreSight ..... 5-12
5.8.4 Direct Memory Access Controller ..... 5-13
5.8.5 Slave Area ..... 5-13
5.9 Write Buffers ..... 5-13
5.10 Register Descriptions ..... 5-14
5.10.1 Remap Register (RMPR) ..... 5-15
5.10.2 AXI Bus Control Register 0 (AXIBUSCTL0) ..... 5-16
5.10.3 AXI Bus Control Register 1 (AXIBUSCTL1) ..... 5-17
5.10.4 AXI Bus Control Register 2 (AXIBUSCTL2) ..... 5-18
5.10.5 AXI Bus Control Register 3 (AXIBUSCTL3) ..... 5-19
5.10.6 AXI Bus Control Register 4 (AXIBUSCTL4) ..... 5-20
5.10.7 AXI Bus Control Register 5 (AXIBUSCTL5) ..... 5-21
5.10.8 AXI Bus Control Register 6 (AXIBUSCTL6) ..... 5-22
5.10.9 AXI Bus Control Register 7 (AXIBUSCTL7) ..... 5-23
5.10.10 AXI Bus Control Register 8 (AXIBUSCTL8) ..... 5-24
5.10.11 AXI Bus Control Register 9 (AXIBUSCTL9) ..... 5-25
5.10.12 AXI Bus Control Register 10 (AXIBUSCTL10) ..... 5-26
5.10.13 AXI Bus Response Error Interrupt Control Register 0 (AXIRERRCTL0) ..... 5-27
5.10.14 AXI Bus Response Error Interrupt Control Register 1 (AXIRERRCTL1) ..... 5-28
5.10.15 AXI Bus Response Error Interrupt Control Register 2 (AXIRERRCTL2) ..... 5-29
5.10.16 AXI Bus Response Error Interrupt Control Register 3 (AXIRERRCTL3) ..... 5-30
5.10.17 AXI Bus Response Error Status Register 0 (AXIRERRST0) ..... 5-31
5.10.18 AXI Bus Response Error Status Register 1 (AXIRERRST1) ..... 5-33
5.10.19 AXI Bus Response Error Status Register 2 (AXIRERRST2) ..... 5-35
5.10.20 AXI Bus Response Error Status Register 3 (AXIRERRST3) ..... 5-36
5.10.21 AXI Bus Response Error Clear Register 0 (AXIRERRCLR0) ..... 5-38
5.10.22 AXI Bus Response Error Clear Register 1 (AXIRERRCLR1) ..... 5-39
5.10.23 AXI Bus Response Error Clear Register 2 (AXIRERRCLR2) ..... 5-40
5.10.24 AXI Bus Response Error Clear Register 3 (AXIRERRCLR3) ..... 5-41

5.11 Interrupt Request ..... 5-42
6. Clock Pulse Generator ..... 6-1
6.1 Features ..... 6-1
6.2 Input/Output Pins ..... 6-4
6.3 Clock Mode ..... 6-5
6.4 Register Descriptions ..... 6-7
6.4.1 Frequency Control Register (FRQCR) ..... 6-7
6.4.2 Frequency Control Register 2 (FRQCR2) ..... 6-9
6.5 Changing the Frequency ..... 6-10
6.5.1 Changing the Division Ratio ..... 6-10
6.6 Usage of the Clock Pins ..... 6-11
6.6.1 In the Case of Inputting an External Clock ..... 6-11
6.6.2 In the Case of Using a Crystal Resonator ..... 6-12
6.6.3 In the Case of Not Using the Clock Pin ..... 6-12
6.7 Oscillation Stabilizing Time ..... 6-13
6.7.1 Oscillation Stabilizing Time of the On-chip Crystal Oscillator ..... 6-13
6.7.2 Oscillation Stabilizing Time of the PLL circuit ..... 6-13
6.8 Notes on Board Design ..... 6-14
6.8.1 Note on Using a PLL Oscillation Circuit ..... 6-14
6.9 Definition of Modulation Rate and Frequency in the SSCG Specification ..... 6-15
6.10 Clock Signals ..... 6-16
6.10.1 Clock Signals for the System and Realtime Clock ..... 6-16
6.10.2 Audio and USB Clock Signals ..... 6-17
6.10.3 Video Image Clock Signals (Channel 0) ..... 6-18
6.10.4 Video Image Clock Signals (Channel 1) ..... 6-19
6.10.5 Other Clock Signals ..... 6-19
6.10.6 Internal Clock Signals (1) ..... 6-20
6.10.7 Internal Clock Signals (2) ..... 6-21
6.11 Usage Note ..... 6-21
6.11.1 Notes on the SSCG ..... 6-21
7. Interrupt Controller ..... 7-1
7.1 Features ..... 7-1
7.2 Input/Output Pins ..... 7-2
7.3 Register Descriptions ..... 7-3
7.3.1 Interrupt Control Register 0 (ICR0) ..... 7-14
7.3.2 Interrupt Control Register 1 (ICR1) ..... 7-15
7.3.3 IRQ Interrupt Request Register (IRQRR) ..... 7-16
7.4 Interrupt Sources ..... 7-17
7.4.1 NMI Interrupt ..... 7-17
7.4.2 IRQ Interrupts ..... 7-17

7.4.3 On-Chip Peripheral Module Interrupts ..... 7-18
7.4.4 Pin Interrupts ..... 7-19
7.5 Interrupt IDs ..... 7-19
7.6 Operation ..... 7-37
7.6.1 Initial Settings ..... 7-37
7.6.2 Flow of Interrupt Operations ..... 7-39
7.7 Data Transfer with Interrupt Request Signals ..... 7-40
7.7.1 Handling Interrupt Request Signals as Sources for CPU Interrupt but Not Direct Memory Access Controller Activating ..... 7-40
7.7.2 Handling Interrupt Request Signals as Sources for Activating Direct Memory Access Controller but Not CPU Interrupt ..... 7-40
7.8 Usage Note ..... 7-41
7.8.1 Timing to Clear an Interrupt Source ..... 7-41
7.8.2 Notes on Selecting IRQ Interrupt Pin Functions ..... 7-41
7.8.3 Notes on Reading Interrupt ID Values from Interrupt Acknowledge Register (ICCIAR) ..... 7-41
7.8.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use ..... 7-42
8. Bus State Controller ..... 8-1
8.1 Features ..... 8-1
8.2 Input/Output Pins ..... 8-3
8.3 Area Overview ..... 8-4
8.3.1 Address Map ..... 8-4
8.3.2 Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode ..... 8-5
8.4 Register Descriptions ..... 8-6
8.4.1 Common Control Register (CMNCR) ..... 8-7
8.4.2 CSn Space Bus Control Register (CSnBCR) (n = 0 to 5) ..... 8-8
8.4.3 CSn Space Wait Control Register (CSnWCR) (n = 0 to 5) ..... 8-10
8.4.4 SDRAM Control Register (SDCR) ..... 8-27
8.4.5 Refresh Timer Control/Status Register (RTCSR) ..... 8-29
8.4.6 Refresh Timer Counter (RTCNT) ..... 8-30
8.4.7 Refresh Time Constant Register (RTCOR) ..... 8-30
8.4.8 Timeout Cycle Constant Register (TOSCORn) (n = 0 to 5) ..... 8-31
8.4.9 Timeout Status Register (TOSTR) ..... 8-32
8.4.10 Timeout Enable Register (TOENR) ..... 8-34
8.5 Operation ..... 8-35
8.5.1 Access Size and Data Alignment ..... 8-35
8.5.2 Normal Space Interface ..... 8-37
8.5.3 Access Wait Control ..... 8-42
8.5.4 $\overline{\text{CSn}}$ Assert Period Expansion ..... 8-44
8.5.5 MPX-I/O Interface ..... 8-45
8.5.6 SDRAM Interface ..... 8-48

8.5.7 Burst ROM (Clocked Asynchronous) Interface ..... 8-77
8.5.8 SRAM Interface with Byte Selection ..... 8-78
8.5.9 Burst ROM (Clocked Synchronous) Interface ..... 8-83
8.5.10 Wait between Access Cycles ..... 8-84
8.5.11 Others ..... 8-87
9. Direct Memory Access Controller ..... 9-1
9.1 Features ..... 9-1
9.2 Input/Output Pins ..... 9-2
9.3 Register Configuration ..... 9-2
9.4 Register Descriptions ..... 9-4
9.4.1 Next Source Address Register n (N0SA_n, N1SA_n) ..... 9-12
9.4.2 Next Destination Address Register n (N0DA_n, N1DA_n) ..... 9-12
9.4.3 Next Transaction Byte Register n (N0TB_n, N1TB_n) ..... 9-13
9.4.4 Current Source Address Register (CRSA_n) ..... 9-13
9.4.5 Current Destination Address Register (CRDA_n) ..... 9-14
9.4.6 Current Transaction Byte Register (CRTB_n) ..... 9-14
9.4.7 Channel Status Register n (CHSTAT_n) ..... 9-15
9.4.8 Channel Control Register n (CHCTRL_n) ..... 9-18
9.4.9 Channel Configuration Register n (CHCFG_n) ..... 9-20
9.4.10 Channel Interval Register n (CHITVL_n) ..... 9-22
9.4.11 Channel Extension Register n (CHEXT_n) ..... 9-23
9.4.12 Next Link Address Register n (NXLA_n) ..... 9-24
9.4.13 Current Link Address Register n (CRLA_n) ..... 9-24
9.4.14 DMA Control Register (DCTRL_0_7, DCTRL_8_15) ..... 9-25
9.4.15 DMA Status EN Register (DSTAT_EN_0_7) ..... 9-26
9.4.16 DMA Status EN Register (DSTAT_EN_8_15) ..... 9-26
9.4.17 DMA Status ER Register (DSTAT_ER_0_7) ..... 9-27
9.4.18 DMA Status ER Register (DSTAT_ER_8_15) ..... 9-27
9.4.19 DMA Status END Register (DSTAT_END_0_7) ..... 9-28
9.4.20 DMA Status END Register (DSTAT_END_8_15) ..... 9-28
9.4.21 DMA Status TC Register (DSTAT_TC_0_7) ..... 9-29
9.4.22 DMA Status TC Register (DSTAT_TC_8_15) ..... 9-29
9.4.23 DMA Status SUS Register (DSTAT_SUS_0_7) ..... 9-30
9.4.24 DMA Status SUS Register (DSTAT_SUS_8_15) ..... 9-30
9.4.25 DMA Extension Resource Selectors 0 to 7 (DMARS0 to DMARS7) ..... 9-31
9.5 Operation ..... 9-34
9.5.1 Transfer Flow ..... 9-34
9.5.2 DMA Transfer Requests ..... 9-34
9.6 DMA Mode ..... 9-41
9.6.1 Mode Setting ..... 9-41

9.6.2 Register Mode ..... 9-41
9.6.3 Link Mode ..... 9-47
9.7 DMA Transfer ..... 9-54
9.7.1 Transfer Mode ..... 9-54
9.7.2 Priority Control for DMA Channels ..... 9-55
9.7.3 Number of States of an External Bus Cycle ..... 9-57
9.7.4 DMA Transfer Request ..... 9-57
9.7.5 DMA Acknowledge Output Function ..... 9-59
9.7.6 DMA Transfer End Output Function ..... 9-61
9.7.7 DMA Transfer End Interrupt ..... 9-61
9.7.8 DMA Error Interrupt ..... 9-62
9.7.9 Interval Count Function ..... 9-62
9.7.10 Difference in Operation Due to the Transfer Size ..... 9-63
9.7.11 Transfer Status ..... 9-64
9.8 DMA Setting Examples ..... 9-68
9.8.1 Setting Example 1 (Register Mode/Hardware Request) ..... 9-68
9.8.2 Setting Example 2 (Register Mode/Software Request) ..... 9-70
9.8.3 Setting Example 3 (Register Mode/Continuous Execution) ..... 9-72
9.8.4 Setting Example 4 (Link Mode) ..... 9-73
9.8.5 Next Register Set Continuous Execution Setting ..... 9-76
9.9 Note ..... 9-78
9.9.1 Divided Output of DACK0 and TEND0 ..... 9-78
9.9.2 TEND0 Not Output ..... 9-79
9.9.3 Atomic Access (ARLOCK[1:0] and AWLOCK[1:0]) ..... 9-79
10. Multi-Function Timer Pulse Unit 2 ..... 10-1
10.1 Features ..... 10-1
10.2 Input/Output Pins ..... 10-5
10.3 Register Descriptions ..... 10-6
10.3.1 Timer Control Register (TCR) ..... 10-8
10.3.2 Timer Mode Register (TMDR) ..... 10-11
10.3.3 Timer I/O Control Register (TIOR) ..... 10-13
10.3.4 Timer Interrupt Enable Register (TIER) ..... 10-31
10.3.5 Timer Status Register (TSR) ..... 10-33
10.3.6 Timer Buffer Operation Transfer Mode Register (TBTM) ..... 10-36
10.3.7 Timer Input Capture Control Register (TICCR) ..... 10-37
10.3.8 Timer A/D Converter Start Request Control Register (TADCR) ..... 10-38
10.3.9 Timer A/D Converter Start Request Cycle Set Registers (TADCORA_4 and TADCORB_4) ..... 10-40
10.3.10 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA_4 and TADCOBRB_4) ..... 10-40
10.3.11 Timer Counter (TCNT) ..... 10-40

10.3.12 Timer General Register (TGR) ..... 10-41
10.3.13 Timer Start Register (TSTR) ..... 10-42
10.3.14 Timer Synchronous Register (TSYR) ..... 10-43
10.3.15 Timer Read/Write Enable Register (TRWER) ..... 10-44
10.3.16 Timer Output Master Enable Register (TOER) ..... 10-45
10.3.17 Timer Output Control Register 1 (TOCR1) ..... 10-46
10.3.18 Timer Output Control Register 2 (TOCR2) ..... 10-48
10.3.19 Timer Output Level Buffer Register (TOLBR) ..... 10-51
10.3.20 Timer Gate Control Register (TGCR) ..... 10-52
10.3.21 Timer Subcounter (TCNTS) ..... 10-53
10.3.22 Timer Dead Time Data Register (TDDR) ..... 10-53
10.3.23 Timer Cycle Data Register (TCDR) ..... 10-54
10.3.24 Timer Cycle Buffer Register (TCBR) ..... 10-54
10.3.25 Timer Interrupt Skipping Set Register (TITCR) ..... 10-55
10.3.26 Timer Interrupt Skipping Counter (TITCNT) ..... 10-57
10.3.27 Timer Buffer Transfer Set Register (TBTER) ..... 10-58
10.3.28 Timer Dead Time Enable Register (TDER) ..... 10-59
10.3.29 Timer Waveform Control Register (TWCR) ..... 10-60
10.3.30 Bus Master Interface ..... 10-60
10.4 Operation ..... 10-61
10.4.1 Basic Functions ..... 10-61
10.4.2 Synchronous Operation ..... 10-67
10.4.3 Buffer Operation ..... 10-69
10.4.4 Cascaded Operation ..... 10-73
10.4.5 PWM Modes ..... 10-78
10.4.6 Phase Counting Mode ..... 10-82
10.4.7 Reset-Synchronized PWM Mode ..... 10-88
10.4.8 Complementary PWM Mode ..... 10-91
10.4.9 A/D Converter Start Request Delaying Function ..... 10-126
10.4.10 TCNT Capture at Crest and/or Trough in Complementary PWM Operation ..... 10-129
10.5 Interrupt Sources ..... 10-130
10.5.1 Interrupt Sources and Priorities ..... 10-130
10.5.2 Activation of Direct Memory Access Controller ..... 10-131
10.5.3 A/D Converter Activation ..... 10-131
10.6 Operation Timing ..... 10-133
10.6.1 Input/Output Timing ..... 10-133
10.6.2 Interrupt Signal Timing ..... 10-138
10.7 Usage Notes ..... 10-141
10.7.1 Module Standby Mode Setting ..... 10-141
10.7.2 Input Clock Restrictions ..... 10-141

10.7.3 Caution on Period Setting ..... 10-142
10.7.4 Contention between TCNT Write and Clear Operations ..... 10-142
10.7.5 Contention between TCNT Write and Increment Operations ..... 10-143
10.7.6 Contention between TGR Write and Compare Match ..... 10-143
10.7.7 Contention between Buffer Register Write and Compare Match ..... 10-144
10.7.8 Contention between Buffer Register Write and TCNT Clear ..... 10-145
10.7.9 Contention between TGR Read and Input Capture ..... 10-145
10.7.10 Contention between TGR Write and Input Capture ..... 10-146
10.7.11 Contention between Buffer Register Write and Input Capture ..... 10-146
10.7.12 TCNT_2 Write and Overflow/Underflow Contention in Cascade Connection ..... 10-147
10.7.13 Counter Value during Complementary PWM Mode Stop ..... 10-148
10.7.14 Buffer Operation Setting in Complementary PWM Mode ..... 10-148
10.7.15 Reset Sync PWM Mode Buffer Operation and Compare Match Flag ..... 10-149
10.7.16 Overflow Flags in Reset Synchronous PWM Mode ..... 10-150
10.7.17 Contention between Overflow/Underflow and Counter Clearing ..... 10-150
10.7.18 Contention between TCNT Write and Overflow/Underflow ..... 10-151
10.7.19 Cautions on Transition from Normal Operation or PWM Mode 1 to Reset-Synchronized PWM Mode ..... 10-151
10.7.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode ..... 10-151
10.7.21 Interrupts in Module Standby Mode ..... 10-151
10.7.22 Simultaneous Capture of TCNT_1 and TCNT_2 in Cascade Connection ..... 10-152
10.7.23 Notes on Output Waveform Control During Synchronous Counter Clearing in Complementary PWM Mode ..... 10-152
10.8 Output Pin Initialization for Multi-Function Timer Pulse Unit 2 ..... 10-154
10.8.1 Operating Modes ..... 10-154
10.8.2 Reset Start Operation ..... 10-154
10.8.3 Operation in Case of Re-Setting Due to Error during Operation, etc. ..... 10-155
10.8.4 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation, etc. ..... 10-156
11. OS Timer ..... 11-1
11.1 Functional Overview ..... 11-1
11.1.1 Features of OSTM ..... 11-1
11.2 Registers ..... 11-2
11.2.1 Registers Overview ..... 11-2
11.2.2 Details of OSTM Registers ..... 11-3
11.3 Functional Description ..... 11-7
11.3.1 Block Diagram ..... 11-7
11.3.2 Count Clock ..... 11-8
11.3.3 Generation of Interrupt Request ..... 11-8
11.3.4 Starting and Stopping the Timer ..... 11-9
11.3.5 Interval Timer Mode ..... 11-9

11.3.6 Free-Running Comparison Mode ..... 11-13
12. Watchdog Timer ..... 12-1
12.1 Features ..... 12-1
12.2 Input/Output Pin ..... 12-2
12.3 Register Descriptions ..... 12-2
12.3.1 Watchdog Timer Counter (WTCNT) ..... 12-3
12.3.2 Watchdog Timer Control/Status Register (WTCSR) ..... 12-3
12.3.3 Watchdog Reset Control/Status Register (WRCSR) ..... 12-5
12.3.4 Notes on Register Access ..... 12-6
12.4 Usage ..... 12-8
12.4.1 Canceling Software Standby Mode ..... 12-8
12.4.2 Using Watchdog Timer Mode ..... 12-8
12.4.3 Using Interval Timer Mode ..... 12-9
12.5 Usage Notes ..... 12-10
12.5.1 Timer Variation ..... 12-10
12.5.2 Prohibition against Setting H'FF to WTCNT ..... 12-10
12.5.3 Interval Timer Overflow Flag ..... 12-10
12.5.4 System Reset by $\overline{\text{WDTOVF}}$ Signal ..... 12-10
12.5.5 Internal Reset in Watchdog Timer Mode ..... 12-10
13. Realtime Clock ..... 13-1
13.1 Features ..... 13-1
13.2 Input/Output Pin ..... 13-3
13.3 Register Descriptions ..... 13-3
13.3.1 64-Hz Counter (R64CNT) ..... 13-4
13.3.2 Second Counter (RSECCNT) ..... 13-5
13.3.3 Minute Counter (RMINCNT) ..... 13-5
13.3.4 Hour Counter (RHRCNT) ..... 13-6
13.3.5 Day of Week Counter (RWKCNT) ..... 13-6
13.3.6 Day Counter (RDAYCNT) ..... 13-7
13.3.7 Month Counter (RMONCNT) ..... 13-7
13.3.8 Year Counter (RYRCNT) ..... 13-8
13.3.9 Second Alarm Register (RSECAR) ..... 13-8
13.3.10 Minute Alarm Register (RMINAR) ..... 13-9
13.3.11 Hour Alarm Register (RHRAR) ..... 13-9
13.3.12 Day of Week Alarm Register (RWKAR) ..... 13-10
13.3.13 Day Alarm Register (RDAYAR) ..... 13-10
13.3.14 Month Alarm Register (RMONAR) ..... 13-11
13.3.15 Year Alarm Register (RYRAR) ..... 13-11
13.3.16 Control Register 1 (RCR1) ..... 13-12
13.3.17 Control Register 2 (RCR2) ..... 13-13

13.3.18 Control Register 3 (RCR3) ..... 13-14
13.3.19 Control Register 5 (RCR5) ..... 13-14
13.3.20 Frequency Register H/L (RFRH/L) ..... 13-15
13.4 Operation ..... 13-16
13.4.1 Initial Settings of Registers after Power-On and Oscillation Stabilization Time ..... 13-16
13.4.2 Setting Time ..... 13-16
13.4.3 Reading Time ..... 13-17
13.4.4 Alarm Function ..... 13-18
13.5 Usage Notes ..... 13-19
13.5.1 Register Writing during Count Operation ..... 13-19
13.5.2 Use of Realtime Clock Periodic Interrupts ..... 13-19
13.5.3 Transition to Standby Mode after Setting Register ..... 13-19
13.5.4 Usage Notes when Writing to and Reading the Register ..... 13-19
14. Serial Communication Interface with FIFO ..... 14-1
14.1 Features ..... 14-1
14.2 Input/Output Pins ..... 14-3
14.3 Register Descriptions ..... 14-4
14.3.1 Receive Shift Register (SCRSR) ..... 14-6
14.3.2 Receive FIFO Data Register (SCFRDR) ..... 14-6
14.3.3 Transmit Shift Register (SCTSR) ..... 14-7
14.3.4 Transmit FIFO Data Register (SCFTDR) ..... 14-7
14.3.5 Serial Mode Register (SCSMR) ..... 14-8
14.3.6 Serial Control Register (SCSCR) ..... 14-10
14.3.7 Serial Status Register (SCFSR) ..... 14-12
14.3.8 Bit Rate Register (SCBRR) ..... 14-16
14.3.9 FIFO Control Register (SCFCR) ..... 14-20
14.3.10 FIFO Data Count Set Register (SCFDR) ..... 14-22
14.3.11 Serial Port Register (SCSPTR) ..... 14-23
14.3.12 Line Status Register (SCLSR) ..... 14-25
14.3.13 Serial Extension Mode Register (SCEMR) ..... 14-26
14.4 Operation ..... 14-27
14.4.1 Overview ..... 14-27
14.4.2 Operation in Asynchronous Mode ..... 14-29
14.4.3 Operation in Clock Synchronous Mode ..... 14-40
14.5 Interrupts ..... 14-48
14.6 Usage Notes ..... 14-49
14.6.1 SCFTDR Writing and TDFE Flag ..... 14-49
14.6.2 SCFRDR Reading and RDF Flag ..... 14-49
14.6.3 Restriction on Direct Memory Controller Usage ..... 14-49
14.6.4 Break Detection and Processing ..... 14-49

14.6.5 Sending a Break Signal ..... 14-50
14.6.6 Receive Data Sampling Timing and Receive Margin (Asynchronous Mode) ..... 14-50
14.6.7 Selection of Base Clock in Asynchronous Mode ..... 14-51
15. Serial Communications Interface ..... 15-1
15.1 Overview ..... 15-1
15.2 Register Descriptions ..... 15-3
15.2.1 Receive Shift Register (RSR) ..... 15-4
15.2.2 Receive Data Register (RDR) ..... 15-4
15.2.3 Transmit Data Register (TDR) ..... 15-4
15.2.4 Transmit Shift Register (TSR) ..... 15-4
15.2.5 Serial Mode Register (SMR) ..... 15-5
15.2.6 Serial Control Register (SCR) ..... 15-8
15.2.7 Serial Status Register (SSR) ..... 15-12
15.2.8 Smart Card Mode Register (SCMR) ..... 15-16
15.2.9 Bit Rate Register (BRR) ..... 15-17
15.2.10 Serial Extended Mode Register (SEMR) ..... 15-21
15.2.11 Noise Filter Setting Register (SNFR) ..... 15-21
15.2.12 Extended Function Control Register (SECR) ..... 15-22
15.3 Operation in Asynchronous Mode ..... 15-23
15.3.1 Serial Data Transfer Format ..... 15-23
15.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode ..... 15-25
15.3.3 Clock ..... 15-26
15.3.4 CTS and RTS Functions ..... 15-26
15.3.5 SCI Initialization (Asynchronous Mode) ..... 15-27
15.3.6 Serial Data Transmission (Asynchronous Mode) ..... 15-28
15.3.7 Serial Data Reception (Asynchronous Mode) ..... 15-30
15.4 Multi-Processor Communications Function ..... 15-34
15.4.1 Multi-Processor Serial Data Transmission ..... 15-35
15.4.2 Multi-Processor Serial Data Reception ..... 15-36
15.5 Operation in Clock Synchronous Mode ..... 15-39
15.5.1 Clock ..... 15-39
15.5.2 CTS and RTS Functions ..... 15-39
15.5.3 Initialization (Clock Synchronous Mode) ..... 15-40
15.5.4 Serial Data Transmission (Clock Synchronous Mode) ..... 15-41
15.5.5 Serial Data Reception (Clock Synchronous Mode) ..... 15-43
15.5.6 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode) ..... 15-46
15.6 Operation in Smart Card Interface Mode ..... 15-47
15.6.1 Sample Connection ..... 15-47
15.6.2 Data Format (Except in Block Transfer Mode) ..... 15-48
15.6.3 Block Transfer Mode ..... 15-50

15.6.4 Receive Data Sampling Timing and Reception Margin ..... 15-50
15.6.5 Initialization (Smart Card Interface Mode) ..... 15-51
15.6.6 Serial Data Transmission (Except in Block Transfer Mode) ..... 15-52
15.6.7 Serial Data Reception (Except in Block Transfer Mode) ..... 15-55
15.6.8 Clock Output Control ..... 15-56
15.7 Noise Cancellation Function ..... 15-58
15.8 Interrupt Sources ..... 15-59
15.8.1 Interrupts in Serial Communications Interface Mode ..... 15-59
15.8.2 Interrupts in Smart Card Interface Mode ..... 15-60
15.9 Usage Notes ..... 15-61
15.9.1 Setting the Module Standby Function ..... 15-61
15.9.2 Break Detection and Processing ..... 15-61
15.9.3 The Mark State and Production of Breaks ..... 15-61
15.9.4 Receive Error Flags and Transmit Operations (Clock Synchronous Mode Only) ..... 15-61
15.9.5 Writing Data to TDR ..... 15-61
15.9.6 Restrictions on Clock Synchronous Transmission ..... 15-61
15.9.7 Restrictions on Using DMAC ..... 15-61
15.9.8 Points to Note on Starting Transfer ..... 15-61
15.9.9 SCI Operations during Low Power Consumption State ..... 15-62
15.9.10 External Clock Input in Clock Synchronous Mode ..... 15-64
15.10 IrDA Communications ..... 15-65
15.11 IrDA Register Description ..... 15-66
15.11.1 IrDA Control Register (IRCR) ..... 15-66
15.12 IrDA Operation ..... 15-67
15.12.1 Flow of IrDA Setting ..... 15-67
15.12.2 Transmission ..... 15-67
15.12.3 Reception ..... 15-68
15.12.4 Selection of High-Level Pulse Width ..... 15-68
15.13 Notes on Using the IrDA Module ..... 15-69
15.13.1 Shortest Pulse Width in Reception ..... 15-69
15.13.2 Asynchronous Basic Clock for Serial Communication Interface ..... 15-69
16. Renesas Serial Peripheral Interface ..... 16-1
16.1 Features ..... 16-1
16.2 Input/Output Pins ..... 16-3
16.3 Register Descriptions ..... 16-4
16.3.1 Control Register (SPCR) ..... 16-7
16.3.2 Slave Select Polarity Register (SSLP) ..... 16-8
16.3.3 Pin Control Register (SPPCR) ..... 16-8
16.3.4 Status Register (SPSR) ..... 16-9
16.3.5 Data Register (SPDR) ..... 16-11

16.3.6 Sequence Control Register (SPSCR) ..... 16-11
16.3.7 Sequence Status Register (SPSSR) ..... 16-12
16.3.8 Bit Rate Register (SPBR) ..... 16-12
16.3.9 Data Control Register (SPDCR) ..... 16-13
16.3.10 Clock Delay Register (SPCKD) ..... 16-14
16.3.11 Slave Select Negation Delay Register (SSLND) ..... 16-15
16.3.12 Next-Access Delay Register (SPND) ..... 16-16
16.3.13 Command Register (SPCMD) ..... 16-17
16.3.14 Buffer Control Register (SPBFCR) ..... 16-19
16.3.15 Buffer Data Count Setting Register (SPBFDR) ..... 16-20
16.4 Operation ..... 16-21
16.4.1 Overview of Operations ..... 16-21
16.4.2 Pin Control ..... 16-22
16.4.3 System Configuration Example ..... 16-22
16.4.4 Transfer Format ..... 16-25
16.4.5 Data Format ..... 16-27
16.4.6 Error Detection ..... 16-33
16.4.7 Initialization ..... 16-35
16.4.8 SPI Operation ..... 16-36
16.4.9 Error Handling ..... 16-46
16.4.10 Loopback Mode ..... 16-47
16.4.11 Interrupt Sources ..... 16-47
17. SPI Multi I/O Bus Controller ..... 17-1
17.1 Features ..... 17-1
17.2 Block Diagram ..... 17-2
17.3 Input/Output Pins ..... 17-3
17.4 Register Descriptions ..... 17-4
17.4.1 Common Control Register (CMNCR) ..... 17-6
17.4.2 SSL Delay Register (SSLDR) ..... 17-8
17.4.3 Bit Rate Register (SPBCR) ..... 17-9
17.4.4 Data Read Control Register (DRCR) ..... 17-11
17.4.5 Data Read Command Setting Register (DRCMR) ..... 17-12
17.4.6 Data Read Extended Address Setting Register (DREAR) ..... 17-13
17.4.7 Data Read Option Setting Register (DROPR) ..... 17-14
17.4.8 Data Read Enable Setting Register (DRENR) ..... 17-15
17.4.9 SPI Mode Control Register (SMCR) ..... 17-17
17.4.10 SPI Mode Command Setting Register (SMCMR) ..... 17-18
17.4.11 SPI Mode Address Setting Register (SMADR) ..... 17-18
17.4.12 SPI Mode Option Setting Register (SMOPR) ..... 17-19
17.4.13 SPI Mode Enable Setting Register (SMENR) ..... 17-20

17.4.14 SPI Mode Read Data Register 0 (SMRDR0) ..... 17-22
17.4.15 SPI Mode Read Data Register 1 (SMRDR1) ..... 17-22
17.4.16 SPI Mode Write Data Register 0 (SMWDR0) ..... 17-23
17.4.17 SPI Mode Write Data Register 1 (SMWDR1) ..... 17-23
17.4.18 Common Status Register (CMNSR) ..... 17-24
17.4.19 SPI AC Input Characteristics Adjustment Register (CKDLY) ..... 17-25
17.4.20 Data Read Dummy Cycle Setting Register (DRDMCR) ..... 17-26
17.4.21 Data Read DDR Enable Register (DRDRENR) ..... 17-27
17.4.22 SPI Mode Dummy Cycle Setting Register (SMDMCR) ..... 17-28
17.4.23 SPI Mode DDR Enable Register (SMDRENR) ..... 17-29
17.4.24 SPI AC Output Characteristics Adjustment Register (SPODLY) ..... 17-30
17.5 Operation ..... 17-31
17.5.1 System Configuration ..... 17-31
17.5.2 Address Map ..... 17-32
17.5.3 32-bit Serial Flash Addresses ..... 17-32
17.5.4 Data Alignment ..... 17-33
17.5.5 Operating Modes ..... 17-34
17.5.6 External Address Space Read Mode ..... 17-34
17.5.7 Read Cache ..... 17-38
17.5.8 SPI Operating Mode ..... 17-39
17.5.9 Transfer Format ..... 17-42
17.5.10 Data Format ..... 17-43
17.5.11 Data Pin Control ..... 17-48
17.5.12 SPBSSL Pin Control ..... 17-50
17.5.13 Flags ..... 17-50
17.6 Usage Notes ..... 17-51
17.6.1 Notes on Transfer to Read Data in SPI Operating Mode ..... 17-51
17.6.2 Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode ..... 17-51
18. I²C Bus Interface ..... 18-1
18.1 Features ..... 18-1
18.1.1 Channels ..... 18-1
18.1.2 Register Base Addresses ..... 18-1
18.1.3 External I/O Signals ..... 18-2
18.2 Overview ..... 18-3
18.2.1 Functional Overview ..... 18-3
18.2.2 Block Diagram ..... 18-5
18.3 Registers ..... 18-7
18.3.1 RIICnCR1 — I²C Bus Control Register 1 ..... 18-7
18.3.2 RIICnCR2 — I²C Bus Control Register 2 ..... 18-10
18.3.3 RIICnMR1 — I²C Bus Mode Register 1 ..... 18-14

18.3.4 RIICnMR2 — I²C Bus Mode Register 2 ..... 18-16
18.3.5 RIICnMR3 — I²C Bus Mode Register 3 ..... 18-18
18.3.6 RIICnFER — I²C Bus Function Enable Register ..... 18-21
18.3.7 RIICnSER — I²C Bus Status Enable Register ..... 18-23
18.3.8 RIICnIER — I²C Bus Interrupt Enable Register ..... 18-25
18.3.9 RIICnSR1 — I²C Bus Status Register 1 ..... 18-27
18.3.10 RIICnSR2 — I²C Bus Status Register 2 ..... 18-30
18.3.11 RIICnSARy — I²C Slave Address Register y (y = 0 to 2) ..... 18-35
18.3.12 RIICnBRL — I²C Bus Bit Rate Low-Level Register ..... 18-37
18.3.13 RIICnBRH — I²C Bus Bit Rate High-Level Register ..... 18-38
18.3.14 RIICnDRT — I²C Bus Transmit Data Register ..... 18-41
18.3.15 RIICnDRR — I²C Bus Receive Data Register ..... 18-42
18.3.16 RIICnDRS — I²C Bus Shift Register ..... 18-43
18.4 Interrupt Sources ..... 18-44
18.5 Operation ..... 18-45
18.5.1 Communication Data Format ..... 18-45
18.5.2 Initial Settings ..... 18-46
18.5.3 Master Transmit Operation ..... 18-47
18.5.4 Master Receive Operation ..... 18-52
18.5.5 Slave Transmit Operation ..... 18-58
18.5.6 Slave Receive Operation ..... 18-61
18.6 SCL Synchronization Circuit ..... 18-64
18.7 Facility for Delaying SDA Output ..... 18-65
18.8 Digital Noise-Filter Circuits ..... 18-66
18.9 Address Match Detection ..... 18-67
18.9.1 Slave-Address Match Detection ..... 18-67
18.9.2 Detection of the General Call Address ..... 18-69
18.9.3 Device-ID Address Detection ..... 18-70
18.9.4 Host Address Detection ..... 18-72
18.10 Automatically Low-Hold Function for SCL ..... 18-73
18.10.1 Function to Prevent Wrong Transmission of Transmit Data ..... 18-73
18.10.2 NACK Reception Transfer Suspension Function ..... 18-74
18.10.3 Function to Prevent Failure to Receive Data ..... 18-75
18.11 Arbitration-Lost Detection Functions ..... 18-77
18.11.1 Master Arbitration-Lost Detection (MALE Bit) ..... 18-77
18.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit) ..... 18-79
18.11.3 Slave Arbitration-Lost Detection (SALE Bit) ..... 18-80
18.12 Start Condition/Restart Condition/Stop Condition Issuing Function ..... 18-81
18.12.1 Issuing a Start Condition ..... 18-81
18.12.2 Issuing a Restart Condition ..... 18-81

18.12.3 Issuing a Stop Condition....18-83
18.13 Bus Hanging....18-84
18.13.1 Timeout Function....18-84
18.13.2 Extra SCL Clock Cycle Output Function....18-86
18.13.3 RIIC Reset and Internal Reset....18-87
18.14 SMBus Operation....18-88
18.14.1 SMBus Timeout Measurement....18-88
18.14.2 SMBus Host Notification Protocol/Notify ARP Master....18-89
18.15 Reset Function of RIIC....18-90
19. Serial Sound Interface....19-1
19.1 Features....19-1
19.2 Input/Output Pins....19-3
19.3 Register Description....19-4
19.3.1 Control Register (SSICR)....19-6
19.3.2 Status Register (SSISR)....19-10
19.3.3 Transmit Data Register (SSITDR)....19-12
19.3.4 Receive Data Register (SSIRDR)....19-12
19.3.5 FIFO Control Register (SSIFCR)....19-13
19.3.6 FIFO Status Register (SSIFSR)....19-15
19.3.7 Transmit FIFO Data Register (SSIFTDR)....19-17
19.3.8 Receive FIFO Data Register (SSIFRDR)....19-17
19.3.9 TDM Mode Register (SSITDMR)....19-18
19.3.10 FC Control Register (SSIFCCR)....19-19
19.3.11 FC Mode Register (SSIFCMR)....19-20
19.3.12 FC Status Register (SSIFCSR)....19-21
19.4 Operation Description....19-22
19.4.1 Bus Format....19-22
19.4.2 Non-Compressed Modes....19-23
19.4.3 TDM Mode....19-31
19.4.4 WS Continue Mode....19-32
19.4.5 Operation Modes....19-32
19.4.6 Transmit Operation....19-33
19.4.7 Receive Operation....19-36
19.4.8 Serial Bit Clock Control....19-38
19.5 Usage Notes....19-38
19.5.1 Limitations from Underflow or Overflow during DMA Operation....19-38
19.5.2 Note on Changing Mode from Master Transceiver to Master Receiver....19-38
19.5.3 Limits on TDM mode and WS Continue Mode....19-38
20. Media Local Bus....20-1
20.1 Features....20-1

20.2 Input/Output Pins ..... 20-2
20.3 Register Description ..... 20-2
21. CAN Interface ..... 21-1
21.1 Overview ..... 21-1
21.1.1 Units ..... 21-1
21.1.2 Register addresses ..... 21-2
21.1.3 Clock supply ..... 21-2
21.1.4 Interrupts ..... 21-3
21.1.5 I/O signals ..... 21-4
21.2 Function ..... 21-4
21.2.1 Block Diagram ..... 21-7
21.3 Registers ..... 21-8
21.3.1 RSCAN0CmCFG — Channel Configuration Register (m = 0 to 4) ..... 21-34
21.3.2 RSCAN0CmCTR — Channel Control Register (m = 0 to 4) ..... 21-36
21.3.3 RSCAN0CmSTS — Channel Status Register (m = 0 to 4) ..... 21-40
21.3.4 RSCAN0CmERFL — Channel Error Flag Register (m = 0 to 4) ..... 21-42
21.3.5 RSCAN0GCFG — Global Configuration Register ..... 21-46
21.3.6 RSCAN0GCTR — Global Control Register ..... 21-49
21.3.7 RSCAN0GSTS — Global Status Register ..... 21-51
21.3.8 RSCAN0GERFL — Global Error Flag Register ..... 21-53
21.3.9 RSCAN0GTINTSTS0 — Global TX Interrupt Status Register 0 ..... 21-54
21.3.10 RSCAN0GTINTSTS1 — Global TX Interrupt Status Register 1 ..... 21-57
21.3.11 RSCAN0GTSC — Global Timestamp Counter Register ..... 21-59
21.3.12 RSCAN0GAFLECTR — Receive Rule Entry Control Register ..... 21-60
21.3.13 RSCAN0GAFLCFG0 — Receive Rule Configuration Register 0 ..... 21-61
21.3.14 RSCAN0GAFLCFG1 — Receive Rule Configuration Register 1 ..... 21-63
21.3.15 RSCAN0GAFLIDj — Receive Rule ID Register (j = 0 to 15) ..... 21-64
21.3.16 RSCAN0GAFLMj — Receive Rule Mask Register (j = 0 to 15) ..... 21-66
21.3.17 RSCAN0GAFLP0j — Receive Rule Pointer 0 Register (j = 0 to 15) ..... 21-67
21.3.18 RSCAN0GAFLP1j — Receive Rule Pointer 1 Register (j = 0 to 15) ..... 21-69
21.3.19 RSCAN0RMNB — Receive Buffer Number Register ..... 21-70
21.3.20 RSCAN0RMNDy — Receive Buffer New Data Register y (y = 0 to 2) ..... 21-71
21.3.21 RSCAN0RMIDq — Receive Buffer ID Register (q = 0 to 79) ..... 21-72
21.3.22 RSCAN0RMPTRq — Receive Buffer Pointer Register (q = 0 to 79) ..... 21-73
21.3.23 RSCAN0RMDF0q — Receive Buffer Data Field 0 Register (q = 0 to 79) ..... 21-74
21.3.24 RSCAN0RMDF1q — Receive Buffer Data Field 1 Register (q = 0 to 79) ..... 21-75
21.3.25 RSCAN0RFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) ..... 21-76
21.3.26 RSCAN0RFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ..... 21-78
21.3.27 RSCAN0RFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) ..... 21-80

21.3.28 RSCAN0RFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7) ..... 21-81
21.3.29 RSCAN0RFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7) ..... 21-82
21.3.30 RSCAN0RFDF0x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7) ..... 21-83
21.3.31 RSCAN0RFDF1x — Receive FIFO Buffer Access Data Field 1 Register (x = 0 to 7) ..... 21-84
21.3.32 RSCAN0CFCCk — Transmit/receive FIFO buffer Configuration and Control Register k (k = 0 to 14) ..... 21-85
21.3.33 RSCAN0CFSTSk — Transmit/receive FIFO buffer Status Register (k = 0 to 14) ..... 21-89
21.3.34 RSCAN0CFPCTRk — Transmit/receive FIFO buffer Pointer Control Register (k = 0 to 14) ..... 21-92
21.3.35 RSCAN0CFIDk — Transmit/receive FIFO buffer Access ID Register (k = 0 to 14) ..... 21-94
21.3.36 RSCAN0CFPTRk — Transmit/receive FIFO buffer Access Pointer Register (k = 0 to 14) ..... 21-96
21.3.37 RSCAN0CFDF0k — Transmit/receive FIFO buffer Access Data Field 0 Register (k = 0 to 14) ..... 21-98
21.3.38 RSCAN0CFDF1k — Transmit/receive FIFO buffer Access Data Field 1 Register (k = 0 to 14) ..... 21-99
21.3.39 RSCAN0FESTS — FIFO Empty Status Register ..... 21-100
21.3.40 RSCAN0FFSTS — FIFO Full Status Register ..... 21-102
21.3.41 RSCAN0FMSTS — FIFO Message Lost Status Register ..... 21-104
21.3.42 RSCAN0RFISTS — Receive FIFO Buffer Interrupt Flag Status Register ..... 21-106
21.3.43 RSCAN0CFRISTS — Transmit/receive FIFO buffer Receive Interrupt Flag Status Register ..... 21-107
21.3.44 RSCAN0CFTISTS — Transmit/receive FIFO buffer Transmit Interrupt Flag Status Register ..... 21-108
21.3.45 RSCAN0TMCp — Transmit Buffer Control Register (p = 0 to 79) ..... 21-109
21.3.46 RSCAN0TMSTSp — Transmit Buffer Status Register (p = 0 to 79) ..... 21-111
21.3.47 RSCAN0TMTRSTSy — Transmit Buffer Transmit Request Status Register y (y = 0 to 2) ..... 21-113
21.3.48 RSCAN0TMTARSTSy — Transmit Buffer Transmit Abort Request Status Register y (y = 0 to 2) ..... 21-115
21.3.49 RSCAN0TMTCSTSy — Transmit Buffer Transmit Complete Status Register y (y = 0 to 2) ..... 21-117
21.3.50 RSCAN0TMTASTSy — Transmit Buffer Transmit Abort Status Register y (y = 0 to 2) ..... 21-119
21.3.51 RSCAN0TMIECy — Transmit Buffer Interrupt Enable Configuration Register y (y = 0 to 2) ..... 21-121
21.3.52 RSCAN0TMIDp — Transmit Buffer ID Register (p = 0 to 79) ..... 21-123
21.3.53 RSCAN0TMPTRp — Transmit Buffer Pointer Register (p= 0 to 79) ..... 21-125
21.3.54 RSCAN0TMDF0p — Transmit Buffer Data Field 0 Register (p = 0 to 79) ..... 21-126
21.3.55 RSCAN0TMDF1p — Transmit Buffer Data Field 1 Register (p = 0 to 79) ..... 21-127
21.3.56 RSCAN0TXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 4) ..... 21-128

21.3.57 RSCAN0TXQSTSm — Transmit Queue Status Register (m = 0 to 4) ....21-130
21.3.58 RSCAN0TXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 4) ....21-132
21.3.59 RSCAN0THLCCm — Transmit History Configuration and Control Register (m = 0 to 4) ....21-133
21.3.60 RSCAN0THLSTSm — Transmit History Status Register (m = 0 to 4) ....21-135
21.3.61 RSCAN0THLACCm — Transmit History Access Register (m = 0 to 4) ....21-137
21.3.62 RSCAN0THLPCTRm — Transmit History Pointer Control Register (m = 0 to 4) ....21-138
21.3.63 RSCAN0GTSTCFG — Global Test Configuration Register....21-139
21.3.64 RSCAN0GTSTCTR — Global Test Control Register....21-141
21.3.65 RSCAN0GLOCKK — Global Lock Key Register ....21-142
21.4 Interrupt Sources....21-143
21.5 RSCAN Modes ....21-147
21.5.1 Global Modes ....21-147
21.5.2 Channel Modes ....21-150
21.6 Reception Function....21-155
21.6.1 Data Processing Using the Receive Rule Table ....21-155
21.7 Transmission Functions ....21-159
21.7.1 Transmit Priority Determination ....21-160
21.7.2 Transmission Using Transmit Buffers....21-160
21.7.3 Transmission Using FIFO Buffers ....21-161
21.7.4 Transmission Using Transmit Queues....21-164
21.7.5 Transmit History Function....21-164
21.8 Gateway Function....21-166
21.9 Test Function ....21-167
21.9.1 Standard Test Mode....21-167
21.9.2 Listen-Only Mode....21-167
21.9.3 Self-Test Mode (Loopback Mode) ....21-168
21.9.4 Inter-Channel Communication Test ....21-170
21.10 RS-CAN Setting Procedure ....21-171
21.10.1 Initial Settings....21-171
21.10.2 Reception Procedure....21-177
21.10.3 Transmission Procedure ....21-182
21.10.4 Test Settings ....21-191
21.11 Notes on the RS-CAN Module....21-193
22. IEBus Controller....22-1
22.1 IEBB Features....22-1
22.2 Configuration....22-3
22.2.1 Function overview ....22-3
22.2.2 Block diagram....22-4
22.3 Registers ....22-5

22.3.1 IEBBn register overview ..... 22-5
22.3.2 IEBBn control register details ..... 22-6
22.4 Interrupt Operations ..... 22-72
22.4.1 Interrupt request signals ..... 22-72
22.4.2 Interrupt judgment examples ..... 22-77
22.5 Operation ..... 22-79
22.5.1 FIFO ..... 22-79
22.5.2 Initial settings ..... 22-81
22.5.3 Master transmission (single mode) ..... 22-82
22.5.4 Master transmission (FIFO mode) ..... 22-84
22.5.5 Master reception (single mode) ..... 22-86
22.5.6 Master reception (FIFO mode) ..... 22-88
22.5.7 Slave transmission (single mode) ..... 22-90
22.5.8 Slave transmission (FIFO mode) ..... 22-93
22.5.9 Slave reception (single mode) ..... 22-96
22.5.10 Slave reception (FIFO mode) ..... 22-98
22.6 Setup Procedures ..... 22-99
22.6.1 Master transmission (single mode) ..... 22-99
22.6.2 Master transmission (FIFO mode) ..... 22-100
22.6.3 Master reception (single mode) ..... 22-101
22.6.4 Master reception (FIFO mode) ..... 22-102
22.6.5 Slave transmission (single mode) ..... 22-103
22.6.6 Slave transmission (FIFO mode) ..... 22-106
22.6.7 Slave reception (single mode) ..... 22-109
22.6.8 Slave reception (FIFO mode) ..... 22-110
22.7 Functions ..... 22-111
22.7.1 IEBus communication protocol ..... 22-111
22.7.2 Determination of bus mastership (arbitration) ..... 22-112
22.7.3 Communication mode ..... 22-112
22.7.4 Communication address ..... 22-113
22.7.5 Broadcast communication ..... 22-113
22.7.6 IEBus transfer format ..... 22-114
22.7.7 Transfer data ..... 22-124
22.7.8 Bit format ..... 22-128
23. Renesas SPDIF Interface ..... 23-1
23.1 Overview ..... 23-1
23.2 Features ..... 23-1
23.3 Functional Block Diagram ..... 23-2
23.4 Input/Output Pins ..... 23-3
23.5 Renesas SPDIF (IEC60958) Frame Format ..... 23-3

23.6 Register ..... 23-5
23.7 Register Descriptions ..... 23-6
23.7.1 Control Register (CTRL) ..... 23-6
23.7.2 Status Register (STAT) ..... 23-9
23.7.3 Transmitter Channel 1 Audio Register (TLCA) ..... 23-11
23.7.4 Transmitter Channel 2 Audio Register (TRCA) ..... 23-12
23.7.5 Transmitter DMA Audio Data Register (TDAD) ..... 23-12
23.7.6 Transmitter User Data Register (TUI) ..... 23-13
23.7.7 Transmitter Channel 1 Status Register (TLCS) ..... 23-14
23.7.8 Transmitter Channel 2 Status Register (TRCS) ..... 23-15
23.7.9 Receiver Channel 1 Audio Register (RLCA) ..... 23-16
23.7.10 Receiver Channel 2 Audio Register (RRCA) ..... 23-16
23.7.11 Receiver DMA Audio Data (RDAD) ..... 23-17
23.7.12 Receiver User Data Register (RUI) ..... 23-18
23.7.13 Receiver Channel 1 Status Register (RLCS) ..... 23-19
23.7.14 Receiver Channel 2 Status Register (RRCS) ..... 23-20
23.8 Functional Description—Transmitter ..... 23-21
23.8.1 Transmitter Module ..... 23-21
23.8.2 Transmitter Module Initialization ..... 23-21
23.8.3 Initial Settings for Transmitter Module ..... 23-22
23.8.4 Transmitter Module Data Transfer ..... 23-22
23.9 Functional Description—Receiver ..... 23-24
23.9.1 Receiver Module ..... 23-24
23.9.2 Receiver Module Initialization ..... 23-24
23.9.3 Receiver Module Data Transfer ..... 23-25
23.10 Disabling the Module ..... 23-27
23.10.1 Transmitter and Receiver Idle ..... 23-27
23.11 Compressed Mode Data ..... 23-27
23.12 References ..... 23-27
23.13 Usage Notes ..... 23-27
23.13.1 Clearing TUIR ..... 23-27
23.13.2 Frequency of Clock Input for Audio ..... 23-27
24. CD-ROM Decoder ..... 24-1
24.1 Features ..... 24-1
24.1.1 Formats Supported by CD-ROM Decoder ..... 24-2
24.2 Block Diagrams ..... 24-2
24.3 Register Descriptions ..... 24-5
24.3.1 Enable Control Register (CROMEN) ..... 24-7
24.3.2 Sync Code-Based Synchronization Control Register (CROMSY0) ..... 24-8
24.3.3 Decoding Mode Control Register (CROMCTL0) ..... 24-9

24.3.4 EDC/ECC Check Control Register (CROMCTL1) ..... 24-10
24.3.5 Automatic Decoding Stop Control Register (CROMCTL3) ..... 24-11
24.3.6 Decoding Option Setting Control Register (CROMCTL4) ..... 24-12
24.3.7 HEAD20 to HEAD22 Representation Control Register (CROMCTL5) ..... 24-13
24.3.8 Sync Code Status Register (CROMST0) ..... 24-13
24.3.9 Post-ECC Header Error Status Register (CROMST1) ..... 24-14
24.3.10 Post-ECC Subheader Error Status Register (CROMST3) ..... 24-14
24.3.11 Header/Subheader Validity Check Status Register (CROMST4) ..... 24-15
24.3.12 Mode Determination and Link Sector Detection Status Register (CROMST5) ..... 24-16
24.3.13 ECC/EDC Error Status Register (CROMST6) ..... 24-17
24.3.14 Buffer Status Register (CBUFST0) ..... 24-17
24.3.15 Decoding Stoppage Source Status Register (CBUFST1) ..... 24-18
24.3.16 Buffer Overflow Status Register (CBUFST2) ..... 24-18
24.3.17 Pre-ECC Correction Header: Minutes Data Register (HEAD00) ..... 24-19
24.3.18 Pre-ECC Correction Header: Seconds Data Register (HEAD01) ..... 24-19
24.3.19 Pre-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD02) ..... 24-19
24.3.20 Pre-ECC Correction Header: Mode Data Register (HEAD03) ..... 24-19
24.3.21 Pre-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD00) ..... 24-20
24.3.22 Pre-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD01) ..... 24-20
24.3.23 Pre-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD02) ..... 24-20
24.3.24 Pre-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD03) ..... 24-21
24.3.25 Pre-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD04) ..... 24-21
24.3.26 Pre-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD05) ..... 24-21
24.3.27 Pre-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD06) ..... 24-22
24.3.28 Pre-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD07) ..... 24-22
24.3.29 Post-ECC Correction Header: Minutes Data Register (HEAD20) ..... 24-22
24.3.30 Post-ECC Correction Header: Seconds Data Register (HEAD21) ..... 24-23
24.3.31 Post-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD22) ..... 24-23
24.3.32 Post-ECC Correction Header: Mode Data Register (HEAD23) ..... 24-23
24.3.33 Post-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD20) ..... 24-24
24.3.34 Post-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD21) ..... 24-24
24.3.35 Post-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD22) ..... 24-24
24.3.36 Post-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD23) ..... 24-25
24.3.37 Post-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD24) ..... 24-25
24.3.38 Post-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD25) ..... 24-25
24.3.39 Post-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD26) ..... 24-26
24.3.40 Post-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD27) ..... 24-26
24.3.41 Automatic Buffering Setting Control Register (CBUFCTL0) ..... 24-27
24.3.42 Automatic Buffering Start Sector Setting: Minutes Control Register (CBUFCTL1) ..... 24-28
24.3.43 Automatic Buffering Start Sector Setting: Seconds Control Register (CBUFCTL2) ..... 24-28

24.3.44 Automatic Buffering Start Sector Setting: Frames Control Register (CBUFCTL3).....24-28
24.3.45 ISY Interrupt Source Mask Control Register (CROMST0M).....24-29
24.3.46 CD-ROM Decoder Reset Control Register (ROMDECRST).....24-29
24.3.47 CD-ROM Decoder Reset Status Register (RSTSTAT).....24-30
24.3.48 Serial Sound Interface Data Control Register (SSI).....24-31
24.3.49 Interrupt Flag Register (INTHOLD).....24-32
24.3.50 Interrupt Source Mask Control Register (INHINT).....24-33
24.3.51 CD-ROM Decoder Stream Data Input Register (STRMDIN0).....24-33
24.3.52 CD-ROM Decoder Stream Data Input Register (STRMDIN2).....24-34
24.3.53 CD-ROM Decoder Stream Data Output Register (STRMDOUT0).....24-34
24.4 Operation.....24-35
24.4.1 Endian Conversion for Data in the Input Stream.....24-35
24.4.2 Sync Code Maintenance Function.....24-36
24.4.3 Error Correction.....24-38
24.4.4 Automatic Decoding Stop Function.....24-39
24.4.5 Buffering Format.....24-40
24.4.6 Target-Sector Buffering Function.....24-41
24.5 Interrupt Sources.....24-43
24.5.1 Interrupt and DMA Transfer Request Signals.....24-43
24.5.2 Timing of Status Registers Updates.....24-44
24.6 Usage Notes.....24-45
24.6.1 Stopping and Resuming Buffering Alone during Decoding.....24-45
24.6.2 Setting Sync Code Status Register (CROMST0).....24-45
24.6.3 Link Blocks.....24-45
24.6.4 Stopping and Resuming CD-DSP Operation.....24-45
24.6.5 Note on Clearing the IREADY Flag.....24-45
24.6.6 Note on Stream Data Transfer (1).....24-46
24.6.7 Note on Stream Data Transfer (2).....24-46
24.6.8 Note on Software Reset.....24-46
25. LIN Interface.....25-1
25.1 Features.....25-1
25.1.1 Channels.....25-1
25.1.2 Register Addresses.....25-1
25.1.3 Clock Supply.....25-1
25.1.4 Interrupts and DMA.....25-2
25.1.5 I/O Signals.....25-2
25.2 Function.....25-3
25.2.1 Block Diagram.....25-5
25.2.2 Description of Blocks.....25-5
25.3 Registers.....25-6

25.3.1 LIN Master Related Registers ..... 25-7
25.4 Interrupt Sources ..... 25-33
25.5 Modes ..... 25-34
25.6 LIN Reset Mode ..... 25-36
25.7 LIN Mode ..... 25-37
25.7.1 LIN Master Mode ..... 25-39
25.7.2 Data Transmission/Reception ..... 25-42
25.7.3 Transmission/Reception Data Buffering ..... 25-44
25.7.4 Wake-up Transmission/Reception ..... 25-47
25.7.5 Status ..... 25-49
25.7.6 Error Status ..... 25-50
25.8 LIN Self-Test Mode ..... 25-52
25.8.1 Change to LIN Self-Test Mode ..... 25-54
25.8.2 Transmission in LIN Master Self-Test Mode ..... 25-55
25.8.3 Reception in LIN Master Self-Test Mode ..... 25-56
25.8.4 Terminating LIN Self-Test Mode ..... 25-57
25.9 Baud Rate Generator ..... 25-58
25.9.1 LIN Master Mode ..... 25-58
25.9.2 Noise Filter ..... 25-59
26. Ethernet Controller ..... 26-1
26.1 Features ..... 26-1
26.2 Input/Output Pins ..... 26-3
26.3 Register Descriptions ..... 26-4
26.3.1 Software Reset Register (ARSTR) ..... 26-7
26.3.2 E-MAC Mode Register (ECMR) ..... 26-8
26.3.3 E-MAC Status Register (ECSR) ..... 26-10
26.3.4 E-MAC Interrupt Permission Register (ECSIPR) ..... 26-11
26.3.5 PHY Interface Register (PIR) ..... 26-12
26.3.6 MAC Address High Register (MAHR) ..... 26-12
26.3.7 MAC Address Low Register (MALR) ..... 26-13
26.3.8 Receive Frame Length Register (RFLR) ..... 26-14
26.3.9 CRC Error Frame Receive Counter Register (CEFCR) ..... 26-15
26.3.10 Frame Receive Error Counter Register (FRECR) ..... 26-15
26.3.11 Too-Short Frame Receive Counter Register (TSFRCR) ..... 26-16
26.3.12 Too-Long Frame Receive Counter Register (TLFRCR) ..... 26-16
26.3.13 Residual-Bit Frame Receive Counter Register (RFCR) ..... 26-17
26.3.14 Multicast Address Frame Receive Counter Register (MAFCR) ..... 26-17
26.3.15 Automatic PAUSE Frame Register (APR) ..... 26-18
26.3.16 Manual PAUSE Frame Register (MPR) ..... 26-19
26.3.17 Automatic PAUSE Frame Retransmit Count Register (TPAUSER) ..... 26-20

26.3.18 PAUSE Frame Transmit Counter Register (PFTCR) ..... 26-20
26.3.19 PAUSE Frame Receive Counter Register (PFRCR) ..... 26-21
26.3.20 TSU Counter Reset Register (TSU_CTRST) ..... 26-21
26.3.21 CAM Entry Table Specification Enable Register (Common) (TSU_FWSLC) ..... 26-22
26.3.22 VLANtag Set Register (TSU_VTAG0) ..... 26-23
26.3.23 CAM Entry Table Busy Register (TSU_ADSBSY) ..... 26-24
26.3.24 CAM Entry Table Enable Register (TSU_TEN) ..... 26-25
26.3.25 CAM Entry Table POST 1 Register (TSU_POST1) ..... 26-27
26.3.26 CAM Entry Table POST 2 Register (TSU_POST2) ..... 26-28
26.3.27 CAM Entry Table POST 3 Register (TSU_POST3) ..... 26-29
26.3.28 CAM Entry Table POST 4 Register (TSU_POST4) ..... 26-30
26.3.29 CAM Entry Table 0H to 31H Registers (TSU_ADRH0 to TSU_ADRH31) ..... 26-32
26.3.30 CAM Entry Table 0L to 31L Registers (TSU_ADRL0 to TSU_ADRL31) ..... 26-32
26.3.31 Transmit Frame Counter Register (Normal Transmission Only) (TXNLCR0) ..... 26-33
26.3.32 Transmit Frame Counter Register (Normal and Erroneous Transmission) (TXALCR0) ..... 26-33
26.3.33 Receive Frame Counter Register (Normal Reception Only) (RXNLCR0) ..... 26-34
26.3.34 Receive Frame Counter Register (Normal and Erroneous Reception) (RXALCR0) ..... 26-34
26.3.35 E-DMAC Start Register (EDSR) ..... 26-35
26.3.36 E-DMAC Mode Register (EDMR) ..... 26-36
26.3.37 E-DMAC Transmit Request Register (EDTRR) ..... 26-37
26.3.38 E-DMAC Receive Request Register (EDRRR) ..... 26-38
26.3.39 Transmit Descriptor List Start Address Register (TDLAR) ..... 26-39
26.3.40 Receive Descriptor List Start Address Register (RDLAR) ..... 26-39
26.3.41 E-MAC/E-DMAC Status Register (EESR) ..... 26-40
26.3.42 E-MAC/E-DMAC Status Interrupt Permission Register (EESIPR) ..... 26-43
26.3.43 Transmit/Receive Status Copy Enable Register (TRSCER) ..... 26-45
26.3.44 Receive Missed-Frame Counter Register (RMFCR) ..... 26-46
26.3.45 Transmit FIFO Threshold Register (TFTR) ..... 26-47
26.3.46 FIFO Depth Register (FDR) ..... 26-48
26.3.47 Receiving Method Control Register (RMCR) ..... 26-49
26.3.48 Receive Descriptor Fetch Address Register (RDFAR) ..... 26-49
26.3.49 Receive Descriptor Finished Address Register (RDFXR) ..... 26-50
26.3.50 Receive Descriptor Final Flag Register (RDFFR) ..... 26-50
26.3.51 Transmit Descriptor Fetch Address Register (TDFAR) ..... 26-51
26.3.52 Transmit Descriptor Finished Address Register (TDFXR) ..... 26-51
26.3.53 Transmit Descriptor Final Flag Register (TDFFR) ..... 26-52
26.3.54 Overflow Alert FIFO Threshold Register (FCFTR) ..... 26-53
26.3.55 Receive Data Padding Insert Register (RPADIR) ..... 26-54
26.3.56 Intelligent Checksum Mode Register (CSMR) ..... 26-55
26.3.57 Intelligent Checksum Skipped Bytes Monitor Register (CSSBM) ..... 26-56

26.3.58 Intelligent Checksum Monitor Register (CSSMR) ..... 26-56
26.4 Operation ..... 26-57
26.4.1 Descriptors and Descriptor List ..... 26-59
26.4.2 Transmission ..... 26-70
26.4.3 Reception ..... 26-74
26.4.4 CAM Function ..... 26-77
26.4.5 Transmit Processing of Multi-Buffer Frame (Single-Frame/Multi-Descriptor) ..... 26-78
26.4.6 Padding Insertion in Receive Data ..... 26-79
26.4.7 Interrupt Processing ..... 26-80
26.4.8 Activation Procedure ..... 26-81
26.4.9 Flow Control ..... 26-82
26.4.10 Intelligent Checksum Calculation Function ..... 26-83
26.5 Connection to PHY-LSI ..... 26-85
26.5.1 MII Frame Transmission/Reception Timing ..... 26-85
26.5.2 Accessing MII Registers ..... 26-86
26.6 Usage Notes ..... 26-89
26.6.1 Checksum Calculation of Ethernet Frames ..... 26-89
26.6.2 Notes on Using the Intelligent Checksum Function ..... 26-90
26.6.3 Software Reset ..... 26-90
27. A/D Converter ..... 27-1
27.1 Features ..... 27-1
27.2 Input/Output Pins ..... 27-3
27.3 Register Descriptions ..... 27-4
27.3.1 A/D Data Registers A to H (ADDRA to ADDRH) ..... 27-5
27.3.2 A/D Comparison Upper Limit Value Registers A to H (ADCMPHA to ADCMPHH) ..... 27-6
27.3.3 A/D Comparison Lower Limit Value Registers A to H (ADCMPLA to ADCMPLH) ..... 27-7
27.3.4 A/D Control/Status Register (ADCSR) ..... 27-8
27.3.5 A/D Comparison Interrupt Enable Register (ADCMPER) ..... 27-10
27.3.6 A/D Comparison Status Register (ADCMPSR) ..... 27-11
27.4 Operation ..... 27-12
27.4.1 Single Mode ..... 27-12
27.4.2 Multi Mode ..... 27-14
27.4.3 Scan Mode ..... 27-16
27.4.4 A/D Converter Activation by External Trigger or Multi-Function Timer Pulse Unit 2 ..... 27-18
27.4.5 Input Sampling and A/D Conversion Time ..... 27-18
27.4.6 External Trigger Input Timing ..... 27-20
27.5 Interrupt Sources and DMA Transfer Request ..... 27-21
27.6 Definitions of A/D Conversion Accuracy ..... 27-22
27.7 Usage Notes ..... 27-23
27.7.1 Module Standby Mode Setting ..... 27-23

27.7.2 Setting Analog Input Voltage ..... 27-23
27.7.3 Notes on Board Design ..... 27-23
27.7.4 Processing of Analog Input Pins ..... 27-24
27.7.5 Permissible Signal Source Impedance ..... 27-25
27.7.6 Influences on Absolute Precision ..... 27-25
27.7.7 Usage Note on Port Pins ..... 27-25
28. NAND Flash Memory Controller ..... 28-1
28.1 Features ..... 28-1
28.2 Input/Output Pins ..... 28-3
28.3 Register Descriptions ..... 28-4
28.3.1 Common Control Register (FLCMNCR) ..... 28-5
28.3.2 Command Control Register (FLCMDCR) ..... 28-6
28.3.3 Command Code Register (FLCMCDR) ..... 28-7
28.3.4 Address Register (FLADR) ..... 28-8
28.3.5 Address Register 2 (FLADR2) ..... 28-8
28.3.6 Data Counter Register (FLDTCNTR) ..... 28-9
28.3.7 Data Register (FLDATAR) ..... 28-10
28.3.8 Interrupt DMA Control Register (FLINTDMACR) ..... 28-11
28.3.9 Ready Busy Timeout Setting Register (FLBSYTMR) ..... 28-13
28.3.10 Ready Busy Timeout Counter (FLBSYCNT) ..... 28-13
28.3.11 Data FIFO Register (FLDTFIFO) ..... 28-14
28.3.12 Transfer Control Register (FLTRCR) ..... 28-14
28.4 Operation ..... 28-15
28.4.1 Access Sequence ..... 28-15
28.4.2 Register Setting Procedure ..... 28-16
28.4.3 Command Access Mode ..... 28-17
28.4.4 Status Read ..... 28-20
28.5 Interrupt Processing ..... 28-21
28.6 DMA Transfer Settings ..... 28-21
28.7 Usage Notes ..... 28-22
28.7.1 Usage Note for the SNAND Bit ..... 28-22
29. USB2.0 Host/Function Module ..... 29-1
29.1 Features ..... 29-1
29.2 Input/Output Pins ..... 29-3
29.3 Register Descriptions ..... 29-4
29.3.1 System Configuration Control Register (SYSCFG0) ..... 29-10
29.3.2 CPU Bus Wait Setting Register (BUSWAIT) ..... 29-12
29.3.3 System Configuration Status Register (SYSSTS0) ..... 29-13
29.3.4 Device State Control Register 0 (DVSTCTR0) ..... 29-14
29.3.5 Test Mode Register (TESTMODE) ..... 29-17

29.3.6 DMAn-FIFO Bus Configuration Registers (D0FBCFG, D1FBCFG) 29-18
29.3.7 FIFO Port Registers (CFIFO, D0FIFO, D1FIFO) 29-19
29.3.8 FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL) 29-21
29.3.9 FIFO Port Control Registers (CFIFOCTR, D0FIFOCTR, D1FIFOCTR) 29-25
29.3.10 Interrupt Enable Register 0 (INTENB0) 29-27
29.3.11 Interrupt Enable Register 1 (INTENB1) 29-28
29.3.12 BRDY Interrupt Enable Register (BRDYENB) 29-29
29.3.13 NRDY Interrupt Enable Register (NRDYENB) 29-30
29.3.14 BEMP Interrupt Enable Register (BEMPENB) 29-30
29.3.15 SOF Output Configuration Register (SOFCFG) 29-31
29.3.16 Interrupt Status Register 0 (INTSTS0) 29-32
29.3.17 Interrupt Status Register 1 (INTSTS1) 29-35
29.3.18 BRDY Interrupt Status Register (BRDYSTS) 29-37
29.3.19 NRDY Interrupt Status Register (NRDYSTS) 29-38
29.3.20 BEMP Interrupt Status Register (BEMPSTS) 29-38
29.3.21 Frame Number Register (FRMNUM) 29-39
29.3.22 µFrame Number Register (UFRMNUM) 29-40
29.3.23 USB Address Register (USBADDR) 29-40
29.3.24 USB Request Type Register (USBREQ) 29-41
29.3.25 USB Request Value Register (USBVAL) 29-42
29.3.26 USB Request Index Register (USBINDX) 29-42
29.3.27 USB Request Length Register (USBLENG) 29-43
29.3.28 DCP Configuration Register (DCPCFG) 29-43
29.3.29 DCP Maximum Packet Size Register (DCPMAXP) 29-46
29.3.30 DCP Control Register (DCPCTR) 29-47
29.3.31 Pipe Window Select Register (PIPESEL) 29-51
29.3.32 Pipe Configuration Register (PIPECFG) 29-52
29.3.33 Pipe Buffer Setting Register (PIPEBUF) 29-56
29.3.34 Pipe Maximum Packet Size Register (PIPEMAXP) 29-58
29.3.35 Pipe Timing Control Register (PIPEPERI) 29-59
29.3.36 PIPEn Control Registers (PIPEnCTR) (n = 1 to F) 29-60
29.3.37 PIPEn Transaction Counter Enable Registers (PIPEnTRE) (n = 1 to 5, 9, and A to F) 29-69
29.3.38 PIPEn Transaction Counter Registers (PIPEnTRN) (n = 1 to 5, 9, and A to F) 29-70
29.3.39 Device Address n Configuration Registers (DEVADDn) (n = 0 to 9, and A) 29-71
29.3.40 UTMI Suspend Mode Register (SUSPMODE) 29-72
29.3.41 FIFO Continuous Transfer Port Registers (D0FIFOBn, D1FIFOBn) (n = 0 to 7) 29-73
29.4 Operation 29-74
29.4.1 System Control and Oscillation Control 29-74
29.4.2 Interrupt Functions 29-76
29.4.3 Pipe Control 29-88

29.4.4 FIFO Buffer Memory ..... 29-94
29.4.5 FIFO Port Functions ..... 29-96
29.4.6 Control Transfers (DCP) ..... 29-99
29.4.7 Bulk Transfers (PIPE1 to PIPE5, PIPE9 to PIPE15) ..... 29-101
29.4.8 Interrupt Transfers (PIPE6 to PIPE9, PIPE10) ..... 29-103
29.4.9 Isochronous Transfers (PIPE1 and PIPE2) ..... 29-104
29.4.10 SOF Interpolation Function ..... 29-112
30. Digital Video Decoder ..... 30-1
30.1 Features ..... 30-1
30.2 Block Diagram ..... 30-2
30.3 Input/Output Pins ..... 30-3
30.4 Register Descriptions ..... 30-4
30.4.1 ADC Control Register 1 (ADCCR1) ..... 30-10
30.4.2 Timing Generation Control Register 1 (TGCR1) ..... 30-10
30.4.3 Timing Generation Control Register 2 (TGCR2) ..... 30-11
30.4.4 Timing Generation Control Register 3 (TGCR3) ..... 30-11
30.4.5 Sync Separation Control Register 1 (SYNSCR1) ..... 30-14
30.4.6 Sync Separation Control Register 2 (SYNSCR2) ..... 30-18
30.4.7 Sync Separation Control Register 3 (SYNSCR3) ..... 30-19
30.4.8 Sync Separation Control Register 4 (SYNSCR4) ..... 30-20
30.4.9 Sync Separation Control Register 5 (SYNSCR5) ..... 30-21
30.4.10 Horizontal AFC Control Register 1 (HAFCCR1) ..... 30-22
30.4.11 Horizontal AFC Control Register 2 (HAFCCR2) ..... 30-24
30.4.12 Horizontal AFC Control Register 3 (HAFCCR3) ..... 30-25
30.4.13 Vertical Countdown Control Register 1 (VCDWCR1) ..... 30-26
30.4.14 Digital Clamp Control Register 1 (DCPCR1) ..... 30-28
30.4.15 Digital Clamp Control Register 2 (DCPCR2) ..... 30-29
30.4.16 Digital Clamp Control Register 3 (DCPCR3) ..... 30-30
30.4.17 Digital Clamp Control Register 4 (DCPCR4) ..... 30-30
30.4.18 Digital Clamp Control Register 5 (DCPCR5) ..... 30-31
30.4.19 Digital Clamp Control Register 6 (DCPCR6) ..... 30-31
30.4.20 Digital Clamp Control Register 7 (DCPCR7) ..... 30-32
30.4.21 Digital Clamp Control Register 8 (DCPCR8) ..... 30-32
30.4.22 Noise Detection Control Register (NSDCR) ..... 30-33
30.4.23 Burst Lock/Chroma Decoding Control Register (BTLCR) ..... 30-34
30.4.24 Burst Gate Pulse Control Register (BTGPCR) ..... 30-37
30.4.25 ACC Control Register 1 (ACCCR1) ..... 30-38
30.4.26 ACC Control Register 2 (ACCCR2) ..... 30-40
30.4.27 ACC Control Register 3 (ACCCR3) ..... 30-41
30.4.28 TINT Control Register (TINTCR) ..... 30-42

30.4.29 Y/C Delay/Chroma Decoding Control Register (YCDCR) ..... 30-43
30.4.30 AGC Control Register 1 (AGCCR1) ..... 30-44
30.4.31 AGC Control Register 2 (AGCCR2) ..... 30-46
30.4.32 Peak Limiter Control Register (PKLIMITCR) ..... 30-47
30.4.33 Over-Range Control Register 1 (RGORCR1) ..... 30-49
30.4.34 Over-Range Control Register 2 (RGORCR2) ..... 30-50
30.4.35 Over-Range Control Register 3 (RGORCR3) ..... 30-50
30.4.36 Over-Range Control Register 4 (RGORCR4) ..... 30-51
30.4.37 Over-Range Control Register 5 (RGORCR5) ..... 30-51
30.4.38 Over-Range Control Register 6 (RGORCR6) ..... 30-52
30.4.39 Over-Range Control Register 7 (RGORCR7) ..... 30-53
30.4.40 Feedback Control Register for Horizontal AFC Phase Comparator (AFCPFCR) ..... 30-54
30.4.41 Register Update Enable Register (RUPDCR) ..... 30-55
30.4.42 Sync Separation Status/Vertical Cycle Read Register (VSYNCSR) ..... 30-56
30.4.43 Horizontal Cycle Read Register (HSYNCSR) ..... 30-57
30.4.44 Digital Clamp Read Register 1 (DCPSR1) ..... 30-57
30.4.45 Digital Clamp Read Register 2 (DCPSR2) ..... 30-58
30.4.46 Noise Detection Read Register (NSDSR) ..... 30-58
30.4.47 Chroma Decoding Read Register 1 (CROMASR1) ..... 30-59
30.4.48 Chroma Decode Read Register 2 (CROMASR2) ..... 30-60
30.4.49 Sync Separation Read Register (SYNCSSR) ..... 30-61
30.4.50 AGC Control Read Register 1 (AGCCSR1) ..... 30-61
30.4.51 AGC Control Read Register 2 (AGCCSR2) ..... 30-62
30.4.52 Y/C Separation Control Register 3 (YCSCR3) ..... 30-63
30.4.53 Y/C Separation Control Register 4 (YCSCR4) ..... 30-64
30.4.54 Y/C Separation Control Register 5 (YCSCR5) ..... 30-65
30.4.55 Y/C Separation Control Register 6 (YCSCR6) ..... 30-65
30.4.56 Y/C Separation Control Register 7 (YCSCR7) ..... 30-66
30.4.57 Y/C Separation Control Register 8 (YCSCR8) ..... 30-67
30.4.58 Y/C Separation Control Register 9 (YCSCR9) ..... 30-68
30.4.59 Y/C Separation Control Register 11 (YCSCR11) ..... 30-69
30.4.60 Y/C Separation Control Register 12 (YCSCR12) ..... 30-70
30.4.61 Digital Clamp Control Register 9 (DCPCR9) ..... 30-71
30.4.62 Chroma Filter TAP Coefficient (WA_F0 to WA_F8) Registers for Y/C Separation (YCTWA_F0 to YCTWA_F8) ..... 30-72
30.4.63 Chroma Filter TAP Coefficient (WB_F0 to WB_F8) Registers for Y/C Separation (YCTWB_F0 to YCTWB_F8) ..... 30-73
30.4.64 Chroma Filter TAP Coefficient (NA_F0 to NA_F8) Registers for Y/C Separation (YCTNA_F0 to YCTNA_F8) ..... 30-74
30.4.65 Chroma Filter TAP Coefficient (NB_F0 to NB_F8) Registers for Y/C Separation (YCTNB_F0 to YCTNB_F8) ..... 30-75

30.4.66 Luminance (Y) Signal Gain Control Register (YGAINCR) ..... 30-76
30.4.67 Color Difference (Cb) Signal Gain Control Register (CBGAINCR) ..... 30-76
30.4.68 Color Difference (Cr) Signal Gain Control Register (CRGAINCR) ..... 30-77
30.4.69 PGA Register Update (PGA_UPDATE) ..... 30-77
30.4.70 PGA Control Register (PGACR) ..... 30-78
30.4.71 ADC Control Register 2 (ADCCR2) ..... 30-78
30.5 Operation ..... 30-79
30.5.1 Overview ..... 30-79
30.5.2 A/D Converter for Video Signal Input ..... 30-80
30.5.3 Sync Separator Circuit ..... 30-82
30.5.4 Burst Controlled Oscillator (BCO) ..... 30-86
30.5.5 Y/C Separator Circuit ..... 30-87
30.5.6 Chroma Decoding Circuit ..... 30-94
30.5.7 Digital Clamp Circuit ..... 30-95
30.5.8 Output Control Circuit ..... 30-97
30.6 Recommended Setting ..... 30-98
30.7 Connection Example ..... 30-103
31. Video Display Controller 5 (1): Overview ..... 31-1
31.1 Features ..... 31-1
31.2 Block Diagram ..... 31-3
31.3 Input/Output Pins ..... 31-4
31.4 Clocks ..... 31-5
31.5 Hsync and Vsync Signals ..... 31-5
31.5.1 External Input Vsync ..... 31-6
31.5.2 Free-Running Vsync ..... 31-7
31.5.3 Blending Two Input Video Images ..... 31-9
31.5.4 Usage Note on Changing Vsync Signal Selections ..... 31-9
32. Video Display Controller 5 (2): Input Controller ..... 32-1
32.1 Input Controller Functions ..... 32-1
32.1.1 Overview of Functions ..... 32-1
32.1.2 Updating Registers of External Signal Input Block and Sync Signal Adjustment Block ..... 32-2
32.1.3 Selecting Input Signals ..... 32-2
32.1.4 Controlling Externally Input Video Signals ..... 32-3
32.1.5 Selecting Clock Edge for Externally Input Signals ..... 32-4
32.1.6 Externally Input Sync Signal Inversion Control ..... 32-4
32.1.7 Bit Allocation of Externally Input Video Image Signals ..... 32-5
32.1.8 Typical Signal Timing of BT601 Format ..... 32-9
32.1.9 Typical Signal Timing of BT656 Format ..... 32-12
32.1.10 SAV/EAV Code in BT656 Format ..... 32-14
32.1.11 BT656 Progressive Format ..... 32-17

32.1.12 BT656/BT601/YCbCr422 Format Setting ..... 32-20
32.1.13 YCbCr444/RBG888/666/565 Input Timing ..... 32-23
32.1.14 Field Differentiation and Vsync Signal Phase Adjustment ..... 32-25
32.1.15 Vsync Signal Delay Adjustment in Line Units ..... 32-26
32.1.16 Sync Signal Delay Adjustment ..... 32-26
32.1.17 Horizontal Noise Reduction ..... 32-27
32.1.18 Color Matrix ..... 32-29
32.2 Register Descriptions ..... 32-32
32.2.1 External Input Block Register Update Control Register (INP_UPDATE) ..... 32-34
32.2.2 Input Select Control Register (INP_SEL_CNT) ..... 32-35
32.2.3 External Input Sync Signal Control Register (INP_EXT_SYNC_CNT) ..... 32-36
32.2.4 Vsync Signal Phase Adjustment Register (INP_VSYNC_PH_ADJ) ..... 32-37
32.2.5 Sync Signal Delay Adjustment Register (INP_DLY_ADJ) ..... 32-37
32.2.6 Image Quality Adjustment Block Register Update Control Register (IMGCNT_UPDATE) ..... 32-38
32.2.7 NR Control Register 0 (IMGCNT_NR_CNT0) ..... 32-39
32.2.8 NR Control Register 1 (IMGCNT_NR_CNT1) ..... 32-40
32.2.9 Image Quality Adjustment Block Matrix Mode Register (IMGCNT_MTX_MODE) ..... 32-41
32.2.10 Image Quality Adjustment Block Matrix YG Adjustment Register 0 (IMGCNT_MTX_YG_ADJ0) ..... 32-41
32.2.11 Image Quality Adjustment Block Matrix YG Adjustment Register 1 (IMGCNT_MTX_YG_ADJ1) ..... 32-42
32.2.12 Image Quality Adjustment Block Matrix CBB Adjustment Register 0 (IMGCNT_MTX_CBB_ADJ0) ..... 32-43
32.2.13 Image Quality Adjustment Block Matrix CBB Adjustment Register 1 (IMGCNT_MTX_CBB_ADJ1) ..... 32-44
32.2.14 Image Quality Adjustment Block Matrix CRR Adjustment Register 0 (IMGCNT_MTX_CRR_ADJ0) ..... 32-45
32.2.15 Image Quality Adjustment Block Matrix CRR Adjustment Register 1 (IMGCNT_MTX_CRR_ADJ1) ..... 32-46
32.2.16 Dynamic Range Compression Register (IMGCNT_DRC_REG) ..... 32-46
32.3 Usage Methods ..... 32-47
32.3.1 Input Format Adjustment Method ..... 32-47
32.3.2 Usage Method of Conversion Color Matrix ..... 32-50
33. Video Display Controller 5 (3): Scaler ..... 33-1
33.1 Scaler ..... 33-1
33.1.1 Overview of Functions ..... 33-1
33.1.2 Register Control ..... 33-2
33.1.3 Synchronization Control ..... 33-4
33.1.4 Setting Angle of View ..... 33-9
33.1.5 Scaling Settings ..... 33-13
33.1.6 Horizontal Prefilter ..... 33-15

33.1.7 Horizontal Scale-Down ..... 33-15
33.1.8 Vertical Scale-Down ..... 33-17
33.1.9 Horizontal Scale Up ..... 33-19
33.1.10 Vertical Scale-Up ..... 33-20
33.1.11 IP Conversion ..... 33-22
33.1.12 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image Line before Scaling-down ..... 33-24
33.1.13 Trimming ..... 33-25
33.1.14 Screen Synthesis ..... 33-26
33.1.15 Selecting Format for Writing Video Image Signals to Frame Buffer ..... 33-27
33.1.16 Horizontal Mirroring and Rotation ..... 33-28
33.1.17 Writing to Frame Buffer ..... 33-28
33.1.18 Selecting a Scaling-up Process or Graphics 0 or 1 Process ..... 33-34
33.1.19 Selecting Field for Frame Buffer Reading ..... 33-35
33.1.20 Pointer Buffer and Frame Buffer Reading Processing ..... 33-36
33.1.21 Cascaded Connection ..... 33-38
33.1.22 Blending Two Input Video Images ..... 33-38
33.2 Register Descriptions ..... 33-39
33.2.1 SCL0 Register Update Control Register (SC0_SCL0_UPDATE) ..... 33-47
33.2.2 Mask Control Register (SC0_SCL0_FRC1) ..... 33-48
33.2.3 Missing Vsync Compensation Control Register (SC0_SCL0_FRC2) ..... 33-48
33.2.4 Output Sync Select Register (SC0_SCL0_FRC3) ..... 33-49
33.2.5 Free-Running Period Control Register (SC0_SCL0_FRC4) ..... 33-50
33.2.6 Output Delay Control Register (SC0_SCL0_FRC5) ..... 33-50
33.2.7 Full-Screen Vertical Size Register (SC0_SCL0_FRC6) ..... 33-51
33.2.8 Full-Screen Horizontal Size Register (SC0_SCL0_FRC7) ..... 33-52
33.2.9 Vsync Detection Register (SC0_SCL0_FRC9) ..... 33-53
33.2.10 Status Monitor 0 Register (SC0_SCL0_MON0) ..... 33-53
33.2.11 Interrupt Control Register (SC0_SCL0_INT) ..... 33-54
33.2.12 Scaling-Down Control Register (SC0_SCL0_DS1) ..... 33-54
33.2.13 Vertical Capture Size Register (SC0_SCL0_DS2) ..... 33-55
33.2.14 Horizontal Capture Size Register (SC0_SCL0_DS3) ..... 33-56
33.2.15 Horizontal Scale Down Register (SC0_SCL0_DS4) ..... 33-57
33.2.16 Initial Vertical Phase Register (SC0_SCL0_DS5) ..... 33-58
33.2.17 Vertical Scaling Register (SC0_SCL0_DS6) ..... 33-59
33.2.18 Scaling-Down Control Block Output Size Register (SC0_SCL0_DS7) ..... 33-60
33.2.19 Scaling-Up Control Register (SC0_SCL0_US1) ..... 33-61
33.2.20 Output Image Vertical Size Register (SC0_SCL0_US2) ..... 33-62
33.2.21 Output Image Horizontal Size Register (SC0_SCL0_US3) ..... 33-63
33.2.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4) ..... 33-64
33.2.23 Horizontal Scale Up Register (SC0_SCL0_US5) ..... 33-64

33.2.24 Horizontal Scale Up Initial Phase Register (SC0_SCL0_US6) ..... 33-65
33.2.25 Trimming Register (SC0_SCL0_US7) ..... 33-65
33.2.26 Frame Buffer Read Select Register (SC0_SCL0_US8) ..... 33-66
33.2.27 Background Color Register (SC0_SCL0_OVR1) ..... 33-66
33.2.28 SCL1 Register Update Control Register (SC0_SCL1_UPDATE) ..... 33-67
33.2.29 Writing Mode Register (SC0_SCL1_WR1) ..... 33-68
33.2.30 Write Address Register 1T (SC0_SCL1_WR2) ..... 33-69
33.2.31 Write Address Register 2T (SC0_SCL1_WR3) ..... 33-70
33.2.32 Write Address Register 3T (SC0_SCL1_WR4) ..... 33-71
33.2.33 Frame Sub-Sampling Register (SC0_SCL1_WR5) ..... 33-72
33.2.34 Bit Reduction Register (SC0_SCL1_WR6) ..... 33-73
33.2.35 Write Detection Register (SC0_SCL1_WR7) ..... 33-73
33.2.36 Write Address Register 1B (SC0_SCL1_WR8) ..... 33-74
33.2.37 Write Address Register 2B (SC0_SCL1_WR9) ..... 33-75
33.2.38 Write Address Register 3B (SC0_SCL1_WR10) ..... 33-76
33.2.39 Write Detection Register B (SC0_SCL1_WR11) ..... 33-76
33.2.40 Status Monitor 1 Register (SC0_SCL1_MON1) ..... 33-77
33.2.41 Pointer Buffer 0 Register (SC0_SCL1_PBUF0) ..... 33-77
33.2.42 Pointer Buffer 1 Register (SC0_SCL1_PBUF1) ..... 33-78
33.2.43 Pointer Buffer 2 Register (SC0_SCL1_PBUF2) ..... 33-78
33.2.44 Pointer Buffer 3 Register (SC0_SCL1_PBUF3) ..... 33-79
33.2.45 Pointer Buffer and Field Information Register (SC0_SCL1_PBUF_FLD) ..... 33-79
33.2.46 Pointer Buffer Control Register (SC0_SCL1_PBUF_CNT) ..... 33-80
33.2.47 Graphics 0 Register Update Control Register (GR0_UPDATE) ..... 33-81
33.2.48 Frame Buffer Read Control Register (Graphics 0) (GR0_FLM_RD) ..... 33-81
33.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1) ..... 33-82
33.2.50 Frame Buffer Control Register 2 (Graphics 0) (GR0_FLM2) ..... 33-83
33.2.51 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3) ..... 33-84
33.2.52 Frame Buffer Control Register 4 (Graphics 0) (GR0_FLM4) ..... 33-85
33.2.53 Frame Buffer Control Register 5 (Graphics 0) (GR0_FLM5) ..... 33-86
33.2.54 Frame Buffer Control Register 6 (Graphics 0) (GR0_FLM6) ..... 33-87
33.2.55 Alpha Blending Control Register 1 (Graphics 0) (GR0_AB1) ..... 33-89
33.2.56 Alpha Blending Control Register 2 (Graphics 0) (GR0_AB2) ..... 33-90
33.2.57 Alpha Blending Control Register 3 (Graphics 0) (GR0_AB3) ..... 33-90
33.2.58 Alpha Blending Control Register 7 (Graphics 0) (GR0_AB7) ..... 33-91
33.2.59 Alpha Blending Control Register 8 (Graphics 0) (GR0_AB8) ..... 33-92
33.2.60 Alpha Blending Control Register 9 (Graphics 0) (GR0_AB9) ..... 33-92
33.2.61 Alpha Blending Control Register 10 (Graphics 0) (GR0_AB10) ..... 33-93
33.2.62 Alpha Blending Control Register 11 (Graphics 0) (GR0_AB11) ..... 33-94
33.2.63 Background Color Control Register (Graphics 0) (GR0_BASE) ..... 33-94

33.2.64 CLUT Table Control Register (Graphics 0) (GR0_CLUT) ..... 33-95
33.2.65 SCL0 Register Update Control Register (SC1_SCL0_UPDATE) ..... 33-96
33.2.66 Mask Control Register (SC1_SCL0_FRC1) ..... 33-97
33.2.67 Missing Vsync Compensation Control Register (SC1_SCL0_FRC2) ..... 33-97
33.2.68 Output Sync Select Register (SC1_SCL0_FRC3) ..... 33-98
33.2.69 Free-Running Period Control Register (SC1_SCL0_FRC4) ..... 33-99
33.2.70 Output Delay Control Register (SC1_SCL0_FRC5) ..... 33-99
33.2.71 Full-Screen Vertical Size Register (SC1_SCL0_FRC6) ..... 33-100
33.2.72 Full-Screen Horizontal Size Register (SC1_SCL0_FRC7) ..... 33-100
33.2.73 Vsync Detection Register (SC1_SCL0_FRC9) ..... 33-101
33.2.74 Status Monitor 0 Register (SC1_SCL0_MON0) ..... 33-101
33.2.75 Interrupt Control Register (SC1_SCL0_INT) ..... 33-102
33.2.76 Scaling-Down Control Register (SC1_SCL0_DS1) ..... 33-102
33.2.77 Vertical Capture Size Register (SC1_SCL0_DS2) ..... 33-103
33.2.78 Horizontal Capture Size Register (SC1_SCL0_DS3) ..... 33-104
33.2.79 Horizontal Scale Down Register (SC1_SCL0_DS4) ..... 33-105
33.2.80 Initial Vertical Phase Register (SC1_SCL0_DS5) ..... 33-105
33.2.81 Vertical Scaling Register (SC1_SCL0_DS6) ..... 33-106
33.2.82 Scaling-Down Control Block Output Size Register (SC1_SCL0_DS7) ..... 33-107
33.2.83 Scaling-Up Control Register (SC1_SCL0_US1) ..... 33-107
33.2.84 Output Image Vertical Size Register (SC1_SCL0_US2) ..... 33-108
33.2.85 Output Image Horizontal Size Register (SC1_SCL0_US3) ..... 33-109
33.2.86 Scaling-Up Control Block Input Size Register (SC1_SCL0_US4) ..... 33-109
33.2.87 Horizontal Scale Up Register (SC1_SCL0_US5) ..... 33-110
33.2.88 Horizontal Scale Up Initial Phase Register (SC1_SCL0_US6) ..... 33-111
33.2.89 Trimming Register (SC1_SCL0_US7) ..... 33-112
33.2.90 Frame Buffer Read Select Register (SC1_SCL0_US8) ..... 33-112
33.2.91 Background Color Register (SC1_SCL0_OVR1) ..... 33-113
33.2.92 SCL1 Register Update Control Register (SC1_SCL1_UPDATE) ..... 33-114
33.2.93 Writing Mode Register (SC1_SCL1_WR1) ..... 33-114
33.2.94 Write Address Register 1T (SC1_SCL1_WR2) ..... 33-116
33.2.95 Write Address Register 2T (SC1_SCL1_WR3) ..... 33-117
33.2.96 Write Address Register 3T (SC1_SCL1_WR4) ..... 33-118
33.2.97 Frame Sub-Sampling Register (SC1_SCL1_WR5) ..... 33-119
33.2.98 Bit Reduction Register (SC1_SCL1_WR6) ..... 33-120
33.2.99 Write Detection Register (SC1_SCL1_WR7) ..... 33-120
33.2.100 Write Address Register 1B (SC1_SCL1_WR8) ..... 33-121
33.2.101 Write Address Register 2B (SC1_SCL1_WR9) ..... 33-122
33.2.102 Write Address Register 3B (SC1_SCL1_WR10) ..... 33-123
33.2.103 Write Detection Register B (SC1_SCL1_WR11) ..... 33-124

33.2.104 Status Monitor 1 Register (SC1_SCL1_MON1) ..... 33-124
33.2.105 Pointer Buffer 0 Register (SC1_SCL1_PBUF0) ..... 33-125
33.2.106 Pointer Buffer 1 Register (SC1_SCL1_PBUF1) ..... 33-125
33.2.107 Pointer Buffer 2 Register (SC1_SCL1_PBUF2) ..... 33-126
33.2.108 Pointer Buffer 3 Register (SC1_SCL1_PBUF3) ..... 33-126
33.2.109 Pointer Buffer and Field Information Register (SC1_SCL1_PBUF_FLD) ..... 33-127
33.2.110 Pointer Buffer Control Register (SC1_SCL1_PBUF_CNT) ..... 33-128
33.2.111 Graphics 1 Register Update Control Register (GR1_UPDATE) ..... 33-128
33.2.112 Frame Buffer Read Control Register (Graphics 1) (GR1_FLM_RD) ..... 33-129
33.2.113 Frame Buffer Control Register 1 (Graphics 1) (GR1_FLM1) ..... 33-130
33.2.114 Frame Buffer Control Register 2 (Graphics 1) (GR1_FLM2) ..... 33-131
33.2.115 Frame Buffer Control Register 3 (Graphics 1) (GR1_FLM3) ..... 33-131
33.2.116 Frame Buffer Control Register 4 (Graphics 1) (GR1_FLM4) ..... 33-132
33.2.117 Frame Buffer Control Register 5 (Graphics 1) (GR1_FLM5) ..... 33-133
33.2.118 Frame Buffer Control Register 6 (Graphics 1) (GR1_FLM6) ..... 33-134
33.2.119 Alpha Blending Control Register 1 (Graphics 1) (GR1_AB1) ..... 33-136
33.2.120 Alpha Blending Control Register 2 (Graphics 1) (GR1_AB2) ..... 33-137
33.2.121 Alpha Blending Control Register 3 (Graphics 1) (GR1_AB3) ..... 33-138
33.2.122 Alpha Blending Control Register 4 (Graphics 1) (GR1_AB4) ..... 33-138
33.2.123 Alpha Blending Control Register 5 (Graphics 1) (GR1_AB5) ..... 33-139
33.2.124 Alpha Blending Control Register 6 (Graphics 1) (GR1_AB6) ..... 33-139
33.2.125 Alpha Blending Control Register 7 (Graphics 1) (GR1_AB7) ..... 33-140
33.2.126 Alpha Blending Control Register 8 (Graphics 1) (GR1_AB8) ..... 33-141
33.2.127 Alpha Blending Control Register 9 (Graphics 1) (GR1_AB9) ..... 33-141
33.2.128 Alpha Blending Control Register 10 (Graphics 1) (GR1_AB10) ..... 33-142
33.2.129 Alpha Blending Control Register 11 (Graphics 1) (GR1_AB11) ..... 33-143
33.2.130 Background Color Control Register (Graphics 1) (GR1_BASE) ..... 33-143
33.2.131 CLUT Table Control Register (Graphics 1) (GR1_CLUT) ..... 33-144
33.2.132 Status Monitor Register (Graphics 1) (GR1_MON) ..... 33-145
33.3 Usage Method ..... 33-146
33.3.1 Scaling Setting Example for 525i Video Input and VGA-Size (640 x 480) Video Output ..... 33-146
33.3.2 Scaling Setting Example for Graphics Display ..... 33-149
33.3.3 Scaling Setting Example for Scaled-up Graphics Display ..... 33-151
34. Video Display Controller 5 (4): Image Quality Improver ..... 34-1
34.1 Image Quality Improver ..... 34-1
34.1.1 Overview of Functions ..... 34-1
34.1.2 Register Update Control ..... 34-2
34.1.3 Black Stretch ..... 34-2
34.1.4 Enhancer ..... 34-3

34.1.5 Color Matrix ..... 34-9
34.2 Register Description ..... 34-11
34.2.1 Register Update Control Register in Image Quality Improver (ADJ0_UPDATE) ..... 34-14
34.2.2 Black Stretch Register (ADJ0_BKSTR_SET) ..... 34-15
34.2.3 Enhancer Timing Adjustment Register 1 (ADJ0_ENH_TIM1) ..... 34-16
34.2.4 Enhancer Timing Adjustment Register 2 (ADJ0_ENH_TIM2) ..... 34-16
34.2.5 Enhancer Timing Adjustment Register 3 (ADJ0_ENH_TIM3) ..... 34-17
34.2.6 Enhancer Sharpness Register 1 (ADJ0_ENH_SHP1) ..... 34-17
34.2.7 Enhancer Sharpness Register 2 (ADJ0_ENH_SHP2) ..... 34-18
34.2.8 Enhancer Sharpness Register 3 (ADJ0_ENH_SHP3) ..... 34-19
34.2.9 Enhancer Sharpness Register 4 (ADJ0_ENH_SHP4) ..... 34-20
34.2.10 Enhancer Sharpness Register 5 (ADJ0_ENH_SHP5) ..... 34-20
34.2.11 Enhancer Sharpness Register 6 (ADJ0_ENH_SHP6) ..... 34-21
34.2.12 Enhancer LTI Register 1 (ADJ0_ENH_LTI1) ..... 34-22
34.2.13 Enhancer LTI Register 2 (ADJ0_ENH_LTI2) ..... 34-23
34.2.14 Matrix Mode Register in Image Quality Improver (ADJ0_MTX_MODE) ..... 34-24
34.2.15 Matrix YG Control Register 0 in Image Quality Improver (ADJ0_MTX_YG_ADJ0) ..... 34-24
34.2.16 Matrix YG Control Register 1 in Image Quality Improver (ADJ0_MTX_YG_ADJ1) ..... 34-25
34.2.17 Matrix CBB Control Register 0 in Image Quality Improver (ADJ0_MTX_CBB_ADJ0) ..... 34-26
34.2.18 Matrix CBB Control Register 1 in Image Quality Improver (ADJ0_MTX_CBB_ADJ1) ..... 34-27
34.2.19 Matrix CRR Control Register 0 in Image Quality Improver (ADJ0_MTX_CRR_ADJ0) ..... 34-28
34.2.20 Matrix CRR Control Register 1 in Image Quality Improver (ADJ0_MTX_CRR_ADJ1) ..... 34-29
34.2.21 Register Update Control Register in Image Quality Improver (ADJ1_UPDATE) ..... 34-29
34.2.22 Black Stretch Register (ADJ1_BKSTR_SET) ..... 34-30
34.2.23 Enhancer Timing Adjustment Register 1 (ADJ1_ENH_TIM1) ..... 34-31
34.2.24 Enhancer Timing Adjustment Register 2 (ADJ1_ENH_TIM2) ..... 34-31
34.2.25 Enhancer Timing Adjustment Register 3 (ADJ1_ENH_TIM3) ..... 34-32
34.2.26 Enhancer Sharpness Register 1 (ADJ1_ENH_SHP1) ..... 34-33
34.2.27 Enhancer Sharpness Register 2 (ADJ1_ENH_SHP2) ..... 34-34
34.2.28 Enhancer Sharpness Register 3 (ADJ1_ENH_SHP3) ..... 34-35
34.2.29 Enhancer Sharpness Register 4 (ADJ1_ENH_SHP4) ..... 34-36
34.2.30 Enhancer Sharpness Register 5 (ADJ1_ENH_SHP5) ..... 34-36
34.2.31 Enhancer Sharpness Register 6 (ADJ1_ENH_SHP6) ..... 34-37
34.2.32 Enhancer LTI Register 1 (ADJ1_ENH_LTI1) ..... 34-38
34.2.33 Enhancer LTI Register 2 (ADJ1_ENH_LTI2) ..... 34-39
34.2.34 Matrix Mode Register in Image Quality Improver (ADJ1_MTX_MODE) ..... 34-40
34.2.35 Matrix YG Control Register 0 in Image Quality Improver (ADJ1_MTX_YG_ADJ0) ..... 34-40
34.2.36 Matrix YG Control Register 1 in Image Quality Improver (ADJ1_MTX_YG_ADJ1) ..... 34-41
34.2.37 Matrix CBB Control Register 0 in Image Quality Improver (ADJ1_MTX_CBB_ADJ0) ..... 34-42
34.2.38 Matrix CBB Control Register 1 in Image Quality Improver (ADJ1_MTX_CBB_ADJ1) ..... 34-43

34.2.39 Matrix CRR Control Register 0 in Image Quality Improver (ADJ1_MTX_CRR_ADJ0).....34-44
34.2.40 Matrix CRR Control Register 1 in Image Quality Improver (ADJ1_MTX_CRR_ADJ1).....34-45
34.3 Usage Method.....34-46
34.3.1 Black Stretch Usage Method.....34-46
34.3.2 LTI Processing of Enhancer.....34-46
34.3.3 Sharpness Processing of Enhancer.....34-47
34.3.4 Setting Method for Color Matrix Data Conversion.....34-48
35. Video Display Controller 5 (5): Image Synthesizer.....35-1
35.1 Image Synthesizer.....35-1
35.1.1 Overview of Functions.....35-1
35.1.2 Graphics Data Read Control.....35-3
35.1.3 Setting Graphics Display Area.....35-13
35.1.4 Interrupt Generation at Specified Line.....35-14
35.1.5 Formats of Frame Buffer Read Signals and Corresponding Alpha Blending Types.....35-14
35.1.6 Display Selection.....35-15
35.1.7 Background Color Display Processing.....35-17
35.1.8 Lower-Layer Graphics Display Processing.....35-17
35.1.9 Current Graphics Display Processing.....35-17
35.1.10 Display with Alpha Blending in a Rectangular Area.....35-18
35.1.11 RGB-Index Chroma-Key Processing.....35-20
35.1.12 CLUT-Index Chroma-Key Processing.....35-21
35.1.13 Display with Alpha Blending in One-Pixel Units.....35-22
35.1.14 Alpha Blending Calculation.....35-23
35.1.15 CLUT Table.....35-23
35.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area.....35-24
35.1.17 Selection of Lower-Layer/Current Graphics in VIN Synthesizer.....35-24
35.2 Register Descriptions.....35-25
35.2.1 Graphics 2 Register Update Control Register (GR2_UPDATE).....35-32
35.2.2 Frame Buffer Read Control Register (Graphics 2) (GR2_FLM_RD).....35-32
35.2.3 Frame Buffer Control Register 1 (Graphics 2) (GR2_FLM1).....35-33
35.2.4 Frame Buffer Control Register 2 (Graphics 2) (GR2_FLM2).....35-34
35.2.5 Frame Buffer Control Register 3 (Graphics 2) (GR2_FLM3).....35-34
35.2.6 Frame Buffer Control Register 4 (Graphics 2) (GR2_FLM4).....35-35
35.2.7 Frame Buffer Control Register 5 (Graphics 2) (GR2_FLM5).....35-35
35.2.8 Frame Buffer Control Register 6 (Graphics 2) (GR2_FLM6).....35-36
35.2.9 Alpha Blending Control Register 1 (Graphics 2) (GR2_AB1).....35-37
35.2.10 Alpha Blending Control Register 2 (Graphics 2) (GR2_AB2).....35-38
35.2.11 Alpha Blending Control Register 3 (Graphics 2) (GR2_AB3).....35-39
35.2.12 Alpha Blending Control Register 4 (Graphics 2) (GR2_AB4).....35-39
35.2.13 Alpha Blending Control Register 5 (Graphics 2) (GR2_AB5).....35-40

35.2.14 Alpha Blending Control Register 6 (Graphics 2) (GR2_AB6) ..... 35-40
35.2.15 Alpha Blending Control Register 7 (Graphics 2) (GR2_AB7) ..... 35-41
35.2.16 Alpha Blending Control Register 8 (Graphics 2) (GR2_AB8) ..... 35-41
35.2.17 Alpha Blending Control Register 9 (Graphics 2) (GR2_AB9) ..... 35-42
35.2.18 Alpha Blending Control Register 10 (Graphics 2) (GR2_AB10) ..... 35-42
35.2.19 Alpha Blending Control Register 11 (Graphics 2) (GR2_AB11) ..... 35-43
35.2.20 Background Color Control Register (Graphics 2) (GR2_BASE) ..... 35-43
35.2.21 CLUT Table Control Register (Graphics 2) (GR2_CLUT) ..... 35-44
35.2.22 Status Monitor Register (Graphics 2) (GR2_MON) ..... 35-44

35.2.32 Alpha Blending Control Register 2 (Graphics 3) (GR3_AB2) ..... 35-51
35.2.33 Alpha Blending Control Register 3 (Graphics 3) (GR3_AB3) ..... 35-51
35.2.34 Alpha Blending Control Register 4 (Graphics 3) (GR3_AB4) ..... 35-52
35.2.35 Alpha Blending Control Register 5 (Graphics 3) (GR3_AB5) ..... 35-52
35.2.36 Alpha Blending Control Register 6 (Graphics 3) (GR3_AB6) ..... 35-53
35.2.37 Alpha Blending Control Register 7 (Graphics 3) (GR3_AB7) ..... 35-53
35.2.38 Alpha Blending Control Register 8 (Graphics 3) (GR3_AB8) ..... 35-54
35.2.39 Alpha Blending Control Register 9 (Graphics 3) (GR3_AB9) ..... 35-54
35.2.40 Alpha Blending Control Register 10 (Graphics 3) (GR3_AB10) ..... 35-55
35.2.41 Alpha Blending Control Register 11 (Graphics 3) (GR3_AB11) ..... 35-55
35.2.42 Background Color Control Register (Graphics 3) (GR3_BASE) ..... 35-56
35.2.43 CLUT Table and Interrupt Control Register (Graphics 3) (GR3_CLUT_INT) ..... 35-56
35.2.44 Status Monitor Register (Graphics 3) (GR3_MON) ..... 35-57
35.2.45 VIN Synthesizer Register Update Control Register (GR_VIN_UPDATE) ..... 35-58
35.2.46 Alpha Blending Control Register 1 (VIN Synthesizer) (GR_VIN_AB1) ..... 35-59
35.2.47 Alpha Blending Control Register 2 (VIN Synthesizer) (GR_VIN_AB2) ..... 35-60
35.2.48 Alpha Blending Control Register 3 (VIN Synthesizer) (GR_VIN_AB3) ..... 35-60
35.2.49 Alpha Blending Control Register 4 (VIN Synthesizer) (GR_VIN_AB4) ..... 35-61
35.2.50 Alpha Blending Control Register 5 (VIN Synthesizer) (GR_VIN_AB5) ..... 35-61
35.2.51 Alpha Blending Control Register 6 (VIN Synthesizer) (GR_VIN_AB6) ..... 35-62
35.2.52 Alpha Blending Control Register 7 (VIN Synthesizer) (GR_VIN_AB7) ..... 35-62
35.2.53 Background Color Control Register (VIN Synthesizer) (GR_VIN_BASE) ..... 35-63

35.2.54 Status Monitor Register (VIN Synthesizer) (GR_VIN_MON) ..... 35-63
35.3 Usage Method ..... 35-64
35.3.1 Mute Image ..... 35-64
35.3.2 Alpha Blending in Rectangular Area ..... 35-64
36. Video Display Controller 5 (6): Output Image Generator ..... 36-1
36.1 Output Image Generation Functions ..... 36-1
36.1.1 Overview of Functions ..... 36-1
36.1.2 Register Control ..... 36-3
36.1.3 Enabling or Disabling Output Image Generator ..... 36-4
36.1.4 Synchronization Control ..... 36-4
36.1.5 Setting Angle of View ..... 36-6
36.1.6 Scaling Settings ..... 36-9
36.1.7 Screen Synthesis ..... 36-9
36.1.8 Selecting Format for Writing Video Image Signals to Frame Buffer ..... 36-10
36.1.9 Writing to Frame Buffer ..... 36-11
36.1.10 Selecting an Input Video Image Signal Processing or Graphics (OIR) Processing ..... 36-15
36.2 Register Descriptions ..... 36-16
36.2.1 SCL0 Register Update Control Register (OIR_SCL0_UPDATE) ..... 36-20
36.2.2 Mask Control Register (OIR_SCL0_FRC1) ..... 36-21
36.2.3 Missing Vsync Compensation Control Register (OIR_SCL0_FRC2) ..... 36-21
36.2.4 Output Sync Select Register (OIR_SCL0_FRC3) ..... 36-22
36.2.5 Free-Running Period Control Register (OIR_SCL0_FRC4) ..... 36-22
36.2.6 Output Delay Control Register (OIR_SCL0_FRC5) ..... 36-23
36.2.7 Full-Screen Vertical Size Register (OIR_SCL0_FRC6) ..... 36-24
36.2.8 Full-Screen Horizontal Size Register (OIR_SCL0_FRC7) ..... 36-25
36.2.9 Scaling-Down Control Register (OIR_SCL0_DS1) ..... 36-26
36.2.10 Vertical Capture Size Register (OIR_SCL0_DS2) ..... 36-27
36.2.11 Horizontal Capture Size Register (OIR_SCL0_DS3) ..... 36-28
36.2.12 Scaling-Down Control Block Output Size Register (OIR_SCL0_DS7) ..... 36-29
36.2.13 Scaling-Up Control Register (OIR_SCL0_US1) ..... 36-30
36.2.14 Output Image Vertical Size Register (OIR_SCL0_US2) ..... 36-31
36.2.15 Output Image Horizontal Size Register (OIR_SCL0_US3) ..... 36-32
36.2.16 Frame Buffer Read Select Register (OIR_SCL0_US8) ..... 36-33
36.2.17 Background Color Register (OIR_SCL0_OVR1) ..... 36-34
36.2.18 SCL1 Register Update Control Register (OIR_SCL1_UPDATE) ..... 36-35
36.2.19 Writing Mode Register (OIR_SCL1_WR1) ..... 36-36
36.2.20 Write Address Register 1 (OIR_SCL1_WR2) ..... 36-37
36.2.21 Write Address Register 2 (OIR_SCL1_WR3) ..... 36-38
36.2.22 Write Address Register 3 (OIR_SCL1_WR4) ..... 36-39
36.2.23 Frame Sub-Sampling Register (OIR_SCL1_WR5) ..... 36-40

36.2.24 Bit Reduction Register (OIR_SCL1_WR6) ..... 36-41
36.2.25 Write Detection Register (OIR_SCL1_WR7) ..... 36-41
36.2.26 Graphics (OIR) Register Update Control Register (GR_OIR_UPDATE) ..... 36-42
36.2.27 Frame Buffer Read Control Register (Graphics (OIR)) (GR_OIR_FLM_RD) ..... 36-42
36.2.28 Frame Buffer Control Register 1 (Graphics (OIR)) (GR_OIR_FLM1) ..... 36-43
36.2.29 Frame Buffer Control Register 2 (Graphics (OIR)) (GR_OIR_FLM2) ..... 36-44
36.2.30 Frame Buffer Control Register 3 (Graphics (OIR)) (GR_OIR_FLM3) ..... 36-45
36.2.31 Frame Buffer Control Register 4 (Graphics (OIR)) (GR_OIR_FLM4) ..... 36-46
36.2.32 Frame Buffer Control Register 5 (Graphics (OIR)) (GR_OIR_FLM5) ..... 36-47
36.2.33 Frame Buffer Control Register 6 (Graphics (OIR)) (GR_OIR_FLM6) ..... 36-48
36.2.34 Alpha Blending Control Register 1 (Graphics (OIR)) (GR_OIR_AB1) ..... 36-50
36.2.35 Alpha Blending Control Register 2 (Graphics (OIR)) (GR_OIR_AB2) ..... 36-51
36.2.36 Alpha Blending Control Register 3 (Graphics (OIR)) (GR_OIR_AB3) ..... 36-52
36.2.37 Alpha Blending Control Register 7 (Graphics (OIR)) (GR_OIR_AB7) ..... 36-53
36.2.38 Alpha Blending Control Register 8 (Graphics (OIR)) (GR_OIR_AB8) ..... 36-53
36.2.39 Alpha Blending Control Register 9 (Graphics (OIR)) (GR_OIR_AB9) ..... 36-54
36.2.40 Alpha Blending Control Register 10 (Graphics (OIR)) (GR_OIR_AB10) ..... 36-55
36.2.41 Alpha Blending Control Register 11 (Graphics (OIR)) (GR_OIR_AB11) ..... 36-56
36.2.42 Background Color Control Register (Graphics (OIR)) (GR_OIR_BASE) ..... 36-57
36.2.43 CLUT Table Control Register (Graphics (OIR)) (GR_OIR_CLUT) ..... 36-58
36.2.44 Status Monitor Register (GR_OIR_MON) ..... 36-59

37. Video Display Controller 5 (7): Output Controller ..... 37-1
37.1 Output Controller ..... 37-1
37.1.1 Overview of Functions ..... 37-1
37.1.2 Register Update Control ..... 37-2
37.1.3 Route Selection ..... 37-2
37.1.4 Panel Brightness Adjustment ..... 37-3
37.1.5 Contrast Adjustment ..... 37-3
37.1.6 Gamma Correction ..... 37-4
37.1.7 Dither Process ..... 37-8
37.1.8 Output Format Conversion ..... 37-10
37.1.9 LCD TCON ..... 37-16
37.2 Register Descriptions ..... 37-26
37.2.1 Register Update Control Register G in Gamma Correction Block (GAM_G_UPDATE) ..... 37-34
37.2.2 Function Switch Register in Gamma Correction Block (GAM_SW) ..... 37-35
37.2.3 Table Setting Register G1 to G16 in Gamma Correction Block (GAM_G_LUT1 to GAM_G_LUT16) ..... 37-36
37.2.4 Area Setting Register G1 in Gamma Correction Block (GAM_G_AREA1) ..... 37-38
37.2.5 Area Setting Register G2 in Gamma Correction Block (GAM_G_AREA2) ..... 37-39
37.2.6 Area Setting Register G3 in Gamma Correction Block (GAM_G_AREA3) ..... 37-40

37.2.7 Area Setting Register G4 in Gamma Correction Block (GAM_G_AREA4) ..... 37-41
37.2.8 Area Setting Register G5 in Gamma Correction Block (GAM_G_AREA5) ..... 37-42
37.2.9 Area Setting Register G6 in Gamma Correction Block (GAM_G_AREA6) ..... 37-43
37.2.10 Area Setting Register G7 in Gamma Correction Block (GAM_G_AREA7) ..... 37-44
37.2.11 Area Setting Register G8 in Gamma Correction Block (GAM_G_AREA8) ..... 37-45
37.2.12 Register Update Control Register B in Gamma Correction Block (GAM_B_UPDATE) ..... 37-46
37.2.13 Table Setting Register B1 to B16 in Gamma Correction Block (GAM_B_LUT1 to GAM_B_LUT16) ..... 37-47
37.2.14 Area Setting Register B1 in Gamma Correction Block (GAM_B_AREA1) ..... 37-49
37.2.15 Area Setting Register B2 in Gamma Correction Block (GAM_B_AREA2) ..... 37-50
37.2.16 Area Setting Register B3 in Gamma Correction Block (GAM_B_AREA3) ..... 37-51
37.2.17 Area Setting Register B4 in Gamma Correction Block (GAM_B_AREA4) ..... 37-52
37.2.18 Area Setting Register B5 in Gamma Correction Block (GAM_B_AREA5) ..... 37-53
37.2.19 Area Setting Register B6 in Gamma Correction Block (GAM_B_AREA6) ..... 37-54
37.2.20 Area Setting Register B7 in Gamma Correction Block (GAM_B_AREA7) ..... 37-55
37.2.21 Area Setting Register B8 in Gamma Correction Block (GAM_B_AREA8) ..... 37-56
37.2.22 Register Update Control Register R in Gamma Correction Block (GAM_R_UPDATE) ..... 37-57
37.2.23 Table Setting Register R1 to R16 in Gamma Correction Block (GAM_R_LUT1 to GAM_R_LUT16) ..... 37-58
37.2.24 Area Setting Register R1 in Gamma Correction Block (GAM_R_AREA1) ..... 37-60
37.2.25 Area Setting Register R2 in Gamma Correction Block (GAM_R_AREA2) ..... 37-61
37.2.26 Area Setting Register R3 in Gamma Correction Block (GAM_R_AREA3) ..... 37-62
37.2.27 Area Setting Register R4 in Gamma Correction Block (GAM_R_AREA4) ..... 37-63
37.2.28 Area Setting Register R5 in Gamma Correction Block (GAM_R_AREA5) ..... 37-64
37.2.29 Area Setting Register R6 in Gamma Correction Block (GAM_R_AREA6) ..... 37-65
37.2.30 Area Setting Register R7 in Gamma Correction Block (GAM_R_AREA7) ..... 37-66
37.2.31 Area Setting Register R8 in Gamma Correction Block (GAM_R_AREA8) ..... 37-67
37.2.32 TCON Register Update Control Register (TCON_UPDATE) ..... 37-68
37.2.33 TCON Reference Timing Setting Register (TCON_TIM) ..... 37-68
37.2.34 TCON Vertical Timing Setting Register A1 (TCON_TIM_STVA1) ..... 37-69
37.2.35 TCON Vertical Timing Setting Register A2 (TCON_TIM_STVA2) ..... 37-70
37.2.36 TCON Vertical Timing Setting Register B1 (TCON_TIM_STVB1) ..... 37-71
37.2.37 TCON Vertical Timing Setting Register B2 (TCON_TIM_STVB2) ..... 37-72
37.2.38 TCON Horizontal Timing Setting Register STH1 (TCON_TIM_STH1) ..... 37-73
37.2.39 TCON Horizontal Timing Setting Register STH2 (TCON_TIM_STH2) ..... 37-74
37.2.40 TCON Horizontal Timing Setting Register STB1 (TCON_TIM_STB1) ..... 37-75
37.2.41 TCON Horizontal Timing Setting Register STB2 (TCON_TIM_STB2) ..... 37-76
37.2.42 TCON Horizontal Timing Setting Register CPV1 (TCON_TIM_CPV1) ..... 37-77
37.2.43 TCON Horizontal Timing Setting Register CPV2 (TCON_TIM_CPV2) ..... 37-78
37.2.44 TCON Horizontal Timing Setting Register POLA1 (TCON_TIM_POLA1) ..... 37-79
37.2.45 TCON Horizontal Timing Setting Register POLA2 (TCON_TIM_POLA2) ..... 37-80

37.2.46 TCON Horizontal Timing Setting Register POLB1 (TCON_TIM_POLB1) ..... 37-81
37.2.47 TCON Horizontal Timing Setting Register POLB2 (TCON_TIM_POLB2) ..... 37-82
37.2.48 TCON Data Enable Polarity Setting Register (TCON_TIM_DE) ..... 37-83
37.2.49 Register Update Control Register in Output Controller (OUT_UPDATE) ..... 37-83
37.2.50 Output Interface Register (OUT_SET) ..... 37-84
37.2.51 Brightness (DC) Correction Register 1 (OUT_BRIGHT1) ..... 37-85
37.2.52 Brightness (DC) Correction Register 2 (OUT_BRIGHT2) ..... 37-86
37.2.53 Contrast (Gain) Correction Register (OUT_CONTRAST) ..... 37-86
37.2.54 Panel Dither Register (OUT_PDTHA) ..... 37-87
37.2.55 Output Phase Control Register (OUT_CLK_PHASE) ..... 37-88
37.3 Usage Methods ..... 37-89
37.3.1 Gamma Correction Adjustment Method ..... 37-89
37.3.2 Dither Usage Method ..... 37-89
37.3.3 Output Format Adjustment Method ..... 37-90
38. Video Display Controller 5 (8):System Controller ..... 38-1
38.1 System Controller ..... 38-1
38.1.1 Overview of Functions ..... 38-1
38.1.2 Interrupt Control ..... 38-1
38.1.3 Panel Clock Control ..... 38-5
38.1.4 CLUT Table Read Select Signal Status Flag ..... 38-6
38.2 Register Descriptions ..... 38-7
38.2.1 Interrupt Control Register 1 (SYSCNT_INT1) ..... 38-8
38.2.2 Interrupt Control Register 2 (SYSCNT_INT2) ..... 38-10
38.2.3 Interrupt Control Register 3 (SYSCNT_INT3) ..... 38-12
38.2.4 Interrupt Control Register 4 (SYSCNT_INT4) ..... 38-14
38.2.5 Interrupt Control Register 5 (SYSCNT_INT5) ..... 38-15
38.2.6 Interrupt Control Register 6 (SYSCNT_INT6) ..... 38-16
38.2.7 Panel Clock Control Register (SYSCNT_PANEL_CLK) ..... 38-17
38.2.8 CLUT Table Read Select Signal Status Register (SYSCNT_CLUT) ..... 38-18
39. Dynamic Range Compression ..... 39-1
40. LVDS Output Interface ..... 40-1
40.1 Features ..... 40-1
40.2 Block Diagram ..... 40-1
40.3 Input/Output Pins ..... 40-2
40.4 Register Descriptions ..... 40-3
40.4.1 LVDS Register Update Control Register (LVDS_UPDATE) ..... 40-3
40.4.2 LVDS Format Conversion Register L (LVDSFCL) ..... 40-4
40.4.3 LVDS Clock Select Register (LCLKSELR) ..... 40-5
40.4.4 LVDS PLL Setting Register (LPLLSETR) ..... 40-6
40.4.5 LVDS PHY Characteristics Switching Register (LPHYACC) ..... 40-7

40.5 Operation ..... 40-8
40.5.1 LVDS PLL Settings ..... 40-8
40.5.2 LVDS Output Format ..... 40-10
40.5.3 Procedures for Register Settings ..... 40-12
40.6 Notes ..... 40-13
40.6.1 LVDS Output Pin Settings ..... 40-13
41. Image Renderer (IMR-LS2) ..... 41-1
42. Image Renderer for Display (IMR-LSD) ..... 42-1
43. Display Out Comparison Unit ..... 43-1
43.1 Features ..... 43-1
43.2 Block Diagram ..... 43-2
43.3 Register Descriptions ..... 43-3
43.3.1 Control Register (DOCMCR) ..... 43-4
43.3.2 Status Register (DOCMSTR) ..... 43-4
43.3.3 Status Clear Register (DOCMCLSTR) ..... 43-5
43.3.4 Interrupt Enable Register (DOCMIENR) ..... 43-5
43.3.5 Operation Parameter Setting Register (DOCMPMR) ..... 43-6
43.3.6 Expected CRC Code Register (DOCMECRCR) ..... 43-6
43.3.7 Calculated CRC Code Value Register (DOCMCCRCR) ..... 43-7
43.3.8 Horizontal Start Position Setting Register (DOCMSPXR) ..... 43-7
43.3.9 Vertical Start Position Setting Register (DOCMSPYR) ..... 43-8
43.3.10 Horizontal Size Setting Register (DOCMSZXR) ..... 43-8
43.3.11 Vertical Size Setting Register (DOCMSZYR) ..... 43-9
43.3.12 CRC Code Initialization Register (DOCMCRCIR) ..... 43-9
43.4 Operation ..... 43-10
43.4.1 Overview of Operations ..... 43-10
43.4.2 System Configuration ..... 43-10
43.4.3 CRC Calculation Method ..... 43-11
43.4.4 Graphics Data Selection for CRC Code Generation ..... 43-11
43.4.5 Pixel Format ..... 43-11
43.4.6 Rectangular Area Settings ..... 43-11
43.4.7 CRC Calculation Time Period and Comparison Timing ..... 43-13
43.4.8 Register Update Timing ..... 43-14
43.4.9 Operation Flow ..... 43-15
43.5 Interrupt ..... 43-17
43.6 Usage Note ..... 43-17
43.6.1 Expected CRC Value ..... 43-17
43.6.2 Expansion Control Functionality ..... 43-17
44. Renesas Graphics Processor for OpenVG™ ..... 44-1
44.1 Specification ..... 44-1

45. JPEG Codec Unit ..... 45-1
45.1 Features ..... 45-1
45.2 Register Descriptions ..... 45-3
45.2.1 JPEG Code Mode Register (JCMOD) ..... 45-4
45.2.2 JPEG Code Command Register (JCCMD) ..... 45-5
45.2.3 JPEG Code Quantization Table Number Register (JCQTN) ..... 45-6
45.2.4 JPEG Code Huffman Table Number Register (JCHTN) ..... 45-7
45.2.5 JPEG Code DRI Upper Register (JCDRIU) ..... 45-7
45.2.6 JPEG Code DRI Lower Register (JCDRID) ..... 45-8
45.2.7 JPEG Code Vertical Size Upper Register (JCVSZU) ..... 45-8
45.2.8 JPEG Code Vertical Size Lower Register (JCVSZD) ..... 45-8
45.2.9 JPEG Code Horizontal Size Upper Register (JCHSZU) ..... 45-9
45.2.10 JPEG Coded Horizontal Size Lower Register (JCHSZD) ..... 45-9
45.2.11 JPEG Code Data Count Upper Register (JCDTCU) ..... 45-9
45.2.12 JPEG Code Data Count Middle Register (JCDTCM) ..... 45-10
45.2.13 JPEG Code Data Count Lower Register (JCDTCD) ..... 45-10
45.2.14 JPEG Interrupt Enable Register 0 (JINTE0) ..... 45-11
45.2.15 JPEG Interrupt Status Register 0 (JINTS0) ..... 45-12
45.2.16 JPEG Code Decode Error Register (JCDERR) ..... 45-12
45.2.17 JPEG Code Reset Register (JCRST) ..... 45-13
45.2.18 JPEG Interface Compression Control Register (JIFECNT) ..... 45-14
45.2.19 JPEG Interface Compression Source Address Register (JIFESA) ..... 45-15
45.2.20 JPEG Interface Compression Line Offset Register (JIFESOFST) ..... 45-16
45.2.21 JPEG Interface Compression Destination Address Register (JIFEDA) ..... 45-16
45.2.22 JPEG Interface Compression Source Line Count Register (JIFESLC) ..... 45-17
45.2.23 JPEG Interface Compression Destination Count Register (JIFEDDC) ..... 45-17
45.2.24 JPEG Interface Decompression Control Register (JIFDCNT) ..... 45-18
45.2.25 JPEG Interface Decompression Source Address Register (JIFDSA) ..... 45-20
45.2.26 JPEG Interface Decompression Line Offset Register (JIFDDOFST) ..... 45-20
45.2.27 JPEG Interface Decompression Destination Address Register (JIFDDA) ..... 45-21
45.2.28 JPEG Interface Decompression Source Data Count Register (JIFDSDC) ..... 45-22
45.2.29 JPEG Interface Decompression Destination Line Count Register (JIFDDLC) ..... 45-22
45.2.30 JPEG Interface Decompression α Set Register (JIFDADT) ..... 45-23
45.2.31 JPEG Interrupt Enable Register 1 (JINTE1) ..... 45-24
45.2.32 JPEG Interrupt Status Register 1 (JINTS1) ..... 45-25
45.2.33 JPEG Input Image Data CbCr Range Setting Register (JIFESVSZ) ..... 45-26
45.2.34 JPEG Output Image Data CbCr Range Setting Register (JIFESHSZ) ..... 45-26
45.3 Operation ..... 45-27
45.3.1 Compression ..... 45-27
45.3.2 Decompression ..... 45-33

45.3.3 Output Pixel Format in Decompression ..... 45-39
45.3.4 Storing Image Data ..... 45-43
45.4 Interrupts ..... 45-44
45.4.1 Compression/Decompression Process Interrupt Request (JEDI) ..... 45-44
45.4.2 Data Transfer Interrupt Request (JDTI) ..... 45-44
45.5 Bus Reset Processing ..... 45-46
46. Capture Engine Unit ..... 46-1
46.1 Features of CEU ..... 46-1
46.2 Functional Overview of CEU ..... 46-2
46.3 Pin Configuration of CEU ..... 46-3
46.4 Register Descriptions of CEU ..... 46-4
46.4.1 Capture Start Register (CAPSR) ..... 46-5
46.4.2 Capture Control Register (CAPCR) ..... 46-9
46.4.3 Capture Interface Control Register (CAMCR) ..... 46-12
46.4.4 Capture Interface Cycle Register (CMCYR) ..... 46-16
46.4.5 Capture Interface Offset Register (CAMOR) ..... 46-17
46.4.6 Capture Interface Width Register (CAPWR) ..... 46-19
46.4.7 Capture Interface Input Format Register (CAIFR) ..... 46-21
46.4.8 CEU Register Control Register (CRCNTR) ..... 46-25
46.4.9 CEU Register Forcible Control Register (CRCMPR) ..... 46-26
46.4.10 Capture Filter Control Register (CFLCR) ..... 46-27
46.4.11 Capture Filter Size Clip Register (CFSZR) ..... 46-29
46.4.12 Capture Destination Width Register (CDWDR) ..... 46-31
46.4.13 Capture Data Address Y Register (CDAYR) ..... 46-32
46.4.14 Capture Data Address C Register (CDACR) ..... 46-33
46.4.15 Capture Data Bottom-Field Address Y Register (CDBYR) ..... 46-35
46.4.16 Capture Data Bottom-Field Address C Register (CDBCR) ..... 46-36
46.4.17 Capture Bundle Destination Size Register (CBDSR) ..... 46-37
46.4.18 Capture Low-Pass Filter Control Register (CLFCR) ..... 46-38
46.4.19 Firewall Operation Control Register (CFWCR) ..... 46-39
46.4.20 Capture Data Output Control Register (CDOCR) ..... 46-39
46.4.21 Capture Event Interrupt Enable Register (CEIER) ..... 46-43
46.4.22 Capture Event Flag Clear Register (CETCR) ..... 46-45
46.4.23 Capture Status Register (CSTSR) ..... 46-49
46.4.24 Capture Data Size Register (CDSSR) ..... 46-51
46.4.25 Capture Data Address Y Register 2 (CDAYR2) ..... 46-53
46.4.26 Capture Data Address C Register 2 (CDACR2) ..... 46-55
46.4.27 Capture Data Bottom-Field Address Y Register 2 (CDBYR2) ..... 46-57
46.4.28 Capture Data Bottom-Field Address C Register 2 (CDBCR2) ..... 46-58
46.5 Usage Notes for CEU ..... 46-59

46.5.1 Conditions for Connection to an External Module ..... 46-59
46.5.2 Restrictions on Input/Output Functions ..... 46-60
46.5.3 Cooperation with Video Display Controller 5 ..... 46-60
46.5.4 Software Reset ..... 46-60
47. Pixel Format Converter ..... 47-1
47.1 Features ..... 47-1
47.2 Register Descriptions ..... 47-2
47.2.1 PFV Control Register (PFVCR) ..... 47-3
47.2.2 PFV Interrupt Control Register (PFVICR) ..... 47-4
47.2.3 PFV Interrupt Status Register (PFVISR) ..... 47-5
47.2.4 PFV Input Buffer Register (PFVID) ..... 47-6
47.2.5 PFV Output Buffer Register (PFVOD) ..... 47-6
47.2.6 PFV Input FIFO Status Register (PFVIFSR) ..... 47-7
47.2.7 PFV Output FIFO Status Register (PFVOFSR) ..... 47-7
47.2.8 PFV α Setting Register (PFVACR) ..... 47-8
47.2.9 PFV Matrix Mode Register (PFV_MTX_MODE) ..... 47-8
47.2.10 PFV Matrix YG Adjustment Register 0 (PFV_MTX_YG_ADJ0) ..... 47-9
47.2.11 PFV Matrix YG Adjustment Register 1 (PFV_MTX_YG_ADJ1) ..... 47-9
47.2.12 PFV Matrix CBB Adjustment Register 0 (PFV_MTX_CBB_ADJ0) ..... 47-10
47.2.13 PFV Matrix CBB Adjustment Register 1 (PFV_MTX_CBB_ADJ1) ..... 47-10
47.2.14 PFV Matrix CRR Adjustment Register 0 (PFV_MTX_CRR_ADJ0) ..... 47-11
47.2.15 PFV Matrix CRR Adjustment Register 1 (PFV_MTX_CRR_ADJ1) ..... 47-11
47.2.16 PFV Image Size Setting Register (PFVSZR) ..... 47-12
47.3 Operation ..... 47-13
47.3.1 Overview ..... 47-13
47.3.2 Input/Output Data Format ..... 47-13
47.3.3 Color Matrix ..... 47-14
47.3.4 Bit Reduction ..... 47-16
47.3.5 Operating Procedures ..... 47-17
47.4 Interrupt Requests ..... 47-19
48. SCUX ..... 48-1
48.1 Features ..... 48-1
48.2 Input/Output Pins ..... 48-3
48.3 Register Descriptions ..... 48-4
48.3.1 IPC0_n Initialization Register (IPCIR_IPC0_n) (n = 0, 1, 2, 3) ..... 48-11
48.3.2 IPC0_n Pass Select Register (IPSLR_IPC0_n) (n = 0, 1, 2, 3) ..... 48-11
48.3.3 OPC0_n Initialization Register (OPCIR_OPC0_n) (n = 0, 1, 2, 3) ..... 48-12
48.3.4 OPC0_n Pass Select Register (OPSLR_OPC0_n) (n = 0, 1, 2, 3) ..... 48-12
48.3.5 FFD0_n FIFO Download Initialization Register (FFDIR_FFD0_n) (n = 0, 1, 2, 3) ..... 48-13
48.3.6 FFD0_n FIFO Download Audio Information Register (FDAIR_FFD0_n) (n = 0, 1, 2, 3) ... 48-13

48.3.7 FFD0_n FIFO Download Request Size Register (DRQSR_FFD0_n) (n = 0, 1, 2, 3) ..... 48-14
48.3.8 FFD0_n FIFO Download Pass Register (FFDPR_FFD0_n) (n = 0, 1, 2, 3) ..... 48-15
48.3.9 FFD0_n FIFO Download Boot Register (FFDBR_FFD0_n) (n = 0, 1, 2, 3) ..... 48-15
48.3.10 FFD0_n FIFO Download Event Mask Register (DEVMR_FFD0_n) (n = 0, 1, 2, 3) ..... 48-16
48.3.11 FFD0_n FIFO Download Event Clear Register (DEVCR_FFD0_n) (n = 0, 1, 2, 3) ..... 48-17
48.3.12 FFU0_n FIFO Upload Initialization Register (FFUIR_FFU0_n) (n = 0, 1, 2, 3) ..... 48-18
48.3.13 FFU0_n FIFO Upload Audio Information Register (FUAIR_FFU0_n) (n = 0, 1, 2, 3) ..... 48-18
48.3.14 FFU0_n FIFO Upload Request Size Register (URQSR_FFU0_n) (n = 0, 1, 2, 3) ..... 48-19
48.3.15 FFU0_n FIFO Upload Pass Register (FFUPR_FFU0_n) (n = 0, 1, 2, 3) ..... 48-20
48.3.16 FFU0_n FIFO Upload Event Mask Register (UEVMR_FFU0_n) (n = 0, 1, 2, 3) ..... 48-21
48.3.17 FFU0_n FIFO Upload Event Clear Register (UEVCR_FFU0_n) (n = 0, 1, 2, 3) ..... 48-22
48.3.18 2SRC0_m Initialization Register p (SRCIRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-23
48.3.19 2SRC0_m Audio Information Register p (SADIRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-24
48.3.20 2SRC0_m Bypass Register p (SRCBRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-25
48.3.21 2SRC0_m IFS Control Register p (IFSCRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-25
48.3.22 2SRC0_m IFS Value Setting Register p (IFSVRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-26
48.3.23 2SRC0_m Control Register p (SRCCRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-31
48.3.24 2SRC0_m Minimum FS Setting Register p (MNFSRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-32
48.3.25 2SRC0_m Buffer Size Setting Register p (BFSSRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-32
48.3.26 2SRC0_m SCU2 Status Register p (SC2SRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-33
48.3.27 2SRC0_m Wait Time Setting Register p (WATSRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-33
48.3.28 2SRC0_m Event Mask Register p (SEVMRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-34
48.3.29 2SRC0_m Event Clear Register p (SEVCRp_2SRC0_m) (m = 0, 1; p = 0, 1) ..... 48-35
48.3.30 2SRC0_m Initialization Register RIF (SRCIRR_2SRC0_m) (m = 0, 1) ..... 48-36
48.3.31 DVU0_n Initialization Register (DVUIR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-36
48.3.32 DVU0_n Audio Information Register (VADIR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-37
48.3.33 DVU0_n Bypass Register (DVUBR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-38
48.3.34 DVU0_n Control Register (DVUCR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-38
48.3.35 DVU0_n Zero Cross Mute Control Register (ZCMCR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-39
48.3.36 DVU0_n Volume Ramp Control Register (VRCTR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-40
48.3.37 DVU0_n Volume Ramp Period Register (VRPDR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-41
48.3.38 DVU0_n Volume Ramp Decibel Register (VRDBR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-42
48.3.39 DVU0_n Volume Ramp Wait Time Register (VRWTR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-43
48.3.40 DVU0_n Volume Value Setting 0 Register (VOL0R_DVU0_n) (n = 0, 1, 2, 3) ..... 48-43
48.3.41 DVU0_n Volume Value Setting 1 Register (VOL1R_DVU0_n) (n = 0, 1, 2, 3) ..... 48-44
48.3.42 DVU0_n Volume Value Setting 2 Register (VOL2R_DVU0_n) (n = 0, 1, 2, 3) ..... 48-45
48.3.43 DVU0_n Volume Value Setting 3 Register (VOL3R_DVU0_n) (n = 0, 1, 2, 3) ..... 48-46
48.3.44 DVU0_n Volume Value Setting 4 Register (VOL4R_DVU0_n) (n = 0, 1, 2, 3) ..... 48-47
48.3.45 DVU0_n Volume Value Setting 5 Register (VOL5R_DVU0_n) (n = 0, 1, 2, 3) ..... 48-48
48.3.46 DVU0_n Volume Value Setting 6 Register (VOL6R_DVU0_n) (n = 0, 1, 2, 3) ..... 48-49

48.3.47 DVU0_n Volume Value Setting 7 Register (VOL7R_DVU0_n) (n = 0, 1, 2, 3) ..... 48-50
48.3.48 DVU0_n Enable Register (DVUER_DVU0_n) (n = 0, 1, 2, 3) ..... 48-50
48.3.49 DVU0_n Status Register (DVUSR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-51
48.3.50 DVU0_n Event Mask Register (VEVMR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-52
48.3.51 DVU0_n Event Clear Register (VEVCR_DVU0_n) (n = 0, 1, 2, 3) ..... 48-54
48.3.52 MIX0_0 Initialization Register (MIXIR_MIX0_0) ..... 48-55
48.3.53 MIX0_0 Audio Information Register (MADIR_MIX0_0) ..... 48-56
48.3.54 MIX0_0 Bypass Register (MIXBR_MIX0_0) ..... 48-57
48.3.55 MIX0_0 Mode Register (MIXMR_MIX0_0) ..... 48-57
48.3.56 MIX0_0 Volume Period Register (MVPDR_MIX0_0) ..... 48-58
48.3.57 MIX0_0 Decibel A Register (MDBAR_MIX0_0) ..... 48-59
48.3.58 MIX0_0 Decibel B Register (MDBBR_MIX0_0) ..... 48-59
48.3.59 MIX0_0 Decibel C Register (MDBCR_MIX0_0) ..... 48-60
48.3.60 MIX0_0 Decibel D Register (MDBDR_MIX0_0) ..... 48-61
48.3.61 MIX0_0 Decibel Enable Register (MDBER_MIX0_0) ..... 48-61
48.3.62 MIX0_0 Status Register (MIXSR_MIX0_0) ..... 48-62
48.3.63 Software Reset Register (SWRSR_CIM) ..... 48-62
48.3.64 DMA Control Register (DMACR_CIM) ..... 48-63
48.3.65 DMA Transfer Register for FFD0_n (DMATDn_CIM) (n = 0, 1, 2, 3) ..... 48-64
48.3.66 DMA Transfer Register for FFU0_n (DMATUn_CIM) (n = 0, 1, 2, 3) ..... 48-65
48.3.67 SSI Route Select Register (SSIRSEL_CIM) ..... 48-66
48.3.68 FFD0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3) ..... 48-69
48.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3) ..... 48-71
48.3.70 SSI Pin Mode Register (SSIPMD_CIM) ..... 48-73
48.3.71 SSI Control Register (SSICTRL_CIM) ..... 48-76
48.3.72 SRCn Route Select Register (SRCRSELn_CIM) (n = 0, 1, 2, 3) ..... 48-78
48.3.73 MIX Route Select Register (MIXRSEL_CIM) ..... 48-82
48.4 Operation ..... 48-86
48.4.1 Initial Setting Procedure ..... 48-86
48.4.2 Transfer Start Procedure and Stop Procedure ..... 48-86
48.4.3 Data Rearrangement for Each Channel ..... 48-91
48.4.4 Pin Connection Specifications of SSIF ..... 48-94
48.4.5 Data Transfer Route ..... 48-95
48.4.6 Input Timing Signal and Output Timing Signal ..... 48-101
48.4.7 2SRC (SRC) Block ..... 48-104
48.4.8 DVU Block ..... 48-106
48.4.9 MIX Block ..... 48-110
48.5 Usage Note ..... 48-113
48.5.1 Software Reset ..... 48-113

49. Sound Generator ..... 49-1
49.1 Features ..... 49-1
49.2 Input/Output Pins ..... 49-2
49.3 Register Descriptions ..... 49-2
49.3.1 Sound Generator Control Register 1 (SGCR1) ..... 49-3
49.3.2 Sound Generator Control Status Register (SGCSR) ..... 49-4
49.3.3 Sound Generator Control Register 2 (SGCR2) ..... 49-4
49.3.4 Sound Generator Loudness Register (SGLR) ..... 49-5
49.3.5 Sound Generator Tone Frequency Register (SGTFR) ..... 49-5
49.3.6 Sound Generator Reference Frequency Register (SGSFR) ..... 49-6
49.4 Operation ..... 49-7
49.4.1 Base Operation ..... 49-7
49.4.2 Tone Frequency Setting ..... 49-10
49.4.3 Auto Attenuator Function ..... 49-11
49.4.4 Output Waveform ..... 49-11
49.5 Interrupt Source ..... 49-12
49.6 Usage Note ..... 49-13
49.6.1 Module Stop Mode Settings ..... 49-13
50. SD Host Interface ..... 50-1
50.1 Overview ..... 50-1
50.1.1 Features ..... 50-1
50.1.2 Block Diagram ..... 50-1
50.1.3 Input/Output Pins ..... 50-2
50.2 Register Descriptions ..... 50-3
50.2.1 Command Type Register (SD_CMD) ..... 50-5
50.2.2 SD Command Argument Registers (SD_ARG) ..... 50-6
50.2.3 Data STOP Register (SD_STOP) ..... 50-7
50.2.4 Block Count Register (SD_SECCNT) ..... 50-8
50.2.5 SD Card Response Registers (SD_RSP) ..... 50-8
50.2.6 SD Card Interrupt Flag Register 1 (SD_INFO1) ..... 50-10
50.2.7 SD Card Interrupt Flag Register 2 (SD_INFO2) ..... 50-12
50.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK) ..... 50-14
50.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK) ..... 50-15
50.2.10 SD Clock Control Register (SD_CLK_CTRL) ..... 50-16
50.2.11 Transfer Data Length Register (SD_SIZE) ..... 50-16
50.2.12 SD Card Access Control Option Register (SD_OPTION) ..... 50-17
50.2.13 SD Error Status Register 1 (SD_ERR_STS1) ..... 50-18
50.2.14 SD Error Status Register 2 (SD_ERR_STS2) ..... 50-19
50.2.15 SD Buffer Read/Write Register (SD_BUF0) ..... 50-19
50.2.16 SDIO Mode Control Register (SDIO_MODE) ..... 50-20

50.2.17 SDIO Interrupt Flag Register (SDIO_INFO1) ..... 50-22
50.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK) ..... 50-23
50.2.19 DMA Mode Enable Register (CC_EXT_MODE) ..... 50-23
50.2.20 Software Reset Register (SOFT_RST) ..... 50-24
50.2.21 Version Register (VERSION) ..... 50-24
50.2.22 Swap Control Register (EXT_SWAP) ..... 50-25
50.3 Operation ..... 50-26
50.3.1 SD I/F ..... 50-26
50.3.2 Card Detect/Write Protect ..... 50-28
50.3.3 Interrupt Request and DMA Transfer Request ..... 50-30
50.3.4 Communications Errors and Timeouts ..... 50-32
50.4 Usage Example ..... 50-34
50.4.1 Command without Data Transfer ..... 50-34
50.4.2 Single Block Read ..... 50-36
50.4.3 Single Block Write ..... 50-38
50.4.4 Multiple Block Read ..... 50-40
50.4.5 Multiple Block Write ..... 50-42
50.4.6 IO_RW_DIRECT Command (CMD52) ..... 50-44
50.4.7 IO_RW_EXTENDED Command (CMD53/Multiple Block Read) ..... 50-45
50.4.8 IO_RW_EXTENDED Command (CMD53/Multiple Block Write) ..... 50-47
50.4.9 DMA Transfer ..... 50-49
50.4.10 Example of SD_CMD Register Setting ..... 50-51
50.5 Usage Note ..... 50-52
51. MMC Host Interface ..... 51-1
51.1 Features ..... 51-1
51.2 Input/Output Pins ..... 51-1
51.3 Register Descriptions ..... 51-2
51.3.1 Command Setting Register (CE_CMD_SET) ..... 51-3
51.3.2 Argument Register (CE_ARG) ..... 51-5
51.3.3 Argument Register for Automatically-Issued CMD12 (CE_ARG_CMD12) ..... 51-5
51.3.4 Command Control Register (CE_CMD_CTRL) ..... 51-6
51.3.5 Transfer Block Setting Register (CE_BLOCK_SET) ..... 51-6
51.3.6 Clock Control Register (CE_CLK_CTRL) ..... 51-7
51.3.7 Buffer Access Configuration Register (CE_BUF_ACC) ..... 51-8
51.3.8 Response Registers 3 to 0 (CE_RESP3 to CE_RESP0) ..... 51-9
51.3.9 Response Register for Automatically-Issued CMD12 (CE_RESP_CMD12) ..... 51-10
51.3.10 Data Register (CE_DATA) ..... 51-10
51.3.11 Interrupt Flag Register (CE_INT) ..... 51-11
51.3.12 Interrupt Enable Register (CE_INT_EN) ..... 51-15
51.3.13 Status Register 1 (CE_HOST _STS1) ..... 51-17

51.3.14 Status Register 2 (CE_HOST _STS2) ..... 51-18
51.3.15 DMA Mode Setting Register (CE_DMA_MODE) ..... 51-19
51.3.16 Card Detection/Port Control Register (CE_DETECT) ..... 51-20
51.3.17 Special Mode Setting Register (CE_ADD_MODE) ..... 51-21
51.3.18 Version Register (CE_VERSION) ..... 51-21
51.4 Interrupt Requests ..... 51-22
51.5 DMA Specifications ..... 51-23
51.5.1 DMA for Buffer Writing ..... 51-23
51.5.2 DMA for Buffer Reading ..... 51-23
51.6 Operation ..... 51-24
51.6.1 Command/Response Formats ..... 51-24
51.6.2 Data Block Format ..... 51-25
51.6.3 Buffer Structure and Buffer Accesses ..... 51-26
51.6.4 Automatic CMD12 Issuance ..... 51-27
51.6.5 High Priority Interrupt (HPI) ..... 51-28
51.6.6 Background Operation ..... 51-28
51.6.7 Operation in the Case of Error/Timeout ..... 51-28
51.7 Examples of Setting ..... 51-29
51.7.1 Legends ..... 51-29
51.7.2 Command Transmission ..... 51-29
51.7.3 Command Transmission → Response Reception ..... 51-30
51.7.4 Command Transmission → Response Reception (with Response Busy) ..... 51-31
51.7.5 Single-Block Read ..... 51-33
51.7.6 Multi-Block Read ..... 51-34
51.7.7 Multi-Block Read (with Automatic CMD12 Issuance) ..... 51-35
51.7.8 Single-Block Write ..... 51-36
51.7.9 Multi-Block Write ..... 51-37
51.7.10 Multi-Block Write (with Automatic CMD12 Issuance) ..... 51-38
51.7.11 Forcible Termination ..... 51-39
51.7.12 Setting Values of CE_CMD_SET ..... 51-40
51.8 Usage Note ..... 51-42
51.8.1 Card Detection ..... 51-42
51.8.2 Multi-Block Transfer ..... 51-42
51.8.3 Software Reset ..... 51-42
52. Motor Control PWM Timer ..... 52-1
52.1 Features ..... 52-1
52.2 Input/Output Pins ..... 52-3
52.3 Register Descriptions ..... 52-4
52.3.1 PWM Control Register_n (PWCR_n) (n = 1, 2) ..... 52-5
52.3.2 PWM Polarity Register_n (PWPR_n) (n = 1, 2) ..... 52-6

52.3.3 PWM Counter_n (PWCNT_n) (n = 1, 2) ..... 52-6
52.3.4 PWM Cycle Register_n (PWCYR_n) (n = 1, 2) ..... 52-6
52.3.5 PWM Duty Registers_nA, nC, nE, nG (PWDTR_nA, PWDTR_nC, PWDTR_nE, PWDTR_nG) (n = 1, 2) ..... 52-7
52.3.6 PWM Buffer Registers_nA, nC, nE, nG (PWBFR_nA, PWBFR_nC, PWBFR_nE, PWBFR_nG) (n = 1, 2) ..... 52-9
52.3.7 PWM Buffer Transfer Control Register (PWBTCR) ..... 52-10
52.4 Bus Master Interface ..... 52-11
52.4.1 16-Bit Data Registers ..... 52-11
52.4.2 8-Bit Data Registers ..... 52-11
52.5 Operation ..... 52-12
52.5.1 PWM Operation ..... 52-12
52.5.2 Buffer Transfer Control ..... 52-13
52.6 Usage Note ..... 52-14
52.6.1 Conflict between Buffer Register Write and Compare Match ..... 52-14
53. On-Chip RAM ..... 53-1
53.1 Features ..... 53-1
53.2 Usage Notes ..... 53-3
53.2.1 Page Conflict ..... 53-3
53.2.2 Data Retention ..... 53-3
54. Ports ..... 54-1
54.1 Features ..... 54-1
54.1.1 Port group ..... 54-1
54.1.2 Port group index n ..... 54-1
54.1.3 Base address ..... 54-1
54.2 Functional Overview ..... 54-2
54.2.1 Mode of Pin Functions ..... 54-2
54.2.2 Pin Data Input/Output ..... 54-3
54.3 Register Description ..... 54-4
54.3.1 Port Register (Pn) ..... 54-4
54.3.2 Port Set and Reset Register (PSRn) ..... 54-5
54.3.3 Port Pin Read Register (PPRn/JPPR0) ..... 54-5
54.3.4 Port Mode Register (PMn) ..... 54-6
54.3.5 Port Mode Control Register (PMCn/JPMC0) ..... 54-6
54.3.6 Port Function Control Register (PFCn) ..... 54-7
54.3.7 Port Function Control Expansion Register (PFCEn) ..... 54-8
54.3.8 Port NOT Register (PNOTn) ..... 54-8
54.3.9 Port Mode Set and Reset Register (PMSRn) ..... 54-9
54.3.10 Port Mode Control Set and Reset Register (PMCSRn/JPMCSR0) ..... 54-10
54.3.11 Port Function Control Additional Expansion Register (PFCAEn) ..... 54-10
54.3.12 Port Input Buffer Control Register (PIBCn/JPIBC0) ..... 54-11

54.3.13 Port Bidirection Control Register (PBDCn) ..... 54-11
54.3.14 Port IP Control Register (PIPCn) ..... 54-12
54.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR) ..... 54-13
54.4 Port Function ..... 54-14
54.5 JTAG Port 0 (JP0) ..... 54-14
54.6 Port 0 (P0) ..... 54-15
54.7 Port 1 (P1) ..... 54-16
54.8 Port 2 (P2) ..... 54-18

# 1. Overview

## 1.1 Features of This LSI

This LSI is a single-chip microcontroller that includes an Arm Cortex®-A9 processor along with the integrated peripheral functions required to configure a system.

This LSI includes a 32-Kbyte L1 instruction cache, a 32-Kbyte L1 data cache, and a 128-Kbyte L2 cache. This LSI also includes on-chip peripheral functions necessary for system configuration, such as a 10-Mbyte (RZ/A1H) or 5-Mbyte (RZ/A1M) large-capacity RAM (128 Kbytes are shared by the data-retention RAM), data-retention RAM, multi-function timer pulse unit 2, OS timer, realtime clock, serial communication interface with FIFO, serial communication interface, $I^2C$ bus interface, serial sound interface, media local bus, SCUX, CAN interface, IEBus™*1 controller, Renesas SPDIF interface, Renesas serial peripheral interface, SPI multi I/O bus controller, CD-ROM decoder, A/D converter, LIN interface, Ethernet controller, EthernetAVB, NAND flash memory controller, USB 2.0 host/function, digital video decoder, video display controller 5, dynamic range compression, image renderer, image renderer for display, display out comparison unit, Renesas graphics processor for OpenVG™*2, JPEG codec unit, capture engine unit, pixel format converter, sound generator, SD host interface, MMC host interface, motor control PWM timer, interrupt controller modules, and general I/O ports.

The features of this LSI are listed in Table 1.1.

Note 1. IEBus (Inter Equipment Bus) is a trademark of Renesas Electronics Corporation.
Note 2. OpenVG is a trademark of Khronos Group Inc.

**Table 1.1 Features of RZ/A1H and RZ/A1M**

| Items | Specification |
|---|---|
| CPU | • Arm Cortex-A9 processor<br>• Maximum operating frequency: 400 MHz<br>• Instruction cache size: 32 Kbytes<br>• Data cache size: 32 Kbytes (write-back algorithm)<br>• TLB entries: 128 entries<br>• Jazelle® architecture extension: Full implementation<br>• Media processing engine with NEON™ technology |
| L2 cache memory | • Arm CoreLink™ Level 2 Cache Controller L2C-310<br>• Operating frequency: 133 MHz<br>• Cache size: 128 Kbytes |
| Interrupt controller | • Arm PrimeCell® Generic Interrupt Controller (PL390)<br>• External interrupt pins (NMI, IRQ7 to IRQ0, and TINT170 to TINT0)<br>• On-chip peripheral interrupts: Priority level set for each module<br>• 32 priority levels available |
| Bus state controller | • Address space divided into six areas (0 to 5), each a maximum of 64 Mbytes<br>• The following features settable for each area independently<br>—Bus size (8, 16, or 32 bits): Available sizes depend on the area.<br>—Number of access wait cycles (different wait cycles can be specified for read and write access cycles in some areas)<br>—Idle wait cycle insertion (between the same area access cycles or different area access cycles)<br>—Specifying the memory to be connected to each area enables direct connection to SRAM, SRAM with byte selection, SDRAM, and burst ROM (clocked synchronous or asynchronous). The address/data multiplexed I/O (MPX) interface is also available.<br>• Outputs a chip select signal ($\overline{CS0}$ to $\overline{CS5}$) according to the target area ($\overline{CS}$ assert or negate timing can be selected by software)<br>• SDRAM refresh<br>• Auto refresh or self refresh mode selectable<br>• SDRAM burst access |
| Direct memory access controller | • Sixteen channels; external requests are available for one of them.<br>• Can be activated by on-chip peripheral modules.<br>• A specific DMA transfer interval can be specified to adjust the bus occupancy.<br>• Link mode (DMA transfer under descriptor control) supported<br>• Transfer information can be automatically reloaded. |
| Clock pulse generator | • Clock mode: Input clock can be selected from external input (EXTAL or USB_X1) or crystal resonator.<br>• Input clock can be multiplied by 32 (max.) by the internal PLL circuit.<br>• Peak values of EMI noise can be reduced by the on-chip SSCG circuit.<br>• Five types of clocks generated:<br>—CPU clock (Iφ): Maximum 400.00 MHz<br>—Image processing clock (Gφ): Maximum 266.67 MHz<br>—Internal bus clock (Bφ): Maximum 133.33 MHz<br>—Peripheral clock 1 (P1φ): Maximum 66.67 MHz<br>—Peripheral clock 0 (P0φ): Maximum 33.33 MHz |
| Watchdog timer | • On-chip one-channel watchdog timer<br>• A counter overflow can reset the LSI. |
| Power-down modes | • Four power-down modes provided to reduce the power consumption in this LSI<br>—Sleep mode<br>—Software standby mode<br>—Deep standby mode<br>—Module standby mode |

| Items | Specification |
|---|---|
| Multi-function timer pulse unit 2 | • Maximum 16 lines of pulse inputs/outputs based on five channels of 16-bit timers<br>• 18 output compare and input capture registers<br>• Input capture function<br>• Pulse output modes<br>• Toggle, PWM, complementary PWM, and reset-synchronized PWM modes<br>• Synchronization of multiple counters<br>• Complementary PWM output mode<br>—Non-overlapping waveforms output for 3-phase inverter control<br>—Automatic dead time setting<br>—0% to 100% PWM duty value specifiable<br>—A/D converter start request delaying function<br>—Interrupt skipping at crest or trough<br>• Reset-synchronized PWM mode<br>Three-phase PWM waveforms in positive and negative phases can be output with a required duty value.<br>• Phase counting mode<br>Two-phase encoder pulse counting available |
| OS timer | • Two-channel 32-bit counters<br>• Two operating modes:<br>—Interval timer mode<br>—Free-running comparison mode<br>• DMA transfer request or interrupt request can be issued when a compare match occurs. |
| Realtime clock | • Internal clock, calendar function, alarm function<br>• Interrupts can be generated at intervals of 1/64 s by the 32.768-kHz or 4-MHz on-chip crystal oscillator. |
| Serial communication interface with FIFO | • Eight channels<br>• Clock synchronous mode or asynchronous mode selectable<br>• Simultaneous transmission and reception (full-duplex communication) supported<br>• Dedicated baud rate generator<br>• Separate 16-byte FIFO registers for transmission and reception<br>• Modem control function (channels 1, 5, and 7 in asynchronous mode) |
| Serial communication interface | • Two channels<br>• Clock synchronous mode, asynchronous mode, or smart card interface mode is selectable.<br>• Simultaneous transmission and reception (full-duplex communication) supported<br>• Dedicated baud rate generator<br>• LSB first/MSB first selectable<br>• Modem control function<br>• Encoding and decoding of IrDA communications waveforms in accord with version 1.0 of the IrDA standard (on channel 0) |
| Renesas serial peripheral interface | • Five channels<br>• SPI operation<br>• Master mode and slave mode selectable<br>• Programmable bit length, clock polarity, and clock phase can be selected.<br>• Consecutive transfers<br>• MSB first/LSB first selectable<br>• Maximum transfer rate: 33.33 Mbps |
| SPI multi I/O bus controller | • Two channels<br>• Up to two serial flash memories with multiple I/O bus sizes (single/dual/quad) can be connected.<br>• External address space read mode (built-in read cache)<br>• SPI operating mode<br>• Clock polarity and clock phase can be selected.<br>• MSB first/LSB first selectable<br>• Maximum transfer rate: 533.33 Mbps (SDR transfer, with two serial flash memories connected) |
| $I^2C$ bus interface | • Four channels<br>• Master mode and slave mode supported<br>• Support for 7-bit and 10-bit slave address formats<br>• Support for multi-master operation<br>• Timeout detection |

| Items | Specification |
|---|---|
| Serial sound interface | • Six-channel bidirectional serial transfer<br>• Duplex communication (channels 0, 1, 3, and 5)<br>• Support of various serial audio formats<br>• Support of master and slave functions<br>• Generation of programmable word clock and bit clock<br>• Multi-channel formats<br>• Support of 8, 16, 18, 20, 22, 24, and 32-bit data formats<br>• Support of eight-stage FIFO for transmission and reception<br>• Support of TDM mode<br>• Support of WS continue mode in which the SSIWS signal is not stopped.<br>• Support of direct transfer to the SCUX module<br>• A change of the sampling frequency can be detected. |
| Media local bus | • Conforms with version 2.0 of the MediaLB standard. Data transfer at up to 50 Mbps is possible. |
| SCUX | • Sampling rate conversion<br>—Asynchronous or synchronous sampling rate conversion is possible.<br>—Sampling rate (synchronous mode)<br>Note: The selectable sampling rates depend on the number of used channels and rate ratio.<br>Input [kHz]: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 64, 88.2, or 96 is selectable.<br>Output [kHz]: 8, 16, 24, 44.1, 48, or 96 is selectable.<br>—Sampling rate (asynchronous mode)<br>Note: The selectable sampling rates depend on the number of used channels and rate ratio.<br>Input/output [kHz]: 1 to 96<br>—Data format: 16 or 24 bits<br>• Digital volume and mute functions<br>—The digital volume can be set within the range from a multiple of 0 to 8 (−120 to 18 dB)<br>—Volume ramping supports soft mute, fade-in, and fade-out.<br>—The zero crossing mute function can apply muting at zero-crossing points.<br>• Mixer<br>—Data of two to four source systems can be mixed (added together) into one system.<br>—The ratio to add the sources can be set.<br>—Direct transfer to the serial sound interface module is supported. |
| CAN interface | • Five channels<br>• ISO11898-1 compliant<br>• Message buffer:<br>—Up to 64 5-channel receive message buffers: shared among all channels.<br>—16 transmit message buffers per channel |
| IEBus™ controller | • Conforms with the IEBus protocol (communication modes 1 and 2).<br>• Transfer rates: approximately 18 kbps (in communication mode 1),<br>approximately 27 kbps (in communication mode 2)<br>• Maximum numbers of bytes for transfer: 32 bytes/frame (in communication mode 1),<br>128 bytes/frame (in communication mode 2)<br>• Operating clock: 8 MHz<br>Note: Input of peripheral clock 0 (P0φ) running at 32 MHz is required. |
| Renesas SPDIF interface | • Support of IEC60958 standard (stereo and consumer use modes only)<br>• Sampling frequencies of 32 kHz, 44.1 kHz, and 48 kHz<br>• Audio word sizes of 16 to 24 bits per sample<br>• Biphase mark encoding<br>• Double buffered data<br>• Parity encoded serial data<br>• Simultaneous transmit and receive<br>• Receiver autodetects IEC 61937 compressed mode data. |
| CD-ROM decoder | • Support of five formats: Mode 0, mode 1, mode 2, mode 2 form 1, and mode 2 form 2<br>• Sync codes detection and protection<br>• (Protection: When a sync code is not detected, it is automatically inserted.)<br>• Descrambling<br>• ECC correction<br>—P, Q, PQ, and QP correction<br>—PQ or QP correction can be repeated up to three times.<br>• EDC check<br>Performed before and after ECC<br>• Mode and form are automatically detected.<br>• Link sectors are automatically detected.<br>• Buffering data control<br>Buffering CD-ROM data including Sync code is transferred in specified format, after the data is descrambled, corrected by ECC, and checked by EDC. |

| Items | Specification |
|---|---|
| LIN interface | • Two channels<br>• Conforms with revisions 1.3, 2.0, 2.1, and 2.2 of the LIN protocol and SAEJ 2062.<br>• Master mode supported |
| Ethernet controller | • Conforms with the Ethernet or the IEEE802.3 MAC (Media Access Control) layer standard<br>• MAC function<br>Constructs/deconstructs data frames (frame format conforming to IEEE802.3, 2000 Edition)<br>Supports transfer at 10 and 100 Mbps<br>Supports full-duplex mode<br>Flow control conforming to IEEE802.3x<br>Supports an MII (Media Independent Interface) for connection to a PHY interface in conformance with IEEE 802.3<br>Upward protocol support (checksum) function<br>• E-DMAC (Direct Memory Access Controller for Ethernet controller) function |
| EthernetAVB | • Conforms with the Ethernet or the IEEE802.3 MAC (Media Access Control) layer standard<br>• MAC function<br>Constructs/deconstructs data frames (frame format conforming to IEEE802.3, 2000 Edition)<br>Supports transfer at 100 Mbps<br>Supports full-duplex mode<br>Flow control conforming to IEEE802.3x<br>Supports an MII (Media Independent Interface) for connection to a PHY interface in conformance with IEEE 802.3<br>Upward protocol support (checksum) function<br>• AVB-DMAC (DMAC dedicated to EthernetAVB) function<br>AVB-DMAC conforms with the following 3 standards; IEEE802.1AS (Clock Synchronization Protocol), IEEE802.1Qav (Realtime Transfer Protocol) and IEEE802.1Qat (Bandwidth Reservation Protocol) |
| NAND flash memory controller | • Direct-connected memory interface with NAND-type flash memory<br>• Command access mode<br>• Interrupt request and DMA transfer request<br>• Supports flash memory requiring 5-byte addresses (2 Gbits and more) |
| USB 2.0 host/function module | • Two channels<br>• Conforms to the Universal Serial Bus Specification Revision 2.0<br>• 480-Mbps, 12-Mbps, and 1.5-Mbps transfer rates provided (host mode)<br>• 480-Mbps and 12-Mbps transfer rates provided (function mode)<br>• On-chip 8-Kbyte RAM as communication buffers |
| Digital video decoder | • Two channels<br>• Video input<br>Composite video input (CVBS)<br>• A/D converter for video signal input<br>VIN1 and VIN2 pin input selection<br>Low-pass filter (LPF)<br>Sync tip clamp<br>Programmable gain amplifier (PGA) (0 to 6.021 dB)<br>10-bit precision pipelined A/D converter<br>• Sync separation<br>Noise reduction LPF, auto level control sync slicer, horizontal auto frequency control (AFC), vertical count-down, interlace detection, auto gain control (AGC)/peak limiter control<br>• Y/C separation<br>NTSC 2D, PAL 2D, and SECAM 1D supported.<br>• Chroma-key decoding<br>NTSC, PAL, and SECAM supported.<br>Color killer, auto color control (ACC), TINT correction, R-Y axis correction<br>• Digital clamp<br>Pedestal clamp (Y), center clamp (Cb/Cr), noise detection<br>• Adjustment of output gain<br>Contrast: 0 to approximately 2 times<br>Color (Cb/Cr independently): 0 to approximately 2 times |

| Items | Specification |
|---|---|
| Video display controller 5 | • Two channels<br>• Video input interface: One channel can be selected from the followings.<br>BT601, BT656 format (NTSC/PAL) input: Input clock: 27 MHz/54 MHz<br>Digital pin input (channel 0):<br>YCbCr422, YCbCr444, RGB888, RGB666, RGB565<br>Digital pin input size:<br>Maximum input video image size to be set*: 1440 pixels × 1024 lines (horizontal × vertical)<br>Note:*Depends on the AC characteristics of the connected device.<br>Examples of input video image size :<br>WXGA (1280 × 768)<br>XGA (1024 × 768)<br>SVGA (800 × 600),<br>WVGA (800 × 480),<br>VGA (640 × 480),<br>WQVGA (480 × 240),<br>QVGA (320 × 240, 240 × 320)<br>Composite video (CVBS) signal input decoded by the digital video decoder<br>• Input video control<br>Horizontal noise reduction (NR), brightness adjustment and contrast adjustment using matrix operation<br>• Scaling control<br>Vertical and horizontal scaling up or down of input video possible at a desired ratio (scaling up of graphics also possible)<br>Scaling up ratio: 1 to 8; scaling down ratio: 1/8 to 1<br>Interpolation: Hold or linear selectable<br>2D IP conversion: 2D IP conversion through separately setting the initial phases for the top and bottom fields<br>• Video recording<br>Output pixel format: YCbCr444, YCbCr422, RGB888, RGB565<br>Output field rate: 1/1, 1/2, 1/4, 1/8<br>Rotation: Horizontal mirroring and 90/180/270 degree rotation for YCbCr422 and RGB565<br>Maximum video image size to be stored: ×1 size of input video image<br>• Output video control<br>Black stretch: Black area stretched according to Y signal state<br>Enhancer capability: LTI (transient improvement) and sharpness (contour emphasis) for Y signal |

| Items | Specification |
|---|---|
| Video display controller 5 | • Four graphics layers (two of them also for input video)<br>Available input pixel formats<br>1 bit/pixel: CLUT1<br>4 bits/pixel: CLUT4<br>8 bits/pixel: CLUT8<br>16 bits/pixel: YCbCr422 (graphics layers 0 and 1), RGB565, ARGB1555, RGBA5551, ARGB4444<br>32 bits/pixel: ARGB8888, RGBA8888, RGB888, YCbCr444 (graphics layers 0 and 1)<br>• Blending of two input video images<br>Two input video images superimposed by alpha blending over a rectangular area can be output.<br>• Superimposition<br>Alpha blending in a rectangular area:<br>Input video, layer 1, and layer 2 blended according to the transparency percentage α (fade-in and fade-out function available)<br>Chroma key function:<br>Mixing based on transparency percentage α using the specified RGB and CLUT value<br>Pixel-base alpha blending:<br>Alpha blending for each pixel based on transparency percentage α<br>Generation of output video images<br>Video images superimposed on graphics layers can be output to memory.<br>• Panel output control<br>Panel output correction:<br>Brightness adjustment and contrast adjustment, gamma correction, panel dithering<br>TCON:<br>Various timing output for LCD panel driving provided by a total of seven vertical and horizontal panel driver signals<br>Panel output pixel format: RGB888, RGB666, RGB565, serial RGB<br>Output video image size:<br>Maximum output video image size to be set*:<br>1999 pixels × 2035 lines (horizontal × vertical)<br>Note:*Depends on the AC characteristics of the display panel.<br>Examples of output video image size:<br>WXGA (1280 × 768)<br>XGA (1024 × 768)<br>SVGA (800 × 600),<br>WVGA (800 × 480),<br>VGA (640 × 480),<br>WQVGA (480 × 240),<br>QVGA (320 × 240, 240 × 320) |
| Dynamic range compression | • Two channels<br>• Contrast adjustment of captured data<br>Contrast expansion processing optimized per region of the image |
| Image renderer (IMR-LS2) | • Two channels<br>• Refers to the video captured data as two-dimensional texture data and draws a shape by performing texture mapping for an arbitrary shape divided into triangular objects.<br>• Display list system<br>• Drawing functions<br>Texture mapping, bilinear filtering, automatic coordinate generation (and relative coordinate input)<br>• Instruction system<br>Draw instruction: TRI for drawing a triangle<br>Control instructions: TRAP, INT, NOP, SYNCM, SYNCW, WTL, and WTS<br>• Drawing space<br>Destination coordinates: 0 ≤ X ≤ 2,047, 0 ≤ Y ≤ 2,047<br>Source coordinates: 0 ≤ u ≤ 1,439, 0 ≤ v ≤ 1,023 |
| Image renderer for display (IMR-LSD) | • Refers to the output video image data from the video display controller 5 (channel 0) as two-dimensional texture data and draws shapes by performing texture mapping for an arbitrary shape divided into triangular objects.<br>• Display list system<br>• Drawing functions<br>Texture mapping, bilinear filtering, automatic coordinate generation (and relative coordinate input)<br>• Instruction system<br>Draw instruction: TRI for drawing a triangle<br>Control instructions: TRAP, INT, NOP, SYNCM, SYNCW, WTL, and WTS<br>• Drawing space<br>Destination coordinates: 0 ≤ X ≤ 2,047, 0 ≤ Y ≤ 2,047<br>Source coordinates: 0 ≤ u ≤ 1,439, 0 ≤ v ≤ 1,023 |

| Items | Specification |
|---|---|
| Display out comparison unit | • Two channels<br>• Calculates the CRC code of an arbitrary graphics plane and compares it with the pre-calculated CRC code.<br>• Specifies a rectangular area in an arbitrary graphics plane selected from among four graphics planes, one plane of the graphics data obtained after α blending, or one plane of the data read from the output video image generator of the video display controller 5.<br>• Pixel format<br>32 bits/pixel: ARGB8888/RGB888/RGB666<br>16 bits/pixel: RGB565 |
| Renesas graphics processor for OpenVG™ | • OpenVG™, which is an open 2D vector graphics API, can be processed.<br>• Processes can be accelerated in OpenVG™ stage 2 to stage 8 using the dedicated hardware and programmable shader. |
| JPEG codec unit | • Compression and decompression method conforming to the JPEG baseline standard within the range described in this document.<br>• Operational precision: Conforming to JPEG Part 2, ISO-IEC10918-2<br>• Pixel format:<br>Compression: YCbCr422<br>Decompression: YCbCr444, YCbCr422, YCbCr411, YCbCr420<br>Output pixel format to the buffer: YCbCr422, ARGB8888, RGB565<br>• Four quantization tables provided<br>• Four Huffman tables provided (two tables for AC coefficients and two tables for DC coefficients)<br>• Markers supported: SOI, SOF0, SOS, DQT, DHT, DRI, RSTm, and EOI<br>• Image data rate: Max. 133.33 Mbytes/s (at 66.67-MHz operation) |
| Capture engine unit | • Examples of input video image size :<br>5 megapixels (2,560 × 1,920)<br>3 megapixels (2,048 × 1,536)<br>2 megapixels (1,632 × 1,224)<br>UXGA (1,600 × 1,200)<br>SXGA (1) (1,280 × 1,024)<br>SXGA (2) (1,280 × 960)<br>WXGA (1,280 × 768)<br>XGA (1,024 × 768)<br>SVGA (800 × 600)<br>WVGA (800 × 480)<br>VGA (640 × 480)<br>WQVGA (480 × 240)<br>QVGA (320 × 240, 240 × 320)<br>Note: Depends on the AC characteristics of the connected device, frame rate of the connected device, and transfer speed to the destination RAM.<br>• Input format: 8- or 16-bit YCbCr422 binary data<br>• Memory output format: YCbCr422, YCbCr420<br>Note: The captured data cannot be displayed via the video display controller 5 because the Y data and CbCr data are split when written to memory. |
| Pixel format converter | • Two channels<br>• Brightness adjustment, gain adjustment, and YCbCr and RGB mutual conversion.<br>• Input pixel data: RGB888, RGB565, YCbCr422<br>• Output pixel data: ARGB8888, RGB565, YCbCr422 |
| Sound generator | • Four channels<br>• Capable of adjusting sound volume using 8-bit PWM output<br>• Four types of operating clocks (P0φ/2, P0φ/4, P0φ/8, and P0φ/16) can be selected.<br>• Frequency settings in the 25-Hz to 20-kHz range with precision of 1% or less<br>• Automatic attenuator function can be selected. |
| SD host interface | • Two channels<br>• SD memory I/O card interface (1-/4-bit SD bus)<br>• Error check function: CRC7 (command), CRC16 (data)<br>• Interrupt requests<br>—Card access interrupt<br>—SDIO access interrupt<br>—Card detect interrupt<br>• DMA transfer requests<br>—SD_BUF write<br>—SD_BUF read<br>• Card detection function, write protect supported |

| Items | Specification |
|---|---|
| MMC host interface | • Interface to multi-media card (MMC)<br>• Data bus: 1-/4-/8-bit MMC mode<br>• Interrupt requests: card detection, error/time-out, and normal operation<br>• DMA transfer requests: CE_DATA write and CE_DATA read<br>• Card detection function |
| General I/O ports | • 256-pin: 115 I/Os, 8 inputs with open-drain outputs, and 16 inputs (input only)<br>• 324-pin: 147 I/Os, 8 inputs with open-drain outputs, and 16 inputs (input only)<br>• Input or output can be selected for each bit. |
| A/D converter | • 12-bit resolution<br>• Eight input channels<br>• Minimum conversion time: 5.0 µs<br>• A/D conversion request by the external trigger or timer trigger |
| Motor control PWM timer | • Two 10-bit PWM channels, each with eight outputs |
| Debugging interface | • Arm CoreSight™ architecture<br>• JTAG-standard pin assignment |
| On-chip RAM | • 10-Mbyte (RZ/A1H) or 5-Mbyte (RZ/A1M) large capacity memory for video display/recording and work (128 Kbytes are used for data retention)<br>• 128-Kbyte memory for data retention<br>(16 Kbytes × 2, 32 Kbytes × 1, 64 Kbytes × 1) |
| Boot modes | • Five boot modes<br>Boot mode 0: Booting from memory (bus width: 16 bits) connected to the CS0 space<br>Boot mode 1: Booting from memory (bus width: 32 bits) connected to the CS0 space<br>Boot mode 2: —<br>Boot mode 3: Booting from a serial flash memory<br>Boot mode 4: Booting from a NAND flash memory with SD controller<br>Boot mode 5: Booting from a NAND flash memory with MMC controller |
| Power supply voltage | • Vcc: 1.10 to 1.26 V<br>• PVcc: 3.0 to 3.6 V |
| Package | • PLBG0256KA-B<br>256-pin BGA, 11-mm square, 0.5-mm pitch<br>JEITA package code: P-LFBGA256-11×11-0.50<br>RENESAS code: PLBG0256KA-B<br>• PLQP0256LB-A<br>256-pin QFP, 28-mm square, 0.4-mm pitch<br>JEITA package code: P-LFQFP256-28×28-0.40<br>RENESAS code: PLQP0256LB-A<br>• PRBG0324GA-A<br>324-pin BGA, 19-mm square, 0.8-mm pitch<br>JEITA package code: P-FBGA324-19×19-0.80<br>RENESAS code: PRBG0324GA-A |

## 1.2 Product Lineup

**Table 1.2 Product Lineup**

| Group | Part Number | Temperature Range | Quality Level | Package |
|---|---|---|---|---|
| RZ/A1H | R7S721000VCBG | -40 to +85°C | Industry usage etc. | PLBG0256KA-B |
| | R7S721000VCFP | | Industry usage etc. | PLQP0256LB-A |
| | R7S721000VLFP | | Car Accessories | |
| | R7S721001VCBG | | Industry usage etc. | PRBG0324GA-A |
| | R7S721001VLBG | | Car Accessories | |
| RZ/A1M | R7S721010VCBG | -40 to +85°C | Industry usage etc. | PLBG0256KA-B |
| | R7S721010VCFP | | Industry usage etc. | PLQP0256LB-A |
| | R7S721010VLFP | | Car Accessories | |
| | R7S721011VCBG | | Industry usage etc. | PRBG0324GA-A |
| | R7S721011VLBG | | Car Accessories | |

**Figure 1.3 Pin Assignment of the 324-Pin BGA (Top Perspective View)**

## 1.5 Pin Functions

**Table 1.3 Pin Functions**

| Classification | Symbol | I/O | Name | Function |
|---|---|---|---|---|
| Power supply | Vcc | I | Power supply | Power supply pins. All the Vcc pins must be connected to the system power supply. This LSI does not operate correctly if there is a pin left open. |
| | Vss | I | Ground | Ground pins. All the Vss pins must be connected to the system power supply (0 V). This LSI does not operate correctly if there is a pin left open. |
| | PVcc | I | Power supply for I/O circuits | Power supply for I/O pins. All the PVcc pins must be connected to the system power supply. This LSI does not operate correctly if there is a pin left open. |
| | PLLVcc | I | Power supply for PLL | Power supply for the on-chip PLL oscillator. |
| Clock | EXTAL | I | External clock | Connected to a crystal resonator. An external clock signal may also be input to the EXTAL pin. |
| | XTAL | O | Crystal | Connected to a crystal resonator. |
| | CKIO | O | System clock output | Supplies the system clock to external devices. |
| | AUDIO_CLK | I | External clock for audio | Input pin of external clock for audio. A clock input to the divider is selected from an oscillation clock input on this pin or pins AUDIO_X1 and AUDIO_X2. |
| | AUDIO_X1 | I | Crystal resonator/ external clock for audio | Pins connected to a crystal resonator for audio. An external clock can be input on pin AUDIO_X1. A clock input to the divider is selected from an oscillation clock input on these pins or the AUDIO_CLK pin. |
| | AUDIO_X2 | O | | |
| | AUDIO_XOUT | O | AUDIO_X1 clock output | Output for the on-chip crystal oscillator on AUDIO_X1 or the external clock signal. |
| | AUDIO_XOUT2 | O | AUDIO_X1 divided-by-two clock output | Output for the on-chip crystal oscillator on AUDIO_X1 or the external clock signal after frequency division of the selected signal by two. |
| | AUDIO_XOUT3 | O | AUDIO_X1 divided-by-three clock output | Output for the on-chip crystal oscillator on AUDIO_X1 or the external clock signal after frequency division of the selected signal by three. |
| Operating mode control | MD_BOOT2, MD_BOOT1, MD_BOOT0 | I | Mode set | Sets the operating mode. Do not change the signal levels on these pins while the $\overline{\text{RES}}$ pin is asserted or until the mode is fixed, after the negation. |
| | MD_CLK | I | Clock mode set | Sets the clock operating mode. Do not change the signal levels on this pin while the $\overline{\text{RES}}$ pin is asserted or until the mode is fixed, after the negation. |
| | MD_CLKS | I | SSCG clock mode set | Switches the SSCG circuit on or off. Do not change the signal levels on this pin while the $\overline{\text{RES}}$ pin is asserted or until the mode is fixed, after the negation. |
| | BSCANP | I | Boundary scan set | Boundary scan setting pin.<br>This pin is set to the high level for a boundary scan and to the low level for normal operation. |

| Classification | Symbol | I/O | Name | Function |
|---|---|---|---|---|
| System control | $\overline{\text{RES}}$ | I | Power-on reset | This LSI enters the power-on reset state when this signal goes low. |
| | $\overline{\text{WDTOVF}}$ | O | Watchdog timer overflow | Outputs an overflow signal from the watchdog timer. |
| Interrupts | NMI | I | Non-maskable interrupt | Non-maskable interrupt request pin. It is handled as an FIQ exception. Fix it high when not in use. |
| | IRQ7 to IRQ0 | I | Interrupt requests 7 to 0 | Maskable interrupt request pins. Level-input or edge-input detection can be selected. When the edge-input detection is selected, the rising edge, falling edge, or both edges can also be selected. |
| | TINT170 to TINT0 | I | Interrupt requests 170 to 0 | Maskable interrupt request pins. Detection through input of the high level or a rising edge can be selected. |
| Address bus | A25 to A0 | O | Address bus | Outputs addresses. |
| Data bus | D31 to D0 | I/O | Data bus | Bidirectional data bus. |
| Bus control | $\overline{\text{CS5}}$ to $\overline{\text{CS0}}$ | O | Chip select 5 to 0 | Chip-select signals for external memory or devices. |
| | $\overline{\text{RD}}$ | O | Read | Indicates that data is read from an external device. |
| | RD/$\overline{\text{WR}}$ | O | Read/write | Read/write signal. |
| | $\overline{\text{BS}}$ | O | Bus start | Bus-cycle start signal. |
| | $\overline{\text{AH}}$ | O | Address hold | Address hold timing signal for the device that uses the address/data-multiplexed bus. |
| | $\overline{\text{WAIT}}$ | I | Wait | Inserts a wait cycle into the bus cycles during access to the external space. |
| | $\overline{\text{WE0}}$ | O | Byte select | Indicates a write access to bits 7 to 0 of data of external memory or device. |
| | $\overline{\text{WE1}}$ | O | Byte select | Indicates a write access to bits 15 to 8 of data of external memory or device. |
| | $\overline{\text{WE2}}$ | O | Byte select | Indicates a write access to bits 23 to 16 of data of external memory or device. |
| | $\overline{\text{WE3}}$ | O | Byte select | Indicates a write access to bits 31 to 24 of data of external memory or device. |
| | DQMLL | O | Byte select | Selects bits D7 to D0 when SDRAM is connected. |
| | DQMLU | O | Byte select | Selects bits D15 to D8 when SDRAM is connected. |
| | DQMUL | O | Byte select | Selects bits D23 to D16 when SDRAM is connected. |
| | DQMUU | O | Byte select | Selects bits D31 to D24 when SDRAM is connected. |
| | $\overline{\text{RAS}}$ | O | RAS | Connected to the $\overline{\text{RAS}}$ pin when SDRAM is connected. |
| | $\overline{\text{CAS}}$ | O | CAS | Connected to the $\overline{\text{CAS}}$ pin when SDRAM is connected. |
| | CKE | O | CK enable | Connected to the CKE pin when SDRAM is connected. |

| Classification | Symbol | I/O | Name | Function |
|---|---|---|---|---|
| Direct memory access controller | DREQ0 | I | DMA-transfer request | Input pin to receive external requests for DMA transfer. |
| | DACK0 | O | DMA-transfer request accept | Output pin for signals indicating acceptance of external requests from external devices. |
| | TEND0 | O | DMA-transfer end output | Output pin for DMA transfer end. |
| Multi-function timer pulse unit 2 | TCLKA, TCLKB, TCLKC, TCLKD | I | Timer clock input | External clock input pins for the timer. |
| | TIOC0A, TIOC0B, TIOC0C, TIOC0D | I/O | Input capture/ output compare (channel 0) | The TGRA_0 to TGRD_0 input capture input/output compare output/PWM output pins. |
| | TIOC1A, TIOC1B | I/O | Input capture/ output compare (channel 1) | The TGRA_1 and TGRB_1 input capture input/output compare output/PWM output pins. |
| | TIOC2A, TIOC2B | I/O | Input capture/ output compare (channel 2) | The TGRA_2 and TGRB_2 input capture input/output compare output/PWM output pins. |
| | TIOC3A, TIOC3B, TIOC3C, TIOC3D | I/O | Input capture/ output compare (channel 3) | The TGRA_3 to TGRD_3 input capture input/output compare output/PWM output pins. |
| | TIOC4A, TIOC4B, TIOC4C, TIOC4D | I/O | Input capture/ output compare (channel 4) | The TGRA_4 to TGRD_4 input capture input/output compare output/PWM output pins. |
| Realtime clock | RTC_X1 | I | Crystal resonator for realtime clock/ external clock | Connected to 32.768-kHz crystal resonator. The RTC_X1 pin can also be used to input an external clock. |
| | RTC_X2 | O | | |
| | RTC_X3 | I | Crystal resonator for realtime clock/ external clock | Connected to 4-MHz crystal resonator. The RTC_X3 pin can also be used to input an external clock. |
| | RTC_X4 | O | | |
| Serial communication interface with FIFO | TxD7 to TxD0 | O | Transmit data | Data output pins. |
| | RxD7 to RxD0 | I | Receive data | Data input pins. |
| | SCK7 to SCK0 | I/O | Serial clock | Clock input/output pins. |
| | $\overline{\text{RTS7}}$, $\overline{\text{RTS5}}$, $\overline{\text{RTS1}}$ | I/O | Transmit request | Modem control pins. |
| | $\overline{\text{CTS7}}$, $\overline{\text{CTS5}}$, $\overline{\text{CTS1}}$ | I/O | Transmit enable | Modem control pins. |
| Serial communication interface | SCI_SCK1, SCI_SCK0 | I/O | Serial clock | Clock input/output pins. |
| | SCI_TXD1, SCI_TXD0 | O | Transmit data | Data output pins. |
| | SCI_RXD1, SCI_RXD0 | I | Receive data | Data input pins. |
| | $\overline{\text{SCI_CTS1}}$/$\overline{\text{RTS1}}$, $\overline{\text{SCI_CTS0}}$/$\overline{\text{RTS0}}$ | I/O | Transmit and receive start control | I/O pins for controlling the start of transmission and reception. |
| Renesas serial peripheral interface | MOSI4 to MOSI0 | I/O | Data | Data I/O pins. |
| | MISO4 to MISO0 | I/O | Data | Data I/O pins. |
| | RSPCK4 to RSPCK0 | I/O | Clock | Clock I/O pins. |
| | SSL40, SSL30, SSL20, SSL10, SSL00 | I/O | Slave select | Slave select I/O pins. |

| Classification | Symbol | I/O | Name | Function |
|---|---|---|---|---|
| SPI multi I/O bus controller | SPBCLK_1, SPBCLK_0 | O | Clock | Clock output pins. |
| | SPBSSL_1, SPBSSL_0 | O | Slave select | Slave select output pins. |
| | SPBMO0_0/SPBIO00_0, SPBMI0_0/SPBIO10_0, SPBIO20_0, SPBIO30_0, SPBMO1_0/SPBIO01_0, SPBMI1_0/SPBIO11_0, SPBIO21_0, SPBIO31_0 | I/O | Data | Data I/O pins for channel 0. |
| | SPBMO0_1/SPBIO00_1, SPBMI0_1/SPBIO10_1, SPBIO20_1, SPBIO30_1, SPBMO1_1/SPBIO01_1, SPBMI1_1/SPBIO11_1, SPBIO21_1, SPBIO31_1 | I/O | Data | Data I/O pins for channel 1. |
| $I^2C$ bus interface | RIIC3SCL to RIIC0SCL | I/O | Serial clock pin | Serial clock I/O pins. |
| | RIIC3SDA to RIIC0SDA | I/O | Serial data pin | Serial data I/O pins. |
| Serial sound interface | SSITxD5, SSITxD3, SSITxD1, SSITxD0 | O | Data output | Serial data output pin. |
| | SSIRxD5, SSIRxD3, SSIRxD1, SSIRxD0 | I | Data input | Serial data input pin. |
| | SSIDATA4, SSIDATA2 | I/O | Data I/O | Serial data I/O pins. |
| | SSISCK5 to SSISCK0 | I/O | SSI clock I/O | I/O pins for serial clocks. |
| | SSIWS5 to SSIWS0 | I/O | SSI clock LR I/O | I/O pins for word selection. |
| Media local bus | MLB_CLK | I | Clock input | MediaLB clock input pin. |
| | MLB_SIG | I/O | Signal information I/O | MediaLB signal information I/O pin. |
| | MLB_DAT | I/O | Data I/O | MediaLB data I/O pin. |
| CAN interface | CAN_CLK | I | Clock source for CAN communication | Clock source for CAN communication. |
| | CAN4TX to CAN0TX | O | CAN bus transmit data | Output pins for transmit data on the CAN bus. |
| | CAN4RX to CAN0RX | I | CAN bus receive data | Input pins for receive data on the CAN bus. |
| IEBus™ controller | IETxD | O | IEBus™ controller transmit data | Output pin for transmit data on IEBus™ controller. |
| | IERxD | I | IEBus™ controller receive data | Input pin for receive data on IEBus™ controller. |
| Renesas SPDIF interface | SPDIF_OUT | O | Output data | Transmit data output pin. |
| | SPDIF_IN | I | Input data | Receive data input pin. |
| LIN interface | RLIN31TX, RLIN30TX | O | Output data | Transmit data output pins. |
| | RLIN31RX, RLIN30RX | I | Input data | Receive data input pins. |

| Classification | Symbol | I/O | Name | Function |
|---|---|---|---|---|
| Ethernet controller, EthernetAVB Note: Regarding the switching of pin functions between Ethernet controller and EthernetAVB, refer to section 54, Ports. | ET_TXCLK | I | Transmit clock | Clock pin for transmission. |
| | ET_TXEN | O | Transmit enable | Transmit data enable pin |
| | ET_TXD3 to ET_TXD0 | O | Transmit data | MII transmit data pins. |
| | ET_COL | I | Collision detection | Collision detection pin. |
| | ET_TXER | O | Transmit error | Transmit error output pin. |
| | ET_RXCLK | I | Receive clock | Receive clock pin |
| | ET_RXDV | I | Receive enable | Receive data enable pin |
| | ET_RXD3 to ET_RXD0 | I | Receive data | MII receive data pins. |
| | ET_RXER | I | Receive error | Receive error input pin. |
| | ET_CRS | I | Carrier detection | Carrier detection pin. |
| | ET_MDC | O | Management data clock | Clock pin for information transfer via MDIO. |
| | ET_MDIO | I/O | Management data I/O | Bidirectional pin for exchange of management data |
| EthernetAVB | AVB_CAPTURE | I | Timer capture | Capturing input pin for AVTP presentation timer |
| | AVB_GPTP_EXTERN | I | gPTP timer external clock | External clock pin for gPTP timer |
| NAND flash memory controller | FALE | O | Flash memory address latch enable | Asserted for address output and negated for data I/O. |
| | $\overline{\text{FRE}}$ | O | Flash memory read enable | Reads data at falling edge. |
| | $\overline{\text{FCE}}$ | O | Flash memory chip enable | Enables the flash memory connected to this LSI. |
| | FCLE | O | Flash memory command latch enable | Asserted at command output. |
| | FRB | I | Flash memory ready/ busy | High level indicates ready state and low level indicates busy state. |
| | $\overline{\text{FWE}}$ | O | Flash memory write enable | Flash memory latches commands, addresses, and data at falling edge. |
| | NAF7 to NAF0 | I/O | Flash memory data | Data I/O pins. |
| USB 2.0 host/ function module | DP1, DP0 | I/O | USB 2.0 host/function module D+ data | D+ data pins for USB 2.0 host/function module bus. |
| | DM1, DM0 | I/O | USB 2.0 host/function module D– data | D– data pins for USB 2.0 host/function module bus. |
| | VBUS1, VBUS0 | I | VBUS input | Connected to Vbus on USB 2.0 host/ function module bus. |
| | REFRIN | I | Reference input | Connected to USBAPVss via 5.6-kΩ ± 1% resistance. (QFP package) Connected to Vss via 5.6-kΩ ± 1% resistance. (BGA package) |

| Classification | Symbol | I/O | Name | Function |
|---|---|---|---|---|
| USB 2.0 host/ function module | USB_X1 | I | Crystal resonator/ external clock for USB 2.0 host/function module | Connected to a crystal resonator for USB 2.0 host/function module. An external clock signal may also be input to the USB_X1 pin. |
| | USB_X2 | O | | |
| | USBAPVcc | I | Power supply for transceiver analog pins | Power supply for pins. |
| | USBAPVss<br>Note: This pin is not present on products in the BGA package. | I | Ground for transceiver analog pins | Ground for pins. |
| | USBDPVcc<br>Note: This pin is not present on products in the BGA package. | I | Power supply for transceiver digital pins | Power supply for pins. |
| | USBDPVss<br>Note: This pin is not present on products in the BGA package. | I | Ground for transceiver digital pins | Ground for pins. |
| | USBAVcc | I | Power supply for transceiver analog core | Power supply for core. |
| | USBAVss<br>Note: This pin is not present on products in the BGA package. | I | Ground for transceiver analog core | Ground for core. |
| | USBDVcc<br>Note: This pin is not present on products in the BGA package. | I | Power supply for transceiver digital core | Power supply for core. |
| | USBDVss<br>Note: This pin is not present on products in the BGA package. | I | Ground for transceiver digital core | Ground for core. |
| | USBUVcc<br>Note: This pin is not present on products in the BGA package. | I | 480-MHz power supply for USB 2.0 host/function module | Power supply for 480-MHz sections |
| | USBUVss<br>Note: This pin is not present on products in the BGA package. | I | 480-MHz ground for USB 2.0 host/function module | Ground for 480-MHz sections |

| Classification | Symbol | I/O | Name | Function |
|---|---|---|---|---|
| Digital video decoder | VIN1A, VIN2A | I | Composite video signal (CVBS) input | Composite video signal (CVBS) channel 0 input pins. |
| | VIN1B, VIN2B | I | Composite video signal (CVBS) input | Composite video signal (CVBS) channel 1 input pins. |
| | VIDEO_X1 | I | Crystal resonator/ external clock for digital video decoder | Connected to a crystal resonator for digital video decoder. An external clock signal may also be input to the VIDEO_X1 pin. |
| | VIDEO_X2 | O | | |
| | VRP | O | TOP reference voltage | TOP reference voltage pin for the A/D converter to input video signals. Connected to VDAVss via 0.1-μF capacitor. |
| | VRM | O | BOTTOM reference voltage | BOTTOM reference voltage pin for the A/D converter to input video signals. Connected to VDAVss via 0.1-μF capacitor. |
| | REXT | I | Reference voltage | Reference voltage pin for the A/D converter to input video signals. Connected to VDAVss via 22-kΩ ± 1% resistance. |
| | VDAVcc | I | Analog power supply | Power supply pin for the A/D converter to input video signals. |
| | VDAVss | I | Analog ground | Ground pin for the A/D converter to input video signals. |
| Video display controller 5 | LCD1_DATA23 to LCD1_DATA0, LCD0_DATA23 to LCD0_DATA0 | O | Output data | Data output pins for panel. |
| | LCD1_TCON6 to LCD1_TCON0, LCD0_TCON6 to LCD0_TCON0 | O | Panel timing adjustment output | Output pins for panel timing adjustment |
| | LCD1_CLK, LCD0_CLK | O | Panel clock | Panel clock output pins. |
| | LCD1_EXTCLK, LCD0_EXTCLK | I | Panel clock source | Panel clock source input pins. |
| | DV0_DATA23 to DV0_DATA0, DV1_DATA7 to DV1_DATA0 | I | Input data | Data input pins for graphics data. |
| | DV1_VSYNC, DV0_VSYNC | I | VSYNC input | VSYNC input pins. |
| | DV1_HSYNC, DV0_HSYNC | I | HSYNC input | HSYNC input pins. |
| | DV1_CLK, DV0_CLK | I | Input clock | Clock input signal pins for graphics data. |
| LVDS output interface | TXCLKOUTP, TXCLKOUTM | O | Output clock | LVDS differential clock output pins. |
| | TXOUT2P to TXOUT0P, TXOUT2M to TXOUT0M | O | Output data | LVDS differential data output pins. |
| | LVDSREFRIN | I | Reference input | Connected to LVDSAPVss via 5.6-kΩ ± 1% resistance.(QFP package) Connected to Vss via 5.6-kΩ ± 1% resistance. (BGA package) |
| | LVDSAPVcc | I | LVDS analog power supply | Power supply for LVDS output. |
| | LVDSAPVss<br>Note: This pin is not present on products in the BGA package. | I | LVDS analog ground | Ground for LVDS output. |
| | LVDSPLLVcc | I | LVDS PLL power supply | Power supply for LVDS PLL. |
| Capture engine unit | VIO_D15 to VIO_D0 | I | Input data | Graphics data input pins. |
| | VIO_CLK | I | Input clock | Graphics data clock input pin. |
| | VIO_VD | I | VSYNC input | VSYNC input pin. |
| | VIO_HD | I | HSYNC input | HSYNC input pin. |
| | VIO_FLD | I | FIELD input | Input pin for field information |

| Classification | Symbol | I/O | Name | Function |
|---|---|---|---|---|
| Sound generator | SGOUT3 to SGOUT0 | O | Sound generator output | Sound generator output pins. |
| SD host interface | SD_CLK_0, SD_CLK_1 | O | SD clock | Output pins for SD clock. |
| | SD_CMD_0, SD_CMD_1 | I/O | SD command | SD command output and response input signals. |
| | SD_D3_0 to SD_D0_0,<br>SD_D3_1 to SD_D0_1 | I/O | SD data | SD data bus signals. |
| | SD_CD_0, SD_CD_1 | I | SD card detection | SD card detection. |
| | SD_WP_0, SD_WP_1 | I | SD write protection | SD write protection signals. |
| MMC host interface | MMC_CLK | O | MMC clock | Output pin for MMC clock. |
| | MMC_CMD | I/O | MMC command | MMC command output and response input signal. |
| | MMC_D7 to MMC_D0 | I/O | MMC data | MMC data bus signals. |
| | MMC_CD | I | MMC card detection | MMC card detection. |
| Motor control PWM timer | PWM1H to PWM1A<br>PWM2H to PWM2A | O | Timer output | PWM output pins. |
| A/D converter | AN7 to AN0 | I | Analog input pins | Analog input pins. |
| | $\overline{\text{ADTRG}}$ | I | A/D conversion trigger input | External trigger input pin for starting A/D conversion. |
| | AVcc | I | Analog power supply | Power supply pin for A/D converter. |
| | AVss | I | Analog ground | Ground pin for A/D converter. |
| | AVref | I | Analog reference voltage | Reference voltage pin for A/D converter. |
| General I/O ports | P2_0 to P2_15,<br>P3_0 to P3_15,<br>P4_0 to P4_15,<br>P5_0 to P5_10,<br>P6_0 to P6_15,<br>P7_0 to P7_15,<br>P8_0 to P8_15,<br>P9_0 to P9_7,<br>P10_0 to P10_15<br>P11_0 to P11_15 | I/O | General port | General I/O port pins. |
| | P1_0 to P1_7 | I/O | General port | 8 input port pins with open-drain output. |
| | JP0_0, JP0_1, P0_0 to P0_5, P1_8 to P1_15 | I | General port | 16 general input port pins. |
| Debugging interface | TCK/SWDCLK | I | Test clock | Test-clock input pin.<br>Also used as the input clock pin for serial wire debugging |
| | TMS/SWDIO | I, I/O | Test mode select | Test-mode select signal input pin.<br>Also used as the I/O data pin for serial wire debugging |
| | TDI | I | Test data input | Serial input pin for instructions and data. |
| | TDO | O | Test data output | Serial output pin for instructions and data. |
| | $\overline{\text{TRST}}$ | I | Test reset | Initialization-signal input pin. |
| | TRACEDATA3 to TRACEDATA0 | O | Data output | Trace data output pins. |
| | TRACECLK | O | Clock output | Trace clock output pin. |
| | TRACECTL | O | Enable output | Trace enable output pin. |

# 2. CPU

This product incorporates the Arm single-core Cortex-A9 MPCore, where the IP version is r3p0.

## 2.1 Features *1

- Instruction cache size: 32 Kbytes
- Data cache size*2: 32 Kbytes
- TLB entries: 128 entries
- Jazelle architecture extension: Full
- Media processing engine with NEON technology: Included
- FPU: Included
- PTM interface: Included
- Wrappers to support for power off and dormant mode: Not included
- Preload engine: Not included
- Number of interrupts: 0 (On-chip interrupt controller is not used.)
- Accelerator Coherence Port: Not included

Note 1. For details, refer to Cortex-A9 MPCore Technical Reference Manual issued by Arm Ltd.
Note 2. Contents of memory regions which are set as write-through are not cached even if data caching is enabled. For details, refer to Cortex-A9 Technical Reference Manual issued by Arm Ltd.

## 2.2 Configuration Signals

Table 2.1 shows the Cortex-A9 configuration signals and the settings.

**Table 2.1 Cortex-A9 Configuration Signal Settings**

| Configuration Signal | Setting Values |
|---|---|
| CFGEND | 1’b0 |
| CFGNMIF | 1’b1 |
| CLUSTERID | 4'h0 |
| FILTEREN*1 | 1’b1 |
| FILTERSTART[31:20]*1 | 12’hE00 |
| FILTEREND[31:20]*1 | 12’hFFF |
| PERIPHBASE[31:13]*2 | 19’b111_1000_0000_0000_0000 |
| TEINIT | 1’b0 |
| VINITHI | NOR, SRAM boot: 1’b0; on-chip ROM boot: 1’b1 |

Note 1. Do not change the initial settings of these signals by software.
Note 2. The base address for the private memory area in the Cortex-A9 processor is H'F0000000. For details and overview of the registers located in the addresses relative to this base address, refer to Cortex-A9 MPCore Technical Reference Manual issued by Arm Ltd.

# 3. Boot Mode

This LSI can be booted from the memory connected to the CS0 space and the serial flash memory.

Note 1. Booting from the NAND flash memory with an SD controller and the NAND flash memory with an MMC controller are not currently supported.

## 3.1 Features

- Five boot modes
  Boot mode 0: Boots the LSI from the memory (bus width: 16 bits) connected to the CS0 space
  Boot mode 1: Boots the LSI from the memory (bus width: 32 bits) connected to the CS0 space
  Boot mode 3: Boots the LSI from the serial flash memory connected to the SPI multi I/O bus space
  Boot mode 4: Boots the LSI from the NAND flash memory with the SD controller*1
  Boot mode 5: Boots the LSI from the NAND flash memory with the MMC controller*2

Note 1. It is possible to boot the LSI from the embedded SD (eSD) defined by the SD specification part 1 eSD addendum version 2.10 standard.

Note 2. It is possible to boot the LSI from the eMMC device corresponding to the boot operating mode of the JEDEC standard JESD84 A44 (MMCA 4.4) Standard. (It is not possible to boot the LSI from the MMC card.)

## 3.2 Boot Mode and Pin Function Setting

This LSI can determine the boot mode using external pins when $\overline{\text{RES}}$ is low. The external pin settings for selecting the boot mode are shown in Table 3.1.

**Table 3.1 External Pin (MD_BOOT2 to MD_BOOT0) Settings and Corresponding Boot Modes**

| MD_BOOT2 | MD_BOOT1 | MD_BOOT0 | Boot Mode |
|---|---|---|---|
| * | 0 | 0 | Boot Mode 0 (CS0-space 16-bit booting)<br>Boots the LSI from the memory (bus width: 16 bits) connected to the CS0 space. |
| * | 1 | 0 | Boot Mode 1 (CS0-space 32-bit booting)<br>Boots the LSI from the memory (bus width: 32 bits) connected to the CS0 space. |
| 1 | 0 | 1 | Boot Mode 3 (serial flash booting)<br>Boots the LSI from the serial flash memory connected to the SPI multi I/O bus space.<br>The only way of booting this LSI chip is from channel 0 (P9_2 to P9_5) in this mode. |
| 0 | 1 | 1 | Boot Mode 4 (eSD booting)<br>Boots the LSI from the NAND flash memory with the SD controller. The only way of booting this LSI chip is from channel 0 (P4_10 to P4_15) in this mode. |
| 1 | 1 | 1 | Boot Mode 5 (eMMC booting)<br>Boots the LSI from the NAND flash memory with the MMC controller. The only way of booting this LSI chip is from channel 0 (P3_10 to P3_15) in this mode. |

## 3.3 Hardware Used in Each Boot Mode

Table 3.2 gives information about the hardware used in each boot mode.

**Table 3.2 Hardware Used in Each Boot Mode**

| Boot Mode | Peripheral Module | Pins Used | Remarks |
|---|---|---|---|
| Boot Mode 0<br>(CS0-space 16-bit booting) | Bus state controller | A[20:1]<br>D[15:0]<br>$\overline{CS0}$<br>$\overline{RD}$<br>CKIO | — |
| Boot Mode 1<br>(CS0-space 32-bit booting) | Bus state controller | A[20:2]<br>D[31:0]<br>$\overline{CS0}$<br>$\overline{RD}$<br>CKIO | — |
| Boot Mode 3<br>(Serial flash booting) | SPI multi I/O bus controller | SPBCLK_0<br>SPBSSL_0<br>SPBMO0_0<br>SPBMI0_0 | The internal baud rate generator generates SPBCLK_0 by dividing Bϕ by 8. |
| Boot Mode 4<br>(eSD booting) | SD host interface | SD_CLK0<br>SD_CMD0<br>SD_D[3:0]0 | The SD clock frequency (SD_CLK0) is generated by dividing P1ϕ by 4. |
| Boot Mode 5<br>(eMMC booting) | MMC host interface | MMC_CLK<br>MMC_CMD<br>MMC_D[3:0] | The clock frequency (MMC_CLK) is generated by diving P1ϕ by 4. |

## 3.4 Exception Vector Address at a Reset in Each Boot Mode

In this LSI, the exception vector address at a reset differs depending on the boot mode.
In this LSI, the exception vector at a reset starts from H'0000_0000 (low vector) in boot mode 0 or 1 and from H'FFFF_0000 (high vector) in boot mode 3 to 5.
In this LSI, an on-chip ROM is allocated in area H'FFFF_0000 to H'FFFF_FFFF. The on-chip ROM has a boot program which executes processing corresponding to the boot mode set by the MD_BOOT2 to MD_BOOT0 external pins.
Table 3.3 lists the exception vector address at a reset for each boot mode.

**Table 3.3 Exception Vector Address at a Reset in Each Boot Mode**

| Boot Mode | Exception Vector Address at a Rest | Memory Allocated at the Exception Vector Address |
|---|---|---|
| Boot Mode 0<br>(CS0-space 16-bit booting) | H'0000 0000 (low vector) | Memory connected to the CS0 space |
| Boot Mode 1<br>(CS0-space 32-bit booting) | H'0000 0000 (low vector) | Memory connected to the CS0 space |
| Boot Mode 3<br>(Serial flash booting) | H'FFFF 0000 (high vector) | On-chip ROM (boot program) |
| Boot Mode 4<br>(eSD booting) | H'FFFF 0000 (high vector) | On-chip ROM (boot program) |
| Boot Mode 5<br>(eMMC booting) | H'FFFF 0000 (high vector) | On-chip ROM (boot program) |

## 3.5 Operation

### 3.5.1 Boot Modes 0 and 1

In boot modes 0 and 1, this LSI is booted from the memory connected to the CS0 space. In these modes, this LSI operates as follows:
After the power-on reset is canceled, program execution is started from H'0000_0000 in the memory connected to the CS0 space.

### 3.5.2 Boot Mode 3

In boot mode 3, booting up is from the serial flash memory connected to the SPI multi I/O bus space. In this mode, this LSI operates as follows: After the power-on reset is canceled, the boot program stored in the on-chip ROM (starting from H'FFFF_0000) is executed.
The boot program configures the SPI multi I/O bus controller in external address space read mode. With this configuration, this LSI converts reads from the SPI multi I/O bus space to SPI communications and is ready to read directly from the connected serial flash memory. The boot program configures a read command (opcode: 03H, address: 3 bytes, dummy cycle: none) as the command to the serial flash memory used for SPI communication conversion. Figure 3.1 shows the control signals output to the serial flash memory through SPI communication conversion.

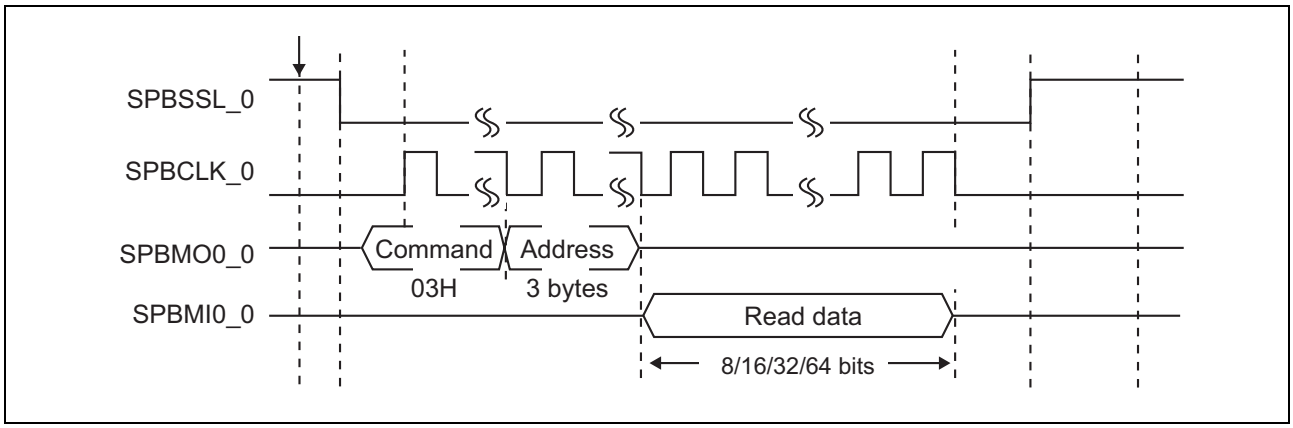

**Figure 3.1 Control Signals Output to the Serial Flash Memory Through SPI Communication Conversion**

The boot program uses the area at H'2002_0000 to H'2002_3FFF as work memory. It branches to H'1800_0000 (SPI multi I/O bus space) at the end of the processing. At this time, the I bit, F bit, T bit and bits Mode[4:0] in CPSR are set to the initial states with the I bit set to 1'b1 (IRQ masked state), the F bit set to 1'b1 (FIQ masked state), the T bit set to 1'b0 (Arm state) and bits Mode[4:0] set to 5'b10011 (supervisor mode).

### 3.5.3 Boot Mode 4

In boot mode 4, booting up is from the NAND flash memory with the SD controller, which is connected to channel 0 of the SD host interface. The flow of operation of this LSI in boot mode 4 is as described below.

After a power-on reset, this LSI executes the boot program stored in the on-chip ROM (starting from H'FFFF_0000). The boot program transfers 28 Kbytes of program from the NAND flash memory with the SD controller connected to channel 0 of the SD host interface to the address range from H'2002_4000 to H'2002_AFFF of the large-capacity on-chip RAM.
The program (28 Kbytes) that the boot program transfers to the large-capacity on-chip RAM is called a loader program.

The boot program uses an area from H'2002_0000 to H'2002_3FFF as work memory. Note that the loader program must be stored in the NAND flash memory with the SD controller according to the loader program storage specifications.*1

Note 1. For the storage specifications of the loader program, contact Renesas Electronics Corporation's sales office.

After the boot program finishes processing, it branches to H'2002_4000 (large-capacity on-chip RAM). At this time, the I bit, F bit, T bit and bits Mode[4:0] in CPSR are set to the initial states with the I bit set to 1'b1 (IRQ masked state), the F bit set to 1'b1 (FIQ masked state), the T bit set to 1'b0 (Arm state) and bits Mode[4:0] set to 5'b10011 (supervisor mode).
The size of the loader program that the boot program transfers to the large-capacity on-chip RAM is fixed to 28 Kbytes. If your loader program exceeds this limit, use the loader program to transfer your program (application program) from the NAND flash memory with the SD controller to the large-capacity on-chip or external RAM using channel 0 of the SD host interface. Note that you must design a loader program.

#### (1) Initiation of the SD Host Interface Channel 0

#### (2) Transfer of the Loader Program

The 28-KB loader program is transferred from flash memory with the SD controller, which is connected to channel 0 of the SD host interface, to the address range from H'2002_4000 to H'2002_AFFF (page 0) of the large-capacity on-chip RAM. The address range from H'2002_0000 to H'2002_3FFF (page 0) of the large-capacity on-chip RAM is also used as the work memory for boot process.

Once transfer of the loader program has been completed, execution by the CPU jumps to page 0 of the large-capacity on-chip RAM so that it can start executing the transferred loader program.

#### (3) Transfer of an Application Program (as Desired)

The loader program employs the SD host interface to transfer the data to be deployed from flash memory with the SD controller to on-chip RAM or external RAM.

Figure 3.2 is a schematic view of the specification for boot mode 4.

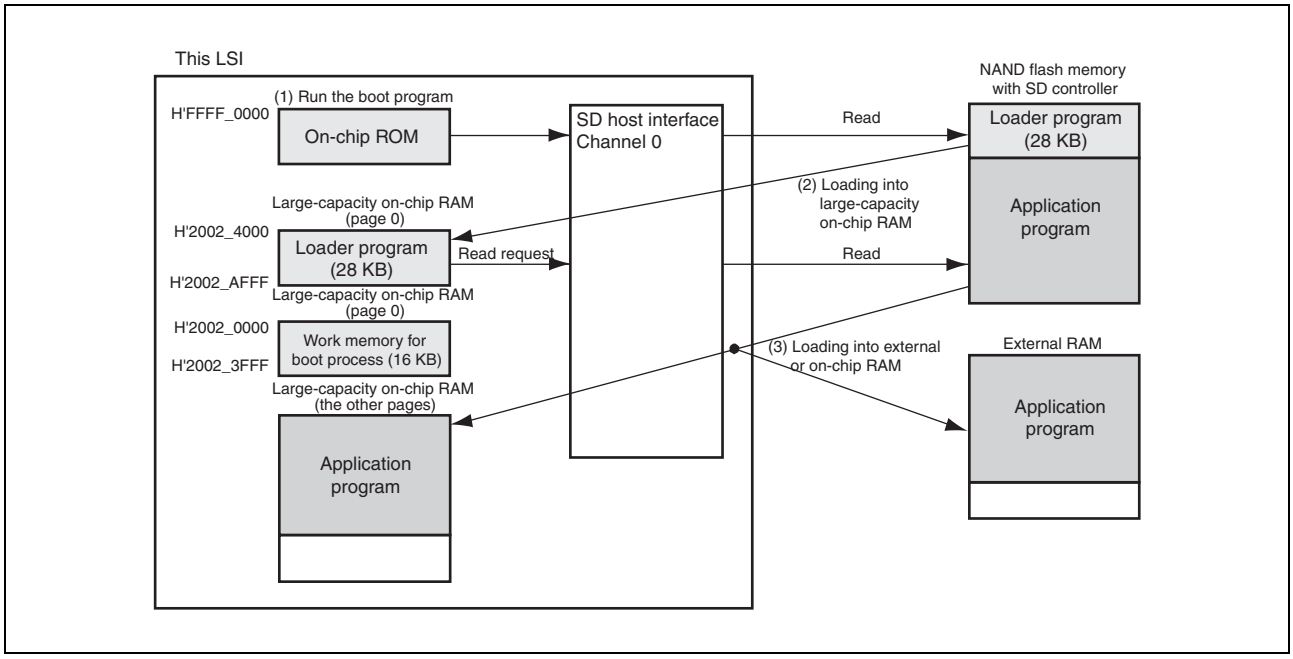

**Figure 3.2 Schematic View of Specification for Boot Mode 4**

### 3.5.4 Boot Mode 5

In boot mode 5, booting up is from the NAND flash memory with the MMC controller, which is connected to the MMC host interface. The flow of operation of this LSI in boot mode 5 is as described below.

After a power-on reset, this LSI executes the boot program stored in the on-chip ROM (starting from H'FFFF_0000). The boot program transfers 28 Kbytes of program from the NAND flash memory with the MMC controller connected to the MMC host interface to the address range from H'2002_4000 to H'2002_AFFF of the large-capacity on-chip RAM. The program (28 Kbytes) that the boot program transfers to the large-capacity on-chip RAM is called a loader program.

The boot program uses an area from H'2002_0000 to H'2002_3FFF as work memory. Note that the loader program must be stored in the NAND flash memory with the MMC controller according to the loader program storage specifications.*1

Note 1. For the storage specifications of the loader program, contact Renesas Electronics Corporation's sales office.

After the boot program finishes processing, it branches to H'2002_4000 (large-capacity on-chip RAM). At this time, the I bit, F bit, T bit and bits Mode[4:0] in CPSR are set to the initial states with the I bit set to 1'b1 (IRQ masked state), the F bit set to 1'b1 (FIQ masked state), the T bit set to 1'b0 (Arm state) and bits Mode[4:0] set to 5'b10011 (supervisor mode).
The size of the loader program that the boot program transfers to the large-capacity on-chip RAM is fixed to 28 Kbytes. If your loader program exceeds this limit, use the loader program to transfer your program (application program) from the NAND flash memory with the MMC controller to the large-capacity on-chip or external RAM using the MMC host interface. Note that you must design a loader program.

#### (1) Initiation of the MMC Host Interface

#### (2) Transfer of the Loader Program

The 28-KB loader program is transferred from flash memory with the MMC controller, which is connected to the MMC host interface, to the address range from H'2002_4000 to H'2002_AFFF (page 0) of the large-capacity on-chip RAM with the MMC data bus width of 4 bits. The address range from H'2002_0000 to H'2002_3FFF (page 0) of the large-capacity on-chip RAM is also used as the work memory for boot process.

Once transfer of the loader program has been completed, execution by the CPU jumps to page 0 of the large-capacity on-chip RAM so that it can start executing the transferred loader program.

#### (3) Transfer of an Application Program (as Desired)

The loader program employs the MMC host interface to transfer the data to be deployed from flash memory with the MMC controller to on-chip RAM or external RAM.

Figure 3.3 is a schematic view of the specification for boot mode 5.

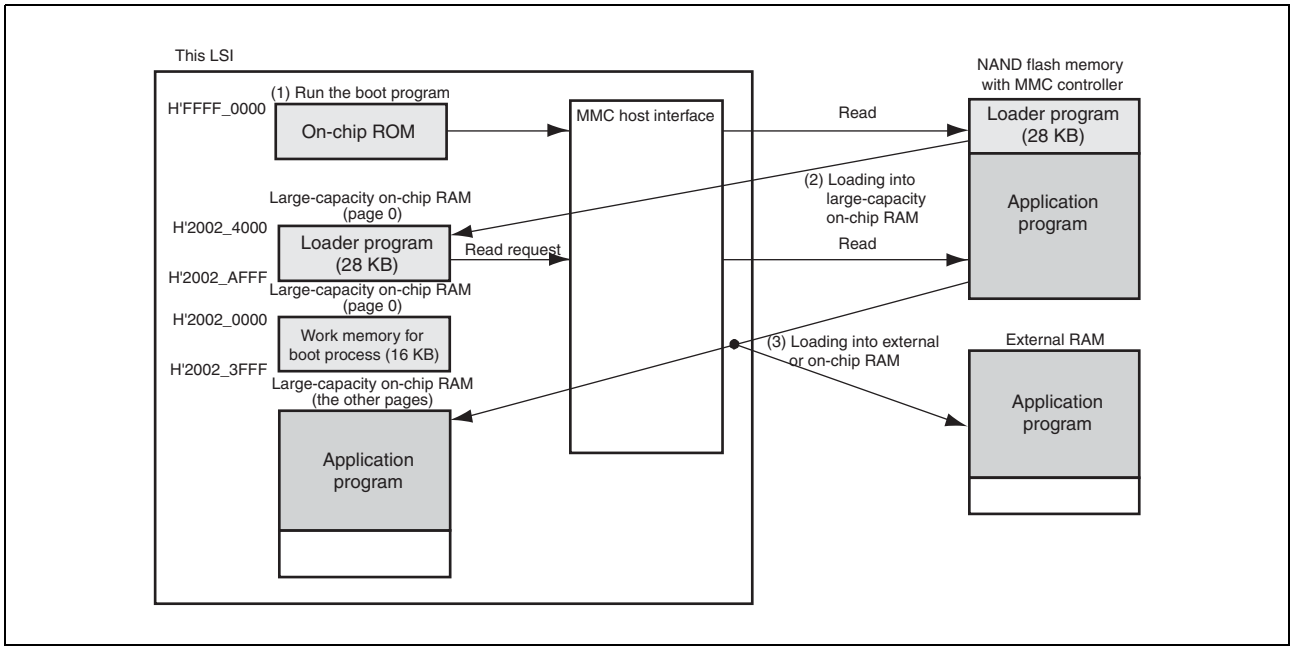

**Figure 3.3 Schematic View of Specification for Boot Mode 5**

## 3.6 Notes

### 3.6.1 Boot Related Pins

The initial states and output states in deep standby mode of the pins related to CS0 space memory read, SPI multi I/O bus space memory read, channel 0 of the SD host interface, and the MMC host interface are different in each boot mode. For details, refer to section 8, Bus State Controller, section 54, Ports, and section 55, Power-Down Modes.

### 3.6.2 Operation when an Exception Occurs with the Exception Vector Set to the High Vector Address

In this LSI, the program counter loops to its own address (exception vector address) in the on-chip ROM if an exception (except for a reset) occurs when the exception vector is set to the high vector address. In boot mode 3, 4 or 5, set the V bit in SCTLR to 0 to set the exception vector to the low vector address before an exception (except for a reset) occurs. For the details about the CP15 system control register (SCTLR), refer to the Arm Architecture Reference Manual.

### 3.6.3 Notes on Serial Flash Booting (Boot Mode 3) after This LSI is Reset

In booting up from serial flash memory (boot mode 3), read commands (opcode: 03H, address: 3 bytes, dummy cycles: none) are set for sending to the serial flash memory. Therefore, if this chip enters the reset state while the serial flash memory cannot accept read commands, correct booting up of the chip may not be possible. For example, if the chip is reset while the serial flash memory is being erased (placing it in the busy state), the serial flash memory will not accept read commands. In such cases, that is, in system configurations where the chip may be reset while the serial flash memory is unable to accept read commands, ensure that the serial flash memory is able to accept read commands after the chip is released from the reset state by using serial flash memory that has its own reset pin or cutting off power to the serial flash memory when a reset occurs.

# 4. Secondary Cache

This product incorporates Arm's PL310 as a secondary cache. The IP version is r3p2.

## 4.1 Features

- Total cache size: 128 Kbytes
- Number of cache ways: 8 ways
- Number of master ports : 2
- Number of slave ports: 2
- Lockdown by master: No
- Lockdown by line Defined
- Speculative read: No
- Sideband signal from CA9: No

For details, see CoreLink™ Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.

## 4.2 Configuration Signals

The setting values of the configuration signals are shown in Table 4.1.

**Table 4.1 Setting Values of Configuration Signals**

| Configuration Signals | Setting Values |
|---|---|
| ASSOCIATIVITY*1 | 1'b0 (8 ways) |
| CACHEID[5:0] | 6'b000000 |
| CFGADDRFILTEN*1 | 1'b1 |
| CFGADDRFILTEND[11:0]*1 | 12'h3FF |
| CFGADDRFILTSTART[11:0]*1 | 12'h180 |
| CFGBIGEND | 1'b0 |
| DATAREADLAT[2:0]*1 | 3'b000 |
| DATASETUPLAT[2:0]*1 | 3'b000 |
| DATAWRITELAT[2:0]*1 | 3'b000 |
| REGFILEBASE[19:0]*2 | 20'h3FFFF |
| TAGREADLAT[2:0]*1 | 3'b000 |
| TAGSETUPLAT[2:0]*1 | 3'b000 |
| TAGWRITELAT[2:0]*1 | 3'b000 |
| WAYSIZE[2:0]*1 | 3'b001 (16 Kbytes) |

Note 1. Do not change the initial settings of these signals by software.
Note 2. The base address for the PL310 registers is H'3FFFF000. For the details and overview of the registers, see CoreLink™ Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd. The external ROM/RAM mirror area (0x4000_0000 to 0x5FFF_FFFF) is mirrored before the secondary cache. Accordingly, when a cache maintenance operation is to be executed for the external ROM/RAM mirror area, treat this as the normal external ROM/RAM area in the physical addresses range from 0x0000_0000 to 0x1FFF_FFFF.

# 5. LSI Internal Bus

## 5.1 LSI Internal Bus

### 5.1.1 Configuration

This LSI has two main buses: the north main bus where peripheral modules are connected and the south main bus where on-chip RAM and external ROM and RAM are connected. Figure 5.1 is a schematic diagram of the internal buses.

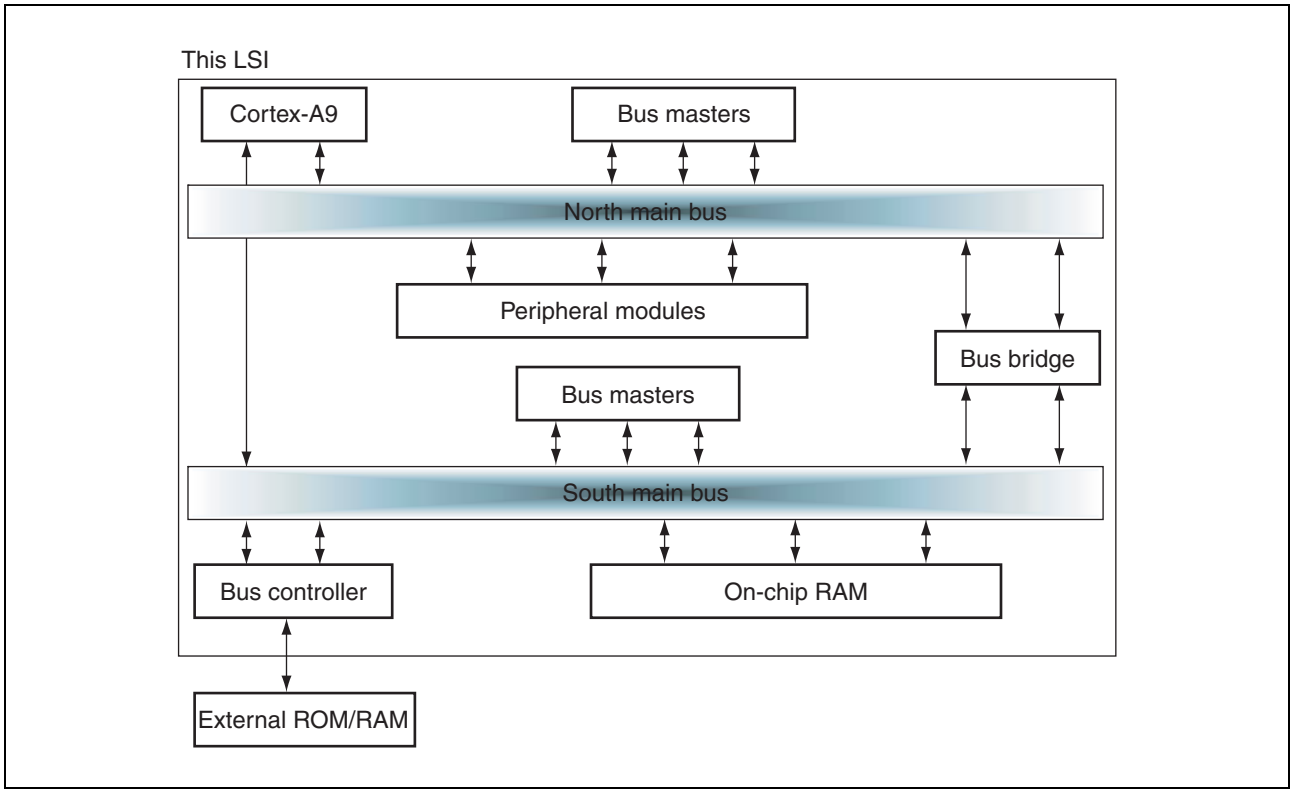

**Figure 5.1 Schematic Diagram of LSI Internal Bus**

### 5.1.2 Operation

Cortex-A9 has separate interfaces for the north main bus and south main bus. The addresses assigned to the north main bus are accessed through the north main bus interface, and those assigned to the south main bus are accessed through the south main bus interface.

When a bus master connected to the north main bus, except for Cortex-A9, accesses the on-chip RAM or external ROM or RAM, access is executed through the bus bridge for access from the north main bus to the south main bus. The bus masters connected to the south main bus cannot access an address assigned to the north main bus. The internal bus of this LSI operates in little endian.

## 5.2 North Main Bus

### 5.2.1 Configuration

Various peripheral modules are connected to the north main bus. Figure 5.2 shows the configuration of the north main bus.

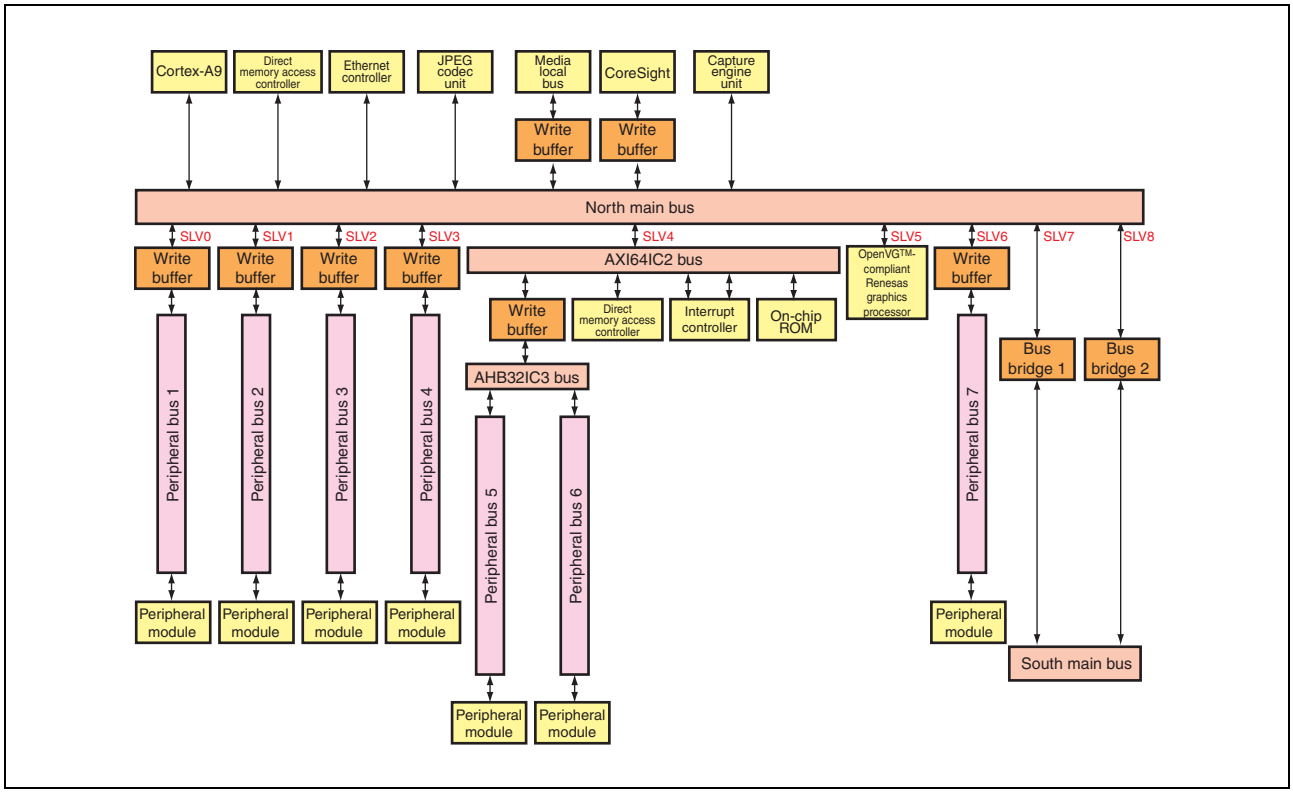

**Figure 5.2 North Main Bus Configuration**

### 5.2.2 Features

Table 5.1 shows the features of the north main bus.

**Table 5.1 North Main Bus**

| Item | Description |
|---|---|
| Bus protocol | AMBA® AXI protocol |
| Bus system configuration | AXI interconnect with multi-layer configuration for all channels |
| Bus clock frequency | Bφ |
| Bus width | 64 bits |
| Arbitration | Round robin |

### 5.2.3 Peripheral Buses

Table 5.2 is a list of the peripheral buses connected to the north main bus.

**Table 5.2 List of Peripheral Buses**

| Item | Description |
|---|---|
| Peripheral bus 1 | |
| Bus clock frequency | P0φ |
| Bus width | 32 bits |
| Connected peripheral modules | Multi-function timer pulse unit 2 |
| | Realtime clock |
| | NAND flash memory controller |
| | Digital video decoder channels 0 and 1 |
| | Video display controller 5 channels 0 and 1 |
| | Image renderer (IMR-LS2) channels 0 and 1 |
| | Image renderer for display (IMR-LSD) |
| | Display out comparison unit channels 0 and 1 |
| | Sound generator channels 0 to 3 |
| | Motor control PWM timer |
| Peripheral bus 2 | |
| Bus clock frequency | P0φ |
| Bus width | 32 bits |
| Connected peripheral modules | Clock pulse generator |
| | Interrupt controller |
| | Direct memory access controller |
| | OS timer channels 0 and 1 |
| | $I^2C$ bus interface channels 0 to 3 |
| | IEBus controller |
| | LIN interface channels 0 and 1 |
| | General I/O ports |
| Peripheral bus 3 | |
| Bus clock frequency | P1φ |
| Bus width | 32 bits |
| Connected peripheral modules | CAN interface |
| | Media local bus |
| | Dynamic range compression channels 0 and 1 |
| | SD host interface channels 0 and 1 |
| | MMC host interface |
| Peripheral bus 4 | |
| Bus clock frequency | P1φ |
| Bus width | 32 bits |

**Table 5.2 List of Peripheral Buses**

| Item | Description |
|---|---|
| Connected peripheral modules | Serial communication interface with FIFO channels 0 to 7 |
| | Serial communication interface channels 0 and 1 |
| | Renesas serial peripheral interface channels 0 to 4 |
| | Renesas SPDIF interface |
| | CD-ROM decoder |
| | A/D converter |
| | USB2.0 host/function module channel 0 |
| | JPEG codec unit |
| AXI64IC2 bus | |
| Bus protocol | AMBA AXI protocol |
| Bus system configuration | AXI interconnect with multi-layer configuration for all channels |
| Bus clock frequency | Bφ |
| Bus width | 64 bits |
| Arbitration | Round robin |
| AHB32IC3 bus | |
| Bus protocol | AMBA AHB protocol |
| Bus clock frequency | Bφ |
| Bus width | 32 bits |
| Peripheral bus 5 | |
| Bus clock frequency | P1φ |
| Bus width | 32 bits |
| Connected peripheral modules | Serial sound interface channels 0 to 5 |
| | USB2.0 host/function module channel 1 |
| | SCUX |
| Peripheral bus 6 | |
| Bus clock frequency | Bφ |
| Bus width | 32 bits |
| Connected peripheral modules | Ethernet controller |
| | Pixel format converter channels 0 and 1 |
| | Capture engine unit |
| | EthernetAVB |
| Peripheral bus 7 | |
| Bus clock frequency | P1φ |
| Bus width | 32 bits |
| Connected peripheral modules | CoreSight |

## 5.3 South Main Bus

### 5.3.1 Configuration

On-chip RAM and external ROM and RAM are connected to the south main bus. Figure 5.3 shows the configuration of the south main bus.

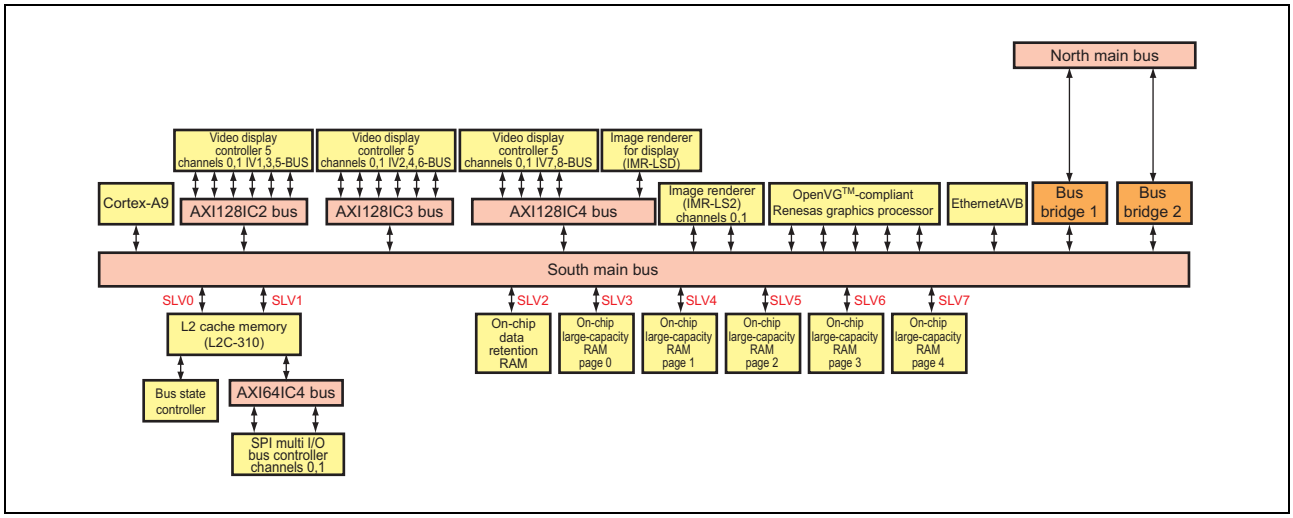

**Figure 5.3 South Main Bus Configuration**

### 5.3.2 Features

Table 5.3 shows the features of the south main bus.

**Table 5.3 South Main Bus**

| Item | Description |
|---|---|
| Bus protocol | AMBA AXI protocol |
| Bus system configuration | AXI interconnect with multi-layer configuration for all channels |
| Bus clock frequency | Bφ |
| Bus width | 128 bits |
| Arbitration | Round robin |

### 5.3.3 Connected Buses

Table 5.4 is a list of the buses connected to the south main bus and their features.

**Table 5.4 List of Buses Connected to South Main Bus and their Features**

| Item | Description |
|---|---|
| AXI128IC2, AXI128IC3, and AXI128IC4 buses | |
| Bus protocol | AMBA AXI protocol |
| Bus system configuration | AXI interconnect with multi-layer configuration for all channels |
| Bus clock frequency | Bφ |
| Bus width | 128 bits |
| Arbitration | Round robin |
| AXI64IC4 bus | |
| Bus protocol | AMBA AXI protocol |
| Bus system configuration | AXI interconnect with multi-layer configuration for all channels |

## 5.4 Address Map

Table 5.5 shows the address map of this LSI.

**Table 5.5 Address Map**

| Address | Area | Slave Area Viewed from North Main Bus Masters | Slave Area Viewed from South Main Bus Masters |
|---|---|---|---|
| 0xFFFF_0000 to 0xFFFF_FFFF | I/O area | ROM in SLV4*1 | — |
| 0xFD00_0000 to 0xFFFE_FFFF | Reserved area | — | |
| 0xFCFF_0000 to 0xFCFF_FFFF | I/O area | SLV0 *1 | |
| 0xFCFE_0000 to 0xFCFE_FFFF | I/O area | SLV1*1 | |
| 0xFC08_0000 to 0xFCFD_FFFF | Reserved area | — | |
| 0xFC00_0000 to 0xFC07_FFFF | I/O area | SLV6*2, *4 | |
| 0xF000_2000 to 0xFBFF_FFFF | Reserved area | — | |
| 0xF000_0000 to 0xF000_1FFF | Cortex-A9 private area | — | |
| 0xE823_0000 to 0xEFFF_FFFF | Reserved area | — | |
| 0xE820_0000 to 0xE822_FFFF | I/O area | SLV4 *1, *3 | |
| 0xE814_0000 to 0xE81F_FFFF | Reserved area | — | |
| 0xE810_0000 to 0xE813_FFFF | I/O area | SLV5 *2, *5 | |
| 0xE805_0000 to 0xE80F_FFFF | Reserved area | — | |
| 0xE803_0000 to 0xE804_FFFF | I/O area | SLV2 *1 | |
| 0xE802_0000 to 0xE802_FFFF | Reserved area | — | |
| 0xE800_0000 to 0xE801_FFFF | I/O area | SLV3 *1 | — |
| 0xE000_0000 to 0xE7FF_FFFF | Reserved area | — | |
| 0x60A0_0000 to 0xDFFF_FFFF | Reserved area | — | |
| 0x6080_0000 to 0x609F_FFFF | On-chip large-capacity RAM page 4 mirror area (2 Mbytes)*9 | SLV7 | SLV7 |
| 0x6060_0000 to 0x607F_FFFF | On-chip large-capacity RAM page 3 mirror area (2 Mbytes)*9 | | SLV6 |
| 0x6040_0000 to 0x605F_FFFF | On-chip large-capacity RAM page 2 mirror area (2 Mbytes)*9 | SLV8 | SLV5 |
| 0x6020_0000 to 0x603F_FFFF | On-chip large-capacity RAM page 1 mirror area (2 Mbytes)*9 | | SLV4 |
| 0x6002_0000 to 0x601F_FFFF | On-chip large-capacity RAM page 0, (including on-chip data retention RAM) mirror area (2 Mbytes)*9 | | SLV3 |
| 0x6000_0000 to 0x6001_FFFF | | | SLV2 |

**Table 5.5 Address Map**

| Address | Area | Slave Area Viewed from North Main Bus Masters | Slave Area Viewed from South Main Bus Masters |
|---|---|---|---|
| 0x5C00_0000 to 0x5FFF_FFFF | SPI multi I/O bus area channel 1 mirror area (64 Mbytes) | SLV7 | SLV0 |
| 0x5800_0000 to 0x5BFF_FFFF | SPI multi I/O bus area channel 0 mirror area (64 Mbytes) | | SLV1 |
| 0x5400_0000 to 0x57FF_FFFF | CS5 space mirror area (64 Mbytes) | | SLV0 |
| 0x5000_0000 to 0x53FF_FFFF | CS4 space mirror area (64 Mbytes) | | |
| 0x4C00_0000 to 0x4FFF_FFFF | CS3 space mirror area (64 Mbytes) | | |
| 0x4800_0000 to 0x4BFF_FFFF | CS2 space mirror area (64 Mbytes) | | |
| 0x4400_0000 to 0x47FF_FFFF | CS1 space mirror area (64 Mbytes) | | |
| 0x4000_0000 to 0x43FF_FFFF | CS0 space mirror area (64 Mbytes) | | |
| 0x3FFF_C000 to 0x3FFF_FFFF | I/O area | SLV8 | SLV0 |
| 0x3FEF_C000 to 0x3FFF_BFFF | Reserved area | — | — |
| 0x3FEF_B000 to 0x3FEF_BFFF | I/O area | SLV8 | SLV0 |
| 0x3FEF_A000 to 0x3FEF_AFFF | I/O area | | SLV1 |
| 0x20A0_0000 to 0x3FEF_9FFF | Reserved area | — | — |
| 0x2090_0000 to 0x209F_FFFF | On-chip large-capacity RAM page 4 lower area (1 Mbyte)*9, *10 | SLV7 | SLV7 |
| 0x2080_0000 to 0x208F_FFFF | On-chip large-capacity RAM page 3 lower area (1 Mbyte)*9, *10 | | SLV6 |
| 0x2070_0000 to 0x207F_FFFF | On-chip large-capacity RAM page 2 lower area (1 Mbyte)*9, *10 | SLV8 | SLV5 |
| 0x2060_0000 to 0x206F_FFFF | On-chip large-capacity RAM page 1 lower area (1 Mbyte)*9, *10 | | SLV4 |
| 0x2050_0000 to 0x205F_FFFF | On-chip large-capacity RAM page 0 lower area (1 Mbyte)*9, *10 | | SLV3 |
| 0x2040_0000 to 0x204F_FFFF | On-chip large-capacity RAM page 4 upper area (1 Mbyte)*10 | SLV7 | SLV7 |
| 0x2030_0000 to 0x203F_FFFF | On-chip large-capacity RAM page 3 upper area (1 Mbyte)*10 | | SLV6 |
| 0x2020_0000 to 0x202F_FFFF | On-chip large-capacity RAM page 2 upper area (1 Mbyte)*10 | SLV8 | SLV5 |
| 0x2010_0000 to 0x201F_FFFF | On-chip large-capacity RAM page 1 upper area (1 Mbyte)*10 | | SLV4 |
| 0x2002_0000 to 0x200F_FFFF | On-chip large-capacity RAM page 0 upper area (including on-chip data retention RAM) (1 Mbyte)*10 | | SLV3 |
| 0x2000_0000 to 0x2001_FFFF | | | SLV2 |

**Table 5.5 Address Map**

| Address | Area | Slave Area Viewed from North Main Bus Masters | Slave Area Viewed from South Main Bus Masters |
|---|---|---|---|
| 0x1C00_0000 to 0x1FFF_FFFF | SPI multi I/O bus area channel 1 (64 Mbytes) | SLV8 | SLV0 |
| 0x1800_0000 to 0x1BFF_FFFF | SPI multi I/O bus area channel 0 (64 Mbytes) | | SLV1 |
| 0x1400_0000 to 0x17FF_FFFF | CS5 space (64 Mbytes) | | SLV0 |
| 0x1000_0000 to 0x13FF_FFFF | CS4 space (64 Mbytes) | | |
| 0x0C00_0000 to 0x0FFF_FFFF | CS3 space (64 Mbytes) | | |
| 0x0800_0000 to 0x0BFF_FFFF | CS2 space (64 Mbytes) | | |
| 0x0400_0000 to 0x07FF_FFFF | CS1 space (64 Mbytes) | | |
| 0x0000_0000 to 0x03FF_FFFF | CS0 space (64 Mbytes) | | |

Note 1. Only Cortex-A9, the direct memory access controller, and CoreSight can access this area. If any other north main bus master accesses this area, a decode error will occur.
Note 2. Only Cortex-A9 and CoreSight can access this area. If any other north main bus master accesses this area, a decode error will occur.
Note 3. If any address from 0xE821_5800 to 0xE822_FFFF is accessed, a decode error or slave error will occur.
Note 4. A slave error may occur depending on the CoreSight state.
Note 5. If this area is accessed while the OpenVG™-compliant Renesas graphics processor is in module standby state, a slave error will occur.
Note 6. If the on-chip large-capacity RAM is accessed while access is disabled, a slave error will occur.
Note 7. If the area indicated as "—" is accessed, a decode error or a slave error will occur.
Note 8. I/O areas should be accessed in the size specified for each slave module.
Note 9. This area is reserved in the RZ/A1M.
Note 10. "Upper" and "lower" in the table represent the 1-Mbyte areas with higher and lower addresses in the normal on-chip large-capacity RAM for each page, respectively. Note that they do not reflect the physical configuration of the RAM. For the physical configuration of the RAM, see section 53, On-Chip RAM.

## 5.5 Address Remapping

### 5.5.1 Overview

Execution in Cortex-A9 jumps to an exception vector placed in addresses 0x0000_0000 to 0x0000_001C when an exception such as a reset or an interrupt occurs. The interrupt response time depends on the time to access the memory connected to this area, and when low-speed memory is connected, the overhead is large. To avoid this, the exception vectors can be remapped to the on-chip high-speed RAM by using the MMU or vector base address register, or the address remapping function can be used to allocate the addresses where the exception vectors are placed to the on-chip high-speed RAM.

Figure 5.4 show the address maps before and after address remapping.

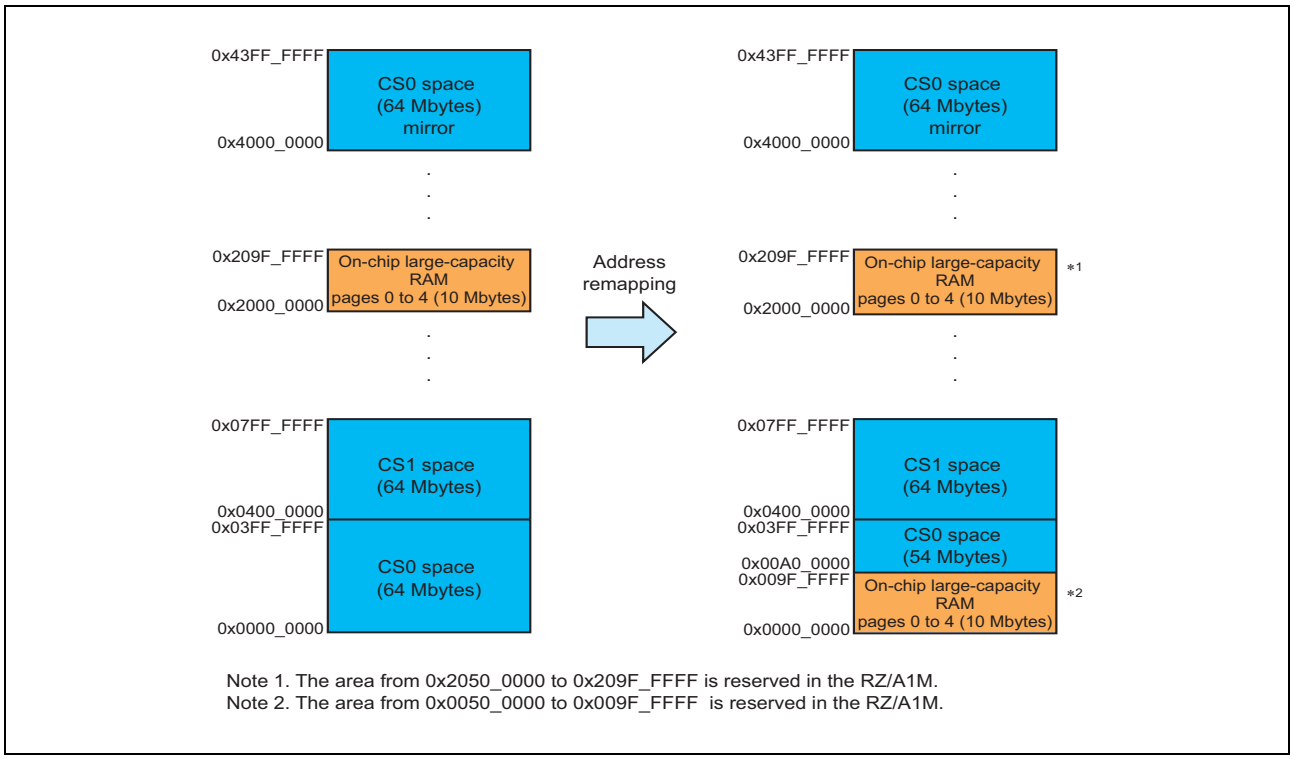

**Figure 5.4 Address Remapping**

### 5.5.2 Operation

Addresses are remapped by setting the AXI128 bit in the remap register to 0. After address remapping, pages 0 to 4 of the on-chip large-capacity RAM are allocated to addresses 0x0000_0000 to 0x009F_FFFF (0x0000_0000 to 0x004F_FFFF for the RZ/A1M). To access the CS0 space after address remapping, use the mirror area for the CS0 space.

During address remapping, access to addresses 0x0000_0000 to 0x009F_FFFF (0x0000_0000 to 0x004F_FFFF for the RZ/A1M) is prohibited. Accordingly, to modify the remap register, use the following steps.

(1) Stop the bus masters except for Cortex-A9,
or make settings so that addresses 0x0000_0000 to 0x009F_FFFF (0x0000_0000 to 0x004F_FFFF for the RZ/A1M) are never accessed.
(2) Execute a program outside addresses 0x0000_0000 to 0x009F_FFFF (0x0000_0000 to 0x004F_FFFF for the RZ/A1M).
(3) After modifying the value of the remap register, execute a dummy read of the remap register.

## 5.6 AXI Interconnect

### 5.6.1 Configuration

The AXI interconnect in this LSI has a multi-layer configuration in all channels (five channels).
Figure 5.5 shows a conceptual diagram of the AXI interconnect configuration.

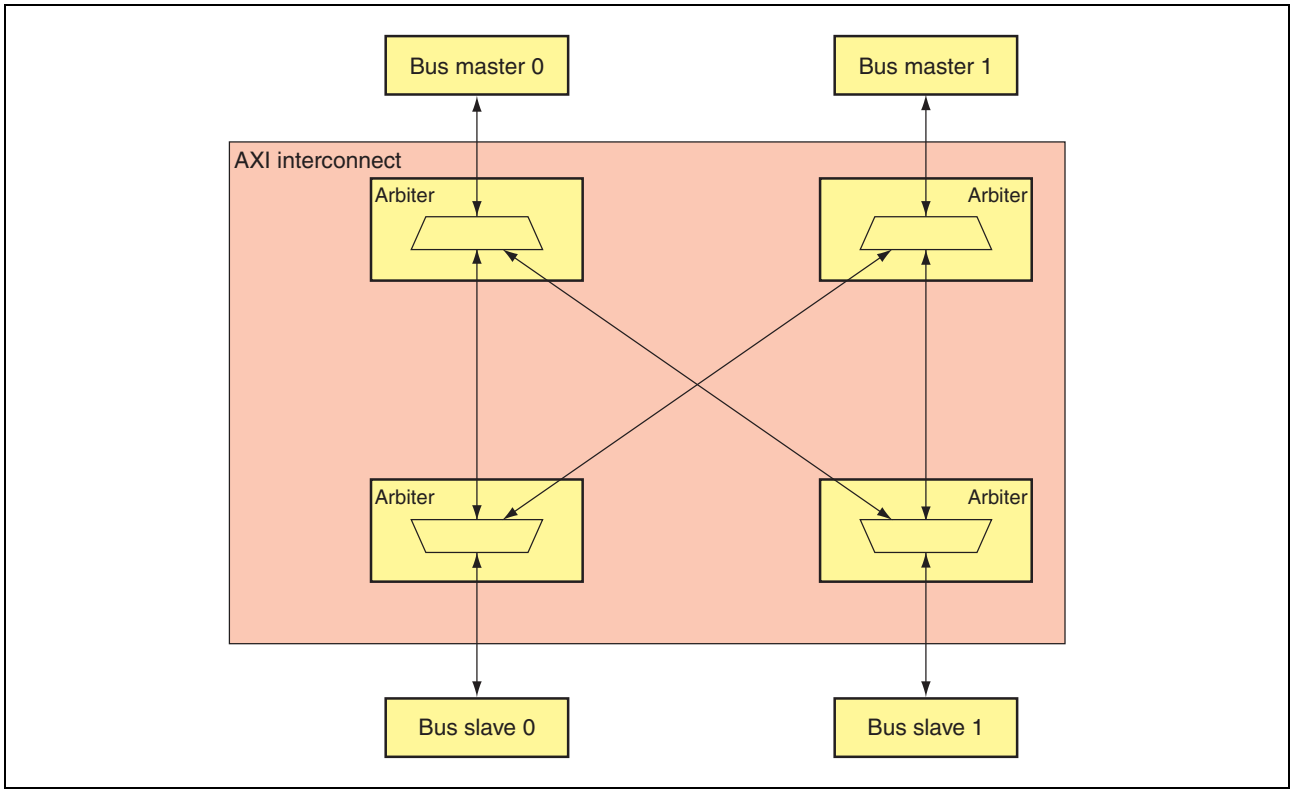

**Figure 5.5 Conceptual Diagram of AXI Interconnect Configuration**

### 5.6.2 Operation

In the AXI interconnect, the necessary wiring is prepared for connection between all bus masters and all bus slaves in all channels. When bus masters and slaves access bus slaves and masters, transfer will proceed after bus arbitration by the arbiter. The bus mastership priority changes in a round-robin manner. When multiple bus masters or slaves access different bus slaves or masters, multiple accesses can be executed in parallel. However, when multiple bus masters or slaves access a single bus slave or master at the same time, the bus arbiter executes bus arbitration. When a bus master or slave cannot obtain the bus mastership, it enters a wait state until the bus master or slave that has the bus mastership completes transfer unless the access destination bus master or slave cannot accept multiple transfers. When the destination bus master or slave can accept multiple transfers, bus arbitration is done again with the next transfer timing.

## 5.7 Bus Bridges

Access from the north main bus to the south main bus is executed through a bus bridge. There are two bus bridges and which bus bridge is used is determined depending on the slave area to be accessed. For assignment of the slave areas to be accessed, see Table 5.5, Address Map.
Each bus bridge can accept up to eight transfers at the same time. Out-of-order transfer is also supported. Therefore, when access to low-speed external ROM and access to on-chip high-speed RAM from different bus masters occur sequentially in this order, the on-chip RAM access can be done without waiting for completion of the previous external ROM access completion.

## 5.8 AXI Protocol Control Signals

The AXI protocol control signals can be set as desired for each bus master. For details of the AXI protocol control signals, refer to the AMBA AXI Protocol Specification prepared by Arm Ltd.

### 5.8.1 Bus Masters other than Cortex-A9, CoreSight, and the Direct Memory Access Controller

#### (1) Cache control signals (ARCACHE[3:0], AWCACHE[3:0])

Use the AXI bus control register (AXIBUSCTL) to make settings of the ARCACHE[3:0] and AWCACHE[3:0] signals for each bus master. Be sure to make settings while the target bus master does not use the AXI bus.

#### (2) Response signals (RRESP[1:0], BRESP[1:0])

Use the AXI bus response error status register (AXIRERRST) to read the RRESP[1:0] and BRESP[1:0] signals received by each bus master. The register value is updated when a response error occurs. The status register value can be cleared to 00 through the AXI bus response error clear register (AXIRERRCLR).
In addition, enabling interrupts through the AXI bus response error interrupt control register (AXIRERRCTL) allows an interrupt to be generated when a response error occurs.
This interrupt should be used only for debugging purposes. Make sure that no response error occurs during system operation.

#### (3) Protection unit information (ARPROT[2:0], AWPROT[2:0])

Signals ARPROT[2:0] and AWPROT[2:0] are fixed as follows and cannot be modified.
ARPROT[2], AWPROT[2]: 0 (data access)
ARPROT[1], AWPROT[1]: 1* (non-secure access)
ARPROT[0], AWPROT[0]: 0 (normal access)
Note: * For the EthernetAVB, signals ARPROT[1] and AWPROT[1] are fixed to 0 (secure access).

#### (4) Atomic access (ARLOCK[1:0], AWLOCK[1:0])

Signals ARLOCK[1:0] and AWLOCK[1:0] are fixed as follows and cannot be modified.
ARLOCK[1:0], AWLOCK[1:0]: 00 (normal access)

### 5.8.2 Cortex-A9

For details on the Cortex-A9, refer to the Arm Architecture Reference Manual.

### 5.8.3 CoreSight

For details on CoreSight, refer to the technical reference manual issued by Arm Ltd.
The bus master side (AHB access port) of CoreSight is connected to the main bus via the AHB-AXI bus conversion circuit.
The signals are converted as follows for connection to the AXI bus.

#### (1) Cache control (ARCACHE[3:0], AWCACHE[3:0])

ARCACHE[3], AWCACHE[3]: 0 when HPROT[3] is 0, 1 when HPROT[3] is 1.
ARCACHE[2], AWCACHE[2]: 0 when HPROT[3] is 0, 1 when HPROT[3] is 1.
ARCACHE[1], AWCACHE[1]: Value of HPROT[3] (cacheable)
ARCACHE[0], AWCACHE[0]: Value of HPROT[2] (bufferable)

#### (2) Response unit (RRESP[1:0], BRESP[1:0])

OKAY is returned when RRESP[1:0] and BRESP[1:0] are 00 or 01.
ERROR is returned when RRESP[1:0] and BRESP[1:0] are 10 or 11.

#### (3) Protection unit information (ARPROT[2:0], AWPROT[2:0])

ARPROT[2], AWPROT[2]: Inverse of HPROT[0] (data/opcode)
ARPROT[1], AWPROT[1]: Fixed to 1 (non-secure access)
ARPROT[0], AWPROT[0]: Value of HPROT[1] (privileged)

#### (4) Atomic access (ARLOCK[1:0], AWLOCK[1:0])

ARLOCK[1:0], AWLOCK[1:0]: Fixed to 00 (normal access)

### 5.8.4 Direct Memory Access Controller

For details on the direct memory access controller, refer to section 9, Direct Memory Access Controller.

### 5.8.5 Slave Area

The control signals are handled as follows by the modules in the slave area.

#### (1) Cache control (ARCACHE[3:0], AWCACHE[3:0])

The L2 cache memory and write buffer refer to these signals. Other modules in the slave area do not refer to them.

#### (2) Response unit (RRESP[1:0], BRESP[1:0])

See Table 5.5, Address Map.

#### (3) Protection unit information (ARPROT[2:0], AWPROT[2:0])

ARPROT[2], AWPROT[2] (instruction/data): The modules in the slave area do not refer to these signals.
ARPROT[1], AWPROT[1] (non-secure/secure): The interrupt controller and L2 cache memory refer to these signals. Other modules in the slave area do not refer to them.
ARPROT[0], AWPROT[0] (privileged/user): The modules in the slave area do not refer to these signals.

#### (4) Atomic access (ARLOCK[1:0], AWLOCK[1:0])

This LSI does not support atomic access. Signals ARLOCK[1:0] and AWLOCK[1:0] should be fixed to 00 for normal access by the bus master.*

Note: * This restriction means that instructions for exclusive access (LDREX, STREX, LDREXB, STREXB, LDREXD, STREXD, LDREXH, STREXH) and semaphore instructions (SWP, SWPB) cannot be used by the Cortex-A9 in the internal non-cacheable areas.

## 5.9 Write Buffers

A write buffer is provided at each connection between the north main bus and a peripheral bus and at each connection between the media local bus and the north main bus, and CoreSight and the north main bus. When the AWCACHE[1:0] cache control signals are set to cache-enabled or buffer-enabled (either of the AWCACHE[1:0] signals is set to 1), the write buffer sends a write completion response to the bus master before accessing the slave area under the write buffer. At this time, even if a slave error response is returned from the slave area to be accessed, it is ignored.

## 5.10 Register Descriptions

Table 5.6 shows the registers related to the internal bus.

**Table 5.6 Register Configuration**

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| Remap register | RMPR | R/W | H'0000_0003 | H'FCFE_1A00 | 32 |
| AXI bus control register 0 | AXIBUSCTL0 | R/W | H'0000_0000 | H'FCFE_1A04 | 32 |
| AXI bus control register 1 | AXIBUSCTL1 | R/W | H'0000_0000 | H'FCFE_1A08 | 32 |
| AXI bus control register 2 | AXIBUSCTL2 | R/W | H'0000_0000 | H'FCFE_1A0C | 32 |
| AXI bus control register 3 | AXIBUSCTL3 | R/W | H'0000_0000 | H'FCFE_1A10 | 32 |
| AXI bus control register 4 | AXIBUSCTL4 | R/W | H'0000_0000 | H'FCFE_1A14 | 32 |
| AXI bus control register 5 | AXIBUSCTL5 | R/W | H'0000_0000 | H'FCFE_1A18 | 32 |
| AXI bus control register 6 | AXIBUSCTL6 | R/W | H'0000_0000 | H'FCFE_1A1C | 32 |
| AXI bus control register 7 | AXIBUSCTL7 | R/W | H'0000_0000 | H'FCFE_1A20 | 32 |
| AXI bus control register 8 | AXIBUSCTL8 | R/W | H'0000_0000 | H'FCFE_1A24 | 32 |
| AXI bus control register 9 | AXIBUSCTL9 | R/W | H'0000_0000 | H'FCFE_1A28 | 32 |
| AXI bus control register 10 | AXIBUSCTL10 | R/W | H'0000_0000 | H'FCFE_1A2C | 32 |
| AXI bus response error interrupt control register 0 | AXIRERRCTL0 | R/W | H'0000_0000 | H'FCFE_1A30 | 32 |
| AXI bus response error interrupt control register 1 | AXIRERRCTL1 | R/W | H'0000_0000 | H'FCFE_1A34 | 32 |
| AXI bus response error interrupt control register 2 | AXIRERRCTL2 | R/W | H'0000_0000 | H'FCFE_1A38 | 32 |

## 5.10.1 Remap Register (RMPR)

This register controls the address remapping function.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | AXI128 | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1 | AXI128 | 1 | R/W | AXI128 Address Remapping<br>This bit enables or disables allocation of addresses H’0000_0000 to H’009F_FFFF (H'0000_0000 to H'004F_FFFF for the RZ/A1M) to on-chip RAM pages 0 to 4.<br>0: Address remapping is enabled.<br>1: Address remapping is disabled. |
| 0 | — | 1 | R | Reserved<br>This bit is always read as 1. The write value should always be 1. |

## 5.10.2 AXI Bus Control Register 0 (AXIBUSCTL0)

This register controls the cache operation for the JPEG codec unit and Ethernet controller.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | JCUARCACHE[3:0] | | | | — | — | — | — | JCUAWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | ETHARCACHE[3:0] | | | | — | — | — | — | ETHAWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | JCUARCACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for JPEG Codec Unit<br>These bits specify the system cache operation when the JPEG codec unit performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the JPEG codec unit. Modify the values of these bits only while the JPEG codec unit does not use the internal bus. |
| 23 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 19 to 16 | JCUAWCACHE [3:0] | 0000 | R/W | AWCACHE[3:0] Signals for JPEG Codec Unit<br>These bits specify the system cache operation when the JPEG codec unit performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the JPEG codec unit. Modify the values of these bits only while the JPEG codec unit does not use the internal bus. |
| 15 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | ETHARCACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Ethernet Controller<br>These bits specify the system cache operation when the Ethernet controller performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the Ethernet controller. Modify the values of these bits only while the Ethernet controller does not use the internal bus. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | ETHAWCACHE [3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Ethernet Controller<br>These bits specify the system cache operation when the Ethernet controller performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the Ethernet controller. Modify the values of these bits only while the Ethernet controller does not use the internal bus. |

## 5.10.3 AXI Bus Control Register 1 (AXIBUSCTL1)

This register controls the cache operation for the image renderer (IMR-LS2).

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | IMR20ARCACHE[3:0] | | | | — | — | — | — | IMR20AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | IMR21ARCACHE[3:0] | | | | — | — | — | — | IMR21AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | IMR20ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Image Renderer (IMR-LS2) Channel 0<br>These bits specify the system cache operation when image renderer (IMR-LS2) channel 0 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for image renderer (IMR-LS2) channel 0. Modify the values of these bits only while image renderer (IMR-LS2) channel 0 does not use the internal bus. |
| 23 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 19 to 16 | IMR20AWCACHE[3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Image Renderer (IMR-LS2) Channel 0<br>These bits specify the system cache operation when image renderer (IMR-LS2) channel 0 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for image renderer (IMR-LS2) channel 0. Modify the values of these bits only while image renderer (IMR-LS2) channel 0 does not use the internal bus. |
| 15 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | IMR21ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Image Renderer (IMR-LS2) Channel 1<br>These bits specify the system cache operation when image renderer (IMR-LS2) channel 1 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for image renderer (IMR-LS2) channel 1. Modify the values of these bits only while image renderer (IMR-LS2) channel 1 does not use the internal bus. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | IMR21AWCACHE[3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Image Renderer (IMR-LS2) Channel 1<br>These bits specify the system cache operation when image renderer (IMR-LS2) channel 1 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for image renderer (IMR-LS2) channel 1. Modify the values of these bits only while image renderer (IMR-LS2) channel 1 does not use the internal bus. |

## 5.10.4 AXI Bus Control Register 2 (AXIBUSCTL2)

This register controls the cache operation for the image renderer for display (IMR-LSD) and capture engine unit.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | IMRDARCACHE[3:0] | | | | — | — | — | — | IMRDAWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CEUAWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | IMRDARCACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Image Renderer for Display (IMR-LSD)<br>These bits specify the system cache operation when the image renderer for display (IMR-LSD) performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the image renderer for display (IMR-LSD). Modify the values of these bits only while the image renderer for display (IMR-LSD) does not use the internal bus. |
| 23 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 19 to 16 | IMRDAWCACHE [3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Image Renderer for Display (IMR-LSD)<br>These bits specify the system cache operation when the image renderer for display (IMR-LSD) performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the image renderer for display (IMR-LSD). Modify the values of these bits only while the image renderer for display (IMR-LSD) does not use the internal bus. |
| 15 to 4 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | CEUAWCACHE [3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Capture Engine Unit<br>These bits specify the system cache operation when capture engine unit performs write access. The values of these bits are used as the AWCACHE[3:0] signals for capture engine unit. Modify the values of these bits only while capture engine unit does not use the internal bus. |

## 5.10.5 AXI Bus Control Register 3 (AXIBUSCTL3)

This register controls the cache operation for the OpenVG™-compliant Renesas graphics processor.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | RGP640ARCACHE[3:0] | | | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | RGP641ARCACHE[3:0] | | | | — | — | — | — | RGP641AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | RGP640ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for OpenVG™-Compliant Renesas Graphics Processor AXI640 Bus<br>These bits specify the system cache operation when the AXI640 bus of the OpenVG™-compliant Renesas graphics processor performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the AXI640 bus of the OpenVG™-compliant Renesas graphics processor. Modify the values of these bits only while the OpenVG™-compliant Renesas graphics processor does not use the internal bus. |
| 23 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | RGP641ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for OpenVG™-Compliant Renesas Graphics Processor AXI641 Bus<br>These bits specify the system cache operation when the AXI641 bus of the OpenVG™-compliant Renesas graphics processor performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the AXI641 bus of the OpenVG™-compliant Renesas graphics processor. Modify the values of these bits only while the OpenVG™-compliant Renesas graphics processor does not use the internal bus. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | RGP641AWCACHE[3:0] | 0000 | R/W | AWCACHE[3:0] Signals for OpenVG™-Compliant Renesas Graphics Processor AXI641 Bus<br>These bits specify the system cache operation when the AXI641 bus of the OpenVG™-compliant Renesas graphics processor performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the AXI641 bus of the OpenVG™-compliant Renesas graphics processor. Modify the values of these bits only while the OpenVG™-compliant Renesas graphics processor does not use the internal bus. |

## 5.10.6 AXI Bus Control Register 4 (AXIBUSCTL4)

This register controls the cache operation for the OpenVG™-compliant Renesas graphics processor.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | RGB1282ARCACHE[3:0] | | | | — | — | — | — | RGB1282AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | RGP1280ARCACHE[3:0] | | | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | RGB1282 ARCACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for OpenVG™-Compliant Renesas Graphics Processor AXI1282 Bus<br>These bits specify the system cache operation when the AXI1282 bus of the OpenVG™-compliant Renesas graphics processor performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the AXI1282 bus of the OpenVG™-compliant Renesas graphics processor. Modify the values of these bits only while the OpenVG™-compliant Renesas graphics processor does not use the internal bus. |
| 23 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 19 to 16 | RGB1282 AWCACHE [3:0] | 0000 | R/W | AWCACHE[3:0] Signals for OpenVG™-Compliant Renesas Graphics Processor AXI1282 Bus<br>These bits specify the system cache operation when the AXI1282 bus of the OpenVG™-compliant Renesas graphics processor performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the AXI1282 bus of the OpenVG™-compliant Renesas graphics processor. Modify the values of these bits only while the OpenVG™-compliant Renesas graphics processor does not use the internal bus. |
| 15 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | RGP1280A RCACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for OpenVG™-Compliant Renesas Graphics Processor AXI1280 Bus<br>These bits specify the system cache operation when the AXI1280 bus of the OpenVG™-compliant Renesas graphics processor performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the AXI1280 bus of the OpenVG™-compliant Renesas graphics processor. Modify the values of these bits only while the OpenVG™-compliant Renesas graphics processor does not use the internal bus. |
| 7 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

## 5.10.7 AXI Bus Control Register 5 (AXIBUSCTL5)

This register controls the cache operation for the OpenVG™-compliant Renesas graphics processor and media local bus.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | RGP1281ARCACHE[3:0] | | | | — | — | — | — | RGP1281AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MLBAXCACHE [1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | RGP1281ARCACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for OpenVG™-Compliant Renesas Graphics Processor AXI1281 Bus<br>These bits specify the system cache operation when the AXI1281 bus of the OpenVG™-compliant Renesas graphics processor performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the AXI1281 bus of the OpenVG™-compliant Renesas graphics processor. Modify the values of these bits only while the OpenVG™-compliant Renesas graphics processor does not use the internal bus. |
| 23 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 19 to 16 | RGP1281AWCACHE [3:0] | 0000 | R/W | AWCACHE[3:0] Signals for OpenVG™-Compliant Renesas Graphics Processor AXI1281 Bus<br>These bits specify the system cache operation when the AXI1281 bus of the OpenVG™-compliant Renesas graphics processor performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the AXI1281 bus of the OpenVG™-compliant Renesas graphics processor. Modify the values of these bits only while the OpenVG™-compliant Renesas graphics processor does not use the internal bus. |
| 15 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1, 0 | MLBAXCACHE [1:0] | 00 | R/W | AWCACHE[3:0] and ARCACHE[3:0] Signals for Media Local Bus<br>These bits specify the system cache operation when the media local bus performs read or write access. The values of these bits are used as the AWCACHE[3:0] and ARCACHE[3:0] signals for the media local bus.<br>The MLBAXCACHE[0] value is used as ARCACHE[0] and AWCACHE[0] without change.<br>When MLBAXCACHE[1] = 0, the ARCACHE[3:1] and AWCACHE[3:1] signals are all set to 0.<br>When MLBAXCACHE[1] = 1, the ARCACHE[3:1] and AWCACHE[3:1] signals are all set to 1.<br>Modify the values of these bits only while the media local bus does not use the internal bus. |

## 5.10.8 AXI Bus Control Register 6 (AXIBUSCTL6)

This register controls the cache operation for video display controller 5.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC501ARCACHE[3:0] | | | | — | — | — | — | VDC501AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC502ARCACHE[3:0] | | | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | VDC501ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 0 IV3-BUS<br>These bits specify the system cache operation when the IV3-BUS in channel 0 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV3-BUS in channel 0 of video display controller 5. Modify the values of these bits only while channel 0 of video display controller 5 does not use the internal bus. |
| 23 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 19 to 16 | VDC501AWCACHE[3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Video Display Controller 5 Channel 0 IV1-BUS<br>These bits specify the system cache operation when the IV1-BUS in channel 0 of video display controller 5 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the IV1-BUS in channel 0 of video display controller 5. Modify the values of these bits only while channel 0 of video display controller 5 does not use the internal bus. |
| 15 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | VDC502ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 0 IV5-BUS<br>These bits specify the system cache operation when the IV5-BUS in channel 0 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV5-BUS in channel 0 of video display controller 5. Modify the values of these bits only while channel 0 of video display controller 5 does not use the internal bus. |
| 7 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

## 5.10.9 AXI Bus Control Register 7 (AXIBUSCTL7)

This register controls the cache operation for video display controller 5.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC503ARCACHE[3:0] | | | | — | — | — | — | VDC503AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC504ARCACHE[3:0] | | | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | VDC503ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 0 IV4-BUS<br>These bits specify the system cache operation when the IV4-BUS in channel 0 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV4-BUS in channel 0 of video display controller 5. Modify the values of these bits only while channel 0 of video display controller 5 does not use the internal bus. |
| 23 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 19 to 16 | VDC503AWCACHE[3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Video Display Controller 5 Channel 0 IV2-BUS<br>These bits specify the system cache operation when the IV2-BUS in channel 0 of video display controller 5 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the IV2-BUS in channel 0 of video display controller 5. Modify the values of these bits only while channel 0 of video display controller 5 does not use the internal bus. |
| 15 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | VDC504ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 0 IV6-BUS<br>These bits specify the system cache operation when the IV6-BUS in channel 0 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV6-BUS in channel 0 of video display controller 5. Modify the values of these bits only while channel 0 of video display controller 5 does not use the internal bus. |
| 7 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

## 5.10.10 AXI Bus Control Register 8 (AXIBUSCTL8)

This register controls the cache operation for video display controller 5.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC505ARCACHE[3:0] | | | | — | — | — | — | VDC505AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC511ARCACHE[3:0] | | | | — | — | — | — | VDC511AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | VDC505AR CACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 0 IV8-BUS<br>These bits specify the system cache operation when the IV8-BUS in channel 0 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV8-BUS in channel 0 of video display controller 5. Modify the values of these bits only while channel 0 of video display controller 5 does not use the internal bus. |
| 23 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 19 to 16 | VDC505AW CACHE [3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Video Display Controller 5 Channel 0 IV7-BUS<br>These bits specify the system cache operation when the IV7-BUS in channel 0 of video display controller 5 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the IV7-BUS in channel 0 of video display controller 5. Modify the values of these bits only while channel 0 of video display controller 5 does not use the internal bus. |
| 15 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | VDC511AR CACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 1 IV3-BUS<br>These bits specify the system cache operation when the IV3-BUS in channel 1 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV3-BUS in channel 1 of video display controller 5. Modify the values of these bits only while channel 1 of video display controller 5 does not use the internal bus. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | VDC511AW CACHE [3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Video Display Controller 5 Channel 1 IV1-BUS<br>These bits specify the system cache operation when the IV1-BUS in channel 1 of video display controller 5 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the IV1-BUS in channel 1 of video display controller 5. Modify the values of these bits only while channel 1 of video display controller 5 does not use the internal bus. |

## 5.10.11 AXI Bus Control Register 9 (AXIBUSCTL9)

This register controls the cache operation for video display controller 5.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC512ARCACHE[3:0] | | | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC513ARCACHE[3:0] | | | | — | — | — | — | VDC513AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | VDC512ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 1 IV5-BUS<br>These bits specify the system cache operation when the IV5-BUS in channel 1 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV5-BUS in channel 1 of video display controller 5. Modify the values of these bits only while channel 1 of video display controller 5 does not use the internal bus. |
| 23 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | VDC513ARCACHE[3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 1 IV4-BUS<br>These bits specify the system cache operation when the IV4-BUS in channel 1 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV4-BUS in channel 1 of video display controller 5. Modify the values of these bits only while channel 1 of video display controller 5 does not use the internal bus. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | VDC513AWCACHE[3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Video Display Controller 5 Channel 1 IV2-BUS<br>These bits specify the system cache operation when the IV2-BUS in channel 1 of video display controller 5 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the IV2-BUS in channel 1 of video display controller 5. Modify the values of these bits only while channel 1 of video display controller 5 does not use the internal bus. |

## 5.10.12 AXI Bus Control Register 10 (AXIBUSCTL10)

This register controls the cache operation for video display controller 5.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC514ARCACHE[3:0] | | | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | VDC515ARCACHE[3:0] | | | | — | — | — | — | VDC515AWCACHE[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | VDC514ARCACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 1 IV6-BUS<br>These bits specify the system cache operation when the IV6-BUS in channel 1 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV6-BUS in channel 1 of video display controller 5. Modify the values of these bits only while channel 1 of video display controller 5 does not use the internal bus. |
| 23 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | VDC515ARCACHE [3:0] | 0000 | R/W | ARCACHE[3:0] Signals for Video Display Controller 5 Channel 1 IV8-BUS<br>These bits specify the system cache operation when the IV8-BUS in channel 1 of video display controller 5 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV8-BUS in channel 1 of video display controller 5. Modify the values of these bits only while channel 1 of video display controller 5 does not use the internal bus. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | VDC515AWCACHE [3:0] | 0000 | R/W | AWCACHE[3:0] Signals for Video Display Controller 5 Channel 1 IV7-BUS<br>These bits specify the system cache operation when the IV7-BUS in channel 1 of video display controller 5 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the IV7-BUS in channel 1 of video display controller 5. Modify the values of these bits only while channel 1 of video display controller 5 does not use the internal bus. |

## 5.10.13 AXI Bus Response Error Interrupt Control Register 0 (AXIRERRCTL0)

This register controls AXI bus response error interrupts.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | JCURERREN | — | — | — | ETHRERREN | — | — | — | IMR20RERREN | — | — | — | IMR21RERREN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | IMRDRERREN | — | — | — | CEURERREN | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 28 | JCURERREN | 0 | R/W | Response Error Interrupt Enable for JPEG Codec Unit<br>Enables or disables interrupt requests when access from the JPEG codec unit generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 27 to 25 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 24 | ETHRERREN | 0 | R/W | Response Error Interrupt Enable for Ethernet Controller<br>Enables or disables interrupt requests when access from the Ethernet controller generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 23 to 21 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 20 | IMR20RERREN | 0 | R/W | Response Error Interrupt Enable for Image Renderer (IMR-LS2) Channel 0<br>Enables or disables interrupt requests when access from image renderer (IMR-LS2) channel 0 generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 19 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 16 | IMR21RERREN | 0 | R/W | Response Error Interrupt Enable for Image Renderer (IMR-LS2) Channel 1<br>Enables or disables interrupt requests when access from image renderer (IMR-LS2) channel 1 generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 15 to 13 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 12 | IMRDRERREN | 0 | R/W | Response Error Interrupt Enable for Image Renderer for Display (IMR-LSD)<br>Enables or disables interrupt requests when access from the image renderer for display (IMR-LSD) generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 11 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 8 | CEURERREN | 0 | R/W | Response Error Interrupt Enable for Capture Engine Unit<br>Enables or disables interrupt requests when access from capture engine unit generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 7 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

## 5.10.14 AXI Bus Response Error Interrupt Control Register 1 (AXIRERRCTL1)

This register controls AXI bus response error interrupts.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | RGP640 RERREN | — | — | — | RGP641 RERREN | — | — | — | RGP1282 RERREN | — | — | — | RGP1280 RERREN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | RGP1281 RERREN | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 28 | RGP640 RERREN | 0 | R/W | Response Error Interrupt Enable for OpenVG™-Compliant Renesas Graphics Processor AXI640 Bus<br>Enables or disables interrupt requests when access from the AXI640 bus of the OpenVG™-compliant Renesas graphics processor generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 27 to 25 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 24 | RGP641 RERREN | 0 | R/W | Response Error Interrupt Enable for OpenVG™-Compliant Renesas Graphics Processor AXI641 Bus<br>Enables or disables interrupt requests when access from the AXI641 bus of the OpenVG™-compliant Renesas graphics processor generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 23 to 21 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 20 | RGP1282 RERREN | 0 | R/W | Response Error Interrupt Enable for OpenVG™-Compliant Renesas Graphics processor AXI1282 Bus<br>Enables or disables interrupt requests when access from the AXI1282 bus of the OpenVG™-compliant Renesas graphics processor generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 19 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 16 | RGP1280 RERREN | 0 | R/W | Response Error Interrupt Enable for OpenVG™-Compliant Renesas Graphics Processor AXI1280 Bus<br>Enables or disables interrupt requests when access from the AXI1280 bus of the OpenVG™-compliant Renesas graphics processor generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 15 to 13 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 12 | RGP1281 RERREN | 0 | R/W | Response Error Interrupt Enable for OpenVG™-Compliant Renesas Graphics Processor AXI1281 Bus<br>Enables or disables interrupt requests when access from the AXI1281 bus of the OpenVG™-compliant Renesas graphics processor generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 11 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

## 5.10.15 AXI Bus Response Error Interrupt Control Register 2 (AXIRERRCTL2)

This register controls AXI bus response error interrupts.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | VDC501 RERREN | — | — | — | VDC502 RERREN | — | — | — | VDC503 RERREN | — | — | — | VDC504 RERREN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | VDC505 RERREN | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 28 | VDC501 RERREN | 0 | R/W | Response Error Interrupt Enable for Video Display Controller 5 Channel 0 IV1/3-BUS<br>Enables or disables interrupt requests when access from the IV1-BUS or IV3-BUS in channel 0 of video display controller 5 generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 27 to 25 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 24 | VDC502 RERREN | 0 | R/W | Response Error Interrupt Enable for Video Display Controller 5 Channel 0 IV5-BUS<br>Enables or disables interrupt requests when access from the IV5-BUS in channel 0 of video display controller 5 generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 23 to 21 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 20 | VDC503 RERREN | 0 | R/W | Response Error Interrupt Enable for Video Display Controller 5 Channel 0 IV2/4-BUS<br>Enables or disables interrupt requests when access from the IV2-BUS or IV4-BUS in channel 0 of video display controller 5 generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 19 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 16 | VDC504 RERREN | 0 | R/W | Response Error Interrupt Enable for Video Display Controller 5 Channel 0 IV6-BUS<br>Enables or disables interrupt requests when access from the IV6-BUS in channel 0 of video display controller 5 generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 15 to 13 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 12 | VDC505 RERREN | 0 | R/W | Response Error Interrupt Enable for Video Display Controller 5 Channel 0 IV7/8-BUS<br>Enables or disables interrupt requests when access from the IV7-BUS or IV8-BUS in channel 0 of video display controller 5 generates a response error.<br>0: Interrupt requests are disabled.<br>1: Interrupt requests are enabled. |
| 11 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

## 5.10.16 AXI Bus Response Error Interrupt Control Register 3 (AXIRERRCTL3)

This register controls AXI bus response error interrupts.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | VDC511 RERREN | — | — | — | VDC512 RERREN | — | — | — | VDC513 RERREN | — | — | — | VDC514 RERREN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | VDC515 RERREN | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |

## 5.11 Interrupt Request

When a decode error or a slave error occurs, an AXI bus response error interrupt request (PRRI) is issued.
An interrupt request is issued when a response is returned from the bus for which interrupt requests are enabled through the AXI bus response error interrupt control register (AXIRERRCTL). To check the response error type, read the AXI bus response error status register (AXIRERRST). To clear the interrupt request, clear the AXI bus response error status register through the AXI bus response error clear register (AXIRERRCLR).
This interrupt should be used only for debugging purposes. Make sure that no response error occurs during system operation.

# 6. Clock Pulse Generator

This LSI has a clock pulse generator that generates a CPU clock (Iφ), image processing clock (Gφ), internal bus clock (Bφ), peripheral clock 1 (P1φ), and peripheral clock 0 (P0φ). The clock pulse generator consists of a crystal oscillator, PLL circuits, and divider circuits.

## 6.1 Features

- Clock types
  A CPU clock (Iφ); an image processing clock (Gφ); an internal bus clock (Bφ); peripheral clock 1 (P1φ = CKIO) for the external bus interface; peripheral clock 0 (P0φ) for the on-chip peripheral modules
- Frequency change function
  CPU and image processing clock frequencies can be changed independently using the PLL (phase locked loop) circuits and divider circuits within this module. Frequencies are changed by software using frequency control register (FRQCR, FRQCR2) settings.
- Power-down mode control
  The clock can be stopped in sleep mode, software standby mode, and deep standby mode, and specific modules can be stopped using the module standby function. For details on clock control in the power-down modes, see section 55, Power-Down Modes.
- SSCG function
  The CPU's internal PLL (phase locked loop) circuit includes an SSCG (spread spectrum clock generator).
  The SSCG can be used to decrease the peak value of EMI (electromagnetic interference) noise by frequency modulation, that is, by slightly modulating the output frequency.
  The specification of the SSCG for this LSI is as follows.
  —Specification of SSCG
    (1) Modulation waveform (modulation profile): Triangle wave
    (2) Type of spreading: Down-spreading
    (3) Modulation rate: -3.3% (clock mode 0), -3.1% (clock mode 1)
    (4) Modulation frequency: 20.00 to 26.67 kHz (frequency on the EXTAL pin ÷ 500)
    24.00 kHz (frequency on the USB_X1 pin x (1/4) ÷ 500)

Figure 6.1 shows a block diagram of the clock pulse generator.

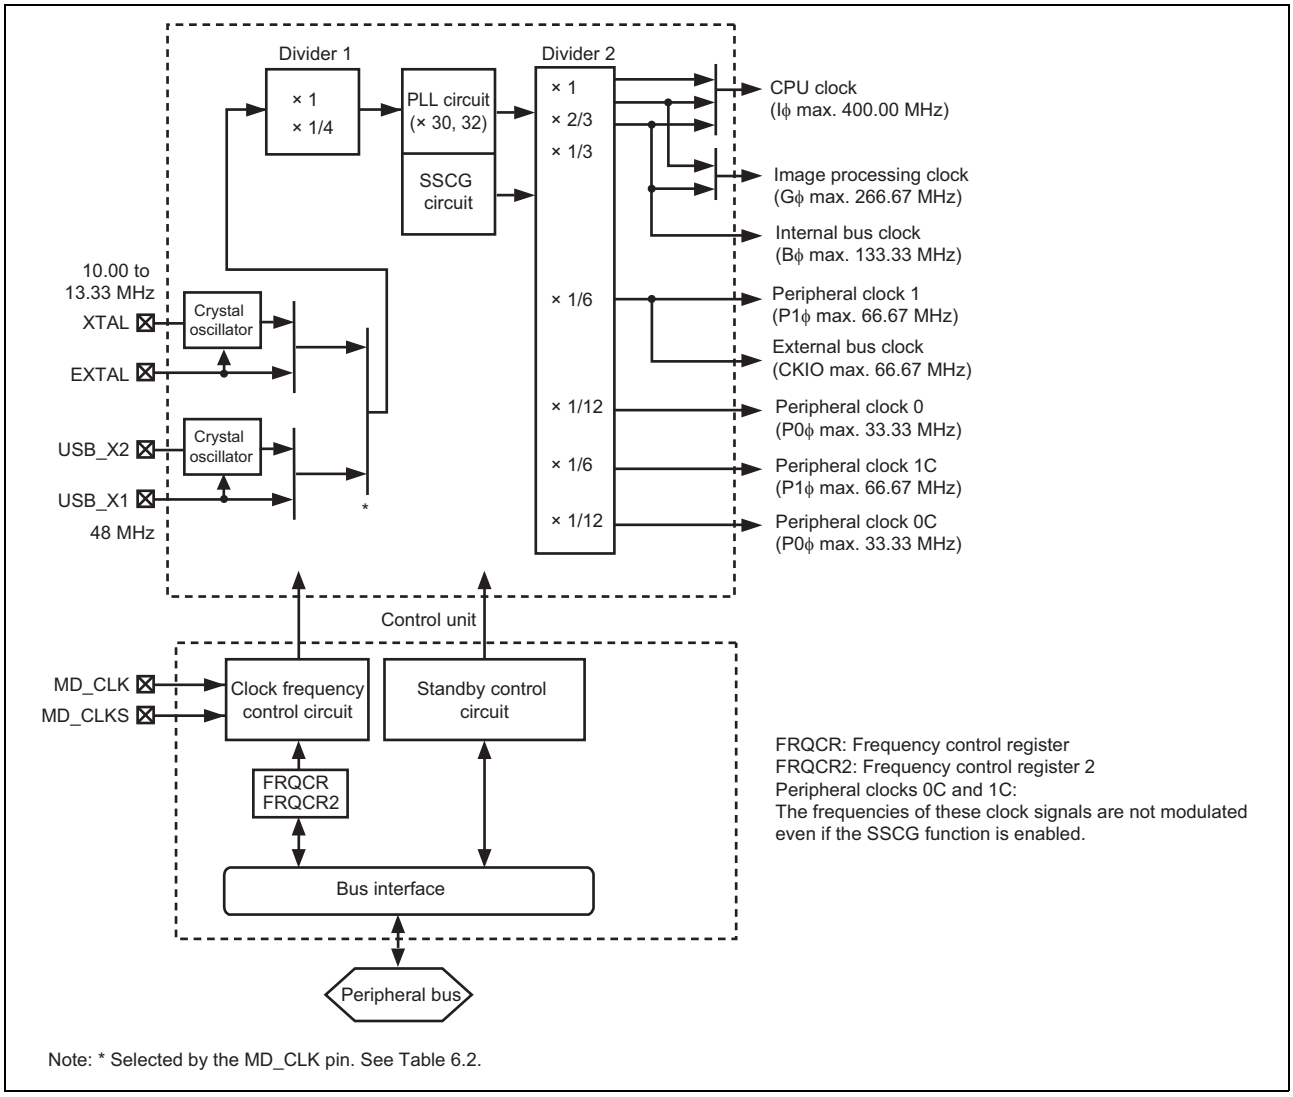

**Figure 6.1 Block Diagram**

The blocks of this module function as follows:

### (1) Crystal Oscillator

A crystal oscillator is connected to the XTAL and EXTAL pins or to the USB_X2 and USB_X1 pins. Either the EXTAL or USB_X1 pin is selected by the clock mode settings.

### (2) PLL Circuit

The PLL circuit is capable of multiplying the frequency of the input clock signal from the EXTAL pin by 30. If the input clock signal from the USB_X1 pin is selected, the frequency is multiplied by 32.

### (3) Divider 1 and Divider 2

The ratio for frequency division by divider 1 is fixed to 1/1 for the input from the EXTAL pin and 1/4 for the input from the USB_X1 pin.
Divider 2 generates a clock signal whose operating frequency can be used for the CPU clock, image processing clock, internal bus clock, peripheral clock 1, and peripheral clock 0. The division ratio of the CPU clock and the image processing clock is set by the frequency control register (FRQCR, FRQCR2). The division ratios for peripheral clocks 1 and 0 are fixed to 1/6 and 1/12, respectively.

### (4) Clock Frequency Control Circuit

The clock frequency control circuit controls the clock frequency using the frequency control register (FRQCR, FRQCR2).

### (5) Standby Control Circuit

The standby control circuit controls the states of the on-chip oscillation circuit and other modules during clock switching, or, software standby or deep standby mode.
In addition, the standby control register is provided to control the power-down mode of other modules. For details on the standby control register, see section 55, Power-Down Modes.

### (6) Frequency Control Register (FRQCR, FRQCR2)

The frequency control register (FRQCR, FRQCR2) has control bits assigned for the following functions: clock output/non-output from the CKIO pin during software standby mode or deep standby mode and the frequency division ratio of the CPU clock (Iφ) and the image processing clock (Gφ).

### (7) SSCG Circuit

Operation of the SSCG circuit is switched on or off (enabled or disabled) by the MD_CLKS pin. When the SSCG function is disabled, all of the internal clock frequencies are fixed, i.e. not modulated. When the SSCG function is enabled, the frequencies of clock signals supplied to peripheral modules other than those listed below are modulated.

Peripheral modules to which non-modulated clock signals are supplied:
IEBus™ controller, multi-function timer pulse unit 2, serial communications interface with FIFO, CAN interface, OS timer, motor control PWM timer, sound generator, LIN interface, serial communication interface, and LVDS output interface (LVDS PLL circuit only).

## 6.2 Input/Output Pins

Table 6.1 lists the clock pulse generator pins and their functions.

**Table 6.1 Pin Configuration and Functions of the Clock Pulse Generator**

| Pin Name | Symbol | I/O | Function |
|---|---|---|---|
| Mode control pin | MD_CLK | Input | Switches between the EXTAL input and the USB_X1 input. |
| | MD_CLKS | Input | Enables or disables the SSCG circuit. |
| Crystal input/output pins (clock input pins) | XTAL | Output | Connected to the crystal resonator. (Leave this pin open when the crystal resonator is not in use.) |
| | EXTAL | Input | Connected to the crystal resonator or used to input external clock. |
| | USB_X2 | Output | Connected to the crystal resonator. (Leave this pin open when the crystal resonator is not in use.) |
| | USB_X1 | Input | Connected to the crystal resonator or used to input external clock. |
| Clock output pin | CKIO | Output | Clock output pin. |

## 6.3 Clock Mode

Table 6.2 indicates the input/output clock frequency. Table 6.3 shows the usable frequency ranges.

**Table 6.2 Input/Output Clock Frequency**

| Mode | MD_CLK Pin Setting | Clock I/O Source | Output | Divider 1 | PLL Circuit | CKIO Frequency |
|---|---|---|---|---|---|---|
| 0 | 0 | EXTAL/crystal resonator | CKIO | 1 | ON (x 30) | (EXTAL/crystal resonator) x 5 |
| 1 | 1 | USB_X1/crystal resonator | CKIO | 1/4 | ON (x 32) | (USB_X1/crystal resonator) x 4/3 |

In clock mode 0, the clock signal is the input from the EXTAL pin or the crystal oscillator. The PLL circuit shapes waveforms and multiples the frequency, and then supplies the clock to the LSI. The oscillating frequency for the crystal resonator and EXTAL pin input clock ranges from 10 to 13.33 MHz. The frequency range of CKIO is from 50 to 66.67 MHz.

In clock mode 1, the clock signal is the input from the USB_X1 pin or the crystal oscillator. The PLL circuit shapes waveforms and multiples the frequency, and then supplies the clock to the LSI. The oscillating frequency for the crystal resonator and USB_X1 pin input clock is 48 MHz. The frequency of CKIO is 64 MHz.
When changing the frequency, be sure to set the standby_mode_en bit of the power control register in the PL310. For details on the register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
After the setting of IFC[1:0] or GFC[1:0] in the frequency control registers (FRQCR and FRQCR2) is changed, the hardware automatically stops the bus master and starts changing the frequency following the wait for completion of the issuing-finished request from the bus master.
Since processing to change the frequency cannot start if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on.
Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for proceeding to change the frequency is also effective.

**Table 6.3 Settable Frequency Ranges**

| Mode | FRQCR Setting *1 | FRQCR2 Setting *2 | PLL Frequency Multiplier: PLL Circuit | Ratio of Internal Clock Frequencies (I : G : B : P1 : P0)*3 | Selectable Frequency Range (MHz): Input Clock*4 | Output Clock (CKIO Pin) | CPU Clock (Iφ) | Image processing clock (Gφ) | Internal Bus Clock (Bφ) | Peripheral Clock 1 (P1φ) | Peripheral Clock 0 (P0φ) |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 0 | H'x035 | H'0001 | ON (× 30) | 30 : 20 : 10 : 5 : 5/2 | 10.00 to 13.33 | 50.00 to 66.67 | 300.00 to 400.00 | 200.00 to 266.67 | 100.00 to 133.33 | 50.00 to 66.67 | 25.00 to 33.33 |

| | H'x135 | H'0001 | | 16/3 : 16/3 : 8/3 : 4/3 : 2/3 | | | 256.00 | | | | |
| | H'x035 | H'0003 | | 8 : 8/3 : 8/3 : 4/3 : 2/3 | | | 384.00 | 128.00 | | | |
| | H'x135 | H'0003 | | 16/3 : 8/3 : 8 /3 : 4/3 : 2/3 | | | 256.00 | | | | |
| | H'x335 | H'0003 | | 8/ 3 : 8/3 : 8/3 : 4/3 : 2/3 | | | 128.00 | | | | |

Note 1. x in the FRQCR register setting depends on the set value in bits 12, 13, and 14.
Note 2. When using an image renderer, image renderer for display, or Renesas graphics processor for OpenVG™, be sure to set the FRQCR2 register to H'0001.
Note 3. The ratio of clock frequencies, where the input clock frequency is assumed to be 1.
Note 4. In clock mode 0, the frequency of the EXTAL pin input clock or the crystal resonator.
In clock mode 1, the frequency of the USB_X1 pin input clock or the crystal resonator.

Caution: Do not use this LSI for frequency settings other than those in Table 6.3.

The clock source of the chip is switched by the setting of the MD_CLK pin while the $\overline{\text{RES}}$ pin is being held low. The following table shows the correspondence between clock source and pin settings.

**Table 6.4 Clock Source Selection**

| MD_CLK Pin Setting | Clock Source |
|---|---|
| 0 | EXTAL/crystal resonator |
| 1 | USB_X1/crystal resonator |

The SSCG function of the chip is switched on or off by the setting of the MD_CLKS pin while the $\overline{\text{RES}}$ pin is being held low. The following table shows the correspondence between SSCG operation and pin settings. Note that the pin setting does not affect the PLL frequency multipliers and division ratios for individual clock signals.

**Table 6.5 SSCG Operation Setting**

| MD_CLKS Pin Setting | SSCG Operation |
|---|---|
| 0 | Off |
| 1 | On |

## 6.4 Register Descriptions

Table 6.6 shows the register configuration of the clock pulse generator.

**Table 6.6 Register Configuration**

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| Frequency control register | FRQCR | R/W | H'0335 | H'FCFE0010 | 16 |
| | FRQCR2 | R/W | H'0003 | H'FCFE0014 | 16 |

### 6.4.1 Frequency Control Register (FRQCR)

FRQCR is a 16-bit readable/writable register used to specify whether a clock is output from the CKIO pin during normal operation mode, change of gain of crystal oscillator for the XTAL pin, software standby mode, deep standby mode, and standby mode cancellation. The register specifies the frequency division ratio for the CPU clock (Iφ). FRQCR can be accessed in 16-bit units.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | CKOEN2 | CKOEN[1:0] | | - | - | IFC[1:0] | | - | - | - | - | - | - | - | - |

| 0 | — | 1 | R | Reserved<br>This bit is always read as 1. The write value should always be 1. |

**Table 6.7 CKOEN[1:0] Settings**

| Setting | Normal Operation | Software Standby Mode | Deep Standby Mode* |
|---|---|---|---|
| 00 | Output | Output off (Hi-Z) | Output off (Hi-Z) |
| 01 | Output | Low-level output | Low-level output |
| 10 | Output | Output (unstable clock output) | Low-level or high-level output |
| 11 | Output off (Hi-Z) | Output off (Hi-Z) | Output off (Hi-Z) |

Note: * Note that the first cycle of the output CKIO clock may be missing after release from deep standby.

### 6.4.2 Frequency Control Register 2 (FRQCR2)

FRQCR2 is a 16-bit readable/writable register used to specify the frequency division ratio for the image processing clock (Gφ). FRQCR2 can be accessed in 16-bit units.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | GFC[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 2 | — | All 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 1, 0 | GFC[1:0] | 11 | R/W | Image Processing Clock Frequency Division Ratio<br>These bits specify the frequency division ratio of the image processing clock with respect to the output frequency of PLL circuit. Note: See section 6.5.1.<br>00: Reserved (setting prohibited)<br>01: 2/3 time<br>10: Reserved (setting prohibited)<br>11: 1/3 time |

## 6.5 Changing the Frequency

The frequency of the CPU clock (Iφ) and image processing clock (Gφ) can be changed by changing the division rate of divider. The division rate can be changed by software through the frequency control register (FRQCR, FRQCR2).

### 6.5.1 Changing the Division Ratio

The division rate of divider can be changed by the following operation.

1. In the initial state, IFC[1:0] = B'11 and GFC[1:0] = B'11.
2. Set the desired value in the IFC[1:0] and GFC[1:0] bits. Note that if the wrong value is set, this LSI will malfunction. If the setting of FRQCR2 is H'0001, change FRQCR to H'x035 or H'x135 before making these settings. In this case, setting FRQCR to H'x335 is prohibited. The settings should be such that the clock frequency of Gφ is no higher than that of Iφ.
3. After the register bits (IFC[1:0] and GFC[1:0]) have been set, the clock is supplied of the new division ratio.

Note: When executing the WFI instruction after changing the frequency, be sure to read the frequency control registers (FRQCR and FRQCR2) to confirm that the new settings are in place and read the ISBUSY0 bit in the CPU status register (CPUSTS) to confirm that it is set to 0 beforehand.
For the CPUSTS register, see section 55, Power-Down Modes.

## 6.6 Usage of the Clock Pins

For the connection of a crystal resonator or the input of a clock signal, this LSI circuit has the pins listed in Table 6.8. With regard to these pins, take care on the following points. Furthermore, Xin pin and Xout pin are used in this section to refer to the pins listed in the table.

**Table 6.8 Clock Pins**

| Xin Pins (Used for Connection of a Crystal Resonator and Input of External Clock Signals) | Xout Pins (Used for Connection of a Crystal Resonator) |
|---|---|
| EXTAL | XTAL |
| USB_X1 | USB_X2 |
| AUDIO_X1 | AUDIO_X2 |
| RTC_X1 | RTC_X2 |
| RTC_X3 | RTC_X4 |
| VIDEO_X1 | VIDEO_X2 |

### 6.6.1 In the Case of Inputting an External Clock

An example of the connection of an external clock is shown in Figure 6.2. In cases where the Xout pin is left open state, take the parasitic capacitance as less than 10 pF.

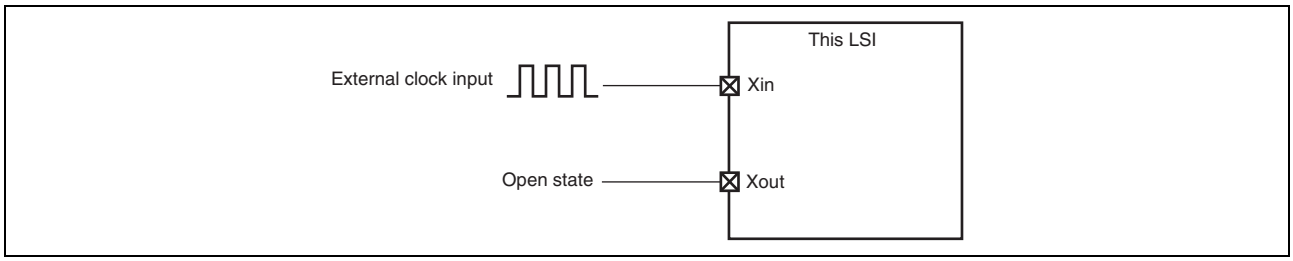

**Figure 6.2 Example of the Connection of an External Clock**

### 6.6.2 In the Case of Using a Crystal Resonator

An example of the connection of crystal resonator is shown in Figure 6.3.

Place the crystal resonator and capacitors (CL1 and CL2) as close to pins Xin and Xout as possible. Furthermore, to avoid inductance so that oscillation is correct, use the points where the capacitors are connected to the crystal resonator in common and do not place wiring patterns close to these components.

Since the design of the user board is closely connected with the effective characteristics of the crystal resonator, refer to the example of connection of the crystal resonator that is introduced in this section and perform thorough evaluation on the user side as well. The rated value of the crystal resonator will vary with the floating capacitances and so on of the crystal resonator and mounted circuit, so proceed with decisions on the basis of full discussions with the maker of the crystal resonator. Ensure that voltages applied to the clock pins do not exceed the maximum rated values.

Although the feedback resistor is included in this LSI, an external feedback resistor may be required in some cases. This depends on the characteristics of the crystal resonator.

Set the parameters (of resistors and capacitors) with thorough evaluation on the user side.

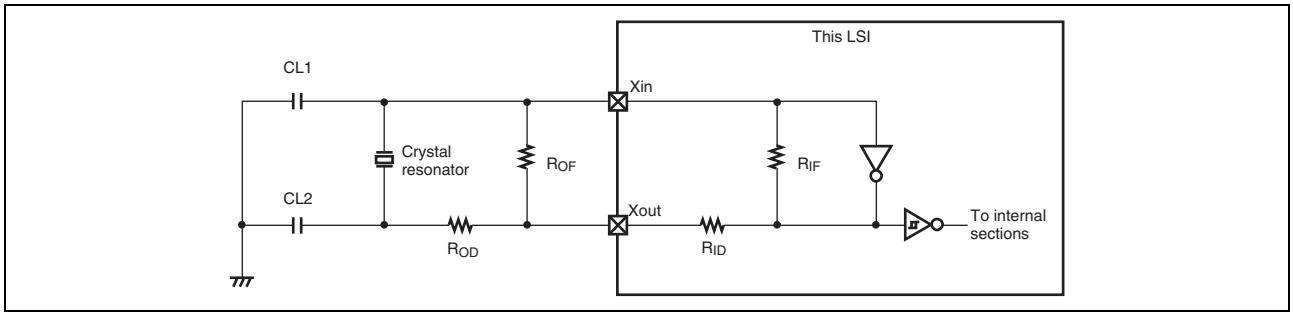

**Figure 6.3 Example of the Connection of a Crystal Resonator**

### 6.6.3 In the Case of Not Using the Clock Pin

In cases where the pins are not in use, fix the level on the Xin pin (pull it up or down, or connect it to the power-supply or ground level), and leave the Xout pin open state.

## 6.7 Oscillation Stabilizing Time

### 6.7.1 Oscillation Stabilizing Time of the On-chip Crystal Oscillator

In the case of using a crystal resonator, wait for the oscillation stabilizing time of the on-chip oscillation circuit at the following cases, to keep the oscillation stabilizing time of the on-chip crystal oscillator (in the case of inputting an external clock input, it is not necessary).

- Power on
- Releasing the software standby mode or deep standby mode by $\overline{\text{RES}}$ pin
- Changing from halting oscillation to running oscillation by power-on reset or register setting (AUDIO_X1)
- Changing from halting oscillation to running oscillation by register setting (RTC_X1, RTC_X3)
- Changing the gain of the on-chip crystal oscillator by $\overline{\text{RES}}$ pin (EXTAL, RTC_X3)

### 6.7.2 Oscillation Stabilizing Time of the PLL circuit

The clock from EXTAL is supplied to the PLL circuit. So, regardless of whether using a crystal resonator or inputting an external clock from EXTAL, wait for at least the oscillation stabilizing time at the following cases, to keep the oscillation stabilizing time of the PLL circuit.

- Power on (in the case of using the crystal resonator)/start inputting external clock (in the case of inputting the external clock)
- Releasing the software standby mode or deep standby mode by $\overline{\text{RES}}$ pin

[Remarks]
The oscillation stabilizing time is kept by the counter running in the LSI at the following cases.

- Releasing the software standby mode or deep standby mode by the other than $\overline{\text{RES}}$ pin
- Changing the gain of the on-chip crystal oscillator by the register setting (EXTAL, RTC_X3)

## 6.8 Notes on Board Design

### 6.8.1 Note on Using a PLL Oscillation Circuit

In the PLLVcc connection pattern for the PLL, signal lines from the board power supply pins must be as short as possible and pattern width must be as wide as possible to reduce inductive interferences.

Since the analog power supply pins of the PLL are sensitive to the noise, the system may malfunction due to inductive interference at the other power supply pins. To prevent such malfunction, the analog power supply pins and the digital power supply pins Vcc and PVcc should not supply the same resources on the board if at all possible.

## 6.9 Definition of Modulation Rate and Frequency in the SSCG Specification

The SSCG circuit can be used to decrease the peak value of electromagnetic interference noise by frequency modulation, i.e. by slightly modulating the output frequency. In this case, the rate of change in the frequency and the size of the change to the input clock frequency are defined as the modulation rate and modulation frequency, respectively. Figure 6.4 shows the modulation rate and modulation frequency.

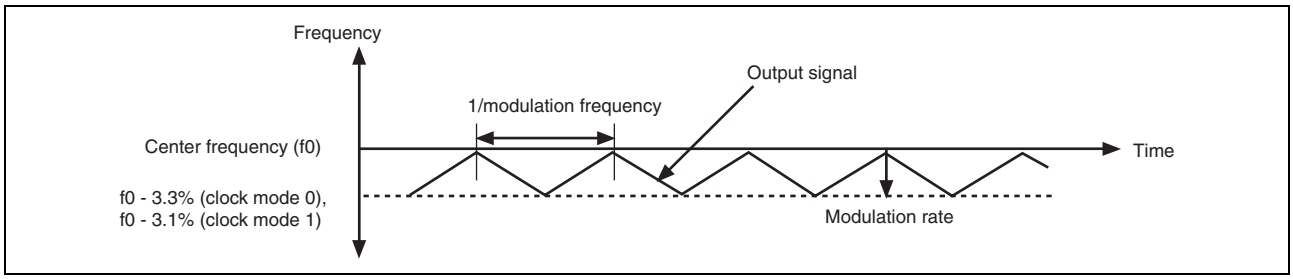

**Figure 6.4 Definition of SSCG Modulation Rate and Frequency**

## 6.10 Clock Signals

### 6.10.1 Clock Signals for the System and Realtime Clock

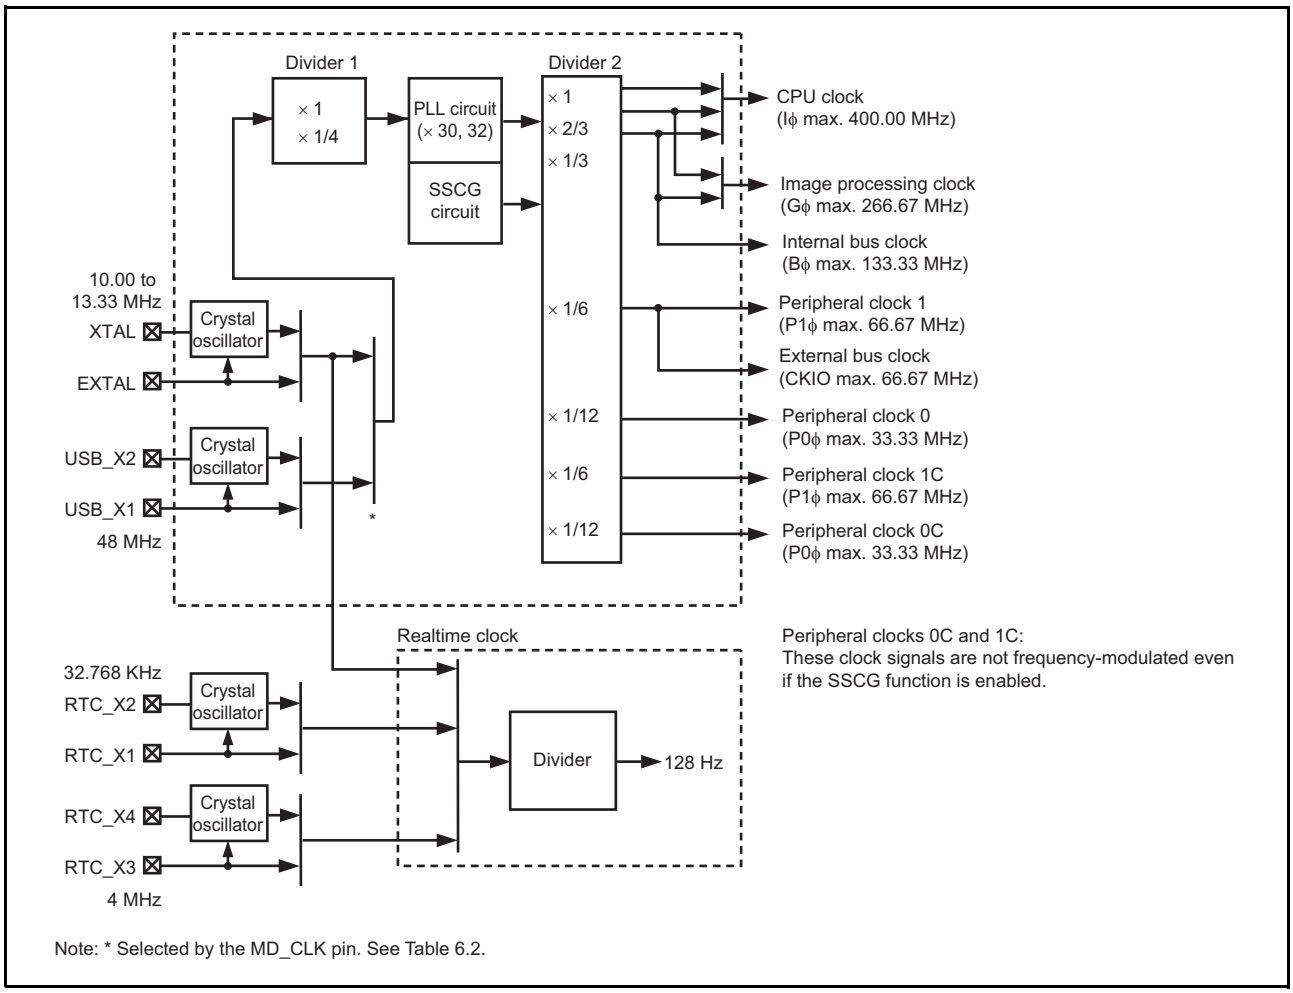

**Figure 6.5 Clock Signals for the System and Realtime Clock**

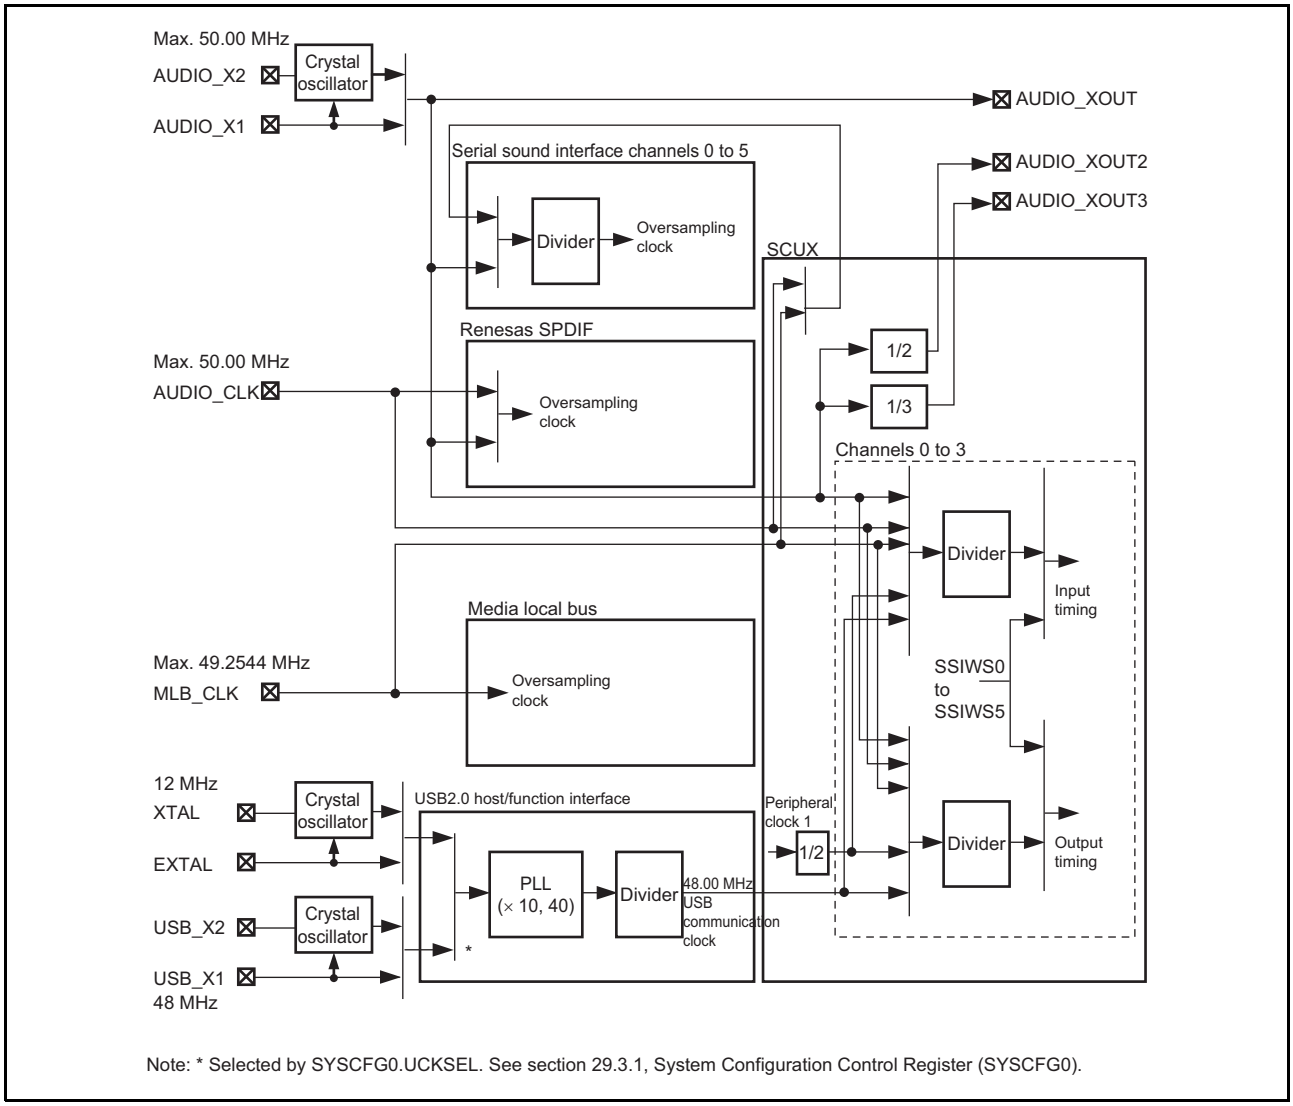
## 6.10.2 Audio and USB Clock Signals



Note: * Selected by SYSCFG0.UCKSEL. See section 29.3.1, System Configuration Control Register (SYSCFG0).

**Figure 6.6 Audio and USB Clock Signals**

## 6.10.3 Video Image Clock Signals (Channel 0)

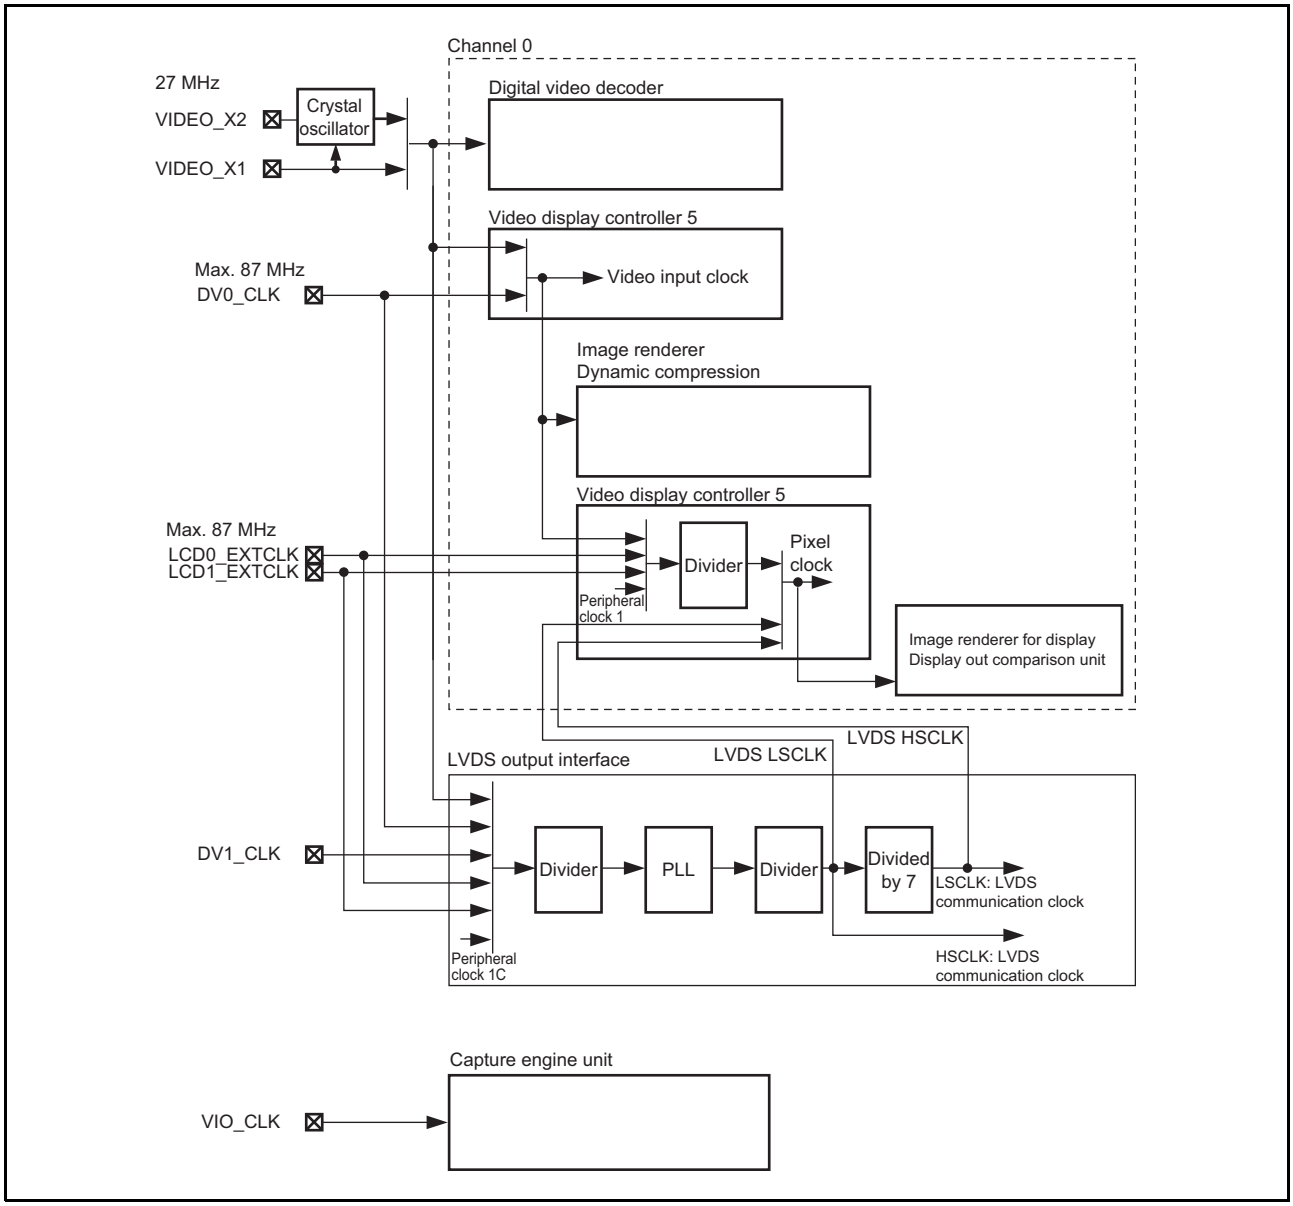


**Figure 6.7 Video Image Clock Signals (Channel 0)**

### 6.10.4 Video Image Clock Signals (Channel 1)

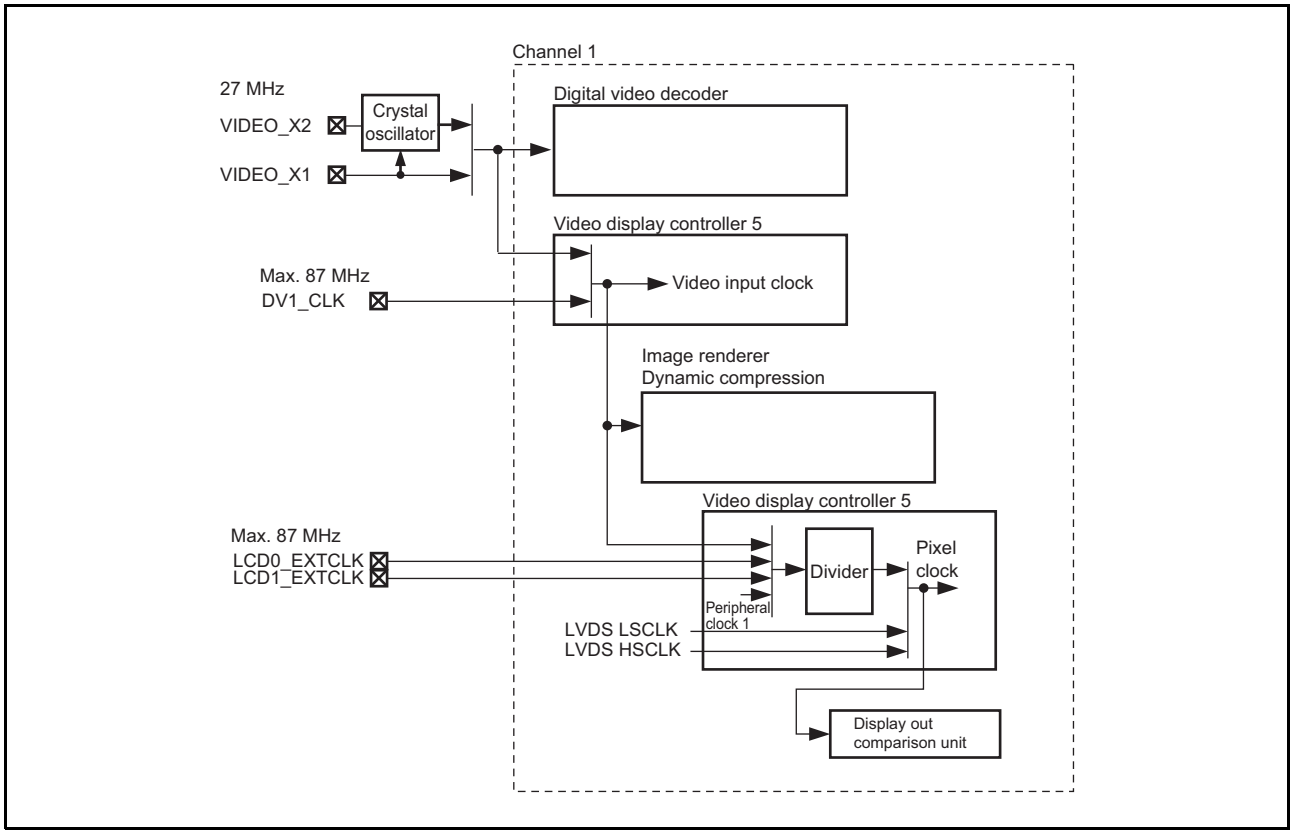

**Figure 6.8 Video Image Clock Signals (Channel 1)**

### 6.10.5 Other Clock Signals

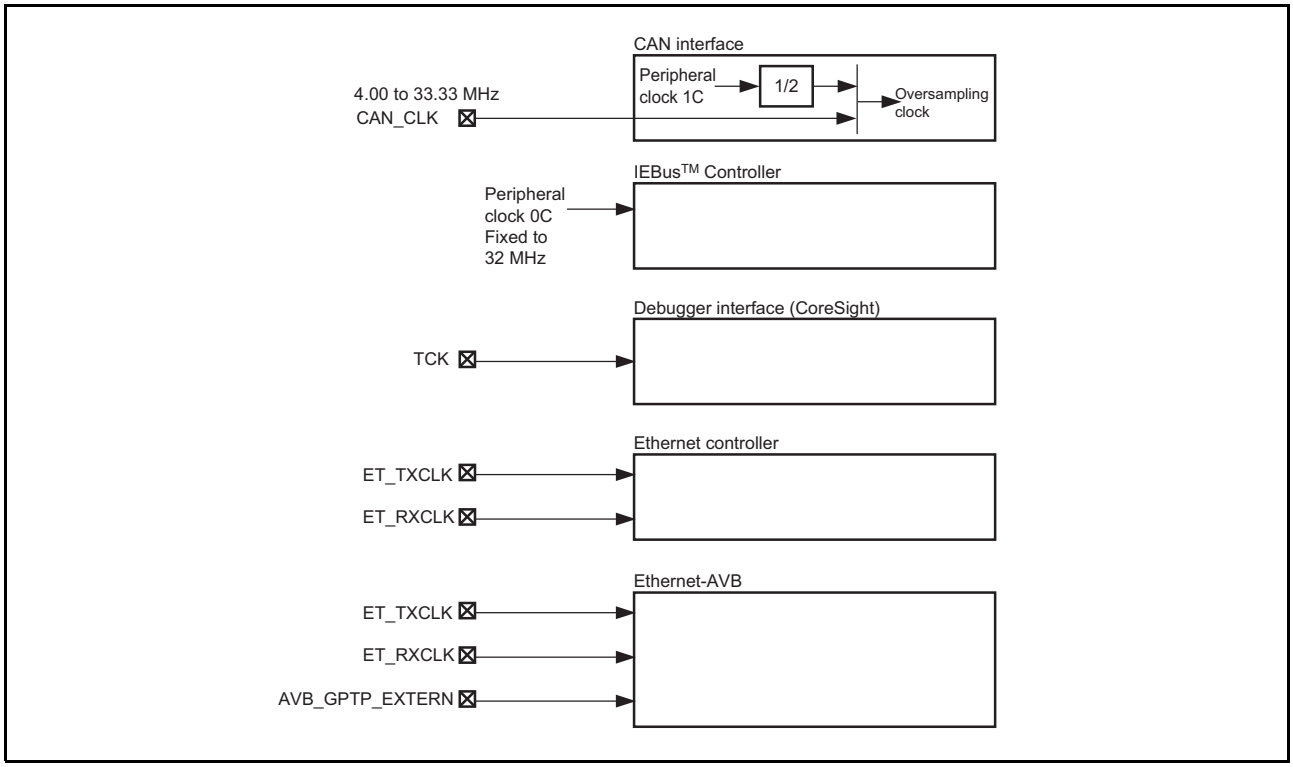

**Figure 6.9 Clock Signals for Other Modules**

## 6.10.6 Internal Clock Signals (1)

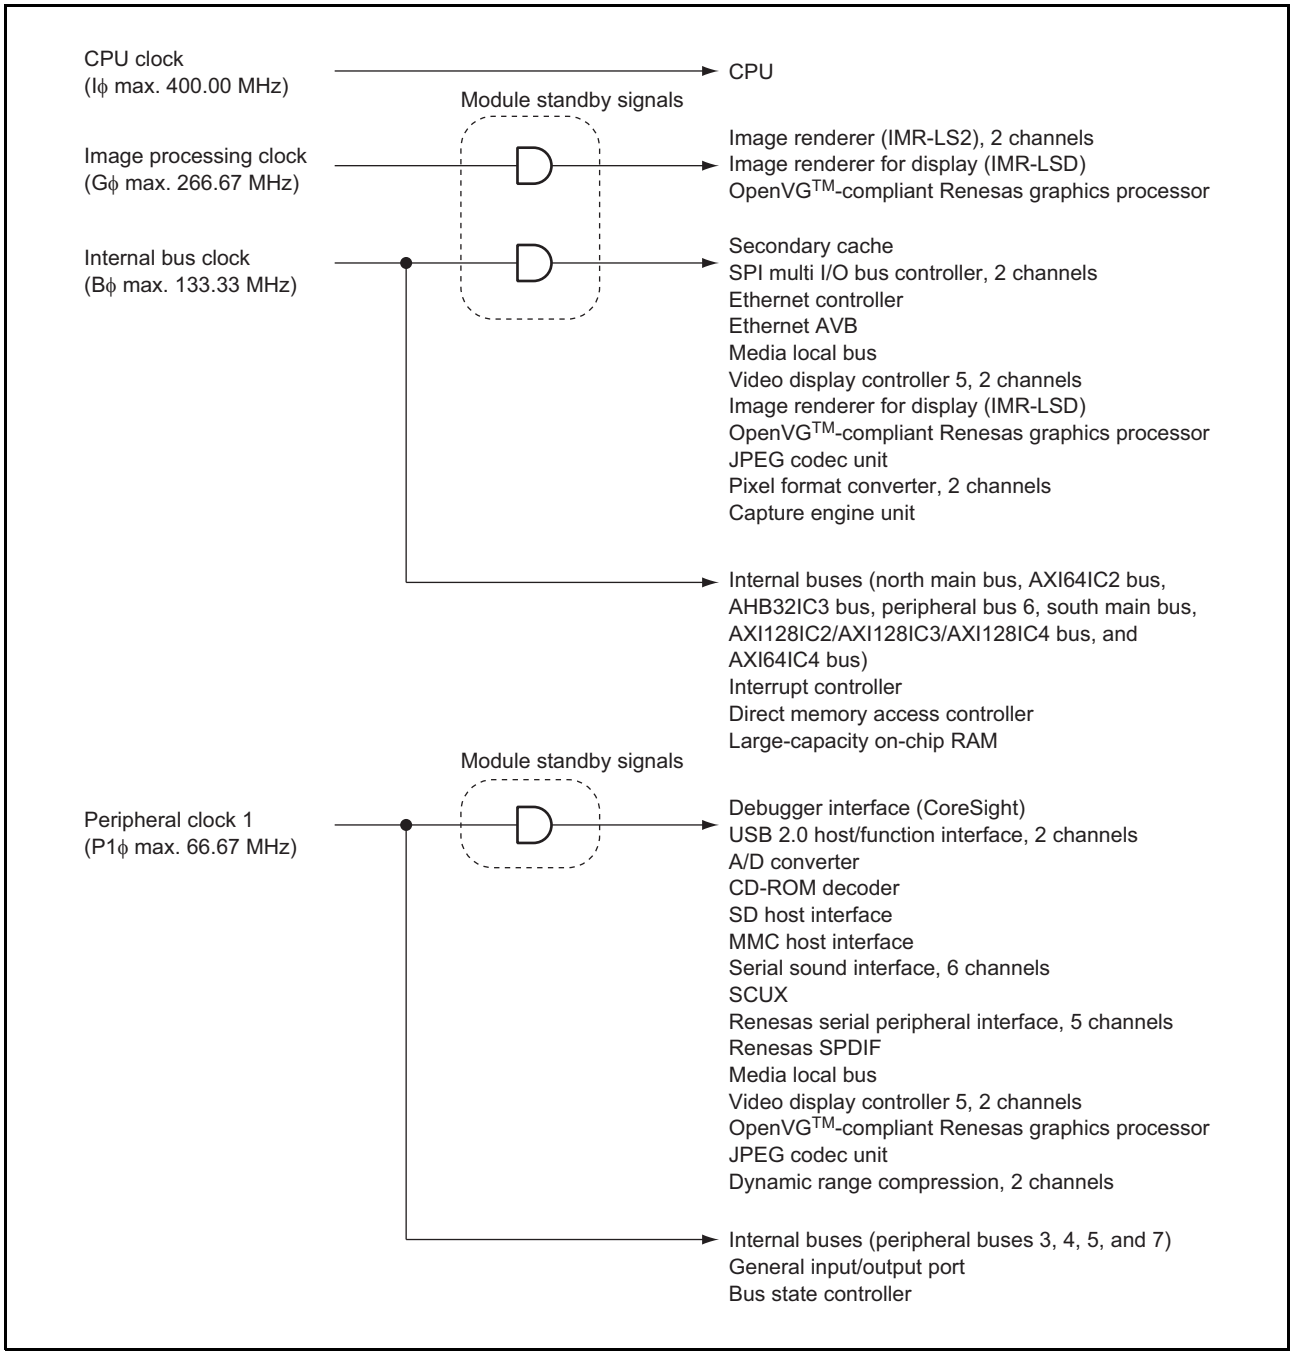

**Figure 6.10 Distribution of Internal Clock Signals**

### 6.10.7 Internal Clock Signals (2)

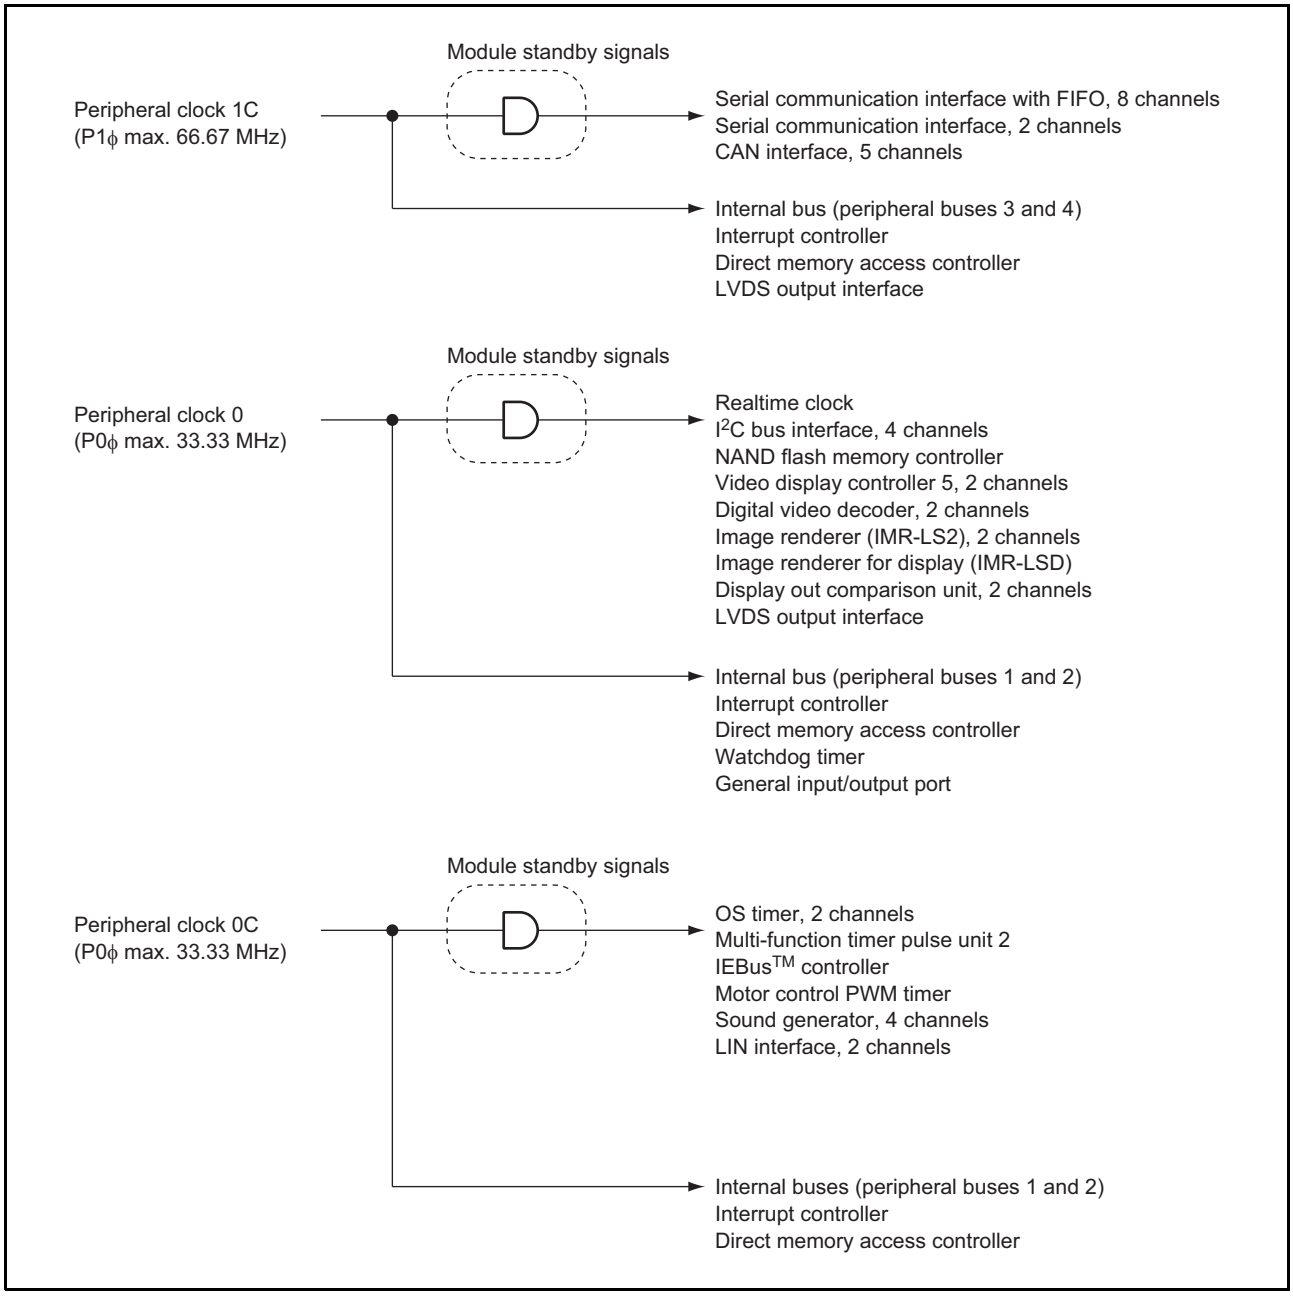

**Figure 6.11 Distribution of Internal Clock Signals (2)**

## 6.11 Usage Note

### 6.11.1 Notes on the SSCG

When the SSCG is to be used, secure the SSCG stabilizing time (tSSCG) shown in Table 59.5, Clock Timing in section 59, Electrical Characteristics. Furthermore, avoid deep standby while the SSCG is in use.

# 7. Interrupt Controller

The interrupt controller ascertains the priority of interrupt sources and controls interrupt requests to the CPU. The interrupt controller registers set the order of priority of each interrupt, allowing the user to process interrupt requests according to the user-set priority.

## 7.1 Features

- 32 levels of interrupt priority can be set.
  By setting the interrupt priority registers, the priorities of IRQ interrupts, on-chip peripheral module interrupts, and pin interrupts can be selected from 32 levels for request sources.
- NMI noise canceler function
  An NMI input-level bit indicates the NMI pin state. By reading this bit in the interrupt exception service routine, the pin state can be checked, enabling it to be used as the noise canceler function.
- Arm PrimeCell® Generic Interrupt Controller (PL390)*

Note: * The PL390 supports version 1 of the specification for the architecture of the Arm Generic Interrupt Controller (GIC).

Figure 7.1 shows a block diagram.

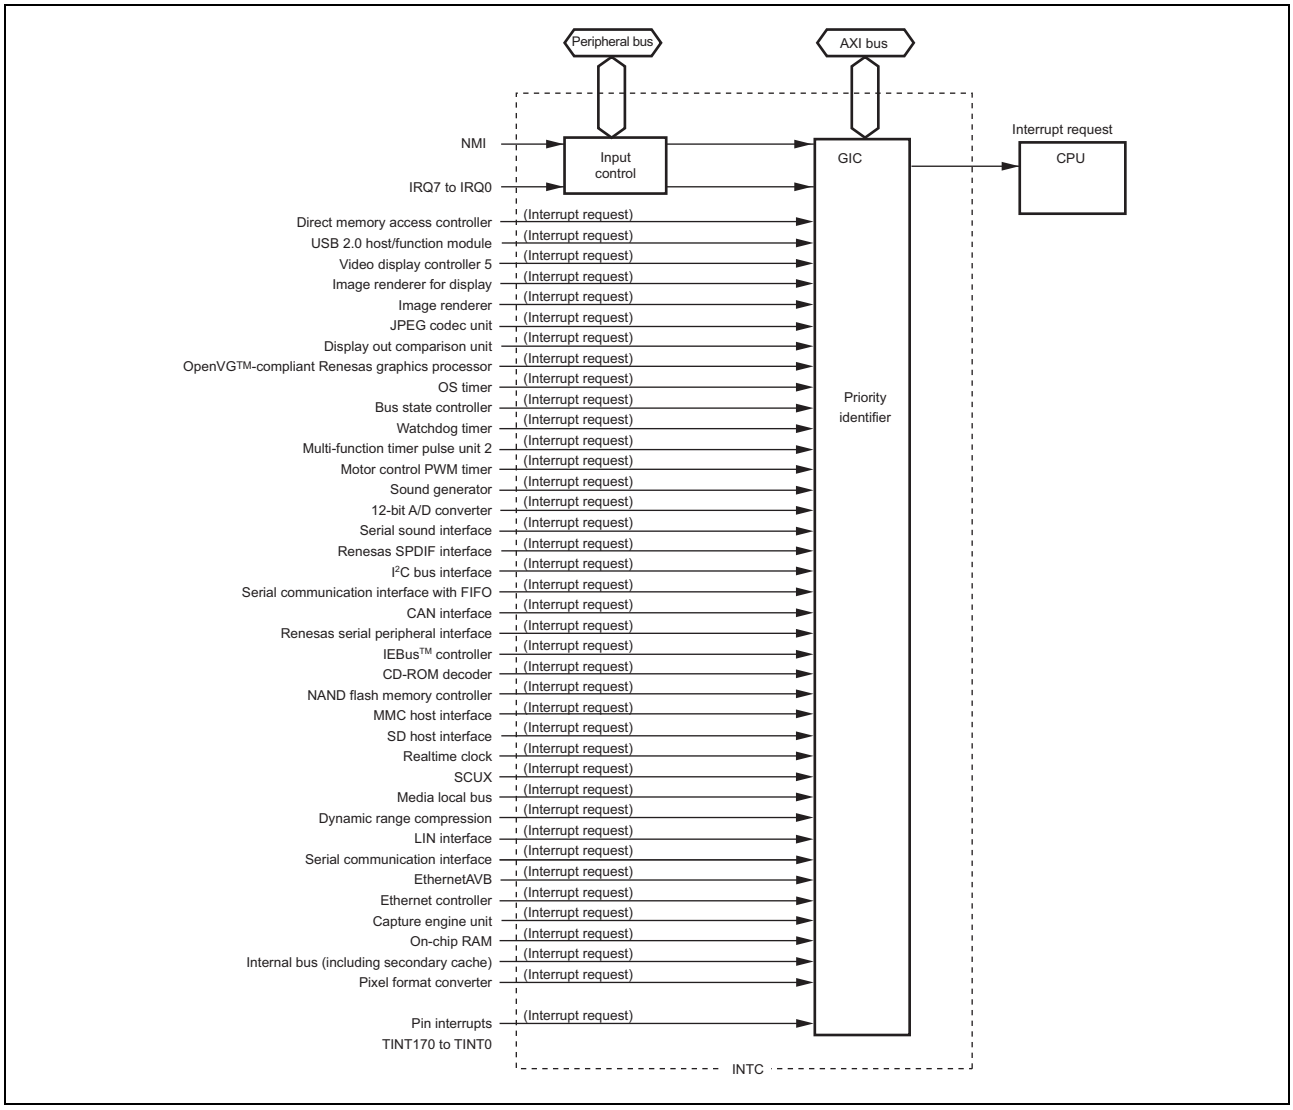

**Figure 7.1 Block Diagram**

## 7.2 Input/Output Pins

Table 7.1 shows the pin configuration.

**Table 7.1 Pin Configuration**

| Pin Name | Symbol | I/O | Function |
|---|---|---|---|
| Nonmaskable interrupt input pin | NMI | Input | Input of nonmaskable interrupt request signal |
| Interrupt request input pins | IRQ7 to IRQ0 | Input | Input of maskable interrupt request signals |
| | TINT170 to TINT0 | Input | Input of maskable interrupt request signals |

## 7.3 Register Descriptions

Table 7.2 shows the register configuration. These registers are used to set the interrupt priorities and control detection of the external interrupt input signal.

For a description of the registers other than interrupt control register 0, interrupt control register 1, and IRQ interrupt request register, see the Arm Generic Interrupt Controller Architecture Specification and the PrimeCell Generic Interrupt Controller (PL390) Technical Reference Manual from Arm.

**Table 7.2 Register Configuration**

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |

Note 1. When the NMI pin is high, becomes H'8000; when low, becomes H'0000.
Note 2. Only 0 can be written after reading 1, to clear the flag.
Note 3. Use the following expression to calculate the maximum number of interrupt IDs from the number of IT lines.
(17+1) × 32 + 1 to (17 + 2) × 32: 577 to 608

### 7.3.1 Interrupt Control Register 0 (ICR0)

ICR0 is a 16-bit register that sets the input signal detection mode for the external interrupt input pin NMI, and indicates the input level at the NMI pin.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NMIL | - | - | - | - | - | - | NMIE | - | - | - | - | - | - | NMIF | - |
| Initial value: | *1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R/(W)*2 | R |

Notes: 1. 1 when the NMI pin is high, and 0 when the NMI pin is low.
2. Only 0 can be written after reading 1, to clear the flag.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | NMIL | *1 | R | NMI Input Level<br>Sets the level of the signal input at the NMI pin. The NMI pin level can be obtained by reading this bit. This bit cannot be modified.<br>0: Low level is input to NMI pin<br>1: High level is input to NMI pin |
| 14 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 8 | NMIE | 0 | R/W | NMI Edge Select<br>Selects whether the falling or rising edge of the interrupt request signal on the NMI pin is detected.<br>0: Interrupt request is detected on falling edge of NMI input<br>1: Interrupt request is detected on rising edge of NMI input |
| 7 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1 | NMIF | 0 | R/(W)*2 | NMI Interrupt Request<br>This bit indicates the status of the NMI interrupt request. This bit cannot be modified.<br>0: NMI interrupt request has not occurred<br>[Clearing conditions]<br>• Cleared by changing NMIE of ICR0<br>• Cleared by reading NMIF while NMIF = 1, then writing 0 to NMIF<br>1: NMI interrupt request is detected<br>[Setting condition]<br>• Edge corresponding to NMIE of ICR0 has occurred at NMI pin |
| 0 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |

### 7.3.2 Interrupt Control Register 1 (ICR1)

ICR1 is a 16-bit register that specifies the detection mode for external interrupt input pins IRQ7 to IRQ0 individually: low level, falling edge, rising edge, or both edges.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | IRQ71S | IRQ70S | IRQ61S | IRQ60S | IRQ51S | IRQ50S | IRQ41S | IRQ40S | IRQ31S | IRQ30S | IRQ21S | IRQ20S | IRQ11S | IRQ10S | IRQ01S | IRQ00S |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | IRQ71S | 0 | R/W | IRQ Sense Select<br>These bits select whether interrupt signals corresponding to pins IRQ7 to IRQ0 are detected by a low level, falling edge, rising edge, or both edges.<br>00: Interrupt request is detected on low level of IRQn input<br>01: Interrupt request is detected on falling edge of IRQn input<br>10: Interrupt request is detected on rising edge of IRQn input<br>11: Interrupt request is detected on both edges of IRQn input |
| 14 | IRQ70S | 0 | R/W | |
| 13 | IRQ61S | 0 | R/W | |
| 12 | IRQ60S | 0 | R/W | |
| 11 | IRQ51S | 0 | R/W | |
| 10 | IRQ50S | 0 | R/W | |
| 9 | IRQ41S | 0 | R/W | |
| 8 | IRQ40S | 0 | R/W | |
| 7 | IRQ31S | 0 | R/W | |
| 6 | IRQ30S | 0 | R/W | |
| 5 | IRQ21S | 0 | R/W | |
| 4 | IRQ20S | 0 | R/W | |
| 3 | IRQ11S | 0 | R/W | |
| 2 | IRQ10S | 0 | R/W | |
| 1 | IRQ01S | 0 | R/W | |
| 0 | IRQ00S | 0 | R/W | |

[Legend]
n = 7 to 0

### 7.3.3 IRQ Interrupt Request Register (IRQRR)

IRQRR is a 16-bit register that indicates interrupt requests from external input pins IRQ7 to IRQ0. If edge detection is set for the IRQ7 to IRQ0 interrupts, writing 0 to the IRQ7F to IRQ0F bits after reading IRQ7F to IRQ0F = 1 cancels the retained interrupts.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | IRQ7F | IRQ6F | IRQ5F | IRQ4F | IRQ3F | IRQ2F | IRQ1F | IRQ0F |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/(W)* | R/(W)* | R/(W)* | R/(W)* | R/(W)* | R/(W)* | R/(W)* | R/(W)* |

Note: * Only 0 can be written to clear the flag after 1 is read.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 | IRQ7F | 0 | R/(W)* | IRQ Interrupt Request<br>These bits indicate the status of the IRQ7 to IRQ0 interrupt requests.<br>Level detection:<br>0: IRQn interrupt request has not occurred<br>[Clearing condition]<br>• IRQn input is high<br>1: IRQn interrupt has occurred<br>[Setting condition]<br>• IRQn input is low<br>Edge detection:<br>0: IRQn interrupt request is not detected<br>[Clearing condition]<br>• Cleared by reading IRQnF while IRQnF = 1, then writing 0 to IRQnF<br>1: IRQn interrupt request is detected<br>[Setting condition]<br>• Edge corresponding to IRQn1S or IRQn0S of ICR1 has occurred at IRQn pin |
| 6 | IRQ6F | 0 | R/(W)* | |
| 5 | IRQ5F | 0 | R/(W)* | |
| 4 | IRQ4F | 0 | R/(W)* | |
| 3 | IRQ3F | 0 | R/(W)* | |
| 2 | IRQ2F | 0 | R/(W)* | |
| 1 | IRQ1F | 0 | R/(W)* | |
| 0 | IRQ0F | 0 | R/(W)* | |

## 7.4 Interrupt Sources

There are four types of interrupt sources: NMI, IRQ, on-chip peripheral modules, and pin interrupts. Each interrupt has a priority level (0 to 31), with 0 the highest and 31 the lowest.

### 7.4.1 NMI Interrupt

The NMI interrupt with the highest priority is accepted by the CPU as an FIQ exception all times. NMI interrupt requests are edge-detected, and the NMI edge select bit (NMIE) in ICR0 selects whether the rising edge or falling edge is detected. The status of the interrupt request can be checked by reading the NMI interrupt request bit (NMIF) in the ICR0. When the NMIE bit is changed, the NMI interrupt request that is retained is cleared.
When deep standby mode is entered, deep standby mode is canceled by the NMI interrupt.

### 7.4.2 IRQ Interrupts

IRQ interrupts are input from pins IRQ7 to IRQ0. For the IRQ interrupts, low-level, falling-edge, rising-edge, or both-edge detection can be selected individually for each pin by the IRQ sense select bits (IRQ71S to IRQ01S and IRQ70S to IRQ00S) in interrupt control register 1 (ICR1).
When using low-level sensing for IRQ interrupts, an interrupt request signal is sent to the interrupt controller while the IRQ7 to IRQ0 pins are low. An interrupt request signal is stopped being sent to the interrupt controller when the IRQ7 to IRQ0 pins are driven high. The status of the interrupt requests can be checked by reading the IRQ interrupt request bits (IRQ7F to IRQ0F) in the IRQ interrupt request register (IRQRR).
When using edge-sensing for IRQ interrupts, an interrupt request is detected due to change of the IRQ7 to IRQ0 pin states, and an interrupt request signal is sent to the interrupt controller. The result of IRQ interrupt request detection is retained until that interrupt request is accepted. Whether IRQ interrupt requests have been detected or not can be checked by reading the IRQ7F to IRQ0F bits in the IRQ interrupt request register (IRQRR). Writing 0 to these bits after reading them as 1 clears the result of IRQ interrupt request detection.
When returning from IRQ interrupt exception service routine, execute the return instruction after confirming that the interrupt request has been cleared by the IRQ interrupt request register (IRQRR) so as not to accidentally receive the interrupt request again.

### 7.4.3 On-Chip Peripheral Module Interrupts

On-chip peripheral module interrupts are generated by the following on-chip peripheral modules:

- Direct memory access controller
- USB 2.0 host/function module
- Video display controller 5
- Image renderer for display
- Image renderer
- JPEG codec unit
- Display out comparison unit
- OpenVG™-compliant Renesas graphics processor
- OS timer
- Bus state controller
- Watchdog timer
- Multi-function timer pulse unit 2
- Motor control PWM timer
- Sound generator
- 12-bit A/D converter
- Serial sound interface
- Renesas SPDIF interface
- I²C bus interface
- Serial communication interface with FIFO
- CAN interface
- Renesas serial peripheral interface
- IEBusTM controller
- CD-ROM decoder
- NAND flash memory controller
- MMC host interface
- SD host interface
- Realtime clock
- SCUX
- Media local bus
- Dynamic range compression
- LIN interface
- Serial communication interface
- EthernetAVB
- Ethernet controller
- Capture engine unit
- On-chip RAM
- Internal bus
- Pixel format converter

When returning from the interrupt exception service routine for an interrupt request at the peripheral-module level, execute the return instruction after clearing the source flag at the source of the request and reading the source flag so that the interrupt request is not accidentally received again.

### 7.4.4 Pin Interrupts

Pin interrupts are input from pins TINT170 to TINT0. Signals input on pins TINT170 to TINT0 are conveyed as interrupt signals regardless of mode settings and pin function settings for the general-purpose I/O port pin.
Accordingly, if pin interrupts are to be used in port mode, set the pin as an input port pin. Alternatively, if an alternative mode is selected, the alternative pin with an input function can only be used for pin interrupts. For the settings of general-purpose I/O port pins, see section 54, Ports.
For the pin interrupts, high-level or rising-edge detection can be selected individually for each pin by the interrupt configuration registers (ICDICFRn). For a description of the interrupt configuration registers (ICDICFRn), see the GIC architecture specification.

## 7.5 Interrupt IDs

Table 7.3 lists the interrupt sources and their interrupt IDs, and the registers for setting the interrupt sources. Do not make settings other than those in Table 7.3 otherwise, the operation cannot be guaranteed.
Each interrupt source is allocated a different interrupt ID. To control notification of the interrupt source to the CPU and reference its status, it is necessary to set and reference the following registers which correspond to given interrupt IDs.

- Interrupt security register ICDISRn
- Interrupt set-enable register ICDISERn
- Interrupt clear-enable register ICDICERn
- Interrupt set-pending register ICDISPRn
- Interrupt clear-pending register ICDICPRn
- Active bit register ICDABRn
- Interrupt configuration register ICDICFRn
- Interrupt priority register ICDIPRn
- Interrupt processor target register ICDIPTRn

For the procedure for the initial settings of the registers, see section 7.6.1, Initial Settings. For details on individual registers, see the Arm Generic Interrupt Controller Architecture Specification and the PrimeCell Generic Interrupt Controller (PL390) Technical Reference Manual from Arm.

**Table 7.3 List of Interrupt IDs**

| Interrupt Source | | | | | Register Allocation | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| Module | Channel | Request Source Name | Interrupt Request Edge/ Level | Inter -rupt ID | ICDISRn ICDISERn ICDICERn ICDISPRn ICDICPRn ICDABRn | Bit | ICDICFRn | Bit | ICDIPRn ICDIPTRn | Bit |
| GIC software interrupt | - | - | - | 0 | 0 | 0 | 0 | 1 to 0 | 0 | 7 to 0 |
| | | | | 1 | | 1 | | 3 to 2 | | 15 to 8 |

## 7.6 Operation

### 7.6.1 Initial Settings

For details on the registers for making initial settings and the procedures for settings in general, see the Arm Generic Interrupt Controller Architecture Specification and the PrimeCell Generic Interrupt Controller (PL390) Technical Reference Manual from Arm. Figure 7.2 illustrates the flow of initial settings.

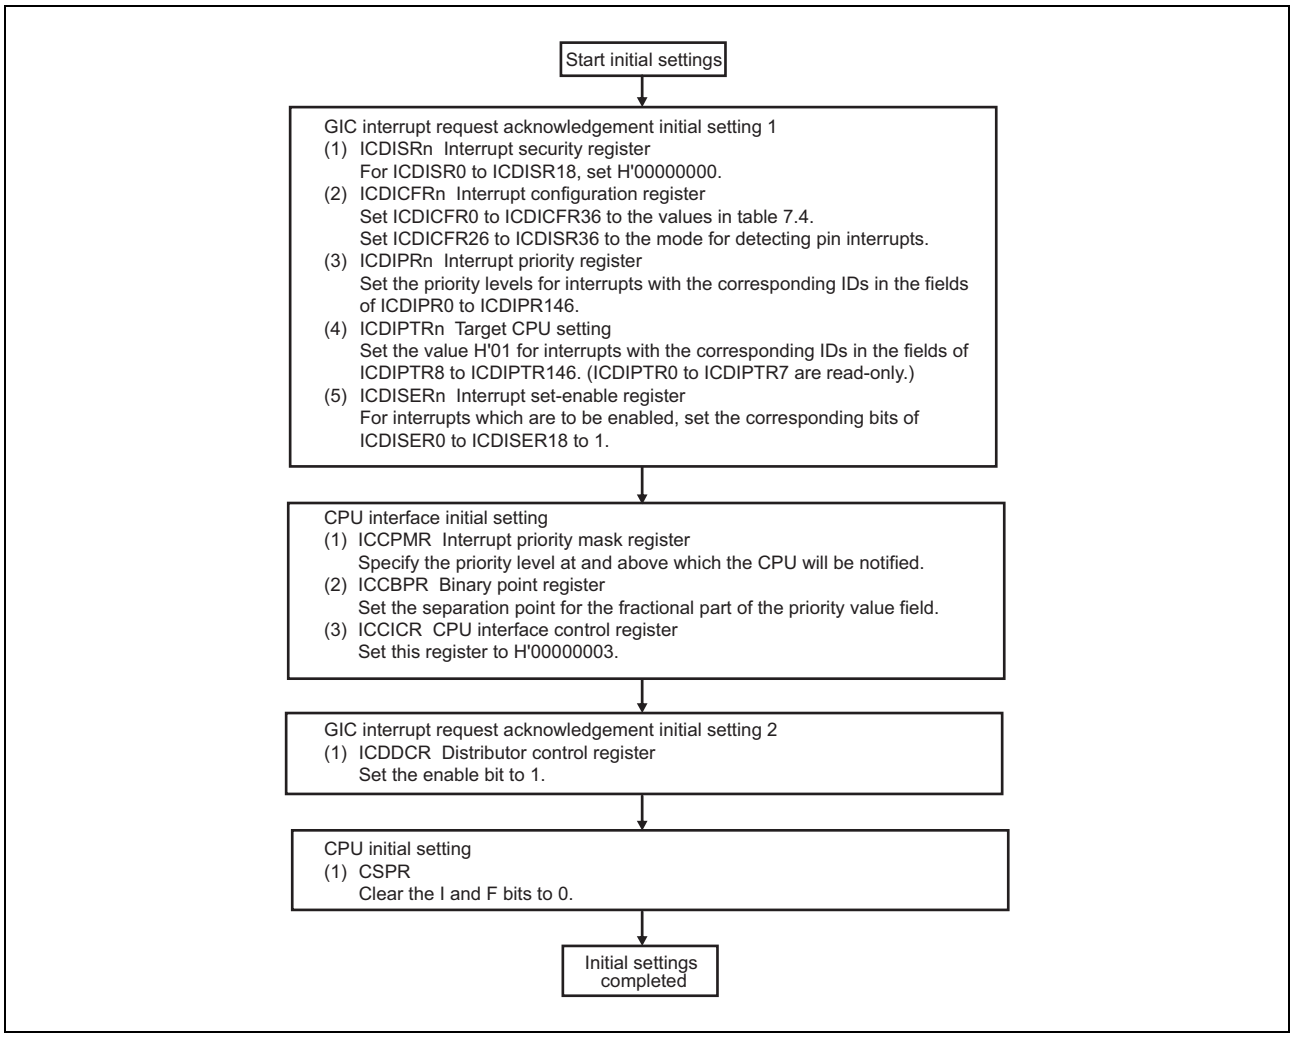

**Figure 7.2 Flow of Initial Settings**

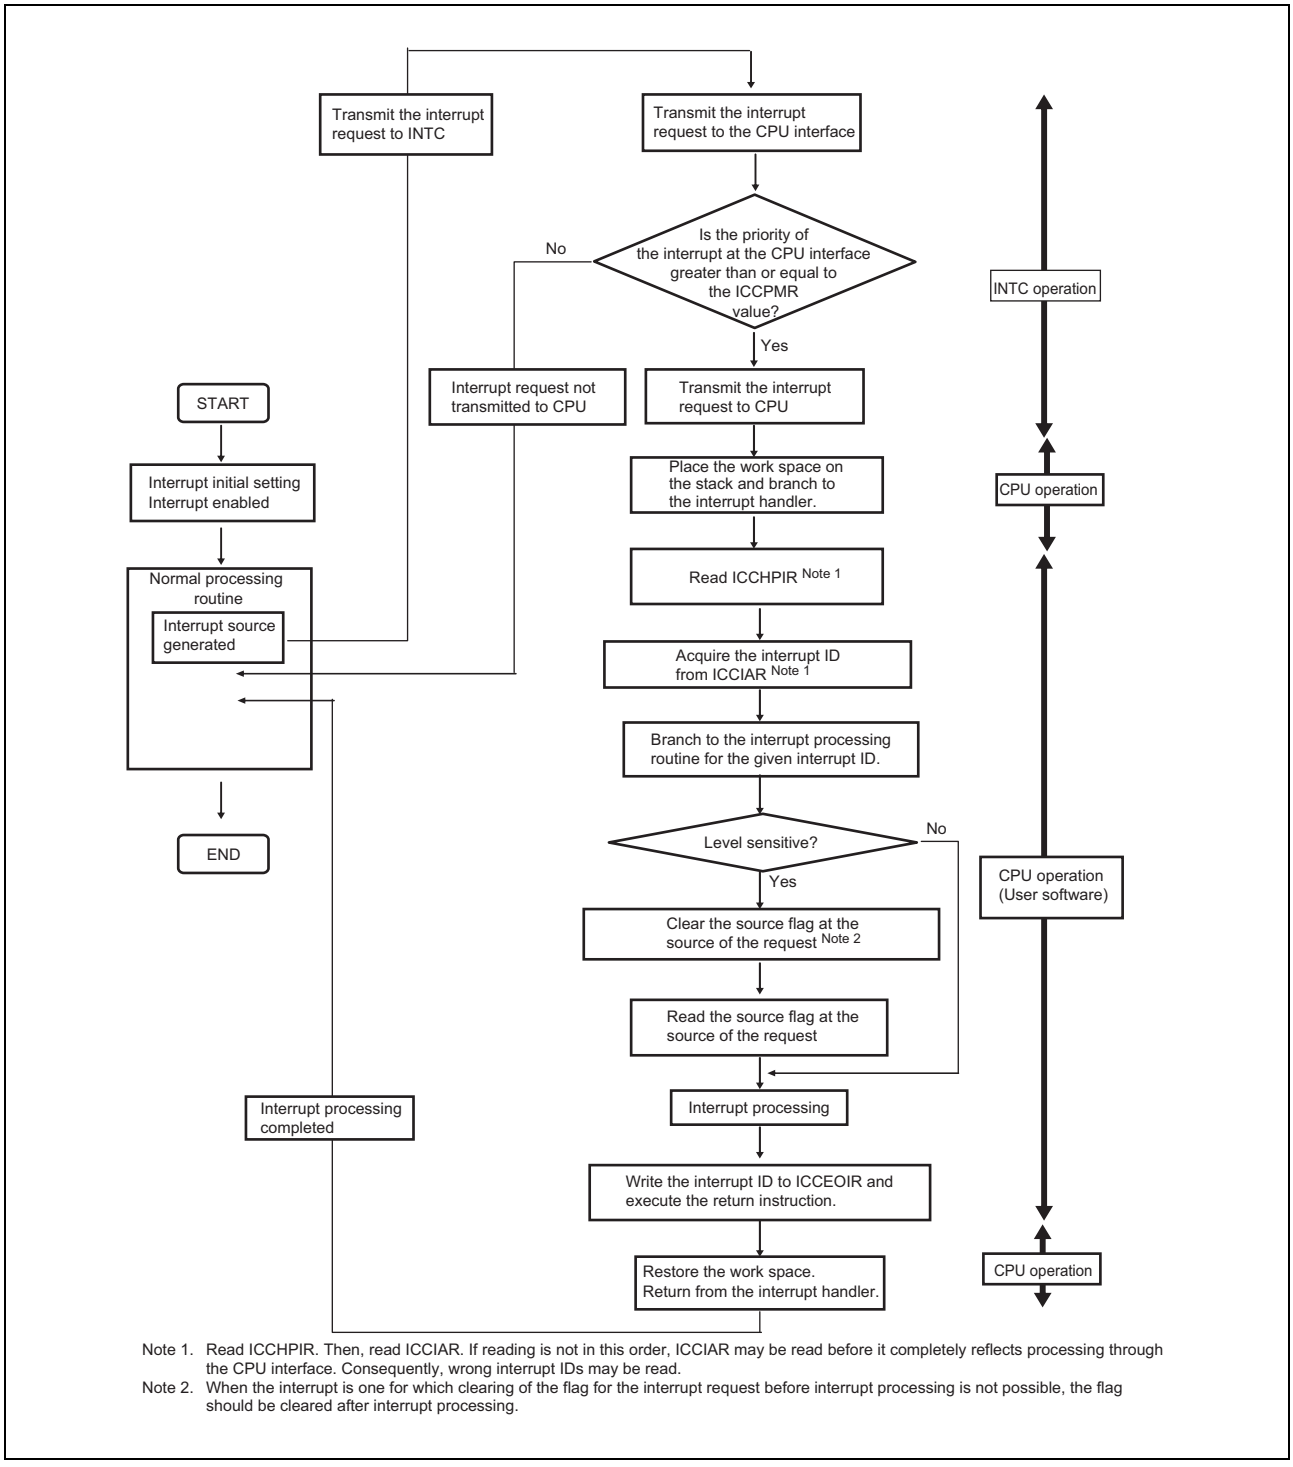
**Table 7.4 CDICFRn Interrupt Configuration Register Settings**

| Register Name | Setting | Interrupt ID |
|---|---|---|
| ICDICFR0 | H'AAAAAAAA | 15 to 0 |
| ICDICFR1 | H'00000055 | 31 to 16 |
| ICDICFR2 | H'FFFD5555 | 47 to 32 |
| ICDICFR3 | H'555FFFFF | 63 to 48 |
| ICDICFR4 | H'55555555 | 79 to 64 |
| ICDICFR5 | H'55555555 | 95 to 80 |
| ICDICFR6 | H'55555555 | 111 to 96 |
| ICDICFR7 | H'55555555 | 127 to 112 |
| ICDICFR8 | H'5555F555 | 143 to 128 |
| ICDICFR9 | H'55555555 | 159 to 144 |
| ICDICFR10 | H'55555555 | 175 to 160 |
| ICDICFR11 | H'F5555555 | 191 to 176 |
| ICDICFR12 | H'F555F555 | 207 to 192 |
| ICDICFR13 | H'5555F555 | 223 to 208 |
| ICDICFR14 | H'55555555 | 239 to 224 |
| ICDICFR15 | H'55555555 | 255 to 240 |
| ICDICFR16 | H'55555555 | 271 to 256 |
| ICDICFR17 | H'FD555555 | 287 to 272 |
| ICDICFR18 | H'55555557 | 303 to 288 |
| ICDICFR19 | H'55555555 | 319 to 304 |
| ICDICFR20 | H'FFD55555 | 335 to 320 |
| ICDICFR21 | H'5F55557F | 351 to 336 |
| ICDICFR22 | H'FD55555F | 367 to 352 |
| ICDICFR23 | H'55555557 | 383 to 368 |
| ICDICFR24 | H'55555555 | 399 to 384 |
| ICDICFR25 | H'55555555 | 415 to 400 |
| ICDICFR26*1 | H'55555555 | 431 to 416 |
| ICDICFR27*1 | H'55555555 | 447 to 432 |
| ICDICFR28*1 | H'55555555 | 463 to 448 |
| ICDICFR29*1 | H'55555555 | 479 to 464 |
| ICDICFR30*1 | H'55555555 | 495 to 480 |
| ICDICFR31*1 | H'55555555 | 511 to 496 |
| ICDICFR32*1 | H'55555555 | 527 to 512 |
| ICDICFR33*1 | H'55555555 | 543 to 528 |
| ICDICFR34*1 | H'55555555 | 559 to 544 |
| ICDICFR35*1 | H'55555555 | 575 to 560 |
| ICDICFR36*1 | H'55555555 | 586 to 576 |

Note 1. Edge or level detection can be selected for IDs corresponding to pin interrupts. The settings in the above table select level detection.

## 7.6.2 Flow of Interrupt Operations

For details on operation involved in interrupt generation, see the Arm Generic Interrupt Controller Architecture Specification and the PrimeCell Generic Interrupt Controller (PL390) Technical Reference Manual from Arm. Figure 7.3 shows the flow of interrupt operations.



Note 1. Read ICCHPIR. Then, read ICCIAR. If reading is not in this order, ICCIAR may be read before it completely reflects processing through the CPU interface. Consequently, wrong interrupt IDs may be read.
Note 2. When the interrupt is one for which clearing of the flag for the interrupt request before interrupt processing is not possible, the flag should be cleared after interrupt processing.

**Figure 7.3 Flow of Interrupt Operations**

## 7.7 Data Transfer with Interrupt Request Signals

Interrupt request signals can be used to activate the direct memory access controller and transfer data.
Interrupt sources for which the direct memory access controller is designated as the destination by DMA extension resource selectors 0 to 7 are masked and requests from them are not input to the interrupt controller.
Figure 7.4 shows a block diagram of interrupt control. For details, see section 9, Direct Memory Access Controller.

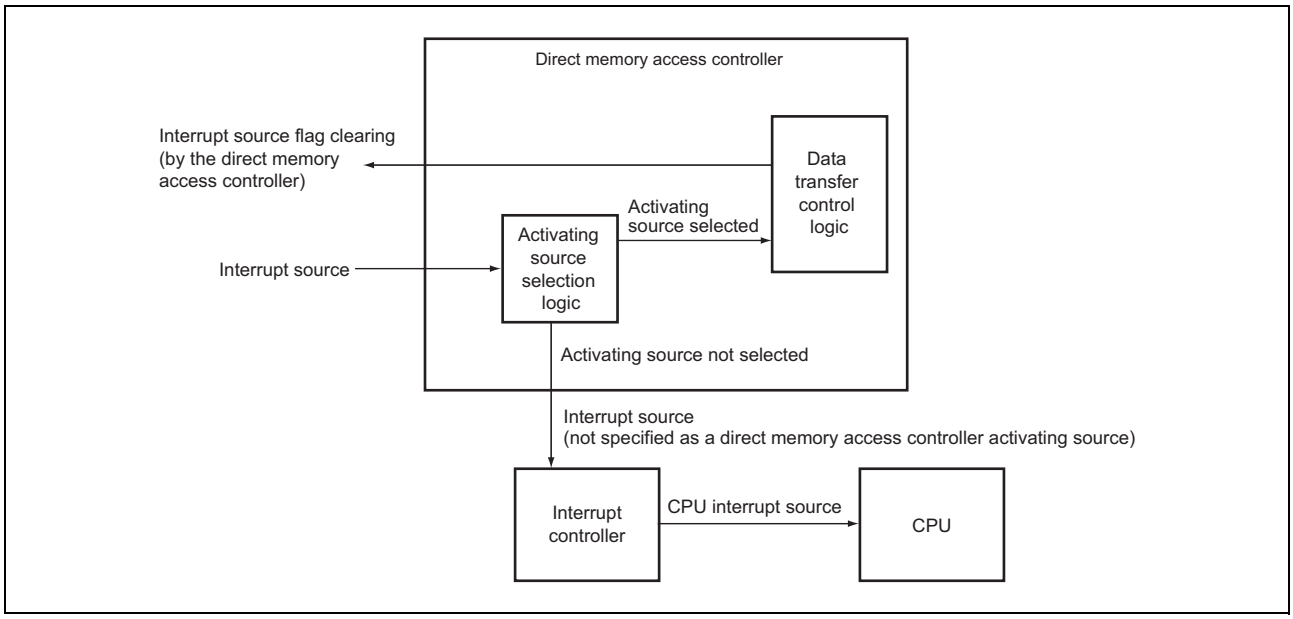


**Figure 7.4 Interrupt Control Block Diagram**

### 7.7.1 Handling Interrupt Request Signals as Sources for CPU Interrupt but Not Direct Memory Access Controller Activating

1. Do not select direct memory access controller activating sources.
2. When interrupts occur, interrupt requests are sent to the CPU.
3. The CPU clears the interrupt source and performs the necessary processing in the interrupt exception service routine.

### 7.7.2 Handling Interrupt Request Signals as Sources for Activating Direct Memory Access Controller but Not CPU Interrupt

1. Select direct memory access controller activating sources.
2. Activating sources are applied to the direct memory access controller when interrupts occur.
3. The direct memory access controller clears the interrupt sources when starting transfer.

## 7.8 Usage Note

### 7.8.1 Timing to Clear an Interrupt Source

The interrupt source flags should be cleared in the interrupt exception service routine. After clearing the interrupt source flag, time is required before the interrupt source sent to the CPU is actually cancelled. To ensure that an interrupt request that should have been cleared is not inadvertently accepted again, read the interrupt source flag after it has been cleared, and then execute an RFE instruction.

### 7.8.2 Notes on Selecting IRQ Interrupt Pin Functions

While the corresponding setting in interrupt control register 1 (ICR1) is for interrupt requests to be detected on falling edges or both edges of an IRQn input and the current input on the pin is at the low level, this will be detected as a falling edge and thus an interrupt when the pin function is switched to the IRQ interrupt function.

### 7.8.3 Notes on Reading Interrupt ID Values from Interrupt Acknowledge Register (ICCIAR)

If an interrupt ID value read from the interrupt acknowledge register (ICCIAR) is 0, the interrupt notice may be wrong. At that time, confirm the interrupt state before proceeding with interrupt processing.
When the interrupt ID is read as 0, the interrupt state can be confirmed by using bit 0 in the active bit register 0 (ICDABR0).

If the interrupt state is inactive, the interrupt notice is wrong and no interrupt processing is required. Return from interrupt processing after writing the same value as the setting value to the interrupt priority register 0 (ICDIPR0).
If the interrupt state is active, the interrupt notice is correct. Proceed with interrupt processing.
If an interrupt ID value read from the interrupt acknowledge register (ICCIAR) is 1022 or 1023, return from interrupt processing after writing the same value as the setting value to the interrupt priority register 0 (ICDIPR0).

### 7.8.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use

To use an IRQ pin as the trigger for release from standby when software standby is in use, execute the following processing.

#### (1) When the mode setting for an IRQ pin has been switched from the alternative mode to the port mode

Set the IRQ sense select bits corresponding to the given IRQ pin in interrupt control register 1 (ICR1) to the initial value, 00 (interrupt requests being detected as the low level of the IRQn input).

#### (2) When the mode setting for an IRQ pin has been switched from the port mode to the alternative mode

After switching the pin mode setting, make the setting of the IRQ sense select bits corresponding to the given IRQ pin in the following sequence. To start with, set the IRQ sense select bits in interrupt control register 1 (ICR1) to the initial value, 00 (interrupt requests being detected as the low level of the IRQn input), and then set them to the desired value, as described below.

- When the IRQ pin is to be used with the IRQ sense select bits set to 01 (interrupt requests being detected on falling edges of the IRQn input)
  Set these bits to 00 (detection as the low level) *1 and then to 01 (detection on falling edges).
- When the IRQ pin is to be used with the IRQ sense select bits set to 10 (interrupt requests being detected on rising edges of the IRQn input)
  Set these bits to 00 (detection as the low level) *1 and then to 10 (detection on rising edges).
- When the IRQ pin is to be used with the IRQ sense select bits set to 11 (interrupt requests being detected on the both edges of the IRQn input)
  Set these bits to 00 (detection as the low level) *1 and then to 11 (detection on the both edges).

Note 1. This setting is for the detection of interrupt requests when the IRQ pin is at the low level. Make the appropriate settings so that the interrupt function does not operate or the interrupt is ignored, during the period from setting of the IRQ pin mode to setting of the IRQ sense select bits.

# 8. Bus State Controller

The bus state controller outputs control signals for various types of memory and external devices that are connected to the external address space. The functions of this module enable this LSI to connect directly with SRAM, SDRAM, and other memory storage devices, and external devices.

## 8.1 Features

1. External address space
   —A maximum of 64 Mbytes for each of areas CS0 to CS5.
   —Can specify the normal space interface, SRAM interface with byte selection, burst ROM (clocked synchronous or asynchronous), MPX-I/O, and SDRAM memory type for each address space.
   —Can select the data bus width (8, 16, or 32 bits) for each of address spaces.
   —Controls insertion of wait cycles for each address space.
   —Controls insertion of wait cycles for each read access and write access.
   —Can set independent idle cycles during the continuous access for five casecs: read-write (in same space/different spaces), read-read (in same space/different spaces), the first cycle is a write access.
2. Normal space interface
   —Supports the interface that can directly connect to the SRAM.
3. Burst ROM interface (clocked asynchronous)
   —High-speed access to the ROM that has the page mode function.
4. MPX-I/O interface
   —Can directly connect to a peripheral LSI that needs an address/data multiplexing.
5. SDRAM interface
   —Can set the SDRAM in up to two areas.
   —Multiplex output for row address/column address.
   —Efficient access by single read/single write.
   —High-speed access in bank-active mode.
   —Supports an auto-refresh and self-refresh.
   —Supports a power-down mode.
   —Issues MRS and EMRS commands.
6. SRAM interface with byte selection
   —Can connect directly to a SRAM with byte selection.
7. Burst ROM interface (clocked synchronous)
   —Can connect directly to a burst ROM of the clocked synchronous type.
8. Refresh function
   —Supports the auto-refresh and self-refresh functions.
   —Specifies the refresh interval using the refresh counter and clock selection.
   —Can execute concentrated refresh by specifying the refresh counts (1, 2, 4, 6, or 8).
9. Usage as interval timer for refresh counter
   —Generates an interrupt request at compare match.
10. Detection of long wait state for access by the signal on the external $\overline{\text{WAIT}}$ pin.
    —A timeout detection condition is specifiable per CS space.
    —Once timeout is detected, the external WAIT function is disabled and a timeout detection interrupt request is issued.

Figure 8.1 shows a block diagram of this module.

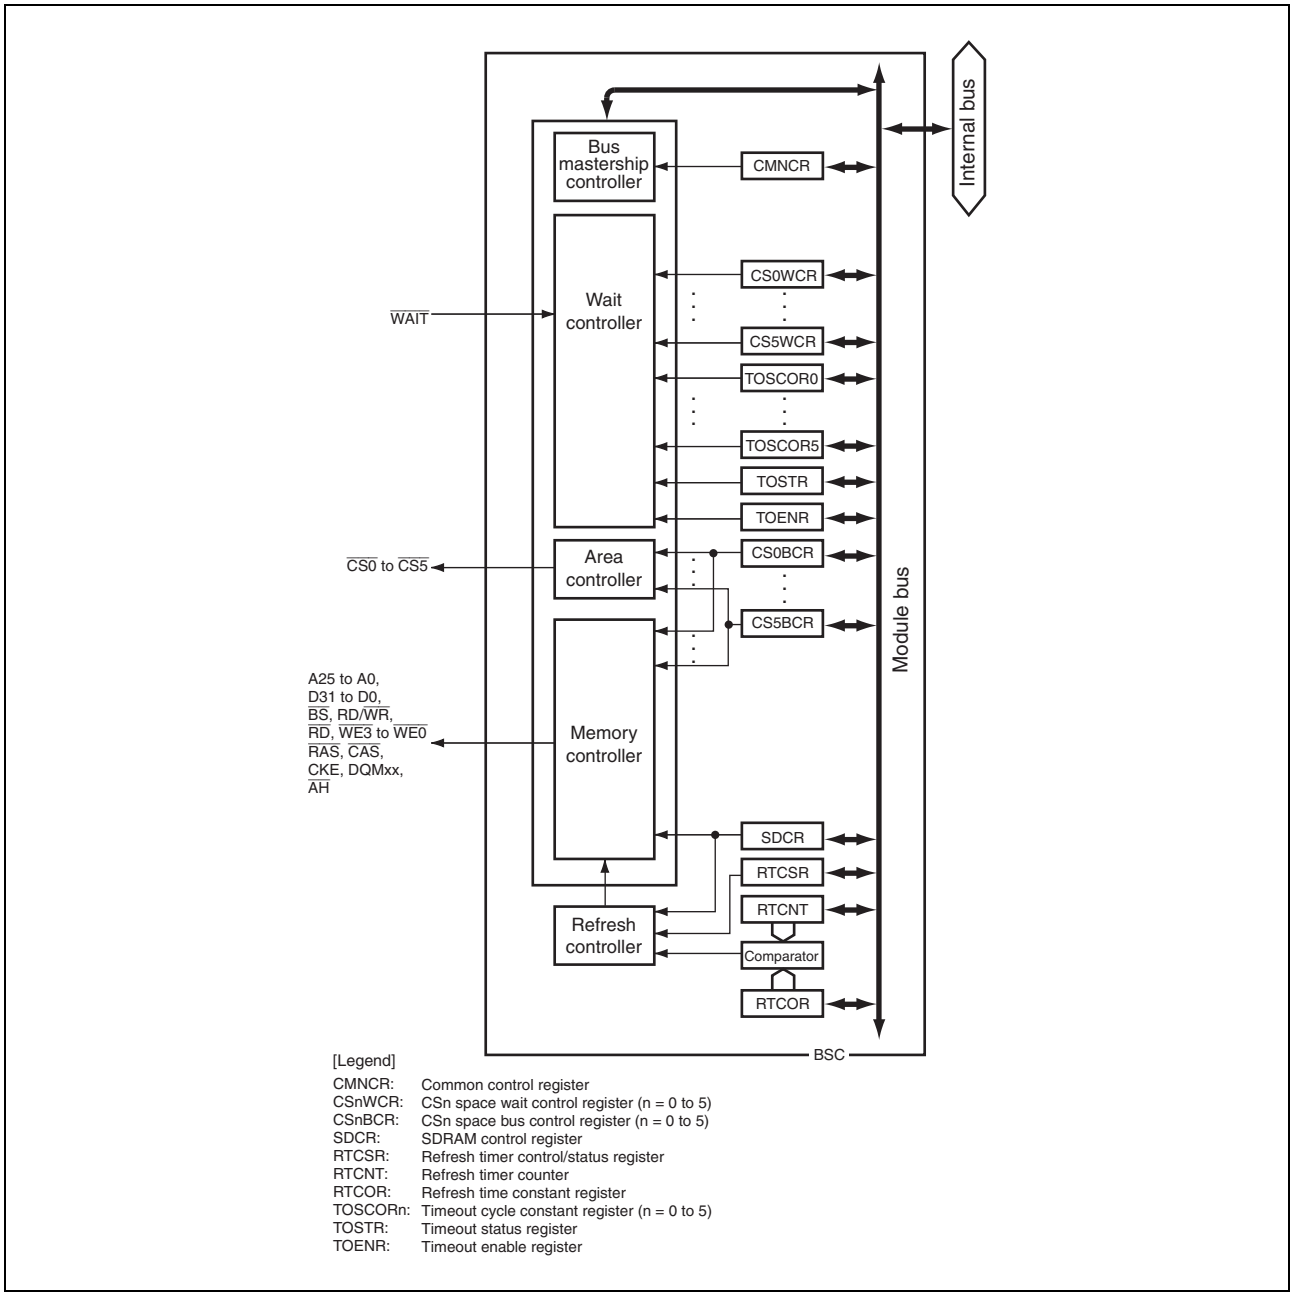

**Figure 8.1 Block Diagram of Bus State Controller**

## 8.2 Input/Output Pins

Table 8.1 shows the pin configuration.

**Table 8.1 Pin Configuration**

| Name | I/O | Function |
|---|---|---|
| A25 to A0 | Output | Address bus |
| D31 to D0 | I/O | Data bus |
| $\overline{BS}$ | Output | Bus cycle start |
| $\overline{CS0}$ to $\overline{CS5}$ | Output | Chip select |
| RD/$\overline{WR}$ | Output | Read/write<br>Connects to $\overline{WE}$ pins when SDRAM or SRAM with byte selection is connected. |
| $\overline{RD}$ | Output | Read pulse signal (read data output enable signal) |
| $\overline{WE3}$/DQMUU/$\overline{AH}$ | Output | Indicates that D31 to D24 are being written to.<br>Connected to the byte select signal when a SRAM with byte selection is connected.<br>Functions as the select signals for D31 to D24 when SDRAM is connected.<br>Functions as the address hold signal when the MPX-I/O is used. |
| $\overline{WE2}$/DQMUL | Output | Indicates that D23 to D16 are being written to.<br>Connected to the byte select signal when a SRAM with byte selection is connected.<br>Functions as the select signals for D23 to D16 when SDRAM is connected. |
| $\overline{WE1}$/DQMLU | Output | Indicates that D15 to D8 are being written to.<br>Connected to the byte select signal when a SRAM with byte selection is connected.<br>Functions as the select signals for D15 to D8 when SDRAM is connected. |
| $\overline{WE0}$/DQMLL | Output | Indicates that D7 to D0 are being written to.<br>Connected to the byte select signal when a SRAM with byte selection is connected.<br>Functions as the select signals for D7 to D0 when SDRAM is connected. |
| $\overline{RAS}$ | Output | Connects to $\overline{RAS}$ pin when SDRAM is connected. |
| $\overline{CAS}$ | Output | Connects to $\overline{CAS}$ pin when SDRAM is connected. |
| CKE | Output | Connects to CKE pin when SDRAM is connected. |
| $\overline{WAIT}$ | Input | External wait input |

## 8.3 Area Overview

### 8.3.1 Address Map

In the architecture, this LSI has a 32-bit address space, which is divided into external memory spaces (SPI multi I/O bus space, large-capacity on-chip RAM, hold on-chip RAM, on-chip peripheral modules, and reserved areas) according to the upper bits of the address.
See section 5, LSI Internal Bus (including Secondary Cache) for how to enable or disable caching for the CS0 to CS5 external address spaces.
The kind of memory to be connected and the data bus width are specified in each partial space. The address map for the external address space is listed below.

**Table 8.2 Address Map**

| Internal Address | Space | Memory to be Connected |
|---|---|---|
| H'00000000 to H'03FFFFFF | CS0 | Normal space, SRAM with byte selection, burst ROM (asynchronous or synchronous) |
| H'04000000 to H'07FFFFFF | CS1 | Normal space, SRAM with byte selection |
| H'08000000 to H'0BFFFFFF | CS2 | Normal space, SRAM with byte selection, SDRAM |
| H'0C000000 to H'0FFFFFFF | CS3 | Normal space, SRAM with byte selection, SDRAM |
| H'10000000 to H'13FFFFFF | CS4 | Normal space, SRAM with byte selection, burst ROM (asynchronous) |
| H'14000000 to H'17FFFFFF | CS5 | Normal space, SRAM with byte selection, MPX-I/O |
| H'18000000 to H'3FFFFFFF | Other | SPI multi I/O bus space, large-capacity on-chip RAM, hold on-chip RAM, on-chip peripheral modules, reserved area*1 |
| H'40000000 to H'43FFFFFF | CS0 mirror | Normal space, SRAM with byte selection, burst ROM (asynchronous or synchronous) |
| H'44000000 to H'47FFFFFF | CS1 mirror | Normal space, SRAM with byte selection |
| H'48000000 to H'4BFFFFFF | CS2 mirror | Normal space, SRAM with byte selection, SDRAM |
| H'4C000000 to H'4FFFFFFF | CS3 mirror | Normal space, SRAM with byte selection, SDRAM |
| H'50000000 to H'53FFFFFF | CS4 mirror | Normal space, SRAM with byte selection, burst ROM (asynchronous) |
| H'54000000 to H'57FFFFFF | CS5 mirror | Normal space, SRAM with byte selection, MPX-I/O |
| H'58000000 to H'FFFFFFFF | Other | SPI multi I/O bus space (mirror), large-capacity on-chip RAM (mirror), hold on-chip RAM (mirror), on-chip peripheral modules, reserved area*1 |

Note 1. For the large-capacity on-chip RAM space and hold on-chip RAM space, access the addresses shown in section 53, On-Chip RAM. For the on-chip peripheral module space, access the addresses shown in section 58, List of Registers. Do not access addresses which are not described in these sections. Otherwise, the correct operation cannot be guaranteed.

### 8.3.2 Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode

The initial state of data bus width and settings of the pins related to this module depends on boot mode. For boot mode, refer to section 3, Boot Mode.

In boot modes 0 and 1, the state of area 0 is fixed to the state with bus width of 16 or 32 bits, because this LSI is started up by the program stored in the ROM connected to area 0. The initial states of areas 1 to 5 are the same as that of area 0, but the bus width can be changed by the program. Immediately after a power-on reset in these modes, some of the address and data-bus signals and the $\overline{CS0}$ and $\overline{RD}$ signals are automatically selected by default as the functions of the corresponding pins, since these signals are required to read ROM data from area 0. With the exception of these pins, the general purpose pin function is selected by default, and other required pin functions must be specified by the program. Read access to area 0 is only permitted before the pin settings are completed.

In boot modes 3 to 5, the state of areas 0 to 5 can be changed from the initial state by the program, because the LSI is started by the program stored in the SPI serial memory, the NAND flash memory with the SD controller, or the NAND flash memory with the MMC controller. Since pin functions related to this module are not set automatically, they need to be set by the program. Do not access external address spaces before the pin settings are completed.

Table 8.3 shows the initial state by areas 0 to 5 in boot modes 0, 1, and 2 to 5.

The sample access waveforms shown in this section include the pins such as $\overline{BS}$, RD/$\overline{WR}$, and $\overline{WEn}$. They are the waveforms when pin functions are assigned to the general I/O ports. For example, when 16-bit bus width is used in boot mode 1, setting for pin A1 is needed. When 8-bit bus width is used, setting for pins A1 and A0 is also needed.

For details on pin function settings, see section 54, Ports.

**Table 8.3 Initial States by Areas in Boot Modes 0, 1, and 2 to 5**

| Boot Mode | Item | Area 0 | Areas 1 to 5 |
|---|---|---|---|
| 0 | Data bus width | Fixed to 16 bits.<br>Not changeable. | 16 bits. Can be changed by program. |
| | Settings of pins related to this module | Pins A20 to A1, D15 to D0, $\overline{CS0}$, and $\overline{RD}$ are set automatically. Other pins need to be set by program. | |
| 1 | Data bus width | Fixed to 32 bits.<br>Not changeable. | 32 bits. Can be changed by program. |
| | Settings of pins related to this module | Pins A20 to A2, D31 to D0, $\overline{CS0}$, and $\overline{RD}$ are set automatically. Other pins need to be set by program. | |
| 3 to 5 | Data bus width | 32 bits. Can be changed by program. | |
| | Settings of pins related to this module | General I/O function.<br>For external bus access, all the necessary pins need to be set by program. | |

Note 1. If operation is to start in boot mode 0 or 1 and the connected boot ROM includes address bit A21 or higher-order address bits, the circuit board must include pull-down resistors for the corresponding address lines.

Note 2. The data-bus width may be limited by the type of memory in use. For details, see section 8.4.2, CSn Space Bus Control Register (CSnBCR) (n = 0 to 5).

## 8.4 Register Descriptions

Table 8.4 shows the register configuration of this module.
Do not access the areas until settings of the connected memory interface are completed.

**Table 8.4 Register Configuration**

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| Common control register | CMNCR | R/W | H'00001018 | H'3FFFC000 | 32 |
| CS0 space bus control register | CS0BCR | R/W | H'36DB0C00*1 | H'3FFFC004 | 32 |
| CS1 space bus control register | CS1BCR | R/W | H'36DB0C00*1 | H'3FFFC008 | 32 |
| CS2 space bus control register | CS2BCR | R/W | H'36DB0C00*1 | H'3FFFC00C | 32 |
| CS3 space bus control register | CS3BCR | R/W | H'36DB0C00*1 | H'3FFFC010 | 32 |
| CS4 space bus control register | CS4BCR | R/W | H'36DB0C00*1 | H'3FFFC014 | 32 |
| CS5 space bus control register | CS5BCR | R/W | H'36DB0C00*1 | H'3FFFC018 | 32 |
| CS0 space wait control register | CS0WCR | R/W | H'00000500 | H'3FFFC028 | 32 |
| CS1 space wait control register | CS1WCR | R/W | H'00000500 | H'3FFFC02C | 32 |
| CS2 space wait control register | CS2WCR | R/W | H'00000500 | H'3FFFC030 | 32 |
| CS3 space wait control register | CS3WCR | R/W | H'00000500 | H'3FFFC034 | 32 |
| CS4 space wait control register | CS4WCR | R/W | H'00000500 | H'3FFFC038 | 32 |
| CS5 space wait control register | CS5WCR | R/W | H'00000500 | H'3FFFC03C | 32 |
| SDRAM control register | SDCR | R/W | H'00000000 | H'3FFFC04C | 32 |
| Refresh timer control/status register | RTCSR | R/W | H'00000000 | H'3FFFC050 | 32 |
| Refresh timer counter | RTCNT | R/W | H'00000000 | H'3FFFC054 | 32 |
| Refresh time constant register | RTCOR | R/W | H'00000000 | H'3FFFC058 | 32 |
| Timeout cycle constant register 0 | TOSCOR0 | R/W | H'00000000 | H’3FFFC060 | 32 |
| Timeout cycle constant register 1 | TOSCOR1 | R/W | H'00000000 | H’3FFFC064 | 32 |
| Timeout cycle constant register 2 | TOSCOR2 | R/W | H'00000000 | H’3FFFC068 | 32 |
| Timeout cycle constant register 3 | TOSCOR3 | R/W | H'00000000 | H’3FFFC06C | 32 |
| Timeout cycle constant register 4 | TOSCOR4 | R/W | H'00000000 | H’3FFFC070 | 32 |

Note: * For High-Z control of CKIO, see section 6, Clock Pulse Generator.

## 8.4.2 CSn Space Bus Control Register (CSnBCR) (n = 0 to 5)

CSnBCR is a 32-bit readable/writable register that specifies the memory connected to each space, the number of idle cycles between bus cycles, and the bus width.

Do not access external memory for the corresponding area until CSnBCR initial setting and pin setting are completed. Idle cycles may be inserted even when they are not specified. For details, see section 8.5.10, Wait between Access Cycles.

Note: * B'10 in boot mode 0; B'11 in boot modes 1 and 3 to 5.

### 8.4.3 CSn Space Wait Control Register (CSnWCR) (n = 0 to 5)

CSnWCR specifies various wait cycles for memory access. The bit configuration of this register varies as shown below according to the memory type (TYPE2 to TYPE0) specified by the CSn space bus control register (CSnBCR). Specify CSnWCR before accessing the target area. Specify CSnBCR first, then specify CSnWCR.

#### (1) Normal Space, SRAM with Byte Selection, and MPX-I/O

### 8.4.5 Refresh Timer Control/Status Register (RTCSR)

RTCSR specifies various items about refresh for SDRAM.

When RTCSR is written, the upper 16 bits of the write data must be H'A55A to cancel write protection.

The phase of the clock for incrementing the count in the refresh timer counter (RTCNT) is adjusted only by a power-on reset. Note that there is an error in the time until the compare match flag is set for the first time after the timer is started with the CKS[2:0] bits being set to a value other than B'000.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 2 to 0 | RRC[2:0] | 000 | R/W | Refresh Count<br>Specify the number of continuous refresh cycles, when the refresh request occurs after the coincidence of the values of the refresh timer counter (RTCNT) and the refresh time constant register (RTCOR). These bits can make the period of occurrence of refresh long.<br>000: 1 time<br>001: 2 times<br>010: 4 times<br>011: 6 times<br>100: 8 times<br>101: Reserved (setting prohibited)<br>110: Reserved (setting prohibited)<br>111: Reserved (setting prohibited) |

## 8.4.6 Refresh Timer Counter (RTCNT)

RTCNT is an 8-bit counter that increments using the clock selected by bits CKS[2:0] in RTCSR. When RTCNT matches RTCOR, RTCNT is cleared to 0. The value in RTCNT returns to 0 after counting up to 255. When the RTCNT is written, the upper 16 bits of the write data must be H'A55A to cancel write protection.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. |
| 7 to 0 | | All 0 | R/W | 8-Bit Counter |

## 8.4.7 Refresh Time Constant Register (RTCOR)

RTCOR is an 8-bit register. When RTCOR matches RTCNT, the CMF bit in RTCSR is set to 1 and RTCNT is cleared to 0.

When the RFSH bit in SDCR is 1, a memory refresh request is issued by this matching signal. This request is maintained until the refresh operation is performed. If the request is not processed when the next matching occurs, the previous request is ignored.

When the CMIE bit in RTCSR is set to 1, an interrupt request is issued by this matching signal. The request continues to be output until the CMF bit in RTCSR is cleared. Clearing the CMF bit only affects the interrupt request and does not clear the refresh request. Therefore, a combination of refresh request and interval timer interrupt can be specified so that the number of refresh requests are counted by using timer interrupts while refresh is performed periodically.

When RTCOR is written, the upper 16 bits of the write data must be H'A55A to cancel write protection.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 to 0 | | All 0 | R/W | 8-Bit Counter |

### 8.4.8 Timeout Cycle Constant Register (TOSCORn) (n = 0 to 5)

TOSCORn is a 16-bit register the value of which is effective when the WM bit in the CSn space wait control register (CSnWCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1. When the number of cycles of waiting due to the signal on the eternal wait input pin matches the setting of TOSCORn, external wait input is disabled to end the cycle of access, the timeout status flag for the corresponding space in the timeout status register (TOSTR) is set, and a timeout detection interrupt request is generated. The timeout detection interrupt request is retained until the corresponding bit in TOENR is set to 0 or 0 is written to the timeout status flag for the corresponding space. Note that timeout detection is enabled even while the timeout status flag for the corresponding space in TOSTR is 1, and external wait input is disabled in response to a further timeout.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. |

### 8.4.9 Timeout Status Register (TOSTR)

TOSTOR is an 8-bit register that holds the timeout status flags for the CS spaces. When the WM bit in the CSn space wait control register (CSnWCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1 and the number of cycles of waiting in response to the signal on the eternal wait input matches the setting of TOSCORn, the timeout status flag for the corresponding space is set and a timeout detection interrupt request is generated. The only writable value for the timeout status flags is 0, which clears the flag. Writing 1 to a flag is ignored.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 8.5 Operation

### 8.5.1 Access Size and Data Alignment

This LSI supports little endian, in which the least significant byte (LSB) is that in the direction of the 0th address.
Data bus width can be selected from 8 bits, 16 bits, and 32 bits for the normal memory and SRAM with byte selection.
Data bus width can be selected from 16 bits and 32 bits for SDRAM. For MPX-I/O, the data bus width is fixed to either 8 or 16 bits, or made selectable as 8 bits or 16 bits by one of the address lines.
Data bus width varies depending on boot mode. For details, refer to section 8.3.2, Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode.
Data alignment is performed in accordance with the data bus width selected for the device. This also means that four read operations are required to read 32-bit data from a byte-width device. In this LSI, data alignment and conversion of data length is performed automatically between the respective interfaces.
Table 8.5 to Table 8.7 show the relationship between device data width and access unit.

**Table 8.5 32-Bit External Device Access and Data Alignment in Little Endian**

| | Data Bus | | | | Strobe Signals | | | |

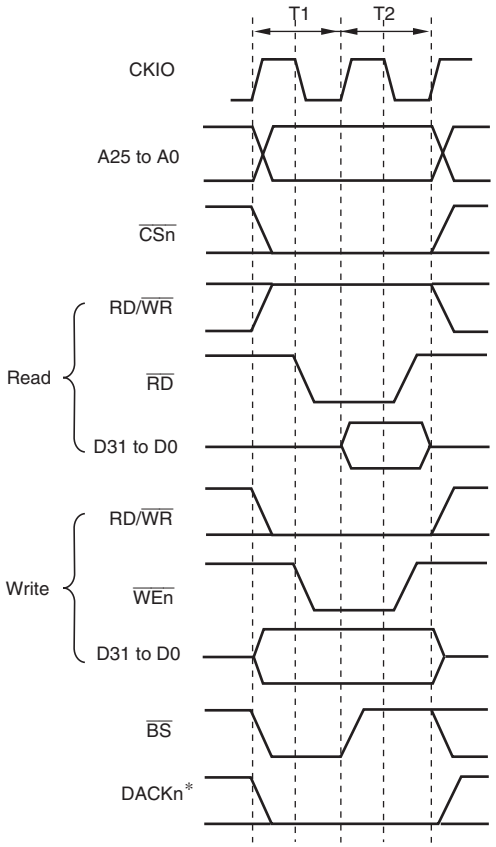
## 8.5.2 Normal Space Interface

### (1) Basic Timing

For access to a normal space, this LSI uses strobe signal output in consideration of the fact that mainly static RAM will be directly connected. When using SRAM with a byte-selection pin, see section 8.5.8, SRAM Interface with Byte Selection. Figure 8.2 shows the basic timings of normal space access. A no-wait normal access is completed in two cycles. The $\overline{BS}$ signal is asserted for one cycle to indicate the start of a bus cycle.



Note: * The waveform for DACKn is when active low is specified.

**Figure 8.2 Normal Space Basic Access Timing (Access Wait 0)**

There is no access size specification when reading. The correct access start address is output in the least significant bit of the address, but since there is no access size specification, 32 bits are always read in case of a 32-bit device. 16 bits are always read in case of a 16-bit device. When writing, only the $\overline{WEn}$ signal for the byte to be written is asserted.
It is necessary to output the data that has been read using $\overline{RD}$ when a buffer is established in the data bus. The RD/$\overline{WR}$ signal is in a read state (high output) when no access has been carried out. Therefore, care must be taken when controlling the external data buffer with this signal, to avoid output collision.
Figure 8.3 and Figure 8.4 show the basic timings in continuous access to normal space. If the WM bit in CSnWCR is cleared to 0, a Tnop cycle is inserted after the CSn space access to evaluate the external wait (Figure 8.3). If the WM bit in CSnWCR is set to 1, external waits are ignored and no Tnop cycle is inserted (Figure 8.4).

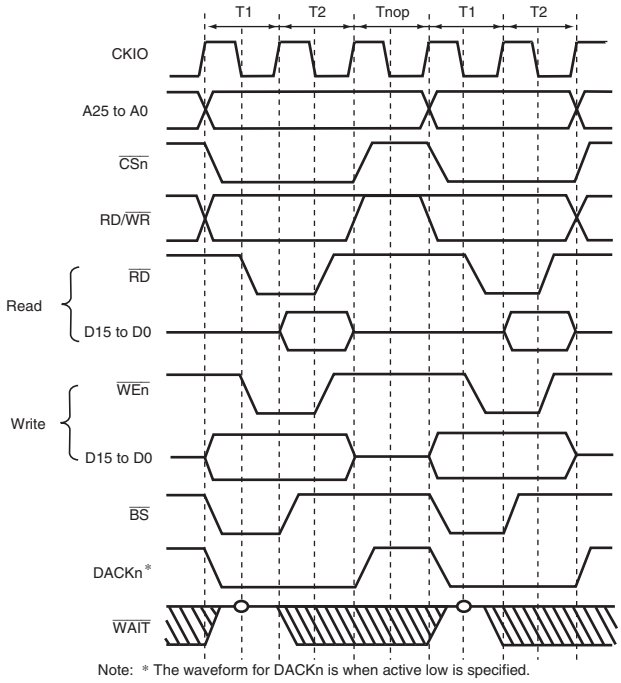


**Figure 8.3 Continuous Access to Normal Space (1) Bus Width = 16 Bits, 32-Bit Access, CSnWCR.WM Bit = 0 (Access Wait = 0, Cycle Wait = 0**

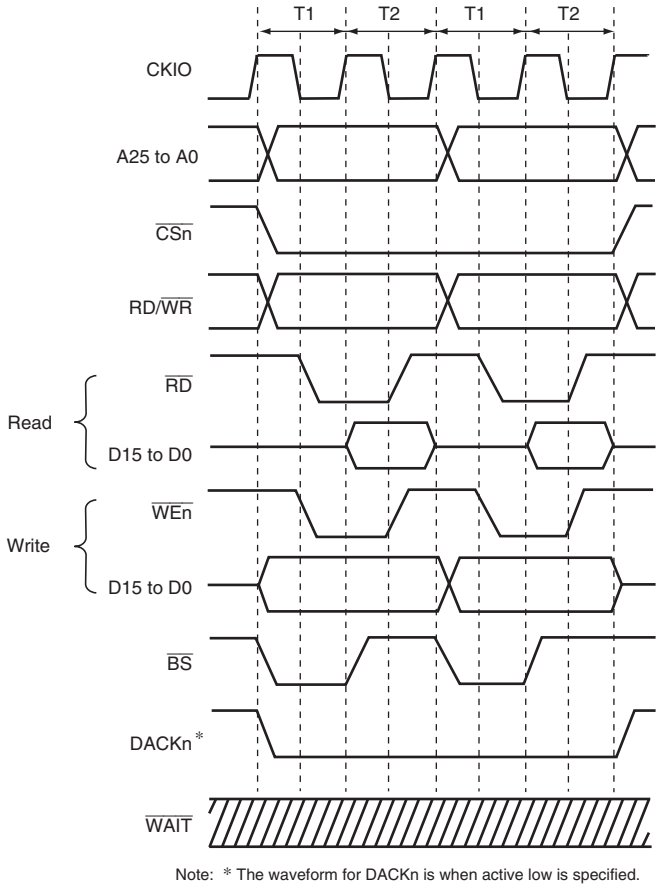

**Figure 8.4 Continuous Access to Normal Space (2) Bus Width = 16 Bits, 32-Bit Access, CSnWCR.WM Bit = 1 (Access Wait = 0, Cycle Wait = 0)**

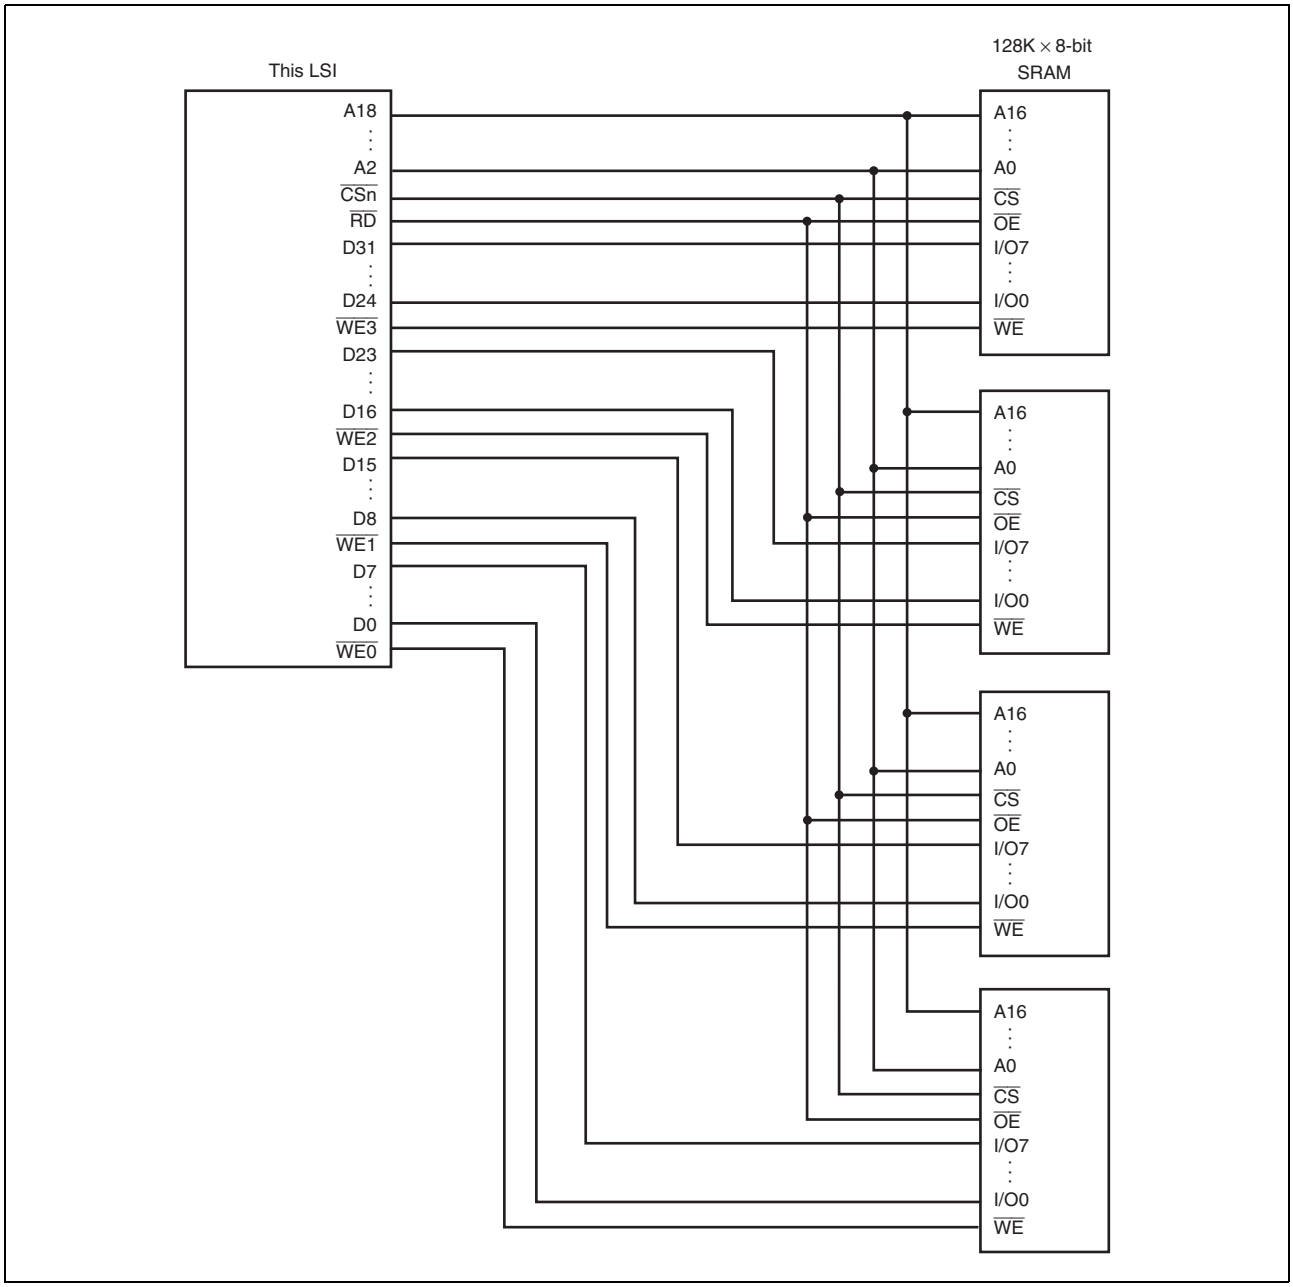

**Figure 8.5 Example of 32-Bit Data-Width SRAM Connection**

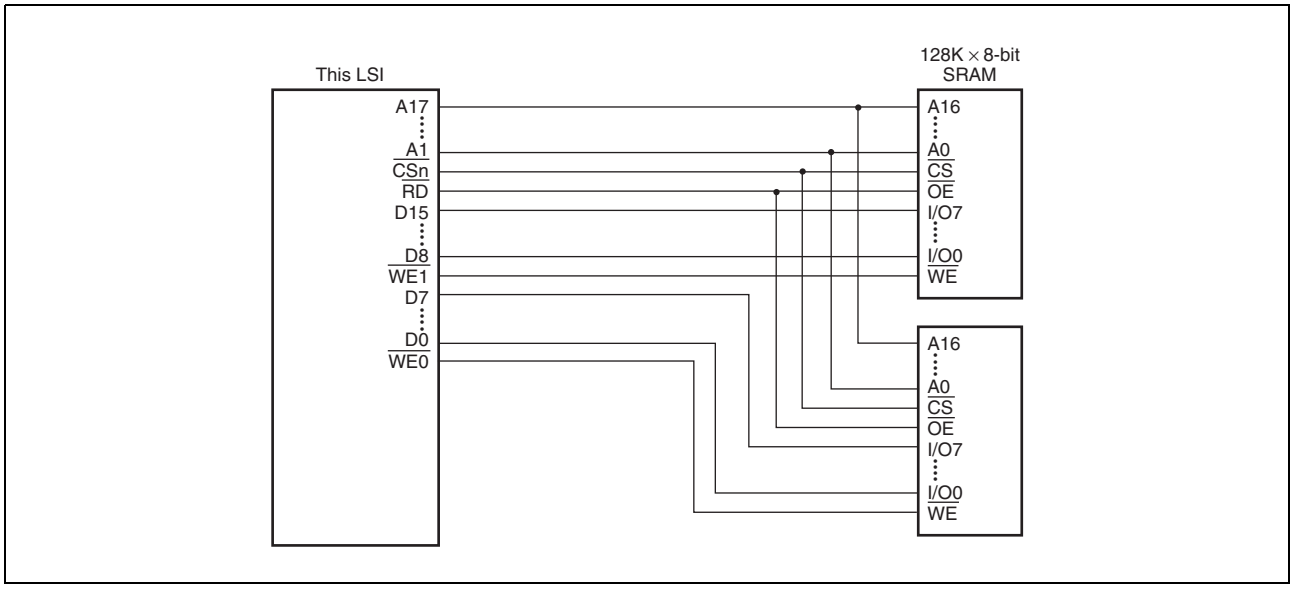

**Figure 8.6 Example of 16-Bit Data-Width SRAM Connection**

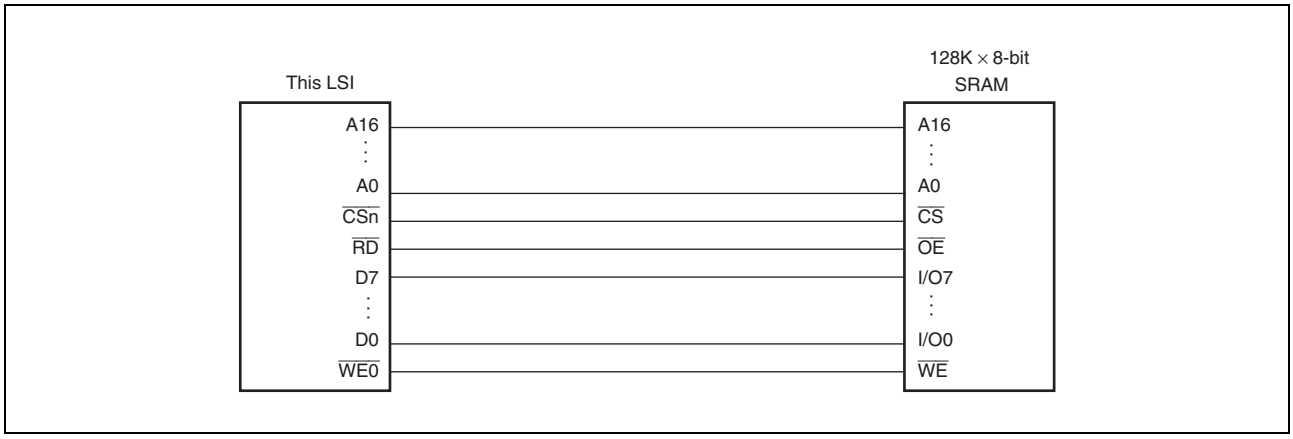

**Figure 8.7 Example of 8-Bit Data-Width SRAM Connection**

### 8.5.3 Access Wait Control

Wait cycle insertion on a normal space access can be controlled by the settings of bits WR3 to WR0 in CSnWCR. It is possible for areas 1, 4, and 5 to insert wait cycles independently in read access and in write access. Areas 0, 2, and 3 have common access wait for read cycle and write cycle. The specified number of Tw cycles are inserted as wait cycles in a normal space access shown in Figure 8.8.

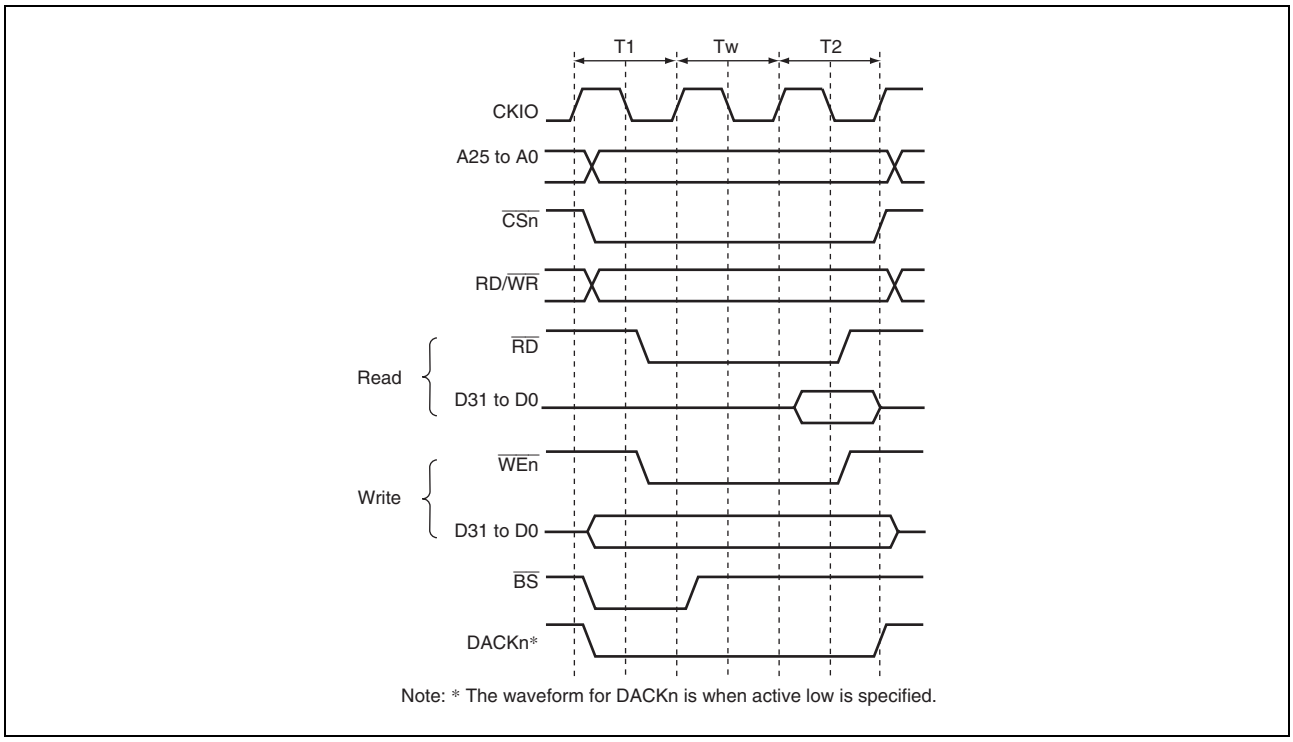

**Figure 8.8 Wait Timing for Normal Space Access (Software Wait Only)**

When the WM bit in CSnWCR is cleared to 0, the external wait input $\overline{\text{WAIT}}$ signal is also sampled. $\overline{\text{WAIT}}$ pin sampling is shown in Figure 8.9. A 2-cycle wait is specified as a software wait. The $\overline{\text{WAIT}}$ signal is sampled on the falling edge of CKIO at the transition from the T1 or Tw cycle to the T2 cycle.

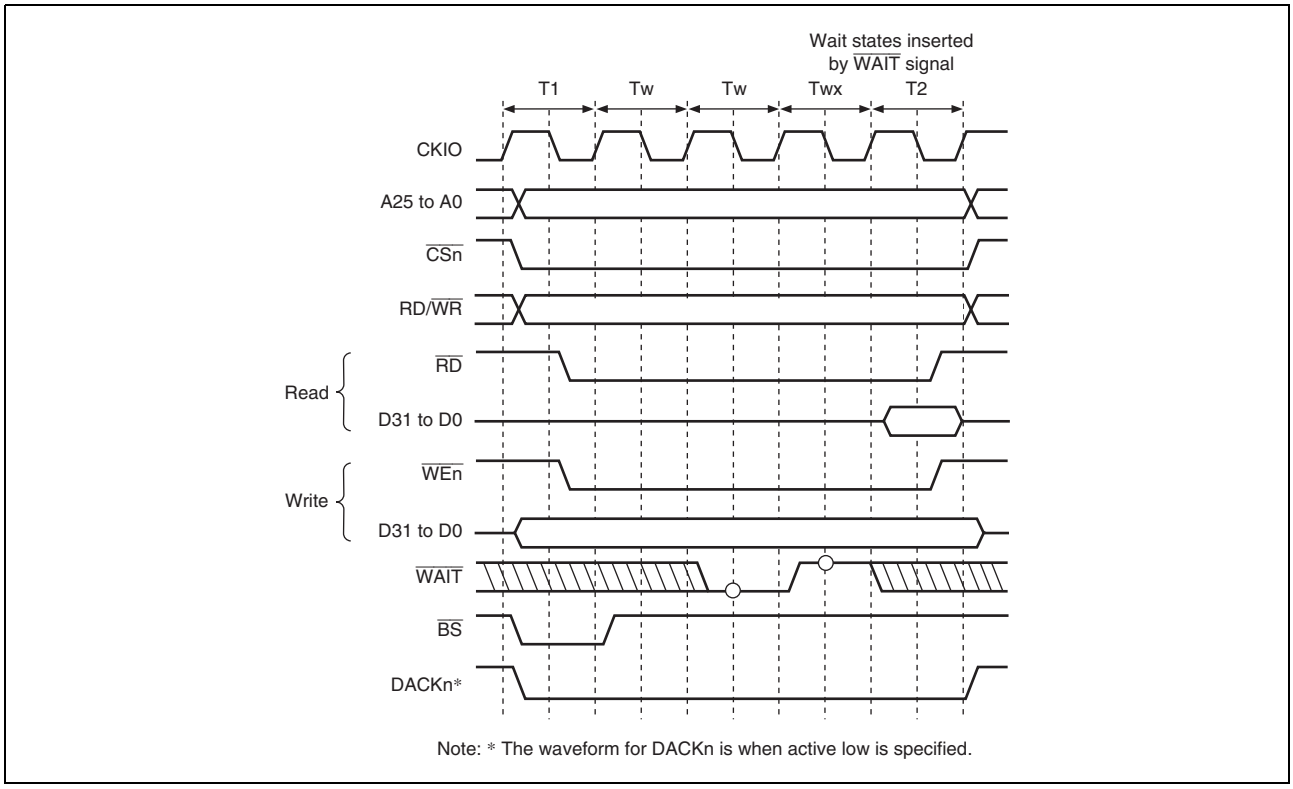

**Figure 8.9 Wait Cycle Timing for Normal Space Access (Wait Cycle Insertion Using $\overline{\text{WAIT}}$ Signal)**

### 8.5.4 $\overline{\text{CSn}}$ Assert Period Expansion

The number of cycles from $\overline{\text{CSn}}$ assertion to $\overline{\text{RD}}$, $\overline{\text{WEn}}$ assertion can be specified by setting bits SW1 and SW0 in CSnWCR. The number of cycles from $\overline{\text{RD}}$, $\overline{\text{WEn}}$ negation to $\overline{\text{CSn}}$ negation can be specified by setting bits HW1 and HW0. Therefore, a flexible interface to an external device can be obtained. Figure 8.10 shows an example. A Th cycle and a Tf cycle are added before and after an ordinary cycle, respectively. In these cycles, $\overline{\text{RD}}$ and $\overline{\text{WEn}}$ are not asserted, while other signals are asserted. The data output is prolonged to the Tf cycle, and this prolongation is useful for devices with slow writing operations.

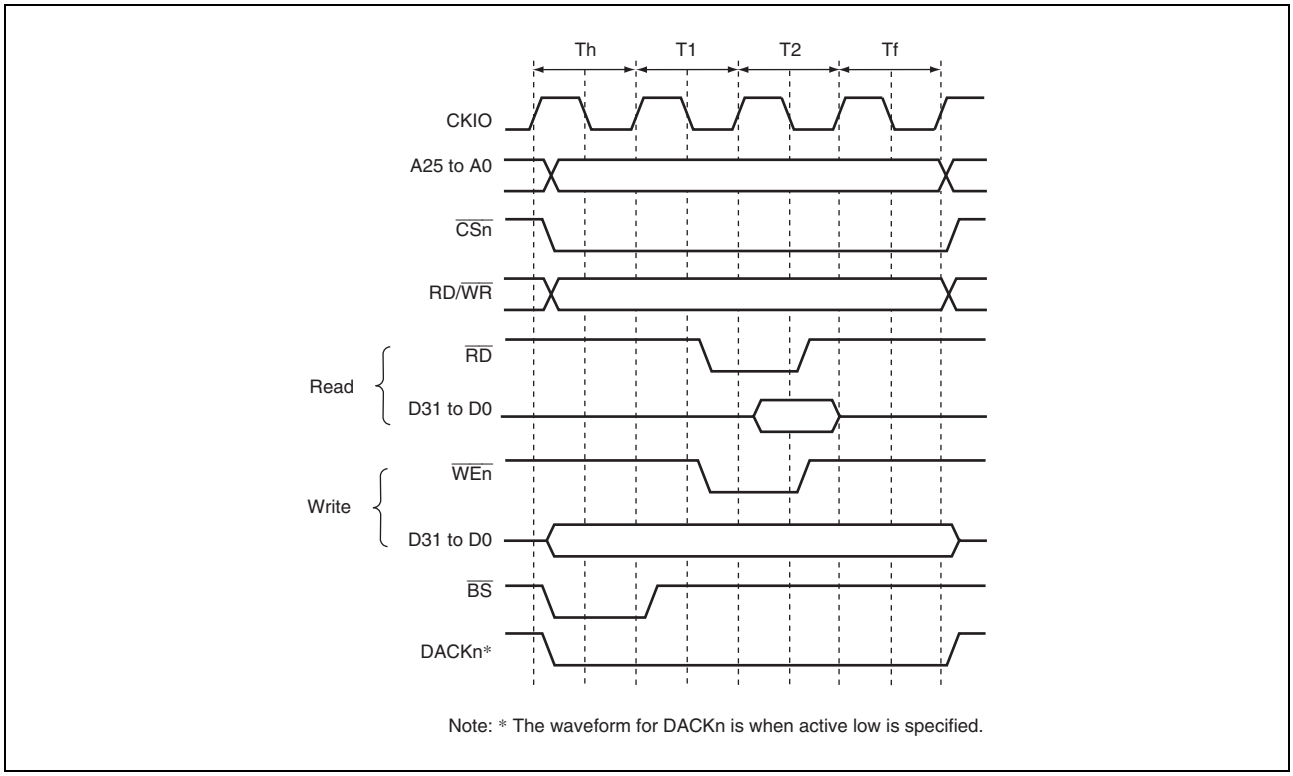

**Figure 8.10 $\overline{\text{CSn}}$ Assert Period Expansion**

### 8.5.5 MPX-I/O Interface

Access timing for the MPX space is shown below. In the MPX space, $\overline{CS5}$, $\overline{AH}$, $\overline{RD}$, and $\overline{WEn}$ signals control the accessing. The basic access for the MPX space consists of 2 cycles of address output followed by an access to a normal space. The bus width for the address output cycle or the data input/output cycle is fixed to 8 bits or 16 bits. Alternatively, it can be 8 bits or 16 bits depending on the address to be accessed.

Output of the addresses D15 to D0 or D7 to D0 is performed from cycle Ta2 to cycle Ta3. Because cycle Ta1 has a high-impedance state, collisions of addresses and data can be avoided without inserting idle cycles, even in continuous access cycles. Address output is increased to 3 cycles by setting the MPXW bit in CS5WCR to 1.

The RD/$\overline{WR}$ signal is output at the same time as the $\overline{CS5}$ signal; it is high in the read cycle and low in the write cycle. The data cycle is the same as that in a normal space access.

The delay cycles the number of which is specified by SW[1:0] are inserted between cycle Ta3 and cycle T1. The delay cycles the number of which is specified by HW[1:0] are added after cycle T2.

Timing charts are shown in Figure 8.11 to Figure 8.13.

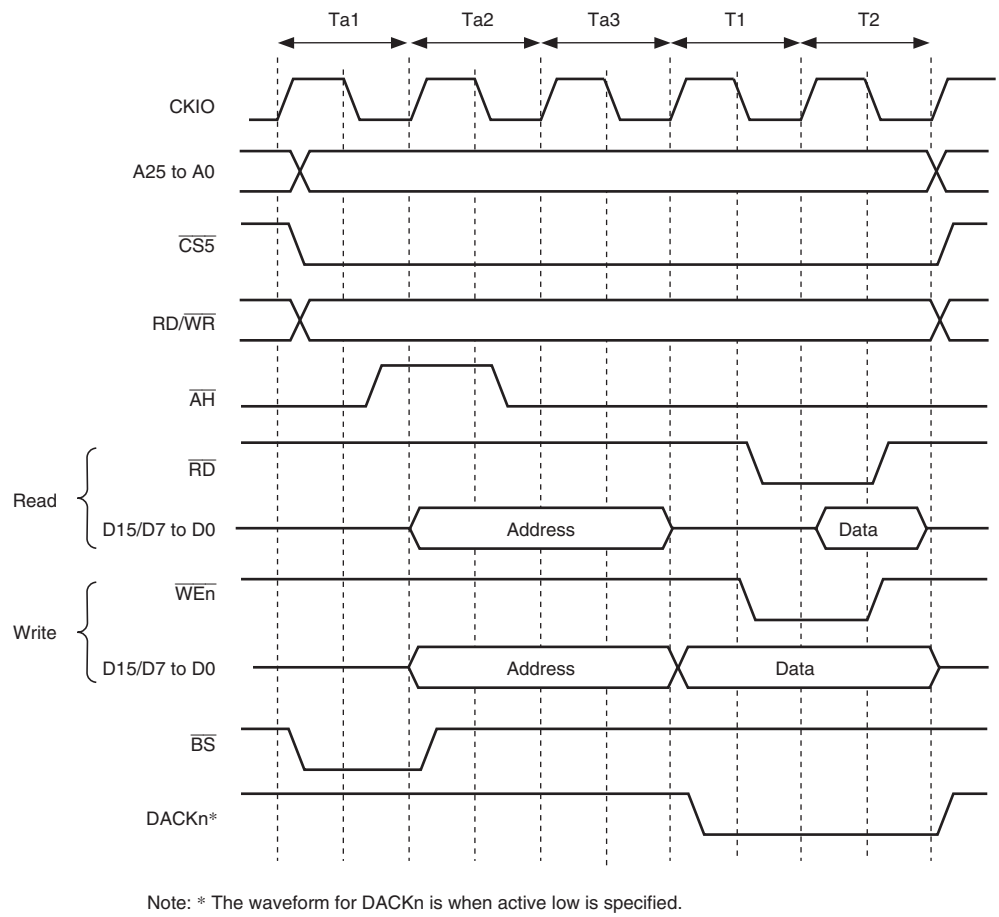

**Figure 8.11 (1) Access Timing for MPX Space (Address Cycle No Wait, Data Cycle No Wait)**

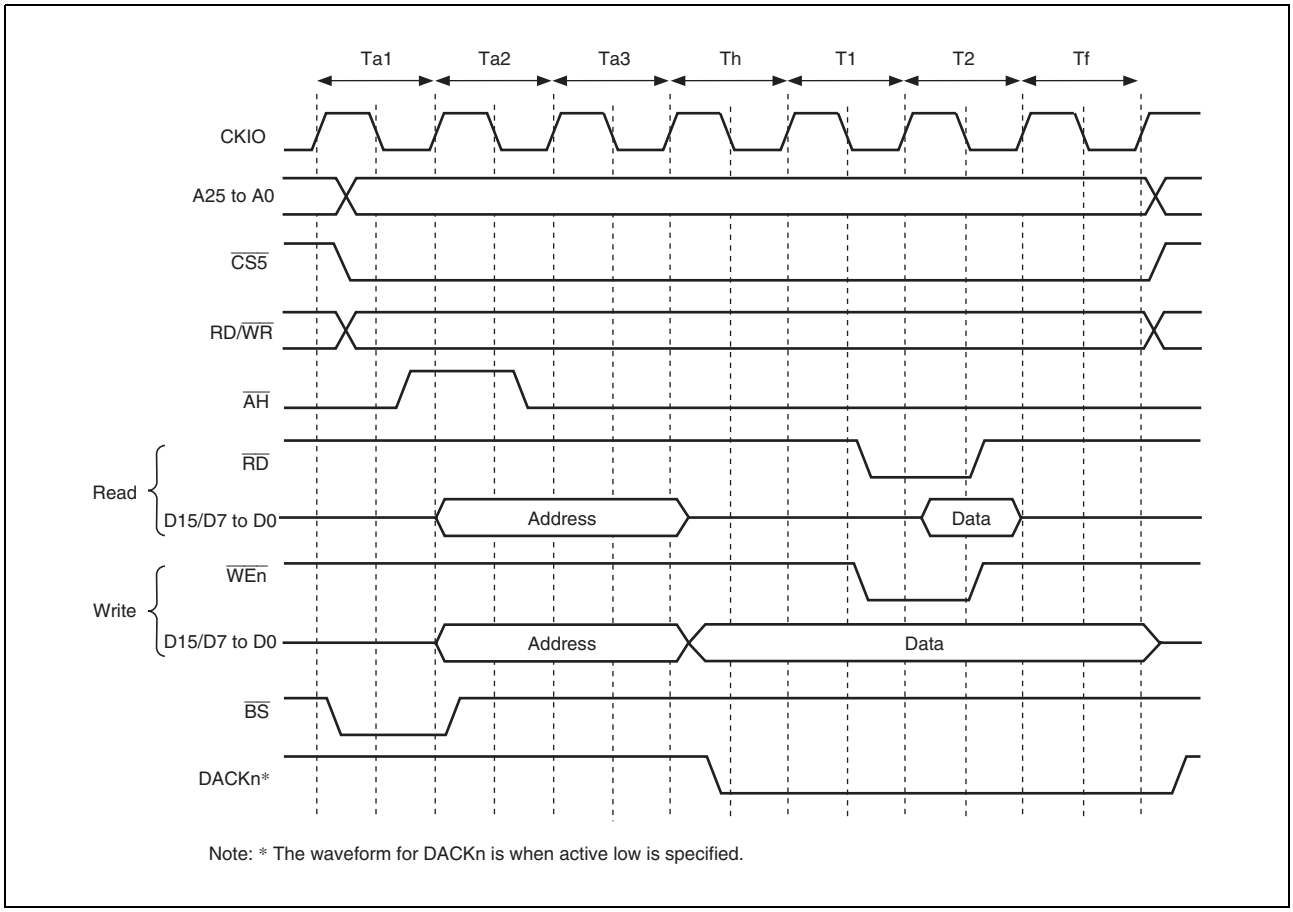

**Figure 8.11 (2) Access Timing for MPX Space (Address Cycle No Wait, Extended Assertion Cycle 1.5, Data Cycle No Wait, Extended Negation Cycle 1.5)**

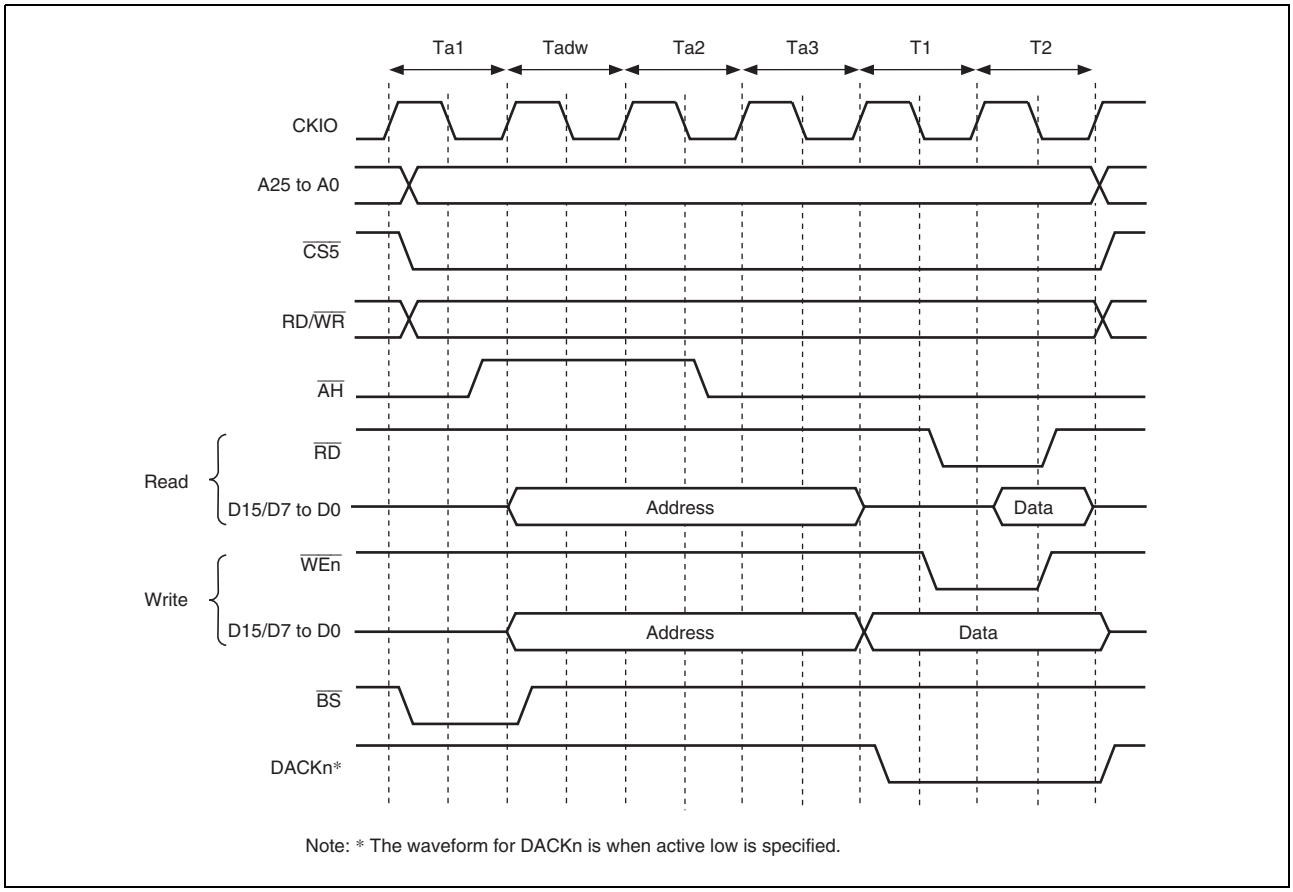

**Figure 8.12 Access Timing for MPX Space (Address Cycle Wait 1, Data Cycle No Wait)**

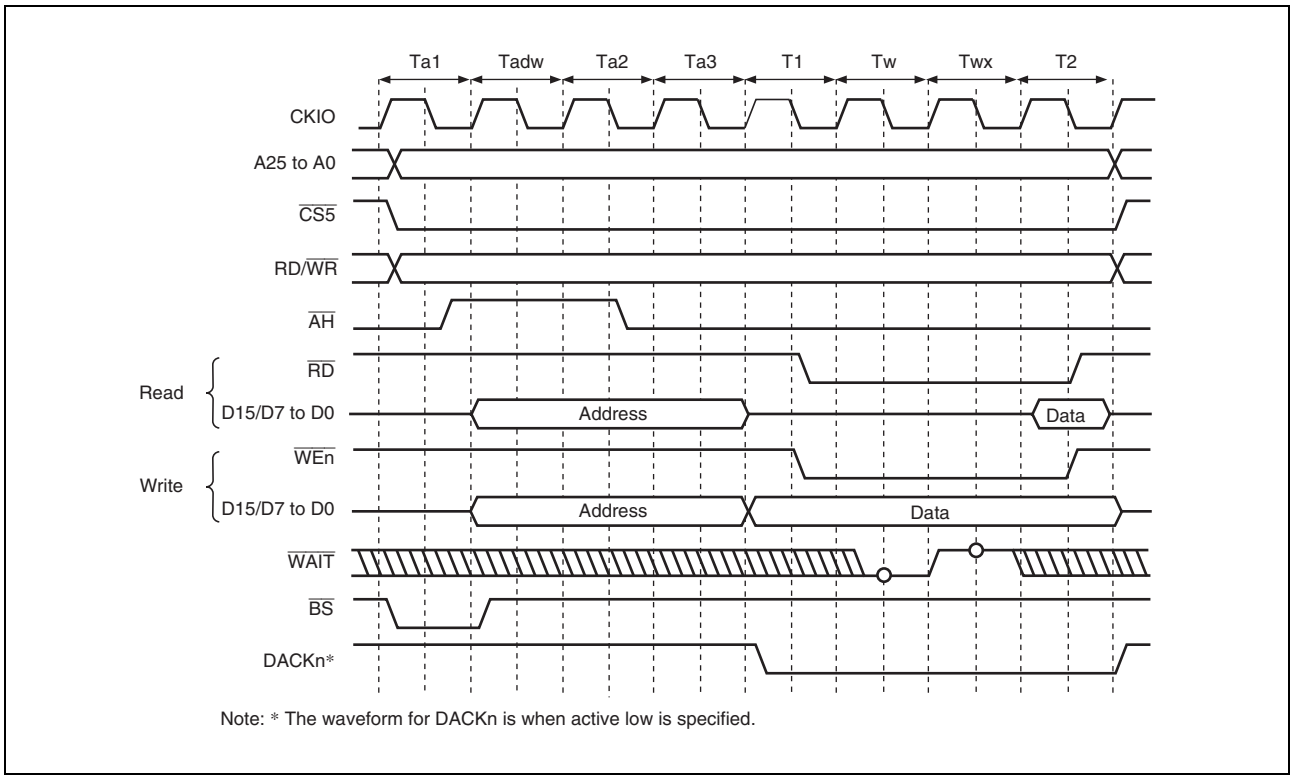

**Figure 8.13 Access Timing for MPX Space (Address Cycle Access Wait 1, Data Cycle Wait 1, External Wait 1)**

## 8.5.6 SDRAM Interface

### (1) SDRAM Direct Connection

The SDRAM that can be connected to this LSI is a product that has 11/12/13 bits of row address, 8/9/10 bits of column address, 4 or less banks, and uses the A10 pin for setting precharge mode in read and write command cycles.
The control signals for direct connection of SDRAM are $\overline{RAS}$, $\overline{CAS}$, RD/$\overline{WR}$, DQMUU, DQMUL, DQMLU, DQMLL, CKE, $\overline{CS2}$, and $\overline{CS3}$. All the signals other than $\overline{CS2}$ and $\overline{CS3}$ are common to all areas, and signals other than CKE are valid only when $\overline{CS2}$ or $\overline{CS3}$ is asserted. SDRAM can be connected to up to 2 spaces. The data bus width of the area that is connected to SDRAM is 16 bits or 32 bits.
Burst read/single write (burst length 1) and burst read/burst write (burst length 1) are supported as the SDRAM operating mode.
Commands for SDRAM can be specified by $\overline{RAS}$, $\overline{CAS}$, RD/$\overline{WR}$, and specific address signals. These commands supports:

- NOP
- Auto-refresh (REF)
- Self-refresh (SELF)
- All banks pre-charge (PALL)
- Specified bank pre-charge (PRE)
- Bank active (ACTV)
- Read (READ)
- Read with pre-charge (READA)
- Write (WRIT)
- Write with pre-charge (WRITA)
- Write mode register (MRS, EMRS)

The byte to be accessed is specified by DQMUU, DQMUL, DQMLU, and DQMLL. Reading or writing is performed for a byte whose corresponding DQMxx is low. For details on the relationship between DQMxx and the byte to be accessed, see section 8.5.1, Access Size and Data Alignment.

Figure 8.14 and Figure 8.15 show examples of the connection of the SDRAM with the LSI.

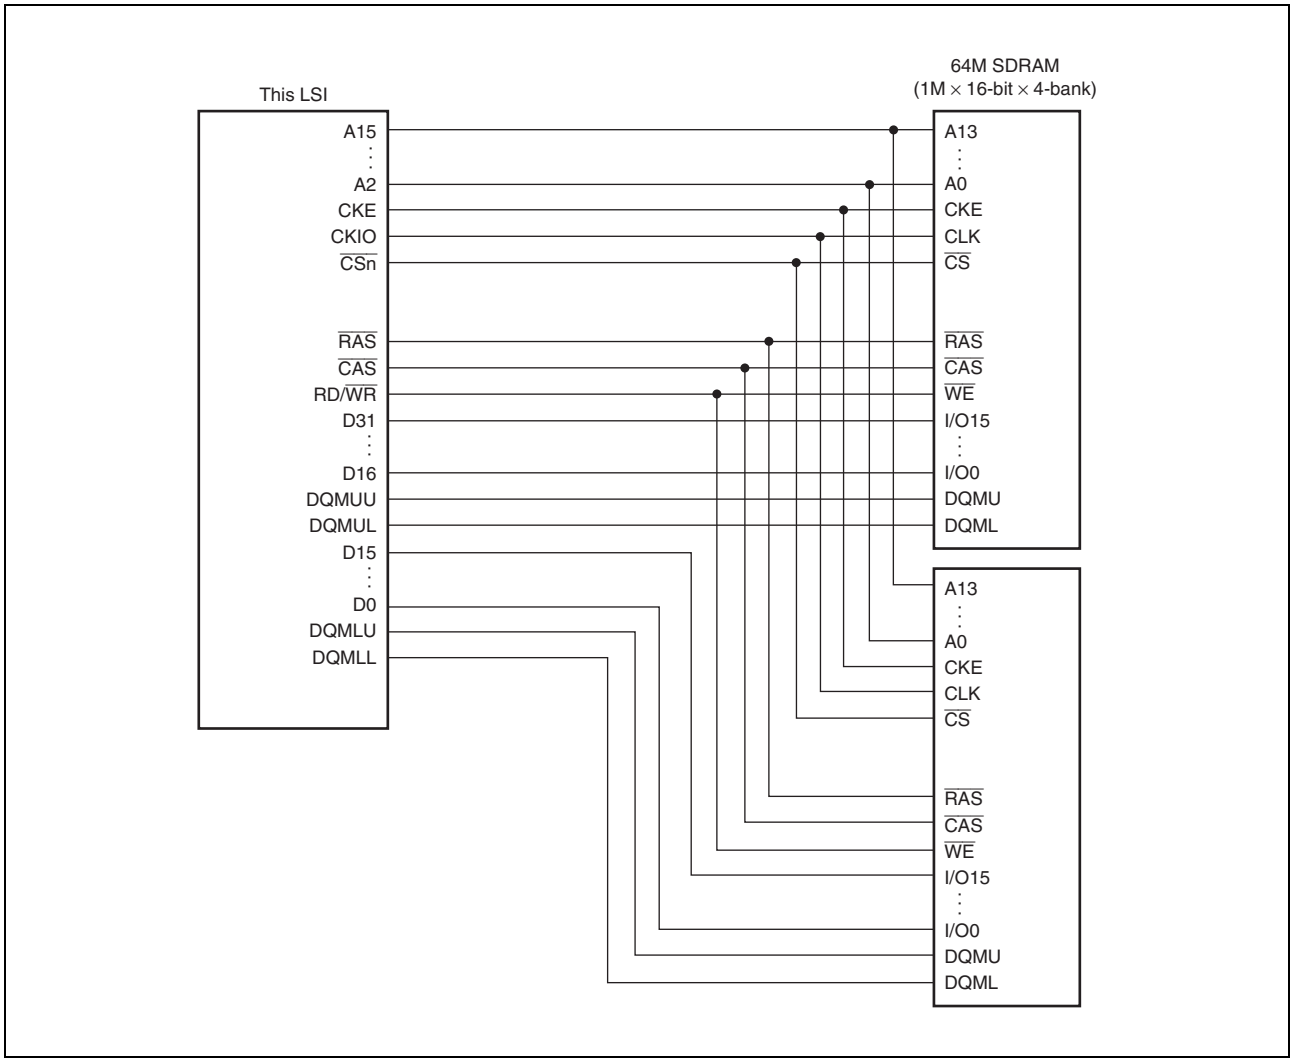

**Figure 8.14 Example of 32-Bit Data Width SDRAM Connection**

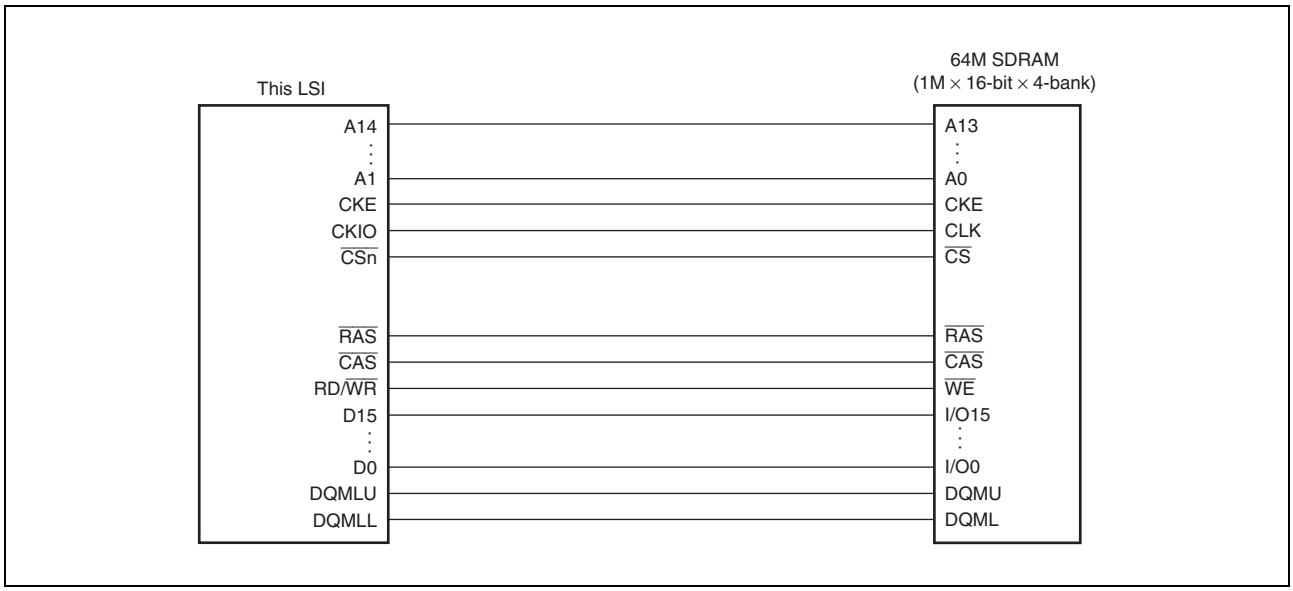

**Figure 8.15 Example of 16-Bit Data Width SDRAM Connection**

### (2) Address Multiplexing

An address multiplexing is specified so that SDRAM can be connected without external multiplexing circuitry according to the setting of bits BSZ[1:0] in CSnBCR and bits A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] in SDCR. Table 8.8 to Table 8.13 show the relationship between the settings of bits BSZ[1:0], A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] and the bits output at the address pins. Do not specify those bits in the manner other than this table, otherwise the operation of this LSI is not guaranteed. A25 to A18 are not multiplexed and the original values of address are always output at these pins.

When the data bus width is 16 bits (BSZ1 and BSZ0 = B'10), A0 of SDRAM specifies a 16-bit address. Therefore, connect this A0 pin of SDRAM to the A1 pin of the LSI; the A1 pin of SDRAM to the A2 pin of the LSI, and so on.

When the data bus width is 32 bits (BSZ1 and BSZ0 = B'11), A0 of SDRAM specifies a 32-bit address. Therefore, connect this A0 pin of SDRAM to the A2 pin of the LSI; the A1 pin of SDRAM to the A3 pin of the LSI, and so on.

### (3) Burst Read

A burst read occurs in the following cases with this LSI.

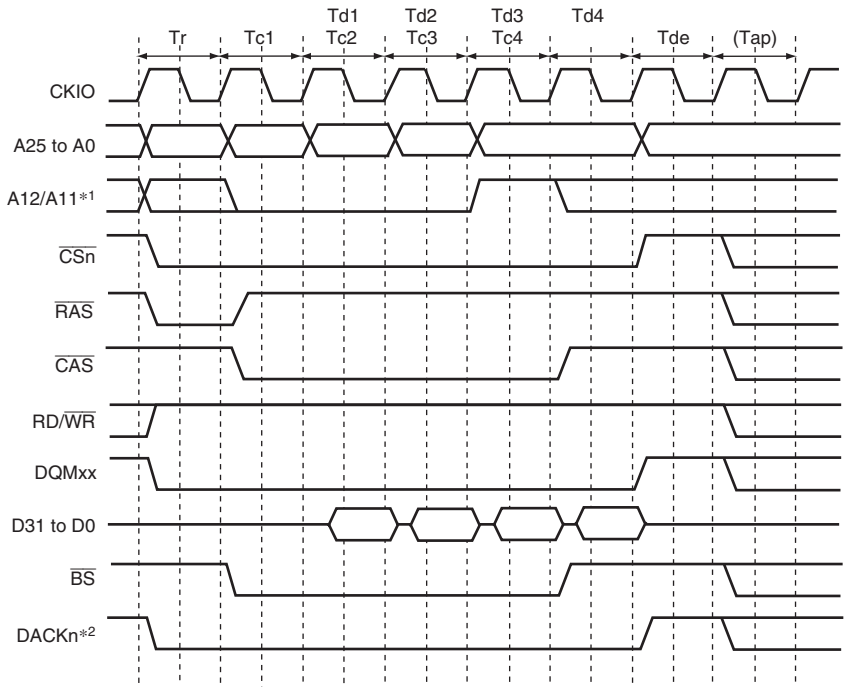
- Access size in reading is larger than data bus width.
- 16-, 32- or 64-byte transfer

This LSI always accesses the SDRAM with burst length 1. For example, read access of burst length 1 is performed consecutively 8 times to read 16-byte continuous data from the SDRAM that is connected to a 16-bit data bus. This access is called the burst read with the burst number 8. Table 8.14 shows the relationship between the access size and the number of bursts.

**Table 8.14 Relationship between Access Size and Number of Bursts**

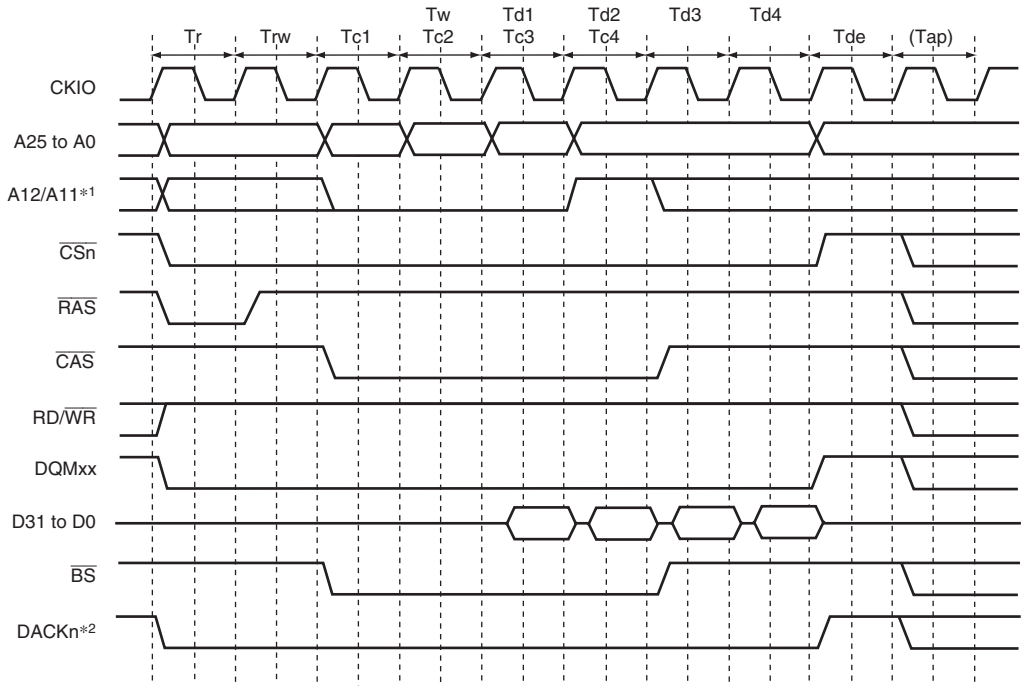
| Bus Width | Access Size | Number of Bursts |
|---|---|---|
| 16 bits | 8 bits | 1 |
| | 16 bits | 1 |
| | 32 bits | 2 |
| | 16 bytes | 8 |
| | 32 bytes | 16 |
| | 64 bytes | 32 |
| 32 bits | 8 bits | 1 |
| | 16 bits | 1 |
| | 32 bits | 1 |
| | 16 bytes | 4 |
| | 32 bytes | 8 |
| | 64 bytes | 16 |

Figure 8.16 and Figure 8.17 show timing charts in burst read. In burst read, an ACTV command is output in the Tr cycle, the READ command is issued in the Tc1, Tc2, and Tc3 cycles, the READA command is issued in the Tc4 cycle, and the read data is received at the rising edge of the external clock (CKIO) in the Td1 to Td4 cycles. The Tap cycle is used to wait for the completion of an auto-precharge induced by the READA command in the SDRAM. In the Tap cycle, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Tap cycles is specified by the WTRP1 and WTRP0 bits in CS3WCR.
In this LSI, wait cycles can be inserted by specifying each bit in CS3WCR to connect the SDRAM in variable frequencies. Figure 8.17 shows an example in which wait cycles are inserted. The number of cycles from the Tr cycle where the ACTV command is output to the Tc1 cycle where the READ command is output can be specified using the WTRCD1 and WTRCD0 bits in CS3WCR. If the WTRCD1 and WTRCD0 bits specify one cycle or more, a Trw cycle where the NOP command is issued is inserted between the Tr cycle and Tc1 cycle. The number of cycles from the Tc1 cycle where the READ command is output to the Td1 cycle where the read data is latched can be specified for the CS2 and CS3 spaces independently, using the A2CL1 and A2CL0 bits in CS2WCR or the A3CL1 and A3CL0 bits in CS3WCR. The number of cycles from Tc1 to Td1 corresponds to the SDRAM CAS latency. The CAS latency for the SDRAM is normally defined as up to three cycles. However, the CAS latency in this LSI can be specified as 1 to 4 cycles. This CAS latency can be achieved by connecting a latch circuit between this LSI and the SDRAM.
A Tde cycle is an idle cycle required to transfer the read data into this LSI and occurs once for every burst read or every single read.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

**Figure 8.16 Burst Read Basic Timing (CAS Latency 1, Auto Pre-Charge)**



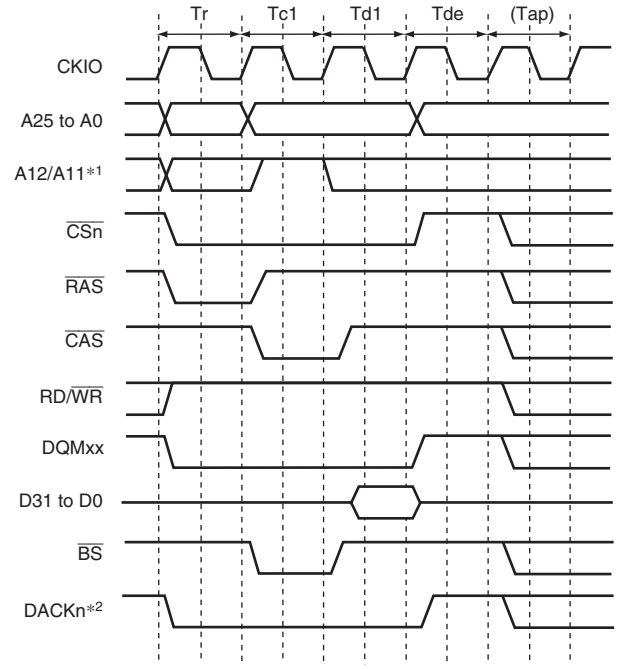
Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

**Figure 8.17 Burst Read Wait Specification Timing (CAS Latency 2, WTRCD[1:0] = 1 Cycle, Auto Pre-Charge)**

### (4) Single Read

A read access ends in one cycle when the data bus width is larger than or equal to the access size. As the SDRAM is set to the burst read with the burst length 1, only the required data is output. A read access that ends in one cycle is called single read.

Figure 8.18 shows the single read basic timing.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

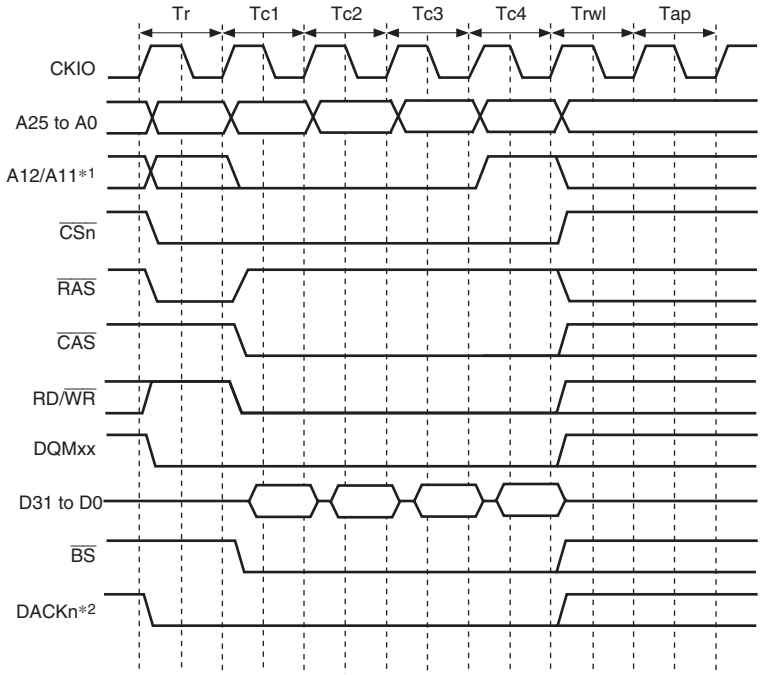
**Figure 8.18 Basic Timing for Single Read (CAS Latency 1, Auto Pre-Charge)**

### (5) Burst Write

A burst write occurs in the following cases in this LSI.

- Access size in writing is larger than data bus width.
- 16-, 32- or 64-byte transfer

This LSI always accesses SDRAM with burst length 1. For example, write access of burst length 1 is performed continuously 8 times to write 16-byte continuous data to the SDRAM that is connected to a 16-bit data bus. This access is called burst write with the burst number 8. The relationship between the access size and the number of bursts is shown in Table 8.14. Figure 8.19 shows a timing chart for burst writes. In burst write, an ACTV command is output in the Tr cycle, the WRIT command is issued in the Tc1, Tc2, and Tc3 cycles, and the WRITA command is issued to execute an auto-precharge in the Tc4 cycle. In the write cycle, the write data is output simultaneously with the write command. After the write command with the auto-precharge is output, the Trw1 cycle that waits for the auto-precharge initiation is followed by the Tap cycle that waits for completion of the auto-precharge induced by the WRITA command in the SDRAM. Between the Trwl and the Tap cycle, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Trw1 cycles is specified by the TRWL1 and TRWL0 bits in CS3WCR. The number of Tap cycles is specified by the WTRP1 and WTRP0 bits in CS3WCR.

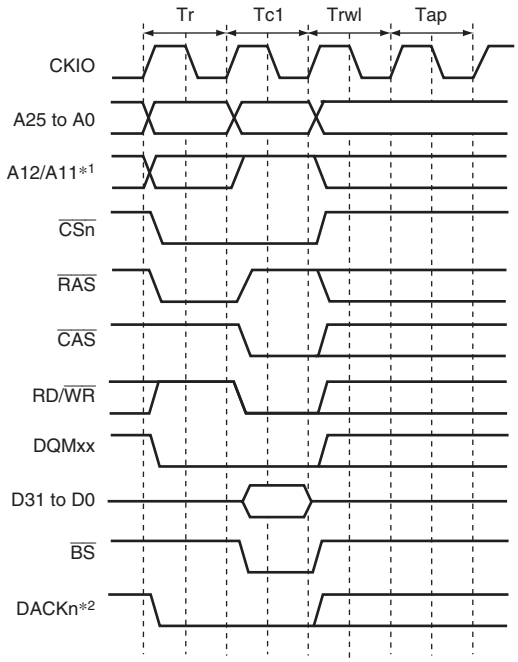


Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

**Figure 8.19 Basic Timing for Burst Write (Auto Pre-Charge)**

### (6) Single Write

A write access ends in one cycle when the data bus width is larger than or equal to access size. As a single write or burst write with burst length 1 is set in SDRAM, only the required data is output. The write access that ends in one cycle is called single write. Figure 8.20 shows the single write basic timing.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

**Figure 8.20 Single Write Basic Timing (Auto-Precharge)**

### (7) Bank Active

The SDRAM bank function can be used to support high-speed access to the same row address. When the BACTV bit in SDCR is 1, access is performed using commands without auto-precharge (READ or WRIT). This function is called bank-active function. This function is valid only for area 3. When area 3 is set to bank-active mode, area 2 should be set to normal space or SRAM with byte selection. When areas 2 and 3 are both set to SDRAM, auto precharge mode must be set.

When the bank-active function is used, precharging is not performed when the access ends. When accessing the same row address in the same bank, it is possible to issue the READ or WRIT command immediately, without issuing an ACTV command. As SDRAM is internally divided into several banks, it is possible to activate one row address in each bank. If the next access is to a different row address, a PRE command is first issued to precharge the relevant bank, then when precharging is completed, the access is performed by issuing an ACTV command followed by a READ or WRIT command. If this is followed by an access to a different row address, the access time will be longer because of the precharging performed after the access request is issued. The number of cycles between issuance of the PRE command and the ACTV command is determined by the WTRP1 and WTPR0 bits in CS3WCR.

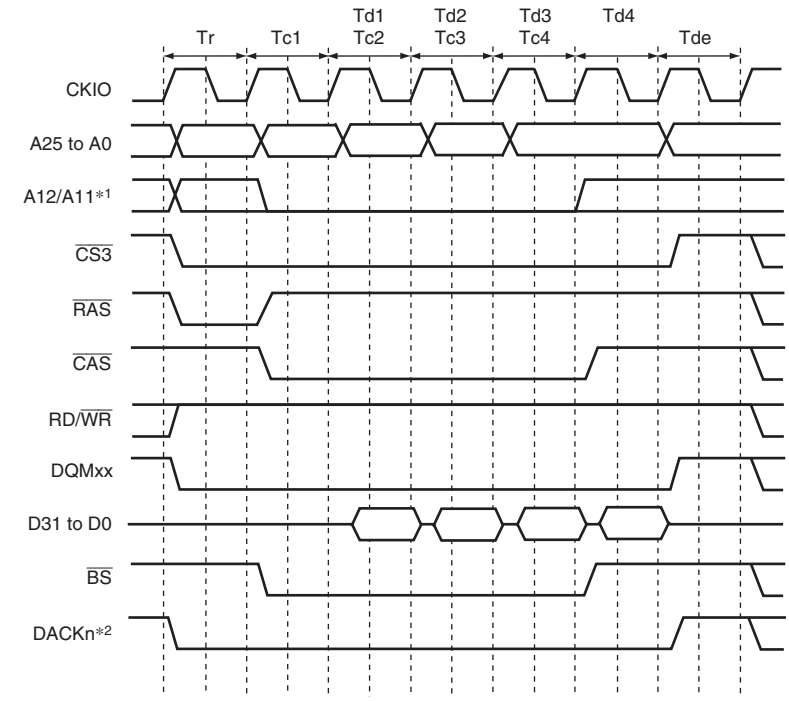
In a write, when an auto-precharge is performed, a command cannot be issued to the same bank for a period of Trwl + Tap cycles after issuance of the WRITA command. When bank active mode is used, READ or WRIT commands can be issued successively if the row address is the same. The number of cycles can thus be reduced by Trwl + Tap cycles for each write.

There is a limit on tRAS, the time for placing each bank in the active state. If there is no guarantee that there will not be a cache hit and another row address will be accessed within the period in which this value is maintained by program execution, it is necessary to set auto-refresh and set the refresh cycle to no more than the maximum value of tRAS.

A burst read cycle without auto-precharge is shown in Figure 8.21, a burst read cycle for the same row address in Figure 8.22, and a burst read cycle for different row addresses in Figure 8.23. Similarly, a single write cycle without auto-precharge is shown in Figure 8.24, a single write cycle for the same row address in Figure 8.25, and a single write cycle for different row addresses in Figure 8.26.

In Figure 8.22, a Tnop cycle in which no operation is performed is inserted before the Tc cycle that issues the READ command. The Tnop cycle is inserted to acquire two cycles of CAS latency for the DQMxx signal that specifies the read byte in the data read from the SDRAM. If the CAS latency is specified as two cycles or more, the Tnop cycle is not inserted because the two cycles of latency can be acquired even if the DQMxx signal is asserted after the Tc cycle.

When bank active mode is set, if only access cycles to the respective banks in the area 3 space are considered, as long as access cycles to the same row address continue, the operation starts with the cycle in Figure 8.21 or Figure 8.24, followed by repetition of the cycle in Figure 8.22 or Figure 8.25. An access to a different area during this time has no effect. If there is an access to a different row address in the bank active state, the bus cycle in Figure 8.23 or Figure 8.26 is executed instead of that in Figure 8.22 or Figure 8.25. In bank active mode, too, all banks become inactive after a refresh cycle.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

**Figure 8.26 Single Write Timing (Bank Active, Different Row Addresses in the Same Bank)**

### (8) Refreshing

This module has a function for controlling SDRAM refreshing. Auto-refreshing can be performed by clearing the RMODE bit to 0 and setting the RFSH bit to 1 in SDCR. A continuous refreshing can be performed by setting the RRC2 to RRC0 bits in RTCSR. If SDRAM is not accessed for a long period, self-refresh mode, in which the power consumption for data retention is low, can be activated by setting both the RMODE bit and the RFSH bit to 1.

#### (a) Auto-refreshing

Refreshing is performed at intervals determined by the input clock selected by bits CKS2 to CKS0 in RTCSR, and the value set by in RTCOR. The value of bits CKS2 to CKS0 in RTCOR should be set so as to satisfy the refresh interval stipulation for the SDRAM used. First make the settings for RTCOR, RTCNT, and the RMODE and RFSH bits in SDCR, and then make the CKS2 to CKS0 and RRC2 to RRC0 settings. When the clock is selected by bits CKS2 to CKS0, RTCNT starts counting up from the value at that time. The RTCNT value is constantly compared with the RTCOR value, and if the two values are the same, a refresh request is generated and an auto-refresh is performed for the number of times specified by the RRC2 to RRC0. At the same time, RTCNT is cleared to zero and the count-up is restarted.
Figure 8.27 shows the auto-refresh cycle timing. After starting the auto refreshing, PALL command is issued in the Tp cycle to make all the banks to pre-charged state from active state when some bank is being pre-charged. Then REF command is issued in the Trr cycle after inserting idle cycles of which number is specified by the WTRP1 and WTRP0 bits in CS3WCR. A new command is not issued for the duration of the number of cycles specified by the WTRC1 and WTRC0 bits in CS3WCR after the Trr cycle. The WTRC1 and WTRC0 bits must be set so as to satisfy the SDRAM refreshing cycle time stipulation (tRC). An idle cycle is inserted between the Tp cycle and Trr cycle when the setting value of the WTRP1 and WTRP0 bits in CS3WCR is longer than or equal to 1 cycle.
)

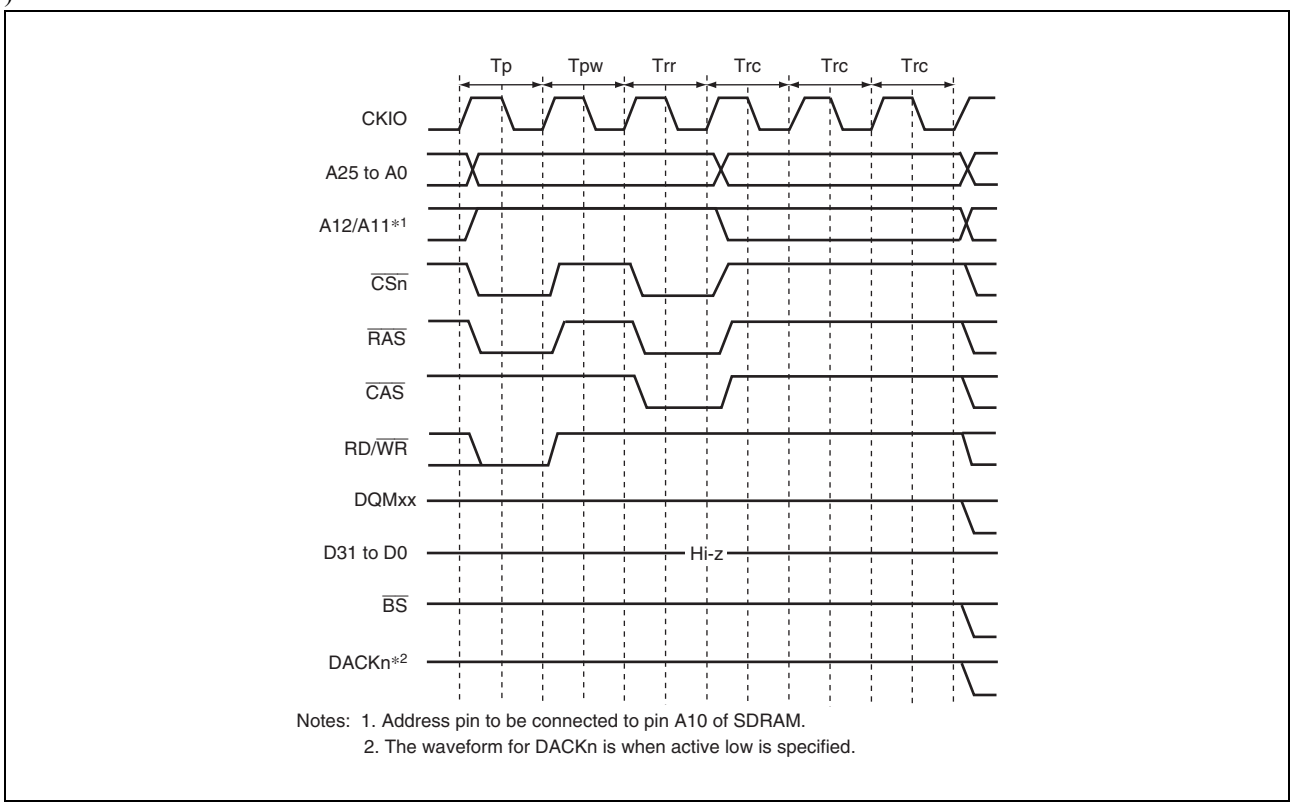

**Figure 8.27 Auto-Refresh Timing**

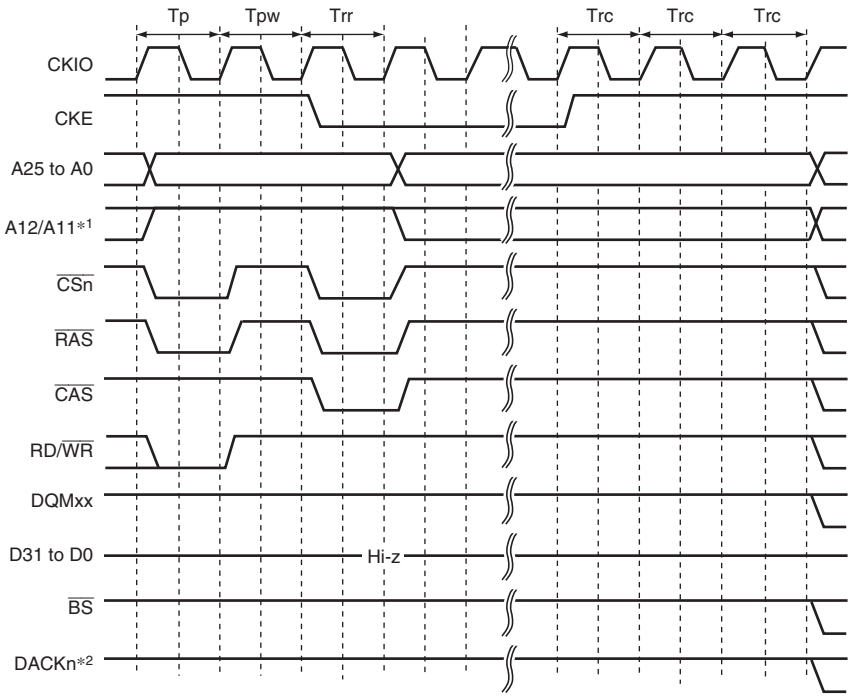
### (b) Self-refreshing

Self-refresh mode is a kind of standby mode, in which the refresh timing and refresh addresses are generated within the SDRAM. Self-refreshing is activated by setting both the RMODE bit and the RFSH bit in SDCR to 1. After starting the self-refreshing, PALL command is issued in Tp cycle after the completion of the pre-charging bank. A SELF command is then issued after inserting idle cycles of which number is specified by the WTRP1 and WTRP0 bits in CS3WSR. SDRAM cannot be accessed while in the self-refresh state. Self-refresh mode is cleared by clearing the RMODE bit to 0. After self-refresh mode has been cleared, command issuance is disabled for the number of cycles specified by the WTRC1 and WTRC0 bits in CS3WCR.

Self-refresh timing is shown in figure 8.28. Settings must be made so that self-refresh clearing and data retention are performed correctly, and auto-refreshing is performed at the correct intervals. When self-refreshing is activated from the state in which auto-refreshing is set, auto-refreshing is restarted if the RFSH bit is set to 1 and the RMODE bit is cleared to 0 when self-refresh mode is cleared. If the transition from clearing of self-refresh mode to the start of auto-refreshing takes time, this time should be taken into consideration when setting the initial value of RTCNT. Making the RTCNT value 1 less than the RTCOR value will enable refreshing to be started immediately.

After self-refreshing has been set, the self-refresh state continues even if the chip standby state is entered using the LSI standby function, and is maintained even after recovery from standby mode due to an interrupt. Note that the necessary signals such as CKE must be driven even in standby state by setting the HIZCNT bit in CMNCR to 1.

In case of a power-on reset, the bus state controller's registers are initialized, and therefore the self-refresh state is cleared.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

**Figure 8.28 Self-Refresh Timing**

### (9) Relationship between Refresh Requests and Bus Cycles

If a refresh request occurs during bus cycle execution, the refresh cycle must wait for the bus cycle to be completed. If a new refresh request occurs while waiting for the previous refresh request, the previous refresh request is deleted. To refresh correctly, a bus cycle longer than the refresh interval must be prevented from occurring.

### (10) Power-Down Mode

If the PDOWN bit in SDCR is set to 1, the SDRAM is placed in power-down mode by bringing the CKE signal to the low level in the non-access cycle. This power-down mode can effectively lower the power consumption in the non-access cycle. However, note that if an access occurs in power-down mode, a cycle of overhead occurs because a cycle is needed to assert the CKE in order to cancel the power-down mode.
Figure 8.29 shows the access timing in power-down mode.

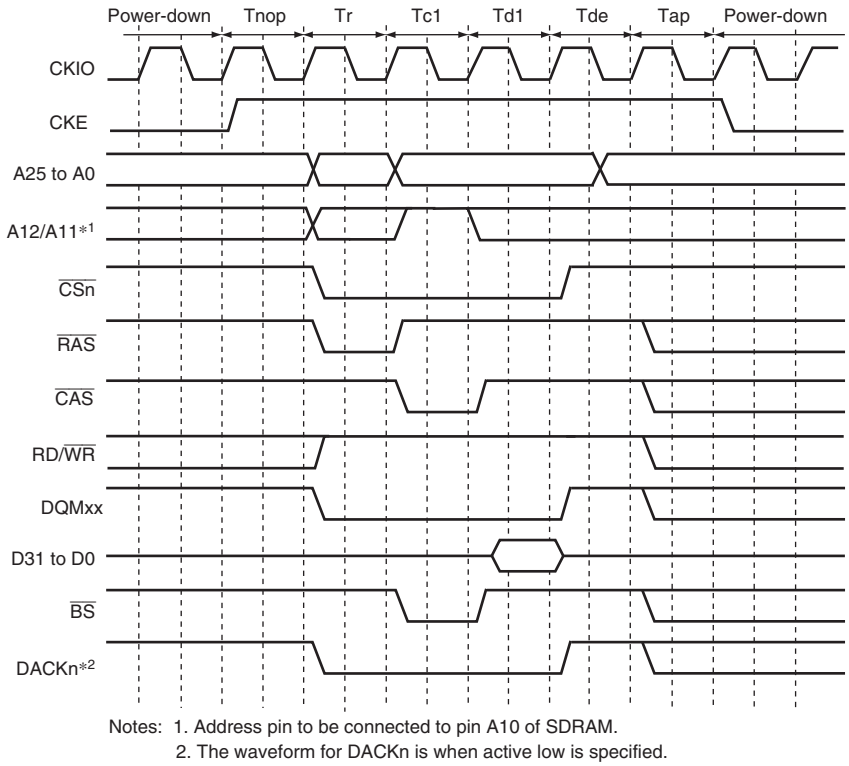


**Figure 8.29 Power-Down Mode Access Timing**

## (11) Power-On Sequence

In order to use SDRAM, mode setting must first be made for SDRAM after the pose interval specified for the SDRAM to be used after powering on. The pose interval should be obtained by a power-on reset generating circuit or software.
To perform SDRAM initialization correctly, the registers of this module must first be set, followed by a write to the SDRAM mode register. In SDRAM mode register setting, the address signal value at that time is latched by a combination of the $\overline{CSn}$, $\overline{RAS}$, $\overline{CAS}$, and RD/$\overline{WR}$ signals. If the value to be set is X, the bus state controller provides for value X to be written to the SDRAM mode register by performing a 16-bit write to address H'3FFFD000 + X for area 2 SDRAM, and to address H'3FFFE000 + X for area 3 SDRAM. In this operation the data is ignored, but the mode write is performed as a byte-size access. To set burst read/single write or burst read/burst write (CAS latency 2 to 3, wrap type = sequential, and burst length 1) supported by the LSI, arbitrary data is written in 16 bits to the access addresses shown in table 8.15. In this time 0 is output at the external address pins of A12 or later.

**Table 8.15 Access Address in SDRAM Mode Register Write**

- Setting for Area 2
  Burst read/single write (burst length 1):

| Data Bus Width | CAS Latency | Access Address | External Address Pin |
|---|---|---|---|
| 16 bits | 2 | H'3FFFD440 | H'0000440 |
| | 3 | H'3FFFD460 | H'0000460 |
| 32 bits | 2 | H'3FFFD880 | H'0000880 |
| | 3 | H'3FFFD8C0 | H'00008C0 |

Burst read/burst write (burst length 1):

| Data Bus Width | CAS Latency | Access Address | External Address Pin |
|---|---|---|---|
| 16 bits | 2 | H'3FFFD040 | H'0000040 |
| | 3 | H'3FFFD060 | H'0000060 |
| 32 bits | 2 | H'3FFFD080 | H'0000080 |
| | 3 | H'3FFFD0C0 | H'00000C0 |

- Setting for Area 3
  Burst read/single write (burst length 1):

| Data Bus Width | CAS Latency | Access Address | External Address Pin |

Burst read/burst write (burst length 1):

| Data Bus Width | CAS Latency | Access Address | External Address Pin |
|---|---|---|---|
| 16 bits | 2 | H'3FFFE040 | H'0000040 |
| | 3 | H'3FFFE060 | H'0000060 |
| 32 bits | 2 | H'3FFFE080 | H'0000080 |
| | 3 | H'3FFFE0C0 | H'00000C0 |

Mode register setting timing is shown in Figure 8.30. A PALL command (all bank pre-charge command) is firstly issued. A REF command (auto refresh command) is then issued 8 times. An MRS command (mode register write command) is finally issued. Idle cycles, of which number is specified by the WTRP1 and WTRP0 bits in CS3WCR, are inserted between the PALL and the first REF. Idle cycles, of which number is specified by the WTRC1 and WTRC0 bits in CS3WCR, are inserted between REF and REF, and between the 8th REF and MRS. One or more idle cycles are inserted between the MRS and a command to be issued next.
It is necessary to keep idle time of certain cycles for SDRAM before issuing PALL command after power-on. Refer to the manual of the SDRAM for the idle time to be needed. When the pulse width of the reset signal is longer than the idle time, mode register setting can be started immediately after the reset, but care should be taken when the pulse width of the reset signal is shorter than the idle time.

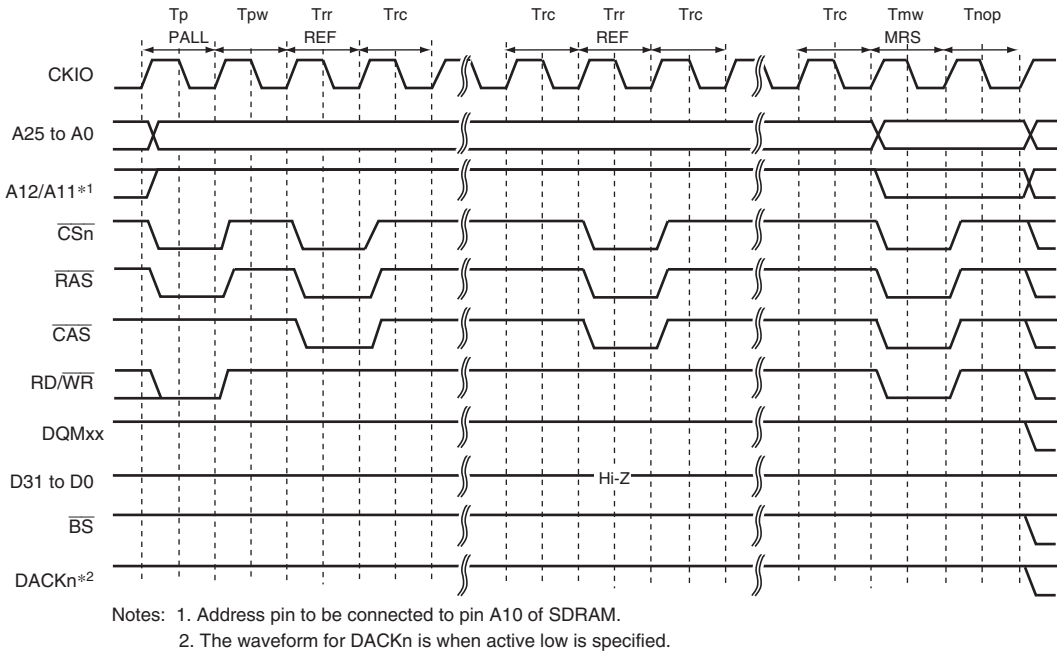

**Figure 8.30 SDRAM Mode Write Timing (Based on JEDEC)**

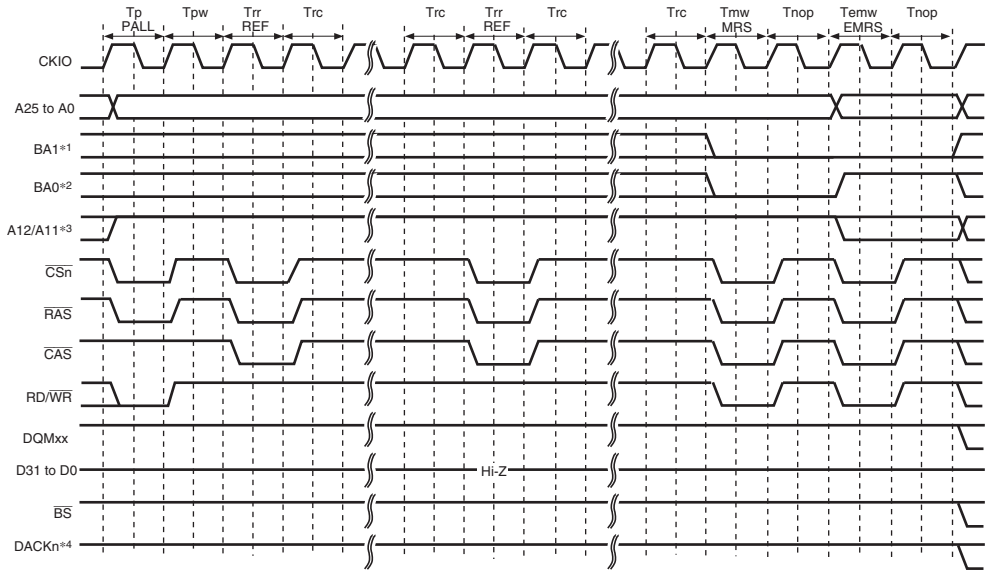
## (12) Low-Power SDRAM

The low-power SDRAM can be accessed using the same protocol as the normal SDRAM.
The differences between the low-power SDRAM and normal SDRAM are that partial refresh takes place that puts only a part of the SDRAM in the self-refresh state during the self-refresh function, and that power consumption is low during refresh under user conditions such as the operating temperature. The partial refresh is effective in systems in which the data in a work area other than the specific area can be lost without severe repercussions. For details, refer to the Data Sheet for the low-power SDRAM to be used.
The low-power SDRAM supports the extension mode register in addition to the mode registers as the normal SDRAM. This LSI supports issuing of the extension mode register write command (EMRS).
The EMRS command is issued according to the conditions specified in table below. For example, if data H'0YYYYYYY is written to address H'3FFFEXX0 in 32 bits, the commands are issued to the CS3 space in the following sequence: PALL -> REF ´ 8 -> MRS -> EMRS. In this case, the MRS and EMRS issue addresses are H'0000XX0 and H'YYYYYYY, respectively. If data H'1YYYYYYY is written to address H'3FFFEXX0 in 32 bits, the commands are issued to the CS3 space in the following sequence: PALL -> MRS -> EMRS.

**Table 8.16 Output Addresses when EMRS Command Is Issued**

| Command to be Issued | Access Address | Access Data | Write Access Size | MRS Command Issue Address | EMRS Command Issue Address |
|---|---|---|---|---|---|
| CS2 MRS | H'3FFFDXX0 | H'******** | 16 bits | H'0000XX0 | — |
| CS3 MRS | H'3FFFEXX0 | H'******** | 16 bits | H'0000XX0 | — |
| CS2 MRS + EMRS (with refresh) | H'3FFFDXX0 | H'0YYYYYYY | 32 bits | H'0000XX0 | H'YYYYYYY |
| CS3 MRS + EMRS (with refresh) | H'3FFFEXX0 | H'0YYYYYYY | 32 bits | H'0000XX0 | H'YYYYYYY |
| CS2 MRS + EMRS (without refresh) | H'3FFFDXX0 | H'1YYYYYYY | 32 bits | H'0000XX0 | H'YYYYYYY |
| CS3 MRS + EMRS (without refresh) | H'3FFFEXX0 | H'1YYYYYYY | 32 bits | H'0000XX0 | H'YYYYYYY |

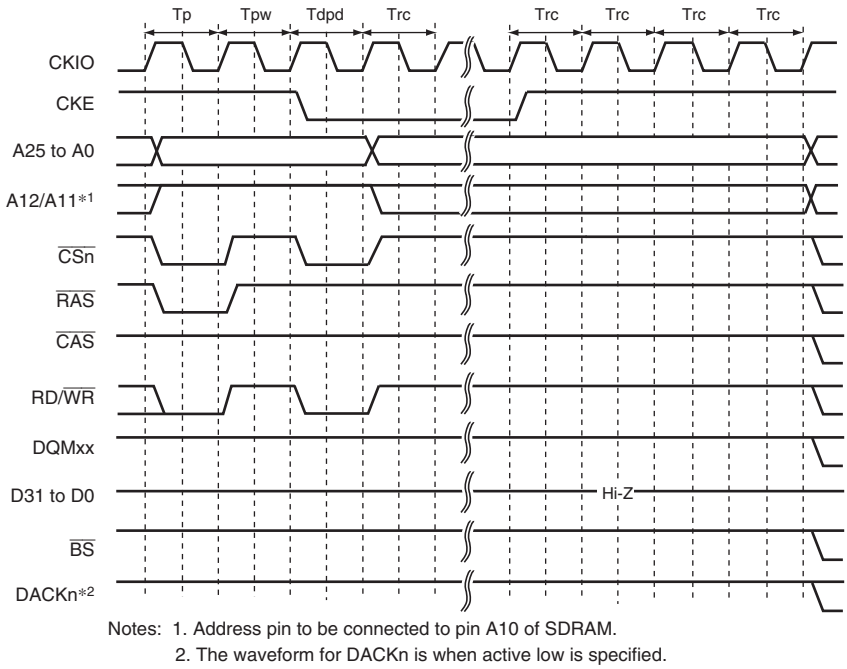


Notes: 1. Address pin to be connected to pin BA1 of SDRAM.
2. Address pin to be connected to pin BA0 of SDRAM.
3. Address pin to be connected to pin A10 of SDRAM.
4. The waveform for DACKn is when active low is specified.

**Figure 8.31 EMRS Command Issue Timing**

- Deep power-down mode
  The low-power SDRAM supports the deep power-down mode as a low-power consumption mode. In the partial self-refresh function, self-refresh is performed on a specific area. In the deep power-down mode, self-refresh will not be performed on any memory area. This mode is effective in systems where all of the system memory areas are used as work areas.

If the RMODE bit in the SDCR is set to 1 while the DEEP and RFSH bits in the SDCR are set to 1, the low-power SDRAM enters the deep power-down mode. If the RMODE bit is cleared to 0, the CKE signal is pulled high to cancel the deep power-down mode. Before executing an access after returning from the deep power-down mode, the power-up sequence must be re-executed.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

**Figure 8.32 Deep Power-Down Mode Transition Timing**

### 8.5.7 Burst ROM (Clocked Asynchronous) Interface

The burst ROM (clocked asynchronous) interface is used to access a memory with a high-speed read function using a method of address switching called the burst mode or page mode. In a burst ROM (clocked asynchronous) interface, basically the same access as the normal space is performed, but the 2nd and subsequent access cycles are performed only by changing the address, without negating the $\overline{RD}$ signal at the end of the 1st cycle. In the 2nd and subsequent access cycles, addresses are changed at the falling edge of the CKIO.

For the 1st access cycle, the number of wait cycles specified by the W3 to W0 bits in CSnWCR is inserted. For the 2nd and subsequent access cycles, the number of wait cycles specified by the BW1 and BW0 bits in CSnWCR is inserted.

In the access to the burst ROM (clocked asynchronous), the $\overline{BS}$ signal is asserted only to the first access cycle. An external wait input is valid only to the first access cycle.

In the single access or write access that does not perform the burst operation in the burst ROM (clocked asynchronous) interface, access timing is same as a normal space.

Table 8.17 lists a relationship between bus width, access size, and the number of bursts. Figure 8.33 shows a timing chart.

**Table 8.17 Relationship between Bus Width, Access Size, and Number of Bursts**

| Bus Width | Access Size | CSnWCR. BST[1:0] Bits | Number of Bursts | Access Count |
|---|---|---|---|---|
| 8 bits | 8 bits | Not affected | 1 | 1 |
| | 16 bits | Not affected | 2 | 1 |
| | 32 bits | Not affected | 4 | 1 |
| | 16 bytes | 00 | 16 | 1 |
| | | 01 | 4 | 4 |
| | 32 bytes | 00 | 16 | 2 |
| | | 01 | 4 | 8 |
| | 64 bytes | 00 | 16 | 4 |
| | | 01 | 4 | 16 |
| 16 bits | 8 bits | Not affected | 1 | 1 |
| | 16 bits | Not affected | 1 | 1 |
| | 32 bits | Not affected | 2 | 1 |
| | 16 bytes | 00 | 8 | 1 |
| | | 01 | 2 | 4 |
| | | 10*1 | 4 | 2 |
| | | | 2, 4, 2 | 3 |
| | 32 bytes | 00 | 8 | 2 |
| | | 01 | 2 | 8 |
| | | 10*1 | 4 | 4 |
| | | | 2, 4, 2 | 6 |
| | 64 bytes | 00 | 8 | 4 |
| | | 01 | 2 | 16 |
| | | 10*1 | 4 | 8 |
| | | | 2, 4, 2 | 12 |
| 32 bits | 8 bits | Not affected | 1 | 1 |
| | 16 bits | Not affected | 1 | 1 |
| | 32 bits | Not affected | 1 | 1 |
| | 16 bytes | Not affected | 4 | 1 |
| | 32 bytes | Not affected | 4 | 2 |
| | 64 bytes | Not affected | 4 | 4 |

Note 1. When the bus width is 16 bits, the access size is 16 bytes or more, and the BST[1:0] bits in CSnWCR are 10, the number of bursts and access count depend on the access start address. At address H'xxx0 or H'xxx8, 4-4 burst access is performed. At address H'xxx4 or H'xxxC, 2-4-2 burst access is performed.

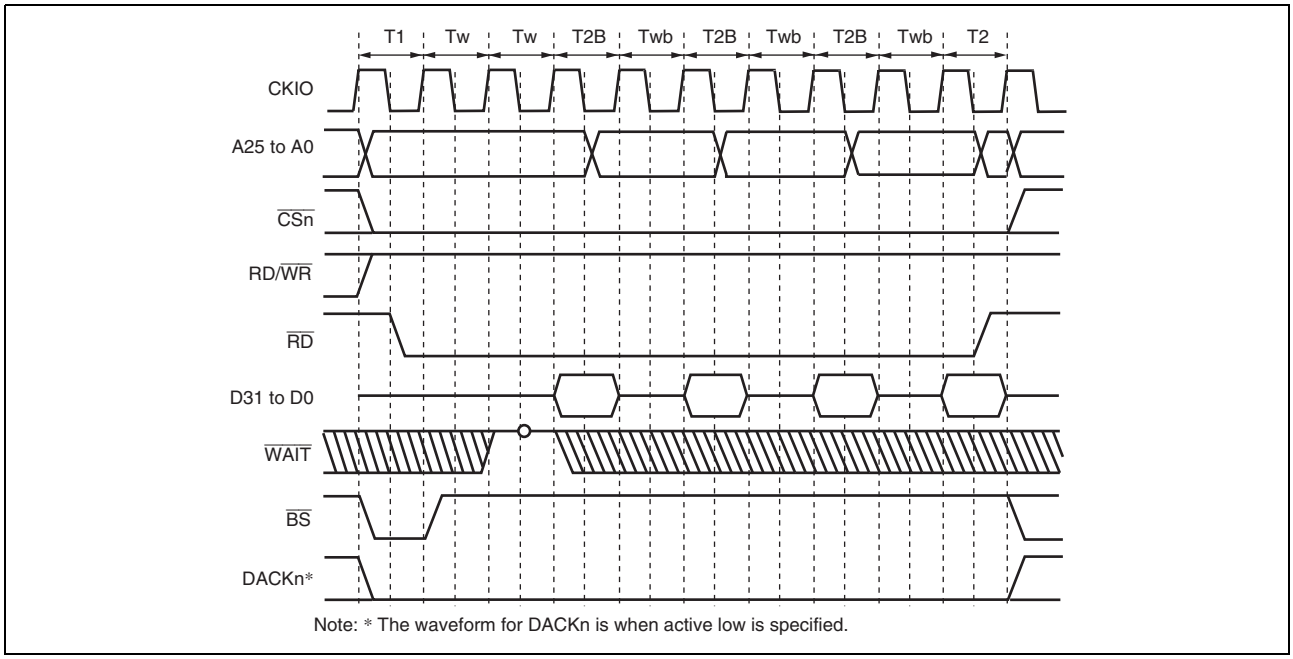


**Figure 8.33 Burst ROM Access Timing (Clocked Asynchronous) (Bus Width = 32 Bits, 16-Byte Transfer (Number of Burst 4), Wait Cycles Inserted in First Access = 2, Wait Cycles Inserted in Second and Subsequent Access Cycles = 1)**

## 8.5.8 SRAM Interface with Byte Selection

The SRAM interface with byte selection is a memory interface that outputs the byte selection signal ($\overline{\text{WEn}}$) in both read and write bus cycles. This interface has 16-bit data pins and accesses SRAMs having upper and lower byte selection pins, such as $\overline{\text{UB}}$ and $\overline{\text{LB}}$.

When the BAS bit in CSnWCR is cleared to 0 (initial value), the write access timing of the SRAM interface with byte selection is the same as that for the normal space interface. While in read access of a byte-selection SRAM interface, the byte-selection signal is output from the $\overline{\text{WEn}}$ pin, which is different from that for the normal space interface. The basic access timing is shown in figure 8.34. In write access, data is written to the memory according to the timing of the byte-selection pin ($\overline{\text{WEn}}$). For details, refer to the Data Sheet for the corresponding memory.

If the BAS bit in CSnWCR is set to 1, the $\overline{\text{WEn}}$ pin and RD/$\overline{\text{WR}}$ pin timings change. Figure 8.35 shows the basic access timing. In write access, data is written to the memory according to the timing of the write enable pin (RD/$\overline{\text{WR}}$). The data hold timing from RD/$\overline{\text{WR}}$ negation to data write must be acquired by setting the HW1 and HW0 bits in CSnWCR. Figure 8.36 shows the access timing when a software wait is specified.

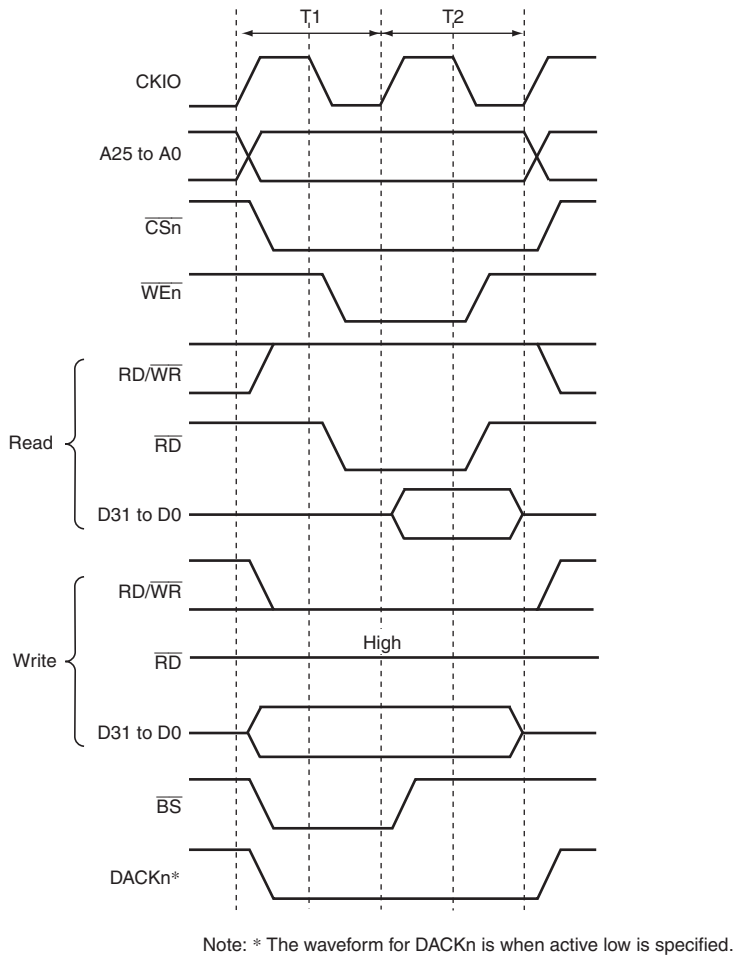

**Figure 8.34 Basic Access Timing for SRAM with Byte Selection (BAS = 0)**

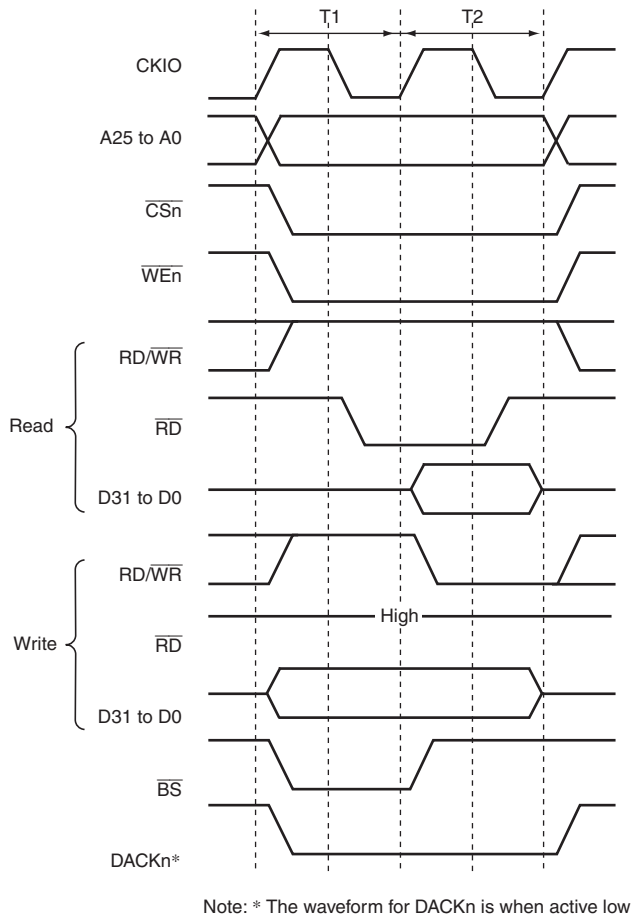
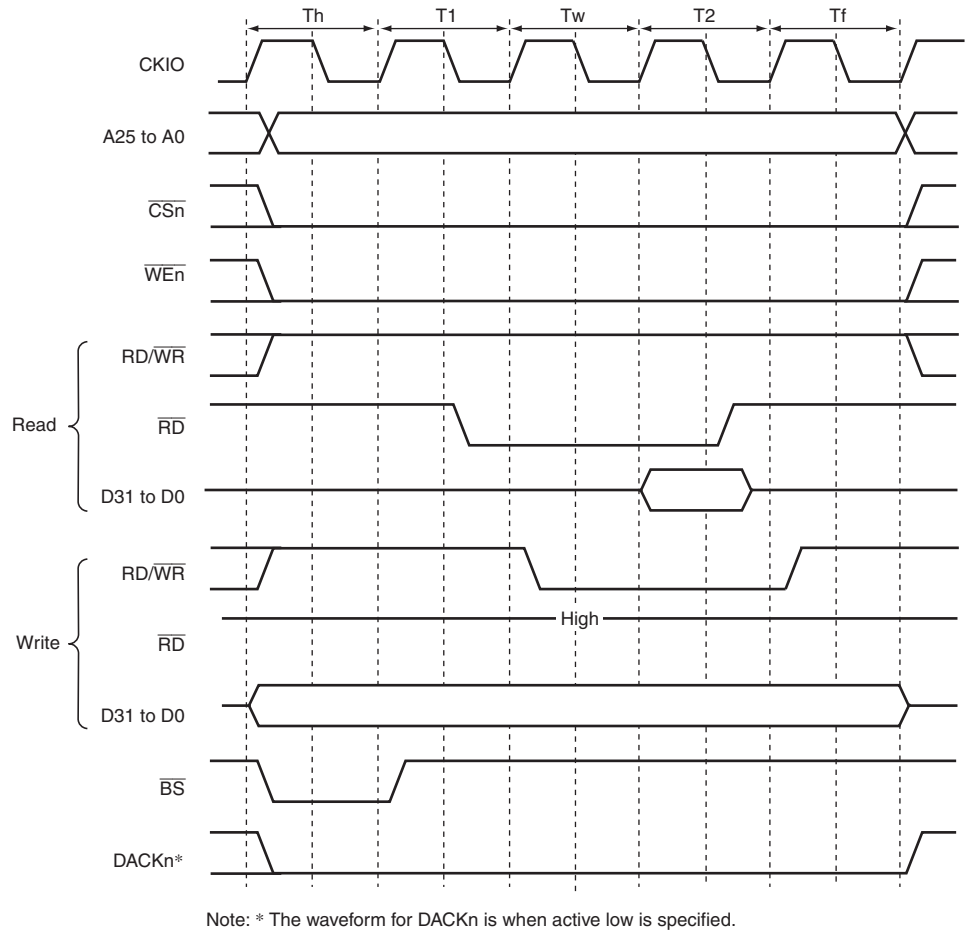


Note: * The waveform for DACKn is when active low is specified.

**Figure 8.35 Basic Access Timing for SRAM with Byte Selection (BAS = 1)**



Note: * The waveform for DACKn is when active low is specified.

**Figure 8.36 Wait Timing for SRAM with Byte Selection (BAS = 1) (SW[1:0] = 01, WR[3:0] = 0001, HW[1:0] = 01)**

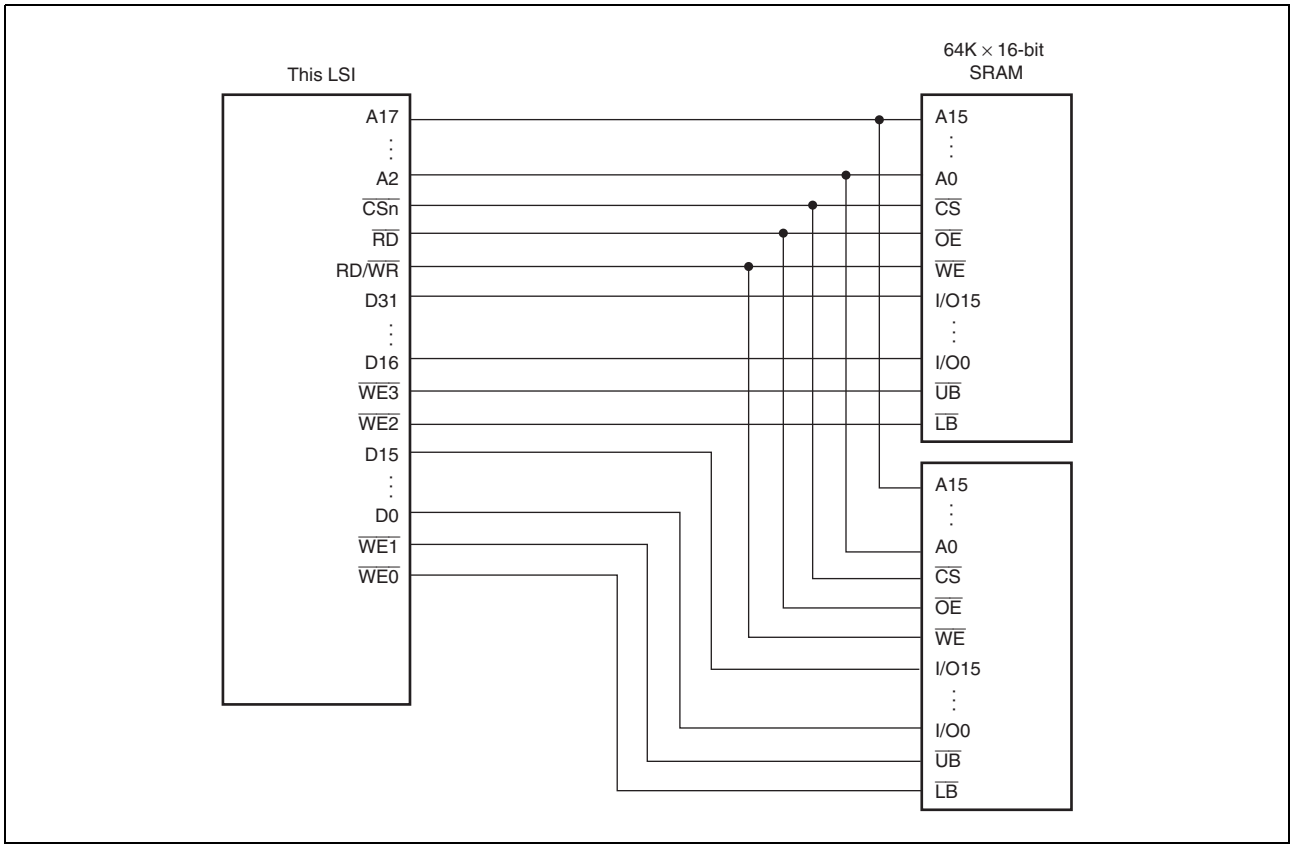


**Figure 8.37 Example of Connection with 32-Bit Data-Width SRAM with Byte Selection**

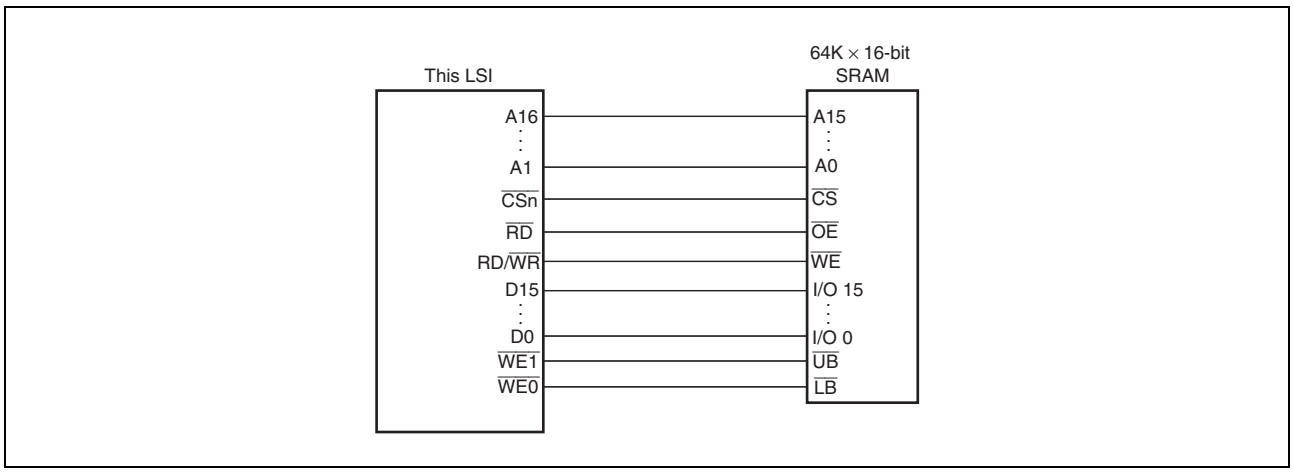

**Figure 8.38 Example of Connection with 16-Bit Data-Width SRAM with Byte Selection**

### 8.5.9 Burst ROM (Clocked Synchronous) Interface

The burst ROM (clocked synchronous) interface is supported to access a ROM with a synchronous burst function at high speed. The burst ROM interface accesses the burst ROM in the same way as a normal space. This interface is valid only for area 0.

In the first access cycle, wait cycles are inserted. In this case, the number of wait cycles to be inserted is specified by the W3 to W0 bits in CS0WCR. In the second and subsequent cycles, the number of wait cycles to be inserted is specified by the BW1 and BW0 bits in CS0WCR.

While the burst ROM (clocked synchronous) is accessed, the $\overline{BS}$ signal is asserted only for the first access cycle and an external wait input is also valid for the first access cycle.

When the bus width is 16 bits, the burst length must be specified as 8. When the bus width is 32 bits, the burst length must be specified as 4. The burst ROM interface does not support the 8-bit bus width for the burst ROM.

The burst ROM interface performs burst operations for all read access. For example, in a 32-bit access over a 16-bit bus, valid 16-bit data is read two times and invalid 16-bit data is read six times. These invalid data read cycles increase the memory access time and degrade the program execution speed and DMA transfer speed. To prevent this problem, it is recommended using a read in a 16-byte or more access size. The burst ROM interface performs write access in the same way as normal space access.

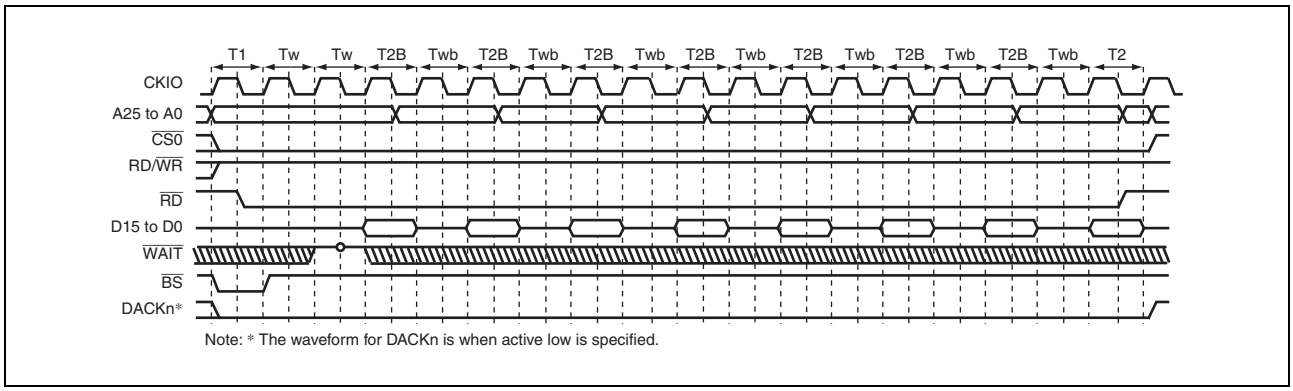

**Figure 8.39 Burst ROM Access Timing (Clocked Synchronous) (Burst Length = 8, Wait Cycles Inserted in First Access = 2, Wait Cycles Inserted in Second and Subsequent Access Cycles = 1)**

### 8.5.10 Wait between Access Cycles

As the operating frequency of LSIs becomes higher, the off-operation of the data buffer often collides with the next data access when the read operation from devices with slow access speed is completed. As a result of these collisions, the reliability of the device is low and malfunctions may occur. A function that avoids data collisions by inserting idle (wait) cycles between continuous access cycles has been newly added.
The number of wait cycles between access cycles can be set by the WM bit in CSnWCR, bits IWW2 to IWW0, IWRWD2 to IWRWD0, IWRWS2 to IWRWS0, IWRRD2 to IWRRD0, and IWRRS2 to IWRRS 0 in CSnBCR. The conditions for setting the idle cycles between access cycles are shown below.

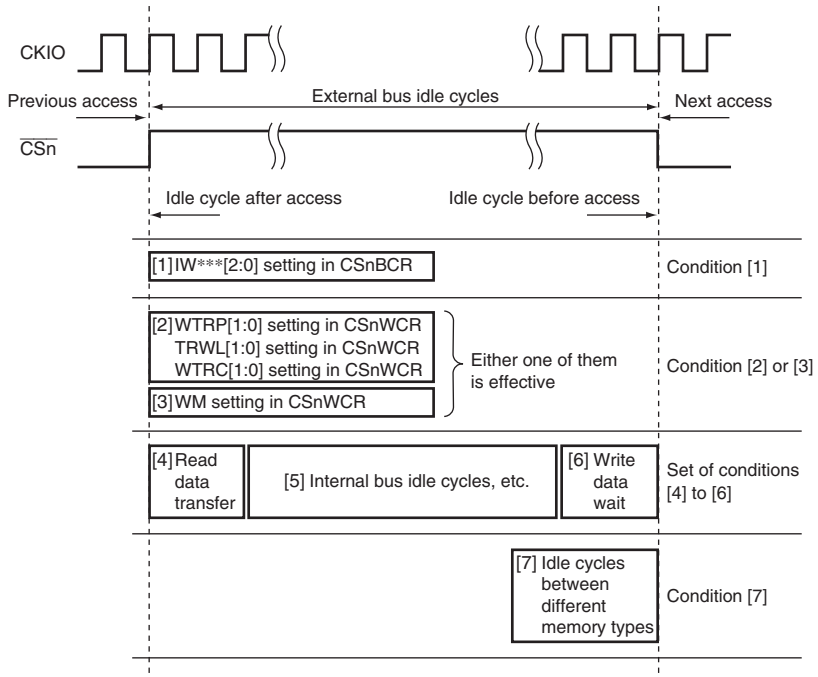
1. Continuous access cycles are write-read or write-write
2. Continuous access cycles are read-write for different spaces
3. Continuous access cycles are read-write for the same space
4. Continuous access cycles are read-read for different spaces
5. Continuous access cycles are read-read for the same space

For the specification of the number of idle cycles between access cycles described above, refer to the description of each register.
Besides the idle cycles between access cycles specified by the registers, idle cycles must be inserted to interface with the internal bus or to obtain the minimum pulse width for a multiplexed pin ($\overline{\text{WEn}}$). The following gives detailed information about the idle cycles and describes how to estimate the number of idle cycles.
The number of idle cycles on the external bus from $\overline{\text{CSn}}$ negation to $\overline{\text{CSn}}$ or $\overline{\text{CSm}}$ assertion is described below.
There are seven conditions that determine the number of idle cycles on the external bus as shown in Table 8.18. The effects of these conditions are shown in Figure 8.40.

**Table 8.18 Conditions for Determining Number of Idle Cycles**

| No. | Condition | Description | Range | Note |
|---|---|---|---|---|
| [1] | IW***[2:0] in CSnBCR | These bits specify the number of idle cycles for access. The number of idle cycles can be specified independently for each combination of the previous and next cycles. For example, in the case where reading CS1 space followed by reading other CS space, the bits IWRRD[2:0] in CS1BCR should be set to B'100 to specify six or more idle cycles. This condition is effective only for access cycles other than single address transfer and generates idle cycles after the access is completed. | 0 to 12 | Do not set 0 for the number of idle cycles between memory types which are not allowed to be accessed successively. |
| [2] | SDRAM-related bits in CSnWCR | These bits specify precharge completion and startup wait cycles and idle cycles between commands for SDRAM access. This condition is effective only for SDRAM access and generates idle cycles after the access is completed | 0 to 3 | Specify these bits in accordance with the specification of the target SDRAM. |
| [3] | WM in CSnWCR | This bit enables or disables external $\overline{\text{WAIT}}$ pin input for the memory types other than SDRAM. When this bit is cleared to 0 (external $\overline{\text{WAIT}}$ enabled), one idle cycle is inserted to check the external $\overline{\text{WAIT}}$ pin input after the access is completed. When this bit is set to 1 (disabled), no idle cycle is generated. | 0 or 1 | |
| [4] | Read data transfer cycle | One idle cycle is inserted after a read access is completed. This idle cycle is not generated for the first or middle cycles in divided access cycles. This is neither generated when the HW[1:0] bits in CSnWCR are not B'00. | 0 or 1 | One idle cycle is always generated after a read cycle with SDRAM. |
| [5] | Internal bus idle cycles, etc. | External bus access requests from the CPU or the direct memory access controller and their results are passed through the internal bus. The external bus enters idle state during internal bus idle cycles or while a bus other than the external bus is being accessed. This condition is not effective for divided access cycles, which are generated by the bus state controller when the access size is larger than the external data bus width. | 0 or larger | The number of internal bus idle cycles may not become 0 depending on the CPU: internal bus: CKIO |
| [6] | Write data wait cycles | During write access, a write cycle is executed on the external bus only after the write data becomes ready. This write data wait period generates idle cycles before the write cycle. Note that when the previous cycle is a write cycle and the internal bus idle cycles are shorter than the previous write cycle, write data can be prepared in parallel with the previous write cycle and therefore, no idle cycle is generated (write buffer effect). | 0 or 1 | For write → write or write → read access cycles, successive access cycles without idle cycles may be available due to the write buffer effect described in the left column. If successive access cycles without idle cycles are not allowed, specify the minimum number of idle cycles between access cycles through CSnBCR. |
| [7] | Idle cycles between different memory types | To ensure the minimum pulse width on the signal-multiplexed pins, idle cycles may be inserted before access after memory types are switched. For some memory types, idle cycles are inserted even when memory types are not switched. | 0 to 2 | The number of idle cycles depends on the target memory types. See Table 8.19. |

In the above conditions, a total of four conditions, that is, condition [1], condition [2] or [3] (either one is effective), a set of conditions [4] to [6] (these are generated successively, and therefore the sum of them should be taken as one set of idle cycles), and condition [7] are generated at the same time. The maximum number of idle cycles among these four conditions become the number of idle cycles on the external bus. To ensure the minimum idle cycles, be sure to make register settings for condition [1].



Note: A total of four conditions (condition [1], condition [2] or [3], a set of conditions [4] to [6], and condition [7]) generate idle cycle at the same time. Accordingly, the maximum number of cycles among these four conditions become the number of idle cycles.

**Figure 8.40 Idle Cycle Conditions**

**Table 8.19 Number of Idle Cycles Inserted between Access Cycles to Different Memory Types**

| | Next Cycle | | | | | | |
|---|---|---|---|---|---|---|---|
| **Previous Cycle** | **SRAM** | **Burst ROM (Asynchronous)** | **MPX-I/O** | **Byte SRAM (BAS = 0)** | **Byte SRAM (BAS = 1)** | **SDRAM** | **Burst ROM (Synchronous)** |
| SRAM | 0 | 0 | 1 | 0 | 0/1*1 | 0/1*1 | 0 |
| Burst ROM (asynchronous) | 0 | 0 | 1 | 0 | 0/1*1 | 0/1*1 | 0 |
| MPX-I/O | 1 | 1 | 0 | 1 | 1 | 1 | 1 |
| Byte SRAM (BAS = 0) | 0 | 0 | 1 | 0 | 0/1*1 | 0/1*1 | 0 |
| Byte SRAM (BAS = 1) | 0/1*1 | 0/1*1 | 1/2*1 | 0/1*1 | 0 | 0 | 0/1*1 |
| SDRAM | 1 | 1 | 2 | 1 | 0 | 0 | 1 |
| Burst ROM (synchronous) | 0 | 0 | 1 | 0 | 1 | 1 | 0 |

Note 1. The number of idle cycles is determined by the setting of bits HW[1:0] in the CSnWCR register for the previous cycle. The values on the left and right sides of the virgules show the numbers of idle cycles when HW[1:0] ≠ B'00 and HW[1:0] = B'00, respectively. If the memory connected to the CSn space in the previous cycle is of a type for which bits HW[1:0] in the CSnWCR register are ineffective, the number of idle cycles will be the value on the right side.

## 8.5.11 Others

### (1) Reset

This module can be initialized completely only at power-on reset. At power-on reset, all signals are negated and data output buffers are turned off regardless of the bus cycle state after the internal reset is synchronized with the internal clock. All control registers are initialized. In software standby and sleep, control registers of the bus state controller are not initialized.

### (2) Caution on Write Buffer

Since the bus state controller incorporates a one-stage write buffer, it can execute an access via the internal bus before the previous external bus cycle is completed in a write cycle. If the on-chip module is read or written after the external low-speed memory is written, the on-chip module can be accessed before the completion of the external low-speed memory write cycle.

In read cycles, the CPU is placed in the wait state until read operation has been completed. To continue the process after the data write to the device has been completed, perform a dummy read to the same address to check for completion of the write before the next process to be executed.

The write buffer of the bus state controller functions in the same way for an access by a bus master other than the CPU such as the direct memory access controller. Accordingly, to perform DMA transfers, the next read cycle is initiated before the previous write cycle is completed. Note, however, that if both the DMA source and destination addresses exist in external memory space, the next read cycle will not be initiated until the previous write cycle is completed.

Changing the registers in this module while the write buffer is operating may disrupt correct write access. Therefore, do not change the registers in this module immediately after a write access. If this change becomes necessary, do it after executing a dummy read of the write data.

### (3) On-Chip Peripheral Module Access

To access an on-chip module register, two or more peripheral module clock (P0$\phi$ or P1$\phi$) cycles are required.

When the CPU writes data to the internal peripheral registers, the CPU performs the succeeding instructions without waiting for the completion of writing to registers.

For example, a case is described here in which the system is transferring to the software standby mode for power savings. To make this transition, the WFI instruction must be performed after setting the STBY bit in the STBCR1 register to 1. However a dummy read of the STBCR1 register is required before executing the WFI instruction. If a dummy read is omitted, the CPU executes the WFI instruction before the STBY bit is set to 1, thus the system enters sleep mode not software standby mode. A dummy read of the STBCR1 register is indispensable to complete writing to the STBY bit.

To reflect the change by internal peripheral registers while performing the succeeding instructions, execute a dummy read of registers to which write instruction is given and then perform the succeeding instructions.

# 9. Direct Memory Access Controller

The direct memory access controller can be used in place of the CPU to perform high-speed transfers between external devices that have DACK (transfer request acknowledge signal), external memory, on-chip memory, memory-mapped external devices, and on-chip peripheral modules.

## 9.1 Features

- Number of channels selectable: 16 channels (CH0 to CH15). Only the CH0 channel can receive external requests.
- 4-Gbyte address space (according to the architecture)
- Transfer data size: Byte, two bytes, four bytes, eight bytes, 16 bytes, 32 bytes, 64 bytes, and 128 bytes
- Maximum transfer count: $2^{32}$ - 1 bytes
- Address mode: Dual address mode
- Transfer requests: Can be selected from the three types of external request, on-chip peripheral module request, and auto request (software trigger)
- The following modules can issue on-chip peripheral module requests.
  —Serial communication interface with FIFO: 16 sources
  —A/D converter: 1 source
  —Multi-function timer pulse unit 2: 5 sources
  —USB2.0 host/function module: 4 sources
  —NAND flash memory controller: 1 source
  —Serial sound interface: 10 sources
  —Sound generator: 4 sources
  —Renesas SPDIF interface: 2 sources
  —CD-ROM decoder: 1 source
  —SD host interface: 4 sources
  —MMC host interface: 2 sources
  —Renesas serial peripheral interface: 10 sources
  —Motor control PWM timer: 2 sources
  —IEBus™ controller: 2 sources
  —OS timer: 2 sources
  —SCUX: 8 sources
  —Media local bus: 1 source
  —Serial communication interface: 4 sources
  —$I^2C$ bus interface: 8 sources
  —LIN interface: 4 sources
  —Pixel format converter: 4 sources
- Transfer mode: Single transfer mode and block transfer mode are selectable.
- Priority: The channel priority levels within channels 0 to 7 and within channels 8 to 15 are selectable between fixed mode and round-robin mode (the channel priority level between the group of channels 0 to 7 and the group of channels 8 to 15 is round-robin mode).
- Interrupt request: An interrupt request can be sent to the CPU on completion of data transfer (DMA transfer end interrupt per channel) or on occurrence of a transfer error (DMA error interrupt).
- External request detection: Low level detection, high level detection, rising edge detection, and falling edge detection are selectable for DREQ input detection.
- The DMA registers have a continuous execution function that allows the next DMA transfer to be executed continuously by making settings for the next DMA transfer during execution of the current DMA transfer. This continuous execution function can be enabled or disabled independently in each channel.
- Link mode: In this mode, the setting data (descriptor data) located in the memory by the CPU is automatically

retrieved by the DMAC, and DMA transfer is performed according to those values.

- Buffer sweep: If an ongoing DMA transfer is forced to end, the data already retrieved into the buffer can be output before DMA transfer ends.
- Interval: A specific DMA transfer interval can be specified to adjust the bus occupancy.

## 9.2 Input/Output Pins

Table 9.1 lists the pin configuration. This module has pins for a single channel (CH0) as the external bus use.

**Table 9.1 Pin Configuration**

| Channel | Name | Pin Name | I/O | Function |
|---|---|---|---|---|
| 0 | DMA transfer request | DREQ0 | Input | DMA transfer request input from an external device to channel 0 |
| | DMA transfer request acknowledge | DACK0 | Output | DMA transfer request acknowledge output from channel 0 of this module |
| | DMA transfer end | TEND0 | Output | DMA transfer end output for channel 0 of this module |

Note 1. For the active level of DACK0 and TEND0, refer to section 8, Bus State Controller.

## 9.3 Register Configuration

The register configuration is shown in the figure below.

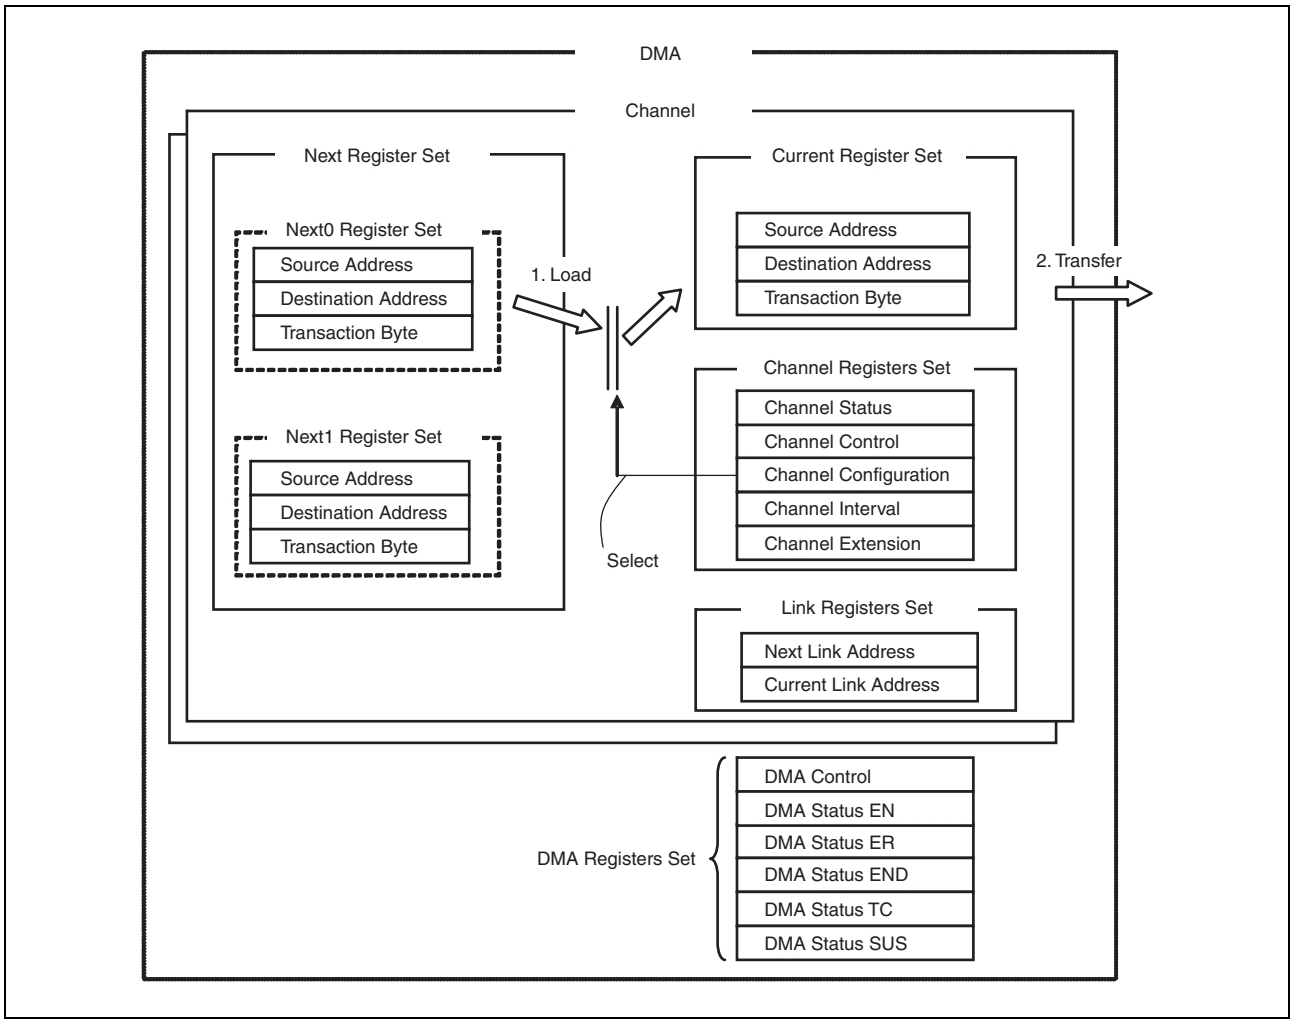


**Figure 9.1 Register Configuration**

### (a) Next Register Set

This register set is used to set the source address, destination address, and transfer byte count of the DMA transaction to be executed next.
It consists of the Next0 register set and the Next1 register set.
In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.
These register set values are loaded to the Current Register Set and used for DMA transfer.

### (b) Current Register Set

This register set indicates the source address, destination address, and transfer byte count of the currently executed DMA transaction.
The values are loaded from the Next0/1 register set (register mode) or from the descriptor read data (link mode). The user cannot write directly to this register set.
The register set is automatically updated each time a DMA transaction is executed.

### (c) Channel Register Set

This register set is used to make the DMA transfer settings.
The settings to be made with this register set include channel status indication, channel control, DMA transaction setting, and DMA transaction interval.

### (d) Link Register Set

This register set consists of a register that sets the address of the descriptor to be loaded next in link mode (Next Link Address Register) and a register that indicates the address of the currently executed descriptor (Current Link Address Register).
The Current Link Address Register is automatically updated when a descriptor is read. The user cannot write directly to this register set.

### (e) DMA Register Set

This register set consists of a register that controls DMA as a whole and registers that indicate the status of the corresponding channels. It enables channel priority control as well as the monitoring of the channel status (EN, ER, END, TC, and SUS).

### (f) Extended Resource Selector Register Set

This register set is used to select the on-chip peripheral module to perform DMA transfer and the external request.

## 9.4 Register Descriptions

Table 9.2 lists the register configuration. There are eleven control registers and five status registers for each channel, and twelve common control registers are used by all channels. In addition, there is one extension resource selector per two channels. Each channel number is expressed in the register names, as in N0SA_0 for N0SA in channel 0.

**Table 9.2 Register Configuration**

| Channel | Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | Next0 source address register 0 | N0SA_0 | RW | H'00000000 | H'E8200000 | 32 |
| | Next0 destination address register 0 | N0DA_0 | RW | H'00000000 | H'E8200004 | 32 |
| | Next0 transaction byte register 0 | N0TB_0 | RW | H'00000000 | H'E8200008 | 32 |
| | Next1 source address register 0 | N1SA_0 | RW | H'00000000 | H'E820000C | 32 |
| | Next1 destination address register 0 | N1DA_0 | RW | H'00000000 | H'E8200010 | 32 |
| | Next1 transaction byte register 0 | N1TB_0 | RW | H'00000000 | H'E8200014 | 32 |
| | Current source address register 0 | CRSA_0 | R | H'00000000 | H'E8200018 | 32 |

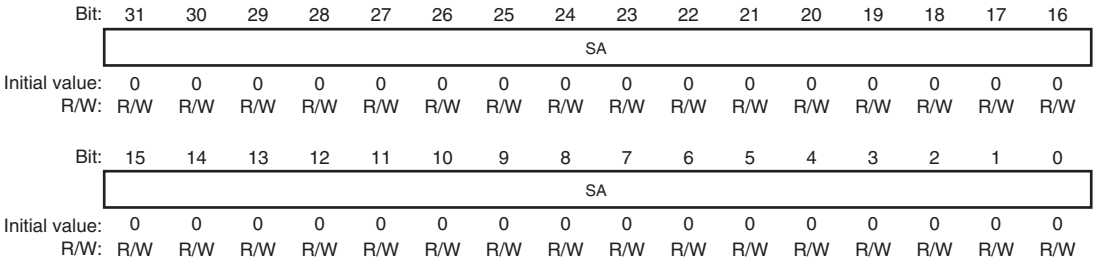
### 9.4.1 Next Source Address Register n (N0SA_n, N1SA_n)

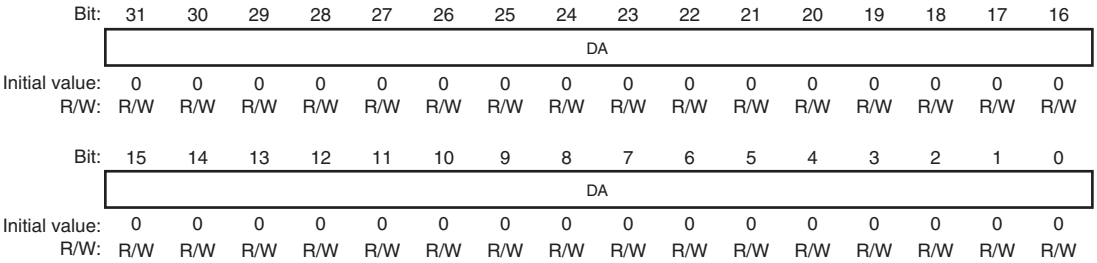
This register sets the DMA transfer source address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next.
N0SA_n is for the Next0 Register Set, and N1SA_n is for the Next1 Register Set.
In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.
These register set values are loaded to the Current Register Set and used for DMA transfer.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SA | All 0 | R/W | Source Address<br>Sets the start address of the DMA transfer source. |

### 9.4.2 Next Destination Address Register n (N0DA_n, N1DA_n)

This register sets the DMA transfer destination address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next.
N0DA_n is for the Next0 Register Set, and N1DA_n is for the Next1 Register Set.
In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.
These register set values are loaded to the Current Register Set and used for DMA transfer.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DA | All 0 | R/W | Destination Address<br>Sets the start address of the DMA transfer destination. |

### 9.4.3 Next Transaction Byte Register n (N0TB_n, N1TB_n)

This register sets the total transfer byte count (DMA transaction) of DMA channel (n = 0 to 15) which is to be executed next.
N0TB_n is for the Next0 Register Set, and N1TB_n is for the Next1 Register Set.
In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.
These register set values are loaded to the Current Register Set and used for DMA transfer.

### 9.4.4 Current Source Address Register (CRSA_n)

This register indicates the DMA transfer source address of DMA channel n (n = 0 to 15).
The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

(Any value obtained during the DMA operation should be handled as a reference value.) |

### 9.4.5 Current Destination Address Register (CRDA_n)

This register indicates the DMA transfer destination address of DMA channel n (n = 0 to 15).
The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRDA | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRDA | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRDA | All 0 | R | Current Destination Address Register<br>Indicates the write address of the next DMA transaction.<br>The value automatically increments during the DMA transaction. (The value is fixed when 1 is set in DAD of the CHCFG_n register.)<br>The value increments when a write transfer starts.<br>Read this register after DMA stops (0 is set in EN of the CHSTAT_n register). (Any value obtained during the DMA operation should be handled as a reference value.) |

### 9.4.6 Current Transaction Byte Register (CRTB_n)

This register indicates the total transfer byte count of DMA channel n (n = 0 to 15). The value of this register becomes 0 when the transaction ends.
The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRTB | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRTB | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRTB | All 0 | R | Current Transaction Byte Register<br>Indicates the remaining transfer byte count of the currently executed DMA transaction.<br>The value automatically decrements during the DMA transaction.<br>The value decrements when a write transfer is completed.<br>Read this register after DMA stops (0 is set in EN of the CHSTAT_n register). (Any value obtained during the DMA operation should be handled as a reference value.) |

### 9.4.7 Channel Status Register n (CHSTAT_n)

This register indicates the status of DMA channel n (n = 0 to 15).

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | INTMSK |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | MODE | DER | DW | DL | SR | TC | END | ER | SUS | TACT | RQST | EN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 16 | INTMSK | 0 | R | Indicates the temporary mask status of the DMA transfer end interrupt.<br>1: Masked temporarily<br>0: Unmasked temporarily<br><br>Set condition(s):<br>• When SETINTMSK (CHCTRL_n) is set to 1<br>Reset condition(s):<br>• When CLRINTMSK (CHCTRL_n) is set to 1<br>• When SWRST (CHCTRL_n) is set to 1 |
| 15 to 12 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 11 | MODE | 0 | R | DMA Mode<br>Indicates the DMA mode. It corresponds to the value set in the DMS bit of the CHCFG_n register.<br>0: Register mode<br>1: Link mode |
| 10 | DER | 0 | R | Descriptor Error<br>Indicates whether the link valid value of the read descriptor is invalid (LV = 0) (this is not dependent on the DIM level of the descriptor). If a descriptor error has occurred, the transfer is stopped but no DMA error interrupt occurs.<br>0: Descriptor Error not detected<br>1: Descriptor Error detected<br><br>Set condition(s):<br>• When the LV value loaded with the descriptor in link mode is 0<br>Reset condition(s):<br>• When SWRST (CHCTRL_n) is set to 1 |
| 9 | DW | 0 | R | Descriptor WriteBack<br>Indicates the descriptor writeback status. The bit maintains 1 if a bus error is received during descriptor writeback.<br>0: Operation other than writeback is being performed for the header in link mode.<br>1: (ER = 0)<br>Writeback is being performed for the header in link mode.<br>(ER = 1)<br>A bus error occurs during writeback for the header in link mode.<br><br>Set condition(s):<br>• When header writeback in link mode starts<br>Reset condition(s):<br>• When header writeback in link mode ends with an OK response<br>• When SWRST (CHCTRL_n) is set to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8 | DL | 0 | R | Descriptor Load<br>Indicates whether the descriptor is being loaded. The bit maintains 1 if a bus error is received during descriptor load.<br>0: Operation other than descriptor load<br>1: (ER = 0)<br>Descriptor load is in progress in link mode.<br>(ER = 1)<br>A bus error occurs during descriptor load in link mode.<br><br>Set condition(s):<br>• When descriptor load in link mode starts<br>Reset condition(s):<br>• When descriptor load in link mode ends with an OK response<br>• When SWRST (CHCTRL_n) is set to 1 |
| 7 | SR | 0 | R | Selected Register Set<br>Indicates the register set currently selected in register mode.<br>0: Next0 Register Set<br>1: Next1 Register Set<br><br>Set condition(s):<br>• When RSEL (CHCFG_n) is set to 1<br>Reset condition(s):<br>• When RSEL (CHCFG_n) is set to 0 |
| 6 | TC | 0 | R | Terminal Count<br>Indicates whether the DMA transaction is completed.<br>0: DMA transfer not completed<br>1: DMA transfer completed<br><br>Set condition(s):<br>• When data equivalent to the total transfer byte count set in the CRTB register has been transferred in register mode<br>• When data equivalent to the total transfer byte count set in the CRTB register has been transferred in link mode, with 1 set in WBD of the descriptor header<br>• When descriptor writeback is completed in link mode, with 0 set in WBD of the descriptor header<br>Clear condition(s):<br>• When the CLRTC (CHCTRL_n) bit is set to 1<br>• When the SWRST (CHCTRL_n) bit is set to 1 |
| 5 | END | 0 | R | DMAEND Interrupted<br>Indicates whether the DMA transaction is completed and whether the DMA transfer end interrupt has occurred.<br>0: DMA transfer not completed<br>1: DMA transfer completed<br><br>Set condition(s):<br>• When one of the set conditions for the TC bit is met and 0 is set in DEM of the CHCFG_n register<br>• When the descriptor is read in link mode and both LV of the header and DIM are set to 0<br>Clear condition(s):<br>• When CLREND (CHCTRL_n) is set to 1<br>• When SWRST (CHCTRL_n) is set to 1 |
| 4 | ER | 0 | R | Error bit<br>Indicates that a DMA error interrupt has occurred because an error response has been received from the transfer source or destination and a bus error has occurred during the DMA transfer.<br>0: No bus error has occurred<br>1: A DMA error interrupt has occurred due to a bus error<br><br>Set condition(s):<br>• When a bus error has occurred during a bus cycle<br>Clear condition(s):<br>• When SWRST (CHCTRL_n) is set to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | SUS | 0 | R | Suspend<br>Indicates whether the channel is suspended.<br>0: Channel_n not suspended<br>1: Channel_n suspended<br><br>Set condition(s):<br>• When SETSUS (CHCTRL_n) is set to 1 during a DMA transfer on Channel_n, creating a SUSPEND status internally<br>Clear condition(s):<br>• When CLRSUS (CHCTRL_n) is set to 1<br>• When CLREN (CHCTRL_n) is set to 1 |
| 2 | TACT | 0 | R | Transaction Active<br>Indicates whether the DMAC is active. This bit is intended to check that the channel is completely inactive.<br>0: DMA on Channel_n inactive<br>1: DMA on Channel_n active<br><br>Set condition(s):<br>• When a DMA transaction starts on Channel_n<br>Clear condition(s):<br>• When a DMA transaction is completed |
| 1 | RQST | 0 | R | Request<br>Indicates whether a transfer request is being received.<br>0: DMA transfer request not being received<br>1: DMA transfer request being received<br><br>Set condition(s):<br>• When the STG bit (CHCTRL_n) is set to 1 (auto request)<br>• When a transfer request is received from the DMA request source set in the CHCFG_n register<br>Clear condition(s):<br>• When SWRST (CHCTRL_n) is set to 1<br>• When CLRRQ (CHCTRL_n) is set to 1<br>• When a transfer is executed on the side specified by REQD (CHCFG_n) in single transfer mode (TM = 0).<br>• When all DMA transactions are completed in register mode (the transaction ends with REN set to 0)<br>• When the DMA transfer of the last descriptor (LE = 1) is completed in link mode<br>• When descriptor read stops (LV = 0) in link mode<br>• When a bus error is received due to an error response |
| 0 | EN | 0 | R | Enable<br>Indicates whether the operation of DMA channel n is enabled or disabled.<br>0: Operation disabled<br>1: Operation enabled<br><br>Set condition(s):<br>• When SETEN (CHCTRL_n) is set to 1<br>Clear condition(s):<br>• When SWRST (CHCTRL_n) is set to 1<br>• When CLREN (CHCTRL_n) is set to 1<br>• When a bus error is received due to an error response during the transfer<br>• When all DMA transactions are completed in register mode (the transaction ends with REN set to 0)<br>• When the DMA transfer of the last descriptor (LE = 1) is completed in link mode (writeback when WBD is set to 0)<br>• When descriptor read stops (LV = 0) in link mode |

<Caution> If the ER bit is set to 1 for any transfer, the whole transfer should be handled as invalid.
To suspend a DMA transaction, mask or clear the transfer request or clear the Enable bit (for the procedure, see section 9.7.11 (2) Transfer Stop).
If a transfer request from an on-chip peripheral module or the external DREQ input is made concurrently with an auto request (by setting 1 in the STG bit) for the same one channel, the trigger source that takes effect cannot be identified. Make sure that only one of these transfer requests is used in the system.
When transfer is requested by an auto request, wait for the last requested DMA transfer to complete (use the Current Register or other data to check the status) before setting the STG bit for the next transfer request.

## 9.4.8 Channel Control Register n (CHCTRL_n)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | CLRINT MSK | SETINT MSK |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | CLR SUS | SET SUS | - | CLRTC | CLR END | CLRRQ | SWRST | STG | CLREN | SETEN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 17 | CLRINTMSK | 0 | R/W | When this bit is set to 1, the mask of the DMA transfer end interrupt is cleared. Also, the INTMSK bit of the CHSTAT_n register is set to 0.<br>If the mask is cleared when 1 is set in both LVINT of the DCTRL register and END of the CHSTAT_n register, the DMA transfer end interrupt becomes active. (It does not become active when 0 is set in LVINT.)<br>A read operation results in 0 being read.<br>1: Clears the mask set by SETINTMSK.<br>0: Does not affect the operation. |
| 16 | SETINTMSK | 0 | R/W | When this bit is set to 1, the DMA transfer end interrupt is temporarily masked. Also, the INTMSK bit of the CHSTAT_n register is set to 1.<br>A read operation results in 0 being read.<br>1: Masks the DMA transfer end interrupt.<br>0: Does not affect the operation. |
| 15 to 10 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 9 | CLRSUS | 0 | R/W | Clear Suspend<br>Clears the suspend status. Setting this bit to 1 when 1 is set in SUS of the CHSTAT_n register can clear the suspend status.<br>An attempt to read this bit results in 0 being read.<br>1: Clears the suspend status of the current DMA transfer.<br>0: Does not affect the operation. |
| 8 | SETSUS | 0 | R/W | Set Suspend<br>Suspends the current DMA transfer. Setting this bit to 1 when 1 is set in EN of the CHSTAT_n register can suspend the current DMA transfer.<br>An attempt to read this bit results in 0 being read.<br>1: Suspends the current DMA transfer.<br>0: Does not affect the operation. |
| 7 | — | 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 6 | CLRTC | 0 | R/W | Clear TC bit<br>Setting this bit to 1 can clear the TC bit of the CHSTAT_n register. An attempt to read this bit results in 0 being read.<br>1: Clears the TC bit.<br>0: Does not affect the operation. |
| 5 | CLREND | 0 | R/W | Clear End bit<br>Setting this bit to 1 can clear the END bit of the CHSTAT_n register.<br>Also, the DMA transfer end interrupt is cleared.<br>An attempt to read this bit results in 0 being read.<br>1: Clears the END bit.<br>0: Does not affect the operation. |
| 4 | CLRRQ | 0 | R/W | Clear Request bit<br>Setting this bit to 1 can clear the RQST bit of the CHSTAT_n register.<br>An attempt to read this bit results in 0 being read.<br>1: Clears the RQST bit.<br>0: Does not affect the operation. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | SWRST | 0 | R/W | Software Reset<br>Setting this bit to 1 can clear the channel status register (CHSTAT_n). When setting this bit to 1, make sure that both the EN bit and TACT bit are set to 0.<br>An attempt to read this bit results in 0 being read.<br>1: Resets the channel status register.<br>0: Does not affect the operation. |
| 2 | STG | 0 | R/W | Software Trigger<br>Setting this bit to 1 sets an auto request. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence.<br>An attempt to read this bit results in 0 being read.<br>1: Sets a transfer request triggered by an auto request (sets 1 in the RQST bit).<br>0: Does not affect the operation. |
| 1 | CLREN | 0 | R/W | Clear Enable<br>Setting this bit to 1 can clear the EN bit (for details, see section 9.7.11 (2) Transfer Stop).<br>An attempt to read this bit results in 0 being read.<br>1: Stops the DMA transfer (clears the EN bit).<br>0: Does not affect the operation. |
| 0 | SETEN | 0 | R/W | Set Enable<br>Enables a DMA transfer on DMA channel n. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence and the transfer does not start.<br>An attempt to read this bit results in 0 being read.<br>1: Enables a DMA transfer (sets 1 in the EN bit).<br>0: Does not affect the operation. |

### 9.4.9 Channel Configuration Register n (CHCFG_n)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DMS | REN | RSW | RSEL | SBE | - | - | DEM | - | TM | DAD | SAD | DDS[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SDS[3:0] | | | | - | AM[2:0] | | | - | LVL | HIEN | LOEN | REQD | SEL[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | DMS | 0 | R/W | DMA Mode Select<br>Sets the DMA mode.<br>0: Register mode (initial value)<br>1: Link mode |
| 30 | REN | 0 | R/W | Register Set Enable<br>After a DMA transaction is completed, DMA transfers are continued using the Next register set selected by RSEL. This bit is valid only in register mode.<br>0: Does not continue DMA transfers.<br>1: Continues DMA transfers.<br><br>Set condition(s):<br>• When 1 is written to this bit<br>Clear condition(s):<br>• When 0 is written to this bit<br>• When a DMA transaction is completed, with REN set to 1 |
| 29 | RSW | 0 | R/W | Register Select Switch<br>Inverts RSEL automatically after a DMA transaction is completed. This bit is valid only in register mode.<br>0: Does not invert RSEL automatically after a DMA transaction (initial value).<br>1: Inverts RSEL automatically after a DMA transaction. |
| 28 | RSEL | 0 | R/W | Register Set Select<br>Selects the Next register set to be executed next. This bit is valid only in register mode. When RSW is set to 1, this bit is inverted automatically when a DMA transaction is completed.<br>0: Executes the Next0 Register Set (initial value).<br>1: Executes the Next1 Register Set.<br><br>Transition condition(s):<br>• When a DMA transaction is completed, with RSW set to 1 |
| 27 | SBE | 0 | R/W | Sweep Buffer Enable<br>Selects whether to sweep (write) the data already read into the buffer and stop the DMA transfer if the Enable bit is cleared to 0 during a DMA transaction.<br>The sweep mode is available only when REQD is set to 0.<br>0: Stops the DMA transfer without sweeping the buffer (initial value).<br>1: Stops the DMA transfer after sweeping the buffer. |
| 26, 25 | — | 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 24 | DEM | 0 | R/W | DMA Transfer End Interrupt Mask<br>Masks the DMA transfer end interrupt for register mode transfer.<br>If 1 is set in this bit when a DMA transfer end interrupt is output, the DMA transfer end interrupt signal is not asserted. In this case, DEM is cleared to 0 automatically.<br>0: Does not mask the DMA transfer end interrupt (initial value).<br>1: Masks the DMA transfer end interrupt.<br><br>Clear condition(s):<br>• When a DMA transaction is completed with DEM set to 1 |
| 23 | — | 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 22 | TM | 0 | R/W | Transfer Mode<br>Sets the DMA transfer mode.<br>0: Single transfer mode (initial value)<br>1: Block transfer mode |
| 21 | DAD | 0 | R/W | Sets the destination address counting direction of DMA channel n.<br>0: Increment (initial value)<br>1: Fixed |
| 20 | SAD | 0 | R/W | Sets the source address counting direction of DMA channel n.<br>0: Increment (initial value)<br>1: Fixed |
| 19 to 16 | DDS [3:0] | 0000 | R/W | Destination Data Size<br>Sets the DMA transfer size of the transfer destination. |

| Value | Size | Remark |
|---|---|---|
| 0000 | 8 bits | Initial value |
| 0001 | 16 bits | |
| 0010 | 32 bits | |
| 0011 | 64 bits | |
| 0100 | 128 bits | |
| 0101 | 256 bits | |
| 0110 | 512 bits | |
| 0111 | 1024 bits | |
| Other than the above | — | Setting prohibited |

| | | | | |
|---|---|---|---|---|
| 15 to 12 | SDS [3:0] | 0000 | R/W | Source Data Size<br>Sets the DMA transfer size of the transfer source. |

| Value | Size | Remark |
|---|---|---|
| 0000 | 8 bits | Initial value |
| 0001 | 16 bits | |
| 0010 | 32 bits | |
| 0011 | 64 bits | |
| 0100 | 128 bits | |
| 0101 | 256 bits | |
| 0110 | 512 bits | |
| 0111 | 1024 bits | |
| Other than the above | — | Setting prohibited |

| | | | | |
|---|---|---|---|---|
| 11 | — | 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 10 to 8 | AM [2:0] | 000 | R/W | ACK Mode<br>Sets the DMAACK output mode.<br>000: (initial value)<br>001: Level mode (active until the transfer request from an on-chip peripheral module or the external DREQ input becomes inactive)<br>01x: Bus cycle mode (active while the DMA transfer is in a bus cycle)<br>1xx: DMAACK not to be output (this setting should be made when an auto request is made by STG (CHCTRL_n)) |
| 7 | — | 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 6 | LVL | 0 | R/W | Level<br>Selects whether to detect a DMA request based on the level or edge of the signal.<br>0: Detects based on the edge (initial value).<br>1: Detects based on the level. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 5 | HIEN | 0 | R/W | High Enable<br>Selects whether to detect a DMA request using the High level or rising edge of the signal.<br>When LVL = 0:<br>HIEN = 1: Detects a request in response to the rising edge of the signal.<br>HIEN = 0: Does not detect a request in response to the rising edge of the signal (initial value).<br>When LVL = 1:<br>HIEN = 1: Detects a request when the signal is at the High level.<br>HIEN = 0: Does not detect a request even when the signal is at the High level (initial value). |
| 4 | LOEN | 0 | R/W | Low Enable<br>Selects whether to detect a DMA request using the Low level or falling edge of the signal.<br>When LVL = 0:<br>LOEN = 1: Detects a request in response to the falling edge of the signal.<br>LOEN = 0: Does not detect a request in response to the falling edge of the signal (initial value).<br>When LVL = 1:<br>LOEN = 1: Detects a request when the signal is at the Low level.<br>LOEN = 0: Does not detect a request even when the signal is at the Low level (initial value). |
| 3 | REQD | 0 | R/W | Request Direction<br>Selects whether DMAREQ selected by the SEL bit is the source or destination. This bit is also used to define when DMAACK is to become active.<br>0: Source; DMAACK is to become active when read (initial value).<br>1: Destination; DMAACK is to become active when written. |
| 2 to 0 | SEL[2:0] | 000 | R/W | These bits are used to set a DMAC channel. Set one of the following values so that the channel set by the SEL bits matches the CHCFG_n channel.<br>000: CH0/CH8<br>001: CH1/CH9<br>010: CH2/CH10<br>011: CH3/CH11<br>100: CH4/CH12<br>101: CH5/CH13<br>110: CH6/CH14<br>111: CH7/CH15 |

## 9.4.10 Channel Interval Register n (CHITVL_n)

This register sets the transfer interval for DMA channel n (n = 0 to 15).

For details, see section 9.7.9, Interval Count Function.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ITVL | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 15 to 0 | ITVL | All 0 | R/W | Sets the channel transfer interval. |

## 9.4.11 Channel Extension Register n (CHEXT_n)

This is an extension register for DMA channel n (n = 0 to 15).

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DCA[3:0] | | | | - | DPR[2:0] | | | SCA[3:0] | | | | - | SPR[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Set 0. A read operation results in 0 being read. |
| 15 to 12 | DCA[3:0] | 0000 | R/W | Destination CACHE<br>Sets the value to be output to AWCACHE[3:0] for DMA write transfer.<br>See Note 1 below. |
| 11 | — | 0 | R | Set 0. A read operation results in 0 being read. |
| 10 to 8 | DPR[2:0] | 000 | R/W | Destination PROT<br>Sets the value to be output to AWPROT[2:0] for DMA write transfer.<br>See Note 2 below. |
| 7 to 4 | SCA[3:0] | 0000 | R/W | Source CACHE<br>Sets the value to be output to ARCACHE[3:0] for DMA read transfer.<br>See Note 1 below. |
| 3 | — | 0 | R | Set 0. A read operation results in 0 being read. |
| 2 to 0 | SPR[2:0] | 000 | R/W | Source PROT<br>Sets the value to be output to ARPROT[2:0] for DMA read transfer.<br>See Note 2 below. |

Note 1. Cache support: Bits SCA and DCA are used to change the settings.
When the transfer destination or source is not in the external bus space, set these bits to 0000.
Even when the transfer destination or source is in the external bus space but the secondary cache is not in use, set these bits to 0000. In this case, the DACK0 output and TEND0 output are issued in response to the DREQ0 transfer request.
When the secondary cache is in use in the external bus space, set CACHE[3:0].

Note 2. Protection unit support: Bits SPR and DPR are used to change the settings.
For the setting value, see AMBA AXI Protocol Specification from Arm Limited.

### 9.4.12 Next Link Address Register n (NXLA_n)

This is a 32-bit register that sets the link address of DMA channel n (n = 0 to 15).
For information about the link mode, see section 9.6.3, Link Mode.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NXLA | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NXLA | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | NXLA | All 0 | R/W | Sets a link address. The low-order 2 bits are masked with 0s. Only an address aligned with a 4-byte boundary can be set. |

### 9.4.13 Current Link Address Register n (CRLA_n)

This is a 32-bit register that indicates the link address of DMA channel n (n = 0 to 15).
For information about the link mode, see section 9.6.3, Link Mode.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRLA | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRLA | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRLA | All 0 | R | Indicates the address of the currently executed descriptor. |

## 9.4.14 DMA Control Register (DCTRL_0_7, DCTRL_8_15)

This register sets the transfer type for descriptor access and the arbitration between channels.
(DCTRL_0_7 is common for channels 0 to 7 and DCTRL_8_15 is common for channels 8 to 15.)

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LWCA | | | | - | LWPR | | | LDCA | | | | - | LDPR | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | LVINT | PR |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | LWCA | 0000 | R/W | Link WriteBack CACHE<br>Sets the value to be output to AWCACHE[3:0] during descriptor writeback in link mode.<br>For the setting value, see Note in section 9.4.11, Channel Extension Register n (CHEXT_n). |
| 27 | — | 0 | R | Reserved area. Set 0. The initial value is 0. |
| 26 to 24 | LWPR | 000 | R/W | Link WriteBack PROT<br>Sets the value to be output to AWPROT[2:0] during descriptor writeback in link mode.<br>For the setting value, see AMBA AXI Protocol Specification from Arm Limited. |
| 23 to 20 | LDCA | 0000 | R/W | Link Descriptor CACHE<br>Sets the value to be output to ARCACHE[3:0] during descriptor load in link mode.<br>For the setting value, see Note in section 9.4.11, Channel Extension Register n (CHEXT_n). |
| 19 | — | 0 | R | Reserved area. Set 0. The initial value is 0. |
| 18 to 16 | LDPR | 000 | R/W | Link Descriptor PROT<br>Sets the value to be output to ARPROT[2:0] during descriptor load in link mode.<br>For the setting value, see AMBA AXI Protocol Specification from Arm Limited. |
| 15 to 2 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 1 | LVINT | 0 | R/W | Sets whether to use pulse output or level output for the DMA transfer end interrupt and DMA error interrupt. Set pulse output for this product.<br>0: Pulse output (initial value)<br>1: Level output |
| 0 | PR | 0 | R/W | Sets the transfer priority control mode between channels (see section 9.7.2, Priority Control for DMA Channels).<br>0: Fixed priority mode (initial value)<br>1: Round robin mode |

## 9.4.15 DMA Status EN Register (DSTAT_EN_0_7)

This register indicates the EN bit status of the CHSTAT_n register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | EN7 | EN6 | EN5 | EN4 | EN3 | EN2 | EN1 | EN0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 7 | EN7 | 0 | R | Indicates the EN bit status of DMA channel 7. |
| 6 | EN6 | 0 | R | Indicates the EN bit status of DMA channel 6. |
| 5 | EN5 | 0 | R | Indicates the EN bit status of DMA channel 5. |
| 4 | EN4 | 0 | R | Indicates the EN bit status of DMA channel 4. |
| 3 | EN3 | 0 | R | Indicates the EN bit status of DMA channel 3. |
| 2 | EN2 | 0 | R | Indicates the EN bit status of DMA channel 2. |
| 1 | EN1 | 0 | R | Indicates the EN bit status of DMA channel 1. |
| 0 | EN0 | 0 | R | Indicates the EN bit status of DMA channel 0. |

## 9.4.16 DMA Status EN Register (DSTAT_EN_8_15)

This register indicates the EN bit status of the CHSTAT_n register (n = 8 to 15).
Writing to this register does not affect the values of the bits.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | EN15 | EN14 | EN13 | EN12 | EN11 | EN10 | EN9 | EN8 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 7 | EN15 | 0 | R | Indicates the EN bit status of DMA channel 15. |
| 6 | EN14 | 0 | R | Indicates the EN bit status of DMA channel 14. |
| 5 | EN13 | 0 | R | Indicates the EN bit status of DMA channel 13. |
| 4 | EN12 | 0 | R | Indicates the EN bit status of DMA channel 12. |
| 3 | EN11 | 0 | R | Indicates the EN bit status of DMA channel 11. |
| 2 | EN10 | 0 | R | Indicates the EN bit status of DMA channel 10. |
| 1 | EN9 | 0 | R | Indicates the EN bit status of DMA channel 9. |
| 0 | EN8 | 0 | R | Indicates the EN bit status of DMA channel 8. |

## 9.4.17 DMA Status ER Register (DSTAT_ER_0_7)

This register indicates the ER bit status of the CHSTAT_n register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | ER7 | ER6 | ER5 | ER4 | ER3 | ER2 | ER1 | ER0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 7 | ER7 | 0 | R | Indicates the ER bit status of DMA channel 7. |
| 6 | ER6 | 0 | R | Indicates the ER bit status of DMA channel 6. |
| 5 | ER5 | 0 | R | Indicates the ER bit status of DMA channel 5. |
| 4 | ER4 | 0 | R | Indicates the ER bit status of DMA channel 4. |
| 3 | ER3 | 0 | R | Indicates the ER bit status of DMA channel 3. |
| 2 | ER2 | 0 | R | Indicates the ER bit status of DMA channel 2. |
| 1 | ER1 | 0 | R | Indicates the ER bit status of DMA channel 1. |
| 0 | ER0 | 0 | R | Indicates the ER bit status of DMA channel 0. |

## 9.4.18 DMA Status ER Register (DSTAT_ER_8_15)

This register indicates the ER bit status of the CHSTAT_n register (n = 8 to 15).
Writing to this register does not affect the values of the bits.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | ER15 | ER14 | ER13 | ER12 | ER11 | ER10 | ER9 | ER8 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 7 | ER15 | 0 | R | Indicates the ER bit status of DMA channel 15. |
| 6 | ER14 | 0 | R | Indicates the ER bit status of DMA channel 14. |
| 5 | ER13 | 0 | R | Indicates the ER bit status of DMA channel 13. |
| 4 | ER12 | 0 | R | Indicates the ER bit status of DMA channel 12. |
| 3 | ER11 | 0 | R | Indicates the ER bit status of DMA channel 11. |
| 2 | ER10 | 0 | R | Indicates the ER bit status of DMA channel 10. |
| 1 | ER9 | 0 | R | Indicates the ER bit status of DMA channel 9. |
| 0 | ER8 | 0 | R | Indicates the ER bit status of DMA channel 8. |

## 9.4.19 DMA Status END Register (DSTAT_END_0_7)

This register indicates the END bit status of the CHSTAT_n register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | END7 | END6 | END5 | END4 | END3 | END2 | END1 | END0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 7 | END7 | 0 | R | Indicates the END bit status of DMA channel 7. |
| 6 | END6 | 0 | R | Indicates the END bit status of DMA channel 6. |
| 5 | END5 | 0 | R | Indicates the END bit status of DMA channel 5. |
| 4 | END4 | 0 | R | Indicates the END bit status of DMA channel 4. |
| 3 | END3 | 0 | R | Indicates the END bit status of DMA channel 3. |
| 2 | END2 | 0 | R | Indicates the END bit status of DMA channel 2. |
| 1 | END1 | 0 | R | Indicates the END bit status of DMA channel 1. |
| 0 | END0 | 0 | R | Indicates the END bit status of DMA channel 0. |

## 9.4.20 DMA Status END Register (DSTAT_END_8_15)

This register indicates the END bit status of the CHSTAT_n register (n = 8 to 15).
Writing to this register does not affect the values of the bits.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | END15 | END14 | END13 | END12 | END11 | END10 | END9 | END8 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 7 | END15 | 0 | R | Indicates the END bit status of DMA channel 15. |
| 6 | END14 | 0 | R | Indicates the END bit status of DMA channel 14. |
| 5 | END13 | 0 | R | Indicates the END bit status of DMA channel 13. |
| 4 | END12 | 0 | R | Indicates the END bit status of DMA channel 12. |
| 3 | END11 | 0 | R | Indicates the END bit status of DMA channel 11. |
| 2 | END10 | 0 | R | Indicates the END bit status of DMA channel 10. |
| 1 | END9 | 0 | R | Indicates the END bit status of DMA channel 9. |
| 0 | END8 | 0 | R | Indicates the END bit status of DMA channel 8. |

## 9.4.21 DMA Status TC Register (DSTAT_TC_0_7)

This register indicates the TC bit status of the CHSTAT_n register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | TC7 | TC6 | TC5 | TC4 | TC3 | TC2 | TC1 | TC0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 7 | TC7 | 0 | R | Indicates the TC bit status of DMA channel 7. |
| 6 | TC6 | 0 | R | Indicates the TC bit status of DMA channel 6. |
| 5 | TC5 | 0 | R | Indicates the TC bit status of DMA channel 5. |
| 4 | TC4 | 0 | R | Indicates the TC bit status of DMA channel 4. |
| 3 | TC3 | 0 | R | Indicates the TC bit status of DMA channel 3. |
| 2 | TC2 | 0 | R | Indicates the TC bit status of DMA channel 2. |
| 1 | TC1 | 0 | R | Indicates the TC bit status of DMA channel 1. |
| 0 | TC0 | 0 | R | Indicates the TC bit status of DMA channel 0. |

## 9.4.22 DMA Status TC Register (DSTAT_TC_8_15)

This register indicates the TC bit status of the CHSTAT_n register (n = 8 to 15).
Writing to this register does not affect the values of the bits.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | TC15 | TC14 | TC13 | TC12 | TC11 | TC10 | TC9 | TC8 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 7 | TC15 | 0 | R | Indicates the TC bit status of DMA channel 15. |
| 6 | TC14 | 0 | R | Indicates the TC bit status of DMA channel 14. |
| 5 | TC13 | 0 | R | Indicates the TC bit status of DMA channel 13. |
| 4 | TC12 | 0 | R | Indicates the TC bit status of DMA channel 12. |
| 3 | TC11 | 0 | R | Indicates the TC bit status of DMA channel 11. |
| 2 | TC10 | 0 | R | Indicates the TC bit status of DMA channel 10. |
| 1 | TC9 | 0 | R | Indicates the TC bit status of DMA channel 9. |
| 0 | TC8 | 0 | R | Indicates the TC bit status of DMA channel 8. |

## 9.4.23 DMA Status SUS Register (DSTAT_SUS_0_7)

This register indicates the SUS bit status of the CHSTAT_n register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved area. Set 0. A read operation results in 0 being read. |
| 7 | SUS15 | 0 | R | Indicates the SUS bit status of DMA channel 15. |
| 6 | SUS14 | 0 | R | Indicates the SUS bit status of DMA channel 14. |
| 5 | SUS13 | 0 | R | Indicates the SUS bit status of DMA channel 13. |
| 4 | SUS12 | 0 | R | Indicates the SUS bit status of DMA channel 12. |
| 3 | SUS11 | 0 | R | Indicates the SUS bit status of DMA channel 11. |
| 2 | SUS10 | 0 | R | Indicates the SUS bit status of DMA channel 10. |
| 1 | SUS9 | 0 | R | Indicates the SUS bit status of DMA channel 9. |
| 0 | SUS8 | 0 | R | Indicates the SUS bit status of DMA channel 8. |

### 9.4.25 DMA Extension Resource Selectors 0 to 7 (DMARS0 to DMARS7)

DMARS are 32-bit readable/writable registers that specify the DMA transfer sources from peripheral modules in each channel. DMARS0 is for channels 0 and 1, DMARS1 is for channels 2 and 3, and so on.

Table 9.4 shows the specifiable combinations.

DMARS can specify transfer requests to be accepted for the following triggers.

The following modules can issue on-chip peripheral module requests.

Serial communication interface with FIFO: 16 sources
A/D converter: 1 source
Multi-function timer pulse unit 2: 5 sources
USB2.0 host/function module: 4 sources
NAND flash memory controller: 1 source
Serial sound interface: 10 sources
Sound generator: 4 sources
Renesas SPDIF interface: 2 sources
CD-ROM decoder: 1 source
SD host interface: 4 sources
MMC host interface: 2 sources
Renesas serial peripheral interface: 10 sources
Motor control PWM timer: 2 sources
IEBus™ controller: 2 sources
OS timer: 2 sources
SCUX: 8 sources
Media local bus: 1 source
Serial communication interface: 4 sources
$I^2C$ bus interface: 8 sources
LIN interface: 4 sources
Pixel format converter: 4 sources

Some on-chip peripheral modules in this product use the same signal both for an interrupt request and for a DMA transfer request. If such a module is selected by a DMARS register, the signal works as a DMA transfer request signal and interrupt requests to the interrupt controller are masked. To enable the interrupt, clear the setting of DMARS (set all MID[6:0] and RID[1:0] to 0).

## 9.5 Operation

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority order; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in three modes: auto request, external request, and on-chip peripheral module request.

### 9.5.1 Transfer Flow

After the next source address register (N0SA_n/N1SA_n), next destination address register (N0DA_n/N1DA_n), next transaction byte register (N0TB_n/N1TB_n), channel control register (CHCTRL_n), channel configuration register (CHCFG_n), channel extension register (CHEXT_n), DMA control register (DCTRL_0_7/DCTRL_8_15), and DMA extension resource selector (DMARS) are set for the target transfer conditions, the DMAC transfers data according to the following procedure:

1. Checks to see if transfer is enabled (EN = 0 and TACT = 0 in channel status register).
2. Clears the channel status register (set 1 in the SWRST bit of the channel control register).
3. Enables DMA transfer (set 1 in the SETEN bit of the channel control register).
4. When a transfer request comes and transfer is enabled, the DMAC transfers one transfer unit of data (depending on the DDS[3:0] and SDS[3:0] bit settings). For an auto request, the transfer begins automatically when 1 is set in the STG bit of the channel control register. The CRTB_n value will be decremented by 1 for each transfer.
5. If 0 is set in the REN bit of the channel configuration register when transfer has been completed for the specified count (when CRTB_n reaches 0), transfer ends normally. If the DEM bit of the channel configuration register is set to 0 at this time, a DMA transfer end interrupt is sent to the CPU. If the REN bit is 1 when CRTB_n reaches 0, transfer operations are continued with the values of N0SA_n/N1SA_n, N0DA_n/N1DA_n, and N0TB_n/N1TB_n set by the RSEL bit of the channel configuration register until there are no more transfer requests.
6. When an address error in the DMAC is generated, the transfer is stopped. Transfers are also stopped when 1 is set in the CLREN bit of CHCTRL_n.

### 9.5.2 DMA Transfer Requests

DMA transfer requests are basically generated in either the data transfer source or destination, but they can also be generated in external devices and on-chip peripheral modules that are neither the transfer source nor destination. Transfers can be requested in three modes: auto request, external request, and on-chip peripheral module request. External request or on-chip peripheral module request is selected by the DMARS0 to DMARS7 registers.

#### (1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the DMAC to automatically generate a transfer request signal internally. When the STG bit in channel control register n is set to 1, the transfer begins so long as the TACT bit in channel status register is 0.

#### (2) External Request Mode

In this mode a transfer is performed at the transfer request signal (DREQ0) of an external device of the LSI. When the DMA transfer is enabled, DMA transfer is performed upon a DREQ input.
Choose to detect DREQ0 by either the edge or level of the signal input with the LVL, HIEN, and LOEN bits in channel configuration register 0 as shown below. The source of the transfer request does not have to be the data transfer source or destination.
For the output level settings of the DACK0 and TEND0 pins, refer to section 8, Bus State Controller.

**Table 9.3 Settings for External Request Detection**

| | CHCFG_0 | | |
|---|---|---|---|
| **LVL** | **HIEN** | **LOEN** | **Detection of External Request** |
| 0 | 0 | 1 | Falling edge detection |
| | 1 | 0 | Rising edge detection |
| 1 | 0 | 1 | Low level detection |
| | 1 | 0 | High level detection |

When DREQ0 is accepted, the DREQ0 pin enters the request accept disabled state (non-sensitive period). After issuing an acknowledge DACK0 signal for the accepted DREQ0, the DREQ0 pin again enters the request accept enabled state.

### (3) On-Chip Peripheral Module Request Mode

In this mode, the transfer is performed in response to the DMA transfer request signal from an on-chip peripheral module.

When a transfer request signal is sent in on-chip peripheral module request mode while DMA transfer is enabled, the DMA transfer is performed.

The DMA transfer request signals to be sent from on-chip peripheral modules or external pin input are listed in Table 9.4.

The transfer source or destination is fixed for some on-chip peripheral module requests. For details, see Table 9.4.

## 9.6 DMA Mode

### 9.6.1 Mode Setting

The DMS field of the CHCFG_n register can be used to toggle between register mode and link mode.

**Table 9.5 DMA Mode Setting**

| DMS (CHCFG_n) | Mode | Description |
|---|---|---|
| 0 | Register mode | A DMA transfer is executed using the values set in the Next Register Set. |
| 1 | Link mode | A DMA transfer is executed using the descriptor set in the Current register. The DMAC repeatedly loads the descriptor and executes the DMA transfer unless otherwise set by the descriptor or stopped by the control register. |

### 9.6.2 Register Mode

In register mode, a DMA transfer is executed using the values set in the internal registers.
Two sets of the source address, destination address, and transfer byte count (Next0 Register Set and Next1 Register Set) can be set. It is possible to select the Next register set to be used for the DMA transfer, as well as to execute two Next register sets continuously for the DMA transfer.

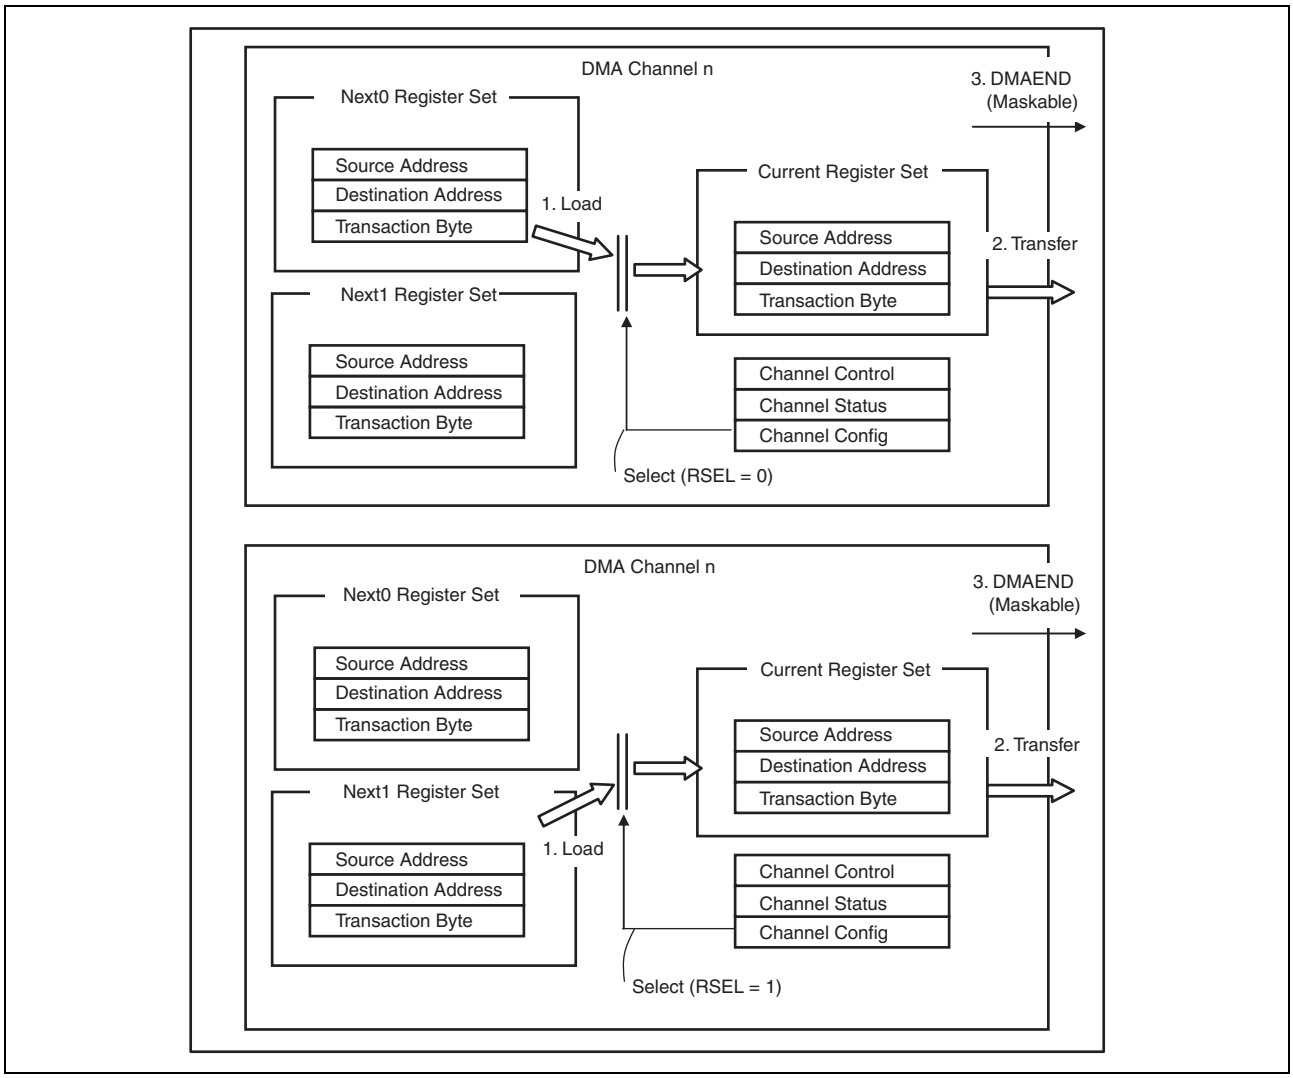

**Figure 9.2 Outline of Normal Register Mode**

The above figure shows how the transfer is executed when the Next0 Register Set is used (upper part of the figure) and when the Next1 Register Set is used (lower part of the figure).

## (1) Operation Flow

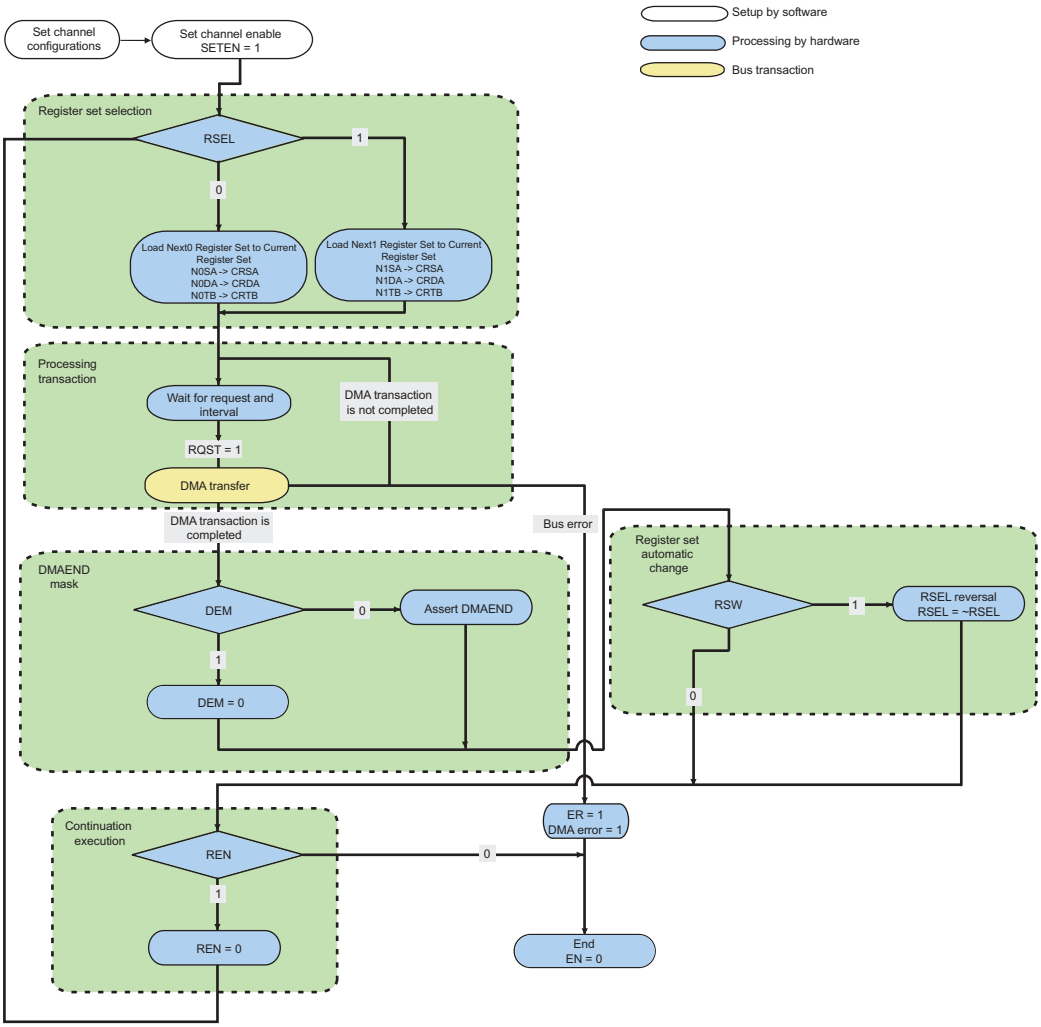

**Figure 9.3 Register Mode Flow**

<Explanation of the register mode flow>

1. Channel setting (set channel configuration)
   The Next0 or Next1 register set (destination address, source address, and total transfer byte count) is set.
   In the Channel register set, the DMA register set (REQ, DMAACK, transfer size, etc.) is set. (See section 9.7, DMA Transfer.)

2. Register set selection (register set selection)
   When 1 is set in EN, the values set in the Next register set selected by RSEL are loaded to the Current register set.

3. DMA transaction (processing transaction)
   A DMA transfer is executed according to the set values. For details of the transfer, see section 9.7, DMA Transfer.

4. DMA transfer end interrupt mask (DMAINT mask)
   The DMA transfer end interrupt is masked according to the value set in the DEM bit of CHCFG_n. When 1 is set in DEM, the DMA transfer end interrupt is not output. Also, immediately after that, DEM is automatically cleared to 0.

5. Automatic register set change (register set automatic change)
   Whether to use the other Next register set is determined by the value set in the RSW bit of CHCFG_n.

6. Continuation of execution (continuation execution)
   Whether to continue the execution of the DMA transfer is determined by the value set in the REN bit of CHCFG_n. When 1 is set in REN, the execution of the DMA transfer is continued. Also, immediately after that, REN is automatically cleared to 0.

## (2) Register Setting

### (a) Register mode setting

Select the register set to be executed.

**Table 9.6 Register Mode Setting**

| DMS (CHCFG_n) | RSEL (CHCFG_n) | Description |
|---|---|---|
| 0 | 0 | Executes the Next0 Register Set. |
| | 1 | Executes the Next1 Register Set. |

### (b) DMA transfer end interrupt mask setting

The DMA transfer end interrupt can be masked individually for each register set.

**Table 9.7 DMAINT Mask Setting**

| DEM (CHCFG_n) | Operation | Remark |
|---|---|---|
| 0 | When the DMA transaction is completed, a DMA transfer end interrupt is issued. | |
| 1 | Even when the DMA transaction is completed, a DMA transfer end interrupt is not issued.<br>After the DMA transaction is completed, DEM is cleared to 0 by hardware. | |

### (c) Automatic register set execution setting

After DMA transfers, the DMA transaction of the selected register set is automatically executed.

**Table 9.8 Automatic Register Set Execution Setting**

| REN (CHCFG_n) | Operation | Remark |
|---|---|---|
| 0 | When the DMA transaction of the register set selected by RSEL is completed, the EN bit is cleared and the DMA operation ends. | Set this value to execute a DMA transaction once. |
| 1 | When a DMA transaction is completed, the DMAC continues to execute a DMA transfer by using the data set in the selected register set. When continuous transfers are successful, REN is cleared to 0. | Set this value to continuously execute DMA transfers by using the data set in separate register sets. |

### (d) Automatic register set change setting

When 1 is set in REN, the DMAC can automatically change to the register set to be executed next, after a DMA transaction is completed.

**Table 9.9 Automatic Register Set Change Setting**

| RSW (CHCFG_n) | Operation | Remark |
|---|---|---|
| 0 | If 1 is set in REN when a DMA transaction is completed, the register set is not changed. | Set this value to use only one register set. |
| 1 | If 1 is set in REN when a DMA transaction is completed, the value of RSEL is automatically inverted and the other register set is selected. | Set this value to change the register set. |

## (3) Setting Examples

### (a) When only the Next0 register set is used

**Table 9.10 Register Mode Setting Example 1**

| DMS (CHCFG_n) | RSEL (CHCFG_n) | DEM (CHCFG_n) | RSW (CHCFG_n) | REN (CHCFG_n) |
|---|---|---|---|---|
| 0 (Register mode) | 0 (Next0) | 0 (not masked) | 0 (not switched) | 0 (not continuously executed) |

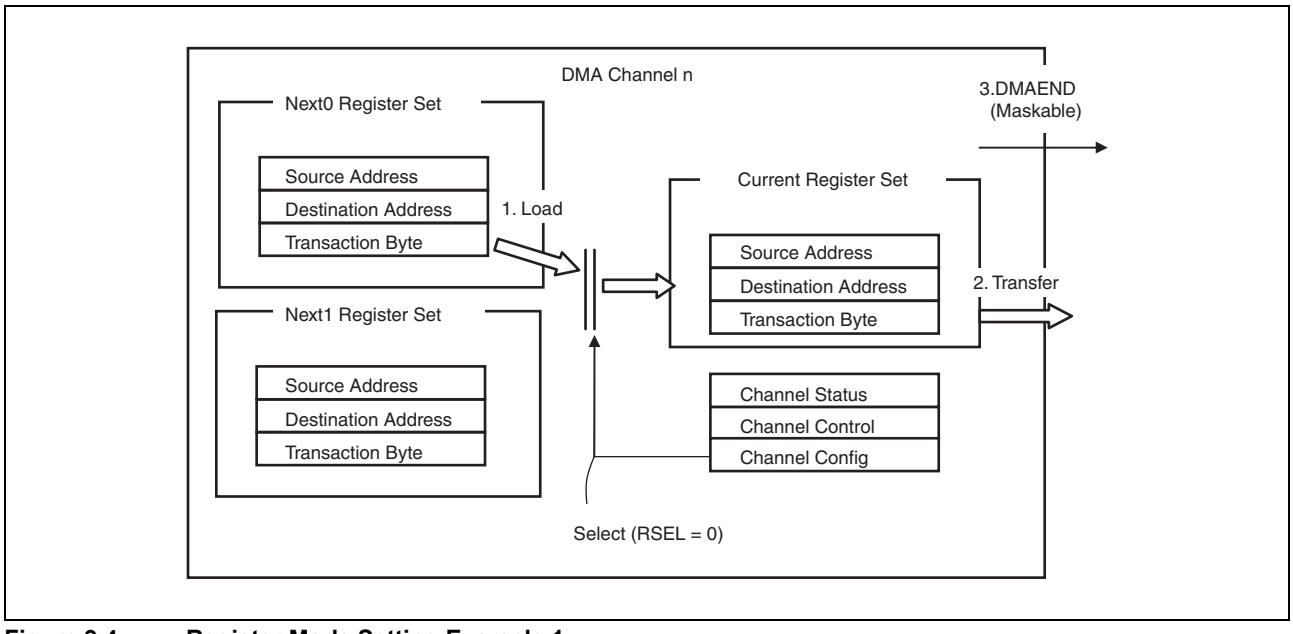

**Figure 9.4 Register Mode Setting Example 1**

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
4. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

(b) When two register sets are used continuously

**Table 9.11 Automatic Register Set Execution Setting**

| DMS (CHCFG_n) | RSEL (CHCFG_n) | DEM (CHCFG_n) | RSW (CHCFG_n) | REN (CHCFG_n) |
|---|---|---|---|---|
| 0 (Register mode) | 0 (Next0) | 1 (masked) | 1 (switched) | 1 (continuously executed) |

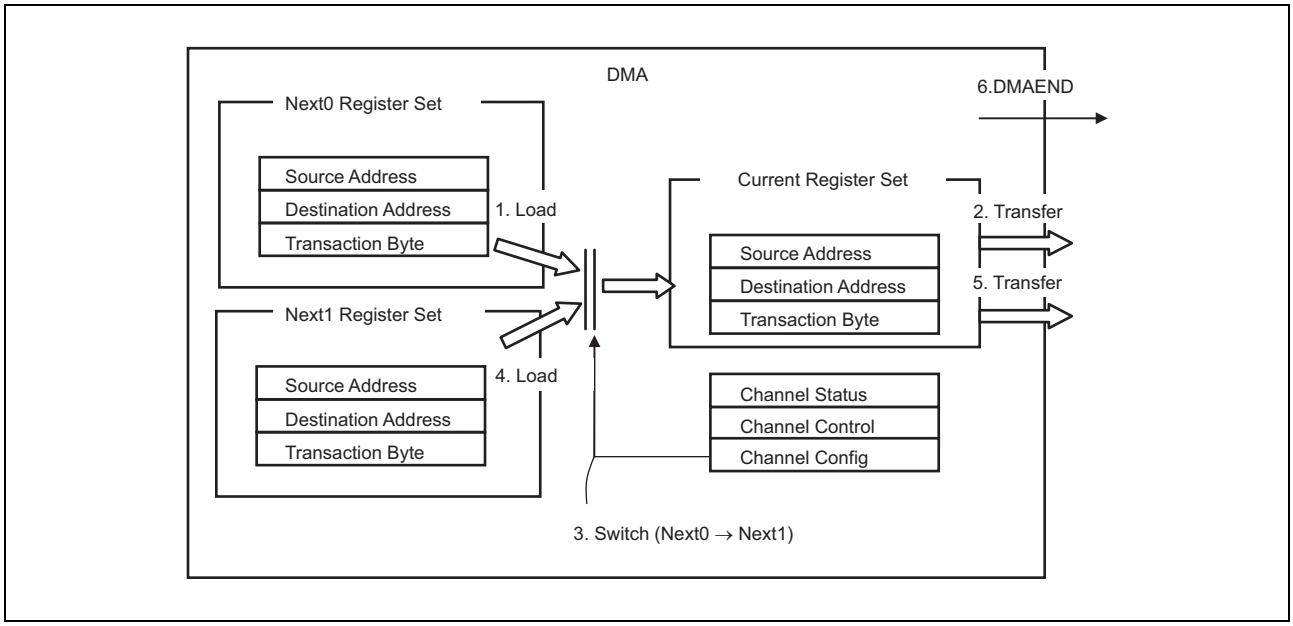

**Figure 9.5 Register Mode Setting Example 2**

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 1 is set in DEM, DMA transfer end interrupt is not output after the DMA transaction is completed. Also, DEM is automatically cleared to 0.
4. Because 1 is set in REN, the execution is continued. Also, REN is automatically cleared to 0.
5. Because 1 is set in RSW, the register set to be executed next is switched (RSEL = 0 → 1).
6. The Next1 register set is loaded to the Current register set.
7. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
8. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
9. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

### 9.6.3 Link Mode

In link mode, a descriptor stored in external memory is loaded as set values and a DMA transaction is executed using the loaded values. The DMAC contains a Next Link address and a Current Link address for each channel, and these addresses are used to set the descriptor address to be executed next and to indicate the descriptor address of the currently executed DMA transaction, respectively.

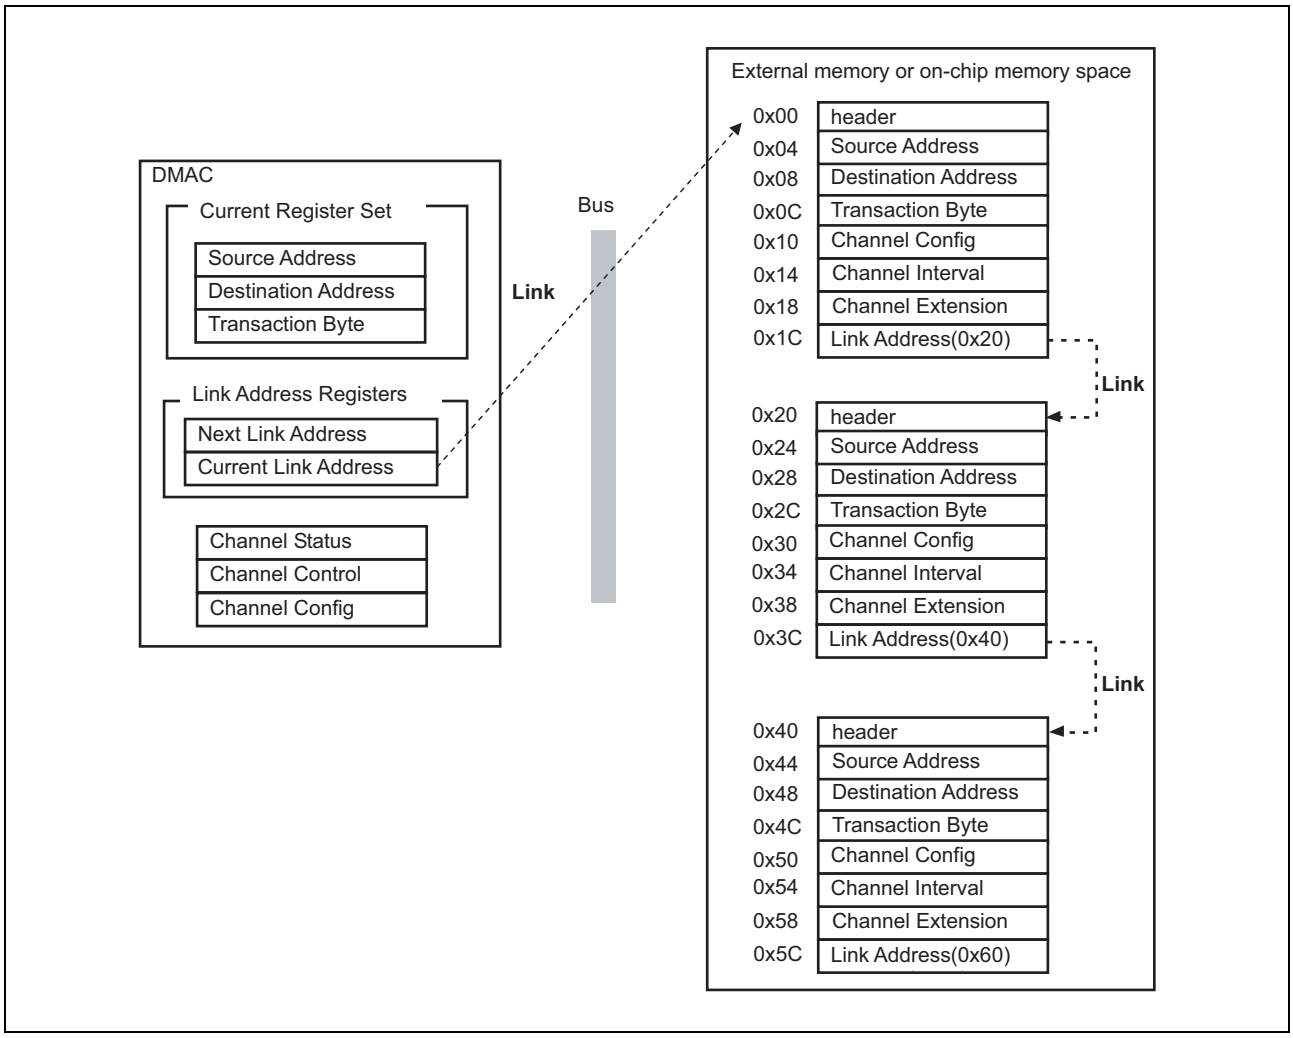

**Figure 9.6 Link Mode Outline**

## (1) Operation Flow

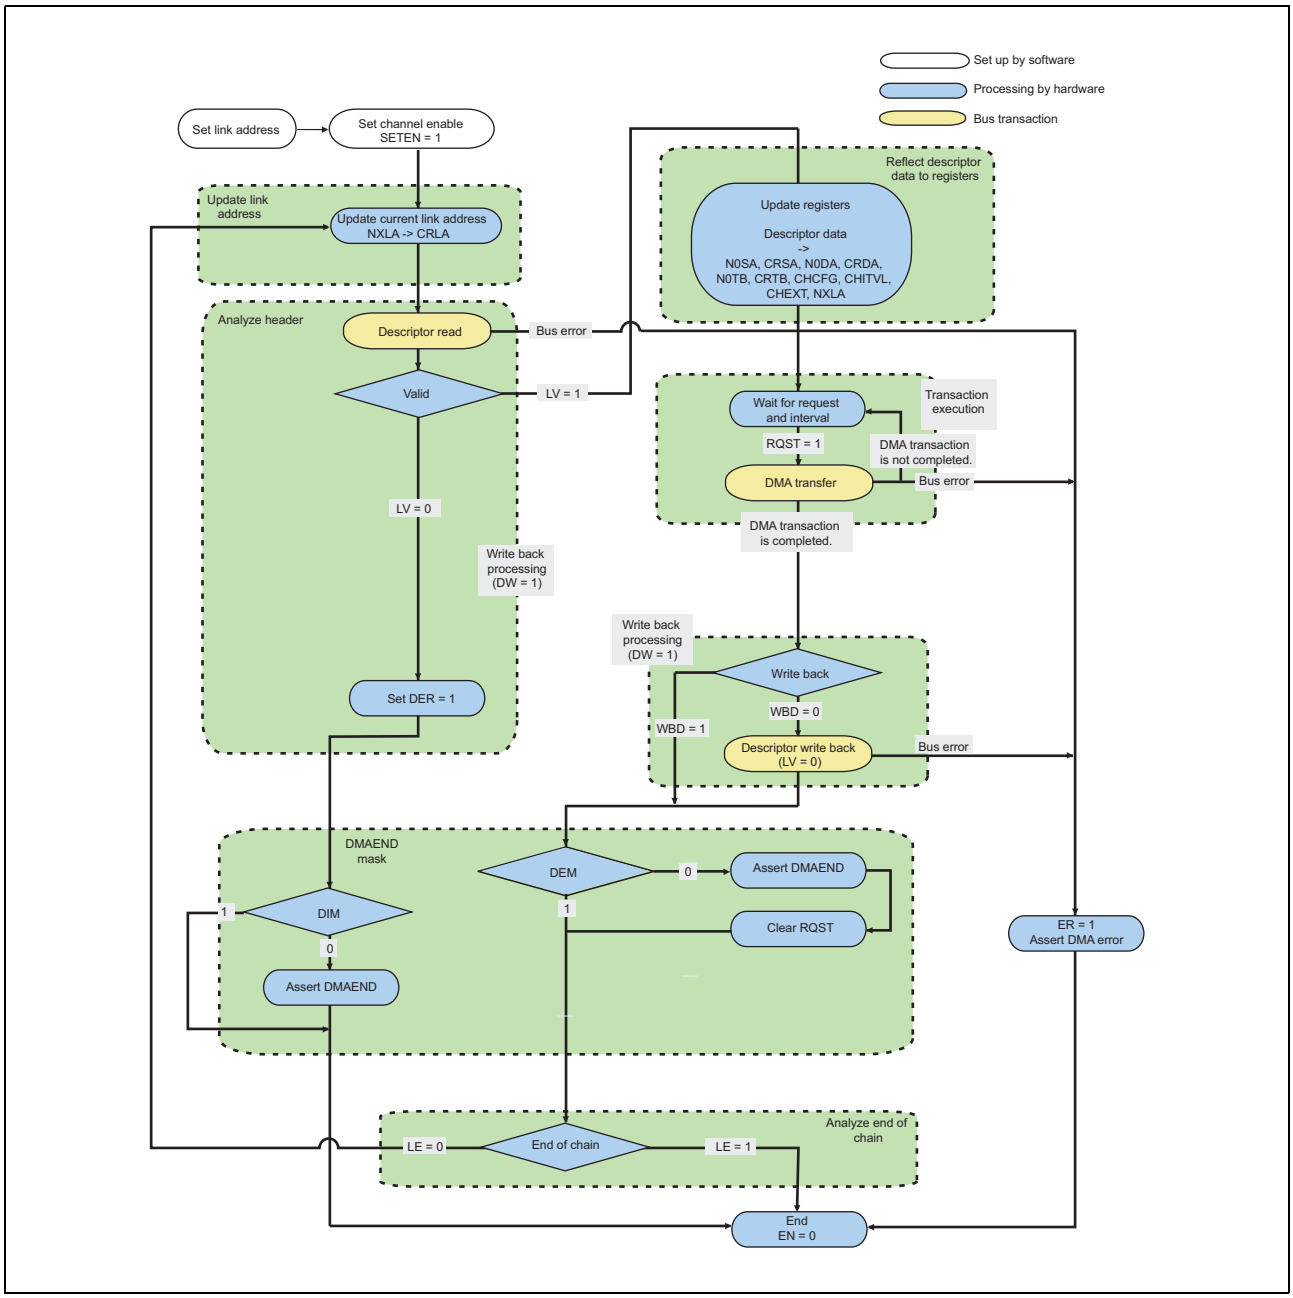

**Figure 9.7 Link Mode Flow**

<Explanation of the link mode flow>

1. Channel setting
   The start address of the link destination is set in NXLA_n.

2. Link address update
   When 1 is set in EN (1 is set in SETEN), the Link address set in NXLA_n is loaded to CRLA_n.

3. Descriptor load and header analysis
   The DMAC begins to load the descriptor and then analyzes the content of the header. When LV is 0, the DMAC discards the loaded descriptor and sets 1 in DER to end the operation (EN = 0). In this case, if 0 is set in DIM of the header, DMAEND is issued.

4. Descriptor setting
   The loaded descriptor is set in the Current register set and Channel register set. Also, the next link address is set in NXLA_n.

5. DMA transaction
   A DMA transaction is executed according to the set values.

6. Header writeback
   When 0 is set in WBD of the header, the DMAC writes back the header with 0 set in its LV bit.

7. DMAINT mask
   When 0 is set in the DEM bit of CHCFG_n, the DMA transfer end interrupt is issued.

8. Link end analysis
   When 1 is set in LE of the header, the operation is ended by clearing EN to 0, after transfer using the settings of the descriptor is completed. If the setting of LE is 0, the Current registers are then updated and loading of the next descriptor begins. The TEND signal is issued after the transfer of each descriptor.

## (2) Register Setting

### (a) Link mode setting

To use the link mode, set 1 in the DMS bit of the CHCFG_n register.

**Table 9.12 Link Mode Setting**

| DMS (CHCFG_n) | Description |
|---|---|
| 1 | Operates in link mode.<br>This bit cannot be changed using a descriptor. |

### (b) Link address setting

There are two registers that indicate a link address: Next Link address register and Current Link address register.
To start the link mode, set a link address in the Next Link address register.
The Next Link address indicates the next link address after a descriptor is loaded. The Current Link address indicates the currently executed link address.

**Table 9.13 Link Address Register Set**

| Register | Description |
|---|---|
| Next Link Address Register (NXLA_n) | Sets and indicates the next link address. Before starting the link mode, set a link address in this register. |
| Current Link Address Register (CRLA_n) | Indicates the currently executed link address. This register is read-only. |

<Caution> In link mode, the settings can be changed by reading a descriptor. It is not possible, however, to synchronize the change of the settings with a peripheral module request or external request. Therefore, when using a peripheral module request or external request, set AM, LVL, HIEN, LOEN, and SEL of the CHCFG_n register before setting Enable and do not change any of these bits in the descriptor.

## (3) Descriptor Setting

In a link address, prepare a descriptor with data arranged in the order shown below.
The DMAC reads the descriptor in burst mode.

### (a) Descriptor data arrangement

**Table 9.14 Descriptor Data Arrangement**

| Address | Data | Remark |
|---|---|---|
| Link address + 00H | header | |
| Link address + 04H | Source Address | |
| Link address + 08H | Destination Address | |
| Link address + 0CH | Transaction Byte | |
| Link address + 10H | Config | The register mode cannot be set. |
| Link address + 14H | Interval | |
| Link address + 18H | Extension | |
| Link address + 1CH | Next Link Address | |

Remark: As a link address, set an address aligned along the 32-bit boundary.

### (b) header

The header indicates the status of the descriptor, as shown below.
The DMAC reads this area when a DMA transfer is started in link mode. Also, after a DMA transaction is completed, the DMAC writes back the transfer status to the area.

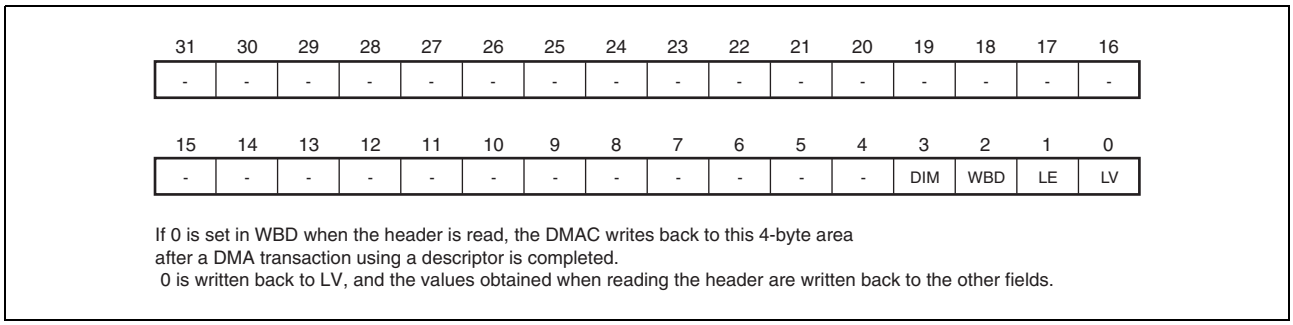

**Figure 9.8 header Area**

**Table 9.15 Header Area**

| Bit Position | Bit Name | Meaning |
|---|---|---|
| 31 to 4 | — | — |
| 3 | DIM | Descriptor Interrupt Mask<br>Sets whether to mask the DMA transfer end interrupt if 0 is set in LV when the header is loaded.<br>0: Issues a DMA transfer end interrupt.<br>1: Does not issue a DMA transfer end interrupt. |
| 2 | WBD | Write Back Disable<br>Sets whether to mask LV bit writeback. When 1 is set in this bit, the DMAC does not perform writeback.<br>0: Writes the LV bit back to 0.<br>1: Does not write back the LV bit. |
| 1 | LE | Link End<br>Indicates whether the link ends with the DMA transaction of this descriptor.<br>Set 1 in this bit to indicate the end of the link.<br>0: The link continues.<br>1: The link ends. |
| 0 | LV | Link Valid<br>Indicates whether this descriptor is valid.<br>If 0 is set in WBD, the DMAC writes 0 in this bit after the DMA transaction written in the descriptor is executed. When setting the header, set 1 in this bit.<br>0: Descriptor invalid<br>1: Descriptor valid |

### (c) Descriptor data other than the header

The data items of the descriptor other than the header are the same as defined in the internal register specifications (note that the DMS bit of the CHCFG_n register cannot be changed using the descriptor). For information about the internal register specifications, see section 9.4, Register Descriptions.
For descriptor setting examples, see section 9.8, DMA Setting Examples.

### (d) CACHE settings for descriptor access

The CACHE settings for descriptor access can be set in LWCA and LDCA of the DMA control register (DCTRL_0_7, DCTRL_8_15). Make these settings as appropriate for the access destination in which the descriptor is prepared.

### (e) Descriptor area and DMA transfer area

The following figure outlines the descriptor area and DMA transfer area that are accessed by the DMAC.

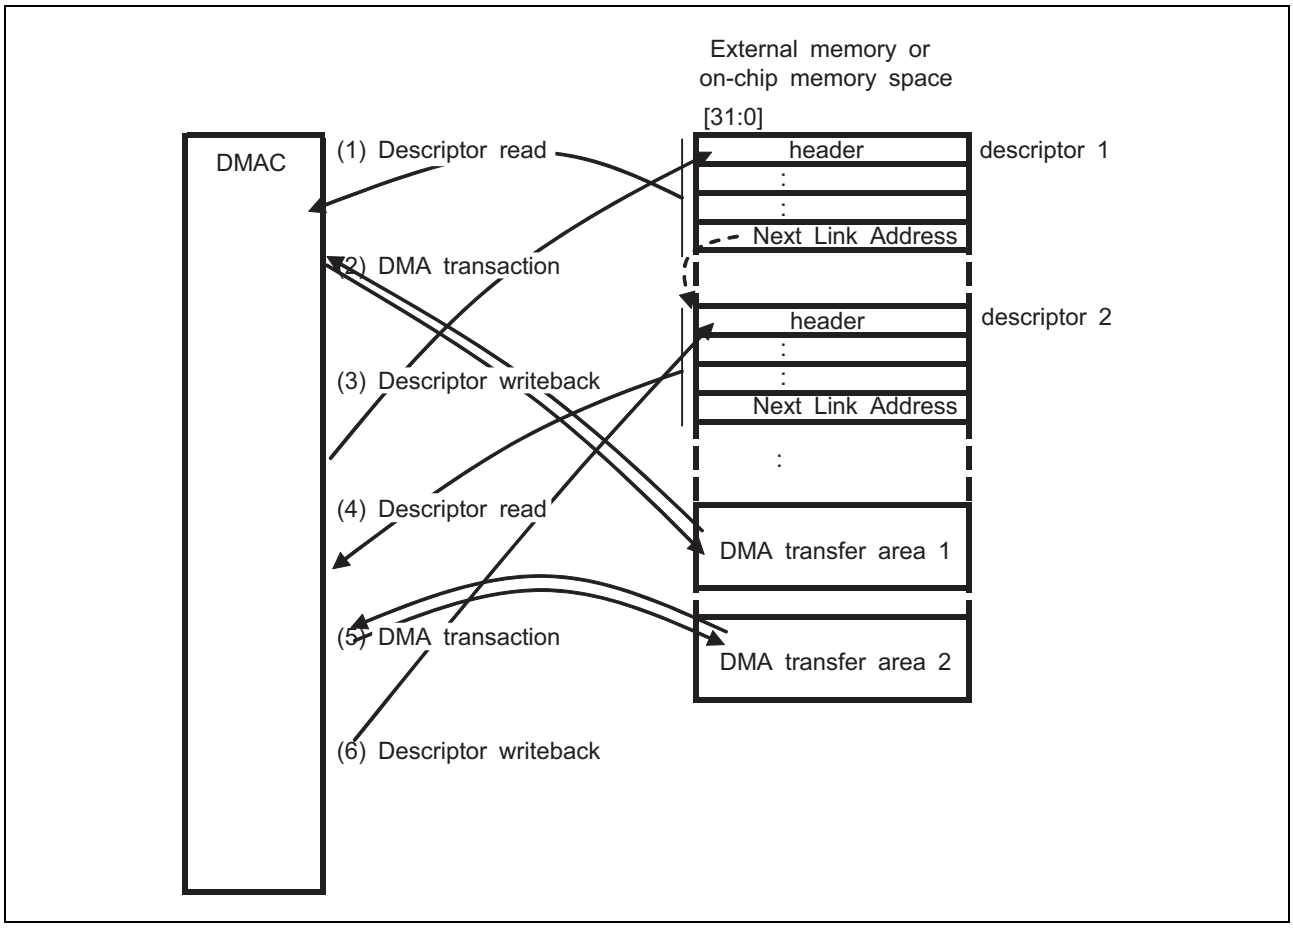

**Figure 9.9 Outline of the Descriptor Area and DMA Transfer Area**

1. Descriptor read
   The values set in the internal Next Link Address register are loaded to the Current Link Address register, and a descriptor is read from the external memory space (descriptor1) pointed to by the Current Link Address register.
2. DMA transfer
   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.
3. Descriptor writeback
   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor1, with 0 set in LV and the other bits containing the values read in <1>.
4. Descriptor read
   When 0 is set in the LE bit of the header in the last read descriptor (<1>), the next descriptor is read from the address (descriptor2) indicated by Next Link Address in the descriptor.
5. DMA transfer
   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.
6. Descriptor writeback
   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor2, with 0 set in LV and the other bits containing the values read in <4>.

4 through 6 are repeated.
When the header contains 1 in LE and 0 in WBD, the DMAC executes a DMA transfer using the settings of that descriptor, writes back data with 0 set in the LV bit of the header and ends the operation.
When the header contains 1 in both LE and WBD, the DMAC executes a DMA transfer using the settings of that descriptor and ends the operation (without writing back).
When the header contains 0 in LV, the DMAC ends the operation (without executing a DMA transfer).

### (4) Descriptor Configuration Examples

In link mode, a descriptor can be configured as shown below.

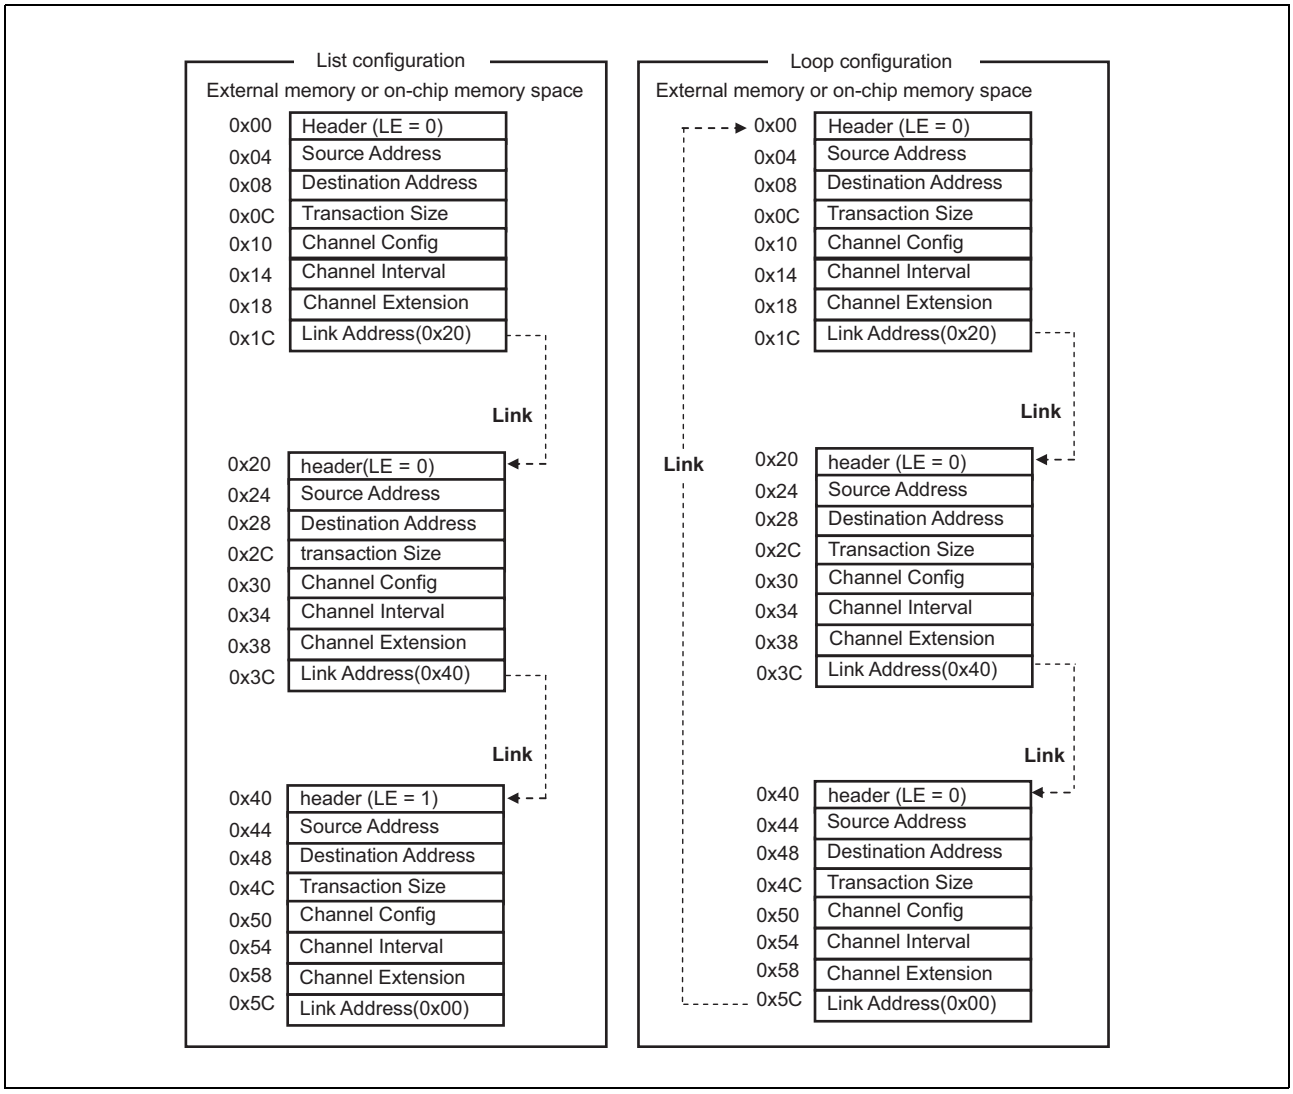

**Figure 9.10 Descriptor Configuration Examples**

- List configuration
  The link is ended by setting 1 in the LE bit of the header in the last descriptor.

- Loop configuration
  A descriptor can be created with a loop configuration, by setting the address of the top descriptor in the link address of the last descriptor. To end the loop, change the value of the LE bit of the header to 1 before the DMAC reads the descriptor, or follow the transfer suspension procedure.

## 9.7 DMA Transfer

The basic operation of DMA transfer is described here.

### 9.7.1 Transfer Mode

Two transfer modes are supported: single transfer mode and block transfer mode.
To select a transfer mode, set the TM bit of CHCFG_n for each channel.

**Table 9.16 Basic Transfer Setting**

| Transfer Mode | TM (CHCFG_n) | Function |
|---|---|---|
| Single transfer | 0 | A single DMA transfer is executed in response to a DMAREQ. |
| Block transfer | 1 | In response to a DMAREQ, the DMAC continues to execute the transfer until the DMA transaction is completed. |

#### (1) Single Transfer Mode

When a DMA transfer request is received, a DMA transfer is executed once in the direction indicated by REQD (source or destination). A DMA transfer is executed once each time a transfer request is received, and this operation continues until the number of bytes loaded to CRTB_n is reached (arbitration between channels is accomplished for each DMA transfer).

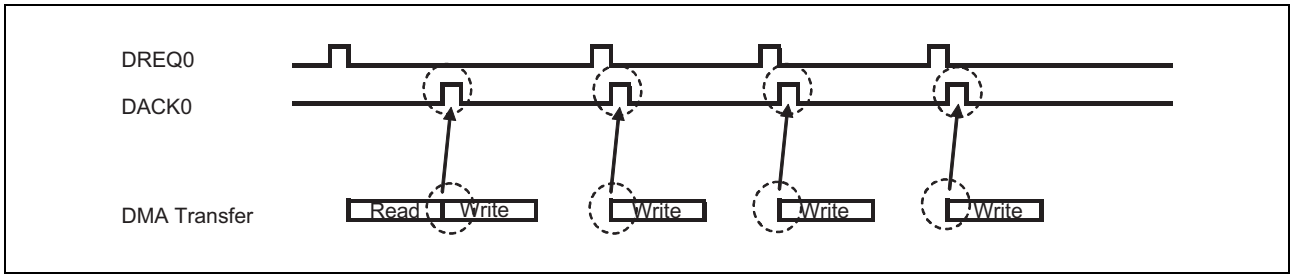

**Figure 9.11 Single Transfer Mode (REQD = 1, SDS > DDS)**

#### (2) Block Transfer Mode

Once a DMA transfer request is received, the DMAC continues to execute the transfer until data equivalent to the number of bytes loaded to the DMA transfer byte register (CRTB_n register) is transferred (the DMA transaction is completed) (arbitration between channels is accomplished for each DMA transfer).

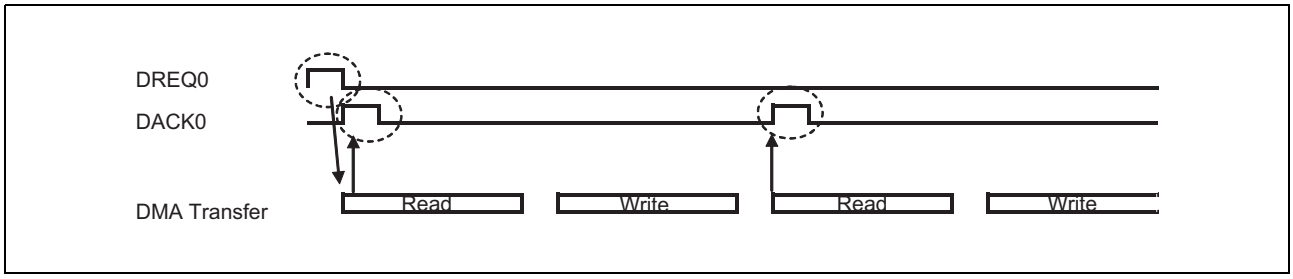

**Figure 9.12 Block Transfer Mode (REQD = 0, SDS < DDS)**

## 9.7.2 Priority Control for DMA Channels

Within channels 0 to 7 and 8 to 15, two priority control modes are supported: fixed priority mode and round robin mode. Only round robin mode is supported for priority control between the group of channels 0 to 7 and the group of channels 8 to 15. To select a priority control mode, use the PR bit of the DMA control register (DCTRL register). The fixed priority mode is selected when 0 is set in the PR bit, and the round robin mode is selected when 1 is set.
Read priority and write priority are controlled independently.
The DMAC issues transfer requests to different channels concurrently without waiting for the completion of any particular transfer and processes responses in the order it receives them. Therefore, the order in which the channels start transactions is not necessarily consistent with the order in which the transactions end.

**Table 9.17 Priority Control Setting**

| Mode | PR (DCTRL) | Function | Purpose |
|---|---|---|---|
| Fixed priority | 0 | Requests are controlled based on the fixed order of priority for channels 0 to 7 and 8 to 15 (High: CH0 (CH8) > CH1 (CH9) > CH2 (CH10) > CH3 (CH11) > CH4 (CH12) > CH5 (CH13) > CH6 (CH14) > CH7 (CH15): Low). | Use this mode when the channels have a specific order of priority. |
| Round robin | 1 | Requests are controlled in a round robin fashion. | Use this mode to execute all requests evenly. |

### (1) Fixed Priority Mode

In fixed priority mode, the channels have a fixed order of priority in channels 0 to 7 and 8 to 15. Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.
Immediately after a reset, the order of priority is as follows.
High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low
If there is a transfer request from DMA channel 0 in this state, a transfer is executed on DMA channel 0. After the transfer is completed, the order of priority is as follows.
High CH8 > CH0 > CH9 > CH1 > CH10 > CH2 > CH11 > CH3 > CH12 > CH4 > CH13 > CH5 > CH14 > CH6 > CH15 > CH7 Low
If a DMA transfer request occurs on multiple channels simultaneously, the DMA transfer request of the channel having the smallest channel number is given priority. The following figure shows an example where a DMA transfer request occurs on a channel having a higher priority while a DMA transfer is being executed in fixed priority mode.

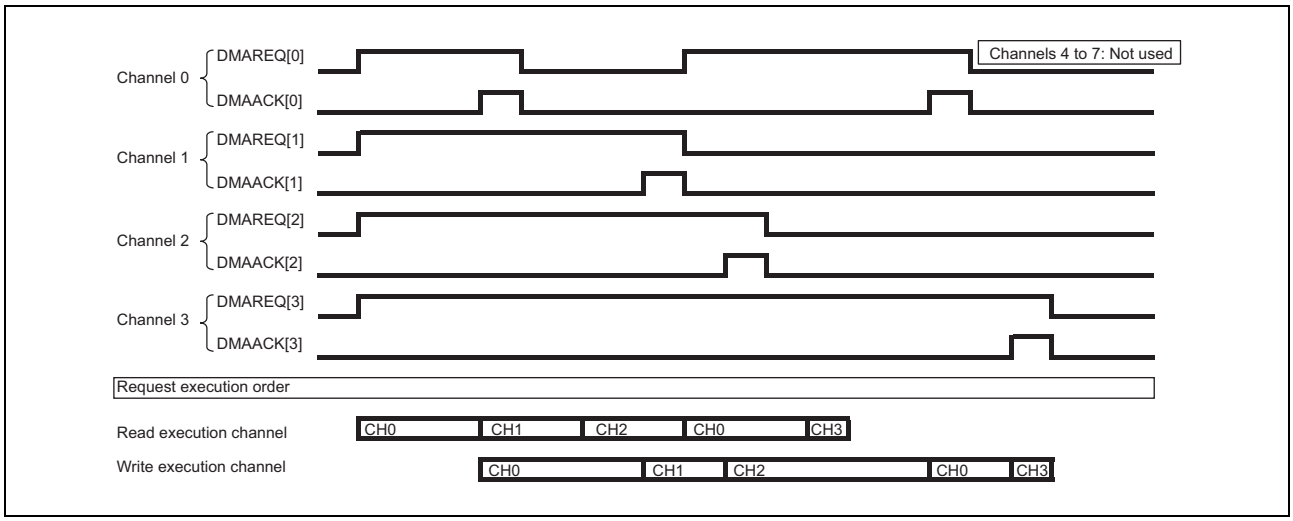

**Figure 9.13 Fixed Priority Mode (Number of Channels = 4, REQD = 1)**

### (2) Round Robin Mode

In round robin mode, each time a transfer request is received from a channel in the group of channels 0 to 7 and the group of channels 8 to 15, the order of priority is changed in such a way that the channel that executed a transfer last has the lowest priority.

Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.

Immediately after a reset, the order of priority is the same as that of the fixed priority mode, which is as follows.

High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low

If a transfer request is received from DMA channel 2 in this state, a transfer is executed on DMA channel 2. After the transfer is completed, the order of priority is as follows.

High CH8 > CH3 > CH9 > CH4 > CH10 > CH5 > CH11 > CH6 > CH12 > CH7 > CH13 > CH0 > CH14 > CH1 > CH15 > CH2 Low

The following figure shows an example where DMA transfers are executed in round robin mode.

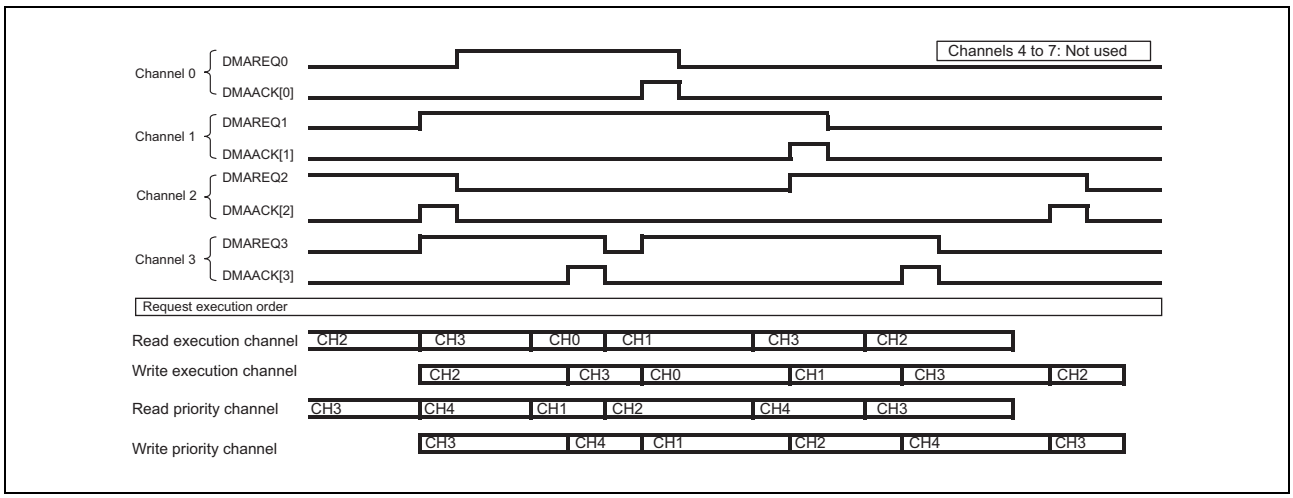

**Figure 9.14 Round Robin Mode (Number of Channels = 4, REQD = 0)**

The channel whose channel number is the number of the currently transferring channel + 1 gets to execute a DMA transfer next. If there is no transfer request from this channel, the channel whose channel number is the number of this channel + 1 gets to execute a DMA transfer.

### 9.7.3 Number of States of an External Bus Cycle

When this module is the bus master, the number of states of an external bus cycle is controlled by the bus state controller as when the CPU is the bus master. For details, refer to section 8, Bus State Controller.

### 9.7.4 DMA Transfer Request

Edge detection or level detection can be selected using the LVL bit of the CHCFG_n register.
The HIEN and LOEN bits of the CHCFG_n register are used to select either the rising edge or falling edge in the case of edge detection or either the high level or low level in the case of level detection.
When the transfer request is by an on-chip peripheral module, set the CHCFG_n register according to Table 9.4, On-Chip Peripheral Module Requests.
When the transfer request is by the external pin (DREQ0), set the detection conditions (rising/falling edge and high/low level) according to Table 9.18, Setting for Detection of External Pin Request.

**Table 9.18 Setting for Detection of External Pin Request**

| Mode | LVL (CHCFG_0) | HIEN (CHCFG_0) | LOEN (CHCFG_0) | Function |
|---|---|---|---|---|
| Edge detection | 0 | 0 | 0 | Specify this value when auto request triggers are in use. |
| | | | 1 | Detects external pin request (DREQ0) at its falling edge. |
| | | 1 | 0 | Detects external pin request (DREQ0) at its rising edge. |
| | | | 1 | Setting prohibited |
| Level detection | 1 | 0 | 0 | Setting prohibited |
| | | | 1 | Detects external pin request (DREQ0) in Low level mode. |
| | | 1 | 0 | Detects external pin request (DREQ0) in High level mode. |
| | | | 1 | Setting prohibited |

#### (1) Edge Detection

Setting 0 in the LVL bit of the CHCFG_n register enables edge detection.
When 1 is set in the HIEN bit of the CHCFG_n register, rising edge detection is enabled. When 1 is set in the LOEN bit, falling edge detection is enabled.
Wait for DACK0 to be detected, before issuing the next DREQ0 request.

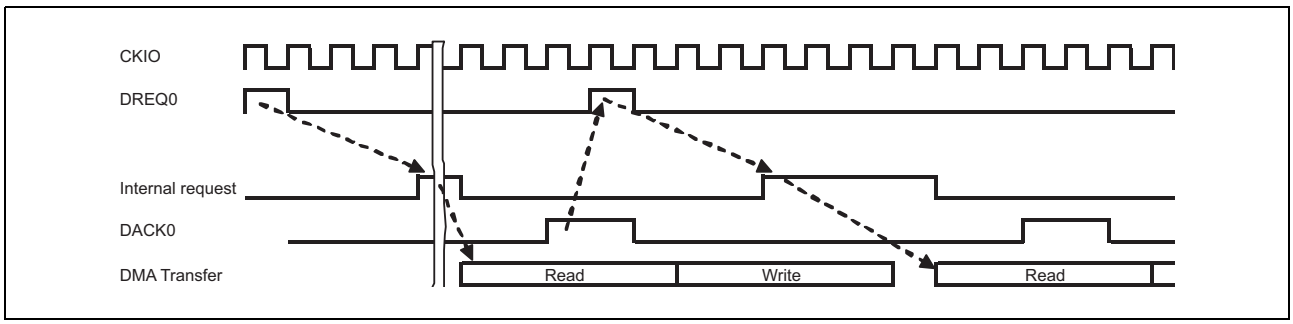

**Figure 9.15 Edge Detection Timing (HIEN = 1, REQD = 0)**

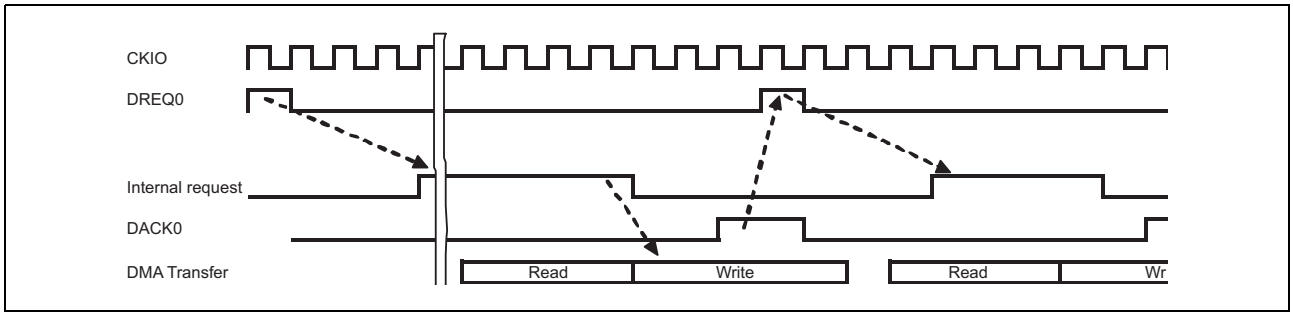

**Figure 9.16 Edge Detection Timing (HIEN = 1, REQD = 1)**

### (2) Level Detection

Setting 1 in the LVL bit of the CHCFG_n register enables level detection.
DREQ0 is regarded as valid when it remains active for two consecutive clock cycles or more (depending on the HIEN and LOEN settings).
When the level mode is selected for DACK0, it remains at the High level until DREQ0 is deasserted.
When the next DMA transfer request is to be issued, DACK0 needs to be deasserted before that DREQ0 can be asserted.

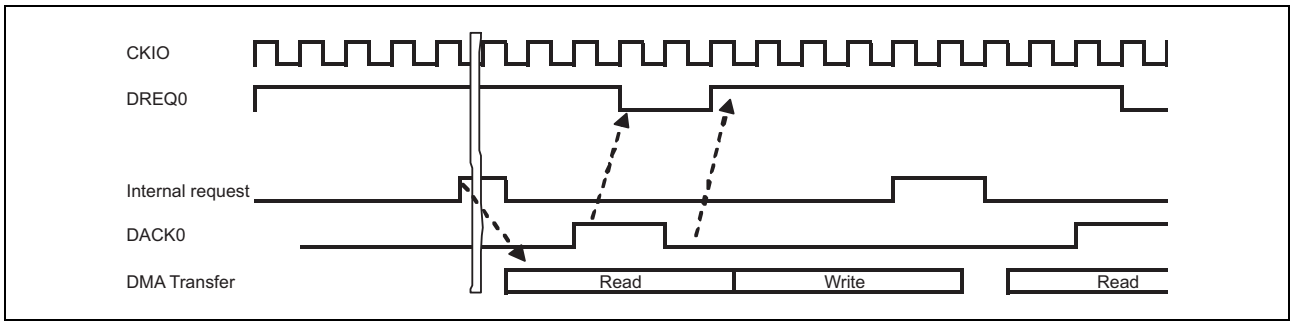

**Figure 9.17 Level Detection Timing (HIEN = 1, REQD = 0, AM[2:0] = 001)**

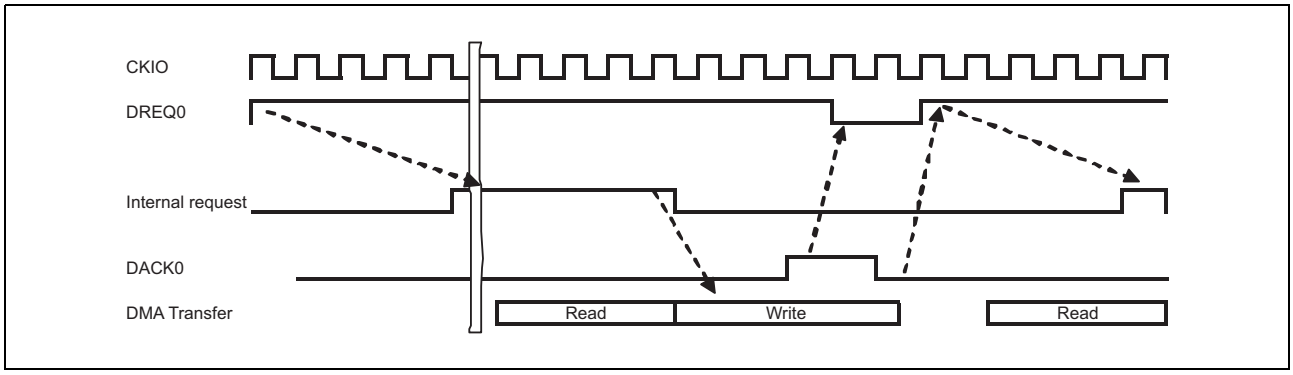

**Figure 9.18 Level Detection Timing (HIEN = 1, REQD = 1, AM[2:0] = 001)**

### 9.7.5 DMA Acknowledge Output Function

DACK0 is an acknowledge signal that is sent to DREQ0. Level output and bus cycle output settings are supported as the DACK0 output mode. DACK0 is asserted at the same time as $\overline{CS}$ assertion except for the MPX-IO interface. For details, refer to section 8, Bus State Controller.

#### (1) DMA Acknowledge Signal Output Timing Setting

Upon receiving a DMA transfer request, the DACK0 pin becomes active (High level output). By using the REQD and AM[2:0] bits of the CHCFG_n register, the DACK0 output timing can be set as shown below.

**Table 9.19 DACK0 Output Timing Setting**

| Mode | AM[2] (CHCFG_0) | AM[1:0] (CHCFG_0) | REQD (CHCFG_0) | Purpose |
|---|---|---|---|---|
| Pulse | 0 | 00 | 0 | Setting prohibited |
| | | | 1 | |
| Level | 0 | 01 | 0 ( Active during read) | DACK0 is output as a level. DACK0 remains asserted until DREQ0 is deasserted. |
| | | | 1 (Active during write) | |
| Bus cycle | 0 | 10<br>11 | 0 (Active during read) | DACK0 is output for the duration of a bus cycle. Use this mode to keep DACK0 asserted until the end of the bus cycle. |
| | | | 1 (Active during write) | |
| Mask | 1 | — | — | Make this setting when using auto request trigger. |

#### (2) Level Output

Setting 001 in the AM bits of the CHCFG_n register enables level output. DACK0 remains asserted until DREQ0 is deasserted.

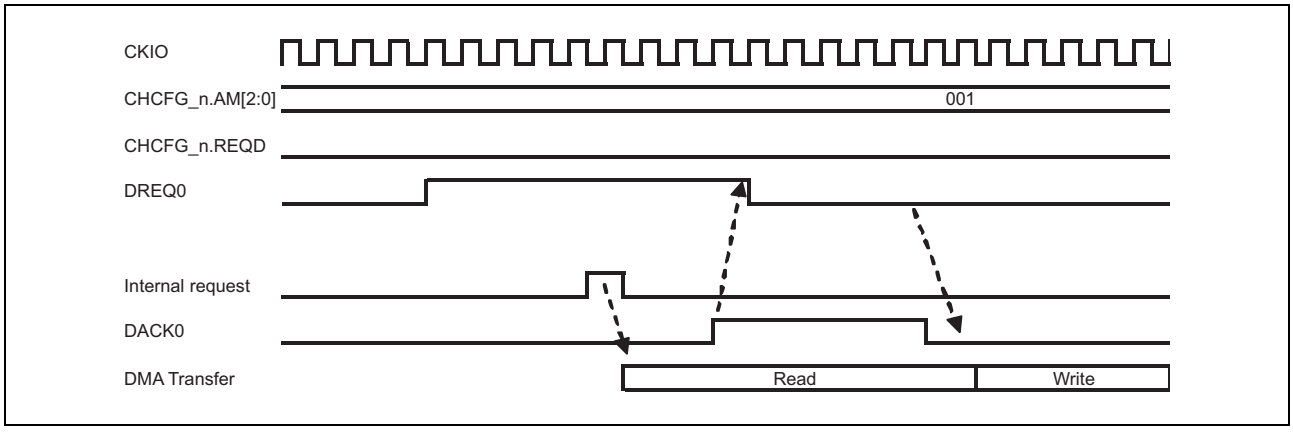

**Figure 9.19 DACK0 Output Timing (AM[2:0] = 001, REQD = 0)**

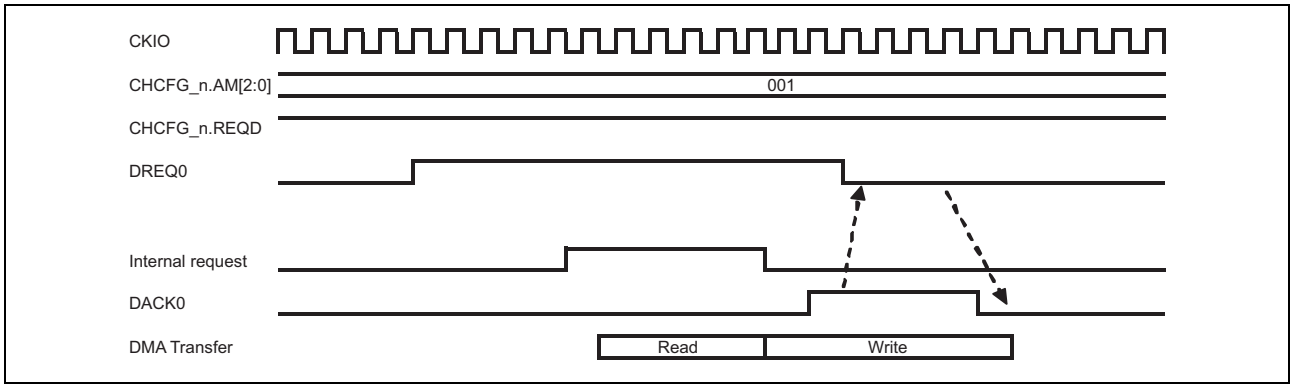

**Figure 9.20 DACK0 Output Timing (AM[2:0] = 001, REQD = 1)**

### (3) Bus Cycle Output

Setting 010 in the AM bits of the CHCTRL_n register enables bus cycle output. DACK0 remains active for the duration of a bus cycle.

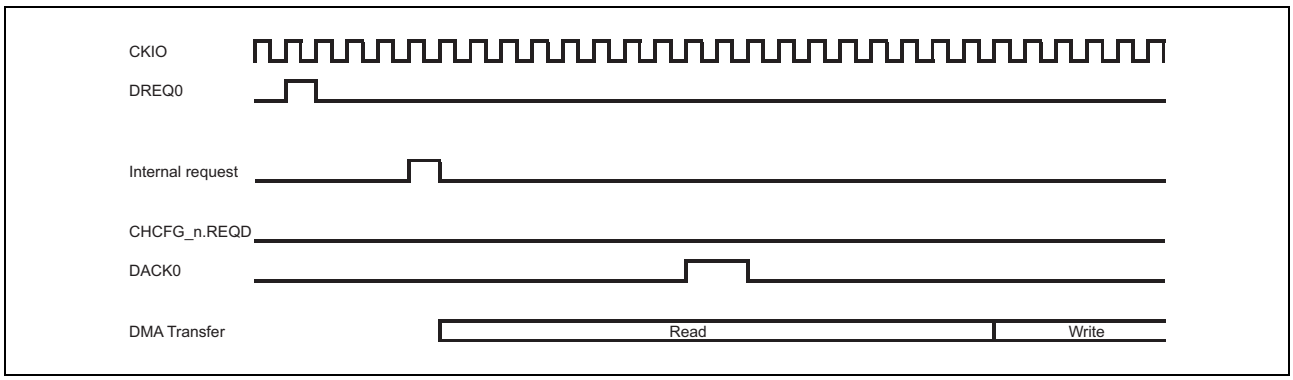

**Figure 9.21 Bus Cycle Output Timing (REQD = 0)**

- In the read active mode (REQD = 0), DACK0 remains active from the time when a read request is output on the bus until one cycle after the final read data.
- When level detection is selected for DREQ0, DREQ0 remains disabled until the cycle following the end of the bus cycle.

The following signals trigger the rise and fall of DACK0:

Rise: Transfer start (MARVALID = 1)

Fall: Transfer end (MRLAST & MRREADY = 1)

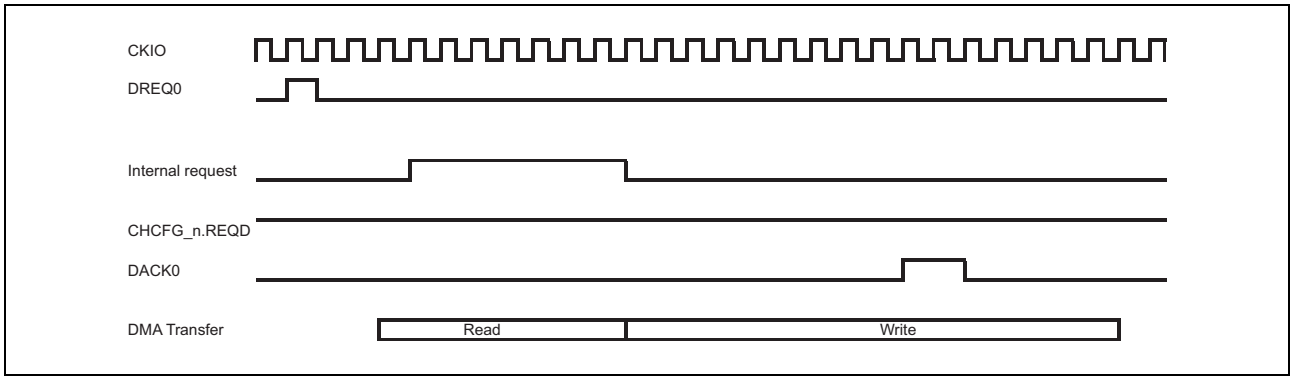

**Figure 9.22 Bus Cycle Output Timing (REQD = 1)**

- In the write active mode (REQD = 1), DACK0 remains active from the time when a write request is output until one cycle after the response to the final data is returned.
- When level detection is selected for DREQ0, DREQ0 remains disabled until the cycle following the end of the bus cycle.

The following signals trigger the rise and fall of DACK0:
Rise: Transfer start (MAWVALID = 1)
Fall: Transfer end (MBVALID & MBREADY = 1)

### 9.7.6 DMA Transfer End Output Function

TEND0 is a transaction completion signal that is sent to the source of a DMA transfer request. TEND0 is asserted as the same time as DACK0 for the last transfer transaction. Figure 9.23 shows the TEND0 output timing.

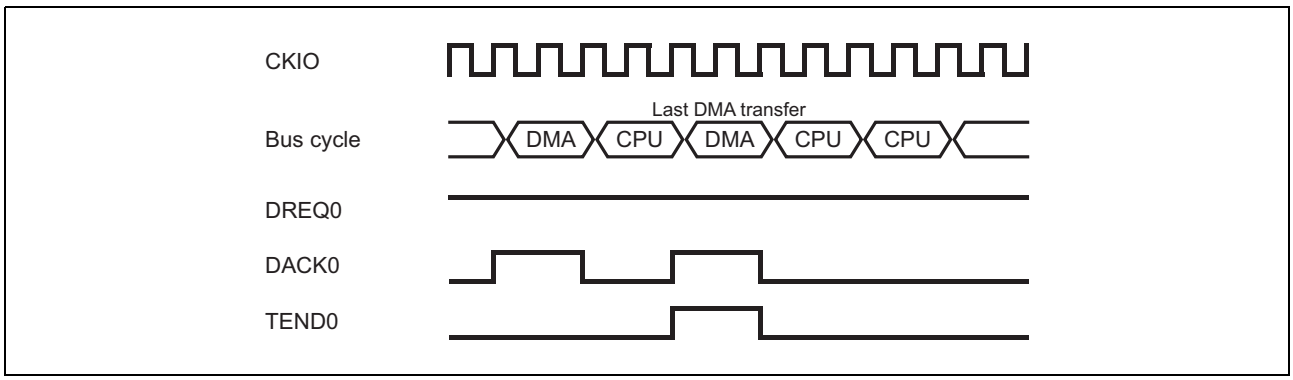

**Figure 9.23 TEND0 Output Timing**

### 9.7.7 DMA Transfer End Interrupt

The DMA transfer end interrupt is an interrupt request signal that indicates that a DMA transaction is completed.
There is an independent DMA transfer end interrupt for each channel.
When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed, 1 is set in END of the CHSTAT_n register. In this case, when 0 is set in DEM of the CHCFG_n register, the DMA transfer end interrupt is output (n = 0 to 15). (When writeback is performed in link mode, the signal is output after the writeback operation.)
When 0 is set in LV of the header in the read descriptor in link mode, 1 is set in DER of the CHSTAT_n register. In this case, when 0 is set in DIM of the header, the DMA transfer end interrupt is output.

**Table 9.20 Assertion Conditions of DMA Transfer End Interrupt**

| Source | Condition | DMA Transfer End Interrupt Mask Signal |
|---|---|---|
| DMA transaction end | When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed with an OKAY response (or after the writeback operation when writeback is performed in link mode) | DEM bit of the CHCFG_n register |
| Descriptor invalid | When 0 is set in LV of the header in the read descriptor in link mode while 0 is set in DIM of the header | DIM bit of the header |

### 9.7.8 DMA Error Interrupt

If an error response is received for a DMA transfer or descriptor access, the DMAC regards it as an error and stops the transfer. Upon receiving an error response, the EN bit of the CHSTAT_n register of transferring channel n is cleared to 0 and 1 is set in the ER bit (n = 0 to 15). Also, the DMA error interrupt is output.
The DMA error interrupt cannot be masked.
Once an error occurs, the data of the whole transfer cannot be guaranteed. Be sure to start the transaction again from the beginning by following the procedure below.

1. Set 1 in the SWRST bit of the CHCTRL_n register.
2. Set each register again.

### 9.7.9 Interval Count Function

The interval at which a DMA transfer is executed can be adjusted by setting the ITVL bit of the channel interval register (CHITVL_n). This function is intended to prevent the DMA controller from occupying the bus all the time.
When a read or write operation is completed, a countdown starts from the value set in CHITVL_n. The next internal request is not executed until the count value reaches 0.
The following figure shows an example of how this works.

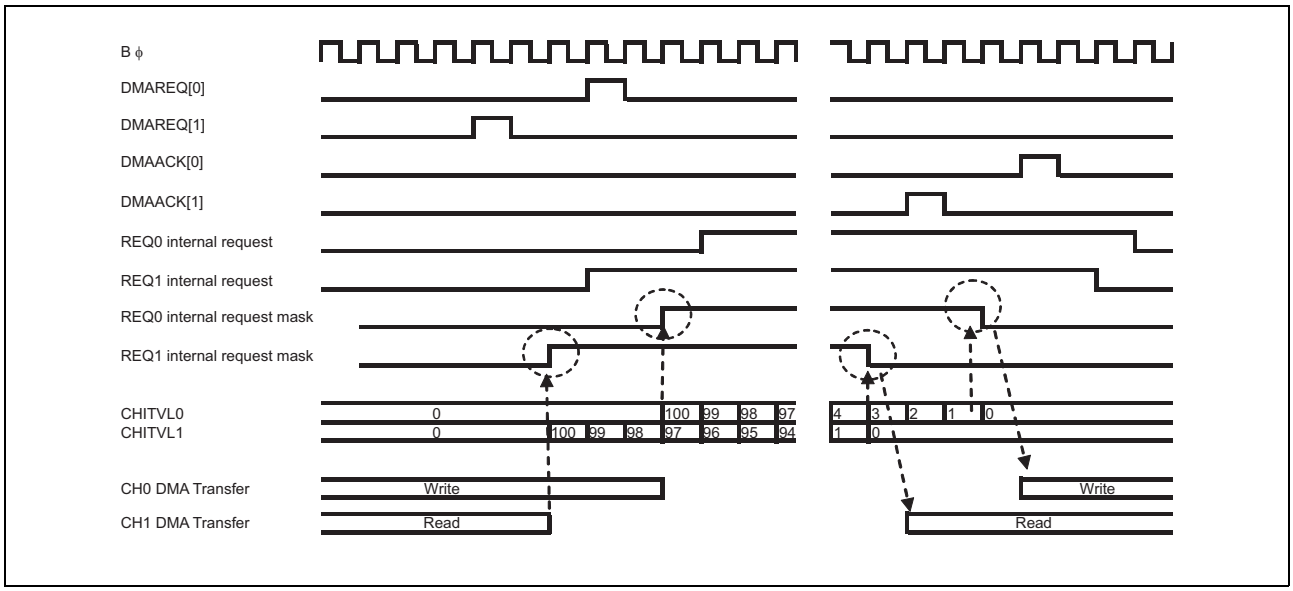

**Figure 9.24 Interval Count**

## 9.7.10 Difference in Operation Due to the Transfer Size

### (1) When the Source Transfer Size Is Smaller

When the read of data equivalent to the destination data size is completed, the data is written to the destination.
The following figure shows a timing chart where the source transfer size is 8 bits and the destination transfer size is 32 bits (in the case of rising edge detection).

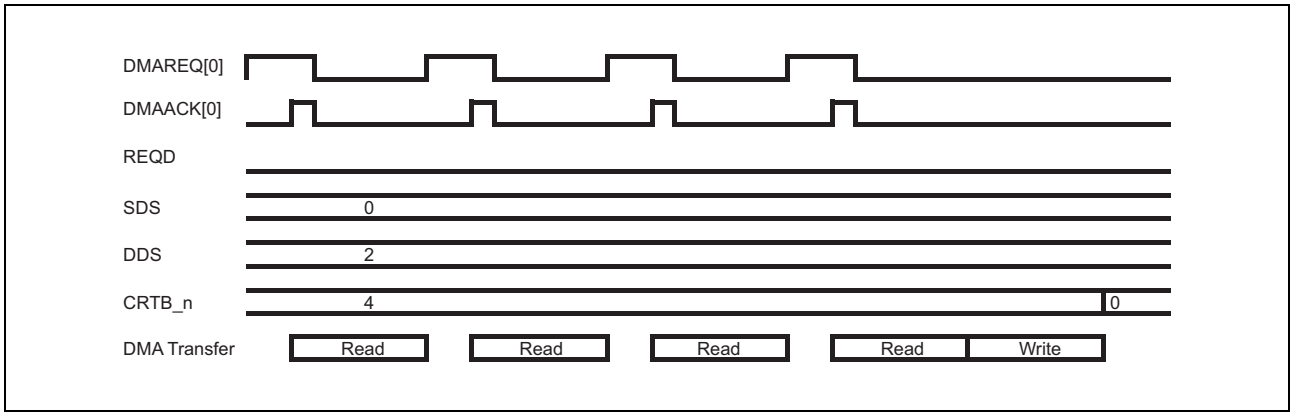

**Figure 9.25 When the Source Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 0, SDS < DDS in CHCFG_n)**

### (2) When the Destination Transfer Size Is Smaller

Since the source transfer size is larger, multiple destination writes occur after a single source read. The following figure shows a timing chart where the source transfer size is 64 bits and the destination transfer size is 16 bits (in the case of rising edge detection) (1 is set in REQD of the CHCFG_n register).

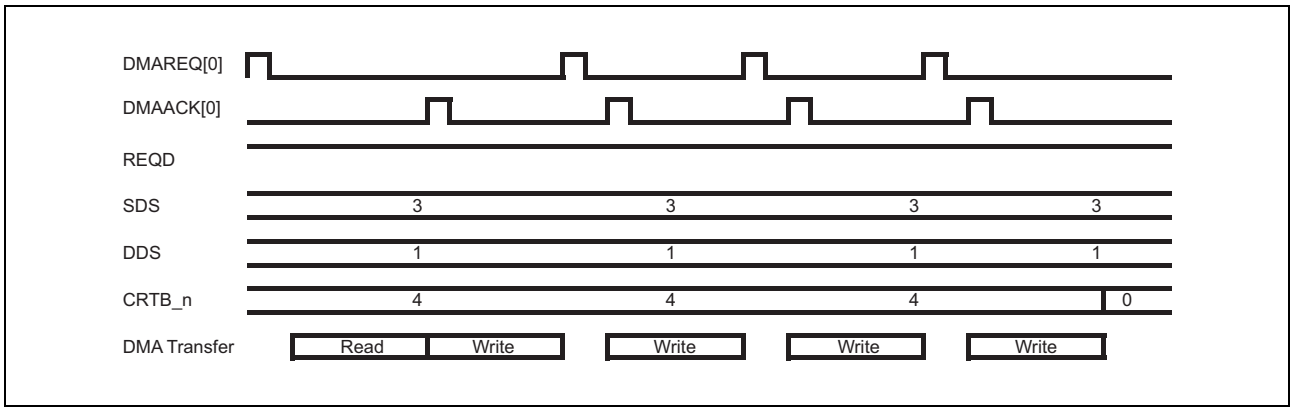

**Figure 9.26 When the Destination Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 1, SDS > DDS in CHCFG_n)**

### (3) When the Source Transfer Size Is the Same as the Destination Transfer Size

Every time a DMA transfer request is detected, a source read and a destination write occur.
The following figure shows a timing chart where the source transfer size and the destination transfer size are both 8 bits (in the case of rising edge detection, with 1 set in REQD of the CHCFG_n register).

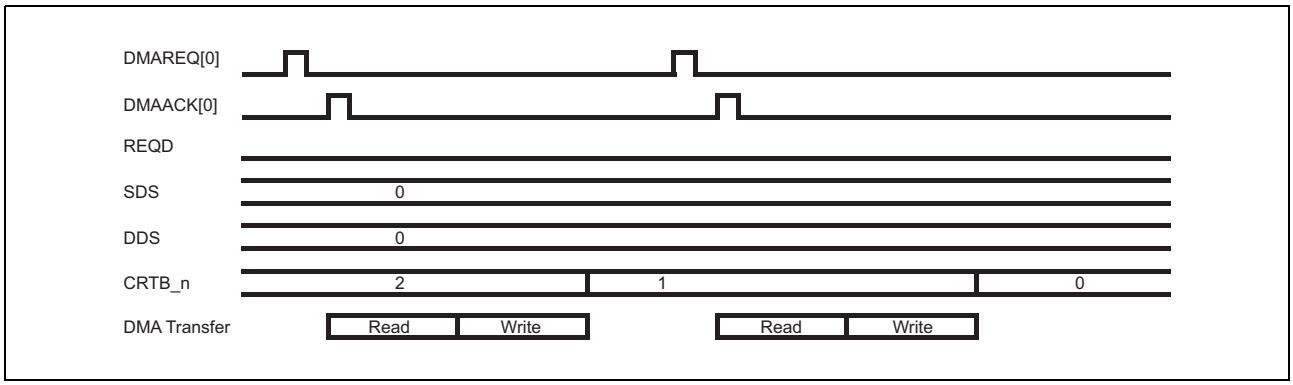

**Figure 9.27 When the Source Transfer Size Is the Same as the Destination Transfer Size (LVL = 0, HIEN = 1, REQD = 0, SDS = DDS in CHCFG_n)**

## 9.7.11 Transfer Status

The channel status register indicates the status of DMA transfer execution on a channel.

### (1) Suspend

A DMA transfer can be suspended by using the SETSUS bit of CHCTRL_n. In this case, if an ongoing bus cycle exists, the DMAC waits for that cycle to end before suspending the transfer. Writing 1 in the CLRSUS bit restores the DMA transfer from the suspend status.

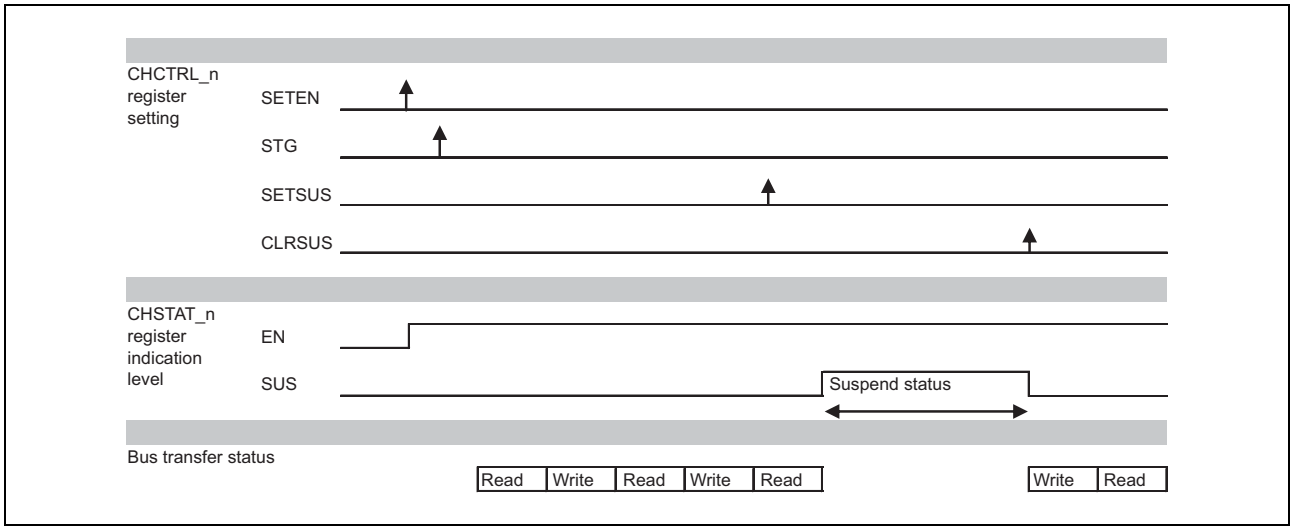

**Figure 9.28 DMAC Suspend Status (Auto Request/Block Transfer)**

In the above case, the DMA transfer is suspended after the read transfer is completed.
If there is any ongoing DMA transfer, the suspend status starts when that transfer is completed. To make sure that the transfer is suspended, read the CHSTAT or DSTAT_SUS register, after setting SETSUS, and check that 1 is set in the SUS bit for the relevant channel.

### (2) Transfer Stop

If 1 is written to CLREN while a DMA transaction is in progress, the DMA transaction for the corresponding channel can be stopped. For the post-stop processing, two modes are supported: one sweeps out the data remaining in the buffer when the transaction is stopped (SBE = 1) and the other does not (SBE = 0). One of these modes can be selected using the SBE bit of the CHCFG_n register. By default, SBE is set to 0.
When this sweep mode is enabled and CLREN is set to 1, and if a DMA transaction is stopped with data remaining in the DMAC buffer, the transaction is completed after the DMAC sweeps the data.

#### (a) Transfer Stop (Buffer Sweep Disabled - SBE = 0)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. The stop timing depends on the value set in REQD. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMA internal status before setting the next transfer.

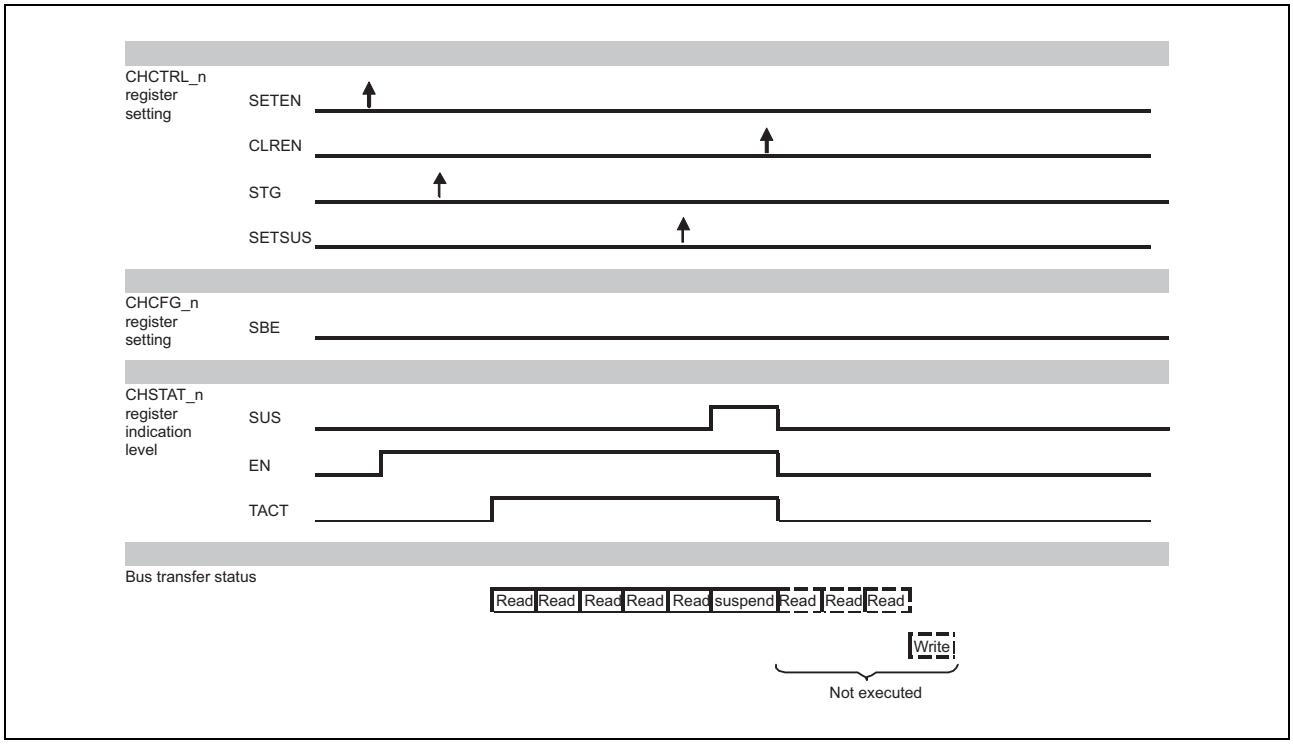

**Figure 9.29 DMAC Transfer Stop**

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If an ongoing DMA transfer is stopped before it is completed, the DMA transfer end interrupt is not asserted.
- If 0 is set in REQD, the DMA transfer is stopped when the next read is completed. (If the buffer contains any data that can be written, the DMA transfer is stopped after the data is written.)
- If 1 is set in REQD, the DMA transfer is stopped when the next write is completed.

### (b) Transfer Stop (Buffer Sweep Enabled - SBE = 1)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. When 0 is set in REQD, the DMA transfer is stopped after the DMAC sweeps (writes) the already read data. If 1 is set in REQD to use hardware requests, do not use the sweep mode. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMAC internal status before setting the next transfer.

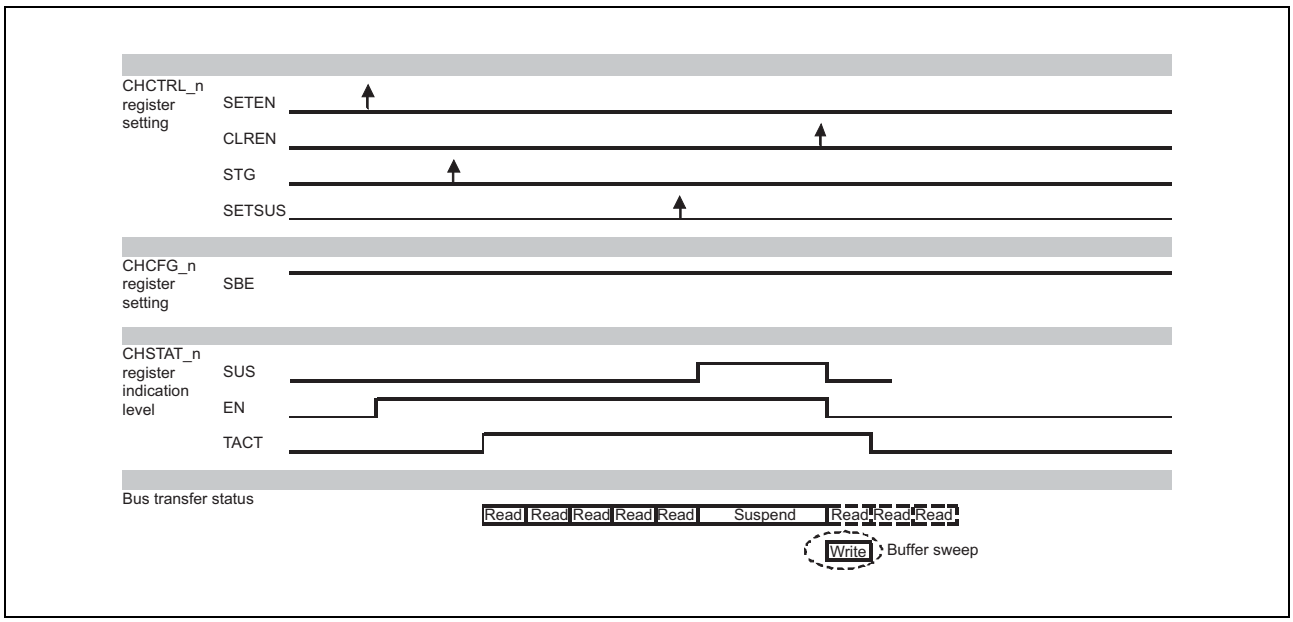

**Figure 9.30 DMA Transfer Stop (Buffer Sweep Mode)**

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If a transfer is stopped in sweep mode (SBE = 1) during the fifth read transfer by setting SETSUS and then CLREN, the read data is written before the DMA transfer is stopped.

### (c) Channel Stop Check Method

Even when the EN bit is cleared to 0, the DMA transfer cannot be stopped immediately, if the bus is already executing the transfer. Therefore, in order to make sure that the DMAC has been brought to a complete stop, check that the EN bit and TACT bit are both set to 0.

### (d) Transfer Stop Procedure

The transfer stop procedure is described below.

1. Set 1 in SETSUS of CHCTRL_n.
2. Repeat polling until the SUS bit of CHSTAT_n is set to 1. (If EN is already set to 0, the DMAC has already been stopped. Go to step 6.)
3. Set 1 in CLREN of CHCTRL_n.
4. When 0 is set in SBE, the transfer is stopped according to the value of REQD. When 1 is set in SBE, the sweep mode is enabled. When 1 is set in SBE, set 0 in REQD.
5. Read CHSTAT_n to check that 0 is set in the TACT bit. When TACT is set to 0, it means that the DMAC has been brought to a complete stop. When TACT is set to 1, repeat polling until this bit is set to 0.
6. To execute the next DMA transfer after stopping a transfer, be sure to set 1 in the SWRST (software reset) bit of CHCTRL_n before the next DMA transfer starts.

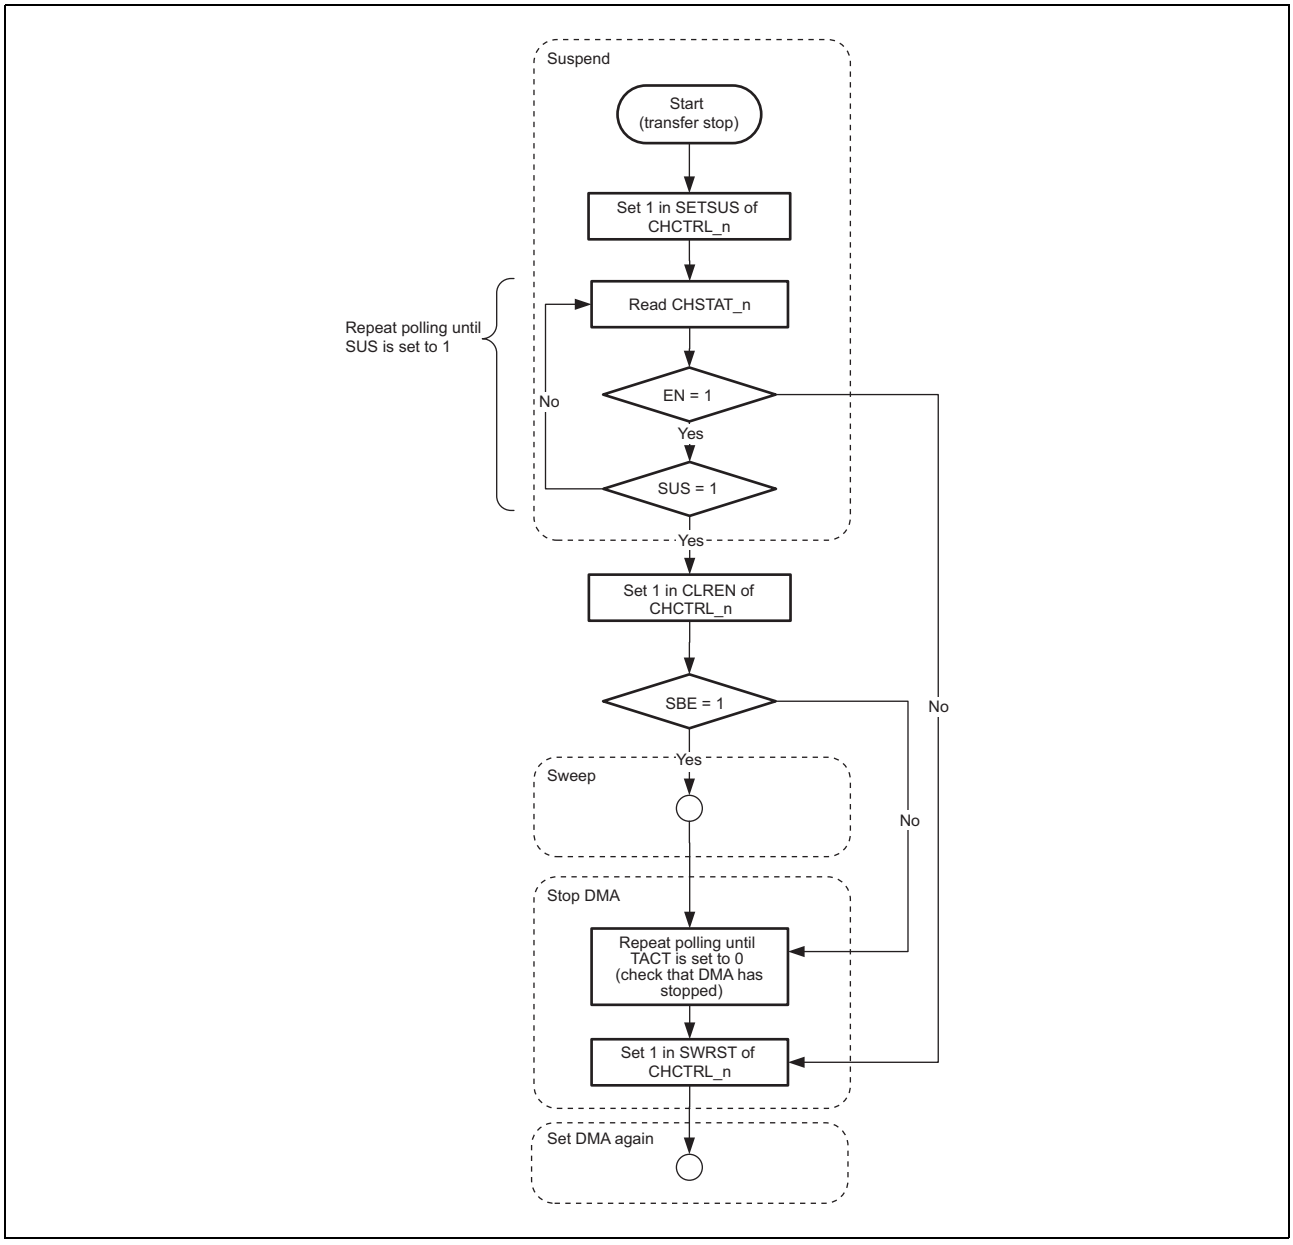

**Figure 9.31 Transfer Stop Flow**

## 9.8 DMA Setting Examples

Setting examples applicable when DMA transfer is executed using the direct memory access controller are shown in the following.
The transfer conditions for these setting examples are as follows.

**Table 9.21 Transfer Condition List for DMA Transfer Setting Examples**

| | DMA Mode | Transfer Mode | Transfer Request |
|---|---|---|---|
| Setting example 1 | Register | Single | Hardware |
| Setting example 2 | Register | Block | Software |
| Setting example 3 | Register<br>(continuous execution) | Block | Software |
| Setting example 4 | Link | Block | Software |

For details of the settings, see the individual setting examples.

### 9.8.1 Setting Example 1 (Register Mode/Hardware Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

**Table 9.22 DMA Transfer Setting Example 1**

| Item | | Description | |
|---|---|---|---|
| Channel used | | 3 | |
| DMA mode | | Register | |
| Transfer mode | | Single transfer | |
| Register set used | | Next0 | |
| Source/destination | | Source | Destination |
| | Start address | 1111_0000H | 2222_0000H |
| | Address direction | Increment | Increment |
| | Data size | 32 bits | 32 bits |
| DMA transfer byte count | | 64 bytes | |
| DMA transfer request | | Rising edge detection by hardware | |
| DMAACK signal | | Level output during read | |
| DMA transfer end interrupt mask | | Not masked | |
| CACHE setting | | Default value | |

**Setting example 1**

N0SA = 1111_0000H (source address)
N0DA = 2222_0000H (destination address)
N0TB = 0000_0040H (transfer byte count)

CHCFG = 0002_2123H (configuration)
CHITVL = 0000_0000H (interval)
CHEXT = 0000_0000H (CACHE setting)

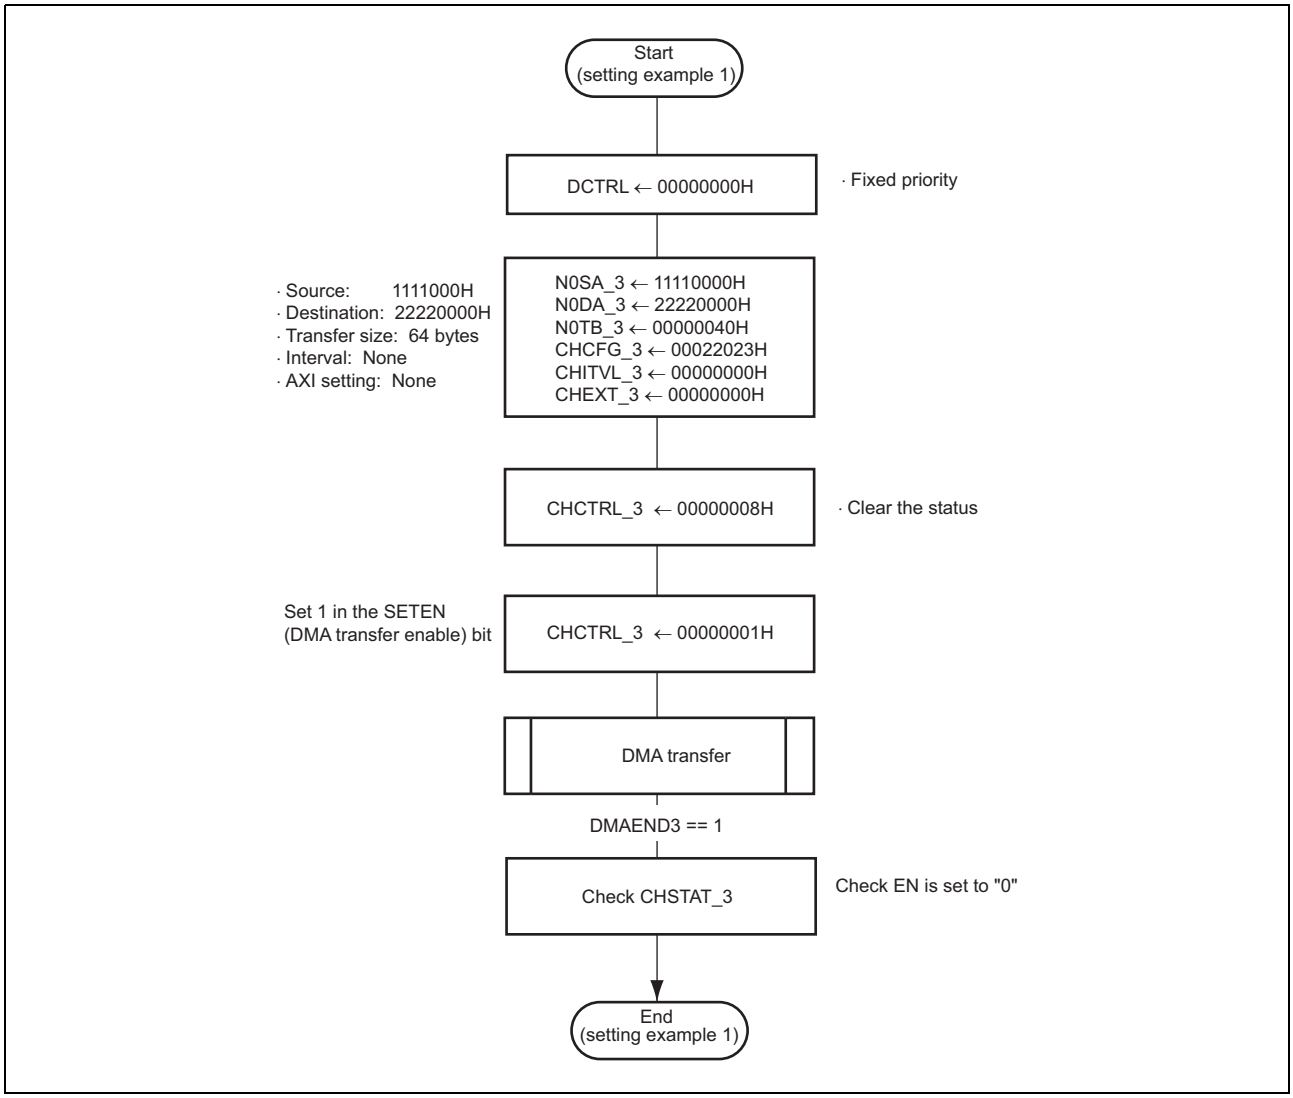

**Figure 9.32 Setting Example 1**

### 9.8.2 Setting Example 2 (Register Mode/Software Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

**Table 9.23 DMA Transfer Setting Example 2**

| Item | | Description | |
|---|---|---|---|
| Channel used | | 2 | |
| Priority control | | Round robin | |
| DMA mode | | Register | |
| Transfer mode | | Block transfer | |
| Register set used | | Next1 | |
| Source/destination | | Source | Destination |
| | Start address | 0FFF_E000H | 3333_0000H |
| | Address direction | Increment | Increment |
| | Data size | 8 bits | 256 bits |
| DMA transfer byte count | | 128 bytes | |
| DMA transfer request | | Auto request | |
| DMAACK signal | | Masked | |
| DMA transfer end interrupt mask | | Not masked | |
| CACHE setting | | Default value | |

**Setting example 2**

DCTRL = 0000_0001H (DMA setting)

N1SA = 0FFF_E000H (source address)
N1DA = 3333_0000H (destination address)
N1TB = 0000_0080H (transfer byte count)

CHCFG = 1045_0402H (configuration)
CHITVL = 0000_0000H (interval)
CHEXT = 0000_0000H (CACHE setting)

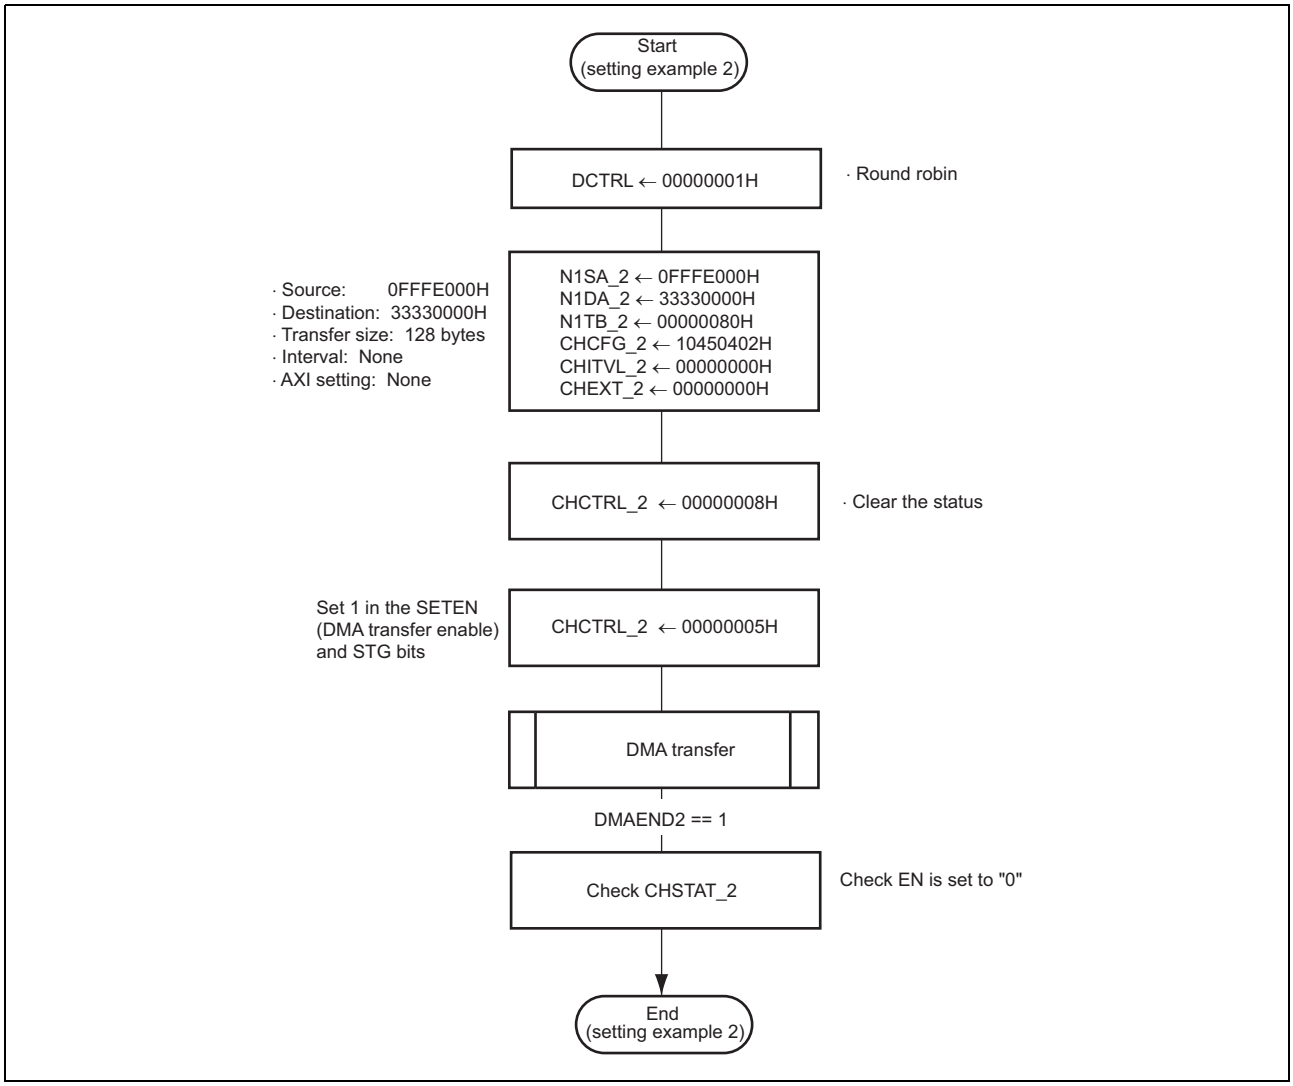

**Figure 9.33 Setting Example 2**

### 9.8.3 Setting Example 3 (Register Mode/Continuous Execution)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

**Table 9.24 DMA Transfer Setting Example 3**

| Item | | Description | |
|---|---|---|---|
| Channel used | | 1 | |
| Priority control | | Round robin | |
| DMA mode | | Register | |
| Transfer mode | | Block transfer | |
| Register set used | | Use Next0 and then Next1 continuously | |
| Next0 | | Source | Destination |
| | Start address | 1111_0000H | 3333_0000H |
| | Address direction | Fixed | Fixed |
| | Data size | 32 bits | 512 bits |
| | DMA transfer byte count | 512 bytes | |

## 9.8.4 Setting Example 4 (Link Mode)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

**Table 9.25 DMA Transfer Setting Example 4**

| Item | Description |
|---|---|
| Channel used | 0 |
| Priority control | Round robin |
| DMA mode | Link |
| Transfer mode | Block transfer |
| Register set used | — |
| Descriptor start address | 0000_1000H |

**Table 9.26 DMA Transfer Setting Example 4 (Descriptor 1)**

| Item | | Description | |
|---|---|---|---|
| Descriptor start address | | 0000_1000H | |
| Next descriptor start address | | 0000_2000H | |
| Transfer mode | | Block transfer | |
| Next0 | | Source | Destination |
| | Start address | 1111_0000H | 3333_0000H |
| | Address direction | Increment | Increment |
| | Data size | 32 bits | 32 bits |
| | DMA transfer byte count | 2048 bytes | |
| DMA transfer request | | Auto request trigger (STG) | |
| DMAACK signal | | Not output | |
| DMA transfer end interrupt mask | | Masked | |
| CACHE setting | | Default value | |
| header | | | |
| | DMA interrupt when LV = 1 | Issued (DIM = 0) | |
| | LV writeback | Done (WBD = 0) | |
| | Next link address | Available (LE = 0) | |
| | Descriptor valid | Valid (LV = 1) | |

**Table 9.27 DMA Transfer Setting Example 4 (Descriptor 2)**

| Item | | Description | |
|---|---|---|---|
| Descriptor start address | | 0000_2000H | |
| Next descriptor start address | | 0000_5000H | |
| Transfer mode | | Block transfer | |
| Next0 | | Source | Destination |
| | Start address | 4444_0000H | 5555_0000H |
| | Address direction | Increment | Increment |
| | Data size | 64 bits | 256 bits |
| | DMA transfer byte count | 1024 bytes | |
| DMA transfer request | | Auto request trigger (STG) | |
| DMAACK signal | | Not output | |
| DMA transfer end interrupt mask | | Masked | |
| CACHE setting | | Default value | |
| header | | | |
| | DMA interrupt when LV = 1 | Issued (DIM = 0) | |
| | LV writeback | Done (WBD = 0) | |
| | Next link address | Available (LE = 0) | |
| | Descriptor valid | Valid (LV = 1) | |

**Table 9.28 DMA Transfer Setting Example 4 (Descriptor 3)**

| Item | | Description | |

### Setting example 4

DCTRL= 0000_0001H (DMA setting)
NXLA = 0000_1000H (descriptor start address)
CHCFG = 8000_0000H (configuration)

**Table 9.29 Descriptor Setting**

| | Descriptor 1 | Descriptor 2 | Descriptor 3 |
|---|---|---|---|
| header | 0000_0001H | 0000_0001H | 0000_0003H |
| SA (Source Address) | 1111_0000H | 4444_0000H | 7777_0000H |
| DA (Destination Address) | 3333_0000H | 5555_0000H | AAAA _0000H |
| TB (Transaction Byte) | 0000_0800H | 0000_0400H | 0000_1000H |
| CFG (Configuration) | 8142_2008H | 8145_3008H | 8046_6008H |
| ITVL (Interval) | 0000_0000H | 0000_0000H | 0000_0000H |
| EXT (Extension) | 0000_0000H | 0000_0000H | 0000_0000H |
| NXLA (Next Link Address) | 0000_2000H | 0000_5000H | 0000_0000H |

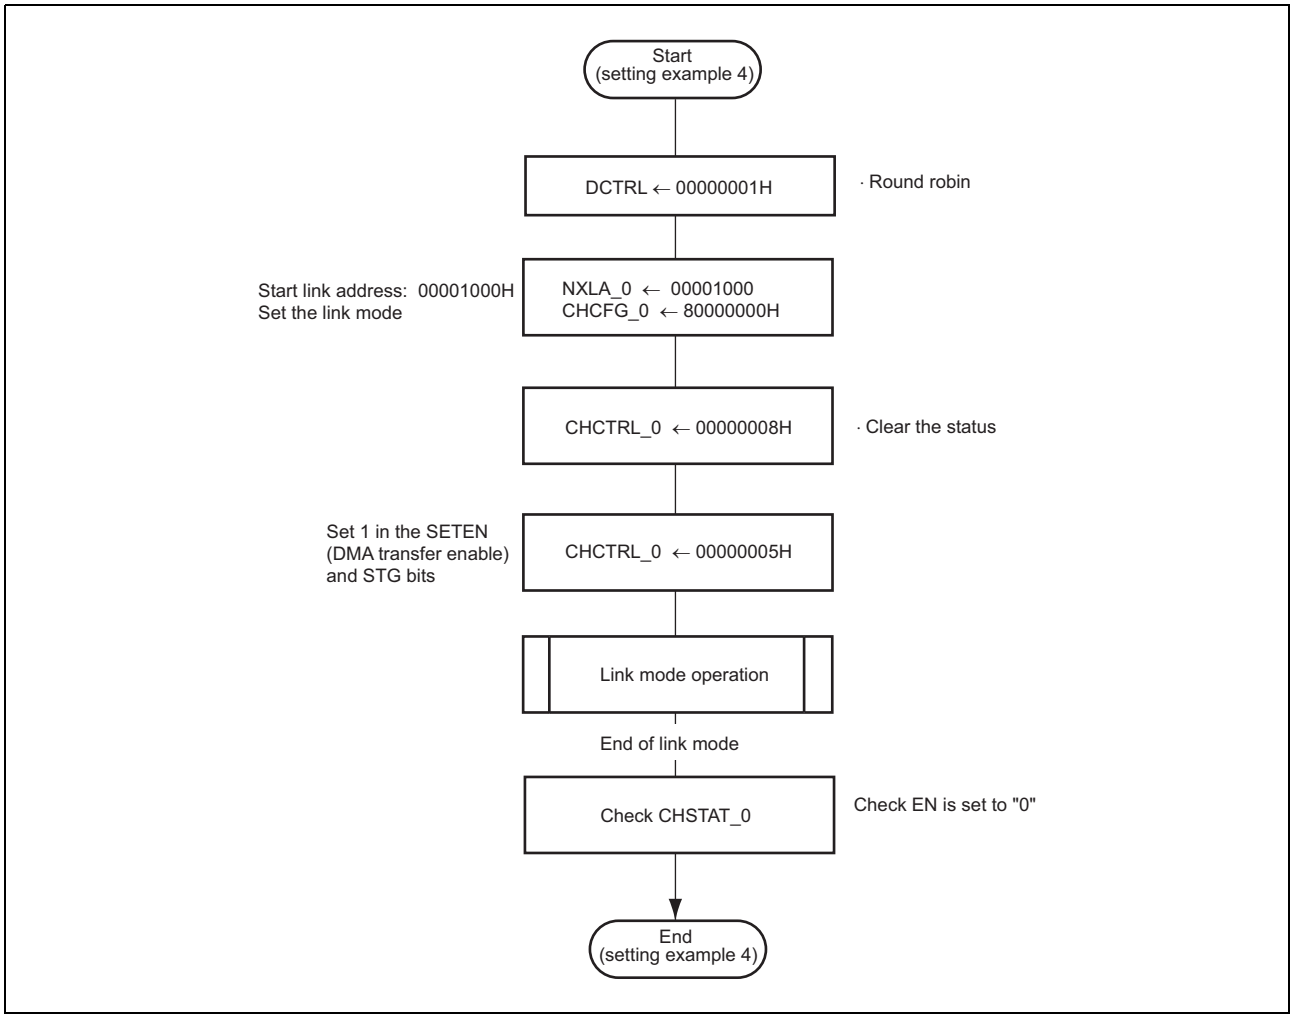

**Figure 9.35 Setting Example 4**

## 9.8.5 Next Register Set Continuous Execution Setting

The following figure shows the flowchart for executing DMA transfers continuously by using two Next register sets in register mode. While a DMA transaction is being executed using one Next register set, the other Next register set is set in order to continue to execute DMA transfers.

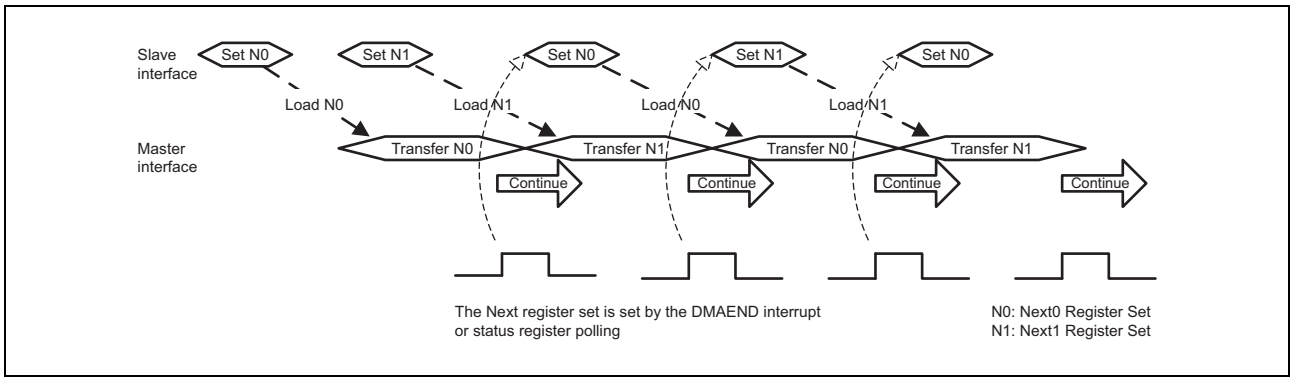

**Figure 9.36 Image of Next Register Set Continuous Execution**

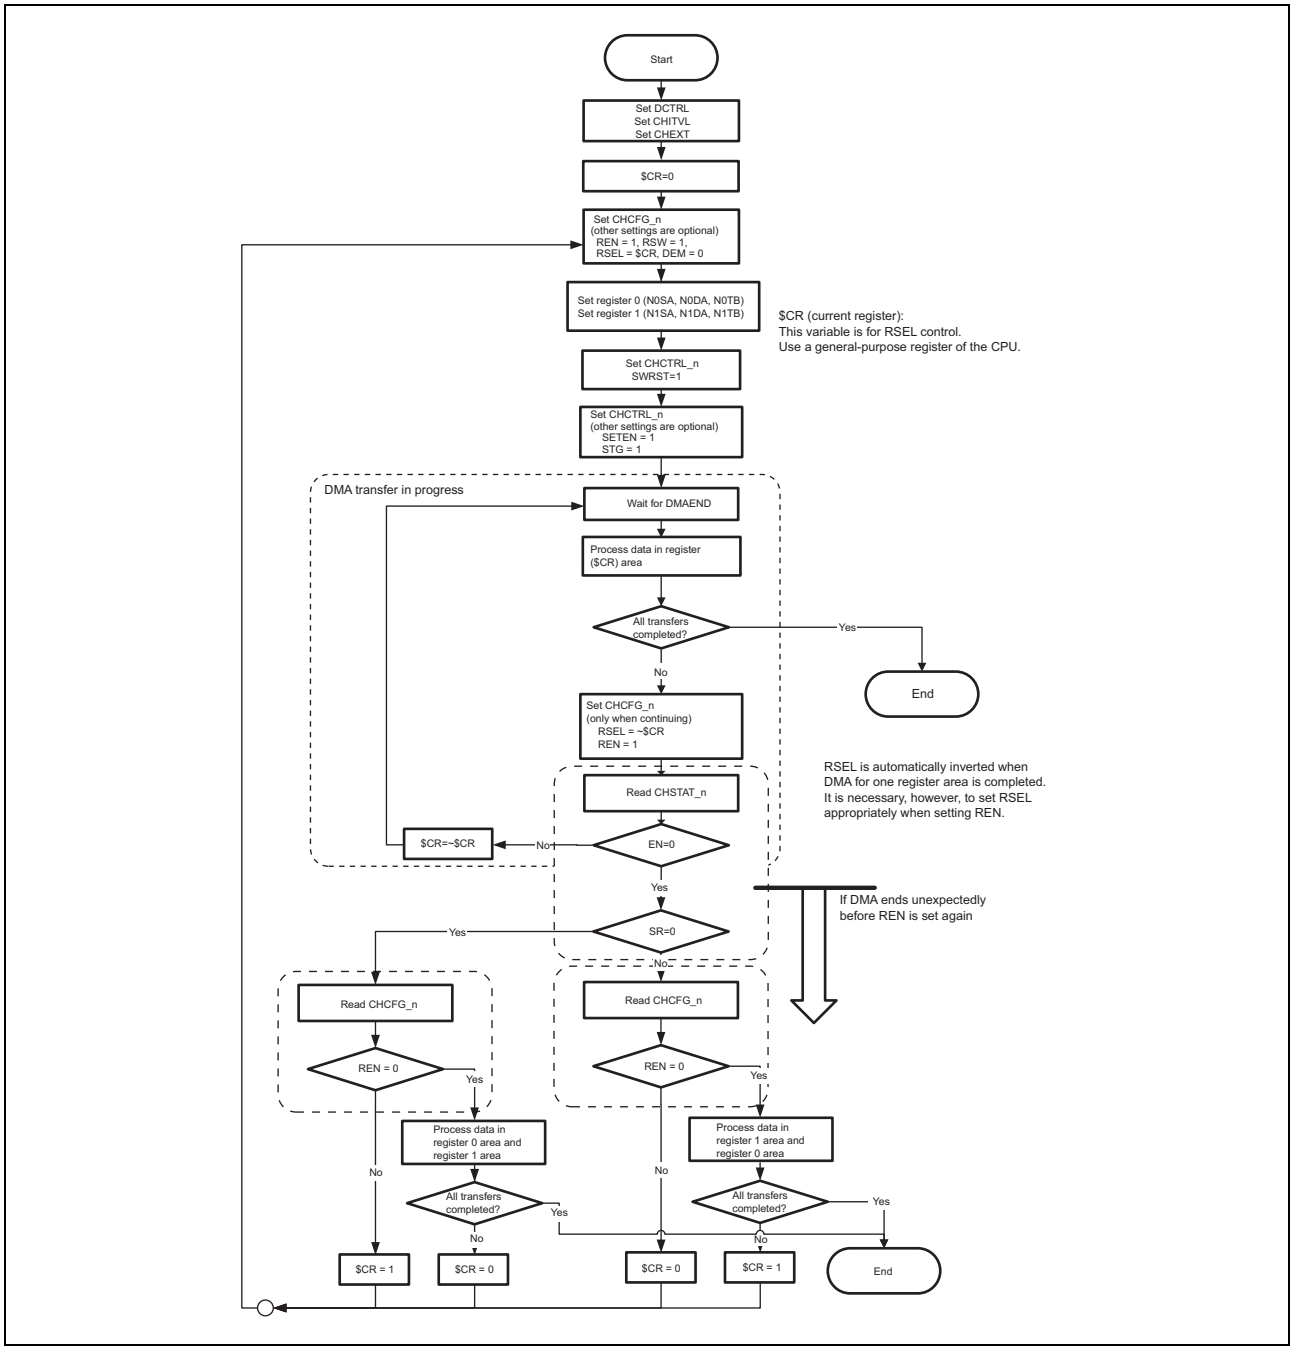

**Figure 9.37 Example of Continuous DMA Execution by Using a Next Register Set**

- Supplementary information
  First, save the data of the register sets to be used for DMA transfers (0 (N0SA, N0DA, and N0TB) and 1 (N1SA, N1DA, and N1TB)) to a general-purpose register of the CPU (the values of this register is referred to as $CR for the sake of convenience).
  Each time the DMA transfers for one register set are completed (the DMA transfer end interrupt is output), REN is automatically cleared to 0. In order to continue to execute DMA transfers, it is necessary to set REN of the CHCFG_n register every time the DMA transfer end interrupt is asserted. This register also contains the RSEL bit, and the value of this bit needs to be set appropriately as well. Therefore, use $CR.
  In this mode, two Next register sets are executed continuously. However, if CLREN is not set before the DMA transaction is completed (the next DMA transfer end interrupt is output), continuous execution stops. In this case, how much of data has been transferred can be checked by reading the SR and EN bits of the CHSTAT_n register and the REN bit of the CHCFG_n register. To restart the DMA transaction, follow the flowchart shown above.

## 9.9 Note

### 9.9.1 Divided Output of DACK0 and TEND0

When transferring 4 bytes or more to an 8-bit or 16-bit external device or transferring 2 bytes or more to an 8-bit external device, each DMA transfer unit is divided into multiple bus cycles. Note that, if the setting is such that DMA transfer is divided into multiple bus cycles and $\overline{CS}$ is negated between bus cycles, the DACK0 output and the TEND0 output is divided to align data as with $\overline{CS}$. Figure 9.38 shows an example.

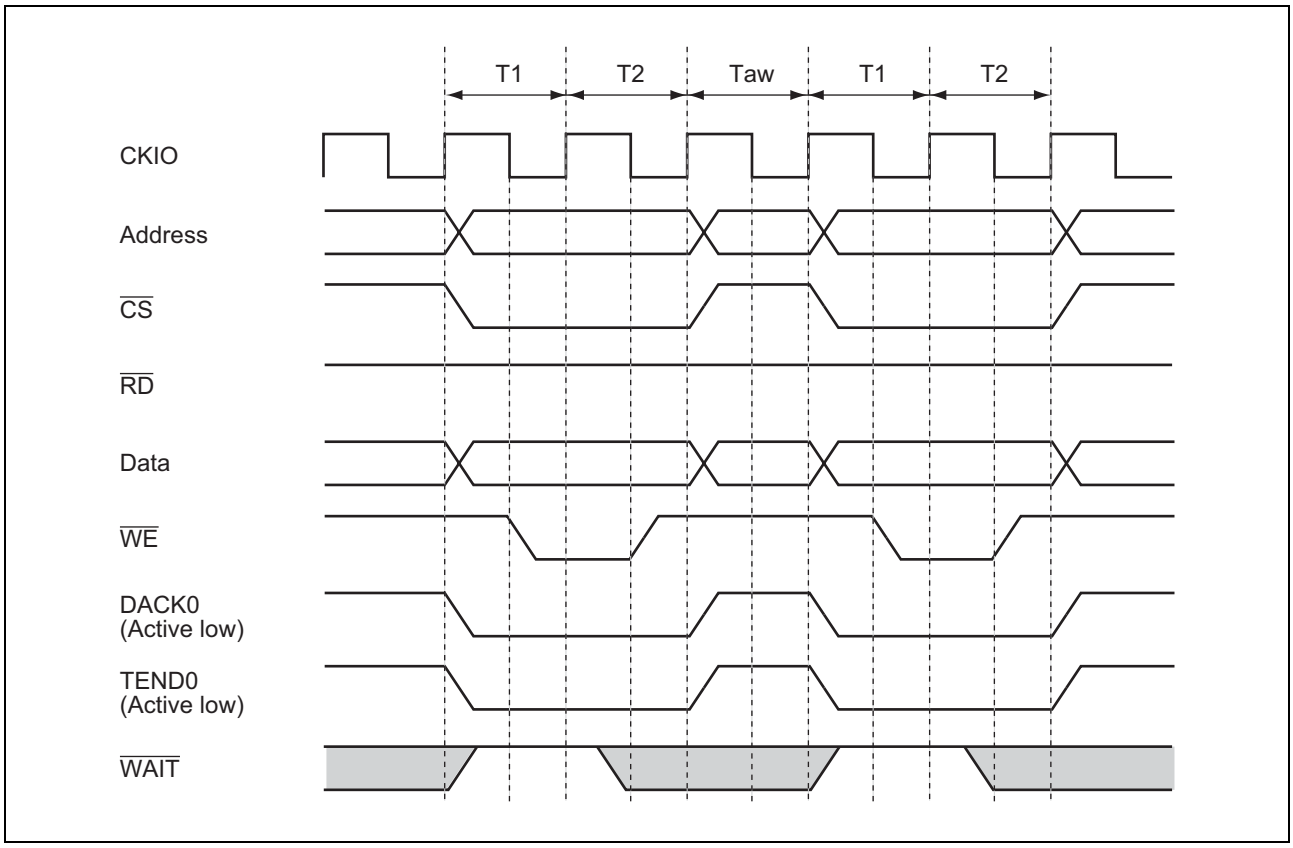

**Figure 9.38 Example of TEND0 Divided Output Timing**

### 9.9.2 TEND0 Not Output

Note that TEND0 may not be output depending on the combination of the bits DDS[3:0], SDS[3:0] and REQD in the CHCFG_0 register.

Table 9.30 shows when TEND0 is not output and Figure 9.39 shows an operation example.

**Table 9.30 Bit Combination when TEND0 Is Not Output**

| CHCFG_0 Register | | | |
|---|---|---|---|
| **REQD** | **DDS** | **SDS** | **TEND0 Output** |
| 1 | — | — | Output |
| 0 | DDS > SDS | | Output |
| | DDS = SDS | | Output |
| | DDS < SDS | | Not output |

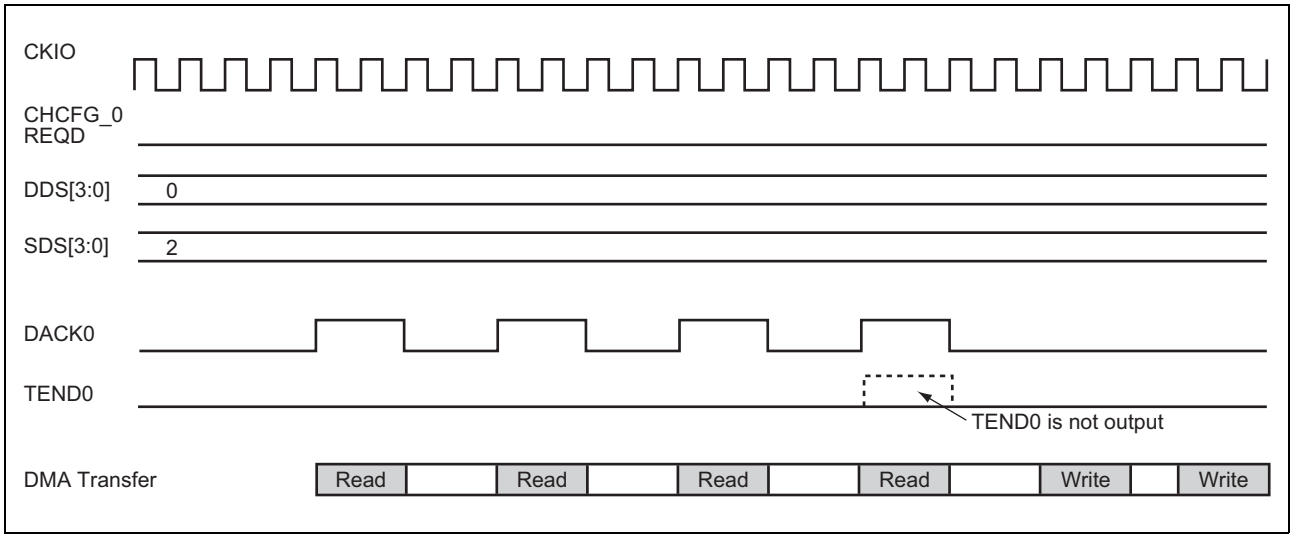

**Figure 9.39 TEND0 Not Output**

### 9.9.3 Atomic Access (ARLOCK[1:0] and AWLOCK[1:0])

This module does not support atomic (locked or exclusive) access, that is, it only supports normal access.

Signals ARLOCK[1:0] and AWLOCK[1:0] are fixed as follows and cannot be modified.

ARLOCK[1:0], AWLOCK[1:0]: 00 (normal access)

# 10. Multi-Function Timer Pulse Unit 2

This LSI has an on-chip multi-function timer pulse unit 2 that comprises five 16-bit timer channels.

## 10.1 Features

- Maximum 16 pulse input/output lines
- Selection of eight counter input clocks for each channel
- The following operations can be set:
  - Waveform output at compare match
  - Input capture function
  - Counter clear operation
  - Multiple timer counters (TCNT) can be written to simultaneously
  - Simultaneous clearing by compare match and input capture is possible
  - Register simultaneous input/output is possible by synchronous counter operation
  - A maximum 12-phase PWM output is possible in combination with synchronous operation
- Buffer operation settable for channels 0, 3, and 4
- Phase counting mode settable independently for each of channels 1 and 2
- Cascade connection operation
- Fast access via internal 16-bit bus
- 25 interrupt sources
- Automatic transfer of register data
- A/D converter start trigger can be generated
- Module standby mode can be settable
- A total of six-phase waveform output, which includes complementary PWM output, and positive and negative phases of reset PWM output by interlocking operation of channels 3 and 4, is possible.
- AC synchronous motor (brushless DC motor) drive mode using complementary PWM output and reset PWM output is settable by interlocking operation of channels 0, 3, and 4, and the selection of two types of waveform outputs (chopping and level) is possible.
- In complementary PWM mode, interrupts at the crest and trough of the counter value and A/D converter start triggers can be skipped.

| | TIOC4C | I/O | TGRC_4 input capture input/output compare output/PWM output pin |
| | TIOC4D | I/O | TGRD_4 input capture input/output compare output/PWM output pin |

Note: For the pin configuration in complementary PWM mode, see Table 10.52 in section 10.4.8, Complementary PWM Mode.

## 10.3 Register Descriptions

Table 10.3 shows the register configuration. To distinguish registers in each channel, an underscore and the channel number are added as a suffix to the register name; TCR for channel 0 is expressed as TCR_0.

**Table 10.3 Register Configuration**

| Channel | Register Name | Abbreviation | R/W | Initial value | Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | Timer control register_0 | TCR_0 | R/W | H'00 | H'FCFF0300 | 8 |

### 10.3.1 Timer Control Register (TCR)

The TCR registers are 8-bit readable/writable registers that control the TCNT operation for each channel. This module has a total of five TCR registers, one each for channels 0 to 4. TCR register settings should be conducted only when TCNT operation is stopped.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CCLR[2:0] | | | CKEG[1:0] | | TPSC[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 5 | CCLR[2:0] | 000 | R/W | Counter Clear 0 to 2<br>These bits select the TCNT counter clearing source. See Table 10.4 and Table 10.5 for details. |
| 4, 3 | CKEG[1:0] | 00 | R/W | Clock Edge 0 and 1<br>These bits select the input clock edge. When the input clock is counted using both edges, the input clock period is halved (e.g. P0ϕ/4 both edges = P0ϕ/2 rising edge). If phase counting mode is used on channels 1 and 2, this setting is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the input clock is P0ϕ/4 or slower. When P0ϕ/1, or the overflow/underflow of another channel is selected for the input clock, although values can be written, counter operation compiles with the initial value.<br>00: Count at rising edge<br>01: Count at falling edge<br>1x: Count at both edges |
| 2 to 0 | TPSC[2:0] | 000 | R/W | Time Prescaler 0 to 2<br>These bits select the TCNT counter clock. The clock source can be selected independently for each channel. See Table 10.6 to Table 10.9 for details. |

[Legend]
x: Don't care

**Table 10.4 CCLR0 to CCLR2 (Channels 0, 3, and 4)**

| Channel | Bit 7 CCLR2 | Bit 6 CCLR1 | Bit 5 CCLR0 | Description |
|---|---|---|---|---|
| 0, 3, 4 | 0 | 0 | 0 | TCNT clearing disabled |
| | | | 1 | TCNT cleared by TGRA compare match/input capture |
| | | 1 | 0 | TCNT cleared by TGRB compare match/input capture |
| | | | 1 | TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation*1 |
| | 1 | 0 | 0 | TCNT clearing disabled |
| | | | 1 | TCNT cleared by TGRC compare match/input capture*2 |
| | | 1 | 0 | TCNT cleared by TGRD compare match/input capture*2 |
| | | | 1 | TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation*1 |

Note 1. Synchronous operation is set by setting the SYNC bit in TSYR to 1.
Note 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority, and compare match/input capture does not occur.

**Table 10.5 CCLR0 to CCLR2 (Channels 1 and 2)**

| Channel | Bit 7 Reserved*2 | Bit 6 CCLR1 | Bit 5 CCLR0 | Description |
|---|---|---|---|---|
| 1, 2 | 0 | 0 | 0 | TCNT clearing disabled |
| | | | 1 | TCNT cleared by TGRA compare match/input capture |
| | | 1 | 0 | TCNT cleared by TGRB compare match/input capture |
| | | | 1 | TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation*1 |

Note 1. Synchronous operation is selected by setting the SYNC bit in TSYR to 1.
Note 2. Bit 7 is reserved in channels 1 and 2. It is always read as 0 and cannot be modified.

**Table 10.6 TPSC0 to TPSC2 (Channel 0)**

| Channel | Bit 2 TPSC2 | Bit 1 TPSC1 | Bit 0 TPSC0 | Description |
|---|---|---|---|---|
| 0 | 0 | 0 | 0 | Internal clock: counts on P0ϕ/1 |
| | | | 1 | Internal clock: counts on P0ϕ/4 |
| | | 1 | 0 | Internal clock: counts on P0ϕ/16 |
| | | | 1 | Internal clock: counts on P0ϕ/64 |
| | 1 | 0 | 0 | External clock: counts on TCLKA pin input |
| | | | 1 | External clock: counts on TCLKB pin input |
| | | 1 | 0 | External clock: counts on TCLKC pin input |
| | | | 1 | External clock: counts on TCLKD pin input |

**Table 10.7 TPSC0 to TPSC2 (Channel 1)**

| Channel | Bit 2 TPSC2 | Bit 1 TPSC1 | Bit 0 TPSC0 | Description |
|---|---|---|---|---|
| 1 | 0 | 0 | 0 | Internal clock: counts on P0ϕ/1 |
| | | | 1 | Internal clock: counts on P0ϕ/4 |
| | | 1 | 0 | Internal clock: counts on P0ϕ/16 |
| | | | 1 | Internal clock: counts on P0ϕ/64 |
| | 1 | 0 | 0 | External clock: counts on TCLKA pin input |
| | | | 1 | External clock: counts on TCLKB pin input |
| | | 1 | 0 | Internal clock: counts on P0ϕ/256 |
| | | | 1 | Counts on TCNT_2 overflow/underflow |

Note: This setting is ignored when channel 1 is in phase counting mode.

**Table 10.8 TPSC0 to TPSC2 (Channel 2)**

| Channel | Bit 2 TPSC2 | Bit 1 TPSC1 | Bit 0 TPSC0 | Description |
|---|---|---|---|---|
| 2 | 0 | 0 | 0 | Internal clock: counts on P0ϕ/1 |
| | | | 1 | Internal clock: counts on P0ϕ/4 |
| | | 1 | 0 | Internal clock: counts on P0ϕ/16 |
| | | | 1 | Internal clock: counts on P0ϕ/64 |
| | 1 | 0 | 0 | External clock: counts on TCLKA pin input |
| | | | 1 | External clock: counts on TCLKB pin input |
| | | 1 | 0 | External clock: counts on TCLKC pin input |
| | | | 1 | Internal clock: counts on P0ϕ/1024 |

Note: This setting is ignored when channel 2 is in phase counting mode.

**Table 10.9 TPSC0 to TPSC2 (Channels 3 and 4)**

| Channel | Bit 2 TPSC2 | Bit 1 TPSC1 | Bit 0 TPSC0 | Description |
|---|---|---|---|---|
| 3, 4 | 0 | 0 | 0 | Internal clock: counts on P0ϕ/1 |
| | | | 1 | Internal clock: counts on P0ϕ/4 |
| | | 1 | 0 | Internal clock: counts on P0ϕ/16 |
| | | | 1 | Internal clock: counts on P0ϕ/64 |
| | 1 | 0 | 0 | Internal clock: counts on P0ϕ/256 |
| | | | 1 | Internal clock: counts on P0ϕ/1024 |
| | | 1 | 0 | External clock: counts on TCLKA pin input |
| | | | 1 | External clock: counts on TCLKB pin input |

## 10.3.2 Timer Mode Register (TMDR)

The TMDR registers are 8-bit readable/writable registers that are used to set the operating mode of each channel. This module has five TMDR registers, one each for channels 0 to 4. TMDR register settings should be changed only when TCNT operation is stopped.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | BFE | BFB | BFA | MD[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 6 | BFE | 0 | R/W | Buffer Operation E<br>Specifies whether TGRE_0 and TGRF_0 are to operate in the normal way or to be used together for buffer operation.<br>TGRF compare match is generated when TGRF is used as the buffer register.<br>In channels 1 to 4, this bit is reserved. It is always read as 0 and the write value should always be 0.<br>0: TGRE_0 and TGRF_0 operate normally<br>1: TGRE_0 and TGRF_0 used together for buffer operation |
| 5 | BFB | 0 | R/W | Buffer Operation B<br>Specifies whether TGRB is to operate in the normal way, or TGRB and TGRD are to be used together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare is not generated in a mode other than complementary PWM. In channels 1 and 2, which have no TGRD, bit 5 is reserved. It is always read as 0 and cannot be modified.<br>0: TGRB and TGRD operate normally<br>1: TGRB and TGRD used together for buffer operation |
| 4 | BFA | 0 | R/W | Buffer Operation A<br>Specifies whether TGRA is to operate in the normal way, or TGRA and TGRC are to be used together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare is not generated in a mode other than complementary PWM. TGRC compare match is generated when in complementary PWM mode. When compare match for channel 4 occurs during the Tb period in complementary PWM mode, TGFC is set. Therefore, set the TGIEC bit in the timer interrupt enable register 4 (TIER_4) to 0.<br>In channels 1 and 2, which have no TGRC, bit 4 is reserved. It is always read as 0 and cannot be modified.<br>0: TGRA and TGRC operate normally<br>1: TGRA and TGRC used together for buffer operation |
| 3 to 0 | MD[3:0] | 0000 | R/W | Modes 0 to 3<br>These bits are used to set the timer operating mode.<br>See Table 10.10 for details. |

**Table 10.10 Setting of Operation Mode by Bits MD0 to MD3**

| Bit 3 MD3 | Bit 2 MD2 | Bit 1 MD1 | Bit 0 MD0 | Description |
|---|---|---|---|---|
| 0 | 0 | 0 | 0 | Normal operation |
| | | | 1 | Setting prohibited |
| | | 1 | 0 | PWM mode 1 |
| | | | 1 | PWM mode 2*1 |
| | 1 | 0 | 0 | Phase counting mode 1*2 |
| | | | 1 | Phase counting mode 2*2 |
| | | 1 | 0 | Phase counting mode 3*2 |
| | | | 1 | Phase counting mode 4*2 |
| 1 | 0 | 0 | 0 | Reset synchronous PWM mode*3 |
| | | | 1 | Setting prohibited |
| | | 1 | X | Setting prohibited |
| | 1 | 0 | 0 | Setting prohibited |
| | | | 1 | Complementary PWM mode 1 (transmit at crest)*3 |
| | | 1 | 0 | Complementary PWM mode 2 (transmit at trough)*3 |
| | | | 1 | Complementary PWM mode 3 (transmit at crest and trough)*3 |

[Legend]
X: Don't care

Note 1. PWM mode 2 cannot be set for channels 3 and 4.

Note 2. Phase counting mode cannot be set for channels 0, 3, and 4.

Note 3. Reset synchronous PWM mode, complementary PWM mode can only be set for channel 3. When channel 3 is set to reset synchronous PWM mode or complementary PWM mode, the channel 4 settings become ineffective and automatically conform to the channel 3 settings. However, do not set channel 4 to reset synchronous PWM mode or complementary PWM mode. Reset synchronous PWM mode and complementary PWM mode cannot be set for channels 0, 1, and 2.

### 10.3.3 Timer I/O Control Register (TIOR)

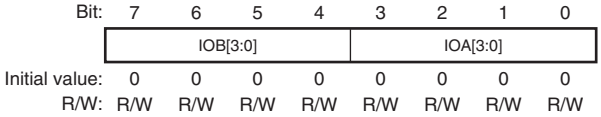
The TIOR registers are 8-bit readable/writable registers that control the TGR registers. This module has a total of eight TIOR registers, two each for channels 0, 3, and 4, one each for channels 1 and 2.

TIOR should be set while TMDR is set in normal operation, PWM mode, or phase counting mode.

The initial output specified by TIOR is valid when the counter is stopped (the CST bit in TSTR is cleared to 0). Note also that, in PWM mode 2, the output at the point at which the counter is cleared to 0 is specified.

When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

- TIORH_0, TIOR_1, TIOR_2, TIORH_3, TIORH_4



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|

| | | 1 | X | | Input capture at both edges |

[Legend]
X: Don't care
Note 1. After power-on reset, 0 is output until TIOR is set.
Note 2. When the BFA bit in TMDR_4 is set to 1 and TGRC_4 is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

### 10.3.4 Timer Interrupt Enable Register (TIER)

The TIER registers are 8-bit readable/writable registers that control enabling or disabling of interrupt requests for each channel. This module has six TIER registers, two for channel 0 and one each for channels 1 to 4.

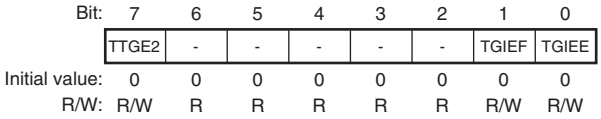
- TIER_0, TIER_1, TIER_2, TIER_3, TIER_4

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TTGE | TTGE2 | TCIEU | TCIEV | TGIED | TGIEC | TGIEB | TGIEA |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | TTGE | 0 | R/W | A/D Conversion Start Request Enable<br>Enables or disables generation of A/D conversion start requests by TGRA input capture/compare match.<br>0: A/D converter start request generation disabled<br>1: A/D converter start request generation enabled |
| 6 | TTGE2 | 0 | R/W | A/D Conversion Start Request Enable 2<br>Enables or disables generation of A/D conversion start requests by TCNT_4 underflow (trough) in complementary PWM mode.<br>In channels 0 to 3, bit 6 is reserved. It is always read as 0 and the write value should always be 0.<br>0: A/D conversion start request generation by TCNT_4 underflow (trough) disabled<br>1: A/D conversion start request generation by TCNT_4 underflow (trough) enabled |
| 5 | TCIEU | 0 | R/W | Underflow Interrupt Enable<br>Enables or disables interrupt requests (TCIU) by the TCFU flag when the TCFU flag in TSR is set to 1 in channels 1 and 2.<br>In channels 0, 3, and 4, bit 5 is reserved. It is always read as 0 and the write value should always be 0.<br>0: Interrupt requests (TCIU) by TCFU disabled<br>1: Interrupt requests (TCIU) by TCFU enabled |
| 4 | TCIEV | 0 | R/W | Overflow Interrupt Enable<br>Enables or disables interrupt requests (TCIV) by the TCFV flag when the TCFV flag in TSR is set to 1.<br>0: Interrupt requests (TCIV) by TCFV disabled<br>1: Interrupt requests (TCIV) by TCFV enabled |
| 3 | TGIED | 0 | R/W | TGR Interrupt Enable D<br>Enables or disables interrupt requests (TGID) by the TGFD bit when the TGFD bit in TSR is set to 1 in channels 0, 3, and 4.<br>In channels 1 and 2, bit 3 is reserved. It is always read as 0 and the write value should always be 0.<br>0: Interrupt requests (TGID) by TGFD bit disabled<br>1: Interrupt requests (TGID) by TGFD bit enabled |
| 2 | TGIEC | 0 | R/W | TGR Interrupt Enable C<br>Enables or disables interrupt requests (TGIC) by the TGFC bit when the TGFC bit in TSR is set to 1 in channels 0, 3, and 4.<br>In channels 1 and 2, bit 2 is reserved. It is always read as 0 and the write value should always be 0.<br>0: Interrupt requests (TGIC) by TGFC bit disabled<br>1: Interrupt requests (TGIC) by TGFC bit enabled |
| 1 | TGIEB | 0 | R/W | TGR Interrupt Enable B<br>Enables or disables interrupt requests (TGIB) by the TGFB bit when the TGFB bit in TSR is set to 1.<br>0: Interrupt requests (TGIB) by TGFB bit disabled<br>1: Interrupt requests (TGIB) by TGFB bit enabled |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | TGIEA | 0 | R/W | TGR Interrupt Enable A<br>Enables or disables interrupt requests (TGIA) by the TGFA bit when the TGFA bit in TSR is set to 1.<br>0: Interrupt requests (TGIA) by TGFA bit disabled<br>1: Interrupt requests (TGIA) by TGFA bit enabled |

- TIER2_0



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | TTGE2 | 0 | R/W | A/D Converter Start Request Enable 2<br>Enables or disables generation of A/D converter start requests by compare match between TCNT_0 and TGRE_0.<br>0: A/D converter start request generation by compare match between TCNT_0 and TGRE_0 disabled<br>1: A/D converter start request generation by compare match between TCNT_0 and TGRE_0 enabled |
| 6 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1 | TGIEF | 0 | R/W | TGR Interrupt Enable F<br>Enables or disables interrupt requests by compare match between TCNT_0 and TGRF_0.<br>0: Interrupt requests (TGIF) by TGFE bit disabled<br>1: Interrupt requests (TGIF) by TGFE bit enabled |
| 0 | TGIEE | 0 | R/W | TGR Interrupt Enable E<br>Enables or disables interrupt requests by compare match between TCNT_0 and TGRE_0.<br>0: Interrupt requests (TGIE) by TGEE bit disabled<br>1: Interrupt requests (TGIE) by TGEE bit enabled |

### 10.3.5 Timer Status Register (TSR)

The TSR registers are 8-bit readable/writable registers that indicate the status of each channel. This module has six TSR registers, two for channel 0 and one each for channels 1 to 4.

- TSR_0, TSR_1, TSR_2, TSR_3, TSR_4

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TCFD | - | TCFU | TCFV | TGFD | TGFC | TGFB | TGFA |
| Initial value: | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R/(W)*1 | R/(W)*1 | R/(W)*1 | R/(W)*1 | R/(W)*1 | R/(W)*1 |

Note: 1. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | TCFD | 1 | R | Count Direction Flag<br>Status flag that shows the direction in which TCNT counts in channels 1 to 4. In channel 0, bit 7 is reserved. It is always read as 1 and the write value should always be 1.<br>0: TCNT counts down<br>1: TCNT counts up |
| 6 | — | 1 | R | Reserved<br>This bit is always read as 1. The write value should always be 1. |
| 5 | TCFU | 0 | R/(W)*1 | Underflow Flag<br>Status flag that indicates that TCNT underflow has occurred when channels 1 and 2 are set to phase counting mode. Only 0 can be written, for flag clearing. In channels 0, 3, and 4, bit 5 is reserved. It is always read as 0 and the write value should always be 0.<br>[Clearing condition]<br>• When 0 is written to TCFU after reading TCFU = 1*2<br>[Setting condition]<br>• When the TCNT value underflows (changes from H'0000 to H'FFFF) |
| 4 | TCFV | 0 | R/(W)*1 | Overflow Flag<br>Status flag that indicates that TCNT overflow has occurred. Only 0 can be written, for flag clearing.<br>[Clearing condition]<br>• When 0 is written to TCFV after reading TCFV = 1*2<br>[Setting condition]<br>• When the TCNT value overflows (changes from H'FFFF to H'0000) In channel 4, when the TCNT_4 value underflows (changes from H'0001 to H'0000) in complementary PWM mode, this flag is also set. |
| 3 | TGFD | 0 | R/(W)*1 | Input Capture/Output Compare Flag D<br>Status flag that indicates the occurrence of TGRD input capture or compare match in channels 0, 3, and 4.<br>Only 0 can be written, for flag clearing. In channels 1 and 2, bit 3 is reserved. It is always read as 0 and the write value should always be 0.<br>[Clearing condition]<br>• When 0 is written to TGFD after reading TGFD = 1*2<br>[Setting conditions]<br>• When TCNT = TGRD and TGRD is functioning as output compare register<br>• When TCNT value is transferred to TGRD by input capture signal and TGRD is functioning as input capture register |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | TGFC | 0 | R/(W)*1 | Input Capture/Output Compare Flag C<br>Status flag that indicates the occurrence of TGRC input capture or compare match in channels 0, 3, and 4. Only 0 can be written, for flag clearing. In channels 1 and 2, bit 2 is reserved. It is always read as 0 and the write value should always be 0.<br>[Clearing condition]<br>• When 0 is written to TGFC after reading TGFC = 1*2<br>[Setting conditions]<br>• When TCNT = TGRC and TGRC is functioning as output compare register<br>• When TCNT value is transferred to TGRC by input capture signal and TGRC is functioning as input capture register |
| 1 | TGFB | 0 | R/(W)*1 | Input Capture/Output Compare Flag B<br>Status flag that indicates the occurrence of TGRB input capture or compare match. Only 0 can be written, for flag clearing.<br>[Clearing condition]<br>• When 0 is written to TGFB after reading TGFB = 1*2<br>[Setting conditions]<br>• When TCNT = TGRB and TGRB is functioning as output compare register<br>• When TCNT value is transferred to TGRB by input capture signal and TGRB is functioning as input capture register |
| 0 | TGFA | 0 | R/(W)*1 | Input Capture/Output Compare Flag A<br>Status flag that indicates the occurrence of TGRA input capture or compare match. Only 0 can be written, for flag clearing.<br>[Clearing conditions]<br>• When the direct memory access controller is activated by TGIA interrupt<br>• When 0 is written to TGFA after reading TGFA = 1*2<br>[Setting conditions]<br>• When TCNT = TGRA and TGRA is functioning as output compare register<br>• When TCNT value is transferred to TGRA by input capture signal and TGRA is functioning as input capture register |

Note 1. Writing 0 to this bit after reading it as 1 clears the flag.
Note 2. If the next flag is set before TGFA is cleared to 0 after reading TGFA = 1, TGFA remains 1 even when 0 is written to. In this case, read TGFA = 1 again to clear TGFA to 0.

- TSR2_0

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | TGFF | TGFE |
| Initial value: | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/(W)*1 | R/(W)*1 |

Note: 1. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7, 6 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. |
| 5 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1 | TGFF | 0 | R/(W)*1 | Compare Match Flag F<br>Status flag that indicates the occurrence of compare match between TCNT_0 and TGRF_0.<br>[Clearing condition]<br>• When 0 is written to TGFF after reading TGFF = 1*2<br>[Setting condition]<br>• When TCNT_0 = TGRF_0 and TGRF_0 is functioning as compare register |
| 0 | TGFE | 0 | R/(W)*1 | Compare Match Flag E<br>Status flag that indicates the occurrence of compare match between TCNT_0 and TGRE_0.<br>[Clearing condition]<br>• When 0 is written to TGFE after reading TGFE = 1*2<br>[Setting condition]<br>• When TCNT_0 = TGRE_0 and TGRE_0 is functioning as compare register |

Note 1. Writing 0 to this bit after reading it as 1 clears the flag.
Note 2. If the next flag is set before TGFA is cleared to 0 after reading TGFA = 1, TGFA remains 1 even when 0 is written to. In this case, read TGFA = 1 again to clear TGFA to 0.

### 10.3.6 Timer Buffer Operation Transfer Mode Register (TBTM)

The TBTM registers are 8-bit readable/writable registers that specify the timing for transferring data from the buffer register to the timer general register in PWM mode. This module has three TBTM registers, one each for channels 0, 3, and 4.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | TTSE | TTSB | TTSA |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 2 | TTSE | 0 | R/W | Timing Select E<br>Specifies the timing for transferring data from TGRF_0 to TGRE_0 when they are used together for buffer operation.<br>In channels 3 and 4, bit 2 is reserved. It is always read as 0 and the write value should always be 0. Do not set this bit to 1 when PWM mode is not selected in channel 0.<br>0: When compare match E occurs in channel 0<br>1: When TCNT_0 is cleared |
| 1 | TTSB | 0 | R/W | Timing Select B<br>Specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. Do not set this bit to 1 when PWM mode is not selected in any channels.<br>0: When compare match B occurs in each channel<br>1: When TCNT is cleared in each channel |
| 0 | TTSA | 0 | R/W | Timing Select A<br>Specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. Do not set this bit to 1 when PWM mode is not selected in any channels.<br>0: When compare match A occurs in each channel<br>1: When TCNT is cleared in each channel |

### 10.3.7 Timer Input Capture Control Register (TICCR)

TICCR is an 8-bit readable/writable register that specifies input capture conditions when TCNT_1 and TCNT_2 are cascaded. This module has one TICCR in channel 1.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | I2BE | I2AE | I1BE | I1AE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 3 | I2BE | 0 | R/W | Input Capture Enable<br>Specifies whether to include the TIOC2B pin in the TGRB_1 input capture conditions.<br>0: Does not include the TIOC2B pin in the TGRB_1 input capture conditions<br>1: Includes the TIOC2B pin in the TGRB_1 input capture conditions |
| 2 | I2AE | 0 | R/W | Input Capture Enable<br>Specifies whether to include the TIOC2A pin in the TGRA_1 input capture conditions.<br>0: Does not include the TIOC2A pin in the TGRA_1 input capture conditions<br>1: Includes the TIOC2A pin in the TGRA_1 input capture conditions |
| 1 | I1BE | 0 | R/W | Input Capture Enable<br>Specifies whether to include the TIOC1B pin in the TGRB_2 input capture conditions.<br>0: Does not include the TIOC1B pin in the TGRB_2 input capture conditions<br>1: Includes the TIOC1B pin in the TGRB_2 input capture conditions |
| 0 | I1AE | 0 | R/W | Input Capture Enable<br>Specifies whether to include the TIOC1A pin in the TGRA_2 input capture conditions.<br>0: Does not include the TIOC1A pin in the TGRA_2 input capture conditions<br>1: Includes the TIOC1A pin in the TGRA_2 input capture conditions |

## 10.3.8 Timer A/D Converter Start Request Control Register (TADCR)

TADCR is a 16-bit readable/writable register that enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping operation. This module has one TADCR in channel 4.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | BF[1:0] | | - | - | - | - | - | - | UT4AE | DT4AE | UT4BE | DT4BE | ITA3AE | ITA4VE | ITB3AE | ITB4VE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0* | 0 | 0* | 0* | 0* | 0* | 0* |
| R/W: | R/W | R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15, 14 | BF[1:0] | 00 | R/W | TADCOBRA_4/TADCOBRB_4 Transfer Timing Select<br>Select the timing for transferring data from TADCOBRA_4 and TADCOBRB_4 to TADCORA_4 and TADCORB_4.<br>For details, see Table 10.27. |
| 13 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 | UT4AE | 0 | R/W | Up-Count TRG4AN Enable<br>Enables or disables A/D converter start requests (TRG4AN) during TCNT_4 up-count operation.<br>0: A/D converter start requests (TRG4AN) disabled during TCNT_4 up-count operation<br>1: A/D converter start requests (TRG4AN) enabled during TCNT_4 up-count operation |
| 6 | DT4AE | 0* | R/W | Down-Count TRG4AN Enable<br>Enables or disables A/D converter start requests (TRG4AN) during TCNT_4 down-count operation.<br>0: A/D converter start requests (TRG4AN) disabled during TCNT_4 down-count operation<br>1: A/D converter start requests (TRG4AN) enabled during TCNT_4 down-count operation |
| 5 | UT4BE | 0 | R/W | Up-Count TRG4BN Enable<br>Enables or disables A/D converter start requests (TRG4BN) during TCNT_4 up-count operation.<br>0: A/D converter start requests (TRG4BN) disabled during TCNT_4 up-count operation<br>1: A/D converter start requests (TRG4BN) enabled during TCNT_4 up-count operation |
| 4 | DT4BE | 0* | R/W | Down-Count TRG4BN Enable<br>Enables or disables A/D converter start requests (TRG4BN) during TCNT_4 down-count operation.<br>0: A/D converter start requests (TRG4BN) disabled during TCNT_4 down-count operation<br>1: A/D converter start requests (TRG4BN) enabled during TCNT_4 down-count operation |
| 3 | ITA3AE | 0* | R/W | TGIA_3 Interrupt Skipping Link Enable<br>Select whether to link A/D converter start requests (TRG4AN) with TGIA_3 interrupt skipping operation.<br>0: Does not link with TGIA_3 interrupt skipping<br>1: Links with TGIA_3 interrupt skipping |
| 2 | ITA4VE | 0* | R/W | TCIV_4 Interrupt Skipping Link Enable<br>Select whether to link A/D converter start requests (TRG4AN) with TCIV_4 interrupt skipping operation.<br>0: Does not link with TCIV_4 interrupt skipping<br>1: Links with TCIV_4 interrupt skipping |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1 | ITB3AE | 0* | R/W | TGIA_3 Interrupt Skipping Link Enable<br>Select whether to link A/D converter start requests (TRG4BN) with TGIA_3 interrupt skipping operation.<br>0: Does not link with TGIA_3 interrupt skipping<br>1: Links with TGIA_3 interrupt skipping |
| 0 | ITB4VE | 0* | R/W | TCIV_4 Interrupt Skipping Link Enable<br>Select whether to link A/D converter start requests (TRG4BN) with TCIV_4 interrupt skipping operation.<br>0: Does not link with TCIV_4 interrupt skipping<br>1: Links with TCIV_4 interrupt skipping |

Note 1. TADCR must not be accessed in eight bits; it should always be accessed in 16 bits.
Note 2. When interrupt skipping is disabled (the T3AEN and T4VEN bits in the timer interrupt skipping set register (TITCR) are cleared to 0 or the skipping count set bits (3ACOR and 4VCOR) in TITCR are cleared to 0), do not link A/D converter start requests with interrupt skipping operation (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the timer A/D converter start request control register (TADCR) to 0).
Note 3. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.
Note: * Do not set to 1 when complementary PWM mode is not selected.

**Table 10.27 Setting of Transfer Timing by Bits BF1 and BF0**

| Bit 7 | Bit 6 | |
|---|---|---|
| BF1 | BF0 | Description |
| 0 | 0 | Does not transfer data from the cycle set buffer register to the cycle set register. |
| 0 | 1 | Transfers data from the cycle set buffer register to the cycle set register at the crest of the TCNT_4 count.*1 |
| 1 | 0 | Transfers data from the cycle set buffer register to the cycle set register at the trough of the TCNT_4 count.*2 |
| 1 | 1 | Transfers data from the cycle set buffer register to the cycle set register at the crest and trough of the TCNT_4 count.*2 |

Note 1. Data is transferred from the cycle set buffer register to the cycle set register when the crest of the TCNT_4 count is reached in complementary PWM mode, when compare match occurs between TCNT_3 and TGRA_3 in reset-synchronized PWM mode, or when compare match occurs between TCNT_4 and TGRA_4 in PWM mode 1 or normal operation mode.
Note 2. These settings are prohibited when complementary PWM mode is not selected.

### 10.3.9 Timer A/D Converter Start Request Cycle Set Registers (TADCORA_4 and TADCORB_4)

TADCORA_4 and TADCORB_4 are 16-bit readable/writable registers. When the TCNT_4 count reaches the value in TADCORA_4 or TADCORB_4, a corresponding A/D converter start request will be issued.

TADCORA_4 and TADCORB_4 are initialized to H'FFFF.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: TADCORA_4 and TADCORB_4 must not be accessed in eight bits; they should always be accessed in 16 bits.

### 10.3.10 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA_4 and TADCOBRB_4)

TADCOBRA_4 and TADCOBRB_4 are 16-bit readable/writable registers. When the crest or trough of the TCNT_4 count is reached, these register values are transferred to TADCORA_4 and TADCORB_4, respectively.

TADCOBRA_4 and TADCOBRB_4 are initialized to H'FFFF.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: TADCOBRA_4 and TADCOBRB_4 must not be accessed in eight bits; they should always be accessed in 16 bits.

### 10.3.11 Timer Counter (TCNT)

The TCNT counters are 16-bit readable/writable counters. This module has five TCNT counters, one each for channels 0 to 4.

The TCNT counters must not be accessed in eight bits; they should always be accessed in 16 bits.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: The TCNT counters must not be accessed in eight bits; they should always be accessed in 16 bits.

### 10.3.12 Timer General Register (TGR)

The TGR registers are 16-bit readable/writable registers. This module has eighteen TGR registers, six for channel 0, two each for channels 1 and 2, four each for channels 3 and 4.

TGRA, TGRB, TGRC, and TGRD function as either output compare or input capture registers. TGRC and TGRD for channels 0, 3, and 4 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.

TGRE_0 and TGRF_0 function as compare registers. When the TCNT_0 count matches the TGRE_0 value, an A/D converter start request can be issued. TGRF can also be designated for operation as a buffer register. TGR buffer register combination is TGRE and TGRF.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: The TGR registers must not be accessed in eight bits; they should always be accessed in 16 bits.
TGR registers are initialized to H'FFFF.

## 10.3.13 Timer Start Register (TSTR)

TSTR is an 8-bit readable/writable register that selects operation/stoppage of TCNT for channels 0 to 4.

When setting the operating mode in TMDR or setting the count clock in TCR, first stop the TCNT counter.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CST4 | CST3 | - | - | - | CST2 | CST1 | CST0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | CST4 | 0 | R/W | Counter Start 4 and 3<br>These bits select operation or stoppage for TCNT.<br>If 0 is written to the CST bit during operation with the TIOC pin designated for output, the counter stops but the TIOC pin output compare output level is retained. If TIOR is written to when the CST bit is cleared to 0, the pin output level will be changed to the set initial output value.<br>0: TCNT_4 and TCNT_3 count operation is stopped<br>1: TCNT_4 and TCNT_3 performs count operation |
| 6 | CST3 | 0 | R/W | |
| 5 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 2 | CST2 | 0 | R/W | Counter Start 2 to 0<br>These bits select operation or stoppage for TCNT.<br>If 0 is written to the CST bit during operation with the TIOC pin designated for output, the counter stops but the TIOC pin output compare output level is retained. If TIOR is written to when the CST bit is cleared to 0, the pin output level will be changed to the set initial output value.<br>0: TCNT_2 to TCNT_0 count operation is stopped<br>1: TCNT_2 to TCNT_0 performs count operation |
| 1 | CST1 | 0 | R/W | |
| 0 | CST0 | 0 | R/W | |

## 10.3.14 Timer Synchronous Register (TSYR)

TSYR is an 8-bit readable/writable register that selects independent operation or synchronous operation for the channel 0 to 4 TCNT counters. A channel performs synchronous operation when the corresponding bit in TSYR is set to 1.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SYNC4 | SYNC3 | - | - | - | SYNC2 | SYNC1 | SYNC0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | SYNC4 | 0 | R/W | Timer Synchronous operation 4 and 3<br>These bits are used to select whether operation is independent of or synchronized with other channels.<br>When synchronous operation is selected, the TCNT synchronous presetting of multiple channels, and synchronous clearing by counter clearing on another channel, are possible.<br>To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit , the TCNT clearing source must also be set by means of bits CCLR0 to CCLR2 in TCR.<br>0: TCNT_4 and TCNT_3 operate independently (TCNT presetting/clearing is unrelated to other channels)<br>1: TCNT_4 and TCNT_3 performs synchronous operation<br>TCNT synchronous presetting/synchronous clearing is possible |
| 6 | SYNC3 | 0 | R/W | |
| 5 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 2 | SYNC2 | 0 | R/W | Timer Synchronous operation 2 to 0<br>These bits are used to select whether operation is independent of or synchronized with other channels.<br>When synchronous operation is selected, the TCNT synchronous presetting of multiple channels, and synchronous clearing by counter clearing on another channel, are possible.<br>To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits CCLR0 to CCLR2 in TCR.<br>0: TCNT_2 to TCNT_0 operates independently (TCNT presetting /clearing is unrelated to other channels)<br>1: TCNT_2 to TCNT_0 performs synchronous operation<br>TCNT synchronous presetting/synchronous clearing is possible |
| 1 | SYNC1 | 0 | R/W | |
| 0 | SYNC0 | 0 | R/W | |

### 10.3.15 Timer Read/Write Enable Register (TRWER)

TRWER is an 8-bit readable/writable register that enables or disables access to the registers and counters which have write-protection capability against accidental modification in channels 3 and 4.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | RWE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | RWE | 1 | R/W | Read/Write Enable<br>Enables or disables access to the registers which have write-protection capability against accidental modification.<br>0: Disables read/write access to the registers<br>1: Enables read/write access to the registers<br>[Clearing condition]<br>• When 0 is written to the RWE bit after reading RWE = 1 |

- Registers and counters having write-protection capability against accidental modification
  22 registers: TCR_3, TCR_4, TMDR_3, TMDR_4, TIORH_3, TIORH_4, TIORL_3, TIORL_4, TIER_3, TIER_4, TGRA_3, TGRA_4, TGRB_3, TGRB_4, TOER, TOCR1, TOCR2, TGCR, TCDR, TDDR, TCNT_3, and TCNT_4.

### 10.3.16 Timer Output Master Enable Register (TOER)

TOER is an 8-bit readable/writable register that enables/disables output settings for output pins TIOC4D, TIOC4C, TIOC3D, TIOC4B, TIOC4A, and TIOC3B. These pins do not output correctly if the TOER bits have not been set. Set TOER of CH3 and CH4 prior to setting TIOR of CH3 and CH4.

Make settings of the TOER while counting by the TCNT registers of channels 3 and 4 is stopped.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | OE4D | OE4C | OE3D | OE4B | OE4A | OE3B |
| Initial value: | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7, 6 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. |
| 5 | OE4D | 0 | R/W | Master Enable TIOC4D<br>This bit enables/disables the TIOC4D pin output for this module.<br>0: Output for this module is disabled (inactive level)*<br>1: Output for this module is enabled |
| 4 | OE4C | 0 | R/W | Master Enable TIOC4C<br>This bit enables/disables the TIOC4C pin output for this module.<br>0: Output for this module is disabled (inactive level)*<br>1: Output for this module is enabled |
| 3 | OE3D | 0 | R/W | Master Enable TIOC3D<br>This bit enables/disables the TIOC3D pin output for this module.<br>0: Output for this module is disabled (inactive level)*<br>1: Output for this module is enabled |
| 2 | OE4B | 0 | R/W | Master Enable TIOC4B<br>This bit enables/disables the TIOC4B pin output for this module.<br>0: Output for this module is disabled (inactive level)*<br>1: Output for this module is enabled |
| 1 | OE4A | 0 | R/W | Master Enable TIOC4A<br>This bit enables/disables the TIOC4A pin output for this module.<br>0: Output for this module is disabled (inactive level)*<br>1: Output for this module is enabled |
| 0 | OE3B | 0 | R/W | Master Enable TIOC3B<br>This bit enables/disables the TIOC3B pin output for this module.<br>0: Output for this module is disabled (inactive level)*<br>1: Output for this module is enabled |

Note: * The inactive level is determined by the settings in timer output control registers 1 and 2 (TOCR1 and TOCR2). For details, refer to section 10.3.17, Timer Output Control Register 1 (TOCR1), and section 10.3.18, Timer Output Control Register 2 (TOCR2). Set these bits to 1 to enable output for this module in other than complementary PWM or reset-synchronized PWM mode. When these bits are set to 0, low level is output.

## 10.3.17 Timer Output Control Register 1 (TOCR1)

TOCR1 is an 8-bit readable/writable register that enables/disables PWM synchronized toggle output in complementary PWM mode/reset synchronized PWM mode, and controls output level inversion of PWM output.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | PSYE | - | - | TOCL | TOCS | OLSN | OLSP |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R/W | R | R | R/(W)*3 | R/W | R/W | R/W |

| Bit | Bit Name | Initial value | R/W | Description |
|---|---|---|---|---|
| 7 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 6 | PSYE | 0 | R/W | PWM Synchronous Output Enable<br>This bit selects the enable/disable of toggle output synchronized with the PWM period.<br>0: Toggle output is disabled<br>1: Toggle output is enabled |
| 5, 4 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 3 | TOCL | 0 | R/(W)*3 | TOC Register Write Protection*1<br>This bit selects the enable/disable of write access to the TOCS, OLSN, and OLSP bits in TOCR1.<br>0: Write access to the TOCS, OLSN, and OLSP bits is enabled<br>1: Write access to the TOCS, OLSN, and OLSP bits is disabled |
| 2 | TOCS | 0 | R/W | TOC Select<br>This bit selects either the TOCR1 or TOCR2 setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.<br>0: TOCR1 setting is selected<br>1: TOCR2 setting is selected |
| 1 | OLSN | 0 | R/W | Output Level Select N*2*4<br>This bit selects the negative phase output level in reset-synchronized PWM mode/complementary PWM mode. See Table 10.28. |
| 0 | OLSP | 0 | R/W | Output Level Select P*2<br>This bit selects the positive phase output level in reset-synchronized PWM mode/complementary PWM mode. See Table 10.29. |

Note 1. Setting the TOCL bit to 1 prevents accidental modification when the CPU goes out of control.
Note 2. Clearing the TOCS bit to 0 makes this bit setting valid.
Note 3. After power-on reset, 1 can be written only once. After 1 has been written, 0 cannot be written.
Note 4. If the dead-time is not generated, the negative-phase output will be the exact inverse of the positive-phase output. Furthermore, set OLSP and OLSN to the same value.

**Table 10.28 Output Level Select Function**

| Bit 1 | Function | | | |
|---|---|---|---|---|
| | | | Compare Match Output | |
| OLSN | Initial Output | Active Level | Up Count | Down Count |
| 0 | High level | Low level | High level | Low level |
| 1 | Low level | High level | Low level | High level |

Note: The negative phase waveform initial output value changes to active level after elapse of the dead time after count start.

**Table 10.29 Output Level Select Function**

| Bit 0 | Function | | | |
|---|---|---|---|---|
| | | | Compare Match Output | |
| OLSP | Initial Output | Active Level | Up Count | Down Count |
| 0 | High level | Low level | Low level | High level |
| 1 | Low level | High level | High level | Low level |

Figure 10.2 shows an example of complementary PWM mode output (1 phase) when OLSN = 1, OLSP = 1.

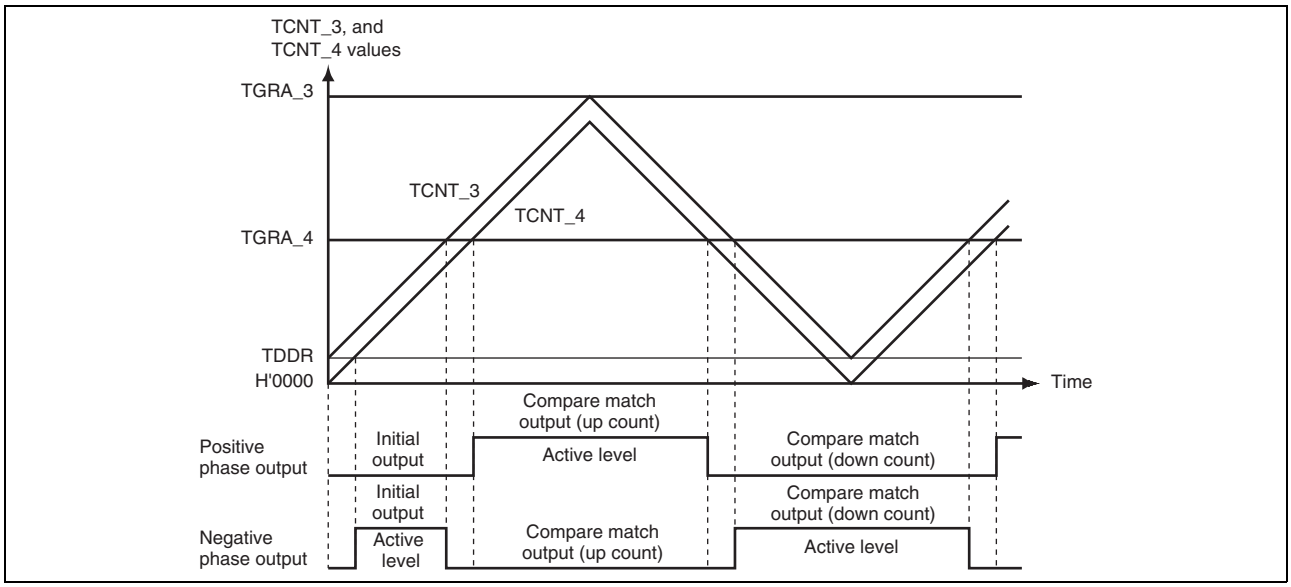


**Figure 10.2 Complementary PWM Mode Output Level Example**

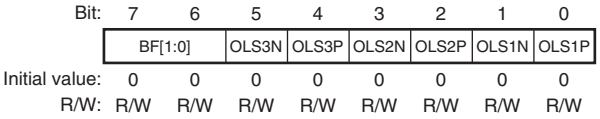
## 10.3.18 Timer Output Control Register 2 (TOCR2)

TOCR2 is an 8-bit readable/writable register that controls output level inversion of PWM output in complementary PWM mode and reset-synchronized PWM mode.



| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BF[1:0] | | OLS3N | OLS3P | OLS2N | OLS2P | OLS1N | OLS1P |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial value | R/W | Description |
|---|---|---|---|---|
| 7, 6 | BF[1:0] | 00 | R/W | TOLBR Buffer Transfer Timing Select<br>These bits select the timing for transferring data from TOLBR to TOCR2.<br>For details, see Table 10.30. |
| 5 | OLS3N | 0 | R/W | Output Level Select 3N*<br>This bit selects the output level on TIOC4D in reset-synchronized PWM mode/ complementary PWM mode. See Table 10.31. |
| 4 | OLS3P | 0 | R/W | Output Level Select 3P*<br>This bit selects the output level on TIOC4B in reset-synchronized PWM mode/ complementary PWM mode. See Table 10.32. |
| 3 | OLS2N | 0 | R/W | Output Level Select 2N*<br>This bit selects the output level on TIOC4C in reset-synchronized PWM mode/ complementary PWM mode. See Table 10.33. |
| 2 | OLS2P | 0 | R/W | Output Level Select 2P*<br>This bit selects the output level on TIOC4A in reset-synchronized PWM mode/ complementary PWM mode. See Table 10.34. |
| 1 | OLS1N | 0 | R/W | Output Level Select 1N*<br>This bit selects the output level on TIOC3D in reset-synchronized PWM mode/ complementary PWM mode. See Table 10.35. |
| 0 | OLS1P | 0 | R/W | Output Level Select 1P*<br>This bit selects the output level on TIOC3B in reset-synchronized PWM mode/ complementary PWM mode. See Table 10.36. |

Note: * Setting the TOCS bit in TOCR1 to 1 makes this bit setting valid.
If the dead-time is not generated, the negative-phase output will be the exact inverse of the positive-phase output. Furthermore, set OLSiP and OLSiN (i = 1, 2, 3) to the same value.

**Table 10.30 Setting of Bits BF1 and BF0**

| Bit 7 | Bit 6 | Description | |
|---|---|---|---|
| BF1 | BF0 | Complementary PWM Mode | Reset-Synchronized PWM Mode |
| 0 | 0 | Does not transfer data from the buffer register (TOLBR) to TOCR2. | Does not transfer data from the buffer register (TOLBR) to TOCR2. |
| 0 | 1 | Transfers data from the buffer register (TOLBR) to TOCR2 at the crest of the TCNT_4 count. | Transfers data from the buffer register (TOLBR) to TOCR2 when TCNT_3/TCNT_4 is cleared |
| 1 | 0 | Transfers data from the buffer register (TOLBR) to TOCR2 at the trough of the TCNT_4 count. | Setting prohibited |
| 1 | 1 | Transfers data from the buffer register (TOLBR) to TOCR2 at the crest and trough of the TCNT_4 count. | Setting prohibited |

**Table 10.31 TIOC4D Output Level Select Function**

| Bit 5 | Function | | | |
|---|---|---|---|---|
| | | | Compare Match Output | |
| OLS3N | Initial Output | Active Level | Up Count | Down Count |
| 0 | High level | Low level | High level | Low level |
| 1 | Low level | High level | Low level | High level |

Note: The negative phase waveform initial output value changes to the active level after elapse of the dead time after count start.

**Table 10.32 TIOC4B Output Level Select Function**

| Bit 4 | Function | | | |
|---|---|---|---|---|

| 0 | High level | Low level | High level | Low level |
| 1 | Low level | High level | Low level | High level |

Note: The negative phase waveform initial output value changes to the active level after elapse of the dead time after count start.

**Table 10.36 TIOC4B Output Level Select Function**

| Bit 0 | Function | | | |
|---|---|---|---|---|
| | | | Compare Match Output | |
| OLS1P | Initial Output | Active Level | Up Count | Down Count |
| 0 | High level | Low level | Low level | High level |
| 1 | Low level | High level | High level | Low level |

## 10.3.19 Timer Output Level Buffer Register (TOLBR)

TOLBR is an 8-bit readable/writable register that functions as a buffer for TOCR2 and specifies the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | OLS3N | OLS3P | OLS2N | OLS2P | OLS1N | OLS1P |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial value | R/W | Description |
|---|---|---|---|---|
| 7, 6 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 5 | OLS3N | 0 | R/W | Specifies the buffer value to be transferred to the OLS3N bit in TOCR2. |
| 4 | OLS3P | 0 | R/W | Specifies the buffer value to be transferred to the OLS3P bit in TOCR2. |
| 3 | OLS2N | 0 | R/W | Specifies the buffer value to be transferred to the OLS2N bit in TOCR2. |
| 2 | OLS2P | 0 | R/W | Specifies the buffer value to be transferred to the OLS2P bit in TOCR2. |
| 1 | OLS1N | 0 | R/W | Specifies the buffer value to be transferred to the OLS1N bit in TOCR2. |
| 0 | OLS1P | 0 | R/W | Specifies the buffer value to be transferred to the OLS1P bit in TOCR2. |

Figure 10.3 shows an example of the PWM output level setting procedure in buffer operation.

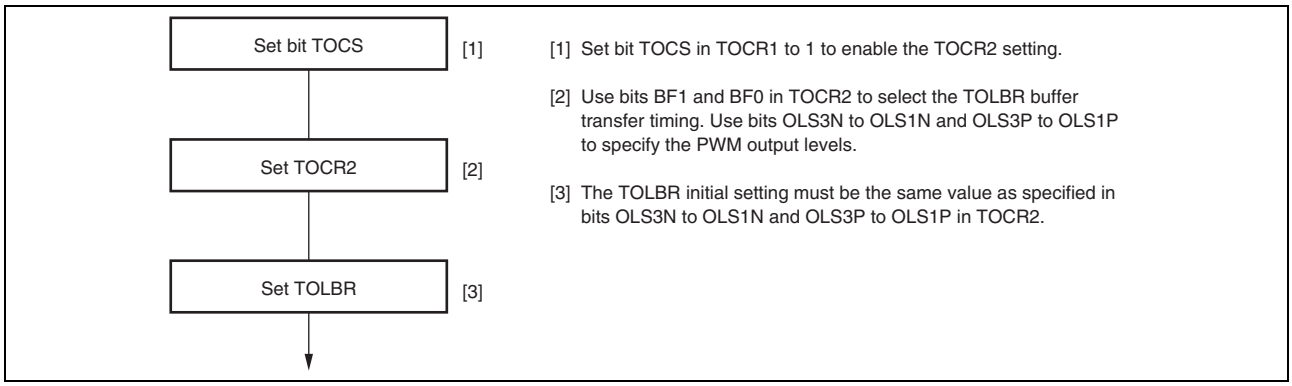

**Figure 10.3 PWM Output Level Setting Procedure in Buffer Operation**

## 10.3.20 Timer Gate Control Register (TGCR)

TGCR is an 8-bit readable/writable register that controls the waveform output necessary for brushless DC motor control in reset-synchronized PWM mode/complementary PWM mode. These register settings are ineffective for anything other than complementary PWM mode/reset-synchronized PWM mode.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | BDC | N | P | FB | WF | VF | UF |
| Initial value: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial value | R/W | Description |
|---|---|---|---|---|
| 7 | — | 1 | R | Reserved<br>This bit is always read as 1. The write value should always be 1. |
| 6 | BDC | 0 | R/W | Brushless DC Motor<br>This bit selects whether to make the functions of this register (TGCR) effective or ineffective.<br>0: Ordinary output<br>1: Functions of this register are made effective |
| 5 | N | 0 | R/W | Negative Phase Output (N) Control<br>This bit selects whether the level output or the reset-synchronized PWM/ complementary PWM output while the reverse pins (TIOC3D, TIOC4C, and TIOC4D) are output.<br>0: Level output<br>1: Reset synchronized PWM/complementary PWM output |
| 4 | P | 0 | R/W | Positive Phase Output (P) Control<br>This bit selects whether the level output or the reset-synchronized PWM/ complementary PWM output while the positive pins (TIOC3B, TIOC4A, and TIOC4B) are output.<br>0: Level output<br>1: Reset synchronized PWM/complementary PWM output |
| 3 | FB | 0 | R/W | External Feedback Signal Enable<br>This bit selects whether the switching of the output of the positive/negative phase is carried out automatically with channel-0 TGRA, TGRB, TGRC input capture signals or by writing 0 or 1 to bits 2 to 0 in TGCR.<br>0: Output switching is external input (Input sources are channel 0 TGRA, TGRB, TGRC input capture signal)<br>1: Output switching is carried out by software (setting values of UF, VF, and WF in TGCR). |
| 2 | WF | 0 | R/W | Output Phase Switch 2 to 0<br>These bits set the positive phase/negative phase output phase on or off state. The setting of these bits is valid only when the FB bit in this register is set to 1. In this case, the setting of bits 2 to 0 is a substitute for external input. See Table 10.37. |
| 1 | VF | 0 | R/W | |
| 0 | UF | 0 | R/W | |

## 10.3.21 Timer Subcounter (TCNTS)

TCNTS is a 16-bit read-only counter that is used only in complementary PWM mode.

The initial value of TCNTS is H'0000.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note: Accessing the TCNTS in 8-bit units is prohibited. Always access in 16-bit units.

## 10.3.22 Timer Dead Time Data Register (TDDR)

TDDR is a 16-bit register, used only in complementary PWM mode that specifies the TCNT_3 and TCNT_4 counter offset values. In complementary PWM mode, when the TCNT_3 and TCNT_4 counters are cleared and then restarted, the TDDR register value is loaded into the TCNT_3 counter and the count operation starts.

The initial value of TDDR is H'FFFF.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: Accessing the TDDR in 8-bit units is prohibited. Always access in 16-bit units.

### 10.3.23 Timer Cycle Data Register (TCDR)

TCDR is a 16-bit register used only in complementary PWM mode. Set half the PWM carrier cycle value (note that this value should be at least double the value specified in TDDR + 3) as the TCDR register value. This register is constantly compared with the TCNTS counter in complementary PWM mode, and when a match occurs, the TCNTS counter switches direction (decrement to increment).

The initial value of TCDR is H'FFFF.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: Accessing the TCDR in 8-bit units is prohibited. Always access in 16-bit units.

### 10.3.24 Timer Cycle Buffer Register (TCBR)

TCBR is a 16-bit register used only in complementary PWM mode. It functions as a buffer register for the TCDR register. The TCBR register values are transferred to the TCDR register with the transfer timing set in the TMDR register. The initial value of TCBR is H'FFFF.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: Accessing the TCBR in 8-bit units is prohibited. Always access in 16-bit units.

## 10.3.25 Timer Interrupt Skipping Set Register (TITCR)

TITCR is an 8-bit readable/writable register that enables or disables interrupt skipping and specifies the interrupt skipping count. This module has one TITCR.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | T3AEN | 3ACOR[2:0] | | | T4VEN | 4VCOR[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial value | R/W | Description |
|---|---|---|---|---|
| 7 | T3AEN | 0 | R/W | T3AEN<br>Enables or disables TGIA_3 interrupt skipping.<br>0: TGIA_3 interrupt skipping disabled<br>1: TGIA_3 interrupt skipping enabled |
| 6 to 4 | 3ACOR[2:0] | 000 | R/W | These bits specify the TGIA_3 interrupt skipping count within the range from 0 to 7.*<br>For details, see Table 10.38. |
| 3 | T4VEN | 0 | R/W | T4VEN<br>Enables or disables TCIV_4 interrupt skipping.<br>0: TCIV_4 interrupt skipping disabled<br>1: TCIV_4 interrupt skipping enabled |
| 2 to 0 | 4VCOR[2:0] | 000 | R/W | These bits specify the TCIV_4 interrupt skipping count within the range from 0 to 7.*<br>For details, see Table 10.39. |

Note: * When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed. Before changing the interrupt skipping count, be sure to clear the T3AEN and T4VEN bits to 0 to clear the skipping counter (TITCNT).

**Table 10.38 Setting of Interrupt Skipping Count by Bits 3ACOR2 to 3ACOR0**

| Bit 6 | Bit 5 | Bit 4 | |
|---|---|---|---|
| **3ACOR2** | **3ACOR1** | **3ACOR0** | **Description** |
| 0 | 0 | 0 | Does not skip TGIA_3 interrupts. |
| 0 | 0 | 1 | Sets the TGIA_3 interrupt skipping count to 1. |
| 0 | 1 | 0 | Sets the TGIA_3 interrupt skipping count to 2. |
| 0 | 1 | 1 | Sets the TGIA_3 interrupt skipping count to 3. |
| 1 | 0 | 0 | Sets the TGIA_3 interrupt skipping count to 4. |
| 1 | 0 | 1 | Sets the TGIA_3 interrupt skipping count to 5. |
| 1 | 1 | 0 | Sets the TGIA_3 interrupt skipping count to 6. |
| 1 | 1 | 1 | Sets the TGIA_3 interrupt skipping count to 7. |

**Table 10.39 Setting of Interrupt Skipping Count by Bits 4VCOR2 to 4VCOR0**

| Bit 2 | Bit 1 | Bit 0 | |
|---|---|---|---|
| **4VCOR2** | **4VCOR1** | **4VCOR0** | **Description** |
| 0 | 0 | 0 | Does not skip TCIV_4 interrupts. |
| 0 | 0 | 1 | Sets the TCIV_4 interrupt skipping count to 1. |
| 0 | 1 | 0 | Sets the TCIV_4 interrupt skipping count to 2. |
| 0 | 1 | 1 | Sets the TCIV_4 interrupt skipping count to 3. |
| 1 | 0 | 0 | Sets the TCIV_4 interrupt skipping count to 4. |
| 1 | 0 | 1 | Sets the TCIV_4 interrupt skipping count to 5. |
| 1 | 1 | 0 | Sets the TCIV_4 interrupt skipping count to 6. |
| 1 | 1 | 1 | Sets the TCIV_4 interrupt skipping count to 7. |

## 10.3.26 Timer Interrupt Skipping Counter (TITCNT)

TITCNT is an 8-bit readable counter. This module has one TITCNT. TITCNT retains its value even after stopping the count operation of TCNT_3 and TCNT_4.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | 3ACNT[2:0] | | | - | 4VCNT[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | — | 0 | R | Reserved<br>This bit is always read as 0. |
| 6 to 4 | 3ACNT[2:0] | 000 | R | TGIA_3 Interrupt Counter<br>While the T3AEN bit in TITCR is set to 1, the count in these bits is incremented every time a TGIA_3 interrupt occurs.<br>[Clearing conditions]<br>• When the 3ACNT2 to 3ACNT0 value in TITCNT matches the 3ACOR2 to 3ACOR0 value in TITCR<br>• When the T3AEN bit in TITCR is cleared to 0<br>• When the 3ACOR2 to 3ACOR0 bits in TITCR are cleared to 0 |
| 3 | — | 0 | R | Reserved<br>This bit is always read as 0. |
| 2 to 0 | 4VCNT[2:0] | 000 | R | TCIV_4 Interrupt Counter<br>While the T4VEN bit in TITCR is set to 1, the count in these bits is incremented every time a TCIV_4 interrupt occurs.<br>[Clearing conditions]<br>• When the 4VCNT2 to 4VCNT0 value in TITCNT matches the 4VCOR2 to 4VCOR0 value in TITCR<br>• When the T4VEN bit in TITCR is cleared to 0<br>• When the 4VCOR2 to 4VCOR0 bits in TITCR are cleared to 0 |

Note: To clear the TITCNT, clear the bits T3AEN and T4VEN in TITCR to 0.

## 10.3.27 Timer Buffer Transfer Set Register (TBTER)

TBTER is an 8-bit readable/writable register that enables or disables transfer from the buffer registers* used in complementary PWM mode to the temporary registers and specifies whether to link the transfer with interrupt skipping operation. This module has one TBTER.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | BTE[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1, 0 | BTE[1:0] | 00 | R/W | These bits enable or disable transfer from the buffer registers* used in complementary PWM mode to the temporary registers and specify whether to link the transfer with interrupt skipping operation.<br>For details, see Table 10.40. |

Note: * Applicable buffer registers:
TGRC_3, TGRD_3, TGRC_4, TGRD_4, and TCBR

**Table 10.40 Setting of Bits BTE1 and BTE0**

| Bit 1 | Bit 0 | |
|---|---|---|
| **BTE1** | **BTE0** | **Description** |
| 0 | 0 | Enables transfer from the buffer registers to the temporary registers*1 and does not link the transfer with interrupt skipping operation. |
| 0 | 1 | Disables transfer from the buffer registers to the temporary registers. |
| 1 | 0 | Links transfer from the buffer registers to the temporary registers with interrupt skipping operation.*2 |
| 1 | 1 | Setting prohibited |

Note 1. Data is transferred according to the MD3 to MD0 bit setting in TMDR. For details, refer to section 10.4.8, Complementary PWM Mode.

Note 2. When interrupt skipping is disabled (the T3AEN and T4VEN bits are cleared to 0 in the timer interrupt skipping set register (TITCR) or the skipping count set bits (3ACOR and 4VCOR) in TITCR are cleared to 0)), be sure to disable link of buffer transfer with interrupt skipping (clear the BTE1 bit in the timer buffer transfer set register (TBTER) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

## 10.3.28 Timer Dead Time Enable Register (TDER)

TDER is an 8-bit readable/writable register that controls dead time generation in complementary PWM mode. This module has one TDER in channel 3. TDER must be modified only while TCNT stops.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | TDER |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R/(W) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | TDER | 1 | R/(W) | Dead Time Enable<br>Specifies whether to generate dead time.<br>0: Does not generate dead time<br>1: Generates dead time*<br>[Clearing condition]<br>• When 0 is written to TDER after reading TDER = 1 |

Note: * TDDR must be set to 1 or a larger value.

## 10.3.29 Timer Waveform Control Register (TWCR)

TWCR is an 8-bit readable/writable register that controls the waveform when synchronous counter clearing occurs in TCNT_3 and TCNT_4 in complementary PWM mode and specifies whether to clear the counters at TGRA_3 compare match. The CCE bit and WRE bit in TWCR must be modified only while TCNT stops.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CCE | - | - | - | - | - | - | WRE |
| Initial value: | 0* | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/(W) | R | R | R | R | R | R | R/(W) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | CCE | 0* | R/(W) | Compare Match Clear Enable<br>Specifies whether to clear counters at TGRA_3 compare match in complementary PWM mode.<br>0: Does not clear counters at TGRA_3 compare match<br>1: Clears counters at TGRA_3 compare match<br>[Setting condition]<br>• When 1 is written to CCE after reading CCE = 0 |
| 6 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | WRE | 0 | R/(W) | Initial Output Suppression Enable<br>Selects the waveform output when synchronous counter clearing occurs in complementary PWM mode. The initial output is suppressed only when synchronous clearing occurs within the Tb interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial value specified in TOCR is output regardless of the WRE bit setting. The initial value is also output when synchronous clearing occurs in the Tb interval at the trough immediately after TCNT_3 and TCNT_4 start operation. For the Tb interval at the trough in complementary PWM mode, see Figure 10.40.<br>0: Outputs the initial value specified in TOCR<br>1: Suppresses initial output<br>[Setting condition]<br>• When 1 is written to WRE after reading WRE = 0 |

Note: * Do not set to 1 when complementary PWM mode 1 is not selected.

## 10.3.30 Bus Master Interface

The timer counters (TCNT), general registers (TGR), timer subcounter (TCNTS), timer cycle buffer register (TCBR), timer dead time data register (TDDR), timer cycle data register (TCDR), timer A/D converter start request control register (TADCR), timer A/D converter start request cycle set registers (TADCOR), and timer A/D converter start request cycle set buffer registers (TADCOBR) are 16-bit registers. 16-bit read/writes is possible. 8-bit read/write is not possible. Always access in 16-bit units.

All registers other than the above registers are 8-bit registers. 8-bit read/writes is possible. 16-bit read/writes is not possible. Always access in 8-bit units.

## 10.4 Operation

### 10.4.1 Basic Functions

Each channel has a TCNT and TGR register. TCNT performs up-counting, and is also capable of free-running operation, cycle counting, and external event counting.

Each TGR can be used as an input capture register or output compare register.

Always select functions for external pins of this module using the general I/O ports.

#### (1) Counter Operation

When one of bits CST0 to CST4 in TSTR is set to 1, the TCNT counter for the corresponding channel begins counting. TCNT can operate as a free-running counter, periodic counter, for example.

#### (a) Example of Count Operation Setting Procedure

Figure 10.4 shows an example of the count operation setting procedure.

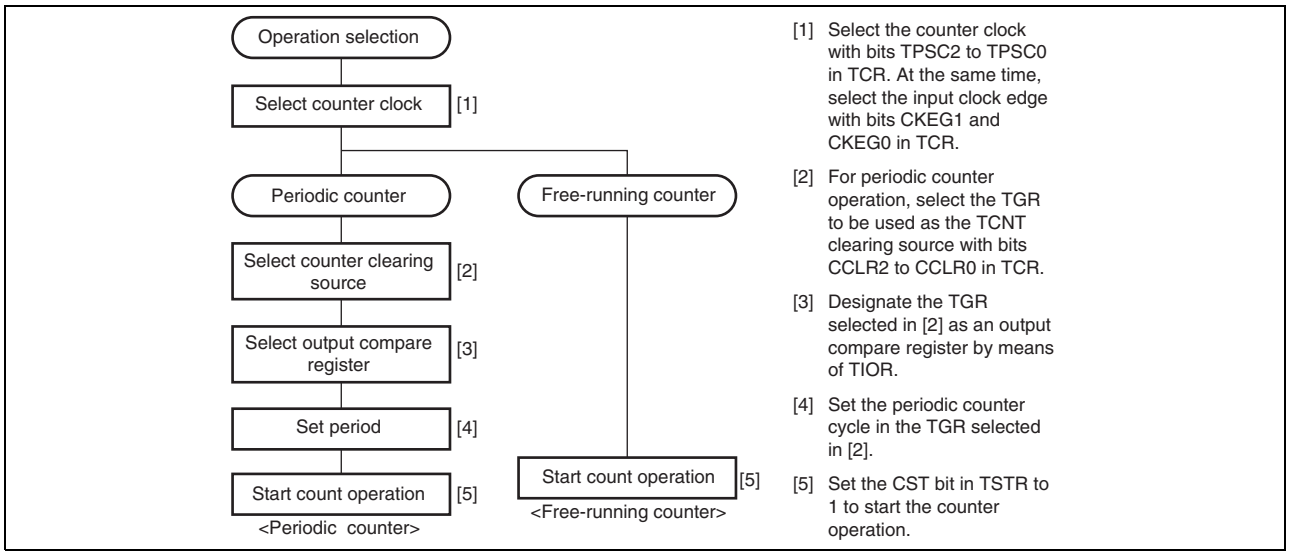

**Figure 10.4 Example of Counter Operation Setting Procedure**

### (b) Free-Running Count Operation and Periodic Count Operation:

Immediately after a reset, the TCNT counters of this module are all designated as free-running counters. When the relevant bit in TSTR is set to 1 the corresponding TCNT counter starts up-count operation as a free-running counter. When TCNT overflows (from H'FFFF to H'0000), the TCFV bit in TSR is set to 1. If the value of the corresponding TCIEV bit in TIER is 1 at this point, this module requests an interrupt. After overflow, TCNT starts counting up again from H'0000.

Figure 10.5 illustrates free-running counter operation.

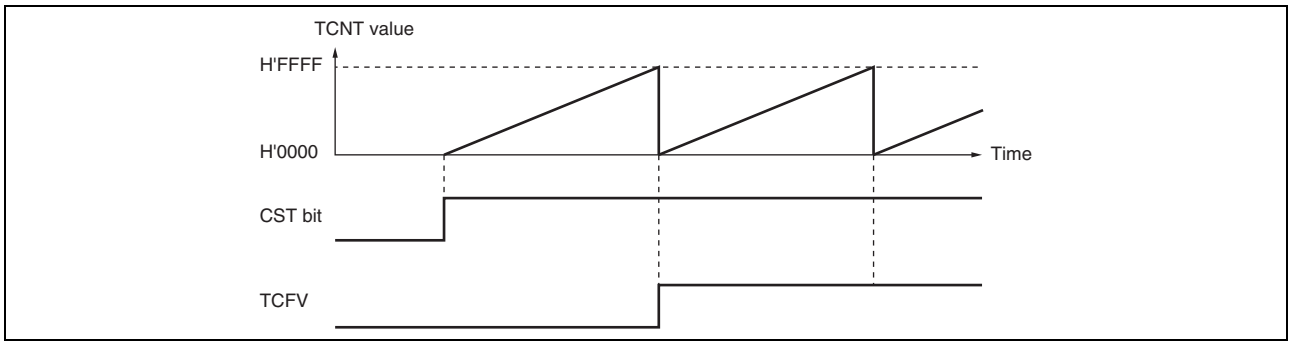

**Figure 10.5 Free-Running Counter Operation**

When compare match is selected as the TCNT clearing source, the TCNT counter for the relevant channel performs periodic count operation. The TGR register for setting the period is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR0 to CCLR2 in TCR. After the settings have been made, TCNT starts up-count operation as a periodic counter when the corresponding bit in TSTR is set to 1. When the count value matches the value in TGR, the TGF bit in TSR is set to 1 and TCNT is cleared to H'0000.

If the value of the corresponding TGIE bit in TIER is 1 at this point, this module requests an interrupt. After a compare match, TCNT starts counting up again from H'0000.

Figure 10.6 illustrates periodic counter operation.

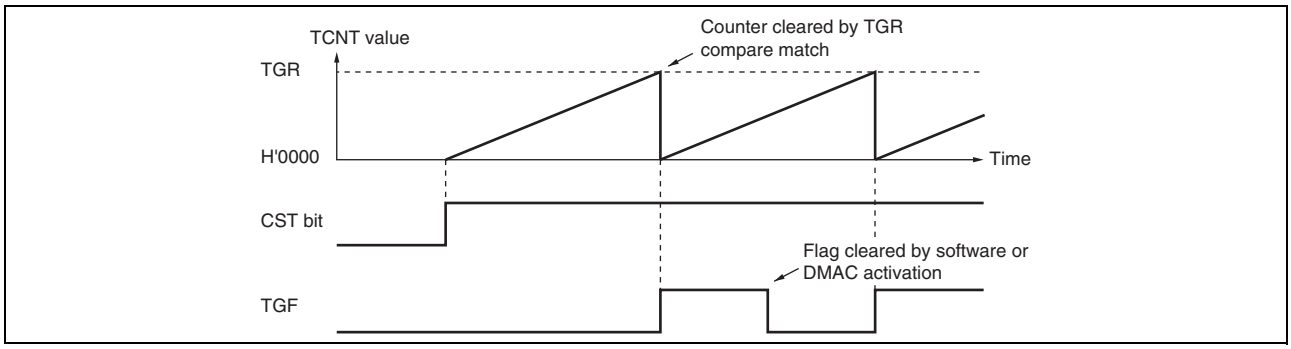

**Figure 10.6 Periodic Counter Operation**

### (2) Waveform Output by Compare Match

This module can perform 0, 1, or toggle output from the corresponding output pin using compare match.

#### (a) Example of Setting Procedure for Waveform Output by Compare Match

Figure 10.7 shows an example of the setting procedure for waveform output by compare match.

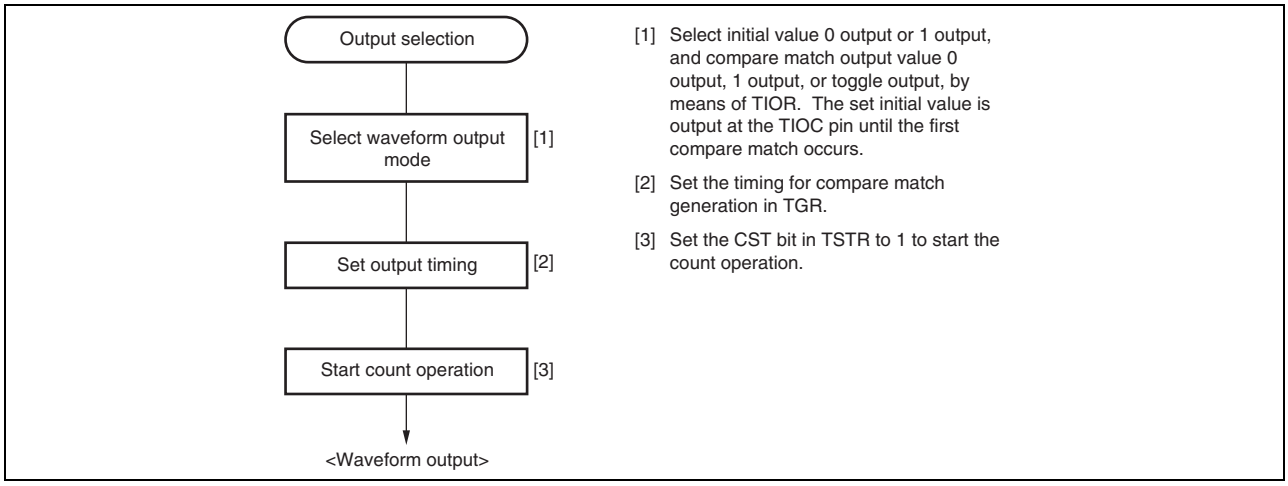

**Figure 10.7 Example of Setting Procedure for Waveform Output by Compare Match**

#### (b) Examples of Waveform Output Operation:

Figure 10.8 shows an example of 0 output/1 output.

In this example TCNT has been designated as a free-running counter, and settings have been made such that 1 is output by compare match A, and 0 is output by compare match B. When the set level and the pin level coincide, the pin level does not change.

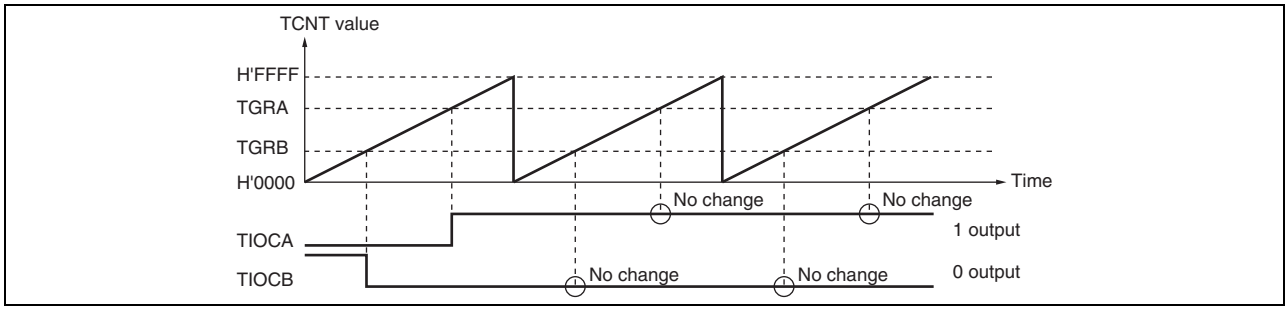

**Figure 10.8 Example of 0 Output/1 Output Operation**

Figure 10.9 shows an example of toggle output.

In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made such that the output is toggled by both compare match A and compare match B.

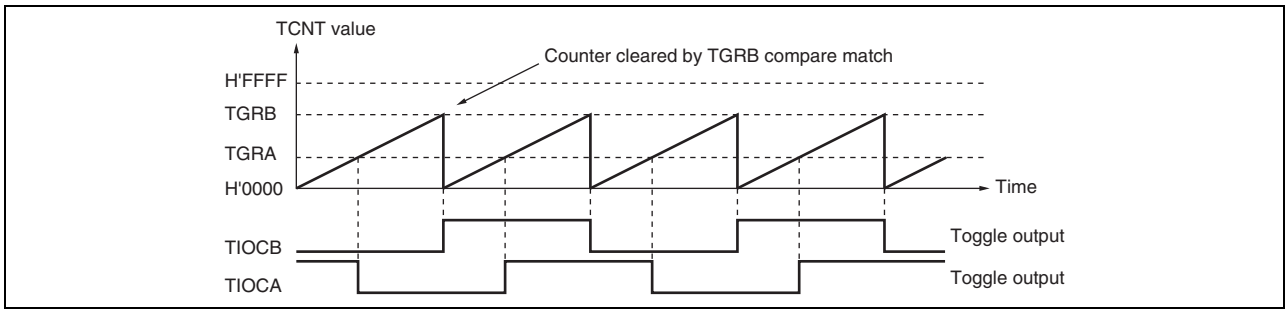

**Figure 10.9 Example of Toggle Output Operation**

### (3) Input Capture Function

The TCNT value can be transferred to TGR on detection of the TIOC pin input edge.

Rising edge, falling edge, or both edges can be selected as the detected edge. For channels 0 and 1, it is also possible to specify another channel's counter input clock or compare match signal as the input capture source.

Note: When another channel's counter input clock is used as the input capture input for channels 0 and 1, P0ϕ/1 should not be selected as the counter input clock used for input capture input. Input capture will not be generated if P0ϕ/1 is selected.

#### (a) Example of Input Capture Operation Setting Procedure

Figure 10.10 shows an example of the input capture operation setting procedure.

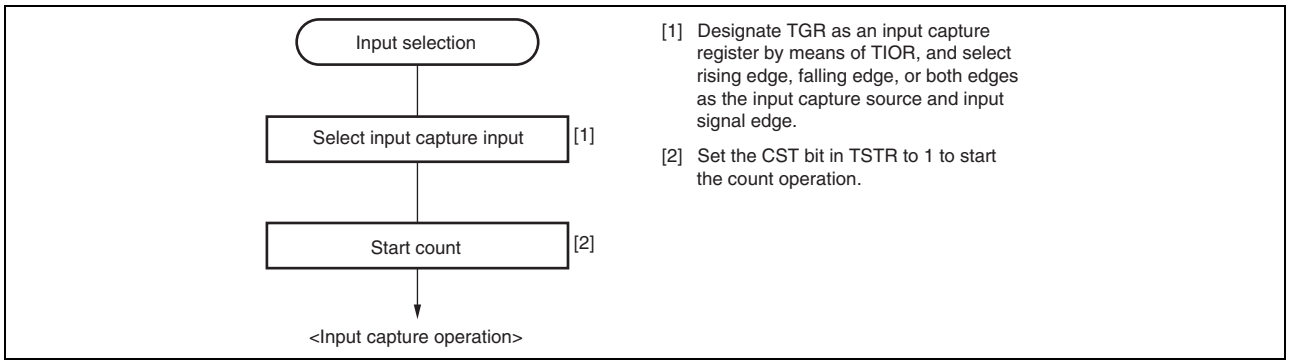

**Figure 10.10 Example of Input Capture Operation Setting Procedure**

### (b) Example of Input Capture Operation

Figure 10.11 shows an example of input capture operation.

In this example both rising and falling edges have been selected as the TIOCA pin input capture input edge, the falling edge has been selected as the TIOCB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT.

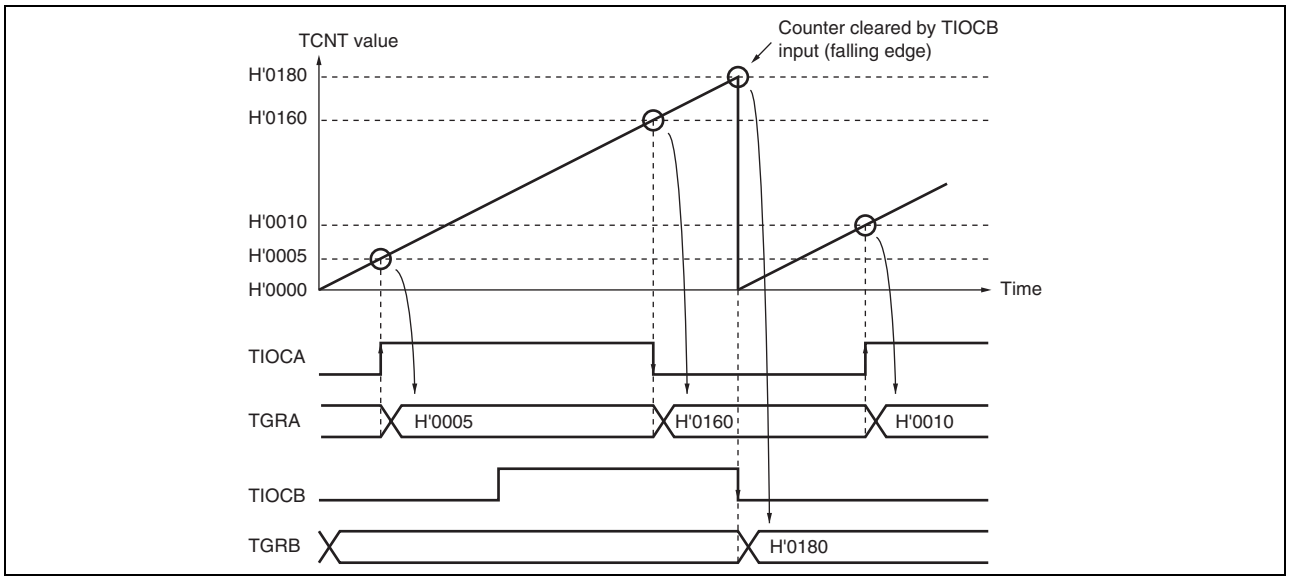

**Figure 10.11 Example of Input Capture Operation**

## 10.4.2 Synchronous Operation

In synchronous operation, the values in a number of TCNT counters can be rewritten simultaneously (synchronous presetting). Also, a number of TCNT counters can be cleared simultaneously by making the appropriate setting in TCR (synchronous clearing).

Synchronous operation enables TGR to be incremented with respect to a single time base.

Channels 0 to 4 can all be designated for synchronous operation.

### (1) Example of Synchronous Operation Setting Procedure

Figure 10.12 shows an example of the synchronous operation setting procedure.

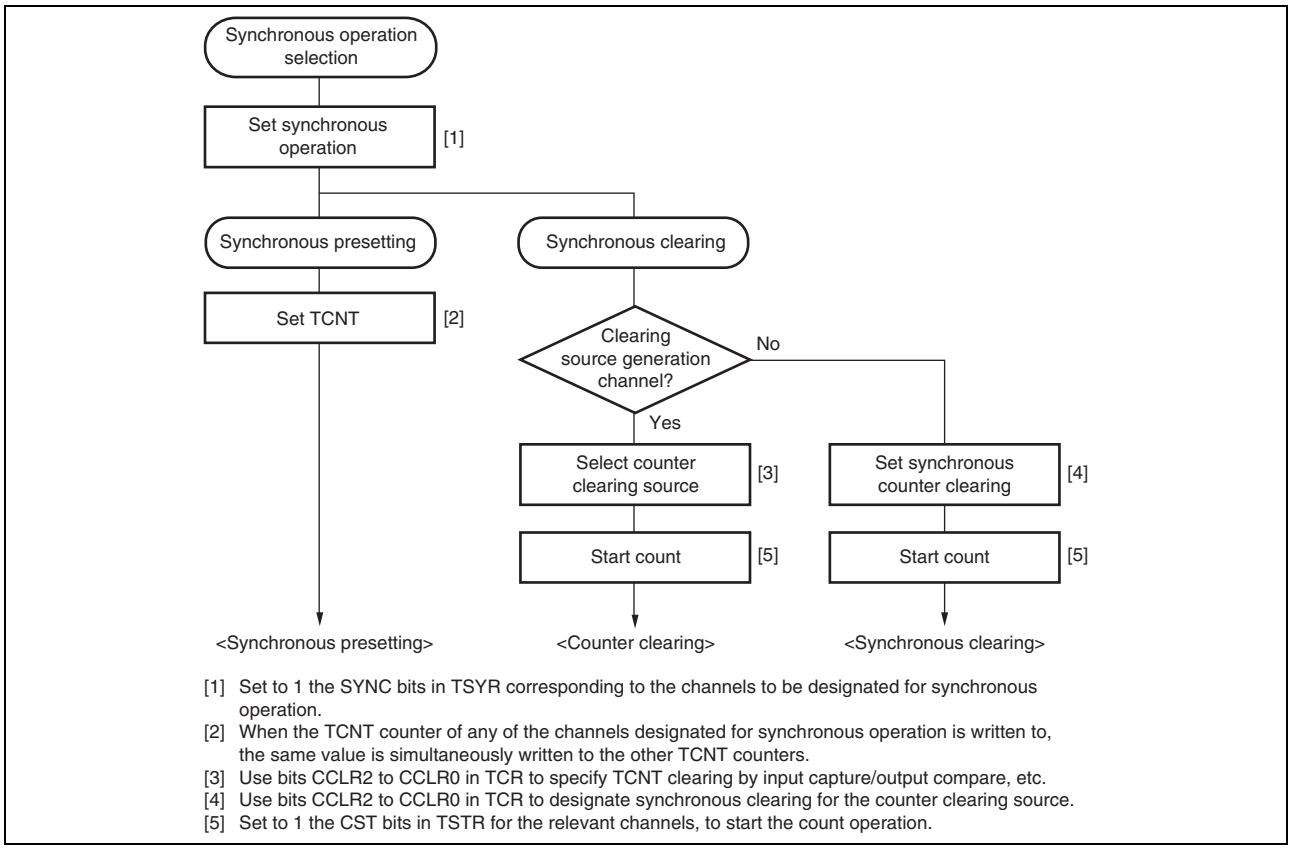

**Figure 10.12 Example of Synchronous Operation Setting Procedure**

### (2) Example of Synchronous Operation

Figure 10.13 shows an example of synchronous operation.

In this example, synchronous operation and PWM mode 1 have been designated for channels 0 to 2, TGRB_0 compare match has been set as the channel 0 counter clearing source, and synchronous clearing has been set for the channel 1 and 2 counter clearing source.

Three-phase PWM waveforms are output from pins TIOC0A, TIOC1A, and TIOC2A. At this time, synchronous presetting, and synchronous clearing by TGRB_0 compare match, are performed for channel 0 to 2 TCNT counters, and the data set in TGRB_0 is used as the PWM cycle.

For details of PWM modes, see section 10.4.5, PWM Modes.

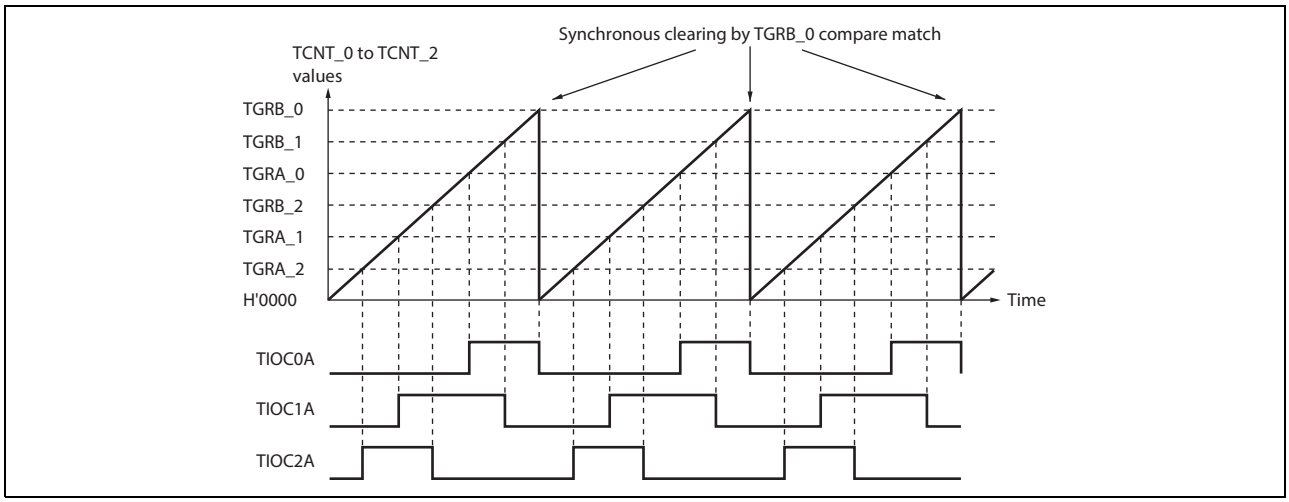

**Figure 10.13 Example of Synchronous Operation**

### 10.4.3 Buffer Operation

Buffer operation, provided for channels 0, 3, and 4, enables TGRC and TGRD to be used as buffer registers. In channel 0, TGRF can also be used as a buffer register.

Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

Note: TGRE_0 cannot be designated as an input capture register and can only operate as a compare match register.

Table 10.41 shows the register combinations used in buffer operation.

**Table 10.41 Register Combinations in Buffer Operation**

| Channel | Timer General Register | Buffer Register |
|---|---|---|
| 0 | TGRA_0 | TGRC_0 |
| | TGRB_0 | TGRD_0 |
| | TGRE_0 | TGRF_0 |
| 3 | TGRA_3 | TGRC_3 |
| | TGRB_3 | TGRD_3 |
| 4 | TGRA_4 | TGRC_4 |
| | TGRB_4 | TGRD_4 |

- When TGR is an output compare register
  When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.
  This operation is illustrated in Figure 10.14.

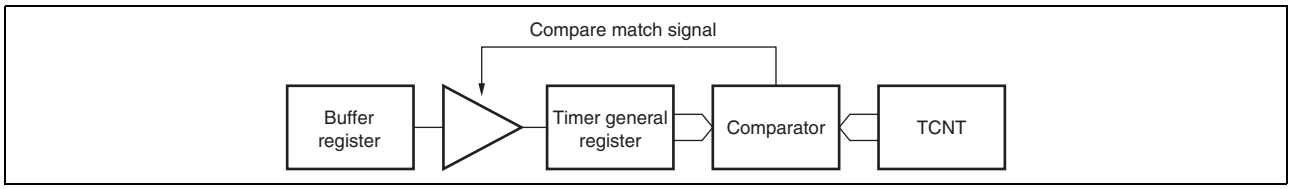

**Figure 10.14 Compare Match Buffer Operation**

- When TGR is an input capture register
  When input capture occurs, the value in TCNT is transferred to TGR and the value previously held in the timer general register is transferred to the buffer register.
  This operation is illustrated in Figure 10.15.

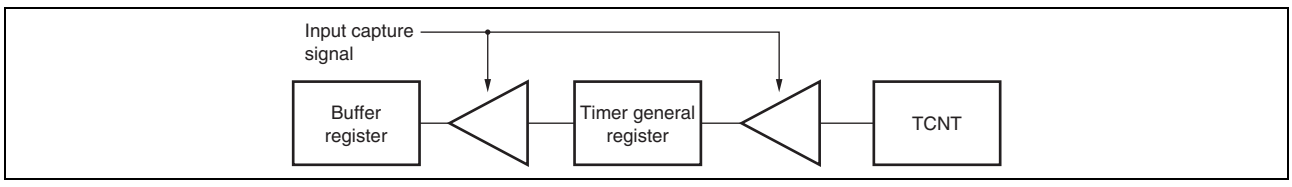

**Figure 10.15 Input Capture Buffer Operation**

### (1) Example of Buffer Operation Setting Procedure

Figure 10.16 shows an example of the buffer operation setting procedure.

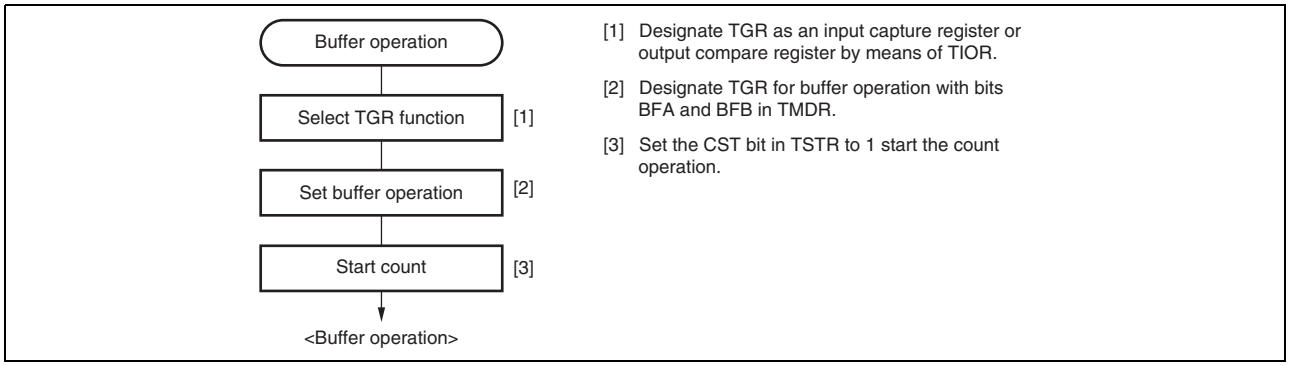

**Figure 10.16 Example of Buffer Operation Setting Procedure**

### (2) Examples of Buffer Operation

#### (a) When TGR is an output compare register

Figure 10.17 shows an operation example in which PWM mode 1 has been designated for channel 0, and buffer operation has been designated for TGRA and TGRC. The settings used in this example are TCNT clearing by compare match B, 1 output at compare match A, and 0 output at compare match B. In this example, the TTSA bit in TBTM is cleared to 0.

As buffer operation has been set, when compare match A occurs the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time that compare match A occurs.

For details of PWM modes, see section 10.4.5, PWM Modes.

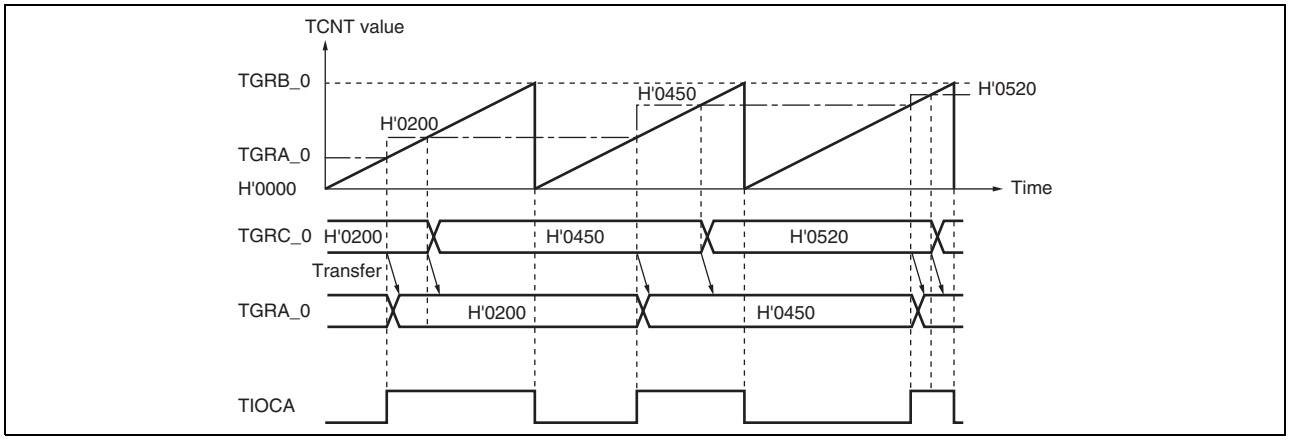

**Figure 10.17 Example of Buffer Operation (1)**

### (b) When TGR is an input capture register

Figure 10.18 shows an operation example in which TGRA has been designated as an input capture register, and buffer operation has been designated for TGRA and TGRC.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the TIOCA pin input capture input edge.

As buffer operation has been set, when the TCNT value is stored in TGRA upon the occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

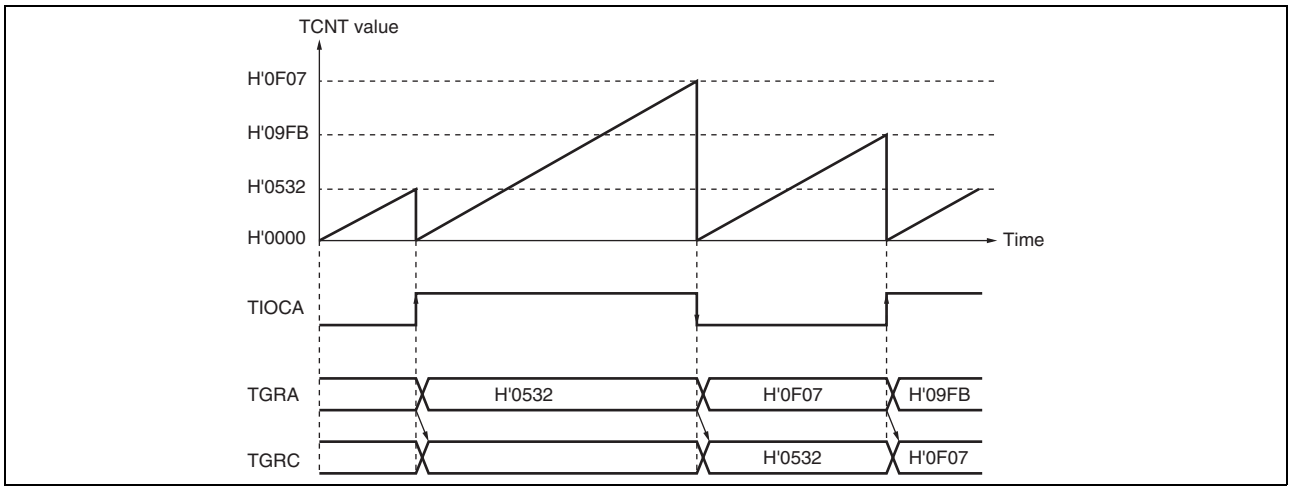

**Figure 10.18 Example of Buffer Operation (2)**

### (3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in Buffer Operation

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode 1 or 2 for channel 0 or in PWM mode 1 for channels 3 and 4 by setting the buffer operation transfer mode registers (TBTM_0, TBTM_3, and TBTM_4). Either compare match (initial setting) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (H'FFFF to H'0000)
- When H'0000 is written to TCNT during counting
- When TCNT is cleared to H'0000 under the condition specified in the CCLR2 to CCLR0 bits in TCR

Note: TBTM must be modified only while TCNT stops.

Figure 10.19 shows an operation example in which PWM mode 1 is designated for channel 0 and buffer operation is designated for TGRA_0 and TGRC_0. The settings used in this example are TCNT_0 clearing by compare match B, 1 output at compare match A, and 0 output at compare match B. The TTSA bit in TBTM_0 is set to 1.

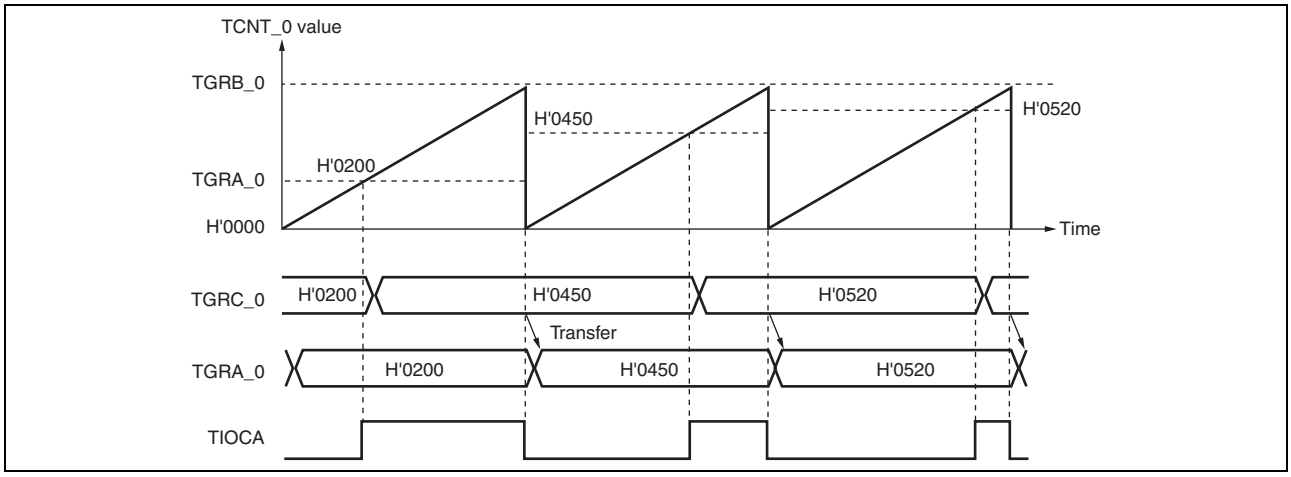

**Figure 10.19 Example of Buffer Operation When TCNT_0 Clearing is Selected for TGRC_0 to TGRA_0 Transfer Timing**

### 10.4.4 Cascaded Operation

In cascaded operation, two 16-bit counters for different channels are used together as a 32-bit counter.

This function works by counting the channel 1 counter clock upon overflow/underflow of TCNT_2 as set in bits TPSC0 to TPSC2 in TCR.

Underflow occurs only when the lower 16-bit TCNT is in phase-counting mode.

Table 10.42 shows the register combinations used in cascaded operation.

Note: When phase counting mode is set for channel 1, the counter clock setting is invalid and the counters operates independently in phase counting mode.

**Table 10.42 Cascaded Combinations**

| Combination | Upper 16 Bits | Lower 16 Bits |
|---|---|---|
| Channels 1 and 2 | TCNT_1 | TCNT_2 |

For simultaneous input capture of TCNT_1 and TCNT_2 during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). The condition for input capture is the detection of an edge in the signal obtained from the logical OR of the signal on the main input pin and the signal on the additional input pin. For details, see (4), Cascaded Operation Example (c). For input capture in cascade connection, refer to section 10.7.22, Simultaneous Capture of TCNT_1 and TCNT_2 in Cascade Connection.

Table 10.43 show the TICCR setting and input capture input pins.

**Table 10.43 TICCR Setting and Input Capture Input Pins**

| Target Input Capture | TICCR Setting | Input Capture Input Pins |
|---|---|---|
| Input capture from TCNT_1 to TGRA_1 | I2AE bit = 0 (initial value) | TIOC1A |
| | I2AE bit = 1 | TIOC1A, TIOC2A |
| Input capture from TCNT_1 to TGRB_1 | I2BE bit = 0 (initial value) | TIOC1B |
| | I2BE bit = 1 | TIOC1B, TIOC2B |
| Input capture from TCNT_2 to TGRA_2 | I1AE bit = 0 (initial value) | TIOC2A |
| | I1AE bit = 1 | TIOC2A, TIOC1A |
| Input capture from TCNT_2 to TGRB_2 | I1BE bit = 0 (initial value) | TIOC2B |
| | I1BE bit = 1 | TIOC2B, TIOC1B |

### (1) Example of Cascaded Operation Setting Procedure

Figure 10.20 shows an example of the setting procedure for cascaded operation.

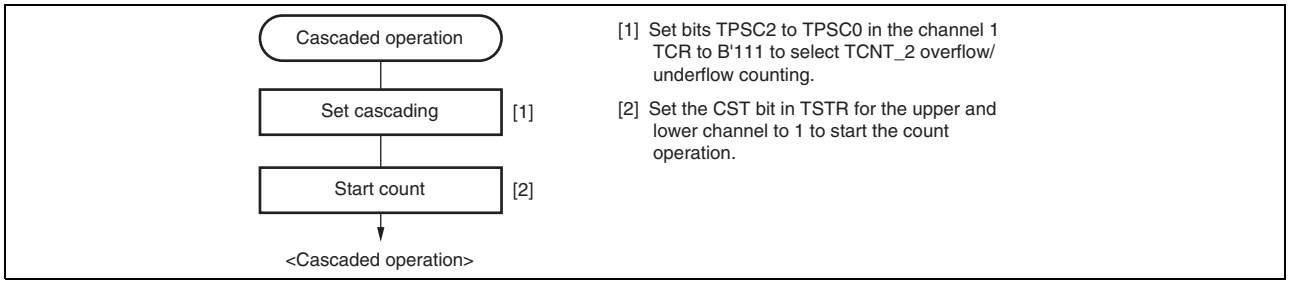

**Figure 10.20 Cascaded Operation Setting Procedure**

### (2) Cascaded Operation Example (a)

Figure 10.21 illustrates the operation when TCNT_2 overflow/underflow counting has been set for TCNT_1 and phase counting mode has been designated for channel 2.

TCNT_1 is incremented by TCNT_2 overflow and decremented by TCNT_2 underflow.

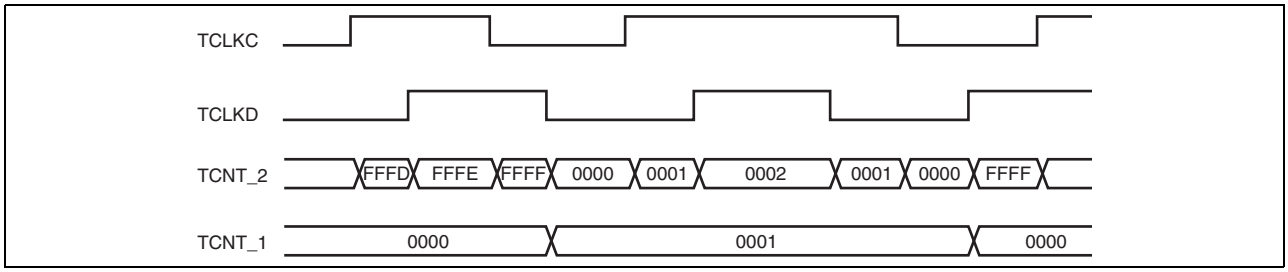

**Figure 10.21 Cascaded Operation Example (a)**

### (3) Cascaded Operation Example (b)

Figure 10.22 illustrates the operation when TCNT_1 and TCNT_2 have been cascaded and the I2AE bit in TICCR has been set to 1 to include the TIOC2A pin in the TGRA_1 input capture conditions. In this example, the IOA0 to IOA3 bits in TIOR_1 have selected the TIOC1A rising edge for the input capture timing while the IOA0 to IOA3 bits in TIOR_2 have selected the TIOC2A rising edge for the input capture timing.

Under these conditions, the rising edge of both TIOC1A and TIOC2A is used for the TGRA_1 input capture condition. For the TGRA_2 input capture condition, the TIOC2A rising edge is used.

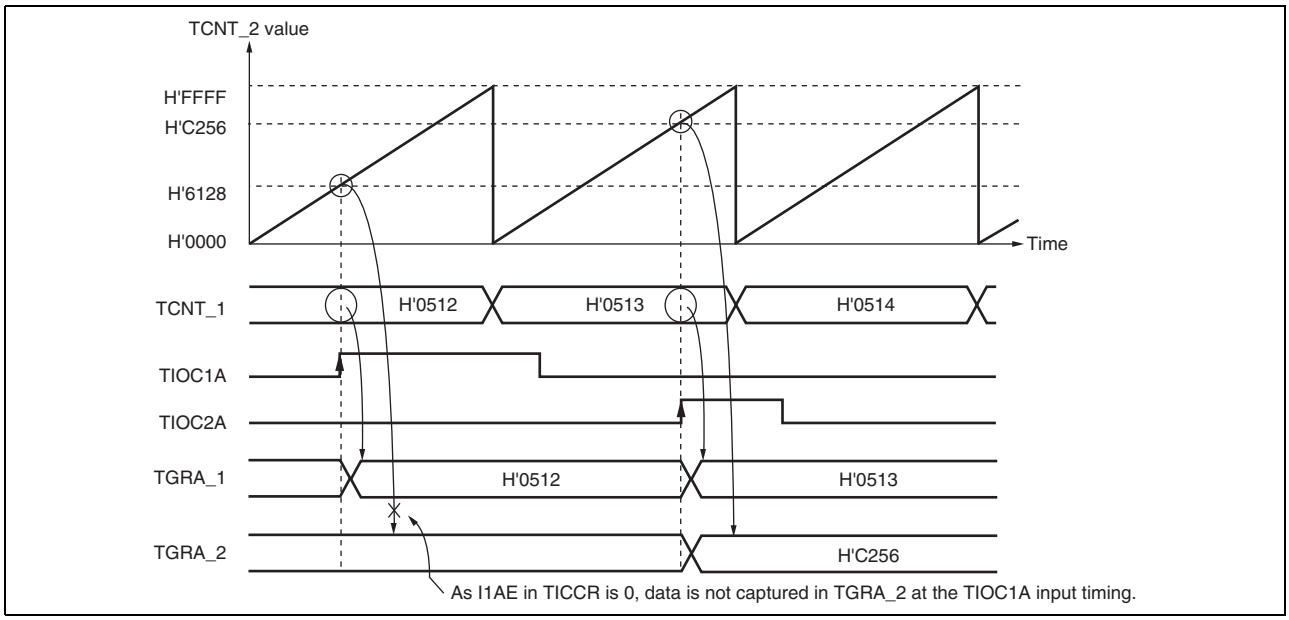

**Figure 10.22 Cascaded Operation Example (b)**

### (4) Cascaded Operation Example (c)

Figure 10.23 illustrates the operation when TCNT_1 and TCNT_2 have been cascaded and the I2AE and I1AE bits in TICCR have been set to 1 to include the TIOC2A and TIOC1A pins in the TGRA_1 and TGRA_2 input capture conditions, respectively. In this example, the IOA0 to IOA3 bits in both TIOR_1 and TIOR_2 have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of TIOC1A and TIOC2A input is used for the TGRA_1 and TGRA_2 input capture conditions.

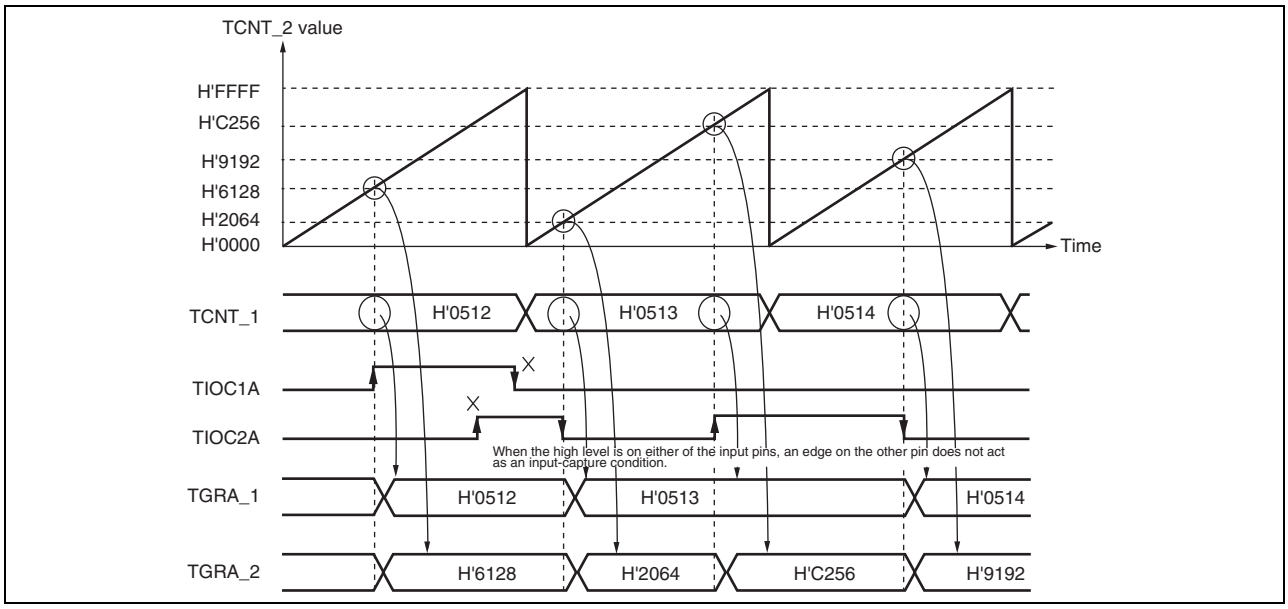

**Figure 10.23 Cascaded Operation Example (c)**

### (5) Cascaded Operation Example (d)

Figure 10.24 illustrates the operation when TCNT_1 and TCNT_2 have been cascaded and the I2AE bit in TICCR has been set to 1 to include the TIOC2A pin in the TGRA_1 input capture conditions. In this example, the IOA0 to IOA3 bits in TIOR_1 have selected TGRA_0 compare match or input capture occurrence for the input capture timing while the IOA0 to IOA3 bits in TIOR_2 have selected the TIOC2A rising edge for the input capture timing.

Under these conditions, as TIOR_1 has selected TGRA_0 compare match or input capture occurrence for the input capture timing, the TIOC2A edge is not used for TGRA_1 input capture condition although the I2AE bit in TICCR has been set to 1.

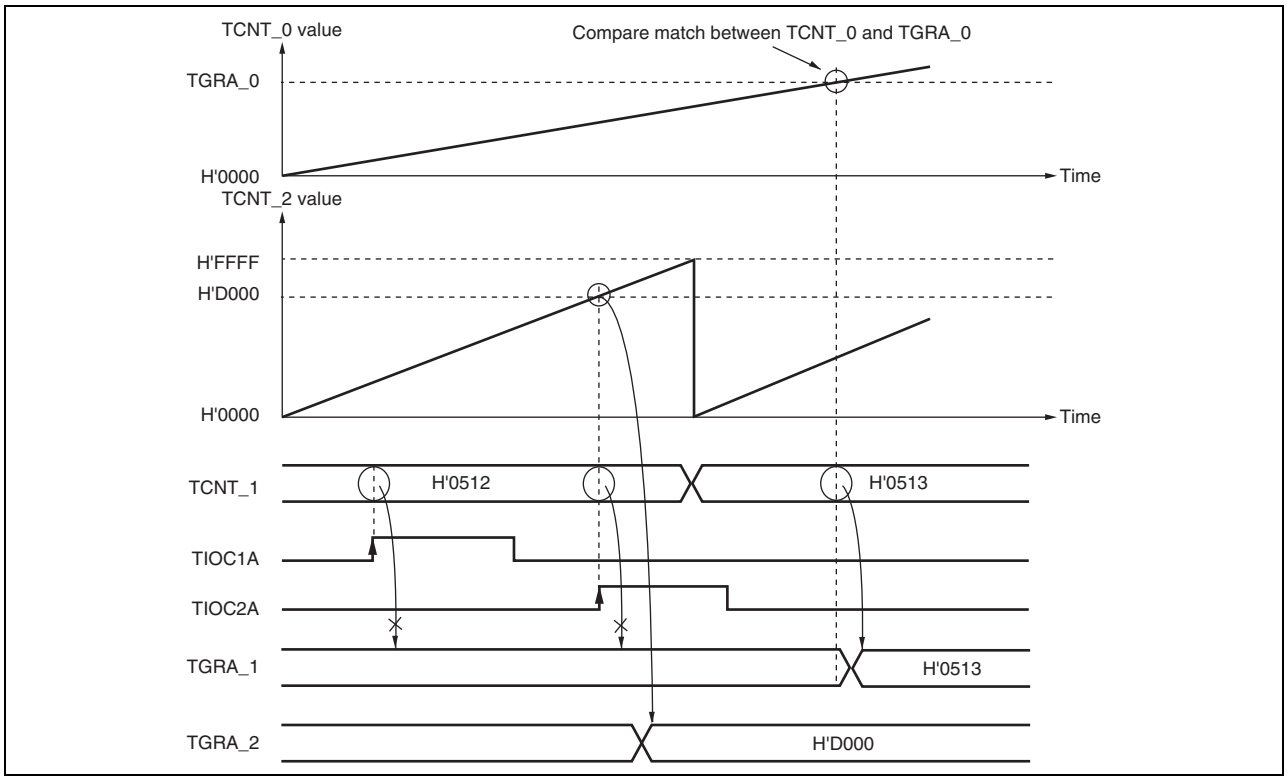

**Figure 10.24 Cascaded Operation Example (d)**

### 10.4.5 PWM Modes

In PWM mode, PWM waveforms are output from the output pins. The output level can be selected as 0, 1, or toggle output in response to a compare match of each TGR.

TGR registers settings can be used to output a PWM waveform in the range of 0% to 100% duty.

Designating TGR compare match as the counter clearing source enables the period to be set in that register. All channels can be designated for PWM mode independently. Synchronous operation is also possible.

There are two PWM modes, as described below.

- PWM mode 1
  PWM output is generated from the TIOCA and TIOCC pins by pairing TGRA with TGRB and TGRC with TGRD. The output specified by bits IOA0 to IOA3 and IOC0 to IOC3 in TIOR is output from the TIOCA and TIOCC pins at compare matches A and C, and the output specified by bits IOB0 to IOB3 and IOD0 to IOD3 in TIOR is output at compare matches B and D. The initial output value is the value set in TGRA or TGRC. If the set values of paired TGRs are identical, the output value does not change when a compare match occurs.
  In PWM mode 1, a maximum 8-phase PWM output is possible.
- PWM mode 2
  PWM output is generated using one TGR as the cycle register and the others as duty registers. The output specified in TIOR is performed by means of compare matches. Upon counter clearing by a cycle register compare match, the output value of each pin is the initial value set in TIOR. If the set values of the cycle and duty registers are identical, the output value does not change when a compare match occurs.
  In PWM mode 2, a maximum 8-phase PWM output is possible in combination use with synchronous operation.

The correspondence between PWM output pins and registers is shown in Table 10.44.

**Table 10.44 PWM Output Registers and Output Pins**

| | | Output Pins | |
|---|---|---|---|
| **Channel** | **Registers** | **PWM Mode 1** | **PWM Mode 2** |
| 0 | TGRA_0 | TIOC0A | TIOC0A |
| | TGRB_0 | | TIOC0B |
| | TGRC_0 | TIOC0C | TIOC0C |
| | TGRD_0 | | TIOC0D |
| 1 | TGRA_1 | TIOC1A | TIOC1A |
| | TGRB_1 | | TIOC1B |
| 2 | TGRA_2 | TIOC2A | TIOC2A |
| | TGRB_2 | | TIOC2B |
| 3 | TGRA_3 | TIOC3A | Cannot be set |
| | TGRB_3 | | Cannot be set |
| | TGRC_3 | TIOC3C | Cannot be set |
| | TGRD_3 | | Cannot be set |
| 4 | TGRA_4 | TIOC4A | Cannot be set |
| | TGRB_4 | | Cannot be set |
| | TGRC_4 | TIOC4C | Cannot be set |
| | TGRD_4 | | Cannot be set |

Note: In PWM mode 2, PWM output is not possible for the TGR register in which the period is set.

### (1) Example of PWM Mode Setting Procedure

Figure 10.25 shows an example of the PWM mode setting procedure.

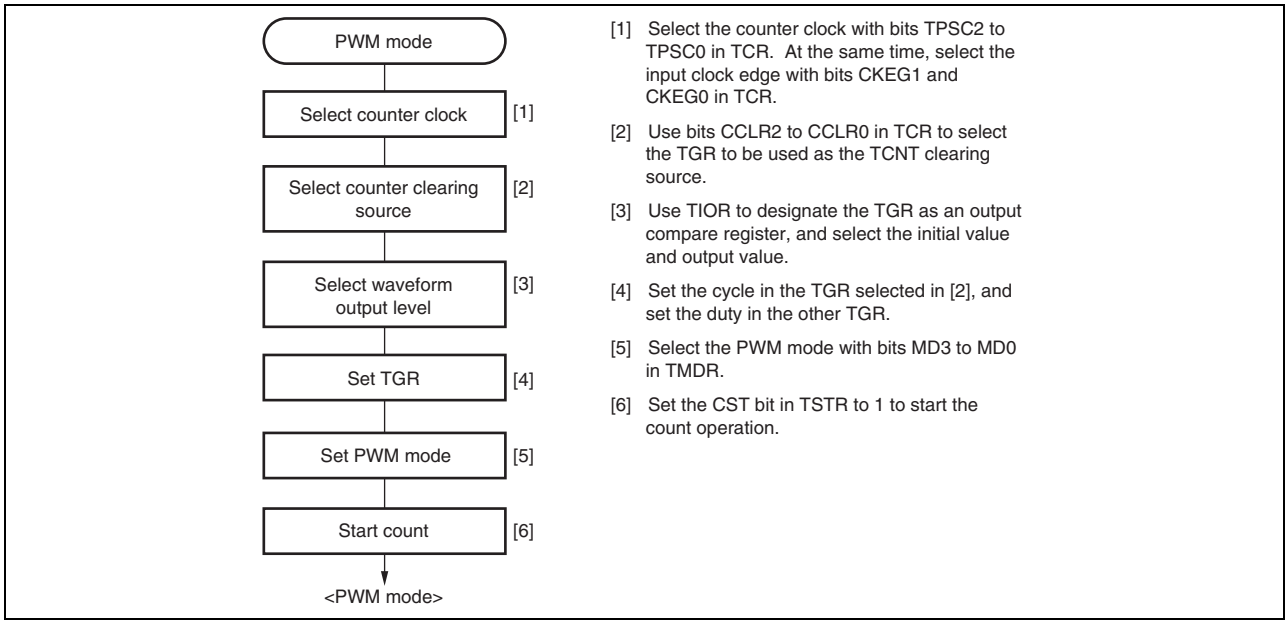

**Figure 10.25 Example of PWM Mode Setting Procedure**

### (2) Examples of PWM Mode Operation

Figure 10.26 shows an example of PWM mode 1 operation.

In this example, TGRA compare match is set as the TCNT clearing source, 0 is set for the TGRA initial output value and output value, and 1 is set as the TGRB output value.

In this case, the value set in TGRA is used as the period, and the values set in the TGRB registers are used as the duty levels.

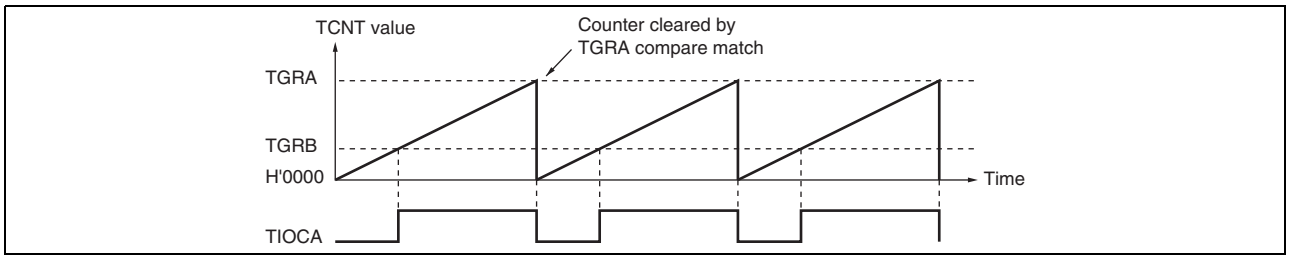

**Figure 10.26 Example of PWM Mode Operation (1)**

Figure 10.27 shows an example of PWM mode 2 operation.

In this example, synchronous operation is designated for channels 0 and 1, TGRB_1 compare match is set as the TCNT clearing source, and 0 is set for the initial output value and 1 for the output value of the other TGR registers (TGRA_0 to TGRD_0, TGRA_1), outputting a 5-phase PWM waveform.

In this case, the value set in TGRB_1 is used as the cycle, and the values set in the other TGRs are used as the duty levels.

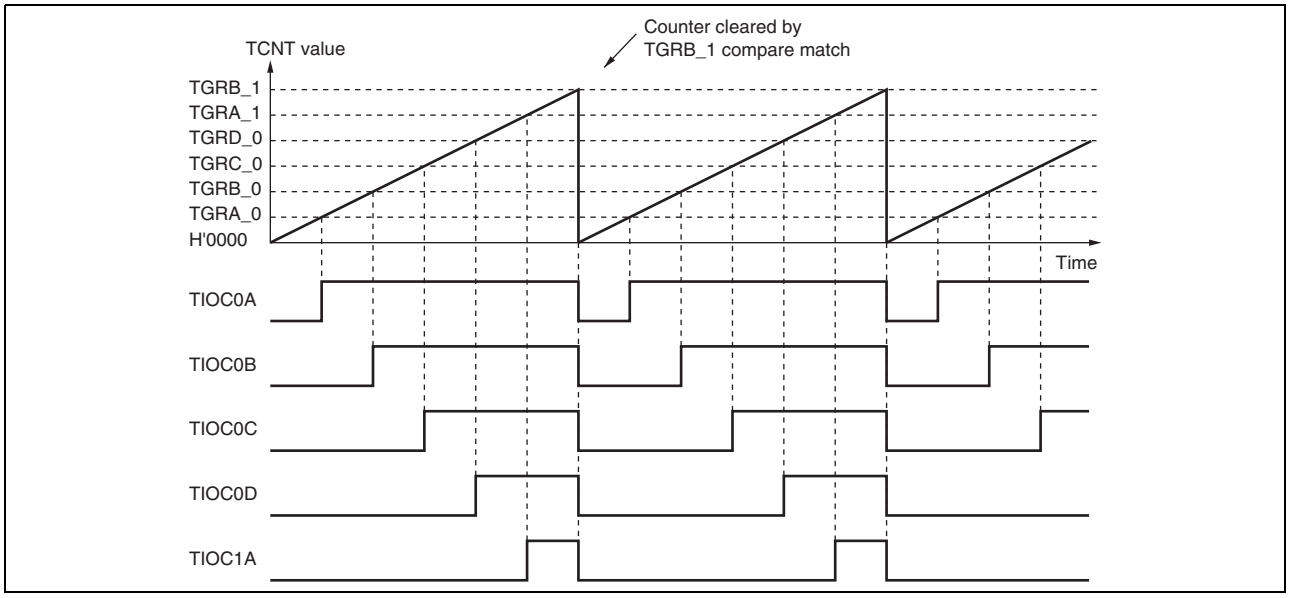

**Figure 10.27 Example of PWM Mode Operation (2)**

Figure 10.28 shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode.

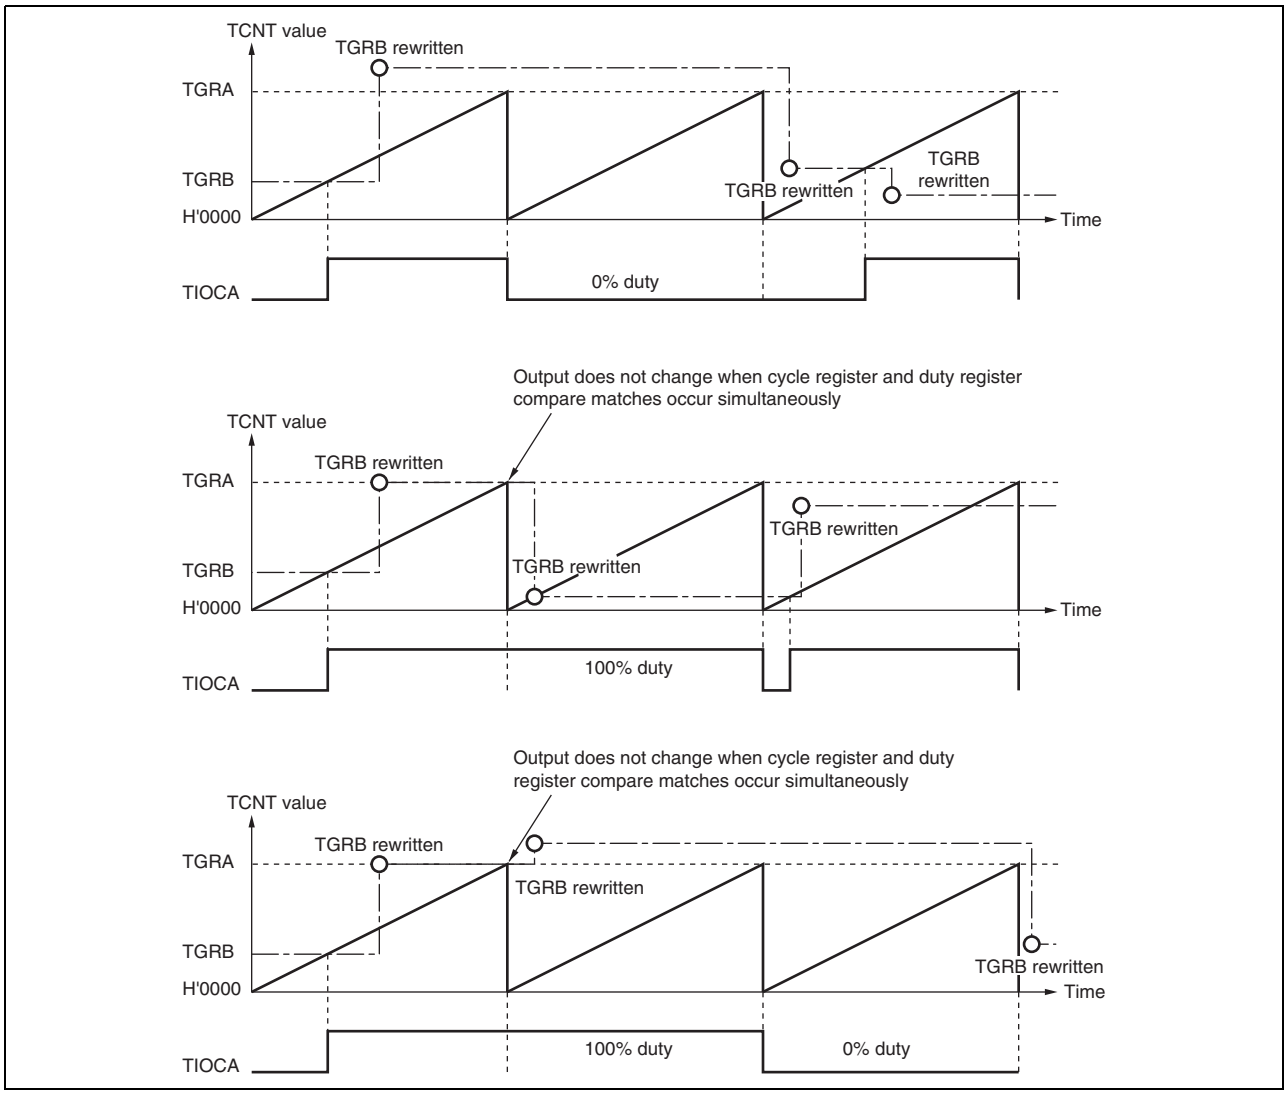

**Figure 10.28 Example of PWM Mode Operation (3)**

### 10.4.6 Phase Counting Mode

In phase counting mode, the phase difference between two external clock inputs is detected and TCNT is incremented/decremented accordingly. This mode can be set for channels 1 and 2.

When phase counting mode is set, an external clock is selected as the counter input clock and TCNT operates as an up/down-counter regardless of the setting of bits TPSC0 to TPSC2 and bits CKEG0 and CKEG1 in TCR. However, the functions of bits CCLR0 and CCLR1 in TCR, and of TIOR, TIER, and TGR, are valid, and input capture/compare match and interrupt functions can be used.

This can be used for two-phase encoder pulse input.

If overflow occurs when TCNT is counting up, the TCFV flag in TSR is set; if underflow occurs when TCNT is counting down, the TCFU flag is set.

The TCFD bit in TSR is the count direction flag. Reading the TCFD flag reveals whether TCNT is counting up or down.

Table 10.45 shows the correspondence between external clock pins and channels.

**Table 10.45 Phase Counting Mode Clock Input Pins**

| | External Clock Pins | |
|---|---|---|
| **Channels** | **A-Phase** | **B-Phase** |
| When channel 1 is set to phase counting mode | TCLKA | TCLKB |
| When channel 2 is set to phase counting mode | TCLKC | TCLKD |

#### (1) Example of Phase Counting Mode Setting Procedure

Figure 10.29 shows an example of the phase counting mode setting procedure.

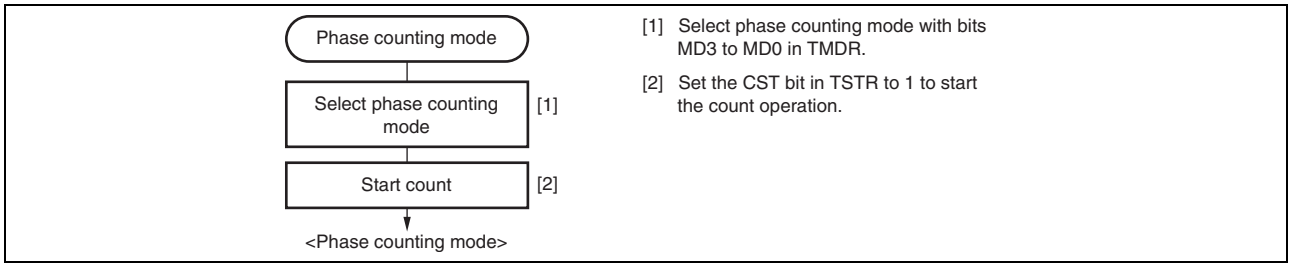

**Figure 10.29 Example of Phase Counting Mode Setting Procedure**

### (2) Examples of Phase Counting Mode Operation

In phase counting mode, TCNT counts up or down according to the phase difference between two external clocks. There are four modes, according to the count conditions.

#### (a) Phase counting mode 1

Figure 10.30 shows an example of phase counting mode 1 operation, and Table 10.46 summarizes the TCNT up/down-count conditions.

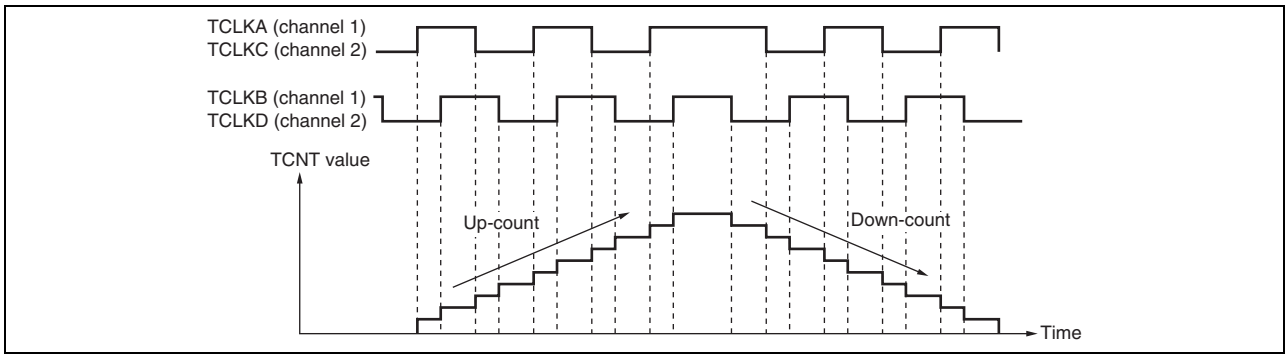

**Figure 10.30 Example of Phase Counting Mode 1 Operation**

**Table 10.46 Up/Down-Count Conditions in Phase Counting Mode 1**

| TCLKA (Channel 1)<br>TCLKC (Channel 2) | TCLKB (Channel 1)<br>TCLKD (Channel 2) | Operation |
|---|---|---|
| High level | ↑ | Up-count |
| Low level | ↓ | |
| ↑ | Low level | |
| ↓ | High level | |
| High level | ↓ | Down-count |
| Low level | ↑ | |
| ↑ | High level | |
| ↓ | Low level | |

[Legend]
↑ :Rising edge
↓ :Falling edge

### (b) Phase counting mode 2

Figure 10.31 shows an example of phase counting mode 2 operation, and Table 10.47 summarizes the TCNT up/down-count conditions.

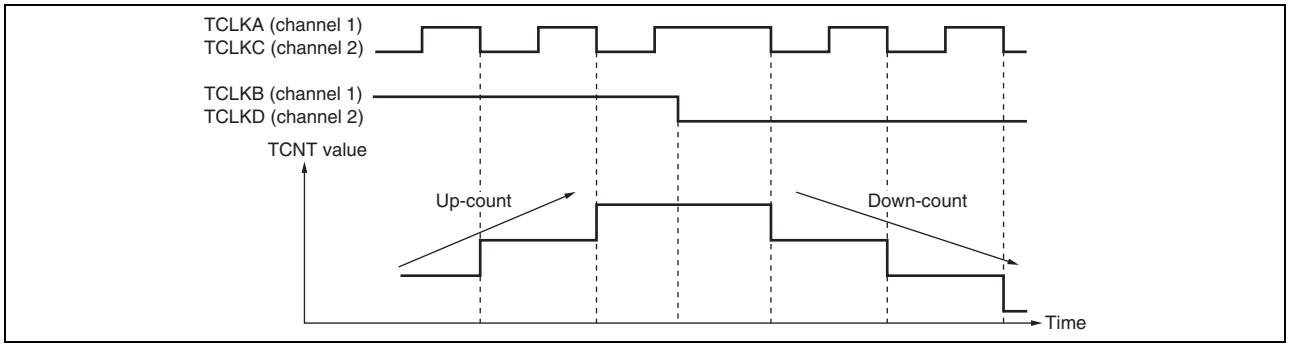

**Figure 10.31 Example of Phase Counting Mode 2 Operation**

**Table 10.47 Up/Down-Count Conditions in Phase Counting Mode 2**

| TCLKA (Channel 1)<br>TCLKC (Channel 2) | TCLKB (Channel 1)<br>TCLKD (Channel 2) | Operation |
|---|---|---|
| High level | ↑ | Don't care |
| Low level | ↓ | Don't care |
| ↑ | Low level | Don't care |
| ↓ | High level | Up-count |
| High level | ↓ | Don't care |
| Low level | ↑ | Don't care |

↓ :Falling edge

### (3) Phase Counting Mode Application Example

Figure 10.34 shows an example in which channel 1 is in phase counting mode, and channel 1 is coupled with channel 0 to input servo motor 2-phase encoder pulses in order to detect position or speed.

Channel 1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to TCLKA and TCLKB.

Channel 0 operates with TCNT counter clearing by TGRC_0 compare match; TGRA_0 and TGRC_0 are used for the compare match function and are set with the speed control period and position control period. TGRB_0 is used for input capture, with TGRB_0 and TGRD_0 operating in buffer mode. The channel 1 counter input clock is designated as the TGRB_0 input capture source, and the pulse widths of 2-phase encoder 4-multiplication pulses are detected.

TGRA_1 and TGRB_1 for channel 1 are designated for input capture, and channel 0 TGRA_0 and TGRC_0 compare matches are selected as the input capture source and store the up/down-counter values for the control periods.

This procedure enables the accurate detection of position and speed.

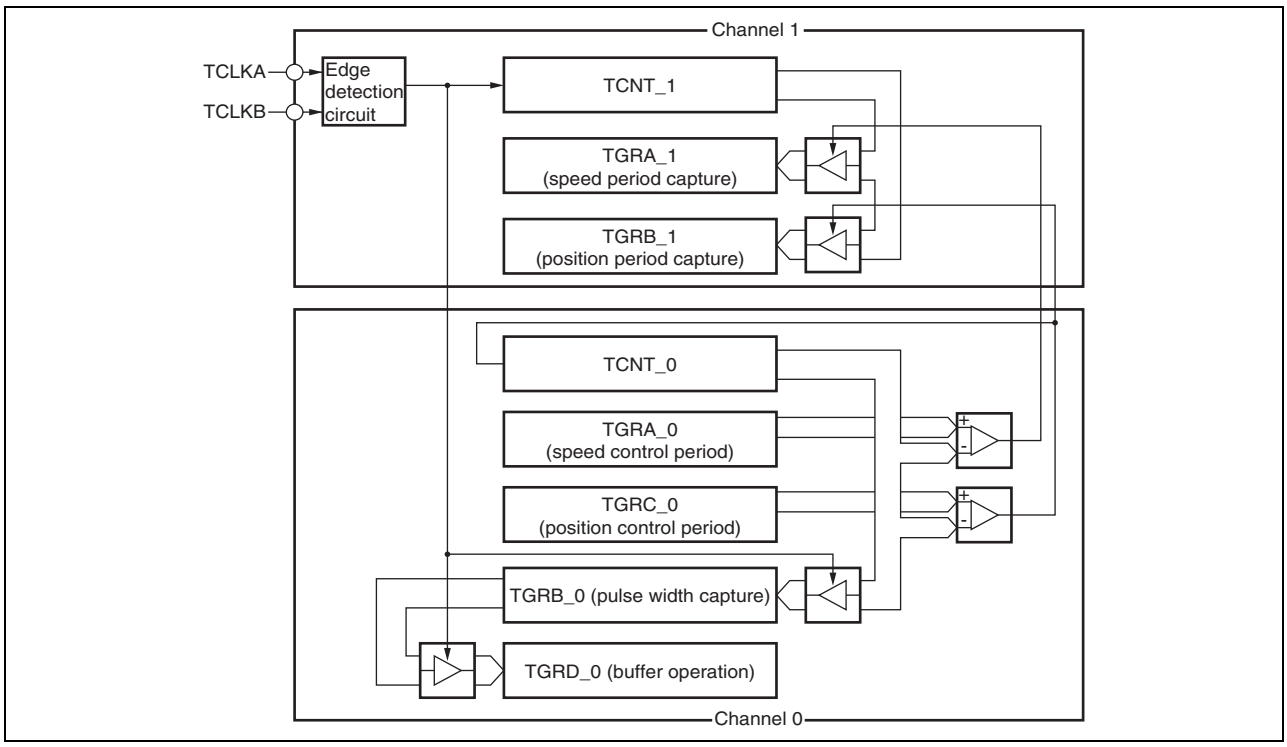

**Figure 10.34 Phase Counting Mode Application Example**

### 10.4.7 Reset-Synchronized PWM Mode

In the reset-synchronized PWM mode, three-phase output of positive and negative PWM waveforms that share a common wave transition point can be obtained by combining channels 3 and 4.

When set for reset-synchronized PWM mode, the TIOC3B, TIOC3D, TIOC4A, TIOC4C, TIOC4B, and TIOC4D pins function as PWM output pins and TCNT_3 functions as an upcounter.

Table 10.50 shows the PWM output pins used. Table 10.51 shows the settings of the registers.

**Table 10.50 Output Pins for Reset-Synchronized PWM Mode**

| Channel | Output Pin | Description |
|---|---|---|
| 3 | TIOC3B | PWM output pin 1 |
| | TIOC3D | PWM output pin 1' (negative-phase waveform of PWM output 1) |
| 4 | TIOC4A | PWM output pin 2 |
| | TIOC4C | PWM output pin 2' (negative-phase waveform of PWM output 2) |
| | TIOC4B | PWM output pin 3 |
| | TIOC4D | PWM output pin 3' (negative-phase waveform of PWM output 3) |

**Table 10.51 Register Settings for Reset-Synchronized PWM Mode**

| Register | Description of Setting |
|---|---|
| TCNT_3 | Initial setting of H'0000 |
| TCNT_4 | Initial setting of H'0000 |
| TGRA_3 | Set count cycle for TCNT_3 |
| TGRB_3 | Sets the turning point for PWM waveform output by the TIOC3B and TIOC3D pins |
| TGRA_4 | Sets the turning point for PWM waveform output by the TIOC4A and TIOC4C pins |
| TGRB_4 | Sets the turning point for PWM waveform output by the TIOC4B and TIOC4D pins |

### (1) Procedure for Selecting the Reset-Synchronized PWM Mode

Figure 10.35 shows an example of procedure for selecting the reset synchronized PWM mode.

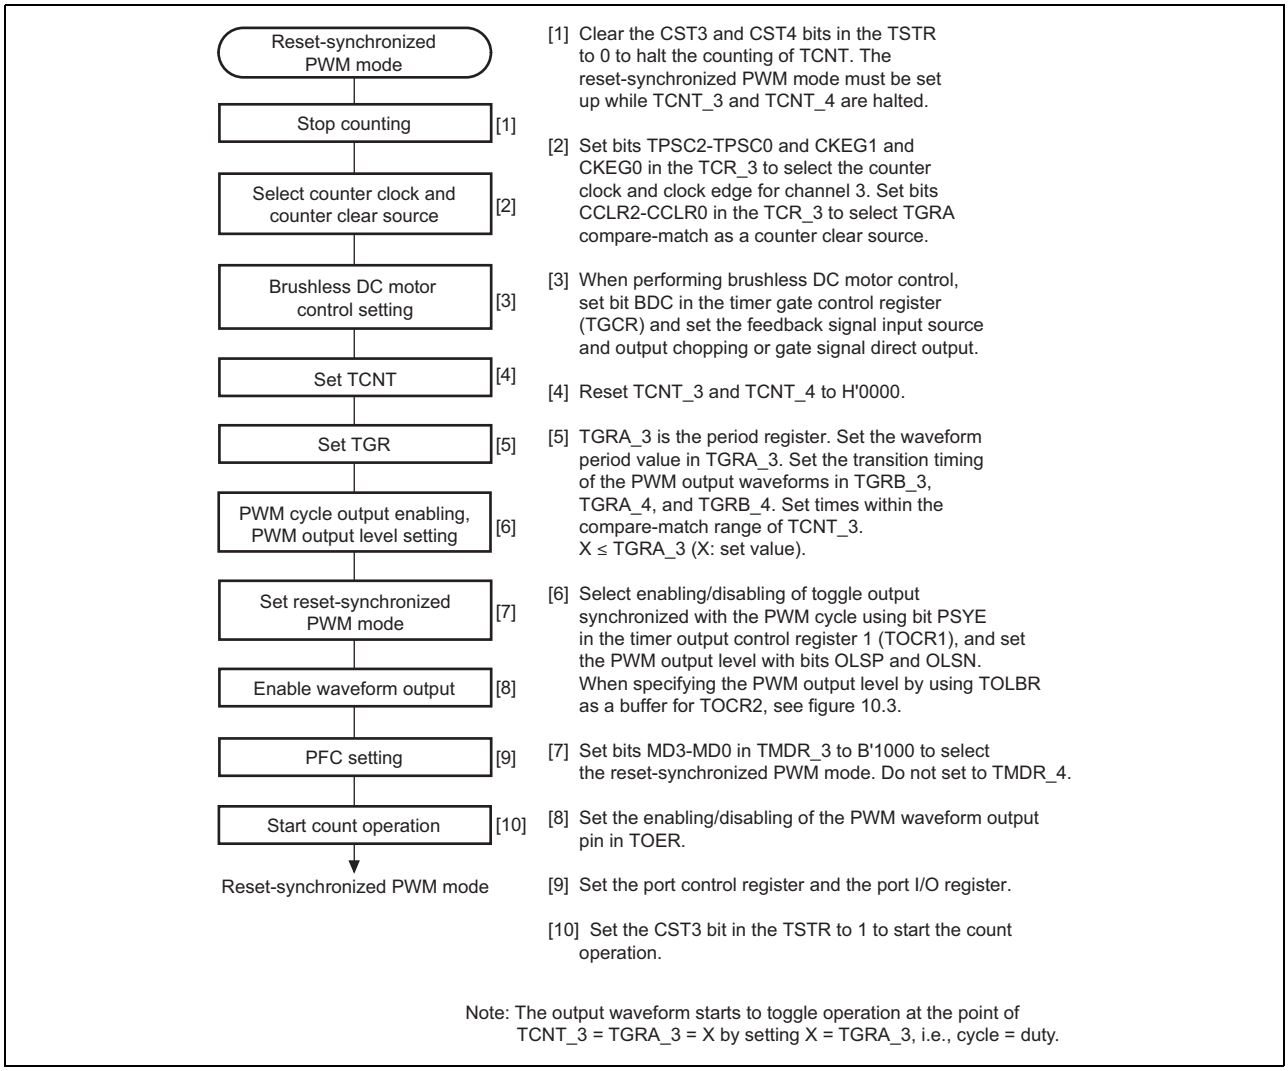

**Figure 10.35 Procedure for Selecting Reset-Synchronized PWM Mode**

### (2) Reset-Synchronized PWM Mode Operation

Figure 10.36 shows an example of operation in the reset-synchronized PWM mode. TCNT_3 and TCNT_4 operate as upcounters. The counter is cleared when a TCNT_3 and TGRA_3 compare-match occurs, and then begins incrementing from H'0000. The PWM output pin output toggles with each occurrence of a TGRB_3, TGRA_4, TGRB_4 compare-match, and upon counter clears.

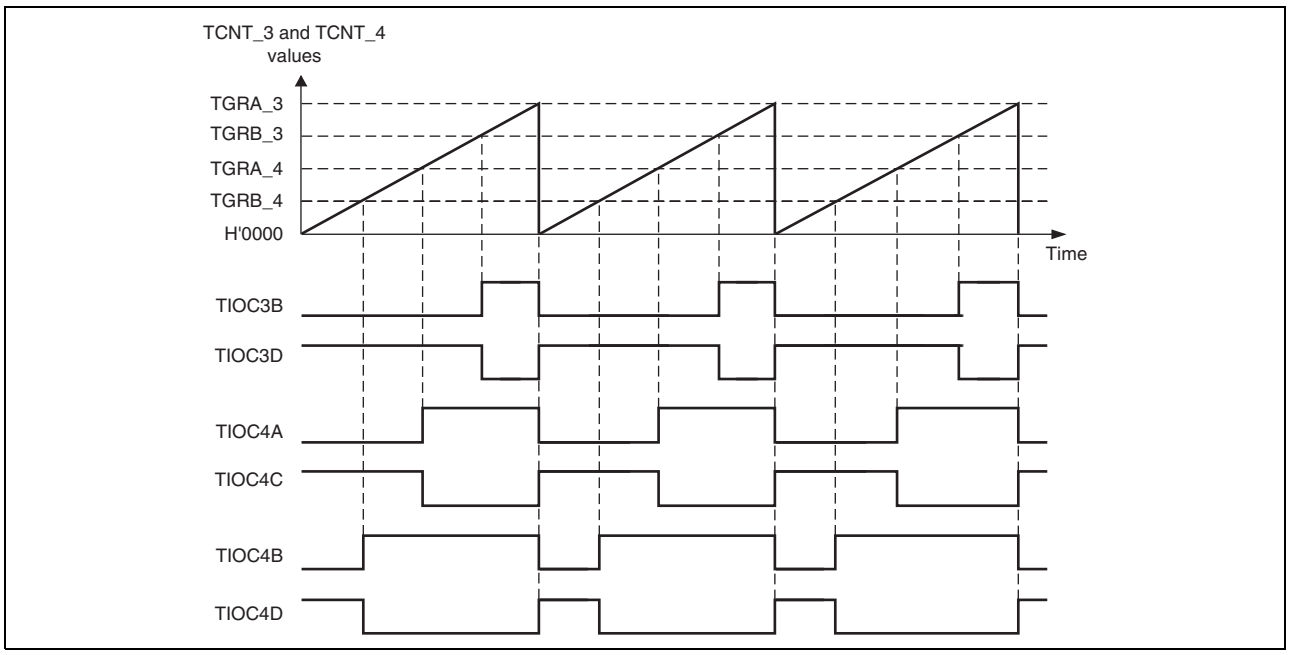

**Figure 10.36 Reset-Synchronized PWM Mode Operation Example (When TOCR's OLSN = 1 and OLSP = 1)**

### 10.4.8 Complementary PWM Mode

In the complementary PWM mode, three-phase output of non-overlapping positive and negative PWM waveforms can be obtained by combining channels 3 and 4. PWM waveforms without non-overlapping interval are also available.

In complementary PWM mode, TIOC3B, TIOC3D, TIOC4A, TIOC4B, TIOC4C, and TIOC4D pins function as PWM output pins, the TIOC3A pin can be set for toggle output synchronized with the PWM period. TCNT_3 and TCNT_4 function as up/down counters.

Table 10.52 shows the PWM output pins used. Table 10.53 shows the settings of the registers used.

**Table 10.52 Output Pins for Complementary PWM Mode**

| Channel | Output Pin | Description |
|---|---|---|
| 3 | TIOC3A | Toggle output synchronized with PWM period (or I/O port) |
| | TIOC3B | PWM output pin 1 |
| | TIOC3C | I/O port* |
| | TIOC3D | PWM output pin 1'<br>(non-overlapping negative-phase waveform of PWM output 1; PWM output without non-overlapping interval is also available) |
| 4 | TIOC4A | PWM output pin 2 |
| | TIOC4B | PWM output pin 3 |
| | TIOC4C | PWM output pin 2'<br>(non-overlapping negative-phase waveform of PWM output 2; PWM output without non-overlapping interval is also available) |
| | TIOC4D | PWM output pin 3'<br>(non-overlapping negative-phase waveform of PWM output 3; PWM output without non-overlapping interval is also available) |

Note: * Avoid setting the TIOC3C pin as a timer I/O pin in the complementary PWM mode.

**Table 10.53 Register Settings for Complementary PWM Mode**

| Channel | Counter/Register | Description | Read/Write from CPU |
|---|---|---|---|
| 3 | TCNT_3 | Start of up-count from value set in dead time register | Maskable by TRWER setting* |
| | TGRA_3 | Set TCNT_3 upper limit value (1/2 carrier cycle + dead time) | Maskable by TRWER setting* |
| | TGRB_3 | PWM output 1 compare register | Maskable by TRWER setting* |
| | TGRC_3 | TGRA_3 buffer register | Always readable/writable |
| | TGRD_3 | PWM output 1/TGRB_3 buffer register | Always readable/writable |
| 4 | TCNT_4 | Up-count start, initialized to H'0000 | Maskable by TRWER setting* |
| | TGRA_4 | PWM output 2 compare register | Maskable by TRWER setting* |
| | TGRB_4 | PWM output 3 compare register | Maskable by TRWER setting* |
| | TGRC_4 | PWM output 2/TGRA_4 buffer register | Always readable/writable |
| | TGRD_4 | PWM output 3/TGRB_4 buffer register | Always readable/writable |
| Timer dead time data register (TDDR) | | Set TCNT_4 and TCNT_3 offset value (dead time value) | Maskable by TRWER setting* |
| Timer cycle data register (TCDR) | | Set TCNT_4 upper limit value (1/2 carrier cycle) | Maskable by TRWER setting* |
| Timer cycle buffer register (TCBR) | | TCDR buffer register | Always readable/writable |
| Subcounter (TCNTS) | | Subcounter for dead time generation | Read-only |
| Temporary register 1 (TEMP1) | | PWM output 1/TGRB_3 temporary register | Not readable/writable |
| Temporary register 2 (TEMP2) | | PWM output 2/TGRA_4 temporary register | Not readable/writable |
| Temporary register 3 (TEMP3) | | PWM output 3/TGRB_4 temporary register | Not readable/writable |

Note: * Access can be enabled or disabled according to the setting of bit 0 (RWE) in TRWER (timer read/write enable register).

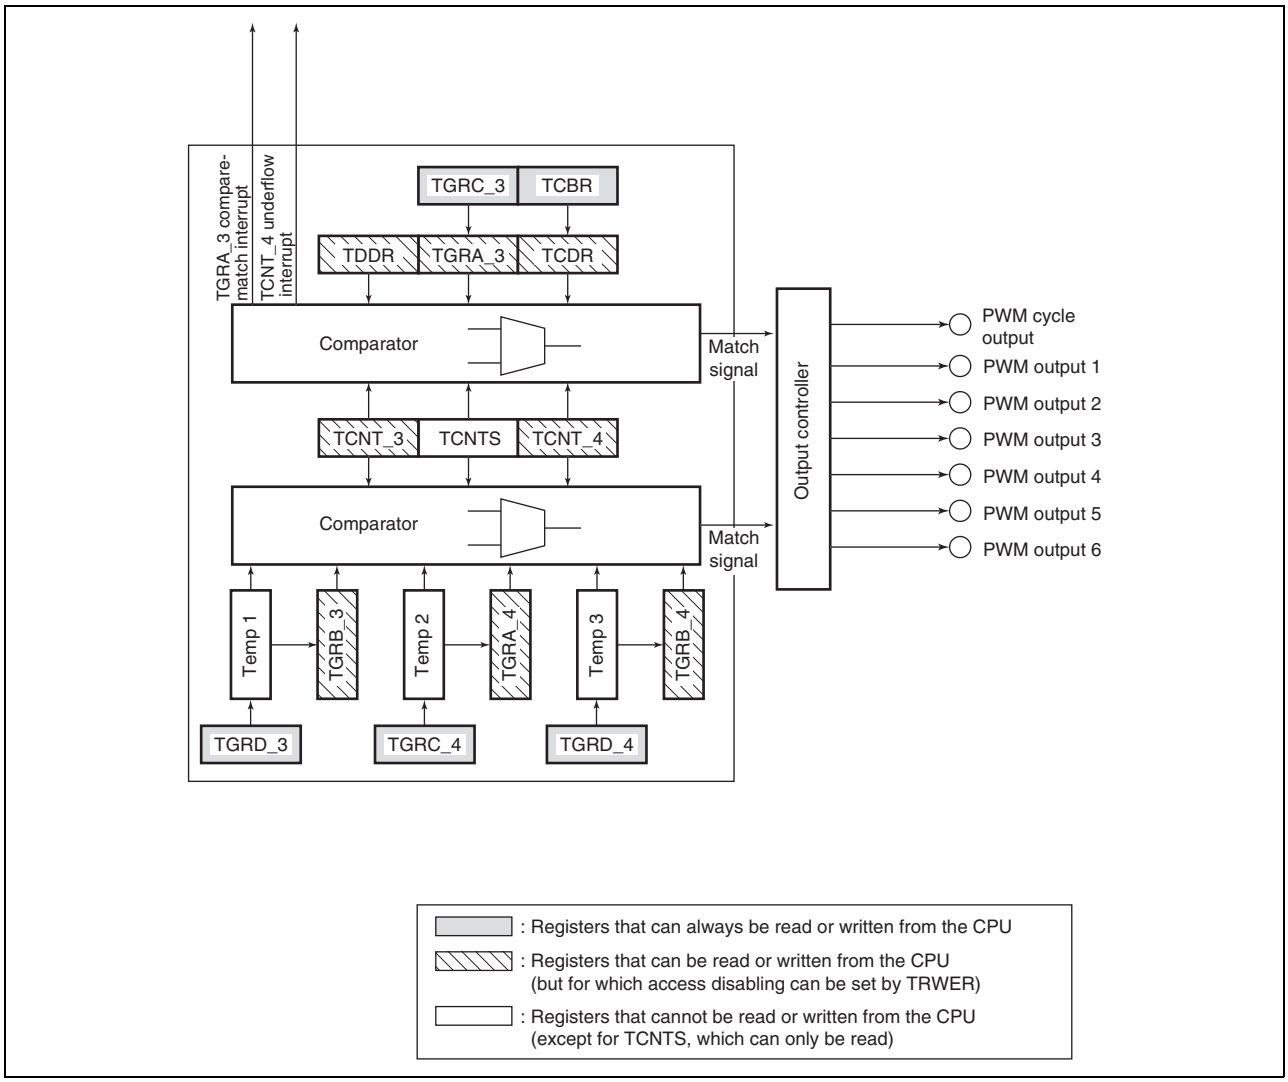

**Figure 10.37 Block Diagram of Channels 3 and 4 in Complementary PWM Mode**

## (1) Example of Complementary PWM Mode Setting Procedure

An example of the complementary PWM mode setting procedure is shown in Figure 10.38.

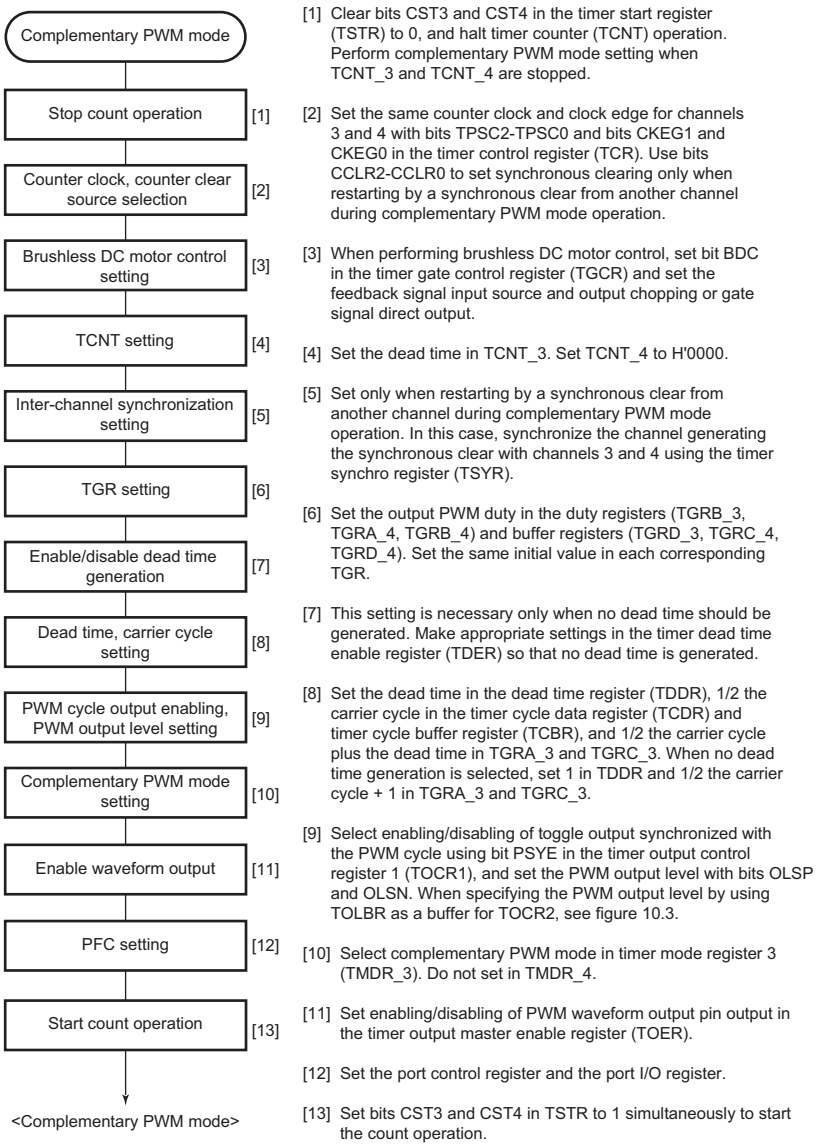

**Figure 10.38 Example of Complementary PWM Mode Setting Procedure**

### (2) Outline of Complementary PWM Mode Operation

In complementary PWM mode, 6-phase PWM output is possible. Figure 10.39 illustrates counter operation in complementary PWM mode, and Figure 10.40 shows an example of complementary PWM mode operation.

### (a) Counter Operation

In complementary PWM mode, three counters—TCNT_3, TCNT_4, and TCNTS—perform up/down-count operations.

TCNT_3 is automatically initialized to the value set in TDDR when complementary PWM mode is selected and the CST bit in TSTR is 0.

When the CST bit is set to 1, TCNT_3 counts up to the value set in TGRA_3, then switches to down-counting when it matches TGRA_3. When the TCNT_3 value matches TDDR, the counter switches to up-counting, and the operation is repeated in this way.

TCNT_4 is initialized to H'0000.

When the CST bit is set to 1, TCNT_4 counts up in synchronization with TCNT_3, and switches to down-counting when it matches TCDR. On reaching H'0000, TCNT_4 switches to up-counting, and the operation is repeated in this way.

TCNTS is a read-only counter. It need not be initialized.

When TCNT_3 matches TCDR during TCNT_3 and TCNT_4 up/down-counting, down-counting is started, and when TCNTS matches TCDR, the operation switches to up-counting. When TCNTS matches TGRA_3, it is cleared to H'0000. When TCNT_4 matches TDDR during TCNT_3 and TCNT_4 down-counting, up-counting is started, and when TCNTS matches TDDR, the operation switches to down-counting. When TCNTS reaches H'0000, it is set with the value in TGRA_3.

TCNTS is compared with the compare register and temporary register in which the PWM duty is set during the count operation only.

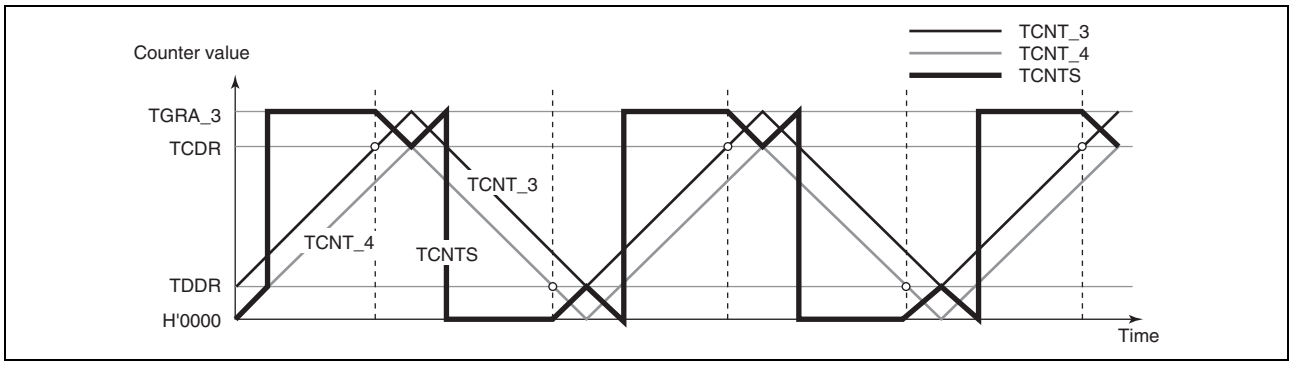

**Figure 10.39 Complementary PWM Mode Counter Operation**

### (b) Register Operation

In complementary PWM mode, nine registers are used, comprising compare registers, buffer registers, and temporary registers. Figure 10.40 shows an example of complementary PWM mode operation.

The registers which are constantly compared with the counters to perform PWM output are TGRB_3, TGRA_4, and TGRB_4. When these registers match the counter, the value set in bits OLSN and OLSP in the timer output control register (TOCR) is output.

The buffer registers for these compare registers are TGRD_3, TGRC_4, and TGRD_4.

Between a buffer register and compare register there is a temporary register. The temporary registers cannot be accessed by the CPU.

Data in a compare register is changed by writing the new data to the corresponding buffer register. The buffer registers can be read or written at any time.

The data written to a buffer register is constantly transferred to the temporary register in the Ta interval. Data is not transferred to the temporary register in the Tb interval. Data written to a buffer register in this interval is transferred to the temporary register at the end of the Tb interval.

The value transferred to a temporary register is transferred to the compare register when TCNTS for which the Tb interval ends matches TGRA_3 when counting up, or H'0000 when counting down. The timing for transfer from the temporary register to the compare register can be selected with bits MD3 to MD0 in the timer mode register (TMDR). Figure 10.40 shows an example in which the mode is selected in which the change is made in the trough.

In the tb interval (tb1 in Figure 10.40) in which data transfer to the temporary register is not performed, the temporary register has the same function as the compare register, and is compared with the counter. In this interval, therefore, there are two compare match registers for one-phase output, with the compare register containing the pre-change data, and the temporary register containing the new data. In this interval, the three counters—TCNT_3, TCNT_4, and TCNTS—and two registers—compare register and temporary register—are compared, and PWM output controlled accordingly.

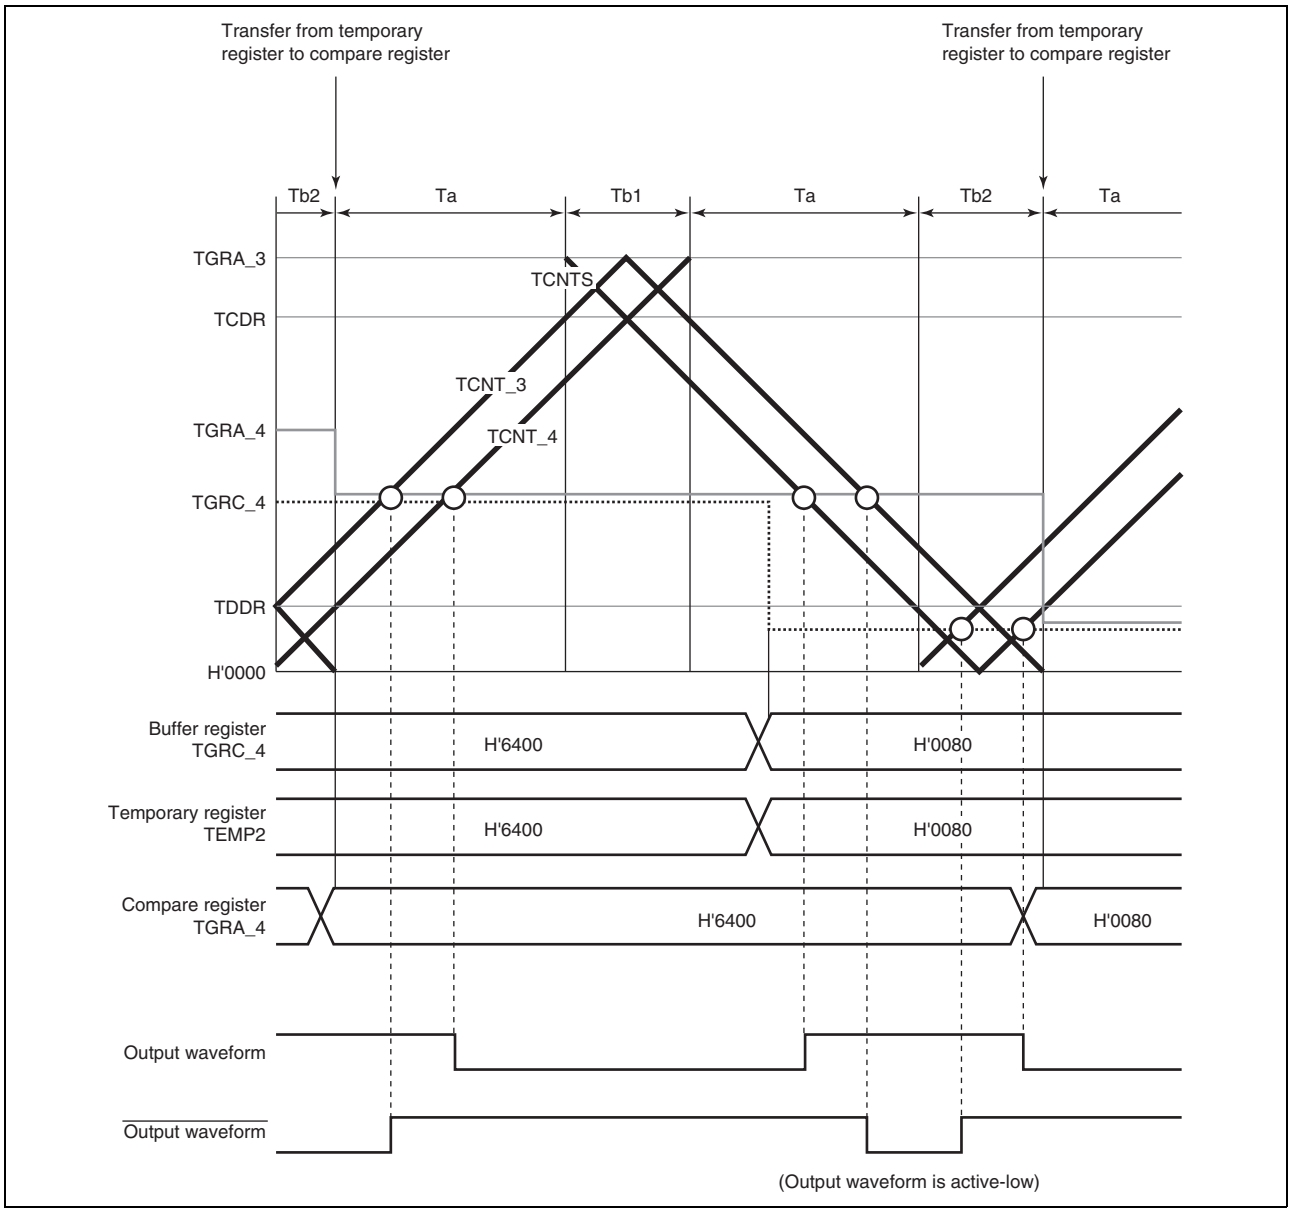

**Figure 10.40 Example of Complementary PWM Mode Operation**

### (c) Initialization

In complementary PWM mode, there are six registers that must be initialized. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).

Before setting complementary PWM mode with bits MD3 to MD0 in the timer mode register (TMDR), the following initial register values must be set.

TGRC_3 operates as the buffer register for TGRA_3, and should be set with 1/2 the PWM carrier cycle + dead time Td. The timer cycle buffer register (TCBR) operates as the buffer register for the timer cycle data register (TCDR), and should be set with 1/2 the PWM carrier cycle. Set dead time Td in the timer dead time data register (TDDR).

When dead time is not needed, the TDER bit in the timer dead time enable register (TDER) should be cleared to 0, TGRC_3 and TGRA_3 should be set to 1/2 the PWM carrier cycle + 1, and TDDR should be set to 1.

Set the respective initial PWM duty values in buffer registers TGRD_3, TGRC_4, and TGRD_4.

The values set in the five buffer registers excluding TDDR are transferred simultaneously to the corresponding compare registers when complementary PWM mode is set.

Set TCNT_4 to H'0000 before setting complementary PWM mode.

**Table 10.54 Registers and Counters Requiring Initialization**

| Register/Counter | Set Value |
|---|---|
| TGRC_3 | 1/2 PWM carrier cycle + dead time Td (1/2 PWM carrier cycle + 1 when dead time generation is disabled by TDER) |
| TDDR | Dead time Td (1 when dead time generation is disabled by TDER) |
| TCBR | 1/2 PWM carrier cycle |
| TGRD_3, TGRC_4, TGRD_4 | Initial PWM duty value for each phase |
| TCNT_4 | H'0000 |

Note: The TGRC_3 set value must be the sum of 1/2 the PWM carrier cycle set in TCBR and dead time Td set in TDDR. When dead time generation is disabled by TDER, TGRC_3 must be set to 1/2 the PWM carrier cycle + 1.

### (d) PWM Output Level Setting

In complementary PWM mode, the PWM pulse output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2).

The output level can be set for each of the three positive phases and three negative phases of 6-phase output.

Complementary PWM mode should be cleared before setting or changing output levels.

### (e) Dead Time Setting

In complementary PWM mode, PWM pulses are output with a non-overlapping relationship between the positive and negative phases. This non-overlap time is called the dead time.

The non-overlap time is set in the timer dead time data register (TDDR). The value set in TDDR is used as the TCNT_3 counter start value, and creates non-overlap between TCNT_3 and TCNT_4. Complementary PWM mode should be cleared before changing the contents of TDDR.

### (f) Dead Time Suppressing

Dead time generation is suppressed by clearing the TDER bit in the timer dead time enable register (TDER) to 0. TDER can be cleared to 0 only when 0 is written to it after reading TDER = 1.

TGRA_3 and TGRC_3 should be set to 1/2 PWM carrier cycle + 1 and the timer dead time data register (TDDR) should be set to 1.

By the above settings, PWM waveforms without dead time can be obtained. Figure 10.41 shows an example of operation without dead time.

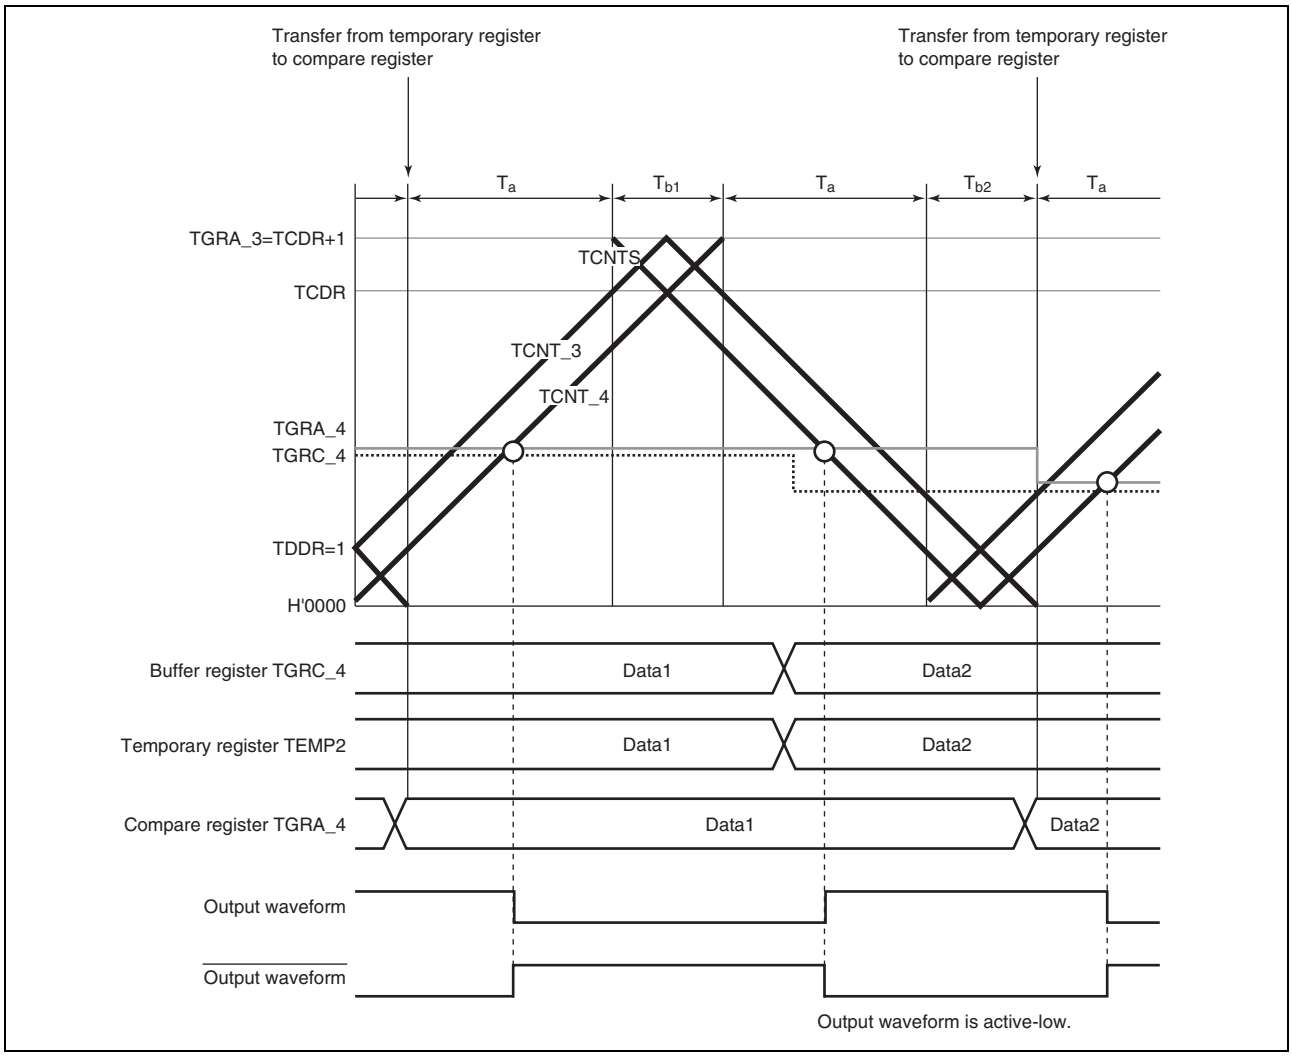

**Figure 10.41 Example of Operation without Dead Time**

### (g) PWM Cycle Setting

In complementary PWM mode, the PWM pulse cycle is set in two registers—TGRA_3, in which the TCNT_3 upper limit value is set, and TCDR, in which the TCNT_4 upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: TGRA_3 set value = TCDR set value + TDDR set value
TCDR set value > Double the TDDR set value + 2
Without dead time: TGRA_3 set value = TCDR set value + 1
TCDR set value > 4

The TGRA_3 and TCDR settings are made by setting the values in buffer registers TGRC_3 and TCBR. The values set in TGRC_3 and TCBR are transferred simultaneously to TGRA_3 and TCDR in accordance with the transfer timing selected with bits MD3 to MD0 in the timer mode register (TMDR).

The updated PWM cycle is reflected from the next cycle when the data update is performed at the crest, and from the current cycle when performed in the trough. Figure 10.42 illustrates the operation when the PWM cycle is updated at the crest.

See (h) Register Data Updating, for the method of updating the data in each buffer register.

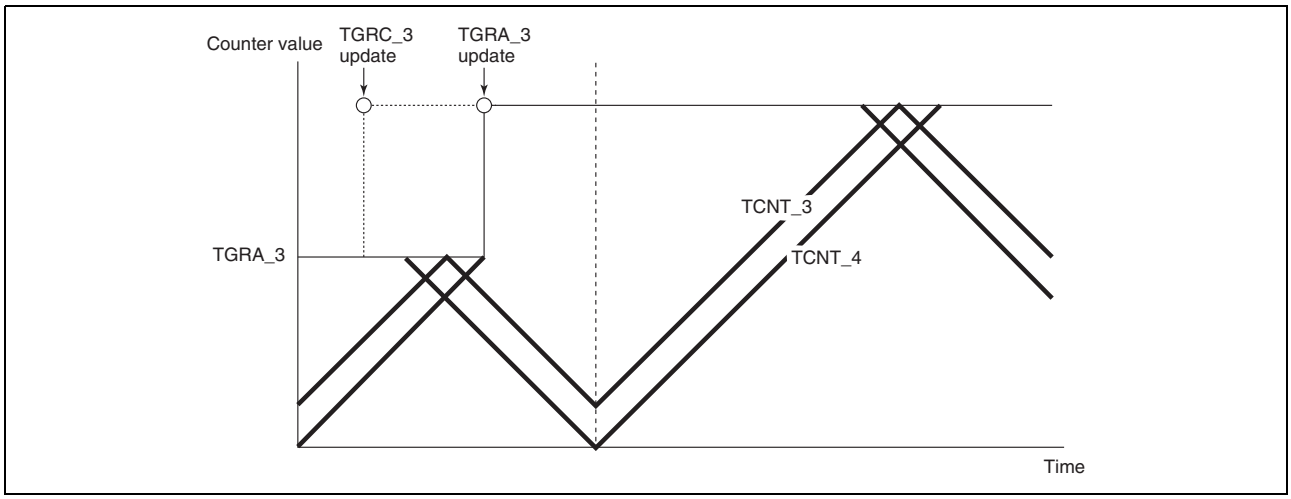

**Figure 10.42 Example of PWM Cycle Updating**

### (h) Register Data Updating

In complementary PWM mode, the buffer register is used to update the data in a compare register. The update data can be written to the buffer register at any time. There are five PWM duty and carrier cycle registers that have buffer registers and can be updated during operation.

There is a temporary register between each of these registers and its buffer register. When subcounter TCNTS is not counting, if buffer register data is updated, the temporary register value is also rewritten. Transfer is not performed from buffer registers to temporary registers when TCNTS is counting; in this case, the value written to a buffer register is transferred after TCNTS halts.

The temporary register value is transferred to the compare register at the data update timing set with bits MD3 to MD0 in the timer mode register (TMDR). Figure 10.43 shows an example of data updating in complementary PWM mode. This example shows the mode in which data updating is performed at both the counter crest and trough.

When rewriting buffer register data, a write to TGRD_4 must be performed at the end of the update. Data transfer from the buffer registers to the temporary registers is performed simultaneously for all five registers after the write to TGRD_4.

A write to TGRD_4 must be performed after writing data to the registers to be updated, even when not updating all five registers, or when updating the TGRD_4 data. In this case, the data written to TGRD_4 should be the same as the data prior to the write operation.

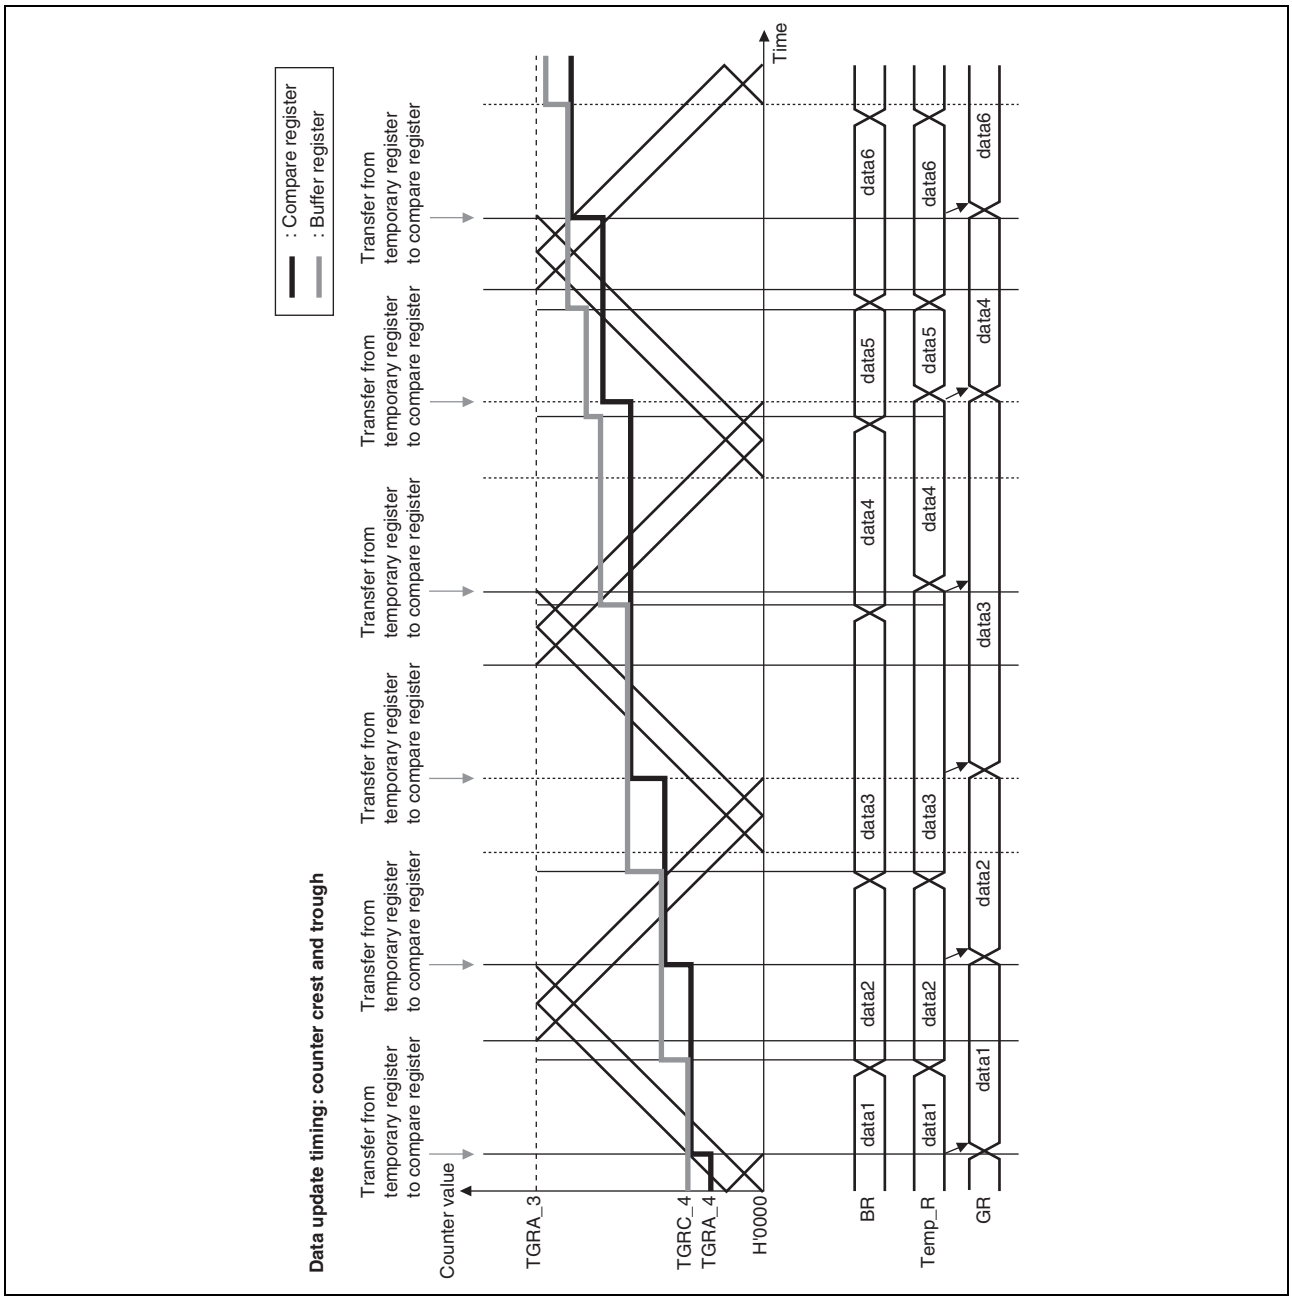

**Figure 10.43 Example of Data Update in Complementary PWM Mode**

### (i) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of bits OLSN and OLSP in timer output control register 1 (TOCR1) or bits OLS1N to OLS3N and OLS1P to OLS3P in timer output control register 2 (TOCR2).

This initial output is the PWM pulse non-active level, and is output from when complementary PWM mode is set with the timer mode register (TMDR) until TCNT_4 exceeds the value set in the dead time register (TDDR). Figure 10.44 shows an example of the initial output in complementary PWM mode.

An example of the waveform when the initial PWM duty value is smaller than the TDDR value is shown in Figure 10.45.

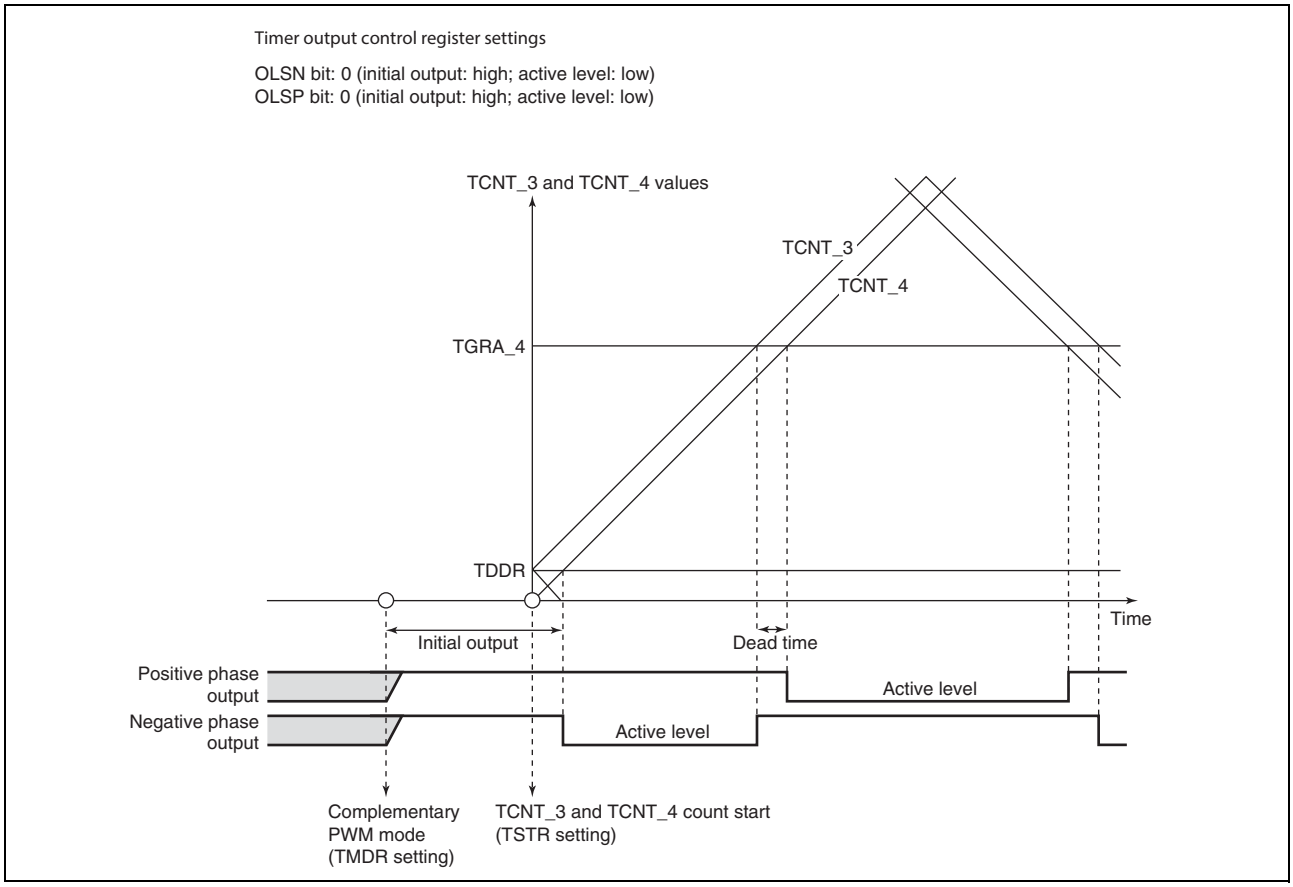

**Figure 10.44 Example of Initial Output in Complementary PWM Mode (1)**

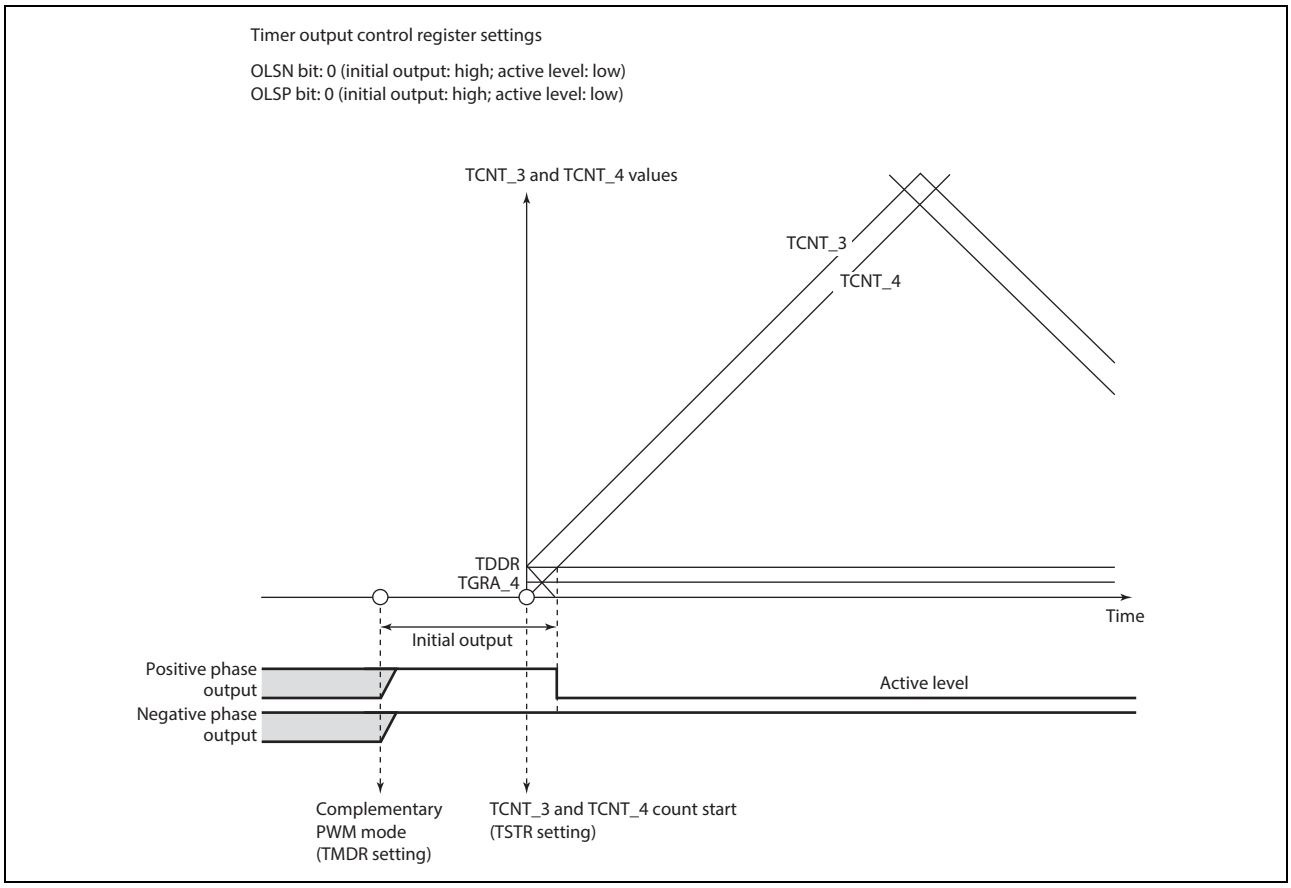

**Figure 10.45 Example of Initial Output in Complementary PWM Mode (2)**

### (j) Complementary PWM Mode PWM Output Generation Method

In complementary PWM mode, 3-phase output is performed of PWM waveforms with a non-overlap time between the positive and negative phases. This non-overlap time is called the dead time.

A PWM waveform is generated by output of the output level selected in the timer output control register in the event of a compare-match between a counter and compare register. While TCNTS is counting, compare register and temporary register values are simultaneously compared to create consecutive PWM pulses from 0 to 100%. The relative timing of on and off compare-match occurrence may vary, but the compare-match that turns off each phase takes precedence to secure the dead time and ensure that the positive phase and negative phase on times do not overlap. Figure 10.46 to Figure 10.48 show examples of waveform generation in complementary PWM mode.

The positive phase/negative phase off timing is generated by a compare-match with the solid-line counter, and the on timing by a compare-match with the dotted-line counter operating with a delay of the dead time behind the solid-line counter. In the T1 period, compare-match **a** that turns off the negative phase has the highest priority, and compare-matches occurring prior to **a** are ignored. In the T2 period, compare-match **c** that turns off the positive phase has the highest priority, and compare-matches occurring prior to **c** are ignored.

In normal cases, compare-matches occur in the order **a** → **b** → **c** → **d** (or **c** → **d** → **a'** → **b'**), as shown in figure 10.46.

If compare-matches deviate from the **a** → **b** → **c** → **d** order, since the time for which the negative phase is off is less than twice the dead time, the figure shows the positive phase is not being turned on. If compare-matches deviate from the **c** → **d** → **a'** → **b'** order, since the time for which the positive phase is off is less than twice the dead time, the figure shows the negative phase is not being turned on.

If compare-match **c** occurs first following compare-match **a**, as shown in Figure 10.47, compare-match **b** is ignored, and the negative phase is turned on by compare-match **d**. This is because turning off of the positive phase has priority due to the occurrence of compare-match **c** (positive phase off timing) before compare-match **b** (positive phase on timing) (consequently, the waveform does not change since the positive phase goes from off to off).

Similarly, in the example in Figure 10.48, compare-match **a'** with the new data in the temporary register occurs before compare-match **c**, but other compare-matches occurring up to **c**, which turns off the positive phase, are ignored. As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare-matches at turn-off timings take precedence, and turn-on timing compare-matches that occur before a turn-off timing compare-match are ignored.

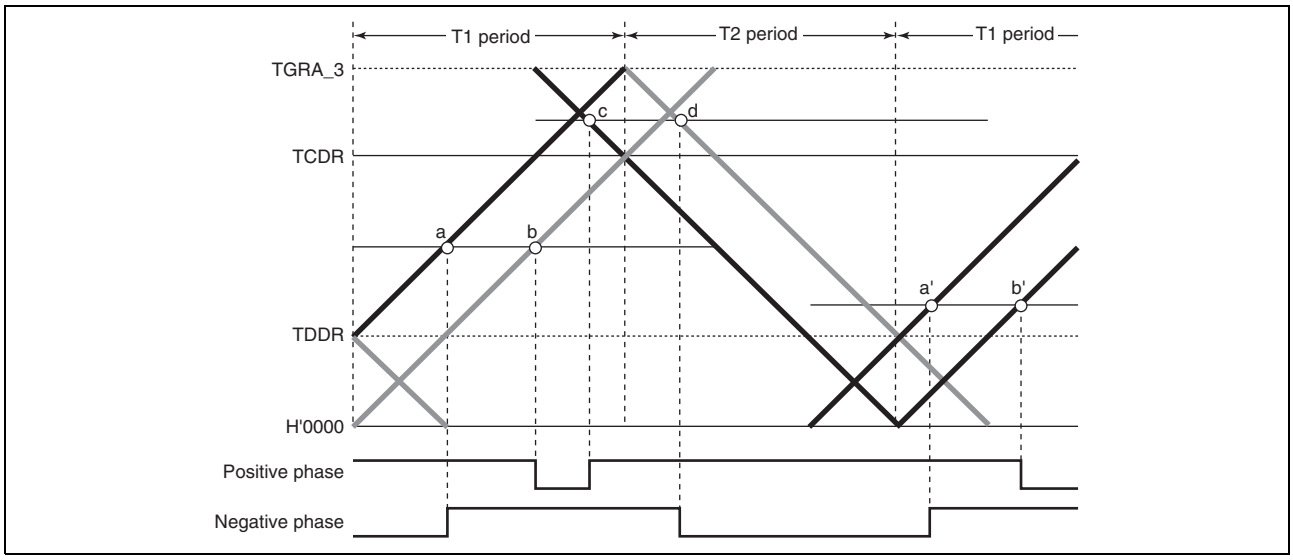

**Figure 10.46 Example of Complementary PWM Mode Waveform Output (1)**

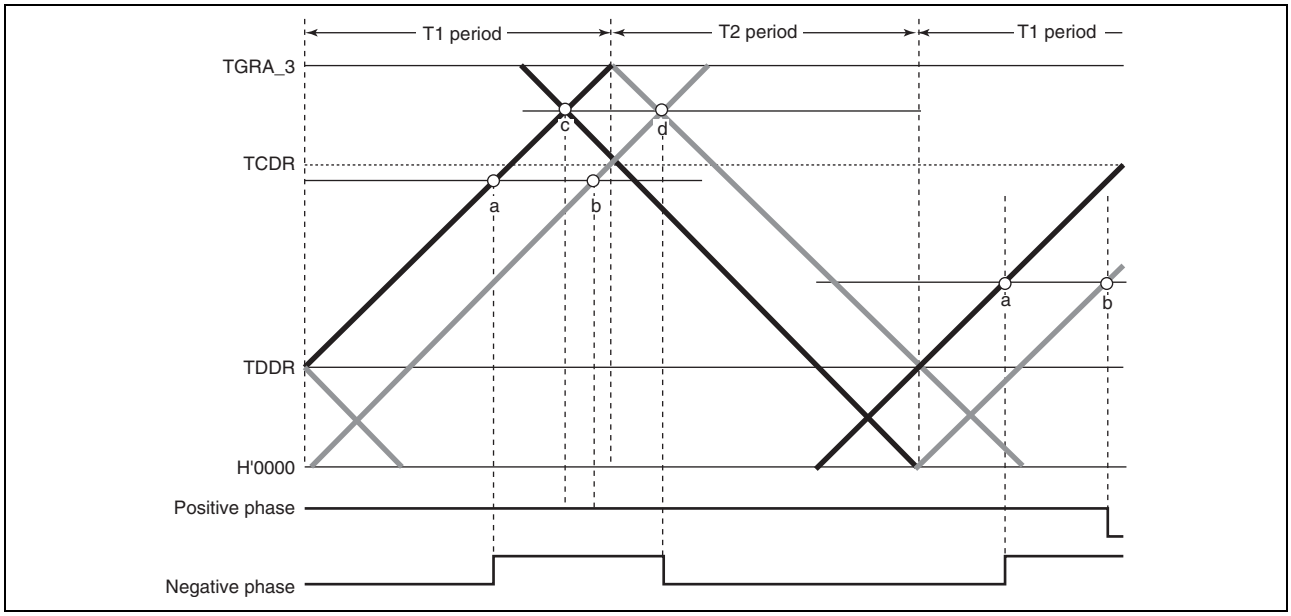

**Figure 10.47 Example of Complementary PWM Mode Waveform Output (2)**

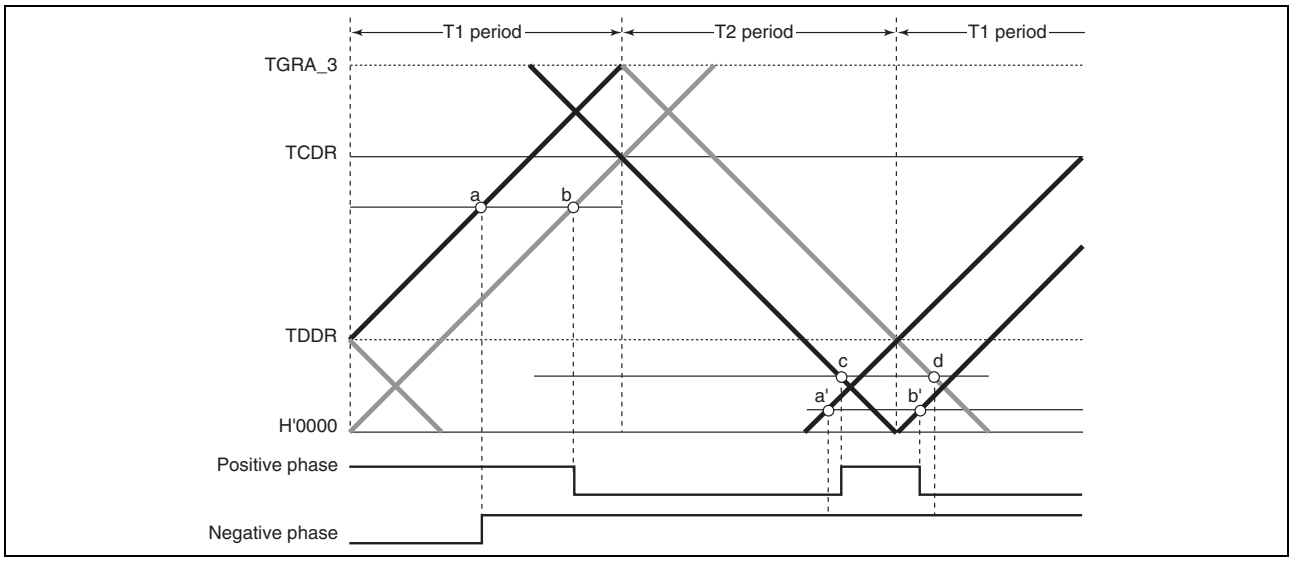

**Figure 10.48 Example of Complementary PWM Mode Waveform Output (3)**

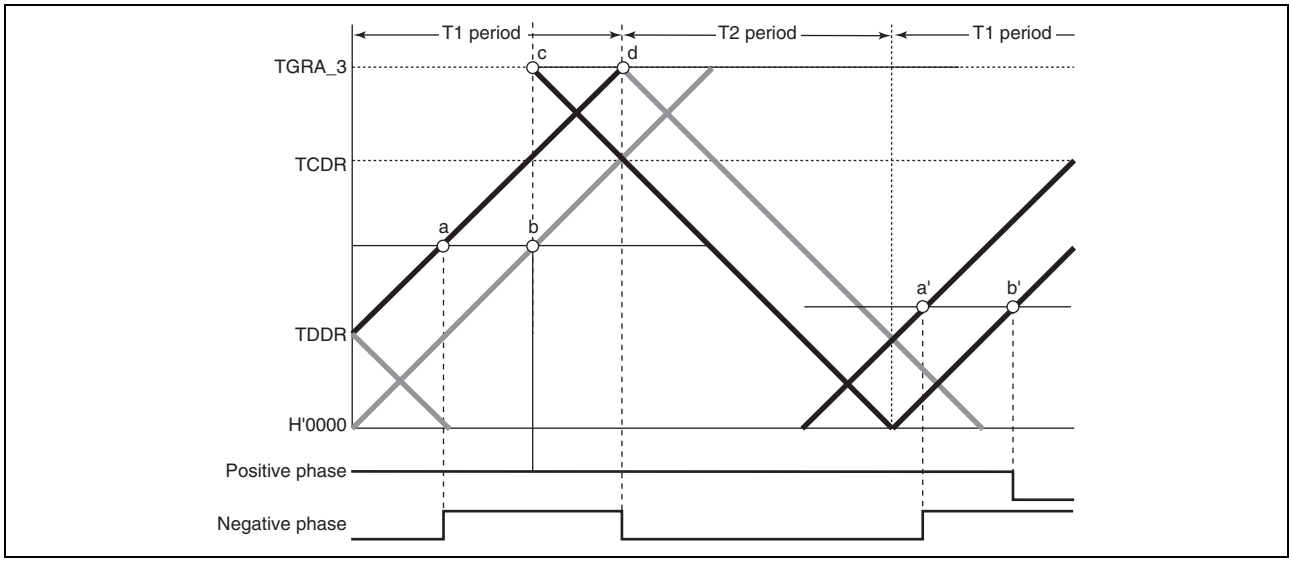

**Figure 10.49 Example of Complementary PWM Mode 0% and 100% Waveform Output (1)**

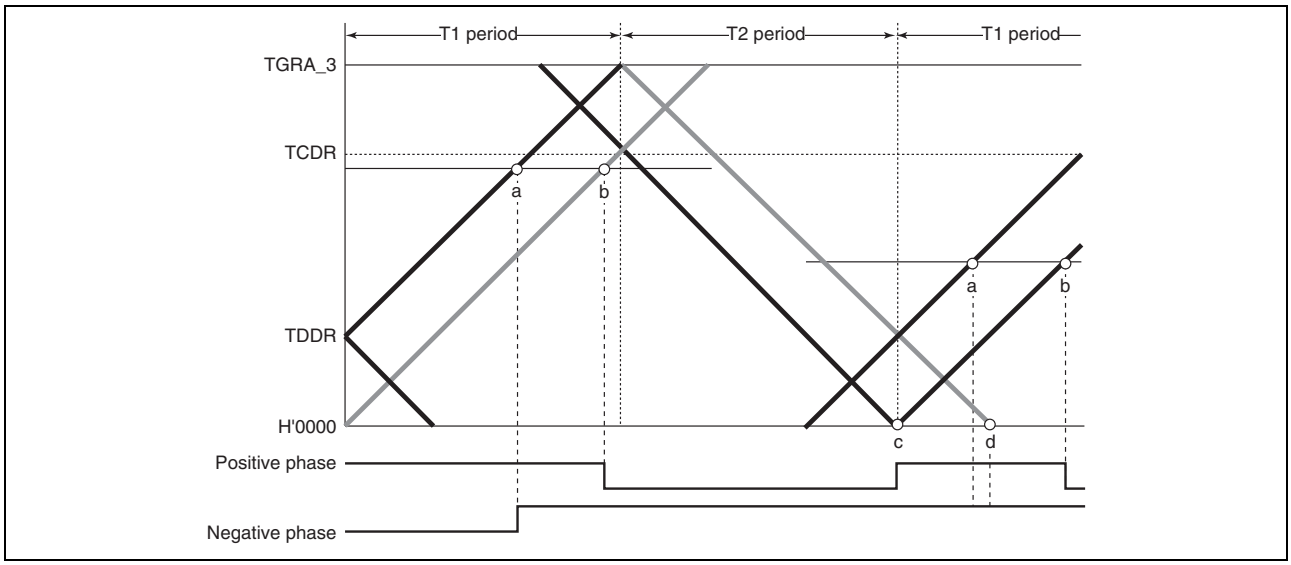

**Figure 10.50 Example of Complementary PWM Mode 0% and 100% Waveform Output (2)**

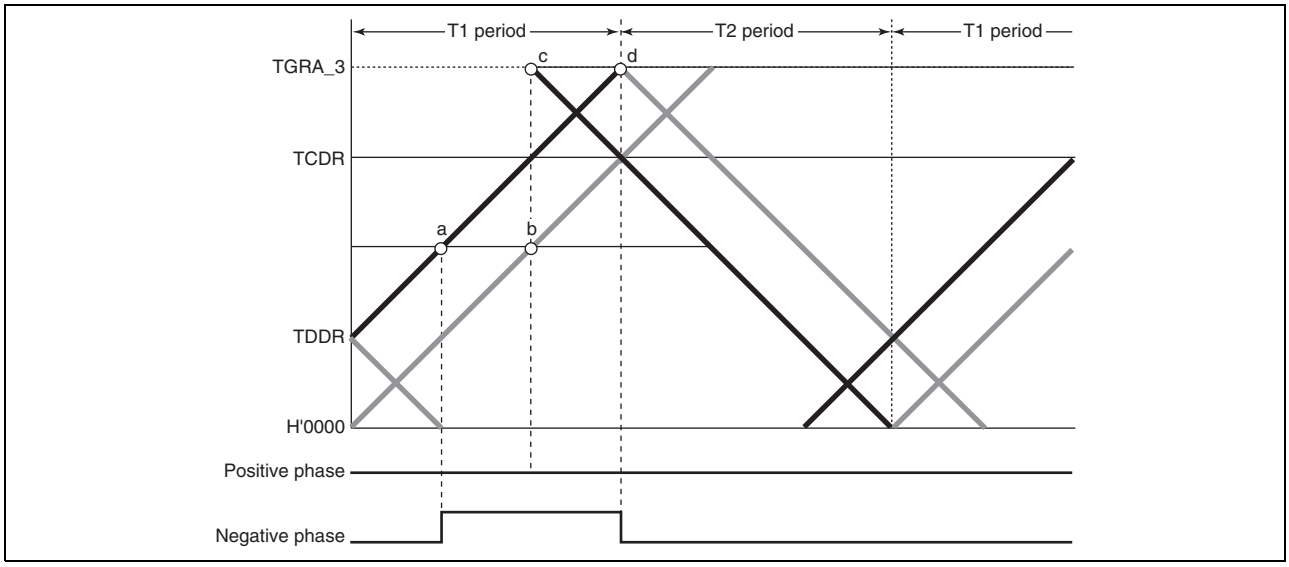

**Figure 10.51 Example of Complementary PWM Mode 0% and 100% Waveform Output (3)**

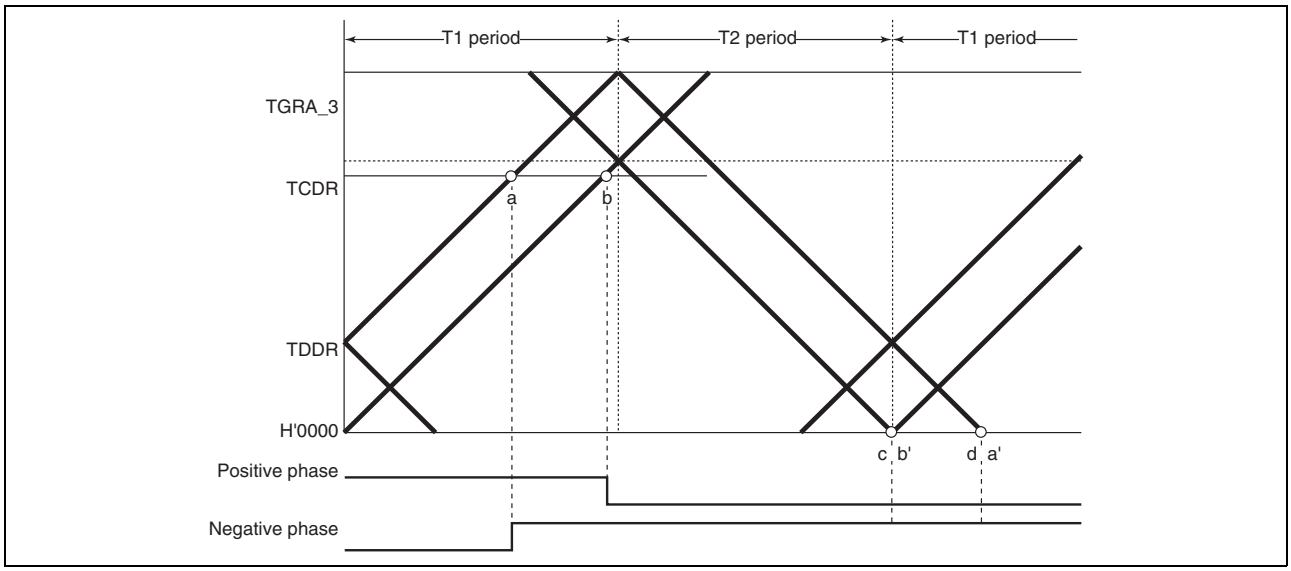

**Figure 10.52 Example of Complementary PWM Mode 0% and 100% Waveform Output (4)**

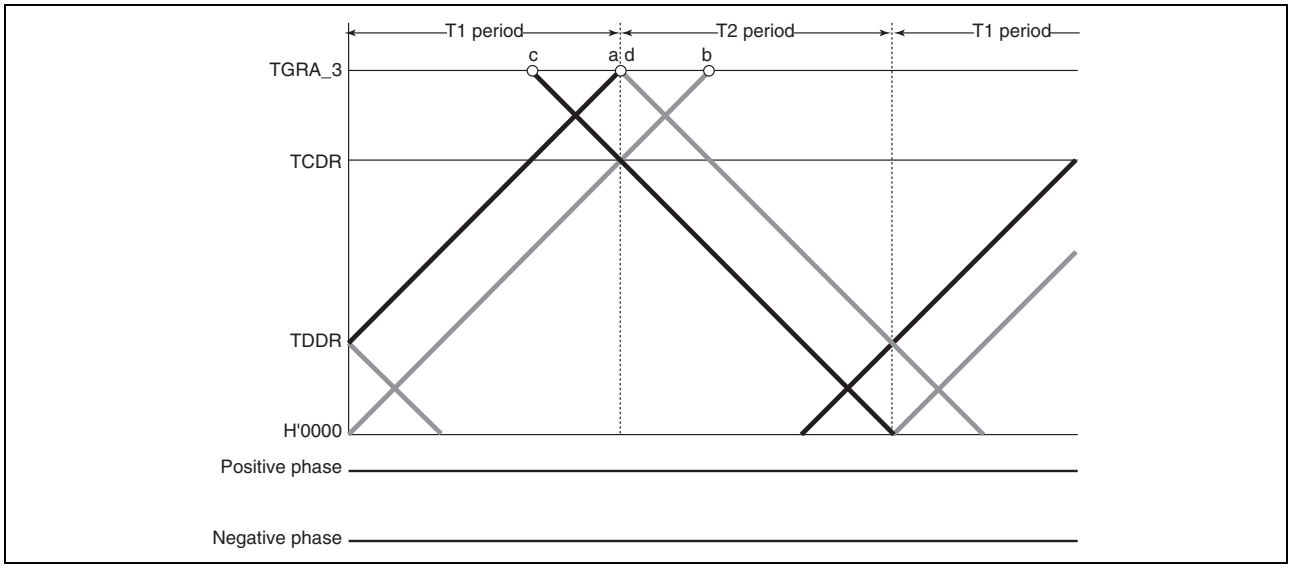

**Figure 10.53 Example of Complementary PWM Mode 0% and 100% Waveform Output (5)**

### (k) Complementary PWM Mode 0% and 100% Duty Output

In complementary PWM mode, 0% and 100% duty cycles can be output as required. Figure 10.49 to Figure 10.53 show output examples.

100% duty output is performed when the compare register value is set to H'0000. The waveform in this case has a positive phase with a 100% on-state. 0% duty output is performed when the compare register value is set to the same value as TGRA_3. The waveform in this case has a positive phase with a 100% off-state.

On and off compare-matches occur simultaneously, but if a turn-on compare-match and turn-off compare-match for the same phase occur simultaneously, both compare-matches are ignored and the waveform does not change.

### (l) Toggle Output Synchronized with PWM Cycle

In complementary PWM mode, toggle output can be performed in synchronization with the PWM carrier cycle by setting the PSYE bit to 1 in the timer output control register (TOCR). An example of a toggle output waveform is shown in Figure 10.54.

This output is toggled by a compare-match between TCNT_3 and TGRA_3 and a compare-match between TCNT_4 and H'0000.

The output pin for this toggle output is the TIOC3A pin. The initial output is 1.

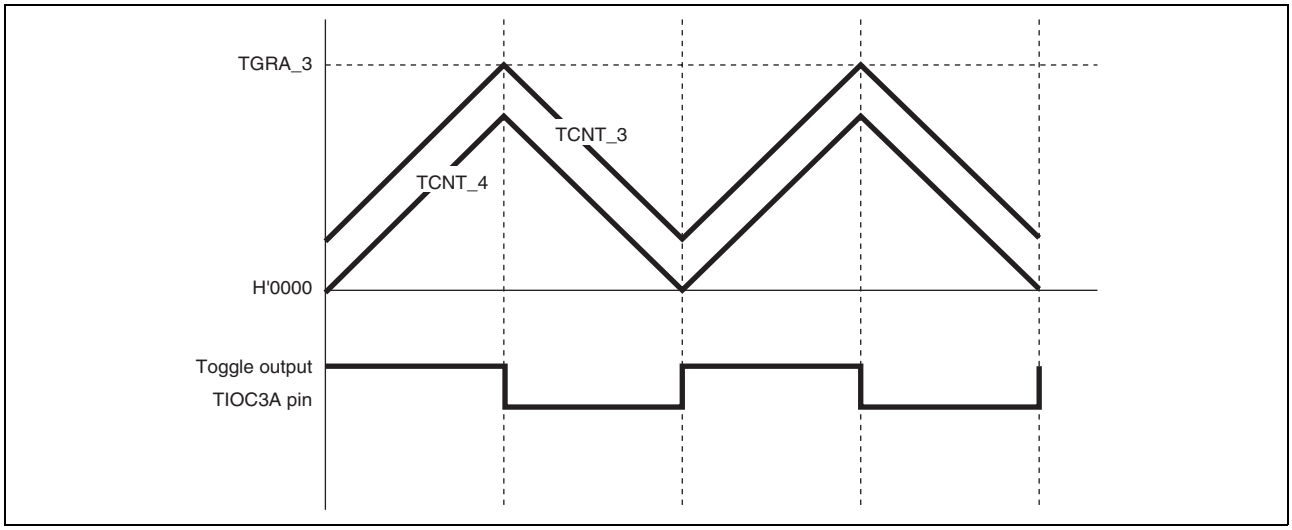

**Figure 10.54 Example of Toggle Output Waveform Synchronized with PWM Output**

### (m) Counter Clearing by Another Channel

In complementary PWM mode, by setting a mode for synchronization with another channel by means of the timer synchronous register (TSYR), and selecting synchronous clearing with bits CCLR2 to CCLR0 in the timer control register (TCR), it is possible to have TCNT_3, TCNT_4, and TCNTS cleared by another channel.

Figure 10.55 illustrates the operation.

Use of this function enables counter clearing and restarting to be performed by means of an external signal.

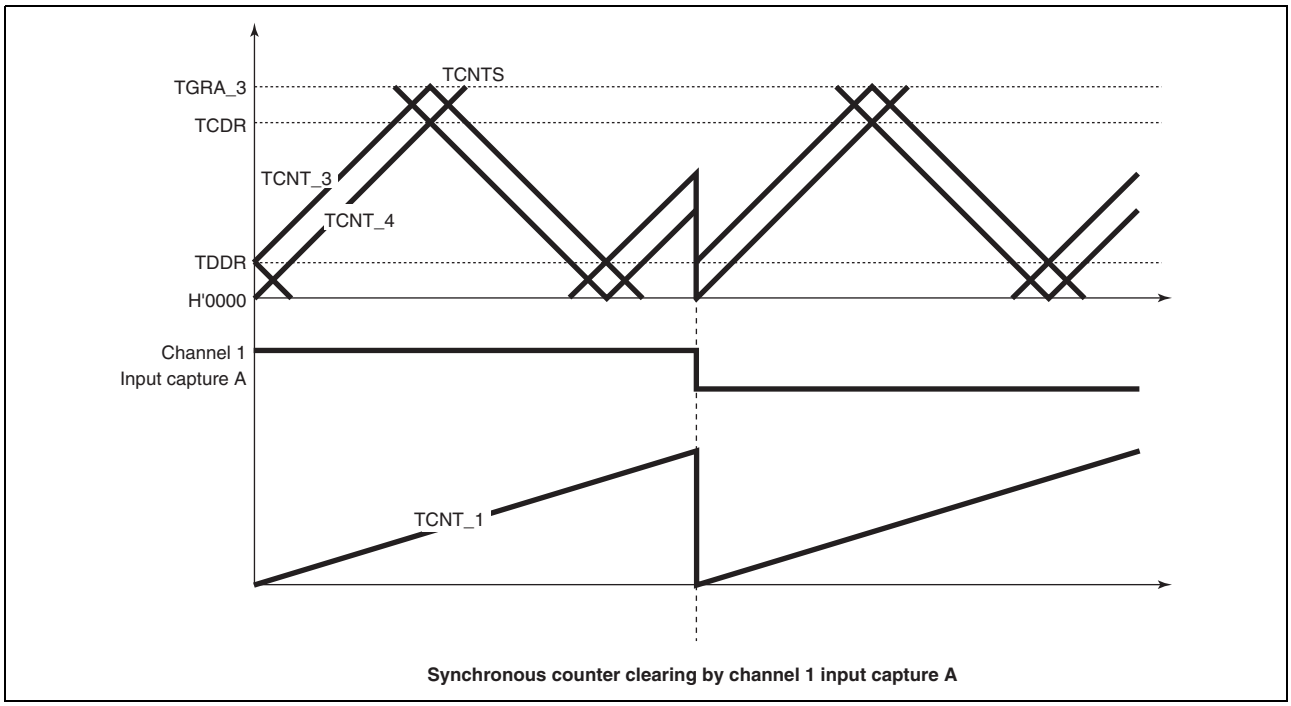

**Figure 10.55 Counter Clearing Synchronized with Another Channel**

### (n) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCR to 1 suppresses initial output when synchronous counter clearing occurs in the Tb interval at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression is applicable only when synchronous clearing occurs in the Tb interval at the trough as indicated by (10) or (11) in Figure 10.56. When synchronous clearing occurs outside that interval, the initial value specified by the OLS bits in TOCR is output. Even in the Tb interval at the trough, if synchronous clearing occurs in the initial value output period (indicated by (1) in Figure 10.56) immediately after the counters start operation, initial value output is not suppressed.

When using the initial output suppression function, make sure to set compare registers TGRB_3, TGRA_4, and TGRB_4 to a value twice or more the setting of dead time data register TDDR. If synchronous clearing occurs with the compare registers set to a value less than twice the setting of TDDR, the PWM output dead time may be too short (or nonexistent) or illegal active-level PWM negative-phase output may occur during the initial output suppression interval. For details, see section 10.7.23, Notes on Output Waveform Control During Synchronous Counter Clearing in Complementary PWM Mode.

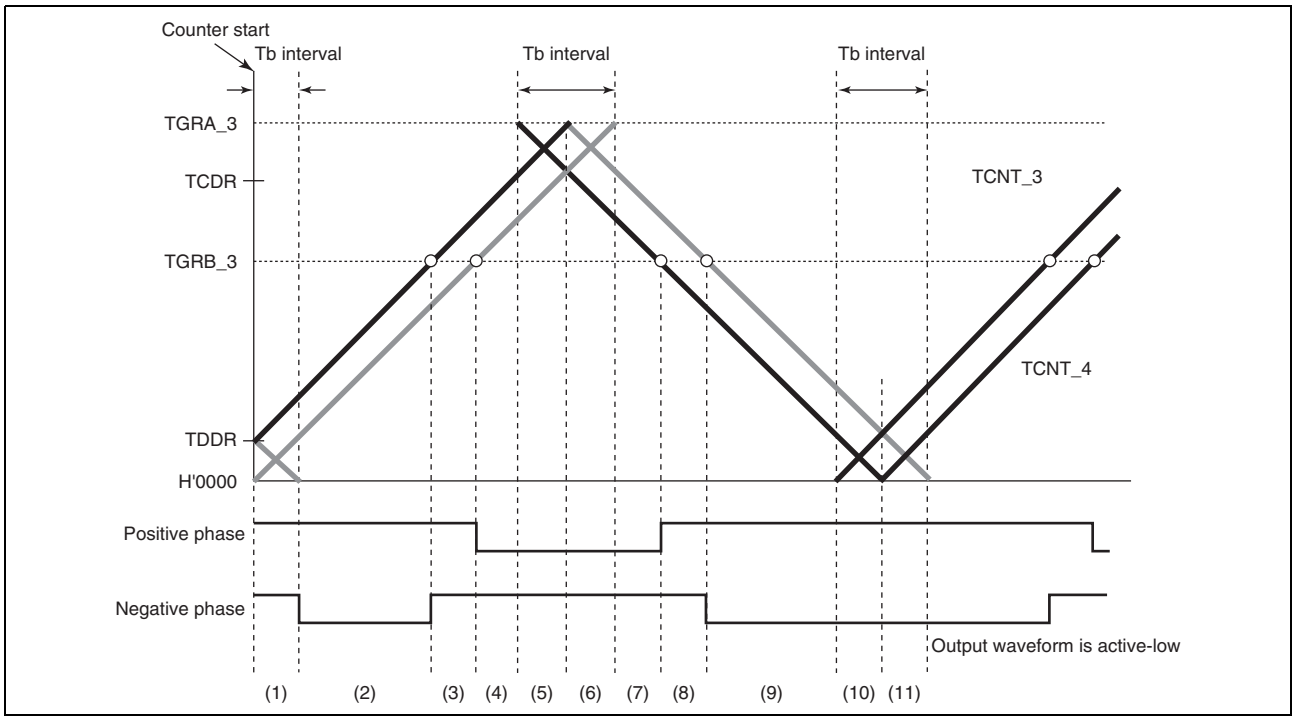

**Figure 10.56 Timing for Synchronous Counter Clearing**

- Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode
  An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in Figure 10.57.

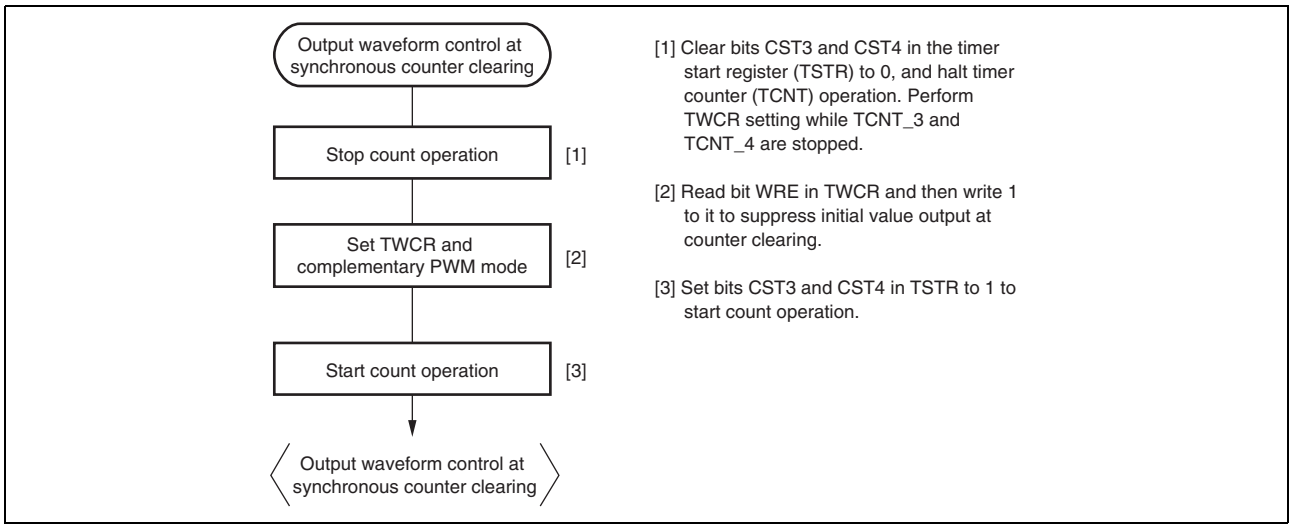

**Figure 10.57 Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode**

- Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode
  Figure 10.58 to Figure 10.61 show examples of output waveform control in which this module operates in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCR is set to 1. In the examples shown in Figure 10.58 to Figure 10.61, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 10.56, respectively.

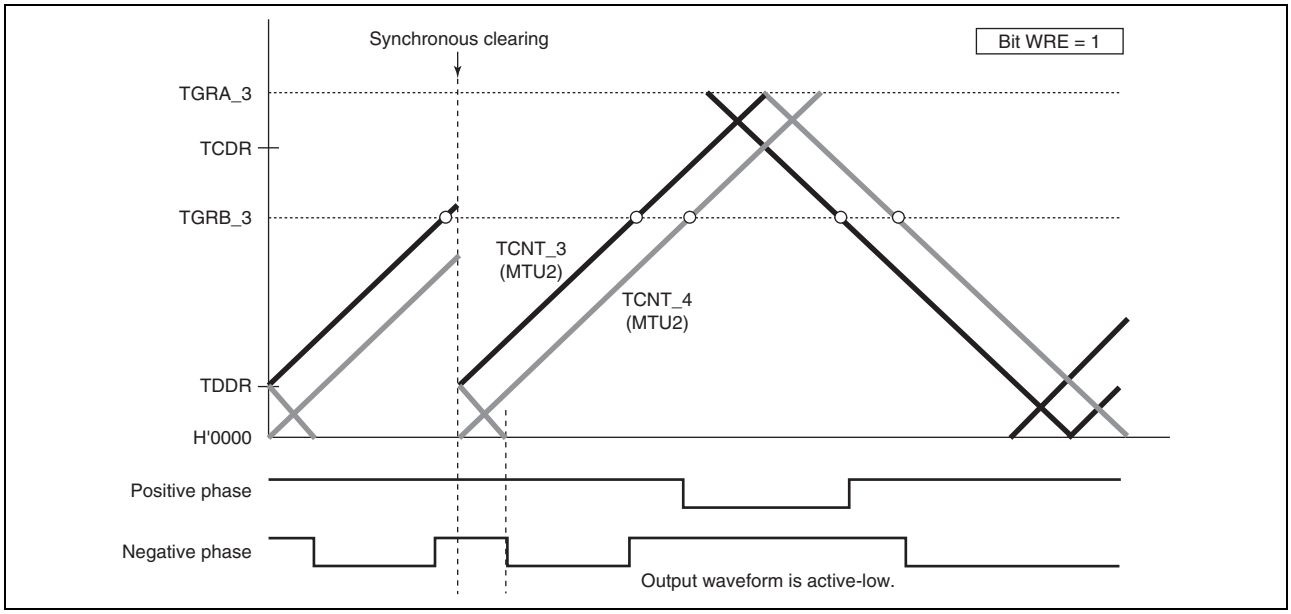

**Figure 10.58 Example of Synchronous Clearing in Dead Time during Up-Counting (Timing (3) in Figure 10.56; Bit WRE of TWCR is 1)**

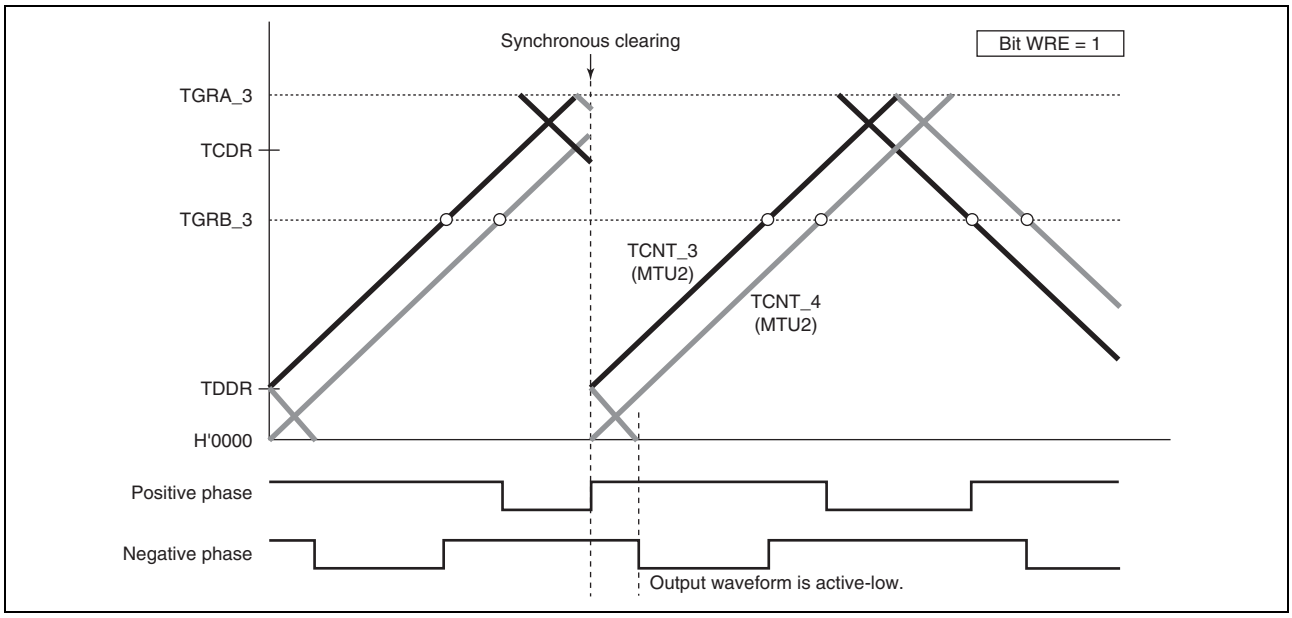

**Figure 10.59 Example of Synchronous Clearing in Interval Tb at Crest (Timing (6) in Figure 10.56; Bit WRE of TWCR is 1)**

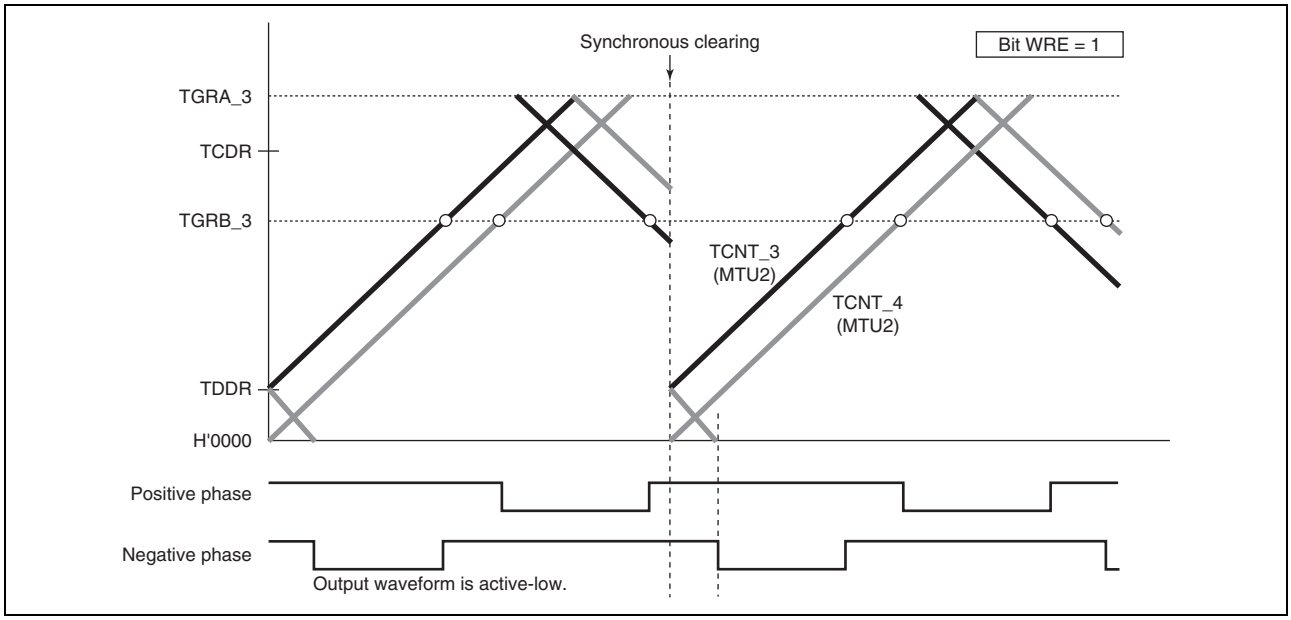

**Figure 10.60 Example of Synchronous Clearing in Dead Time during Down-Counting (Timing (8) in Figure 10.56; Bit WRE of TWCR is 1)**

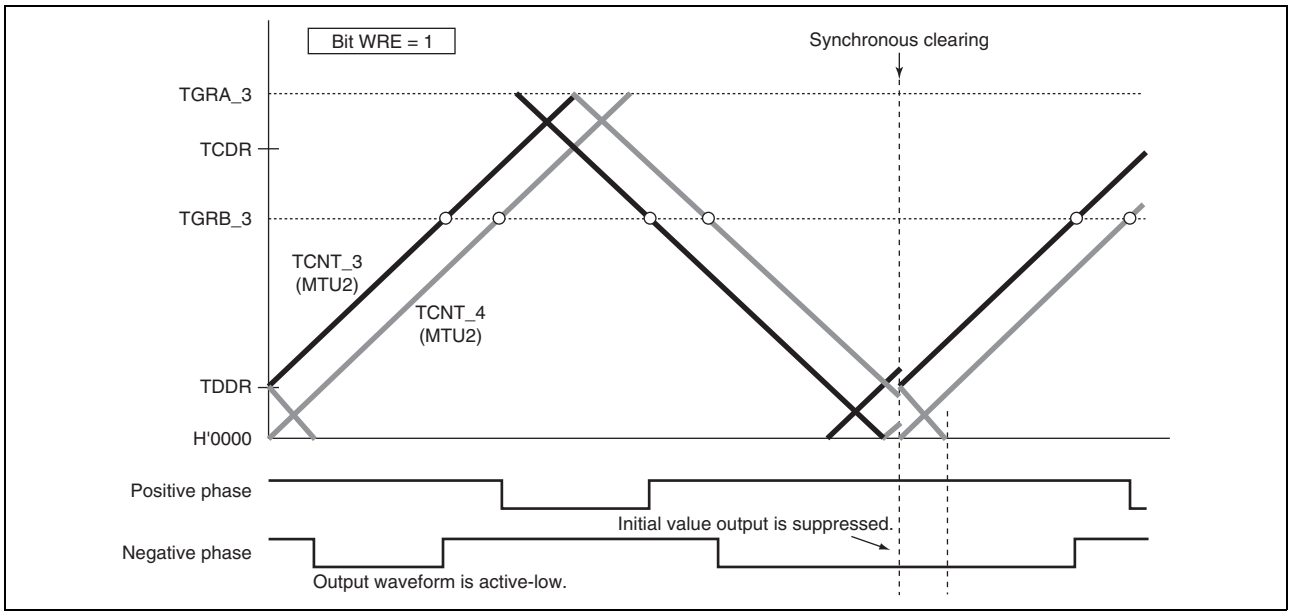

**Figure 10.61 Example of Synchronous Clearing in Interval Tb at Trough (Timing (11) in Figure 10.56; Bit WRE of TWCR is 1)**

### (o) Counter Clearing by TGRA_3 Compare Match

In complementary PWM mode, by setting the CCE bit in the timer waveform control register (TWCR), it is possible to have TCNT_3, TCNT_4, and TCNTS cleared by TGRA_3 compare match.

Figure 10.62 illustrates an operation example.

Note 1. Use this function only in complementary PWM mode 1 (transfer at crest)
Note 2. Do not specify synchronous clearing by another channel (do not set the SYNC0 to SYNC4 bits in the timer synchronous register (TSYR) to 1).
Note 3. Do not set the PWM duty value to H'0000.
Note 4. Do not set the PSYE bit in timer output control register 1 (TOCR1) to 1.

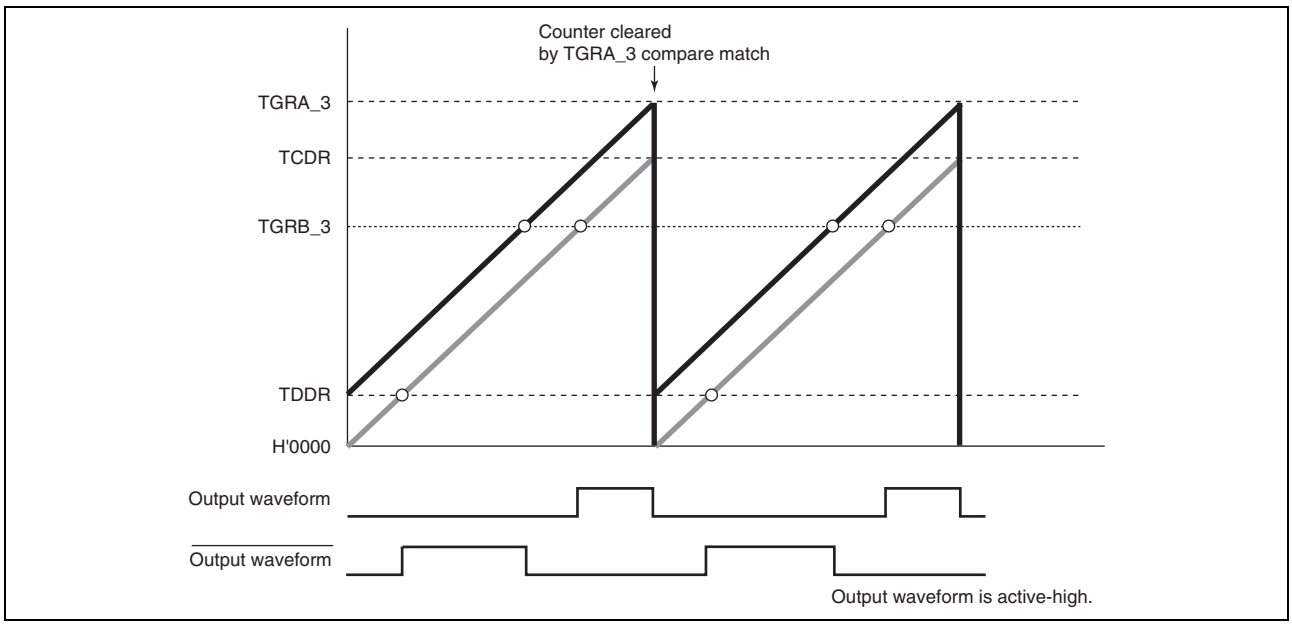

**Figure 10.62 Example of Counter Clearing Operation by TGRA_3 Compare Match**

### (p) Example of AC Synchronous Motor (Brushless DC Motor) Drive Waveform Output

In complementary PWM mode, a brushless DC motor can easily be controlled using the timer gate control register (TGCR). Figure 10.63 to Figure 10.66 show examples of brushless DC motor drive waveforms created using TGCR.

When output phase switching for a 3-phase brushless DC motor is performed by means of external signals detected with a Hall element, etc., clear the FB bit in TGCR to 0. In this case, the external signals indicating the polarity position are input to channel 0 timer input pins TIOC0A, TIOC0B, and TIOC0C (set with the general I/O ports). When an edge is detected at pin TIOC0A, TIOC0B, or TIOC0C, the output on/off state is switched automatically.

When the FB bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCR is cleared to 0 or set to 1. The drive waveforms are output from the complementary PWM mode 6-phase output pins. With this 6-phase output, in the case of on output, it is possible to use complementary PWM mode output and perform chopping output by setting the N bit or P bit to 1. When the N bit or P bit is 0, level output is selected.

The 6-phase output active level (on output level) can be set with the OLSN and OLSP bits in the timer output control register (TOCR) regardless of the setting of the N and P bits.

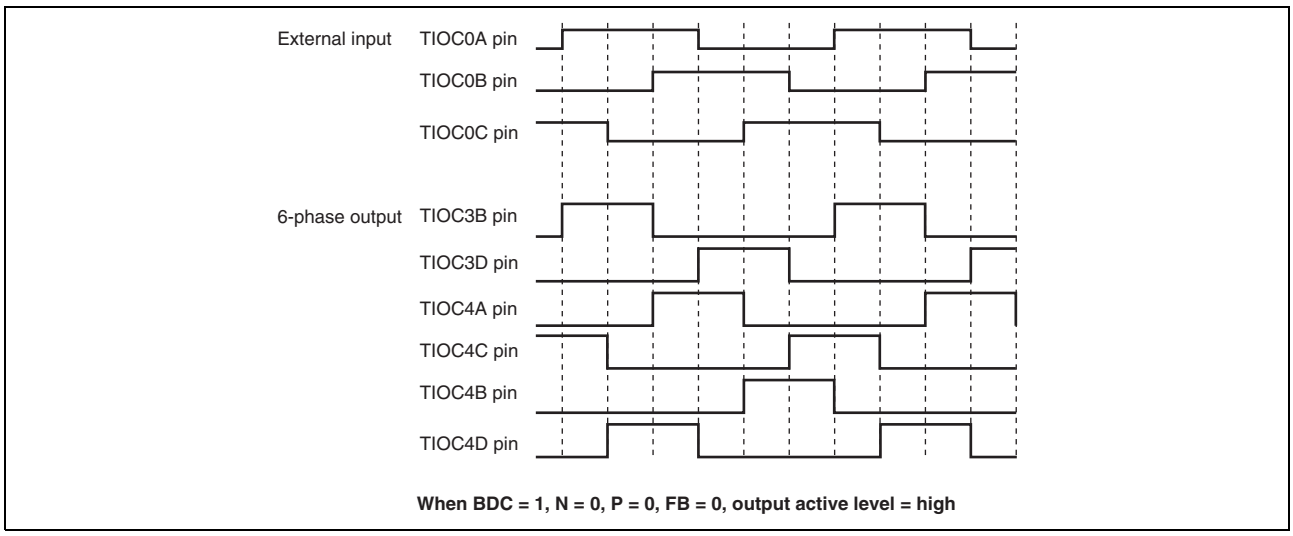

**Figure 10.63 Example of Output Phase Switching by External Input (1)**

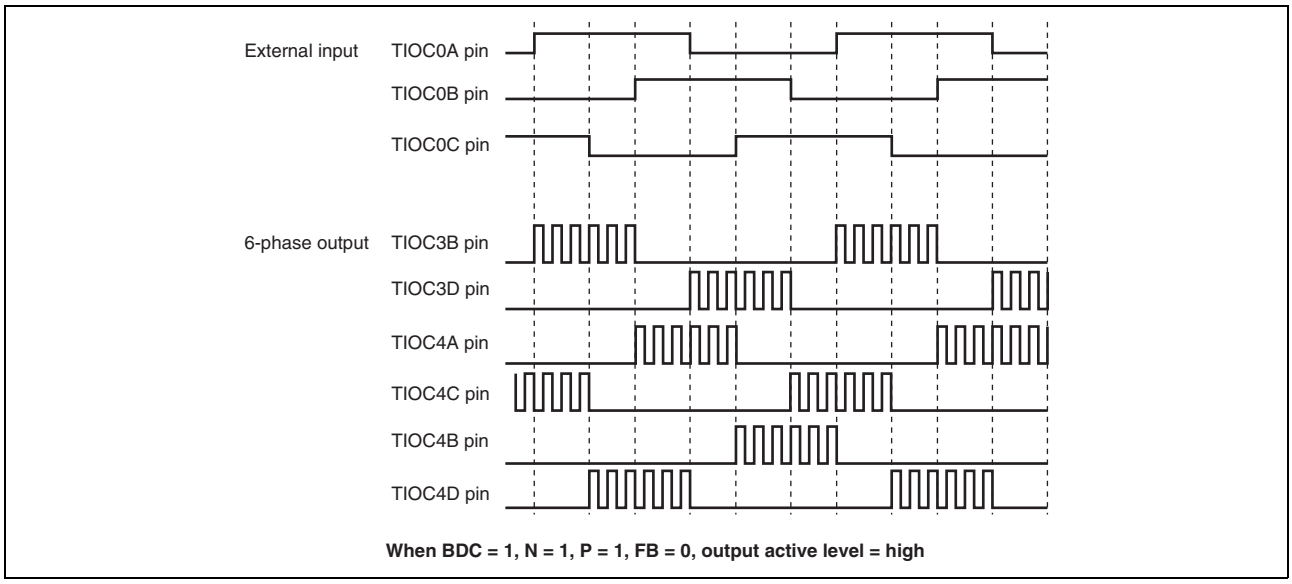

**Figure 10.64 Example of Output Phase Switching by External Input (2)**

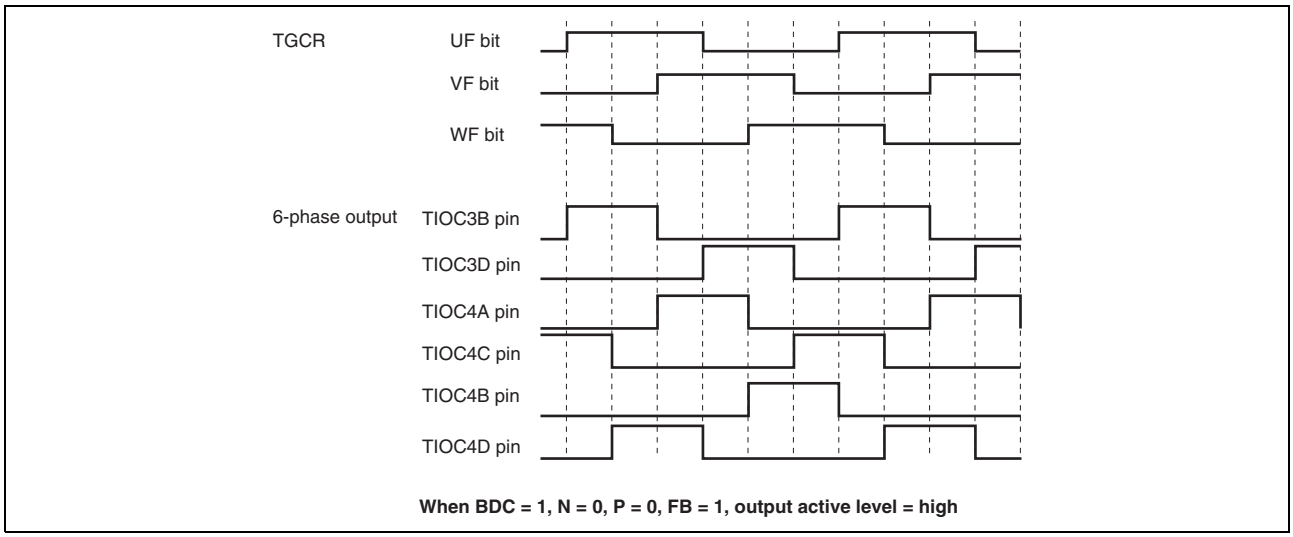

**Figure 10.65 Example of Output Phase Switching by Means of UF, VF, WF Bit Settings (1)**

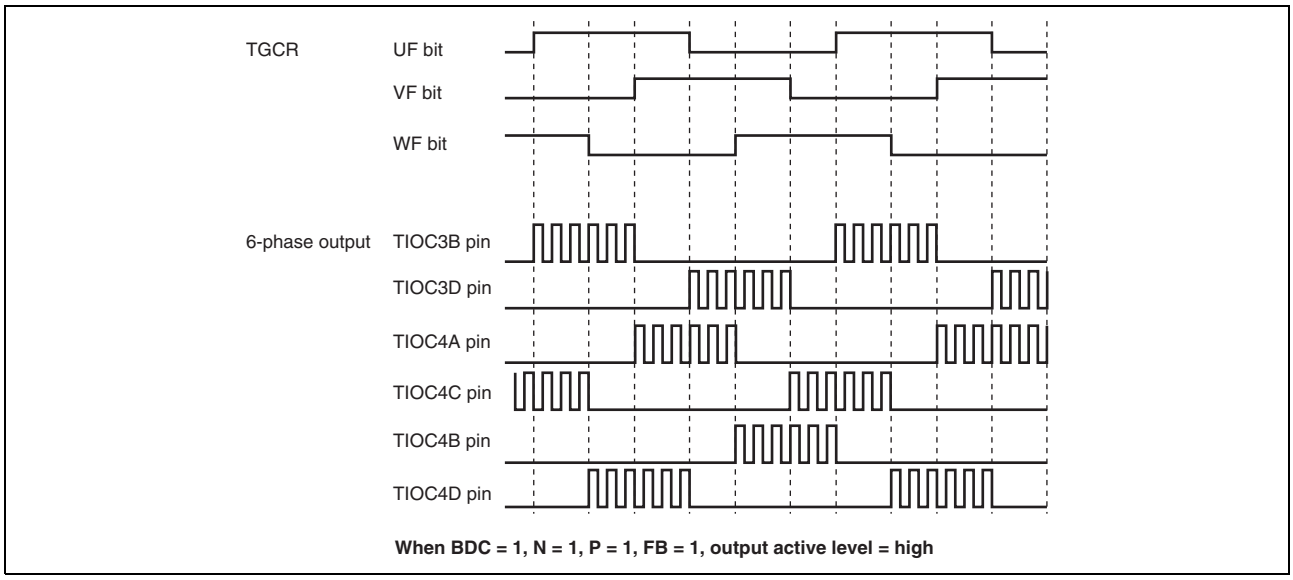

**Figure 10.66 Example of Output Phase Switching by Means of UF, VF, WF Bit Settings (2)**

## (q) A/D Converter Start Request Setting

In complementary PWM mode, an A/D converter start request can be issued using a TGRA_3 compare-match, TCNT_4 underflow (trough), or compare-match on a channel other than channels 3 and 4.

When start requests using a TGRA_3 compare-match are specified, A/D conversion can be started at the crest of the TCNT_3 count.

A/D converter start requests can be set by setting the TTGE bit to 1 in the timer interrupt enable register (TIER). To issue an A/D converter start request at a TCNT_4 underflow (trough), set the TTGE2 bit in TIER_4 to 1.

### (3) Interrupt Skipping in Complementary PWM Mode

Interrupts TGIA_3 (at the crest) and TCIV_4 (at the trough) in channels 3 and 4 can be skipped up to seven times by making settings in the timer interrupt skipping set register (TITCR).

Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the timer buffer transfer register (TBTER). For the linkage with buffer registers, refer to description (c), Buffer Transfer Control Linked with Interrupt Skipping, below.

A/D converter start requests generated by the A/D converter start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the timer A/D converter request control register (TADCR). For the linkage with the A/D converter start request delaying function, refer to section 10.4.9, A/D Converter Start Request Delaying Function.

The setting of the timer interrupt skipping setting register (TITCR) must be done while the TGIA_3 and TCIV_4 interrupt requests are disabled by the settings of TIER_3 and TIER_4 along with under the conditions in which TGFA_3 and TCFV_4 flag settings by compare match never occur. Before changing the skipping count, be sure to clear the T3AEN and T4VEN bits to 0 to clear the skipping counter.

#### (a) Example of Interrupt Skipping Operation Setting Procedure

Figure 10.67 shows an example of the interrupt skipping operation setting procedure. Figure 10.68 shows the periods during which interrupt skipping count can be changed.

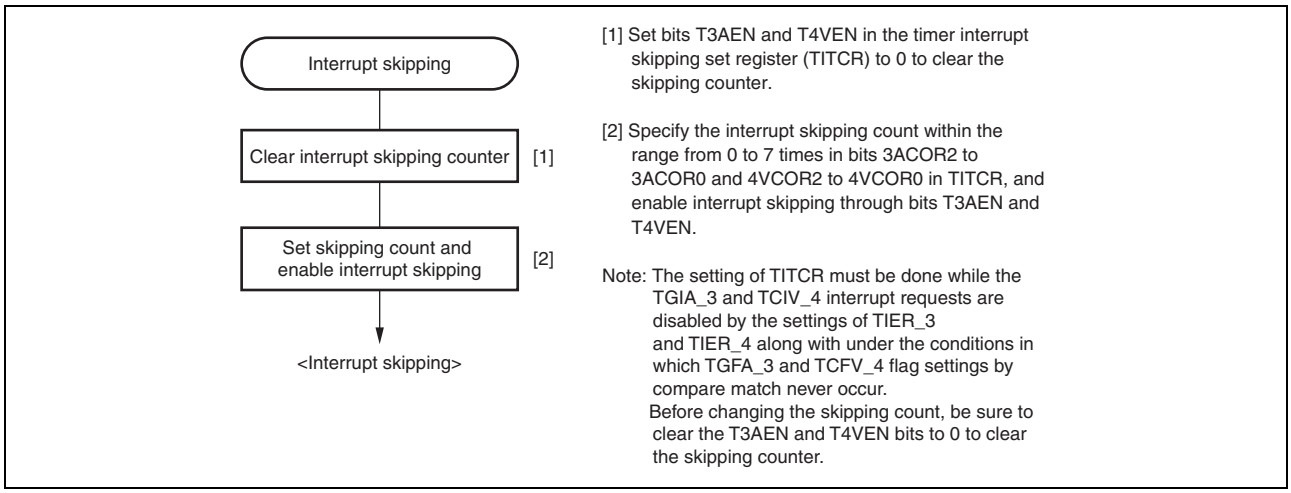

**Figure 10.67 Example of Interrupt Skipping Operation Setting Procedure**

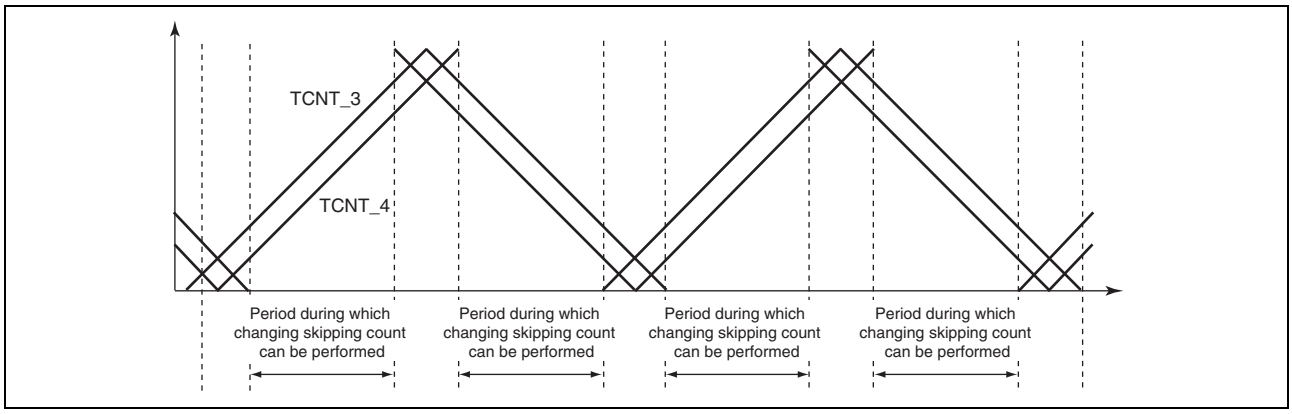

**Figure 10.68 Periods during which Interrupt Skipping Count can be Changed**

## (b) Example of Interrupt Skipping Operation

Figure 10.69 shows an example of TGIA_3 interrupt skipping in which the interrupt skipping count is set to three by the 3ACOR bit and the T3AEN bit is set to 1 in the timer interrupt skipping set register (TITCR).

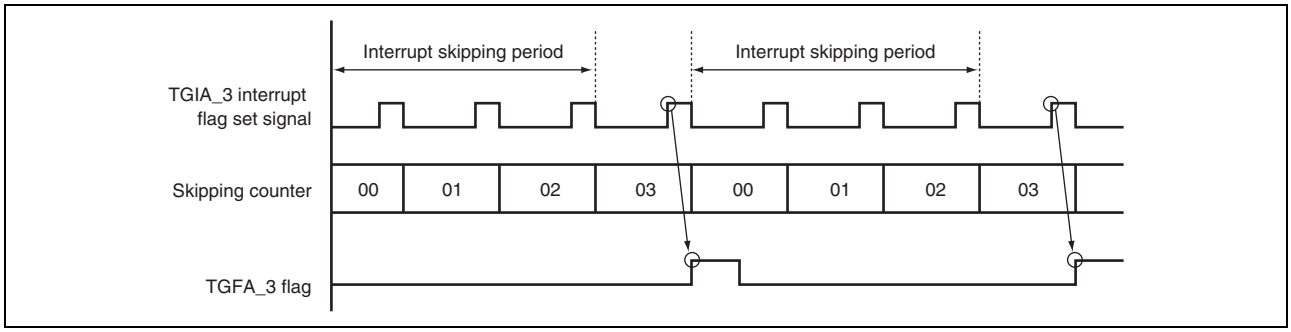

**Figure 10.69 Example of Interrupt Skipping Operation**

### (c) Buffer Transfer Control Linked with Interrupt Skipping

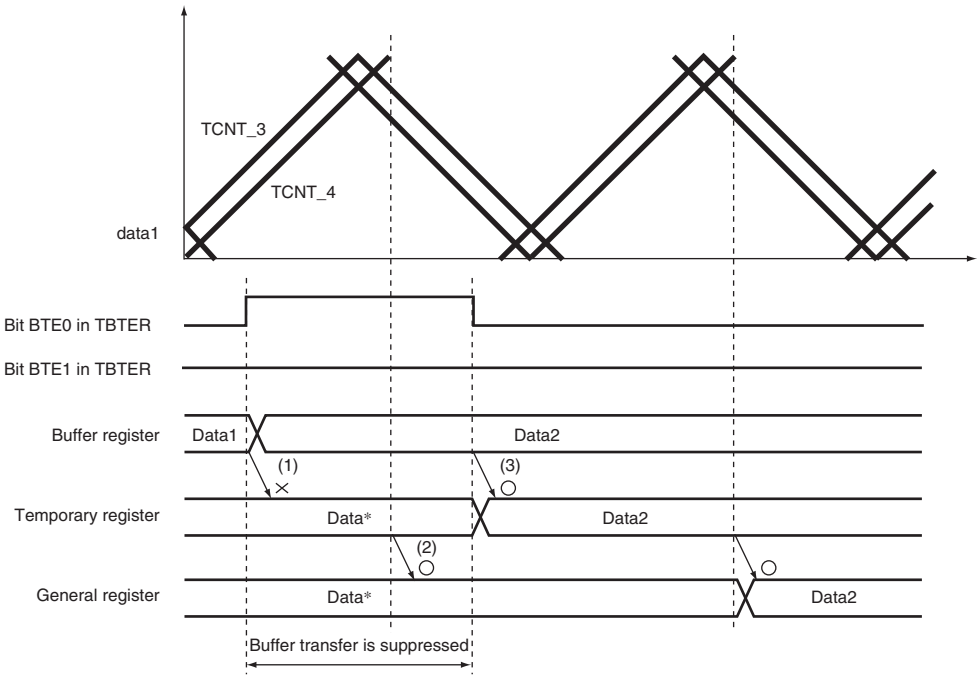
In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE1 and BTE0 bits in the timer buffer transfer set register (TBTER).

Figure 10.70 shows an example of operation when buffer transfer is suppressed (BTE1 = 0 and BTE0 = 1). While this setting is valid, data is not transferred from the buffer register to the temporary register.

Figure 10.71 shows an example of operation when buffer transfer is linked with interrupt skipping (BTE1 = 1 and BET0 = 0). While this setting is valid, data is not transferred from the buffer register to the temporary register outside the buffer transfer-enabled period. Depending on the rewrite timing from the interrupt generation to the buffer register, there are two types of the transfer timing such as from the buffer register to the temporary register and from the temporary register to the general register.

Note that the buffer transfer-enabled period depends on the T3AEN and T4VEN bit settings in the timer interrupt skipping set register (TITCR). Figure 10.72 shows the relationship between the T3AEN and T4VEN bit settings in TITCR and buffer transfer-enabled period.

Note: This function must always be used in combination with interrupt skipping.
When interrupt skipping is disabled (the T3AEN and T4VEN bits in the timer interrupt skipping set register (TITCR) are cleared to 0 or the skipping count set bits (3ACOR and 4VCOR) in TITCR are cleared to 0), make sure that buffer transfer is not linked with interrupt skipping (clear the BTE1 bit in the timer buffer transfer set register (TBTER) to 0). If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.



[Legend]
(1) No data is transferred from the buffer register to the temporary register in the buffer transfer-disabled period (bits BTE1 and BTE0 in TBTER are set to 0 and 1, respectively).
(2) Data is transferred from the temporary register to the general register even in the buffer transfer-disabled period.
(3) After buffer transfer is enabled, data is transferred from the buffer register to the temporary register.

Note: * When buffer transfer at the crest is selected.

**Figure 10.70 Example of Operation when Buffer Transfer is Suppressed (BTE1 = 0 and BTE0 = 1)**

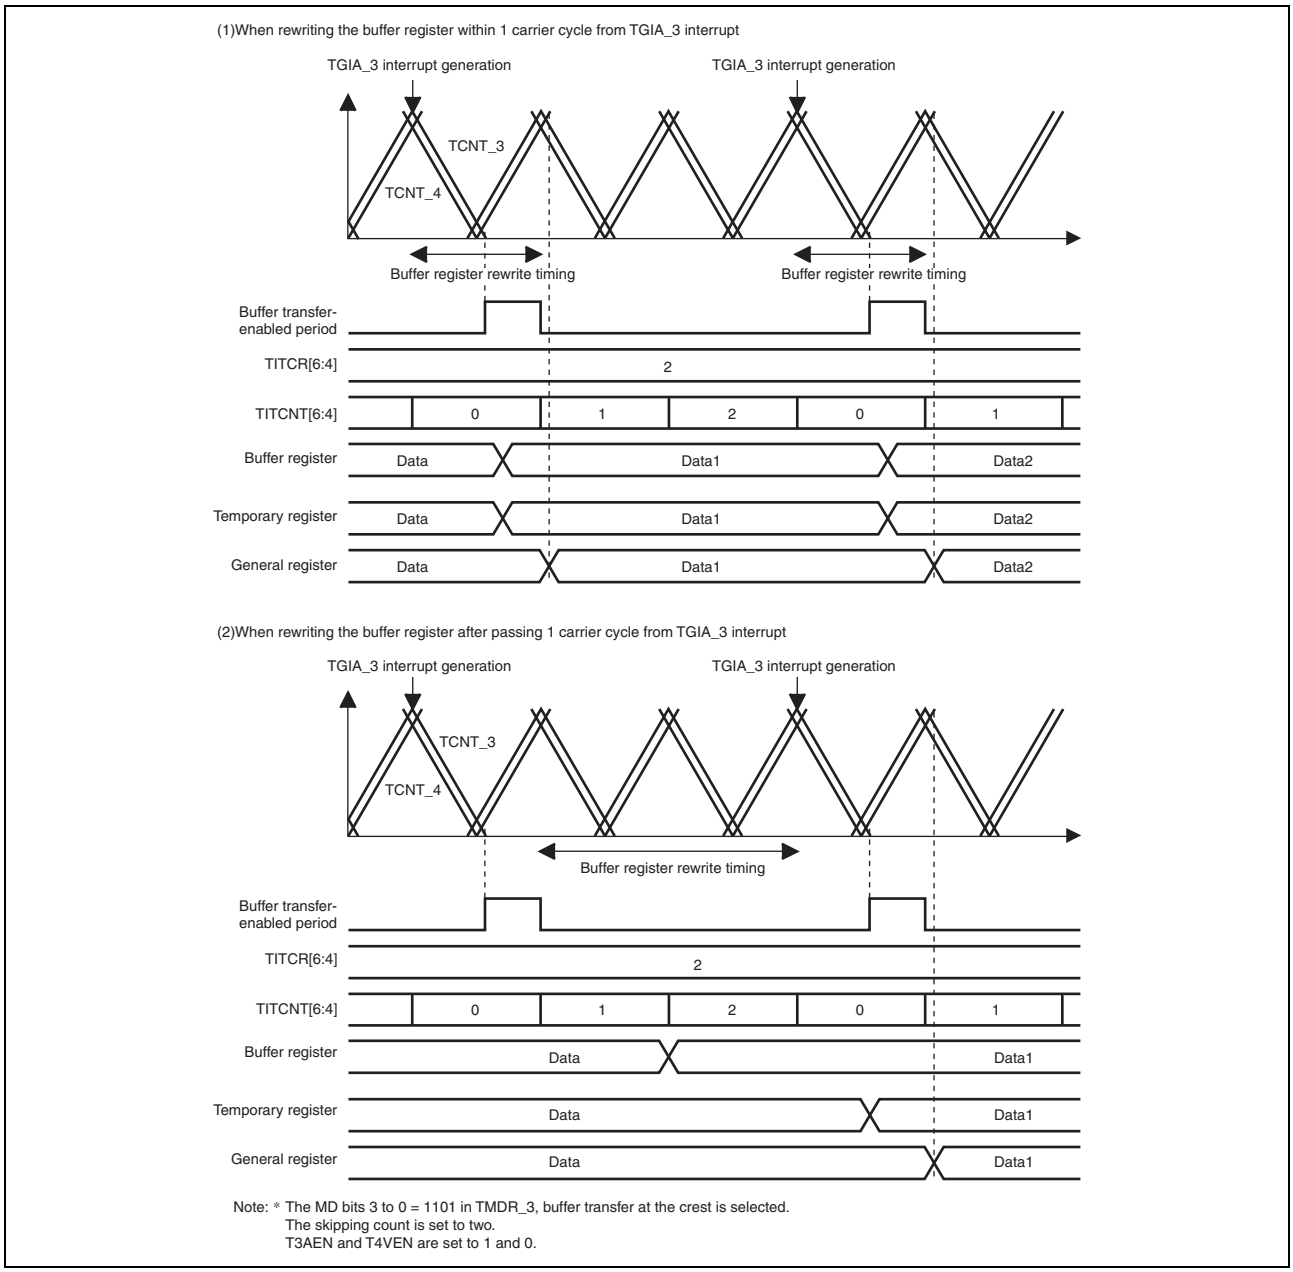


**Figure 10.71 Example of Operation when Buffer Transfer is Linked with Interrupt Skipping (BTE1 = 1 and BTE0 = 0)**

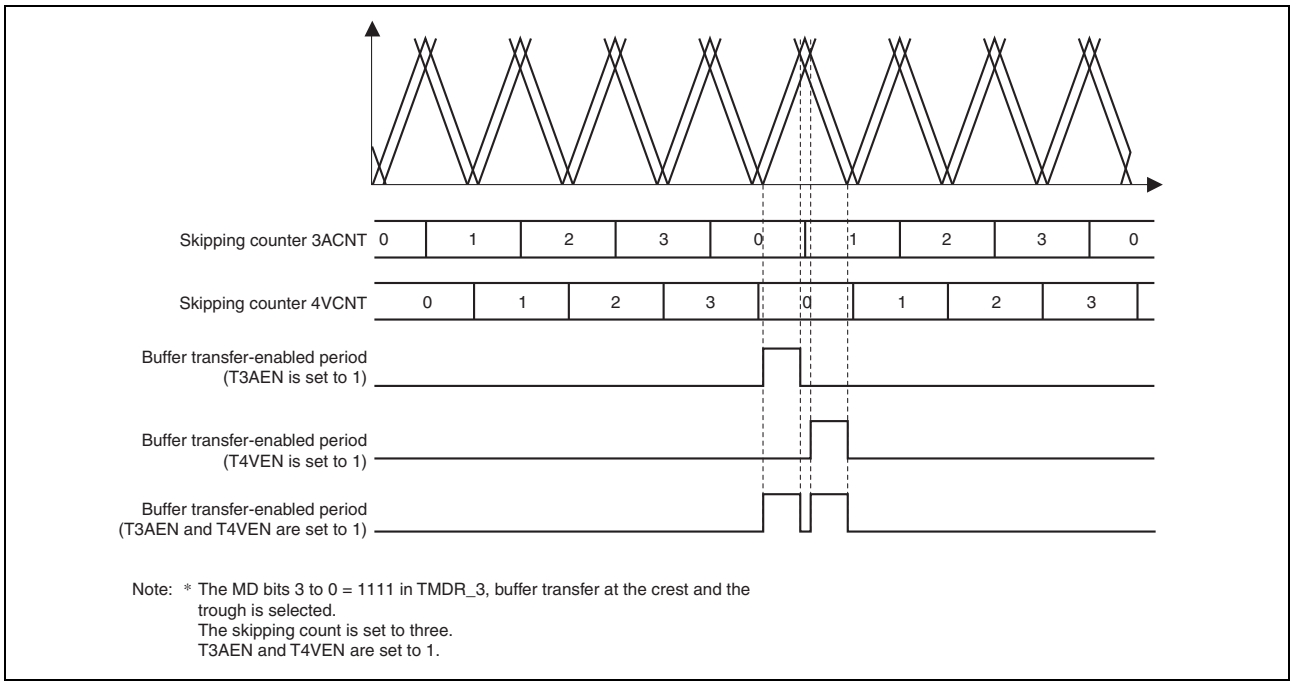

**Figure 10.72 Relationship between Bits T3AEN and T4VEN in TITCR and Buffer Transfer-Enabled Period**

### (4) Complementary PWM Mode Output Protection Function

Complementary PWM mode output has the following protection function.

#### (a) Register and counter miswrite prevention function

With the exception of the buffer registers, which can be rewritten at any time, access by the CPU can be enabled or disabled for the mode registers, control registers, compare registers, and counters used in complementary PWM mode by means of the RWE bit in the timer read/write enable register (TRWER). The applicable registers are some (21 in total) of the registers in channels 3 and 4 shown in the following:

- TCR_3 and TCR_4, TMDR_3 and TMDR_4, TIORH_3 and TIORH_4, TIORL_3 and TIORL_4, TIER_3 and TIER_4, TCNT_3 and TCNT_4, TGRA_3 and TGRA_4, TGRB_3 and TGRB_4, TOER, TOCR, TGCR, TCDR, and TDDR.

This function enables miswriting due to CPU runaway to be prevented by disabling CPU access to the mode registers, control registers, and counters. When the applicable registers are read in the access-disabled state, undefined values are returned. Writing to these registers is ignored.

### 10.4.9 A/D Converter Start Request Delaying Function

A/D converter start requests can be issued in channel 4 by making settings in the timer A/D converter start request control register (TADCR), timer A/D converter start request cycle set registers (TADCORA_4 and TADCORB_4), and timer A/D converter start request cycle set buffer registers (TADCOBRA_4 and TADCOBRB_4).

The A/D converter start request delaying function compares TCNT_4 with TADCORA_4 or TADCORB_4, and when their values match, the function issues a respective A/D converter start request (TRG4AN or TRG4BN).

A/D converter start requests (TRG4AN and TRG4BN) can be skipped in coordination with interrupt skipping by setting the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in TADCR.

- Example of Procedure for Specifying A/D Converter Start Request Delaying Function
  Figure 10.73 shows an example of procedure for specifying the A/D converter start request delaying function.

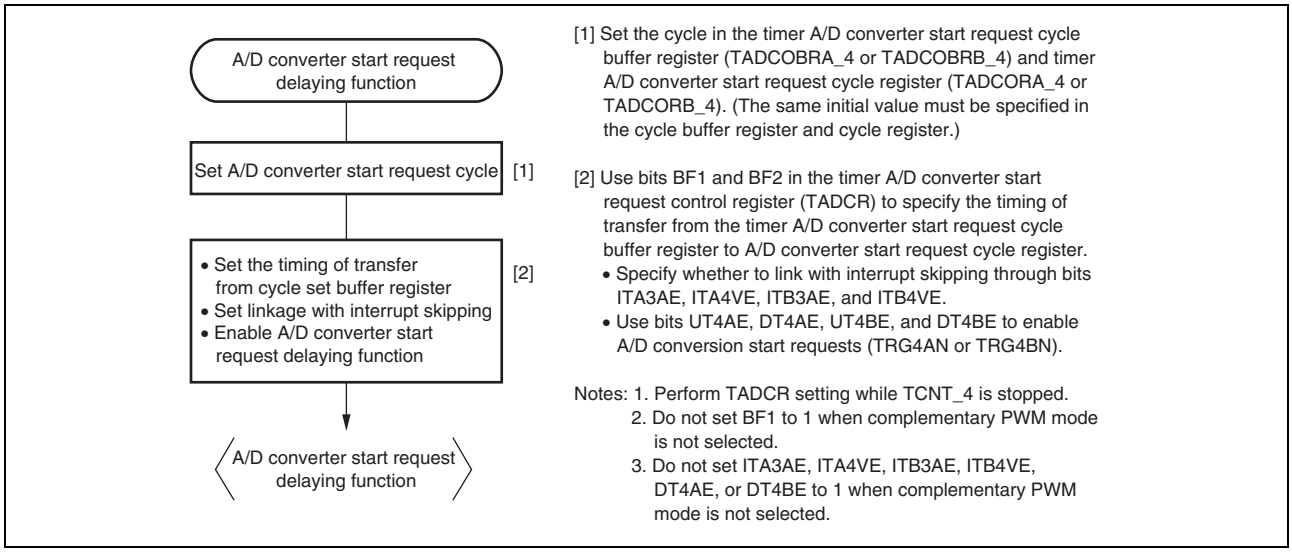

**Figure 10.73 Example of Procedure for Specifying A/D Converter Start Request Delaying Function**

- Basic Operation Example of A/D Converter Start Request Delaying Function
  Figure 10.74 shows a basic example of A/D converter request signal (TRG4AN) operation when the trough of TCNT_4 is specified for the buffer transfer timing and an A/D converter start request signal is output during TCNT_4 down-counting.

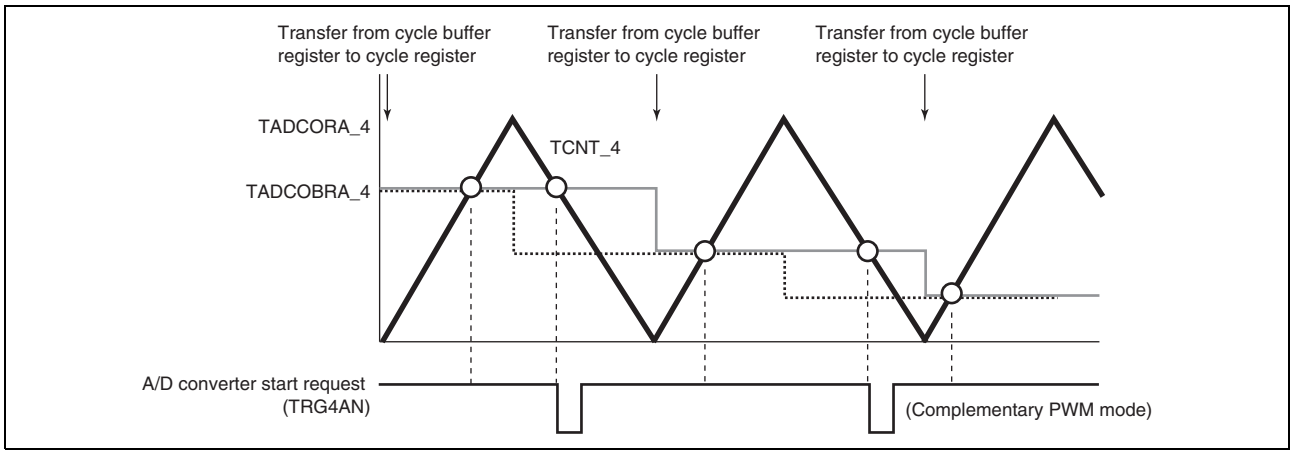

**Figure 10.74 Basic Example of A/D Converter Start Request Signal (TRG4AN) Operation**

- Buffer Transfer
  The data in the timer A/D converter start request cycle set registers (TADCORA_4 and TADCORB_4) is updated by writing data to the timer A/D converter start request cycle set buffer registers (TADCOBRA_4 and TADCOBRB_4). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF1 and BF0 bits in the timer A/D converter start request control register (TADCR_4).

- A/D Converter Start Request Delaying Function Linked with Interrupt Skipping
  A/D converter start requests (TRG4AN and TRG4BN) can be issued in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the timer A/D converter start request control register (TADCR).
  Figure 10.75 shows an example of A/D converter start request signal (TRG4AN) operation when TRG4AN output is enabled during TCNT_4 up counting and down counting and A/D converter start requests are linked with interrupt skipping.
  Figure 10.76 shows another example of A/D converter start request signal (TRG4AN) operation when TRG4AN output is enabled during TCNT_4 up counting and A/D converter start requests are linked with interrupt skipping.

Note: This function must be used in combination with interrupt skipping.
When interrupt skipping is disabled (the T3AEN and T4VEN bits in the timer interrupt skipping set register (TITCR) are cleared to 0 or the skipping count set bits (3ACOR and 4VCOR) in TITCR are cleared to 0), make sure that A/D converter start requests are not linked with interrupt skipping (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the timer A/D converter start request control register (TADCR) to 0).

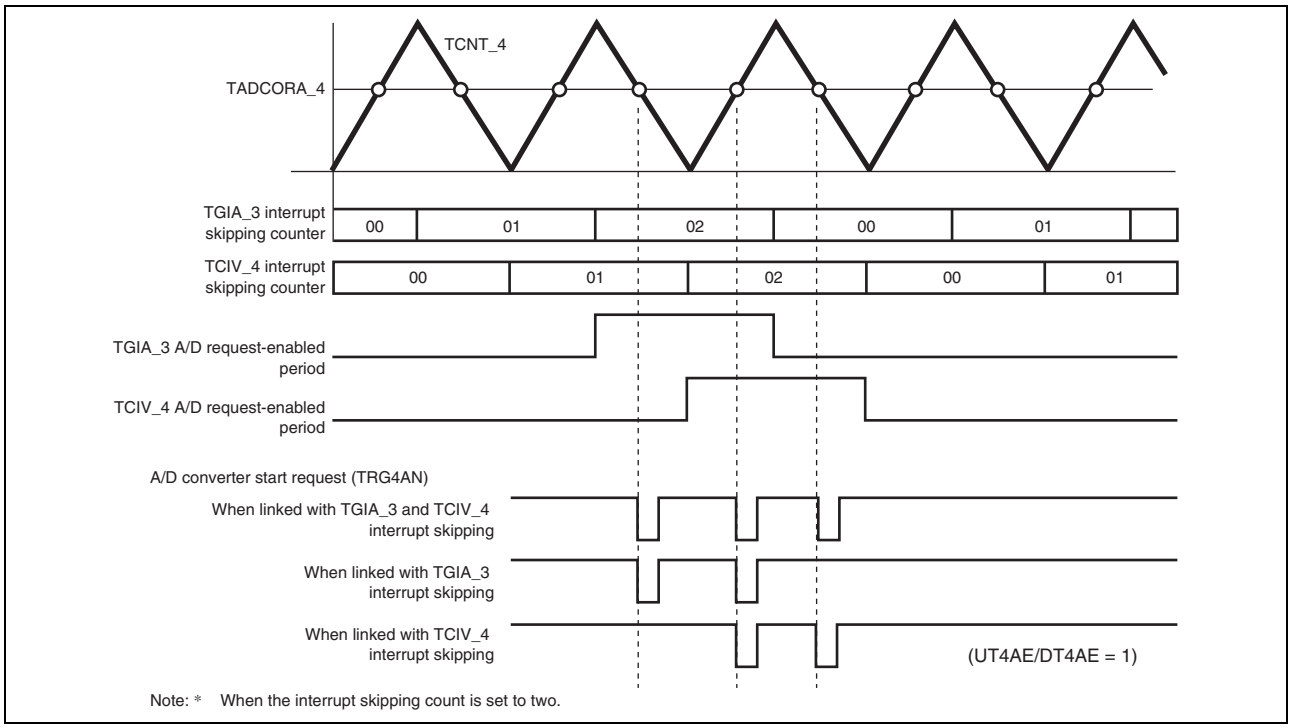

**Figure 10.75 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping(1)**

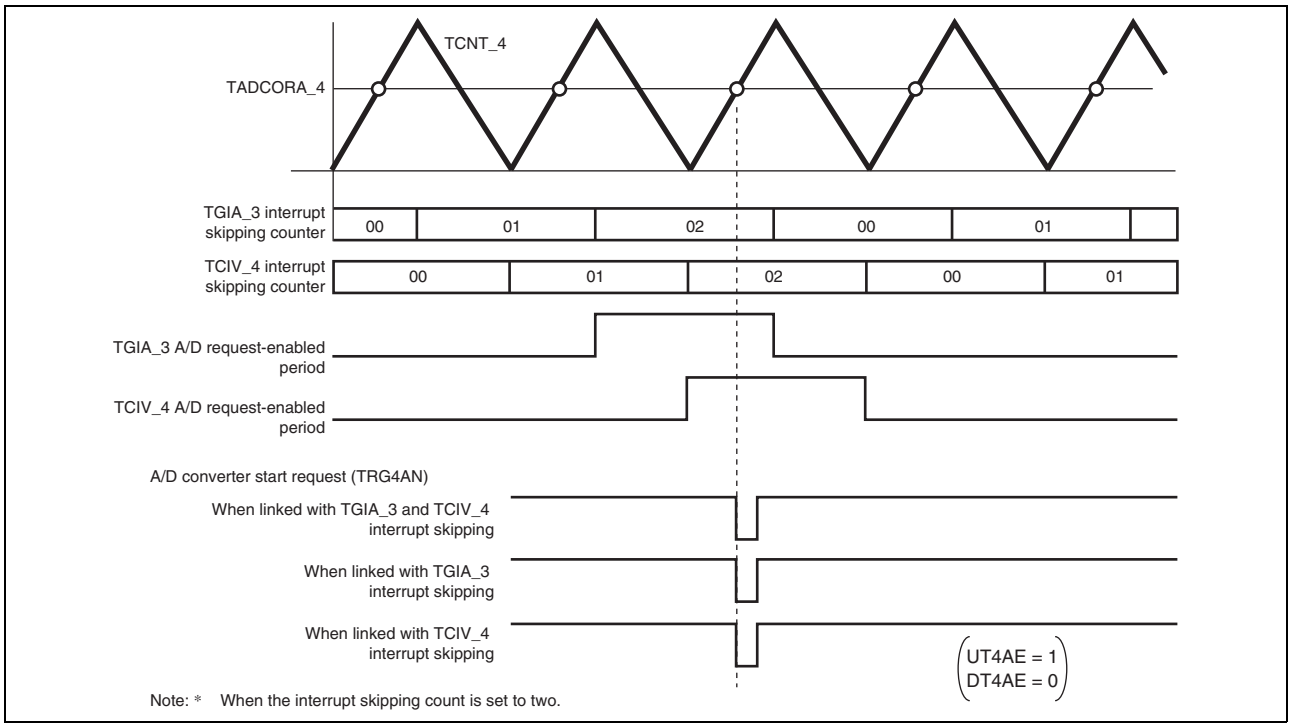

**Figure 10.76 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping(2)**

### 10.4.10 TCNT Capture at Crest and/or Trough in Complementary PWM Operation

The TCNT value is captured in TGR at either the crest or trough or at both the crest and trough during complementary PWM operation. The timing for capturing in TGR can be selected by TIOR.

Figure 10.77 shows an example in which TCNT is used as a free-running counter without being cleared, and the TCNT value is captured in TGR at the specified timing (either crest or trough, or both crest and trough).

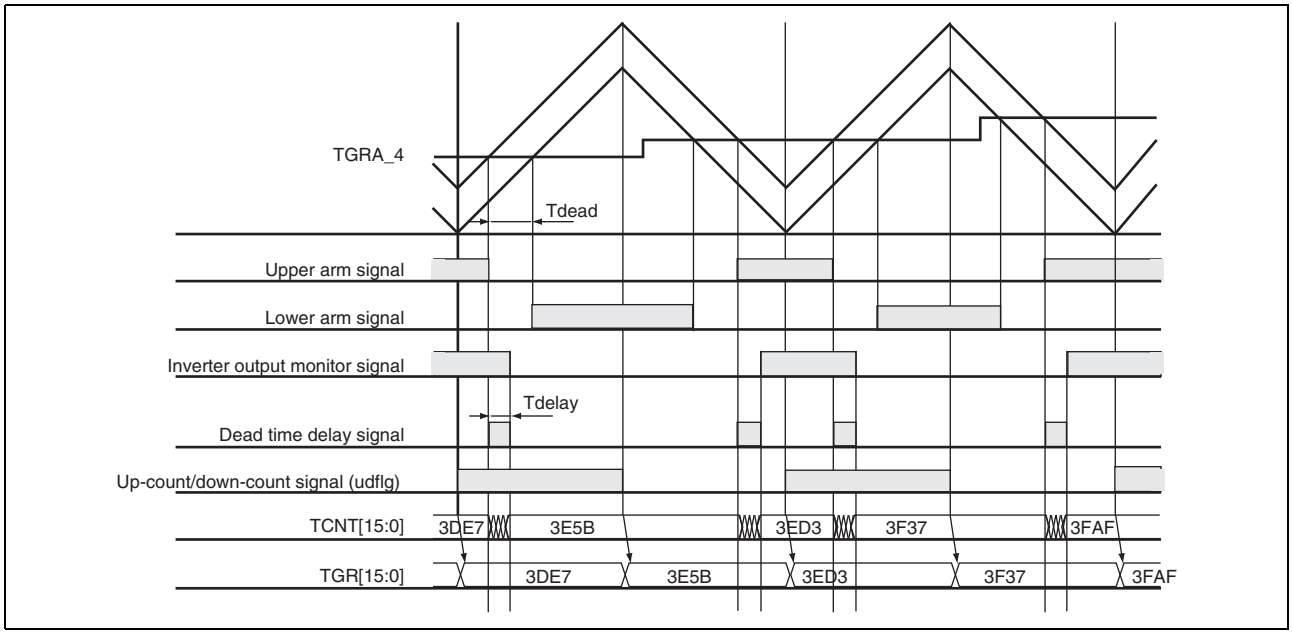

**Figure 10.77 TCNT Capturing at Crest and/or Trough in Complementary PWM Operation**

## 10.5 Interrupt Sources

### 10.5.1 Interrupt Sources and Priorities

This module has three kinds of interrupt sources; TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own status flag and enable/disabled bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt request is generated, the corresponding status flag in TSR is set to 1. If the corresponding enable/disable bit in TIER is set to 1 at this time, an interrupt is requested. The interrupt request is cleared by clearing the status flag to 0.

Relative channel priorities can be changed by the interrupt controller, however the priority order within a channel is fixed. For details, see section 7, Interrupt Controller.

Table 10.55 lists the interrupt sources of this module.

**Table 10.55 Interrupts of Multi-Function Timer Pulse Unit 2**

| Channel | Name | Interrupt Source | Interrupt Flag | Activation of Direct Memory Access Controller | Priority |
|---|---|---|---|---|---|
| 0 | TGIA_0 | TGRA_0 input capture/compare match | TGFA_0 | Possible | High |
| | TGIB_0 | TGRB_0 input capture/compare match | TGFB_0 | Not possible | |
| | TGIC_0 | TGRC_0 input capture/compare match | TGFC_0 | Not possible | |
| | TGID_0 | TGRD_0 input capture/compare match | TGFD_0 | Not possible | |
| | TCIV_0 | TCNT_0 overflow | TCFV_0 | Not possible | |
| | TGIE_0 | TGRE_0 compare match | TGFE_0 | Not possible | |
| | TGIF_0 | TGRF_0 compare match | TGFF_0 | Not possible | |
| 1 | TGIA_1 | TGRA_1 input capture/compare match | TGFA_1 | Possible | |
| | TGIB_1 | TGRB_1 input capture/compare match | TGFB_1 | Not possible | |
| | TCIV_1 | TCNT_1 overflow | TCFV_1 | Not possible | |
| | TCIU_1 | TCNT_1 underflow | TCFU_1 | Not possible | |
| 2 | TGIA_2 | TGRA_2 input capture/compare match | TGFA_2 | Possible | |
| | TGIB_2 | TGRB_2 input capture/compare match | TGFB_2 | Not possible | |
| | TCIV_2 | TCNT_2 overflow | TCFV_2 | Not possible | |
| | TCIU_2 | TCNT_2 underflow | TCFU_2 | Not possible | |
| 3 | TGIA_3 | TGRA_3 input capture/compare match | TGFA_3 | Possible | |
| | TGIB_3 | TGRB_3 input capture/compare match | TGFB_3 | Not possible | |
| | TGIC_3 | TGRC_3 input capture/compare match | TGFC_3 | Not possible | |
| | TGID_3 | TGRD_3 input capture/compare match | TGFD_3 | Not possible | |
| | TCIV_3 | TCNT_3 overflow | TCFV_3 | Not possible | |
| 4 | TGIA_4 | TGRA_4 input capture/compare match | TGFA_4 | Possible | |
| | TGIB_4 | TGRB_4 input capture/compare match | TGFB_4 | Not possible | |
| | TGIC_4 | TGRC_4 input capture/compare match | TGFC_4 | Not possible | |
| | TGID_4 | TGRD_4 input capture/compare match | TGFD_4 | Not possible | |
| | TCIV_4 | TCNT_4 overflow/underflow | TCFV_4 | Not possible | Low |

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

#### (1) Input Capture/Compare Match Interrupt

An interrupt is requested if the TGIE bit in TIER is set to 1 when the TGF flag in TSR is set to 1 by the occurrence of a TGR input capture/compare match on a particular channel. The interrupt request is cleared by clearing the TGF flag to 0. This module has eighteen input capture/compare match interrupts, six for channel 0, four each for channels 3 and 4, and two each for channels 1 and 2. The TGFE_0 and TGFF_0 flags in channel 0 are not set by the occurrence of an input capture.

#### (2) Overflow Interrupt

An interrupt is requested if the TCIEV bit in TIER is set to 1 when the TCFV flag in TSR is set to 1 by the occurrence of TCNT overflow on a channel. The interrupt request is cleared by clearing the TCFV flag to 0. This module has five overflow interrupts, one for each channel.

#### (3) Underflow Interrupt

An interrupt is requested if the TCIEU bit in TIER is set to 1 when the TCFU flag in TSR is set to 1 by the occurrence of TCNT underflow on a channel. The interrupt request is cleared by clearing the TCFU flag to 0. This module has two underflow interrupts, one each for channels 1 and 2.

### 10.5.2 Activation of Direct Memory Access Controller

The direct memory access controller can be activated by the TGRA input capture/compare match interrupt in each channel. For details, see section 9, Direct Memory Access Controller.

In this module, a total of five TGRA input capture/compare match interrupts can be used as direct memory access controller activation sources, one each for channels 0 to 4.

### 10.5.3 A/D Converter Activation

The A/D converter can be activated by one of the following three methods in this module. Table 10.56 shows the relationship between interrupt sources and A/D converter start request signals.

#### (1) A/D Converter Activation by TGRA Input Capture/Compare Match or at TCNT_4 Trough in Complementary PWM Mode

The A/D converter can be activated by the occurrence of a TGRA input capture/compare match in each channel. In addition, if complementary PWM operation is performed while the TTGE2 bit in TIER_4 is set to 1, the A/D converter can be activated at the trough of TCNT_4 count (TCNT_4 = H'0000).

A/D converter start request signal TRGAN is issued to the A/D converter under either one of the following conditions.

- When the TGFA flag in TSR is set to 1 by the occurrence of a TGRA input capture/compare match on a particular channel while the TTGE bit in TIER is set to 1
- When the TCNT_4 count reaches the trough (TCNT_4 = H'0000) during complementary PWM operation while the TTGE2 bit in TIER_4 is set to 1

When either condition is satisfied, if A/D converter start signal TRGAN from this module is selected as the trigger in the A/D converter, A/D conversion will start.

### (2) A/D Converter Activation by Compare Match between TCNT_0 and TGRE_0

The A/D converter can be activated by generating A/D converter start request signal TRG0N when a compare match occurs between TCNT_0 and TGRE_0 in channel 0.

When the TGFE flag in TSR2_0 is set to 1 by the occurrence of a compare match between TCNT_0 and TGRE_0 in channel 0 while the TTGE2 bit in TIER2_0 is set to 1, A/D converter start request TGR0N is issued to the A/D converter. If A/D converter start signal TGR0N from this module is selected as the trigger in the A/D converter, A/D conversion will start.

### (3) A/D Converter Activation by A/D Converter Start Request Delaying Function

The A/D converter can be activated by generating A/D converter start request signal TRG4AN or TRG4BN when the TCNT_4 count matches the TADCORA or TADCORB value if the UT4AE, DT4AE, UT4BE, or DT4BE bit in the A/D converter start request control register (TADCR) is set to 1. For details, refer to section 10.4.9, A/D Converter Start Request Delaying Function.

A/D conversion will start if A/D converter start signal TRG4AN from this module is selected as the trigger in the A/D converter when TRG4AN is generated or if TRG4BN from this module is selected as the trigger in the A/D converter when TRG4BN is generated.

**Table 10.56 Interrupt Sources and A/D Converter Start Request Signals**

| Target Registers | Interrupt Source | A/D Converter Start Request Signal |
|---|---|---|
| TGRA_0 and TCNT_0 | Input capture/compare match | TRGAN |
| TGRA_1 and TCNT_1 | | |
| TGRA_2 and TCNT_2 | | |
| TGRA_3 and TCNT_3 | | |
| TGRA_4 and TCNT_4 | | |
| TCNT_4 | TCNT_4 Trough in complementary PWM mode | |
| TGRE_0 and TCNT_0 | Compare match | TRG0N |
| TADCORA and TCNT_4 | | TRG4AN |
| TADCORB and TCNT_4 | | TRG4BN |

## 10.6 Operation Timing

### 10.6.1 Input/Output Timing

#### (1) TCNT Count Timing

Figure 10.78 shows TCNT count timing in internal clock operation, and Figure 10.79 shows TCNT count timing in external clock operation (normal mode), and Figure 10.80 shows TCNT count timing in external clock operation (phase counting mode).

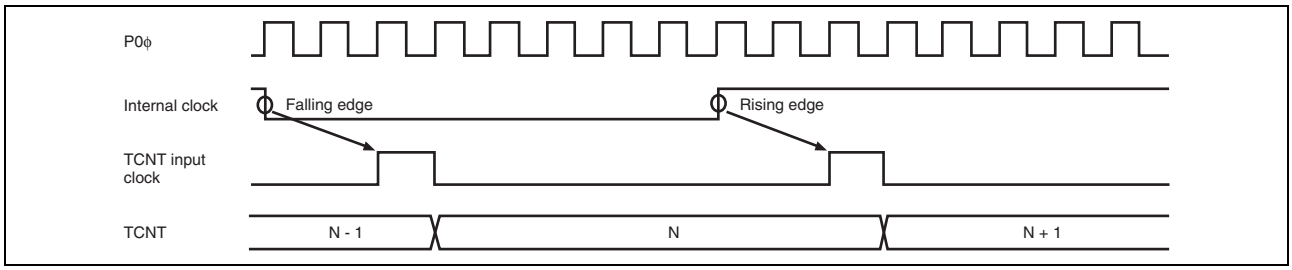

**Figure 10.78 Count Timing in Internal Clock Operation**

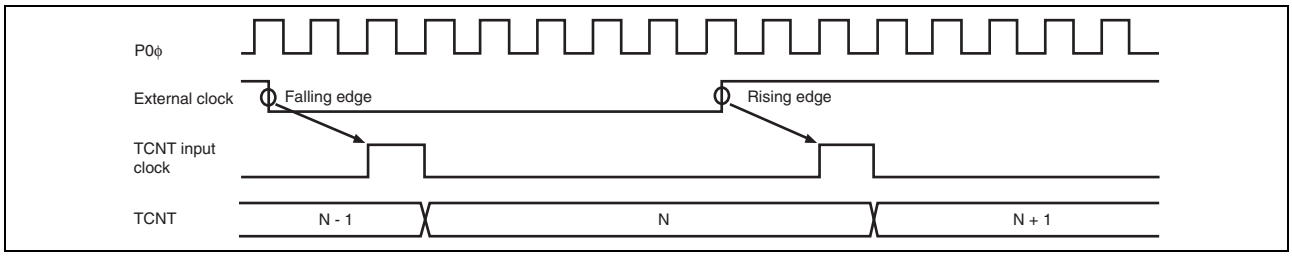

**Figure 10.79 Count Timing in External Clock Operation**

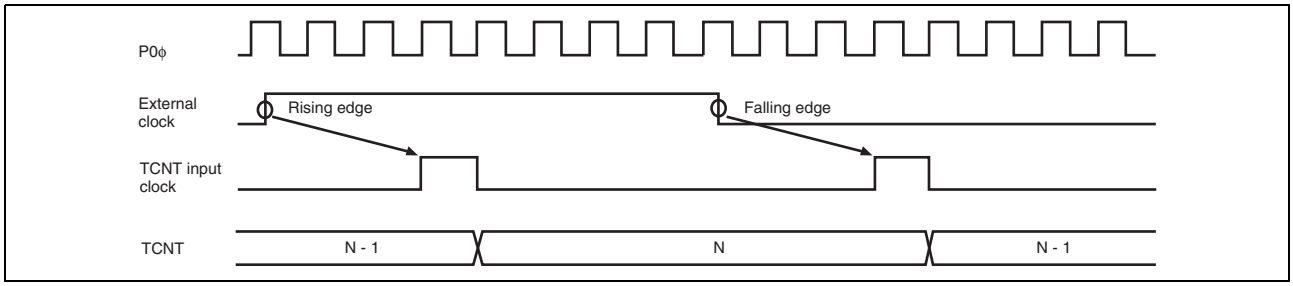

**Figure 10.80 Count Timing in External Clock Operation (Phase Counting Mode)**

### (2) Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the output value set in TIOR is output at the output compare output pin (TIOC pin). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT input clock is generated.

Figure 10.81 shows output compare output timing (normal mode and PWM mode) and Figure 10.82 shows output compare output timing (complementary PWM mode and reset synchronous PWM mode).

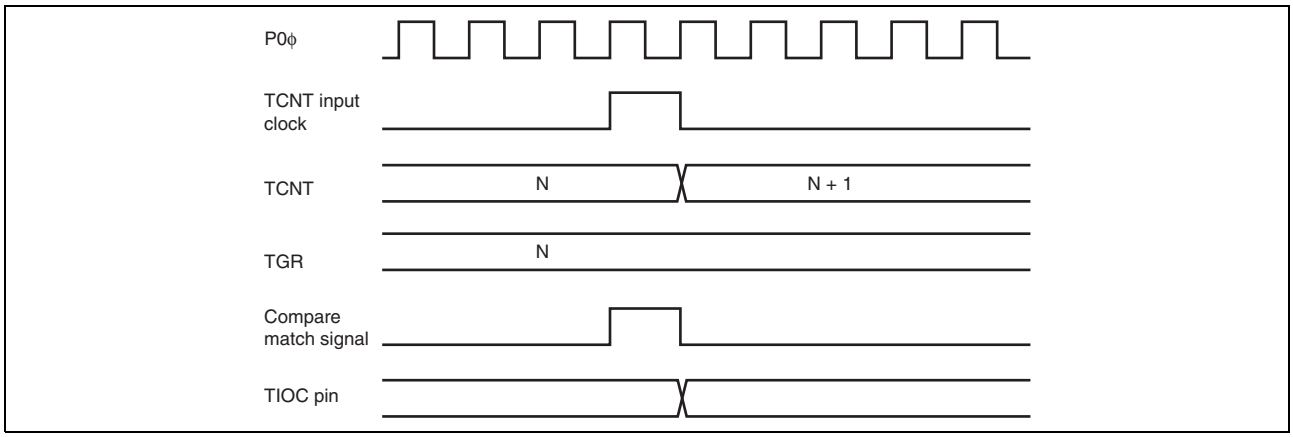

**Figure 10.81 Output Compare Output Timing (Normal Mode/PWM Mode)**

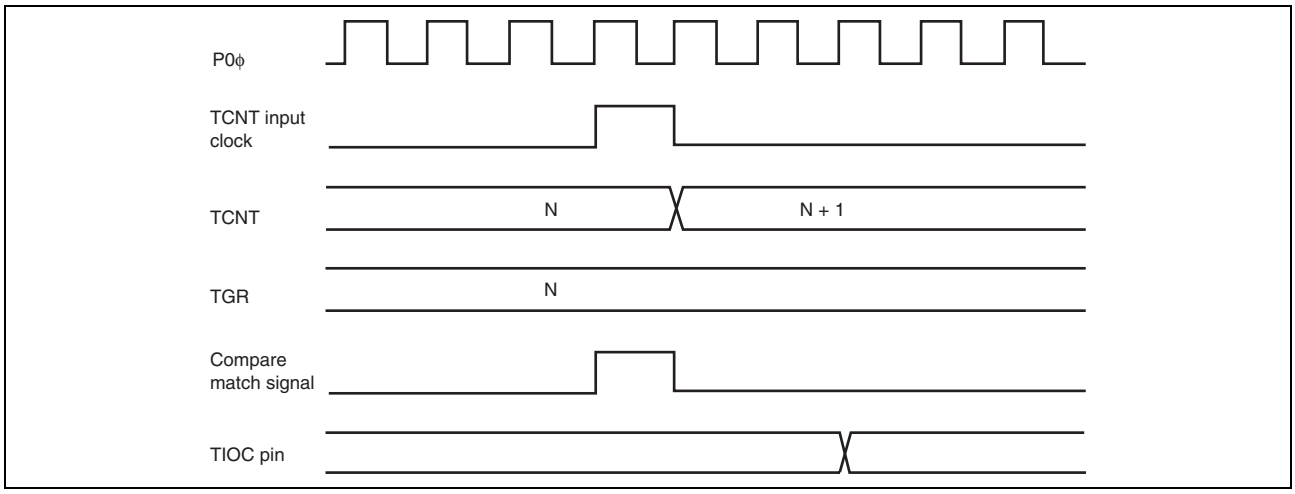

**Figure 10.82 Output Compare Output Timing (Complementary PWM Mode/Reset Synchronous PWM Mode)**

### (3) Input Capture Signal Timing

Figure 10.83 shows input capture signal timing.

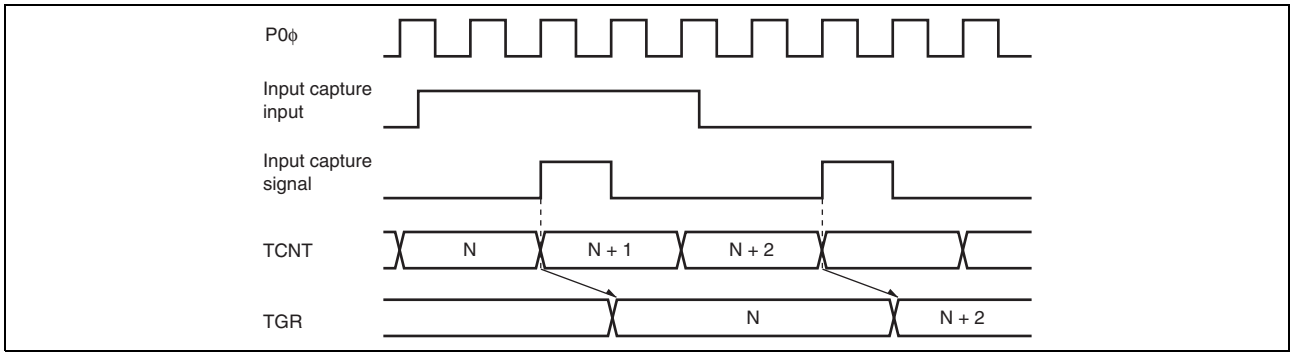

**Figure 10.83 Input Capture Input Signal Timing**

### (4) Timing for Counter Clearing by Compare Match/Input Capture

Figure 10.84 shows the timing when counter clearing on compare match is specified, and Figure 10.85 shows the timing when counter clearing on input capture is specified.

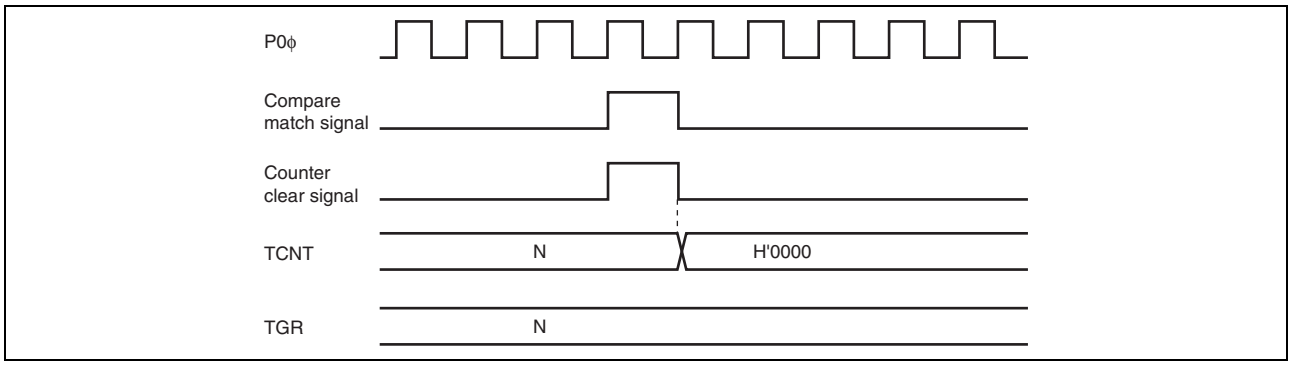

**Figure 10.84 Counter Clear Timing (Compare Match)**

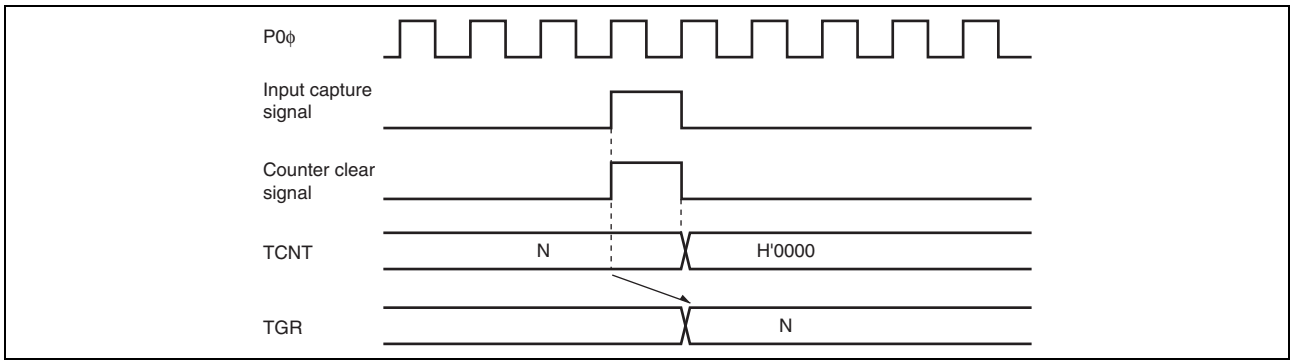

**Figure 10.85 Counter Clear Timing (Input Capture)**

### (5) Buffer Operation Timing

Figure 10.86 to Figure 10.88 show the timing in buffer operation.

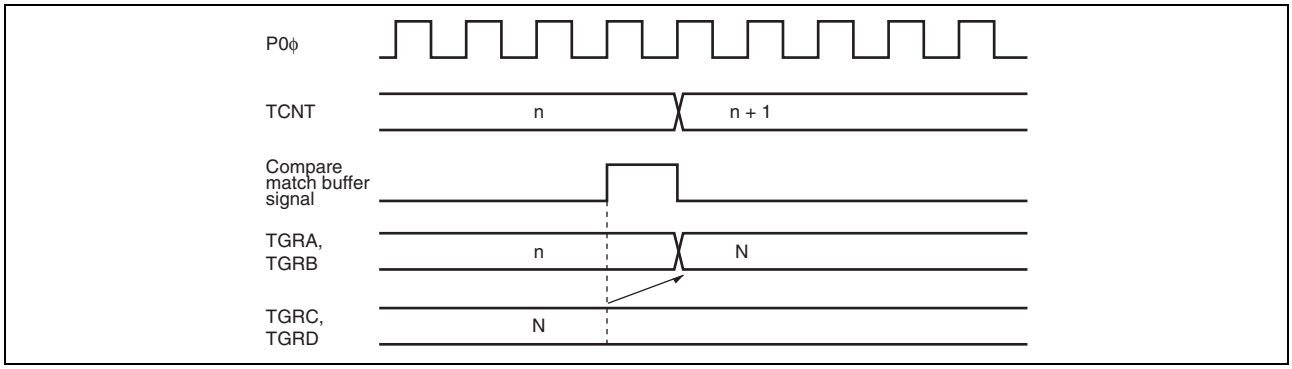

**Figure 10.86 Buffer Operation Timing (Compare Match)**

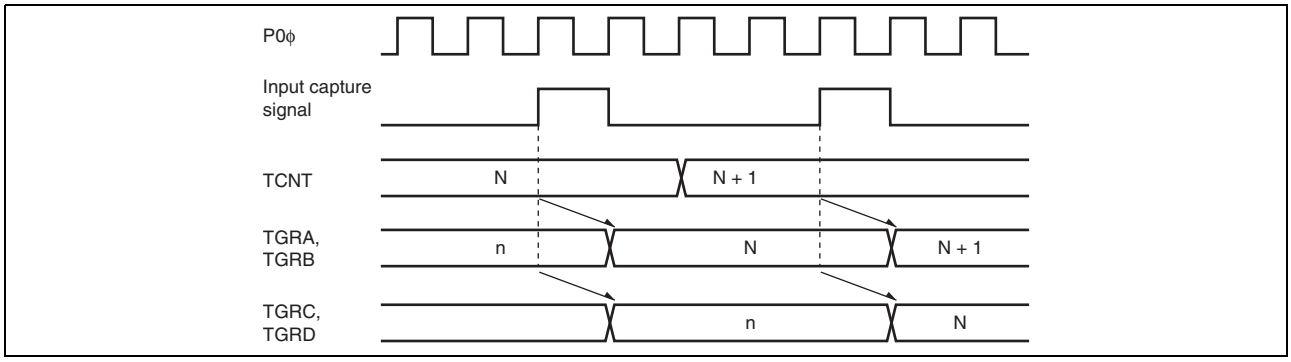

**Figure 10.87 Buffer Operation Timing (Input Capture)**

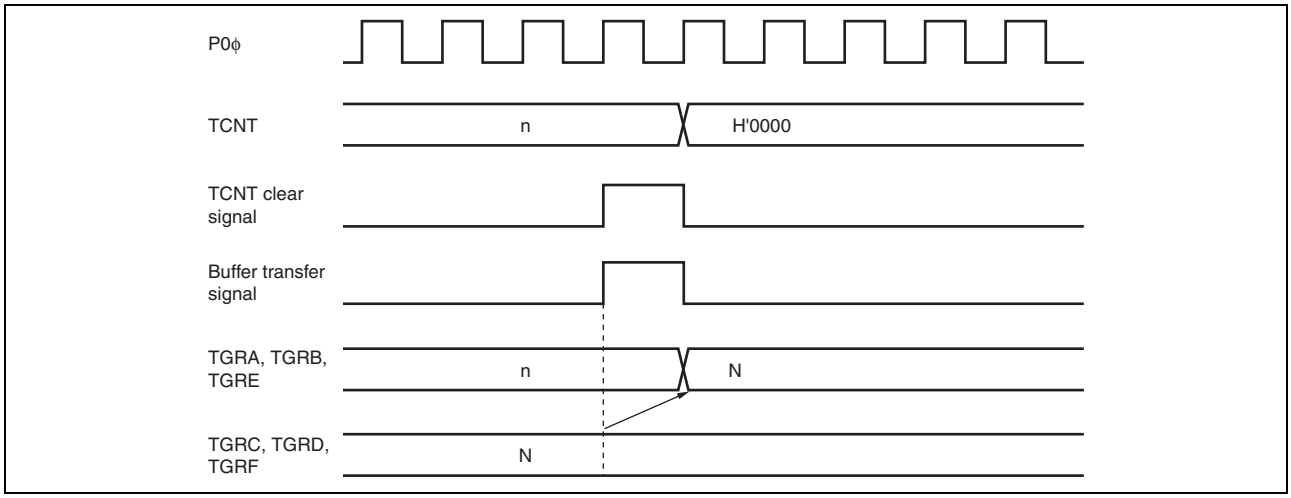

**Figure 10.88 Buffer Transfer Timing (when TCNT Cleared)**

### (6) Buffer Transfer Timing (Complementary PWM Mode)

Figure 10.89 to Figure 10.91 show the buffer transfer timing in complementary PWM mode.

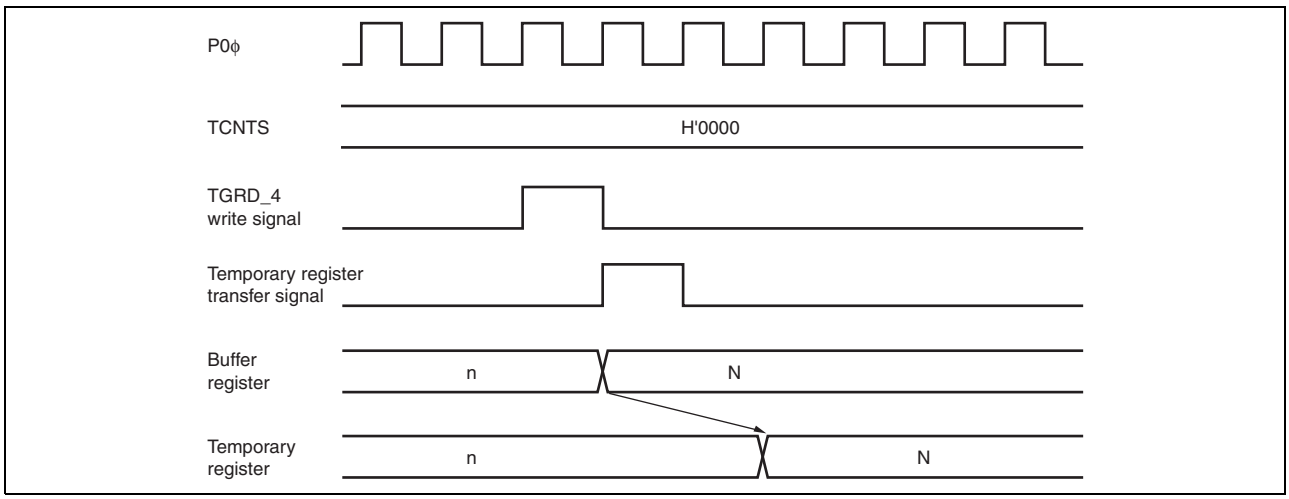

**Figure 10.89 Transfer Timing from Buffer Register to Temporary Register (TCNTS Stop)**

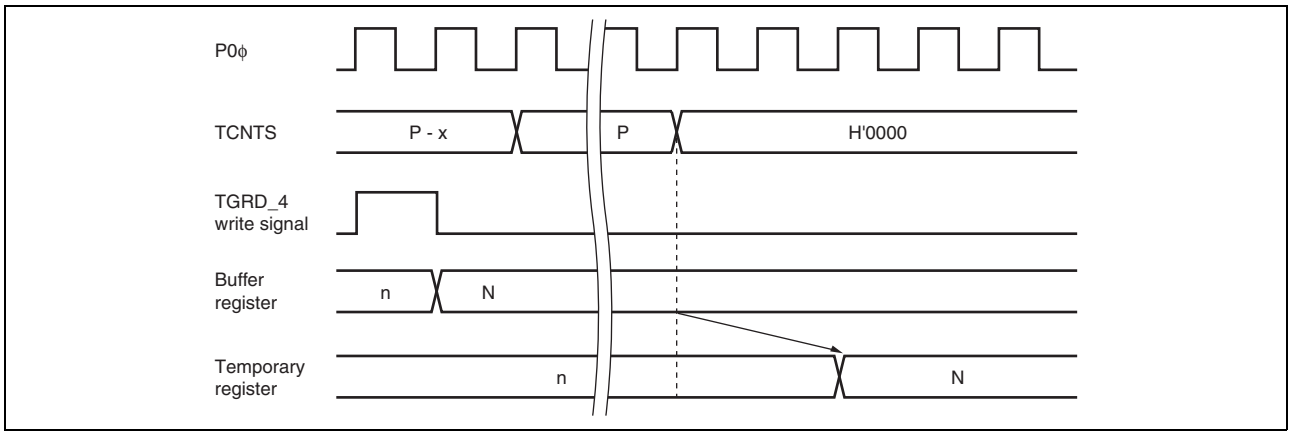

**Figure 10.90 Transfer Timing from Buffer Register to Temporary Register (TCNTS Operating)**

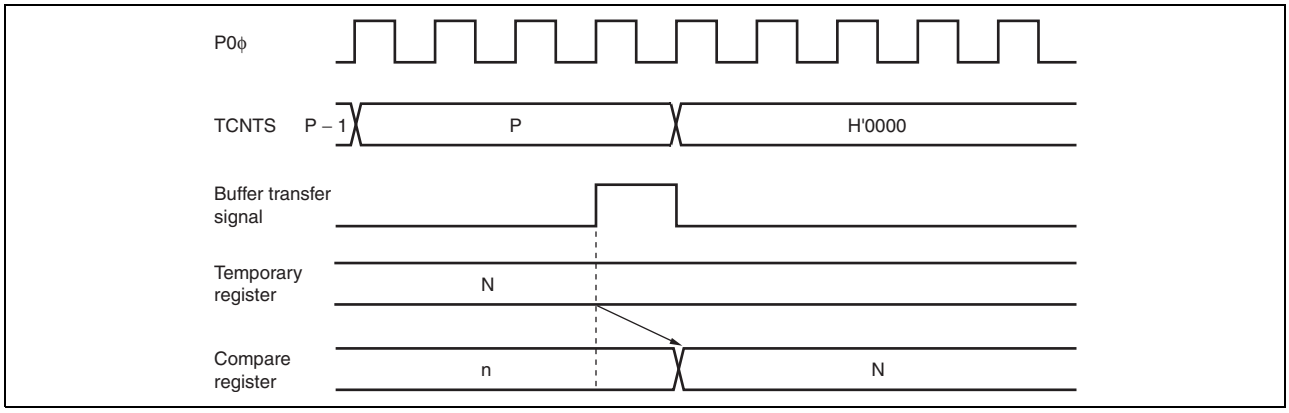

**Figure 10.91 Transfer Timing from Temporary Register to Compare Register**

## 10.6.2 Interrupt Signal Timing

### (1) TGF Flag Setting Timing in Case of Compare Match

Figure 10.92 shows the timing for setting of the TGF flag in TSR on compare match, and TGI interrupt request signal timing.

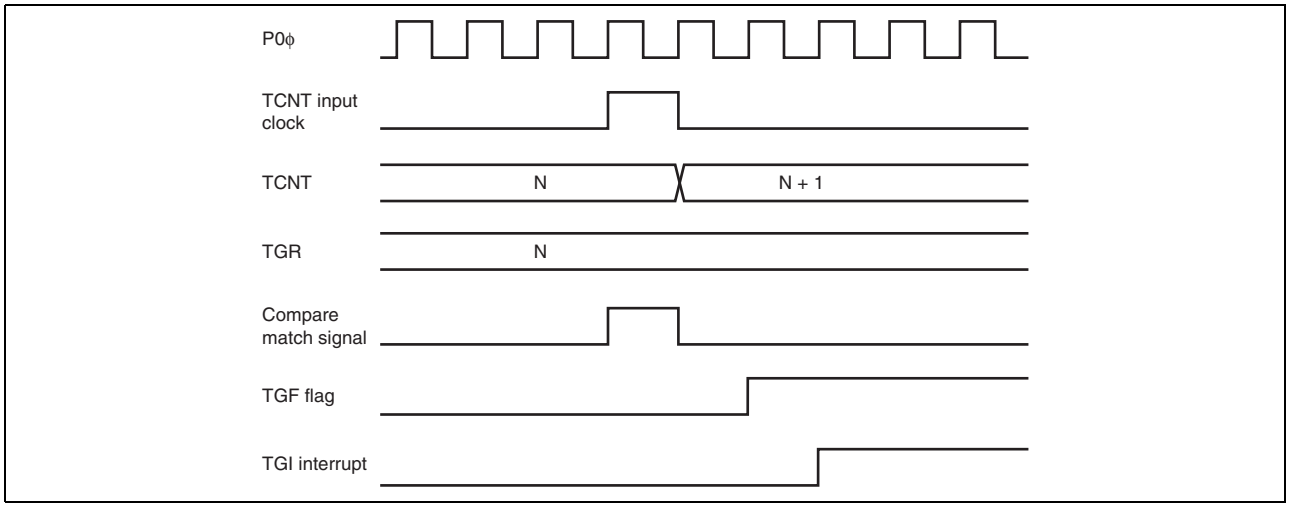

**Figure 10.92 TGI Interrupt Timing (Compare Match)**

### (2) TGF Flag Setting Timing in Case of Input Capture

Figure 10.93 shows the timing for setting of the TGF flag in TSR on input capture, and TGI interrupt request signal timing.

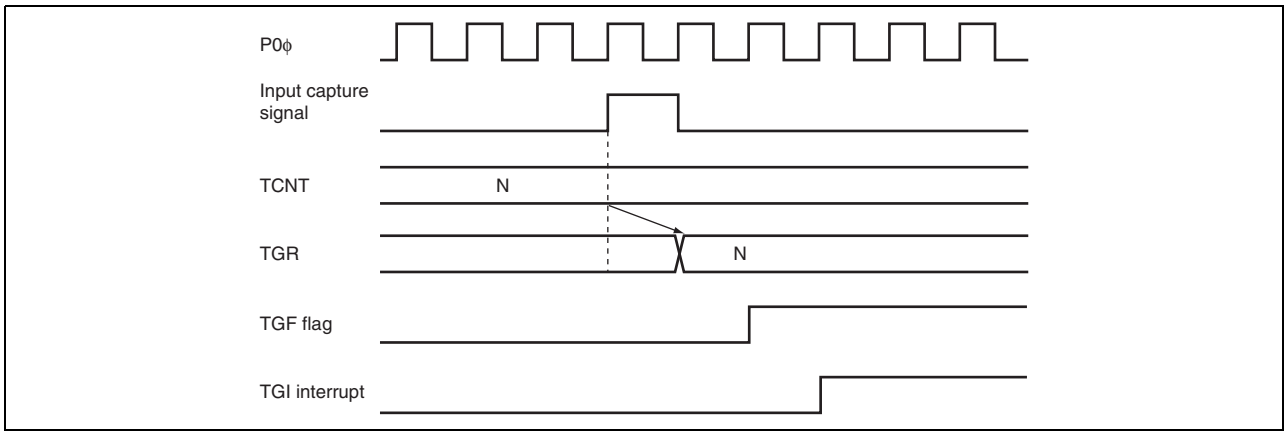

**Figure 10.93 TGI Interrupt Timing (Input Capture)**

### (3) TCFV Flag/TCFU Flag Setting Timing

Figure 10.94 shows the timing for setting of the TCFV flag in TSR on overflow, and TCIV interrupt request signal timing.

Figure 10.95 shows the timing for setting of the TCFU flag in TSR on underflow, and TCIU interrupt request signal timing.

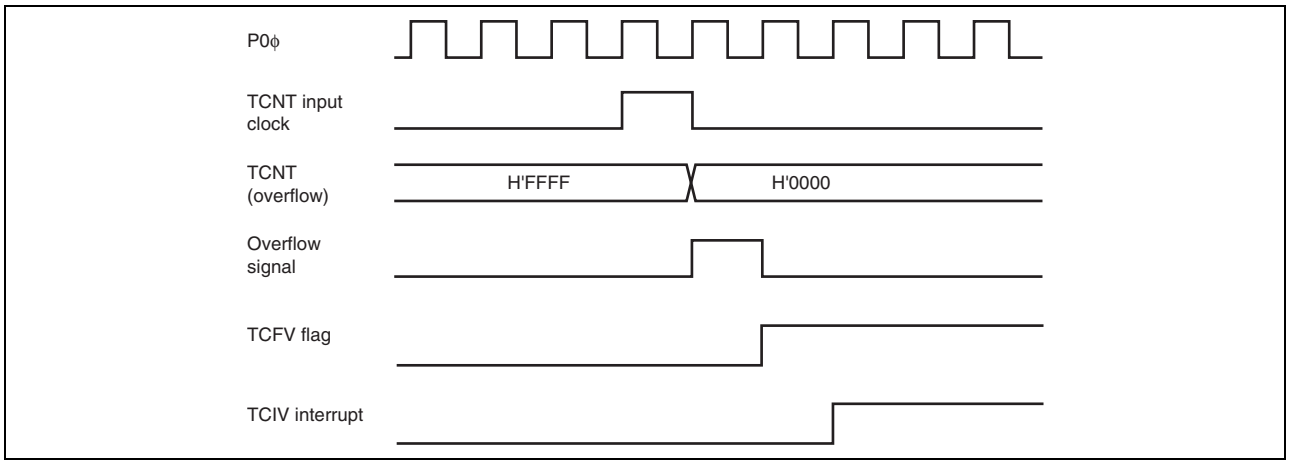

**Figure 10.94 TCIV Interrupt Setting Timing**

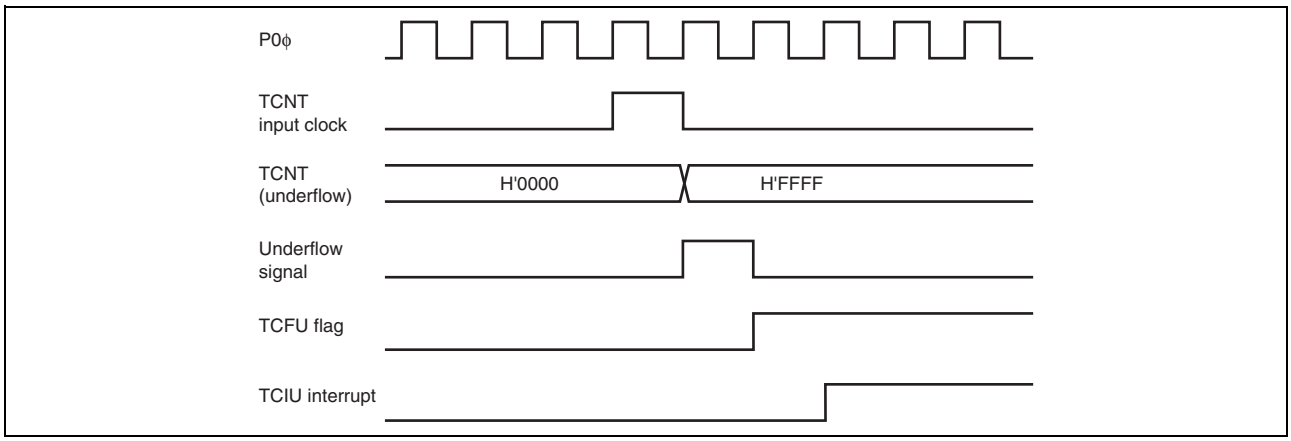

**Figure 10.95 TCIU Interrupt Setting Timing**

### (4) Status Flag Clearing Timing

After a status flag is read as 1 by the CPU, it is cleared by writing 0 to it. When the direct memory access controller is activated, the flag is cleared automatically. Figure 10.96 shows the timing for status flag clearing by the CPU, and Figure 10.97 shows the timing for status flag clearing by the direct memory access controller.

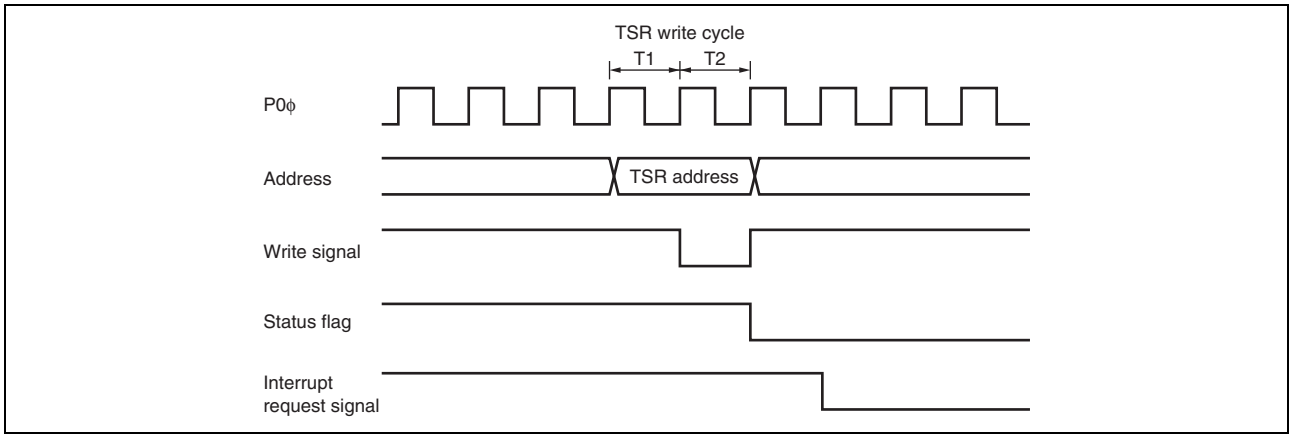

**Figure 10.96 Timing for Status Flag Clearing by CPU**

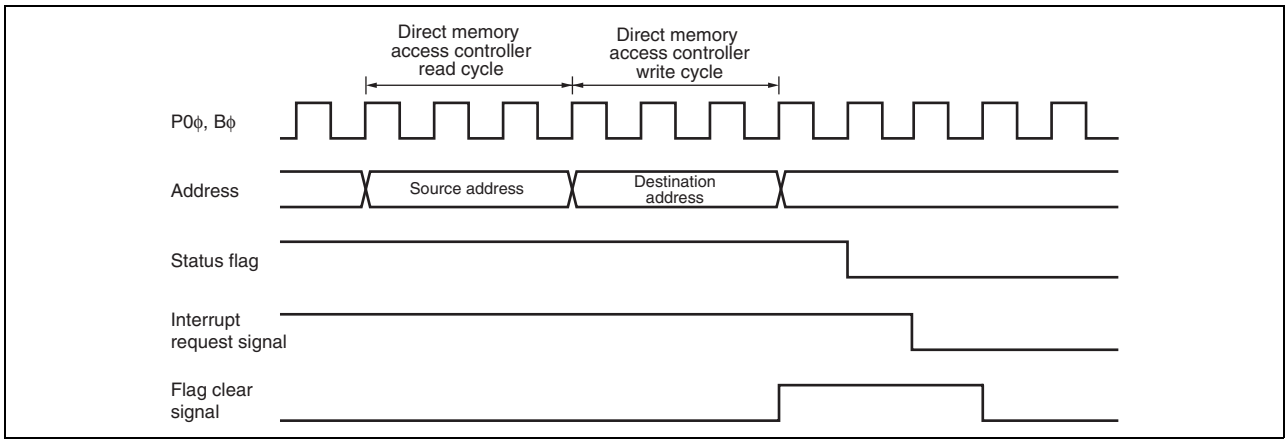

**Figure 10.97 Timing for Status Flag Clearing by Direct Memory Access Controller Activation**

## 10.7 Usage Notes

### 10.7.1 Module Standby Mode Setting

Operation of this module can be disabled or enabled using the standby control register. The initial setting is for the operation to be halted. Register access is enabled by clearing module standby mode. For details, refer to section 55, Power-Down Modes.

### 10.7.2 Input Clock Restrictions

The input clock pulse width must be at least 1.5 states in the case of single-edge detection, and at least 2.5 states in the case of both-edge detection. This module will not operate properly at narrower pulse widths.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least 1.5 states, and the pulse width must be at least 2.5 states. Figure 10.98 shows the input clock conditions in phase counting mode.

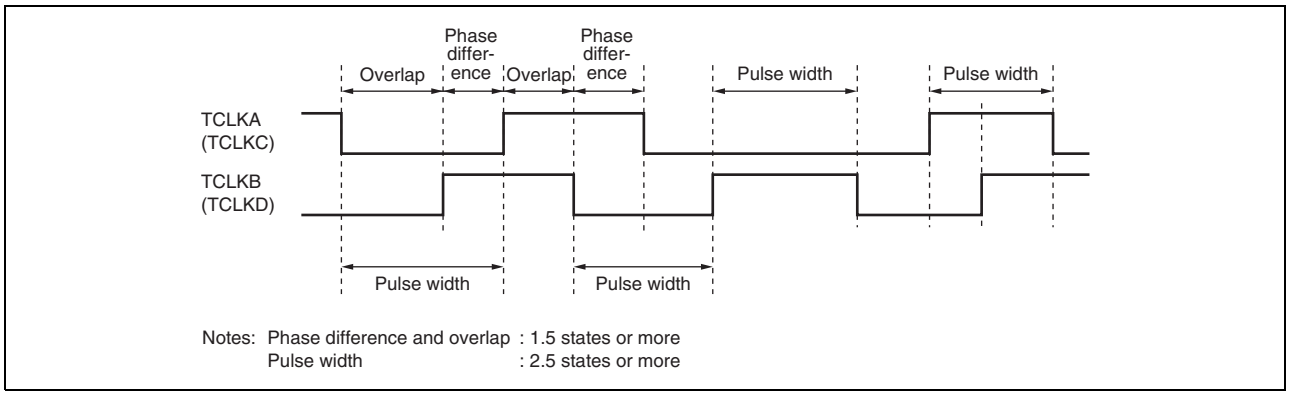

**Figure 10.98 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode**

### 10.7.3 Caution on Period Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which the count value matched by TCNT is updated). Consequently, the actual counter frequency is given by the following formula:

$$f = \frac{P0\phi}{(N+1)}$$

Where f: Counter frequency
P0ϕ: Peripheral clock operating frequency
N: TGR set value

### 10.7.4 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the T2 state of a TCNT write cycle, TCNT clearing takes precedence and the TCNT write is not performed.

Figure 10.99 shows the timing in this case.

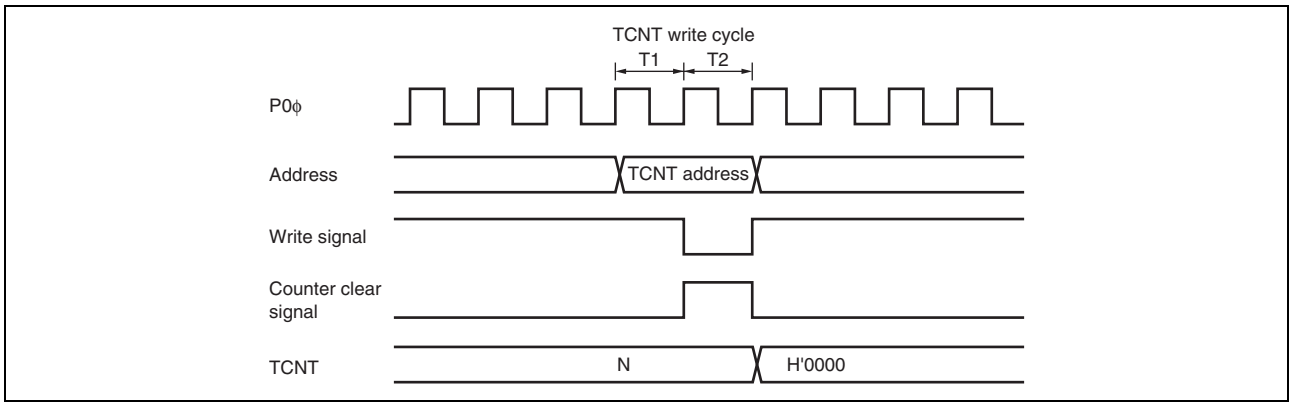

**Figure 10.99 Contention between TCNT Write and Clear Operations**

### 10.7.5 Contention between TCNT Write and Increment Operations

If incrementing occurs in the T2 state of a TCNT write cycle, the TCNT write takes precedence and TCNT is not incremented.

Figure 10.100 shows the timing in this case.

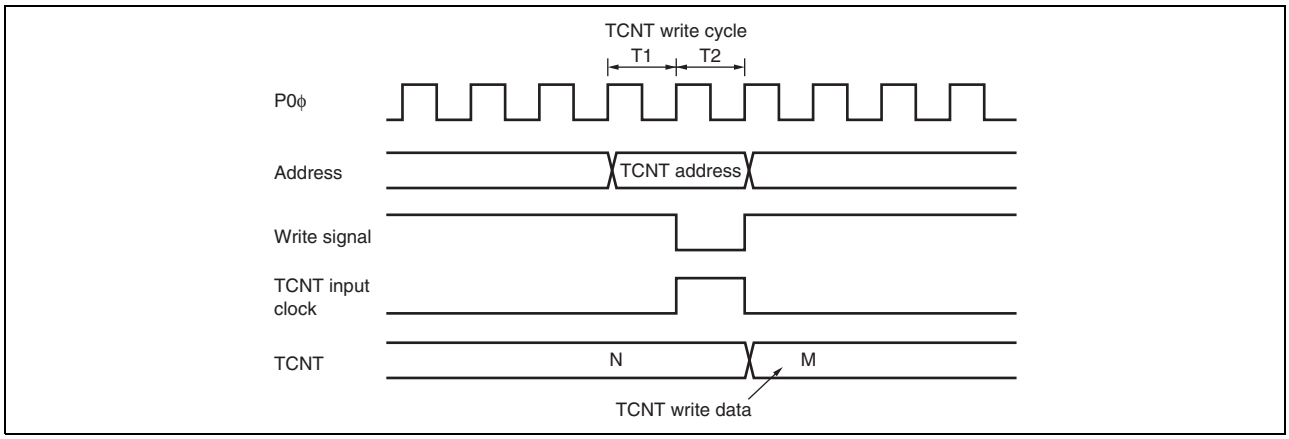

**Figure 10.100 Contention between TCNT Write and Increment Operations**

### 10.7.6 Contention between TGR Write and Compare Match

If a compare match occurs in the T2 state of a TGR write cycle, the TGR write is executed and the compare match signal is also generated.

Figure 10.101 shows the timing in this case.

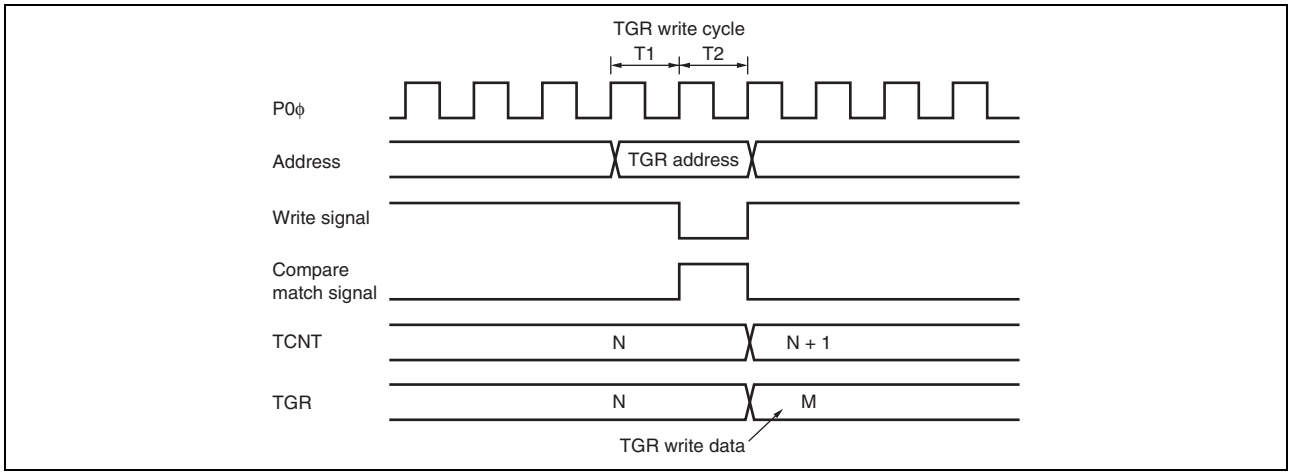

**Figure 10.101 Contention between TGR Write and Compare Match**

### 10.7.7 Contention between Buffer Register Write and Compare Match

If a compare match occurs in the T2 state of a TGR write cycle, the data that is transferred to TGR by the buffer operation is the data after write.

Figure 10.102 shows the timing in this case.

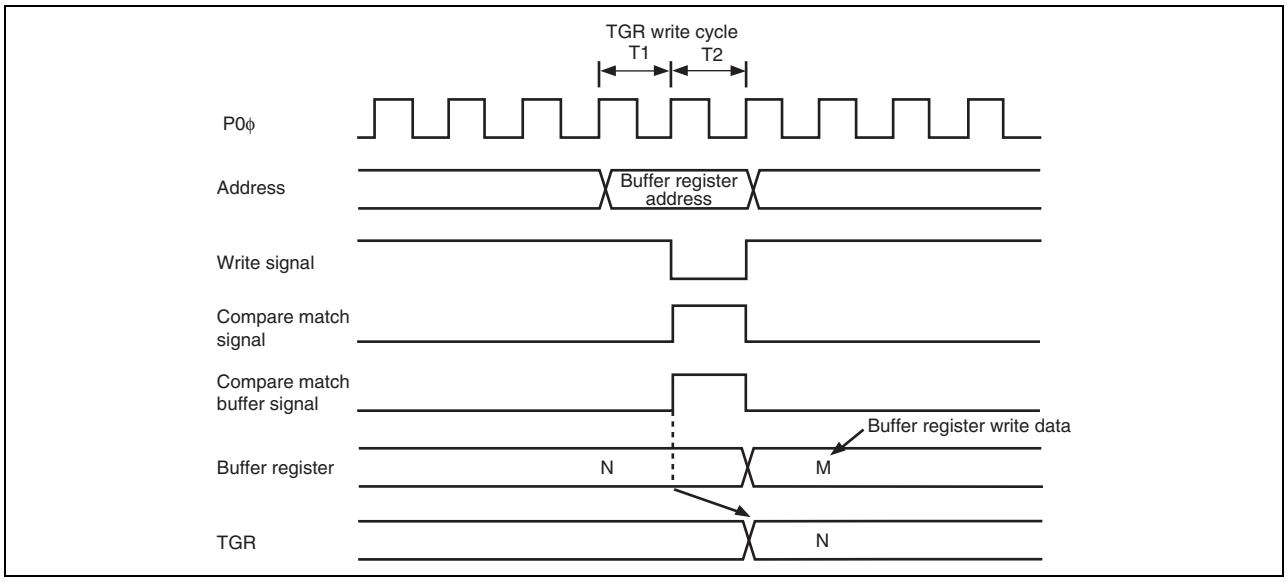

**Figure 10.102 Contention between Buffer Register Write and Compare Match**

### 10.7.8 Contention between Buffer Register Write and TCNT Clear

When the buffer transfer timing is set at the TCNT clear by the buffer transfer mode register (TBTM), if TCNT clear occurs in the T2 state of a TGR write cycle, the data that is transferred to TGR by the buffer operation is the data before write.

Figure 10.103 shows the timing in this case.

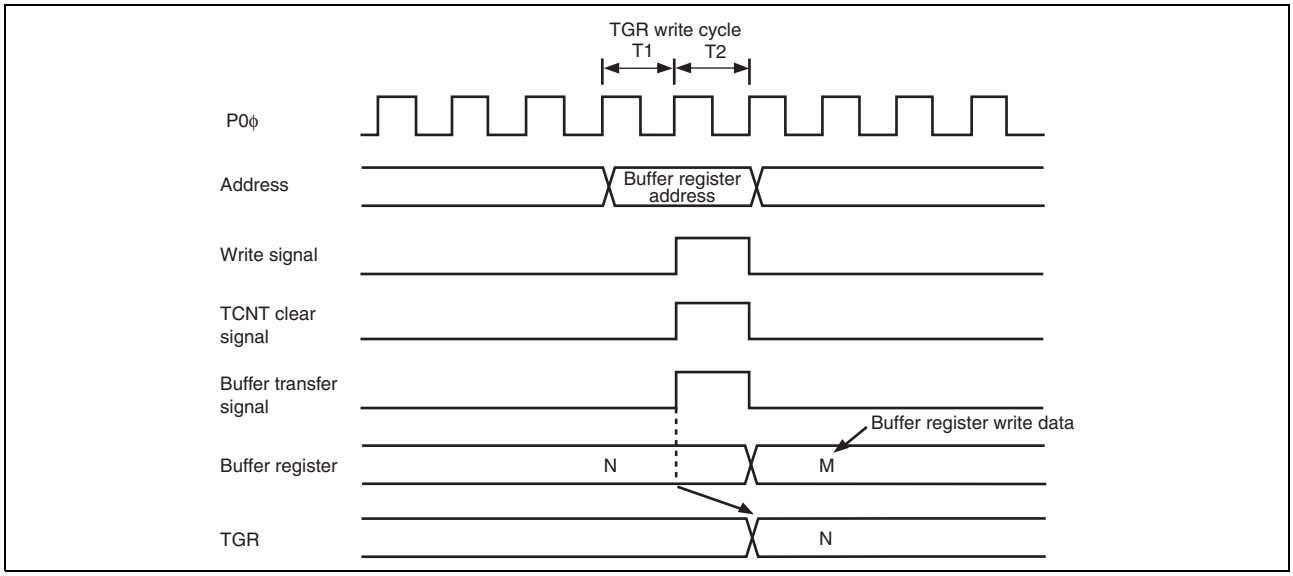

**Figure 10.103 Contention between Buffer Register Write and TCNT Clear**

### 10.7.9 Contention between TGR Read and Input Capture

If an input capture signal is generated in the T1 state of a TGR read cycle, the data that is read will be the data in the buffer before input capture transfer.

Figure 10.104 shows the timing in this case.

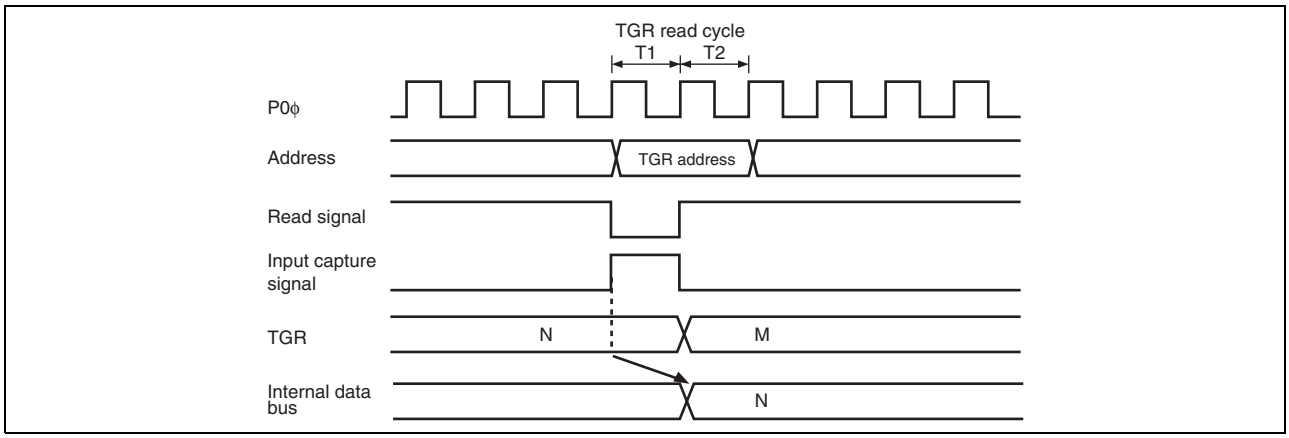

**Figure 10.104 Contention between TGR Read and Input Capture**

### 10.7.10 Contention between TGR Write and Input Capture

If an input capture signal is generated in the T2 state of a TGR write cycle, the input capture operation takes precedence and the write to TGR is not performed.

Figure 10.105 shows the timing in this case.

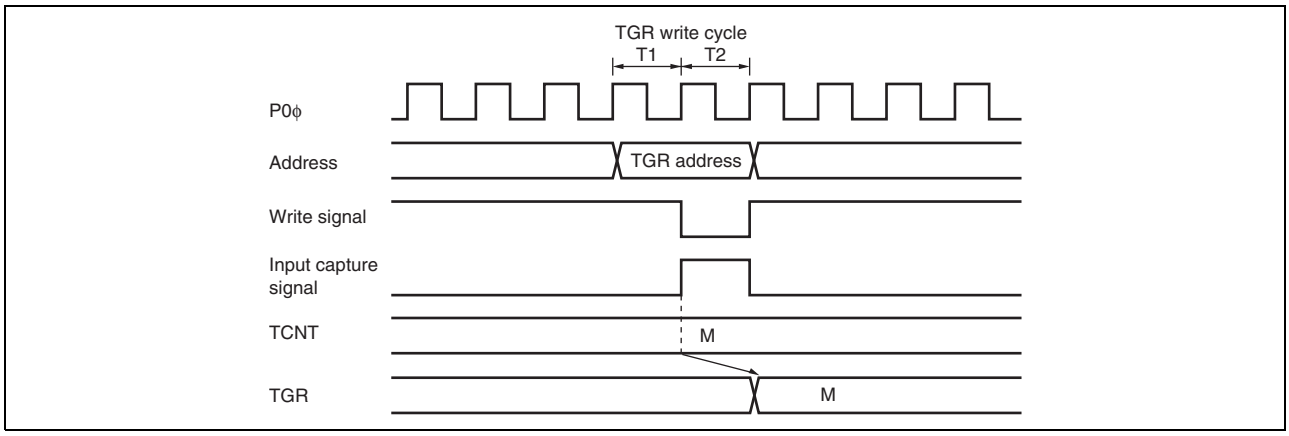

**Figure 10.105 Contention between TGR Write and Input Capture**

### 10.7.11 Contention between Buffer Register Write and Input Capture

If an input capture signal is generated in the T2 state of a buffer register write cycle, the buffer operation takes precedence and the write to the buffer register is not performed.

Figure 10.106 shows the timing in this case.

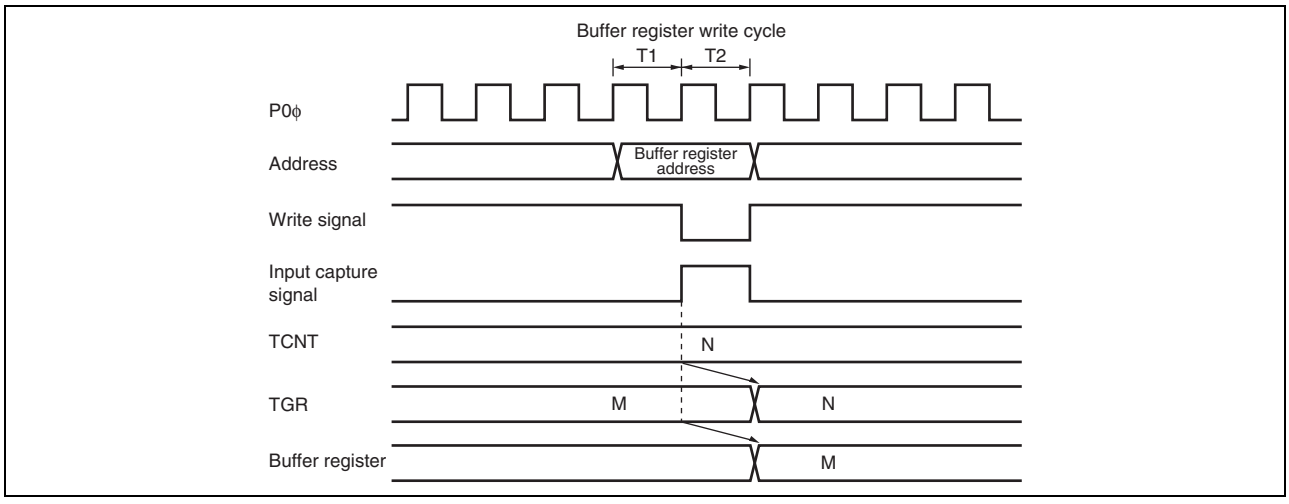

**Figure 10.106 Contention between Buffer Register Write and Input Capture**

### 10.7.12 TCNT_2 Write and Overflow/Underflow Contention in Cascade Connection

With timer counters TCNT_1 and TCNT_2 in a cascade connection, when a contention occurs during TCNT_1 count (during a TCNT_2 overflow/underflow) in the $T_2$ state of the TCNT_2 write cycle, the write to TCNT_2 is conducted, and the TCNT_1 count signal is disabled. At this point, if there is match with TGRA_1 and the TCNT_1 value, a compare signal is issued. Furthermore, when the TCNT_1 count clock is selected as the input capture source of channel 0, TGRA_0 to D_0 carry out the input capture operation. In addition, when the compare match/input capture is selected as the input capture source of TGRB_1, TGRB_1 carries out input capture operation. The timing is shown in Figure 10.107.

For cascade connections, be sure to synchronize settings for channels 1 and 2 when setting TCNT clearing.

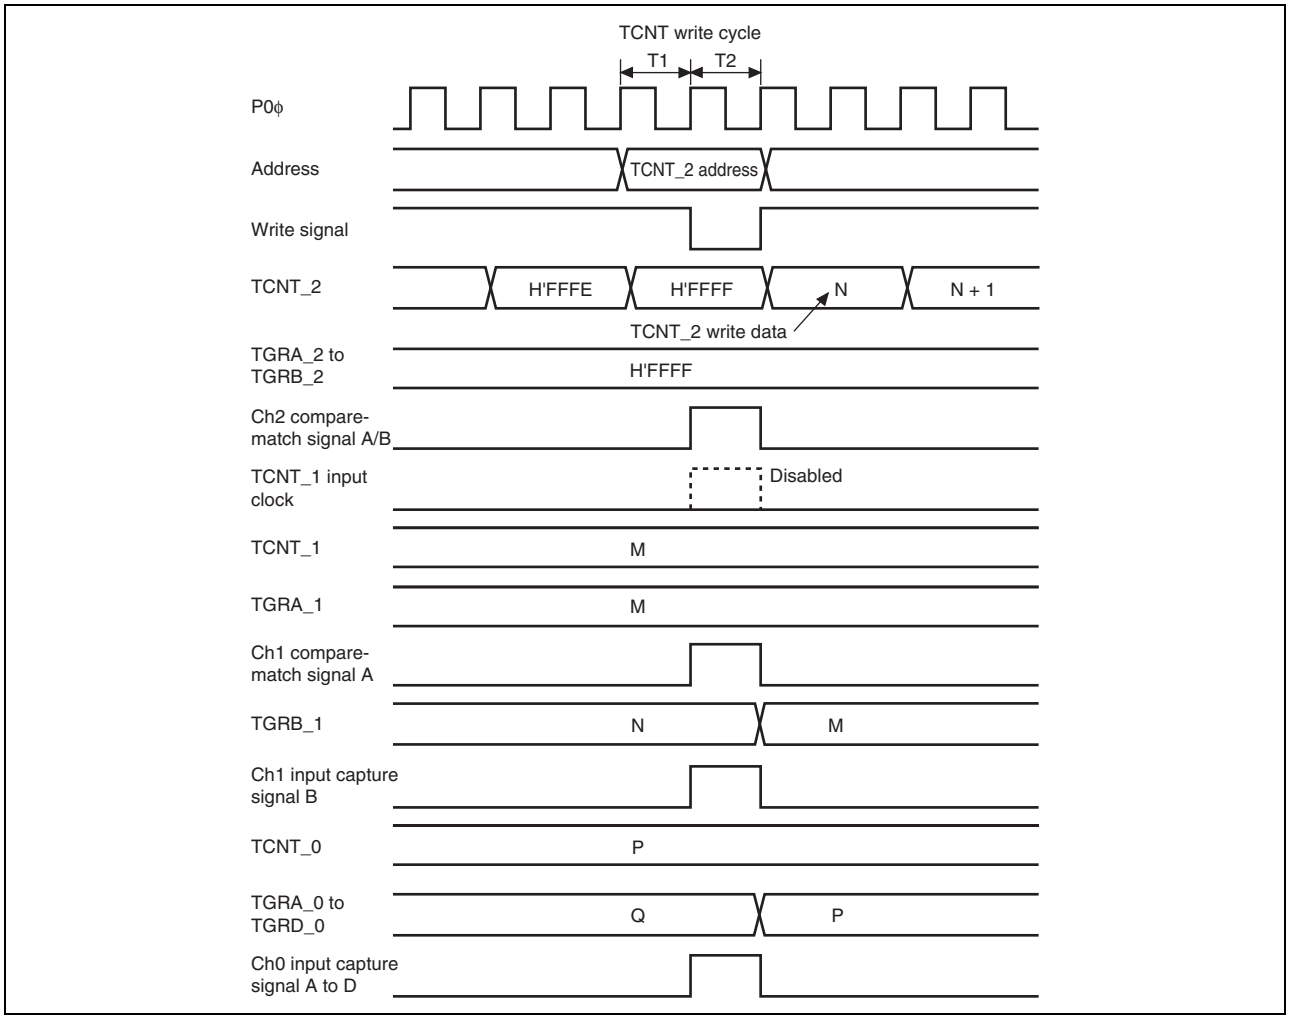

**Figure 10.107 TCNT_2 Write and Overflow/Underflow Contention with Cascade Connection**

### 10.7.13 Counter Value during Complementary PWM Mode Stop

When counting operation is suspended with TCNT_3 and TCNT_4 in complementary PWM mode, TCNT_3 has the timer dead time register (TDDR) value, and TCNT_4 is held at H'0000.

When restarting complementary PWM mode, counting begins automatically from the initialized state. This explanatory diagram is shown in Figure 10.108.

When counting begins in another operating mode, be sure that TCNT_3 and TCNT_4 are set to the initial values.

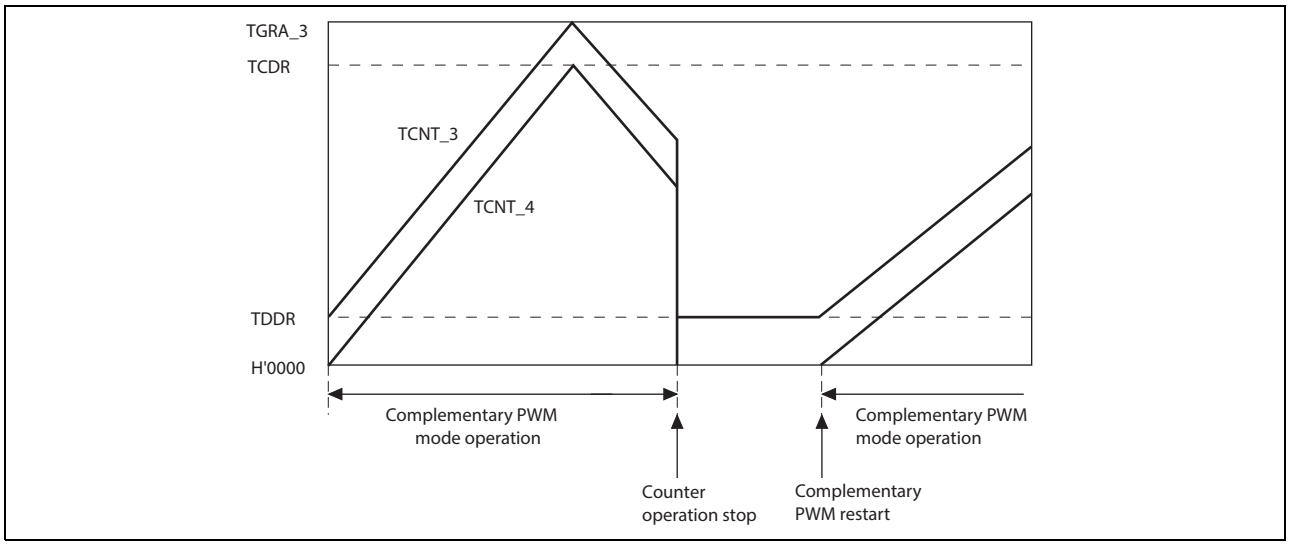

**Figure 10.108 Counter Value during Complementary PWM Mode Stop**

### 10.7.14 Buffer Operation Setting in Complementary PWM Mode

In complementary PWM mode, conduct rewrites by buffer operation for the PWM cycle setting register (TGRA_3), timer cycle data register (TCDR), and duty setting registers (TGRB_3, TGRA_4, and TGRB_4).

In complementary PWM mode, channel 3 and channel 4 buffers operate in accordance with bit settings BFA and BFB of TMDR_3. When TMDR_3's BFA bit is set to 1, TGRC_3 functions as a buffer register for TGRA_3. At the same time, TGRC_4 functions as the buffer register for TGRA_4, and TCBR functions as the TCDR's buffer register.

### 10.7.15 Reset Sync PWM Mode Buffer Operation and Compare Match Flag

When setting buffer operation for reset sync PWM mode, set the BFA and BFB bits of TMDR_4 to 0. The TIOC4C pin will be unable to produce its waveform output if the BFA bit of TMDR_4 is set to 1.

In reset sync PWM mode, the channel 3 and channel 4 buffers operate in accordance with the BFA and BFB bit settings of TMDR_3. For example, if the BFA bit of TMDR_3 is set to 1, TGRC_3 functions as the buffer register for TGRA_3. At the same time, TGRC_4 functions as the buffer register for TGRA_4.

The TGFC bit and TGFD bit of TSR_3 and TSR_4 are not set when TGRC_3 and TGRD_3 are operating as buffer registers.

Figure 10.109 shows an example of operations for TGR_3, TGR_4, TIOC3, and TIOC4, with TMDR_3's BFA and BFB bits set to 1, and TMDR_4's BFA and BFB bits set to 0.

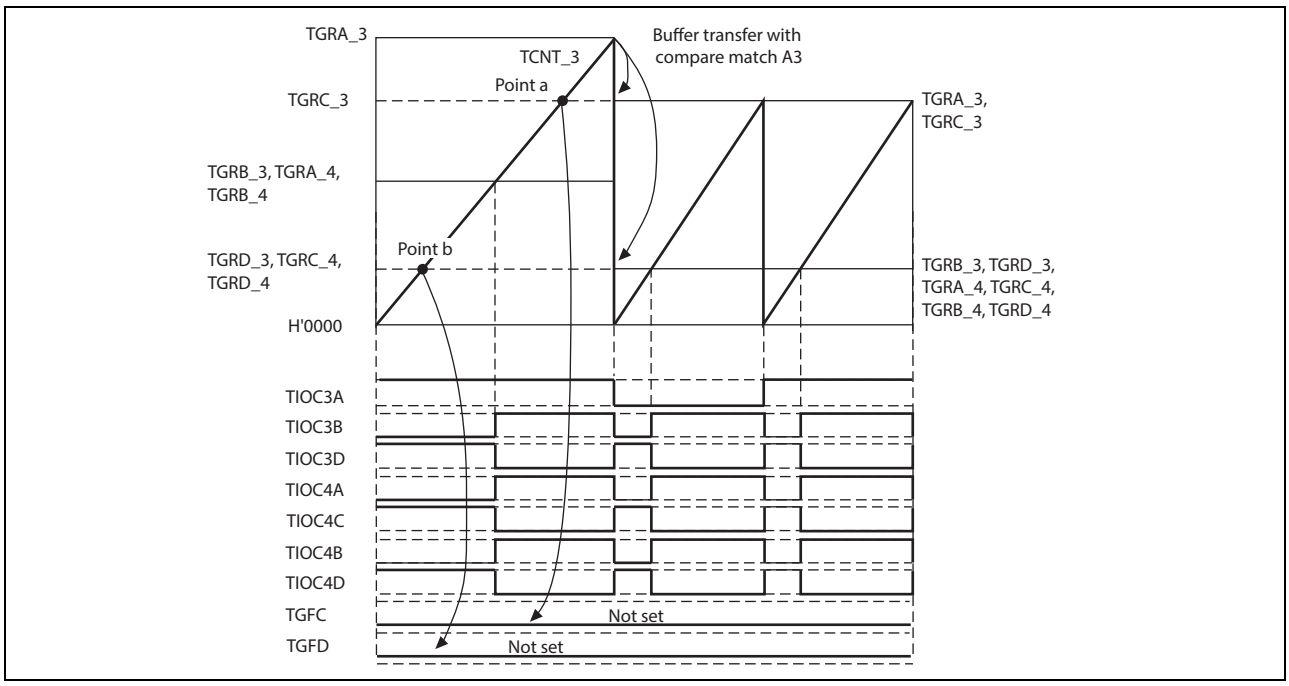

**Figure 10.109 Buffer Operation and Compare-Match Flags in Reset Synchronous PWM Mode**

### 10.7.16 Overflow Flags in Reset Synchronous PWM Mode

When set to reset synchronous PWM mode, TCNT_3 and TCNT_4 start counting when the CST3 bit of TSTR is set to 1. At this point, TCNT_4's count clock source and count edge obey the TCR_3 setting.

In reset synchronous PWM mode, with cycle register TGRA_3's set value at H'FFFF, when specifying TGR3A compare-match for the counter clear source, TCNT_3 and TCNT_4 count up to H'FFFF, then a compare-match occurs with TGRA_3, and TCNT_3 and TCNT_4 are both cleared. At this point, TSR's overflow flag TCFV bit is not set.

Figure 10.110 shows a TCFV bit operation example in reset synchronous PWM mode with a set value for cycle register TGRA_3 of H'FFFF, when a TGRA_3 compare-match has been specified without synchronous setting for the counter clear source.

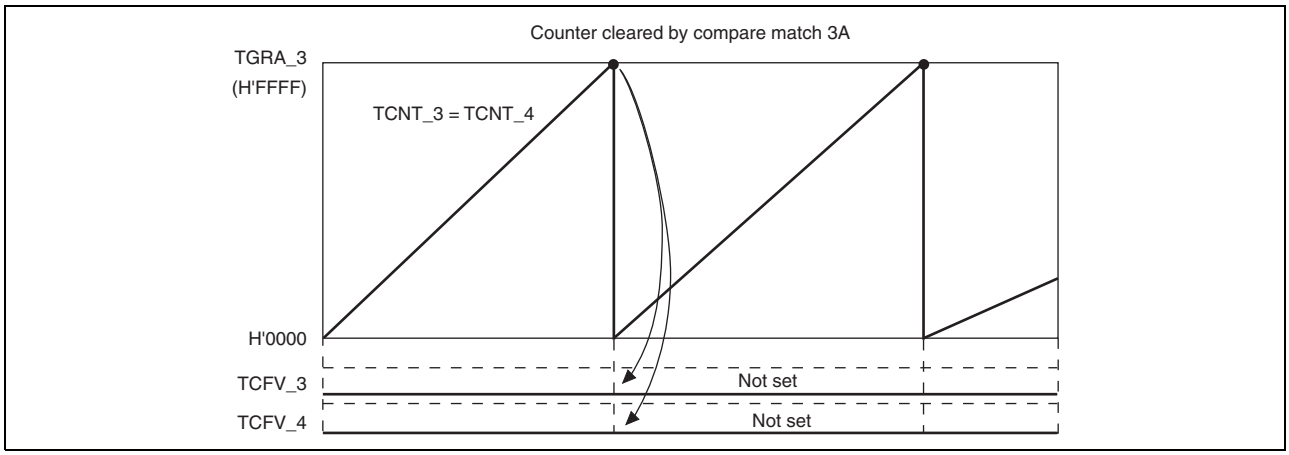

**Figure 10.110 Reset Synchronous PWM Mode Overflow Flag**

### 10.7.17 Contention between Overflow/Underflow and Counter Clearing

If overflow/underflow and counter clearing occur simultaneously, the TCFV/TCFU flag in TSR is not set and TCNT clearing takes precedence.

Figure 10.111 shows the operation timing when a TGR compare match is specified as the clearing source, and when H'FFFF is set in TGR.

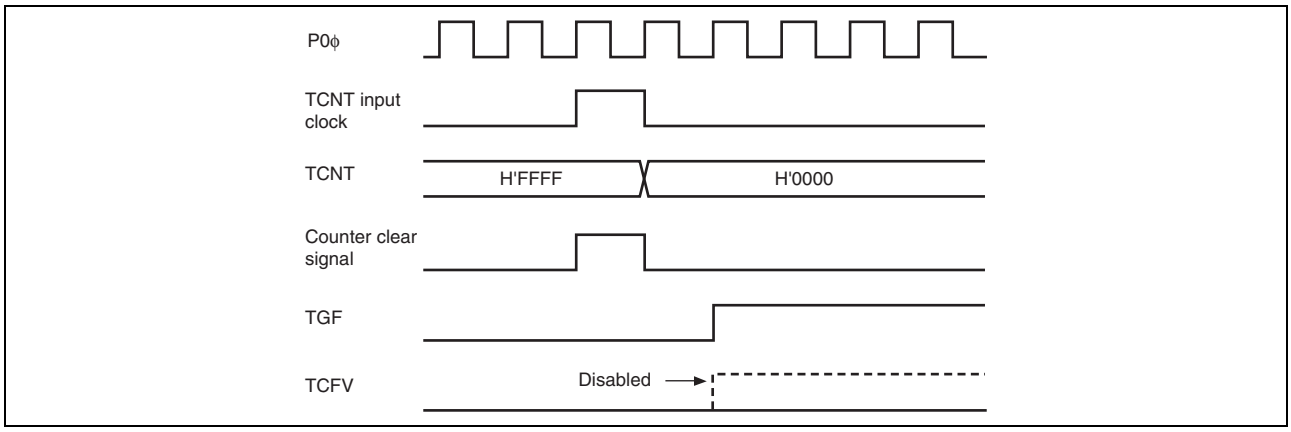

**Figure 10.111 Contention between Overflow and Counter Clearing**

### 10.7.18 Contention between TCNT Write and Overflow/Underflow

If there is an up-count or down-count in the T2 state of a TCNT write cycle, and overflow/underflow occurs, the TCNT write takes precedence and the TCFV/TCFU flag in TSR is not set.

Figure 10.112 shows the operation timing when there is contention between TCNT write and overflow.

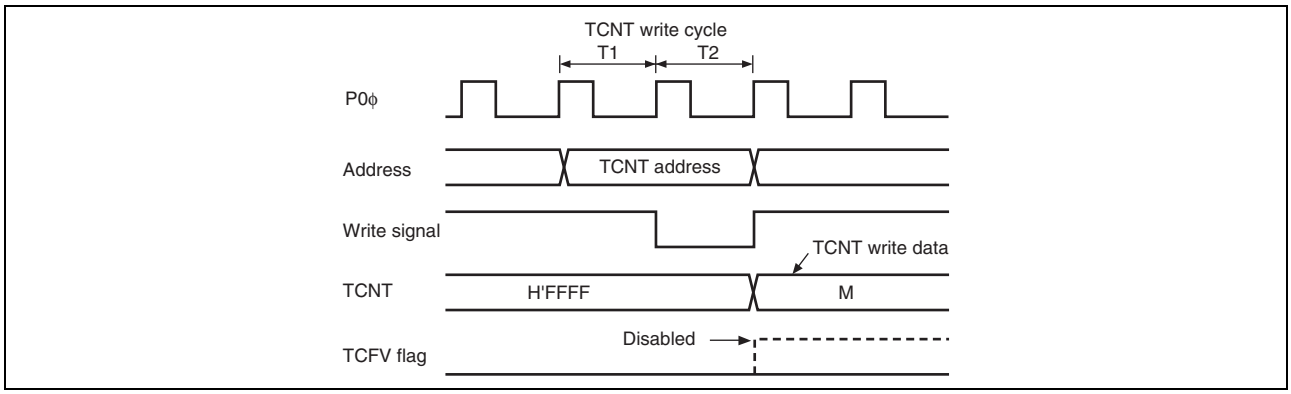

**Figure 10.112 Contention between TCNT Write and Overflow**

### 10.7.19 Cautions on Transition from Normal Operation or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from channel 3 or 4 normal operation or PWM mode 1 to reset-synchronized PWM mode, if the counter is halted with the output pins (TIOC3B, TIOC3D, TIOC4A, TIOC4C, TIOC4B, TIOC4D) in the high-level state, followed by the transition to reset-synchronized PWM mode and operation in that mode, the initial pin output will not be correct.

When making a transition from normal operation to reset-synchronized PWM mode, write H'11 to registers TIORH_3, TIORL_3, TIORH_4, and TIORL_4 to initialize the output pins to low level output, then set an initial register value of H'00 before making the mode transition.

When making a transition from PWM mode 1 to reset-synchronized PWM mode, first switch to normal operation, then initialize the output pins to low level output and set an initial register value of H'00 before making the transition to reset-synchronized PWM mode.

### 10.7.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When channels 3 and 4 are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is set with the OLSP and OLSN bits in the timer output control register (TOCR). In the case of complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to H'00.

### 10.7.21 Interrupts in Module Standby Mode

If module standby mode is entered when an interrupt has been requested, it will not be possible to clear the CPU interrupt source or the direct memory access controller activation source. Interrupts should therefore be disabled before entering module standby mode.

## 10.7.22 Simultaneous Capture of TCNT_1 and TCNT_2 in Cascade Connection

When timer counters 1 and 2 (TCNT_1 and TCNT_2) are operated as a 32-bit counter in cascade connection, the cascade counter value cannot be captured successfully even if input-capture input is simultaneously done to TIOC1A and TIOC2A or to TIOC1B and TIOC2B. This is because the input timing of TIOC1A and TIOC2A or of TIOC1B and TIOC2B may not be the same when external input-capture signals to be input into TCNT_1 and TCNT_2 are taken in synchronization with the internal clock. For example, TCNT_1 (the counter for upper 16 bits) does not capture the count-up value by overflow from TCNT_2 (the counter for lower 16 bits) but captures the count value before the count-up. In this case, the values of TCNT_1 = H'FFF1 and TCNT_2 = H'0000 should be transferred to TGRA_1 and TGRA_2 or to TGRB_1 and TGRB_2, but the values of TCNT_1 = H'FFF0 and TCNT_2 = H'0000 are erroneously transferred.

## 10.7.23 Notes on Output Waveform Control During Synchronous Counter Clearing in Complementary PWM Mode

In complementary PWM mode, when output waveform control during synchronous counter clearing is enabled (WRE in the TWCR register set to 1), the following problems may occur when condition (1) or condition (2), below, is satisfied.

- Dead time for the PWM output pins may be too short (or nonexistent).
- Active-level output from the PWM negative-phase pins may occur outside the correct active-level output interval

Condition (1): When synchronous clearing occurs in the PWM output dead time interval within initial output suppression interval (10) (Figure 10.113).

Condition (2): When synchronous clearing occurs within initial output suppression interval (10) or (11) and TGRB_3 ≤ TDDR, TGRA_4 ≤ TDDR, or TGRB_4 ≤ TDDR is true (Figure 10.114)

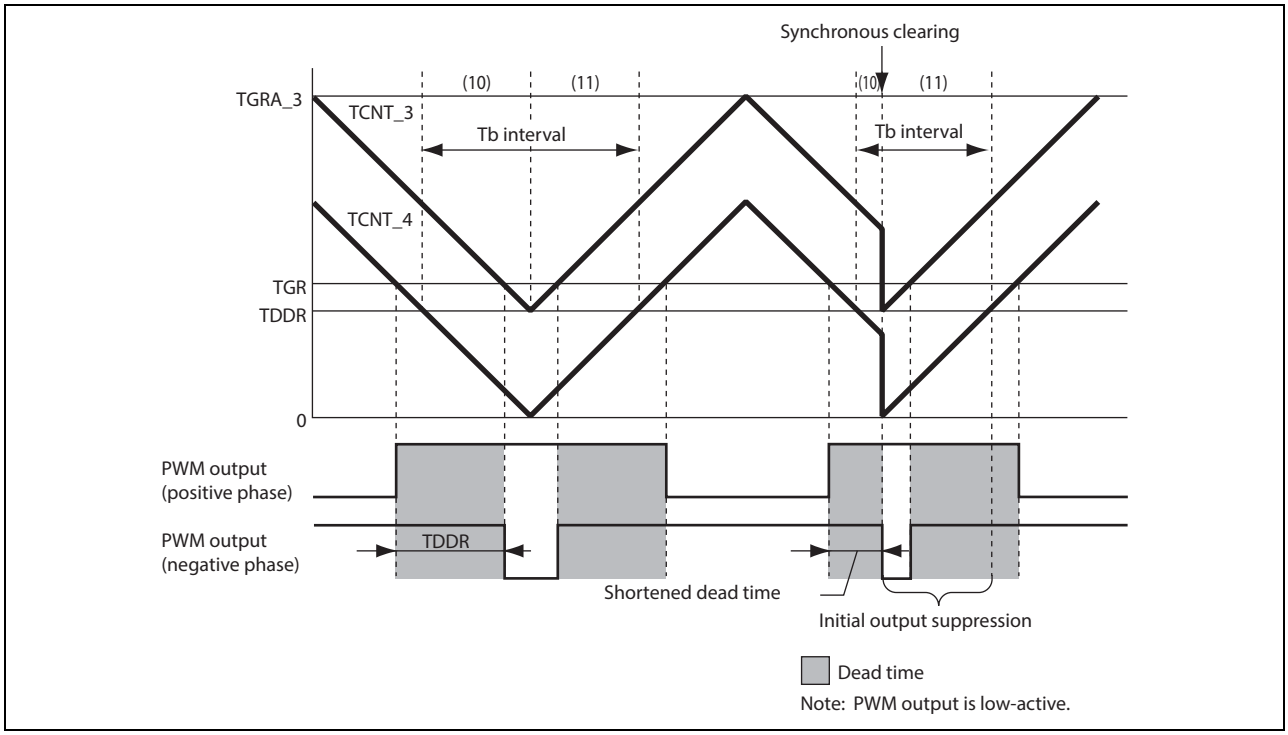

**Figure 10.113 Condition (1) Synchronous Clearing Example**

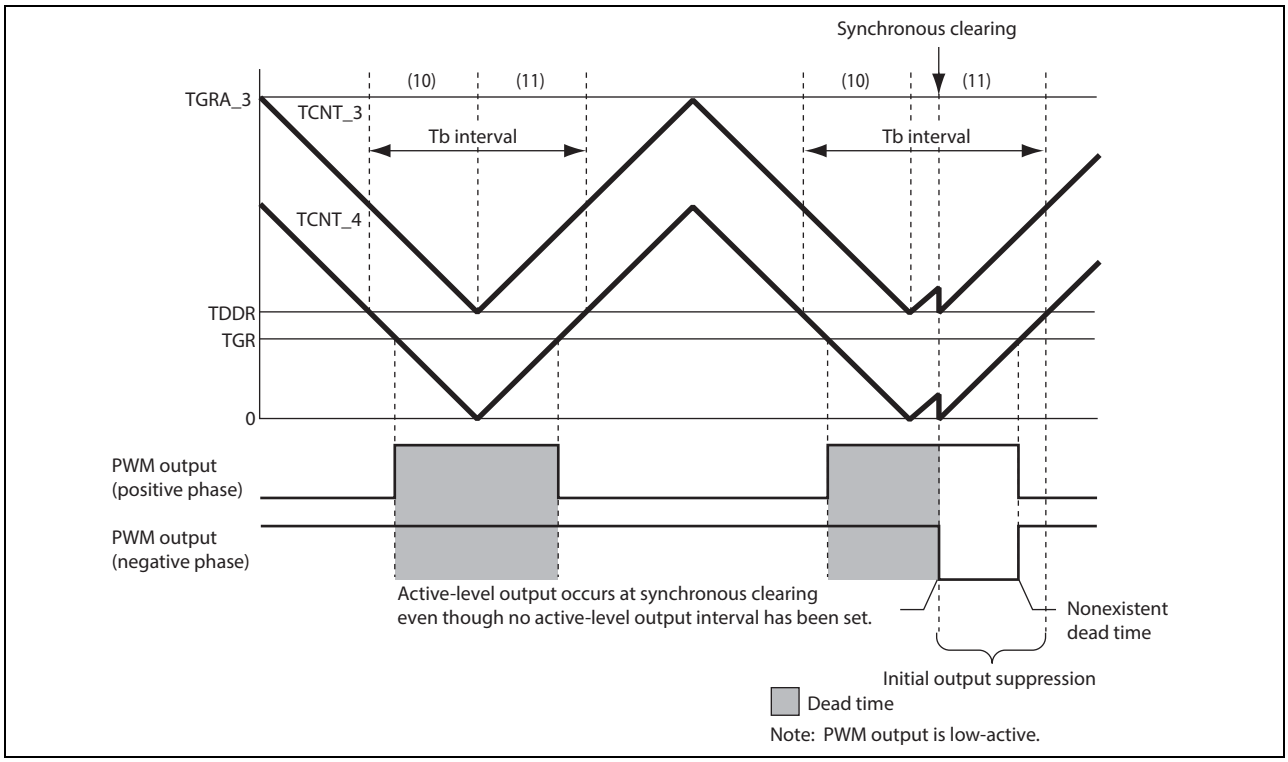

**Figure 10.114 Condition (2) Synchronous Clearing Example**

The following workaround can be used to avoid these problems.

When using synchronous clearing, make sure to set compare registers TGRB_3, TGRA_4, and TGRB_4 to a value twice or more the setting of dead time data register TDDR.

## 10.8 Output Pin Initialization for Multi-Function Timer Pulse Unit 2

### 10.8.1 Operating Modes

This module has the following six operating modes. Waveform output is possible in all of these modes.

- Normal mode (channels 0 to 4)
- PWM mode 1 (channels 0 to 4)
- PWM mode 2 (channels 0 to 2)
- Phase counting modes 1 to 4 (channels 1 and 2)
- Complementary PWM mode (channels 3 and 4)
- Reset-synchronized PWM mode (channels 3 and 4)

The output pin initialization method for each of these modes is described in this section.

### 10.8.2 Reset Start Operation

The output pins of this module (TIOC*) are initialized low by a power-on reset or in deep standby mode. Since the pin functions are selected using the general I/O ports, when the general I/O port is set, the pin states at that point are output to the ports. When this module output is selected by the general I/O port immediately after a reset, the initial output level, low, is output directly at the port. When the active level is low, the system will operate at this point, and therefore the general
I/O port setting should be made after the initialization of the output pins is completed.

Note: Channel number and port notation are substituted for *.

### 10.8.3 Operation in Case of Re-Setting Due to Error during Operation, etc.

If an error occurs during operation of this module, the module output should be cut by the system. Cutoff is performed by switching the pin output to port output with the general I/O port and outputting the inverse of the active level. The pin initialization procedures for re-setting due to an error during operation, etc., and the procedures for restarting in a different mode after re-setting, are shown below.

This module has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Possible mode transition combinations are shown in Table 10.57.

**Table 10.57 Mode Transition Combinations**

| | After | | | | | |
|---|---|---|---|---|---|---|
| **Before** | **Normal** | **PWM1** | **PWM2** | **PCM** | **CPWM** | **RPWM** |
| Normal | (1) | (2) | (3) | (4) | (5) | (6) |
| PWM1 | (7) | (8) | (9) | (10) | (11) | (12) |
| PWM2 | (13) | (14) | (15) | (16) | None | None |
| PCM | (17) | (18) | (19) | (20) | None | None |
| CPWM | (21) | (22) | None | None | (23) (24) | (25) |
| RPWM | (26) | (27) | None | None | (28) | (29) |

[Legend]
Normal: Normal mode
PWM1: PWM mode 1
PWM2: PWM mode 2
PCM: Phase counting modes 1 to 4
CPWM: Complementary PWM mode
RPWM: Reset-synchronized PWM mode

### 10.8.4 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation, etc.

- When making a transition to a mode (Normal, PWM1, PWM2, PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of a TIOR setting.
- In PWM mode 1, since a waveform is not output to the TIOC*B (TIOC *D) pin, setting TIOR will not initialize the pins. If initialization is required, carry it out in normal mode, then switch to PWM mode 1.
- In PWM mode 2, since a waveform is not output to the cycle register pin, setting TIOR will not initialize the pins. If initialization is required, carry it out in normal mode, then switch to PWM mode 2.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, setting TIOR will not initialize the buffer register pins. If initialization is required, clear buffer mode, carry out initialization, then set buffer mode again.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, setting TIOR will not initialize the TGRC pin. To initialize the TGRC pin, clear buffer mode, carry out initialization, then set buffer mode again.
- When making a transition to a mode (CPWM, RPWM) in which the pin output level is selected by the timer output control register (TOCR) setting, switch to normal mode and perform initialization with TIOR, then restore TIOR to its initial value, and temporarily disable channel 3 and 4 output with the timer output master enable register (TOER). Then operate the unit in accordance with the mode setting procedure (TOCR setting, TMDR setting, TOER setting).

Note: Channel number is substituted for * indicated in this article.

Pin initialization procedures are described below for the numbered combinations in Table 10.57. The active level is assumed to be low.

### (1) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in Normal Mode

Figure 10.115 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in normal mode after re-setting.

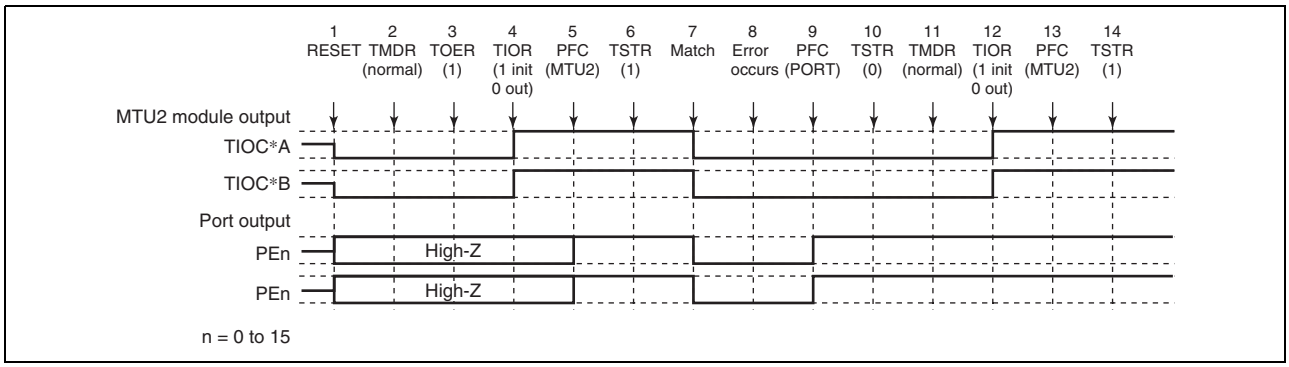

**Figure 10.115 Error Occurrence in Normal Mode, Recovery in Normal Mode**

1. After a reset, the module output is low and ports are in the high-impedance state.
2. After a reset, the TMDR setting is for normal mode.
3. For channels 3 and 4, enable output with TOER before initializing the pins with TIOR.
4. Initialize the pins with TIOR. (The example shows initial high output, with low output on compare-match occurrence.)
5. Set the multi-function timer pulse unit 2 output with the general I/O port.
6. The count operation is started by TSTR.
7. Output goes low on compare-match occurrence.
8. An error occurs.
9. Set port output with the general I/O port and output the inverse of the active level.
10. The count operation is stopped by TSTR.
11. Not necessary when restarting in normal mode.
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

### (2) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in PWM Mode 1

Figure 10.116 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

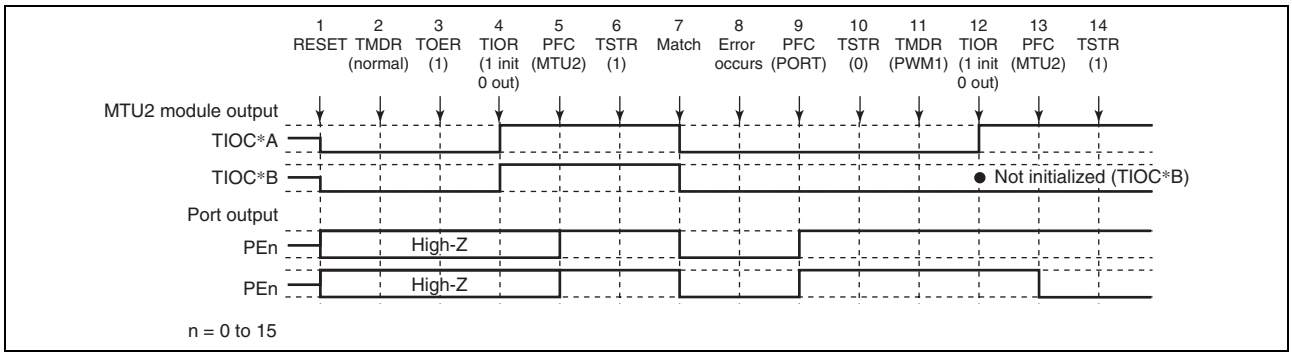

**Figure 10.116 Error Occurrence in Normal Mode, Recovery in PWM Mode 1**

1 to 10 are the same as in Figure 10.115.

11. Set PWM mode 1.
12. Initialize the pins with TIOR. (In PWM mode 1, the TIOC*B side is not initialized. If initialization is required, initialize in normal mode, and then switch to PWM mode 1.)
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

### (3) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in PWM Mode 2

Figure 10.117 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

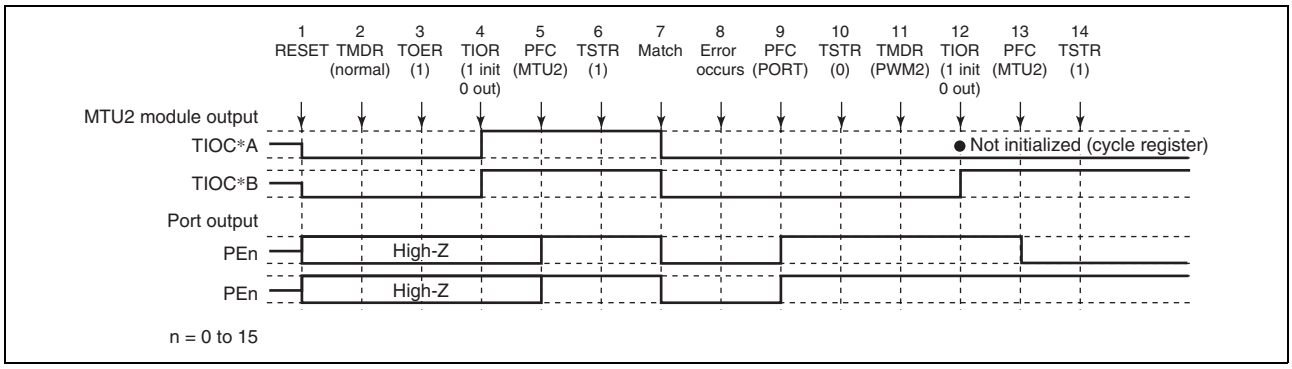

**Figure 10.117 Error Occurrence in Normal Mode, Recovery in PWM Mode 2**

1 to 10 are the same as in Figure 10.115.

11. Set PWM mode 2.
12. Initialize the pins with TIOR. (In PWM mode 2, the cycle register pins are not initialized. If initialization is required, initialize in normal mode, and then switch to PWM mode 2.)
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

Note: PWM mode 2 can only be set for channels 0 to 2, and therefore TOER setting is not necessary.

### (4) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in Phase Counting Mode

Figure 10.118 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

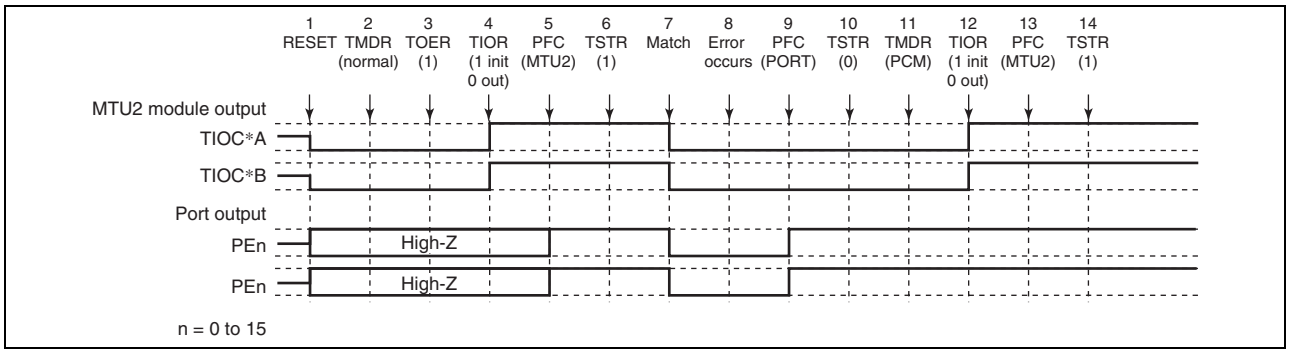

**Figure 10.118 Error Occurrence in Normal Mode, Recovery in Phase Counting Mode**

1 to 10 are the same as in Figure 10.115.

11. Set phase counting mode.
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

Note: Phase counting mode can only be set for channels 1 and 2, and therefore TOER setting is not necessary.

### (5) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in Complementary PWM Mode

Figure 10.119 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

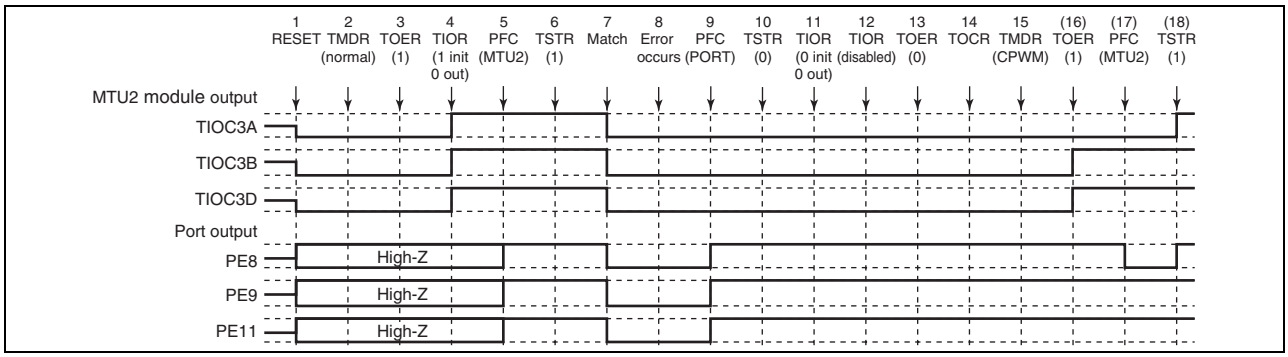

**Figure 10.119 Error Occurrence in Normal Mode, Recovery in Complementary PWM Mode**

1 to 10 are the same as in Figure 10.115.

11. Initialize the normal mode waveform generation section with TIOR.
12. Disable operation of the normal mode waveform generation section with TIOR.
13. Disable channel 3 and 4 output with TOER.
14. Select the complementary PWM output level and cyclic output enabling/disabling with TOCR.
15. Set complementary PWM.
16. Enable channel 3 and 4 output with TOER.
17. Set the multi-function timer pulse unit 2 output with the general I/O port.
18. Operation is restarted by TSTR.

### (6) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 10.120 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

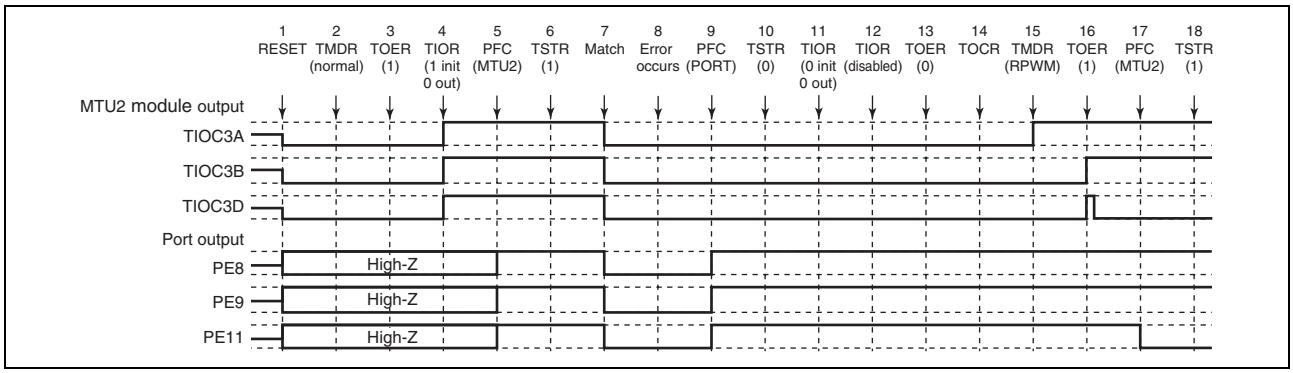

**Figure 10.120 Error Occurrence in Normal Mode, Recovery in Reset-Synchronized PWM Mode**

1 to 13 are the same as in Figure 10.115.

14. Select the reset-synchronized PWM output level and cyclic output enabling/disabling with TOCR.
15. Set reset-synchronized PWM.
16. Enable channel 3 and 4 output with TOER.
17. Set the multi-function timer pulse unit 2 output with the general I/O port.
18. Operation is restarted by TSTR.

### (7) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in Normal Mode

Figure 10.121 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

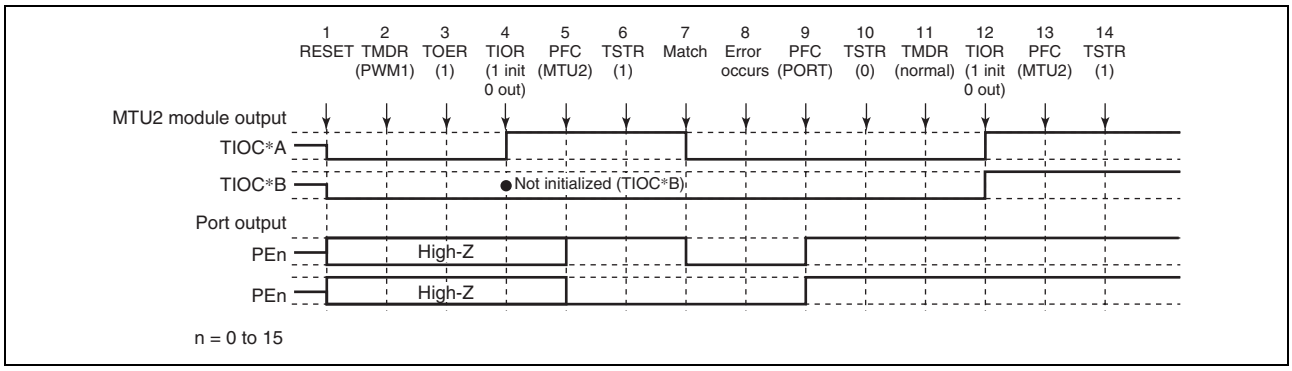

**Figure 10.121 Error Occurrence in PWM Mode 1, Recovery in Normal Mode**

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Set PWM mode 1.
3. For channels 3 and 4, enable output with TOER before initializing the pins with TIOR.
4. Initialize the pins with TIOR. (The example shows initial high output, with low output on compare-match occurrence. In PWM mode 1, the TIOC*B side is not initialized.)
5. Set the multi-function timer pulse unit 2 output with the general I/O port.
6. The count operation is started by TSTR.
7. Output goes low on compare-match occurrence.
8. An error occurs.
9. Set port output with the general I/O port and output the inverse of the active level.
10. The count operation is stopped by TSTR.
11. Set normal mode.
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

### (8) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in PWM Mode 1

Figure 10.122 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

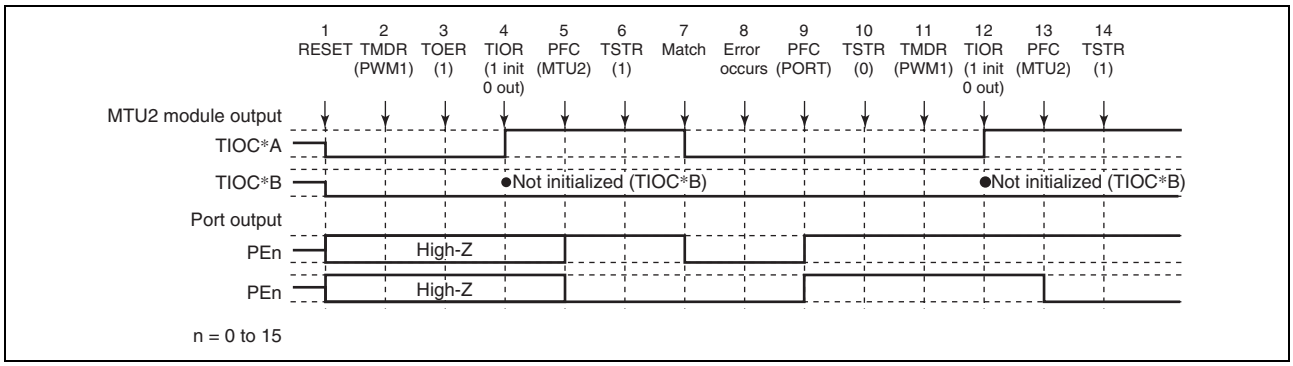

**Figure 10.122 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 1**

1 to 10 are the same as in Figure 10.121.

11. Not necessary when restarting in PWM mode 1.
12. Initialize the pins with TIOR. (In PWM mode 1, the TIOC*B side is not initialized.)
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

### (9) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in PWM Mode 2

Figure 10.123 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

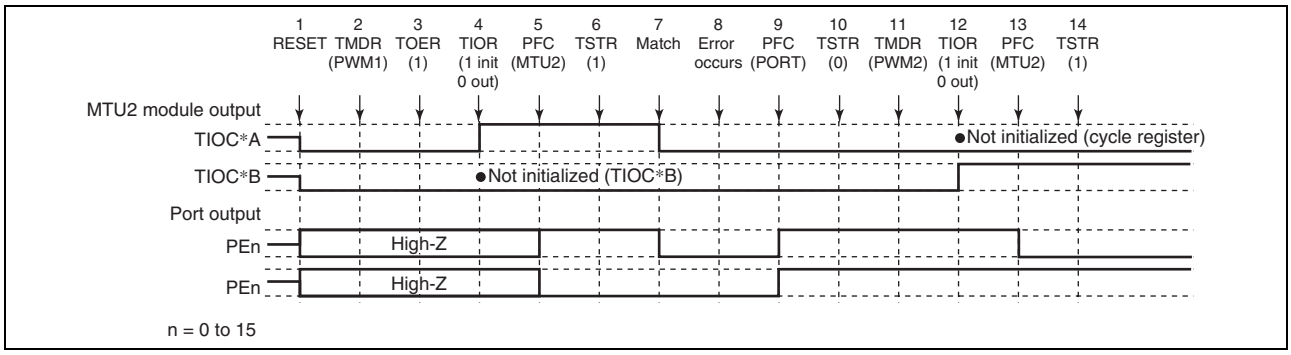

**Figure 10.123 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 2**

1 to 10 are the same as in Figure 10.121.

11. Set PWM mode 2.
12. Initialize the pins with TIOR. (In PWM mode 2, the cycle register pins are not initialized.)
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

Note: PWM mode 2 can only be set for channels 0 to 2, and therefore TOER setting is not necessary.

### (10) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in Phase Counting Mode

Figure 10.124 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

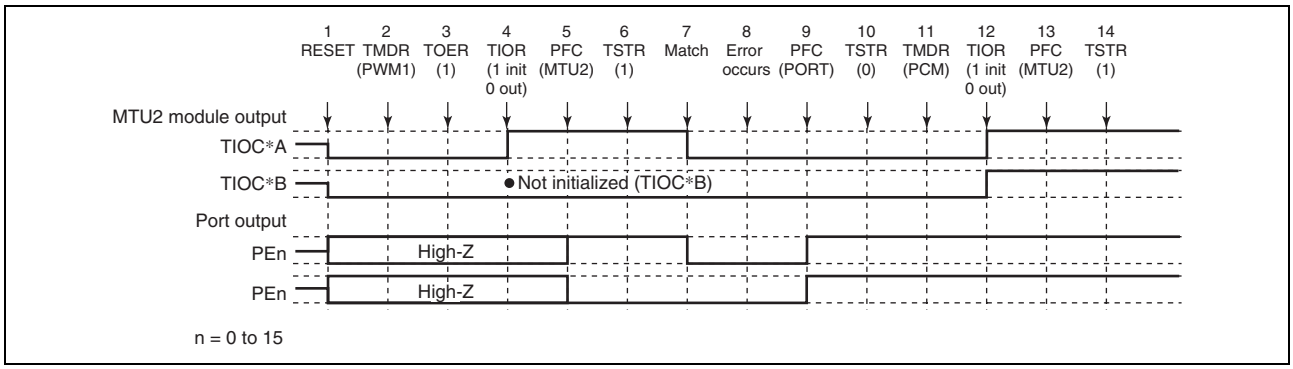

**Figure 10.124 Error Occurrence in PWM Mode 1, Recovery in Phase Counting Mode**

1 to 10 are the same as in Figure 10.121.

11. Set phase counting mode.
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

Note: Phase counting mode can only be set for channels 1 and 2, and therefore TOER setting is not necessary.

## (11) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in Complementary PWM Mode

Figure 10.125 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

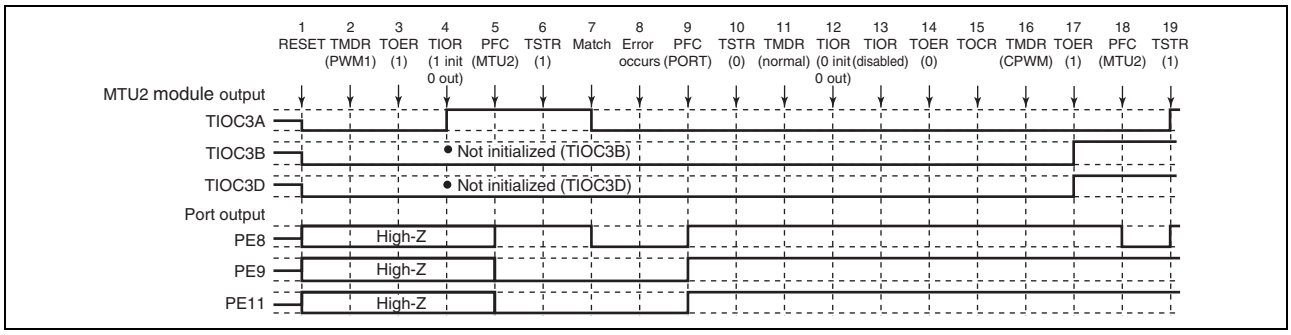

**Figure 10.125 Error Occurrence in PWM Mode 1, Recovery in Complementary PWM Mode**

1 to 10 are the same as in Figure 10.121.

11. Set normal mode for initialization of the normal mode waveform generation section.
12. Initialize the PWM mode 1 waveform generation section with TIOR.
13. Disable operation of the PWM mode 1 waveform generation section with TIOR.
14. Disable channel 3 and 4 output with TOER.
15. Select the complementary PWM output level and cyclic output enabling/disabling with TOCR.
16. Set complementary PWM.
17. Enable channel 3 and 4 output with TOER.
18. Set the multi-function timer pulse unit 2 output with the general I/O port.
19. Operation is restarted by TSTR.

## (12) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 10.126 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

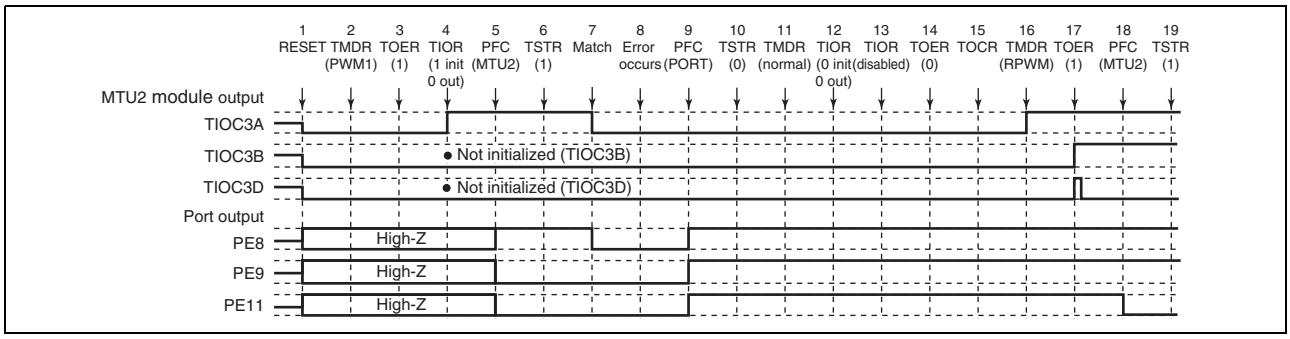

**Figure 10.126 Error Occurrence in PWM Mode 1, Recovery in Reset-Synchronized PWM Mode**

1 to 14 are the same as in Figure 10.125.

15. Select the reset-synchronized PWM output level and cyclic output enabling/disabling with TOCR.
16. Set reset-synchronized PWM.
17. Enable channel 3 and 4 output with TOER.
18. Set the multi-function timer pulse unit 2 output with the general I/O port.
19. Operation is restarted by TSTR.

### (13) Operation when Error Occurs during PWM Mode 2 Operation, and Operation is Restarted in Normal Mode

Figure 10.127 shows an explanatory diagram of the case where an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

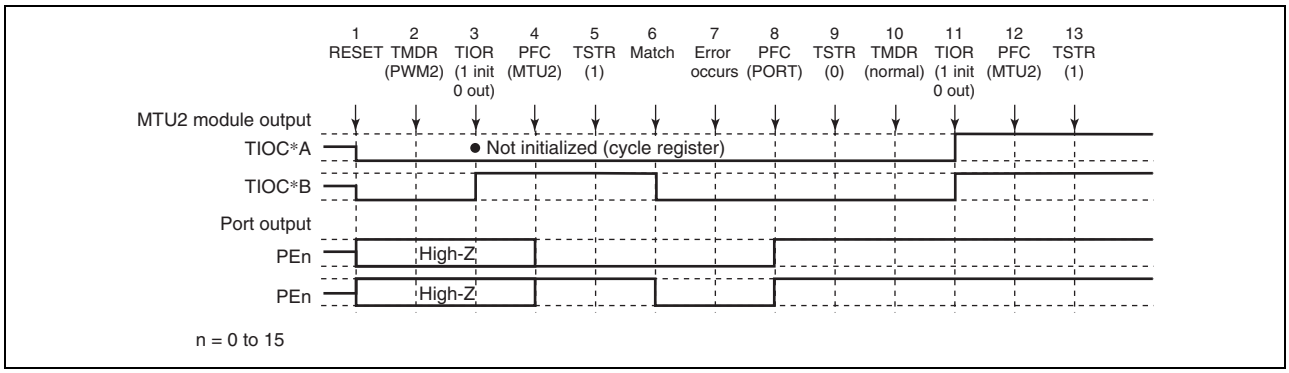

**Figure 10.127 Error Occurrence in PWM Mode 2, Recovery in Normal Mode**

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Set PWM mode 2.
3. Initialize the pins with TIOR. (The example shows initial high output, with low output on compare-match occurrence. In PWM mode 2, the cycle register pins are not initialized. In the example, TIOC *A is the cycle register.)
4. Set the multi-function timer pulse unit 2 output with the general I/O port.
5. The count operation is started by TSTR.
6. Output goes low on compare-match occurrence.
7. An error occurs.
8. Set port output with the general I/O port and output the inverse of the active level.
9. The count operation is stopped by TSTR.
10. Set normal mode.
11. Initialize the pins with TIOR.
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

### (14) Operation when Error Occurs during PWM Mode 2 Operation, and Operation is Restarted in PWM Mode 1

Figure 10.128 shows an explanatory diagram of the case where an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

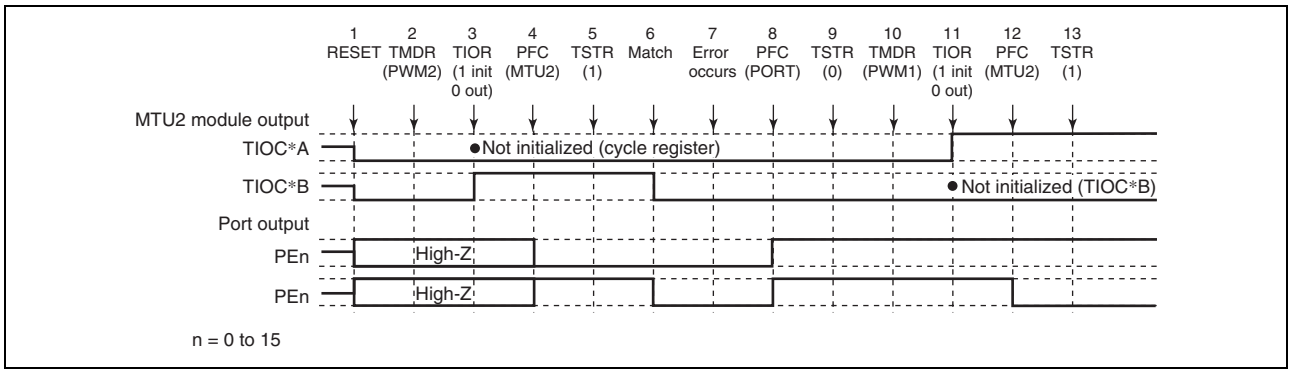

**Figure 10.128 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 1**

1 to 9 are the same as in Figure 10.127.

10. Set PWM mode 1.
11. Initialize the pins with TIOR. (In PWM mode 1, the TIOC*B side is not initialized.)
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

## (15) Operation when Error Occurs during PWM Mode 2 Operation, and Operation is Restarted in PWM Mode 2

Figure 10.129 shows an explanatory diagram of the case where an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

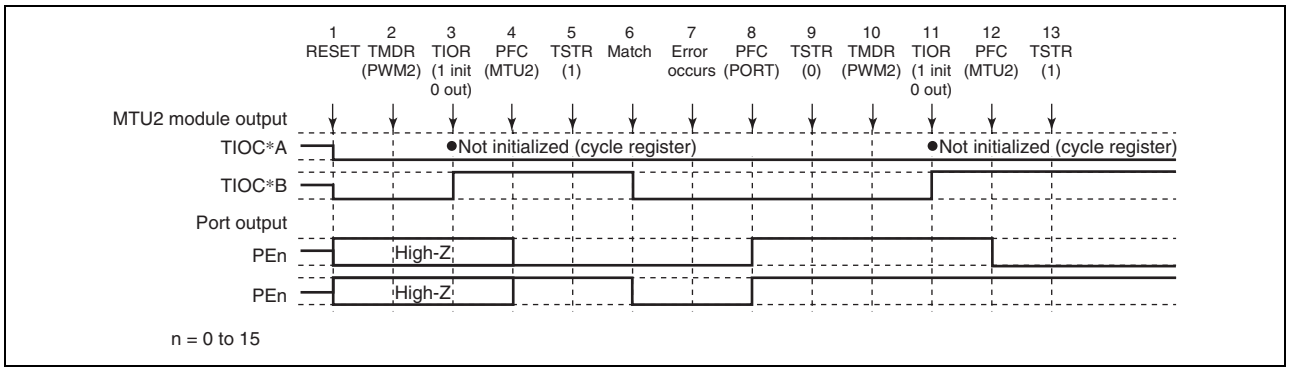

**Figure 10.129 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 2**

1 to 9 are the same as in Figure 10.127.

10. Not necessary when restarting in PWM mode 2.
11. Initialize the pins with TIOR. (In PWM mode 2, the cycle register pins are not initialized.)
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

### (16) Operation when Error Occurs during PWM Mode 2 Operation, and Operation is Restarted in Phase Counting Mode

Figure 10.130 shows an explanatory diagram of the case where an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

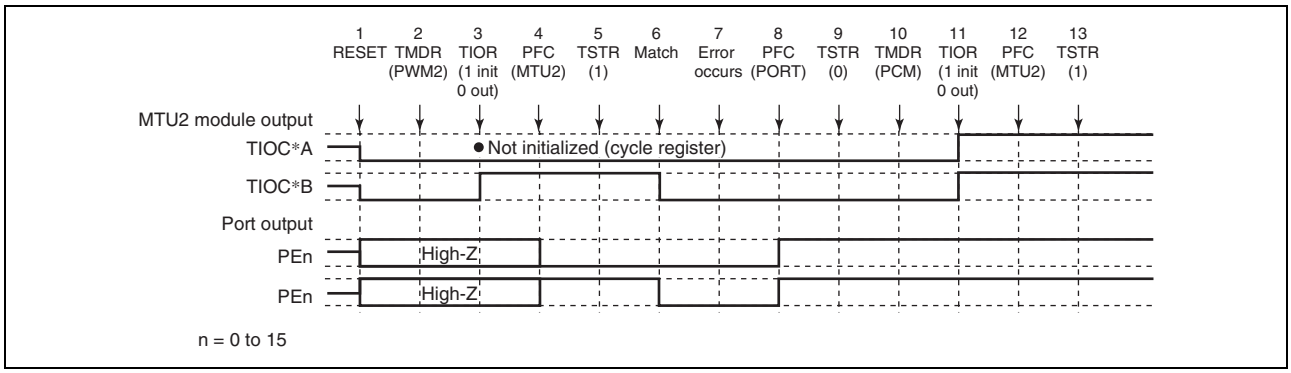

**Figure 10.130 Error Occurrence in PWM Mode 2, Recovery in Phase Counting Mode**

1 to 9 are the same as in Figure 10.127.

10. Set phase counting mode.
11. Initialize the pins with TIOR.
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

### (17) Operation when Error Occurs during Phase Counting Mode Operation, and Operation is Restarted in Normal Mode

Figure 10.131 shows an explanatory diagram of the case where an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

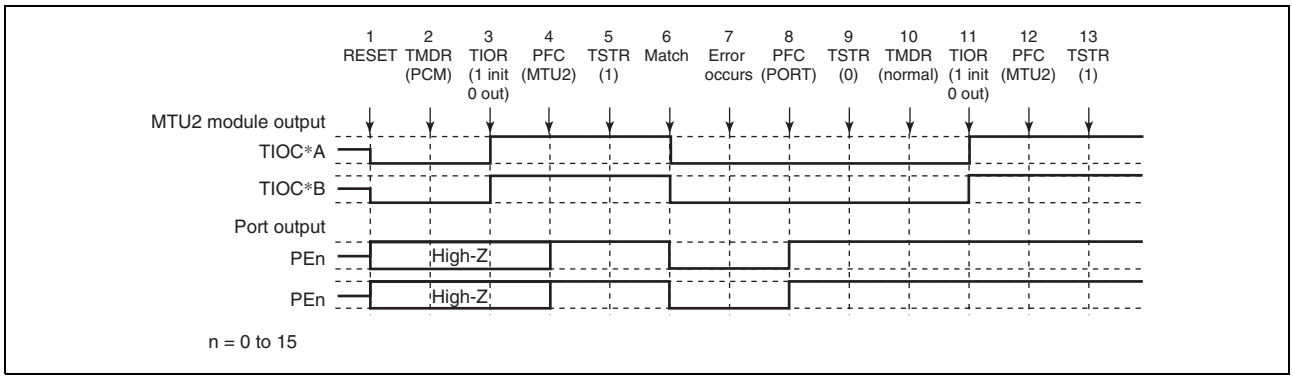

**Figure 10.131 Error Occurrence in Phase Counting Mode, Recovery in Normal Mode**

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Set phase counting mode.
3. Initialize the pins with TIOR. (The example shows initial high output, with low output on compare-match occurrence.)
4. Set the multi-function timer pulse unit 2 output with the general I/O port.
5. The count operation is started by TSTR.
6. Output goes low on compare-match occurrence.
7. An error occurs.
8. Set port output with the general I/O port and output the inverse of the active level.
9. The count operation is stopped by TSTR.
10. Set in normal mode.
11. Initialize the pins with TIOR.
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

### (18) Operation when Error Occurs during Phase Counting Mode Operation, and Operation is Restarted in PWM Mode 1

Figure 10.132 shows an explanatory diagram of the case where an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

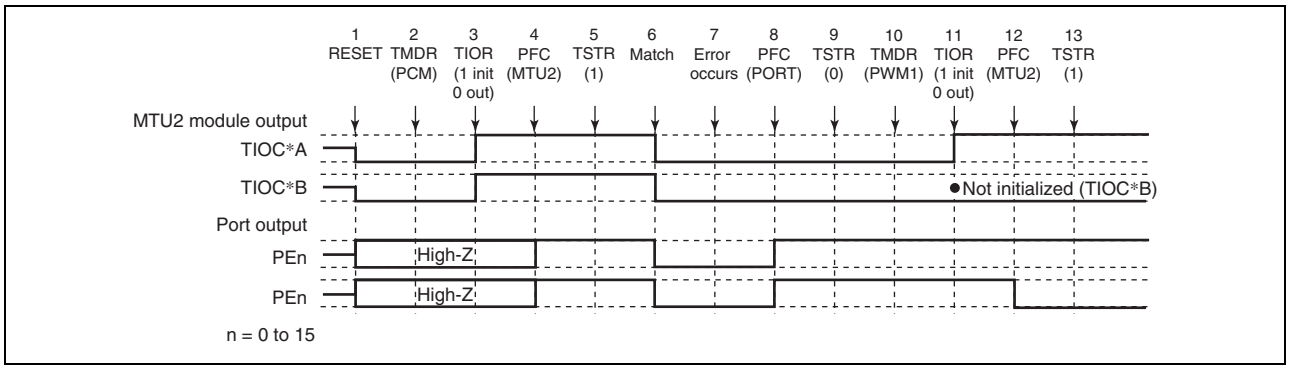

**Figure 10.132 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 1**

1 to 9 are the same as in Figure 10.131.

10. Set PWM mode 1.
11. Initialize the pins with TIOR. (In PWM mode 1, the TIOC *B side is not initialized.)
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

### (19) Operation when Error Occurs during Phase Counting Mode Operation, and Operation is Restarted in PWM Mode 2

Figure 10.133 shows an explanatory diagram of the case where an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

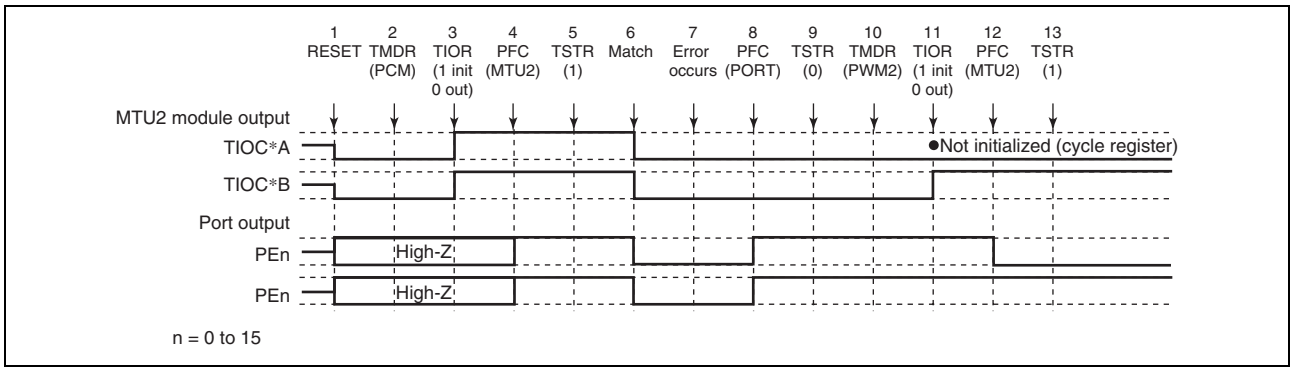

**Figure 10.133 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 2**

1 to 9 are the same as in Figure 10.131.

10. Set PWM mode 2.
11. Initialize the pins with TIOR. (In PWM mode 2, the cycle register pins are not initialized.)
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

### (20) Operation when Error Occurs during Phase Counting Mode Operation, and Operation is Restarted in Phase Counting Mode

Figure 10.134 shows an explanatory diagram of the case where an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

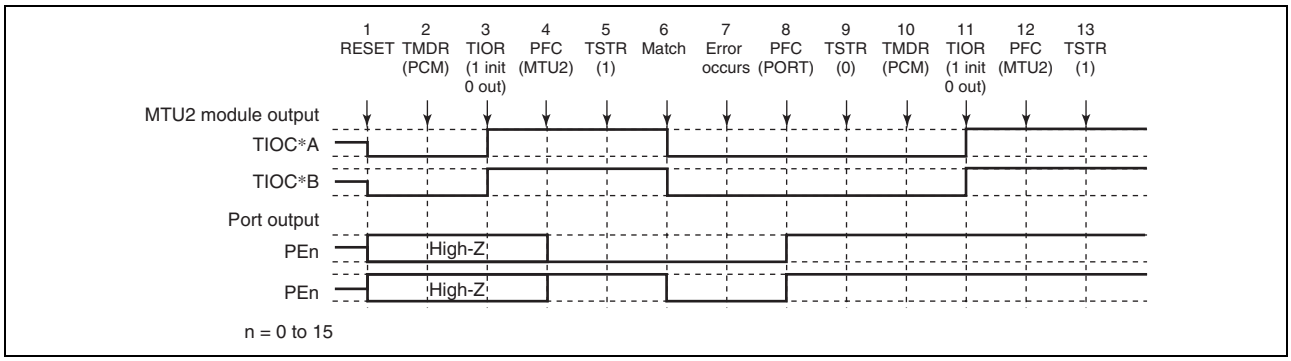

**Figure 10.134 Error Occurrence in Phase Counting Mode, Recovery in Phase Counting Mode**

1 to 9 are the same as in Figure 10.131.

10. Not necessary when restarting in phase counting mode.
11. Initialize the pins with TIOR.
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

## (21) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in Normal Mode

Figure 10.135 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

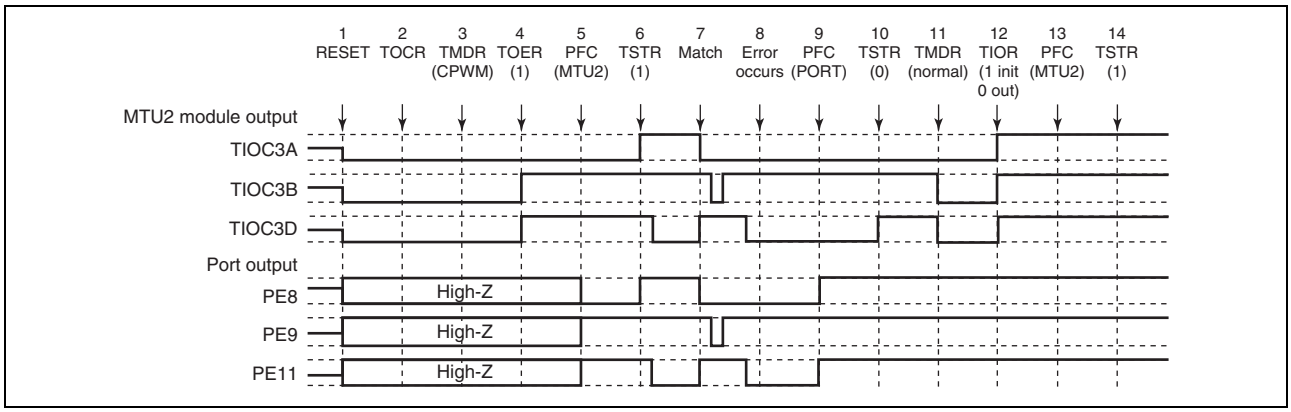

**Figure 10.135 Error Occurrence in Complementary PWM Mode, Recovery in Normal Mode**

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Select the complementary PWM output level and cyclic output enabling/disabling with TOCR.
3. Set complementary PWM.
4. Enable channel 3 and 4 output with TOER.
5. Set the multi-function timer pulse unit 2 output with the general I/O port.
6. The count operation is started by TSTR.
7. The complementary PWM waveform is output on compare-match occurrence.
8. An error occurs.
9. Set port output with the general I/O port and output the inverse of the active level.
10. The count operation is stopped by TSTR. (This module outputs the same value as the complementary PWM output initial value.)
11. Set normal mode. (This module outputs a low-level signal.)
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

### (22) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in PWM Mode 1

Figure 10.136 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

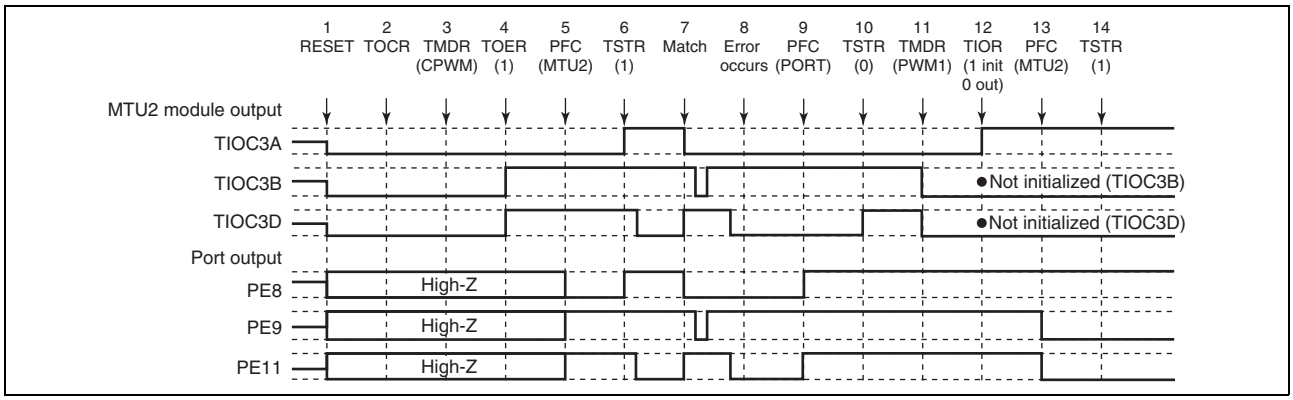

**Figure 10.136 Error Occurrence in Complementary PWM Mode, Recovery in PWM Mode 1**

1 to 10 are the same as in Figure 10.135.

11. Set PWM mode 1. (This module outputs a low-level signal.)
12. Initialize the pins with TIOR. (In PWM mode 1, the TIOC *B side is not initialized.)
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

### (23) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in Complementary PWM Mode

Figure 10.137 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the cycle and duty settings at the time the counter was stopped).

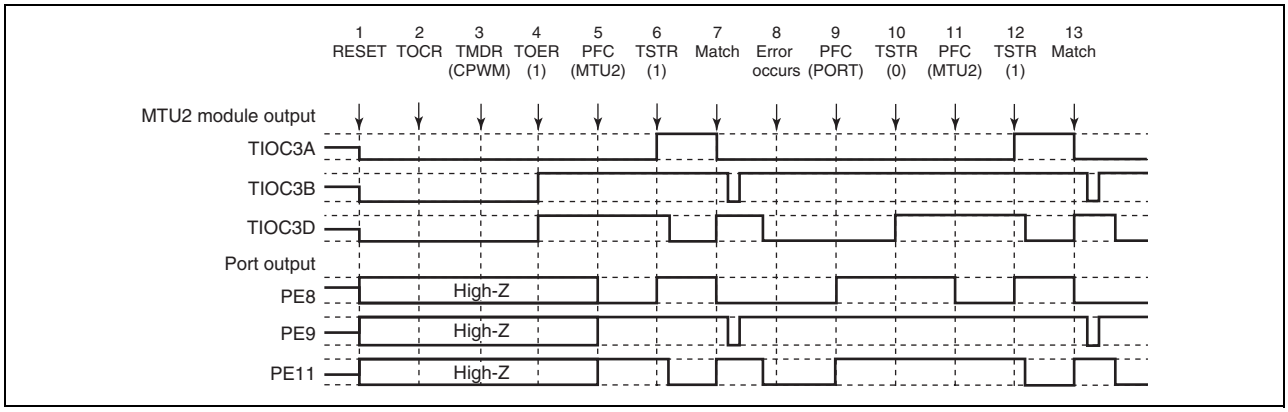

**Figure 10.137 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode**

1 to 10 are the same as in Figure 10.135.

11. Set the multi-function timer pulse unit 2 output with the general I/O port.
12. Operation is restarted by TSTR.
13. The complementary PWM waveform is output on compare-match occurrence.

### (24) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in Complementary PWM Mode

Figure 10.138 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using completely new cycle and duty settings).

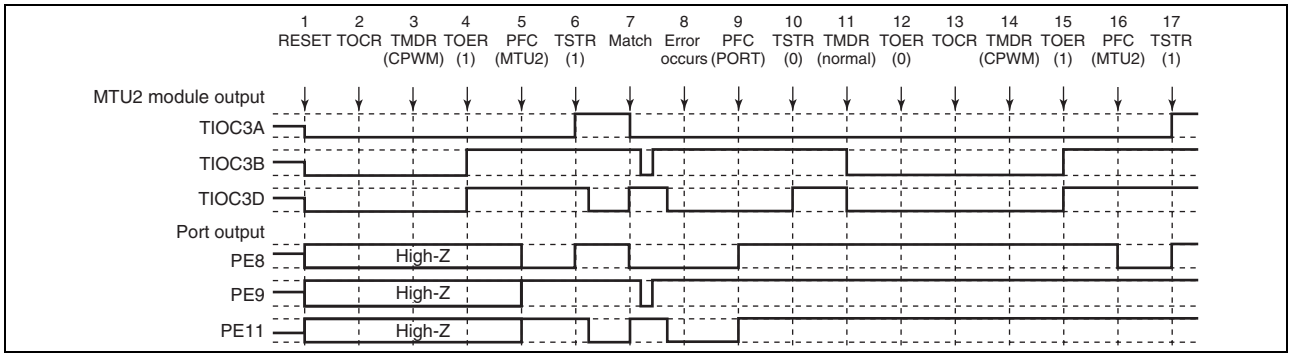

**Figure 10.138 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode**

1 to 10 are the same as in Figure 10.135.

11. Set normal mode and make new settings. (This module outputs a low-level signal.)
12. Disable channel 3 and 4 output with TOER.
13. Select the complementary PWM mode output level and cyclic output enabling/disabling with TOCR.
14. Set complementary PWM.
15. Enable channel 3 and 4 output with TOER.
16. Set the multi-function timer pulse unit 2 output with the general I/O port.
17. Operation is restarted by TSTR.

### (25) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 10.139 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in reset-synchronized PWM mode.

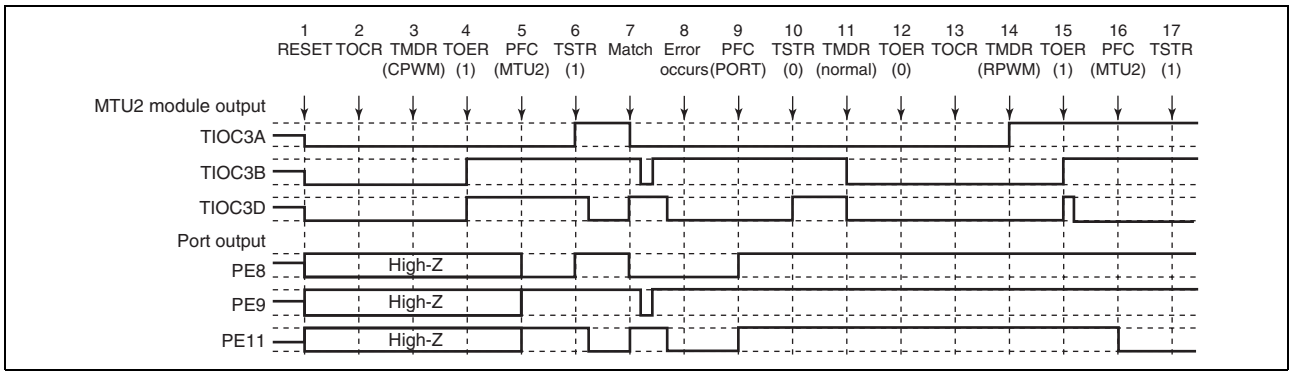

**Figure 10.139 Error Occurrence in Complementary PWM Mode, Recovery in Reset-Synchronized PWM Mode**

1 to 10 are the same as in Figure 10.135.

11. Set normal mode. (This module outputs a low-level signal.)
12. Disable channel 3 and 4 output with TOER.
13. Select the reset-synchronized PWM mode output level and cyclic output enabling/disabling with TOCR.
14. Set reset-synchronized PWM.
15. Enable channel 3 and 4 output with TOER.
16. Set the multi-function timer pulse unit 2 output with the general I/O port.
17. Operation is restarted by TSTR.

### (26) Operation when Error Occurs during Reset-Synchronized PWM Mode Operation, and Operation is Restarted in Normal Mode

Figure 10.140 shows an explanatory diagram of the case where an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

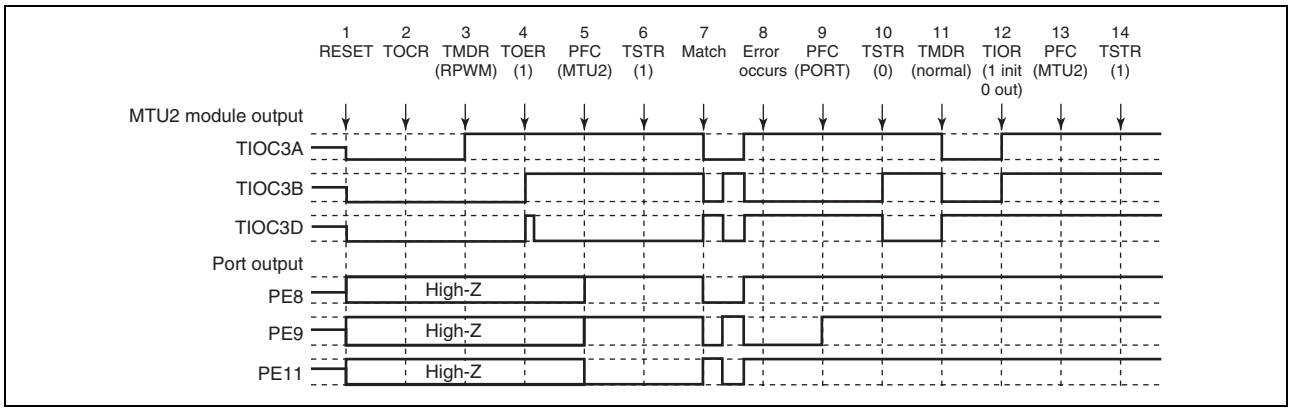

**Figure 10.140 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Normal Mode**

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Select the reset-synchronized PWM output level and cyclic output enabling/disabling with TOCR.
3. Set reset-synchronized PWM.
4. Enable channel 3 and 4 output with TOER.
5. Set the multi-function timer pulse unit 2 output with the general I/O port.
6. The count operation is started by TSTR.
7. The reset-synchronized PWM waveform is output on compare-match occurrence.
8. An error occurs.
9. Set port output with the general I/O port and output the inverse of the active level.
10. The count operation is stopped by TSTR. (This module outputs the same value as the reset-synchronized PWM output initial value.)
11. Set normal mode. (The positive phase output from this module is low, and negative phase output is high.)
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

## (27) Operation when Error Occurs during Reset-Synchronized PWM Mode Operation, and Operation is Restarted in PWM Mode 1

Figure 10.141 shows an explanatory diagram of the case where an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

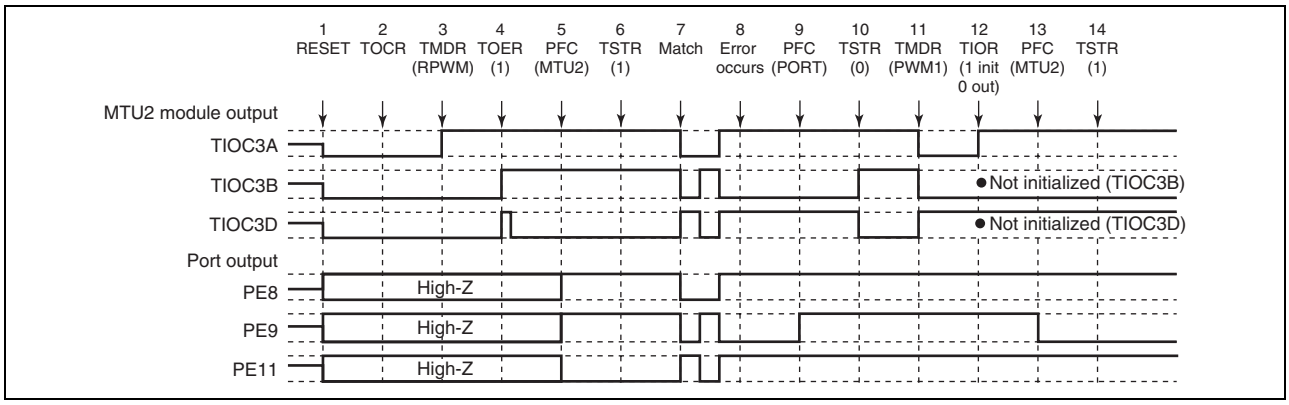

**Figure 10.141 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in PWM Mode 1**

1 to 10 are the same as in Figure 10.140.

11. Set PWM mode 1. (The positive phase output from this module is low, and negative phase output is high.)
12. Initialize the pins with TIOR. (In PWM mode 1, the TIOC *B side is not initialized.)
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

### (28) Operation when Error Occurs during Reset-Synchronized PWM Mode Operation, and Operation is Restarted in Complementary PWM Mode

Figure 10.142 shows an explanatory diagram of the case where an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

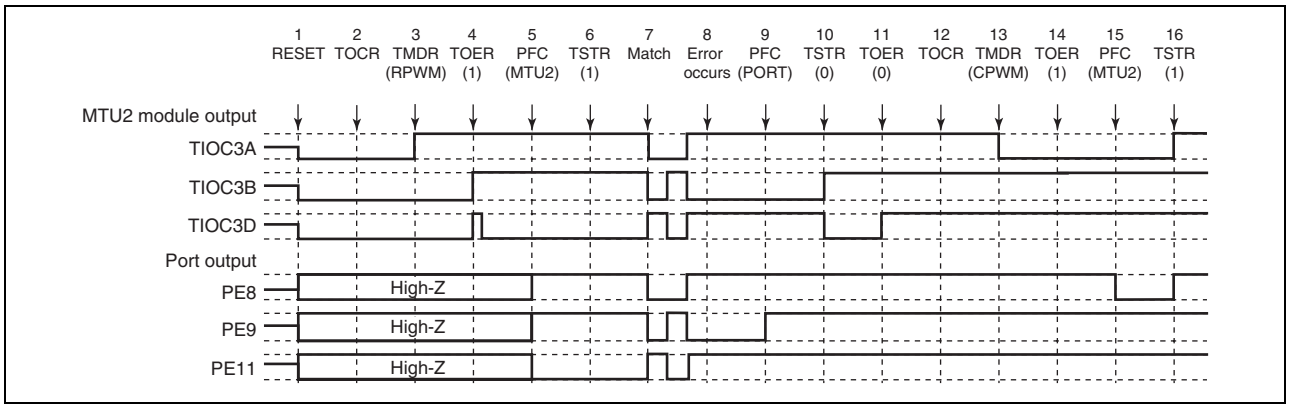

**Figure 10.142 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Complementary PWM Mode**

1 to 10 are the same as in Figure 10.140.

11. Disable channel 3 and 4 output with TOER.
12. Select the complementary PWM output level and cyclic output enabling/disabling with TOCR.
13. Set complementary PWM. (The cyclic output pin of this module outputs a low-level signal.)
14. Enable channel 3 and 4 output with TOER.
15. Set the multi-function timer pulse unit 2 output with the general I/O port.
16. Operation is restarted by TSTR.

### (29) Operation when Error Occurs during Reset-Synchronized PWM Mode Operation, and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 10.143 shows an explanatory diagram of the case where an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

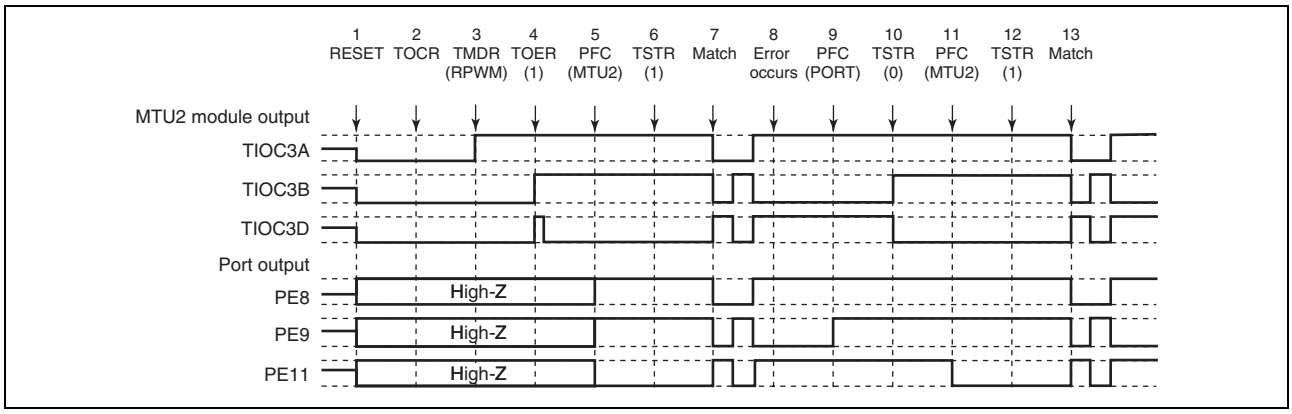

**Figure 10.143 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Reset-Synchronized PWM Mode**

1 to 10 are the same as in Figure 10.140.

11. Set the multi-function timer pulse unit 2 output with the general I/O port.
12. Operation is restarted by TSTR.
13. The reset-synchronized PWM waveform is output on compare-match occurrence.

# 11. OS Timer

## 11.1 Functional Overview

The OS timer has the following features.

- Two operating modes
  - Interval timer mode
  - Free-running comparison mode
- Choice between startup of DMA by compare match and generation of interrupt

### 11.1.1 Features of OSTM

#### Channels

This product has the following number of channels of the OS timer.

**Table 11.1 Channels of OS timer**

| | OS Timer |
|---|---|
| Number of Channels | 2 |
| Name | OSTMn |

#### Meaning of n

Throughout this section, the individual channels of the OS timer are identified by the index "n" (n = 0, 1), for example OSTMnTO for the OS timer n output register.

#### Register address

The register addresses of the OS timer are given as offsets from the individual base addresses <OSTMn_base>.

The register base addresses of each OSTMn are listed in the following table.

**Table 11.2 Register Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <OSTM0_base> | FCFE C000$_H$ |
| <OSTM1_base> | FCFE C400$_H$ |

#### Interrupts

The OS timers can generate the following interrupt requests.

**Table 11.3 OSTMn Interrupt Requests**

| OSTMn Signal | Function | Startup of Direct Memory Access Controller |
|---|---|---|
| OSTM0TINT | OSTM0 interrupt | √ |
| OSTM1TINT | OSTM1 interrupt | √ |

## 11.2 Registers

The OS timer is controlled and operated by the following registers.

### 11.2.1 Registers Overview

The list of OSTMn (n = 0, 1) registers and the memory addresses are as follows.

For the base addresses, see the Table 11.2.

For the actual addresses, the offset values indicated in the following table are added to the base addresses.

| Register Name | Function | R/W | Reset Value | Access Unit (bit) | | | Address |
|---|---|---|---|---|---|---|---|
| | | | | 8 | 16 | 32 | |
| OSTMnCMP | OSTM compare register | R/W | $0000\ 0000_H$ | — | — | √ | <OSTMn_base> + $00_H$ |
| OSTMnCNT | OSTM counter register | R | $FFFF\ FFFF_H$ | — | — | √ | <OSTMn_base> + $04_H$ |
| OSTMnTE | OSTM count enable status register | R | $00_H$ | √ | — | — | <OSTMn_base> + $10_H$ |
| OSTMnTS | OSTM count start trigger register | W | $00_H$ | √ | — | — | <OSTMn_base> + $14_H$ |
| OSTMnTT | OSTM count stop trigger register | W | $00_H$ | √ | — | — | <OSTMn_base> + $18_H$ |
| OSTMnCTL | OSTM control register | R/W | $00_H$ | √ | — | — | <OSTMn_base> + $20_H$ |

## 11.2.2 Details of OSTM Registers

### 11.2.2.1 OSTMnCMP — OSTM Compare Register

Depending on the mode of operation, this register holds the start value for the down-counter or the value for comparison with that of the counter.

**Access:** This register is readable/writable in 32-bit units.

**Address:** <OSTMn_base>

**Initial value:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSTMnCMP[31:16] | | | | | | | | | | | | | | | |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSTMnCMP[15:0] | | | | | | | | | | | | | | | |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 11.4 OSTMnCMP register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | OSTMnCMP [31:0] | • In interval timer mode: start value of the down-counter<br>• In free-running comparison mode: value for comparison |

### 11.2.2.2 OSTMnCNT — OSTM Counter Register

This register indicates the counter value of the timer.

**Access:** This register is readable in 32-bit units.

**Address:** OSTMn_base> + $4_H$

**Initial value:** The initial value depends on the operating mode of the OS timer. Refer to **Table 11.6, Correspondence between Operating Mode, Counting Direction and Initial Value**.

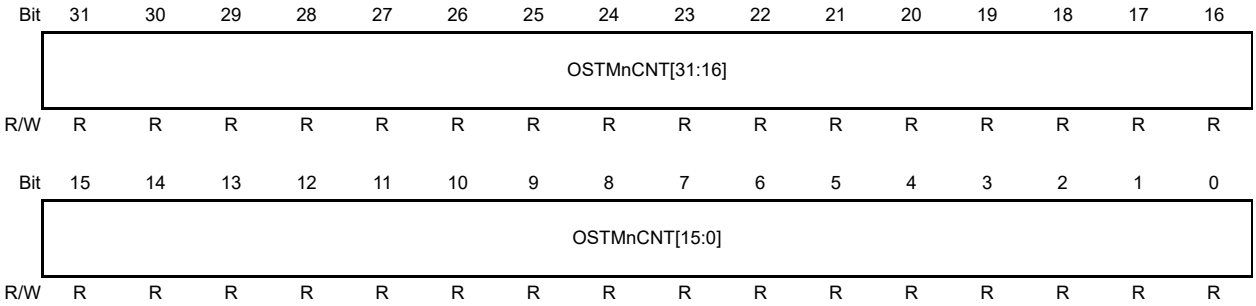

**Table 11.5 OSTMnCNT register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | OSTMnCNT [31:0] | 32-bit counter value |

The following table shows the correspondence between operating mode, counting direction and initial value. The initial value is the value read from the counter after a change to the operating mode.

**Table 11.6 Correspondence between Operating Mode, Counting Direction and Initial Value**

| Timer Operating Mode | OSTMnCTL.OSTMnMD1 | Counting Direction | Initial value |
|---|---|---|---|
| Interval timer mode | 0 *1 | Down | FFFF FFFF$_H$ |
| Free-running comparison mode | 1 | Up | 0000 0000$_H$ |

Note 1. Value after reset

### 11.2.2.3 OSTMnTE — OSTM Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

**Access:** This register is readable in 8-bit units.

**Address:** <OSTMn_base>+ $10_H$

**Initial value:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | 0 | 0 | 0 | 0 | 0 | 0 | 0 | OSTMnTE |
| R/W | R | R | R | R | R | R | R | R |

**Table 11.7 OSTMnTE register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | OSTMnTE | This bit indicates whether the counter is enabled or disabled.<br>0: Counter disabled<br>1: Counter enabled<br>This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1.<br>This bit is reset to 0 in response to OSTMnTT.OSTMnTT being set to 1. |

NOTE

When OSTMnTE = 0, the counter retains its value.

If the counter is restarted, it

- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
- restarts counting up from the counter value 0000 $0000_H$ if it is in free running comparison mode.

### 11.2.2.4 OSTMnTS — OSTM Count Start Trigger Register

This register starts the counter.

**Access:** This register is writable in 8-bit units. It is always read as $00_H$.

**Address:** <OSTMn_base>+ $14_H$

**Initial value:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | 0 | 0 | 0 | 0 | 0 | 0 | 0 | OSTMnTS |
| R/W | R | R | R | R | R | R | R | W |

**Table 11.8 OSTMnTS register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | Reserved<br>These bits are always read as 0. The write value should always be 0. |

### 11.2.2.5 OSTMnTT — OSTM Count Stop Trigger Register

This register stops the counter.

**Access:** This register is writable in 8-bit units. It is always read as $00_H$.

**Address:** <OSTMn_base>+ $18_H$

**Initial value:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | 0 | 0 | 0 | 0 | 0 | 0 | 0 | OSTMnTT |
| R/W | R | R | R | R | R | R | R | W |

**Table 11.9 OSTMnTT register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | OSTMnTT | Stops the counter.<br>0: This setting has no effect.<br>1: Stops the counter and clears the OSTMnTE.OSTMnTE bit. |

### 11.2.2.6 OSTMnCTL — OSTM Control Register

This register specifies the operating mode for the counter and controls enabling/disabling of OSTMnTINT interrupt requests when counting starts.

**Access:** This register is readable/writable in 8-bit units. Writing to this register is only possible if the counter is disabled (OSTMnTOE.OSTMnTOE = 0).

**Address:** <OSTMn_base>+ $20_H$

**Initial value:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | 0 | 0 | 0 | 0 | 0 | 0 | OSTMnMD1 | OSTMnMD0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

**Table 11.10 OSTMnCTL register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1 | OSTMnMD1 | Specifies the operating mode for the counter.<br>0: Interval timer mode<br>1: Free-running comparison mode |
| 0 | OSTMnMD0 | Controls enabling/disabling of OSTMnTINT interrupt requests when counting starts.<br>0: Disables the interrupts when counting starts.<br>1: Enables the interrupts when counting starts. |

## 11.3 Functional Description

Each OS timer is a 32-bit timer/counter.

The settings for operating mode specify the direction of counting (up or down) and the generation of interrupt requests.

### 11.3.1 Block Diagram

The following block diagram shows the main components of OSTM.

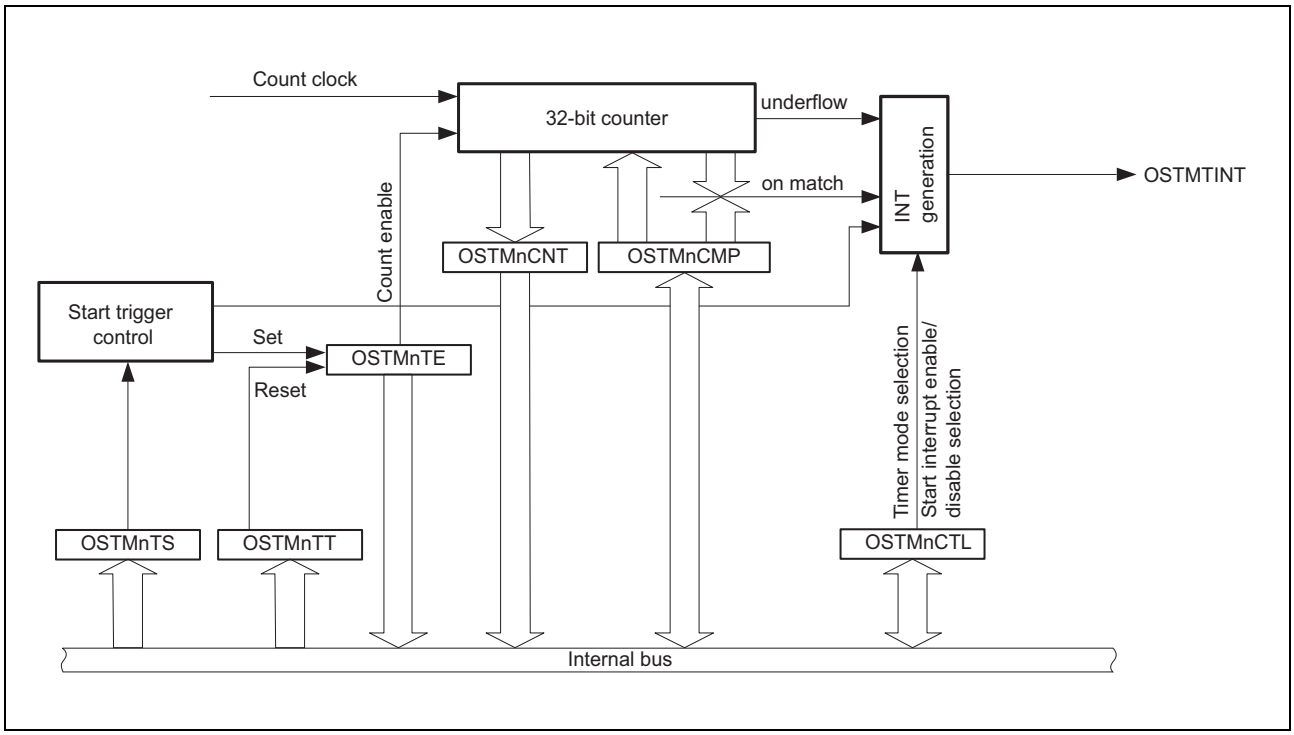

**Figure 11.1 Block Diagram of OSTM**

### 11.3.2 Count Clock

The count clock of OSTMn is P0ϕ.

### 11.3.3 Generation of Interrupt Request

An OSTMnTINT interrupt request is generated whenever the counter reaches 0000 $0000_H$ (in interval timer mode) or matches the comparison value (in free-running comparison mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This operation is shown in the following figure.

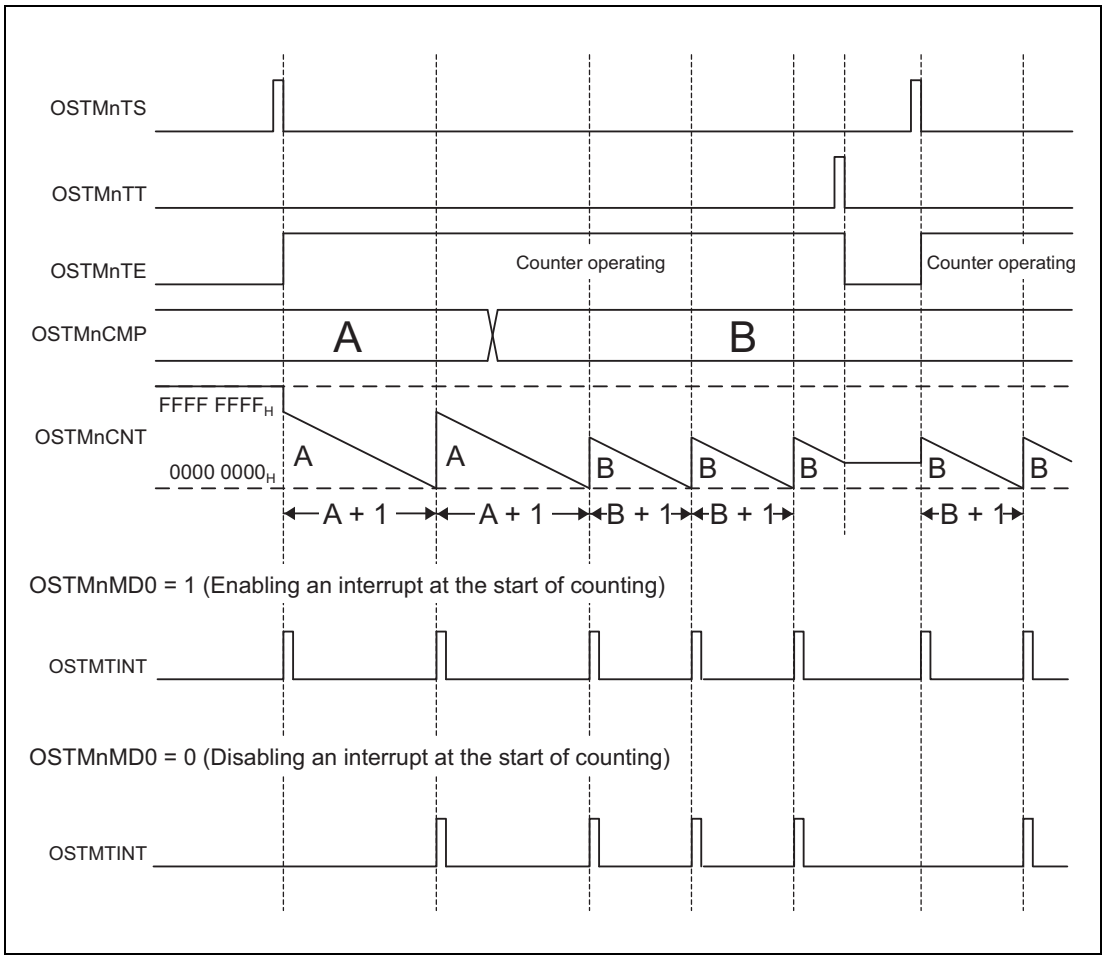

**Figure 11.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)**

### 11.3.4 Starting and Stopping the Timer

The OS timer is started and stopped as follows.

#### Starting the timer

The timer is started in either of the following way:

- setting the OSTMnTS.OSTMnTSF bit to 1

Status bit OSTMnTE.OSTMnTE is set to 1.

The counter starts to count up or down in accord with the settings for operating mode.

#### Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops the timer.

This also clears the OSTMnTE.OSTMnTE status flag.

### 11.3.5 Interval Timer Mode

Select the interval timer mode when an OS timer is to be used as a reference timer for generating interrupt requests at a fixed interval.

#### 11.3.5.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMnTINT interrupt request is generated when the counter reaches 0000 $0000_H$.

Select interval timer mode by setting OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next 0000 $0000_H$ is reached.

#### Cycles of OSTMnTINT output

The cycle of OSTMnTINT output is as follows.

- OSTMnTINT generation cycle = counter-clock cycle × (OSTMnCMP + 1)

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

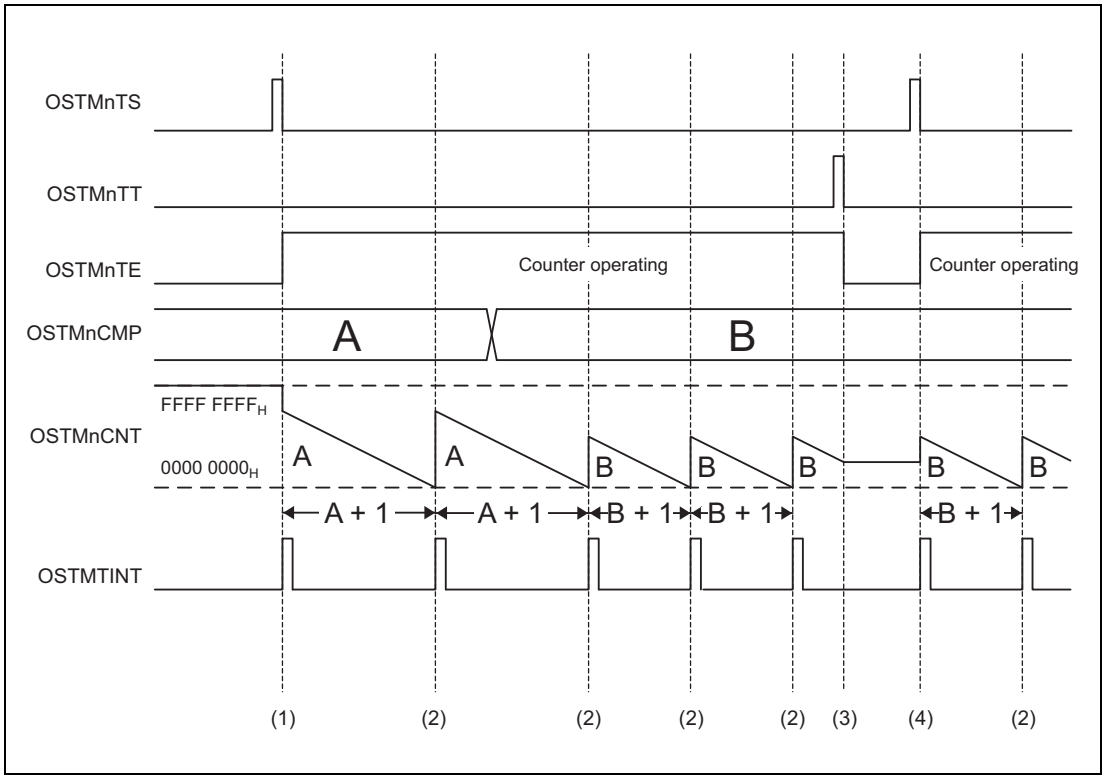

**Figure 11.3 Timing Diagram of OSTM in Interval Timer Mode**

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register contains the current value as the counter.

(2) When the counter reaches 0000 0000$_H$, an OSTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

### Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.

The counter loads the start value from the OSTMnCMP register and continues to count down.

The following figure shows the forced restart of the OS Timer in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

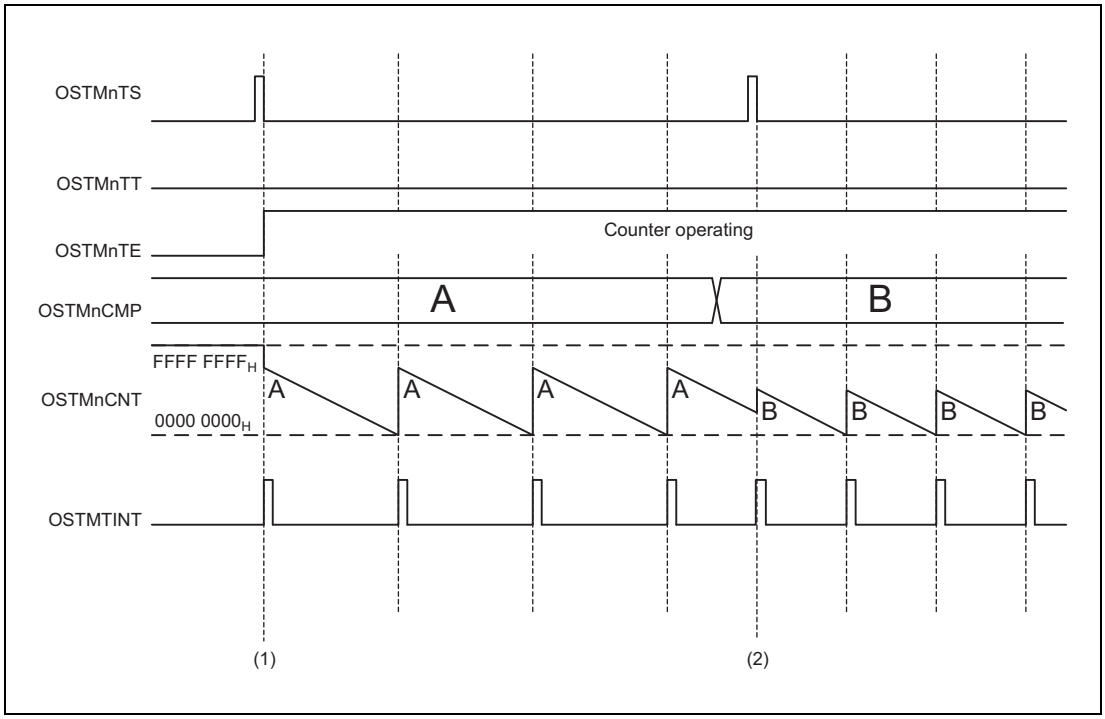

**Figure 11.4 Timing Diagram of Forced Restart in Interval Timer Mode**

Operations shown in the above timing diagram are as follows.

(1) The counter is started and stopped as described under Figure 11.3, Timing Diagram of OSTM in Interval Timer Mode.

(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP. When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated when counting starts.

### 11.3.5.2 Operation when OSTMnCMP = 0000 0000$_H$

When OSTMnCMP = 0000 0000$_H$, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1.

The following figure shows operations of OSTM when OSTMnCMP = 0000 0000$_H$, and counter-start interrupts are enabled.

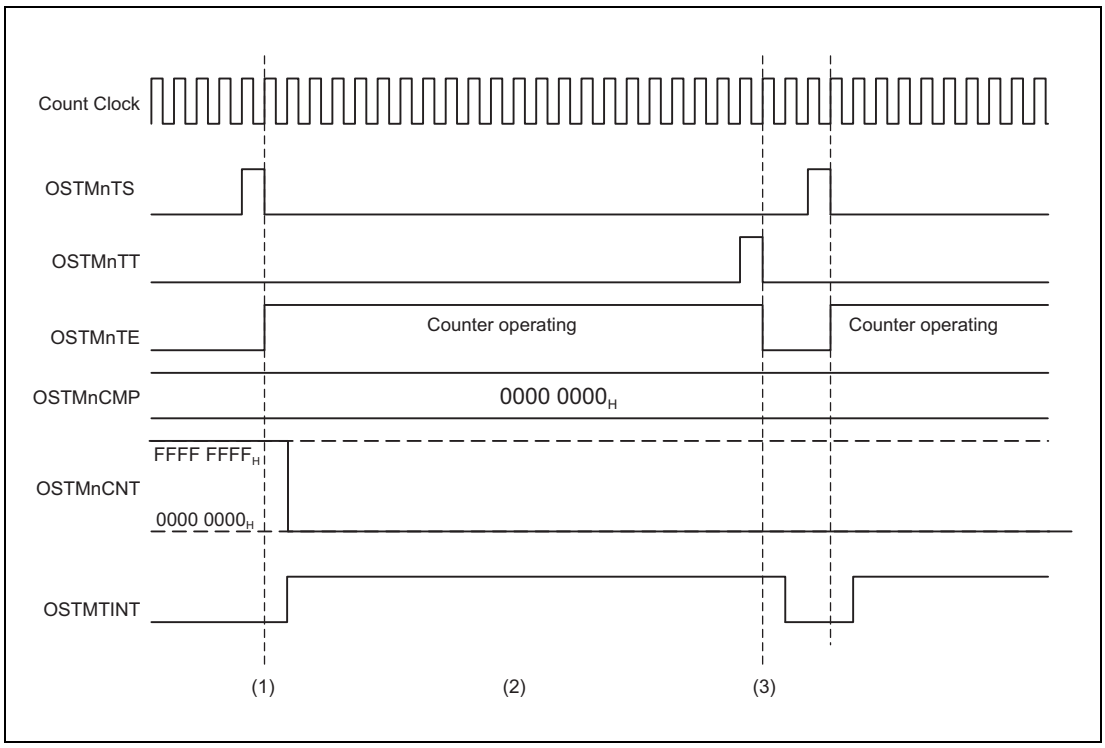

**Figure 11.5 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Interval Timer Mode**

The timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value 0000 0000$_H$ is retained in OSTMnCMP.

(2) The OSTMTINT interrupt request is continuously asserted.

(3) After the counter stops, the OSTMTINT interrupt request signal is deasserted.

(4) When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

## 11.3.6 Free-Running Comparison Mode

### 11.3.6.1 Basic Operation in Free-Running Comparison Mode

In free-running comparison mode, the counter counts up from 0000 $0000_H$ to FFFF $FFFF_H$. An OSTMnTINT interrupt request is output when the current value of the counter matches the value of the OSTMnCMP register. The free-running comparison mode is selected by setting the OSTMnCTL.OSTMnMD1 bit to 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

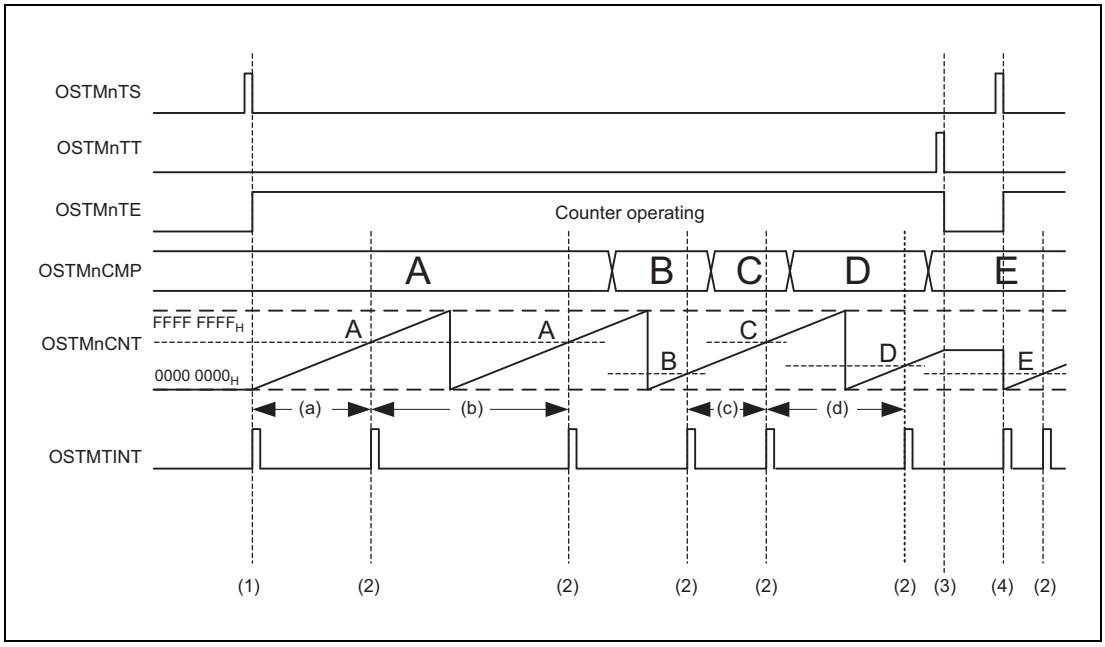

**Figure 11.6 Timing Diagram of OSTM in Free-Run Compare Mode**

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1.
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from 0000 $0000_H$ to FFFF $FFFF_H$. The OSTMnCNT register is the counter, so it contains the current value.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated at the start of counting.

(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from 0000 $0000_H$ when OSTMnTS.OSTMnTS = 1.

### OSTMTINT period

The OSTMTINT generation period is different at the start of counting and depends on the old and new compare values if OSTMnCMP is rewritten during operation.

**Table 11.11 OSTMTINT Generation Timing**

| Old Value for Comparison | New Value for Comparison | Counter Value at Time of Rewriting | Period of OSTMTINT Generation | Label in Timing Diagram |
|---|---|---|---|---|
| Counter starts | | | (A + 1) × counter clock period | (a) |
| A | A | No rewriting | (FFFF FFFF$_H$ + 1) × counter clock period | (b) |
| B | C > B | B < counter value < C | (C – B) × counter clock period | (c) |
| C | D < C | Counter value > D,C | (FFFF FFFF$_H$ – C + D + 1) × counter clock period | (d) |

### Forced restart

Forced restarting does not proceed during counting even if the OSTMnTS.OSTMnTS bit is set.

The counter ignores the attempted setting and continues counting.

## 11.3.6.2 Operation when OSTMnCMP = 0000 0000$_H$

The following figure shows the operation of OSTM when OSTMnCMP = 0000 0000$_H$, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

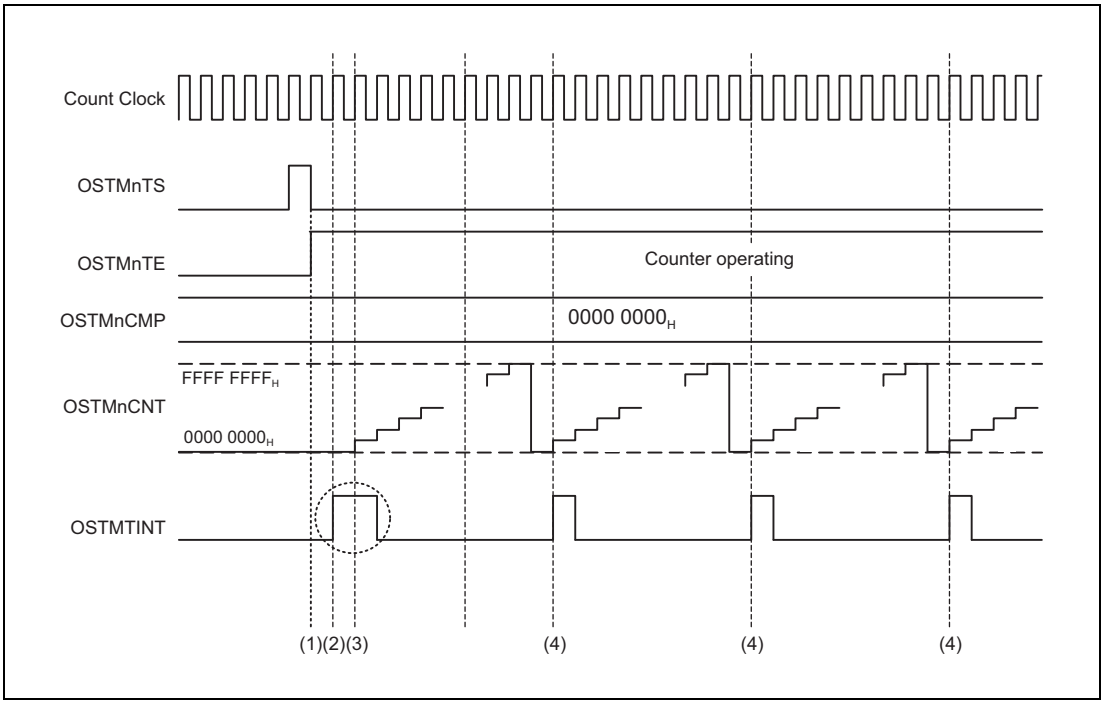

**Figure 11.7 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Free-Run Compare Mode**

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from 0000 0000$_H$ to FFFF FFFF$_H$.

(2) An OSTMTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated. If OSTMnCMP = 0000 0000$_H$ in the above case, OSTMTINT is generated over two clock cycles.

(4) Every (FFFF FFFF$_H$ + 1) clock cycles the OSTMTINT interrupt request is asserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

# 12. Watchdog Timer

This LSI includes the watchdog timer, which externally outputs an overflow signal ($\overline{\text{WDTOVF}}$) on overflow of the counter when the value of the counter has not been updated because of a system malfunction. This module can simultaneously generate an internal reset signal for the entire LSI.
This module is a single channel timer that counts up the clock oscillation settling period when the system leaves software standby mode. It can also be used as a general watchdog timer or interval timer.

## 12.1 Features

- Can be used to ensure the clock oscillation settling time
  This module is used in leaving software standby mode.
- Can switch between watchdog timer mode and interval timer mode.
- Outputs $\overline{\text{WDTOVF}}$ signal in watchdog timer mode
  When the counter overflows in watchdog timer mode, the $\overline{\text{WDTOVF}}$ signal is output externally. It is possible to select whether to reset the LSI internally when this happens. The internal reset signal is used as the power-on reset signal.
- Interrupt generation in interval timer mode
  An interval timer interrupt is generated when the counter overflows.
- Choice of eight counter input clocks
  Eight clocks (P0ϕ × 1 to P0ϕ × 1/16384) that are obtained by dividing the peripheral clock can be selected.

Figure 12.1 shows a block diagram.

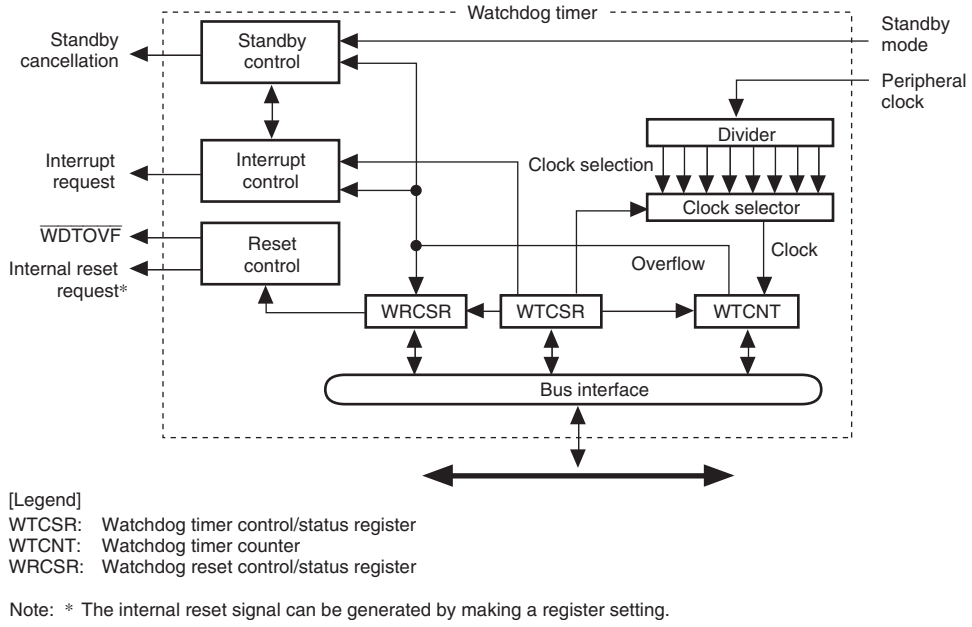

**Figure 12.1 Block Diagram**

## 12.2 Input/Output Pin

Table 12.1 shows the pin configuration.

**Table 12.1 Pin Configuration**

| Pin Name | Symbol | I/O | Function |
|---|---|---|---|
| Watchdog timer overflow | $\overline{\text{WDTOVF}}$ | Output | Outputs the counter overflow signal in watchdog timer mode |

## 12.3 Register Descriptions

Table 12.2 shows the register configuration.

**Table 12.2 Register Configuration**

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| Watchdog timer counter | WTCNT | R/W | H'00 | H'FCFE0002 | 16* |
| Watchdog timer control/status register | WTCSR | R/W | H'18 | H'FCFE0000 | 16* |
| Watchdog reset control/status register | WRCSR | R/W | H'1F | H'FCFE0004 | 16* |

Note: * For the access size, see section 12.3.4, Notes on Register Access.

### 12.3.1 Watchdog Timer Counter (WTCNT)

WTCNT is an 8-bit readable/writable register that is incremented by cycles of the selected clock signal. When an overflow occurs, it generates a watchdog timer overflow signal ($\overline{\text{WDTOVF}}$) in watchdog timer mode and an interrupt in interval timer mode.

Use 16-bit access to write to WTCNT, writing H'5A in the upper byte. Use 8-bit access to read from WTCNT.

Note: The method for writing to WTCNT differs from that for other registers to prevent erroneous writes. See section 12.3.4, Notes on Register Access for details.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### 12.3.2 Watchdog Timer Control/Status Register (WTCSR)

WTCSR is an 8-bit readable/writable register composed of bits to select the clock used for the count, overflow flags, and timer enable bit.

When used to count the clock oscillation settling time for canceling software standby mode, it retains its value after counter overflow.

Use 16-bit access to write to WTCSR, writing H'A5 in the upper byte. Use 8-bit access to read from WTCSR.

Note: The method for writing to WTCSR differs from that for other registers to prevent erroneous writes. See section 12.3.4, Notes on Register Access for details.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IOVF | WT/$\overline{\text{IT}}$ | TME | - | - | CKS[2:0] | | |
| Initial value: | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |
| R/W: | R/(W) | R/W | R/W | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | IOVF | 0 | R/(W) | Interval Timer Overflow<br>Indicates that WTCNT has overflowed in interval timer mode. This flag is not set in watchdog timer mode.<br>0: No overflow<br>1: WTCNT overflow in interval timer mode<br>[Clearing condition]<br>• When 0 is written to IOVF after reading IOVF |
| 6 | WT/$\overline{\text{IT}}$ | 0 | R/W | Timer Mode Select<br>Selects whether to use this module as a watchdog timer or an interval timer.<br>0: Use as interval timer<br>1: Use as watchdog timer<br>Note: When the WTCNT overflows in watchdog timer mode, the $\overline{\text{WDTOVF}}$ signal is output externally.<br>If this bit is modified when this module is running, the up-count may not be performed correctly. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 5 | TME | 0 | R/W | Timer Enable<br>Starts and stops timer operation. Clear this bit to 0 when using this module in software standby mode or when changing the clock frequency.<br>0: Timer disabled<br>Count-up stops and WTCNT value is retained<br>1: Timer enabled |
| 4,3 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. |
| 2 to 0 | CKS[2:0] | 000 | R/W | Clock Select<br>These bits select the clock to be used for the WTCNT count from the eight types obtainable by dividing the peripheral clock (P0ϕ). The overflow period that is shown inside the parenthesis in the table is the value when the peripheral clock (P0ϕ) is 33.33 MHz. |

| Bits 2 to 0 | Clock Ratio | Overflow Cycle |
|---|---|---|
| 000: | 1 x P0ϕ | 7.7 μs |
| 001: | 1/64 x P0ϕ | 490 μs |
| 010: | 1/128 x P0ϕ | 979 μs |
| 011: | 1/256 x P0ϕ | 2.0 ms |
| 100: | 1/512 x P0ϕ | 3.9 ms |
| 101: | 1/1024 x P0ϕ | 7.8 ms |
| 110: | 1/4096 x P0ϕ | 31 ms |
| 111: | 1/16384 x P0ϕ | 125 ms |

Note: If bits CKS[2:0] are modified when this module is running, the up-count may not be performed correctly. Ensure that these bits are modified only when this module is not running.

### 12.3.3 Watchdog Reset Control/Status Register (WRCSR)

WRCSR is an 8-bit readable/writable register that controls output of the internal reset signal generated by watchdog timer counter (WTCNT) overflow.

Note: The method for writing to WRCSR differs from that for other registers to prevent erroneous writes. See section 12.3.4, Notes on Register Access for details.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WOVF | RSTE | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/(W) | R/W | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | WOVF | 0 | R/(W) | Watchdog Timer Overflow<br>Indicates that the WTCNT has overflowed in watchdog timer mode. This bit is not set in interval timer mode.<br>0: No overflow<br>1: WTCNT has overflowed in watchdog timer mode<br>[Clearing condition]<br>• When 0 is written to WOVF after reading WOVF |
| 6 | RSTE | 0 | R/W | Reset Enable<br>Selects whether to generate a signal to reset the LSI internally if WTCNT overflows in watchdog timer mode. In interval timer mode, this setting is ignored.<br>0: Not reset when WTCNT overflows*<br>1: Reset when WTCNT overflows<br>Note: * LSI not reset internally, but WTCNT and WTCSR reset within this module. |
| 5 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 4 to 0 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. |

### 12.3.4 Notes on Register Access

The watchdog timer counter (WTCNT), watchdog timer control/status register (WTCSR), and watchdog reset control/status register (WRCSR) are more difficult to write to than other registers. The procedures for reading or writing to these registers are given below.

#### (1) Writing to WTCNT and WTCSR

These registers must be written by a 16-bit transfer instruction. They cannot be written by an 8- or 32-bit transfer instruction.

When writing to WTCNT, set the upper byte to H'5A and transfer the lower byte as the write data, as shown in Figure 12.2. When writing to WTCSR, set the upper byte to H'A5 and transfer the lower byte as the write data. This transfer procedure writes the lower byte data to WTCNT or WTCSR.

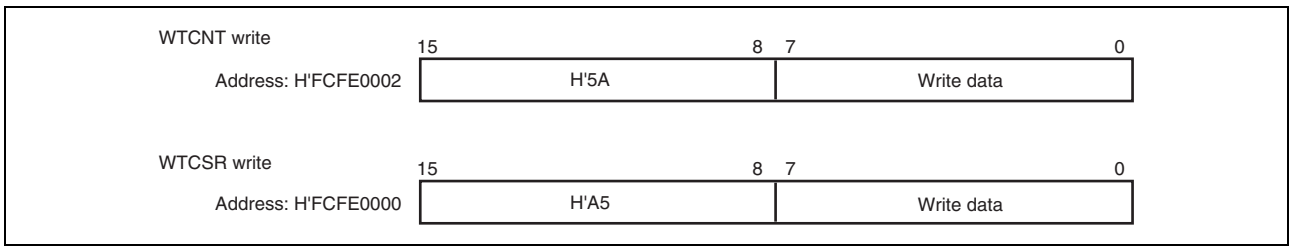

**Figure 12.2 Writing to WTCNT and WTCSR**

#### (2) Writing to WRCSR

WRCSR must be written by a 16-bit access to address H'FCFE0004. It cannot be written by 8- or 32-bit transfer instructions.

Procedures for writing 0 to WOVF (bit 7) and for writing to RSTE (bit 6) are different, as shown in Figure 12.3.

To write 0 to the WOVF bit, the write data must be H'A5 in the upper byte and H'00 in the lower byte. This clears the WOVF bit to 0. The RSTE bit is not affected. To write to the RSTE bit, the upper byte must be H'5A and the lower byte must be the write data. The value of bit 6 of the lower byte is transferred to the RSTE bit. The WOVF bit is not affected.

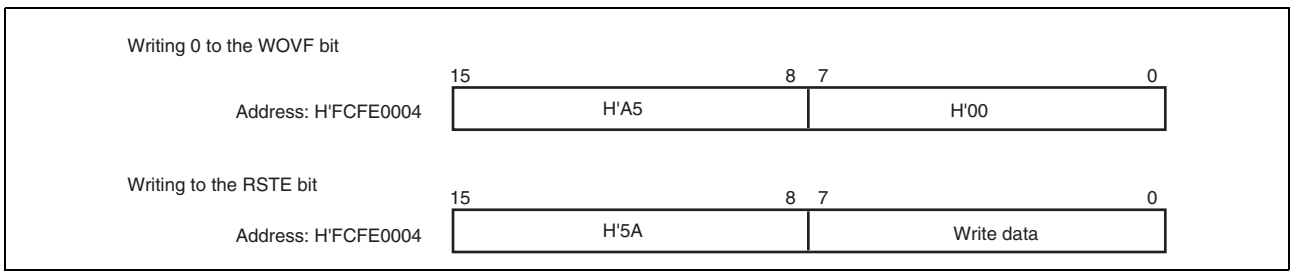

**Figure 12.3 Writing to WRCSR**

### (3) Reading from WTCNT, WTCSR, and WRCSR

WTCNT, WTCSR, and WRCSR are read in a method similar to other registers. WTCSR is allocated to address H'FCFE0000, WTCNT to address H'FCFE0002, and WRCSR to address H'FCFE0004. Eight-bit transfer instructions must be used for reading from these registers.

## 12.4 Usage

### 12.4.1 Canceling Software Standby Mode

This module can be used to cancel software standby mode with an interrupt such as an NMI interrupt. The procedure is described below. (This module does not operate when resets are used for canceling, so keep the $\overline{\text{RES}}$ pin low until clock oscillation settles.)

1. Before making a transition to software standby mode, always clear the TME bit in WTCSR to 0. When the TME bit is 1, an erroneous reset or interval timer interrupt may be generated when the count overflows.
2. Set the type of count clock used in the CKS[2:0] bits in WTCSR and the initial value of the counter in WTCNT. These values should ensure that the time till count overflow is equal to or longer than the clock oscillation settling time*1.
3. After setting the STBY and DEEP bits of the standby control register 1 (STBCR1: see section 55, Power-Down Modes) to 1 and 0 respectively, the execution of a WFI instruction puts the system in software standby mode and clock operation then stops.
4. This module starts counting by detecting the edge change of the NMI signal.
5. When the module count overflows, the clock pulse generator starts supplying the clock and this LSI resumes operation. The WOVF flag in WRCSR is not set when this happens.

Note 1. If the RCKSEL bit of RCR5 is selecting EXTAL when clock mode 0 is selected, EXTAL continues oscillating even during software standby mode. Therefore, set a value greater than or equal to the on-chip PLL circuit oscillation settling time ($t_{POSC}$).
If the RCKSEL bit of RCR5 is not selecting EXTAL, EXTAL stops oscillating during software standby mode. Therefore, set a value greater than or equal to the sum of the on-chip oscillation circuit oscillation setting time ($t_{ROSC}$) of EXTAL and the on-chip PLL circuit oscillation setting time ($t_{POSC}$).
When clock mode 1 is selected, USB_X1 stops oscillating. Therefore, set a value greater than or equal to the sum of the on-chip oscillation circuit oscillation setting time ($t_{ROSC}$) of USB_X1 and the on-chip PLL circuit oscillation setting time ($t_{POSC}$).
Since the oscillation settling time does not include the oscillation start time, it does not coincide with the activation start time. The watchdog timer counter (WTCNT) starts counting after EXTAL or USB_X1 oscillation has started in response to the request for release from software standby mode.

### 12.4.2 Using Watchdog Timer Mode

1. Set the WT/$\overline{\text{IT}}$ bit in WTCSR to 1, the type of count clock in the CKS[2:0] bits in WTCSR, whether this LSI is to be reset internally or not in the RSTE bit in WRCSR and the initial value of the counter in WTCNT.
2. Set the TME bit in WTCSR to 1 to start the count in watchdog timer mode.
3. While operating in watchdog timer mode, rewrite the counter periodically to H'00 to prevent the counter from overflowing.
4. When the counter overflows, this module sets the WOVF flag in WRCSR to 1, and the $\overline{\text{WDTOVF}}$ signal is output externally (Figure 12.4). The $\overline{\text{WDTOVF}}$ signal can be used to reset the system. The $\overline{\text{WDTOVF}}$ signal is output for 64 × P0ϕ clock cycles.
5. If the RSTE bit in WRCSR is set to 1, a signal to reset the inside of this LSI can be generated simultaneously with the $\overline{\text{WDTOVF}}$ signal. The internal reset signal is output for 128 × P0ϕ clock cycles.
6. When an overflow reset of this module is generated simultaneously with a reset input on the $\overline{\text{RES}}$ pin, the $\overline{\text{RES}}$ pin reset takes priority, and the WOVF bit in WRCSR is cleared to 0.

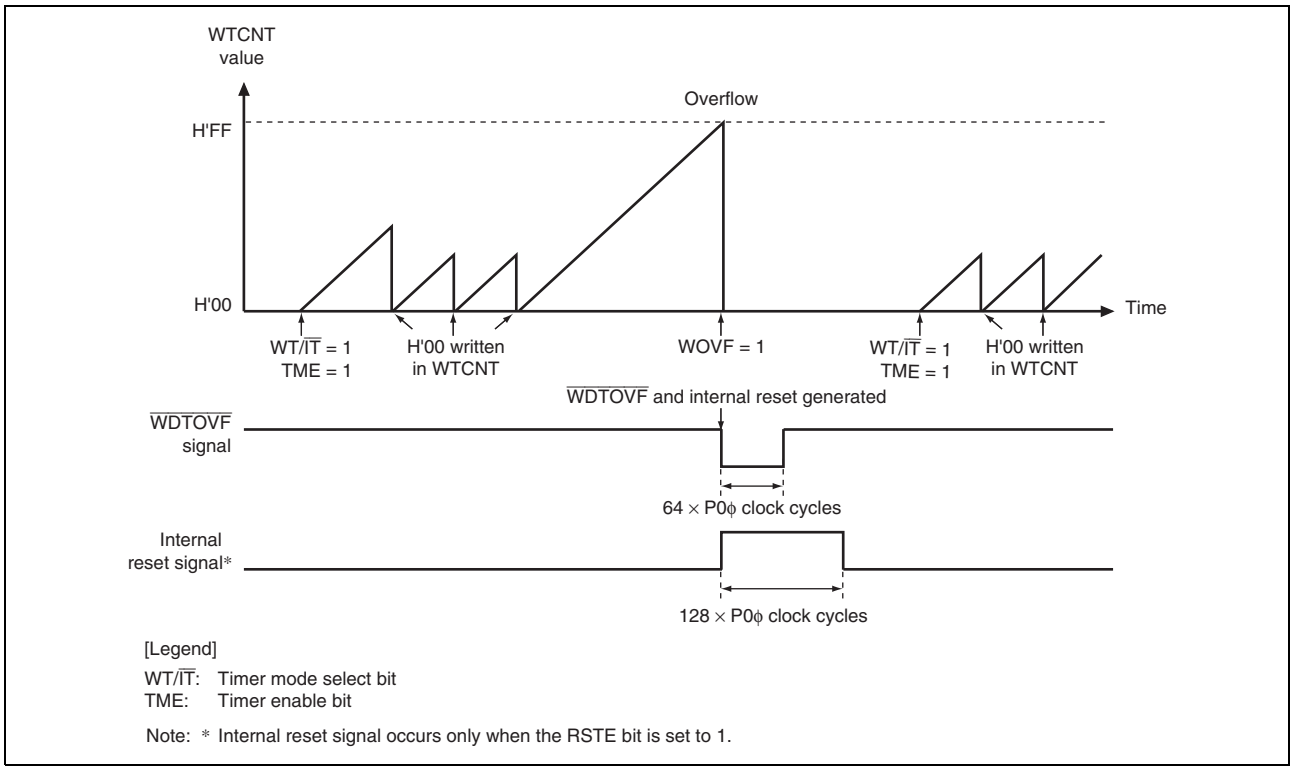

**Figure 12.4 Operation in Watchdog Timer Mode**

## 12.4.3 Using Interval Timer Mode

When operating in interval timer mode, interval timer interrupts are generated at every overflow of the counter. This enables interrupts to be generated at set periods.

1. Clear the WT/$\overline{IT}$ bit in WTCSR to 0, set the type of count clock in the CKS[2:0] bits in WTCSR, and set the initial value of the counter in WTCNT.
2. Set the TME bit in WTCSR to 1 to start the count in interval timer mode.
3. When the counter overflows, this module sets the IOVF bit in WTCSR to 1 and an interval timer interrupt request is sent to the interrupt controller. The counter then resumes counting.

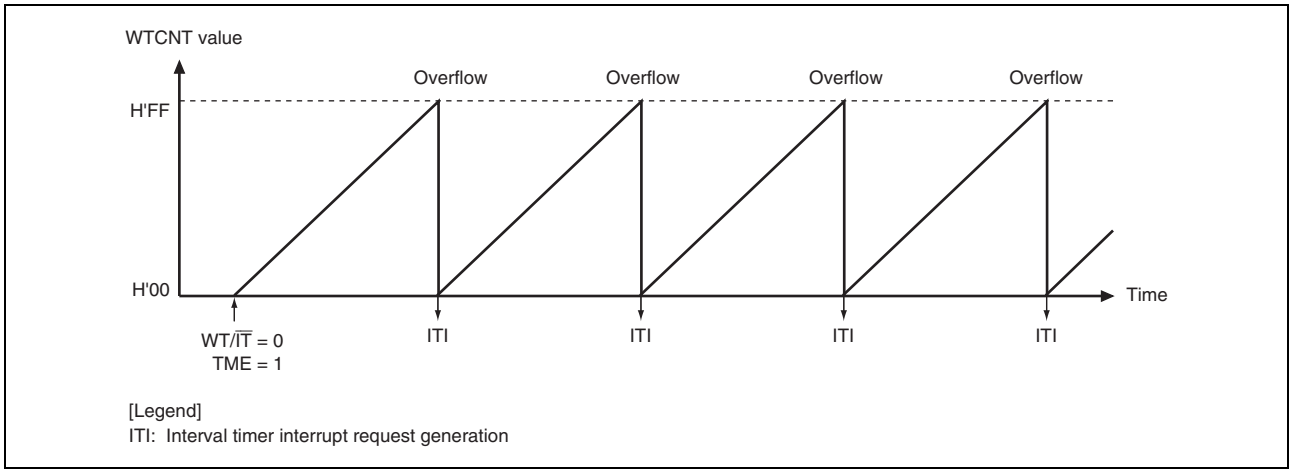

**Figure 12.5 Operation in Interval Timer Mode**

## 12.5 Usage Notes

Pay attention to the following points when using this module in either the interval timer or watchdog timer mode.

### 12.5.1 Timer Variation

After timer operation has started, the period from the power-on reset point to the first count up timing of WTCNT varies depending on the time period that is set by the TME bit of WTCSR. The shortest such time period is thus one cycle of the peripheral clock, P0ϕ, while the longest is the result of frequency division according to the value in the CKS[2:0] bits. The timing of subsequent incrementation is in accord with the selected frequency division ratio. Accordingly, this time difference is referred to as timer variation.

This also applies to the timing of the first incrementation after WTCNT has been written to during timer operation.

### 12.5.2 Prohibition against Setting H'FF to WTCNT

When the value in WTCNT reaches H'FF, this module assumes that an overflow has occurred. Accordingly, when H'FF is set in WTCNT, an interval timer interrupt or reset will occur immediately, regardless of the current clock selection by the CKS[2:0] bits.

### 12.5.3 Interval Timer Overflow Flag

When the value in WTCNT is H'FF, the IOVF flag in WTCSR cannot be cleared.

Only clear the IOVF flag when the value in WTCNT has either become H'00 or been changed to a value other than H'FF.

### 12.5.4 System Reset by $\overline{\text{WDTOVF}}$ Signal

If the $\overline{\text{WDTOVF}}$ signal is input to the $\overline{\text{RES}}$ pin of this LSI, this LSI cannot be initialized correctly.

Avoid input of the $\overline{\text{WDTOVF}}$ signal to the $\overline{\text{RES}}$ pin of this LSI through glue logic circuits. To reset the entire system with the $\overline{\text{WDTOVF}}$ signal, use the circuit shown in Figure 12.6.

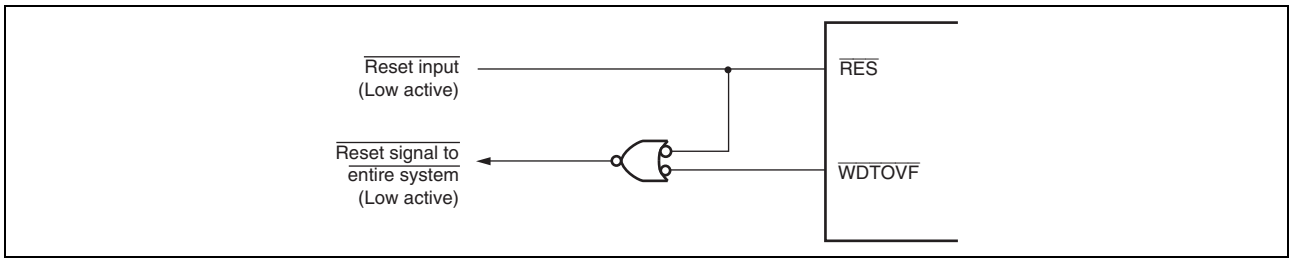

**Figure 12.6 Example of System Reset Circuit Using $\overline{\text{WDTOVF}}$ Signal**

### 12.5.5 Internal Reset in Watchdog Timer Mode

When an internal reset is generated due to an overflow of the watchdog timer counter (WTCNT) in watchdog timer mode, the watchdog reset control/status register (WRCSR) is not initialized, so the WOVF bit retains the value 1. As long as the WOVF bit is 1, an internal reset will not be generated even if the WTCNT overflows again.

# 13. Realtime Clock

This LSI has a realtime clock and 32.768-kHz and 4-MHz crystal oscillators.

## 13.1 Features

- Clock and calendar functions (BCD format): Seconds, minutes, hours, day of the week, day, month, and year.
- 1-Hz to 64-Hz timer (binary format)
  64-Hz counter indicates the state of the divider circuit between 64 Hz and 1 Hz
- Start/stop function
- 30-second adjust function
- Alarm interrupt: Comparison with seconds, minutes, hours, day of the week, day, month, or year can be selected as a condition for the alarm interrupt
- Periodic interrupt: the interrupt cycle may be 1/64 second, 1/16 second, 1/4 second, 1/2 second, 1 second, or 2 seconds
- Carry interrupt: a carry interrupt indicates that a second counter carry is generated or a 64-Hz counter carry is generated reading the 64-Hz counter
- Automatic leap year adjustment
- The external clock signal input for internal operation or the external clock signal input dedicated to the clock operation can be selected as the operating clock signal for the clock function.
- Recovery from deep standby mode can be performed by an alarm interrupt.

Figure 13.1 shows the block diagram.

## 13.2 Input/Output Pin

Table 13.1 shows the pin configuration.

**Table 13.1 Pin Configuration**

| Pin Name | Symbol | I/O | Description |
|---|---|---|---|
| Realtime clock crystal resonator pin/external clock | RTC_X1 | Input | Connects a 32.768-kHz crystal resonator for this module. External clock can be input to the RTC_X1 pin. |
| | RTC_X2 | Output | |
| | RTC_X3 | Input | Connects a 4-MHz crystal resonator for this module. External clock can be input to the RTC_X3 pin. |
| | RTC_X4 | Output | |
| Internal clock crystal resonator/external clock | EXTAL | Input | Connects crystal resonator used for internal operation. For details, see section 6, Clock Pulse Generator. |
| | XTAL | Output | |

## 13.3 Register Descriptions

Table 13.2 shows the register configuration.

**Table 13.2 Register Configuration**

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| 64-Hz counter | R64CNT | R | H'xx | H'FCFF1000 | 8 |
| Second counter | RSECCNT | R/W | H'xx | H'FCFF1002 | 8 |

### 13.3.1 64-Hz Counter (R64CNT)

R64CNT indicates the state of the divider circuit between 64 Hz and 1 Hz.

Reading this register, when carry from 128-Hz divider stage is generated, sets the CF bit in the control register 1 (RCR1) to 1, which indicates that the carrying and reading the 64-Hz counter are performed at the same time. In this case, the R64CNT should be read again after writing 0 to the CF bit in RCR1 since the read value is not valid.

Setting the RESET or ADJ bit in the control register 2 (RCR2) to 1 initializes the divider circuit and the R64CNT.

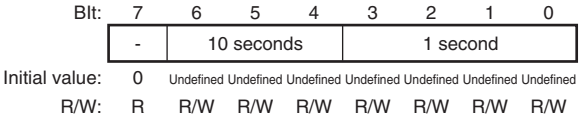
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | 1Hz | 2Hz | 4Hz | 8Hz | 16Hz | 32Hz | 64Hz |
| Initial value: | 0 | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined |
| R/W: | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 6 | 1 Hz | Undefined | R | Indicate the state of the divider circuit between 64 Hz and 1 Hz. |
| 5 | 2 Hz | Undefined | R | |
| 4 | 4 Hz | Undefined | R | |
| 3 | 8 Hz | Undefined | R | |
| 2 | 16 Hz | Undefined | R | |
| 1 | 32 Hz | Undefined | R | |
| 0 | 64 Hz | Undefined | R | |

### 13.3.2 Second Counter (RSECCNT)

RSECCNT is the counter used for setting/counting the BCD-coded second value. The count operation is performed by a carry for each second of the 64-Hz counter.

The assignable range is from 00 through 59 (practically in BCD); otherwise an operation error will occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

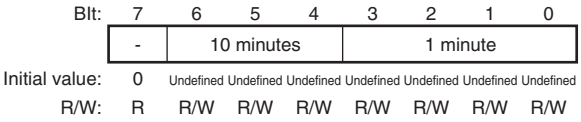


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 6 to 4 | 10 seconds | Undefined | R/W | Counting Ten's Position of Seconds<br>Counts from 0 to 5 for 60-seconds counting. |
| 3 to 0 | 1 second | Undefined | R/W | Counting One's Position of Seconds<br>Counts from 0 to 9, one number per second. When a carry is generated, 1 is added to the ten's position. |

### 13.3.3 Minute Counter (RMINCNT)

RMINCNT is the counter used for setting/counting the BCD-coded minute value. The count operation is performed by a carry for each minute of the second counter.

The assignable range is from 00 through 59 (practically in BCD); otherwise an operation error will occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | — | 0 | R | Reserved<br>This bit is always read as 0.The write value should always be 0. |
| 6 to 4 | 10 minutes | Undefined | R/W | Counting Ten's Position of Minutes<br>Counts from 0 to 5 for 60-minutes counting. |
| 3 to 0 | 1 minute | Undefined | R/W | Counting One's Position of Minutes<br>Counts from 0 to 9, one number per minute. When a carry is generated, 1 is added to the ten's position. |

### 13.3.4 Hour Counter (RHRCNT)

RHRCNT is the counter used for setting/counting the BCD-coded hour value. The count operation is performed by a carry for each 1 hour of the minute counter.

The assignable range is from 00 through 23 (practically in BCD); otherwise an operation error will occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | 10 hours | | 1 hour | | | |
| Initial value: | 0 | 0 | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7, 6 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 5, 4 | 10 hours | Undefined | R/W | Counting Ten's Position of Hours<br>Counts from 0 to 2 for ten's position of hours. |
| 3 to 0 | 1 hour | Undefined | R/W | Counting One's Position of Hours<br>Counts from 0 to 9, one number per hour. When a carry is generated, 1 is added to the ten's position. |

### 13.3.5 Day of Week Counter (RWKCNT)

RWKCNT is the counter used for setting/counting the BCD-coded day-of-week value. The count operation is performed by a carry for each day of the hour counter.

The assignable range is from 0 through 6 (practically in BCD); otherwise an operation error will occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | Day | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | Undefined | Undefined | Undefined |
| R/W: | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | Day | Undefined | R/W | Day-of-Week Counting<br>Day-of-week is indicated with a binary code.<br>000: Sunday<br>001: Monday<br>010: Tuesday<br>011: Wednesday<br>100: Thursday<br>101: Friday<br>110: Saturday<br>111: Reserved (setting prohibited) |

### 13.3.6 Day Counter (RDAYCNT)

RDAYCNT is the counter used for setting/counting the BCD-coded day value. The count operation is performed by a carry for each day of the hour counter.

The assignable range is from 01 through 31 (practically in BCD); otherwise an operation error will occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

The assignable range changes depending on the month and in leap years. Confirm the correct setting. A leap year is determined by checking if the year counter (RYRCNT) value is divisible by 400, 100, and 4.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | 10 days | | 1 day | | | |
| Initial value: | 0 | 0 | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7, 6 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 5, 4 | 10 days | Undefined | R/W | Counting Ten's Position of Days |
| 3 to 0 | 1 day | Undefined | R/W | Counting One's Position of Days<br>Counts from 0 to 9, one number per day. When a carry is generated, 1 is added to the ten's position. |

### 13.3.7 Month Counter (RMONCNT)

RMONCNT is the counter used for setting/counting the BCD-coded month value. The count operation is performed by a carry for each month of the date counter.

The assignable range is from 01 through 12 (practically in BCD); otherwise an operation error will occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

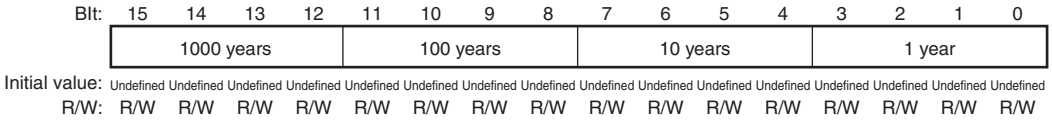
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | 10 months | 1 month | | | |
| Initial value: | 0 | 0 | 0 | Undefined | Undefined | Undefined | Undefined | Undefined |
| R/W: | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 5 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 4 | 10 months | Undefined | R/W | Counting Ten's Position of Months |
| 3 to 0 | 1 month | Undefined | R/W | Counting One's Position of Months<br>Counts from 0 to 9, one number per month. When a carry is generated, 1 is added to the ten's position. |

### 13.3.8 Year Counter (RYRCNT)

RYRCNT is the counter used for setting/counting the BCD-coded year value. The count operation is performed by a carry for each year of the month counter.

The assignable range is from 0000 through 9999 (practically in BCD); otherwise an operation error will occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

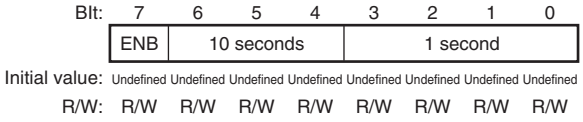


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 12 | 1000 years | Undefined | R/W | Counting Thousand's Position of Years |
| 11 to 8 | 100 years | Undefined | R/W | Counting Hundred's Position of Years |
| 7 to 4 | 10 years | Undefined | R/W | Counting Ten's Position of Years |
| 3 to 0 | 1 year | Undefined | R/W | Counting One's Position of Years |

### 13.3.9 Second Alarm Register (RSECAR)

RSECAR is an alarm register corresponding to the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, a comparison with the RSECCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 00 through 59 + ENB bits (practically in BCD); otherwise an operation error will occur.

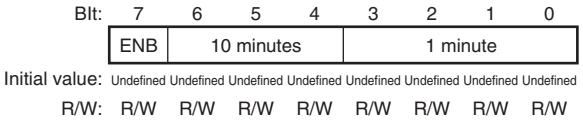


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | ENB | Undefined | R/W | When this bit is set to 1, a comparison with the RSECCNT value is performed. |
| 6 to 4 | 10 seconds | Undefined | R/W | Ten's position of seconds setting value |
| 3 to 0 | 1 second | Undefined | R/W | One's position of seconds setting value |

### 13.3.10 Minute Alarm Register (RMINAR)

RMINAR is an alarm register corresponding to the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, a comparison with the RMINCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 00 through 59 + ENB bits (practically in BCD); otherwise an operation error will occur.

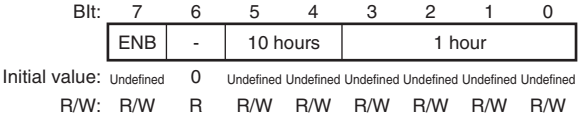


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | ENB | Undefined | R/W | When this bit is set to 1, a comparison with the RMINCNT value is performed. |
| 6 to 4 | 10 minutes | Undefined | R/W | Ten's position of minutes setting value |
| 3 to 0 | 1 minute | Undefined | R/W | One's position of minutes setting value |

### 13.3.11 Hour Alarm Register (RHRAR)

RHRAR is an alarm register corresponding to the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, a comparison with the RHRCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 00 through 23 + ENB bits (practically in BCD); otherwise an operation error will occur.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | ENB | Undefined | R/W | When this bit is set to 1, a comparison with the RHRCNT value is performed. |
| 6 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 5, 4 | 10 hours | Undefined | R/W | Ten's position of hours setting value |
| 3 to 0 | 1 hour | Undefined | R/W | One's position of hours setting value |

### 13.3.12 Day of Week Alarm Register (RWKAR)

RWKAR is an alarm register corresponding to the BCD-coded day of week counter RWKCNT. When the ENB bit is set to 1, a comparison with the RWKCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 0 through 6 + ENB bits (practically in BCD); otherwise an operation error will occur.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ENB | - | - | - | - | Day | | |
| Initial value: | Undefined | 0 | 0 | 0 | 0 | Undefined | Undefined | Undefined |
| R/W: | R/W | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | ENB | Undefined | R/W | When this bit is set to 1, a comparison with the RWKCNT value is performed. |
| 6 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | Day | Undefined | R/W | Day of Week Setting Value<br>000: Sunday<br>001: Monday<br>010: Tuesday<br>011: Wednesday<br>100: Thursday<br>101: Friday<br>110: Saturday<br>111: Reserved (setting prohibited) |

### 13.3.13 Day Alarm Register (RDAYAR)

RDAYAR is an alarm register corresponding to the BCD-coded day counter RDAYCNT. When the ENB bit is set to 1, a comparison with the RDAYCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 01 through 31 + ENB bits (practically in BCD); otherwise an operation error will occur.

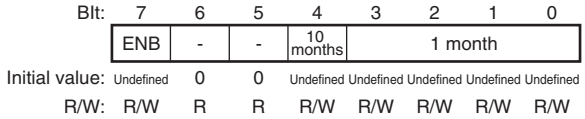
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ENB | - | 10 days | | 1 day | | | |
| Initial value: | Undefined | 0 | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined |
| R/W: | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | ENB | Undefined | R/W | When this bit is set to 1, a comparison with the RDAYCNT value is performed. |
| 6 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 5, 4 | 10 days | Undefined | R/W | Ten's position of days setting value |
| 3 to 0 | 1 day | Undefined | R/W | One's position of days setting value |

### 13.3.14 Month Alarm Register (RMONAR)

RMONAR is an alarm register corresponding to the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, a comparison with the RMONCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

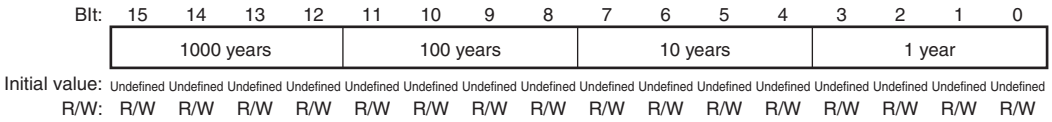
The assignable range is from 01 through 12 + ENB bits (practically in BCD); otherwise an operation error will occur.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | ENB | Undefined | R/W | When this bit is set to 1, a comparison with the RMONCNT value is performed. |
| 6, 5 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 4 | 10 months | Undefined | R/W | Ten's position of months setting value |
| 3 to 0 | 1 month | Undefined | R/W | One's position of months setting valu |

### 13.3.15 Year Alarm Register (RYRAR)

RYRAR is an alarm register corresponding to the BCD-coded year counter RYRCNT. The assignable range is from 0000 through 9999 (practically in BCD); otherwise an operation error will occur.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 12 | 1000 years | Undefined | R/W | Thousand's position of years setting value |
| 11 to 8 | 100 years | Undefined | R/W | Hundred's position of years setting value |
| 7 to 4 | 10 years | Undefined | R/W | Ten's position of years setting value |
| 3 to 0 | 1 year | Undefined | R/W | One's position of years setting value |

### 13.3.16 Control Register 1 (RCR1)

RCR1 is a register that affects carry flags and alarm flags. It also selects whether to generate interrupts for each flag. The CF flag remains undefined until the divider circuit is reset (the RESET and ADJ bits in RCR2 are set to 1). When using the CF flag, make sure to reset the divider circuit beforehand.

The AF flag remains undefined until the value is set to an alarm register and a counter. When using the AF flag, make sure to set the alarm register and counter beforehand.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | CF | - | - | CIE | AIE | - | - | AF |
| Initial value: | Undefined | 0 | 0 | 0 | 0 | 0 | 0 | Undefined |
| R/W: | R/W | R | R | R/W | R/W | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | CF | Undefined | R/W | Carry Flag<br>Status flag that indicates that a carry has occurred. CF is set to 1 when a second counter carry is generated or a 64-Hz counter carry is generated while reading the 64-Hz counter A value read from the count register at this time cannot be guaranteed; another read is required.<br>0: No carry of second counter or no carry of 64-Hz counter while reading 64-Hz counter<br>[Clearing condition]<br>When 0 is written to CF<br>1: Carry of second counter or carry of 64-Hz counter while reading 64-Hz counter<br>[Setting condition]<br>When a second counter carry is generated or a 64-Hz counter carry is generated while reading the 64-Hz counter, or 1 is written to CF. |
| 6, 5 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 4 | CIE | 0 | R/W | Carry Interrupt Enable Flag<br>When the carry flag (CF) is set to 1, the CIE bit enables an interrupt.<br>0: A carry interrupt is not generated when the CF flag is set to 1<br>1: A carry interrupt is generated when the CF flag is set to 1 |
| 3 | AIE | 0 | R/W | Alarm Interrupt Enable Flag<br>When the alarm flag (AF) is set to 1, the AIE bit enables an interrupt.<br>0: An alarm interrupt is not generated when the AF flag is set to 1<br>1: An alarm interrupt is generated when the AF flag is set to 1 |
| 2, 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | AF | Undefined | R/W | Alarm Flag<br>The AF flag is set when the alarm time, which is set by the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, or RYRAR whose ENB bit is set to 1), and counters match.<br>0: Alarm registers and counters not match<br>[Clearing condition]<br>When 0 is written to AF<br>1: Alarm registers and counters match*<br>[Setting condition]<br>When alarm registers (only the registers with ENB bit set to 1) and counters match<br>Note: * Writing 1 holds previous value. |

### 13.3.17 Control Register 2 (RCR2)

RCR2 is a register for periodic interrupt control, 30-second adjustment, divider circuit RESET, and count control.

RCR2 is initialized by a power-on reset or in deep standby mode. The RTCEN bit is only initialized by a power-on reset using the $\overline{\text{RES}}$ pin.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PEF | PES[2:0] | | | RTCEN | ADJ | RESET | START |
| Initial value: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | PEF | 0 | R/W | Periodic Interrupt Flag<br>Indicates that an interrupt is generated with the period designated by the PES2 to PES0 bits. When set to 1, PEF generates periodic interrupts.<br>0: Interrupts not generated with the period designated by the bits PES2 to PES0.<br>[Clearing condition]<br>When 0 is written to PEF<br>1: Interrupts generated with the period designated by the PES2 to PES0 bits.<br>[Setting condition]<br>When an interrupt is generated with the period designated by the bits PES0 to PES2 or when 1 is written to the PEF flag |
| 6 to 4 | PES[2:0] | 000 | R/W | Interrupt Enable Flags<br>These bits specify the period of the periodic interrupt.<br>000: No periodic interrupts generated<br>001: Setting prohibited<br>010: Periodic interrupt generated every 1/64 second<br>011: Periodic interrupt generated every 1/16 second<br>100: Periodic interrupt generated every 1/4 second<br>101: Periodic interrupt generated every 1/2 second<br>110: Periodic interrupt generated every 1 second<br>111: Periodic interrupt generated every 2 seconds |
| 3 | RTCEN | 1 | R/W | RTC_X1 and RTC_X3 Clock Control<br>Controls the function of the RTC_X1 and RTC_X3 pins.<br>0: Halts the on-chip crystal oscillator/disables the external clock input.<br>1: Runs the on-chip crystal oscillator/enables the external clock input.<br>Note: The on-chip crystal oscillator selected with the RCKSEL[1:0] bits in the RCR5 register runs. This bit must not be set to 1 when the RCKSEL[1:0] bits are set to 01. |
| 2 | ADJ | 0 | R/W | 30-Second Adjustment<br>When 1 is written to the ADJ bit, times of 29 seconds or less will be rounded down to 00 seconds and 30 seconds or more up to 1 minute. The divider circuit (prescaler and R64CNT) will be simultaneously reset. The ADJ bit is automatically reset to 0; there is no need to write 0 to this bit. This bit is always read as 0.<br>0: Normal clock operation<br>1: 30-second adjustment |
| 1 | RESET | 0 | R/W | Reset<br>Writing 1 to this bit initializes the divider circuit, the R64CNT register, the alarm register, the RCR3 register, bits CF and AF in RCR1, and bit PEF in RCR2. In this case, the RESET bit is automatically reset to 0 after 1 is written to and the above registers are reset. Thus, there is no need to write 0 to this bit. This bit is always read as 0.<br>0: Normal clock operation<br>1: Divider circuit is reset. |
| 0 | START | 1 | R/W | Start<br>Halts and restarts the counter (clock).<br>0: Second, minute, hour, day, week, month, and year counters halt.<br>1: Second, minute, hour, day, week, month, and year counters run normally |

### 13.3.18 Control Register 3 (RCR3)

When the ENB bit is set to 1, RCR3 performs a comparison with the RYRCNT. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | ENB | - | - | - | - | - | - | - |
| Initial value: | Undefined | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | ENB | Undefined | R/W | When this bit is set to 1, comparison of the year alarm register (RYRAR) and the year counter (RYRCNT) is performed. |
| 6 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

### 13.3.19 Control Register 5 (RCR5)

When the RCKSEL[1:0] bits in RCR5 are set to 00, 01, and 10, the RTC_X1 clock pulses (32.768 kHz), the EXTAL clock pulses, and the RTC_X3 clock pulses are used for clock counting, respectively.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | RCKSEL[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | Undefined | Undefined |
| R/W: | R | R | R | R | R | R | R/W | R/W |

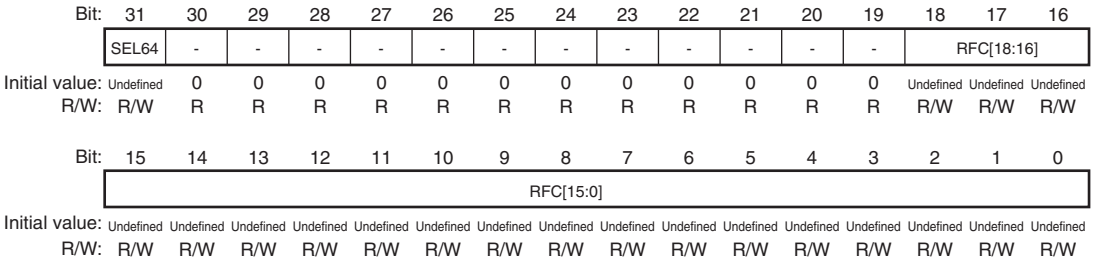
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1, 0 | RCKSEL[1:0] | Undefined | R/W | Operation clock select<br>Operation clock can be selected from RTC_X1, EXTAL, and RTC_X3.<br>The setting of these bits should not be switched during operation.<br>00: Selects RTC_X1 (32.768 kHz).<br>01: Selects EXTAL.<br>10: Selects RTC_X3.<br>11: Setting prohibited. |

## 13.3.20 Frequency Register H/L (RFRH/L)

RFRH/L is a 16-bit readable/writable register.

The "frequency comparison value" is set in RFC[18:0] so that a 128-Hz clock is generated when the realtime clock operates at the EXTAL or RTC_X3 clock frequency.

Change the "frequency comparison value" according to the EXTAL clock frequency. The calculation method is shown below. When the RCKSEL bits in RCR5 are set to 00, setting this register is not necessary.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | SEL64 | Undefined | R/W | 64-Hz Divider Select<br>Indicates the EXTAL or RTC_X3 clock frequency is not dividable by 128 Hz but is dividable by 64 Hz.<br>0: EXTAL or RTC_X3 clock frequency is dividable by 128 Hz.<br>1: EXTAL or RTC_X3 clock frequency is not dividable by 128 Hz but is dividable by 64 Hz. |
| 30 to 19 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 18 to 0 | RFC[18:0] | Undefined | R/W | Frequency comparison value<br>Sets the comparison value to generate operation clock from the EXTAL or RTC_X3 clock frequency. |

### (1) Method for calculating "frequency comparison value".

- When EXTAL clock frequency is dividable by 128 Hz:
  RFC[18:0] = (EXTAL or RTC_X3 clock frequency)/128
  Clear the SEL64 bit to 0.
- When EXTAL clock frequency is not dividable by 128 Hz but is dividable by 64 Hz:
  RFC[18:0] = (EXTAL or RTC_X3 clock frequency)/64
  Set the SEL64 bit to 1.

### (2) Setting Example

**Table 13.3 Setting Example**

| Clock Frequency | | SEL64 Setting Value | RFC Setting Value |
|---|---|---|---|
| EXTAL | 10 MHz | 0 | H'1312D |
| | 11 MHz | 1 | H'29F63 |
| | 12 MHz | 0 | H'16E36 |
| | 13 MHz | 1 | H'31975 |
| RTC_X3 | 4 MHz | 0 | H'07A12 |

## 13.4 Operation

A usage example of this module is shown below.

### 13.4.1 Initial Settings of Registers after Power-On and Oscillation Stabilization Time

All the registers should be initialized after the power is turned on. When the RTC_X1 or RTC_X3 crystal oscillator is used, oscillation stabilization time is necessary after changing the RTCEN bit in RCR2 from 0 to 1. During oscillation stabilization time, various configurations for or operation of the real time clock must not be performed. For details on oscillation stabilization time, refer to section 59, Electrical Characteristics.

### 13.4.2 Setting Time

Figure 13.2 shows how to set the time when the clock is stopped.

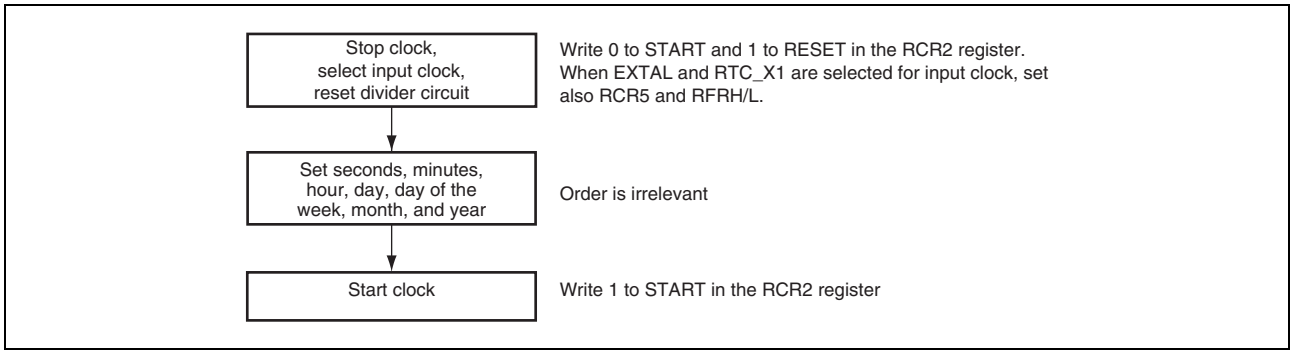


**Figure 13.2 Setting Time**

### 13.4.3 Reading Time

Figure 13.3 shows how to read the time.

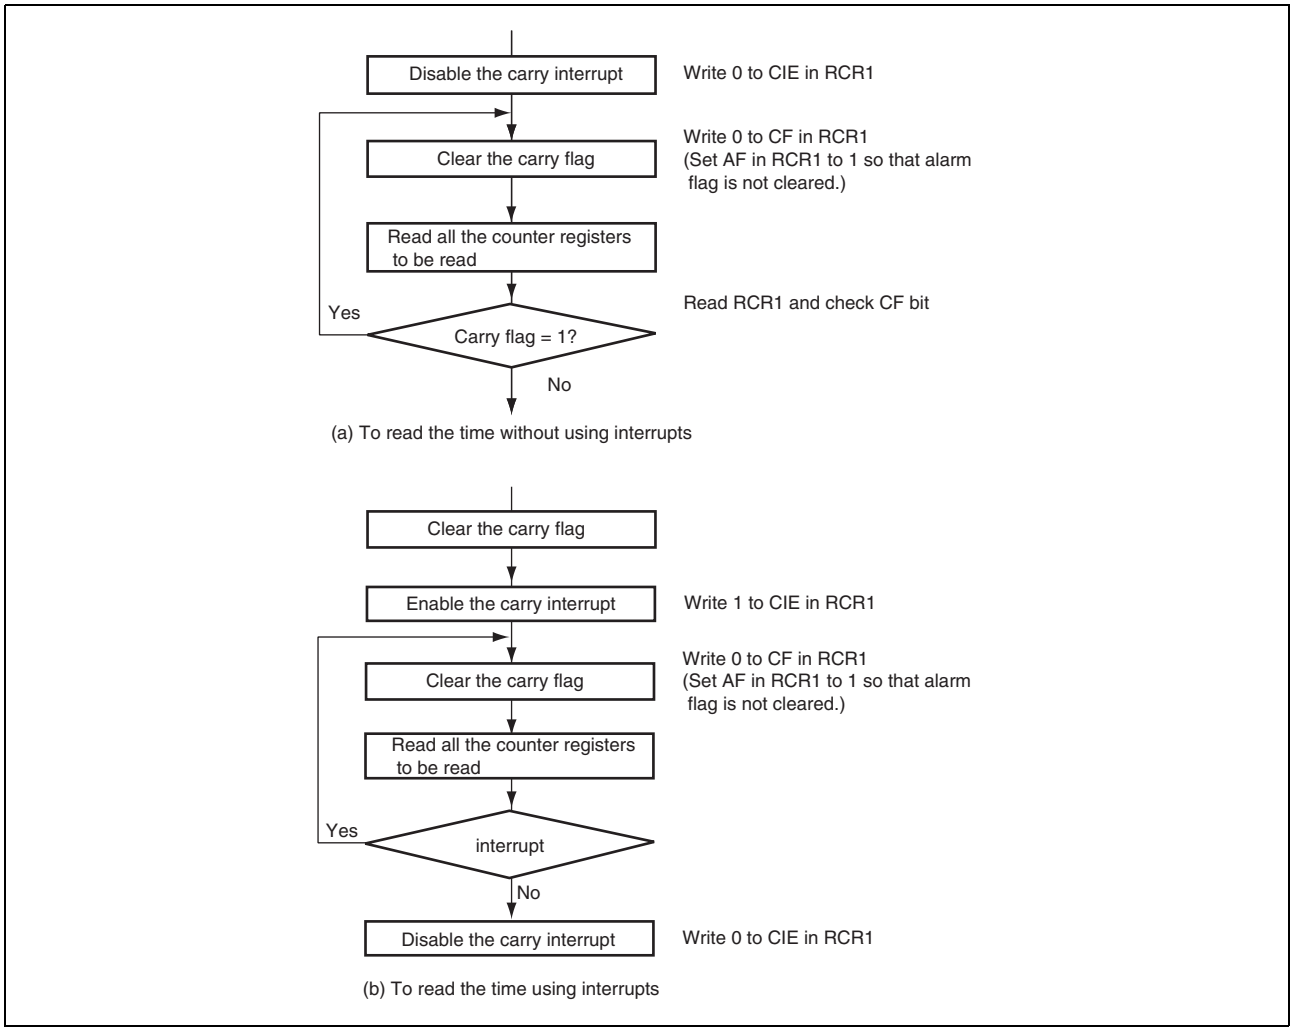

**Figure 13.3 Reading Time**

If a carry occurs while reading the time, the correct time will not be obtained, so it must be read again. Part (a) in Figure 13.3 shows the method of reading the time without using interrupts; part (b) in Figure 13.3 shows the method using carry interrupts. To keep programming simple, method (a) should normally be used.

### 13.4.4 Alarm Function

Figure 13.4 shows how to use the alarm function.

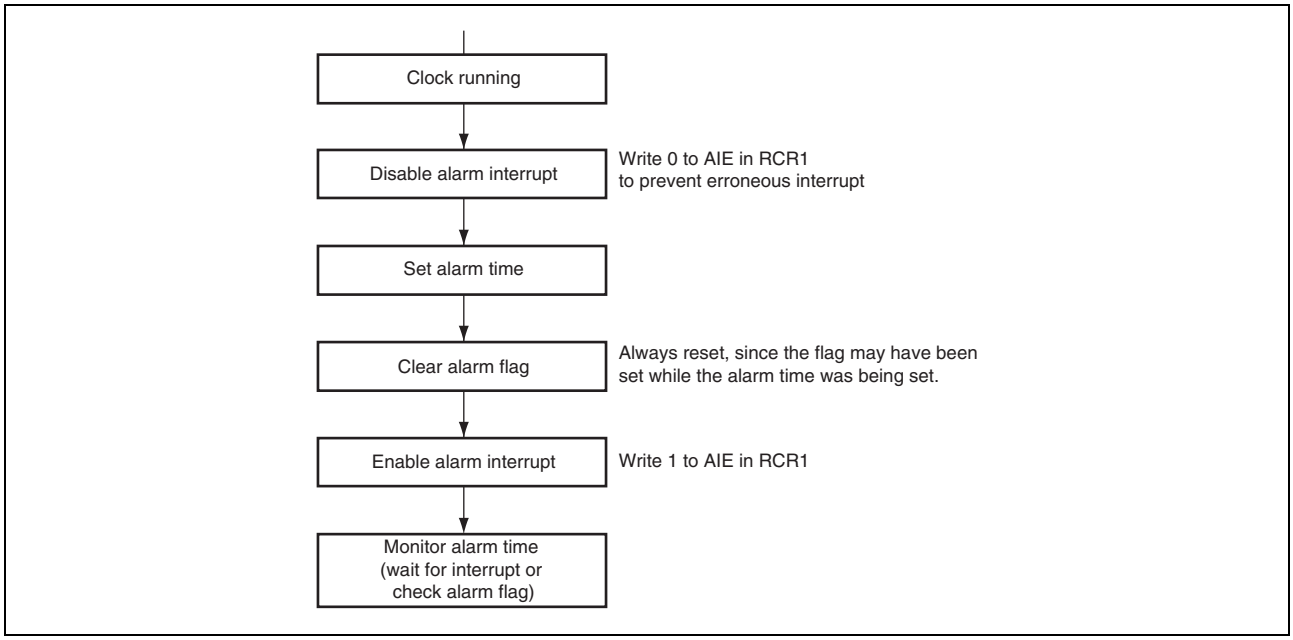

**Figure 13.4 Using Alarm Function**

Alarms can be generated using seconds, minutes, hours, day of the week, day, month, year, or any combination of these. Set the ENB bit in the register on which the alarm is placed to 1, and then set the alarm time in the lower bits. Clear the ENB bit in the register on which the alarm is not placed to 0.

When the clock and alarm times match, 1 is set in the AF bit in RCR1. Alarm detection can be checked by reading this bit, but normally it is done by interrupt. If 1 is set in the AIE bit in RCR1, an interrupt is generated when an alarm occurs.

The alarm flag is set when the clock and alarm times match. However, the alarm flag can be cleared by writing 0.

## 13.5 Usage Notes

### 13.5.1 Register Writing during Count Operation

The following registers cannot be written to during count operation (while the START bit = 1 in RCR2).

RSECCNT, RMINCNT, RHRCNT, RDAYCNT, RWKCNT, RMONCNT, RYRCONT

Count operation must be stopped before writing to any of the above registers.

### 13.5.2 Use of Realtime Clock Periodic Interrupts

The method of using the periodic interrupt function is shown in Figure 13.5.

A periodic interrupt can be generated periodically at the interval set by bits PES2 to PES0 in RCR2. When the time set by bits PES2 to PES0 has elapsed, the PEF is set to 1.

The PEF is cleared to 0 upon periodic interrupt generation or when bits PES2 to PES0 are set. Periodic interrupt generation can be confirmed by reading this bit, but normally the interrupt function is used.

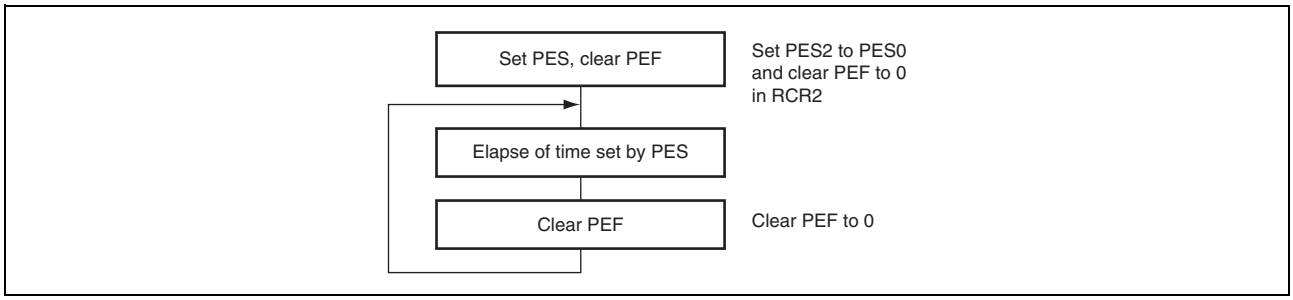

**Figure 13.5 Using Periodic Interrupt Function**

### 13.5.3 Transition to Standby Mode after Setting Register

When a transition to standby mode is made after registers in this module are set, sometimes counting is not performed correctly. After the registers are set, be sure to perform one dummy read of the registers before making a transition to standby mode.

### 13.5.4 Usage Notes when Writing to and Reading the Register

- After writing to the RCR2 register or any of the counters such as the second counter, dummy-read the register twice before reading the actual value. The register contents before the write are returned by the two dummy reads, and the third read returns the register contents reflecting the write.
- Registers other than the above can be read immediately after a write and the written value is reflected.

# 14. Serial Communication Interface with FIFO

This LSI has an eight-channel serial communication interface with FIFO that supports both asynchronous and clock synchronous serial communication. It also has 16-stage FIFO registers for both transmission and reception independently for each channel that enable this LSI to perform efficient high-speed continuous communication.

## 14.1 Features

- Asynchronous serial communication:
  - Serial data communication is performed by start-stop in character units. This module can communicate with a universal asynchronous receiver/transmitter (UART), an asynchronous communication interface adapter (ACIA), or any other communications chip that employs a standard asynchronous serial system. There are eight selectable serial data communication formats.
  - Data length: 7 or 8 bits
  - Stop bit length: 1 or 2 bits
  - Parity: Even, odd, or none
  - Receive error detection: Parity, framing, and overrun errors
  - Break detection: Break is detected when a framing error is followed by at least one frame at the space 0 level (low level). It is also detected by reading the RxD pin level directly from the serial port register when a framing error occurs.
- Clock synchronous serial communication:
  - Serial data communication is synchronized with a clock signal. This module can communicate with other chips having a clock synchronous communication function. There is one serial data communication format.
  - Data length: 8 bits
  - Receive error detection: Overrun errors
- Full duplex communication: The transmitting and receiving sections are independent, so this module can transmit and receive simultaneously. Both sections use 16-stage FIFO buffering, so high-speed continuous data transfer is possible in both the transmit and receive directions.
- On-chip baud rate generator with selectable bit rates
- Internal or external transmit/receive clock source: From either baud rate generator (internal) or SCK pin (external)
- Four types of interrupts: Transmit-FIFO-data-empty interrupt, break interrupt, receive-FIFO-data-full interrupt, and receive-error interrupt are requested independently.
- When this module is not in use, it can be stopped by halting the clock supplied to it, saving power.
- In asynchronous mode, on-chip modem control functions ($\overline{\text{RTS}}$ and $\overline{\text{CTS}}$) (only channels 1, 5, and 7).
- The quantity of data in the transmit and receive FIFO data registers and the number of receive errors of the receive data in the receive FIFO data register can be ascertained.
- A time-out error (DR) can be detected when receiving in asynchronous mode.
- In asynchronous mode, the base clock frequency can be either 16 or 8 times the bit rate.
- When an internal clock is selected as a clock source and the SCK pin is used as an input pin in asynchronous mode, either normal mode or double-speed mode can be selected for the baud rate generator.

Figure 14.1 shows a block diagram. However, certain channels do not have the $\overline{\text{CTS}}$ and $\overline{\text{RTS}}$ pins.

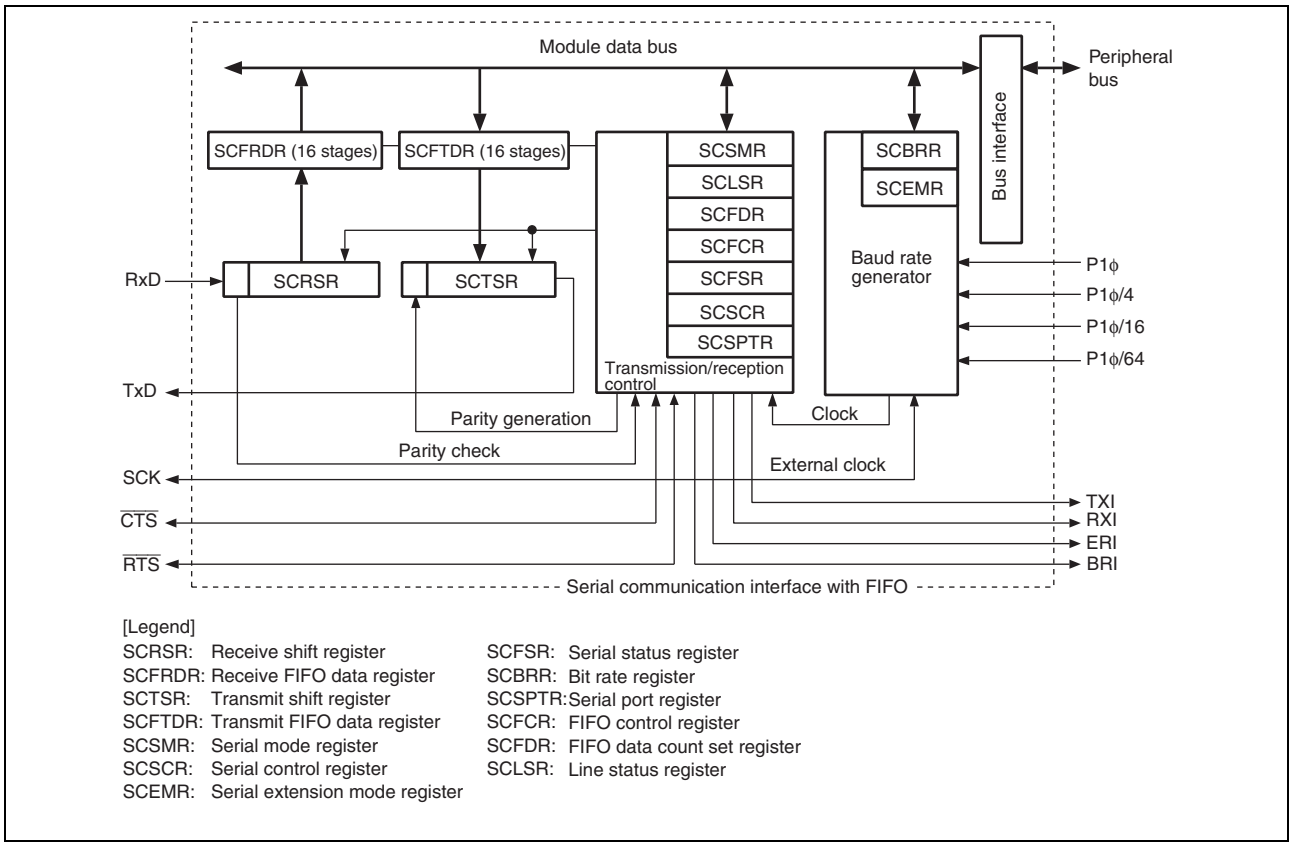

**Figure 14.1 Block Diagram**

## 14.2 Input/Output Pins

Table 14.1 shows the pin configuration.

**Table 14.1 Pin Configuration**

| Channel | Pin Name | Symbol | I/O | Function |
|---|---|---|---|---|
| 0 to 7 | Serial clock pins | SCK0 to SCK7 | I/O | Clock I/O |
| | Receive data pins | RxD0 to RxD7 | Input | Receive data input |
| | Transmit data pins | TxD0 to TxD7 | Output | Transmit data output |
| 1, 5, 7 | Request to send pin | $\overline{\text{RTS1}}$, $\overline{\text{RTS5}}$, $\overline{\text{RTS7}}$ | I/O | Request to send |
| | Clear to send pin | $\overline{\text{CTS1}}$, $\overline{\text{CTS5}}$, $\overline{\text{CTS7}}$ | I/O | Clear to send |

## 14.3 Register Descriptions

This module has the following registers.

**Table 14.2 Register Configuration**

| Channel | Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | Serial mode register_0 | SCSMR_0 | R/W | H'0000 | H'E8007000 | 16 |
| | Bit rate register_0 | SCBRR_0 | R/W | H'FF | H'E8007004 | 8 |
| | Serial control register_0 | SCSCR_0 | R/W | H'0000 | H'E8007008 | 16 |
| | Transmit FIFO data register_0 | SCFTDR_0 | W | Undefined | H'E800700C | 8 |
| | Serial status register_0 | SCFSR_0 | R/(W)*1 | H'0060 | H'E8007010 | 16 |
| | Receive FIFO data register_0 | SCFRDR_0 | R | Undefined | H'E8007014 | 8 |
| | FIFO control register_0 | SCFCR_0 | R/W | H'0000 | H'E8007018 | 16 |
| | FIFO data count set register_0 | SCFDR_0 | R | H'0000 | H'E800701C | 16 |

Note 1. Only 0 can be written to clear the flag. Bits 15 to 8, 3, and 2 are read-only bits that cannot be modified.
Note 2. Only 0 can be written to clear the flag. Bits 15 to 1 are read-only bits that cannot be modified.

### 14.3.1 Receive Shift Register (SCRSR)

SCRSR receives serial data. Data input at the RxD pin is loaded into SCRSR in the order received, LSB (bit 0) first, being converted to parallel form. When one byte has been received, it is automatically transferred to the receive FIFO data register (SCFRDR).

The CPU cannot read from or write to SCRSR directly.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial value: | - | - | - | - | - | - | - | - |
| R/W: | - | - | - | - | - | - | - | - |

### 14.3.2 Receive FIFO Data Register (SCFRDR)

SCFRDR is a 16-stage FIFO register that stores serial receive data. The reception of one byte of serial data is complete when the received data is moved from the receive shift register (SCRSR) to SCFRDR for storage. Continuous reception is possible until 16 bytes are stored. The CPU can read but not write to SCFRDR. If data is read when there is no receive data in the SCFRDR, the value is undefined.

When SCFRDR is full of receive data, subsequent serial data is lost.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial value: | - | - | - | - | - | - | - | - |
| R/W: | R | R | R | R | R | R | R | R |

### 14.3.3 Transmit Shift Register (SCTSR)

SCTSR transmits serial data. Transmit data is loaded from the transmit FIFO data register (SCFTDR) into SCTSR, then the data is transmitted serially from the TxD pin, LSB (bit 0) first. After one data byte has been transmitted, the next transmit data is automatically loaded from SCFTDR into SCTSR and transmission is started again.

The CPU cannot read from or write to SCTSR directly.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial value: | - | - | - | - | - | - | - | - |
| R/W: | - | - | - | - | - | - | - | - |

### 14.3.4 Transmit FIFO Data Register (SCFTDR)

SCFTDR is a 16-stage FIFO register that stores data for serial transmission. When the transmit shift register (SCTSR) empty is detected, transmit data written in the SCFTDR is moved to SCTSR and serial transmission is started. Continuous serial transmission is performed until there is no transmit data left in SCFTDR. The CPU can write to SCFTDR at all times.

When SCFTDR is full of transmit data (16 bytes), no more data can be written. If writing of next data is attempted, the data is ignored.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial value: | - | - | - | - | - | - | - | - |
| R/W: | W | W | W | W | W | W | W | W |

### 14.3.5 Serial Mode Register (SCSMR)

SCSMR specifies the serial communication format and selects the clock source for the baud rate generator.

The CPU can always read from and write to SCSMR.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | C/$\overline{A}$ | CHR | PE | O/$\overline{E}$ | STOP | - | CKS[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 | C/$\overline{A}$ | 0 | R/W | Communication Mode<br>Selects operating mode from asynchronous and clock synchronous modes.<br>0: Asynchronous mode<br>1: Clock synchronous mode |
| 6 | CHR | 0 | R/W | Character Length<br>Selects 7-bit or 8-bit data length in asynchronous mode. In the clock synchronous mode, the data length is always 8 bits, regardless of the CHR setting.<br>0: 8-bit data<br>1: 7-bit data*<br>Note: * When 7-bit data is selected, the MSB (bit 7) of the transmit FIFO data register is not transmitted. |
| 5 | PE | 0 | R/W | Parity Enable<br>Selects whether to add a parity bit to transmit data and to check the parity of receive data, in asynchronous mode. In clock synchronous mode, a parity bit is neither added nor checked, regardless of the PE setting.<br>0: Parity bit not added or checked<br>1: Parity bit added and checked*<br>Note: * When PE is set to 1, an even or odd parity bit is added to transmit data, depending on the parity mode (O/$\overline{E}$) setting. Receive data parity is checked according to the even/odd (O/$\overline{E}$) mode setting. |
| 4 | O/$\overline{E}$ | 0 | R/W | Parity Mode<br>Selects even or odd parity when parity bits are added and checked. The O/$\overline{E}$ setting is used only in asynchronous mode and only when the parity enable bit (PE) is set to 1 to enable parity addition and checking. The O/$\overline{E}$ setting is ignored in clock synchronous mode or in asynchronous mode when parity addition and checking is disabled.<br>0: Even parity*1<br>1: Odd parity*2<br>Note: 1. If even parity is selected, the parity bit is added to transmit data to make an even number of 1s in the transmitted character and parity bit combined. Receive data is checked to see if it has an even number of 1s in the received character and parity bit combined.<br>2. If odd parity is selected, the parity bit is added to transmit data to make an odd number of 1s in the transmitted character and parity bit combined. Receive data is checked to see if it has an odd number of 1s in the received character and parity bit combined. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | STOP | 0 | R/W | Stop Bit Length<br>Selects one or two bits as the stop bit length in asynchronous mode. This setting is used only in asynchronous mode. It is ignored in clock synchronous mode because no stop bits are added.<br>When receiving, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1, it is treated as a stop bit, but if the second stop bit is 0, it is treated as the start bit of the next incoming character.<br>0: One stop bit<br>When transmitting, a single 1-bit is added at the end of each transmitted character.<br>1: Two stop bits<br>When transmitting, two 1 bits are added at the end of each transmitted character. |
| 2 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 1, 0 | CKS[1:0] | 00 | R/W | Clock Select<br>Select the internal clock source of the on-chip baud rate generator. For further information on the clock source, bit rate register settings, and baud rate, see section 14.3.8, Bit Rate Register (SCBRR).<br>00: P1$\phi$<br>01: P1$\phi$/4<br>10: P1$\phi$/16<br>11: P1$\phi$/64<br>Note: P1$\phi$: Peripheral clock |

## 14.3.6 Serial Control Register (SCSCR)

SCSCR enables/disables the transmitter/receiver operation and interrupt requests, and selects the transmit/receive clock source. The CPU can always read and write to SCSCR.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | TIE | RIE | TE | RE | REIE | - | CKE[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 | TIE | 0 | R/W | Transmit Interrupt Enable<br>Enables or disables the transmit-FIFO-data-empty interrupt (TXI) requested when the serial transmit data is transferred from the transmit FIFO data register (SCFTDR) to the transmit shift register (SCTSR), the quantity of data in the transmit FIFO register becomes less than the specified number of transmission triggers, and then the TDFE flag in the serial status register (SCFSR) is set to1.<br>0: Transmit-FIFO-data-empty interrupt request (TXI) is disabled<br>1: Transmit-FIFO-data-empty interrupt request (TXI) is enabled*<br>Note: * The TXI interrupt request can be cleared by writing a greater quantity of transmit data than the specified transmission trigger number to SCFTDR and clearing TDFE to 0 after reading 1 from TDFE, or by clearing TIE to 0. |
| 6 | RIE | 0 | R/W | Receive Interrupt Enable<br>Enables or disables the receive FIFO data full (RXI) interrupts requested when the RDF flag or DR flag in serial status register (SCFSR) is set to1, receive-error (ERI) interrupts requested when the ER flag in SCFSR is set to1, and break (BRI) interrupts requested when the BRK flag in SCFSR or the ORER flag in line status register (SCLSR) is set to1.<br>0: Receive FIFO data full interrupt (RXI), receive-error interrupt (ERI), and break interrupt (BRI) requests are disabled<br>1: Receive FIFO data full interrupt (RXI), receive-error interrupt (ERI), and break interrupt (BRI) requests are enabled*<br>Note: * RXI interrupt requests can be cleared by reading the DR or RDF flag after it has been set to 1, then clearing the flag to 0, or by clearing RIE to 0. ERI or BRI interrupt requests can be cleared by reading the ER, BRK or ORER flag after it has been set to 1, then clearing the flag to 0, or by clearing RIE and REIE to 0. |
| 5 | TE | 0 | R/W | Transmit Enable<br>Enables or disables serial transmission.<br>0: Serial transmission disabled<br>1: Serial transmission enabled*<br>Note: * When this bit is set to 1, serial transmission starts after writing of transmit data into SCFTDR. Be sure to select the transmit format in SCSMR and SCFCR and reset the transmit FIFO before setting TE to 1. |
| 4 | RE | 0 | R/W | Receive Enable<br>Enables or disables serial reception.<br>0: Serial reception disabled*1<br>1: Serial reception enabled*2<br>Notes: 1. Clearing RE to 0 does not affect the receive flags (DR, ER, BRK, RDF, FER, PER, and ORER). These flags retain their previous values.<br>2. When this bit is set to 1, serial reception starts when a start bit is detected in asynchronous mode, or synchronous clock is detected in clock synchronous mode. Be sure to select the receive format in SCSMR and SCFCR and reset the receive FIFO before setting RE to 1. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | REIE | 0 | R/W | Receive Error Interrupt Enable<br>Enables or disables the receive-error (ERI) interrupts and break (BRI) interrupts. The setting of REIE bit is valid only when RIE bit is set to 0.<br>0: Receive-error interrupt (ERI) and break interrupt (BRI) requests are disabled<br>1: Receive-error interrupt (ERI) and break interrupt (BRI) requests are enabled*<br>Note: * ERI or BRI interrupt requests can be cleared by reading the ER, BRK or ORER flag after it has been set to 1, then clearing the flag to 0, or by clearing RIE and REIE to 0. Even if RIE is set to 0, when REIE is set to 1, ERI or BRI interrupt requests are enabled. |
| 2 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 1, 0 | CKE[1:0] | 00 | R/W | Clock Enable<br>Select the clock source and enable or disable clock output from the SCK pin. Depending on CKE[1:0], the SCK pin can be used for serial clock output or serial clock input. If synchronous clock output is set in clock synchronous mode, set the C/$\overline{A}$ bit in SCSMR to 1, and then set CKE[1:0].<br>• Asynchronous mode<br>00: Internal clock, SCK pin used for input (input signal is ignored)<br>01: Internal clock, SCK pin used for clock output<br>(The output clock frequency is either 16 or 8 times the bit rate.)<br>10: External clock, SCK pin used for clock input<br>(The input clock frequency is either 16 or 8 times the bit rate.)<br>11: Setting prohibited<br>• Clock synchronous mode<br>00: Internal clock, SCK pin used for synchronous clock output<br>01: Internal clock, SCK pin used for synchronous clock output<br>10: External clock, SCK pin used for synchronous clock input<br>11: Setting prohibited |

### 14.3.7 Serial Status Register (SCFSR)

SCFSR is a 16-bit register. The upper 8 bits indicate the number of receive errors in the receive FIFO data register, and the lower 8 bits indicate the status flag indicating operating state.

The CPU can always read from and write to SCFSR, but cannot write 1 to the status flags (ER, TEND, TDFE, BRK, RDF, and DR). These flags can be cleared to 0 only if they have first been read (after being set to 1). The PER flag (bits 15 to 12 and bit 2) and the FER flag (bits 11 to 8 and bit 3) are read-only bits that cannot be written.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PER[3:0] | | | | FER[3:0] | | | | ER | TEND | TDFE | BRK | FER | PER | RDF | DR |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/(W)* | R/(W)* | R/(W)* | R/(W)* | R | R | R/(W)* | R/(W)* |

Note: * Only 0 can be written to clear the flag after 1 is read.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 12 | PER[3:0] | 0000 | R | Number of Parity Errors<br>Indicate the quantity of data including a parity error in the receive data stored in the receive FIFO data register (SCFRDR). The value indicated by bits 15 to 12 after the ER bit in SCFSR is set, represents the number of parity errors in SCFRDR. When parity errors have occurred in all 16-byte receive data in SCFRDR, PER[3:0] shows 0000. |
| 11 to 8 | FER[3:0] | 0000 | R | Number of Framing Errors<br>Indicate the quantity of data including a framing error in the receive data stored in SCFRDR. The value indicated by bits 11 to 8 after the ER bit in SCFSR is set, represents the number of framing errors in SCFRDR. When framing errors have occurred in all 16-byte receive data in SCFRDR, FER[3:0] shows 0000. |
| 7 | ER | 0 | R/(W)* | Receive Error<br>Indicates the occurrence of a framing error, or of a parity error when receiving data that includes parity.*1<br>0: Receiving is in progress or has ended normally<br>[Clearing conditions]<br>• ER is cleared to 0 by a power-on reset<br>• ER is cleared to 0 when 0 is written to after 1 is read from ER<br>1: A framing error or parity error has occurred.<br>[Setting conditions]<br>• ER is set to 1 when the stop bit is 0 after checking whether or not the last stop bit of the received data is 1 at the end of one data receive operation*2<br>• ER is set to 1 when the total number of 1s in the receive data plus parity bit does not match the even/odd parity specified by the O/$\overline{E}$ bit in SCSMR<br>Note: 1. Clearing the RE bit to 0 in SCSCR does not affect the ER bit, which retains its previous value. Even if a receive error occurs, the receive data is transferred to SCFRDR and the receive operation is continued. Whether or not the data read from SCFRDR includes a receive error can be detected by the FER and PER bits in SCFSR.<br>2. In two stop bits mode, only the first stop bit is checked; the second stop bit is not checked. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 6 | TEND | 1 | R/(W)* | Transmit End<br>Indicates that when the last bit of a serial character was transmitted, SCFTDR did not contain valid data, so transmission has ended.<br>0: Transmission is in progress<br>[Clearing condition]<br>• TEND is cleared to 0 when 0 is written after 1 is read from TEND after transmit data is written in SCFTDR*1<br>1: End of transmission<br>[Setting conditions]<br>• TEND is set to 1 by a power-on reset<br>• TEND is set to 1 when TE is cleared to 0 in the serial control register (SCSCR)<br>• TEND is set to 1 when SCFTDR does not contain transmit data when the last bit of a one-byte serial character is transmitted<br>Note: 1. Do not use this bit as a transmit end flag when the direct memory access controller writes data to SCFTDR due to a TXI interrupt request. |
| 5 | TDFE | 1 | R/(W)* | Transmit FIFO Data Empty<br>Indicates that data has been transferred from the transmit FIFO data register (SCFTDR) to the transmit shift register (SCTSR), the quantity of data in SCFTDR has become less than the transmission trigger number specified by the TTRG[1:0] bits in the FIFO control register (SCFCR), and writing of transmit data to SCFTDR is enabled.<br>0: The quantity of transmit data written to SCFTDR is greater than the specified transmission trigger number<br>[Clearing conditions]<br>• TDFE is cleared to 0 when data exceeding the specified transmission trigger number is written to SCFTDR after 1 is read from TDFE and then 0 is written to TDFE<br>• TDFE is cleared to 0 when direct memory access controller is activated by transmit FIFO data empty interrupt (TXI) and data exceeding the specified transmission trigger number is written to SCFTDR<br>1: The quantity of transmit data in SCFTDR is less than or equal to the specified transmission trigger number*1<br>[Setting conditions]<br>• TDFE is set to 1 by a power-on reset<br>• TDFE is set to 1 when the quantity of transmit data in SCFTDR becomes less than or equal to the specified transmission trigger number as a result of transmission<br>Note: 1. Since SCFTDR is a 16-byte FIFO register, the maximum quantity of data that can be written when TDFE is 1 is "16 minus the specified transmission trigger number". If an attempt is made to write additional data, the data is ignored. The quantity of data in SCFTDR is indicated by the upper 8 bits of SCFDR. |
| 4 | BRK | 0 | R/(W)* | Break Detection<br>Indicates that a break signal has been detected in receive data.<br>0: No break signal received<br>[Clearing conditions]<br>• BRK is cleared to 0 by a power-on reset<br>• BRK is cleared to 0 when software reads BRK after it has been set to 1, then writes 0 to BRK<br>1: Break signal received*1<br>[Setting condition]<br>• BRK is set to 1 when data including a framing error is received, followed by at least one frame at the space 0 level (low level)<br>Note: 1. When a break is detected, transfer of the receive data (H'00) to SCFRDR stops after detection. When the break ends and the receive signal becomes mark 1, the transfer of receive data resumes. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | FER | 0 | R | Framing Error Indication<br>Indicates a framing error in the data read from the receive FIFO data register (SCFRDR) in asynchronous mode.<br>0: No receive framing error occurred in the next data read from SCFRDR<br>[Clearing conditions]<br>• FER is cleared to 0 by a power-on reset<br>• FER is cleared to 0 when no framing error is present in the next data read from SCFRDR<br>1: A receive framing error occurred in the next data read from SCFRDR<br>[Setting condition]<br>• FER is set to 1 when a framing error is present in the next data read from SCFRDR |
| 2 | PER | 0 | R | Parity Error Indication<br>Indicates a parity error in the data read from the receive FIFO data register (SCFRDR) in asynchronous mode.<br>0: No receive parity error occurred in the next data read from SCFRDR<br>[Clearing conditions]<br>• PER is cleared to 0 by a power-on reset<br>• PER is cleared to 0 when no parity error is present in the next data read from SCFRDR<br>1: A receive parity error occurred in the next data read from SCFRDR<br>[Setting condition]<br>• PER is set to 1 when a parity error is present in the next data read from SCFRDR |
| 1 | RDF | 0 | R/(W)* | Receive FIFO Data Full<br>Indicates that receive data has been transferred to the receive FIFO data register (SCFRDR), and the quantity of data in SCFRDR has become more than the receive trigger number specified by the RTRG[1:0] bits in the FIFO control register (SCFCR).<br>0: The quantity of transmit data written to SCFRDR is less than the specified receive trigger number<br>[Clearing conditions]<br>• RDF is cleared to 0 by a power-on reset<br>• RDF is cleared to 0 when the SCFRDR is read until the quantity of receive data in SCFRDR becomes less than the specified receive trigger number after 1 is read from RDF, and then 0 is written<br>• RDF is cleared to 0 when the direct memory access controller is activated by receive FIFO data full interrupt (RXI) and SCFRDR is read until the quantity of receive data in it becomes less than the specified receive trigger number<br>1: The quantity of receive data in SCFRDR is equal to or greater than the specified receive trigger number<br>[Setting condition]<br>• RDF is set to 1 when a quantity of receive data equal to or greater than the specified receive trigger number is stored in SCFRDR*1<br>Note: 1. As SCFRDR is a 16-byte FIFO register, the maximum quantity of data that can be read when RDF is 1 is the specified receive trigger number. If an attempt is made to read after all the data in SCFRDR has been read, the data is undefined. The quantity of receive data in SCFRDR is indicated by the lower 8 bits of SCFDR. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | DR | 0 | R/(W)* | Receive Data Ready<br>Indicates that the quantity of data in the receive FIFO data register (SCFRDR) is less than the specified receive trigger number, and that the next data has not yet been received after the elapse of 15 ETU from the last stop bit in asynchronous mode. In clock synchronous mode, this bit is not set to 1.<br>0: Receiving is in progress, or no receive data remains in SCFRDR after receiving ended normally<br>[Clearing conditions]<br>• DR is cleared to 0 by a power-on reset<br>• DR is cleared to 0 when all receive data are read from SCFRDR after 1 is read from DR, and then 0 is written.<br>• DR is cleared to 0 when all receive data are read from SCFRDR after the direct memory access controller is activated by receive FIFO data full interrupt (RXI).<br>1: Next receive data has not been received<br>[Setting condition]<br>• DR is set to 1 when SCFRDR contains less data than the specified receive trigger number, and the next data has not yet been received after the elapse of 15 ETU from the last stop bit.*1<br>Note: 1. This is equivalent to 1.5 frames with the 8-bit, 1-stop-bit format. (ETU: elementary time unit) |

Note: * Only 0 can be written to clear the flag after 1 is read.

### 14.3.8 Bit Rate Register (SCBRR)

SCBRR is an 8-bit register that is used with the CKS1 and CKS0 bits in the serial mode register (SCSMR) and the BGDM and ABCS bits in the serial extension mode register (SCEMR) to determine the serial transmit/receive bit rate.

The CPU can always read from and write to SCBRR. SCBRR is initialized to H'FF by a power-on reset. Each channel has independent baud rate generator control, so different values can be set in eight channels.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The SCBRR setting is calculated as follows:

- Asynchronous mode:

When baud rate generator operates in normal mode (when the BGDM bit of SCEMR is 0):

$$N = \frac{P1\phi}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$ (Operation on a base clock with a frequency of 16 times the bit rate)

$$N = \frac{P1\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$ (Operation on a base clock with a frequency of 8 times the bit rate)

When baud rate generator operates in double speed mode (when the BGDM bit of SCEMR is 1):

$$N = \frac{P1\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$ (Operation on a base clock with a frequency of 16 times the bit rate)

$$N = \frac{P1\phi}{16 \times 2^{2n-1} \times B} \times 10^6 - 1$$ (Operation on a base clock with a frequency of 8 times the bit rate)

- Clock synchronous mode:

$$N = \frac{P1\phi}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

B: Bit rate (bits/s)
N: SCBRR setting for baud rate generator ($0 \leq N \leq 255$)
(The setting must satisfy the electrical characteristics.)
P1ϕ: Operating frequency for peripheral modules (MHz)
n: Baud rate generator clock source (n = 0, 1, 2, 3) (for the clock sources and values of n, see Table 14.3.)

**Table 14.3 SCSMR Settings**

| | | SCSMR Settings | |
|---|---|---|---|
| **n** | **Clock Source** | **CKS[1]** | **CKS[0]** |
| 0 | P1ϕ | 0 | 0 |
| 1 | P1ϕ/4 | 0 | 1 |
| 2 | P1ϕ/16 | 1 | 0 |
| 3 | P1ϕ/64 | 1 | 1 |

The bit rate error in asynchronous mode is given by the following formula:

When baud rate generator operates in normal mode (the BGDM bit of SCEMR is 0):

$$\text{Error (\%)} = \left\{ \frac{P1\phi \times 10^6}{(N+1) \times B \times 64 \times 2^{2n-1}} - 1 \right\} \times 100$$ (Operation on a base clock with a frequency of 16 times the bit rate)

$$\text{Error (\%)} = \left\{ \frac{P1\phi \times 10^6}{(N+1) \times B \times 32 \times 2^{2n-1}} - 1 \right\} \times 100$$ (Operation on a base clock with a frequency of 8 times the bit rate)

When baud rate generator operates in double speed mode (the BGDM bit of SCEMR is 1):

$$\text{Error (\%)} = \left\{ \frac{P1\phi \times 10^6}{(N+1) \times B \times 32 \times 2^{2n-1}} - 1 \right\} \times 100$$ (Operation on a base clock with a frequency of 16 times the bit rate)

$$\text{Error (\%)} = \left\{ \frac{P1\phi \times 10^6}{(N+1) \times B \times 16 \times 2^{2n-1}} - 1 \right\} \times 100$$ (Operation on a base clock with a frequency of 8 times the bit rate)

Table 14.4 lists the sample SCBRR settings in asynchronous mode in which a base clock frequency is 16 times the bit rate (the ABCS bit in SCEMR is 0) and the baud rate generator operates in normal mode (the BGDM bit in SCEMR is 0), and Table 14.5 lists the sample SCBRR settings in clock synchronous mode.

**Table 14.4 Bit Rates and SCBRR Settings (Asynchronous Mode, BGDM = 0, ABCS = 0)**

| | P1ϕ (MHz) | | | | | |
|---|---|---|---|---|---|---|
| | 50 | | | 66.67 | | |
| Bit Rate (bits/s) | n | N | Error (%) | n | N | Error (%) |
| 110 | 3 | 221 | -0.02 | | | |
| 150 | 3 | 162 | -0.15 | 3 | 216 | 0.01 |
| 300 | 3 | 80 | 0.47 | 3 | 108 | -0.45 |
| 600 | 2 | 162 | -0.15 | 2 | 216 | 0.01 |

Table 14.6 indicates the maximum bit rates in asynchronous mode when the baud rate generator is used. Table 14.7 lists the maximum bit rates in asynchronous mode when the external clock input is used. Table 14.8 lists the maximum bit rates in clock synchronous mode when the external clock input is used (when $t_{Scyc} = 12t_{pcyc}$*).

Note: * Make sure that the electrical characteristics of this LSI and that of a connected LSI are satisfied.

**Table 14.6 Maximum Bit Rates for Various Frequencies with Baud Rate Generator (Asynchronous Mode)**

### 14.3.9 FIFO Control Register (SCFCR)

SCFCR resets the quantity of data in the transmit and receive FIFO data registers, sets the trigger data quantity, and contains an enable bit for loop-back testing. SCFCR can always be read and written to by the CPU.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

### 14.3.10 FIFO Data Count Set Register (SCFDR)

SCFDR is a 16-bit register which indicates the quantity of data stored in the transmit FIFO data register (SCFTDR) and the receive FIFO data register (SCFRDR).

It indicates the quantity of transmit data in SCFTDR with the upper 8 bits, and the quantity of receive data in SCFRDR with the lower 8 bits. SCFDR can always be read by the CPU.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | T[4:0] | | | | | - | - | - | R[4:0] | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 13 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 12 to 8 | T[4:0] | 00000 | R | T4 to T0 bits indicate the quantity of non-transmitted data stored in SCFTDR. H'00 means no transmit data, and H'10 means that all transmit data is stored in SCFTDR. |
| 7 to 5 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 4 to 0 | R[4:0] | 00000 | R | R4 to R0 bits indicate the quantity of receive data stored in SCFRDR. H'00 means no receive data, and H'10 means that all receive data is stored in SCFRDR. |

### 14.3.11 Serial Port Register (SCSPTR)

SCSPTR controls input/output and data of pins multiplexed to the functions of this module. Bits 7 and 6 can control input/output data of $\overline{\text{RTS}}$ pin. Bits 5 and 4 can control input/output data of $\overline{\text{CTS}}$ pin. Bits 3 and 2 can control input/output data of SCK pin. Bits 1 and 0 can input data from RxD pin and output data to TxD pin, so they control break of serial transmitting/receiving.

The CPU can always read and write to SCSPTR.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | RTSIO | RTSDT | CTSIO | CTSDT | SCKIO | SCKDT | SPB2IO | SPB2DT |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 | RTSIO | 0 | R/W | $\overline{\text{RTS}}$ Port Input/Output<br>Specifies input or output for the serial port $\overline{\text{RTS}}$ pin. When the $\overline{\text{RTS}}$ pin is actually used as a port outputting the RTSDT bit value, the MCE bit in SCFCR should be cleared to 0.<br>0: RTSDT bit value not output to $\overline{\text{RTS}}$ pin<br>1: RTSDT bit value output to $\overline{\text{RTS}}$ pin |
| 6 | RTSDT | 1 | R/W | $\overline{\text{RTS}}$ Port Data<br>Specifies the input/output data of the serial port $\overline{\text{RTS}}$ pin. Input/output is specified by the RTSIO bit. For output, the RTSDT bit value is output to the $\overline{\text{RTS}}$ pin. The $\overline{\text{RTS}}$ pin status is read from the RTSDT bit regardless of the RTSIO bit setting. However, $\overline{\text{RTS}}$ input/output must be set in the general purpose I/O ports.<br>0: Input/output data is low level<br>1: Input/output data is high level |
| 5 | CTSIO | 0 | R/W | $\overline{\text{CTS}}$ Port Input/Output<br>Specifies input or output for the serial port $\overline{\text{CTS}}$ pin. When the $\overline{\text{CTS}}$ pin is actually used as a port outputting the CTSDT bit value, the MCE bit in SCFCR should be cleared to 0.<br>0: CTSDT bit value not output to $\overline{\text{CTS}}$ pin<br>1: CTSDT bit value output to $\overline{\text{CTS}}$ pin |
| 4 | CTSDT | 1 | R/W | $\overline{\text{CTS}}$ Port Data<br>Specifies the input/output data of the serial port $\overline{\text{CTS}}$ pin. Input/output is specified by the CTSIO bit. For output, the CTSDT bit value is output to the $\overline{\text{CTS}}$ pin. The $\overline{\text{CTS}}$ pin status is read from the CTSDT bit regardless of the CTSIO bit setting. However, $\overline{\text{CTS}}$ input/output must be set in the general purpose I/O ports.<br>0: Input/output data is low level<br>1: Input/output data is high level |
| 3 | SCKIO | 0 | R/W | SCK Port Input/Output<br>Specifies input or output for the serial port SCK pin. When the SCK pin is actually used as a port outputting the SCKDT bit value, the CKE[1:0] bits in SCSCR should be cleared to 0.<br>0: SCKDT bit value not output to SCK pin<br>1: SCKDT bit value output to SCK pin |
| 2 | SCKDT | 0 | R/W | SCK Port Data<br>Specifies the input/output data of the serial port SCK pin. Input/output is specified by the SCKIO bit. For output, the SCKDT bit value is output to the SCK pin. The SCK pin status is read from the SCKDT bit regardless of the SCKIO bit setting. However, SCK input/output must be set in the general purpose I/O ports.<br>0: Input/output data is low level<br>1: Input/output data is high level |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1 | SPB2IO | 0 | R/W | Serial Port Break Input/Output<br>Specifies input or output for the serial port TxD pin. When the TxD pin is actually used as a port outputting the SPB2DT bit value, the TE bit in SCSCR should be cleared to 0.<br>0: SPB2DT bit value not output to TxD pin<br>1: SPB2DT bit value output to TxD pin |
| 0 | SPB2DT | 0 | R/W | Serial Port Break Data<br>Specifies the input data of the RxD pin and the output data of the TxD pin used as serial ports. Input/output is specified by the SPB2IO bit. When the TxD pin is set to output, the SPB2DT bit value is output to the TxD pin. The RxD pin status is read from the SPB2DT bit regardless of the SPB2IO bit setting. However, RxD input and TxD output must be set in the general purpose I/O ports.<br>0: Input/output data is low level<br>1: Input/output data is high level |

## 14.3.12 Line Status Register (SCLSR)

The CPU can always read or write to SCLSR, but cannot write 1 to the ORER flag. This flag can be cleared to 0 only if it has first been read (after being set to 1).

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | ORER |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/(W)* |

Note: * Only 0 can be written to clear the flag after 1 is read.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | ORER | 0 | R/(W)* | Overrun Error<br>Indicates the occurrence of an overrun error during reception.<br>0: Receiving is in progress or has ended normally*1<br>[Clearing conditions]<br>• ORER is cleared to 0 by a power-on reset<br>• ORER is cleared to 0 when 0 is written after 1 is read from ORER.<br>1: An overrun error has occurred during reception*2<br>[Setting condition]<br>• ORER is set to 1 when the next serial receiving is finished while the receive FIFO is full of 16-byte receive data.<br>Note: 1. Clearing the RE bit to 0 in SCSCR does not affect the ORER bit, which retains its previous value.<br>2. The receive FIFO data register (SCFRDR) retains the data before an overrun error has occurred, and the next received data is discarded. When the ORER bit is set to 1, the next serial reception cannot be continued. |

### 14.3.13 Serial Extension Mode Register (SCEMR)

The CPU can always read from or write to SCEMR. Setting the BGDM bit in this register to 1 allows the baud rate generator in this module to operate in double-speed mode when asynchronous mode is selected (by setting the C/$\overline{A}$ bit in SCSMR to 0) and an internal clock is selected as a clock source and the SCK pin is set as an input pin (by setting the CKE[1:0] bits in SCSCR to 00).

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | BGDM | - | - | - | - | - | - | ABCS |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 | BGDM | 0 | R/W | Baud Rate Generator Double-Speed Mode<br>When the BGDM bit is set to 1, the baud rate generator in this module operates in double-speed mode. This bit is valid only when asynchronous mode is selected by setting the C/$\overline{A}$ bit in SCSMR to 0 and an internal clock is selected as a clock source and the SCK pin is set as an input pin by setting the CKE[1:0] bits in SCSCR to 00. In other settings, use normal mode.<br>0: Normal mode<br>1: Double-speed mode |
| 6 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | ABCS | 0 | R/W | Base Clock Select in Asynchronous Mode<br>This bit selects the base clock frequency within a bit period in asynchronous mode. This bit is valid only in asynchronous mode (when the C/$\overline{A}$ bit in SCSMR is 0).<br>0: Base clock frequency is 16 times the bit rate<br>1: Base clock frequency is 8 times the bit rate |

## 14.4 Operation

### 14.4.1 Overview

For serial communication, this module has an asynchronous mode in which characters are synchronized individually, and a clock synchronous mode in which communication is synchronized with clock pulses.

This module has a 16-stage FIFO buffer for both transmission and reception, reducing the overhead of the CPU, and enabling continuous high-speed communication. Furthermore, channels 1, 5, and 7 have $\overline{\text{RTS}}$ and $\overline{\text{CTS}}$ signals to be used as modem control signals.

The transmission/reception format is selected in the serial mode register (SCSMR), as shown in Table 14.9. The clock source is selected by the combination of the C/$\overline{\text{A}}$ bit in SCSMR and the CKE1 and CKE0 bits in the serial control register (SCSCR), as shown in Table 14.10.

#### (1) Asynchronous Mode

- Data length is selectable: 7 or 8 bits
- Parity bit is selectable. So is the stop bit length (1 or 2 bits). The combination of the preceding selections constitutes the communication format and character length.
- In receiving, it is possible to detect framing errors, parity errors, receive FIFO data full, overrun errors, receive data ready, and breaks.
- The number of stored data bytes is indicated for both the transmit and receive FIFO registers.
- An internal or external clock can be selected as the clock source.
  - When an internal clock is selected, this module operates using the clock of on-chip baud rate generator.
  - When an external clock is selected, the external clock input must have a frequency 16 or 8 times the bit rate. (The on-chip baud rate generator is not used.)

### (2) Clock Synchronous Mode

- The transmission/reception format has a fixed 8-bit data length.
- In receiving, it is possible to detect overrun errors (ORER).
- An internal or external clock can be selected as the clock source.
  - When an internal clock is selected, this module operates using the clock of the on-chip baud rate generator, and outputs this clock to external devices as the synchronous clock.
  - When an external clock is selected, this module operates on the input external synchronous clock not using the on-chip baud rate generator.

**Table 14.9 SCSMR Settings and Communication Formats**

| SCSMR Settings | | | | | Communication Format | | |
|---|---|---|---|---|---|---|---|
| **Bit 7 C/A** | **Bit 6 CHR** | **Bit 5 PE** | **Bit 3 STOP** | **Mode** | **Data Length** | **Parity Bit** | **Stop Bit Length** |
| 0 | 0 | 0 | 0 | Asynchronous | 8 bits | Not set | 1 bit |
| | | | 1 | | | | 2 bits |
| | | 1 | 0 | | | Set | 1 bit |
| | | | 1 | | | | 2 bits |
| | 1 | 0 | 0 | | 7 bits | Not set | 1 bit |
| | | | 1 | | | | 2 bits |
| | | 1 | 0 | | | Set | 1 bit |
| | | | 1 | | | | 2 bits |
| 1 | x | x | x | Clock synchronous | 8 bits | Not set | None |

[Legend]
x: Don't care

**Table 14.10 SCSMR and SCSCR Settings and Clock Source Selection**

| SCSMR | SCSCR | | | |
|---|---|---|---|---|
| **Bit 7 C/A** | **Bit 1, 0 CKE[1:0]** | **Mode** | **Clock Source** | **SCK Pin Function** |
| 0 | 00 | Asynchronous | Internal | This module does not use the SCK pin. |
| | 01 | | | Outputs a clock with a frequency 16/8 times the bit rate |
| | 10 | | External | Inputs a clock with frequency 16/8 times the bit rate |
| | 11 | | Setting prohibited | |
| 1 | 0x | Clock synchronous | Internal | Outputs the synchronous clock |
| | 10 | | External | Inputs the synchronous clock |
| | 11 | | Setting prohibited | |

[Legend]
x: Don't care
Note: When using the baud rate generator in double-speed mode (BGMD = 1), select asynchronous mode by setting the C/$\overline{A}$ bit to 0, and select an internal clock as a clock source and the SCK pin is not used (the CKE[1:0] bits set to 00).

### 14.4.2 Operation in Asynchronous Mode

In asynchronous mode, each transmitted or received character begins with a start bit and ends with a stop bit. Serial communication is synchronized one character at a time.

The transmitting and receiving sections in this module are independent, so full duplex communication is possible. The transmitter and receiver are 16-stage FIFO buffered, so data can be written and read while transmitting and receiving are in progress, enabling continuous transmitting and receiving.

Figure 14.2 shows the general format of asynchronous serial communication.

In asynchronous serial communication, the communication line is normally held in the mark (high) state. This module monitors the line and starts serial communication when the line goes to the space (low) state, indicating a start bit.

One serial character consists of a start bit (low), data (LSB first), parity bit (high or low), and stop bit (high), in that order. When receiving in asynchronous mode, this module synchronizes at the falling edge of the start bit. This module samples each data bit on the eighth or fourth pulse of a clock with a frequency 16 or 8 times the bit rate; receive data is latched at the center of each bit.

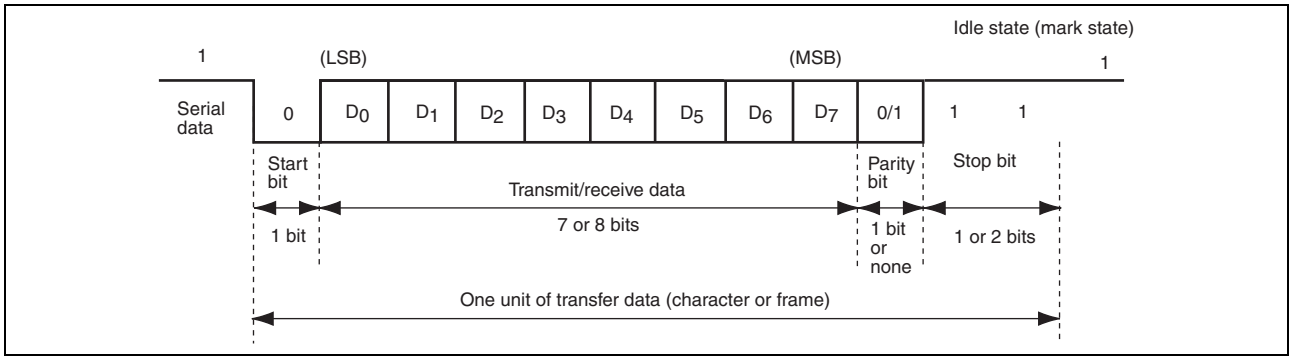

**Figure 14.2 Example of Data Format in Asynchronous Communication (8-Bit Data with Parity and Two Stop Bits)**

### (1) Transmit/Receive Formats

Table 14.11 lists the eight communication formats that can be selected in asynchronous mode. The format is selected by settings in the serial mode register (SCSMR).

**Table 14.11 Serial Communication Formats (Asynchronous Mode)**

| SCSMR Bits | | | Serial Transmit/Receive Format and Frame Length | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CHR | PE | STOP | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| 0 | 0 | 0 | START | 8-bit data | | | | | | | | STOP | | |
| 0 | 0 | 1 | START | 8-bit data | | | | | | | | STOP | STOP | |
| 0 | 1 | 0 | START | 8-bit data | | | | | | | | P | STOP | |
| 0 | 1 | 1 | START | 8-bit data | | | | | | | | P | STOP | STOP |
| 1 | 0 | 0 | START | 7-bit data | | | | | | | STOP | | | |
| 1 | 0 | 1 | START | 7-bit data | | | | | | | STOP | STOP | | |
| 1 | 1 | 0 | START | 7-bit data | | | | | | | P | STOP | | |
| 1 | 1 | 1 | START | 7-bit data | | | | | | | P | STOP | STOP | |

[Legend]
START: Start bit
STOP: Stop bit
P: Parity bit

### (2) Clock

An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected as the transmit/receive clock. The clock source is selected by the C/$\overline{A}$ bit in the serial mode register (SCSMR) and the CKE1 and CKE0 bits in the serial control register (SCSCR). For clock source selection, refer to Table 14.10, SCSMR and SCSCR Settings and Clock Source Selection.

When an external clock is input at the SCK pin, it must have a frequency equal to 16 or 8 times the desired bit rate. When this module operates on an internal clock, it can output a clock signal on the SCK pin. The frequency of this output clock is 16 or 8 times the desired bit rate.

### (3) Transmitting and Receiving Data

- Initialization (Asynchronous Mode)
  Before transmitting or receiving, clear the TE and RE bits to 0 in the serial control register (SCSCR), then initialize this module as follows.
  When changing the operation mode or the communication format, always clear the TE and RE bits to 0 before following the procedure given below. Clearing TE to 0 initializes the transmit shift register (SCTSR). Clearing TE and RE to 0, however, does not initialize the serial status register (SCFSR), transmit FIFO data register (SCFTDR), or receive FIFO data register (SCFRDR), which retain their previous contents. Clear TE to 0 after all transmit data has been transmitted and the TEND flag in the SCFSR is set. The TE bit can be cleared to 0 during transmission, but the transmit data goes to the Mark state after the bit is cleared to 0. Set the TFRST bit in SCFCR to 1 and reset SCFTDR before TE is set again to start transmission.
  When an external clock is used, the clock should not be stopped during initialization or subsequent operation. The operation becomes unreliable if the clock is stopped.

Figure 14.3 shows a sample flowchart for initialization.

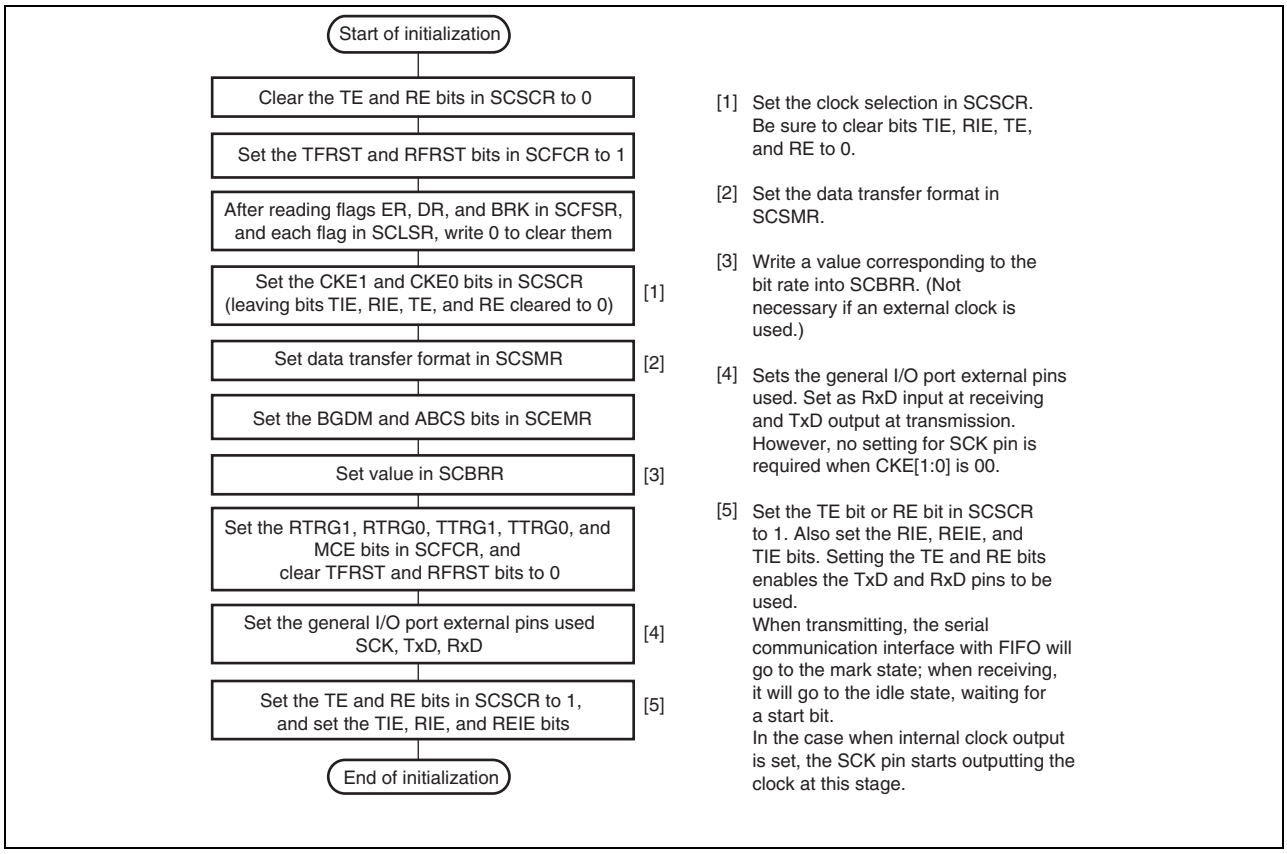

**Figure 14.3 Sample Flowchart for Initialization**

- Transmitting Serial Data (Asynchronous Mode)

  Figure 14.4 shows a sample flowchart for serial transmission.

  Use the following procedure for serial data transmission after enabling transmission.

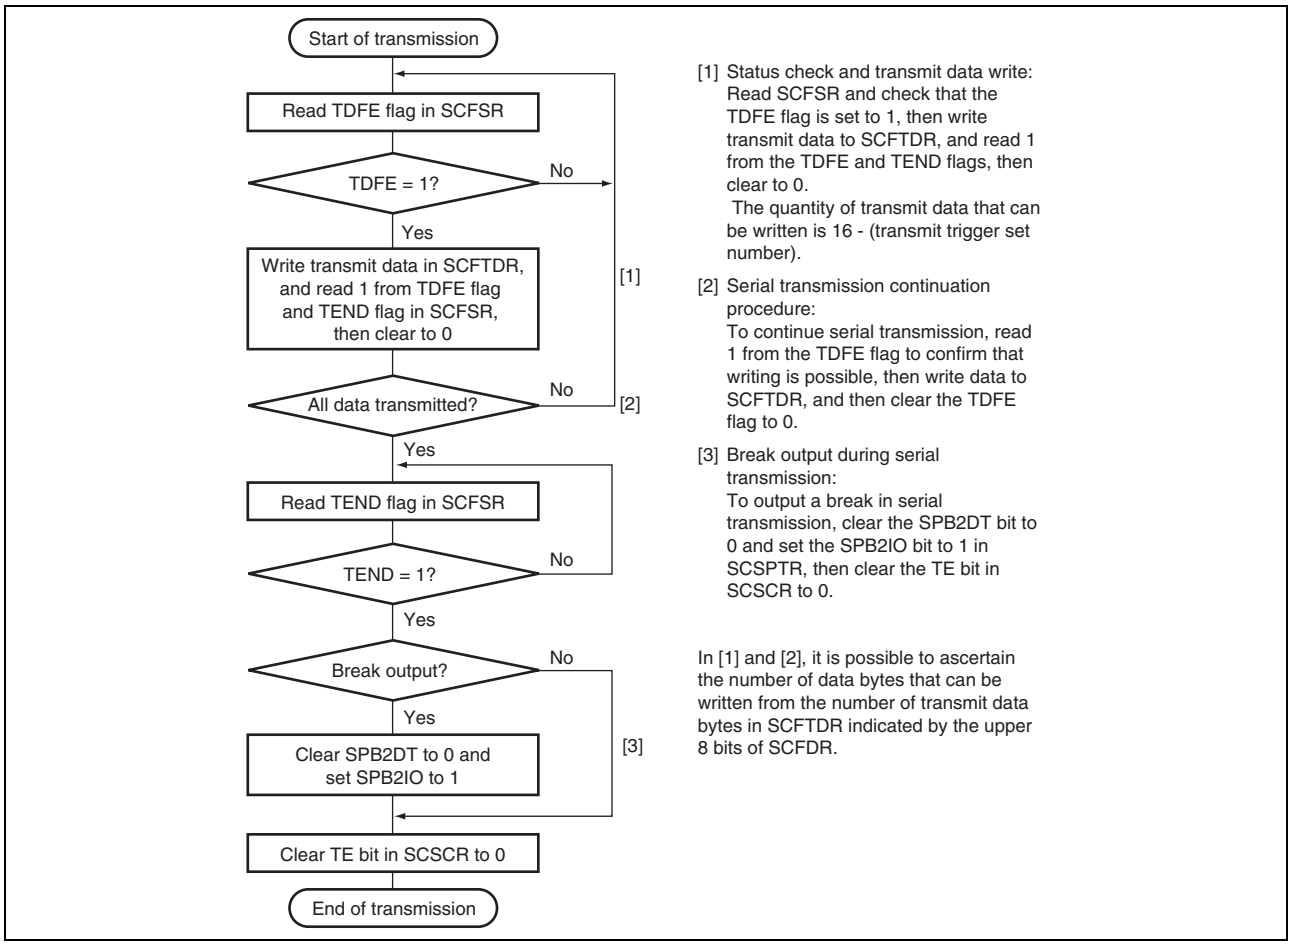

**Figure 14.4 Sample Flowchart for Transmitting Serial Data**

In serial transmission, this module operates as described below.

1. When data is written into the transmit FIFO data register (SCFTDR), the data is transferred from SCFTDR to the transmit shift register (SCTSR). Confirm that the TDFE flag in the serial status register (SCFSR) is set to 1 before writing transmit data to SCFTDR. The number of data bytes that can be written is (16 – transmit trigger setting).

2. When data is transferred from SCFTDR to SCTSR and transmission is started, consecutive transmit operations are performed until there is no transmit data left in SCFTDR. When the number of transmit data bytes in SCFTDR becomes equal to or less than the transmit trigger number set in the FIFO control register (SCFCR), the TDFE flag is set. If the TIE bit in the serial control register (SCSR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated.
   The serial transmit data is sent from the TxD pin in the following order.

   A. Start bit: One-bit 0 is output.
   B. Transmit data: 8-bit or 7-bit data is output in LSB-first order.
   C. Parity bit: One parity bit (even or odd parity) is output. (A format in which a parity bit is not output can also be selected.)
   D. Stop bit(s): One or two 1 bits (stop bits) are output.
   E. Mark state: 1 is output continuously until the start bit that starts the next transmission is sent.

3. The SCFTDR transmit data is checked at the timing for sending the stop bit. If data is present, the data is transferred from SCFTDR to SCTSR, the stop bit is sent, and then serial transmission of the next frame is started.

Figure 14.5 shows an example of the operation for transmission.

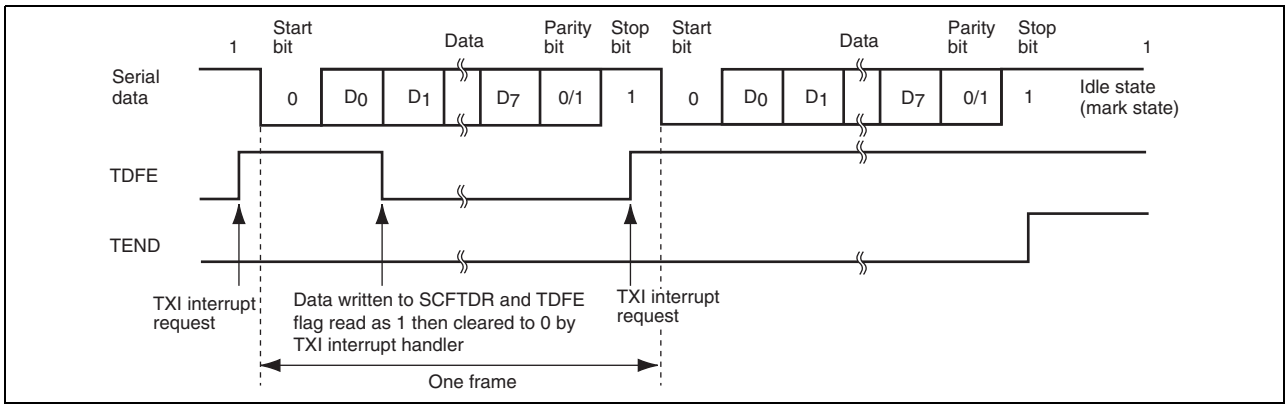

**Figure 14.5 Example of Transmit Operation (8-Bit Data, Parity, 1 Stop Bit)**

4. When modem control is enabled in channels 1, 5, and 7, transmission can be stopped and restarted in accordance with the $\overline{\text{CTS}}$ input value. When $\overline{\text{CTS}}$ is set to 1, if transmission is in progress, the line goes to the mark state after transmission of one frame. When $\overline{\text{CTS}}$ is set to 0, the next transmit data is output starting from the start bit.

Figure 14.6 shows an example of the operation when modem control is used.

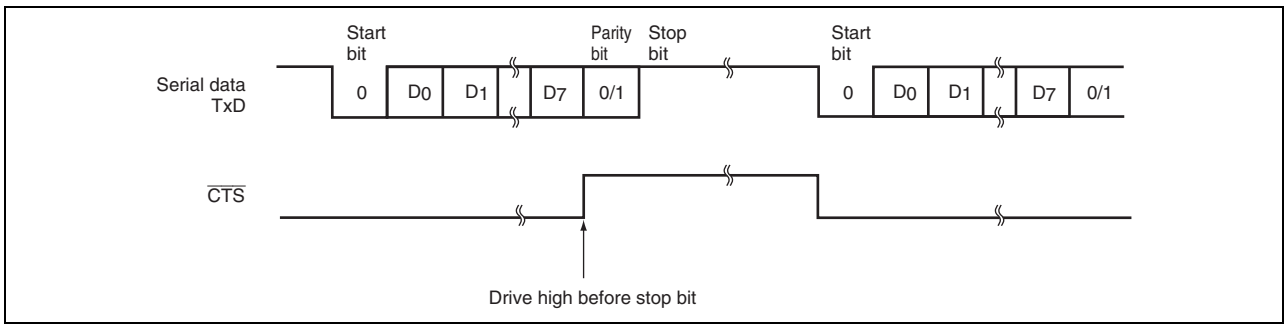

**Figure 14.6 Example of Operation Using Modem Control ($\overline{\text{CTS}}$)**

- Receiving Serial Data (Asynchronous Mode)

  Figure 14.7 and Figure 14.8 show sample flowcharts for serial reception.
  Use the following procedure for serial data reception after enabling reception.

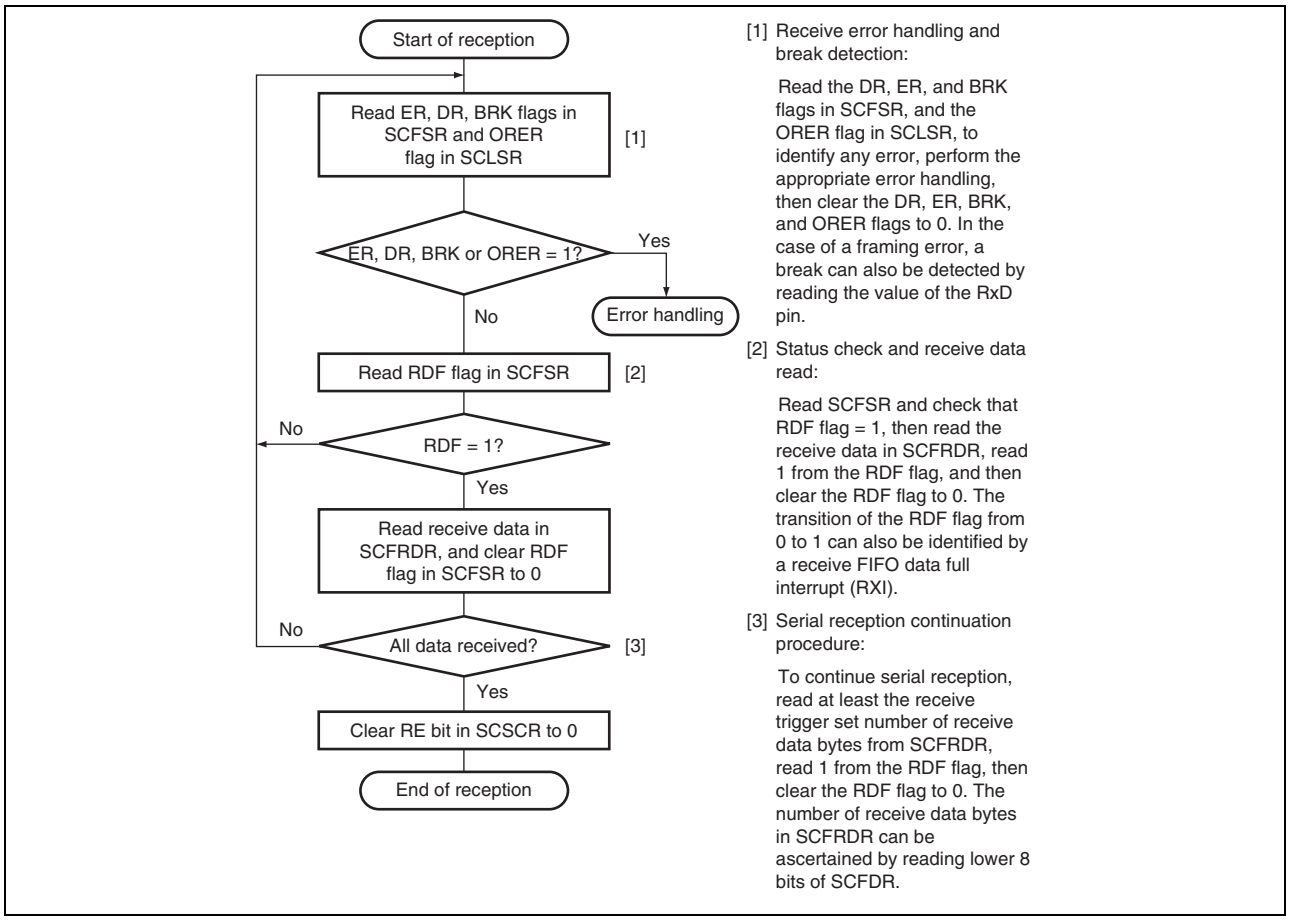

**Figure 14.7 Sample Flowchart for Receiving Serial Data (1)**

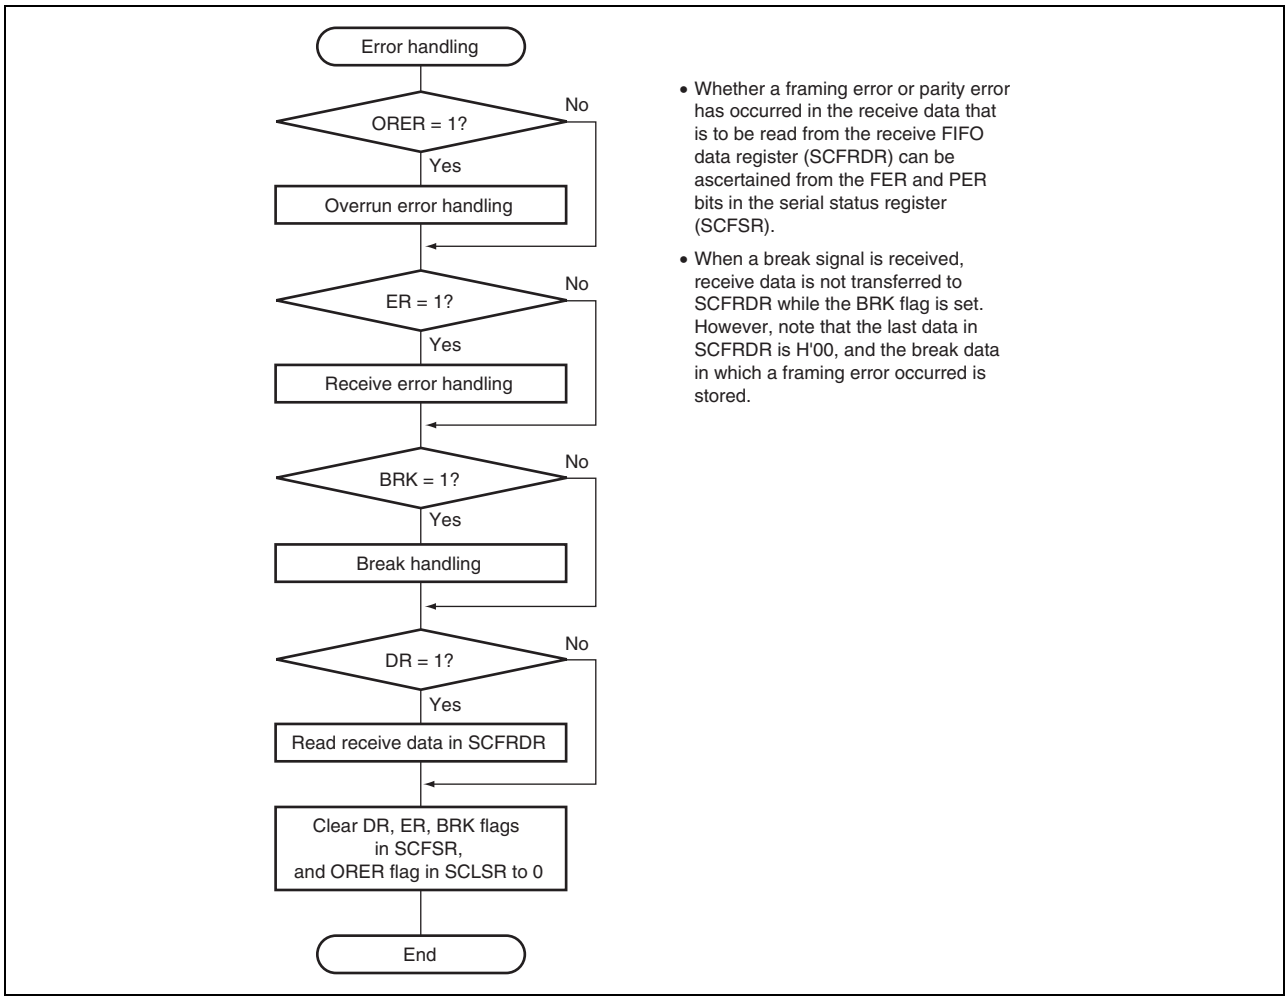

**Figure 14.8 Sample Flowchart for Receiving Serial Data (2)**

In serial reception, this module operates as described below.

1. The transmission line is monitored, and if a 0 start bit is detected, internal synchronization is performed and reception is started.

2. The received data is stored in SCRSR in LSB-to-MSB order.

3. The parity bit and stop bit are received.
   After receiving these bits, this module carries out the following checks.

   A. Stop bit check: Checks whether the stop bit is 1. If there are two stop bits, only the first is checked.
   B. Checks whether receive data can be transferred from the receive shift register (SCRSR) to SCFRDR.
   C. Overrun check: Checks that the ORER flag is 0, indicating that the overrun error has not occurred.
   D. Break check: Checks that the BRK flag is 0, indicating that the break state is not set.

   If all the above checks are passed, the receive data is stored in SCFRDR.

   Note: When a parity error or a framing error occurs, reception is not suspended.

4. If the RIE bit in SCSCR is set to 1 when the RDF or DR flag changes to 1, a receive-FIFO-data-full interrupt (RXI) request is generated. If the RIE bit or the REIE bit in SCSCR is set to 1 when the ER flag changes to 1, a receive-error interrupt (ERI) request is generated. If the RIE bit or the REIE bit in SCSCR is set to 1 when the BRK or ORER flag changes to 1, a break reception interrupt (BRI) request is generated.

Figure 14.9 shows an example of the operation for reception in asynchronous mode.

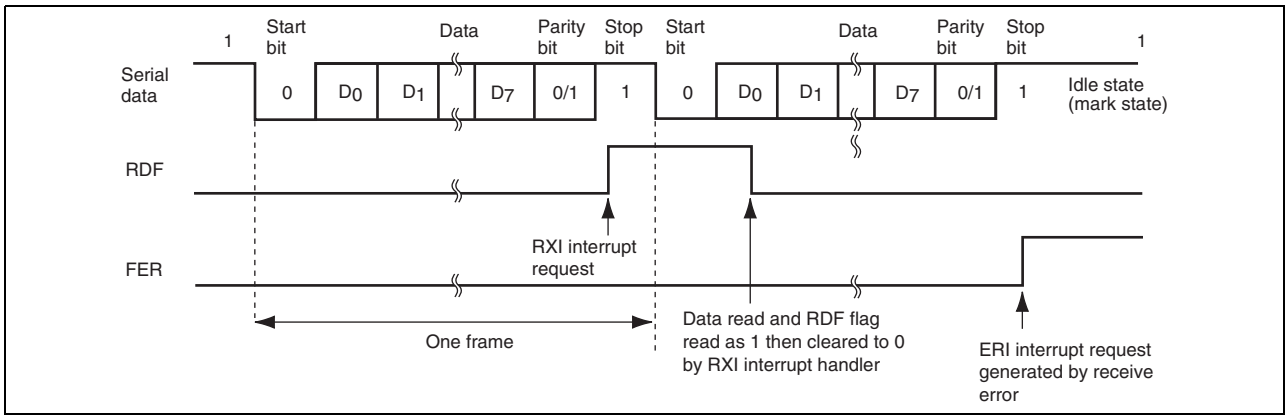

**Figure 14.9 Example of Receive Operation(8-Bit Data, Parity, 1 Stop Bit)**

5. When modem control is enabled in channels 1, 5, and 7, the $\overline{\text{RTS}}$ signal is output when SCFRDR is empty. When $\overline{\text{RTS}}$ is 0, reception is possible. When $\overline{\text{RTS}}$ is 1, this indicates that the quantity of data stored in SCFRDR has become equal to or greater than the number set for the RTS output active trigger.

Figure 14.10 shows an example of the operation when modem control is used.

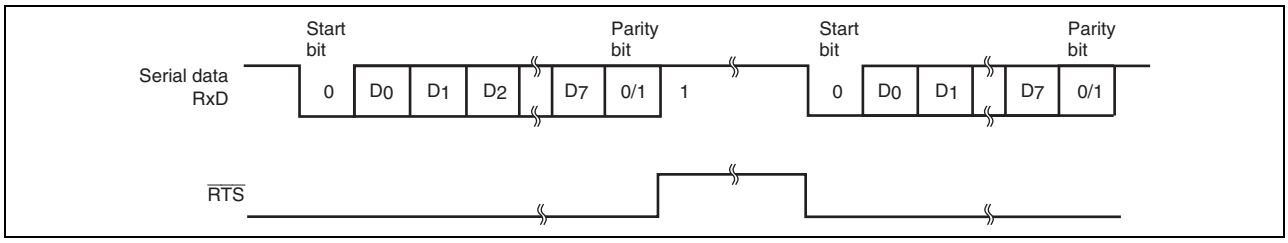

**Figure 14.10 Example of Operation Using Modem Control ($\overline{\text{RTS}}$)**

### 14.4.3 Operation in Clock Synchronous Mode

In clock synchronous mode, data is transmitted and received in synchronization with clock pulses. This mode is suitable for high-speed serial communication.

The transmitter and receiver in this module are independent, so full-duplex communication is possible while sharing the same clock. The transmitter and receiver are also 16-stage FIFO buffered, so continuous transmitting or receiving is possible by reading or writing data while transmitting or receiving is in progress.

Figure 14.11 shows the general format in clock synchronous serial communication.

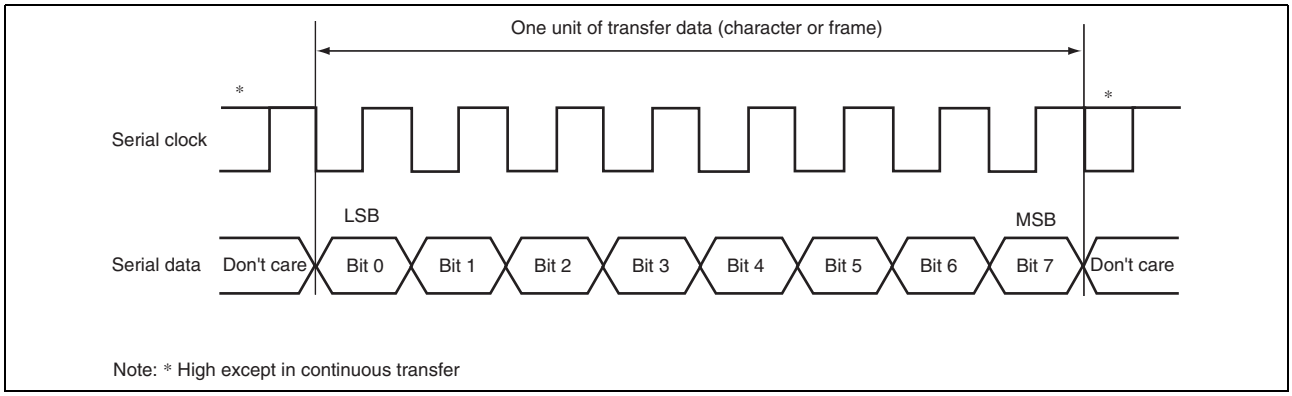

**Figure 14.11 Data Format in Clock Synchronous Communication**

In clock synchronous serial communication, each data bit is output on the communication line from one falling edge of the serial clock to the next. Data is guaranteed valid at the rising edge of the serial clock.

In each character, the serial data bits are transmitted in order from the LSB (first) to the MSB (last). After output of the MSB, the communication line remains in the state of the MSB.

In clock synchronous mode, data is received in synchronization with the rising edge of the synchronous clock.

### (1) Transmit/Receive Formats

The data length is fixed at eight bits. No parity bit can be added.

### (2) Clock

An internal clock generated by the on-chip baud rate generator or an external synchronous clock input from the SCK pin can be selected by setting the C/$\overline{A}$ bit in SCSMR and the CKE[1:0] bits in SCSCR,.

When this module operates on an internal clock, it outputs the synchronous clock signal at the SCK pin. Eight clock pulses are output per one character transmission or reception. When transmission or reception is not performed, the clock signal remains in the high state. When only receiving is performed with the internal clock selected, the clock signal pulses are output while the RE bit of SCSCR is 1 and the number of data in receive FIFO is more than the receive FIFO data trigger number.

### (3) Transmitting and Receiving Data

- Initialization (Clock Synchronous Mode)
  Before transmitting, receiving, or changing the mode or communication format, the software must clear the TE and RE bits to 0 in the serial control register (SCSCR), and then initialize this module following the procedure described below.

  Clearing TE to 0 initializes the transmit shift register (SCTSR). Clearing RE to 0, however, does not initialize the RDF, PER, FER, and ORER flags and receive data register (SCRDR), which retain their previous contents.

Figure 14.12 shows a sample flowchart for initialization.

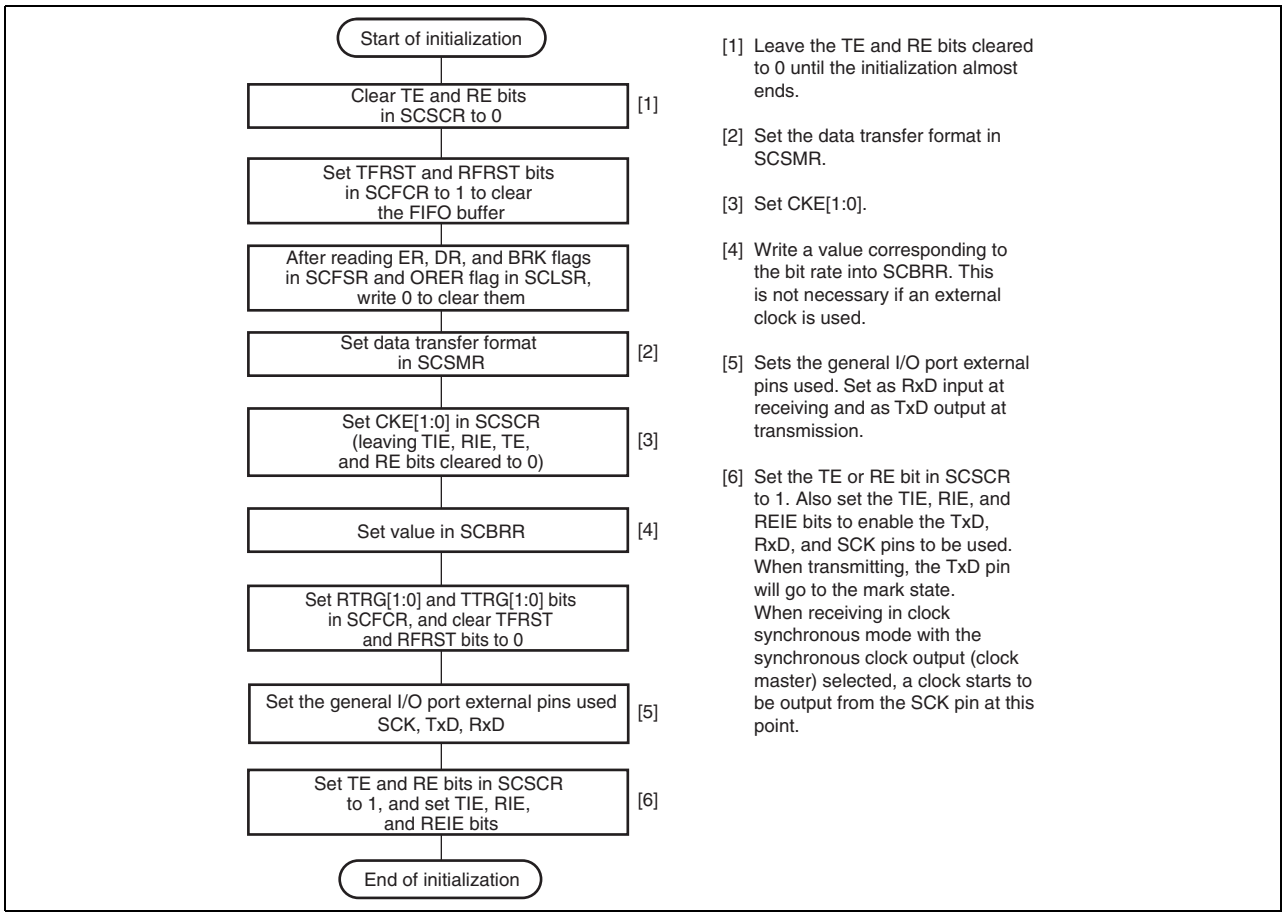

**Figure 14.12 Sample Flowchart for Initialization**

- Transmitting Serial Data (Clock Synchronous Mode)

  Figure 14.13 shows a sample flowchart for transmitting serial data.
  Use the following procedure for serial data transmission after enabling transmit operation.

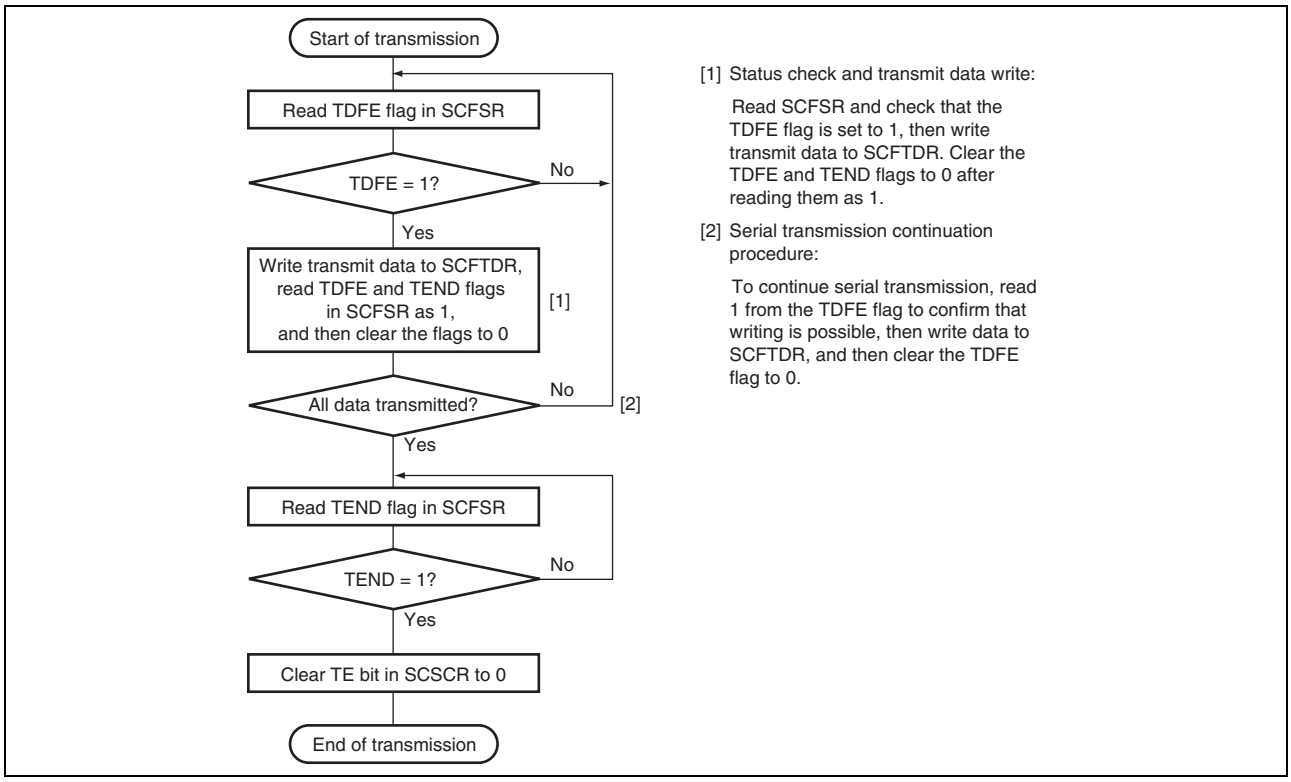

**Figure 14.13 Sample Flowchart for Transmitting Serial Data**

In serial transmission, this module operates as described below.

1. When data is written into the transmit FIFO data register (SCFTDR), the data is transferred from SCFTDR to the transmit shift register (SCTSR). Confirm that the TDFE flag in the serial status register (SCFSR) is set to 1 before writing transmit data to SCFTDR. The number of transmit data bytes that can be written is (16 – transmit trigger setting).

2. When data is transferred from SCFTDR to SCTSR and transmission is started, consecutive transmit operations are performed until there is no transmit data left in SCFTDR. When the number of transmit data bytes in SCFTDR falls below the transmit trigger number set in the FIFO control register (SCFCR), the TDFE flag is set. If the TIE bit in the serial control register (SCSCR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated.
   If clock output mode is selected, eight synchronous clock pulses are output. If an external clock source is selected, data is output in synchronization with the input clock. Data is output from the TxD pin in order from the LSB (bit 0) to the MSB (bit 7).

3. The SCFTDR transmit data is checked at the timing for sending the MSB (bit 7). If data is present, the data is transferred from SCFTDR to SCTSR, and then serial transmission of the next frame is started. If there is no data, the TxD pin holds the state after the TEND flag in SCFSR is set to 1 and the MSB (bit 7) is sent.

4. After the end of serial transmission, the SCK pin is held in the high state.

Figure 14.14 shows an example of transmit operation.

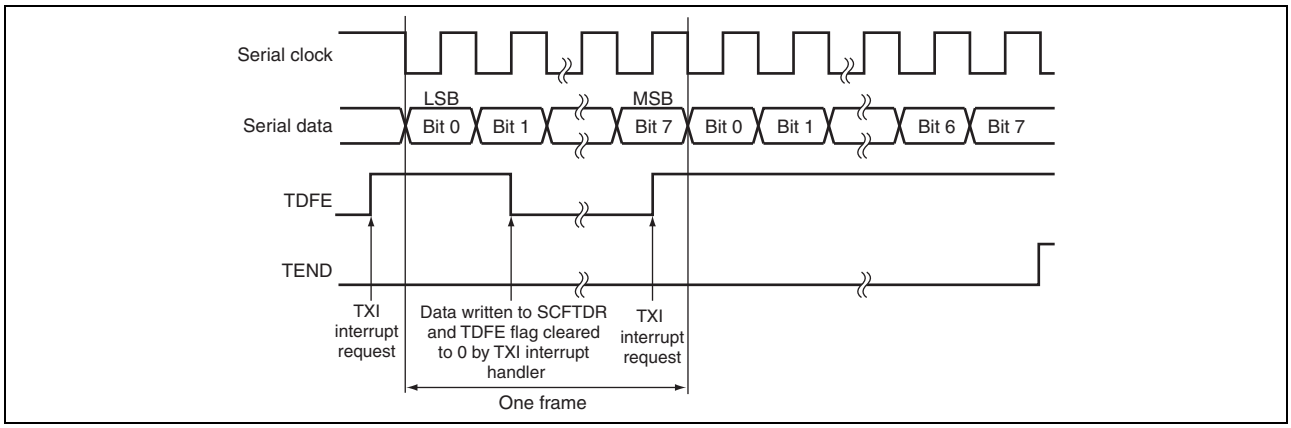

**Figure 14.14 Example of Transmit Operation**

- Receiving Serial Data (Clock Synchronous Mode)

  Figure 14.15 and Figure 14.16 show sample flowcharts for receiving serial data. Use the following procedure for serial data reception after enabling receive operation. When switching from asynchronous mode to clock synchronous mode without initialization, make sure that ORER, PER, and FER are cleared to 0.

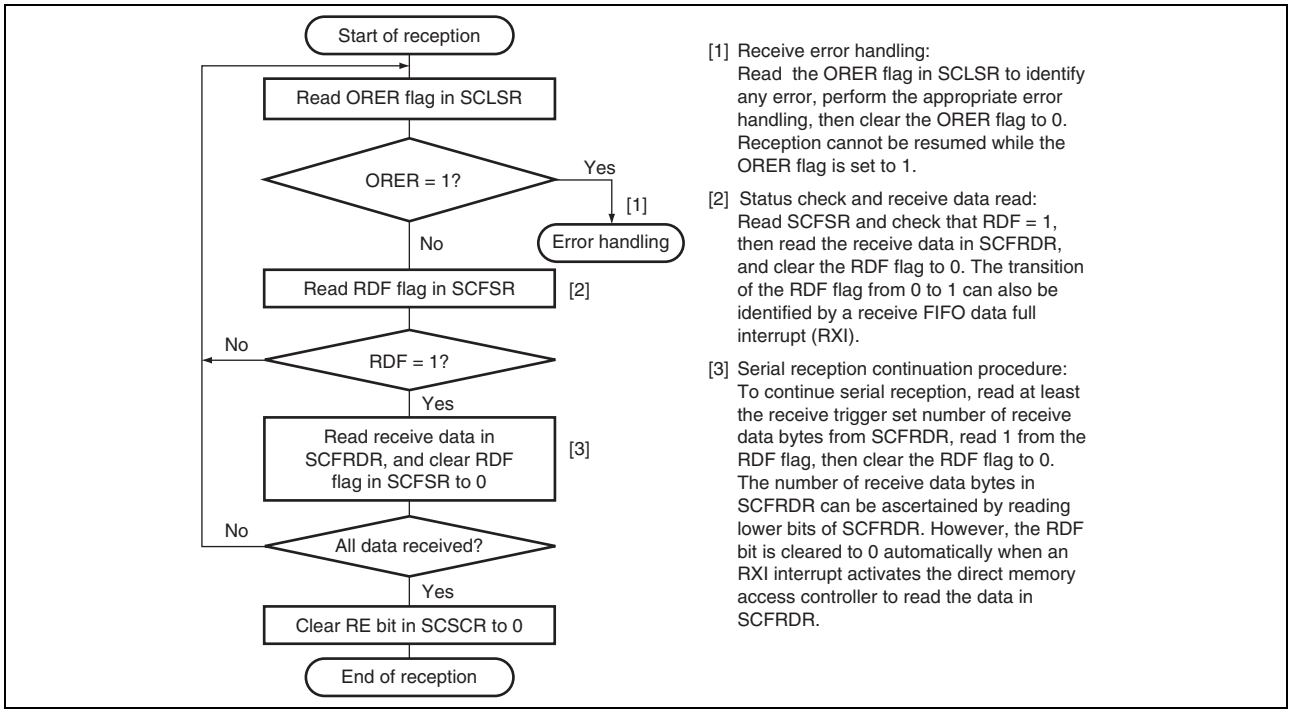

**Figure 14.15 Sample Flowchart for Receiving Serial Data (1)**

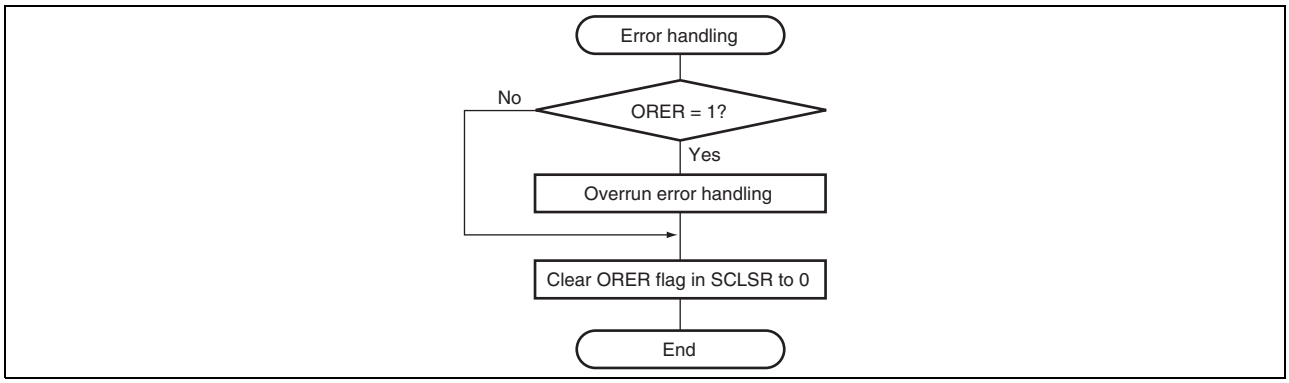

**Figure 14.16 Sample Flowchart for Receiving Serial Data (2)**

In serial reception, this module operates as described below.

1. Reception is started in synchronization with synchronous clock input or output.

2. Receive data is shifted into SCRSR in order from the LSB to the MSB. After the data reception, whether the receive data can be loaded from SCRSR into SCFRDR or not is checked. If this check is passed, the RDF flag is set to 1 and the received data is stored in SCFRDR. If the check is not passed (overrun error is detected), further reception is prevented.

3. After setting RDF to 1, if the receive interrupt enable bit (RIE) is set to 1 in SCSCR, a receive FIFO data full interrupt (RXI) request is generated. If the ORER bit is set to 1 and the receive interrupt enable bit (RIE) or the receive error interrupt enable bit (REIE) in SCSCR is also set to 1, a break interrupt (BRI) request is generated.

Figure 14.17 shows an example of receive operation.

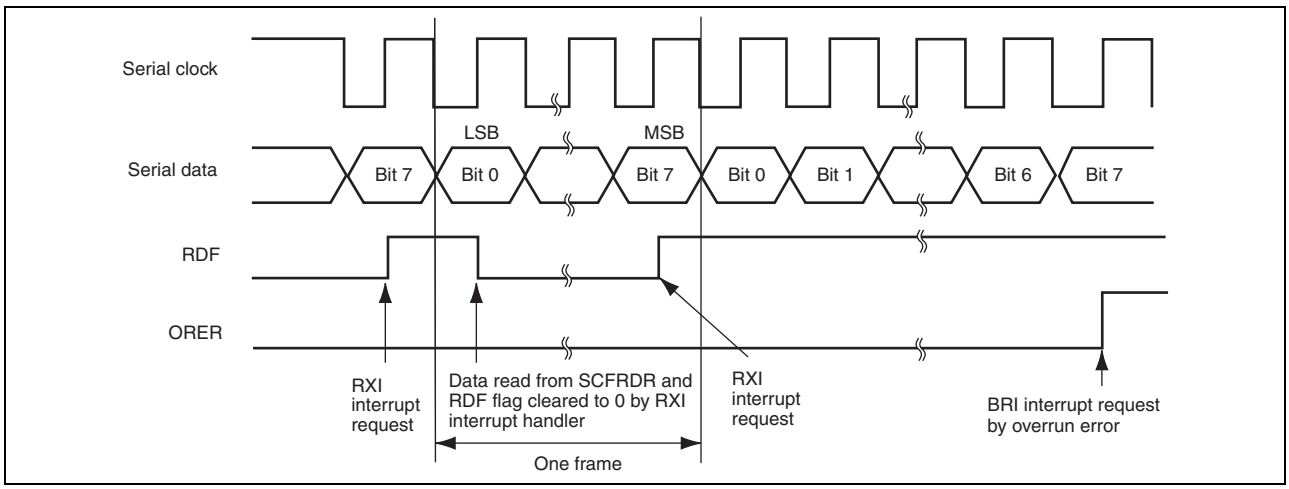

**Figure 14.17 Example of Receive Operation**

- Transmitting and Receiving Serial Data Simultaneously (Clock Synchronous Mode)

  Figure 14.18 shows a sample flowchart for transmitting and receiving serial data simultaneously.
  Use the following procedure for the simultaneous transmission/reception of serial data, after enabling transmit/receive operation.

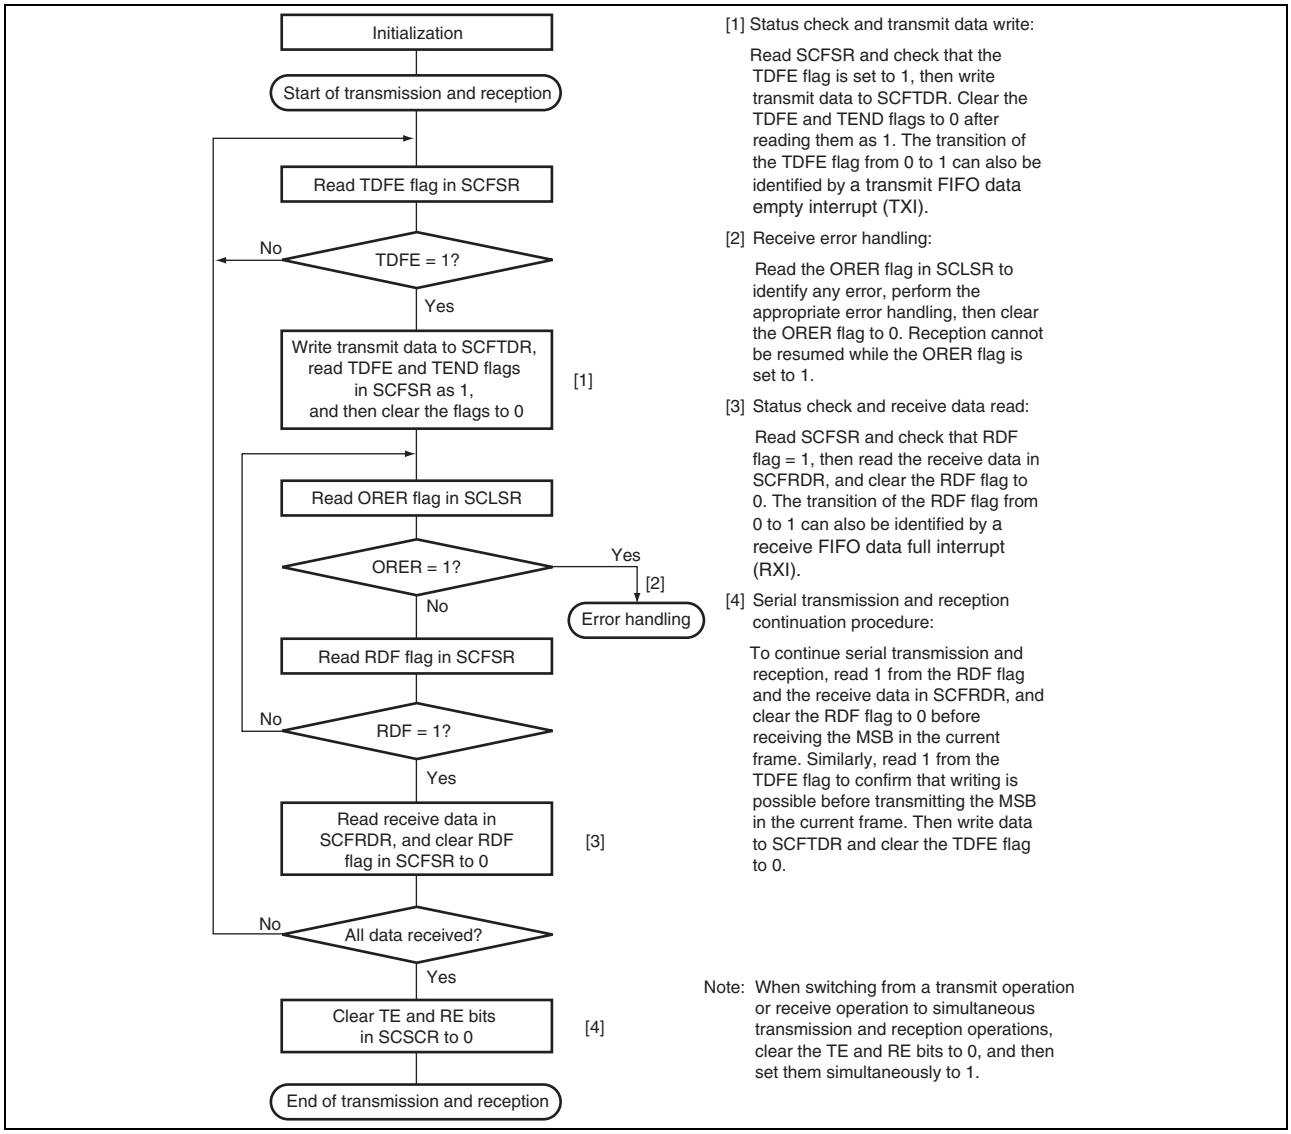

**Figure 14.18 Sample Flowchart for Transmitting/Receiving Serial Data**

## 14.5 Interrupts

This module has four interrupt sources: transmit-FIFO-data-empty (TXI), receive-error (ERI), receive FIFO data full (RXI), and break (BRI).

Table 14.12 shows the interrupt sources and their order of priority. The interrupt sources are enabled or disabled by means of the TIE, RIE, and REIE bits in SCSCR. A separate interrupt request is sent to the interrupt controller for each of these interrupt sources.

When a TXI request is enabled by the TIE bit and the TDFE flag in the serial status register (SCFSR) is set to 1, a TXI interrupt request is generated. The direct memory access controller can be activated and data transfer performed by this TXI interrupt request. At this time, an interrupt request is not sent to the CPU.

When an RXI request is enabled by the RIE bit and the RDF flag or the DR flag in SCFSR is set to 1, an RXI interrupt request is generated. The direct memory access controller can be activated and data transfer performed by this RXI interrupt request. At this time, an interrupt request is not sent to the CPU. The RXI interrupt request caused by the DR flag is generated only in asynchronous mode.

When the RIE bit is set to 0 and the REIE bit is set to 1, this module requests only an ERI or a BRI interrupt without requesting an RXI interrupt.

The TXI indicates that transmit data can be written, and the RXI indicates that there is receive data in SCFRDR.

**Table 14.12 Interrupt Sources**

| Interrupt Source | Description | Direct Memory Access Controller Activation | Priority on Reset Release |
|---|---|---|---|
| BRI | Interrupt initiated by break (BRK) or overrun error (ORER) | Not possible | High |
| ERI | Interrupt initiated by receive error (ER) | Not possible | ↕ |
| RXI | Interrupt initiated by receive FIFO data full (RDF) or data ready (DR) | Possible | |
| TXI | Interrupt initiated by transmit FIFO data empty (TDFE) | Possible | Low |

## 14.6 Usage Notes

Note the following when using this module.

### 14.6.1 SCFTDR Writing and TDFE Flag

The TDFE flag in the serial status register (SCFSR) is set when the number of transmit data bytes written in the transmit FIFO data register (SCFTDR) has fallen below the transmit trigger number set by bits TTRG[1:0] in the FIFO control register (SCFCR). After the TDFE flag is set, transmit data up to the number of empty bytes in SCFTDR can be written, allowing efficient continuous transmission.

However, if the number of data bytes written in SCFTDR is equal to or less than the transmit trigger number, the TDFE flag will be set to 1 again after being read as 1 and cleared to 0. The TDFE flag should therefore be cleared to 0 after being read as 1 when SCFTDR contains more than the transmit trigger number of transmit data bytes.

The number of transmit data bytes in SCFTDR can be found from the upper 8 bits of the FIFO data count register (SCFDR).

### 14.6.2 SCFRDR Reading and RDF Flag

The RDF flag in the serial status register (SCFSR) is set when the number of receive data bytes in the receive FIFO data register (SCFRDR) has become equal to or greater than the receive trigger number set by bits RTRG[1:0] in the FIFO control register (SCFCR). After RDF flag is set, receive data equivalent to the trigger number can be read from SCFRDR, allowing efficient continuous reception.

However, if the number of data bytes in SCFRDR exceeds the trigger number, the RDF flag will be set to 1 again after being read as 1 and then cleared to 0. The RDF flag should therefore be cleared to 0 after being read as 1 after reading the number of the received data in the receive FIFO data register (SCFRDR) which is less than the trigger number.

The number of receive data bytes in SCFRDR can be found from the lower 8 bits of the FIFO data count register (SCFDR).

### 14.6.3 Restriction on Direct Memory Controller Usage

When the direct memory access controller writes data to SCFTDR due to a TXI interrupt request, the state of the TEND flag becomes undefined. Therefore, the TEND flag should not be used as the transfer end flag in such a case.

### 14.6.4 Break Detection and Processing

Break signals can be detected by reading the RxD pin directly when a framing error (FER) is detected. In the break state the input from the RxD pin consists of all 0s, so the FER flag is set and the parity error flag (PER) may also be set.

Note that, although transfer of receive data to SCFRDR is halted in the break state, the receive operation is continued.

### 14.6.5 Sending a Break Signal

The I/O condition and level of the TxD pin are determined by the SPB2IO and SPB2DT bits in the serial port register (SCSPTR). This feature can be used to send a break signal.

Until TE bit is set to 1 (enabling transmission) after initializing, the TxD pin does not work. During the period, mark status is performed by the SPB2DT bit. Therefore, the SPB2IO and SPB2DT bits should be set to 1 (high level output).

To send a break signal during serial transmission, clear the SPB2DT bit to 0 (designating low level), then clear the TE bit to 0 (halting transmission). When the TE bit is cleared to 0, the transmitter is initialized regardless of the current transmission state, and 0 is output from the TxD pin.

### 14.6.6 Receive Data Sampling Timing and Receive Margin (Asynchronous Mode)

This module operates on a base clock with a frequency 16 or 8 times the bit rate. In reception, the falling edge of the start bit is sampled at the base clock to perform synchronization internally. Receive data is latched at the rising edge of the eighth or fourth base clock pulse. When this module operates on a base clock with a frequency 16 times the bit rate, the receive data is sampled at the timing shown in Figure 14.19.

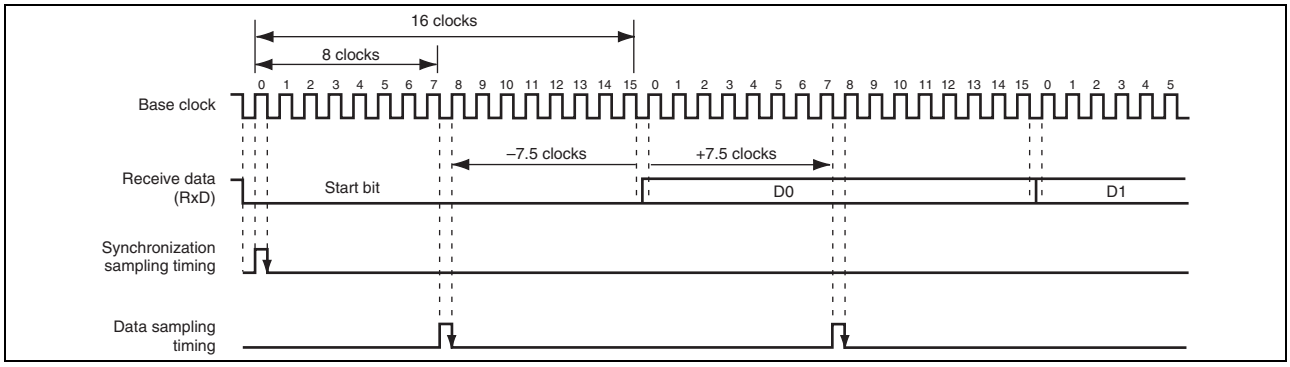

**Figure 14.19 Receive Data Sampling Timing in Asynchronous Mode (Operation on a Base Clock with a Frequency 16 Times the Bit Rate)**

The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

Equation 1:

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\ \%$$

Where: M: Receive margin (%)
N: Ratio of clock frequency to bit rate (N = 16 or 8)
D: Clock duty (D = 0 to 1.0)
L: Frame length (L = 9 to 12)
F: Absolute deviation of clock frequency

From equation 1, if F = 0, D = 0.5 and N = 16, the receive margin is 46.875%, as given by equation 2.

**Equation 2:**

When D = 0.5 and F = 0:

$M = (0.5 - 1/(2 \times 16)) \times 100\%$

$= 46.875\%$

This is a theoretical value. A reasonable margin to allow in system designs is 20% to 30%.

### 14.6.7 Selection of Base Clock in Asynchronous Mode

In this LSI, when asynchronous mode is selected, the base clock frequency within a bit period can be set to the frequency 16 or 8 times the bit rate by setting the ABCS bit in SCEMR.

Note that, however, if the base clock frequency 8 times the bit rate is used, receive margin is decreased as calculated using equation 1 in section 14.6.6, Receive Data Sampling Timing and Receive Margin (Asynchronous Mode).

If the desired bit rate can be set simply by setting SCBRR and the CKS1and CKS0 bits in SCSMR, it is recommended to use the base clock frequency within a bit period 16 times the bit rate (by setting the ABCS bit in SCEMR to 0). If an internal clock is selected as a clock source and the SCK pin is not used, the bit rate can be increased without decreasing receive margin by selecting double-speed mode for the baud rate generator (setting the BGDM bit in SCEMR to 1).

# 15. Serial Communications Interface

This LSI has two independent serial communications interface (SCI) channels.
The SCI can handle both asynchronous and clock synchronous serial communications.
Asynchronous serial data communications can be carried out with standard asynchronous communications chips such as a Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communications Interface Adapter (ACIA).
As an extended function in asynchronous communications mode, the SCI also supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards).

## 15.1 Overview

Table 15.1 lists the specifications of the SCI module.
Figure 15.1 is a block diagram of the SCI module.

**Table 15.1 Specifications of SCI**

| Item | | Specifications |
|---|---|---|
| Serial communications mode | | • Asynchronous operation<br>• Clock synchronous operation<br>• Smart card interface |
| Transfer speed | | Bit rate specifiable with on-chip baud rate generator. |
| Full-duplex communications | | Transmitter: Enables continuous transmission by double-buffering.<br>Receiver: Enables continuous reception by double-buffering. |
| I/O pins | | See Table 15.2. |
| Data transfer | | Selectable as LSB-first or MSB-first transfer |
| Interrupt sources | | Transmit-end, transmit-data-empty, receive-data-full, and receive error |
| Power consumption reduction function | | Module-standby state can be set for each channel. |
| Asynchronous mode | Data length | 7 or 8 bits |
| | Transmission stop bit | 1 or 2 bits |
| | Parity | Even, odd, or none |
| | Receive error detection | Parity, overrun, and framing errors |
| | Hardware flow control | CTSn and RTSn pins can be used in transfer control. |
| | Break detection | Break can be detected by reading RXDn pin level directly in case of a framing error |
| | Clock source | Selectable from internal or external clock |
| | Multi-processor communications function | Serial communication among multiple processors |
| | Noise cancellation | The signal paths from input on the RXDn pins incorporate digital noise filters. |
| Clock synchronous mode | Data length | 8 bits |
| | Receive error detection | Overrun errors |
| | Hardware flow control | CTSn and RTSn pins can be used in transfer control. |
| Smart card interface mode | Error processing | An error signal can be automatically transmitted on detection of a parity error during reception |
| | | Data can be automatically re-transmitted on receiving an error signal during transmission |
| | Data type | Both direct convention and inverse convention are supported. |

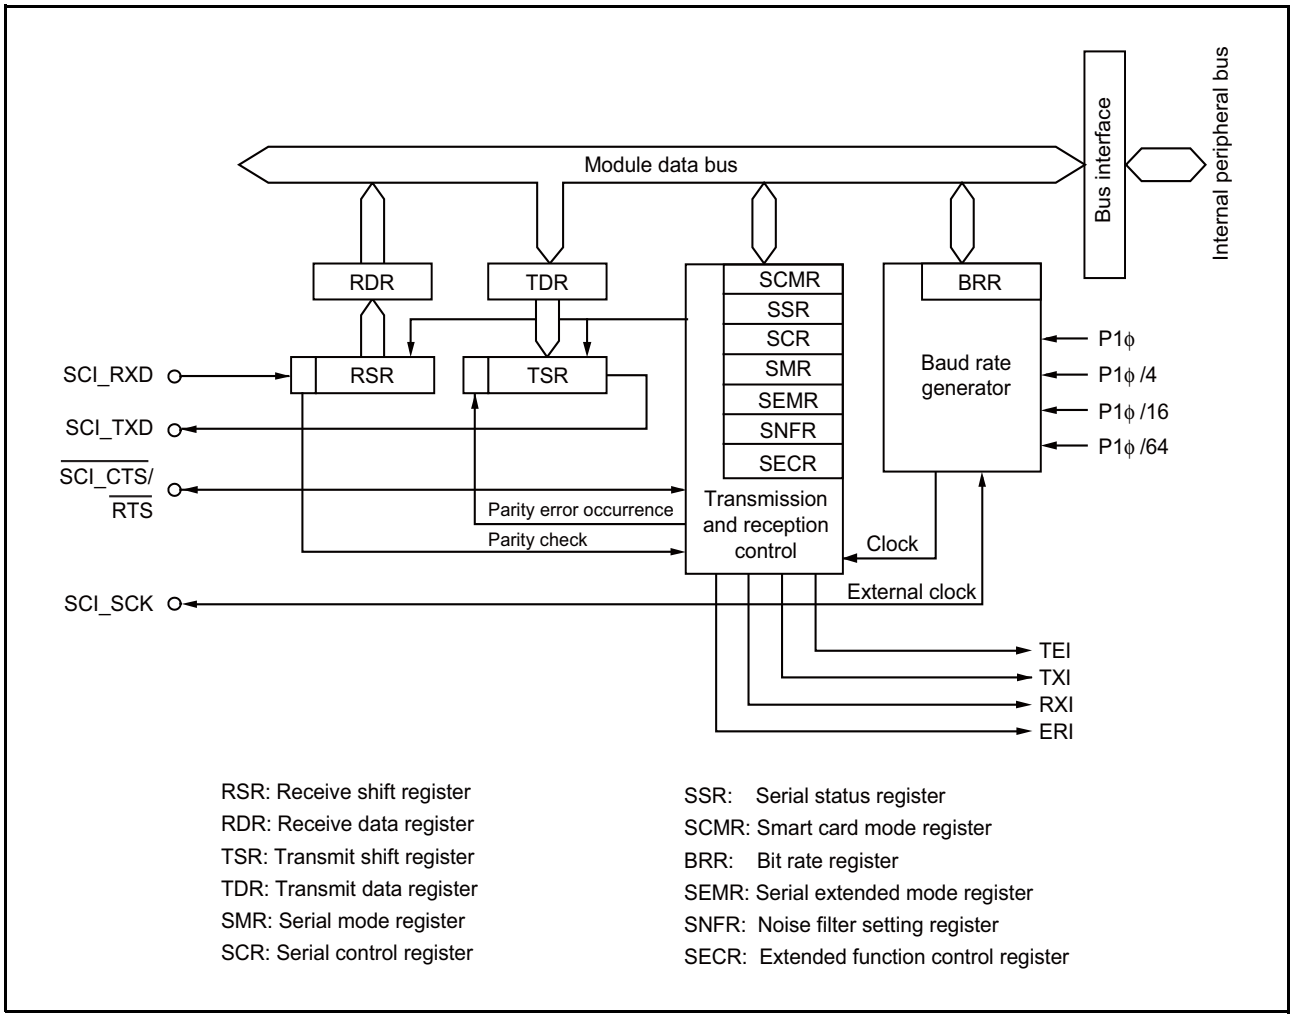

**Figure 15.1 Block Diagram of SCI**

Table 15.2 lists the pin configuration of the SCIs.

**Table 15.2 Input and Output Pins of the SCIs**

| Channel | Pin Name | I/O | Function |
|---|---|---|---|
| SCI0 | SCI_SCK0 | I/O | SCI0 clock input/output |
| | SCI_RXD0 | Input | SCI0 receive data input |
| | SCI_TXD0 | Output | SCI0 transmit data output |
| | $\overline{\text{SCI_CTS0}}$/$\overline{\text{RTS0}}$ | I/O | SCI0 transfer start control input/output |
| SCI1 | SCI_SCK1 | I/O | SCI1 clock input/output |
| | SCI_RXD1 | Input | SCI1 receive data input |
| | SCI_TXD1 | Output | SCI1 transmit data output |
| | $\overline{\text{SCI_CTS1}}$/$\overline{\text{RTS1}}$ | I/O | SCI1 transfer start control input/output |

Note: • These pins are referred to as SCKn, RXDn, TXDn, RTSn#, and CTSn# in the text in this section.

## 15.2 Register Descriptions

Table 15.3 is a list of registers.

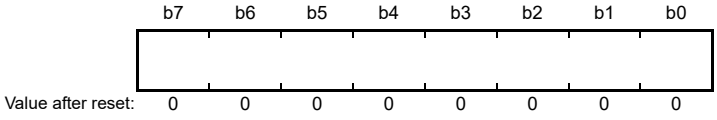
**Table 15.3 List of Registers**

| Channel | Register Name | Symbol | Value after Reset | Address | Access size |
|---|---|---|---|---|---|
| 0 | Serial mode register 0 | SMR0 | H'00 | H'E800B000 | 8 |
| | Bit rate register 0 | BRR0 | H'FF | H'E800B001 | 8 |
| | Serial control register 0 | SCR0 | H'00 | H'E800B002 | 8 |
| | Transmit data register 0 | TDR0 | H'FF | H'E800B003 | 8 |
| | Serial status register 0 | SSR0 | H'84 | H'E800B004 | 8 |
| | Receive data register 0 | RDR0 | H'00 | H'E800B005 | 8 |
| | Smart card mode register 0 | SCMR0 | H'F2 | H'E800B006 | 8 |
| | Serial extended mode register 0 | SEMR0 | H'00 | H'E800B007 | 8 |
| | Noise filter setting register 0 | SNFR0 | H'00 | H'E800B008 | 8 |
| | Extended function control register 0 | SECR0 | H'00 | H'E800B00D | 8 |
| 1 | Serial mode register 1 | SMR1 | H'00 | H'E800B800 | 8 |
| | Bit rate register 1 | BRR1 | H'FF | H'E800B801 | 8 |
| | Serial control register 1 | SCR1 | H'00 | H'E800B802 | 8 |
| | Transmit data register 1 | TDR1 | H'FF | H'E800B803 | 8 |
| | Serial status register 1 | SSR1 | H'84 | H'E800B804 | 8 |
| | Receive data register 1 | RDR1 | H'00 | H'E800B805 | 8 |
| | Smart card mode register 1 | SCMR1 | H'F2 | H'E800B806 | 8 |
| | Serial extended mode register 1 | SEMR1 | H'00 | H'E800B807 | 8 |
| | Noise filter setting register 1 | SNFR1 | H'00 | H'E800B808 | 8 |
| | Extended function control register 1 | SECR1 | H'00 | H'E800B80D | 8 |

### 15.2.1 Receive Shift Register (RSR)

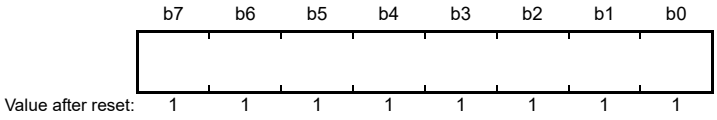
RSR is a shift register which is used to receive serial data input from the RXDn pin and converts it into parallel data. When one frame of data has been received, it is transferred to RDR automatically.
RSR cannot be directly accessed by the CPU.

### 15.2.2 Receive Data Register (RDR)



RDR is an 8-bit register that stores receive data.
When the SCI has received one frame of serial data, it transfers the received serial data from RSR to RDR where it is stored. This allows RSR to receive the next data.
Since RSR and RDR function as a double buffer in this way, continuous receive operations can be performed.
Only read RDR once after each instance of the receive data full interrupt (RXI). Note that if next one frame of data is received before reading receive data from RDR, an overrun error occurs.
RDR cannot be written to by the CPU.

### 15.2.3 Transmit Data Register (TDR)



TDR is an 8-bit register that stores transmit data.
When the SCI detects that TSR is empty, it transfers the transmit data written in TDR to TSR and starts transmission.
The double-buffered structures of TDR and TSR enable continuous serial transmission. If the next transmit data has already been written to TDR when one frame of data is transmitted, the SCI transfers the written data to TSR to continue transmission.
The CPU is able to read from or write to TDR at any time. Only write data for transmission to TDR once after each instance of the transmit data empty interrupt (TXI).

### 15.2.4 Transmit Shift Register (TSR)

TSR is a shift register that transmits serial data.
To perform serial data transmission, the SCI first automatically transfers transmit data from TDR to TSR, and then sends the data to the TXDn pin.
TSR cannot be directly accessed by the CPU.

## 15.2.5 Serial Mode Register (SMR)

Note: • Some bits in SMR have different functions in serial communications interface mode and smart card interface mode.

### (1) Serial Communications Interface Mode (SMIF in SCMR = 0)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | CM | CHR | PE | PM | STOP | MP | CKS[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b1, b0 | CKS[1:0] | Clock Select | b1 b0<br>0 0: P1ϕ clock (n = 0)*1<br>0 1: P1ϕ/4 clock (n = 1)*1<br>1 0: P1ϕ/16 clock (n = 2)*1<br>1 1: P1ϕ/64 clock (n = 3)*1 | R/W*4 |
| b2 | MP | Multi-Processor Mode | (Valid only in asynchronous mode)<br>0: Multi-processor communications function is disabled<br>1: Multi-processor communications function is enabled | R/W*4 |
| b3 | STOP | Stop Bit Length | (Valid only in asynchronous mode)<br>0: 1 stop bit<br>1: 2 stop bits | R/W*4 |
| b4 | PM | Parity Mode | (Valid only when the PE bit is 1 in asynchronous mode)<br>0: Selects even parity<br>1: Selects odd parity | R/W*4 |
| b5 | PE | Parity Enable | (Valid only in asynchronous mode)<br>• When transmitting<br>0: Parity bit addition is not performed<br>1: The parity bit is added<br>• When receiving<br>0: Parity bit checking is not performed<br>1: The parity bit is checked | R/W*4 |
| b6 | CHR | Character Length | (Valid only in asynchronous mode)<br>0: Selects 8 bits as the data length*2<br>1: Selects 7 bits as the data length*3 | R/W*4 |
| b7 | CM | Communications Mode | 0: Asynchronous mode<br>1: Clock synchronous mode | R/W*4 |

Note 1. n is the decimal notation of the value of n in BRR (see section 15.2.9, Bit Rate Register (BRR)).
Note 2. In clock synchronous mode, this bit setting is invalid and a fixed data length of 8 bits is used.
Note 3. LSB-first is fixed and the MSB (bit 7) in TDR is not transmitted in transmission.
Note 4. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

#### CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.
For the relation between the settings of these bits and the baud rate, see section 15.2.9, Bit Rate Register (BRR).

#### MP Bit (Multi-Processor Mode)

Disables/enables the multi-processor communications function. The settings of the PE bit and PM bit are invalid in multi-processor mode.

#### STOP Bit (Stop Bit Length)

Selects the stop bit length in transmission.
In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit frame.

### PM Bit (Parity Mode)

Selects the parity mode (even or odd) for transmission and reception.
The setting of the PM bit is invalid in multi-processor mode.

### PE Bit (Parity Enable)

When this bit is set to 1, the parity bit is added to transmit data, and the parity bit is checked in reception.
Irrespective of the setting of the PE bit, the parity bit is not added or checked in multi-processor format.

### CHR Bit (Character Length)

Selects the data length for transmission and reception.
In clock synchronous mode, a fixed data length of 8 bits is used.

## (2) Smart Card Interface Mode (SMIF in SCMR = 1)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | GM | BLK | PE | PM | BCP[1:0] | | CKS[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b1, b0 | CKS[1:0] | Clock Select | b1 b0<br>0 0: P1ϕ clock (n = 0)*1<br>0 1: P1ϕ/4 clock (n = 1)*1<br>1 0: P1ϕ/16 clock (n = 2)*1<br>1 1: P1ϕ/64 clock (n = 3)*1 | R/W*3 |
| b3, b2 | BCP[1:0] | Base Clock Pulse | Selects the number of base clock cycles in combination with the BCP2 bit in SCMR.<br>Setting values in BCP2 bit in SCMR and BCP[1:0] bits in SMR:<br>BCP2 b3 b2<br>0 0 0: 93 clock cycles (S = 93)*2<br>0 0 1: 128 clock cycles (S = 128)*2<br>0 1 0: 186 clock cycles (S = 186)*2<br>0 1 1: 512 clock cycles (S = 512)*2<br>1 0 0: 32 clock cycles (S = 32)*2 (Initial value)<br>1 0 1: 64 clock cycles (S = 64)*2<br>1 1 0: 372 clock cycles (S = 372)*2<br>1 1 1: 256 clock cycles (S = 256)*2 | R/W*3 |
| b4 | PM | Parity Mode | (Valid only when the PE bit is 1 in asynchronous mode)<br>0: Selects even parity<br>1: Selects odd parity | R/W*3 |
| b5 | PE | Parity Enable | When this bit is set to 1, a parity bit is added to data for transmission, and the parity of received data is checked. Set this bit to 1 in smart card interface mode. | R/W*3 |
| b6 | BLK | Block Transfer Mode | 0: Normal mode operation<br>1: Block transfer mode operation | R/W*3 |
| b7 | GM | GSM Mode | 0: Normal mode operation<br>1: GSM mode operation | R/W*3 |

Note 1. n is the decimal notation of the value of n in BRR (see section 15.2.9, Bit Rate Register (BRR)).
Note 2. S is the value of S in BRR (see section 15.2.9, Bit Rate Register (BRR)).
Note 3. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

### CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.
For the relationship between the settings of these bits and the baud rate, see section 15.2.9, Bit Rate Register (BRR).

**BCP[1:0] Bits (Base Clock Pulse)**

These bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode.
Set these bits in combination with the BCP2 bit in SCMR.
For details, see section 15.6.4, Receive Data Sampling Timing and Reception Margin.

**PM Bit (Parity Mode)**

Selects the parity mode for transmission and reception (even or odd).
For details on the usage of this bit in smart card interface mode, see section 15.6.2, Data Format (Except in Block Transfer Mode).

**PE Bit (Parity Enable)**

Set the PE bit to 1.
The parity bit is added to transmit data before transmission, and the parity bit is checked in reception.

**BLK Bit (Block Transfer Mode)**

Setting this bit to 1 allows block transfer mode operation.
For details, see section 15.6.3, Block Transfer Mode.

**GM Bit (GSM Mode)**

Setting this bit to 1 allows GSM mode operation.
In GSM mode, the SSR.TEND flag set timing is put forward to 11.0 etu (elementary time unit = 1-bit transfer time) from the start and the clock output control function is appended. For details, see section 15.6.6, Serial Data Transmission (Except in Block Transfer Mode) and section 15.6.8, Clock Output Control.

## 15.2.6 Serial Control Register (SCR)

Note: • Some bits in SCR have different functions in serial communications interface mode and smart card interface mode.

### (1) Serial Communications Interface Mode (SMIF in SCMR = 0)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TIE | RIE | TE | RE | MPIE | TEIE | CKE[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b1, b0 | CKE[1:0] | Clock Enable | (Asynchronous mode)<br>b1 b0<br>0 0: On-chip baud rate generator<br>The SCKn pin functions as general-purpose I/O port.<br>0 1: On-chip baud rate generator<br>The clock with the same frequency as the bit rate is output from the SCKn pin.<br>1 x: External clock<br>SEMR.ABCS bit is 0:<br>The clock with a frequency 16 times the bit rate should be input from the SCKn pin.<br>SEMR.ABCS bit is 1:<br>The clock with a frequency eight times the bit rate should be input from the SCKn pin.<br><br>(Clock synchronous mode)<br>b1 b0<br>0 x: Internal clock<br>The SCKn pin functions as the clock output pin.<br>1 x: External clock<br>The SCKn pin functions as the clock input pin. | R/W*1 |
| b2 | TEIE | Transmit End Interrupt Enable | 0: A TEI interrupt request is disabled<br>1: A TEI interrupt request is enabled | R/W |
| b3 | MPIE | Multi-Processor Interrupt Enable | (Valid in asynchronous mode when SMR.MP = 1)<br>0: Normal reception<br>1: When the data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE bit is automatically cleared to 0, and normal reception is resumed. | R/W |
| b4 | RE | Receive Enable | 0: Serial reception is disabled<br>1: Serial reception is enabled | R/W*2 |
| b5 | TE | Transmit Enable | 0: Serial transmission is disabled<br>1: Serial transmission is enabled | R/W*2 |
| b6 | RIE | Receive Interrupt Enable | 0: RXI and ERI interrupt requests are disabled<br>1: RXI and ERI interrupt requests are enabled | R/W |
| b7 | TIE | Transmit Interrupt Enable | 0: A TXI interrupt request is disabled<br>1: A TXI interrupt request is enabled | R/W |

x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. A 1 can be written only when TE = 0 and RE = 0, while the SMR.CM bit is 1. After setting TE or RE to 1, only 0 can be written in TE and RE. While the SMR.CM bit is 0, writing is enabled under any condition.

#### CKE[1:0] Bits (Clock Enable)

These bits select the clock source and SCKn pin function.

#### TEIE Bit (Transmit End Interrupt Enable)

Enables or disables a TEI interrupt request.
A TEI interrupt request is disabled by clearing the TEIE bit to 0.

#### MPIE Bit (Multi-Processor Interrupt Enable)

When this bit is set to 1 and the data with the multi-processor bit set to 0 is received, the data is not read and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE is automatically cleared to 0, and normal reception is resumed. For details, see section 15.4, Multi-Processor Communications Function.
When the receive data includes the MPB bit is SSR set to 0, the receive data is not transferred from the RSR to the RDR, a receive error is not detected, and setting the flags ORER and FER to 1 is disabled.
When the receive data includes the MPB bit set to 1, the MPB bit is set to 1, the MPIE bit is automatically cleared to 0, the RXI and ERI interrupt requests are enabled (if the RIE bit in SCR is set to 1), and setting the flags ORER and FER to 1 is enabled.
MPIE should be set to 0 if multi-processor communications function is not to be used.

#### RE Bit (Receive Enable)

Enables or disables serial reception.
When this bit is set to 1, serial reception is started by detecting the start bit in asynchronous mode or the synchronous clock input in clock synchronous mode. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.
Even if reception is halted by clearing the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

#### TE Bit (Transmit Enable)

Enables or disables serial transmission.
When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

#### RIE Bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.
An RXI interrupt request is disabled by clearing the RIE bit to 0.
An ERI interrupt request can be cancelled by reading 1 from the ORER, FER, or PER flag in SSR and then clearing the flag to 0, or clearing the RIE bit to 0.

#### TIE Bit (Transmit Interrupt Enable)

Enables or disables notification of a TXI interrupt request.
Notification of a TXI interrupt request is disabled by clearing the TIE bit to 0.

### (2) Smart Card Interface Mode (SMIF in SCMR = 1)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TIE | RIE | TE | RE | MPIE | TEIE | CKE[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b1, b0 | CKE[1:0] | Clock Enable | • When GM in SMR = 0<br>b1 b0<br>0 0: Output disabled (The SCKn pin is available for use as an I/O port in accord with the general-purpose I/O port settings.)<br>0 1: Clock output<br>1 x: (Setting prohibited)<br><br>• When GM in SMR = 1<br>b1 b0<br>0 0: Output fixed low<br>x 1: Clock output<br>1 0: Output fixed high | R/W*1 |
| b2 | TEIE | Transmit End Interrupt Enable | This bit should be 0 in smart card interface mode. | R/W |
| b3 | MPIE | Multi-Processor Interrupt Enable | This bit should be 0 in smart card interface mode. | R/W |
| b4 | RE | Receive Enable | 0: Serial reception is disabled<br>1: Serial reception is enabled | R/W*2 |
| b5 | TE | Transmit Enable | 0: Serial transmission is disabled<br>1: Serial transmission is enabled | R/W*2 |
| b6 | RIE | Receive Interrupt Enable | 0: RXI and ERI interrupt requests are disabled<br>1: RXI and ERI interrupt requests are enabled | R/W |
| b7 | TIE | Transmit Interrupt Enable | 0: A TXI interrupt request is disabled<br>1: A TXI interrupt request is enabled | R/W |

x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. A 1 can be written only when TE = 0 and RE = 0, while the SMR.CM bit is 1. After setting TE or RE to 1, only 0 can be written in TE and RE. While the SMR.CM bit is 0, writing is enabled under any condition.

For details on interrupt requests, see section 15.8, Interrupt Sources.

#### CKE[1:0] Bits (Clock Enable)

These bits control the clock output from the SCKn pin.

In GSM mode, clock output can be dynamically switched. For details, see section 15.6.8, Clock Output Control.

#### TEIE Bit (Transmit End Interrupt Enable)

This bit should be 0 in smart card interface mode.

#### MPIE Bit (Multi-Processor Interrupt Enable)

This bit should be 0 in smart card interface mode.

#### RE Bit (Receive Enable)

Enables or disables serial reception.

When this bit is set to 1, serial reception is started by detecting the start bit. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.

Even if reception is halted by clearing the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

**TE Bit (Transmit Enable)**

Enables or disables serial transmission.

When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

**RIE Bit (Receive Interrupt Enable)**

Enables or disables RXI and ERI interrupt requests.

An RXI interrupt request is disabled by clearing the RIE bit to 0.

An ERI interrupt request can be cancelled by reading 1 from the ORER, FER, or PER flag in SSR and then clearing the flag to 0, or clearing the RIE bit to 0.

**TIE Bit (Transmit Interrupt Enable)**

Enables or disables notification of a TXI interrupt request.

Notification of a TXI interrupt request is disabled by clearing the TIE bit to 0.

## 15.2.7 Serial Status Register (SSR)

Note: • Some bits in SSR have different functions in serial communications interface mode and smart card interface mode.

### (1) Serial Communications Interface Mode (SMIF in SCMR = 0)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | ORER | FER | PER | TEND | MPB | MPBT |
| Value after reset: | x | x | 0 | 0 | 0 | 1 | 0 | 0 |

x: Undefined

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b0 | MPBT | Multi-Processor Bit Transfer | Sets the multi-processor bit for adding to the transmission frame<br>0: Data transmission cycles<br>1: ID transmission cycles | R/W |
| b1 | MPB | Multi-Processor | Value of the multi-processor bit in the reception frame<br>0: Data transmission cycles<br>1: ID transmission cycles | R |
| b2 | TEND | Transmit End Flag | 0: A character is being transmitted.<br>1: Character transfer has been completed. | R |
| b3 | PER | Parity Error Flag | 0: No parity error occurred<br>1: A parity error has occurred | R/(W) *1 |
| b4 | FER | Framing Error Flag | 0: No framing error occurred<br>1: A framing error has occurred | R/(W) *1 |
| b5 | ORER | Overrun Error Flag | 0: No overrun error occurred<br>1: An overrun error has occurred | R/(W) *1 |
| b7, b6 | — | Reserved | The read value is undefined. The write value should be 1. | R |

Note 1. Only 0 can be written to this bit, to clear the flag.

#### MPB Bit (Multi-Processor)

Holds the value of the multi-processor bit in the reception frame. This bit does not change when the RE bit in SCR is 0.

#### TEND Flag (Transmission End Flag)

Indicates completion of transmission.

[Setting conditions]

- Clearing of the SCR.TE bit to 0 (disabling serial transmission operations)
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- The TDR is not updated at the time of transmission of the tail-end bit of a character being transmitted

[Clearing condition]

- When data for transmission are written to the TDR while the SCR.TE is 1
  When the TEND flag is cleared in response to writing of data for transmission to the TDR, dummy read the TEND flag before return from interrupt exception processing for TEI interrupt requests when the latter are enabled.

### PER Bit (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1 (after writing 0 to it, read the PER bit to check that it has actually been cleared to 0.)
  Even when the RE bit in SCR is cleared to 0 (which indicates that serial reception is disabled), the PER flag is not affected and retains its previous value.

### FER Bit (Framing Error Flag)

Indicates that a framing error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When the stop bit is 0
  In 2-stop-bit mode, only the first stop bit is checked whether it is 1 but the second stop bit is not checked. Note that although receive data when the framing error occurs is transferred to RDR, no RXI interrupt request occurs. In addition, when the FER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to FER after reading FER = 1 (after writing 0 to it, read the FER bit to check that it has actually been cleared to 0.)
  Even when the RE bit in SCR is cleared to 0, the FER flag is not affected and retains its previous value.

### ORER Bit (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, receive data prior to an overrun error occurrence is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed. Note that, in clock synchronous mode, serial transmission also cannot continue.

[Clearing condition]

- When a 0 is written to ORER after reading ORER = 1 (after writing a 0 to it, read the ORER bit to check that it has actually been cleared to 0.)
  Even when the RE bit in SCR is cleared to 0, the ORER flag is not affected and retains its previous value.

## (2) Smart Card Interface Mode (SMIF in SCMR = 1)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | ORER | ERS | PER | TEND | MPB | MPBT |
| Value after reset: | x | x | 0 | 0 | 0 | 1 | 0 | 0 |

x: Undefined

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b0 | MPBT | Multi-Processor Bit Transfer | This bit should be set to 0 in smart card interface mode. | R/W |
| b1 | MPB | Multi-Processor | This bit is not used in smart card interface mode. It should be set to 0. | R |
| b2 | TEND | Transmit End Flag | 0: A character is being transmitted.<br>1: Character transfer has been completed. | R |
| b3 | PER | Parity Error Flag | 0: No parity error occurred<br>1: A parity error has occurred | R/(W) *1 |
| b4 | ERS | Error Signal Status Flag | 0: Low error signal not responded<br>1: Low error signal responded | R/(W) *1 |
| b5 | ORER | Overrun Error Flag | 0: No overrun error occurred<br>1: An overrun error has occurred | R/(W) *1 |
| b7, b6 | — | Reserved | The read value is undefined. The write value should be 1. | R |

Note 1. Only 0 can be written to this bit, to clear the flag.

### MPBT Bit (Multi-Processor Bit Transfer)

This bit should be set to 0 in smart card interface mode.

### MPB Bit (Multi-Processor)

This bit is not used in smart card interface mode. It should be set to 0.

### TEND Flag (Transmission End Flag)

With no error signal from the receiving side, this bit is set to 1 when further data for transfer is ready to be transferred to the TDR register.

[Setting conditions]

- When SCR.TE bit = 0 (disabling serial transmission operations)
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When a specified period has elapsed after the latest transmission of one byte, the ERS flag is 0, and the TDR register is not updated
  The set timing is determined by register settings as listed below.
  When SMR.GM = 0 and SMR.BLK = 0, 12.5 etu after the start of transmission
  When SMR.GM = 0 and SMR.BLK = 1, 11.5 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 0, 11.0 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 1, 11.0 etu after the start of transmission

[Clearing condition]

- When data for transmission are written to the TDR while the SCR.TE is 1

### PER Flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1 (After writing 0 to it, read the PER bit to check that it has actually been cleared to 0.)
  Even when the RE bit in SCR is cleared to 0 (which indicates that serial reception is disabled), the PER flag is not affected and retains its previous value.

### ERS Flag (Error Signal Status Flag)

[Setting condition]

- When a low error signal is sampled

[Clearing condition]

- When 0 is written to ERS after reading ERS = 1

### ORER Flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, the receive data prior to an overrun error occurrence is retained, but data received following the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1 (After writing 0 to it, read the ORER bit to check that it has actually been cleared to 0.)
  Even when the RE bit in SCR is cleared to 0, the ORER flag is not affected and retains its previous value.

## 15.2.8 Smart Card Mode Register (SCMR)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | BCP2 | — | — | — | SDIR | SINV | — | SMIF |
| Value after reset: | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b0 | SMIF | Smart Card Interface Mode Select | 0: Serial communications interface mode<br>1: Smart card interface mode | R/W*1 |
| b1 | — | Reserved | This bit is read as 1. The write value should be 1. | R |
| b2 | SINV | Transmitted/Received Data Invert | 0: TDR contents are transmitted as they are. Receive data is stored as it is in RDR.<br>1: TDR contents are inverted before being transmitted. Receive data is stored in inverted form in RDR. | R/W*1 |
| b3 | SDIR | Transmitted/Received Data Transfer Direction | 0: Transfer with LSB-first<br>1: Transfer with MSB-first | R/W*1 |
| b6 to b4 | — | Reserved | This bit is read as 1. The write value should be 1. | R |
| b7 | BCP2 | Base Clock Pulse 2 | Selects the number of base clock cycles in combination with the SMR.BCP[1:0] bits.<br>Setting values in the SCMR.BCP2 bit and SMR.BCP[1:0] bits<br>BCP2 BCP1 BCP0<br>0 0 0: 93 clock cycles (S = 93)*2<br>0 0 1: 128 clock cycles (S = 128)*2<br>0 1 0: 186 clock cycles (S = 186)*2<br>0 1 1: 512 clock cycles (S = 512)*2<br>1 0 0: 32 clock cycles (S = 32)*2 (Initial Value)<br>1 0 1: 64 clock cycles (S = 64)*2<br>1 1 0: 372 clock cycles (S = 372)*2<br>1 1 1: 256 clock cycles (S = 256)*2 | R/W*1 |

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).
Note 2. S is the value of S in BRR (see section 15.2.9, Bit Rate Register (BRR)).

### SMIF Bit (Smart Card Interface Mode Select)

When this bit is set to 1, smart card interface mode is selected.
When this bit is set to 0, asynchronous or clock synchronous mode is selected.

### SINV Bit (Transmitted/Received Data Invert)

Inverts the transmit/receive data logic level. This bit does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SMR.

### SDIR Bit (Transmitted/Received Data Transfer Direction)

Selects the serial/parallel conversion format.

### BCP2 Bit (Base Clock Pulse 2)

Selects the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set this bit in combination with the SMR.BCP[1:0] bits.

## 15.2.9 Bit Rate Register (BRR)

BRR is an 8-bit register that adjusts the bit rate.
As each SCI channel has independent baud-rate generator control, different bit rates can be set for each. Table 15.4 lists the relationships between the setting (N) in the BRR and the bit rate (B) for normal asynchronous mode, multi-processor transfer, clock synchronous mode, and smart card interface mode.
The initial value of BRR is FFh.
BRR can be read from by the CPU at all times, but it can be written to only when the TE and RE bits in SCR are 0.

**Table 15.4 Relationships between N Setting in BRR and Bit Rate B**

| Mode | ABCS Bit in SEMR | BRR Setting | Error |
|---|---|---|---|
| Asynchronous, multi-processor transfer | 0 | $N = \frac{P1\varphi \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | $Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$ |
| | 1 | $N = \frac{P1\varphi \times 10^6}{32 \times 2^{2n-1} \times B} - 1$ | $Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$ |
| Clock synchronous | | $N = \frac{P1\varphi \times 10^6}{8 \times 2^{2n-1} \times B} - 1$ | |
| Smart card interface | | $N = \frac{P1\varphi \times 10^6}{S \times 2^{2n+1} \times B} - 1$ | $Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1\} \times 100$ |

B: Bit rate (bps)
N: BRR setting for baud rate generator ($0 \leq N \leq 255$)
P1$\phi$: Operating frequency (MHz)
n and S: Determined by the SMR setting listed in the following table.

**Table 15.5 Clock Source Settings**

| SMR Setting | | |
|---|---|---|
| **CKS[1:0] Bits** | **Clock Source** | **n** |
| 0 0 | P1$\phi$ clock | 0 |
| 0 1 | P1$\phi$/4 clock | 1 |
| 1 0 | P1$\phi$/16 clock | 2 |
| 1 1 | P1$\phi$/64 clock | 3 |

**Table 15.6 Base Clock Settings in Smart Card Interface Mode**

| SCMR Setting | SMR Setting | Base Clock Cycles for One-bit Period | S |
|---|---|---|---|
| BCP2 Bit | BCP[1:0] Bits | | |
| 0 | 0 0 | 93 clock cycles | 93 |
| 0 | 0 1 | 128 clock cycles | 128 |
| 0 | 1 0 | 186 clock cycles | 186 |
| 0 | 1 1 | 512 clock cycles | 512 |
| 1 | 0 0 | 32 clock cycles | 32 |
| 1 | 0 1 | 64 clock cycles | 64 |
| 1 | 1 0 | 372 clock cycles | 372 |
| 1 | 1 1 | 256 clock cycles | 256 |

Table 15.7 lists sample N settings in BRR in normal asynchronous mode. Table 15.8 lists the maximum bit rate settable for each operating frequency. Examples of BRR (N) settings in clock synchronous mode are listed in Table 15.10. Examples of BRR (N) settings in smart card interface mode are listed in Table 15.12. In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, see section 15.6.4, Receive Data Sampling Timing and Reception Margin. Table 15.9 and Table 15.11 list the maximum bit rates with external clock input.

When the asynchronous mode base clock select bit (ABCS) in the serial extended mode register (SEMR) is set to 1 in asynchronous mode, the bit rate is two times that of listed in Table 15.7.

**Table 15.7 Examples of BRR Settings for Various Bit Rates (Asynchronous Mode)**

| | Operating Frequency P1ϕ (MHz) | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | 50 | | | 64 | | | 66.67 | | |
| Bit Rate (bps) | n | N | Error (%) | n | N | Error (%) | n | N | Error (%) |
| 110 | 3 | 221 | –0.02 | | | | | | |
| 150 | 3 | 162 | –0.15 | 3 | 207 | 0.16 | 3 | 216 | 0.01 |
| 300 | 3 | 80 | 0.47 | 3 | 103 | 0.16 | 3 | 108 | –0.45 |
| 600 | 2 | 162 | –0.15 | 2 | 207 | 0.16 | 2 | 216 | 0.01 |
| 1200 | 2 | 80 | 0.47 | 2 | 103 | 0.16 | 2 | 108 | –0.45 |
| 2400 | 1 | 162 | –0.15 | 1 | 207 | 0.16 | 1 | 216 | 0.01 |
| 4800 | 1 | 80 | 0.47 | 1 | 103 | 0.16 | 1 | 108 | –0.45 |
| 9600 | 0 | 162 | –0.15 | 1 | 51 | 0.16 | 0 | 216 | 0.01 |

## 15.2.10 Serial Extended Mode Register (SEMR)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | NFEN | ABCS | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b3 to b0 | — | Reserved | These bits are read as 0. The write value should be 0. | R |
| b4 | ABCS | Asynchronous Mode Base Clock Select | (Valid only in asynchronous mode)<br>0: Selects 16 base clock cycles for 1-bit period<br>1: Selects 8 base clock cycles for 1-bit period | R/W*1 |
| b5 | NFEN | Digital Noise Filter Function Enable | (In asynchronous mode)<br>0: Noise cancellation function for the RXDn input signal is disabled.<br>1: Noise cancellation function for the RXDn input signal is enabled.<br>The NFEN bit should be 0 in any mode other than above. | R/W*1 |
| b7, b6 | — | Reserved | These bits are read as 0. The write value should be 0. | R |

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

### NFEN Bit (Digital Noise Filter Function Enable)

This bit enables or disables the digital noise filter function.

When the function is enabled, noise cancellation is applied to the RXDn input signal in asynchronous mode.

In any mode other than above, set the NFEN bit to 0 to disable the digital noise filter function.

When the function is disabled, input signals are transferred as is, as internal signals.

## 15.2.11 Noise Filter Setting Register (SNFR)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | NFCS[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b2 to b0 | NFCS[2:0] | Noise Filter Clock Select | In asynchronous mode, the standard setting for the base clock is as follows.<br>b2 b0<br>0 0 0: The clock signal divided by 1 is used with the noise filter.<br><br>Other values: Do not make settings other than those listed above. | R/W*1 |
| b7 to b3 | — | Reserved | These bits are read as 0. The write value should be 0. | R |

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR are 0. (both serial transmission and reception are disabled.)

### NFCS[2:0] Bits (Noise Filter Clock Select)

These bits select the sampling clock for the digital noise filter. To use the noise filter in asynchronous mode, set these bits to 000b.

## 15.2.12 Extended Function Control Register (SECR)

| | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | CTSE | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit Name | Description | R/W |
|---|---|---|---|---|
| b0 | — | Reserved | This bit is read as 0. The write value should be 0. | R |
| b1 | CTSE | CTS Enable | 0: CTS pin function is disabled (RTS output function is enabled).<br>1: CTS pin function is enabled | R/W*1 |
| b7 to b2 | — | Reserved | These bits are read as 0. The write value should be 0. | R |

Note 1. Writing to this bit is only possible when the RE and TE bits in the SCR are 0 (both serial transmission and reception are disabled).

SECR is used to select the extension settings in asynchronous and clock-synchronous modes.

### CTSE Bit (CTS Enable)

Set this bit to 1 if the CTS control signal is used for control of transmission and reception. The RTS signal is output when this bit is set to 0. Set this bit to 0 in smart card interface mode.

## 15.3 Operation in Asynchronous Mode

Figure 15.2 shows the general format for asynchronous serial communications.
One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level).
In asynchronous serial communications, the communications line is usually held in the mark state (high level).
The SCI monitors the communications line, and when it goes to the space state (low level), recognizes a start bit and starts serial communications.
Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and the receiver also have a double-buffered structure, so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

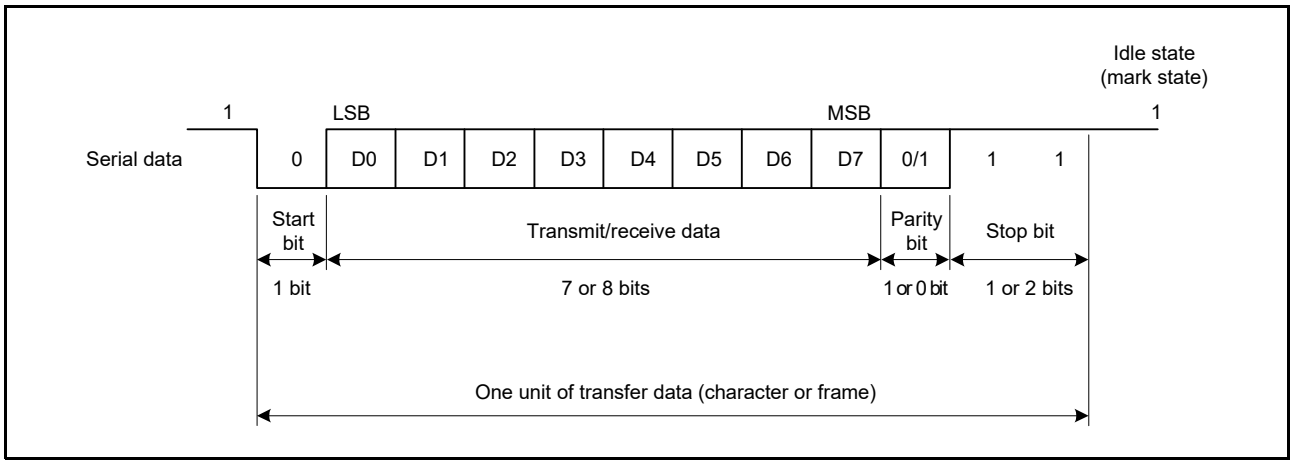

**Figure 15.2 Data Format in Asynchronous Serial Communications (Example with 8-Bit Data, Parity, Two Stop Bits)**

### 15.3.1 Serial Data Transfer Format

Table 15.14 lists the serial data transfer formats that can be used in asynchronous mode.
Any of 12 transfer formats can be selected according to the SMR setting. For details of multi-processor function, see section 15.4, Multi-Processor Communications Function.

**Table 15.14 Serial Transfer Formats (Asynchronous Mode)**

| SMR Setting | | | | Serial Transfer Format and Frame Length |
|---|---|---|---|---|
| CHR | PE | MP | STOP | 1 2 3 4 5 6 7 8 9 10 11 12 |
| 0 | 0 | 0 | 0 | S 8-bit data STOP |
| 0 | 0 | 0 | 1 | S 8-bit data STOP STOP |
| 0 | 1 | 0 | 0 | S 8-bit data P STOP |
| 0 | 1 | 0 | 1 | S 8-bit data P STOP STOP |
| 1 | 0 | 0 | 0 | S 7-bit data STOP |
| 1 | 0 | 0 | 1 | S 7-bit data STOP STOP |
| 1 | 1 | 0 | 0 | S 7-bit data P STOP |
| 1 | 1 | 0 | 1 | S 7-bit data P STOP STOP |
| 0 | — | 1 | 0 | S 8-bit data MPB STOP |
| 0 | — | 1 | 1 | S 8-bit data MPB STOP STOP |
| 1 | — | 1 | 0 | S 7-bit data MPB STOP |
| 1 | — | 1 | 1 | S 7-bit data MPB STOP STOP |

S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multi-processor bit

### 15.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times*1 the bit rate.
In reception, the SCI samples the falling edge of the start bit using the base clock, and performs internal synchronization. Since receive data is sampled at the rising edge of the 8th pulse*1 of the base clock, data is latched at the middle of each bit, as shown in Figure 15.3. Thus the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)\,F - \frac{D - 0.5}{N}(1+F) \right| \times 100\ [\%] \quad \cdots \text{ Formula (1)}$$

M: Reception margin
N: Ratio of bit rate to clock (N = 16 when ABCS in SEMR = 0, N = 8 when ABCS in SEMR = 1)
D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 12)
F: Absolute value of clock frequency deviation

Assuming values of F = 0 and D = 0.5 in formula (1), the reception margin is determined by the formula below.

$M = \{0.5 - 1/(2 \times 16)\} \times 100\ (\%) = 46.875\%$

However, this is only the computed value, and a margin of 20% to 30% should be allowed in system design.

Note 1. This is an example when the ABCS bit in SEMR is 0. When the ABCS bit is 1, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at the rising edge of the 4th pulse of the base clock

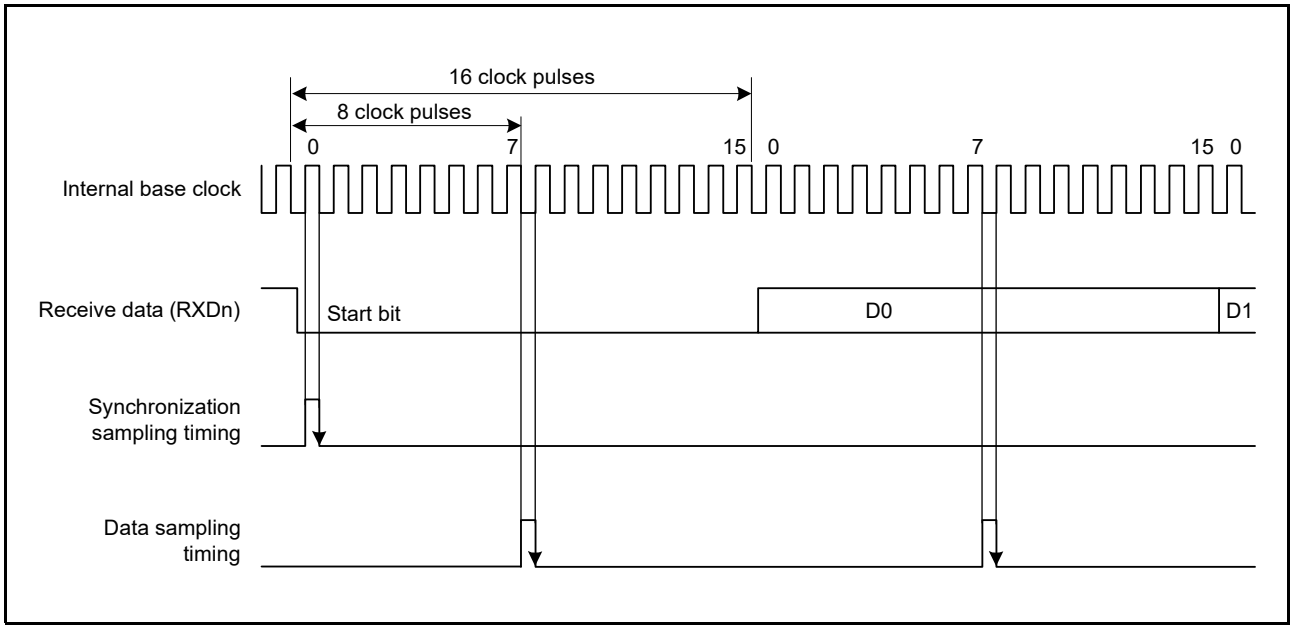

**Figure 15.3 Receive Data Sampling Timing in Asynchronous Mode**

### 15.3.3 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input to the SCKn pin can be selected as the SCI's transfer clock, according to the setting of the CM bit in SMR and the CKE[1:0] bits in SCR.
When an external clock is input to the SCKn pin, the clock frequency should be 16 times the bit rate (when ABCS in SEMR = 0) and 8 times the bit rate (when ABCS in SEMR = 1).
When the SCI is operated on an internal clock, the clock can be output from the SCKn pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in Figure 15.4.

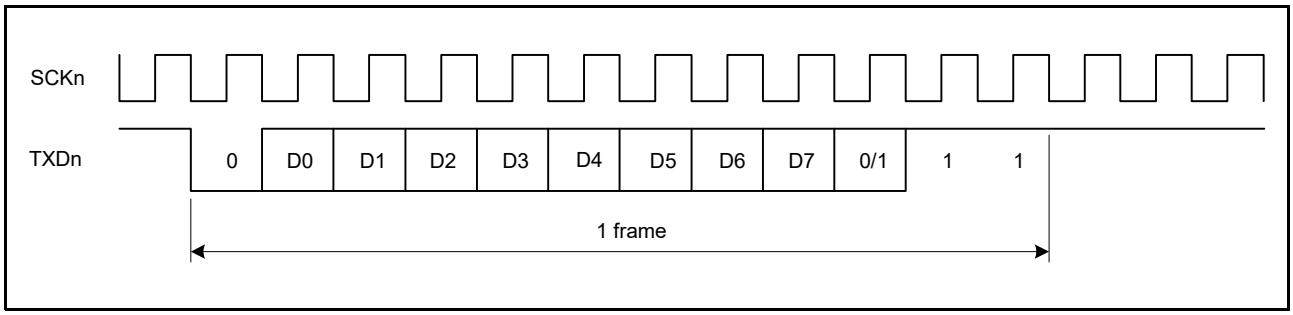

**Figure 15.4 Phase Relationship between Output Clock and Transmit Data (Asynchronous Mode: SMR.CHR = 0, PE = 1, MP = 0, STOP = 1)**

### 15.3.4 CTS and RTS Functions

The CTS function is the use of input on the CTSn# pin in transmission control. Setting the SECR.CTSE bit to 1 enables the CTS function. When the CTS function is enabled, placing the low level on the CTSn# pin causes transmission to start.
Applying the low level to the CTS# pin while transmission is in progress does not affect transmission of the current frame, which continues.
In the RTS function, by using the function of output on the RTSn# pin, a low level is output when reception becomes possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output]
Satisfaction of all conditions listed below

- The value of the RE bit in the SCR is 1
- Reception is not in progress
- There are no received data yet to be read
- The ORER, FER, and PER flags in the SSR are all 0

[Condition for high-level output]

- Any of the conditions for the low level not being satisfied

### 15.3.5 SCI Initialization (Asynchronous Mode)

Before transmitting and receiving data, start by writing the initial value “00h” to SCR and then continue through the procedure for SCI given in the sample flowchart (Figure 15.5). Whenever the operating mode or transfer format is changed, SCR must be initialized before the change is made.
When the external clock is used in asynchronous mode, ensure that the clock signal is supplied even during initialization.
Note that clearing the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR.
Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.

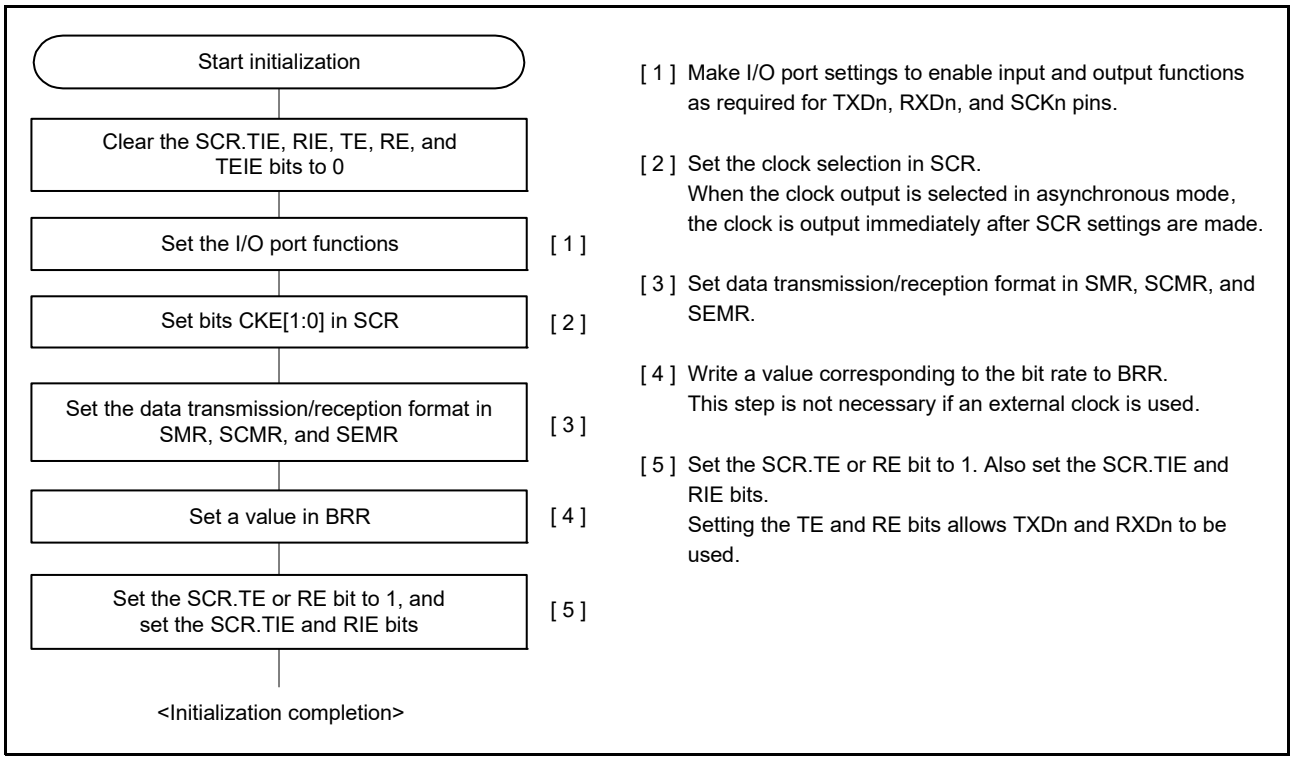

**Figure 15.5 Sample SCI Initialization Flowchart (Asynchronous Mode)**

### 15.3.6 Serial Data Transmission (Asynchronous Mode)

Figure 15.6 shows an example of the operation for serial transmission in asynchronous mode.
In serial transmission, the SCI operates as described below.

1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt processing routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these two bits are set to 1 simultaneously by a single instruction.
2. Transmission starts after the CTSE bit in SECR is set to 0 (disabling the CTS function) and a low level on the CTS# pin causes data transfer from TDR to TSR. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Continuous transmission is obtainable by writing the next data for transmission to TDR in the TXI interrupt processing routine before transmission of the current data for transmission is completed. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (disabling TXI requests) and the SCR.TEIE bit to 1 (enabling TEI requests) after the last of the data to be transmitted are written to the TDR from the processing routine for TXI requests.
3. Data is sent from the TXDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks for updating of (writing to) TDR at the time of stop bit output.
5. When TDR is updated, setting of the CTSE bit in SECR to 0 (CTS function disabled) or a low level input on the CTSn# pin causes the next transfer of the next data for transmission from TDR to TSR and sending of the stop bit, after which serial transmission of the next frame starts.
6. If TDR is not updated, the TEND flag in SSR is set to 1, the stop bit is sent, and then the mark state is entered in which 1 is output. If the TEIE flag in SCR is 1 at this time, the TEND flag in SSR is set to 1 and a TEI interrupt request is generated.

Figure 15.7 shows a sample flowchart for serial transmission in asynchronous mode.

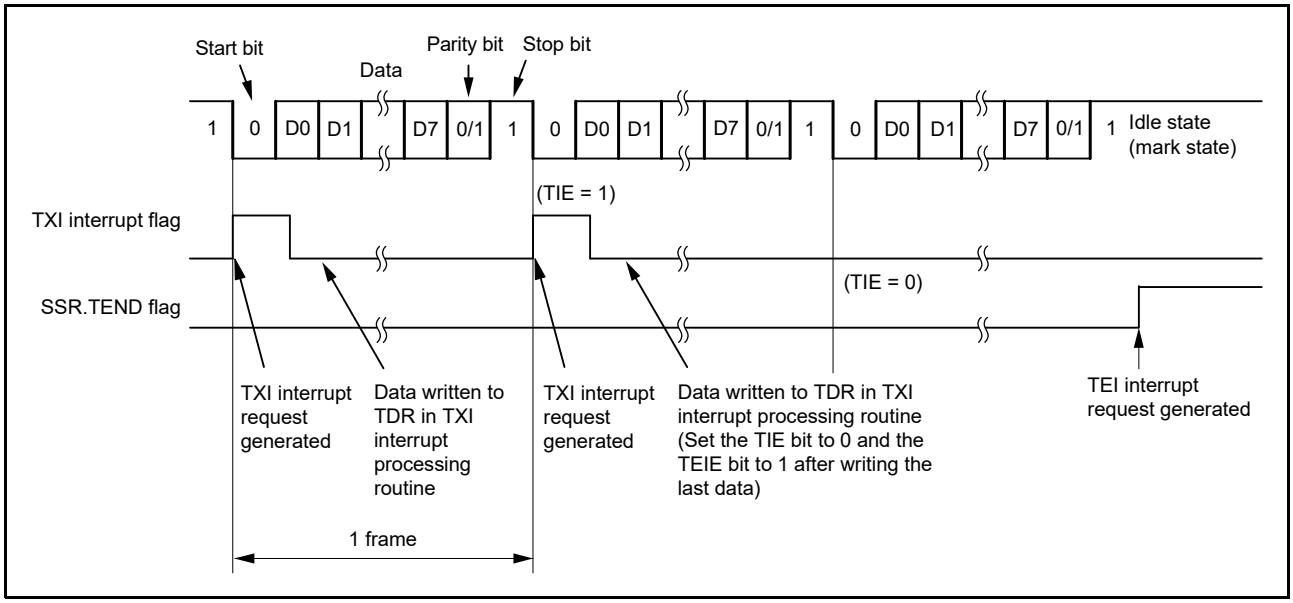

**Figure 15.6 Example of Operation for Serial Transmission in Asynchronous Mode (from the Middle of Transmission until Transmission Completion) (Example with 8-Bit Data, Parity, One Stop Bit)**

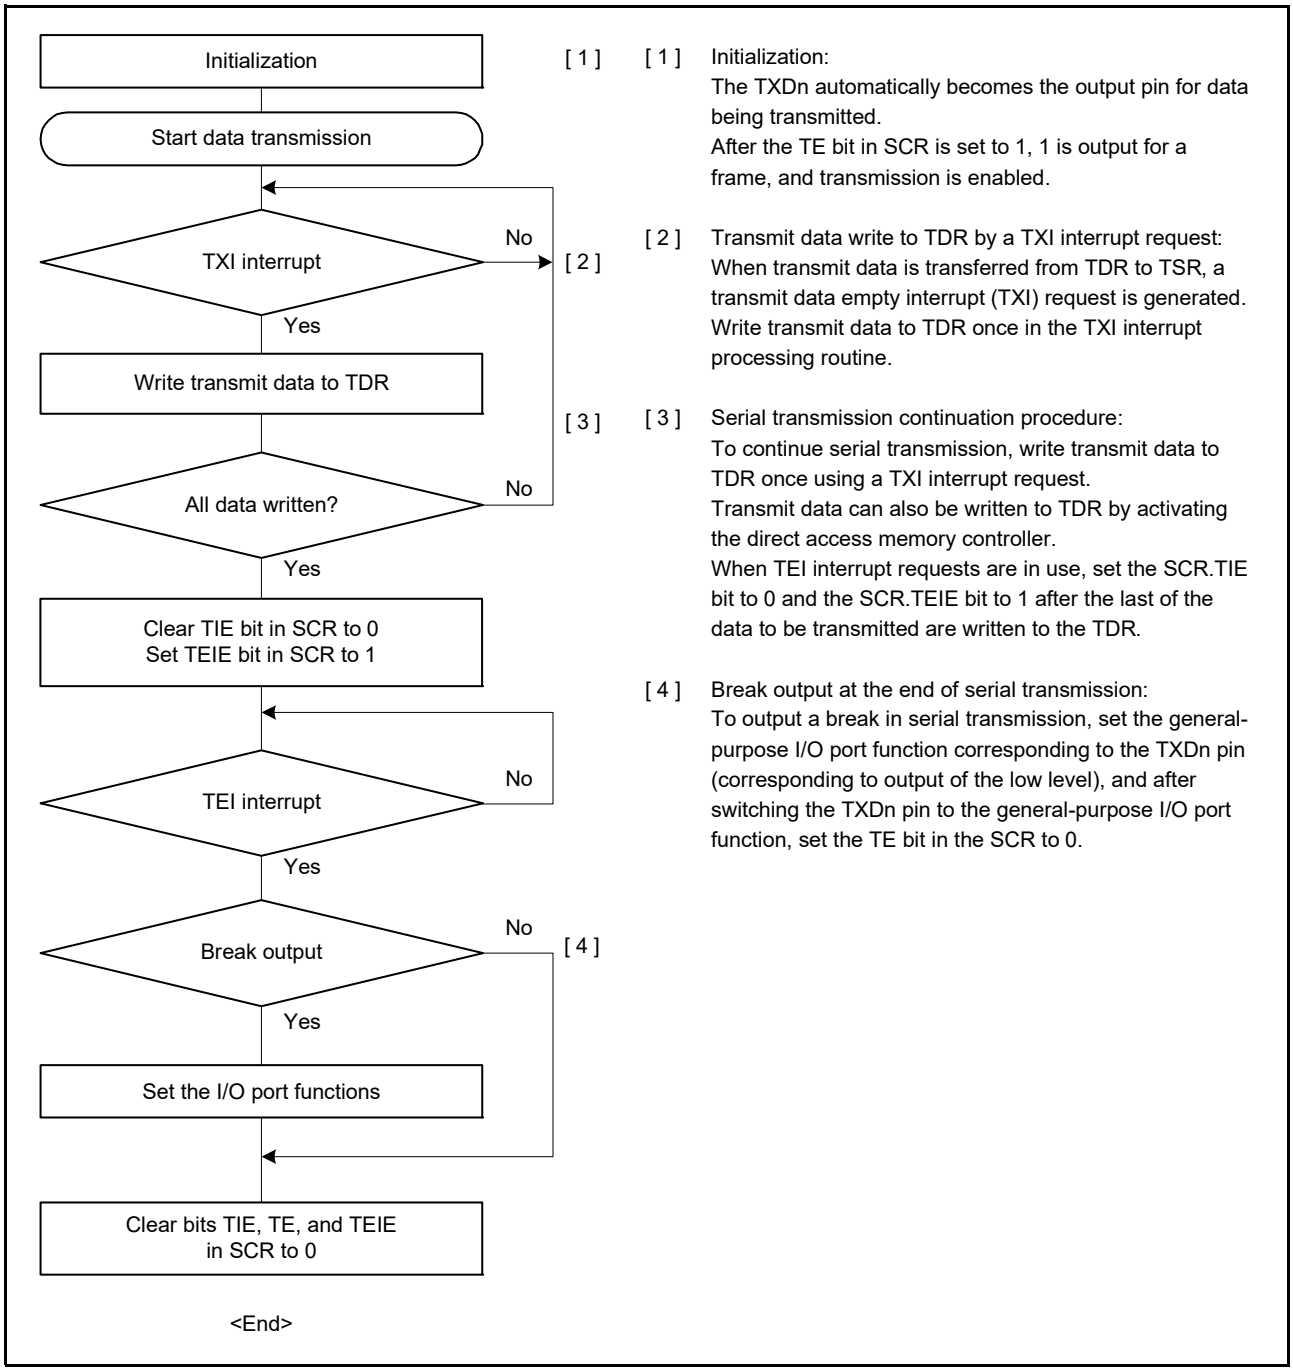

**Figure 15.7 Example of Serial Transmission Flowchart in Asynchronous Mode**

### 15.3.7 Serial Data Reception (Asynchronous Mode)

Figure 15.8 and Figure 15.9 show examples of the operation for serial data reception in asynchronous mode.
In serial data reception, the SCI operates as described below.

1. When the value of the RE bit in SCR becomes 1, the output signal on the RTSn# pin goes to the low level.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If an overrun error occurs, the ORER flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR.
4. If a parity error is detected, the PER bit in SSR is set to 1 and receive data is transferred to RDR. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
5. If a framing error (when the stop bit is 0) is detected, the FER bit in SSR is set to 1 and receive data is transferred to RDR. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
6. When reception finishes successfully, receive data is transferred to RDR. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR in this RXI interrupt processing routine before reception of the next receive data is completed. Reading out the received data that have been transferred to RDR causes the RTSn# pin to output the low level.

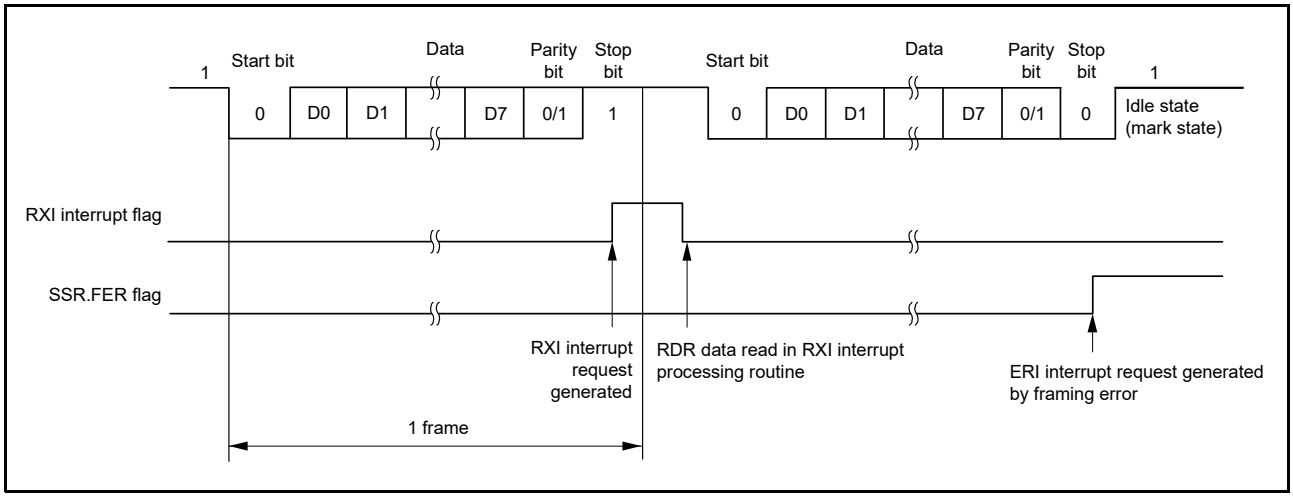

**Figure 15.8 Example of SCI Operation for Serial Reception in Asynchronous Mode (1) (when RTS Function is not Used) (Example with 8-Bit Data, Parity, One Stop Bit)**

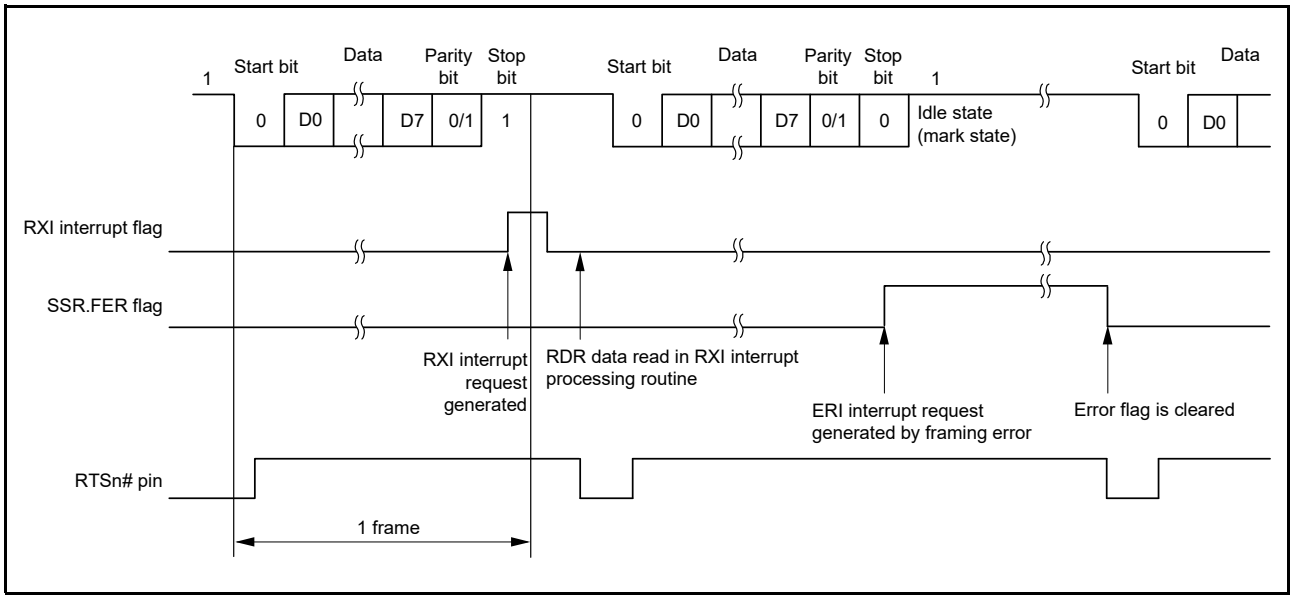

**Figure 15.9 Example of SCI Operation for Serial Reception in Asynchronous Mode (2) (when RTS Function Is Used) (Example with 8-Bit Data, Parity, One Stop Bit)**

Table 15.15 lists the states of the SSR status flags and receive data handling when a receive error is detected.
If a receive error is detected, an ERI interrupt request is generated but an RXI interrupt request is not generated. Data reception cannot be resumed while the receive error flag is 1. Accordingly, clear the ORER, FER, and PER bits to 0 before resuming reception. Moreover, be sure to read the RDR during overrun error processing.
Figure 15.10 and Figure 15.11 show samples of flowcharts for serial data reception.

**Table 15.15 SSR Status Flags and Receive Data Handling**

| SSR Status Flag | | | | |
|---|---|---|---|---|
| **ORER** | **FER** | **PER** | **Receive Data** | **Receive Error Type** |
| 1 | 0 | 0 | Lost | Overrun error |
| 0 | 1 | 0 | Transferred to RDR | Framing error |
| 0 | 0 | 1 | Transferred to RDR | Parity error |
| 1 | 1 | 0 | Lost | Overrun error + framing error |
| 1 | 0 | 1 | Lost | Overrun error + parity error |
| 0 | 1 | 1 | Transferred to RDR | Framing error + parity error |
| 1 | 1 | 1 | Lost | Overrun error + framing error + parity error |

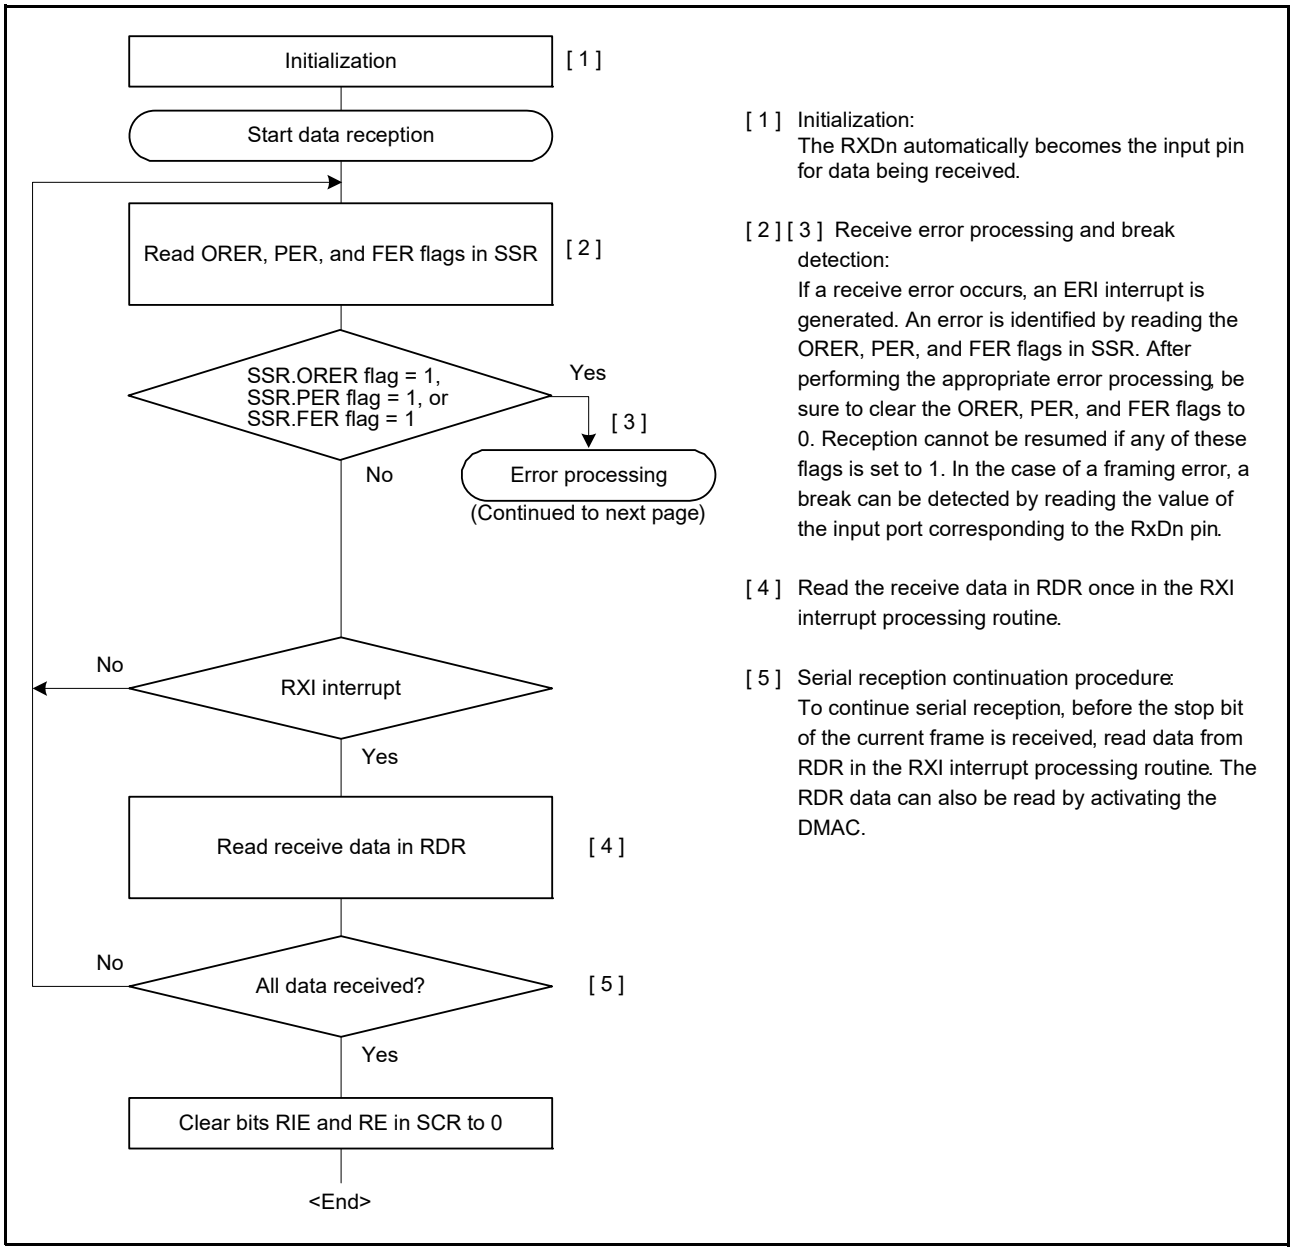

**Figure 15.10 Example of Serial Reception Flowchart (1) (Asynchronous Mode)**

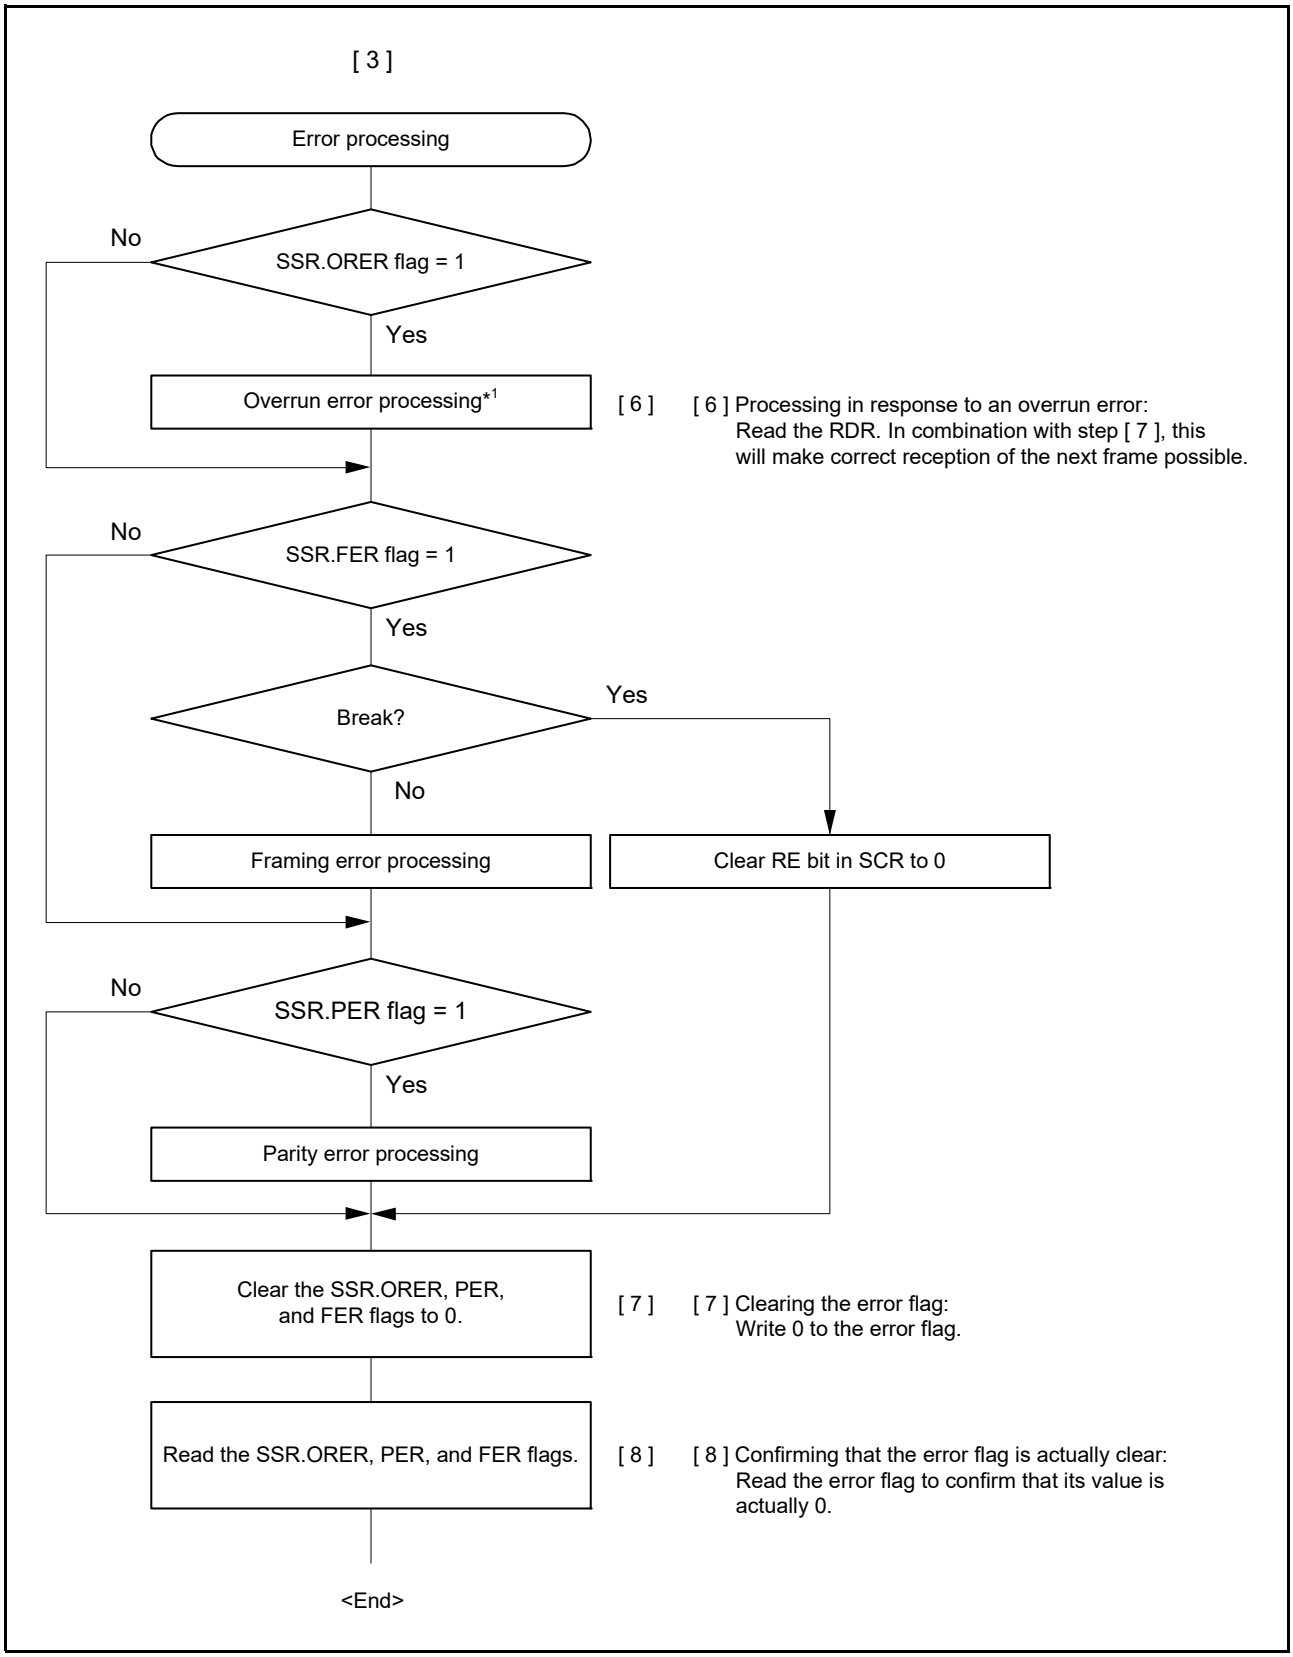

**Figure 15.11 Example of Serial Reception Flowchart (2) (Asynchronous Mode)**

## 15.4 Multi-Processor Communications Function

Using the multi-processor communication functions enables to transmit and receive data by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish between the ID transmission cycle and the data transmission cycle. When the multi-processor bit is set to 1, it indicates the ID transmission cycle and when the multi-processor bit is set to 0, it indicates the data transmission cycle. Figure 15.12 shows an example of communication between processors by using a multi-processor format. First, a transmitting station transmits communication data in which the multi-processor bit set to 1 is added to the ID code of the receiving station. Next, the transmitting station transmits the communication data in which the multi-processor bit set to 0 is added to the transmission data. Upon receiving the communication data in which the multi-processor bit is set to 1, the receiving station compares the received ID with the ID of the receiving station itself and if the two match, receives the communication data that is subsequently transmitted. If the received ID does not match with the ID of the receiving station, the receiving station skips the communication data until again receiving the communication data in which the multi-processor bit is set to 1.

For supporting this function, the SCI provides the MPIE bit in SCR. When the MPIE bit in SCR is set to 1, transfer of receive data from the RSR to the RDR, detection of a reception error, and setting the respective status flags ORER and FER in SSR are disabled until reception of data in which the multi-processor bit is set to 1. Upon receiving a reception character in which the multi-processor bit is set to 1, the MPBT bit in SSR is set to 1 and the MPIE bit in SCR is automatically cleared, thus returning to a normal reception operation. During this time, an RXI interrupt is generated if the RIE bit in SCR is set.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the normal asynchronous mode. A clock which is used for the multi-processor communication is also the same as the clock used in the normal asynchronous mode.

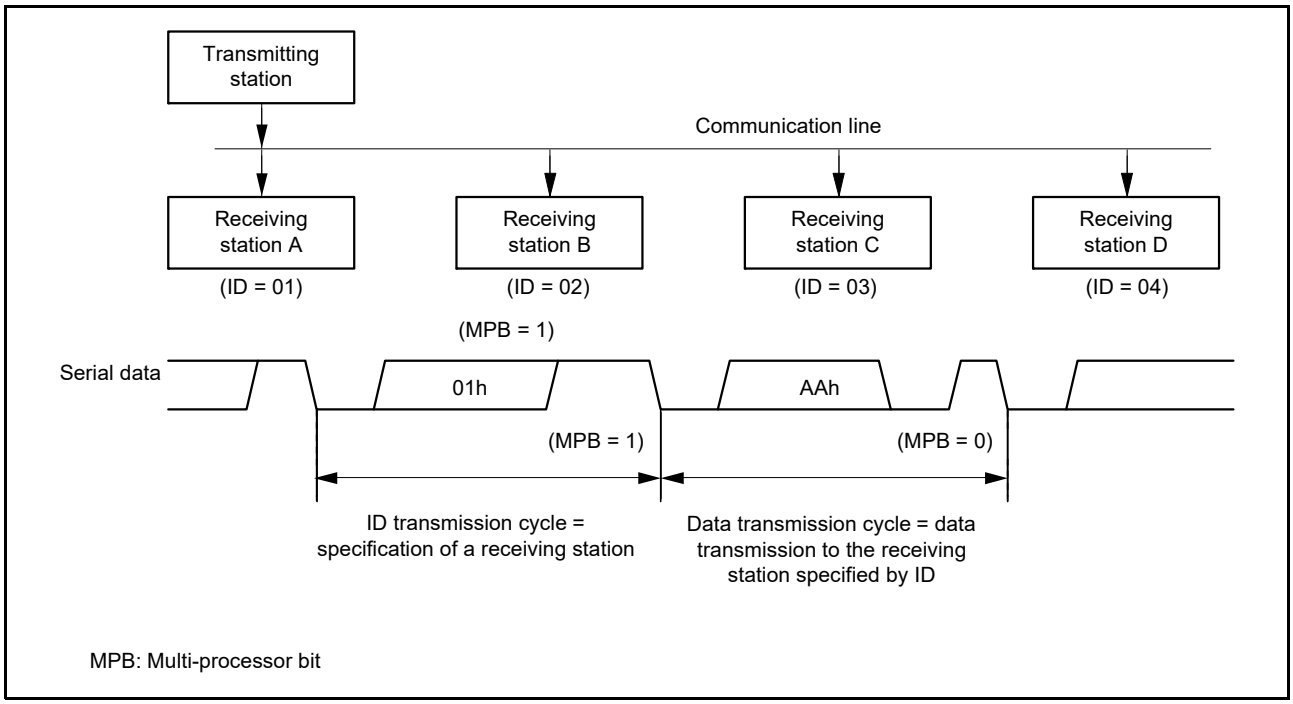

**Figure 15.12 An Example of Communication using the Multi-Processor Format (Example of Transmission of Data AAh to Receiving Station A)**

### 15.4.1 Multi-Processor Serial Data Transmission

Figure 15.13 is a sample flowchart of multi-processor data transmission. In the ID transmission cycle, the ID should be transmitted with the MPBT bit in SSR set to 1. In the data transmission cycle, the data should be transmitted with the MPBT bit set to 0. The other operations are the same as the operations in asynchronous mode.

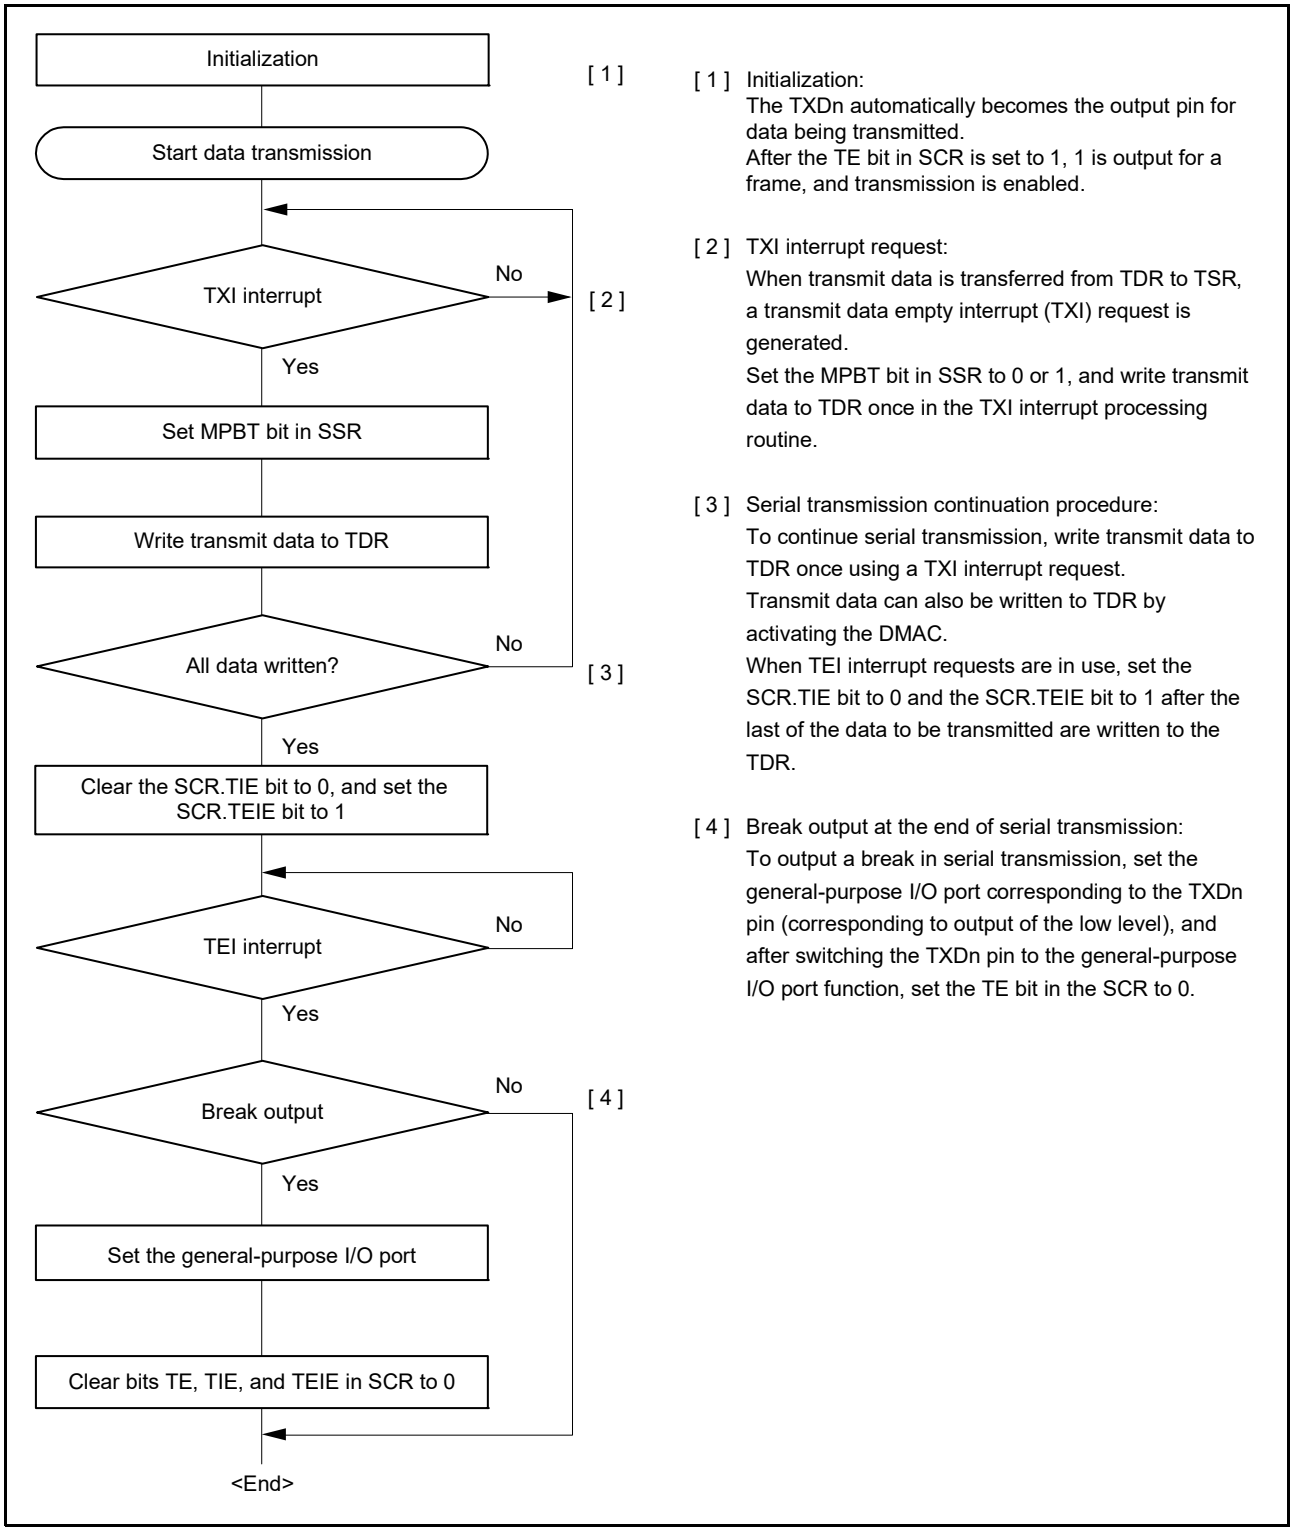

**Figure 15.13 Example of Multi-Processor Serial Transmission Flowchart**

## 15.4.2 Multi-Processor Serial Data Reception

Figure 15.15 and Figure 15.16 are sample flowcharts of multi-processor data reception. When the MPIE bit in SCR is set to 1, reading the communication data is skipped until reception of the communication data in which the multi-processor bit is set to 1. When the communication data in which the multi-processor bit is set to 1 is received, the received data is transferred to RDR. During this time, the RXI interrupt request is generated. The other operations are the same as the operations in asynchronous mode.
Figure 15.14 is the example of operation for reception.

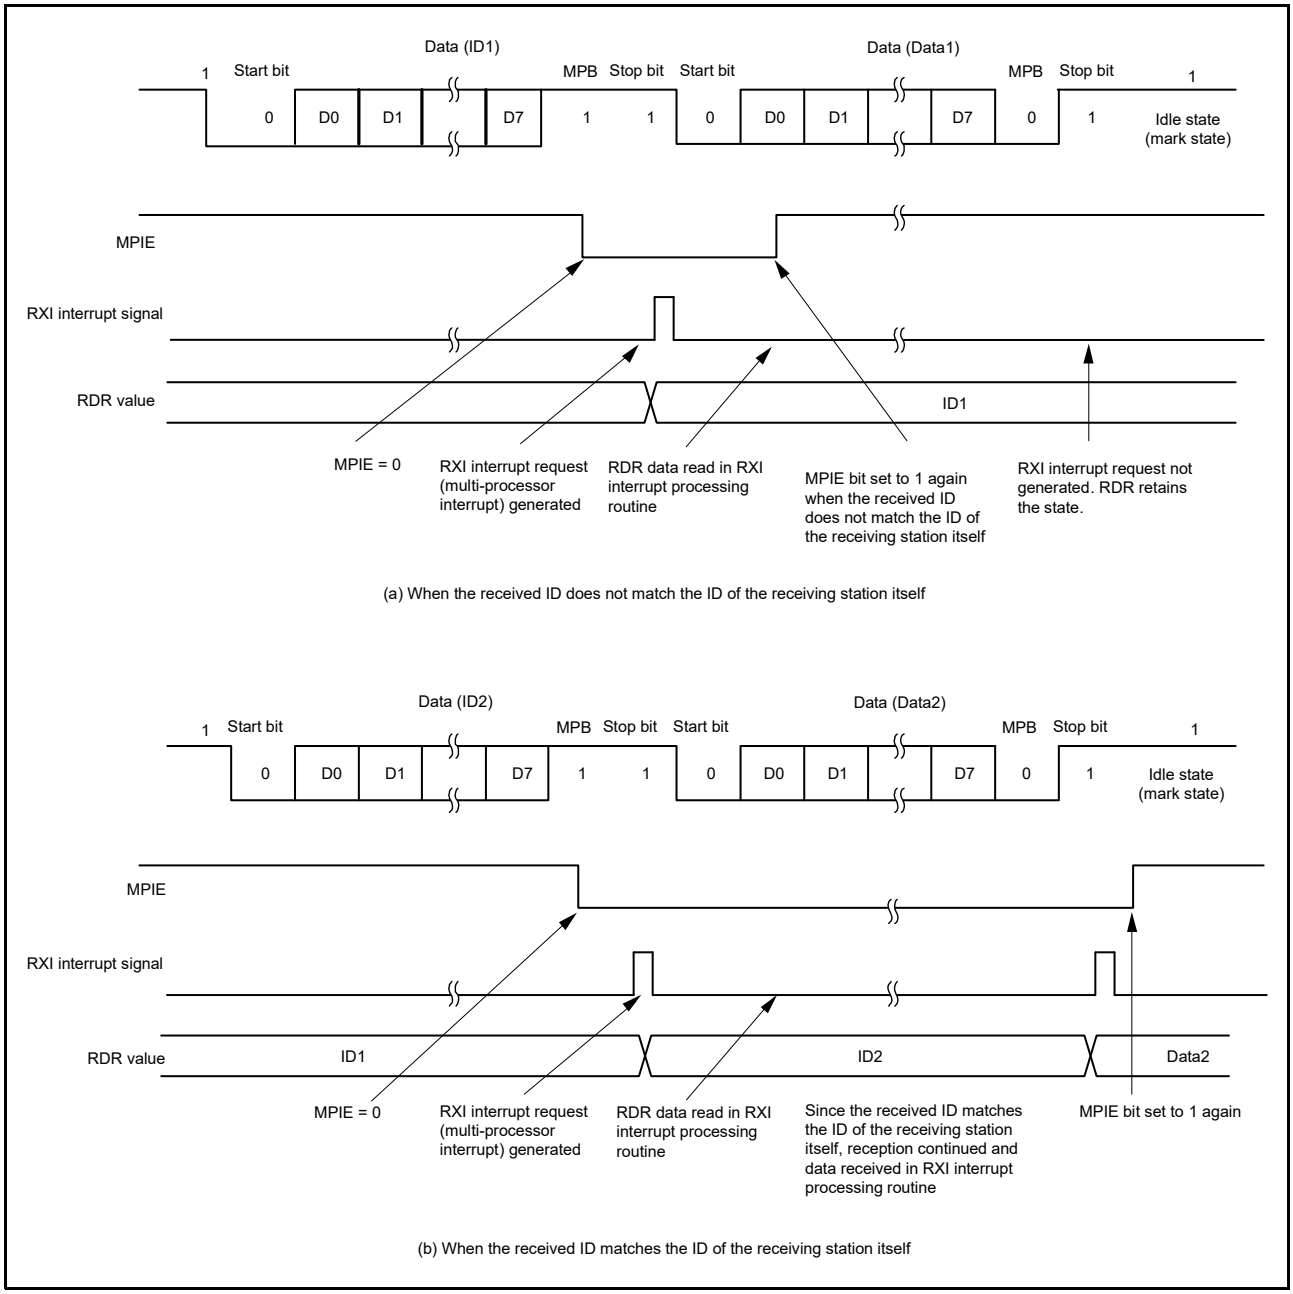

**Figure 15.14 Example of Reception (8-Bit Data/Multi-Processor Bit/One Stop Bit)**

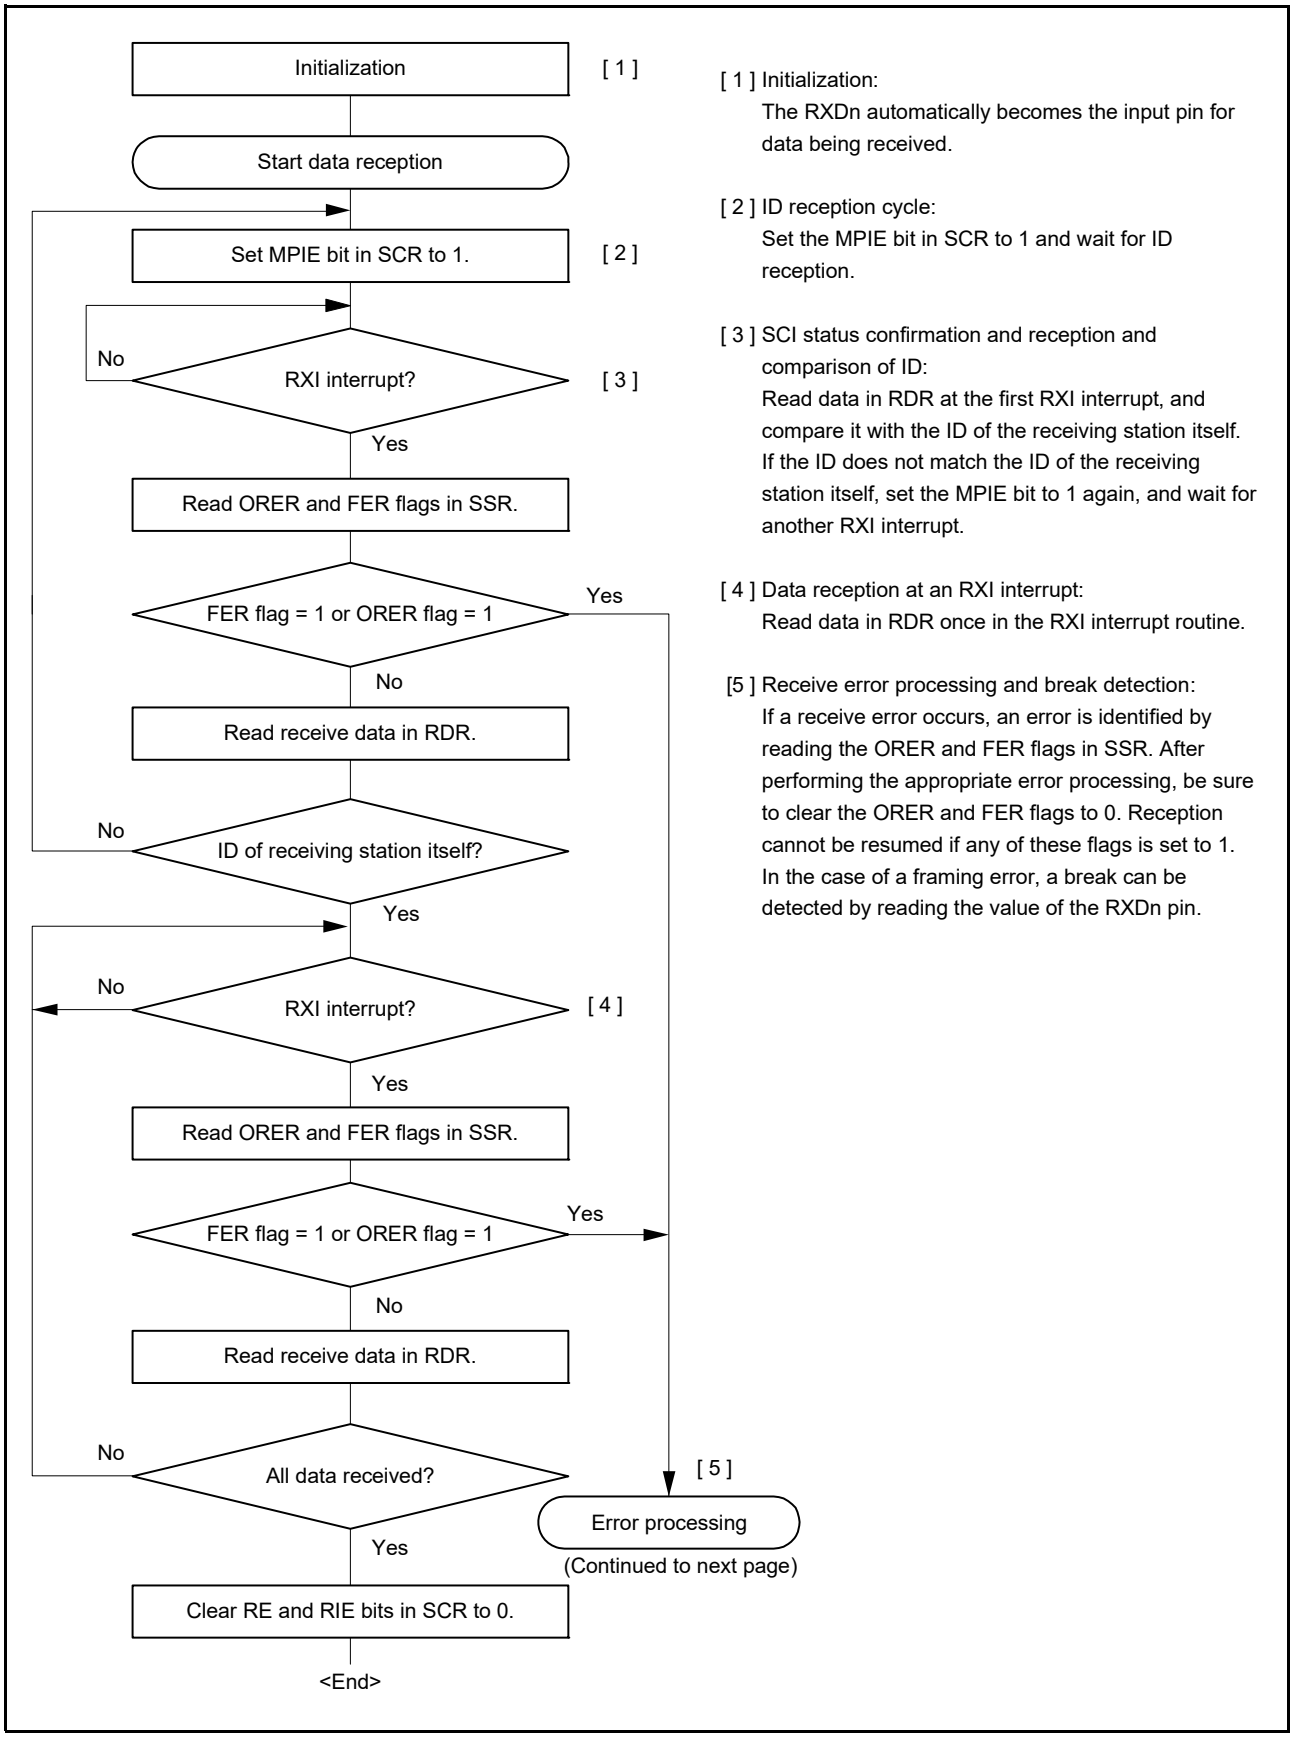

**Figure 15.15 Example of Multi-Processor Serial Reception Flowchart (1)**

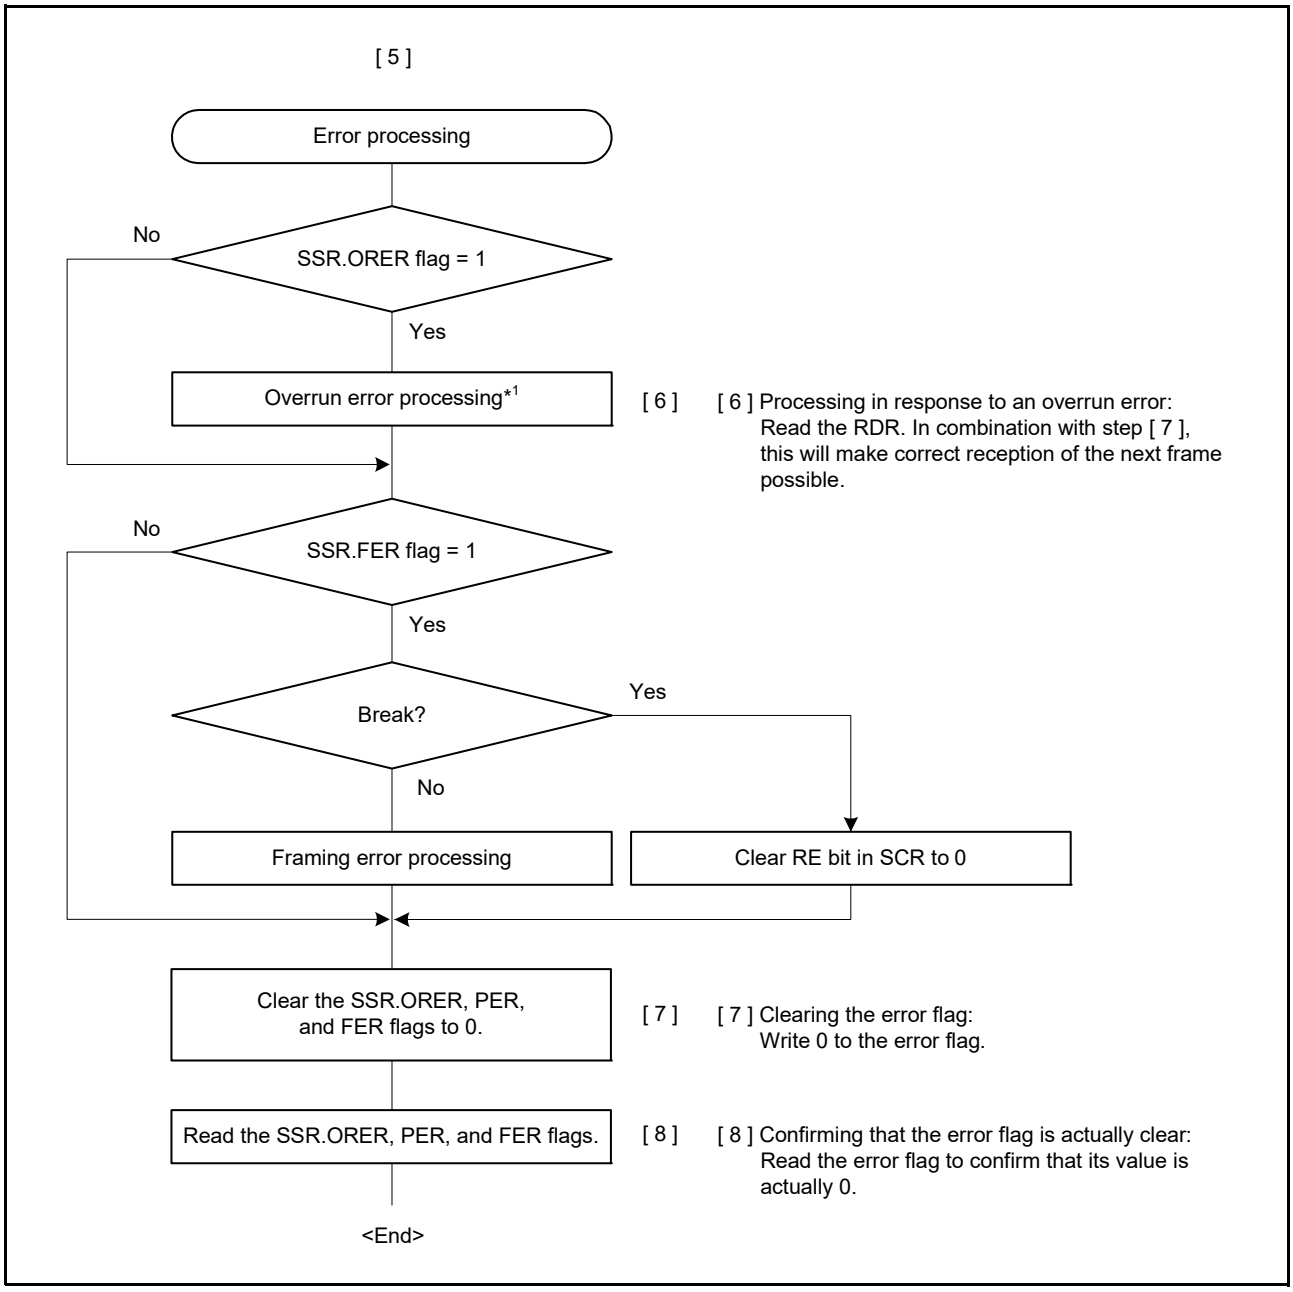

**Figure 15.16 Example of Multi-Processor Serial Reception Flowchart (2)**

## 15.5 Operation in Clock Synchronous Mode

Figure 15.17 shows the data format for clock synchronous serial data communications.
In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In clock synchronous mode, no parity bit can be added.
In data transmission, the SCI outputs data from one falling edge of the synchronization clock to the next. In data reception, the SCI receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the transmission line holds the last bit output state.
Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications by use of a common clock. Both the transmitter and the receiver also have a double-buffered structure, so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.

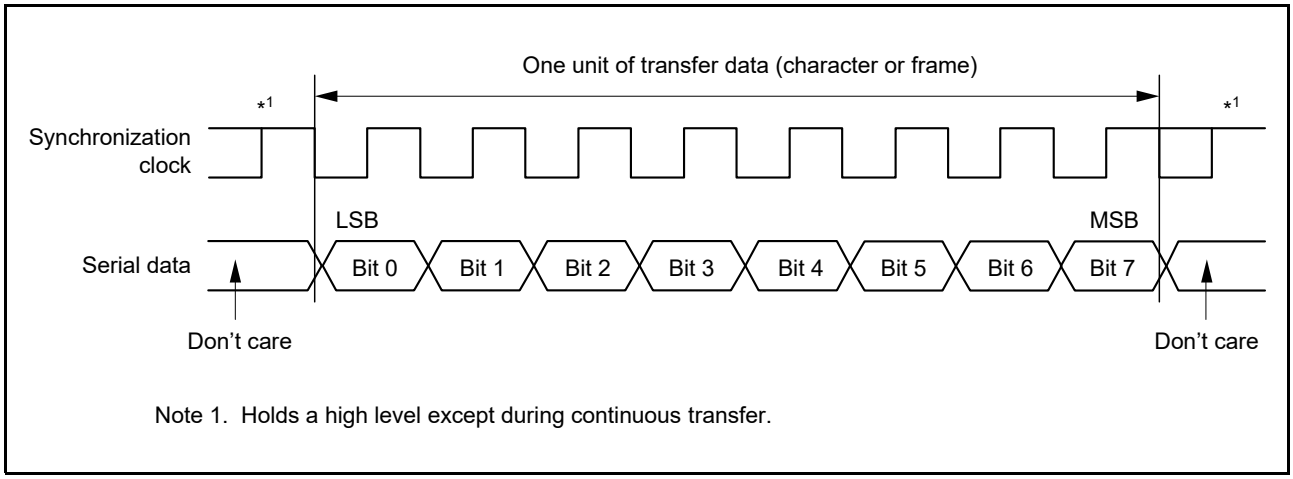

**Figure 15.17 Data Format in Clock Synchronous Serial Communications (LSB-First)**

### 15.5.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external synchronization clock input at the SCKn pin can be selected, according to the setting of the CKE[1:0] bits in SCR.
When the SCI is operated on an internal clock, the synchronization clock is output from the SCKn pin. Eight synchronization clock pulses are output in the transfer of one character, and when no transfer is performed the clock is held high. However, when only data reception is performed, output of the synchronizing clock signal continues until the CTS function is enabled and the high level is input on the CTSn# pin, an overflow error occurs, or the RE bit in SCR is set to 0. When the CTS function is enabled, the synchronous clock signal output is stopped if the CTSn# pin input is high on completion of the frame reception.

### 15.5.2 CTS and RTS Functions

In the CTS function, CTSn# pin input is used to control reception/transmission start when the clock source is the internal clock. Setting the SECR.CTSE bit to 1 enables the CTS function.
When the CTS function is enabled, placing the low level on the CTSn# pin causes reception/transmission to start.
In the RTS function, RTSn# pin output is used to request reception/transmission start when the clock source is an external synchronizing clock. A low level is output when serial communications become possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output]
Satisfaction of all conditions listed below

- The value of the RE or TE bit in the SCR is 1
- Neither transmission nor reception is in progress
- There are no received data yet to be read (when the SCR.RE bit is 1)
- Transmit data has been written (when the SCR.TE bit is 1)
- ORER flag in SSR is 0

[Condition for high-level output]
Any of the conditions for the low level not being satisfied

### 15.5.3 Initialization (Clock Synchronous Mode)

Before transmitting and receiving data, start by writing the initial value “00h” to the SCR and then continue through the procedure for SCI given in the sample flowchart (Figure 15.18). Whenever the operating mode or transfer format is changed, the SCR must be initialized before the change is made.
Note that clearing the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR.
Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.

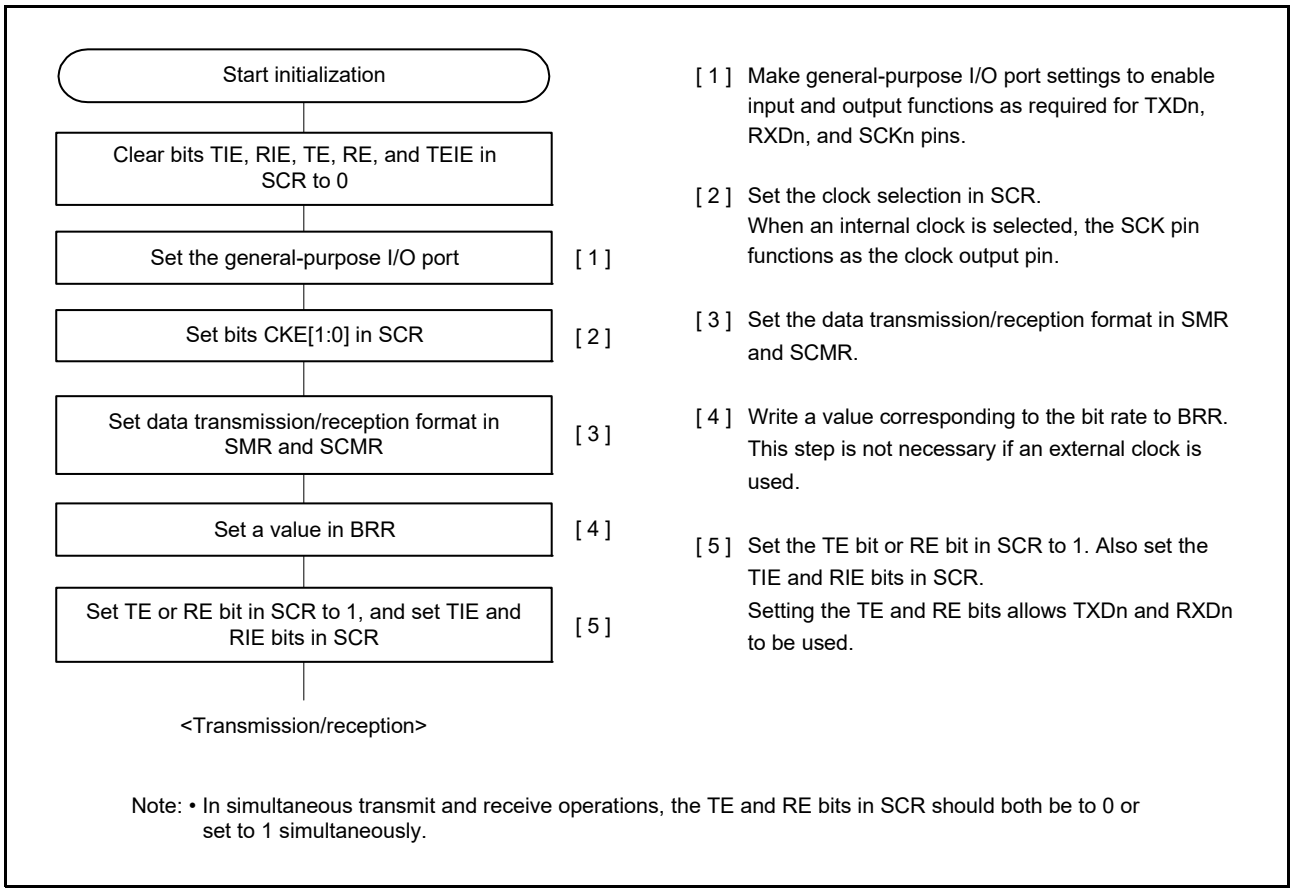

**Figure 15.18 Example of Initialization Flowchart (Clock Synchronous Mode)**

### 15.5.4 Serial Data Transmission (Clock Synchronous Mode)

Figure 15.19 shows an example of the operation for serial transmission in clock synchronous mode.
In serial data transmission, the SCI operates as described below.

1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt processing routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these two bits are set to 1 simultaneously by a single instruction.
2. After transferring data from TDR to TSR, the SCI starts transmission. When the SCR.TIE bit is set to 1 at this time, a TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to TDR in this TXI interrupt processing routine before transmission of the current transmit data has finished. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (disabling TXI requests) and the SCR.TEIE bit to 1 (enabling TEI requests) after the last of the data to be transmitted are written to the TDR from the processing routine for TXI requests.
3. 8-bit data is sent from the TXDn pin in synchronization with the output clock when clock output mode has been specified and in synchronization with the input clock when use of an external clock has been specified. Output of the clock signal is suspended until the input CTS signal is at the low level while the CTSE bit in SECR is 1 (enabling the CTS function).
4. The SCI checks for updating of (writing to) the TDR at the time of the last bit output.
5. When TDR is updated, the next transmit data is transferred from TDR to TSR, and serial transmission of the next frame is started.
6. If TDR is not updated, set the SSR flag in TEND to 1 and the TXDn pin retains the output state of the last bit. If the TEIE bit in SCR is 1 at this time, a TEI interrupt request is generated. The SCKn pin is held high.

Figure 15.20 shows a sample flowchart of serial data transmission.
Transmission will not start while a receive error flag (ORER, FER, or PER in SSR) is set to 1. Be sure to clear the receive error flags to 0 before starting transmission. Note that clearing the RE bit in SCR to 0 does not clear the receive error flags.

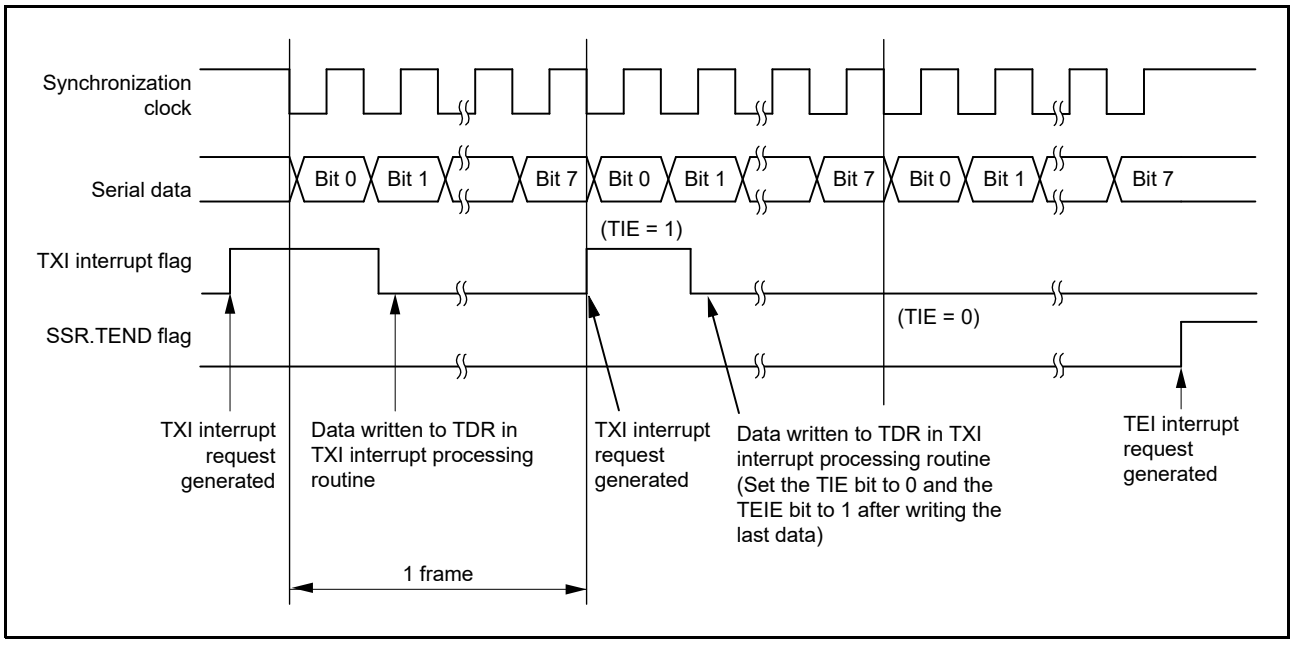

**Figure 15.19 Example of Operation for Serial Transmission in Clock Synchronous Mode (from the Middle of Transmission until Transmission Completion)**

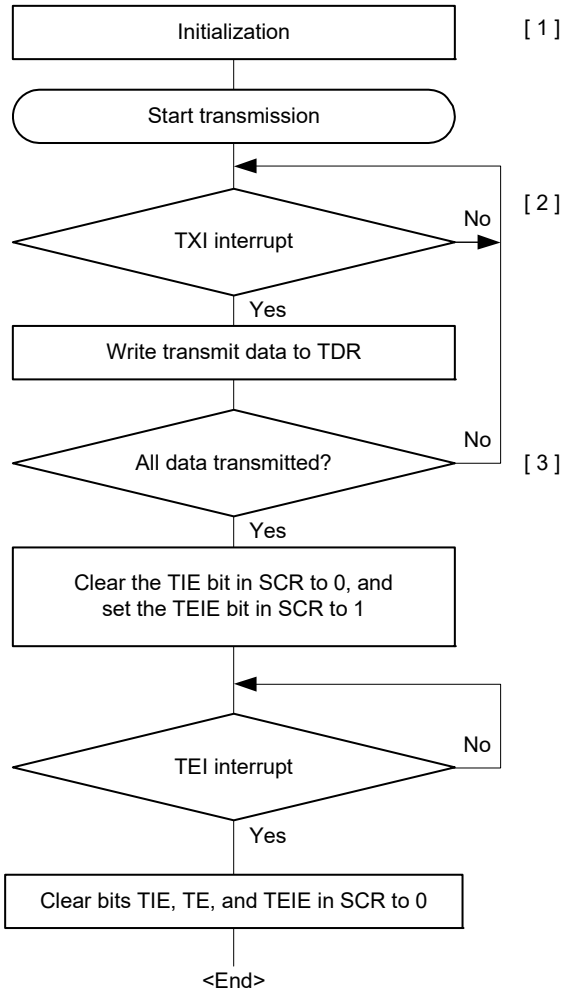

[ 1 ] Initialization:
The TXDn automatically becomes the output pin for data being transmitted.

[ 2 ] Writing transmit data write to TDR by a TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Transmit data is written to TDR once from the processing routine for TXI requests.

[ 3 ] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR upon accepting a transmit data empty interrupt (TXI). Transmit data can also be written to TDR by activating the DMAC by the TXI interrupt request.
When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

Note: • When the external clock is in use (the value of the SCR.CKE[1:0] bits is 10b or 11b), the rising edge on the SCK pin for the last bit sets the SSR.TEND flag to 1. Clearing the SCR.TE bit to 0 immediately after this may lead to insufficient received-data hold time on the receiver side.

**Figure 15.20 Example of Serial Transmission Flowchart (Clock Synchronous Mode)**

### 15.5.5 Serial Data Reception (Clock Synchronous Mode)

Figure 15.21 and Figure 15.22 show examples of SCI operation for serial reception in clock synchronous mode. In serial data reception, the SCI operates as described below.

1. The value of the RE bit in SCR becoming 1 places the signal output on the RTS pin at the low level (when the RTS function is in use).
2. The SCI performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores the receive data in RSR.
3. If an overrun error occurs, the ORER bit in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR.
4. When reception finishes successfully, receive data is transferred to RDR. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR in this RXI interrupt processing routine before reception of the next receive data is completed. Reading out the received data that have been transferred to RDR causes the RTSn# pin to output the low level (when the RTS function is in use).

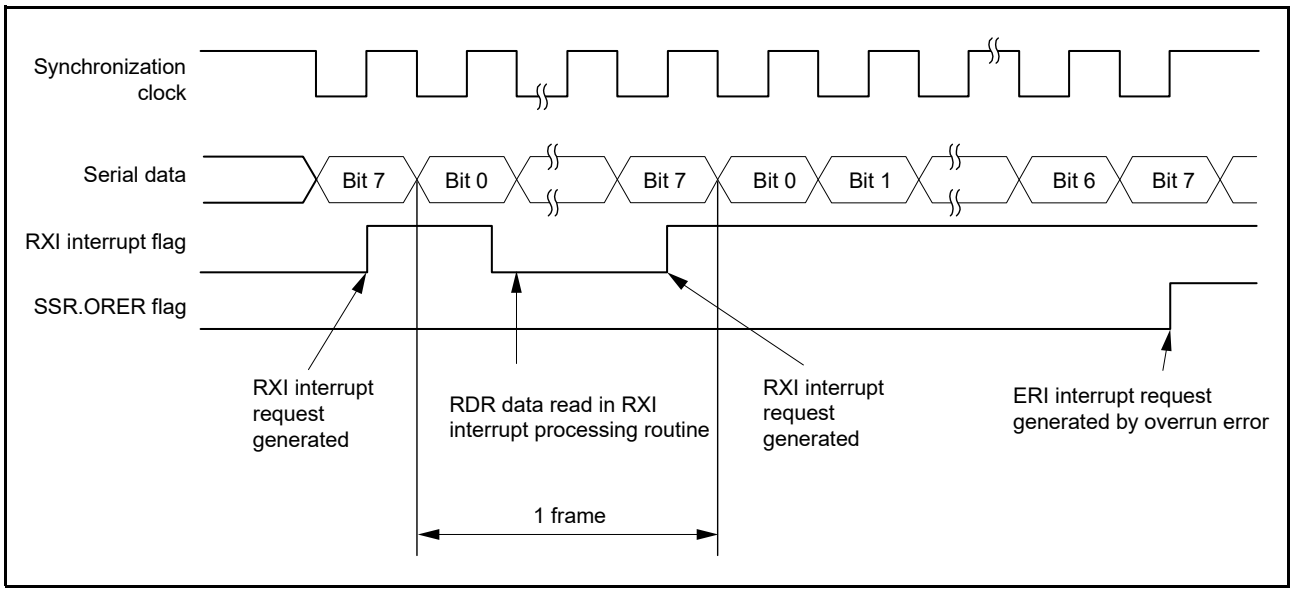

**Figure 15.21 Example of Operation for Serial Reception in Clock Synchronous Mode (1) (when RTS Function is not Used)**

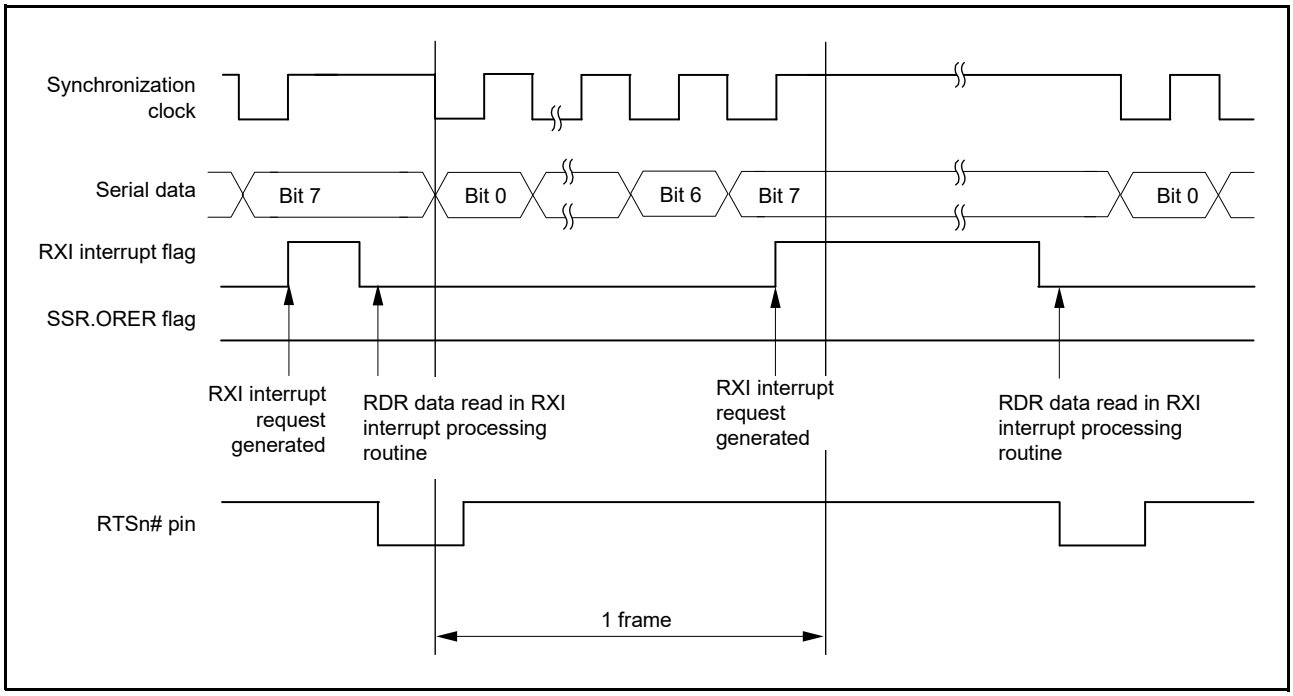

**Figure 15.22 Example of Operation for Serial Reception in Clock Synchronous Mode (2) (when RTS Function is Used)**

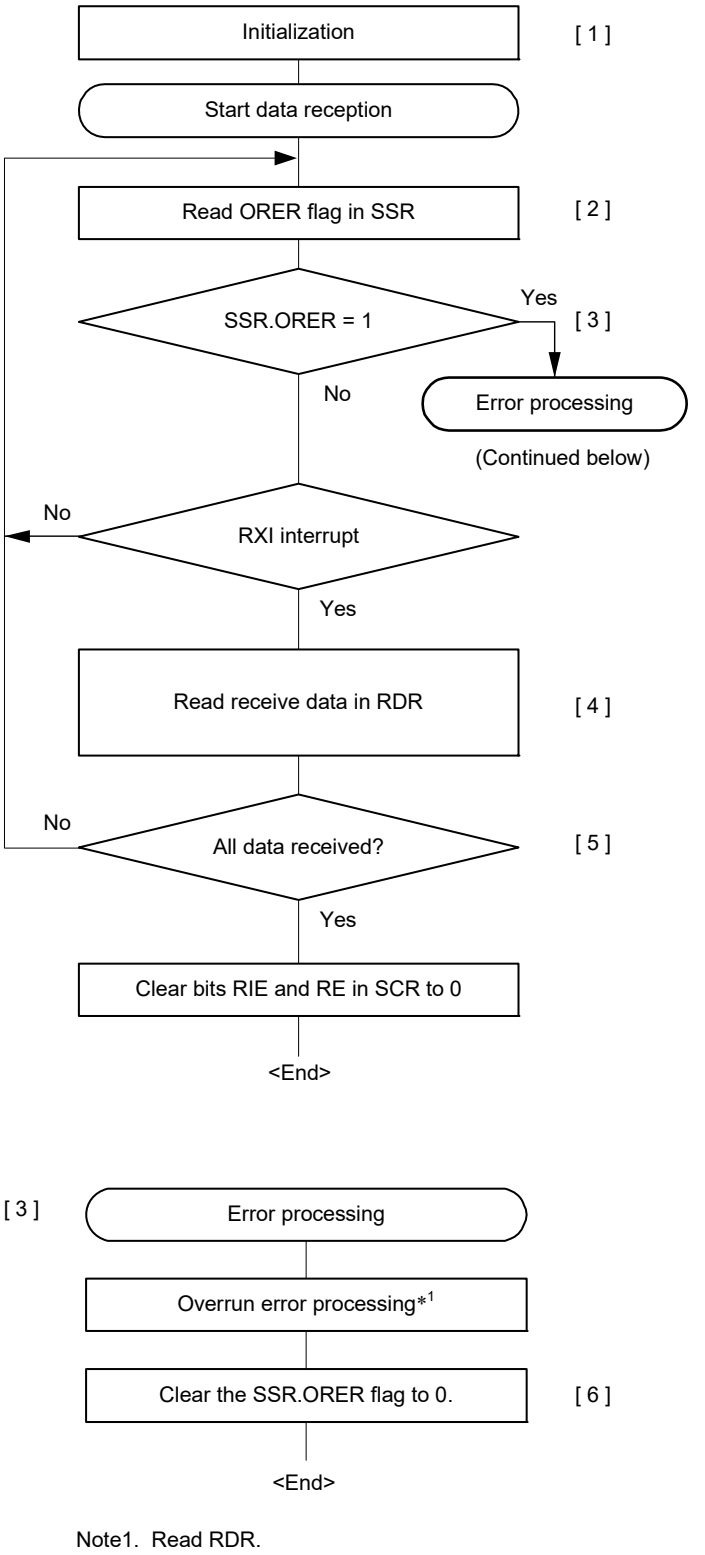
Data transfer cannot be resumed while a receive error flag is 1. Accordingly, clear the ORER, FER, and PER bits in SSR to 0 before resuming reception. Moreover, be sure to read the RDR during overrun error processing.
Figure 15.23 shows a sample flowchart for serial data reception.



[ 1 ] Initialization:
Make input port-pin settings for pins to be used as RXDn pins.

[ 2 ] [ 3 ] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, and then clear the ORER flag to 0. Data reception cannot be resumed while the ORER flag is 1.

[ 4 ] Read the receive data in RDR once in the receive data full interrupt (RXI) request processing routine.

[ 5 ] Serial reception continuation procedure:
To continue serial reception, before the MSB (bit 7) of the current frame is received, finish reading the receive data in RDR. The RDR data can also be read by activating the DMAC by an RXI interrupt request.

[ 6 ] Clearing the error flag:
Clear the error flag to 0.
After writing 0, confirm that the flag is actually cleared.

**Figure 15.23 Example of Serial Reception Flowchart (Clock Synchronous Mode)**

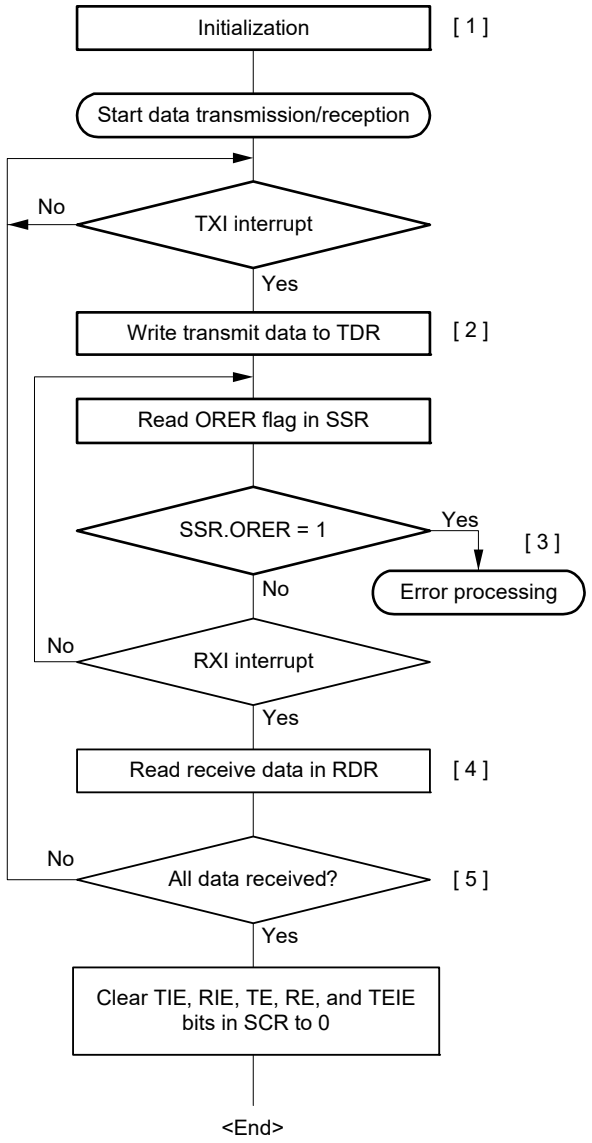
### 15.5.6 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode)

Figure 15.24 shows a sample flowchart for simultaneous serial transmit and receive operations in clock synchronous mode.

After initializing the SCI, the following procedure should be used for simultaneous serial data transmit and receive operations.

To switch from transmit mode to simultaneous transmit and receive mode, check that the SCI has finished transmission by reading that the TEND flag in SSR is 1, and then initialize the SCR register. Then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.

To switch from receive mode to simultaneous transmit and receive mode, check that the SCI has finished reception, and then clear the RIE and RE bits to 0. Then check that the receive error flags (ORER, FER, and PER in SSR) are 0, and then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.



[ 1 ] Initialization:
The TXDn pin can act as the output pin for transmitted data and the RXDn pin can act as the input pin for received data at the same time.

[ 2 ] Transmit data write:
Write transmit data to TDR once in the TXI interrupt request processing routine.

[ 3 ] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, and then clear the ORER flag to 0. Data reception cannot be resumed while the ORER flag is 1.

[ 4 ] Reading receive data:
Read the receive data in RDR once in the RXI interrupt request processing routine.

[ 5 ] Serial transmission/reception continuation procedure:
To continue serial transmission and reception, before the MSB (bit 7) of the current frame is received, finish reading the receive data in RDR by the RXI interrupt. Also, before the MSB (bit 7) of the current frame is transmitted, write data to TDR by the TXI interrupt.
Transmit data can also be written to TDR by activating the DMAC by a transmit data empty interrupt (TXI) request. Similarly, the RDR data can also be read by activating the DMAC by a receive data full interrupt (RXI) request.

Note: • When switching from transmit or receive operation to simultaneous transmit and receive operations, first clear the TIE, RIE, TE, RE, and TEIE bits in SCR to 0, and then set TIE, RIE, TE, and RE bits to 1 simultaneously.

**Figure 15.24 Example of Simultaneous Serial Transmission and Reception Flowchart (Clock Synchronous Mode)**

## 15.6 Operation in Smart Card Interface Mode

The SCI supports the smart card (IC card) interface conforming to the ISO/IEC 7816-3 (Identification Card) standard. Smart card interface mode can be selected using the appropriate register.

### 15.6.1 Sample Connection

Figure 15.25 shows a sample connection between a smart card (IC card) and this LSI.
As in the figure, since this LSI communicates with an IC card using a single transmission line, interconnect the TXDn and RXDn pins and pull up the data transmission line to Vcc using a resistor.
Setting the TE and RE bits in SCR to 1 with an IC card disconnected enables closed transmission/reception allowing self-diagnosis.
To supply an IC card with the clock pulses generated by the SCI, input the SCKn pin output to the CLK pin of an IC card. The output port of this LSI can be used to output a reset signal.

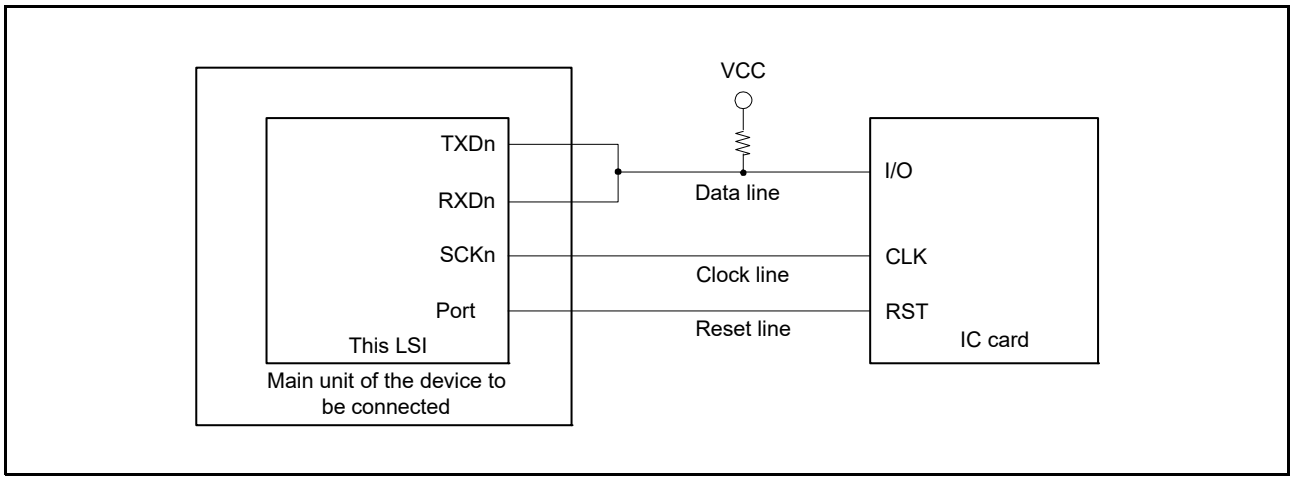


**Figure 15.25 Sample Connection with a Smart Card (IC Card)**

### 15.6.2 Data Format (Except in Block Transfer Mode)

Figure 15.26 shows the data transfer formats in smart card interface mode.

- One frame consists of 8-bit data and a parity bit in asynchronous mode.
- During transmission, at least 2 etu (elementary time unit: time required for transferring one bit) is secured as a guard time from the end of the parity bit until the start of the next frame.
- If a parity error is detected during reception, a low-level error signal is output for 1 etu after 10.5 etu has passed from the start bit.
- If an error signal is sampled during transmission, the same data is automatically re-transmitted after at least 2 etu.

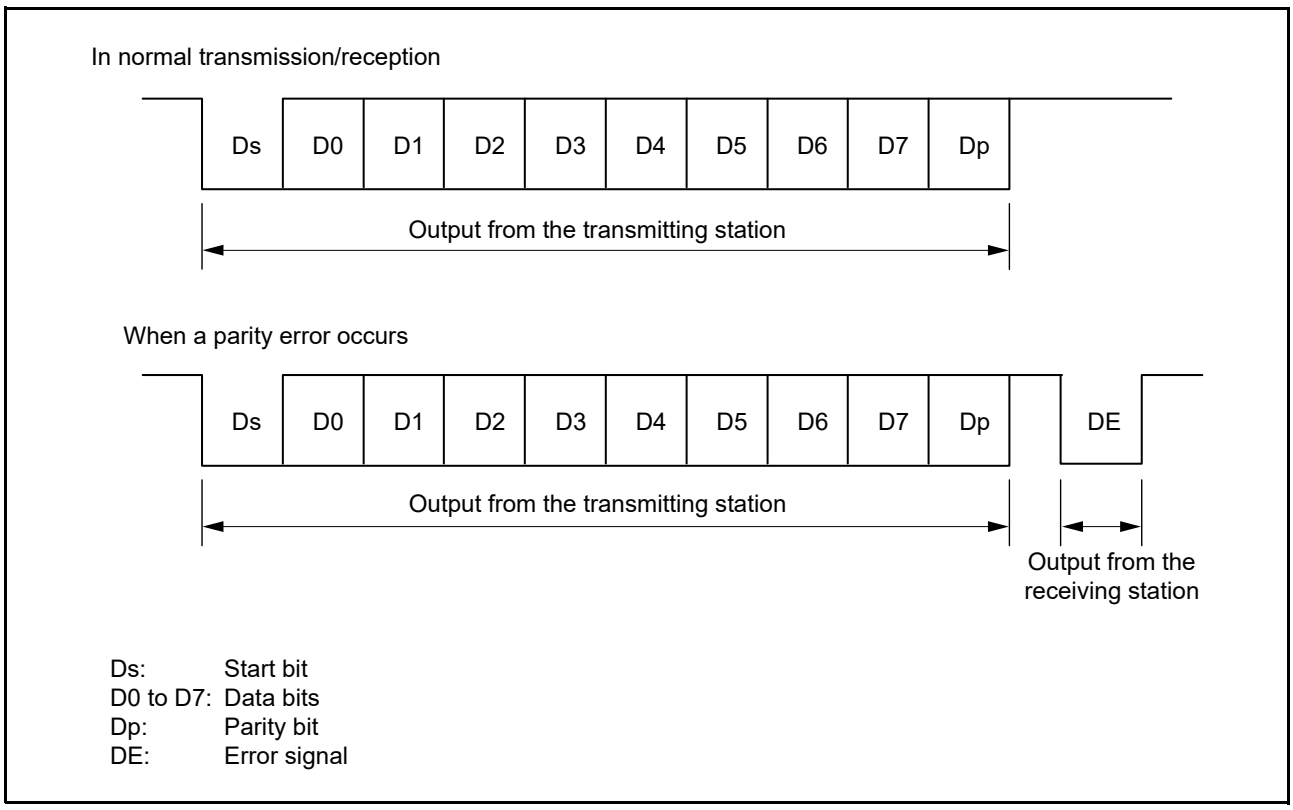

**Figure 15.26 Data Formats in Smart Card Interface Mode**

For communications with IC cards of the direct convention type and inverse convention type, follow the procedure below.

### (1) Direct Convention Type

For the direct convention type, logic levels 1 and 0 correspond to states Z and A, respectively, and data is transferred with LSB-first as the start character, as shown in Figure 15.27. Therefore, data in the start character in the figure is 3Bh. When using the direct convention type, write 0 to both the SDIR and SINV bits in SCMR. Write 0 to the PM bit in SMR in order to use even parity, which is prescribed by the smart card standard.

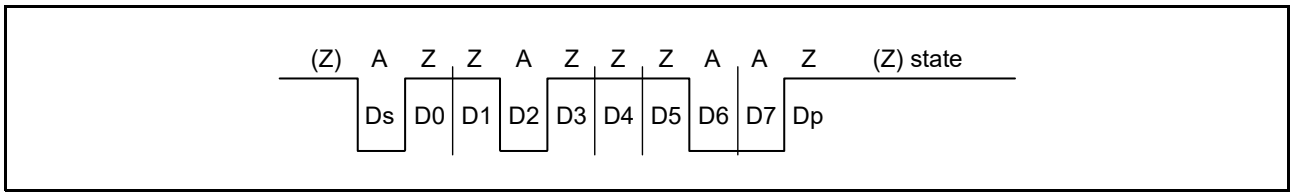

**Figure 15.27 Direct Convention (SDIR in SCMR = 0, SINV in SCMR = 0, PM in SMR = 0)**

### (2) Inverse Convention Type

For the inverse convention type, logic levels 1 and 0 correspond to states A and Z, respectively and data is transferred with MSB-first as the start character, as shown in Figure 15.28. Therefore, data in the start character in the figure is 3Fh. When using the inverse convention type, write 1 to both the SDIR and SINV bits in SCMR. The parity bit is logic level 0 to produce even parity, which is prescribed by the smart card standard, and corresponds to state Z. Since the SCMR.SINV bit of this LSI only inverts data bits D7 to D0, write 1 to the PM bit in SMR to invert the parity bit for both transmission and reception.

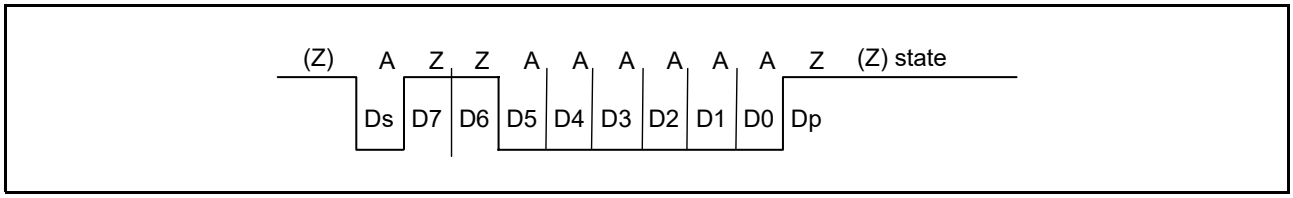

**Figure 15.28 Inverse Convention (SDIR in SCMR = 1, SINV in SCMR = 1, PM in SMR = 1)**

### 15.6.3 Block Transfer Mode

Block transfer mode is different from normal smart card interface mode in the following respects.

- Even if a parity error is detected during reception, no error signal is output. Since the PER bit in SSR is set by error detection, clear the PER bit before receiving the parity bit of the next frame.
- During transmission, at least 1 etu is secured as a guard time from the end of the parity bit until the start of the next frame.
- Since the same data is not re-transmitted during transmission, the TEND flag in SSR is set 11.5 etu after transmission start.
- In block transfer mode, the ERS flag in SSR indicates the error signal status as in normal smart card interface mode, but the flag is always read as 0 because no error signal is transferred.

### 15.6.4 Receive Data Sampling Timing and Reception Margin

Only the internal clock generated by the on-chip baud rate generator can be used as a transfer clock in smart card interface mode.
In this mode, the SCI can operate on a base clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate according to the settings of the BCP2 bit in SCMR and the BCP[1:0] bits in SMR (the frequency is always 16 times the bit rate in normal asynchronous mode).
For data reception, the falling edge of the start bit is sampled with the base clock to perform internal synchronization. Receive data is sampled on the 16th, 32nd, 186th, 128th, 46th, 64th, 93rd, and 256th rising edges of the base clock so that it can be latched at the middle of each bit as shown in Figure 15.29. The reception margin here is determined by the following formula.

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)\ F - \frac{\left| D - 0.5 \right|}{N}\ (1+F) \right| \times 100\ [\%]$$

M: Reception margin (%)
N: Ratio of bit rate to clock (N = 32, 64, 372, 256)
D: Duty cycle of clock (D = 0 to 1.0)
L: Frame length (L = 10)
F: Absolute value of clock frequency deviation

Assuming values of F = 0, D = 0.5, and N = 372 in the above formula, the reception margin is determined by the formula below.

$$M = \{0.5 - 1/(2 \times 372)\} \times 100\ [\%] = 49.866\%$$

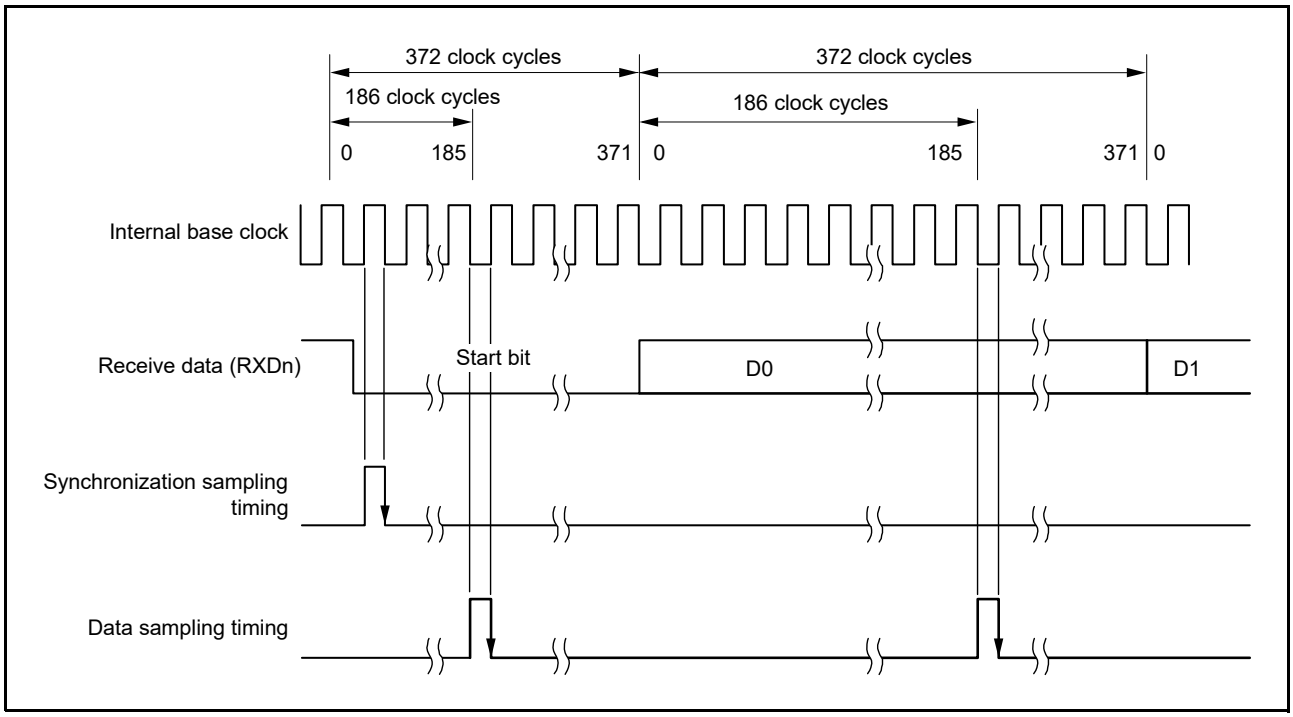

**Figure 15.29 Receive Data Sampling Timing in Smart Card Interface Mode (When Clock Frequency is 372 Times the Bit Rate)**

## 15.6.5 Initialization (Smart Card Interface Mode)

Before transmitting and receiving data, initialize the SCI using the following procedure. Initialization is also necessary before switching from transmission to reception and vice versa.

1. Write the initial value “00h” to the SCR.
2. Make general-purpose I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.
3. Set the error flags ORER, ERS, and PER in SSR to 0.
4. Set bits GM, BLK, PM, BCP[1:0], and CKS[1:0] in SMR and the BCP2 bit in SCMR appropriately. Also set the PE bit in SMR to 1.
5. Set bits SDIR, SINV, and SMIF in SCMR appropriately. Then, the TXDn and RXDn pins are placed in the high impedance state.
6. Set the value corresponding to the bit rate in BRR.
7. Set the CKE[1:0] bits in SCR appropriately, and set bits TIE, RIE, TE, RE, and TEIE in SCR to 0 at the same time. When the CKE[1:0] bit in SCR is set to 1, the SCKn pin is allowed to output clock pulses.
8. Set the TIE, RIE, TE, and RE bits in SCR to 1. Setting the TE and RE bits to 1 simultaneously is prohibited except for self-diagnosis.

To change reception mode to transmission mode, first check that reception has completed, and then initialize the SCI. At the end of initialization, set SCR.TE = 1 and SCR.RE = 0. Reception completion can be verified by reading the RXI request, ORER, or PER flag in SSR.

To change transmission mode to reception mode, first check that transmission has completed, and then initialize the SCI. At the end of initialization, set SCR.TE = 0 and SCR.RE = 1. Transmission completion can be verified by reading the TEND flag in SSR.

### 15.6.6 Serial Data Transmission (Except in Block Transfer Mode)

Serial data transmission in smart card interface mode (except in block transfer mode), in that an error signal is sampled and data can be re-transmitted, is different from that in normal serial communications interface mode. Figure 15.30 shows the data retransfer operation during transmission.

1. When an error signal from the receiver end is sampled after one-frame data has been transmitted, the ERS flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the ERS flag in SSR to 0 before the next parity bit is sampled.
2. For a frame in which an error signal is received, the TEND flag in SSR is not set. Data is retransferred from TDR to TSR allowing automatic data retransmission.
3. If no error signal is returned from the receiver, the ERS flag in SSR is not set to 1.
4. In this case, the SCI judges that transmission of one-frame data (including retransfer) has been completed, and the TEND flag is set. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Writing transmit data to TDR starts transmission of the next data.

Figure 15.32 shows a sample flowchart of serial transmission. All the processing steps are automatically performed using a TXI interrupt request to activate the DMAC.
When the TEND flag in SSR is set to 1 in transmission, if the TIE bit in SCR is 1, a TXI interrupt request is generated. The DMAC is activated by a TXI interrupt request if the TXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of transmit data. The TEND flag in SSR is automatically cleared to 0 when the DMAC transfers the data.
If an error occurs, the SCI automatically re-transmits the same data. During this retransmission, the TEND flag in SSR is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, since the ERS flag in SSR is not automatically cleared, set the RIE bit in SCR to 1 beforehand to enable an ERI interrupt request to be generated at error occurrence, and clear the ERS flag in SSR to 0.
When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings.
For DMAC settings, see section 9, Direct Memory Access Controller.

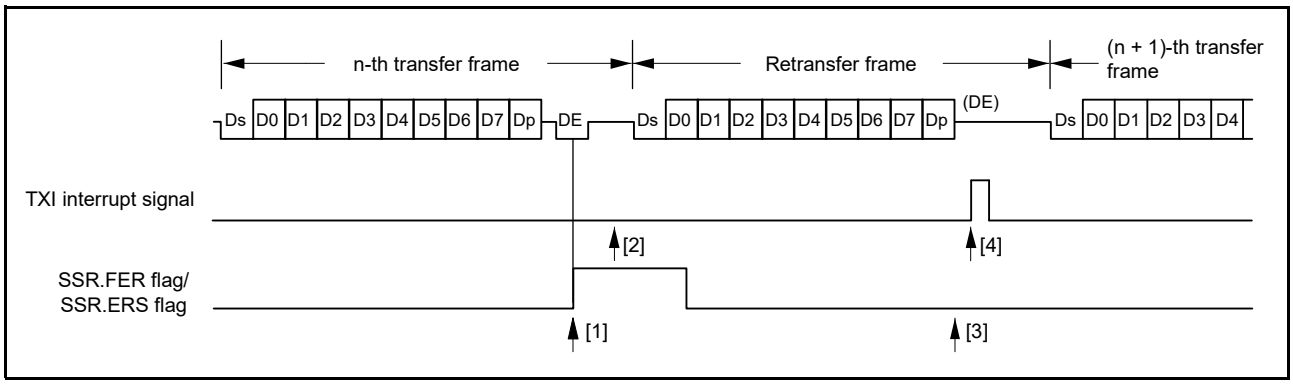

**Figure 15.30 Data Retransfer Operation in Transmission Mode**

Note that the SSR.TEND flag is set in different timings depending on the GM bit setting in SMR. Figure 15.31 shows the SSR.TEND flag generation timing.

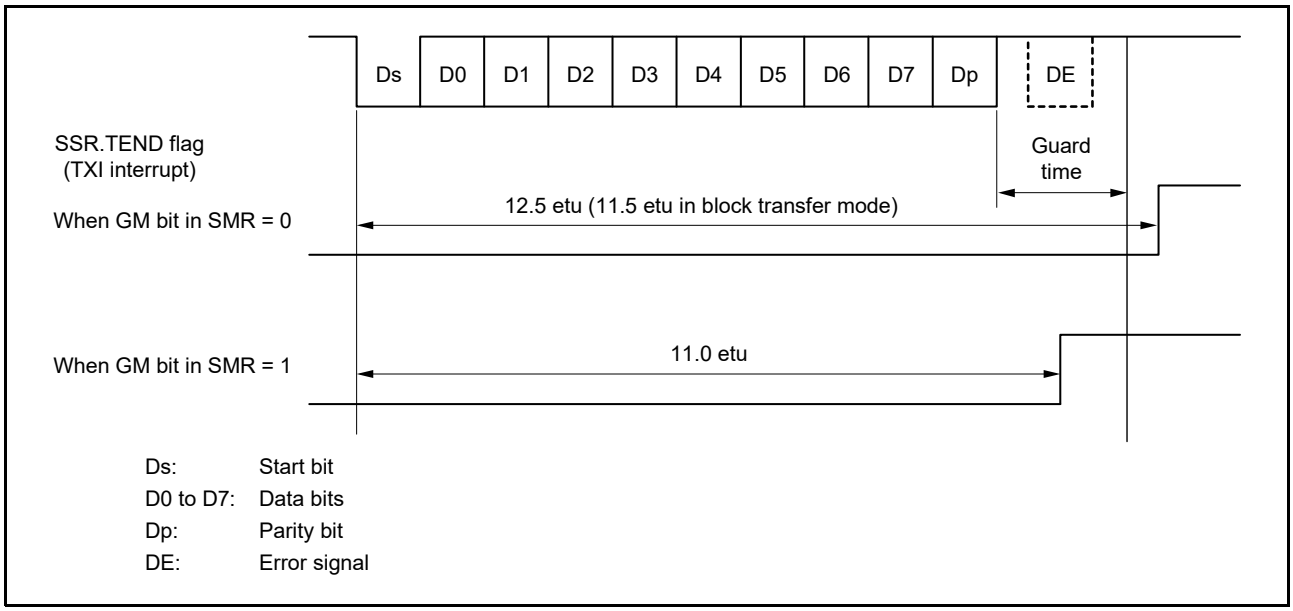

**Figure 15.31 SSR.TEND Flag Generation Timing during Transmission**

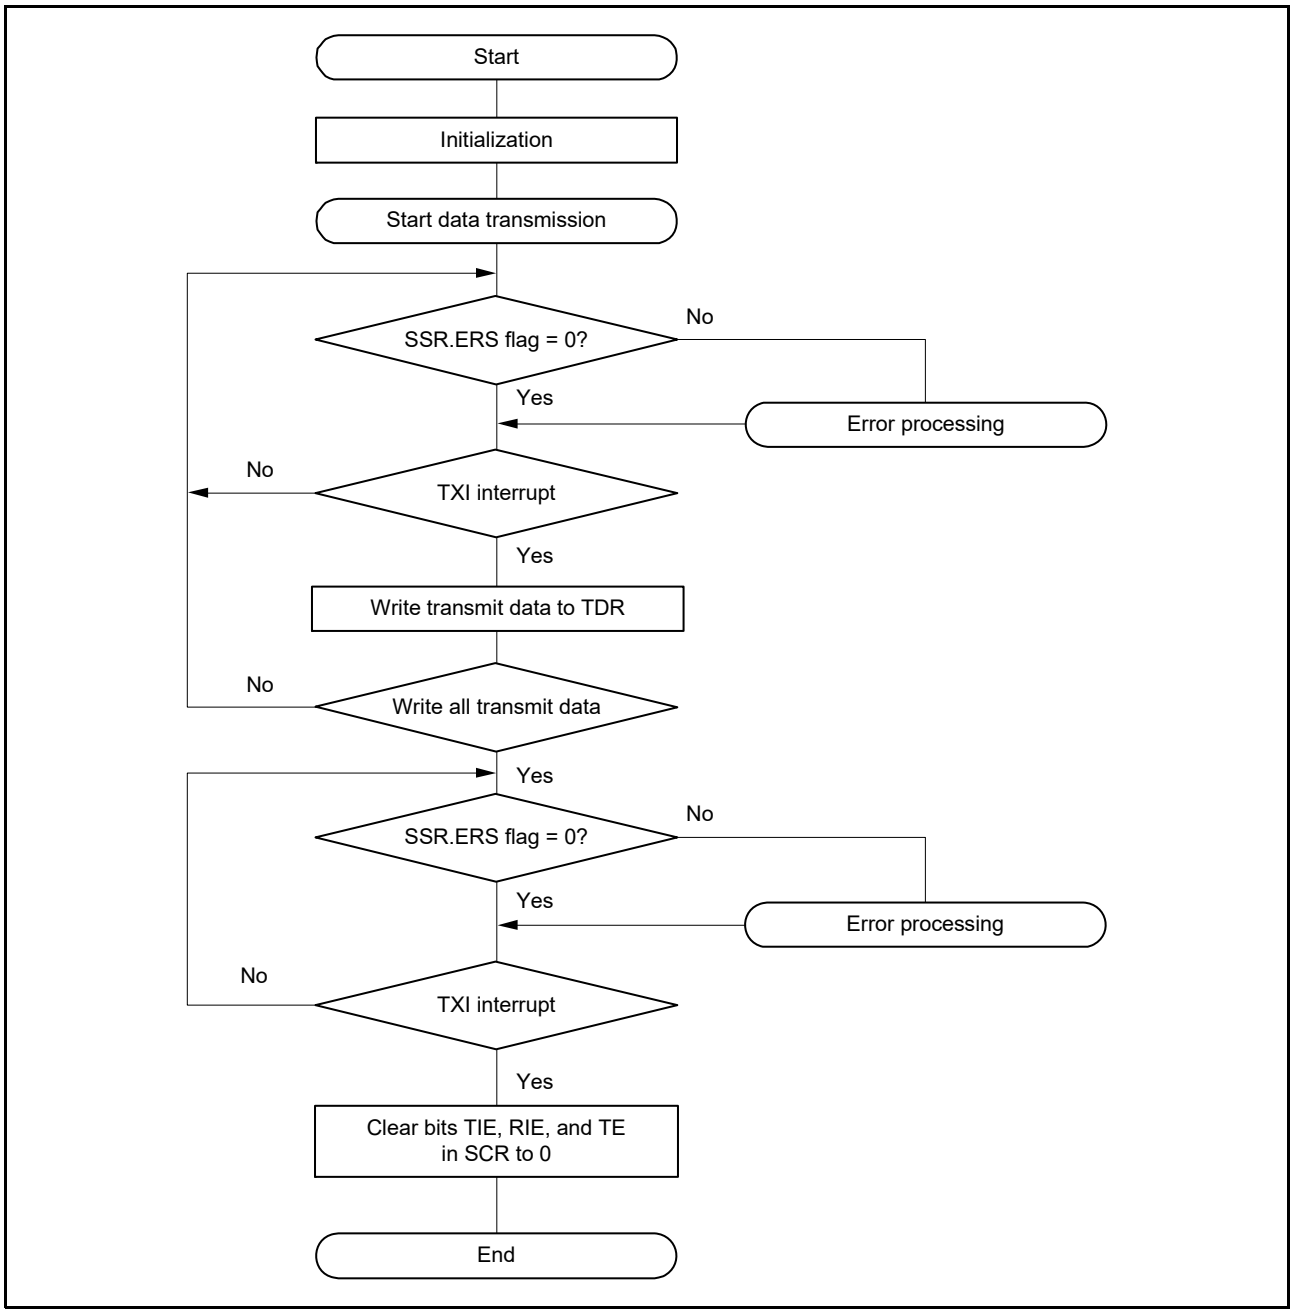

**Figure 15.32 Sample Smart Card Interface Transmission Flowchart**

### 15.6.7 Serial Data Reception (Except in Block Transfer Mode)

Serial data reception in smart card interface mode is similar to that in serial communications interface mode. Figure 15.33 shows the data retransfer operation in reception mode.

1. If a parity error is detected in receive data, the PER flag in SSR is set to 1. When the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the PER flag in SSR to 0 before the next parity bit is sampled.
2. For a frame in which a parity error is detected, no RXI interrupt is generated.
3. When no parity error is detected, the PER flag in SSR is not set to 1.
4. In this case, data is determined to have been received successfully. When the RIE bit in SCR is 1, an RXI interrupt request is generated.

Figure 15.34 shows a sample flowchart for serial data reception. All the processing steps are automatically performed using an RXI interrupt request to activate the DMAC.
In reception, setting the RIE bit in SCR to 1 allows an RXI interrupt request to be generated. The DMAC is activated by an RXI interrupt request if the RXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of receive data.
If an error occurs during reception and either the ORER or PER flag in SSR is set to 1, a receive error interrupt (ERI) request is generated. Clear the error flag after the error occurrence. If an error occurs, the DMAC is not activated and receive data is skipped. Therefore, the number of bytes of receive data specified in the DMAC is transferred.
Even if a parity error occurs and the PER flag in SSR is set to 1 during reception, receive data is transferred to RDR, thus allowing the data to be read.
Note 1. For operations in block transfer mode, see section 15.3, Operation in Asynchronous Mode.

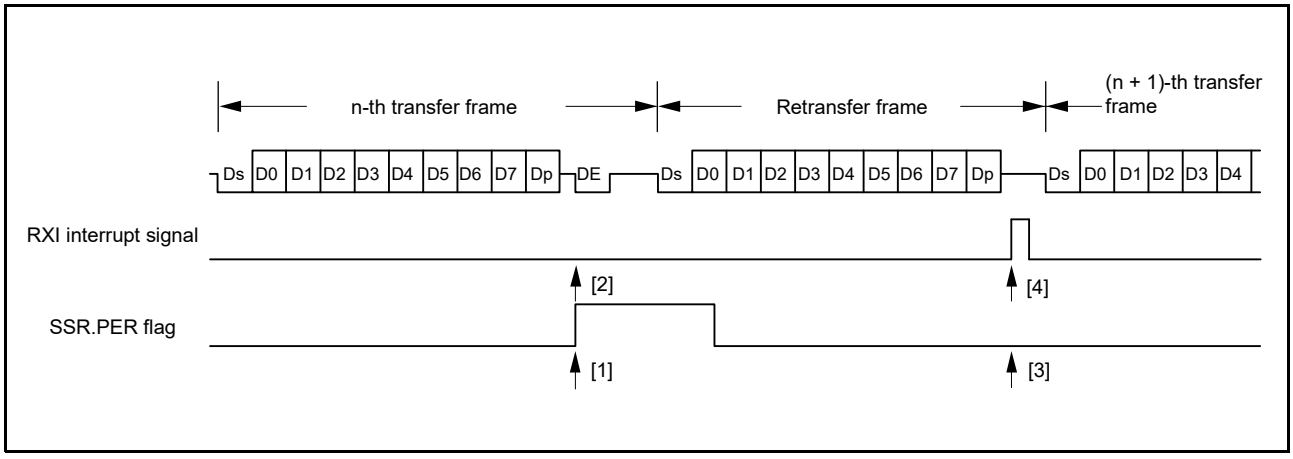

**Figure 15.33 Data Retransfer Operation in Reception Mode**

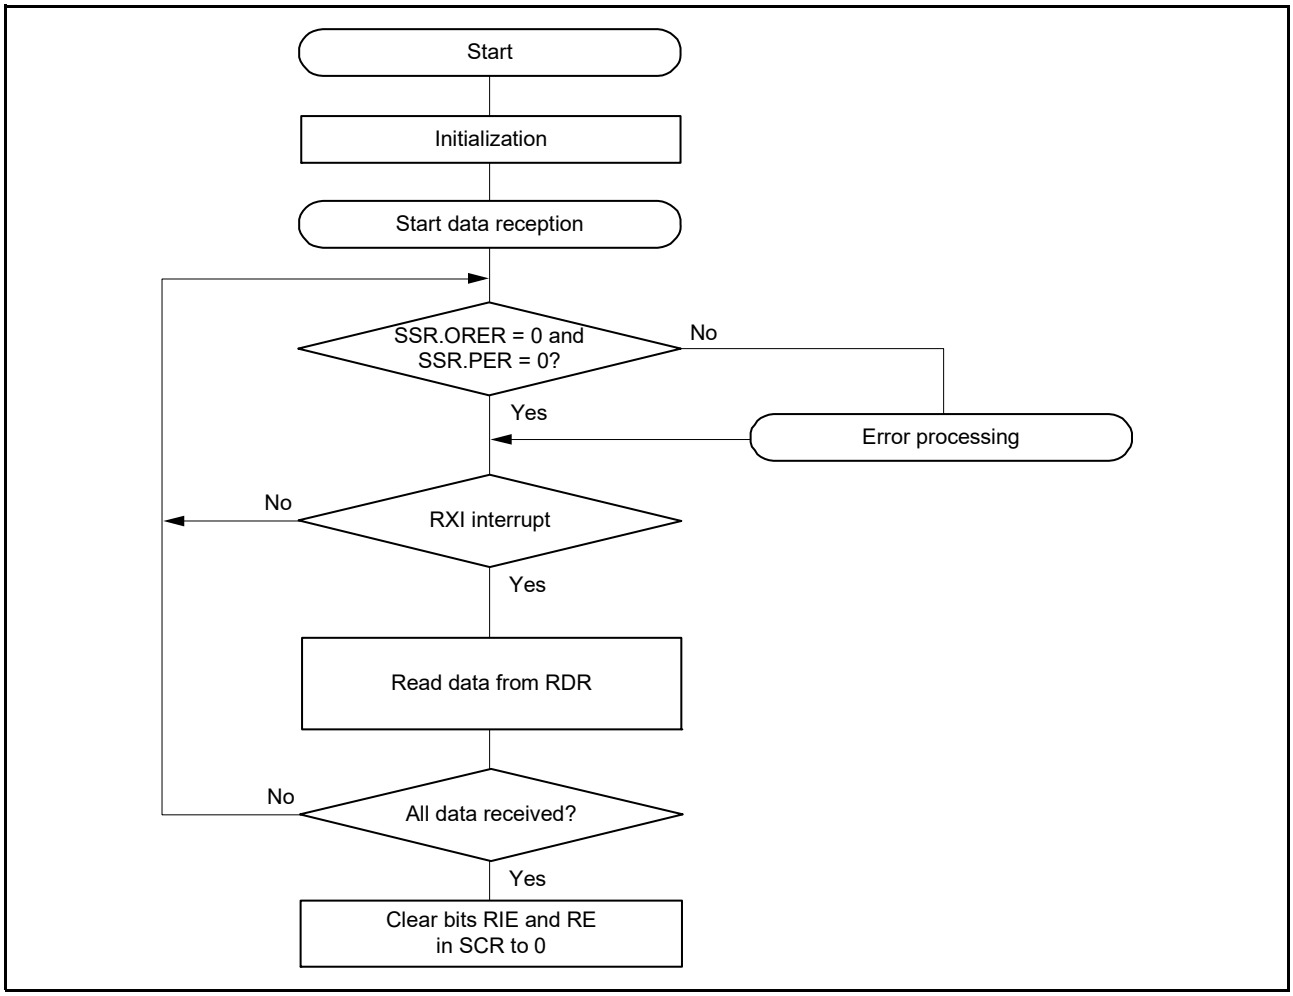

**Figure 15.34 Sample Smart Card Interface Reception Flowchart**

## 15.6.8 Clock Output Control

Clock output can be fixed using the CKE[1:0] bits in SCR when the GM bit in SMR is 1. Specifically, the minimum width of a clock pulse can be specified.

Figure 15.35 shows an example of clock output fixing timing when the CKE0 bit is controlled with SMR.GM = 1 and SCR.CKE1 = 0.

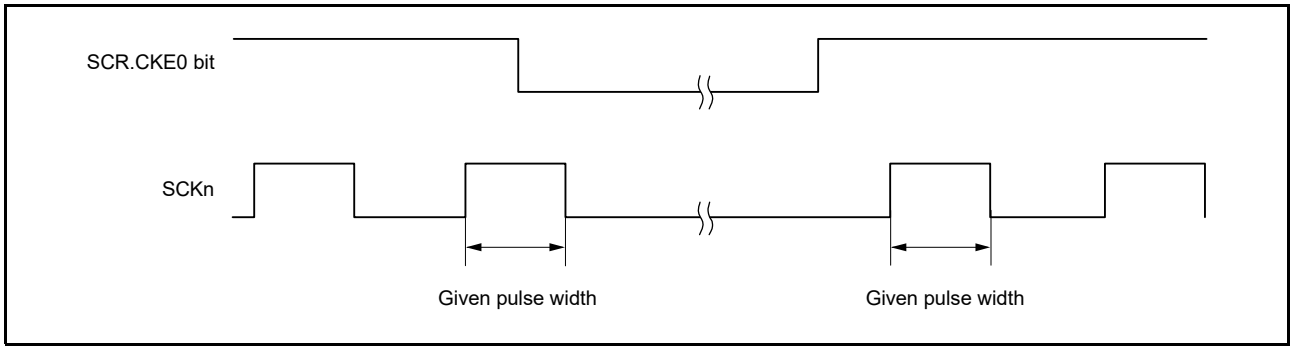

**Figure 15.35 Clock Output Fixing Timing**

At power-on and transitions to/from software standby mode, use the following procedure to secure the appropriate clock duty cycle.

### (1) At Power-On

To secure the appropriate clock duty cycle simultaneously with power-on, use the following procedure.

1. Initially, port input is enabled in the high-impedance state. To fix the potential level, use a pull-up or pull-down resistor.
2. Fix the SCKn pin to the specified output by setting the SCR.CKE[1] bit and general-purpose I/O port.
3. Set SMR and SCMR to enable smart card interface mode.
4. Set the SCR.CKE[0] bit to 1 to start clock output.

### (2) At Mode Switching

#### (a) At transition from smart card interface mode to software standby mode

1. Set low power consumption mode to make the SCKn pin fixed with a desired output value in software standby mode.
2. Write 0 to the TE and RE bits in SCR to stop transmission/reception.
   Simultaneously, set the SCR.CKE[1] bit to the value for the output fixed state in software standby mode.
3. Write 0 to the SCR.CKE[0] bit to stop the clock.
4. Wait for one cycle of the serial clock. In the mean time, the clock output is fixed to the specified level with the duty cycle retained.
5. After switching the SCKn pin to the general-purpose I/O port function, make a transition to software standby mode.

#### (b) Return from software standby mode to smart card interface mode

6. Cancel software standby mode.
7. Set the SCR.CKE[0] bit to 1 to start clock output. A clock signal with the appropriate duty cycle is then generated.

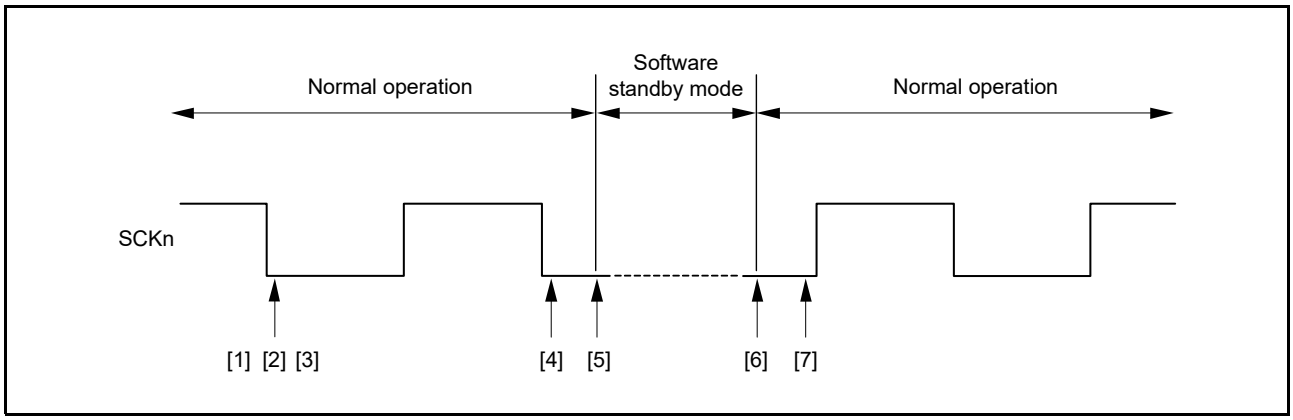

**Figure 15.36 Clock Stop and Restart Procedure**

## 15.7 Noise Cancellation Function

Figure 15.37 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of two stages of flip-flop circuits and a match-detection circuit. When the level on the pin matches in three consecutive samples taken at the set sampling interval, the matching level continues to be conveyed internally until the level on the pin again matches in three consecutive samples.

In asynchronous mode, the noise cancellation function can be applied on the RXDn input signal. The period of the base clock (1/16th of a bit-period when SEMR.ABCS = 0 and 1/8th of a bit-period when SEMR.ABCS = 1) is the sampling interval.

If the base clock is stopped with the noise filter enabled and then the clock input is started again, the noise filter operation resumes from where the clock was stopped. If SCR.TE and SCR.RE are set to 0 during base clock input, all of the noise filter flip-flop values are initialized to 1. Accordingly, if the input data is 1 when reception operation resumes, it is determined that a level match is detected and is conveyed to the internal signal. When the level being input corresponds to 0, the initial output of the noise filter is retained until the level matches in three consecutive samples.

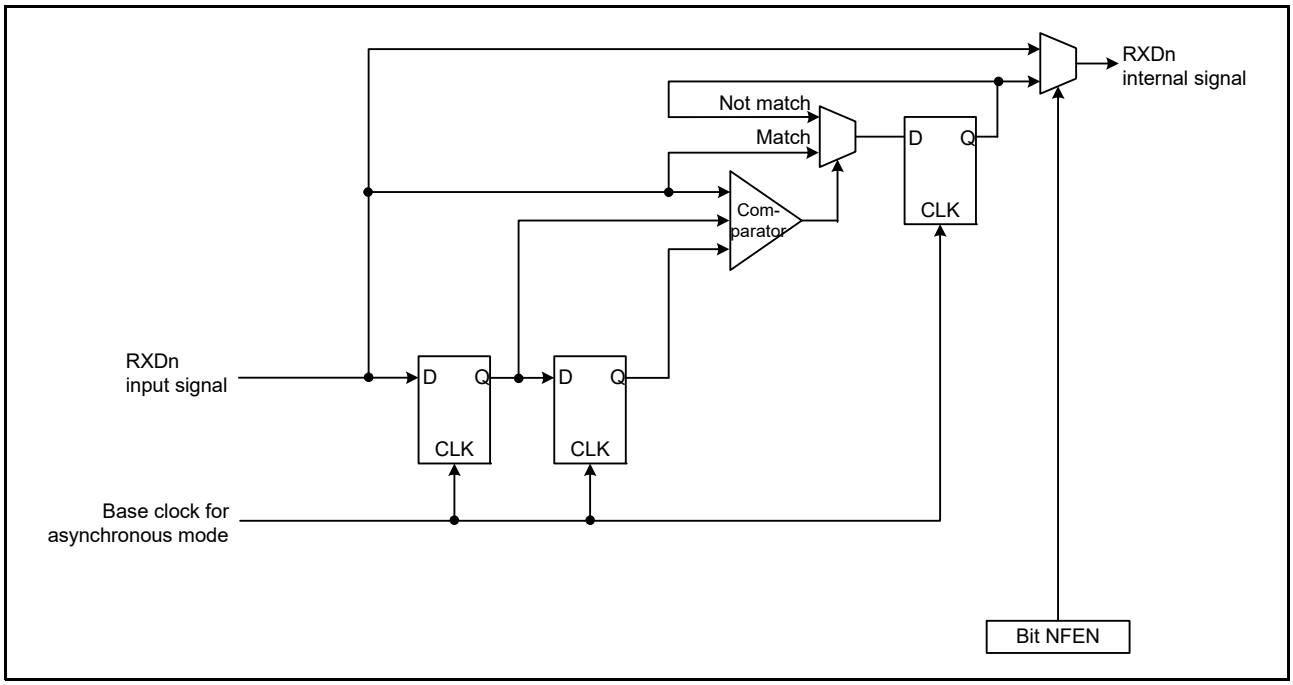

**Figure 15.37 Block Diagram of Digital Noise Filter Circuit**

## 15.8 Interrupt Sources

### 15.8.1 Interrupts in Serial Communications Interface Mode

Table 15.16 lists interrupt sources in serial communication interface mode. Individual interrupt sources can be enabled or disabled with the enable bits in SCR.

If the SCR.TIE bit is 1, a TXI interrupt request is generated when data for transmission are transferred from the TDR to the TSR. A TXI interrupt request can also be generated by setting the SCR.TE bit to 1 after setting the SCR.TIE bit to 1 or by using a single instruction to set the SCR.TE and SCR.TIE bit to 1 at the same time. A TXI interrupt request can activate the DMAC to handle data transfer.

A TXI interrupt request is not generated by setting the SCR.TE bit to 1 while the setting of the SCR.TIE bit is 0 or by setting the SCR.TIE bit to 1 while the setting of the SCR.TE bit is 1.*1

When new data are not written by the time of transmission of the last bit of the current data for transmission and the setting of the SCR.TEIE bit is 1, the SSR.TEND flag becomes 1 and a TEI interrupt request is generated. Furthermore, when the setting of the SCR.TE bit is 1, the SSR.TEND flag retains the value 1 until further data for transmission are written to the TDR, and setting the SCR.TEIE bit to 1 leads to the generation of a TEI interrupt request.

Writing data to the TDR leads to clearing of the SSR.TEND flag and, after a certain time, discarding of the TEI interrupt request.

If the SCR.RIE bit is 1, an RXI interrupt request is generated when received data are stored in the RDR. An RXI interrupt request can activate the DMAC to handle data transfer.

Setting of any from among the ORER, FER, and PER flags in the SSR to 1 while the SCR.RIE bit is 1 leads to the generation of an ERI interrupt request. An RXI interrupt request is not generated at this time. Clearing all three flags (ORER, FER, and PER) leads to discarding of the ERI interrupt request.

Note 1. To temporarily prohibit TXI interrupts at the time of transmission of the last of the data and so on when you wish a new round of transmission to start after handling of the transmission-completed interrupt, control prohibiting and permitting of the interrupt by using the interrupt request enable bit in the interrupt controller rather than using the SCR.TIE bit. This can prevent the suppression of TXI interrupt requests in the transfer of new data.

**Table 15.16 Interrupt Sources**

| Name | Interrupt Source | Interrupt Flag | DMAC Activation |
|---|---|---|---|
| ERI | Receive error | ORER, FER, or PER | Not possible |
| RXI | Receive data full | — | Possible |
| TXI | Transmit data empty | — | Possible |
| TEI | Transmit end | TEND | Not possible |

### 15.8.2 Interrupts in Smart Card Interface Mode

Table 15.17 lists interrupt sources in smart card interface mode. A transmit end interrupt (TEI) request cannot be used in this mode.

**Table 15.17 Interrupt Sources**

| Name | Interrupt Source | Interrupt Flag | DMAC Activation |
|---|---|---|---|
| ERI | Receive error or error signal detection | ORER, PER, or ERS | Not possible |
| RXI | Receive data full | — | Possible |
| TXI | Transmit data empty | TEND | Possible |

Data transmission/reception using the DMAC is also possible in smart card interface mode. In transmission, when the TEND flag in SSR is set to 1, a TXI interrupt request is generated. This TXI interrupt request activates the DMAC allowing transfer of transmit data if the TXI request is specified beforehand as a source of DMAC activation. The TEND flag in SSR is automatically cleared to 0 when the DMAC transfers the data.
If an error occurs, the SCI automatically re-transmits the same data. During the retransmission, the TEND flag in SSR is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, the ERS flag in SSR is not automatically cleared to 0 at error occurrence. Therefore, the ERS flag in SSR must be cleared by previously setting the RIE bit in SCR to 1 to enable an ERI interrupt request to be generated at error occurrence.
When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings. For DMAC settings, see section 9, Direct Memory Access Controller.

In reception, an RXI interrupt request is generated when receive data is set to RDR. This RXI interrupt request activates the DMAC allowing transfer of receive data if the RXI request is specified beforehand as a source of DMAC activation. If an error occurs, the error flag is set. Therefore, the DMAC is not activated and an ERI interrupt request is issued to the CPU instead; the error flag must be cleared.

## 15.9 Usage Notes

### 15.9.1 Setting the Module Standby Function

SCI operation can be started and stopped by setting the module standby mode. With the value after a reset, SCI operations are stopped. The registers of the modules only become accessible after release from the module standby state. For details, refer to section 55, Power-Down Modes.

### 15.9.2 Break Detection and Processing

When a framing error is detected, a break can be detected by reading the RXDn pin value directly. In a break, the input from the RXDn pin becomes all 0s, and so the FER flag in SSR is set to 1 (framing error), and the PER flag in SSR may also be set to 1 (parity error). The SCI continues the receive operation even after a break is received. Therefore, note that even if the FER flag in SSR is cleared to 0 (no framing error), it will be set to 1 again.

### 15.9.3 The Mark State and Production of Breaks

When the SCR.TE bit is 0 (prohibiting serial transmission), setting the general-purpose I/O port makes selection of the level and direction (input or output) of the TXDn pin possible. If this is done, the TXDn pin can be placed in the mark state to send a break at the time of data transmission. Until the SCR.TE bit is set to 1 (permitting serial transmission), the general-purpose I/O port is used to set the TXDn pin to output 1 and set the pin mode to a general-purpose I/O port pin, and thus place the transfer circuit in the mark state (state of having the value 1). On the other hand, to output a break at the time of data transmission, set the TXDn pin to output 0 and make the pin mode settings for a general-purpose I/O port pin. When the SCR.TE bit is set to 0, the transmission section is initialized regardless of the current state of transmission.

### 15.9.4 Receive Error Flags and Transmit Operations (Clock Synchronous Mode Only)

Transmission cannot be started when a receive error flag (ORER) in SSR is set to 1, even if data is written to TDR. Be sure to clear the receive error flags to 0 before starting transmission. Note also that the receive error flags cannot be cleared to 0 even if the RE bit in SCR is cleared to 0 (serial reception disabled).

### 15.9.5 Writing Data to TDR

Data can always be written to TDR. However, if new data is written to TDR when transmit data is remaining in TDR, the previous data in TDR is lost because it has not been transferred to TSR yet. Be sure to write transmit data to TDR in the TXI interrupt request processing routine.

### 15.9.6 Restrictions on Clock Synchronous Transmission

When the external clock source is used as a synchronization clock, update TDR by the DMAC and wait for at least five P1ϕ clock cycles before allowing the transmit clock to be input. If the transmit clock is input within four clock cycles after TDR is updated, the SCI may malfunction.

### 15.9.7 Restrictions on Using DMAC

When using the DMAC to read RDR, be sure to set the receive end interrupt (RXI) as the activation source of the relevant channel.

### 15.9.8 Points to Note on Starting Transfer

On the generation of an interrupt request for the interrupt controller at the point where transfer starts, follow the procedure below to clear interrupt requests before permitting operations (by setting the SCR.TE or SCR.RE bit to 1).

- Confirm that transfer has stopped (the setting of the SCR.TE or SCR.RE bits is 0).
- Set the corresponding interrupt enable bit (SCR.TIE or SCR.RIE) to 0.
- Read out the corresponding interrupt enable bit (SCR.TIE or SCR.RIE bit) to check that it has actually become 0.
- Clear the interrupt status flag in the interrupt controller to 0.

### 15.9.9 SCI Operations during Low Power Consumption State

#### (1) Transmission

When making settings for the module standby state or in transitions to software standby, stop operations (by setting the TIE, TE, and TEIE bits in the SCR to 0) after switching the TXDn pin to the general-purpose I/O port pin function. Clearing the TE bit in SCR to 0 resets the TSR and the TEND bit in the SSR. The states of the output pins in the software standby mode depend on the settings for the power-down modes. When transitions to these states are made during transmission, the data being transmitted become indeterminate.

To transmit data in the same transmission mode after cancellation of the low power consumption state, set the TE bit in SCR to 1, read SSR, and write data to TDR sequentially to start data transmission. To transmit data with a different transmission mode, initialize the SCI first.

Figure 15.38 shows a sample flowchart for transition to software standby mode during transmission.

#### (2) Reception

Before specifying the module standby state or making a transition to software standby mode, stop the receive operations (RE = 0 in SCR). If transition is made during data reception, the data being received will be invalid.

To receive data in the same reception mode after cancellation of the low power consumption state, set the RE bit in SCR to 1, and then start reception. To receive data in a different reception mode, initialize the SCI first.

Figure 15.39 shows a sample flowchart for transition to software standby mode during reception.

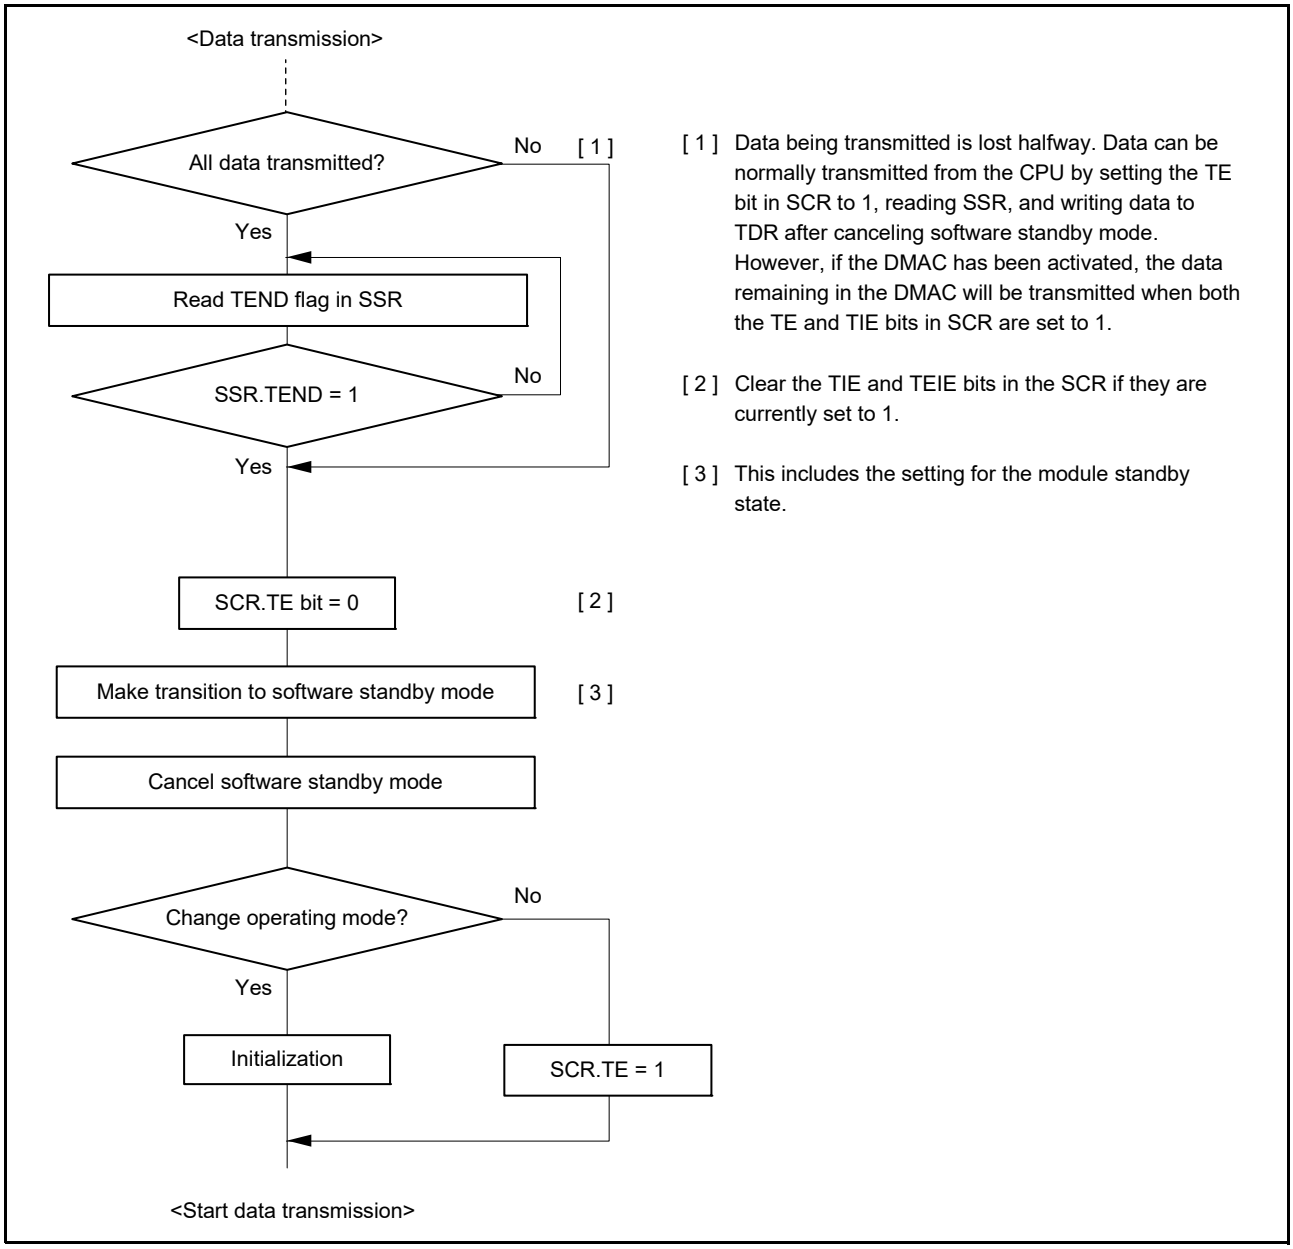

**Figure 15.38 Example of Flowchart for Transition to Software Standby Mode during Transmission**

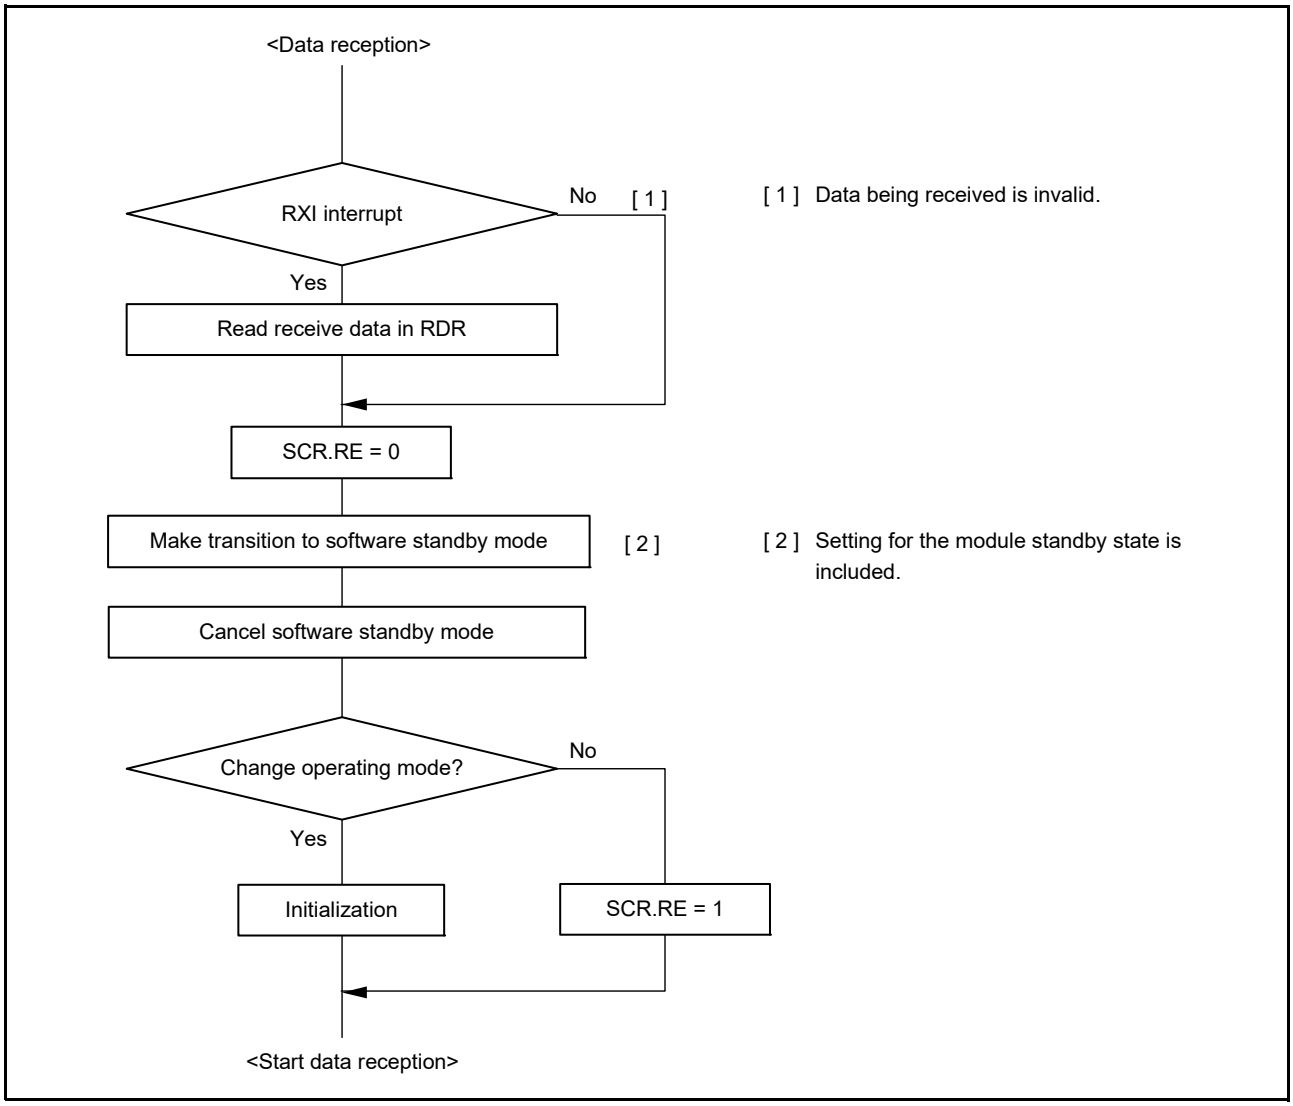

**Figure 15.39 Example of Flowchart for Transition to Software Standby Mode during Reception**

## 15.9.10 External Clock Input in Clock Synchronous Mode

In clock synchronous mode, the external clock SCKn must be input as follows:
High-pulse period, low-pulse period = 2 P1ϕ clock cycles or more, period = 6 P1ϕ clock cycles or more

## 15.10 IrDA Communications

In combination with the on-chip IrDA module, the channel 0 serial communications interface (SCI) transmits and receives waveforms conforming with version 1.0 of the Infrared Data Association (IrDA) standard.
When the IrDA function is enabled by the IRE bit in the IRCR register, the SCI_TXD0 and SCI_RXD0 signals transmitted and received on channel 0 are encoded to and decoded from waveforms conforming with the standard. Connecting these signals to an infrared transceiver enables infrared transmission and reception conforming with the standard.
The standard allows starting communications at a transfer rate of 9600 bps and changing the rate as required. The IrDA module does not have the function of automatically changing the transfer rate. To change the transfer rate of IrDA communications, change the transfer rate of the SCI.

Figure 15.40 shows the block diagram. Table 15.18 shows the pin configuration of the IrDA.

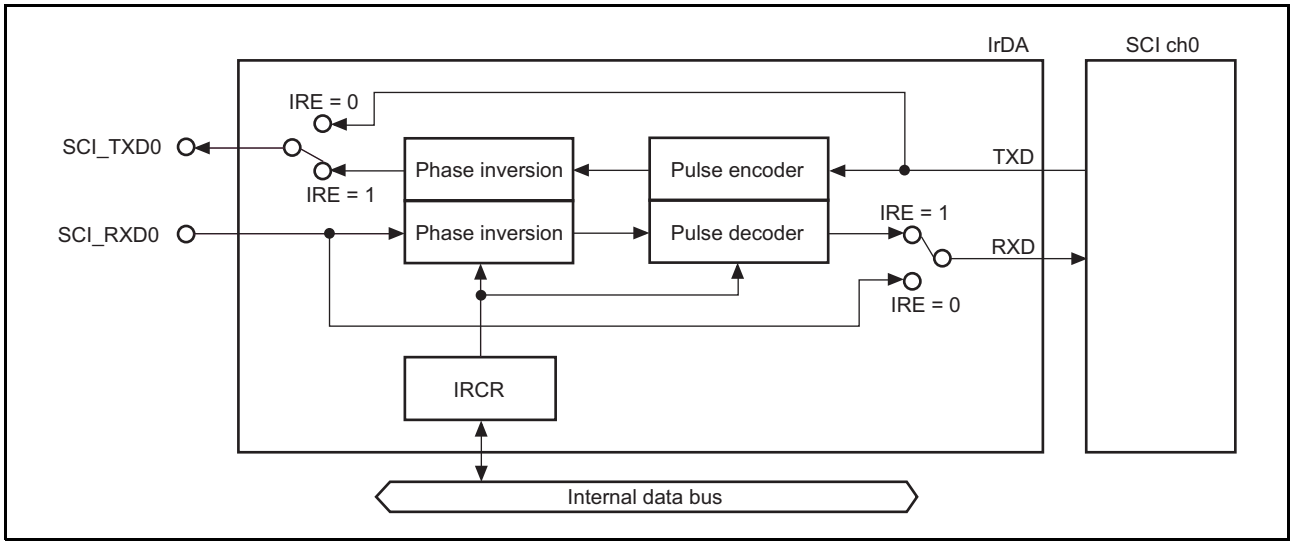

**Figure 15.40 Block Diagram**

**Table 15.18 Pin Configuration**

| Name | Pin Name | I/O | Description |
|---|---|---|---|
| IrDA transmit data pin | SCI_TXD0 | O | IrDA transmit data output |
| IrDA receive data pin | SCI_RXD0 | I | IrDA receive data input |

## 15.11 IrDA Register Description

Table 15.19 shows the register configuration.

**Table 15.19 Register Configuration**

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| IrDA control register | IRCR | R/W | H'00 | H'E8014000 | 8 |

### 15.11.1 IrDA Control Register (IRCR)

IRCR is the register which sets the operation of the IrDA module.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | IRE | IRCKS[2:0] | | | IRTXINV | IRRXINV | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | IRE | 0 | R/W | IrDA Enable<br>Sets whether the SCI_TXD0 and SCI_RXD0 pins have normal serial function or IrDA function.<br>0: IrDA function is disabled<br>(The TXD signal transmitted on channel 0 is directly output to the SCI_TXD0 pin)<br>The RXD signal received on channel 0 is directly input to the SCI_RXD0 pin)<br>1: IrDA function is enabled<br>(The TXD signal transmitted on channel 0 is output to the SCI_TXD0 pin after encoded)<br>The RXD signal received on channel 0 is input to the SCI_RXD0 pin after decoded) |
| 6 to 4 | IRCKS[2:0] | 000 | R/W | IrDA Clock Select<br>Sets the pulse width when the SCI_TXD0 output pulse is encoded with the IRE bit set to 1.<br>000: B × 3/16 (B = bit rate)<br>001: P1ϕ/2<br>010: P1ϕ/4<br>011: P1ϕ/8<br>100: P1ϕ/16<br>101: P1ϕ/32<br>110: P1ϕ/64<br>111: P1ϕ/128 |
| 3 | IRTXINV | 0 | R/W | SCI_TXD0 Data Sense Switch<br>Sets whether or not to invert the logic levels for SCI_TXD0 output.<br>0: Data for transmission are directly output to SCI_TXD0.<br>The pulse width set by the IRCKS bits is the width at the high level.<br>1: Data for transmission are output to SCI_TXD0 after inversion.<br>The pulse width set by the IRCKS bits is the width at the low level. |
| 2 | IRRXINV | 0 | R/W | SCI_RXD0 Data Sense Switch<br>Sets whether or not to invert the logic levels of SCI_RXD0 input.<br>0: SCI_RXD0 input is directly used as receive data.<br>1: SCI_RXD0 input is used as receive data after inversion. |
| 1, 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

## 15.12 IrDA Operation

### 15.12.1 Flow of IrDA Setting

To set the operation of the IrDA module, follow the procedure below.

1. Make the general-purpose I/O port settings.
2. Set the IRCR register.
3. Set the relevant registers of the SCI.

### 15.12.2 Transmission

In transmission with the IrDA function enabled, serial data from the TXD pin for the SCI (UART frame data) are converted to IR frames (see Figure 15.41). When the IRTXINV bit is 0 and the value of the serial data is 0, a high-level pulse is output to the SCI_TXD0 pin for three sixteenths of one-bit period (initial value). The width of the high-level pulse can be changed by the IRCKS[2:0] bits in the IRCR register. The IrDA standard stipulates that the high-level pulse width is at least 1.41 µs and no greater than ((3/16 + 2.5%) × bit rate) or ((3/16 × bit rate) + 1.08) µs. When P1ϕ is 66.67 MHz, the width of the high-level pulse can be set from 1.41 µs to 1.92 µs. When the value of a bit of the serial data is 1, no pulse is output.

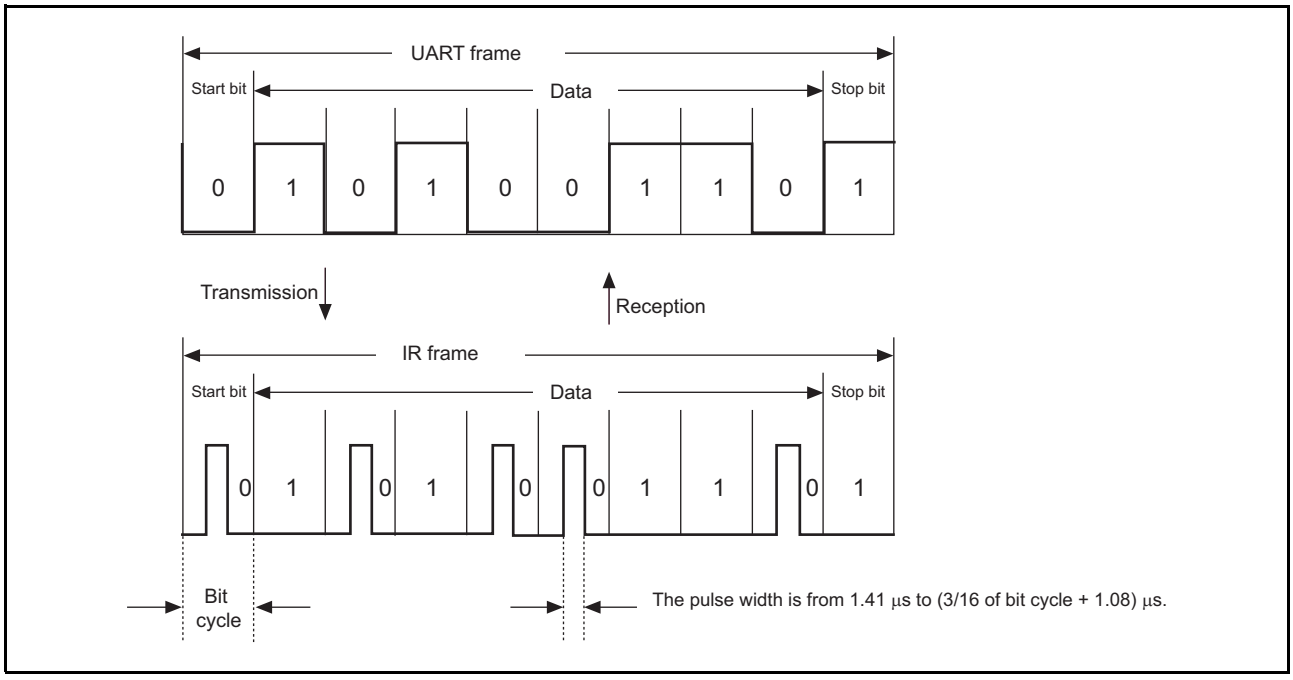

**Figure 15.41 Example of IrDA Transmission and Reception**

### 15.12.3 Reception

In reception with the IRDA function enabled, IR frame data from the SCI_RXD0 pin are converted to serial data and output to the RXD pin for the SCI. When the IRRXINV bit is 0, a bit with the value 0 is output on the detection of a high-level pulse. When no pulse is received during one-bit period, a bit with the value 1 is output. Pulses shorter than the lower limit (1.41 μs) are not recognized.

### 15.12.4 Selection of High-Level Pulse Width

Table 15.20 shows the correspondence between the applicable IRCKS[2:0] bit setting (shortest pulse width), operating frequency P1ϕ, and bit rate when the pulse width is shortened below (bit rate × 3/16) in transmission.

**Table 15.20 IRCKS[2:0] Bit Setting**

| | Bit Rate (bps) (Upper Row) / Bit Cycle × 3/16 (μs) (Lower Row) | | | | | |
|---|---|---|---|---|---|---|
| | **2400** | **9600** | **19200** | **38400** | **57600** | **115200** |
| **P1ϕ (MHz)** | **78.13** | **19.53** | **9.77** | **4.88** | **3.26** | **1.63** |
| 50 | 111 | 111 | 111 | 111 | 111 | —*1 |
| 64 | 111 | 111 | 111 | 111 | 111 | —*2 |
| 66.67 | 111 | 111 | 111 | 111 | 111 | —*2 |

Note 1. The bit rate cannot be set at the SCI.
Note 2. A pulse width shorter than (bit rate × 3/16) cannot be set.

## 15.13 Notes on Using the IrDA Module

### 15.13.1 Shortest Pulse Width in Reception

Pulses shorter than the lower limit (1.41 µs) are not recognized.

### 15.13.2 Asynchronous Basic Clock for Serial Communication Interface

The IrDA module receives the basic clock with a frequency which is 16 times as high as the communication bit rate from the SCI and operates in combination with the clock. Although one-bit period of the SCI can be set to 16 or 8 clock cycles, the IrDA module supports the SCI that one-bit period is set to 16 clock cycles.

# 16. Renesas Serial Peripheral Interface

This LSI circuit includes five independent Renesas serial peripheral interfaces.
This module is capable of full-duplex synchronous serial communication.

## 16.1 Features

This module has the following features.

- SPI transfer functions
  Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allows for serial communications through SPI operation (four-wire method).
  Capable of serial communications in master/slave mode
  Supports mode fault error detection (only in SPI slave mode)
  Supports overrun error detection (only in SPI slave mode)
  Switching of the polarity of the serial transfer clock
  Switching of the clock phase of serial transfer
- Data format
  MSB-first/LSB-first selectable
  Transfer bit-length is selectable as 8, 16, or 32 bits.
- Bit rate
  RSPCK can be divided by a maximum of 4096 in master mode
  RSPCK can be generated by dividing P1ϕ by the on-chip baud rate generator.
  An externally input clock can be used as a serial clock.
- Buffer configuration
  8 bytes for transmission and 32 bytes for reception
- SSL control function
  One SSL signal for each channel
  In master mode, outputs SSL signal.
  In slave mode, inputs SSL signal.
  Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay)
  Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
  Controllable delay from RSPCK stoppage to SSL output negation (SSL negation delay)
  Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
  Controllable wait for next-access SSL output assertion (next-access delay)
  Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
  Function for changing SSL polarity
- Control in master transfer
  A transfer of up to four commands can be executed sequentially in looped execution.
  For each command, the following can be set:
  SSL signal value, bit rate, RSPCK polarity/phase, transfer data length, LSB/MSB first, burst, RSPCK delay, SSL negation delay, and next-access delay.
  A transfer can be initiated by writing to the transmit buffer.
  A transfer can be initiated by clearing the SPTEF bit.
  MOSI signal value specifiable in SSL negation
- Interrupt sources
  Maskable interrupt sources:
  Receive interrupt (receive buffer full)
  Transmit interrupt (transmit buffer empty)
  Error interrupt (mode fault, overrun)

- Others
  Provides loop back mode
  Provides a function for disabling (initializing) this module

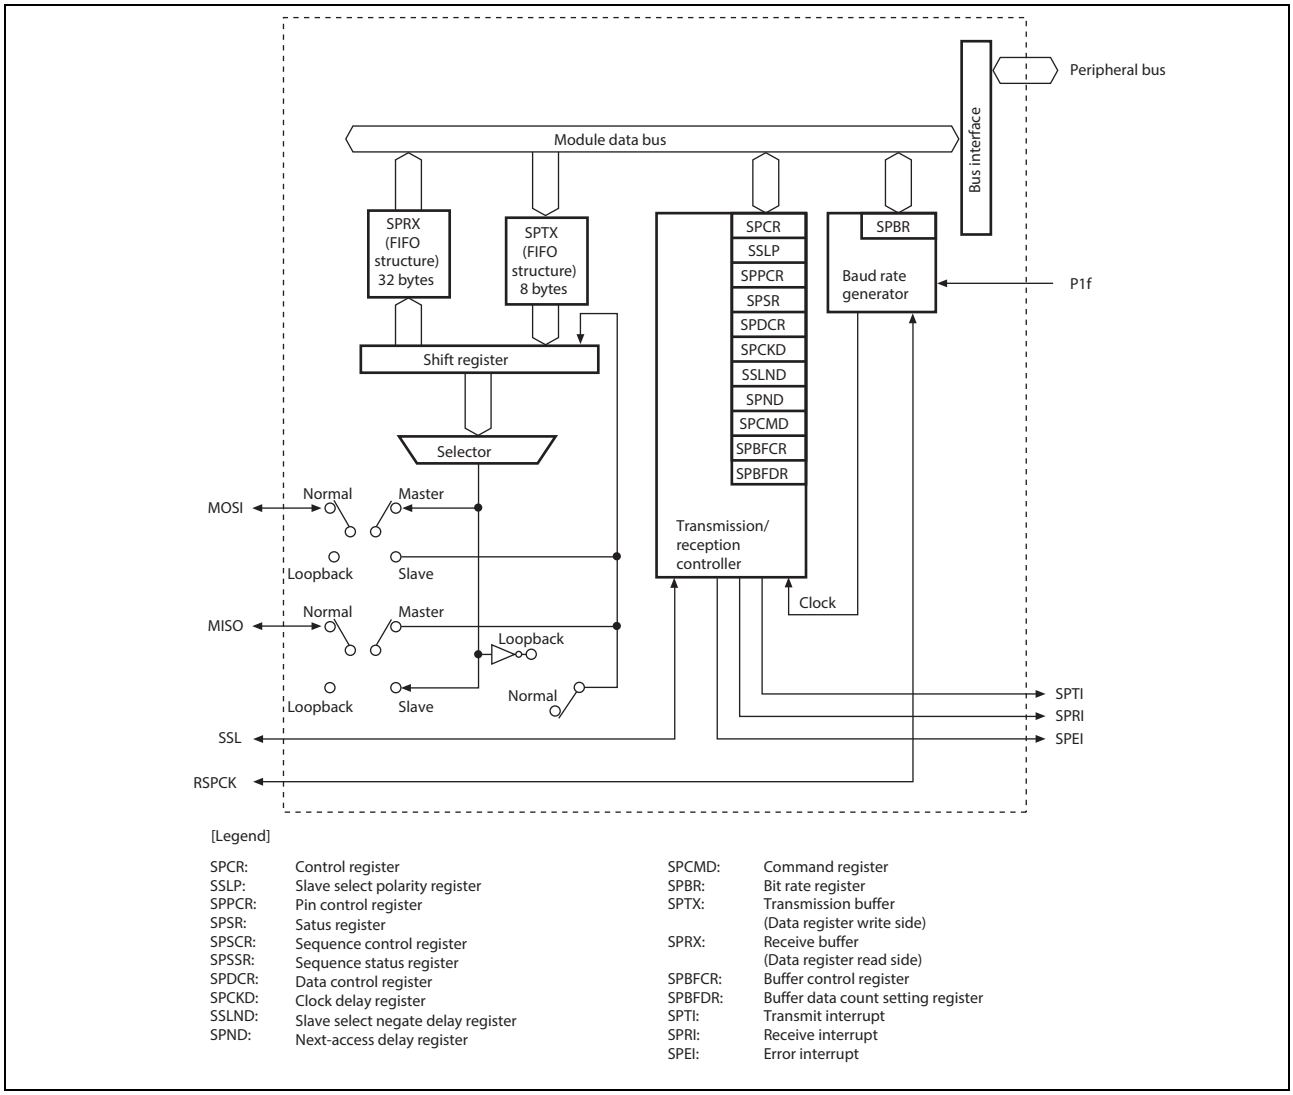

**Figure 16.1 Block Diagram (for One Channel)**

## 16.2 Input/Output Pins

Table 16.1 shows the pin configuration. This module automatically switches the input/output direction of the SSL pin. SSL is set as an output in master mode and as an input in slave mode. Pins RSPCK, MOSI, and MISO are automatically set as inputs or outputs according to the setting of master or slave and the level input on SSL (see section 16.4.2, Pin Control).

**Table 16.1 Pin Configuration**

| Channel | Pin Name | Pin Name | I/O | Function |
|---|---|---|---|---|
| 0 | Clock pin | RSPCK0 | I/O | Clock input/output |
| | Master transmit data pin | MOSI0 | I/O | Master transmit data |
| | Slave transmit data pin | MISO0 | I/O | Slave transmit data |
| | Slave select 0 pin | SSL00 | I/O | Slave selection |
| 1 | Clock pin | RSPCK1 | I/O | Clock input/output |
| | Master transmit data pin | MOSI1 | I/O | Master transmit data |
| | Slave transmit data pin | MISO1 | I/O | Slave transmit data |
| | Slave select 0 pin | SSL10 | I/O | Slave selection |
| 2 | Clock pin | RSPCK2 | I/O | Clock input/output |
| | Master transmit data pin | MOSI2 | I/O | Master transmit data |
| | Slave transmit data pin | MISO2 | I/O | Slave transmit data |
| | Slave select 0 pin | SSL20 | I/O | Slave selection |
| 3 | Clock pin | RSPCK3 | I/O | Clock input/output |
| | Master transmit data pin | MOSI3 | I/O | Master transmit data |
| | Slave transmit data pin | MISO3 | I/O | Slave transmit data |
| | Slave select 0 pin | SSL30 | I/O | Slave selection |
| 4 | Clock pin | RSPCK4 | I/O | Clock input/output |
| | Master transmit data pin | MOSI4 | I/O | Master transmit data |
| | Slave transmit data pin | MISO4 | I/O | Slave transmit data |
| | Slave select 0 pin | SSL40 | I/O | Slave selection |

Note: • In the description of the pins, the channel is omitted and pin names are described as RSPCK, MOSI, MISO, and SSL.

## 16.3 Register Descriptions

Table 16.2 shows the register configuration. These registers enable this module to perform the following controls: specifying master/slave modes, specifying a transfer format, and controlling the transmitter and receiver.

**Table 16.2 Register Configuration**

| Channel | Register Name | Abbreviation*1 | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | Control register_0 | SPCR_0 | R/W | H'00 | H'E800C800 | 8 |

Note 1. In the description of the register names, the channel is omitted.
Note 2. Only 0 can be written to clear the flag.

### 16.3.1 Control Register (SPCR)

SPCR sets the operating mode. If the MSTR and MODFEN bits are changed while the function of this module is enabled by setting the SPE bit to 1, subsequent operations cannot be guaranteed.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SPRIE | SPE | SPTIE | SPEIE | MSTR | MODFEN | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 | SPRIE | 0 | R/W | Receive Interrupt Enable<br>Enables or disables generation of receive interrupt requests (SPRI) when the number of receive data units in the receive buffer (SPRX) is equal to or greater than the specified receive buffer data triggering number and the SPRF flag in SPSR is set to 1.<br>0: Disables the generation of receive interrupt requests.<br>1: Enables the generation of receive interrupt requests. |
| 6 | SPE | 0 | R/W | Function Enable<br>Setting this bit to 1 enables the module function. When the MODF bit in the status register (SPSR) is 1, the SPE bit cannot be set to 1 (see section 16.4.6, Error Detection). Setting the SPE bit to 0 disables the module function, and initializes a part of the module function (see section 16.4.7, Initialization).<br>0: Disables the module function.<br>1: Enables the module function. |
| 5 | SPTIE | 0 | R/W | Transmit Interrupt Enable<br>Enables or disables generation of transmit interrupt requests (SPTI) when the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the specified transmit buffer data triggering number and the SPTEF flag in SPSR is set to 1.<br>0: Disables the generation of transmit interrupt requests.<br>1: Enables the generation of transmit interrupt requests. |
| 4 | SPEIE | 0 | R/W | Error Interrupt Enable<br>Enables or disables the generation of error interrupt requests when this module detects a mode fault error and sets the MODF bit in the status register (SPSR) to 1, or when this module detects an overrun error and sets the OVRF bit in SPSR to 1 (see section 16.4.6, Error Detection).<br>0: Disables the generation of error interrupt requests.<br>1: Enables the generation of error interrupt requests.<br>Note: This bit is valid only in SPI slave mode. |
| 3 | MSTR | 0 | R/W | Master/Slave Mode Select<br>Selects master/slave mode. According to MSTR bit settings, this module determines the direction of the RSPCK, MOSI, MISO, and SSL pins.<br>0: Slave mode<br>1: Master mode |
| 2 | MODFEN | 0 | R/W | Mode Fault Error Detection Enable<br>Enables or disables the detection of a mode fault error (see section 16.4.6, Error Detection).<br>0: Disables the detection of a mode fault error.<br>1: Enables the detection of a mode fault error.<br>Note: This bit is valid only in SPI slave mode. When master mode is specified with the MSTR bit, this bit should always be cleared to 0. |
| 1, 0 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |

### 16.3.2 Slave Select Polarity Register (SSLP)

SSLP sets the polarity of the SSL signal. If the contents of SSL0P are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SSL0P |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 to 1 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 0 | SSL0P | 0 | R/W | SSL Signal Polarity Setting<br>Sets the polarity of the SSL signal. The value of SSL0P indicates the active polarity of the SSL signal.<br>0: SSL signal 0-active<br>1: SSL signal 1-active |

### 16.3.3 Pin Control Register (SPPCR)

SPPCR sets the modes of the pins. If the contents of this register are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | MOIFE | MOIFV | — | — | — | SPLP |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R/W | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7, 6 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 5 | MOIFE | 0 | R/W | MOSI Idle Value Fixing Enable<br>Fixes the MOSI output value when this module in master mode is in an SSL negation period (including the SSL retention period during a burst transfer). When MOIFE is 0, this module outputs the last output value from the previous serial transfer during the SSL negation period to the MOSI pin. (The value is undefined when CPHA is 0). When MOIFE is 1, this module outputs the fixed value set in the MOIFV bit to the MOSI pin.<br>0: MOSI output value equals the last output value from previous transfer. (The value is undefined when CPHA is 0).<br>1: MOSI output value equals the value set in the MOIFV bit. |
| 4 | MOIFV | 0 | R/W | MOSI Idle Fixed Value<br>If the MOIFE bit is 1 in master mode, this module, according to MOIFV bit settings, determines the MOSI signal value during the SSL negation period (including the SSL retention period during a burst transfer).<br>0: MOSI Idle fixed value equals 0.<br>1: MOSI Idle fixed value equals 1. |
| 3 to 1 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 0 | SPLP | 0 | R/W | Loopback<br>When the SPLP bit is set to 1, this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects (reverses) the input path and the output path for the shift register.<br>0: Normal mode<br>1: Loopback mode |

## 16.3.4 Status Register (SPSR)

SPSR indicates the operating status.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SPRF | TEND | SPTEF | — | — | MODF | — | OVRF |
| Initial value: | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/(W)* | R | R/(W)* |

Note: * Only 0 can be written to clear the flag after reading 1.

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 | SPRF | 0 | R | Receive Buffer Full Flag<br>Indicates that the number of receive data units in the receive buffer (SPRX) is equal to or greater than the receive buffer data triggering number specified in the buffer control register (SPBFCR).<br>0: The number of receive data units in the receive buffer is less than the receive buffer data triggering number.<br>1: The number of receive data units in the receive buffer is equal to or greater than the receive buffer data triggering number.<br>[Clearing conditions]<br>• The receive buffer data is read until the number of data units in the receive buffer becomes less than the specified receive buffer data triggering number.<br>• Receive buffer data reset is enabled.<br>• Power-on reset<br>[Setting condition]<br>• The number of data units in the receive buffer is equal to or greater than the specified receive buffer data triggering number. |
| 6 | TEND | 1 | R | Transmit End<br>This bit is set to 1 when transmission is completed, and this bit is 0 when transmission is not completed.<br>[Clearing condition]<br>• When transmit data are transferred from the transmit register to the shift register.<br>[Setting condition]<br>• When the number of data units in the transmit buffer (SPTX) is zero when a serial transfer is completed.<br>Note: • This bit is valid only in SPI master mode. |
| 5 | SPTEF | 1 | R | Transmit Buffer Empty Flag<br>Indicates that the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the transmit buffer data triggering number specified in the buffer control register (SPBFCR).<br>0: The number of transmit data units in the transmit buffer is equal to or greater than the specified transmit buffer data triggering number.<br>1: The number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number.<br>[Clearing condition]<br>• When data is written to the transmit buffer until the number of transmit data units in the transmit buffer exceeds the specified transmit buffer data triggering number.<br>[Setting conditions]<br>• When the number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number.<br>• When transmit buffer data reset is enabled.<br>• Power-on reset |
| 4, 3 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 2 | MODF | 0 | R/(W)*1 | Mode Fault Error Flag<br>Indicates the occurrence of a mode fault error. If the MODFEN bit is set to 1 when this module is in slave mode and the SSL pin is negated before the RSPCK cycle necessary for data transfer ends, this module detects a mode fault error. The active level of the SSL signal is determined by the SSL0P bit in the slave select polarity register (SSLP).<br>[Clearing conditions]<br>• SPSR is read when the MODF bit is 1, and then 0 is written to the MODF bit.<br>• Power-on reset<br>0: No mode fault error occurred<br>1: A mode fault error occurred<br>Note: This bit is valid only in SPI slave mode. |
| 1 | — | 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 0 | OVRF | 0 | R/(W)*1 | Overrun Error Flag<br>Indicates the occurrence of an overrun error. If a serial transfer ends when there is not enough space for receiving the specified length of data in the receive buffer (SPRX), this module detects an overrun error, and sets the OVRF bit to 1.<br>[Clearing conditions]<br>• SPSR is read when the OVRF bit is 1, and then 0 is written to the OVRF bit.<br>• Power-on reset<br>0: No overrun error occurred<br>1: An overrun error occurred<br>Note: This bit is valid only in SPI slave mode. |

Note 1. Only 0 can be written to clear the flag after reading 1.

### 16.3.5 Data Register (SPDR)

SPDR is a buffer that holds data for transmission and reception.
The transmit buffer (SPTX) and receive buffer (SPRX) are independent and are mapped to SPDR.
SPDR should be read or written to in byte, word, or longword units according to the access width specification bit (SPLW) in the data control register (SPDCR).
The bit length to be used is determined by the data length specification bits (SPB3 to SPB0) in the command register (SPCMD).
The access width set by SPDCR must agree with the data length set by SPCMD.
When data is written to SPDR, the data will be written to the transmit buffer from SPDR if the transmit buffer has a space equal to or more than the SPDR access width. If there is not enough space, data will not be written to the transmit buffer. Even if an attempt is made to write data to the buffer, the data is ignored.
When data is read from SPDR, receive data in the receive buffer will be read. If SPDR is read when there is no receive data in the receive buffer, the read value is undefined.
When SPDR is written to with the longword-, word-, or byte-access width, the transmit data should be written to address 0 irrespective of the access width. If data is written to the other addresses, the data is not guaranteed.
When SPDR is read with the longword-, word-, or byte-access width, the receive data should be read from address 0. If data is read from the other addresses, the data is not guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 16.3.6 Sequence Control Register (SPSCR)

SPSCR sets the sequence control method when this module operates in master mode. If the contents of SPSCR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | SPSLN1 | SPSLN0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 to 2 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 1<br>0 | SPSLN1<br>SPSLN0 | 0<br>0 | R/W<br>R/W | Sequence Length Specification<br>These bits specify a sequence length when this module in master mode performs sequential operations. This module in master mode changes command registers 0 to 3 (SPCMD0 to SPCMD3) to be referenced and the order in which they are referenced according to the sequence length that is set in the SPSLN1 and SPSLN0 bits.<br>The relationship among the setting of bits SPSLN1 and SPSLN0, sequence length, and SPCMD0 to SPCMD3 referenced by this module is shown below. In slave mode, SPCMD0 is always referenced.<br>Sequence Length / Referenced SPCMD #<br>00: 1 — 0 → 0 → …<br>01: 2 — 0 → 1 → 0 → …<br>10: 3 — 0 → 1 → 2 → 0 → …<br>11: 4 — 0 → 1 → 2 → 3 → 0 → … |

### 16.3.7 Sequence Status Register (SPSSR)

SPSSR indicates the sequence control status when this module operates in master mode.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | SPCP1 | SPCP0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 to 2 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 1 | SPCP1 | 0 | R | Command Pointer<br>During sequence control, these bits indicate one of the command registers 0 to 3 (SPCMD0 to SPCMD3) that is currently pointed to by the pointer. The relationship between the setting of SPCP1 and SPCP0 and SPCMD0 to SPCMD3 is shown below.<br>For the sequence control, see section 16.4.8 (1) (c), Sequence Control.<br>00: SPCMD0<br>01: SPCMD1<br>10: SPCMD2<br>11: SPCMD3 |
| 0 | SPCP0 | 0 | R | |

### 16.3.8 Bit Rate Register (SPBR)

SPBR sets the bit rate in master mode. If the contents of SPBR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SPR7 | SPR6 | SPR5 | SPR4 | SPR3 | SPR2 | SPR1 | SPR0 |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

When this module is used in slave mode, the bit rate depends on the bit rate of the input clock regardless of the settings of SPBR and BRDV.

The bit rate is determined by combinations of SPBR settings and the bit settings in the BRDV1 and BRDV0 bits in the command registers (SPCMD0 to SPCMD3). The equation for calculating the bit rate is given below. In the equation, n denotes an SPBR setting (0, 1, 2, …, 255), and N denotes a BRDV1 and BRDV0 bit setting (0, 1, 2, 3).

$$\text{Bit rate} = \frac{f(P1\phi)}{2 \times (n + 1) \times 2^{N}}$$

Table 16.3 shows examples of the relationship between the SPBR register and BRDV1 and BRDV0 bit settings.

**Table 16.3 Relationship between SPBR and BRDV1 and BRDV0 Settings**

| | | | Bit Rate | | |
|---|---|---|---|---|---|
| **SPBR (n)** | **BRDV[1:0] (N)** | **Division Ratio** | **P1ϕ = 50 MHz** | **P1ϕ = 64 MHz** | **P1ϕ = 66.67 MHz** |
| 0 | 0 | 2*1 | 25.00 Mbps | 32.00 Mbps | 33.33 Mbps |
| 1 | 0 | 4 | 12.50 Mbps | 16.00 Mbps | 16.67 Mbps |
| 2 | 0 | 6 | 8.33 Mbps | 10.67 Mbps | 11.11 Mbps |
| 3 | 0 | 8 | 6.25 Mbps | 8.00 Mbps | 8.33 Mbps |
| 4 | 0 | 10 | 5.00 Mbps | 6.40 Mbps | 6.67 Mbps |
| 5 | 0 | 12 | 4.17 Mbps | 5.33 Mbps | 5.56 Mbps |
| 5 | 1 | 24 | 2.08 Mbps | 2.67 Mbps | 2.78 Mbps |
| 5 | 2 | 48 | 1.04 Mbps | 1.33 Mbps | 1.39 Mbps |
| 5 | 3 | 96 | 520.83 Kbps | 666.67 Kbps | 694.44 Kbps |
| 255 | 3 | 4096 | 12.21 Kbps | 15.63 Kbps | 16.28 Kbps |

Note 1. Examine the timing specifications to determine the bit rate in the actual system.

## 16.3.9 Data Control Register (SPDCR)

SPDCR selects the width to access SPDR from longword-, word-, and byte-width, and enables or disables dummy data transmission for the master mode operation.

If the contents of SPDCR are changed while bit TEND in the status register (SPSR) indicates that transmission is not completed, the subsequent operation cannot be guaranteed.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TXDMY | SPLW1 | SPLW0 | — | — | — | — | — |
| Initial value: | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 | TXDMY | 0 | R/W | Dummy Data Transmission Enable<br>Enables or disables dummy data transmission.<br>When communication is performed with this bit set to 1, dummy data is transmitted from the MOSI pin and a serial communication can be performed even if there is no transmit data in the transmit buffer. Specifically, if there is no transmit data in the transmit buffer and this bit is set to 1, dummy data is transferred to the shift register. Data previously transmitted from the pin is used as dummy data. If this bit is set to 1 after the initialization and a transfer is performed, the transmitted dummy data is undefined.<br>0: Disables dummy data transmission.<br>1: Enables dummy data transmission.<br>Note: This bit is valid only in the master mode. |
| 6<br>5 | SPLW1<br>SPLW0 | 0<br>1 | R/W<br>R/W | Access Width Specification<br>Specifies the width for accessing the data register (SPDR). If the length of data transferred to SPDR does not agree with these bit settings, operation is not guaranteed.*<br>00: Setting prohibited<br>01: SPDR is accessed in bytes (8 bits).<br>10: SPDR is accessed in words (16 bits).<br>11: SPDR is accessed in longwords (32 bits). |
| 4 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |

Note: * The data length is specified by the SPB3 to SPB0 bits in the command register (SPCMD).

See section 16.3.5, Data Register (SPDR).

### 16.3.10 Clock Delay Register (SPCKD)

SPCKD sets a period from the beginning of SSL signal assertion to RSPCK oscillation (RSPCK delay) when the SCKDEN bit in the command register (SPCMD) is 1. If the contents of SPCKD are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.
When using this module in slave mode, set B'000 to SCKDL2 to SCKDL0.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SCKDL2 | SCKDL1 | SCKDL0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 2<br>1<br>0 | SCKDL2<br>SCKDL1<br>SCKDL0 | 0<br>0<br>0 | R/W<br>R/W<br>R/W | RSPCK Delay Setting<br>These bits set an RSPCK delay value when the SCKDEN bit in SPCMD is 1.<br>The relationship between the setting of SCKDL2 to SCKDL0 and the RSPCK delay value is shown below.<br>000: 1 RSPCK<br>001: 2 RSPCK<br>010: 3 RSPCK<br>011: 4 RSPCK<br>100: 5 RSPCK<br>101: 6 RSPCK<br>110: 7 RSPCK<br>111: 8 RSPCK |

### 16.3.11 Slave Select Negation Delay Register (SSLND)

SSLND sets a period (SSL negation delay) from the transmission of a final RSPCK edge to the negation of the SSL signal during a serial transfer by this module in master mode. If the contents of SSLND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set B'000 to SLNDL2 to SLNDL0.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SLNDL2 | SLNDL1 | SLNDL0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 2<br>1<br>0 | SLNDL2<br>SLNDL1<br>SLNDL0 | 0<br>0<br>0 | R/W<br>R/W<br>R/W | SSL Negation Delay Setting<br>These bits set an SSL negation delay when the SLNDEN bit in SPCMD is 1.<br>The relationship between the setting of SLNDL2 to SLNDL0 and the SSL negation delay value is shown below.<br>000: 1 RSPCK<br>001: 2 RSPCK<br>010: 3 RSPCK<br>011: 4 RSPCK<br>100: 5 RSPCK<br>101: 6 RSPCK<br>110: 7 RSPCK<br>111: 8 RSPCK |

### 16.3.12 Next-Access Delay Register (SPND)

SPND sets a non-active period (next-access delay) after termination of a serial transfer when the SPNDEN bit in the command register (SPCMD) is 1. If the contents of SPND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set B'000 to SPNDL2 to SPNDL0.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SPNDL2 | SPNDL1 | SPNDL0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 2 | SPNDL2 | 0 | R/W | Next-Access Delay Setting<br>These bits set a next-access delay when the SPNDEN bit in SPCMD is 1.<br>The relationship between the setting of SPNDL2 to SPNDL0 and the next-access delay value is shown below.<br>000: 1 RSPCK + 2 P1ϕ<br>001: 2 RSPCK + 2 P1ϕ<br>010: 3 RSPCK + 2 P1ϕ<br>011: 4 RSPCK + 2 P1ϕ<br>100: 5 RSPCK + 2 P1ϕ<br>101: 6 RSPCK + 2 P1ϕ<br>110: 7 RSPCK + 2 P1ϕ<br>111: 8 RSPCK + 2 P1ϕ |
| 1 | SPNDL1 | 0 | R/W | |
| 0 | SPNDL0 | 0 | R/W | |

## 16.3.13 Command Register (SPCMD)

Each channel has four command registers (SPCMD0 to SPCMD3). SPCMD0 to SPCMD3 are used to set a transfer format for master mode operation. Some of the bits in SPCMD0 are used to set a transfer mode for slave mode operation. In master mode, this module sequentially references SPCMD0 to SPCMD3 according to the settings in bits SPSLN1 and SPSLN0 in the sequence control register (SPSCR), and executes the serial transfer that is set in the referenced SPCMD. While bit TEND in the status register (SPSR) indicates that transmission is not completed, correct operation of this module cannot be guaranteed if SPCMD is changed that is referred by this module. SPCMD referenced by this module in master mode can be checked by means of bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the function of this module in slave mode is enabled, operation cannot be guaranteed if the value set in SPCMD0 is changed.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | SCK DEN | SLN DEN | SPN DEN | LSBF | SPB3 | SPB2 | SPB1 | SPB0 |

## 16.3.14 Buffer Control Register (SPBFCR)

SPBFCR resets the number of data units in the transmit buffer (SPTX) or receive buffer (SPRX) and sets the number of triggering data units.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TXRST | RXRST | TXTRG[1:0] | | — | RXTRG[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 7 | TXRST | 0 | R/W | Transmit Buffer Data Reset<br>Resets the transmit buffer to an empty state. Transmit data in the transmit buffer becomes invalid when this bit is set to 1.<br>0: Disables the reset operation*.<br>1: Enables the reset operation<br>Note: The reset operation is performed after a power-on reset. |
| 6 | RXRST | 0 | R/W | Receive Buffer Data Reset<br>Resets the receive buffer to an empty state. Receive data in the receive buffer becomes invalid when this bit is set to 1.<br>0: Disables the reset operation*.<br>1: Enables the reset operation<br>Note: The reset operation is performed after a power-on reset. |
| 5, 4 | TXTRG[1:0] | 00 | R/W | Transmit Buffer Data Triggering Number<br>Specifies the timing at which the transmit buffer empty state is determined, that is when the SPTEF flag in the status register is set. When the number of bytes of data in the transmit buffer (SPTX) is equal to or less than the specified triggering number, the SPTEF flag is set to 1.<br>00: 7 bytes (1)*<br>01: 6 bytes (2)*<br>10: 4 bytes (4)*<br>11: 0 bytes (8)*<br>Note: The value in the parenthesis shows the number of available bytes in the transmit buffer (SPTX). |
| 3 | — | 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 2 to 0 | RXTRG[2:0] | 000 | R/W | Receive Buffer Data Triggering Number<br>Specifies the timing at which the receive buffer full state is determined, that is when the SPRF flag in the status register is set. When the number of bytes of data in the receive buffer (SPRX) is equal to or greater than the specified triggering number, the SPRF flag is set to 1.<br>000: 1 byte (31)*<br>001: 2 bytes (30)*<br>010: 4 bytes (28)*<br>011: 8 bytes (24)*<br>100: 16 bytes (16)*<br>101: 24 bytes (8)*<br>110: 32 bytes (0)*<br>111: 5 bytes (27)*<br>Note: * The value in the parenthesis shows the number of available bytes in the receive buffer (SPRX). |

## 16.3.15 Buffer Data Count Setting Register (SPBFDR)

SPBFDR indicates the number of data units stored in the transmit buffer (SPTX) and receive buffer (SPRX). The upper eight bits indicate the number of transmit data units in SPTX and the lower eight bits indicate the number of receive data units in SPRX.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | T[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R |

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | R[5:0] | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Function |
|---|---|---|---|---|
| 15 to 12 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 11 to 8 | T[3:0] | 0000 | R | Indicates the number of bytes of data to be transmitted in SPTX.<br>B'0000 indicates that SPTX is empty.<br>B'1000 indicates that SPTX is full. |
| 7, 6 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 5 to 0 | R[5:0] | 000000 | R | Shows the number of bytes of received data in SPRX.<br>B'000000 indicates that SPRX is empty.<br>B'100000 indicates that SPRX is full. |

## 16.4 Operation

In this section, the serial transfer period means a period from the beginning of driving valid data to the fetching of the final valid data.

### 16.4.1 Overview of Operations

This module is capable of serial transfers in slave mode and master mode. A particular mode of this module can be selected by using the MSTR bit in the control register (SPCR). Table 16.4 gives the relationship between the modes and SPCR settings, and a description of each mode.

**Table 16.4 Relationship between Modes and SPCR and Description of Each Mode**

| Mode | Slave (SPI Operation) | Master (SPI Operation) |
|---|---|---|
| MSTR bit setting | 0 | 1 |
| MODFEN bit setting | 0 or 1 | 0 |
| RSPCK signal | Input | Output |
| MOSI signal | Input | Output |
| MISO signal | Output/Hi-Z | Input |
| SSL signal | Input | Output |
| SSL polarity modification function | Supported | Supported |
| Transfer rate | Up to P1ϕ/8 | Up to P1ϕ/2 |
| Clock source | RSPCK input | On-chip baud rate generator |
| Clock polarity | Two | Two |
| Clock phase | Two | Two |
| First transfer bit | MSB/LSB | MSB/LSB |
| Transfer data length | 8, 16, or 32 bits | 8, 16, or 32 bits |
| Burst transfer | Possible (CPHA = 1) | Possible (CPHA = 0,1) |
| RSPCK delay control | Not supported | Supported |
| SSL negation delay control | Not supported | Supported |
| Next-access delay control | Not supported | Supported |
| Transfer activation method | SSL input active or RSPCK oscillation | Transmit buffer is written when SPE = 1 |
| Sequence control | Not supported | Supported |
| Transmit buffer empty detection | Supported | Supported |
| Receive buffer full detection | Supported | Supported |
| Overrun error detection | Supported | Not Supported |
| Mode fault error detection | Supported (MODFEN = 1) | Not supported |

### 16.4.2 Pin Control

According to the MSTR bit in the control register (SPCR), this module can automatically switch pin directions and output modes. Table 16.5 shows the relationship between pin states and bit settings.

**Table 16.5 Relationship between Pin States and Bit Settings**

| Mode | Pin | Pin State*1 |
|---|---|---|
| Master mode (SPI operation) (MSTR = 1) | RSPCK | CMOS output |
| | SSL | CMOS output |
| | MOSI | CMOS output |
| | MISO | Input |
| Slave mode (SPI operation) (MSTR = 0) | RSPCK | Input |
| | SSL | Input |
| | MOSI | Input |
| | MISO*1 | CMOS output/Hi-Z |

Note 1. When SSL is at the non-active level or the SPE bit in SPCR is cleared to 0, the pin state is Hi-Z.

This module in master mode (SPI operation) determines MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) according to MOIFE and MOIFV bit settings in SPPCR, as shown in Table 16.6.

**Table 16.6 MOSI Signal Value Determination during SSL Negation Period**

| MOIFE | MOIFV | MOSI Signal Value during SSL Negation Period |
|---|---|---|
| 0 | 0, 1 | Last output value from previous transfer (The value is undefined when CPHA is 0) |
| 1 | 0 | Always 0 |
| 1 | 1 | Always 1 |

### 16.4.3 System Configuration Example

#### (1) Master/Slave (with This LSI Acting as Master)

Figure 16.2 shows a master/slave system configuration example when this LSI is used as a master. In master/slave configuration, the SSL output of this LSI (master) is not used. The SSL input of the slave is fixed to the low level, and the slave is always maintained in a selected state. In the transfer format corresponding to the case where the CPHA bit in the control register (SPCR) is 0, there are slave devices for which the SSL signal cannot be fixed to the active level. In situations where the SSL signal cannot be fixed, the SSL output of this LSI should be connected to the SSL input of the slave device.
This LSI (master) always drives the RSPCK and MOSI. The slave always drives the MISO.

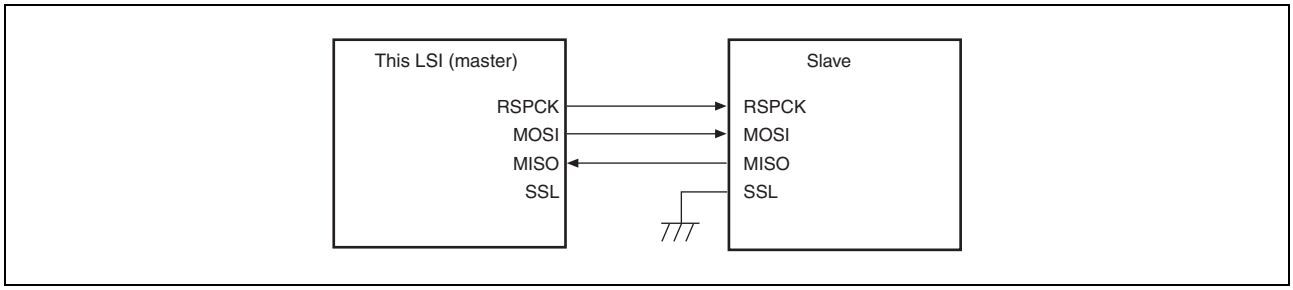

**Figure 16.2 Master/Slave Configuration Example (This LSI = Master)**

### (2) Master/Slave (with This LSI Acting as Slave)

Figure 16.3 shows a master/slave system configuration example when this LSI is used as a slave. When this LSI is to operate as a slave, the SSL pin is used as SSL input. The master always drives the RSPCK and MOSI. This LSI (slave) always drives the MISO. When SSL is at the non-active level, the pin state is Hi-Z.

In the slave configuration in which the CPHA bit in the command register (SPCMD) is set to 1, the SSL input of this LSI (slave) is fixed to the 0 level, this LSI (slave) is always maintained in a selected state, and in this manner it is possible to execute serial transfer (Figure 16.4).

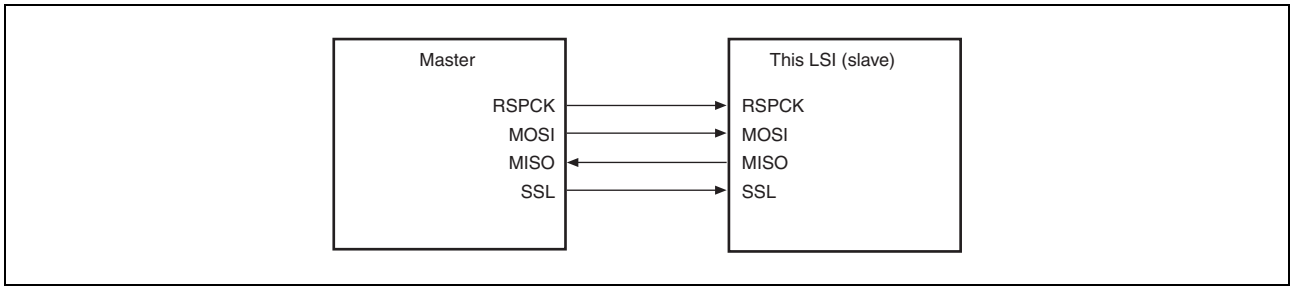

**Figure 16.3 Master/Slave Configuration Example (This LSI = Slave)**

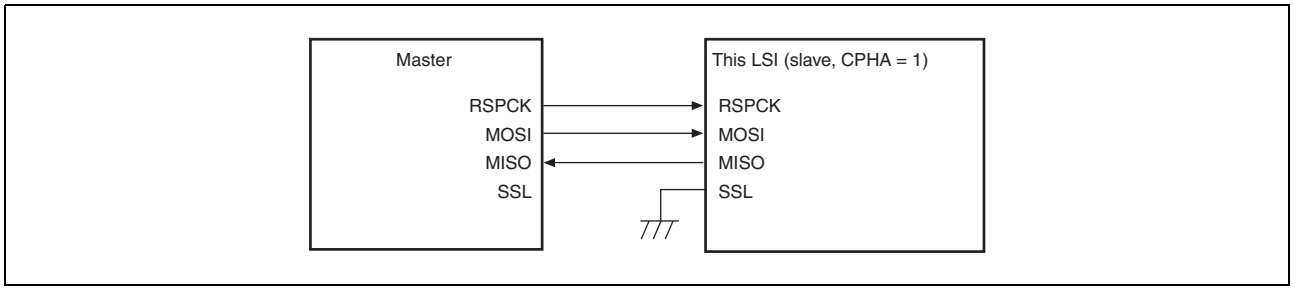

**Figure 16.4 Master/Slave Configuration Example (This LSI = Slave, CPHA = 1)**

### (3) Master/Multi-Slave (with This LSI Acting as Slave)

Figure 16.5 shows a master/multi-slave system configuration example when this LSI is used as a slave. In the example of Figure 16.5, the system is comprised of a master and two LSIs (slave X and slave Y).
The RSPCK and MOSI outputs of the master are connected to the RSPCK and MOSI inputs of the LSIs (slave X and slave Y). The MISO outputs of the LSIs (slave X and slave Y) are all connected to the MISO input of the master. SSLX and SSLY outputs of the master are connected to the SSL inputs of the LSIs (slave X and slave Y), respectively.
The master always drives RSPCK, MOSI, SSLX, and SSLY. Of the LSIs (slave X and slave Y), the slave that receives low level input into the SSL0 input drives MISO.

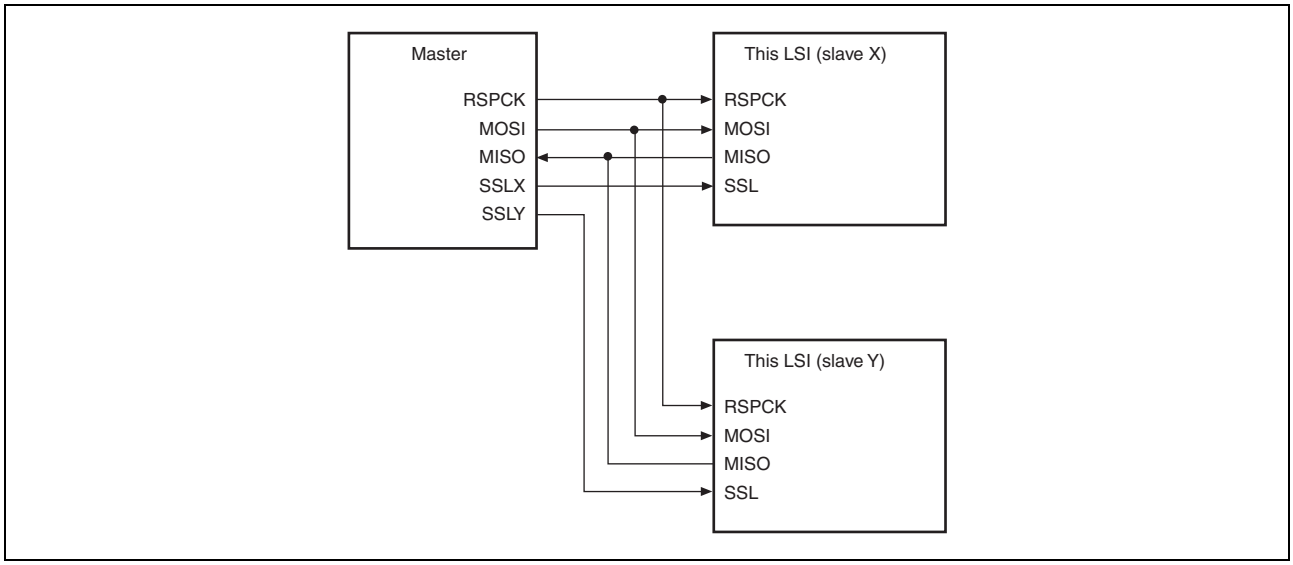

**Figure 16.5 Master/Multi-Slave Configuration Example (This LSI = Slave)**

## 16.4.4 Transfer Format

### (1) CPHA = 0

Figure 16.6 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 0. In Figure 16.6, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the settings of this module. For details, see section 16.4.2, Pin Control.

When the CPHA bit is 0, the driving of valid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The first RSPCK signal change timing that occurs after the SSL signal assertion becomes the first transfer data fetching timing. After this timing, data is sampled at every 1 RSPCK cycle. The change timing for MOSI and MISO signals is always 1/2 RSPCK cycle after the transfer data fetch timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1 denotes a period from an SSL signal assertion to RSPCK oscillation (RSPCK delay). t2 denotes a period from the cessation of RSPCK oscillation to an SSL signal negation (SSL negation delay). t3 denotes a period in which SSL signal assertion is suppressed for the next transfer after the end of serial transfer (next-access delay). t1, t2, and t3 are controlled by a master device running on the system. For a description of t1, t2, and t3 when this module is in master mode, see section 16.4.3 (1), Master/Slave (with This LSI Acting as Master).

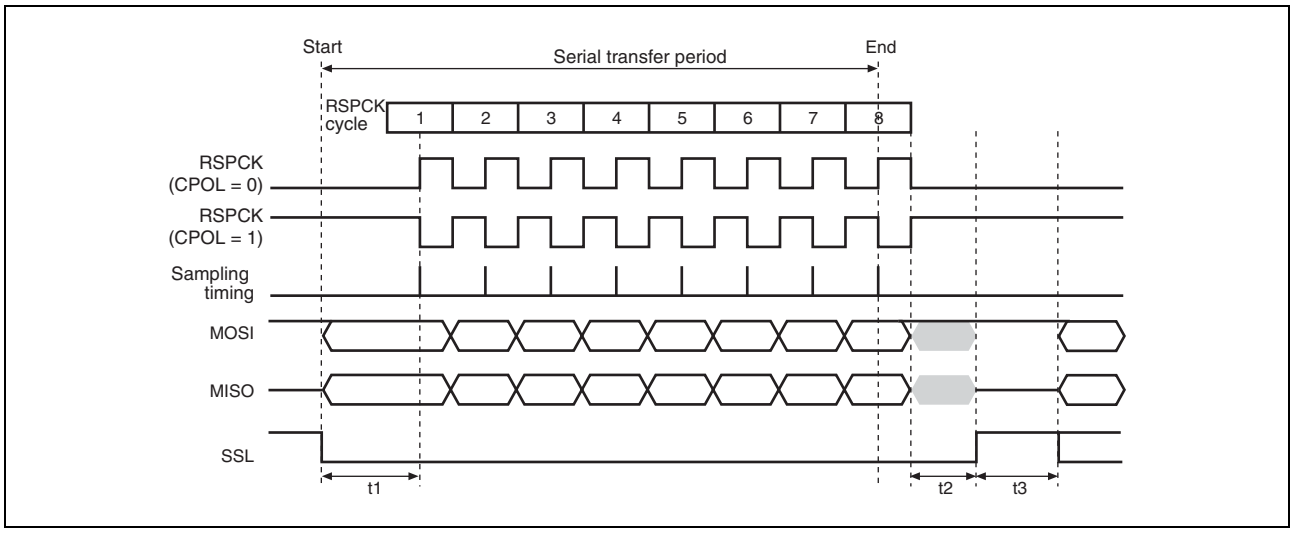

**Figure 16.6 Transfer Format (CPHA = 0)**

### (2) CPHA = 1

Figure 16.7 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 1. In Figure 16.7, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the modes (master or slave). For details, see section 16.4.2, Pin Control.
When the CPHA bit is 1, the driving of invalid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The driving of valid data to the MOSI and MISO signals commences at the first RSPCK signal change timing that occurs after the SSL signal assertion. After this timing, data is updated at every 1 RSPCK cycle. The transfer data fetch timing is always 1/2 RSPCK cycle after the data update timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.
t1, t2, and t3 are the same as those in the case of CPHA = 0. For a description of t1, t2, and t3 when this module is in master mode, see section 16.4.3 (1), Master/Slave (with This LSI Acting as Master).

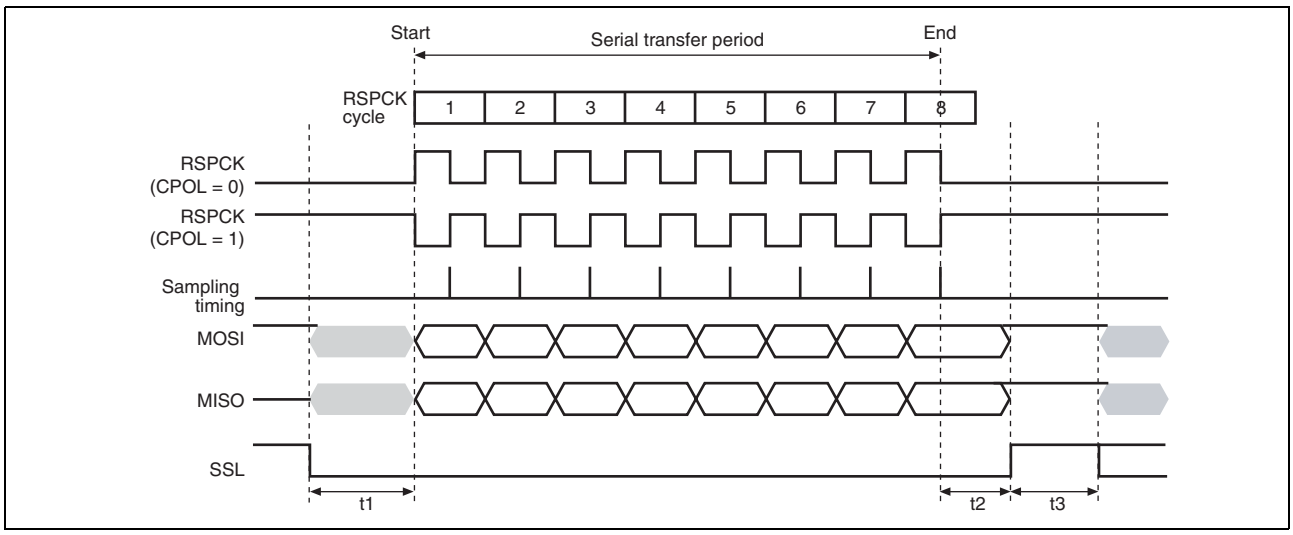

**Figure 16.7 Transfer Format (CPHA = 1)**

### 16.4.5 Data Format

The data format depends on the settings in the command register (SPCMD). Irrespective of MSB/LSB first, this module treats the range from the LSB of the data register (SPDR) to the assigned data length as transfer data.

#### (1) MSB First Transfer (32-Bit Data)

Figure 16.8 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer of SPDR. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R31 to R00 is stored in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R31 to R00 is shifted out from the shift register.

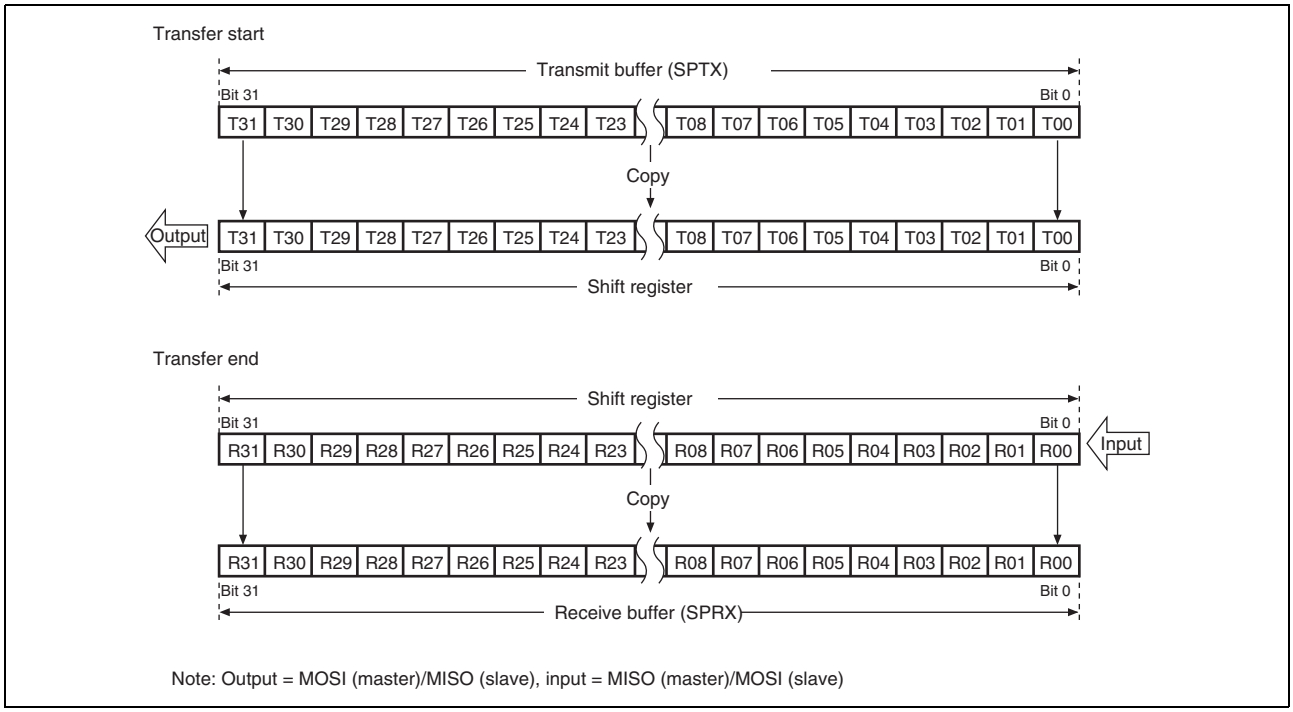

**Figure 16.8 MSB First Transfer (32-Bit Data)**

### (2) MSB First Transfer (16-Bit Data)

Figure 16.9 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 15 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R15 to R00 is stored in bits 15 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 16 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R15 to R00 is shifted out from the shift register.

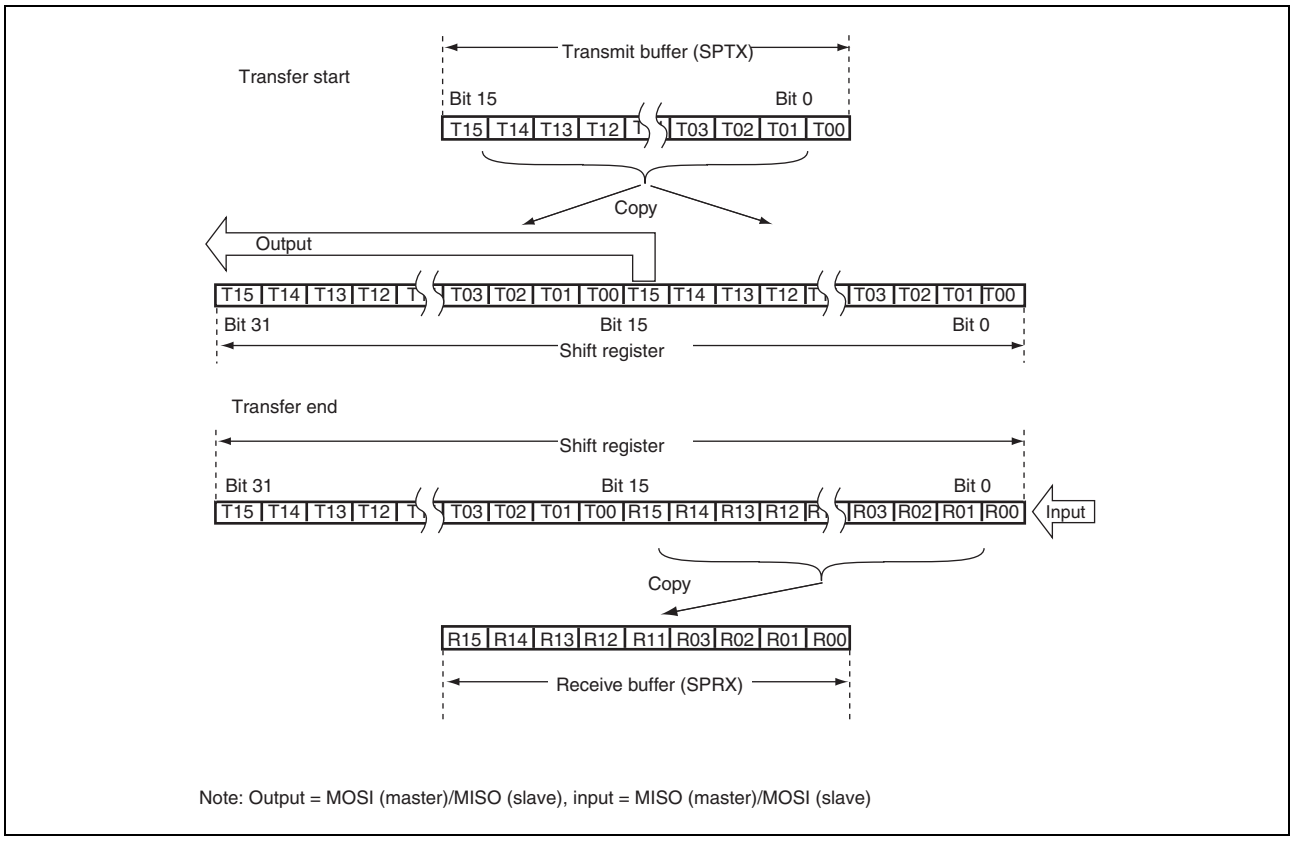

**Figure 16.9 MSB First Transfer (16-Bit Data)**

### (3) MSB First Transfer (8-Bit Data)

Figure 16.10 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 7 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R07 to R00 is stored in bits 7 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 8 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary area in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R07 to R00 is shifted out from the shift register.

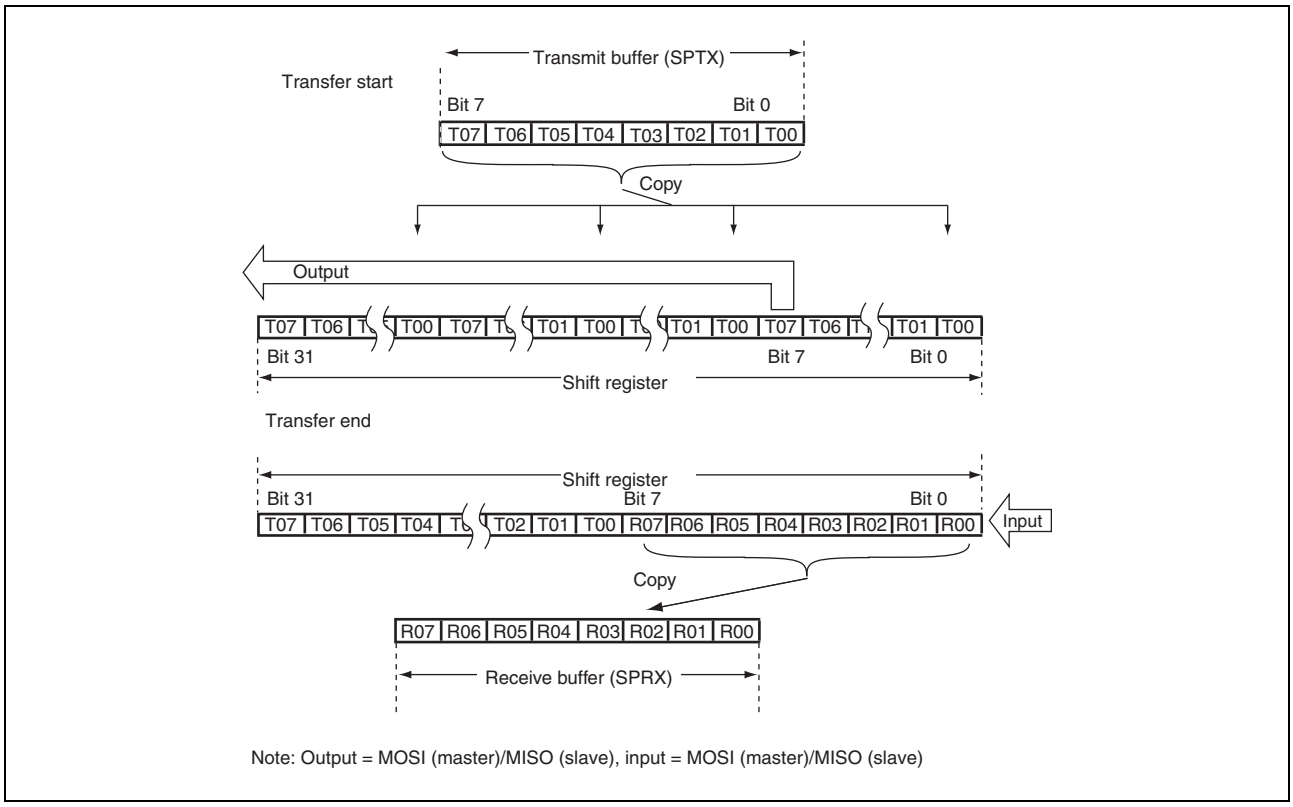

**Figure 16.10 MSB First Transfer (8-Bit Data)**

### (4) LSB First Transfer (32-Bit Data)

Figure 16.11 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R00 to R31 is stored in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of the SPDR, received data R00 to R31 is shifted out from the shift register.

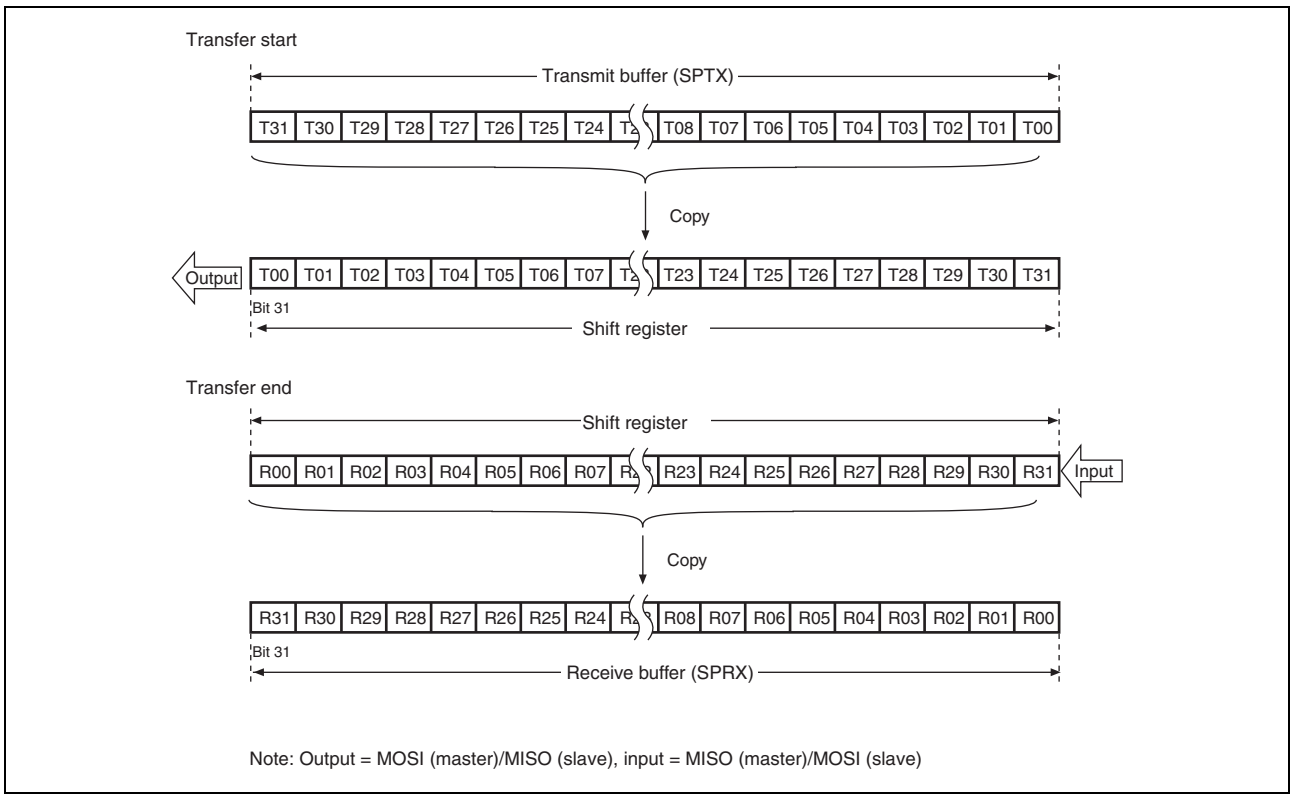

**Figure 16.11 LSB First Transfer (32-Bit Data)**

### (5) LSB First Transfer (16-Bit Data)

Figure 16.12 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 16 in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R00 to R15 is stored in bits 31 to 16 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 15 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register.

If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R15 is shifted out from the shift register.

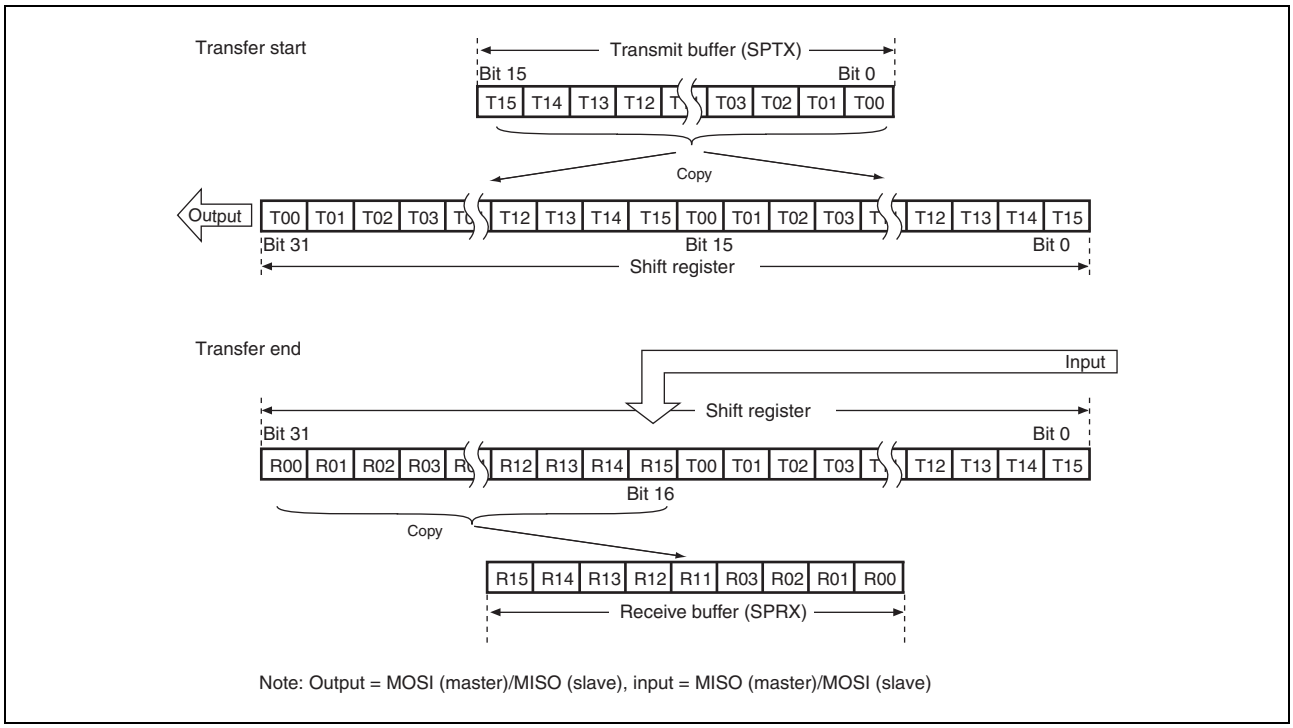

**Figure 16.12 LSB First Transfer (16-Bit Data)**

### (6) LSB First Transfer (8-Bit Data)

Figure 16.13 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 24 in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R00 to R07 is stored in bits 31 to 24 of the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 23 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R07 is shifted out from the shift register.

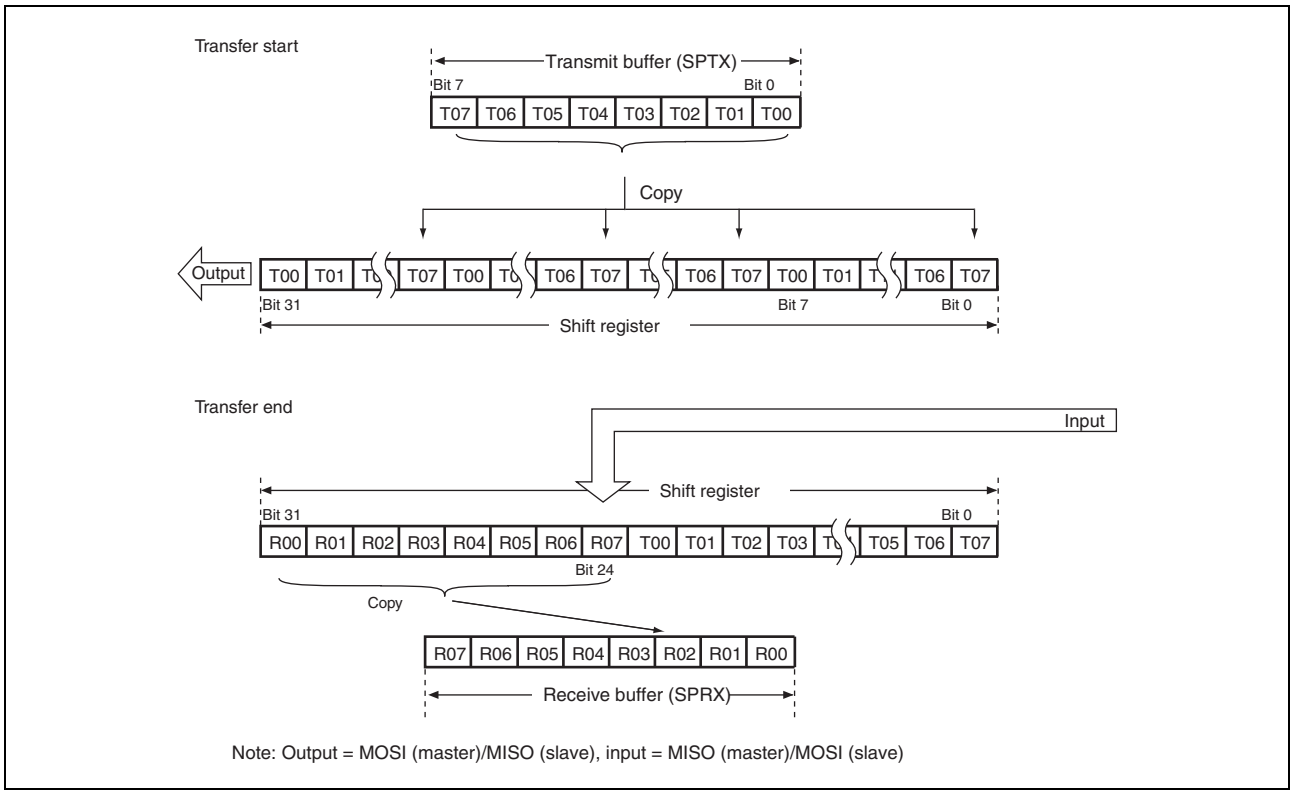

**Figure 16.13 LSB First Transfer (8-Bit Data)**

### 16.4.6 Error Detection

In the normal serial transfer, the data written to the transmit buffer of the data register (SPDR) is serially transmitted, and the serially received data can be read from the receive buffer of SPDR. If access is made to SPDR, depending on the status of the transmit buffer/receive buffer or the status at the beginning or end of serial transfer, in some cases non-normal transfers can be executed.
If a non-normal transfer operation occurs, this module detects the event as an overrun error or a mode fault error. Table 16.7 shows the relationship between non-normal transfer operations and the error detection function.

**Table 16.7 Relationship between Non-Normal Transfer Operations and Error Detection Function**

| | Occurrence Condition | Operation | Error Detection |
|---|---|---|---|
| A | SPDR is written when the transmit buffer is full. | Missing write data. | None |
| B | Serial transfer is started in slave mode when transmit data is still not loaded on the shift register. | Data received in previous serial transfer is serially transmitted. | None |
| C | SPDR is read when the receive buffer is empty. | The output data is undefined. | None |
| D | Serial transfer terminates when the receive buffer is full. | Missing serial receive data. | Overrun error (only in slave mode) |
| E | The SSL input signal is negated during serial transfer in slave mode. | Serial transfer suspended.<br>Missing send/receive data.<br>Operation disabled. | Mode fault error |

On operation A shown in Table 16.7, this module does not detect an error. Whether SPDR can be written to or not can be checked using the T[3:0] bits in the buffer data count setting register (SPBFDR).
Likewise, this module does not detect an error on operation B. In a serial transfer that was started before the shift register was updated, this module sends the data that was received in the previous serial transfer, and does not treat the operation indicated in B as an error. Note that the received data from the previous serial transfer is retained in the receive buffer of SPDR, thus it can be correctly read.
Similarly, this module does not detect an error on operation C. To prevent extraneous data from being read, the number of receive data units stored in the receive buffer should be read from the R[5:0] bits in the buffer data count setting register (SPBFDR).
An overrun error shown in D is described in section 16.4.6 (1), Overrun Error. A mode fault error shown in E is described in section 16.4.6 (2), Mode Fault Error.

### (1) Overrun Error

If serial transfer ends when the receive buffer of the data register (SPDR) is full, this module detects an overrun error, and sets the OVRF bit in SPSR to 1. When the OVRF bit is 1, this module does not copy data from the shift register to the receive buffer so that the data prior to the occurrence of the error is retained in the receive buffer. To reset the OVRF bit in SPSR to 0, either perform a power-on reset, or write a 0 to the OVRF bit after SPSR has been read with the OVRF bit set to 1.

Figure 16.14 shows an example of operation of the SPRF and OVRF bits in SPSR. The SPSR and SPDR accesses shown in Figure 16.14 indicate the condition of accesses to SPSR and SPDR, respectively, where I denotes an idle cycle, W a write cycle, and R a read cycle. In the example of Figure 16.14, this module performs an 8-bit serial transfer in which the CPHA bit in the command register (SPCMD) is 1, and CPOL is 0. The numbers given under the RSPCK waveform represent the number of RSPCK cycles (i.e., the number of transferred bits).

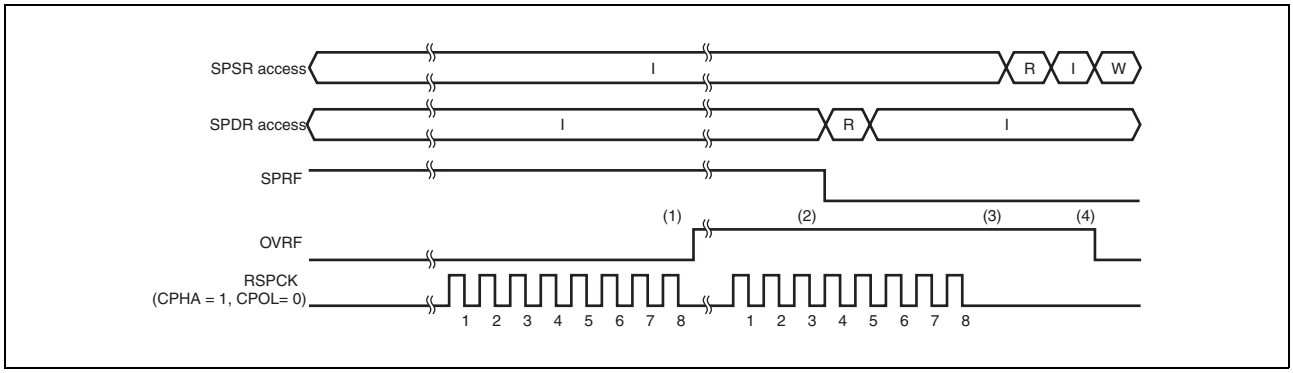

**Figure 16.14 SPRF and OVRF Bit Operation Example**

The operation of the flags at the timing shown in steps (1) to (4) in the figure is described below.

1. If a serial transfer terminates when the receive buffer does not have a space for the receive data length, this module detects an overrun error, and sets the OVRF bit to 1. This module does not copy the data in the shift register to the receive buffer.
2. The OVFR bit is not cleared even when SPDR is read and thus the number of data bytes in the receive buffer becomes less than the number of the receive buffer data triggering number specified by the RXTRG bits.
3. If the serial transfer terminates in an overrun error state, this module determines that the shift register is empty; in this manner, data transfer is enabled from the transmit buffer to the shift register.
4. If 0 is written to the OVRF bit after SPSR is read with OVRF = 1, this module clears the OVRF bit.

The occurrence of an overrun can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. When executing a serial transfer without using an error interrupt, measures should be taken to ensure the early detection of overrun errors, such as reading SPSR immediately after SPDR is read.

The OVRF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition in which the OVRF bit is set to 1, 0 is written to the OVRF bit.
- Power-on reset

Note: • When the receive buffer has area enough to store receive data with an overrun error, this module receives receive data.

### (2) Mode Fault Error

When the MSTR bit is 0, this module operates in slave mode. This module detects a mode fault error if the SSL input signal is negated during the serial transfer period (from the time the driving of valid data is started to the time the final valid data is fetched) when the MODFEN bit is 1 in slave mode.
Upon detecting a mode fault error, this module stops driving of the output signals and clears the SPE bit in SPCR to 0. When the SPE bit is cleared to 0, the function of this module is disabled and this module stops driving external signals. For details of disabling the function of this module by clearing the SPE bit to 0, see section 16.4.7, Initialization.
The occurrence of a mode fault error can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. To detect a mode fault error without using an error interrupt, it is necessary to poll SPSR.
When the MODF bit is 1, writing 1 to the SPE bit is ignored. To enable the function of this module after the detection of a mode fault error, the MODF bit must be set to 0. The MODF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition where the MODF bit has turned 1, 0 is written to the MODF bit.
- Power-on reset

## 16.4.7 Initialization

If 0 is written to the SPE bit in the control register (SPCR) or this module clears the SPE bit to 0 because of the detection of a mode fault error, this module disables the module function, and initializes a part of the module function. When a power-on reset is generated, this module initializes all of the module function. An explanation follows of initialization by the clearing of the SPE bit.

### (1) Initialization by Clearing SPE Bit

When the SPE bit in SPCR is cleared, this module performs the following initialization:

- Suspending any serial transfer that is being executed
- Stopping the driving of output signals (Hi-Z) in slave mode
- Initializing the internal state
- Initializing the TEND bit in SPSR

Initialization by the clearing of the SPE bit does not initialize the control bits of this module. For this reason, this module can be started in the same transfer mode as prior to the initialization if the SPE bit is re-set to 1.

## 16.4.8 SPI Operation

### (1) Multi-Master Mode Operation

This section explains the operation in multi-master mode.

#### (a) Starting Serial Transfer

A serial transfer is started when transmit data is copied from the transmit buffer to the shift register, the shift register becomes full, and the receive buffer has a space for the receive data length. If transmit data has already been written to the shift register, data is not copied from the transmit buffer to the shift register.
For details of the transfer format, see section 16.4.4, Transfer Format.

#### (b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register (SPCMD), this module terminates the serial transfer after transmitting an RSPCK edge corresponding to the final sampling timing. After the serial transfer is completed, receive data is copied from the shift register to the receive buffer. If the receive buffer does not have a space for the receive data length after receive data is copied from the shift register to the receive buffer, another serial transfer will not be performed. In order to perform another serial transfer, data for the receive data length should be read from the receive buffer to secure the space for the receive data.
It should be noted that the final sampling timing varies depending on the bit length of transfer data. In master mode, the data length depends on the settings in bits SPB3 to SPB0 in SPCMD. For details on the transfer format, see section 16.4.4, Transfer Format.

#### (c) Sequence Control

The transfer format that is employed in master mode is determined by the sequence control register (SPSCR), command registers 0 to 3 (SPCMD0 to SPCMD3), the bit rate register (SPBR), the clock delay register (SPCKD), the slave select negation delay register (SSLND), and the next-access delay register (SPND).
SPSCR is a register used to determine the sequence configuration for serial transfers that are executed by this module in master mode. The following items are set in command registers SPCMD0 to SPCMD3: SSL output signal value, MSB/LSB first, data length, some of the bit rate settings, RSPCK polarity/phase, whether SPCKD is to be referenced, whether SSLND is to be referenced, and whether SPND is to be referenced. SPBR holds some of the bit rate settings; SPCKD, a clock delay value; SSLND, an SSL negation delay; and SPND, a next-access delay value.
According to the sequence length that is assigned to SPSCR, this module makes up a sequence comprised of a part or all of SPCMD0 to SPCMD3. This module contains a pointer to the SPCMD that makes up the sequence. The value of this pointer can be checked by reading bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the SPE bit in the control register (SPCR) is set to 1 and the function of this module is enabled, this module loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 settings into the transfer format at the beginning of serial transfer. This module increments the pointer each time the next-access delay period for a data transfer ends. Upon completion of the serial transfer that corresponds to the final command comprising the sequence, this module sets the pointer in SPCMD0, and in this manner the sequence is executed repeatedly.

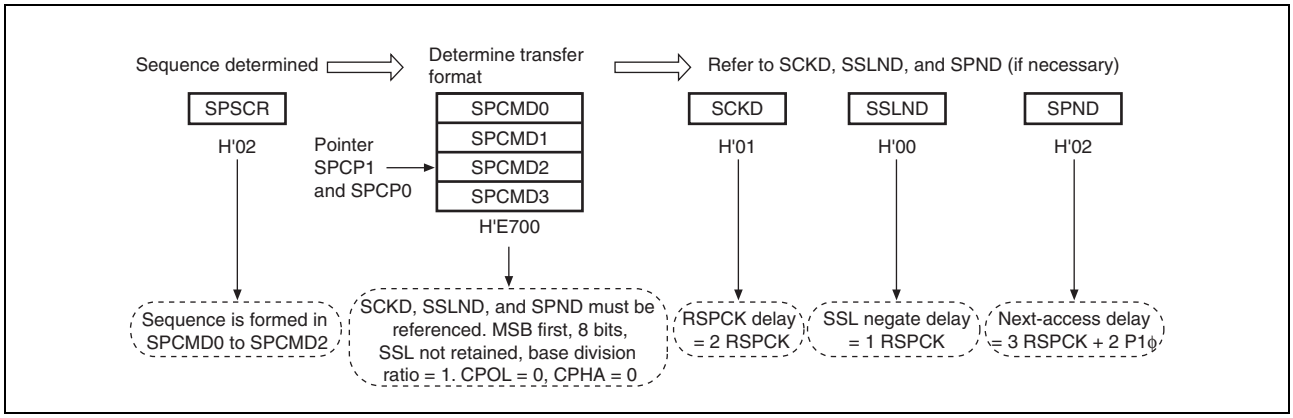

**Figure 16.15 Determination Procedure of Serial Transfer Mode in Master Mode**

## (d) Burst Transfer

If the SSLKP bit in the command register (SPCMD) that this module references during the current serial transfer is 1, this module keeps the SSL signal level during the serial transfer until the beginning of the SSL signal assertion for the next serial transfer. If the SSL signal level for the next serial transfer is the same as the SSL signal level for the current serial transfer, this module can execute continuous serial transfers while keeping the SSL signal assertion status (burst transfer).

Figure 16.16 shows an example of an SSL signal operation for the case where a burst transfer is implemented using SPCMD0 and SPCMD1 settings. The text below explains operations (1) to (7) as depicted in Figure 16.16. It should be noted that the polarity of the SSL output signal depends on the settings in the slave select polarity register (SSLP).

1. Based on SPCMD0, this module asserts the SSL signal and inserts RSPCK delays.
2. Serial transfers are executed according to SPCMD0.
3. SSL negation delays are inserted.
4. Because the SSLKP bit in SPCMD0 is 1, this module keeps the SSL signal value on SPCMD0. This period is sustained, at the shortest, for a period equal to the next-access delay of SPCMD0. If the shift register is empty after the passage of a minimum period, this period is sustained until such time as the transmit data is stored in the shift register for another transfer.
5. Based on SPCMD1, this module asserts the SSL signal and inserts RSPCK delays.
6. Serial transfers are executed according to SPCMD1.
7. Because the SSLKP bit in SPCMD1 is 0, this module negates the SSL signal. In addition, a next-access delay is inserted according to SPCMD1.

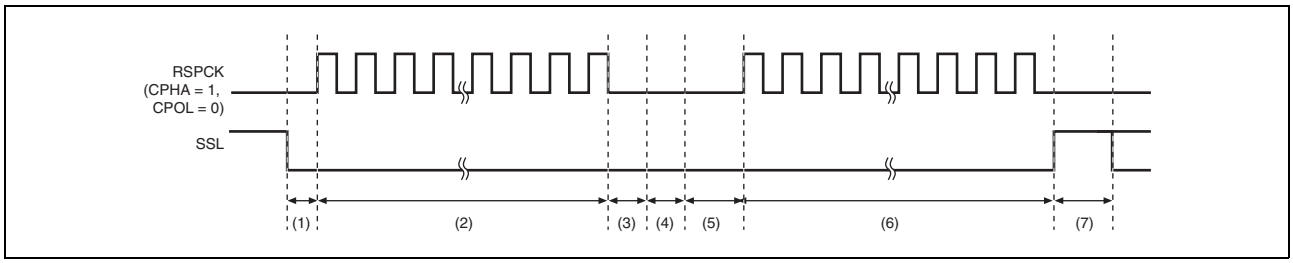

**Figure 16.16 Example of Burst Transfer Operation using SSLKP Bit**

If the SSL signal settings in the SPCMD in which 1 is assigned to the SSLKP bit are different from the SSL signal output settings in the SPCMD to be used in the next transfer, this module switches the SSL signal status to SSL signal assertion ((5) in Figure 16.16) corresponding to the command for the next transfer. Notice that if such an SSL signal switching occurs, the slaves that drive the MISO signal compete, and the possibility arises of the collision of signal levels.

This module in master mode references within the module the SSL signal operation for the case where the SSLKP bit is

not used. Even when the CPHA bit in SPCMD is 0, this module can accurately start serial transfers by asserting the SSL signal for the next transfer. For this reason, burst transfers in master mode can be executed irrespective of CPHA bit settings (see section 16.4.8 (2), Slave Mode Operation).

### (e) RSPCK Delay (t1)

The RSPCK delay value in master mode depends on SCKDEN bit settings in the command register (SPCMD) and on clock delay register (SPCKD) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an RSPCK delay value during serial transfer by using the SCKDEN bit in the selected SPCMD and SPCKD, as shown in Table 16.8. For a definition of RSPCK delay, see section 16.4.4, Transfer Format.

**Table 16.8 Relationship among SCKDEN and SPCKD Settings and RSPCK Delay Values**

| SCKDEN | SPCKD | RSPCK Delay Value |
|---|---|---|
| 0 | 000 to 111 | 1 RSPCK |
| 1 | 000 | 1 RSPCK |
| | 001 | 2 RSPCK |
| | 010 | 3 RSPCK |
| | 011 | 4 RSPCK |
| | 100 | 5 RSPCK |
| | 101 | 6 RSPCK |
| | 110 | 7 RSPCK |
| | 111 | 8 RSPCK |

### (f) SSL Negation Delay (t2)

The SSL negation delay value in master mode depends on SLNDEN bit settings in the command register (SPCMD) and on SSL negation delay register (SSLND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an SSL negation delay value during serial transfer by using the SLNDEN bit in the selected SPCMD and SSLND, as shown in Table 16.9. For a definition of SSL negation delay, see section 16.4.4, Transfer Format.

**Table 16.9 Relationship among SLNDEN and SSLND Settings and SSL Negation Delay Values**

| SLNDEN | SSLND | SSL Negation Delay Value |
|---|---|---|
| 0 | 000 to 111 | 1 RSPCK |
| 1 | 000 | 1 RSPCK |
| | 001 | 2 RSPCK |
| | 010 | 3 RSPCK |
| | 011 | 4 RSPCK |
| | 100 | 5 RSPCK |
| | 101 | 6 RSPCK |
| | 110 | 7 RSPCK |
| | 111 | 8 RSPCK |

### (g) Next-Access Delay (t3)

The next-access delay value in master mode depends on SPNDEN bit settings in the command register (SPCMD) and on next-access delay register (SPND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines a next-access delay value during serial transfer by using the SPNDEN bit in the selected SPCMD and SPND, as shown in Table 16.10. For a definition of next-access delay, see section 16.4.4, Transfer Format.

**Table 16.10 Relationship among SPNDEN and SPND Settings and Next-Access Delay Values**

| SPNDEN | SPND | Next-Access Delay Value |
|---|---|---|
| 0 | 000 to 111 | 1 RSPCK + 2 P1ϕ |
| 1 | 000 | 1 RSPCK + 2 P1ϕ |
| | 001 | 2 RSPCK + 2 P1ϕ |
| | 010 | 3 RSPCK + 2 P1ϕ |
| | 011 | 4 RSPCK + 2 P1ϕ |
| | 100 | 5 RSPCK + 2 P1ϕ |
| | 101 | 6 RSPCK + 2 P1ϕ |
| | 110 | 7 RSPCK + 2 P1ϕ |
| | 111 | 8 RSPCK + 2 P1ϕ |

### (h) Initialization Flowchart

Figure 16.17 is a flowchart illustrating an example of initialization in SPI operation when this module is used in master mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

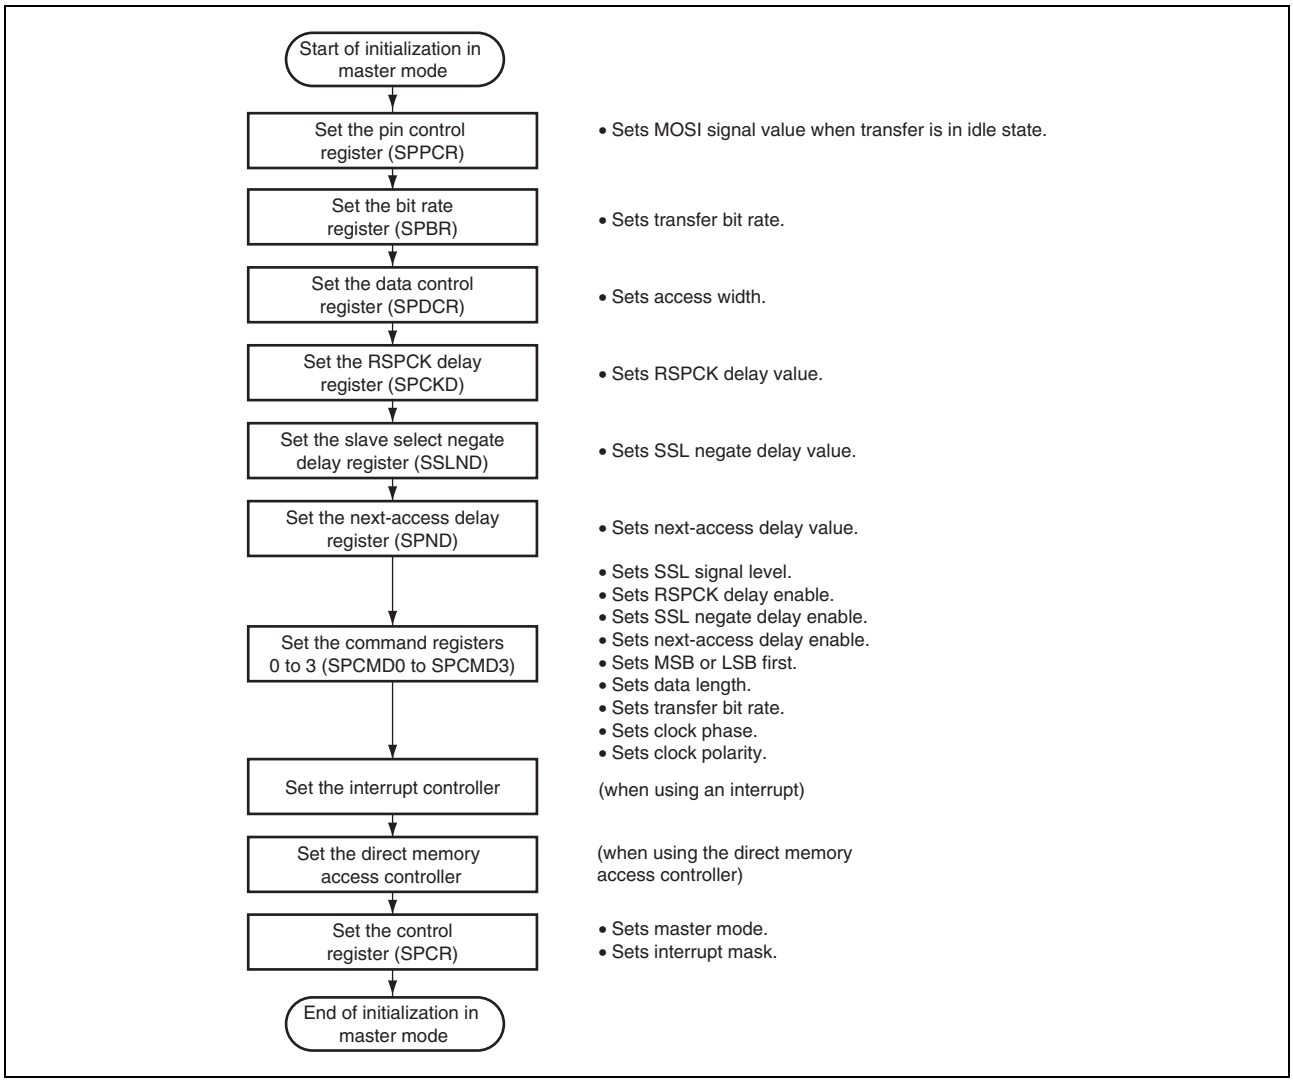

**Figure 16.17 Example of Initialization Flowchart in Master Mode**

### (i) Transfer Operation Flowchart

Figure 16.18 is a flowchart illustrating a transfer in SPI operation when this module is used in master mode.

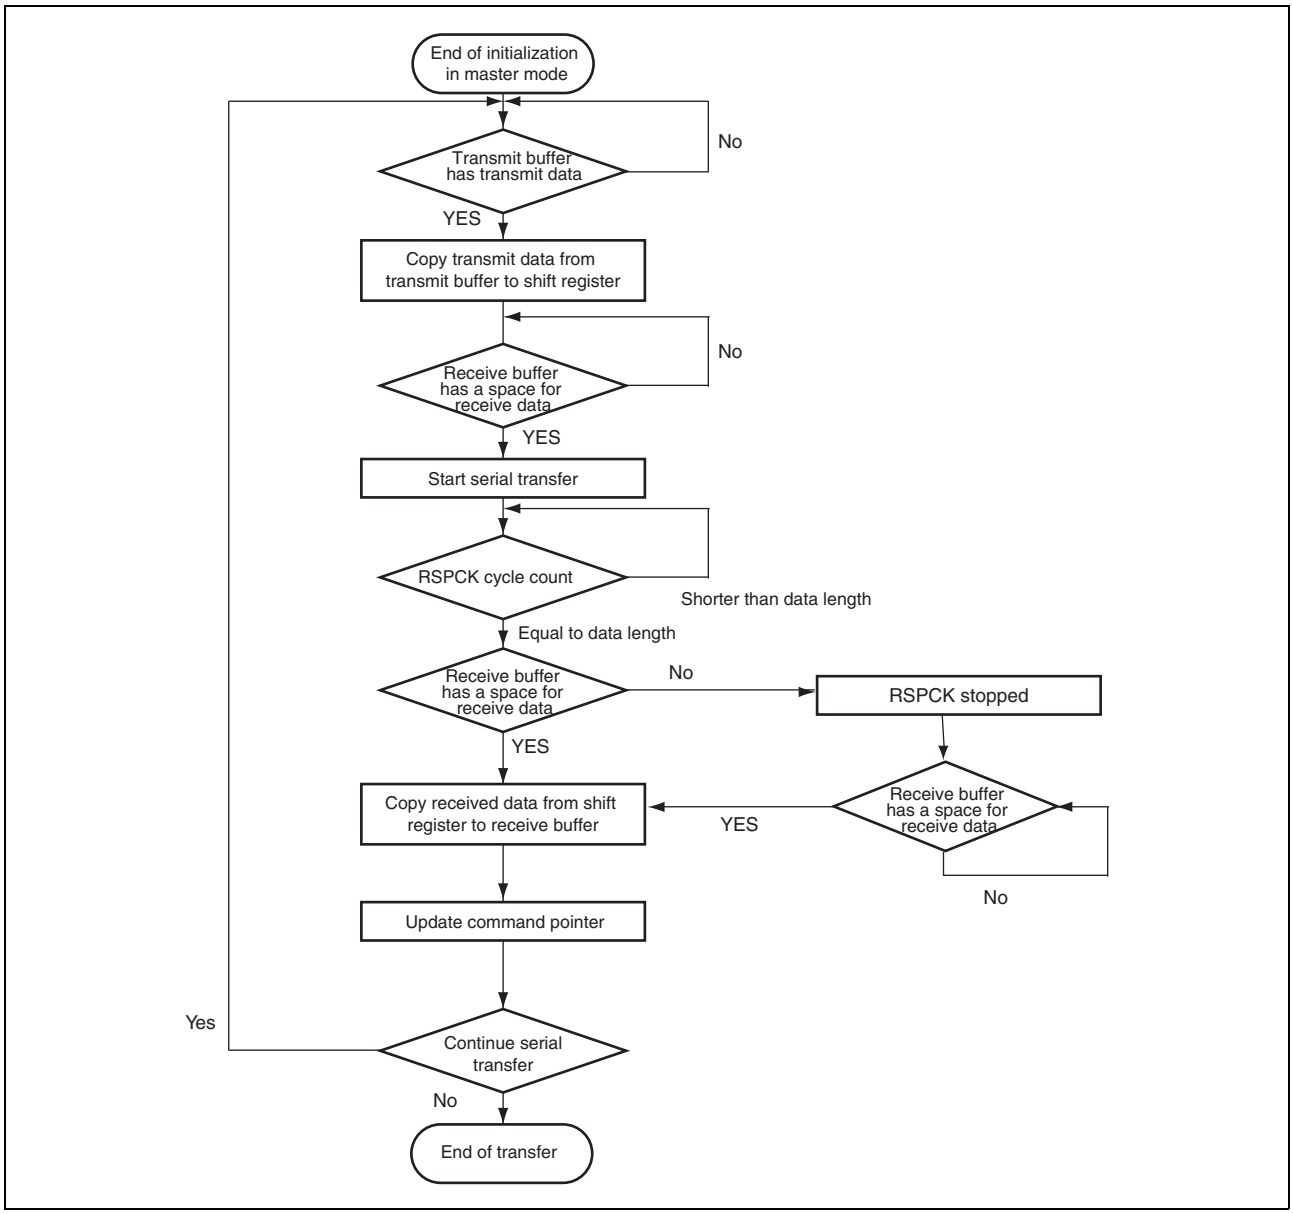

**Figure 16.18 Transfer Operation Flowchart in Master Mode**

### (2) Slave Mode Operation

#### (a) Starting Serial Transfer

If this module detects an SSL input signal assertion when the CPHA bit in the command register 0 (SPCMD0) is 0, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 0, the asserting of the SSL input signal triggers the start of a serial transfer.
If this module detects the first RSPCK edge in an SSL signal asserted condition when the CPHA bit is 1, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 1, the first RSPCK edge in an SSL signal asserted condition triggers the start of a serial transfer.
When detecting the start of a serial transfer in a condition in which the shift register is empty, this module changes the status of the shift register to "full", so that data cannot be copied from the transmit buffer to the shift register when serial transfer is in progress. If the shift register was full before the serial transfer started, this module leaves the status of the shift register intact, in the full state.
Irrespective of CPHA bit settings, this module starts driving MISO output signals at the SSL signal assertion timing. Whether the data output from this module is valid or invalid differs depending on CPHA bit settings.
For details on the transfer format, see section 16.4.4, Transfer Format. The polarity of the SSL input signal depends on the setting of the SSL0P bit in the slave select polarity register (SSLP).

#### (b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register 0 (SPCMD0), this module terminates the serial transfer after detecting an RSPCK edge corresponding to the final sampling timing. When the receive buffer has an enough space for receive data, this module copies received data from the shift register to the receive buffer of the data register (SPDR) upon termination of the serial transfer. Irrespective of the value of the SPRF bit, this module changes the status of the shift register to "empty" upon termination of the serial transfer. If this module detects an SSL input signal negation from the beginning of serial transfer to the end of serial transfer, a mode fault error occurs (see section 16.4.6, Error Detection).
The final sampling timing changes depending on the bit length of the transfer data. In slave mode, the data length depends on the settings in bits SPB3 to SPB0 bits in SPCMD0. The polarity of the SSL input signal depends on the setting in the SSL0P bit in the slave select polarity register (SSLP). For details on the transfer format, see section 16.4.4, Transfer Format.

#### (c) Notes on Slave Operations

If the CPHA bit in the command register 0(SPCMD0) is 0, this module starts serial transfers when it detects the assertion edge for an SSL input signal. In the type of configuration shown in Figure 16.4 as an example, if this module is used in single-slave mode, the SSL signal is always fixed at active state. Therefore, when the CPHA bit is set to 0, this module cannot correctly start a serial transfer. To correctly execute send/receive operation in a configuration in which the SSL input signal is fixed at active state, the CPHA bit should be set to 1. When it is necessary to set the CPHA bit to 0, the SSL input signal should not be fixed.

#### (d) Burst Transfer

If the CPHA bit in the command register 0 (SPCMD0) is 1, continuous serial transfer (burst transfer) can be executed while retaining the assertion state for the SSL input signal. If the CPHA bit is 1, the period from the first RSPCK edge to the sampling timing for the reception of the final bit in an SSL signal active state corresponds to a serial transfer period. Even when the SSL input signal remains at the active level, this module can accommodate burst transfers because it can detect the start of access.
If the CPHA bit is 0, for the reason given in section 16.4.8 (2) (c), Notes on Slave Operations, second and subsequent serial transfers during the burst transfer cannot be executed correctly.

### (e) Initialization Flowchart

Figure 16.19 is a flowchart illustrating an example of initialization in SPI operation when this module is used in slave mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

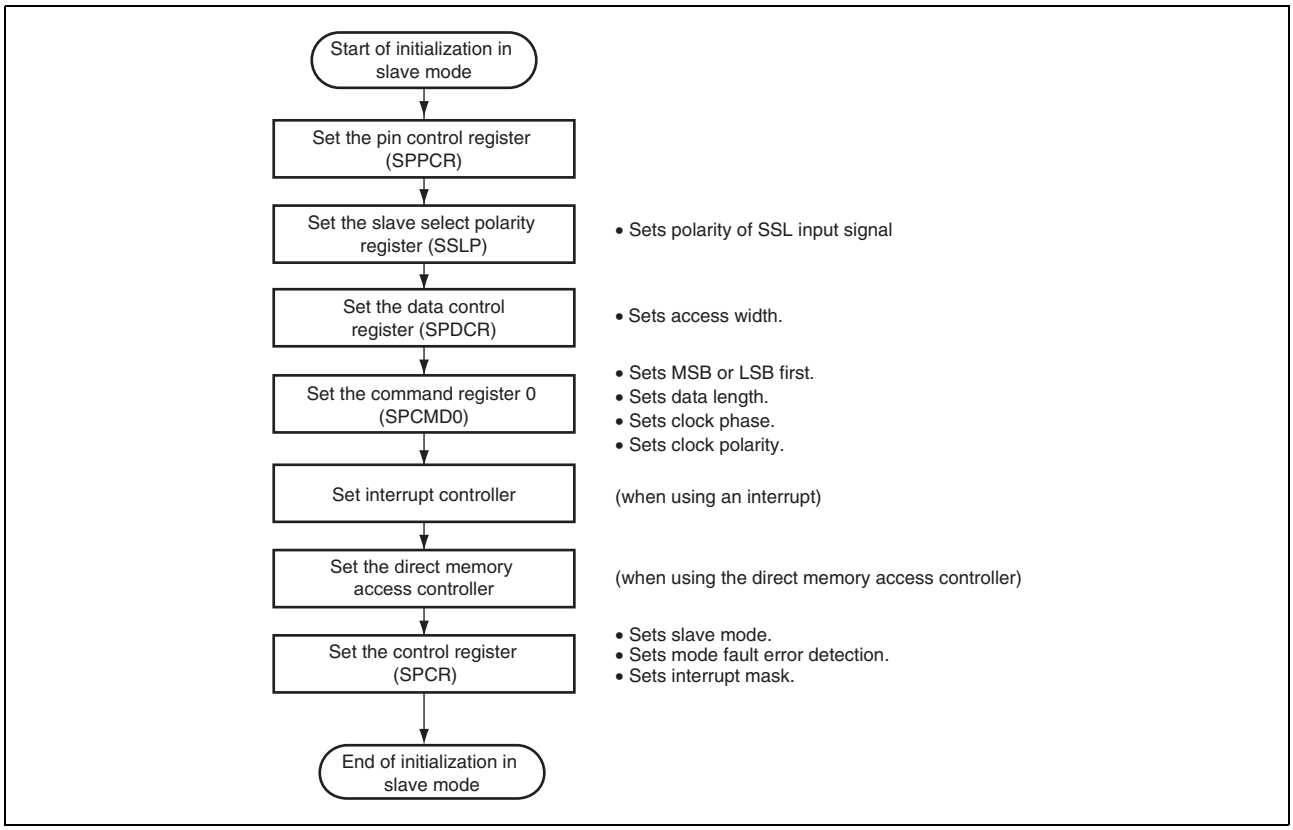

**Figure 16.19 Example of Initialization Flowchart in Slave Mode**

### (f) Transfer Operation Flowchart (CPHA = 0)

Figure 16.20 is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) set to 0.

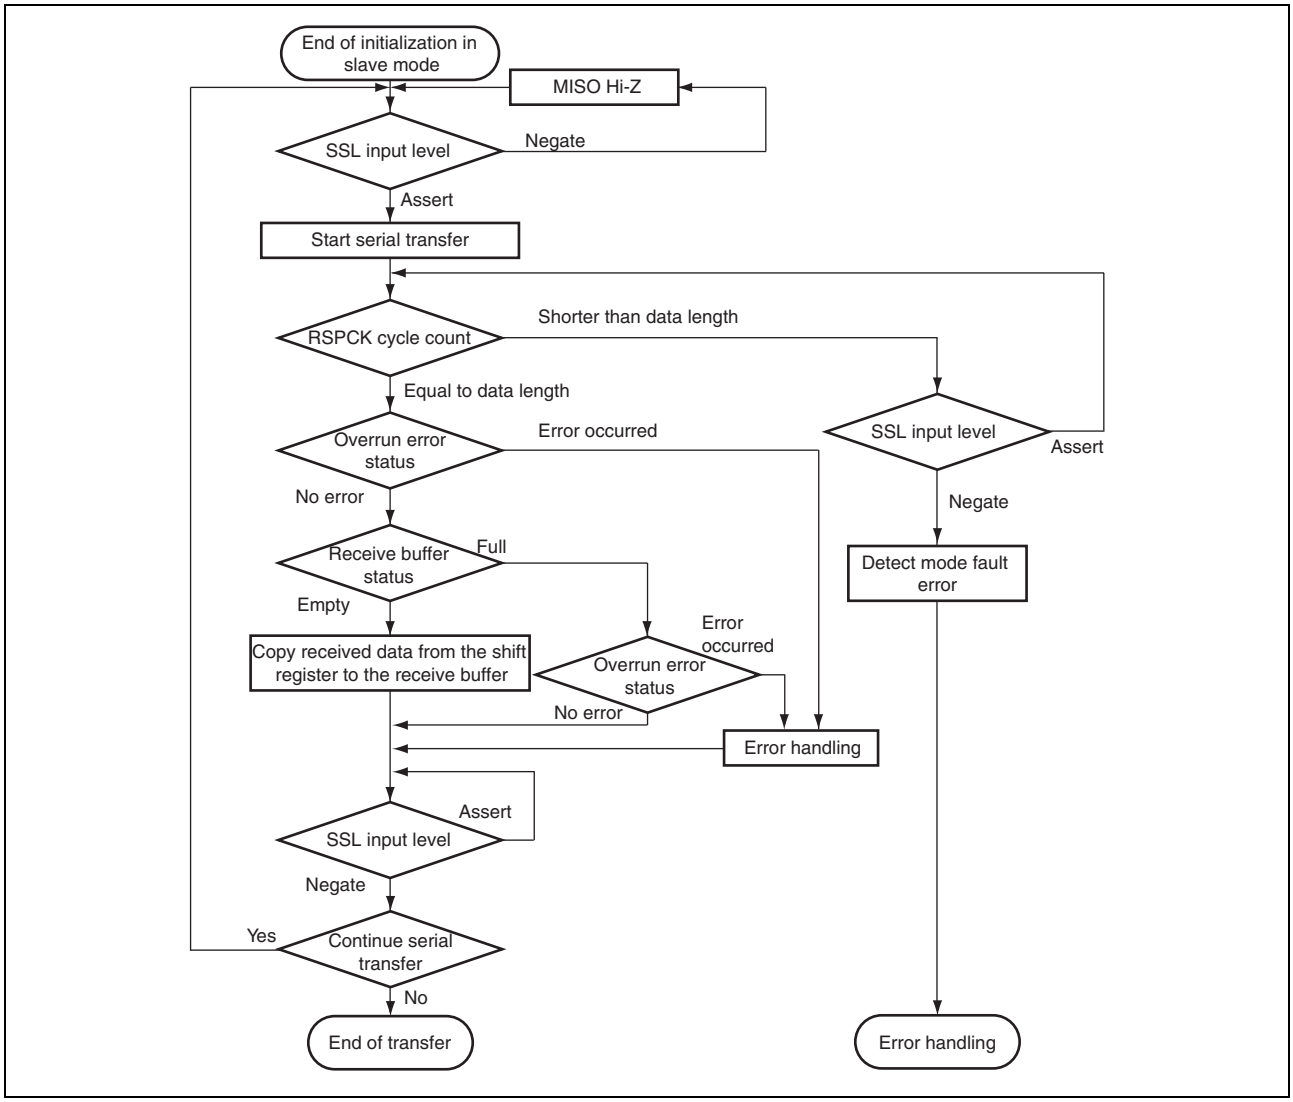

**Figure 16.20 Transfer Operation Flowchart in Slave (CPHA = 0)**

### (g) Transfer Operation Flowchart (CPHA = 1)

Figure 16.21 is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) and the MODFEN bit in the control register (SPCR) set to 1, respectively. The subsequent operation is not guaranteed when the serial transfer is started with the MODFEN bit set to 0 and the SSL input level is negated with the number of RSPCK cycles shorter than the data length.

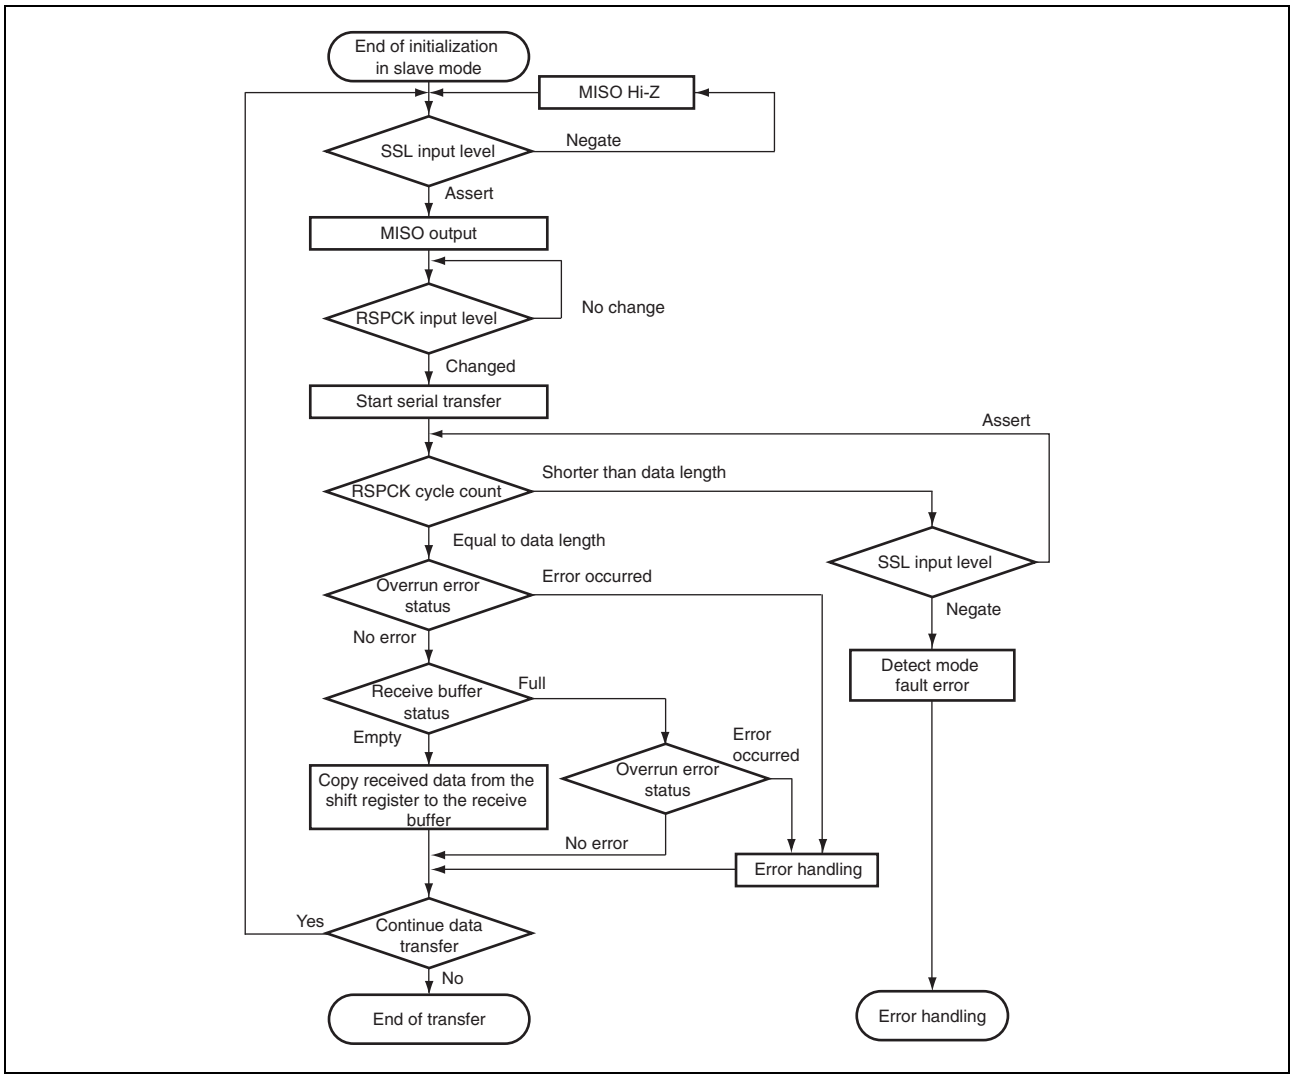

**Figure 16.21 Transfer Operation Flowchart in Slave Mode (CPHA = 1)**

### 16.4.9 Error Handling

Figure 16.22 and Figure 16.23 show the error handling. The following error handling is used to return from the error state after an error in master or slave mode.

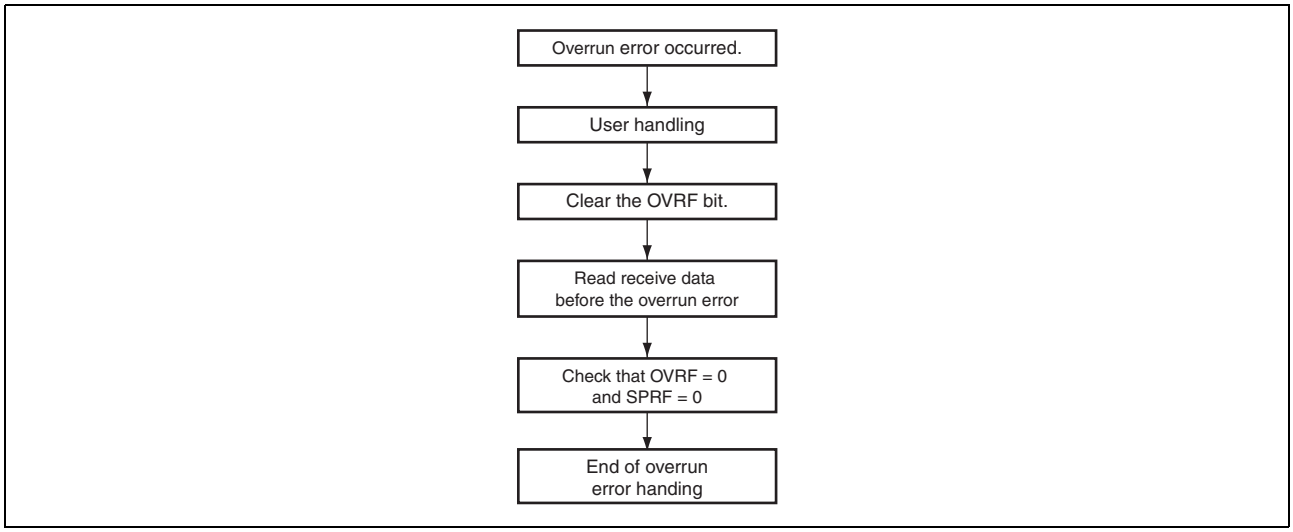

**Figure 16.22 Error Handling (Overrun Error)**

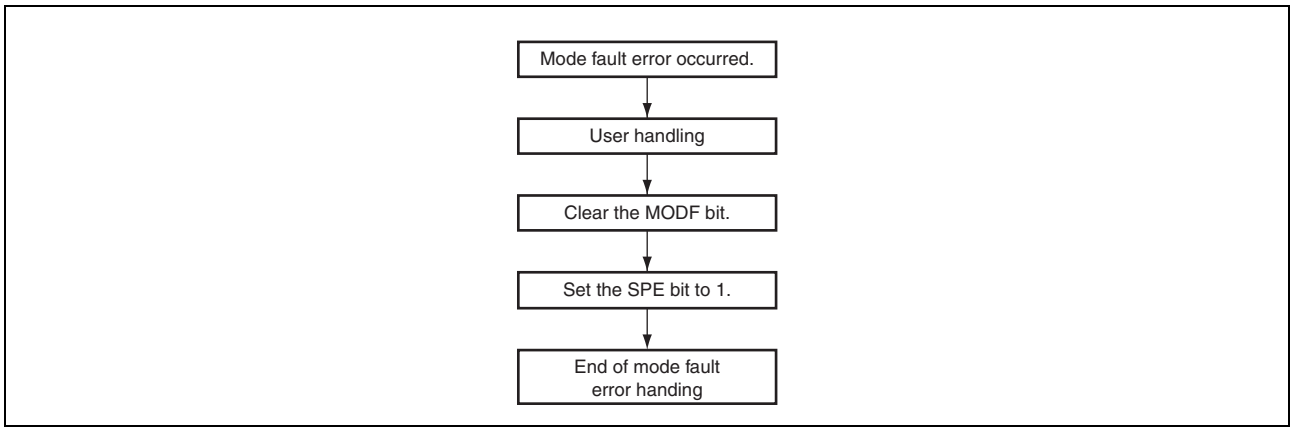

**Figure 16.23 Error Handling (Mode Fault Error)**

### 16.4.10 Loopback Mode

When 1 is written to the SPLP bit in the pin control register (SPPCR), this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects the input path and the output path (reversed) of the shift register. This is called loopback mode. When a serial transfer is executed in loopback mode, the transmit data becomes the received data. Figure 16.24 shows the configuration of the shift register input/output paths for the case where this module in master mode is set in loopback mode.

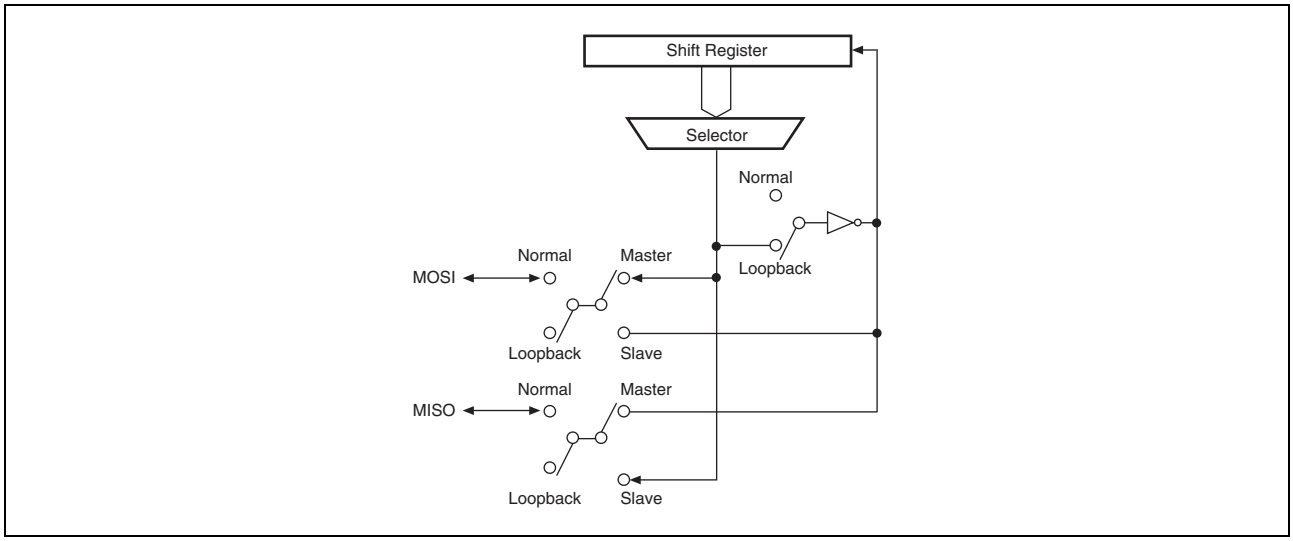

**Figure 16.24 Configuration of Shift Register Input/Output Paths in Loopback Mode (Master Mode)**

### 16.4.11 Interrupt Sources

This module has interrupt sources of receive buffer full, transmit buffer empty, mode fault, and overrun. In addition, the direct memory access controller can be activated by the receive buffer full or transmit buffer empty interrupt for data transfer.

Table 16.11 shows the interrupt sources.

When any of the interrupt conditions in Table 16.11 is met, an interrupt is generated. The interrupt sources should be cleared with data transfer by the CPU or direct memory access controller.

**Table 16.11 Interrupt Sources**

| Name | Interrupt Source | Abbreviation | Interrupt Condition | Activation of Direct Memory Access Controller |
|---|---|---|---|---|
| SPRI | Receive buffer full | RXI | (SPRIE = 1) • (SPRF = 1) | Possible |
| SPTI | Transmit buffer empty | TXI | (SPTIE = 1) • (SPTEF = 1) | Possible |
| SPEI | Mode fault | MOI | (SPEIE = 1) • (MODF = 1) | — |
| | Overrun | OVI | (SPEIE = 1) • (OVRF = 1) | — |

# 17. SPI Multi I/O Bus Controller

The SPI multi I/O bus controller outputs control signals to the serial flash memory connected to the SPI multi I/O bus space, thus enabling direct connection of the serial flash memory.
This LSI incorporates two independent SPI multi I/O bus controller channels.

## 17.1 Features

This module allows the connected serial flash memory to be accessed by directly reading the SPI multi I/O bus space, or using SPI operating mode to transmit and receive data.

- Serial Flash Memory Interface
  Up to two serial flash memories per channel can be connected.
  A data bus size of 1 bit, 2 bits, or 4 bits can be selected for one serial flash memory device.
  Serial flash memory for DDR transfer can be directly connected.
- External Address Space Read Mode
  A maximum of 8-Gbyte address space is supported (when two serial flash memories are connected)
  The SPBSSL pin can be automatically controlled through access address monitoring
  Efficient data reception due to built-in read cache (64-bit line × 16 entries)
- SPI Operating Mode
  Desired read/write access to serial flash memory possible
- Bit rate
  SPBCLK is generated by frequency division of Bϕ by internal baud rate generator
  SPBCLK frequency division ratio can be set from 2 to 4080
- SPBSSL Pin Control
  Delay from SPBSSL signal assertion to SPBCLK operation (clock delay) can be set
  Range: 1 to 8 SPBCLK cycles (set in SPBCLK-cycle units)
  Delay from SPBCLK stop to SPBSSL output negation (SPBSSL negation delay) can be set
  Range: 1.5 to 8.5 SPBCLK cycles (set in SPBCLK-cycle units)
  SPBSSL output assertion wait before next access (next access delay) can be set
  Range: 1 to 8 SPBCLK cycles (set in SPBCLK-cycle units)
  SPBSSL polarity can be changed

## 17.2 Block Diagram

Figure 17.1 shows a block diagram of this module for one channel.

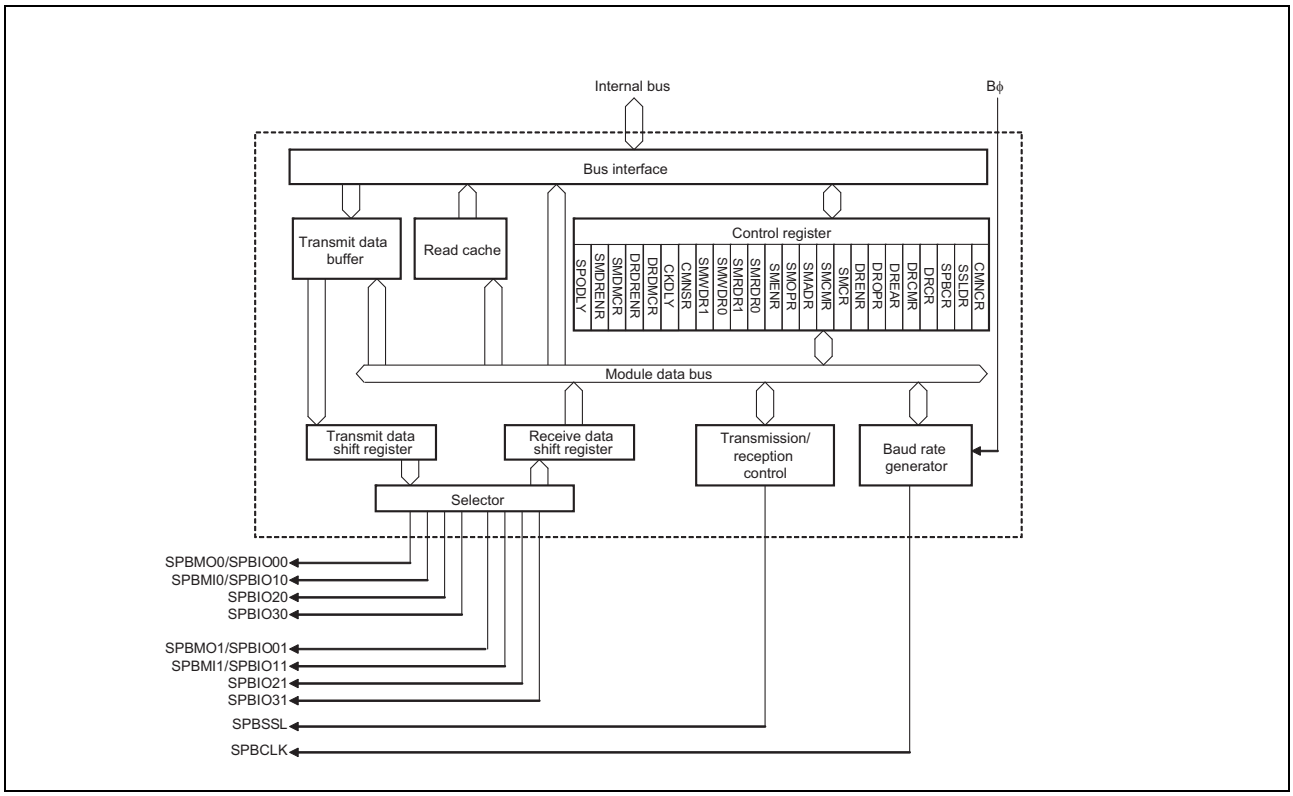

**Figure 17.1 Block Diagram**

## 17.3 Input/Output Pins

Table 17.1 shows the pin configuration for one channel.

**Table 17.1 Pin Configuration**

| Port | Pin Name | Symbol | I/O | Function |
|---|---|---|---|---|
| Common | Clock pin | SPBCLK_n | Output | Clock output |
| | Slave select pin | SPBSSL_n | Output | Slave selection |
| 0 | Data 0 pin | SPBMO0_n/ SPBIO00_n | I/O | Port 0 master transmit data/data 0 |
| | Port 0 data 1 pin | SPBMI0_n/ SPBIO10_n | I/O | Port 0 master input data/ data 1 |
| | Port 0 data 2 pin | SPBIO20_n | I/O | Port 0 data 2 |
| | Port 0 data 3 pin | SPBIO30_n | I/O | Port 0 data 3 |
| 1 | Port 1 data 0 pin | SPBMO1_n/ SPBIO01_n | I/O | Port 1 master transmit data/data 0 |
| | Port 1 data 1 pin | SPBMI1_n/ SPBIO11_n | I/O | Port 1 master input data/ data 1 |
| | Port 1 data 2 pin | SPBIO21_n | I/O | Port 1 data 2 |
| | Port 1 data 3 pin | SPBIO31_n | I/O | Port 1 data 3 |

Note: • n represents a channel number (0 or 1). In the text, the channel number is omitted.

## 17.4 Register Descriptions

Table 17.2 shows the register configuration.

**Table 17.2 Register Configuration**

| Channel | Register Name | Abbreviation | Initial Value | R/W | Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | Common control register_0 | CMNCR_0 | H'01AA4000 | R/W | H'3FEFA000 | 32 |

### 17.4.1 Common Control Register (CMNCR)

CMNCR is a 32-bit register that controls the SPI multi I/O bus controller. The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

## 17.4.2 SSL Delay Register (SSLDR)

SSLDR is a 32-bit register that adjusts the timing between the SPBSSL signal and the SPBCLK signal.
The settings of this register are reflected both in external address space read mode and SPI operating mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

## 17.4.3 Bit Rate Register (SPBCR)

SPBCR is a 32-bit register that sets the bit rate.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SPBR[7:0] | | | | | | | | - | - | - | - | - | - | BRDV[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 15 to 8 | SPBR[7:0] | All 0 | R/W | Bit Rate<br>Sets the bit rate. The bit rate is determined by a combination of these bits with the BRDV[1:0] bits. For details, see Table 17.3, Relationship between SPBR[7:0] and BRDV[1:0] Settings. |
| 7 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1, 0 | BRDV[1:0] | 11 | R/W | Bit Rate Frequency Division<br>Sets the bit rate. The bit rate is determined by a combination of these bits with the SPBR[7:0] bits. The SPBR value is used to set the base bit rate. The BRDV value is used to select a division ratio of the base bit rate from among no division, 2, 4, and 8.<br>00: Base bit rate<br>01: Base bit rate divided by 2<br>10: Base bit rate divided by 4<br>11: Base bit rate divided by 8 |

### (1) Bit Rate

SPBR[7:0] and BRDV[1:0] are used for setting the bit rate.

The following formula is used to calculate the bit rate when SPBR[7:0] ≠ 0.

Bit rate = Bϕ / (2 × n × $2^N$)
n: SPBR[7:0] setting (1, …, 255)
N: BRDV[1:0] setting (0 to 3)

Also the following formula is used to calculate the bit rate when SPBR[7:0] = 0.

Bit rate = Bϕ /$2^N$
N: BRDV[1:0] setting (0 to 3)

**Table 17.3 Relationship between SPBR[7:0] and BRDV[1:0] Settings**

| | | | Bit Rate | | |
|---|---|---|---|---|---|
| **SPBR[7:0] (n)** | **BRDV[1:0] (N)** | **Division Ratio** | **Bϕ = 100 MHz** | **Bϕ = 128 MHz** | **Bϕ = 133.33 MHz** |
| 0 | 0 | 1 | Setting prohibited | | |
| 1 | 0 | 2 | 50 Mbps | 64 Mbps | 66.67 Mbps |
| 2 | 0 | 4 | 25 Mbps | 32 Mbps | 33.33 Mbps |
| 3 | 0 | 6 | 16.67 Mbps | 21.33 Mbps | 22.22 Mbps |
| 4 | 0 | 8 | 12.5 Mbps | 16 Mbps | 16.67 Mbps |
| 5 | 0 | 10 | 10 Mbps | 12.8 Mbps | 13.33 Mbps |
| 6 | 0 | 12 | 8.33 Mbps | 10.67 Mbps | 11.11 Mbps |
| 6 | 1 | 24 | 4.17 Mbps | 5.33 Mbps | 5.56 Mbps |
| 6 | 2 | 48 | 2.08 Mbps | 2.67 Mbps | 2.78 Mbps |
| 6 | 3 | 96 | 1.04 Mbps | 1.33 Mbps | 1.39 Mbps |
| 255 | 3 | 4080 | 24.51 Kbps | 31.37 Kbps | 32.68 Kbps |

Note: • The bit rate should be set so that it will satisfy the AC characteristics of this module.

### 17.4.4 Data Read Control Register (DRCR)

DRCR is a 32-bit register that sets the operation in external address space read mode.
The bits except the SSLN bit should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | SSLN | - | - | - | - | RBURST[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | RCF | RBE | - | - | - | - | - | - | - | SSLE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | W | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 25 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 24 | SSLN | 0 | W | SPBSSL Negation<br>Asserted SPBSSL can be negated by writing 1 to this bit when both the RBE and SSLE bits are 1.<br>This bit is always read as 0.<br>Note: To start next access after SPBSSL negation using this bit, read SSLF in CMNSR = 0 to confirm that the SPBSSL has been negated. |
| 23 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 19 to 16 | RBURST [3:0] | 0000 | R/W | Read Data Burst Length<br>Sets the burst length (data unit count) when reading.<br>This bit is enabled when the RBE bit is set to 1.<br>0000: 1 data unit<br>0001: 2 continuous data units<br>:<br>1110: 15 continuous data units<br>1111: 16 continuous data units<br>One data unit is 64 bits long. |
| 15 to 10 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 9 | RCF | 0 | W | Read Cache Flush<br>When 1 is written to this bit, all the entries in the read cache are cleared.<br>This bit is always read as 0.<br>Note: After flushing the read cache by writing 1 to the RCF bit, read the DRCR before proceeding to read from the external address space. |
| 8 | RBE | 0 | R/W | Read Burst<br>Turns burst ON or OFF when reading.<br>0: Data is read according to the access size.<br>1: Read cache is enabled, and as many data units as the burst count specified in RBURST[3:0] bits is read. |
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | SSLE | 0 | R/W | SPBSSL Negation<br>Sets the conditions for SPBSSL negation during read burst.<br>SPBSSL is negated for each access during normal read.<br>0: SPBSSL is negated after transfer of data set in burst length.<br>1: SPBSSL is negated when the accessed address is not continuous with the previously transferred address. |

### 17.4.5 Data Read Command Setting Register (DRCMR)

DRCMR is a 32-bit register that sets the commands issued in external address space read mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | CMD[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | OCMD[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | CMD[7:0] | H'03 | R/W | Command<br>Sets the command. |
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | OCMD[7:0] | H'00 | R/W | Optional Command<br>Sets the optional command. |

## 17.4.6 Data Read Extended Address Setting Register (DREAR)

DREAR is a 32-bit register that sets the address when the serial flash address is output in 32-bit mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

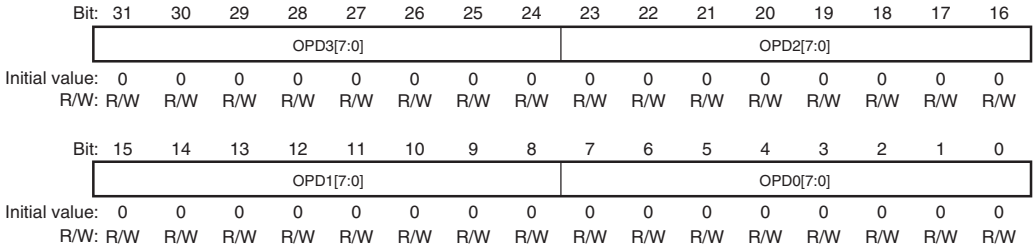
## 17.4.7 Data Read Option Setting Register (DROPR)

DROPR is a 32-bit register that sets the option data in external address space read mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | OPD3[7:0] | H'00 | R/W | Option Data 3<br>Sets the option data 3. |
| 23 to 16 | OPD2[7:0] | H'00 | R/W | Option Data 2<br>Sets the option data 2. |
| 15 to 8 | OPD1[7:0] | H'00 | R/W | Option Data 1<br>Sets the option data 1. |
| 7 to 0 | OPD0[7:0] | H'00 | R/W | Option Data 0<br>Sets the option data 0. |

Note: • OPD3, OPD2, OPD1, and OPD0 are output in this order.

## 17.4.8 Data Read Enable Setting Register (DRENR)

DRENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and read data in external address space read mode and enables outputting them other than read data.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 3 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

## 17.4.9 SPI Mode Control Register (SMCR)

SMCR is a 32-bit register that sets the operation in SPI operating mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | SSLKP | - | - | - | - | - | SPIRE | SPIWE | SPIE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R/W | R/W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 8 | SSLKP | 0 | R/W | SPBSSL Signal Level<br>Determines the SPBSSL status after the end of transfer.<br>0: SPBSSL signal is negated at the end of transfer.<br>1: SPBSSL signal level is maintained from the end of transfer to the start of next access. |
| 7 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 2 | SPIRE | 0 | R/W | Data Read Enable<br>Enables reading in SPI operating mode.<br>0: Data reading disabled<br>1: Data reading enabled<br>Note: When the transfer data bit size is set to 2 bits or 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time. |
| 1 | SPIWE | 0 | R/W | Data Write Enable<br>Enables writing in SPI operating mode.<br>0: Data writing disabled<br>1: Data writing enabled<br>Note: When the transfer data bit size is set to 2 bits or 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time. |
| 0 | SPIE | 0 | W | SPI Data Transfer Enable<br>Data is transferred by setting this bit to 1.<br>This bit is enabled only when the TEND bit in CMNSR is set to 1. The operation cannot be guaranteed when this bit is set to 1 with the TEND bit set to 0.<br>This bit is always read as 0.<br>Note: When the SPBSSL pin is de-asserted, the command, optional command, address, and option data that are output enabled are output even if the SPIRE and SPIWE bits are set to 0. When the SPBSSL pin is asserted, follow the notes described in section 17.6.2, Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode. |

## 17.4.10 SPI Mode Command Setting Register (SMCMR)

SMCMR is a 32-bit register that sets the commands issued in SPI operating mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | CMD[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | OCMD[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | CMD[7:0] | H'00 | R/W | Command<br>Sets the command. |
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | OCMD[7:0] | H'00 | R/W | Optional Command<br>Sets the optional command. |

## 17.4.11 SPI Mode Address Setting Register (SMADR)

SMADR is a 32-bit register that sets the addresses in SPI operating mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

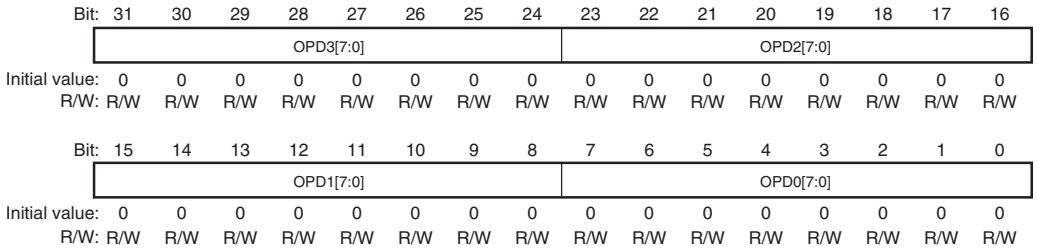
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ADR[31:24] | | | | | | | | ADR[23:16] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ADR[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | ADR[31:24] | H'00 | R/W | Address<br>Sets the value of bits 31 to 24 when the serial flash address is output in 32-bit units.<br>This setting is valid when ADE[3] in SMENR is 1. |
| 23 to 0 | ADR[23:0] | H'000000 | R/W | Address<br>Sets the address. |

## 17.4.12 SPI Mode Option Setting Register (SMOPR)

SMOPR is a 32-bit register that sets the option data in SPI operating mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | OPD3[7:0] | H'00 | R/W | Option Data 3<br>Sets the option data 3. |
| 23 to 16 | OPD2[7:0] | H'00 | R/W | Option Data 2<br>Sets the option data 2. |
| 15 to 8 | OPD1[7:0] | H'00 | R/W | Option Data 1<br>Sets the option data 1. |
| 7 to 0 | OPD0[7:0] | H'00 | R/W | Option Data 0<br>Sets the option data 0. |

Note: • OPD3, OPD2, OPD1, and OPD0 are output in this order.

## 17.4.13 SPI Mode Enable Setting Register (SMENR)

SMENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and transfer data in SPI operating mode and enables their output. SMENR also enables dummy cycle insertion. Disabling all of the command, optional command, address, option data, dummy cycle, and transfer data is prohibited. At least one of them except dummy cycle must be enabled.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CDB[1:0] | | OCDB[1:0] | | - | - | ADB[1:0] | | - | - | OPDB[1:0] | | - | - | SPIDB[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R | R | R/W | R/W | R | R | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

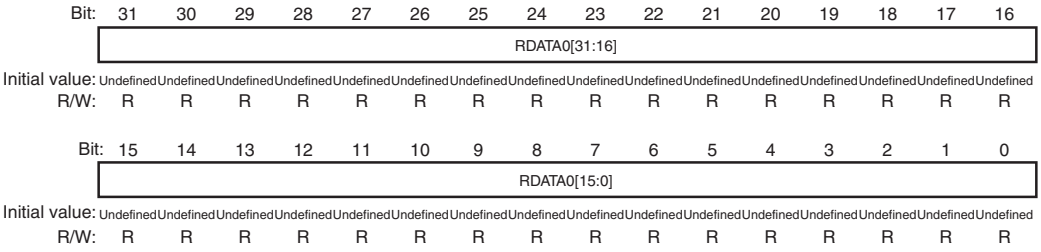
## 17.4.14 SPI Mode Read Data Register 0 (SMRDR0)

SMRDR0 is a 32-bit register that stores the read data in SPI operating mode.
Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SMENR). Be sure to access from address 0.
The settings of this register should be read when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

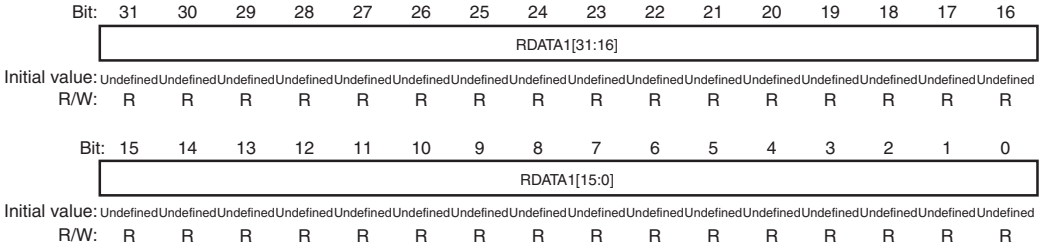


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | RDATA0 [31:0] | Undefined | R | Read Data<br>Holds the data read in SPI operating mode.<br>Data bits differ depending on the settings of SFDE and BSZ[1:0] bits in CMNCR and SPIDE[3:0] bits in SMENR.<br>BSZ[1:0] = 01, SPIDE[3:0] = 1111, SFDE = 1: Read data[63:32].<br>BSZ[1:0] = 01, SPIDE[3:0] = 1111, SFDE = 0: Read data[31:0].<br>Other than the above: Read data[31:0]. |

Note: • The contents of this register and SMRDR1 are modified upon completion of reception in SPI operating mode. Be sure to read data when reception in SPI operating mode is completed.

## 17.4.15 SPI Mode Read Data Register 1 (SMRDR1)

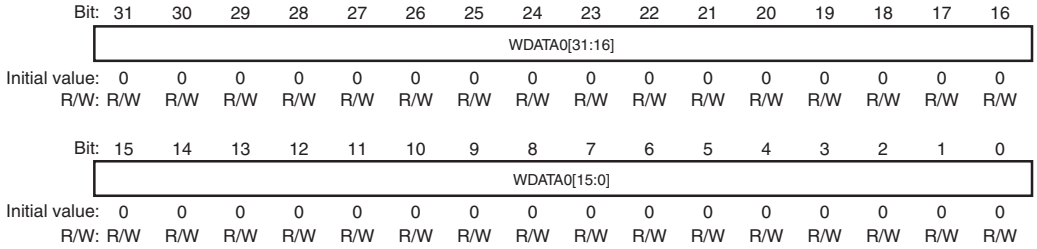
SMRDR1 is a 32-bit register that stores the read data in SPI operating mode.
This register is enabled when the BSZ[1:0] bits in CMNCR are set to 01 (two serial flash memories connected) and disabled when the BSZ[1:0] bits in CMNCR are set to 00 (one serial flash memory connected).
Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SMENR). Be sure to access from address 0.
The settings of this register should be read when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | RDATA1 [31:0] | Undefined | R | Read Data<br>Holds the data read in SPI operating mode.<br>Data bits differ depending on the settings of SFDE and BSZ[1:0] bits in CMNCR and SPIDE[3:0] bits in SMENR.<br>BSZ[1:0] = 01, SPIDE[3:0] = 1111, SFDE = 1: Read data[31:0].<br>BSZ[1:0] = 01, SPIDE[3:0] = 1111, SFDE = 0: Read data[63:32].<br>Other than the above: Bits in this register are disabled. |

## 17.4.16 SPI Mode Write Data Register 0 (SMWDR0)

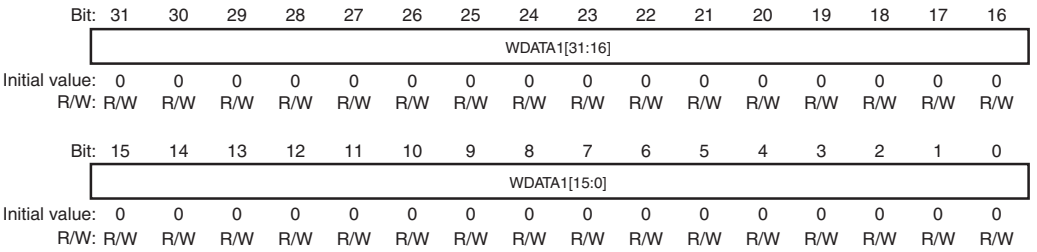
SMWDR0 is a 32-bit register that sets the write data in SPI operating mode.
Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SMENR). Be sure to access from address 0.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | WDATA0 [31:0] | All 0 | R/W | Write Data<br>Holds the data to be written in SPI operating mode.<br>Data bits differ depending on the settings of SFDE and BSZ[1:0] bits in CMNCR and SPIDE[3:0] bits in SMENR.<br>BSZ[1:0] = 01, SPIDE[3:0] = 1111, SFDE = 1: Write data[63:32].<br>BSZ[1:0] = 01, SPIDE[3:0] = 1111, SFDE = 0: Write data[31:0].<br>Other than the above: Write data[31:0]. |

## 17.4.17 SPI Mode Write Data Register 1 (SMWDR1)

SMWDR1 is a 32-bit register that sets the write data in SPI operating mode.
This register is enabled when the BSZ[1:0] bits in CMNCR are set to 01 (two serial flash memories connected) and disabled when the BSZ[1:0] bits in CMNCR are set to 00 (one serial flash memory connected).
Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SMENR). Be sure to access from address 0.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | WDATA1 [31:0] | All 0 | R/W | Write Data<br>Holds the data to be written in SPI operating mode.<br>Data bits differ depending on the settings of SFDE and BSZ[1:0] bits in CMNCR and SPIDE[3:0] bits in SMENR.<br>BSZ[1:0] = 01, SPIDE[3:0] = 1111, SFDE = 1: Write data[31:0].<br>BSZ[1:0] = 01, SPIDE[3:0] = 1111, SFDE = 0: Write data[63:32].<br>Other than the above: Bits in this register are disabled. |

## 17.4.18 Common Status Register (CMNSR)

CMNSR is a 32-bit register that holds flags indicating the operating state.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 1 | SSLF | 0 | R | SPBSSL Pin Monitor<br>0: SPBSSL pin is negated<br>1: SPBSSL pin is asserted |
| 0 | TEND | 1 | R | Transfer End Flag<br>Indicates whether the data transfer has ended.<br>0: Indicates that data transfer is in progress<br>1: Indicates that data transfer has ended |

### 17.4.19 SPI AC Input Characteristics Adjustment Register (CKDLY)

CKDLY is used to adjust the timing of the setup and hold times for data input. The timing should be adjusted to suit the AC characteristics of the serial flash memory to be connected. Settings of this register should be changed while the SSLF flag in CMNSR is 0; otherwise, the operation cannot be guaranteed. When writing, write to the register as a 32-bit unit with bits 15 to 8 set to H'A5.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 17.4.20 Data Read Dummy Cycle Setting Register (DRDMCR)

DRDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in external address space read mode.

The settings of this register are enabled when the DME bit in the data read enable setting register (DRENR) is 1.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | DMDB[1:0] | |

## 17.4.21 Data Read DDR Enable Register (DRDRENR)

DRDRENR is a 32-bit register that sets SDR or DDR transfer of the address, option data, and read data in external address space read mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 17.4.22 SPI Mode Dummy Cycle Setting Register (SMDMCR)

SMDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in SPI operating mode.
The settings of this register are enabled when the DME bit in the SPI mode enable setting register (SMENR) is 1.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | DMDB[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

## 17.4.23 SPI Mode DDR Enable Register (SMDRENR)

SMDRENR is a 32-bit register that sets SDR or DDR transfer of the address, option data, and transfer data in SPI operating mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

## 17.4.24 SPI AC Output Characteristics Adjustment Register (SPODLY)

SPODLY is used to adjust the timing of the delay, hold, buffer on and buffer off times for data output. The timing should be adjusted to suit the AC characteristics of the serial flash memory to be connected. Settings of this register should be changed while the SSLF flag in CMNSR is 0; otherwise, the operation cannot be guaranteed. When writing, write to the register as a 32-bit unit with bits 31 to 24 set to H'A5.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GB[7:0] | | | | | | | | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | W | W | W | W | W | W | W | W | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SPODLY[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

|---|---|---|---|---|
| 31 to 24 | GB[7:0] | All 0 | W | Guard<br>When writing, write to the register as a 32-bit unit with these bits set to H'A5.<br>These bits are always read as 0. |
| 23 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | SPODLY[15:0] | All 0 | R/W | Output Characteristics Adjustment<br>Switches the timing of the delay, hold, buffer on and buffer off times for data output.<br>The two values below are specifiable.<br>H'0000: Initial value<br>H'6363: The delay, hold, buffer on and buffer off times for data output are lengthened.<br>Other than the above: Settings prohibited |

## 17.5 Operation

### 17.5.1 System Configuration

With this module, one or two serial flash memories can be directly connected per channel (data size of 1, 2, and 4 bits). The number of connected memories can be selected using the BSZ[1:0] bits in CMNCR.

Examples of system configuration with one serial flash memory connected and two serial flash memories connected are shown in Figure 17.2 and Figure 17.3, respectively.

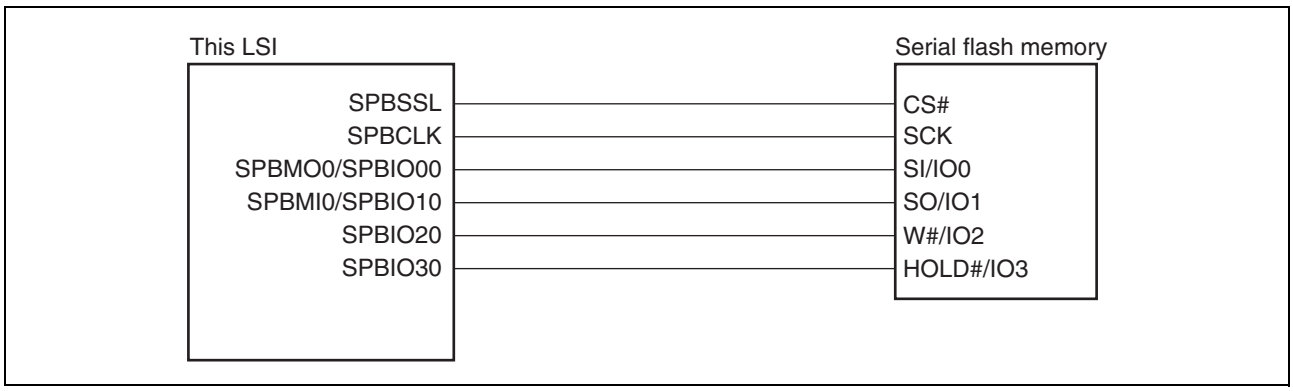

**Figure 17.2 System Configuration Example with 4-Bit Data Size and One Serial Flash Memory Connected (BSZ[1:0] Bits in CMNCR = 00)**

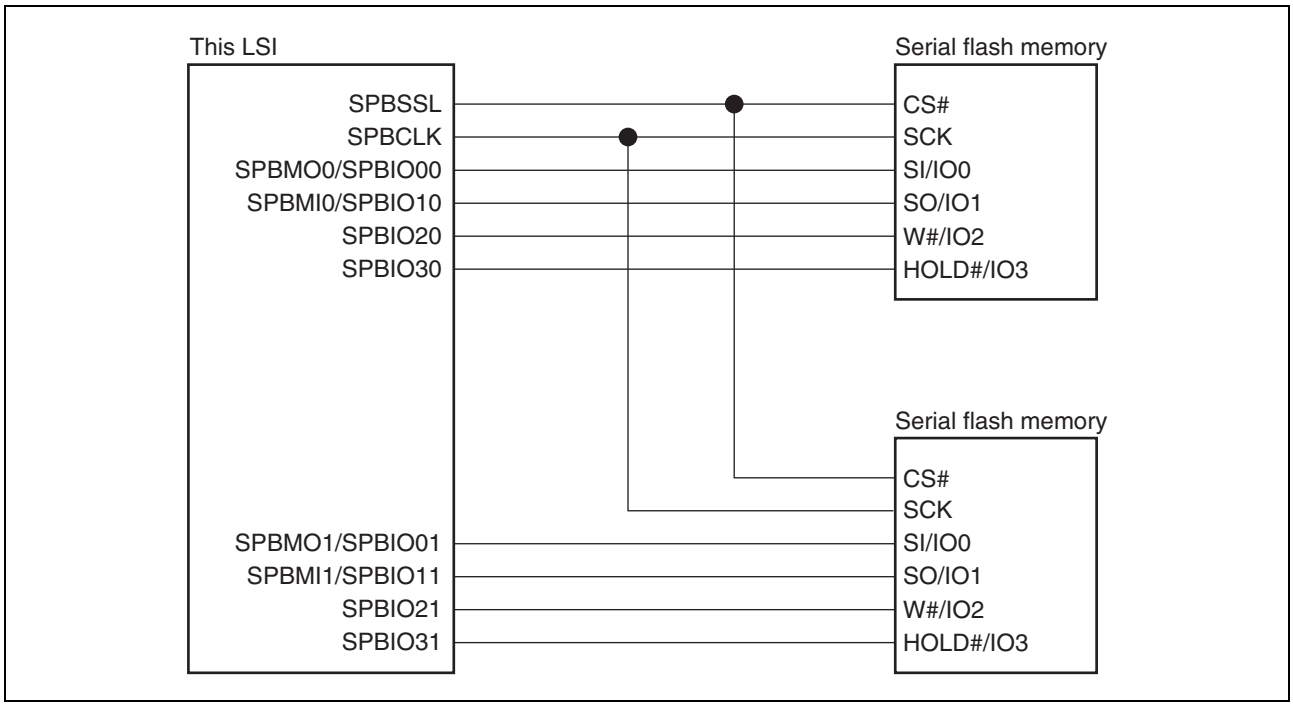

**Figure 17.3 System Configuration Example with 4-Bit Data Size and Two Serial Flash Memories Connected (BSZ[1:0] Bits in CMNCR = 01)**

### 17.5.2 Address Map

In external address space read mode, the serial flash connected is assigned in the SPI multi I/O bus space. A maximum accessible address space differs depending on the number of serial flash memories connected. In combination with DREAR, a maximum of 4 Gbytes can be accessed when one serial flash memory is connected, and a maximum of 8 Gbytes can be accessed when two memories are connected.

**Table 17.4 Address Map**

| Channel | Number of Serial Flash Memories Connected | Internal Address | Max. Access Area |
|---|---|---|---|
| 0 | 1 | H'18000000 to H'1BFFFFFF | 4 Gbytes |
| | | H'58000000 to H'5BFFFFFF (mirror area) | |
| | 2 | H'18000000 to H'1BFFFFFF | 8 Gbytes |
| | | H'58000000 to H'5BFFFFFF (mirror area) | |
| 1 | 1 | H'1C000000 to H'1FFFFFFF | 4 Gbytes |
| | | H'5C000000 to H'5FFFFFFF (mirror area) | |
| | 2 | H'1C000000 to H'1FFFFFFF | 8 Gbytes |
| | | H'5C000000 to H'5FFFFFFF (mirror area) | |

### 17.5.3 32-bit Serial Flash Addresses

Since the SPI multi I/O bus space is 64 Mbytes, only a part of the 32-bit serial flash address area can be directly accessed. Here, the fixed value set in the pertinent register is used as the upper bit value of a 32-bit address.
To output serial flash addresses in 32 bits, set the ADE[3] bit in DRENR to 1, set the range of the external addresses used as the serial flash addresses to the EAC[2:0] bits in DREAR, and set the upper bit value of the 32-bit address as the fixed value to the EAV[7:0] bits in DREAR.

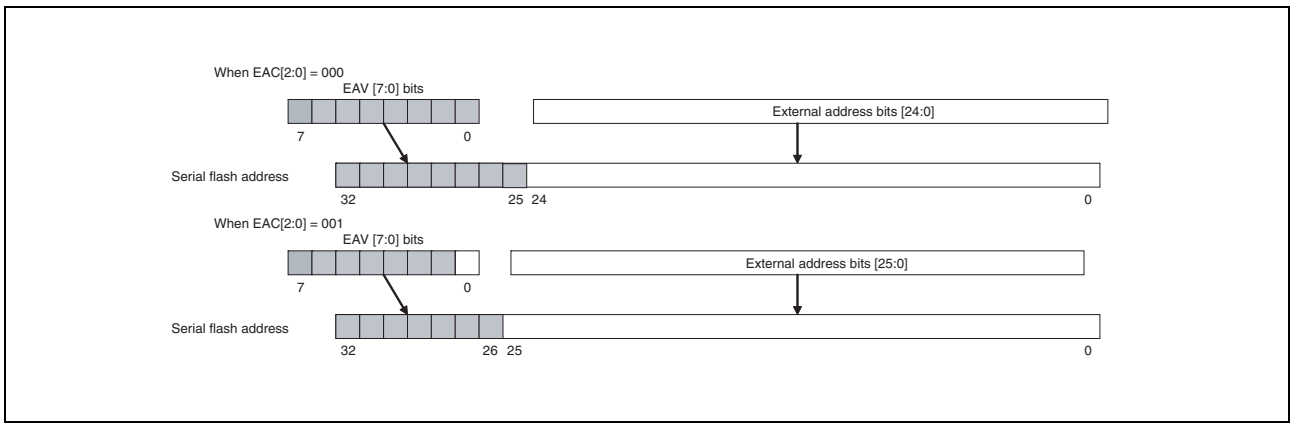

**Figure 17.4 32-Bit Address Setting**

Setting the ADE[3] bit in DRENR to 1 allows the serial flash address to be output using [31:0] bits. When EAC[2:0] = 000, external address bits [24:0] are valid; set the value for [32:25] bits to EAV[7:0]. When EAC[2:0] = 001, external address bits [25:0] are valid; set the value for [32:26] bits to EAV[7:1].
The address bits actually used for access depend on the number of serial flash memories connected. When one serial flash memory is connected, address bits [31:0] are used and when two memories are connected, address bits [32:1] are used.

Note: • When the capacity of the serial flash memory used is smaller than 4 Gbytes, keep the following point in mind. If an access spreads over the last address of the serial flash in burst mode (RBE bit in DRCR = 1), the access address does not agree with the internal address of the serial flash. To prevent this, software should appropriately manage the accessible address areas for the serial flash memory used according to the memory capacity.

## 17.5.4 Data Alignment

Data alignment can be set by using the SFDE bit in the common control register (CMNCR). Data alignment in data read mode and in SPI mode are shown in Figure 17.5 and Figure 17.6, respectively.

When two serial flash memories are connected, the serial flash memory connected to the pin SPBIO30-SPBIO00 has the address 2n and the serial flash memory connected to the pin SPBIO31-SPBIO01 has the address 2n + 1. The data should be accessed in word or larger units. It cannot be accessed in byte units.

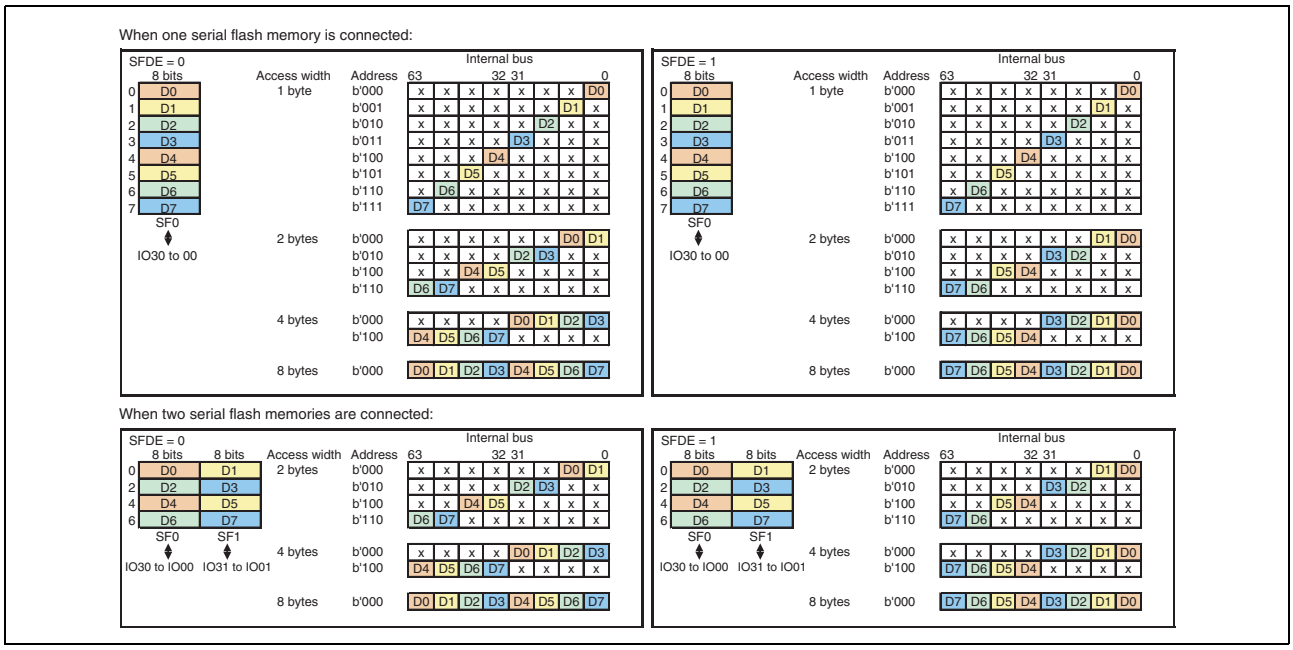

**Figure 17.5 Data Alignment in Data Read Mode**

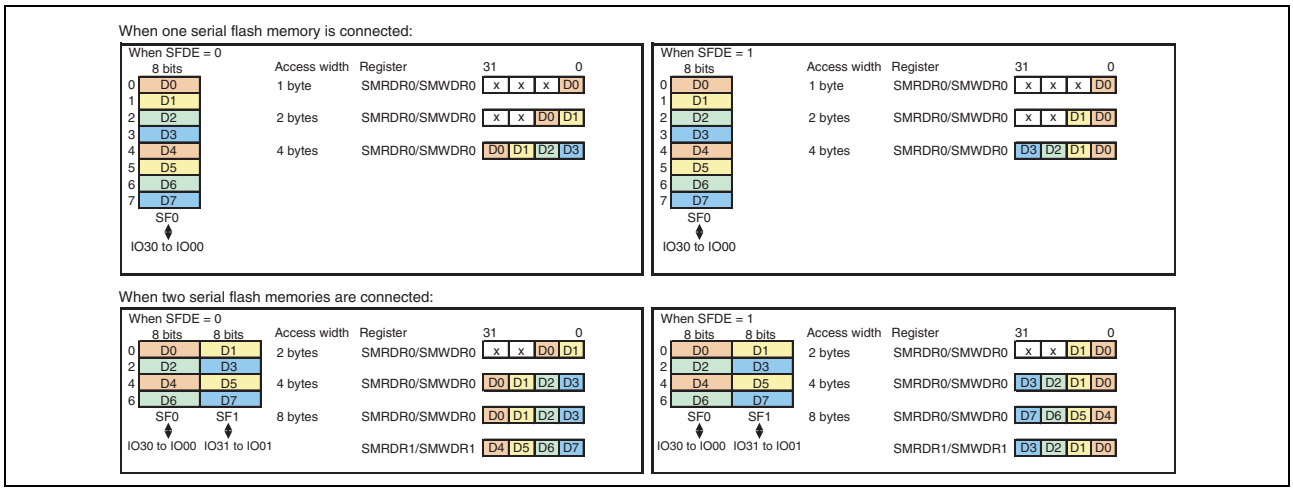

**Figure 17.6 Data Alignment in SPI Mode**

### 17.5.5 Operating Modes

This module has two operating modes: external address space read mode and SPI operating mode.
In external address space read mode, a read access to the SPI multi I/O bus space is converted into SPI communication and data is received. After data acquisition, data is returned to the bus master that is the issuing source. For details, see section 17.5.6, External Address Space Read Mode.
In SPI operating mode, arbitrary SPI communication is carried out using register settings. For details, see section 17.5.8, SPI Operating Mode.

### 17.5.6 External Address Space Read Mode

A read access to the SPI multi I/O bus space can be converted into SPI communication in external address space read mode. Further, the commands, optional commands, option data, and dummy cycle issued for reading can be modified using registers. For the address, option data, and read data, either SDR or DDR transfer can be selected using the appropriate register when the SPBCLK frequency division ratio is two or larger.
In external address space read mode, either normal read operation or burst read operation can be selected. The transfer format is determined based on the common control register (CMNCR), SSL delay register (SSLDR), bit rate setting register (SPBCR), data read control register (DRCR), data read command setting register (DRCMR), data read extended address setting register (DREAR), data read option setting register (DROPR), data read enable setting register (DRENR), data read dummy cycle setting register (DRDMCR), and data read DDR enable register (DRDRENR).

#### (1) Normal Read Operation

When the RBE bit in DRCR is set to 0, normal read operation is performed.
In the normal read operation, the data of 8 bits, 16 bits, 32 bits, and 64 bits are read for respectively a byte, a word, and a longword read access. Here, a byte access is enabled only when one serial flash memory is connected. After reading, the SPBSSL pin is negated.
The normal read operation timing is shown in Figure 17.7.
t1 is the time period from SPBSSL pin assertion to SPBCLK oscillation (clock delay), t2 is the time period from transmission of the last SPBCLK edge of a transfer to SPBSSL pin negation (SPBSSL negation delay), and t3 is the time period from one transfer end to the next transfer start (next access). For details of t1, t2, and t3, see section 17.5.9, Transfer Format.

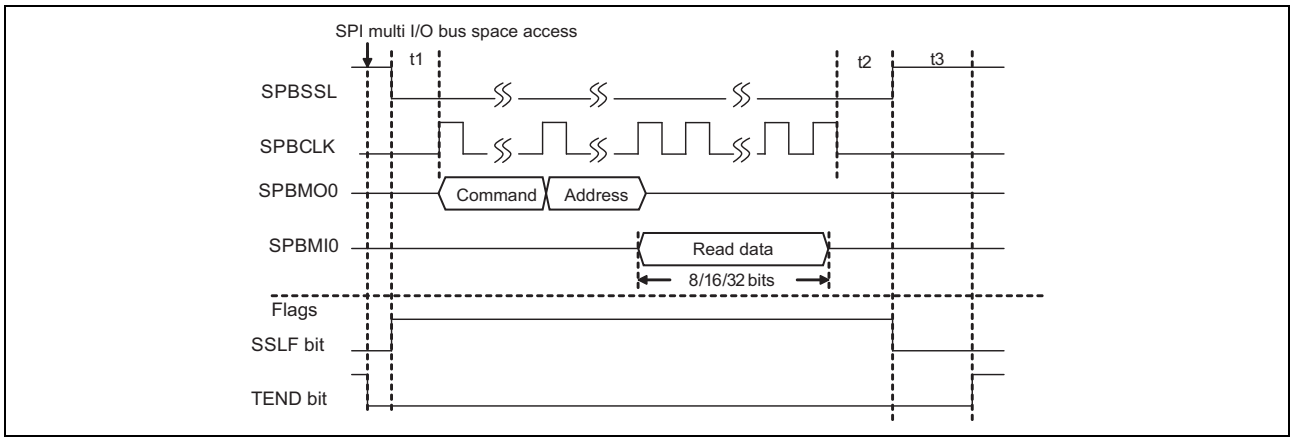

**Figure 17.7 Normal Read Operation Timing**

### (2) Burst Read Operation

When the RBE bit in DRCR is set to 1, burst read operation is performed.
Read cache is enabled in the burst read operation. For read cache operation, see section 17.5.7, Read Cache.
For reading bytes, words, or longwords, the read cache is first referred to for the data. When the read cache contains the data, the data is read from the read cache without accessing the serial flash memory. When the read cache does not contain the data, burst read operation is performed in the serial flash memory and the read data is stored in the read cache. The data transfer length at that time is 64 bits × RBURST[3:0] bits and the data is always read from the 64-bit boundary.
The SPBSSL pin status after data transfer can be selected by using the SSLE bit in DRCR. When the SSLE bit is set to 0, the SPBSSL pin is negated after data transfer. For an operation performed when the SSLE bit is set to 1, see (3) Burst Read Operation with Automatic SPBSSL Negation, just below.
A pattern diagram of this operation and a burst read operation timing diagram when SSLE bit is set to 0 are shown in Figure 17.8 and Figure 17.9.

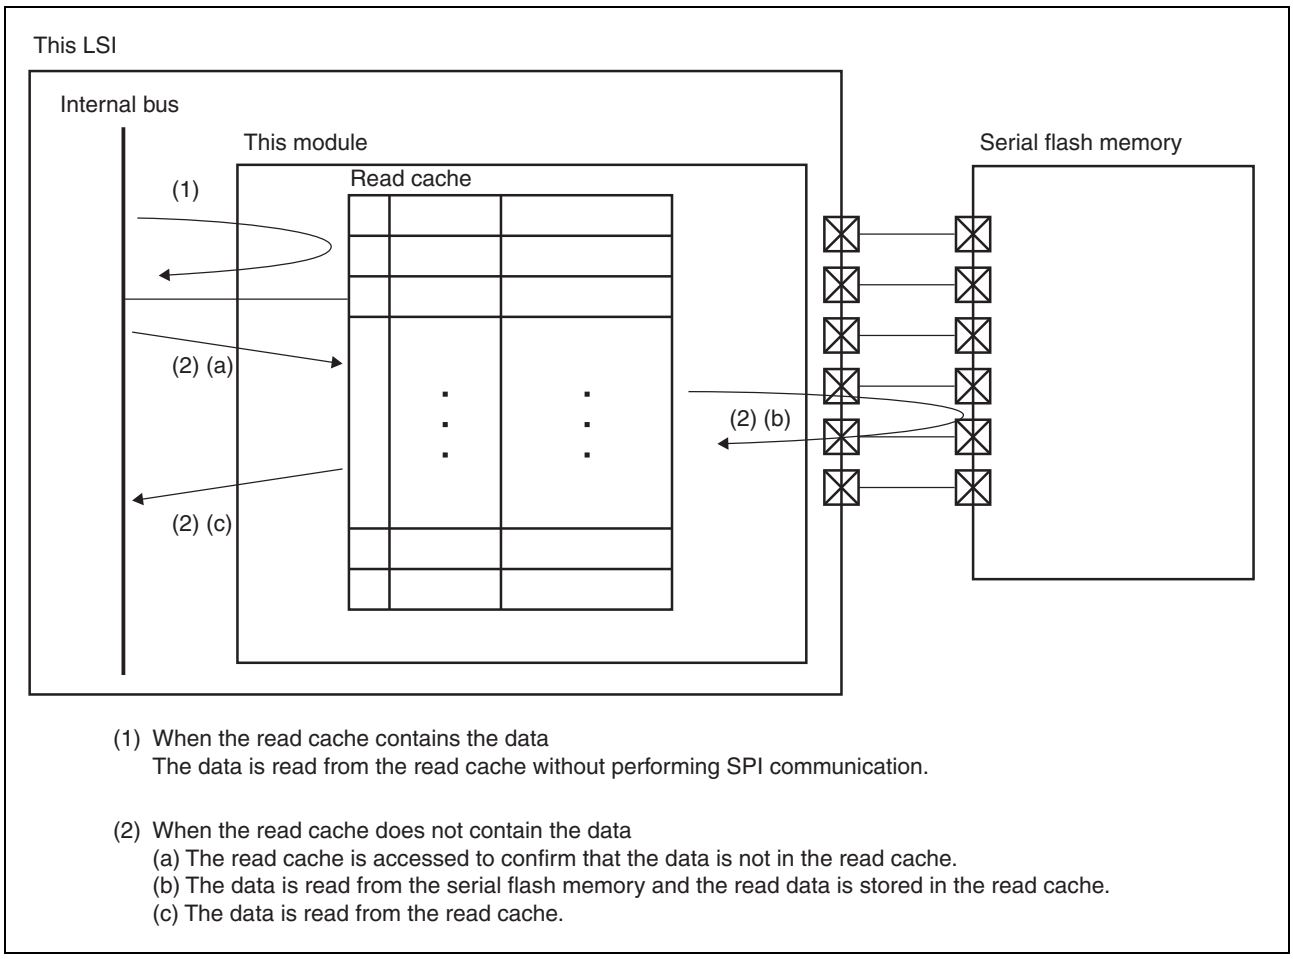

**Figure 17.8 Burst Read Operation**

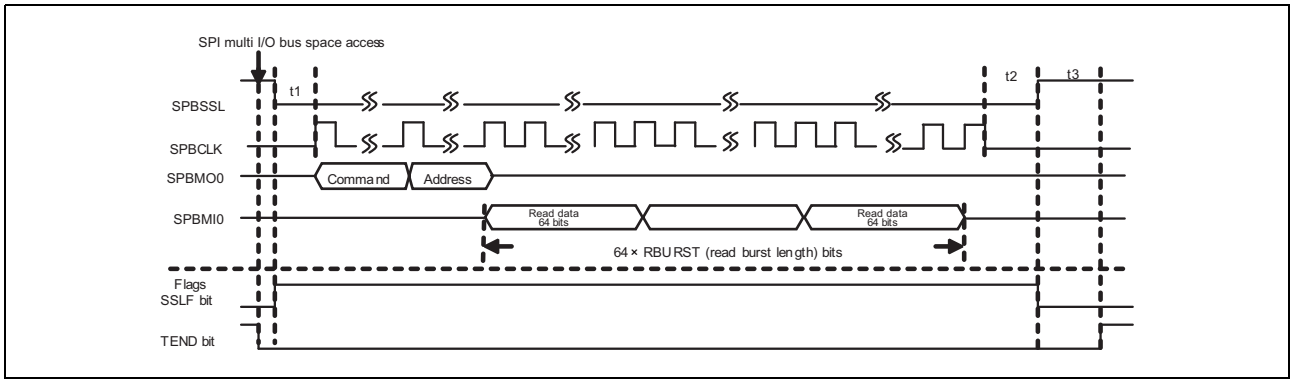

**Figure 17.9 Burst Read Operation Timing (SSLE Bit = 0)**

## (3) Burst Read Operation with Automatic SPBSSL Negation

When SSLE bit in DRCR is set to 1, this module does not negate the SPBSSL pin after the burst read transfer. When accessing the next time, if the address is continuous with the previous read address, the burst read operation is performed without issuing the command, optional command, address, option data, or dummy cycle. If the address is not continuous with the previous read address, the SPBSSL pin is once negated and the burst read operation is performed after issuing the command, optional command, address, option data, or dummy cycle.

Burst read timing diagrams for continuous address and non-continuous address are shown in Figure 17.10 and Figure 17.11.

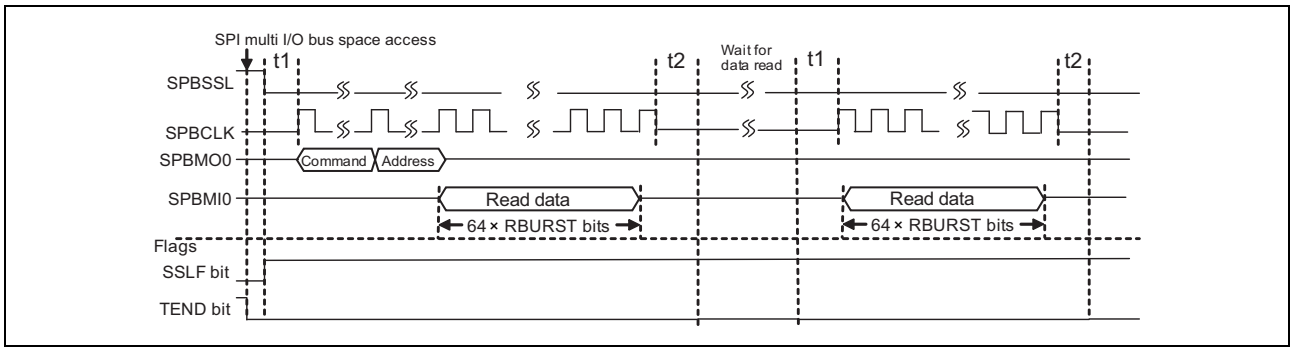

**Figure 17.10 Burst Read Timing for Continuous Address (SSLE Bit = 1)**

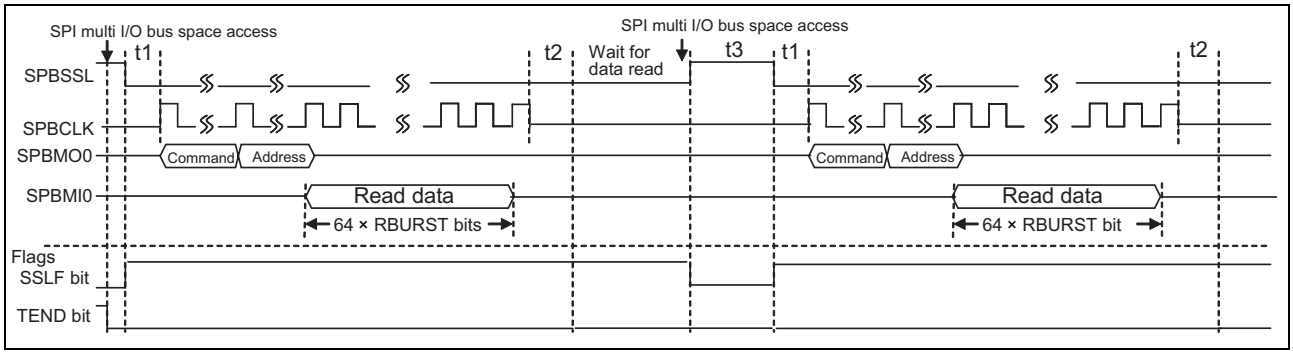

**Figure 17.11 Burst Read Timing for Non-Continuous Address (SSLE Bit = 1)**

For the next access after negation of the SPBSSL with the SSLN bit in DRCR with this operation, read SSLF = 0 in CMNSR to confirm that the SPBSSL has been negated.

## (4) Initial Setting Flow

An example of an initial setting flow in external address space read mode is shown in Figure 17.12.

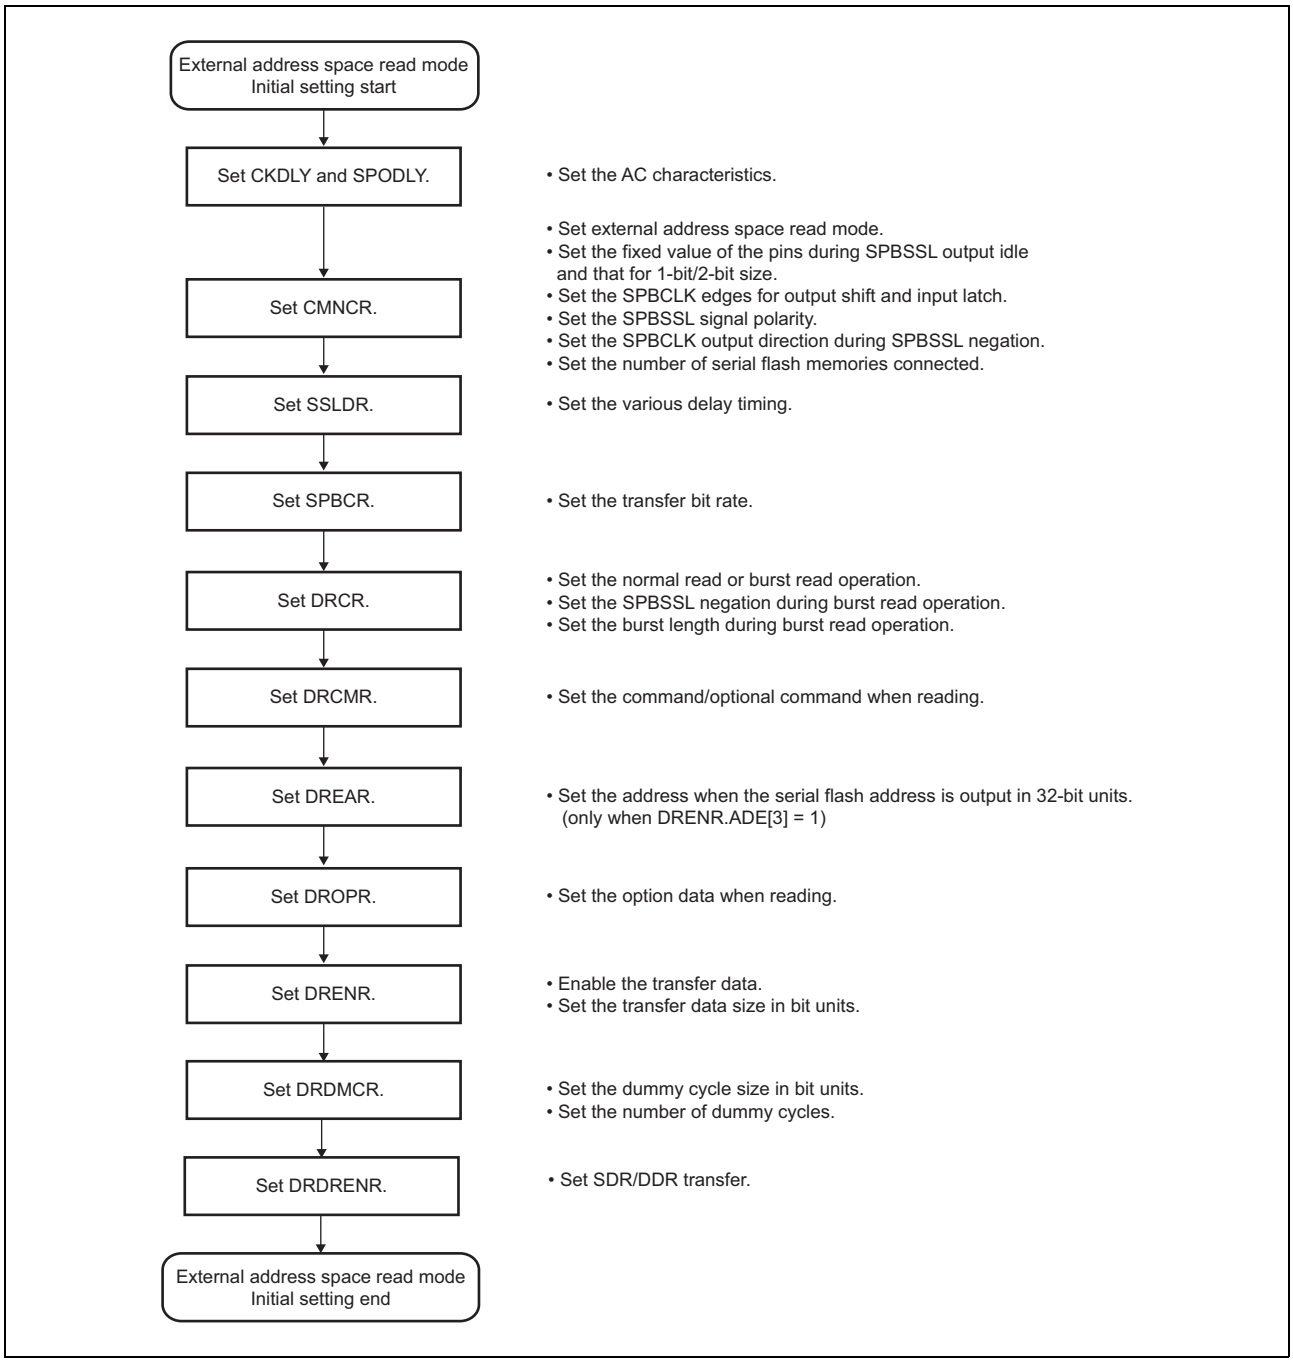

**Figure 17.12 Example of Initial Setting Flow in External Address Space Read Mode**

## 17.5.7 Read Cache

This module has a simple built-in read cache. The read cache can be used during external address space read mode and burst read operation. The read cache is configured with a line size of 64 bits and 16 entries.
Read cache configuration is shown in Figure 17.13.

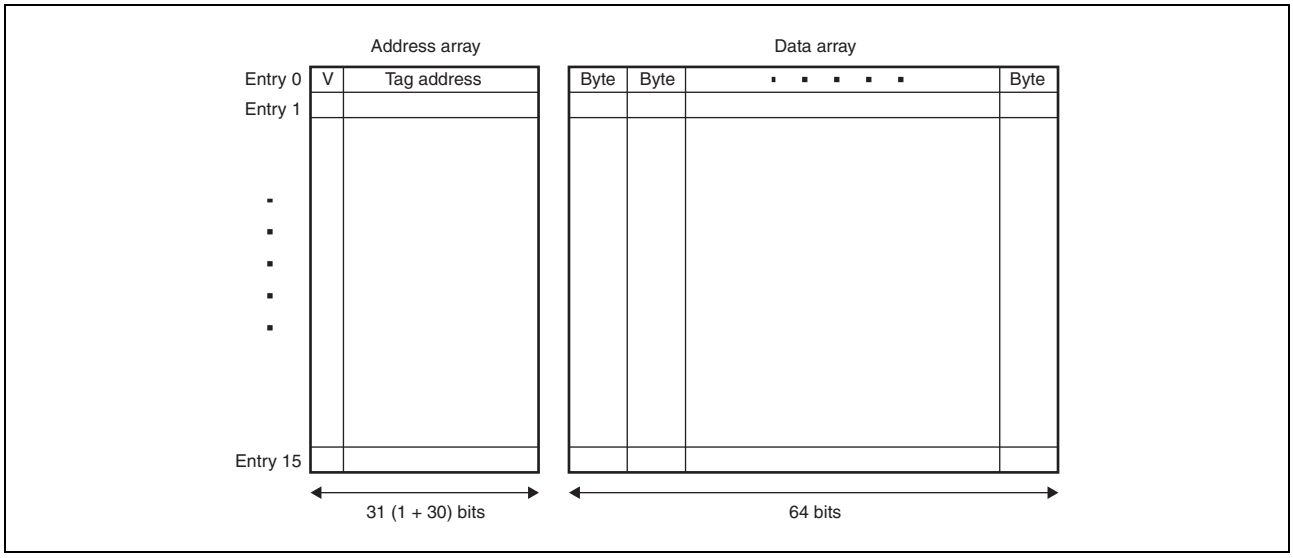

**Figure 17.13 Read Cache Configuration**

### (1) Address Array

The V bit indicates whether the entry data is valid. When the V bit is 1, the data is valid and when V bit is 0, the data is invalid.
The tag address bits hold the address used for the serial flash memory. Address bits 32 to 3 are used for the purpose.
Address bits 23 to 3 are enabled when address output is 24 bits and one serial flash memory is connected; and address bits 24 to 3 are enabled when two serial flash memories are connected.
Address bits 31 to 3 are enabled when address output is 32 bits and one serial flash memory is connected; and address bits 32 to 3 are enabled when two serial flash memories are connected.

### (2) Data Array

It retains the 64-bit read data. Registration in the read cache is performed in line units.

### (3) Read Operation

In case of read-hit, data is read from the read cache. In case of read-miss, after the 64 × RBURST (read burst length) data is read from the serial flash memory and the read cache is updated, the data is returned to the bus master.

### (4) Data Replacement

The write pointer is used to update data. In case of read-miss, the RBURST (read burst length) portion data is replaced starting at the entry specified by the write pointer. In other words, the data is replaced in the storage order of the data.
Whether data is referred to or not will not affect the replacement order of data.

## 17.5.8 SPI Operating Mode

This module can carry out an arbitrary SPI operation by using the register settings.
The transfer format is determined based on the common control register (CMNCR), SSL delay register (SSLDR), bit rate setting register (SPBCR), SPI mode control register (SMCR), SPI mode command setting register (SMCMR), SPI mode address setting register (SMADR), SPI mode option setting register (SMOPR), and SPI mode enable setting register (SMENR), SPI mode read data register (SMRDR), SPI mode write data register (SMWDR), SPI mode dummy cycle setting register (SMDMCR), and SPI mode DDR enable register (SMDRENR). For the address, option data, and transfer data, either SDR or DDR transfer can be selected using the appropriate register when the SPBCLK frequency division ratio is two or larger.
SPI operating mode can be used for reading the status of the serial flash memory and writing to the serial flash memory. In this mode, one transfer refers to the operation from when the SPIE bit in SMCR is set to 1 to when the TEND bit is set to 1.

### (1) Transfer Start

The transfer of data is started in the set transfer format by setting the SPIE bit in SMCR to 1. When write operation is enabled, the SPI mode write data register is transmitted to the serial flash memory. When read operation is enabled, data read from the serial flash memory is stored into the SPI mode read data register.
The SPI operation timing is shown in Figure 17.14.

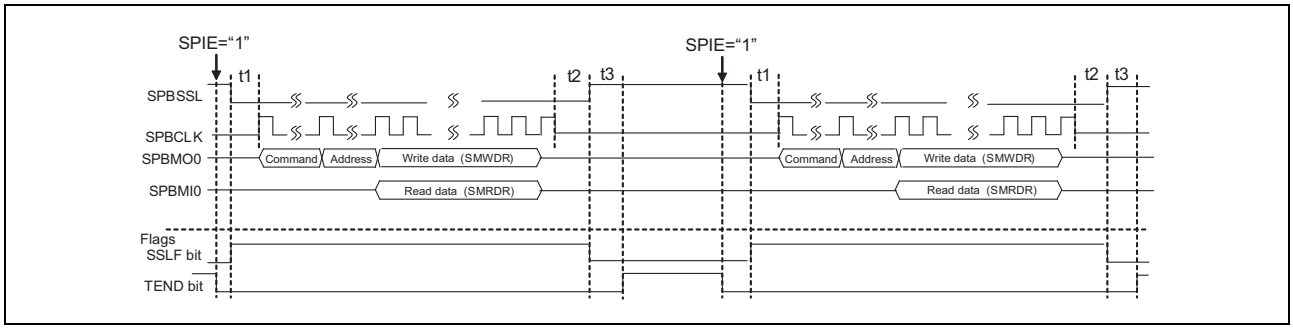

**Figure 17.14 SPI Operation Timing**

### (2) Read/Write Enable

- Read operation: Data can be read by setting the SPIRE bit in SMCR to 1. The read data is stored into SMRDR.
- Write operation: Data can be written by setting the SPIWE bit in SMCR to 1. The data stored in SMWDR is output.

When the data size is set to 1 bit using the SPIDB[1:0] bits in SMENR, data can be transmitted and received by setting the SPIRE and SPIWE bits to 1. However, when the data size is set to 2 or 4 bits by using the SPIDB[1:0] bits, only one of the SPIRE and SPIWE bits should be enabled. The operation is not guaranteed if both the bits are enabled.

### (3) Retention of SPBSSL Pin Assertion

By setting the SSLKP bit in SMCR to 1, assertion of the SPBSSL pin can be continued till the next transfer. With this function, the transfer can be carried out continuously with the SPBSSL kept in the asserted state.
The data transfer timing using the SSLKP bit is shown in Figure 17.15.

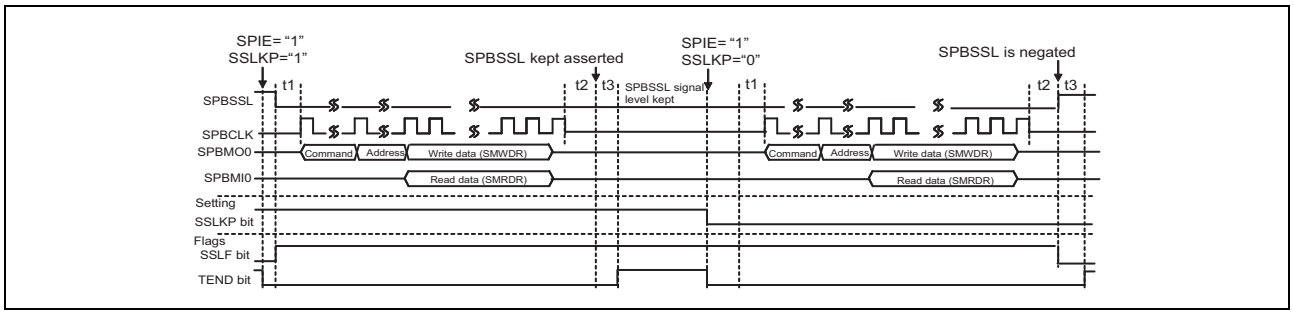

**Figure 17.15 Data Transfer Timing using the SSLKP Bit**

### (4) Initial Setting Flow

An example of an initial setting flow in SPI operating mode is shown in Figure 17.16.

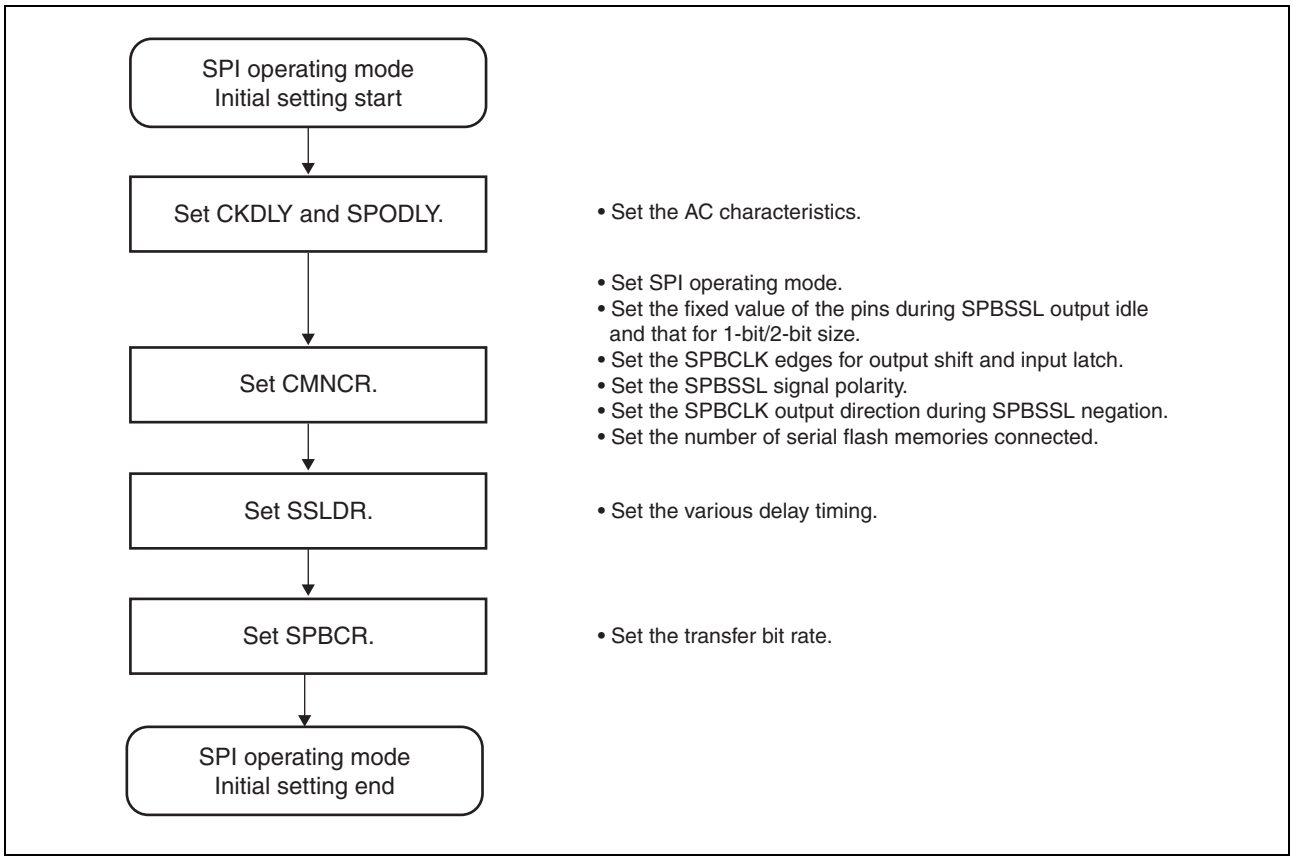

**Figure 17.16 Example of Initial Setting Flow in SPI Operating Mode**

### (5) Data Transfer Setting Flow

An example of a data transfer setting flow in SPI operating mode is shown in Figure 17.17.

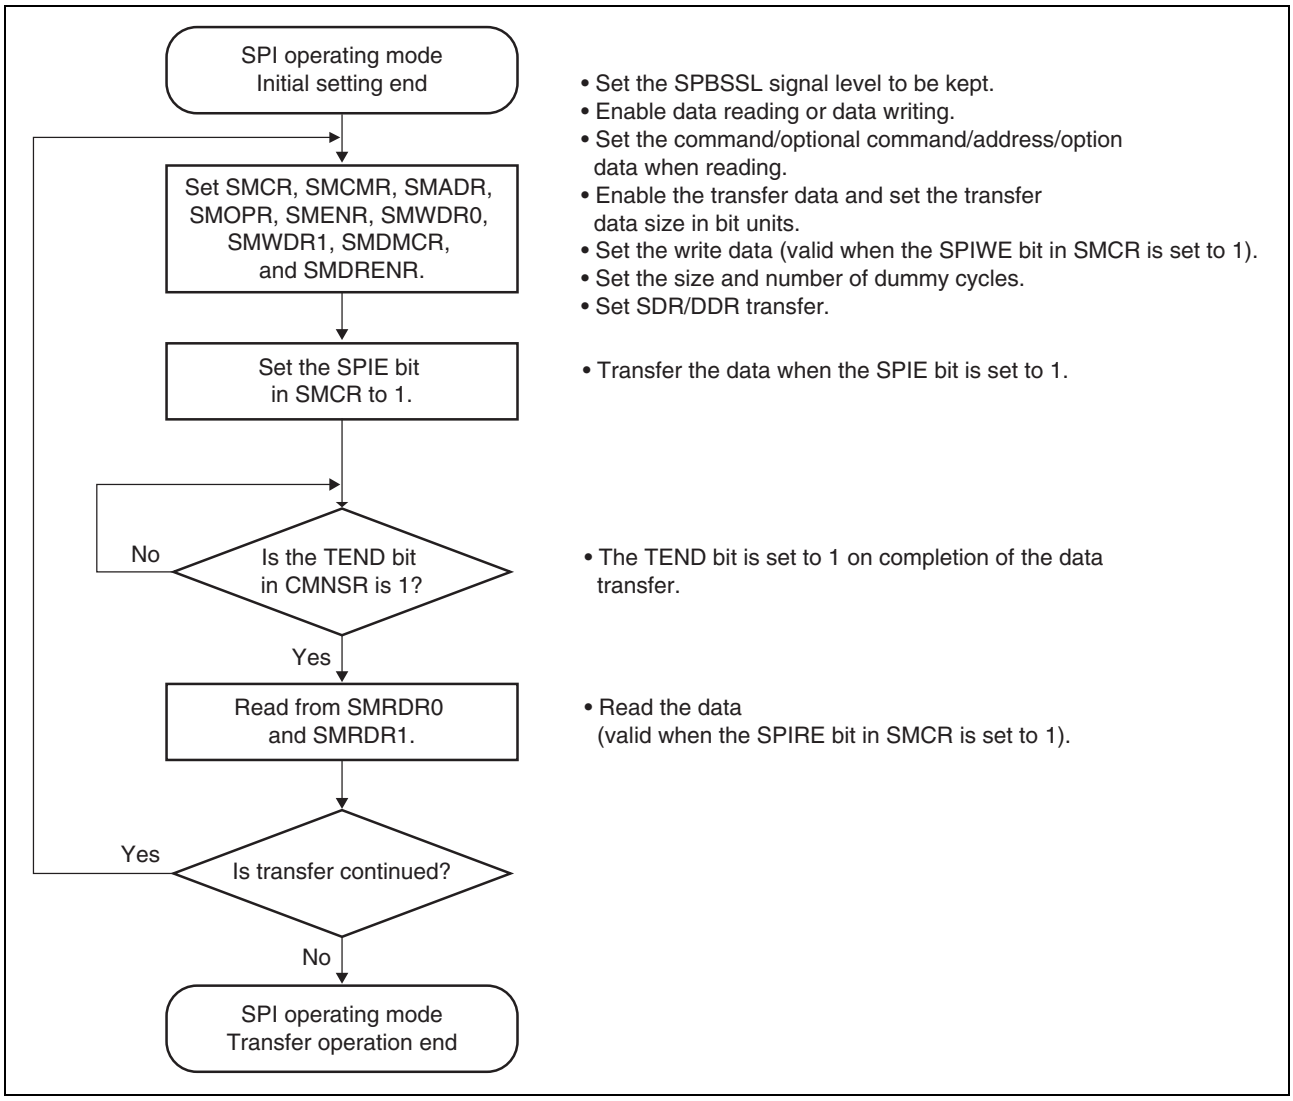

**Figure 17.17 Example of a Data Transfer Setting Flow in SPI Operating Mode**

## 17.5.9 Transfer Format

### (1) SPBSSL Pin Enable Polarity Control

The enable polarity of the SPBSSL pin can be changed with the SSLP bit in CMNCR.

### (2) SPBCLK Output

The SPBCLK output direction during SPBSSL negation can be set with the CPOL bit in CMNCR.

### (3) Data Transmission and Reception Timing

Data transmission and reception timing is different between SDR transfer and DDR transfer.
During SDR transfer, data is transmitted and received at either the odd or even edges. The data transmission timing can be set to the odd or even edge with the CPHAT bit in CMNCR. Similarly, the data reception timing can be set to the odd or even edge with the CPHAR bit in CMNCR.
During DDR transfer, data is transmitted and received at both the odd and even edges. The first data transmission timing can be set to the odd or even edge with the CPHAT bit in CMNCR. Similarly, the first data reception timing can be set to the odd or even edge with the CPHAR bit in CMNCR.

### (4) Delay Settings

t1 is the time period from SPBSSL pin assertion to SPBCLK oscillation (clock delay). It can be set with the SCKDL[2:0] bits in SSLDR. t2 is the time period till the SPBSSL signal negation after the SPBCLK oscillation is stopped (SPBSSL negation delay). It can be set with the SLNDL[2:0] bits in SSLDR. t3 is the time period required to prevent SPBSSL signal assertion for the next transfer after the end of the previous transfer (next access delay). It can be set with the SPNDL[2:0] bits in SSLDR.

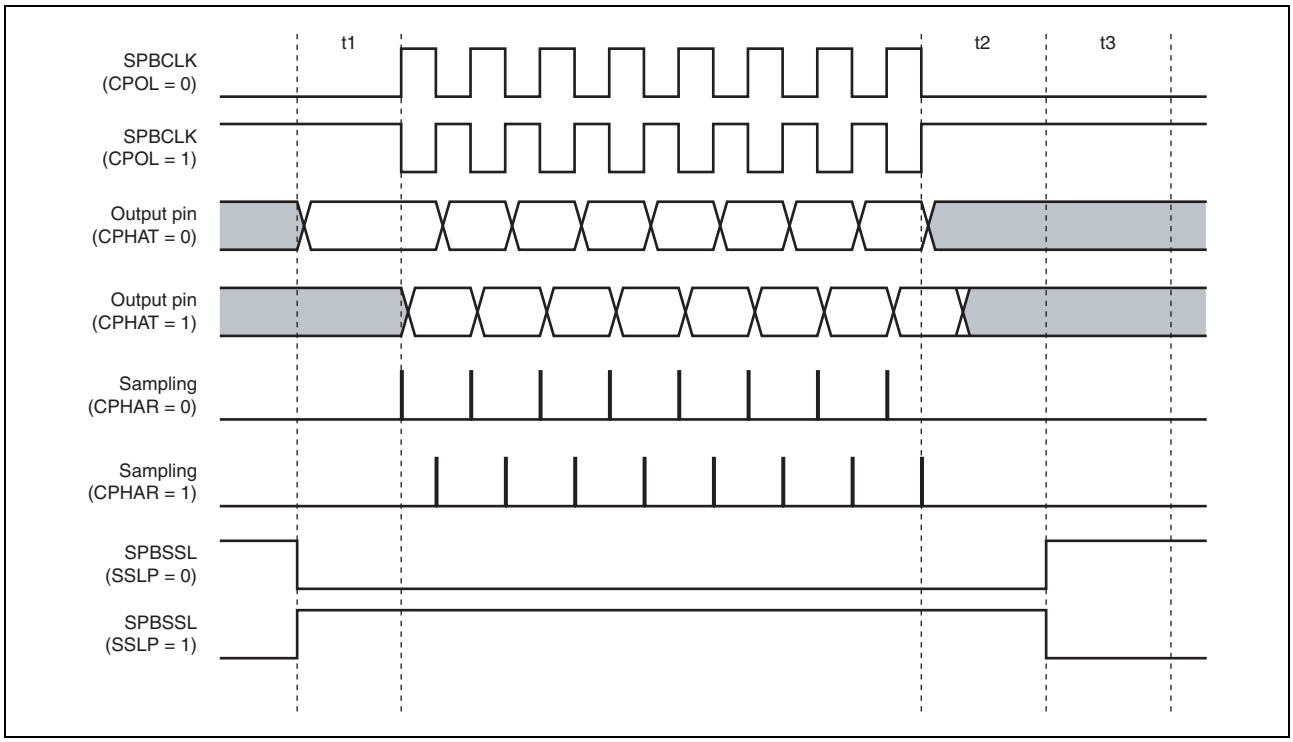

**Figure 17.18 SDR Transfer Format**

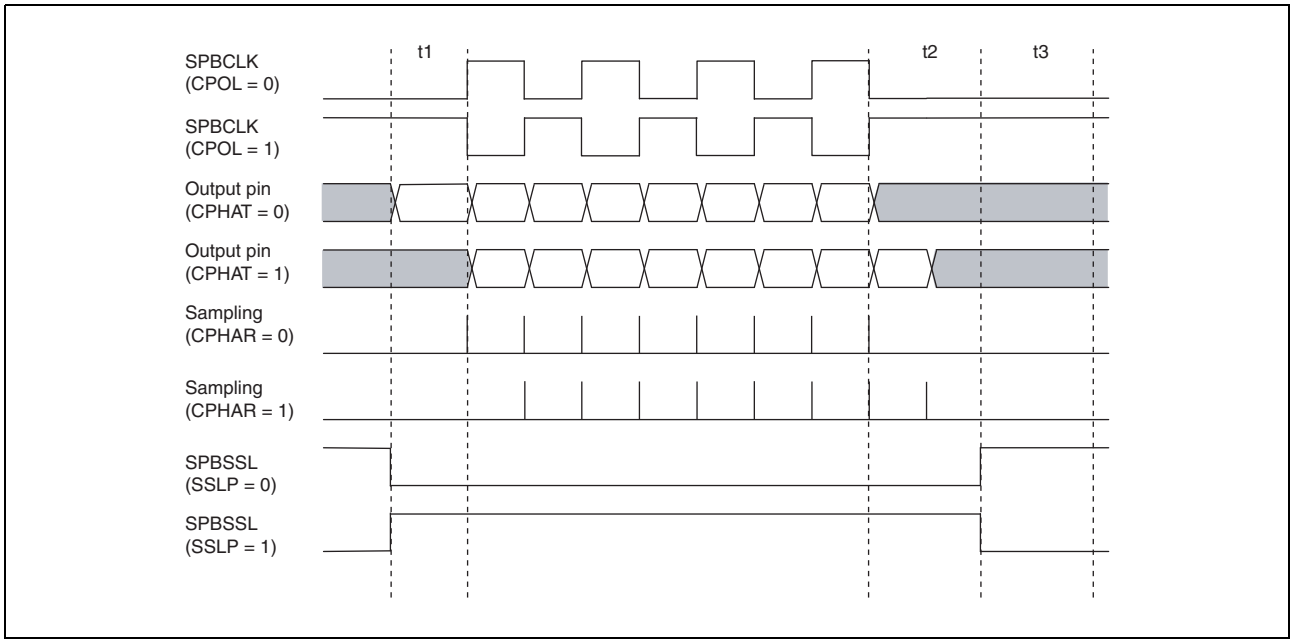

**Figure 17.19 DDR Transfer Format**

Note: • In DDR reception when CPHAR = 1, the sampling timing of the last bit is based on the frequency-divided clock in this module.
When CPHAT = 1 in DDR transfer, the serial flash memory cannot provide the sampling timing of the last bit; therefore, a transfer ending with a DDR transfer is not performed correctly when CPHAT = 1.

## 17.5.10 Data Format

This module can input and output data in the order of command, optional command, address, option data, dummy cycle, and data.

### (1) Data Registers

Table 17.5 shows the input and output data.

**Table 17.5 Data Registers**

| Data | | External Address Space Read Operation | SPI Operation |
|---|---|---|---|
| Command (8 bits) | | CMD[7:0] bits in DRCMR | CMD[7:0] bits in SMCMR |
| Optional command (8 bits) | | OCMD[7:0] bits in DRCMR | OCMD[7:0] bits in SMCMR |
| Address (32/24 bits) | BSZ[1:0] = 00 (one flash memory connected) | 32 bits: DREAR.EAV[6:1 to 0] bits + lower [25 to 24:0] bits of the read address.<br>24 bits: Lower [23:0] bits of the read address | 32 bits: ADR[31:0] bits in SMADR<br>24 bits: ADR[23:0] bits in SMADR |
| | BSZ[1:0] = 01 (two flash memories connected) | 32 bits: DREAR.EAV[7:1 to 0] bits + lower [25 to 24:1] bits of the read address.<br>24 bits: Lower [24:1] bits of the read address | |
| Option data (8 bits × 4) | | DROPR | SMOPR |
| Dummy cycle (1 to 8 cycles) | | DRDMCR | SMDMCR (only when read) |
| Transfer data | | Normal read: 8, 16, and 32 bits<br>Burst read: 64 × RBURST bits | Read: SMRDR0, SMRDR1<br>Write: SMWDR0, SMWDR1 |

## (2) Data Enable

In external address space read mode, transfer enable or disable of the command, optional command, address, option data, and dummy cycle can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in DRENR, respectively. The size and number of dummy cycles can be controlled with the data read dummy cycle setting register (DRDMCR). When the SPBCLK frequency division ratio is two or larger, either SDR or DDR transfer can be selected for the address, option data, and read data, using the ADDRE, OPDRE, and DRDRE bits in the data read DDR enable register (DRDRENR).

Similarly, in SPI operating mode, enable or disable of the command, optional command, address, option data, dummy cycle, and transfer data can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], DME, and SPIDE[3:0] bits in SMENR, respectively. However, disabling all the above parameters is prohibited in SPI operating mode. At least one of them except dummy cycle must be enabled. The size and number of dummy cycles can be controlled with the SPI mode dummy cycle setting register (SMDMCR). When the SPBCLK frequency division ratio is two or larger, either SDR or DDR transfer can be selected for the address, option data, and transfer data, using the ADDRE, OPDRE, and SPIDRE bits in the SPI mode DDR enable register (SMDRENR).

For the address and option data in external address space read mode; and the address, option data, and transfer data in SPI operating mode, the enable bit setting allowed is determined according to the transfer data size. For the allowed setting combinations of the enable bits and transfer data size, refer to the description of the pertinent register.

If data is disabled, that data is skipped, and input and output of the next data is carried out. The command, optional command, address, and option data are always output. During dummy cycles, the state of the used pins is Hi-Z. In external address space read mode, data is always input; and in SPI operating mode, input and output of data is determined based on the settings of the SPIRE and SPIWE bits in SMCR.

There are some restrictions on dummy cycle insertion; refer to the description of the DME bits in DRENR and SMENR for details.

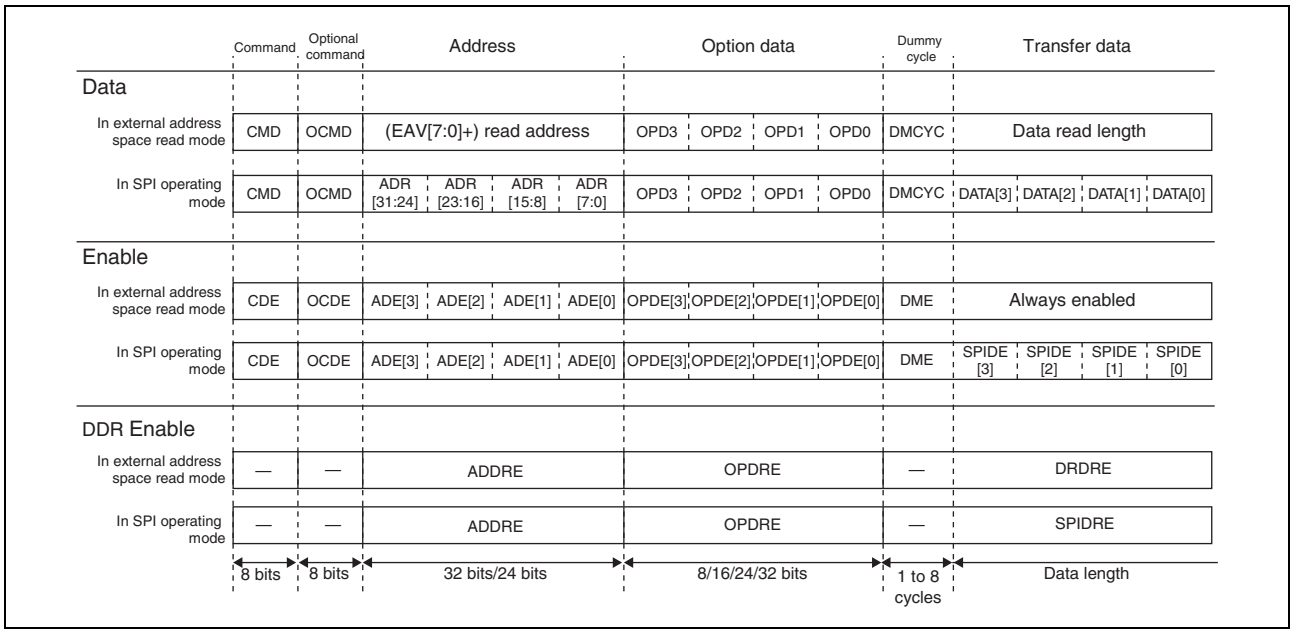

**Figure 17.20 Data and Enable**

### (3) Bit Size

In external address space read mode, the size of the command, optional command, address, option data, and the read data in bit units is respectively controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and DRDB[1:0] bits in DRENR. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in DRDMCR.
Similarly, in SPI operating mode, the size of the command, optional command, address, option data, and read write data in bit units is controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and SPIDB[1:0] bits in SMENR. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in SMDMCR.

#### (a) 1-bit Size

When the size is set to 1 bit, SPBMI0 and SPBMI1 pins will be the input pins and SPBMO0 and SPBMO1 pins will be the output pins. SPBIO20, SPBIO21, SPBIO30, and SPBIO31 pins are not used.
Figure 17.21 and Figure 17.22 show the transfer format examples.

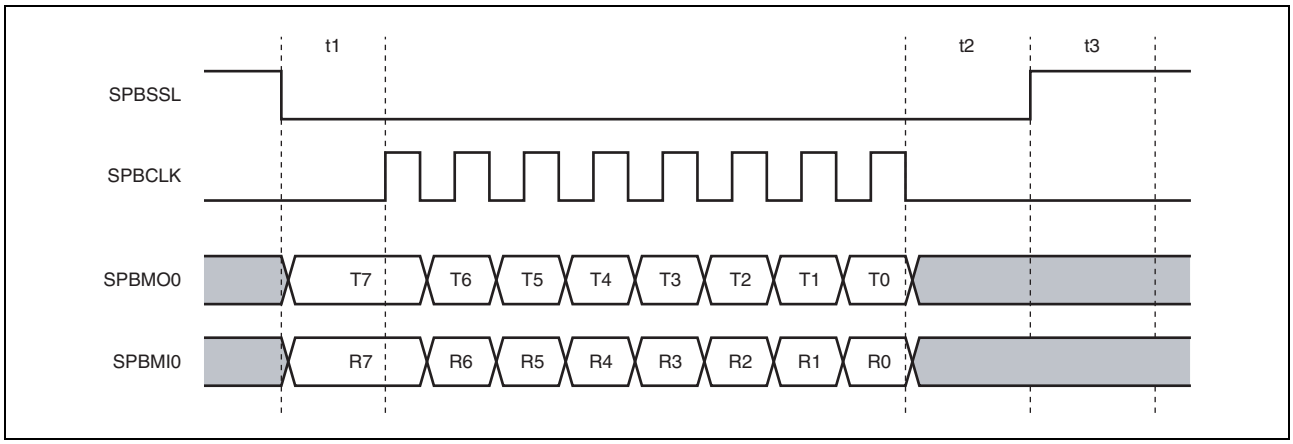

**Figure 17.21 Transfer Format Example with 1-Bit Data Size and One Serial Flash Memory Connected**

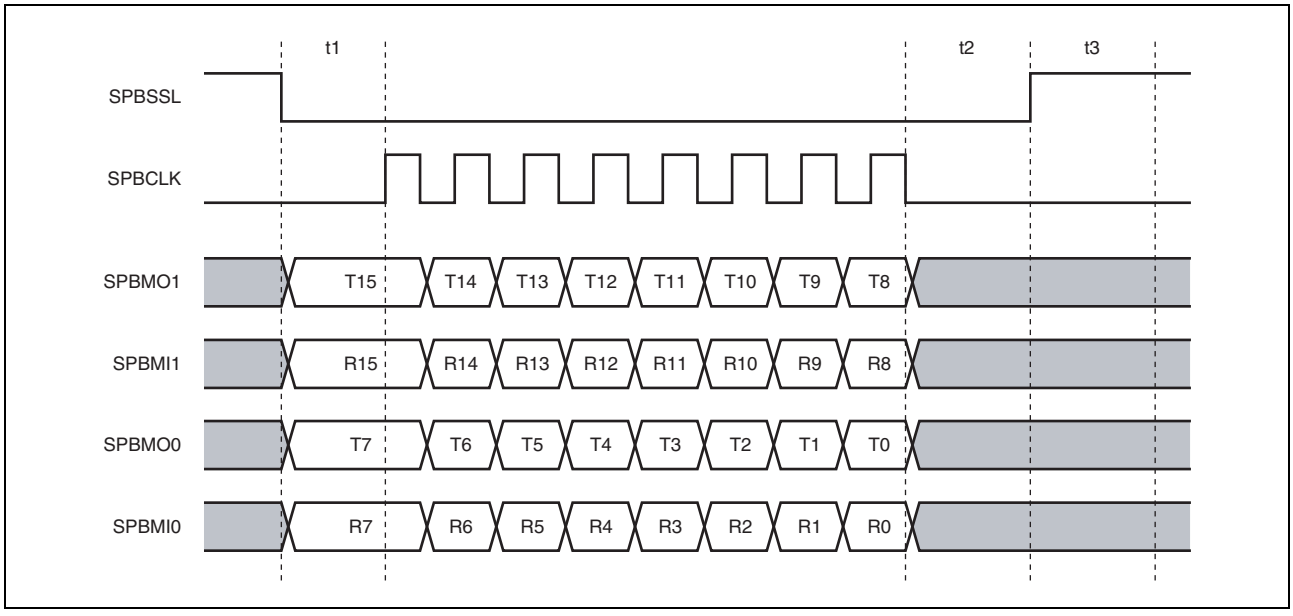

**Figure 17.22 Transfer Format Example with 1-Bit Data Size and Two Serial Flash Memories Connected**

### (b) 2-bit Size

When the size is set to 2 bits, SPBIO0_0, SPBIO01, SPBIO10, and SPBIO11 pins will be either the input pins or the output pins. SPBIO20, SPBIO21, SPBIO30, and SPBIO31 pins are not used.
Figure 17.23 and Figure 17.24 show the transfer format examples.

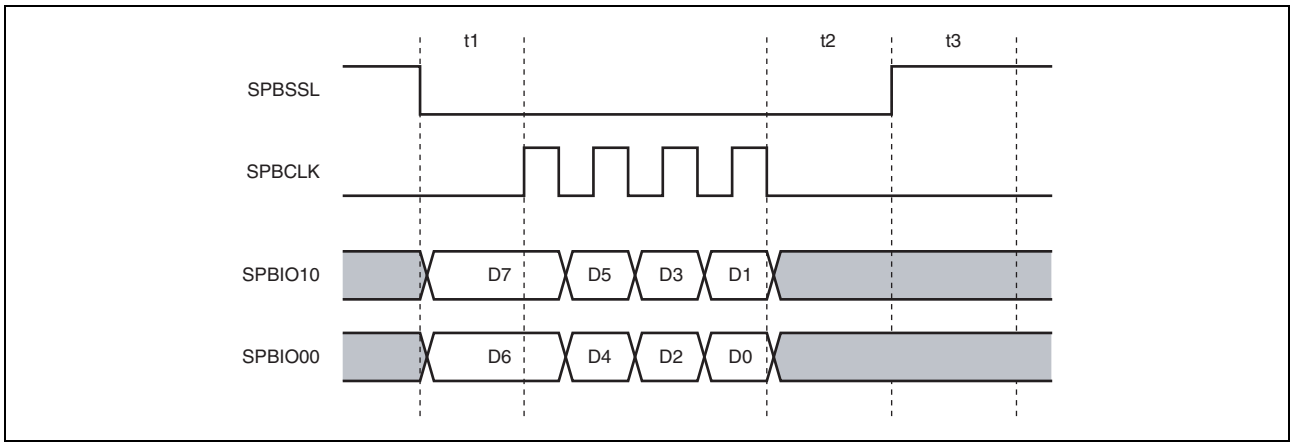

**Figure 17.23 Transfer Format Example with 2-Bit Data Size and One Serial Flash Memory Connected**

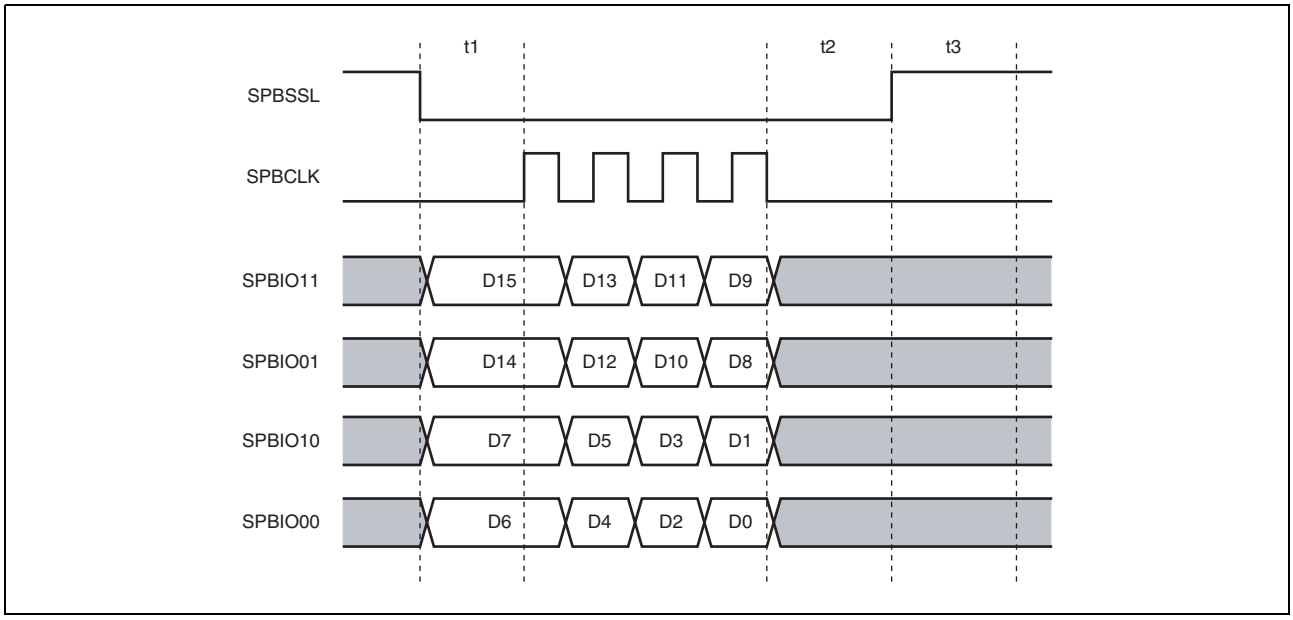

**Figure 17.24 Transfer Format Example with 2-Bit Data Size and Two Serial Flash Memories Connected**

### (c) 4-bit Size

When the size is set to 4 bits, SPBIO00, SPBIO01, SPBIO10, SPBIO11, SPBIO20, SPBIO21, SPBIO30, and SPBIO31 pins will be either the input pins or the output pins.
Figure 17.25 and Figure 17.26 show the transfer format examples.

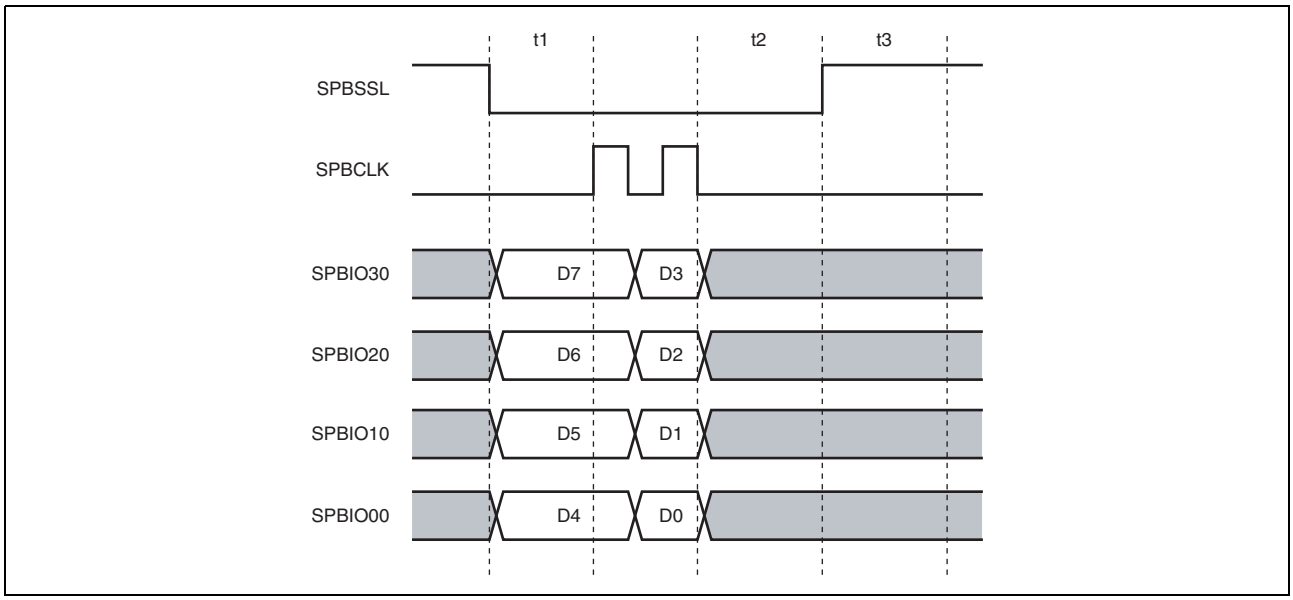

**Figure 17.25 Transfer Format Example with 4-Bit Data Size and One Serial Flash Memory Connected**

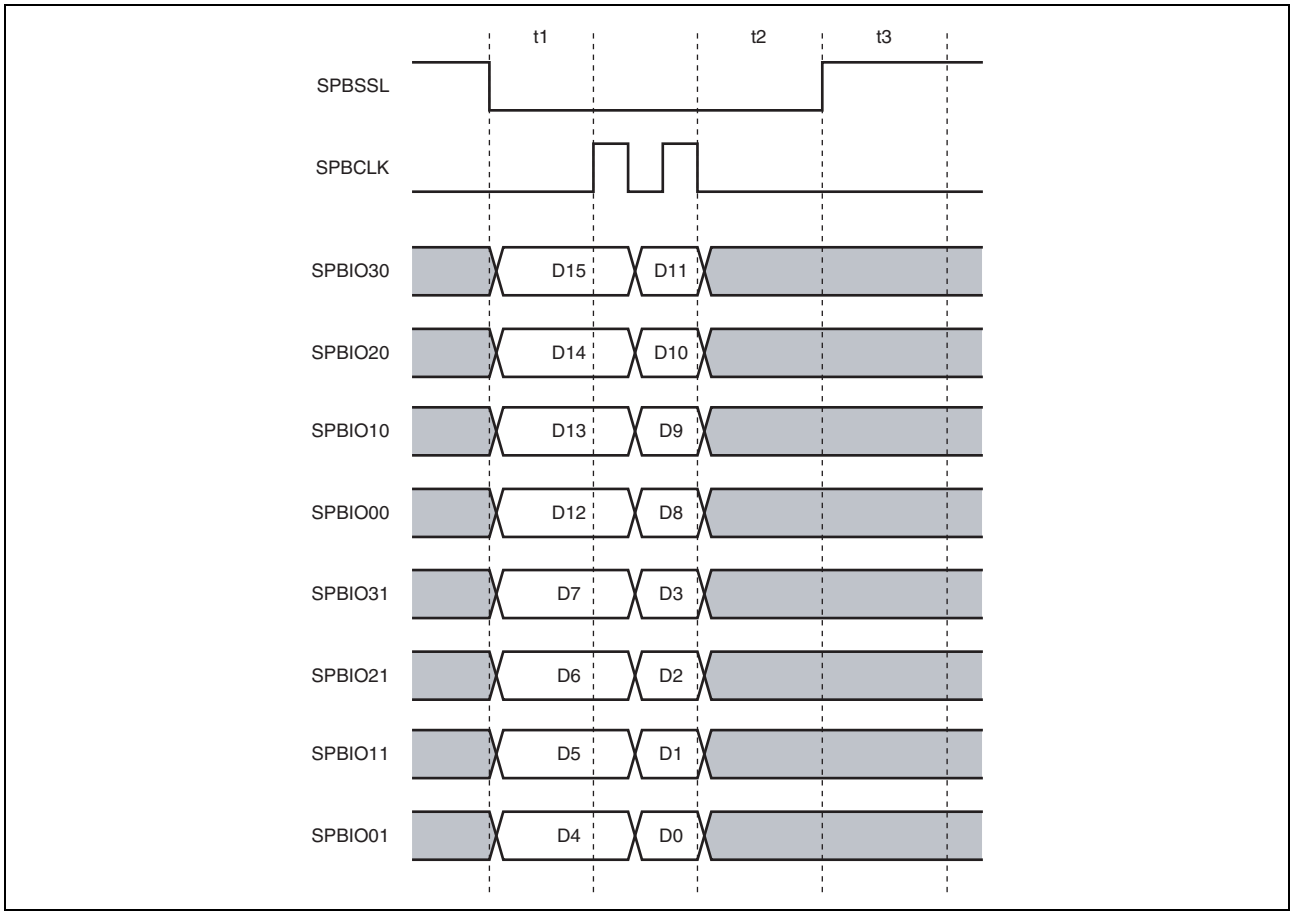

**Figure 17.26 Transfer Format Example with 4-Bit Data Size and Two Serial Flash Memories Connected**

### 17.5.11 Data Pin Control

With this module, the status of pins can be automatically changed based on the data size to be used and the read/write settings. The pin status during the SPBSSL negation can be set with the MOIIO3, MOIIO2, MOIIO1, and MOIIO0 bits in CMNCR. The SPBSSL and SPBCLK pins are always output pins. The status of respective pins is specified in Table 17.6 to Table 17.9.

**Table 17.6 Pin Status (1)**

| | | SPBSSL Assertion | | |
|---|---|---|---|---|
| | | Command, Optional Command, Address, Option Data | | |
| **Pin** | **SPBSSL Negation** | **1-bit Size** | **2-bit Size** | **4-bit Size** |
| SPBMO0/ SPBIO00, SPBMO1/ SPBIO01 | MOIIO0 bit value | Output | Output | Output |
| SPBMI0/ SPBIO10, SPBMI1/ SPBIO11 | MOIIO1 bit value | Hi-Z | Output | Output |
| SPBIO20, SPBIO21 | MOIIO2 bit value | IO2FV bit value | IO2FV bit value | Output |
| SPBIO30, SPBIO31 | MOIIO3 bit value | IO3FV bit value | IO3FV bit value | Output |

**Table 17.7 Pin Status (2)**

| | Transfer Data | | | | | |
|---|---|---|---|---|---|---|
| | External Address Space Read Operation | | | SPI Operation | | |
| | | | | SPIRE Bit = 1, SPIWE Bit = 0 | | |
| **Pin** | **1-bit Size** | **2-bit Size** | **4-bit Size** | **1-bit Size** | **2-bit Size** | **4-bit Size** |
| SPBMO0/ SPBIO00, SPBMO1/ SPBIO01 | IO0FV bit value | Input | Input | IO0FV bit value | Input | Input |
| SPBMI0/ SPBIO10, SPBMI1/ SPBIO11 | Input | Input | Input | Input | Input | Input |
| SPBIO20, SPBIO21 | IO2FV bit value | IO2FV bit value | Input | IO2FV bit value | IO2FV bit value | Input |
| SPBIO30, SPBIO31 | IO3FV bit value | IO3FV bit value | Input | IO3FV bit value | IO3FV bit value | Input |

**Table 17.8 Pin Status (3)**

| | Transfer Data | | | | | |
|---|---|---|---|---|---|---|
| | SPI Operation | | | | | |
| | SPIRE Bit = 0, SPIWE Bit = 1 | | | SPIRE Bit = 1, SPIWE Bit = 1 | | |
| **Pin** | **1-bit Size** | **2-bit Size** | **4-bit Size** | **1-bit Size** | **2-bit Size** | **4-bit Size** |
| SPBMO0/ SPBIO00, SPBMO1/ SPBIO01 | Output | Output | Output | Output | Setting prohibited | Setting prohibited |
| SPBMI0/ SPBIO10, SPBMI1/ SPBIO11 | Hi-Z | Output | Output | Input | Setting prohibited | Setting prohibited |
| SPBIO20, SPBIO21 | IO2FV bit value | IO2FV bit value | Output | IO2FV bit value | Setting prohibited | Setting prohibited |
| SPBIO30, SPBIO31 | IO3FV bit value | IO3FV bit value | Output | IO3FV bit value | Setting prohibited | Setting prohibited |

**Table 17.9 Pin Status (4)**

| | Dummy Cycle | | |
|---|---|---|---|
| **Pin** | **1-bit Size** | **2-bit Size** | **4-bit Size** |
| SPBMO0/ SPBIO00, SPBMO1/ SPBIO01 | IO0FV bit value | Hi-Z | Hi-Z |
| SPBMI0/ SPBIO10, SPBMI1/ SPBIO11 | Hi-Z | Hi-Z | Hi-Z |
| SPBIO20, SPBIO21 | IO2FV bit value | IO2FV bit value | Hi-Z |
| SPBIO30, SPBIO31 | IO3FV bit value | IO3FV bit value | Hi-Z |

### 17.5.12 SPBSSL Pin Control

Negation conditions of the SPBSSL pin are as follows.

#### (1) External Address Space Read Mode

##### (a) Normal read operation (RBE bit in DRCR = 0)

SPBSSL negated after completing the data transfer and t2 cycle.

##### (b) Burst read without automatic SPBSSL negation (RBE bit in DRCR = 1, SSLE bit in DRCR = 0)

SPBSSL negated after completing the data transfer and t2 cycle.

##### (c) Burst read with automatic SPBSSL negation (RBE bit in DRCR = 1, SSLE bit in DRCR = 1)

- SPBSSL negated after t2 cycle when the read address is not continuous with the previously read address
- SPBSSL negated after the SSLN bit in DRCR is set to 1

#### (2) SPI Operating Mode

##### (a) SPBSSL pin assertion not retained (SSLKP bit in SMCR = 0)

SPBSSL negated after completing the data transfer and t2 cycle.

##### (b) SPBSSL pin assertion retained (SSLKP bit in SMCR = 1)

SPBSSL not negated.
When to be negated, data should be transferred after setting the SSLKP bit to 0.

### 17.5.13 Flags

This module has two flag bits SSLF and TEND in CMNSR. These bits are read-only bits.

#### (1) SSLF Bit

This bit indicates the SPBSSL pin status. The status is 1 when the SPBSSL is asserted, and the status is 0 when the SPBSSL is negated.

#### (2) TEND Bit

This bit indicates whether transfer of data is in progress or the transfer of data has ended.
During t1 time period, data transfer, t2 time period, t3 time period, and waiting for read access by burst read and SPBSSL automatic negation, the TEND bit is read as 0 to indicate that the transfer of data is in progress.
When other than the above, the TEND bit is read as 1 to indicate that transfer of data has ended.

#### (3) Register Re-writing Timing

The status of the TEND bit determines the rewritable registers.
The registers which can be written to, except the SSLN bit in DRCR, should be modified when TEND = 1. Read SMRDR0 and SMRDR1 when TEND = 1. CMNSR can always be read.

## 17.6 Usage Notes

### 17.6.1 Notes on Transfer to Read Data in SPI Operating Mode

If the setting for the bit mode is for division by two or more in SPI operating mode, take note of the following points for caution when setting the SPI mode enable setting register (SMENR) to enable transfer only for reading data.
“Transfer only for reading data” indicates transfer to read data while the CDE, OCDE, ADE[3:0], and OPDE[3:0] bits in SMENR are all 0.

#### (1) Transfer to read data while the signal on the SPBSSL pin is de-asserted

Set the SMENR.SPIDE[3:0] bits to 1100 or 1111 when transfer only for reading data is to proceed.
Transfer will not proceed normally if the setting of the SMENR.SPIDE[3:0] bits is 1000.

#### (2) Transfer to read data while the signal on the SPBSSL pin is asserted

When transfer only for reading data is to proceed, set the SMENR.SPIDE[3:0] bits to 1100 or 1111, or end the immediately preceding transfer with reading data.
When the immediately preceding transfer is of a command, optional command, address, or option data, or is transfer for writing data, the subsequent transfer only for reading data will not proceed normally if the setting of the SMENR.SPIDE[3:0] bits is 1000.

### 17.6.2 Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode

Be sure to set the SPIWE bit in the SMCR register to 1 when the transfer of a command, optional command, address, or option data is started while the SPBSSL pin is being asserted in SPI operating mode.

# 18. I²C Bus Interface

This section gives an overall description of the $I^2C$ bus interface (RIIC).

The first section describes the features specific to this LSI, including the number of units and the register base addresses. The subsequent sections describe the RIIC's functions and registers.

## 18.1 Features

### 18.1.1 Channels

This LSI has the following number of channels of the $I^2C$ bus interface (RIIC).

**Table 18.1 Channels of RIIC**

| Package | 256 Pins | 324 Pins |
|---|---|---|
| Number of channels | 4 | |
| Name | RIICn (n = 0 to 3) | |

**Table 18.2 Index**

| Index | Description |
|---|---|
| n | Throughout this section, the individual channels of the $I^2C$ bus interface are identified by the index "n" (n = 0 to 3); for example, RIICnCR1 for the $I^2C$ bus control register 1. |

### 18.1.2 Register Base Addresses

The base address <RIICn_base> of each RIICn is listed in the following table.

All RIICn register addresses are given as values obtained by adding offsets to the register base address <RIICn_base> for each channel.

**Table 18.3 Register Base Address**

| Channel | Base Address Name | Base Address |
|---|---|---|
| RIIC0 | <RIIC0_base> | FCFE E000$_H$ |
| RIIC1 | <RIIC1_base> | FCFE E400$_H$ |
| RIIC2 | <RIIC2_base> | FCFE E800$_H$ |
| RIIC3 | <RIIC3_base> | FCFE EC00$_H$ |

### 18.1.3 External I/O Signals

The following table shows the external I/O signals of the RIIC.

**Table 18.4 RIICn Pin Configuration**

| Channel | Alternative Port Pin Name | Function |
|---|---|---|
| **RIIC0** | RIIC0SCL | RIIC0 serial clock I/O pin |
| | RIIC0SDA | RIIC0 serial data I/O pin |
| **RIIC1** | RIIC1SCL | RIIC1 serial clock I/O pin |
| | RIIC1SDA | RIIC1 serial data I/O pin |
| **RIIC2** | RIIC2SCL | RIIC2 serial clock I/O pin |
| | RIIC2SDA | RIIC2 serial data I/O pin |
| **RIIC3** | RIIC3SCL | RIIC3 serial clock I/O pin |
| | RIIC3SDA | RIIC3 serial data I/O pin |

## 18.2 Overview

### 18.2.1 Functional Overview

#### Communications format

- $I^2C$ bus format or SMBus format
- Master mode or slave mode selectable
- Automatic securing of the various set-up times, hold times, and bus-free times for the transfer rate

#### Transfer rate

Up to 400 kbps

#### SCL clock

For master operation, the duty cycle of the SCL clock is selectable in the following range.

0% < Duty cycle < 100%

#### Issuing and detecting conditions

- Start, restart, and stop conditions are automatically generated.
- Start conditions (including restart conditions) and stop conditions are detected.

#### Slave address

- Up to three slave-address settings can be made.
- Seven- and ten-bit address formats are supported (along with the use of both at once).
- General call addresses, device ID addresses, and SMBus host addresses are detected.

#### Acknowledgement

- For transmission, the acknowledge bit is automatically loaded
  - Transfer of the next data for transmission can be automatically suspended on detection of a not-acknowledge bit.
- For reception, the acknowledge bit is automatically transmitted
  - If a wait between the eighth and ninth clock cycles has been selected, software control of the value in the acknowledge field in response to the received value is possible.

#### Wait function

- In reception, the following periods of waiting can be obtained by holding the clock signal (SCL) at the low level:
  - Waiting between the eighth and ninth clock cycles
  - Waiting between the ninth clock cycle and the first clock cycle of the next transfer (WAIT function)

#### SDA output delay function

Timing of the output of transmitted data, including the acknowledge bit, can be delayed.

### Arbitration

- For multi-master operation
  - Operation to synchronize the SCL (clock) signal in cases of conflict with the SCL signal from another master is possible.
  - When issuing the start condition would create conflict on the bus, loss of arbitration is detected by testing for non-matching between the internal signal for the SDA line and the level on the SDA line.
  - In master operation, loss of arbitration is detected by testing for non-matching between the signal on the SDA line and the internal signal for the SDA line.
- Loss of arbitration due to detection of the start condition while the bus is busy is detectable (to prevent the issuing of double start conditions).
- Loss of arbitration in transfer of a not-acknowledge bit due to the internal signal for the SDA line and the level on the SDA line not matching is detectable.
- Loss of arbitration due to non-matching of internal and line levels for data is detectable in slave transmission.

### Timeout function

The internal time-out function is capable of detecting long-interval stop of the SCL (clock signal).

### Noise removal

The interface incorporates analog noise filters and digital noise filters for input on the RIICnSCL and RIICnSDA pins, and the width for noise cancellation by the digital noise filters is adjustable by software.

### Interrupt sources

- Eight sources:
  - Transmission complete
  - Receive-data-full
  - Transmit-data-empty
  - Detection of a stop condition
  - Detection of a start condition
  - Reception of a NACK
  - Arbitration lost
  - Timeout

### Low power consumption function

Module-stop state can be set.

## 18.2.2 Block Diagram

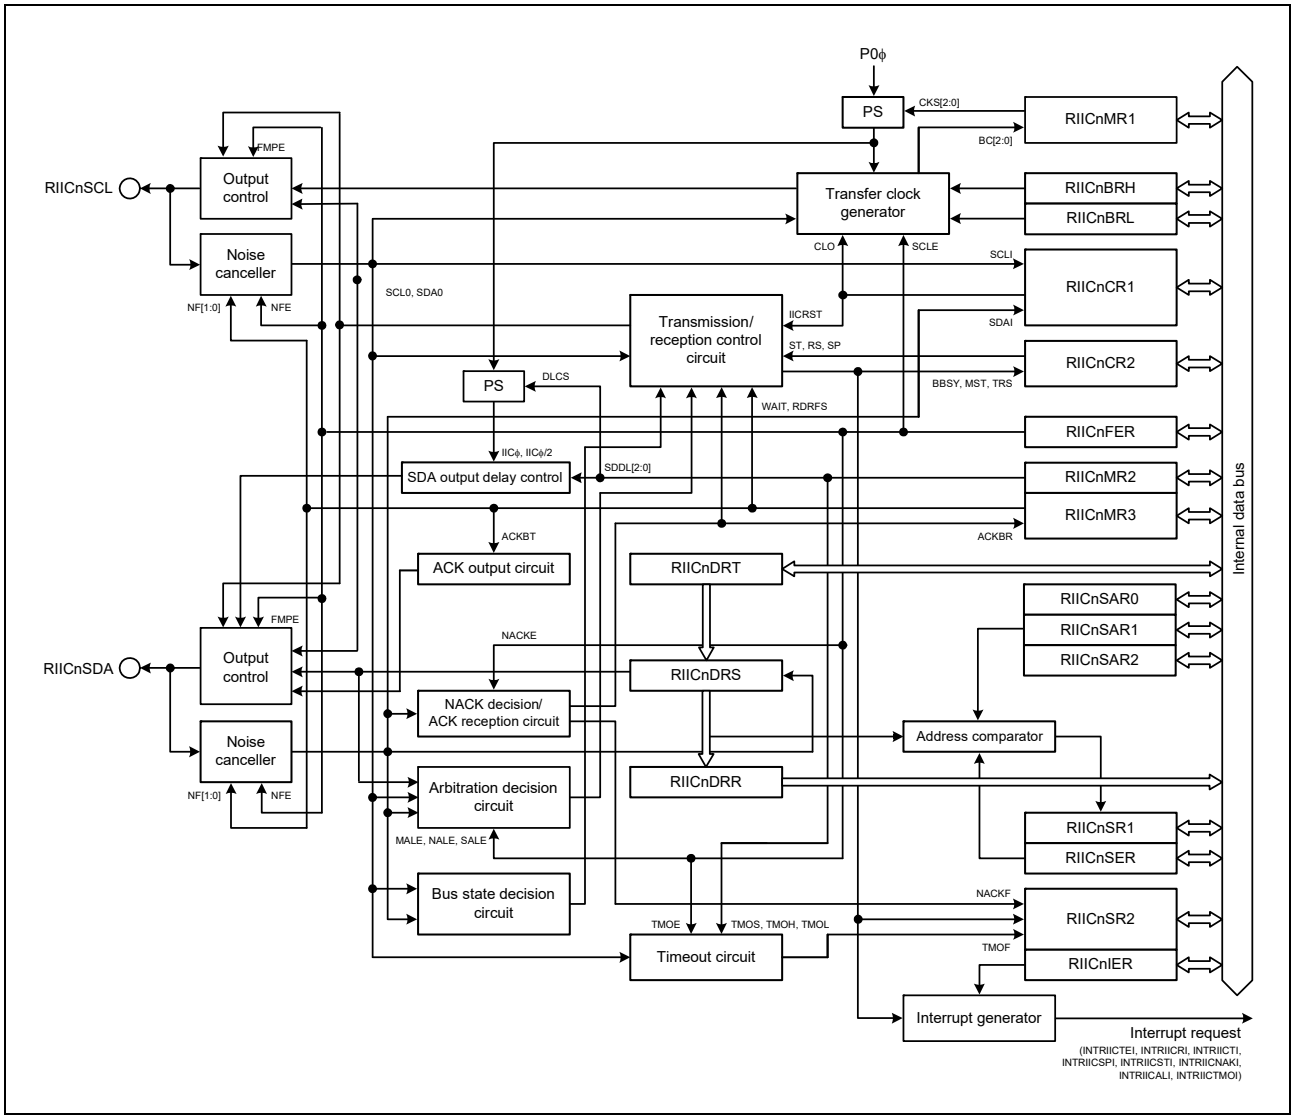

**Figure 18.1 Block Diagram of RIIC**

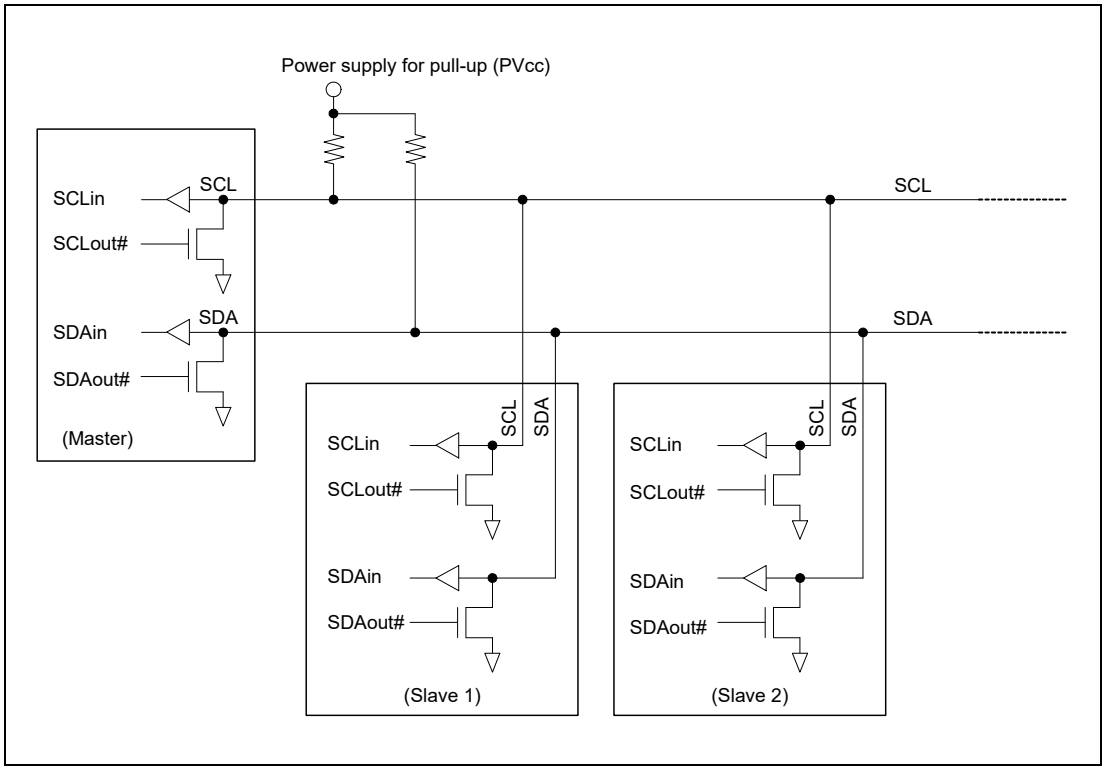

**Figure 18.2 Connections to the External Circuit by the I/O Pins (I²C Bus Configuration Example)**

RIICnSCL and RIICnSDA are Schmitt input/open-drain output pins for both master and slave operations. Because the output is open drain, an external pull-up resistor is required.

## 18.3 Registers

### 18.3.1 RIICnCR1 — I²C Bus Control Register 1

**Access:** RIICnCR1 is a 32-bit readable/writable register.
RIICnCR1L and RIICnCR1H are 16-bit readable/writable registers.
RIICnCR1LL, RIICnCR1LH, RIICnCR1HL, and RIICnCR1HH are 8-bit readable/writable registers.

**Address:** RIICnCR1: <RIICn_base> + $0000_H$
RIICnCR1L: <RIICn_base> + $0000_H$, RIICnCR1H: <RIICn_base> + $0002_H$
RIICnCR1LL: <RIICn_base> + $0000_H$, RIICnCR1LH: <RIICn_base> + $0001_H$, RIICnCR1HL: <RIICn_base> + $0002_H$,
RIICnCR1HH: <RIICn_base> + $0003_H$

**Initial Value:** 0000 $001F_H$. This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | ICE | IICRST | CLO | SOWP | SCLO | SDAO | SCLI | SDAI |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

**Table 18.5 RIICnCR1 register contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | — | Reserved<br>These bits are read as 0. The write value should be 0. |
| 7 | ICE | $I^2C$ Bus Interface Enable<br>0: Output to the RIICnSCL and RIICnSDA pins is disabled. (Input to the RIICnSCL and RIICnSDA pins is enabled.)<br>1: Enabled (RIICnSCL and RIICnSDA pins are in the driving state)<br>(An RIIC reset or an internal reset is selected according to the combination of this bit and IICRST bit settings.) |
| 6 | IICRST | $I^2C$ Bus Interface Internal Reset<br>0: Clears the RIIC reset or internal reset.<br>1: Initiates the RIIC reset or internal reset.<br>(Clears the bit counter and the SCL/SDA output latch) |
| 5 | CLO | Extra SCL Clock Cycle Output<br>0: Does not output an extra SCL clock cycle (default).<br>1: Outputs an extra SCL clock cycle.<br>(The CLO bit is cleared automatically after one clock cycle is output.) |
| 4 | SOWP*2 | SCLO/SDAO Write Protect<br>0: Allows the SCLO and SDAO bits to be rewritten.<br>(This bit is read as 1.) |
| 3 | SCLO*1,*2 | SDA Output Control<br>• Read:<br>0: RIICnSCL pin output is at a low level.<br>1: RIICnSCL pin is in a high-impedance state.<br>• Write:<br>0: Changes the RIICnSCL pin output to a low level.<br>1: Changes the RIICnSCL pin in a high-impedance state.<br>(High level output is achieved through an external pull-up resistor.) |

**Table 18.5 RIICnCR1 register contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 2 | SDAO[*1,*2] | SDA Output Control<br>• Read:<br>0: RIICnSDA pin output is at a low level.<br>1: RIICnSDA pin is in a high-impedance state.<br>• Write:<br>0: Changes the RIICnSDA pin output to a low level.<br>1: Changes the RIICnSDA pin in a high-impedance state.<br>(High level output is achieved through an external pull-up resistor.) |
| 1 | SCLI | SCL Bus Input Monitor<br>0: RIICnSCL pin input is at a low level.<br>1: RIICnSCL pin input is at a high level. |
| 0 | SDAI | SDA Bus Input Monitor<br>0: RIICnSDA pin input is at a low level.<br>1: RIICnSDA pin input is at a high level. |

Note 1. Do not write to these bits during communication. Changing a value during communication may cause a transmission or reception failure or an AL error.

Note 2. To change the SDAO and SCLO bits, set the SOWP bit to 0 at the same timing to set the SDAO and SCLO bits to 0.

### CLO Bit (Extra SCL Clock Cycle Output)

This bit is used to output an extra SCL clock cycle for debugging or error processing.

Normally, set the bit to 0. Setting the bit to 1 in a normal communication state causes a communication error.

For details on this function, see Section 18.13.2, Extra SCL Clock Cycle Output Function.

### IICRST Bit (I²C Bus Interface Internal Reset)

This bit is used to reset the internal states of the RIIC.

Setting this bit to 1 initiates an RIIC reset or internal reset.

Whether an RIIC reset or internal reset is initiated is determined according to the combination with the ICE bit. Table 18.6 lists the resets of the RIIC.

The RIIC reset resets all registers including the RIICnCR2.BBSY flag (except ICE and IICRST) and internal states of the RIIC, and the internal reset resets the bit counter (RIICnMR1.BC[2:0] bits), the I²C bus shift register (RIICnDRS), and the I²C bus status registers (RIICnSR1 and RIICnSR2) as well as the internal states of the RIIC. For the reset conditions for each register, see Section 18.15, Reset Function of RIIC.

An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the RIIC without initializing the port settings and the control and setting registers of the RIIC when the bus or RIIC hangs up due to a communication error.

If the RIIC hangs up in a low level output state, resetting the internal states cancels the low level output state and releases the bus with the RIICnSCL pin and RIICnSDA pin at a high impedance.

CAUTION

If an internal reset is initiated using the IICRST bit for a bus hang-up occurred during communication with the master device in slave mode, the states may become different between the slave device and the master device (due to the difference in the bit counter information). For this reason, do not initiate an internal reset in slave mode, but initiate restoration processing from the master device. If an internal reset is necessary because the RIIC hangs up with the SCL line in a low level output state in slave mode, initiate an internal reset and then issue a restart condition from the master device or resume communication from the start condition issuance after issuing a stop condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start condition or restart condition from the master device, synchronization will be lost because the master and slave devices operate asynchronously.

**Table 18.6 RIIC Resets**

| IICRST | ICE | State | Specifications |
|---|---|---|---|
| 1 | 0 | RIIC reset | Resets all registers (except ICE and IICRST) and internal states of the RIIC. |
| | 1 | Internal reset | Reset the RIICnMR1.BC[2:0] bits, and the RIICnSR1, RIICnSR2, RIICnDRS registers and the internal states of the RIIC. |

### ICE Bit (I²C Bus Interface Enable)

The ICE bit selects driving or non-driving of the RIICnSCL and RIICnSDA pins. Moreover, this bit can perform two types of reset in combination with the IICRST bit. For the types of reset, see **Table 18.6, RIIC Resets**.

Set the ICE bit to 1 when using RIIC. Setting the ICE bit to 1 selects driving of the RIICnSCL and RIICnSDA pins.

Set the ICE bit to 0 when RIIC is not to be used. Clearing the ICE bit to 0 disables output from the RIICnSCL and RIICnSDA pins.

## 18.3.2 RIICnCR2 — I²C Bus Control Register 2

**Access:** RIICnCR2 is a 32-bit readable/writable register.
RIICnCR2L and RIICnCR2H are 16-bit readable/writable registers.
RIICnCR2LL, RIICnCR2LH, RIICnCR2HL, and RIICnCR2HH are 8-bit readable/writable registers.

**Address:** RIICnCR2: <RIICn_base> + $0004_H$
RIICnCR2L: <RIICn_base> + $0004_H$, RIICnCR2H: <RIICn_base> + $0006_H$
RIICnCR2LL: <RIICn_base> + $0004_H$, RIICnCR2LH: <RIICn_base> + $0005_H$, RIICnCR2HL: <RIICn_base> + $0006_H$,
RIICnCR2HH: <RIICn_base> + $0007_H$

**Initial Value:** $0000\ 0000_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | BBSY | MST | TRS | — | SP | RS | ST | — |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R |

**Table 18.7 RIICnCR2 register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | — | Reserved<br>These bits are read as 0. The write value should be 0. |
| 7 | BBSY | Bus Busy Detection Flag<br>0: The I²C bus is released (bus free state).<br>1: The I²C bus is occupied (bus busy state or in the bus free state). |
| 6 | MST | Master/Slave Mode<br>0: Slave mode<br>1: Transmit mode |
| 5 | TRS | Transmit/Receive Mode<br>0: Receive mode<br>1: Transmit mode |
| 4 | — | Reserved<br>These bits are read as 0. The write value should be 0. |
| 3 | SP | Stop Condition Issuance Request<br>0: Does not request to issue a stop condition.<br>1: Requests to issue a stop condition. |
| 2 | RS | Restart Condition Issuance Request<br>0: Does not request to issue a restart condition.<br>1: Requests to issue a restart condition. |
| 1 | ST | Start Condition Issuance Request<br>0: Does not request to issue a start condition.<br>1: Requests to issue a start condition. |
| 0 | — | Reserved<br>These bits are read as 0. The write value should be 0. |

### ST Bit (Start Condition Issuance Request)

This bit is used to request transition to master mode and issuance of a start condition.

When this bit is set to 1 to request to issue a start condition, a start condition is issued when the BBSY flag is set to 0 (bus free).

For details on the start condition issuance, see Section 18.12, Start Condition/Restart Condition/ Stop Condition Issuing Function.

[Setting condition]

When 1 is written to the ST bit

[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition has been issued
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTION

Set the ST bit to 1 (start condition issuance request) when the BBSY flag is set to 0 (bus free).
Note that arbitration may be lost if the ST bit is set to 1 (start condition issuance request) when the BBSY flag is set to 1 (bus busy).

### RS Bit (Restart Condition Issuance Request)

This bit is used to request that a restart condition be issued in master mode.

When this bit is set to 1 to request to issue a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the restart condition issuance, see Section 18.12, Start Condition/Restart Condition/ Stop Condition Issuing Function.

[Setting condition]

When 1 is written to the RS bit with the RIICnCR2.BBSY flag set to 1

[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition has been issued or a start condition is detected
- When a stop condition is detected
- When the RIICnCR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTIONS

1. Do not set the RS bit to 1 while issuing a stop condition.
2. It is commended to issue a restart condition in master transmit mode. If the RS bit is set to 1 (restart condition issuance request) in mode other than master mode, the restart condition is not issued in this mode but the restart condition issuance request bit remains set. If the operating mode changes to master mode with the bit not being cleared, the restart condition may be issued.

### SP Bit (Stop Condition Issuance Request)

This bit is used to request that a stop condition be issued in master mode.

When this bit is set to 1 to request to issue a stop condition, a stop condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the stop condition issuance, see Section 18.12, Start Condition/Restart Condition/ Stop Condition Issuing Function.

[Setting condition]

When 1 is written to the SP bit with both the RIICnCR2.BBSY flag and the RIICnCR2.MST bit set to 1

[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition has been issued or a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When a start condition and a restart condition are detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTIONS

1. Wring to the SP bit is not possible while the setting of the BBSY flag is 0 (bus free).
2. Do not set the SP bit to 1 while a restart condition is being issued.

### TRS Bit (Transmit/Receive Mode)

This bit indicates transmit or receive mode.

The RIIC is in receive mode when the TRS bit is set to 0 and is in transmit mode when the bit is set to 1. Combination of this bit and the MST bit indicates the operating mode of the RIIC.

The value of the TRS bit is automatically changed to the value for transmission mode or reception mode by detection or issuing of a start condition, setting or clearing of the R/W# bit, etc.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When the R/W# bit added to the slave address is set to 0 in master mode
- When the address received in slave mode matches the address enabled in RIICnSER, with the R/W# bit set to 1

[Clearing conditions]

- When a stop condition is detected
- The RIICnSR2.AL (arbitration-lost) flag being set to 1
- In master mode, reception of a slave address to which an R/W# bit with the value 1 is appended
- In slave mode, a match between the received address and the address enabled in RIICnSER when the value of the received R/W# bit is 0 (including cases where the received address is the general call address)
- In slave transmit mode, a restart condition is detected (a restart condition is detected with

RIICnCR2.BBSY = 1 and RIICnCR2.MST = 0)

- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### MST Bit (Master/Slave Mode)

This bit indicates master or slave mode.

The RIIC is in slave mode when the MST bit is set to 0 and is in master mode when the bit is set to 1. Combination of this bit and the TRS bit indicates the operating mode of the RIIC.

The value of the MST bit is automatically changed to the value for master mode or slave mode by detection or issuing of a start condition, etc.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)

[Clearing conditions]

- When a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### BBSY Flag (Bus Busy Detection)

The BBSY flag indicates whether the $I^2C$ bus is occupied (bus busy) or released (bus free).

This bit is set to 1 when the SDA line changes from high to low under the condition of SCL = high, assuming that a start condition has been issued.

When the SDA line changes from low to high under the condition of SCL = high, this bit is cleared to 0 after the bus free time (specified in RIICnBRL) start condition is not detected, assuming that a stop condition has been issued.

[Setting condition]

When a start condition is detected

[Clearing conditions]

- When the bus free time (specified in RIICnBRL) start condition is not detected after detecting a stop condition
- When 1 is written to the RIICnCR1.IICRST bit with the RIICnCR1.ICE bit set to 0 (RIIC reset)

## 18.3.3 RIICnMR1 — I²C Bus Mode Register 1

**Access:** RIICnMR1 is a 32-bit readable/writable register.
RIICnMR1L and RIICnMR1H are 16-bit readable/writable registers.
RIICnMR1LL, RIICnMR1LH, RIICnMR1HL, and RIICnMR1HH are 8-bit readable/writable registers.

**Address:** RIICnMR1: <RIICn_base> + $0008_H$
RIICnMR1L: <RIICn_base> + $0008_H$, RIICnMR1H: <RIICn_base> + $000A_H$
RIICnMR1LL: <RIICn_base> + $0008_H$, RIICnMR1LH: <RIICn_base> + $0009_H$, RIICnMR1HL: <RIICn_base> + $000A_H$,
RIICnMR1HH: <RIICn_base> + $000B_H$

**Initial Value:** 0000 $0008_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | CKS[2:0] | | | BCWP | BC[2:0] | | |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.8 RIICnMR1 register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 7 | — | Reserved<br>These bits are read as 0. The write value should be 0. |
| 6 to 4 | CKS[2:0] | Internal Reference Clock (IICϕ) Selection<br>b6 b4<br>0 0 0: IICϕ = P0ϕ/1<br>0 0 1: IICϕ = P0ϕ/2<br>0 1 0: IICϕ = P0ϕ/4<br>0 1 1: IICϕ = P0ϕ/8<br>1 0 0: IICϕ = P0ϕ/16<br>1 0 1: IICϕ = P0ϕ/32<br>1 1 0: IICϕ = P0ϕ/64<br>1 1 1: IICϕ = P0ϕ/128 |
| 3 | BCWP*1 | BC Write Protect<br>0: Enables a value to be written in the BC[2:0] bits.<br>(This bit is read as 1.) |
| 2 to 0 | BC[2:0] | Bit Counter<br>b2 b0<br>0 0 0: 9 bits<br>0 0 1: 2 bits<br>0 1 0: 3 bits<br>0 1 1: 4 bits<br>1 0 0: 5 bits<br>1 0 1: 6 bits<br>1 1 0: 7 bits<br>1 1 1: 8 bits |

Note 1. When rewriting the BC[2:0] bits, write 0 to the BCWP bit simultaneously.

#### BC[2:0] Bits (Bit Counter)

These bits function as a counter that indicates the number of bits remaining to be transferred at the detection of a rising edge on the SCL line. Although these bits are writable and readable, it is not necessary to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one (data is transferred with an additional acknowledge bit) between transferred frames when the SCL line is at a low level.

The values of the BC[2:0] bits return to $000_B$ at the end of a data transfer including the acknowledge bit or when a start condition including a restart condition is detected.

## 18.3.4 RIICnMR2 — I²C Bus Mode Register 2

**Access:** RIICnMR2 is a 32-bit readable/writable register.
RIICnMR2L and RIICnMR2H are 16-bit readable/writable registers.
RIICnMR2LL, RIICnMR2LH, RIICnMR2HL, and RIICnMR2HH are 8-bit readable/writable registers.

**Address:** RIICnMR2: <RIICn_base> + $000C_H$
RIICnMR2L: <RIICn_base> + $000C_H$, RIICnMR2H: <RIICn_base> + $000E_H$
RIICnMR2LL: <RIICn_base> + $000C_H$, RIICnMR2LH: <RIICn_base> + $000D_H$, RIICnMR2HL: <RIICn_base> + $000E_H$,
RIICnMR2HH: <RIICn_base> + $000F_H$

**Initial Value:** $0000\ 0006_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 2 | TMOH | Timeout H Count Control<br>0: Count is disabled while the SCL line is at a high level.<br>1: Count is enabled while the SCL line is at a high level. |
| 1 | TMOL | Timeout L Count Control<br>0: Count is disabled while the SCL line is at a low level.<br>1: Count is enabled while the SCL line is at a low level. |

**Table 18.9 RIICnMR2 register contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | TMOS | Timeout Detection Time Selection<br>0: Long mode is selected.<br>1: Short mode is selected. |

Note 1. The setting DLCS = 1 (IICϕ/2) only becomes valid when SCL is at the low level. When SCL is at the high level, the setting DLCS = 1 becomes invalid and the clock source becomes the internal reference clock (IICϕ).

### TMOS Bit (Timeout Detection Time Selection)

This bit is used to select long mode or short mode for the timeout detection time when the timeout function is enabled (RIICnFER.TMOE bit = 1). When this bit is set to 0, long mode is selected. When this bit is set to 1, short mode is selected. In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14 bit-counter. While the SCL line is in the state that enables this counter as specified by bits TMOH and TMOL, the counter counts up in synchronization with the internal reference clock (IICϕ) as a count source.

For details on the timeout function, see Section 18.13.1, Timeout Function.

### TMOL Bit (Timeout L Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held low when the timeout function is enabled (RIICnFER.TMOE bit = 1).

### TMOH Bit (Timeout H Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held high when the timeout function is enabled (RIICnFER.TMOE bit = 1).

### SDDL[2:0] Bits (SDA Output Delay Setup Counter)

The SDA output can be delayed by the SDDL[2:0] setting. This counter works with the clock source selected by the DLCS bit. The setting of this function can be used for all types of SDA output, including the transmission of the acknowledge bit.

For details on this function, see Section 18.7, Facility for Delaying SDA Output.

CAUTION

Set the SDA output delay time to meet the $I^2C$ bus standard (within the data enable time/acknowledge enable time*1) or the SMBus standard (within the data hold time: 300 [ns] or more, and SCL-clock low-level period - the data setup time: 250 [ns]). Note that, if a value outside the standard is set, communication with communication devices may malfunction or it may seemingly become a start condition or stop condition depending on the bus state.

Note 1. Data enable time/acknowledge enable time
3,450 [ns] (0 to 100 [kbps]: standard mode (Sm))
900 [ns] (0 to 400 [kbps]: fast mode (Fm))

## 18.3.5 RIICnMR3 — I²C Bus Mode Register 3

**Access:** RIICnMR3 is a 32-bit readable/writable register.
RIICnMR3L and RIICnMR3H are 16-bit readable/writable registers.
RIICnMR3LL, RIICnMR3LH, RIICnMR3HL, and RIICnMR3HH are 8-bit readable/writable registers.

**Address:** RIICnMR3: <RIICn_base> + $0010_H$
RIICnMR3L: <RIICn_base> + $0010_H$, RIICnMR3H: <RIICn_base> + $0012_H$
RIICnMR3LL: <RIICn_base> + $0010_H$, RIICnMR3LH: <RIICn_base> + $0011_H$, RIICnMR3HL: <RIICn_base> + $0012_H$,
RIICnMR3HH: <RIICn_base> + $0013_H$

**Initial Value:** $0000\ 0000_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | W | R/W | R | R/W | R/W |

**Table 18.10 RIICnMR3 register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 7 | SMBE | SMBus/I²C Bus Selection<br>0: I²C bus is selected.<br>1: SMBus is selected. |
| 6 | WAIT*2 | WAIT<br>0: No WAIT<br>(The period between ninth clock cycle and first clock cycle is not held low.)<br>1: WAIT<br>(The period between ninth clock cycle and first clock cycle is held low.)<br>Low-hold is released by reading RIICnDRR. |
| 5 | RDRFS*2 | RDRF Flag Set Timing Selection<br>0: The RDRF flag is set at the rising edge of the ninth SCL clock cycle.<br>(The SCL line is not held low at the falling edge of the eighth clock cycle.)<br>1: The RDRF flag is set at the rising edge of the eighth SCL clock cycle.<br>(The SCL line is held low at the falling edge of the eighth clock cycle.) Low-hold is released by writing a value to the ACKBT bit. |
| 4 | ACKWP*1 | ACKBT Write Protect<br>0: Modification of the ACKBT bit is disabled.<br>1: Modification of the ACKBT bit is enabled. |
| 3 | ACKBT*1 | Transmit Acknowledge<br>0: A 0 is sent as the acknowledge bit (ACK transmission).<br>1: A 1 is sent as the acknowledge bit (NACK transmission). |
| 2 | ACKBR | Receive Acknowledge<br>0: A 0 is received as the acknowledge bit (ACK reception).<br>1: A 1 is received as the acknowledge bit (NACK reception). |
| 1, 0 | NF[1:0] | Noise Filter Stage Selection<br>b1 b0<br>0 0: Noise of up to one IICϕ cycle is filtered out (single-stage filter).<br>0 1: Noise of up to two IICϕ cycles is filtered out (2-stage filter).<br>1 0: Noise of up to three IICϕ cycles is filtered out (3-stage filter).<br>1 1: Noise of up to four IICϕ cycles is filtered out (4-stage filter). |

Note 1. If it is attempted to write 1 to both ACKWP and ACKBT bits, the ACKBT bit cannot be set to 1.

Note 2. The WAIT and RDRFS bits are valid only in receive mode (invalid in transmit mode).

### NF[1:0] Bits (Noise Filter Stage Selection)

These bits are used to select the width of noise that can be removed from the signals input to RIICnSCL or RIICnSDA pin.

### ACKBR Bit (Receive Acknowledge)

This bit is used to store the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

When 1 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When 0 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

### ACKBT Bit (Transmit Acknowledge)

This bit is used to set the bit to be sent at the acknowledge timing in receive mode.

[Setting condition]

When 1 is written to this bit with the ACKWP bit set to 1

[Clearing conditions]

- When 0 is written to this bit with the ACKWP bit set to 1
- When stop condition issuance is detected
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

CAUTION

The ACKBT bit must be written to while the ACKWP bit is 1. If the ACKBT bit is written to with the ACKWP bit cleared to 0, writing to the ACKBT bit is disabled.

### ACKWP Bit (ACKBT Write Protect)

This bit is used to control the modification of the ACKBT bit.

### RDRFS Bit (RDRF Flag Set Timing Selection)

This bit is used to select the RDRF flag set timing in receive mode and also to select whether to hold the SCL line low at the falling edge of the eighth SCL clock cycle.

When the RDRFS bit is 0, the SCL line is not held low at the falling edge of the eighth SCL clock cycle, and the RDRF flag is set to 1 at the rising edge of the ninth SCL clock cycle.

When the RDRFS bit is 1, the RDRF flag is set to 1 at the rising edge of the eighth SCL clock cycle and the SCL line is held low at the falling edge of the eighth SCL clock cycle. The low-hold of the SCL line is released by writing a value to the ACKBT bit.

After data is received with this setting, the SCL line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1) according to receive data.

### WAIT Bit (WAIT)

This bit is used to control whether to hold the period between the ninth SCL clock cycle and the first SCL clock cycle low until the receive data buffer (RIICnDRR) is completely read each time single-byte data is received in receive mode.

When the WAIT bit is 0, the receive operation is continued without holding the period between the ninth and the first SCL clock cycle low. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCL line is held low from the falling edge of the ninth clock cycle until the RIICnDRR value is read each time single-byte data is received. This enables receive operation in byte units.

CAUTION

When the value of the WAIT bit is to be read, be sure to read the RIICnDRR beforehand.

### SMBE Bit (SMBus Select)

Setting this bit to 1 enables the RIICnSER.HOAE bit.

## 18.3.6 RIICnFER — I²C Bus Function Enable Register

**Access:** RIICnFER is a 32-bit readable/writable register.
RIICnFERL and RIICnFERH are 16-bit readable/writable registers.
RIICnFERLL, RIICnFERLH, RIICnFERHL, and RIICnFERHH are 8-bit readable/writable registers.

**Address:** RIICnFER: <RIICn_base> + $0014_H$
RIICnFERL: <RIICn_base> + $0014_H$, RIICnFERH: <RIICn_base> + $0016_H$
RIICnFERLL: <RIICn_base> + $0014_H$, RIICnFERLH: <RIICn_base> + $0015_H$, RIICnFERHL: <RIICn_base> + $0016_H$,
RIICnFERHH: <RIICn_base> + $0017_H$

**Initial Value:** $0000\ 0072_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 18.11 RIICnFER register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 7 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 6 | SCLE | SCL Synchronous Circuit Enable<br>0: No SCL synchronous circuit is used.<br>1: An SCL synchronous circuit is used. |
| 5 | NFE | Digital Noise Filter Circuit Enable<br>0: No digital noise filter circuit is used.<br>1: A digital noise filter circuit is used. |
| 4 | NACKE | NACK Reception Transfer Suspension Enable<br>0: Transfer operation is not suspended during NACK reception (transfer suspension disabled).<br>1: Transfer operation is suspended during NACK reception (transfer suspension enabled). |
| 3 | SALE | Slave Arbitration-Lost Detection Enable<br>0: Slave arbitration-lost detection is disabled.<br>1: Slave arbitration-lost detection is enabled. |
| 2 | NALE | NACK Transmission Arbitration-Lost Detection Enable<br>0: NACK transmission arbitration-lost detection is disabled.<br>1: NACK transmission arbitration-lost detection is enabled. |
| 1 | MALE | Master Arbitration-Lost Detection Enable<br>0: Master arbitration-lost detection is disabled.<br>(Disables the arbitration-lost detection function and does not clear the RIICnCR2.MST and TRS bits automatically when arbitration is lost.)<br>1: Master arbitration-lost detection is enabled.<br>(Enables the arbitration-lost detection function and clears the RIICnCR2.MST and TRS bits automatically when arbitration is lost.) |
| 0 | TMOE | Timeout Function Enable<br>0: The timeout function is disabled.<br>1: The timeout function is enabled. |

#### TMOE Bit (Timeout Function Enable)

This bit is used to enable or disable the timeout function.

For details on the timeout function, see Section 18.13.1, Timeout Function.

#### MALE Bit (Master Arbitration-Lost Detection Enable)

This bit is used to specify whether to use the arbitration-lost detection function in master mode. Normally, set this bit to 1.

#### NALE Bit (NACK Transmission Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when ACK is detected during transmission of NACK in receive mode (such as when slaves with the same address exist on the bus or when two or more masters select the same slave device simultaneously with different number of receive bytes).

#### SALE Bit (Slave Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode (such as when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs due to noise).

#### NACKE Bit (NACK Reception Transfer Suspension Enable)

This bit is used to specify whether to continue or discontinue the transfer operation when NACK is received in transmit mode. Normally, set this bit to 1.

When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended.

When the NACKE bit is 0, the next transfer operation is continued regardless of the received acknowledge content.

#### SCLE Bit (SCL Synchronous Circuit Enable)

This bit is used to specify whether to synchronize the SCL clock with the SCL input clock. Normally, set this bit to 1.

When the SCLE bit is cleared to 0 (SCL synchronous circuit not used), the RIIC does not synchronize the SCL clock with the SCL input clock. In this setting, the RIIC outputs the SCL clock with the transfer rate set in RIICnBRH and RIICnBRL regardless of the SCL line state. For this reason, if the bus load of the $I^2C$ bus line is much larger than the specification value or if the SCL clock output overlaps in multiple masters, the short-cycle SCL clock that does not meet the specification may be output. When no SCL synchronous circuit is used, it also affects the issuance of a start condition, restart condition, and stop condition, and the continuous output of extra SCL clock cycles.

This bit must not be cleared to 0 except for checking the output of the transfer rate.

## 18.3.7 RIICnSER — I²C Bus Status Enable Register

**Access:** RIICnSER is a 32-bit readable/writable register.
RIICnSERL and RIICnSERH are 16-bit readable/writable registers.
RIICnSERLL, RIICnSERLH, RRIICnSERHL, and RIICnSERHH are 8-bit readable/writable registers.

**Address:** RIICnSER: <RIICn_base> + $0018_H$
RIICnSERL: <RIICn_base> + $0018_H$, RIICnSERH: <RIICn_base> + $001A_H$
RIICnSERLL: <RIICn_base> + $0018_H$, RIICnSERLH: <RIICn_base> + $0019_H$, RIICnSERHL: <RIICn_base> + $001A_H$,
RIICnSERHH: <RIICn_base> + $001B_H$

**Initial Value:** $0000\ 0009_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R/W | R/W | R/W |

**Table 18.12 RIICnSER register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 7 | HOAE | Host Address Enable<br>0: Host address detection is disabled.<br>1: Host address detection is enabled. |
| 6 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 5 | DIDE | Device-ID Address Detection Enable<br>0: Device-ID address detection is disabled.<br>1: Device-ID address detection is enabled. |
| 4 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 3 | GCE | General Call Address Enable<br>0: General call address detection is disabled.<br>1: General call address detection is enabled. |
| 2 | SAR2 | Slave Address Register 2 Enable<br>0: Slave address in RIICnSAR2 is disabled.<br>1: Slave address in RIICnSAR2 is enabled. |
| 1 | SAR1 | Slave Address Register 1 Enable<br>0: Slave address in RIICnSAR1 is disabled.<br>1: Slave address in RIICnSAR1 is enabled. |
| 0 | SAR0 | Slave Address Register 0 Enable<br>0: Slave address in RIICnSAR0 is disabled.<br>1: Slave address in RIICnSAR0 is enabled. |

#### SARy Bit (Slave Address Register y Enable) (y = 0 to 2)

This bit is used to enable or disable the received slave address and the slave address set in RIICnSARy.

When this bit is set to 1, the slave address set in RIICnSARy is enabled and is compared with the received slave address.

When this bit is cleared to 0, the slave address set in RIICnSARy is disabled and is ignored even if it matches the received slave address.

#### GCE Bit (General Call Address Enable)

This bit is used to specify whether to ignore the general call address ($0000\ 000_B$ + 0 [W]: All 0) when it is received.

When this bit is set to 1, if the received slave address matches the general call address, the RIIC recognizes the received slave address as the general call address independently of the slave addresses set in RIICnSARy (y = 0 to 2) and performs data receive operation.

When this bit is cleared to 0, the received slave address is ignored even if it matches the general call address.

#### DIDE Bit (Device-ID Address Detection Enable)

This bit is used to specify whether to recognize and execute the Device-ID address when a device ID ($1111\ 100_B$) is received in the first frame after a start condition or restart condition is detected.

When this bit is set to 1, if the received first frame matches the device ID, the RIIC recognizes that the Device-ID address has been received. When the following R/W# bit is 0 [W], the RIIC recognizes the second and the following frames as slave addresses and continues the receive operation.

When this bit is cleared to 0, the RIIC ignores the received first frame even if it matches the device ID address and recognizes the first frame as a normal slave address.

For details on the device-ID address detection, see **Section 18.9.3, Device-ID Address Detection**.

#### HOAE Bit (Host Address Enable)

This bit is used to specify whether to ignore received host address ($0001\ 000_B$) when the RIICnMR3.SMBS bit is 1.

When this bit is set to 1 while the RIICnMR3.SMBS bit is 1, if the received slave address matches the host address, the RIIC recognizes the received slave address as the host address independently of the slave addresses set in RIICnSARy (y = 0 to 2) and performs the receive operation.

When the RIICnMR3.SMBS bit or the HOAE bit is cleared to 0, the received slave address is ignored even if it matches the host address.

## 18.3.8 RIICnIER — I²C Bus Interrupt Enable Register

**Access:** RIICnIER is a 32-bit readable/writable register.
RIICnIERL and RIICnIERH are 16-bit readable/writable registers.
RIICnIERLL, RIICnIERLH, RIICnIERHL, and RIICnIERHH are 8-bit readable/writable registers.

**Address:** RIICnIER: <RIICn_base> + $001C_H$
RIICnIERL: <RIICn_base> + $001C_H$, RIICnIERH: <RIICn_base> + $001E_H$
RIICnIERLL: <RIICn_base> + $001C_H$, RIICnIERLH: <RIICn_base> + $001D_H$, RIICnIERHL: <RIICn_base> + $001E_H$,
RIICnIERHH: <RIICn_base> + $001F_H$

**Initial Value:** $0000\ 0000_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 18.13 RIICnIER register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 7 | TIE | Transmit Data Empty Interrupt Enable<br>0: Transmit data empty interrupt request (INTRIICTI) is disabled.<br>1: Transmit data empty interrupt request (INTRIICTI) is enabled. |
| 6 | TEIE | Transmit End Interrupt Enable<br>0: Transmit end interrupt request (INTRIICTEI) is disabled.<br>1: Transmit end interrupt request (INTRIICTEI) is enabled. |
| 5 | RIE | Receive Data Full Interrupt Enable<br>0: Receive data full interrupt request (INTRIICRI) is disabled.<br>1: Receive data full interrupt request (INTRIICRI) is enabled. |
| 4 | NAKIE | NACK Reception Interrupt Enable<br>0: NACK reception interrupt request (INTRIICNAKI) is disabled.<br>1: NACK reception interrupt request (INTRIICNAKI) is enabled. |
| 3 | SPIE | Stop Condition Detection Interrupt Enable<br>0: Stop condition detection interrupt request (INTRIICSPI) is disabled.<br>1: Stop condition detection interrupt request (INTRIICSPI) is enabled. |
| 2 | STIE | Start Condition Detection Interrupt Enable<br>0: Start condition detection interrupt request (INTRIICSTI) is disabled.<br>1: Start condition detection interrupt request (INTRIICSTI) is enabled. |
| 1 | ALIE | Arbitration-Lost Interrupt Enable<br>0: Arbitration-lost interrupt request (INTRIICALI) is disabled.<br>1: Arbitration-lost interrupt request (INTRIICALI) is enabled. |
| 0 | TMOIE | Timeout Interrupt Enable<br>0: Timeout interrupt request (INTRIICTMOI) is disabled.<br>1: Timeout interrupt request (INTRIICTMOI) is enabled. |

#### TMOIE Bit (Timeout Interrupt Enable)

This bit is used to enable or disable timeout interrupt requests (INTRIICTMOI) when the RIICnSR2.TMOF flag is set to 1. An INTRIICTMOI interrupt request is canceled by clearing the TMOF flag or the TMOIE bit to 0.

#### ALIE Bit (Arbitration-Lost Interrupt Enable)

This bit is used to enable or disable arbitration-lost interrupt requests (INTRIICALII) when the RIICnSR2.AL flag is set to 1. An INTRIICALII interrupt request is canceled by clearing the AL flag or the ALIE bit to 0.

#### STIE Bit (Start Condition Detection Interrupt Enable)

This bit is used to enable or disable start condition detection interrupt requests (INTRIICSTI) when the RIICnSR2.START flag is set to 1. An INTRIICSTI interrupt request is canceled by clearing the START flag or the STIE bit to 0.

#### SPIE Bit (Stop Condition Detection Interrupt Enable)

This bit is used to enable or disable stop condition detection interrupt requests (INTRIICSPI) when the RIICnSR2.STOP flag is set to 1. An INTRIICSPI interrupt request is canceled by clearing the STOP flag or the SPIE bit to 0.

#### NAKIE Bit (NACK Reception Interrupt Enable)

This bit is used to enable or disable NACK reception interrupt requests (INTRIICNAKI) when the RIICnSR2.NACKF flag is set to 1. An INTRIICNAKI interrupt request is canceled by clearing the NACKF flag or the NAKIE bit to 0.

#### RIE Bit (Receive Data Full Interrupt Enable)

This bit is used to enable or disable receive data full interrupt requests (INTRIICRI) when the RIICnSR2.RDRF flag in ICSR2 is set to 1. An INTRIICRI interrupt request is canceled by clearing the RDRF flag or the RIE bit to 0.

#### TEIE Bit (Transmit End Interrupt Enable)

This bit is used to enable or disable transmit end interrupts (INTRIICTEI) when the RIICnSR2.TEND flag is set to 1. An INTRIICTEI interrupt request is canceled by clearing the TEND flag or the TEIE bit to 0.

#### TIE Bit (Transmit Data Empty Interrupt Enable)

This bit is used to enable or disable transmit data empty interrupts (INTRIICTI) when the RIICnSR2.TDRE flag is set to 1.

## 18.3.9 RIICnSR1 — I²C Bus Status Register 1

**Access:** RIICnSR1 is a 32-bit readable/writable register.
RIICnSR1L and RIICnSR1H are 16-bit readable/writable registers.
RIICnSR1LL, RIICnSR1LH, RIICnSR1HL, and RIICnSR1HH are 8/1-bit readable/writable registers.

**Address:** RIICnSR1: <RIICn_base> + $0020_H$
RIICnSR1L: <RIICn_base> + $0020_H$, RIICnSR1H: <RIICn_base> + $0022_H$
RIICnSR1LL: <RIICn_base> + $0020_H$, RIICnSR1LH: <RIICn_base> + $0021_H$, RIICnSR1HL: <RIICn_base> + $0022_H$,
RIICnSR1HH: <RIICn_base> + $0023_H$

**Initial Value:** $0000\ 0000_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. Only 0 can be written to this bit.

**Table 18.14 RIICnSR1 register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 7 | HOA | Host Address Detection Flag<br>0: Host address is not detected.<br>1: Host address is detected. |
| 6 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 5 | DID | Device-ID Address Detection Flag<br>0: Device-ID command is not detected.<br>1: Device-ID command is detected. |
| 4 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 3 | GCA | General Call Address Detection Flag<br>0: General call address is not detected.<br>1: General call address is detected. |
| 2 | AAS2 | Slave Address 2 Detection Flag<br>0: Slave address 2 is not detected.<br>1: Slave address 2 is detected. |
| 1 | AAS1 | Slave Address 1 Detection Flag<br>0: Slave address 1 is not detected.<br>1: Slave address 1 is detected. |
| 0 | AAS0 | Slave Address 0 Detection Flag<br>0: Slave address 0 is not detected.<br>1: Slave address 0 is detected. |

### AASy Flag (Slave Address y Detection) (y = 0 to 2)

[Setting conditions]

<For 7-bit address format: RIICnSARy.FSy = 0>

When the received slave address matches the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

When the received slave address matches a value of (1111 $0_B$ + RIICnSARy.SVA[9:8]) and the following address matches the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy bit after reading AASy = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

<For 7-bit address format: RIICnSARy.FSy = 0>

- When the received slave address does not match the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

- When the received slave address does not match a value of (1111 $0_B$ + RIICnSARy.SVA[9:8]) with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the received slave address matches a value of (1111 $0_B$ + RIICnSARy.SVA[9:8]) and the following address does not match the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

### GCA Flag (General Call Address Detection)

[Setting condition]

When the received slave address matches the general call address (0000 $000_B$ + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA bit after reading GCA = 1
- When a stop condition is detected
- When the received slave address does not match the general call address (0000 $000_B$ + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### DID Flag (Device-ID Address Detection)

[Setting condition]

- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID ($1111\ 100_B$) + 0 [W]) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.
- When a restart condition is detected after a match with the device ID address and the device ID address ($1111\ 100_B$) + 1 [R] has matched with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID bit after reading DID = 1
- When a stop condition is detected
- When the first frame received immediately after a start condition or restart condition is detected does not match a value of (device ID ($1111\ 100_B$)) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID ($1111\ 100_B$) + 0 [W]) and the second frame does not match any of slave addresses 0 to 2 with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### HOA Flag (Host Address Detection)

[Setting condition]

When the received slave address matches the host address ($0001\ 000_B$) while the RIICnMR3.SMBE bit and RIICnSER.HOAE bit are set to 1 (host address detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the HOA bit after reading HOA = 1
- When a stop condition is detected
- When 0 is written to the RIICnMR3.SMBS bit in ICMR3 or the RIICnSER.HOAE bit
- When the received slave address does not match the host address ($0001\ 000_B$) with the RIICnSER.HOAE bit set to 1 (host address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit 1 to apply an RIIC reset or an internal reset

## 18.3.10 RIICnSR2 — I²C Bus Status Register 2

**Access:** RIICnSR2 is a 32-bit readable/writable register.
RIICnSR2L and RIICnSR2H are 16-bit readable/writable registers.
RIICnSR2LL, RIICnSR2LH, RIICnSR2HL, and RIICnSR2HH are 8/1-bit readable/writable registers.

**Address:** RIICnSR2: <RIICn_base> + $0024_H$
RIICnSR2L: <RIICn_base> + $0024_H$, RIICnSR2H: <RIICn_base> + $0026_H$
RIICnSR2LL: <RIICn_base> + $0024_H$, RIICnSR2LH: <RIICn_base> + $0025_H$, RIICnSR2HL: <RIICn_base> + $0026_H$, RIICnSR2HH: <RIICn_base> + $0027_H$

**Initial Value:** $0000\ 0000_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TDRE | TEND | RDRF | NACKF | STOP | START | AL | TMOF |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R(/W)*1 | R(/W)*1 | R(/W)*1 | R(/W)*1 | R(/W)*1 | R(/W)*1 | R(/W)*1 |

Note 1. Only 0 can be written to this bit.

**Table 18.15 RIICnSR2 register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 7 | TDRE | Transmit Data Empty Flag<br>0: RIICnDRT contains transmit data.<br>1: RIICnDRT contains no transmit data. |
| 6 | TEND | Transmit End Flag<br>0: Data is being transmitted.<br>1: Data has been transmitted. |
| 5 | RDRF | Receive Data Full Flag<br>0: RIICnDRR contains no receive data.<br>1: RIICnDRR contains receive data. |
| 4 | NACKF | NACK Reception Flag<br>0: NACK is not received.<br>1: NACK is received. |
| 3 | STOP | Stop Condition Detection Flag<br>0: Stop condition is not detected.<br>1: Stop condition is detected. |
| 2 | START | Start Condition Detection Flag<br>0: Start condition is not detected.<br>1: Start condition is detected. |
| 1 | AL | Arbitration-Lost Flag<br>0: Arbitration is not lost.<br>1: Arbitration is lost. |
| 0 | TMOF | Timeout Flag<br>0: No timeout has occurred.<br>1: Timeout has occurred. |

### TMOF Flag (Timeout)

This flag is set to 1 when the RIIC recognizes timeout after the SCL line state remains unchanged for a certain period.

[Setting condition]

The timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is held low or high during the following conditions:

- The bus is busy (RIICnCR2.BBSY = 1) in master mode (RIICnCR2.MST = 1).
- The slave address matches that of this module (RIICnSR1 register is not $00_H$) and the bus is busy (RIICnCR2.BBSY = 1) in slave mode (RIICnCR2.MST = 0).
- Issuing of a start condition is being requested (RIICnCR2.ST = 1) and the bus is free (RIICnCR2.BBSY = 0).

[Clearing conditions]

- When 0 is written to the TMOF bit after reading TMOF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### AL Flag (Arbitration-Lost)

This flag shows that bus mastership has been lost (loss in arbitration) due to a bus conflict or some other reason when a start condition is issued or an address and data are transmitted. The RIIC monitors the level on the SDA line during transmission and, if the level on the line does not match the value of the bit being output, sets the value of the AL bit to 1 to indicate that the bus is occupied by another device.

The RIIC can also set the flag to indicate the detection of loss of arbitration during NACK transmission in receive mode or during data transmission in slave mode.

[Setting conditions]

<When master arbitration-lost detection is enabled: RIICnFER.MALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data (including slave address) transmission in master transmit mode (when the SDA line is driven low while the internal SDA output is at a high level (the SDA pin is in the high-impedance state))
- When a start condition is detected while the RIICnCR2.ST bit is 1 (start condition issuance request) or the internal SDA output state does not match the SDA line level
- When the RIICnCR2.ST bit is set to 1 (start condition issuance request) with the RIICnCR2.BBSY flag set to 1.

<When NACK arbitration-lost detection is enabled: RIICnFER.NALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock in the ACK period during NACK transmission in receive mode

<When slave arbitration-lost detection is enabled: RIICnFER.SALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data transmission in slave transmit mode

[Clearing conditions]

- When 0 is written to the AL bit after reading AL = 1

- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**Table 18.16 Relationship between Arbitration-Lost Generation Sources and Arbitration-Lost Enable Functions**

| RIICnFER | | | RIICnSR2 | | |
|---|---|---|---|---|---|
| MALE | NALE | SALE | AL | Error | Arbitration-Lost Generation Source |
| 1 | x | x | 1 | Start condition issuance error | When internal SDA output state does not match SDA line level when a start condition is detected while the RIICnCR2.ST bit is 1 |
| | | | | | When RIICnCR2.ST is set to 1 with RIICnCR2.BBSY set to 1 |
| | | | 1 | Transmit data mismatch | When transmit data (including slave address) does not match the bus state in master transmit mode |
| x | 1 | x | 1 | NACK transmission mismatch | When ACK is detected during transmission of NACK in master receive mode or slave receive mode |
| x | x | 1 | 1 | Transmit data mismatch | When transmit data does not match the bus state in slave transmit mode |

x: Don't care

### START Flag (Start Condition Detection)

[Setting condition]

When a start condition (or a restart condition) is detected

[Clearing conditions]

- When 0 is written to the START bit after reading START = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### STOP Flag (Stop Condition Detection)

[Setting condition]

When a stop condition is detected

[Clearing conditions]

- When 0 is written to the STOP bit after reading STOP = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### NACKF Flag (NACK Reception)

[Setting condition]

When acknowledge is not received (NACK is received) from the receive device in transmit mode with the RIICnFER.NACKE bit set to 1 (transfer suspension enabled)

[Clearing conditions]

- When 0 is written to the NACKF bit after reading NACKF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTION

When the NACKF flag is set to 1, the RIIC suspends data transmission/reception. Writing to RIICnDRT in transmit mode or reading from RIICnDRR in receive mode with the NACKF flag set to 1 does not enable data transmit/receive operation. To restart data transmission/reception, clear the NACKF flag to 0.

### RDRF Flag (Receive Data Full)

[Setting conditions]

- Slave receive mode
  - When the received slave address matches and the RIICnCR2.TRS bit is cleared to 0 after a start condition (or a restart condition) is detected
  - At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit) after receive data is transferred from RIICnDRS to RIICnDRR
- Master receive mode
  - When the slave address and the data direction are transmitted and the receive mode is entered (the RIICnCR2.TRS bit is set to 0) after a start condition (or a restart condition) is issued
  - At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit) after receive data is transferred from RIICnDRS to RIICnDRR

[Clearing conditions]

- When 0 is written to the RDRF bit after reading RDRF = 1
- When data is read from RIICnDRR
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### TEND Flag (Transmit End)

[Setting condition]

At the rising edge of the ninth SCL clock cycle while the TDRE flag is 1

[Clearing conditions]

- When 0 is written to the TEND bit after reading TEND = 1
- When data is written to RIICnDRT
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### TDRE Flag (Transmit Data Empty)

[Setting conditions]

- When data has been transferred from RIICnDRT to RIICnDRS and RIICnDRT becomes empty
- When the RIICnCR2.TRS bit is set to 1
  - When the RIICnCR2.MST bit is set to 1 after a start condition (or a restart condition) is detected
  - When the RIIC enters transmit mode from receive mode
- When the received slave address matches while the TRS bit is 1

[Clearing conditions]

- When data is written to RIICnDRT
- When the RIICnCR2.TRS bit is cleared to 0
  - When a stop condition is detected
  - When the RIIC enters receive mode from transmit mode
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTION

When the NACKF flag is set to 1 while the RIICnFER.NACKE bit is 1, the RIIC suspends data transmission/reception. Here, if the TDRE flag is 0 (next transmit data has been written), data is transferred to the RIICnDRS register and the RIICnDRT register becomes empty at the rising edge of the ninth clock cycle, but the TDRE flag is not set to 1.

## 18.3.11 RIICnSARy — I²C Slave Address Register y (y = 0 to 2)

**Access:** RIICnSARy is a 32-bit readable/writable register.
RIICnSARyL and RIICnSARyH are 16-bit readable/writable registers.
RIICnSARyLL, RIICnSARyLH, RIICnSARyHL, and RIICnSARyHH are 8-bit readable/writable registers.

**Address:** RIICnSAR0: <RIICn_base> + $0028_H$
RIICnSAR0L: <RIICn_base> + $0028_H$, RIICnSAR0H: <RIICn_base> + $002A_H$
RIICnSAR0LL: <RIICn_base> + $0028_H$, RIICnSAR0LH: <RIICn_base> + $0029_H$, RIICnSAR0HL: <RIICn_base> + $002A_H$,
RIICnSAR0HH: <RIICn_base> + $002B_H$
RIICnSAR1: <RIICn_base> + $002C_H$
RIICnSAR1L: <RIICn_base> + $002C_H$, RIICnSAR1H: <RIICn_base> + $002E_H$
RIICnSAR1LL: <RIICn_base> + $002C_H$, RIICnSAR1LH: <RIICn_base> + $002D_H$, RIICnSAR1HL: <RIICn_base> + $002E_H$,
RIICnSAR1HH: <RIICn_base> + $002F_H$
RIICnSAR2: <RIICn_base> + $0030_H$
RIICnSAR2L: <RIICn_base> + $0030_H$, RIICnSAR2H: <RIICn_base> + $0032_H$
RIICnSAR2LL: <RIICn_base> + $0030_H$, RIICnSAR2LH: <RIICn_base> + $0031_H$, RIICnSAR2HL: <RIICn_base> + $0032_H$,
RIICnSAR2HH: <RIICn_base> + $0033_H$

**Initial Value:** $0000\ 0000_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | FSy | — | — | — | — | — | SVA[9:1] | | | | | | | | | SVA0 |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 18.17 RIICnSARy register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 15 | FSy | 7-Bit/10-Bit Address Format Selection<br>0: The 7-bit address format is selected.<br>1: The 10-bit address format is selected. |
| 14 to 10 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 9 to 1 | SVA[9:1] | 7-Bit Address/10-Bit Address Upper Bits<br>A slave address is set.<br>• When the FSy bit is 0 (7-bit address format), the SVA[7:1] bits are Valid and form a 7-bit slave address.<br>• When the FSy bit is 1 (10-bit address format), SVA[9:1] bits form a 10-bit slave address (combined with the SVA0 bit). |
| 0 | SVA0 | 10-Bit Address LSB<br>The least significant bit (LSB) of a 10-bit slave address is set.<br>• When the FSy bit is 0 (7-bit address format), this bit is invalid.<br>• When the FSy bit is 1 (10-bit address format), this bit is a 10-bit slave address (combined with the SVA[9:1] bits). |

### SVA0 Bit (10-Bit Address LSB)

When the 10-bit address format is selected (RIICnSARy.FSy = 1), this bit functions as the LSB of a 10-bit address and forms a 10-bit address in combination with the SVA[9:1] bits.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, this bit is valid. While the RIICnSARy.FSy bit or SARy bit is 0, the setting of this bit is ignored.

#### SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits)

When the 7-bit address format is selected (RIICnSARy.FSy = 0), these bits function as a 7-bit address. When the 10-bit address format is selected (RIICnSARy.FSy = 1), these bits function as a 10-bit address in combination with the SVA0 bit.
While the RIICnSER.SARy bit is 0, the setting of these bits is ignored.

#### FSy Bit (7-Bit/10-Bit Address Format Selection)

This bit is used to select 7-bit address or 10-bit address for slave address y (in RIICnSARy).

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 0, the 7-bit address format is selected for slave address y, the RIICnSARy.SVA[7:1] setting is valid, and the settings of the SVA[9:8] bits and the RIICnSARy.SVA0 bit are ignored.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, the 10-bit address format is selected for slave address y and the settings of the SVA[9:1] bits and the SVA0 bit are valid.

While the RIICnSER.SARy bit is 0 (RIICnSARy disabled), the setting of the RIICnSARy.FSy bit is invalid.

## 18.3.12 RIICnBRL — I²C Bus Bit Rate Low-Level Register

**Access:** RIICnBRL is a 32-bit readable/writable register.
RIICnBRLL and RIICnBRLH are 16-bit readable/writable registers.
RIICnBRLLL, RIICnBRLLH, RIICnBRLHL, and RIICnBRLHH are 8-bit readable/writable registers.

**Address:** RIICnBRL: <RIICn_base> + $0034_H$
RIICnBRLL: <RIICn_base> + $0034_H$, RIICnBRLH: <RIICn_base> + $0036_H$
RIICnBRLLL: <RIICn_base> + $0034_H$, RIICnBRLLH: <RIICn_base> + $0035_H$, RIICnBRLHL: <RIICn_base> + $0036_H$, RIICnBRLHH: <RIICn_base> + $0037_H$

**Initial Value:** 0000 $00FF_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 18.18 RIICnBRL register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 7 to 5 | — | Reserved<br>This bit is read as 1. The write value should be 1. |
| 4 to 0 | BRL[4:0] | Bit Rate Low-Level Period<br>Low-level period of SCL clock |

The RIICnBRL register is a 5-bit register that is used to set the width at low level for the SCL clock.

It also works to generate the data setup time for automatic SCL low-hold operation (see Section 18.10, Automatically Low-Hold Function for SCL); when the RIIC is used only in slave mode, this register needs to be set to a value equal to or longer than the data setup time*1.

RIICnBRL counts the low-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits.

Note 1. Data setup time ($t_{SU: DAT}$)
250 [ns] (0 to 100 [kbps]: standard mode (Sm))
100 [ns] (0 to 400 [kbps]: fast mode (Fm))

## 18.3.13 RIICnBRH — I²C Bus Bit Rate High-Level Register

**Access:** RIICnBRH is a 32-bit readable/writable register.
RIICnBRHL and RIICnBRHH are 16-bit readable/writable registers.
RIICnBRHLL, RIICnBRHLH, RIICnBRHHL, and RIICnBRHHH are 8-bit readable/writable registers.

**Address:** RIICnBRH: <RIICn_base> + $0038_H$
RIICnBRHL: <RIICn_base> + $0038_H$, RIICnBRHH: <RIICn_base> + $003A_H$
RIICnBRHLL: <RIICn_base> + $0038_H$, RIICnBRHLH: <RIICn_base> + $0039_H$, RIICnBRHHL: <RIICn_base> + $003A_H$,
RIICnBRHHH:<RIICn_base> + $003B_H$

**Initial Value:** 0000 $00FF_H$ This register is initialized by any reset.

**Table 18.19 RIICnBRH register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | — | Reserved<br>This bit is read as 0. The write value should be 0. |
| 7 to 5 | — | Reserved<br>This bit is read as 1. The write value should be 1. |
| 4 to 0 | BRH[4:0] | Bit Rate High-Level Period<br>High-level period of SCL clock |

RIICnBRH is a 5-bit register to set the high-level period of SCL clock. RIICnBRH is valid in master mode. If the RIIC is used only in slave mode, this register need not to set the high-level period.

RIICnBRH counts the high-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits in ICMR1.

The frequency and duty cycle are calculated using one of the following expressions (1) to (5) according to the register settings.

CAUTION

The minimum value that can be specified in RIICnBRL and RIICnBRH is determined according to the values of the SCLE and NFE bits in RIICnFER and the NF bit in RIICnMR3. For details of the minimum specifiable value, see Table 18.20.

(1) When SCLE = 0

Frequency = 1 / {[ (BRH + 1) + (BRL + 1)] / IICϕ + tr + tf}

Duty cycle = {tr + (BRH + 1) / IICϕ} / {tr + tf + [(BRH + 1) + (BRL + 1)] / IICϕ}

(2) When SCLE = 1, NFE = 0, CKS = 000 (IICϕ = P0ϕ)
Frequency = 1 / {[(BRH + 3) + (BRL + 3)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 3) / IICϕ} / {tr + tf + [(BRH + 3) + (BRL + 3) ] / IICϕ}

(3) When SCLE = 1, NFE = 1, CKS = 000 (IICϕ = P0ϕ)
Frequency = 1 / {[(BRH + 3 + nf) + (BRL + 3 + nf)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 3 + nf) / IICϕ} / {tr + tf + [(BRH + 3 + nf) + (BRL + 3 + nf)] / IICϕ}

(4) When SCLE = 1, NFE = 0, CKS ≠ 000 (IICϕ < P0ϕ)
Frequency = 1 / {[(BRH + 2) + (BRL + 2)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 2) / IICϕ} / {tr + tf + [(BRH + 2) + (BRL + 2) ] / IICϕ}

(5) When SCLE = 1, NFE = 1, CKS ≠ 000 (IICϕ < P0ϕ)
Frequency = 1 / {[(BRH + 2 + nf) + (BRL + 2 + nf)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 2 + nf) / IICϕ} / {tr + tf + [(BRH + 2 + nf) + (BRL + 2 + nf) ] / IICϕ}

Symbols in the expressions

SCLE: RIICnFER.SCLE bit

BRH: RIICnBRH.BRH[4:0] bits

BRL: RIICnBRL.BRL[4:0] bits

CKS: RIICnMR1.CKS bits

NFE: RIICnFER.NFE bit

IICϕ: Internal reference clock selected by the CKS bits

tf: SCL signal falling time [s] *1

tr: SCL signal rising time [s] *1

nf: Number of digital noise filter stages specified in the RIICnMR3.NF[0.1] bits

Note 1. The rising time (tr) and falling time (tf) of the SCL signal depend on the total capacitance of the bus line (Cb) and pull-up resistor (Rp). For details, see I²C Bus Standard from NXP Semiconductors.

**Table 18.20 Minimum Specifiable Value for RIICnBRL and RIICnBRH**

| SCLE | NFE | nf | Minimum Pulse Width that Passes through Digital Filter | Minimum Specifiable Value for BRH and BRL | Pulse Width when Minimum Value is Specified |
|---|---|---|---|---|---|
| 0 | 0 | — | 1 × IICϕ | 1 | 2 × IICϕ |
| 0 | 1 | 1 | 2 × IICϕ | 2 | 3 × IICϕ |
| 0 | 1 | 2 | 3 × IICϕ | 3 | 4 × IICϕ |
| 0 | 1 | 3 | 4 × IICϕ | 4 | 5 × IICϕ |
| 0 | 1 | 4 | 5 × IICϕ | 5 | 6 × IICϕ |
| IICϕ cycle > P0ϕ cycle (CKS ≠ 000) | | | | | |
| 1 | 0 | — | 1 × IICϕ | 0 | 2 × IICϕ |
| 1 | 1 | 1 | 2 × IICϕ | 1 | 4 × IICϕ |

## 18.3.14 RIICnDRT — I²C Bus Transmit Data Register

**Access:** RIICnDRT is a 32-bit readable/writable register.
RIICnDRTL and RIICnDRTH are 16-bit readable/writable registers.
RIICnDRTLL, RIICnDRTLH, RIICnDRTHL, and RIICnDRTHH are 8-bit readable/writable registers.

**Address:** RIICnDRT: <RIICn_base> + $003C_H$
RIICnDRTL: <RIICn_base> + $003C_H$, RIICnDRTH: <RIICn_base> + $003E_H$
RIICnDRTLL: <RIICn_base> + $003C_H$, RIICnDRTLH: <RIICn_base> + $003D_H$, RIICnDRTHL: <RIICn_base> + $003E_H$,
RIICnDRTHH: <RIICn_base> + $003F_H$

**Initial Value:** 0000 $00FF_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | DRT[7:0] | | | | | | | |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

When RIICnDRT detects a space in the $I^2C$ bus shift register (RIICnDRS), it transfers the transmit data that has been written to RIICnDRT to RIICnDRS and starts transmitting data in transmit mode.

The double-buffer structure of RIICnDRT and RIICnDRS allows continuous transmit operation if the next transmit data has been written to RIICnDRT while the RIICnDRS data is being transmitted.

RIICnDRT can always be read and written. Write transmit data to RIICnDRT once when a transmit data empty interrupt (INTRIICTI) request is generated. When writing to bits 8 to 15, be sure to write 0 to these bits.

## 18.3.15 RIICnDRR — I²C Bus Receive Data Register

**Access:** RIICnDRR is a 32-bit readable/writable register.
RIICnDRRL and RIICnDRRH are 16-bit readable/writable registers.
RIICnDRRLL, RIICnDRRLH, RIICnDRRHL, and RIICnDRRHH are 8-bit readable/writable registers.

**Address:** RIICnDRR: <RIICn_base> + $0040_H$
RIICnDRRL: <RIICn_base> + $0040_H$, RIICnDRRH: <RIICn_base> + $0042_H$
RIICnDRRLL: <RIICn_base> + $0040_H$, RIICnDRRLH: <RIICn_base> + $0041_H$, RIICnDRRHL: <RIICn_base> + $0042_H$,
RIICnDRRHH: <RIICn_base> + $0043_H$

**Initial Value:** $0000\ 0000_H$ This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

When 1 byte of data has been received, the received data is transferred from the $I^2C$ bus shift register (RIICnDRS) to RIICnDRR to enable the next data to be received.

The double-buffer structure of RIICnDRS and RIICnDRR allows continuous receive operation if the received data has been read from RIICnDRR while RIICnDRS is receiving data.

RIICnDRR cannot be written. Read data from RIICnDRR once when a receive data full interrupt (INTRIICRI) request is generated.

If DRR receives the next receive data before the current data is read from RIICnDRR (while the RIICnSR2.RDRF flag is 1), the RIIC automatically holds the SCL clock low one cycle before the RDRF flag is set to 1 next.

## 18.3.16 RIICnDRS — I²C Bus Shift Register

**Access:** This register is not accessible.

**Address:** —

**Initial Value:** 0000 00FF$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

RIICnDRS is an 8-bit shift register to transmit and receive data.

During transmission, transmit data is transferred from RIICnDRT to RIICnDRS and is sent from the SDA pin. During reception, data is transferred from RIICnDRS to RIICnDRR after 1 byte of data has been received.

RIICnDRS cannot be accessed directly.

## 18.4 Interrupt Sources

The RIIC issues eight types of interrupt request: transmit end, receive data full, transmit data empty, stop condition detection, start condition detection, NACK reception, arbitration-lost, and timeout.

Table 18.23 lists details of the several interrupt requests. The receive data full and transmit data empty sources are both capable of launching data transfer by theDMAC.

**Table 18.23 Interrupt Sources**

| Symbol | Interrupt Source | Interrupt Flag | DMAC Launching | Priority*1 | Interrupt Condition |
|---|---|---|---|---|---|
| INTRIICTEI | Transmission complete | TEND | Not possible | High | TEND = 1 • TEIE = 1 |
| INTRIICRI | Receive-data-full | RDRF | Possible | | RDRF = 1 • RIE = 1 |
| INTRIICTI | Transmit-data-empty | TDRE | Possible | | TDRE = 1 • TIE = 1 |
| INTRIICSPI | Detection of a stop condition | STOP | Not possible | | STOP = 1 • SPIE = 1 |
| INTRIICSTI | Detection of a start condition | START | Not possible | | START = 1 • STIE = 1 |
| INTRIICNAKI | Reception of a NACK | NACKF | Not possible | | NACKF = 1 • NAKIE = 1 |
| INTRIICALI | Arbitration lost | AL | Not possible | | AL = 1 • ALIE = 1 |
| INTRIICTMOI | Timeout | TMOF | Not possible | Low | TMOF = 1 • TMOIE = 1 |

Note 1. When the interrupt priority register (ICDIPRn) setting is the same

Clear or mask the each flag during interrupt handling.

CAUTIONS

1. There is a latency (delay) between the execution of a write instruction for a peripheral module by the CPU and actual writing to the module. Thus, when an interrupt flag has been cleared or masked, read the relevant flag again to check whether clearing or masking has been completed, and then return from interrupt processing. Returning from interrupt processing without checking that writing to the module has been completed creates a possibility of repeated processing of the same interrupt.
2. Since INTRIICRI and INTRIICTI are edge-detected interrupts, they do not require clearing.
3. When using the INTRIICTEI interrupt, clear the RIICnSR2.TEND flag in the INTRIICTEI interrupt processing.
4. When using the INTRIICSPI interrupt, clear the RIICnSR2.STOP flag in the INTRIICSPI interrupt processing.
5. When using the INTRIICSTI interrupt, clear the RIICnSR2.START flag in the INTRIICSTI interrupt processing.
6. When using the INTRIICNAKI interrupt, clear the RIICnSR2.NACKF flag in the INTRIICNAKI interrupt processing.
7. When using the INTRIICALI interrupt, clear the RIICnSR2.AL flag in the INTRIICALI interrupt processing.
8. When using the INTRIICTMOI interrupt, clear the RIICnSR2.TMOF flag in the INTRIICTMOI interrupt processing.

## 18.5 Operation

### 18.5.1 Communication Data Format

The I²C bus format consists of 8-bit data and 1-bit acknowledge (one frame). After a start condition or restart condition is issued, the master device sends the slave address and data direction in the first frame. The specified slave is valid until a stop condition is issued or a new slave is specified by a restart condition.

Figure 18.3 shows the I²C bus format, and Figure 18.4 shows the I²C bus timing.

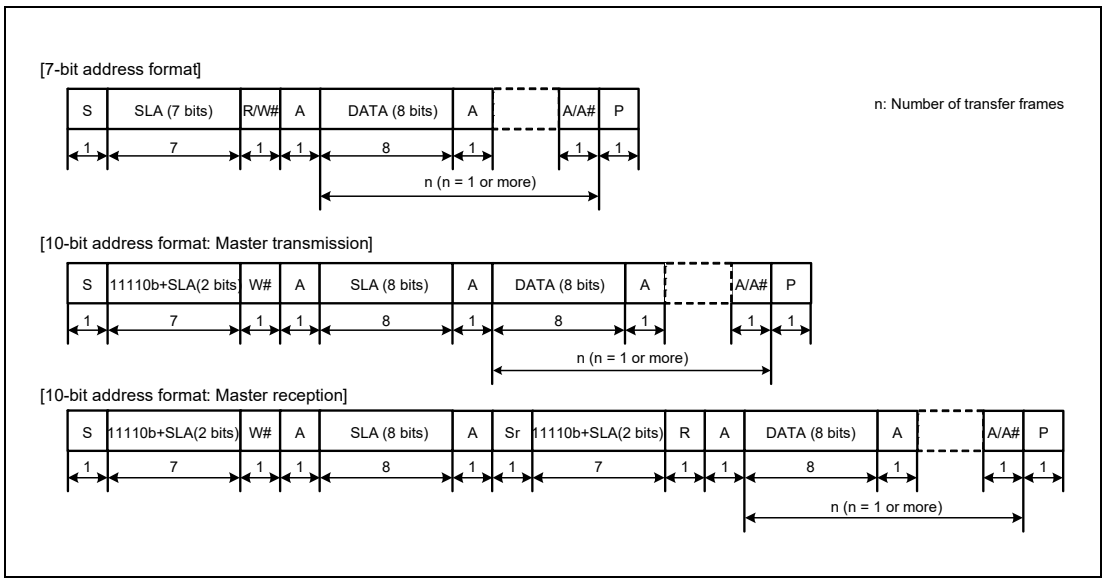

**Figure 18.3 I²C Bus Format**

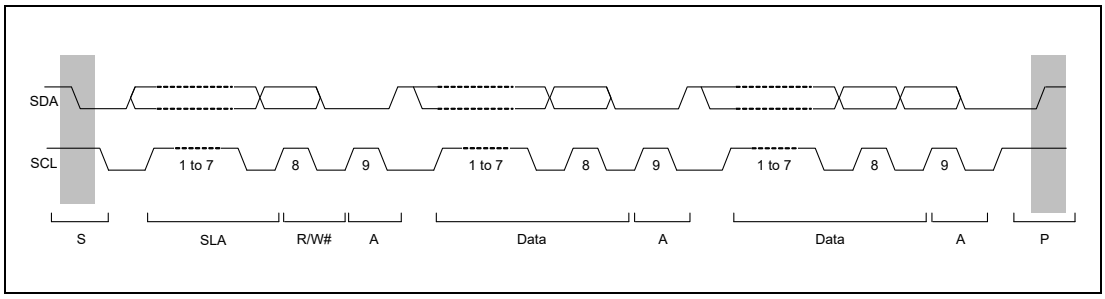

**Figure 18.4 I²C Bus Timing (SLA = 7 Bits)**

S: Start condition. The master device drives the SDA line low from high level while the SCL line is at a high level.

SLA: Slave address, by which the master device selects a slave device.

R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W is 1, or from the master device to the slave device when R/W is 0.

A: Acknowledge. The receive device drives the SDA line low. (In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.)

A#: Not-acknowledge. The receiving device has not returned a response or is not present so the SDA line has remained at the high level.

Sr: Restart condition. The master device drives the SDA line low from the high level after the setup time has elapsed with the SCL line at the high level.

DATA: Transmitted or received data

P: Stop condition. The master device drives the SDA line high from low level while the SCL line is at a high level.

## 18.5.2 Initial Settings

Before starting data transmission and reception, initialize the RIIC according to the procedure in Figure 18.5.

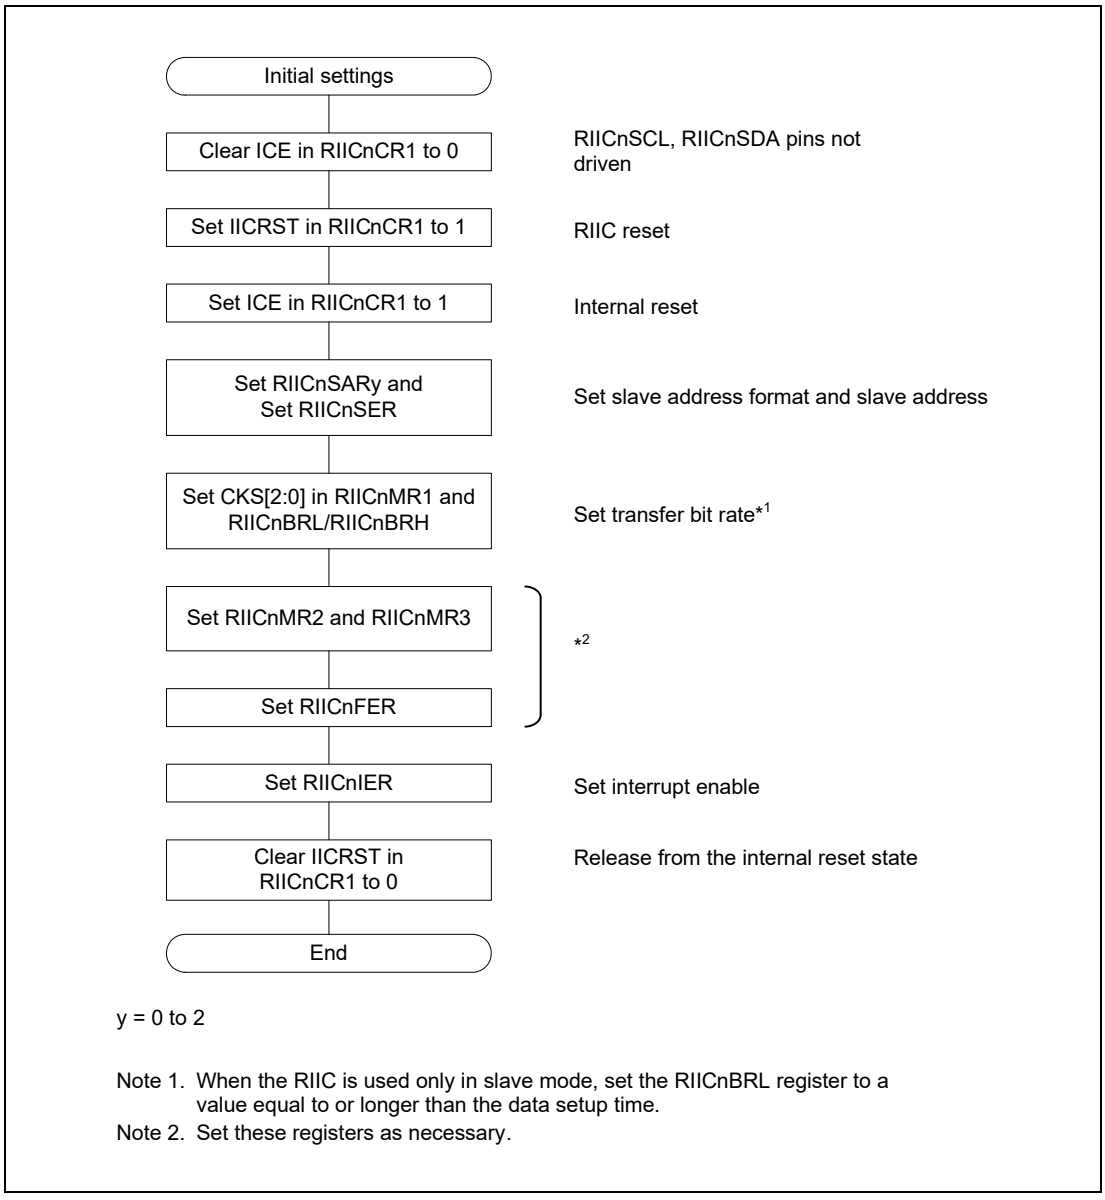

**Figure 18.5 Example of RIIC Initialization Flowchart**

### 18.5.3 Master Transmit Operation

In master transmit operation, the RIIC outputs the SCL (clock) and transmitted data signals as the master device, and the slave device returns acknowledgements. Figure 18.6 shows an example of usage of master transmission and Figure 18.7 to Figure 18.9 show the timing of operations in master transmission.

The following describes the procedure and operations for master transmission.

(1) Set the RIICnCR1.IICRST bit 1 to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see Figure 18.5). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. At the same time, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the byte containing the slave address and R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the RIIC continues in master transmit mode.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For data transmission with an address in the 10-bit format, start by writing 1111 $0_B$, the two higher-order bits of the slave address, and W# to RIICnDRT as the first address transmission. Then, as the second address transmission, write the eight lower-order bits of the slave address to RIICnDRT.

(4) After confirming that the RIICnSR2.TDRE flag is 1, write the data for transmission to the RIICnDRT register. The RIIC automatically holds the SCL line low until the data for transmission are ready or a stop condition is issued.

(5) After the last byte of the data to be transmitted is written to the RIICnDRT register, wait until the value of the RIICnSR2.TEND flag returns to 1, and then set the RIICnCR2.SP bit to 1 (stop condition issuance request). Upon receiving a stop condition issuance request, the RIIC issues the stop condition.

(6) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to $00_B$ and enters slave receive mode. Furthermore, it automatically clears the RIICnSR2.TDRE and TEND flags to 0, and sets the RIICnSR2.STOP flag in to 1.

(7) Clear the RIICnSR2.NACKF and STOP flags to 0.

CAUTION

Operations for transfer start if the RIICnSR2.NACKF flag is cleared to 0 before RIICnSR2.STOP is set to 1. Be sure to confirm that RIICnSR2.STOP is set to 1 before clearing RIICnSR2.NACKF to 0. In particular, when the NACK receive interrupt (INTRIICNAKI) is in use, take care not to clear the NACKF flag to 0 before the STOP flag is set to 1 during interrupt processing.

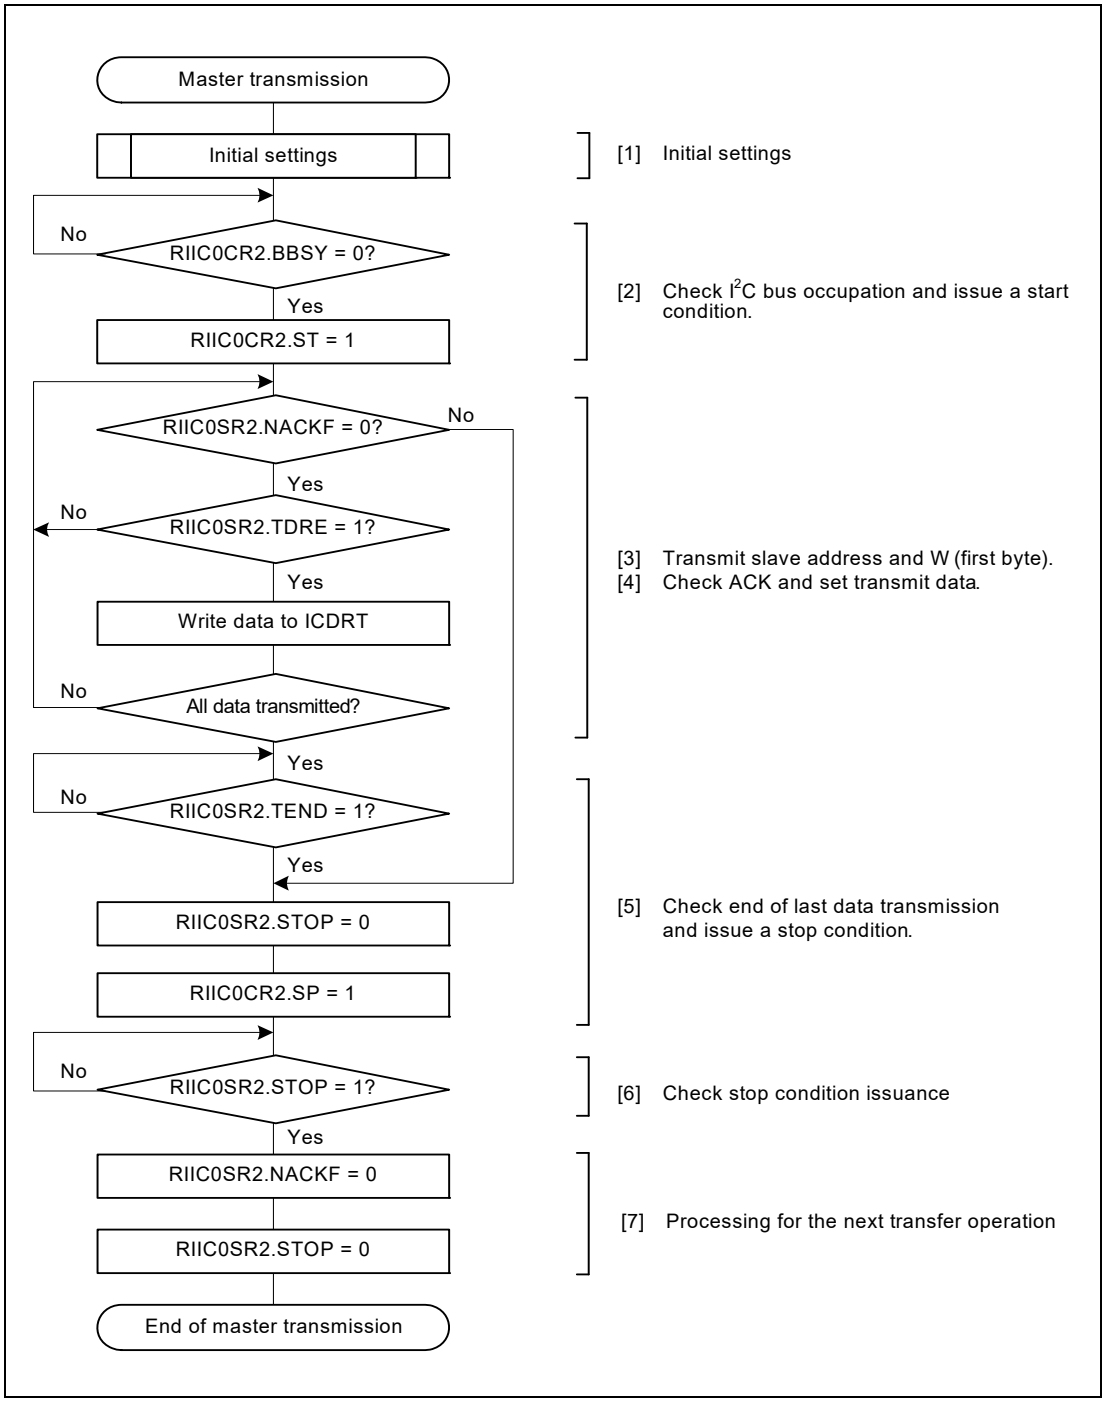

**Figure 18.6 Example of Master Transmission Flowchart**

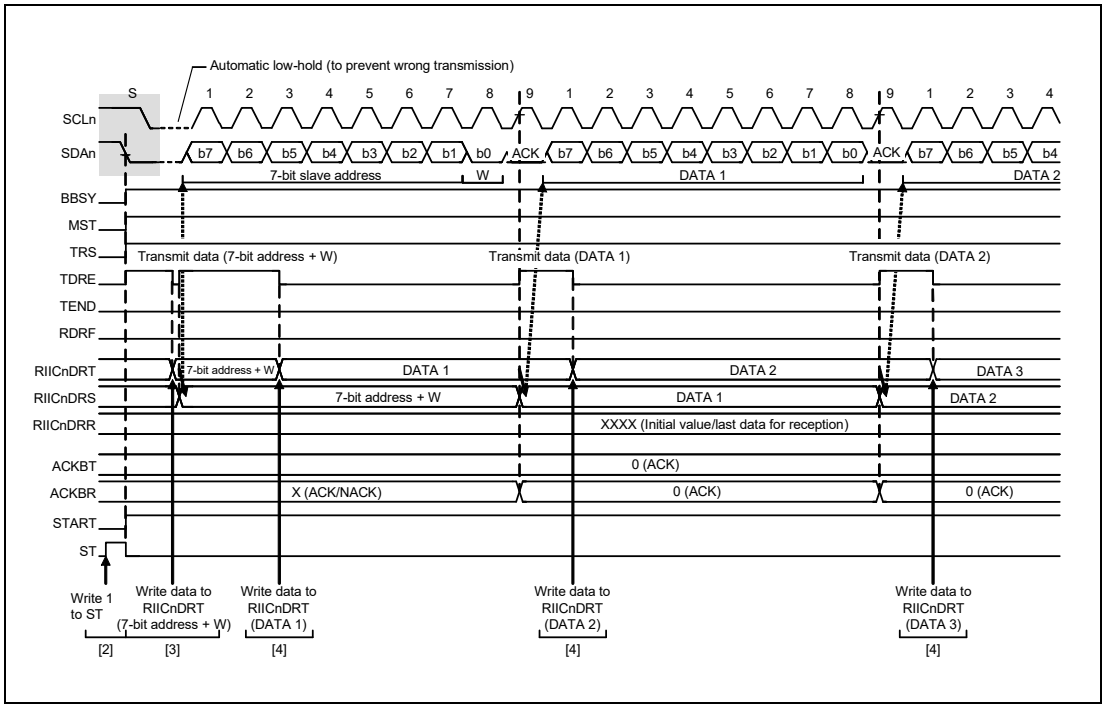

**Figure 18.7 Master Transmit Operation Timing (1) (7-Bit Address Format)**

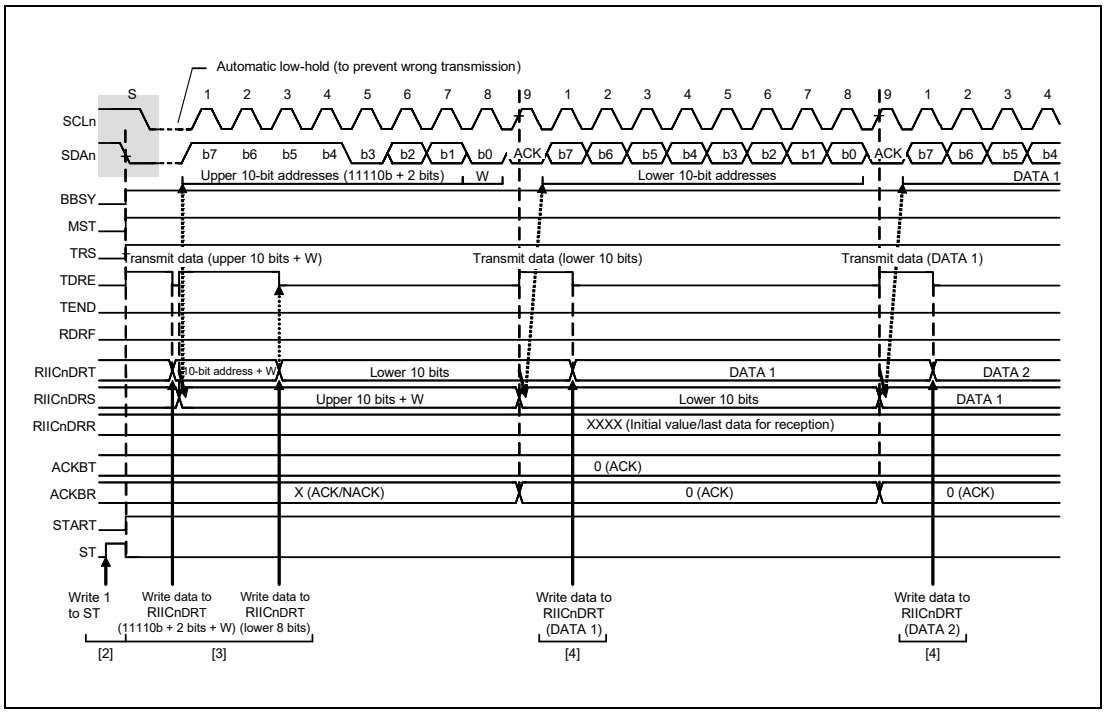

**Figure 18.8 Master Transmit Operation Timing (2) (10-Bit Address Format)**

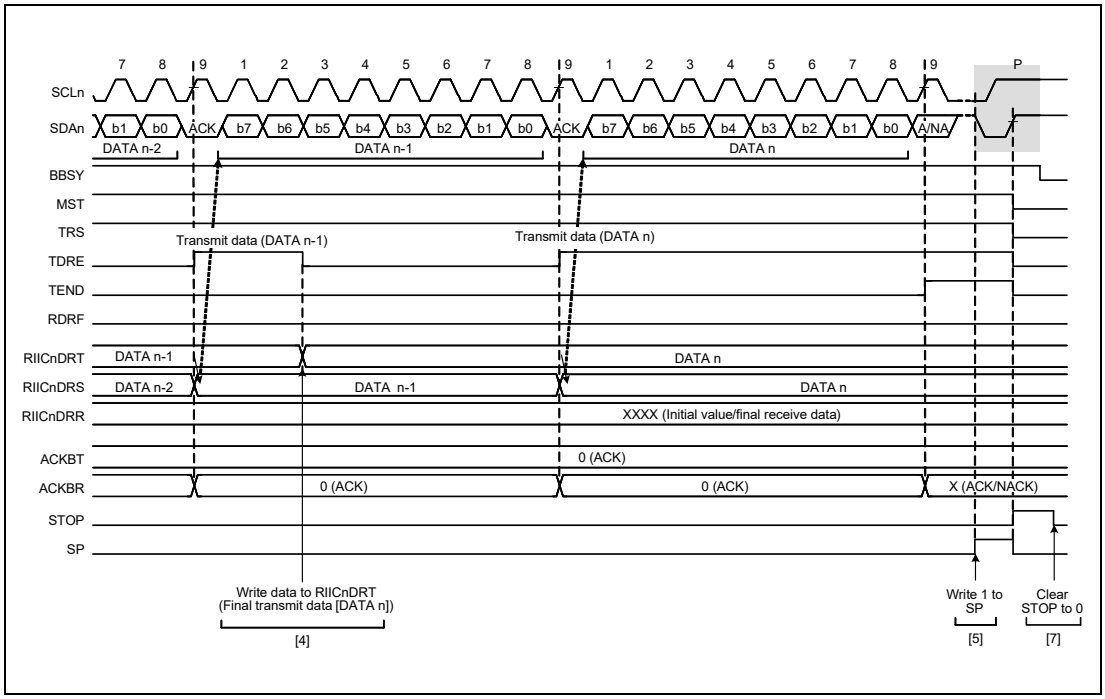

**Figure 18.9 Master Transmit Operation Timing (3)**

### 18.5.4 Master Receive Operation

In master receive operation, the RIIC as a master device outputs the SCL (clock) signal, receives data from the slave device, and returns acknowledgements. Since the RIIC must start by sending a slave address to the corresponding slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

Figure 18.10 shows an example of usage for the master reception of 3 or more bytes (7-bit address format), Figure 18.14 shows an example of usage for the master reception of 1 or 2 bytes (7-bit address format), and Figure 18.11 to Figure 18.13 show the timing of operations in master reception.

The following describes the procedure and operations for master reception.

(1) Set the RIICnCR1.IICRST bit to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see Figure 18.5). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. When the RIIC detects the start condition, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the levels for the SDA output and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the first byte indicates the slave address and value of the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. Once the byte containing the slave address and R/W# bit has been transmitted, the value of the RIICnCR2.TRS bit is automatically updated to select transmit or receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 1, the RIICnCR2.TRS bit is cleared to 0 on the rising edge of the ninth cycle of SCL (the clock signal), placing the RIIC in master receive mode. At this time, the TDRE flag is automatically cleared to 0 and the RIICnSR2.RDRF flag is automatically set to 1.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For master reception from a device with a 10-bit address, start by using master transmission to issue the 10-bit address, and then issue a restart condition. After that, transmitting 1111 $0_B$, the two higher-order bits of the slave address, and the R bit places the RIIC in master receive mode.

(4) Dummy read RIICnDRR after confirming that the RIICnSR2.RDRF flag is 1; this makes the RIIC start output of the SCL (clock) signal and start data reception.

(5) After 1 byte of data has been received, the RIICnSR2.RDRF flag is set to 1 on the rising edge of the eighth or ninth cycle of SCL clock (the clock signal) as selected by the RIICnMR3.RDRFS bit. Reading out RIICnDRR at this time will produce the received data, and the RDRF flag is automatically cleared to 0 at the same time. Furthermore, the value of the acknowledgement field received during the ninth cycle of SCL clock is returned as the value set in the RIICnMR3.ACKBT bit. Furthermore, if the next byte to be received is the next to last byte, set the RIICnMR3.WAIT bit to 1 (for wait insertion) before reading the RIICnDRR (containing the second byte from last). As well as enabling NACK output even in the case of delays in processing to set the RIICnMR3.ACKBT bit to 1 (NACK) in step (6), due to other interrupts, etc., this fixes the SCL line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, so the state is such that issuing a stop condition is possible.

(6) When the RIICnMR3.RDRFS bit is 0 and the slave device must be notified that it is to end transfer for data reception after transfer of the next (final) byte, set the RIICnMR3.ACKBT bit to 1 (NACK).

(7) After reading out the byte before last from the RIICnDRR register, if the value of the RIICnSR2.RDRF flag is confirmed to be 1, write 1 to the RIICnCR2.SP bit (stop condition issuance request) and then read the last byte from RIICnDRR. When RIICnDRR is read, the RIIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is completed or the SCL line is released from the low-hold state.

(8) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to $00_B$ and enters slave receive mode. Furthermore, detection of the stop condition leads to setting of the RIICnSR2.STOP flag to 1.

(9) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

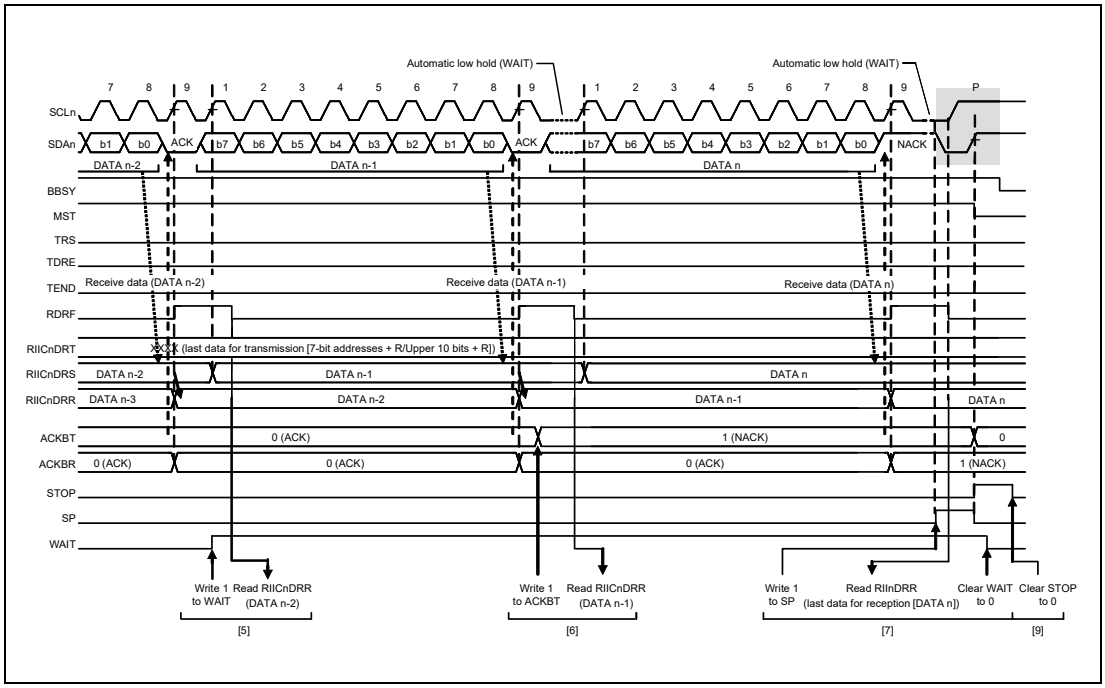

**Figure 18.13 Master Receive Operation Timing (3) (when RDRFS = 0)**

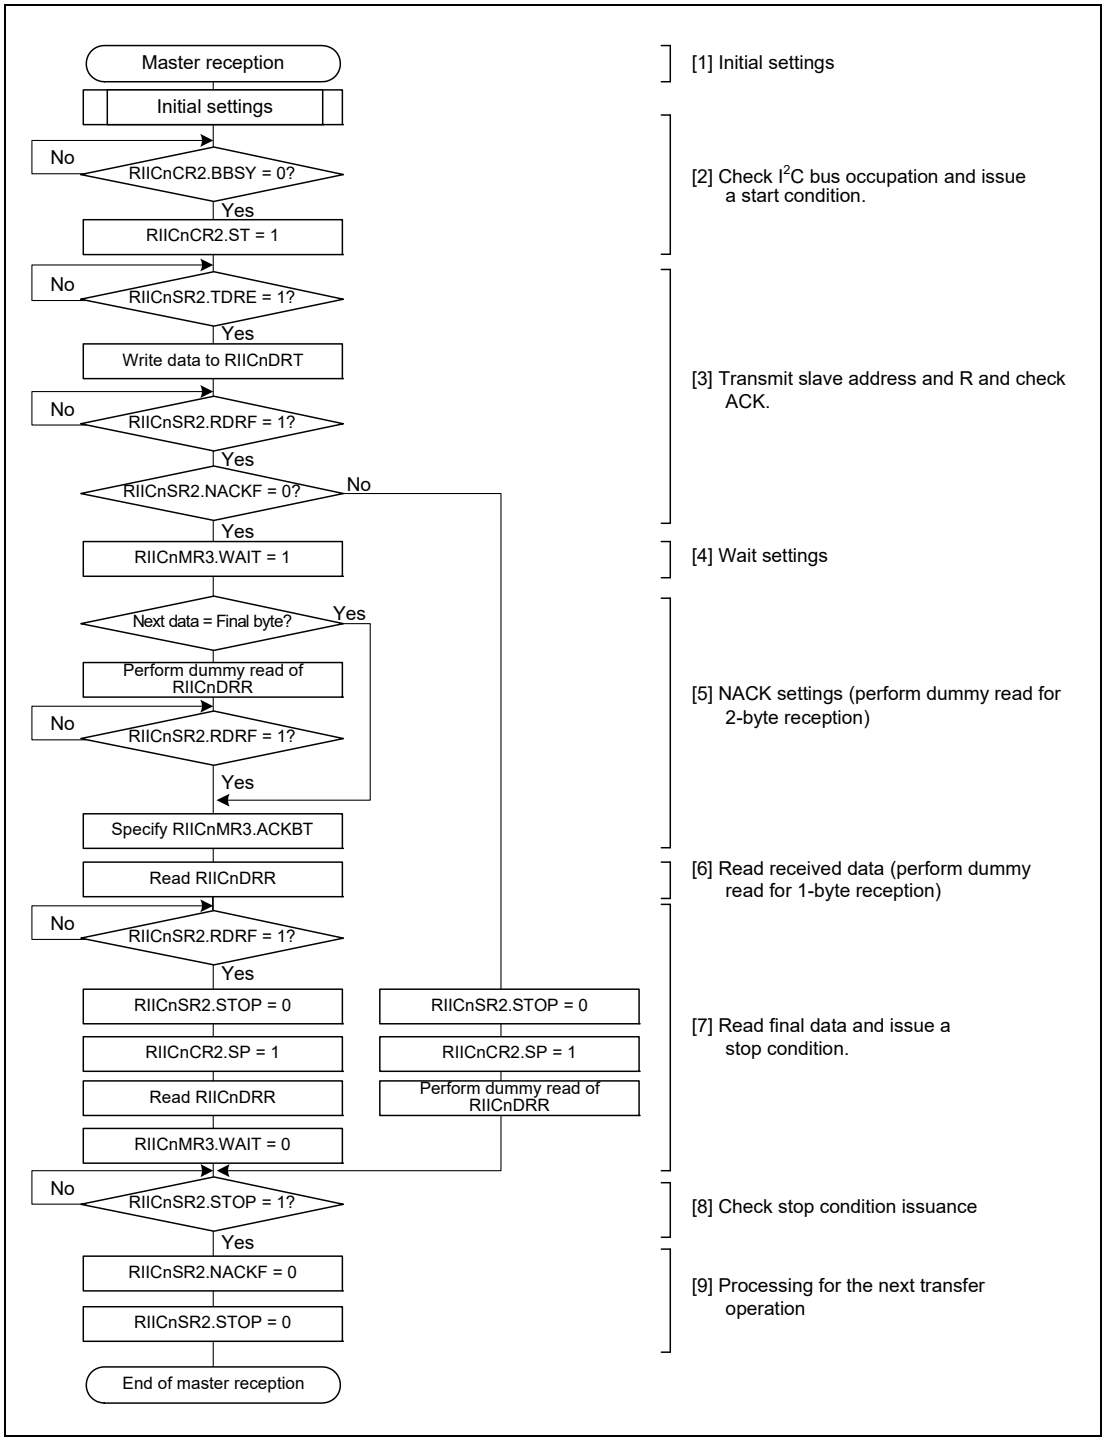

**Figure 18.14 Example Flowchart for the Master Reception of 1 or 2 Bytes (7-Bit Address Format)**

### 18.5.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL (clock) signal, the RIIC transmits data as a slave device, and the master device returns acknowledgements.

Figure 18.15 shows an example of usage of slave transmission and Figure 18.16 and Figure 18.17 show the timing of operations in slave transmission.

The following describes the procedure and operations for slave transmission.

(1) Follow the procedure in Figure 18.5 to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC will stay in the standby state until it receives a slave address that it matches.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 1, the RIIC automatically places itself in slave transmit mode by setting both the RIICnCR2.TRS bit and the RIICnSR2.TDRE flag to 1.

(3) After the RIICnSR2.TEND flag is confirmed to be 1, write the data for transmission to the RIICnDRT register. At this time, if the RIIC receives no acknowledge from the master device (receives an NACK signal) while the RIICnFER.NACKE bit is 1, the RIIC suspends transfer of the next data.

(4) Wait unit the RIICnSR2.TEND flag is set to 1 while the RIICnSR2.TDRE flag is 1, after the RIICnSR2.NACKF flag is set to 1 or the last byte for transmission is written to the RIICnDRT register. When the RIICnSR2.NACKF flag or the TEND flag is 1, the RIIC drives the SCL line low on the ninth falling edge of SCL clock.

(5) When the RIICnSR2.NACKF flag or the RIICnSR2.TEND flag is 1, dummy read RIICnDRR to complete the processing. This releases the SCL line.

(6) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2), flags RIICnSR2.TDRE and TEND, and the RIICnCR2.TRS bit to 0, and enters slave receive mode.

(7) Clear the RIICnSR2.NACKF and STOP flags to 0.

CAUTION

Operations for transfer start if the RIICnSR2.NACKF flag is cleared to 0 before RIICnSR2.STOP is set to 1. Be sure to confirm that RIICnSR2.STOP is set to 1 before clearing RIICnSR2.NACKF to 0. In particular, when the NACK receive interrupt (INTRIICNAKI) is in use, take care not to clear the NACKF flag to 0 before the STOP flag is set to 1 during interrupt processing.

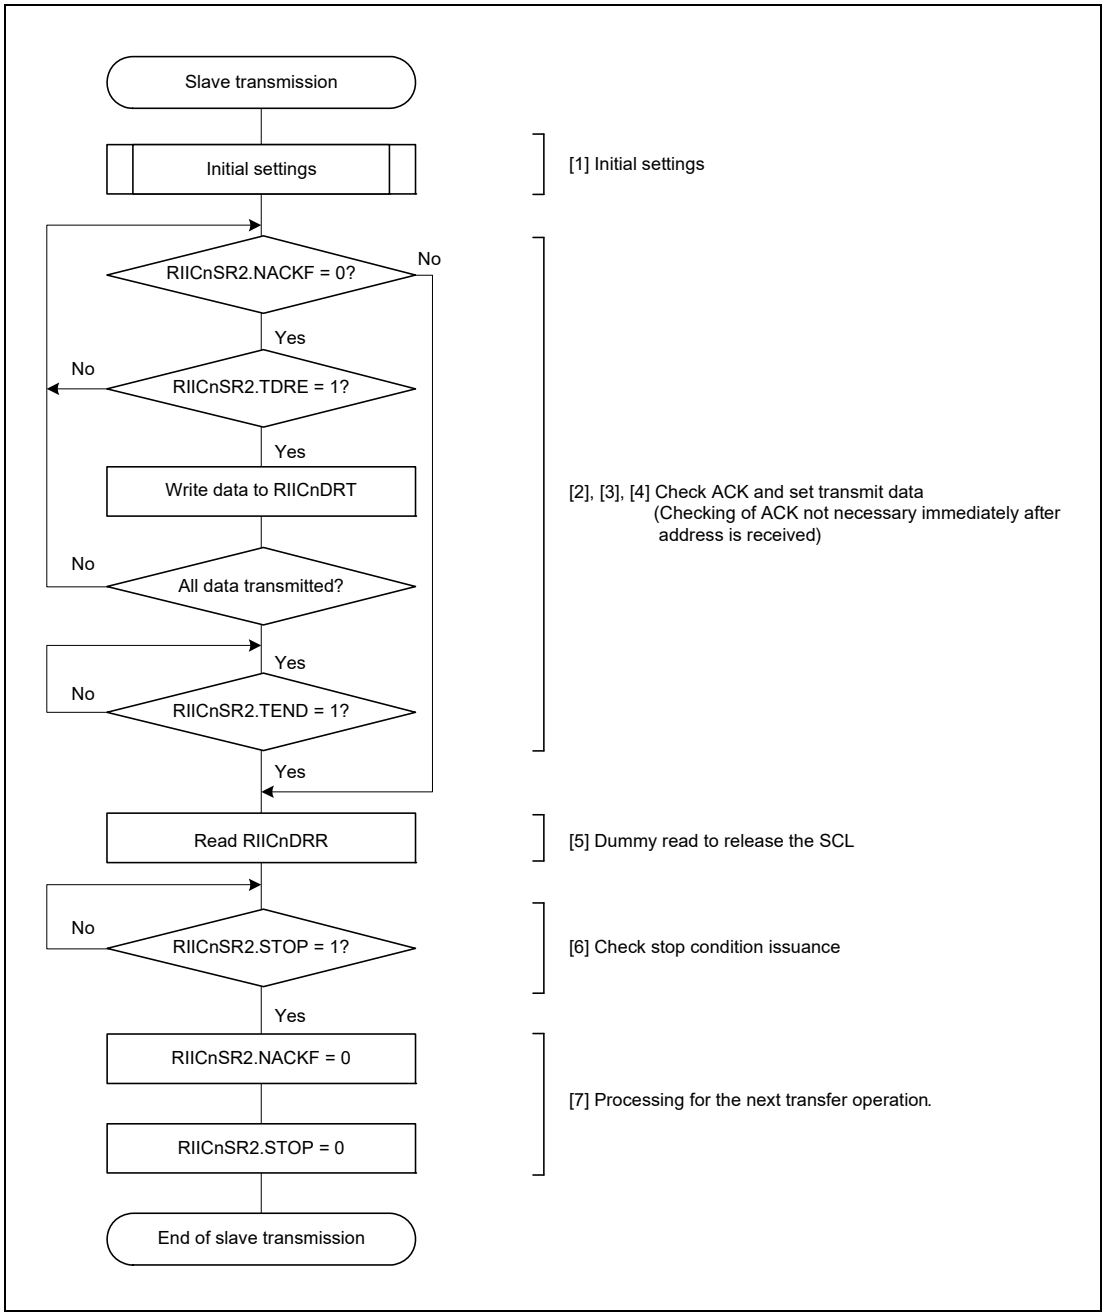

**Figure 18.15 Example of Slave Transmission Flowchart**

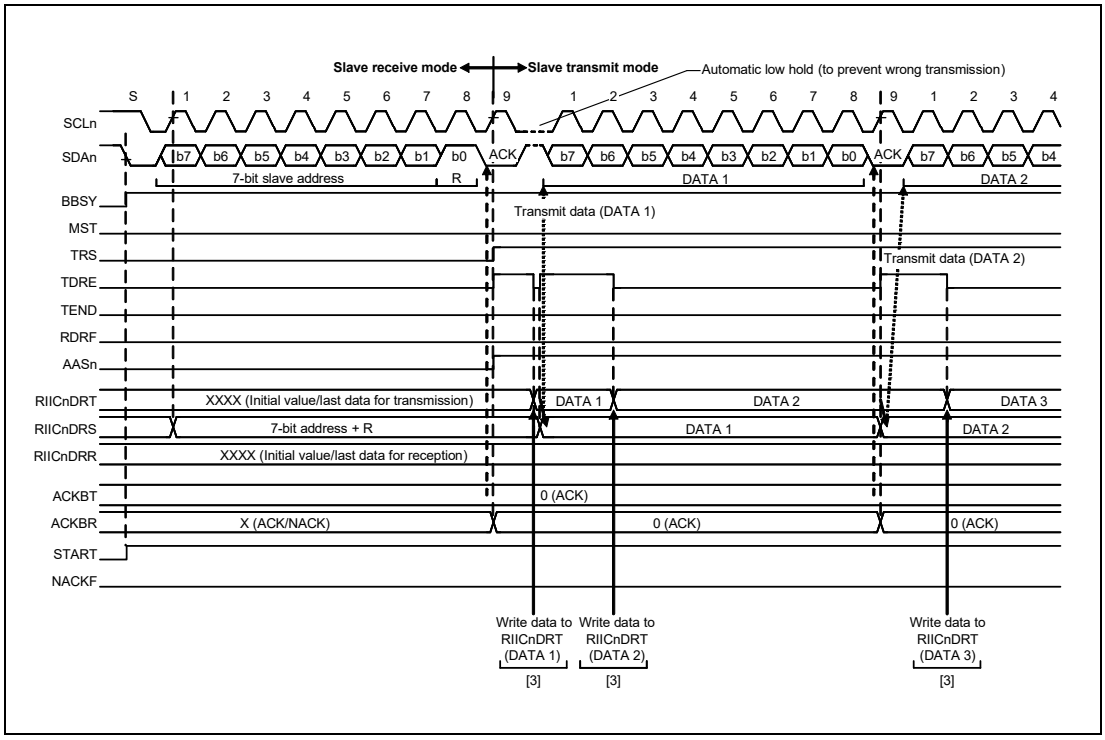

**Figure 18.16 Slave Transmit Operation Timing (1) (7-Bit Address Format)**

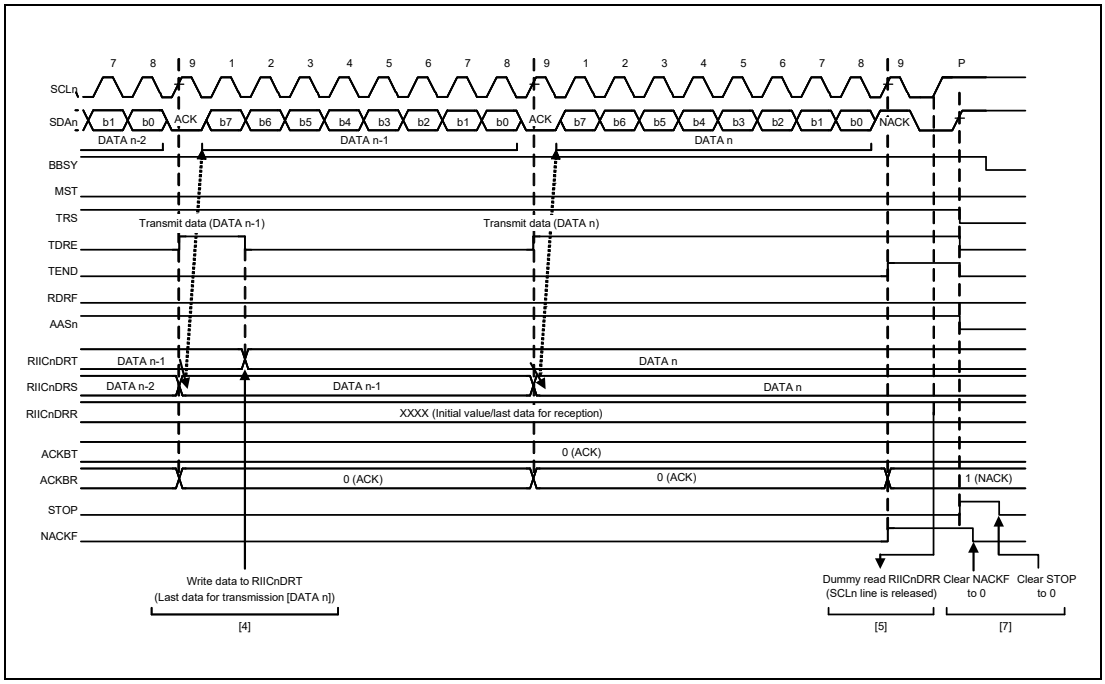

**Figure 18.17 Slave Transmit Operation Timing (2)**

### 18.5.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the RIIC returns acknowledgements as a slave device.

Figure 18.18 shows an example of usage of slave reception and Figure 18.19 and Figure 18.20 show the timing of operations in slave reception.

The following describes the procedure and operations for slave reception.

(1) Follow the procedure in Figure 18.5 to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC will stay in the standby state until it receives a slave address that it matches.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 0, the RIIC continues to place itself in slave receive mode and sets the RIICnSR2.RDRF flag to 1.

(3) After the RIICnSR2.STOP flag is confirmed to be 0 and the RIICnSR2.RDRF flag to be 1, dummy read RIICnDRR (the dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower eight bits when the 10-bit address format is selected).

(4) When RIICnDRR is read, the RIIC automatically clears the RIICnSR2.RDRF flag to 0. If reading of RIICnDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the RIIC holds the SCL line low from one SCL cycle before the timing with which RDRF should be set. In this case, reading RIICnDRR releases the SCL line from being held at the low level.
When the RIICnSR2.STOP flag is 1 and the RIICnSR2.RDRF flag is also 1, read RIICnDRR until all the data is completely received.

(5) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 0.

(6) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.STOP flag to 0 for the next transfer operation.

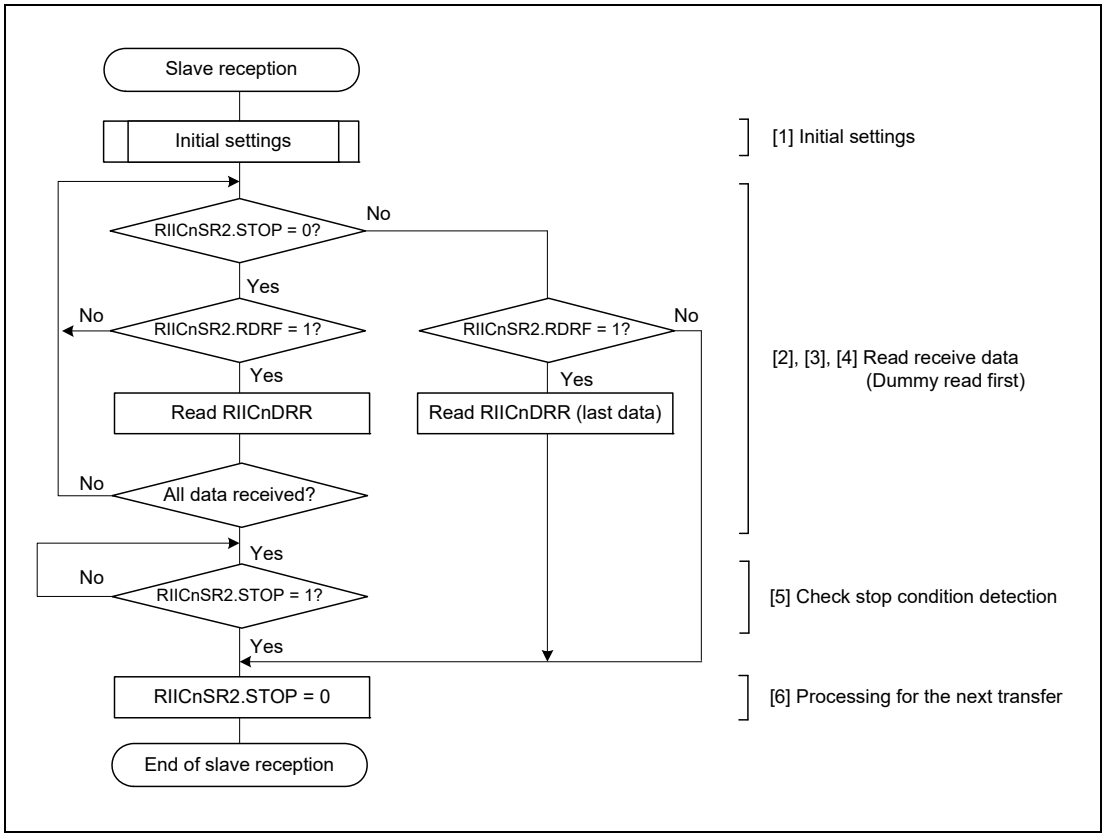

**Figure 18.18 Example of Slave Reception Flowchart**

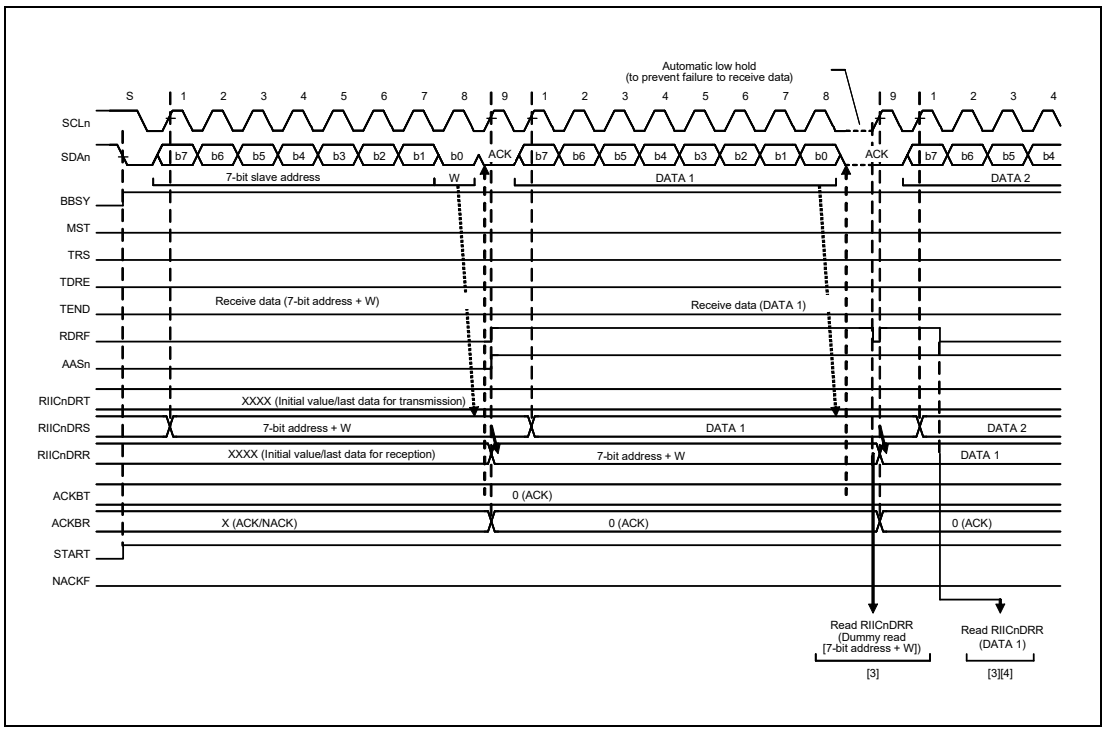

**Figure 18.19 Slave Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)**

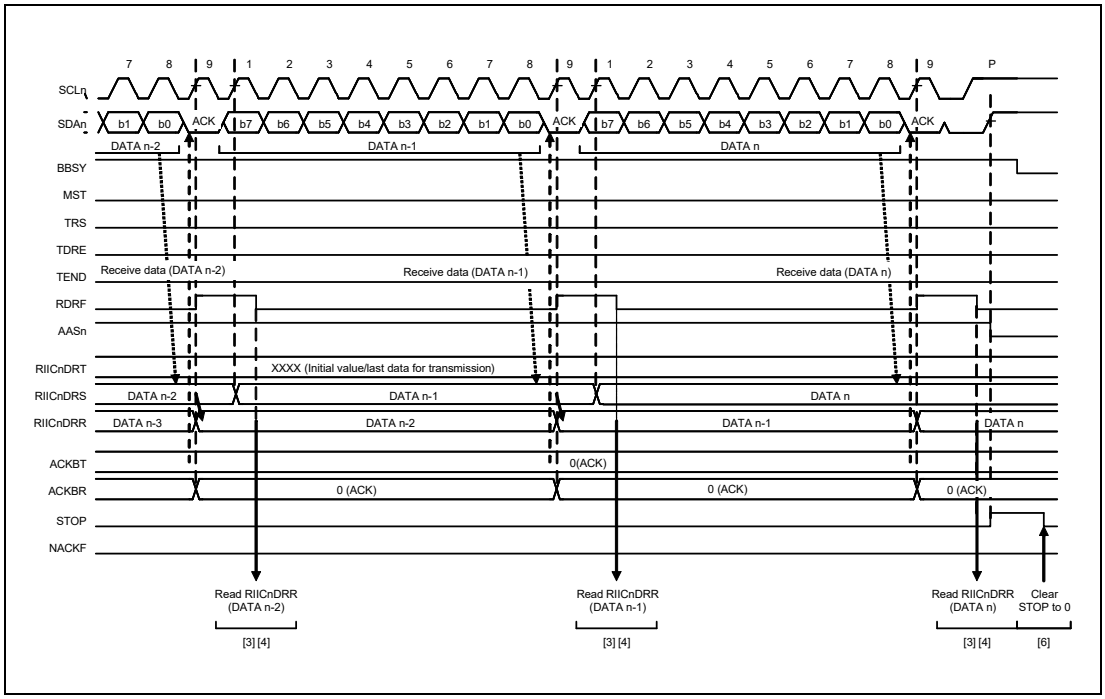

**Figure 18.20 Slave Receive Operation Timing (2) (when RDRFS = 0)**

## 18.6 SCL Synchronization Circuit

In generation of the SCL (clock) signal, the RIIC starts counting out the value for width at high level specified in RIICnBRH when it detects a rising edge on the SCL line and drives the SCL line low once counting of the width at high level is complete. When the RIIC detects the falling edge of the SCL line, it starts counting out the width at low level period specified in RIICnBRL, and then stops driving the SCL line (releases the line) once counting of the width at low level is complete. The SCL (clock) signal is thus generated.

If multiple master devices are connected to the $I^2C$ bus, a collision of SCL signals may arise due to contention with another master device. In such cases, the master devices have to synchronize their SCL signals. Since this synchronization of SCL signals must be bit by bit, the RIIC is equipped with a facility (the SCL synchronization circuit) to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCL line during communication.

When the RIIC has detected a rising edge on the SCL line and thus started counting out the width at high level specified in RIICnBRH, and the level on the SCL line falls because an SCL signal is being generated by another master device, the RIIC stops counting when it detects the falling edge, drives the level on the SCL line low, and starts counting out the width at low level specified in RIICnBRL. When the RIIC finishes counting out the width at low level, it stops driving the SCL line to the low level (i.e. releases the line). At this time, if the width at low level of the SCL clock signal from the other master device is longer than the width at low level set in the RIIC, the width at low level of the SCL signal will be extended. Once the width at low level for the other master device has ended, the SCL signal rises because the SCL line has been released. When the RIIC finishes outputting the low-level period of the SCL clock, the SCL line is released and the SCL clock rises. That is, in cases of contention of SCL signals from more than one master, the width at high level of the SCL signal is synchronized with that of the clock having the narrower width, and the width at low level of the SCL signal is synchronized with that of the clock having the broader width. However, such synchronization of the SCL signal is only enabled when the RIICnFER.SCLE bit is set to 1.

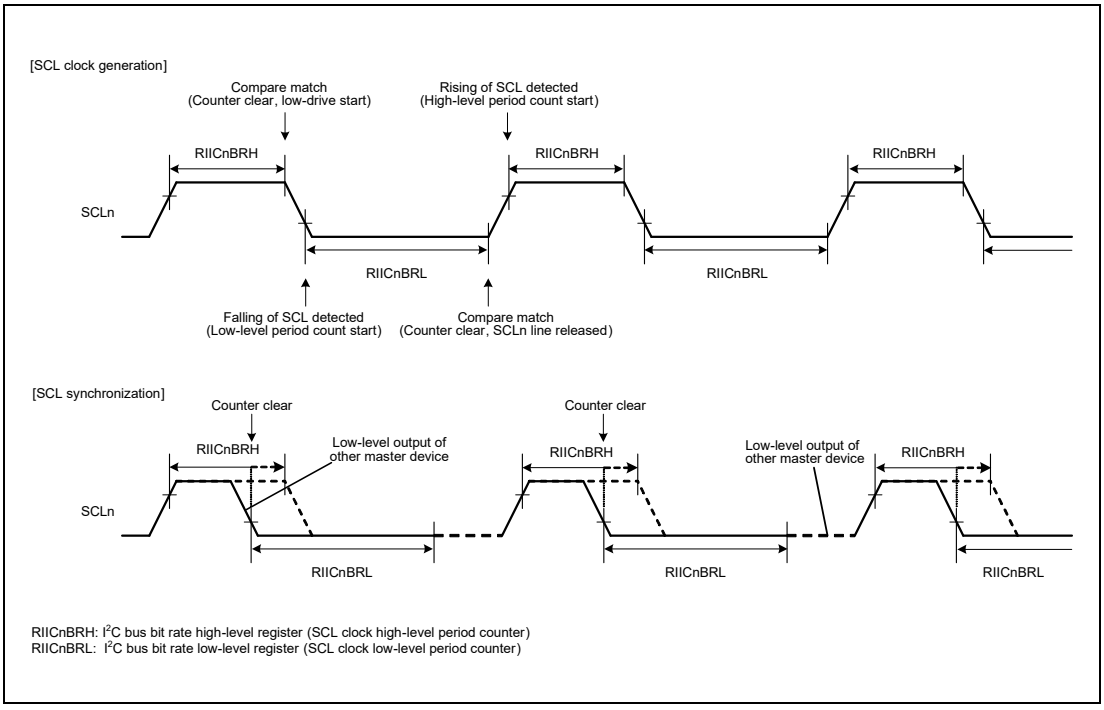

**Figure 18.21 Generation and Synchronization of the SCL Signal from the RIIC**

## 18.7 Facility for Delaying SDA Output

The RIIC module incorporates a facility for delaying output on the SDA line. The delay can be applied to all output (issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals) on the SDA line.

With the SDA output delay facility, SDA output is delayed from detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval over which the SCL (clock) signal is at the low level. Doing this leads to usage with the aim of preventing erroneous operation of communications devices, with the aim of satisfying the 300-ns (min.) data-hold time requirement of the SMBus specification.

The output delay facility is enabled by setting the RIICnMR2.SDDL[2:0] bits to any value other than $000_B$, and disabled by setting the same bits to $000_B$.

While the SDA output delay facility is enabled (i.e. while the SDDL[2:0] bits in IMCR2 are set to any value other than $000_B$), the RIICnMR2.DLCS bit selects the clock source for counting by the SDA output delay counter as the internal base clock (IICϕ) for the RIIC module or as a clock signal derived by dividing the frequency of the internal base clock by two (IICϕ/2). The counter counts the number of cycles set in the SDDL[2:0] bits in IMCR2. After counting of the set number of cycles of delay is completed, the RIIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.

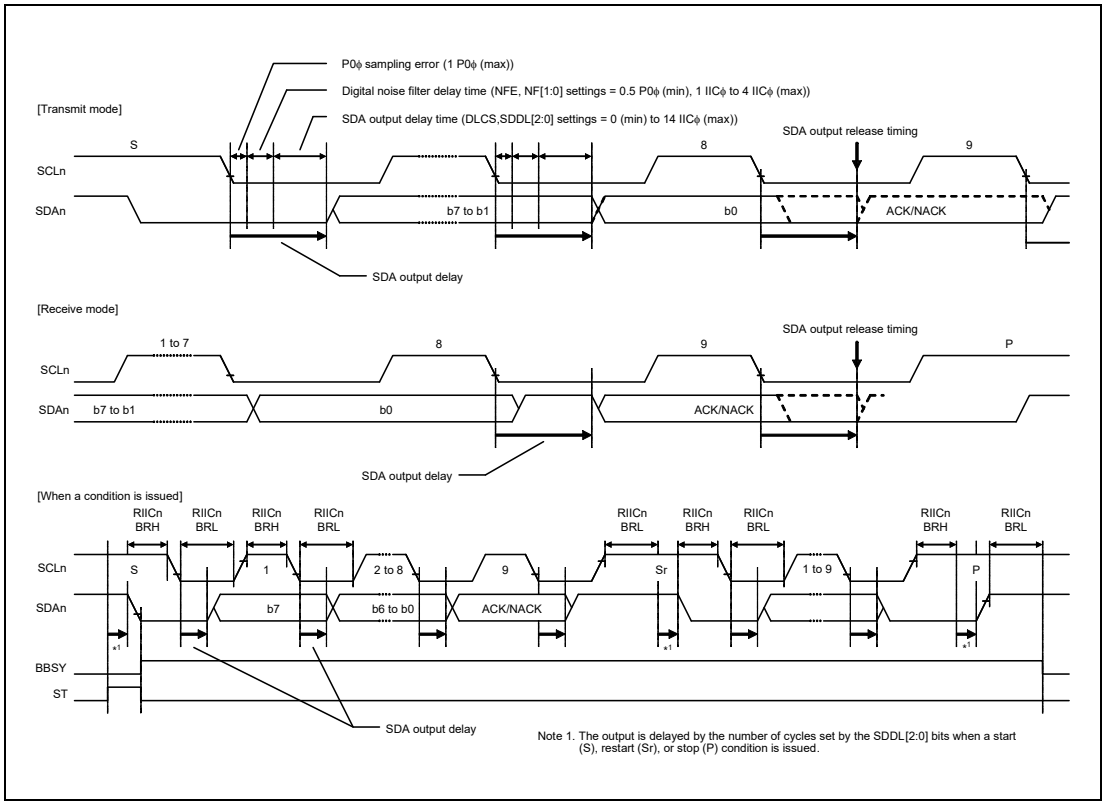

**Figure 18.22 SDA Output Delay Facility**

## 18.8 Digital Noise-Filter Circuits

Figure 18.23 is a block diagram of the digital noise-filter circuit. When the NFE bit in the RIICnFER register is set to 1, input to the RIICnSCL and RIICnSDA pins are conveyed to the internal circuitry through digital noise-filter circuits.

The on-chip digital noise-filter circuit of the RIIC consists of four flip-flop circuit stages connected in series and a match-detection circuit.

The number of effective stages in the digital noise filter is selected by the RIICnMR3.NF[1:0] bits. The selected number of effective stages determines the noise-filtering capability as a period from one to four IICϕ cycles.

The input signal to the RIICnSCL pin (or RIICnSDA pin) is sampled on falling edges of the IICϕ signal. When the input signal level matches the output level of the number of effective flip-flop circuit stages as selected by the RIICnMR3.NF[1:0] bits, the signal level is conveyed to the subsequent stage. If the signal levels do not match, the previous value is retained.

If the ratio between P0ϕ and IICϕ is small when the RIICnMR1.CKS[2:0] bits are set to $000_B$, note that the characteristics of the digital noise filter may lead to the elimination of needed signals as noise.

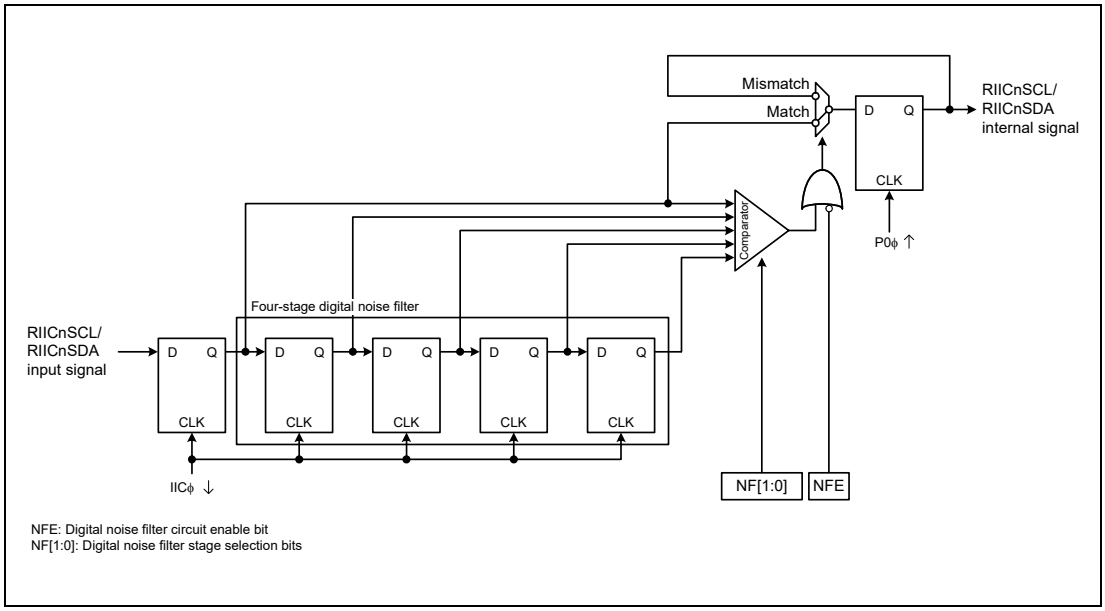

**Figure 18.23 Block Diagram of Digital Noise Filter Circuit**

## 18.9 Address Match Detection

The RIIC can set three unique slave addresses in addition to the general call address and host address, and also can set 7-bit or 10-bit slave addresses.

### 18.9.1 Slave-Address Match Detection

The RIIC can set three unique slave addresses, and has a slave address detection function for each unique slave address. When the RIICnSER.SARy bit (y = 0 to 2) is set to 1, the slave addresses set in RIICnSARy (y = 0 to 2) can be detected.

When the RIIC detects a match of the set slave address, the corresponding RIICnSR1.AASy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle, and the RIICnSR2.RDRF flag or the RIICnSR2.TDRE flag is set to 1 by the following R/W# bit. This causes a receive data full interrupt (INTRIICRI) or transmit data empty interrupt (INTRIICTI) to be generated. The AASy flag is used to identify which slave address has been specified.

Figure 18.24 to Figure 18.26 show the AASy flag set timing in three cases.

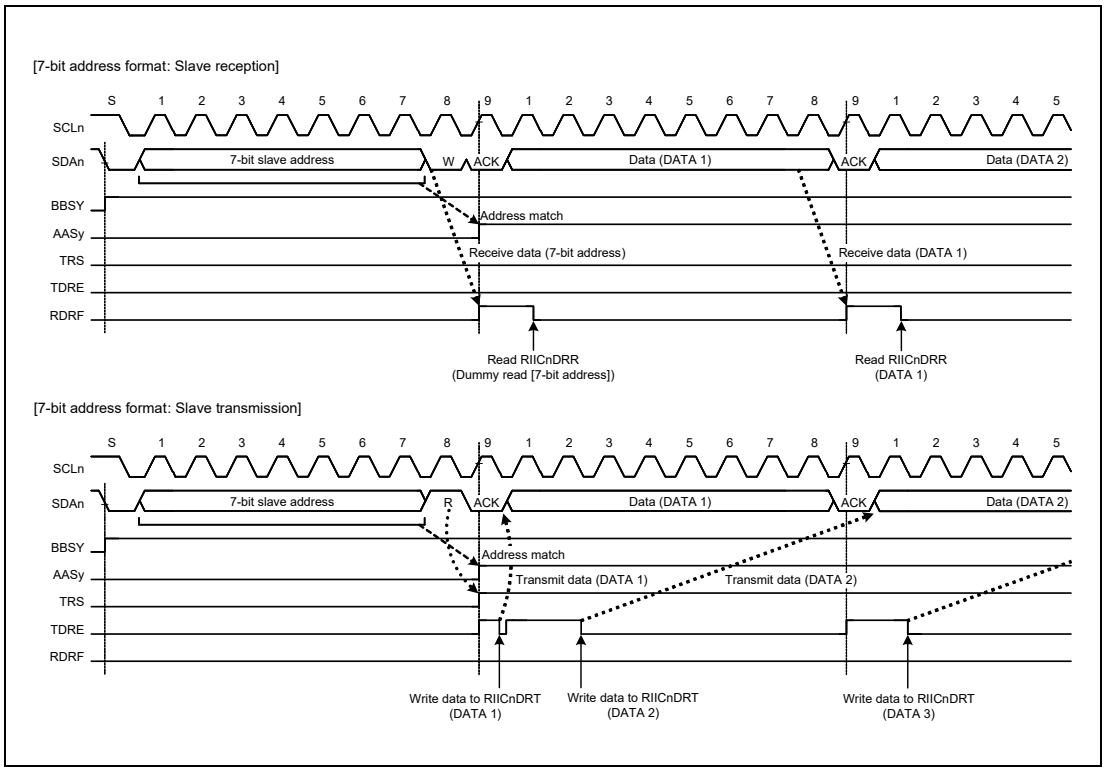

**Figure 18.24 AASy Flag Set Timing with 7-Bit Address Format Selected**

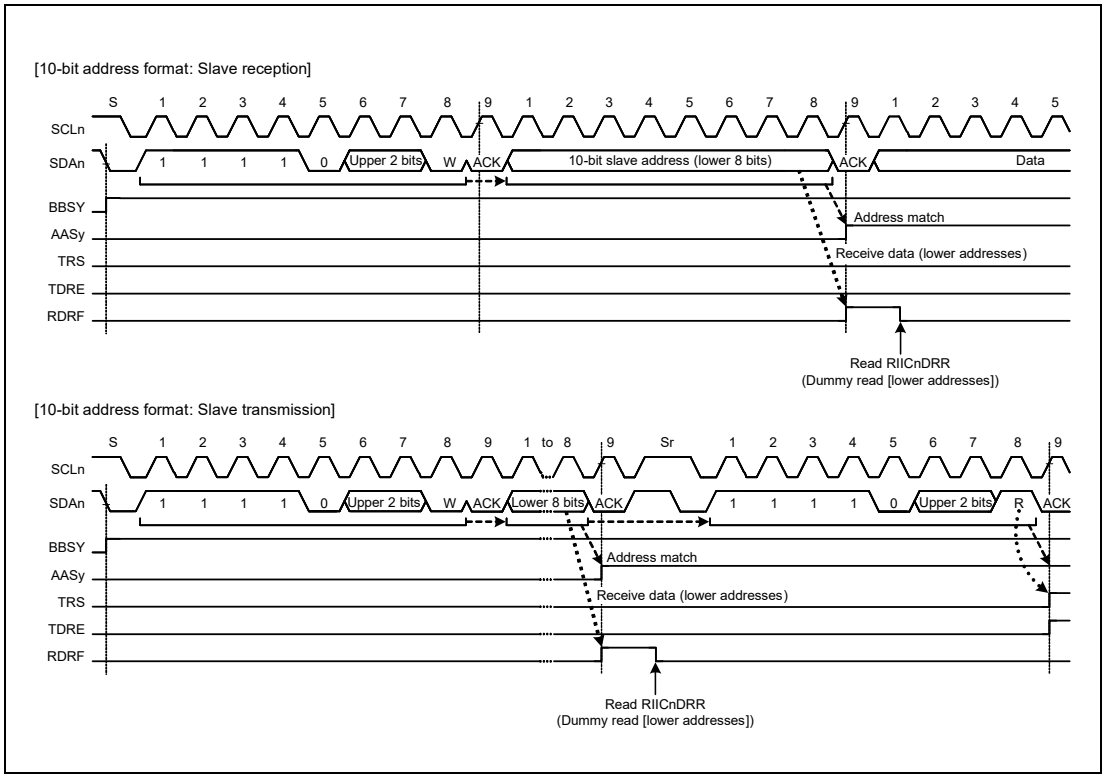

**Figure 18.25 AASy Flag Set Timing with 10-Bit Address Format Selected**

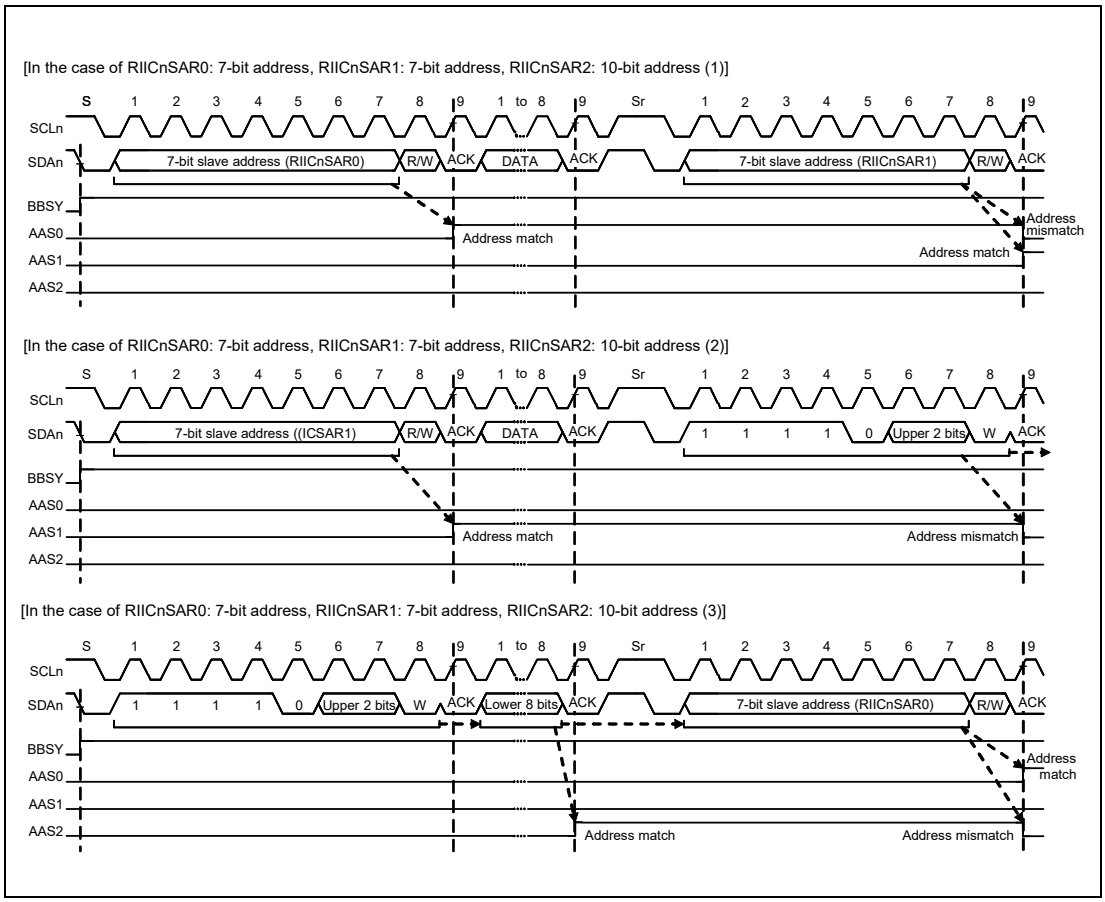

**Figure 18.26 AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed**

### 18.9.2 Detection of the General Call Address

The RIIC has a facility for detecting the general call address (0000 $000_B$ + 0 [W]). This is enabled by setting the RIICnSER.GCE bit to 1.

If the address received after a start or restart condition is issued is 0000 $000_B$ + 1[R] (start byte), the RIIC recognizes this as the address of a slave device with an “all-zero” address but not as the general call address.

When the RIIC detects the general call address, both the RIICnSR1.GCA flag and the RIICnSR2.RDRF flag are set to 1 on the rising edge of the ninth cycle of SCL clock. This leads to the generation of a receive data full interrupt (INTRIICRI). The value of the GCA flag can be confirmed to recognize that the general call address has been transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

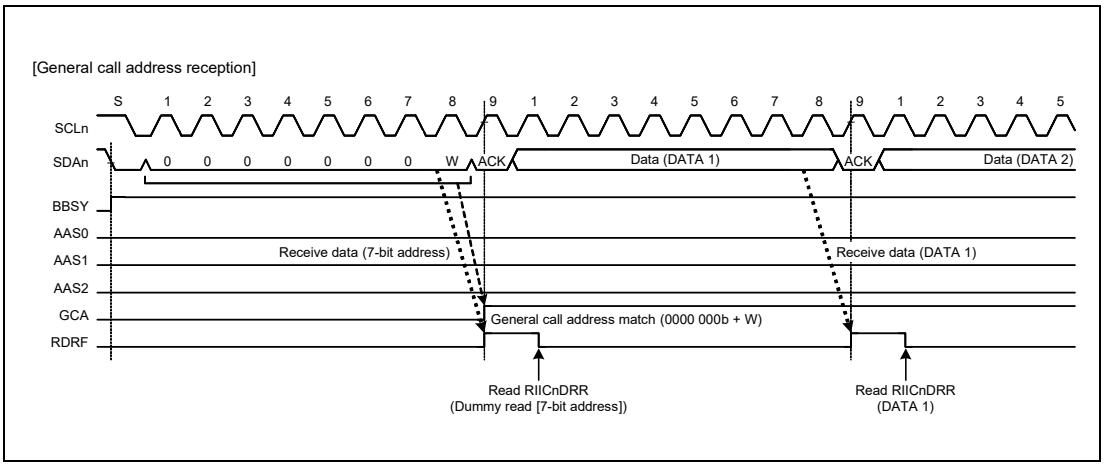

**Figure 18.27 Timing of GCA Flag Setting during Reception of General Call Address**

### 18.9.3 Device-ID Address Detection

The RIIC module has a facility for detecting device-ID addresses conformant with the $I^2C$ bus specification (Rev. 03). When the RIIC receives 1111 $100_B$ as the first byte after a start condition or restart condition was issued with the RIICnSER.DIDE bit set to 1, the RIIC recognizes the address as a device ID, sets the RIICnSR1.DID flag to 1 on the rising edge of the ninth SCL clock cycle when the following R/W# bit is 0, and then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the RIIC sets the corresponding RIICnSR1.AASy flag (y = 0 to 2) to 1.

After that, when the first byte received after a start or restart condition is issued matches the device ID address (1111 $100_B$) again and the following R/W# bit is 1, the RIIC does not compare the second and subsequent bytes and sets the RIICnSR2.TDRE flag to 1.

In the device-ID address detection function, the RIIC clears the DID flag to 0 if a match with the RIIC's own slave address is not obtained or a match with the device ID address is not obtained after a match with the RIIC's own slave address and the detection of a restart condition. If the first byte after detection of a start or restart condition matches the device ID address (1111 $100_B$) and the R/W# bit is 0, the RIIC sets the DID flag to 1 and compares the second and subsequent bytes with the RIIC's slave address. If the R/W# bit is 1, the DID flag holds the previous value and the RIIC does not compare the second and subsequent bytes. Therefore, the reception of a device-ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Furthermore, prepare the device-ID fields (three bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal data for transmission. For details, see $I^2C$ Bus Standard from NXP Semiconductors.

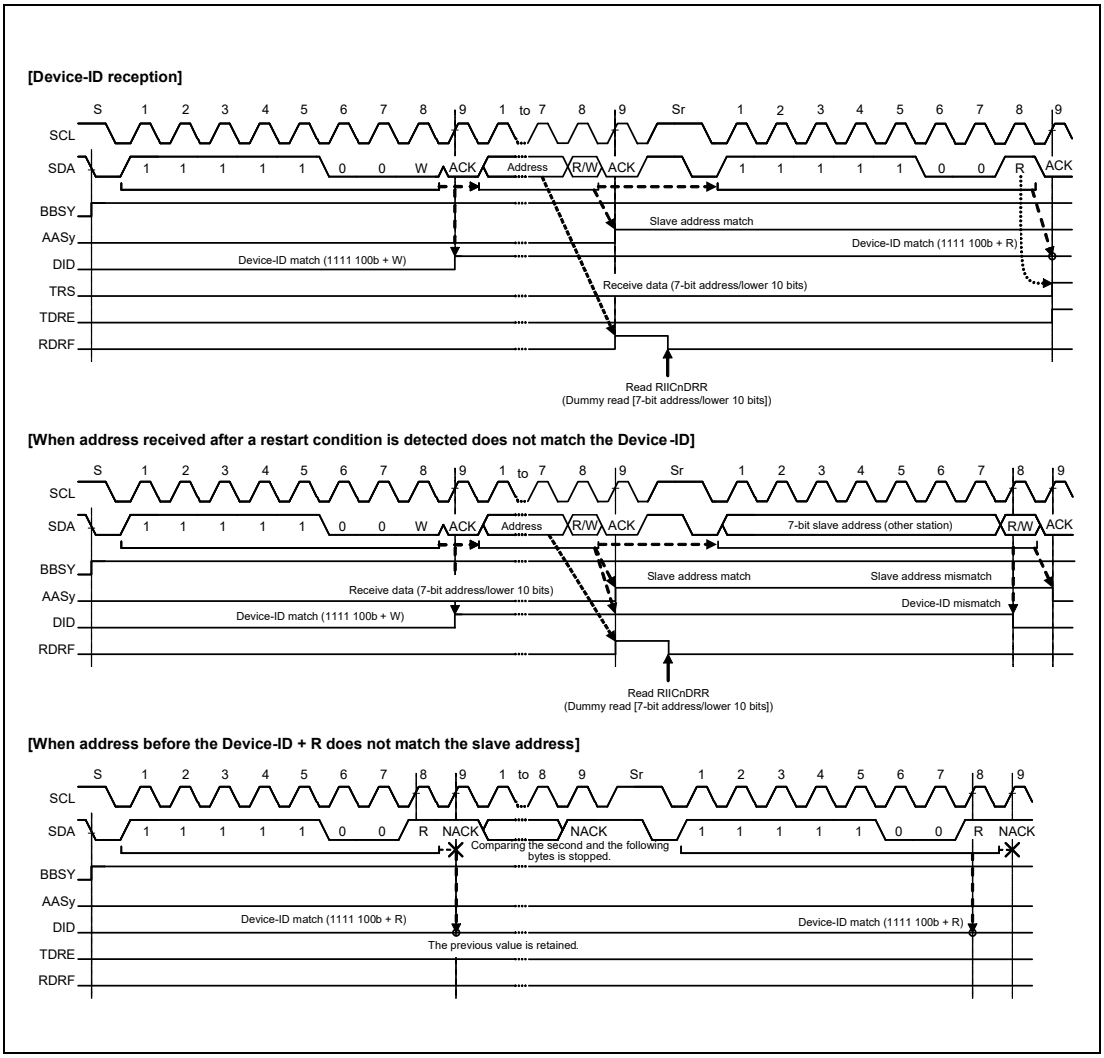

**Figure 18.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID**

### 18.9.4 Host Address Detection

The RIIC has a function to detect the host address while the SMBus is operating. When the RIICnSER.HOAE bit is set to 1 while the RIICnMR3.SMBS bit is 1, the RIIC can detect the host address (0001 $000_B$) in slave receive mode (RIICnCR2.MST and TRS bits = $00_B$).

When the RIIC detects the host address, the RIICnSR1.HOA flag is set to 1 at the rising edge of the ninth SCL clock cycle, and at the same time, the RIICnSR2.RDRF flag is set to 1 when the R/W# bit is 0 (Wr bit). This causes a receive data full interrupt (INTRIICRI) to be generated. The HOA flag is used to recognize that the host address was sent from the smart battery or other devices.

If the bit following the host address (0001 $000_B$) is an Rd bit (R/W# bit = 1), the RIIC can also detect the host address. After the host address is detected, the RIIC operates in the same manner as normal slave operation.

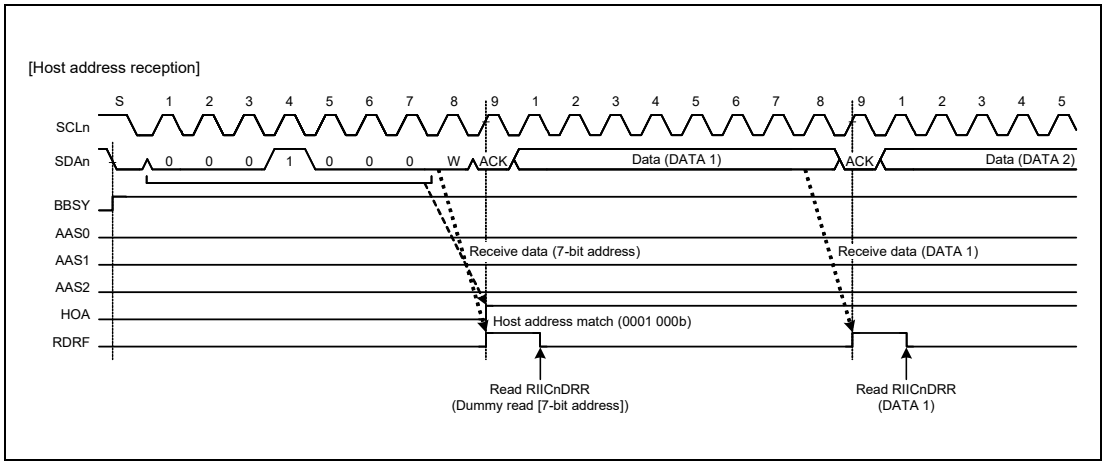

**Figure 18.29 HOA Flag Set Timing during Reception of Host Address**

## 18.10 Automatically Low-Hold Function for SCL

### 18.10.1 Function to Prevent Wrong Transmission of Transmit Data

If the shift register (RIICnDRS) is empty when data have not been written to the transmit data register (RIICnDRT) with the RIIC in transmission mode (RIICnCR2.TRS bit = 1), the SCL signal is automatically held at the low level over the intervals shown below. This low-hold period is extended until data for transmission have been written, which prevents the unintended transmission of erroneous data.

**<Master transmit mode>**

- Low-level interval after a start condition or restart condition is issued
- Low-level interval of one clock cycle between the ninth clock cycle of one transfer and the first clock cycle of the next

**<Slave transmit mode>**

- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next

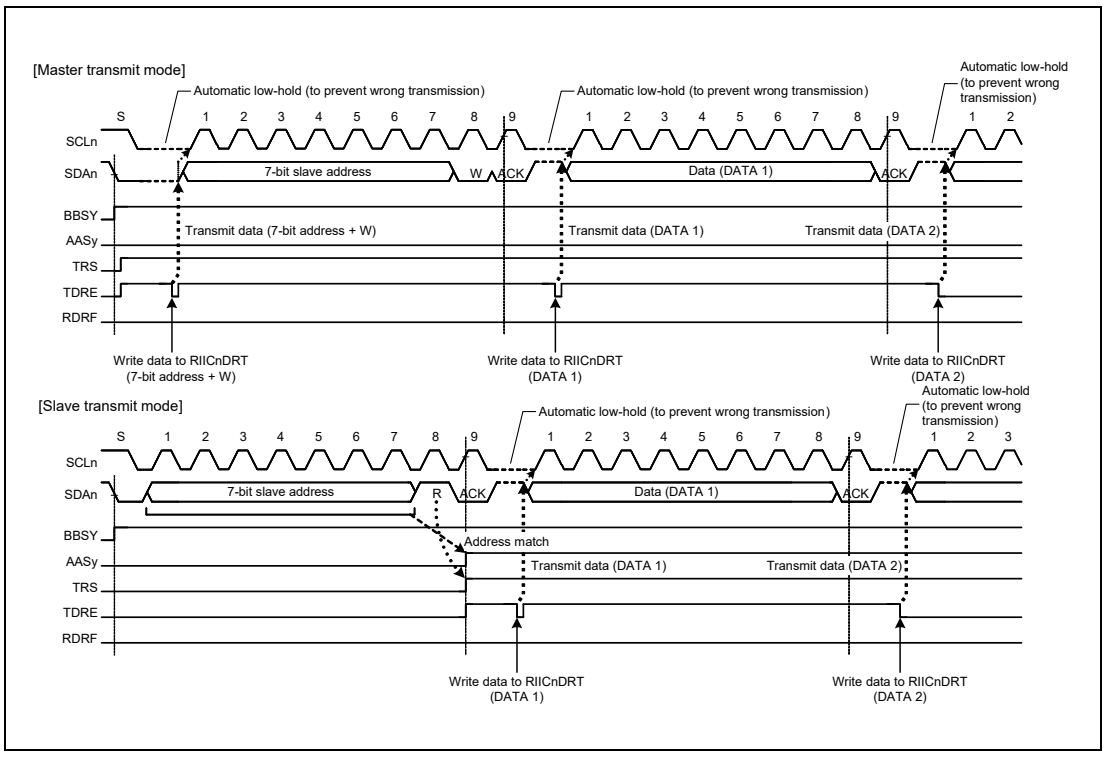

**Figure 18.30 Automatic Low-Hold Operation in Transmit Mode**

## 18.10.2 NACK Reception Transfer Suspension Function

The RIIC has a function to suspend transfer operation when NACK is received in transmit mode (RIICnCR2.TRS bit = 1). This function is enabled when the RIICnFER.NACKE bit is set to 1 (transfer suspension enabled). If the next transmit data has already been written (RIICnSR2.TDRE flag = 0) when NACK is received, next data transmission at the falling edge of the ninth SCL clock cycle is automatically suspended. This prevents the SDA line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (RIICnSR2.NACKF flag = 1), transmit operation and receive operation are discontinued. To restore transmit/receive operation, be sure to clear the NACKF flag to 0. In master transmit mode, clear the NACKF flag to 0 after issuing a restart condition or clear the NACKF and STOP flags to 0 after confirming that a stop condition has been issued, and then issue a start condition.

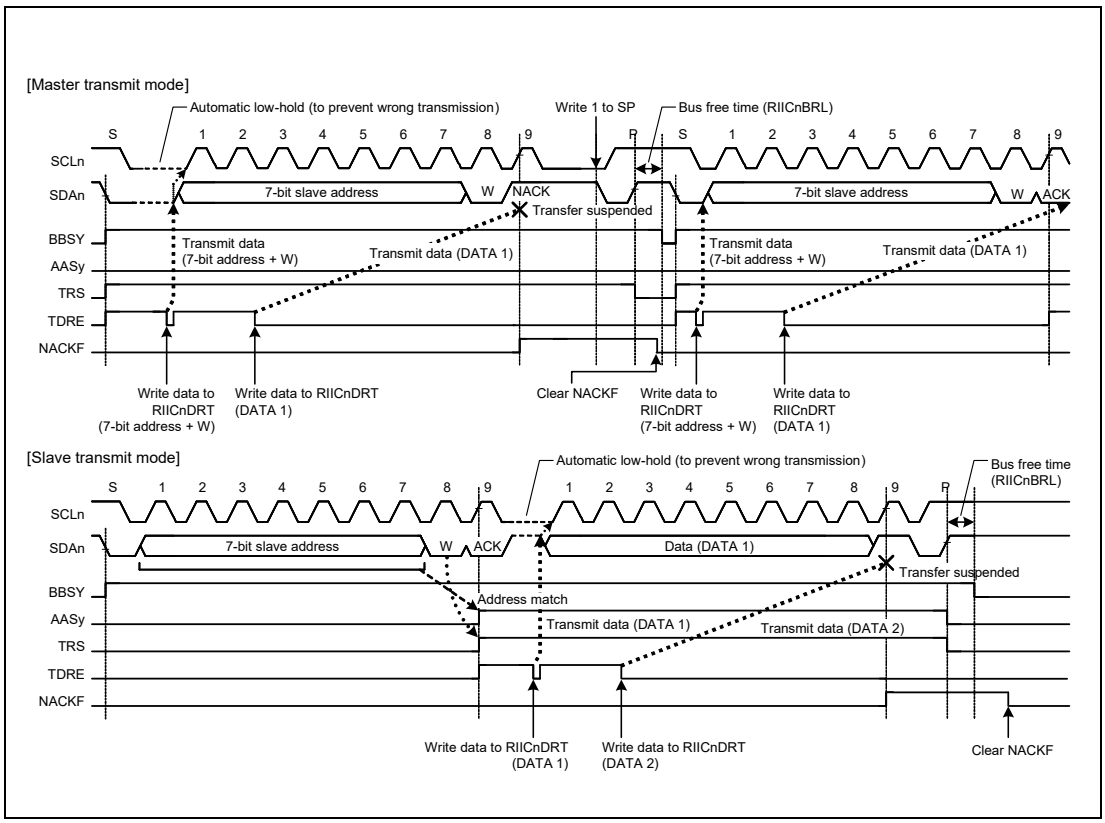

**Figure 18.31 Suspension of Data Transfer when NACK is Received (NACKE = 1)**

### 18.10.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (RIICnDRR) read is delayed for a period of one transfer frame or more with receive data full (RIICnSR2.RDRF flag = 1) in receive mode (RIICnCR2.TRS = 0), the RIIC holds the SCL line low automatically immediately before the next data is received to prevent failure to receive data.

This function to prevent failure to receive data using the automatic low-hold function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, the RIIC's own slave address is designated after a stop condition is issued. This function does not disturb other communication because the RIIC does not hold the SCL line low when a mismatch with its own slave address occurs after a stop condition is issued.

Sections in which the SCL line is held low can be selected with a combination of the RIICnMR3.WAIT and RDRFS bits.

#### (1) One-Byte Receive Operation and Automatic Low-Hold Function Using the WAIT Bit

When the RIICnMR3.WAIT bit is set to 1, the RIIC performs one-byte receive operation using the WAIT bit function.
Furthermore, when the RIICnMR3.RDRFS bit is 0, the RIIC automatically sends the RIICnMR3.ACKBT bit value for the acknowledge bit in the period from the falling edge of the eighth SCL clock cycle to the falling edge of the ninth SCL clock cycle, and automatically holds the SCL line low at the falling edge of the ninth SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from RIICnDRR, which enables bytewise receive operation.

The WAIT bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

#### (2) One-Byte Receive Operation (ACK/NACK Transmission Control) and Automatic Low-Hold Function Using the RDRFS Bit

When the RIICnMR3.RDRFS bit is set to 1, the RIIC performs one-byte receive operation using the RDRFS bit function.
When the RIICnSR2.RDRFS bit is set to 1, the RDRF flag (receive data full) in RIICnSR2 is set to 1 at the rising edge of the eighth SCL clock cycle, and the SCL line is automatically held low at the falling edge of the eighth SCL clock cycle. This lowhold is released by writing a value to the RIICnMR3.ACKBT bit, but cannot be released by reading data from RIICnDRR, which enables receive operation by the ACK/NACK transmission control according to the data received in byte units.

The RDRFS bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

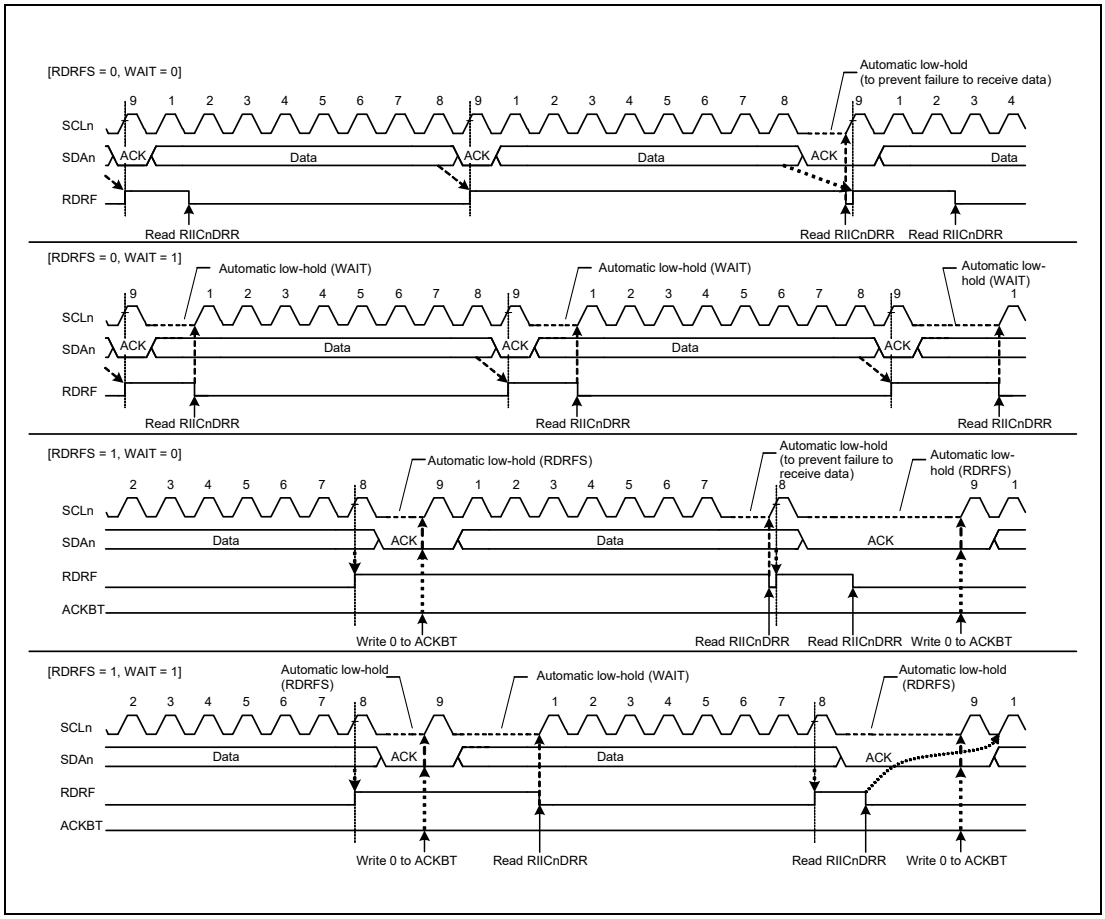

**Figure 18.32 Automatic Low-Hold Operation in Receive Mode (Using RDRFS and WAIT Bits)**

## 18.11 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the $I^2C$ bus standard, the RIIC has functions to prevent double-issue of a start condition, to detect arbitration-lost during transmission of NACK, and to detect arbitration-lost in slave transmit mode.

### 18.11.1 Master Arbitration-Lost Detection (MALE Bit)

The RIIC drives the SDA line low to issue a start condition. However, if the SDA line has already been driven low by another master device issuing a start condition, the RIIC regards its own issuing of a start condition as an error and considers this a loss in arbitration, so priority is given to transfer by the other master device. Similarly, if a request to issue a start condition is made by setting the RIICnCR2.ST bit to 1 while the bus is busy (RIICnCR2.BBSY flag = 1), the RIIC regards this as a double-issuing-of-start-condition error and considers itself to have lost in arbitration, thus preventing a failure of transfer due to issuing of a start condition while transfer is in progress.

When a start condition is issued successfully, if the data for transmission including the address bits (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state) and the low level is detected on the SDA line, the RIIC loses in arbitration.

After a loss in arbitration of mastership, the RIIC immediately enters slave receive mode. If a slave address (including the general call address) matches its own address at this time, the RIIC continues in slave operation.

A loss in arbitration of mastership is detected when the following conditions are met while the RIICnFER.MALE bit is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Non-matching of the internal level for output on SDA and the level on the SDA line after a start condition was issued by setting the RIICnCR2.ST bit to 1 while the RIICnCR2.BBSY flag was cleared to 0 (erroneous issuing of a start condition)
- Setting of the RIICnCR2.ST bit to 1 (start condition double-issue error) while the RIICnCR2.BBSY flag is set to 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDA line in master transmit mode (RIICnCR2.MST and TRS bits = $11_B$)

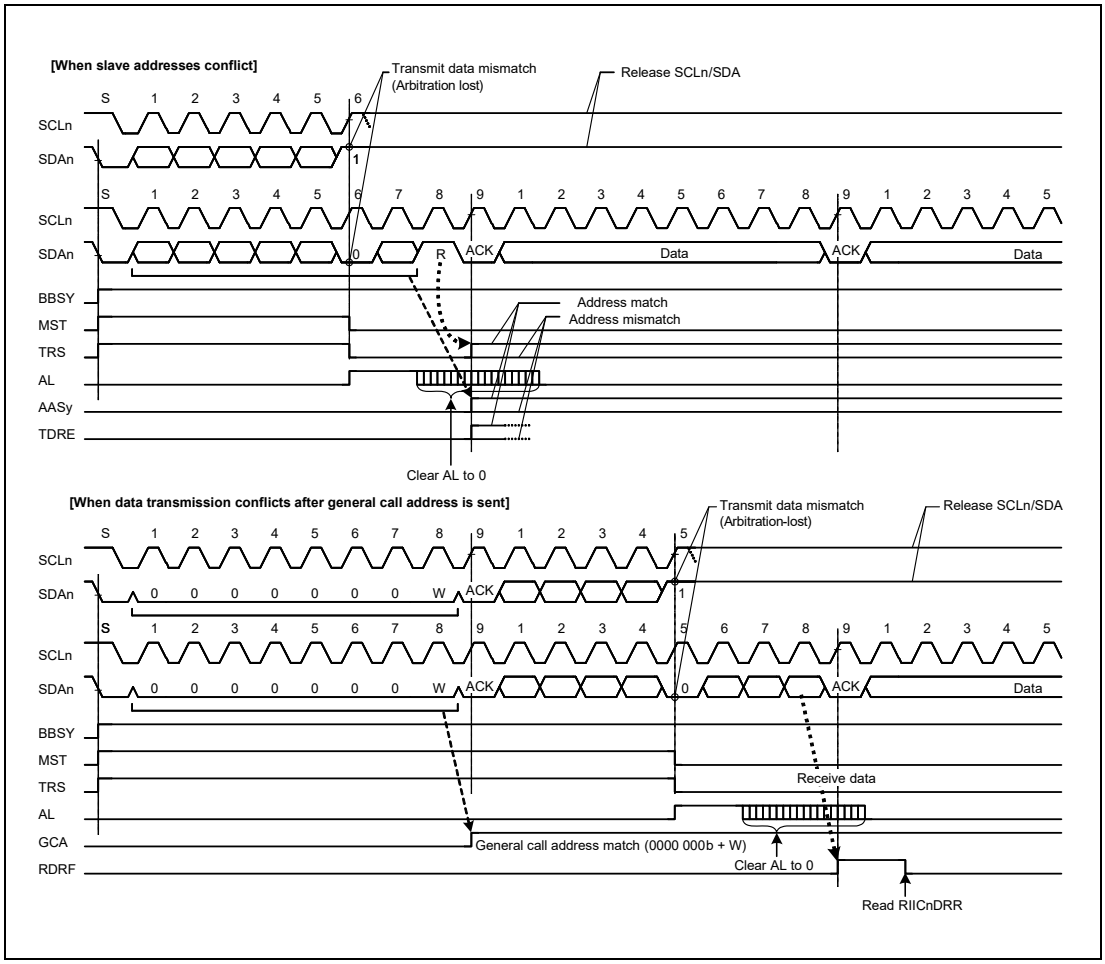

**Figure 18.33 Examples of Master Arbitration-Lost Detection (MALE = 1)**

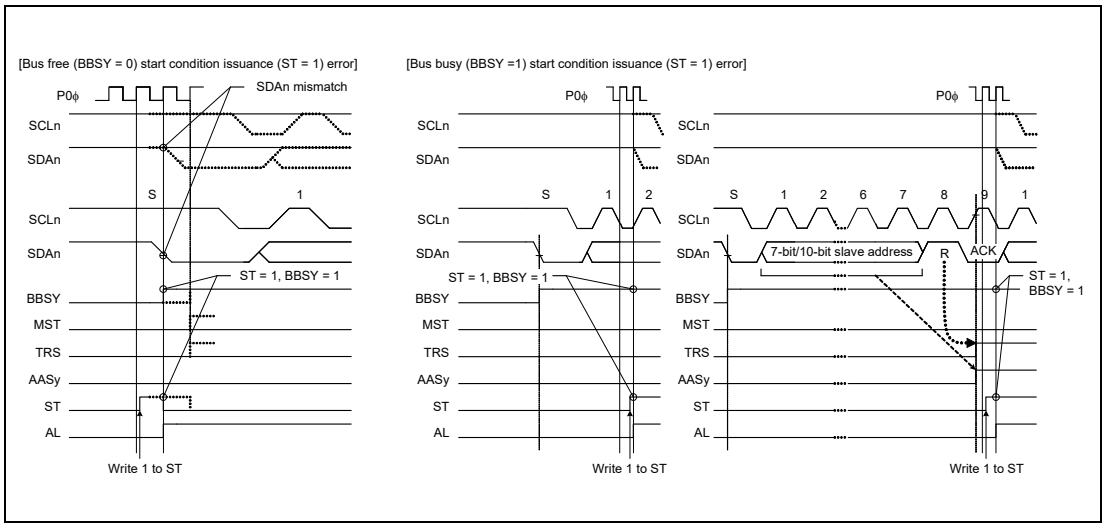

**Figure 18.34 Arbitration-Lost when a Start Condition is Issued (MALE = 1)**

### 18.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

The RIIC has a function to cause arbitration to be lost if the internal SDA output level does not match the level on the SDA line (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state) and the low level is detected on the SDA line during transmission of NACK in receive mode. Arbitration is lost due to a conflict of NACK transmission and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send/receive the same information through a single slave device. Figure 18.35 shows an example of arbitration-lost detection during transmission of NACK.

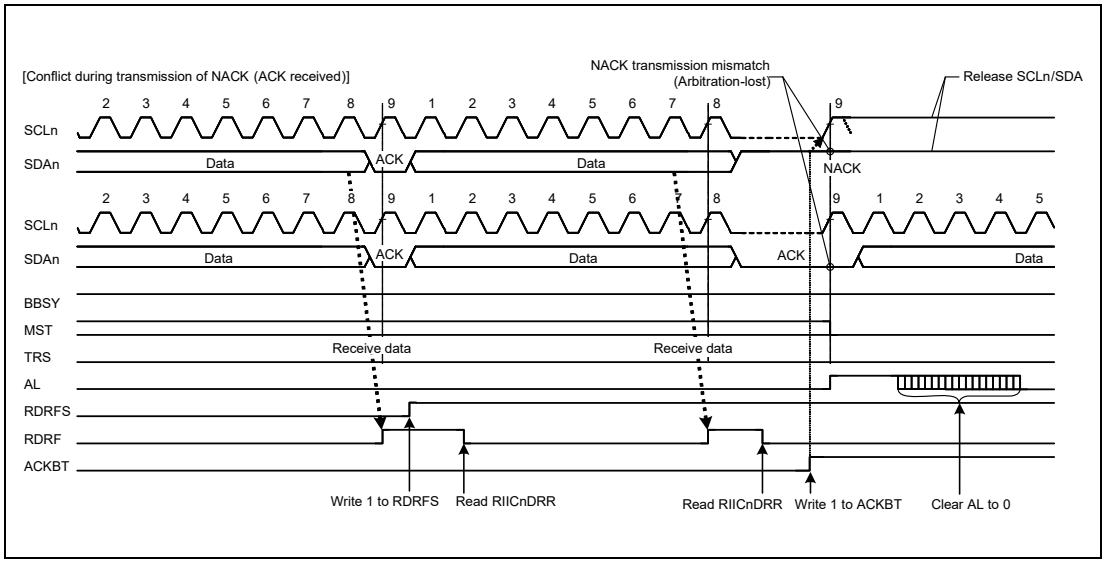

**Figure 18.35 Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)**

The following explains arbitration-lost detection using an example where two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives two bytes of data from the slave device, and master B receives four bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in both master A and master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Here, master A sends NACK when it has received two final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received necessary four bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect ACK transmitted by master B and issues a stop condition.

Therefore, the issuance of the stop condition conflicts with the SCL clock output of master B, which disturbs communication.

When the RIIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost.

If arbitration is lost during transmission of NACK, the RIIC enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

Similarly, in the ARP command processing of SMBus, the function to detect loss of arbitration during transmission of NACK is also available for eliminating the extra clock cycle processing (such as $FF_H$

transmission processing) necessary if the UDID (Unique Device Identifier) of assign address does not match in the Get UDID (general) processing after the Assign address command.

The RIIC detects arbitration-lost during transmission of NACK when the following condition is met with the RIICnFER.NALE bit set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

When the internal SDA output level does not match the SDA line (ACK is received) during transmission of NACK (RIICnMR3.ACKBT bit = 1)

### 18.11.3 Slave Arbitration-Lost Detection (SALE Bit)

The RIIC has a function to cause arbitration to be lost if the data for transmission (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the highimpedance state) and the low level is detected on the SDA line in slave transmit mode. This arbitration-lost detection function is mainly used when transmitting a UDID (Unique Device Identifier) over an SMBus.

When it loses slave arbitration, the RIIC enters slave receive mode. This function can detect conflicts of data during transmission of UDIDs over an SMBus and eliminates

subsequent redundant processing (processing for the transmission of $FF_H$).

The RIIC detects slave arbitration-lost when the following condition is met with the RIICnFER.SALE bit set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

When transmit data excluding acknowledge (internal SDA output level) does not match the SDA line in slave transmit mode (RIICnCR2.MST and TRS bits = $01_B$)

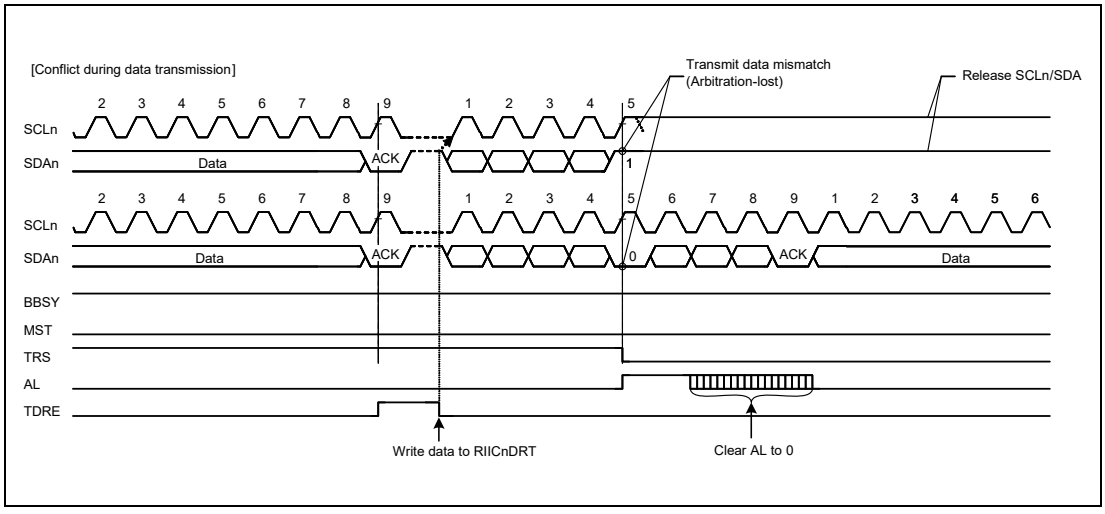

**Figure 18.36 Example of Slave Arbitration-Lost Detection (SALE = 1)**

## 18.12 Start Condition/Restart Condition/Stop Condition Issuing Function

### 18.12.1 Issuing a Start Condition

The RIIC issues a start condition when the RIICnCR2.ST bit is set to 1.

When the ST bit is set to 1, a start condition issuance request is made and the RIIC issues a start condition when the RIICnCR2.BBSY flag is 0 (bus free). When a start condition is issued normally, the RIIC automatically shifts to the master transmit mode.

A start condition is issued in the following sequence.

[Start condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the start condition hold time.
- Drive the SCL line low (high level to low level).
- Detect low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

### 18.12.2 Issuing a Restart Condition

The RIIC issues a restart condition when the RIICnCR2.RS bit is set to 1.

When the RS bit is set to 1, a restart condition issuance request is made and the RIIC issues a restart condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A restart condition is issued in the following sequence.

[Restart condition issuance]

- Release the SDA line.
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRL and the restart condition setup time.
- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the restart condition hold time.
- Drive the SCL line low (high level to low level).
- Detect a low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

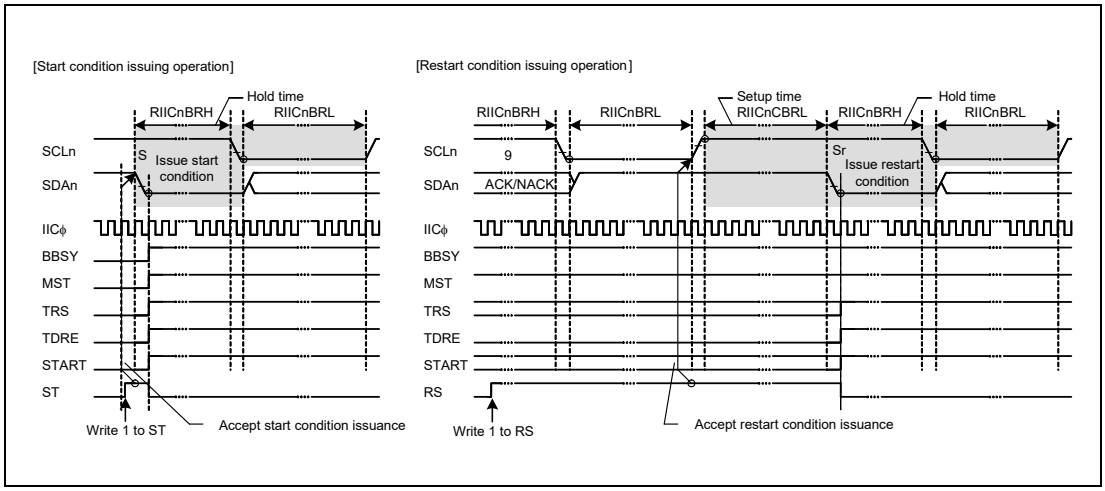

**Figure 18.37 Start Condition/Restart Condition Issue Timing (ST and RS Bits)**

### 18.12.3 Issuing a Stop Condition

The RIIC issues a stop condition when the RIICnCR2.SP bit is set to 1.

When the SP bit is set to 1, a stop condition issuance request is made and the RIIC issues a stop condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A stop condition is issued in the following sequence.

[Stop condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRH and the stop condition setup time.
- Release the SDA line (low level to high level).
- Ensure the time set in RIICnBRL and the bus free time.
- Clear the BBSY flag to 0 (to release the bus mastership).

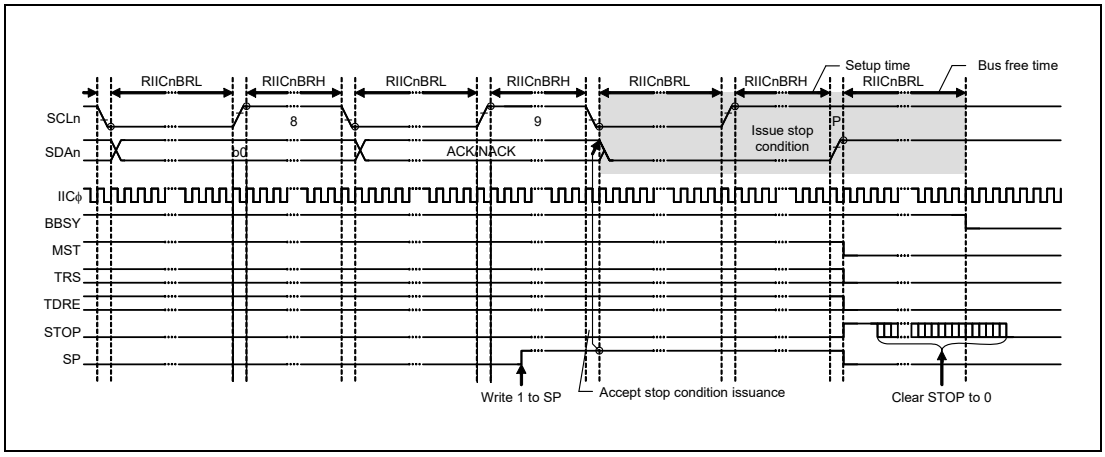

**Figure 18.38 Stop Condition Issue Timing (SP Bit)**

## 18.13 Bus Hanging

If the clock signals from the master and slave devices go out of synchronization due to noise or other factors, the $I^2C$ bus might hang with a fixed level on the SCL line and/or SDA line.

As measures against the bus hanging, the RIIC has a timeout function to detect hanging by monitoring the SCL line, a function for the output of an extra SCL clock cycle to release the bus from a hung state due to clock signals being out of synchronization, and the RIIC/internal reset function.

By checking the RIICnCR1.SCLO, SDAO, SCLI, and SDAI bits, it is possible to see whether the RIIC or its partner in communications is placing the low level on the SCL or SDA lines.

### 18.13.1 Timeout Function

The RIIC has the timeout function to detect an abnormality that the SCL line is held for a certain period of time. The RIIC can detect an abnormal bus state by monitoring that the SCL line is held low or high for a predetermined time.

The timeout function monitors the SCL line state and counts the low-level period or high-level period using the internal counter. The timeout function resets the internal counter each time the SCL line changes (rising or falling), but continues to count unless the SCL line changes. If the internal counter overflows due to no SCL line change, the RIIC can detect the timeout and report the bus abnormality.

This timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state in which the SCL line is held low or high in the following cases.

1. When the bus is busy (RIICnCR2.BBSY = 1) in master mode (RIICnCR2.MST = 1)
2. When the bus is busy (RIICnCR2.BBSY = 1) and the RIIC's own slave address matches (RIICnSR1 is not $00_H$) in slave mode (RIICnCR2.MST = 0)
3. While the bus is free (RIICnCR2.BBSY = 0) and issuing of a start condition is being requested (RIICnCR2.ST = 1).

The internal counter of the timeout function works using the internal reference clock (IICϕ) set by the RIICnMR1.CKS[2:0] bits as a count source. It functions as a 16-bit counter when long mode is selected (RIICnMR2.TMOS bit = 0) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCL line level (low/high or both levels) during which this counter is activated can be selected by the setting of the RIICnMR2.TMOH and TMOL bits. If both TMOL and TMOH bits are cleared to 0, the internal counter does not work.

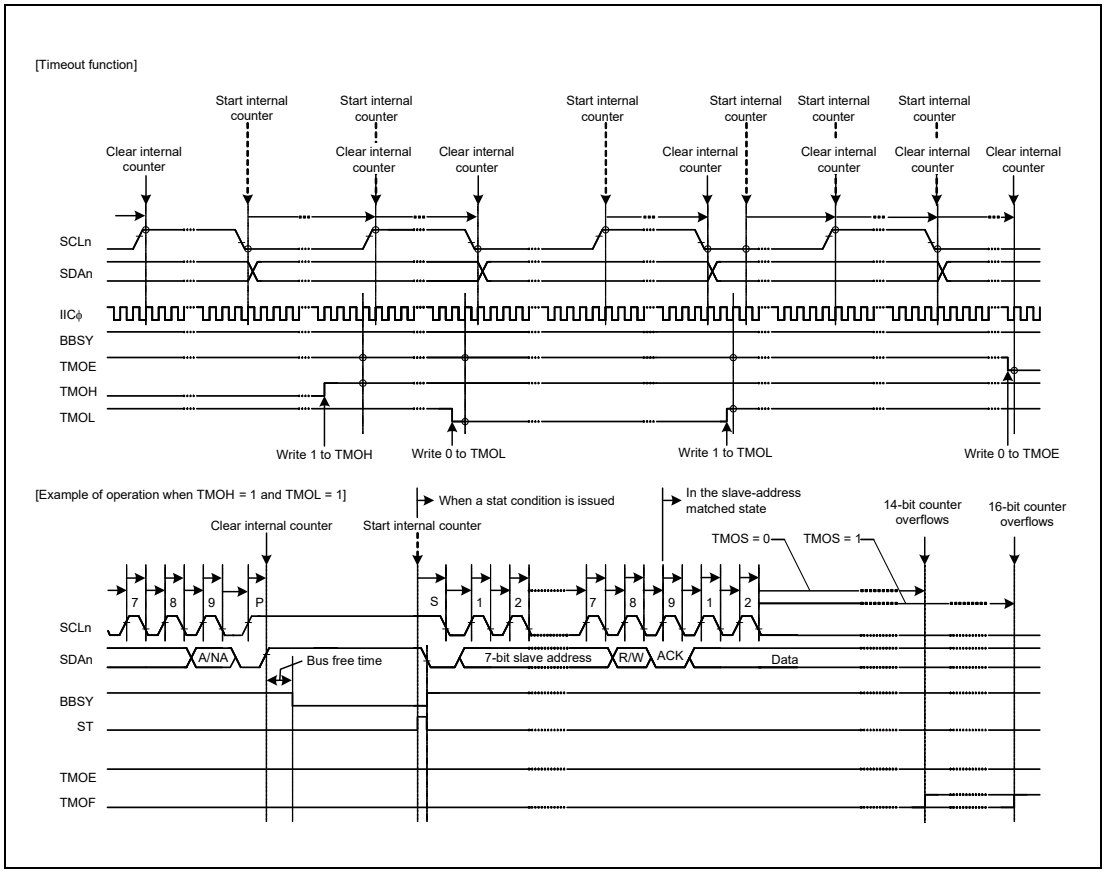

**Figure 18.39 Timeout Function (TMOE, TMOS, TMOH, and TMOL Bits)**

## 18.13.2 Extra SCL Clock Cycle Output Function

In master mode, the RIIC module has a facility for the output of extra SCL (clock) cycles to release the SDA line of the slave device from being held at the low level due to the master being out of synchronization with the slave device.

This function is mainly used in master mode to release the SDA line of the slave device from the state of being fixed to the low level by including extra cycles of SCL output from the RIIC with single cycles of the SCL (clock) signal as the unit in the case of a bus error where the RIIC cannot issue a stop condition because the slave device is holding the SDA line at the low level. Do not use this facility in normal situations. Using it when communications are proceeding correctly will lead to malfunctions.

When the RIICnCR1.CLO bit is set to 1 in master mode, a single cycle of the SCL clock at the frequency corresponding to the transfer rate settings (settings of the RIICnMR1.CKS[2:0] bits, and of the RIICnBRH and RIICnBRL registers) is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit is automatically cleared to 0. In this case, if the BBSY flag is set to 1, the SCL pin continues outputting the low level. If the BBSY flag is set to 0, the SCL pin goes high. In addition, further extra clock cycles can be output consecutively by the software program writing 1 to the CLO bit after having read CLO = 0.

When the RIIC module is in master mode and the slave device is holding the SDA line at the low level because synchronization with the slave device has been lost due to the effects of noise, etc., the output of a stop condition is not possible. The facility for output of an extra cycle of the SCL (clock) signal can be used to output extra cycles of SCL one by one to make the slave device release the SDA line from being held at the low level, thus recovering the bus from an unusable state. Release of the SDA line by the slave device can be monitored by reading the RIICnCR1.SDAI bit. After confirming release of the SDA line by the slave device, complete communications by reissuing the stop condition.

[Output conditions for using the RIICnCR1.CLO bit]

- When the bus is free (RIICnCR2.BBSY flag = 0) or in master mode (RIICnCR2.MST bit = 1 and BBSY flag = 1)
- When the communication device does not hold the SCL line low

Figure 18.40 shows the operation timing of the extra SCL clock cycle output function (CLO bit).

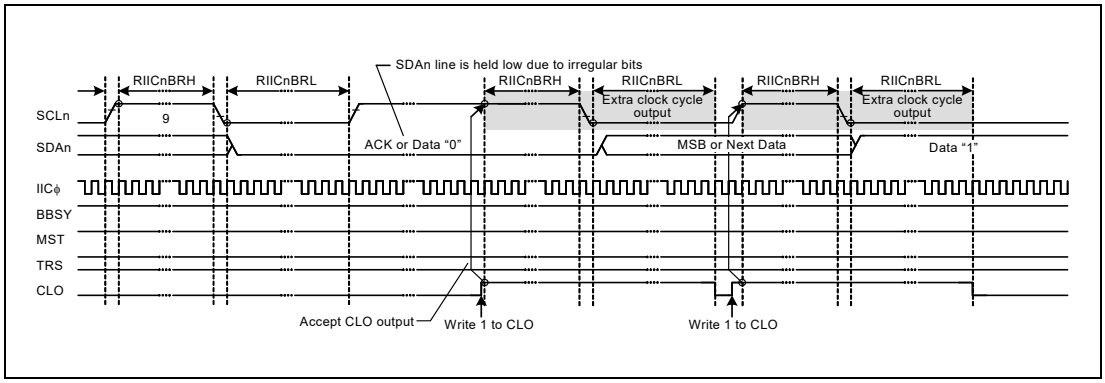

**Figure 18.40 Extra SCL Clock Cycle Output Function (CLO Bit)**

### 18.13.3 RIIC Reset and Internal Reset

The RIIC module incorporates a function for resetting itself. There are two types of reset. One is referred to as an RIIC reset; this initializes all registers including the RIICnCR2.BBSY flag. The other is referred to as an internal reset; this releases the RIIC from the slave-address matched state and initializes the internal counter while retaining other settings.

After issuing a reset, be sure to clear the RIICnCR1.IICRST bit to 0.

Both types of reset are effective for release from bus-hung states since both restore the output state of the SCL and SDA pins to the high impedance state.

Issuing a reset during slave operation may lead to a loss of synchronization between the master device clock and the slave device clock, so avoided this where possible. Note that monitoring of the bus state, such as for the presence of a start condition, is not possible during an RIIC reset (RIICnCR1.ICE and IICRST bits = $01_B$).

For a detailed description of the RIIC and internal resets, see Section 18.15, Reset Function of RIIC.

## 18.14 SMBus Operation

The RIIC is available for data communication conforming to the SMBus (Version 2.0). To perform SMBus communication, set the RIICnMR3.SMBS bit to 1. To use the transfer rate within a range of 10 kbps to 100 kbps of the SMBus standard, set the RIICnMR1.CKS[2:0] bits, RIICnCBRH, and RIICnBRL. In addition, determine the values of the RIICnMR2.DLCS bit and the RIICnMR2.SDDL[2:0] bits to meet the data hold time specification of 300 ns or more. If the RIIC is used only as a slave device, the transfer rate setting is not necessary. When the RIIC is used only as a slave device, the transfer rate setting is not necessary, whereas the RIICnBRL needs to be set to a value equal to or longer than the data setup time (250 ns).

For the SMBus device default address ($1100\ 001_B$), use one of the slave address registers L0 to L2 (RIICnSAR0, RIICnSAR1, and RIICnSAR2), and set the corresponding RIICnSARy.FSy bit (7-bit/10-bit address format select) (y = 0 to 2) to 0 (7-bit address format).

When transmitting the UDID (Unique Device Identifier), set the RIICnFER.SALE bit to 1 to enable the slave arbitration lost detection function.

### 18.14.1 SMBus Timeout Measurement

#### (1)Measuring timeout of slave device

The following period (timeout interval: $T_{LOW:\ SEXT}$) must be measured for slave devices in SMBus communication.

- From start condition to stop condition

  To measure timeout for slave devices, measure the period from start condition detection to stop condition detection with the internal timer using a start condition detection interrupt (INTRIICSTI) and stop condition detection interrupt (INTRIICSPI) of the RIIC. The measured timeout period must be within the total clock low-level period [slave device] $T_{LOW:\ SEXT}$: 25 ms (max.) of the SMBus standard.
  If the time measured with the internal timer exceeds the clock low-level detection timeout $T_{TIMEOUT}$: 25 ms (min.) of the SMBus standard, the slave device must release the bus by writing 1 to the RIICnCR1.IICRST bit to issue an internal reset of the RIIC. When an internal reset is issued, the RIIC stops driving the bus for the SCL pin and SDA pin and make the SCL/SDA pin outputs high impedance, which releases the bus.

#### (2)Measuring timeout of master device

The following periods (timeout interval: $T_{LOW:\ MEXT}$) must be measured for master devices in SMBus communication.

- From start condition to acknowledge bit
- Between acknowledge bits
- From acknowledge bit to stop condition

To measure timeout for master devices, measure these periods with the internal timer using a start condition detection interrupt (INTRIICSTI), stop condition detection interrupt (INTRIICSPI), and transmit end interrupt (INTRIICTEI) or receive data full interrupt (INTRIICRI) of the RIIC. The measured timeout period must be within the total clock low-level extended period [master device] $T_{LOW:\ MEXT}$: 10 ms (max.) of the SMBus standard, and the total of all $T_{LOW:\ MEXT}$ from start condition to stop condition must be within $T_{LOW:\ SEXT}$: 25 ms (max.).

For the ACK receive timing (rising edge of the ninth SMBCLK clock cycle), monitor theRIICnSR2. TEND flag in master transmit mode (master transmitter) and the RIICnSR2.RDRF flag in master receive mode (master receiver). For this reason, perform bytewise transmit operation in master transmit mode, and hold the RIICnMR3.RDRFS bit 0 until the byte just before reception of the final byte in master receive mode. While the RDRFS bit is 0, the RDRF flag is set to 1 at the rising edge of the ninth SMBCLK clock cycle.

If the period measured with the internal timer exceeds the total clock low-level extended period [master device] $T_{LOW:MEXT}$: 10 ms (max.) of the SMBus standard or the total of measured periods exceeds the clock low-level detection timeout $T_{TIMEOUT}$: 25 ms (min.) of the SMBus standard, the master device must stop the transaction by issuing a stop condition. In master transmit mode, immediately stop the transmit operation (writing data to RIICnDRT).

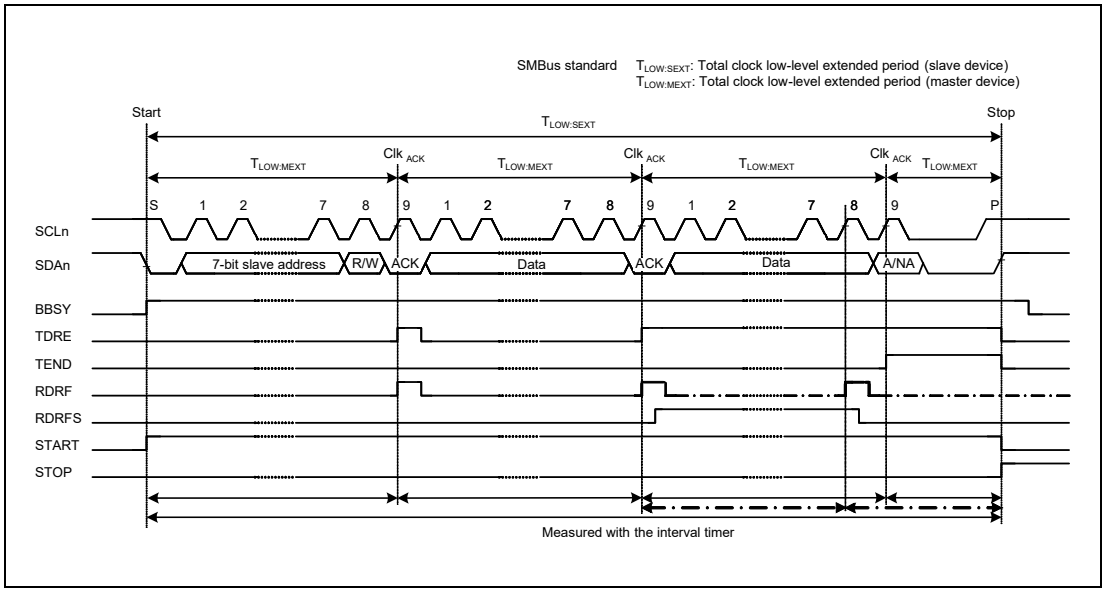

**Figure 18.41 SMBus Timeout Measurement**

## 18.14.2 SMBus Host Notification Protocol/Notify ARP Master

In communications over an SMBus, a slave device can temporarily act as a master device to notify the SMBus host (or ARP master) of (or request the SMBus host for) its own slave address or to request its own slave address from the SMBus host.

For this LSI to operate as an SMBus host (or ARP master), the host address ($0001\ 000_B$) sent from the slave device must be detected as a slave address, so the RIIC has a function for detecting the host address. To detect the host address as a slave address, set the RIICnMR3.SMBS bit and the RIICnSER.HOAE bit to 1. Operation after the host address has been detected is the same as normal slave operation.

## 18.15 Reset Function of RIIC

The RIIC has chip reset, RIIC reset, and internal reset functions. Table 18.24 lists the scope of each reset and reset conditions.

**Table 18.24 RIIC Reset Functions (1/2)**

| Register | | RIIC Reset (ICE = 0, IICRST = 1) | Internal Reset (ICE = 1, IICRST = 1) | Start Condition/ Restart Condition Detection | Stop Condition Detection |
|---|---|---|---|---|---|
| RIICnCR1 | ICE | 0 | 1 | Retained | Retained |
| | IICRST | 1 | 1 | Retained | Retained |

Note 1. When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
When an internal reset is applied while the bus is not free, the BBSY flag is not cleared.

# 19. Serial Sound Interface

The serial sound interface is a module designed to send or receive audio data interface with various devices offering $I^2S$ bus compatibility. It also provides additional modes for other common formats, as well as support for multi-channel mode.

## 19.1 Features

- Number of channels: Six channels
- Operating mode: Non-compressed mode
  The non-compressed mode supports serial audio streams divided by channels.
- Serves as both a transmitter and a receiver
  Channels 0, 1, 3, and 5 support full-duplex communications.
- Capable of using serial bus format
- Asynchronous transfer takes place between the data buffer and the shift register.
- It is possible to select a dividing ratio for the clock used by the serial bus interface.
- It is possible to control data transmission or reception with DMA transfer and interrupt requests.
  A path is also provided for direct data transfer between this module and the SCUX module.
- Selects the oversampling clock input from among the following pins:
  —AUDIO_CLK (1 to 50 MHz)
  —AUDIO_X1, AUDIO_X2 (when connecting a crystal resonator: 10 to 50 MHz, when used to input external clock: 1 to 50 MHz)
- Includes 8-stage FIFO buffers in transmitter and receiver
- Supports multi-channel mode (TDM mode) in which the SSIWS signal is high only for system word 1 period.
- Supports WS continue mode in which the SSIWS signal is not stopped.
- An interrupt is used to notify the CPU of a change of sampling frequency during transfer.

Figure 19.1 shows a block diagram of this module.

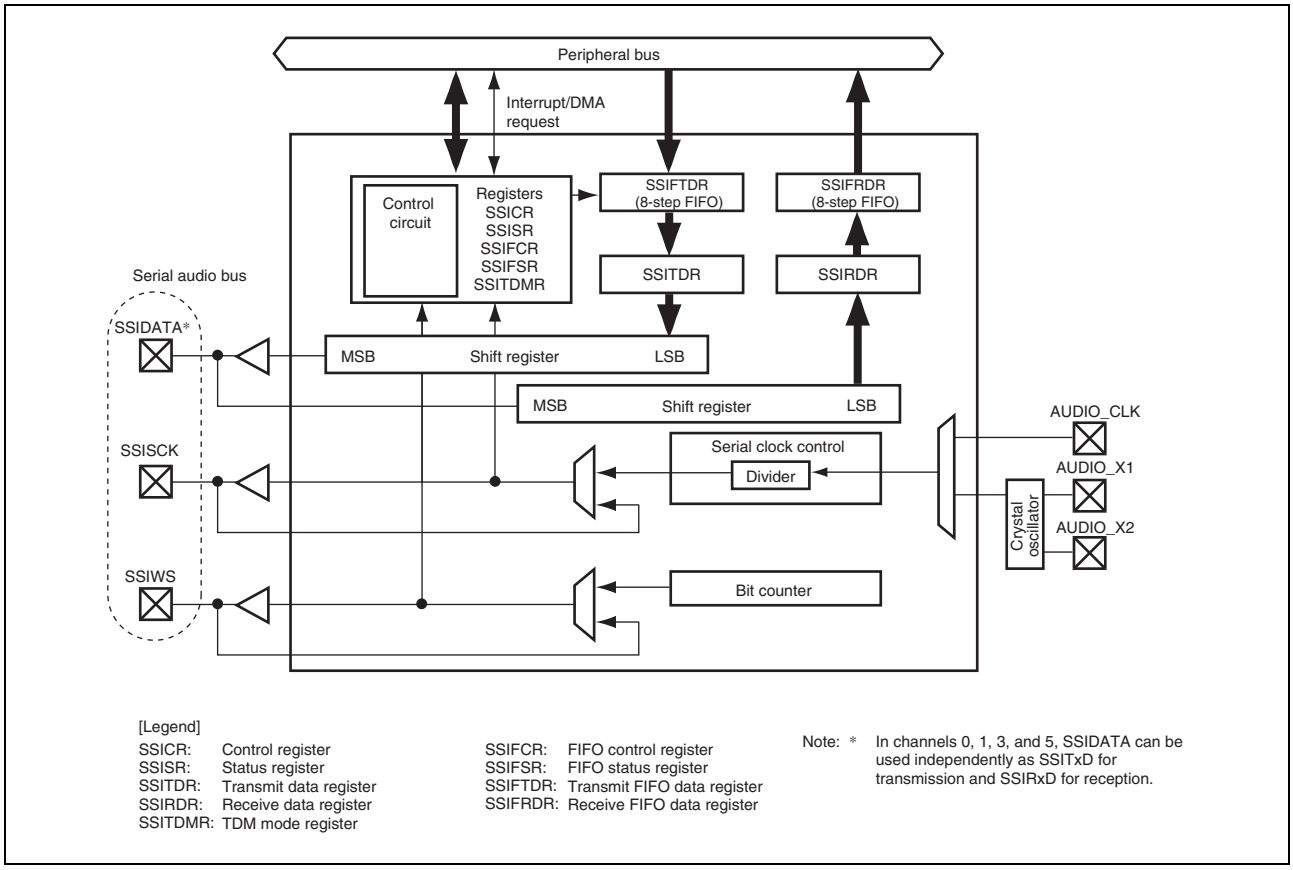

**Figure 19.1 Block Diagram of Serial Sound Interface**

## 19.2 Input/Output Pins

Table 19.1 shows the pin assignments relating to this module.

**Table 19.1 Pin Assignments**

| Channel | Pin Name | I/O | Description |
|---|---|---|---|
| 0, 1, 3, 5 | SSISCK0*1*3, SSISCK1*1*3, SSISCK3*1*3, SSISCK5*1*3 | I/O | Serial bit clock |
| | SSIWS0*1*3, SSIWS1*1*3, SSIWS3*1*3, SSIWS5*1*3 | I/O | Word selection |
| | SSITxD0, SSITxD1, SSITxD3, SSITxD5 | Output | Serial data output |
| | SSIRxD0*1, SSIRxD1*1, SSIRxD3*1, SSIRxD5*1 | Input | Serial data input |
| 2, 4 | SSISCK2*1*3, SSISCK4*1*3 | I/O | Serial bit clock |
| | SSIWS2*1*3, SSIWS4*1*3 | I/O | Word selection |
| | SSIDATA2*1, SSIDATA4*1 | I/O | Serial data input/output |
| Common | AUDIO_CLK*2 | Input | External clock for audio (input oversampling clock) |
| | AUDIO_X1 | Input | Crystal resonator/external clock for audio (input oversampling clock) |
| | AUDIO_X2 | Output | |

Note 1. In slave mode, whether or not to use the noise canceler in the input route can be selected. For details, refer to section 54.3.15, Serial Sound Interface Noise Canceler Control Register (SNCR), under section 54, Ports.

Note 2. When the SSInCKS bit (n = 0 to 5) is set to 1, the MLB_CLK pin is used as the AUDIO_CLK pin. For details, refer to section 48.3.70, SSI Pin Mode Register (SSIPMD_CIM) and section 48.4.4, Pin Connection Specifications of SSIF.

Note 3. Each of SSIF1 to SSIF3 can use SSISCK0 and SSIWS0 of SSIF0 as its own SSISCK and SSIWS. Each of SSIF4 and SSIF5 can use SSISCK3 and SSIWS3 of SSIF3 as its own SSISCK and SSIWS. For details, refer to section 48.3.70, SSI Pin Mode Register (SSIPMD_CIM) and section 48.4.4, Pin Connection Specifications of SSIF. When SSIF1 to SSIF3 uses SSIF0 as the master or SSIF4 and SSIF5 uses SSIF3 as the master, the noise canceler function cannot be used.

## 19.3 Register Description

Table 19.2 lists the register configuration. Note that explanation in the text does not refer to the channels.

**Table 19.2 Register Configuration**

| Channel | Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | Control register 0 | SSICR_0 | R/W | H'00000000 | H'E820B000 | 32 |
| | Status register 0 | SSISR_0 | R/W*1 | H'02000013 | H'E820B004 | 32 |
| | FIFO control register 0 | SSIFCR_0 | R/W | H'00000000 | H'E820B010 | 32 |
| | FIFO status register 0 | SSIFSR_0 | R/(W)*2 | H'00010000 | H'E820B014 | 32 |
| | Transmit FIFO data register 0 | SSIFTDR_0 | W | Undefined | H'E820B018 | 32 |
| | Receive FIFO data register 0 | SSIFRDR_0 | R | Undefined | H'E820B01C | 32 |
| | TDM mode register 0 | SSITDMR_0 | R/W | H'00000000 | H'E820B020 | 32 |
| | FC control register 0 | SSIFCCR_0 | R/W | H'00000000 | H'E820B024 | 32 |
| | FC mode register 0 | SSIFCMR_0 | R/W | H'00000000 | H'E820B028 | 32 |
| | FC status register 0 | SSIFCSR_0 | R/(W)*3 | H'00000000 | H'E820B02C | 32 |
| 1 | Control register 1 | SSICR_1 | R/W | H'00000000 | H'E820B800 | 32 |
| | Status register 1 | SSISR_1 | R/W*1 | H'02000013 | H'E820B804 | 32 |
| | FIFO control register 1 | SSIFCR_1 | R/W | H'00000000 | H'E820B810 | 32 |
| | FIFO status register 1 | SSIFSR_1 | R/(W)*2 | H'00010000 | H'E820B814 | 32 |
| | Transmit FIFO data register 1 | SSIFTDR_1 | W | Undefined | H'E820B818 | 32 |

| | FC status register 4 | SSIFCSR_4 | R/(W)*3 | H'00000000 | H'E820D02C | 32 |
| 5 | Control register 5 | SSICR_5 | R/W | H'00000000 | H'E820D800 | 32 |
| | Status register 5 | SSISR_5 | R/W*1 | H'02000013 | H'E820D804 | 32 |
| | FIFO control register 5 | SSIFCR_5 | R/W | H'00000000 | H'E820D810 | 32 |
| | FIFO status register 5 | SSIFSR_5 | R/(W)*2 | H'00010000 | H'E820D814 | 32 |
| | Transmit FIFO data register 5 | SSIFTDR_5 | W | Undefined | H'E820D818 | 32 |
| | Receive FIFO data register 5 | SSIFRDR_5 | R | Undefined | H'E820D81C | 32 |
| | TDM mode register 5 | SSITDMR_5 | R/W | H'00000000 | H'E820D820 | 32 |
| | FC control register 5 | SSIFCCR_5 | R/W | H'00000000 | H'E820D824 | 32 |
| | FC mode register 5 | SSIFCMR_5 | R/W | H'00000000 | H'E820D828 | 32 |
| | FC status register 5 | SSIFCSR_5 | R/(W)*3 | H'00000000 | H'E820D82C | 32 |

Note 1. Although bits 29 to 26 in these registers can be read from or written to, bits other than these are read-only. For details, refer to section 19.3.2, Status Register (SSISR).

Note 2. To bits 16 and 0 in these registers, only 0 can be written to clear the flags. Other bits are read-only. For details, refer to section 19.3.6, FIFO Status Register (SSIFSR).

Note 3. To bit 24 in these registers, only 0 can be written to clear the flag. Other bits are read-only. For details, refer to section 19.3.12, FC Status Register (SSIFCSR).

### 19.3.1 Control Register (SSICR)

SSICR is a 32-bit readable/writable register that controls the IRQ, selects the polarity status, and sets operating mode.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note: This bit has no meaning in direct transfer between this module and the SCUX. Use the SWAP function of the SCUX.

| | | | | |
|---|---|---|---|---|
| 8 | DEL | 0 | R/W | Serial Data Delay<br>0: 1 clock cycle delay between SSIWS and SSIDATA<br>1: No delay between SSIWS and SSIDATA |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 4 | CKDV[3:0] | 0000 | R/W | Serial Oversampling Clock Division Ratio<br>Sets the ratio between the oversampling clock (AUDIOφ) and the serial bit clock. When the SCKD bit is 0, the setting of these bits is ignored. The serial bit clock is used in the shift register and is supplied from the SSISCK pin.<br>0000: AUDIOφ<br>0001: AUDIOφ/2<br>0010: AUDIOφ/4<br>0011: AUDIOφ/8<br>0100: AUDIOφ/16<br>0101: AUDIOφ/32<br>0110: AUDIOφ/64<br>0111: AUDIOφ/128<br>1000: AUDIOφ/6<br>1001: AUDIOφ/12<br>1010: AUDIOφ/24<br>1011: AUDIOφ/48<br>1100: AUDIOφ/96<br>1101: Setting prohibited<br>1110: Setting prohibited<br>1111: Setting prohibited |
| 3 | MUEN | 0 | R/W | Mute Enable<br>This bit is used to specify muting of the signals from this module during transmission. It is also used to specify the logical value to be output from the SSITxD pin when the MUEN bit is set to 0 with transfer disabled in WS continue mode.<br>0: This module is not muted.<br>1: This module is muted.<br>Note: When this module is muted, serial data to be output is rewritten to 0 but data transmission in the module is not stopped. Write dummy data to the SSIFTDR not to generate a transmit underflow because the number of data in the transmit FIFO is decreasing. |
| 2 | ¾ | 0 | R | Reserved<br>The read value is undefined. The write value should always be 0. |
| 1 | TEN | 0 | R/W | Transmit Enable<br>0: Disables the transmit operation.<br>1: Enables the transmit operation.<br>Note: When transmission stop/start is controlled by the SSI control register (SSICTRL_CIM) in the SCUX, set this bit to 0. |
| 0 | REN | 0 | R/W | Receive Enable<br>0: Disables the receive operation.<br>1: Enables the receive operation.<br>Note: When reception stop/start is controlled by the SSI control register (SSICTRL_CIM) in the SCUX, set this bit to 0. |

## 19.3.2 Status Register (SSISR)

SSISR consists of status flags indicating the operational status of this module and bits indicating the current channel numbers and word numbers.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | TUIRQ | TOIRQ | RUIRQ | ROIRQ | IIRQ | - | - | - | - | - | - | - | - | - |
| Initial value: | Undefined | Undefined | 0 | 0 | 0 | 0 | 1 | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined |
| R/W: | R | R | R/(W)* | R/(W)* | R/(W)* | R/(W)* | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | TCHNO[1:0] | | TSWNO | RCHNO[1:0] | | RSWNO | IDST |
| Initial value: | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | 0 | 0 | 1 | 0 | 0 | 1 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note: * The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31, 30 | — | Undefined | R | Reserved<br>The read value is undefined. The write value should always be 0. |
| 29 | TUIRQ | 0 | R/(W)* | Transmit Underflow Error Interrupt Status Flag<br>This status flag indicates that transmit data was supplied at a lower rate than was required.<br>This bit is set to 1 regardless of the value of the TUIEN bit and can be cleared by writing 0 to this bit.<br>If TUIRQ = 1 and TUIEN = 1, an SSI interrupt occurs.<br>If TUIRQ = 1, SSITDR did not have data written to it before it was required for transmission. This will lead to the same data being transmitted once more and a potential corruption of multi-channel data. As a result, this module will output erroneous data.<br>Note: When an underflow error occurs, the current data in the data buffer of this module is transmitted until the next data is written. |
| 28 | TOIRQ | 0 | R/(W)* | Transmit Overflow Error Interrupt Status Flag<br>This status flag indicates that transmit data was supplied at a higher rate than was required.<br>This bit is set to 1 regardless of the value of the TOIEN bit and can be cleared by writing 0 to this bit.<br>If TOIRQ = 1 and TOIEN = 1, an SSI interrupt occurs.<br>If TOIRQ = 1, SSIFTDR had data written to it while the transmit FIFO is full (TDC = H'8). This will lead to the loss of data and a potential corruption of multi-channel data. |
| 27 | RUIRQ | 0 | R/(W)* | Receive Underflow Error Interrupt Status Flag<br>This status flag indicates that receive data was supplied at a lower rate than was required.<br>This bit is set to 1 regardless of the value of the RUIEN bit and can be cleared by writing 0 to this bit.<br>If RUIRQ = 1 and RUIEN = 1, an SSI interrupt occurs.<br>If RUIRQ = 1, SSIFRDR was read while the receive FIFO is empty (RDC = H'0).This can cause invalid receive data to be stored, which may lead to corruption of multi-channel data. |
| 26 | ROIRQ | 0 | R/(W)* | Receive Overflow Error Interrupt Status Flag<br>This status flag indicates that receive data was supplied at a higher rate than was required.<br>This bit is set to 1 regardless of the value of the ROIEN bit and can be cleared by writing 0 to this bit.<br>If ROIRQ = 1 and ROIEN = 1, an SSI interrupt occurs.<br>If ROIRQ = 1, SSIRDR was not read before there was new unread data written to it. This will lead to the loss of data and a potential corruption of multi-channel data.<br>Note: When an overflow error occurs, the current data in the data buffer of this module is overwritten by the next incoming data from the SSI interface. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 25 | IIRQ | 1 | R | Idle Mode Interrupt Status Flag<br>This status flag indicates whether this module is in the idle state.<br>This bit is set to 1 regardless of the value of the IIEN bit to allow polling.<br>The interrupt can be masked by clearing IIEN to 0, but cannot be cleared by writing 0 to this bit.<br>If IIRQ = 1 and IIEN = 1, an SSI interrupt occurs.<br>0: This module is not in idle state.<br>1: This module is in idle state. |
| 24 to 7 | — | Undefined | R | Reserved<br>The read value is undefined. The write value should always be 0. |
| 6, 5 | TCHNO [1:0] | 00 | R | Transmit Channel Number<br>These bits show the current channel number.<br>These bits indicate the number of a channel whose data is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR.<br>When TDM or CONT is 1, these bits cannot be used. |
| 4 | TSWNO | 1 | R | Transmit Serial Word Number<br>This status bit indicates the current word number.<br>This bit indicates which system word is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR.<br>When TDM or CONT is 1, this bit cannot be used. |
| 3, 2 | RCHNO [1:0] | 00 | R | Receive Channel Number<br>These bits show the current channel number.<br>These bits indicate which channel the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register.<br>When TDM or CONT is 1, these bits cannot be used. |
| 1 | RSWNO | 1 | R | Receive Serial Word Number<br>This status bit indicates the current word number.<br>This bit indicates which system word the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register, regardless of whether SSIRDR has been read.<br>When TDM or CONT is 1, this bit cannot be used. |
| 0 | IDST | 1 | R | Idle Mode Status Flag<br>This status flag indicates that the serial bus activity has stopped.<br>This bit is cleared to 0 if the serial bus is currently active while TEN = 1 or REN = 1.<br>This bit is automatically set to 1 if both TEN and REN are cleared to 0 and the current system word communication is completed.<br>Note: If the external device stops the serial bus clock before the current system word is completed, this bit is not set. |

Note: * The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

### 19.3.3 Transmit Data Register (SSITDR)

SSITDR is a 32-bit register that stores data to be transmitted. The data for transmission to be stored to SSITDR is automatically transferred from the transmit FIFO data register.

Data written to this register is transferred to the shift register upon transmission request. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR.

The CPU cannot read or write data from/to SSITDR.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W: | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

### 19.3.4 Receive Data Register (SSIRDR)

SSIRDR is a 32-bit register that stores received data. The received data stored in SSIRDR is automatically transferred to the receive FIFO data register.

Data in this register is transferred from the shift register each time data word is received. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR.

The CPU cannot read or write data from/to SSIRDR.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial value: | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W: | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W: | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

## 19.3.5 FIFO Control Register (SSIFCR)

SSIFCR is a 32-bit readable/writable register that specifies the data trigger numbers for the transmit and receive FIFO data registers, and enables or disables FIFO data resets and interrupt requests.
SSIFCR can always be read or written by the CPU.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7, 6 | TTRG[1:0] | 00 | R/W | Transmit Data Trigger Number<br>When the FIFO is operating for transmission, these bits specify the number of bytes for transmission in the FIFO (trigger number for transmission) at which the TDE flag in the FIFO status register (SSIFSR) will be set. The TDE flag is set to 1 when the number of bytes for transmission in the transmit FIFO data register (SSIFTDR) has fallen to or below the trigger number corresponding to the setting as shown below.<br>00: 7 (1)*<br>01: 6 (2)*<br>10: 4 (4)*<br>11: 2 (6)*<br>Note: * The values in parentheses are the number of empty stages in SSIFTDR at which the TDE flag is set. |
| 5, 4 | RTRG[1:0] | 00 | R/W | Receive Data Trigger Number<br>When the FIFO is operating for reception, these bits specify the number of received bytes in the FIFO (trigger number for reception) at which the RDF flag in the FIFO status register (SSIFSR) will be set. The RDF flag is set to 1 when the number of received bytes in the receive FIFO data register (SSIFRDR) has risen to or above the trigger number corresponding to the setting as shown below.<br>00: 1<br>01: 2<br>10: 4<br>11: 6 |
| 3 | TIE | 0 | R/W | Transmit Interrupt Enable<br>This bit enables or disables generation of transmit data empty interrupt (TXI) requests in the following situation: when the FIFO is operating for transmission, the data for transmission in the transmit FIFO data register (SSIFTDR) are transferred to the transmit data register (SSITDR) and the number of data bytes in the transmit FIFO data register has become less than the set transmit trigger number, so that the TDE flag in the FIFO status register (SSIFSR) is set to 1.<br>0: Transmit data empty interrupt (TXI) request is disabled.<br>1: Transmit data empty interrupt (TXI) request is enabled.*<br>Note: * TXI can be cleared by clearing either the TDE flag (see the description of the TDE bit for details) or TIE bit to 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | RIE | 0 | R/W | Receive Interrupt Enable<br>Enables or disables generation of receive data full interrupt (RXI) requests when the RDF flag in the FIFO status register (SSIFSR) is set to 1 while the FIFO is operating for reception.<br>0: Receive data full interrupt (RXI) request is disabled.<br>1: Receive data full interrupt (RXI) request is enabled.*<br>Note: * RXI can be cleared by clearing either the RDF flag (see the description of the RDF bit for details) or RIE bit to 0. |
| 1 | TFRST | 0 | R/W | Transmit FIFO Data Register Reset<br>Invalidates the data in the transmit FIFO data register (SSIFTDR) to reset the FIFO to an empty state.<br>0: Reset is disabled.*<br>1: Reset is enabled.<br>Note: * FIFO is reset at a power-on reset. |
| 0 | RFRST | 0 | R/W | Receive FIFO Data Register Reset<br>Invalidates the data in the receive FIFO data register (SSIFRDR) to reset the FIFO to an empty state.<br>0: Reset is disabled.*<br>1: Reset is enabled.<br>Note: * FIFO is reset at a power-on reset. |

## 19.3.6 FIFO Status Register (SSIFSR)

SSIFSR contains status flags that indicate the state of operation of the transmit and receive FIFO data registers.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | TDC[3:0] | | | | - | - | - | - | - | - | - | TDE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/(W)* |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | RDC[3:0] | | | | - | - | - | - | - | - | - | RDF |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/(W)* |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 27 to 24 | TDC[3:0] | 0000 | R | Number of Data Bytes Stored in SSIFTDR<br>TDC[3:0] = H'0 indicates no data for transmission.<br>TDC[3:0] = H'8 indicates that 32 bytes of data for transmission is stored in SSIFTDR. |
| 23 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 16 | TDE | 1 | R/(W)* | Transmit Data Empty<br>Indicates that, when the FIFO is operating for transmission, the data for transmission in the transmit FIFO data register (SSIFTDR) is transferred to the transmit data register (SSITDR), the number of data bytes in SSIFTDR has become less than the transmit trigger number specified by TTRG[1:0] in the FIFO control register (SSIFCR), and thus writing of transmit data to SSIFTDR has been enabled.<br>0: Number of data bytes for transmission in SSIFTDR is greater than the set transmit trigger number.<br>[Clearing conditions]<br>• 0 is written to TDE after data of the number of bytes larger than the set transmit trigger number is written to SSIFTDR.<br>• The direct memory access controller is activated by transmit data empty (TXI) interrupt, and data of the number of bytes larger than the set transmit trigger number is written to SSIFTDR.<br>1: Number of data bytes for transmission in SSIFTDR is equal to or less than the set transmit trigger number.*1<br>[Setting conditions]<br>• Power-on reset<br>• Number of transmission data bytes stored in SSIFTDR has become equal to or less than the set transmit trigger number.<br>Note: *1 Since SSIFTDR is an 8-stage FIFO register, the amount of data that can be written to it while TDE = 1 is "8 – transmit trigger number to be specified" bytes at maximum. Writing more data will be ignored. The number of data bytes in SSIFTDR is indicated in the TDC bits in SSIFSR. |
| 15 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | RDC[3:0] | 0000 | R | Number of Data Bytes Stored in SSIFRDR<br>RDC[3:0] = H'0 indicates no received data.<br>RDC[3:0] = H'8 indicates that 32 bytes of received data is stored in SSIFRDR. |
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | RDF | 0 | R/(W)* | Receive Data Full<br>Indicates that, when the FIFO is operating for reception, the received data is transferred to the receive FIFO data register (SSIFRDR) and the number of data bytes in SSIFRDR has become greater than the receive trigger number specified by RTRG[1:0] in the FIFO control register (SSIFCR).<br>0: Number of received data bytes in SSIFRDR is less than the set receive trigger number.<br>[Clearing conditions]<br>• Power-on reset<br>• 0 is written to RDF after the receive FIFO is emptied with writing 1 to RFRST.<br>• 0 is written to RDF after data is read from SSIFRDR until the number of data bytes in SSIFRDR becomes less than the set receive trigger number.<br>• The direct memory access controller is activated by receive data full (RXI) interrupt, and data is read from SSIFRDR until the number of data bytes in SSIFRDR becomes less than the set receive trigger number.<br>1: Number of received data bytes in SSIFRDR is equal to or greater than the set receive trigger number.<br>[Setting condition]<br>• Data of the number of bytes that is equal to or greater than the set receive trigger number is stored in SSIFRDR.*1<br>Note: *1 Since SSIFRDR is an 8-stage FIFO register, the amount of data that can be read from it while RDF = 1 is the set receive trigger number of bytes at maximum.<br>Continuing to read data from SSIFRDR after reading all the data will result in undefined data to be read. The number of data bytes in SSIFRDR is indicated in the RDC bits in SSIFSR. |

Note: * The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

### 19.3.7 Transmit FIFO Data Register (SSIFTDR)

SSIFTDR is a FIFO register consisting of eight stages of 32-bit registers for storing data to be serially transmitted. On detecting that the transmit data register (SSITDR) is empty, this module transfers the data for transmission written to SSIFTDR to SSITDR to start serial transmission, which can continue until SSIFTDR becomes empty. SSIFTDR can be written to by the CPU at any time.
Note that when SSIFTDR is full of transmit data (32 bytes), the next data cannot be written to it. If writing is attempted, it will be ignored and an overflow occurs.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial value: | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W: | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial value: | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W: | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

Note: * Not writable while FIFO is receiving data.

### 19.3.8 Receive FIFO Data Register (SSIFRDR)

SSIFRDR is a FIFO register consisting of eight stages of 32-bit registers for storing serially received data. When four bytes of data have been received, this module transfers the received data in the receive data register (SSIRDR) to SSIFRDR to complete reception operation. Reception can continue until 32 bytes of data have been stored to SSIFRDR. SSIFRDR can be read but cannot be written to by the CPU. Note that when SSIFRDR is read while it does not hold received data, the value read is undefined and a reception underflow will occur.
After SSIFRDR becomes full of received data, the data received thereafter will be lost and a receive overflow occurs.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial value: | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial value: | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

## 19.3.9 TDM Mode Register (SSITDMR)

SSITDMR is a 32-bit readable/writable register that enables or disables muting of receive data in direct transfer, TDM mode, and WS continue mode.

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | RXD MUTE | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | CONT | - | - | - | - | - | - | - | TDM |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 17 | RXDMUTE | 0 | R/W | Receive Direct Data Mute Setting<br>When receive data is output directly to the SCUX, the output data is forcibly muted so that there is no signal (output as 0 data).<br>0: The receive data is output without change.<br>1: 0 data is output. |
| 16 | — | 0 | R/W | Reserved<br>Always write 0 to this bit. |
| 15 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 8 | CONT | 0 | R/W | WS Continue Mode<br>0: Disables WS continue mode.<br>1: Enables WS continue mode.<br>Note: This bit can be set only in master mode<br>(SCKD = 1 and SWSD = 1) |
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | TDM | 0 | R/W | TDM Mode<br>0: Disables TDM mode.<br>1: Enables TDM mode. |

## 19.3.10 FC Control Register (SSIFCCR)

SSIFCCR is a 32-bit readable/writable register that controls frequency change detection.

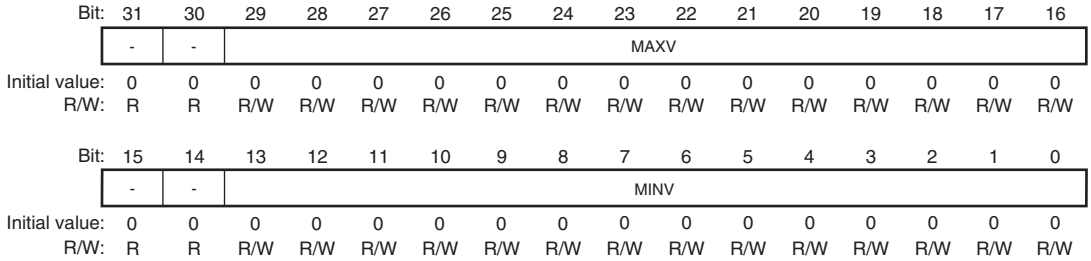
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | FIEN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | FCEN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 16 | FIEN | 0 | R/W | Frequency Change Detection Interrupt Enable<br>0: Disables a frequency change detection interrupt.<br>1: Enables a frequency change detection interrupt. |
| 15 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | FCEN | 0 | R/W | Frequency Change Detection Enable<br>When this bit is set to 1, counting up of cycles of peripheral clock 1 (P1φ) starts at the beginning of the next SSIWS cycle. On the start of each SSIWS cycle, the current counted value is moved to the VALUE bits in the FC Status Register (SSIFCSR). The counter is then cleared to 0 and counting up is resumed. When this bit is set to 0, the counter is cleared to 0 and counting up is stopped.<br>0: Disables frequency change detection.<br>1: Enables frequency change detection.<br>Note: Set this bit to 1 after setting the desired values in SSICR, SSIFCMR, and SSITDMR. |

## 19.3.11 FC Mode Register (SSIFCMR)

SSIFCMR sets the maximum and minimum allowable numbers of cycles of the peripheral clock 1 (P1ϕ) for each SSIWS cycle, when frequency change detection is enabled.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31, 30 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 29 to 16 | MAXV | 0 | R/W | Maximum Value<br>Sets the maximum allowable number of cycles of the peripheral clock 1 (P1φ) for each SSIWS cycle, when SSIFCCR.FCEN = 1. |
| 15, 14 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 13 to 0 | MINV | 0 | R/W | Minimum Value<br>Sets the minimum allowable number of cycles of the peripheral clock 1 (P1φ) for each SSIWS cycle, when SSIFCCR.FCEN = 1. |

## 19.3.12 FC Status Register (SSIFCSR)

SSIFCSR consists of the frequency change detection status flag and the bits that indicate the current cycle count of the peripheral clock 1 (P1ϕ).

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | - | - | - | - | - | FCIRQ | - | - | - | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/(W)* | R | R | R | R | R | R | R | R |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | - | - | VALUE | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 25 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 24 | FCIRQ | 0 | R/(W)* | Frequency Change Detection Error Interrupt Status<br>Indicates VALUE > SSIFCMR.MAXV or 0 < VALUE < SSIFCMR.MINV when SSIFCCR.FCEN = 1.<br>This bit is set to 1 regardless of the setting of the FIEN bit in SSIFCCR. Write 0 to clear this flag to 0.<br>When FCIRQ = 1 and SSIFCCR.FIEN = 1, an SSI interrupt is generated. |
| 23 to 14 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 13 to 0 | VALUE | 0 | R | VALUE<br>Indicates the current cycle count of the peripheral clock 1 (P1φ) in an SSIWS cycle, when SSIFCCR.FCEN = 1. Each time the next SSIWS cycle starts, the value is updated.<br>Note: When the SSISCK signal stops, the start of an SSIWS cycle cannot be detected. Consequently, the value is not updated. |

Note: * The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

## 19.4 Operation Description

### 19.4.1 Bus Format

This module can operate as a transmitter or a receiver and can be configured into many serial bus formats in either mode. The bus format can be selected from one of the twelve major modes shown in Table 19.3.

**Table 19.3 Bus Format for SSIF Module**

| | TEN | REN | SCKD | SWSD | TDM | MUEN | IIEN | TOIEN | TUIEN | ROIEN | RUIEN | CONT | SWSP | DEL | PDTA | SDTA | SPDP | SCKP | SWL[2:0] | DWL[2:0] | CHNL[1:0] |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Non-Compression Slave Receiver | 0 | 1 | 0 | 0 | 0 | Control Bits | | | | | | | Configuration Bits | | | | | | | | |
| Non-Compression Slave Transmitter | 1 | 0 | 0 | 0 | 0 | | | | | | | | | | | | | | | | |
| Non-Compression Slave Transceiver* | 1 | 1 | 0 | 0 | 0 | | | | | | | | | | | | | | | | |
| Non-Compression Master Receiver | 0 | 1 | 1 | 1 | 0 | | | | | | | | | | | | | | | | |
| Non-Compression Master Transmitter | 1 | 0 | 1 | 1 | 0 | | | | | | | | | | | | | | | | |
| Non-Compression Master Transceiver* | 1 | 1 | 1 | 1 | 0 | | | | | | | | | | | | | | | | |
| TDM Slave Receiver | 0 | 1 | 0 | 0 | 1 | | | | | | | | 0 | Configuration Bits | | | | | | | |
| TDM Slave Transmitter | 1 | 0 | 0 | 0 | 1 | | | | | | | | 0 | | | | | | | | |
| TDM Slave Transceiver* | 1 | 1 | 0 | 0 | 1 | | | | | | | | 0 | | | | | | | | |
| TDM Master Receiver | 0 | 1 | 1 | 1 | 1 | | | | | | | | 0 | | | | | | | | |
| TDM Master Transmitter | 1 | 0 | 1 | 1 | 1 | | | | | | | | 0 | | | | | | | | |
| TDM Master Transceiver* | 1 | 1 | 1 | 1 | 1 | | | | | | | | 0 | | | | | | | | |

Note: * Set the TEN and REN bits to 1 at the same time when using transceiver mode.

### 19.4.2 Non-Compressed Modes

The non-compressed modes support all serial audio streams split into channels. It supports the $I^2S$ compatible format as well as many more variants on these modes.

#### (1) Slave Receiver

This mode allows the module to receive serial data from another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of this module, operation is not guaranteed.

#### (2) Slave Transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of this module, operation is not guaranteed.

#### (3) Slave Transceiver

This mode allows serial data transmission and reception between this module and another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of this module, operation is not guaranteed.

#### (4) Master Receiver

This mode allows the module to receive serial data from another device. The clock and word select signals are internally derived from the oversampling clock. The format of these signals is defined in the configuration fields of this module. If the incoming data from another device does not follow the configured format, operation is not guaranteed.

#### (5) Master Transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signals are internally derived from the oversampling clock. The format of these signals is defined in the configuration fields of this module.

#### (6) Master Transceiver

This mode allows serial data transmission and reception between this module and another device. The clock and word select signals are internally derived from the oversampling clock. The format of these signals is defined in the configuration fields of this module.

#### (7) Operation Setting Related to Word Length

All bits related to the SSICR's word length are valid in non-compressed modes. There are many configurations this module supports, but some of the combinations are shown below for the $I^2S$ compatible format, MSB-first and left-aligned format, and MSB-first and right-aligned format.

- I²S Compatible Format

Figure 19.2 and Figure 19.3 show the I²S compatible formats without and with padding, respectively. Padding occurs when the data word length is smaller than the system word length.

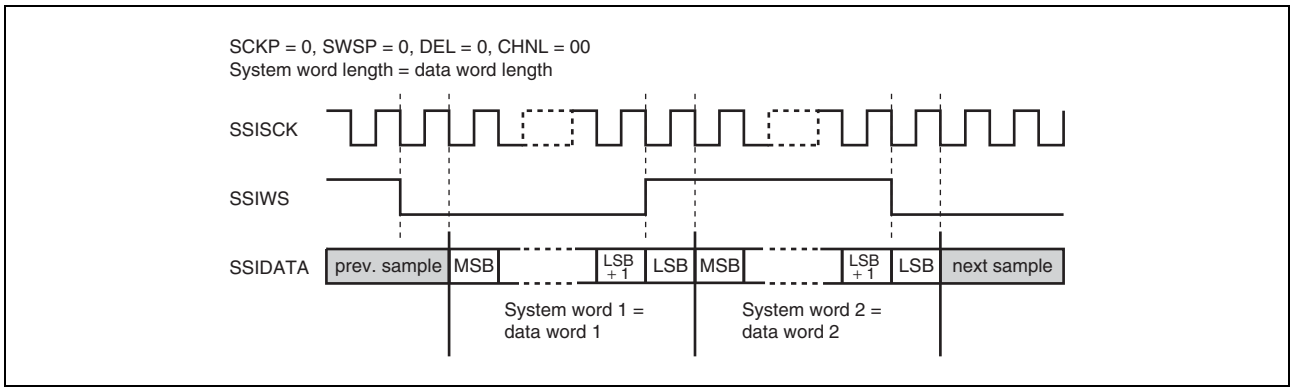


**Figure 19.2 I²S Compatible Format (without Padding)**

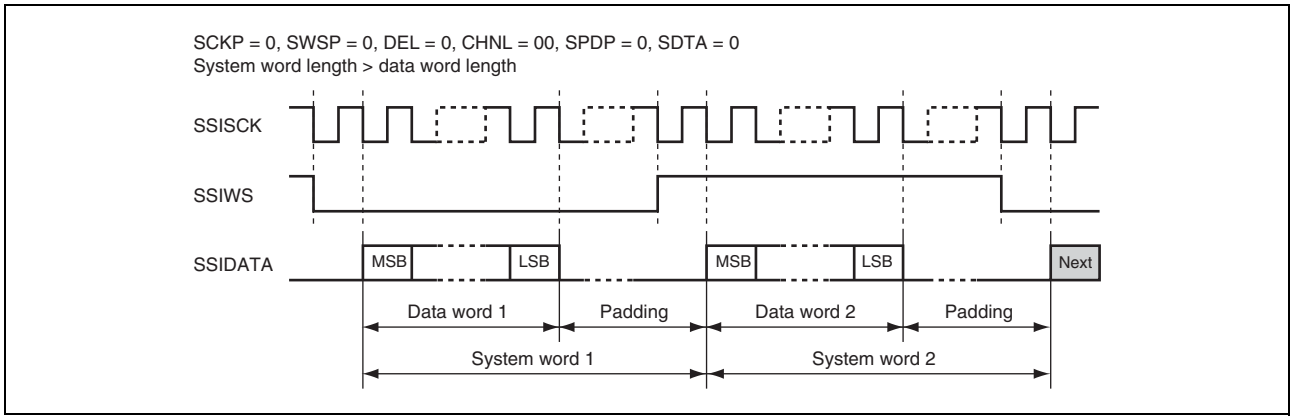

**Figure 19.3 I²S Compatible Format (with Padding)**

Figure 19.4 shows the MSB-first and left-aligned format and Figure 19.5 shows the MSB-first and right-aligned format.

- MSB-first and Left-aligned Format

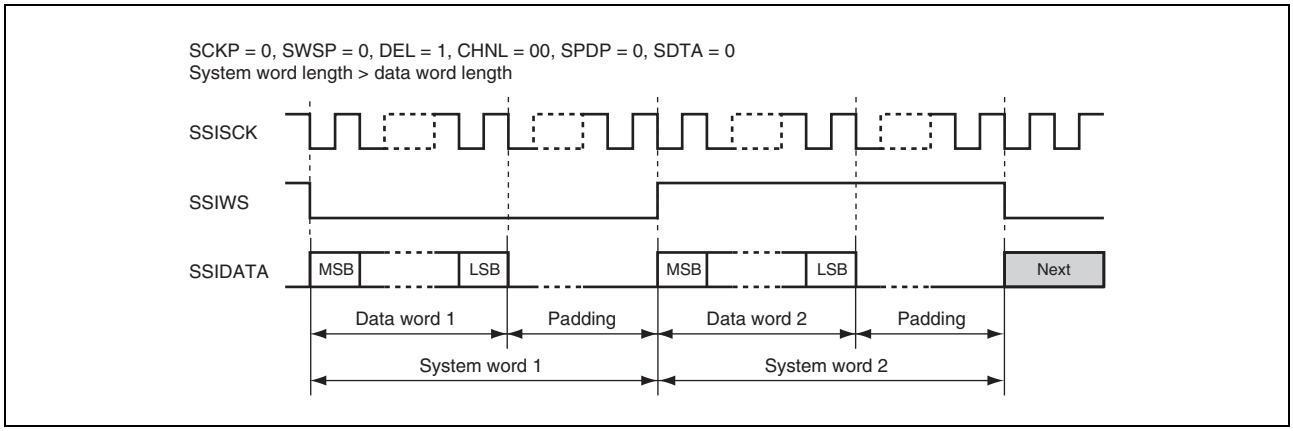

**Figure 19.4 MSB-first and Left-aligned Format (Transmitted and Received in the Order of Serial Data and Padding Bits)**

- MSB-first and Right-aligned Format

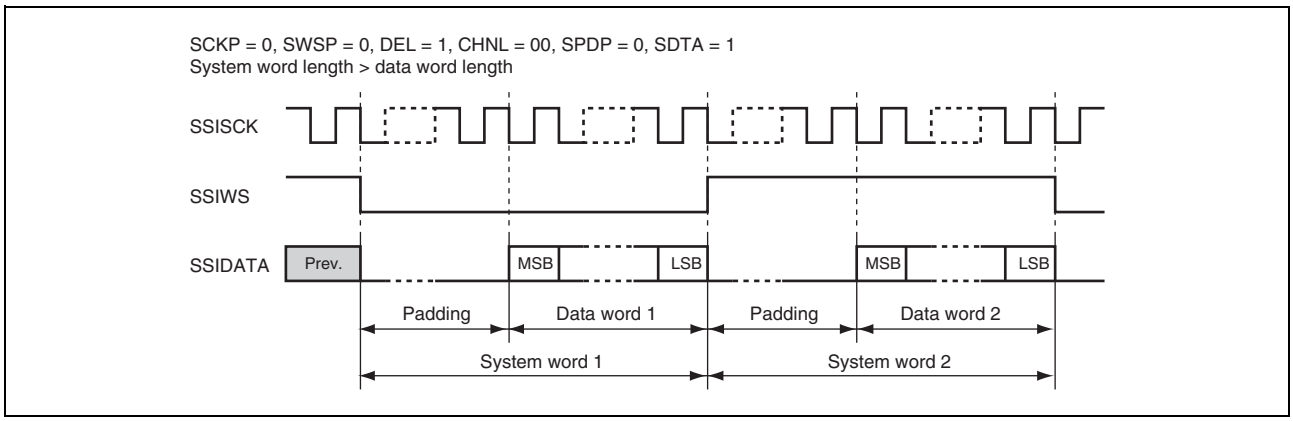

**Figure 19.5 MSB-first and Right-aligned Format (Transmitted and Received in the Order of Padding Bits and Serial Data)**

### (8) Multi-channel Formats

Some devices extend the definition of the I²S bus specification and allow more than 2 channels to be transferred within two system words.

This module supports the transfer of 4, 6, and 8 channels by using the CHNL, SWL and DWL bits only when the system word length (SWL) is greater than or equal to the data word length (DWL) multiplied by channels (CHNL).

Table 19.4 shows the number of padding bits for each of the valid setting. If setting is not valid, "—" is indicated instead of a number.

**Table 19.4 The Number of Padding Bits for Each Valid Setting**

| Padding Bits per System Word | | | DWL[2:0] | 000 | 001 | 010 | 011 | 100 | 101 | 110 |
|---|---|---|---|---|---|---|---|---|---|---|
| CHNL [1:0] | Decoded Channels per System Word | SWL [2:0] | Decoded Word Length | 8 | 16 | 18 | 20 | 22 | 24 | 32 |
| 00 | 1 | 000 | 8 | 0 | — | — | — | — | — | — |
| | | 001 | 16 | 8 | 0 | — | — | — | — | — |
| | | 010 | 24 | 16 | 8 | 6 | 4 | 2 | 0 | — |
| | | 011 | 32 | 24 | 16 | 14 | 12 | 10 | 8 | 0 |
| | | 100 | 48 | 40 | 32 | 30 | 28 | 26 | 24 | 16 |
| | | 101 | 64 | 56 | 48 | 46 | 44 | 42 | 40 | 32 |
| | | 110 | 128 | 120 | 112 | 110 | 108 | 106 | 104 | 96 |
| | | 111 | 256 | 248 | 240 | 238 | 236 | 234 | 232 | 224 |
| 01 | 2 | 000 | 8 | — | — | — | — | — | — | — |
| | | 001 | 16 | 0 | — | — | — | — | — | — |
| | | 010 | 24 | 8 | — | — | — | — | — | — |
| | | 011 | 32 | 16 | 0 | — | — | — | — | — |
| | | 100 | 48 | 32 | 16 | 12 | 8 | 4 | 0 | — |
| | | 101 | 64 | 48 | 32 | 28 | 24 | 20 | 16 | 0 |
| | | 110 | 128 | 112 | 96 | 92 | 88 | 84 | 80 | 64 |
| | | 111 | 256 | 240 | 224 | 220 | 216 | 212 | 208 | 192 |
| 10 | 3 | 000 | 8 | — | — | — | — | — | — | — |
| | | 001 | 16 | — | — | — | — | — | — | — |
| | | 010 | 24 | 0 | — | — | — | — | — | — |
| | | 011 | 32 | 8 | — | — | — | — | — | — |
| | | 100 | 48 | 24 | 0 | — | — | — | — | — |
| | | 101 | 64 | 40 | 16 | 10 | 4 | — | — | — |
| | | 110 | 128 | 104 | 80 | 74 | 68 | 62 | 56 | 32 |
| | | 111 | 256 | 232 | 208 | 202 | 196 | 190 | 184 | 160 |
| 11 | 4 | 000 | 8 | — | — | — | — | — | — | — |
| | | 001 | 16 | — | — | — | — | — | — | — |
| | | 010 | 24 | — | — | — | — | — | — | — |
| | | 011 | 32 | 0 | — | — | — | — | — | — |
| | | 100 | 48 | 16 | — | — | — | — | — | — |
| | | 101 | 64 | 32 | 0 | — | — | — | — | — |
| | | 110 | 128 | 96 | 64 | 56 | 48 | 40 | 32 | 0 |
| | | 111 | 256 | 224 | 192 | 184 | 176 | 168 | 160 | 128 |

When this module acts as a transmitter, each word written to SSITDR is transmitted to the serial audio bus in the order they are written. When this module acts as a receiver, each word received by the serial audio bus is read from the SSIRDR register in the order they are received.

Figure 19.6 to Figure 19.8 show how the data on 4, 6, and 8 channels are transferred to the serial audio bus. Note that there are no padding bits in the first example (Figure 19.6), the second example (Figure 19.7) is left-aligned and the third (Figure 19.8) is right-aligned. The other conditions in these examples have been selected arbitrarily.

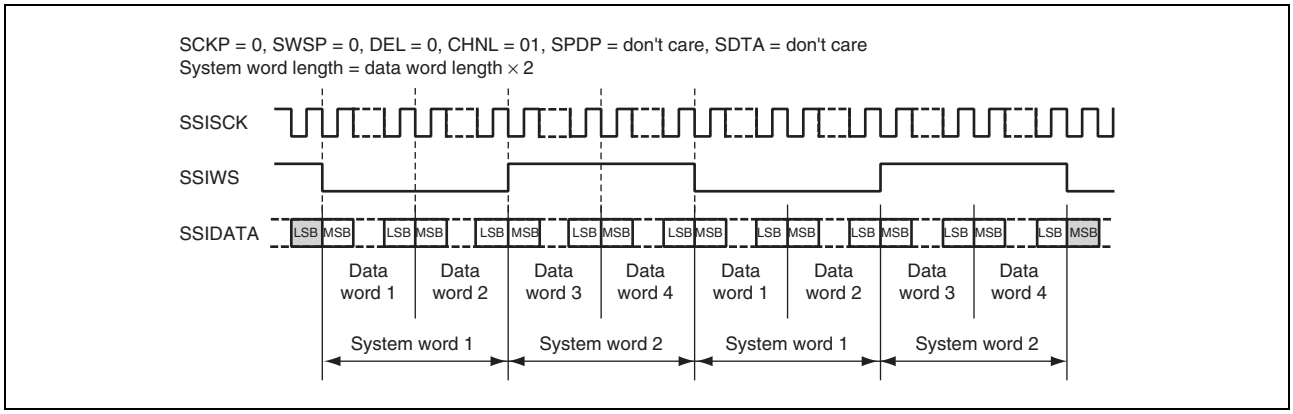

**Figure 19.6 Multi-Channel Format (4 Channels Without Padding)**

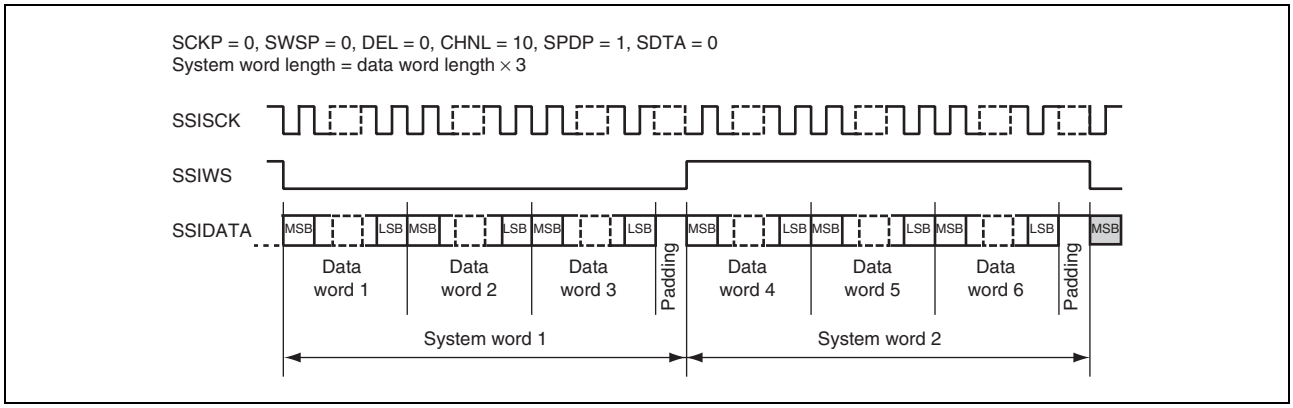

**Figure 19.7 Multi-Channel Format (6 Channels with High Padding)**

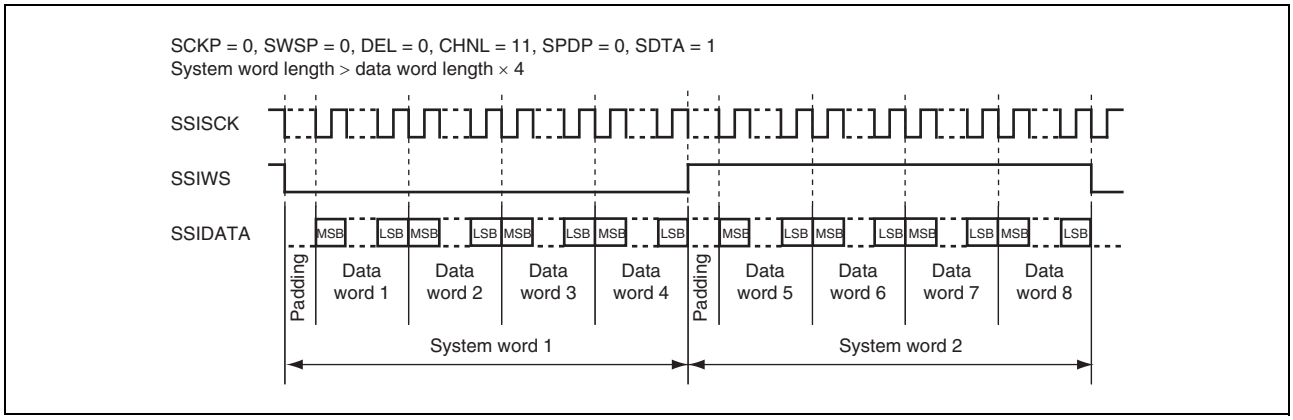

**Figure 19.8 Multi-Channel Format (8 Channels; Transmitting and Receiving in the Order of Padding Bits and Serial Data ; with Padding)**

### (9) Operation Format Configuration Bits

Several more configuration bits in non-compressed mode are shown below. These bits are not mutually exclusive, but some combinations may not be useful.
These configuration bits are described below with reference to the basic sample format in Figure 19.9.

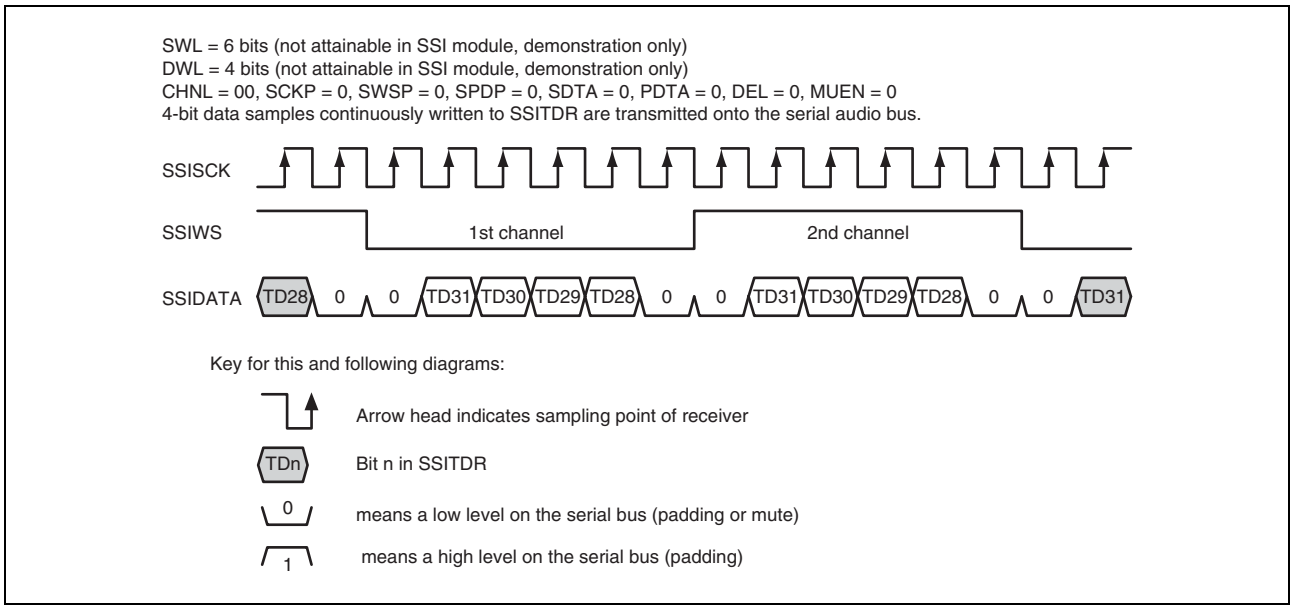

**Figure 19.9 Basic Sample Format (Transmit Mode with Example System/Data Word Length)**

Figure 19.9 uses a system word length of 6 bits and a data word length of 4 bits. These settings are not possible with this module but are used as an example only for clarification of the other configuration bits.

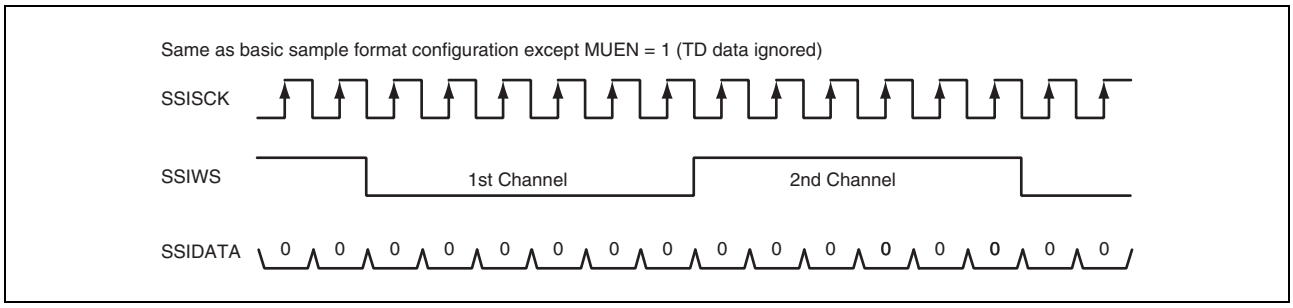

**Figure 19.17 Mute Enabled**

### 19.4.3 TDM Mode

TDM mode is provided to enable connection to multi-channel devices for TDM. This mode can be set using the TDM bit in the TDM mode register (SSITDMR). In this mode, the SSIWS signal is high only for system word 1 period and low for the other periods. The pulse produced on the SSIWS signal is defined as SYNC pulse. Note that the SYNC pulse always has the positive polarity (high only for system word 1 period).
Figure 19.18 and Figure 19.19 show the TDM formats without and with padding, respectively.

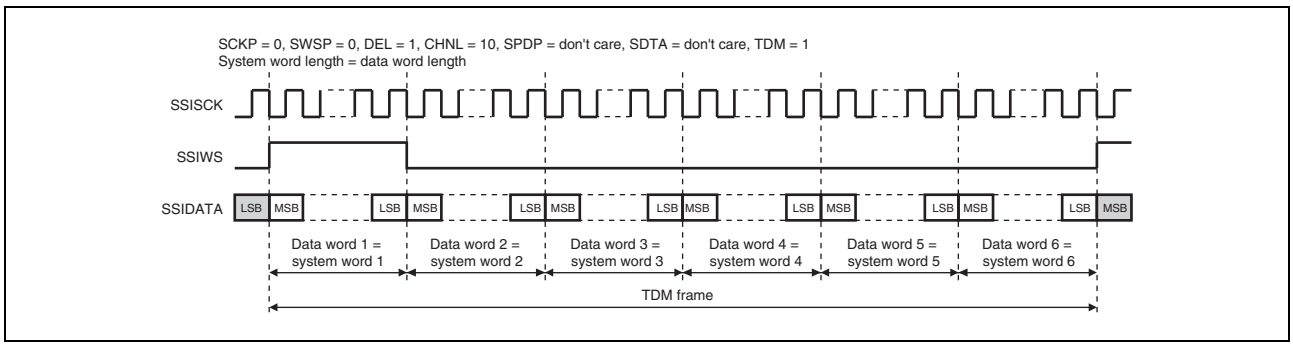

**Figure 19.18 TDM Format (6 system words, no padding)**

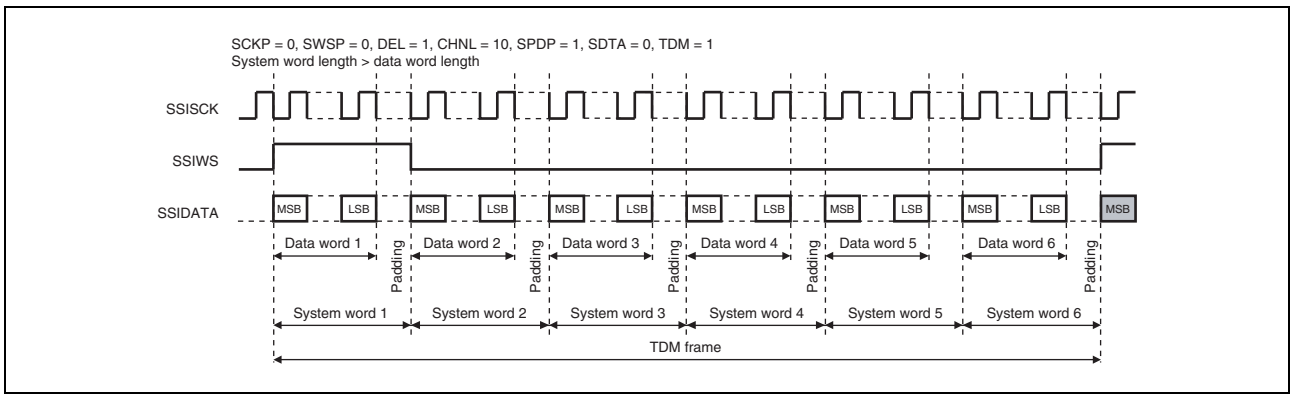

**Figure 19.19 TDM Format (6 system words, with padding)**

### 19.4.4 WS Continue Mode

In WS continue mode, the SSIWS signal continues to be output irrespective whether data transfer is enabled or disabled. This mode can be set using the CONT bit in the TDM mode register (SSITDMR). With this mode enabled, the SSIWS signal does not stop but continues operating even if TEN and REN bits in the control register (SSICR) are both set to 0 (transfer disabled). While transfer is disabled, the SSITxD pin outputs 0 if the MUEN bit in SSICR is set to 0, and outputs the value specified by the SPDP bit in SSICR if the MUEN bit is set to 0. With this mode disabled, the SSIWS signal stops if TEN and REN bits are both set to 0.
Figure 19.20 and Figure 19.21 show the operations with WS continue mode enabled and disabled, respectively.

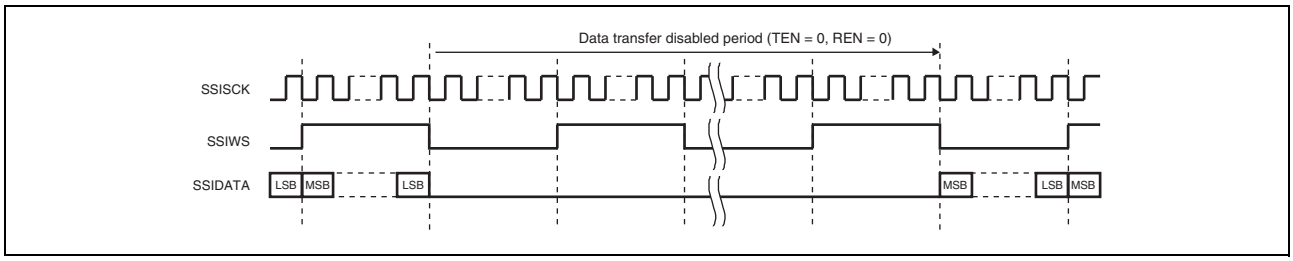

**Figure 19.20 WS Continue Mode Enabled**

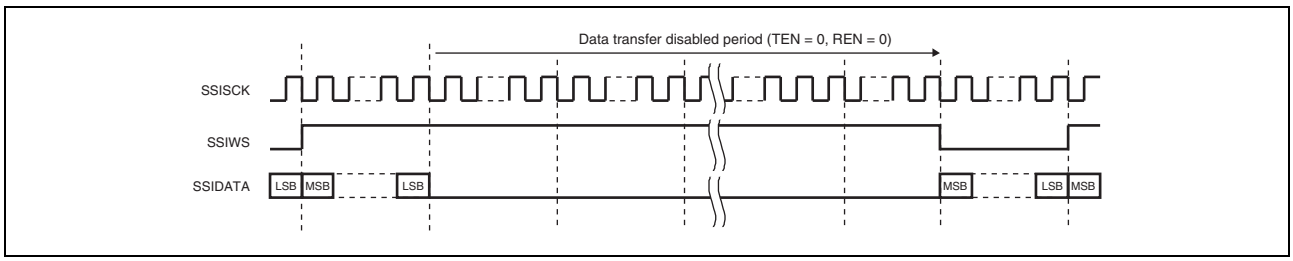

**Figure 19.21 WS Continue Mode Disabled**

### 19.4.5 Operation Modes

There are three modes of operation: configuration, enabled and disabled. Figure 19.22 shows how the module enters each of these modes.

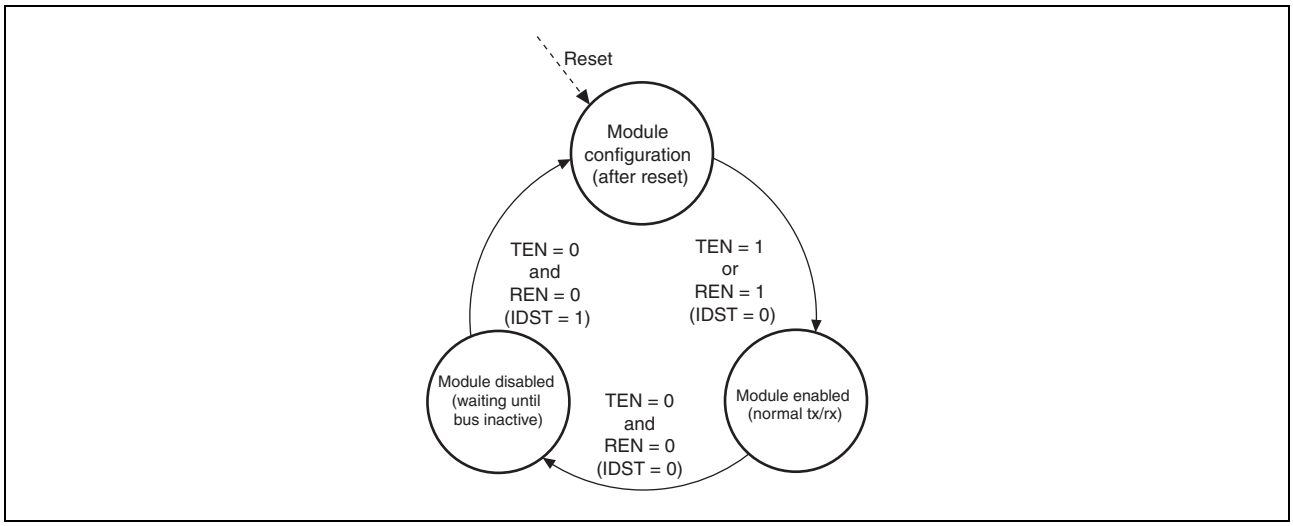

**Figure 19.22 Operation Modes**

### (1) Configuration Mode

This mode is entered after the module is released from reset. All required configuration fields in the control register should be defined in this mode, before this module is enabled by setting the TEN and REN bits.
Setting the TEN and REN bits causes the module to enter the module enabled mode.

### (2) Module Enabled Mode

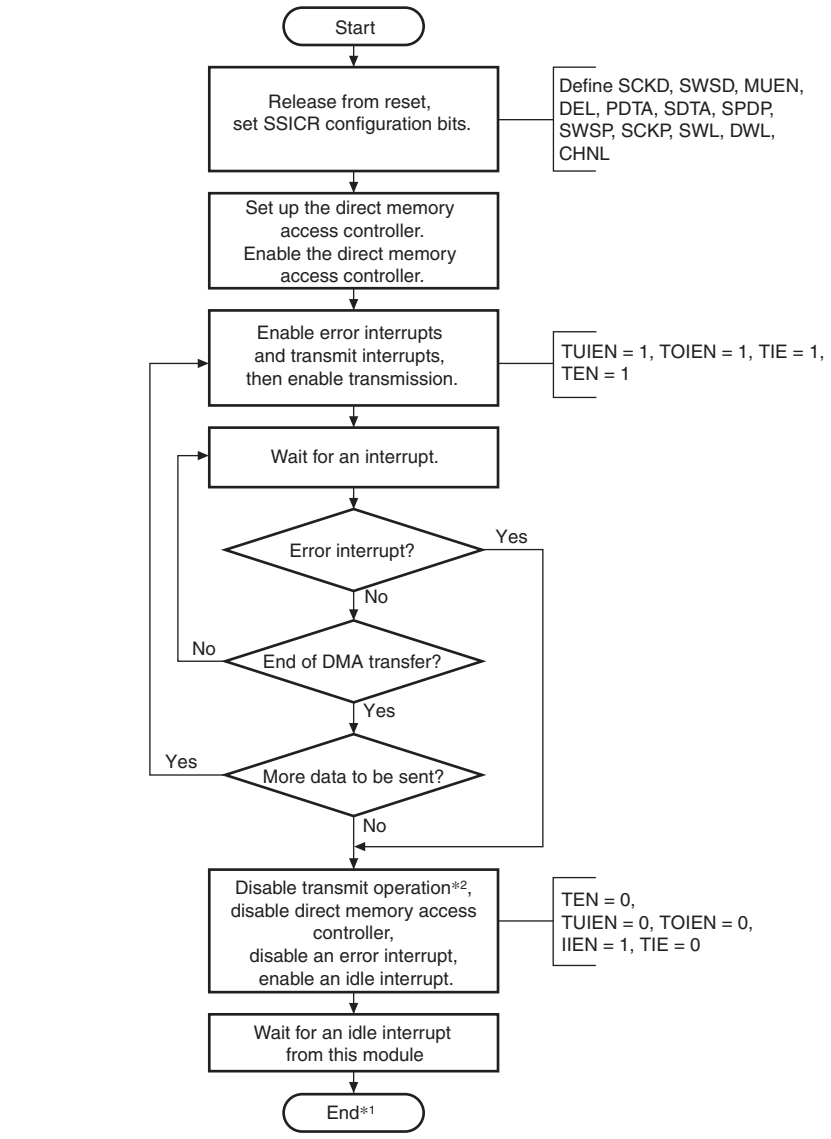
Operation of the module in this mode is dependent on the operation mode selected. For details, refer to section 19.4.6, Transmit Operation, and section 19.4.7, Receive Operation, below.

## 19.4.6 Transmit Operation

Transmission can be controlled either by DMA transfer or interrupt.
DMA control is preferred to reduce the processor load. In DMA control mode, the processor will only receive interrupts if there is an underflow or overflow of data or if the DMA transfer has been completed.
The alternative method is using the interrupts that this module generates to supply data as required.
When disabling this module, the clock* must be kept supplied to this module until the IIRQ bit indicates that the module is in the idle state.
Figure 19.23 shows the transmit operation in DMA control mode, and Figure 19.24 shows the transmit operation in interrupt control mode.

Note: * Input clock from the SSISCK pin when SCKD = 0.
Oversampling clock when SCKD = 1.

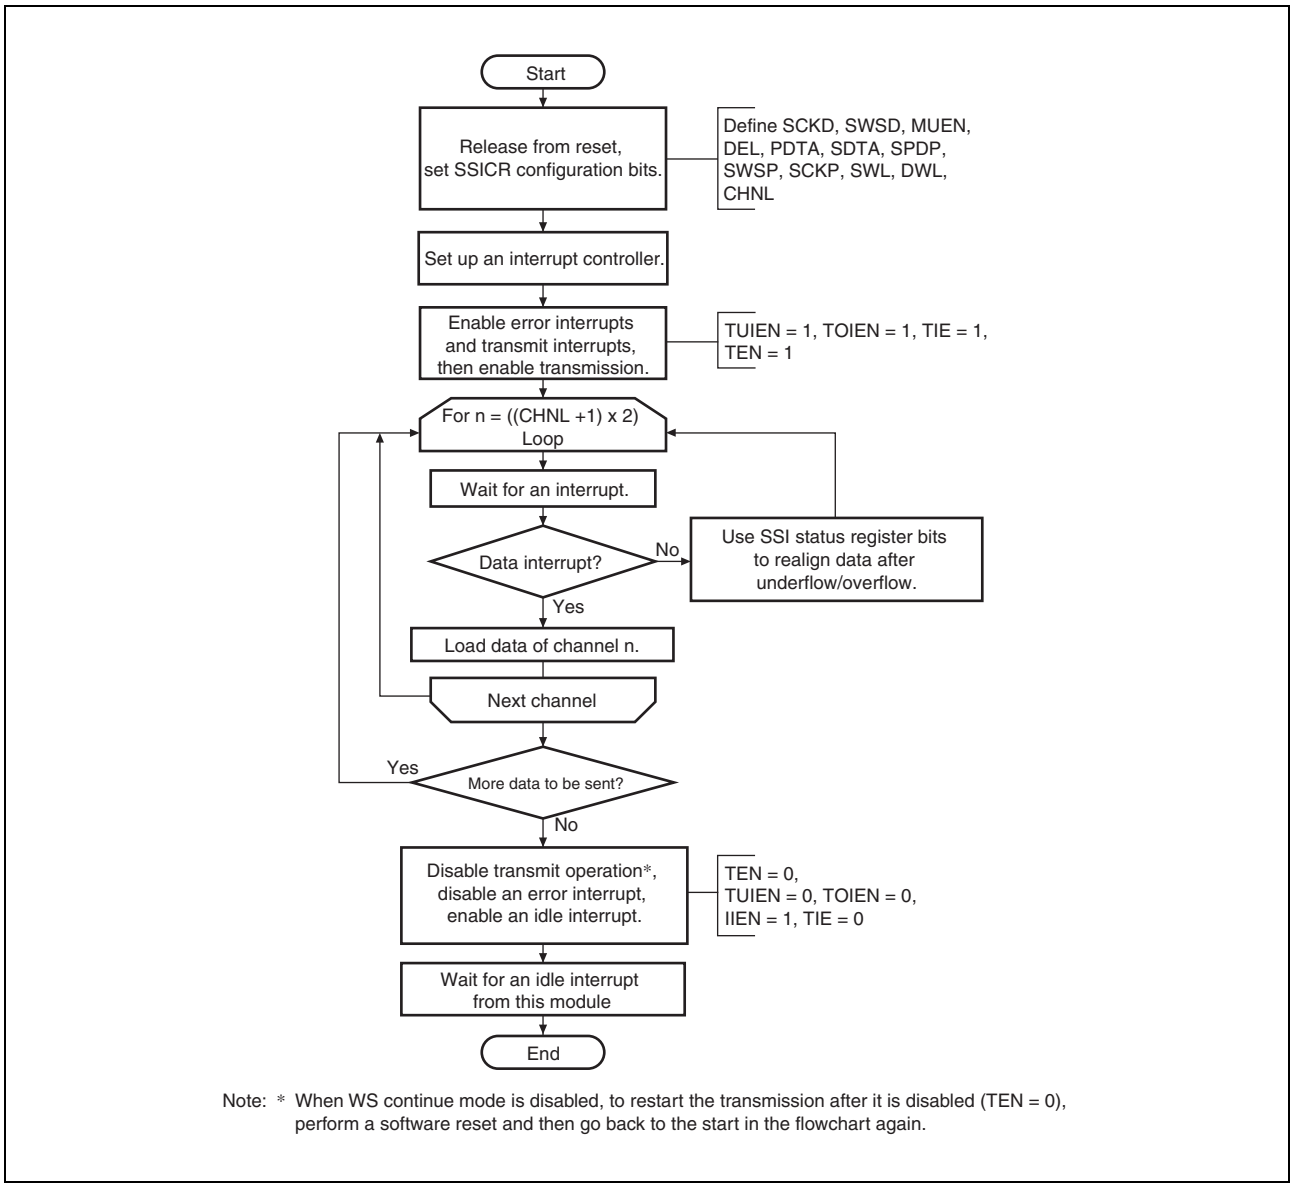
## (1) Transmission Using Direct Memory Access Controller



Notes: 1. If an error interrupt (underflow/overflow) occurs, go back to the start in the flowchart again.
2. When WS continue mode is disabled, to restart the transmission after it is disabled (TEN = 0), perform a software reset and then go back to the start in the flowchart again.

**Figure 19.23 Transmission Using Direct Memory Access Controller**

## (2) Transmission Using Interrupt-Driven Data Flow Control



Note: * When WS continue mode is disabled, to restart the transmission after it is disabled (TEN = 0), perform a software reset and then go back to the start in the flowchart again.

**Figure 19.24 Transmission Using Interrupt-Driven Data Flow Control**

## 19.4.7 Receive Operation

Like transmission, reception can be controlled either by DMA transfer or interrupt.

Figure 19.25 and Figure 19.26 show the flow of operation.

When disabling this module, the clock* must be kept supplied to this module until the IIRQ bit indicates that the module is in the idle state.

Note: * Input clock from the SSISCK pin when SCKD = 0.
Oversampling clock when SCKD = 1.

### (1) Reception Using Direct Memory Access Controller

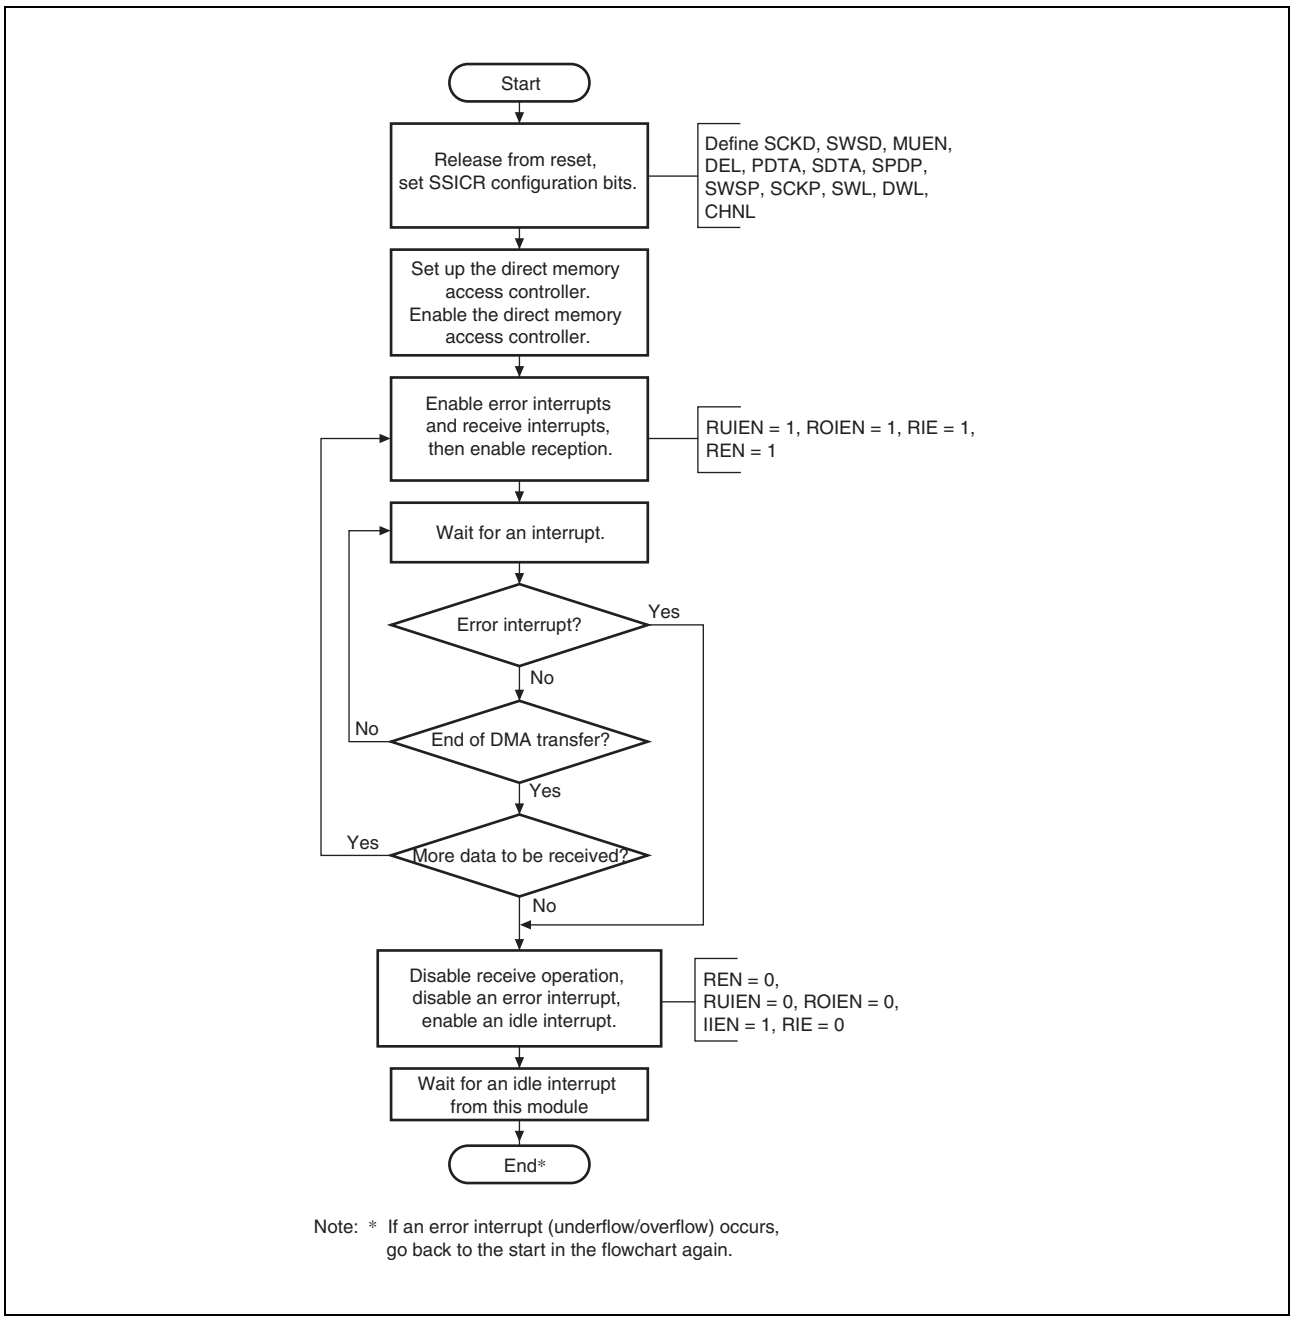


**Figure 19.25 Reception Using Direct Memory Access Controller**

### (2) Reception Using Interrupt-Driven Data Flow Control

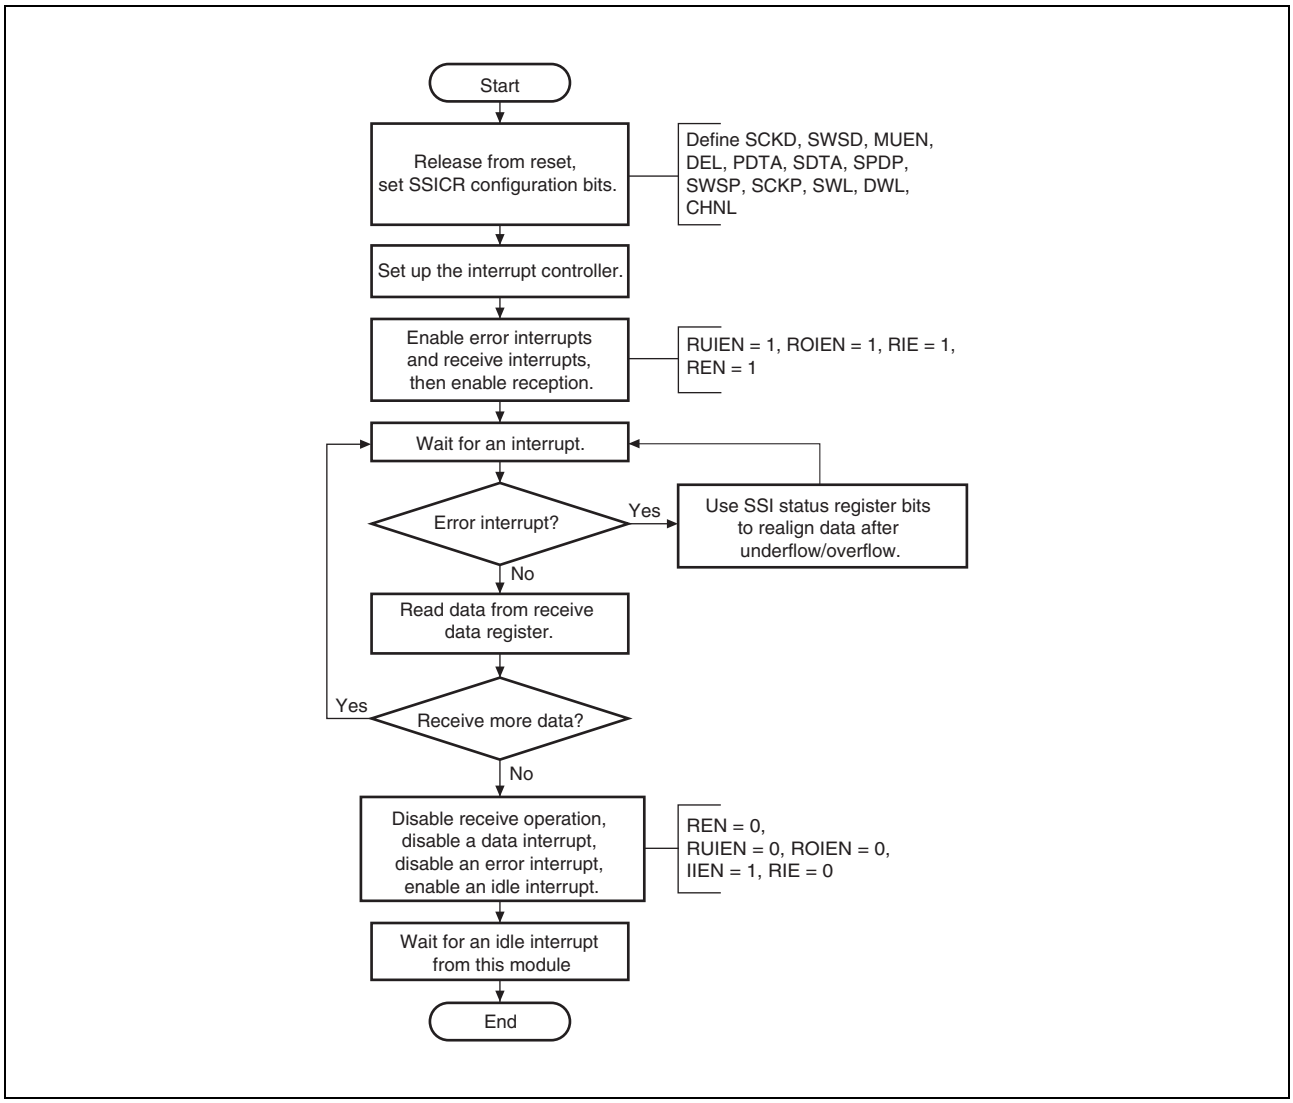

**Figure 19.26 Reception Using Interrupt-Driven Data Flow Control**

When an underflow or overflow error condition has matched, this module can be recovered to the status before underflow or overflow condition match by using the TCHNO [1:0] and TSWNO bits in transmission and the RCHNO[1:0] and RSWNO bits in reception. When an underflow or overflow occurs, the host CPU can read the channel number and system word number to determine what point the serial audio stream has reached. In the transmitter case, the host CPU can skip forward through the data it wants to transmit until it finds the sample data that matches what this module is expecting to transmit next, and so resynchronize with the audio data stream. In the receiver case the host CPU can store null data to make the number of receive data items consistent until it is ready to store the sample data that this module is indicating will be received next, and so resynchronize with the audio data stream.

### 19.4.8 Serial Bit Clock Control

This function is used to control and select the clock that is used for the serial bus interface.
If the serial bit clock direction is set to input (SCKD = 0), this module is in clock slave mode and the shift register uses the bit clock that was input to the SSISCK pin.
If the serial bit clock direction is set to output (SCKD = 1), this module is in clock master mode, and the shift register uses the oversampling clock or a divided oversampling clock as the bit clock. The oversampling clock is divided by the ratio specified by the serial oversampling clock division ratio bits (CKDV) in SSICR for use as the bit clock by the shift register.
In either case above, the output of the SSISCK pin is the same as the bit clock.

## 19.5 Usage Notes

### 19.5.1 Limitations from Underflow or Overflow during DMA Operation

If an underflow or overflow occurs while the DMA is in operation, the module should be restarted. The transmit and receive buffers in the SSIF consists of 32-bit registers that share the L and R channels. Therefore, data to be transmitted and received at the L channel may sometimes be transmitted and received at the R channel if an underflow or overflow occurs, for example, under the following condition: the control register (SSICR) has a 32-bit setting for both data word length (DWL2 to DWL0) and system word length (SWL2 to SWL0).
If an error occurrence is confirmed with four types of error interrupts (transmit underflow, transmit overflow, receive underflow, and receive overflow) or the corresponding error status flags (the bits TUIRQ, TOIRQ, RUIRQ, and ROIRQ in SSISR), write 0 to the TEN or REN bit in SSICR to disable DMA transfer requests in this module, thus stopping the operation. (In this case, the direct memory access controller setting should also be stopped.) After this, if reception had been in progress, write 0 to the error status flag bit to clear it, set the direct memory access controller again, and restart the transfer. For transmission, issue a software reset and execute the procedure to start again.

### 19.5.2 Note on Changing Mode from Master Transceiver to Master Receiver

If a transmit underflow occurs in master transceiver mode while WS continue mode is disabled (SSITDMR.CONT = 0) and the TEN bit in SSICR is set to 0 in order to disable transmit operation, SSIWS output is broken. In order to receive seamlessly after changing mode to master receiver mode, write dummy data to SSIFTDR to suppress transmit underflow.

### 19.5.3 Limits on TDM mode and WS Continue Mode

If TDM mode or WS continue mode setting is changed, the operation of the SSISCK and SSIWS signals immediately after switching are not guaranteed. If it affects the device to be connected, do not change the setting dynamically.
To temporarily halt and restart transmission while the WS continue mode is enabled (SSITDMR.CONT = 1), after writing to the transmit FIFO data register (SSIFTDR) a multiple of two times, use the transmit underflow error interrupt or the corresponding error status flag (SSISR.TUIRQ) to confirm that an error has occurred, and then write 0 to the TEN bit of the SSISCR register.
Note that after the transmit underflow error, the last value written to SSIFTDR will be repeatedly sent as long as SSISCR.TEN = 1. Therefore, write a dummy value as the last data for transmission or mute the signal by writing 1 to the MUEN bit of the SSISCR register.
To restart transmission, do not apply a software reset; after writing 0 to the error status flag bit to clear it, use the idle mode status flag (SSISR.IDST) to confirm that this module is in the idle state, and then write 1 to the TEN bit of the SSISCR register.

# 20. Media Local Bus

This product supports the media local bus as an interface to connect to the MOST controller.

## 20.1 Features

- 3-pin interface
- A maximum of 50 Mbps of data can be transferred.

For details on the functions and registers, contact Renesas Electronics Corporation's sales office.

Figure 20.1 shows the block diagram.

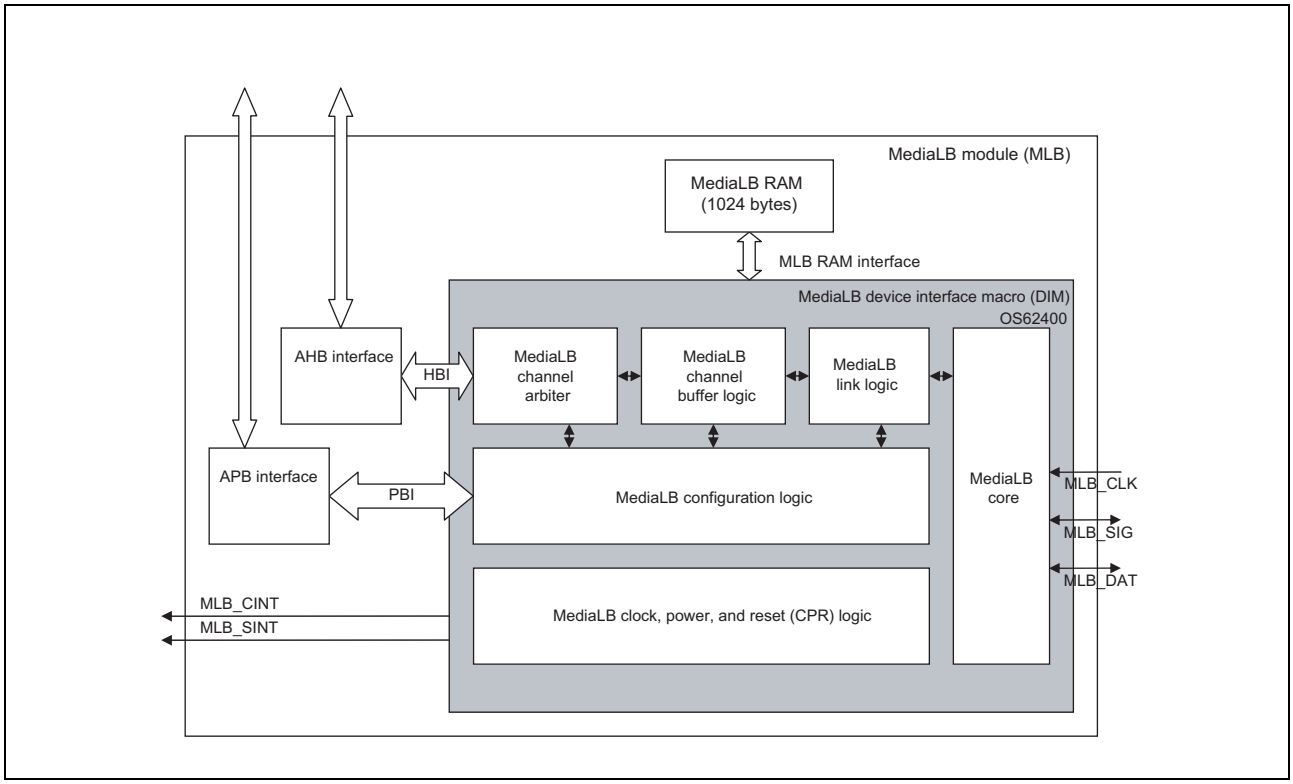

**Figure 20.1 Block Diagram**

## 20.2 Input/Output Pins

Table 20.1 shows the pin configuration.

**Table 20.1 Pin Configuration**

| Pin Name | I/O | Description |
|---|---|---|
| MLB_CLK | I | MediaLB clock input |
| MLB_SIG | I/O | MediaLB signal information I/O |
| MLB_DAT | I/O | MediaLB data I/O |

## 20.3 Register Description

Table 20.2 shows the register configuration.

For details on the registers, contact Renesas Electronics Corporation's sales office.

**Table 20.2 Register Configuration**

| | Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|---|
| Configuration control register | Device control configuration register | DCCR | *1 | *1 | H'E8034000 | 32 |
| | System status configuration register | SSCR | *1 | *1 | H'E8034004 | 32 |
| | System data configuration register | SDCR | *1 | *1 | H'E8034008 | 32 |
| | System mask configuration register | SMCR | *1 | *1 | H'E803400C | 32 |
| | Version control configuration register | VCCR | *1 | *1 | H'E803401C | 32 |
| | Synchronous base address configuration register | SBCR | *1 | *1 | H'E8034020 | 32 |
| | Asynchronous base address configuration register | ABCR | *1 | *1 | H'E8034024 | 32 |
| | Control base address configuration register | CBCR | *1 | *1 | H'E8034028 | 32 |
| | Isochronous base address configuration register | IBCR | *1 | *1 | H'E803402C | 32 |
| | Channel interrupt configuration register | CICR | *1 | *1 | H'E8034030 | 32 |
| Channel m*2 configuration register | Channel m entry configuration register | CECRm | *1 | *1 | H'E8034040 + m x 10 | 32 |
| | Channel m status configuration register | CSCRm | *1 | *1 | H'E8034044 + m x 10 | 32 |
| | Channel m current buffer configuration register | CCBCRm | *1 | *1 | H'E8034048 + m x 10 | 32 |
| | Channel m next buffer configuration register | CNBCRm | *1 | *1 | H'E803404C + m x 10 | 32 |
| | Local channel m buffer configuration register | LCBCRm | *1 | *1 | H'E8034280 + m x 4 | 32 |

Note 1. Contact Renesas Electronics Corporation's sales office.
Note 2. Each channel of the media local bus is identified by “m” (m = 0 to 30).

# 21. CAN Interface

This section gives an overall description of the CAN interface (RS-CAN).

The first section describes the features specific to this LSI, including the number of units and the register base addresses. The subsequent sections describe the RS-CAN's functions and registers.

## 21.1 Overview

### 21.1.1 Units

This microcontroller incorporates the following number of units of the CAN interface (RS-CAN).

**Table 21.1 Units of RS-CAN**

| | RS-CAN |
|---|---|
| Number of units | 1 |
| Name | RSCAN0 |

The RS-CAN has five channels.

**Table 21.2 Channels of RS-CAN**

| | RS-CAN |
|---|---|
| Number of channels | 5 |
| Name | CAN0, CAN1, CAN2, CAN3, CAN4 |

**Table 21.3 Index**

| Index | Meaning | Available Number of CAN Channels and Index |
|---|---|---|
| | | 5 channels |
| n | Throughout this section, the unit of the RS-CAN is identified by the index "n": for example, RSCANnGCFG is the global configuration register in the RS-CANn unit. | n = 0 |
| m | Throughout this section, the individual channels in the RS-CAN units are identified by the index "m": for example, RSCAN0CmSTS is the channel m status register in the RS-CAN0 unit. | m = 0 to 4 |
| j | The individual receive rule table registers in the RS-CAN units are identified by the index "j": for example, RSCAN0GAFLIDj is the receive rule ID register j in the RS-CAN0 unit. | j = 0 to 15 |
| k | The individual transmit/receive FIFO in the RS-CAN units are identified by the index "k" (k = 0 to channel m × 3 + 2): for example, RSCAN0CFCCk is the transmit/receive FIFO buffer configuration and control register k in the RS-CAN0 unit. | k = 0 to 14 |
| q | The individual receive buffer in the RS-CAN units are identified by the index "q" (q = 0 to channel m × 16 + 15): for example, RSCAN0RMIDq is the receive buffer ID register q in the RS-CAN0 unit. | q = 0 to 79 |
| p | The individual transmit buffers in the RS-CAN units are identified by the index "p" (p = 0 to channel m × 16 + 15): for example, RSCAN0TMCp is the transmit buffer control register p in the RS-CAN0 unit. | p = 0 to 79 |
| y | When the registers other than above are collectively explained, they are identified by the index "y" (y = 0 to 2): for example, RSCAN0RMNDy is the receive buffer new data register in the RS-CAN0 unit. | y = 0 to 2 |

### 21.1.2 Register addresses

RS-CAN base addresses are listed in the following table.

RS-CAN register addresses are given as offsets from the base addresses.

**Table 21.4 Register base address**

| Base Address Name | Base Address |
|---|---|
| <RSCAN0_base> | E803 A000$_H$ |

### 21.1.3 Clock supply

The RS-CAN provides two clock inputs:

**Table 21.5 RS-CAN clock supply**

| Module | RS-CAN clock Clock | Connected to |
|---|---|---|
| RSCAN0 | clk_xincan | CAN_CLK |
| | clkc | P1ϕ/2 |
| | pclk | P1ϕ |

The operating frequency of the RS-CAN depends on the transfer rate and the number of channels in use. Table 21.6 shows the range of the frequency.

**Table 21.6 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in this LSI**

| Condition | | Range of Operating Frequency | | |
|---|---|---|---|---|
| Transfer Rate | No. of Channels in Use | pclk | clk_xincan*1 | clkc*1, *2 |
| 1 Mbps | 5ch | pclk ≥ 46 MHz | 8 MHz ≤ clk_xincan ≤ pclk/2 | 12.5 MHz ≤ clkc ≤ pclk/2 |
| | 4ch | pclk ≥ 40 MHz | | |
| | 3ch | pclk ≥ 32 MHz | | |
| | 2ch | pclk ≥ 26 MHz | | |
| | 1ch | pclk ≥ 18 MHz | | |
| 500 kbps | 5ch | pclk ≥ 23 MHz | 4 MHz ≤ clk_xincan ≤ pclk/2 | 12.5 MHz ≤ clkc ≤ pclk/2 |
| | 4ch | pclk ≥ 20 MHz | | |
| | 3ch | pclk ≥ 16 MHz | | |
| | 2ch | pclk ≥ 13 MHz | | |
| | 1ch | pclk ≥ 8 MHz | | |
| 125 kbps | 5ch | pclk ≥ 8 MHz | 4 MHz ≤ clk_xincan ≤ pclk/2 | 12.5 MHz ≤ clkc ≤ pclk/2 |
| | 4ch | | | |
| | 3ch | | | |
| | 2ch | | | |
| | 1ch | | | |

Note 1. Setting the DCS bit in RSCAN0GCFG enables to select either clk_xincan or clkc. Set clocks less than or equal to pclk/2.

Note 2. Select clk_xincan when pclk < 25 MHz.

### 21.1.4 Interrupts

The Controller Area Network (RS-CAN) can generate the interrupt requests shown in the following table.

**Table 21.7 RS-CAN interrupt requests**

| Unit Interrupt Name | Outline | Interrupt ID | DMA Trigger Number |
|---|---|---|---|
| **RSCAN0** | | | |
| INTRCANGERR | CAN global error interrupt | 253 | — |
| INTRCANGRECC | CAN receive FIFO interrupt | 254 | — |
| **CAN0** | | | |
| INTRCANmERR (m = 0) | CAN0 error interrupt | 256 | — |
| INTRCANmREC (m = 0) | CAN0 transmit/receive FIFO receive completion interrupt | 255 | — |
| INTRCANmTRX (m = 0) | CAN0 transmit interrupt | 257 | — |
| **CAN1** | | | |
| INTRCANmERR (m = 1) | CAN1 error interrupt | 259 | — |
| INTRCANmREC (m = 1) | CAN1 transmit/receive FIFO receive completion interrupt | 258 | — |
| INTRCANmTRX (m = 1) | CAN1 transmit interrupt | 260 | — |
| **CAN2** | | | |
| INTRCANmERR (m = 2) | CAN2 error interrupt | 262 | — |
| INTRCANmREC (m = 2) | CAN2 transmit/receive FIFO receive completion interrupt | 261 | — |
| INTRCANmTRX (m = 2) | CAN2 transmit interrupt | 263 | — |
| **CAN3** | | | |
| INTRCANmERR (m = 3) | CAN3 error interrupt | 265 | — |
| INTRCANmREC (m = 3) | CAN3 transmit/receive FIFO receive completion interrupt | 264 | — |
| INTRCANmTRX (m = 3) | CAN3 transmit interrupt | 266 | — |
| **CAN4** | | | |
| INTRCANmERR (m = 4) | CAN4 error interrupt | 268 | — |
| INTRCANmREC (m = 4) | CAN4 transmit/receive FIFO receive completion interrupt | 267 | — |
| INTRCANmTRX (m = 4) | CAN4 transmit interrupt | 269 | — |

### 21.1.5 I/O signals

Table 21.8 lists the I/O pins of the RS-CAN module.

**Table 21.8 I/O Pins of the RS-CAN Module**

| Unit Signal Name | Outline | Alternative port pin signal |
|---|---|---|
| **CAN0** | | |
| CANmRX (m = 0) | CAN0 receive data input | CAN0RX |
| CANmTX (m = 0) | CAN0 transmit data output | CAN0TX |
| **CAN1** | | |
| CANmRX (m = 1) | CAN1 receive data input | CAN1RX |
| CANmTX (m = 1) | CAN1 transmit data output | CAN1TX |
| **CAN2** | | |
| CANmRX (m = 2) | CAN2 receive data input | CAN2RX |
| CANmTX (m = 2) | CAN2 transmit data output | CAN2TX |
| **CAN3** | | |
| CANmRX (m = 3) | CAN3 receive data input | CAN3RX |
| CANmTX (m = 3) | CAN3 transmit data output | CAN3TX |
| **CAN4** | | |
| CANmRX (m = 4) | CAN4 receive data input | CAN4RX |
| CANmTX (m = 4) | CAN4 transmit data output | CAN4TX |

## 21.2 Function

This LSI incorporates one unit of the CAN interface (RS-CAN) which consists of five channels (CAN0 to CAN4) of the CAN controller conforming to the ISO11898-1 specifications. Table 21.9 shows the RSCAN module specifications.

Figure 21.1 shows the RS-CAN module block diagram.

**Table 21.9 RS-CAN Module Specifications (1/3)**

| Item | Specification |
|---|---|
| Number of channels | 5 |
| Protocol | ISO11898-1 compliant |
| Communication speed | • Maximum 1 Mbps<br>$\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$<br>$\text{CANm bit time} = \text{CANmTq} \times \text{Tq count per bit}$<br>$\text{CANmTq} = \frac{\text{(BRP[9:0] bits in the RSCAN0CmCFG register + 1)}}{\text{fCAN}}$<br>m = 0 to 4<br>Tq: Time quantum<br>fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCAN0GCFG register) |

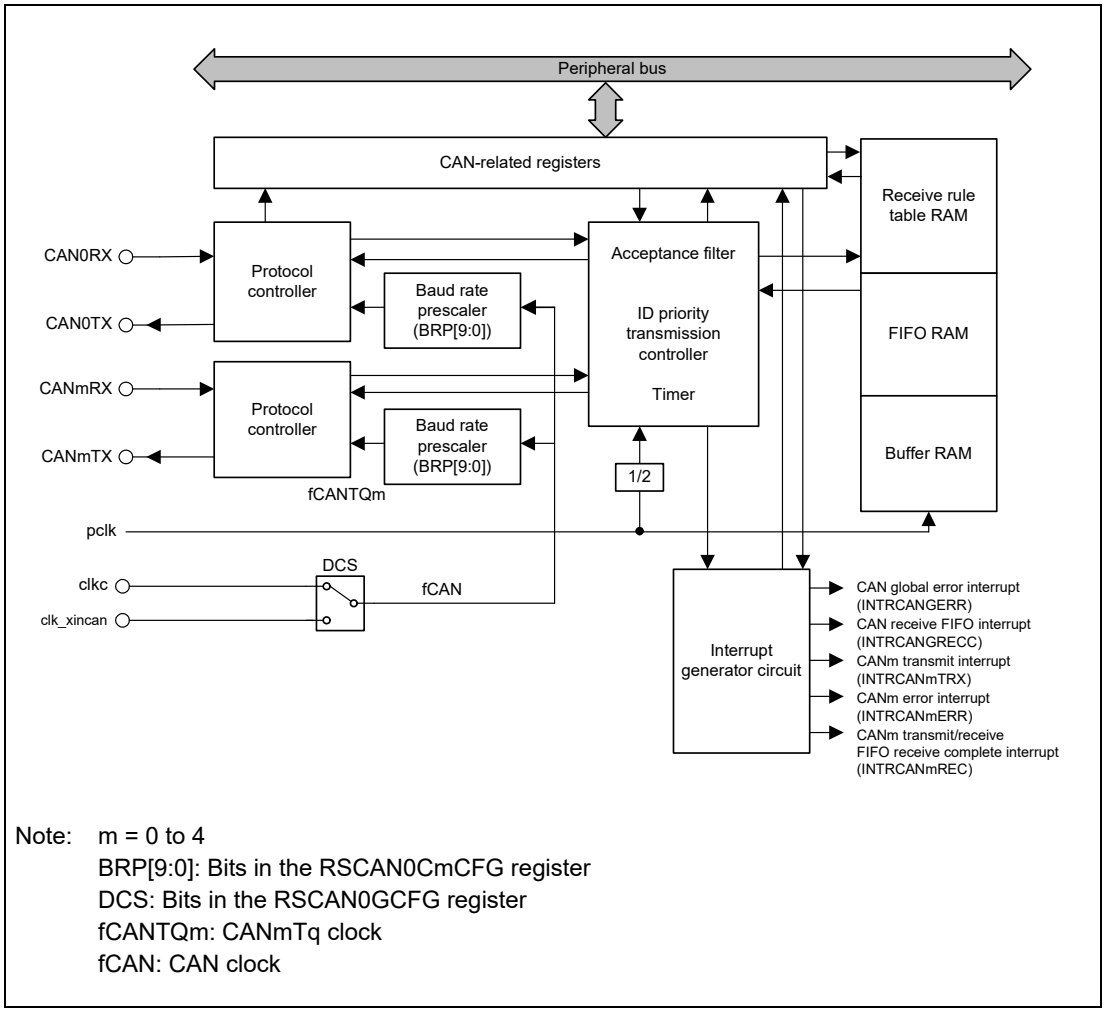
**Table 21.9 RS-CAN Module Specifications (2/3)**

| Item | Specification |
|---|---|
| Buffer | 400 buffers in total<br>• Individual buffers: 80 buffers (16 buffers × 5 channels)<br>Transmit buffer: 16 buffers per channel<br>Transmit queue: Single queue per channel<br>• Shared buffers: 320 buffers for all channels<br>Receive buffer: 0 to 80 buffers<br>Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each)<br>Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) |
| Reception function | • Receives data frames and remote frames.<br>• Selects ID format (standard ID, extended ID, or both IDs) to be received.<br>• Sets interrupt enable/disable for each FIFO.<br>• Mirror function (CAN mode receives its own transmitted messages.)<br>• Timestamp function (to record message reception time as a 16-bit timer value) |
| Reception filter function | • Selects receive messages according to 320 receive rules.<br>• Sets the number of receive rules (0 to 128) for each channel.<br>• Acceptance filter processing: Sets ID and mask for each receive rule.<br>• DLC filter processing: Sets DLC check value for each acceptance rule. |
| Receive message transfer function | • Routing function to transfer receive messages to arbitrary destinations (can be transferred to up to 8 buffers)<br>Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer<br>• Label addition function<br>Stores label information together with a message in a receive buffer and FIFO buffer. |
| Transmission function | • Transmits data frames and remote frames.<br>• Selects ID format (standard ID, extended ID, or both IDs) to be transmitted.<br>• Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer.<br>• Selects ID priority transmission or transmit buffer number priority transmission.<br>• Transmit request can be aborted (possible to confirm with a flag)<br>• One-shot transmission function |
| Interval transmission function | Transmit messages at intervals<br>(transmit mode or gateway mode of transmit/receive FIFO buffers) |
| Transmit queue function | Transmits all stored messages according to the ID priority. |
| Transmit history function | Stores the history information of transmitted messages. |
| Gateway function | A received message is automatically routed to a different channel. |
| Bus off recovery mode selection | Selects the method for returning from bus off state.<br>• ISO11898-1 compliant<br>• Automatic entry to channel halt mode at bus-off entry<br>• Automatic entry to channel halt mode at bus-off end<br>• Transition to channel standby mode by program request<br>• Transition to the error-active state by program request |
| Error status monitoring | • Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock).<br>• Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery)<br>• Reads the error counter.<br>• Monitors DLC errors. |

**Table 21.9 RS-CAN Module Specifications (3/3)**

| Item | Specification |
|---|---|
| Interrupt source | 17 sources<br>• Global Interrupts [2 sources: common among channels]<br>Receive FIFO interrupt [1 source: common among channels]<br>Global error interrupt [1 source: common among channels]<br>• Channel interrupts [15 sources: 3 sources × number of channels]<br>CANm transmit interrupt [1 source for each channel]<br>– CANm transmit complete interrupt<br>– CANm transmit abort interrupt<br>– CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)<br>– CANm transmit history interrupt<br>– CANm transmit queue interrupt<br>CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) [1 source for each channel]<br>CANm error interrupt [1 source for each channel]<br>(m = 0 to 4) |
| CAN stop mode | Reduces power consumption by stopping clock supply to the RS-CAN module. |
| CAN clock source | Selects the clkc or the clk_xincan.<br>As for the range of operating frequency, refer to Table 21.6. |
| Test function | Test function for user evaluation<br>• Listen-only mode<br>• Self-test mode 0 (external loopback)<br>• Self-test mode 1 (internal loopback)<br>• Inter-channel communication test |

### 21.2.1 Block Diagram



Note: m = 0 to 4
BRP[9:0]: Bits in the RSCAN0CmCFG register
DCS: Bits in the RSCAN0GCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

## 21.3 Registers

Table 21.10 lists the registers of the RS-CAN module.n = 0, 1.

**Table 21.10 List of RS-CAN Module Registers (1/25)**

| Register Name | Symbol | After Reset | Address | Access Size |
|---|---|---|---|---|
| Channel 0 configuration register | RSCAN0C0CFG | 0000 0000$_H$ | <RSCAN0_base> + 0000$_H$ | 8, 16, 32 |
| Channel 0 control register | RSCAN0C0CTR | 0000 0005$_H$ | <RSCAN0_base> + 0004$_H$ | 8, 16, 32 |
| Channel 0 status register | RSCAN0C0STS | 0000 0005$_H$ | <RSCAN0_base> + 0008$_H$ | 8, 16, 32 |
| Channel 0 error flag register | RSCAN0C0ERFL | 0000 0000$_H$ | <RSCAN0_base> + 000C$_H$ | 8, 16, 32 |
| Channel 1 configuration register | RSCAN0C1CFG | 0000 0000$_H$ | <RSCAN0_base> + 0010$_H$ | 8, 16, 32 |
| Channel 1 control register | RSCAN0C1CTR | 0000 0005$_H$ | <RSCAN0_base> + 0014$_H$ | 8, 16, 32 |
| Channel 1 status register | RSCAN0C1STS | 0000 0005$_H$ | <RSCAN0_base> + 0018$_H$ | 8, 16, 32 |
| Channel 1 error flag register | RSCAN0C1ERFL | 0000 0000$_H$ | <RSCAN0_base> + 001C$_H$ | 8, 16, 32 |
| Channel 2 configuration register | RSCAN0C2CFG | 0000 0000$_H$ | <RSCAN0_base> + 0020$_H$ | 8, 16, 32 |
| Channel 2 control register | RSCAN0C2CTR | 0000 0005$_H$ | <RSCAN0_base> + 0024$_H$ | 8, 16, 32 |
| Channel 2 status register | RSCAN0C2STS | 0000 0005$_H$ | <RSCAN0_base> + 0028$_H$ | 8, 16, 32 |
| Channel 2 error flag register | RSCAN0C2ERFL | 0000 0000$_H$ | <RSCAN0_base> + 002C$_H$ | 8, 16, 32 |
| Channel 3 configuration register | RSCAN0C3CFG | 0000 0000$_H$ | <RSCAN0_base> + 0030$_H$ | 8, 16, 32 |
| Channel 3 control register | RSCAN0C3CTR | 0000 0005$_H$ | <RSCAN0_base> + 0034$_H$ | 8, 16, 32 |
| Channel 3 status register | RSCAN0C3STS | 0000 0005$_H$ | <RSCAN0_base> + 0038$_H$ | 8, 16, 32 |
| Channel 3 error flag register | RSCAN0C3ERFL | 0000 0000$_H$ | <RSCAN0_base> + 003C$_H$ | 8, 16, 32 |
| Channel 4 configuration register | RSCAN0C4CFG | 0000 0000$_H$ | <RSCAN0_base> + 0040$_H$ | 8, 16, 32 |
| Channel 4 control register | RSCAN0C4CTR | 0000 0005$_H$ | <RSCAN0_base> + 0044$_H$ | 8, 16, 32 |
| Channel 4 status register | RSCAN0C4STS | 0000 0005$_H$ | <RSCAN0_base> + 0048$_H$ | 8, 16, 32 |
| Channel 4 error flag register | RSCAN0C4ERFL | 0000 0000$_H$ | <RSCAN0_base> + 004C$_H$ | 8, 16, 32 |
| Global configuration register | RSCAN0GCFG | 0000 0000$_H$ | <RSCAN0_base> + 0084$_H$ | 8, 16, 32 |
| Global control register | RSCAN0GCTR | 0000 0005$_H$ | <RSCAN0_base> + 0088$_H$ | 8, 16, 32 |
| Global status register | RSCAN0GSTS | 0000 000D$_H$ | <RSCAN0_base> + 008C$_H$ | 8, 16, 32 |
| Global error flag register | RSCAN0GERFL | 0000 0000$_H$ | <RSCAN0_base> + 0090$_H$ | 8, 16, 32 |
| Global timestamp counter register | RSCAN0GTSC | 0000 0000$_H$ | <RSCAN0_base> + 0094$_H$ | 16, 32 |
| Receive rule entry control register | RSCAN0GAFLECTR | 0000 0000$_H$ | <RSCAN0_base> + 0098$_H$ | 8, 16, 32 |
| Receive rule configuration register 0 | RSCAN0GAFLCFG0 | 0000 0000$_H$ | <RSCAN0_base> + 009C$_H$ | 8, 16, 32 |
| Receive rule configuration register 1 | RSCAN0GAFLCFG1 | 0000 0000$_H$ | <RSCAN0_base> + 00A0$_H$ | 8, 16, 32 |
| Receive buffer number register | RSCAN0RMNB | 0000 0000$_H$ | <RSCAN0_base> + 00A4$_H$ | 8, 16, 32 |
| Receive buffer new data register 0 | RSCAN0RMND0 | 0000 0000$_H$ | <RSCAN0_base> + 00A8$_H$ | 8, 16, 32 |
| Receive buffer new data register 1 | RSCAN0RMND1 | 0000 0000$_H$ | <RSCAN0_base> + 00AC$_H$ | 8, 16, 32 |
| Receive buffer new data register 2 | RSCAN0RMND2 | 0000 0000$_H$ | <RSCAN0_base> + 00B0$_H$ | 8, 16, 32 |
| Receive FIFO buffer configuration and control register 0 | RSCAN0RFCC0 | 0000 0000$_H$ | <RSCAN0_base> + 00B8$_H$ | 8, 16, 32 |
| Receive FIFO buffer configuration and control register 1 | RSCAN0RFCC1 | 0000 0000$_H$ | <RSCAN0_base> + 00BC$_H$ | 8, 16, 32 |
| Receive FIFO buffer configuration and control register 2 | RSCAN0RFCC2 | 0000 0000$_H$ | <RSCAN0_base> + 00C0$_H$ | 8, 16, 32 |
| Receive FIFO buffer configuration and control register 3 | RSCAN0RFCC3 | 0000 0000$_H$ | <RSCAN0_base> + 00C4$_H$ | 8, 16, 32 |
| Receive FIFO buffer configuration and control register 4 | RSCAN0RFCC4 | 0000 0000$_H$ | <RSCAN0_base> + 00C8$_H$ | 8, 16, 32 |
| Receive FIFO buffer configuration and control register 5 | RSCAN0RFCC5 | 0000 0000$_H$ | <RSCAN0_base> + 00CC$_H$ | 8, 16, 32 |
| Receive FIFO buffer configuration and control register 6 | RSCAN0RFCC6 | 0000 0000$_H$ | <RSCAN0_base> + 00D0$_H$ | 8, 16, 32 |
| Receive FIFO buffer configuration and control register 7 | RSCAN0RFCC7 | 0000 0000$_H$ | <RSCAN0_base> + 00D4$_H$ | 8, 16, 32 |
| Receive FIFO buffer status register 0 | RSCAN0RFSTS0 | 0000 0001$_H$ | <RSCAN0_base> + 00D8$_H$ | 8, 16, 32 |
| Receive FIFO buffer status register 1 | RSCAN0RFSTS1 | 0000 0001$_H$ | <RSCAN0_base> + 00DC$_H$ | 8, 16, 32 |
| Receive FIFO buffer status register 2 | RSCAN0RFSTS2 | 0000 0001$_H$ | <RSCAN0_base> + 00E0$_H$ | 8, 16, 32 |
| Receive FIFO buffer status register 3 | RSCAN0RFSTS3 | 0000 0001$_H$ | <RSCAN0_base> + 00E4$_H$ | 8, 16, 32 |

**Table 21.10 List of RS-CAN Module Registers (2/25)**

| Register Name | Symbol | After Reset | Address | Access Size |
|---|---|---|---|---|
| Receive FIFO buffer status register 4 | RSCAN0RFSTS4 | 0000 0001$_H$ | <RSCAN0_base> + 00E8$_H$ | 8, 16, 32 |
| Receive FIFO buffer status register 5 | RSCAN0RFSTS5 | 0000 0001$_H$ | <RSCAN0_base> + 00EC$_H$ | 8, 16, 32 |
| Receive FIFO buffer status register 6 | RSCAN0RFSTS6 | 0000 0001$_H$ | <RSCAN0_base> + 00F0$_H$ | 8, 16, 32 |
| Receive FIFO buffer status register 7 | RSCAN0RFSTS7 | 0000 0001$_H$ | <RSCAN0_base> + 00F4$_H$ | 8, 16, 32 |
| Receive FIFO buffer pointer control register 0 | RSCAN0RFPCTR0 | — | <RSCAN0_base> + 00F8$_H$ | 8, 16, 32 |
| Receive FIFO buffer pointer control register 1 | RSCAN0RFPCTR1 | — | <RSCAN0_base> + 00FC$_H$ | 8, 16, 32 |
| Receive FIFO buffer pointer control register 2 | RSCAN0RFPCTR2 | — | <RSCAN0_base> + 0100$_H$ | 8, 16, 32 |
| Receive FIFO buffer pointer control register 3 | RSCAN0RFPCTR3 | — | <RSCAN0_base> + 0104$_H$ | 8, 16, 32 |
| Receive FIFO buffer pointer control register 4 | RSCAN0RFPCTR4 | — | <RSCAN0_base> + 0108$_H$ | 8, 16, 32 |
| Receive FIFO buffer pointer control register 5 | RSCAN0RFPCTR5 | — | <RSCAN0_base> + 010C$_H$ | 8, 16, 32 |
| Receive FIFO buffer pointer control register 6 | RSCAN0RFPCTR6 | — | <RSCAN0_base> + 0110$_H$ | 8, 16, 32 |

| | Transmit buffer 16 × m + 14 |
| | Transmit buffer 16 × m + 15 |

**Table 21.12 Transmit/Receive FIFO Buffer k Allocated to Each Channel**

| | CANm |
|---|---|
| Transmit/receive FIFO buffer k | Transmit/receive FIFO buffer 3 × m + 0 |
| | Transmit/receive FIFO buffer 3 × m + 1 |
| | Transmit/receive FIFO buffer 3 × m + 2 |

**Table 21.13 Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer by the Setting of Bits CFTML[3:0]**

| Setting of Bits CFTML[3:0] | Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer |
|---|---|
| $0000_B$ | Transmit buffer 16 × m + 0 |
| $0001_B$ | Transmit buffer 16 × m + 1 |
| $0010_B$ | Transmit buffer 16 × m + 2 |
| $0011_B$ | Transmit buffer 16 × m + 3 |
| $0100_B$ | Transmit buffer 16 × m + 4 |
| $0101_B$ | Transmit buffer 16 × m + 5 |
| $0110_B$ | Transmit buffer 16 × m + 6 |
| $0111_B$ | Transmit buffer 16 × m + 7 |
| $1000_B$ | Transmit buffer 16 × m + 8 |
| $1001_B$ | Transmit buffer 16 × m + 9 |
| $1010_B$ | Transmit buffer 16 × m + 10 |
| $1011_B$ | Transmit buffer 16 × m + 11 |
| $1100_B$ | Transmit buffer 16 × m + 12 |
| $1101_B$ | Transmit buffer 16 × m + 13 |
| $1110_B$ | Transmit buffer 16 × m + 14 |
| $1111_B$ | Transmit buffer 16 × m + 15 |

**Table 21.14 Transmit Buffer p Allocated to the Transmit Queue of Each Channel**

| Setting of Bits TXQDC[3:0] | Transmit Buffer p Allocated to the Transmit Queue |
|---|---|
| $0000_B$ | Setting prohibited |
| $0001_B$ | Setting prohibited |
| $0010_B$ | Transmit buffer 16 × m + 15 to 16 × m + 13 |
| $0011_B$ | Transmit buffer 16 × m + 15 to 16 × m + 12 |
| $0100_B$ | Transmit buffer 16 × m + 15 to 16 × m + 11 |
| $0101_B$ | Transmit buffer 16 × m + 15 to 16 × m + 10 |
| $0110_B$ | Transmit buffer 16 × m + 15 to 16 × m + 9 |
| $0111_B$ | Transmit buffer 16 × m + 15 to 16 × m + 8 |
| $1000_B$ | Transmit buffer 16 × m + 15 to 16 × m + 7 |
| $1001_B$ | Transmit buffer 16 × m + 15 to 16 × m + 6 |
| $1010_B$ | Transmit buffer 16 × m + 15 to 16 × m + 5 |
| $1011_B$ | Transmit buffer 16 × m + 15 to 16 × m + 4 |
| $1100_B$ | Transmit buffer 16 × m + 15 to 16 × m + 3 |
| $1101_B$ | Transmit buffer 16 × m + 15 to 16 × m + 2 |
| $1110_B$ | Transmit buffer 16 × m + 15 to 16 × m + 1 |
| $1111_B$ | Transmit buffer 16 × m + 15 to 16 × m + 0 |

## 21.3.1 RSCAN0CmCFG — Channel Configuration Register (m = 0 to 4)

**Access:** Can be read/written in 8-, 16-, and 32-bit units

**Address:** <RSCAN0_base> + $0000_H$ + (m * $0010_H$)

**Initial value:** $0000\ 0000_H$

| 15 to 10 | Reserved | These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | BRP[9:0] | Prescaler Division Ratio Set<br>When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1. |

Modify the RSCAN0CmCFG register in channel reset mode or channel halt mode. Set this register before requesting a transition to channel communication mode or channel wait mode. For a description of the bit timing parameters and settings, see Section 21.10.1, Initial Settings.

#### SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq, inclusive.
Set a value less than or equal to the value of the TSEG2 bits.

#### TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase buffer segment 2 (PHASE_SEG2). Allowed values are 2 Tq to 8 Tq, inclusive.
Set a value smaller than the value of the TSEG1 bits.

#### TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation time segment (PROP_SEG) and phase buffer segment 1 (PHASE_SEG1).
Allowed values are 4 Tq to 16 Tq, inclusive.

#### BRP[9:0] Bits

The CANmTq (fCANTQm) clock is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

## 21.3.2 RSCAN0CmCTR — Channel Control Register (m = 0 to 4)

**Access:** Can be read/written in 8-, 16-, and 32-bit units

**Address:** <RSCAN0_base> + $0004_H$ + (m * $0010_H$)

**Initial value:** 0000 $0005_H$

### CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

### CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

### ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCAN0CmERFL register.
When this bit is clear to 0, only the flags of the first error are set to 1. If two or more errors occur in the first error, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

#### BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CAN module.

When the BOM[1:0] bits are set to $00_B$, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CAN module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to $10_B$ (channel halt mode) before recessive bits are detected 128 times, the RS-CAN module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CAN module reaches the bus off state when the BOM[1:0] bits are set to $01_B$, the CHMDC[1:0] bits in the RSCAN0CmCTR register (m = 0 to 4) are set to $10_B$ and the RS-CAN module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits in the RSCAN0CmSTS register are cleared to $00_H$.

When the RS-CAN module reaches the bus off state when the BOM[1:0] bits are set to $10_B$, the CHMDC[1:0] bits are set to $10_B$ and the RS-CAN module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_H$.

When the BOM[1:0] bits are set to $11_B$ and the CHMDC[1:0] bits are set to $10_B$ while the RS-CAN module is in the bus off state, the RS-CAN module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_H$. However, if 11 consecutive recessive bits are detected 128 times and the RS-CAN module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to $10_B$, a bus off recovery interrupt request is generated.

If the CPU requests a transition to channel reset mode at the same time as the RS-CAN module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are $01_B$ or at bus off end when the BOM[1:0] bits are $10_B$), the CPU's request takes precedence. Modify the BOM bits only in channel reset mode.

#### TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

#### ALIE Bit

When the ALF flag in the RSCAN0CmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BLIE Bit

When the BLF flag in the RSCAN0CmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### OLIE Bit

When the OVLF flag in the RSCAN0CmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BORIE Bit

When the BORF flag in the RSCAN0CmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BOEIE Bit

When the BOEF flag in the RSCAN0CmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EPIE Bit

When the EPF flag in the RSCAN0CmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EWIE Bit

When the EWF flag in the RSCAN0CmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BEIE Bit

When the BEF flag in the RSCAN0CmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCAN0CmSTS register to $00_H$ and also clears the BOSTS flag in the RSCAN0CmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCAN0CmCTR register are $00_B$ (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

#### CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.

Clearing this bit to 0 makes the channel exit channel stop mode.

Modify this bit from 0 to 1 only in channel reset mode.

#### CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see Section 21.5.2, Channel Modes. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to $11_B$. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become $10_B$.

## 21.3.3 RSCAN0CmSTS — Channel Status Register (m = 0 to 4)

**Access:** Can be read in 8-, 16-, and 32-bit units

**Address:** <RSCAN0_base> + $0008_H$ + (m * $0010_H$)

**Initial value:** 0000 $0005_H$
